Proof. We may assume that S is an affine scheme. It is shown in Algebra, Lemmas 7.139.23 and 7.139.24 that $\mathcal{O}^h_{S,s}$ and $\mathcal{O}^{sh}_{S,s}$ are filtered colimits of the rings $\mathcal{O}_{T,t}$ where $T \to S$ is étale and affine. Hence the local ring maps $\mathcal{O}_{S,s} \to \mathcal{O}^h_{S,s} \to \mathcal{O}^{sh}_{S,s}$ are flat as directed colimits of étale ring maps, see Algebra, Lemma 7.35.2. Hence (3) ⇒ (2) ⇒ (1) and (5) ⇒ (4) follow from Algebra, Lemma 7.35.3. Of course these maps are faithfully flat, see Algebra, Lemma 7.35.16. Hence the equivalences (6) ⇔ (5) and (5) ⇔ (3) follow from Algebra, Lemma 7.35.7. Thus it suffices to show that (1) ⇒ (2) ⇒ (3) and (4) ⇒ (5).

Assume (1). By Lemma 34.3.4 we see that M^{sh} is flat over $\mathcal{O}_{T,t}$ for any étale neighbourhood $(T, t) \to (S, s)$. Since $\mathcal{O}^h_{S,s}$ and $\mathcal{O}^{sh}_{S,s}$ are directed colimits of local rings of the form $\mathcal{O}_{T,t}$ (see above) we conclude that M^{sh} is flat over $\mathcal{O}^h_{S,s}$ and $\mathcal{O}^{sh}_{S,s}$ by Algebra, Lemma 7.35.5. Thus (1) implies (2) and (3). Of course this implies also (2) ⇒ (3) by replacing $\mathcal{O}_{S,s}$ by $\mathcal{O}^h_{S,s}$. The same argument applies to prove (4) ⇒ (5). □

Lemma 34.3.6. *Let $g : T \to S$ be a finite flat morphism of schemes. Let $\mathcal{G}$ be a quasi-coherent $\mathcal{O}_S$-module. Let $t \in T$ be a point with image $s \in S$. Then*

$$t \in WeakAss(g^*\mathcal{G}) \Leftrightarrow s \in WeakAss(\mathcal{G})$$

Proof. The implication "⇐" follows immediately from Divisors, Lemma 26.6.4. Assume $t \in \text{WeakAss}(g^*\mathcal{G})$. Let $Spec(A) \subset S$ be an affine open neighbourhood of s. Let $\mathcal{G}$ be the quasi-coherent sheaf associated to the A-module M. Let $\mathfrak{p} \subset A$ be the prime ideal corresponding to s. As g is finite flat we have $g^{-1}(Spec(A)) = Spec(B)$ for some finite flat A-algebra B. Note that $g^*\mathcal{G}$ is the quasi-coherent $\mathcal{O}_{Spec(B)}$-module associated to the B-module $M \otimes_A B$ and $g_*g^*\mathcal{G}$ is the quasi-coherent $\mathcal{O}_{Spec(A)}$-module associated to the A-module $M \otimes_A B$. By Algebra, Lemma 7.72.4 we have $B_\mathfrak{p} \cong A_\mathfrak{p}^{\oplus n}$ for some integer $n \geq 0$. Note that $n \geq 1$ as we assumed there exists at least one point of T lying over s. Hence we see by looking at stalks that

$$s \in \text{WeakAss}(\mathcal{G}) \Leftrightarrow s \in \text{WeakAss}(g_*g^*\mathcal{G})$$

Now the assumption that $t \in \text{WeakAss}(g^*\mathcal{G})$ implies that $s \in \text{WeakAss}(g_*g^*\mathcal{G})$ by Divisors, Lemma 26.6.3 and hence by the above $s \in \text{WeakAss}(\mathcal{G})$. □

Lemma 34.3.7. *Let $h : U \to S$ be an étale morphism of schemes. Let $\mathcal{G}$ be a quasi-coherent $\mathcal{O}_S$-module. Let $u \in U$ be a point with image $s \in S$. Then*

$$u \in WeakAss(h^*\mathcal{G}) \Leftrightarrow s \in WeakAss(\mathcal{G})$$

Proof. After replacing S and U by affine neighbourhoods of s and u we may assume that g is a standard étale morphism of affines, see Morphisms, Lemma 24.35.14. Thus we may assume $S = Spec(A)$ and $X = Spec(A[x, 1/g]/(f))$, where f is monic and f' is invertible in $A[x, 1/g]$. Note that $A[x, 1/g]/(f) = (A[x]/(f))_g$ is also the localization of the finite free A-algebra $A[x]/(f)$. Hence we may think of U as an open subscheme of the scheme $T = Spec(A[x]/(f))$ which is finite locally free over S. This reduces us to Lemma 34.3.6 above. □

34.4. The local structure of a finite type module

The key technical lemma that makes a lot of the arguments in this chapter work is the geometric Lemma 34.4.2.

Lemma 34.4.1. *Let $f : X \to S$ be a finite type morphism of affine schemes. Let $\mathcal{F}$ be a finite type quasi-coherent $\mathcal{O}_X$-module. Let $x \in X$ with image $s = f(x)$ in S. Set $\mathcal{F}_s = \mathcal{F}|_{X_s}$. Then there exist a closed immersion $i : Z \to X$ of finite presentation, and a quasi-coherent finite type $\mathcal{O}_Z$-module $\mathcal{G}$ such that $i_*\mathcal{G} = \mathcal{F}$ and $Z_s = Supp(\mathcal{F}_s)$.*

Proof. Say the morphism $f : X \to S$ is given by the ring map $A \to B$ and that $\mathcal{F}$ is the quasi-coherent sheaf associated to the B-module M. By Morphisms, Lemma 24.14.2 we know that $A \to B$ is a finite type ring map, and by Properties, Lemma 23.16.1 we know that M is a finite B-module. In particular the support of $\mathcal{F}$ is the closed subscheme of $Spec(B)$ cut out by the annihilator $I = \{x \in B \mid xm = 0\ \forall m \in M\}$ of M, see Algebra, Lemma 7.59.4. Let $\mathfrak{q} \subset B$ be the prime ideal corresponding to x and let $\mathfrak{p} \subset A$ be the prime ideal corresponding to s. Note that $X_s = Spec(B \otimes_A \kappa(\mathfrak{p}))$ and that $\mathcal{F}_s$ is the quasi-coherent sheaf associated to the $B \otimes_A \kappa(\mathfrak{p})$ module $M \otimes_A \kappa(\mathfrak{p})$. By Coherent, Lemma 25.10.3 the support of $\mathcal{F}_s$ is equal to $V(I(B \otimes_A \kappa(\mathfrak{p})))$. Since $B \otimes_A \kappa(\mathfrak{p})$ is of finite type over $\kappa(\mathfrak{p})$ there exist finitely many elements $f_1, \ldots, f_m \in I$ such that

$$I(B \otimes_A \kappa(\mathfrak{p})) = (f_1, \ldots, f_n)(B \otimes_A \kappa(\mathfrak{p})).$$

Denote $i : Z \to X$ the closed subscheme cut out by $(f_1, \ldots, f_m)$, in a formula $Z = Spec(B/(f_1, \ldots, f_m))$. Since M is annihilated by I we can think of M as an $B/(f_1, \ldots, f_m)$-module. In other words, $\mathcal{F}$ is the pushforward of a finite type module on Z. As $Z_s = \mathrm{Supp}(\mathcal{F}_s)$ by construction, this proves the lemma. □

Lemma 34.4.2. *Let $f : X \to S$ be morphism of schemes which is locally of finite type. Let $\mathcal{F}$ be a finite type quasi-coherent $\mathcal{O}_X$-module. Let $x \in X$ with image $s = f(x)$ in S. Set $\mathcal{F}_s = \mathcal{F}|_{X_s}$ and $n = \dim_x(Supp(\mathcal{F}_s))$. Then we can construct*

(1) *elementary étale neighbourhoods $g : (X', x') \to (X, x)$, $e : (S', s') \to (S, s)$,*
(2) *a commutative diagram*

$$\begin{tikzcd} X & X' \arrow[l, "g"'] \arrow[d] & Z' \arrow[l, "i"'] \arrow[d, "\pi"] \\ & & Y' \arrow[d, "h"] \\ S \arrow[from=uu, "f"'] & S' \arrow[l, "e"'] \arrow[from=u] & S' \arrow[l, equal] \end{tikzcd}$$

(3) *a point $z' \in Z'$ with $i(z') = x'$, $y' = \pi(z')$, $h(y') = s'$,*
(4) *a finite type quasi-coherent $\mathcal{O}_{Z'}$-module $\mathcal{G}$,*

such that the following properties hold

(1) *X', Z', Y', S' are affine schemes,*
(2) *i is a closed immersion of finite presentation,*
(3) *$i_*(\mathcal{G}) \cong g^*\mathcal{F}$,*
(4) *π is finite and $\pi^{-1}(\{y'\}) = \{z'\}$,*
(5) *the extension $\kappa(s') \subset \kappa(y')$ is purely transcendental,*
(6) *h is smooth of relative dimension n with geometrically integral fibres.*

Proof. Let $V \subset S$ be an affine neighbourhood of s. Let $U \subset f^{-1}(V)$ be an affine neighbourhood of x. Then it suffices to prove the lemma for $f|_U : U \to V$ and $\mathcal{F}|_U$. Hence in the rest of the proof we assume that X and S are affine.

First, suppose that $X_s = \mathrm{Supp}(\mathcal{F}_s)$, in particular $n = \dim_x(X_s)$. Apply More on Morphisms, Lemmas 33.31.2 and 33.31.3. This gives us a commutative diagram

$$\begin{tikzcd} X \arrow[dd] & X' \arrow[l, "g"'] \arrow[d, "\pi"] \\ & Y' \arrow[d, "h"] \\ S & S' \arrow[l, "e"] \end{tikzcd}$$

and point $x' \in X'$. We set $Z' = X'$, $i = \mathrm{id}$, and $\mathcal{G} = g^*\mathcal{F}$ to obtain a solution in this case.

In general choose a closed immersion $Z \to X$ and a sheaf $\mathcal{G}$ on Z as in Lemma 34.4.1. Applying the result of the previous paragraph to $Z \to S$ and $\mathcal{G}$ we obtain a diagram

$$\begin{tikzcd} X \arrow[dd, "f"'] & Z \arrow[l] \arrow[dd, "f|_Z"'] & Z' \arrow[l, "g"'] \arrow[d, "\pi"] \\ & & Y' \arrow[d, "h"] \\ S \arrow[r, equal] & S & S' \arrow[l, "e"] \end{tikzcd}$$

and point $z' \in Z'$ satisfying all the required properties. We will use Lemma 34.3.1 to embed Z' into a scheme étale over X. We cannot apply the lemma directly as we want X' to be a scheme over S'. Instead we consider the morphisms

$$Z' \longrightarrow Z \times_S S' \longrightarrow X \times_S S'$$

The first morphism is étale by Morphisms, Lemma 24.35.18. The second is a closed immersion as a base change of a closed immersion. Finally, as X, S, S', Z, Z' are all affine we may apply Lemma 34.3.1 to get an étale morphism of affine schemes $X' \to X \times_S S'$ such that

$$Z' = (Z \times_S S') \times_{(X \times_S S')} X' = Z \times_X X'.$$

As $Z \to X$ is a closed immersion of finite presentation, so is $Z' \to X'$. Let $x' \in X'$ be the point corresponding to $z' \in Z'$. Then the completed diagram

$$\begin{tikzcd} X \arrow[dd] & X' \arrow[l] \arrow[dd] & Z' \arrow[l, "i"'] \arrow[d, "\pi"] \\ & & Y' \arrow[d, "h"] \\ S & S' \arrow[l, "e"] \arrow[r, equal] & S' \end{tikzcd}$$

is a solution of the original problem. □

Lemma 34.4.3. *Assumptions and notation as in Lemma 34.4.2. If f is locally of finite presentation then π is of finite presentation. In this case the following are equivalent*

(1) *$\mathcal{F}$ is an $\mathcal{O}_X$-module of finite presentation in a neighbourhood of x,*
(2) *$\mathcal{G}$ is an $\mathcal{O}_{Z'}$-module of finite presentation in a neighbourhood of z', and*
(3) *$\pi_*\mathcal{G}$ is an $\mathcal{O}_{Y'}$-module of finite presentation in a neighbourhood of y'.*

Still assuming f locally of finite presentation the following are equivalent to each other

(a) *$\mathcal{F}_x$ is an $\mathcal{O}_{X,x}$-module of finite presentation,*
(b) *$\mathcal{G}_{z'}$ is an $\mathcal{O}_{Z',z'}$-module of finite presentation, and*
(c) *$(\pi_*\mathcal{G})_{y'}$ is an $\mathcal{O}_{Y',y'}$-module of finite presentation.*

Proof. Assume f locally of finite presentation. Then $Z' \to S$ is locally of finite presentation as a composition of such, see Morphisms, Lemma 24.20.3. Note that $Y' \to S$ is also locally of finite presentation as a composition of a smooth and an étale morphism. Hence Morphisms, Lemma 24.20.11 implies π is locally of finite presentation. Since π is finite we conclude that it is also separated and quasi-compact, hence π is actually of finite presentation.

To prove the equivalence of (1), (2), and (3) we also consider: (4) $g^*\mathcal{F}$ is a $\mathcal{O}_{X'}$-module of finite presentation in a neighbourhood of x'. The pull back of a module of finite presentation is of finite presentation, see Modules, Lemma 15.11.4. Hence (1) $\Rightarrow$ (4). The étale morphism g is open, see Morphisms, Lemma 24.35.13. Hence for any open neighbourhood $U' \subset X'$ of x', the image $g(U')$ is an open neighbourhood of x and the map $\{U' \to g(U')\}$ is an étale covering. Thus (4) $\Rightarrow$ (1) by Descent, Lemma 31.5.2. Using Descent, Lemma 31.5.8 and some easy topological arguments (see More on Morphisms, Lemma 33.31.4) we see that (4) $\Leftrightarrow$ (2) $\Leftrightarrow$ (3).

To prove the equivalence of (a), (b), (c) consider the ring maps

$$\mathcal{O}_{X,x} \to \mathcal{O}_{X',x'} \to \mathcal{O}_{Z',z'} \leftarrow \mathcal{O}_{Y',y'}$$

The first ring map is faithfully flat. Hence $\mathcal{F}_x$ is of finite presentation over $\mathcal{O}_{X,x}$ if and only if $g^*\mathcal{F}_{x'}$ is of finite presentation over $\mathcal{O}_{X',x'}$, see Algebra, Lemma 7.77.2. The second ring map is surjective (hence finite) and finitely presented by assumption, hence $g^*\mathcal{F}_{x'}$ is of finite presentation over $\mathcal{O}_{X',x'}$ if and only if $\mathcal{G}_{z'}$ is of finite presentation over $\mathcal{O}_{Z',z'}$, see Algebra, Lemma 7.7.4. Because π is finite, of finite presentation, and $\pi^{-1}(\{y'\}) = \{x'\}$ the ring homomorphism $\mathcal{O}_{Y',y'} \leftarrow \mathcal{O}_{Z',z'}$ is finite and of finite presentation, see More on Morphisms, Lemma 33.31.4. Hence $\mathcal{G}_{z'}$ is of finite presentation over $\mathcal{O}_{Z',z'}$ if and only if $\pi_*\mathcal{G}_{y'}$ is of finite presentation over $\mathcal{O}_{Y',y'}$, see Algebra, Lemma 7.7.4. □

Lemma 34.4.4. *Assumptions and notation as in Lemma 34.4.2. The following are equivalent*

(1) *$\mathcal{F}$ is flat over S in a neighbourhood of x,*
(2) *$\mathcal{G}$ is flat over S' in a neighbourhood of z', and*
(3) *$\pi_*\mathcal{G}$ is flat over S' in a neighbourhood of y'.*

The following are equivalent also

(a) *$\mathcal{F}_x$ is flat over $\mathcal{O}_{S,s}$,*
(b) *$\mathcal{G}_{z'}$ is flat over $\mathcal{O}_{S',s'}$, and*
(c) *$(\pi_*\mathcal{G})_{y'}$ is flat over $\mathcal{O}_{S',s'}$.*

Proof. To prove the equivalence of (1), (2), and (3) we also consider: (4) $g^*\mathcal{F}$ is flat over S in a neighbourhood of x'. We will use Lemma 34.3.3 to equate flatness over S and S' without further mention. The étale morphism g is flat and open, see Morphisms, Lemma 24.35.13. Hence for any open neighbourhood $U' \subset X'$ of x', the image $g(U')$ is an open neighbourhood of x and the map $U' \to g(U')$ is surjective and flat. Thus (4) $\Leftrightarrow$ (1) by Morphisms, Lemma 24.24.11. Note that

$$\Gamma(X', g^*\mathcal{F}) = \Gamma(Z', \mathcal{G}) = \Gamma(Y', \pi_*\mathcal{G})$$

Hence the flatness of $g^*\mathcal{F}$, $\mathcal{G}$ and $\pi_*\mathcal{G}$ over S' are all equivalent (this uses that X', Z', Y', and S' are all affine). Some omitted topological arguments (compare More on Morphisms, Lemma 33.31.4) regarding affine neighbourhoods now show that (4) $\Leftrightarrow$ (2) $\Leftrightarrow$ (3).

To prove the equivalence of (a), (b), (c) consider the commutative diagram of local ring maps

$$\begin{tikzcd}
\mathcal{O}_{X',x'} \arrow[r, "\iota"'] & \mathcal{O}_{Z',z'} & \mathcal{O}_{Y',y'} \arrow[l, "\alpha"'] & \mathcal{O}_{S',s'} \arrow[l, "\beta"'] \\
\mathcal{O}_{X,x} \arrow[u, "\gamma"] & & & \mathcal{O}_{S,s} \arrow[lll, "\varphi"'] \arrow[u, "\epsilon"']
\end{tikzcd}$$

We will use Lemma 34.3.4 to equate flatness over $\mathcal{O}_{S,s}$ and $\mathcal{O}_{S',s'}$ without further mention. The map γ is faithfully flat. Hence $\mathcal{F}_x$ is flat over $\mathcal{O}_{S,s}$ if and only if $g^*\mathcal{F}_{x'}$ is flat over $\mathcal{O}_{S',s'}$, see Algebra, Lemma 7.35.8. As $\mathcal{O}_{S',s'}$-modules the modules $g^*\mathcal{F}_{x'}$, $\mathcal{G}_{z'}$, and $\pi_*\mathcal{G}_{y'}$ are all isomorphic, see More on Morphisms, Lemma 33.31.4. This finishes the proof. □

34.5. One step dévissage

In this section we explain what is a one step dévissage of a module. A one step dévissage exist étale locally on base and target. We discuss base change, Zariski shrinking and étale localization of a one step dévissage.

Definition 34.5.1. Let S be a scheme. Let X be locally of finite type over S. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module of finite type. Let $s \in S$ be a point. A *one step dévissage of $\mathcal{F}/X/S$ over s* is given by morphisms of schemes over S

$$X \xleftarrow{i} Z \xrightarrow{\pi} Y$$

and a quasi-coherent $\mathcal{O}_Z$-module $\mathcal{G}$ of finite type such that

1. X, S, Z and Y are affine,
2. i is a closed immersion of finite presentation,
3. $\mathcal{F} \cong i_*\mathcal{G}$,
4. π is finite, and
5. the structure morphism $Y \to S$ is smooth with geometrically irreducible fibres of dimension $\dim(\text{Supp}(\mathcal{F}_s))$.

In this case we say $(Z, Y, i, \pi, \mathcal{G})$ is a one step dévissage of $\mathcal{F}/X/S$ over s.

Note that such a one step dévissage can only exist if X and S are affine. In the definition above we only require X to be (locally) of finite type over S and we continue working in this setting below. In [**GR71**] the authors use consistently the setup where $X \to S$ is locally of finite presentation and $\mathcal{F}$ quasi-coherent $\mathcal{O}_X$-module of finite type. The advantage of this choice is that it ``makes sense'' to ask for $\mathcal{F}$ to be of finite presentation as an $\mathcal{O}_X$-module, whereas in our setting it ``does not make sense''. Please see Section 34.2 for a discussion; the observations made there show that in our setup we may consider the condition of $\mathcal{F}$ being ``locally of finite presentation relative to S'', and we could work consistently with this notion. Instead however, we will rely on the results of Lemma 34.4.3 and the observations in Remark 34.7.3 to deal with this issue in an ad hoc fashion whenever it comes up.

Definition 34.5.2. Let S be a scheme. Let X be locally of finite type over S. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module of finite type. Let $x \in X$ be a point with image s in S. A *one step dévissage of $\mathcal{F}/X/S$ at x* is a system $(Z, Y, i, \pi, \mathcal{G}, z, y)$, where $(Z, Y, i, \pi, \mathcal{G})$ is a one step dévissage of $\mathcal{F}/X/S$ over s and

1. $\dim_x(\text{Supp}(\mathcal{F}_s)) = \dim(\text{Supp}(\mathcal{F}_s))$,
2. $z \in Z$ is a point with $i(z) = x$ and $\pi(z) = y$,
3. we have $\pi^{-1}(\{y\}) = \{z\}$,
4. the extension $\kappa(s) \subset \kappa(y)$ is purely transcendental.

A one step dévissage of $\mathcal{F}/X/S$ at x can only exist if X and S are affine. Condition (1) assures us that $Y \to S$ has relative dimension equal to $\dim_x(\text{Supp}(\mathcal{F}_s))$ via condition (5) of Definition 34.5.1.

Lemma 34.5.3 (Reformulation of Lemma 34.4.2)**.** *Let $f : X \to S$ be morphism of schemes which is locally of finite type. Let $\mathcal{F}$ be a finite type quasi-coherent $\mathcal{O}_X$-module. Let $x \in X$ with image $s = f(x)$ in S. Then there exists a commutative diagram of pointed schemes*

$$\begin{tikzcd} (X, x) \arrow[d, "f"'] & (X', x') \arrow[l, "g"'] \arrow[d] \\ (S, s) & (S', s') \arrow[l] \end{tikzcd}$$

such that $(S', s') \to (S, s)$ and $(X', x') \to (X, x)$ are elementary étale neighbourhoods, and such that $g^*\mathcal{F}/X'/S'$ has a one step dévissage at x'.

Proof. This is immediate from Definition 34.5.2 and Lemma 34.4.2. □

Lemma 34.5.4. *Let S, X, $\mathcal{F}$, s be as in Definition 34.5.1. Let $(Z, Y, i, \pi, \mathcal{G})$ be a one step dévissage of $\mathcal{F}/X/S$ over s. Let $(S', s') \to (S, s)$ be any morphism of pointed schemes. Given this data let X', Z', Y', i', π' be the base changes of X, Z, Y, i, π via $S' \to S$. Let $\mathcal{F}'$ be the pullback of $\mathcal{F}$ to X' and let $\mathcal{G}'$ be the pullback of $\mathcal{G}$ to Z'. If S' is affine, then $(Z', Y', i', \pi', \mathcal{G}')$ is a one step dévissage of $\mathcal{F}'/X'/S'$ over s'.*

Proof. Fibre products of affines are affine, see Schemes, Lemma 21.17.2. Base change preserves closed immersions, morphisms of finite presentation, finite morphisms, smooth morphisms, morphisms with geometrically irreducible fibres, and morphisms of relative dimension n, see Morphisms, Lemmas 24.2.4, 24.20.4, 24.42.6, 24.33.5, 24.28.2, and More on Morphisms, Lemma 33.20.2. We have $i'_*\mathcal{G}' \cong \mathcal{F}'$ because pushforward along the finite morphism i commutes with base change, see Coherent, Lemma 25.6.1. We have $\dim(\text{Supp}(\mathcal{F}_s)) = \dim(\text{Supp}(\mathcal{F}'_{s'}))$ by Morphisms, Lemma 24.27.3 because

$$\text{Supp}(\mathcal{F}_s) \times_s s' = \text{Supp}(\mathcal{F}'_{s'}).$$

This proves the lemma. □

Lemma 34.5.5. *Let S, X, $\mathcal{F}$, x, s be as in Definition 34.5.2. Let $(Z, Y, i, \pi, \mathcal{G}, z, y)$ be a one step dévissage of $\mathcal{F}/X/S$ at x. Let $(S', s') \to (S, s)$ be a morphism of pointed schemes which induces an isomorphism $\kappa(s) = \kappa(s')$. Let $(Z', Y', i', \pi', \mathcal{G}')$ be as constructed in Lemma 34.5.4 and let $x' \in X'$ (resp. $z' \in Z'$, $y' \in Y'$) be the unique point mapping to both $x \in X$ (resp. $z \in Z$, $y \in Y$) and $s' \in S'$. If S' is affine, then $(Z', Y', i', \pi', \mathcal{G}', z', y')$ is a one step dévissage of $\mathcal{F}'/X'/S'$ at x'.*

Proof. By Lemma 34.5.4 $(Z', Y', i', \pi', \mathcal{G}')$ is a one step dévissage of $\mathcal{F}'/X'/S'$ over s'. Properties (1) -- (4) of Definition 34.5.2 hold for $(Z', Y', i', \pi', \mathcal{G}', z', y')$ as the assumption that $\kappa(s) = \kappa(s')$ insures that the fibres $X'_{s'}$, $Z'_{s'}$, and $Y'_{s'}$ are isomorphic to X_s, Z_s, and Y_s. ☐

Definition 34.5.6. Let S, X, $\mathcal{F}$, x, s be as in Definition 34.5.2. Let $(Z, Y, i, \pi, \mathcal{G}, z, y)$ be a one step dévissage of $\mathcal{F}/X/S$ at x. Let us define a *standard shrinking* of this situation to be given by standard opens $S' \subset S$, $X' \subset X$, $Z' \subset Z$, and $Y' \subset Y$ such that $s \in S'$, $x \in X'$, $z \in Z'$, and $y \in Y'$ and such that

$$(Z', Y', i|_{Z'}, \pi|_{Z'}, \mathcal{G}|_{Z'}, z, y)$$

is a one step dévissage of $\mathcal{F}|_{X'}/X'/S'$ at x.

Lemma 34.5.7. *With assumption and notation as in Definition 34.5.6 we have:*

1. *If $S' \subset S$ is a standard open neighbourhood of s, then setting $X' = X_{S'}$, $Z' = Z_{S'}$ and $Y' = Y_{S'}$ we obtain a standard shrinking.*
2. *Let $W \subset Y$ be a standard open neighbourhood of y. Then there exists a standard shrinking with $Y' = W \times_S S'$.*
3. *Let $U \subset X$ be an open neighbourhood of x. Then there exists a standard shrinking with $X' \subset U$.*

Proof. Part (1) is immediate from Lemma 34.5.5 and the fact that the inverse image of a standard open under a morphism of affine schemes is a standard open, see Algebra, Lemma 7.16.4.

Let $W \subset Y$ as in (2). Because $Y \to S$ is smooth it is open, see Morphisms, Lemma 24.33.10. Hence we can find a standard open neighbourhood S' of s contained in the image of W. Then the fibres of $W_{S'} \to S'$ are nonempty open subschemes of the fibres of $Y \to S$ over S' and hence geometrically irreducible too. Setting $Y' = W_{S'}$ and $Z' = \pi^{-1}(Y')$ we see that $Z' \subset Z$ is a standard open neighbourhood of z. Let $\overline{h} \in \Gamma(Z, \mathcal{O}_Z)$ be a function such that $Z' = D(\overline{h})$. As $i : Z \to X$ is a closed immersion, we can find a function $h \in \Gamma(X, \mathcal{O}_X)$ such that $i^\sharp(h) = \overline{h}$. Take $X' = D(h) \subset X$. In this way we obtain a standard shrinking as in (2).

Let $U \subset X$ be as in (3). We may after shrinking U assume that U is a standard open. By More on Morphisms, Lemma 33.31.4 there exists a standard open $W \subset Y$ neighbourhood of y such that $\pi^{-1}(W) \subset i^{-1}(U)$. Apply (2) to get a standard shrinking X', S', Z', Y' with $Y' = W_{S'}$. Since $Z' \subset \pi^{-1}(W) \subset i^{-1}(U)$ we may replace X' by $X' \cap U$ (still a standard open as U is also standard open) without violating any of the conditions defining a standard shrinking. Hence we win. ☐

Lemma 34.5.8. *Let S, X, $\mathcal{F}$, x, s be as in Definition 34.5.2. Let $(Z, Y, i, \pi, \mathcal{G}, z, y)$ be a one step dévissage of $\mathcal{F}/X/S$ at x. Let*

$$\begin{tikzcd} (Y, y) \arrow[d] & (Y', y') \arrow[l] \arrow[d] \\ (S, s) & (S', s') \arrow[l] \end{tikzcd}$$

be a commutative diagram of pointed schemes such that the horizontal arrows are elementary étale neighbourhoods. Then there exists a commutative diagram

$$
\begin{tikzcd}
 & & (X'', x'') \arrow[dll] \arrow[d] & (Z'', z'') \arrow[l] \arrow[dll] \arrow[d] \\
(X, x) \arrow[d] & (Z, z) \arrow[l] \arrow[d] & (S'', s'') \arrow[dll] & (Y'', y'') \arrow[l] \arrow[dll] \\
(S, s) & (Y, y) \arrow[l] & &
\end{tikzcd}
$$

of pointed schemes with the following properties:

(1) *$(S'', s'') \to (S', s')$ is an elementary étale neighbourhood and the morphism $S'' \to S$ is the composition $S'' \to S' \to S$,*
(2) *Y'' is an open subscheme of $Y' \times_{S'} S''$,*
(3) *$Z'' = Z \times_Y Y''$,*
(4) *$(X'', x'') \to (X, x)$ is an elementary étale neighbourhood, and*
(5) *$(Z'', Y'', i'', \pi'', \mathcal{G}'', z'', y'')$ is a one step dévissage at x'' of the sheaf $\mathcal{F}''$.*

Here $\mathcal{F}''$ (resp. $\mathcal{G}''$) is the pullback of $\mathcal{F}$ (resp. $\mathcal{G}$) via the morphism $X'' \to X$ (resp. $Z'' \to Z$) and $i'' : Z'' \to X''$ and $\pi'' : Z'' \to Y''$ are as in the diagram.

Proof. Let $(S'', s'') \to (S', s')$ be any elementary étale neighbourhood with S'' affine. Let $Y'' \subset Y' \times_{S'} S''$ be any affine open neighbourhood containing the point $y'' = (y', s'')$. Then we obtain an affine (Z'', z'') by (3). Moreover $Z_{S''} \to X_{S''}$ is a closed immersion and $Z'' \to Z_{S''}$ is an étale morphism. Hence Lemma 34.3.1 applies and we can find an étale morphism $X'' \to X_{S'}$ of affines such that $Z'' \cong X'' \times_{X_{S'}} Z_{S'}$. Denote $i'' : Z'' \to X''$ the corresponding closed immersion. Setting $x'' = i''(z'')$ we obtain a commutative diagram as in the lemma. Properties (1), (2), (3), and (4) hold by construction. Thus it suffices to show that (5) holds for a suitable choice of $(S'', s'') \to (S', s')$ and Y''.

We first list those properties which hold for any choice of $(S'', s'') \to (S', s')$ and Y'' as in the first paragraph. As we have $Z'' = X'' \times_X Z$ by construction we see that $i''_* \mathcal{G}'' = \mathcal{F}''$ (with notation as in the statement of the lemma), see Coherent, Lemma 25.6.1. Set $n = \dim(\text{Supp}(\mathcal{F}_s)) = \dim_x(\text{Supp}(\mathcal{F}_s))$. The morphism $Y'' \to S''$ is smooth of relative dimension n (because $Y' \to S'$ is smooth of relative dimension n as the composition $Y' \to Y_{S'} \to S'$ of an étale and smooth morphism of relative dimension n and because base change preserves smooth morphisms of relative dimension n). We have $\kappa(y'') = \kappa(y)$ and $\kappa(s) = \kappa(s'')$ hence $\kappa(y'')$ is a purely transcendental extension of $\kappa(s'')$. The morphism of fibres $X''_{s''} \to X_s$ is an étale morphism of affine schemes over $\kappa(s) = \kappa(s'')$ mapping the point x'' to the point x and pulling back $\mathcal{F}_s$ to $\mathcal{F}''_{s''}$. Hence

$$\dim(\text{Supp}(\mathcal{F}''_{s''})) = \dim(\text{Supp}(\mathcal{F}_s)) = n = \dim_x(\text{Supp}(\mathcal{F}_s)) = \dim_{x''}(\text{Supp}(\mathcal{F}''_{s''}))$$

because dimension is invariant under étale localization, see Descent, Lemma 31.17.2. As $\pi'' : Z'' \to Y''$ is the base change of π we see that π'' is finite and as $\kappa(y) = \kappa(y'')$ we see that $\pi^{-1}(\{y''\}) = \{z''\}$.

At this point we have verified all the conditions of Definition 34.5.1 except we have not verfied that $Y'' \to S''$ has geometrically irreducible fibres. Of course in general this is not going to be true, and it is at this point that we will use that $\kappa(s) \subset \kappa(y)$ is purely transcendental. Namely, let $T \subset Y'_{s'}$ be the irreducible component of $Y'_{s'}$ containing $y' = (y, s')$. Note that T is an open subscheme of $Y'_{s'}$ as this is a smooth scheme over $\kappa(s')$. By Varieties, Lemma 28.5.14 we see that T is geometrically connected because $\kappa(s') = \kappa(s)$ is algebraically closed in $\kappa(y') = \kappa(y)$. As T is smooth we see that T is geometrically irreducible. Hence More on Morphisms, Lemma 33.30.3 applies and we can find an elementary étale morphism $(S'', s'') \to (S', s')$ and an affine open $Y'' \subset Y'_{S''}$ such that all fibres of $Y'' \to S''$ are geometrically irreducible and such that $T = Y''_{s''}$. After shrinking (first Y'' and then S'') we may assume that both Y'' and S'' are affine. This finishes the proof of the lemma. $\square$

Lemma 34.5.9. *Let S, X, $\mathcal{F}$, s be as in Definition 34.5.1. Let $(Z, Y, i, \pi, \mathcal{G})$ be a one step dévissage of $\mathcal{F}/X/S$ over s. Let $\xi \in Y_s$ be the (unique) generic point. Then there exists an integer $r > 0$ and an $\mathcal{O}_Y$-module map*

$$\alpha : \mathcal{O}_Y^{\oplus r} \longrightarrow \pi_* \mathcal{G}$$

such that

$$\alpha : \kappa(\xi)^{\oplus r} \longrightarrow (\pi_* \mathcal{G})_\xi \otimes_{\mathcal{O}_{Y,\xi}} \kappa(\xi)$$

is an isomorphism. Moreover, in this case we have

$$\dim(Supp(Coker(\alpha)_s)) < \dim(Supp(\mathcal{F}_s)).$$

Proof. By assumption the schemes S and Y are affine. Write $S = Spec(A)$ and $Y = Spec(B)$. As π is finite the $\mathcal{O}_Y$-module $\pi_*\mathcal{G}$ is a finite type quasi-coherent $\mathcal{O}_Y$-module. Hence $\pi_*\mathcal{G} = \widetilde{N}$ for some finite B-module N. Let $\mathfrak{p} \subset B$ be the prime ideal corresponding to ξ. To obtain α set $r = \dim_{\kappa(\mathfrak{p})} N \otimes_B \kappa(\mathfrak{p})$ and pick $x_1, \ldots, x_r \in N$ which form a basis of $N \otimes_B \kappa(\mathfrak{p})$. Take $\alpha : B^{\oplus r} \to N$ to be the map given by the formula $\alpha(b_1, \ldots, b_r) = \sum b_i x_i$. It is clear that $\alpha : \kappa(\mathfrak{p})^{\oplus r} \to N \otimes_B \kappa(\mathfrak{p})$ is an isomorphism as desired. Finally, suppose α is any map with this property. Then $N' = \text{Coker}(\alpha)$ is a finite B-module such that $N' \otimes \kappa(\mathfrak{p}) = 0$. By Nakayama's lemma (Algebra, Lemma 7.14.5) we see that $N'_\mathfrak{p} = 0$. Since the fibre Y_s is geometrically irreducible of dimension n with generic point ξ and since we have just seen that ξ is not in the support of $\text{Coker}(\alpha)$ the last assertion of the lemma holds. $\square$

34.6. Complete dévissage

In this section we explain what is a complete dévissage of a module and prove that such exist. The material in this section is mainly bookkeeping.

Definition 34.6.1. Let S be a scheme. Let X be locally of finite type over S. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module of finite type. Let $s \in S$ be a point. A *complete dévissage of*

$\mathcal{F}/X/S$ over s is given by a diagram

$$
\begin{tikzcd}
X & Z_1 \arrow[l, "i_1"'] \arrow[d, "\pi_1"] & & & \\
& Y_1 & Z_2 \arrow[l, "i_2"'] \arrow[d, "\pi_2"] & & \\
& & Y_2 & Z_3 \arrow[l] \arrow[d] & \\
& & & \dots & \dots \arrow[l] \arrow[d] \\
& & & & Y_n
\end{tikzcd}
$$

of schemes over S, finite type quasi-coherent $\mathcal{O}_{Z_k}$-modules $\mathcal{G}_k$, and $\mathcal{O}_{Y_k}$-module maps

$$\alpha_k : \mathcal{O}_{Y_k}^{\oplus r_k} \longrightarrow \pi_{k,*}\mathcal{G}_k, \quad k = 1, \ldots, n$$

satisfying the following properties:

(1) $(Z_1, Y_1, i_1, \pi_1, \mathcal{G}_1)$ is a one step dévissage of $\mathcal{F}/X/S$ over s,
(2) the map α_k induces an isomorphism
$$\kappa(\xi_k)^{\oplus r_k} \longrightarrow (\pi_{k,*}\mathcal{G}_k)_{\xi_k} \otimes_{\mathcal{O}_{Y_k,\xi_k}} \kappa(\xi_k)$$
where $\xi_k \in (Y_k)_s$ is the unique generic point,
(3) for $k = 2, \ldots, n$ the system $(Z_k, Y_k, i_k, \pi_k, \mathcal{G}_k)$ is a one step dévissage of $\mathrm{Coker}(\alpha_{k-1})/Y_{k-1}/S$ over s,
(4) $\mathrm{Coker}(\alpha_n) = 0$.

In this case we say that $(Z_k, Y_k, i_k, \pi_k, \mathcal{G}_k, \alpha_k)_{k=1,\ldots,n}$ is a complete dévissage of $\mathcal{F}/X/S$ over s.

Definition 34.6.2. Let S be a scheme. Let X be locally of finite type over S. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module of finite type. Let $x \in X$ be a point with image $s \in S$. A *complete dévissage of $\mathcal{F}/X/S$ at x* is given by a system

$$(Z_k, Y_k, i_k, \pi_k, \mathcal{G}_k, \alpha_k, z_k, y_k)_{k=1,\ldots,n}$$

such that $(Z_k, Y_k, i_k, \pi_k, \mathcal{G}_k, \alpha_k)$ is a complete dévissage of $\mathcal{F}/X/S$ over s, and such that

(1) $(Z_1, Y_1, i_1, \pi_1, \mathcal{G}_1, z_1, y_1)$ is a one step dévissage of $\mathcal{F}/X/S$ at x,
(2) for $k = 2, \ldots, n$ the system $(Z_k, Y_k, i_k, \pi_k, \mathcal{G}_k, z_k, y_k)$ is a one step dévissage of $\mathrm{Coker}(\alpha_{k-1})/Y_{k-1}/S$ at y_{k-1}.

Again we remark that a complete dévissage can only exist if X and S are affine.

Lemma 34.6.3. *Let S, X, $\mathcal{F}$, s be as in Definition 34.6.1. Let $(S', s') \to (S, s)$ be any morphism of pointed schemes. Let $(Z_k, Y_k, i_k, \pi_k, \mathcal{G}_k, \alpha_k)_{k=1,\ldots,n}$ be a complete dévissage of $\mathcal{F}/X/S$ over s. Given this data let $X', Z'_k, Y'_k, i'_k, \pi'_k$ be the base changes of X, Z_k, Y_k, i_k, π_k via $S' \to S$. Let $\mathcal{F}'$ be the pullback of $\mathcal{F}$ to X' and let $\mathcal{G}'_k$ be the pullback of $\mathcal{G}_k$ to Z'_k. Let α'_k be the pullback of α_k to Y'_k. If S' is affine, then $(Z'_k, Y'_k, i'_k, \pi'_k, \mathcal{G}'_k, \alpha'_k)_{k=1,\ldots,n}$ is a complete dévissage of $\mathcal{F}'/X'/S'$ over s'.*

Proof. By Lemma 34.5.4 we know that the base change of a one step dévissage is a one step dévissage. Hence it suffices to prove that formation of $\mathrm{Coker}(\alpha_k)$ commutes with base change and that condition (2) of Definition 34.6.1 is preserved by base change. The first is true as $\pi'_{k,*}\mathcal{G}'_k$ is the pullback of $\pi_{k,*}\mathcal{G}_k$ (by Coherent, Lemma 25.6.1) and because $\otimes$ is right exact. The second because by the same token we have

$$(\pi_{k,*}\mathcal{G}_k)_{\xi_k} \otimes_{\mathcal{O}_{Y_k,\xi_k}} \kappa(\xi_k) \otimes_{\kappa(\xi_k)} \kappa(\xi'_k) \cong (\pi'_{k,*}\mathcal{G}'_k)_{\xi'_k} \otimes_{\mathcal{O}_{Y'_k,\xi'_k}} \kappa(\xi'_k)$$

with obvious notation. □

Lemma 34.6.4. *Let S, X, $\mathcal{F}$, x, s be as in Definition 34.6.2. Let $(S', s') \to (S, s)$ be a morphism of pointed schemes which induces an isomorphism $\kappa(s) = \kappa(s')$. Let $(Z_k, Y_k, i_k, \pi_k, \mathcal{G}_k, \alpha_k, z_k, y_k)_{k=1,\ldots,n}$ be a complete dévissage of $\mathcal{F}/X/S$ at x. Let $(Z'_k, Y'_k, i'_k, \pi'_k, \mathcal{G}'_k, \alpha'_k)_{k=1,\ldots,n}$ be as constructed in Lemma 34.6.3 and let $x' \in X'$ (resp. $z'_k \in Z'$, $y'_k \in Y'$) be the unique point mapping to both $x \in X$ (resp. $z_k \in Z_k$, $y_k \in Y_k$) and $s' \in S'$. If S' is affine, then $(Z'_k, Y'_k, i'_k, \pi'_k, \mathcal{G}'_k, \alpha'_k, z'_k, y'_k)_{k=1,\ldots,n}$ is a complete dévissage of $\mathcal{F}'/X'/S'$ at x'.*

Proof. Combine Lemma 34.6.3 and Lemma 34.5.5. □

Definition 34.6.5. Let S, X, $\mathcal{F}$, x, s be as in Definition 34.6.2. Consider a complete dévissage $(Z_k, Y_k, i_k, \pi_k, \mathcal{G}_k, \alpha_k, z_k, y_k)_{k=1,\ldots,n}$ of $\mathcal{F}/X/S$ at x. Let us define a *standard shrinking* of this situation to be given by standard opens $S' \subset S$, $X' \subset X$, $Z'_k \subset Z_k$, and $Y'_k \subset Y_k$ such that $s_k \in S'$, $x_k \in X'$, $z_k \in Z'$, and $y_k \in Y'$ and such that

$$(Z'_k, Y'_k, i'_k, \pi'_k, \mathcal{G}'_k, \alpha'_k, z_k, y_k)_{k=1,\ldots,n}$$

is a one step dévissage of $\mathcal{F}'/X'/S'$ at x where $\mathcal{G}'_k = \mathcal{G}_k|_{Z'_k}$ and $\mathcal{F}' = \mathcal{F}|_{X'}$.

Lemma 34.6.6. *With assumption and notation as in Definition 34.6.5 we have:*

1. *If $S' \subset S$ is a standard open neighbourhood of s, then setting $X' = X_{S'}$, $Z'_k = Z_{S'}$ and $Y'_k = Y_{S'}$ we obtain a standard shrinking.*
2. *Let $W \subset Y_n$ be a standard open neighbourhood of y. Then there exists a standard shrinking with $Y'_n = W \times_S S'$.*
3. *Let $U \subset X$ be an open neighbourhood of x. Then there exists a standard shrinking with $X' \subset U$.*

Proof. Part (1) is immediate from Lemmas 34.6.4 and 34.5.7.

Proof of (2). For convenience denote $X = Y_0$. We apply Lemma 34.5.7 (2) to find a standard shrinking S', Y'_{n-1}, Z'_n, Y'_n of the one step dévissage of $\mathrm{Coker}(\alpha_{n-1})/Y_{n-1}/S$ at y_{n-1} with $Y'_n = W \times_S S'$. We may repeat this procedure and find a standard shrinking $S'', Y''_{n-2}, Z''_{n-1}, Y''_{n-1}$ of the one step dévissage of $\mathrm{Coker}(\alpha_{n-2})/Y_{n-2}/S$ at y_{n-2} with $Y''_{n-1} = Y'_{n-1} \times_S S''$. We may continue in this manner until we obtain $S^{(n)}, Y^{(n)}_0, Z^{(n)}_1, Y^{(n)}_1$. At this point it is clear that we obtain our desired standard shrinking by taking $S^{(n)}$, $X^{(n)}$, $Z^{(n-k)}_k \times_S S^{(n)}$, and $Y^{(n-k)}_k \times_S S^{(n)}$ with the desired property.

Proof of (3). We use induction on the length of the complete dévissage. First we apply Lemma 34.5.7 (3) to find a standard shrinking S', X', Z'_1, Y'_1 of the one step dévissage of $\mathcal{F}/X/S$ at x with $X' \subset U$. If $n = 1$, then we are done. If $n > 1$, then by induction we can find a standard shrinking S'', Y''_1, Z''_k, and Y''_k of the complete dévissage $(Z_k, Y_k, i_k, \pi_k, \mathcal{G}_k, \alpha_k, z_k, y_k)_{k=2,\ldots,n}$ of $\mathrm{Coker}(\alpha_1)/Y_1/S$ at x such that $Y''_1 \subset Y'_1$. Using

Lemma 34.5.7 (2) we can find $S''' \subset S'$, $X''' \subset X'$, Z_1''' and $Y_1''' = Y_1'' \times_S S'''$ which is a standard shrinking. The solution to our problem is to take

$$S''', X''', Z_1''', Y_1''', Z_2'' \times_S S''', Y_2'' \times_S S''', \ldots, Z_n'' \times_S S''', Y_n'' \times_S S'''$$

This ends the proof of the lemma. □

Proposition 34.6.7. *Let S be a scheme. Let X be locally of finite type over S. Let $x \in X$ be a point with image $s \in S$. There exists a commutative diagram*

$$\begin{tikzcd} (X, x) \arrow[d] & (X', x') \arrow[l, "g"'] \arrow[d] \\ (S, s) & (S', s') \arrow[l] \end{tikzcd}$$

of pointed schemes such that the horizontal arrows are elementary étale neighbourhoods and such that $g^*\mathcal{F}/X'/S'$ has a complete dévissage at x.

Proof. We prove this by induction on the integer $d = \dim_x(\text{Supp}(\mathcal{F}_s))$. By Lemma 34.5.3 there exists a diagram

$$\begin{tikzcd} (X, x) \arrow[d] & (X', x') \arrow[l, "g"'] \arrow[d] \\ (S, s) & (S', s') \arrow[l] \end{tikzcd}$$

of pointed schemes such that the horizontal arrows are elementary étale neighbourhoods and such that $g^*\mathcal{F}/X'/S'$ has a one step dévissage at x'. The local nature of the problem implies that we may replace $(X, x) \to (S, s)$ by $(X', x') \to (S', s')$. Thus after doing so we may assume that there exists a one step dévissage $(Z_1, Y_1, i_1, \pi_1, \mathcal{G}_1)$ of $\mathcal{F}/X/S$ at x.

We apply Lemma 34.5.9 to find a map

$$\alpha_1 : \mathcal{O}_{Y_1}^{\oplus r_1} \longrightarrow \pi_{1,*}\mathcal{G}_1$$

which induces an isomorphism of vector spaces over $\kappa(\xi_1)$ where $\xi_1 \in Y_1$ is the unique generic point of the fibre of Y_1 over s. Moreover $\dim_{y_1}(\text{Supp}(\text{Coker}(\alpha_1)_s)) < d$. It may happen that the stalk of $\text{Coker}(\alpha_1)_s$ at y_1 is zero. In this case we may shrink Y_1 by Lemma 34.5.7 (2) and assume that $\text{Coker}(\alpha_1) = 0$ so we obtain a complete dévissage of length zero.

Assume now that the stalk of $\text{Coker}(\alpha_1)_s$ at y_1 is not zero. In this case, by induction, there exists a commutative diagram

(34.6.7.1)
$$\begin{tikzcd} (Y_1, y_1) \arrow[d] & (Y_1', y_1') \arrow[l, "h"'] \arrow[d] \\ (S, s) & (S', s') \arrow[l] \end{tikzcd}$$

of pointed schemes such that the horizontal arrows are elementary étale neighbourhoods and such that $h^*\text{Coker}(\alpha_1)/Y_1'/S'$ has a complete dévissage

$$(Z_k, Y_k, i_k, \pi_k, \mathcal{G}_k, \alpha_k, z_k, y_k)_{k=2,\ldots,n}$$

at y_1'. (In particular $i_2 : Z_2 \to Y_1'$ is a closed immersion into Y_2'.) At this point we apply Lemma 34.5.8 to $S, X, \mathcal{F}, x, s$, the system $(Z_1, Y_1, i_1, \pi_1, \mathcal{G}_1)$ and diagram (34.6.7.1). We obtain a diagram

$$\begin{tikzcd}[row sep=small, column sep=small]
 & & (X'', x'') \arrow[dll] \arrow[d] & (Z''_1, z''_1) \arrow[l] \arrow[dll] \arrow[d] \\
(X, x) \arrow[d] & (Z_1, z_1) \arrow[l] \arrow[d] & (S'', s'') \arrow[dll] & (Y''_1, y''_1) \arrow[l] \arrow[dll] \\
(S, s) & (Y_1, y_1) \arrow[l] & &
\end{tikzcd}$$

with all the properties as listed in the referenced lemma. In particular $Y''_1 \subset Y'_1 \times_{S'} S''$. Set $X_1 = Y'_1 \times_{S'} S''$ and let $\mathcal{F}_1$ denote the pullback of $\text{Coker}(\alpha_1)$. By Lemma 34.6.4 the system

$$(Z_k \times_{S'} S'', Y_k \times_{S'} S'', i''_k, \pi''_k, \mathcal{G}''_k, \alpha''_k, z''_k, y''_k)_{k=2,\ldots,n} \tag{34.6.7.2}$$

is a complete dévissage of $\mathcal{F}_1$ to X_1. Again, the nature of the problem allows us to replace $(X, x) \to (S, s)$ by $(X'', x'') \to (S'', s'')$. In this we see that we may assume:

(a) There exists a one step dévissage $(Z_1, Y_1, i_1, \pi_1, \mathcal{G}_1)$ of $\mathcal{F}/X/S$ at x,
(b) there exists an $\alpha_1 : \mathcal{O}_{Y_1}^{\oplus r_1} \to \pi_{1,*}\mathcal{G}_1$ such that $\alpha \otimes \kappa(\xi_1)$ is an isomorphism,
(c) $Y_1 \subset X_1$ is open, $y_1 = x_1$, and $\mathcal{F}_1|_{Y_1} \cong \text{Coker}(\alpha_1)$, and
(d) there exists a complete dévissage $(Z_k, Y_k, i_k, \pi_k, \mathcal{G}_k, \alpha_k, z_k, y_k)_{k=2,\ldots,n}$ of $\mathcal{F}_1/X_1/S$ at x_1.

To finish the proof all we have to do is shrink the one step dévissage and the complete dévissage such that they fit together to a complete dévissage. (We suggest the reader do this on their own using Lemmas 34.5.7 and 34.6.6 instead of reading the proof that follows.) Since $Y_1 \subset X_1$ is an open neighbourhood of x_1 we may apply Lemma 34.6.6 (3) to find a standard shrinking $S', X'_1, Z'_2, Y'_2, \ldots, Y'_n$ of the datum (d) so that $X'_1 \subset Y_1$. Note that X'_1 is also a standard open of the affine scheme Y_1. Next, we shrink the datum (a) as follows: first we shrink the base S to S', see Lemma 34.5.7 (1) and then we shrink the result to S'', X'', Z''_1, Y''_1 using Lemma 34.5.7 (2) such that eventually $Y''_1 = X'_1 \times_S S''$ and $S'' \subset S'$. Then we see that

$$Z''_1, Y''_1, Z'_2 \times_{S'} S'', Y'_2 \times_{S'} S'', \ldots, Y'_n \times_{S'} S''$$

gives the complete dévissage we were looking for. □

Some more bookkeeping gives the following consequence.

Lemma 34.6.8. *Let $X \to S$ be a finite type morphism of schemes. Let $\mathcal{F}$ be a finite type quasi-coherent $\mathcal{O}_X$-module. Let $s \in S$ be a point. There exists an elementary étale neighbourhood $(S', s') \to (S, s)$ and étale morphisms $h_i : Y_i \to X_{S'}$, $i = 1, \ldots, n$ such that for each i there exists a complete dévissage of $\mathcal{F}_i/Y_i/S'$ over s', where $\mathcal{F}_i$ is the pullback of $\mathcal{F}$ to Y_i and such that $X_s = (X_{S'})_{s'} \subset \bigcup h_i(Y_i)$.*

Proof. For every point $x \in X_s$ we can find a diagram

$$\begin{tikzcd}
(X, x) \arrow[d] & (X', x') \arrow[l, "g"'] \arrow[d] \\
(S, s) & (S', s') \arrow[l]
\end{tikzcd}$$

of pointed schemes such that the horizontal arrows are elementary étale neighbourhoods and such that $g^*\mathcal{F}/X'/S'$ has a complete dévissage at x'. As $X \to S$ is of finite type the fibre X_s is quasi-compact, and since each $g : X' \to X$ as above is open we can cover X_s by a finite union of $g(X'_{s'})$. Thus we can find a finite family of such diagrams

$$\begin{tikzcd} (X, x) \arrow[d] & (X'_i, x'_i) \arrow[l, "g_i"'] \arrow[d] \\ (S, s) & (S'_i, s'_i) \arrow[l] \end{tikzcd} \quad i = 1, \ldots, n$$

such that $X_s = \bigcup g_i(X'_i)$. Set $S' = S'_1 \times_S \ldots \times_S S'_n$ and let $Y_i = X_i \times_{S'_i} S'$ be the base change of X'_i to S'. By Lemma 34.6.3 we see that the pullback of $\mathcal{F}$ to Y_i has a complete dévissage over s and we win. $\square$

34.7. Translation into algebra

It may be useful to spell out algebraically what it means to have a complete dévissage. We introduce the following notion (which is not that useful so we give it an impossibly long name).

Definition 34.7.1. Let $R \to S$ be a ring map. Let $\mathfrak{q}$ be a prime of S lying over the prime $\mathfrak{p}$ of R. A *elementary étale localization of the ring map $R \to S$ at $\mathfrak{q}$* is given by a commutative diagram of rings and accompanying primes

$$\begin{tikzcd} S \arrow[r] & S' \\ R \arrow[u] \arrow[r] & R' \arrow[u] \end{tikzcd} \qquad \begin{tikzcd} \mathfrak{q} \arrow[r, dash] \arrow[d, dash] & \mathfrak{q}' \arrow[d, dash] \\ \mathfrak{p} \arrow[r, dash] & \mathfrak{p}' \end{tikzcd}$$

such that $R \to R'$ and $S \to S'$ are étale ring maps and $\kappa(\mathfrak{p}) = \kappa(\mathfrak{p}')$ and $\kappa(\mathfrak{q}) = \kappa(\mathfrak{q}')$.

Definition 34.7.2. Let $R \to S$ be a finite type ring map. Let $\mathfrak{r}$ be a prime of R. Let N be a finite S-module. A *complete dévissage of $N/S/R$ over $\mathfrak{r}$* is given by R-algebra maps

$$\begin{tikzcd}[column sep=small] & A_1 & & A_2 & & \ldots & & A_n & \\ S \arrow[ur] & & B_1 \arrow[ul] \arrow[ur] & & \ldots \arrow[ul] \arrow[ur] & & \ldots \arrow[ul] \arrow[ur] & & B_n \arrow[ul] \end{tikzcd}$$

finite A_i-modules M_i and B_i-module maps $\alpha_i : B_i^{\oplus r_i} \to M_i$ such that

(1) $S \to A_1$ is surjective and of finite presentation,
(2) $B_i \to A_{i+1}$ is surjective and of finite presentation,
(3) $B_i \to A_i$ is finite,
(4) $R \to B_i$ is smooth with geometrically irreducible fibres,
(5) $N \cong M_1$ as S-modules,
(6) $\mathrm{Coker}(\alpha_i) \cong M_{i+1}$ as B_i-modules,
(7) $\alpha_i : \kappa(\mathfrak{p}_i)^{\oplus r_i} \to M_i \otimes_{B_i} \kappa(\mathfrak{p}_i)$ is an isomorphism where $\mathfrak{p}_i = \mathfrak{r}B_i$, and
(8) $\mathrm{Coker}(\alpha_n) = 0$.

In this situation we say that $(A_i, B_i, M_i, \alpha_i)_{i=1,\ldots,n}$ is a complete dévissage of $N/S/R$ over $\mathfrak{r}$.

Remark 34.7.3. Note that the R-algebras B_i for all i and A_i for $i \geq 2$ are of finite presentation over R. If S is of finite presentation over R, then it is also the case that A_1 is of finite presentation over R. In this case all the ring maps in the complete dévissage are of finite presentation. See Algebra, Lemma 7.6.2. Still assuming S of finite presentation over R the following are equivalent

(1) M is of finite presentation over S,
(2) M_1 is of finite presentation over A_1,
(3) M_1 is of finite presentation over B_1,
(4) each M_i is of finite presentation both as an A_i-module and as a B_i-module.

The equivalences (1) $\Leftrightarrow$ (2) and (2) $\Leftrightarrow$ (3) follow from Algebra, Lemma 7.7.4. If M_1 is finitely presented, so is $\text{Coker}(\alpha_1)$ (see Algebra, Lemma 7.5.4) and hence M_2, etc.

Definition 34.7.4. Let $R \to S$ be a finite type ring map. Let $\mathfrak{q}$ be a prime of S lying over the prime $\mathfrak{r}$ of R. Let N be a finite S-module. A *complete dévissage of $N/S/R$ at* $\mathfrak{q}$ is given by a complete dévissage $(A_i, B_i, M_i, \alpha_i)_{i=1,\ldots,n}$ of $N/S/R$ over $\mathfrak{r}$ and prime ideals $\mathfrak{q}_i \subset B_i$ lying over $\mathfrak{r}$ such that

(1) $\kappa(\mathfrak{r}) \subset \kappa(\mathfrak{q}_i)$ is purely transcendental,
(2) there is a unique prime $\mathfrak{q}_i' \subset A_i$ lying over $\mathfrak{q}_i \subset B_i$,
(3) $\mathfrak{q} = \mathfrak{q}_1' \cap S$ and $\mathfrak{q}_i = \mathfrak{q}_{i+1}' \cap A_i$,
(4) $R \to B_i$ has relative dimension $\dim_{\mathfrak{q}_i}(\text{Supp}(M_i \otimes_R \kappa(\mathfrak{r})))$.

Remark 34.7.5. Let $A \to B$ be a finite type ring map and let N be a finite B-module. Let $\mathfrak{q}$ be a prime of B lying over the prime $\mathfrak{r}$ of A. Set $X = Spec(B)$, $S = Spec(A)$ and $\mathcal{F} = \widetilde{N}$ on X. Let x be the point corresponding to $\mathfrak{q}$ and let $s \in S$ be the point corresponding to $\mathfrak{p}$. Then

(1) if there exists a complete dévissage of $\mathcal{F}/X/S$ over s then there exists a complete dévissage of $N/B/A$ over $\mathfrak{p}$, and
(2) there exists a complete dévissage of $\mathcal{F}/X/S$ at x if and only if there exists a complete dévissage of $N/B/A$ at $\mathfrak{q}$.

There is just a small twist in that we omitted the condition on the relative dimension in the formulation of ``a complete dévissage of $N/B/A$ over $\mathfrak{p}$'' which is why the implication in (1) only goes in one direction. The notion of a complete dévissage at $\mathfrak{q}$ does have this condition built in. In any case we will only use that existence for $\mathcal{F}/X/S$ implies the existence for $N/B/A$.

Lemma 34.7.6. *Let $R \to S$ be a finite type ring map. Let M be a finite S-module. Let $\mathfrak{q}$ be a prime ideal of S. There exists an elementary étale localization $R' \to S', \mathfrak{q}', \mathfrak{p}'$ of the ring map $R \to S$ at $\mathfrak{q}$ such that there exists a complete dévissage of $(M \otimes_S S')/S'/R'$ at $\mathfrak{q}'$.*

Proof. This is a reformulation of Proposition 34.6.7 via Remark 34.7.5 $\square$

34.8. Localization and universally injective maps

Lemma 34.8.1. *Let $R \to S$ be a ring map. Let N be a S-module. Assume*

(1) *R is a local ring with maximal ideal $\mathfrak{m}$,*
(2) *$\overline{S} = S/\mathfrak{m}S$ is Noetherian, and*
(3) *$\overline{N} = N/\mathfrak{m}_R N$ is a finite $\overline{S}$-module.*

Let $\Sigma \subset S$ be the multiplicative subset of elements which are not a zero divisor on $\overline{N}$. Then $\Sigma^{-1}S$ is a semi-local ring whose spectrum consists of primes $\mathfrak{q} \subset S$ contained in an element of $\text{Ass}_S(\overline{N})$. Moreover, any maximal ideal of $\Sigma^{-1}S$ corresponds to an associated prime of $\overline{N}$ over $\overline{S}$.

Proof. Note that $\text{Ass}_S(\overline{N}) = \text{Ass}_{\overline{S}}(\overline{N})$, see Algebra, Lemma 7.60.13. This is a finite set by Algebra, Lemma 7.60.5. Say $\{\mathfrak{q}_1, \ldots, \mathfrak{q}_r\} = \text{Ass}_S(\overline{N})$. We have $\Sigma = S \setminus (\bigcup \mathfrak{q}_i)$ by Algebra, Lemma 7.60.9. By the description of $Spec(\Sigma^{-1}S)$ in Algebra, Lemma 7.16.5 we see that the primes of $\Sigma^{-1}S$ correspond to the primes of S contained in one of the $\mathfrak{q}_i$. Hence the maximal ideals of $\Sigma^{-1}S$ correspond one-to-one with the maximal (w.r.t. inclusion) elements of the set $\{\mathfrak{q}_1, \ldots, \mathfrak{q}_r\}$. This proves the lemma. □

Lemma 34.8.2. *Assumption and notation as in Lemma 34.8.1. Assume moreover that*

1. *S is local and $R \to S$ is a local homomorphism,*
2. *S is essentially of finite presentation over R,*
3. *N is finitely presented over S, and*
4. *N is flat over R.*

Then each $s \in \Sigma$ defines a universally injective R-module map $s : N \to N$, and the map $N \to \Sigma^{-1}N$ is R-universally injective.

Proof. By Algebra, Lemma 7.119.4 the sequence $0 \to N \to N \to N/sN \to 0$ is exact and N/sN is flat over R. This implies that $s : N \to N$ is universally injective, see Algebra, Lemma 7.35.11. The map $N \to \Sigma^{-1}N$ is universally injective as the directed colimit of the maps $s : N \to N$. □

Lemma 34.8.3. *Let $R \to S$ be a ring map. Let N be an S-module. Let $S \to S'$ be a ring map. Assume*

1. *$R \to S$ is a local homomorphism of local rings*
2. *S is essentially of finite presentation over R,*
3. *N is of finite presentation over S,*
4. *N is flat over R,*
5. *$S \to S'$ is flat, and*
6. *the image of $Spec(S') \to Spec(S)$ contains all primes $\mathfrak{q}$ of S lying over $\mathfrak{m}_R$ such that $\mathfrak{q}$ is an associated prime of $N/\mathfrak{m}_R N$.*

Then $N \to N \otimes_R S'$ is R-universally injective.

Proof. Set $N' = N \otimes_R S'$. Consider the commutative diagram

$$\begin{tikzcd} N \arrow[r] \arrow[d] & N' \arrow[d] \\ \Sigma^{-1}N \arrow[r] & \Sigma^{-1}N' \end{tikzcd}$$

where $\Sigma \subset S$ is the set of elements which are not a zero divisor on $N/\mathfrak{m}_R N$. If we can show that the map $N \to \Sigma^{-1}N'$ is universally injective, then $N \to N'$ is too (see Algebra, Lemma 7.76.10).

By Lemma 34.8.1 the ring $\Sigma^{-1}S$ is a semi-local ring whose maximal ideals correspond to associated primes of $N/\mathfrak{m}_R N$. Hence the image of $Spec(\Sigma^{-1}S') \to Spec(\Sigma^{-1}S)$ contains all these maximal ideals by assumption. By Algebra, Lemma 7.35.15 the ring map $\Sigma^{-1}S \to \Sigma^{-1}S'$ is faithfully flat. Hence $\Sigma^{-1}N \to \Sigma^{-1}N'$, which is the map

$$N \otimes_S \Sigma^{-1}S \longrightarrow N \otimes_S \Sigma^{-1}S'$$

is universally injective, see Algebra, Lemmas 7.76.11 and 7.76.8. Finally, we apply Lemma 34.8.2 to see that $N \to \Sigma^{-1}N$ is universally injective. As the composition of universally injective module maps is universally injective (see Algebra, Lemma 7.76.9) we conclude that $N \to \Sigma^{-1}N'$ is universally injective and we win. □

Lemma 34.8.4. *Let $R \to S$ be a ring map. Let N be an S-module. Let $S \to S'$ be a ring map. Assume*

1. *$R \to S$ is of finite presentation and N is of finite presentation over S,*
2. *N is flat over R,*
3. *$S \to S'$ is flat, and*
4. *the image of $Spec(S') \to Spec(S)$ contains all primes $\mathfrak{q}$ such that $\mathfrak{q}$ is an associated prime of $N \otimes_R \kappa(\mathfrak{p})$ where $\mathfrak{p}$ is the inverse image of $\mathfrak{q}$ in R.*

Then $N \to N \otimes_R S'$ is R-universally injective.

Proof. By Algebra, Lemma 7.76.12 it suffices to show that $N_{\mathfrak{q}} \to (N \otimes_R S')_{\mathfrak{q}}$ is a $R_{\mathfrak{p}}$-universally injective for any prime $\mathfrak{q}$ of S lying over $\mathfrak{p}$ in R. Thus we may apply Lemma 34.8.3 to the ring maps $R_{\mathfrak{p}} \to S_{\mathfrak{q}} \to S'_{\mathfrak{q}}$ and the module $N_{\mathfrak{q}}$. □

The reader may want to compare the following lemma to Algebra, Lemma 7.91.1 and Lemma 7.119.4. In each case the conclusion is that the map $u : M \to N$ is universally injective with flat cokernel.

Lemma 34.8.5. *Let $(R, \mathfrak{m})$ be a local ring. Let $u : M \to N$ be an R-module map. If M is a projective R-module, N is a flat R-module, and $\overline{u} : M/\mathfrak{m}M \to N/\mathfrak{m}N$ is injective then u is universally injective.*

Proof. By Algebra, Theorem 7.79.4 the module M is free. If we show the result holds for every finitely generated direct summand of M, then the lemma follows. Hence we may assume that M is finite free. Write $N = colim_i N_i$ as a directed colimit of finite free modules, see Algebra, Theorem 7.75.4. Note that $u : M \to N$ factors through N_i for some i (as M is finite free). Denote $u_i : M \to N_i$ the corresponding R-module map. As $\overline{u}$ is injective we see that $\overline{u_i} : M/\mathfrak{m}M \to N_i/\mathfrak{m}N_i$ is injective and remains injective on composing with the maps $N_i/\mathfrak{m}N_i \to N_{i'}/\mathfrak{m}N_{i'}$ for all $i' \geq i$. As M and $N_{i'}$ are finite free over the local ring R this implies that $M \to N_{i'}$ is a split injection for all $i' \geq i$. Hence for any R-module Q we see that $M \otimes_R Q \to N_{i'} \otimes_R Q$ is injective for all $i' \geq i$. As $- \otimes_R Q$ commutes with colimits we conclude that $M \otimes_R Q \to N_{i'} \otimes_R Q$ is injective as desired. □

Lemma 34.8.6. *Assumption and notation as in Lemma 34.8.1. Assume moreover that N is projective as an R-module. Then each $s \in \Sigma$ defines a universally injective R-module map $s : N \to N$, and the map $N \to \Sigma^{-1}N$ is R-universally injective.*

Proof. Pick $s \in \Sigma$. By Lemma 34.8.5 the map $s : N \to N$ is universally injective. The map $N \to \Sigma^{-1}N$ is universally injective as the directed colimit of the maps $s : N \to N$. □

34.9. Completion and Mittag-Leffler modules

Lemma 34.9.1. *Let R be a ring. Let $I \subset R$ be an ideal. Let A be a set. Assume R is Noetherian and complete with respect to I. The completion $(\bigoplus_{\alpha \in A} R)^\wedge$ is flat and Mittag-Leffler.*

Proof. By More on Algebra, Lemma 12.20.1 the map $(\bigoplus_{\alpha \in A} R)^\wedge \to \prod_{\alpha \in A} R$ is universally injective. Thus, by Algebra, Lemmas 7.76.7 and 7.83.6 it suffices to show that $\prod_{\alpha \in A} R$ is flat and Mittag-Leffler. By Algebra, Proposition 7.84.5 (and Algebra, Lemma 7.84.4) we see that $\prod_{\alpha \in A} R$ is flat. Thus we conclude because a product of copies of R is Mittag-Leffler, see Algebra, Lemma 7.85.3. □

Lemma 34.9.2. *Let R be a ring. Let $I \subset R$ be an ideal. Let M be an R-module. Assume*

(1) *R is Noetherian and I-adically complete,*
(2) *M is flat over R, and*
(3) *M/IM is a projective R/I-module.*

Then the I-adic completion $M^\wedge$ is a flat Mittag-Leffler R-module.

Proof. Choose a surjection $F \to M$ where F is a free R-module. By Algebra, Lemma 7.90.18 the module $M^\wedge$ is a direct summand of the module $F^\wedge$. Hence it suffices to prove the lemma for F. In this case the lemma follows from Lemma 34.9.1. $\square$

In Lemmas 34.9.3 and 34.9.4 the assumption that S be Noetherian holds if $R \to S$ is of finite type, see Algebra, Lemma 7.28.1.

Lemma 34.9.3. *Let R be a ring. Let $I \subset R$ be an ideal. Let $R \to S$ be a ring map, and N an S-module. Assume*

(1) *R is a Noetherian ring,*
(2) *S is a Noetherian ring,*
(3) *N is a finite S-module, and*
(4) *for any finite R-module Q, any $\mathfrak{q} \in Ass_S(Q \otimes_R N)$ satisfies $IS + \mathfrak{q} \neq S$.*

Then the map $N \to N^\wedge$ of N into the I-adic completion of N is universally injective as a map of R-modules.

Proof. We have to show that for any finite R-module Q the map $Q \otimes_R N \to Q \otimes_R N^\wedge$ is injective, see Algebra, Theorem 7.76.3. As there is a canonical map $Q \otimes_R N^\wedge \to (Q \otimes_R N)^\wedge$ it suffices to prove that the canonical map $Q \otimes_R N \to (Q \otimes_R N)^\wedge$ is injective. Hence we may replace N by $Q \otimes_R N$ and it suffices to prove the injectivity for the map $N \to N^\wedge$.

Let $K = \mathrm{Ker}(N \to N^\wedge)$. It suffices to show that $K_\mathfrak{q} = 0$ for $\mathfrak{q} \in \mathrm{Ass}(N)$ as N is a submodule of $\prod_{\mathfrak{q} \in \mathrm{Ass}(N)} N_\mathfrak{q}$, see Algebra, Lemma 7.60.18. Pick $\mathfrak{q} \in \mathrm{Ass}(N)$. By the last assumption we see that there exists a prime $\mathfrak{q}' \supset IS + \mathfrak{q}$. Since $K_\mathfrak{q}$ is a localization of $K_{\mathfrak{q}'}$ it suffices to prove the vanishing of $K_{\mathfrak{q}'}$. Note that $K = \bigcap I^n N$, hence $K_{\mathfrak{q}'} \subset \bigcap I^n N_{\mathfrak{q}'}$. Hence $K_{\mathfrak{q}'} = 0$ by Algebra, Lemma 7.47.6. $\square$

Lemma 34.9.4. *Let R be a ring. Let $I \subset R$ be an ideal. Let $R \to S$ be a ring map, and N an S-module. Assume*

(1) *R is a Noetherian ring,*
(2) *S is a Noetherian ring,*
(3) *N is a finite S-module,*
(4) *N is flat over R, and*
(5) *for any prime $\mathfrak{q} \subset S$ which is an associated prime of $N \otimes_R \kappa(\mathfrak{p})$ where $\mathfrak{p} = R \cap \mathfrak{q}$ we have $IS + \mathfrak{q} \neq S$.*

Then the map $N \to N^\wedge$ of N into the I-adic completion of N is universally injective as a map of R-modules.

Proof. This follows from Lemma 34.9.3 because Algebra, Lemma 7.62.5 and Remark 7.62.6 guarantee that the set of associated primes of tensor products $N \otimes_R Q$ are contained in the set of associated primes of the modules $N \otimes_R \kappa(\mathfrak{p})$. $\square$

34.10. Projective modules

The following lemma can be used to prove projectivity by Noetherian induction on the base, see Lemma 34.10.2.

Lemma 34.10.1. *Let R be a ring. Let $I \subset R$ be an ideal. Let $R \to S$ be a ring map, and N an S-module. Assume*

(1) *R is Noetherian and I-adically complete,*
(2) *$R \to S$ is of finite type,*
(3) *N is a finite S-module,*
(4) *N is flat over R,*
(5) *N/IN is projective as a R/I-module, and*
(6) *for any prime $\mathfrak{q} \subset S$ which is an associated prime of $N \otimes_R \kappa(\mathfrak{p})$ where $\mathfrak{p} = R \cap \mathfrak{q}$ we have $IS + \mathfrak{q} \neq S$.*

Then N is projective as an R-module.

Proof. By Lemma 34.9.4 the map $N \to N^\wedge$ is universally injective. By Lemma 34.9.2 the module $N^\wedge$ is Mittag-Leffler. By Algebra, Lemma 7.83.6 we conclude that N is Mittag-Leffler. Hence N is countably generated, flat and Mittag-Leffler as an R-module, whence projective by Algebra, Lemma 7.87.1. $\square$

Lemma 34.10.2. *Let R be a ring. Let $R \to S$ be a ring map. Assume*

(1) *R is Noetherian,*
(2) *$R \to S$ is of finite type and flat, and*
(3) *every fibre ring $S \otimes_R \kappa(\mathfrak{p})$ is geometrically integral over $\kappa(\mathfrak{p})$.*

Then S is projective as an R-module.

Proof. Consider the set

$$\{I \subset R \mid S/IS \text{ not projective as } R/I\text{-module}\}$$

We have to show this set is empty. To get a contradiction assume it is nonempty. Then it contains a maximal element I. Let $J = \sqrt{I}$ be its radical. If $I \neq J$, then S/JS is projective as a R/J-module, and S/IS is flat over R/I and J/I is a nilpotent ideal in R/I. Applying Algebra, Lemma 7.71.5 we see that S/IS is a projective R/I-module, which is a contradiction. Hence we may assume that I is a radical ideal. In other words we are reduced to proving the lemma in case R is a reduced ring and S/IS is a projective R/I-module for every nonzero ideal I of R.

Assume R is a reduced ring and S/IS is a projective R/I-module for every nonzero ideal I of R. By generic flatness, Algebra, Lemma 7.109.1 (applied to a localization R_g which is a domain) or the more general Algebra, Lemma 7.109.7 there exists a nonzero $f \in R$ such that S_f is free as an R_f-module. Denote $R^\wedge = lim\, R/(f^n)$ the (f)-adic completion of R. Note that the ring map

$$R \longrightarrow R_f \times R^\wedge$$

is a faithfully flat ring map, see Algebra, Lemma 7.90.3. Hence by faithfully flat descent of projectivity, see Algebra, Theorem 7.89.5 it suffices to prove that $S \otimes_R R^\wedge$ is a projective $R^\wedge$-module. To see this we will use the criterion of Lemma 34.10.1. First of all, note that $S/fS = (S \otimes_R R^\wedge)/f(S \otimes_R R^\wedge)$ is a projective $R/(f)$-module and that $S \otimes_R R^\wedge$ is flat and of finite type over $R^\wedge$ as a base change of such. Next, suppose that $\mathfrak{p}^\wedge$ is a prime ideal of $R^\wedge$. Let $\mathfrak{p} \subset R$ be the corresponding prime of R. As $R \to S$ has geometrically integral fibre rings, the same is true for the fibre rings of any base change. Hence $\mathfrak{q}^\wedge = \mathfrak{p}^\wedge(S \otimes_R R^\wedge)$, is a prime ideals lying over $\mathfrak{p}^\wedge$ and it is the unique associated prime of $S \otimes_R \kappa(\mathfrak{p}^\wedge)$. Thus we win if $f(S \otimes_R R^\wedge) + \mathfrak{q}^\wedge \neq S \otimes_R R^\wedge$. This is true because $\mathfrak{p}^\wedge + fR^\wedge \neq R^\wedge$ as f lies in the radical of the f-adically complete ring $R^\wedge$ and because $R^\wedge \to S \otimes_R R^\wedge$ is surjective on spectra as its fibres are nonempty (irreducible spaces are nonempty). $\square$

Lemma 34.10.3. *Let R be a ring. Let $R \to S$ be a ring map. Assume*

(1) *$R \to S$ is of finite presentation and flat, and*
(2) *every fibre ring $S \otimes_R \kappa(\mathfrak{p})$ is geometrically integral over $\kappa(\mathfrak{p})$.*

Then S is projective as an R-module.

Proof. We can find a cocartesian diagram of rings

$$\begin{tikzcd} S_0 \arrow[r] & S \\ R_0 \arrow[u] \arrow[r] & R \arrow[u] \end{tikzcd}$$

such that R_0 is of finite type over $\mathbf{Z}$, the map $R_0 \to S_0$ is of finite type and flat with geometrically integral fibres, see More on Morphisms, Lemmas 33.24.4, 33.24.6, 33.24.7, and 33.24.11. By Lemma 34.10.2 we see that S_0 is a projective R_0-module. Hence $S = S_0 \otimes_{R_0} R$ is a projective R-module, see Algebra, Lemma 7.88.1. $\square$

Remark 34.10.4. Lemma 34.10.3 is a key step in the development of results in this chapter. The analogue of this lemma in [**GR71**] is [**GR71**, I Proposition 3.3.1]: If $R \to S$ is smooth with geometrically integral fibres, then S is projective as an R-module. This is a special case of Lemma 34.10.3, but as we will later improve on this lemma anyway, we do not gain much from having a stronger result at this point. We briefly sketch the proof of this as it is given in [**GR71**].

(1) First reduce to the case where R is Noetherian as above.
(2) Since projectivity descends through faithfully flat ring maps, see Algebra, Theorem 7.89.5 we may work locally in the fppf topology on R, hence we may assume that $R \to S$ has a section $\sigma : S \to R$. (Just by the usual trick of base changing to S.) Set $I = \mathrm{Ker}(S \to R)$.
(3) Localizing a bit more on R we may assume that I/I^2 is a free R-module and that the completion $S^\wedge$ of S with respect to I is isomorphic to $R[[t_1, \ldots, t_n]]$, see Morphisms, Lemma 24.33.20. Here we are using that $R \to S$ is smooth.
(4) To prove that S is projective as an R-module, it suffices to prove that S is flat, countably generated and Mittag-Leffler as an R-module, see Algebra, Lemma 7.87.1. The first two properties are evident. Thus it suffices to prove that S is Mittag-Leffler as an R-module. By Algebra, Lemma 7.85.4 the module $R[[t_1, \ldots, t_n]]$ is Mittag-Leffler over R. Hence Algebra, Lemma 7.83.6 shows that it suffices to show that the $S \to S^\wedge$ is universally injective as a map of R-modules.
(5) Apply Lemma 34.8.4 to see that $S \to S^\wedge$ is R-universally injective. Namely, as $R \to S$ has geometrically integral fibres, any associated point of any fibre ring is just the generic point of the fibre ring which is in the image of $Spec(S^\wedge) \to Spec(S)$.

There is an analogy between the proof as sketched just now, and the development of the arguments leading to the proof of Lemma 34.10.3. In both a completion plays an essential role, and both times the assumption of having geometrically integral fibres assures one that the map from S to the completion of S is R-universally injective.

34.11. Flat finite type modules, Part I

In some cases given a ring map $R \to S$ of finite presentation and a finite S-module N the flatness of N over R implies that N is of finite presentation. In this section we prove this is true ``pointwise''. We remark that the first proof of Proposition 34.11.3 uses the geometric results of Section 34.4 but not the existence of a complete dévissage.

Lemma 34.11.1. *Let $(R, \mathfrak{m})$ be a local ring. Let $R \to S$ be a finitely presented flat ring map with geometrically integral fibres. Write $\mathfrak{p} = \mathfrak{m}S$. Let $\mathfrak{q} \subset S$ be a prime ideal lying over $\mathfrak{m}$. Let N be a finite S-module. There exists $r \geq 0$ and an S-module map*

$$\alpha : S^{\oplus r} \longrightarrow N$$

such that $\alpha : \kappa(\mathfrak{p})^{\oplus r} \to N \otimes_S \kappa(\mathfrak{p})$ is an isomorphism. For any such α the following are equivalent:

(1) *$N_\mathfrak{q}$ is R-flat,*
(2) *α is R-universally injective and $Coker(\alpha)_\mathfrak{q}$ is R-flat,*
(3) *α is injective and $Coker(\alpha)_\mathfrak{q}$ is R-flat,*
(4) *$\alpha_\mathfrak{p}$ is an isomorphism and $Coker(\alpha)_\mathfrak{q}$ is R-flat, and*
(5) *$\alpha_\mathfrak{q}$ is injective and $Coker(\alpha)_\mathfrak{q}$ is R-flat.*

Proof. To obtain α set $r = \dim_{\kappa(\mathfrak{p})} N \otimes_S \kappa(\mathfrak{p})$ and pick $x_1, \ldots, x_r \in N$ which form a basis of $N \otimes_S \kappa(\mathfrak{p})$. Define $\alpha(s_1, \ldots, s_r) = \sum s_i x_i$. This proves the existence.

Fix an α. The most interesting implication is (1) $\Rightarrow$ (2) which we prove first. Assume (1). Because $S/\mathfrak{m}S$ is a domain with fraction field $\kappa(\mathfrak{p})$ we see that $(S/\mathfrak{m}S)^{\oplus r} \to N_\mathfrak{p}/\mathfrak{m}N_\mathfrak{p} = N \otimes_S \kappa(\mathfrak{p})$ is injective. Hence by Lemmas 34.8.5 and 34.10.3. the map $S^{\oplus r} \to N_\mathfrak{p}$ is R-universally injective. It follows that $S^{\oplus r} \to N$ is R-universally injective, see Algebra, Lemma 7.76.10. Then also the localization $\alpha_\mathfrak{q}$ is R-universally injective, see Algebra, Lemma 7.76.13. We conclude that $\mathrm{Coker}(\alpha)_\mathfrak{q}$ is R-flat by Algebra, Lemma 7.76.7.

The implication (2) $\Rightarrow$ (3) is immediate. If (3) holds, then $\alpha_\mathfrak{p}$ is injective as a localization of an injective module map. By Nakayama's lemma (Algebra, Lemma 7.14.5) $\alpha_\mathfrak{p}$ is surjective too. Hence (3) $\Rightarrow$ (4). If (4) holds, then $\alpha_\mathfrak{p}$ is an isomorphism, so α is injective as $S_\mathfrak{q} \to S_\mathfrak{p}$ is injective. Namely, elements of $S \setminus \mathfrak{p}$ are nonzero divisors on S by a combination of Lemmas 34.8.6 and 34.10.3. Hence (4) $\Rightarrow$ (5). Finally, if (5) holds, then $N_\mathfrak{q}$ is R-flat as an extension of flat modules, see Algebra, Lemma 7.35.12. Hence (5) $\Rightarrow$ (1) and the proof is finished. □

Lemma 34.11.2. *Let $(R, \mathfrak{m})$ be a local ring. Let $R \to S$ be a ring map of finite presentation. Let N be a finite S-module. Let $\mathfrak{q}$ be a prime of S lying over $\mathfrak{m}$. Assume that $N_\mathfrak{q}$ is flat over R, and assume there exists a complete dévissage of $N/S/R$ at $\mathfrak{q}$. Then N is a finitely presented S-module, free as an R-module, and there exists an isomorphism*

$$N \cong B_1^{\oplus r_1} \oplus \ldots \oplus B_n^{\oplus r_n}$$

as R-modules where each B_i is a smooth R-algebra with geometrically irreducible fibres.

Proof. Let $(A_i, B_i, M_i, \alpha_i, \mathfrak{q}_i)_{i=1,\ldots,n}$ be the given complete dévissage. We prove the lemma by induction on n. Note that N is finitely presented as an S-module if and only if M_1 is finitely presented as an B_1-module, see Remark 34.7.3. Note that $N_\mathfrak{q} \cong (M_1)_{\mathfrak{q}_1}$ as R-modules because (a) $N_\mathfrak{q} \cong (M_1)_{\mathfrak{q}_1'}$ where $\mathfrak{q}_1'$ is the unique prime in A_1 lying over $\mathfrak{q}_1$ and (b) $(A_1)_{\mathfrak{q}_1'} = (A_1)_{\mathfrak{q}_1}$ by Algebra, Lemma 7.36.11, so (c) $(M_1)_{\mathfrak{q}_1'} \cong (M_1)_{\mathfrak{q}_1}$. Hence $(M_1)_{\mathfrak{q}_1}$ is a flat R-module. Thus we may replace (S, N) by (B_1, M_1) in order to prove the lemma. By Lemma 34.11.1 the map $\alpha_1 : B_1^{\oplus r_1} \to M_1$ is R-universally injective and $\mathrm{Coker}(\alpha_1)_{\mathfrak q}$ is R-flat. Note that $(A_i, B_i, M_i, \alpha_i, \mathfrak{q}_i)_{i=2,\ldots,n}$ is a complete dévissage of $\mathrm{Coker}(\alpha_1)/B_1/R$ at $\mathfrak{q}_1$. Hence the induction hypothesis implies that $\mathrm{Coker}(\alpha_1)$ is finitely presented as a B_1-module, free as an R-module, and has a decomposition as in the lemma. This implies that M_1 is finitely presented as a B_1-module, see Algebra, Lemma 7.5.4. It further implies that $M_1 \cong B_1^{\oplus r_1} \oplus \mathrm{Coker}(\alpha_1)$ as R-modules, hence a decomposition as in the lemma. Finally, B_1 is projective as an R-module by Lemma 34.10.3 hence free as an R-module by Algebra, Theorem 7.79.4. This finishes the proof. $\square$

Proposition 34.11.3. *Let $f : X \to S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent sheaf on X. Let $x \in X$ with image $s \in S$. Assume that*

1. *f is locally of finite presentation,*
2. *$\mathcal{F}$ is of finite type, and*
3. *$\mathcal{F}$ is flat at x over S.*

Then there exists an elementary étale neighbourhood $(S', s') \to (S, s)$ and an open subscheme

$$V \subset X \times_S Spec(\mathcal{O}_{S',s'})$$

which contains the unique point of $X \times_S Spec(\mathcal{O}_{S',s'})$ mapping to x such that the pullback of $\mathcal{F}$ to V is an $\mathcal{O}_V$-module of finite presentation and flat over $\mathcal{O}_{S',s'}$.

First proof. This proof is longer but does not use the existence of a complete dévissage. The problem is local around x and s, hence we may assume that X and S are affine. During the proof we will finitely many times replace S by an elementary étale neighbourhood of (S, s). The goal is then to find (after such a replacement) an open $V \subset X \times_S Spec(\mathcal{O}_{S,s})$ containing x such that $\mathcal{F}|_V$ is flat over S and finitely presented. Of course we may also replace S by $Spec(\mathcal{O}_{S,s})$ at any point of the proof, i.e., we may assume S is a local scheme. We will prove the lemma by induction on the integer $n = \dim_x(\mathrm{Supp}(\mathcal{F}_s))$.

We can choose

1. elementary étale neighbourhoods $g : (X', x') \to (X, x)$, $e : (S', s') \to (S, s)$,
2. a commutative diagram

$$\begin{tikzcd}
X \arrow[d, "f"'] & X' \arrow[l, "g"'] \arrow[dd] & Z' \arrow[l, "i"'] \arrow[d, "\pi"] \\
 & & Y' \arrow[d, "h"] \\
S & S' \arrow[l, "e"'] \arrow[r, equal] & S'
\end{tikzcd}$$

3. a point $z' \in Z'$ with $i(z') = x'$, $y' = \pi(z')$, $h(y') = s'$,
4. a finite type quasi-coherent $\mathcal{O}_{Z'}$-module $\mathcal{G}$,

as in Lemma 34.4.2. We are going to replace S by $Spec(\mathcal{O}_{S',s'})$, see remarks in first paragraph of the proof. Consider the diagram

$$\begin{tikzcd} X_{\mathcal{O}_{S',s'}} \arrow[ddr, "f"'] & X'_{\mathcal{O}_{S',s'}} \arrow[l, "g"'] \arrow[dd] & Z'_{\mathcal{O}_{S',s'}} \arrow[l, "i"'] \arrow[d, "\pi"] \\ & & Y'_{\mathcal{O}_{S',s'}} \arrow[dl, "h"] \\ & Spec(\mathcal{O}_{S',s'}) & \end{tikzcd}$$

Here we have base changed the schemes X', Z', Y' over S' via $Spec(\mathcal{O}_{S',s'}) \to S'$ and the scheme X over S via $Spec(\mathcal{O}_{S',s'}) \to S$. It is still the case that g is étale, see Lemma 34.3.2. After replacing X by $X_{\mathcal{O}_{S',s'}}$, X' by $X'_{\mathcal{O}_{S',s'}}$, Z' by $Z'_{\mathcal{O}_{S',s'}}$, and Y' by $Y'_{\mathcal{O}_{S',s'}}$ we may assume we have a diagram as Lemma 34.4.2 where in addition $S = S'$ is a local scheme with closed point s. By Lemmas 34.4.3 and 34.4.4 the result for $Y' \to S$, the sheaf $\pi_*\mathcal{G}$, and the point y' implies the result for $X \to S$, $\mathcal{F}$ and x. Hence we may assume that S is local and $X \to S$ is a smooth morphism of affines with geometrically irreducible fibres of dimension n.

The base case of the induction: $n = 0$. As $X \to S$ is smooth with geometrically irredible fibres of dimension 0 we see that $X \to S$ is an open immersion, see Descent, Lemma 31.21.2. As S is local and the closed point is in the image of $X \to S$ we conclude that $X = S$. Thus we see that $\mathcal{F}$ corresponds to a finite flat $\mathcal{O}_{S,s}$ module. In this case the result follows from Algebra, Lemma 7.72.4 which tells us that $\mathcal{F}$ is in fact finite free.

The induction step. Assume the result holds whenever the dimension of the support in the closed fibre is $< n$. Write $S = Spec(A)$, $X = Spec(B)$ and $\mathcal{F} = \widetilde{N}$ for some B-module N. Note that A is a local ring; denote its maximal ideal $\mathfrak{m}$. Then $\mathfrak{p} = \mathfrak{m}B$ is the unique minimal prime lying over $\mathfrak{m}$ as $X \to S$ has geometrically irreducible fibres. Finally, let $\mathfrak{q} \subset B$ be the prime corresponding to x. By Lemma 34.11.1 we can choose a map

$$\alpha : B^{\oplus r} \to N$$

such that $\kappa(\mathfrak{p})^{\oplus r} \to N \otimes_B \kappa(\mathfrak{p})$ is an isomorphism. Moreover, as $N_\mathfrak{q}$ is A-flat the lemma also shows that α is injective and that $\mathrm{Coker}(\alpha)_\mathfrak{q}$ is A-flat. Set $Q = \mathrm{Coker}(\alpha)$. Note that the support of $Q/\mathfrak{m}Q$ does not contain $\mathfrak{p}$. Hence it is certainly the case that $\dim_\mathfrak{q}(\mathrm{Supp}(Q/\mathfrak{m}Q)) < n$. Combining everything we know about Q we see that the induction hypothesis applies to Q. It follows that there exists an elementary étale morphism $(S', s) \to (S, s)$ such that the conclusion holds for $Q \otimes_A A'$ over $B \otimes_A A'$ where $A' = \mathcal{O}_{S',s'}$. After replacing A by A' we have an exact sequence

$$0 \to B^{\oplus r} \to N \to Q \to 0$$

(here we use that α is injective as mentioned above) of finite B-modules and we also get an element $g \in B$, $g \notin \mathfrak{q}$ such that Q_g is finitely presented over B_g and flat over A. Since localization is exact we see that

$$0 \to B_g^{\oplus r} \to N_g \to Q_g \to 0$$

is still exact. As B_g and Q_g are flat over A we conlude that N_g is flat over A, see Algebra, Lemma 7.35.12, and as B_g and Q_g are finitely presented over B_g the same holds for N_g, see Algebra, Lemma 7.5.4. □

Second proof. We apply Proposition 34.6.7 to find a commutative diagram

$$\begin{tikzcd} (X, x) \arrow[d] & (X', x') \arrow[l, "g"] \arrow[d] \\ (S, s) & (S', s') \arrow[l] \end{tikzcd}$$

of pointed schemes such that the horizontal arrows are elementary étale neighbourhoods and such that $g^*\mathcal{F}/X'/S'$ has a complete dévissage at x. (In particular S' and X' are affine.) By Morphisms, Lemma 24.24.11 we see that $g^*\mathcal{F}$ is flat at x' over S and by Lemma 34.3.3 we see that it is flat at x' over S'. Via Remark 34.7.5 we deduce that

$$\Gamma(X', g^*\mathcal{F})/\Gamma(X', \mathcal{O}_{X'})/\Gamma(S', \mathcal{O}_{S'})$$

has a complete dévisage at the prime of $\Gamma(X', \mathcal{O}_{X'})$ corresponding to x'. We may base change this complete dévissage to the local ring $\mathcal{O}_{S',s'}$ of $\Gamma(S', \mathcal{O}_{S'})$ at the prime corresponding to s'. Thus Lemma 34.11.2 implies that

$$\Gamma(X', \mathcal{F}') \otimes_{\Gamma(S', \mathcal{O}_{S'})} \mathcal{O}_{S',s'}$$

is flat over $\mathcal{O}_{S',s'}$ and of finite presentation over $\Gamma(X', \mathcal{O}_{X'}) \otimes_{\Gamma(S',\mathcal{O}_{S'})} \mathcal{O}_{S',s'}$. In other words, the restriction of $\mathcal{F}$ to $X' \times_{S'} Spec(\mathcal{O}_{S',s'})$ is of finite presentation and flat over $\mathcal{O}_{S',s'}$. Since the morphism $X' \times_{S'} Spec(\mathcal{O}_{S',s'}) \to X \times_S Spec(\mathcal{O}_{S',s'})$ is étale (Lemma 34.3.2) its image $V \subset X \times_S Spec(\mathcal{O}_{S',s'})$ is an open subscheme, and by étale descent the restriction of $\mathcal{F}$ to V is of finite presentation and flat over $\mathcal{O}_{S',s'}$. (Results used: Morphisms, Lemma 24.35.13, Descent, Lemma 31.5.2, and Morphisms, Lemma 24.24.11.) □

Lemma 34.11.4. *Let $f : X \to S$ be a morphism of schemes which is locally of finite type. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module of finite type. Let $s \in S$. Then the set*

$$\{x \in X_s \mid \mathcal{F} \text{ flat over } S \text{ at } x\}$$

is open in the fibre X_s.

Proof. Suppose $x \in U$. Choose an elementary étale neighbourhood $(S', s') \to (S, s)$ and open $V \subset X \times_S Spec(\mathcal{O}_{S',s'})$ as in Proposition 34.11.3. Note that $X_{s'} = X_s$ as $\kappa(s) = \kappa(s')$. If $x' \in V \cap X_{s'}$, then the pullback of $\mathcal{F}$ to $X \times_S S'$ is flat over S' at x'. Hence $\mathcal{F}$ is flat at x' over S, see Morphisms, Lemma 24.24.11. In other words $X_s \cap V \subset U$ is an open neighbourhood of x in U. □

Lemma 34.11.5. *Let $f : X \to S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent sheaf on X. Let $x \in X$ with image $s \in S$. Assume that*

(1) *f is locally of finite type,*
(2) *$\mathcal{F}$ is of finite type, and*
(3) *$\mathcal{F}$ is flat at x over S.*

Then there exists an elementary étale neighbourhood $(S', s') \to (S, s)$ and an open subscheme

$$V \subset X \times_S Spec(\mathcal{O}_{S',s'})$$

which contains the unique point of $X \times_S Spec(\mathcal{O}_{S',s'})$ mapping to x such that the pullback of $\mathcal{F}$ to V is flat over $\mathcal{O}_{S',s'}$.

Proof. (The only difference between this and Proposition 34.11.3 is that we do not assume f is of finite presentation.) The question is local on X and S, hence we may assume X and S are affine. Write $X = Spec(B)$, $S = Spec(A)$ and write $B = A[x_1, \ldots, x_n]/I$. In other words we obtain a closed immersion $i : X \to \mathbf{A}^n_S$. Denote $t = i(x) \in \mathbf{A}^n_S$. We may apply Proposition 34.11.3 to $\mathbf{A}^n_S \to S$, the sheaf $i_*\mathcal{F}$ and the point t. We obtain an elementary étale neighbourhood $(S', s') \to (S, s)$ and an open subscheme

$$W \subset \mathbf{A}^n_{\mathcal{O}_{S',s'}}$$

such that the pull back of $i_*\mathcal{F}$ to W is flat over $\mathcal{O}_{S',s'}$. This means that $V := W \cap \big(X \times_S Spec(\mathcal{O}_{S',s'})\big)$ is the desired open subscheme. □

Lemma 34.11.6. *Let $f : X \to S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent sheaf on X. Let $s \in S$. Assume that*

(1) *f is of finite presentation,*
(2) *$\mathcal{F}$ is of finite type, and*
(3) *$\mathcal{F}$ is flat over S at every point of the fibre X_s.*

Then there exists an elementary étale neighbourhood $(S', s') \to (S, s)$ and an open subscheme

$$V \subset X \times_S Spec(\mathcal{O}_{S',s'})$$

which contains the fibre $X_s = X \times_S s'$ such that the pullback of $\mathcal{F}$ to V is an $\mathcal{O}_V$-module of finite presentation and flat over $\mathcal{O}_{S',s'}$.

Proof. For every point $x \in X_s$ we can use Proposition 34.11.3 to find an elementary étale neighbourhood $(S_x, s_x) \to (S, s)$ and an open $V_x \subset X \times_S Spec(\mathcal{O}_{S_x,s_x})$ such that $x \in X_s = X \times_S s_x$ is contained in V_x and such that the pullback of $\mathcal{F}$ to V_x is an $\mathcal{O}_{V_x}$-module of finite presentation and flat over $\mathcal{O}_{S_x,s_x}$. In particular we may view the fibre $(V_x)_{s_x}$ as an open neighbourhood of x in X_s. Because X_s is quasi-compact we can find a finite number of points $x_1, \ldots, x_n \in X_s$ such that X_s is the union of the $(V_{x_i})_{s_{x_i}}$. Choose an elementary étale neighbourhood $(S', s') \to (S, s)$ which dominates each of the neighbourhoods (S_{x_i}, s_{x_i}), see More on Morphisms, Lemma 33.25.4. Set $V = \bigcup V_i$ where V_i is the inverse images of the open V_{x_i} via the morphism

$$X \times_S Spec(\mathcal{O}_{S',s'}) \longrightarrow X \times_S Spec(\mathcal{O}_{S_{x_i},s_{x_i}})$$

By construction V contains X_s and by construction the pullback of $\mathcal{F}$ to V is an $\mathcal{O}_V$-module of finite presentation and flat over $\mathcal{O}_{S',s'}$. □

Lemma 34.11.7. *Let $f : X \to S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent sheaf on X. Let $s \in S$. Assume that*

(1) *f is of finite type,*
(2) *$\mathcal{F}$ is of finite type, and*
(3) *$\mathcal{F}$ is flat over S at every point of the fibre X_s.*

Then there exists an elementary étale neighbourhood $(S', s') \to (S, s)$ and an open subscheme

$$V \subset X \times_S Spec(\mathcal{O}_{S',s'})$$

which contains the fibre $X_s = X \times_S s'$ such that the pullback of $\mathcal{F}$ to V is flat over $\mathcal{O}_{S',s'}$.

Proof. (The only difference between this and Lemma 34.11.6 is that we do not assume f is of finite presentation.) For every point $x \in X_s$ we can use Lemma 34.11.5 to find an elementary étale neighbourhood $(S_x, s_x) \to (S, s)$ and an open $V_x \subset X \times_S Spec(\mathcal{O}_{S_x,s_x})$ such that $x \in X_s = X \times_S s_x$ is contained in V_x and such that the pullback of $\mathcal{F}$ to V_x is flat over $\mathcal{O}_{S_x,s_x}$. In particular we may view the fibre $(V_x)_{s_x}$ as an open neighbourhood of x in X_s. Because X_s is quasi-compact we can find a finite number of points $x_1, \ldots, x_n \in X_s$ such that

X_s is the union of the $(V_{x_i})_{s_{x_i}}$. Choose an elementary étale neighbourhood $(S', s') \to (S, s)$ which dominates each of the neighbourhoods (S_{x_i}, s_{x_i}), see More on Morphisms, Lemma 33.25.4. Set $V = \bigcup V_i$ where V_i is the inverse images of the open V_{x_i} via the morphism

$$X \times_S Spec(\mathcal{O}_{S',s'}) \longrightarrow X \times_S Spec(\mathcal{O}_{S_{x_i},s_{x_i}})$$

By construction V contains X_s and by construction the pullback of $\mathcal{F}$ to V is flat over $\mathcal{O}_{S',s'}$. □

Lemma 34.11.8. *Let S be a scheme. Let X be locally of finite type over S. Let $x \in X$ with image $s \in S$. If X is flat at x over S, then there exists an elementary étale neighbourhood $(S', s') \to (S, s)$ and an open subscheme*

$$V \subset X \times_S Spec(\mathcal{O}_{S',s'})$$

which contains the unique point of $X \times_S Spec(\mathcal{O}_{S',s'})$ mapping to x such that $V \to Spec(\mathcal{O}_{S',s'})$ is flat and of finite presentation.

Proof. The question is local on X and S, hence we may assume X and S are affine. Write $X = Spec(B)$, $S = Spec(A)$ and write $B = A[x_1, \ldots, x_n]/I$. In other words we obtain a closed immersion $i : X \to \mathbf{A}^n_S$. Denote $t = i(x) \in \mathbf{A}^n_S$. We may apply Proposition 34.11.3 to $\mathbf{A}^n_S \to S$, the sheaf $\mathcal{F} = i_*\mathcal{O}_X$ and the point t. We obtain an elementary étale neighbourhood $(S', s') \to (S, s)$ and an open subscheme

$$W \subset \mathbf{A}^n_{\mathcal{O}_{S',s'}}$$

such that the pull back of $i_*\mathcal{O}_X$ is flat and of finite presentation. This means that $V := W \cap \left(X \times_S Spec(\mathcal{O}_{S',s'})\right)$ is the desired open subscheme. □

Lemma 34.11.9. *Let $f : X \to S$ be a morphism which is locally of finite presentation. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module of finite type. If $x \in X$ and $\mathcal{F}$ is flat at x over S, then $\mathcal{F}_x$ is an $\mathcal{O}_{X,x}$-module of finite presentation.*

Proof. Let $s = f(x)$. By Proposition 34.11.3 there exists an elementary étale neighbourhood $(S', s') \to (S, s)$ such that the pullback of $\mathcal{F}$ to $X \times_S Spec(\mathcal{O}_{S',s'})$ is of finite presentation in a neighbourhood of the point $x' \in X_{s'} = X_s$ corresponding to x. The ring map

$$\mathcal{O}_{X,x} \longrightarrow \mathcal{O}_{X \times_S Spec(\mathcal{O}_{S',s'}),x'} = \mathcal{O}_{X \times_S S',x'}$$

is flat and local as a localization of an étale ring map. Hence $\mathcal{F}_x$ is of finite presentation over $\mathcal{O}_{X,x}$ by descent, see Algebra, Lemma 7.77.2 (and also that a flat local ring map is faithfully flat, see Algebra, Lemma 7.35.16). □

Lemma 34.11.10. *Let $f : X \to S$ be a morphism which is locally of finite type. Let $x \in X$ with image $s \in S$. If f is flat at x over S, then $\mathcal{O}_{X,x}$ is essentially of finite presentation over $\mathcal{O}_{S,s}$.*

Proof. We may assume X and S affine. Write $X = Spec(B)$, $S = Spec(A)$ and write $B = A[x_1, \ldots, x_n]/I$. In other words we obtain a closed immersion $i : X \to \mathbf{A}^n_S$. Denote $t = i(x) \in \mathbf{A}^n_S$. We may apply Lemma 34.11.9 to $\mathbf{A}^n_S \to S$, the sheaf $\mathcal{F} = i_*\mathcal{O}_X$ and the point t. We conclude that $\mathcal{O}_{X,x}$ is of finite presentation over $\mathcal{O}_{\mathbf{A}^n_S,t}$ which implies what we want. □

34.12. Flat finitely presented modules

In some cases given a ring map $R \to S$ of finite presentation and a finitely presented S-module N the flatness of N over R implies that N is projective as an R-module, at least after replacing S by an étale extension. In this section we collect a some results of this nature.

Lemma 34.12.1. *Let R be a ring. Let $R \to S$ be a finitely presented flat ring map with geometrically integral fibres. Let $\mathfrak{q} \subset S$ be a prime ideal lying over the prime $\mathfrak{r} \subset R$. Set $\mathfrak{p} = \mathfrak{r}S$. Let N be a finitely presented S-module. There exists $r \geq 0$ and an S-module map*

$$\alpha : S^{\oplus r} \longrightarrow N$$

such that $\alpha : \kappa(\mathfrak{p})^{\oplus r} \to N \otimes_S \kappa(\mathfrak{p})$ is an isomorphism. For any such α the following are equivalent:

1. *$N_{\mathfrak{q}}$ is R-flat,*
2. *there exists an $f \in R$, $f \notin \mathfrak{r}$ such that $\alpha_f : S_f^{\oplus r} \to N_f$ is R_f-universally injective and a $g \in S$, $g \notin \mathfrak{q}$ such that $Coker(\alpha)_g$ is R-flat,*
3. *$\alpha_{\mathfrak{r}}$ is $R_{\mathfrak{r}}$-universally injective and $Coker(\alpha)_{\mathfrak{q}}$ is R-flat*
4. *$\alpha_{\mathfrak{r}}$ is injective and $Coker(\alpha)_{\mathfrak{q}}$ is R-flat,*
5. *$\alpha_{\mathfrak{p}}$ is an isomorphism and $Coker(\alpha)_{\mathfrak{q}}$ is R-flat, and*
6. *$\alpha_{\mathfrak{q}}$ is injective and $Coker(\alpha)_{\mathfrak{q}}$ is R-flat.*

Proof. To obtain α set $r = \dim_{\kappa(\mathfrak{p})} N \otimes_S \kappa(\mathfrak{p})$ and pick $x_1, \ldots, x_r \in N$ which form a basis of $N \otimes_S \kappa(\mathfrak{p})$. Define $\alpha(s_1, \ldots, s_r) = \sum s_i x_i$. This proves the existence.

Fix a choice of α. We may apply Lemma 34.11.1 to the map $\alpha_{\mathfrak{r}} : S_{\mathfrak{r}}^{\oplus r} \to N_{\mathfrak{r}}$. Hence we see that (1), (3), (4), (5), and (6) are all equivalent. Since it is also clear that (2) implies (3) we see that all we have to do is show that (1) implies (2).

Assume (1). By openness of flatness, see Algebra, Theorem 7.120.4, the set

$$U_1 = \{\mathfrak{q}' \subset S \mid N_{\mathfrak{q}'} \text{ is flat over } R\}$$

is open in $Spec(S)$. It contains $\mathfrak{q}$ by assumption and hence $\mathfrak{p}$. Because $S^{\oplus r}$ and N are finitely presented S-modules the set

$$U_2 = \{\mathfrak{q}' \subset S \mid \alpha_{\mathfrak{q}'} \text{ is an isomorphism}\}$$

is open in $Spec(S)$, see Algebra, Lemma 7.73.2. It contains $\mathfrak{p}$ by (5). As $R \to S$ is finitely presented and flat the map $\Phi : Spec(S) \to Spec(R)$ is open, see Algebra, Proposition 7.36.8. For any prime $\mathfrak{r}' \in \Phi(U_1 \cap U_2)$ we see that there exists a prime $\mathfrak{q}'$ lying over $\mathfrak{r}'$ such that $N_{\mathfrak{q}'}$ is flat and such that $\alpha_{\mathfrak{q}'}$ is an isomorphism, which implies that $\alpha \otimes \kappa(\mathfrak{p}')$ is an isomorphism where $\mathfrak{p}' = \mathfrak{r}'S$. Thus $\alpha_{\mathfrak{r}'}$ is $R_{\mathfrak{r}'}$-universally injective by the implication (1) $\Rightarrow$ (3). Hence if we pick $f \in R$, $f \notin \mathfrak{r}$ such that $D(f) \subset \Phi(U_1 \cap U_2)$ then we conclude that α_f is R_f-universally injective, see Algebra, Lemma 7.76.12. The same reasoning also shows that for any $\mathfrak{q}' \in U_1 \cap \Phi^{-1}(\Phi(U_1 \cap U_2))$ the module $\mathrm{Coker}(\alpha)_{\mathfrak{q}'}$ is R-flat. Note that $\mathfrak{q} \in U_1 \cap \Phi^{-1}(\Phi(U_1 \cap U_2))$. Hence we can find a $g \in S$, $g \notin \mathfrak{q}$ such that $D(g) \subset U_1 \cap \Phi^{-1}(\Phi(U_1 \cap U_2))$ and we win. $\square$

Lemma 34.12.2. *Let $R \to S$ be a ring map of finite presentation. Let N be a finitely presented S-module flat over R. Let $\mathfrak{r} \subset R$ be a prime ideal. Assume there exists a complete dévissage of $N/S/R$ over $\mathfrak{r}$. Then there exists an $f \in R$, $f \notin \mathfrak{r}$ such that*

$$N_f \cong B_1^{\oplus r_1} \oplus \ldots \oplus B_n^{\oplus r_n}$$

as R-modules where each B_i is a smooth R_f-algebra with geometrically irreducible fibres. Moreover, N_f is projective as an R_f-module.

Proof. Let $(A_i, B_i, M_i, \alpha_i)_{i=1,\ldots,n}$ be the given complete dévissage. We prove the lemma by induction on n. Note that the assertions of the lemma are entirely about the structure of N as an R-module. Hence we may replace N by M_1, and we may think of M_1 as a B_1-module. See Remark 34.7.3 in order to see why M_1 is of finite presentation as a B_1-module. By Lemma 34.12.1 we may, after replacing R by R_f for some $f \in R$, $f \not\in \mathfrak r$, assume the map $\alpha_1 : B_1^{\oplus r_1} \to M_1$ is R-universally injective. Since M_1 and $B_1^{\oplus r_1}$ are R-flat and finitely presented as B_1-modules we see that $\text{Coker}(\alpha_1)$ is R-flat (Algebra, Lemma 7.76.7) and finitely presented as a B_1-module. Note that $(A_i, B_i, M_i, \alpha_i)_{i=2,\ldots,n}$ is a complete dévissage of $\text{Coker}(\alpha_1)$. Hence the induction hypothesis implies that, after replacing R by R_f for some $f \in R$, $f \not\in \mathfrak r$, we may assume that $\text{Coker}(\alpha_1)$ has a decomposition as in the lemma and is projective. In particular $M_1 = B_1^{\oplus r_1} \oplus \text{Coker}(\alpha_1)$. This proves the statement regarding the decomposition. The statement on projectivity follows as B_1 is projective as an R-module by Lemma 34.10.3. $\square$

Remark 34.12.3. There is a variant of Lemma 34.12.2 where we weaken the flatness condition by assuming only that N is flat at some given prime $\mathfrak q$ lying over $\mathfrak r$ but where we strengthen the dévissage condition by assuming the existence of a complete dévissage *at* $\mathfrak q$. Compare with Lemma 34.11.2.

The following is the main result of this section.

Proposition 34.12.4. *Let $f : X \to S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent sheaf on X. Let $x \in X$ with image $s \in S$. Assume that*

(1) *f is locally of finite presentation,*
(2) *$\mathcal{F}$ is of finite presentation, and*
(3) *$\mathcal{F}$ is flat at x over S.*

Then there exists a commutative diagram of pointed schemes

$$\begin{tikzcd} (X, x) \arrow[d] & (X', x') \arrow[l, "g"'] \arrow[d] \\ (S, s) & (S', s') \arrow[l] \end{tikzcd}$$

whose horizontal arrows are elementary étale neighbourhoods such that X', S' are affine and such that $\Gamma(X', g^*\mathcal{F})$ is a projective $\Gamma(S', \mathcal{O}_{S'})$-module.

Proof. By openness of flatness, see More on Morphisms, Theorem 33.11.1 we may replace X by an open neighbourhood of x and assume that $\mathcal{F}$ is flat over S. Next, we apply Proposition 34.6.7 to find a diagram as in the statement of the proposition such that $g^*\mathcal{F}/X'/S'$ has a complete dévissage over s'. (In particular S' and X' are affine.) By Morphisms, Lemma 24.24.11 we see that $g^*\mathcal{F}$ is flat over S and by Lemma 34.3.3 we see that it is flat over S'. Via Remark 34.7.5 we deduce that

$$\Gamma(X', g^*\mathcal{F})/\Gamma(X', \mathcal{O}_{X'})/\Gamma(S', \mathcal{O}_{S'})$$

has a complete dévisage over the prime of $\Gamma(S', \mathcal{O}_{S'})$ corresponding to s'. Thus Lemma 34.12.2 implies that the result of the proposition holds after replacing S' by a standard open neighbourhood of s'. $\square$

In the rest of this section we prove a number of variants on this result. The first is a ``global'' version.

Lemma 34.12.5. *Let $f : X \to S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent sheaf on X. Let $s \in S$. Assume that*

(1) *f is of finite presentation,*
(2) *$\mathcal{F}$ is of finite presentation, and*
(3) *$\mathcal{F}$ is flat over S at every point of the fibre X_s.*

Then there exists an elementary étale neighbourhood $(S', s') \to (S, s)$ and a commutative diagram of schemes

$$\begin{tikzcd} X \arrow[d] & X' \arrow[l, "g"'] \arrow[d] \\ S & S' \arrow[l] \end{tikzcd}$$

such that g is étale, $X_s \subset g(X')$, the schemes X', S' are affine, and such that $\Gamma(X', g^*\mathcal{F})$ is a projective $\Gamma(S', \mathcal{O}_{S'})$-module.

Proof. For every point $x \in X_s$ we can use Proposition 34.12.4 to find a commutative diagram

$$\begin{tikzcd} (X, x) \arrow[d] & (Y_x, y_x) \arrow[l, "g_x"'] \arrow[d] \\ (S, s) & (S_x, s_x) \arrow[l] \end{tikzcd}$$

whose horizontal arrows are elementary étale neighbourhoods such that Y_x, S_x are affine and such that $\Gamma(Y_x, g_x^*\mathcal{F})$ is a projective $\Gamma(S_x, \mathcal{O}_{S_x})$-module. In particular $g_x(Y_x) \cap X_s$ is an open neighbourhood of x in X_s. Because X_s is quasi-compact we can find a finite number of points $x_1, \ldots, x_n \in X_s$ such that X_s is the union of the $g_{x_i}(Y_{x_i}) \cap X_s$. Choose an elementary étale neighbourhood $(S', s') \to (S, s)$ which dominates each of the neighbourhoods (S_{x_i}, s_{x_i}), see More on Morphisms, Lemma 33.25.4. We may also assume that S' is affine. Set $X' = \coprod Y_{x_i} \times_{S_{x_i}} S'$ and endow it with the obvious morphism $g : X' \to X$. By construction $g(X')$ contains X_s and

$$\Gamma(X', g^*\mathcal{F}) = \bigoplus \Gamma(Y_{x_i}, g_{x_i}^*\mathcal{F}) \otimes_{\Gamma(S_{x_i}, \mathcal{O}_{S_{x_i}})} \Gamma(S', \mathcal{O}_{S'}).$$

This is a projective $\Gamma(S', \mathcal{O}_{S'})$-module, see Algebra, Lemma 7.88.1. □

The following two lemmas are reformulations of the results above in case $\mathcal{F} = \mathcal{O}_X$.

Lemma 34.12.6. *Let $f : X \to S$ be locally of finite presentation. Let $x \in X$ with image $s \in S$. If f is flat at x over S, then there exists a commutative diagram of pointed schemes*

$$\begin{tikzcd} (X, x) \arrow[d] & (X', x') \arrow[l, "g"'] \arrow[d] \\ (S, s) & (S', s') \arrow[l] \end{tikzcd}$$

whose horizontal arrows are elementary étale neighbourhoods such that X', S' are affine and such that $\Gamma(X', \mathcal{O}_{X'})$ is a projective $\Gamma(S', \mathcal{O}_{S'})$-module.

Proof. This is a special case of Proposition 34.12.4. □

Lemma 34.12.7. *Let $f : X \to S$ be of finite presentation. Let $s \in S$. If X is flat over S at all points of X_s, then there exists an elementary étale neighbourhood $(S', s') \to (S, s)$ and a commutative diagram of schemes*

$$\begin{tikzcd} X \arrow[d] & X' \arrow[l, "g"'] \arrow[d] \\ S & S' \arrow[l] \end{tikzcd}$$

with g étale, $X_s \subset g(X')$, such that X', S' are affine, and such that $\Gamma(X', \mathcal{O}_{X'})$ is a projective $\Gamma(S', \mathcal{O}_{S'})$-module.

Proof. This is a special case of Lemma 34.12.5. □

The following lemmas explain consequences of Proposition 34.12.4 in case we only assume the morphism and the sheaf are of finite type (and not necessarily of finite presentation).

Lemma 34.12.8. *Let $f : X \to S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent sheaf on X. Let $x \in X$ with image $s \in S$. Assume that*

(1) *f is locally of finite presentation,*
(2) *$\mathcal{F}$ is of finite type, and*
(3) *$\mathcal{F}$ is flat at x over S.*

Then there exists an elementary étale neighbourhood $(S', s') \to (S, s)$ and a commutative diagram of pointed schemes

$$\begin{tikzcd} (X, x) \arrow[d] & (X', x') \arrow[l, "g"'] \arrow[d] \\ (S, s) & (Spec(\mathcal{O}_{S',s'}), s') \arrow[l] \end{tikzcd}$$

such that $X' \to X \times_S Spec(\mathcal{O}_{S',s'})$ is étale, $\kappa(x) = \kappa(x')$, the scheme X' is affine of finite presentation over $\mathcal{O}_{S',s'}$, the sheaf $g^*\mathcal{F}$ is of finite presentation over $\mathcal{O}_{X'}$, and such that $\Gamma(X', g^*\mathcal{F})$ is a free $\mathcal{O}_{S',s'}$-module.

Proof. To prove the lemma we may replace (S, s) by any elementary étale neighbourhood, and we may also replace S by $Spec(\mathcal{O}_{S,s})$. Hence by Proposition 34.11.3 we may assume that $\mathcal{F}$ is finitely presented and flat over S in a neighbourhood of x. In this case the result follows from Proposition 34.12.4 because Algebra, Theorem 7.79.4 assures us that projective = free over a local ring. □

Lemma 34.12.9. *Let $f : X \to S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent sheaf on X. Let $x \in X$ with image $s \in S$. Assume that*

(1) *f is locally of finite type,*
(2) *$\mathcal{F}$ is of finite type, and*
(3) *$\mathcal{F}$ is flat at x over S.*

Then there exists an elementary étale neighbourhood $(S', s') \to (S, s)$ and a commutative diagram of pointed schemes

$$\begin{tikzcd} (X, x) \arrow[d] & (X', x') \arrow[l, "g"'] \arrow[d] \\ (S, s) & (Spec(\mathcal{O}_{S',s'}), s') \arrow[l] \end{tikzcd}$$

such that $X' \to X \times_S Spec(\mathcal{O}_{S',s'})$ is étale, $\kappa(x) = \kappa(x')$, the scheme X' is affine, and such that $\Gamma(X', g^*\mathcal{F})$ is a free $\mathcal{O}_{S',s'}$-module.

Proof. (The only difference with Lemma 34.12.8 is that we do not assume f is of finite presentation.) The problem is local on X and S. Hence we may assume X and S are affine, say $X = Spec(B)$ and $S = Spec(A)$. Since B is a finite type A-algebra we can find a surjection $A[x_1, \ldots, x_n] \to B$. In other words, we can choose a closed immersion $i : X \to \mathbf{A}^n_S$. Set $t = i(x)$ and $\mathcal{G} = i_*\mathcal{F}$. Note that $\mathcal{G}_t \cong \mathcal{F}_x$ are $\mathcal{O}_{S,s}$-modules. Hence $\mathcal{G}$ is flat over S at t. We apply Lemma 34.12.8 to the morphism $\mathbf{A}^n_S \to S$, the point t, and the sheaf $\mathcal{G}$. Thus we can find an elementary étale neighbourhood $(S', s') \to (S, s)$ and a commutative diagram of pointed schemes

$$\begin{tikzcd}
(\mathbf{A}^n_S, t) \arrow[d] & (Y, y) \arrow[l, "h"'] \arrow[d] \\
(S, s) & (Spec(\mathcal{O}_{S',s'}), s') \arrow[l]
\end{tikzcd}$$

such that $Y \to \mathbf{A}^n_{\mathcal{O}_{S',s'}}$ is étale, $\kappa(t) = \kappa(y)$, the scheme Y is affine, and such that $\Gamma(Y, h^*\mathcal{G})$ is a projective $\mathcal{O}_{S',s'}$-module. Then a solution to the orginal problem is given by the closed subscheme $X' = Y \times_{\mathbf{A}^n_S} X$ of Y. $\square$

Lemma 34.12.10. *Let $f : X \to S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent sheaf on X. Let $s \in S$. Assume that*

1. *f is of finite presentation,*
2. *$\mathcal{F}$ is of finite type, and*
3. *$\mathcal{F}$ is flat over S at all points of X_s.*

Then there exists an elementary étale neighbourhood $(S', s') \to (S, s)$ and a commutative diagram of schemes

$$\begin{tikzcd}
X \arrow[d] & X' \arrow[l, "g"'] \arrow[d] \\
S & Spec(\mathcal{O}_{S',s'}) \arrow[l]
\end{tikzcd}$$

such that $X' \to X \times_S Spec(\mathcal{O}_{S',s'})$ is étale, $X_s = g((X')_{s'})$, the scheme X' is affine of finite presentation over $\mathcal{O}_{S',s'}$, the sheaf $g^*\mathcal{F}$ is of finite presentation over $\mathcal{O}_{X'}$, and such that $\Gamma(X', g^*\mathcal{F})$ is a free $\mathcal{O}_{S',s'}$-module.

Proof. For every point $x \in X_s$ we can use Lemma 34.12.8 to find an elementary étale neighbourhood $(S_x, s_x) \to (S, s)$ and a commutative diagram

$$\begin{tikzcd}
(X, x) \arrow[d] & (Y_x, y_x) \arrow[l, "g_x"'] \arrow[d] \\
(S, s) & (Spec(\mathcal{O}_{S_x,s_x}), s_x) \arrow[l]
\end{tikzcd}$$

such that $Y_x \to X \times_S Spec(\mathcal{O}_{S_x,s_x})$ is étale, $\kappa(x) = \kappa(y_x)$, the scheme Y_x is affine of finite presentation over $\mathcal{O}_{S_x,s_x}$, the sheaf $g_x^*\mathcal{F}$ is of finite presentation over $\mathcal{O}_{Y_x}$, and such that $\Gamma(Y_x, g_x^*\mathcal{F})$ is a free $\mathcal{O}_{S_x,s_x}$-module. In particular $g_x((Y_x)_{s_x})$ is an open neighbourhood of x in X_s. Because X_s is quasi-compact we can find a finite number of points $x_1, \ldots, x_n \in X_s$ such that X_s is the union of the $g_{x_i}((Y_{x_i})_{s_{x_i}})$. Choose an elementary étale neighbourhood

$(S', s') \to (S, s)$ which dominates each of the neighbourhoods (S_{x_i}, s_{x_i}), see More on Morphisms, Lemma 33.25.4. Set

$$X' = \coprod Y_{x_i} \times_{Spec(\mathcal{O}_{S_{x_i}, s_{x_i}})} Spec(\mathcal{O}_{S', s'})$$

and endow it with the obvious morphism $g : X' \to X$. By construction $X_s = g(X'_{s'})$ and

$$\Gamma(X', g^*\mathcal{F}) = \bigoplus \Gamma(Y_{x_i}, g_{x_i}^*\mathcal{F}) \otimes_{\mathcal{O}_{S_{x_i}, s_{x_i}}} \mathcal{O}_{S', s'}.$$

This is a free $\mathcal{O}_{S', s'}$-module as a direct sum of base changes of free modules. Some minor details omitted. □

Lemma 34.12.11. *Let $f : X \to S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent sheaf on X. Let $s \in S$. Assume that*

1. *f is of finite type,*
2. *$\mathcal{F}$ is of finite type, and*
3. *$\mathcal{F}$ is flat over S at all points of X_s.*

Then there exists an elementary étale neighbourhood $(S', s') \to (S, s)$ and a commutative diagram of schemes

$$\begin{tikzcd} X \arrow[d] & X' \arrow[l, "g"'] \arrow[d] \\ S & Spec(\mathcal{O}_{S', s'}) \arrow[l] \end{tikzcd}$$

such that $X' \to X \times_S Spec(\mathcal{O}_{S', s'})$ is étale, $X_s = g((X')_{s'})$, the scheme X' is affine, and such that $\Gamma(X', g^*\mathcal{F})$ is a free $\mathcal{O}_{S', s'}$-module.

Proof. (The only difference with Lemma 34.12.10 is that we do not assume f is of finite presentation.) For every point $x \in X_s$ we can use Lemma 34.12.9 to find an elementary étale neighbourhood $(S_x, s_x) \to (S, s)$ and a commutative diagram

$$\begin{tikzcd} (X, x) \arrow[d] & (Y_x, y_x) \arrow[l, "g_x"'] \arrow[d] \\ (S, s) & (Spec(\mathcal{O}_{S_x, s_x}), s_x) \arrow[l] \end{tikzcd}$$

such that $Y_x \to X \times_S Spec(\mathcal{O}_{S_x, s_x})$ is étale, $\kappa(x) = \kappa(y_x)$, the scheme Y_x is affine, and such that $\Gamma(Y_x, g_x^*\mathcal{F})$ is a free $\mathcal{O}_{S_x, s_x}$-module. In particular $g_x((Y_x)_{s_x})$ is an open neighbourhood of x in X_s. Because X_s is quasi-compact we can find a finite number of points $x_1, \ldots, x_n \in X_s$ such that X_s is the union of the $g_{x_i}((Y_{x_i})_{s_{x_i}})$. Choose an elementary étale neighbourhood $(S', s') \to (S, s)$ which dominates each of the neighbourhoods (S_{x_i}, s_{x_i}), see More on Morphisms, Lemma 33.25.4. Set

$$X' = \coprod Y_{x_i} \times_{Spec(\mathcal{O}_{S_{x_i}, s_{x_i}})} Spec(\mathcal{O}_{S', s'})$$

and endow it with the obvious morphism $g : X' \to X$. By construction $X_s = g(X'_{s'})$ and

$$\Gamma(X', g^*\mathcal{F}) = \bigoplus \Gamma(Y_{x_i}, g_{x_i}^*\mathcal{F}) \otimes_{\mathcal{O}_{S_{x_i}, s_{x_i}}} \mathcal{O}_{S', s'}.$$

This is a free $\mathcal{O}_{S', s'}$-module as a direct sum of base changes of free modules. □

34.13. Flat finite type modules, Part II

The following lemma will be superseded by the stronger Lemma 34.13.3 below.

Lemma 34.13.1. *Let $(R, \mathfrak{m})$ be a local ring. Let $R \to S$ be of finite presentation. Let N be a finitely presented S-module which is free as an R-module. Let M be an R-module. Let $\mathfrak{q}$ be a prime of S lying over $\mathfrak{m}$. Then*

(1) *if $\mathfrak{q} \in WeakAss_S(M \otimes_R N)$ then $\mathfrak{m} \in WeakAss_R(M)$ and $\overline{\mathfrak{q}} \in Ass_{\overline{S}}(\overline{N})$,*
(2) *if $\mathfrak{m} \in WeakAss_R(M)$ and $\overline{\mathfrak{q}} \in Ass_{\overline{S}}(\overline{N})$ is a maximal element then $\mathfrak{q} \in WeakAss_S(M \otimes_R N)$.*

Here $\overline{S} = S/\mathfrak{m}S$, $\overline{\mathfrak{q}} = \mathfrak{q}\overline{S}$, and $\overline{N} = N/\mathfrak{m}N$.

Proof. Suppose that $\overline{\mathfrak{q}} \not\in \text{Ass}_{\overline{S}}(\overline{N})$. By Algebra, Lemmas 7.60.9, 7.60.5, and 7.14.3 there exists an element $\overline{g} \in \overline{\mathfrak{q}}$ which is not a zero divisor on $\overline{N}$. Let $g \in \mathfrak{q}$ be an element which maps to $\overline{g}$ in $\overline{\mathfrak{q}}$. By Lemma 34.8.6 the map $g : N \to N$ is R-universally injective. In particular we see that $g : M \otimes_R N \to M \otimes_R N$ is injective. Clearly this implies that $\mathfrak{q} \not\in \text{WeakAss}_S(M \otimes_R N)$. We conclude that $\mathfrak{q} \in \text{WeakAss}_S(M \otimes_R N)$ implies $\overline{\mathfrak{q}} \in \text{Ass}_{\overline{S}}(\overline{N})$.

Assume $\mathfrak{q} \in \text{WeakAss}_S(M \otimes_R N)$. Let $z \in M \otimes_R N$ be an element whose annihilator in S has radical $\mathfrak{q}$. As N is a free R-module, we can find a finite free direct summand $F \subset N$ such that $z \in M \otimes_R F$. The radical of the annihilator of $z \in M \otimes_R F$ in R is $\mathfrak{m}$ (by our assumption on z and because $\mathfrak{q}$ lies over $\mathfrak{m}$). Hence we see that $\mathfrak{m} \in \text{WeakAss}(M \otimes_R F)$ which implies that $\mathfrak{m} \in \text{WeakAss}(M)$ by Algebra, Lemma 7.63.3. This finishes the proof of (1).

Assume that $\mathfrak{m} \in \text{WeakAss}_R(M)$ and $\overline{\mathfrak{q}} \in \text{Ass}_{\overline{S}}(\overline{N})$ is a maximal element. Let $y \in M$ be an element whose annihilator $I = \text{Ann}_R(y)$ has radical $\mathfrak{m}$. Then $R/I \subset M$ and by flatness of N over R we get $N/IN = R/I \otimes_R N \subset M \otimes_R N$. Hence it is enough to show that $\mathfrak{q} \in \text{WeakAss}(N/IN)$. Write $\overline{\mathfrak{q}} = (\overline{g}_1, \ldots, \overline{g}_n)$ for some $\overline{g}_i \in \overline{S}$. Choose lifts $g_i \in \mathfrak{q}$. Consider the map

$$\Psi : N/IN \longrightarrow N/IN^{\oplus n}, \quad z \longmapsto (g_1 z, \ldots, g_n z).$$

We may think of this as a map of free R/I-modules. As the ring R/I is auto-associated (since $\mathfrak{m}/I$ is locally nilpotent) and since $\Psi \otimes R/\mathfrak{m}$ isn't injective (since $\overline{\mathfrak{q}} \in \text{Ass}(\overline{N})$) we see by More on Algebra, Lemma 12.10.4 that Ψ isn't injective. Pick $z \in N/IN$ nonzero in the kernel of Ψ. The annihilator of z contains I and g_i, whence its radical $J = \sqrt{\text{Ann}_S(z)}$ contains $\mathfrak{q}$. Let $\mathfrak{q}' \supset J$ be a minimal prime over J. Then $\mathfrak{q}' \in \text{WeakAss}(M \otimes_R N)$ (by definition) and by (1) we see that $\overline{\mathfrak{q}}' \in \text{Ass}(\overline{N})$. Then since $\mathfrak{q} \subset \mathfrak{q}'$ by construction the maximality of $\overline{\mathfrak{q}}$ implies $\mathfrak{q} = \mathfrak{q}'$ whence $\mathfrak{q} \in \text{WeakAss}(M \otimes_R N)$. This proves part (2) of the lemma. □

Lemma 34.13.2. *Let S be a scheme. Let $f : X \to S$ be locally of finite type. Let $x \in X$ with image $s \in S$. Let $\mathcal{F}$ be a finite type quasi-coherent sheaf on X. Let $\mathcal{G}$ be a quasi-coherent sheaf on Y. If $\mathcal{F}$ is flat at x over S, then*

$$x \in WeakAss_X(\mathcal{F} \otimes_{\mathcal{O}_X} f^*\mathcal{G}) \Leftrightarrow s \in WeakAss_S(\mathcal{G}) \text{ and } x \in Ass_{X_s}(\mathcal{F}_s).$$

Proof. The question is local on X and S, hence we may assume X and S are affine. Write $X = Spec(B)$, $S = Spec(A)$ and write $B = A[x_1, \ldots, x_n]/I$. In other words we obtain a closed immersion $i : X \to \mathbf{A}^n_S$ over S. Denote $t = i(x) \in \mathbf{A}^n_S$. Note that $i_*\mathcal{F}$ is a finite type quasi-coherent sheaf on $\mathbf{A}^n_S$ which is flat at t over S and note that

$$i_*(\mathcal{F} \otimes_{\mathcal{O}_X} f^*\mathcal{G}) = i_*\mathcal{F} \otimes_{\mathcal{O}_{\mathbf{A}^n_S}} p^*\mathcal{G}$$

where $p : \mathbf{A}^n_S \to S$ is the projection. Note that t is a weakly associated point of $i_*(\mathcal{F} \otimes_{\mathcal{O}_X} f^*\mathcal{G})$ if and only if x is a weakly associated popint of $\mathcal{F} \otimes_{\mathcal{O}_X} f^*\mathcal{G}$, see Divisors, Lemma 26.6.3. Similarly $x \in \text{Ass}_{X_s}(\mathcal{F}_s)$ if and only if $t \in \text{Ass}_{\mathbf{A}^n_s}((i_*\mathcal{F})_s)$ (see Algebra, Lemma 7.60.13). Hence it suffices to prove the the lemma in case $X = \mathbf{A}^n_S$. In particular we may assume that $X \to S$ is of finite presentation.

Recall that $\text{Ass}_{X_s}(\mathcal{F}_s)$ is a locally finite subset of the locally Noetherian scheme X_s, see Divisors, Lemma 26.2.5. After replacing X by a suitable affine neighbourhood of x we may assume that

(∗) if $x' \in \text{Ass}_{X_s}(\mathcal{F}_s)$ and $x \rightsquigarrow x'$ then $x = x'$.

(Proof omitted. Hint: using Algebra, Lemma 7.14.3 invert a function which does not vanish at x but does vanish in all the finitely many points of $\text{Ass}_{X_s}(\mathcal{F}_s)$ which are specializations of x but not equal to x.) In words, no point of $\text{Ass}_{X_s}(\mathcal{F}_s)$ is a proper specialization of x.

Suppose given a commutative diagram

$$\begin{tikzcd} (X, x) \arrow[d] & (X', x') \arrow[l, "g"'] \arrow[d] \\ (S, s) & (S', s') \arrow[l, "e"'] \end{tikzcd}$$

of pointed schemes whose horizontal arrows are elementary étale neighbourhoods. Then it suffices to prove the statement for x', s', $g^*\mathcal{F}$ and $e^*\mathcal{G}$, see Lemma 34.3.7. Note that property (∗) is preserved by such an étale localization by the same lemma (if there is a proper specialization $x' \rightsquigarrow x''$ on $X'_{s'}$ then this maps to a proper specialization on X_s because the fibres of an étale morphism are discrete). We may also replace S by the spectrum of its local ring as the condition of being an associated point of a quasi-coherent sheaf depends only on the stalk of the sheaf. Again property (∗) is preserved by this as well. Thus we may first apply Proposition 34.11.3 to reduce to the case where $\mathcal{F}$ is of finite presentation and flat over S, whereupon we may use Proposition 34.12.4 to reduce to the case that $X \to S$ is a morphism of affines and $\Gamma(X, \mathcal{F})$ is a finitely presented $\Gamma(X, \mathcal{O}_X)$-module which is projective as a $\Gamma(S, \mathcal{O}_S)$-module. Localizing S once more we may assume that $\Gamma(S, \mathcal{O}_S)$ is a local ring such that s corresponds to the maximal ideal. In this case Algebra, Theorem 7.79.4 guarantees that $\Gamma(X, \mathcal{F})$ is free as an $\Gamma(S, \mathcal{O}_S)$-module. The implication $x \in \text{WeakAss}_X(\mathcal{F} \otimes_{\mathcal{O}_X} f^*\mathcal{G}) \Rightarrow s \in \text{WeakAss}_S(\mathcal{G})$ and $x \in \text{Ass}_{X_s}(\mathcal{F}_s)$ follows from part (1) of Lemma 34.13.1. The converse implication follows from part (2) of Lemma 34.13.1 as property (∗) insures that the prime corresponding to x gives rise to a maximal element of $\text{Ass}_{\overline{S}}(\overline{N})$ exactly as in the statement of part (2) of Lemma 34.13.1. □

Lemma 34.13.3. *Let $R \to S$ be a ring map which is essentially of finite type. Let N be a localization of a finite S-module flat over R. Let M be an R-module. Then*

$$WeakAss_S(M \otimes_R N) = \bigcup\nolimits_{\mathfrak{p} \in WeakAss_R(M)} Ass_{S \otimes_R \kappa(\mathfrak{p})}(N \otimes_R \kappa(\mathfrak{p}))$$

Proof. This lemma is a translation of Lemma 34.13.2 into algebra. Details of translation omitted. □

Lemma 34.13.4. *Let $f : X \to S$ be a morphism which is locally of finite type. Let $\mathcal{F}$ be a finite type quasi-coherent sheaf on X which is flat over S. Let $\mathcal{G}$ be a quasi-coherent sheaf on S. Then we have*

$$WeakAss_X(\mathcal{F} \otimes_{\mathcal{O}_X} f^*\mathcal{G}) = \bigcup\nolimits_{s \in WeakAss_S(\mathcal{G})} Ass_{X_s}(\mathcal{F}_s)$$

Proof. Immediate consequence of Lemma 34.13.2. □

Theorem 34.13.5. *Let $f : X \to S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Assume*

1. *$X \to S$ is locally of finite presentation,*
2. *$\mathcal{F}$ is an $\mathcal{O}_X$-module of finite type, and*
3. *the set of weakly associated points of S is locally finite in S.*

Then $U = \{x \in X \mid \mathcal{F}$ flat at x over $S\}$ is open in X and $\mathcal{F}|_U$ is an $\mathcal{O}_U$-module of finite presentation and flat over S.

Proof. Let $x \in X$ be such that $\mathcal{F}$ is flat at x over S. We have to find an open neighbourhood of x such that $\mathcal{F}$ restricts to a S-flat finitely presented module on this neighbourhood. The problem is local on X and S, hence we may assume that X and S are affine. As $\mathcal{F}_x$ is a finitely presented $\mathcal{O}_{X,x}$-module by Lemma 34.11.9 we conclude from Algebra, Lemma 7.117.5 there exists a finitely presented $\mathcal{O}_X$-module $\mathcal{F}'$ and a map $\varphi : \mathcal{F}' \to \mathcal{F}$ which induces an isomorphism $\varphi_x : \mathcal{F}'_x \to \mathcal{F}_x$. In particular we see that $\mathcal{F}'$ is flat over S at x, hence by openness of flatness More on Morphisms, Theorem 33.11.1 we see that after shrinking X we may assume that $\mathcal{F}'$ is flat over S. As $\mathcal{F}$ is of finite type after shrinking X we may assume that φ is surjective, see Modules, Lemma 15.9.4 or alternatively use Nakayama's lemma (Algebra, Lemma 7.14.5). By Lemma 34.13.4 we have

$$\mathrm{WeakAss}_X(\mathcal{F}') \subset \bigcup\nolimits_{s \in \mathrm{WeakAss}(S)} \mathrm{Ass}_{X_s}(\mathcal{F}'_s)$$

As $\mathrm{WeakAss}(S)$ is finite by assumption and since $\mathrm{Ass}_{X_s}(\mathcal{F}'_s)$ is finite by Divisors, Lemma 26.2.5 we conclude that $\mathrm{WeakAss}_X(\mathcal{F}')$ is finite. Using Algebra, Lemma 7.14.3 we may, after shrinking X once more, assume that $\mathrm{WeakAss}_X(\mathcal{F}')$ is contained in the generalization of x. Now consider $\mathcal{K} = \mathrm{Ker}(\varphi)$. We have $\mathrm{WeakAss}_X(\mathcal{K}) \subset \mathrm{WeakAss}_X(\mathcal{F}')$ (by Divisors, Lemma 26.5.4) but on the other hand, φ_x is an isomorphism, also $\varphi_{x'}$ is an isomorphism for all $x' \rightsquigarrow x$. We conclude that $\mathrm{WeakAss}_X(\mathcal{K}) = \emptyset$ whence $\mathcal{K} = 0$ by Divisors, Lemma 26.5.5. □

Lemma 34.13.6 (Algebra version of Theorem 34.13.5)**.** *Let $R \to S$ be a ring map of finite presentation. Let M be a finite S-module. Assume $WeakAss_S(S)$ is finite. Then*

$$U = \{\mathfrak{q} \subset S \mid M_{\mathfrak{q}} \text{ flat over } R\}$$

is open in $Spec(S)$ and for every $g \in S$ such that $D(g) \subset U$ the localization M_g is a finitely presented S_g-module flat over R.

Proof. Follows immediately from Theorem 34.13.5. □

Lemma 34.13.7. *Let $f : X \to S$ be a morphism of schemes which is locally of finite type. Assume the set of weakly associated points of S is locally finite in S. Then the set of points $x \in X$ where f is flat is an open subscheme $U \subset X$ and $U \to S$ is flat and locally of finite presentation.*

Proof. The problem is local on X and S, hence we may assume that X and S are affine. Then $X \to S$ corresponds to a finite type ring map $A \to B$. Choose a surjection $A[x_1, \ldots, x_n] \to B$ and consider B as an $A[x_1, \ldots, x_n]$-module. An application of Lemma 34.13.6 finishes the proof. □

Lemma 34.13.8. *Let $f : X \to S$ be a morphism of schemes which is locally of finite type and flat. If S is integral, then f is locally of finite presentation.*

Proof. Special case of Lemma 34.13.7. □

Lemma 34.13.9. *Let $A \to B$ be a finite type, flat ring map with A an integral domain. Then B is a finitely presented A-algebra.*

Proof. Special case of Lemma 34.13.8. It is also a consequence of More on Algebra, Proposition 12.18.8. □

Remark 34.13.10 (Finite type version of Theorem 34.13.5)**.** Let $f : X \to S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Assume

(1) $X \to S$ is locally of finite type,
(2) $\mathcal{F}$ is an $\mathcal{O}_X$-module of finite type, and
(3) the set of weakly associated points of S is locally finite in S.

Then $U = \{x \in X \mid \mathcal{F} \text{ flat at } x \text{ over } S\}$ is open in X and $\mathcal{F}|_U$ is flat over S and locally finitely presented relative to S (see Definition 34.2.1). If we ever need this result in the stacks project we will convert this remark into a lemma with a proof.

Remark 34.13.11 (Algebra version of Remark 34.13.10)**.** Let $R \to S$ be a ring map of finite type. Let M be a finite S-module. Assume $\text{WeakAss}_S(S)$ is finite. Then

$$U = \{\mathfrak{q} \subset S \mid M_{\mathfrak{q}} \text{ flat over } R\}$$

is open in $Spec(S)$ and for every $g \in S$ such that $D(g) \subset U$ the localization M_g is flat over R and an S_g-module finitely presented relative to R (see More on Algebra, Definition 12.44.2). If we ever need this result in the stacks project we will convert this remark into a lemma with a proof.

34.14. Examples of relatively pure modules

In the short section we discuss some examples of results that will serve as motivation for the notion of a *relatively pure module* and the concept of an *impurity* which we will introduce later. Each of the examples is stated as a lemma. Note the similarity with the condition on associated primes to the conditions appearing in Lemmas 34.8.4, 34.9.3, 34.9.4, and 34.10.1. See also Algebra, Lemma 7.62.1 for a discussion.

Lemma 34.14.1. *Let R be a local ring with maximal ideal $\mathfrak{m}$. Let $R \to S$ be a ring map. Let N be an S-module. Assume*

(1) N is projective as an R-module, and
(2) $S/\mathfrak{m}S$ is Noetherian and $N/\mathfrak{m}N$ is a finite $S/\mathfrak{m}S$-module.

Then for any prime $\mathfrak{q} \subset S$ which is an associated prime of $N \otimes_R \kappa(\mathfrak{p})$ where $\mathfrak{p} = R \cap \mathfrak{q}$ we have $\mathfrak{q} + \mathfrak{m}S \neq S$.

Proof. Note that the hypotheses of Lemmas 34.8.1 and 34.8.6 are satisfied. We will use the conclusions of these lemmas without further mention. Let $\Sigma \subset S$ be the multiplicative set of elements which are not zero divisors on $N/\mathfrak{m}N$. The map $N \to \Sigma^{-1}N$ is R-universally injective. Hence we see that any $\mathfrak{q} \subset S$ which is an associated prime of $N \otimes_R \kappa(\mathfrak{p})$ is also an associated prime of $\Sigma^{-1}N \otimes_R \kappa(\mathfrak p)$. Clearly this implies that $\mathfrak q$ corresponds to a prime of $\Sigma^{-1}S$. Thus $\mathfrak q \subset \mathfrak q'$ where $\mathfrak q'$ corresponds to an associated prime of $N/\mathfrak m N$ and we win. $\square$

The following lemma gives another (slightly silly) example of this phenomenon.

Lemma 34.14.2. *Let R be a ring. Let $I \subset R$ be an ideal. Let $R \to S$ be a ring map. Let N be an S-module. If N is I-adically complete, then for any R-module M and for any prime $\mathfrak q \subset S$ which is an associated prime of $N \otimes_R M$ we have $\mathfrak q + IS \neq S$.*

Proof. Let $S^\wedge$ denote the I-adic completion of S. Note that N is an $S^\wedge$-module, hence also $N \otimes_R M$ is an $S^\wedge$-module. Let $z \in N \otimes_R M$ be an element such that $\mathfrak q = \text{Ann}_S(z)$. Since $z \neq 0$ we see that $\text{Ann}_{S^\wedge}(z) \neq S^\wedge$. Hence $\mathfrak q S^\wedge \neq S^\wedge$. Hence there exists a maximal ideal $\mathfrak m \subset S^\wedge$ with $\mathfrak q S^\wedge \subset \mathfrak m$. Since $IS^\wedge \subset \mathfrak m$ by Algebra, Lemma 7.90.11 we win. $\square$

Note that the following lemma gives an alternative proof of Lemma 34.14.1 as a projective module over a local ring is free, see Algebra, Theorem 7.79.4.

Lemma 34.14.3. *Let R be a local ring with maximal ideal $\mathfrak m$. Let $R \to S$ be a ring map. Let N be an S-module. Assume N is isomorphic as an R-module to a direct sum of finite R-modules. Then for any R-module M and for any prime $\mathfrak q \subset S$ which is an associated prime of $N \otimes_R M$ we have $\mathfrak q + \mathfrak m S \neq S$.*

Proof. Write $N = \bigoplus_{i \in I} M_i$ with each M_i a finite R-module. Let M be an R-module and let $\mathfrak q \subset S$ be an associated prime of $N \otimes_R M$ such that $\mathfrak q + \mathfrak m S = S$. Let $z \in N \otimes_R M$ be an element with $\mathfrak q = \text{Ann}_S(z)$. After modifying the direct sum decomposition a little bit we may assume that $z \in M_1 \otimes_R M$ for some element $1 \in I$. Write $1 = f + \sum x_j g_j$ for some $f \in \mathfrak q$, $x_j \in \mathfrak m$, and $g_j \in S$. For any $g \in S$ denote g' the R-linear map

$$M_1 \to N \xrightarrow{g} N \to M_1$$

where the first arrow is the inclusion map, the second arrow is multiplication by g and the third arrow is the projection map. Because each $x_j \in R$ we obtain the equality

$$f' + \sum x_j g'_j = \text{id}_{M_1} \in \text{End}_R(M_1)$$

By Nakayama's lemma (Algebra, Lemma 7.14.5) we see that f' is surjective, hence by Algebra, Lemma 7.15.4 we see that f' is an isomorphism. In particular the map

$$M_1 \otimes_R M \to N \otimes_R M \xrightarrow{f} N \otimes_R M \to M_1 \otimes_R M$$

is an isomorphism. This contradicts the assumption that $fz = 0$. $\square$

Lemma 34.14.4. *Let R be a henselian local ring with maximal ideal $\mathfrak m$. Let $R \to S$ be a ring map. Let N be an S-module. Assume N is countably generated and Mittag-Leffler as an R-module. Then for any R-module M and for any prime $\mathfrak q \subset S$ which is an associated prime of $N \otimes_R M$ we have $\mathfrak q + \mathfrak m S \neq S$.*

Proof. This lemma reduces to Lemma 34.14.3 by Algebra, Lemma 7.139.26. $\square$

Suppose $f : X \to S$ is a morphism of schemes and $\mathcal F$ is a quasi-coherent module on X. Let $\xi \in \text{Ass}_{X/S}(\mathcal F)$ and let $Z = \overline{\{\xi\}}$. Picture

$$\begin{tikzcd} \xi \arrow[d, mapsto] & Z \arrow[r] \arrow[dr] & X \arrow[d, "f"] \\ f(\xi) & & S \end{tikzcd}$$

Note that $f(Z) \subset \overline{\{f(\xi)\}}$ and that $f(Z)$ is closed if and only if equality holds, i.e., $f(Z) = \overline{\{f(\xi)\}}$. It follows from Lemma 34.14.1 that if S, X are affine, the fibres X_s are Noetherian, $\mathcal{F}$ is of finite type, and $\Gamma(X, \mathcal{F})$ is a projective $\Gamma(S, \mathcal{O}_S)$-module, then $f(Z) = \overline{\{f(\xi)\}}$ is a closed subset. Slightly different analogous statements holds for the cases described in Lemmas 34.14.2, 34.14.3, and 34.14.4.

34.15. Impurities

We want to formalize the phenomenon of which we gave examples in Section 34.14 in terms of specializations of points of $\text{Ass}_{X/S}(\mathcal{F})$. We also want to work locally around a point $s \in S$. In order to do so we make the following definitions.

Situation 34.15.1. Here S, X are schemes and $f : X \to S$ is a finite type morphism. Also, $\mathcal{F}$ is a finite type quasi-coherent $\mathcal{O}_X$-module. Finally s is a point of S.

In this situation consider a morphism $g : T \to S$, a point $t \in T$ with $g(t) = s$, a specialization $t' \rightsquigarrow t$, and a point $\xi \in X_T$ in the base change of X lying over t'. Picture

(34.15.1.1)
$$\begin{tikzcd} \xi \arrow[d, mapsto] & & X_T \arrow[r] \arrow[d] & X \arrow[d] \\ t' \arrow[r, rightsquigarrow] & t \arrow[d, mapsto] & T \arrow[r, "g"] \arrow[d, "g"] & S \\ & s & S & \end{tikzcd}$$

Moreover, denote $\mathcal{F}_T$ the pullback of $\mathcal{F}$ to X_T.

Definition 34.15.2. In Situation 34.15.1 we say a diagram (34.15.1.1) defines an *impurity of $\mathcal{F}$ above s* if $\xi \in \text{Ass}_{X_T/T}(\mathcal{F}_T)$ and $\overline{\{\xi\}} \cap X_t = \emptyset$. We will indicate this by saying ``let $(g : T \to S, t' \rightsquigarrow t, \xi)$ be an impurity of $\mathcal{F}$ above s''.

Lemma 34.15.3. *In Situation 34.15.1. If there exists an impurity of $\mathcal{F}$ above s, then there exists an impurity $(g : T \to S, t' \rightsquigarrow t, \xi)$ of $\mathcal{F}$ above s such that g is locally of finite presentation and t a closed point of the fibre of g above s.*

Proof. Let $(g : T \to S, t' \rightsquigarrow t, \xi)$ be any impurity of $\mathcal{F}$ above s. We apply Limits, Lemma 27.10.1 to $t \in T$ and $Z = \overline{\{\xi\}}$ to obtain an open neighbourhood $V \subset T$ of t, a commutative diagram

$$\begin{tikzcd} V \arrow[r, "a"] \arrow[d] & T' \arrow[d, "b"] \\ T \arrow[r, "g"] & S, \end{tikzcd}$$

and a closed subscheme $Z' \subset X_{T'}$ such that

(1) the morphism $b : T' \to S$ is locally of finite presentation,
(2) we have $Z' \cap X_{a(t)} = \emptyset$, and
(3) $Z \cap X_V$ maps into Z' via the morphism $X_V \to X_{T'}$.

As t' specializes to t we may replace T by the open neighbourhood V of t. Thus we have a commutative diagram

$$\begin{tikzcd} X_T \arrow[r] \arrow[d] & X_{T'} \arrow[r] \arrow[d] & X \arrow[d] \\ T \arrow[r, "a"] & T' \arrow[r, "b"] & S \end{tikzcd}$$

where $b \circ a = g$. Let $\xi' \in X_{T'}$ denote the image of ξ. By Divisors, Lemma 26.7.2 we see that $\xi' \in \text{Ass}_{X_{T'}/T'}(\mathcal{F}_{T'})$. Moreover, by construction the closure of $\overline{\{\xi'\}}$ is contained in the closed subset Z' which avoids the fibre $X_{a(t)}$. In this way we see that $(T' \to S, a(t') \rightsquigarrow a(t), \xi')$ is an impurity of $\mathcal{F}$ above s.

Thus we may assume that $g : T \to S$ is locally of finite presentation. Let $Z = \overline{\{\xi\}}$. By assumption $Z_t = \emptyset$. By More on Morphisms, Lemma 33.17.1 this means that $Z_{t''} = \emptyset$ for t'' in an open subset of $\overline{\{t\}}$. Since the fibre of $T \to S$ over s is a Jacobson scheme, see Morphisms, Lemma 24.15.10 we find that there exist a closed point $t'' \in \overline{\{t\}}$ such that $Z_{t''} = \emptyset$. Then $(g : T \to S, t' \rightsquigarrow t'', \xi)$ is the desired impurity. □

Lemma 34.15.4. *In Situation 34.15.1. Let $(g : T \to S, t' \rightsquigarrow t, \xi)$ be an impurity of $\mathcal{F}$ above s. Assume S is affine and that T is written $T = lim_{i \in I} T_i$ as a directed colimit of affine schemes over S. Then for some i the triple $(T_i \to S, t_i' \rightsquigarrow t_i, \xi_i)$ is an impurity of $\mathcal{F}$ above s.*

Proof. The notation in the statement means this: Let $f_i : T \to T_i$ be the projection morphisms, let $t_i = f_i(t)$ and $t_i' = f_i(t')$. Finally $\xi_i \in X_{T_i}$ is the image of ξ. By Divisors, Lemma 26.7.2 it is true that ξ_i is a point of the relative assassin of $\mathcal{F}_{T_i}$ over T_i. Thus the only point is to show that $\overline{\{\xi_i\}} \cap X_{t_i} = \emptyset$ for some i. Set $Z = \overline{\{\xi\}}$. Apply Limits, Lemma 27.10.1 to this situation to obtain an open neighbourhood $V \subset T$ of t, a commutative diagram

$$\begin{tikzcd} V \arrow[r, "a"] \arrow[d] & T' \arrow[d, "b"] \\ T \arrow[r, "g"] & S, \end{tikzcd}$$

and a closed subscheme $Z' \subset X_{T'}$ such that

(1) the morphism $b : T' \to S$ is locally of finite presentation,
(2) we have $Z' \cap X_{a(t)} = \emptyset$, and
(3) $Z \cap X_V$ maps into Z' via the morphism $X_V \to X_{T'}$.

We may assume V is an affine open of T, hence by Limits, Lemmas 27.3.5 and 27.3.7 we can find an i and an affine open $V_i \subset T_i$ with $V = f_i^{-1}(V_i)$. By Limits, Proposition 27.4.1 after possibly increasing i a bit we can find a morphism $a_i : V_i \to T'$ such that $a = a_i \circ f_i|_V$. The induced morphism $X_{T_i} \to X_{T'}$ maps ξ_i into Z'. As $Z' \cap X_{a(t)} = \emptyset$ we conclude that $(T_i \to S, t_i' \rightsquigarrow t_i, \xi_i)$ is an impurity of $\mathcal{F}$ above s. □

Lemma 34.15.5. *In Situation 34.15.1. If there exists an impurity $(g : T \to S, t' \rightsquigarrow t, \xi)$ of $\mathcal{F}$ above s with g quasi-finite at t, then there exists an impurity $(g : T \to S, t' \rightsquigarrow t, \xi)$ such that $(T, t) \to (S, s)$ is an elementary étale neighbourhood.*

Proof. Let $(g : T \to S, t' \rightsquigarrow t, \xi)$ be an impurity of $\mathcal{F}$ above s such that g is quasi-finite at t. After shrinking T we may assume that g is locally of finite type. Apply More on

Morphisms, Lemma 33.28.1 to $T \to S$ and $t \mapsto s$. This gives us a diagram

$$\begin{tikzcd} T \arrow[d] & T \times_S U \arrow[l] \arrow[d] & V \arrow[l] \arrow[dl] \\ S & U \arrow[l] & \end{tikzcd}$$

where $(U, u) \to (S, s)$ is an elementary étale neighbourhood and $V \subset T \times_S U$ is an open neighbouhood of $v = (t, u)$ such that $V \to U$ is finite and such that v is the unique point of V lying over u. Since the morphism $V \to T$ is étale hence flat we see that there exists a specialization $v' \rightsquigarrow v$ such that $v' \mapsto t'$. Note that $\kappa(t') \subset \kappa(v')$ is finite separable. Pick any point $\zeta \in X_{v'}$ mapping to $\xi \in X_{t'}$. By Divisors, Lemma 26.7.2 we see that $\zeta \in \text{Ass}_{X_V/V}(\mathcal{F}_V)$. Moreover, the closure $\overline{\{\zeta\}}$ does not meet the fibre X_v as by assumption the closure $\overline{\{\xi\}}$ does not meet X_t. In other words $(V \to S, v' \rightsquigarrow v, \zeta)$ is an impurity of $\mathcal{F}$ above S.

Next, let $u' \in U'$ be the image of v' and let $\theta \in X_U$ be the image of ζ. Then $\theta \mapsto u'$ and $u' \rightsquigarrow u$. By Divisors, Lemma 26.7.2 we see that $\theta \in \text{Ass}_{X_U/U}(\mathcal{F})$. Moreover, as $\pi : X_V \to X_U$ is finite we see that $\pi\big(\overline{\{\zeta\}}\big) = \overline{\{\pi(\zeta)\}}$. Since v is the unique point of V lying over u we see that $X_u \cap \overline{\{\pi(\zeta)\}} = \emptyset$ because $X_v \cap \overline{\{\zeta\}} = \emptyset$. In this way we conclude that $(U \to S, u' \rightsquigarrow u, \theta)$ is an impurity of $\mathcal{F}$ above s and we win. $\square$

Lemma 34.15.6. *In Situation 34.15.1. Assume that S is locally Noetherian. If there exists an impurity of $\mathcal{F}$ above s, then there exists an impurity $(g : T \to S, t' \rightsquigarrow t, \xi)$ of $\mathcal{F}$ above s such that g is quasi-finite at t.*

Proof. We may replace S by an affine neighbourhood of s. By Lemma 34.15.3 we may assume that we have an impurity $(g : T \to S, t' \rightsquigarrow t, \xi)$ of such that g is locally of finite type and t a closed point of the fibre of g above s. We may replace T by the reduced induced scheme structure on $\overline{\{t'\}}$. Let $Z = \overline{\{\xi\}} \subset X_T$. By assumption $Z_t = \emptyset$ and the image of $Z \to T$ contains t'. By More on Morphisms, Lemma 33.18.1 there exists a nonempty open $V \subset Z$ such that for any $w \in f(V)$ any generic point ξ' of V_w is in $\text{Ass}_{X_T/T}(\mathcal{F}_T)$. By More on Morphisms, Lemma 33.17.2 there exists a nonempty open $W \subset T$ with $W \subset f(V)$. By More on Morphisms, Lemma 33.33.7 there exists a closed subscheme $T' \subset T$ such that $t \in T'$, $T' \to S$ is quasi-finite at t, and there exists a point $z \in T' \cap W$, $z \rightsquigarrow t$ which does not map to s. Choose any generic point ξ' of the nonempty scheme V_z. Then $(T' \to S, z \rightsquigarrow t, \xi')$ is the desired impurity. $\square$

In the following we will use the henselization $S^h = Spec(\mathcal{O}^h_{S,s})$ of S at s, see Étale Cohomology, Definition 38.33.2. Since $S^h \to S$ maps to closed point of S^h to s and induces an isomorphism of residue fields, we will indicate $s \in S^h$ this closed point also. Thus $(S^h, s) \to (S, s)$ is a morphism of pointed schemes.

Lemma 34.15.7. *In Situation 34.15.1. If there exists an impurity $(S^h \to S, s' \rightsquigarrow s, \xi)$ of $\mathcal{F}$ above s then there exists an impurity $(T \to S, t' \rightsquigarrow t, \xi)$ of $\mathcal{F}$ above s where $(T, t) \to (S, s)$ is an elementary étale neighbourhood.*

Proof. We may replace S by an affine neighbourhood of s. Say $S = Spec(A)$ and s corresponds to the prime $\mathfrak{p} \subset A$. Then $\mathcal{O}^h_{S,s} = colim_{(T,t)} \Gamma(T, \mathcal{O}_T)$ where the limit is over the opposite of the cofiltered category of affine elementary étale neighbourhoods (T, t) of (S, s), see More on Morphisms, Lemma 33.25.5 and its proof. Hence $S^h = lim_i T_i$ and we win by Lemma 34.15.4. $\square$

Lemma 34.15.8. *In Situation 34.15.1 the following are equivalent*

(1) *there exists an impurity* $(S^h \to S, s' \rightsquigarrow s, \xi)$ *of* $\mathcal{F}$ *above* s *where* S^h *is the henselization of* S *at* s*,*
(2) *there exists an impurity* $(T \to S, t' \rightsquigarrow t, \xi)$ *of* $\mathcal{F}$ *above* s *such that* $(T, t) \to (S, s)$ *is an elementary étale neighbourhood, and*
(3) *there exists an impurity* $(T \to S, t' \rightsquigarrow t, \xi)$ *of* $\mathcal{F}$ *above* s *such that* $T \to S$ *is quasi-finite at* t*.*

Proof. As an étale morphism is locally quasi-finite it is clear that (2) implies (3). We have seen that (3) implies (2) in Lemma 34.15.5. We have seen that (1) implies (2) in Lemma 34.15.7. Finally, if $(T \to S, t' \rightsquigarrow t, \xi)$ is an impurity of $\mathcal{F}$ above s such that $(T, t) \to (S, s)$ is an elementary étale neighbourhood, then we can choose a factorization $S^h \to T \to S$ of the structure morphism $S^h \to S$. Choose any point $s' \in S^h$ mapping to t' and choose any $\xi' \in X_{s'}$ mapping to $\xi \in X_{t'}$. Then $(S^h \to S, s' \rightsquigarrow s, \xi')$ is an impurity of $\mathcal{F}$ above s. We omit the details. □

34.16. Relatively pure modules

The notion of a module pure relative to a base was introduced in [**GR71**].

Definition 34.16.1. Let $f : X \to S$ be a morphism of schemes which is of finite type. Let $\mathcal{F}$ be a finite type quasi-coherent $\mathcal{O}_X$-module.

(1) Let $s \in S$. We say $\mathcal{F}$ is *pure along* X_s if there is no impurity $(g : T \to S, t' \rightsquigarrow t, \xi)$ of $\mathcal{F}$ above s with $(T, t) \to (S, s)$ an elementary étale neighbourhood.
(2) We say $\mathcal{F}$ is *universally pure along* X_s if there does not exist any impurity of $\mathcal{F}$ above s.
(3) We say that X is *pure along* X_s if $\mathcal{O}_X$ is pure along X_s.
(4) We say $\mathcal{F}$ is *universally* S*-pure*, or *universally pure relative to* S if $\mathcal{F}$ is universally pure along X_s for every $s \in S$.
(5) We say $\mathcal{F}$ is S*-pure*, or *pure relative to* S if $\mathcal{F}$ is pure along X_s for every $s \in S$.
(6) We say that X is S*-pure* or *pure relative to* S if $\mathcal{O}_X$ is pure relative to S.

We intentionally restrict ourselves here to morphisms which are of finite type and not just morphisms which are locally of finite type, see Remark 34.16.2 for a discussion. In the situation of the definition Lemma 34.15.8 tells us that the following are equivalent

(1) $\mathcal{F}$ is pure along X_s,
(2) there is no impurity $(g : T \to S, t' \rightsquigarrow t, \xi)$ with g quasi-finite at t,
(3) there does not exist any impurity of the form $(S^h \to S, s' \rightsquigarrow s, \xi)$, where S^h is the henselization of S at s.

If we denote $X^h = X \times_S S^h$ and $\mathcal{F}^h$ the pullback of $\mathcal{F}$ to X^h, then we can formulate the last condition in the following more positive way:

(4) All points of $\mathrm{Ass}_{X^h/S^h}(\mathcal{F}^h)$ specialize to points of X_s.

In particular, it is clear that $\mathcal{F}$ is pure along X_s if and only if the pullback of $\mathcal{F}$ to $X \times_S Spec(\mathcal{O}_{S,s})$ is pure along X_s.

Remark 34.16.2. Let $f : X \to S$ be a morphism which is locally of finite type and $\mathcal{F}$ a quasi-coherent finite type $\mathcal{O}_X$-module. In this case it is still true that (1) and (2) above are equivalent because the proof of Lemma 34.15.5 does not use that f is quasi-compact. It is also clear that (3) and (4) are equivalent. However, we don't know if (1) and (3) are equivalent. In this case it may sometimes be more convenient to define purity using the equivalent conditions (3) and (4) as is done in [**GR71**]. On the other hand, for many applications it seems that the correct notion is really that of being universally pure.

A natural question to ask is if the propery of being pure relative to the base is preserved by base change, i.e., if being pure is the same thing as being universally pure. It turns out that this is true over Noetherian base schemes (see Lemma 34.16.5), or if the sheaf is flat (see Lemmas 34.18.3 and 34.18.4). It is not true in general, even if the morphism and the sheaf are of finite presentation, see Examples, Section 64.21 for a counter example. First we match our usage of ``universally'' to the usual notion.

Lemma 34.16.3. *Let $f : X \to S$ be a morphism of schemes which is of finite type. Let $\mathcal{F}$ be a finite type quasi-coherent $\mathcal{O}_X$-module. Let $s \in S$. The following are equivalent*

1. *$\mathcal{F}$ is universally pure along X_s, and*
2. *for every morphism of pointed schemes $(S', s') \to (S, s)$ the pullback $\mathcal{F}_{S'}$ is pure along $X_{s'}$.*

In particular, $\mathcal{F}$ is universally pure relative to S if and only if every base change $\mathcal{F}_{S'}$ of $\mathcal{F}$ is pure relative to S'.

Proof. This is formal. $\square$

Lemma 34.16.4. *Let $f : X \to S$ be a morphism of schemes which is of finite type. Let $\mathcal{F}$ be a finite type quasi-coherent $\mathcal{O}_X$-module. Let $s \in S$. Let $(S', s') \to (S, s)$ be a morphism of pointed schemes. If $S' \to S$ is quasi-finite at s' and $\mathcal{F}$ is pure along X_s, then $\mathcal{F}_{S'}$ is pure along $X_{s'}$.*

Proof. It $(T \to S', t' \rightsquigarrow t, \xi)$ is an impurity of $\mathcal{F}_{S'}$ above s' with $T \to S'$ quasi-finite at t, then $(T \to S, t' \to t, \xi)$ is an impurity of $\mathcal{F}$ above s with $T \to S$ quasi-finite at t, see Morphisms, Lemma 24.19.12. Hence the lemma follows immediately from the characterization (2) of purity given following Definition 34.16.1. $\square$

Lemma 34.16.5. *Let $f : X \to S$ be a morphism of schemes which is of finite type. Let $\mathcal{F}$ be a finite type quasi-coherent $\mathcal{O}_X$-module. Let $s \in S$. If $\mathcal{O}_{S,s}$ is Noetherian then $\mathcal{F}$ is pure along X_s if and only if $\mathcal{F}$ is universally pure along X_s.*

Proof. First we may replace S by $Spec(\mathcal{O}_{S,s})$, i.e., we may assume that S is Noetherian. Next, use Lemma 34.15.6 and characterization (2) of purity given in discussion following Definition 34.16.1 to conclude. $\square$

Purity satisfies flat descent.

Lemma 34.16.6. *Let $f : X \to S$ be a morphism of schemes which is of finite type. Let $\mathcal{F}$ be a finite type quasi-coherent $\mathcal{O}_X$-module. Let $s \in S$. Let $(S', s') \to (S, s)$ be a morphism of pointed schemes. Assume $S' \to S$ is flat at s'.*

1. *If $\mathcal{F}_{S'}$ is pure along $X_{s'}$, then $\mathcal{F}$ is pure along X_s.*
2. *If $\mathcal{F}_{S'}$ is universally pure along $X_{s'}$, then $\mathcal{F}$ is universally pure along X_s.*

Proof. Let $(T \to S, t' \rightsquigarrow t, \xi)$ be an impurity of $\mathcal{F}$ above s. Set $T_1 = T \times_S S'$, and let t_1 be the unique point of T_1 mapping to t and s'. Since $T_1 \to T$ is flat at t_1, see Morphisms, Lemma 24.24.7, there exists a specialization $t'_1 \rightsquigarrow t_1$ lying over $t' \rightsquigarrow t$, see Algebra, Section 7.36. Choose a point $\xi_1 \in X_{t'_1}$ which corresponds to a generic point of $Spec(\kappa(t'_1) \otimes_{\kappa(t')} \kappa(\xi))$, see Schemes, Lemma 21.17.5. By Divisors, Lemma 26.7.2 we see that $\xi_1 \in \text{Ass}_{X_{T_1}/T_1}(\mathcal{F}_{T_1})$. As the Zariski closure of $\{\xi_1\}$ in X_{T_1} maps into the Zariski closure of $\{\xi\}$ in X_T we conclude that this closure is disjoint from X_{t_1}. Hence

$(T_1 \to S', t_1' \rightsquigarrow t_1, \xi_1)$ is an impurity of $\mathcal{F}_{S'}$ above s'. In other words we have proved the contrapositive to part (2) of the lemma. Finally, if $(T, t) \to (S, s)$ is an elementary étale neighbourhood, then $(T_1, t_1) \to (S', s')$ is an elementary étale neighbourhood too, and in this way we see that (1) holds. □

Lemma 34.16.7. *Let $i : Z \to X$ be a closed immersion of schemes of finite type over a scheme S. Let $s \in S$. Let $\mathcal{F}$ be a finite type, quasi-coherent sheaf on Z. Then $\mathcal{F}$ is (universally) pure along Z_s if and only if $i_*\mathcal{F}$ is (universally) pure along X_s.*

Proof. Omitted. □

34.17. Examples of relatively pure sheaves

Here are some example cases where it is possible to see what purity means.

Lemma 34.17.1. *Let $f : X \to S$ be a proper morphism of schemes. Then every finite type, quasi-coherent $\mathcal{O}_X$-module $\mathcal{F}$ is universally pure relative to S. In particular X is universally pure relative to S.*

Proof. Let $(g : T \to S, t' \rightsquigarrow t, \xi)$ be an impurity of $\mathcal{F}$ above $s \in S$. Since f is proper, it is universally closed. Hence $f_T : X_T \to T$ is closed. Since $f_T(\xi) = t'$ this implies that $t \in f(\overline{\{\xi\}})$ which is a contradiction. □

Lemma 34.17.2. *Let $f : X \to S$ be a separated, finite type morphism of schemes. Let $\mathcal{F}$ be a finite type, quasi-coherent $\mathcal{O}_X$-module. Assume that $\text{Supp}(\mathcal{F}_s)$ is finite for every $s \in S$. Then the following are equivalent*

(1) *$\mathcal{F}$ is pure relative to S,*
(2) *the scheme theoretic support of $\mathcal{F}$ is finite over S, and*
(3) *$\mathcal{F}$ is universally pure relative to S.*

In particular, given a quasi-finite separated morphism $X \to S$ we see that X is pure relative to S if and only if $X \to S$ is finite.

Proof. Let $Z \subset X$ be the scheme theoretic support of $\mathcal{F}$, see Coherent, Definition 25.10.5. Then $Z \to S$ is a separated, finite type morphism of schemes with finite fibres. Hence it is separated and quasi-finite, see Morphisms, Lemma 24.19.10. By Lemma 34.16.7 it suffices to prove the lemma for $Z \to S$ and the sheaf $\mathcal{F}$ viewed as a finite type quasi-coherent module on Z. Hence we may assume that $X \to S$ is separated and quasi-finite and that $\text{Supp}(\mathcal{F}) = X$.

It follows from Lemma 34.17.1 and Morphisms, Lemma 24.42.10 that (2) implies (3). Trivially (3) implies (1). Assume (1) holds. We will prove that (2) holds. It is clear that we may assume S is affine. By More on Morphisms, Lemma 33.29.4 we can find a diagram

$$\begin{tikzcd} X \arrow[rr, "j"] \arrow[dr, "f"'] & & T \arrow[dl, "\pi"] \\ & S & \end{tikzcd}$$

with π finite and j a quasi-compact open immersion. If we show that j is closed, then j is a closed immersion and we conclude that $f = \pi \circ j$ is finite. To show that j is closed it suffices to show that specializations lift along j, see Schemes, Lemma 21.19.8. Let $x \in X$, set $t' = j(x)$ and let $t' \rightsquigarrow t$ be a specialization. We have to show $t \in j(X)$. Set $s' = f(x)$ and

$s = \pi(t)$ so $s' \rightsquigarrow s$. By More on Morphisms, Lemma 33.28.4 we can find an elementary étale neighbourhood $(U, u) \to (S, s)$ and a decomposition

$$T_U = T \times_S U = V \amalg W$$

into open and closed subschemes, such that $V \to U$ is finite and there exists a unique point v of V mapping to u, and such that v maps to t in T. As $V \to T$ is étale, we can lift generalizations, see Morphisms, Lemmas 24.24.8 and 24.35.12. Hence there exists a specialization $v' \rightsquigarrow v$ such that v' maps to $t' \in T$. In particular we see that $v' \in X_U \subset T_U$. Denote $u' \in U$ the image of t'. Note that $v' \in \text{Ass}_{X_U/U}(\mathcal{F})$ because $X_{u'}$ is a finite discrete set and $X_{u'} = \text{Supp}(\mathcal{F}_{u'})$. As $\mathcal{F}$ is pure relative to S we see that v' must specialize to a point in X_u. Since v is the only point of V lying over u (and since no point of W can be a specialization of v') we see that $v \in X_u$. Hence $t \in X$. $\square$

Lemma 34.17.3. *Let $f : X \to S$ be a finite type, flat morphism of schemes with geometrically integral fibres. Then X is universally pure over S.*

Proof. Let $\xi \in X$ with $s' = f(\xi)$ and $s' \rightsquigarrow s$ a specialization of S. If ξ is an associated point of $X_{s'}$, then ξ is the unique generic point because $X_{s'}$ is an integral scheme. Let ξ_0 be the unique generic point of X_s. As $X \to S$ is flat we can lift $s' \rightsquigarrow s$ to a specialization $\xi' \rightsquigarrow \xi_0$ in X, see Morphisms, Lemma 24.24.8. The $\xi \rightsquigarrow \xi'$ because ξ is the generic point of $X_{s'}$ hence $\xi \rightsquigarrow \xi_0$. This means that $(\text{id}_S, s' \to s, \xi)$ is not an impurity of $\mathcal{O}_X$ above s. Since the assumption that f is finite type, flat with geometrically integral fibres is preserved under base change, we see that there doesn't exist an impurity after any base change. In this way we see that X is universally S-pure. $\square$

Lemma 34.17.4. *Let $f : X \to S$ be a finite type, affine morphism of schemes. Let $\mathcal{F}$ be a finite type quasi-coherent $\mathcal{O}_X$-module such that $f_*\mathcal{F}$ is locally projective on S, see Properties, Definition 23.19.1. Then $\mathcal{F}$ is universally pure over S.*

Proof. After reducing to the case where S is the spectrum of a henselian local ring this follows from Lemma 34.14.1. $\square$

34.18. A criterion for purity

We first prove that given a flat family of finite type quasi-coherent sheaves the points in the relative assassin specialize to points in the relative assassins of nearby fibres (if they specialize at all).

Lemma 34.18.1. *Let $f : X \to S$ be a morphism of schemes of finite type. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module of finite type. Let $s \in S$. Assume that $\mathcal{F}$ is flat over S at all points of X_s. Let $x' \in \text{Ass}_{X/S}(\mathcal{F})$ with $f(x') = s'$ such that $s' \rightsquigarrow s$ is a specialization in S. If x' specializes to a point of X_s, then $x' \rightsquigarrow x$ with $x \in \text{Ass}_{X_s}(\mathcal{F}_s)$.*

Proof. Let $x' \rightsquigarrow t$ be a specialization with $t \in X_s$. We may replace X by an affine neighbourhood of t and S by an affine neighbourhood of s. Choose a closed immersion $i : X \to \mathbf{A}^n_S$. Then it suffices to prove the lemma for the module $i_*\mathcal{F}$ on $\mathbf{A}^n_S$ and the point $i(x')$. Hence we may assume $X \to S$ is of finite presentation.

Let $x' \rightsquigarrow t$ be a specialization with $t \in X_s$. Set $A = \mathcal{O}_{S,s}$, $B = \mathcal{O}_{X,t}$, and $N = \mathcal{F}_t$. Note that B is essentially of finite presentation over A and that N is a finite B-module flat over A. Also N is a finitely presented B-module by Lemma 34.11.9. Let $\mathfrak{q}' \subset B$ be the prime ideal corresponding to x' and let $\mathfrak{p}' \subset A$ be the prime ideal corresponding to s'. The assumption $x' \in \text{Ass}_{X/S}(\mathcal{F})$ means that $\mathfrak{q}'$ is an associated prime of $N \otimes_A \kappa(\mathfrak{p}')$. Let

$\Sigma \subset B$ be the multiplicative subset of elements which are not zero divisors on $N/\mathfrak{m}_A N$. By Lemma 34.8.2 the map $N \to \Sigma^{-1}N$ is universally injective. In particular, we see that $N \otimes_A \kappa(\mathfrak{p}') \to \Sigma^{-1}N \otimes_A \kappa(\mathfrak{p}')$ is injective which implies that $\mathfrak{q}'$ is an associated prime of $\Sigma^{-1}N \otimes_A \kappa(\mathfrak{p}')$ and hence $\mathfrak{q}'$ is in the image of $Spec(\Sigma^{-1}B) \to Spec(B)$. Thus Lemma 34.8.1 implies that $\mathfrak{q}' \subset \mathfrak{q}$ for some prime $\mathfrak{q} \in \text{Ass}_B(N/\mathfrak{m}_A N)$ (which in particular implies that $\mathfrak{m}_A = A \cap \mathfrak{q}$). If $x \in X_s$ denotes the point corresponding to $\mathfrak{q}$, then $x \in \text{Ass}_{X_s}(\mathcal{F}_s)$ and $x' \rightsquigarrow x$ as desired. □

Lemma 34.18.2. *Let $f : X \to S$ be a morphism of schemes of finite type. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module of finite type. Let $s \in S$. Let $(S', s') \to (S, s)$ be an elementary étale neighbourhood and let*

$$\begin{tikzcd} X \arrow[d] & X' \arrow[l, "g"'] \arrow[d] \\ S & S' \arrow[l] \end{tikzcd}$$

be a commutative diagram of morphisms of schemes. Assume

(1) *$\mathcal{F}$ is flat over S at all points of X_s,*
(2) *$X' \to S'$ is of finite type,*
(3) *$g^*\mathcal{F}$ is pure along $X'_{s'}$,*
(4) *$g : X' \to X$ is étale, and*
(5) *$g(X')$ contains $\text{Ass}_{X_s}(\mathcal{F}_s)$.*

In this situation $\mathcal{F}$ is pure along X_s if and only if the image of $X' \to X \times_S S'$ contains the points $\text{Ass}_{X \times_S S'/S'}(\mathcal{F} \times_S S')$ lying over points in S' which specialize to s'.

Proof. Since the morphism $S' \to S$ is étale, we see that if $\mathcal{F}$ is pure along X_s, then $\mathcal{F} \times_S S'$ is pure along X_s, see Lemma 34.16.4. Since purity satisfies flat descent, see Lemma 34.16.6, we see that if $\mathcal{F} \times_S S'$ is pure along $X_{s'}$, then $\mathcal{F}$ is pure along X_s. Hence we may replace S by S' and assume that $S = S'$ so that $g : X' \to X$ is an étale morphism between schemes of finite type over S. Moreover, we may replace S by $Spec(\mathcal{O}_{S,s})$ and assume that S is local.

First, assume that $\mathcal{F}$ is pure along X_s. In this case every point of $\text{Ass}_{X/S}(\mathcal{F})$ specializes to a point of X_s by purity. Hence by Lemma 34.18.1 we see that every point of $\text{Ass}_{X/S}(\mathcal{F})$ specializes to a point of $\text{Ass}_{X_s}(\mathcal{F}_s)$. Thus every point of $\text{Ass}_{X/S}(\mathcal{F})$ is in the image of g (as the image is open and contains $\text{Ass}_{X_s}(\mathcal{F}_s)$).

Conversely, assume that $g(X')$ contains $\text{Ass}_{X/S}(\mathcal{F})$. Let $S^h = Spec(\mathcal{O}_{S,s}^h)$ be the henselization of S at s. Denote $g^h : (X')^h \to X^h$ the base change of g by $S^h \to S$, and denote $\mathcal{F}^h$ the pullback of $\mathcal{F}$ to X^h. By Divisors, Lemma 26.7.2 and Remark 26.7.3 the relative assassin $\text{Ass}_{X^h/S^h}(\mathcal{F}^h)$ is the inverse image of $\text{Ass}_{X/S}(\mathcal{F})$ via the projection $X^h \to X$. As we have assumed that $g(X')$ contains $\text{Ass}_{X/S}(\mathcal{F})$ we conclude that the base change $g^h((X')^h) = g(X') \times_S S^h$ contains $\text{Ass}_{X^h/S^h}(\mathcal{F}^h)$. In this way we reduce to the case where S is the spectrum of a henselian local ring. Let $x \in \text{Ass}_{X/S}(\mathcal{F})$. To finish the proof of the lemma we have to show that x specializes to a point of X_s, see criterion (4) for purity in discussion following Definition 34.16.1. By assumption there exists a $x' \in X'$ such that $g(x') = x$. As $g : X' \to X$ is étale, we see that $x' \in \text{Ass}_{X'/S}(g^*\mathcal{F})$, see Lemma 34.3.7 (applied to the morphism of fibres $X'_w \to X_w$ where $w \in S$ is the image of x'). Since $g^*\mathcal{F}$ is pure along X'_s we see that $x' \rightsquigarrow y$ for some $y \in X'_s$. Hence $x = g(x') \rightsquigarrow g(y)$ and $g(y) \in X_s$ as desired. □

Lemma 34.18.3. *Let $f : X \to S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Let $s \in S$. Assume*

(1) *f is of finite type,*
(2) *$\mathcal{F}$ is of finite type,*
(3) *$\mathcal{F}$ is flat over S at all points of X_s, and*
(4) *$\mathcal{F}$ is pure along X_s.*

Then $\mathcal{F}$ is universally pure along X_s.

Proof. We first make a preliminary remark. Suppose that $(S', s') \to (S, s)$ is an elementary étale neighbourhood. Denote $\mathcal{F}'$ the pullback of $\mathcal{F}$ to $X' = X \times_S S'$. By the discussion following Definition 34.16.1 we see that $\mathcal{F}'$ is pure along $X'_{s'}$. Moreover, $\mathcal{F}'$ is flat over S' along $X'_{s'}$. Then it suffices to prove that $\mathcal{F}'$ is universally pure along $X'_{s'}$. Namely, given any morphism $(T, t) \to (S, s)$ of pointed schemes the fibre product $(T', t') = (T \times_S S', (t, s'))$ is flat over (T, t) and hence if $\mathcal{F}_{T'}$ is pure along $X_{t'}$ then $\mathcal{F}_T$ is pure along X_t by Lemma 34.16.6. Thus during the proof we may always replace (s, S) by an elementary étale neighbourhood. We may also replace S by $Spec(\mathcal{O}_{S,s})$ due to the local nature of the problem.

Choose an elementary étale neighbourhood $(S', s') \to (S, s)$ and a commutative diagram

$$\begin{tikzcd} X \arrow[d] & X' \arrow[l, "g"'] \arrow[d] \\ S & Spec(\mathcal{O}_{S',s'}) \arrow[l] \end{tikzcd}$$

such that $X' \to X \times_S Spec(\mathcal{O}_{S',s'})$ is étale, $X_s = g((X')_{s'})$, the scheme X' is affine, and such that $\Gamma(X', g^*\mathcal{F})$ is a free $\mathcal{O}_{S',s'}$-module, see Lemma 34.12.11. Note that $X' \to Spec(\mathcal{O}_{S',s'})$ is of finite type (as a quasi-compact morphism which is the composition of an étale morphism and the base change of a finite type morphism). By our preliminary remarks in the first paragraph of the proof we may replace S by $Spec(\mathcal{O}_{S',s'})$. Hence we may assume there exists a commutative diagram

$$\begin{tikzcd} X \arrow[dr] & & X' \arrow[ll, "g"'] \arrow[dl] \\ & S & \end{tikzcd}$$

of schemes of finite type over S, where g is étale, $X_s \subset g(X')$, with S local with closed point s, with X' affine, and with $\Gamma(X', g^*\mathcal{F})$ a free $\Gamma(S, \mathcal{O}_S)$-module. Note that in this case $g^*\mathcal{F}$ is universally pure over S, see Lemma 34.17.4.

In this situation we apply Lemma 34.18.2 to deduce that $\text{Ass}_{X/S}(\mathcal{F}) \subset g(X')$ from our assumption that $\mathcal{F}$ is pure along X_s and flat over S along X_s. By Divisors, Lemma 26.7.2 and Remark 26.7.3 we see that for any morphism of pointed schemes $(T, t) \to (S, s)$ we have

$$\text{Ass}_{X_T/T}(\mathcal{F}_T) \subset (X_T \to X)^{-1}(\text{Ass}_{X/S}(\mathcal{F})) \subset g(X') \times_S T = g_T(X'_T).$$

Hence by Lemma 34.18.2 applied to the base change of our displayed diagram to (T, t) we conclude that $\mathcal{F}_T$ is pure along X_t as desired. $\square$

Lemma 34.18.4. *Let $f : X \to S$ be a finite type morphism of schemes. Let $\mathcal{F}$ be a finite type quasi-coherent $\mathcal{O}_X$-module. Assume $\mathcal{F}$ is flat over S. In this case $\mathcal{F}$ is pure relative to S if and only if $\mathcal{F}$ is universally pure relative to S.*

Proof. Immediate consequence of Lemma 34.18.3 and the definitions. □

Lemma 34.18.5. *Let I be a directed partially ordered set. Let $(S_i, g_{ii'})$ be an inverse system of affine schemes over I. Set $S = lim_i S_i$ and $s \in S$. Denote $g_i : S \to S_i$ the projections and set $s_i = g_i(s)$. Suppose that $f : X \to S$ is a morphism of finite presentation, $\mathcal{F}$ a quasi-coherent $\mathcal{O}_X$-module of finite presentation which is pure along X_s and flat over S at all points of X_s. Then there exists an $i \in I$, a morphism of finite presentation $X_i \to S_i$, a quasi-coherent $\mathcal{O}_{X_i}$-module $\mathcal{F}_i$ of finite presentation which is pure along $(X_i)_{s_i}$ and flat over S_i at all points of $(X_i)_{s_i}$ such that $X \cong X_i \times_{S_i} S$ and such that the pullback of $\mathcal{F}_i$ to X is isomorphic to $\mathcal{F}$.*

Proof. Let $U \subset X$ be the set of points where $\mathcal{F}$ is flat over S. By More on Morphisms, Theorem 33.11.1 this is an open subscheme of X. By assumption $X_s \subset U$. As X_s is quasi-compact, we can find a quasi-compact open $U' \subset U$ with $X_s \subset U'$. By Limits, Lemma 27.6.1 we can find an $i \in I$ and a morphism of finite presentation $f_i : X_i \to S_i$ whose base change to S is isomorphic to f_i. Fix such a choice and set $X_{i'} = X_i \times_{S_i} S_{i'}$. Then $X = lim_{i'} X_{i'}$ with affine transition morphisms. By Limits, Lemma 27.6.8 we can, after possible increasing i assume there exists a quasi-coherent $\mathcal{O}_{X_i}$-module $\mathcal{F}_i$ of finite presentation whose base change to S is isomorphic to $\mathcal{F}$. By Limits, Lemma 27.3.5 after possibly increasing i we may assume there exists an open $U'_i \subset X_i$ whose inverse image in X is U'. Note that in particular $(X_i)_{s_i} \subset U'_i$. By Limits, Lemma 27.6.9 (after increasing i once more) we may assume that $\mathcal{F}_i$ is flat on U'_i. In particular we see that $\mathcal{F}_i$ is flat along $(X_i)_{s_i}$.

Next, we use Lemma 34.12.5 to choose an elementary étale neighbourhood $(S'_i, s'_i) \to (S_i, s_i)$ and a commutative diagram of schemes

$$\begin{tikzcd} X_i \arrow[d] & X'_i \arrow[l, "g_i"'] \arrow[d] \\ S_i & S'_i \arrow[l] \end{tikzcd}$$

such that g_i is étale, $(X_i)_{s_i} \subset g_i(X'_i)$, the schemes X'_i, S'_i are affine, and such that $\Gamma(X'_i, g_i^*\mathcal{F}_i)$ is a projective $\Gamma(S'_i, \mathcal{O}_{S'_i})$-module. Note that $g_i^*\mathcal{F}_i$ is universally pure over S'_i, see Lemma 34.17.4. We may base change the diagram above to a diagram with morphisms $(S'_{i'}, s'_{i'}) \to (S_{i'}, s_{i'})$ and $g_{i'} : X'_{i'} \to X_{i'}$ over $S_{i'}$ for any $i' \geq i$ and we may base change the diagram to a diagram with morphisms $(S', s') \to (S, s)$ and $g : X' \to X$ over S.

At this point we can use our criterion for purity. Set $W'_i \subset X_i \times_{S_i} S'_i$ equal to the image of the étale morphism $X'_i \to X_i \times_{S_i} S'_i$. For every $i' \geq i$ we have similarly the image $W'_{i'} \subset X_{i'} \times_{S_{i'}} S'_{i'}$ and we have the image $W' \subset X \times_S S'$. Taking images commutes with base change, hence $W'_{i'} = W'_i \times_{S'_i} S'_{i'}$ and $W' = W_i \times_{S'_i} S'$. Because $\mathcal{F}$ is pure along X_s the Lemma 34.18.2 implies that

$$f^{-1}(Spec(\mathcal{O}_{S',s'})) \cap \mathrm{Ass}_{X \times_S S'/S'}(\mathcal{F} \times_S S') \subset W' \tag{34.18.5.1}$$

By More on Morphisms, Lemma 33.18.5 we see that

$$E = \{t \in S' \mid \mathrm{Ass}_{X_t}(\mathcal{F}_t) \subset W'\} \quad \text{and} \quad E_{i'} = \{t \in S'_{i'} \mid \mathrm{Ass}_{X_t}(\mathcal{F}_{i',t}) \subset W'_{i'}\}$$

are locally constructible subsets of S' and $S'_{i'}$. By More on Morphisms, Lemma 33.18.4 we see that $E_{i'}$ is the inverse image of E_i under the morphism $S'_{i'} \to S'_i$ and that E is the inverse image of E_i under the morphism $S' \to S'_i$. Thus Equation (34.18.5.1) is equivalent to the assertion that $Spec(\mathcal{O}_{S',s'})$ maps into E_i. As $\mathcal{O}_{S',s'} = colim_{i' \geq i} \mathcal{O}_{S'_{i'},s'_{i'}}$ we see that $Spec(\mathcal{O}_{S'_{i'},s'_{i'}})$ maps into E_i for some $i' \geq i$, see Limits, Lemma 27.3.4. Then, applying Lemma 34.18.2 to the situation over $S_{i'}$, we conclude that $\mathcal{F}_{i'}$ is pure along $(X_{i'})_{s_{i'}}$. $\square$

Lemma 34.18.6. *Let $f : X \to S$ be a morphism of finite presentation. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module of finite presentation flat over S. Then the set*

$$U = \{s \in S \mid \mathcal{F} \text{ is pure along } X_s\}$$

is open in S.

Proof. Let $s \in U$. Using Lemma 34.12.5 we can find an elementary étale neighbourhood $(S', s') \to (S, s)$ and a commutative diagram

$$\begin{tikzcd} X \arrow[d] & X' \arrow[l, "g"'] \arrow[d] \\ S & S' \arrow[l] \end{tikzcd}$$

such that g is étale, $X_s \subset g(X')$, the schemes X', S' are affine, and such that $\Gamma(X', g^*\mathcal{F})$ is a projective $\Gamma(S', \mathcal{O}_{S'})$-module. Note that $g^*\mathcal{F}$ is universally pure over S', see Lemma 34.17.4. Set $W' \subset X \times_S S'$ equal to the image of the étale morphism $X' \to X \times_S S'$. Note that W is open and quasi-compact over S'. Set

$$E = \{t \in S' \mid \text{Ass}_{X_t}(\mathcal{F}_t) \subset W'\}.$$

By More on Morphisms, Lemma 33.18.5 E is a constructible subset of S'. By Lemma 34.18.2 we see that $Spec(\mathcal{O}_{S',s'}) \subset E$. By Morphisms, Lemma 24.21.4 we see that E contains an open neighbourhood V' of s'. Applying Lemma 34.18.2 once more we see that for any point s_1 in the image of V' in S the sheaf $\mathcal{F}$ is pure along X_{s_1}. Since $S' \to S$ is étale the image of V' in S is open and we win. $\square$

34.19. How purity is used

Here are some examples of how purity can be used. The first lemma actually uses a slightly weaker form of purity.

Lemma 34.19.1. *Let $f : X \to S$ be a morphism of finite type. Let $\mathcal{F}$ be a quasi-coherent sheaf of finite type on X. Assume S is local with closed point s. Assume $\mathcal{F}$ is pure along X_s and that $\mathcal{F}$ is flat over S. Let $\varphi : \mathcal{F} \to \mathcal{G}$ of quasi-coherent $\mathcal{O}_X$-modules. Then the following are equivalent*

1. *the map on stalks φ_x is injective for all $x \in Ass_{X_s}(\mathcal{F}_s)$, and*
2. *φ is injective.*

Proof. Let $\mathcal{K} = \text{Ker}(\varphi)$. Our goal is to prove that $\mathcal{K} = 0$. In order to do this it suffices to prove that $\text{WeakAss}_X(\mathcal{K}) = \emptyset$, see Divisors, Lemma 26.5.5. We have $\text{WeakAss}_X(\mathcal{K}) \subset \text{WeakAss}_X(\mathcal{F})$, see Divisors, Lemma 26.5.4. As $\mathcal{F}$ is flat we see from Lemma 34.13.4 that $\text{WeakAss}_X(\mathcal{F}) \subset \text{Ass}_{X/S}(\mathcal{F})$. By purity any point x' of $\text{Ass}_{X/S}(\mathcal{F})$ is a generalization of a point of X_s, and hence is the specialization of a point $x \in \text{Ass}_{X_s}(\mathcal{F}_s)$, by Lemma 34.18.1. Hence the injectivity of φ_x implies the injectivity of $\varphi_{x'}$, whence $\mathcal{K}_{x'} = 0$. $\square$

Proposition 34.19.2. *Let $f : X \to S$ be an affine, finitely presented morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module of finite presentation, flat over S. Then the following are equivalent*

(1) *$f_*\mathcal{F}$ is locally projective on S, and*
(2) *$\mathcal{F}$ is pure relative to S.*

In particular, given a ring map $A \to B$ of finite presentation and a finitely presented B-module N flat over A we have: N is projective as an A-module if and only if $\widetilde{N}$ on $Spec(B)$ is pure relative to $Spec(A)$.

Proof. The implication (1) $\Rightarrow$ (2) is Lemma 34.17.4. Assume $\mathcal{F}$ is pure relative to S. Note that by Lemma 34.18.3 this implies $\mathcal{F}$ remains pure after any base change. By Descent, Lemma 31.5.5 it suffices to prove $f_*\mathcal{F}$ is fpqc locally projective on S. Pick $s \in S$. We will prove that the restriction of $f_*\mathcal{F}$ to an étale neighbourhood of s is locally projective. Namely, by Lemma 34.12.5, after replacing S by an affine elementary étale neighbourhood of s, we may assume there exists a diagram

$$\begin{tikzcd} X \arrow[dr] & & X' \arrow[ll, "g"'] \arrow[dl] \\ & S & \end{tikzcd}$$

of schemes affine and of finite presentation over S, where g is étale, $X_s \subset g(X')$, and with $\Gamma(X', g^*\mathcal{F})$ a projective $\Gamma(S, \mathcal{O}_S)$-module. Note that in this case $g^*\mathcal{F}$ is universally pure over S, see Lemma 34.17.4. Hence by Lemma 34.18.2 we see that the open $g(X')$ contains the points of $\text{Ass}_{X/S}(\mathcal{F})$ lying over $Spec(\mathcal{O}_{S,s})$. Set

$$E = \{t \in S \mid \text{Ass}_{X_t}(\mathcal{F}_t) \subset g(X')\}.$$

By More on Morphisms, Lemma 33.18.5 E is a constructible subset of S. We have seen that $Spec(\mathcal{O}_{S,s}) \subset E$. By Morphisms, Lemma 24.21.4 we see that E contains an open neighbourhood of s. Hence after replacing S by an affine neighbourhood of s we may assume that $\text{Ass}_{X/S}(\mathcal{F}) \subset g(X')$. By Lemma 34.8.4 this means that

$$\Gamma(X, \mathcal{F}) \longrightarrow \Gamma(X', g^*\mathcal{F})$$

is $\Gamma(S, \mathcal{O}_S)$-universally injective. By Algebra, Lemma 7.83.6 we conclude that $\Gamma(X, \mathcal{F})$ is Mittag-Leffler as an $\Gamma(S, \mathcal{O}_S)$-module. Since $\Gamma(X, \mathcal{F})$ is countably generated and flat as a $\Gamma(S, \mathcal{O}_S)$-module, we conclude it is projective by Algebra, Lemma 7.87.1. ☐

We can use the proposition to improve some of our earlier results. The following lemma is an improvement of Proposition 34.12.4.

Lemma 34.19.3. *Let $f : X \to S$ be a morphism which is locally of finite presentation. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module which is of finite presentation. Let $x \in X$ with $s = f(x) \in S$. If $\mathcal{F}$ is flat at x over S there exists an affine elementary étale neighbourhood $(S', s') \to (S, s)$ and an affine open $U' \subset X \times_S S'$ which contains $x' = (x, s')$ such that $\Gamma(U', \mathcal{F}|_{U'})$ is a projective $\Gamma(S', \mathcal{O}_{S'})$-module.*

Proof. During the proof we may replace X by an open neighbourhood of x and we may replace S by an elementary étale neighbourhood of s. Hence, by openness of flatness (see More on Morphisms, Theorem 33.11.1) we may assume that $\mathcal{F}$ is flat over S. We may assume S and X are affine. After shrinking X some more we may assume that any point of $\text{Ass}_{X_s}(\mathcal{F}_s)$ is a generalization of x. This property is preserved on replacing (S, s) by an elementary étale neighbourhood. Hence we may apply Lemma 34.12.5 to arrive at the situation where there exists a diagram

$$\begin{tikzcd} X & & X' \arrow[ll, "g"'] \arrow[dl] \\ & S \arrow[from=ul, crossing over] & \end{tikzcd}$$

of schemes affine and of finite presentation over S, where g is étale, $X_s \subset g(X')$, and with $\Gamma(X', g^*\mathcal{F})$ a projective $\Gamma(S, \mathcal{O}_S)$-module. Note that in this case $g^*\mathcal{F}$ is universally pure over S, see Lemma 34.17.4.

Let $U \subset g(X')$ be an affine open neighbourhood of x. We claim that $\mathcal{F}|_U$ is pure along U_s. If we prove this, then the lemma follows because $\mathcal{F}|_U$ will be pure relative to S after shrinking S, see Lemma 34.18.6, whereupon the projectivity follows from Proposition 34.19.2. To prove the claim we have to show, after replacing (S, s) by an arbitrary elementary étale neighbourhood, that any point ξ of $\text{Ass}_{U/S}(\mathcal{F}|_U)$ lying over some $s' \in S$, $s' \rightsquigarrow s$ specializes to a point of U_s. Since $U \subset g(X')$ we can find a $\xi' \in X'$ with $g(\xi') = \xi$. Because $g^*\mathcal{F}$ is pure over S, using Lemma 34.18.1, we see there exists a specialization $\xi' \rightsquigarrow x'$ with $x' \in \text{Ass}_{X'_s}(g^*\mathcal{F}_s)$. Then $g(x') \in \text{Ass}_{X_s}(\mathcal{F}_s)$ (see for example Lemma 34.3.7 applied to the étale morphism $X'_s \to X_s$ of Noetherian schemes) and hence $g(x') \rightsquigarrow x$ by our choice of X above! Since $x \in U$ we conclude that $g(x') \in U$. Thus $\xi = g(\xi') \rightsquigarrow g(x') \in U_s$ as desired. □

The following lemma is an improvement of Lemma 34.12.9.

Lemma 34.19.4. *Let $f : X \to S$ be a morphism which is locally of finite type. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module which is of finite type. Let $x \in X$ with $s = f(x) \in S$. If $\mathcal{F}$ is flat at x over S there exists an affine elementary étale neighbourhood $(S', s') \to (S, s)$ and an affine open $U' \subset X \times_S Spec(\mathcal{O}_{S',s'})$ which contains $x' = (x, s')$ such that $\Gamma(U', \mathcal{F}|_{U'})$ is a free $\mathcal{O}_{S',s'}$-module.*

Proof. The question is Zariski local on X and S. Hence we may assume that X and S are affine. Then we can find a closed immersion $i : X \to \mathbf{A}^n_S$ over S. It is clear that it suffices to prove the lemma for the sheaf $i_*\mathcal{F}$ on $\mathbf{A}^n_S$ and the point $i(x)$. In this way we reduce to the case where $X \to S$ is of finite presentation. After replacing S by $Spec(\mathcal{O}_{S',s'})$ and X by an open of $X \times_S Spec(\mathcal{O}_{S',s'})$ we may assume that $\mathcal{F}$ is of finite presentation, see Proposition 34.11.3. In this case we may appeal to Lemma 34.19.3 and Algebra, Theorem 7.79.4 to conclude. □

Lemma 34.19.5. *Let $A \to B$ be a local ring map of local rings which is essentially of finite type. Let N be a finite B-module which is flat as an A-module. If A is henselian, then N is a filtered colimit*

$$N = colim_i\, F_i$$

of free A-modules F_i such that all transition maps $u_i : F_i \to F_{i'}$ of the system induce injective maps $\overline{u}_i : F_i/\mathfrak{m}_A F_i \to F_{i'}/\mathfrak{m}_A F_{i'}$.

Proof. We can find a morphism of finite type $X \to S = Spec(A)$ and a point $x \in X$ lying over the closed point s of S and a finite type quasi-coherent $\mathcal{O}_X$-module $\mathcal{F}$ such that $\mathcal{F}_x \cong N$ as an A-module. After shrinking X we may assume that each point of $\text{Ass}_{X_s}(\mathcal{F}_s)$ specializes to x. By Lemma 34.19.4 we see that there exists a fundamental system of affine open neighbourds $U_i \subset X$ of x such that $\Gamma(U_i, \mathcal{F})$ is a free A-module F_i. Note that if $U_{i'} \subset U_i$, then

$$F_i/\mathfrak{m}_A F_i = \Gamma(U_{i,s}, \mathcal{F}_s) \longrightarrow \Gamma(U_{i',s}, \mathcal{F}_s) = F_{i'}/\mathfrak{m}_A F_{i'}$$

is injective because a section of the kernel would be supported at a closed subset of X_s not meeting x which is a contradiction to our choice of X above. □

34.20. Flattening functors

Let S be a scheme. Recall that a functor $F : (Sch/S)^{opp} \to Sets$ is called limit preserving if for every directed inverse system $\{T_i\}_{i\in I}$ of affine schemes with limit T we have $F(T) = colim_i\, F(T_i)$.

Situation 34.20.1. Let $f : X \to S$ be a morphism of schemes. Let $u : \mathcal{F} \to \mathcal{G}$ be a homomorphismm of quasi-coherent $\mathcal{O}_X$-modules. For any scheme T over S we will denote $u_T : \mathcal{F}_T \to \mathcal{G}_T$ the base change of u to T, in other words, u_T is the pullback of u via the projection morphism $X_T = X \times_S T \to X$. In this situation we can consider the functor

$$(34.20.1.1) \quad F_{iso} : (Sch/S)^{opp} \longrightarrow Sets, \quad T \longrightarrow \begin{cases} \{*\} & \text{if} \quad u_T \text{ is an isomorphism,} \\ \emptyset & \text{else.} \end{cases}$$

There are variants F_{inj}, F_{surj} where we ask that u_T is injective, resp. surjective.

Lemma 34.20.2. *In Situation 34.20.1.*

(1) *Each of the functors F_{iso}, F_{inj}, F_{surj} satisfies the sheaf property for the fpqc topology.*
(2) *If f is quasi-compact and $\mathcal{G}$ is of finite type, then F_{surj} is limit preserving.*
(3) *If f is quasi-compact, $\mathcal{F}$ is of finite type, and $\mathcal{G}$ is of finite presentation, then F_{iso} is limit preserving.*

Proof. Let $\{T_i \to T\}_{i\in I}$ be an fpqc covering of schemes over S. Set $X_i = X_{T_i} = X \times_S T_i$ and $u_i = u_{T_i}$. Note that $\{X_i \to X_T\}_{i\in I}$ is an fpqc covering of X_T, see Topologies, Lemma 30.8.7. In particular, for every $x \in X_T$ there exists an $i \in I$ and an $x_i \in X_i$ mapping to x. Since $\mathcal{O}_{X_T,x} \to \mathcal{O}_{X_i,x_i}$ is flat, hence faithfully flat (see Algebra, Lemma 7.35.16) we conclude that $(u_i)_{x_i}$ is injective, surjective, or bijective if and only if $(u_T)_x$ is injective, surjective, or bijective. Whence part (1) of the lemma.

Assume f quasi-compact and $\mathcal{G}$ of finite type. Let $T = lim_{i\in I}\, T_i$ be a directed limit of affine S-schemes and assume that u_T is surjective. Set $X_i = X_{T_i} = X \times_S T_i$ and $u_i = u_{T_i} : \mathcal{F}_i = \mathcal{F}_{T_i} \to \mathcal{G}_i = \mathcal{G}_{T_i}$. To prove part (2) we have to show that u_i is surjective for some i. Pick $i_0 \in I$ and replace I by $\{i \mid i \geq i_0\}$. Since f is quasi-compact each the scheme X_{i_0} is quasi-compact. Hence we may choose affine opens $W_1, \ldots, W_m \subset X$ and an affine open covering $X_{i_0} = U_{1,i_0} \cup \ldots \cup U_{m,i_0}$ such that U_{j,i_0} maps into W_j under the projection morphism $X_{i_0} \to X$. For any $i \in I$ let $U_{j,i}$ be the inverse image of U_{j,i_0}. Setting $U_j = lim_i\, U_{j,i}$ we see that $X_T = U_1 \cup \ldots \cup U_m$ is an affine open covering of X_T. Now it suffices to show, for a given $j \in \{1, \ldots, m\}$ that $u_i|_{U_{j,i}}$ is surjective for some $i = i(j) \in I$. Using Properties, Lemma 23.16.1 this translates into the following algebra problem: Let A be a ring and let $u : M \to N$ be an A-module map. Suppose that $R = colim_{i\in I}\, R_i$ is a directed colimit of A-algebras. If N is a finite A-module and if $u \otimes 1 : M \otimes_A R \to N \otimes_A R$ is surjective, then for some i the map $u \otimes 1 : M \otimes_A R_i \to N \otimes_A R_i$ is surjective. This is Algebra, Lemma 7.118.3 part (2).

Assume f quasi-compact and $\mathcal{F}, \mathcal{G}$ of finite presentation. Arguing in exactly the same manner as in the previous paragraph (using in addition also Properties, Lemma 23.16.2) part (3) translates into the following algebra statement: Let A be a ring and let $u : M \to N$ be an A-module map. Suppose that $R = colim_{i\in I} R_i$ is a directed colimit of A-algebras. Assume M is a finite A-module, N is a finitely presented A-module, and $u \otimes 1 : M \otimes_A R \to N \otimes_A R$ is an isomorphism. Then for some i the map $u \otimes 1 : M \otimes_A R_i \to N \otimes_A R_i$ is an isomorphism. This is Algebra, Lemma 7.118.3 part (3). □

Situation 34.20.3. Let $(A, \mathfrak{m}_A)$ be a local ring. Denote $\mathcal{C}$ the category whose objects are A-algebras A' which are local rings such that the algebra structure $A \to A'$ is a local homomorphism of local rings. A morphism between objects A', A'' of $\mathcal{C}$ is a local homomorphism $A' \to A''$ of A-algebras. Let $A \to B$ be a local ring map of local rings and let M be a B-module. If A' is an object of $\mathcal{C}$ we set $B' = B \otimes_A A'$ and we set $M' = M \otimes_A A'$ as a B'-module. Given $A' \in Ob(\mathcal{C})$, consider the condition

$$\forall \mathfrak{q} \in V(\mathfrak{m}_{A'} B' + \mathfrak{m}_B B') \subset Spec(B') : M'_{\mathfrak{q}} \text{ is flat over } A'. \tag{34.20.3.1}$$

Note the similarity with More on Algebra, Equation (12.14.1.1). In particular, if $A' \to A''$ is a morphism of $\mathcal{C}$ and (34.20.3.1) holds for A', then it holds for A'', see More on Algebra, Lemma 12.14.2. Hence we obtain a functor

$$F_{lf} : \mathcal{C} \longrightarrow Sets, \quad A' \longrightarrow \begin{cases} \{*\} & \text{if (34.20.3.1) holds,} \\ \emptyset & \text{else.} \end{cases} \tag{34.20.3.2}$$

Lemma 34.20.4. *In Situation 34.20.3.*

1. *If $A' \to A''$ is a flat morphism in $\mathcal{C}$ then $F_{fl}(A') = F_{lf}(A'')$.*
2. *If $A \to B$ is essentially of finite presentation and M is a B-module of finite presentation, then F_{fl} is limit preserving: If $\{A_i\}_{i\in I}$ is a directed system of objects of $\mathcal{C}$, then $F_{fl}(colim_i A_i) = colim_i F_{fl}(A_i)$.*

Proof. Part (1) is a special case of More on Algebra, Lemma 12.14.3. Part (2) is a special case of More on Algebra, Lemma 12.14.4. □

Lemma 34.20.5. *In Situation 34.20.3 suppose that $B \to C$ is a local map of local A-algebras and that $M \cong N$ as B-modules. Denote $F'_{lf} : \mathcal{C} \to Sets$ the functor associated to the pair (C, N). If $B \to C$ is finite, then $F_{lf} = F'_{lf}$.*

Proof. Let A' be an object of $\mathcal{C}$. Set $C' = C \otimes_A A'$ and $N' = N \otimes_A A'$ similarly to the definitions of B', M' in Situation 34.20.3. Note that $M' \cong N'$ as B'-modules. The assumption that $B \to C$ is finite has two consequences: (a) $\mathfrak{m}_C = \sqrt{\mathfrak{m}_B C}$ and (b) $B' \to C'$ is finite. Consequence (a) implies that

$$V(\mathfrak{m}_{A'} C' + \mathfrak{m}_C C') = \left(Spec(C') \to Spec(B')\right)^{-1} V(\mathfrak{m}_{A'} B' + \mathfrak{m}_B B').$$

Suppose $\mathfrak{q} \subset V(\mathfrak{m}_{A'} B' + \mathfrak{m}_B B')$. Then $M'_{\mathfrak{q}}$ is flat over A' if and only if the $C'_{\mathfrak{q}}$-module $N'_{\mathfrak{q}}$ is flat over A' (because these are isomorphic as A'-modules) if and only if for every maximal ideal $\mathfrak{r}$ of $C'_{\mathfrak{q}}$ the module $N'_{\mathfrak{r}}$ is flat over A' (see Algebra, Lemma 7.35.19). As $B'_{\mathfrak{q}} \to C'_{\mathfrak{q}}$ is finite by (b), the maximal ideals of $C'_{\mathfrak{q}}$ correspond exactly to the primes of C' lying over $\mathfrak{q}$ (see Algebra, Lemma 7.32.20) and these primes are all contained in $V(\mathfrak{m}_{A'} C' + \mathfrak{m}_C C')$ by the displayed equation above. Thus the result of the lemma holds. □

Lemma 34.20.6. *In Situation 34.20.3 suppose that $B \to C$ is a flat local homomorphism of local rings. Set $N = M \otimes_B C$. Denote $F'_{lf} : \mathcal{C} \to Sets$ the functor associated to the pair (C, N). Then $F_{lf} = F'_{lf}$.*

Proof. Let A' be an object of $\mathcal{C}$. Set $C' = C \otimes_A A'$ and $N' = N \otimes_A A' = M' \otimes_{B'} C'$ similarly to the defintions of B', M' in Situation 34.20.3. Note that

$$V(\mathfrak{m}_{A'}B' + \mathfrak{m}_B B') = Spec(\kappa(\mathfrak{m}_B) \otimes_A \kappa(\mathfrak{m}_{A'}))$$

and similarly for $V(\mathfrak{m}_{A'}C' + \mathfrak{m}_C C')$. The ring map

$$\kappa(\mathfrak{m}_B) \otimes_A \kappa(\mathfrak{m}_{A'}) \longrightarrow \kappa(\mathfrak{m}_C) \otimes_A \kappa(\mathfrak{m}_{A'})$$

is faithfully flat, hence $V(\mathfrak{m}_{A'}C' + \mathfrak{m}_C C') \to V(\mathfrak{m}_{A'}B' + \mathfrak{m}_B B')$ is surjective. Finally, if $\mathfrak{r} \in V(\mathfrak{m}_{A'}C' + \mathfrak{m}_C C')$ maps to $\mathfrak{q} \in V(\mathfrak{m}_{A'}B' + \mathfrak{m}_B B')$, then $M'_\mathfrak{q}$ is flat over A' if and only if $N'_\mathfrak{r}$ is flat over A' because $B' \to C'$ is flat, see Algebra, Lemma 7.35.8. The lemma follows formally from these remarks. □

Situation 34.20.7. Let $f : X \to S$ be a smooth morphism with geometrically irreducible fibres. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module of finite type. For any scheme T over S we will denote $\mathcal{F}_T$ the base change of $\mathcal{F}$ to T, in other words, $\mathcal{F}_T$ is the pullback of $\mathcal{F}$ via the projection morphism $X_T = X \times_S T \to X$. Note that $X_T \to T$ is smooth with geometrically irreducible fibres, see Morphisms, Lemma 24.33.5 and More on Morphisms, Lemma 33.20.2. Let $p \geq 0$ be an integer. Given a point $t \in T$ consider the condition

(34.20.7.1) $\qquad \mathcal{F}_T$ is free of rank p in a neighbourhood of ξ_t

where ξ_t is the generic point of the fibre X_t. This condition for all $t \in T$ is stable under base change, and hence we obtain a functor

(34.20.7.2)

$$H_p : (Sch/S)^{opp} \longrightarrow Sets, \quad T \longrightarrow \begin{cases} \{*\} & \text{if } \mathcal{F}_T \text{ satisfies (34.20.7.1) } \forall t \in T, \\ \emptyset & \text{else.} \end{cases}$$

Lemma 34.20.8. *In Situation 34.20.7.*

(1) *The functor H_p satisfies the sheaf property for the fpqc topology.*
(2) *If $\mathcal{F}$ is of finite presentation, then functor H_p is limit preserving.*

Proof. Let $\{T_i \to T\}_{i \in I}$ be an fpqc[1] covering of schemes over S. Set $X_i = X_{T_i} = X \times_S T_i$ and denote $\mathcal{F}_i$ the pullback of $\mathcal{F}$ to X_i. Assume that $\mathcal{F}_i$ satisfies (34.20.7.1) for all i. Pick $t \in T$ and let $\xi_t \in X_T$ denote the generic point of X_t. We have to show that $\mathcal{F}$ is free in a neighbourhood of ξ_t. For some $i \in I$ we can find a $t_i \in T_i$ mapping to t. Let $\xi_i \in X_i$ denote the generic point of X_{t_i}, so that ξ_i maps to ξ_t. The fact that $\mathcal{F}_i$ is free of rank p in a neighbourhood of ξ_i implies that $(\mathcal{F}_i)_{x_i} \cong \mathcal{O}_{X_i,x_i}^{\oplus p}$ which implies that $\mathcal{F}_{T,\xi_t} \cong \mathcal{O}_{X_T,\xi_t}^{\oplus p}$ as $\mathcal{O}_{X_T,\xi_t} \to \mathcal{O}_{X_i,x_i}$ is flat, see for example Algebra, Lemma 7.72.5. Thus there exists an affine neighbourhood U of ξ_t in X_T and a surjection $\mathcal{O}_U^{\oplus p} \to \mathcal{F}_U = \mathcal{F}_T|_U$, see Modules, Lemma 15.9.4. After shrinking T we may assume that $U \to T$ is surjective. Hence $U \to T$ is a smooth morphism of affines with geometrically irreducible fibres. Moreover, for every $t' \in T$ we see that the induced map

$$\alpha : \mathcal{O}_{U,\xi_{t'}}^{\oplus p} \longrightarrow \mathcal{F}_{U,\xi_{t'}}$$

is an isomorphism (since by the same argument as before the module on the right is free of rank p). It follows from Lemma 34.11.1 that

$$\Gamma(U, \mathcal{O}_U^{\oplus p}) \otimes_{\Gamma(T,\mathcal{O}_T)} \mathcal{O}_{T,t'} \longrightarrow \Gamma(U, \mathcal{F}_U) \otimes_{\Gamma(T,\mathcal{O}_T)} \mathcal{O}_{T,t'}$$

[1] It is quite easy to show that H_p is a sheaf for the fppf topology using that flat morphisms of finite presentation are open. This is all we really need later on. But it is kind of fun to prove directly that it also satisfies the sheaf condition for the fpqc topology.

is injective for every $t' \in T$. Hence we see the surjection α is an isomorphism. This finishes the proof of (1).

Assume that $\mathcal{F}$ is of finite presentation. Let $T = lim_{i \in I} T_i$ be a directed limit of affine S-schemes and assume that $\mathcal{F}_T$ satisfies (34.20.7.1). Set $X_i = X_{T_i} = X \times_S T_i$ and denote $\mathcal{F}_i$ the pullback of $\mathcal{F}$ to X_i. Let $U \subset X_T$ denote the open subscheme of points where $\mathcal{F}_T$ is flat over T, see More on Morphisms, Theorem 33.11.1. By assumption every generic point of every fibre is a point of U, i.e., $U \to T$ is a smooth surjective morphism with geometrically irreducible fibres. We may shrink U a bit and assume that U is quasi-compact. Using Limits, Lemma 27.3.5 we can find an $i \in I$ and a quasi-compact open $U_i \subset X_i$ whose inverse image in X_T is U. After increasing i we may assume that $\mathcal{F}_i|_{U_i}$ is flat over T_i, see Limits, Lemma 27.6.9. In particular, $\mathcal{F}_i|_{U_i}$ is finite locally free hence defines a locally constant rank function $\rho : U_i \to \{0, 1, 2, \ldots\}$. Let $(U_i)_p \subset U_i$ denote the open and closed subset where ρ has value p. Let $V_i \subset T_i$ be the image of $(U_i)_p$; note that V_i is open and quasi-compact. By assumption the image of $T \to T_i$ is contained in V_i. Hence there exists an $i' \geq i$ such that $T_{i'} \to T_i$ factors through V_i by Limits, Lemma 27.3.5. Then $\mathcal{F}_{i'}$ satisfies (34.20.7.1) as desired. Some details omitted. □

Situation 34.20.9. Let $f : X \to S$ be a morphism of schemes which is of finite type. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module of finite type. For any scheme T over S we will denote $\mathcal{F}_T$ the base change of $\mathcal{F}$ to T, in other words, $\mathcal{F}_T$ is the pullback of $\mathcal{F}$ via the projection morphism $X_T = X \times_S T \to X$. Note that $X_T \to T$ is of finite type and that $\mathcal{F}_T$ is an $\mathcal{O}_{X_T}$-module of finite type, see Morphisms, Lemma 24.14.4 and Modules, Lemma 15.9.2. Let $n \geq 0$. We say that *$\mathcal{F}_T$ is flat over T in dimensions $\geq n$* if for every $t \in T$ the closed subset $Z \subset X_t$ of points where $\mathcal{F}_T$ is not flat over T (see Lemma 34.11.4) satisfies $\dim(Z) < n$ for all $t \in T$. Note that if this is the case, and if $T' \to T$ is a morphism, then $\mathcal{F}_{T'}$ is also flat in dimensions $\geq n$ over T', see Morphisms, Lemmas 24.24.6 and 24.27.3. Hence we obtain a functor

$$(34.20.9.1) \quad F_n : (Sch/S)^{opp} \longrightarrow Sets, \quad T \longrightarrow \begin{cases} \{*\} & \text{if } \mathcal{F}_T \text{ is flat over } T \text{ in } \dim \geq n, \\ \emptyset & \text{else.} \end{cases}$$

Lemma 34.20.10. *In Situation 34.20.9.*

(1) *The functor F_n satisfies the sheaf property for the fpqc topology.*
(2) *If f is quasi-compact and locally of finite presentation and $\mathcal{F}$ is of finite presentation, then the functor F_n is limit preserving.*

Proof. Let $\{T_i \to T\}_{i \in I}$ be an fpqc covering of schemes over S. Set $X_i = X_{T_i} = X \times_S T_i$ and denote $\mathcal{F}_i$ the pullback of $\mathcal{F}$ to X_i. Assume that $\mathcal{F}_i$ is flat over T_i in dimensions $\geq n$ for all i. Let $t \in T$. Choose an index i and a point $t_i \in T_i$ mapping to t. Consider the cartesian diagram

$$\begin{tikzcd} X_{Spec(\mathcal{O}_{T,t})} \arrow[d] & X_{Spec(\mathcal{O}_{T_i,t_i})} \arrow[l] \arrow[d] \\ Spec(\mathcal{O}_{T,t}) & Spec(\mathcal{O}_{T_i,t_i}) \arrow[l] \end{tikzcd}$$

As the lower horizontal morphism is flat we see from More on Morphisms, Lemma 33.11.2 that the set $Z_i \subset X_{t_i}$ where $\mathcal{F}_i$ is not flat over T_i and the set $Z \subset X_t$ where $\mathcal{F}_T$ is not flat over T are related by the rule $Z_i = Z_{\kappa(t_i)}$. Hence we see that $\mathcal{F}_T$ is flat over T in dimensions $\geq n$ by Morphisms, Lemma 24.27.3.

Assume that f is quasi-compact and locally of finite presentation and that $\mathcal{F}$ is of finite presentation. In this paragraph we first reduce the proof of (2) to the case where f is of finite presentation. Let $T = lim_{i\in I} T_i$ be a directed limit of affine S-schemes and assume that $\mathcal{F}_T$ is flat in dimensions $\geq n$. Set $X_i = X_{T_i} = X \times_S T_i$ and denote $\mathcal{F}_i$ the pullback of $\mathcal{F}$ to X_i. We have to show that $\mathcal{F}_i$ is flat in dimensions $\geq n$ for some i. Pick $i_0 \in I$ and replace I by $\{i \mid i \geq i_0\}$. Since T_{i_0} is affine (hence quasi-compact) there exist finitely many affine opens $W_j \subset S$, $j = 1, \ldots, m$ and an affine open overing $T_{i_0} = \bigcup_{j=1,\ldots,m} V_{j,i_0}$ such that $T_{i_0} \to S$ maps V_{j,i_0} into W_j. For $i \geq i_0$ denote $V_{j,i}$ the inverse image of V_{j,i_0} in T_i. If we can show, for each j, that there exists an i such that $\mathcal{F}_{V_{j,i_0}}$ is flat in dimensions $\geq n$, then we win. In this way we reduce to the case that S is affine. In this case X is quasi-compact and we can choose a finite affine open covering $X = W_1 \cup \ldots \cup W_m$. In this case the result for $(X \to S, \mathcal{F})$ is equivalent to the result for $(\coprod W_j, \coprod \mathcal{F}|_{W_j})$. Hence we may assume that f is of finite presentation.

Assume f is of finite presentation and $\mathcal{F}$ is of finite presentation. Let $U \subset X_T$ denote the open subscheme of points where $\mathcal{F}_T$ is flat over T, see More on Morphisms, Theorem 33.11.1. By assumption the dimension of every fibre of $Z = X_T \setminus U$ over T has dimension $\leq n$. By Limits, Lemma 27.11.2 we can find a closed subscheme $Z \subset Z' \subset X_T$ such that $\dim(Z'_t) < n$ for all $t \in T$ and such that $Z' \to X_T$ is of finite presentation. By Limits, Lemmas 27.6.1 and 27.6.5 there exists an $i \in I$ and a closed subscheme $Z'_i \subset X_i$ of finite presentation whose base change to T is Z'. By Limits, Lemma 27.11.1 we may assume all fibres of $Z'_i \to T_i$ have dimension $< n$. By Limits, Lemma 27.6.9 we may assume that $\mathcal{F}_i|_{X_i \setminus T'_i}$ is flat over T_i. This implies that $\mathcal{F}_i$ is flat in dimensions $\geq n$; here we use that $Z' \to X_T$ is of finite presentation, and hence the complement $X_T \setminus Z'$ is quasi-compact! Thus part (2) is proved and the proof of the lemma is complete. □

Situation 34.20.11. Let $f : X \to S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. For any scheme T over S we will denote $\mathcal{F}_T$ the base change of $\mathcal{F}$ to T, in other words, $\mathcal{F}_T$ is the pullback of $\mathcal{F}$ via the projection morphism $X_T = X \times_S T \to X$. Since the base change of a flat module is flat we obtain a functor

$$F_{flat} : (Sch/S)^{opp} \longrightarrow Sets, \quad T \longrightarrow \begin{cases} \{*\} & \text{if } \mathcal{F}_T \text{ is flat over } T, \\ \emptyset & \text{else.} \end{cases} \tag{34.20.11.1}$$

Lemma 34.20.12. *In Situation 34.20.11.*

(1) *The functor F_{flat} satisfies the sheaf property for the fpqc topology.*
(2) *If f is quasi-compact and locally of finite presentation and $\mathcal{F}$ is of finite presentation, then the functor F_{flat} is limit preserving.*

Proof. Part (1) follows from the following statement: If $T' \to T$ is a surjective flat morphism of schemes over S, then $\mathcal{F}_{T'}$ is flat over T' if and only if $\mathcal{F}_T$ is flat over T, see More on Morphisms, Lemma 33.11.2. Part (2) follows from Limits, Lemma 27.6.9 after reducing to the case where X and S are affine (compare with the proof of Lemma 34.20.10). □

34.21. Flattening stratifications

Just the definitions and an important baby case.

Definition 34.21.1. Let $X \to S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. We say that the *universal flattening of $\mathcal{F}$ exists* if the functor F_{flat} defined in Situation 34.20.11 is representable by a scheme S' over S. We say that the *universal flattening of X exists* if the universal flattening of $\mathcal{O}_X$ exists.

Note that if the universal flattening S'[2] of $\mathcal{F}$ exists, then the morphism $S' \to S$ is a monomorphism of schemes such that $\mathcal{F}_{S'}$ is flat over S' and such that a morphism $T \to S$ factors through S' if and only if $\mathcal{F}_T$ is flat over T.

A *stratification $\{S_i\}_{i \in I}$ of S by locally closed subschemes* is given by locally closed subschemes $S_i \subset S$ such that every point of S is contained in a unique S_i. In this case we obtain a monomorphism

$$S' = \coprod\nolimits_{i \in I} S_i \longrightarrow S.$$

We will call this the *monomorphism associated to the stratification*. With this terminology we can define what it means to have a flattening stratification.

Definition 34.21.2. Let $X \to S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. We say that $\mathcal{F}$ has a *flattening stratification* if the functor F_{flat} defined in Situation 34.20.11 is representable by a monomorphism $S' \to S$ associated to a stratification of S by locally closed subschemes. We say that X has a *flattening stratification* if $\mathcal{O}_X$ has a flattening stratification.

Of course in this situation it is important to understand the index set for the strata in the stratification. This often has to do with ranks of modules, as in the baby case below.

Lemma 34.21.3. *Let S be a scheme. Let $\mathcal{F}$ be a finite type, quasi-coherent $\mathcal{O}_S$-module. Let $r \geq 0$. The functor*

$$F_r : (Sch/S)^{opp} \to Sets, \quad T \mapsto \begin{cases} \{*\} & \text{if} \quad \mathcal{F}_T \text{ locally free rank } r \\ \emptyset & \text{else.} \end{cases}$$

is representable by a monomorphism $S_r \to S$ of schemes. If $\mathcal{F}$ is of finite presentation, then $S_r \to S$ is of finite presentation.

Proof. We refer to the chapter on exercises for more information on *fitting ideals*. Let

$$\mathcal{I}_0 \subset \mathcal{I}_1 \subset \mathcal{I}_2 \subset \ldots \subset \mathcal{O}_S$$

be the fitting ideals of $\mathcal{F}$ as an $\mathcal{O}_S$-module. If $U \subset X$ is open, and

$$\bigoplus\nolimits_{i \in I} \mathcal{O}_U \to \mathcal{O}_U^{\oplus n} \to \mathcal{F}|_U \to 0$$

is a presentation of $\mathcal{F}$ over U, then $\mathcal{I}_k|_U$ is generated by the $(n-k) \times (n-k)$-minors of the matrix defining the first arrow of the presentation. In particular, $\mathcal{I}_k$ is locally generated by sections, whence quasi-coherent. For any morphism $g : T \to S$ we see that $\mathcal{F}_T$ is locally free of rank r if and only if $\mathcal{I}_r \cdot \mathcal{O}_T = \mathcal{O}_T$ and $\mathcal{I}_{r-1} \cdot \mathcal{O}_T = 0$. Hence, letting $Z_k \subset S$ denote the closed subscheme defined by $\mathcal{I}_k$ we see that $S_r = Z_r \setminus Z_{r-1}$ works. If $\mathcal{F}$ is of finite presentation, then each of the morphisms $Z_k \to X$ is of finite presentation as $\mathcal{I}_k$ is locally generated by finitely many minors. This implies that $Z_k \setminus Z_{r-1}$ is a retrocompact open in Z_k and hence the morphism $S_r \to Z_r$ is of finite presentation as well. $\square$

Lemma 34.21.4. *Let S be a scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_S$-module of finite presentation. There exists a flattening stratification $S' = \coprod_{r \geq 0} S_r$ for $\mathcal{F}$ (relative to $id_S : S \to S$) such that $\mathcal{F}|_{S_r}$ is locally free of rank r. Moreover, each $S_r \to S$ is of finite presentation.*

---

[2]The scheme S' is sometimes called the *universal flatificator*. In [**GR71**] it is called the *platificateur universel*. Existence of the universal flattening should not be confused with the type of results discussed in More on Algebra, Section 12.19.

Proof. Suppose that $g : T \to S$ is a morphism of schemes such that the pullback $\mathcal{F}_T = g^*\mathcal{F}$ is flat. Then $\mathcal{F}_T$ is a flat $\mathcal{O}_T$-module of finite presentation. Hence $\mathcal{F}_T$ is finite locally free, see Properties, Lemma 23.18.2. Thus $T = \coprod_{r \geq 0} T_r$, where $\mathcal{F}_T|_{T_r}$ is locally free of rank r. This implies that

$$F_{flat} = \coprod\nolimits_{r \geq 0} F_r$$

in the category of Zariski sheaves on Sch/S. Hence it follows that F_{flat} is represented by $\coprod_{r \geq 0} S_r$ where S_r is as in Lemma 34.21.3. □

34.22. Flattening stratification over an Artinian ring

A flatting stratification exists when the base scheme is the spectrum of an Artinian ring.

Lemma 34.22.1. *Let S be the spectrum of an Artinian ring. For any scheme X over S, and any quasi-coherent $\mathcal{O}_X$-module there exists a universal flattening. In fact the universal flattening is given by a closed immersion $S' \to S$, and hence is a flattening stratification for $\mathcal{F}$ as well.*

Proof. Choose an affine open covering $X = \bigcup U_i$. Then F_{flat} is the product of the functors associated to each of the pairs $(U_i, \mathcal{F}|_{U_i})$. Hence it suffices to prove the result for each $(U_i, \mathcal{F}|_{U_i})$. In the affine case the lemma follows immediately from More on Algebra, Lemma 12.12.2. □

34.23. Flattening a map

Theorem 34.23.3 is the key to further flattening statements.

Lemma 34.23.1. *Let S be a scheme. Let $g : X' \to X$ be a flat morphism of schemes over S with X locally of finite type over S. Let $\mathcal{F}$ be a finite type $\mathcal{O}_X$-module which is flat over S. If $Ass_{X/S}(\mathcal{F}) \subset g(X')$ then the canonical map*

$$\mathcal{F} \longrightarrow g_*g^*\mathcal{F}$$

is injective, and remains injective after any base change.

Proof. The final assertion means that $\mathcal{F}_T \to (g_T)_*g_T^*\mathcal{F}_T$ is injective for any morphism $T \to S$. The assumption $\text{Ass}_{X/S}(\mathcal{F}) \subset g(X')$ is preserved by base change, see Divisors, Lemma 26.7.2 and Remark 26.7.3. The same holds for the assumption of flatness and finite type. Hence it suffices to prove the injectivity of the displayed arrow. Let $\mathcal{K} = \text{Ker}(\mathcal{F} \to g_*g^*\mathcal{F})$. Our goal is to prove that $\mathcal{K} = 0$. In order to do this it suffices to prove that $\text{WeakAss}_X(\mathcal{K}) = \emptyset$, see Divisors, Lemma 26.5.5. We have $\text{WeakAss}_X(\mathcal{K}) \subset \text{WeakAss}_X(\mathcal{F})$, see Divisors, Lemma 26.5.4. As $\mathcal{F}$ is flat we see from Lemma 34.13.4 that $\text{WeakAss}_X(\mathcal{F}) \subset \text{Ass}_{X/S}(\mathcal{F})$. By assumption any point x of $\text{Ass}_{X/S}(\mathcal{F})$ is the image of some $x' \in X'$. Since g is flat the local ring map $\mathcal{O}_{X,x} \to \mathcal{O}_{X',x'}$ is faithfully flat, hence the map

$$\mathcal{F}_x \longrightarrow g^*\mathcal{F}_{x'} = \mathcal{F}_x \otimes_{\mathcal{O}_{X,x}} \mathcal{O}_{X',x'}$$

is injective (see Algebra, Lemma 7.76.11). This implies that $\mathcal{K}_x = 0$ as desired. □

Lemma 34.23.2. *Let A be a ring. Let $u : M \to N$ be a surjective map of A-modules. If M is projective as an A-module, then there exists an ideal $I \subset A$ such that for any ring map $\varphi : A \to B$ the following are equivalent*

(1) *$u \otimes 1 : M \otimes_A B \to N \otimes_A B$ is an isomorphism, and*
(2) *$\varphi(I) = 0$.*

Proof. As M is projective we can find a projective A-module C such that $F = M \oplus C$ is a free R-module. By replacing u by $u \oplus 1 : F = M \oplus C \to N \oplus C$ we see that we may assume M is free. In this case let I be the ideal of A generated by coefficients of all the elements of $\text{Ker}(u)$ with respect to some (fixed) basis of M. The reason this works is that, since u is surjective and $\otimes_A B$ is right exact, $\text{Ker}(u \otimes 1)$ is the image of $\text{Ker}(u) \otimes_A B$ in $M \otimes_A B$. □

Theorem 34.23.3. *In Situation 34.20.1 assume*

(1) *f is of finite presentation,*
(2) *$\mathcal{F}$ is of finite presentation, flat over S, and pure relative to S, and*
(3) *u is surjective.*

Then F_{iso} is representable by a closed immersion $Z \to S$. Moreover $Z \to S$ is of finite presentation if $\mathcal{G}$ is of finite presentation.

Proof. We will use without further mention that $\mathcal{F}$ is universally pure over S, see Lemma 34.18.3. By Lemma 34.20.2 and Descent, Lemma 31.33.2 and 31.35.1 the question is local for the étale topology on S. Hence it suffices to prove, given $s \in S$, that there exists an étale neighbourhood of (S, s) so that the theorem holds.

Using Lemma 34.12.5 and after replacing S by an elementary étale neighbourhood of s we may asume there exists a commutative diagram

$$\begin{tikzcd} X \arrow[dr] & & X' \arrow[ll, "g"'] \arrow[dl] \\ & S & \end{tikzcd}$$

of schemes of finite presentation over S, where g is étale, $X_s \subset g(X')$, the schemes X' and S are affine, $\Gamma(X', g^*\mathcal{F})$ a projective $\Gamma(S, \mathcal{O}_S)$-module. Note that $g^*\mathcal{F}$ is universally pure over S, see Lemma 34.17.4. Hence by Lemma 34.18.2 we see that the open $g(X')$ contains the points of $\text{Ass}_{X/S}(\mathcal{F})$ lying over $Spec(\mathcal{O}_{S,s})$. Set

$$E = \{t \in S \mid \text{Ass}_{X_t}(\mathcal{F}_t) \subset g(X')\}.$$

By More on Morphisms, Lemma 33.18.5 E is a constructible subset of S. We have seen that $Spec(\mathcal{O}_{S,s}) \subset E$. By Morphisms, Lemma 24.21.4 we see that E contains an open neighbourhood of s. Hence after replacing S by a smaller affine neighbourhood of s we may assume that $\text{Ass}_{X/S}(\mathcal{F}) \subset g(X')$.

Since we have assumed that u is surjective we have $F_{iso} = F_{inj}$. From Lemma 34.23.1 it follows that $u : \mathcal{F} \to \mathcal{G}$ is injective if and only if $g^*u : g^*\mathcal{F} \to g^*\mathcal{G}$ is injective, and the same remains true after any base change. Hence we have reduced to the case where, in addition to the assumptions in the theorem, $X \to S$ is a morphism of affine schemes and $\Gamma(X, \mathcal{F})$ is a projective $\Gamma(S, \mathcal{O}_S)$-module. This case follows immediately from Lemma 34.23.2.

To see that Z is of finite presentation if $\mathcal{G}$ is of finite presentation, combine Lemma 34.20.2 part (3) with Limits, Remark 27.4.2. □

Lemma 34.23.4. *Let $f : X \to S$ be a morphism of schemes which is of finite presentation, flat, and pure. Let Y be a closed subscheme of X. Let $F = f_*Y$ be the Weil restriction functor of Y along f, defined by*

$$F : (Sch/S)^{opp} \to Sets, \quad T \mapsto \begin{cases} \{*\} & \text{if} \quad Y_T \to X_T \text{ is an isomorphism,} \\ \emptyset & \text{else.} \end{cases}$$

Then F is representable by a closed immersion $Z \to S$. Moreover $Z \to S$ is of finite presentation if $Y \to S$ is.

Proof. Let $\mathcal{I}$ be the ideal sheaf defining Y in X and let $u : \mathcal{O}_X \to \mathcal{O}_X/\mathcal{I}$ be the surjection. Then for an S-scheme T, the closed immersion $Y_T \to X_T$ is an isomorphism if and only if u_T is an isomorphism. Hence the result follows from Theorem 34.23.3. $\square$

34.24. Flattening in the local case

In this section we start applying the earlier material to obtain a shadow of the flattening stratification.

Theorem 34.24.1. *In Situation 34.20.3 assume that B is essentially of finite type over A and that M is a finite B-module. Then there exists an ideal $I \subset A$ such that A/I corepresents the functor F_{lf} on the category $\mathcal{C}$. In other words given a local homomorphism of local rings $\varphi : A \to A'$ with $B' = B \otimes_A A'$ and $M' = M \otimes_A A'$ the following are equivalent:*

(1) $\forall \mathfrak{q} \in V(\mathfrak{m}_{A'}B' + \mathfrak{m}_B B') \subset Spec(B') : M'_{\mathfrak{q}}$ *is flat over A', and*
(2) $\varphi(I) = 0$.

If B is essentially of finite presentation over A and M of finite presentation over B, then I is a finitely generated ideal.

Proof. Choose a finite type ring map $A \to C$ and a finite C-module N and a prime $\mathfrak{q}$ of C such that $B = C_{\mathfrak{q}}$ and $M = N_{\mathfrak{q}}$. In the following, when we say ``the theorem holds for $(N/C/A, \mathfrak{q})$ we mean that it holds for $(A \to B, M)$ where $B = C_{\mathfrak{q}}$ and $M = N_{\mathfrak{q}}$. By Lemma 34.20.6 the functor F_{lf} is unchanged if we replace B by a local ring flat over B. Hence, since A is henselian, we may apply Lemma 34.7.6 and assume that there exists a complete dévissage of $N/C/A$ at $\mathfrak{q}$.

Let $(A_i, B_i, M_i, \alpha_i, \mathfrak{q}_i)_{i=1,\ldots,n}$ be such a complete dévissage of $N/C/A$ at $\mathfrak{q}$. Let $\mathfrak{q}'_i \subset A_i$ be the unique prime lying over $\mathfrak{q}_i \subset B_i$ as in Definition 34.7.4. Since $C \to A_1$ is surjective and $N \cong M_1$ as C-modules, we see by Lemma 34.20.5 it suffices to prove the theorem holds for $(M_1/A_1/A, \mathfrak{q}'_1)$. Since $B_1 \to A_1$ is finite and $\mathfrak{q}_1$ is the only prime of B_1 over $\mathfrak{q}'_1$ we see that $(A_1)_{\mathfrak{q}'_1} \to (B_1)_{\mathfrak{q}_1}$ is finite (see Algebra, Lemma 7.36.11 or More on Morphisms, Lemma 33.31.4). Hence by Lemma 34.20.5 it suffices to prove the theorem holds for $(M_1/B_1/A, \mathfrak{q}_1)$.

At this point we may assume, by induction on the length n of the dévissage, that the theorem holds for $(M_2/B_2/A, \mathfrak{q}_2)$. (If $n = 1$, then $M_2 = 0$ which is flat over A.) Reversing the last couple of steps of the previous paragraph, using that $M_2 \cong \mathrm{Coker}(\alpha_2)$ as B_1-modules, we see that the theorem holds for $(\mathrm{Coker}(\alpha_1)/B_1/A, \mathfrak{q}_1)$.

Let A' be an object of $\mathcal{C}$. At this point we use Lemma 34.11.1 to see that if $(M_1 \otimes_A A')_{\mathfrak{q}'}$ is flat over A' for a prime $\mathfrak{q}'$ of $B_1 \otimes_A A'$ lying over $\mathfrak{m}_{A'}$, then $(\mathrm{Coker}(\alpha_1) \otimes_A A')_{\mathfrak{q}'}$ is flat over A'. Hence we conclude that F_{lf} is a subfunctor of the functor F'_{lf} associated to the module $\mathrm{Coker}(\alpha_1)_{\mathfrak{q}_1}$ over $(B_1)_{\mathfrak{q}_1}$. By the previous paragraph we know F'_{lf} is corepresented by A/J for some ideal $J \subset A$. Hence we may replace A by A/J and assume that $\mathrm{Coker}(\alpha_1)_{\mathfrak{q}_1}$ is flat over A.

Since $\mathrm{Coker}(\alpha_1)$ is a B_1-module for which there exist a complete dévissage of $N_1/B_1/A$ at $\mathfrak{q}_1$ and since $\mathrm{Coker}(\alpha_1)_{\mathfrak{q}_1}$ is flat over A by Lemma 34.11.2 we see that $\mathrm{Coker}(\alpha_1)$ is free as an A-module, in particular flat as an A-module. Hence Lemma 34.11.1 implies $F_{lf}(A')$ is nonempty if and only if $\alpha \otimes 1_{A'}$ is injective. Let $N_1 = \mathrm{Im}(\alpha_1) \subset M_1$ so that we have exact sequences

$$0 \to N_1 \to M_1 \to \mathrm{Coker}(\alpha_1) \to 0 \quad \text{and} \quad B_1^{\oplus r_1} \to N_1 \to 0$$

The flatness of $\text{Coker}(\alpha_1)$ implies the first sequence is universally exact (see Algebra, Lemma 7.76.5). Hence $\alpha \otimes 1_{A'}$ is injective if and only if $B_1^{\oplus r_1} \otimes_A A' \to N_1 \otimes_A A'$ is an isomorphism. Finally, Theorem 34.23.3 applies to show this functor is corepresentable by A/I for some ideal I and we conclude F_{lf} is corepresentable by A/I also.

To prove the final statement, suppose that $A \to B$ is essentially of finite presentation and M of finite presentation over B. Let $I \subset A$ be the ideal such that F_{lf} is corepresented by A/I. Write $I = \bigcup I_\lambda$ where I_λ ranges over the finitely generated ideals contained in I. Then, since $F_{lf}(A/I) = \{*\}$ we see that $F_{lf}(A/I_\lambda) = \{*\}$ for some λ, see Lemma 34.20.4 part (2). Clearly this implies that $I = I_\lambda$. □

Remark 34.24.2. Here is a scheme theoretic reformulation of Theorem 34.24.1. Let $(X, x) \to (S, s)$ be a morphism of pointed schemes which is locally of finite type. Let $\mathcal{F}$ be a finite type quasi-coherent $\mathcal{O}_X$-module. Assume S henselian local with closed point s. There exists a closed subscheme $Z \subset S$ with the following property: for any morphism of pointed schemes $(T, t) \to (S, s)$ the following are equivalent

1. $\mathcal{F}_T$ is flat over T at all points of the fibre X_t which map to $x \in X_s$, and
2. $Spec(\mathcal{O}_{T,t}) \to S$ factors through Z.

Moreover, if $X \to S$ is of finite presentation at x and $\mathcal{F}_x$ of finite presentation over $\mathcal{O}_{X,x}$, then $Z \to S$ is of finite presentation.

At this point we can obtain some very general results completely for free from the result above. Note that perhaps the most interesting case is when $T = X_s$!

Lemma 34.24.3. *Let S be the spectrum of a henselian local ring with closed point s. Let $X \to S$ be a morphism of schemes which is locally of finite type. Let $\mathcal{F}$ be a finite type quasi-coherent $\mathcal{O}_X$-module. Let $T \subset X_s$ be a subset. There exists a closed subscheme $Z \subset S$ with the following property: for any morphism of pointed schemes $(T, t) \to (S, s)$ the following are equivalent*

1. *$\mathcal{F}_T$ is flat over T at all points of the fibre X_t which map to a point of $T \subset X_s$, and*
2. *$Spec(\mathcal{O}_{T,t}) \to S$ factors through Z.*

Moreover, if $X \to S$ is locally of finite presentation, $\mathcal{F}$ is of finite presentation, and $T \subset X_s$ is closed and quasi-compact, then $Z \to S$ is of finite presentation.

Proof. For $x \in X_s$ denote $Z_x \subset S$ the closed subscheme we found in Remark 34.24.2. Then it is clear that $Z = \bigcap_{x \in T} Z_x$ works!

To prove the final statement assume X locally of finite presentation, $\mathcal{F}$ of finite presentation and Z closed and quasi-compact. First, choose finitely many affine opens $W_j \subset X$ such that $T \subset \bigcup W_j$. It clearly suffices to prove the result for each morphism $W_j \to S$ with sheaf $\mathcal{F}|_{X_j}$ and closed subset $T \cap W_j$. Hence we may assume X is affine. In this case, More on Algebra, Lemma 12.14.4 shows that the functor defined by (1) is ``limit preserving''. Hence we can show that $Z \to S$ is of finite presentation exactly as in the last part of the proof of Theorem 34.24.1. □

Remark 34.24.4. Tracing the proof of Lemma 34.24.3 to its origins we find a long and winding road. But if we assume that

1. f is of finite type,
2. $\mathcal{F}$ is a finite type $\mathcal{O}_X$-module,
3. $T = X_s$, and
4. S is the spectrum of a Noetherian complete local ring.

then there is a proof relying completely on more elementary algebra as follows: first we reduce to the case where X is affine by taking a finite affine open cover. In this case Z exists by More on Algebra, Lemma 12.15.3. The key step in this proof is constructing the closed subscheme Z step by step inside the truncations $Spec(\mathcal{O}_{S,s}/\mathfrak{m}_s^n)$. This relies on the fact that flattening stratifications always exist when the base is Artinian, and the fact that $\mathcal{O}_{S,s} = lim\, \mathcal{O}_{S,s}/\mathfrak{m}_s^n$.

34.25. Flat finite type modules, Part III

The following lemma improves Algebra, Lemma 7.119.4.

Lemma 34.25.1. *Let $\varphi : A \to B$ be a local ring homomorphism of local rings which is essentially of finite type. Let M be a flat A-module, N a finite B-module and $u : N \to M$ an A-module map such that $\overline{u} : N/\mathfrak{m}_A N \to M/\mathfrak{m}_A M$ is injective. Then u is A-universally injective, N is of finite presentation over B, and N is flat over A.*

Proof. Let $A \to A^h$ be the henselization of A. Let B' be the localization of $B \otimes_A A^h$ at the maximal ideal $\mathfrak{m}_B \otimes A^h + B \otimes \mathfrak{m}_{A^h}$. Since $B \to B'$ is flat (hence faithfully flat, see Algebra, Lemma 7.35.16), we may replace $A \to B$ with $A^h \to B'$, M by $M \otimes_A A^h$, and N by $N \otimes_B B'$, see Algebra, Lemmas 7.77.2 and 7.35.8. Thus we may and do assume that A is a henselian local ring.

Write $B = C/I$ where C is the localization of a polynomial algebra over A at a prime. If we can show that N is finitely presented as a C-module, then a fortiori this shows that N is finitely presented as a B-module (see discussion in Section 34.2; more precisely, see Algebra, Lemma 7.6.4). Hence we may assume that B is essentially of finite presentation over A (even the localization of a polynomial algebra). Next, write $N = B^{\oplus n}/K$ for some submodule $K \subset B^{\oplus n}$. Since $B/\mathfrak{m}_A B$ is Noetherian (as it is essentially of finite type over a field), there exist finitely many elements $k_1, \ldots, k_s \in K$ such that for $K' = \sum Bk_i$ and $N' = B^{\oplus n}/K'$ the canonical surjection $N' \to N$ induces an isomorphism $N'/\mathfrak{m}_A N' \cong N/\mathfrak{m}_A N$. Thus, if we can prove the lemma for the composition $u' : N' \to M$, then u' is injective, hence $N' = N$ and N is of finite presentation. In this way we reduce to the case where N is of finite presentation over B!

Assume A is a henselian local ring, B is essentially of finite presentation over A, N of finite presentation over B and let us temporarily make the additional assumption that N is flat over A. Then N is a filtered colimit $N = colim_i\, F_i$ of free A-modules F_i such that the transition maps $u_{ii'} : F_i \to F_{i'}$ are injective modulo $\mathfrak{m}_A$, see Lemma 34.19.5. Each of the compositions $u_i : F_i \to M$ is A-universally injective by Lemma 34.8.5 wherefore $u = colim\, u_i$ is A-universally injective as desired.

Assume A is a henselian local ring, B is essentially of finite presentation over A, N of finite presentation over B. By Theorem 34.24.1 there exists a finitely generated ideal $I \subset A$ such that N/IN is flat over A/I and such that N/I^2N is not flat over A/I^2 unless $I = 0$. The result of the previous paragraph shows that the lemma holds for u mod $I : N/IN \to M/IM$ over A/I. Consider the commutative diagram

$$\begin{tikzcd}
0 \arrow[r] & M \otimes_A I/I^2 \arrow[r] & M/I^2M \arrow[r] & M/IM \arrow[r] & 0 \\
& N \otimes_A I/I^2 \arrow[r] \arrow[u, "u"] & N/I^2N \arrow[r] \arrow[u, "u"] & N/IN \arrow[r] \arrow[u, "u"] & 0
\end{tikzcd}$$

whose rows are exact by right exactness of $\otimes$ and the fact that M is flat over A. Note that the left vertical arrow is the map $N/IN \otimes_{A/I} I/I^2 \to M/IM \otimes_{A/I} I/I^2$, hence is injective. A diagram chase shows that the lower left arrow is injective, i.e., $\mathrm{Tor}^1_{A/I^2}(I/I^2, M/I^2) = 0$ see Algebra, Remark 7.69.8. Hence N/I^2N is flat over A/I^2 by Algebra, Lemma 7.91.8 a contradiction unless $I = 0$. □

Theorem 34.25.2. *Let $f : X \to S$ be locally of finite type. Let $\mathcal{F}$ be an $\mathcal{O}_X$-module of finite type. Let $x \in X$ with image $s \in S$. The following are equivalent*

1. *$\mathcal{F}$ is flat at x over S, and*
2. *for every $x' \in Ass_{X_s}(\mathcal{F}_s)$ which specializes to x we have that $\mathcal{F}$ is flat at x' over S.*

Proof. It is clear that (1) implies (2) as $\mathcal{F}_{x'}$ is a localization of $\mathcal{F}_x$ for every point which specializes to x. Set $A = \mathcal{O}_{S,s}$, $B = \mathcal{O}_{X,x}$ and $N = \mathcal{F}_x$. Let $\Sigma \subset B$ be the multiplicative subset of B of elements which act as nonzero divisors on $N/\mathfrak{m}_AN$. Assumption (2) implies that $\Sigma^{-1}N$ is A-flat by the description of $Spec(\Sigma^{-1}N)$ in Lemma 34.8.1. On the other hand, the map $N \to \Sigma^{-1}N$ is injective modulo $\mathfrak{m}_A$ by construction. Hence applying Lemma 34.25.1 we win. □

Now we apply this directly to obtain the following useful results.

Lemma 34.25.3. *Let S be a local scheme with closed point s. Let $f : X \to S$ be locally of finite type. Let $\mathcal{F}$ be a finite type $\mathcal{O}_X$-module. Assume that*

1. *every point of $\mathrm{Ass}_{X/S}(\mathcal{F})$ specializes to a point of the closed fibre X_s[3],*
2. *$\mathcal{F}$ is flat over S at every point of X_s.*

Then $\mathcal{F}$ is flat over S.

Proof. This is immediate from the fact that it suffices to check for flatness at points of the relative assassin of $\mathcal{F}$ over S by Theorem 34.25.2. □

34.26. Universal flattening

If $f : X \to S$ is a proper, finitely presented morphism of schemes then one can find a universal flattening of f. In this section we discuss this and some of its variants.

Lemma 34.26.1. *In Situation 34.20.7. For each $p \geq 0$ the functor H_p (34.20.7.2) is representable by a locally closed immersion $S_p \to S$. If $\mathcal{F}$ is of finite presentation, then $S_p \to S$ is of finite presentation.*

Proof. For each S we will prove the statement for all $p \geq 0$ concurrently. The functor H_p is a sheaf for the fppf topology by Lemma 34.20.8. Hence combining Descent, Lemma 31.35.1, More on Morphisms, Lemma 33.35.1 , and Descent, Lemma 31.20.1 we see that the question is local for the étale topology on S. In particular, the question is Zariski local on S.

For $s \in S$ denote ξ_s the unique generic point of the fibre X_s. Note that for every $s \in S$ the restriction $\mathcal{F}_s$ of $\mathcal{F}$ is locally free of some rank $p(s) \geq 0$ in some neighbourhood of ξ_s. (As X_s is irreducible and smooth this follows from generic flatness for $\mathcal{F}_s$ over X_s, see Algebra, Lemma 7.109.1 allthough this is overkill.) For future reference we note that

$$p(s) = \dim_{\kappa(\xi_s)}(\mathcal{F}_{\xi_s} \otimes_{\mathcal{O}_{X,\xi_s}} \kappa(\xi_s)).$$

[3]For example this holds if f is finite type and $\mathcal{F}$ is pure along X_s, or if f is proper.

In particular $H_{p(s)}(s)$ is nonempty and $H_q(s)$ is empty if $q \neq p(s)$.

Let $U \subset X$ be an open subscheme. As $f : X \to S$ is smooth, it is open. It is immediate from (34.20.7.2) that the functor H_p for the pair $(f|_U : U \to f(U), \mathcal{F}|_U)$ and the functor H_p for the pair $(f|_{f^{-1}(f(U))}, \mathcal{F}|_{f^{-1}(f(U))})$ are the same. Hence to prove the existence of S_p over $f(U)$ we may always replace X by U.

Pick $s \in S$. There exists an affine open neighbourhood U of ξ_s such that $\mathcal{F}|_U$ can be generated by at most $p(s)$ elements. By the arguments above we see that in order to prove the statement for $H_{p(s)}$ in an neighbourhood of s we may assume that $\mathcal{F}$ is generated by $p(s)$ elements, i.e., that there exists a surjection

$$u : \mathcal{O}_X^{\oplus p(s)} \longrightarrow \mathcal{F}$$

In this case it is clear that $H_{p(s)}$ is equal to F_{iso} (34.20.1.1) for the map u (this follows immediately from Lemma 34.19.1 but also from Lemma 34.12.1 after shrinking a bit more so that both S and X are affine.) Thus we may apply Theorem 34.23.3 to see that $H_{p(s)}$ is representable by a closed immersion in a neighbourhood of s.

The result follows formally from the above. Namely, the arguments above show that locally on S the function $s \mapsto p(s)$ is bounded. Hence we may use induction on $p = \max_{s \in S} p(s)$. The functor H_p is representable by a closed immersion $S_p \to S$ by the above. Replace S by $S \setminus S_p$ which drops the maximum by at least one and we win by induction hypothesis.

To see that $S_p \to S$ is of finite presentation if $\mathcal{F}$ is of finite presentation combine Lemma 34.20.8 part (2) with Limits, Remark 27.4.2. □

Lemma 34.26.2. *In Situation 34.20.9. Let $h : X' \to X$ be an étale morphism. Set $\mathcal{F}' = h^*\mathcal{F}$ and $f' = f \circ h$. Let F'_n be (34.20.9.1) associated to $(f' : X' \to S, \mathcal{F}')$. Then F_n is a subfunctor of F'_n and if $h(X') \supset Ass_{X/S}(\mathcal{F})$, then $F_n = F'_n$.*

Proof. Let $T \to S$ be any morphism. Then $h_T : X'_T \to X_T$ is étale as a base change of the étale morphism g. For $t \in T$ denote $Z \subset X_t$ the set of points where $\mathcal{F}_T$ is not flat over T, and similarly denote $Z' \subset X'_t$ the set of points where $\mathcal{F}'_T$ is not flat over T. As $\mathcal{F}'_T = h_T^*\mathcal{F}_T$ we see that $Z' = h_t^{-1}(Z)$, see Morphisms, Lemma 24.24.11. Hence $Z' \to Z$ is an étale morphism, so $\dim(Z') \leq \dim(Z)$ (for example by Descent, Lemma 31.17.2 or just because an étale morphism is smooth of relative dimension 0). This implies that $F_n \subset F'_n$.

Finally, suppose that $h(X') \supset \mathrm{Ass}_{X/S}(\mathcal{F})$ and that $T \to S$ is a morphism such that $F'_n(T)$ is nonempty, i.e., such that $\mathcal{F}'_T$ is flat in dimensions $\geq n$ over T. Pick a point $t \in T$ and let $Z \subset X_t$ and $Z' \subset X'_t$ be as above. To get a contradiction assume that $\dim(Z) \geq n$. Pick a generic point $\xi \in Z$ corresponding to a component of dimension $\geq n$. Let $x \in \mathrm{Ass}_{X_t}(\mathcal{F}_t)$ be a generalization of ξ. Then x maps to a point of $\mathrm{Ass}_{X/S}(\mathcal{F})$ by Divisors, Lemma 26.7.2 and Remark 26.7.3. Thus we see that x is in the image of h_T, say $x = h_T(x')$ for some $x' \in X'_T$. But $x' \notin Z'$ as $x \rightsquigarrow \xi$ and $\dim(Z') < n$. Hence $\mathcal{F}'_T$ is flat over T at x' which implies that $\mathcal{F}_T$ is flat at x over T (by Morphisms, Lemma 24.24.11). Since this holds for every such x we conclude that $\mathcal{F}_T$ is flat over T at ξ by Theorem 34.25.2 which is the desired contradiction. □

Lemma 34.26.3. *Assume that $X \to S$ is a smooth morphism of affine schemes with geometrically irreducible fibres of dimension d and that $\mathcal{F}$ is a quasi-coherent $\mathcal{O}_X$-module of finite presentation. Then $F_d = \coprod_{p=0,\ldots,c} H_p$ for some $c \geq 0$ with F_d as in (34.20.9.1) and H_p as in (34.20.7.2).*

Proof. As X is affine and $\mathcal{F}$ is quasi-coherent of finite presentation we know that $\mathcal{F}$ can be generated by $c \geq 0$ elements. Then $\dim_{\kappa(x)}(\mathcal{F}_x \otimes \kappa(x))$ in any point $x \in X$ never exceeds c. In particular $H_p = \emptyset$ for $p > c$. Moreover, note that there certainly is an inclusion $\coprod H_p \to F_d$. Having said this the content of the lemma is that, if a base change $\mathcal{F}_T$ is flat in dimensions $\geq d$ over T and if $t \in T$, then $\mathcal{F}_T$ is free of some rank r in an open neighbourhood $U \subset X_T$ of the unique generic point of X_t. (Namely, it then follows that H_r contains an open neighbourhood of t.) To prove this we may replace T by S. Let $s \in S$ and let $\xi \in X$ be the unique generic point of X_s. The assumption that $\mathcal{F}$ is flat in dimensions $\geq d$ over S means that $\mathcal{F}_\xi$ is flat over $\mathcal{O}_{S,s}$. Pick $\alpha : \mathcal{O}_X^{\oplus r} \to \mathcal{F}$ which induces an isomorphism of fibres $\kappa(\xi)^{\oplus r} \to \mathcal{F}_\xi \otimes \kappa(\xi)$ at ξ, see Lemma 34.12.1. The same lemma implies, since $\mathcal{F}_\xi$ is flat over $\mathcal{O}_{S,s}$, that α is an isomorphism in an open neighbourhood of ξ and we win. $\square$

Lemma 34.26.4. *In Situation 34.20.9. Let $s \in S$ let $d \geq 0$. Assume*

(1) *there exists a complete dévisage of $\mathcal{F}/X/S$ over some point $s \in S$,*
(2) *X is of finite presentation over S,*
(3) *$\mathcal{F}$ is an $\mathcal{O}_X$-module of finite presentation, and*
(4) *$\mathcal{F}$ is flat in dimensions $\geq d + 1$ over S.*

Then after possibly replacing S by an open neighbourhood of s the functor F_d (34.20.9.1) is representable by a monomorphism $Z_d \to S$ of finite presentation.

Proof. A preliminary remark is that X, S are affine schemes and that it suffices to prove F_d is representable by a closed subscheme on the category of affine schemes over S. Hence throughout the proof of the lemma we work in the category of affine schemes over S.

Let $(Z_k, Y_k, i_k, \pi_k, \mathcal{G}_k, \alpha_k)_{k=1,\ldots,n}$ be a complete dévissage of $\mathcal{F}/X/S$ over s, see Definition 34.6.1. We will use induction on the length n of the dévissage. Recall that $Y_k \to S$ is smooth with geometrically irreducible fibres, see Definition 34.5.1. Let d_k be the relative dimension of Y_k over S. Recall that $i_{k,*}\mathcal{G}_k = \mathrm{Coker}(\alpha_k)$ and that i_k is a closed immersion. By the definitions referenced above we have $d_1 = \dim(\mathrm{Supp}(\mathcal{F}_s))$ and

$$d_k = \dim(\mathrm{Supp}(\mathrm{Coker}(\alpha_{k-1})_s)) = \dim(\mathrm{Supp}(\mathcal{G}_{k,s}))$$

for $k = 2, \ldots, n$. It follows that $d_1 > d_2 > \ldots > d_n \geq 0$ because α_k is an isomorphism in the generic point of $(Y_k)_s$.

Note that i_1 is a closed immersion and $\mathcal{F} = i_{1,*}\mathcal{G}_1$. Hence for any morphism of schemes $T \to S$ with T affine, we have $\mathcal{F}_T = i_{1,T,*}\mathcal{G}_{1,T}$ and $i_{1,T}$ is still a closed immersion of schemes over T. Thus $\mathcal{F}_T$ is flat in dimensions $\geq d$ over T if and only if $\mathcal{G}_{1,T}$ is flat in dimensions $\geq d$ over T. Because $\pi_1 : Z_1 \to Y_1$ is finite we see in the same manner that $\mathcal{G}_{1,T}$ is flat in dimensions $\geq d$ over T if and only if $\pi_{1,T,*}\mathcal{G}_{1,T}$ is flat in dimensions $\geq d$ over T. The same arguments work for ``flat in dimensions $\geq d + 1$'' and we conclude in particular that $\pi_{1,*}\mathcal{G}_1$ is flat over S in dimensions $\geq d + 1$ by our assumption on $\mathcal{F}$.

Suppose that $d_1 > d$. It follows from the discussion above that in particular $\pi_{1,*}\mathcal{G}_1$ is flat over S at the generic point of $(Y_1)_s$. By Lemma 34.12.1 we may replace S by an affine neighbourhood of s and assume that α_1 is S-universally injective. Because α_1 is S-universally injective, for any morphism $T \to S$ with T affine, we have a short exact sequence

$$0 \to \mathcal{O}_{Y_{1,T}}^{\oplus r_1} \to \pi_{1,T,*}\mathcal{G}_{1,T} \to \mathrm{Coker}(\alpha_1)_T \to 0$$

and still the first arrow is T-unversally injective. Hence the set of points of $(Y_1)_T$ where $\pi_{1,T,*}\mathcal{G}_{1,T}$ is flat over T is the same as the set of points of $(Y_1)_T$ where $\mathrm{Coker}(\alpha_1)_T$ is flat over

S. In this way the question reduces to the sheaf $\text{Coker}(\alpha_1)$ which has a complete dévissage of length $n-1$ and we win by induction.

If $d_1 < d$ then F_d is represented by S and we win.

The last case is the case $d_1 = d$. This case follows from a combination of Lemma 34.26.3 and Lemma 34.26.1. □

Theorem 34.26.5. *In Situation 34.20.9. Assume moreover that f is of finite presentation, that $\mathcal{F}$ is an $\mathcal{O}_X$-module of finite presentation, and that $\mathcal{F}$ is pure relative to S. Then F_n is representable by a monomorphism $Z_n \to S$ of finite presentation.*

Proof. The functor F_n is a sheaf for the fppf topology by Lemma 34.20.10. Hence combining Descent, Lemma 31.35.1, More on Morphisms, Lemma 33.35.1 , and Descent, Lemmas 31.19.29 and 31.19.11 we see that the question is local for the étale topology on S.

In particular the situation is local for the Zariski toplogy on S and we may assume that S is affine. In this case the dimension of the fibres of f is bounded above, hence we see that F_n is representable for n large enough. Thus we may use descending induction on n. Suppose that we know F_{n+1} is representable by a monomorphism $Z_{n+1} \to S$ of finite presentation. Consider the base change $X_{n+1} = Z_{n+1} \times_S X$ and the pullback $\mathcal{F}_{n+1}$ of $\mathcal{F}$ to X_{n+1}. The morphism $Z_{n+1} \to S$ is quasi-finite as it is a monomorphism of finite presentation, hence Lemma 34.16.4 implies that $\mathcal{F}_{n+1}$ is pure relative to Z_{n+1}. Since F_n is a subfunctor of F_{n+1} we conclude that in order to prove the result for F_n it suffices to prove the result for the corresponding functor for the situation $\mathcal{F}_{n+1}/X_{n+1}/Z_{n+1}$. In this way we reduce to proving the result for F_n in case $S_{n+1} = S$, i.e., we may assume that $\mathcal{F}$ is flat in dimensions $\geq n+1$ over S.

Fix n and assume $\mathcal{F}$ is flat in dimensions $\geq n+1$ over S. To finish the proof we have to show that F_n is representable by a monomorphism $Z_n \to S$ of finite presentation. Since the question is local in the étale topology on S it suffices to show that for every $s \in S$ there exists an elementary étale neighbourhood $(S', s') \to (S, s)$ such that the result holds after base change to S'. Thus by Lemma 34.6.8 we may assume there exist étale morphisms $h_j : Y_j \to X$, $j = 1, \ldots, m$ such that for each i there exists a complete dévissage of $\mathcal{F}_j/Y_j/S$ over s, where $\mathcal{F}_j$ is the pullback of $\mathcal{F}$ to Y_j and such that $X_s \subset \bigcup h_j(Y_j)$. Note that by Lemma 34.26.2 the sheaves $\mathcal{F}_j$ are still flat over in dimensions $\geq n+1$ over S. Set $W = \bigcup h_j(Y_j)$, which is a quasi-compact open of X. As $\mathcal{F}$ is pure along X_s we see that

$$E = \{t \in S \mid \text{Ass}_{X_t}(\mathcal{F}_t) \subset W\}.$$

contains all generalizations of s. By More on Morphisms, Lemma 33.18.5 E is a constructible subset of S. We have seen that $Spec(\mathcal{O}_{S,s}) \subset E$. By Morphisms, Lemma 24.21.4 we see that E contains an open neighbourhood of s. Hence after shrinking S we may assume that $E = S$. It follows from Lemma 34.26.2 that it suffices to prove the lemma for the functor F_n associated to $X = \coprod Y_j$ and $\mathcal{F} = \coprod \mathcal{F}_j$. If $F_{j,n}$ denotes the functor for $Y_j \to S$ and the sheaf $\mathcal{F}_i$ we see that $F_n = \prod F_{j,n}$. Hence it suffices to prove each $F_{j,n}$ is representable by some monomorphism $Z_{j,n} \to S$ of finite presentation, since then

$$Z_n = Z_{1,n} \times_S \ldots \times_S Z_{m,n}$$

Thus we have reduced the theorem to the special case handled in Lemma 34.26.4. □

We make explicit what the theorem means in terms of universal flattenings in the following lemma.

Lemma 34.26.6. *Let $f : X \to S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module.*

(1) *If f is of finite presentation, $\mathcal{F}$ is an $\mathcal{O}_X$-module of finite presentation, and $\mathcal{F}$ is pure relative to S, then there exists a universal flattening $S' \to S$ of $\mathcal{F}$. Moreover $S' \to S$ is a monomorphism of finite presentation.*
(2) *If f is of finite presentation and X is pure relative to S, then there exists a universal flattening $S' \to S$ of X. Moreover $S' \to S$ is a monomorphism of finite presentation.*
(3) *If f is proper and of finite presentation and $\mathcal{F}$ is an $\mathcal{O}_X$-module of finite presentation, then there exists a universal flattening $S' \to S$ of $\mathcal{F}$. Moreover $S' \to S$ is a monomorphism of finite presentation.*
(4) *If f is proper and of finite presentation then there exists a universal flattening $S' \to S$ of X.*

Proof. These statements follow immediately from Theorem 34.26.5 applied to $F_0 = F_{flat}$ and the fact that if f is proper then $\mathcal{F}$ is automatically pure over the base, see Lemma 34.17.1. □

CHAPTER 35

Groupoid Schemes

35.1. Introduction

This chapter is devoted to generalities concering groupoid schemes. See for example the beautiful paper [**KM97a**] by Keel and Mori.

35.2. Notation

Let S be a scheme. If U, T are schemes over S we denote $U(T)$ for the set of T-valued points of U *over* S. In a formula: $U(T) = Mor_S(T, U)$. We try to reserve the letter T to denote a ``test scheme'' over S, as in the discussion that follows. Suppose we are given schemes X, Y over S and a morphism of schemes $f : X \to Y$ over S. For any scheme T over S we get an induced map of sets

$$f : X(T) \longrightarrow Y(T)$$

which as indicated we denote by f also. In fact this construction is functorial in the scheme T/S. Yoneda's Lemma, see Categories, Lemma 4.3.5, says that f determines and is determined by this transformation of functors $f : h_X \to h_Y$. More generally, we use the same notation for maps between fibre products. For example, if X, Y, Z are schemes over S, and if $m : X \times_S Y \to Z \times_S Z$ is a morphism of schemes over S, then we think of m as corresponding to a collection of maps between T-valued points

$$X(T) \times Y(T) \longrightarrow Z(T) \times Z(T).$$

And so on and so forth.

We continue our convention to label projection maps starting with index 0, so we have $\mathrm{pr}_0 : X \times_S Y \to X$ and $\mathrm{pr}_1 : X \times_S Y \to Y$.

35.3. Equivalence relations

Recall that a *relation* R on a set A is just a subset of $R \subset A \times A$.We usually write aRb to indicate $(a, b) \in R$. We say the relation is *transitive* if $aRb, bRc \Rightarrow aRc$. We say the relation is *reflexive* if aRa for all $a \in A$. We say the relation is *symmetric* if $aRb \Rightarrow bRa$. A relation is called an *equivalence relation* if it is transitive, reflexive and symmetric.

In the setting of schemes we are going to relax the notion of a relation a little bit and just require $R \to A \times A$ to be a map. Here is the definition.

Definition 35.3.1. Let S be a scheme. Let U be a scheme over S.

1. A *pre-relation* on U over S is any morphism $j : R \to U \times_S U$. In this case we set $t = \mathrm{pr}_0 \circ j$ and $s = \mathrm{pr}_1 \circ j$, so that $j = (t, s)$.
2. A *relation* on U over S is a monomorphism $j : R \to U \times_S U$.
3. A *pre-equivalence relation* is a pre-relation $j : R \to U \times_S U$ such that the image of $j : R(T) \to U(T) \times U(T)$ is an equivalence relation for all T/S.

(4) We say a morphism $R \to U \times_S U$ is an *equivalence relation on U over S* if and only if for every T/S the T-valued points of R define an equivalence relation on the set of T-valued points of U.

In other words, an equivalence relation is a pre-equivalence relation such that j is a relation.

Lemma 35.3.2. *Let S be a scheme. Let U be a scheme over S. Let $j : R \to U \times_S U$ be a pre-relation. Let $g : U' \to U$ be a morphism of schemes. Finally, set*

$$R' = (U' \times_S U') \times_{U \times_S U} R \xrightarrow{j'} U' \times_S U'$$

Then j' is a pre-relation on U' over S. If j is a relation, then j' is a relation. If j is a pre-equivalence relation, then j' is a pre-equivalence relation. If j is an equivalence relation, then j' is an equivalence relation.

Proof. Omitted. □

Definition 35.3.3. Let S be a scheme. Let U be a scheme over S. Let $j : R \to U \times_S U$ be a pre-relation. Let $g : U' \to U$ be a morphism of schemes. The pre-relation $j' : R' \to U' \times_S U'$ is called the *restriction*, or *pullback* of the pre-relation j to U'. In this situation we sometimes write $R' = R|_{U'}$.

Lemma 35.3.4. *Let $j : R \to U \times_S U$ be a pre-relation. Consider the relation on points of the scheme U defined by the rule*

$$x \sim y \Leftrightarrow \exists\, r \in R : t(r) = x, s(r) = y.$$

If j is a pre-equivalence relation then this is an equivalence relation.

Proof. Suppose that $x \sim y$ and $y \sim z$. Pick $r \in R$ with $t(r) = x$, $s(r) = y$ and pick $r' \in R$ with $t(r') = y$, $s(r') = z$. Pick a field K fitting into the following commutative diagram

$$\begin{tikzcd} \kappa(r) \arrow[r] & K \\ \kappa(y) \arrow[u] \arrow[r] & \kappa(r') \arrow[u] \end{tikzcd}$$

Denote $x_K, y_K, z_K : Spec(K) \to U$ the morphisms

$$\begin{aligned} Spec(K) \to Spec(\kappa(r)) \to Spec(\kappa(x)) \to U \\ Spec(K) \to Spec(\kappa(r)) \to Spec(\kappa(y)) \to U \\ Spec(K) \to Spec(\kappa(r')) \to Spec(\kappa(z)) \to U \end{aligned}$$

By construction $(x_K, y_K) \in j(R(K))$ and $(y_K, z_K) \in j(R(K))$. Since j is a pre-equivalence relation we see that also $(x_K, z_K) \in j(R(K))$. This clearly implies that $x \sim z$.

The proof that $\sim$ is reflexive and symmetric is omitted. □

35.4. Group schemes

Let us recall that a *group* is a pair (G, m) where G is a set, and $m : G \times G \to G$ is a map of sets with the following properties:

(1) (associativity) $m(g, m(g', g'')) = m(m(g, g'), g'')$ for all $g, g', g'' \in G$,
(2) (identity) there exists a unique element $e \in G$ (called the *identity*, *unit*, or 1 of G) such that $m(g, e) = m(e, g) = g$ for all $g \in G$, and
(3) (inverse) for all $g \in G$ there exists a $i(g) \in G$ such that $m(g, i(g)) = m(i(g), g) = e$, where e is the identity.

Thus we obtain a map $e : \{*\} \to G$ and a map $i : G \to G$ so that the quadruple (G, m, e, i) satisfies the axioms listed above.

A *homomorphism of groups* $\psi : (G, m) \to (G', m')$ is a map of sets $\psi : G \to G'$ such that $m'(\psi(g), \psi(g')) = \psi(m(g, g'))$. This automatically insures that $\psi(e) = e'$ and $i'(\psi(g)) = \psi(i(g))$. (Obvious notation.) We will use this below.

Definition 35.4.1. Let S be a scheme.

(1) A *group scheme over* S is a pair (G, m), where G is a scheme over S and $m : G \times_S G \to G$ is a morphism of schemes over S with the following property: For every scheme T over S the pair $(G(T), m)$ is a group.
(2) A *morphism* $\psi : (G, m) \to (G', m')$ *of group schemes over* S is a morphism $\psi : G \to G'$ of schemes over S such that for every T/S the induced map $\psi : G(T) \to G'(T)$ is a homomorphism of groups.

Let (G, m) be a group scheme over the scheme S. By the discussion above (and the discussion in Section 35.2) we obtain morphisms of schemes over S: (identity) $e : S \to G$ and (inverse) $i : G \to G$ such that for every T the quadruple $(G(T), m, e, i)$ satsifies the axioms of a group listed above.

Let (G, m), (G', m') be group schemes over S. Let $f : G \to G'$ be a morphism of schemes over S. It follows from the definition that f is a morphism of group schemes over S if and only if the following diagram is commutative:

$$\begin{tikzcd}
G \times_S G \arrow[r, "f \times f"'] \arrow[d, "m"'] & G' \times_S G' \arrow[d, "m"] \\
G \arrow[r, "f"] & G'
\end{tikzcd}$$

Lemma 35.4.2. *Let (G, m) be a group scheme over S. Let $S' \to S$ be a morphism of schemes. The pullback $(G_{S'}, m_{S'})$ is a group scheme over S'.*

Proof. Omitted. $\square$

Definition 35.4.3. Let S be a scheme. Let (G, m) be a group scheme over S.

(1) A *closed subgroup scheme* of G is a closed subscheme $H \subset G$ such that $m|_{H \times_S H}$ factors through H and induces a group scheme structure on H over S.
(2) An *open subgroup scheme* of G is an open subscheme $G' \subset G$ such that $m|_{G' \times_S G'}$ factors through G' and induces a group scheme structure on G' over S.

Alternatively, we could say that H is a closed subgroup scheme of G if it is a group scheme over S endowed with a morphism of group schemes $i : H \to G$ over S which identifies H with a closed subscheme of G.

Definition 35.4.4. Let S be a scheme. Let (G, m) be a group scheme over S.

(1) We say G is a *smooth group scheme* if the structure morphism $G \to S$ is smooth.
(2) We say G is a *flat group scheme* if the structure morphism $G \to S$ is flat.
(3) We say G is a *separated group scheme* if the structure morphism $G \to S$ is separated.

Add more as needed.

35.5. Examples of group schemes

Example 35.5.1. (Multiplicative group scheme.) Consider the functor which associates to any scheme T the group $\Gamma(T, \mathcal{O}_T^*)$ of units in the global sections of the structure sheaf. This is representable by the scheme

$$\mathbf{G}_m = Spec(\mathbf{Z}[x, x^{-1}])$$

The morphism giving the group structure is the morphism

$$\begin{matrix} \mathbf{G}_m \times \mathbf{G}_m & \to & \mathbf{G}_m \\ Spec(\mathbf{Z}[x, x^{-1}] \otimes_{\mathbf{Z}} \mathbf{Z}[x, x^{-1}]) & \to & Spec(\mathbf{Z}[x, x^{-1}]) \\ \mathbf{Z}[x, x^{-1}] \otimes_{\mathbf{Z}} \mathbf{Z}[x, x^{-1}] & \leftarrow & \mathbf{Z}[x, x^{-1}] \\ x \otimes x & \leftarrow & x \end{matrix}$$

Hence we see that $\mathbf{G}_m$ is a group scheme over $\mathbf{Z}$. For any scheme S the base change $\mathbf{G}_{m,S}$ is a group scheme over S whose functor of points is

$$T/S \longmapsto \mathbf{G}_{m,S}(T) = \mathbf{G}_m(T) = \Gamma(T, \mathcal{O}_T^*)$$

as before.

Example 35.5.2. (Roots of unity.) Let $n \in \mathbf{N}$. Consider the functor which associates to any scheme T the subgroup of $\Gamma(T, \mathcal{O}_T^*)$ consisting of nth roots of unity. This is representable by the scheme

$$\mu_n = Spec(\mathbf{Z}[x]/(x^n - 1)).$$

The morphism giving the group structure is the morphism

$$\begin{matrix} \mu_n \times \mu_n & \to & \mu_n \\ Spec(\mathbf{Z}[x]/(x^n - 1) \otimes_{\mathbf{Z}} \mathbf{Z}[x]/(x^n - 1)) & \to & Spec(\mathbf{Z}[x]/(x^n - 1)) \\ \mathbf{Z}[x]/(x^n - 1) \otimes_{\mathbf{Z}} \mathbf{Z}[x]/(x^n - 1) & \leftarrow & \mathbf{Z}[x]/(x^n - 1) \\ x \otimes x & \leftarrow & x \end{matrix}$$

Hence we see that μ_n is a group scheme over $\mathbf{Z}$. For any scheme S the base change $\mu_{n,S}$ is a group scheme over S whose functor of points is

$$T/S \longmapsto \mu_{n,S}(T) = \mu_n(T) = \{f \in \Gamma(T, \mathcal{O}_T^*) \mid f^n = 1\}$$

as before.

Example 35.5.3. (Additive group scheme.) Consider the functor which associates to any scheme T the group $\Gamma(T, \mathcal{O}_T)$ of global sections of the structure sheaf. This is representable by the scheme

$$\mathbf{G}_a = Spec(\mathbf{Z}[x])$$

The morphism giving the group structure is the morphism

$$\begin{matrix} \mathbf{G}_a \times \mathbf{G}_a & \to & \mathbf{G}_a \\ Spec(\mathbf{Z}[x] \otimes_{\mathbf{Z}} \mathbf{Z}[x]) & \to & Spec(\mathbf{Z}[x]) \\ \mathbf{Z}[x] \otimes_{\mathbf{Z}} \mathbf{Z}[x] & \leftarrow & \mathbf{Z}[x] \\ x \otimes 1 + 1 \otimes x & \leftarrow & x \end{matrix}$$

Hence we see that $\mathbf{G}_a$ is a group scheme over $\mathbf{Z}$. For any scheme S the base change $\mathbf{G}_{a,S}$ is a group scheme over S whose functor of points is

$$T/S \longmapsto \mathbf{G}_{a,S}(T) = \mathbf{G}_a(T) = \Gamma(T, \mathcal{O}_T)$$

as before.

Example 35.5.4. (General linear group scheme.) Let $n \geq 1$. Consider the functor which associates to any scheme T the group

$$\mathrm{GL}_n(\Gamma(T, \mathcal{O}_T))$$

of invertible $n \times n$ matrices over the global sections of the structure sheaf. This is representable by the scheme

$$\mathrm{GL}_n = Spec(\mathbf{Z}[\{x_{ij}\}_{1 \leq i,j \leq n}][1/d])$$

where $d = \det((x_{ij}))$ with (x_{ij}) the $n \times n$ matrix with entry x_{ij} in the (i, j)-spot. The morphism giving the group structure is the morphism

$$\begin{array}{rcl} \mathrm{GL}_n \times \mathrm{GL}_n & \to & \mathrm{GL}_n \\ Spec(\mathbf{Z}[x_{ij}, 1/d] \otimes_{\mathbf{Z}} \mathbf{Z}[x_{ij}, 1/d]) & \to & Spec(\mathbf{Z}[x_{ij}, 1/d]) \\ \mathbf{Z}[x_{ij}, 1/d] \otimes_{\mathbf{Z}} \mathbf{Z}[x_{ij}, 1/d] & \leftarrow & \mathbf{Z}[x_{ij}, 1/d] \\ \sum x_{ik} \otimes x_{kj} & \leftarrow & x_{ij} \end{array}$$

Hence we see that GL_n is a group scheme over $\mathbf{Z}$. For any scheme S the base change $\mathrm{GL}_{n,S}$ is a group scheme over S whose functor of points is

$$T/S \longmapsto \mathrm{GL}_{n,S}(T) = \mathrm{GL}_n(T) = \mathrm{GL}_n(\Gamma(T, \mathcal{O}_T))$$

as before.

Example 35.5.5. The determinant defines a morphisms of group schemes

$$\det : \mathrm{GL}_n \longrightarrow \mathbf{G}_m$$

over $\mathbf{Z}$. By base change it gives a morphism of group schemes $\mathrm{GL}_{n,S} \to \mathbf{G}_{m,S}$ over any base scheme S.

Example 35.5.6. (Constant group.) Let G be an abstract group. Consider the functor which associates to any scheme T the group of locally constant maps $T \to G$ (where T has the Zariski topology and G the discrete topology). This is representable by the scheme

$$G_{Spec(\mathbf{Z})} = \coprod\nolimits_{g \in G} Spec(\mathbf{Z}).$$

The morphism giving the group structure is the morphism

$$G_{Spec(\mathbf{Z})} \times_{Spec(\mathbf{Z})} G_{Spec(\mathbf{Z})} \longrightarrow G_{Spec(\mathbf{Z})}$$

which maps the component corresponding to the pair (g, g') to the component corresponding to gg'. For any scheme S the base change G_S is a group scheme over S whose functor of points is

$$T/S \longmapsto G_S(T) = \{f : T \to G \text{ locally constant}\}$$

as before.

35.6. Properties of group schemes

In this section we collect some simple properties of group schemes which hold over any base.

Lemma 35.6.1. *Let S be a scheme. Let G be a group scheme over S. Then $G \to S$ is separated (resp. quasi-separated) if and only if the identity morphism $e : S \to G$ is a closed immersion (resp. quasi-compact).*

Proof. We recall that by Schemes, Lemma 21.21.12 we have that e is an immersion which is a closed immersion (resp. quasi-compact) if $G \to S$ is separated (resp. quasi-separated). For the converse, consider the diagram

$$\begin{tikzcd} G \arrow[r, "\Delta_{G/S}"'] \arrow[d] & G \times_S G \arrow[d, "(g,g') \mapsto m(i(g),g')"] \\ S \arrow[r, "e"] & G \end{tikzcd}$$

It is an exercise in the functorial point of view in algebraic geometry to show that this diagram is cartesian. In other words, we see that $\Delta_{G/S}$ is a base change of e. Hence if e is a closed immersion (resp. quasi-compact) so is $\Delta_{G/S}$, see Schemes, Lemma 21.18.2 (resp. Schemes, Lemma 21.19.3). □

Lemma 35.6.2. *Let S be a scheme. Let G be a group scheme over S. Let T be a scheme over S and let $\psi : T \to G$ be a morphism over S. If T is flat over S, then the morphism*

$$T \times_S G \longrightarrow G, \quad (t, g) \longmapsto m(\psi(t), g)$$

is flat. In particular, if G is flat over S, then $m : G \times_S G \to G$ is flat.

Proof. Consider the diagram

$$\begin{tikzcd} T \times_S G \arrow[r, "(t,g) \mapsto (t, m(\psi(t), g))"'] & T \times_S G \arrow[r, "\text{pr}"'] \arrow[d] & G \arrow[d] \\ & T \arrow[r] & S \end{tikzcd}$$

The left top horizontal arrow is an isomorphism and the square is cartesian. Hence the lemma follows from Morphisms, Lemma 24.24.7. □

Lemma 35.6.3. *Let (G, m, e, i) be a group scheme over the scheme S. Denote $f : G \to S$ the structure morphism. Assume f is flat. Then there exist canonical isomorphisms*

$$\Omega_{G/S} \cong f^*\mathcal{C}_{S/G} \cong f^*e^*\Omega_{G/S}$$

where $\mathcal{C}_{S/G}$ denotes the conormal sheaf of the immersion e. In particular, if S is the spectrum of a field, then $\Omega_{G/S}$ is a free $\mathcal{O}_G$-module.

Proof. In Morphisms, Section 24.32 we defined $\Omega_{G/S}$ as the conormal sheaf of the diagonal morphism $\Delta_{G/S}$. In the proof of Lemma 35.6.1 we showed that $\Delta_{G/S}$ is a base change of the immersion e by the morphism $(g, g') \mapsto m(i(g), g')$. This morphism is isomorphic to the morphism $(g, g') \mapsto m(g, g')$ hence is flat by Lemma 35.6.2. Hence we get the first isomorphism by Morphisms, Lemma 24.31.4. By Morphisms, Lemma 24.32.18 we have $\mathcal{C}_{S/G} \cong e^*\Omega_{G/S}$.

If S is the spetrum of a field, then $G \to S$ is flat, and any $\mathcal{O}_S$-module on S is free. □

35.7. Properties of group schemes over a field

In this section we collect some simple properties of group schemes over a field.

Lemma 35.7.1. *If (G, m) is a group scheme over a field k, then the multiplication map $m : G \times_k G \to G$ is open.*

Proof. The multiplication map is isomorphic to the projection map $\text{pr}_0 : G \times_k G \to G$ because the diagram

$$\begin{tikzcd} G \times_k G \arrow[r, "(g,g')\mapsto(m(g,g'),g')"'] \arrow[d, "m"] & G \times_k G \arrow[d, "(g,g')\mapsto g"] \\ G \arrow[r, "\text{id}"] & G \end{tikzcd}$$

is commutative with isomorphisms as horizontal arrows. The projection is open by Morphisms, Lemma 24.22.4. □

Lemma 35.7.2. *Let G be a group scheme over a field. Then G is a separated scheme.*

Proof. Say $S = Spec(k)$ with k a field, and let G be a group scheme over S. By Lemma 35.6.1 we have to show that $e : S \to G$ is a closed immersion. By Morphisms, Lemma 24.19.2 the image of $e : S \to G$ is a closed point of G. It is clear that $\mathcal{O}_G \to e_*\mathcal{O}_S$ is surjective, since $e_*\mathcal{O}_S$ is a skyscraper sheaf supported at the neutral element of G with value k. We conclude that e is a closed immersion by Schemes, Lemma 21.24.2. □

Lemma 35.7.3. *Let G be a group scheme over a field k. Then*

(1) *every local ring $\mathcal{O}_{G,g}$ of G has a unique minimal prime ideal,*
(2) *there is exactly one irreducible component Z of G passing through e, and*
(3) *Z is geometrically irreducible over k.*

Proof. For any point $g \in G$ there exists a field extension $k \subset K$ and a K-valued point $g' \in G(K)$ mapping to g. If we think of g' as a K-rational point of the group scheme G_K, then we see that $\mathcal{O}_{G,g} \to \mathcal{O}_{G_K,g'}$ is a faithfully flat local ring map (as $G_K \to G$ is flat, and a local flat ring map is faithfully flat, see Algebra, Lemma 7.35.16). The result for $\mathcal{O}_{G_K,g'}$ implies the result for $\mathcal{O}_{G,g}$, see Algebra, Lemma 7.27.5. Hence in order to prove (1) it suffices to prove it for k-rational points g of G. In this case translation by g defines an automorphism $G \to G$ which maps e to g. Hence $\mathcal{O}_{G,g} \cong \mathcal{O}_{G,e}$. In this way we see that (2) implies (1), since irreducible components passing through e correspond one to one with minimal prime ideals of $\mathcal{O}_{G,e}$.

In order to prove (2) and (3) it suffices to prove (2) when k is algebraically closed. In this case, let Z_1, Z_2 be two irreducible components of G passing through e. Since k is algebraically closed the closed subscheme $Z_1 \times_k Z_2 \subset G \times_k G$ is irreducible too, see Varieties, Lemma 28.6.4. Hence $m(Z_1 \times_k Z_2)$ is contained in an irreducible component of G. On the other hand it contains Z_1 and Z_2 since $m|_{e\times G} = \text{id}_G$ and $m|_{G\times e} = \text{id}_G$. We conclude $Z_1 = Z_2$ as desired. □

Remark 35.7.4. Warning: The result of Lemma 35.7.3 does not mean that every irreducible component of G/k is geometrically irreducible. For example the group scheme $\mu_{3,\mathbf{Q}} = Spec(\mathbf{Q}[x]/(x^3 - 1))$ over $\mathbf{Q}$ has two irreducible components corresponding to the factorization $x^3 - 1 = (x - 1)(x^2 + x + 1)$. The first factor corresponds to the irreducible component passing through the identity, and the second irreducible component is not geometrically irreducible over $Spec(\mathbf{Q})$.

Lemma 35.7.5. *Let G be a group scheme which is locally of finite type over a field k. Then G is equidimensional and* $\dim(G) = \dim_g(G)$ *for all $g \in G$. For any closed point $g \in G$ we have* $\dim(G) = \dim(\mathcal{O}_{G,g})$.

Proof. Let us first prove that $\dim_g(G) = \dim_{g'}(G)$ for any pair of points $g, g' \in G$. By Morphisms, Lemma 24.27.3 we may extend the ground field at will. Hence we may assume that both g and g' are defined over k. Hence there exists an automorphism of G mapping g to g', whence the equality. By Morphisms, Lemma 24.27.1 we have $\dim_g(G) = \dim(\mathcal{O}_{G,g}) + \text{trdeg}_k(\kappa(g))$. On the other hand, the dimension of G (or any open subset of G) is the supremum of the dimensions of the local rings of of G, see Properties, Lemma 23.11.4. Clearly this is maximal for closed points g in which case $\text{trdeg}_k(\kappa(g)) = 0$ (by the Hilbert Nullstellensatz, see Morphisms, Section 24.15). Hence the lemma follows. □

The following result is sometimes referred to as Cartier's theorem.

Lemma 35.7.6. *Let G be a group scheme which is locally of finite type over a field k of characteristic zero. Then the structure morphism $G \to Spec(k)$ is smooth, i.e., G is a smooth group scheme.*

Proof. By Lemma 35.6.3 the module of differentials of G over k is free. Hence smoothness follows from Varieties, Lemma 28.15.1. □

Remark 35.7.7. Any group scheme over a field of characteristic 0 is reduced, see [**Per75**, I, Theorem 1.1 and I, Corollary 3.9, and II, Theorem 2.4] and also [**Per76**, Proposition 4.2.8]. This was a question raised in [**Oor66**, page 80]. We have seen in Lemma 35.7.6 that this holds when the group scheme is locally of finite type.

Lemma 35.7.8. *Let G be a group scheme which is locally of finite type over a perfect field k of characteristic $p > 0$ (see Lemma 35.7.6 for the characteristic zero case). If G is reduced then the structure morphism $G \to Spec(k)$ is smooth, i.e., G is a smooth group scheme.*

Proof. By Lemma 35.6.3 the sheaf $\Omega_{G/k}$ is free. Hence the lemma follows from Varieties, Lemma 28.15.2. □

Remark 35.7.9. Let k be a field of characteristic $p > 0$. Let $\alpha \in k$ be an element which is not a pth power. The closed subgroup scheme

$$G = V(x^p + \alpha y^p) \subset \mathbf{G}_{a,k}^2$$

is reduced and irreducible but not smooth (not even normal).

Lemma 35.7.10. *Let G be a group scheme over a perfect field k. Then the reduction G_{red} of G is a closed subgroup scheme of G.*

Proof. Omitted. Hint: Use that $G_{red} \times_k G_{red}$ is reduced by Varieties, Lemmas 28.4.3 and 28.4.7. □

The next lemma will be generalized slightly in More on Groupoids, Lemma 36.10.2. Namely, if $G' \to G$ is a morphism of group schemes over a field whose image is open, then its image is closed.

Lemma 35.7.11. *Let G be group scheme over a field k. Let $G' \subset G$ be an open subgroup scheme. Then G' is open and closed in G.*

Proof. Suppose that $k \subset K$ is a field extension such that $G'_K \subset G_K$ is closed. Then it follows from Morphisms, Lemma 24.24.10 that G' is closed (as $G_K \to G$ is flat, quasi-compact and surjective). Hence it suffices to prove the lemma after replacing k by some extension. Choose K to be an algebraically closed field extension of very large cardinality. Then by Varieties, Lemma 28.12.2, we see that G_K is a Jacobson scheme all of whose closed points have residue field equal to K. In other words we may assume G is a Jacobson scheme all of whose closed points have residue field k.

Let $Z = G \setminus G'$. We have to show that Z is open. Because G is Jacobson and Z is closed the closed points of Z are dense in Z. Moreover any closed point $z \in Z$ is a k-rational point and hence we translation by z defines an automorphism $L_z : G \to G$, $g \mapsto m(z, g)$ with $e \mapsto z$. As G' is a subgroup scheme we conclude that $L_z(G') \subset Z$. Alltogether we see that

$$Z = \bigcup\nolimits_{z \in Z(k)} L_z(G')$$

is a union of open subsets, and hence open as desired. □

Lemma 35.7.12. *Let $i : G' \to G$ be an immersion of group schemes over a field k. Then i is a closed immersion, i.e., $i(G')$ is a closed subgroup scheme of G.*

Proof. To show that i is a closed immersion it suffices to show that $i(G')$ is a closed subset of G. Let $k \subset k'$ be a perfect extension of k. If $i(G'_{k'}) \subset G_{k'}$ is closed, then $i(G') \subset G$ is closed by Morphisms, Lemma 24.24.10 (as $G_{k'} \to G$ is flat, quasi-compact and surjective). Hence we may and do assume k is perfect. We will use without further mention that products of reduced schemes over k are reduced. We may replace G' and G by their reductions, see Lemma 35.7.10. Let $\overline{G'} \subset G$ be the closure of $i(G')$ viewed as a reduced closed subscheme. By Varieties, Lemma 28.14.1 we conclude that $\overline{G'} \times_k \overline{G'}$ is the closure of the image of $G' \times_k G' \to G \times_k G$. Hence

$$m\left(\overline{G'} \times_k \overline{G'}\right) \subset \overline{G'}$$

as m is continuous. It follows that $\overline{G'} \subset G$ is a (reduced) closed subgroup scheme. By Lemma 35.7.11 we see that $i(G') \subset \overline{G'}$ is also closed which implies that $i(G') = \overline{G'}$ as desired. □

Lemma 35.7.13. *Let G be a group scheme over a field. There exists an open and closed subscheme $G' \subset G$ which is a countable union of affines.*

Proof. Let $e \in U(k)$ be a quasi-compact open neighbourhood of the identity element. By replacing U by $U \cap i(U)$ we may assume that U is invariant under the inverse map. As G is separated this is still a quasi-compact set. Set

$$G' = \bigcup\nolimits_{n \geq 1} m_n(U \times_k \ldots \times_k U)$$

where $m_n : G \times_k \ldots \times_k G \to G$ is the n-slot multiplication map $(g_1, \ldots, g_n) \mapsto m(m(\ldots(m(g_1, g_2), g_3), \ldots), g_n)$. Each of these maps are open (see Lemma 35.7.1) hence G' is an open subgroup scheme. By Lemma 35.7.11 it is also a closed subgroup scheme. □

Remark 35.7.14. If G is a group scheme over a field, is there always a quasi-compact open and closed subgroup scheme? Or is there a counter example?

35.8. Actions of group schemes

Let (G, m) be a group and let V be a set. Recall that a *(left) action* of G on V is given by a map $a : G \times V \to V$ such that

(1) (associativity) $a(m(g, g'), v) = a(g, a(g', v))$ for all $g, g' \in G$ and $v \in V$, and
(2) (identity) $a(e, v) = v$ for all $v \in V$.

We also say that V is a *G-set* (this usually means we drop the a from the notation -- which is abuse of notation). A *map of G-sets* $\psi : V \to V'$ is any set map such that $\psi(a(g, v)) = a(g, \psi(v))$ for all $v \in V$.

Definition 35.8.1. Let S be a scheme. Let (G, m) be a group scheme over S.

(1) An *action of G on the scheme X/S* is a morphism $a : G \times_S X \to X$ over S such that for every T/S the map $a : G(T) \times X(T) \to X(T)$ defines the structure of a $G(T)$-set on $X(T)$.
(2) Suppose that X, Y are schemes over S each endowed with an action of G. An *equivariant* or more precisely a *G-equivariant* morphism $\psi : X \to Y$ is a morphism of schemes over S such that for every T/S the map $\psi : X(T) \to Y(T)$ is a morphism of $G(T)$-sets.

In situation (1) this means that the diagrams

$$\begin{tikzcd} G \times_S G \times_S X \arrow[r, "1_G \times a"'] \arrow[d, "m \times 1_X"'] & G \times_S X \arrow[d, "a"] \\ G \times_S X \arrow[r, "a"] & X \end{tikzcd} \qquad \begin{tikzcd} G \times_S X \arrow[r, "a"'] & X \\ X \arrow[u, "e \times 1_X"] \arrow[ur, "1_X"'] & \end{tikzcd} \tag{35.8.1.1}$$

are commutative. In situation (2) this just means that the diagram

$$\begin{tikzcd} G \times_S X \arrow[r, "\mathrm{id} \times f"'] \arrow[d, "a"'] & G \times_S Y \arrow[d, "a"] \\ X \arrow[r, "f"] & Y \end{tikzcd}$$

commutes.

35.9. Principal homogeneous spaces

In Cohomology on Sites, Definition 19.5.1 we have defined a torsor for a sheaf of groups on a site. Suppose $\tau \in \{Zariski, étale, smooth, syntomic, fppf\}$ is a topology and (G, m) is a group scheme over S. Since τ is stronger than the canonical topology (see Descent, Lemma 31.9.3) we see that $\underline{G}$ (see Sites, Definition 9.12.3) is a sheaf of groups on $(Sch/S)_\tau$. Hence we already know what it means to have a torsor for $\underline{G}$ on $(Sch/S)_\tau$. A special situation arises if this sheaf is representable. In the following definitions we define directly what it means for the representing scheme to be a G-torsor.

Definition 35.9.1. Let S be a scheme. Let (G, m) be a group scheme over S. Let X be a scheme over S, and let $a : G \times_S X \to X$ be an action of G on X.

(1) We say X is a *pseudo G-torsor* or that X is *formally principally homogeneous under G* if the induced morphism of schemes $G \times_S X \to X \times_S X$, $(g, x) \mapsto (a(g, x), x)$ is an isomorphism of schemes over S.
(2) A pseudo G-torsor X is called *trivial* if there exists an G-equivariant isomorphism $G \to X$ over S where G acts on G by left multiplication.

It is clear that if $S' \to S$ is a morphism of schemes then the pullback $X_{S'}$ of a pseudo G-torsor over S is a pseudo $G_{S'}$-torsor over S'.

Lemma 35.9.2. *In the situation of Definition 35.9.1.*

(1) *The scheme X is a pseudo G-torsor if and only if for every scheme T over S the set $X(T)$ is either empty or the action of the group $G(T)$ on $X(T)$ is simply transitive.*

(2) *A pseudo G-torsor X is trivial if and only if the morphism $X \to S$ has a section.*

Proof. Omitted. □

Definition 35.9.3. Let S be a scheme. Let (G, m) be a group scheme over S. Let X be a pseudo G-torsor over S.

(1) We say X is a *principal homogeneous space* or a *G-torsor* if there exists a fpqc covering[1] $\{S_i \to S\}_{i \in I}$ such that each $X_{S_i} \to S_i$ has a section (i.e., is a trivial pseudo G_{S_i}-torsor).
(2) Let $\tau \in \{Zariski, étale, smooth, syntomic, fppf\}$. We say X is a *G-torsor in the τ topology*, or a *τ G-torsor*, or simply a *τ torsor* if there exists a τ covering $\{S_i \to S\}_{i \in I}$ such that each $X_{S_i} \to S_i$ has a section.
(3) If X is a G-torsor, then we say that it is *quasi-isotrivial* if it is a torsor for the étale topology.
(4) If X is a G-torsor, then we say that it is *locally trivial* if it is a torsor for the Zariski topology.

We sometimes say ``let X be a G-torsor over S'' to indicate that X is a scheme over S equippend with an action of G which turns it into a principal homogeneous space over S. Next we show that this agrees with the notation introduced earlier when both apply.

Lemma 35.9.4. *Let S be a scheme. Let (G, m) be a group scheme over S. Let X be a scheme over S, and let $a : G \times_S X \to X$ be an action of G on X. Let $\tau \in \{Zariski, étale, smooth, syntomic, fppf\}$. Then X is a G-torsor in the τ-topology if and only if $\underline{X}$ is a $\underline{G}$-torsor on $(Sch/S)_\tau$.*

Proof. Omitted. □

Remark 35.9.5. Let (G, m) be a group scheme over the scheme S. In this situation we have the following natural types of questions:

(1) If $X \to S$ is a pseudo G-torsor and $X \to S$ is surjective, then is X necessarily a G-torsor?
(2) Is every $\underline{G}$-torsor on $(Sch/S)_{fppf}$ representable? In other words, does every $\underline{G}$-torsor come from a fppf G-torsor?
(3) Is every G-torsor an fppf (resp. smooth, resp. étale, resp. Zariski) torsor?

In general the answers to these questions is no. To get a positive answer we need to impose additional conditions on $G \to S$. For example: If S is the spectrum of a field, then the answer to (1) is yes because then $\{X \to S\}$ is a fpqc covering trivializing X. If $G \to S$ is affine, then the answer to (2) is yes (insert future reference here). If $G = \mathrm{GL}_{n,S}$ then the answer to (3) is yes and in fact any $\mathrm{GL}_{n,S}$-torsor is locally trivial (insert future reference here).

35.10. Equivariant quasi-coherent sheaves

We think of ``functions'' as dual to ``space''. Thus for a morphism of spaces the map on functions goes the other way. Moreover, we think of the sections of a sheaf of modules as ``functions''. This leads us naturally to the direction of the arrows chosen in the following definition.

[1] This means that the default type of torsor is a pseudo torsor which is trivial on an fpqc covering. This is the definition in [**ABD+66**, Exposé IV, 6.5]. It is a little bit inconvenient for us as we most often work in the fppf topology.

Definition 35.10.1. Let S be a scheme, let (G, m) be a group scheme over S, and let $a : G \times_S X \to X$ be an action of the group scheme G on X/S. An *G-equivariant quasi-coherent $\mathcal{O}_X$-module*, or simply a *equivariant quasi-coherent $\mathcal{O}_X$-module*, is a pair $(\mathcal{F}, \alpha)$, where $\mathcal{F}$ is a quasi-coherent $\mathcal{O}_X$-module, and α is a $\mathcal{O}_{G\times_S X}$-module map

$$\alpha : a^*\mathcal{F} \longrightarrow \mathrm{pr}_1^*\mathcal{F}$$

where $\mathrm{pr}_1 : G \times_S X \to X$ is the projection such that

(1) the diagram

$$\begin{tikzcd}
(1_G \times a)^*\mathrm{pr}_2^*\mathcal{F} \arrow[r, "\mathrm{pr}_{12}^*\alpha"'] & \mathrm{pr}_2^*\mathcal{F} \\
(1_G \times a)^*a^*\mathcal{F} \arrow[u, "(1_G\times a)^*\alpha"] \arrow[r, equal] & (m \times 1_X)^*a^*\mathcal{F} \arrow[u, "(m\times 1_X)^*\alpha"']
\end{tikzcd}$$

is a commutative in the category of $\mathcal{O}_{G\times_S G\times_S X}$-modules, and

(2) the pullback

$$(e \times 1_X)^*\alpha : \mathcal{F} \longrightarrow \mathcal{F}$$

is the identity map.

For explanation compare with the relevant diagrams of Equation (35.8.1.1).

Note that the commutativity of the first diagram garantees that $(e \times 1_X)^*\alpha$ is an idempotent operator on $\mathcal{F}$, and hence condition (2) is just the condition that it is an isomorphism.

Lemma 35.10.2. *Let S be a scheme. Let G be a group scheme over S. Let $f : X \to Y$ be a G-equivariant morphism between S-schemes endowed with G-actions. Then pullback f^* given by $(\mathcal{F}, \alpha) \mapsto (f^*\mathcal{F}, (1_G \times f)^*\alpha)$ defines a functor from the category of G-equivariant sheaves on X to the category of quasi-coherent G-equivariant sheaves on Y.*

Proof. Omitted. □

35.11. Groupoids

Recall that a groupoid is a category in which every morphism is an isomorphism, see Categories, Definition 4.2.5. Hence a groupoid has a set of objects Ob, a set of arrows Arrows, a *source* and *target* map s, t : Arrows $\to$ Ob, and a *composition law* c : Arrows $\times_{s,\mathrm{Ob},t}$ Arrows $\to$ Arrows. These maps satisfy exactly the following axioms

(1) (associativity) $c\circ(1, c) = c\circ(c, 1)$ as maps Arrows$\times_{s,\mathrm{Ob},t}$Arrows$\times_{s,\mathrm{Ob},t}$Arrows $\to$ Arrows,
(2) (identity) there exists a map e : Ob $\to$ Arrows such that
  (a) $s \circ e = t \circ e = \mathrm{id}$ as maps Ob $\to$ Ob,
  (b) $c \circ (1, e \circ s) = c \circ (e \circ t, 1) = 1$ as maps Arrows $\to$ Arrows,
(3) (inverse) there exists a map i : Arrows $\to$ Arrows such that
  (a) $s \circ i = t$, $t \circ i = s$ as maps Arrows $\to$ Ob, and
  (b) $c \circ (1, i) = e \circ t$ and $c \circ (i, 1) = e \circ s$ as maps Arrows $\to$ Arrows.

If this is the case the maps e and i are uniquely determined and i is a bijection. Note that if (Ob′, Arrows′, s', t', c') is a second groupoid category, then a functor f : (Ob, Arrows, s, t, c) $\to$ (Ob′, Arrows′, s', t', c') is given by a pair of set maps f : Ob $\to$ Ob′ and f : Arrows $\to$ Arrows′ such that $s' \circ f = f \circ s$, $t' \circ f = f \circ t$, and $c' \circ (f, f) = f \circ c$. The compatibility with identity and inverse is automatic. We will use this below. (Warning: The compatibility with identity has to be imposed in the case of general categories.)

Definition 35.11.1. Let S be a scheme.

(1) A *groupoid scheme over S*, or simply a *groupoid over S* is a quintuple (U, R, s, t, c) where U and R are schemes over S, and $s, t : R \to U$ and $c : R \times_{s,U,t} R \to R$ are morphisms of schemes over S with the following property: For any scheme T over S the quintuple
$$(U(T), R(T), s, t, c)$$
is a groupoid category in the sense described above.

(2) A *morphism $f : (U, R, s, t, c) \to (U', R', s', t', c')$ of groupoid schemes over S* is given by morphisms of schemes $f : U \to U'$ and $f : R \to R'$ with the following property: For any scheme T over S the maps f define a functor from the groupoid category $(U(T), R(T), s, t, c)$ to the groupoid category $(U'(T), R'(T), s', t', c')$.

Let (U, R, s, t, c) be a groupoid over S. Note that, by the remarks preceding the definition and the Yoneda lemma, there are unique morphisms of schemes $e : U \to R$ and $i : R \to R$ over S such that for every scheme T over S the induced map $e : U(T) \to R(T)$ is the identity, and $i : R(T) \to R(T)$ is the inverse of the groupoid category. The septuple (U, R, s, t, c, e, i) satisfies commutative diagrams corresponding to each of the axioms (1), (2)(a), (2)(b), (3)(a) and (3)(b) above, and conversely given a septuple with this property the quintuple (U, R, s, t, c) is a groupoid scheme. Note that i is an isomorphism, and e is a section of both s and t. Moreover, given a groupoid scheme over S we denote
$$j = (t, s) : R \longrightarrow U \times_S U$$
which is compatible with our conventions in Section 35.3 above. We sometimes say ``let (U, R, s, t, c, e, i) be a groupoid over S'' to stress the existence of identity and inverse.

Lemma 35.11.2. *Given a groupoid scheme (U, R, s, t, c) over S the morphism $j : R \to U \times_S U$ is a pre-equivalence relation.*

Proof. Omitted. This is a nice exercise in the definitions. ☐

Lemma 35.11.3. *Given an equivalence relation $j : R \to U$ over S there is a unique way to extend it to a groupoid (U, R, s, t, c) over S.*

Proof. Omitted. This is a nice exercise in the definitions. ☐

Lemma 35.11.4. *Let S be a scheme. Let (U, R, s, t, c) be a groupoid over S. In the commutative diagram*

$$\begin{tikzcd} & U & \\ R \arrow[ur, "t"] \arrow[d, "s"'] & R \times_{s,U,t} R \arrow[l, "pr_0"] \arrow[r, "c"'] \arrow[d, "pr_1"] & R \arrow[ul, "t"'] \arrow[d, "s"] \\ U & R \arrow[l, "t"] \arrow[r, "s"'] & U \end{tikzcd}$$

the two lower squares are fibre product squares. Moreover, the triangle on top (which is really a square) is also cartesian.

Proof. Omitted. Exercise in the definitions and the functorial point of view in algebraic geometry. ☐

Lemma 35.11.5. *Let S be a scheme. Let (U, R, s, t, c, e, i) be a groupoid over S. The diagram*

(35.11.5.1)
$$\begin{tikzcd} R \times_{t,U,t} R \arrow[r, shift left, "pr_1"] \arrow[r, shift right, "pr_0"'] \arrow[d, "pr_0 \times c\circ(i,1)"'] & R \arrow[r, "t"] \arrow[d, "id_R"] & U \arrow[d, "id_U"] \\ R \times_{s,U,t} R \arrow[r, shift left, "c"] \arrow[r, shift right, "pr_0"'] \arrow[d, "pr_1"'] & R \arrow[r, "t"] \arrow[d, "s"] & U \\ R \arrow[r, shift left, "s"] \arrow[r, shift right, "t"'] & U & \end{tikzcd}$$

is commutative. The two top rows are isomorphic via the vertical maps given. The two lower left squares are cartesian.

Proof. The commutativity of the diagram follows from the axioms of a groupoid. Note that, in terms of groupoids, the top left vertical arrow assigns to a pair of morphisms (α, β) with the same target, the pair of morphisms $(\alpha, \alpha^{-1} \circ \beta)$. In any groupoid this defines a bijection between Arrows $\times_{t,\mathrm{Ob},t}$ Arrows and Arrows $\times_{s,\mathrm{Ob},t}$ Arrows. Hence the second assertion of the lemma. The last assertion follows from Lemma 35.11.4. $\square$

35.12. Quasi-coherent sheaves on groupoids

See the introduction of Section 35.10 for our choices in direction of arrows.

Definition 35.12.1. Let S be a scheme, let (U, R, s, t, c) be a groupoid scheme over S. A *quasi-coherent module on* (U, R, s, t, c) is a pair $(\mathcal{F}, \alpha)$, where $\mathcal{F}$ is a quasi-coherent $\mathcal{O}_U$-module, and α is a $\mathcal{O}_R$-module map

$$\alpha : t^*\mathcal{F} \longrightarrow s^*\mathcal{F}$$

such that

(1) the diagram

$$\begin{tikzcd} & \mathrm{pr}_1^* t^*\mathcal{F} \arrow[r, "\mathrm{pr}_1^*\alpha"'] \arrow[dl, equal] & \mathrm{pr}_1^* s^*\mathcal{F} \arrow[dr, equal] & \\ \mathrm{pr}_0^* s^*\mathcal{F} & & & c^*s^*\mathcal{F} \\ & \mathrm{pr}_0^* t^*\mathcal{F} \arrow[ul, "\mathrm{pr}_0^*\alpha"] \arrow[r, equal] & c^*t^*\mathcal{F} \arrow[ur, "c^*\alpha"'] & \end{tikzcd}$$

is a commutative in the category of $\mathcal{O}_{R\times_{s,U,t}R}$-modules, and

(2) the pullback

$$e^*\alpha : \mathcal{F} \longrightarrow \mathcal{F}$$

is the identity map.

Compare with the commutative diagrams of Lemma 35.11.4.

The commutativity of the first diagram forces the operator $e^*\alpha$ to be idempotent. Hence the second condition can be reformulated as saying that $e^*\alpha$ is an isomorphism. In fact, the condition implies that α is an isomorphism.

Lemma 35.12.2. *Let S be a scheme, let (U, R, s, t, c) be a groupoid scheme over S. If $(\mathcal{F}, \alpha)$ is a quasi-coherent module on (U, R, s, t, c) then α is an isomorphism.*

Proof. Pull back the commutative diagram of Definition 35.12.1 by the morphism $(i, 1) : R \to R \times_{s,U,t} R$. Then we see that $i^*\alpha \circ \alpha = s^*e^*\alpha$. Pulling back by the morphism $(1, i)$ we obtain the relation $\alpha \circ i^*\alpha = t^*e^*\alpha$. By the second assumption these morphisms are the identity. Hence $i^*\alpha$ is an inverse of α. $\square$

Lemma 35.12.3. *Let S be a scheme. Consider a morphism $f : (U, R, s, t, c) \to (U', R', s', t', c')$ of groupoid schemes over S. Then pullback f^* given by*

$$(\mathcal{F}, \alpha) \mapsto (f^*\mathcal{F}, f^*\alpha)$$

defines a functor from the category of quasi-coherent sheaves on (U', R', s', t', c') to the category of quasi-coherent sheaves on (U, R, s, t, c).

Proof. Omitted. $\square$

Lemma 35.12.4. *Let S be a scheme. Let (U, R, s, t, c) be a groupoid scheme over S. The category of quasi-coherent modules on (U, R, s, t, c) has colimits.*

Proof. Let $i \mapsto (\mathcal{F}_i, \alpha_i)$ be a diagram over the index category $\mathcal{I}$. We can form the colimit $\mathcal{F} = colim\, \mathcal{F}_i$ which is a quasi-coherent sheaf on U, see Schemes, Section 21.24. Since colimits commute with pullback we see that $s^*\mathcal{F} = colim\, s^*\mathcal{F}_i$ and similarly $t^*\mathcal{F} = colim\, t^*\mathcal{F}_i$. Hence we can set $\alpha = colim\, \alpha_i$. We omit the proof that $(\mathcal{F}, \alpha)$ is the colimit of the diagram in the category of quasi-coherent modules on (U, R, s, t, c). $\square$

Lemma 35.12.5. *Let S be a scheme. Let (U, R, s, t, c) be a groupoid scheme over S. If s, t are flat, then the category of quasi-coherent modules on (U, R, s, t, c) is abelian.*

Proof. Let $\varphi : (\mathcal{F}, \alpha) \to (\mathcal{G}, \beta)$ be a homomorphism of quasi-coherent modules on (U, R, s, t, c). Since s is flat we see that

$$0 \to s^*\text{Ker}(\varphi) \to s^*\mathcal{F} \to s^*\mathcal{G} \to s^*\text{Coker}(\varphi) \to 0$$

is exact and similarly for pullback by t. Hence α and β induce isomorphisms $\kappa : t^*\text{Ker}(\varphi) \to s^*\text{Ker}(\varphi)$ and $\lambda : t^*\text{Coker}(\varphi) \to s^*\text{Coker}(\varphi)$ which satisfy the cocycle condition. Then it is straightforward to verify that $(\text{Ker}(\varphi), \kappa)$ and $(\text{Coker}(\varphi), \lambda)$ are a kernel and cokernel in the category of quasi-coherent modules on (U, R, s, t, c). Moreover, the condition $\text{Coim}(\varphi) = \text{Im}(\varphi)$ follows because it holds over U. $\square$

Let S be a scheme. Let (U, R, s, t, c) be a groupoid in schemes over S. Let κ be a cardinal. In the following we will say that a quasi-coherent sheaf $(\mathcal{F}, \alpha)$ on (U, R, s, t, c) is κ-generated if $\mathcal{F}$ is a κ-generated $\mathcal{O}_U$-module, see Properties, Definition 23.21.1.

Lemma 35.12.6. *Let (U, R, s, t, c) be a groupoid scheme over S. Let κ be a cardinal. There exists a set T and a family $(\mathcal{F}_t, \alpha_t)_{t \in T}$ of κ-generated quasi-coherent modules on (U, R, s, t, c) such that every κ-generated quasi-coherent module on (U, R, s, t, c) is isomorphic to one of the $(\mathcal{F}_t, \alpha_t)$.*

Proof. For each quasi-coherent module $\mathcal{F}$ on U there is a (possibly empty) set of maps $\alpha : t^*\mathcal{F} \to s^*\mathcal{F}$ such that $(\mathcal{F}, \alpha)$ is a quasi-coherent modules on (U, R, s, t, c). By Properties, Lemma 23.21.2 there exists a set of isomorphism classes of κ-generated quasi-coherent $\mathcal{O}_U$-modules. $\square$

Lemma 35.12.7. *Let (U, R, s, t, c) be a groupoid scheme over S. Assume that s, t are flat. There exists a cardinal κ such that every quasi-coherent module $(\mathcal{F}, \alpha)$ on (U, R, s, t, c) is the directed colimit of its κ-generated quasi-coherent submodules.*

Proof. In the statement of the lemma and in this proof a *submodule* of a quasi-coherent module $(\mathcal{F}, \alpha)$ is a quasi-coherent submodule $\mathcal{G} \subset \mathcal{F}$ such that $\alpha(t^*\mathcal{G}) = s^*\mathcal{G}$ as subsheaves of $s^*\mathcal{F}$. This makes sense because since s, t are flat the pullbacks s^* and t^* are exact, i.e., preserve subsheaves. The proof will be a repeat of the proof of Properties, Lemma 23.21.3. We urge the reader to read that proof first.

Choose an affine open covering $U = \bigcup_{i \in I} U_i$. For each pair i, j choose affine open coverings

$$U_i \cap U_j = \bigcup\nolimits_{k \in I_{ij}} U_{ijk} \quad \text{and} \quad s^{-1}(U_i) \cap t^{-1}(U_j) = \bigcup\nolimits_{k \in J_{ij}} W_{ijk}.$$

Write $U_i = \mathrm{Spec}(A_i)$, $U_{ijk} = \mathrm{Spec}(A_{ijk})$, $W_{ijk} = \mathrm{Spec}(B_{ijk})$. Let κ be any infinite cardinal $\geq$ than the cardinality of any of the sets I, I_{ij}, J_{ij}.

Let $(\mathcal{F}, \alpha)$ be a quasi-coherent module on (U, R, s, t, c). Set $M_i = \mathcal{F}(U_i)$, $M_{ijk} = \mathcal{F}(U_{ijk})$. Note that

$$M_i \otimes_{A_i} A_{ijk} = M_{ijk} = M_j \otimes_{A_j} A_{ijk}$$

and that α gives isomorphisms

$$\alpha|_{W_{ijk}} : M_i \otimes_{A_i, t} B_{ijk} \longrightarrow M_j \otimes_{A_j, s} B_{ijk}$$

see Schemes, Lemma 21.7.3. Using the axiom of choice we choose a map

$$(i, j, k, m) \mapsto S(i, j, k, m)$$

which associates to every $i, j \in I$, $k \in I_{ij}$ or $k \in J_{ij}$ and $m \in M_i$ a finite subset $S(i, j, k, m) \subset M_j$ such that we have

$$m \otimes 1 = \sum\nolimits_{m' \in S(i,j,k,m)} m' \otimes a_{m'} \quad \text{or} \quad \alpha(m \otimes 1) = \sum\nolimits_{m' \in S(i,j,k,m)} m' \otimes b_{m'}$$

in M_{ijk} for some $a_{m'} \in A_{ijk}$ or $b_{m'} \in B_{ijk}$. Moreover, let's agree that $S(i, i, k, m) = \{m\}$ for all $i, j = i, k, m$ when $k \in I_{ij}$. Fix such a collection $S(i, j, k, m)$

Given a family $\mathcal{S} = (S_i)_{i \in I}$ of subsets $S_i \subset M_i$ of cardinality at most κ we set $\mathcal{S}' = (S'_i)$ where

$$S'_j = \bigcup\nolimits_{(i,j,k,m) \text{ such that } m \in S_i} S(i, j, k, m)$$

Note that $S_i \subset S'_i$. Note that S'_i has cardinality at most κ because it is a union over a set of cardinality at most κ of finite sets. Set $\mathcal{S}^{(0)} = \mathcal{S}$, $\mathcal{S}^{(1)} = \mathcal{S}'$ and by induction $\mathcal{S}^{(n+1)} = (\mathcal{S}^{(n)})'$. Then set $\mathcal{S}^{(\infty)} = \bigcup_{n \geq 0} \mathcal{S}^{(n)}$. Writing $\mathcal{S}^{(\infty)} = (S_i^{(\infty)})$ we see that for any element $m \in S_i^{(\infty)}$ the image of m in M_{ijk} can be written as a finite sum $\sum m' \otimes a_{m'}$ with $m' \in S_j^{(\infty)}$. In this way we see that setting

$$N_i = A_i\text{-submodule of } M_i \text{ generated by } S_i^{(\infty)}$$

we have

$$N_i \otimes_{A_i} A_{ijk} = N_j \otimes_{A_j} A_{ijk} \quad \text{and} \quad \alpha(N_i \otimes_{A_i, t} B_{ijk}) = N_j \otimes_{A_j, s} B_{ijk}$$

as submodules of M_{ijk} or $M_j \otimes_{A_j, s} B_{ijk}$. Thus there exists a quasi-coherent submodule $\mathcal{G} \subset \mathcal{F}$ with $\mathcal{G}(U_i) = N_i$ such that $\alpha(t^*\mathcal{G}) = s^*\mathcal{G}$ as submodules of $s^*\mathcal{F}$. In other words, $(\mathcal{G}, \alpha|_{t^*\mathcal{G}})$ is a submodule of $(\mathcal{F}, \alpha)$. Moreover, by construction $\mathcal{G}$ is κ-generated.

Let $\{(\mathcal{G}_t, \alpha_t)\}_{t\in T}$ be the set of κ-generated quasi-coherent submodules of $(\mathcal{F}, \alpha)$. If $t, t' \in T$ then $\mathcal{G}_t + \mathcal{G}_{t'}$ is also a κ-generated quasi-coherent submodule as it is the image of the map $\mathcal{G}_t \oplus \mathcal{G}_{t'} \to \mathcal{F}$. Hence the system (ordered by inclusion) is directed. The arguments above show that every section of $\mathcal{F}$ over U_i is in one of the $\mathcal{G}_t$ (because we can start with $\mathcal{S}$ such that the given section is an element of S_i). Hence $colim_t \mathcal{G}_t \to \mathcal{F}$ is both injective and surjective as desired. □

35.13. Groupoids and group schemes

There are many ways to construct a groupoid out of an action a of a group G on a set V. We choose the one where we think of an element $g \in G$ as an arrow with source v and target $a(g, v)$. This leads to the following construction for group actions of schemes.

Lemma 35.13.1. *Let S be a scheme. Let Y be a scheme over S. Let (G, m) be a group scheme over Y with identity e_G and inverse i_G. Let X/Y be a scheme over Y and let $a : G \times_Y X \to X$ be an action of G on X/Y. Then we get a groupoid scheme (U, R, s, t, c, e, i) over S in the following manner:*

1. *We set $U = X$, and $R = G \times_Y X$.*
2. *We set $s : R \to U$ equal to $(g, x) \mapsto x$.*
3. *We set $t : R \to U$ equal to $(g, x) \mapsto a(g, x)$.*
4. *We set $c : R \times_{s,U,t} R \to R$ equal to $((g, x), (g', x')) \mapsto (m(g, g'), x')$.*
5. *We set $e : U \to R$ equal to $x \mapsto (e_G(x), x)$.*
6. *We set $i : R \to R$ equal to $(g, x) \mapsto (i_G(g), a(g, x))$.*

Proof. Omitted. Hint: It is enough to show that this works on the set level. For this use the description above the lemma describing g as an arrow from v to $a(g, v)$. □

Lemma 35.13.2. *Let S be a scheme. Let Y be a scheme over S. Let (G, m) be a group scheme over Y. Let X be a scheme over Y and let $a : G \times_Y X \to X$ be an action of G on X over Y. Let (U, R, s, t, c) be the groupoid scheme constructed in Lemma 35.13.1. The rule $(\mathcal{F}, \alpha) \mapsto (\mathcal{F}, \alpha)$ defines an equivalence of categories between G-equivariant $\mathcal{O}_X$-modules and the category of quasi-coherent modules on (U, R, s, t, c).*

Proof. The assertion makes sense because $t = a$ and $s = \mathrm{pr}_1$ as morphisms $R = G \times_Y X \to X$, see Definitions 35.10.1 and 35.12.1. Using the translation in Lemma 35.13.1 the commutativity requirements of the two definitions match up exactly. □

35.14. The stabilizer group scheme

Given a groupoid scheme we get a group scheme as follows.

Lemma 35.14.1. *Let S be a scheme. Let (U, R, s, t, c) be a groupoid over S. The scheme G defined by the cartesian square*

$$\begin{tikzcd} G \arrow[r] \arrow[d] & R \arrow[d, "j=(t,s)"] \\ U \arrow[r, "\Delta"] & U \times_S U \end{tikzcd}$$

is a group scheme over U with compostion law m induced by the composition law c.

Proof. This is true because in a groupoid category the set of self maps of any object forms a group. □

Since Δ is an immersion we see that $G = j^{-1}(\Delta_{U/S})$ is a locally closed subscheme of R. Thinking of it in this way, the structure morphism $j^{-1}(\Delta_{U/S}) \to U$ is induced by either s or t (it is the same), and m is induced by c.

Definition 35.14.2. Let S be a scheme. Let (U, R, s, t, c) be a groupoid over S. The group scheme $j^{-1}(\Delta_{U/S}) \to U$ is called the *stabilizer of the groupoid scheme* (U, R, s, t, c).

In the literature the stabilizer group scheme is often denoted S (because the word stabilizer starts with an ``s'' presumably); we cannot do this since we have already used S for the base scheme.

Lemma 35.14.3. *Let S be a scheme. Let (U, R, s, t, c) be a groupoid over S, and let G/U be its stabilizer. Denote R_t/U the scheme R seen as a scheme over U via the morphism $t : R \to U$. There is a canonical left action*

$$a : G \times_U R_t \longrightarrow R_t$$

induced by the composition law c.

Proof. In terms of points over T/S we define $a(g, r) = c(g, r)$. □

Lemma 35.14.4. *Let S be a scheme. Let (U, R, s, t, c) be a groupoid scheme over S. Let G be the stabilizer group scheme of R. Let*

$$G_0 = G \times_{U, pr_0} (U \times_S U) = G \times_S U$$

as a group scheme over $U \times_S U$. The action of G on R of Lemma 35.14.3 induces an action of G_0 on R over $U \times_S U$ which turns R into a pseudo G_0-torsor over $U \times_S U$.

Proof. This is true because in a groupoid category $\mathcal{C}$ the set $Mor_{\mathcal{C}}(x, y)$ is a principal homogeneous set under the group $Mor_{\mathcal{C}}(y, y)$. □

Lemma 35.14.5. *Let S be a scheme. Let (U, R, s, t, c) be a groupoid scheme over S. Let $p \in U \times_S U$ be a point. Denote R_p the scheme theoretic fibre of $j = (t, s) : R \to U \times_S U$. If $R_p \neq \emptyset$, then the action*

$$G_{0,\kappa(p)} \times_{\kappa(p)} R_p \longrightarrow R_p$$

(see Lemma 35.14.4) which turns R_p into a $G_{\kappa(p)}$-torsor over $\kappa(p)$.

Proof. The action is a pseudo-torsor by the lemma cited in the statement. And if R_p is not the empty scheme, then $\{R_p \to p\}$ is an fpqc covering which trivializs the pseudo-torsor. □

35.15. Restricting groupoids

Consider a (usual) groupoid $\mathcal{C} = (\text{Ob}, \text{Arrows}, s, t, c)$. Suppose we have a map of sets $g : \text{Ob}' \to \text{Ob}$. Then we can construct a groupoid $\mathcal{C}' = (\text{Ob}', \text{Arrows}', s', t', c')$ by thinking of a morphism between elements x', y' of Ob' as a morphisms in $\mathcal{C}$ between $g(x'), g(y')$. In other words we set

$$\text{Arrows}' = \text{Ob}' \times_{g,\text{Ob},t} \text{Arrows} \times_{s,\text{Ob},g} \text{Ob}'.$$

with obvious choices for s', t', and c'. There is a canonical functor $\mathcal{C}' \to \mathcal{C}$ which is fully faithful, but not necessarily essentially surjective. This groupoid $\mathcal{C}'$ endowed with the functor $\mathcal{C}' \to \mathcal{C}$ is called the *restriction* of the groupoid $\mathcal{C}$ to Ob'.

Lemma 35.15.1. *Let S be a scheme. Let (U, R, s, t, c) be a groupoid scheme over S. Let $g : U' \to U$ be a morphism of schemes. Consider the following diagram*

$$\begin{tikzcd}
R' \arrow[r] \arrow[d] \arrow[rr, bend left, "s'"] \arrow[dd, bend right, "t'"'] & R \times_{s,U} U' \arrow[r] \arrow[d] & U' \arrow[d, "g"] \\
U' \times_{U,t} R \arrow[r] \arrow[d] & R \arrow[r, "s"] \arrow[d, "t"] & U \\
U' \arrow[r, "g"] & U &
\end{tikzcd}$$

where all the squares are fibre product squares. Then there is a canonical composition law $c' : R' \times_{s',U',t'} R' \to R'$ such that (U', R', s', t', c') is a groupoid scheme over S and such that $U' \to U$, $R' \to R$ defines a morphism $(U', R', s', t', c') \to (U, R, s, t, c)$ of groupoid schemes over S. Moreover, for any scheme T over S the functor of groupoids

$$(U'(T), R'(T), s', t', c') \to (U(T), R(T), s, t, c)$$

is the restriction (see above) of $(U(T), R(T), s, t, c)$ via the map $U'(T) \to U(T)$.

Proof. Omitted. $\square$

Definition 35.15.2. Let S be a scheme. Let (U, R, s, t, c) be a groupoid scheme over S. Let $g : U' \to U$ be a morphism of schemes. The morphism of groupoids $(U', R', s', t', c') \to (U, R, s, t, c)$ constructed in Lemma 35.15.1 is called the *restriction of (U, R, s, t, c) to U'*. We sometime use the notation $R' = R|_{U'}$ in this case.

Lemma 35.15.3. *The notions of restricting groupoids and (pre-)equivalence relations defined in Definitions 35.15.2 and 35.3.3 agree via the constructions of Lemmas 35.11.2 and 35.11.3.*

Proof. What we are saying here is that R' of Lemma 35.15.1 is also equal to

$$R' = (U' \times_S U') \times_{U \times_S U} R \longrightarrow U' \times_S U'$$

In fact this might have been a clearer way to state that lemma. $\square$

Lemma 35.15.4. *Let S be a scheme. Let (U, R, s, t, c) be a groupoid scheme over S. Let $g : U' \to U$ be a morphism of schemes. Let (U', R', s', t', c') be the restriction of (U, R, s, t, c) via g. Let G be the stabilizer of (U, R, s, t, c) and let G' be the stabilizer of (U', R', s', t', c'). Then G' is the base change of G by g, i.e., there is a canonical identification $G' = U' \times_{g,U} G$.*

Proof. Omitted. $\square$

35.16. Invariant subschemes

In this section we discuss briefly the notion of an invariant subscheme.

Definition 35.16.1. Let (U, R, s, t, c) be a groupoid scheme over the base scheme S.

1. We say an open $W \subset U$ is *R-invariant* if $t(s^{-1}(W)) \subset W$.
2. A closed subscheme $Z \subset U$ is called *R-invariant* if $t^{-1}(Z) = s^{-1}(Z)$. Here we use the scheme theoretic inverse image, see Schemes, Definition 21.17.7.
3. A monomorphism of schemes $T \to U$ is *R-invariant* if $T \times_{U,t} R = R \times_{s,U} T$ as schemes over R.

For an open subscheme $W \subset U$ the R-invariance is also equivalent to requiring that $s^{-1}(W) = t^{-1}(W)$. If $W \subset U$ is R-equivariant then the restriction of R to W is just $R_W = s^{-1}(W) = t^{-1}(W)$. Similarly, if $Z \subset U$ is an R-invariant closed subscheme, then the restriction of R to Z is just $R_Z = s^{-1}(Z) = t^{-1}(Z)$.

Lemma 35.16.2. *Let S be a scheme. Let (U, R, s, t, c) be a groupoid scheme over S.*

(1) *If s and t are open, then for every open $W \subset U$ the open $s(t^{-1}(W))$ is R-invariant.*
(2) *If s and t are open and quasi-compact, then U has an open covering consisting of R-invariant quasi-compact open subschemes.*

Proof. Assume s and t open and $W \subset U$ open. Since s is open the set $W' = s(t^{-1}(W))$ is an open subset of U. Now it is quite easy to using the functorial point of view that this is an R-invariant open subset of U, but we are going to argue this directly by some diagrams, since we think it is instructive. Note that $t^{-1}(W')$ is the image of the morphism

$$A := t^{-1}(W) \times_{s|_{t^{-1}(W)}, U, t} R \xrightarrow{\mathrm{pr}_1} R$$

and that $s^{-1}(W')$ is the image of the morphism

$$B := R \times_{s, U, s|_{t^{-1}(W)}} t^{-1}(W) \xrightarrow{\mathrm{pr}_0} R.$$

The schemes A, B on the left of the arrows above are open subschemes of $R \times_{s,U,t} R$ and $R \times_{s,U,s} R$ respectively. By Lemma 35.11.4 the diagram

$$\begin{tikzcd} R \times_{s,U,t} R \arrow[rr, "(\mathrm{pr}_1, c)"'] \arrow[dr, "\mathrm{pr}_1"'] & & R \times_{s,U,s} R \arrow[dl, "\mathrm{pr}_0"] \\ & R & \end{tikzcd}$$

is commutative, and the horizontal arrow is an isomorphism. Moreover, it is clear that $(\mathrm{pr}_1, c)(A) = B$. Hence we conclude $s^{-1}(W') = t^{-1}(W')$, and W' is R-invariant. This proves (1).

Assume now that s, t are both open and quasi-compact. Then, if $W \subset U$ is a quasi-compact open, then also $W' = s(t^{-1}(W))$ is a quasi-compact open, and invariant by the discussion above. Letting W range over all affine opens of U we see (2). $\square$

35.17. Quotient sheaves

Let $\tau \in \{Zariski, étale, fppf, smooth, syntomic\}$. Let S be a scheme. Let $j : R \to U \times_S U$ be a pre-relation over S. Say U, R, S are objects of a τ-site Sch_τ (see Topologies, Section 30.2). Then we can consider the functors

$$h_U, h_R : (Sch/S)_\tau^{opp} \longrightarrow Sets.$$

These are sheaves, see Descent, Lemma 31.9.3. The morphism j induces a map $j : h_R \to h_U \times h_U$. For each object $T \in Ob((Sch/S)_\tau)$ we can take the equivalence relation $\sim_T$ generated by $j(T) : R(T) \to U(T) \times U(T)$ and consider the quotient. Hence we get a presheaf

$$(Sch/S)_\tau^{opp} \longrightarrow Sets, \quad T \longmapsto U(T)/\sim_T \qquad (35.17.0.1)$$

Definition 35.17.1. Let τ, S, and the pre-relation $j : R \to U \times_S U$ be as above. In this setting the *quotient sheaf* U/R associated to j is the sheafification of the presheaf (35.17.0.1) in the τ-topology. If $j : R \to U \times_S U$ comes from the action of a group scheme G/S on U as in Lemma 35.13.1 then we sometimes denote the quotient sheaf U/G.

This means exactly that the diagram

$$h_R \rightrightarrows h_U \longrightarrow U/R$$

is a coequalizer diagram in the category of sheaves of sets on $(Sch/S)_\tau$. Using the Yoneda embedding we may view $(Sch/S)_\tau$ as a full subcategory of sheaves on $(Sch/S)_\tau$ and hence identify schemes with representable functors. Using this abuse of notation we will often depict the diagram above simply

$$\begin{tikzcd} R \arrow[r, shift left, "s"] \arrow[r, shift right, "t"'] & U \arrow[r] & U/R \end{tikzcd}$$

We will mostly work with the fppf topology when considering quotient sheaves of groupoids/equivalence relations.

Definition 35.17.2. In the situation of Definition 35.17.1. We say that the pre-relation j has a *representable quotient* if the sheaf U/R is representable. We will say a groupoid (U, R, s, t, c) has a *representable quotient* if the quotient U/R with $j = (t, s)$ is representable.

The following lemma characterizes schemes M representing the quotient. It applies for example if $\tau = fppf$, $U \to M$ is flat, of finite presentation and surjective, and $R \cong U \times_M U$.

Lemma 35.17.3. *In the situation of Definition 35.17.1. Assume there is a scheme M, and a morphism $U \to M$ such that*

(1) *the morphism $U \to M$ equalizes s, t,*
(2) *the morphism $U \to M$ induces a surjection of sheaves $h_U \to h_M$ in the τ-topology, and*
(3) *the induced map $(t, s) : R \to U \times_M U$ induces a surjection of sheaves $h_R \to h_{U\times_M U}$ in the τ-topology.*

In this case M represents the quotient sheaf U/R.

Proof. Condition (1) says that $h_U \to h_M$ factors through U/R. Condition (2) says that $U/R \to h_M$ is surjective as a map of sheaves. Condition (3) says that $U/R \to h_M$ is injective as a map of sheaves. Hence the lemma follows. $\square$

The following lemma is wrong if we do not require j to be a pre-equivalence relation (but just a pre-relation say).

Lemma 35.17.4. *Let $\tau \in \{Zariski, étale, fppf, smooth, syntomic\}$. Let S be a scheme. Let $j : R \to U \times_S U$ be a pre-equivalence relation over S. Assume U, R, S are objects of a τ-site Sch_τ. For $T \in Ob((Sch/S)_\tau)$ and $a, b \in U(T)$ the following are equivalent:*

(1) *a and b map to the same element of $(U/R)(T)$, and*
(2) *there exists a τ-covering $\{f_i : T_i \to T\}$ of T and morphisms $r_i : T_i \to R$ such that $a \circ f_i = s \circ r_i$ and $b \circ f_i = t \circ r_i$.*

In other words, in this case the map of τ-sheaves

$$h_R \longrightarrow h_U \times_{U/R} h_U$$

is surjective.

Proof. Omitted. Hint: The reason this works is that the presheaf (35.17.0.1) in this case is really given by $T \mapsto U(T)/j(R(T))$ as $j(R(T)) \subset U(T) \times U(T)$ is an equivalence relation, see Definition 35.3.1. $\square$

Lemma 35.17.5. *Let $\tau \in \{Zariski, étale, fppf, smooth, syntomic\}$. Let S be a scheme. Let $j : R \to U \times_S U$ be a pre-equivalence relation over S and $g : U' \to U$ a morphism of schemes over S. Let $j' : R' \to U' \times_S U'$ be the restriction of j to U'. Assume U, U', R, S are objects of a τ-site Sch_τ. The map of quotient sheaves*

$$U'/R' \longrightarrow U/R$$

is injective. If g defines a surjection $h_{U'} \to h_U$ of sheaves in the τ-topology (for example if $\{g : U' \to U\}$ is a τ-covering), then $U'/R' \to U/R$ is an isomorphism.

Proof. Suppose $\xi, \xi' \in (U'/R')(T)$ are sections which map to the same section of U/R. Then we can find a τ-covering $\mathcal{T} = \{T_i \to T\}$ of T such that $\xi|_{T_i}, \xi'|_{T_i}$ are given by $a_i, a_i' \in U'(T_i)$. By Lemma 35.17.4 and the axioms of a site we may after refining $\mathcal{T}$ assume there exist morphisms $r_i : T_i \to R$ such that $g \circ a_i = s \circ r_i$, $g \circ a_i' = t \circ r_i$. Since by construction $R' = R \times_{U \times_S U} (U' \times_S U')$ we see that $(r_i, (a_i, a_i')) \in R'(T_i)$ and this shows that a_i and a_i' define the same section of U'/R' over T_i. By the sheaf condition this implies $\xi = \xi'$.

If $h_{U'} \to h_U$ is a surjection of sheaves, then of course $U'/R' \to U/R$ is surjective also. If $\{g : U' \to U\}$ is a τ-covering, then the map of sheaves $h_{U'} \to h_U$ is surjective, see Sites, Lemma 9.12.5. Hence $U'/R' \to U/R$ is surjective also in this case. $\square$

Lemma 35.17.6. *Let $\tau \in \{Zariski, étale, fppf, smooth, syntomic\}$. Let S be a scheme. Let (U, R, s, t, c) be a groupoid scheme over S. Let $g : U' \to U$ a morphism of schemes over S. Let (U', R', s', t', c') be the restriction of (U, R, s, t, c) to U'. Assume U, U', R, S are objects of a τ-site Sch_τ. The map of quotient sheaves*

$$U'/R' \longrightarrow U/R$$

is injective. If the composition

$$\begin{tikzcd} U' \times_{g,U,t} R \arrow[r, "pr_1"'] \arrow[rr, bend left, "h"] & R \arrow[r, "s"'] & U \end{tikzcd}$$

defines a surjection of sheaves in the τ-topology then the map is bijective. This holds for example if $\{h : U' \times_{g,U,t} R \to U\}$ is a τ-covering, or if $U' \to U$ defines a surjection of sheaves in the τ-topology, or if $\{g : U' \to U\}$ is a covering in the τ-topology.

Proof. Injectivity follows on combining Lemmas 35.11.2 and 35.17.5. To see surjectivity (see Sites, Section 9.11 for a characterization of surjective maps of sheaves) we argue as follows. Suppose that T is a scheme and $\sigma \in U/R(T)$. There exists a covering $\{T_i \to T\}$ such that $\sigma|_{T_i}$ is the image of some element $f_i \in U(T_i)$. Hence we may assume that σ if the image of $f \in U(T)$. By the assumption that h is a surjection of sheaves, we can find a τ-covering $\{\varphi_i : T_i \to T\}$ and morphisms $f_i : T_i \to U' \times_{g,U,t} R$ such that $f \circ \varphi_i = h \circ f_i$. Denote $f_i' = \text{pr}_0 \circ f_i : T_i \to U'$. Then we see that $f_i' \in U'(T_i)$ maps to $g \circ f_i' \in U(T_i)$ and that $g \circ f_i' \sim_{T_i} h \circ f_i = f \circ \varphi_i$ notation as in (35.17.0.1). Namely, the element of $R(T_i)$ giving the relation is $\text{pr}_1 \circ f_i$. This means that the restriction of σ to T_i is in the image of $U'/R'(T_i) \to U/R(T_i)$ as desired.

If $\{h\}$ is a τ-covering, then it induces a surjection of sheaves, see Sites, Lemma 9.12.5. If $U' \to U$ is surjective, then also h is surjective as s has a section (namely the neutral element e of the groupoid scheme). $\square$

35.18. Separation conditions

This really means conditions on the morphism $j : R \to U \times_S U$ when given a groupoid (U, R, s, t, c) over S. As in the previous section we first formulate the corresponding diagram.

Lemma 35.18.1. *Let S be a scheme. Let (U, R, s, t, c) be a groupoid over S. Let $G \to U$ be the stabilizer group scheme. The commutative diagram*

$$\begin{tikzcd} R \arrow[rr, "f \mapsto (f, s(f))"'] \arrow[d, "\Delta_{R/U \times_S U}"] & & R \times_{s,U} U \arrow[r] \arrow[d] & U \arrow[d] \\ R \times_{(U \times_S U)} R \arrow[rr, "(f,g) \mapsto (f, f^{-1} \circ g)"] & & R \times_{s,U} G \arrow[r] & G \end{tikzcd}$$

the two left horizontal arrows are isomorphisms and the right square is a fibre product square.

Proof. Omitted. Exercise in the definitions and the functorial point of view in algebraic geometry. $\square$

Lemma 35.18.2. *Let S be a scheme. Let (U, R, s, t, c) be a groupoid over S. Let $G \to U$ be the stabilizer group scheme.*

(1) *The following are equivalent*
   (a) *$j : R \to U \times_S U$ is separated,*
   (b) *$G \to U$ is separated, and*
   (c) *$e : U \to G$ is a closed immersion.*
(2) *The following are equivalent*
   (a) *$j : R \to U \times_S U$ is quasi-separated,*
   (b) *$G \to U$ is quasi-separated, and*
   (c) *$e : U \to G$ is quasi-compact.*

Proof. The group scheme $G \to U$ is the base change of $R \to U \times_S U$ by the diagonal morphism $U \to U \times_S U$, see Lemma 35.14.1. Hence if j is separated (resp. quasi-separated), then $G \to U$ is separated (resp. quasi-separated). (See Schemes, Lemma 21.21.13). Thus (a) $\Rightarrow$ (b) in both (1) and (2).

If $G \to U$ is separated (resp. quasi-separated), then the morphism $U \to G$, as a section of the structure morphism $G \to U$ is a closed immersion (resp. quasi-compact), see Schemes, Lemma 21.21.12. Thus (b) $\Rightarrow$ (a) in both (1) and (2).

By the result of Lemma 35.18.1 (and Schemes, Lemmas 21.18.2 and 21.19.3) we see that if e is a closed immersion (resp. quasi-compact) $\Delta_{R/U \times_S U}$ is a closed immersion (resp. quasi-compact). Thus (c) $\Rightarrow$ (a) in both (1) and (2). $\square$

35.19. Finite flat groupoids, affine case

Let S be a scheme. Let (U, R, s, t, c) be a groupoid scheme over S. Assume $U = Spec(A)$, and $R = Spec(B)$ are affine. In this case we get two ring maps $s^\sharp, t^\sharp : A \longrightarrow B$. Let C be the equalizer of $s^\sharp$ and $t^\sharp$. In a formula

$$C = \{a \in A \mid t^\sharp(a) = s^\sharp(a)\}. \tag{35.19.0.1}$$

We will sometimes call this the *ring of R-invariant functions on U*. What properties does $M = Spec(C)$ have? The first observation is that the diagram

$$\begin{tikzcd} R \arrow[r, "s"] \arrow[d, "t"'] & U \arrow[d] \\ U \arrow[r] & M \end{tikzcd}$$

is commutative, i.e., the morphism $U \to M$ equalizes s, t. Moreover, if T is any affine scheme, and if $U \to T$ is a morphism which equalizes s, t, then $U \to T$ factors through $U \to M$. In other words, $U \to M$ is a coequalizer in the category of affine schemes.

We would like to find conditions that garantee the morphism $U \to M$ is really a ``quotient" in the category of schemes. We will discuss this at length elsewhere (insert future reference here); here we just discuss some special cases. Namely, we will focus on the case where s, t are finite locally free.

Example 35.19.1. Let k be a field. Let $U = \mathrm{GL}_{2,k}$. Let $B \subset \mathrm{GL}_2$ be the closed subgroup scheme of upper triangular matrices. Then the quotient sheaf $\mathrm{GL}_{2,k}/B$ (in the Zariski, étale or fppf topology, see Definition 35.17.1) is representable by the projective line: $\mathbf{P}^1 = \mathrm{GL}_{2,k}/B$. (Details omitted.) On the other hand, the ring of invariant functions in this case is just k. Note that in this case the morphisms $s, t : R = \mathrm{GL}_{2,k} \times_k B \to \mathrm{GL}_{2,k} = U$ are smooth of relative dimension 3.

Recall that in Exercises, Exercises 65.15.6 and 65.15.7 we have defined the determinant and the norm for finitely locally free modules and finite locally free ring extensions. If $\varphi : A \to B$ is a finite locally free ring map, then we will denote $\mathrm{Norm}_\varphi(b) \in A$ the norm of $b \in B$.

Lemma 35.19.2. *Let S be a scheme. Let (U, R, s, t, c) be a groupoid scheme over S. Assume $U = Spec(A)$, and $R = Spec(B)$ are affine, and $s, t : R \to U$ finite locally free. Let C be as in (35.19.0.1). Let $f \in A$. Then $Norm_{s^\sharp}(t^\sharp(f)) \in C$.*

Proof. Consider the commutative diagram

$$\begin{tikzcd} & U & \\ R \arrow[ur, "t"] \arrow[d, "s"'] & R \times_{s,U,t} R \arrow[l, "\mathrm{pr}_0"] \arrow[r, "c"'] \arrow[d, "\mathrm{pr}_1"] & R \arrow[ul, "t"'] \arrow[d, "s"] \\ U & R \arrow[l, "t"'] \arrow[r, "s"] & U \end{tikzcd}$$

of Lemma 35.11.4. Think of $f \in \Gamma(U, \mathcal{O}_U)$. The commutativity of the top part of the diagram shows that $pr_0^\sharp(t^\sharp(f)) = c^\sharp(t^\sharp(f))$ as elements of $\Gamma(R \times_{S,U,t} R, \mathcal{O})$. Looking at the right lower cartesian square the compatibility of the norm construction with base change shows that $s^\sharp(\mathrm{Norm}_{s^\sharp}(t^\sharp(f))) = \mathrm{Norm}_{\mathrm{pr}_1}(c^\sharp(t^\sharp(f)))$. Similarly we get $t^\sharp(\mathrm{Norm}_{s^\sharp}(t^\sharp(f))) = \mathrm{Norm}_{\mathrm{pr}_1}(\mathrm{pr}_0^\sharp(t^\sharp(f)))$. Hence by the first equality of this proof we see that $s^\sharp(\mathrm{Norm}_{s^\sharp}(t^\sharp(f))) = t^\sharp(\mathrm{Norm}_{s^\sharp}(t^\sharp(f)))$ as desired. $\square$

Lemma 35.19.3. *Let S be a scheme. Let (U, R, s, t, c) be a groupoid scheme over S. Assume $s, t : R \to U$ finite locally free. Then*

$$U = \coprod\nolimits_{r \geq 1} U_r$$

is a disjoint union of R-invariant opens such that the restriction R_r of R to U_r has the property that $s, t : R_r \to U_r$ are finite locally free of rank 1.

Proof. By Morphisms, Lemma 24.44.5 there exists a decomposition $U = \coprod_{r \geq 0} U_r$ such that $s : s^{-1}(U_r) \to U_r$ is finite locally free of rank r. As s is surjective we see that $U_0 = \emptyset$. Note that $u \in U_r \Leftrightarrow$ the scheme theoretic fibre $s^{-1}(u)$ has degree r over $\kappa(u)$. Now, if $z \in R$ with $s(z) = u$ and $t(z) = u'$ then $\text{pr}_1^{-1}(z)$ see diagram of Lemma 35.11.4 is a scheme over $\kappa(z)$ which is the base change of both $s^{-1}(u)$ and $s^{-1}(u')$ via $\kappa(u) \to \kappa(z)$ and $\kappa(u') \to \kappa(z)$ by the properties of that diagram. Hence we see that the open subsets U_r are R-invariant. In particular the restricton of R to U_r is just $s^{-1}(U_r)$ and $s : R_r \to U_r$ is finite locally free of rank r. As $t : R_r \to U_r$ is isomorphic to s by the inverse of R_r we see that it has also rank r. □

Lemma 35.19.4. *Let S be a scheme. Let (U, R, s, t, c) be a groupoid scheme over S. Assume $U = Spec(A)$, and $R = Spec(B)$ are affine, and $s, t : R \to U$ finite locally free. Let $C \subset A$ be as in (35.19.0.1). Then A is integral over C.*

Proof. First, by Lemma 35.19.3 we know that (U, R, s, t, c) is a disjoint union of groupoid schemes (U_r, R_r, s, t, c) such that each $s, t : R_r \to U_r$ has constant rank r. As U is quasi-compact, we have $U_r =$ for almost all r. It suffices to prove the lemma for each (U_r, R_r, s, t, c) and hence we may assume that s, t are finite locally free of rank r.

Assume that s, t are finite locally free of rank r. Let $f \in A$. Consider the element $x - f \in A[x]$, where we think of x as the coordinate on $\mathbf{A}^1$. Since

$$(U \times \mathbf{A}^1, R \times \mathbf{A}^1, s \times \text{id}_{\mathbf{A}^1}, t \times \text{id}_{\mathbf{A}^1}, c \times \text{id}_{\mathbf{A}^1})$$

is also a groupoid scheme with finite source and target, we may apply Lemma 35.19.2 to it and we see that $P(x) = \text{Norm}_{s^\sharp}(t^\sharp(x - f))$ is an element of $C[x]$. Because $s^\sharp : A \to B$ is finite locally free of rank r we see that P is monic of degree r. Moreover $P(f) = 0$ by Cayley-Hamilton (Algebra, Lemma 7.15.1). □

Lemma 35.19.5. *Let S be a scheme. Let (U, R, s, t, c) be a groupoid scheme over S. Assume $U = Spec(A)$, and $R = Spec(B)$ are affine, and $s, t : R \to U$ finite locally free. Let $C \subset A$ be as in (35.19.0.1). Let $C \to C'$ be a ring map, and set $U' = Spec(A \otimes_C C')$, $R' = Spec(B \otimes_C C')$. Then*

1. *the maps s, t, c induce maps s', t', c' such that (U', R', s', t', c') is a groupoid scheme, and*
2. *there is a canonical map $\varphi : C' \to C^1$ of C' into the R'-invariant functions C^1 on U' with the properties*
   (a) *for every $f \in C^1$ there exists an $n > 0$ such that f^n is in the image of φ, and*
   (b) *for every $f \in Ker(\varphi)$ there exists an $n > 0$ such that $f^n = 0$.*
3. *if $C \to C'$ is flat then φ is an isomorphism.*

Proof. The proof of part (1) is omitted. Let us denote $A' = A \otimes_C C'$ and $B' = B \otimes_C C'$. Then we have

$$C^1 = \{x \in A' \mid (t')^\sharp(x) = (s')^\sharp(x)\} = \{a \in A \otimes_C C' \mid t^\sharp \otimes 1(x) = s^\sharp \otimes 1(x)\}.$$

In other words, C^1 is the kernel of the difference map $(t^\sharp - s^\sharp) \otimes 1$ which is just the base change of the C-linear map $t^\sharp - s^\sharp : A \to B$ by $C \to C'$. Hence (3) follows.

Proof of part (2)(b). Since $C \to A$ is integral (Lemma 35.19.4) and injective we see that $Spec(A) \to Spec(C)$ is surjective, see Algebra, Lemma 7.32.15. Thus also $Spec(A') \to$

$Spec(C')$ is surjective as a base change of a surjective morphism (Morphisms, Lemma 24.9.4). Hence $Spec(C^1) \to Spec(C')$ is surjective also. This implies that the kernel of φ is contained in the radical of the ring C', i.e., (2)(b) holds.

Proof of part (2)(a). By Lemma 35.19.3 we know that A is a finite product of rings A_r and B is a finite product of rings B_r such that the groupoid scheme decomposes accordingly (see the proof of Lemma 35.19.4). Then also C is a product of rings C_r and correspondingly C' decomposes as a product. Hence we may and do assume that the ring maps $s^\sharp, t^\sharp : A \to B$ are finite locally free of a fixed rank r. Let $f \in C^1 \subset A' = A \otimes_C C'$. We may replace C' by a finitely generated C-subalgebra of C' and hence we may assume that $C' = C[X_1, \ldots, X_n]/I$ for some ideal I. Choose a lift $\tilde{f} \in A \otimes_C C[X_i] = A[X_i]$ of the element f. Note that $f^r = \mathrm{Norm}_{(s')^\sharp}((t')^\sharp(f))$ in A as $t^\sharp(f) = s^\sharp(f)$. Hence we see that

$$h = \mathrm{Norm}_{s^\sharp \otimes 1}(t^\sharp \otimes 1(f)) \in A[X_i]$$

is invariant according to Lemma 35.19.2 and maps to f^r in A'. Since $C \to C[X_i]$ is flat we see from (3) that $h \in C[X_i]$. Hence it follows that f^r is in the image of φ. □

Lemma 35.19.6. *Let S be a scheme. Let (U, R, s, t, c) be a groupoid scheme over S. Assume $U = Spec(A)$, and $R = Spec(B)$ are affine, and $s, t : R \to U$ finite locally free. Let $C \subset A$ be as in (35.19.0.1). Then $U \to M = Spec(C)$ has the following properties:*

1. *the map on points $|U| \to |M|$ is surjective and $u_0, u_1 \in |U|$ map to the same point if and only if there exists a $r \in |R|$ with $t(r) = u_0$ and $s(r) = u_1$, in a formula*
$$|M| = |U|/|R|$$
2. *for any algebraically closed field k we have*
$$M(k) = U(k)/R(k)$$

Proof. Let k be an algebraically closed field. Since $C \to A$ is integral (Lemma 35.19.4) and injective we see that $Spec(A) \to Spec(C)$ is surjective, see Algebra, Lemma 7.32.15. Thus $|M| \to |U|$ is surjective. Let $C \to k$ be a ring map. Since surjective morphisms are preserved under base change (Morphisms, Lemma 24.9.4) we see that $A \otimes_C k$ is not zero. Now $k \subset A \otimes_C k$ is a nonzero integral extension. Hence any residue field of $A \otimes_C k$ is an algebraic extension of k, hence equal to k. Thus we see that $U(k) \to M(k)$ is surjective.

Let $a_0, a_1 : A \to k$ be ring maps. If there exists a ring map $b : B \to k$ such that $a_0 = b \circ t^\sharp$ and $a_1 = b \circ s^\sharp$ then we see that $a_0|_C = a_1|_C$ by definition. Conversely, suppose that $a_0|_C = a_1|_C$. Let us name this algebra map $c : C \to k$. Consider the diagram

$$\begin{tikzcd}
 & B \arrow[dl, dashed] \\
k & A \arrow[l, shift right, "a_0"'] \arrow[l, shift left, "a_1"] \arrow[u, shift left] \arrow[u, shift right] \\
 & C \arrow[ul, "c"] \arrow[u]
\end{tikzcd}$$

We are trying to construct the dotted arrow, and if we do then part (2) follows, which in turn implies part (1). Since $A \to B$ is finite and faithfully flat there exist finitely many ring maps $b_1, \ldots, b_n : B \to k$ such that $b_i \circ s^\sharp = a_1$. If the dotted arrow does not exist, then we see that none of the $a'_i = b_i \circ t^\sharp$, $i = 1, \ldots, n$ is equal to a_0. Hence the maximal ideals

$$\mathfrak{m}'_i = \mathrm{Ker}(a'_i \otimes 1 : A \otimes_C k \to k)$$

of $A \otimes_C k$ are distinct from $\mathfrak{m} = \mathrm{Ker}(a_0 \otimes 1 : A \otimes_C k \to k)$. By Algebra, Lemma 7.14.3 we would get an element $f \in A \otimes_C k$ with $f \in \mathfrak{m}$, but $f \not\in \mathfrak{m}'_i$ for $i = 1, \ldots, n$. Consider the norm

$$g = \mathrm{Norm}_{s^\sharp \otimes 1}(t^\sharp \otimes 1(f)) \in A \otimes_C k$$

By Lemma 35.19.2 this lies in the invariants $C^1 \subset A \otimes_C k$ of the base change groupoid (base change via the map $c : C \to k$). On the one hand, $a_1(g) \in k^*$ since the value of $t^\sharp(f)$ at all the points (which correspond to $b_1, \ldots, b_n$) lying over a_1 is invertible (insert future reference on property determinant here). On the other hand, since $f \in \mathfrak{m}$, we see that f is not a unit, hence $t^\sharp(f)$ is not a unit (as $t^\sharp \otimes 1$ is faithfully flat), hence its norm is not a unit (insert future reference on property determinant here). We conclude that C^1 contains an element which is not nilpotent and not a unit. We will now show that this leads to a contradiction. Namely, apply Lemma 35.19.5 to the map $c : C \to C' = k$, then we see that the map of k into the invariants C^1 is injective and moreover, that for any element $x \in C^1$ there exists an integer $n > 0$ such that $x^n \in k$. Hence every element of C^1 is either a unit or nilpotent. $\square$

Lemma 35.19.7. *Let S be a scheme. Let (U, R, s, t, c) be a groupoid scheme over S. Assume*

(1) *$U = Spec(A)$, and $R = Spec(B)$ are affine, and*
(2) *there exist elements $x_i \in A$, $i \in I$ such that $B = \bigoplus_{i \in I} s^\sharp(A)t^\sharp(x_i)$.*

Then $A = \bigoplus_{i \in I} Cx_i$, and $B \cong A \otimes_C A$ where $C \subset A$ is the R-invariant functions on U as in (35.19.0.1).

Proof. During this proof we will write $s, t : A \to B$ instead of $s^\sharp, t^\sharp$, and similarly $c : B \to B \otimes_{s,A,t} B$. We write $p_0 : B \to B \otimes_{s,A,t} B$, $b \mapsto b \otimes 1$ and $p_1 : B \to B \otimes_{s,A,t} B$, $b \mapsto 1 \otimes b$. By Lemma 35.11.5 and the definition of C we have the following commutative diagram

$$\begin{tikzcd}
B \otimes_{s,A,t} B & B \arrow[l, shift right, "c"'] \arrow[l, shift left, "p_0"] & A \arrow[l, "t"] \\
B \arrow[u, "p_1"] & A \arrow[l, shift right, "s"'] \arrow[l, shift left, "t"] \arrow[u, "s"] & C \arrow[l] \arrow[u]
\end{tikzcd}$$

Moreover the tow left squares are cocartesian in the category of rings, and the top row is isomorphic to the diagram

$$\begin{tikzcd}
B \otimes_{t,A,t} B & B \arrow[l, shift right, "p_1"'] \arrow[l, shift left, "p_0"] & A \arrow[l, "t"]
\end{tikzcd}$$

which is an equalizer diagram according to Descent, Lemma 31.3.6 because condition (2) implies in particular that s (and hence also then isomorphic arrow t) is faithfully flat. The lower row is an equalizer diagram by definition of C. We can use the x_i and get a commutative diagram

$$\begin{tikzcd}
B \otimes_{s,A,t} B & B \arrow[l, shift right, "c"'] \arrow[l, shift left, "p_0"] & A \arrow[l, "t"] \\
\bigoplus_{i \in I} Bx_i \arrow[u, "p_1"] & \bigoplus_{i \in I} Ax_i \arrow[l, shift right, "s"'] \arrow[l, shift left, "t"] \arrow[u, "s"] & \bigoplus_{i \in I} Cx_i \arrow[l] \arrow[u]
\end{tikzcd}$$

where in the right vertical arrow we map x_i to x_i, in the middle vertical arrow we map x_i to $t(x_i)$ and in the left vertical arrow we map x_i to $c(t(x_i)) = t(x_i) \otimes 1 = p_0(t(x_i))$

(equality by the commutativity of the top part of the diagram in Lemma 35.11.4). Then the diagram commutes. Moreover the middle vertical arrow is an isomorphism by assumption. Since the left two squares are cocartesian we conclude that also the left vertical arrow is an isomorphism. On the other hand, the horizontal rows are exact (i.e., they are equalizers). Hence we conclude that also the right vertical arrow is an isomorphism. □

Proposition 35.19.8. *Let S be a scheme. Let (U, R, s, t, c) be a groupoid scheme over S. Assume*

(1) *$U = Spec(A)$, and $R = Spec(B)$ are affine,*
(2) *$s, t : R \to U$ finite locally free, and*
(3) *$j = (t, s)$ is an equivalence.*

In this case, let $C \subset A$ be as in (35.19.0.1). Then $U \to M = Spec(C)$ is finite locally free and $R = U \times_M U$. Moreover, M represents the quotient sheaf U/R in the fppf topology (see Definition 35.17.1).

Proof. During this proof we use the notation $s, t : A \to B$ instead of the notation $s^\sharp, t^\sharp$. By Lemma 35.17.3 it suffices to show that $C \to A$ is finite locally free and that the map

$$t \otimes s : A \otimes_C A \longrightarrow B$$

is an isomorphism. First, note that j is a monomorphism, and also finite (since already s and t are finite). Hence we see that j is a closed immersion by Morphisms, Lemma 24.42.13. Hence $A \otimes_C A \to B$ is surjective.

We will perform base change by flat ring maps $C \to C'$ as in Lemma 35.19.5, and we will use that formation of invariants commutes with flat base change, see part (3) of the lemma cited. We will show below that for every prime $\mathfrak{p} \subset C$, there exists a local flat ring map $C_\mathfrak{p} \to C'_\mathfrak{p}$ such that the result holds after a base change to $C'_\mathfrak{p}$. This implies immediately that $A \otimes_C A \to B$ is injective (use Algebra, Lemma 7.21.1). It also implies that $C \to A$ is flat, by combining Algebra, Lemmas 7.35.16, 7.35.19, and 7.35.7. Then since $U \to Spec(C)$ is surjective also (Lemma 35.19.6) we conclude that $C \to A$ is faithfully flat. Then the isomorphism $B \cong A \otimes_C A$ implies that A is a finitely presented C-module, see Algebra, Lemma 7.77.2. Hence A is finite locally free over C, see Algebra, Lemma 7.72.2.

By Lemma 35.19.3 we know that A is a finite product of rings A_r and B is a finite product of rings B_r such that the groupoid scheme decomposes accordingly (see the proof of Lemma 35.19.4). Then also C is a product of rings C_r and correspondingly C' decomposes as a product. Hence we may and do assume that the ring maps $s, t : A \to B$ are finite locally free of a fixed rank r.

The local ring maps $C_\mathfrak{p} \to C'_\mathfrak{p}$ we are going to use are any local flat ring maps such that the residue field of $C'_\mathfrak{p}$ is infinite. By Algebra, Lemma 7.142.1 such local ring maps exist.

Assume C is a local ring with maximal ideal $\mathfrak{m}$ and infinite residue field, and assume that $s, t : A \to B$ is finite locally free of constant rank $r > 0$. Since $C \subset A$ is integral (Lemma 35.19.4) all primes lying over $\mathfrak{m}$ are maximal, and all maximal ideals of A lie over $\mathfrak{m}$. Similarly for $C \subset B$. Pick a maximal ideal $\mathfrak{m}'$ of A lying over $\mathfrak{m}$ (exists by Lemma 35.19.6). Since $t : A \to B$ is finite locally free there exist at most finitely many maximal ideals of B lying over $\mathfrak{m}'$. Hence we conclude (by Lemma 35.19.6 again) that A has finitely many maximal ideals, i.e., A is semi-local. This in turn implies that B is semi-local as well. OK, and now, because $t \otimes s : A \otimes_C A \to B$ is surjective, we can apply Algebra, Lemma 7.72.7 to the ring map $C \to A$, the A-module $M = B$ (seen as an A-module via t) and the C-submodule $s(A) \subset B$. This lemma implies that there exist

$x_1, \ldots, x_r \in A$ such that M is free over A on the basis $s(x_1), \ldots, s(x_r)$. Hence we conlude that $C \to A$ is finite free and $B \cong A \otimes_C A$ by applying Lemma 35.19.7. □

35.20. Finite flat groupoids

Lemma 35.20.1. *Let S be a scheme. Let (U, R, s, t, c) be a groupoid scheme over S. Assume s, t are finite locally free. Let $u \in U$ be a point such that $t(s^{-1}(\{u\}))$ is contained in an affine open of U. Then there exists an R-invariant affine open neighbourhood of u in U.*

Proof. Since s is finite locally free it has finite fibres. Hence $t(s^{-1}(\{u\})) = \{u_1, \ldots, u_n\}$ is a finite set. Note that $u \in \{u_1, \ldots, u_n\}$. Let $W \subset U$ be an affine open containing $\{u_1, \ldots, u_n\}$, in particular $u \in W$. Consider $Z = R \setminus s^{-1}(W) \cap t^{-1}(W)$. This is a closed subset of R. The image $t(Z)$ is a closed subset of U which can be loosely described as the set of points of U which are not R-equivalent to a point of W. Hence $W' = U \setminus t(Z)$ is an R-invariant, open subscheme of U contained in W, and $\{u_1, \ldots, u_n\} \subset W'$. Picture

$$\{u_1, \ldots, u_n\} \subset W' \subset W \subset U.$$

Let $f \in \Gamma(W, \mathcal{O}_W)$ be an element such that $\{u_1, \ldots, u_n\} \subset D(f) \subset W'$. Such an f exists by Algebra, Lemma 7.14.3. By our choice of W' we have $s^{-1}(W') \subset t^{-1}(W)$, and hence we get a diagram

$$\begin{tikzcd} s^{-1}(W') \arrow[r, "t"'] \arrow[d, "s"'] & W \\ W' & \end{tikzcd}$$

The vertical arrow is finite locally free by assumption. Set

$$g = \mathrm{Norm}_s(t^\sharp f) \in \Gamma(W', \mathcal{O}_{W'})$$

By construction g is a function on W' which is nonzero in u, as $t^\sharp(f)$ is nonzero in each of the points of R lying over u, since f is nonzero in $u_1, \ldots, u_n$. Similarly, $D(g) \subset W'$ is equal to the set of points w such that f is not zero in any of the points equivalent to w. This means that $D(g)$ is an R-invariant affine open of W'. The final picture is

$$\{u_1, \ldots, u_n\} \subset D(g) \subset D(f) \subset W' \subset W \subset U$$

and hence we win. □

35.21. Descent data give equivalence relations

In Descent, Section 31.36 we saw how descent data relative to $X \to S$ can be formulated in terms of cartesian simplicial schemes over $(X/S)_\bullet$. Here we link this to equivalence relations as follows.

Lemma 35.21.1. *Let $f : X \to S$ be a morphism of schemes. Let $\pi : V_\bullet \to (X/S)_\bullet$ be a cartesian morphism, see Descent, Definition 31.36.1. Then the morphism*

$$j = (d^1_1, d^1_0) : V_1 \to V_0 \times_S V_0$$

defines an equivalence relation on V_0 over S, see Definition 35.3.1.

Proof. Note that j is a monomorphism. Namely the composition $V_1 \to V_0 \times_S V_0 \to V_0 \times_S X$ is an isomorphism as π is cartesian.

Consider the morphism

$$(d^2_2, d^2_0) : V_2 \to V_1 \times_{d^1_0, V_0, d^1_1} V_1.$$

This works because $d_0 \circ d_2 = d_1 \circ d_0$, see Simplicial, Remark 14.3.3. Also, it is a morphism over $(X/S)_2$. It is an isomorphism because $V_\bullet \to (X/S)_\bullet$ is cartesian. Note for example that the right hand side is isomorphic to $V_0 \times_{\pi_0, X, \mathrm{pr}_1} (X \times_S X \times_S X) = X \times_S V_0 \times_S X$ because π is cartesian. Details omitted.

As usual, see Definition 35.3.1 we denote $t = \mathrm{pr}_0 \circ j = d^1_1$ and $s = \mathrm{pr}_1 \circ j = d^1_0$. The isomorphism above, combined with the morphism $d^2_1 : V_2 \to V_1$ give us a composition morphism

$$c : V_1 \times_{s, V_0, t} V_1 \longrightarrow V_1$$

over $V_0 \times_S V_0$. This immediately implies that for any scheme T/S the relation $V_1(T) \subset V_0(T) \times V_0(T)$ is transitive.

Reflexivity follows from the fact that the restriction of the morphism j to the diagonal $\Delta : X \to X \times_S X$ is an isomorphism (again use the cartesian property of π).

To see symmetry we consider the morphism

$$(d^2_2, d^2_1) : V_2 \to V_1 \times_{d^1_1, V_0, d^1_1} V_1.$$

This works because $d_1 \circ d_2 = d_1 \circ d_1$, see Simplicial, Remark 14.3.3. It is an isomorphism because $V_\bullet \to (X/S)_\bullet$ is cartesian. Note for example that the right hand side is isomorphic to $V_0 \times_{\pi_0, X, \mathrm{pr}_0} (X \times_S X \times_S X) = V_0 \times_S X \times_S X$ because π is cartesian. Details omitted.

Let T/S be a scheme. Let $a \sim b$ for $a, b \in V_0(T)$ be synonymous with $(a, b) \in V_1(T)$. The isomorphism (d^2_2, d^2_1) above implies that if $a \sim b$ and $a \sim c$, then $b \sim c$. Combined with reflexivity this shows that $\sim$ is an equivalence relation. □

35.22. An example case

In this section we show that disjoint unions of spectra of Artinian rings can be descended along a quasi-compact surjective flat morphism of schemes.

Lemma 35.22.1. *Let $X \to S$ be a morphism of schemes. Suppose $V_\bullet \to (X/S)_\bullet$ is cartesian. For $v \in V_0$ a point define*

$$T_v = \{v' \in V \mid \exists\, v_1 \in V_1 : d^1_1(v_1) = v, d^1_0(v_1) = v'\}$$

as a subset of V_0. Then $v \in T_v$ and $T_v \cap T_{v'} \neq \emptyset \Rightarrow T_v = T_{v'}$.

Proof. Combine Lemmas 35.21.1 and 35.3.4. □

Lemma 35.22.2. *Let $X \to S$ be a morphism of schemes. Suppose $V_\bullet \to (X/S)_\bullet$ is cartesian. Let $v \in V_0$ be a point. If $X \to S$ is quasi-compact, then*

$$T_v = \{v' \in V \mid \exists\, v_1 \in V_1 : d^1_1(v_1) = v, d^1_0(v_1) = v'\}$$

is a quasi-compact subset of V_0.

Proof. Let F_v be the scheme theoretic fibre of $d^1_1 : V_1 \to V_0$ at v. Then we see that T_v is the image of the morphism

$$\begin{tikzcd} F_v \arrow[r] \arrow[d] & V_1 \arrow[r, "d^1_0"] \arrow[d, "d^1_1"] & V_0 \\ v \arrow[r] & V_0 & \end{tikzcd}$$

Note that F_v is quasi-compact. This proves the lemma. □

Lemma 35.22.3. *Let $X \to S$ be a quasi-compact flat surjective morphism. Let (V, φ) be a descent datum relative to $X \to S$. If V is a disjoint union of spectra of Artinian rings, then (V, φ) is effective.*

Proof. We may write $V = \coprod_{i \in I} Spec(A_i)$ with each A_i local Artinian. Moreover, let $v_i \in V$ be the unique closed point of $Spec(A_i)$ for all $i \in I$. Write $i \sim j$ if and only if $v_i \in T_{v_j}$ with notation as in Lemma 35.22.1 above. By Lemmas 35.22.1 and 35.22.2 this is an equivalence relation with finite equivalence classes. Let $\overline{I} = I/\sim$. Then we can write $V = \coprod_{\overline{i} \in \overline{I}} V_{\overline{i}}$ with $V_{\overline{i}} = \coprod_{i \in \overline{i}} Spec(A_i)$. By construction we see that $\varphi : V \times_S X \to X \times_S V$ maps the open and closed subspaces $V_{\overline{i}} \times_S X$ into the open and closed subspaces $X \times_S V_{\overline{i}}$. In other words, we get descent data $(V_{\overline{i}}, \varphi_{\overline{i}})$, and (V, φ) is the coproduct of them in the category of descent data. Since each of the $V_{\overline{i}}$ is a finite union of spectra of Artinian local rings the morphism $V_{\overline{i}} \to X$ is affine, see Morphisms, Lemma 24.11.13. Since $\{X \to S\}$ is an fpqc covering we see that all the descent data $(V_{\overline{i}}, \varphi_{\overline{i}})$ are effective by Descent, Lemma 31.33.1. Hence we win. ☐

To be sure, the lemma above has very limited applicability!

CHAPTER 36

More on Groupoid Schemes

36.1. Introduction

This chapter is devoted to advanced topics on groupoid schemes. Even though the results are stated in terms of groupoid schemes, the reader should keep in mind the 2-cartesian diagram

$$\begin{tikzcd} R \arrow[r] \arrow[d] & U \arrow[d] \\ U \arrow[r] & {[U/R]} \end{tikzcd} \tag{36.1.0.1}$$

where $[U/R]$ is the quotient stack, see Groupoids in Spaces, Remark 52.19.4. Many of the results are motivated by thinking about this diagram. See for example the beautiful paper [**KM97a**] by Keel and Mori.

36.2. Notation

We continue to abide by the conventions and notation introduced in Groupoids, Section 35.2.

36.3. Useful diagrams

We briefly restate the results of Groupoids, Lemmas 35.11.4 and 35.11.5 for easy reference in this chapter. Let S be a scheme. Let (U, R, s, t, c) be a groupoid scheme over S. In the commutative diagram

$$\begin{tikzcd} & U & \\ R \arrow[ru, "t"] \arrow[d, "s"'] & R \times_{s,U,t} R \arrow[l, "\mathrm{pr}_0"] \arrow[r, "c"'] \arrow[d, "\mathrm{pr}_1"] & R \arrow[lu, "t"'] \arrow[d, "s"] \\ U & R \arrow[l, "t"'] \arrow[r, "s"] & U \end{tikzcd} \tag{36.3.0.2}$$

the two lower squares are fibre product squares. Moreover, the triangle on top (which is really a square) is also cartesian.

The diagram

$$
\begin{tikzcd}
R \times_{t,U,t} R \arrow[r, shift left, "\mathrm{pr}_1"] \arrow[r, shift right, "\mathrm{pr}_0"'] \arrow[d, "\mathrm{pr}_0 \times c \circ (i,1)"'] & R \arrow[r, "t"] \arrow[d, "\mathrm{id}_R"] & U \arrow[d, "\mathrm{id}_U"] \\
R \times_{s,U,t} R \arrow[r, shift left, "c"] \arrow[r, shift right, "\mathrm{pr}_0"'] \arrow[d, "\mathrm{pr}_1"'] & R \arrow[r, "t"] \arrow[d, "s"] & U \\
R \arrow[r, shift left, "s"] \arrow[r, shift right, "t"'] & U &
\end{tikzcd}
\tag{36.3.0.3}
$$

is commutative. The two top rows are isomorphic via the vertical maps given. The two lower left squares are cartesian.

36.4. Sheaf of differentials

The following lemma is the analogue of Groupoids, Lemma 35.6.3.

Lemma 36.4.1. *Let S be a scheme. Let (U, R, s, t, c) be a groupoid scheme over S. The sheaf of differentials of R seen as a scheme over U via t is a quotient of the pullback via t of the conormal sheaf of the immersion $e : U \to R$. In a formula: there is a canonical surjection $t^*\mathcal{C}_{U/R} \to \Omega_{R/U}$. If s is flat, then this map is an isomorphism.*

Proof. Note that $e : U \to R$ is an immersion as it is a section of the morphism s, see Schemes, Lemma 21.21.12. Consider the following diagram

$$
\begin{tikzcd}
R \arrow[r, "(1,i)"'] \arrow[d, "t"'] & R \times_{s,U,t} R \arrow[r, "(\mathrm{pr}_0, i \circ \mathrm{pr}_1)"'] \arrow[d, "c"] & R \times_{t,U,t} R \\
U \arrow[r, "e"] & R &
\end{tikzcd}
$$

The square on the left is cartesian, because if $a \circ b = e$, then $b = i(a)$. The composition of the horizontal maps is the diagonal morphism of $t : R \to U$. The right top horizontal arrow is an isomorphism. Hence since $\Omega_{R/U}$ is the conormal sheaf of the composition it is isomorphic to the conormal sheaf of $(1, i)$. By Morphisms, Lemma 24.31.4 we get the surjection $t^*\mathcal{C}_{U/R} \to \Omega_{R/U}$ and if c is flat, then this is an isomorphism. Since c is a base change of s by the properties of Diagram (36.3.0.3) we conclude that if s is flat, then c is flat, see Morphisms, Lemma 24.24.7. □

36.5. Properties of groupoids

Let (U, R, s, t, c) be a groupoid scheme. The idea behind the results in this section is that $s : R \to U$ is a base changes of the morphism $U \to [U/R]$ (see Diagram (36.1.0.1). Hence the local properties of $s : R \to U$ should reflect local properties of the morphism $U \to [U/R]$. This doesn't work, because $[U/R]$ is not always an algebraic stack, and hence we cannot speak of geometric or algebraic properties of $U \to [U/R]$. But it turns out that we can make some of it work without even referring to the quotient stack at all.

Here is a first example of such a result. The open $W \subset U'$ found in the lemma is roughly speaking the locus where the morphism $U' \to [U/R]$ has property $\mathcal{P}$.

Lemma 36.5.1. *Let S be a scheme. Let (U, R, s, t, c, e, i) be a groupoid over S. Let $g : U' \to U$ be a morphism of schemes. Denote h the composition*

$$h : U' \times_{g,U,t} R \xrightarrow[pr_1]{} R \xrightarrow[s]{} U.$$

Let $\mathcal{P}, \mathcal{Q}, \mathcal{R}$ be properties of morphisms of schemes. Assume

(1) *$\mathcal{R} \Rightarrow \mathcal{Q}$,*
(2) *$\mathcal{Q}$ is preserved under base change and composition,*
(3) *for any morphism $f : X \to Y$ which has $\mathcal{Q}$ there exists a largest open $W(\mathcal{P}, f) \subset X$ such that $f|_{W(\mathcal{P},f)}$ has $\mathcal{P}$, and*
(4) *for any morphism $f : X \to Y$ which has $\mathcal{Q}$, and any morphism $Y' \to Y$ which has $\mathcal{R}$ we have $Y' \times_Y W(\mathcal{P}, f) = W(\mathcal{P}, f')$, where $f' : X_{Y'} \to Y'$ is the base change of f.*

If s, t have $\mathcal{R}$ and g has $\mathcal{Q}$, then there exists an open subscheme $W \subset U'$ such that $W \times_{g,U,t} R = W(\mathcal{P}, h)$.

Proof. Note that the following diagram is commutative

$$\begin{tikzcd} U' \times_{g,U,t} R \times_{t,U,t} R \arrow[r, "\mathrm{pr}_{12}"'] \arrow[d, shift right, "\mathrm{pr}_{01}"'] \arrow[d, shift left, "\mathrm{pr}_{02}"] & R \times_{t,U,t} R \arrow[d, shift right, "\mathrm{pr}_0"'] \arrow[d, shift left, "\mathrm{pr}_1"] \\ U' \times_{g,U,t} R \arrow[r, "\mathrm{pr}_1"] & R \end{tikzcd}$$

with both squares cartesian (this uses that the two maps $t \circ \mathrm{pr}_i : R \times_{t,U,t} R \to U$ are equal). Combining this with the properties of diagram (36.3.0.3) we get a commutative diagram

$$\begin{tikzcd} U' \times_{g,U,t} R \times_{t,U,t} R \arrow[r, "c\circ(i,1)"'] \arrow[d, shift right, "\mathrm{pr}_{01}"'] \arrow[d, shift left, "\mathrm{pr}_{02}"] & R \arrow[d, shift right, "t"'] \arrow[d, shift left, "s"] \\ U' \times_{g,U,t} R \arrow[r, "h"] & U \end{tikzcd}$$

where both squares are cartesian.

Assume s, t have $\mathcal{R}$ and g has $\mathcal{Q}$. Then h has $\mathcal{Q}$ as a composition of s (which has $\mathcal{R}$ hence $\mathcal{Q}$) and a base change of g (which has $\mathcal{Q}$). Thus $W(\mathcal{P}, h) \subset U' \times_{g,U,t} R$ exists. By our assumptions we have $\mathrm{pr}_{01}^{-1}(W(\mathcal{P}, h)) = \mathrm{pr}_{02}^{-1}(W(\mathcal{P}, h))$ since both are the largest open on which $c \circ (i, 1)$ has $\mathcal{P}$. Note that the projection $U' \times_{g,U,t} R \to U'$ has a section, namely $\sigma : U' \to U' \times_{g,U,t} R$, $u' \mapsto (u', e(g(u')))$. Also via the isomorphism

$$(U' \times_{g,U,t} R) \times_{U'} (U' \times_{g,U,t} R) = U' \times_{g,U,t} R \times_{t,U,t} R$$

the two projections of the left hand side to $U' \times_{g,U,t} R$ agree with the morphisms pr_{01} and pr_{02} on the right hand side. Since $\mathrm{pr}_{01}^{-1}(W(\mathcal{P}, h)) = \mathrm{pr}_{02}^{-1}(W(\mathcal{P}, h))$ we conclude that $W(\mathcal{P}, h)$ is the inverse image of a subset of U, which is necessarily the open set $W = \sigma^{-1}(W(\mathcal{P}, h))$. $\square$

Remark 36.5.2. Warning: Lemma 36.5.1 should be used with care. For example, it applies to $\mathcal{P}$=``flat", $\mathcal{Q}$ =``empty", and $\mathcal{R}$ =``flat and locally of finite presentation". But given a morphism of schemes $f : X \to Y$ the largest open $W \subset X$ such that $f|_W$ is flat is *not* the set of points where f is flat!

Remark 36.5.3. Notwithstanding the warning in Remark 36.5.2 there are some cases where Lemma 36.5.1 can be used without causing too much ambiguity. We give a list. In each case we omit the verification of assumptions (1) and (2) and we give references which imply (3) and (4). Here is the list:

(1) $\mathcal{Q} = \mathcal{R} =$``locally of finite type", and $\mathcal{P}$=``relative dimension $\leq d$". See Morphisms, Definition 24.28.1 and Morphisms, Lemmas 24.27.4 and 24.27.3.
(2) $\mathcal{Q} = \mathcal{R} =$``locally of finite type", and $\mathcal{P}$=``locally quasi-finite". This is the case $d = 0$ of the previous item, see Morphisms, Lemma 24.28.5.
(3) $\mathcal{Q} = \mathcal{R} =$``locally of finite type", and $\mathcal{P}$=``unramified". See Morphisms, Lemmas 24.34.3 and 24.34.15.

What is interesting about the cases listed above is that we do not need to assume that s, t are flat to get a conclusion about the locus where the morphism h has property $\mathcal{P}$. We continue the list:

(4) $\mathcal{Q}$ =``locally of finite presentation", $\mathcal{R}$ =``flat and locally of finite presentation", and $\mathcal{P}$=``flat". See More on Morphisms, Theorem 33.11.1 and Lemma 33.11.2.
(5) $\mathcal{Q}$ =``locally of finite presentation", $\mathcal{R}$ =``flat and locally of finite presentation", and $\mathcal{P}$ =``Cohen-Macaulay". See More on Morphisms, Definition 33.15.1 and More on Morphisms, Lemmas 33.15.3 and 33.15.4.
(6) $\mathcal{Q}$ =``locally of finite presentation", $\mathcal{R}$ =``flat and locally of finite presentation", and $\mathcal{P}$=``syntomic" use Morphisms, Lemma 24.30.12 (the locus is automically open).
(7) $\mathcal{Q}$ =``locally of finite presentation", $\mathcal{R}$ =``flat and locally of finite presentation", and $\mathcal{P}$=``smooth". See Morphisms, Lemma 24.33.15 (the locus is automically open).
(8) $\mathcal{Q}$ =``locally of finite presentation", $\mathcal{R}$ =``flat and locally of finite presentation", and $\mathcal{P}$ =``étale". See Morphisms, Lemma 24.35.17 (the locus is automically open).

Here is the second result. The R-invariant open $W \subset U$ should be thought of as the inverse image of the largest open of $[U/R]$ over which the morphism $U \to [U/R]$ has property $\mathcal{P}$.

Lemma 36.5.4. *Let S be a scheme. Let (U, R, s, t, c) be a groupoid over S. Let $\tau \in \{Zariski, fppf, étale, smooth, syntomic\}$[1]. Let $\mathcal{P}$ be a property of morphisms of schemes which is τ-local on the target (Descent, Definition 31.18.1). Assume $\{s : R \to U\}$ and $\{t : R \to U\}$ are coverings for the τ-topology. Let $W \subset U$ be the maximal open subscheme such that $s|_{s^{-1}(W)} : s^{-1}(W) \to W$ has property $\mathcal{P}$. Then W is R-invariant, see Groupoids, Definition 35.16.1.*

Proof. The existence and properties of the open $W \subset U$ are described in Descent, Lemma 31.18.3. In Diagram (36.3.0.2) let $W_1 \subset R$ be the maximal open subscheme over which the morphism $\text{pr}_1 : R \times_{s,U,t} R \to R$ has property $\mathcal{P}$. It follows from the aforementioned Descent, Lemma 31.18.3 and the assumption that $\{s : R \to U\}$ and $\{t : R \to U\}$ are coverings for the τ-topology that $t^{-1}(W) = W_1 = s^{-1}(W)$ as desired. □

Lemma 36.5.5. *Let S be a scheme. Let (U, R, s, t, c) be a groupoid over S. Let $G \to U$ be its stabilizer group scheme. Let $\tau \in \{fppf, étale, smooth, syntomic\}$. Let $\mathcal{P}$ be a property of morphisms which is τ-local on the target. Assume $\{s : R \to U\}$ and $\{t : R \to U\}$ are coverings for the τ-topology. Let $W \subset U$ be the maximal open subscheme such that $G_W \to W$ has property $\mathcal{P}$. Then W is R-invariant (see Groupoids, Definition 35.16.1).*

[1] The fact that $fpqc$ is missing is not a typo.

Proof. The existence and properties of the open $W \subset U$ are described in Descent, Lemma 31.18.3. The morphism

$$G \times_{U,t} R \longrightarrow R \times_{s,U} G, \quad (g, r) \longmapsto (r, r^{-1} \circ g \circ r)$$

is an isomorphism over R (where $\circ$ denotes composition in the groupoid). Hence $s^{-1}(W) = t^{-1}(W)$ by the properties of W proved in the aforementioned Descent, Lemma 31.18.3. $\square$

36.6. Comparing fibres

Let (U, R, s, t, c, e, i) be a groupoid scheme over S. Diagram (36.3.0.2) gives us a way to compare the fibres of the map $s : R \to U$ in a groupoid. For a point $u \in U$ we will denote $F_u = s^{-1}(u)$ the scheme theoretic fibre of $s : R \to U$ over u. For example the diagram implies that if $u, u' \in U$ are points such that $s(r) = u$ and $t(r) = u'$, then $(F_u)_{\kappa(r)} \cong (F_{u'})_{\kappa(r)}$. This is a special case of the more general and more precise Lemma 36.6.1 below. To see this take $r' = i(r)$.

A pair (X, x) consisting of a scheme X and a point $x \in X$ is sometimes called the *germ of X at x*. A *morphism of germs* $f : (X, x) \to (S, s)$ is a morphism $f : U \to S$ defined on an open neighbourhood of x with $f(x) = s$. Two such f, f' are said to give the same morphism of germs if and only if f and f' agree in some open neighbourhood of x. Let $\tau \in \{Zariski, étale, smooth, syntomic, fppf\}$. We temporarily introduce the following concept: We say that two morphisms of germs $f : (X, x) \to (S, s)$ and $f' : (X', x') \to (S', s')$ are *isomorphic locally on the base in the τ-topology*, if there exists a pointed scheme (S'', s'') and morphisms of germs $g : (S'', s'') \to (S, s)$, and $g' : (S'', s'') \to (S', s')$ such that

(1) g and g' are an open immersion (resp. étale, smooth, syntomic, flat and locally of finite presentation) at s'',
(2) there exists an isomorphism

$$(S'' \times_{g,S,f} X, \tilde{x}) \cong (S'' \times_{g',S',f'} X', \tilde{x}')$$

of germs over the germ (S'', s'') for some choice of points $\tilde{x}$ and $\tilde{x}'$ lying over (s'', x) and (s'', x').

Finally, we simply say that the maps of germs $f : (X, x) \to (S, s)$ and $f' : (X', x') \to (S', s')$ are *flat locally on the base isomorphic* if there exist S'', s'', g, g' as above but with (1) replaced by the condition that g and g' are flat at s'' (this is much weaker than any of the τ conditions above as a flat morphism need not be open).

Lemma 36.6.1. *Let S be a scheme. Let (U, R, s, t, c) be a groupoid over S. Let $r, r' \in R$ with $t(r) = t(r')$ in U. Set $u = s(r)$, $u' = s(r')$. Denote $F_u = s^{-1}(u)$ and $F_{u'} = s^{-1}(u')$ the scheme theoretic fibres.*

(1) *There exists a common field extension $\kappa(u) \subset k$, $\kappa(u') \subset k$ and an isomorphism $(F_u)_k \cong (F_{u'})_k$.*
(2) *We may choose the isomorphism of (1) such that a point lying over r maps to a point lying over r'.*
(3) *If the morphisms s, t are flat then the morphisms of germs $s : (R, r) \to (U, u)$ and $s : (R, r') \to (U, u')$ are flat locally on the base isomorphic.*
(4) *If the morphisms s, t are étale (resp. smooth, syntomic, or flat and locally of finite presentation) then the morphisms of germs $s : (R, r) \to (U, u)$ and $s : (R, r') \to (U, u')$ are locally on the base isomorphic in the étale (resp. smooth, syntomic, or fppf) topology.*

Proof. We repeatedly use the properties and the existence of diagram (36.3.0.2). By the properties of the diagram (and Schemes, Lemma 21.17.5) there exists a point ξ of $R \times_{s,U,t} R$ with $\mathrm{pr}_0(\xi) = r$ and $c(\xi) = r'$. Let $\tilde{r} = \mathrm{pr}_1(\xi) \in R$.

Proof of (1). Set $k = \kappa(\tilde{r})$. Since $t(\tilde{r}) = u$ and $s(\tilde{r}) = u'$ we see that k is a common extension of both $\kappa(u)$ and $\kappa(u')$ and in fact that both $(F_u)_k$ and $(F_{u'})_k$ are isomorphic to the fibre of $\mathrm{pr}_1 : R \times_{s,U,t} R \to R$ over $\tilde{r}$. Hence (1) is proved.

Part (2) follows since the point ξ maps to r, resp. r'.

Part (3) is clear from the above (using the point ξ for $\tilde{u}$ and $\tilde{u}'$) and the definitions.

If s and t are flat and of finite presentation, then they are open morphisms (Morphisms, Lemma 24.24.9). Hence the image of some affine open neighbourhood V'' of $\tilde{r}$ will cover an open neighbourhood V of u, resp. V' of u'. These can be used to show that properties (1) and (2) of the definition of ``locally on the base isomorphic in the τ-topology". ☐

36.7. Cohen-Macaulay presentations

Given any groupoid (U, R, s, t, c) with s, t flat and locally of finite presentation there exists an ``equivalent" groupoid $(U', R', s', t', c')$ such that $s'$ and $t'$ are Cohen-Macaulay morphisms (and locally of finite presentation). See More on Morphisms, Section 33.15 for more information on Cohen-Macaulay morphisms. Here ``equivalent" can be taken to mean that the quotient stacks $[U/R]$ and $[U'/R']$ are equivalent stacks, see Groupoids in Spaces, Section 52.19 and Section 52.24.

Lemma 36.7.1. *Let S be a scheme. Let (U, R, s, t, c) be a groupoid over S. Assume s and t are flat and locally of finite presentation. Then there exists an open $U' \subset U$ such that*

1. *$t^{-1}(U') \subset R$ is the largest open subscheme of R on which the morphism s is Cohen-Macaulay,*
2. *$s^{-1}(U') \subset R$ is the largest open subscheme of R on which the morphism t is Cohen-Macaulay,*
3. *the morphism $t|_{s^{-1}(U')} : s^{-1}(U') \to U$ is surjective,*
4. *the morphism $s|_{t^{-1}(U')} : t^{-1}(U') \to U$ is surjective, and*
5. *the restriction $R' = s^{-1}(U') \cap t^{-1}(U')$ of R to U' defines a groupoid (U', R', s', t', c') which has the property that the morphisms s' and t' are Cohen-Macaulay and locally of finite presentation.*

Proof. Apply Lemma 36.5.1 with $g = \mathrm{id}$ and $\mathcal{Q} =$``locally of finite presentation", $\mathcal{R} =$``flat and locally of finite presentation", and $\mathcal{P} =$``Cohen-Macaulay", see Remark 36.5.3. This gives us an open $U' \subset U$ such that Let $t^{-1}(U') \subset R$ is the largest open subscheme of R on which the morphism s is Cohen-Macaulay. This proves (1). Let $i : R \to R$ be the inverse of the groupoid. Since i is an isomorphism, and $s \circ i = t$ and $t \circ i = s$ we see that $s^{-1}(U')$ is also the largest open of R on which t is Cohen-Macaulay. This proves (2). By More on Morphisms, Lemma 33.15.4 the open subset $t^{-1}(U')$ is dense in every fibre of $s : R \to U$. This proves (3). Same argument for (4). Part (5) is a formal consequence of (1) and (2) and the discussion of restrictions in Groupoids, Section 35.15. ☐

36.8. Restricting groupoids

In this section we collect a bunch of lemmas on properties of groupoids which are inherited by restrictions. Most of these lemmas can be proved by contemplating the defining diagram

(36.8.0.1)
$$\begin{tikzcd}
R' \arrow[r] \arrow[rr, bend left, "s'"] \arrow[d] \arrow[dd, bend right, "t'"'] & R \times_{s,U} U' \arrow[r] \arrow[d] & U' \arrow[d, "g"] \\
U' \times_{U,t} R \arrow[r] \arrow[d] & R \arrow[r, "s"] \arrow[d, "t"] & U \\
U' \arrow[r, "g"] & U &
\end{tikzcd}$$

of a restriction. See Groupoids, Lemma 35.15.1.

Lemma 36.8.1. *Let S be a scheme. Let (U, R, s, t, c) be a groupoid scheme over S. Let $g : U' \to U$ be a morphism of schemes. Let (U', R', s', t', c') be the restriction of (U, R, s, t, c) via g.*

(1) *If s, t are locally of finite type and g is locally of finite type, then s', t' are locally of finite type.*
(2) *If s, t are locally of finite presentation and g is locally of finite presentation, then s', t' are locally of finite presentation.*
(3) *If s, t are flat and g is flat, then s', t' are flat.*
(4) *Add more here.*

Proof. The property of being locally of finite type is stable under composition and arbitrary base change, see Morphisms, Lemmas 24.14.3 and 24.14.4. Hence (1) is clear from Diagram (36.8.0.1). For the other cases, see Morphisms, Lemmas 24.20.3, 24.20.4, 24.24.5, and 24.24.7. □

The following lemma could have been used to prove the results of the preceding lemma in a more uniform way.

Lemma 36.8.2. *Let S be a scheme. Let (U, R, s, t, c) be a groupoid scheme over S. Let $g : U' \to U$ be a morphism of schemes. Let (U', R', s', t', c') be the restriction of (U, R, s, t, c) via g, and let $h = s \circ pr_1 : U' \times_{g,U,t} R \to U$. If $\mathcal{P}$ is a property of morphisms of schemes such that*

(1) *h has property $\mathcal{P}$, and*
(2) *$\mathcal{P}$ is preserved under base change,*

then s', t' have property $\mathcal{P}$.

Proof. This is clear as s' is the base change of h by Diagram (36.8.0.1) and t' is isomorphic to s' as a morphism of schemes. □

Lemma 36.8.3. *Let S be a scheme. Let (U, R, s, t, c) be a groupoid scheme over S. Let $g : U' \to U$ and $g' : U'' \to U'$ be morphisms of schemes. Set $g'' = g \circ g'$. Let (U', R', s', t', c') be the restriction of R to U'. Let $h = s \circ pr_1 : U' \times_{g,U,t} R \to U$, let $h' = s' \circ pr_1 : U'' \times_{g',U',t} R \to U'$, and let $h'' = s \circ pr_1 : U'' \times_{g'',U,t} R \to U$. The following diagram is* *commutative*

$$\begin{tikzcd} U'' \times_{g',U',t} R' \arrow[d, "h'"] & (U' \times_{g,U,t} R) \times_U (U'' \times_{g'',U,t} R) \arrow[l] \arrow[r] \arrow[d] & U'' \times_{g'',U,t} R \arrow[d, "h''"] \\ U' & U' \times_{g,U,t} R \arrow[l, "pr_0"] \arrow[r, "h"] & U \end{tikzcd}$$

with both squares cartesian where the left upper horizontal arrow is given by the rule

$$\begin{matrix} (U' \times_{g,U,t} R) \times_U (U'' \times_{g'',U,t} R) & \longrightarrow & U'' \times_{g',U',t} R' \\ ((u', r_0), (u'', r_1)) & \longmapsto & (u'', (c(r_1, i(r_0)), (g'(u''), u'))) \end{matrix}$$

with notation as explained in the proof.

Proof. We work this out by exploiting the functorial point of view and reducing the lemma to a statement on arrows in restrictions of a groupoid category. In the last formula of the lemma the notation $((u', r_0), (u'', r_1))$ indicates a T-valued point of $(U' \times_{g,U,t} R) \times_U (U'' \times_{g'',U,t} R)$. This means that u', u'', r_0, r_1 are T-valued points of U', U'', R, R and that $g(u') = t(r_0)$, $g(g'(u'')) = g''(u'') = t(r_1)$, and $s(r_0) = s(r_1)$. It would be more correct here to write $g \circ u' = t \circ r_0$ and so on but this makes the notation even more unreadable. If we think of r_1 and r_0 as arrows in a groupoid category then we can represent this by the picture

$$t(r_0) = g(u') \xleftarrow{r_0} s(r_0) = s(r_1) \xrightarrow{r_1} t(r_1) = g(g'(u''))$$

This diagram in particular demonstrates that the composition $c(r_1, i(r_0))$ makes sense. Recall that

$$R' = R \times_{(t,s),U \times_S U, g \times g} U' \times_S U'$$

hence a T-valued point of R' looks like $(r, (u'_0, u'_1))$ with $t(r) = g(u'_0)$ and $s(r) = g(u'_1)$. In particular given $((u', r_0), (u'', r_1))$ as above we get the T-valued point $(c(r_1, i(r_0)), (g'(u''), u'))$ of R' because we have $t(c(r_1, i(r_0))) = t(r_1) = g(g'(u''))$ and $s(c(r_1, i(r_0))) = s(i(r_0)) = t(r_0) = g(u')$. We leave it to the reader to show that the left square commutes with this definition.

To show that the left square is cartesian, suppose we are given (v'', p') and (v', p) which are T-valued points of $U'' \times_{g',U',t} R'$ and $U' \times_{g,U,t} R$ with $v' = s'(p')$. This also means that $g'(v'') = t'(p')$ and $g(v') = t(p)$. By the discussion above we know that we can write $p' = (r, (u'_0, u'_1))$ with $t(r) = g(u'_0)$ and $s(r) = g(u'_1)$. Using this notation we see that $v' = s'(p') = u'_1$ and $g'(v'') = t'(p') = u'_0$. Here is a picture

$$s(p) \xrightarrow{p} g(v') = g(u'_1) \xrightarrow{r} g(u'_0) = g(g'(v''))$$

What we have to show is that there exists a unique T-valued point $((u', r_0), (u'', r_1))$ as above such that $v' = u'$, $p = r_0$, $v'' = u''$ and $p' = (c(r_1, i(r_0)), (g'(u''), u'))$. Comparing the two diagrams above it is clear that we have no choice but to take

$$((u', r_0), (u'', r_1)) = ((v', p), (v'', c(r, p)))$$

Some details omitted. □

Lemma 36.8.4. *Let S be a scheme. Let (U, R, s, t, c) be a groupoid scheme over S. Let $g : U' \to U$ and $g' : U'' \to U'$ be morphisms of schemes. Set $g'' = g \circ g'$. Let (U', R', s', t', c') be the restriction of R to U'. Let $h = s \circ pr_1 : U' \times_{g,U,t} R \to U$, let $h' = s' \circ pr_1 : U'' \times_{g',U',t} R \to U'$, and let $h'' = s \circ pr_1 : U'' \times_{g'',U,t} R \to U$. Let $\tau \in \{Zariski,$*

étale, smooth, syntomic, fppf, fpqc}. Let $\mathcal{P}$ be a property of morphisms of schemes which is preserved under base change, and which is local on the target for the τ-topology. If

(1) *$h(U' \times_U R)$ is open in U,*
(2) *$\{h : U' \times_U R \to h(U' \times_U R)\}$ is a τ-covering,*
(3) *h' has property $\mathcal{P}$,*

then h'' has property $\mathcal{P}$. Conversely, if

(a) *$\{t : R \to U\}$ is a τ-covering,*
(d) *h'' has property $\mathcal{P}$,*

then h' has property $\mathcal{P}$.

Proof. This follows formally from the properties of the diagram of Lemma 36.8.3. In the first case, note that the image of the morphism h'' is contained in the image of h, as $g'' = g \circ g'$. Hence we may replace the U in the lower right corner of the diagram by $h(U' \times_U R)$. This explains the significance of conditions (1) and (2) in the lemma. In the second case, note that $\{\text{pr}_0 : U' \times_{g,U,t} R \to U'\}$ is a τ-covering as a base change of τ and condition (a). $\square$

36.9. Properties of groupoids on fields

A ``groupoid on a field'' indicates a groupoid scheme (U, R, s, t, c) where U is the spectrum of a field. It does **not** mean that (U, R, s, t, c) is defined over a field, more precisely, it does **not** mean that the morphisms $s, t : R \to U$ are equal. Given any field k, an abstract group G and a group homomorphism $\varphi : G \to \text{Aut}(k)$ we obtain a groupoid scheme (U, R, s, t, c) over $\mathbf{Z}$ by setting

$$
\begin{aligned}
U &= Spec(k) \\
R &= \coprod\nolimits_{g \in G} Spec(k) \\
s &= \coprod\nolimits_{g \in G} Spec(\text{id}_k) \\
t &= \coprod\nolimits_{g \in G} Spec(\varphi(g)) \\
c &= \text{composition in } G
\end{aligned}
$$

This example still is a groupoid scheme over $Spec(k^G)$. Hence, if G is finite, then $U = Spec(k)$ is finite over $Spec(k^G)$. In some sense our goal in this section is to show that suitable finiteness conditions on s, t force any groupoid on a field to be defined over a finite index subfield $k' \subset k$.

If k is a field and (G, m) is a group scheme over k with structure morphism $p : G \to Spec(k)$, then $(Spec(k), G, p, p, m)$ is an example of a groupoid on a field (and in this case of course the whole structure is defined over a field). Hence this section can be viewed as the analogue of Groupoids, Section 35.7.

Lemma 36.9.1. *Let S be a scheme. Let (U, R, s, t, c) be a groupoid scheme over S. If U is the spectrum of a field, then the composition morphism $c : R \times_{s,U,t} R \to R$ is open.*

Proof. The composition is isomorphic to the projection map $\text{pr}_1 : R \times_{t,U,t} R \to R$ by Diagram (36.3.0.3). The projection is open by Morphisms, Lemma 24.22.4. $\square$

Lemma 36.9.2. *Let S be a scheme. Let (U, R, s, t, c) be a groupoid scheme over S. If U is the spectrum of a field, then R is a separated scheme.*

Proof. By Groupoids, Lemma 35.7.2 the stabilizer group scheme $G \to U$ is separated. By Groupoids, Lemma 35.18.2 the morphism $j = (t, s) : R \to U \times_S U$ is separated. As U is the spectrum of a field the scheme $U \times_S U$ is affine (by the construction of fibre products in Schemes, Section 21.17). Hence R is a separated scheme, see Schemes, Lemma 21.21.13. $\square$

Lemma 36.9.3. *Let S be a scheme. Let (U, R, s, t, c) be a groupoid scheme over S. Assume $U = Spec(k)$ with k a field. For any points $r, r' \in R$ there exists a field extension $k \subset k'$ and points $r_1, r_2 \in R \times_{s,Spec(k)} Spec(k')$ and a diagram*

$$R \xleftarrow{pr_0} R \times_{s,Spec(k)} Spec(k') \xrightarrow{\varphi} R \times_{s,Spec(k)} Spec(k') \xrightarrow{pr_0} R$$

such that φ is an isomorphism of schemes over $Spec(k')$, we have $\varphi(r_1) = r_2$, $pr_0(r_1) = r$, and $pr_0(r_2) = r'$.

Proof. This is a special case of Lemma 36.6.1 parts (1) and (2). $\square$

Lemma 36.9.4. *Let S be a scheme. Let (U, R, s, t, c) be a groupoid scheme over S. Assume $U = Spec(k)$ with k a field. Let $k \subset k'$ be a field extension, $U' = Spec(k')$ and let (U', R', s', t', c') be the restriction of (U, R, s, t, c) via $U' \to U$. In the defining diagram*

$$\begin{tikzcd}
R' \arrow[r] \arrow[rr, bend left, "s'"] \arrow[d] \arrow[dr, dotted] \arrow[dd, bend right, "t'"'] & R \times_{s,U} U' \arrow[r] \arrow[d] & U' \arrow[d] \\
U' \times_{U,t} R \arrow[r] \arrow[d] & R \arrow[r, "s"] \arrow[d, "t"] & U \\
U' \arrow[r] & U &
\end{tikzcd}$$

all the morphisms are surjective, flat, and universally open. The dotted arrow $R' \to R$ is in addition affine.

Proof. The morphism $U' \to U$ equals $Spec(k') \to Spec(k)$, hence is affine, surjective and flat. The morphisms $s, t : R \to U$ and the morphism $U' \to U$ are universally open by Morphisms, Lemma 24.22.4. Since R is not empty and U is the spectrum of a field the morphisms $s, t : R \to U$ are surjective and flat. Then you conclude by using Morphisms, Lemmas 24.9.4, 24.9.2, 24.22.3, 24.11.8, 24.11.7, 24.24.7, and 24.24.5. $\square$

Lemma 36.9.5. *Let S be a scheme. Let (U, R, s, t, c) be a groupoid scheme over S. Assume $U = Spec(k)$ with k a field. For any point $r \in R$ there exist*

(1) *a field extension $k \subset k'$ with k' algebraically closed,*
(2) *a point $r' \in R'$ where (U', R', s', t', c') is the restriction of (U, R, s, t, c) via $Spec(k') \to Spec(k)$*

such that

(1) *the point r' maps to r under the morphism $R' \to R$, and*
(2) *the maps $s', t' : R' \to Spec(k')$ induce isomorphisms $k' \to \kappa(r')$.*

Proof. Translating the geometric statement into a statement on fields, this means that we can find a diagram

$$\begin{tikzcd}
k' & k' \arrow[l, "1"'] & \\
k' \arrow[u, "\tau"] & \kappa(r) \arrow[ul, "\sigma"] & k \arrow[l, "s"] \arrow[ul, "i"'] \\
& k \arrow[u, "t"'] \arrow[ul, "i"] &
\end{tikzcd}$$

where $i : k \to k'$ is the embedding of k into k', the maps $s, t : k \to \kappa(r)$ are induced by $s, t : R \to U$, and the map $\tau : k' \to k'$ is an automorphism. To produce such a diagram we may proceed in the following way:

(1) Pick $i : k \to k'$ a field map with k' algebraically closed of very large transcendence degree over k.
(2) Pick an embedding $\sigma : \kappa(r) \to k'$ such that $\sigma \circ s = i$. Such a σ exists because we can just choose a transcendence basis $\{x_\alpha\}_{\alpha \in A}$ of $\kappa(r)$ over k and find $y_\alpha \in k'$, $\alpha \in A$ which are algebraically independent over $i(k)$, and map $s(k)(\{x_\alpha\})$ into k' by the rules $s(\lambda) \mapsto i(\lambda)$ for $\lambda \in k$ and $x_\alpha \mapsto y_\alpha$ for $\alpha \in A$. Then extend to $\tau : \kappa(\alpha) \to k'$ using that k' is algebraically closed.
(3) Pick an automorphism $\tau : k' \to k'$ such that $\tau \circ i = \sigma \circ t$. To do this pick a transcendence basis $\{x_\alpha\}_{\alpha \in A}$ of k over its prime field. On the one hand, extend $\{i(x_\alpha)\}$ to a transcedence basis of k' by adding $\{y_\beta\}_{\beta \in B}$ and extend $\{\sigma(t(x_\alpha))\}$ to a transcendence basis of k' by adding $\{z_\gamma\}_{\gamma \in C}$. As k' is algebraically closed we can extend the isomorphism $\sigma \circ t \circ i^{-1} : i(k) \to \sigma(t(k))$ to an isomorphism $\tau' : \overline{i(k)} \to \overline{\sigma(t(k))}$ of their algebraic closures in k'. As k' has large transcendence degree we see that the sets B and C have the same cardinality. Thus we can use a bijection $B \to C$ to extend τ' to an isomorphism
$$\overline{i(k)}(\{y_\beta\}) \longrightarrow \overline{\sigma(t(k))}(\{z_\gamma\})$$
and then since k' is the algebraic closure of both sides we see that this extends to an automorphism $\tau : k' \to k'$ as desired.

This proves the lemma. □

Lemma 36.9.6. *Let S be a scheme. Let (U, R, s, t, c) be a groupoid scheme over S. Assume $U = Spec(k)$ with k a field. If $r \in R$ is a point such that s, t induce isomorphisms $k \to \kappa(r)$, then the map*
$$R \longrightarrow R, \quad x \longmapsto c(r, x)$$
(see proof for precise notation) is an automorphism $R \to R$ which maps e to r.

Proof. This is completely obvious if you think about groupoids in a functorial way. But we will also spell it out completely. Denote $a : U \to R$ the morphism with image r such that $s \circ a = \mathrm{id}_U$ which exists by the hypothesis that $s : k \to \kappa(r)$ is an isomorphism. Similarly, denote $b : U \to R$ the morphism with image r such that $t \circ b = \mathrm{id}_U$. Note that $b = a \circ (t \circ a)^{-1}$, in particular $a \circ s \circ b = b$.

Consider the morphism $\Psi : R \to R$ given on T-valued points by
$$(f : T \to R) \longmapsto (c(a \circ t \circ f, f) : T \to R)$$

To see this is defined we have to check that $s \circ a \circ t \circ f = t \circ f$ which is obvious as $s \circ a = 1$. Note that $\Phi(e) = a$, so that in order to prove the lemma it suffices to show that Φ is an automorphism of R. Let $\Phi : R \to R$ be the morphism given on T-valued points by

$$(g : T \to R) \longmapsto (c(i \circ b \circ t \circ g, g) : T \to R).$$

This is defined because $s \circ i \circ b \circ t \circ g = t \circ b \circ t \circ g = t \circ g$. We claim that Φ and Ψ are inverse to each other. To see this we compute

$$\begin{aligned} & c(a \circ t \circ c(i \circ b \circ t \circ g, g), c(i \circ b \circ t \circ g, g)) \\ & = c(a \circ t \circ i \circ b \circ t \circ g, c(i \circ b \circ t \circ g, g)) \\ & = c(a \circ s \circ b \circ t \circ g, c(i \circ b \circ t \circ g, g)) \\ & = c(b \circ t \circ g, c(i \circ b \circ t \circ g, g)) \\ & = c(c(b \circ t \circ g, i \circ b \circ t \circ g), g)) \\ & = c(e, g) \\ & = g \end{aligned}$$

where we have used the relation $a \circ s \circ b = b$ shown above. In the other direction we have

$$\begin{aligned} & c(i \circ b \circ t \circ c(a \circ t \circ f, f), c(a \circ t \circ f, f)) \\ & = c(i \circ b \circ t \circ a \circ t \circ f, c(a \circ t \circ f, f)) \\ & = c(i \circ a \circ (t \circ a)^{-1} \circ t \circ a \circ t \circ f, c(a \circ t \circ f, f)) \\ & = c(i \circ a \circ t \circ f, c(a \circ t \circ f, f)) \\ & = c(c(i \circ a \circ t \circ f, a \circ t \circ f), f) \\ & = c(e, f) \\ & = f \end{aligned}$$

The lemma is proved. $\square$

Lemma 36.9.7. *Let S be a scheme. Let (U, R, s, t, c) be a groupoid scheme over S. Assume $U = Spec(k)$ with k a field. By abuse of notation denote $e \in R$ the image of the identity morphism $e : U \to R$. Then*

1. *every local ring $\mathcal{O}_{R,r}$ of R has a unique minimal prime ideal,*
2. *there is exactly one irreducible component Z of R passing through e, and*
3. *Z is geometrically irreducible over k via either s or t.*

Proof. Let $r \in R$ be a point. In this proof we will use the correspondence between irreducible components of R passing through a point r and minimal primes of the local ring $\mathcal{O}_{R,r}$ without further mention. Choose $k \subset k'$ and $r' \in R'$ as in Lemma 36.9.5. Note that $\mathcal{O}_{R,r} \to \mathcal{O}_{R',r'}$ is faithfully flat and local, see Lemma 36.9.4. Hence the result for $r' \in R'$ implies the result for $r \in R$. In other words we may assume that $s, t : k \to \kappa(r)$ are isomorphisms. By Lemma 36.9.6 there exists an automorphism moving e to r. Hence we may assume $r = e$, i.e., part (1) follows from part (2).

We first prove (2) in case k is separably algebraically closed. Namely, let $X, Y \subset R$ be irreducible components passing through e. Then by Varieties, Lemma 28.6.4 and 28.6.3 the scheme $X \times_{s,U,t} Y$ is irreducible as well. Hence $c(X \times_{s,U,t} Y) \subset R$ is an irreducible subset. We claim it contains both X and Y (as subsets of R). Namely, let T be the spectrum of a field. If $x : T \to X$ is a T-valued point of X, then $c(x, e \circ s \circ x) = x$ and $e \circ s \circ x$ factors through Y as $e \in Y$. Similarly for points of Y. This clearly implies that $X = Y$, i.e., there is a unique irreducible component of R passing through e.

Proof of (2) and (3) in general. Let $k \subset k'$ be a separable algebraic closure, and let (U', R', s', t', c') be the restriction of (U, R, s, t, c) via $Spec(k') \to Spec(k)$. By the previous paragraph there is exactly one irreducible component Z' of R' passing through e'. Denote $e'' \in R \times_{s,U} U'$ the base change of e. As $R' \to R \times_{s,U} U'$ is faithfully flat, see Lemma 36.9.4, and $e' \mapsto e''$ we see that there is exactly one irreducible component Z'' of $R \times_{s,k} k'$ passing through e''. This implies, as $R \times_k k' \to R$ is faithfully flat, that there is exactly one irreducible component Z of R passing through e. This proves (2).

To prove (3) let $Z''' \subset R \times_k k'$ be an arbitrary irreducible component of $Z \times_k k'$. By Varieties, Lemma 28.6.12 we see that $Z''' = \sigma(Z'')$ for some $\sigma \in \mathrm{Gal}(k'/k)$. Since $\sigma(e'') = e''$ we see that $e'' \in Z'''$ and hence $Z''' = Z''$. This means that Z is geometrically irreducible over $Spec(k)$ via the morphism s. The same argument implies that Z is geometrically irreducible over $Spec(k)$ via the morphism t. $\square$

Lemma 36.9.8. *Let S be a scheme. Let (U, R, s, t, c) be a groupoid scheme over S. Assume $U = Spec(k)$ with k a field. Assume s, t are locally of finite type. Then*

(1) *R is equidimensional,*
(2) $\dim(R) = \dim_r(R)$ *for all $r \in R$,*
(3) *for any $r \in R$ we have $trdeg_{s(k)}(\kappa(r)) = trdeg_{t(k)}(\kappa(r))$, and*
(4) *for any closed point $r \in R$ we have* $\dim(R) = \dim(\mathcal{O}_{R,r})$.

Proof. Let $r, r' \in R$. Then $\dim_r(R) = \dim_{r'}(R)$ by Lemma 36.9.3 and Morphisms, Lemma 24.27.3. By Morphisms, Lemma 24.27.1 we have

$$\dim_r(R) = \dim(\mathcal{O}_{R,r}) + \mathrm{trdeg}_{s(k)}(\kappa(r)) = \dim(\mathcal{O}_{R,r}) + \mathrm{trdeg}_{t(k)}(\kappa(r)).$$

On the other hand, the dimension of R (or any open subset of R) is the supremum of the dimensions of the local rings of of R, see Properties, Lemma 23.11.4. Clearly this is maximal for closed points r in which case $\mathrm{trdeg}_k(\kappa(r)) = 0$ (by the Hilbert Nullstellensatz, see Morphisms, Section 24.15). Hence the lemma follows. $\square$

Lemma 36.9.9. *Let S be a scheme. Let (U, R, s, t, c) be a groupoid scheme over S. Assume $U = Spec(k)$ with k a field. Assume s, t are locally of finite type. Then* $\dim(R) = \dim(G)$ *where G is the stabilizer group scheme of R.*

Proof. Let $Z \subset R$ be the irreducible component passing through e (see Lemma 36.9.7) thought of as an integral closed subscheme of R. Let k'_s, resp. k'_t be the integral closure of $s(k)$, resp. $t(k)$ in $\Gamma(Z, \mathcal{O}_Z)$. Recall that k'_s and k'_t are fields, see Varieties, Lemma 28.17.4. By Varieties, Proposition 28.18.1 we have $k'_s = k'_t$ as subrings of $\Gamma(Z, \mathcal{O}_Z)$. As e factors through Z we obtain a commutative diagram

$$\begin{tikzcd}
k \arrow[dr, "t"'] \arrow[drr, "1"] & & \\
& \Gamma(Z, \mathcal{O}_Z) \arrow[r, "e"] & k \\
k \arrow[ur, "s"] \arrow[urr, "1"'] & &
\end{tikzcd}$$

This on the one hand shows that $k'_s = s(k)$, $k'_t = t(k)$, so $s(k) = t(k)$, which combined with the diagram above implies that $s = t$! In other words, we conclude that Z is a closed subscheme of $G = R \times_{(t,s), U \times_S U, \Delta} U$. The lemma follows as both G and R are equidimensional, see Lemma 36.9.8 and Groupoids, Lemma 35.7.5. $\square$

Remark 36.9.10. Warning: Lemma 36.9.9 is wrong without the condition that s and t are locally of finite type. An easy example is to start with the action

$$\mathbf{G}_{m,\mathbf{Q}} \times_{\mathbf{Q}} \mathbf{A}^1_{\mathbf{Q}} \to \mathbf{A}^1_{\mathbf{Q}}$$

and restrict the corresponding groupoid scheme to the generic point of $\mathbf{A}^1_{\mathbf{Q}}$. In other words restrict via the morphism $Spec(\mathbf{Q}(x)) \to Spec(\mathbf{Q}[x]) = \mathbf{A}^1_{\mathbf{Q}}$. Then you get a groupoid scheme (U, R, s, t, c) with $U = Spec(\mathbf{Q}(x))$ and

$$R = Spec\left(\mathbf{Q}(x)[y]\left[\frac{1}{P(xy)}, P \in \mathbf{Q}[T], P \neq 0\right]\right)$$

In this case $\dim(R) = 1$ and $\dim(G) = 0$.

Lemma 36.9.11. *Let S be a scheme. Let (U, R, s, t, c) be a groupoid scheme over S. Assume*

(1) *$U = Spec(k)$ with k a field,*
(2) *s, t are locally of finite type, and*
(3) *the characteristic of k is zero.*

Then $s, t : R \to U$ are smooth.

Proof. By Lemma 36.4.1 the sheaf of differentials of $R \to U$ is free. Hence smoothness follows from Varieties, Lemma 28.15.1. ☐

Lemma 36.9.12. *Let S be a scheme. Let (U, R, s, t, c) be a groupoid scheme over S. Assume*

(1) *$U = Spec(k)$ with k a field,*
(2) *s, t are locally of finite type,*
(3) *R is reduced, and*
(4) *k is perfect.*

Then $s, t : R \to U$ are smooth.

Proof. By Lemma 36.4.1 the sheaf $\Omega_{R/U}$ is free. Hence the lemma follows from Varieties, Lemma 28.15.2. ☐

36.10. Morphisms of groupoids on fields

This section studies morphisms between groupoids on fields. This is slightly more general, but very akin to, studying morphisms of groupschemes over a field.

Situation 36.10.1. Let S be a scheme. Let $U = Spec(k)$ be a scheme over S with k a field. Let (U, R_1, s_1, t_1, c_1), (U, R_2, s_2, t_2, c_2) be groupoid schemes over S with identical first component. Let $a : R_1 \to R_2$ be a morphism such that (id_U, a) defines a morphism of groupoid schemes over S, see Groupoids, Definition 35.11.1. In particular, the following diagrams commute

$$\begin{tikzcd} R_2 \arrow[dr, "a"] \arrow[drr, "t_2"] \arrow[dd, "s_2"'] & & \\ & R_1 \arrow[r, "s_1"'] \arrow[d, "t_1"] & U \\ & U & \end{tikzcd} \qquad \begin{tikzcd} R_1 \times_{s_1, U, t_1} R_1 \arrow[r, "c_1"'] \arrow[d, "a \times a"'] & R_1 \arrow[d, "a"] \\ R_2 \times_{s_2, U, t_2} R_2 \arrow[r, "c_2"] & R_2 \end{tikzcd}$$

The following lemma is a generalization of Groupoids, Lemma 35.7.11.

Lemma 36.10.2. *Notation and assumptions as in Situation 36.10.1. If $a(R_1)$ is open in R_2, then $a(R_1)$ is closed in R_2.*

Proof. Let $r_2 \in R_2$ be a point in the closure of $a(R_1)$. We want to show $r_2 \in a(R_1)$. Pick $k \subset k'$ and $r_2' \in R_2'$ adapted to (U, R_2, s_2, t_2, c_2) and r_2 as in Lemma 36.9.5. Let R_i' be the restriction of R_i via the morphism $U' = Spec(k') \to U = Spec(k)$. Let $a' : R_1' \to R_2'$ be the base change of a. The diagram

$$\begin{array}{ccc} R_1' & \xrightarrow{a'} & R_2' \\ {\scriptstyle p_1}\downarrow & & \downarrow{\scriptstyle p_2} \\ R_1 & \xrightarrow{a} & R_2 \end{array}$$

is a fibre square. Hence the image of a' is the inverse image of the image of a via the morphism $p_2 : R_2' \to R_2$. By Lemma 36.9.4 the map p_2 is surjective and open. Hence by Topology, Lemma 5.15.2 we see that r_2' is in the closure of $a'(R_1')$. This means that we may assume that $r_2 \in R_2$ has the property that the maps $k \to \kappa(r_2)$ induced by s_2 and t_2 are isomorphisms.

In this case we can use Lemma 36.9.6. This lemma implies $c(r_2, a(R_1))$ is an open neighbourhood of r_2. Hence $a(R_1) \cap c(r_2, a(R_1)) \neq \emptyset$ as we assumed that r_2 was a point of the closure of $a(R_1)$. Using the inverse of R_2 and R_1 we see this means $c_2(a(R_1), a(R_1))$ contains r_2. As $c_2(a(R_1), a(R_1)) \subset a(c_1(R_1, R_1)) = a(R_1)$ we conclude $r_2 \in a(R_1)$ as desired. $\square$

Lemma 36.10.3. *Notation and assumptions as in Situation 36.10.1. Let $Z \subset R_2$ be the reduced closed subscheme (see Schemes, Definition 21.12.5) whose underlying topological space is the closure of the image of $a : R_1 \to R_2$. Then $c_2(Z \times_{s_2, U, t_2} Z) \subset Z$ set theoretically.*

Proof. Consider the commutative diagram

$$\begin{array}{ccc} R_1 \times_{s_1, U, t_1} R_1 & \longrightarrow & R_1 \\ \downarrow & & \downarrow \\ R_2 \times_{s_2, U, t_2} R_2 & \longrightarrow & R_2 \end{array}$$

By Varieties, Lemma 28.14.2 the closure of the image of the left vertical arrow is (set theoretically) $Z \times_{s_2, U, t_2} Z$. Hence the result follows. $\square$

Lemma 36.10.4. *Notation and assumptions as in Situation 36.10.1. Assume that k is perfect. Let $Z \subset R_2$ be the reduced closed subscheme (see Schemes, Definition 21.12.5) whose underlying topological space is the closure of the image of $a : R_1 \to R_2$. Then*

$$(U, Z, s_2|_Z, t_2|_Z, c_2|_Z)$$

is a groupoid scheme over S.

Proof. We first explain why the statement makes sense. Since U is the spectrum of a perfect field k, the scheme Z is geometrically reduced over k (via either projection), see Varieties, Lemma 28.4.3. Hence the scheme $Z \times_{s_2, U, t_2} Z \subset Z$ is reduced, see Varieties, Lemma 28.4.7. Hence by Lemma 36.10.3 we see that c induces a morphism $Z \times_{s_2, U, t_2} Z \to Z$. Finally, it is clear that e_2 factors through Z and that the map $i_2 : R_2 \to R_2$ preserves Z. Since the morphisms of the septtuple $(U, R_2, s_2, t_2, c_2, e_2, i_2)$ satisfies the axioms of a groupoid, it follows that after restricting to Z they satisfy the axioms. $\square$

Lemma 36.10.5. *Notation and assumptions as in Situation 36.10.1. If the image $a(R_1)$ is a locally closed subset of R_2 then it is a closed subset.*

Proof. Let $k \subset k'$ be a perfect closure of the field k. Let R_i' be the restriction of R_i via the morphism $U' = Spec(k') \to Spec(k)$. Note that the morphisms $R_i' \to R_i$ are universal homeomorphisms as compositions of base changes of the universal homeomorphism $U' \to U$ (see diagram in statement of Lemma 36.9.4). Hence it suffices to prove that $a'(R_1')$ is closed in R_2'. In other words, we may assume that k is perfect.

If k is perfect, then the closure of the image is a groupoid scheme $Z \subset R_2$, by Lemma 36.10.4. By the same lemma applied to $\mathrm{id}_{R_1} : R_1 \to R_1$ we see that $(R_2)_{red}$ is a groupoid scheme. Thus we may apply Lemma 36.10.2 to the morphism $a|_{(R_2)_{red}} : (R_2)_{red} \to Z$ to conclude that Z equals the image of a. □

Lemma 36.10.6. *Notation and assumptions as in Situation 36.10.1. Assume that $a : R_1 \to R_2$ is a quasi-compact morphism. Let $Z \subset R_2$ be the scheme theoretic image (see Morphisms, Definition 24.4.2) of $a : R_1 \to R_2$. Then*

$$(U, Z, s_2|_Z, t_2|_Z, c_2|_Z)$$

is a groupoid scheme over S.

Proof. The main difficulty is to show that $c_2|_{Z\times_{s_2,U,t_2}Z}$ maps into Z. Consider the commutative diagram

$$\begin{tikzcd} R_1 \times_{s_1,U,t_1} R_1 \arrow[r] \arrow[d, "a\times a"] & R_1 \arrow[d] \\ R_2 \times_{s_2,U,t_2} R_2 \arrow[r] & R_2 \end{tikzcd}$$

By Varieties, Lemma 28.14.3 we see that the scheme theoretic image of $a\times a$ is $Z\times_{s_2,U,t_2} Z$. By the commutativity of the diagram we conclude that $Z \times_{s_2,U,t_2} Z$ maps into Z by the bottom horizontal arrow. As in the proof of Lemma 36.10.4 it is also true that $i_2(Z) \subset Z$ and that e_2 factors through Z. Hence we conclude as in the proof of that lemma. □

Lemma 36.10.7. *Let S be a scheme. Let (U, R, s, t, c) be a groupoid scheme over S. Assume U is the spectrum of a field. Let $Z \subset U \times_S U$ be the reduced closed subscheme (see Schemes, Definition 21.12.5) whose underlying topological space is the closure of the image of $j = (t, s) : R \to U \times_S U$. Then $pr_{02}(Z \times_{pr_1,U,pr_0} Z) \subset Z$ set theoretically.*

Proof. As $(U, U \times_S U, \mathrm{pr}_1, \mathrm{pr}_0, \mathrm{pr}_{02})$ is a groupoid scheme over S this is a special case of Lemma 36.10.3. But we can also prove it directly as follows.

Write $U = Spec(k)$. Denote R_s (resp. Z_s, resp. U_s^2) the scheme R (resp. Z, resp. $U \times_S U$) viewed as a scheme over k via s (resp. $\mathrm{pr}_1|_Z$, resp. pr_1). Simlarly, denote ${}_tR$ (resp. ${}_tZ$, resp. ${}_tU^2$) the scheme R (resp. Z, resp. $U\times_S U$) viewed as a scheme over k via t (resp. $\mathrm{pr}_0|_Z$, resp. pr_0). The morphism j induces morphisms of schemes $j_s : R_s \to U_s^2$ and ${}_tj : {}_tR \to {}_tU^2$ over k. Consider the commutative diagram

$$\begin{tikzcd} R_s \times_k {}_tR \arrow[r, "c"] \arrow[d, "j_s\times_t j"'] & R \arrow[d, "j"] \\ U_s^2 \times_k {}_tU^2 \arrow[r] & U \times_S U \end{tikzcd}$$

By Varieties, Lemma 28.14.2 we see that the closure of the image of $j_s \times_t j$ is $Z_s \times_{k\ t} Z$. By the commutativity of the diagram we conclude that $Z_s \times_{k\ t} Z$ maps into Z by the bottom horizontal arrow. $\square$

Lemma 36.10.8. *Let S be a scheme. Let (U, R, s, t, c) be a groupoid scheme over S. Assume U is the spectrum of a perfect field. Let $Z \subset U \times_S U$ be the reduced closed subscheme (see Schemes, Definition 21.12.5) whose underlying topological space is the closure of the image of $j = (t, s) : R \to U \times_S U$. Then*

$$(U, Z, pr_0|_Z, pr_1|_Z, pr_{02}|_{Z \times_{pr_1, U, pr_0} Z})$$

is a groupoid scheme over S.

Proof. As $(U, U \times_S U, \mathrm{pr}_1, \mathrm{pr}_0, \mathrm{pr}_{02})$ is a groupoid scheme over S this is a special case of Lemma 36.10.4. But we can also prove it directly as follows.

We first explain why the statement makes sense. Since U is the spectrum of a perfect field k, the scheme Z is geometrically reduced over k (via either projection), see Varieties, Lemma 28.4.3. Hence the scheme $Z \times_{\mathrm{pr}_1, U, \mathrm{pr}_0} Z \subset Z$ is reduced, see Varieties, Lemma 28.4.7. Hence by Lemma 36.10.7 we see that pr_{02} induces a morphism $Z \times_{\mathrm{pr}_1, U, \mathrm{pr}_0} Z \to Z$. Finally, it is clear that $\Delta_{U/S}$ factors through Z and that the map $\sigma : U \times_S U \to U \times_S U$, $(x, y) \mapsto (y, x)$ preserves Z. Since $(U, U \times_S U, \mathrm{pr}_0, \mathrm{pr}_1, \mathrm{pr}_{02}, \Delta_{U/S}, \sigma)$ satisfies the axioms of a groupoid, it follows that after restricting to Z they satisfy the axioms. $\square$

Lemma 36.10.9. *Let S be a scheme. Let (U, R, s, t, c) be a groupoid scheme over S. Assume U is the spectrum of a field and assume R is quasi-compact (equivalently s, t are quasi-compact). Let $Z \subset U \times_S U$ be the scheme theoretic image (see Morphisms, Definition 24.4.2) of $j = (t, s) : R \to U \times_S U$. Then*

$$(U, Z, pr_0|_Z, pr_1|_Z, pr_{02}|_{Z \times_{pr_1, U, pr_0} Z})$$

is a groupoid scheme over S.

Proof. As $(U, U \times_S U, \mathrm{pr}_1, \mathrm{pr}_0, \mathrm{pr}_{02})$ is a groupoid scheme over S this is a special case of Lemma 36.10.6. But we can also prove it directly as follows.

The main difficulty is to show that $\mathrm{pr}_{02}|_{Z \times_{\mathrm{pr}_1, U, \mathrm{pr}_0} Z}$ maps into Z. Write $U = Spec(k)$. Denote R_s (resp. Z_s, resp. U_s^2) the scheme R (resp. Z, resp. $U \times_S U$) viewed as a scheme over k via s (resp. $\mathrm{pr}_1|_Z$, resp. pr_1). Simlarly, denote ${}_tR$ (resp. ${}_tZ$, resp. ${}_tU^2$) the scheme R (resp. Z, resp. $U \times_S U$) viewed as a scheme over k via t (resp. $\mathrm{pr}_0|_Z$, resp. pr_0). The morphism j induces morphisms of schemes $j_s : R_s \to U_s^2$ and ${}_tj : {}_tR \to {}_tU^2$ over k. Consider the commutative diagram

$$\begin{tikzcd} R_s \times_{k\ t} R \arrow[r, "c"] \arrow[d, "j_s \times_t j"'] & R \arrow[d, "j"] \\ U_s^2 \times_{k\ t} U^2 \arrow[r] & U \times_S U \end{tikzcd}$$

By Varieties, Lemma 28.14.3 we see that the scheme theoretic image of $j_s \times_t j$ is $Z_s \times_{k\ t} Z$. By the commutativity of the diagram we conclude that $Z_s \times_{k\ t} Z$ maps into Z by the bottom horizontal arrow. As in the proof of Lemma 36.10.8 it is also true that $\sigma(Z) \subset Z$ and that $\Delta_{U/S}$ factors through Z. Hence we conclude as in the proof of that lemma. $\square$

36.11. Slicing groupoids

The following lemma shows that we may slice a Cohen-Macaulay groupoid scheme in order to reduce the dimension of the fibres, provided that the dimension of the stabilizer is small. This is an essential step in the process of improving a given presentation of a quotient stack.

Situation 36.11.1. Let S be a scheme. Let (U, R, s, t, c) be a groupoid scheme over S. Let $g : U' \to U$ be a morphism of schemes. Let $u \in U$ be a point, and let $u' \in U'$ be a point such that $g(u') = u$. Given these data, denote (U', R', s', t', c') the restriction of (U, R, s, t, c) via the morphism g. Denote $G \to U$ the stabilizer group scheme of R, which is a locally closed subscheme of R. Denote h the composition

$$h = s \circ \mathrm{pr}_1 : U' \times_{g,U,t} R \longrightarrow U.$$

Denote $F_u = s^{-1}(u)$ (scheme theoretic fibre), and G_u the scheme theoretic fibre of G over u. Similarly for R' we denote $F'_{u'} = (s')^{-1}(u')$. Because $g(u') = u$ we have

$$F'_{u'} = h^{-1}(u) \times_{Spec(\kappa(u))} Spec(\kappa(u')).$$

The point $e(u) \in R$ may be viewed as a point on G_u and F_u also, and $e'(u')$ is a point of R' (resp. $G'_{u'}$, resp. $F'_{u'}$) which maps to $e(u)$ in R (resp. G_u, resp. F_u).

Lemma 36.11.2. *Let S be a scheme. Let (U, R, s, t, c, e, i) be a groupoid scheme over S. Let $G \to U$ be the stabilizer group scheme. Assume s and t are Cohen-Macaulay and locally of finite presentation. Let $u \in U$ be a finite type point of the scheme U, see Morphisms, Definition 24.15.3. With notation as in Situation 36.11.1, set*

$$d_1 = \dim(G_u), \quad d_2 = \dim_{e(u)}(F_u).$$

If $d_2 > d_1$, then there exist an affine scheme U' and a morphism $g : U' \to U$ such that (with notation as in Situation 36.11.1)

1. *g is an immersion*
2. *$u \in U'$,*
3. *g is locally of finite presentation,*
4. *the morphism $h : U' \times_{g,U,t} R \longrightarrow U$ is Cohen-Macaulay at $(u, e(u))$, and*
5. *we have $\dim_{e'(u)}(F'_u) = d_2 - 1$.*

Proof. Let $Spec(A) \subset U$ be an affine neighbourhood of u such that u corresponds to a closed point of U, see Morphisms, Lemma 24.15.4. Let $Spec(B) \subset R$ be an affine neighbourhood of $e(u)$ which maps via j into the open $Spec(A) \times_S Spec(A) \subset U \times_S U$. Let $\mathfrak{m} \subset A$ be the maximal ideal corresponding to u. Let $\mathfrak{q} \subset B$ be the prime ideal corresponding to $e(u)$. Pictures:

$$\begin{tikzcd} B & A \arrow[l, "s"'] \\ A \arrow[u, "t"] & \end{tikzcd} \quad \text{and} \quad \begin{tikzcd} B_{\mathfrak{q}} & A_{\mathfrak{m}} \arrow[l, "s"'] \\ A_{\mathfrak{m}} \arrow[u, "t"] & \end{tikzcd}$$

Note that the two induced maps $s, t : \kappa(\mathfrak{m}) \to \kappa(\mathfrak{q})$ are equal and isomorphisms as $s \circ e = t \circ e = \mathrm{id}_U$. In particular we see that $\mathfrak{q}$ is a maximal ideal as well. The ring maps $s, t : A \to B$ are of finite presentation and flat. By assumption the ring

$$\mathcal{O}_{F_u, e(u)} = B_{\mathfrak{q}}/s(\mathfrak{m})B_{\mathfrak{q}}$$

is Cohen-Macaulay of dimension d_2. The equality of dimension holds by Morphisms, Lemma 24.27.1.

Let R'' be the restriction of R to $u = Spec(\kappa(u))$ via the morphism $Spec(\kappa(u)) \to U$. As $u \to U$ is locally of finite type, we see that $(Spec(\kappa(u)), R'', s'', t'', c'')$ is a groupoid scheme with s'', t'' locally of finite type, see Lemma 36.8.1. By Lemma 36.9.9 this implies that $\dim(G'') = \dim(R'')$. We also have $\dim(R'') = \dim_{e''}(R'') = \dim(\mathcal{O}_{R'',e''})$, see Lemma 36.9.8. By Groupoids, Lemma 35.15.4 we have $G'' = G_u$. Hence we conclude that $\dim(\mathcal{O}_{R'',e''}) = d_1$.

As a scheme R'' is

$$R'' = R \times_{(U \times_S U)} \Big(Spec(\kappa(\mathfrak{m})) \times_S Spec(\kappa(\mathfrak{m})) \Big)$$

Hence an affine open neighbourhood of e'' is the spectrum of the ring

$$B \otimes_{(A \otimes A)} (\kappa(\mathfrak{m}) \otimes \kappa(\mathfrak{m})) = B/s(\mathfrak{m})B + t(\mathfrak{m})B$$

We conclude that

$$\mathcal{O}_{R'',e''} = B_{\mathfrak{q}}/s(\mathfrak{m})B_{\mathfrak{q}} + t(\mathfrak{m})B_{\mathfrak{q}}$$

and so now we know that this ring has dimension d_1.

We claim this implies we can find an element $f \in \mathfrak{m}$ such that

$$\dim(B_{\mathfrak{q}}/(s(\mathfrak{m})B_{\mathfrak{q}} + fB_{\mathfrak{q}}) < d_2$$

Namely, suppose $\mathfrak{n}_j \supset s(\mathfrak{m})B_{\mathfrak{q}}$, $j = 1, \ldots, m$ correspond to the minimal primes of the local ring $B_{\mathfrak{q}}/s(\mathfrak{m})B_{\mathfrak{q}}$. There are finitely many as this ring is Noetherian (since it is essentially of finite type over a field -- but also because a Cohen-Macaulay ring is Noetherian). By the Cohen-Macaulay condition we have $\dim(B_{\mathfrak{q}}/\mathfrak{n}_j) = d_2$, for example by Algebra, Lemma 7.96.4. Note that $\dim(B_{\mathfrak{q}}/(\mathfrak{n}_j + t(\mathfrak{m})B_{\mathfrak{q}})) \leq d_1$ as it is a quotient of the ring $\mathcal{O}_{R'',e''} = B_{\mathfrak{q}}/s(\mathfrak{m})B_{\mathfrak{q}} + t(\mathfrak{m})B_{\mathfrak{q}}$ which has dimension d_1. As $d_1 < d_2$ this implies that $\mathfrak{m} \not\subset t^{-1}(\mathfrak{n}_i)$. By prime avoidence, see Algebra, Lemma 7.14.3, we can find $f \in \mathfrak{m}$ with $t(f) \not\in \mathfrak{n}_j$ for $j = 1, \ldots, m$. For this choice of f we have the displayed inequality above, see Algebra, Lemma 7.57.11.

Set $A' = A/fA$ and $U' = Spec(A')$. Then it is clear that $U' \to U$ is an immersion, locally of finite presentation and that $u \in U'$. Thus (1), (2) and (3) of the lemma hold. The morphism

$$U' \times_{g,U,t} R \longrightarrow U$$

factors through $Spec(A)$ and corresponds to the ring map

$$B/t(f)B = A/(f) \otimes_{A,t} B \xleftarrow{s} A$$

Now, we see $t(f)$ is not a zero divisor on $B_{\mathfrak{q}}/s(\mathfrak{m})B_{\mathfrak{q}}$ as this is a Cohen-Macaulay ring of positive dimension and f is not contained in any minimal prime, see for example Algebra, Lemma 7.96.2. Hence by Algebra, Lemma 7.119.5 we conclude that $s : A_{\mathfrak{m}} \to B_{\mathfrak{q}}/t(f)B_{\mathfrak{q}}$ is flat with fibre ring $B_{\mathfrak{q}}/(s(\mathfrak{m})B_{\mathfrak{q}} + t(f)B_{\mathfrak{q}})$ which is Cohen-Macaulay by Algebra, Lemma 7.96.2 again. This implies part (4) of the lemma. To see part (5) note that by Diagram (36.8.0.1) the fibre F'_u is equal to the fibre of h over u. Hence $\dim_{e'(u)}(F'_u) = \dim(B_{\mathfrak{q}}/(s(\mathfrak{m})B_{\mathfrak{q}} + t(f)B_{\mathfrak{q}}))$ by Morphisms, Lemma 24.27.1 and the dimension of this ring is $d_2 - 1$ by Algebra, Lemma 7.96.2 once more. This proves the final assertion of the lemma and we win. ☐

Now that we know how to slice we can combine it with the preceding material to get the following ``optimal" result. It is optimal in the sense that since G_u is a locally closed subscheme of F_u one always has the inequality $\dim(G_u) = \dim_{e(u)}(G_u) \leq \dim_{e(u)}(F_u)$ so it is not possible to slice more than in the lemma.

Lemma 36.11.3. *Let S be a scheme. Let (U, R, s, t, c, e, i) be a groupoid scheme over S. Let $G \to U$ be the stabilizer group scheme. Assume s and t are Cohen-Macaulay and locally of finite presentation. Let $u \in U$ be a finite type point of the scheme U, see Morphisms, Definition 24.15.3. With notation as in Situation 36.11.1 there exist an affine scheme U' and a morphism $g : U' \to U$ such that*

(1) *g is an immersion,*
(2) *$u \in U'$,*
(3) *g is locally of finite presentation,*
(4) *the morphism $h : U' \times_{g,U,t} R \longrightarrow U$ is Cohen-Macaulay and locally of finite presentation,*
(5) *the morphisms $s', t' : R' \to U'$ are Cohen-Macaulay and locally of finite presentation, and*
(6) $\dim_{e(u)}(F'_u) = \dim(G'_u)$.

Proof. As s is locally of finite presentation the scheme F_u is locally of finite type over $\kappa(u)$. Hence $\dim_{e(u)}(F_u) < \infty$ and we may argue by induction on $\dim_{e(u)}(F_u)$.

If $\dim_{e(u)}(F_u) = \dim(G_u)$ there is nothing to prove. Assume $\dim_{e(u)}(F_u) > \dim(G_u)$. This means that Lemma 36.11.2 applies and we find a morphism $g : U' \to U$ which has properties (1), (2), (3), instead of (6) we have $\dim_{e(u)}(F'_u) < \dim_{e(u)}(F_u)$, and instead of (4) and (5) we have that the composition

$$h = s \circ \mathrm{pr}_1 : U' \times_{g,U,t} R \longrightarrow U$$

is Cohen-Macaulay at the point $(u, e(u))$. We apply Remark 36.5.3 and we obtain an open subscheme $U'' \subset U'$ such that $U'' \times_{g,U,t} R \subset U' \times_{g,U,t} R$ is the largest open subscheme on which h is Cohen-Macaulay. Since $(u, e(u)) \in U'' \times_{g,U,t} R$ we see that $u \in U''$. Hence we may replace U' by U'' and assume that in fact h is Cohen-Macaulay everywhere! By Lemma 36.8.2 we conclude that s', t' are locally of finite presentation and Cohen-Macaulay (use Morphisms, Lemma 24.20.4 and More on Morphisms, Lemma 33.15.3).

By construction $\dim_{e'(u)}(F'_u) < \dim_{e(u)}(F_u)$, so we may apply the induction hypothesis to (U', R', s', t', c') and the point $u \in U'$. Note that u is also a finite type point of U' (for example you can see this using the characterization of finite type points from Morphisms, Lemma 24.15.4). Let $g' : U'' \to U'$ and $(U'', R'', s'', t'', c'')$ be the solution of the corresponding problem starting with (U', R', s', t', c') and the point $u \in U'$. We claim that the composition

$$g'' = g \circ g' : U'' \longrightarrow U$$

is a solution for the original problem. Properties (1), (2), (3), (5), and (6) are immediate. To see (4) note that the morphism

$$h'' = s \circ \mathrm{pr}_1 : U'' \times_{g'',U,t} R \longrightarrow U$$

is locally of finite presentation and Cohen-Macaulay by an application of Lemma 36.8.4 (use More on Morphisms, Lemma 33.15.7 to see that Cohen-Macaulay morphisms are fppf local on the target). □

In case the stabilizer group scheme has fibres of dimension 0 this leads to the following slicing lemma.

Lemma 36.11.4. *Let S be a scheme. Let (U, R, s, t, c, e, i) be a groupoid scheme over S. Let $G \to U$ be the stabilizer group scheme. Assume s and t are Cohen-Macaulay and locally of finite presentation. Let $u \in U$ be a finite type point of the scheme U, see Morphisms,* *Definition 24.15.3. Assume that $G \to U$ is locally quasi-finite. With notation as in Situation 36.11.1 there exist an affine scheme U' and a morphism $g : U' \to U$ such that*

(1) *g is an immersion,*
(2) *$u \in U'$,*
(3) *g is locally of finite presentation,*
(4) *the morphism $h : U' \times_{g,U,t} R \longrightarrow U$ is flat, locally of finite presentation, and locally quasi-finite, and*
(5) *the morphisms $s', t' : R' \to U'$ are flat, locally of finite presentation, and locally quasi-finite.*

Proof. Take $g : U' \to U$ as in Lemma 36.11.3. Since $h^{-1}(u) = F'_u$ we see that h has relative dimension ≤ 0 at $(u, e(u))$. Hence, by Remark 36.5.3, we obtain an open subscheme $U'' \subset U'$ such that $u \in U''$ and $U'' \times_{g,U,t} R$ is the maximal open subscheme of $U' \times_{g,U,t} R$ on which h has relative dimension ≤ 0. After replacing U' by U'' we see that h has relative dimension ≤ 0. This implies that h is locally quasi-finite by Morphisms, Lemma 24.28.5. Since it is still locally of finite presentation and Cohen-Macaulay we see that it is flat, locally of finite presentation and locally quasi-finite, i.e., (4) above holds. This implies that s' is flat, locally of finite presentation and locally quasi-finite as a base change of h, see Lemma 36.8.2. □

36.12. Étale localization of groupoids

In this section we begin applying the étale localization techniques of More on Morphisms, Section 33.28 to groupoid schemes. More advanced material of this kind can be found in More on Groupoids in Spaces, Section 53.11. Lemma 36.12.2 will be used to prove results on algebraic spaces separated and quasi-finite over a scheme, namely Morphisms of Spaces, Proposition 42.39.2 and its corollary Morphisms of Spaces, Lemma 42.40.1.

Lemma 36.12.1. *Let S be a scheme. Let (U, R, s, t, c) be a groupoid scheme over S. Let $p \in S$ be a point, and let $u \in U$ be a point lying over p. Assume that*

(1) *$U \to S$ is locally of finite type,*
(2) *$U \to S$ is quasi-finite at u,*
(3) *$U \to S$ is separated,*
(4) *$R \to S$ is separated,*
(5) *s, t are flat and locally of finite presentation, and*
(6) *$s^{-1}(\{u\})$ is finite.*

Then there exists an étale neighbourhood $(S', p') \to (S, p)$ with $\kappa(p) = \kappa(p')$ and a base change diagram

$$\begin{tikzcd}
R' \coprod W' \arrow[r, equal] & S' \times_S R \arrow[r] \arrow[d, shift right, "t'"'] \arrow[d, shift left, "s'"] & R \arrow[d, shift right, "t"'] \arrow[d, shift left, "s"] \\
U' \coprod W \arrow[r, equal] & S' \times_S U \arrow[r] \arrow[d] & U \arrow[d] \\
 & S' \arrow[r] & S
\end{tikzcd}$$

where the equal signs are decompositions into open and closed subschemes such that

(a) *there exists a point u' of U' mapping to u in U,*
(b) *the fibre $(U')_{p'}$ equals $t'\left((s')^{-1}(\{u'\})\right)$ set theoretically,*
(c) *the fibre $(R')_{p'}$ equals $(s')^{-1}\left((U')_{p'}\right)$ set theoretically,*

(d) *the schemes U' and R' are finite over S',*
(e) *we have $s'(R') \subset U'$ and $t'(R') \subset U'$,*
(f) *we have $c'(R' \times_{s',U',t'} R') \subset R'$ where c' is the base change of c, and*
(g) *the morphisms s', t', c' determine a groupoid structure by taking the system $(U', R', s'|_{R'}, t'|_{R'}, c'|_{R' \times_{s',U',t'} R'})$.*

Proof. Let us denote $f : U \to S$ the structure morphism of U. By assumption (6) we can write $s^{-1}(\{u\}) = \{r_1, \ldots, r_n\}$. Since this set is finite, we see that s is quasi-finite at each of these finitely many inverse images, see Morphisms, Lemma 24.19.7. Hence we see that $f \circ s : R \to S$ is quasi-finite at each r_i (Morphisms, Lemma 24.19.12). Hence r_i is isolated in the fibre R_p, see Morphisms, Lemma 24.19.6. Write $t(\{r_1, \ldots, r_n\}) = \{u_1, \ldots, u_m\}$. Note that it may happen that $m < n$ and note that $u \in \{u_1, \ldots, u_m\}$. Since t is flat and locally of finite presentation, the morphism of fibres $t_p : R_p \to U_p$ is flat and locally of finite presentation (Morphisms, Lemmas 24.24.7 and 24.20.4), hence open (Morphisms, Lemma 24.24.9). The fact that each r_i is isolated in R_p implies that each $u_j = t(r_i)$ is isolated in U_p. Using Morphisms, Lemma 24.19.6 again, we see that f is quasi-finite at $u_1, \ldots, u_m$.

Denote $F_u = s^{-1}(u)$ and $F_{u_j} = s^{-1}(u_j)$ the scheme theoretic fibres. Note that F_u is finite over $\kappa(u)$ as it is locally of finite type over $\kappa(u)$ with finitely many points (for example it follows from the much more general Morphisms, Lemma 24.48.8). By Lemma 36.6.1 we see that F_u and F_{u_j} become isomorphic over a common field extension of $\kappa(u)$ and $\kappa(u_j)$. Hence we see that F_{u_j} is finite over $\kappa(u_j)$. In particular we see $s^{-1}(\{u_j\})$ is a finite set for each $j = 1, \ldots, m$. Thus we see that assumptions (2) and (6) hold for each u_j also (above we saw that $U \to S$ is quasi-finite at u_j). Hence the argument of the first paragraph applies to each u_j and we see that $R \to U$ is quasi-finite at each of the points of

$$\{r_1, \ldots, r_N\} = s^{-1}(\{u_1, \ldots, u_m\})$$

Note that $t(\{r_1, \ldots, r_N\}) = \{u_1, \ldots, u_m\}$ and $t^{-1}(\{u_1, \ldots, u_m\}) = \{r_1, \ldots, r_N\}$ since R is a groupoid[2]. Moreover, we have $\mathrm{pr}_0(c^{-1}(\{r_1, \ldots, r_N\})) = \{r_1, \ldots, r_N\}$ and $\mathrm{pr}_1(c^{-1}(\{r_1, \ldots, r_N\})) = \{r_1, \ldots, r_N\}$. Similarly we get $e(\{u_1, \ldots, u_m\}) \subset \{r_1, \ldots, r_N\}$ and $i(\{r_1, \ldots, r_N\}) = \{r_1, \ldots, r_N\}$.

We may apply More on Morphisms, Lemma 33.28.4 to the pairs $(U \to S, \{u_1, \ldots, u_m\})$ and $(R \to S, \{r_1, \ldots, r_N\})$ to get an étale neighbourhood $(S', p') \to (S, p)$ which induces an identification $\kappa(p) = \kappa(p')$ such that $S' \times_S U$ and $S' \times_S R$ decompose as

$$S' \times_S U = U' \coprod W, \quad S' \times_S R = R' \coprod W'$$

with $U' \to S'$ finite and $(U')_{p'}$ mapping bijectively to $\{u_1, \ldots, u_m\}$, and $R' \to S'$ finite and $(R')_{p'}$ mapping bijectively to $\{r_1, \ldots, r_N\}$. Moreover, no point of $W_{p'}$ (resp. $(W')_{p'}$) maps to any of the points u_j (resp. r_i). At this point (a), (b), (c), and (d) of the lemma are satisfied. Moreover, the inclusions of (e) and (f) hold on fibres over p', i.e., $s'((R')_{p'}) \subset (U')_{p'}$, $t'((R')_{p'}) \subset (U')_{p'}$, and $c'((R' \times_{s',U',t'} R')_{p'}) \subset (R')_{p'}$.

We claim that we can replace S' by a Zariski open neighbourhood of p' so that the inclusions of (e) and (f) hold. For example, consider the set $E = (s'|_{R'})^{-1}(W)$. This is open and closed in R' and does not contain any points of R' lying over p'. Since $R' \to S'$ is closed, after replacing S' by $S' \setminus (R' \to S')(E)$ we reach a situation where E is empty. In other words s' maps R' into U'. Note that this property is preserved under further shrinking S'. Similarly, we can arrange it so that t' maps R' into U'. At this point (e) holds. In the same

[2]Explanation in groupoid language: The original set $\{r_1, \ldots, r_n\}$ was the set of arrows with source u. The set $\{u_1, \ldots, u_m\}$ was the set of objects isomorphic to u. And $\{r_1, \ldots, r_N\}$ is the set of all arrows between all the objects equivalent to u.

manner, consider the set $E = (c'|_{R' \times_{s',U',t'} R'})^{-1}(W')$. It is open and closed in the scheme $R' \times_{s',U',t'} R'$ which is finite over S', and does not contain any points lying over p'. Hence after replacing S' by $S' \setminus (R' \times_{s',U',t'} R' \to S')(E)$ we reach a situation where E is empty. In other words we obtain the inclusion in (f). We may repeat the argument also with the identity $e' : S' \times_S U \to S' \times_S R$ and the inverse $i' : S' \times_S R \to S' \times_S R$ so that we may assume (after shrinking S' some more) that $(e'|_{U'})^{-1}(W') = \emptyset$ and $(i'|_{R'})^{-1}(W') = \emptyset$.

At this point we see that we may consider the structure

$$(U', R', s'|_{R'}, t'|_{R'}, c'|_{R' \times_{t',U',s'} R'}, e'|_{U'}, i'|_{R'}).$$

The axioms of a groupoid scheme over S' hold because they hold for the groupoid scheme $(S' \times_S U, S' \times_S R, s', t', c', e', i')$. □

Lemma 36.12.2. *Let S be a scheme. Let (U, R, s, t, c) be a groupoid scheme over S. Let $p \in S$ be a point, and let $u \in U$ be a point lying over p. Assume assumptions (1) -- (6) of Lemma 36.12.1 hold as well as*

(7) *$j : R \to U \times_S U$ is universally closed*[3].

Then we can choose $(S', p') \to (S, p)$ and decompositions $S' \times_S U = U' \amalg W$ and $S' \times_S R = R' \amalg W'$ and $u' \in U'$ such that (a) -- (g) of Lemma 36.12.1 hold as well as

(h) *R' is the restriction of $S' \times_S R$ to U'.*

Proof. We apply Lemma 36.12.1 for the groupoid (U, R, s, t, c) over the scheme S with points p and u. Hence we get an étale neighbourhood $(S', p') \to (S, p)$ and disjoint union decompositions

$$S' \times_S U = U' \amalg W, \quad S' \times_S R = R' \amalg W'$$

and $u' \in U'$ satisfying conclusions (a), (b), (c), (d), (e), (f), and (g). We may shrink S' to a smaller neighbourhood of p' without affecting the conclusions (a) -- (g). We will show that for a suitable shrinking conclusion (h) holds as well. Let us denote j' the base change of j to S'. By conclusion (e) it is clear that

$$j'^{-1}(U' \times_{S'} U') = R' \amalg Rest$$

for some open and closed $Rest$ piece. Since $U' \to S'$ is finite by conclusion (d) we see that $U' \times_{S'} U'$ is finite over S'. Since j is universally closed, also j' is universally closed, and hence $j'|_{Rest}$ is universally closed too. By conclusions (b) and (c) we see that the fibre of

$$(U' \times_{S'} U' \to S') \circ j'|_{Rest} : Rest \longrightarrow S'$$

over p' is empty. Hence, since $Rest \to S'$ is closed as a composition of closed morphisms, after replacing S' by $S' \setminus \mathrm{Im}(Rest \to S')$, we may assume that $Rest = \emptyset$. And this is exactly the condition that R' is the restriction of $S' \times_S R$ to the open subscheme $U' \subset S' \times_S U$, see Groupoids, Lemma 35.15.3 and its proof. □

CHAPTER 37

Étale Morphisms of Schemes

37.1. Introduction

In this Chapter, we discuss étale morphisms of schemes. We illustrate some of the more important concepts by working with the Noetherian case. Our principal goal is to collect for the reader with enough commutative algebra results to start reading a treatise on étale cohomology. An auxiliary goal is to provide enough evidence to ensure that the reader stops calling the phrase ``the étale topology of schemes'' an exercise in general nonsense, if (s)he does indulge in such blasphemy.

We will refer to the other chapters of the stacks project for standard results in algebraic geometry (on schemes and commutative algebra). We will provide detailed proofs of the new results that we state here.

37.2. Conventions

In this chapter, frequently schemes will be assumed locally Noetherian and frequently rings will be assumed Noetherian. But in all the statements we will reiterate this when necessary, and make sure we list all the hypotheses! On the other hand, here are some general facts that we will use often and are useful to keep in mind:

(1) A ring homomorphism $A \to B$ of finite type with A Noetherian is of finite presentation. See Algebra, Lemma 7.28.4.
(2) A morphism (locally) of finite type between locally Noetherian schemes is automatically (locally) of finite presentation. See Morphisms, Lemma 24.20.9.
(3) Add more like this here.

37.3. Unramified morphisms

We first define the notion of unramified morphisms for local rings, and then globalise it to get one for arbitrary schemes.

Definition 37.3.1. Let A, B be Noetherian local rings. A local homomorphism $A \to B$ is said to be *unramified homomorphism of local rings* if

(1) $\mathfrak{m}_A B = \mathfrak{m}_B$,
(2) $\kappa(\mathfrak{m}_A)$ is a finite separable extension of $\kappa(\mathfrak{m}_B)$, and
(3) B is essentially of finite type over A (this means that B is the localization of a finite type A-algebra at a prime).

This is the local version of the definition in Algebra, Section 7.138. In that section a ring map $R \to S$ is defined to be unramified if and only if it is of finite type, and $\Omega_{S/R} = 0$. It is shown in Algebra, Lemmas 7.138.5 and 7.138.7 that given a ring map $R \to S$ of finite type, and a prime $\mathfrak{q}$ of S lying over $\mathfrak{p} \subset R$, then we have

$$R \to S \text{ is unramified at } \mathfrak{q} \Leftrightarrow \mathfrak{p}S_{\mathfrak{q}} = \mathfrak{q}S_{\mathfrak{q}} \text{ and } \kappa(\mathfrak{p}) \subset \kappa(\mathfrak{q}) \text{ finite separable}$$

Thus we see that for a local homomorphism of local rings the properties of our definition above are closely related to the question of being unramified. In fact, we have proved the following lemma.

Lemma 37.3.2. *Let $A \to B$ be of finite type with A a Noetherian ring. Let $\mathfrak{q}$ be a prime of B lying over $\mathfrak{p} \subset A$. Then $A \to B$ is unramified at $\mathfrak{q}$ if and only if $A_{\mathfrak{p}} \to B_{\mathfrak{q}}$ is an unramified homomorphism of local rings.*

Proof. See discussion above. □

We will characterize the property of being unramified in terms of completions. For a Noetherian local ring A we denote $A^\wedge$ the completion of A with respect to the maximal ideal. It is also a Noetherian local ring, see Algebra, Lemma 7.90.10.

Lemma 37.3.3. *Let A, B be Noetherian local rings. Let $A \to B$ be a local homomorphism.*

(1) *if $A \to B$ is an unramified homomorphism of local rings, then $B^\wedge$ is a finite $A^\wedge$ module,*
(2) *if $A \to B$ is an unramified homomorphism of local rings and $\kappa(\mathfrak{m}_A) = \kappa(\mathfrak{m}_B)$, then $A^\wedge \to B^\wedge$ is surjective,*
(3) *if $A \to B$ is an unramified homomorphism of local rings and $\kappa(\mathfrak{m}_A)$ is separably closed, then $A^\wedge \to B^\wedge$ is surjective,*
(4) *if A and B are complete discrete valuation rings, then $A \to B$ is an unramified homomorphism of local rings if and only the uniformizer for A maps to a uniformizer for B, and the residue field extension is finite separable (and B is essentially of finite type over A).*

Proof. Part (1) is a special case of Algebra, Lemma 7.90.16. For part (2), note that the $\kappa(\mathfrak{m}_A)$-vector space $B^\wedge/\mathfrak{m}_{A^\wedge}B^\wedge$ is generated by 1. Hence by Nakayama's lemma (Algebra, Lemma 7.14.5) the map $A^\wedge \to B^\wedge$ is surjective. Part (3) is a special case of part (2). Part (4) is immediate from the definitions. □

Lemma 37.3.4. *Let A, B be Noetherian local rings. Let $A \to B$ be a local homomorphism such that B is essentially of finite type over A. The following are equivalent*

(1) *$A \to B$ is an unramified homomorphism of local rings*
(2) *$A^\wedge \to B^\wedge$ is an unramified homomorphism of local rings, and*
(3) *$A^\wedge \to B^\wedge$ is unramified.*

Proof. The equivalence of (1) and (2) follows from the fact that $\mathfrak{m}_A A^\wedge$ is the maximal ideal of $A^\wedge$ (and similarly for B) and faithful flatness of $B \to B^\wedge$. For example if $A^\wedge \to B^\wedge$ is unramified, then $\mathfrak{m}_A B^\wedge = (\mathfrak{m}_A B)B^\wedge = \mathfrak{m}_B B^\wedge$ and hence $\mathfrak{m}_A B = \mathfrak{m}_B$.

Assume the equivalent conditions (1) and (2). By Lemma 37.3.3 we see that $A^\wedge \to B^\wedge$ is finite. Hence $A^\wedge \to B^\wedge$ is of finite presentation, and by Algebra, Lemma 7.138.7 we conclude that $A^\wedge \to B^\wedge$ is unramified at $\mathfrak{m}_{B^\wedge}$. Since $B^\wedge$ is local we conclude that $A^\wedge \to B^\wedge$ is unramified.

Assume (3). By Algebra, Lemma 7.138.5 we conclude that $A^\wedge \to B^\wedge$ is an unramified homomorphism of local rings, i.e., (2) holds. □

Definition 37.3.5. (See Morphisms, Definition 24.34.1 for the definition in the general case.) Let Y be a locally Noetherian scheme. Let $f : X \to Y$ be locally of finite type. Let $x \in X$.

(1) We say f is *unramified at x* if $\mathcal{O}_{Y,f(x)} \to \mathcal{O}_{X,x}$ is an unramified homomorphism of local rings.

(2) The morphism $f : X \to Y$ is said to be *unramified* if it is unramified at all points of X.

Let us prove that this definition agrees with the definition in the chapter on morphisms of schemes. This in particular garantees that the set of points where a morphism is unramified is open.

Lemma 37.3.6. *Let Y be a locally Noetherian scheme. Let $f : X \to Y$ be locally of finite type. Let $x \in X$. The morphism f is unramified at x in the sense of Definition 37.3.5 if and only if it is unramified in the sense of Morphisms, Definition 24.34.1.*

Proof. This follows from Lemma 37.3.2 and the definitions. □

Here are some results on unramified morphisms. The formulations as given in this list apply only to morphisms locally of finite type between locally Noetherian schemes. In each case we give a reference to the general result as proved earlier in the project, but in some cases one can prove the result more easily in the Noetherian case. Here is the list:

(1) Unramifiedness is local on the source and the target in the Zariski topology.
(2) Unramified morphisms are stable under base change and composition. See Morphisms, Lemmas 24.34.5 and 24.34.4.
(3) Unramified morphisms of schemes are locally quasi-finite and quasi-compact unramified morphisms are quasi-finite. See Morphisms, Lemma 24.34.10
(4) Unramified morphisms have relative dimension 0. See Morphisms, Definition 24.28.1 and Morphisms, Lemma 24.28.5.
(5) A morphism is unramified if and only if all its fibres are unramified. That is, unramifiedness can be checked on the scheme theoretic fibres. See Morphisms, Lemma 24.34.12.
(6) Let X and Y be unramified over a base scheme S. Any S-morphism from X to Y is unramified. See Morphisms, Lemma 24.34.16.

37.4. Three other characterizations of unramified morphisms

The following theorem gives three equivalent notions of being unramified at a point. See Morphisms, Lemma 24.34.14 for (part of) the statement for general schemes.

Theorem 37.4.1. *Let Y be a locally Noetherian scheme. Let $f : X \to Y$ be a morphism of schemes which is locally of finite type. Let x be a point of X. The following are equivalent*

(1) *f is unramified at x,*
(2) *the stalk $\Omega_{X/Y,x}$ of the module of relative differentials at x is trivial,*
(3) *there exist open neighbourhoods U of x and V of $f(x)$, and a commutative diagram*

$$\begin{tikzcd} U \arrow[rr, "i"] \arrow[dr] & & \mathbf{A}^n_V \arrow[dl] \\ & V & \end{tikzcd}$$

where i is a closed immersion defined by a quasi-coherent sheaf of ideals $\mathcal{I}$ such that the differentials dg for $g \in \mathcal{I}_{i(x)}$ generate $\Omega_{\mathbf{A}^n_V/V,i(x)}$, and
(4) *the diagonal $\Delta_{X/Y} : X \to X \times_Y X$ is a local isomorphism at x.*

Proof. The equivalence of (1) and (2) is proved in Morphisms, Lemma 24.34.14.

If f is unramified at x, then f is unramified in an open neighbourhood of x; this does not follow immediately from Definition 37.3.5 of this chapter but it does follow from Morphisms, Definition 24.34.1 which we proved to be equivalent in Lemma 37.3.6. Choose affine opens $V \subset Y$, $U \subset X$ with $f(U) \subset V$ and $x \in U$, such that f is unramified on U, i.e., $f|_U : U \to V$ is unramified. By Morphisms, Lemma 24.34.13 the morphism $U \to U \times_V U$ is an open immersion. This proves that (1) implies (4).

If $\Delta_{X/Y}$ is a local isomorphism at x, then $\Omega_{X/Y,x} = 0$ by construction of the sheaf of relative differentials (see Morphisms, Definition 24.32.4). Hence we see that (4) implies (2). At this point we know that (1), (2) and (4) are all equivalent.

Assume (3). The assumption on the diagram combined with Morphisms, Lemma 24.32.17 show that $\Omega_{U/V,x} = 0$. Since $\Omega_{U/V,x} = \Omega_{X/Y,x}$ we conclude (2) holds.

Finally, assume that (2) holds. To prove (3) we may localize on X and Y and assume that X and Y are affine. Say $X = Spec(B)$ and $Y = Spec(A)$. The point $x \in X$ corresponds to a prime $\mathfrak{q} \subset B$. Our assumption is that $\Omega_{B/A,\mathfrak{q}} = 0$ (see Morphisms, Lemma 24.32.7 for the relationship between differentials on schemes and modules of differentials in commutative algebra). Since Y is locally Noetherian and f locally of finite type we see that A is Noetherian and $B \cong A[x_1, \ldots, x_n]/(f_1, \ldots, f_m)$, see Properties, Lemma 23.5.2 and Morphisms, Lemma 24.14.2. In particular, $\Omega_{B/A}$ is a finite B-module. Hence we can find a single $g \in B$, $g \notin \mathfrak{q}$ such that the principal localization $(\Omega_{B/A})_g$ is zero. Hence after replacing B by B_g we see that $\Omega_{B/A} = 0$ (formation of modules of differentials commutes with localization, see Algebra, Lemma 7.122.8). This means that $d(f_j)$ generate the kernel of the canonical map $\Omega_{A[x_1,\ldots,x_n]/A} \otimes_A B \to \Omega_{B/A}$. Thus the surjection $A[x_1, \ldots, x_n] \to B$ of A-algebras gives the commutative diagram of (3), and the theorem is proved. $\square$

How can we use this theorem? Well, here are a few remarks:

(1) Suppose that $f : X \to Y$ and $g : Y \to Z$ are two morphisms locally of finite type between locally Noetherian schemes. There is a canonical short exact sequence
$$f^*(\Omega_{Y/Z}) \to \Omega_{X/Z} \to \Omega_{X/Y} \to 0$$
see Morphisms, Lemma 24.32.11. The theorem therefore implies that if $g \circ f$ is unramified, then so is f. This is Morphisms, Lemma 24.34.16.

(2) The definition of $\Omega_{X/Y}$ as the pullback $\Delta^*(\mathcal{J}/\mathcal{J}^2)$ of the conormal sheaf of the diagonal morphism (see Morphisms, Definition 24.32.4) allows us to conclude that if $X \to Y$ is a monomorphism of locally Noetherian schemes and locally of finite type, then $X \to Y$ is unramified. In particular, open and closed immersions of locally Noetherian schemes are unramified. See Morphisms, Lemmas 24.34.7 and 24.34.8.

(3) The theorem also implies that the set of points where a morphism $f : X \to Y$ (locally of finite type of locally Noetherian schemes) is not unramified is the support of the coherent sheaf $\Omega_{X/Y}$. This allows one to give a scheme theoretic definition to the ``ramification locus''.

37.5. The functorial characterization of unramified morphisms

In basic algebraic geometry we learn that some classes of morphisms can be characterised functorially, and that such descriptions are quite useful. Unramified morphisms too have such a characterisation.

Theorem 37.5.1. *Let $f : X \to S$ be a morphism of schemes. Assume S is a locally Noetherian scheme, and f is locally of finite type. Then the following are equivalent:*

(1) *f is unramified,*
(2) *the morphism f is formally unramified: for any affine S-scheme T and subscheme T_0 of T defined by a square-zero ideal, the natural map*

$$Hom_S(T, X) \longrightarrow Hom_S(T_0, X)$$

is injective.

Proof. See More on Morphisms, Lemma 33.4.8 for a more general statement and proof. What follows is a sketch of the proof in the current case.

Firstly, one checks both properties are local on the source and the target. This we may assume that S and X are affine. Say $X = Spec(B)$ and $S = Spec(R)$. Say $T = Spec(C)$. Let J be the square-zero ideal of C with $T_0 = Spec(C/J)$. Assume that we are given the diagram

$$\begin{tikzcd} & B \arrow[d, "\phi"] \arrow[dr, "\bar{\phi}"] & \\ R \arrow[ur] \arrow[r] & C \arrow[r] & C/J \end{tikzcd}$$

Secondly, one checks that the association $\phi' \mapsto \phi' - \phi$ gives a bijection between the set of liftings of $\bar{\phi}$ and the module $\mathrm{Der}_R(B, J)$. Thus, we obtain the implication (1) $\Rightarrow$ (2) via the description of unramified morphisms having trivial module of differentials, see Theorem 37.4.1.

To obtain the reverse implication, consider the surjection $q : C = (B \otimes_R B)/I^2 \to B = C/J$ defined by the square zero ideal $J = I/I^2$ where I is the kernel of the multiplication map $B \otimes_R B \to B$. We already have a lifting $B \to C$ defined by, say, $b \mapsto b \otimes 1$. Thus, by the same reasoning as above, we obtain a bijective correspondence between liftings of $\mathrm{id} : B \to C/J$ and $\mathrm{Der}_R(B, J)$. The hypothesis therefore implies that the latter module is trivial. But we know that $J \cong \Omega_{B/R}$. Thus, B/R is unramified. □

37.6. Topological properties of unramified morphisms

The first topological result that will be of utility to us is one which says that unramified and separated morphisms have ``nice'' sections. The material in this section does not require any Noetherian hypotheses.

Proposition 37.6.1. *(Sections of unramified morphisms.)*

(1) *Any section of an unramified morphism is an open immersion.*
(2) *Any section of a separated morphism is a closed immersion.*
(3) *Any section of an unramified separated morphism is open and closed.*

Proof. Fix a base scheme S. If $f : X' \to X$ is any S-morphism, then the graph $\Gamma_f : X' \to X' \times_S X$ is obtained as the base change of the diagonal $\Delta_{X/S} : X \to X \times_S X$ via the projection $X' \times_S X \to X \times_S X$. If $g : X \to S$ is separated (resp. unramified) then the diagonal is a closed immersion (resp. open immersion) by Schemes, Definition 21.21.3 (resp. Morphisms, Lemma 24.34.13). Hence so is the graph as a base change (by Schemes, Lemma 21.18.2). In the special case $X' = S$, we obtain (1), resp. (2). Part (3) follows on combining (1) and (2). □

We can now explicitly describe the sections of unramified morphisms.

Theorem 37.6.2. *Let Y be a connected scheme. Let $f : X \to Y$ be unramified and separated. Every section of f is an isomorphism onto a connected component. There exists a bijective correspondence*

$$\text{sections of } f \leftrightarrow \left\{ \begin{matrix} \text{connected components } X' \text{ of } X \text{ such that} \\ \text{the induced map } X' \to Y \text{ is an isomorphism} \end{matrix} \right\}$$

In particular, given $x \in X$ there is at most one section passing through x.

Proof. Direct from Proposition 37.6.1 part (3). □

The preceding theorem gives us some idea of the ``rigidity'' of unramified morphisms. Further indication is provided by the following proposition which, besides being intrinsically interesting, is also useful in the theory of the algebraic fundamental group (see [**Gro71**, Exposé V]). See also the more general Morphisms, Lemma 24.34.17.

Proposition 37.6.3. *Let S is be a scheme. Let $\pi : X \to S$ be unramified and separated. Let Y be an S-scheme and $y \in Y$ a point. Let $f, g : Y \to X$ be two S-morphisms. Assume*

1. *Y is connected*
2. *$x = f(y) = g(y)$, and*
3. *the induced maps $f^\sharp, g^\sharp : \kappa(x) \to \kappa(y)$ on residue fields are equal.*

Then $f = g$.

Proof. The maps $f, g : Y \to X$ define maps $f', g' : Y \to X_Y = Y \times_S X$ which are sections of the structure map $X_Y \to Y$. Note that $f = g$ if and only if $f' = g'$. The structure map $X_Y \to Y$ is the base change of π and hence unramified and separated also (see Morphisms, Lemmas 24.34.5 and Schemes, Lemma 21.21.13). Thus according to Theorem 37.6.2 it suffices to prove that f' and g' pass through the same point of X_Y. And this is exactly what the hypotheses (2) and (3) garantee, namely $f'(y) = g'(y) \in X_Y$. □

37.7. Universally injective, unramified morphisms

Recall that a morphism of schemes $f : X \to Y$ is universally injective if any base change of f is injective (on underlying topological spaces), see Morphisms, Definition 24.10.1. Universally injective and unramified morphisms can be characterized as follows.

Lemma 37.7.1. *Let $f : X \to S$ be a morphism of schemes. The following are equivalent:*

1. *f is unramified and a monomorphism,*
2. *f is unramified and universally injective,*
3. *f is locally of finite type and a monomorphism,*
4. *f is universally injective, locally of finite type, and formally unramified,*
5. *f is locally of finite type and X_y is either empty or $X_y \to y$ is an isomorphism for all $y \in Y$.*

Proof. We have seen in More on Morphisms, Lemma 33.4.8 that being formally unramified and locally of finite type is the same thing as being unramified. Hence (4) is equivalent to (2). A monomorphism is certainly universally injective and formally unramified hence (3) implies (4). It is clear that (1) implies (3). Finally, if (2) holds, then $\Delta : X \to X \times_S X$ is both an open immersion (Morphisms, Lemma 24.34.13) and surjective (Morphisms, Lemma 24.10.2) hence an isomorphism, i.e., f is a monomorphism. In this way we see that (2) implies (1).

Condition (3) implies (5) because monomorphisms are preserved under base change (Schemes, Lemma 21.23.5) and because of the description of monomorphisms towards the spectra of fields in Schemes, Lemma 21.23.10. Condition (5) implies (4) by Morphisms, Lemmas 24.10.2 and 24.34.12. □

This leads to the following useful characterization of closed immersions.

Lemma 37.7.2. *Let $f : X \to S$ be a morphism of schemes. The following are equivalent:*

1. *f is a closed immersion,*
2. *f is a proper monomorphism,*
3. *f is proper, unramified, and universally injective,*
4. *f is universally closed, unramified, and a monomorphism,*
5. *f is universally closed, unramified, and universally injective,*
6. *f is universally closed, locally of finite type, and a monomorphism,*
7. *f is universally closed, universally injective, locally of finite type, and formally unramified.*

Proof. The equivalence of (4) -- (7) follows immediately from Lemma 37.7.1.

Let $f : X \to S$ satisfy (6). Then f is separated, see Schemes, Lemma 21.23.3 and has finite fibres. Hence More on Morphisms, Lemma 33.29.5 shows f is finite. Then Morphisms, Lemma 24.42.13 implies f is a closed immersion, i.e., (1) holds.

Note that (1) $\Rightarrow$ (2) because a closed immersion is proper and a monomorphism (Morphisms, Lemma 24.40.6 and Schemes, Lemma 21.23.7). By Lemma 37.7.1 we see that (2) implies (3). It is clear that (3) implies (5). □

Here is another result of a similar flavor.

Lemma 37.7.3. *Let $\pi : X \to S$ be a morphism of schemes. Let $s \in S$. Assume that*

1. *π is finite,*
2. *π is unramified,*
3. *$\pi^{-1}(\{s\}) = \{x\}$, and*
4. *$\kappa(s) \subset \kappa(x)$ is purely inseparable*[1].

Then there exists an open neighbourhood U of s such that $\pi|_{\pi^{-1}(U)} : \pi^{-1}(U) \to U$ is a closed immersion.

Proof. The question is local on S. Hence we may assume that $S = Spec(A)$. By definition of a finite morphism this implies $X = Spec(B)$. Note that the ring map $\varphi : A \to B$ defining π is a finite unramified ring map. Let $\mathfrak{p} \subset A$ be the prime corresponding to s. Let $\mathfrak{q} \subset B$ be the prime corresponding to x. By Conditions (2), (3) and (4) imply that $B_{\mathfrak{q}}/\mathfrak{p}B_{\mathfrak{q}} = \kappa(\mathfrak{p})$. Algebra, Lemma 7.36.11 we have $B_{\mathfrak{q}} = B_{\mathfrak{p}}$ (note that a finite ring map satisfies going up, see Algebra, Section 7.36.) Hence we see that $B_{\mathfrak{p}}/\mathfrak{p}B_{\mathfrak{p}} = \kappa(\mathfrak{p})$. As B is a finite A-module we see from Nakayama's lemma (see Algebra, Lemma 7.14.5) that $B_{\mathfrak{p}} = \varphi(A_{\mathfrak{p}})$. Hence (using the finiteness of B as an A-module again) there exists a $f \in A$, $f \notin \mathfrak{p}$ such that $B_f = \varphi(A_f)$ as desired. □

The topological results presented above will be used to give a functorial characterisation of étale morphisms similar to Theorem 37.5.1.

[1] In view of condition (2) this is equivalent to $\kappa(s) = \kappa(x)$.

37.8. Examples of unramified morphisms

Here are a few examples.

Example 37.8.1. Let k be a field. Unramified quasi-compact morphisms $X \to Spec(k)$ are affine. This is true because X has dimension 0 and is Noetherian, hence is a finite discrete set, and each point gives an affine open, so X is a finite disjoint union of affines hence affine. Noether normalisation forces X to be the spectrum of a finite k-algebra A. This algebra is a product of finite separable field extensions of k. Thus, an unramified quasi-compact morphism to $Spec(k)$ corresponds to a finite number of finite separable field extensions of k. In particular, an unramified morphism with a connected source and a one point target is forced to be a finite separable field extension. As we will see later, $X \to Spec(k)$ is étale if and only if it is unramified. Thus, in this case at least, we obtain a very easy description of the étale topology of a scheme. Of course, the cohomology of this topology is another story.

Example 37.8.2. Property (3) in Theorem 37.4.1 gives us a canonical source of examples for unramified morphisms. Fix a ring R and an integer n. Let $I = (g_1, \cdots, g_m)$ be an ideal in $R[x_1, \cdots, x_n]$. Let $\mathfrak q \subset R[x_1, \ldots, x_n]$ be a prime. Assume $I \subset \mathfrak q$ and that the matrix

$$\left(\frac{\partial g_i}{\partial x_j}\right) \bmod \mathfrak q \quad \in \quad \mathrm{Mat}(n \times m, \kappa(\mathfrak q))$$

has rank n. Then the morphism $f : Z = Spec(R[x_1, \cdots, x_n]/I) \to Spec(R)$ is unramified at the point $x \in Z \subset \mathbf{A}^n_R$ corresponding to $\mathfrak q$. Clearly we must have $m \geq n$. In the extreme case $m = n$, i.e., the differential of the map $\mathbf{A}^n_R \to \mathbf{A}^n_R$ defined by the g_i's is an isomorphism of the tangent spaces, then f is also flat x and, hence, is an étale map (see Algebra, Definition 7.126.6, Lemma 7.126.7 and Example 7.126.8).

Example 37.8.3. Fix an extension of number fields L/K with rings of integers $\mathcal{O}_L$ and $\mathcal{O}_K$. The injection $K \to L$ defines a morphism $f : Spec(\mathcal{O}_L) \to Spec(\mathcal{O}_K)$. As discussed above, the points where f is unramified in our sense correspond to the set of points where f is unramified in the conventional sense. In the conventional sense, the locus of ramification in $Spec(\mathcal{O}_L)$ can be defined by vanishing set of the different; this is an ideal in $\mathcal{O}_L$. In fact, the different is nothing but the annihilator of the module $\Omega_{\mathcal{O}_L/\mathcal{O}_K}$. Similarly, the discriminant is an ideal in $\mathcal{O}_K$, namely it is the norm of the different. The vanishing set of the discriminant is precisely the set of points of K which ramify in L. Thus, denoting by X the complement of the closed subset defined by the different in $Spec(\mathcal{O}_L)$, we obtain a morphism $X \to Spec(\mathcal{O}_L)$ which is unramified. Furthermore, this morphism is also flat, as any local homomorphism of discrete valuation rings is flat, and hence this morphism is actually étale. If L/K is Galois, then denoting by Y the complement of the closed subset defined by the discriminant in $Spec(\mathcal{O}_K)$, we see that we get even a finite étale morphism $X \to Y$. Thus, this is an example of a finite étale covering.

37.9. Flat morphisms

This section simply exists to summarise the properties of flatness that will be useful to us. Thus, we will be content with stating the theorems precisely and giving references for the proofs.

After briefly recalling the necessary facts about flat modules over Noetherian rings, we state a theorem of Grothendieck which gives sufficient conditions for ``hyperplane sections'' of certain modules to be flat.

Definition 37.9.1. Flatness of modules and rings.

(1) A module N over a ring A is said to be *flat* if the functor $M \mapsto M \otimes_A N$ is exact.
(2) If this functor is also faithful, we say that N is *faithfully flat* over A.
(3) A morphism of rings $f : A \to B$ is said to be *flat (resp. faithfully flat)* if the functor $M \mapsto M \otimes_A B$ is exact (resp. faithful and exact).

Here is a list of facts with references to the algebra chapter.

(1) Free and projective modules are flat. This is clear for free modules and follows for projective modules as they are direct summands of free modules and $\otimes$ commutes with direct sums.
(2) Flatness is a local property, that is, M is flat over A if and only if $M_{\mathfrak{p}}$ is flat over $A_{\mathfrak{p}}$ for all $\mathfrak{p} \in Spec(A)$. See Algebra, Lemma 7.35.19.
(3) If M is a flat A-module and $A \to B$ is a ring map, then $M \otimes_A B$ is a flat B-module. See Algebra, Lemma 7.35.6.
(4) Finite flat modules over local rings are free. See Algebra, Lemma 7.72.4.
(5) If $f : A \to B$ is a morphism of arbitrary rings, f is flat if and only if the induced maps $A_{f^{-1}(\mathfrak{q})} \to B_{\mathfrak{q}}$ are flat for all $\mathfrak{q} \in Spec(B)$. See Algebra, Lemma 7.35.19
(6) If $f : A \to B$ is a local homomorphism of local rings, f is flat if and only if it is faithfully flat. See Algebra, Lemma 7.35.16.
(7) A map $A \to B$ of rings is faithfully flat if and only if it is flat and the induced map on spectra is surjective. See Algebra, Lemma 7.35.15.
(8) If A is a noetherian local ring, the completion $A^\wedge$ is faithfully flat over A. See Algebra, Lemma 7.90.4.
(9) Let A be a Noetherian local ring and M an A-module. Then M is flat over A if and only if $M \otimes_A A^\wedge$ is flat over $A^\wedge$. (Combine the previous statement with Algebra, Lemma 7.35.7.)

Before we move on to the geometric category, we present Grothendieck's theorem, which provides a convenient recipe for producing flat modules.

Theorem 37.9.2. *Let A, B be Noetherian local rings. Let $f : A \to B$ be a local homomorphism. If M is a finite B-module that is flat as an A-module, and $t \in \mathfrak{m}_B$ is an element such that multiplication by t is injective on $M/\mathfrak{m}_A M$, then M/tM is also A-flat.*

Proof. See Algebra, Lemma 7.91.1. See also [**Mat70**, Section 20]. ☐

Definition 37.9.3. (See Morphisms, Definition 24.24.1). Let $f : X \to Y$ be a morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module.

(1) Let $x \in X$. We say $\mathcal{F}$ is *flat over Y at $x \in X$* if $\mathcal{F}_x$ is a flat $\mathcal{O}_{Y,f(x)}$-module. This uses the map $\mathcal{O}_{Y,f(x)} \to \mathcal{O}_{X,x}$ to think of $\mathcal{F}_x$ as a $\mathcal{O}_{Y,f(x)}$-module.
(2) Let $x \in X$. We say f is *flat at $x \in X$* if $\mathcal{O}_{Y,f(x)} \to \mathcal{O}_{X,x}$ is flat.
(3) We say f is *flat* if it is flat at all points of X.
(4) A morphism $f : X \to Y$ that is flat and surjective is sometimes said to be *faithfully flat*.

Once again, here is a list of results:

(1) The property (of a morphism) of being flat is, by fiat, local in the Zariski topology on the source and the target.
(2) Open immersions are flat. (This is clear because it induces isomorphisms on local rings.)

(3) Flat morphisms are stable under base change and composition. Morphisms, Lemmas 24.24.7 and 24.24.5.
(4) If $f : X \to Y$ is flat, then the pullback functor $QCoh(\mathcal{O}_Y) \to QCoh(\mathcal{O}_X)$ is exact. This is immediate by looking at stalks.
(5) Let $f : X \to Y$ be a morphism of schemes, and assume Y is quasi-compact and quasi-separated. In this case if the functor f^* is exact then f is flat. (Proof omitted. Hint: Use Properties, Lemma 23.20.1 to see that Y has ``enough'' ideal sheaves and use the characterization of flatness in Algebra, Lemma 7.35.4.)

37.10. Topological properties of flat morphisms

We ``recall'' below some openness properties that flat morphisms enjoy.

Theorem 37.10.1. *Let Y be a locally Noetherian scheme. Let $f : X \to Y$ be a morphism which is locally of finite type. Let $\mathcal{F}$ be a coherent $\mathcal{O}_X$-module. The set of points in X where $\mathcal{F}$ is flat over S is an open set. In particular the set of points where f is flat is open in X.*

Proof. See More on Morphisms, Theorem 33.11.1. □

Theorem 37.10.2. *Let Y be a locally Noetherian scheme. Let $f : X \to Y$ be a morphism which is flat and locally of finite type. Then f is (universally) open.*

Proof. See Morphisms, Lemma 24.24.9. □

Theorem 37.10.3. *A faithfully flat quasi-compact morphism is a quotient map for the Zariski topology.*

Proof. See Morphisms, Lemma 24.24.10. □

An important reason to study flat morphisms is that they provide the adequate framework for capturing the notion of a family of schemes parametrised by the points of another scheme. Naively one may think that any morphism $f : X \to S$ should be thought of as a family parametrized by the points of S. However, without a flatness restriction on f, really bizarre things can happen in this so-called family. For instance, we aren't guaranteed that relative dimension (dimension of the fibres) is constant in a family. Other numerical invariants, such as the Hilbert polynomial, too may change from fibre to fibre. Flatness prevents such things from happening and, therefore, provides some ``continuity'' to the fibres.

37.11. Étale morphisms

In this section, we will define étale morphisms and prove a number of important properties about them. The most important one, no doubt, is the functorial characterisation presented in Theorem 37.16.1. Following this, we will also discuss a few properties of rings which are insensitive to an étale extension (properties which hold for a ring if and only if they hold for all its étale extensions) to motivate the basic tenet of étale cohomology -- étale morphisms are the algebraic analogue of local isomorphisms.

As the title suggests, we will define the class of étale morphisms -- the class of morphisms (whose surjective families) we shall deem to be coverings in the category of schemes over a base scheme S in order to define the étale site $S_{étale}$. Intuitively, an étale morphism is supposed to capture the idea of a covering space and, therefore, should be close to a local isomorphism. If we're working with varieties over algebraically closed fields, this last statement can be made into a definition provided we replace ``local isomorphism'' with ``formal local isomorphism'' (isomorphism after completion). One can then give a definition over any base field by asking that the base change to the algebraic closure be étale (in the aforementioned sense). But, rather than proceeding via such aesthetically displeasing constructions, we will adopt a cleaner, albeit slightly more abstract, algebraic approach.

Definition 37.11.1. Let A, B be Noetherian local rings. A local homomorphism $f : A \to B$ is said to be a *étale homomorphism of local rings* if it is flat and unramified homomorphism of local rings (please see Definition 37.3.1).

This is the local version of the definition of an étale ring map in Algebra, Section 7.132. The exact definition given in that section is that it is a smooth ring map of relative dimension 0. It is shown (in Algebra, Lemma 7.132.2 after some work) that an étale R-algebra S always has a presentation

$$S = R[x_1, \ldots, x_n]/(f_1, \ldots, f_n)$$

such that

$$g = \det \begin{pmatrix} \partial f_1/\partial x_1 & \partial f_2/\partial x_1 & \ldots & \partial f_n/\partial x_1 \\ \partial f_1/\partial x_2 & \partial f_2/\partial x_2 & \ldots & \partial f_n/\partial x_2 \\ \ldots & \ldots & \ldots & \ldots \\ \partial f_1/\partial x_n & \partial f_2/\partial x_n & \ldots & \partial f_n/\partial x_n \end{pmatrix}$$

maps to an invertible element in S. The following two lemmas link the two notions.

Lemma 37.11.2. *Let $A \to B$ be of finite type with A a Noetherian ring. Let $\mathfrak{q}$ be a prime of B lying over $\mathfrak{p} \subset A$. Then $A \to B$ is étale at $\mathfrak{q}$ if and only if $A_{\mathfrak{p}} \to B_{\mathfrak{q}}$ is an étale homomorphism of local rings.*

Proof. See Algebra, Lemmas 7.132.3 (flatness of étale maps), 7.132.5 (étale maps are unramified) and 7.132.7 (flat and unramified maps are étale). □

Lemma 37.11.3. *Let A, B be Noetherian local rings. Let $A \to B$ be a local homomorphism such that B is essentially of finite type over A. The following are equivalent*

(1) *$A \to B$ is an étale homomorphism of local rings*
(2) *$A^\wedge \to B^\wedge$ is an étale homomorphism of local rings, and*
(3) *$A^\wedge \to B^\wedge$ is étale.*

Moreover, in this case $B^\wedge \cong (A^\wedge)^{\oplus n}$ as $A^\wedge$-modules for some $n \geq 1$.

Proof. To see the equivalences of (1), (2) and (3), as we have the corresponding results for unramified ring maps (Lemma 37.3.4) it suffices to prove that $A \to B$ is flat if and only if $A^\wedge \to B^\wedge$ is flat. This is clear from our lists of properties of flat maps since the ring maps $A \to A^\wedge$ and $B \to B^\wedge$ are faithfully flat. For the final statement, by Lemma 37.3.3 we see that $B^\wedge$ is a finite flat $A^\wedge$ module. Hence it is finite free by our list of properties on flat modules in Section 37.9. □

The integer n which occurs in the lemma above is nothing other than the degree $[\kappa(\mathfrak{m}_B) : \kappa(\mathfrak{m}_A)]$ of the residue field extension. In particular, if $\kappa(\mathfrak{m}_A)$ is separably closed, we see that $A^\wedge \to B^\wedge$ is an isomorphism, which vindicates our earlier claims.

Definition 37.11.4. (See Morphisms, Definition 24.35.1.) Let Y be a locally Noetherian scheme. Let $f : X \to Y$ be a morphism of schemes which is locally of finite type.

(1) Let $x \in X$. We say f is *étale at $x \in X$* if $\mathcal{O}_{Y,f(x)} \to \mathcal{O}_{X,x}$ is an étale homomorphism of local rings.
(2) The morphism is said to be *étale* if it is étale at all its points.

Let us prove that this definition agrees with the definition in the chapter on morphisms of schemes. This in particular guarantees that the set of points where a morphism is étale is open.

Lemma 37.11.5. *Let Y be a locally Noetherian scheme. Let $f : X \to Y$ be locally of finite type. Let $x \in X$. The morphism f is étale at x in the sense of Definition 37.11.4 if and only if it is unramified at x in the sense of Morphisms, Definition 24.35.1.*

Proof. This follows from Lemma 37.11.2 and the definitions. □

Here are some results on étale morphisms. The formulations as given in this list apply only to morphisms locally of finite type between locally Noetherian schemes. In each case we give a reference to the general result as proved earlier in the project, but in some cases one can prove the result more easily in the Noetherian case. Here is the list:

1. An étale morphism is unramified. (Clear from our definitions.)
2. Étaleness is local on the source and the target in the Zariski topology.
3. Étale morphisms are stable under base change and composition. See Morphisms, Lemmas 24.35.4 and 24.35.3.
4. Étale morphisms of schemes are locally quasi-finite and quasi-compact étale morphisms are quasi-finite. (This is true because it holds for unramified morphisms as seen earlier.)
5. Étale morphisms have relative dimension 0. See Morphisms, Definition 24.28.1 and Morphisms, Lemma 24.28.5.
6. A morphism is étale if and only if it is flat and all its fibres are étale. See Morphisms, Lemma 24.35.8.
7. Étale morphisms are open. This is true because an étale morphism is flat, and Theorem 37.10.2.
8. Let X and Y be étale over a base scheme S. Any S-morphism from X to Y is étale. See Morphisms, Lemma 24.35.18.

37.12. The structure theorem

We present a theorem which describes the local structure of étale and unramified morphisms. Besides its obvious independent importance, this theorem also allows us to make the transition to another definition of étale morphisms that captures the geometric intuition better than the one we've used so far.

To state it we need the notion of a *standard étale ring map*, see Algebra, Definition 7.132.13. Namely, suppose that R is a ring and $f, g \in R[t]$ are polynomials such that

(a) f is a monic polynomial, and
(b) $f' = \mathrm{d}f/\mathrm{d}t$ is invertible in the localization $R[t]_g$.

Then the map

$$R \longrightarrow R[t]_g/(f) = R[t, 1/g]/(f)$$

is a standard étale algebra, and any standard étale algebra is isomorphic to one of these. It is a pleasant exercise to prove that such a ring map is flat, and unramified and hence étale (as expected of course). A special case of a standard étale ring map is any ring map

$$R \longrightarrow R[t]_{f'}/(f) = R[t, 1/f']/(f)$$

with f a monic polynomial, and any standard étale algebra is (isomorphic to) a principal localization of one of these.

Theorem 37.12.1. *Let $f : A \to B$ be an étale homomorphism of local rings. Then there exist $f, g \in A[t]$ such that*

(1) *$B' = A[t]_g/(f)$ is standard étale -- see (a) and (b) above, and*
(2) *B is isomorphic to a localization of B' at a prime.*

Proof. Write $B = B'_{\mathfrak{q}}$ for some finite type A-algebra B' (we can do this because B is essentially of finite type over A). By Lemma 37.11.2 we see that $A \to B'$ is étale at $\mathfrak{q}$. Hence we may apply Algebra, Proposition 7.132.16 to see that a principal localization of B' is standard étale. □

Here is the version for unramified homomorphisms of local rings.

Theorem 37.12.2. *Let $f : A \to B$ be an unramified morphism of local rings. Then there exist $f, g \in A[t]$ such that*

(1) *$B' = A[t]_g/(f)$ is standard étale -- see (a) and (b) above, and*
(2) *B is isomorphic to a quotient of a localization of B' at a prime.*

Proof. Write $B = B'_{\mathfrak{q}}$ for some finite type A-algebra B' (we can do this because B is essentially of finite type over A). By Lemma 37.3.2 we see that $A \to B'$ is unramified at $\mathfrak{q}$. Hence we may apply Algebra, Proposition 7.138.8 to see that a principal localization of B' is a quotient of a standard étale A-algebra. □

Via standard lifting arguments, one then obtains the following geometric statement which will be of essential use to us.

Theorem 37.12.3. *Let $\varphi : X \to Y$ be a morphism of schemes. Let $x \in X$. If φ is étale at x, then there exist exist affine opens $V \subset Y$ and $U \subset X$ with $x \in U$ and $\varphi(U) \subset V$ such that we have the following diagram*

$$\begin{tikzcd} X \arrow[d] & U \arrow[l] \arrow[r, "j"'] \arrow[d] & Spec(R[t]_{f'}/(f)) \arrow[d] \\ Y & V \arrow[l] \arrow[r, equal] & Spec(R) \end{tikzcd}$$

where j is an open immersion, and $f \in R[t]$ is monic.

Proof. This is equivalent to Morphisms, Lemma 24.35.14 allthough the statements differ slightly. □

37.13. Étale and smooth morphisms

An étale morphism is smooth of relative dimension zero. The projection $\mathbf{A}^n_S \to S$ is a standard example of a smooth morphism of relative dimension n. It turns out that any smooth morphism is étale locally of this form. Here is the precise statement.

Theorem 37.13.1. *Let $\varphi : X \to Y$ be a morphism of schemes. Let $x \in X$. If φ is smooth at x, then there exist exist and integer $n \geq 0$ and affine opens $V \subset Y$ and $U \subset X$ with $x \in U$ and $\varphi(U) \subset V$ such that there exists a commutative diagram*

$$\begin{tikzcd} X \arrow[d] & U \arrow[l] \arrow[r, "\pi"'] \arrow[d] & \mathbf{A}^n_R \arrow[r, equal] \arrow[d] & Spec(R[x_1, \ldots, x_n]) \arrow[dl] \\ Y & V \arrow[l] \arrow[r, equal] & Spec(R) & \end{tikzcd}$$

where π is étale.

Proof. See Morphisms, Lemma 24.35.20. □

37.14. Topological properties of étale morphisms

We present a few of the topological properties of étale and unramified morphisms. First, we give what Grothendieck calls the *fundamental property of étale morphisms*, see [**Gro71**, Exposé I.5].

Theorem 37.14.1. *Let $f : X \to Y$ be a morphism of schemes The following are equivalent:*

(1) *f is an open immersion,*
(2) *f is universally injective and étale, and*
(3) *f is a flat monomorphism, locally of finite presentation.*

Proof. An open immersion is universally injective since any base change of an open immersion is an open immersion. Moreover, it is étale by Morphisms, Lemma 24.35.9. Hence (1) implies (2).

Assume f is universally injective and étale. Since f is étale it is flat and locally of finite presentation, see Morphisms, Lemmas 24.35.12 and 24.35.11. By Lemma 37.7.1 we see that f is a monomorphism. Hence (2) implies (3).

Assume f is flat, locally of finite presentation, and a monomorphism. Then f is open, see Morphisms, Lemma 24.24.9. Thus we may replace Y by $f(X)$ and we may assume f is surjective. Then f is open and bijective hence a homeomorphism. Hence f is quasi-compact. Hence Descent, Lemma 31.21.1 shows that f is an isomorphism and we win. □

Here is another result of a similar flavor.

Lemma 37.14.2. *Let $\pi : X \to S$ be a morphism of schemes. Let $s \in S$. Assume that*

(1) *π is finite,*
(2) *π is étale,*
(3) *$\pi^{-1}(\{s\}) = \{x\}$, and*
(4) *$\kappa(s) \subset \kappa(x)$ is purely inseparable*[2].

Then there exists an open neighbourhood U of s such that $\pi|_{\pi^{-1}(U)} : \pi^{-1}(U) \to U$ is an isomorphism.

Proof. By Lemma 37.7.3 there exists an open neighbourhood U of s such that $\pi|_{\pi^{-1}(U)} : \pi^{-1}(U) \to U$ is a closed immersion. But a morphism which is étale and a closed immersion is an open immersion (for example by Theorem 37.14.1). Hence after shrinking U we obtain an isomorphism. □

37.15. Topological invariance of the étale topology

Next, we present an extremely crucial theorem which, roughly speaking, says that étaleness is a topological property.

Theorem 37.15.1. *Let X and Y be two schemes over a base scheme S. Let S_0 be a closed subscheme of S whose ideal sheaf has square zero. Denote X_0 (resp. Y_0) the base change $S_0 \times_S X$ (resp. $S_0 \times_S Y$). If X is étale over S, then the map*

$$Mor_S(Y, X) \longrightarrow Mor_{S_0}(Y_0, X_0)$$

is bijective.

[2] In view of condition (2) this is equivalent to $\kappa(s) = \kappa(x)$.

Proof. After base changing via $Y \to S$, we may assume that $Y = S$. In this case the theorem states that any S-morphism $\sigma_0 : S_0 \to X$ actually factors uniquely through a section $S \to X$ of the étale structure morphism $X \to S$.

Existence. Since we have equality of underlying topological spaces $|S_0| = |S|$ and $|X_0| = |X|$, by Theorem 37.6.2, the section σ_0 is uniquely determined by a connected component X' of X such that the base change $X'_0 = S_0 \times_S X'$ maps isomorphically to S_0. In particular, $X' \to S$ is a universal homeomorphism and therefore universally injective. Since $X' \to S$ is étale, it follows from Theorem 37.14.1 that $X' \to S$ is an isomorphism and, therefore, it has an inverse σ which is the required section.

Uniqueness. This follows from Theorem 37.5.1, or directly from Theorem 37.6.2, or, if one carefully observes, from our proof itself. □

From the proof of preceeding theorem, we also obtain one direction of the promised functorial characterisation of étale morphisms. The following theorem will be strengthened in Étale Cohomology, Theorem 38.45.1.

Theorem 37.15.2. *(Une equivalence remarquable de catégories.) Let S be a scheme. Let $S_0 \subset S$ be a closed subscheme defined by an ideal with square zero. The functor*

$$X \longmapsto X_0 = S_0 \times_S X$$

defines an equivalence of categories

$$\{\textit{schemes } X \textit{ étale over } S\} \leftrightarrow \{\textit{schemes } X_0 \textit{ étale over } S_0\}$$

Proof. By Theorem 37.15.1 we see that this functor is fully faithful. It remains to show that the functor is essentially surjective. Let $Y \to S_0$ be an étale morphism of schemes.

Suppose that the result holds if S and Y are affine. In that case, we choose an affine open covering $Y = \bigcup V_j$ such that each V_j maps into an affine open of S. By assumption (affine case) we can find étale morphisms $W_j \to S$ such that $W_{j,0} \cong V_j$ (as schemes over S_0). Let $W_{j,j'} \subset W_j$ be the open subscheme whose underlying topological space corresponds to $V_j \cap V_{j'}$. Because we have isomorphisms

$$W_{j,j',0} \cong V_j \cap V_{j'} \cong W_{j',j,0}$$

as schemes over S_0 we see by fully faithfulness that we obtain isomorphisms $\theta_{j,j'} : W_{j,j'} \to W_{j',j}$ of schemes over S. We omit the verification that these isomorphisms satisfy the cocyle condition of Schemes, Section 21.14. Applying Schemes, Lemma 21.14.2 we obtain a scheme $X \to S$ by glueing the schemes W_j along the identifications $\theta_{j,j'}$. It is clear that $X \to S$ is étale and $X_0 \cong Y$ by construction.

Thus it suffices to show the lemma in case S and Y are affine. Say $S = Spec(R)$ and $S_0 = Spec(R/I)$ with $I^2 = 0$. By Algebra, Lemma 7.132.2 we know that Y is the spectrum of a ring $\overline{A}$ with

$$\overline{A} = (R/I)[x_1, \ldots, x_n]/(\overline{f}_1, \ldots, \overline{f}_n)$$

such that

$$\overline{g} = \det \begin{pmatrix} \partial\overline{f}_1/\partial x_1 & \partial\overline{f}_2/\partial x_1 & \ldots & \partial\overline{f}_n/\partial x_1 \\ \partial\overline{f}_1/\partial x_2 & \partial\overline{f}_2/\partial x_2 & \ldots & \partial\overline{f}_n/\partial x_2 \\ \ldots & \ldots & \ldots & \ldots \\ \partial\overline{f}_1/\partial x_n & \partial\overline{f}_2/\partial x_n & \ldots & \partial\overline{f}_n/\partial x_n \end{pmatrix}$$

maps to an invertible element in A. Choose any lifts $f_i \in R[x_1, \ldots, x_n]$. Since I is nilpotent it follows that the determinant of the matrix of partials of the f_i is invertible in the algebra A defined by

$$A = R[x_1, \ldots, x_n]/(f_1, \ldots, f_n)$$

Hence $R \to A$ is étale and $(R/I) \otimes_R A \cong \overline{A}$. To prove the general case one argues with glueing affine pieces. □

37.16. The functorial characterization

We finally present the promised functorial characterisation. Thus there are four ways to think about étale morphisms of schemes:

(1) as a smooth morphism of relative dimension 0,
(2) as locally finitely presented, flat, and unramified morphisms,
(3) using the structure theorem, and
(4) using the functorial characterisation.

Theorem 37.16.1. *Let $f : X \to S$ be a morphism that is locally of finite presentation. The following are equivalent*

(1) *f is étale,*
(2) *for all affine S-schemes Y, and closed subschemes $Y_0 \subset Y$ defined by square-zero ideals, the natural map*

$$Mor_S(Y, X) \longrightarrow Mor_S(Y_0, X)$$

is bijective.

Proof. This is More on Morphisms, Lemma 33.6.9. □

This characterisation says that solutions to the equations defining X can be lifted uniquely through nilpotent thickenings.

37.17. Étale local structure of unramified morphisms

In the chapter More on Morphisms, Section 33.28 the reader can find some results on the étale local structure of quasi-finite morphisms. In this section we want to combine this with the topological properties of unramified morphisms we have seen in this chapter. The basic overall picture to keep in mind is

$$\begin{tikzcd} V \arrow[r] \arrow[dr] & X_U \arrow[r] \arrow[d] & X \arrow[d, "f"] \\ & U \arrow[r] & S \end{tikzcd}$$

see More on Morphisms, Equation (33.28.0.1). We start with a very general case.

Lemma 37.17.1. *Let $f : X \to S$ be a morphism of schemes. Let $x_1, \ldots, x_n \in X$ be points having the same image s in S. Assume f is unramified at each x_i. Then there exists an étale neighbourhood $(U, u) \to (S, s)$ and opens $V_{i,j} \subset X_U$, $i = 1, \ldots, n$, $j = 1, \ldots, m_i$ such that*

(1) *$V_{i,j} \to U$ is a closed immersion passing through u,*
(2) *u is not in the image of $V_{i,j} \cap V_{i',j'}$ unless $i = i'$ and $j = j'$, and*
(3) *any point of $(X_U)_u$ mapping to x_i is in some $V_{i,j}$.*

Proof. By Morphisms, Definition 24.34.1 there exists an open neighbourhood of each x_i which is locally of finite type over S. Replacing X by an open neighbourhood of $\{x_1, \ldots, x_n\}$ we may assume f is locally of finite type. Apply More on Morphisms, Lemma 33.28.3 to get the étale neighbourhood (U, u) and the opens $V_{i,j}$ finite over U. By Lemma 37.7.3 after possibly shrinking U we get that $V_{i,j} \to U$ is a closed immersion. □

Lemma 37.17.2. *Let $f : X \to S$ be a morphism of schemes. Let $x_1, \ldots, x_n \in X$ be points having the same image s in S. Assume f is separated and f is unramified at each x_i. Then there exists an étale neighbourhood $(U, u) \to (S, s)$ and a disjoint union decomposition*

$$X_U = W \amalg \coprod\nolimits_{i,j} V_{i,j}$$

such that

1. *$V_{i,j} \to U$ is a closed immersion passing through u,*
2. *the fibre W_u contains no point mapping to any x_i.*

In particular, if $f^{-1}(\{s\}) = \{x_1, \ldots, x_n\}$, then the fibre W_u is empty.

Proof. Apply Lemma 37.17.1. We may assume U is affine, so X_U is separated. Then $V_{i,j} \to X_U$ is a closed map, see Morphisms, Lemma 24.40.7. Suppose $(i,j) \neq (i', j')$. Then $V_{i,j} \cap V_{i',j'}$ is closed in $V_{i,j}$ and its image in U does not contain u. Hence after shrinking U we may assume that $V_{i,j} \cap V_{i',j'} = \emptyset$. Moreover, $\bigcup V_{i,j}$ is a closed and open subscheme of X_U and hence has an open and closed complement W. This finishes the proof. □

The following lemma is in some sense much weaker than the preceding one but it may be useful to state it explicitly here. It says that a finite uramified morphism is étale locally on the base a closed immersion.

Lemma 37.17.3. *Let $f : X \to S$ be a finite unramified morphism of schemes. Let $s \in S$. There exists an étale neighbourhood $(U, u) \to (S, s)$ and a disjoint union decomposition*

$$X_U = \coprod\nolimits_j V_j$$

such that each $V_j \to U$ is a closed immersion.

Proof. Since $X \to S$ is finite the fibre over S is a finite set $\{x_1, \ldots, x_n\}$ of points of X. Apply Lemma 37.17.2 to this set (a finite morphism is separated, see Morphisms, Section 24.42). The image of W in U is a closed subset (as $X_U \to U$ is finite, hence proper) which does not contain u. After removing this from U we see that $W = \emptyset$ as desired. □

37.18. Étale local structure of étale morphisms

This is a bit silly, but perhaps helps form intuition about étale morphisms. We simply copy over the results of Section 37.17 and change ``closed immersion'' into ``isomorphism''.

Lemma 37.18.1. *Let $f : X \to S$ be a morphism of schemes. Let $x_1, \ldots, x_n \in X$ be points having the same image s in S. Assume f is étale at each x_i. Then there exists an étale neighbourhood $(U, u) \to (S, s)$ and opens $V_{i,j} \subset X_U$, $i = 1, \ldots, n$, $j = 1, \ldots, m_i$ such that*

1. *$V_{i,j} \to U$ is an isomorphism,*
2. *u is not in the image of $V_{i,j} \cap V_{i',j'}$ unless $i = i'$ and $j = j'$, and*
3. *any point of $(X_U)_u$ mapping to x_i is in some $V_{i,j}$.*

Proof. An étale morphism is unramified, hence we may apply Lemma 37.17.1. Now $V_{i,j} \to U$ is a closed immersion and étale. Hence it is an open immersion, for example by Theorem 37.14.1. Replace U by the intersection of the images of $V_{i,j} \to U$ to get the lemma. □

Lemma 37.18.2. *Let $f : X \to S$ be a morphism of schemes. Let $x_1, \ldots, x_n \in X$ be points having the same image s in S. Assume f is separated and f is étale at each x_i. Then there exists an étale neighbourhood $(U, u) \to (S, s)$ and a disjoint union decomposition*

$$X_U = W \amalg \coprod\nolimits_{i,j} V_{i,j}$$

such that

(1) *$V_{i,j} \to U$ is an isomorphism,*
(2) *the fibre W_u contains no point mapping to any x_i.*

In particular, if $f^{-1}(\{s\}) = \{x_1, \ldots, x_n\}$, then the fibre W_u is empty.

Proof. An étale morphism is unramified, hence we may apply Lemma 37.17.2. As in the proof of Lemma 37.18.1 the morphisms $V_{i,j} \to U$ are open immersions and we win after replacing U by the intersection of their images. □

The following lemma is in some sense much weaker than the preceding one but it may be useful to state it explicitly here. It says that a finite étale morphism is étale locally on the base a ``topological covering space'', i.e., a finite product of copies of the base.

Lemma 37.18.3. *Let $f : X \to S$ be a finite étale morphism of schemes. Let $s \in S$. There exists an étale neighbourhood $(U, u) \to (S, s)$ and a disjoint union decomposition*

$$X_U = \coprod\nolimits_j V_j$$

such that each $V_j \to U$ is an isomorphism.

Proof. An étale morphism is unramified, hence we may apply Lemma 37.17.3. As in the proof of Lemma 37.18.1 we see that $V_{i,j} \to U$ is an open immersion and we win after replacing U by the intersection of their images. □

37.19. Permanence properties

In what follows, we present a few ``permanence'' properties of étale homomorphisms of Noetherian local rings (as defined in Definition 37.11.1). See More on Algebra, Section 12.33 for the analogue of this material for the completion of a Noetherian local ring.

Lemma 37.19.1. *Let A, B be Noetherian local rings. Let $A \to B$ be a étale homomorphism of local rings. Then* $\dim(A) = \dim(B)$.

Proof. See for example Algebra, Lemma 7.103.7. □

Proposition 37.19.2. *Let A, B be Noetherian local rings. Let $f : A \to B$ be an étale homomorphism of local rings. Then $depth(A) = depth(B)$*

Proof. See Algebra, Lemma 7.145.1. □

Proposition 37.19.3. *Let A, B be Noetherian local rings. Let $f : A \to B$ be an étale homomorphism of local rings. Then A is Cohen-Macaulay if and only if B is so.*

Proof. A local ring A is Cohen-Macaulay if and only $\dim(A) = \text{depth}(A)$. As both of these invariants is preserved under an étale extension, the claim follows. □

Proposition 37.19.4. *Let A, B be Noetherian local rings. Let $f : A \to B$ be an étale homomorphism of local rings. Then A is regular if and only if B is so.*

Proof. If B is regular, then A is regular by Algebra, Lemma 7.102.8. Assume A is regular. Let $\mathfrak m$ be the maximal ideal of A. Then $\dim_{\kappa(\mathfrak m)} \mathfrak m/\mathfrak m^2 = \dim(A) = \dim(B)$ (see Lemma 37.19.1). On the other hand, $\mathfrak m B$ is the maximal ideal of B and hence $\mathfrak m_B/\mathfrak m_B = \mathfrak m B/\mathfrak m^2 B$ is generated by at most $\dim(B)$ elements. Thus B is regular. (You can also use the slightly more general Algebra, Lemma 7.103.8.) □

Proposition 37.19.5. *Let A, B be Noetherian local rings. Let $f : A \to B$ be an étale homomorphism of local rings. Then A is reduced if and only if B is so.*

Proof. It is clear from the faithful flatness of $A \to B$ that if B is reduced, so is A. See also Algebra, Lemma 7.146.2. Conversely, assume A is reduced. By assumption B is a localization of a finite type A-algebra B' at some prime $\mathfrak q$. After replacing B' by a localization we may assume that B' is étale over A, see Lemma 37.11.2. Then we see that Algebra, Lemma 7.145.6 applies to $A \to B'$ and B' is reduced. Hence B is reduced. □

Remark 37.19.6. The result on ``reducedness" does not hold with a weaker definition of étale local ring maps $A \to B$ where one drops the assumption that B is essentially of finite type over A. Namely, it can happen that a Noetherian local domain A has nonreduced completion $A^\wedge$, see Examples, Section 64.8. But the ring map $A \to A^\wedge$ is flat, and $\mathfrak m_A A^\wedge$ is the maximal ideal of $A^\wedge$ and of course A and $A^\wedge$ have the same residue fields. This is why it is important to consider this notion only for ring extensions which are essentially of finite type (or essentially of finite presentation if A is not Noetherian).

Proposition 37.19.7. *Let A, B be Noetherian local rings. Let $f : A \to B$ be an étale homomorphism of local rings. Then A is a normal domain if and only if B is so.*

Proof. See Algebra, Lemma 7.146.3 for descending normality. Conversely, assume A is normal. By assumption B is a localization of a finite type A-algebra B' at some prime $\mathfrak q$. After replacing B' by a localization we may assume that B' is étale over A, see Lemma 37.11.2. Then we see that Algebra, Lemma 7.145.7 applies to $A \to B'$ and we conclude that B' is normal. Hence B is a normal domain. □

The preceeding propositions give some indication as to why we'd like to think of étale maps as ``local isomorphisms". Another property that gives an excellent indication that we have the ``right" definition is the fact that for $\mathbf{C}$-schemes of finite type, a morphism is étale if and only if the associated morphism on analytic spaces (the $\mathbf{C}$-valued points given the complex topology) is a local isomorphism in the analytic sense (open embedding locally on the source). This fact can be proven with the aid of the structure theorem and the fact that the analytification commutes with the formation of the completed local rings -- the details are left to the reader.

CHAPTER 38

Étale Cohomology

38.1. Introduction

These are the notes of a course on étale cohomology taught by Johan de Jong at Columbia University in the Fall of 2009. The original note takers were Thibaut Pugin, Zachary Maddock and Min Lee. Over time we will add references to background material in the rest of the stacks project and provide rigorous proofs of all the statements.

38.2. Which sections to skip on a first reading?

We want to use the material in this chapter for the development of theory related to algebraic spaces, Deligne-Mumford stacks, algebraic stacks, etc. Thus we have added some pretty technical material to the original exposition of étale cohomology for schemes. The reader can recognize this material by the frequency of the word ``topos", or by discussions related to set theory, or by proofs dealing with very general properties of morphisms of schemes. Some of these discussions can be skipped on a first reading.

In particular, we suggest that the reader skip the following sections:

(1) Comparing big and small topoi, Section 38.39.
(2) Recovering morphisms, Section 38.40.
(3) Push and pull, Section 38.41.
(4) Property (A), Section 38.42.
(5) Property (B), Section 38.43.
(6) Property (C), Section 38.44.
(7) Topological invariance of the small étale site, Section 38.45.
(8) Integral universally injective morphisms, Section 38.47.
(9) Big sites and pushforward, Section 38.48.
(10) Exactness of big lower shriek, Section 38.49.

Besides these sections there are some sporadic results that may be skipped that the reader can recognize by the keywords given above.

38.3. Prologue

These lectures are about another cohomology theory. The first thing to remark is that the Zariski topology is not entirely satisfactory. One of the main reasons that it fails to give the results that we would want is that if X is a complex variety and $\mathcal{F}$ is a constant sheaf then

$$H^i(X, \mathcal{F}) = 0, \quad \text{for all } i > 0.$$

The reason for that is the following. In an irreducible scheme (a variety in particular), any two nonempty open subsets meet, and so the restriction mappings of a constant sheaf are surjective. We say that the sheaf is *flasque*. In this case, all higher Čech cohomology groups vanish, and so do all higher Zariski cohomology groups. In other words, there are ``not enough" open sets in the Zariski topology to detect this higher cohomology.

On the other hand, if X is a smooth projective complex variety, then

$$H^{2\dim X}_{Betti}(X(\mathbf{C}),\Lambda)=\Lambda \quad \text{for } \Lambda=\mathbf{Z},\ \mathbf{Z}/n\mathbf{Z},$$

where $X(\mathbf{C})$ means the set of complex points of X. This is a feature that would be nice to replicate in algebraic geometry. In positive characteristic in particular.

38.4. The étale topology

It is very hard to simply ``add'' extra open sets to refine the Zariski topology. One efficient way to define a topology is to consider not only open sets, but also some schemes that lie over them. To define the étale topology, one considers all morphisms $\varphi : U \to X$ which are étale. If X is a smooth projective variety over $\mathbf{C}$, then this means

(1) U is a disjoint union of smooth varieties ; and
(2) φ is (analytically) locally an isomorphism.

The word ``analytically'' refers to the usual (transcendental) topology over $\mathbf{C}$. So the second condition means that the derivative of φ has full rank everywhere (and in particular all the components of U have the same dimension as X).

A double cover -- loosely defined as a finite degree 2 map between varieties -- for example

$$Spec(\mathbf{C}[t]) \longrightarrow Spec(\mathbf{C}[t]), \quad t \longmapsto t^2$$

will not be an étale morphism if it has a fibre consisting of a single point. In the example this happens when $t=0$. For a finite map between varieties over $\mathbf{C}$ to be étale all the fibers should have the same number of points. Removing the point $t=0$ from the source of the map in the example will make the morphism étale. But we can remove other points from the source of the morphism also, and the morphism will still be étale. To consider the étale topology, we have to look at all such morphisms. Unlike the Zariski topology, these need not be merely be open subsets of X, even though their images always are.

Definition 38.4.1. A family of morphisms $\{\varphi_i : U_i \to X\}_{i\in I}$ is called an *étale covering* if each φ_i is an étale morphism and their images cover X, i.e., $X=\bigcup_{i\in I}\varphi_i(U_i)$.

This ``defines'' the étale topology. In other words, we can now say what the sheaves are. An *étale sheaf* $\mathcal{F}$ of sets (resp. abelian groups, vector spaces, etc) on X is the data:

(1) for each étale morphism $\varphi : U \to X$ a set (resp. abelian group, vector space, etc) $\mathcal{F}(U)$,
(2) for each pair U, U' of étale schemes over X, and each morphism $U \to U'$ over X (which is automatically étale) a restriction map $\rho^U_{U'} : \mathcal{F}(U) \to \mathcal{F}(U')$

These data have to satisfy the following *sheaf axiom*:

(*) for every étale covering $\{\varphi_i : U_i \to X\}_{i\in I}$, the diagram

$$\emptyset \longrightarrow \mathcal{F}(U) \longrightarrow \Pi_{i\in I}\mathcal{F}(U_i) \rightrightarrows \Pi_{i,j\in I}\mathcal{F}(U_i\times_U U_j)$$

is exact in the category of sets (resp. abelian groups, vector spaces, etc).

Remark 38.4.2. In the last statement, it is essential not to forget the case where $i=j$ which is in general a highly nontrivial condition (unlike in the Zariski topology). In fact, frequently important coverings have only one element.

Since the identity is an étale morphism, we can compute the global sections of an étale sheaf, and cohomology will simply be the corresponding right-derived functors. In other words, once more theory has been developed and statements have been made precise, there will be no obstacle to defining cohomology.

38.5. Feats of the étale topology

For a natural number $n \in \mathbf{N} = \{1, 2, 3, 4, \ldots\}$ it is true that

$$H^2_{et}(\mathbf{P}^1_{\mathbf{C}}, \mathbf{Z}/n\mathbf{Z}) = \mathbf{Z}/n\mathbf{Z}.$$

More generally, if X is a complex variety, then its étale Betti numbers with coefficients in a finite field agree with the usual Betti numbers of $X(\mathbf{C})$, i.e.,

$$\dim_{\mathbf{F}_q} H^{2i}_{et}(X, \mathbf{F}_q) = \dim_{\mathbf{F}_q} H^{2i}_{Betti}(X(\mathbf{C}), \mathbf{F}_q).$$

This is extremely satisfactory. However, these equalities only hold for torsion coefficients, not in general. For integer coefficients, one has

$$H^2_{et}(\mathbf{P}^1_{\mathbf{C}}, \mathbf{Z}) = 0.$$

There are ways to get back to nontorsion coefficients from torsion ones by a limit procedure which we will come to shortly.

38.6. A computation

How do we compute the cohomology of $\mathbf{P}^1_{\mathbf{C}}$ with coefficients $\Lambda = \mathbf{Z}/n\mathbf{Z}$? We use Čech cohomology. A covering of $\mathbf{P}^1_{\mathbf{C}}$ is given by the two standard opens U_0, U_1, which are both isomorphic to $\mathbf{A}^1_{\mathbf{C}}$, and which intersection is isomorphic to $\mathbf{A}^1_{\mathbf{C}} \setminus \{0\} = \mathbf{G}_{m,\mathbf{C}}$. It turns out that the Mayer-Vietoris sequence holds in étale cohomology. This gives an exact sequence

$$H^{i-1}_{et}(U_0 \cap U_1, \Lambda) \to H^i_{et}(\mathbf{P}^1_{\mathbf{C}}, \Lambda) \to H^i_{et}(U_0, \Lambda) \oplus H^i_{et}(U_1, \Lambda) \to H^i_{et}(U_0 \cap U_1, \Lambda).$$

To get the answer we expect, we would need to show that the direct sum in the third term vanishes. In fact, it is true that, as for the usual topology,

$$H^q_{et}(\mathbf{A}^1_{\mathbf{C}}, \Lambda) = 0 \quad \text{for } q \geq 1,$$

and

$$H^q_{et}(\mathbf{A}^1_{\mathbf{C}} \setminus \{0\}, \Lambda) = \begin{cases} \Lambda & \text{if } q = 1, \text{ and} \\ 0 & \text{for } q \geq 2. \end{cases}$$

These results are already quite hard (what is an elementary proof?). Let us explain how we would compute this once the machinery of étale cohomology is at our disposal.

Higher cohomology. This is taken care of by the following general fact: if X is an affine curve over $\mathbf{C}$, then

$$H^q_{et}(X, \mathbf{Z}/n\mathbf{Z}) = 0 \quad \text{for } q \geq 2.$$

This is proved by considering the generic point of the curve and doing some Galois cohomology. So we only have to worry about the cohomology in degree 1.

Cohomology in degree 1. We use the following identifications:

$$\begin{aligned} H^1_{et}(X, \mathbf{Z}/n\mathbf{Z}) &= \left\{ \begin{array}{c} \text{sheaves of sets } \mathcal{F} \text{ on the étale site } X_{\acute{e}t} \text{ endowed with an} \\ \text{action } \mathbf{Z}/n\mathbf{Z} \times \mathcal{F} \to \mathcal{F} \text{ such that } \mathcal{F} \text{ is a } \mathbf{Z}/n\mathbf{Z}\text{-torsor.} \end{array} \right\} \Big/ \cong \\ &= \left\{ \begin{array}{c} \text{morphisms } Y \to X \text{ which are finite étale together} \\ \text{with a free } \mathbf{Z}/n\mathbf{Z} \text{ action such that } X = Y/(\mathbf{Z}/n\mathbf{Z}). \end{array} \right\} \Big/ \cong . \end{aligned}$$

The first identification is very general (it is true for any cohomology theory on a site) and has nothing to do with the étale topology. The second identification is a consequence of descent theory. The last set describes a collection of geometric objects on which we can get our hands.

The curve $\mathbf{A}^1_{\mathbf{C}}$ has no nontrivial finite étale covering and hence $H^1_{et}(\mathbf{A}^1_{\mathbf{C}}, \mathbf{Z}/n\mathbf{Z}) = 0$. This can be seen either topologically or by using the argument in the next paragraph.

Let us describe the finite étale coverings $\varphi : Y \to \mathbf{A}^1_{\mathbf{C}} \setminus \{0\}$. It suffices to consider the case where Y is connected, which we assume. We are going to find out what Y can be by applying the Riemann-Hurwitz formula (of course this is a bit silly, and you can go ahead and skip the the next section if you like). Say that this morphism is n to 1, and consider a projective compactification

$$\begin{tikzcd} Y \arrow[r, hook] \arrow[d, "\varphi"] & \bar{Y} \arrow[d, "\bar{\varphi}"] \\ \mathbf{A}^1_{\mathbf{C}} \setminus \{0\} \arrow[r, hook] & \mathbf{P}^1_{\mathbf{C}} \end{tikzcd}$$

Even though φ is étale and does not ramify, $\bar{\varphi}$ may ramify at 0 and ∞. Say that the preimages of 0 are the points $y_1, \ldots, y_r$ with indices of ramification $e_1, \ldots e_r$, and that the preimages of ∞ are the points $y'_1, \ldots, y'_s$ with indices of ramification $d_1, \ldots d_s$. In particular, $\sum e_i = n = \sum d_j$. Applying the Riemann-Hurwitz formula, we get

$$2g_Y - 2 = -2n + \sum (e_i - 1) + \sum (d_j - 1)$$

and therefore $g_Y = 0$, $r = s = 1$ and $e_1 = d_1 = n$. Hence $Y \cong \mathbf{A}^1_{\mathbf{C}} \setminus \{0\}$, and it is easy to see that $\varphi(z) = \lambda z^n$ for some $\lambda \in \mathbf{C}^*$. After reparametrizing Y we may assume $\lambda = 1$. Thus our covering is given by taking the nth root of the coordinate on $\mathbf{A}^1_{\mathbf{C}} \setminus \{0\}$.

Remember that we need to classify the coverings of $\mathbf{A}^1_{\mathbf{C}} \setminus \{0\}$ together with free $\mathbf{Z}/n\mathbf{Z}$-actions on them. In our case any such action corresponds to an automorphism of Y sending z to $\zeta_n z$, where ζ_n is a primitive nth root of unity. There are $\phi(n)$ such actions (here $\phi(n)$ means the Euler function). Thus there are exactly $\phi(n)$ connected finite étale coverings with a given free $\mathbf{Z}/n\mathbf{Z}$-action, each corresponding to a primitive nth root of unity. We leave it to the reader to see that the disconnected finite étale degree n coverings of $\mathbf{A}^1_{\mathbf{C}} \setminus \{0\}$ with a given free $\mathbf{Z}/n\mathbf{Z}$-action correspond one-to-one with nth roots of 1 which are not primitive. In other words, this computation shows that

$$H^1_{et}(\mathbf{A}^1_{\mathbf{C}} \setminus \{0\}, \mathbf{Z}/n\mathbf{Z}) = \mu_n(\mathbf{C}) \cong \mathbf{Z}/n\mathbf{Z}.$$

The first identification is canonical, the second isn't. We remark that since the proof of Riemann-Hurwitz does not use this fact, the above actually constitutes a proof (provided we fill in the details on vanishing, etc).

38.7. Nontorsion coefficients

To study nontorsion coefficients, one makes the following definition:

$$H^i_{et}(X, \mathbf{Q}_\ell) := \left(lim_n H^i_{et}(X, \mathbf{Z}/\ell^n\mathbf{Z})\right) \otimes_{\mathbf{Z}_\ell} \mathbf{Q}_\ell.$$

The symbol lim_n denote the *limit* of the system of cohomology groups $H^i_{et}(X, \mathbf{Z}/\ell^n\mathbf{Z})$ indexed by n, see Categories, Section 4.19. Thus we will need to study systems of sheaves satisfying some compatibility conditions.

38.8. Sheaf theory

At this point we start talking about sites and sheaves in earnest. There is an amazing amount of useful abstract material that could fit in the next few sections. Some of this material is worked out in earlier chapters, such as the chapter on sites, modules on sites, and cohomology on sites. We try to refrain from adding to much material here, just enough so the material later in this chapter makes sense.

38.9. Presheaves

A reference for this section is Sites, Section 9.2.

Definition 38.9.1. Let $\mathcal{C}$ be a category. A *presheaf of sets* (respectively, an *abelian presheaf*) on $\mathcal{C}$ is a functor $\mathcal{C}^{opp} \to Sets$ (resp. Ab).

Terminology. If $U \in Ob(\mathcal{C})$, then elements of $\mathcal{F}(U)$ are called *sections* of $\mathcal{F}$ on U; for $\varphi : V \to U$ in $\mathcal{C}$, the map $\mathcal{F}(\varphi) : \mathcal{F}(V) \to \mathcal{F}(U)$ is denoted $s \mapsto \mathcal{F}(\varphi)(s) = \varphi^*(s) = s|_V$ and called *restriction mapping*. This last notation is ambiguous since the restriction map depends on φ, but it is a standard abuse of notation. We also use the notation $\Gamma(U, \mathcal{F}) = \mathcal{F}(U)$.

Saying that $\mathcal{F}$ is a functor means that if $W \to V \to U$ are morphisms in $\mathcal{C}$ and $s \in \Gamma(U, \mathcal{F})$ then $(s|_V)|_W = s|_W$, with the abuse of notation just seen. Moreover, the restriction mappings corresponding to the identity morphisms $\text{id}_U : U \to U$ are the identity.

The category of presheaves of sets (respectively of abelian presheaves) on $\mathcal{C}$ is denoted $PSh(\mathcal{C})$ (resp. $PAb(\mathcal{C})$). It is the category of functors from $\mathcal{C}^{opp}$ to $Sets$ (resp. Ab), which is to say that the morphisms of presheaves are natural transformations of functors. We only consider the categories $PSh(\mathcal{C})$ and $PAb(\mathcal{C})$ when the category $\mathcal{C}$ is small. (Our convention is that a category is small unless otherwise mentioned, and if it isn't small it should be listed in Categories, Remark 4.2.2.)

Example 38.9.2. Given an object $X \in Ob(\mathcal{C})$, we consider the functor

$$\begin{array}{cccc} h_X : & \mathcal{C}^{opp} & \longrightarrow & Sets \\ & U & \longmapsto & h_X(U) = Mor_{\mathcal{C}}(U, X) \\ & V \xrightarrow{\varphi} U & \longmapsto & \varphi \circ - : h_X(U) \to h_X(V). \end{array}$$

It is a presheaf, called the *representable presheaf associated to* X. It is not true that representable presheaves are sheaves in every topology on every site.

Lemma 38.9.3. *(Yoneda) Let $\mathcal{C}$ be a category, and $X, Y \in Ob(\mathcal{C})$. There is a natural bijection*

$$\begin{array}{ccc} Mor_{\mathcal{C}}(X, Y) & \longrightarrow & Mor_{PSh(\mathcal{C})}(h_X, h_Y) \\ \psi & \longmapsto & h_\psi = \psi \circ - : h_X \to h_Y. \end{array}$$

Proof. See Categories, Lemma 4.3.5. □

38.10. Sites

Definition 38.10.1. Let $\mathcal{C}$ be a category. A *family of morphisms with fixed target* $\mathcal{U} = \{\varphi_i : U_i \to U\}_{i \in I}$ is the data of

(1) an object $U \in \mathcal{C}$;
(2) a set I (possibly empty) ; and
(3) for all $i \in I$, a morphism $\varphi_i : U_i \to U$ of $\mathcal{C}$ with target U.

There is a notion of a *morphism of families of morphisms with fixed target*. A special case of that is the notion of a *refinement*. A reference for this material is Sites, Section 9.8.

Definition 38.10.2. A *site*[1] consists of a category $\mathscr{C}$ and a set $\mathrm{Cov}(\mathscr{C})$ consising of families of morphisms with fixed target called *coverings*, such that

(1) (isomorphism) if $\varphi : V \to U$ is an isomorphism in $\mathscr{C}$, then $\{\varphi : V \to U\}$ is a covering,
(2) (locality) if $\{\varphi_i : U_i \to U\}_{i\in I}$ is a covering and for all $i \in I$ we are given a covering $\{\psi_{ij} : U_{ij} \to U_i\}_{j\in I_i}$, then
$$\{\varphi_i \circ \psi_{ij} : U_{ij} \to U\}_{(i,j)\in\prod_{i\in I}\{i\}\times I_i}$$
is also a covering, and
(3) (base change) if $\{U_i \to U\}_{i\in I}$ is a covering and $V \to U$ is a morphism in $\mathscr{C}$, then
   (a) for all $i \in I$ the fibre product $U_i \times_U V$ exists in $\mathscr{C}$, and
   (b) $\{U_i \times_U V \to V\}_{i\in I}$ is a covering.

For us the category underlying a site is aways ``small'', i.e., its collection of objects form a set, and the collection of coverings of a site is a set as well (as in the definition above). We will mostly, in this chapter, leave out the arguments that cut down the collection of objects and coverings to a set. For further discussion, see Sites, Remark 9.6.3.

Example 38.10.3. If X is a topological space, then it has an associated site $\mathscr{T}_X$ defined as follows: the objects of $\mathscr{T}_X$ are the open subsets of X, the morphisms between these are the inclusion mappings, and the coverings are the usual topological (surjective) coverings. Observe that if $U, V \subset W \subset X$ are open subsets then $U \times_W V = U \cap V$ exists: this category has fiber products. All the verifications are trivial and everything works as expected.

38.11. Sheaves

Definition 38.11.1. A presheaf $\mathscr{F}$ of sets (resp. abelian presheaf) on a site $\mathscr{C}$ is said to be a *separated presheaf* if for all coverings $\{\varphi_i : U_i \to U\}_{i\in I} \in \mathrm{Cov}(\mathscr{C})$ the map
$$\mathscr{F}(U) \longrightarrow \prod\nolimits_{i\in I} \mathscr{F}(U_i)$$
is injective. Here the map is $s \mapsto (s|_{U_i})_{i\in I}$. The presheaf $\mathscr{F}$ is a *sheaf* if for all coverings $\{\varphi_i : U_i \to U\}_{i\in I} \in \mathrm{Cov}(\mathscr{C})$, the diagram

$$\mathscr{F}(U) \longrightarrow \prod\nolimits_{i\in I} \mathscr{F}(U_i) \rightrightarrows \prod\nolimits_{i,j\in I} \mathscr{F}(U_i \times_U U_j), \tag{38.11.1.1}$$

where the first map is $s \mapsto (s|_{U_i})_{i\in I}$ and the two maps on the right are $(s_i)_{i\in I} \mapsto (s_i|_{U_i\times_U U_j})$ and $(s_i)_{i\in I} \mapsto (s_j|_{U_i\times_U U_j})$, is an equalizer diagram in the category of sets (resp. abelian groups).

Remark 38.11.2. For the empty covering (where $I = \emptyset$), this implies that $\mathscr{F}(\emptyset)$ is an empty product, which is a final object in the corresponding category (a singleton, for both *Sets* and *Ab*).

Example 38.11.3. Working this out for the site $\mathscr{T}_X$ associated to a topological space, see Example 38.10.3, gives the usual notion of sheaves.

Definition 38.11.4. We denote $Sh(\mathscr{C})$ (resp. $Ab(\mathscr{C})$) the full subcategory of $PSh(\mathscr{C})$ (resp. $PAb(\mathscr{C})$) whose objects are sheaves. This is the *category of sheaves of sets* (resp. *abelian sheaves*) on $\mathscr{C}$.

[1]What we call a site is a called a category endowed with a pretopology in [**MA71**, Exposé II, Définition 1.3]. In [**Art62**] it is called a category with a Grothendieck topology.

38.12. The example of G-sets

Let G be a group and define a site $\mathcal{T}_G$ as follows: the underlying category is the category of G-sets, i.e., its objects are sets endowed with a left G-action and the morphisms are equivariant maps; and the coverings of $\mathcal{T}_G$ are the families $\{\varphi_i : U_i \to U\}_{i\in I}$ satisfying $U = \bigcup_{i\in I} \varphi_i(U_i)$.

There is a special object in the site $\mathcal{T}_G$, namely the G-set G endowed with its natural action by left translations. We denote it ${}_GG$. Observe that there is a natural group isomorphism

$$\begin{array}{rccc} \rho : & G^{opp} & \longrightarrow & \mathrm{Aut}_{G\text{-}Sets}({}_GG) \\ & g & \longmapsto & (h \mapsto hg). \end{array}$$

In particular, for any presheaf $\mathcal{F}$, the set $\mathcal{F}({}_GG)$ inherits a G-action via ρ. (Note that by contravariance of $\mathcal{F}$, the set $\mathcal{F}({}_GG)$ is again a left G-set.) In fact, the functor

$$\begin{array}{ccc} Sh(\mathcal{T}_G) & \longrightarrow & G\text{-}Sets \\ \mathcal{F} & \longmapsto & \mathcal{F}({}_GG) \end{array}$$

is an equivalence of categories. Its quasi-inverse is the functor $X \mapsto h_X$. Without giving the complete proof (which can be found in Sites, Section 9.9) let us try to explain why this is true.

(1) If S is a G-set, we can decompose it into orbits $S = \coprod_{i\in I} O_i$. The sheaf axiom for the covering $\{O_i \to S\}_{i\in I}$ says that

$$\mathcal{F}(S) \longrightarrow \prod\nolimits_{i\in I} \mathcal{F}(O_i) \rightrightarrows \prod\nolimits_{i,j\in I} \mathcal{F}(O_i \times_S O_j)$$

is an equalizer. Observing that fibered products in G-$Sets$ are induced from fibered products in $Sets$, and using the fact that $\mathcal{F}(\emptyset)$ is a G-singleton, we get that

$$\prod_{i,j\in I} \mathcal{F}(O_i \times_S O_j) = \prod_{i\in I} \mathcal{F}(O_i)$$

and the two maps above are in fact the same. Therefore the sheaf axiom merely says that $\mathcal{F}(S) = \prod_{i\in I} \mathcal{F}(O_i)$.

(2) If S is the G-set $S = G/H$ and $\mathcal{F}$ is a sheaf on $\mathcal{T}_G$, then we claim that

$$\mathcal{F}(G/H) = \mathcal{F}({}_GG)^H$$

and in particular $\mathcal{F}(\{*\}) = \mathcal{F}({}_GG)^G$. To see this, let's use the sheaf axiom for the covering $\{{}_GG \to G/H\}$ of S. We have

$$\begin{array}{ccc} {}_GG \times_{G/H} {}_GG & \cong & G \times H \\ (g_1, g_2) & \longmapsto & (g_1, g_1g_2^{-1}) \end{array}$$

is a disjoint union of copies of ${}_GG$ (as a G-set). Hence the sheaf axiom reads

$$\mathcal{F}(G/H) \longrightarrow \mathcal{F}({}_GG) \rightrightarrows \prod\nolimits_{h\in H} \mathcal{F}({}_GG)$$

where the two maps on the right are $s \mapsto (s)_{h\in H}$ and $s \mapsto (hs)_{h\in H}$. Therefore $\mathcal{F}(G/H) = \mathcal{F}({}_GG)^H$ as claimed.

This doesn't quite prove the claimed equivalence of categories, but it shows at least that a sheaf $\mathcal{F}$ is entirely determined by its sections over ${}_GG$. Details (and set theoretical remarks) can be found in Sites, Section 9.9.

38.13. Sheafification

Definition 38.13.1. Let $\mathscr{F}$ be a presheaf on the site $\mathscr{C}$ and $\mathscr{U} = \{U_i \to U\} \in \mathrm{Cov}(\mathscr{C})$. We define the *zeroth Cech cohomology group* of $\mathscr{F}$ with respect to $\mathscr{U}$ by

$$\check{H}^0(\mathscr{U}, \mathscr{F}) = \left\{ (s_i)_{i \in I} \in \prod_{i \in I} \mathscr{F}(U_i) \text{ such that } s_i|_{U_i \times_U U_j} = s_j|_{U_i \times_U U_j} \right\}.$$

There is a canonical map $\mathscr{F}(U) \to \check{H}^0(\mathscr{U}, \mathscr{F})$, $s \mapsto (s|_{U_i})_{i \in I}$. We say that a *morphism of coverings* from a covering $\mathscr{V} = \{V_j \to V\}_{j \in J}$ to $\mathscr{U}$ is a triple (χ, α, χ_j), where $\chi : \mathscr{V} \to \mathscr{U}$ is a morphism, $\alpha : J \to I$ is a map of sets, and for all $j \in J$ the morphism χ_j fits into a commutative diagram

$$\begin{tikzcd} V_j \arrow[r, "\chi_j"'] \arrow[d] & U_{\alpha(j)} \arrow[d] \\ V \arrow[r, "\chi"] & U. \end{tikzcd}$$

Given the data $\chi, \alpha, \{\chi_j\}_{i \in J}$ we define

$$\begin{array}{ccc} \check{H}^0(\mathscr{U}, \mathscr{F}) & \longrightarrow & \check{H}^0(\mathscr{V}, \mathscr{F}) \\ (s_i)_{i \in I} & \longmapsto & \left(\chi_j^* \left(s_{\alpha(j)} \right) \right)_{j \in J}. \end{array}$$

We then claim that

(1) the map is well-defined, and
(2) depends only on χ and is independent of the choice of $\alpha, \{\chi_j\}_{i \in J}$.

We omit the proof of the first fact. To see part (2), consider another triple (ψ, β, ψ_j) with $\chi = \psi$. Then we have the commutative diagram

$$\begin{tikzcd} V_j \arrow[rr, "(\chi_j, \psi_j)"] \arrow[ddd] & & U_{\alpha(j)} \times_U U_{\beta(j)} \arrow[dl] \arrow[dr] & \\ & U_{\alpha(j)} \arrow[ddr] & & U_{\beta(j)} \arrow[ddl] \\ & & & \\ V \arrow[rr, "\chi = \psi"] & & U. & \end{tikzcd}$$

Given a section $s \in \mathscr{F}(\mathscr{U})$, its image in $\mathscr{F}(V_j)$ under the map given by $(\chi, \alpha, \{\chi_j\}_{i \in J})$ is $\chi_j^* s_{\alpha(j)}$, and its image under the map given by $(\psi, \beta, \{\psi_j\}_{i \in J})$ is $\psi_j^* s_{\beta(j)}$. These two are equal since by assumption $s \in \check{H}(\mathscr{U}, \mathscr{F})$ and hence both are equal to the pullback of the common value

$$s_{\alpha(j)}|_{U_{\alpha(j)} \times_U U_{\beta(j)}} = s_{\beta(j)}|_{U_{\alpha(j)} \times_U U_{\beta(j)}}$$

pulled back by the map (χ_j, ψ_j) in the diagram.

Theorem 38.13.2. *Let $\mathscr{C}$ be a site and $\mathscr{F}$ a presheaf on $\mathscr{C}$.*

(1) *The rule*

$$U \mapsto \mathscr{F}^+(U) := colim_{\mathscr{U} \text{ covering of } U} \check{H}^0(\mathscr{U}, \mathscr{F})$$

is a presheaf. And the colimit is a directed one.

(2) *There is a canonical map of presheaves $\mathscr{F} \to \mathscr{F}^+$.*
(3) *If $\mathscr{F}$ is a separated presheaf then $\mathscr{F}^+$ is a sheaf and the map in (2) is injective.*
(4) *$\mathscr{F}^+$ is a separated presheaf.*

(5) *$\mathscr{F}^\# = (\mathscr{F}^+)^+$ is a sheaf, and the canonical map induces a functorial isomorphism*

$$Hom_{PSh(\mathscr{C})}(\mathscr{F}, \mathscr{G}) = Hom_{Sh(\mathscr{C})}(\mathscr{F}^\#, \mathscr{G})$$

for any $\mathscr{G} \in Sh(\mathscr{C})$.

Proof. See Sites, Theorem 9.10.10. □

In other words, this means that the natural map $\mathscr{F} \to \mathscr{F}^\#$ is a left adjoint to the forgetful functor $Sh(\mathscr{C}) \to PSh(\mathscr{C})$.

38.14. Cohomology

The following is the basic result that makes it possible to define cohomology for abelian sheaves on sites.

Theorem 38.14.1. *The category of abelian sheaves on a site is an abelian category which has enough injectives.*

Proof. See Modules on Sites, Lemma 16.3.1 and Injectives, Theorem 17.11.4. □

So we can define cohomology as the right-derived functors of the sections functor: if $U \in Ob(\mathscr{C})$ and $\mathscr{F} \in Ab(\mathscr{C})$,

$$H^p(U, \mathscr{F}) := R^p\Gamma(U, \mathscr{F}) = H^p(\Gamma(U, \mathscr{I}^\bullet))$$

where $\mathscr{F} \to \mathscr{I}^\bullet$ is an injective resolution. To do this, we should check that the functor $\Gamma(U, -)$ is left exact. This is true and is part of why the category $Ab(\mathscr{C})$ is abelian, see Modules on Sites, Lemma 16.3.1. For more general discussion of cohomology on sites (including the global sections functor and its right derived functors), see Cohomology on Sites, Section 19.3.

38.15. The fpqc topology

Before doing étale cohomology we study a bit the fpqc topology, since it works well for quasi-coherent sheaves.

Definition 38.15.1. Let T be a scheme. An *fpqc covering* of T is a family $\{\varphi_i : T_i \to T\}_{i \in I}$ such that

(1) each φ_i is a flat morphism and $\bigcup_{i \in I} \varphi_i(T_i) = T$, and
(2) for each affine open $U \subset T$ there exists a finite set K, a map $\mathbf{i} : K \to I$ and affine opens $U_{\mathbf{i}(k)} \subset T_{\mathbf{i}(k)}$ such that $U = \bigcup_{k \in K} \varphi_{\mathbf{i}(k)}(U_{\mathbf{i}(k)})$.

Remark 38.15.2. The first condition corresponds to fp, which stands for *fidèlement plat*, faithfully flat in french, and the second to qc, *quasi-compact*. The second part of the first condition is unnecessary when the second condition holds.

Example 38.15.3. Examples of fpqc coverings.

(1) Any Zariski open covering of T is an fpqc covering.
(2) A family $\{Spec(B) \to Spec(A)\}$ is an fpqc covering if and only if $A \to B$ is a faithfully flat ring map.
(3) If $f : X \to Y$ is flat, surjective and quasi-compact, then $\{f : X \to Y\}$ is an fpqc covering.
(4) The morphism $\varphi : \coprod_{x \in \mathbf{A}^1_k} Spec(\mathscr{O}_{\mathbf{A}^1_k, x}) \to \mathbf{A}^1_k$, where k is a field, is flat and surjective. It is not quasi-compact, and in fact the family $\{\varphi\}$ is not an fpqc covering.

(5) Write $\mathbf{A}^2_k = Spec(k[x, y])$. Denote $i_x : D(x) \to \mathbf{A}^2_k$ and $i_y : D(y) \hookrightarrow \mathbf{A}^2_k$ the standard opens. Then the families $\{i_x, i_y, Spec(k[[x, y]]) \to \mathbf{A}^2_k\}$ and $\{i_x, i_y, Spec(\mathcal{O}_{\mathbf{A}^2_k,0}) \to \mathbf{A}^2_k\}$ are fpqc coverings.

Lemma 38.15.4. *The collection of fpqc coverings on the category of schemes satisfies the axioms of site.*

Proof. See Topologies, Lemma 30.8.7. □

It seems that this lemma allows us to define the fpqc site of the category of schemes. However, there is a set theoretical problem that comes up when considering the fpqc topology, see Topologies, Section 38.15. It comes from our requirement that sites are ``small", but that no small category of schemes can contain a cofinal system of fpqc coverings of a given nonempty scheme. Allthough this does not strictly speaking prevent us from defining ``partial" fpqc sites, it does not seem prudent to do so. The work-around is to allow the notion of a sheaf for the fpqc topology (see below) but to prohibit considering the category of all fpqc sheaves.

Definition 38.15.5. Let S be a scheme. The category of schemes over S is denoted Sch/S. Consider a functor $\mathcal{F} : (Sch/S)^{opp} \to Sets$, in other words a presheaf of sets. We say $\mathcal{F}$ *satisfies the sheaf property for the fpqc topology* if for every fpqc covering $\{U_i \to U\}_{i\in I}$ of schemes over S the diagram (38.11.1.1) is an equalizer diagram.

We similarly say that $\mathcal{F}$ *satisfies the sheaf property for the Zariski topology* if for every open covering $U = \bigcup_{i\in I} U_i$ the diagram (38.11.1.1) is an equalizer diagram. See Schemes, Definition 21.15.3. Clearly, this is equivalent to saying that for every scheme T over S the restriction of $\mathcal{F}$ to the opens of T is a (usual) sheaf.

Lemma 38.15.6. *Let $\mathcal{F}$ be a presheaf on Sch/S. Then $\mathcal{F}$ satisfies the sheaf property for the fpqc topology if and only if*

(1) *$\mathcal{F}$ satisfies the sheaf property with respect to the Zariski topology, and*
(2) *for every faithfully flat morphism $Spec(B) \to Spec(A)$ of affine schemes over S, the sheaf axiom holds for the covering $\{Spec(B) \to Spec(A)\}$. Namely, this means that*

$$\mathcal{F}(Spec(A)) \longrightarrow \mathcal{F}(Spec(B)) \rightrightarrows \mathcal{F}(Spec(B \otimes_A B))$$

is an equalizer diagram.

Proof. See Topologies, Lemma 30.8.13. □

An alternative way to think of a presheaf $\mathcal{F}$ on Sch/S which satisfies the sheaf condition for the fpqc topology is as the following data:

(1) for each T/S, a usual (i.e., Zariski) sheaf $\mathcal{F}_T$ on T_{Zar},
(2) for every map $f : T' \to T$ over S, a restriction mapping $f^{-1}\mathcal{F}_T \to \mathcal{F}_{T'}$

such that

(a) the restriction mappings are functorial,
(b) if $f : T' \to T$ is an open immersion then the restriction mapping $f^{-1}\mathcal{F}_T \to \mathcal{F}_{T'}$ is an isomorphism, and
(c) for every faithfully flat morphism $Spec(B) \to Spec(A)$ over S, the diagram

$$\mathcal{F}_{Spec(A)}(Spec(A)) \longrightarrow \mathcal{F}_{Spec(B)}(Spec(B)) \rightrightarrows \mathcal{F}_{Spec(B\otimes_A B)}(Spec(B \otimes_A B))$$

is an equalizer.

Data (1) and (2) and conditions (a), (b) give the data of a presheaf on *Sch*/S satisfying the sheaf condition for the Zariski topology. By Lemma 38.15.6 condition (c) then suffices to get the sheaf condition for the fpqc topology.

Example 38.15.7. Consider the presheaf

$$\begin{array}{rccc} \mathcal{F} : & (Sch/S)^{opp} & \longrightarrow & Ab \\ & T/S & \longmapsto & \Gamma(T, \Omega_{T/S}). \end{array}$$

The compatibility of differentials with localization implies that $\mathcal{F}$ is a sheaf on the Zariski site. However, it does not satisfy the sheaf condition for the fpqc topology. Namely, consider the case $S = Spec(\mathbf{F}_p)$ and the morphism

$$\varphi : V = Spec(\mathbf{F}_p[v]) \to U = Spec(\mathbf{F}_p[u])$$

given by mapping u to v^p. The family $\{\varphi\}$ is an fpqc covering, yet the restriction mapping $\mathcal{F}(U) \to \mathcal{F}(V)$ sends the generator $\mathrm{d}u$ to $\mathrm{d}(v^p) = 0$, so it is the zero map, and the diagram

$$\mathcal{F}(U) \xrightarrow{0} \mathcal{F}(V) \rightrightarrows \mathcal{F}(V \times_U V)$$

is not an equalizer. We will see later that $\mathcal{F}$ does in fact give rise to a sheaf on the étale and smooth sites.

Lemma 38.15.8. *Any representable presheaf on Sch/S satisfies the sheaf condition for the fpqc topology.*

Proof. See Descent, Lemma 31.9.3. □

We will return to this later, since the proof of this fact uses descent for quasi-coherent sheaves, which we will discuss in the next section. A fancy way of expressing the lemma is to say that *the fpqc topology is weaker than the canonical topology*, or that the fpqc topology is *subcanonical*. In the setting of sites this is discussed in Sites, Section 9.12.

Remark 38.15.9. The fpqc is the finest topology that we will see. Hence any presheaf satisfying the sheaf condition for the fpqc topology will be a sheaf in the subsequent sites (étale, smooth, etc). In particular representable presheaves will be sheaves on the étale site of a scheme for example.

Example 38.15.10. Let S be a scheme. Consider the additive group scheme $\mathbf{G}_{a,S} = \mathbf{A}^1_S$ over S, see Groupoids, Example 35.5.3. The associated representable presheaf is given by

$$h_{\mathbf{G}_{a,S}}(T) = Mor_S(T, \mathbf{G}_{a,S}) = \Gamma(T, \mathcal{O}_T).$$

By the above we now know that this is a presheaf of sets which satisfies the sheaf condition for the fpqc topology. On the other hand, it is clearly a presheaf of rings as well. Hence we can think of this as a functor

$$\begin{array}{rccc} \mathcal{O} : & (Sch/S)^{opp} & \longrightarrow & Rings \\ & T/S & \longmapsto & \Gamma(T, \mathcal{O}_T) \end{array}$$

which satisfies the sheaf condition for the fpqc topology. Correspondingly there is a notion of $\mathcal{O}$-module, and so on and so forth.

38.16. Faithfully flat descent

Definition 38.16.1. Let $\mathcal{U} = \{t_i : T_i \to T\}_{i \in I}$ be a family of morphisms of schemes with fixed target. A *descent datum* for quasi-coherent sheaves with respect to $\mathcal{U}$ is a family $(\mathcal{F}_i, \varphi_{ij})_{i,j \in I}$ where

(1) for all i, $\mathcal{F}_i$ is a quasi-coherent sheaf on T_i ; and
(2) for all $i, j \in I$ the map $\varphi_{ij} : \mathrm{pr}_0^* \mathcal{F}_i \cong \mathrm{pr}_1^* \mathcal{F}_j$ is an isomorphism on $T_i \times_T T_j$ such that the diagrams

$$\begin{tikzcd}
\mathrm{pr}_0^*\mathcal{F}_i \arrow[rr, "\mathrm{pr}_{01}^*\varphi_{ij}"] \arrow[dr, "\mathrm{pr}_{02}^*\varphi_{ik}"'] & & \mathrm{pr}_1^*\mathcal{F}_j \arrow[dl, "\mathrm{pr}_{12}^*\varphi_{jk}"] \\
& \mathrm{pr}_2^*\mathcal{F}_k &
\end{tikzcd}$$

commute on $T_i \times_T T_j \times_T T_k$.

This descent datum is called *effective* if there exist a quasi-coherent sheaf $\mathcal{F}$ over T and $\mathcal{O}_{T_i}$-module isomorphisms $\varphi_i : t_i^* \mathcal{F} \cong \mathcal{F}_i$ satisfying the cocycle condition, namely

$$\varphi_{ij} = \mathrm{pr}_1^*(\varphi_j) \circ \mathrm{pr}_0^*(\varphi_i)^{-1}.$$

In this and the next section we discuss some ingredients of the proof of the following theorem, as well as some related material.

Theorem 38.16.2. *If $\mathcal{V} = \{T_i \to T\}_{i \in I}$ is an fpqc covering, then all descent data for quasi-coherent sheaves with respect to $\mathcal{V}$ are effective.*

Proof. See Descent, Proposition 31.4.2. □

In other words, the fibered category of quasi-coherent sheaves is a stack on the fpqc site. The proof of the theorem is in two steps. The first one is to realize that for Zariski coverings this is easy (or well-known) using standard glueing of sheaves (see Sheaves, Section 6.33) and the locality of quasi-coherence. The second step is the case of an fpqc covering of the form $\{Spec(B) \to Spec(A)\}$ where $A \to B$ is a faithfully flat ring map. This is a lemma in algebra, which we now present.

Descent of modules. If $A \to B$ is a ring map, we consider the complex

$$(B/A)_\bullet : \qquad B \to B \otimes_A B \to B \otimes_A B \otimes_A B \to \cdots$$

where B is in degree 0, $B \otimes_A B$ in degree 1, etc, and the maps are given by

$$\begin{aligned}
b &\mapsto 1 \otimes b - b \otimes 1, \\
b_0 \otimes b_1 &\mapsto 1 \otimes b_0 \otimes b_1 - b_0 \otimes 1 \otimes b_1 + b_0 \otimes b_1 \otimes 1, \\
&\text{etc.}
\end{aligned}$$

Lemma 38.16.3. *If $A \to B$ is faithfully flat, then the complex $(B/A)_\bullet$ is exact in positive degrees, and $H^0((B/A)_\bullet) = A$.*

Proof. See Descent, Lemma 31.3.6. □

Grothendieck proves this in three steps. Firstly, he assumes that the map $A \to B$ has a section, and constructs an explicit homotopy to the complex where A is the only nonzero term, in degree 0. Secondly, he observes that to prove the result, it suffices to do so after a faithfully flat base change $A \to A'$, replacing B with $B' = B \otimes_A A'$. Thirdly, he applies the faithfully flat base change $A \to A' = B$ and remarks that the map $A' = B \to B' = B \otimes_A B$ has a natural section.

The same strategy proves the following lemma.

Lemma 38.16.4. *If $A \to B$ is faithfully flat and M is an A-module, then the complex $(B/A)_\bullet \otimes_A M$ is exact in positive degrees, and $H^0((B/A)_\bullet \otimes_A M) = M$.*

Proof. See Descent, Lemma 31.3.6. □

Definition 38.16.5. Let $A \to B$ be a ring map and N a B-module. A *descent datum* for N with respect to $A \to B$ is an isomorphism $\varphi : N \otimes_A B \cong B \otimes_A N$ of $B \otimes_A B$-modules such that the diagram of $B \otimes_A B \otimes_A B$-modules

$$\begin{tikzcd} N \otimes_A B \otimes_A B \arrow[rr, "\varphi_{02}"] \arrow[dr, "\varphi_{01}"'] & & B \otimes_A N \otimes_A B \arrow[dl, "\varphi_{12}"] \\ & B \otimes_A B \otimes_A N & \end{tikzcd}$$

commutes.

If $N' = B \otimes_A M$ for some A-module M, then it has a canonical descent datum given by the map

$$\begin{array}{cccc} \varphi_{\mathrm{can}} : & N' \otimes_A B & \to & B \otimes_A N' \\ & b_0 \otimes m \otimes b_1 & \mapsto & b_0 \otimes b_1 \otimes m. \end{array}$$

Definition 38.16.6. A descent datum (N, φ) is called *effective* if there exists an A-module M such that $(N, \varphi) \cong (B \otimes_A M, \varphi_{\mathrm{can}})$, with the obvious notion of isomorphism of descent data.

Theorem 38.16.2 is a consequence the following result.

Theorem 38.16.7. *If $A \to B$ is faithfully flat then all descent data with respect to $A \to B$ is effective.*

Proof. See Descent, Proposition 31.3.9. See also Descent, Remark 31.3.11 for an alternative view of the proof. □

Remarks 38.16.8. The results on descent of modules have several applications:

(1) The exactness of the Čech complex in positive degrees for the covering $\{Spec(B) \to Spec(A)\}$ where $A \to B$ is faithfully flat. This will give some vanishing of cohomology.
(2) If (N, φ) is a descent datum with respect to a faithfully flat map $A \to B$, then the corresponding A-module is given by

$$M = \ker \begin{pmatrix} N & \longrightarrow & B \otimes_A N \\ n & \longmapsto & 1 \otimes n - \varphi(n \otimes 1) \end{pmatrix}.$$

See Descent, Proposition 31.3.9.

38.17. Quasi-coherent sheaves

We can apply the descent of modules to study quasi-coherent sheaves.

Proposition 38.17.1. *For any quasi-coherent sheaf $\mathcal{F}$ on S the presheaf*

$$\begin{array}{rccc} \mathcal{F}^a : & Sch/S & \to & Ab \\ & (f : T \to S) & \mapsto & \Gamma(T, f^*\mathcal{F}) \end{array}$$

is an $\mathcal{O}$-module which satisfies the sheaf condition for the fpqc topology.

Proof. This is proved in Descent, Lemma 31.6.1. We indicate the proof here. As established in Lemma 38.15.6, it is enough to check the sheaf property on Zariski coverings and faithfully flat morphisms of affine schemes. The sheaf property for Zariski coverings is standard scheme theory, since $\Gamma(U, i^*\mathcal{F}) = \mathcal{F}(U)$ when $i : U \hookrightarrow S$ is an open immersion.

For $\{Spec(B) \to Spec(A)\}$ with $A \to B$ faithfully flat and $\mathcal{F}|_{Spec(A)} = \widetilde{M}$ this corresponds to the fact that $M = H^0\left((B/A)_\bullet \otimes_A M\right)$, i.e., that

$$0 \to M \to B \otimes_A M \to B \otimes_A B \otimes_A M$$

is exact by Lemma 38.16.4. □

There is an abstract notion of a quasi-coherent sheaf on a ringed site. We briefly introduce this here. For more information please consult Modules on Sites, Section 16.23. Let $\mathcal{C}$ be a category, and let U be an object of $\mathcal{C}$. Then $\mathcal{C}/U$ indicates the category of objects over U, see Categories, Example 4.2.13. If $\mathcal{C}$ is a site, then $\mathcal{C}/U$ is a site as well, namely the coverings of V/U are families $\{V_i/U \to V/U\}$ of morphisms of $\mathcal{C}/U$ with fixed target such that $\{V_i \to V\}$ is a covering of $\mathcal{C}$. Moreover, given any sheaf $\mathcal{F}$ on $\mathcal{C}$ the *restriction* $\mathcal{F}|_{\mathcal{C}/U}$ (defined in the obvious manner) is a sheaf as well. See Sites, Section 9.21 for details.

Definition 38.17.2. Let $\mathcal{C}$ be a *ringed site*, i.e., a site endowed with a sheaf of rings $\mathcal{O}$. A sheaf of $\mathcal{O}$-modules $\mathcal{F}$ on $\mathcal{C}$ is called *quasi-coherent* if for all $U \in Ob(\mathcal{C})$ there exists a covering $\{U_i \to U\}_{i\in I}$ of $\mathcal{C}$ such that the restriction $\mathcal{F}|_{\mathcal{C}/U_i}$ is isomorphic to the cokernel of an $\mathcal{O}$-linear map of free $\mathcal{O}$-modules

$$\bigoplus\nolimits_{k\in K} \mathcal{O}|_{\mathcal{C}/U_i} \longrightarrow \bigoplus\nolimits_{l\in L} \mathcal{O}|_{\mathcal{C}/U_i}.$$

The direct sum over K is the sheaf associated to the presheaf $V \mapsto \bigoplus_{k\in K} \mathcal{O}(V)$ and similary for the other.

Allthough it is useful to be able to give a general definition as above this notion is not well behaved in general.

Remark 38.17.3. In the case where $\mathcal{C}$ has a final object, e.g. S, it suffices to check the condition of the definition for $U = S$ in the above statement. See Modules on Sites, Lemma 16.23.3.

Theorem 38.17.4. *(Meta theorem on quasi-coherent sheaves.) Let S be a scheme. Let $\mathcal{C}$ be a site. Assume that*

(1) *the underlying category $\mathcal{C}$ is a full subcategory of Sch/S,*
(2) *any Zariski covering of $T \in Ob(\mathcal{C})$ can be refined by a covering of $\mathcal{C}$,*
(3) *S/S is an object of $\mathcal{C}$,*
(4) *every covering of $\mathcal{C}$ is an fpqc covering of schemes.*

Then the presheaf $\mathcal{O}$ is a sheaf on $\mathcal{C}$ and any quasi-coherent $\mathcal{O}$-module on $(\mathcal{C}, \mathcal{O})$ is of the form $\mathcal{F}^a$ for some quasi-coherent sheaf $\mathcal{F}$ on S.

Proof. After some formal arguments this is exactly Theorem 38.16.2. Details omitted. In Descent, Proposition 31.6.11 we prove a more precise version of the theorem for the big Zariski, fppf, étale, smooth, and syntomic sites of S, as well as the small Zariski and étale sites of S. □

In other words, there is no difference between quasi-coherent modules on the scheme S and quasi-coherent $\mathcal{O}$-modules on sites $\mathcal{C}$ as in the theorem. More precise statements for the big and small sites $(Sch/S)_{fppf}$, $S_{étale}$, etc can be found in Descent, Section 31.6. In this chapter we will sometimes refer to a ``site as in Theorem 38.17.4" in order to conveniently state results which hold in any of those situations.

38.18. Cech cohomology

Our next goal is to use descent theory to show that $H^i(\mathcal{C}, \mathcal{F}^a) = H^i_{Zar}(S, \mathcal{F})$ for all quasi-coherent sheaves $\mathcal{F}$ on S, and any site $\mathcal{C}$ as in Theorem 38.17.4. To this end, we introduce Čech cohomology on sites. See [**Art62**] and Cohomology on Sites, Sections 19.9, 19.10 and 19.11 for more details.

Definition 38.18.1. Let $\mathcal{C}$ be a category, $\mathcal{U} = \{U_i \to U\}_{i\in I}$ a family of morphisms of $\mathcal{C}$ with fixed target, and $\mathcal{F} \in PAb(\mathcal{C})$ an abelian presheaf. We define the *Cech complex* $\check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{F})$ by

$$\prod_{i_0\in I} \mathcal{F}(U_{i_0}) \to \prod_{i_0,i_1\in I} \mathcal{F}(U_{i_0} \times_U U_{i_1}) \to \prod_{i_0,i_1,i_2\in I} \mathcal{F}(U_{i_0} \times_U U_{i_1} \times_U U_{i_2}) \to \cdots$$

where the first term is in degree 0, and the maps are the usual ones. Again, it is essential to allow the case $i_0 = i_1$ etc. The *Cech cohomology groups* are defined by

$$\check{H}^p(\mathcal{U}, \mathcal{F}) = H^p(\check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{F})).$$

Lemma 38.18.2. *The functor $\check{\mathcal{C}}^\bullet(\mathcal{U}, -)$ is exact on the category $PAb(\mathcal{C})$.*

In other words, if $0 \to \mathcal{F}_1 \to \mathcal{F}_2 \to \mathcal{F}_3 \to 0$ is a short exact sequence of presheaves of abelian groups, then

$$0 \to \check{\mathcal{C}}^\bullet\left(\mathcal{U}, \mathcal{F}_1\right) \to \check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{F}_2) \to \check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{F}_3) \to 0$$

is a short exact sequence of complexes.

Proof. This follows at once from the definition of a short exact sequence of presheaves. Namely, as the category of abelian presheaves is the category of functors on some category with values in Ab, it is automatically an abelian category: a sequence $\mathcal{F}_1 \to \mathcal{F}_2 \to \mathcal{F}_3$ is exact in PAb if and only if for all $U \in Ob(\mathcal{C})$, the sequence $\mathcal{F}_1(U) \to \mathcal{F}_2(U) \to \mathcal{F}_3(U)$ is exact in Ab. So the complex above is merely a product of short exact sequences in each degree. See also Cohomology on Sites, Lemma 19.10.1. □

This shows that $\check{H}^\bullet(\mathcal{U}, -)$ is a δ-functor. We now proceed to show that it is a universal δ-functor. We thus need to show that it is an *effaceable* functor. We start by recalling the Yoneda lemma.

Lemma 38.18.3. *(Yoneda Lemma) For any presheaf $\mathcal{F}$ on a category $\mathcal{C}$ there is a functorial isomophism*

$$Hom_{PSh(\mathcal{C})}(h_U, \mathcal{F}) = \mathcal{F}(U).$$

Proof. See Categories, Lemma 4.3.5. □

Given a set E we denote (in this section) $\mathbf{Z}[E]$ the free abelian group on E. In a formula $\mathbf{Z}[E] = \bigoplus_{e\in E} \mathbf{Z}$, i.e., $\mathbf{Z}[E]$ is a free $\mathbf{Z}$-module having a basis consisting of the elements of E. Using this notation we introduce the free abelian presheaf on a presheaf of sets.

Definition 38.18.4. Let $\mathcal{C}$ be a category. Given a presheaf of sets $\mathcal{G}$, we define the *free abelian presheaf on* $\mathcal{G}$, denoted $\mathbf{Z}_\mathcal{G}$, by the rule

$$\mathbf{Z}_\mathcal{G}(U) = \mathbf{Z}[\mathcal{G}(U)]$$

for $U \in Ob(\mathcal{C})$ with restriction maps induced by the restriction maps of $\mathcal{G}$. In the special case $\mathcal{G} = h_U$ we write simply $\mathbf{Z}_U = \mathbf{Z}_{h_U}$.

The functor $\mathcal{G} \mapsto \mathbf{Z}_\mathcal{G}$ is left adjoint to the forgetful functor $PAb(\mathcal{C}) \to PSh(\mathcal{C})$. Thus, for any presheaf $\mathcal{F}$, there is a canonical isomorphism

$$Hom_{PAb(\mathcal{C})}(\mathbf{Z}_U, \mathcal{F}) = Hom_{PSh(\mathcal{C})}(h_U, \mathcal{F}) = \mathcal{F}(U)$$

the last equality by the Yoneda lemma. In particular, we have the following result.

Lemma 38.18.5. *The Cech complex $\check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{F})$ can be described explicitly as follows*

$$\begin{aligned}\check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{F}) &= \left(\prod_{i_0\in I} Hom_{PAb(\mathcal{C})}(\mathbf{Z}_{U_{i_0}}, \mathcal{F}) \to \prod_{i_0,i_1\in I} Hom_{PAb(\mathcal{C})}(\mathbf{Z}_{U_{i_0}\times_U U_{i_1}}, \mathcal{F}) \to \ldots\right) \\ &= Hom_{PAb(\mathcal{C})}\left(\left(\bigoplus_{i_0\in I}\mathbf{Z}_{U_{i_0}} \leftarrow \bigoplus_{i_0,i_1\in I}\mathbf{Z}_{U_{i_0}\times_U U_{i_1}} \leftarrow \ldots\right), \mathcal{F}\right)\end{aligned}$$

Proof. This follows from the formula above. See Cohomology on Sites, Lemma 19.10.3. $\square$

This reduces us to studying only the complex in the first argument of the last *Hom*.

Lemma 38.18.6. *The complex of abelian presheaves*

$$\mathbf{Z}^\bullet_\mathcal{U} \quad : \quad \bigoplus_{i_0\in I}\mathbf{Z}_{U_{i_0}} \leftarrow \bigoplus_{i_0,i_1\in I}\mathbf{Z}_{U_{i_0}\times_U U_{i_1}} \leftarrow \bigoplus_{i_0,i_1,i_2\in I}\mathbf{Z}_{U_{i_0}\times_U U_{i_1}\times_U U_{i_2}} \leftarrow \ldots$$

is exact in all degrees except 0 *in $PAb(\mathcal{C})$.*

Proof. For any $V \in Ob(\mathcal{C})$ the complex of abelian groups $\mathbf{Z}^\bullet_\mathcal{U}(V)$ is

$$\begin{aligned} &\mathbf{Z}\left[\coprod_{i_0\in I} Mor_\mathcal{C}(V, U_{i_0})\right] \leftarrow \mathbf{Z}\left[\coprod_{i_0,i_1\in I} Mor_\mathcal{C}(V, U_{i_0}\times_U U_{i_1})\right] \leftarrow \ldots = \\ \bigoplus_{\varphi : V\to U}&\left(\mathbf{Z}\left[\coprod_{i_0\in I} Mor_\varphi(V, U_{i_0})\right] \leftarrow \mathbf{Z}\left[\coprod_{i_0,i_1\in I} Mor_\varphi(V, U_{i_0}) \times Mor_\varphi(V, U_{i_1})\right] \leftarrow \ldots\right)\end{aligned}$$

where

$$Mor_\varphi(V, U_i) = \{V \to U_i \text{ such that } V \to U_i \to U \text{ equals } \varphi\}.$$

Set $S_\varphi = \coprod_{i\in I} Mor_\varphi(V, U_i)$, so that

$$\mathbf{Z}^\bullet_\mathcal{U}(V) = \bigoplus_{\varphi : V\to U}\left(\mathbf{Z}[S_\varphi] \leftarrow \mathbf{Z}[S_\varphi\times S_\varphi] \leftarrow \mathbf{Z}[S_\varphi\times S_\varphi\times S_\varphi] \leftarrow \ldots\right).$$

Thus it suffices to show that for each $S = S_\varphi$, the complex

$$\mathbf{Z}[S] \leftarrow \mathbf{Z}[S\times S] \leftarrow \mathbf{Z}[S\times S\times S] \leftarrow \ldots$$

is exact in negative degrees. To see this, we can give an explicit homotopy. Fix $s \in S$ and define $K : n_{(s_0,\ldots,s_p)} \mapsto n_{(s,s_0,\ldots,s_p)}$. One easily checks that K is a nullhomotopy for the operator

$$\delta : \eta_{(s_0,\ldots,s_p)} \mapsto \sum\nolimits_{i=0}^p (-1)^p \eta_{(s_0,\ldots,\hat{s}_i,\ldots,s_p)}.$$

See Cohomology on Sites, Lemma 19.10.4 for more details. $\square$

Lemma 38.18.7. *Let $\mathcal{C}$ be a category. If $\mathcal{I}$ is an injective object of $PAb(\mathcal{C})$ and $\mathcal{U}$ is a family of morphisms with fixed target in $\mathcal{C}$, then $\check{H}^p(\mathcal{U}, \mathcal{I}) = 0$ for all $p > 0$.*

Proof. The Čech complex is the result of applying the functor $Hom_{PAb(\mathcal{C})}(-, \mathcal{I})$ to the complex $\mathbf{Z}^\bullet_{\mathcal{U}}$, i.e.,

$$\check{H}^p(\mathcal{U}; \mathcal{I}) = H^p(Hom_{PAb(\mathcal{C})}(\mathbf{Z}^\bullet_{\mathcal{U}}, \mathcal{I})).$$

But we have just seen that $\mathbf{Z}^\bullet_{\mathcal{U}}$ is exact in negative degrees, and the functor $Hom_{PAb(\mathcal{C})}(-, \mathcal{I})$ is exact, hence $Hom_{PAb(\mathcal{C})}(\mathbf{Z}^\bullet_{\mathcal{U}}, \mathcal{I})$ is exact in positive degrees. ☐

Theorem 38.18.8. *On $PAb(\mathcal{C})$ the functors $\check{H}^p(\mathcal{U}, -)$ are the right derived functors of $\check{H}^0(\mathcal{U}, -)$.*

Proof. By the Lemma 38.18.7, the functors $\check{H}^p(\mathcal{U}, -)$ are universal δ-functors since they are effaceable. So are the right derived functors of $\check{H}^0(\mathcal{U}, -)$. Since they agree in degree 0, they agree by the universal property of universal δ-functors. For more details see Cohomology on Sites, Lemma 19.10.6. ☐

Remark 38.18.9. Observe that all of the preceding statements are about presheaves so we haven't made use of the topology yet.

38.19. The Cech-to-cohomology spectral sequence

This spectral sequence is fundamental in proving foundational results on cohomology of sheaves.

Lemma 38.19.1. *The forgetful functor $Ab(\mathcal{C}) \to PAb(\mathcal{C})$ transforms injectives into injectives.*

Proof. This is formal using the fact that the forgetful functor has a left adjoint, namely sheafification, which is an exact functor. For more details see Cohomology on Sites, Lemma 19.11.1. ☐

Theorem 38.19.2. *Let $\mathcal{C}$ be a site. For any covering $\mathcal{U} = \{U_i \to U\}_{i \in I}$ of $U \in Ob(\mathcal{C})$ and any abelian sheaf $\mathcal{F}$ on $\mathcal{C}$ there is a spectral sequence*

$$E_2^{p,q} = \check{H}^p(\mathcal{U}, \underline{H}^q(\mathcal{F})) \Rightarrow H^{p+q}(U, \mathcal{F}),$$

where $\underline{H}^q(\mathcal{F})$ is the abelian presheaf $V \mapsto H^q(V, \mathcal{F})$.

Proof. Choose an injective resolution $\mathcal{F} \to \mathcal{I}^\bullet$ in $Ab(\mathcal{C})$, and consider the double complex $\check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{I}^\bullet)$ and the maps

$$\begin{tikzcd} \Gamma(U, I^\bullet) \arrow[r] & \check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{I}^\bullet) \\ & \check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{F}) \arrow[u] \end{tikzcd}$$

Here the horizontal map is the natural map $\Gamma(U, I^\bullet) \to \check{\mathcal{C}}^0(\mathcal{U}, \mathcal{I}^\bullet)$ to the left column, and the vertical map is induced by $\mathcal{F} \to \mathcal{I}^0$ and lands in the bottom row. By assumption, $\mathcal{I}^\bullet$ is a complex of injectives in $Ab(\mathcal{C})$, hence by Lemma 38.19.1, it is a complex of injectives in $PAb(\mathcal{C})$. Thus, the rows of the double complex are exact in positive degrees, and the kernel of the horizontal map is equal to $\Gamma(U, \mathcal{I}^\bullet)$, since $\mathcal{I}^\bullet$ is a complex of sheaves. In particular, the cohomology of the total complex is the standard cohomology of the global sections functor $H^0(U, \mathcal{F})$.

For the vertical direction, the qth cohomology group of the pth column is

$$\prod_{i_0,\ldots,i_p} H^q(U_{i_0} \times_U \ldots \times_U U_{i_p}, \mathcal{F}) = \prod_{i_0,\ldots,i_p} \underline{H}^q(\mathcal{F})(U_{i_0} \times_U \ldots \times_U U_{i_p})$$

in the entry $E_1^{p,q}$. So this is a standard double complex spectral sequence, and the E_2-page is as prescribed. For more details see Cohomology on Sites, Lemma 19.11.5. □

Remark 38.19.3. This is a Grothendieck spectral sequence for the composition of functors

$$Ab(\mathcal{C}) \longrightarrow PAb(\mathcal{C}) \xrightarrow{\check{H}^0} Ab.$$

38.20. Big and small sites of schemes

Let S be a scheme. Let τ be one of the topologies we will be discussing. Thus $\tau \in \{fppf, syntomic, smooth, étale, Zariski\}$. Of course if you are only interested in the étale topology, then you can simply assume $\tau = étale$ throughout. Moreover, we will discuss étale morphisms, étale coverings, and étale sites in more detail starting in Section 38.25. In order to proceed with the discussion of cohomology of quasi-coherent sheaves it is convenient to introduce the big τ-site and in case $\tau \in \{étale, Zariski\}$, the small τ-site of S. In order to do this we first introduce the notion of a τ-covering.

Definition 38.20.1. (See Topologies, Definitions 30.7.1, 30.6.1, 30.5.1, 30.4.1, and 30.3.1.) Let $\tau \in \{fppf, syntomic, smooth, étale, Zariski\}$. A family of morphisms of schemes $\{f_i : T_i \to T\}_{i\in I}$ with fixed target is called a *τ-covering* if and only if each f_i is flat of finite presentation, syntomic, smooth, étale, resp. an open immersion, and we have $\bigcup f_i(T_i) = T$.

It turns out that the class of all τ-coverings satisfies the axioms (1), (2) and (3) of Definition 38.10.2 (our definition of a site), see Topologies, Lemmas 30.7.3, 30.6.3, 30.5.3, 30.4.3, and 30.3.2. In order to be able to compare any of these new topologies to the fpqc topology and to use the preceding results on descent on modules we single out a special class of τ-coverings of affine schemes called standard coverings.

Definition 38.20.2. (See Topologies, Definitions 30.7.5, 30.6.5, 30.5.5, 30.4.5, and 30.3.4.) Let $\tau \in \{fppf, syntomic, smooth, étale, Zariski\}$. Let T be an affine scheme. A *standard τ-covering* of T is a family $\{f_j : U_j \to T\}_{j=1,\ldots,m}$ with each U_j is affine, and each f_j flat and of finite presentation, standard syntomic, standard smooth, étale, resp. the immersion of a standard principal open in T and $T = \bigcup f_j(U_j)$.

Lemma 38.20.3. *Let $\tau \in \{fppf, syntomic, smooth, étale, Zariski\}$. Any τ-covering of an affine scheme can be refined by a standard τ-covering.*

Proof. See Topologies, Lemmas 30.7.4, 30.6.4, 30.5.4, 30.4.4, and 30.3.3. □

Finally, we come to our definition of the sites we will be working with. This is actually somewhat involved since, contrary to what happens in [**MA71**], we do not want to choose a universe. Instead we pick a ``partial universe'' (which just means a suitably large set), and consider all schemes contained in this set. Of course we make sure that our favorite base scheme S is contained in the partial universe. Having picked the underlying category we pick a suitably large set of τ-coverings which turns this into a site. The details are in the chapter on topologies on schemes; there is a lot of freedom in the choices made, but in the end the actual choices made will not affect the étale (or other) cohomology of S (just as in [**MA71**] the actual choice of universe doesn't matter at the end). Moreover, the way the material is written the reader who is happy using strongly inaccessible cardinals (i.e., universes) can do so as a substitute.

Definition 38.20.4. Let S be a scheme. Let $\tau \in \{fppf, syntomic, smooth, étale, Zariski\}$.

(1) A *big τ-site of S* is any of the sites $(Sch/S)_\tau$ constructed as explained above and in more detail in Topologies, Definitions 30.7.8, 30.6.8, 30.5.8, 30.4.8, and 30.3.7.
(2) If $\tau \in \{étale, Zariski\}$, then the *small τ-site of S* is the full subcategory S_τ of $(Sch/S)_\tau$ whose objects are schemes T over S whose structure morphism $T \to S$ is étale, resp. an open immersion. A covering in S_τ is a covering $\{U_i \to U\}$ in $(Sch/S)_\tau$ such that U is an object of S_τ.

The underlying category of the site $(Sch/S)_\tau$ has reasonable ``closure'' properties, i.e., given a scheme T in it any locally closed subscheme of T is isomorphic to an object of $(Sch/S)_\tau$. Other such closure properties are: closed under fibre products of schemes, taking countable disjoint unions, taking finite type schemes over a given scheme, given an affine scheme $Spec(R)$ one can complete, localize, or take the quotient of R by an ideal while staying inside the category, etc. On the other hand, for example arbitrary disjoint unions of schemes in $(Sch/S)_\tau$ will take you outside of it. Also note that, given an object T of $(Sch/S)_\tau$ there will exist τ-coverings $\{T_i \to T\}_{i\in I}$ (as in Definition 38.20.1) which are not coverings in $(Sch/S)_\tau$ for example because the schemes T_i are not objects of the category $(Sch/S)_\tau$. But our choice of the sites $(Sch/S)_\tau$ is such that there always does exist a covering $\{U_j \to T\}_{j\in J}$ of $(Sch/S)_\tau$ which refines the covering $\{T_i \to T\}_{i\in I}$, see Topologies, Lemmas 30.7.7, 30.6.7, 30.5.7, 30.4.7, and 30.3.6. We will mostly ignore these issues in this chapter.

If $\mathcal{F}$ is a sheaf on $(Sch/S)_\tau$ or S_τ, then we denote

$$H^p_\tau(U, \mathcal{F}), \text{ in particular } H^p_\tau(S, \mathcal{F})$$

the cohomology groups of $\mathcal{F}$ over the object U of the site, see Section 38.14. Thus we have $H^p_{fppf}(S, \mathcal{F})$, $H^p_{syntomic}(S, \mathcal{F})$, $H^p_{smooth}(S, \mathcal{F})$, $H^p_{étale}(S, \mathcal{F})$[2], and $H^p_{Zar}(S, \mathcal{F})$. The last two are potentially ambiguous since they might refer to either the big or small étale or Zariski site. However, this ambiguity is harmless by the following lemma.

Lemma 38.20.5. *Let $\tau \in \{étale, Zariski\}$. If $\mathcal{F}$ is an abelian sheaf defined on $(Sch/S)_\tau$, then the cohomology groups of $\mathcal{F}$ over S agree with the cohomology groups of $\mathcal{F}|_{S_\tau}$ over S.*

Proof. By Topologies, Lemmas 30.3.13 and 30.4.13 the functors $S_\tau \to (Sch/S)_\tau$ satisfy the hypotheses of Sites, Lemma 9.19.8. Hence our lemma follows from Cohomology on Sites, Lemma 19.8.2. □

For completeness we state and prove the invariance under choice of partial universe of the cohomology groups we are considering. For notation and terminology used in this lemma we refer to Topologies, Section 30.10.

Lemma 38.20.6. *Let $\tau \in \{fppf, syntomic, smooth, étale, Zariski\}$. Let S be a scheme. Let $(Sch/S)_\tau$ and $(Sch'/S)_\tau$ be two big τ-sites of S, and assume that the first is contained in the second. In this case for any abelian sheaf $\mathcal{F}'$ defined on $(Sch'/S)_\tau$ and any object U of $(Sch/S)_\tau$ we have*

$$H^p_\tau(U, \mathcal{F}'|_{(Sch/S)_\tau}) = H^p_\tau(U, \mathcal{F}')$$

In words: the cohomology of $\mathcal{F}'$ over U computed in the bigger site agrees with the cohomology of $\mathcal{F}'$ restricted to the smaller site over U.

[2]We will sometimes abbreviate this to $H^p_{et}(S, \mathcal{F})$.

Proof. By Topologies, Lemma 30.10.2 the inclusion functor $(Sch/S)_\tau \to (Sch'/S)_\tau$ satisfies the assumptions of Sites, Lemma 9.19.8. Hence our lemma follows from Cohomology on Sites, Lemma 19.8.2. □

38.21. The étale topos

A *topos* is the category of sheaves of sets on a site, see Sites, Definition 9.15.1. Hence it is customary to refer to the use the phrase ``étale topos of a scheme'' to refer to the category of sheaves on the small étale site of a scheme. Here is the formal definition.

Definition 38.21.1. Let S be a scheme.

(1) The *étale topos*, or the *small étale topos* of S is the category $Sh(S_{étale})$ of sheaves of sets on the small étale site of S.
(2) The *Zariski topos*, or the *small Zariski topos* of S is the category $Sh(S_{Zar})$ of sheaves of sets on the small Zariski site of S.
(3) For $\tau \in \{fppf, syntomic, smooth, étale, Zariski\}$ a *big τ-topos* is the category of sheaves of set on a big τ-topos of S.

Note that the small Zariski topos of S is simply the category of sheaves of sets on the underlying topological space of S, see Topologies, Lemma 30.3.11. Whereas the small étale topos does not depend on the choices made in the construction of the small étale site, in general the big topoi do depend on those choices.

Here is a lemma, which is one of many possible lemmas expressing the fact that it doesn't matter too much which site we choose to define the small étale topos of a scheme.

Lemma 38.21.2. *Let S be a scheme. Let $S_{affine,étale}$ denote the full subcategory of $S_{étale}$ whose objects are those $U/S \in Ob(S_{étale})$ with U affine. A covering of $S_{affine,étale}$ will be a standard étale covering, see Topologies, Definition 30.4.5. Then restriction*

$$\mathcal{F} \longmapsto \mathcal{F}|_{S_{affine,étale}}$$

defines an equivalence of topoi $Sh(S_{étale}) \cong Sh(S_{affine,étale})$.

Proof. This you can show directly from the definitions, and is a good exercise. But it also follows immediately from Sites, Lemma 9.25.1 by checking that the inclusion functor $S_{affine,étale} \to S_{étale}$ is a special cocontinuous functor (see Sites, Definition 9.25.2). □

38.22. Cohomology of quasi-coherent sheaves

We start with a simple lemma (which holds in greater generality than stated). It says that the Čech complex of a standard covering is equal to the Čech complex of an fpqc covering of the form $\{Spec(B) \to Spec(A)\}$ with $A \to B$ faithfully flat.

Lemma 38.22.1. *Let $\tau \in \{fppf, syntomic, smooth, étale, Zariski\}$. Let S be a scheme. Let $\mathcal{F}$ be an abelian sheaf on $(Sch/S)_\tau$, or on S_τ in case $\tau = étale$, and let $\mathcal{U} = \{U_i \to U\}_{i\in I}$ be a standard τ-covering of this site. Let $V = \coprod_{i\in I} U_i$. Then*

(1) *V is an affine scheme,*
(2) *$\mathcal{V} = \{V \to U\}$ is an fpqc covering.*
(3) *the Cech complexes $\check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{F})$ and $\check{\mathcal{C}}^\bullet(\mathcal{V}, \mathcal{F})$ agree.*

Proof. As the covering is a standard τ-covering each of the schemes U_i is affine and I is a finite set. Hence V is an affine scheme. It is clear that $V \to U$ is flat and surjective, hence $\mathcal{V}$ is an fpqc covering, see Example 38.15.3. Note that $\mathcal{U}$ is a refinement of $\mathcal{V}$ and hence there is a map of Čech complexes $\check{\mathcal{C}}^\bullet(\mathcal{V}, \mathcal{F}) \to \check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{F})$, see Cohomology on Sites, Equation

(19.9.2.1). Next, we observe that if $T = \coprod_{j\in J} T_j$ is a disjoint union of schemes in the site on which $\mathcal{F}$ is defined then the family of morphisms with fixed target $\{T_j \to T\}_{j\in J}$ is a Zariski covering, and so

$$\mathcal{F}(T) = \mathcal{F}(\coprod\nolimits_{j\in J} T_j) = \prod\nolimits_{j\in J} \mathcal{F}(T_j) \tag{38.22.1.1}$$

by the sheaf condition of $\mathcal{F}$. This implies the map of Čech complexes above is an isomorphism in each degree because

$$V \times_U \ldots \times_U V = \prod\nolimits_{i_0,\ldots i_p} U_{i_0} \times_U \ldots \times_U U_{i_p}$$

as schemes. □

Note that Equality (38.22.1.1) is false for a general presheaf. Even for sheaves it does not hold on any site, since coproducts may not lead to coverings, and may not be disjoint. But it does for all the usual ones (at least all the ones we will study).

Remark 38.22.2. In the statement of Lemma 38.22.1, $\mathcal{U}$ is a refinement of $\mathcal{V}$, so this does not mean that it suffices to look at coverings with a single morphism to compute Čech cohomology $\check{H}^n(U, \mathcal{F})$ (which is defined as the colimit over all coverings $\mathcal{U}$ of U of the Cech cohomology groups of $\mathcal{F}$ with respect to $\mathcal{U}$).

Lemma 38.22.3. *(Locality of cohomology) Let $\mathcal{C}$ be a site, $\mathcal{F}$ an abelian sheaf on $\mathcal{C}$, U an object of $\mathcal{C}$, $p > 0$ an integer and $\xi \in H^p(U, \mathcal{F})$. Then there exists a covering $\mathcal{U} = \{U_i \to U\}_{i\in I}$ of U in $\mathcal{C}$ such that $\xi|_{U_i} = 0$ for all $i \in I$.*

Proof. Choose an injective resolution $\mathcal{F} \to \mathcal{I}^\bullet$. Then ξ is represented by a cocycle $\tilde{\xi} \in \mathcal{I}^p(U)$ with $d^p(\tilde{\xi}) = 0$. By assumption, the sequence $\mathcal{I}^{p-1} \to \mathcal{I}^p \to \mathcal{I}^{p+1}$ in exact in $Ab(\mathcal{C})$, which means that there exists a covering $\mathcal{U} = \{U_i \to U\}_{i\in I}$ such that $\tilde{\xi}|_{U_i} = d^{p-1}(\xi_i)$ for some $\xi_i \in \mathcal{I}^{p-1}(U_i)$. Since the cohomology class $\xi|_{U_i}$ is represented by the cocycle $\tilde{\xi}|_{U_i}$ which is a coboundary, it vanishes. For more details see Cohomology on Sites, Lemma 19.8.3. □

Theorem 38.22.4. *Let S be a scheme and $\mathcal{F}$ a quasi-coherent $\mathcal{O}_S$-module. Let $\mathcal{C}$ be either $(Sch/S)_\tau$ for $\tau \in \{fppf, syntomic, smooth, étale, Zariski\}$ or $S_{étale}$. Then*

$$H^p(S, \mathcal{F}) = H^p_\tau(S, \mathcal{F}^a)$$

for all $p \geq 0$ where

1. *the left hand side indicates the usual cohomology of the sheaf $\mathcal{F}$ on the underlying topological space of the scheme S, and*
2. *the right hand side indicates cohomology of the abelian sheaf $\mathcal{F}^a$ (see Proposition 38.17.1) on the site $\mathcal{C}$.*

Remark 38.22.5. Since S is a final object in the category $\mathcal{C}$, the cohomology groups on the right-hand side are merely the right derived functors of the global sections functor. In fact the proof will show that $H^p(U, f^*\mathcal{F}) = H^p_\tau(U, \mathcal{F}^a)$ for any object $f : U \to S$ of the site $\mathcal{C}$.

Proof. We are going to show that $H^p(U, f^*\mathcal{F}) = H^p_\tau(U, \mathcal{F}^a)$ for any object $f : U \to S$ of the site $\mathcal{C}$. The result is true for $p = 0$ by the sheaf property.

Assume that U is affine. Then we want to prove that $H^p_\tau(U, \mathcal{F}^a) = 0$ for all $p > 0$. We use induction on p.

$p = 1$ Pick $\xi \in H^1_\tau(U, \mathcal{F}^a)$. By Lemma 38.22.3, there exists an fpqc covering $\mathcal{U} = \{U_i \to U\}_{i\in I}$ such that $\xi|_{U_i} = 0$ for all $i \in I$. Up to refining $\mathcal{U}$, we may assume that $\mathcal{U}$ is a standard τ-covering. Applying the spectral sequence of Theorem 38.19.2, we see that ξ comes from a cohomology class $\check{\xi} \in \check{H}^1(\mathcal{U}, \mathcal{F}^a)$. Consider the covering $\mathcal{V} = \{\coprod_{i\in I} U_i \to U\}$. By Lemma 38.22.1, $\check{H}^\bullet(\mathcal{U}, \mathcal{F}^a) = \check{H}^\bullet(\mathcal{V}, \mathcal{F}^a)$. On the other hand, since $\mathcal{V}$ is a covering of the form $\{Spec(B) \to Spec(A)\}$ and $f^*\mathcal{F} = \widetilde{M}$ for some A-module M, we see the Čech complex $\check{\mathcal{C}}^\bullet(\mathcal{V}, \mathcal{F})$ is none other than the complex $(B/A)_\bullet \otimes_A M$. Now by Lemma 38.16.4, $H^p((B/A)_\bullet \otimes_A M) = 0$ for $p > 0$, hence $\check{\xi} = 0$ and so $\xi = 0$.

$p > 1$ Pick $\xi \in H^p_\tau(U, \mathcal{F}^a)$. By Lemma 38.22.3, there exists an fpqc covering $\mathcal{U} = \{U_i \to U\}_{i\in I}$ such that $\xi|_{U_i} = 0$ for all $i \in I$. Up to refining $\mathcal{U}$, we may assume that $\mathcal{U}$ is a standard τ-covering. We apply the spectral sequence of Theorem 38.19.2. Observe that the intersections $U_{i_0} \times_U \ldots \times_U U_{i_p}$ are affine, so that by induction hypothesis the cohomology groups

$$E_2^{p,q} = \check{H}^p(\mathcal{U}, \underline{H}^q(\mathcal{F}^a))$$

vanish for all $0 < q < p$. We see that ξ must come from a $\check{\xi} \in \check{H}^p(\mathcal{U}, \mathcal{F}^a)$. Replacing $\mathcal{U}$ with the covering $\mathcal{V}$ containing only one morphism and using Lemma 38.16.4 again, we see that the Čech cohomology class $\check{\xi}$ must be zero, hence $\xi = 0$.

Next, assume that U is separated. Choose an affine open covering $U = \bigcup_{i\in I} U_i$ of U. The family $\mathcal{U} = \{U_i \to U\}_{i\in I}$ is then an fpqc covering, and all the intersections $U_{i_0} \times_S \cdots \times_S U_{i_p}$ are affine since U is separated. So all rows of the spectral sequence of Theorem 38.19.2 are zero, except the zeroth row. Therefore

$$H^p_\tau(S, \mathcal{F}^a) = \check{H}^p(\mathcal{U}, \mathcal{F}^a) = \check{H}^p(\mathcal{U}, \mathcal{F}) = H^p(S, \mathcal{F})$$

where the last equality results from standard scheme theory, see Coherent, Lemma 25.2.4.

The general case is technical and (to extend the proof as given here) requires a discussion about maps of spectral sequences, so we won't treat it. It follows from Descent, Proposition 31.6.10 (whose proof takes a slightly different approach) combined with Cohomology on Sites, Lemma 19.8.1. ☐

38.23. Examples of sheaves

Let S and τ be as in Section 38.20. We have already seen that any representable presheaf is a sheaf on $(Sch/S)_\tau$ or S_τ, see Lemma 38.15.8 and Remark 38.15.9. Here are some special cases.

Definition 38.23.1. On any of the sites $(Sch/S)_\tau$ or S_τ of Section 38.20.

(1) The sheaf $T \mapsto \Gamma(T, \mathcal{O}_T)$ is denoted $\mathcal{O}_S$, or $\mathbf{G}_a$, or $\mathbf{G}_{a,S}$ if we want to indicate the base scheme.
(2) Similarly, the sheaf $T \mapsto \Gamma(T, \mathcal{O}_T^*)$ is denoted $\mathcal{O}_S^*$, or $\mathbf{G}_m$, or $\mathbf{G}_{m,S}$ if we want to indicate the base scheme.
(3) The *constant sheaf* $\underline{\mathbf{Z}/n\mathbf{Z}}$ on any site is the sheafification of the constant presheaf $U \mapsto \mathbf{Z}/n\mathbf{Z}$.

The first is a sheaf by Theorem 38.17.4 for example. The second is a sub presheaf of the first, which is easily seen to be a sheaf itself. The third is a sheaf by definition. Note that each of these sheaves is representable. The first and second by the schemes $\mathbf{G}_{a,S}$ and $\mathbf{G}_{m,S}$, see Groupoids, Section 35.4. The third by the finite étale group scheme $\mathbf{Z}/n\mathbf{Z}_S$ sometimes denoted $(\mathbf{Z}/n\mathbf{Z})_S$ which is just n copies of S endowed with the obvious group scheme structure over S, see Groupoids, Example 35.5.6 and the following remark.

Remark 38.23.2. Let G be an abstract group. On any of the sites $(Sch/S)_\tau$ or S_τ of Section 38.20 the sheafification $\underline{G}$ of the constant presheaf associated to G in the *Zariski topology* of the site already gives

$$\Gamma(U, \underline{G}) = \{\text{Zariski locally constant maps } U \to G\}$$

This Zariski sheaf is representable by the group scheme G_S according to Groupoids, Example 35.5.6. By Lemma 38.15.8 any representable presheaf satisfies the sheaf condition for the τ-topology as well, and hence we conclude that the Zariski sheafification $\underline{G}$ above is also the τ-sheafification.

Definition 38.23.3. Let S be a scheme. The *structure sheaf* of S is the sheaf of rings $\mathcal{O}_S$ on any of the sites S_{Zar}, $S_{étale}$, or $(Sch/S)_\tau$ discussed above.

If there is some possible confusion as to which site we are working on then we will indicate this by using indices. For example we may use $\mathcal{O}_{S_{étale}}$ to stress the fact that we are working on the small étale site of S.

Remark 38.23.4. In the terminology introduced above a special case of Theorem 38.22.4 is

$$H^p_{fppf}(X, \mathbf{G}_a) = H^p_{étale}(X, \mathbf{G}_a) = H^p_{Zar}(X, \mathbf{G}_a) = H^p(X, \mathcal{O}_X)$$

for all $p \geq 0$. Moreover, we could use the notation $H^p_{fppf}(X, \mathcal{O}_X)$ to indicate the cohomology of the structure sheaf on the big fppf site of X.

38.24. Picard groups

The following theorem is sometimes called ``Hilbert 90''.

Theorem 38.24.1. *For any scheme X we have canonical identifications*

$$\begin{aligned} H^1_{fppf}(X, \mathbf{G}_m) &= H^1_{syntomic}(X, \mathbf{G}_m) \\ &= H^1_{smooth}(X, \mathbf{G}_m) \\ &= H^1_{étale}(X, \mathbf{G}_m) \\ &= H^1_{Zar}(X, \mathbf{G}_m) \\ &= Pic(X) \\ &= H^1(X, \mathcal{O}^*_X) \end{aligned}$$

Proof. Let τ be one of the topologies considered in Section 38.20. By Cohomology on Sites, Lemma 19.7.1 we see that $H^1_\tau(X, \mathbf{G}_m) = H^1_\tau(X, \mathcal{O}^*_\tau) = \text{Pic}(\mathcal{O}_\tau)$ where $\mathcal{O}_\tau$ is the structure sheaf of the site $(Sch/X)_\tau$. Now an invertible $\mathcal{O}_\tau$-module is a quasi-coherent $\mathcal{O}_\tau$-module. By Theorem 38.17.4 or the more precise Descent, Proposition 31.6.11 we see that $\text{Pic}(\mathcal{O}_\tau) = \text{Pic}(X)$. The last equality is proved in the same way. $\square$

38.25. The étale site

At this point we start exploring the étale site of a scheme in more detail. As a first step we discuss a little the notion of an étale morphism.

38.26. Étale morphisms

For more details, see Morphisms, Section 24.35 for the formal definition and Étale Morphisms, Sections 37.11, 37.12, 37.13, 37.14, 37.16, and 37.19 for a survey of interesting properties of étale morphisms.

Recall that an algebra A over an algebraically closed field k is *smooth* if it is of finite type and the module of differentials $\Omega_{A/k}$ is finite locally free of rank equal to the dimension. A scheme X over k is *smooth* over k if it is locally of finite type and each affine open is the spectrum of a smooth k-algebra. If k is not algebraically closed then an A-algebra is said to be a smooth k-algebra if $A \otimes_k \overline{k}$ is a smooth $\overline{k}$-algebra. A ring map $A \to B$ is smooth if it is flat, finitely presented, and for all primes $\mathfrak{p} \subset A$ the fibre ring $\kappa(\mathfrak{p}) \otimes_A B$ is smooth over the residue field $\kappa(\mathfrak{p})$. More generally, a morphism of schemes is *smooth* if it is flat, finitely presented, and the geometric fibers are smooth.

For these facts please see Morphisms, Section 24.33. Using this we may define an étale morphism as follows.

Definition 38.26.1. A morphism of schemes is *étale* if it is smooth of relative dimension 0.

In particular, a morphism of schemes $X \to S$ is étale if it is smooth and $\Omega_{X/S} = 0$.

Proposition 38.26.2. *(Facts on étale morphisms)*

(1) *Let k be a field. A morphism of schemes $U \to Spec(k)$ is étale if and only if $U \cong \coprod_{i\in I} Spec(k_i)$ such that for each $i \in I$ the ring k_i is a field which is a finite separable extension of k.*
(2) *Let $\varphi : U \to S$ be a morphism of schemes. The following conditions are equivalent:*
   (a) *φ is étale,*
   (b) *φ is locally finitely presented, flat, and all its fibres are étale,*
   (c) *φ is flat, unramified and locally of finite presentation.*
(3) *A ring map $A \to B$ is étale if and only if $B \cong A[x_1, \ldots, x_n]/(f_1, \ldots, f_n)$ such that $\Delta = \det\left(\frac{\partial f_i}{\partial x_j}\right)$ is invertible in B.*
(4) *The base change of an étale morphism is étale.*
(5) *Compositions of étale morphisms are étale.*
(6) *Fibre products and products of étale morphisms are étale.*
(7) *An étale morphism has relative dimension 0.*
(8) *Let $Y \to X$ be an étale morphism. If X is reduced (respectively regular) then so is Y.*
(9) *Étale morphims are open.*
(10) *If $X \to S$ and $Y \to S$ are étale, then any S-morphism $X \to Y$ is also étale.*

Proof. We have proved these facts (and more) in the preceding chapters. Here is a list of references: (1) Morphisms, Lemma 24.35.7. (2) Morphisms, Lemmas 24.35.8 and 24.35.16. (3) Algebra, Lemma 7.132.2. (4) Morphisms, Lemma 24.35.4. (5) Morphisms, Lemma 24.35.3. (6) Follows formally from (4) and (5). (7) Morphisms, Lemmas 24.35.6 and 24.28.5. (8) See Algebra, Lemmas 7.145.6 and 7.145.5, see also more results of this kind in Étale Morphisms, Section 37.19. (9) See Morphisms, Lemma 24.24.9 and 24.35.12. (10) See Morphisms, Lemma 24.35.18. ☐

Definition 38.26.3. A ring map $A \to B$ is called *standard étale* if $B \cong (A[t]/(f))_g$ with $f, g \in A[t]$, with f monic, and $\mathrm{d}f/\mathrm{d}t$ invertible in B.

It is true that a standard étale ring map is étale. Namely, suppose that $B = (A[t]/(f))_g$ with $f, g \in A[t]$, with f monic, and $\mathrm{d}f/\mathrm{d}t$ invertible in B. Then $A[t]/(f)$ is a finite free A-module of rank equal to the degree of the monic polynomial f. Hence B, as a localization of this free algebra is finitely presented and flat over A. To finish the proof that B is étale it suffices to show that the fibre rings

$$\kappa(\mathfrak{p}) \otimes_A B \cong \kappa(\mathfrak{p}) \otimes_A (A[t]/(f))_g \cong \kappa(\mathfrak{p})[t, 1/\overline{g}]/(\overline{f})$$

are finite products of finite separable field extensions. Here $\overline{f}, \overline{g} \in \kappa(\mathfrak{p})[t]$ are the images of f and g. Let

$$\overline{f} = \overline{f}_1 \dots \overline{f}_a \overline{f}_{a+1}^{e_1} \dots \overline{f}_{a+b}^{e_b}$$

be the factorization of $\overline{f}$ into powers of pairwise distinct irreducible monic factors $\overline{f}_i$ with $e_1, \dots, e_b > 0$. By assumption $\mathrm{d}\overline{f}/\mathrm{d}t$ is invertible in $\kappa(\mathfrak{p})[t, 1/\overline{g}]$. Hence we see that at least all the $\overline{f}_i$, $i > a$ are invertible. We conclude that

$$\kappa(\mathfrak{p})[t, 1/\overline{g}]/(\overline{f}) \cong \prod\nolimits_{i \in I} \kappa(\mathfrak{p})[t]/(\overline{f}_i)$$

where $I \subset \{1, \dots, a\}$ is the subset of indices i such that $\overline{f}_i$ does not divide $\overline{g}$. Moreover, the image of $\mathrm{d}\overline{f}/\mathrm{d}t$ in the factor $\kappa(\mathfrak{p})[t]/(\overline{f}_i)$ is clearly equal to a unit times $\mathrm{d}\overline{f}_i/\mathrm{d}t$. Hence we conclude that $\kappa_i = \kappa(\mathfrak{p})[t]/(\overline{f}_i)$ is a finite field extension of $\kappa(\mathfrak{p})$ generated by one element whose minimal polynomial is separable, i.e., the field extension $\kappa(\mathfrak{p}) \subset \kappa_i$ is finite separable as desired.

It turns out that any étale ring map is locally standard étale. To formulate this we introduce the following notation. A ring map $A \to B$ is *étale at a prime* $\mathfrak{q}$ of B if there exists $h \in B$, $h \notin \mathfrak{q}$ such that $A \to B_h$ is étale. Here is the result.

Theorem 38.26.4. *A ring map $A \to B$ is étale at a prime $\mathfrak{q}$ if and only if there exists $g \in B$, $g \notin \mathfrak{q}$ such that B_g is standard étale over A.*

Proof. See Algebra, Proposition 7.132.16. □

38.27. Étale coverings

We recall the definition.

Definition 38.27.1. An *étale covering* of a scheme U is a family of morphisms of schemes $\{\varphi_i : U_i \to U\}_{i \in I}$ such that

(1) each φ_i is an étale morphism ;
(2) the U_i cover U, i.e., $U = \bigcup_{i \in I} \varphi_i(U_i)$.

Lemma 38.27.2. *Any étale covering is an fpqc covering.*

Proof. (See also Topologies, Lemma 30.8.6.) Let $\{\varphi_i : U_i \to U\}_{i \in I}$ be an étale covering. Since an étale morphism is flat, and the elements of the covering should cover its target, the property fp (faithfully flat) is satisfied. To check the property qc (quasi-compact), let $V \subset U$ be an affine open, and write $\varphi_i^{-1} = \bigcup_{j \in J_i} V_{ij}$ for some affine opens $V_{ij} \subset U_i$. Since φ_i is open (as étale morphisms are open), we see that $V = \bigcup_{i \in I} \bigcup_{j \in J_i} \varphi_i(V_{ij})$ is an open covering of U. Further, since V is quasi-compact, this covering has a finite refinement. □

So any statement which is true for fpqc coverings remains true *a fortiori* for étale coverings. For instance, the étale site is subcanonical.

Definition 38.27.3. (For more details see Section 38.20, or Topologies, Section 30.4.) Let S be a scheme. The *big étale site over S* is the site $(Sch/S)_{étale}$, see Definition 38.20.4. The *small étale site over S* is the site $S_{étale}$, see Definition 38.20.4. We define similarly the *big* and *small Zariski sites* on S, denoted $(Sch/S)_{Zar}$ and S_{Zar}.

Loosely speaking the big étale site of S is made up out of schemes over S and coverings the étale coverings. The small étale site of S is made up out of schemes étale over S with coverings the étale coverings. Actually any morphism between objects of $S_{étale}$ is étale, in virtue of Proposition 38.26.2, hence to check that $\{U_i \to U\}_{i\in I}$ in $S_{étale}$ is a covering it suffices to check that $\coprod U_i \to U$ is surjective.

The small étale site has fewer objects than the big étale site, it contains only the ``opens" of the étale topology on S. It is a full subcategory of the big étale site, and its topology is induced from the topology on the big site. Hence it is true that the restriction functor from the big étale site to the small one is exact and maps injectives to injectives. This has the following consequence.

Proposition 38.27.4. *Let S be a scheme and $\mathcal{F}$ an abelian sheaf on $(Sch/S)_{étale}$. Then $\mathcal{F}|_{S_{étale}}$ is a sheaf on $S_{étale}$ and*

$$H^p_{étale}(S, \mathcal{F}|_{S_{étale}}) = H^p_{étale}(S, \mathcal{F})$$

for all $p \geq 0$.

Proof. This is a special case of Lemma 38.20.5. $\square$

In accordance with the general notation introduced in Section 38.20 we write $H^p_{étale}(S, \mathcal{F})$ for the above cohomology group.

38.28. Kummer theory

Let $n \in \mathbf{N}$ and consider the functor μ_n defined by

$$\begin{array}{ccc} Sch^{opp} & \longrightarrow & Ab \\ S & \longmapsto & \mu_n(T) = \{t \in \Gamma(S, \mathcal{O}_S^*) \mid t^n = 1\}. \end{array}$$

By Groupoids, Example 35.5.2 this is a representable functor, and the scheme representing it is denoted μ_n also. By Lemma 38.15.8 this functor satisfies the sheaf condition for the fpqc topology (in particular, it is also satisfies the sheaf condition for the étale, Zariski, etc topology).

Lemma 38.28.1. *If $n \in \mathcal{O}_S^*$ then*

$$0 \to \mu_{n,S} \to \mathbf{G}_{m,S} \xrightarrow{(\cdot)^n} \mathbf{G}_{m,S} \to 0$$

is a short exact sequence of sheaves on both the small and big étale site of S.

Remark 38.28.2. This lemma is false when ``étale" is replaced with ``Zariski". Since the étale topology is coarser than the smooth topology, see Topologies, Lemma 30.5.2 it follows that the sequence is also exact in the smooth topology.

Proof. By definition the sheaf $\mu_{n,S}$ is the kernel of the map $(\cdot)^n$. Hence it suffices to show that the last map is surjective. Let U be a scheme over S. Let $f \in \mathbf{G}_m(U) = \Gamma(U, \mathcal{O}_U^*)$. We need to show that we can find an étale cover of U over the members of which the restriction of f is an nth power. Set

$$U' = \underline{Spec}_U(\mathcal{O}_U[T]/(T^n - f)) \xrightarrow{\pi} U.$$

(See Constructions, Section 22.3 or 22.4 for a discussion of the relative spectrum.) Let $Spec(A) \subset U$ be an affine open, and say $f|_U$ corresponds to the unit $a \in A^*$. Then $\pi^{-1}(U) = Spec(B)$ with $B = A[T]/(T^n - a)$. The ring map $A \to B$ is finite free of rank n, hence it is faithfully flat, and hence we conclude that $Spec(B) \to Spec(A)$ is surjective. Since this holds for every affine open in U we conclude that π is surjective. In addition, n and T^{n-1} are invertible in B, so $nT^{n-1} \in B^*$ and the ring map $A \to B$ is standard étale, in particular étale. Since this holds for every affine open of U we conclude that π is étale. Hence $\mathcal{U} = \{\pi : U' \to U\}$ is an étale covering. Moreover, $f|_{U'} = (f')^n$ where f' is the class of T in $\Gamma(U', \mathcal{O}_{U'}^*)$, so $\mathcal{U}$ has the desired property. □

By Theorem 38.24.1 and Lemma 38.28.1 and general properties of cohomology we obtain the long exact cohomology sequence

$$\begin{tikzcd}
0 \arrow[r] & H^0_{étale}(S, \mu_{n,S}) \arrow[r] & \Gamma(S, \mathcal{O}_S^*) \arrow[r, "(\cdot)^n"] & \Gamma(S, \mathcal{O}_S^*) \arrow[dll, out=-90, in=90] \\
 & H^1_{étale}(S, \mu_{n,S}) \arrow[r] & \mathrm{Pic}(S) \arrow[r, "(\cdot)^n"] & \mathrm{Pic}(S) \arrow[dll, out=-90, in=90] \\
 & H^2_{étale}(S, \mu_{n,S}) \arrow[r] & \cdots &
\end{tikzcd}$$

at least if n is invertible on S. When n is not invertible on S we can apply the following lemma.

Lemma 38.28.3. *For any $n \in \mathbf{N}$ the sequence*

$$0 \to \mu_{n,S} \to \mathbf{G}_{m,S} \xrightarrow{(\cdot)^n} \mathbf{G}_{m,S} \to 0$$

is a short exact sequence of sheaves on the site $(Sch/S)_{fppf}$ and $(Sch/S)_{syntomic}$.

Remark 38.28.4. This lemma is false for the smooth, étale, or Zariski topology.

Proof. By definition the sheaf $\mu_{n,S}$ is the kernel of the map $(\cdot)^n$. Hence it suffices to show that the last map is surjective. Since the syntomic topology is stronger than the fppf topology, see Topologies, Lemma 30.7.2, it suffices to prove this for the syntomic topology. Let U be a scheme over S. Let $f \in \mathbf{G}_m(U) = \Gamma(U, \mathcal{O}_U^*)$. We need to show that we can find a synomtic cover of U over the members of which the restriction of f is an nth power. Set

$$U' = \underline{Spec}_U(\mathcal{O}_U[T]/(T^n - f)) \xrightarrow{\pi} U.$$

(See Constructions, Section 22.3 or 22.4 for a discussion of the relative spectrum.) Let $Spec(A) \subset U$ be an affine open, and say $f|_U$ corresponds to the unit $a \in A^*$. Then $\pi^{-1}(U) = Spec(B)$ with $B = A[T]/(T^n - a)$. The ring map $A \to B$ is finite free of rank n, hence it is faithfully flat, and hence we conclude that $Spec(B) \to Spec(A)$ is surjective. Since this holds for every affine open in U we conclude that π is surjective. In addition, B is a global relative complete intersection over A, so the ring map $A \to B$ is standard syntomic, in particular syntomic. Since this holds for every affine open of U we conclude that π is syntomic. Hence $\mathcal{U} = \{\pi : U' \to U\}$ is a syntomic covering. Moreover, $f|_{U'} = (f')^n$ where f' is the class of T in $\Gamma(U', \mathcal{O}_{U'}^*)$, so $\mathcal{U}$ has the desired property. □

By Theorem 38.24.1 and Lemma 38.28.3 and general properties of cohomology we obtain the long exact cohomology sequence

$$\begin{tikzcd} 0 \arrow[r] & H^0_{fppf}(S, \mu_{n,S}) \arrow[r] & \Gamma(S, \mathcal{O}_S^*) \arrow[r, "(\cdot)^n"] & \Gamma(S, \mathcal{O}_S^*) \arrow[dll, out=-90, in=90] \\ & H^1_{fppf}(S, \mu_{n,S}) \arrow[r] & \mathrm{Pic}(S) \arrow[r, "(\cdot)^n"] & \mathrm{Pic}(S) \arrow[dll, out=-90, in=90] \\ & H^2_{fppf}(S, \mu_{n,S}) \arrow[r] & \ldots \end{tikzcd}$$

for any scheme S and any integer n. Of course there is a similar sequence with syntomic cohomology.

Let $n \in \mathbf{N}$ and let S be any scheme. There is another more direct way to describe the first cohomology group with values in μ_n. Consider pairs $(\mathcal{L}, \alpha)$ where $\mathcal{L}$ is an invertible sheaf on S and $\alpha : \mathcal{L}^{\otimes n} \to \mathcal{O}_S$ is a trivialization of the nth tensor power of $\mathcal{L}$. Let $(\mathcal{L}', \alpha')$ be a second such pair. An isomorphism $\varphi : (\mathcal{L}, \alpha) \to (\mathcal{L}', \alpha')$ is an isomorphism $\varphi : \mathcal{L} \to \mathcal{L}'$ of invertible sheaves such that the diagram

$$\begin{tikzcd} \mathcal{L}^{\otimes n} \arrow[r, "\alpha"'] \arrow[d, "\varphi^{\otimes n}"'] & \mathcal{O}_S \arrow[d, "1"] \\ (\mathcal{L}')^{\otimes n} \arrow[r, "\alpha'"] & \mathcal{O}_S \end{tikzcd}$$

commutes. Thus we have

$$Isom_S((\mathcal{L}, \alpha), (\mathcal{L}', \alpha')) = \begin{cases} \emptyset & \text{if} \quad \text{they are not isomorphic} \\ H^0(S, \mu_{n,S}) \cdot \varphi & \text{if} \quad \varphi \text{ isomorphism of pairs} \end{cases} \tag{38.28.4.1}$$

Moreover, given two pairs $(\mathcal{L}, \alpha)$, $(\mathcal{L}', \alpha')$ the tensor product

$$(\mathcal{L}, \alpha) \otimes (\mathcal{L}', \alpha') = (\mathcal{L} \otimes \mathcal{L}', \alpha \otimes \alpha')$$

is another pair. The pair $(\mathcal{O}_S, 1)$ is an identity for this tensor product operation, and an inverse is given by

$$(\mathcal{L}, \alpha)^{-1} = (\mathcal{L}^{\otimes -1}, \alpha^{\otimes -1}).$$

Hence the collection of isomorphism classes of pairs forms an abelian group. Note that

$$(\mathcal{L}, \alpha)^{\otimes n} = (\mathcal{L}^{\otimes n}, \alpha^{\otimes n}) \xrightarrow{\alpha} (\mathcal{O}_S, 1)$$

hence every element of this group has order dividing n. We warn the reader that this group is in general **not** the n-torsion in $\mathrm{Pic}(S)$.

Lemma 38.28.5. *Let S be a scheme. There is a canonical identification*

$$H^1_{étale}(S, \mu_n) = \text{group of pairs } (\mathcal{L}, \alpha) \text{ up to isomorphism as above}$$

if n is invertible on S. In general we have

$$H^1_{fppf}(S, \mu_n) = \text{group of pairs } (\mathcal{L}, \alpha) \text{ up to isomorphism as above.}$$

The same result holds with fppf replaced by syntomic.

Proof. We first prove the second isomorphism. Let $(\mathcal{L}, \alpha)$ be a pair as above. Choose an affine open covering $S = \bigcup U_i$ such that $\mathcal{L}|_{U_i} \cong \mathcal{O}_{U_i}$. Say $s_i \in \mathcal{L}(U_i)$ is a generator. Then $\alpha(s_i^{\otimes n}) = f_i \in \mathcal{O}_S^*(U_i)$. Writing $U_i = Spec(A_i)$ we see there exists a global relative complete intersection $A_i \to B_i = A_i[T]/(T^n - f_i)$ such that f_i maps to an nth power in B_i. In other words, setting $V_i = Spec(B_i)$ we obtain a syntomic covering $\mathcal{V} = \{V_i \to S\}_{i \in I}$ and trivializations $\varphi_i : (\mathcal{L}, \alpha)|_{V_i} \to (\mathcal{O}_{V_i}, 1)$.

We will use this result (the existence of the covering $\mathcal{V}$) to associate to this pair a cohomology class in $H^1_{syntomic}(S, \mu_{n,S})$. We give two (equivalent) constructions.

First construction: using Čech cohomology. Over the double overlaps $V_i \times_S V_j$ we have the isomorphism

$$(\mathcal{O}_{V_i \times_S V_j}, 1) \xrightarrow{\mathrm{pr}_0^* \varphi_i^{-1}} (\mathcal{L}|_{V_i \times_S V_j}, \alpha|_{V_i \times_S V_j}) \xrightarrow{\mathrm{pr}_1^* \varphi_j} (\mathcal{O}_{V_i \times_S V_j}, 1)$$

of pairs. By (38.28.4.1) this is given by an element $\zeta_{ij} \in \mu_n(V_i \times_S V_j)$. We omit the verification that these ζ_{ij}'s give a 1-cocycle, i.e., give an element $(\zeta_{i_0 i_1}) \in \check{C}(\mathcal{V}, \mu_n)$ with $d(\zeta_{i_0 i_1}) = 0$. Thus its class is an element in $\check{H}^1(\mathcal{V}, \mu_n)$ and by Theorem 38.19.2 it maps to a cohomology class in $H^1_{syntomic}(S, \mu_{n,S})$.

Second construction: Using torsors. Consider the presheaf

$$\mu_n(\mathcal{L}, \alpha) : U \longmapsto Isom_U((\mathcal{O}_U, 1), (\mathcal{L}, \alpha)|_U))$$

on $(Sch/S)_{syntomic}$. We may view this as a subpresheaf of $\mathcal{H}om_{\mathcal{O}}(\mathcal{O}, \mathcal{L})$ (internal hom sheaf, see Modules on Sites, Section 16.25). Since the conditions defining this subpresheaf are local, we see that it is a sheaf. By (38.28.4.1) this sheaf has a free action of the sheaf $\mu_{n,S}$. Hence the only thing we have to check is that it locally has sections. This is true because of the existence of the trivializing cover $\mathcal{V}$. Hence $\mu_n(\mathcal{L}, \alpha)$ is a $\mu_{n,S}$-torsor and by Cohomology on Sites, Lemma 19.5.3 we obtain a corresponding element of $H^1_{syntomic}(S, \mu_{n,S})$.

Ok, now we have to still show the following

1. The two constructions give the same cohomology class.
2. Isomorphic pairs give rise to the same cohomology class.
3. The cohomology class of $(\mathcal{L}, \alpha) \otimes (\mathcal{L}', \alpha')$ is the sum of the cohomology classes of $\mathcal{L}, \alpha)$ and $(\mathcal{L}', \alpha')$.
4. If the cohomology class is trivial, then the pair is trivial.
5. Any element of $H^1_{syntomic}(S, \mu_{n,S})$ is the cohomology class of a pair.

We omit the proof of (1). Part (2) is clear from the second construction, since isomorphic torsors give the same cohomology classes. Part (3) is clear from the first construction, since the resulting Cech classes add up. Part (4) is clear from the second construction since a torsor is trivial if and only if it has a global section, see Cohomology on Sites, Lemma 19.5.2.

Part (5) can be seen as follows (allthough a direct proof would be preferable). Suppose $\xi \in H^1_{syntomic}(S, \mu_{n,S})$. Then ξ maps to an element $\overline{\xi} \in H^1_{syntomic}(S, \mathbf{G}_{m,S})$ with $n\overline{\xi} = 0$. By Theorem 38.24.1 we see that $\overline{\xi}$ corresponds to an invertible sheaf $\mathcal{L}$ whose nth tensor power is isomorphic to $\mathcal{O}_S$. Hence there exists a pair $(\mathcal{L}, \alpha')$ whose cohomology class ξ' has the same image $\overline{\xi'}$ in $H^1_{syntomic}(S, \mathbf{G}_{m,S})$. Thus it suffices to show that $\xi - \xi'$ is the class of a pair. By construction, and the long exact cohomology sequence above, we see that $\xi - \xi' = \partial(f)$ for some $f \in H^0(S, \mathcal{O}_S^*)$. Consider the pair $(\mathcal{O}_S, f)$. We omit the verification that the cohomology class of this pair is $\partial(f)$, which finishes the proof of the first identification (with fppf replaced with synomtic).

To see the first, note that if n is invertible on S, then the covering $\mathcal{V}$ constructed in the first part of the proof is actually an étale covering (compare with the proof of Lemma 38.28.1). The rest of the proof is independent of the topology, apart from the very last argument which uses that the Kummer sequence is exact, i.e., uses Lemma 38.28.1. □

38.29. Neighborhoods, stalks and points

We can associate to any geometric point of S a stalk functor which is exact. A map of sheaves on $S_{étale}$ is an isomorphism if and only if it is an isomorphism on all these stalks. A complex of abelian sheaves is exact if and only if the complex of stalks is exact at all geometric points. Alltogether this means that the small étale site of a scheme S has enough points. It also turns out that any point of the small étale topos of S (an abstract notion) is given by a geometric point. Thus in some sense the small étale topos of S can be understood in terms of geometric points and neighbourhoods.

Definition 38.29.1. Let S be a scheme.

(1) A *geometric point* of S is a morphism $Spec(k) \to S$ where k is algebraically closed. Such a point is usually denoted $\overline{s}$, i.e., by an overlined small case letter. We often use $\overline{s}$ to denote the scheme $Spec(k)$ as well as the morphism, and we use $\kappa(\overline{s})$ to denote k.
(2) We say $\overline{s}$ *lies over* s to indicate that $s \in S$ is the image of $\overline{s}$.
(3) An *étale neighborhood* of a geometric point $\overline{s}$ of S is a commutative diagram

$$\begin{tikzcd} & U \arrow[d, "\varphi"] \\ \overline{s} \arrow[ur, "\bar{u}"] \arrow[r, "\overline{s}"'] & S \end{tikzcd}$$

where φ is an étale morphism of schemes. We write $(U, \overline{u}) \to (S, \overline{s})$.
(4) A *morphism of étale neighborhoods* $(U, \overline{u}) \to (U', \overline{u}')$ is an S-morphism $h : U \to U'$ such that $\overline{u}' = h \circ \overline{u}$.

Remark 38.29.2. Since U and U' are étale over S, any S-morphism between them is also étale, see Proposition 38.26.2. In particular all morphisms of étale neighborhoods are étale.

Remark 38.29.3. Let S be a scheme and $s \in S$ a point. In More on Morphisms, Definition 33.25.1 we defined the notion of an étale neighbourhood $(U, u) \to (S, s)$ of (S, s). If $\overline{s}$ is a geometric point of S lying over s, then any étale neighbourhood $(U, \overline{u}) \to (S, \overline{s})$ gives rise to an étale neighbourhood (U, u) of (S, s) by taking $u \in U$ to be the unique point of U such that $\overline{u}$ lies over u. Conversely, given an étale neighbourhood (U, u) of (S, s) the residue field extension $\kappa(s) \subset \kappa(u)$ is finite separable (see Proposition 38.26.2) and hence we can find an embedding $\kappa(u) \subset \kappa(\overline{s})$ over $\kappa(s)$. In other words, we can find a geometric point $\overline{u}$ of U lying over u such that $(U, \overline{u})$ is an étale neighbourhood of $(S, \overline{s})$. We will use these observations to go between the two types of étale neighbourhoods.

Lemma 38.29.4. *Let S be a scheme, and let $\overline{s}$ be a geometric point of S. The category of étale neighborhoods is cofiltered. More precisely:*

(1) *Let $(U_i, \overline{u}_i)_{i=1,2}$ be two étale neighborhoods of $\overline{s}$ in S. Then there exists a third étale neighborhood $(U, \overline{u})$ and morphisms $(U, \overline{u}) \to (U_i, \overline{u}_i)$, $i = 1, 2$.*

(2) *Let $h_1, h_2 : (U, \overline{u}) \to (U', \overline{u}')$ be two morphisms between étale neighborhoods of $\overline{s}$. Then there exist an étale neighborhood $(U'', \overline{u}'')$ and a morphism $h : (U'', \overline{u}'') \to (U, \overline{u})$ which equalizes h_1 and h_2, i.e., such that $h_1 \circ h = h_2 \circ h$.*

Proof. For part (1), consider the fibre product $U = U_1 \times_S U_2$. It is étale over both U_1 and U_2 because étale morphisms are preserved under base change, see Proposition 38.26.2. The map $\overline{s} \to U$ defined by $(\overline{u}_1, \overline{u}_2)$ gives it the structure of an étale neighborhood mapping to both U_1 and U_2. For part (2), define U'' as the fibre product

$$\begin{tikzcd} U'' \arrow[r] \arrow[d] & U \arrow[d, "{(h_1,h_2)}"] \\ U' \arrow[r, "\Delta"] & U' \times_S U'. \end{tikzcd}$$

Since $\overline{u}$ and $\overline{u}'$ agree over S with $\overline{s}$, we see that $\overline{u}'' = (\overline{u}, \overline{u}')$ is a geometric point of U''. In particular $U'' \neq \emptyset$. Moreover, since U' is étale over S, so is the fibre product $U' \times_S U'$ (see Proposition 38.26.2). Hence the vertical arrow (h_1, h_2) is étale by Remark 38.29.2 above. Therefore U'' is étale over U' by base change, and hence also étale over S (because compositions of étale morphisms are étale). Thus $(U'', \overline{u}'')$ is a solution to the problem. $\square$

Lemma 38.29.5. *Let S be a scheme. Let $\overline{s}$ be a geometric point of S. Let $(U, \overline{u})$ an étale neighborhood of $\overline{s}$. Let $\mathcal{U} = \{\varphi_i : U_i \to U\}_{i \in I}$ be an étale covering. Then there exist $i \in I$ and $\overline{u}_i : \overline{s} \to U_i$ such that $\varphi_i : (U_i, \overline{u}_i) \to (U, \overline{u})$ is a morphism of étale neighborhoods.*

Proof. As $U = \bigcup_{i \in I} \varphi_i(U_i)$, the fibre product $\overline{s} \times_{\overline{u}, U, \varphi_i} U_i$ is not empty for some i. Then look at the cartesian diagram

$$\begin{tikzcd} \overline{s} \times_{\overline{u}, U, \varphi_i} U_i \arrow[r, "\mathrm{pr}_2"'] \arrow[d, "\mathrm{pr}_1"] & U_i \arrow[d, "\varphi_i"] \\ Spec(k) = \overline{s} \arrow[r, "\overline{u}"] \arrow[u, bend left, "\sigma"] & U \end{tikzcd}$$

The projection pr_1 is the base change of an étale morphisms so it is étale, see Proposition 38.26.2. Therefore, $\overline{s} \times_{\overline{u}, U, \varphi_i} U_i$ is a disjoint union of finite separable extensions of k, by Proposition 38.26.2. Here $\overline{s} = Spec(k)$. But k is algebraically closed, so all these extensions are trivial, and there exists a section σ of pr_1. The composition $\mathrm{pr}_2 \circ \sigma$ gives a map compatible with $\overline{u}$. $\square$

Definition 38.29.6. Let S be a scheme. Let $\mathcal{F}$ be a presheaf on $S_{étale}$. Let $\overline{s}$ be a geometric point of S. The *stalk* of $\mathcal{F}$ at $\overline{s}$ is

$$\mathcal{F}_{\overline{s}} = colim_{(U, \overline{u})} \mathcal{F}(U)$$

where $(U, \overline{u})$ runs over all étale neighborhoods of $\overline{s}$ in S.

By Lemma 38.29.4, this colimit is over a filtered index category, namely the opposite of the category of étale neighbourhoods. In other words, an element of $\mathcal{F}_{\overline{s}}$ can be thought of as a triple $(U, \overline{u}, \sigma)$ where $\sigma \in \mathcal{F}(U)$. Two triples $(U, \overline{u}, \sigma)$, $(U', \overline{u}', \sigma')$ define the same element of the stalk if there exists a third étale neighbourhood $(U'', \overline{u}'')$ and morphisms of étale neighbourhoods $h : (U'', \overline{u}'') \to (U, \overline{u})$, $h' : (U'', \overline{u}'') \to (U', \overline{u}')$ such that $h^*\sigma = (h')^*\sigma'$ in $\mathcal{F}(U'')$. See Categories, Section 4.17.

Lemma 38.29.7. *Let S be a scheme. Let $\overline{s}$ be a geometric point of S. Consider the functor*

$$\begin{aligned} u : S_{\acute{e}tale} &\longrightarrow Sets, \\ U &\longmapsto |U_{\overline{s}}| = \{\overline{u} \text{ such that } (U, \overline{u}) \text{ is an étale neighbourhood of } \overline{s}\}. \end{aligned}$$

Here $|U_{\overline{s}}|$ denotes the underlying set of the geometric fibre. Then u defines a point p of the site $S_{\acute{e}tale}$ (Sites, Definition 9.28.2) and its associated stalk functor $\mathcal{F} \mapsto \mathcal{F}_p$ (Sites, Equation 9.28.1.1) is the functor $\mathcal{F} \mapsto \mathcal{F}_{\overline{s}}$ defined above.

Proof. In the proof of Lemma 38.29.5 we have seen that the scheme $U_{\overline{s}}$ is a disjoint union of schemes isomorphic to $\overline{s}$. Thus we can also think of $|U_{\overline{s}}|$ as the set of geometric points of U lying over $\overline{s}$, i.e., as the collection of morphisms $\overline{u} : \overline{s} \to U$ fitting into the diagram of Definition 38.29.1. From this it follows that $u(S)$ is a singleton, and that $u(U \times_V W) = u(U) \times_{u(V)} u(W)$ whenever $U \to V$ and $W \to V$ are morphisms in $S_{\acute{e}tale}$. And, given a covering $\{U_i \to U\}_{i \in I}$ in $S_{\acute{e}tale}$ we see that $\coprod u(U_i) \to u(U)$ is surjective by Lemma 38.29.5. Hence Sites, Proposition 9.29.2 applies, so p is a point of the site $S_{\acute{e}tale}$. Finally, the our functor $\mathcal{F} \mapsto \mathcal{F}_{\overline{s}}$ is given by exactly the same colimit as the functor $\mathcal{F} \mapsto \mathcal{F}_p$ associated to p in Sites, Equation 9.28.1.1 which proves the final assertion. $\square$

Remark 38.29.8. Let S be a scheme and let $\overline{s} : Spec(k) \to S$ and $\overline{s}' : Spec(k') \to S$ be two geometric points of S. A *morphism $a : \overline{s} \to \overline{s}'$ of geometric points* is simply a morphism $a : Spec(k) \to Spec(k')$ such that $a \circ \overline{s}' = \overline{s}$. Given such a morphism we obtain a functor from the category of étale neighbourhoods of $\overline{s}'$ to the category of étale neighbourhoods of $\overline{s}$ by the rule $(U, \overline{u}') \mapsto (U, a \circ \overline{u}')$. Hence we obtain a canonical map

$$\mathcal{F}_{\overline{s}'} = colim_{(U, \overline{u}')} \mathcal{F}(U) \longrightarrow colim_{(U, \overline{u})} \mathcal{F}(U) = \mathcal{F}_{\overline{s}}$$

from Categories, Lemma 4.13.7. Using the description of elements of stalks as triples this maps the element of $\mathcal{F}_{\overline{s}'}$ represented by the triple $(U, \overline{u}', \sigma)$ to the element of $\mathcal{F}_{\overline{s}}$ represented by the triple $(U, a \circ \overline{u}', \sigma)$. Since the functor above is clearly an equivalence we conclude that this canonical map is an isomorphism of stalk functors.

Let us make sure we have the map of stalks corresponding to a pointing in the correct direction. Note that the above means, according to Sites, Definition 9.33.2, that a defines a morphism $a : p \to p'$ between the points p, p' of the site $S_{\acute{e}tale}$ associated to $\overline{s}, \overline{s}'$ by Lemma 38.29.7. There are more general morphisms of points (corresponding to specializations of points of S) which we will describe later, and which will not be isomorphisms (insert future reference here).

Lemma 38.29.9. *Let S be a scheme. Let $\overline{s}$ be a geometric point of S.*

(1) *The stalk functor $PAb(S_{\acute{e}tale}) \to Ab$, $\mathcal{F} \mapsto \mathcal{F}_{\overline{s}}$ is exact.*
(2) *We have $(\mathcal{F}^{\#})_{\overline{s}} = \mathcal{F}_{\overline{s}}$ for any presheaf of sets $\mathcal{F}$ on $S_{\acute{e}tale}$.*
(3) *The functor $Ab(S_{\acute{e}tale}) \to Ab$, $\mathcal{F} \mapsto \mathcal{F}_{\overline{s}}$ is exact.*
(4) *Similarly the functors $PSh(S_{\acute{e}tale}) \to Sets$ and $Sh(S_{\acute{e}tale}) \to Sets$ given by the stalk functor $\mathcal{F} \mapsto \mathcal{F}_{\overline{x}}$ are exact (see Categories, Definition 4.21.1) and commute with arbitrary colimits.*

Proof. Before we indicate how to prove this by direct arguments we note that the result follows from the general material in Modules on Sites, Section 16.30. This is true because $\mathcal{F} \mapsto \mathcal{F}_{\overline{s}}$ comes from a point of the small étale site of S, see Lemma 38.29.7. We will only give a direct proof of (1), (2) and (3), and omit a dirext proof of (4).

Exactness as a functor on $PAb(S_{étale})$ is formal from the fact that directed colimits commute with all colimits and with finite limits. The identification of the stalks in (2) is via the map

$$\kappa : \mathcal{F}_{\overline{s}} \longrightarrow (\mathcal{F}^\#)_{\overline{s}}$$

induced by the natural morphism $\mathcal{F} \to \mathcal{F}^\#$, see Theorem 38.13.2. We claim that this map is an isomorphism of abelian groups. We will show injectivity and omit the proof of surjectivity.

Let $\sigma \in \mathcal{F}_{\overline{s}}$. There exists an étale neighborhood $(U, \overline{u}) \to (S, \overline{s})$ such that σ is the image of some section $s \in \mathcal{F}(U)$. If $\kappa(\sigma) = 0$ in $(\mathcal{F}^\#)_{\overline{s}}$ then there exists a morphism of étale neighborhoods $(U', \overline{u}') \to (U, \overline{u})$ such that $s|_{U'}$ is zero in $\mathcal{F}^\#(U')$. It follows there exists an étale covering $\{U'_i \to U'\}_{i\in I}$ such that $s|_{U'_i} = 0$ in $\mathcal{F}(U'_i)$ for all i. By Lemma 38.29.5 there exist $i \in I$ and a morphism $\overline{u}'_i : \overline{s} \to U'_i$ such that $(U'_i, \overline{u}'_i) \to (U', \overline{u}') \to (U, \overline{u})$ are morphisms of étale neighborhoods. Hence $\sigma = 0$ since $(U'_i, \overline{u}'_i) \to (U, \overline{u})$ is a morphism of étale neighbourhoods such that we have $s|_{U'_i} = 0$. This proves κ is injective.

To show that the functor $Ab(S_{étale}) \to Ab$ is exact, consider any short exact sequence in $Ab(S_{étale})$: $0 \to \mathcal{F} \to \mathcal{G} \to \mathcal{H} \to 0$. This gives us the exact sequence of presheaves

$$0 \to \mathcal{F} \to \mathcal{G} \to \mathcal{H} \to \mathcal{H}/^p\mathcal{G} \to 0,$$

where $/^p$ denotes the quotient in $PAb(S_{étale})$. Taking stalks at $\overline{s}$, we see that $(\mathcal{H}/^p\mathcal{G})_{\overline{s}} = (\mathcal{H}/\mathcal{G})_{\overline{s}} = 0$, since the sheafification of $\mathcal{H}/^p\mathcal{G}$ is 0. Therefore,

$$0 \to \mathcal{F}_{\overline{s}} \to \mathcal{G}_{\overline{s}} \to \mathcal{H}_{\overline{s}} \to 0 = (\mathcal{H}/^p\mathcal{G})_{\overline{s}}$$

is exact, since taking stalks is exact as a functor from presheaves. □

Theorem 38.29.10. *Let S be a scheme. A map $a : \mathcal{F} \to \mathcal{G}$ of sheaves of sets is injective (resp. surjective) if and only if the map on stalks $a_{\overline{s}} : \mathcal{F}_{\overline{s}} \to \mathcal{G}_{\overline{s}}$ is injective (resp. surjective) for all geometric points of S. A sequence of abelian sheaves on $S_{étale}$ is exact if and only if it is exact on all stalks at geometric points of S.*

Proof. The necessity of exactness on stalks follows from Lemma 38.29.9. For the converse, it suffices to show that a map of sheaves is surjective (respectively injective) if and only if it is surjective (respectively injective) on all stalks. We prove this in the case of surjectivity, and omit the proof in the case of injectivity.

Let $\alpha : \mathcal{F} \to \mathcal{G}$ be a map of abelian sheaves such that $\mathcal{F}_{\overline{s}} \to \mathcal{G}_{\overline{s}}$ is surjective for all geometric points. Fix $U \in Ob(S_{étale})$ and $s \in \mathcal{G}(U)$. For every $u \in U$ choose some $\overline{u} \to U$ lying over u and an étale neighborhood $(V_u, \overline{v}_u) \to (U, \overline{u})$ such that $s|_{V_u} = \alpha(s_{V_u})$ for some $s_{V_u} \in \mathcal{F}(V_u)$. This is possible since α is surjective on stalks. Then $\{V_u \to U\}_{u\in U}$ is an étale covering on which the restrictions of s are in the image of the map α. Thus, α is surjective, see Sites, Section 9.11. □

Remarks 38.29.11. On points of the geometric sites.

1. In the terminology of Sites, Definition 9.34.1 the proof of Theorem 38.29.10 shows that the small étale site of S has enough points.
2. Suppose $\mathcal{F}$ is a sheaf on the big étale site of S. Let $T \to S$ be an object of the big étale site of S, and let $\overline{t}$ be a geometric point of T. Then we define $\mathcal{F}_{\overline{t}}$ as the stalk of the restriction $\mathcal{F}|_{T_{étale}}$ of $\mathcal{F}$ to the small étale site of T. In other words, we can define the stalk of $\mathcal{F}$ at any geometric point of any scheme $T/S \in Ob((Sch/S)_{étale})$.
3. The big étale site of S also has enough points, by considering all geometric points of all objects of this site, see (2).

The following lemma should be skipped on a first reading.

Lemma 38.29.12. *Let S be a scheme.*

(1) *Let p be a point of the small étale site $S_{étale}$ of S given by a functor $u : S_{étale} \to Sets$. Then there exists a geometric point $\overline{s}$ of S such that p is isomorphic to the point of $S_{étale}$ associated to $\overline{s}$ in Lemma 38.29.7.*
(2) *Let $p : Sh(pt) \to Sh(S_{étale})$ be a point of the small étale topos of S. Then p comes from a geometric point of S, i.e., the stalk functor $\mathcal{F} \mapsto \mathcal{F}_p$ is isomorphic to a stalk functor as defined in Definition 38.29.6.*

Proof. By Sites, Lemma 9.28.7 there is a one to one correspondence between points of the site and points of the associated topos, hence it suffices to prove (1). By Sites, Proposition 9.29.2 the functor u has the following properties: (a) $u(S) = \{*\}$, (b) $u(U \times_V W) = u(U) \times_{u(V)} u(W)$, and (c) if $\{U_i \to U\}$ is an étale covering, then $\coprod u(U_i) \to u(U)$ is surjective. In particular, if $U' \subset U$ is an open subscheme, then $u(U') \subset u(U)$. Moreover, by Sites, Lemma 9.28.7 we can write $u(U) = p^{-1}(h_U^\#)$, in other words $u(U)$ is the stalk of the representable sheaf h_U. If $U = V \amalg W$, then we see that $h_U = (h_V \amalg h_W)^\#$ and we get $u(U) = u(V) \amalg u(W)$ since p^{-1} is exact.

Consider the restriction of u to S_{Zar}. By Sites, Examples 9.29.4 and 9.29.5 there exists a unique point $s \in S$ such that for $S' \subset S$ open we have $u(S') = \{*\}$ if $s \in S'$ and $u(S') = \emptyset$ if $s \not\in S'$. Note that if $\varphi : U \to S$ is an object of $S_{étale}$ then $\varphi(U) \subset S$ is open (see Proposition 38.26.2) and $\{U \to \varphi(U)\}$ is an étale covering. Hence we conclude that $u(U) = \emptyset \Leftrightarrow s \in \varphi(U)$.

Pick a geometric point $\overline{s} : \overline{s} \to S$ lying over s, see Definition 38.29.1 for customary abuse of notation. Suppose that $\varphi : U \to S$ is an object of $S_{étale}$ with U affine. Note that φ is separated, and that the fibre U_s of φ over s is an affine scheme over $Spec(\kappa(s))$ which is the spectrum of a finite product of finite separable extensions k_i of $\kappa(s)$. Hence we may apply Étale Morphisms, Lemma 37.18.2 to get an étale neighbourhood $(V, \overline{v})$ of $(S, \overline{s})$ such that

$$U \times_S V = U_1 \amalg \ldots \amalg U_n \amalg W$$

with $U_i \to V$ an isomorphism and W having no point lying over $\overline{v}$. Thus we conclude that

$$u(U) \times u(V) = u(U \times_S V) = u(U_1) \amalg \ldots \amalg u(U_n) \amalg u(W)$$

and of course also $u(U_i) = u(V)$. After shrinking V a bit we can assume that V has exactly one point lying over s, and hence W has no point lying over s. By the above this then gives $u(W) = \emptyset$. Hence we obtain

$$u(U) \times u(V) = u(U_1) \amalg \ldots \amalg u(U_n) = \coprod\nolimits_{i=1,\ldots,n} u(V)$$

Note that $u(V) \neq \emptyset$ as s is in the image of $V \to S$. In particular, we see that in this situation $u(U)$ is a finite set with n elements.

Consider the limit

$$lim_{(V,\overline{v})} u(V)$$

over the category of étale neighbourhoods $(V, \overline{v})$ of $\overline{s}$. It is clear that we get the same value when taking the limit over the subcategory of $(V, \overline{v})$ with V affine. By the previous paragraph (applied with the roles of V and U switched) we see that in this case $u(V)$ is always a finite nonempty set. Moreover, the limit is cofiltered, see Lemma 38.29.4. Hence by Categories, Section 4.18 the limit is nonempty. Pick an element x from this limit. This means we obtain a $x_{V,\overline{v}} \in u(V)$ for every étale neighbourhood $(V, \overline{v})$ of $(S, \overline{s})$ such that for every morphism of étale neighbourhoods $\varphi : (V', \overline{v}') \to (V, \overline{v})$ we have $u(\varphi)(x_{V',\overline{v}'}) = x_{V,\overline{v}}$.

We will use the choice of x to construct a functorial bijective map

$$c : |U_{\overline{s}}| \longrightarrow u(U)$$

for $U \in Ob(S_{\acute{e}tale})$ which will conclude the proof. See Lemma 38.29.7 and its proof for a description of $|U_{\overline{s}}|$. First we claim that it suffices to construct the map for U affine. We omit the proof of this claim. Assume $U \to S$ in $S_{\acute{e}tale}$ with U affine, and let $\overline{u} : \overline{s} \to U$ be an element of $|U_{\overline{s}}|$. Choose a $(V, \overline{v})$ such that $U \times_S V$ decomposes as in the third paragraph of the proof. Then the pair $(\overline{u}, \overline{v})$ gives a geometric point of $U \times_S V$ lying over $\overline{v}$ and determines one of the components U_i of $U \times_S V$. More precisely, there exists a section $\sigma : V \to U \times_S V$ of the projection pr_U such that $(\overline{u}, \overline{v}) = \sigma \circ \overline{v}$. Set $c(\overline{u}) = u(\text{pr}_U)(u(\sigma)(x_{V,\overline{v}})) \in u(U)$. We have to check this is independent of the choice of $(V, \overline{v})$. By Lemma 38.29.4 the category of étale neighbourhoods is cofiltered. Hence it suffice to show that given a morphism of étale neighbourhood $\varphi : (V', \overline{v}') \to (V, \overline{v})$ and a choice of a section $\sigma' : V' \to U \times_S V'$ of the projection such that $(\overline{u}, \overline{v'}) = \sigma' \circ \overline{v}'$ we have $u(\sigma')(x_{V',\overline{v}'}) = u(\sigma)(x_{V,\overline{v}})$. Consider the diagram

$$\begin{tikzcd} V' \arrow[r, "\varphi"'] \arrow[d, "\sigma'"] & V \arrow[d, "\sigma"] \\ U \times_S V' \arrow[r, "1\times\varphi"] & U \times_S V \end{tikzcd}$$

Now, it may not be the case that this diagram commutes. The reason is that the schemes V' and V may not be connected, and hence the decompositions used to construct σ' and σ above may not be unique. But we do know that $\sigma \circ \varphi \circ \overline{v}' = (1 \times \varphi) \circ \sigma' \circ \overline{v}'$ by construction. Hence, since $U \times_S V$ is étale over S, there exists an open neighbourhood $V'' \subset V'$ of $\overline{v'}$ such that the diagram does commute when restricted to V'', see Morphisms, Lemma 24.34.17. This means we may extend the diagram above to

$$\begin{tikzcd} V'' \arrow[r] \arrow[d, "\sigma'|_{V''}"] & V' \arrow[r, "\varphi"'] \arrow[d, "\sigma'"] & V \arrow[d, "\sigma"] \\ U \times_S V'' \arrow[r] & U \times_S V' \arrow[r, "1\times\varphi"] & U \times_S V \end{tikzcd}$$

such that the left square and the outer rectangle commute. Since u is a functor this implies that $x_{V'',\overline{v}'}$ maps to the same element in $u(U \times_S V)$ no matter which route we take through the diagram. On the other hand, it maps to the elements $x_{V',\overline{v}'}$ and $x_{V,\overline{v}}$ in $u(V')$ and $u(V)$. This implies the desired equality $u(\sigma')(x_{V',\overline{v}'}) = u(\sigma)(x_{V,\overline{v}})$.

In a similar manner one proves that the construction $c : |U_{\overline{s}}| \to u(U)$ is functorial in U; details omitted. And finally, by the results of the third paragraph it is clear that the map c is bijective which ends the proof of the lemma. □

38.30. Points in other topologies

In this section we briefly discuss the existence of points for some sites other than the étale site of a scheme. We refer to Sites, Section 9.34 and Topologies, Section 30.2 ff for the terminology used in this section. All of the geometric sites have enough points.

Lemma 38.30.1. *Let S be a scheme. All of the following sites have enough points S_{Zar}, $S_{étale}$, $(Sch/S)_{Zar}$, $(Aff/S)_{Zar}$, $(Sch/S)_{étale}$, $(Aff/S)_{étale}$, $(Sch/S)_{smooth}$, $(Aff/S)_{smooth}$, $(Sch/S)_{syntomic}$, $(Aff/S)_{syntomic}$, $(Sch/S)_{fppf}$, and $(Aff/S)_{fppf}$.*

Proof. For each of the big sites the associated topos is equivalent to the topos defined by the site $(Aff/S)_\tau$, see Topologies, Lemmas 30.3.10, 30.4.11, 30.5.9, 30.6.9, and 30.7.11. The result for the sites $(Aff/S)_\tau$ follows immediately from Deligne's result Sites, Proposition 9.35.3.

The result for S_{Zar} is clear. The result for $S_{étale}$ either follows from (the proof of) Theorem 38.29.10 or from Lemma 38.21.2 and Deligne's result applied to $S_{affine,étale}$. □

The lemma above guarantees the existence of points, but it doesn't tell us what these points look like. We can explicitly construct *some* points as follows. Suppose $\overline{s} : Spec(k) \to S$ is a geometric point with k algebraically closed. Consider the functor

$$u : (Sch/S)_{fppf} \longrightarrow Sets, \quad u(U) = U(k) = Mor_S(Spec(k), U).$$

Note that $U \mapsto U(k)$ commutes with direct limits as $S(k) = \{\overline{s}\}$ and $(U_1 \times_U U_2)(k) = U_1(k) \times_{U(k)} U_2(k)$. Moreover, if $\{U_i \to U\}$ is an fppf covering, then $\coprod U_i(k) \to U(k)$ is surjective. By Sites, Proposition 9.29.2 we see that u defines a point p of $(Sch/S)_{fppf}$ with stalks

$$\mathcal{F}_p = colim_{(U,x)} \mathcal{F}(U)$$

where the colimit is over pairs $U \to S$, $x \in U(k)$ as usual. But... this category has an initial object, namely $(Spec(k), \text{id})$, hence we see that

$$\mathcal{F}_p = \mathcal{F}(Spec(k))$$

which isn't terribly interesting! In fact, in general these points won't form a conservative family of points. A more intereseting type of point is described in the following remark.

Remark 38.30.2. Let $S = Spec(A)$ be an affine scheme. Let (p, u) be a point of the site $(Aff/S)_{fppf}$. Let $B = \mathcal{O}_p$ be the stalk of the structure sheaf at the point p. Since $A = \Gamma(S, \mathcal{O})$ we see that B is an A-algebra. Ignoring set theoretical difficulties, we see that $Spec(B)$ is an object of $(Aff/S)_{fppf}$. Recall that

$$B = colim_{(U,x)} \mathcal{O}(U) = colim_{(Spec(C),x)} C$$

where $x \in u(Spec(C))$. Hence there are canonical maps $C \to B$ and we see that the system has an initial object $(Spec(B), x_B)$ for a suitable $x_B \in u(Spec(B))$. It follows that $\mathcal{F}_p = \mathcal{F}(Spec(B))$ for any sheaf $\mathcal{F}$ on $(Aff/S)_{fppf}$. In other words, every stalk functor is representable. It is straightforward to see that if $\mathcal{F} \mapsto \mathcal{F}(B)$ comes from a point, then B has to be a local A-algebra such that for every faithfully flat, finitely presented ring map $B \to B'$ there is a section $B' \to B$. Conversely, any such A-algebra B gives rise to a point. Details omitted.

38.31. Supports of abelian sheaves

First we talk about supports of local sections.

Lemma 38.31.1. *Let S be a scheme. Let $\mathcal{F}$ be a subsheaf of the final object of the étale topos of S (see Sites, Example 9.10.2). Then there exists a unique open $W \subset S$ such that $\mathcal{F} = h_W$.*

Proof. The condition means that $\mathcal{F}(U)$ is a singleton or empty for all $\varphi : U \to S$ in $Ob(S_{étale})$. In particular local sections always glue. If $\mathcal{F}(U) \neq \emptyset$, then $\mathcal{F}(\varphi(U)) \neq \emptyset$ because $\{\varphi : U \to \varphi(U)\}$ is a covering. Hence we can take $W = \bigcup_{\varphi : U \to S, \mathcal{F}(U) \neq \emptyset} \varphi(U)$. □

Lemma 38.31.2. *Let S be a scheme. Let $\mathcal{F}$ be an abelian sheaf on $S_{étale}$. Let $\sigma \in \mathcal{F}(U)$ be a local section. There exists an open subset $W \subset U$ such that*

(1) *$W \subset U$ is the largest Zariski open subset of U such that $\sigma|_W = 0$,*
(2) *for every $\varphi : V \to U$ in $S_{étale}$ we have*
$$\sigma|_V = 0 \Leftrightarrow \varphi(V) \subset W,$$
(3) *for every geometric point $\overline{u}$ of U we have*
$$(U, \overline{u}, \sigma) = 0 \text{ in } \mathcal{F}_{\overline{s}} \Leftrightarrow \overline{u} \in W$$
where $\overline{s} = (U \to S) \circ \overline{u}$.

Proof. Since $\mathcal{F}$ is a sheaf in the étale topology the restriction of $\mathcal{F}$ to U_{Zar} is a sheaf on U in the Zariski topology. Hence there exists a Zariski open W having property (1), see Modules, Lemma 15.5.2. Let $\varphi : V \to U$ be an arrow of $S_{étale}$. Note that $\varphi(V) \subset U$ is an open subset and that $\{V \to \varphi(V)\}$ is an étale covering. Hence if $\sigma|_V = 0$, then by the sheaf condition for $\mathcal{F}$ we see that $\sigma|_{\varphi(V)} = 0$. This proves (2). To prove (3) we have to show that if $(U, \overline{u}, \sigma)$ defines the zero element of $\mathcal{F}_{\overline{s}}$, then $\overline{u} \in W$. This is true because the assumption means there exists a morphism of étale neighbourhoods $(V, \overline{v}) \to (U, \overline{u})$ such that $\sigma|_V = 0$. Hence by (2) we see that $V \to U$ maps into W, and hence $\overline{u} \in W$. □

Let S be a scheme. Let $s \in S$. Let $\mathcal{F}$ be a sheaf on $S_{étale}$. By Remark 38.29.8 the isomorphism class of the stalk of the sheaf $\mathcal{F}$ at a geometric points lying over s is well defined.

Definition 38.31.3. Let S be a scheme. Let $\mathcal{F}$ be an abelian sheaf on $S_{étale}$.

(1) The *support of* $\mathcal{F}$ is the set of points $s \in S$ such that $\mathcal{F}_{\overline{s}} \neq 0$ for any (some) geometric point $\overline{s}$ lying over s.
(2) Let $\sigma \in \mathcal{F}(U)$ be a section. The *support of* σ is the closed subset $U \setminus W$, where $W \subset U$ is the largest open subset of U on which σ restricts to zero (see Lemma 38.31.2).

In general the support of an abelian sheaf is not closed. For example, suppose that $S = Spec(\mathbf{A}^1_{\mathbf{C}})$. Let $i_t : Spec(\mathbf{C}) \to S$ be the inclusion of the point $t \in \mathbf{C}$. We will see later that $\mathbf{F}_t = i_{t,*}(\mathbf{Z}/2\mathbf{Z})$ is an abelian sheaf whose support is exactly $\{t\}$, see Section 38.46. Then
$$\bigoplus\nolimits_{n \in \mathbf{N}} \mathcal{F}_n$$
is an abelian sheaf with support $\{1, 2, 3, \ldots\} \subset S$. This is true because taking stalks commutes with colimits, see Lemma 38.29.9. Thus an example of an abelian sheaf whose support is not closed. Here are some basic facts on supports of sheaves and sections.

Lemma 38.31.4. *Let S be a scheme. Let $\mathcal{F}$ be an abelian sheaf on $S_{étale}$. Let $U \in Ob(S_{étale})$ and $\sigma \in \mathcal{F}(U)$.*

(1) *The support of σ is closed in U.*
(2) *The support of $\sigma + \sigma'$ is contained in the union of the supports of $\sigma, \sigma' \in \mathcal{F}(U)$.*
(3) *If $\varphi : \mathcal{F} \to \mathcal{G}$ is a map of abelian sheaves on $S_{étale}$, then the support of $\varphi(\sigma)$ is contained in the support of $\sigma \in \mathcal{F}(U)$.*
(4) *The support of $\mathcal{F}$ is the union of the images of the supports of all local sections of $\mathcal{F}$.*

(5) *If $\mathcal{F} \to \mathcal{G}$ is surjective then the support of $\mathcal{G}$ is a subset of the support of $\mathcal{F}$.*
(6) *If $\mathcal{F} \to \mathcal{G}$ is injective then the support of $\mathcal{F}$ is a subset of the support of $\mathcal{G}$.*

Proof. Part (1) holds by definition. Parts (2) and (3) hold because they holds for the restriction of $\mathcal{F}$ and $\mathcal{G}$ to U_{Zar}, see Modules, Lemma 15.5.2. Part (4) is a direct consequence of Lemma 38.31.2 part (3). Parts (5) and (6) follow from the other parts. □

Lemma 38.31.5. *The support of a sheaf of rings on $S_{étale}$ is closed.*

Proof. This is true because (according to our conventions) a ring is 0 if and only if $1 = 0$, and hence the support of a sheaf of rings is the support of the unit section. □

38.32. Henselian rings

We begin by stating a theorem which has already been used many times in the stacks project. There are many versions of this resut; here we just state the algebraic version.

Theorem 38.32.1. *Let $A \to B$ be finite type ring map and $\mathfrak{p} \subset A$ a prime ideal. Then there exist an étale ring map $A \to A'$ and a prime $\mathfrak{p}' \subset A'$ lying over $\mathfrak{p}$ such that*

(1) $\kappa(\mathfrak{p}) = \kappa(\mathfrak{p}')$,
(2) $B \otimes_A A' = B_1 \times \cdots \times B_r \times C$,
(3) *$A' \to B_i$ is finite and there exists a unique prime $q_i \subset B_i$ lying over $\mathfrak{p}'$, and*
(4) *all irreducible components of the fibre $Spec(C \otimes_{A'} \kappa(\mathfrak{p}'))$ of C over $\mathfrak{p}'$ have dimension at least 1.*

Proof. See Algebra, Lemma 7.132.22, or see [**GD67**, Théorème 18.12.1]. For a slew of versions in terms of morphisms of schemes, see More on Morphisms, Section 33.28. □

Recall Hensel's lemma. There are many versions of this lemma. Here are two:

(f) if $f \in \mathbf{Z}_p[T]$ monic and f mod $p = g_0 h_0$ with $gcd(g_0, h_0) = 1$ then f factors as $f = gh$ with $\bar{g} = g_0$ and $\bar{h} = h_0$,
(r) if $f \in \mathbf{Z}_p[T]$, monic $a_0 \in \mathbf{F}_p$, $\bar{f}(a_0) = 0$ but $\bar{f}'(a_0) \neq 0$ then there exists $a \in \mathbf{Z}_p$ with $f(a) = 0$ and $\bar{a} = a_0$.

Both versions are true (we will see this later). The first version asks for lifts of factorizations into coprime parts, and the second version asks for lifts of simple roots modulo the maximal ideal. It turns out that requiring these conditions for a general local ring are equivalent, and are equivalent to many other conditions. We use the root lifting property as the definition of a henselian local ring as it is often the easiest one to check.

Definition 38.32.2. (See Algebra, Definition 7.139.1.) A local ring $(R, \mathfrak{m}, \kappa)$ is called *henselian* if for all $f \in R[T]$ monic, for all $a_0 \in \kappa$ such that $\bar{f}(a_0) = 0$ and $\bar{f}'(a_0) \neq 0$, there exists an $a \in R$ such that $f(a) = 0$ and a mod $\mathfrak{m} = a_0$.

A good example of henselian local rings to keep in mind is complete local rings. Recall (Algebra, Definition 7.143.1) that a complete local ring is a local ring $(R, \mathfrak{m})$ such that $R \cong lim_n\, R/\mathfrak{m}^n$, i.e., it is complete and separated for the $\mathfrak{m}$-adic topology.

Theorem 38.32.3. *Complete local rings are henselian.*

Proof. Newton's method. See Algebra, Lemma 7.139.10. □

Theorem 38.32.4. *Let $(R, \mathfrak{m}, \kappa)$ be a local ring. The following are equivalent:*

(1) *R is henselian,*

(2) *for any $f \in R[T]$ and any factorization $\bar{f} = g_0 h_0$ in $\kappa[T]$ with* $\gcd(g_0, h_0) = 1$, *there exists a factorization $f = gh$ in $R[T]$ with $\bar{g} = g_0$ and $\bar{h} = h_0$,*
(3) *any finite R-algebra S is isomorphic to a finite product of finite local rings,*
(4) *any finite type R-algebra A is isomorphic to a product $A \cong A' \times C$ where $A' \cong A_1 \times \ldots \times A_r$ is a product of finite local R-algebras and all the irreducible components of $C \otimes_R \kappa$ have dimension at least 1,*
(5) *if A is an étale R-algebra and $\mathfrak{n}$ is a maximal ideal of A lying over $\mathfrak{m}$ such that $\kappa \cong A/\mathfrak{n}$, then there exists an isomorphism $\varphi : A \cong R \times A'$ such that $\varphi(\mathfrak{n}) = \mathfrak{m} \times A' \subset R \times A'$.*

Proof. This is just a subset of the results from Algebra, Lemma 7.139.3. Note that part (5) above corresponds to part (8) of Algebra, Lemma 7.139.3 but is formulated slightly differently. □

Lemma 38.32.5. *If R is henselian and A is a finite R-algebra, then A is a finite product of henselian local rings.*

Proof. See Algebra, Lemma 7.139.4. □

Definition 38.32.6. A local ring R is called *strictly henselian* if it is henselian and its residue field is separably closed.

Example 38.32.7. In the case $R = \mathbf{C}[[t]]$, the étale R-algebras are finite products of the trivial extension $R \to R$ and the extensions $R \to R[X, X^{-1}]/(X^n - t)$. The latter ones factor through the open $D(t) \subset Spec(R)$, so any étale covering can be refined by the covering $\{\mathrm{id} : Spec(R) \to Spec(R)\}$. We will see below that this is a somewhat general fact on étale coverings of spectra of henselian rings. This will show that higher étale cohomology of the spectrum of a strictly henselian ring is zero.

Theorem 38.32.8. *Let $(R, \mathfrak{m}, \kappa)$ be a local ring and $\kappa \subset \kappa^{sep}$ a separable algebraic closure. There exist canonical flat local ring maps $R \to R^h \to R^{sh}$ where*

(1) *R^h, R^{sh} are filtered colimits of étale R-algebras,*
(2) *R^h is henselian, R^{sh} is strictly henselian,*
(3) *$\mathfrak{m}R^h$ (resp. $\mathfrak{m}R^{sh}$) is the maximal ideal of R^h (resp. R^{sh}), and*
(4) *$\kappa = R^h/\mathfrak{m}R^h$, and $\kappa^{sep} = R^{sh}/\mathfrak{m}R^{sh}$ as extensions of κ.*

Proof. The structure of R^h and R^{sh} is described in Algebra, Lemmas 7.139.12 and 7.139.13. □

The rings constructed in Theorem 38.32.8 are called respectively the *henselization* and the *strict henselization* of the local ring R, see Algebra, Definition 7.139.14. Many of the properties of R are reflected in its (strict) henselization.

Lemma 38.32.9. *Let R be a local ring. The following are equivalent: R is reduced, the henselization R^h of R is reduced, and the strict henselization R^{sh} of R is reduced.*

Proof. The ring maps $R \to R^h \to R^{sh}$ are faithfully flat. Hence one direction of the implications follows from Algebra, Lemma 7.146.2. Conversely, assume R is reduced. Since R^h and R^{sh} are filtered colimits of étale, hence smooth R-algebras, the result follows from Algebra, Lemma 7.145.6. □

Lemma 38.32.10. *Let R be a local ring. The following are equivalent: R is a normal domain, the henselization R^h of R is a normal domain, and the strict henselization R^{sh} of R is a normal domain.*

Proof. A preliminary remark is that a local ring is normal if and only if it is a normal domain (see Algebra, Definition 7.33.10). The ring maps $R \to R^h \to R^{sh}$ are faithfully flat. Hence one direction of the implications follows from Algebra, Lemma 7.146.3. Conversely, assume R is reduced. Since R^h and R^{sh} are filtered colimits of étale, hence smooth R-algebras, the result follows from Algebra, Lemma 7.145.7. □

Lemma 38.32.11. *Let R be a local ring. The following are equivalent: R is Noetherian, the henselization R^h of R is Noetherian, and the strict henselization R^{sh} of R is Noetherian. In this case the map of completions $R^\wedge \to (R^h)^\wedge$ is an isomorphism.*

Proof. Since $R \to R^h \to R^{sh}$ are flat local ring maps, we see that R^h or R^{sh} being Noetherian implies that R is Noetherian, see Algebra, Lemma 7.146.1. In the rest of the proof we assume R is Noetherian.

Denote $\mathfrak m \subset R$ the maximal ideal. We have seen that $\mathfrak m R^h$ is the maximal ideal of R, $R/\mathfrak m = R^h/\mathfrak m R^h$, and $R \to R^h$ is flat, see Theorem 38.32.8. Hence we see that $R^h/\mathfrak m^n R^h \cong R/\mathfrak m^n$ because $R^h/\mathfrak m^n R^h$ is flat hence free (see Algebra, Lemma 7.93.2) of rank 1 over $R/\mathfrak m^n$. This implies that $R^\wedge \to (R^h)^\wedge$ is an isomorphism.

Next we prove that $(R^h)^\wedge$ is flat over R^h. Write $R^h = colim_i R_i$ as a directed colimit of localizations of étale R-algebras. By Algebra, Lemma 7.35.5 it suffices to show that $(R^h)^\wedge$ is flat over each R_i. This holds because $R_i^\wedge = (R^h)^\wedge$ (by first paragraph proof) is flat over R_i (see Algebra, Lemma 7.90.4). It follows from the flatness of $R^h \to (R^h)^\wedge$ and the Noetherianness of $R^\wedge = (R^h)^\wedge$ (see Algebra, Lemma 7.90.10) that R^h is Noetherian, see Algebra, Lemma 7.146.1.

By Algebra, Lemma 7.90.9 the completion $(R^{sh})^\wedge$ is a Noetherian local ring (as we are completing with respect to the finitely generated maximal ideal $\mathfrak m R^{sh}$). Hence if we can show that $(R^{sh})^\wedge$ is flat over R^{sh} then R^{sh} is Noetherian by Algebra, Lemma 7.146.1 again. Using the limit argument of the second paragraph above we see that it suffices to show that $(R^{sh})^\wedge$ is flat over R.

Pick a separable algebraic extension $\kappa \subset \kappa^{sep}$ which is separably algebraically closed. Pick a basis $\{\overline{x}_j\}_{j\in J}$ of κ^{sep} over κ. Let R^{sh} be the strict henselization of R with respect to $\kappa \subset \kappa^{sep}$. Choose $x_j \in R^{sh}$ mapping to $\overline{x}_j$ in in the residue field $\kappa^{sh} = R^{sh}/\mathfrak m R^{sh}$ of the strict henselization. Arguing as in the first paragraph of the proof, $R^{sh}/\mathfrak m^n R^{sh}$ is free on the elements x_j as a module over $R/\mathfrak m^n$, see Algebra, Lemma 7.93.1. It follows that $(R^{sh})^\wedge$ is isomorphic to the $\mathfrak m$-adic completion of $\bigoplus_{j\in J} R$ as an R-module. By More on Algebra, Lemma 12.20.2 we see this is flat over R and we win. □

Lemma 38.32.12. *Given any local ring R we have* $\dim(R) = \dim(R^h) = \dim(R^{sh})$.

Proof. To see this note that $R \to R^{sh}$ is a flat local ring homomorphism (see Algebra, Section 7.139) and hence $\dim(R^{sh}) \geq \dim(R)$ by going down, see Algebra, Section 7.36. For the converse, we write $R^{sh} = colim\, R_i$ as a directed colimit of local rings R_i each of which is a localization of an étale R-algebra. We can do this by the construction of the strict henselization in Algebra, Section 7.139. Now if $\mathfrak q_0 \subset \mathfrak q_1 \subset \ldots \subset \mathfrak q_n$ is a chain of prime ideals in R^{sh}, then for some sufficiently large i the sequence

$$R_i \cap \mathfrak q_0 \subset R_i \cap \mathfrak q_1 \subset \ldots \subset R_i \cap \mathfrak q_n$$

is a chain of primes in R_i. Thus we see that $\dim(R^{sh}) \leq \sup_i \dim(R_i)$. But by the result of Descent, Lemma 31.17.3 we have $\dim(R_i) = \dim(R)$ for each i and we win. □

Lemma 38.32.13. *Given a Noetherian local ring R we have depth(R) = depth(R^h) = depth(R^{sh}).*

Proof. By Lemma 38.32.11 we know that R^h and R^{sh} are Noetherian. Hence the lemma follows from Algebra, Lemma 7.145.1. $\square$

Lemma 38.32.14. *Let R be a Noetherian local ring. The following are equivalent: R is Cohen-Macaulay, the henselization R^h of R is Cohen-Macaulay, and the strict henselization R^{sh} of R is Cohen-Macaulay.*

Proof. By Lemma 38.32.11 we know that R^h and R^{sh} are Noetherian, hence the lemma makes sense. Since we have $\text{depth}(R) = \text{depth}(R^h) = \text{depth}(R^{sh})$ and $\dim(R) = \dim(R^h) = \dim(R^{sh})$ by Lemmas 38.32.13 and 38.32.12 we conclude. $\square$

Lemma 38.32.15. *Let R be a Noetherian local ring. The following are equivalent: R is a regular local ring, the henselization R^h of R is a regular local ring, and the strict henselization R^{sh} of R is a regular local ring.*

Proof. By Lemma 38.32.11 we know that R^h and R^{sh} are Noetherian, hence the lemma makes sense. Let $\mathfrak{m}$ be the maximal ideal of R. Let $x_1, \ldots, x_t \in \mathfrak{m}$ be a minimal system of generators of $\mathfrak{m}$, i.e., such that the images in $\mathfrak{m}/\mathfrak{m}^2$ form a basis over $\kappa = R/\mathfrak{m}$. Because $R \to R^h$ and $R \to R^{sh}$ are faithfully flat, it follows that the images $x_1^h, \ldots, x_t^h$ in R^h, resp. $x_1^{sh}, \ldots, x_t^{sh}$ in R^{sh} are a minimal system of generators for $\mathfrak{m}^h = \mathfrak{m}R^h$, resp. $\mathfrak{m}^{sh} = \mathfrak{m}R^{sh}$. Regularity of R by definition means $t = \dim(R)$ and similarly for R^h and R^{sh}. Hence the lemma follows from the equality of dimensions $\dim(R) = \dim(R^h) = \dim(R^{sh})$ of Lemma 38.32.12 $\square$

38.33. Stalks of the structure sheaf

In this section we identify the stalk of the structure sheaf at a geometric point with the strict henselization of the local ring at the corresponding ``usual" point.

Lemma 38.33.1. *Let S be a scheme. Let $\overline{s}$ be a geometric point of S lying over $s \in S$. Let $\kappa = \kappa(s)$ and let $\kappa \subset \kappa^{sep} \subset \kappa(\overline{s})$ denote the separable algebraic closure of κ in $\kappa(\overline{s})$. Then there is a canonical identification*

$$(\mathcal{O}_{S,s})^{sh} \cong \mathcal{O}_{S,\overline{s}}$$

where the left hand side is the strict henselization of the local ring $\mathcal{O}_{S,s}$ as described in Theorem 38.32.8 and right hand side is the stalk of the structure sheaf $\mathcal{O}_S$ on $S_{étale}$ at the geometric point $\overline{s}$.

Proof. Let $Spec(A) \subset S$ be an affine neighbourhood of s. Let $\mathfrak{p} \subset A$ be the prime ideal corresponding to s. With these choices we have canonical isomorphisms $\mathcal{O}_{S,s} = A_{\mathfrak{p}}$ and $\kappa(s) = \kappa(\mathfrak{p})$. Thus we have $\kappa(\mathfrak{p}) \subset \kappa^{sep} \subset \kappa(\overline{s})$. Recall that

$$\mathcal{O}_{S,\overline{s}} = colim_{(U,\overline{u})}\, \mathcal{O}(U)$$

where the limit is over the étale neighbourhoods of $(S, \overline{s})$. A cofinal system is given by those étale neighbourhoods $(U, \overline{u})$ such that U is affine and $U \to S$ factors through $Spec(A)$. In other words, we see that

$$\mathcal{O}_{S,\overline{s}} = colim_{(B,\mathfrak{q},\phi)}\, B$$

where the colimit is over étale A-algebras B endowed with a prime $\mathfrak{q}$ lying over $\mathfrak{p}$ and a $\kappa(\mathfrak{p})$-algebra map $\phi : \kappa(\mathfrak{q}) \to \kappa(\overline{s})$. Note that since $\kappa(\mathfrak{q})$ is finite separable over $\kappa(\mathfrak{p})$ the image of ϕ is contained in κ^{sep}. Via these translations the result of the lemma is equivalent to the result of Algebra, Lemma 7.139.24. ☐

Definition 38.33.2. Let S be a scheme. Let $\overline{s}$ be a geometric point of S lying over the point $s \in S$.

(1) The *étale local ring of S at $\overline{s}$* is the stalk of the structure sheaf $\mathcal{O}_S$ on $S_{étale}$ at $\overline{s}$. We sometimes call this the *strict henselization of $\mathcal{O}_{S,s}$* relative to the geometric point $\overline{s}$. Notation used: $\mathcal{O}_{S,\overline{s}} = \mathcal{O}_{S,s}^{sh}$.
(2) The *henselization of $\mathcal{O}_{S,s}$* is the henselization of the local ring of S at s. See Algebra, Definition 7.139.14, and Theorem 38.32.8. Notation: $\mathcal{O}_{S,s}^h$.
(3) The *strict henselization of S at $\overline{s}$* is the scheme $Spec(\mathcal{O}_{S,s}^{sh})$.
(4) The *henselization of S at s* is the scheme $Spec(\mathcal{O}_{S,s}^h)$.

Lemma 38.33.3. *Let S be a scheme. Let $s \in S$. Then we have*

$$\mathcal{O}_{S,s}^h = colim_{(U,u)} \mathcal{O}(U)$$

where the colimit is over the filtered category of étale neighbourhoods (U, u) of (S, s) such that $\kappa(s) = \kappa(u)$.

Proof. This lemma is a copy of More on Morphisms, Lemma 33.25.5. ☐

Remark 38.33.4. Let S be a scheme. Let $s \in S$. If S is locally noetherian then $\mathcal{O}_{S,s}^h$ is also noetherian and it has the same completion:

$$\widehat{\mathcal{O}_{S,s}} \cong \widehat{\mathcal{O}_{S,s}^h}.$$

In particular, $\mathcal{O}_{S,s} \subset \mathcal{O}_{S,s}^h \subset \widehat{\mathcal{O}_{S,s}}$. The henselization of $\mathcal{O}_{S,s}$ is in general much smaller than its completion and inherits many of its properties. For example, if $\mathcal{O}_{S,s}$ is reduced, then so is $\mathcal{O}_{S,s}^h$, but this is not true for the completion in general. Insert future references here.

Lemma 38.33.5. *Let S be a scheme. The small étale site $S_{étale}$ endowed with its structure sheaf $\mathcal{O}_S$ is a locally ringed site, see Modules on Sites, Definition 16.34.4.*

Proof. This follows because the stalks $\mathcal{O}_{S,s}^{sh} = \mathcal{O}_{S,\overline{s}}$ are local, and because $S_{étale}$ has enough points, see Lemma 38.33.1, Theorem 38.29.10, and Remarks 38.29.11. See Modules on Sites, Lemmas 16.34.2 and 16.34.3 for the fact that this implies the small étale site is locally ringed. ☐

38.34. Functoriality of small étale topos

Sofar we haven't yet discussed the functoriality of the étale site, in other words what happens when given a morphism of schemes. A precise formal discussion can be found in Topologies, Section 30.4. In this and the next sections we discuss this material briefly specifically in the setting of small étale sites.

Let $f : X \to Y$ be a morphism of schemes. We obtain a functor

$$u : Y_{étale} \longrightarrow X_{étale}, \quad V/Y \longmapsto X \times_Y V/X. \tag{38.34.0.1}$$

This functor has the following important properties

(1) $u(\text{fi}) = \text{fi}$,
(2) u preserves fibre products,
(3) if $\{V_j \to V\}$ is a covering in $Y_{étale}$, then $\{u(V_j) \to u(V)\}$ is a covering in $X_{étale}$.

Each of these is easy to check (omitted). As a consequence we obtain what is called a *morphism of sites*

$$f_{small} : X_{étale} \longrightarrow Y_{étale},$$

see Sites, Definition 9.14.1 and Sites, Proposition 9.14.6. It is not necessary to know about the abstract notion in detail in order to work with étale sheaves and étale cohomology. It usually suffices to know that there are functors $f_{small,*}$ (pushforward) and f_{small}^{-1} (pullback) on étale sheaves, and to know some of their simple properties. We will discuss these properties in the next sections, but we will sometimes refer to the more abstract material for proofs since that is often the natural setting to prove them.

38.35. Direct images

Let us define the pushforward of a presheaf.

Definition 38.35.1. Let $f : X \to Y$ be a morphism of schemes. Let $\mathcal{F}$ a presheaf of sets on $X_{étale}$. The *direct image*, or *pushforward* of $\mathcal{F}$ (under f) is

$$f_*\mathcal{F} : Y_{étale}^{opp} \longrightarrow Sets, \quad (V/Y) \longmapsto \mathcal{F}(X \times_Y V/X).$$

We sometimes write $f_* = f_{small,*}$ to distinguish from other direct image functors (such as usual Zariski pushforward or $f_{big,*}$).

This is a well-defined étale presheaf since the base change of an étale morphism is again étale. A more categorical way of saying this is that $f_*\mathcal{F}$ is the composition of functors $\mathcal{F} \circ u$ where u is as in Equation (38.34.0.1). This makes it clear that the construction is functorial in the presheaf $\mathcal{F}$ and hence we obtain a functor

$$f_* = f_{small,*} : PSh(X_{étale}) \longrightarrow PSh(Y_{étale})$$

Note that if $\mathcal{F}$ is a presheaf of abelian groups, then $f_*\mathcal{F}$ is also a presheaf of abelian groups and we obtain

$$f_* = f_{small,*} : PAb(X_{étale}) \longrightarrow PAb(Y_{étale})$$

as before (i.e., defined by exactly the same rule).

Remark 38.35.2. We claim that the direct image of a sheaf is a sheaf. Namely, if $\{V_j \to V\}$ is an étale covering in $Y_{étale}$ then $\{X \times_Y V_j \to X \times_Y V\}$ is an étale covering in $X_{étale}$. Hence the sheaf condition for $\mathcal{F}$ with respect to $\{X \times_Y V_i \to X \times_Y V\}$ is equivalent to the sheaf condition for $f_*\mathcal{F}$ with respect to $\{V_i \to V\}$. Thus if $\mathcal{F}$ is a sheaf, so is $f_*\mathcal{F}$.

Definition 38.35.3. Let $f : X \to Y$ be a morphism of schemes. Let $\mathcal{F}$ a sheaf of sets on $X_{étale}$. The *direct image*, or *pushforward* of $\mathcal{F}$ (under f) is

$$f_*\mathcal{F} : Y_{étale}^{opp} \longrightarrow Sets, \quad (V/Y) \longmapsto \mathcal{F}(X \times_Y V/X)$$

which is a sheaf by Remark 38.35.2. We sometimes write $f_* = f_{small,*}$ to distinguish from other direct image functors (such as usual Zariski pushforward or $f_{big,*}$).

The exact same discussion as above applies and we obtain functors

$$f_* = f_{small,*} : Sh(X_{étale}) \longrightarrow Sh(Y_{étale})$$

and

$$f_* = f_{small,*} : Ab(X_{étale}) \longrightarrow Ab(Y_{étale})$$

called *direct image* again.

The functor f_* on abelian sheaves is left exact. (See Homology, Section 10.5 for what it means for a functor between abelian categories to be left exact.) Namely, if $0 \to \mathcal{F}_1 \to$

$\mathcal{F}_2 \to \mathcal{F}_3$ is exact on $X_{étale}$, then for every $U/X \in Ob(X_{étale})$ the sequence of abelian groups $0 \to \mathcal{F}_1(U) \to \mathcal{F}_2(U) \to \mathcal{F}_3(U)$ is exact. Hence for every $V/Y \in Ob(Y_{étale})$ the sequence of abelian groups $0 \to f_*\mathcal{F}_1(V) \to f_*\mathcal{F}_2(V) \to f_*\mathcal{F}_3(V)$ is exact, because this is the previous sequence with $U = X \times_Y V$.

Definition 38.35.4. Let $f : X \to Y$ be a morphism of schemes. The right derived functors $\{R^p f_*\}_{p\geq 1}$ of $f_* : Ab(X_{étale}) \to Ab(Y_{étale})$ are called *higher direct images*.

The higher direct images and their derived category variants are discussed in more detail in (insert future reference here).

38.36. Inverse image

In this section we briefly discuss pullback of sheaves on the small étale sites. The precise construction of this is in Topologies, Section 30.4.

Definition 38.36.1. Let $f : X \to Y$ be a morphism of schemes. The *inverse image*, or *pullback*[3] functors are the functors

$$f^{-1} = f^{-1}_{small} : Sh(Y_{étale}) \longrightarrow Sh(X_{étale})$$

and

$$f^{-1} = f^{-1}_{small} : Ab(Y_{étale}) \longrightarrow Ab(X_{étale})$$

which are left adjoint to $f_* = f_{small,*}$. Thus f^{-1} thus characterized by the fact that

$$Hom_{Sh(X_{étale})}(f^{-1}\mathcal{G}, \mathcal{F}) = Hom_{Sh(Y_{étale})}(\mathcal{G}, f_*\mathcal{F})$$

functorially, for any $\mathcal{F} \in Sh(X_{étale})$ and $\mathcal{G} \in Sh(Y_{étale})$. We similarly have

$$Hom_{Ab(X_{étale})}(f^{-1}\mathcal{G}, \mathcal{F}) = Hom_{Ab(Y_{étale})}(\mathcal{G}, f_*\mathcal{F})$$

for $\mathcal{F} \in Ab(X_{étale})$ and $\mathcal{G} \in Ab(Y_{étale})$.

It is not trivial that such an adjoint exists. On the other hand, it exists in a fairly general setting, see Remark 38.36.3 below. The general machinery shows that $f^{-1}\mathcal{G}$ is the sheaf associated to the presheaf

$$U/X \longmapsto colim_{U\to X\times_Y V}\mathcal{G}(V/Y) \tag{38.36.1.1}$$

where the colimit is over the category of pairs $(V/Y, \varphi : U/X \to X\times_Y V/X)$. To see this apply Sites, Proposition 9.14.6 to the functor u of Equation (38.34.0.1) and use the description of $u_s = (u_p\ )^\#$ in Sites, Sections 9.13 and 9.5. We will occasionally use this formula for the pullback in order to prove some of its basic properties.

Lemma 38.36.2. *Let $f : X \to Y$ be a morphism of schemes.*

(1) *The functor $f^{-1} : Ab(Y_{étale}) \to Ab(X_{étale})$ is exact.*
(2) *The functor $f^{-1} : Sh(Y_{étale}) \to Sh(X_{étale})$ is exact, i.e., it commutes with finite limits and colimits, see Categories, Definition 4.21.1.*
(3) *Let $\overline{x} \to X$ be a geometric point. Let $\mathcal{G}$ be a sheaf on $Y_{étale}$. Then there is a canonical identification*

$$(f^{-1}\mathcal{G})_{\overline{x}} = \mathcal{G}_{\overline{y}}.$$

where $\overline{y} = f \circ \overline{x}$.
(4) *For any $V \to Y$ étale we have $f^{-1}h_V = h_{X\times_Y V}$.*

[3] We use the notation f^{-1} for pullbacks of sheaves of sets or sheaves of abelian groups, and we reserve f^* for pullbacks of sheaves of modules via a morphism of ringed sites/topoi.

Proof. The exactness of f^{-1} on sheaves of sets is a consequence of Sites, Proposition 9.14.6 applied to our functor u of Equation (38.34.0.1). In fact the exactness of pullback is part of the definition of of a morphism of topoi (or sites if you like). Thus we see (2) holds. It implies part (1) since given an abelian sheaf $\mathcal{G}$ on $Y_{étale}$ the underlying sheaf of sets of $f^{-1}\mathcal{F}$ is the same as f^{-1} of the underlying sheaf of sets of $\mathcal{F}$, see Sites, Section 9.38. See also Modules on Sites, Lemma 16.27.2. In the literature (1) and (2) are sometimes deduced from (3) via Theorem 38.29.10.

Part (3) is a general fact about stalks of pullbacks, see Sites, Lemma 9.30.1. We will also prove (3) directly as follows. Note that by Lemma 38.29.9 taking stalks commutes with sheafification. Now recall that $f^{-1}\mathcal{G}$ is the sheaf associated to the presheaf

$$U \longrightarrow colim_{U \to X \times_Y V} \mathcal{G}(V),$$

see Equation (38.36.1.1). Thus we have

$$\begin{aligned}
(f^{-1}\mathcal{G})_{\overline{x}} &= colim_{(U,\overline{u})}\, f^{-1}\mathcal{G}(U) \\
&= colim_{(U,\overline{u})}\, colim_{a : U \to X \times_Y V} \mathcal{G}(V) \\
&= colim_{(V,\overline{v})}\, \mathcal{G}(V) \\
&= \mathcal{G}_{\overline{y}}
\end{aligned}$$

in the third equality the pair $(U, \overline{u})$ and the map $a : U \to X \times_Y V$ corresponds to the pair $(V, a \circ \overline{u})$.

Part (4) can be proved in a similar manner by identfying the colimits which define $f^{-1}h_V$. Or you can use Yoneda's lemma (Categories, Lemma 4.3.5) and the functorial equalities

$$Mor_{Sh(X_{étale})}(f^{-1}h_V, \mathcal{F}) = Mor_{Sh(Y_{étale})}(h_V, f_*\mathcal{F}) = f_*\mathcal{F}(V) = \mathcal{F}(X \times_Y V)$$

combined with the fact that representable presheaves are sheaves. See also Sites, Lemma 9.13.5 for a completely general result. □

The pair of functors (f_*, f^{-1}) define a morphism of small étale topoi

$$f_{small} : Sh(X_{étale}) \longrightarrow Sh(Y_{étale})$$

Many generalities on cohomology of sheaves hold for topoi and morphisms of topoi. We will try to point out when results are general and when they are specific to the étale topos.

Remark 38.36.3. More generally, let $\mathcal{C}_1, \mathcal{C}_2$ be sites, and assume they have final objects and fibre products. Let $u : \mathcal{C}_2 \to \mathcal{C}_1$ be a functor satisfying:

(1) if $\{V_i \to V\}$ is a covering of $\mathcal{C}_2$, then $\{u(V_i) \to V_i\}$ is a covering of $\mathcal{C}_1$ (we say that u is *continuous*), and
(2) u commutes with finite limits (i.e., u is left exact, i.e., u preserves fibre products and final objects).

Then one can define $f_* : Sh(\mathcal{C}_1) \to Sh(\mathcal{C}_2)$ by $f_*\mathcal{F}(V) = \mathcal{F}(u(V))$. Moreover, there exists an exact functor f^{-1} which is left adjoint to f_*, see Sites, Definition 9.14.1 and Proposition 9.14.6. Warning: It is not enough to require simply that u is continuous and commutes with fibre products in order to get a morphism of topoi.

38.37. Functoriality of big topoi

Given a morphism of schemes $f : X \to Y$ there are a whole host of morphisms of topoi associated to f, see Topologies, Section 30.9 for a list. Perhaps the most used ones are the morphisms of topoi

$$f_{big} = f_{big,\tau} : Sh((Sch/X)_\tau) \longrightarrow Sh((Sch/Y)_\tau)$$

where $\tau \in \{Zariski, étale, smooth, syntomic, fppf\}$. These each correspond to a continuous functor

$$(Sch/Y)_\tau \longrightarrow (Sch/X)_\tau, \quad V/Y \longmapsto X \times_Y V/X$$

which preserves final objects, fibre products and covering, and hence defines a morphism of sites

$$f_{big} : (Sch/X)_\tau \longrightarrow (Sch/Y)_\tau.$$

See Topologies, Sections 30.3, 30.4, 30.5, 30.6, and 30.7. In particular, pushforward along f_{big} is given by the rule

$$(f_{big,*}\mathcal{F})(V/Y) = \mathcal{F}(X \times_Y V/X)$$

It turns out that these morphisms of topoi have an inverse image functor f_{big}^{-1} which is very easy to describe. Namely, we have

$$(f_{big}^{-1}\mathcal{G})(U/X) = \mathcal{G}(U/Y)$$

where the structure morphism of U/Y is the composition of the structure morphism $U \to X$ with f, see Topologies, Lemmas 30.3.15, 30.4.15, 30.5.10, 30.6.10, and 30.7.12.

38.38. Functoriality and sheaves of modules

In this section we are going to reformulate some of the material explained in Descent, Section 31.6 in the setting of étale topologies. Let $f : X \to Y$ be a morphism of schemes. We have seen above, see Sections 38.34, 38.35, and 38.36 that this induces a morphism f_{small} of small étale sites. In Descent, Remark 31.6.4 we have seen that f also induces a natural map

$$f_{small}^\sharp : \mathcal{O}_{Y_{étale}} \longrightarrow f_{small,*}\mathcal{O}_{X_{étale}}$$

of sheaves of rings on $Y_{étale}$ such that $(f_{small}, f_{small}^\sharp)$ is a morphism of ringed sites. See Modules on Sites, Definition 16.6.1 for the definition of a morphism of ringed sites. Let us just recall here that $f_{small}^\sharp$ is defined by the compatible system of maps

$$\mathrm{pr}_V^\sharp : \mathcal{O}(V) \longrightarrow \mathcal{O}(X \times_Y V)$$

for V varying over the objects of $Y_{étale}$.

It is clear that this construction is compatible with compositions of morphisms of schemes. More precisely, if $f : X \to Y$ and $g : Y \to Z$ are morphisms of schemes, then we have

$$(g_{small}, g_{small}^\sharp) \circ (f_{small}, f_{small}^\sharp) = ((g \circ f)_{small}, (g \circ f)_{small}^\sharp)$$

as morphisms of ringed topoi. Moreover, by Modules on Sites, Definition 16.13.1 we see that given a morphism $f : X \to Y$ of schemes we get well defined pullback and direct image functors

$$f_{small}^* : Mod(\mathcal{O}_{Y_{étale}}) \longrightarrow Mod(\mathcal{O}_{X_{étale}}),$$
$$f_{small,*} : Mod(\mathcal{O}_{X_{étale}}) \longrightarrow Mod(\mathcal{O}_{Y_{étale}})$$

which are adjoint in the usual way. If $g : Y \to Z$ is another morphism of schemes, then we have $(g \circ f)^*_{small} = f^*_{small} \circ g^*_{small}$ and $(g \circ f)_{small,*} = g_{small,*} \circ f_{small,*}$ because of what we said about compositions.

There is quite a bit of difference between the category of all $\mathcal{O}_X$ modules on X and the category between all $\mathcal{O}_{X_{étale}}$-modules on $X_{étale}$. But the results of Descent, Section 31.6 tell us that there is not much difference between considering quasi-coherent modules on S and quasi-coherent modules on $S_{étale}$. (We have already seen this in Theorem 38.17.4 for example.) In particular, if $f : X \to Y$ is any morphism of schemes, then the pullback functors f^*_{small} and f^* match for quasi-coherent sheaves, see Descent, Proposition 31.6.14. Moreover, the same is true for pushforward provided f is quasi-compact and quasi-separated, see Descent, Lemma 31.6.15.

A few words about functoriality of the structure sheaf on big sites. Let $f : X \to Y$ be a morphism of schemes. Choose any of the topologies $\tau \in \{Zariski, étale, smooth, syntomic, fppf\}$. Then the morphism $f_{big} : (Sch/X)_\tau \to (Sch/Y)_\tau$ becomes a morphism of ringed sites by a map

$$f^\sharp_{big} : \mathcal{O}_Y \longrightarrow f_{big,*}\mathcal{O}_X$$

see Descent, Remark 31.6.4. In fact it is given by the same construction as in the case of small sites explained above.

38.39. Comparing big and small topoi

Let X be a scheme. In Topologies, Lemma 30.4.13 we have introduced comparison morphisms $\pi_X : (Sch/X)_{étale} \to X_{étale}$ and $i_X : Sh(X_{étale}) \to Sh((Sch/X)_{étale})$ with $\pi_X \circ i_X = \text{id}$ and $\pi_{X,*} = i_X^{-1}$. In Descent, Remark 31.6.4 we have extended these to a morphism of ringed sites

$$\pi_X : ((Sch/X)_{étale}, \mathcal{O}) \to (X_{étale}, \mathcal{O}_X)$$

and a morphism of ringed topoi

$$i_X : (Sh(X_{étale}), \mathcal{O}_X) \to (Sh((Sch/X)_{étale}), \mathcal{O})$$

Note that the restriction $i_X^{-1} = \pi_{X,*}$ (see Topologies, Definition 30.4.14) transforms $\mathcal{O}$ into $\mathcal{O}_X$. Hence $i_X^*\mathcal{F} = i_X^{-1}\mathcal{F}$ for any $\mathcal{O}$-module $\mathcal{F}$ on $(Sch/X)_{étale}$. In particular i_X^* is exact. This functor is often denoted $\mathcal{F} \mapsto \mathcal{F}|_{X_{étale}}$.

Lemma 38.39.1. *Let X be a scheme.*

(1) *$\mathcal{I}|_{X_{étale}}$ is injective in $Ab(X_{étale})$ for $\mathcal{I}$ injective in $Ab((Sch/X)_{étale})$, and*
(2) *$\mathcal{I}|_{X_{étale}}$ is injective in $Mod(X_{étale}, \mathcal{O}_X)$ for $\mathcal{I}$ injective in $Mod((Sch/X)_{étale}, \mathcal{O})$.*

Proof. This follows formally from the fact that the restriction functor $\pi_{X,*} = i_X^{-1}$ is an exact left adjoint of $i_{X,*}$, see Homology, Lemma 10.22.1. □

Let $f : X \to Y$ be a morphism of schemes. The commutative diagram of Topologies, Lemma 30.4.16 (3) leads to a commutative diagram of ringed sites

$$\begin{tikzcd}
(T_{étale}, \mathcal{O}_T) \arrow[d, "f_{small}"'] & ((Sch/T)_{étale}, \mathcal{O}) \arrow[l, "\pi_T"'] \arrow[d, "f_{big}"] \\
(S_{étale}, \mathcal{O}_S) & ((Sch/S)_{étale}, \mathcal{O}) \arrow[l, "\pi_S"']
\end{tikzcd}$$

as one easily sees by writing out the definitions of $f^\sharp_{small}$, $f^\sharp_{big}$, $\pi^\sharp_S$, and $\pi^\sharp_T$. In particular this means that

$$(f_{big,*}\mathcal{F})|_{Y_{\acute{e}tale}} = f_{small,*}(\mathcal{F}|_{X_{\acute{e}tale}}) \tag{38.39.1.1}$$

for any sheaf $\mathcal{F}$ on $(Sch/X)_{\acute{e}tale}$ and if $\mathcal{F}$ is a sheaf of $\mathcal{O}$-modules, then (38.39.1.1) is an isomorphism of $\mathcal{O}_Y$-modules on $Y_{\acute{e}tale}$.

Lemma 38.39.2. *Let $f : X \to Y$ be a morphism of schemes.*

(1) *For any $\mathcal{F} \in Ab((Sch/X)_{\acute{e}tale})$ we have*
$$(Rf_{big,*}\mathcal{F})|_{Y_{\acute{e}tale}} = Rf_{small,*}(\mathcal{F}|_{X_{\acute{e}tale}}).$$
in $D(Y_{\acute{e}tale})$.

(2) *For any object $\mathcal{F}$ of $Mod((Sch/X)_{\acute{e}tale}, \mathcal{O})$ we have*
$$(Rf_{big,*}\mathcal{F})|_{Y_{\acute{e}tale}} = Rf_{small,*}(\mathcal{F}|_{X_{\acute{e}tale}}).$$
in $D(Mod(Y_{\acute{e}tale}, \mathcal{O}_Y))$.

Proof. Follows immediately from Lemma 38.39.1 and (38.39.1.1) on choosing an injective resolution of $\mathcal{F}$. $\square$

38.40. Recovering morphisms

In this section we prove that the rule which associates to a scheme its locally ringed small étale topos is fully faithful in a suitable sense, see Theorem 38.40.5.

Lemma 38.40.1. *Let $f : X \to Y$ be a morphism of schemes. The morphism of ringed sites $(f_{small}, f^\sharp_{small})$ associated to f is a morphism of locally ringed sites, see Modules on Sites, Definition 16.34.8.*

Proof. Note that the assertion makes sense since we have seen that $(X_{\acute{e}tale}, \mathcal{O}_{X_{\acute{e}tale}})$ and $(Y_{\acute{e}tale}, \mathcal{O}_{Y_{\acute{e}tale}})$ are locally ringed sites, see Lemma 38.33.5. Moreover, we know that $X_{\acute{e}tale}$ has enough points, see Theorem 38.29.10 and Remarks 38.29.11. Hence it suffices to prove that $(f_{small}, f^\sharp_{small})$ satisfies condition (3) of Modules on Sites, Lemma 16.34.7. To see this take a point p of $X_{\acute{e}tale}$. By Lemma 38.29.12 p corresponds to a geometric point $\overline{x}$ of X. By Lemma 38.36.2 the point $q = f_{small} \circ p$ corresponds to the geometric point $\overline{y} = f \circ \overline{x}$ of Y. Hence the assertion we have to prove is that the induced map of stalks
$$\mathcal{O}_{Y,\overline{y}} \longrightarrow \mathcal{O}_{X,\overline{x}}$$
is a local ring map. Suppose that $a \in \mathcal{O}_{Y,\overline{y}}$ is an element of the left hand side which maps to an element of the maximal ideal of the right hand side. Suppose that a is the equivalence class of a triple $(V, \overline{v}, a)$ with $V \to Y$ étale, $\overline{v} : \overline{x} \to V$ over Y, and $a \in \mathcal{O}(V)$. It maps to the equivalence class of $(X \times_Y V, \overline{x} \times \overline{v}, \mathrm{pr}_V^\sharp(a))$ in the local ring $\mathcal{O}_{X,\overline{x}}$. But it is clear that being in the maximal ideal means that pulling back $\mathrm{pr}_V^\sharp(a)$ to an element of $\kappa(\overline{x})$ gives zero. Hence also pulling back a to $\kappa(\overline{x})$ is zero. Which means that a lies in the maximal ideal of $\mathcal{O}_{Y,\overline{y}}$. $\square$

Lemma 38.40.2. *Let X, Y be schemes. Let $f : X \to Y$ be a morphism of schemes. Let t be a 2-morphism from $(f_{small}, f^\sharp_{small})$ to itself, see Modules on Sites, Definition 16.8.1. Then $t = id$.*

Proof. This means that $t : f_{small}^{-1} \to f_{small}^{-1}$ is a transformation of functors such that the diagram

$$\begin{tikzcd} f_{small}^{-1}\mathcal{O}_Y \arrow[dr, "f_{small}^\sharp"'] & & f_{small}^{-1}\mathcal{O}_Y \arrow[ll, "t"] \arrow[dl, "f_{small}^\sharp"] \\ & \mathcal{O}_X & \end{tikzcd}$$

is commutative. Suppose $V \to Y$ is étale with V affine. By Morphisms, Lemma 24.38.2 we may choose an immersion $i : V \to \mathbf{A}^n_Y$ over Y. In terms of sheaves this means that i induces an injection $h_i : h_V \to \prod_{j=1,\ldots,n} \mathcal{O}_Y$ of sheaves. The base change i' of i to X is an immersion (Schemes, Lemma 21.18.2). Hence $i' : X \times_Y V \to \mathbf{A}^n_X$ is an immersion, which in turn means that $h_{i'} : h_{X \times_Y V} \to \prod_{j=1,\ldots,n} \mathcal{O}_X$ is an injection of sheaves. Via the identification $f_{small}^{-1}h_V = h_{X\times_Y V}$ of Lemma 38.36.2 the map $h_{i'}$ is equal to

$$f_{small}^{-1}h_V \xrightarrow{f^{-1}h_i} \prod\nolimits_{j=1,\ldots,n} f_{small}^{-1}\mathcal{O}_Y \xrightarrow{\prod f^\sharp} \prod\nolimits_{j=1,\ldots,n} \mathcal{O}_X$$

(verification omitted). This means that the map $t : f_{small}^{-1}h_V \to f_{small}^{-1}h_V$ fits into the commutative diagram

$$\begin{tikzcd} f_{small}^{-1}h_V \arrow[r, "f^{-1}h_i"] \arrow[d, "t"] & \prod_{j=1,\ldots,n} f_{small}^{-1}\mathcal{O}_Y \arrow[r, "\prod f^\sharp"] \arrow[d, "\prod t"] & \prod_{j=1,\ldots,n} \mathcal{O}_X \arrow[d, "\mathrm{id}"] \\ f_{small}^{-1}h_V \arrow[r, "f^{-1}h_i"] & \prod_{j=1,\ldots,n} f_{small}^{-1}\mathcal{O}_Y \arrow[r, "\prod f^\sharp"] & \prod_{j=1,\ldots,n} \mathcal{O}_X \end{tikzcd}$$

The commutativity of the right square holds by our assumption on t explained above. Since the composition of the horizontal arrows is injective by the discussion above we conclude that the left vertical arrow is the identity map as well. Any sheaf of sets on $Y_{étale}$ admits a surjection from a (huge) coproduct of sheaves of the form h_V with V affine (combine Lemma 38.21.2 with Sites, Lemma 9.12.4). Thus we conclude that $t : f_{small}^{-1} \to f_{small}^{-1}$ is the identity transformation as desired. $\square$

Lemma 38.40.3. *Let X, Y be schemes. Any two morphisms $a, b : X \to Y$ of schemes for which there exists a 2-isomorphism $(a_{small}, a_{small}^\sharp) \cong (b_{small}, b_{small}^\sharp)$ in the 2-category of ringed topoi are equal.*

Proof. Let us argue this carefully since it is a bit confusing. Let $t : a_{small}^{-1} \to b_{small}^{-1}$ be the 2-isomorphism. Consider any open $V \subset Y$. Note that h_V is a subsheaf of the final sheaf $*$. Thus both $a_{small}^{-1}h_V = h_{a^{-1}(V)}$ and $b_{small}^{-1}h_V = h_{b^{-1}(V)}$ are subsheaves of the final sheaf. Thus the isomorphism

$$t : a_{small}^{-1}h_V = h_{a^{-1}(V)} \to b_{small}^{-1}h_V = h_{b^{-1}(V)}$$

has to be the identity, and $a^{-1}(V) = b^{-1}(V)$. It follows that a and b are equal on underlying topological spaces. Next, take a section $f \in \mathcal{O}_Y(V)$. This determines and is determined by a map of sheaves of sets $f : h_V \to \mathcal{O}_Y$. Pull this back and apply t to get a commutative

diagram

$$\begin{tikzcd} h_{b^{-1}(V)} \arrow[r, equal] & b_{small}^{-1} h_V \arrow[d, "b_{small}^{-1}(f)"] & & a_{small}^{-1} h_V \arrow[ll, "t"'] \arrow[d, "a_{small}^{-1}(f)"] \arrow[r, equal] & h_{a^{-1}(V)} \\ & b_{small}^{-1}\mathcal{O}_Y \arrow[dr, "b^\sharp"'] & & a_{small}^{-1}\mathcal{O}_Y \arrow[ll, "t"'] \arrow[dl, "a^\sharp"] & \\ & & \mathcal{O}_X & & \end{tikzcd}$$

where the triangle is commutative by definition of a 2-isomorphism in Modules on Sites, Section 16.8. Above we have seen that the composition of the top horizontal arrows comes from the identity $a^{-1}(V) = b^{-1}(V)$. Thus the commutativity of the diagram tells us that $a_{small}^\sharp(f) = b_{small}^\sharp(f)$ in $\mathcal{O}_X(a^{-1}(V)) = \mathcal{O}_X(b^{-1}(V))$. Since this holds for every open V and every $f \in \mathcal{O}_Y(V)$ we conclude that $a = b$ as morphisms of schemes. $\square$

Lemma 38.40.4. *Let X, Y be affine schemes. Let*

$$(g, g^\#) : (Sh(X_{étale}), \mathcal{O}_X) \longrightarrow (Sh(Y_{étale}), \mathcal{O}_Y)$$

be a morphism of locally ringed topoi. Then there exists a unique morphism of schemes $f : X \to Y$ such that $(g, g^\#)$ is 2-isomorphic to $(f_{small}, f_{small}^\sharp)$, see Modules on Sites, Definition 16.8.1.

Proof. In this proof we write $\mathcal{O}_X$ for the structure sheaf of the small étale site $X_{étale}$, and similarly for $\mathcal{O}_Y$. Say $Y = Spec(B)$ and $X = Spec(A)$. Since $B = \Gamma(Y_{étale}, \mathcal{O}_Y)$, $A = \Gamma(X_{étale}, \mathcal{O}_X)$ we see that $g^\sharp$ induces a ring map $\varphi : B \to A$. Let $f = Spec(\varphi) : X \to Y$ be the corresponding morphism of affine schemes. We will show this f does the job.

Let $V \to Y$ be an affine scheme étale over Y. Thus we may write $V = Spec(C)$ with C an étale B-algebra. We can write

$$C = B[x_1, \ldots, x_n]/(P_1, \ldots, P_n)$$

with P_i polynomials such that $\Delta = \det(\partial P_i/\partial x_j)$ is invertible in C, see for example Algebra, Lemma 7.132.2. If T is a scheme over Y, then a T-valued point of V is given by n sections of $\Gamma(T, \mathcal{O}_T)$ which satisfy the polynomial equations $P_1 = 0, \ldots, P_n = 0$. In other words, the sheaf h_V on $Y_{étale}$ is the equalizer of the two maps

$$\begin{tikzcd} \prod_{i=1,\ldots,n} \mathcal{O}_Y \arrow[r, shift left, "a"] \arrow[r, shift right, "b"'] & \prod_{j=1,\ldots,n} \mathcal{O}_Y \end{tikzcd}$$

where $b(h_1, \ldots, h_n) = 0$ and $a(h_1, \ldots, h_n) = (P_1(h_1, \ldots, h_n), \ldots, P_n(h_1, \ldots, h_n))$. Since g^{-1} is exact we conclude that the top row of the following solid commutative diagram is an equalizer diagram as well:

$$\begin{tikzcd} g^{-1}h_V \arrow[r] \arrow[d, dashed] & \prod_{i=1,\ldots,n} g^{-1}\mathcal{O}_Y \arrow[r, shift left, "g^{-1}a"] \arrow[r, shift right, "g^{-1}b"'] \arrow[d, "\prod g^\sharp"] & \prod_{j=1,\ldots,n} g^{-1}\mathcal{O}_Y \arrow[d, "\prod g^\sharp"] \\ h_{X \times_Y V} \arrow[r] & \prod_{i=1,\ldots,n} \mathcal{O}_X \arrow[r, shift left, "a'"] \arrow[r, shift right, "b'"'] & \prod_{j=1,\ldots,n} \mathcal{O}_X \end{tikzcd}$$

Here b' is the zero map and a' is the map defined by the images $P'_i = \varphi(P_i) \in A[x_1, \ldots, x_n]$ via the same rule $a'(h_1, \ldots, h_n) = (P'_1(h_1, \ldots, h_n), \ldots, P'_n(h_1, \ldots, h_n))$. that a was defined by. The commutativity of the diagram follows from the fact that $\varphi = g^\sharp$ on global sections. The lower row is an equalizer diagram also, by exactly the same arguments as before since $X \times_Y V$ is the affine scheme $Spec(A \otimes_B C)$ and $A \otimes_B C = A[x_1, \ldots, x_n]/(P'_1, \ldots, P'_n)$. Thus we obtain a unique dotted arrow $g^{-1}h_V \to h_{X \times_Y V}$ fitting into the diagram

We claim that the map of sheaves $g^{-1}h_V \to h_{X \times_Y V}$ is an isomorphism. Since the small étale site of X has enough points (Theorem 38.29.10) it suffices to prove this on stalks. Hence let $\overline{x}$ be a geometric point of X, and denote p the associate point of the small étale topos of X. Set $q = g \circ p$. This is a point of the small étale topos of Y. By Lemma 38.29.12 we see that q corresponds to a geometric point $\overline{y}$ of Y. Consider the map of stalks

$$(g^\sharp)_p : \mathcal{O}_{Y,\overline{y}} = \mathcal{O}_{Y,q} = (g^{-1}\mathcal{O}_Y)_p \longrightarrow \mathcal{O}_{X,p} = \mathcal{O}_{X,\overline{x}}$$

Since $(g, g^\sharp)$ is a morphism of *locally* ringed topoi $(g^\sharp)_p$ is a local ring homomorphism of strictly henselian local rings. Applying localization to the big commutative diagram above and Algebra, Lemma 7.139.25 we conclude that $(g^{-1}h_V)_p \to (h_{X \times_Y V})_p$ is an isomorphism as desired.

We claim that the isomorphisms $g^{-1}h_V \to h_{X \times_Y V}$ are functorial. Namely, suppose that $V_1 \to V_2$ is a morphism of affine schemes étale over Y. Write $V_i = Spec(C_i)$ with

$$C_i = B[x_{i,1}, \ldots, x_{i,n_i}]/(P_{i,1}, \ldots, P_{i,n_i})$$

The morphism $V_1 \to V_2$ is given by a B-algebra map $C_2 \to C_1$ which in turn is given by some polynomials $Q_j \in B[x_{1,1}, \ldots, x_{1,n_1}]$ for $j = 1, \ldots, n_2$. Then it is an easy matter to show that the diagram of sheaves

$$\begin{tikzcd}
h_{V_1} \arrow[r] \arrow[d] & \prod_{i=1,\ldots,n_1} \mathcal{O}_Y \arrow[d, "Q_1,\ldots,Q_{n_2}"] \\
h_{V_2} \arrow[r] & \prod_{i=1,\ldots,n_2} \mathcal{O}_Y
\end{tikzcd}$$

is commutative, and pulling back to $X_{\acute{e}tale}$ we obtain the solid commutative diagram

$$\begin{tikzcd}
g^{-1}h_{V_1} \arrow[r] \arrow[drr] \arrow[dd, dotted] & \prod_{i=1,\ldots,n_1} g^{-1}\mathcal{O}_Y \arrow[drr, "Q_1,\ldots,Q_{n_2}"] \arrow[dd, "g^\sharp"] & & \\
& & g^{-1}h_{V_2} \arrow[r] \arrow[dd, dotted] & \prod_{i=1,\ldots,n_2} g^{-1}\mathcal{O}_Y \arrow[dd, "g^\sharp"] \\
h_{X \times_Y V_1} \arrow[r] \arrow[drr] & \prod_{i=1,\ldots,n_1} \mathcal{O}_X \arrow[drr, "Q'_1,\ldots,Q'_{n_2}"] & & \\
& & h_{X \times_Y V_2} \arrow[r] & \prod_{i=1,\ldots,n_2} \mathcal{O}_X
\end{tikzcd}$$

where $Q'_j \in A[x_{1,1}, \ldots, x_{1,n_1}]$ is the image of Q_j via φ. Since the dotted arrows exist, make the two squares commute, and the horizontal arrows are injective we see that the whole diagram commutes. This proves functoriality (and also that the construction of $g^{-1}h_V \to$

$h_{X\times_Y V}$ is independent of the choice of the presentation, allthough we strictly speaking do not need to show this).

At this point we are able to show that $f_{small,*} \cong g_*$. Namely, let $\mathcal{F}$ be a sheaf on $X_{étale}$. For every $V \in Ob(X_{étale})$ affine we have

$$\begin{aligned}(g_*\mathcal{F})(V) &= Mor_{Sh(Y_{étale})}(h_V, g_*\mathcal{F}) \\ &= Mor_{Sh(X_{étale})}(g^{-1}h_V, \mathcal{F}) \\ &= Mor_{Sh(X_{étale})}(h_{X\times_Y V}, \mathcal{F}) \\ &= \mathcal{F}(X \times_Y V) \\ &= f_{small,*}\mathcal{F}(V)\end{aligned}$$

where in the third equality we use the isomorphism $g^{-1}h_V \cong h_{X\times_Y V}$ constructed above. These isomorphisms are clearly functorial in $\mathcal{F}$ and functorial in V as the isomorphisms $g^{-1}h_V \cong h_{X\times_Y V}$ are functorial. Now any sheaf on $Y_{étale}$ is determined by the restriction to the subcategory of affine schemes (Lemma 38.21.2), and hence we obtain an isomorphism of functors $f_{small,*} \cong g_*$ as desired.

Finally, we have to check that, via the isomorphism $f_{small,*} \cong g_*$ above, the maps $f_{small}^\sharp$ and $g^\sharp$ agree. By construction this is already the case for the global sections of $\mathcal{O}_Y$, i.e., for the elements of B. We only need to check the result on sections over an affine V étale over Y (by Lemma 38.21.2 again). Writing $V = Spec(C)$, $C = B[x_i]/(P_j)$ as before it suffices to check that the coordinate functions x_i are mapped to the same sections of $\mathcal{O}_X$ over $X \times_Y V$. And this is exactly what it means that the diagram

$$\begin{tikzcd} g^{-1}h_V \arrow[r] \arrow[d, dotted] & \prod_{i=1,\ldots,n} g^{-1}\mathcal{O}_Y \arrow[d, "\prod g^\sharp"] \\ h_{X\times_Y V} \arrow[r] & \prod_{i=1,\ldots,n} \mathcal{O}_X \end{tikzcd}$$

commutes. Thus the lemma is proved. ☐

Here is a version for general schemes.

Theorem 38.40.5. *Let X, Y be schemes. Let*

$$(g, g^\#) : (Sh(X_{étale}), \mathcal{O}_X) \longrightarrow (Sh(Y_{étale}), \mathcal{O}_Y)$$

be a morphism of locally ringed topoi. Then there exists a unique morphism of schemes $f : X \to Y$ such that $(g, g^\#)$ is isomorphic to $(f_{small}, f_{small}^\sharp)$. In other words, the construction

$$Sch \longrightarrow Locally\ ringed\ topoi, \quad X \longrightarrow (X_{étale}, \mathcal{O}_X)$$

is fully faithful (morphisms up to 2-isomorphisms on the right hand side).

Proof. You can prove this theorem by carefully adjusting the arguments of the proof of Lemma 38.40.4 to the global setting. However, we want to indicate how we can glue the result of that lemma to get a global morphism due to the rigidity provided by the result of Lemma 38.40.2. Unfortunately, this is a bit messy.

Let us prove existence when Y is affine. In this case choose an affine open covering $X = \bigcup U_i$. For each i the inclusion morphism $j_i : U_i \to X$ induces a morphism of locally ringed topoi $(j_{i,small}, j_{i,small}^\sharp) : (Sh(U_{i,étale}), \mathcal{O}_{U_i}) \to (Sh(X_{étale}), \mathcal{O}_X)$ by Lemma 38.40.1. We can compose this with $(g, g^\sharp)$ to obtain a morphism of locally ringed topoi

$$(g, g^\sharp) \circ (j_{i,small}, j_{i,small}^\sharp) : (Sh(U_{i,étale}), \mathcal{O}_{U_i}) \to (Sh(X_{étale}), \mathcal{O}_X)$$

see Modules on Sites, Lemma 16.34.9. By Lemma 38.40.4 there exists a unique morphism of schemes $f_i : U_i \to Y$ and a 2-isomorphism

$$t_i : (f_{i,small}, f_{i,small}^\sharp) \longrightarrow (g, g^\sharp) \circ (j_{i,small}, j_{i,small}^\sharp).$$

Set $U_{i,i'} = U_i \cap U_{i'}$, and denote $j_{i,i'} : U_{i,i'} \to U_i$ the inclusion morphism. Since we have $j_i \circ j_{i,i'} = j_{i'} \circ j_{i',i}$ we see that

$$\begin{aligned}(g, g^\sharp) \circ (j_{i,small}, j_{i,small}^\sharp) \circ (j_{i,i',small}, j_{i,i',small}^\sharp) = \\ (g, g^\sharp) \circ (j_{i',small}, j_{i',small}^\sharp) \circ (j_{i',i,small}, j_{i',i,small}^\sharp)\end{aligned}$$

Hence by uniqueness (see Lemma 38.40.3) we conclude that $f_i \circ j_{i,i'} = f_{i'} \circ j_{i',i}$, in other words the morphisms of schemes $f_i = f \circ j_i$ are the restrictions of a global morphism of schemes $f : X \to Y$. Consider the diagram of 2-isomorphisms (where we drop the components $^\sharp$ to ease the notation)

$$\begin{tikzcd} g \circ j_{i,small} \circ j_{i,i',small} \arrow[r, "t_i \star \mathrm{id}_{j_{i,i',small}}"] \arrow[d, equal] & f_{small} \circ j_{i,small} \circ j_{i,i',small} \arrow[d, equal] \\ g \circ j_{i',small} \circ j_{i',i,small} \arrow[r, "t_{i'} \star \mathrm{id}_{j_{i',i,small}}"] & f_{small} \circ j_{i',small} \circ j_{i',i,small} \end{tikzcd}$$

The notation $\star$ indicates horizontal composition, see Categories, Definition 4.26.1 in general and Sites, Section 9.32 for our particular case. By the result of Lemma 38.40.2 this diagram commutes. Hence for any sheaf $\mathcal{G}$ on $Y_{étale}$ the isomorphisms $t_i : f_{small}^{-1}\mathcal{G}|_{U_i} \to g^{-1}\mathcal{G}|_{U_i}$ agree over $U_{i,i'}$ and we obtain a global isomorphism $t : f_{small}^{-1}\mathcal{G} \to g^{-1}\mathcal{G}$. It is clear that this isomorphism is functorial in $\mathcal{G}$ and is compatible with the maps $f_{small}^\sharp$ and $g^\sharp$ (because it is compatible with these maps locally). This proves the theorem in case Y is affine.

In the general case, let $V \subset Y$ be an affine open. Then h_V is a subsheaf of the final sheaf $*$ on $Y_{étale}$. As g is exact we see that $g^{-1}h_V$ is a subsheaf of the final sheaf on $X_{étale}$. Hence by Lemma 38.31.1 there exists an open subscheme $W \subset X$ such that $g^{-1}h_V = h_W$. By Modules on Sites, Lemma 16.34.11 there exists a commutative diagram of morphisms of locally ringed topoi

$$\begin{tikzcd} (Sh(W_{étale}), \mathcal{O}_W) \arrow[r] \arrow[d, "g'"'] & (Sh(X_{étale}), \mathcal{O}_X) \arrow[d, "g"] \\ (Sh(V_{étale}), \mathcal{O}_V) \arrow[r] & (Sh(Y_{étale}), \mathcal{O}_Y) \end{tikzcd}$$

where the horizontal arrows are the localization morphisms (induced by the inclusion morphisms $V \to Y$ and $W \to X$) and where g' is induced from g. By the result of the preceding paragraph we obtain a morphism of schemes $f' : W \to V$ and a 2-isomorphism $t : (f'_{small}, (f'_{small})^\sharp) \to (g', (g')^\sharp)$. Exactly as before these morphisms f' (for varying affine opens $V \subset Y$) agree on overlaps by uniqueness, so we get a morphism $f : X \to Y$. Moreover, the 2-isomorphisms t are compatible on overlaps by Lemma 38.40.2 again and we obtain a global 2-isomorphism $(f_{small}, (f_{small})^\sharp) \to (g, (g)^\sharp)$. as desired. Some details omitted. $\square$

38.41. Push and pull

Let $f : X \to Y$ be a morphism of schemes. Here is a list of conditions we will consider in the following:

(A) For every étale morphism $U \to X$ and $u \in U$ there exist an étale morphism $V \to Y$ and a disjoint union decomposition $X \times_Y V = W \amalg W'$ and a morphism $h : W \to U$ over X with u in the image of h.
(B) For every $V \to Y$ étale, and every étale covering $\{U_i \to X \times_Y V\}$ there exists an étale covering $\{V_j \to V\}$ such that for each j we have $X \times_Y V_j = \coprod W_{ji}$ where $W_{ij} \to X \times_Y V$ factors through $U_i \to X \times_Y V$ for some i.
(C) For every $U \to X$ étale, there exists a $V \to Y$ étale and a surjective morphism $X \times_Y V \to U$ over X.

It turns out that each of these properties has meaning in terms of the behaviour of the functor $f_{small,*}$. We will work this out in the next few sections.

38.42. Property (A)

Lemma 38.42.1. *Let $f : X \to Y$ be a morphism of schemes. Assume (A).*

1. *$f_{small,*} : Ab(X_{étale}) \to Ab(Y_{étale})$ reflects injections and surjections,*
2. *$f_{small}^{-1} f_{small,*}\mathcal{F} \to \mathcal{F}$ is surjective for any abelian sheaf $\mathcal{F}$ on $X_{étale}$,*
3. *$f_{small,*} : Ab(X_{étale}) \to Ab(Y_{étale})$ is faithful.*

Proof. Let $\mathcal{F}$ be an abelian sheaf on $X_{étale}$. Let U be an object of $X_{étale}$. By assumption we can find a covering $\{W_i \to U\}$ in $X_{étale}$ such that each W_i is an open and closed subscheme of $X \times_Y V_i$ for some object V_i of $Y_{étale}$. The sheaf condition shows that

$$\mathcal{F}(U) \subset \prod \mathcal{F}(W_i)$$

and that $\mathcal{F}(W_i)$ is a direct summand of $\mathcal{F}(X \times_Y V_i) = f_{small,*}\mathcal{F}(V_i)$. Hence it is clear that $f_{small,*}$ reflects injections.

Next, suppose that $a : \mathcal{G} \to \mathcal{F}$ is a map of abelian sheaves such that $f_{small,*}a$ is surjective. Let $s \in \mathcal{F}(U)$ with U as above. With W_i, V_i as above we see that it suffices to show that $s|_{W_i}$ is étale locally the image of a section of $\mathcal{G}$ under a. Since $\mathcal{F}(W_i)$ is a direct summand of $\mathcal{F}(X \times_Y V_i)$ it suffices to show that for any $V \in Ob(Y_{étale})$ any element $s \in \mathcal{F}(X \times_Y V)$ is étale locally on $X \times_Y V$ the image of a section of $\mathcal{G}$ under a. Since $\mathcal{F}(X \times_Y V) = f_{small,*}\mathcal{F}(V)$ we see by assumption that there exists a covering $\{V_j \to V\}$ such that s is the image of $s_j \in f_{small,*}\mathcal{G}(V_j) = \mathcal{G}(X \times_Y V_j)$. This proves $f_{small,*}$ reflects surjections.

Parts (2), (3) follow formally from part (1), see Modules on Sites, Lemma 16.15.1. $\square$

Lemma 38.42.2. *Let $f : X \to Y$ be a separated locally quasi-finite morphism of schemes. Then property (A) above holds.*

Proof. Let $U \to X$ be an étale morphism and $u \in U$. The geometric statement (A) reduces directly to the case where U and Y are affine schemes. Denote $x \in X$ and $y \in Y$ the images of u. Since $X \to Y$ is locally quasi-finite, and $U \to X$ is locally quasi-finite (see Morphisms, Lemma 24.35.6) we see that $U \to Y$ is locally quasi-finite (see Morphisms, Lemma 24.19.12). Moreover both $X \to Y$ and $U \to Y$ are separated. Thus More on

Morphisms, Lemma 33.28.5 applies to both morphisms. This means we may pick an étale neighbourhood $(V, v) \to (Y, y)$ such that

$$X \times_Y V = W \amalg R, \quad U \times_Y V = W' \amalg R'$$

and points $w \in W$, $w' \in W'$ such that

(1) W, R are open and closed in $X \times_Y V$,
(2) W', R' are open and closed in $U \times_Y V$,
(3) $W \to V$ and $W' \to V$ are finite,
(4) w, w' map to v,
(5) $\kappa(v) \subset \kappa(w)$ and $\kappa(v) \subset \kappa(w')$ are purely inseparable, and
(6) no other point of W or W' maps to v.

Here is a commutative diagram

$$\begin{tikzcd}
U & U \times_Y V \arrow[l] \arrow[d] & W' \amalg R' \arrow[l] \arrow[d] \\
X \arrow[d] & X \times_Y V \arrow[l] \arrow[d] & W \amalg R \arrow[l] \\
Y & V \arrow[l]
\arrow[from=1-1, to=2-1]
\end{tikzcd}$$

After shrinking V we may assume that W' maps into W: just remove the image the inverse image of R in W'; this is a closed set (as $W' \to V$ is finite) not containing v. Then $W' \to W$ is finite because both $W \to V$ and $W' \to V$ are finite. Hence $W' \to W$ is finite étale, and there is exactly one point in the fibre over w with $\kappa(w) = \kappa(w')$. Hence $W' \to W$ is an isomorphism in an open neighbourhood W° of w, see Étale Morphisms, Lemma 37.14.2. Since $W \to V$ is finite the image of $W \setminus W^\circ$ is a closed subset T of V not containing v. Thus after replacing V by $V \setminus T$ we may assume that $W' \to W$ is an isomorphism. Now the decomposition $X \times_Y V = W \amalg R$ and the morphism $W \to U$ are as desired and we win. $\square$

Lemma 38.42.3. *Let $f : X \to Y$ be an integral morphism of schemes. Then property (A) holds.*

Proof. Let $U \to X$ be étale, and let $u \in U$ be a point. We have to find $V \to Y$ étale, a disjoint union decomposition $X \times_Y V = W \amalg W'$ and an X-morphism $W \to U$ with u in the image. We may shrink U and Y and assume U and Y are affine. In this case also X is affine, since an integral morphism is affine by definition. Write $Y = Spec(A)$, $X = Spec(B)$ and $U = Spec(C)$. Then $A \to B$ is an integral ring map, and $B \to C$ is an étale ring map. By Algebra, Lemma 7.132.3 we can find a finite A-subalgebra $B' \subset B$ and an étale ring map $B' \to C'$ such that $C = B \otimes_{B'} C'$. Thus the question reduces to the étale morphism $U' = Spec(C') \to X' = Spec(B')$ over the finite morphism $X' \to Y$. In this case the result follows from Lemma 38.42.2. $\square$

Lemma 38.42.4. *Let $f : X \to Y$ be a morphism of schemes. Denote $f_{small} : Sh(X_{étale}) \to Sh(Y_{étale})$ the associated morphism of small étale topoi. Assume at least one of the following*

(1) *f is integral, or*
(2) *f is separated and locally quasi-finite.*

Then the functor $f_{small,*} : Ab(X_{étale}) \to Ab(Y_{étale})$ has the following properties

(1) *the map $f_{small}^{-1} f_{small,*}\mathcal{F} \to \mathcal{F}$ is always surjective,*
(2) *$f_{small,*}$ is faithful, and*

(3) *$f_{small,*}$ reflects injections and surjections.*

Proof. Combine Lemmas 38.42.2, 38.42.3, and 38.42.1. □

38.43. Property (B)

Lemma 38.43.1. *Let $f : X \to Y$ be a morphism of schemes. Assume (B) holds. Then the functor $f_{small,*} : Sh(X_{étale}) \to Sh(Y_{étale})$ transforms surjections into surjections.*

Proof. This follows from Sites, Lemma 9.36.2. □

Lemma 38.43.2. *Let $f : X \to Y$ be a morphism of schemes. Suppose*

(1) *$V \to Y$ is an étale morphism of schemes,*
(2) *$\{U_i \to X \times_Y V\}$ is an étale covering, and*
(3) *$v \in V$ is a point.*

Assume that for any such data there exists an étale neighbourhood $(V', v') \to (V, v)$, a disjoint union decomposition $X \times_Y V' = \coprod W_i'$, and morphisms $W_i' \to U_i$ over $X \times_Y V$. Then property (B) holds.

Proof. Omitted. □

Lemma 38.43.3. *Let $f : X \to Y$ be a finite morphism of schemes. Then property (B) holds.*

Proof. Consider $V \to Y$ étale, $\{U_i \to X \times_Y V\}$ an étale covering, and $v \in V$. We have to find a $V' \to V$ and decomposition and maps as in Lemma 38.43.2. We may shrink V and Y, hence we may assume that V and Y are affine. Since X is finite over Y, this also implies that X is affine. During the proof we may (finitely often) replace (V, v) by an étale neighbourhood (V', v') and correspondingly the covering $\{U_i \to X \times_Y V\}$ by $\{V' \times_V U_i \to X \times_Y V'\}$.

Since $X \times_Y V \to V$ is finite there exist finitely many (pairwise distinct) points $x_1, \ldots, x_n \in X \times_Y V$ mapping to v. We may apply More on Morphisms, Lemma 33.28.5 to $X \times_Y V \to V$ and the points $x_1, \ldots, x_n$ lying over v and find an étale neighbourhood $(V', v') \to (V, v)$ such that

$$X \times_Y V' = R \amalg \coprod T_a$$

with $T_a \to V'$ finite with exactly one point p_a lying over v' and moreover $\kappa(v') \subset \kappa(p_a)$ purely inseparable, and such that $R \to V'$ has empty fibre over v'. Because $X \to Y$ is finite, also $R \to V'$ is finite. Hence after shrinking V' we may assume that $R = \emptyset$. Thus we may assume that $X \times_Y V = X_1 \amalg \ldots \amalg X_n$ with exactly one point $x_l \in X_l$ lying over v with moreover $\kappa(v) \subset \kappa(x_l)$ purely inseparable. Note that this property is preserved under refinement of the étale neighbourhood (V, v).

For each l choose an i_l and a point $u_l \in U_{i_l}$ mapping to x_l. Now we apply property (A) for the finite morphism $X \times_Y V \to V$ and the étale morphisms $U_{i_l} \to X \times_Y V$ and the points u_l. This is permissible by Lemma 38.42.3 This gives produces an étale neighbourhood $(V', v') \to (V, v)$ and decompositions

$$X \times_Y V' = W_l \amalg R_l$$

and X-morphisms $a_l : W_l \to U_{i_l}$ whose image contains u_{i_l}. Here is a picture:

$$
\begin{tikzcd}
 & & & U_{i_l} \arrow[d] & \\
W_l \arrow[r] \arrow[urrr] & W_l \amalg R_l \arrow[r, equal] & X \times_Y V' \arrow[r] \arrow[d] & X \times_Y V \arrow[r] \arrow[d] & X \arrow[d] \\
 & & V' \arrow[r] & V \arrow[r] & Y
\end{tikzcd}
$$

After replacing (V, v) by (V', v') we conclude that each x_l is contained in an open and closed neighbourhood W_l such that the inclusion morphism $W_l \to X \times_Y V$ factors through $U_i \to X \times_Y V$ for some i. Replacing W_l by $W_l \cap X_l$ we see that these open and closed sets are disjoint and moreover that $\{x_1, \ldots, x_n\} \subset W_1 \cup \ldots \cup W_n$. Since $X \times_Y V \to V$ is finite we may shrink V and assume that $X \times_Y V = W_1 \amalg \ldots \amalg W_n$ as desired. $\square$

Lemma 38.43.4. *Let $f : X \to Y$ be an integral morphism of schemes. Then property (B) holds.*

Proof. Consider $V \to Y$ étale, $\{U_i \to X \times_Y V\}$ an étale covering, and $v \in V$. We have to find a $V' \to V$ and decomposition and maps as in Lemma 38.43.2. We may shrink V and Y, hence we may assume that V and Y are affine. Since X is integral over Y, this also implies that X and $X \times_Y V$ are affine. We may refine the covering $\{U_i \to X \times_Y V\}$, and hence we may assume that $\{U_i \to X \times_Y V\}_{i=1,\ldots,n}$ is a standard étale covering. Write $Y = Spec(A)$, $X = Spec(B)$, $V = Spec(C)$, and $U_i = Spec(B_i)$. Then $A \to B$ is an integral ring map, and $B \otimes_A C \to B_i$ are étale ring maps. By Algebra, Lemma 7.132.3 we can find a finite A-subalgebra $B' \subset B$ and an étale ring map $B' \otimes_A C \to B'_i$ for $i = 1, \ldots, n$ such that $B_i = B \otimes_{B'} B'_i$. Thus the question reduces to the étale covering $\{Spec(B'_i) \to X' \times_Y V\}_{i=1,\ldots,n}$ with $X' = Spec(B')$ finite over Y. In this case the result follows from Lemma 38.43.3. $\square$

Lemma 38.43.5. *Let $f : X \to Y$ be a morphism of schemes. Assume f is integral (for example finite). Then*

(1) *$f_{small,*}$ transforms surjections into surjections (on sheaves of sets and on abelian sheaves),*
(2) *$f_{small}^{-1} f_{small,*}\mathcal{F} \to \mathcal{F}$ is surjective for any abelian sheaf $\mathcal{F}$ on $X_{étale}$,*
(3) *$f_{small,*} : Ab(X_{étale}) \to Ab(Y_{étale})$ is faithful and reflects injections and surjections, and*
(4) *$f_{small,*} : Ab(X_{étale}) \to Ab(Y_{étale})$ is exact.*

Proof. Parts (2), (3) we have seen in Lemma 38.42.4. Part (1) follows from Lemmas 38.43.4 and 38.43.1. Part (4) is a consequence of part (1), see Modules on Sites, Lemma 16.15.2. $\square$

38.44. Property (C)

Lemma 38.44.1. *Let $f : X \to Y$ be a morphism of schemes. Assume (C) holds. Then the functor $f_{small,*} : Sh(X_{étale}) \to Sh(Y_{étale})$ reflects injections and surjections.*

Proof. Follows from Sites, Lemma 9.36.4. We omit the verification that property (C) implies that the functor $Y_{étale} \to X_{étale}$, $V \mapsto X \times_Y V$ satisfies the assumption of Sites, Lemma 9.36.4. $\square$

Remark 38.44.2. Property (C) appears to be a very strong property, but the following example shows that it does not imply that $f_{small,*}$ is exact. Let K be an algebraic closure of $k(x, y)$ where k is a field. Let R be the integral closure of $k[x, y]$ in K. Set $Y = Spec(R)$ and $X = Y \setminus \{0\}$. Then property (C) holds for the morphism $j : X \to Y$, as every étale morphism $U \to X$ is a local isomorphism. But $j_{small,*}$ is not exact on $Ab(X_{\acute{e}tale})$. Details omitted. Hint: In this example étale sheaves are the same thing as Zariski sheaves.

Lemma 38.44.3. *Let $f : X \to Y$ be a morphism of schemes. Assume that for any $V \to Y$ étale we have that*

(1) *$X \times_Y V \to V$ has property (C), and*
(2) *$X \times_Y V \to V$ is closed.*

Then the functor $Y_{\acute{e}tale} \to X_{\acute{e}tale}$, $V \mapsto X \times_Y V$ is almost cocontinuous, see Sites, Definition 9.37.3.

Proof. Let $V \to Y$ be an object of $Y_{\acute{e}tale}$ and let $\{U_i \to X \times_Y V\}_{i \in I}$ be a covering of $X_{\acute{e}tale}$. By assumption (1) for each i we can find an étale morphism $h_i : V_i \to V$ and a surjective morphism $X \times_Y V_i \to U_i$ over $X \times_Y V$. Note that $\bigcup h_i(V_i) \subset V$ is an open set containing the closed set $Z = \mathrm{Im}(X \times_Y V \to V)$. Let $h_0 : V_0 = V \setminus Z \to V$ be the open immersion. It is clear that $\{V_i \to V\}_{i \in I \cup \{0\}}$ is an étale covering such that for each $i \in I \cup \{0\}$ we have either $V_i \times_Y X = \emptyset$ (namely if $i = 0$), or $V_i \times_Y X \to V \times_Y X$ factors through $U_i \to X \times_Y V$ (if $i \neq 0$). Hence the functor $Y_{\acute{e}tale} \to X_{\acute{e}tale}$ is almost cocontinuous. $\square$

Lemma 38.44.4. *Let $f : X \to Y$ be an integral morphism of schemes which defines a homeomorphism of X with a closed subset of Y. Then property (C) holds.*

Proof. Let $g : U \to X$ be an étale morphism. We need to find an object $V \to Y$ of $Y_{\acute{e}tale}$ and a surjective morphism $X \times_Y V \to U$ over X. Suppose that for every $u \in U$ we can find an object $V_u \to Y$ of $Y_{\acute{e}tale}$ and a morphism $h_u : X \times_Y V_u \to U$ over X with $u \in \mathrm{Im}(h_u)$. Then we can take $V = \coprod V_u$ and $h = \coprod h_u$ and we win. Hence given a point $u \in U$ we find a pair (V_u, h_u) as above. To do this we may shrink U and assume that U is affine. In this case $g : U \to X$ is locally quasi-finite. Let $g^{-1}(g(\{u\})) = \{u, u_2, \ldots, u_n\}$. Since there are no specializations $u_i \leadsto u$ we may replace U by an affine neighbourhood so that $g^{-1}(g(\{u\})) = \{u\}$.

The image $g(U) \subset X$ is open, hence $f(g(U))$ is locally closed in Y. Choose an open $V \subset Y$ such that $f(g(U)) = f(X) \cap V$. It follows that g factors through $X \times_Y V$ and that the resulting $\{U \to X \times_Y V\}$ is an étale covering. Since f has property (B) , see Lemma 38.43.4, we see that there exists an étale covering $\{V_j \to V\}$ such that $X \times_Y V_j \to X \times_Y V$ factor through U. This implies that $V' = \coprod V_j$ is étale over Y and that there is a morphism $h : X \times_Y V' \to U$ whose image surjects onto $g(U)$. Since u is the only point in its fibre it must be in the image of h and we win. $\square$

We urge the reader to think of the following lemma as a way station[4] on the journey towards the ultimate truth regarding $f_{small,*}$ for integral universally injective morphisms.

Lemma 38.44.5. *Let $f : X \to Y$ be a morphism of schemes. Assume that f is universally injective and integral (for example a closed immersion). Then*

(1) *$f_{small,*} : Sh(X_{\acute{e}tale}) \to Sh(Y_{\acute{e}tale})$ reflects injections and surjections,*
(2) *$f_{small,*} : Sh(X_{\acute{e}tale}) \to Sh(Y_{\acute{e}tale})$ commutes with pushouts and coequalizers (and more generally finite, nonempty, connected colimits),*

[4] A way station is a place where people stop to eat and rest when they are on a long journey.

(3) *$f_{small,*}$ transforms surjections into surjections (on sheaves of sets and on abelian sheaves),*
(4) *the map $f_{small}^{-1} f_{small,*}\mathcal{F} \to \mathcal{F}$ is surjective for any sheaf (of sets or of abelian groups) $\mathcal{F}$ on $X_{\acute{e}tale}$,*
(5) *the functor $f_{small,*}$ is faithful (on sheaves of sets and on abelian sheaves),*
(6) *$f_{small,*} : Ab(X_{\acute{e}tale}) \to Ab(Y_{\acute{e}tale})$ is exact, and*
(7) *the functor $Y_{\acute{e}tale} \to X_{\acute{e}tale}$, $V \mapsto X \times_Y V$ is almost cocontinuous.*

Proof. By Lemmas 38.42.3, 38.43.4 and 38.44.4 we know that the morphism f has properties (A), (B), and (C). Moreover, by Lemma 38.44.3 we know that the functor $Y_{\acute{e}tale} \to X_{\acute{e}tale}$ is almost cocontinuous. Now we have

(1) property (C) implies (1) by Lemma 38.44.1,
(2) almost continuous implies (2) by Sites, Lemma 9.37.6,
(3) property (B) implies (3) by Lemma 38.43.1.

Properties (4), (5), and (6) follow formally from the first three, see Sites, Lemma 9.36.1 and Modules on Sites, Lemma 16.15.2. Property (7) we saw above. □

38.45. Topological invariance of the small étale site

In the following theorem we show that the small étale site is a topological invariant in the following sense: If $f : X \to Y$ is a morphism of schemes which is a universal homeomorphism, then $X_{\acute{e}tale} \cong Y_{\acute{e}tale}$ as sites. This improves the result of Étale Morphisms, Theorem 37.15.2.

Theorem 38.45.1. *Let $f : X \to Y$ be a morphism of schemes. Assume f is integral, universally injective and surjective (i.e., f is a universal homeomorphism, see Morphisms, Lemma 24.43.3). The functor*

$$V \longmapsto V_X = X \times_Y V$$

defines an equivalence of categories

$$\{\text{schemes } V \text{ étale over } Y\} \leftrightarrow \{\text{schemes } U \text{ étale over } X\}$$

Proof. We claim that it suffices to prove that the functor defines an equivalence

$$\{\text{affine schemes } V \text{ étale over } Y\} \leftrightarrow \{\text{affine schemes } U \text{ étale over } X\} \quad (38.45.1.1)$$

when X and Y are affine. We omit the proof of this claim.

Assume X and Y affine. Let us prove (38.45.1.1) is fully faithful. Suppose that V, V' are affine schemes étale over Y, and that $\varphi : V_X \to V'_X$ is a morphism over X. To prove that $\varphi = \psi_X$ for some $\psi : V \to V'$ over Y we may work locally on V. The graph

$$\Gamma_\varphi \subset (V \times_Y V')_X$$

of φ is an open and closed subscheme, see Étale Morphisms, Proposition 37.6.1. Since f is a universal homeomorphism we see that there exists an open and closed subscheme $\Gamma \subset V \times_Y V'$ with $\Gamma_X = \Gamma_\varphi$. We see that Γ is an affine scheme endowed with an étale, universally injective, and surjective morphism $\Gamma \to V$. This implies that $\Gamma \to V$ is an isomorphism (see Étale Morphisms, Theorem 37.14.1), and hence Γ is the graph of a morphism $\psi : V \to V'$ over Y as desired.

Let us prove (38.45.1.1) is essentially surjective. Let $U \to X$ be an affine scheme étale over X. We have to find $V \to Y$ étale (and affine) such that $X \times_Y V$ is isomorphic to U over X. Note that an étale morphism of affines has universally bounded fibres, see Morphisms, Lemma 24.35.6 and Lemma 24.48.8. Hence we can do induction on the integer n bounding the degree of the fibres of $U \to X$. See Morphisms, Lemma 24.48.7 for a description of this integer in the case of an étale morphism. If $n = 1$, then $U \to X$ is an open immersion (see Étale Morphisms, Theorem 37.14.1), and the result is clear. Assume $n > 1$.

By Lemma 38.44.4 there exists an étale morphism of schemes $W \to Y$ and a surjective morphism $W_X \to U$ over X. As U is quasi-compact we may replace W by a disjoint union of finitely many affine opens of W, hence we may assume that W is affine as well. Here is a diagram

$$\begin{tikzcd} U \arrow[d] & U \times_Y W \arrow[l] \arrow[d] \arrow[r, equal] & W_X \amalg R \\ X \arrow[d] & W_X \arrow[l] \arrow[d] & \\ Y & W \arrow[l] & \end{tikzcd}$$

The disjoint union decomposition arises because by construction the étale morphism of affine schemes $U \times_Y W \to W_X$ has a section. OK, and now we see that the morphism $R \to X \times_Y W$ is an étale morphism of affine schemes whose fibres have degree universally bounded by $n - 1$. Hence by induction assumption there exists a scheme $V' \to W$ étale such that $R \cong W_X \times_W V'$. Taking $V'' = W \amalg V'$ we find a scheme V'' étale over W whose base change to W_X is isomorphic to $U \times_Y W$ over $X \times_Y W$.

At this point we can use descent to find V over Y whose base change to X is isomorphic to U over X. Namely, by the fully faithfulness of the functor (38.45.1.1) corresponding to the universal homeomorphism $X \times_Y (W \times_Y W) \to (W \times_Y W)$ there exists a unique isomorphism $\varphi : V'' \times_Y W \to W \times_Y V''$ whose base change to $X \times_Y (W \times_Y W)$ is the canonical descent datum for $U \times_Y W$ over $X \times_Y W$. In particular φ satisfies the cocycle condition. Hence by Descent, Lemma 31.33.1 we see that φ is effective (recall that all schemes above are affine). Thus we obtain $V \to Y$ and an isomorphism $V'' \cong W \times_Y V$ such that the canonical descent datum on $W \times_Y V/W/Y$ agrees with φ. Note that $V \to Y$ is étale, by Descent, Lemma 31.19.27. Moreover, there is an isomorphism $V_X \cong U$ which comes from descending the isomorphism

$$V_X \times_X W_X = X \times_Y V \times_Y W = (X \times_Y W) \times_W (W \times_Y V) \cong W_X \times_W V'' \cong U \times_Y W$$

which we have by construction. Some details omitted. $\square$

Remark 38.45.2. In the situation of Theorem 38.45.1 it is also true that $V \mapsto V_X$ induces an equivalence between those étale morphisms $V \to Y$ with V affine and those étale morphisms $U \to X$ with U affine. This follows for example from Limits, Proposition 27.7.2.

38.46. Closed immersions and pushforward

Before stating and proving Proposition 38.46.4 in its correct generality we briefly state and prove it for closed immersions. Namely, some of the preceding arguments are quite a bit easier to follow in the case of a closed immersion and so we repeat them here in their simplified form.

In the rest of this section $i : Z \to X$ is a closed immersion. The functor

$$Sch/X \longrightarrow Sch/Z, \quad U \longmapsto U_Z = Z \times_X U$$

will be denoted $U \mapsto U_Z$ as indicated. Since being a closed immersion is preserved under arbitrary base change the scheme U_Z is a closed subscheme of U.

Lemma 38.46.1. *Let $i : Z \to X$ be a closed immersion of schemes. Let U, U' be schemes étale over X. Let $h : U_Z \to U'_Z$ be a morphism over Z. Then there exists a diagram*

$$U \xleftarrow{a} W \xrightarrow{b} U'$$

such that $a_Z : W_Z \to U_Z$ is an isomorphism and $h = b_Z \circ (a_Z)^{-1}$.

Proof. Consider the scheme $M = U \times_Y U'$. The graph $\Gamma_h \subset M_Z$ of h is open. This is true for example as Γ_h is the image of a section of the étale morphism $\mathrm{pr}_{1,Z} : M_Z \to U_Z$, see Étale Morphisms, Proposition 37.6.1. Hence there exists an open subscheme $W \subset M$ whose intersection with the closed subset M_Z is Γ_h. Set $a = \mathrm{pr}_1|_W$ and $b = \mathrm{pr}_2|_W$. □

Lemma 38.46.2. *Let $i : Z \to X$ be a closed immersion of schemes. Let $V \to Z$ be an étale morphism of schemes. There exist étale morphisms $U_i \to X$ and morphisms $U_{i,Z} \to V$ such that $\{U_{i,Z} \to V\}$ is a Zariski covering of V.*

Proof. Since we only have to find a Zariski covering of V consisting of schemes of the form U_Z with U étale over X, we may Zariski localize on X and V. Hence we may assume X and V affine. In the affine case this is Algebra, Lemma 7.132.10. □

If $\overline{x} : Spec(k) \to X$ is a geometric point of X, then either $\overline{x}$ factors (uniquely) through the closed subscheme Z, or $Z_{\overline{x}} = \emptyset$. If $\overline{x}$ factors through Z we say that $\overline{x}$ is a geometric point of Z (because it is) and we use the notation "$\overline{x} \in Z$" to indicate this.

Lemma 38.46.3. *Let $i : Z \to X$ be a closed immersion of schemes. Let $\mathcal{G}$ be a sheaf of sets on $Z_{étale}$. Let $\overline{x}$ be a geometric point of X. Then*

$$(i_{small,*}\mathcal{G})_{\overline{x}} = \begin{cases} * & if \quad \overline{x} \not\in Z \\ \mathcal{F}_{\overline{x}} & if \quad \overline{x} \in Z \end{cases}$$

where $*$ denotes a singleton set.

Proof. Note that $i_{small,*}\mathcal{G}|_{U_{étale}} = *$ is the final object in the category of étale sheaves on U, i.e., the sheaf which associates a singleton set to each scheme étale over U. This explains the value of $(i_{small,*}\mathcal{G})_{\overline{x}}$ if $\overline{x} \not\in Z$.

Next, suppose that $\overline{x} \in Z$. Note that

$$(i_{small,*}\mathcal{G})_{\overline{x}} = colim_{(U,\overline{u})}\, \mathcal{G}(U_Z)$$

and on the other hand

$$\mathcal{G}_{\overline{x}} = colim_{(V,\overline{v})}\, \mathcal{G}(V).$$

Let $\mathcal{C}_1 = \{(U, \overline{u})\}^{opp}$ be the opposite of the category of étale neighbourhoods of $\overline{x}$ in X, and let $\mathcal{C}_2 = \{(V, \overline{v})\}^{opp}$ be the opposite of the category of étale neighbourhoods of $\overline{x}$ in Z. The canonical map

$$\mathcal{G}_{\overline{x}} \longrightarrow (i_{small,*}\mathcal{G})_{\overline{x}}$$

corresponds to the functor $F : \mathcal{C}_1 \to \mathcal{C}_2$, $F(U, \overline{u}) = (U_Z, \overline{x})$. Now Lemmas 38.46.2 and 38.46.1 imply that $\mathcal{C}_1$ is cofinal in $\mathcal{C}_2$, see Categories, Definition 4.17.5. Hence it follows that the displayed arrow is an isomorphism, see Categories, Lemma 4.17.6. □

Proposition 38.46.4. *Let $i : Z \to X$ be a closed immersion of schemes.*

(1) *The functor*

$$i_{small,*} : Sh(Z_{étale}) \longrightarrow Sh(X_{étale})$$

is fully faithful and its essential image is those sheaves of sets $\mathcal{F}$ on $X_{étale}$ whose restriction to $X \setminus Z$ is isomorphic to $*$, and

(2) *the functor*
$$i_{small,*} : Ab(Z_{étale}) \longrightarrow Ab(X_{étale})$$
is fully faithful and its essential image is those abelian sheaves on $X_{étale}$ whose support is contained in Z.

In both cases i_{small}^{-1} is a left inverse to the functor $i_{small,*}$.

Proof. Let's discuss the case of sheaves of sets. For any sheaf $\mathcal{G}$ on Z the morphism $i_{small}^{-1} i_{small,*}\mathcal{G} \to \mathcal{G}$ is an isomorphism by Lemma 38.46.3 (and Theorem 38.29.10). This implies formally that $i_{small,*}$ is fully faithful, see Sites, Lemma 9.36.1. It is clear that $i_{small,*}\mathcal{G}|_{U_{étale}} \cong *$ where $U = X \setminus Z$. Conversely, suppose that $\mathcal{F}$ is a sheaf of sets on X such that $\mathcal{F}|_{U_{étale}} \cong *$. Consider the adjunction mapping
$$\mathcal{F} \longrightarrow i_{small,*} i_{small}^{-1}\mathcal{F}$$
Combining Lemmas 38.46.3 and 38.36.2 we see that it is an isomorphism. This finishes the proof of (1). The proof of (2) is identical. □

38.47. Integral universally injective morphisms

Here is the general version of Proposition 38.46.4.

Proposition 38.47.1. *Let $f : X \to Y$ be a morphism of schemes which is integral and universally injective.*

(1) *The functor*
$$f_{small,*} : Sh(X_{étale}) \longrightarrow Sh(Y_{étale})$$
is fully faithful and its essential image is those sheaves of sets $\mathcal{F}$ on $Y_{étale}$ whose restriction to $Y \setminus f(X)$ is isomorphic to $*$, and

(2) *the functor*
$$f_{small,*} : Ab(X_{étale}) \longrightarrow Ab(Y_{étale})$$
is fully faithful and its essential image is those abelian sheaves on $Y_{étale}$ whose support is contained in $f(X)$.

In both cases f_{small}^{-1} is a left inverse to the functor $f_{small,*}$.

Proof. We may factor f as
$$X \xrightarrow{h} Z \xrightarrow{i} Y$$
where h is integral, universally injective and surjective and $i : Z \to Y$ is a closed immersion. Apply Proposition 38.46.4 to i and apply Theorem 38.45.1 to h. □

38.48. Big sites and pushforward

In this section we prove some technical results on $f_{big,*}$ for certain types of morphisms of schemes.

Lemma 38.48.1. *Let $\tau \in \{Zariski, étale, smooth, syntomic, fppf\}$. Let $f : X \to Y$ be a monomorphism of schemes. Then the canonical map $f_{big}^{-1} f_{big,*}\mathcal{F} \to \mathcal{F}$ is an isomorphism for any sheaf $\mathcal{F}$ on $(Sch/X)_\tau$.*

Proof. In this case the functor $(Sch/X)_\tau \to (Sch/Y)_\tau$ is continuous, cocontinuous and fully faithful. Hence the result follows from Sites, Lemma 9.19.7. □

Remark 38.48.2. In the situation of Lemma 38.48.1 it is true that the canonical map $\mathcal{F} \to f_{big}^{-1} f_{big!}\mathcal{F}$ is an isomorphism for any sheaf of sets $\mathcal{F}$ on $(Sch/X)_\tau$. The proof is the same. This also holds for sheaves of abelian groups. However, note that the functor $f_{big!}$ for sheaves of abelian groups is defined in Modules on Sites, Section 16.16 and is in general different from $f_{big!}$ on sheaves of sets. The result for sheaves of abelian groups follows from Modules on Sites, Lemma 16.16.4.

Lemma 38.48.3. *Let $f : X \to Y$ be a closed immersion of schemes. Let $U \to X$ be a syntomic (resp. smooth, resp. étale) morphism. Then there exist syntomic (resp. smooth, resp. étale) morphisms $V_i \to Y$ and morphisms $V_i \times_Y X \to U$ such that $\{V_i \times_Y X \to U\}$ is a Zariski covering of U.*

Proof. Let us prove the lemma when $\tau = syntomic$. The question is local on U. Thus we may assume that U is an affine scheme mapping into an affine of Y. Hence we reduce to proving the following case: $Y = Spec(A)$, $X = Spec(A/I)$, and $U = Spec(\overline{B})$, where $A/I \to \overline{B}$ be a syntomic ring map. By Algebra, Lemma 7.125.19 we can find elements $\overline{g}_i \in \overline{B}$ such that $\overline{B}_{\overline{g}_i} = A_i/IA_i$ for certain syntomic ring maps $A \to A_i$. This proves the lemma in the syntomic case. The proof of the smooth case is the same except it uses Algebra, Lemma 7.126.19. In the étale case use Algebra, Lemma 7.132.10. □

Lemma 38.48.4. *Let $f : X \to Y$ be a closed immersion of schemes. Let $\{U_i \to X\}$ be a syntomic (resp. smooth, resp. étale) covering. There exists a syntomic (resp. smooth, resp. étale) covering $\{V_j \to Y\}$ such that for each j, either $V_j \times_Y X = \emptyset$, or the morphism $V_j \times_Y X \to X$ factors through U_i for some i.*

Proof. For each i we can choose syntomic (resp. smooth, resp. étale) morphisms $g_{ij} : V_{ij} \to Y$ and morphisms $V_{ij} \times_Y X \to U_i$ over X, such that $\{V_{ij} \times_Y X \to U_i\}$ are Zariski coverings, see Lemma 38.48.3. This in particular implies that $\bigcup_{ij} g_{ij}(V_{ij})$ contains the closed subset $f(X)$. Hence the family of syntomic (resp. smooth, resp. étale) maps g_{ij} together with the open immersion $Y \setminus f(X) \to Y$ forms the desired syntomic (resp. smooth, resp. étale) covering of Y. □

Lemma 38.48.5. *Let $f : X \to Y$ be a closed immersion of schemes. Let $\tau \in \{syntomic, smooth, étale\}$. The functor $V \mapsto X \times_Y V$ defines an almost cocontinuous functor (see Sites, Definition 9.37.3) $(Sch/Y)_\tau \to (Sch/X)_\tau$ between big τ sites.*

Proof. We have to show the following: given a morphism $V \to Y$ and any syntomic (resp. smooth, resp. étale) covering $\{U_i \to X \times_Y V\}$, there exists a smooth (resp. smooth, resp. étale) covering $\{V_j \to V\}$ such that for each j, either $X \times_Y V_j$ is empty, or $X \times_Y V_j \to Z \times_Y V$ factors through one of the U_i. This follows on applying Lemma 38.48.4 above to the closed immersion $X \times_Y V \to V$. □

Lemma 38.48.6. *Let $f : X \to Y$ be a closed immersion of schemes. Let $\tau \in \{syntomic, smooth, étale\}$.*

1. *The pushforward $f_{big,*} : Sh((Sch/X)_\tau) \to Sh((Sch/Y)_\tau)$ commutes with coequalizers and pushouts.*
2. *The pushforward $f_{big,*} : Ab((Sch/X)_\tau) \to Ab((Sch/Y)_\tau)$ is exact.*

Proof. This follows from Sites, Lemma 9.37.6, Modules on Sites, Lemma 16.15.3, and Lemma 38.48.5 above. □

Remark 38.48.7. In Lemma 38.48.6 the case $\tau = fppf$ is missing. The reason is that given a ring A, an ideal I and a faithfully flat, finitely presented ring map $A/I \to \overline{B}$, there is no reason to think that one can find *any* flat finitely presented ring map $A \to B$ with $B/IB \neq 0$ such that $A/I \to B/IB$ factors through $\overline{B}$. Hence the proof of Lemma 38.48.5 does not work for the fppf topology. In fact it is likely false that $f_{big,*} : Ab((Sch/X)_{fppf}) \to Ab((Sch/Y)_{fppf})$ is exact when f is a closed immersion. If you know an example, please email stacks.project@gmail.com.

38.49. Exactness of big lower shriek

This is just the following technical result. Note that the functor $f_{big!}$ has nothing whatsoever to do with cohomology with compact support in general.

Lemma 38.49.1. *Let $\tau \in \{Zariski, étale, smooth, syntomic, fppf\}$. Let $f : X \to Y$ be a morphism of schemes. Let*

$$f_{big} : Sh((Sch/X)_\tau) \longrightarrow Sh((Sch/Y)_\tau)$$

be the corresponding morphism of topoi as in Topologies, Lemma 30.3.15, 30.4.15, 30.5.10, 30.6.10, or 30.7.12.

(1) *The functor $f_{big}^{-1} : Ab((Sch/Y)_\tau) \to Ab((Sch/X)_\tau)$ has a left adjoint*
$$f_{big!} : Ab((Sch/X)_\tau) \to Ab((Sch/Y)_\tau)$$
which is exact.

(2) *The functor $f_{big}^* : Mod((Sch/Y)_\tau, \mathcal{O}) \to Mod((Sch/X)_\tau, \mathcal{O})$ has a left adjoint*
$$f_{big!} : Mod((Sch/X)_\tau, \mathcal{O}) \to Mod((Sch/Y)_\tau, \mathcal{O})$$
which is exact.

Moreover, the two functors $f_{big!}$ agree on underlying sheaves of abelian groups.

Proof. Recall that f_{big} is the morphism of topoi associated to the continuous and cocontinuous functor $u : (Sch/X)_\tau \to (Sch/Y)_\tau$, $U/X \mapsto U/Y$. Moreover, we have $f_{big}^{-1}\mathcal{O} = \mathcal{O}$. Hence the existence of $f_{big!}$ follows from Modules on Sites, Lemma 16.16.2, respectively Modules on Sites, Lemma 16.35.1. Note that if U is an object of $(Sch/X)_\tau$ then the functor u induces an equivalence of categories

$$u' : (Sch/X)_\tau/U \longrightarrow (Sch/Y)_\tau/U$$

because both sides of the arrow are equal to $(Sch/U)_\tau$. Hence the agreement of $f_{big!}$ on underlying abelian sheaves follows from the discussion in Modules on Sites, Remark 16.35.2. The exactness of $f_{big!}$ follows from Modules on Sites, Lemma 16.16.3 as the functor u above which commutes with fibre products and equalizers. $\square$

Next, we prove a technical lemma that will be useful later when comparing sheaves of modules on different sites associated to algebraic stacks.

Lemma 38.49.2. *Let X be a scheme. Let $\tau \in \{Zariski, étale, smooth, syntomic, fppf\}$. Let $\mathcal{C}_1 \subset \mathcal{C}_2 \subset (Sch/X)_\tau$ be full subcategories with the following properties:*

(1) *For an object U/X of $\mathcal{C}_t$,*
   (a) *if $\{U_i \to U\}$ is a covering of $(Sch/X)_\tau$, then U_i/X is an object of $\mathcal{C}_t$,*
   (b) *$U \times \mathbf{A}^1/X$ is an object of $\mathcal{C}_t$.*
(2) *X/X is an object of $\mathcal{C}_t$.*

We endow $\mathcal{C}_t$ with the structure of a site whose coverings are exactly those coverings $\{U_i \to U\}$ of $(Sch/X)_\tau$ with $U \in Ob(\mathcal{C}_t)$. Then

(i) *The functor $\mathcal{C}_1 \to \mathcal{C}_2$ is fully faithful, continuous, and cocontinuous.*

Denote $g : Sh(\mathcal{C}_1) \to Sh(\mathcal{C}_2)$ the corresponding morphism of topoi. Denote $\mathcal{O}_t$ the restriction of $\mathcal{O}$ to $\mathcal{C}_t$. Denote $g_!$ the functor of Modules on Sites, Definition 16.16.1.

(ii) *The canonical map $g_!\mathcal{O}_1 \to \mathcal{O}_2$ is an isomorphism.*

Proof. Assertion (i) is immediate from the definitions. In this proof all schemes are schemes over X and all morphisms of schemes are morphisms of schemes over X. Note that g^{-1} is given by restriction, so that for an object U of $\mathcal{C}_1$ we have $\mathcal{O}_1(U) = \mathcal{O}_2(U) = \mathcal{O}(U)$. Recall that $g_!\mathcal{O}_1$ is the sheaf associated to the presheaf $g_{p!}\mathcal{O}_1$ which associates to V in $\mathcal{C}_2$ the group

$$colim_{V \to U}\, \mathcal{O}(U)$$

where U runs over the objects of $\mathcal{C}_1$ and the colimit is taken in the category of abelian groups. Below we will use frequently that if

$$V \to U \to U'$$

are morphisms with $U, U' \in Ob(\mathcal{C}_1)$ and if $f' \in \mathcal{O}(U')$ restricts to $f \in \mathcal{O}(U)$, then $(V \to U, f)$ and $(V \to U', f')$ define the same element of the colimit. Also, $g_!\mathcal{O}_1 \to \mathcal{O}_2$ maps the element $(V \to U, f)$ simply to the pullback of f to V.

Surjectivity. Let V be a scheme and let $h \in \mathcal{O}(V)$. Then we obtain a morphism $V \to X \times \mathbf{A}^1$ induced by h and the structure morphism $V \to X$. Writing $\mathbf{A}^1 = Spec(\mathbf{Z}[x])$ we see the element $x \in \mathcal{O}(X \times \mathbf{A}^1)$ pulls back to h. Since $X \times \mathbf{A}^1$ is an object of $\mathcal{C}_1$ by assumptions (1)(b) and (2) we obtain the desired surjectivity.

Injectivity. Let V be a scheme. Let $s = \sum_{i=1,\ldots,n}(V \to U_i, f_i)$ be an element of the colimit displayed above. For any i we can use the morphism $f_i : U_i \to X \times \mathbf{A}^1$ to see that $(V \to U_i, f_i)$ defines the same element of the colimit as $(f_i : V \to X \times \mathbf{A}^1, x)$. Then we can consider

$$f_1 \times \ldots \times f_n : V \to X \times \mathbf{A}^n$$

and we see that s is equivalent in the colimit to

$$\sum\nolimits_{i=1,\ldots,n}(f_1 \times \ldots \times f_n : V \to X \times \mathbf{A}^n, x_i) = (f_1 \times \ldots \times f_n : V \to X \times \mathbf{A}^n, x_1 + \ldots + x_n)$$

Now, if $x_1 + \ldots + x_n$ restricts to zero on V, then we see that $f_1 \times \ldots \times f_n$ factors through $X \times \mathbf{A}^{n-1} = V(x_1 + \ldots + x_n)$. Hence we see that s is equivalent to zero in the colimit. $\square$

38.50. Étale cohomology

In the following sections we prove some basic results on étale cohomology.

38.51. Colimits

Let us start by recalling that if $(\mathcal{F}_i, \varphi_{ii'})$ is a diagram of sheaves on a topological space X its colimit (in the category of sheaves) is the sheafification of the presheaf $U \mapsto colim_i\, \mathcal{F}_i(U)$. See Sheaves, Section 6.28. In the case where X is Noetherian and the system is directed, the sheafification is superfluous: See [**Har77**, Chapter II, Exercise 1.11] for a special case, see Sheaves, Lemma 6.29.1 for a general result. See Cohomology, Lemma 18.15.1 for a result dealing with higher cohomology groups of colimits of abelian sheaves. Finally, see Modules, Lemma 15.11.6 for a result on Hom sheaves of $\mathcal{O}_X$-modules when X is a ringed space.

Theorem 38.51.1. *Let X be a quasi-compact and quasi-separated scheme. Let $\left(\mathcal{F}_i, \varphi_{ij}\right)$ be a system of abelian sheaves on $X_{étale}$ over the partially ordered set I. If I is directed then*

$$colim_{i\in I} H^p_{et}(X, \mathcal{F}_i) = H^p_{et}(X, colim_{i\in I} \mathcal{F}_i).$$

Sketch of proof. This is proven for all X at the same time, by induction on p.

(1) For any quasi-compact and quasi-separated scheme X and any étale covering $\mathcal{U}$ of X, show that there exists a refinement $\mathcal{V} = \left\{\mathcal{V}_j \to X\right\}_{j\in J}$ with J finite and each V_j quasi-compact and quasi-separated such that all the $\mathcal{V}_{j_0} \times_X \cdots \times_X \mathcal{V}_{j_p}$ are also quasi-compact and quasi-separated.
(2) Using the previous step and the definition of colimits in the category of sheaves, show that the theorem holds for $p = 0$, all X. (Exercise.)
(3) Using the locality of cohomology (Lemma 38.22.3), the Čech-to-cohomology spectral sequence (Theorem 38.19.2) and the fact that the induction hypothesis applies to all $\mathcal{V}_{j_0} \times_X \cdots \times_X \mathcal{V}_{j_p}$ in the above situation, prove the induction step $p \to p + 1$.

□

Theorem 38.51.2. *Let A be a ring, $(I, \leq)$ a directed poset and (B_i, φ_{ij}) a system of A-algebras. Set $B = colim_{i\in I} B_i$. Let $X \to Spec(A)$ be a quasi-compact and quasi-separated morphism of schemes and $\mathcal{F}$ an abelian sheaf on $X_{étale}$. Denote $X_i = X \times_{Spec(A)} Spec(B_i)$, $Y = X \times_{Spec(A)} Spec(B)$, $\mathcal{F}_i = (X_i \to X)^{-1}\mathcal{F}$ and $\mathcal{G} = (Y \to X)^{-1}\mathcal{F}$. Then*

$$H^p_{et}(Y, \mathcal{G}) = colim_{i\in I} H^p_{et}((X_i), \mathcal{F}_i).$$

Sketch of proof. The proof proceeds along the following steps.

(1) Given $\mathcal{V} \to Y$ étale with $\mathcal{V}$ quasi-compact and quasi-separated, there exist $i \in I$ and $\mathcal{U}_i \to X_i$ such that $\mathcal{V} = \mathcal{U}_i \times_{X_i} Y$.

If all the schemes considered were affine, this would correspond to the following algebra statement: if $B = colim\, B_i$ and $B \to C$ is étale, then there exist $i \in I$ and $B_i \to C_i$ étale such that $C \cong B \otimes_{B_i} C_i$.

This is proven as follows: write $C \cong B\left[x_1, \ldots, x_n\right]/(f_1, \ldots, f_n)$ with $\det(f_j(x_k)) \in C^*$ and pick $i \in I$ large enough so that all the coefficients of the f_js lie in B_i, and let $C_i = B_i\left[x_1, \ldots, x_n\right]/(f_1, \ldots, f_n)$. This makes sense by the assumption. After further increasing i, $\det(f_j(x_k))$ will be invertible in C_i, and C_i will be étale over B_i.

(2) By (1), we see that for every étale covering $\mathcal{V} = \left\{\mathcal{V}_j \to Y\right\}_{j\in J}$ with J finite and the $\mathcal{V}_j$s quasi-compact and quasi-separated, there exists $i \in I$ and an étale covering $\mathcal{V}_i = \left\{\mathcal{V}_{ij} \to X_i\right\}_{j\in J}$ such that $\mathcal{V} \cong \mathcal{V}_i \times_{X_i} Y$.
(3) Show that (2) implies

$$\check{H}^*(\mathcal{V}, \mathcal{G}) = colim_{i\in I} \check{H}^*(\mathcal{V}_i, \mathcal{F}_i).$$

This is not clear, as we have not explained how to deal with $\mathcal{F}_i$ and $\mathcal{G}$, in particular with the dual.
(4) Use the Čech-to-cohomology spectral sequence (Theorem 38.19.2).

□

38.52. Stalks of higher direct images

Lemma 38.52.1. *Let $f : X \to Y$ be a morphism of schemes and $\mathscr{F} \in Ab(X_{étale})$. Then $R^p f_* \mathscr{F}$ is the sheaf associated to the presheaf*

$$(V \to Y) \longmapsto H^0_{et}\left(X \times_Y V, \mathscr{F}|_{X \times_Y V}\right).$$

This lemma is valid for topological spaces, and the proof in this case is the same.

Theorem 38.52.2. *Let $f : X \to S$ be a quasi-compact and quasi-separated morphism of schemes, $\mathscr{F}$ an abelian sheaf on $X_{étale}$, and $\bar{s}$ a geometric point of S. Then*

$$\left(R^p f_* \mathscr{F}\right)_{\bar{s}} = H^p_{et}\left(X \times_S Spec(\mathscr{O}^{\mathrm{sh}}_{S,\bar{s}}), pr^{-1}\mathscr{F}\right)$$

where pr is the projection $X \times_S Spec(\mathscr{O}^{\mathrm{sh}}_{S,\bar{s}}) \to X$.

Proof. Let $\mathscr{I}$ be the category opposite to the category of étale neighborhoods of $\bar{s}$ on S. By Lemma 38.52.1 we have

$$\left(R^p f_* \mathscr{F}\right)_{\bar{s}} = colim_{(\mathscr{V},\bar{v}) \in \mathscr{I}} H^p(X \times_S \mathscr{V}, \mathscr{F}|_{X \times_S \mathscr{V}}).$$

On the other hand,

$$\mathscr{O}^{\mathrm{sh}}_{S,\bar{s}} = colim_{(\mathscr{V},\bar{v}) \in \mathscr{I}} \Gamma(\mathscr{V}, \mathscr{O}_{\mathscr{V}}).$$

Replacing $\mathscr{I}$ with its cofinal subset $\mathscr{I}^{\mathrm{aff}}$ consisting of affine étale neighborhoods $\mathscr{V}_i = Spec(B_i)$ of $\bar{s}$ mapping into some fixed affine open $Spec(A) \subset S$, we get

$$\mathscr{O}^{\mathrm{sh}}_{S,\bar{s}} = colim_{i \in \mathscr{I}^{\mathrm{aff}}} B_i,$$

and the result follows from Theorem 38.51.2. □

38.53. The Leray spectral sequence

Lemma 38.53.1. *Let $f : X \to Y$ be a morphism and $\mathscr{I}$ an injective sheaf in $Ab(X_{étale})$. Then*

1. *for any $\mathscr{V} \in Ob(Y_{étale})$ and any étale covering $\mathscr{V} = \left\{\mathscr{V}_j \to \mathscr{V}\right\}_{j \in J}$ we have $\check{H}^p(\mathscr{V}, f_*\mathscr{I}) = 0$ for all $p > 0$;*
2. *$f_*\mathscr{I}$ is acyclic for the functors $\Gamma(Y, -)$ and $\Gamma(\mathscr{V}, -)$; and*
3. *if $g : Y \to Z$, then $f_*\mathscr{I}$ is acyclic for g_*.*

Proof. Observe that $\check{\mathscr{C}}^\bullet(\mathscr{V}, f_*\mathscr{I}) = \check{\mathscr{C}}^\bullet(\mathscr{V} \times_Y X, \mathscr{I})$ which has no cohomology by Lemma 38.18.7, which proves *i*. The second statement is a great exercise in using the Čech-to-cohomology spectral sequence. See (insert future reference) for more details. Part *iii* is a consequence of *ii* and the description of $R^p g_*$ from Theorem 38.52.2. □

Using the formalism of Grothendieck spectral sequences, this gives the following.

Proposition 38.53.2. *(Leray spectral sequence) Let $f : X \to Y$ be a morphism of schemes and $\mathscr{F}$ an étale sheaf on X. Then there is a spectral sequence*

$$E_2^{p,q} = H^p_{et}(Y, R^q f_* \mathscr{F}) \Rightarrow H^{p+q}_{et}(X, \mathscr{F}).$$

38.54. Vanishing of finite higher direct images

The next goal is to prove that the higher direct images of a finite morphism of schemes vanish.

Lemma 38.54.1. *Let R be a strictly henselian ring and $S = Spec(R)$. Then the global sections functor $\Gamma(S, -) : Ab(S_{étale}) \to Ab$ is exact. In particular*

$$\forall p \geq 1, \quad H^p_{et}(S, \mathcal{F}) = 0$$

for all $\mathcal{F} \in Ab(S_{étale})$.

Proof. Let $\mathcal{U} = \left\{ f_i : \mathcal{U}_i \to S \right\}_{i \in I}$ be an étale covering, and denote s the closed point of S. Then $s = f_i(u_i)$ for some $i \in I$ and some $u_i \in U_i$ by Lemma 38.29.5. Pick an affine open neighborhood $Spec(A)$ of u_i in $\mathcal{U}_i$. Then there is a commutative diagram

$$\begin{tikzcd} R \arrow[r] \arrow[d] & A \arrow[d] \\ \kappa(s) \arrow[r] & \kappa(u_i) \end{tikzcd}$$

where $\kappa(s)$ is separably closed, and the residue extension is finite separable. Therefore, $\kappa(s) \cong \kappa(u_i)$, and using part v of Theorem 38.32.4, we see that $A \cong R \times A'$ and we get a section

$$\begin{tikzcd} Spec(A) \arrow[r, hook] \arrow[dr] & \mathcal{U}_i \arrow[d] \\ & S. \arrow[ul, bend left] \end{tikzcd}$$

In particular, the covering $\{\mathrm{id} : S \to S\}$ refines $\mathcal{U}$. This implies that if

$$0 \to \mathcal{F}_1 \to \mathcal{F}_2 \xrightarrow{\alpha} \mathcal{F}_3 \to 0$$

is a short exact sequence in $Ab(S_{étale})$, then the sequence

$$0 \to \Gamma(S_{étale}, \mathcal{F}_1) \to \Gamma(S_{étale}, \mathcal{F}_2) \to \Gamma(S_{étale}, \mathcal{F}_3) \to 0$$

is also exact. Indeed, exactness is clear except possibly at the last step. But given a section $s \in \Gamma(S_{étale}, \mathcal{F}_3)$, we know that there exist a covering $\mathcal{U}$ and local sections s_i such that $\alpha(s_i) = s|_{\mathcal{U}_i}$. But since this covering can be refined by the identity, the s_i must agree locally with s, hence they glue to a global section of $\mathcal{F}_2$. □

Proposition 38.54.2. *Let $f : X \to Y$ be a finite morphism of schemes. Then for all $q \geq 1$ and all $\mathcal{F} \in Ab(X_{étale})$, $R^q f_* \mathcal{F} = 0$.*

Proof. Let $X^{sh}_{\bar{y}}$ denote the fiber product $X \times_Y Spec(\mathcal{O}^{sh}_{Y,\bar{y}})$. It suffices to show that for all $q \geq 1$, $H^q_{et}(X^{sh}_{\bar{y}}, \mathcal{G}) = 0$. Since f is finite, $X^{sh}_{\bar{y}}$ is finite over $Spec(\mathcal{O}^{sh}_{Y,\bar{y}})$, thus $X^{sh}_{\bar{y}} = Spec(A)$ for some ring A finite over $\mathcal{O}^{sh}_{Y,\bar{y}}$. Since the latter is strictly henselian, Lemma 38.32.5 implies that A is henselian and therefore splits as a product of henselian local rings $A_1 \times \cdots \times A_r$. Furthermore, $\kappa(\mathcal{O}^{sh}_{Y,\bar{y}})$ is separably closed and for each i, the residue field extension $\kappa(\mathcal{O}^{sh}_{Y,\bar{y}}) \subset \kappa(A_i)$ is finite, hence $\kappa(A_i)$ is separably closed and A_i is strictly henselian. This implies that $Spec(A) = \coprod_{i=1}^r Spec(A_i)$, and we can apply Lemma 38.54.1 to get the result. □

38.55. Schemes étale over a point

In this section we describe schemes étale over the spectrum of a field. Before we state the result we introduce the category of G-sets for a topological group G.

Definition 38.55.1. Let G be a topological group. A *G-set*, sometime called a *discrete G-set*, is a set X endowed with a left action $a : G \times X \to X$ such that a is continuous when X is given the discrete topology and $G \times X$ the product topology. A *morphism of G-sets* $f : X \to Y$ is simply any G-equivariant map from X to Y. The category of G-sets is denoted *G-Sets*.

The condition that $a : G \times X \to X$ is continuous signifies simply that the stabilizer of any $x \in X$ is open in G. If G is an abstract group G (i.e., a group but not a topological group) then this agrees with our preceding definition (see for example Sites, Example 9.6.5) provided we endow G with the discrete topology.

Recall that if $K \subset L$ is an infinite Galois extension the Galois group $G = \text{Gal}(L/K)$ comes endowed with a canonical topology. Namely the open subgroups are the subgroups of the form $\text{Gal}(L/K') \subset G$ where K'/K is a finite subextension of L/K. The index of an open subgroup is always finite. We say that G is a profinite (topological) group.

Lemma 38.55.2. *Let K be a field. Let K^{sep} a separable closure of K. Consider the profinite group*

$$G = Aut_{Spec(K)}(Spec(K^{sep}))^{opp} = Gal(K^{sep}/K)$$

The functor

$$\begin{matrix} \textit{schemes étale over } K & \longrightarrow & G\textit{-Sets} \\ X/K & \longmapsto & Mor_{Spec(K)}(Spec(K^{sep}), X) \end{matrix}$$

is an equivalence of categories.

Proof. A scheme X over K is étale over K if and only if $X \cong \coprod_{i \in I} Spec(K_i)$ with each K_i a finite separable extension of K. The functor of the lemma associates to X the G-set

$$\coprod\nolimits_i Hom_K(K_i, K^{sep})$$

with its natural left G-action. Each element has an open stabilizer by definition of the topology on G. Conversely, any G-set S is a disjoint union of its orbits. Say $S = \coprod S_i$. Pick $s_i \in S_i$ and denote $G_i \subset G$ its open stabilizer. By Galois theory the fields $(K^{sep})^{G_i}$ are finite separable field extensions of K, and hence the scheme

$$\coprod\nolimits_i Spec((K^{sep})^{G_i})$$

is étale over K. This gives an inverse to the functor of the lemma. Some details omitted. □

Remark 38.55.3. Under the correspondence of the lemma, the coverings in the small étale site $Spec(K)_{étale}$ of K correspond to surjective families of maps in *G-Sets*.

38.56. Galois action on stalks

In this section we define an action of the absolute Galois group of a residue field of a point s of S on the stalk functor at any geometric point lying over s.

Galois action on stalks. Let S be a scheme. Let $\overline{s}$ be a geometric point of S. Let $\sigma \in \text{Aut}(\kappa(\overline{s})/\kappa(s))$. Define an action of σ on the stalk $\mathcal{F}_{\overline{s}}$ of a sheaf $\mathcal{F}$ as follows

$$\begin{matrix} \mathcal{F}_{\overline{s}} & \longrightarrow & \mathcal{F}_{\overline{s}} \\ (U, \overline{u}, t) & \longmapsto & (U, \overline{u} \circ Spec(\sigma), t). \end{matrix} \tag{38.56.0.1}$$

where we use the description of elements of the stalk in terms of triples as in the discussion following Definition 38.29.6. This is a left action, since if $\sigma_i \in \text{Aut}(\kappa(\overline{s})/\kappa(s))$ then

$$\begin{aligned}\sigma_1 \cdot (\sigma_2 \cdot (U, \overline{u}, t)) &= \sigma_1 \cdot (U, \overline{u} \circ Spec(\sigma_2), t) \\ &= (U, \overline{u} \circ Spec(\sigma_2) \circ Spec(\sigma_1), t) \\ &= (U, \overline{u} \circ Spec(\sigma_1 \circ \sigma_2), t) \\ &= (\sigma_1 \circ \sigma_2) \cdot (U, \overline{u}, t)\end{aligned}$$

It is clear that this action is functorial in the sheaf $\mathcal{F}$. We note that we could have defined this action by referring directly to Remark 38.29.8.

Definition 38.56.1. Let S be a scheme. Let $\overline{s}$ be a geometric point lying over the point s of S. Let $\kappa(s) \subset \kappa(s)^{sep} \subset \kappa(\overline{s})$ denote the separable algebraic closure of $\kappa(s)$ in the algebraically closed field $\kappa(\overline{s})$.

(1) In this situation the *absolute Galois group* of $\kappa(s)$ is $\text{Gal}(\kappa(s)^{sep}/\kappa(s))$. It is sometimes denoted $\text{Gal}_{\kappa(s)}$.
(2) The geometric point $\overline{s}$ is called *algebraic* if $\kappa(s) \subset \kappa(\overline{s})$ is an algebraic closure of $\kappa(s)$.

Example 38.56.2. The geometric point $Spec(\mathbf{C}) \to Spec(\mathbf{Q})$ is not algebraic.

Let $\kappa(s) \subset \kappa(s)^{sep} \subset \kappa(\overline{s})$ be as in the definition. Note that as $\kappa(\overline{s})$ is algebraically closed the map

$$\text{Aut}(\kappa(\overline{s})/\kappa(s)) \longrightarrow \text{Gal}(\kappa(s)^{sep}/\kappa(s)) = \text{Gal}_{\kappa(s)}$$

is surjective. Suppose $(U, \overline{u})$ is an étale neighbourhood of $\overline{s}$, and say $\overline{u}$ lies over the point u of U. Since $U \to S$ is étale, the residue field extension $\kappa(s) \subset \kappa(u)$ is finite separable. This implies the following

(1) If $\sigma \in \text{Aut}(\kappa(\overline{s})/\kappa(s)^{sep})$ then σ acts trivially on $\mathcal{F}_{\overline{s}}$.
(2) More precisely, the action of $\text{Aut}(\kappa(\overline{s})/\kappa(s))$ determines and is determined by an action of the absolute Galois group $\text{Gal}_{\kappa(s)}$ on $\mathcal{F}_{\overline{s}}$.
(3) Given $(U, \overline{u}, t)$ representing an element ξ of $\mathcal{F}_{\overline{s}}$ any element of $\text{Gal}(\kappa(s)^{sep}/K)$ acts trivially, where $\kappa(s) \subset K \subset \kappa(s)^{sep}$ is the image of $\overline{u}^\sharp : \kappa(u) \to \kappa(\overline{s})$.

Alltogether we see that $\mathcal{F}_{\overline{s}}$ becomes a $\text{Gal}_{\kappa(s)}$-set (see Definition 38.55.1). Hence we may think of the stalk functor as a functor

$$Sh(S_{étale}) \longrightarrow \text{Gal}_{\kappa(s)}\text{-}Sets, \quad \mathcal{F} \longmapsto \mathcal{F}_{\overline{s}}$$

and from now on we usually do think about the stalk functor in this way.

Theorem 38.56.3. *Let $S = Spec(K)$ with K a field. Let $\overline{s}$ be a geometric point of S. Let $G = Gal_{\kappa(s)}$ denote the absolute Galois group. Then the functor above induces an equivalence of categories*

$$Sh(S_{étale}) \longrightarrow G\text{-}Sets, \quad \mathcal{F} \longmapsto \mathcal{F}_{\overline{s}}.$$

Proof. Let us construct the inverse to this functor. In Lemma 38.55.2 we have seen that given a G-set M there exists an étale morphism $X \to Spec(K)$ such that $Mor_K(Spec(K^{sep}), X)$ is isomorphic to M as a G-set. Consider the sheaf $\mathcal{F}$ on $Spec(K)_{étale}$ defined by the rule $U \mapsto Mor_K(U, X)$. This is a sheaf as the étale topology is subcanonical. Then we see that $\mathcal{F}_{\overline{s}} = Mor_K(Spec(K^{sep}), X) = M$ as G-sets (details omitted). This gives the inverse of the functor and we win. □

Remark 38.56.4. Another way to state the conclusions of Lemmas 38.55.2 and Theorem 38.56.3 is to say that every sheaf on $Spec(K)_{étale}$ is representable by a scheme X étale over $Spec(K)$. This does not mean that every sheaf is representable in the sense of Sites, Definition 9.12.3. The reason is that in our construction of $Spec(K)_{étale}$ we chose a sufficiently large set of schemes étale over $Spec(K)$, whereas sheaves on $Spec(K)_{étale}$ form a proper class.

Lemma 38.56.5. *Assumptions and notations as in Theorem 38.56.3. There is a functorial bijection*

$$\Gamma(S, \mathcal{F}) = (\mathcal{F}_{\overline{s}})^G$$

Proof. We can prove this using formal arguments and the result of Theorem 38.56.3 as follows. Given a sheaf $\mathcal{F}$ corresponding to the G-set $M = \mathcal{F}_{\overline{s}}$ we have

$$\begin{aligned} \Gamma(S, \mathcal{F}) &= Mor_{Sh(S_{étale})}(h_{Spec(K)}, \mathcal{F}) \\ &= Mor_{G\text{-}Sets)}(\{*\}, M) \\ &= M^G \end{aligned}$$

Here the first identification is explained in Sites, Sections 9.2 and 9.12, the second results from Theorem 38.56.3 and the third is clear. We will also give a direct proof[5].

Suppose that $t \in \Gamma(S, \mathcal{F})$ is a global section. Then the triple $(S, \overline{s}, t)$ defines an element of $\mathcal{F}_{\overline{s}}$ which is clearly invariant under the action of G. Conversely, suppose that $(U, \overline{u}, t)$ defines an element of $\mathcal{F}_{\overline{s}}$ which is invariant. Then we may shrink U and assume $U = Spec(L)$ for some finite separable field extension of K, see Proposition 38.26.2. In this case the map $\mathcal{F}(U) \to \mathcal{F}_{\overline{s}}$ is injective, because for any morphism of étale neighbourhoods $(U', \overline{u}') \to (U, \overline{u})$ the restriction map $\mathcal{F}(U) \to \mathcal{F}(U')$ is injective since $U' \to U$ is a covering of $S_{étale}$. After enlarging L a bit we may assume $K \subset L$ is a finite Galois extension. At this point we use that

$$Spec(L) \times_{Spec(K)} Spec(L) = \coprod\nolimits_{\sigma \in \mathrm{Gal}(L/K)} Spec(L)$$

where the maps $Spec(L \otimes_K L) \to Spec(L)$ come from the ring maps $a \otimes b \mapsto a\sigma(b)$. Hence we see that the condition that $(U, \overline{u}, t)$ is invariant under all of G implies that $t \in \mathcal{F}(Spec(L))$ maps to the same element of $\mathcal{F}(Spec(L) \times_{Spec(K)} Spec(L))$ via restriction by either projection (this uses the injectivity mentioned above; details omitted). Hence the sheaf condition of $\mathcal{F}$ for the étale covering $\{Spec(L) \to Spec(K)\}$ kicks in and we conclude that t comes from a unique section of $\mathcal{F}$ over $Spec(K)$. □

Remark 38.56.6. Let S be a scheme and let $\overline{s} : Spec(k) \to S$ be a geometric point of S. By definition this means that k is algebraically closed. In particular the absolute Galois group of k is trivial. Hence by Theorem 38.56.3 the category of sheaves on $Spec(k)_{étale}$ is equivalent to the category of sets. The equivalence is given by taking sections over $Spec(k)$. This finally provides us with an alternative definition of the stalk functor. Namely, the functor

$$Sh(S_{étale}) \longrightarrow Sets, \quad \mathcal{F} \longmapsto \mathcal{F}_{\overline{s}}$$

is isomorphic to the functor

$$Sh(S_{étale}) \longrightarrow Sh(Spec(k)_{étale}) = Sets, \quad \mathcal{F} \longmapsto \overline{s}^*\mathcal{F}$$

To prove this rigorously one can use Lemma 38.36.2 part (3) with $f = \overline{s}$. Moreover, having said this the general case of Lemma 38.36.2 part (3) follows from functoriality of pullbacks.

[5]For the doubting Thomases out there.

38.57. Cohomology of a point

As a consequence of the discussion in the preceding two sections we obtain the equivalence of étale cohomology of the spectrum of a field with Galois cohomology.

Definition 38.57.1. Let G be a topological group. A *G-module*, sometime called a *discrete G-module*, is an abelian group M endowed with a left action $a : G \times M \to M$ by group homomorphisms such that a is continuous when M is given the discrete topology and $G \times M$ the product topology. A *morphism of G-modules* $f : M \to N$ is simply any G-equivariant homomorphism from M to N. The category of G-modules is denoted Mod_G.

The condition that $a : G \times M \to M$ is continuous signifies simply that the stabilizer of any $x \in M$ is open in G. If G is an abstract group G (i.e., a group but not a topological group) then this corresponds to the notion of an abelian group endowed with a G-action provided we endow G with the discrete topology.

Lemma 38.57.2. *Let $S = Spec(K)$ with K a field. Let $\overline{s}$ be a geometric point of S. Let $G = Gal_{\kappa(s)}$ denote the absolute Galois group. The stalk functor induces an equivalence of categories*

$$Ab(S_{étale}) \longrightarrow Mod_G, \quad \mathcal{F} \longmapsto \mathcal{F}_{\overline{s}}.$$

Proof. In Theorem 38.56.3 we have seen the equivalence between sheaves of sets and G-sets. The current lemma follows formally from this as an abelian sheaf is just a sheaf of sets endowed with a commutative group law, and a G-module is just a G-set endowed with a commutative group law. □

The category Mod_G has enough injectives, see Injectives, Lemma 17.7.1. Consider the left exact functor

$$Mod_G \longrightarrow Ab, \quad M \longmapsto M^G = \{x \in M \mid g \cdot x = x \ \forall g \in G\}$$

We sometimes denote $M^G = H^0(G, M)$ and sometimes we write $M^G = \Gamma_G(M)$. This functor has a total right derived functor $R\Gamma_G(M)$ and ith right derived functor $R^i\Gamma_G(M) = H^i(G, M)$ for any $i \geq 0$.

Definition 38.57.3. Let G be a topological group.

(1) The right derived functors $H^i(G, M)$ are called the *continuous group cohomology groups* of M.
(2) If G is an abstract group endowed with the discrete topology then the $H^i(G, M)$ are called the *group cohomology groups* of M.
(3) If G is a Galois group, then the groups $H^i(G, M)$ are called the *Galois cohomology groups* of M.
(4) If G is the absolute Galois group of a field K, then the groups $H^i(G, M)$ are sometimes called the *Galois cohomology groups of K with coefficients in M*.

Lemma 38.57.4. *Notation and assumptions as in Lemma 38.57.2. Let $\mathcal{F}$ be an abelian sheaf on $Spec(K)_{étale}$ which corresponds to the G-module M. Then*

(1) *in $D(Ab)$ we have a canonical isomorphism $R\Gamma(S, \mathcal{F}) = R\Gamma_G(M)$,*
(2) *$H^0_{et}(S, \mathcal{F}) = M^G$, and*
(3) *$H^q_{et}(S, \mathcal{F}) = H^q(G, M)$.*

Proof. Combine Lemma 38.57.2 with Lemma 38.56.5. □

Example 38.57.5. Sheaves on $Spec(K)_{étale}$. Let $G = \mathrm{Gal}(K^{sep}/K)$ be the absolute Galois group of K.

(1) The constant sheaf $\underline{\mathbf{Z}/n\mathbf{Z}}$ corresponds to the module $\mathbf{Z}/n\mathbf{Z}$ with trivial G-action,
(2) the sheaf $\mathbf{G}_m|_{Spec(K)_{étale}}$ corresponds to $(K^{sep})^*$ with its G-action,
(3) the sheaf $\mathbf{G}_a|_{Spec(K^{sep})}$ corresponds to $(K^{sep}, +)$ with its G-action, and
(4) the sheaf $\mu_n|_{Spec(K^{sep})}$ corresponds to $\mu_n(K^{sep})$ with its G-action.

By Remark 38.23.4 and Theorem 38.24.1 we have the following identifications for cohomology groups:

$$H^0_{et}(S_{étale}, \mathbf{G}_m) = \Gamma(S, \mathcal{O}_S^*)$$
$$H^1_{et}(S_{étale}, \mathbf{G}_m) = H^1_{Zar}(S, \mathcal{O}_S^*) = \mathrm{Pic}(S)$$
$$H^i_{et}(S_{étale}, \mathbf{G}_a) = H^i_{Zar}(S, \mathcal{O}_S)$$

Also, for any quasi-coherent sheaf $\mathcal{F}$ on $S_{étale}$ we have

$$H^i(S_{étale}, \mathcal{F}) = H^i_{Zar}(S, \mathcal{F}),$$

see Theorem 38.22.4. In particular, this gives the following sequence of equalities

$$0 = \mathrm{Pic}(Spec(K)) = H^1_{et}(Spec(K)_{étale}, \mathbf{G}_m) = H^1(G, (K^{sep})^*)$$

which is none other than Hilbert's 90 theorem. Similarly, for $i \geq 1$,

$$0 = H^i(Spec(K), \mathcal{O}) = H^i_{et}(Spec(K)_{étale}, \mathbf{G}_a) = H^i(G, K^{sep})$$

where the K^{sep} indicates K^{sep} as a Galois module with addition as group law. In this way we may consider the work we have done sofar as a complicated way of computing Galois cohomology groups.

38.58. Cohomology of curves

The next task at hand is to compute the étale cohomology of a smooth curve with torsion coefficients, and in particular show that it vanishes in degree at least 3. To prove this, we will compute cohomology at the generic point, which amounts to some Galois cohomology. We now review without proofs. the relevant facts about Brauer groups. For references, see [**Ser62**], [**Ser97**] or [**Wei48**].

38.59. Brauer groups

Brauer groups of fields, defined using finite central simple algebras, are discussed in the chapter Brauer Groups, Section 8.1. Here we give a synopsis.

Theorem 38.59.1. *Let K be a field. For a unital, associative (not necessarily commutative) K-algebra A the following are equivalent*

(1) *A is finite central simple K-algebra,*
(2) *A is a finite dimensional K-vector space, K is the center of A, and A has no nontrivial two-sided ideal,*
(3) *there exists $d \geq 1$ such that $A \otimes_K \bar{K} \cong Mat(d \times d, \bar{K})$,*
(4) *there exists $d \geq 1$ such that $A \otimes_K K^{sep} \cong Mat(d \times d, K^{sep})$,*
(5) *there exist $d \geq 1$ and a finite Galois extension $K \subset K'$ such that $A \otimes_{K'} K' \cong Mat(d \times d, K')$,*
(6) *there exist $n \geq 1$ and a finite central skew field D over K such that $A \cong Mat(n \times n, D)$.*

The integer d is called the degree of A.

Proof. This is a copy of Brauer Groups, Lemma 8.8.6. ☐

Lemma 38.59.2. *Let A be a finite central simple algebra over K. Then*

$$\begin{array}{ccc} A \otimes_K A^{opp} & \longrightarrow & End_K(A) \\ a \otimes a' & \longmapsto & (x \mapsto axa') \end{array}$$

is an isomorphism of algebras over K.

Proof. See Brauer Groups, Lemma 8.4.10. □

Definition 38.59.3. Two finite central simple algebras A_1 and A_2 over K are called *similar*, or *equivalent* if there exist $m, n \geq 1$ such that $\mathrm{Mat}(n \times n, A_1) \cong \mathrm{Mat}(m \times m, A_2)$. We write $A_1 \sim A_2$.

Definition 38.59.4. Let K be a field. The *Brauer group* of K is the set $\mathrm{Br}(K)$ of similarity classes of finite central simple algebras over K, endowed with the group law induced by tensor product (over K). The class of A in $\mathrm{Br}(K)$ is denoted by $[A]$. The neutral element is $[K] = [\mathrm{Mat}(d \times d, K)]$ for any $d \geq 1$.

The previous lemma thus mean that inverses exist, and that $-[A] = [A^{opp}]$. The Brauer group is always torsion, but not finitely generated in general. We will see that $A^{\otimes \deg A} \sim K$ for any finite central simple algebra A (insert future reference here).

Lemma 38.59.5. *Let K be a field and $\mathcal{G} = Gal(K^{sep}|K)$). Then the set of isomorphism classes of central simple algebras of degree d over K is in bijection with the non-abelian cohomology $H^1_{cont}(\mathcal{G}, PGL_d(K^{sep}))$.*

Sketch of proof. The Skolem-Noether theorem (see Brauer Groups, Theorem 8.6.1) implies that for any field L the group $\mathrm{Aut}_{L\text{-Algebras}}(\mathrm{Mat}_d(L))$ equals $\mathrm{PGL}_d(L)$. By Theorem 38.59.1, we see that central simple algebras of degree d correspond to forms of the K-algebra $\mathrm{Mat}_d(K)$, which in turn correspond to $H^1_{cont}(\mathcal{G}, \mathrm{PGL}_d(K^{sep}))$. For more details on twisting, see for example [**Sil86**]. □

If A is a finite central simple algebra over K, we denote ξ_A the corresponding cohomology class in $H^1_{cont}(\mathcal{G}, \mathrm{PGL}_{\deg A}(K^{sep}))$. Consider now the short exact sequence

$$1 \to (K^{sep})^* \to \mathrm{GL}_d(K^{sep}) \to \mathrm{PGL}_d(K^{sep}) \to 1,$$

which gives rise to a long exact cohomology sequence (up to degree 2) with coboundary map

$$\delta_d : H^1_{cont}(\mathcal{G}, \mathrm{PGL}_d(K^{sep})) \to H^2(\mathcal{G}, (K^{sep})^*).$$

Explicitly, this is given as follows: if ξ is a cohomology class represented by the 1-cocyle (g_σ), then $\delta_d(\xi)$ is the class of the 2-cocycle $((g_\sigma^\tau)^{-1} g_{\sigma\tau} g_\tau^{-1})$.

Theorem 38.59.6. *The map*

$$\begin{array}{cccc} \delta : & Br(K) & \longrightarrow & H^2(\mathcal{G}, (K^{sep})^*) \\ & [A] & \longmapsto & \delta_{\deg A}(\xi_A) \end{array}$$

is a group isomorphism.

Proof. Omitted. Hints: In the abelian case ($d = 1$), one has the identification

$$H^1(\mathcal{G}, \mathrm{GL}_d(K^{sep})) = H^1_{et}(Spec(K), \mathrm{GL}_d(\mathcal{O}))$$

the latter of which is trivial by fpqc descent. If this were true in the non-abelian case, this would readily imply injectivity of δ. (See [**Del77**].) Rather, to prove this, one can reinterpret $\delta([A])$ as the obstruction to the existence of a K-vector space V with a left A-module structure and such that $\dim_K V = \deg A$. In the case where V exists, one has $A \cong \mathrm{End}_K(V)$. For surjectivity, pick a cohomology class $\xi \in H^2(\mathcal{G}, (K^{sep})^*)$, then there exists a finite Galois extension $K \subset K' \subset K^{sep}$ such that ξ is the image of some $\xi' \in H^2_{cont}(\mathrm{Gal}(K'|K), (K')^*)$. Then write down an explicit central simple algebra over K using the data K', ξ'. □

The Brauer group of a scheme. Let S be a scheme. An $\mathcal{O}_S$-algebra $\mathcal{A}$ is called *Azumaya* if it is étale locally a matrix algebra, i.e., if there exists an étale covering $\mathcal{U} = \{\varphi_i : \mathcal{U}_i \to S\}_{i\in I}$ such that $\varphi_i^*\mathcal{A} \cong \mathrm{Mat}_{d_i}(\mathcal{O}_{\mathcal{U}_i})$ for some $d_i \geq 1$. Two such $\mathcal{A}$ and $\mathcal{B}$ are called *equivalent* if there exist finite locally free sheaves $\mathcal{F}$ and $\mathcal{G}$ on S such that $\mathcal{A} \otimes_{\mathcal{O}_S} \mathrm{End}(\mathcal{F}) \cong \mathcal{B} \otimes_{\mathcal{O}_S} \mathrm{End}(\mathcal{G})$. The *Brauer group* of S is the set $\mathrm{Br}(S)$ of equivalence classes of Azumaya $\mathcal{O}_S$-algebras with the operation induced by tensor product (over $\mathcal{O}_S$).

In this setting, the analogue of the isomorphism δ of Theorem 38.59.6 is a map

$$\delta_S : \mathrm{Br}(S) \to H^2_{et}(S, \mathbf{G}_m).$$

It is true that δ_S is injective (the previous argument still works). If S is quasi-compact or connected, then $\mathrm{Br}(S)$ is a torsion group, so in this case the image of δ_S is contained in the *cohomological Brauer group* of S

$$\mathrm{Br}'(S) := H^2_{et}(S, \mathbf{G}_m)_{\mathrm{torsion}}.$$

So if S is quasi-compact or connected, there is an inclusion $\mathrm{Br}(S) \subset \mathrm{Br}'(S)$. This is not always an equality: there exists a nonseparated singular surface S for which $\mathrm{Br}(S) \subset \mathrm{Br}'(S)$ is a strict inclusion. If S is quasi-projective, then $\mathrm{Br}(S) = \mathrm{Br}'(S)$. However, it is not known whether this holds for a smooth proper variety over $\mathbf{C}$, say.

Proposition 38.59.7. *Let K be a field, $\mathcal{G} = Gal(K^{sep}|K)$ and suppose that for any finite extension K' of K, $Br(K') = 0$. Then*

(1) *for all $q \geq 1$, $H^q(\mathcal{G}, (K^{sep})^*) = 0$; and*
(2) *for any torsion $\mathcal{G}$-module M and any $q \geq 2$, $H^q_{cont}(\mathcal{G}, M) = 0$.*

See [**Ser97**] for proofs.

Definition 38.59.8. A field K is called C_r if for every $0 < d^r < n$ and every $f \in K[T_1, \ldots, T_n]$ homogeneous of degree d, there exist $\alpha = (\alpha_1, \ldots, \alpha_n)$, $\alpha_i \in K$ not all zero, such that $f(\alpha) = 0$. Such an α is called a *nontrivial solution* of f.

Example 38.59.9. An algebraically closed field is C_r.

In fact, we have the following simple lemma.

Lemma 38.59.10. *Let k be an algebraically closed field. Let $f_1, \ldots, f_s \in k[T_1, \ldots, T_n]$ be homogeneous polynomials of degree $d_1, \ldots, d_s$ with $d_i > 0$. If $s < n$, then $f_1 = \ldots = f_s = 0$ have a common nontrivial solution.*

Proof. Omitted. □

The following result computes the Brauer group of C_1 fields.

Theorem 38.59.11. *Let K be a C_1 field. Then $Br(K) = 0$.*

Proof. Let D be a finite dimensional division algebra over K with center K. We have seen that

$$D \otimes_K K^{sep} \cong \mathrm{Mat}_d(K^{sep})$$

uniquely up to inner isomorphism. Hence the determinant $\det : \mathrm{Mat}_d(K^{sep}) \to K^{sep}$ is Galois invariant and descends to a homogeneous degree d map

$$\det = N_{\mathrm{red}} : D \longrightarrow K$$

called the *reduced norm*. Since K is C_1, if $d > 1$, then there exists a nonzero $x \in D$ with $N_{\text{red}}(x) = 0$. This clearly implies that x is not invertible, which is a contradiction. Hence $\text{Br}(K) = 0$. □

Theorem 38.59.12. *(Tsen) The function field of a variety of dimension r over an algebraically closed field k is C_r.*

Proof.
(1) Projective space. The field $k(x_1, \dots, x_r)$ is C_r (exercise).
(2) General case. Without loss of generality, we may assume X to be projective. Let $f \in K[T_1, \dots, T_n]_d$ with $0 < d^r < n$. Say the coefficients of f are in $\Gamma(X, \mathcal{O}_X(H))$ for some ample $H \subset X$. Let $\boldsymbol{\alpha} = (\alpha_1, \dots, \alpha_n)$ with $\alpha_i \in \Gamma(X, \mathcal{O}_X(eH))$. Then $f(\boldsymbol{\alpha}) \in \Gamma(X, \mathcal{O}_X((de+1)H))$. Consider the system of equations $f(\boldsymbol{\alpha}) = 0$. Then by asymptotic Riemann-Roch,
   - the number of variables is $n \dim_K \Gamma(X, \mathcal{O}_X(eH)) \sim n\frac{e^r}{r!}(H^r)$; and
   - the number of equations is $\dim_K \Gamma(X, \mathcal{O}_X((de+1)H)) \sim \frac{(de+1)^r}{r!}(H^r)$.

   Since $n > d^r$, there are more variables than equations, and since there is a trivial solution, there are also nontrivial solutions.

□

Definition 38.59.13. We call *variety* a separated, geometrically irreducible and geometrically reduced scheme of finite type over a field, and *curve* a variety of dimension 1.

Lemma 38.59.14. *Let C be a curve over an algebraically closed field k. Then the Brauer group of the function field of C is zero: $Br(k(C)) = 0$.*

Proof. This is clear from Tsen's theorem, Theorem 38.59.12. □

Lemma 38.59.15. *Let k be an algebraically closed field and $k \subset K$ a field extension of transcendence degree 1. Then for all $q \geq 1$, $H^q_{et}(Spec(K), \mathbf{G}_m) = 0$.*

Proof. It suffices to show that if $K \subset K'$ is a finite field extension, then $\text{Br}(K') = 0$. Now observe that $K' = colim\, K''$, where K'' runs over the finitely generated subextensions of k contained in K' of transcendence degree 1. By some result in [**Har77**], each K'' is the function field of a curve, hence has trivial Brauer group by Lemma 38.59.14. It now suffices to observe that $\text{Br}(K') = colim\, \text{Br}(K'')$. □

38.60. Higher vanishing for the multiplicative group

In this section, we fix an algebraically closed field k and a smooth curve X over k. We denote $i_x : x \hookrightarrow X$ the inclusion of a closed point of X and $j : \eta \hookrightarrow X$ the inclusion of the generic point. We also denote X^0 the set of closed points of X.

Theorem 38.60.1. *(The Fundamental Exact Sequence) There is a short exact sequence of étale sheaves on X*

$$0 \longrightarrow \mathbf{G}_{m,X} \longrightarrow j_*\mathbf{G}_{m,\eta} \xrightarrow{\div} \bigoplus_{x \in X^0} i_{x*}\underline{\mathbf{Z}} \longrightarrow 0.$$

Proof. Let $\varphi : \mathcal{U} \to X$ be an étale morphism. Then by properties v and vi of étale morphisms (Proposition 38.26.2), $\mathcal{U} = \coprod_i \mathcal{U}_i$ where each $\mathcal{U}_i$ is a smooth curve mapping to X. The above sequence for X is a product of the corresponding sequences for each $\mathcal{U}_i$, so it suffices to treat the case where $\mathcal{U}$ is connected, hence irreducible. In this case, there is a well known exact sequence (see [**Har77**])

$$1 \longrightarrow \Gamma(\mathcal{U}, \mathcal{O}_{\mathcal{U}}^*) \longrightarrow k(\mathcal{U})^* \xrightarrow{\div} \bigoplus_{y \in \mathcal{U}^0} \mathbf{Z}_y.$$

This amounts to a sequence

$$\Gamma(\mathcal{U}, \mathcal{O}_{\mathcal{U}}^*) \longrightarrow \Gamma(\eta \times_X \mathcal{U}, \mathcal{O}_{\eta \times_X \mathcal{U}}^*) \xrightarrow{\div} \bigoplus_{x \in X^0} \Gamma(x \times_X \mathcal{U}, \underline{\mathbf{Z}})$$

which, unfolding definitions, is nothing but a sequence

$$\mathbf{G}_m(\mathcal{U}) \longrightarrow j_*\mathbf{G}_{m,\eta}(\mathcal{U}) \xrightarrow{\div} \bigoplus_{x \in X^0} i_{x*}\underline{\mathbf{Z}}(\mathcal{U}).$$

This defines the maps in the Fundamental Exact Sequence and shows it is exact except possibly at the last step. To see surjectivity, let us recall (from [**Har77**] again) that if C is a nonsingular curve and D is a divisor on C, then there exists a Zariski open covering $\{\mathcal{V}_j \to C\}$ of C such that $D|_{\mathcal{V}_j} = \div(f_j)$ for some $f_j \in k(C)^*$. $\square$

Lemma 38.60.2. *For any $q \geq 1$, $R^q j_* \mathbf{G}_{m,\eta} = 0$.*

Proof. We need to show that $(R^q j_* \mathbf{G}_{m,\eta})_{\bar{x}} = 0$ for every geometric point $\bar{x}$ of X.

(1) Assume that $\bar{x}$ lies over a closed point x of X. Let $Spec(A)$ be an open neighborhood of x in X, and K the fraction field of A, so that

$$Spec(\mathcal{O}_{X,\bar{x}}^{sh}) \times_X \eta = Spec(\mathcal{O}_{X,\bar{x}}^{sh} \otimes_A K).$$

The ring $\mathcal{O}_{X,\bar{x}}^{sh} \otimes_A K$ is a localization of the discrete valuation ring $\mathcal{O}_{X,\bar{x}}^{sh}$, so it is either $\mathcal{O}_{X,\bar{x}}^{sh}$ again, or its fraction field $K_{\bar{x}}^{sh}$. But since some local uniformizer gets inverted, it must be the latter. Hence

$$(R^q j_* \mathbf{G}_{m,\eta})_{(X,\bar{x})} = H_{et}^q(Spec\, K_{\bar{x}}^{sh}, \mathbf{G}_m).$$

Now recall that $\mathcal{O}_{X,\bar{x}}^{sh} = colim_{(\mathcal{U},\bar{u}) \to \bar{x}}\, \mathcal{O}(\mathcal{U}) = colim_{A \subset B}\, B$ where $A \to B$ is étale, hence $K_{\bar{x}}^{sh}$ is an algebraic extension of $k(X)$, and we may apply Lemma 38.59.15 to get the vanishing.

(2) Assume that $\bar{x} = \bar{\eta}$ lies over the generic point η of X (in fact, this case is superfluous). Then $\mathcal{O}_{X,\bar{\eta}} = \kappa(\eta)^{sep}$ and thus

$$\begin{aligned} (R^q j_* \mathbf{G}_{m,\eta})_{\bar{\eta}} &= H_{et}^q(Spec(\kappa(\eta)^{sep}) \times_X \eta, \mathbf{G}_m) \\ &= H_{et}^q(Spec(\kappa(\eta)^{sep}), \mathbf{G}_m) \\ &= 0 \quad \text{for } q \geq 1 \end{aligned}$$

since the corresponding Galois group is trivial.

$\square$

Lemma 38.60.3. *For all $p \geq 1$, $H_{et}^p(X, j_* \mathbf{G}_{m,\eta}) = 0$.*

Proof. The Leray spectral sequence reads

$$E_2^{p,q} = H_{et}^p(X, R^q j_* \mathbf{G}_{m,\eta}) \Rightarrow H_{et}^{p+q}(\eta, \mathbf{G}_{m,\eta}),$$

which vanishes for $p + q \geq 1$ by Lemma 38.59.15. Taking $q = 0$, we get the desired vanishing. $\square$

Lemma 38.60.4. *For all $q \geq 1$, $H_{et}^q(X, \bigoplus_{x \in X^0} i_{x*}\underline{\mathbf{Z}}) = 0$.*

Proof. For X quasi-compact and quasi-separated, cohomology commutes with colimits, so it suffices to show the vanishing of $H^q_{et}(X, i_{x*}\underline{\mathbf{Z}})$. But then the inclusion i_x of a closed point is finite so $R^p i_{x*}\underline{\mathbf{Z}} = 0$ for all $p \geq 1$ by Proposition 38.54.2. Applying the Leray spectral sequence, we see that $H^q_{et}(X, i_{x*}\underline{\mathbf{Z}}) = H^q_{et}(x, \underline{\mathbf{Z}})$. Finally, since x is the spectrum of an algebraically closed field, all higher cohomology on x vanishes. □

Concluding this series of lemmata, we get the following result.

Theorem 38.60.5. *Let X be a smooth curve over an algebraically closed field. Then*

$$H^q_{et}(X, \mathbf{G}_m) = 0 \quad \textit{for all } q \geq 2.$$

We also get the cohomology long exact sequence

$$0 \to H^0_{et}(X, \mathbf{G}_m) \to H^0_{et}(X, j_*\mathbf{G}_{m\eta}) \xrightarrow{\div} H^0_{et}(X, \bigoplus i_{x*}\underline{\mathbf{Z}}) \to H^1_{et}(X, \mathbf{G}_m) \to 0$$

although this is the familiar

$$0 \to H^0_{Zar}(X, \mathcal{O}_X^*) \to k(X)^* \xrightarrow{\div} \mathrm{Div}(X) \to \mathrm{Pic}(X) \to 0.$$

We would like to use the Kummer sequence to deduce some information about the cohomology group of a curve with finite coefficients. In order to get vanishing in the long exact sequence, we review some facts about Picard groups.

38.61. Picards groups of curves

Let X be a smooth projective curve over an algebraically closed field k. There exists a short exact sequence

$$0 \to \mathrm{Pic}^0(X) \to \mathrm{Pic}(X) \xrightarrow{\deg} \mathbf{Z} \to 0.$$

The abelian group $\mathrm{Pic}^0(X)$ can be identified with $\mathrm{Pic}^0(X) = \underline{\mathrm{Pic}}^0_{X/k}(k)$, i.e., the k-valued points of an abelian variety $\underline{\mathrm{Pic}}^0_{X/k}$ of dimension $g = g(X)$ over k.

Definition 38.61.1. An *abelian variety* over k is a proper smooth connected group scheme over k (i.e., a proper group variety over k).

Proposition 38.61.2. *Let A be an abelian variety over an algebraically closed field k. Then*

(1) *A is projective over k;*
(2) *A is a commutative group scheme;*
(3) *the morphism $[n] : A \to A$ is surjective for all $n \geq 1$, in other words $A(k)$ is a divisible abelian group;*
(4) *$A[n] = Ker(A \xrightarrow{[n]} A)$ is a finite flat group scheme of rank $n^{2\dim A}$ over k. It is reduced if and only if $n \in k^*$;*
(5) *if $n \in k^*$ then $A(k)[n] = A[n](k) \cong (\mathbf{Z}/n\mathbf{Z})^{2\dim(A)}$.*

Consequently, if $n \in k^*$ then $\mathrm{Pic}^0(X)[n] \cong (\mathbf{Z}/n\mathbf{Z})^{2g}$ as abelian groups.

Lemma 38.61.3. *Let X be a smooth projective of genus g over an algebraically closed field k and $n \geq 1$, $n \in k^*$. Then there are canonical identifications*

$$H^q_{et}(X, \mu_n) = \begin{cases} \mu_n(k) & \textit{if } q = 0\,; \\ Pic^0(X)[n] & \textit{if } q = 1\,; \\ \mathbf{Z}/n\mathbf{Z} & \textit{if } q = 2\,; \\ 0 & \textit{if } q \geq 3. \end{cases}$$

Since $\mu_n \cong \underline{\mathbf{Z}/n\mathbf{Z}}$, this gives (noncanonical) identifications

$$H^q_{et}(X, \underline{\mathbf{Z}/n\mathbf{Z}}) \cong \begin{cases} \mathbf{Z}/n\mathbf{Z} & \text{if } q = 0\text{ ;} \\ (\mathbf{Z}/n\mathbf{Z})^{2g} & \text{if } q = 1\text{ ;} \\ \mathbf{Z}/n\mathbf{Z} & \text{if } q = 2\text{ ;} \\ 0 & \text{if } q \geq 3. \end{cases}$$

Proof. The Kummer sequence $0 \to \mu_{n,X} \to \mathbf{G}_{m,X} \xrightarrow{(\cdot)^n} \mathbf{G}_{m,X} \to 0$ give the long exact cohomology sequence

$$\begin{tikzcd}
0 \arrow[r] & \mu_n(k) \arrow[r] & k^* \arrow[r, "(\cdot)^n"] & k^* \arrow[dll, out=-90, in=90] \\
& H^1_{et}(X, \mu_n) \arrow[r] & \mathrm{Pic}(X) \arrow[r, "(\cdot)^n"] & \mathrm{Pic}(X) \arrow[dll, out=-90, in=90] \\
& H^2_{et}(X, \mu_n) \arrow[r] & 0 \arrow[r] & 0 \cdots
\end{tikzcd}$$

The n power map $k^* \to k^*$ is surjective since k is algebraically closed. So we need to compute the kernel and cokernel of the map $\mathrm{Pic}(X) \xrightarrow{(\cdot)^n} \mathrm{Pic}(X)$. Consider the commutative diagram with exact rows

$$\begin{tikzcd}
0 \arrow[r] & \mathrm{Pic}^0(X) \arrow[r] \arrow[d, two heads, "(\cdot)^n"] & \mathrm{Pic}(X) \arrow[r, "\deg"] \arrow[d, "(\cdot)^n"] & \mathbf{Z} \arrow[r] \arrow[d, hook, "n"] & 0 \\
0 \arrow[r] & \mathrm{Pic}^0(X) \arrow[r] & \mathrm{Pic}(X) \arrow[r, "\deg"] & \mathbf{Z} \arrow[r] & 0
\end{tikzcd}$$

where the left vertical map is surjective by Proposition 38.61.2 (3). Applying the snake lemma gives the desired identifications. $\square$

Lemma 38.61.4. *Let X be an affine smooth curve over an algebraically closed field k and $n \in k^*$. Then*

(1) $H^0_{et}(X, \mu_n) = \mu_n(k)$*;*
(2) $H^1_{et}(X, \mu_n) \cong (\mathbf{Z}/n\mathbf{Z})^{2g+r-1}$*, where r is the number of points in $\bar{X} - X$ for some smooth projective compactification $\bar{X}$ of X ; and*
(3) *for all $q \geq 2$,* $H^q_{et}(X, \mu_n) = 0$.

Proof. Write $X = \bar{X} - \{x_1, \ldots, x_r\}$. Then $\mathrm{Pic}(X) = \mathrm{Pic}(\bar{X})/R$, where R is the subgroup generated by $\mathcal{O}_{\bar{X}}(x_i)$, $1 \leq i \leq r$. Since $r \geq 1$, we see that $\mathrm{Pic}^0(X) \to \mathrm{Pic}(X)$ is surjective, hence $\mathrm{Pic}(X)$ is divisible. Applying the Kummer sequence, we get *i* and *iii*. For *ii*, recall that

$$\begin{aligned} H^1_{et}(X, \mu_n) &= \left\{(\mathcal{L}, \alpha) | \mathcal{L} \in \mathrm{Pic}(X), \alpha : \mathcal{L}^{\otimes n} \cong \mathcal{O}_X\right\} \Big/ \cong \\ &= \left\{(\bar{\mathcal{L}},\ D,\ \bar{\alpha})\right\} \Big/ \tilde{R} \end{aligned}$$

where $\bar{\mathcal{L}} \in \mathrm{Pic}^0(\bar{X})$, D is a divisor on $\bar{X}$ supported on $\left\{x_1, \cdots, x_r\right\}$ and $\bar{\alpha} : \bar{\mathcal{L}}^{\otimes n} \cong \mathcal{O}_{\bar{X}}(D)$ is an isomorphism. Note that D must have degree 0. Further $\tilde{R}$ is the subgroup of triples of the form $(\mathcal{O}_{\bar{X}}(D'), nD', 1^{\otimes n})$ where D' is supported on $\{x_1, \cdots, x_r\}$ and has degree 0. Thus, we get an exact sequence

$$0 \longrightarrow H^1_{et}(\bar{X}, \mu_n) \longrightarrow H^1_{et}(X, \mu_n) \longrightarrow \bigoplus_{i=1}^{r} \mathbf{Z}/n\mathbf{Z} \xrightarrow{\Sigma} \mathbf{Z}/n\mathbf{Z} \longrightarrow 0$$

where the middle map sends the class of a triple $(\bar{\mathcal{L}}, D, \bar{\alpha})$ with $D = \sum_{i=1}^{r} a_i(x_i)$ to the r-tuple $(a_i)_{i=1}^{r}$. It now suffices to use Lemma 38.61.3 to count ranks. □

Remark 38.61.5. The ``natural'' way to prove the previous corollary is to excise X from $\bar{X}$. This is possible, we just haven't developed that theory.

Our main goal is to prove the following result.

Theorem 38.61.6. *Let X be a separated, finite type, dimension 1 scheme over an algebraically closed field k and $\mathcal{F}$ a torsion sheaf on $X_{étale}$. Then*

$$H^q_{et}(X, \mathcal{F}) = 0, \quad \forall q \geq 3.$$

If X affine then also $H^2_{et}(X, \mathcal{F}) = 0$.

Recall that an abelian sheaf is called a *torsion sheaf* if all of its stalks are torsion groups. We have computed the cohomology of constant sheaves. We now generalize the latter notion to get all the way to torsion sheaves.

38.62. Constructible sheaves

Definition 38.62.1. Let X be a scheme and $\mathcal{F}$ an abelian sheaf on $X_{étale}$. We say that $\mathcal{F}$ is *finite locally constant* if it is represented by a finite étale morphism to X.

Lemma 38.62.2. *Let X be a scheme and $\mathcal{F}$ an abelian sheaf on $X_{étale}$. Then the following are equivalent*

(1) *$\mathcal{F}$ is finite locally constant ;*
(2) *there exists an étale covering $\{\mathcal{U}_i \to X\}_{i \in I}$ such that $\mathcal{F}|_{\mathcal{U}_i} \cong \underline{A_i}$ for some finite abelian group A_i.*

For a proof, see [**Del77**].

Definition 38.62.3. Let X be a quasi-compact and quasi-separated scheme. A sheaf $\mathcal{F}$ on $X_{étale}$ is *constructible* if there exists a finite decomposition of X into locally closed subsets $X = \coprod_i X_i$ such that $\mathcal{F}|_{X_i}$ is finite locally constant for all i.

Lemma 38.62.4. *The kernel and cokernel of a map of finite locally constant sheaves are finite locally constant.*

Proof. Let $\mathcal{U}$ be a connected scheme, A and B finite abelian groups. Then

$$Hom_{Ab(\mathcal{U}_{étale})}\left(\underline{A}_{\mathcal{U}}, \underline{B}_{\mathcal{U}}\right) = Hom_{Ab}(A, B),$$

so $\mathrm{Ker}\left(\underline{A}_{\mathcal{U}} \xrightarrow{\varphi} \underline{B}_{\mathcal{U}}\right) = \underline{\mathrm{Ker}(\varphi)}_{\mathcal{U}}$ and similarly for the cokernel. □

Remark 38.62.5. If X is noetherian, then (with out definitions) any constructible sheaf on $X_{étale}$ is a torsion sheaf.

Lemma 38.62.6. *Let X be a noetherian scheme. Then:*

(1) *the category of constructible sheaves is abelian ;*
(2) *it is a full exact subcategory of $Ab(X_{étale})$;*

(3) *any extension of constructible sheaves is constructible ; and*
(4) *the image of a map from a constructible sheaf to any other sheaf is constructible.*

Proof. Let $\varphi : \mathscr{F} \to \mathscr{G}$ be a map of constructible sheaves. By assumption, there exists a stratification $X = \coprod X_i$ such that $\mathscr{F}|_{X_i}$ and $\mathscr{G}|_{X_i}$ are finite locally constant. Since pullback if exact, we thus have $\operatorname{Ker}(\varphi|_{X_i}) = \operatorname{Ker}(\mathscr{F}|_{X_i} \xrightarrow{\varphi} \mathscr{G}|_{X_i})$ which is finite locally constant by Lemma 38.62.4. Statement (4) means that if $\varphi : \mathscr{F} \to \mathscr{G}$ is a map in $Ab(X_{étale})$ and $\mathscr{F}$ is constructible then $\operatorname{Im}(\varphi)$ is constructible. It is proven in [**Del77**]. □

Lemma 38.62.7. *Let $\varphi : \mathscr{U} \to X$ be an étale morphism of noetherian schemes. Then there exists a stratification $X = \coprod_i X_i$ such that for all i, $X_i \times_X \mathscr{U} \to X_i$ is finite étale.*

Proof. By noetherian induction it suffices to find some nonempty open $\mathscr{V} \subset X$ such that $\varphi^{-1}(\mathscr{V}) \to \mathscr{V}$ is finite. This follows from the following very general lemma. □

Lemma 38.62.8. *(Morphisms, Lemma 24.45.1). Let $f : X \to Y$ be a quasi-compact and quasi-separated morphism of schemes and η a generic point of Y such that $f^{-1}(\eta)$ is finite. Then there exists an open $\mathscr{V} \subset Y$ containing η such that $f^{-1}(\mathscr{V}) \to \mathscr{V}$ is finite.*

38.63. Extension by zero

Definition 38.63.1. Let $j : \mathscr{U} \to X$ be an étale morphism of schemes. The restriction functor j^{-1} is right exact, so it has a left adjoint, denoted $j_! : Ab(\mathscr{U}_{étale}) \to Ab(X_{étale})$ and called *extension by zero*. Thus it is characterized by the functorial isomorphism

$$Hom_X(j_!\mathscr{F}, \mathscr{G}) = Hom_{\mathscr{U}}(\mathscr{F}, j^{-1}\mathscr{G})$$

for all $\mathscr{F} \in Ab(\mathscr{U}_{étale})$ and $\mathscr{G} \in Ab(X_{étale})$.

To describe it more explicitly, recall that j^{-1} is just the restriction functor $\mathscr{U}_{étale} \to X_{étale}$, that is,

$$j^{-1}\mathscr{G}(\mathscr{U}' \to \mathscr{U}) = \mathscr{G}\left(\mathscr{U}' \to \mathscr{U} \xrightarrow{j} X\right).$$

For $\mathscr{F} \in Ab(\mathscr{U}_{étale})$ we consider the presheaf

$$\begin{array}{cccc} j_!^{PSh}\mathscr{F} : & X_{étale} & \longrightarrow & Ab \\ & (\mathscr{V} \to X) & \longmapsto & \displaystyle\bigoplus_{\mathscr{V} \xrightarrow{\varphi} \mathscr{U} \text{ over } X} \mathscr{F}(\mathscr{V} \xrightarrow{\varphi} \mathscr{U}), \end{array}$$

then $j_!\mathscr{F}$ is the sheafification $\left(j_!^{PSh}\mathscr{F}\right)^\#$.

Exercise 38.63.2. Prove directly that $j_!$ is left adjoint to j^{-1} and that j_* is right adjoint to j^{-1}.

Proposition 38.63.3. *Let $j : \mathscr{U} \to X$ be an étale morphism of schemes. Then*
(1) *the functors j^{-1} and $j_!$ are exact ;*
(2) *j^{-1} transforms injectives into injectives ;*
(3) *$H^p_{et}(\mathscr{U}, \mathscr{G}) = H^p_{et}(\mathscr{U}, j^{-1}\mathscr{G})$ for any $\mathscr{G} \in Ab(X_{étale})$*
(4) *if $\bar{x}$ is a geometric point of X, then $\left(j_!\mathscr{F}\right)_{\bar{x}} = \bigoplus_{(\mathscr{U},\bar{u}) \to (X,x)} \mathscr{F}_{\bar{u}}$.*

Proof. The functor j^{-1} has both a right and a left adjoint, so it is exact. The functor $j_!$ has a right adjoint, so it is right exact. To see that it is left exact, use the description above and the fact that sheafification is exact. Property *ii* is standard general nonsense. In part *iii*, the left-hand side refers (as it should) to the right derived functors of $\mathscr{G} \mapsto \mathscr{G}(\mathscr{U})$

on $Ab(X_{étale})$, and the right-hand side refers to global cohomology on $Ab(\mathcal{U}_{étale})$. It is a formal consequence of *ii*. Part *iv* is again a consequence of the above description. □

Lemma 38.63.4. *Extension by zero commutes with base change. More precisely, let $f : Y \to X$ be a morphism of schemes, $j : \mathcal{V} \to X$ be an étale morphism and $\mathcal{F}$ a sheaf on $\mathcal{V}_{étale}$. Consider the cartesian diagram*

$$\begin{tikzcd} \mathcal{V}' = Y \times_X \mathcal{V} \arrow[r, "j'"] \arrow[d, "f'"] & Y \arrow[d, "f"] \\ \mathcal{V} \arrow[r, "j"] & X \end{tikzcd}$$

then $j'_! f'^{-1}\mathcal{F} = f^{-1} j_! \mathcal{F}$.

Sketch of proof. By general nonsense, there exists a map $j'_! \circ f'^{-1} \to f^{-1} \circ j_!$. We merely verify that they agree on stalks. We have

$$\left(j'_! f'^{-1}\mathcal{F}\right)_{\bar{y}} = \bigoplus_{\bar{v}' \to \bar{y}} (f'^{-1}\mathcal{F})_{\bar{v}'} = \bigoplus_{\bar{v} \to f(\bar{y})} \mathcal{F}_{\bar{v}} = (j_!\mathcal{F})_{f(\bar{y})} = (f^{-1} j_! \mathcal{F})_{\bar{y}}.$$

□

Lemma 38.63.5. *Let $j : \mathcal{V} \to X$ be finite and étale. Then $j_! = j_*$.*

Sketch of proof. In this situation, one can again construct a map $j_! \to j_*$ although in this case it is not just by general nonsense and uses the assumptions on j. Again, we only check that the stalks agree. We have on the one hand

$$(j_!\mathcal{F})_{\bar{x}} = \bigoplus_{\bar{v} \to \bar{x}} \mathcal{F}_{\bar{v}},$$

and on the other hand

$$\left(j_*\mathcal{F}\right)_{\bar{x}} = H^0_{et}(Spec(\mathcal{O}^{sh}_{X,\bar{x}}) \times_X \mathcal{V}, \mathcal{F}).$$

But j is finite and $\mathcal{O}_{X,\bar{x}}$ is strictly henselian, hence $Spec(\mathcal{O}^{sh}_{X,\bar{x}}) \times_X \mathcal{V}$ splits completely into spectra of strictly henselian local rings

$$Spec(\mathcal{O}^{sh}_{X,\bar{x}}) \times_X \mathcal{V} = \coprod_{\bar{v} \to \bar{x}} Spec(\mathcal{O}^{sh}_{X,\bar{x}})$$

and so $\left(j_*\mathcal{F}\right)_{\bar{x}} = \prod_{\bar{v} \to \bar{x}} \mathcal{F}_{\bar{v}}$ by Lemma 38.63.4. Since finite products and finite coproducts agree, we get the result. Note that this last step fails if we take infinite colimits, and indeed the result is not true anymore for ind-morphisms, say. □

Lemma 38.63.6. *Let X be a noetherian scheme and $j : \mathcal{U} \to X$ an étale, quasi-compact morphism. Then $j_! \underline{\mathbf{Z}/n\mathbf{Z}}$ is constructible on X.*

Proof. By Lemma 38.62.7, X has a stratification $\coprod_i X_i$ such that $\pi_i : j^{-1}(X_i) \to X_i$ is finite étale, hence

$$j_!(\underline{\mathbf{Z}/n\mathbf{Z}})|_{X_i} = \pi_{i!}(\underline{\mathbf{Z}/n\mathbf{Z}}) = \pi_{i*}(\underline{\mathbf{Z}/n\mathbf{Z}})$$

by Lemma 38.63.5. Thus it suffices to show that for $\pi : Y \to X$ finite étale, $\pi_*(\underline{\mathbf{Z}/n\mathbf{Z}})$ is finite locally constant. This is clear because it is the sheaf represented by $Y \times \mathbf{Z}/n\mathbf{Z}$. □

Remark 38.63.7. Using the alternative definition of finite locally constant (as in Lemma 38.62.2), the last step is replaced by considering a Galois closure of Y.

Lemma 38.63.8. *Let X be a noetherian scheme and $\mathcal{F}$ a torsion sheaf on $X_{\acute{e}tale}$. Then $\mathcal{F}$ is a directed (filtered) colimit of constructible sheaves.*

Sketch of proof. Let $j : \mathcal{U} \to X$ in $X_{\acute{e}tale}$ and $s \in \mathcal{F}(\mathcal{U})$ for some $\mathcal{U}$ noetherian. Then $ns = 0$ for some $n > 0$. Hence we get a map $\underline{\mathbf{Z}/n\mathbf{Z}}_{\mathcal{U}} \to \mathcal{F}|_{\mathcal{U}}$, by sending $\bar{1}$ to s. By adjointness, this gives a map $\varphi : j_!(\underline{\mathbf{Z}/n\mathbf{Z}}) \to \mathcal{F}$ whose image contains s. There is an element $1_{\mathrm{id}_{\mathcal{U}}} \in \Gamma(\mathcal{U}, j_!\underline{\mathbf{Z}/n\mathbf{Z}})$ which maps to s. Thus, $\mathrm{Im}(\varphi) \subset \mathcal{F}$ is a constructible subsheaf and $s \in \mathrm{Im}(\varphi)(\mathcal{U})$. A similar argument applies for a finite collection of sections, and the result follows by taking colimits. $\square$

38.64. Higher vanishing for torsion sheaves

The goal of this section is to prove the result that follows now.

Theorem 38.64.1. *Let X be an affine curve over an algebraically closed field k and $\mathcal{F}$ a torsion sheaf on $X_{\acute{e}tale}$. Then $H^q_{et}(X, \mathcal{F}) = 0$ for all $q \geq 2$.*

We begin by reducing the proof to a more simpler statement.

(1) *If suffices to prove the vanishing when $\mathcal{F}$ is a constructible sheaf.*

Using the compatibility of étale cohomology with colimits and Lemma 38.63.8, we have $colim\, H^q_{et}(X, \mathcal{F}) = H^q_{et}(X, colim\, \mathcal{F}_i)$ for some constructible sheaves $\mathcal{F}_i$, whence the result.

(2) *It suffices to assume that $\mathcal{F} = j_!\mathcal{G}$ where $\mathcal{U} \subset X$ is open, $\mathcal{G}$ is finite locally constant on $\mathcal{U}$ smooth.*

Choose a nonempty open $\mathcal{U} \subset X$ such that $\mathcal{F}|_{\mathcal{U}}$ is finite locally constant, and consider the exact sequence

$$0 \to j_!(\mathcal{F}|_{\mathcal{U}}) \to \mathcal{F} \to Q \to 0.$$

By looking at stalks we get $Q_{\bar{x}} = 0$ unless $\bar{x} \in X - U$. It follows that $Q = \bigoplus_{x \in X-U} i_{x*}(Q_x)$ which has no higher cohomology.

(3) *It suffices to assume that X is smooth and affine (over k), $\mathcal{G}$ is a finite locally constant sheaf on a open $\mathcal{U}$ of X and $\mathcal{F} = j_!\mathcal{G}$.*

Let $\mathcal{U}$, X and $\mathcal{G}$ be as in the step 2, and consider the commutative diagram

$$\begin{tikzcd} & X^\nu \arrow[d, "\nu"] \\ \mathcal{U} \arrow[ru, "j^\nu"] \arrow[r, "j"] & X \end{tikzcd}$$

where $\nu : X^\nu \to X$ is the normalization of X. Since ν is finite, $H^*_{et}(X, j_!\mathcal{G}) = H^*_{et}(X^\nu, j^\nu_!\mathcal{G})$, which implies that $\nu_*((j^\nu)_!\mathcal{G}) = j_!\mathcal{G}$ by looking at stalks. We are thus reduced to proving the following lemma.

Lemma 38.64.2. *Let X be a smooth affine curve over an algebraically closed field k, $j : \mathcal{U} \hookrightarrow X$ an open immersion and $\mathcal{F}$ a finite locally constant sheaf on $\mathcal{U}_{\acute{e}tale}$. Then for all $q \geq 2$, $H^q_{et}(X, j_!\mathcal{F}) = 0$.*

The proof of this follows the ``méthode de la trace" as explained in [**MA71**, Exposé IX, §5].

Definition 38.64.3. Let $f : Y \to X$ be a finite étale morphism. There are pairs of adjoint functors $(f_!, f^{-1})$ and (f^{-1}, f_*) on $Ab(X_{\acute{e}tale})$. The adjunction map $\mathrm{id} \to f_*f^{-1}$ is called *restriction*. Since f is finite, $f_! = f_*$ and the adjunction map $f_*f^{-1} = f_!f^{-1} \to \mathrm{id}$ is called the *trace*.

The trace map is characterized by the following two properties:

(1) it commutes with étale localization ; and
(2) if $f : Y = \coprod_{i=1}^{d} X \to X$ then the trace map is just the sum map $f_* f^{-1}\mathcal{F} = \mathcal{F}^{\oplus d} \to \mathcal{F}$.

It follows that if f has constant degree d, then the composition $\mathcal{F} \xrightarrow{res} f_* f^{-1}\mathcal{F} \xrightarrow{trace} \mathcal{F}$ is multiplication by d. The ``méthode" then essentially consits in the following observation: if $\mathcal{F}$ is an abelian sheaf on $X_{étale}$ such that multiplication by d is an isomorphism $\mathcal{F} \cong \mathcal{F}$, and if furthermore $H^q_{et}(Y, f^{-1}\mathcal{F}) = 0$ then $H^q_{et}(X, \mathcal{F}) = 0$ as well. Indeed, multiplication by d induces an isomorphism on $H^q_{et}(X, \mathcal{F})$ which factors through $H^q_{et}(Y, f^{-1}\mathcal{F}) = 0$.

Using this method, we further reduce the proof of Lemma 38.64.2 to a yet simpler statement.

(4) *We may assume that $\mathcal{F}$ is killed by a prime ℓ.*

Writing $\mathcal{F} = \mathcal{F}_1 \oplus \cdots \oplus \mathcal{F}_r$ where $\mathcal{F}_i$ is ℓ_i-primary for some prime ℓ_i, we may assume that ℓ^n kills $\mathcal{F}$ for some prime ℓ. Now consider the exact sequence

$$0 \to \mathcal{F}[\ell] \to \mathcal{F} \to \mathcal{F}/\mathcal{F}[\ell] \to 0.$$

Applying the exact functor $j_!$ and looking at the long exact cohomology sequence, we see that it suffices to assume that $\mathcal{F}$ is ℓ-torsion, which we do.

(5) *There exists a finite étale morphism $f : \mathcal{V} \to \mathcal{U}$ of degree prime to ℓ such that $f^{-1}\mathcal{F}$ has a filtration*

$$0 \subset \mathcal{G}_1 \subset \mathcal{G}_2 \subset \cdots \subset \mathcal{G}_s = f^{-1}\mathcal{F}$$

with $\mathcal{G}_i/\mathcal{G}_{i-1} \cong \underline{\mathbf{Z}/\ell\mathbf{Z}}_{\mathcal{V}}$ for all $i \leq s$.

Since $\mathcal{F}$ is finite locally constant, there exists a finite étale Galois cover $h : \mathcal{U}' \to \mathcal{U}$ such that $h^{-1}\mathcal{F} \cong \underline{A}_{\mathcal{U}'}$ for some finite abelian group A. Note that $A \cong (\mathbf{Z}/\ell\mathbf{Z})^{\oplus m}$ for some m. Saying that the cover is *Galois* means that the finite group $G = \text{Aut}(\mathcal{U}'|\mathcal{U})$ has (maximal) cardinality $\#G = \deg h$. Now let $H \subset G$ be the ℓ-Sylow, and set

$$\mathcal{U}' \xrightarrow{\pi} \mathcal{V} = \mathcal{U}'/H \xrightarrow{f} \mathcal{U}.$$

The quotient exists by taking invariants (schemes are affine). By construction, $\deg f = \#G/\#H$ is prime to ℓ. The sheaf $\mathcal{G} = f^{-1}\mathcal{F}$ is then a finite locally constant sheaf on $\mathcal{V}$ and

$$\pi^{-1}\mathcal{G} = h^{-1}\mathcal{F} \cong \underline{(\mathbf{Z}/\ell\mathbf{Z})}^{\oplus m}_{\mathcal{U}'}.$$

Moreover,

$$H^0_{et}(\mathcal{V}, \mathcal{G}) = H^0_{et}(\mathcal{U}', \pi^{-1}\mathcal{G})^H = \left((\mathbf{Z}/\ell\mathbf{Z})^{\oplus m}\right)^H \neq 0,$$

where the first equality follows from writing out the sheaf condition for $\mathcal{G}$ (again, schemes are affine), and the last inequality is an exercise in linear algebra over $\mathbf{F}_\ell$. Following, we have found a subsheaf $\underline{\mathbf{Z}/\ell\mathbf{Z}}_{\mathcal{V}} \hookrightarrow \mathcal{G}$. Repeating the argument for the quotient $\mathcal{G}/\underline{\mathbf{Z}/\ell\mathbf{Z}}_{\mathcal{V}}$ if necessary, we eventually get a subsheaf of $\mathcal{G}$ with quotient $\underline{\mathbf{Z}/\ell\mathbf{Z}}_{\mathcal{V}}$. This is the first step of the filtration.

Exercise 38.64.4. Let $f : X \to Y$ be a finite étale morphism with Y noetherian, and X, Y irreducible. Then there exists a finite étale Galois morphism $X' \to Y$ which dominates X over Y.

(6) *We consider the normalization Y of X in $\mathcal{V}$, that is, we have the commutative diagram*

$$\begin{tikzcd} \mathcal{V} \arrow[r, hook, "j'"] \arrow[d, "f"] & Y \arrow[d, "f'"] \\ \mathcal{U} \arrow[r, hook, "j"] & X. \end{tikzcd}$$

Then there is an injection $H^q_{et}(X, j_!\mathcal{F}) \hookrightarrow H^q_{et}(Y, j'_! f^{-1}\mathcal{F})$ for all q.

We have seen that the composition $\mathcal{F} \xrightarrow{res} f_* f^{-1}\mathcal{F} \xrightarrow{trace} \mathcal{F}$ is multiplication by the degree of f, which is prime to ℓ. On the other hand,

$$j_! f_* f^{-1}\mathcal{F} = j_! f_! f^{-1}\mathcal{F} = f'_* j'_! f^{-1}\mathcal{F}$$

since f and f' are both finite and the above diagram is commutative. Hence applying $j_!$ to the previous sequence gives a sequence

$$j_!\mathcal{F} \longrightarrow f'^* j'_! f^{-1}\mathcal{F} \longrightarrow j_!\mathcal{F}.$$

Taking cohomology, we see that $H^q_{et}(X, j_!\mathcal{F})$ injects into $H^q_{et}(X, f'^* j'_! f^{-1}\mathcal{F})$. But since f' is finite, this is merely $H^q_{et}(Y, j'_! f^{-1}\mathcal{F})$, as desired.

(7) *It suffices to prove $H^q_{et}(Y, j'_!\underline{\mathbf{Z}/\ell\mathbf{Z}}) = 0$.*

By Step 3, it suffices to show vanishing of $H^q_{et}(Y, j'_! f^{-1}\mathcal{F})$. But then by Step 2, we may assume that $f^{-1}\mathcal{F}$ has a finite filtration with quotients isomorphic to $\underline{\mathbf{Z}/n\mathbf{Z}}$, whence the claim.

Finally, we are reduced to proving the following lemma.

Lemma 38.64.5. *Let X be a smooth affine curve over an algebraically closed field, $j : \mathcal{U} \hookrightarrow X$ an open immersion and ℓ a prime number. Then for all $q \geq 2$, $H^q_{et}(X, j_!\underline{\mathbf{Z}/\ell\mathbf{Z}}) = 0$.*

Proof. Consider the short exact sequence

$$0 \longrightarrow j_!\underline{\mathbf{Z}/\ell\mathbf{Z}}_{\mathcal{U}} \longrightarrow \underline{\mathbf{Z}/\ell\mathbf{Z}}_X \longrightarrow \bigoplus_{x \in X - \mathcal{U}} i_{x*}(\underline{\mathbf{Z}/\ell\mathbf{Z}}) \longrightarrow 0.$$

We know that the cohomology of the middle sheaf vanishes in degree at least 2 by Lemma 38.61.4 and that of the skyscraper sheaf on the right vanishes in degree at least 1. Thus applying the long exact cohomology sequence, we get the vanishing of $j_!\underline{\mathbf{Z}/\ell\mathbf{Z}}_{\mathcal{U}}$ in degree at least 2. This finishes the proof of the lemma, hence of Lemma 38.64.2, hence of Theorem 38.64.1. □

Remarks 38.64.6. Here are some remarks about what happened above.

- This method is very general. For instance, it applies in Galois cohomology, and this is essentially how Proposition 38.59.7 is proved.
- In fact, we have overlooked the case where ℓ is the characteristic of the field k, since the Kummer sequence is not exact then and we cannot use Lemma 38.61.4 anymore. The result is still true, as shown by considering the *Artin-Schreier* exact sequence for a scheme S of characteristic $p > 0$, namely

$$0 \longrightarrow \underline{\mathbf{Z}/p\mathbf{Z}}_S \longrightarrow \mathbf{G}_{a,S} \xrightarrow{F-1} \mathbf{G}_{a,S} \longrightarrow 0$$

where $F - 1$ is the map $x \mapsto x^p - x$. Using this, it can be shown that is S is affine then $H^q_{et}(S, \underline{\mathbf{Z}/p\mathbf{Z}}) = 0$ for all $q \geq 2$. In fact, if X is projective over k, then $H^q_{et}(X, \underline{\mathbf{Z}/p\mathbf{Z}}) = 0$ for all $q \geq \dim X + 2$.

- If X is a projective curve over an algebraically closed field then $H^q_{et}(X, \mathcal{F}) = 0$ for all $q \geq 3$ and all torsion sheaves $\mathcal{F}$ on $X_{étale}$. This can be shown using Serre's Mayer Vietoris argument, thereby proving Theorem 38.61.6.
- We can prove using the same methods vanishing of higher cohomology on 1-dimensional schemes of finite type over an algebraically closed field. However, it is easier to reduce to the case of a curve by using the topological invariance of étale cohomology as stated below.

Proposition 38.64.7. *(Topological invariance of étale cohomology) Let X be a scheme and $X_0 \hookrightarrow X$ a closed immersion defined by a nilpotent sheaf of ideals. Then the étale sites $X_{étale}$ and $(X_0)_{étale}$ are isomorphic. In particular, for any sheaf $\mathcal{F}$ on $X_{étale}$, $H^q(X, \mathcal{F}) = H^q(X_0, \mathcal{F}|_{X_0})$ for all q.*

38.65. The trace formula

A typical course in étale cohomology would normally state and prove the proper and smooth base change theorems, purity and Poincaré duality. All of these can be found in [**Del77**, Arcata]. Instead, we are going to study the trace formula for the frobenius, following the account of Deligne in [**Del77**, Rapport]. We will only look at dimension 1, but using proper base change this is enough for the general case. Since all the cohomology groups considered will be étale, we drop the subscript $_{étale}$. Let us now describe the formula we are after. Let X be a finite type scheme of dimension 1 over a finite field k, ℓ a prime number and $\mathcal{F}$ a constructible, flat $\mathbf{Z}/\ell^n\mathbf{Z}$ sheaf. Then

$$\sum\nolimits_{x \in X(k)} \mathrm{Tr}(\mathrm{Frob}|\mathcal{F}_{\bar{x}}) = \sum\nolimits_{i=0}^{2} (-1)^i \mathrm{Tr}(\pi_X^* | H^i_c(X \otimes_k \bar{k}, \mathcal{F})) \tag{38.65.0.1}$$

as elements of $\mathbf{Z}/\ell^n\mathbf{Z}$. As we will see, this formulation is slightly wrong as stated. Let us nevertheless describe the symbols that occur therein.

38.66. Frobenii

Throughout this section, X will denote a scheme of finite type over a finite field k with $q = p^f$ elements. Let $\alpha : X \to Spec(k)$ denote the structural morphism, $\bar{k}$ a fixed algebraic closure of k and $G_k = \mathrm{Gal}(\bar{k}|k)$ the absolute Galois group of k.

Definition 38.66.1. The *absolute frobenius* of X is the morphism $F = F_X : X \to X$ which is the identity on the induced topological space, and which takes a section to its pth power. That is, $F^\sharp : \mathcal{O}_X \to \mathcal{O}_X$ is given by $g \mapsto g^p$. It is clear that this induces the identity on the topological space indeed.

Theorem 38.66.2. *(The Baffling Theorem) Let X be a scheme in characteristic $p > 0$. Then the absolute frobenius induces (by pullback) the trivial map on cohomology, i.e., for all integers $j \geq 0$,*

$$F_X^* : H^j(X, \underline{\mathbf{Z}/n\mathbf{Z}}) \longrightarrow H^j(X, \underline{\mathbf{Z}/n\mathbf{Z}})$$

is the identity.

This theorem is purely formal. It is a good idea, however, to review how to compute the pullback of a cohomology class. Let us simply say that in the case where cohomology agrees with Čech cohomology, it suffices to pull back (using the fiber products on a site) the Čech cocycles. The general case is quite technical and can be found in (insert future reference here). A topological analogue of the baffling theorem is the following.

Exercise 38.66.3. Let X be a topological space and $g : X \to X$ a continuous map such that $g^{-1}(U) = U$ for all opens U of X. Then g induces the identity on cohomology on X (for any coefficients).

We now turn to the statement for the étale site.

Lemma 38.66.4. *Let X be a scheme and $g : X \to X$ a morphism. Assume that for all $\varphi : \mathcal{U} \to X$ étale, there is a functorial isomorphism*

$$\begin{tikzcd} \mathcal{U} \arrow[rr, "\sim"] \arrow[dr, "\varphi"'] & & \mathcal{U} \times_{\varphi, X, g} X \arrow[dl, "pr_2"] \\ & X, & \end{tikzcd}$$

then g induces the identity on cohomology (for any sheaf).

The proof is formal and without difficulty. To prove the theorem, we merely verify that the assumption of the lemma holds for the frobenius.

Proof of Theorem 38.66.2. We need to verify the existence of a functorial isomorphism as above. For an étale morphism $\varphi : \mathcal{U} \to S$, consider the diagram

$$\begin{tikzcd} \mathcal{U} \arrow[dr, dashed] \arrow[drr, bend left, "F_{\mathcal{U}}"] \arrow[ddr, bend right, "\varphi"'] & & \\ & \mathcal{U} \times_{\varphi, X, F_X} X \arrow[r, "\mathrm{pr}_1"] \arrow[d, "\mathrm{pr}_2"] & \mathcal{U} \arrow[d, "\varphi"] \\ & X \arrow[r, "F_X"] & X. \end{tikzcd}$$

The dotted arrow is an étale morphism which induces an isomorphism on the underlying topological spaces, so it is an isomorphism. $\square$

Definition 38.66.5. The *geometric frobenius* of X is the morphism $\pi_X : X \to X$ over $Spec(k)$ which equals F_X^f. We can base change it to any scheme over k, and in particular to $X_{\bar{k}} = Spec(\bar{k}) \times_{Spec(k)} X$ to get the morphism $\mathrm{id}_{Spec(\bar{k})} \times \pi_X : X_{\bar{k}} \to X_{\bar{k}}$ which we denote π_X again. This should not be ambiguous, as $X_{\bar{k}}$ does not have a geometric frobenius of its own.

Lemma 38.66.6. *Let $\mathcal{F}$ be a sheaf on $X_{étale}$. Then there are canonical isomorphisms $\pi_X^{-1}\mathcal{F} \cong \mathcal{F}$ and $\mathcal{F} \cong \pi_{X*}\mathcal{F}$.*

This is false for the fppf site.

Proof. Let $\varphi : \mathcal{U} \to X$ be étale. Recall that $\pi_{X*}\mathcal{F}(\mathcal{U}) = \mathcal{F}(\mathcal{U} \times \varphi, X, \pi_X X)$. Since $\pi_X = F_X^f$, by Lemma 38.66.4 that there is a functorial isomorphism

$$\begin{tikzcd} \mathcal{U} \arrow[rr, "\sim", "\gamma_{\mathcal{U}}"'] \arrow[dr, "\varphi"'] & & \mathcal{U} \times_{\varphi, X, \pi_X} X \arrow[dl, "\mathrm{pr}_2"] \\ & X & \end{tikzcd}$$

where $\gamma_{\mathcal{U}} = (\varphi, F_{\mathcal{U}}^f)$. Now we define an isomorphism

$$\mathcal{F}(\mathcal{U}) \longrightarrow \pi_{X*}\mathcal{F}(\mathcal{U}) = \mathcal{F}(\mathcal{U} \times_{\varphi, X, \pi_X} X)$$

by taking the restriction map of $\mathcal{F}$ along $\gamma_{\mathcal{U}}^{-1}$. The other isomorphism is analogous. □

Remark 38.66.7. It may or may not be the case that $F^f_{\mathcal{U}}$ equals $\pi_{\mathcal{U}}$.

Let $\mathcal{F}$ be an abelian sheaf on $X_{\acute{e}tale}$. Consider the cohomology group $H^j(X_{\bar{k}}, \mathcal{F}|_{X_{\bar{k}}})$ as a left G_k-module as follows: if $\sigma \in G_k$, the diagram

$$\begin{tikzcd} X_{\bar{k}} \arrow[rr, "Spec(\sigma)\times \mathrm{id}_X"] \arrow[dr] & & X_{\bar{k}} \arrow[dl] \\ & X & \end{tikzcd}$$

commutes. Thus we can set, for $\xi \in H^j(X_{\bar{k}}, \mathcal{F}|_{X_{\bar{k}}})$

$$\sigma \cdot \xi := (Spec(\sigma) \times \mathrm{id}_X)^*\xi \in H^j(X_{\bar{k}}, (Spec(\sigma) \times \mathrm{id}_X)^{-1}\mathcal{F}|X_{\bar{k}}) = H^j(X_{\bar{k}}, \mathcal{F}|_{X_{\bar{k}}}),$$

where the last equality follows from the commutativity of the previous diagram. This endows the latter group with the structure of a G_k-module.

Lemma 38.66.8. *Let $\mathcal{F}$ be an abelian sheaf on $X_{\acute{e}tale}$. Consider $(R^j\alpha_*\mathcal{F})_{Spec(\bar{k})}$ endowed with its natural Galois action as in Section 38.56. Then the identification*

$$(R^j\alpha_*\mathcal{F})_{Spec(\bar{k})} \cong H^j(X_{\bar{k}}, \mathcal{F}|_{X_{\bar{k}}})$$

from Theorem 38.52.2 is an isomorphism of G_k-modules.

A similar result holds comparing $(R^j\alpha_!\mathcal{F})_{Spec(\bar{k})}$ with $H^j_c(X_{\bar{k}}, \mathcal{F}|_{X_{\bar{k}}})$. We omit the proof.

Definition 38.66.9. The *arithmetic frobenius* is the map $\mathrm{frob}_k : \bar{k} \to \bar{k}$, $x \mapsto x^q$ of G_k.

Theorem 38.66.10. *Let $\mathcal{F}$ be an abelian sheaf on $X_{\acute{e}tale}$. Then for all $j \geq 0$, $frob_k$ acts on the cohomology group $H^j(X_{\bar{k}}, \mathcal{F}|_{X_{\bar{k}}})$ as the inverse of the map π_X^*.*

The map π_X^* is defined by the composition

$$H^j(X_{\bar{k}}, \mathcal{F}|_{X_{\bar{k}}}) \xrightarrow{\pi_{X_{\bar{k}}}^*} H^j(X_{\bar{k}}, (\pi_X^{-1}\mathcal{F})|_{X_{\bar{k}}}) \cong H^j(X_{\bar{k}}, \mathcal{F}|_{X_{\bar{k}}}).$$

where the last isomorphism comes from the canonical isomorphism $\pi_X^{-1}\mathcal{F} \cong \mathcal{F}$ of Lemma 38.66.6.

Proof. The composition $X_{\bar{k}} \xrightarrow{Spec(\mathrm{frob}_k)} X_{\bar{k}} \xrightarrow{\pi_X} X_{\bar{k}}$ is equal to $F^f_{X_{\bar{k}}}$, hence the result follows from the baffling theorem suitably generalized to nontrivial coefficients. Note that the previous composition commutes in the sense that $F^f_{X_{\bar{k}}} = \pi_X \circ Spec(\mathrm{frob}_k) = Spec(\mathrm{frob}_k) \circ \pi_X$. □

Definition 38.66.11. If $x \in X(k)$ is a rational point and $\bar{x} : Spec(\bar{k}) \to X$ the geometric point lying over x, we let $\pi_x : \mathcal{F}_{\bar{x}} \to \mathcal{F}_{\bar{x}}$ denote the action by frob_k^{-1} and call it the *geometric frobenius*[6]

[6] This notation is not standard. This operator is denoted F_x in [**Del77**]. We will likely change this notation in the future.

We can now make a more precise statement (albeit a false one) of the trace formula (38.65.0.1). Let X be a finite type scheme of dimension 1 over a finite field k, ℓ a prime number and $\mathcal{F}$ a constructible, flat $\mathbf{Z}/\ell^n\mathbf{Z}$ sheaf. Then

$$\sum\nolimits_{x\in X(k)} \mathrm{Tr}(\pi_X|\mathcal{F}_{\bar{x}}) = \sum\nolimits_{i=0}^{2}(-1)^i \mathrm{Tr}(\pi_X^*|H_c^i(X_{\bar{k}}, \mathcal{F})) \tag{38.66.11.1}$$

as elements of $\mathbf{Z}/\ell^n\mathbf{Z}$. The reason this equation is wrong is that the trace in the right-hand side does not make sense for the kind of sheaves considered. Before addressing this issue, we try to motivate the appearance of the geometric frobenius (apart from the fact that it is a natural morphism!).

Let us consider the case where $X = \mathbf{P}^1_k$ and $\mathcal{F} = \underline{\mathbf{Z}/\ell\mathbf{Z}}$. For any point, the Galois module $\mathcal{F}_{\bar{x}}$ is trivial, hence for any morphism φ acting on $\mathcal{F}_{\bar{x}}$, the left-hand side is

$$\sum\nolimits_{x\in X(k)} \mathrm{Tr}(\varphi|\mathcal{F}_{\bar{x}}) = \#\mathbf{P}^1_k(k) = q + 1.$$

Now $\mathbf{P}^1_k$ is proper, so compactly supported cohomology equals standard cohomology, and so for a morphism $\pi : \mathbf{P}^1_k \to \mathbf{P}^1_k$, the right-hand side equals

$$\mathrm{Tr}(\pi^*|H^0(\mathbf{P}^1_{\bar{k}}, \underline{\mathbf{Z}/\ell\mathbf{Z}})) + \mathrm{Tr}(\pi^*|H^2(\mathbf{P}^1_{\bar{k}}, \underline{\mathbf{Z}/\ell\mathbf{Z}})).$$

The Galois module $H^0(\mathbf{P}^1_{\bar{k}}, \underline{\mathbf{Z}/\ell\mathbf{Z}}) = \mathbf{Z}/\ell\mathbf{Z}$ is trivial, since the pullback of the identity is the identity. Hence the first trace is 1, regardless of π. For the second trace, we need to compute the pullback of a map $\pi : \mathbf{P}^1_{\bar{k}} \to \mathbf{P}^1_{\bar{k}}$ on $H^2(\mathbf{P}^1_{\bar{k}}, \underline{\mathbf{Z}/\ell\mathbf{Z}}))$. This is a good exercise and the answer is multiplication by the degree of π. In other words, this works as in the familiar situation of complex cohomology. In particular, if π is the geometric frobenius we get

$$\mathrm{Tr}(\pi_X^*|H^2(\mathbf{P}^1_{\bar{k}}, \underline{\mathbf{Z}/\ell\mathbf{Z}})) = q$$

and if π is the arithmetic frobenius then we get

$$\mathrm{Tr}(\mathrm{frob}_k^*|H^2(\mathbf{P}^1_{\bar{k}}, \underline{\mathbf{Z}/\ell\mathbf{Z}})) = q^{-1}.$$

The latter option is clearly wrong.

Remark 38.66.12. The computation of the degrees can be done by lifting (in some obvious sense) to characteristic 0 and considering the situation with complex coefficients. This method almost never works, since lifting is in general impossible for schemes which are not projective space.

The question remains as to why we have to consider compactly supported cohomology. In fact, in view of Poincaré duality, it is not strictly necessary for smooth varieties, but it involves adding in certain powers of q. For example, let us consider the case where $X = \mathbf{A}^1_k$ and $\mathcal{F} = \underline{\mathbf{Z}/\ell\mathbf{Z}}$. The action on stalks is again trivial, so we only need look at the action on cohomology. But then π_X^* acts as the identity on $H^0(\mathbf{A}^1_{\bar{k}}, \underline{\mathbf{Z}/\ell\mathbf{Z}})$ and as multiplication by q on $H^2_c(\mathbf{A}^1_{\bar{k}}, \underline{\mathbf{Z}/\ell\mathbf{Z}})$.

38.67. Traces

We now explain how to take the trace of an endomorphism of a module over a noncommutative ring. Fix a finite ring Λ with cardinality prime to p. Typically, Λ is the group ring $(\mathbf{Z}/\ell^n\mathbf{Z})[G]$ for some finite group G. By convention, all the Λ-modules considered will be left Λ-modules.

We introduce the following notation: We set $\Lambda^\natural$ to be the quotient of Λ by its additive subgroup generated by the commutators (i.e., the elements of the form $ab - ba$, $a, b \in \Lambda$). Note that $\Lambda^\natural$ is not a ring.

For instance, the module $(\mathbf{Z}/\ell^n\mathbf{Z})[G]^\natural$ is the dual of the class functions, so

$$(\mathbf{Z}/\ell^n\mathbf{Z})[G]^\natural = \bigoplus_{\substack{conjugacy\\ classesofG}} \mathbf{Z}/\ell^n\mathbf{Z}.$$

For a free Λ-module, we have $\mathrm{End}_\Lambda(\Lambda^{\oplus m}) = \mathrm{Mat}_n(\Lambda)$. Note that since the modules are left modules, representation of endomorphism by matrices is a right action: if $a \in \mathrm{End}(\Lambda^{\oplus m})$ has matrix A and $v \in \Lambda$, then $a(v) = vA$.

Definition 38.67.1. The *trace* of the endomorphism a is the sum of the diagonal entries of a matrix representing it. This defines an additive map $\mathrm{Tr} : \mathrm{End}_\Lambda(\Lambda^{\oplus m}) \to \Lambda^\natural$.

Exercise 38.67.2. Given maps

$$\Lambda^{\oplus n} \xrightarrow{a} \Lambda^{\oplus n} \xrightarrow{b} \Lambda^{\oplus m}$$

show that $\mathrm{Tr}(ab) = \mathrm{Tr}(ba)$.

We extend the definition of the trace to a finite projective Λ-module $P$and an endomorphism φ of P as follows. Write P as the summand of a free Λ-module, i.e., consider maps $P \xrightarrow{a} \Lambda^{\oplus n} \xrightarrow{b} P$ with

(1) $\Lambda^{\oplus n} = \mathrm{Im}(a) \oplus \ker(b)$; and
(2) $b \circ a = \mathrm{id}_P$.

Then we set $\mathrm{Tr}(\varphi) = \mathrm{Tr}(a\varphi b)$. It is easy to check that this is well-defined, using the previous exercise.

38.68. Why derived categories?

With this definition of the trace, let us now discuss another issue with the formula as stated. Let C be a smooth projective curve over k. Then there is a correspondence between finite locally constant sheaves $\mathcal{F}$ on $C_{étale}$ which stalks are isomorphic to $(\mathbf{Z}/\ell^n\mathbf{Z})^{\oplus m}$ on the one hand, and continuous representations $\rho : \pi_1(C, \bar{c}) \to \mathrm{GL}_m(\mathbf{Z}/\ell^n\mathbf{Z}))$ (for some fixed choice of $\bar{c}$) on the other hand. We denote $\mathcal{F}_\rho$ the sheaf corresponding to ρ. Then $H^2(C_{\bar{k}}, \mathcal{F}_\rho)$ is the group of coinvariants for the action of $\rho(\pi_1(C, \bar{c}))$ on $(\mathbf{Z}/\ell^n\mathbf{Z})^{\oplus m}$, and there is a short exact sequence

$$0 \longrightarrow \pi_1(C_{\bar{k}}, \bar{c}) \longrightarrow \pi_1(C, \bar{c}) \longrightarrow G_k \longrightarrow 0.$$

For instance, let $\mathbf{Z} = \mathbf{Z}\sigma$ act on $\mathbf{Z}/\ell^2\mathbf{Z}$ via $\sigma(x) = (1+\ell)x$. The coinvariants are $(\mathbf{Z}/\ell^2\mathbf{Z})_\sigma = \mathbf{Z}/\ell\mathbf{Z}$, which is not a flat $\mathbf{Z}/\ell\mathbf{Z}$-module. Hence we cannot take the trace of some action on $H^2(C_{\bar{k}}, \mathcal{F}_\rho)$, at least not in the sense of the previous section.

In fact, our goal is to consider a trace formula for ℓ-adic coefficients. But $\mathbf{Q}_\ell = \mathbf{Z}_\ell[1/\ell]$ and $\mathbf{Z}_\ell = lim\, \mathbf{Z}/\ell^n\mathbf{Z}$, and even for a flat $\mathbf{Z}/\ell^n\mathbf{Z}$ sheaf, the individual cohomology groups may not be flat, so we cannot compute traces. One possible remedy is consider the total derived complex $R\Gamma(C_{\bar{k}}, \mathcal{F}_\rho)$ in the derived category $D(\mathbf{Z}/\ell^n\mathbf{Z})$ and show that it is a perfect object, which means that it is quasi-isomorphic to a finite complex of finite free module. For such complexes, we can define the trace, but this will require an account of derived categories.

38.69. Derived categories

To set up notation, let $\mathscr{A}$ be an abelian category. Let $\mathrm{Comp}(\mathscr{A})$ be the abelian category of complexes in $\mathscr{A}$. Let $K(\mathscr{A})$ be the category of complexes up to homotopy, with objects equal to complexes in $\mathscr{A}$ and objects equal to homotopy classes of morphisms of complexes. This is not an abelian category. Loosely speaking, $D(A)$ is defined to be the category obtained by inverting all quasi-isomorphisms in $\mathrm{Comp}(\mathscr{A})$ or, equivalently, in $K(\mathscr{A})$. Moreover, we can define $\mathrm{Comp}^+(\mathscr{A})$, $K^+(\mathscr{A})$, $D^+(\mathscr{A})$ analogously using only bounded below complexes. Similarly, we can define $\mathrm{Comp}^-(\mathscr{A})$, $K^-(\mathscr{A})$, $D^-(\mathscr{A})$ using bounded above complexes, and we can define $\mathrm{Comp}^b(\mathscr{A})$, $K^b(\mathscr{A})$, $D^b(\mathscr{A})$ using bounded complexes.

Remark 38.69.1. Notes on derived categories.

(1) There are some set-theoretical problems when $\mathscr{A}$ is somewhat arbitrary, which we will happily disregard.
(2) The categories $K(A)$ and $D(A)$ may be endowed with the structure of triangulated category, but we will not need these structures in the following discussion.
(3) The categories $\mathrm{Comp}(\mathscr{A})$ and $K(\mathscr{A})$ can also be defined when $\mathscr{A}$ is an additive category.

The homology functor $H^i : \mathrm{Comp}(\mathscr{A}) \to \mathscr{A}$ taking a complex $K^\bullet \mapsto H^i(K^\bullet)$ extends to functors $H^i : K(\mathscr{A}) \to \mathscr{A}$ and $H^i : D(\mathscr{A}) \to \mathscr{A}$.

Lemma 38.69.2. *An object E of $D(\mathscr{A})$ is contained in $D^+(\mathscr{A})$ if and only if $H^i(E) = 0$ for all $i \ll 0$. Similar statements hold for D^- and D^+.*

The proof uses truncation functors.

Lemma 38.69.3. *Morphisms between objects in the derived category.*

(1) *Let $I^\bullet$ be a complex in $\mathscr{A}$ with I^n injective for all $n \in \mathbf{Z}$. Then*
$$Hom_{D(\mathscr{A})}(K^\bullet, I^\bullet) = Hom_{K(\mathscr{A})}(K^\bullet, I^\bullet).$$
(2) *Let $P^\bullet \in Comp^-(\mathscr{A})$ with P^n is projective for all $n \in \mathbf{Z}$. Then*
$$Hom_{D(\mathscr{A})}(P^\bullet, K^\bullet) = Hom_{K(\mathscr{A})}(P^\bullet, K^\bullet).$$
(3) *If $\mathscr{A}$ has enough injectives and $\mathscr{I} \subset \mathscr{A}$ is the additive subcategory of injectives, then $D^+(\mathscr{A}) \cong K^+(\mathscr{I})$ (as triangulated categories).*
(4) *If $\mathscr{A}$ has enough projectives and $\mathscr{P} \subset \mathscr{A}$ is the additive subcategory of projectives, then $D^-(\mathscr{A}) \cong K^-(\mathscr{P})$.*

Proof. Omitted. $\square$

Definition 38.69.4. Let $F : \mathscr{A} \to \mathscr{B}$ be a left exact functor and assume that $\mathscr{A}$ has enough injectives. We define the *total right derived functor of F* as the functor $RF : D^+(\mathscr{A}) \to D^+(\mathscr{B})$ fitting into the diagram

$$\begin{tikzcd} D^+(\mathscr{A}) \arrow[r, "RF"] & D^+(\mathscr{B}) \\ K^+(\mathscr{I}) \arrow[u] \arrow[r, "F"] & K^+(\mathscr{B}). \arrow[u] \end{tikzcd}$$

This is possible since the left vertical arrow is invertible by the previous lemma. Similarly, let $G : \mathscr{A} \to \mathscr{B}$ be a right exact functor and assume that $\mathscr{A}$ has enough projectives. We define the *total right derived functor of G* as the functor $LG : D^-(\mathscr{A}) \to D^-(\mathscr{B})$ fitting into the diagram

$$\begin{tikzcd} D^-(\mathscr{A}) \arrow[r, "LG"] & D^-(\mathscr{B}) \\ K^-(\mathscr{P}) \arrow[u] \arrow[r, "G"] & K^-(\mathscr{B}). \arrow[u] \end{tikzcd}$$

This is possible since the left vertical arrow is invertible by the previous lemma.

Remark 38.69.5. In these cases, it is true that $R^iF(K^\bullet) = H^i(RF(K^\bullet))$, where the left hand side is defined to be ith homology of the complex $F(K^\bullet)$.

38.70. Filtered derived category

It turns out we have to do it all again and build the filtered derived category also.

Definition 38.70.1. Let $\mathscr{A}$ be an abelian category. Let $\mathrm{Fil}(\mathscr{A})$ be the category of filtered objects (A, F) of $\mathscr{A}$, where F is a filtration of the form

$$A \supseteq \cdots \supseteq F^nA \supseteq F^{n+1}A \supseteq \cdots \supseteq 0.$$

This is an additive category. We denote $\mathrm{Fil}^f(\mathscr{A})$ the full subcategory of $\mathrm{Fil}(\mathscr{A})$ whose objects (A, F) have finite filtration. This is also an additive category. An object $I \in \mathrm{Fil}^f(\mathscr{A})$ is called *filtered injective* (respectively *projective*) provided that $\mathrm{gr}^p(I) = \mathrm{gr}^p_F(I) = F^pI/F^{p+1}I$ is injective (resp. projective) in $\mathscr{A}$ for all p. The categories $\mathrm{Comp}(\mathrm{Fil}^f(\mathscr{A})) \supseteq \mathrm{Comp}^+(\mathrm{Fil}^f(\mathscr{A}))$ and $K(\mathrm{Fil}^f(\mathscr{A})) \supseteq K^+(\mathrm{Fil}^f(\mathscr{A}))$ are defined as before.
A morphism $\alpha : K^\bullet \to L^\bullet$ of complexes in $\mathrm{Comp}(\mathrm{Fil}^f(\mathscr{A}))$ is called a *filtered quasi-isomorphism* provided that

$$\mathrm{gr}^p(\alpha) : \mathrm{gr}^p(K^\bullet) \to \mathrm{gr}^p(L^\bullet)$$

is a quasi-isomorphism for all $p \in \mathbf{Z}$. Finally, we define $DF(\mathscr{A})$ (resp. $DF^+(\mathscr{A})$) by inverting the filtered quasi-isomorphisms in $K(\mathrm{Fil}^f(\mathscr{A}))$ (resp. $K^+(\mathrm{Fil}^f(\mathscr{A}))$).

Lemma 38.70.2. *If $\mathscr{A}$ has enough injectives, then $DF^+(\mathscr{A}) \cong K^+(\mathscr{I})$, where $\mathscr{I}$ is the full additive subcategory of $\mathrm{Fil}^f(\mathscr{A})$ consisting of filtered injective objects. Similarly, if $\mathscr{A}$ has enough projectives, then $DF^-(\mathscr{A}) \cong K^+(\mathscr{P})$, where $\mathscr{P}$ is the full additive subcategory of $\mathrm{Fil}^f(\mathscr{A})$ consisting of filtered projective objects.*

Proof. Omitted. □

38.71. Filtered derived functors

And then there are the filetered derived functors.

Definition 38.71.1. Let $T : \mathscr{A} \to \mathscr{B}$ be a left exact functor and assume that $\mathscr{A}$ has enough injectives. Define $RT : DF^+(\mathscr{A}) \to DF^+(\mathscr{B})$ to fit in the diagram

$$\begin{tikzcd} DF^+(\mathscr{A}) \arrow[r, "RT"] & DF^+(\mathscr{B}) \\ K^+(\mathscr{I}) \arrow[u] \arrow[r, "T"] & K^+(\mathrm{Fil}^f(\mathscr{B})). \arrow[u] \end{tikzcd}$$

This is well-defined by the previous lemma. Let $G : \mathscr{A} \to \mathscr{B}$ be a right exact functor and assume that $\mathscr{A}$ has enough projectives. Define $LG : DF^{+}(\mathscr{A}) \to DF^{+}(\mathscr{B})$ to fit in the diagram

$$\begin{tikzcd} DF^{-}(\mathscr{A}) \arrow[r, "LG"] & DF^{-}(\mathscr{B}) \\ K^{-}(\mathscr{P}) \arrow[u] \arrow[r, "G"] & K^{-}(\mathrm{Fil}^{f}(\mathscr{B})). \arrow[u] \end{tikzcd}$$

Again, this is well-defined by the previous lemma. The functors RT, resp. LG, are called the *filtered derived functor* of T, resp. G.

Proposition 38.71.2. *In the situation above, we have*

$$\mathrm{gr}^{p} \circ RT = RT \circ \mathrm{gr}^{p}$$

where the RT on the left is the filtered derived functor while the one on the right is the total derived functor. That is, there is a commuting diagram

$$\begin{tikzcd} DF^{+}(\mathscr{A}) \arrow[r, "RT"] \arrow[d, "gr^{p}"'] & DF^{+}(\mathscr{B}) \arrow[d, "gr^{p}"] \\ D^{+}(\mathscr{A}) \arrow[r, "RT"] & D^{+}(\mathscr{B}). \end{tikzcd}$$

Proof. Omitted. □

Given $K^{\bullet} \in DF^{+}(\mathscr{B})$, we get a spectral sequence

$$E_{1}^{p,q} = H^{p+q}(\mathrm{gr}^{p} K^{\bullet}) \Rightarrow H^{p+q}(\text{forget filt}(K^{\bullet})).$$

38.72. Application of filtered complexes

Let $\mathscr{A}$ be an abelian category with enough injectives, and $0 \to L \to M \to N \to 0$ a short exact sequence in $\mathscr{A}$. Consider $\widetilde{M} \in \mathrm{Fil}^{f}(\mathscr{A})$ to be M along with the filtration defined by

$$F^{1} M = L,\ F^{n} M = M \text{ for } n \leq 0, \text{ and } F^{n} M = 0 \text{ for } n \geq 2.$$

By definition, we have

$$\text{forget filt}(\widetilde{M}) = M, \quad \mathrm{gr}^{0}(\widetilde{M}) = N, \quad \mathrm{gr}^{1}(\widetilde{M}) = L$$

and $\mathrm{gr}^{n}(\widetilde{M}) = 0$ for all other $n \neq 0, 1$. Let $T : \mathscr{A} \to \mathscr{B}$ be a left exact functor. Assume that $\mathscr{A}$ has enough injectives. Then $RT(\widetilde{M}) \in DF^{+}(\mathscr{B})$ is a filtered complex with

$$\mathrm{gr}^{p}(RT(\widetilde{M})) \overset{\text{qis}}{=} \begin{cases} 0 & \text{if} \quad p \neq 0, 1, \\ RT(N) & \text{if} \quad p = 0, \\ RT(L) & \text{if} \quad p = 1. \end{cases}$$

and forget filt$(RT(\widetilde{M})) \overset{\text{qis}}{=} RT(M)$. The spectral sequence applied to $RT(\widetilde{M})$ gives

$$E_{1}^{p,q} = R^{p+q}T(\mathrm{gr}^{p}(\widetilde{M})) \Rightarrow R^{p+q}T(\text{forget filt}(\widetilde{M})).$$

Unwinding the spectral sequence gives us the long exact sequence

$$\begin{tikzcd} 0 \arrow[r] & T(L) \arrow[r] & T(M) \arrow[r] & T(N) \arrow[dll, out=-90, in=90] \\ & R^{1}T(L) \arrow[r] & R^{1}T(M) \arrow[r] & \cdots \end{tikzcd}$$

This will be used as follows. Let X/k be a scheme of finite type. Let $\mathcal{F}$ be a flat constructible $\mathbf{Z}/\ell^n\mathbf{Z}$-module. Then we want to show that the trace

$$\mathrm{Tr}(\pi_X^* | R\Gamma_c(X_{\bar{k}}, \mathcal{F})) \in \mathbf{Z}/\ell^n\mathbf{Z}$$

is additive on short exact sequences. To see this, it will not be enough to work with $R\Gamma_c(X_{\bar{k}}, -) \in D^+(\mathbf{Z}/\ell^n\mathbf{Z})$, but we will have to use the filtered derived category.

38.73. Perfectness

Let Λ be a (possibly noncommutative) ring, Mod_Λ the category of left Λ-modules, $K(\Lambda) = K(\mathrm{Mod}_\Lambda)$ its homotopy category, and $D(\Lambda) = D(\mathrm{Mod}_\Lambda)$ the derived category.

Definition 38.73.1. We denote by $K_{perf}(\Lambda)$ the category whose objects are bounded complexes of finite projective Λ-modules, and whose morphisms are morphisms of complexes up to homotopy. The functor $K_{perf}(\Lambda) \to D(\Lambda)$ is fully faithful, and we denote $D_{perf}(\Lambda)$ its essential image. An object of $D(\Lambda)$ is called *perfect* if it is in $D_{perf}(\Lambda)$.

Proposition 38.73.2. *Let $K \in D_{perf}(\Lambda)$ and $f \in End_{D(\Lambda)}(K)$. Then the trace $Tr(f) \in \Lambda^\natural$ is well defined.*

Proof. Let $P^\bullet$ be a bounded complex of finite projective Λ-modules and $\alpha : P^\bullet \cong K$ be an isomorphism in $D(\Lambda)$. Then $\alpha^{-1} \circ f \circ \alpha$ is the class of some morphism of complexes $f^\bullet : P^\bullet \to P^\bullet$ by (insert reference here). Set

$$\mathrm{Tr}(f) = \sum_i (-1)^i \mathrm{Tr}(f^i : P^i \to P^i) \in \Lambda^\natural.$$

Given $P^\bullet$ and α, this is independent of the choice of $f^\bullet$: any other choice is of the form $\tilde{f}^\bullet = f^\bullet + dh + hd$ for some $h^i : P^i \to P^{i-1} (i \in \mathbf{Z})$. But

$$\begin{aligned} \mathrm{Tr}(dh) &= \sum_i (-1)^i \mathrm{Tr}(P^i \xrightarrow{dh} P^i) \\ &= \sum_i (-1)^i \mathrm{Tr}(P^{i-1} \xrightarrow{hd} P^{i-1}) \\ &= -\sum_i (-1)^{i-1} \mathrm{Tr}(P^{i-1} \xrightarrow{hd} P^{i-1}) \\ &= -\mathrm{Tr}(hd) \end{aligned}$$

and so $\sum_i (-1)^i \mathrm{Tr}((dh + hd)|_{P^i}) = 0$. Furthermore, this is independent of the choice of $(P^\bullet, \alpha)$: suppose $(Q^\bullet, \beta)$ is another choice. Then by ???, the compositions

$$Q^\bullet \xrightarrow{\beta} K \xrightarrow{\alpha^{-1}} P^\bullet \quad \text{and} \quad P^\bullet \xrightarrow{\alpha} K \xrightarrow{\beta^{-1}} Q^\bullet$$

are representable by morphisms of complexes $\gamma_1^\bullet$ and $\gamma_2^\bullet$ respectively, such that $\gamma_1^\bullet \circ \gamma_2^\bullet$ is homotopic to the identity. Thus, the morphism of complexes $\gamma_2^\bullet \circ f^\bullet \circ \gamma_1^\bullet : Q^\bullet \to Q^\bullet$ represents the morphism $\beta^{-1} \circ f \circ \beta$ in $D(\Lambda)$. Now

$$\begin{aligned} \mathrm{Tr}(\gamma_2^\bullet \circ f^\bullet \circ \gamma_1^\bullet|_{Q^\bullet}) &= \mathrm{Tr}(\gamma_1^\bullet \circ \gamma_2^\bullet \circ f^\bullet|_{P^\bullet}) \\ &= \mathrm{Tr}(f^\bullet|_{P^\bullet}) \end{aligned}$$

by the fact that $\gamma_1^\bullet \circ \gamma_2^\bullet$ is homotopic to the identity and the independence from $(P^\bullet, \alpha)$ already proved. $\square$

38.74. Filtrations and perfect complexes

We now present a filtered version of the category of perfect complexes. An object (M, F) of $\mathrm{Fil}^f(\mathrm{Mod}_\Lambda)$ is called *filtered finite projective* if for all p, $\mathrm{gr}^p_F(M)$ is finite and projective. We then consider the homotopy category $K\mathrm{F}_{\mathrm{perf}}(\Lambda)$ of bounded complexes of filtered finite projective objects of $\mathrm{Fil}^f(\mathrm{Mod}_\Lambda)$. We have a diagram of categories

$$\begin{array}{ccc} K\mathrm{F}(\Lambda) & \supseteq & K\mathrm{F}_{\mathrm{perf}}(\Lambda) \\ \downarrow & & \downarrow \\ D\mathrm{F}(\Lambda) & \supseteq & D\mathrm{F}_{\mathrm{perf}}(\Lambda) \end{array}$$

where the vertical functor on the right is fully faithful and the category $D\mathrm{F}_{\mathrm{perf}}(\Lambda)$ is its essential image, as before.

Lemma 38.74.1. *(Additivity) Let $K \in D\mathrm{F}_{perf}(\Lambda)$ and $f \in End_{D\mathrm{F}}(K)$. Then*

$$Tr(f|_K) = \sum\nolimits_{p \in \mathbf{Z}} Tr(f|_{gr^p K}).$$

Proof. By Proposition 38.73.2, we may assume we have a bounded complex $P^\bullet$ of filtered finite projectives of $\mathrm{Fil}^f(\mathrm{Mod}_\Lambda)$ and a map $f^\bullet : P^\bullet \to P^\bullet$ in $\mathrm{Comp}(\mathrm{Fil}^f(\mathrm{Mod}_\Lambda))$. So the lemma follows from the following result, which proof is left to the reader. □

Lemma 38.74.2. *Let $P \in Fil^f(Mod_\Lambda)$ be filtered finite projective, and $f : P \to P$ an endomorphism in $Fil^f(Mod_\Lambda)$. Then*

$$Tr(f|_P) = \sum\nolimits_p Tr(f|_{gr^p(P)}).$$

Proof. Omitted. □

38.75. Characterizing perfect objects

Definition 38.75.1. An object $K \in D^-(\Lambda)$ is said to have *finite Tor-dimension* if there exists $r \in \mathbf{Z}$ such that for any right Λ-module N, $H^i(N \otimes^{\mathbf{L}}_\Lambda K) = 0$ for all $i \leq r$ (in other words, $\mathrm{Tor}^i_\Lambda(N, K) = 0$). Recall that $N \otimes^{\mathbf{L}}_\Lambda K$ is the total left derived functor of the functor $\mathrm{Mod}_\Lambda \to Ab$, $M \mapsto N \otimes_\Lambda M$. It is thus a complex of abelian groups.

Lemma 38.75.2. *Let Λ be a left noetherian ring and $K \in D^-(\Lambda)$. Then K is perfect if and only if the two following conditions hold:*

(1) *K has finite Tor-dimension ; and*
(2) *for all $i \in \mathbf{Z}$, $H^i(K)$ is a finite Λ-module.*

The reader is strongly urged to try and prove this. The proof relies on the fact that a finite module on a finitely left-presented ring is flat if and only if it is projective.

Remark 38.75.3. A common variant of this lemma is to consider instead a noetherian scheme X and the category $D_{perf}(\mathcal{O}_X)$ of complexes which are locally quasi-isomorphic to a finite complex of finite locally free $\mathcal{O}_X$-modules.

Notation: Let Λ be a finite ring, X a noetherian scheme, $K(X, \Lambda)$ the homotopy category of sheaves of Λ-modules on $X_{étale}$, and $D(X, \Lambda)$ the corresponding derived category. We denote by D^b (respectively D^+, D^-) the full subcategory of bounded (resp. above, below) complexes in $D(X, \Lambda)$.

Definition 38.75.4. With notation as above, consider the full subcategory $D^b_{ctf}(X, \Lambda)$ of $D^-(X, \Lambda)$ consisting of objects which are quasi-isomorphic to a bounded complex of constructible flat Λ-modules. Its objects are abusively called *perfect complexes*.

Remark 38.75.5. In fact, for a bounded complex $K^\bullet$ of constructible flat Λ-modules each stalk $K^p_{\bar{x}}$ is a finite projective Λ-module.

Remark 38.75.6. This construction differs from the common variant mentioned above. It can happen that a complex of $\mathcal{O}_X$-modules is locally quasi-isomorphic to a finite complex of finite locally free $\mathcal{O}_X$-modules, without being globally quasi-isomorphic to a bounded complex of locally free $\mathcal{O}_X$-modules. This does not happen in the étale site for constructible sheaves.

In this framework, Lemma 38.75.2 reads as follows.

Lemma 38.75.7. *Let $K \in D^-(X, \Lambda)$. Then $K \in D^b_{ctf}(X, \Lambda)$ if and only if*

(1) *K has finite Tor-dimension ; and*
(2) *for all $i \in \mathbf{Z}$, $\underline{H}^i(K)$ is constructible.*

The first condition can be checked on stalks (provided that the bounds are uniform).

Remark 38.75.8. This lemma is used to prove that if $f : X \to Y$ is a separated, finite type morphism of schemes and Y is noetherian, then $Rf_!$ induces a functor $D^b_{ctf}(X, \Lambda) \to D^b_{ctf}(Y, \Lambda)$. We only need this fact in the case where Y is the spectrum of a field and X is a curve.

Proposition 38.75.9. *Let X be a projective curve over a field k, Λ a finite ring and $K \in D^b_{ctf}(X, \Lambda)$. Then $R\Gamma(X_{\bar{k}}, K) \in D_{perf}(\Lambda)$.*

Sketch of proof. The first step is to show:

(1) *The cohomology of $R\Gamma(X_{\bar{k}}, K)$ is bounded.*

Consider the spectral sequence

$$H^i(X_{\bar{k}}, \underline{H}^j(K)) \Rightarrow H^{i+j}(R\Gamma(X_{\bar{k}}, K)).$$

Since K is bounded and Λ is finite, the sheaves $\underline{H}^j(K)$ are torsion. Moreover, $X_{\bar{k}}$ has finite cohomological dimension, so the left-hand side is nonzero for finitely many i and j only. Therefore, so is the right-hand side.

(2) *The cohomology groups $H^{i+j}(R\Gamma(X_{\bar{k}}, K))$ are finite.*

Since the sheaves $\underline{H}^j(K)$ are constructible, the groups $H^i(X_{\bar{k}}, \underline{H}^j(K))$ are finite, [7] so it follows by the spectral sequence again.

(3) *$R\Gamma(X_{\bar{k}}, K)$ has finite Tor-dimension.*

Let N be a right Λ-module (in fact, since Λ is finite, it suffices to assume that N is finite). By the projection formula (change of module),

$$N \otimes^{\mathbf{L}}_\Lambda R\Gamma(X_{\bar{k}}, K) = R\Gamma(X_{\bar{k}}, N \otimes^{\mathbf{L}}_\Lambda K).$$

Therefore,

$$H^i(N \otimes^{\mathbf{L}}_\Lambda R\Gamma(X_{\bar{k}}, K)) = H^i(R\Gamma(X_{\bar{k}}, N \otimes^{\mathbf{L}}_\Lambda K)).$$

Now consider the spectral sequence

$$H^i(X_{\bar{k}}, \underline{H}^j(N \otimes^{\mathbf{L}}_\Lambda K)) \Rightarrow H^{i+j}(R\Gamma(X_{\bar{k}}, N \otimes^{\mathbf{L}}_\Lambda K)).$$

Since K has finite Tor-dimension, $\underline{H}^j(N \otimes^{\mathbf{L}}_\Lambda K)$ vanishes universally for j small enough, and the left-hand side vanishes whenever $i < 0$. Therefore $R\Gamma(X_{\bar{k}}, K)$ has finite Tor-dimension, as claimed. So it is a perfect complex by Lemma 38.75.2. □

[7] In Section 38.64 where we proved vanishing of cohomology, we should have proved -- using the exact same arguments -- that étale cohomology with values in a torsion sheaf is finite. Maybe that section should be updated. It's flabbergasting that we even forgot to mention it.

38.76. Lefschetz numbers

The fact that the total cohomology of a constructible complex with finite coefficients is a perfect complex is the key technical reason why cohomology behaves well, and allows us to define rigorously the traces occurring in the trace formula.

Definition 38.76.1. Let Λ be a finite ring, X a projective curve over a finite field k and $K \in D_{ctf}^b(X, \Lambda)$ (for instance $K = \underline{\Lambda}$). There is a canonical map $c_K : \pi_X^{-1}K \to K$, and its base change $c_K|_{X_{\bar{k}}}$ induces an action denoted π_X^* on the perfect complex $R\Gamma(X_{\bar{k}}, K|_{X_{\bar{k}}})$. The *global Lefschetz number* of K is the trace $\text{Tr}(\pi_X^*\big|_{R\Gamma(X_{\bar{k}},K)})$ of that action. It is an element of $\Lambda^\natural$.

Definition 38.76.2. With Λ, X, k, K as in Definition 38.76.1. Since $K \in D_{ctf}^b(X, \Lambda)$, for any geometric point $\bar{x}$ of X, the complex $K_{\bar{x}}$ is a perfect complex (in $D_{perf}(\Lambda)$). As we have seen in Section 38.66, the Frobenius π_X acts on $K_{\bar{x}}$. The *local Lefschetz number* of K is the sum

$$\sum_{x \in X(k)} \text{Tr}(\pi_X \big|_{K_{\bar{x}}})$$

which is again an element of $\Lambda^\natural$.

At last, we can formulate precisely the trace formula.

Theorem 38.76.3. *(Lefschetz Trace Formula) Let X be a projective curve over a finite field k, Λ a finite ring and $K \in D_{ctf}^b(X, \Lambda)$. Then the global and local Lefschetz numbers of K are equal, i.e.,*

$$Tr(\pi_X^*\big|_{R\Gamma(X_{\bar{k}},K)}) = \sum\nolimits_{x \in X(k)} Tr(\pi_X\big|_{K_{\bar{x}}}) \tag{38.76.3.1}$$

in $\Lambda^\natural$.

We will use, rather than prove, the trace formula. Nevertheless, we will give quite a few details of the proof of the theorem as given in [**Del77**] (some of the things that are not adequately explained are listed in Section 38.83).

We only stated the formula for curves, and in some weak sense it is a consequence of the following result.

Theorem 38.76.4. *(Weil) Let C be a nonsingular projective curve over an algebraically closed field k, and $\varphi : C \to C$ a k-endomorphism of C distinct from the identity. Let $V(\varphi) = \Delta_C \cdot \Gamma_\varphi$, where Δ_C is the diagonal, Γ_φ is the graph of φ, and the intersection number is taken on $C \times C$. Let $J = \underline{Pic}^0_{C/k}$ be the jacobian of C and denote $\varphi^* : J \to J$ the action induced by φ by taking pullbacks. Then*

$$V(\varphi) = 1 - Tr_J(\varphi^*) + \deg \varphi.$$

The number $V(\varphi)$ is the number of fixed points of φ, it is equal to

$$V(\varphi) = \sum_{c \in |C| : \varphi(c) = c} m_{\text{Fix}(\varphi)}(c)$$

where $m_{\text{Fix}(\varphi)}(c)$ is the multiplicity of c as a fixed point of φ, namely the order or vanishing of the image of a local uniformizer under $\varphi - \text{id}_C$. Proofs of this theorem can be found in [**Lan02, Wei48**].

Example 38.76.5. Let $C = E$ be an elliptic curve and $\varphi = [n]$ be multiplication by n. Then $\varphi^* = \varphi^t$ is multiplication by n on the jacobian, so it has trace $2n$ and degree n^2. On the other hand, the fixed points of φ are the points $p \in E$ such that $np = p$, which is the $(n-1)$-torsion, which has cardinality $(n-1)^2$. So the theorem reads

$$(n-1)^2 = 1 - 2n + n^2.$$

Jacobians. We now discuss without proofs the correspondence between a curve and its jacobian which is used in Weil's proof. Let C be a nonsingular projective curve over an algebraically closed field k and choose a base point $c_0 \in C(k)$. Denote by $A^1(C \times C)$ (or $\text{Pic}(C \times C)$, or $\text{CaCl}(C \times C)$) the abelian group of codimension 1 divisors of $C \times C$. Then

$$A^1(C \times C) = \text{pr}_1^*(A^1(C)) \oplus \text{pr}_2^*(A^1(C)) \oplus R$$

where

$$R = \{Z \in A^1(C \times C) \mid Z|_{C \times \{c_0\}} \sim_{\text{rat}} 0 \text{ and } Z|_{\{c_0\} \times C} \sim_{\text{rat}} 0\}.$$

In other words, R is the subgroup of line bundles which pull back to the trivial one under either projection. Then there is a canonical isomorphism of abelian groups $R \cong \text{End}(J)$ which maps a divisor Z in R to the endomorphism

$$\begin{matrix} J & \to & J \\ \left[\mathcal{O}_C(D)\right] & \mapsto & (\text{pr}_1|_Z)_*(\text{pr}_2|_Z)^*(D). \end{matrix}$$

The aforementioned correspondence is the following. We denote by σ the automorphism of $C \times C$ that switches the factors.

$\text{End}(J)$	R
composition of α, β	$\text{pr}_{13*}(\text{pr}_{12}{}^*(\alpha) \circ \text{pr}_{23}{}^*(\beta))$
id_J	$\Delta_C - \{c_0\} \times C - C \times \{c_0\}$
φ^*	$\Gamma_\varphi - C \times \{\varphi(c_0)\} - \sum_{\varphi(c)=c_0} \{c\} \times C$
the trace form $\alpha, \beta \mapsto \text{Tr}(\alpha\beta)$	$\alpha, \beta \mapsto -\int_{C \times C} \alpha.\sigma^*\beta$
the Rosati involution $\alpha \mapsto \alpha^\dagger$	$\alpha \mapsto \sigma^*\alpha$
positivity of Rosati $\text{Tr}(\alpha\alpha^\dagger) > 0$	Hodge index theorem on $C \times C$ $-\int_{C \times C} \alpha\sigma^*\alpha > 0.$

In fact, in light of the Kunneth formula, the subgroup R corresponds to the 1, 1 hodge classes in $H^1(C) \otimes H^1(C)$.

Weil's proof. Using this correspondence, we can prove the trace formula. We have

$$\begin{aligned} V(\varphi) &= \int_{C\times C} \Gamma_\varphi.\Delta \\ &= \int_{C\times C} \Gamma_\varphi.\left(\Delta_C - \{c_0\}\times C - C\times\{c_0\}\right) + \int_{C\times C} \Gamma_\varphi.\left(\{c_0\}\times C + C\times\{c_0\}\right). \end{aligned}$$

Now, on the one hand

$$\int_{C\times C} \Gamma_\varphi.\left(\{c_0\}\times C + C\times\{c_0\}\right) = 1 + \deg\varphi$$

and on the other hand, since R is the the orthogonal of the ample divisor $\{c_0\}\times C + C\times\{c_0\}$,

$$\begin{aligned} &\int_{C\times C} \Gamma_\varphi.\left(\Delta_C - \{c_0\}\times C - C\times\{c_0\}\right) \\ = &\int_{C\times C}\left(\Gamma_\varphi - C\times\{\varphi(c_0)\} - \sum_{\varphi(c)=c_0}\{c\}\times C\right).\left(\Delta_C - \{c_0\}\times C - C\times\{c_0\}\right) \\ = &-\mathrm{Tr}_J(\varphi^*\circ \mathrm{id}_J). \end{aligned}$$

Recapitulating, we have

$$V(\varphi) = 1 - \mathrm{Tr}_J(\varphi^*) + \deg\varphi$$

which is the trace formula.

Lemma 38.76.6. *Consider the situation of Theorem 38.76.4 and let ℓ be a prime number invertible in k. Then*

$$\sum\nolimits_{i=0}^{2}(-1)^i Tr(\varphi^*|_{H^i(C,\underline{\mathbf{Z}/\ell^n\mathbf{Z}})}) = V(\varphi) \mod \ell^n.$$

Sketch of proof. Observe first that the assumption makes sense because $H^i(C,\underline{\mathbf{Z}/\ell^n\mathbf{Z}})$ is a free $\mathbf{Z}/\ell^n\mathbf{Z}$-module for all i. The trace of φ^* on the 0th degree cohomology is 1. The choice of a primitive ℓ^nth root of unity in k gives an isomorphism

$$H^i(C,\underline{\mathbf{Z}/\ell^n\mathbf{Z}}) \cong H^i(C,\mu_{\ell^n})$$

compatibly with the action of the geometric Frobenius. On the other hand, $H^1(C,\mu_{\ell^n}) = J[\ell^n]$. Therefore,

$$\begin{aligned} \mathrm{Tr}(\varphi^*|_{H^1(C,\underline{\mathbf{Z}/\ell^n\mathbf{Z}})}) &= \mathrm{Tr}_J(\varphi^*) \mod \ell^n \\ &= \mathrm{Tr}_{\mathbf{Z}/\ell^n\mathbf{Z}}(\varphi^* : J[\ell^n]\to J[\ell^n]). \end{aligned}$$

Moreover, $H^2(C,\mu_{\ell^n}) = \mathrm{Pic}(C)/\ell^n\mathrm{Pic}(C) \cong \mathbf{Z}/\ell^n\mathbf{Z}$ where φ^* is multiplication by $\deg\varphi$. Hence

$$\mathrm{Tr}(\varphi^*|_{H^2(C,\underline{\mathbf{Z}/\ell^n\mathbf{Z}})}) = \deg\varphi.$$

Thus we have

$$\sum_{i=0}^{2}(-1)^i\mathrm{Tr}(\varphi^*|_{H^i(C,\underline{\mathbf{Z}/\ell^n\mathbf{Z}})}) = 1 - \mathrm{Tr}_J(\varphi^*) + \deg\varphi \mod \ell^n$$

and the corollary follows from Theorem 38.76.4. □

An alternative way to prove this corollary is to show that

$$X \mapsto H^*(X,\mathbf{Q}_\ell) = \mathbf{Q}_\ell \otimes lim_n\, H^*(X,\mathbf{Z}/\ell^n\mathbf{Z})$$

defines a Weil cohomology theory on smooth projective varieties over k. Then the trace formula

$$V(\varphi) = \sum_{i=0}^{2}(-1)^i \mathrm{Tr}(\varphi^*|_{H^i(C,\mathbf{Q}_\ell)})$$

is a formal consequence of the axioms (it's an exercise in linear algebra, the proof is the same as in the topological case).

38.77. Preliminaries and sorites

Notation: We fix the notation for this section. We denote by A a commutative ring, Λ a (possibly noncommutative) ring with a ring map $A \to \Lambda$ which image lies in the center of Λ. We let G be a finite group, Γ a *monoid extension of G by* $\mathbf{N}$, meaning that there is an exact sequence

$$1 \to G \to \tilde{\Gamma} \to \mathbf{Z} \to 1$$

and Γ consists of those elements of $\tilde{\Gamma}$ which image is nonnegative. Finally, we let P be an $A[\Gamma]$-module which is finite and projective as an $A[G]$-module, and M a $\Lambda[\Gamma]$-module which is finite and projective as a Λ-module.

Our goal is to compute the trace of $1 \in \mathbf{N}$ acting over Λ on the coinvariants of G on $P \otimes_A M$, that is, the number

$$\mathrm{Tr}_\Lambda \left(1; \left(P \otimes_A M\right)_G\right) \in \Lambda^\natural.$$

The element $1 \in \mathbf{N}$ will correspond to the Frobenius.

Lemma 38.77.1. *Let $e \in G$ denote the neutral element. The map*

$$\begin{array}{ccc} \Lambda[G] & \longrightarrow & \Lambda^\natural \\ \sum \lambda_g \cdot g & \longmapsto & \lambda_e \end{array}$$

factors through $\Lambda[G]^\natural$. We denote $\varepsilon : \Lambda[G]^\natural \to \Lambda^\natural$ the induced map.

Proof. We have to show the map annihilates commutators. One has

$$\left(\sum \lambda_g g\right)\left(\sum \mu_g g\right) - \left(\sum \mu_g g\right)\left(\sum \lambda_g g\right) = \sum_g \left(\sum_{g_1 g_2 = g} \lambda_{g_1}\mu_{g_2} - \mu_{g_1}\lambda_{g_2}\right) g$$

The coefficient of e is

$$\sum_g \left(\lambda_g \mu_{g^{-1}} - \mu_g \lambda_{g^{-1}}\right) = \sum_g \left(\lambda_g \mu_{g^{-1}} - \mu_{g^{-1}} \lambda_g\right)$$

which is a sum of commutators, hence it it zero in $\Lambda^\natural$. □

Definition 38.77.2. Let $f : P \to P$ be an endomorphism of a finite projective $\Lambda[G]$-module P. We define

$$\mathrm{Tr}^G_\Lambda(f; P) := \varepsilon\left(\mathrm{Tr}_{\Lambda[G]}(f; P)\right)$$

to be the *G-trace of f on P*.

Lemma 38.77.3. *Let $f : P \to P$ be an endomorphism of the finite projective $\Lambda[G]$-module P. Then*

$$Tr_\Lambda(f; P) = \#G \cdot Tr^G_\Lambda(f; P).$$

Proof. By additivity, reduce to the case $P = \Lambda[G]$. In that case, f is given by right multiplication by some element $\sum \lambda_g \cdot g$ of $\Lambda[G]$. In the basis $(g)_{g \in G}$, the matrix of f has coefficient $\lambda_{g_2^{-1} g_1}$ in the (g_1, g_2) position. In particular, all diagonal coefficients are λ_e, and there are $\#G$ such coefficients. □

Lemma 38.77.4. *The map $A \to \Lambda$ defines an A-module structure on $\Lambda^\natural$.*

This is clear.

Lemma 38.77.5. *Let P be a finite projective $A[G]$-module and M a $\Lambda[G]$-module, finite projective as a Λ-module. Then $P \otimes_A M$ is a finite projective $\Lambda[G]$-module, for the structure induced by the diagonal action of G.*

Note that $P \otimes_A M$ is naturally a Λ-module since M is. Explictly, together with the diagonal action this reads

$$\left(\sum \lambda_g g\right)(p \otimes m) = \sum gp \otimes \lambda_g gm.$$

Proof. For any $\Lambda[G]$-module N one has

$$Hom_{\Lambda[G]}\left(P \otimes_A M, N\right) = Hom_{A[G]}\left(P, Hom_\Lambda(M, N)\right)$$

where the G-action on $Hom_\Lambda(M, N)$ is given by $(g \cdot \varphi)(m) = g\varphi(g^{-1}m)$. Now it suffices to observe that the right-hand side is a composition of exact functors, because of the projectivity of P and M. $\square$

Lemma 38.77.6. *With assumptions as in Lemma 38.77.5, let $u \in End_{A[G]}(P)$ and $v \in End_{\Lambda[G]}(M)$. Then*

$$Tr_\Lambda^G\left(u \otimes v; P \otimes_A M\right) = Tr_A^G(u; P) \cdot Tr_\Lambda(v; M).$$

Sketch of proof. Reduce to the case $P = A[G]$. In that case, u is right multiplication by some element $a = \sum a_g g$ of $A[G]$, which we write $u = R_a$. There is an isomorphism of $\Lambda[G]$-modules

$$\begin{array}{cccc} \varphi: & A[G] \otimes_A M & \cong & \left(A[G] \otimes_A M\right)' \\ & g \otimes m & \longmapsto & g \otimes g^{-1}m \end{array}$$

where $\left(A[G] \otimes_A M\right)'$ has the module structure given by the left G-action, together with the Λ-linearity on M. This transport of structure changes $u \otimes v$ into $\sum_g a_g R_g \otimes g^{-1}v$. In other words,

$$\varphi \circ (u \otimes v) \circ \varphi^{-1} = \sum_g a_g R_g \otimes g^{-1}v.$$

Working out explicitly both sides of the equation, we have to show

$$\mathrm{Tr}_\Lambda^G\left(\sum_g a_g R_g \otimes g^{-1}v\right) = a_e \cdot \mathrm{Tr}_\Lambda(v; M).$$

This is done by showing that

$$\mathrm{Tr}_\Lambda^G\left(a_g R_g \otimes g^{-1}v\right) = \begin{cases} 0 & \text{if } g \neq e \\ a_e \mathrm{Tr}_\Lambda(v; M) & \text{if } g = e \end{cases}$$

by reducing to $M = \Lambda$. $\square$

Notation: Consider the monoid extension $1 \to G \to \Gamma \to \mathbf{N} \to 1$ and let $\gamma \in \Gamma$. Then we write $Z_\gamma = \{g \in G \mid g\gamma = \gamma g\}$.

Lemma 38.77.7. *Let P be a $\Lambda[\Gamma]$-module, finite and projective as a $\Lambda[G]$-module, and $\gamma \in \Gamma$. Then*

$$Tr_\Lambda(\gamma; P) = \# Z_\gamma \cdot Tr_\Lambda^{Z_\gamma}(\gamma; P).$$

Proof. This follows readily from Lemma 38.77.3. $\square$

Lemma 38.77.8. *Let P be an $A[\Gamma]$-module, finite projective as $A[G]$-module. Let M be a $\Lambda[\Gamma]$-module, finite projective as a Λ-module. Then*

$$Tr_{\Lambda}^{Z_\gamma}(\gamma; P \otimes_A M) = Tr_A^{Z_\gamma}(\gamma; P) \cdot Tr_{\Lambda}(\gamma; M).$$

Proof. This follows directly from Lemma 38.77.6. □

Lemma 38.77.9. *Let P be a $\Lambda[\Gamma]$-module, finite projective as $\Lambda[G]$-module. Then the coinvariants $P_G = \Lambda \otimes_{\Lambda[G]} P$ form a finite projective Λ-module, endowed with an action of $\Gamma/G = \mathbf{N}$. Moreover, we have*

$$Tr_{\Lambda}(1; P_G) = \sum\nolimits'_{\gamma \mapsto 1} Tr_{\Lambda}^{Z_\gamma}(\gamma; P)$$

where $\sum'_{\gamma\mapsto 1}$ means taking the sum over the G-conjugacy classes in Γ.

Sketch of proof. We first prove this after multiplying by $\#G$.

$$\#G \cdot \mathrm{Tr}_{\Lambda}(1; P_G) = \mathrm{Tr}_{\Lambda}\Big(\sum_{\gamma\mapsto 1} \gamma; P_G\Big) = \mathrm{Tr}_{\Lambda}\Big(\sum_{\gamma\mapsto 1}\gamma; P\Big)$$

where the second equality follows by considering the commutative triangle

$$\begin{tikzcd} P^G \arrow[r, hook, "a"] & P \arrow[r, two heads, "b"] & P_G \arrow[ll, bend left, "c"] \end{tikzcd}$$

where a is the canonical inclusion, b the canonical surjection and $c = \sum_{\gamma\mapsto 1}\gamma$. Then we have

$$\Big(\sum_{\gamma\mapsto 1}\gamma\Big)\Big|_P = a \circ c \circ b \qquad \text{and} \qquad \Big(\sum_{\gamma\mapsto 1}\gamma\Big)\Big|_{P_G} = b \circ a \circ c$$

hence they have the same trace. We then have

$$\#G \cdot \mathrm{Tr}_{\Lambda}(1; P_G) = {\sum_{\gamma\mapsto 1}}' \frac{\#G}{\#Z_\gamma}\mathrm{Tr}_{\Lambda}(\gamma; P) = \#G {\sum_{\gamma\mapsto 1}}' \mathrm{Tr}_{\Lambda}^{Z_\gamma}(\gamma; P).$$

To finish the proof, reduce to case Λ torsion-free by some universality argument. See [**Del77**] for details. □

Remark 38.77.10. Let us try to illustrate the content of the formula of Lemma 38.77.8. Suppose that Λ, viewed as a trivial Γ-module, admits a finite resolution $0 \to P_r \to \ldots \to P_1 \to P_0 \to \Lambda \to 0$ by some $\Lambda[\Gamma]$-modules P_i which are finite and projective as $\Lambda[G]$-modules. In that case

$$H_*\left(\left(P_\bullet\right)_G\right) = \mathrm{Tor}_*^{\Lambda[G]}(\Lambda, \Lambda) = H_*(G, \Lambda);$$

and

$$\mathrm{Tr}_{\Lambda}^{Z_\gamma}\left(\gamma; P_\bullet\right) = \frac{1}{\#Z_\gamma}\mathrm{Tr}_{\Lambda}(\gamma; P_\bullet) = \frac{1}{\#Z_\gamma}\mathrm{Tr}(\gamma; \Lambda) = \frac{1}{\#Z_\gamma}.$$

Therefore, Lemma 38.77.8 says

$$\mathrm{Tr}_{\Lambda}(1; P_G) = \mathrm{Tr}\left(1 \Big|_{H_*(G,\Lambda)}\right) = {\sum_{\gamma\mapsto 1}}' \frac{1}{\#Z_\gamma}.$$

This can be interpreted as a point count on the stack BG. If $\Lambda = \mathbf{F}_\ell$ with ℓ prime to $\#G$, then $H_*(G, \Lambda)$ is $\mathbf{F}_\ell$ in degree 0 (and 0 in other degrees) and the formula reads

$$1 = \sum_{\substack{\sigma\text{-conjugacy} \\ \text{classes}\langle\gamma\rangle}} \frac{1}{\#Z_\gamma} \mod \ell.$$

This is in some sense a ``trivial" trace formula for G. Later we will see that (38.76.3.1) can in some cases be viewed as a highly nontrivial trace formula for a certain type of group, see Section 38.92.

38.78. Proof of the trace formula

Theorem 38.78.1. *Let k be a finite field and X a finite type, separated scheme of dimension at most 1 over k. Let Λ be a finite ring whose cardinality is prime to that of k, and $K \in D^b_{ctf}(X, \Lambda)$. Then*

$$Tr\left(\pi_X^*\big|_{R\Gamma_c(X_{\bar k}, K)}\right) = \sum\nolimits_{x \in X(k)} Tr\left(\pi_x\big|_{K_{\bar x}}\right) \tag{38.78.1.1}$$

in $\Lambda^\natural$.

Remark 38.78.2. Remarks on the formulation above.

(1) This formula holds in any dimension. By a dévissage lemma (which uses proper base change etc.) it reduces to the current statement -- in that generality.
(2) The complex $R\Gamma_c(X_{\bar k}, K)$ is defined by choosing an open immersion $j : X \hookrightarrow \bar X$ with $\bar X$ projective over k of dimension at most 1 and setting
$$R\Gamma_c(X_{\bar k}, K) := R\Gamma(\bar X_{\bar k}, j_! K).$$
That this is independent of the choice made follows from (the missing section).

Notation: For short, we write
$$T'(X, K) = \sum\nolimits_{x \in X(k)} \mathrm{Tr}\left(\pi_x\big|_{K_{\bar x}}\right)$$
for the right-hand side of (38.78.1.1) and
$$T''(X, K) = \mathrm{Tr}\left(\pi_x^*\big|_{R\Gamma_c(X_{\bar k}, K)}\right)$$
for the left-hand side.

Proof of Theorem 38.78.1. The proof proceeds in a number of steps.

(1) *Let $j : \mathcal{U} \hookrightarrow X$ be an open immersion with complement $Y = X - \mathcal{U}$ and $i : Y \hookrightarrow X$. Then $T''(X, K) = T''(\mathcal{U}, j^{-1}K) + T''(Y, i^{-1}K)$ and $T'(X, K) = T'(\mathcal{U}, j^{-1}K) + T'(Y, i^{-1}K)$.*

This is clear for T'. For T'' use the exact sequence
$$0 \to j_! j^{-1} K \to K \to i_* i^{-1} K \to 0$$
to get a filtration on K. This gives rise to an object $\widetilde{K} \in D\mathrm{F}(X, \Lambda)$ whose graded pieces are $j_! j^{-1} K$ and $i_* i^{-1} K$, both of which lie in $D^b_{ctf}(X, \Lambda)$. Then, by filtered derived abstract nonsense (INSERT REFERENCE), $R\Gamma_c(X_{\bar k}, K) \in D\mathrm{F}_{perf}(\Lambda)$, and it comes equipped with π_x^* in $D\mathrm{F}_{perf}(\Lambda)$. By the discussion of traces on filtered complexes (INSERT REFERENCE) we get
$$\begin{aligned} \mathrm{Tr}\left(\pi_X^*\big|_{R\Gamma_c(X_{\bar k}, K)}\right) &= \mathrm{Tr}\left(\pi_X^*\big|_{R\Gamma_c(X_{\bar k}, j_! j^{-1} K)}\right) + \mathrm{Tr}\left(\pi_X^*\big|_{R\Gamma_c(X_{\bar k}, i_* i^{-1} K)}\right) \\ &= T''(U, i^{-1}K) + T''(Y, i^{-1}K). \end{aligned}$$

(2) *The theorem holds if* $\dim X \leq 0$.

Indeed, in that case

$$R\Gamma_c(X_{\bar k}, K) = R\Gamma(X_{\bar k}, K) = \Gamma(X_{\bar k}, K) = \bigoplus_{\bar x \in X_{\bar k}} K_{\bar x} \leftarrow \pi_X * .$$

Since the fixed points of $\pi_X : X_{\bar k} \to X_{\bar k}$ are exactly the points $\bar x \in X_{\bar k}$ which lie over a k-rational point $x \in X(k)$ we get

$$\mathrm{Tr}\big(\pi_X^*|_{R\Gamma_c(X_{\bar k}, K)}\big) = \sum\nolimits_{x \in X(k)} \mathrm{Tr}(\pi_{\bar x}|_{K_{\bar x}}).$$

(3) *It suffices to prove the equality $T'(\mathcal{U}, \mathcal{F}) = T''(\mathcal{U}, \mathcal{F})$ in the case where*
- *$\mathcal{U}$ is a smooth irreducible affine curve over k ;*
- *$\mathcal{U}(k) = \emptyset$;*
- *$K = \mathcal{F}$ is a finite locally constant sheaf of Λ-modules on $\mathcal{U}$ whose stalk(s) are finite projective Λ-modules ; and*
- *Λ is killed by a power of a prime ℓ and $\ell \in k^*$.*

Indeed, because of Step 2, we can throw out any finite set of points. But we have only finitely many rational points, so we may assume there are none[8]. We may assume that $\mathcal{U}$ is smooth irreducible and affine by passing to irreducible components and throwing away the bad points if necessary. The assumptions of $\mathcal{F}$ come from unwinding the definition of $D^b_{ctf}(X, \Lambda)$ and those on Λ from considering its primary decomposition.

For the remainder of the proof, we consider the situation

$$\begin{tikzcd} \mathcal{V} \arrow[r, hook] \arrow[d, "f"'] & Y \arrow[d, "\bar f"] \\ \mathcal{U} \arrow[r, hook] & X \end{tikzcd}$$

where $\mathcal{U}$ is as above, f is a finite étale Galois covering, $\mathcal{V}$ is connected and the horizontal arrows are projective completions. Denoting $G = \mathrm{Aut}(\mathcal{V}|\mathcal{U})$, we also assume (as we may) that $f^{-1}\mathcal{F} = \underline{M}$ is constant, where the module $M = \Gamma(\mathcal{V}, f^{-1}\mathcal{F})$ is a $\Lambda[G]$-module which is finite and projective over Λ. This corresponds to the trivial monoid extension

$$1 \to G \to \Gamma = G \times \mathbf{N} \to \mathbf{N} \to 1.$$

In that context, using the reductions above, we need to show that $T''(\mathcal{U}, \mathcal{F}) = 0$. We now present a series of lemmata in order to complete the proof.

(A) *There is a natural action of G on $f_*f^{-1}\mathcal{F}$ and the trace map $f_*f^{-1}\mathcal{F} \to \mathcal{F}$ defines an isomorphism*

$$(f_*f^{-1}\mathcal{F}) \otimes_{\Lambda[G]} \Lambda = (f_*f^{-1}\mathcal{F})_G \cong \mathcal{F}.$$

To prove this, simply unwind everything at a geometric point.

(B) *Let $A = \mathbf{Z}/\ell^n\mathbf{Z}$ with $n \gg 0$. Then $f_*f^{-1}\mathcal{F} \cong (f_*\underline{A}) \otimes_{\underline{A}} \underline{M}$ with diagonal G-action.*

(C) *There is a canonical isomorphism $(f_*\underline{A} \otimes_{\underline{A}} \underline{M}) \otimes_{\Lambda[G]} \underline{\Lambda} \cong \mathcal{F}$.*

In fact, this is a derived tensor product, because of the projectivity assumption on $\mathcal{F}$.

(D) *There is a canonical isomorphism*

$$R\Gamma_c(\mathcal{U}_{\bar k}, \mathcal{F}) = (R\Gamma_c(\mathcal{U}_{\bar k}, f_*A) \otimes^{\mathbf{L}}_A M) \otimes^{\mathbf{L}}_{\Lambda[G]} \Lambda,$$

compatible with the action of $\pi_{\mathcal{U}}^*$.

---

[8] At this point, there should be an evil laugh in the background.

This comes from the universal coefficient theorem, i.e., the fact that $R\Gamma_c$ commutes with $\otimes^{\mathbf{L}}$, and the flatness of $\mathcal{F}$ as a Λ-module.

We have

$$\begin{aligned}\mathrm{Tr}(\pi_{\mathcal{U}}^*|_{R\Gamma_c(\mathcal{U}_{\bar{k}},\mathcal{F})}) &= \sum_{g\in G}{}' \mathrm{Tr}_\Lambda^{Z_g}\left((g,\pi_{\mathcal{U}}^*)|_{R\Gamma_c(\mathcal{U}_{\bar{k}},f_*A)\otimes_A^{\mathbf{L}}M}\right) \\ &= \sum_{g\in G}{}' \mathrm{Tr}_A^{Z_g}((g,\pi_{\mathcal{U}}^*)|_{R\Gamma_c(\mathcal{U}_{\bar{k}},f_*A)})\cdot \mathrm{Tr}_\Lambda(g|_M)\end{aligned}$$

where Γ acts on $R\Gamma_c(\mathcal{U}_{\bar{k}},\mathcal{F})$ by G and $(e,1)$ acts via $\pi_{\mathcal{U}}^*$. So the monoidal extension is given by $\Gamma = G\times\mathbf{N}\to\mathbf{N}$, $\gamma\mapsto 1$. The first equality follows from Lemma 38.77.9 and the second from lemma 38.77.8.

(4) *It suffices to show that* $Tr_A^{Z_g}\left((g,\pi_{\mathcal{U}}^*)|_{R\Gamma_c(\mathcal{U}_{\bar{k}},f_*A)}\right)\in A$ *maps to zero in* Λ.

Recall that

$$\begin{aligned}\#Z_g\cdot \mathrm{Tr}_A^{Z_g}\left((g,\pi_{\mathcal{U}}^*)|_{R\Gamma_c(\mathcal{U}_{\bar{k}},f_*A)}\right) &= \mathrm{Tr}_A\left((g,\pi_{\mathcal{U}}^*)|_{R\Gamma_c(\mathcal{U}_{\bar{k}},f_*A)}\right) \\ &= \mathrm{Tr}_A\left((g^{-1}\pi_{\mathcal{V}})^*|_{R\Gamma_c(\mathcal{V}_{\bar{k}},A)}\right).\end{aligned}$$

The first equality is Lemma 38.77.7, the second is the Leray spectral sequence, using the finiteness of f and the fact that we are only taking traces over A. Now since $A=\mathbf{Z}/\ell^n\mathbf{Z}$ with $n\gg 0$ and $\#Z_g=\ell^a$ for some (fixed) a, it suffices to show the following result.

(5) $Tr_A\left((g^{-1}\pi_{\mathcal{V}})^*|_{R\Gamma_c(\mathcal{V},A)}\right)=0$ *in* A.

By additivity again, we have

$$\begin{aligned}\mathrm{Tr}_A\left((g^{-1}\pi_{\mathcal{V}})^*|_{R\Gamma_c(\mathcal{V}_{\bar{k}}A)}\right) &+ \mathrm{Tr}_A\left((g^{-1}\pi_{\mathcal{V}})^*|_{R\Gamma_c(Y-\mathcal{V})_{\bar{k}},A)}\right) \\ &= \mathrm{Tr}_A\left((g^{-1}\pi_Y)^*|_{R\Gamma(Y_{\bar{k}},A)}\right)\end{aligned}$$

The latter trace is the number of fixed points of $g^{-1}\pi_Y$ on Y, by Weil's trace formula Theorem 38.76.4. Moreover, by the 0-dimensional case already proven in step 2,

$$\mathrm{Tr}_A\left((g^{-1}\pi_{\mathcal{V}})^*|_{R\Gamma_c(Y-\mathcal{V})_{\bar{k}},A)}\right)$$

is the number of fixed points of $g^{-1}\pi_Y$ on $(Y-\mathcal{V})_{\bar{k}}$. Therefore,

$$\mathrm{Tr}_A\left((g^{-1}\pi_{\mathcal{V}})^*|_{R\Gamma_c(\mathcal{V}_{\bar{k}},A)}\right)$$

is the number of fixed points of $g^{-1}\pi_Y$ on $\mathcal{V}_{\bar{k}}$. But there are no such points: if $\bar{y}\in Y_{\bar{k}}$ is fixed under $g^{-1}\pi_Y$, then $\bar{f}(\bar{y})\in X_{\bar{k}}$ is fixed under π_X. But $\mathcal{U}$ has no k-rational point, so we must have $\bar{f}(\bar{y})\in(X-\mathcal{U})_{\bar{k}}$ and so $\bar{y}\notin\mathcal{V}_{\bar{k}}$, a contradiction. This finishes the proof. □

Remark 38.78.3. Even though all we did are reductions and mostly algebra, the trace formula Theorem 38.78.1 is much stronger than Weil's geometric trace formula (Theorem 38.76.4) because it applies to coefficient systems (sheaves), not merely constant coefficients.

38.79. Applications

OK, having indicated the proof of the trace formula, let's try to use it for something.

38.80. On l-adic sheaves

Definition 38.80.1. Let X be a noetherian scheme. A $\mathbf{Z}_\ell$-*sheaf* on X, or simply a ℓ-adic sheaf is an inverse system $\left\{\mathcal{F}_n\right\}_{n\geq 1}$ where

(1) $\mathcal{F}_n$ is a constructible $\mathbf{Z}/\ell^n\mathbf{Z}$-module on $X_{étale}$, and
(2) the transition maps $\mathcal{F}_{n+1} \to \mathcal{F}_n$ induce isomorphisms $\mathcal{F}_{n+1} \otimes_{\mathbf{Z}/\ell^{n+1}\mathbf{Z}} \mathbf{Z}/\ell^n\mathbf{Z} \cong \mathcal{F}_n$.

We say that $\mathcal{F}$ is *lisse* if each $\mathcal{F}_n$ is locally constant. A *morphism* of such is merely a morphism of inverse systems.

Lemma 38.80.2. *Let $\{\mathcal{G}_n\}_{n\geq 1}$ be an inverse system of constructible $\mathbf{Z}/\ell^n\mathbf{Z}$-modules. Suppose that for all $k \geq 1$, the maps*

$$\mathcal{G}_{n+1}/\ell^k\mathcal{G}_{n+1} \to \mathcal{G}_n/\ell^k\mathcal{G}_n$$

are isomorphisms for all $n \gg 0$ (where the bound possibly depends on k). In other words, assume that the system $\{\mathcal{G}/\ell^k\mathcal{G}_n\}_{n\geq 1}$ is eventually constant, and call $\mathcal{F}_k$ the corresponding sheaf. Then the system $\left\{\mathcal{F}_k\right\}_{k\geq 1}$ forms a $\mathbf{Z}_\ell$-sheaf on X.

The proof is obvious.

Lemma 38.80.3. *The category of $\mathbf{Z}_\ell$-sheaves on X is abelian.*

Proof. Let $\Phi = \left\{\varphi_n\right\}_{n\geq 1} : \left\{\mathcal{F}_n\right\} \to \left\{\mathcal{G}_n\right\}$ be a morphism of $\mathbf{Z}_\ell$-sheaves. Set

$$\mathrm{Coker}(\Phi) = \left\{\mathrm{Coker}\left(\mathcal{F}_n \xrightarrow{\varphi_n} \mathcal{G}_n\right)\right\}_{n\geq 1}$$

and $\mathrm{Ker}(\Phi)$ is the result of Lemma 38.80.2 applied to the inverse system

$$\left\{\bigcap_{m\geq n} \mathrm{Im}\left(\mathrm{Ker}(\varphi_m) \to \mathrm{Ker}(\varphi_n)\right)\right\}_{n\geq 1}.$$

That this defines an abelian category is left to the reader. $\square$

Example 38.80.4. Let $X = Spec(\mathbf{C})$ and $\Phi : \mathbf{Z}_\ell \to \mathbf{Z}_\ell$ be multiplication by ℓ. More precisely,

$$\Phi = \left\{\mathbf{Z}/\ell^n\mathbf{Z} \xrightarrow{\ell} \mathbf{Z}/\ell^n\mathbf{Z}\right\}_{n\geq 1}.$$

To compute the kernel, we consider the inverse system

$$\cdots \to \mathbf{Z}/\ell\mathbf{Z} \xrightarrow{0} \mathbf{Z}/\ell\mathbf{Z} \xrightarrow{0} \mathbf{Z}/\ell\mathbf{Z}.$$

Since the images are always zero, $\mathrm{Ker}(\Phi)$ is zero as a system.

Remark 38.80.5. If $\mathcal{F} = \left\{\mathcal{F}_n\right\}_{n\geq 1}$ is a $\mathbf{Z}_\ell$-sheaf on X and $\bar{x}$ is a geometric point then $M_n = \left\{\mathcal{F}_{n,\bar{x}}\right\}$ is an inverse system of finite $\mathbf{Z}/\ell^n\mathbf{Z}$-modules such that $M_{n+1} \to M_n$ is surjective and $M_n = M_{n+1}/\ell^n M_{n+1}$. It follows that

$$M = lim_n\, M_n = lim\, \mathcal{F}_{n,\bar{x}}$$

is a finite $\mathbf{Z}_\ell$-module. Indeed, $M/\ell M = M_1$ is finite over $\mathbf{F}_\ell$, so by Nakayama M is finite over $\mathbf{Z}_\ell$. Therefore, $M \cong \mathbf{Z}_\ell^{\oplus r} \oplus \bigoplus_{i=1}^t \mathbf{Z}_\ell/\ell^{e_i}\mathbf{Z}_\ell$ for some $r, t \geq 0$, $e_i \geq 1$. The module $M = \mathcal{F}_{\bar{x}}$ is called the *stalk* of $\mathcal{F}$ at $\bar{x}$.

Definition 38.80.6. A $\mathbf{Z}_\ell$-sheaf $\mathcal{F}$ is *torsion* if $\ell^n : \mathcal{F} \to \mathcal{F}$ is the zero map for some n. The abelian category of $\mathbf{Q}_\ell$-sheaves on X is the quotient of the abelian category of $\mathbf{Z}_\ell$-sheaves by the Serre subcategory of torsion sheaves. In other words, its objects are $\mathbf{Z}_\ell$-sheaves on X, and if $\mathcal{F}, \mathcal{G}$ are two such, then

$$Hom_{\mathbf{Q}_\ell}(\mathcal{F}, \mathcal{G}) = Hom_{\mathbf{Z}_\ell}(\mathcal{F}, \mathcal{G}) \otimes_{\mathbf{Z}_\ell} \mathbf{Q}_\ell.$$

We denote by $\mathcal{F} \mapsto \mathcal{F} \otimes \mathbf{Q}_\ell$ the quotient functor (right adjoint to the inclusion). If $\mathcal{F} = \mathcal{F}' \otimes \mathbf{Q}_\ell$ where $\mathcal{F}'$ is a $\mathbf{Z}_\ell$-sheaf and $\bar{x}$ is a geometric point, then the *stalk* of $\mathcal{F}$ at $\bar{x}$ is $\mathcal{F}_{\bar{x}} = \mathcal{F}'_{\bar{x}} \otimes \mathbf{Q}_\ell$.

Remark 38.80.7. Since a $\mathbf{Z}_\ell$-sheaf is only defined on a noetherian scheme, it is torsion if and only if its stalks are torsion.

Definition 38.80.8. If X is a separated scheme of finite type over an algebraically closed field k and $\mathcal{F} = \left\{\mathcal{F}_n\right\}_{n\geq 1}$ is a $\mathbf{Z}_\ell$-sheaf on X, then we define

$$H^i(X, \mathcal{F}) := lim_n\, H^i(X, \mathcal{F}_n) \qquad \text{and} \qquad H^i_c(X, \mathcal{F}) := lim_n\, H^i_c(X, \mathcal{F}_n).$$

If $\mathcal{F} = \mathcal{F}' \otimes \mathbf{Q}_\ell$ for a $\mathbf{Z}_\ell$-sheaf $\mathcal{F}'$ then we set

$$H^i_c(X, \mathcal{F}) := H^i_c(X, \mathcal{F}') \otimes_{\mathbf{Z}_\ell} \mathbf{Q}_\ell.$$

We call these the *ℓ-adic cohomology* of X with coefficients $\mathcal{F}$.

38.81. L-functions

Definition 38.81.1. Let X be a scheme of finite type over a finite field k. Let Λ be a finite ring of order prime to the characteristic of k and $\mathcal{F}$ a constructible flat Λ-module on $X_{\acute{e}tale}$. Then we set

$$L(X, \mathcal{F}) := \prod_{x \in |X|} \det\left(1 - \pi_x^* \, T^{\deg x}\Big|_{\mathcal{F}_{\bar{x}}}\right)^{-1} \in \Lambda[[T]]$$

where $|X|$ is the set of closed points of X, $\deg x = [\kappa(x) : k]$ and $\bar{x}$ is a geometric point lying over x. This definition clearly generalizes to the case where $\mathcal{F}$ is replace by a $K \in D^b_{ctf}(X, \Lambda)$. We call this the *$L$-function of $\mathcal{F}$.*

Remark 38.81.2. Intuitively, T should be thought of as $T = t^f$ where $p^f = \# k$. The definitions are then independent of the size of the ground field.

Definition 38.81.3. Now assume that $\mathcal{F}$ is a $\mathbf{Q}_\ell$-sheaf on X. In this case we define

$$L(X, \mathcal{F}) := \prod_{x \in |X|} \det\left(1 - \pi_x^* \, T^{\deg x}\Big|_{\mathcal{F}_{\bar{x}}}\right)^{-1} \in \mathbf{Q}_\ell[[T]].$$

Note that this product converges since there are finitely many points of a given degree. We call this the *L-function of $\mathcal{F}$.*

38.82. Cohomological interpretation

This is how Grothendieck interpreted the L-function.

Theorem 38.82.1. *(Finite Coefficients) Let X be a scheme of finite type over a finite field k. Let Λ be a finite ring of order prime to the characteristic of k and $\mathcal{F}$ a constructible flat Λ-module on $X_{\acute{e}tale}$. Then*

$$L(X, \mathcal{F}) = \det\left(1 - \pi_X^* \, T\Big|_{R\Gamma_c(X_{\bar{k}}, \mathcal{F})}\right)^{-1} \in \Lambda[[T]].$$

Thus far, we don't even know whether each cohomology group $H^i_c(X_{\bar k}, \mathcal{F})$ is free.

Theorem 38.82.2. *($\mathbf{Q}_\ell$-sheaves) Let X be a scheme of finite type over a finite field k, and $\mathcal{F}$ a $\mathbf{Q}_\ell$-sheaf on X. Then*

$$L(X, \mathcal{F}) = \prod_i \det\left(1 - \pi_X^* \, T\Big|_{H^i_c(X_{\bar k}, \mathcal{F})}\right)^{(-1)^{i+1}} \in \mathbf{Q}_\ell[[T]].$$

Remark 38.82.3. Since we have only developed some theory of traces and not of determinants, Theorem 38.82.1 is harder to prove than Theorem 38.82.2. We will only prove the latter, for the former see [**Del77**]. Observe also that there is no version of this theorem more general for $\mathbf{Z}_\ell$ coefficients since there is no ℓ-torsion.

We reduce the proof of Theorem 38.82.2 to a trace formula. Since $\mathbf{Q}_\ell$ has characteristic 0, it suffices to prove the equality after taking logarithmic derivatives. More precisely, we apply $T\frac{d}{dT}\log$ to both sides. We have on the one hand

$$\begin{aligned} T\frac{d}{dT}\log L(X, \mathcal{F}) &= T\frac{d}{dT}\log \prod_{x\in|X|} \det\left(1 - \pi_x^* \, T^{\deg x}\Big|_{\mathcal{F}_{\bar x}}\right)^{-1} \\ &= \sum_{x\in|X|} T\frac{d}{dT}\log\left(\det\left(1 - \pi_x^* \, T^{\deg x}\Big|_{\mathcal{F}_{\bar x}}\right)^{-1}\right) \\ &= \sum_{x\in|X|} \deg x \sum_{n\geq 1} \mathrm{Tr}\left(\left(\pi_x^n\right)^*\big|_{\mathcal{F}_{\bar x}}\right) T^{n\deg x} \end{aligned}$$

where the last equality results from the formula

$$T\frac{d}{dT}\log\left(\det\left(1 - fT|_M\right)^{-1}\right) = \sum_{n\geq 1}\mathrm{Tr}(f^n|_M)T^n$$

which holds for any commutative ring Λ and any endomorphism f of a finite projective Λ-module M. On the other hand, we have

$$\begin{aligned} &T\frac{d}{dT}\log\left(\prod_i \det\left(1 - \pi_X^* \, T\Big|_{H^i_c(X_{\bar k}, \mathcal{F})}\right)^{(-1)^{i+1}}\right) \\ &\qquad = \sum_i (-1)^i \sum_{n\geq 1}\mathrm{Tr}\left(\left(\pi_X^n\right)^*\big|_{H^i_c(X_{\bar k}, \mathcal{F})}\right) T^n \end{aligned}$$

by the same formula again. Now, comparing powers of T and using the Mobius inversion formula, we see that Theorem 38.82.2 is a consequence of the following equality

$$\sum_{d|n} d \sum_{\substack{x\in|X| \\ \deg x = d}} \mathrm{Tr}\left(\left(\pi_X^{n/d}\right)^*\Big|_{\mathcal{F}_{\bar x}}\right) = \sum_i (-1)^i \mathrm{Tr}\left(\left(\pi_X^n\right)^*\big|_{H^i_c(X_{\bar k}, \mathcal{F})}\right).$$

Writing k_n for the degree n extension of k, $X_n = X \times_{Spec\, k} Spec(k_n)$ and ${}_n\mathcal{F} = \mathcal{F}|_{X_n}$, this boils down to

$$\sum_{x\in X_n(k_n)} \mathrm{Tr}\left(\pi_X^*\Big|_{{}_n\mathcal{F}_{\bar x}}\right) = \sum_i (-1)^i \mathrm{Tr}\left(\left(\pi_X^n\right)^*\big|_{H^i_c((X_n)_{\bar k}, {}_n\mathcal{F})}\right)$$

which is a consequence of the following result.

Theorem 38.82.4. *Let X be a separated scheme of finite type over a finite field k and $\mathcal{F}$ be a $\mathbf{Q}_\ell$-sheaf on X. Then $\dim_{\mathbf{Q}_\ell} H^i_c(X_{\bar k}, \mathcal{F})$ is finite for all i, and is nonzero for $0 \le i \le 2\dim X$ only. Furthermore, we have*

$$\sum_{x\in X(k)} Tr\left(\pi_x \Big|_{\mathcal{F}_{\bar x}}\right) = \sum_i (-1)^i Tr\left(\pi_X^*\Big|_{H^i_c(X_{\bar k},\mathcal{F})}\right).$$

Theorem 38.82.5. *Let X/k be as above, let Λ be a finite ring with $\#\Lambda \in k^*$ and $K \in D^b_{ctf}(X,\Lambda)$. Then $R\Gamma_c(X_{\bar k}, K) \in D_{perf}(\Lambda)$ and*

$$\sum_{x\in X(k)} Tr\left(\pi_x \Big|_{K_{\bar x}}\right) = Tr\left(\pi_X^* \Big|_{R\Gamma_c(X_{\bar k},K)}\right).$$

Note that we have already proved this (REFERENCE) when $\dim X \le 1$. The general case follows easily from that case together with the proper base change theorem. We now explain how to deduce Theorem 38.82.4 from theorem 38.82.5. We first use some étale cohomology arguments to reduce the proof to an algebraic statement which we subsequently prove.

Let $\mathcal{F}$ be as in Theorem 38.82.4. We can write $\mathcal{F}$ as $\mathcal{F}' \otimes \mathbf{Q}_\ell$ where $\mathcal{F}' = \left\{\mathcal{F}'_n\right\}$ is a $\mathbf{Z}_\ell$-sheaf without torsion, i.e., $\ell : \mathcal{F}' \to \mathcal{F}'$ has trivial kernel in the category of $\mathbf{Z}_\ell$-sheaves. Then each $\mathcal{F}'_n$ is a flat constructible $\mathbf{Z}/\ell^n\mathbf{Z}$-module on $X_{étale}$, so $\mathcal{F}'_n \in D^b_{ctf}(X, \mathbf{Z}/\ell^n\mathbf{Z})$ and $\mathcal{F}'_{n+1} \otimes^{\mathbf{L}}_{\mathbf{Z}/\ell^{n+1}\mathbf{Z}} \mathbf{Z}/\ell^n\mathbf{Z} = \mathcal{F}'_n$. Note that the last equality holds also for standard (non-derived) tensor product, since $\mathcal{F}'_n$ is flat (it is the same equality). Therefore,

(1) the complex $K_n = R\Gamma_c\left(X_{\bar k}, \mathcal{F}'_n\right)$ is perfect, and it is endowed with an endomorphism $\pi_n : K_n \to K_n$ in $D(\mathbf{Z}/\ell^n\mathbf{Z})$;
(2) there are identifications
$$K_{n+1} \otimes^{\mathbf{L}}_{\mathbf{Z}/\ell^{n+1}\mathbf{Z}} \mathbf{Z}/\ell^n\mathbf{Z} = K_n$$
in $D_{perf}(\mathbf{Z}/\ell^n\mathbf{Z})$, compatible with the endomorphisms π_{n+1} and π_n (see [**Del77**, Rapport 4.12]) ;
(3) the equality $\mathrm{Tr}\left(\pi_X^*\Big|_{K_n}\right) = \sum_{x\in X(k)} \mathrm{Tr}\left(\pi_x \Big|_{(\mathcal{F}'_n)_{\bar x}}\right)$ holds ; and
(4) for each $x \in X(k)$, the elements $\mathrm{Tr}\left(\pi_x\Big|_{\mathcal{F}'_{n,\bar x}}\right) \in \mathbf{Z}/\ell^n\mathbf{Z}$ form an element of $\mathbf{Z}_\ell$ which is equal to $\mathrm{Tr}\left(\pi_x \Big|_{\mathcal{F}_{\bar x}}\right) \in \mathbf{Q}_\ell$.

It thus suffices to prove the following algebra lemma.

Lemma 38.82.6. *Suppose we have $K_n \in D_{perf}(\mathbf{Z}/\ell^n\mathbf{Z})$, $\pi_n : K_n \to K_n$ and isomorphisms $\varphi_n : K_{n+1} \otimes^{\mathbf{L}}_{\mathbf{Z}/\ell^{n+1}\mathbf{Z}} \mathbf{Z}/\ell^n\mathbf{Z} \cong K_n$ compatible with π_{n+1} and π_n. Then*

(1) *the elements $t_n = Tr(\pi_n \Big|_{K_n}) \in \mathbf{Z}/\ell^n\mathbf{Z}$ form an element $t_\infty = \{t_n\}$ of $\mathbf{Z}_\ell$;*
(2) *the $\mathbf{Z}_\ell$-module $H^i_\infty = lim_n H^i(k_n)$ is finite and is nonzero for finitely many i only ; and*
(3) *the operators $H^i(\pi_n) : H^i(K_n) \to H^i(K_n)$ are compatible and define $\pi^i_\infty : H^i_\infty \to H^i_\infty$ satisfying*
$$\sum (-1)^i Tr\left(\pi^i_\infty\Big|_{H^i_\infty \otimes_{\mathbf{Z}_\ell} \mathbf{Q}_\ell}\right) = t_\infty.$$

Proof. Since $\mathbf{Z}/\ell^n\mathbf{Z}$ is a local ring and K_n is perfect, each K_n can be represented by a finite complex $K_n^\bullet$ of finite free $\mathbf{Z}/\ell^n\mathbf{Z}$-modules such that the map $K_n^p \to K_n^{p+1}$ has image contained in ℓK_n^{p+1}. It is a fact that such a complex is unique up to isomorphism. Moreover

π_n can be represented by a morphism of complexes $\pi_n^\bullet : K_n^\bullet \to K_n^\bullet$ (which is unique up to homotopy). By the same token the isomorphism $\varphi_n : K_{n+1} \otimes^{\mathbf{L}}_{\mathbf{Z}/\ell^{n+1}\mathbf{Z}} \mathbf{Z}/\ell^n\mathbf{Z} \to K_n$ is represented by a map of complexes

$$\varphi_n^\bullet : K_{n+1}^\bullet \otimes_{\mathbf{Z}/\ell^{n+1}\mathbf{Z}} \mathbf{Z}/\ell^n\mathbf{Z} \to K_n^\bullet.$$

In fact, $\varphi_n^\bullet$ is an isomorphism of complexes, thus we see that

- there exist $a, b \in \mathbf{Z}$ independent of n such that $K_n^i = 0$ for all $i \notin [a, b]$; and
- the rank of K_n^i is independent of n.

Therefore, the module $K_\infty^i = lim_n\{K_n^i, \varphi_n^i\}$ is a finite free $\mathbf{Z}_\ell$-module and $K_\infty^\bullet$ is a finite complex of finite free $\mathbf{Z}_\ell$-modules. By induction on the number of nonzero terms, one can prove that $H^i\left(K_\infty^\bullet\right) = lim_n H^i\left(K_n^\bullet\right)$ (this is not true for unbounded complexes). We conclude that $H_\infty^i = H^i\left(K_\infty^\bullet\right)$ is a finite $\mathbf{Z}_\ell$-module. This proves *ii*. To prove the remainder of the lemma, we need to overcome the possible noncommutativity of the diagrams

$$\begin{tikzcd} K_{n+1}^\bullet \arrow[r, "\varphi_n^\bullet"] \arrow[d, "\pi_{n+1}^\bullet"'] & K_n^\bullet \arrow[d, "\pi_n^\bullet"] \\ K_{n+1}^\bullet \arrow[r, "\varphi_n^\bullet"'] & K_n^\bullet. \end{tikzcd}$$

However, this diagram does commute in the derived category, hence it commutes up to homotopy. We inductively replace $\pi_n^\bullet$ for $n \geq 2$ by homotopic maps of complexes making these diagrams commute. Namely, if $h^i : K_{n+1}^i \to K_n^{i-1}$ is a homotopy, i.e.,

$$\pi_n^\bullet \circ \varphi_n^\bullet - \varphi_n^\bullet \circ \pi_{n+1}^\bullet = dh + hd,$$

then we choose $\tilde{h}^i : K_{n+1}^i \to K_{n+1}^{i-1}$ lifting h^i. This is possible because K_{n+1}^i free and $K_{n+1}^{i-1} \to K_n^{i-1}$ is surjective. Then replace $\pi_n^\bullet$ by $\tilde{\pi}_n^\bullet$ defined by

$$\tilde{\pi}_{n+1}^\bullet = \pi_{n+1}^\bullet + d\tilde{h} + \tilde{h}d.$$

With this choice of $\{\pi_n^\bullet\}$, the above diagrams commute, and the maps fit together to define an endomorphism $\pi_\infty^\bullet = lim_n \pi_n^\bullet$ of $K_\infty^\bullet$. Then part *i* is clear: the elements $t_n = \sum(-1)^i \mathrm{Tr}\left(\pi_n^i\Big|_{K_n^i}\right)$ fit into an element t_∞ of $\mathbf{Z}_\ell$. Moreover

$$\begin{aligned} t_\infty &= \sum(-1)^i \mathrm{Tr}_{\mathbf{Z}_\ell}\left(\pi_\infty^i\big|_{K_\infty^i}\right) \\ &= \sum(-1)^i \mathrm{Tr}_{\mathbf{Q}_\ell}\left(\pi_\infty^i\big|_{K_\infty^i \otimes_{\mathbf{Z}_\ell} \mathbf{Q}_\ell}\right) \\ &= \sum(-1)^i \mathrm{Tr}\left(\pi_\infty\big|_{H^i(K_\infty^\bullet \otimes \mathbf{Q}_\ell)}\right) \end{aligned}$$

where the last equality follows from the fact that $\mathbf{Q}_\ell$ is a field, so the complex $K_\infty^\bullet \otimes \mathbf{Q}_\ell$ is quasi-isomorphic to its cohomology $H^i(K_\infty^\bullet \otimes \mathbf{Q}_\ell)$. The latter is also equal to $H^i(K_\infty^\bullet) \otimes_{\mathbf{Z}} \mathbf{Q}_\ell = H_\infty^i \otimes \mathbf{Q}_\ell$, which finishes the proof of the lemma, and also that of Theorem 38.82.4. $\square$

38.83. List of things which we should add above

What did we skip the proof of in the lectures sofar:

(1) curves and their Jacobians,
(2) proper base change theorem,

(3) inadequate discussion of $R\Gamma_c$,
(4) more generally, given $f : X \to S$ finite type, separated S quasi-projective, discussion of $Rf_!$ on étale sheaves.
(5) discussion of $\otimes^{\mathbf{L}}$
(6) discussion of why $R\Gamma_c$ commutes with $\otimes^{\mathbf{L}}$

38.84. Examples of L-functions

We use Theorem 38.82.2 for curves to give examples of L-functions

38.85. Constant sheaves

Let k be a finite field, X a smooth, geometrically irreducible curve over k and $\mathcal{F} = \underline{\mathbf{Q}_\ell}$ the constant sheaf. If $\bar{x}$ is a geometric point of X, the Galois module $\mathcal{F}_{\bar{x}} = \mathbf{Q}_\ell$ is trivial, so

$$\det\left(1 - \pi_x^* T^{\deg x}\Big|_{\mathcal{F}_{\bar{x}}}\right)^{-1} = \frac{1}{1 - T^{\deg x}}.$$

Applying Theorem 38.82.2, we get

$$\begin{aligned} L(X, \mathcal{F}) &= \prod_{i=0}^{2} \det\left(1 - \pi_X^* T\big|_{H_c^i(X_{\bar{k}}, \mathbf{Q}_\ell)}\right)^{(-1)^{i+1}} \\ &= \frac{\det\left(1 - \pi_X^* T\big|_{H_c^1(X_{\bar{k}}, \mathbf{Q}_\ell)}\right)}{\det\left(1 - \pi_X^* T\big|_{H_c^0(X_{\bar{k}}, \mathbf{Q}_\ell)}\right) \cdot \det\left(1 - \pi_X^* T\big|_{H_c^2(X_{\bar{k}}, \mathbf{Q}_\ell)}\right)}. \end{aligned}$$

To compute the latter, we distinguish two cases.

Projective case. Assume that X is projective, so $H_c^i(X_{\bar{k}}, \mathbf{Q}_\ell) = H^i(X_{\bar{k}}, \mathbf{Q}_\ell)$, and we have

$$H^i(X_{\bar{k}}, \mathbf{Q}_\ell) = \begin{cases} \mathbf{Q}_\ell & \text{if } i = 0, \text{ and } \pi_X^* \text{ acts as } 1 \text{ ;} \\ \mathbf{Q}_\ell^{2g} & \text{if } i = 1 \text{ ;} \\ \mathbf{Q}_\ell & \text{if } i = 2, \text{ and } \pi_X^* \text{ acts as multiplication by } q = \deg \pi_X. \end{cases}$$

We do not know much about the action of π_X^* on the degree 1 cohomology. Let us call $\alpha_1, \ldots, \alpha_{2g}$ its eigenvalues in $\bar{\mathbf{Q}}_\ell$. Putting everything together, Theorem 38.82.2 yields the equality

$$\prod_{x \in |X|} \frac{1}{1 - T^{\deg x}} = \frac{\det\left(1 - \pi_X^* T\big|_{H^1(X_{\bar{k}}, \mathbf{Q}_\ell)}\right)}{(1 - T)(1 - qT)}$$

from which we deduce the following result.

Lemma 38.85.1. *Let X be a smooth, projective, geometrically irreducible curve over a finite field k. Then*

(1) *the L-function $L(X, \mathbf{Q}_\ell)$ is a rational funtion ;*
(2) *the eigenvalues $\alpha_1, \ldots, \alpha_{2g}$ of π_X^* on $H^1(X_{\bar{k}}, \mathbf{Q}_\ell)$ are algebraic integers independent of ℓ,*
(3) *the number of rational points of X on k_n, where $[k_n : k] = n$, is*

$$\#X(k_n) = 1 - \sum\nolimits_{i=1}^{2g} \alpha_i^n + q^n,$$

(4) *for each i, $|\alpha_i| < q$.*

Part (3) is Theorem 38.82.4 applied to $\mathscr{F} = \underline{\mathbf{Q}_\ell}$ on $X \otimes k_n$. For part (4), use the following result.

Exercise 38.85.2. Let $\alpha_1, \dots, \alpha_n \in \mathbf{C}$. Then for any conic sector containing the positive real axis of the form $C_\varepsilon = \{z \in \mathbf{C} \mid |\arg z| < \varepsilon\}$ with $\varepsilon > 0$, there exists an integer $k \geq 1$ such that $\alpha_1^k, \dots, \alpha_n^k \in C_\varepsilon$.

Then prove that $|\alpha_i| \leq q$ for all i. Then, use elementary considerations on complex numbers to prove (as in the proof of the prime number theorem) that $|\alpha_i| < q$. In fact, the Riemann hypothesis says that for all $|\alpha_i| = \sqrt{q}$ for all i. We will come back to this later.

Affine case. Assume now that X is affine, say $X = \bar{X} - \left\{x_1, \dots, x_n\right\}$ where $j : X \hookrightarrow \bar{X}$ is a projective nonsingular completion. Then $H_c^0(X_{\bar{k}}, \mathbf{Q}_\ell) = 0$ and $H_c^2(X_{\bar{k}}, \mathbf{Q}_\ell) = H^2(\bar{X}_{\bar{k}}, \mathbf{Q}_\ell)$ so Theorem 38.82.2 reads

$$L(X, \mathbf{Q}_\ell) = \prod_{x \in |X|} \frac{1}{1 - T^{\deg x}} = \frac{\det\left(1 - \pi_X^* \, T\big|_{H_c^1(X_{\bar{k}}, \mathbf{Q}_\ell)}\right)}{1 - qT}.$$

On the other hand, the previous case gives

$$\begin{aligned} L(X, \mathbf{Q}_\ell) &= L(\bar{X}, \mathbf{Q}_\ell) \prod_{i=1}^n \left(1 - T^{\deg x_i}\right) \\ &= \frac{\prod_{i=1}^n (1 - T^{\deg x_i}) \prod_{j=1}^{2g} (1 - \alpha_j T)}{(1 - T)(1 - qT)}. \end{aligned}$$

Therefore, we see that $\dim H_c^1(X_{\bar{k}}, \mathbf{Q}_\ell) = 2g + \sum_{i=1}^n \deg(x_i) - 1$, and the eigenvalues $\alpha_1, \dots, \alpha_{2g}$ of $\pi_{\bar{X}}^*$ acting on the degree 1 cohomology are roots of unity. More precisely, each x_i gives a complete set of $\deg(x_i)$th roots of unity, and one occurrence of 1 is omitted. To see this directly using coherent sheaves, consider the short exact sequence on $\bar{X}$

$$0 \to j_! \mathbf{Q}_\ell \to \mathbf{Q}_\ell \to \bigoplus_{i=1}^n \mathbf{Q}_{\ell, x_i} \to 0.$$

The long exact cohomology sequence reads

$$0 \to \mathbf{Q}_\ell \to \bigoplus_{i=1}^n \mathbf{Q}_\ell^{\oplus \deg x_i} \to H_c^1(X_{\bar{k}}, \mathbf{Q}_\ell) \to H_c^1(\bar{X}_{\bar{k}}, \mathbf{Q}_\ell) \to 0$$

where the action of Frobenius on $\bigoplus_{i=1}^n \mathbf{Q}_\ell^{\oplus \deg x_i}$ is by cyclic permutation of each term; and $H_c^2(X_{\bar{k}}, \mathbf{Q}_\ell) = H_c^2(\bar{X}_{\bar{k}}, \mathbf{Q}_\ell)$.

38.86. The Legendre family

Let k be a finite field of odd characteristic, $X = Spec(k[\lambda, \frac{1}{\lambda(\lambda-1)}])$, and consider the family of elliptic curves $f : E \to X$ on $\mathbf{P}_X^2$ whose affine equation is $y^2 = x(x-1)(x-\lambda)$. We set $\mathscr{F} = Rf_*^1 \mathbf{Q}_\ell = \left\{R^1 f_* \mathbf{Z}/\ell^n \mathbf{Z}\right\}_{n \geq 1} \otimes \mathbf{Q}_\ell$. In this situation, the following is true

- for each $n \geq 1$, the sheaf $R^1 f_*(\mathbf{Z}/\ell^n\mathbf{Z})$ is finite locally constant -- in fact, it is free of rank 2 over $\mathbf{Z}/\ell^n\mathbf{Z}$;
- the system $\{R^1 f_* \mathbf{Z}/\ell^n \mathbf{Z}\}_{n \geq 1}$ is a lisse ℓ-adic sheaf ; and
- for all $x \in |X|$, $\det\left(1 - \pi_x \, T^{\deg x}\big|_{\mathscr{F}_{\bar{x}}}\right) = (1 - \alpha_x T^{\deg x})(1 - \beta_x T^{\deg x})$ where α_x, β_x are the eigenvalues of the geometric frobenius of E_x acting on $H^1(E_{\bar{x}}, \mathbf{Q}_\ell)$.

Note that E_x is only defined over $\kappa(x)$ and not over k. The proof of these facts uses the proper base change theorem and the local acyclicity of smooth morphisms. For details, see [**Del77**]. It follows that

$$L(E/X) := L(X, \mathscr{F}) = \prod_{x \in |X|} \frac{1}{(1 - \alpha_x T^{\deg x})(1 - \beta_x T^{\deg x})}.$$

Applying Theorem 38.82.2 we get

$$L(E/X) = \prod_{i=0}^{2} \det\left(1 - \pi_X^*\, T\Big|_{H_c^i(X_{\bar{k}}, \mathscr{F})}\right)^{(-1)^{i+1}},$$

and we see in particular that this is a rational function. Furthermore, it is relatively easy to show that $H_c^0(X_{\bar{k}}, \mathscr{F}) = H_c^2(X_{\bar{k}}, \mathscr{F}) = 0$, so we merely have

$$L(E/X) = \det\left(1 - \pi_X^* T\Big|_{H_c^1(X, \mathscr{F})}\right).$$

To compute this determinant explicitly, consider the Leray spectral sequence for the proper morphism $f : E \to X$ over $\mathbf{Q}_\ell$, namely

$$H_c^i(X_{\bar{k}}, R^j f_* \mathbf{Q}_\ell) \Rightarrow H_c^{i+j}(E_{\bar{k}}, \mathbf{Q}_\ell)$$

which degenerates. We have $f_* \mathbf{Q}_\ell = \mathbf{Q}_\ell$ and $R^1 f_* \mathbf{Q}_\ell = \mathscr{F}$. The sheaf $R^2 f_* \mathbf{Q}_\ell = \mathbf{Q}_\ell(-1)$ is the *Tate twist* of $\mathbf{Q}_\ell$, i.e., it is the sheaf $\mathbf{Q}_\ell$ where the Galois action is given by multiplication by $\#\kappa(x)$ on the stalk at $\bar{x}$. It follows that, for all $n \geq 1$,

$$\begin{aligned} \#E(k_n) &= \sum (-1)^i \mathrm{Tr}\left(\pi_E^{n\,*}\big|_{H_c^i(E_{\bar{k}}, \mathbf{Q}_\ell)}\right) \\ &= \sum_{i,j} (-1)^{i+j} \mathrm{Tr}\left(\pi_X^{n\,*}\big|_{H_c^i(X_{\bar{k}}, R^j f_* \mathbf{Q}_\ell)}\right) \\ &= (q^n - 2) + \mathrm{Tr}\left(\pi_X^{n\,*}\big|_{H_c^1(X_{\bar{k}}, \mathscr{F})}\right) + q^n(q^n - 2) \\ &= q^{2n} - q^n - 2 + \mathrm{Tr}\left(\pi_X^{n\,*}\big|_{H_c^1(X_{\bar{k}}, \mathscr{F})}\right) \end{aligned}$$

where the first equality follows from Theorem 38.82.4, the second one from the Leray spectral sequence and the third one by writing down the higher direct images of $\mathbf{Q}_\ell$ under f. Alternatively, we could write

$$\#E(k_n) = \sum_{x \in X(k_n)} \#E_x(k_n)$$

and use the trace formula for each curve. We can also find the number of k_n-rational points simply by counting. The zero section contributes $q^n - 2$ points (we omit the points where $\lambda = 0, 1$) hence

$$\#E(k_n) = q^n - 2 + \#\left\{y^2 = x(x-1)(x-\lambda), \lambda \neq 0, 1\right\}.$$

Now we have

$$\#\left\{y^2 = x(x-1)(x-\lambda),\ \lambda \neq 0,1\right\}$$

$$= \#\left\{y^2 = x(x-1)(x-\lambda) \text{ in } \mathbf{A}^3\right\} - \#\left\{y^2 = x^2(x-1)\right\} - \#\left\{y^2 = x(x-1)^2\right\}$$

$$= \#\left\{\lambda = \tfrac{-y^2}{x(x-1)} + x,\ x \neq 0,1\right\} + \#\left\{y^2 = x(x-1)(x-\lambda), x = 0,1\right\} - 2(q^n - \varepsilon_n)$$

$$= q^n(q^n-2) + 2q^n - 2(q^n - \varepsilon_n)$$

$$= q^{2n} - 2q^n + 2\varepsilon_n$$

where $\varepsilon_n = 1$ if -1 is a square in k_n, 0 otherwise, i.e.,

$$\varepsilon_n = \frac{1}{2}\left(1 + \left(\frac{-1}{k_n}\right)\right) = \frac{1}{2}\left(1 + (-1)^{\frac{q^n-1}{2}}\right).$$

Thus $\#E(k_n) = q^{2n} - q^n - 2 + 2\varepsilon_n$. Comparing with the previous formula, we find

$$\mathrm{Tr}\left(\pi_X^{n\,*}\big|_{H^1_c(X_{\bar k},\mathcal{F})}\right) = 2\varepsilon_n = 1 + (-1)^{\frac{q^n-1}{2}},$$

which implies, by elementary algebra of complex numbers, that if -1 is a square in k_n^*, then $\dim H^1_c(X_{\bar k},\mathcal{F}) = 2$ and the eigenvalues are 1 and 1. Therefore, in that case we have

$$L(E/X) = (1-T)^2.$$

38.87. Exponential sums

A standard problem in number theory is to evaluate sums of the form

$$S_{a,b}(p) = \sum_{x \in \mathbf{F}_p - \{0,1\}} e^{\frac{2\pi i x^a (x-1)^b}{p}}.$$

In our context, this can be interpreted as a cohomological sum as follows. Consider the base scheme $S = Spec(\mathbf{F}_p[x, \frac{1}{x(x-1)}])$ and the affine curve $f : X \to \mathbf{P}^1 - \{0,1,\infty\}$ over S given by the equation $y^{p-1} = x^a(x-1)^b$. This is a finite étale Galois cover with group $\mathbf{F}_p^*$ and there is a splitting

$$f_*(\bar{\mathbf{Q}}_\ell^*) = \bigoplus_{\chi : \mathbf{F}_p^* \to \bar{\mathbf{Q}}_\ell^*} \mathcal{F}_\chi$$

where χ varies over the characters of $\mathbf{F}_p^*$ and $\mathcal{F}_\chi$ is a rank 1 lisse $\mathbf{Q}_\ell$-sheaf on which $\mathbf{F}_p^*$ acts via χ on stalks. We get a corresponding decomposition

$$H^1_c(X_{\bar k}, \mathbf{Q}_\ell) = \bigoplus_\chi H^1(\mathbf{P}^1_{\bar k} - \{0,1,\infty\}, \mathcal{F}_\chi)$$

and the cohomological interpretation of the exponential sum is given by the trace formula applied to $\mathcal{F}_\chi$ over $\mathbf{P}^1 - \{0,1,\infty\}$ for some suitable χ. It reads

$$S_{a,b}(p) = -\mathrm{Tr}\left(\pi_X^*\big|_{H^1(\mathbf{P}^1_{\bar k} - \{0,1,\infty\}, \mathcal{F}_\chi)}\right).$$

The general yoga of Weil suggests that there should be some cancellation in the sum. Applying (roughly) the Riemann-Hurwitz formula, we see that

$$2g_X - 2 \approx -2(p-1) + 3(p-2) \approx p$$

so $g_X \approx p/2$, which also suggests that the χ-pieces are small.

38.88. Trace formula in terms of fundamental groups

In the following sections we reformulate the trace formula completely in terms of the fundamental group of a curve, except if the curve happens to be $\mathbf{P}^1$.

38.89. Fundamental groups

X connected scheme $\overline{x} \to X$ geometric point consider the functor

$$\begin{array}{cccc} F_{\overline{x}}: & \begin{array}{c}\text{finite étale}\\ \text{schemes over } X\end{array} & \longrightarrow & \text{finite sets} \\ & Y/X & \longmapsto & F_{\overline{x}}(Y) = \left\{ \begin{array}{c}\text{geom points } \overline{y}\\ \text{of } Y \text{ lying over } \overline{x}\end{array} \right\} = Y_{\overline{x}} \end{array}$$

Set

$$\pi_1(X, \overline{x}) = Aut(F_{\overline{x}}) = \text{ set of automorphisms of the functor } F_{\overline{x}}$$

Note that for every finite étale $Y \to X$ there is an action

$$\pi_1(X, \overline{x}) \times F_{\overline{x}}(Y) \to F_{\overline{x}}(Y)$$

Definition 38.89.1. A subgroup of the form $\mathrm{Stab}(\overline{y} \in F_{\overline{x}}(Y)) \subset \pi_1(X, \overline{x})$ is called *open*.

Theorem 38.89.2. *(Grothendieck, see* **[Gro71]***) X connected*

(1) *there is a topology on $\pi_1(X, \overline{x})$ such that the open subgroups form a fundamental system of open nbhds of $e \in \pi_1(X, \overline{x})$.*
(2) *$\pi_1(X, \overline{x})$ is a profinite group.*
(3) *the functor*

$$\begin{array}{ccc} \begin{array}{c}\textit{schemes finite}\\ \textit{étale over } X\end{array} & \to & \begin{array}{c}\textit{finite discrete continuous}\\ \pi_1(X,\overline{x})\textit{-sets}\end{array} \\ Y/X & \mapsto & F_{\overline{x}}(Y) \textit{ with its natural action} \end{array}$$

is an equivalence of categories.

Proposition 38.89.3. *Let X be an integral normal Netherian scheme. Let $\overline{y} \to X$ be an algebraic geometric point lying over the generic point $\eta \in X$. Then*

$$\pi_x(X, \overline{\eta}) = Gal(M/\kappa(\eta))$$

($\kappa(\eta)$, function field of X) where

$$\kappa(\overline{\eta}) \supset M \supset \kappa(\eta) = k(X)$$

is the max sub-extension such that for every finite sub extension $M \supset L \supset \kappa(\eta)$ the normalization of X in L is finite étale over X.

Change of base point. For any $\overline{x}_1$, $\overline{x}_2$ geom. points of X there exists an isom. of fibre functions

$$\mathcal{F}_{\overline{x}_1} \cong \mathcal{F}_{\overline{x}_2}$$

(This is a path from $\overline{x}_1$ to $\overline{x}_2$.) Conjugation by this path gives isom

$$\pi_1(X, \overline{x}_1) \cong \pi_1(X, \overline{x}_2)$$

well defined up to inner actions.

Functoriality. For any morphism $X_1 \to X_2$ of connected schemes any $\overline{x} \in X_1$ there is a canonical map

$$\pi_1(X_1, \overline{x}) \to \pi_1(X_2, \overline{x})$$

(Why? because the fibre functor ...)

Base field. Let X be a variety over a field k. Then we get

$$\pi_1(X, \overline{x}) \to \pi_1(Spec(k), \overline{x}) =^{\text{prop}} Gal(k^{\text{sep}}/k)$$

This map is surjective iff X is geom. connected over k. So in the geometrically connected case we get s.e.s. of profinite groups

$$1 \to \pi_1(X_{\overline{k}}, \overline{x}) \to \pi_1(X, \overline{x}) \to Gal(k^{\text{sep}}/k) \to 1$$

($\pi_1(X_{\overline{k}}, \overline{x})$: geometric fundamental group of X, $\pi_1(X, \overline{x})$: arithmetic fundamental group of X)

Comparison. If X is a variety over $\mathbf{C}$ then

$$\pi_1(X, \overline{x}) = \text{ profinite completion of } \pi_1(X(\mathbf{C})(\text{ usual topology}), x)$$

(have $x \in X(\mathbf{C})$)

Frobenii. X variety over k, $\sharp k < \infty$. For any $x \in X$ closed point, let

$$F_x \in \pi_1(x, \overline{x}) = \text{Gal}(\kappa(x)^{\text{sep}}/\kappa(x))$$

be the geometric frobenius. Let $\overline{\eta}$ be an alg. geom. gen. pt. Then

$$\pi_1(X, \overline{\eta}) \leftarrow^{\cong} \pi_1(X, \overline{x}) \overset{\text{fundtoriality}}{\leftarrow} \pi_1(x, \overline{x})$$

Easy fact:

$$\begin{array}{ccc} \pi_1(X, \overline{\eta}) & \to^{\deg} \pi_1(Spec(k), \overline{\eta})* & = Gal(k^{sep}/k) \\ & & || \\ & & \widehat{\mathbf{Z}} \cdot F_{Spec(k)} \\ F_x & \mapsto & \deg(x) \cdot F_{Spec(k)} \end{array}$$

Recall: $\deg(x) = [\kappa(x) : k]$

Fundamental groups and lisse sheaves. Let X be a connected scheme, $\overline{x}$ geom. pt. There are equivalences of categories

(Λ finite ring)	fin. loc. const. sheaves of Λ-modules of $X_{étale}$	$\leftrightarrow$	finite(discrete) Λ-modules with continuous $\pi_1(X,\overline{x})$-action
(l a prime)	lisse l-adic sheaves	$\leftrightarrow$	finitely generated $\mathbf{Z}_l$-modules M with continuous $\pi_1(X,\overline{x})$ action where we use l-adic topology on M

In particular lisse $\mathbf{Q}_l$-sheaves correspond to continuous homomorphisms

$$\pi_1(X, \overline{x}) \to GL_r(\mathbf{Q}_l), \quad r \geq 0$$

Notation: A module with action (M, ρ) corresponds to the sheaf $\mathcal{F}_\rho$.

Trace formulas. X variety over k, $\sharp k < \infty$.

(1) Λ finite ring $(\sharp\Lambda, \sharp k) = 1$

$$\rho : \pi_1(X, \overline{x}) \to GL_r(\Lambda)$$

continuous. For every $n \geq 1$ we have

$$\sum_{d|n} d \left(\sum_{\substack{x \in |X|, \\ \deg(x) = d}} \text{Tr}(\rho(F_x^{n/d})) \right) = \text{Tr}\left((\pi_x^n)^* \Big|_{R\Gamma_c(X_{\overline{k}}, \mathcal{F}_\rho)} \right)$$

(2) $l \neq char(k)$ prime, $\rho : \pi_1(X, \overline{x}) \to GL_r(\mathbf{Q}_l)$. For any $n \geq 1$

$$\sum_{d|n} d \left(\sum_{\substack{x \in |X| \\ \deg(x)=d}} \mathrm{Tr}\left(\rho(F_x^{n/d})\right) \right) = \sum_{i=0}^{2\dim X} (-1)^i \mathrm{Tr}\left(\pi_X^* \Big|_{H_c^i(X_{\overline{k}}, \mathcal{F}_\rho)} \right)$$

Weil conjectures. (Deligne-Weil I, 1974) X smooth proj. over k, $\sharp k = q$, then the eigenvalues of π_X^* on $H^i(X_{\overline{k}}, \mathbf{Q}_l)$ are algebraic integers α with $|\alpha| = q^{1/2}$.

Deligne's conjectures. (almost completely proved by Lafforgue + $\cdots$) Let X be a normal variety over k finite

$$\rho : \pi_1(X, \overline{x}) \longrightarrow GL_r(\mathbf{Q}_l)$$

continuous. Assume: ρ irreducible $\det(\rho)$ of finite order. Then

(1) there exists a number field E such that for all $x \in |X|$(closed points) the char. poly of $\rho(F_x)$ has coefficients in E.
(2) for any $x \in |X|$ the eigenvalues $\alpha_{x,i}$, $i = 1, \ldots, r$ of $\rho(F_x)$ have complex absolute value 1. (these are algebraic numbers not necessary integers)
(3) for every finite place λ(not dividing p), of E (maybe after enlarging E a bit) there exists
$$\rho\lambda : \pi_1(X, \overline{x}) \to GL_r(E_\lambda)$$
compatible with ρ. (some char. polys of F_x's)

Theorem 38.89.4. *(Deligne, Weil II -- not the original formulation) For a sheaf $\mathcal{F}_\rho$ with ρ satisfying the conclusions of the conjecture above then the eigenvalues of π_X^* on $H_c^i(X_{\overline{k}}, \mathcal{F}_\rho)$ are algebraic numbers α with absolute values*

$$|\alpha| = q^{w/2}, \text{ for } w \in \mathbf{Z},\ w \leq i$$

Moreover, if X smooth and proj. then $w = i$.

38.90. Profinite groups, cohomology and homology

Let G be a profinite group.

Cohomology. Consider the category of discrete modules with continuous G-action. This category has enough injectives and we can define

$$H^i(G, M) = R^i H^0(G, M) = R^i(M \mapsto M^G)$$

Also there is a derived version $RH^0(G, -)$.

Homology. Consider the category of compact abelian groups with continuous G-action. This category has enough projectives and we can define

$$H_i(G, M) = L_i H_0(G, M) = L_i(M \mapsto M_G)$$

and there is also a derived version.

Trivial duality. The functor $M \mapsto M^\wedge = Hom_{cont}(M, S^1)$ exchanges the categories above and

$$H^i(G, M)^\wedge = H_i(G, M^\wedge)$$

Moreover, this functor maps torsion discrete G-modules to profinite continuous G-modules and vice versa, and if M is either a discrete or profinite continuous G-module, then $M^\wedge = Hom(M, \mathbf{Q}/\mathbf{Z})$.

Notes on Homology.

(1) If we look at Λ-modules for a finite ring Λ then we can identify
$$H_i(G, M) = Tor_i^{\Lambda[[G]]}(M, \Lambda)$$
where $\Lambda[[G]]$ is the limit of the group algebras of the finite quotients of G.
(2) If $G \lhd \Gamma$, and Γ is also profinite then
  - $H^0(G, -)$: discrete Γ-module$\rightarrow$ discrete Γ/G-modules
  - $H_0(G, -)$: compact Γ-modules $\rightarrow$ compact Γ/G-modules

  and hence the profinite group Γ/G acts on the cohomology groups of G with values in a Γ-module. In other words, there are derived functors
$$RH^0(G, -) : D^+(\text{discrete } \Gamma\text{-modules}) \longrightarrow D^+(\text{discrete } \Gamma/G\text{-modules})$$
  and similarly for $LH_0(G, -)$.

38.91. Cohomology of curves, revisited

Let k be a field, X be geometric connected, smooth curve over k. We have the fundamental short exact sequence
$$1 \to \pi_1(X_{\overline{k}}, \overline{\eta}) \to \pi_1(X, \overline{\eta}) \to \text{Gal}(k^{sep}/k) \to 1$$
If Λ is a finite ring with $\#\Lambda \in k^*$ and M a finite Λ-module, and we are given
$$\rho : \pi_1(X, \overline{\eta}) \to \text{Aut}_\Lambda(M)$$
continuous, then $\mathcal{F}_\rho$ denotes the associated sheaf on $X_{\acute{e}tale}$.

Lemma 38.91.1. *There is a canonical isomorphism*
$$H^2_c(X_{\overline{k}}, \mathcal{F}_\rho) = (M)_{\pi_1(X_{\overline{k}}, \overline{\eta})}(-1)$$
as $Gal(k^{sep}/k)$*-modules.*

Here the subscript $_{\pi_1(X_{\overline{k}}, \overline{\eta})}$ indicates co-invariants, and (-1) indicates the Tate twist i.e., $\sigma \in \text{Gal}(k^{sep}/k)$ acts via
$$\chi_{cycl}(\sigma)^{-1}.\sigma \text{ on RHS}$$
where
$$\chi_{cycl} : \text{Gal}(k^{sep}/k) \to \prod\nolimits_{l \neq char(k)} \mathbf{Z}_l^*$$
is the cyclotomic character.

Reformulation (Deligne, Weil II, page 338). For any finite locally constant sheaf $\mathcal{F}$ on X there is a maximal quotient $\mathcal{F} \to \mathcal{F}''$ with $\mathcal{F}''/X_{\overline{k}}$ a constant sheaf, hence
$$\mathcal{F}'' = (X \to Spec(k))^{-1}F''$$
where F'' is a sheaf $Spec(k)$, i.e., a $\text{Gal}(k^{sep}/k)$-module. Then
$$H^2_c(X_{\overline{k}}, \mathcal{F}) \to H^2_c(X_{\overline{k}}, \mathcal{F}'') \to F''(-1)$$
is an isomorphism.

Proof of Lemma 38.91.1. Let $Y \to^{\varphi} X$ be the finite étale Galois covering corresponding to $Ker(\rho) \subset \pi_1(X, \overline{\eta})$. So
$$\text{Aut}(Y/X) = Ind(\rho)$$
is Galois group. Then $\varphi^*\mathcal{F}_\rho = \underline{M}_Y$ and
$$\varphi_*\varphi^*\mathcal{F}_\rho \to \mathcal{F}_\rho$$

which gives

$$\begin{aligned} & H_c^2(X_{\overline{k}}, \varphi_* \varphi^* \mathscr{F}_\rho) \to H_c^2(X_{\overline{k}}, \mathscr{F}_\rho) \\ & = H_c^2(Y_{\overline{k}}, \varphi^* \mathscr{F}_\rho) \\ & = H_c^2(Y_{\overline{k}}, \underline{M}) = \bigoplus_{\substack{\text{irred. comp. of} \\ Y_{\overline{k}}}} M \end{aligned}$$

$$\mathrm{Im}(\rho) \to H_c^2(Y_{\overline{k}}, \underline{M}) = \bigoplus_{\substack{\text{irred. comp. of} \\ Y_{\overline{k}}}} M \to_{Im(\rho) \text{ equivalent}} H_c^2(X_{\overline{k}}, \mathscr{F}_\rho) \leftarrow^{\text{trivial } Im(\rho)}_{\text{action}}$$

irreducible curve $C/\overline{k}$, $H_c^2(C, \underline{M}) = M$.
Since

$$\begin{matrix}\text{set of irreducible} \\ \text{components of } Y_k\end{matrix} = \frac{Im(\rho)}{Im(\rho|_{\pi_1(X_{\overline{k}}, \overline{\eta})})}$$

We conclude that $H_c^2(X_{\overline{k}}, \mathscr{F}_\rho)$ is a quotient of $M_{\pi_1(X_{\overline{k}}, \overline{\eta})}$. On the other hand, there is a surjection

$$\mathscr{F}_\rho \to \mathscr{F}'' = \begin{matrix}\text{sheaf on } X \text{ associated to} \\ (M)_{\pi_1(X_{\overline{k}}, \overline{\eta})} \leftarrow \pi_1(X, \overline{\eta})\end{matrix}$$

$$H_c^2(X_{\overline{k}}, \mathscr{F}_\rho) \to M_{\pi_1(X_{\overline{k}}, \overline{\eta})}$$

The twist in Galois action comes from the fact that $H_c^2(X_{\overline{k}}, \mu_n) =^{\text{can}} \mathbf{Z}/n\mathbf{Z}$. □

Remark 38.91.2. Thus we conclude that if X is also projective then we have functorially in the representation ρ the identifications

$$H^0(X_{\overline{k}}, \mathscr{F}_\rho) = M^{\pi_1(X_{\overline{k}}, \overline{\eta})}$$

and

$$H_c^2(X_{\overline{k}}, \mathscr{F}_\rho) = M_{\pi_1(X_{\overline{k}}, \overline{\eta})}(-1)$$

Of course if X is not projective, then $H_c^0(X_{\overline{k}}, \mathscr{F}_\rho) = 0$.

Proposition 38.91.3. *Let X/k as before but $X_{\overline{k}} \neq \mathbf{P}^1_{\overline{k}}$ The functors $(M, \rho) \mapsto H_c^{2-i}(X_{\overline{k}}, \mathscr{F}_\rho)$ are the left derived functor of $(M, \rho) \mapsto H_c^2(X_{\overline{k}}, \mathscr{F}_\rho)$ so*

$$H_c^{2-i}(X_{\overline{k}}, \mathscr{F}_\rho) = H_i(\pi_1(X_{\overline{k}}, \overline{\eta}), M)(-1)$$

Moreover, there is a derived version, namely

$$R\Gamma_c(X_{\overline{k}}, \mathscr{F}_\rho) = LH_0(\pi_1(X_{\overline{k}}, \overline{\eta}), M(-1)) = M(-1) \otimes^{\mathbf{L}}_{\Lambda[[\pi_1(X_{\overline{k}}, \overline{\eta})]]} \Lambda$$

in $D(\Lambda[[\widehat{\mathbf{Z}}]])$. Similarly, the functors $(M, \rho) \mapsto H^i(X_{\overline{k}}, \mathscr{F}_\rho)$ are the right derived functor of $(M, \rho) \mapsto M^{\pi_1(X_{\overline{k}}, \overline{\eta})}$ so

$$H^i(X_{\overline{k}}, \mathscr{F}_\rho) = H^i(\pi_1(X_{\overline{k}}, \overline{\eta}), M)$$

Moreover, in this case there is a derived version too.

Proof. (Idea) Show both sides are universal δ-functors. □

Remark 38.91.4. By the proposition and Trivial duality then you get

$$H_c^{2-i}(X_{\overline{k}}, \mathscr{F}_\rho) \times H^i(X_{\overline{k}}, \mathscr{F}_\rho^\wedge(1)) \to \mathbf{Q}/\mathbf{Z}$$

a perfect pairing. If X is projective then this is Poincare duality.

38.92. Abstract trace formula

Suppose given an extension of profinite groups,

$$1 \to G \to \Gamma \xrightarrow{\deg} \widehat{\mathbf{Z}} \to 1$$

We say Γ *has an abstract trace formula* if and only if there exist

(1) an integer $q \geq 1$, and
(2) for every $d \geq 1$ a finite set S_d and for each $x \in S_d$ a conjugacy class $F_x \in \Gamma$ with $\deg(F_x) = d$

such that the following hold

(1) for all ℓ not dividing q have $cd_\ell(G) < \infty$, and
(2) for all finite rings Λ with $q \in \Lambda^*$, for all finite projective Λ-modules M with continuous Γ-action, for all $n > 0$ we have

$$\sum\nolimits_{d|n} d\left(\sum\nolimits_{x \in S_d} \mathrm{Tr}(F_x^{n/d}\big|_M)\right) = q^n \mathrm{Tr}(F^n\Big|_{M \otimes^{\mathbf{L}}_{\Lambda[[G]]}\Lambda})$$

in $\Lambda^\natural$.

Here $M \otimes^{\mathbf{L}}_{\Lambda[[G]]} \Lambda = LH_0(G, M)$ denotes derived homology, and $F = 1$ in $\Gamma/G = \widehat{\mathbf{Z}}$.

Remark 38.92.1. Here are some observations concerning this notion.

(1) If modeling projective curves then we can use cohomology and we don't need factor q^n.
(2) The only examples I know are $\Gamma = \pi_1(X, \overline{\eta})$ where X is smooth, geometrically irreducible and $K(\pi, 1)$ over finite field. In this case $q = (\sharp k)^{\dim X}$. Modulo the proposition, we proved this for curves in this course.
(3) Given the integer q then the sets S_d are uniquely determined. (You can multiple q by an integer m and then replace S_d by m^d copies of S_d without changing the formula.)

Example 38.92.2. Fix an integer $q \geq 1$

$$\begin{array}{ccccccccc} 1 & \to & G = \widehat{\mathbf{Z}}^{(q)} & \to & \Gamma & \to & \widehat{\mathbf{Z}} & \to & 1 \\ & & = \prod_{l\nmid q} \mathbf{Z}_l & & F & \mapsto & 1 & & \end{array}$$

with $FxF^{-1} = ux$, $u \in (\widehat{\mathbf{Z}}^{(q)})^*$. Just using the trivial modules $\mathbf{Z}/m\mathbf{Z}$ we see

$$q^n - (qu)^n \equiv \sum_{d|n} d\sharp S_d$$

in $\mathbf{Z}/m\mathbf{Z}$ for all $(m, q) = 1$ (up to $u \to u^{-1}$) this implies $qu = a \in \mathbf{Z}$ and $|a| < q$. The special case $a = 1$ does occur

$$\pi_1^t(\mathbf{G}_{m,\mathbf{F}_p}, \overline{\eta})$$

$$\sharp S_1 = q - 1$$

$$\sharp S_2 = \frac{(q^2 - 1) - (q - 1)}{2}$$

38.93. Automorphic forms and sheaves

References: See especially the amazing papers [**Dri83**], [**Dri84**] and [**Dri80**] by Drinfeld.

Unramified cusp forms. Let k be a finite field of characteristic p. Let X geometrically irreducible projective smooth curve over k. Set $K = k(X)$ equal to the function field of X. Let v be a place of K which is the same thing as a closed point $x \in X$. Let K_v be the completion of K at v, which is the same thing as the fraction field of the completion of the local ring of X at x, i.e., $K_v = f.f.(\widehat{O_{X,x}})$. Denote $O_v \subset K_v$ the ring of integers. We further set

$$O = \prod\nolimits_v O_v \subset \mathbf{A} = \prod_v{}' K_v$$

and we let Λ be any ring with p invertible in Λ.

Definition 38.93.1. An *unramified cusp form on* $GL_2(\mathbf{A})$ *with values in* Λ[9] is a function

$$f : GL_2(\mathbf{A}) \to \Lambda$$

such that

(1) $f(x\gamma) = f(x)$ for all $x \in GL_2(\mathbf{A})$ and all $\gamma \in GL_2(K)$
(2) $f(ux) = f(x)$ for all $x \in GL_2(\mathbf{A})$ and all $u \in GL_2(O)$
(3) for all $x \in GL_2(\mathbf{A})$,
$$\int_{\mathbf{A} \bmod K} f\left(x \begin{pmatrix} 1 & z \\ 0 & 1 \end{pmatrix}\right) dz = 0$$
see [**dJ01**, Section 4.1] for an explanation of how to make sense out of this for a general ring Λ in which p is invertible.

Hecke Operators. For v a place of K and f an unramified cusp form we set

$$T_v(f)(x) = \int_{g \in M_v} f(g^{-1}x)dg,$$

and

$$U_v(f)(x) = f\left(\begin{pmatrix} \pi_v^{-1} & 0 \\ 0 & \pi_v^{-1} \end{pmatrix} x\right)$$

Notations used: here $\pi_v \in O_v$ is a uniformizer

$$M_v = \left\{h \in Mat(2 \times 2,\ O_v) \,\middle|\, \det h = \pi_v O_v^*\right\}$$

and $dg =$ is the Haar measure on $GL_2(K_v)$ with $\int_{GL_2(O_v)} dg = 1$. Explicitly we have

$$T_v(f)(x) = f\left(\begin{pmatrix} \pi_v^{-1} & 0 \\ 0 & 1 \end{pmatrix} x\right) + \sum_{i=1}^{q_v} f\left(\begin{pmatrix} 1 & 0 \\ -\pi_v^{-1}\lambda_i & \pi_v^{-1} \end{pmatrix} x\right)$$

with $\lambda_i \in O_v$ a set of representatives of $O_v/(\pi_v) = \kappa_v$, $q_v = \#\kappa_v$.

Eigenforms. An *eigenform* f is an unramified cusp form such that some value of f is a unit and $T_v f = t_v f$ and $U_v f = u_v f$ for some (uniquely determined) $t_v,\ u_v \in \Lambda$.

---

[9] This is likely nonstandard notation.

Theorem 38.93.2. *(See* [**Dri80**].*) Given an eigenform f with values in $\overline{\mathbf{Q}}_l$ and eigenvalues $u_v \in \overline{\mathbf{Z}}_l^*$ then there exists*

$$\rho : \pi_1(X) \to GL_2(E)$$

continuous, absolutely irreducible where E is a finite extension of $\mathbf{Q}_\ell$ contained in $\overline{\mathbf{Q}}_l$ such that $t_v = Tr(\rho(F_v))$, and $u_v = q_v^{-1} \det\left(\rho(F_v)\right)$ for all places v.

Theorem 38.93.3. *Suppose $\mathbf{Q}_l \subset E$ finite, and*

$$\rho : \pi_1(X) \to GL_2(E)$$

absolutely irreducible, continuous. Then there exists an eigenform f with values in $\overline{\mathbf{Q}}_l$ whose eigenvalues t_v, u_v satisfy the equalities $t_v = Tr(\rho(F_v))$ and $u_v = q_v^{-1}\det(\rho(F_v))$.

Remark 38.93.4. We now have, thanks to Lafforgue and many other mathematiciens, a complete theorems like this two above for GL_n and allowing ramification! In other words, the full global Langlands correspondence for GL_n is known for function fields of curves over finite fields. At the same time this does not mean there aren't a lot of interesting questions left to answer about the fundamental groups of curves over finite fields, as we shall see below.

Central character. If f is an eigenform then

$$\begin{array}{cccc} \chi_f : & O^*\backslash\mathbf{A}^*/K^* & \to & \Lambda^* \\ & (1,\ldots,\pi_v,1,\ldots,1) & \mapsto & u_v^{-1} \end{array}$$

is called the *central character*. If corresponds to the determinant of ρ via normalizations as above. Set

$$C(\Lambda) = \left\{ \begin{array}{c} \text{unr. cusp forms } f \text{ with coefficients in } \Lambda \\ \text{such that } U_v f = \varphi_v^{-1} f \forall v \end{array} \right\}$$

Proposition 38.93.5. *(See* [**dJ01**, Proposition 4.7]*) If Λ is Noetherian then $C(\Lambda)$ is a finitely generated Λ-module. Moreover, if Λ is a field with prime subfield $\mathbf{F} \subset \Lambda$ then*

$$C(\Lambda) = (C(\mathbf{F})) \otimes_{\mathbf{F}} \Lambda$$

compatibly with T_v acting.

This proposition trivially implies the following lemma.

Lemma 38.93.6. *Algebraicity of eigenvalues. If Λ is a field then the eigenvalues t_v for $f \in C(\Lambda)$ are algebraic over the prime subfield $\mathbf{F} \subset \Lambda$.*

Combining all of the above we can do the following very useful trick.

Lemma 38.93.7. *Switching l. Let E be a number field. Start with*

$$\rho : \pi_1(X) \to SL_2(E_\lambda)$$

absolutely irreducible continuous, where λ is a place of E not lying above p. Then for any second place λ' of E not lying above p there exists a finite extension $E'_{\lambda'}$ and a absolutely irreducible continuous representation

$$\rho' : \pi_1(X) \to SL_2(E'_{\lambda'})$$

which is compatible with ρ in the sense that the characteristic polynomials of all Frobenii are the same.

Note how this is an instance of Deligne's conjecture!

Proof. To prove the switching lemma use Theorem 38.93.3 to obtain $f \in C(\overline{\mathbf{Q}}_l)$ eigenform ass. to ρ. Next, use Proposition 38.93.5 to see that we may choose $f \in C(E')$ with $E \subset E'$ finite. Next we may complete E' to see that we get $f \in C(E'_{\lambda'})$ eigenform with $E'_{\lambda'}$ a finite extension of $E_{\lambda'}$. And finally we use Theorem 38.93.2 to obtain $\rho' : \pi_1(X) \to SL_2(E'_{\lambda'})$ abs. irred. and continuous after perhaps enlarging $E'_{\lambda'}$ a bit again. □

Speculation: If for a (topological) ring Λ we have

$$\left(\begin{array}{c} \rho : \pi_1(X) \to SL_2(\Lambda) \\ \text{abs irred} \end{array} \right) \leftrightarrow \text{ eigen forms in } C(\Lambda)$$

then all eigenvalues of $\rho(F_v)$ algebraic (won't work in an easy way if Λ is a finite ring. Based on the speculation that the Langlands correspondence works more generally than just over fields one arrives at the following conjecture.

Conjecture. (See [**dJ01**]) For any continuous

$$\rho : \pi_1(X) \to GL_n(\mathbf{F}_l[[t]])$$

we have $\#\rho(\pi_1(X_{\overline{k}})) < \infty$.

A rephrasing in the language of sheaves: "For any lisse sheaf of $\overline{\mathbf{F}_l((t))}$-modules the geom monodromy is finite. "

Theorem 38.93.8. *(See* [**dJ01**]*) The Conjecture holds if $n \leq 2$.*

Theorem 38.93.9. *(See* [**Gai07**]*) Conjecture holds if $l > 2n$ modulo some unproven things.*

It turns out the conjecture is useful for something. See work of Drinfeld on Kashiwara's conjectures. But there is also the much more down to earth application as follows.

Theorem 38.93.10. *(See* [**dJ01**, Theorem 3.5]*) Suppose*

$$\rho_0 : \pi_1(X) \to GL_n(\mathbf{F}_l)$$

is a continuous, $l \neq p$. Assume

(1) *Conj. holds for X,*
(2) *$\rho_0\big|_{\pi_1(X_{\overline{k}})}$ abs. irred., and*
(3) *l does not divide n.*

Then the universal determination ring R_{univ} of ρ_0 is finite flat over $\mathbf{Z}_l$.

Explanation: There is a representation $\rho_{\text{univ}} : \pi_1(X) \to GL_n(R_{\text{univ}})$ (Univ. Defo ring) R_{univ} loc. complete, residue field $\mathbf{F}_l$ and $(R_{\text{univ}} \to \mathbf{F}_l) \circ \rho_{\text{univ}} \cong \rho_0$. And given any $R \to \mathbf{F}_l$, R local complete and $\rho : \pi_1(X) \to GL_n(R)$ then there exists $\psi : R_{\text{univ}} \to R$ such that $\psi \circ \rho_{\text{univ}} \cong \rho$. The theorem says that the morphism

$$Spec(R_{\text{univ}}) \longrightarrow Spec(\mathbf{Z}_l)$$

is finite and flat. In particular, such a ρ_0 lifts to a $\rho : \pi_1(X) \to GL_n(\overline{\mathbf{Q}}_l)$.

Notes:

(1) The theorem on deformations is easy.
(2) Any result towards the conjecture seems hard.
(3) It would be interesting to have more conjectures on $\pi_1(X)$!

38.94. Counting points

Let X be a smooth, geometrically irreducible, projective curve over k. $q = \sharp k$. Trace formula gives:
there exists algebraic integers $w_1, \ldots, w_{2g}$ such that

$$\sharp X(k_n) = q^n - \sum_{i=1}^{2g_X} w_i^n + 1.$$

If $\sigma \in \mathrm{Aut}(X)$ then for all i, there exists j such that $\sigma(w_i) = w_j$.

Riemann-Hypothesis. For all i we have $|\omega_i| = \sqrt{q}$.

This was formulated by Emil Artin, in 1924, for hyperelliptic curves. Proved by Weil 1940. Weil gave two proofs

- using intersection theory on $X \times X$, using the Hodge index theorem, and
- using the Jacobian of X.

There is another proof whose initial idea is due to Stephanov, and which was given by Bombieri: it uses the function field $k(X)$ and its Frobenius operator (1969). The starting point is that given $f \in k(X)$ one observes that $f^q - f$ is a rational function which vanishes in all the $\mathbf{F}_q$-rational points of X, and that one can try to use this idea to give an upper bound for the number of points.

38.95. Precise form of Chebotarov

As a first application let us prove a precise form of Chebatarov for a finite étale Galois covering of curves. Let $Y \to_G^\varphi X$, Galois covering, finite étale,

$$G = \mathrm{Aut}(\overline{Y}/X) \leftarrow \pi_1(X).$$

$G = Gal(Y/X)$. Assume $Y_{\overline{k}} =$ irreducible.
If $C \subset G$ is a conjugacy class then for all $n > 0$, we have

$$\left| \sharp \left\{ x \in X(k_n) \,\middle|\, F_x \in C \right\} - \frac{\sharp C}{\sharp G} \cdot \sharp X(k_n) \right| \leq (\sharp C)(2g-2)\sqrt{q^n}$$

(Warning: Please check ($\sharp C$) carefully before using.)

Sketch.

$$\varphi_*(\overline{Q}_l) = \oplus_{\pi \in \widehat{G}} \mathcal{F}_\pi$$

where $\widehat{G}$ = set of isom. classes of irred representations of G over $\overline{\mathbf{Q}}_l$. For $\pi \in \widehat{G}$,

$$\chi_\pi : G \to \overline{\mathbf{Q}}_l$$

character of π.

$$H^*(Y_{\overline{k}}, \overline{\mathbf{Q}}_l) = \oplus_{\pi \in \widehat{G}} H^*(Y_{\overline{k}}, \overline{\mathbf{Q}}_l)_\pi =_{(\varphi \text{ finite })} \oplus_{\pi \in \widehat{G}} H^*(X_{\overline{k}}, \mathcal{F}_\pi)$$

If $\pi \neq 1$

$$H^0(X_{\overline{k}}, \mathcal{F}_\pi) = H^2(X_{\overline{k}}, \mathcal{F}_\pi) = 0, \ \dim H^1(X_{\overline{k}}, \mathcal{F}_\pi) = (2g_X - 2)d_\pi^2$$

(can get this from trace formula for acting on ...)

$$\left| \sum_{x \in X(k_n)} \chi_\pi(\mathcal{F}_x) \right| \leq_{\pi \neq 1} (2g_X - 2)d_\pi^2 \sqrt{q^n}$$

Write $1_C = \sum_\pi a_\pi \chi_\pi,\ a_\pi = \langle 1_C, \chi_\pi \rangle, a_1 = \langle 1_C, \chi_1 \rangle = \frac{\sharp C}{\sharp G}$

$$\langle f, h \rangle = \frac{1}{\sharp G} \sum_{g \in G} f(g)\overline{h(g)}$$

$$\frac{\sharp C}{\sharp G} = ||1_C||^2 = \sum |a_\pi|^2$$

Final step:

$$\begin{aligned} \sharp \left\{ x \in X(k_n) \,\middle|\, F_x \in C \right\} &= \sum_{x \in X(k_n)} 1_C(x) = \sum_{x \in X)k_n} \sum_\pi a_\pi \chi_\pi(F_x) \\ &= \underbrace{\frac{\sharp C}{\sharp G} \sharp X(k_n)}_{\text{term for } \pi=1} + \underbrace{\sum_{\pi \neq 1} a_\pi \sum_{x \in X(k_n)} \chi_\pi(F_x)}_{\text{error term (to be bounded by } E)} \end{aligned}$$

$$\begin{aligned} |E| &\leq \sum_{\substack{\pi \in \widehat{G}, \\ \pi \neq 1}} |a_\pi|(2g-2)d_\pi^2 \sqrt{q^n} \\ &\leq \sum_{\pi \neq 1} \frac{\sharp C}{\sharp G}(2g_X - 2)d_\pi^3 \sqrt{q^n} \end{aligned}$$

By Weil's conjecture, $\sharp X(k_n) \sim q^n$. $\square$

38.96. How many primes decompose completely?

This section gives a second application of the Riemann Hypothesis for curves over a finite field. For number theorists it may be nice to look at the paper by Ihara, entitled ``How many primes decompose completely in an infinite unramified Galois extension of a global field?", see [**Iha83**]. Consider the fundamental exact sequence

$$1 \to \pi_1(X_{\overline{k}}) \to \pi_1(X) \xrightarrow{\deg} \widehat{\mathbf{Z}} \to 1$$

Proposition 38.96.1. *There exists a finite set $x_1, \ldots, x_n$ of closed points of X such that that set of all frobenius elements corresponding to these points topologically generate $\pi_1(X)$.*

Another way to state this is: There exist $x_1, \ldots, x_n \in |X|$ such that the smallest normal closed subgroup Γ of $\pi_1(X)$ containing 1 frobenius element for each x_i is all of $\pi_1(X)$. i.e., $\Gamma = \pi_1(X)$.

Proof. Pick $N \gg 0$ and let

$$\left\{ x_1, \ldots, x_n \right\} = \begin{array}{c} \text{set of all closed points of} \\ X \text{ of degree} \leq N \text{ over } k \end{array}$$

Let $\Gamma \subset \pi_1(X)$ be as in variant statement for these points. Assume $\Gamma \neq \pi_1(X)$. We can pick $\Gamma \lhd \pi_1(X)$ with $U \neq \pi_1(X)$. By R.H. for X this set I will have some x_{i_1} of degree N, some x_{i_2} of degree $N-1$. This shows $\Gamma \to^{\deg} \widehat{\mathbf{Z}}$ and z_0 and so also U. This exactly means if $Y \to X$ is the finite étale Galois covering as to U, then $Y_{\overline{k}}$ irreducible.

$$Y \to^G X,\ G = \pi_1(X)/U$$

By construction all points of X of degree $\leq N$, split completely in Y. So, in particular

$$\sharp Y(k_N) \geq (\sharp G)\sharp X(k_N)$$

Use R.H. on both sides. So you get

$$q^N + 1 + 2g_Y q^{N/2} \geq \sharp G \sharp X(k_N) \geq \sharp G(q^N + 1 - 2g_X q^{N/2})$$

Since $2g_Y - 2 = (\sharp G)(2g_X - 2)$,

$$q^N + 1 + (\sharp G)(2g_X - 1) + 1)q^{N/2} \geq \sharp G(q^N + 1 - 2g_X q^{N/2})$$

□

Weird Question. Set $W_X = \deg^{-1}(\mathbf{Z}) \subset \pi_1(X)$. Is it true that for some finite set of closed points $x_1, \ldots, x_n$ of X the set of all frobenii corresponding to these points *algebraically* generate W_X?

By a Baire category argument this translates into the same question for all Frobenii.

38.97. How many points are there really?

If the genus of the curve is large relative to q, then the main term in the formula $\#X(k) = q - \sum \omega_i + 1$ is not q but the second term $\sum \omega_i$ which can (a priori) have size about $2g_X\sqrt{q}$. In the paper [**VD83**] the authors Drinfeld and Vladut show that this maximum is (as predicted by Ihara earlier) actually at most about $g\sqrt{q}$. Fix q, set

$$A(q) = lim\sup_{X/k} \frac{\sharp X(k)}{g_X}$$

(X as behave $k = \mathbf{F}_q$)

$$g_x \to \infty$$

- RH $\Rightarrow$ $A(q) \leq 2\sqrt{q}$
- Ihara $\Rightarrow$ $A(q) \leq \sqrt{2q}$
- DV $A(q) \leq \sqrt{q} - 1$ (actually this is sharp of q is a square)

Proof. $X \to w_1, \ldots, w_{2g}$, $g = g_X$. Set $\alpha_i = \frac{w_i}{\sqrt{q}}$, $|\alpha_i| = 1$ If α_i occurs then $\overline{\alpha}_i = \alpha_i^{-1}$ also occurs. Then

$$N = \sharp X(k) \leq X(k_r) = q^r + 1 - (\sum \alpha_i) q^{r/2}$$

Rewrite:

$$-\sum \alpha_i^r \geq N q^{-r/2} - q^{r/2} - q^{-r/2}$$

$$0 \leq |\alpha_i^n + \alpha_i^{n-1} + \cdots + \alpha_i + 1|^2 = (n+1) + \sum_{j=1}^{M} (n+1-j)(\alpha_i^j + \alpha_i^{-j})$$

So

$$\begin{aligned}
2g(n+1) &\geq -\sum_i \left(\sum_{j=1}^{n} (n+1-j)(\alpha_i^j + \alpha_i^{-j}) \right) \\
&= -\sum_{j=1}^{n} (n+1-j) \left(\sum_i \alpha_i^j + \sum_i \alpha_i^{-j} \right)
\end{aligned}$$

$$\begin{aligned}
g(n+1) &\geq -\sum_{j=1}^{n} (n+1-j)(\sum_i \alpha_i^j) \\
&\geq N \sum_{j=1}^{n} (n+1-j) q^{-j/2} - \sum_{j=1}^{n} (n+1-j)(q^{j/2} + q^{-j/2})
\end{aligned}$$

This gives

$$\frac{N}{g} \leq \left(\sum_{j=1}^{n} \frac{n+1-j}{n+1} q^{-j/2} \right)^{-1} \cdot \left(1 + \frac{1}{g} \sum_{j=1}^{n} \frac{n+1-j}{n+1} (q^{j/2} + q^{-j/2}) \right)$$

Fix n let $g \to \infty$

$$A(q) \leq \left(\sum_{j=1}^{n} \frac{n+1-j}{n+1} q^{-j/2} \right)^{-1}$$

So

$$A(q) \leq lim_{n \to \infty}(\cdots) = \left(\sum_{j=1}^{\infty} q^{-j/2} \right)^{-1} = \sqrt{q} - 1$$

CHAPTER 39

Crystalline Cohomology

39.1. Introduction

This chapter is based on a lecture series given by Johan de Jong held in 2012 at Columbia University. The goals of this chapter are to give a quick introduction to crystalline cohomology. A reference is the book [**Ber74**].

39.2. Divided powers

In this section we collect some results on divided power rings. We will use the convention $0! = 1$ (as empty products should give 1).

Definition 39.2.1. Let A be a ring. Let I be an ideal of A. A collection of maps $\gamma_n : I \to I$, $n > 0$ is called a *divided power structure* on I if for all $n \geq 0$, $m > 0$, $x, y \in I$, and $a \in A$ we have

(1) $\gamma_1(x) = x$, we also set $\gamma_0(x) = 1$,
(2) $\gamma_n(x)\gamma_m(x) = \frac{(n+m)!}{n!m!}\gamma_{n+m}(x)$,
(3) $\gamma_n(ax) = a^n\gamma_n(x)$,
(4) $\gamma_n(x+y) = \sum_{i=0,\ldots,n}\gamma_i(x)\gamma_{n-i}(y)$,
(5) $\gamma_n(\gamma_m(x)) = \frac{(nm)!}{n!(m!)^n}\gamma_{nm}(x)$.

Note that the rational numbers $\frac{(n+m)!}{n!m!}$ and $\frac{(nm)!}{n!(m!)^n}$ occuring in the definition are in fact integers; the first is the number of ways to choose n out of $n+m$ and the second counts the number of ways to divide a group of nm objects into n groups of m. We make some remarks about the definition which show that $\gamma_n(x)$ is a replacement for $x^n/n!$ in I.

Lemma 39.2.2. *Let A be a ring. Let I be an ideal of A.*

(1) *If γ is a divided power structure on I, then $n!\,\gamma_n(x) = x^n$ for $n \geq 1$, $x \in I$.*

Assume A is torsion free as a $\mathbf{Z}$-module.

(2) *A divided power structure on I, if it exists, is unique.*
(3) *If $\gamma_n : I \to I$ are maps then*
$$\gamma \text{ is a divided power structure} \Leftrightarrow n!\,\gamma_n(x) = x^n\ \forall x \in I, n \geq 1.$$
(4) *The ideal I has a divided power structure if and only if there exists a set of generators x_i of I as an ideal such that for all $n \geq 1$ we have $x_i^n \in (n!)I$.*

Proof. Proof of (1). If γ is a divided power structure, then condition (2) implies that $n\gamma_n(x) = \gamma_1(x)\gamma_{n-1}(x)$. Hence by induction and condition (1) we get $n!\,\gamma_n(x) = x^n$.

Assume A is torsion free as a $\mathbf{Z}$-module. Proof of (2). This is clear from (1).

Proof of (3). Assume that $n!\,\gamma_n(x) = x^n$ for all $x \in I$ and $n \geq 1$. Since $A \subset A \otimes_{\mathbf{Z}} \mathbf{Q}$ it suffices to prove (1) -- (5) in case A is a $\mathbf{Q}$-algebra. In this case $\gamma_n(x) = x^n/n!$ and it is straightforward to verify (1) -- (5), for example (4) corresponds to the binomial formula

$$(x + y)^n = \sum \frac{n!}{i!\,(n-i)!} x^i y^{n-i}$$

We encourage the reader to do the verifications to make sure that we have the coefficients correct.

Proof of (4). Assume we have generators x_i of I as an ideal such that $x_i^n \in (n!\,)I$ for all $n \geq 1$. We claim that for all $x \in I$ we have $x^n \in (n!\,)I$. If the claim holds then we can set $\gamma_n(x) = x^n/n!$ which is a divided power structure by (3). To prove the claim we note that it holds for $x = ax_i$. Hence we see that the claim holds for a set of generators of I as an abelian group. By induction on the length of an expression in terms of these, it suffices to prove the claim for $x+y$ if it holds for x and y. This follows immediately from the binomial theorem. □

Example 39.2.3. Let p be a prime number. Let A be a ring such that every integer n not divisible by p is invertible, i.e., A is a $\mathbf{Z}_{(p)}$-algebra. Then $I = pA$ has a canonical divided power structure. Namely, given $x = pa \in A$ we set

$$\gamma_n(x) = \frac{p^n}{n!} a^n$$

The reader verifies immediately that $p^n/n! \in \mathbf{Z}_{(p)}$ so that the definition makes sense. It is a straightforward exercise to verify that conditions (1) -- (5) of Definition 39.2.1 are satisfied. Alternatively, it is clear that the definition works for $A_0 = \mathbf{Z}_{(p)}$ and then the result follows from Lemma 39.4.2.

Lemma 39.2.4. *Let A be a ring. Let I be an ideal of A. Let $\gamma_n : I \to I$, $n \geq 1$ be a sequence of maps. Assume*

(a) *(1), (3), and (4) of Definition 39.2.1 hold for all $x, y \in I$, and*
(b) *properties (2) and (5) hold for x in set of generators of I as an ideal.*

Then γ is a divided power structure on I.

Proof. The numbers (1), (2), (3), (4), (5) in this proof refer to the conditions listed in Definition 39.2.1. Applying (3) we see that if (2) and (5) hold for x then (2) and (5) hold for ax for all $a \in A$. Hence we see (b) implies (2) and (5) hold for a set of generators of I as an abelian group. Hence, by induction of the length of an expression in terms of these it suffices to prove that, given $x, y \in I$ such that (2) and (5) hold for x and y, then (2) and (5) hold for $x + y$.

Proof of (2) for $x + y$. By (4) we have

$$\gamma_n(x + y)\gamma_m(x + y) = \sum\nolimits_{i+j=n,\ k+l=m} \gamma_i(x)\gamma_k(x)\gamma_j(y)\gamma_l(y)$$

Using (2) for x and y this equals

$$\sum \frac{(i+k)!}{i!\,k!} \frac{(j+l)!}{j!\,l!} \gamma_{i+k}(x)\gamma_{j+l}(y)$$

Comparing this with the expansion

$$\gamma_{n+m}(x + y) = \sum \gamma_a(x)\gamma_b(y)$$

we see that we have to prove that given $a + b = n + m$ we have

$$\sum\nolimits_{i+k=a,\ j+l=b,\ i+j=n,\ k+l=m} \frac{(i+k)!}{i!\,k!} \frac{(j+l)!}{j!\,l!} = \frac{(n+m)!}{n!\,m!}.$$

Instead of arguing this directly, we note that the result is true for the ideal $I = (x, y)$ in the polynomial ring $\mathbf{Q}[x, y]$ because $\gamma_n(f) = f^n/n!$, $f \in I$ defines a divided power structure on I. Hence the equality of rational numbers above is true.

Proof of (5) for $x + y$ given that (1) -- (4) hold and that (5) holds for x and y. We will again reduce the proof to an equality of rational numbers. Namely, using (4) we can write $\gamma_n(\gamma_m(x + y)) = \gamma_n(\sum \gamma_i(x)\gamma_j(y))$. Using (4) we can write $\gamma_n(\gamma_m(x + y))$ as a sum of terms which are products of factors of the form $\gamma_k(\gamma_i(x)\gamma_j(y))$. If $i > 0$ then

$$\begin{aligned}\gamma_k(\gamma_i(x)\gamma_j(y)) &= \gamma_j(y)^k\gamma_k(\gamma_i(x)) \\ &= \frac{(ki)!}{k!\,(i!)^k}\gamma_j(y)^k\gamma_{ki}(x) \\ &= \frac{(ki)!}{k!\,(i!)^k}\frac{(kj)!}{k!\,(j!)^k}\gamma_{ik}(x)\gamma_{kj}(y)\end{aligned}$$

using (3) in the first equality, (5) for x in the second, and (2) exactly k times in the third. Using (5) for y we see the same equality holds when $i = 0$. Continuing like this using all axioms but (5) we see that we can write

$$\gamma_n(\gamma_m(x + y)) = \sum\nolimits_{i+j=nm} c_{ij}\gamma_i(x)\gamma_j(y)$$

for certain universal constants $c_{ij} \in \mathbf{Z}$. Again the fact that the equality is valid in the polynomial ring $\mathbf{Q}[x, y]$ implies that the coefficients c_{ij} are all equal to $(nm)!/n!\,(m!)^n$ as desired. □

Lemma 39.2.5. *Let A be a ring with two ideals $I, J \subset A$. Let γ be a divided power structure on I and let δ be a divided power structure on J. Then*

1. *γ and δ agree on IJ,*
2. *if γ and δ agree on $I \cap J$ then they are the restriction of a unique divided power structure ϵ on $I + J$.*

Proof. Let $x \in I$ and $y \in J$. Then

$$\gamma_n(xy) = y^n\gamma_n(x) = n!\,\delta_n(y)\gamma_n(x) = \delta_n(y)x^n = \delta_n(xy).$$

Hence γ and δ agree on a set of (additive) generators of IJ. By property (4) of Definition 39.2.1 it follows that they agree on all of IJ.

Let $z \in I + J$. Write $z = x + y$ with $x \in I$ and $y \in J$. Then we set

$$\epsilon_n(z) = \sum \gamma_i(x)\delta_{n-i}(y)$$

To see that this is well defined, suppose that $z = x' + y'$ is another representation with $x' \in I$ and $y' \in J$. Then $w = x - x' = y' - y \in I \cap J$. Hence

$$\begin{aligned}\sum\nolimits_{i+j=n}\gamma_i(x)\delta_j(y) &= \sum\nolimits_{i+j=n}\gamma_i(x' + w)\delta_j(y) \\ &= \sum\nolimits_{i'+l+j=n}\gamma_{i'}(x')\gamma_l(w)\delta_j(y) \\ &= \sum\nolimits_{i'+l+j=n}\gamma_{i'}(x')\delta_l(w)\delta_j(y) \\ &= \sum\nolimits_{i'+j'=n}\gamma_{i'}(x')\delta_{j'}(y + w) \\ &= \sum\nolimits_{i'+j'=n}\gamma_{i'}(x')\delta_{j'}(y')\end{aligned}$$

as desired. Next, we prove conditions (1) -- (5) of Definition 39.2.1. Properties (1) and (3) are clear. To see (4), suppose that $z = x + y$ and $z' = x' + y'$ with $x, x' \in I$ and $y, y' \in J$ and compute

$$\begin{aligned} \epsilon_n(z + z') &= \sum\nolimits_{a+b=n} \gamma_i(x + x')\delta_j(y + y') \\ &= \sum\nolimits_{i+i'+j+j'=n} \gamma_i(x)\gamma_{i'}(x')\delta_j(y)\delta_{j'}(y') \\ &= \sum\nolimits_{k=0,\ldots,n} \sum\nolimits_{i+j=k} \gamma_i(x)\delta_j(y) \sum\nolimits_{i'+j'=n-k} \gamma_{i'}(x')\delta_{j'}(y') \\ &= \sum\nolimits_{k=0,\ldots,n} \epsilon_k(z)\epsilon_{n-k}(z') \end{aligned}$$

as desired. Now we see that it suffices to prove (2) and (5) for elements of I or J, see Lemma 39.2.4. This is clear because γ and δ are divided power structures. □

Lemma 39.2.6. *Let p be a prime number. Let A be a ring, let $I \subset A$ be an ideal, and let γ be a divided power structure on I. Assume p is nilpotent in A/I. Then I is locally nilpotent if and only if p is nilpotent in A.*

Proof. If $p^N = 0$ in A, then for $x \in I$ we have $x^{pN} = (pN)!\,\gamma_N(x) = 0$ because $(pN)!$ is divisible by p^N. Conversely, assume I is locally nilpotent. We've also assumed that p is nilpotent in A/I, hence $p^r \in I$ for some r, hence p^r nilpotent, hence p nilpotent. □

The following lemma can be found in [**BO83**].

Lemma 39.2.7. *Let p be a prime number. Let A be a ring such that every integer n not divisible by p is invertible, i.e., A is a $\mathbf{Z}_{(p)}$-algebra. Let $I \subset A$ be an ideal. Two divided power structures γ, γ' on I are equal if and only if $\gamma_p = \gamma'_p$. Moreover, given a map $\delta : I \to I$ such that*

1. *$p!\,\delta(x) = x^p$ for all $x \in I$,*
2. *$\delta(ax) = a^p\delta(x)$ for all $a \in A$, $x \in I$, and*
3. *$\delta(x + y) = \delta(x) + \sum_{i+j=p,i,j\geq 1} \frac{1}{i!j!}x^i y^j + \delta(y)$ for all $x, y \in I$,*

then there exists a unique divided power structure γ on I such that $\gamma_p = \delta$.

Proof. If n is not divisible by p, then $\gamma_n(x) = cx\gamma_{n-1}(x)$ where c is a unit in $\mathbf{Z}_{(p)}$. Moreover,

$$\gamma_{pm}(x) = c\gamma_m(\gamma_p(x))$$

where c is a unit in $\mathbf{Z}_{(p)}$. Thus the first assertion is clear. For the second assertion, we can, working backwards, use these equalities to define all γ_n. More precisely, if $n = a_0 + a_1 p + \ldots + a_e p^e$ with $a_i \in \{0, \ldots, p-1\}$ then we set

$$\gamma_n(x) = c_n x^{a_0}\delta(x)^{a_1} \ldots \delta^e(x)^{a_e}$$

for $c_n \in \mathbf{Z}_{(p)}$ defined by

$$c_n = (p!\,)^{a_1+a_2(1+p)+\ldots+a_e(1+\ldots+p^{e-1})}/n!.$$

Now we have to show the axioms (1) -- (5) of a divided power structure, see Definition 39.2.1. We observe that (1) and (3) are immediate. Verification of (2) and (5) is by a direct calculation which we omit. Let $x, y \in I$. We claim there is a ring map

$$\varphi : \mathbf{Z}_{(p)}\langle x, y\rangle \longrightarrow A$$

which maps $x^{[n]}$ to $\gamma_n(x)$ and $y^{[n]}$ to $\gamma_n(y)$. By construction of $\mathbf{Z}_{(p)}\langle x, y\rangle$ this means we have to check that $\gamma_n(x)\gamma_m(x) = \frac{(n+m)!}{n!m!}\gamma_{n+m}(x)$ and similarly for y, which follows as (2) holds for γ. Let ϵ denote the divided power structure on the ideal $\mathbf{Z}_{(p)}\langle x, y\rangle_+$ of $\mathbf{Z}_{(p)}\langle x, y\rangle$.

Next, we claim that $\varphi(\epsilon_n(f)) = \gamma_n(\varphi(f))$ for $f \in \mathbf{Z}_{(p)}\langle x, y\rangle_+$ and all n. This is clear for $n = 0, 1, \ldots, p-1$. For $n = p$ it suffices to prove it for a set of generators of the ideal $\mathbf{Z}_{(p)}\langle x, y\rangle_+$ because both ϵ_p and $\gamma_p = \delta$ satisfy properties (1) and (3) of the lemma. Hence it suffices to prove that $\gamma_p(\gamma_n(x)) = \frac{(pn)!}{p!(n!)^p}\gamma_{pn}(x)$ and similarly for y, which follows as (5) holds for γ. Now, if $n = a_0 + a_1 p + \ldots + a_e p^e$ is an arbitrary integer written in p-adic expansion as above, then

$$\epsilon_n(f) = c_n f^{a_0}\gamma_p(f)^{a_1}\ldots\gamma_p^e(f)^{a_e}$$

because ϵ is a divided power structure. Hence we see that $\varphi(\epsilon_n(f)) = \gamma_n(\varphi(f))$ holds for all n. Applying this for $f = x + y$ we see that axiom (4) for γ follows from the fact that ϵ is a divided power structure. □

39.3. Divided power rings

There is a category of divided power rings. Here is the definition.

Definition 39.3.1. A *divided power ring* is a triple (A, I, γ) where A is a ring, $I \subset A$ is an ideal, and $\gamma = (\gamma_n)_{n\geq 1}$ is a divided power structure on I. A *homomorphism of divided power rings* $\varphi : (A, I, \gamma) \to (B, J, \delta)$ is a ring homomorphism $\varphi : A \to B$ such that $\varphi(I) \subset J$ and such that $\delta_n(\varphi(x)) = \varphi(\gamma_n(x))$ for all $x \in I$.

We sometimes say ``let (B, J, δ) be a divided power algebra over (A, I, γ)" to indicate that (B, J, δ) is a divided power ring which comes equipped with a homomorphism of divided power rings $(A, I, \gamma) \to (B, J, \delta)$.

Lemma 39.3.2. *The category of divided power rings has all limits and they agree with limits in the category of rings.*

Proof. The empty limit is the zero ring (that's weird but we need it). The product of a collection of divided power rings (A_t, I_t, γ_t), $t \in T$ is given by $(\prod A_t, \prod I_t, \gamma)$ where $\gamma_n((x_t)) = (\gamma_{t,n}(x_t))$. The equalizer of $\alpha, \beta : (A, I, \gamma) \to (B, J, \delta)$ is just $C = \{a \in A \mid \alpha(a) = \beta(a)\}$ with ideal $C \cap I$ and induced divided powers. It follows that all limits exist, see Categories, Lemma 4.13.10. □

The following lemma illustrates a very general category theoretic phenomenon in the case of divided power algebras.

Lemma 39.3.3. *Let $\mathcal{C}$ be the category of divided power rings. Let $F : \mathcal{C} \to Sets$ be a functor. Assume that*

1. *there exists a cardinal κ such that for every $f \in F(A, I, \gamma)$ there exists a morphism $(A', I', \gamma') \to (A, I, \gamma)$ of $\mathcal{C}$ such that f is the image of $f' \in F(A', I', \gamma')$ and $|A'| \leq \kappa$, and*
2. *F commutes with limits.*

Then F is representable, i.e., there exists an object (B, J, δ) of $\mathcal{C}$ such that

$$F(A, I, \gamma) = Hom_{\mathcal{C}}((B, J, \delta), (A, I, \gamma))$$

functorially in (A, I, γ).

Proof. Consider a set of objects $\mathcal{U}$ of $\mathcal{C}$ containing an object isomorphic to every (A, I, γ) with $|A| \leq \kappa$. Let $\mathcal{I}$ be the category of pairs (U, f) where $U \in \mathcal{U}$ and $f \in F(U)$. A morphism $(U, f) \to (U', f')$ of $\mathcal{I}$ is a map $u : U \to U'$ of $\mathcal{C}$ such that $F(u)(f) = f'$. Set

$$(B, J, \delta) = lim_{(U,f)\in\mathcal{I}} U.$$

The limit exists by Lemma 39.3.2. As F commutes with limits we have

$$F(B, J, \delta) = lim_{(U,f)\in\mathcal{I}} F(U).$$

Hence there is a universal element $\xi \in F(B, J, \delta)$ which for $U \in \mathcal{U}$ maps to $f \in F(U)$ under F applied to the projection map $(B, J, \delta) \to U$ of the limit corresponding to f. Using ξ we obtain a transformation of functors

$$\xi : \mathrm{Hom}_{\mathcal{C}}((B, J, \delta), -) \longrightarrow F(-)$$

see Categories, Section 4.3. Let (A, I, γ) be an arbitrary object of $\mathcal{C}$ and let $f \in F(A, I, \gamma)$. Choose $U \to (A, I, \gamma)$ with $U \in \mathcal{U}$ and $f' \in F(U)$ mapping to f which is possible by assumption (1). Then F applied to the maps

$$(B, J, \delta) \longrightarrow U \longrightarrow (A, I, \gamma)$$

(the first being the projection map of the limit defining B) sends ξ to f. Hence the transformation ξ is surjective. Finally, suppose that $a, b : (B, J, \delta) \to (A, I, \gamma)$ are two maps such that $F(a)(\xi) = F(b)(\xi)$. Since F commutes with limits, it commutes with equalizers. This means that ξ comes from an element $\xi' \in F(B', J', \delta')$ where $B' \subset B$ is the equalizer of a and b.

At this point there are two ways to finish the proof. The first is to show that $B' = B$ using compatibility of F with equalizers and the construction of B as a limit over $\mathcal{I}$ above; we omit the details. The second is to replace B by the smallest divided power subring $(B', J', \delta') \subset (B, J, \delta)$ such that ξ comes from an element $\xi' \in F(B', J', \delta')$. Since F commutes with limits F commutes with intersections hence a smallest divided power subring exists. It is clear that the transformation defined by ξ' is still surjective, and the argument above shows that it is also injective. □

Lemma 39.3.4. *The category of divided power rings has all colimits.*

Proof. The empty colimit is $\mathbf{Z}$ with divided power ideal (0). Let's discuss general colimits. Let $\mathcal{C}$ be a category and let $c \mapsto (A_c, I_c, \gamma_c)$ be a diagram. Consider the functor

$$F(B, J, \delta) = lim_{c\in\mathcal{C}} Hom((A_c, I_c, \gamma_c), (B, J, \delta))$$

Note that any $f = (f_c)_{c\in C} \in F(B, J, \delta)$ has the property that all the images $f_c(A_c)$ generate a subring B' of B of bounded cardinality κ and that all the images $f_c(I_c)$ generate a divided power sub ideal J' of B'. And we get a factorization of f as a f' in $F(B')$ followed by the inclusion $B' \to B$. Also, F commutes with limits. Hence we may apply Lemma 39.3.3 to see that F is representable and we win. □

Remark 39.3.5. The forgetful functor $(A, I, \gamma) \mapsto A$ does not commute with colimits. For example, let

$$\begin{tikzcd} (B, J, \delta) \arrow[r] & (B'', J'', \delta'') \\ (A, I, \gamma) \arrow[r] \arrow[u] & (B', J', \delta') \arrow[u] \end{tikzcd}$$

be a push out in the category of divided power rings. Then in general the map $B \otimes_A B' \to B''$ isn't an isomorphism. (It is always surjective.) An explicit example is given by $(A, I, \gamma) = (\mathbf{Z}, (0), \emptyset)$, $(B, J, \delta) = (\mathbf{Z}/4\mathbf{Z}, 2\mathbf{Z}/4\mathbf{Z}, \delta)$, and $(B', J', \delta') = (\mathbf{Z}/4\mathbf{Z}, 2\mathbf{Z}/4\mathbf{Z}, \delta')$ where $\delta_2(2) = 2$ and $\delta_2'(2) = 0$ and all higher divided powers equal to zero. Then $(B'', J'', \delta'') =$

$(\mathbf{F}_2, (0), \emptyset)$ which doesn't agree with the tensor product. However, note that it is always true that

$$B''/J'' = B/J \otimes_{A/I} B'/J'$$

as can be seen from the universal property of the push out by considering maps into divided power algebras of the form $(C, (0), \emptyset)$.

39.4. Extending divided powers

Here is the definition.

Definition 39.4.1. Given a divided power ring (A, I, γ) and a ring map $A \to B$ we say γ *extends* to B if there exists a divided power structure $\bar{\gamma}$ on IB such that $(A, I, \gamma) \to (B, IB, \bar{\gamma})$ is a homomorphism of divided power rings.

Lemma 39.4.2. *Let (A, I, γ) be a divided power ring. Let $A \to B$ be a ring map. If γ extends to B then it extends uniquely. Assume (at least) one of the following conditions holds*

(1) *$IB = 0$,*
(2) *I is principal, or*
(3) *$A \to B$ is flat.*

Then γ extends to B.

Proof. Any element of IB can be written as a finite sum $\sum b_i x_i$ with $b_i \in B$ and $x_i \in I$. If γ extends to $\bar{\gamma}$ on IB then $\bar{\gamma}_n(x_i) = \gamma_n(x_i)$. Thus conditions (3) and (4) imply that

$$\bar{\gamma}_n(\sum b_i x_i) = \sum\nolimits_{n_1+\ldots+n_t=n} \prod\nolimits_{i=1}^{t} b_i^{n_i} \gamma_{n_i}(x_i)$$

Thus we see that $\bar{\gamma}$ is unique if it exists.

If $IB = 0$ then setting $\bar{\gamma}_n(0) = 0$ works. If $I = (x)$ then we define $\bar{\gamma}_n(bx) = b^n \gamma_n(x)$. This is well defined: if $b'x = bx$, i.e., $(b - b')x = 0$ then

$$\begin{aligned} b^n\gamma_n(x) - (b')^n\gamma_n(x) &= (b^n - (b')^n)\gamma_n(x) \\ &= (b^{n-1} + \ldots + (b')^{n-1})(b - b')\gamma_n(x) = 0 \end{aligned}$$

because $\gamma_n(x)$ is divisible by x and hence annihilated by $b - b'$. Next, we prove conditions (1) -- (5) of Definition 39.2.1. Parts (1), (2), (3), (5) are obvious from the construction. For (4) suppose that $y, z \in IB$, say $y = bx$ and $z = cx$. Then $y + z = (b + c)x$ hence

$$\begin{aligned} \bar{\gamma}_n(y + z) &= (b + c)^n\gamma_n(x) \\ &= \sum \frac{n!}{i!\,(n-i)!} b^i c^{n-i}\gamma_n(x) \\ &= \sum b^i c^{n-i}\gamma_i(x)\gamma_{n-i}(x) \\ &= \sum \bar{\gamma}_i(y)\bar{\gamma}_{n-i}(z) \end{aligned}$$

as desired.

Assume $A \to B$ is flat. Suppose that $b_1, \ldots, b_r \in B$ and $x_1, \ldots, x_r \in I$. Then

$$\bar{\gamma}_n(\sum b_i x_i) = \sum b_1^{e_1} \ldots b_r^{e_r} \gamma_{e_1}(x_1) \ldots \gamma_{e_r}(x_r)$$

where the sum is over $e_1 + \ldots + e_r = n$ if $\bar{\gamma}_n$ exists. Next suppose that we have $c_1, \ldots, c_s \in B$ and $a_{ij} \in A$ such that $b_i = \sum a_{ij} c_j$. Setting $y_j = \sum a_{ij} x_i$ we claim that

$$\sum b_1^{e_1} \ldots b_r^{e_r} \gamma_{e_1}(x_1) \ldots \gamma_{e_r}(x_r) = \sum c_1^{d_1} \ldots c_s^{d_s} \gamma_{d_1}(y_1) \ldots \gamma_{d_s}(y_s)$$

in B where on the right hand side we are summing over $d_1 + \ldots + d_s = n$. Namely, using the axioms of a divided power structure we can expand both sides into a sum with coefficients in $\mathbf{Z}[a_{ij}]$ of terms of the form $c_1^{d_1} \ldots c_s^{d_s} \gamma_{e_1}(x_1) \ldots \gamma_{e_r}(x_r)$. To see that the coefficients agree we note that the result is true in $\mathbf{Q}[x_1, \ldots, x_r, c_1, \ldots, c_s, a_{ij}]$ with γ the unique divided power structure on $(x_1, \ldots, x_r)$. By Lazard's theorem (Algebra, Theorem 7.75.4) we can write B as a directed colimit of finite free A-modules. In particular, if $z \in IB$ is written as $z = \sum x_i b_i$ and $z = \sum x'_{i'} b'_{i'}$, then we can find $c_1, \ldots, c_s \in B$ and $a_{ij}, a'_{i'j} \in A$ such that $b_i = \sum a_{ij} c_j$ and $b'_{i'} = \sum a'_{i'j} c_j$ such that $y_j = \sum x_i a_{ij} = \sum x'_{i'} a'_{i'j}$. Hence the procedure above gives a well defined map $\bar{\gamma}_n$ on IB. By construction $\bar{\gamma}$ satisfies conditions (1), (3), and (4). Moreover, for $x \in I$ we have $\bar{\gamma}_n(x) = \gamma_n(x)$. Hence it follows from Lemma 39.2.4 that $\bar{\gamma}$ is a divided power structure on IB. □

Lemma 39.4.3. *Let (A, I, γ) be a divided power ring.*

(1) *If $\varphi : (A, I, \gamma) \to (B, J, \delta)$ is a homomorphism of divided power rings, then $Ker(\varphi) \cap I$ is preserved by γ_n for all $n \geq 1$.*
(2) *Let $\mathfrak{a} \subset A$ be an ideal and set $I' = I \cap \mathfrak{a}$. The following are equivalent*
    (a) *I' is preserved by γ_n for all $n > 0$,*
    (b) *γ extends to $A/\mathfrak{a}$, and*
    (c) *there exist a set of generators x_i of I' as an ideal such that $\gamma_n(x_i) \in I'$ for all $n > 0$.*

Proof. Proof of (1). This is clear. Assume (2)(a). Define $\bar{\gamma}_n(x \bmod I') = \gamma_n(x) \bmod I'$ for $x \in I$. This is well defined since $\gamma_n(x + y) = \gamma_n(x) \bmod I'$ for $y \in I'$ by Definition 39.2.1 (4) and the fact that $\gamma_j(y) \in I'$ by assumption. It is clear that $\bar{\gamma}$ is a divided power structure as γ is one. Hence (2)(b) holds. Also, (2)(b) implies (2)(a) by part (1). It is clear that (2)(a) implies (2)(c). Assume (2)(c). Note that $\gamma_n(x) = a^n \gamma_n(x_i) \in I'$ for $x = ax_i$. Hence we see that $\gamma_n(x) \in I'$ for a set of generators of I' as an abelian group. By induction on the length of an expression in terms of these, it suffices to prove $\forall n : \gamma_n(x + y) \in I'$ if $\forall n : \gamma_n(x), \gamma_n(y) \in I'$. This follows immediately from the fourth axiom of a divided power structure. □

Lemma 39.4.4. *Let (A, I, γ) be a divided power ring. Let $E \subset I$ be a subset. Then the smallest ideal $J \subset I$ preserved by γ and containing all $f \in E$ is the ideal J generated by $\gamma_n(f)$, $n \geq 1$, $f \in E$.*

Proof. Follows immediately from Lemma 39.4.3. □

Lemma 39.4.5. *Let (A, I, γ) be a divided power ring. Let p be a prime. If p is nilpotent in A/I, then*

(1) *the p-adic completion $A^\wedge = lim_e A/p^e A$ surjects onto A/I,*
(2) *the kernel of this map is the p-adic completion $I^\wedge$ of I, and*
(3) *each γ_n is continuous for the p-adic topology and extends to $\gamma_n^\wedge : I^\wedge \to I^\wedge$ defining a divided power structure on $I^\wedge$.*

If moreover A is a $\mathbf{Z}_{(p)}$-algebra, then

(4) *for e large enough the ideal $p^e A \subset I$ is preserved by the divided power structure γ and*
$$(A^\wedge, I^\wedge, \gamma^\wedge) = lim_e(A/p^e A, I/p^e A, \bar{\gamma})$$
in the category of divided power rings.

Proof. Let $t \geq 1$ be an integer such that $p^t A/I = 0$, i.e., $p^t A \subset I$. The map $A^\wedge \to A/I$ is the composition $A^\wedge \to A/p^t A \to A/I$ which is surjective (for example by Algebra, Lemma 7.90.1). As $p^e I \subset p^e A \cap I \subset p^{e-t} I$ for $e \geq t$ we see that the kernel of the composition $A^\wedge \to A/I$ is the p-adic completion of I. The map γ_n is continuous because

$$\gamma_n(x + p^e y) = \sum\nolimits_{i+j=n} p^{je}\gamma_i(x)\gamma_j(y) = \gamma_n(x) \bmod p^e I$$

by the axioms of a divided power structure. It is clear that the axioms for divided power structures are inherited by the maps $\gamma_n^\wedge$ from the maps γ_n. Finally, to see the last statement say $e > t$. Then $p^e A \subset I$ and $\gamma_1(p^e A) \subset p^e A$ and for $n > 1$ we have

$$\gamma_n(p^e a) = p^n \gamma_n(p^{e-1} a) = \frac{p^n}{n!} p^{n(e-1)} a^n \in p^e A$$

as $p^n/n! \in \mathbf{Z}_{(p)}$ and as $n \geq 2$ and $e \geq 2$ so $n(e-1) \geq e$. This proves that γ extends to $A/p^e A$, see Lemma 39.4.3. The statement on limits is clear from the construction of limits in the proof of Lemma 39.3.2. □

39.5. Divided power polynomial algebras

A very useful example is the *divided power polynomial algebra*. Let A be a ring. Let $t \geq 1$. We will denote $A\langle x_1, \ldots, x_t\rangle$ the following A-algebra: As an A-module we set

$$A\langle x_1, \ldots, x_t\rangle = \bigoplus\nolimits_{n_1, \ldots, n_t \geq 0} A x_1^{[n_1]} \ldots x_t^{[n_t]}$$

with multiplication given by

$$x_i^{[n]} x_i^{[m]} = \frac{(n+m)!}{n!\, m!} x_i^{[n+m]}.$$

We also set $x_i = x_i^{[1]}$. Note that $1 = x_1^{[0]} \ldots x_t^{[0]}$. There is a similar construction which gives the divided power polynomial algebra in infinitely many variables. There is an canonical A-algebra map $A\langle x_1, \ldots, x_t\rangle \to A$ sending $x_i^{[n]}$ to zero for $n > 0$. The kernel of this map is denoted $A\langle x_1, \ldots, x_t\rangle_+$.

Lemma 39.5.1. *Let (A, I, γ) be a divided power ring. There exists a unique divided power structure δ on*

$$J = IA\langle x_1, \ldots, x_t\rangle + A\langle x_1, \ldots, x_t\rangle_+$$

such that

(1) *$\delta_n(x_i) = x_i^{[n]}$, and*
(2) *$(A, I, \gamma) \to (A\langle x_1, \ldots, x_t\rangle, J, \delta)$ is a homomorphism of divided power rings.*

Moreover, $(A\langle x_1, \ldots, x_t\rangle, J, \delta)$ has the following universal property: A homomorphism of divided power rings $\varphi : (A\langle x\rangle, J, \delta) \to (C, K, \epsilon)$ is the same thing as a homomorphism of divided power rings $A \to C$ and elements $k_1, \ldots, k_t \in K$.

Proof. We will prove the lemma in case of a divided power polynomial algebra in one variable. The result for the general case can be argued in exactly the same way, or by noting that $A\langle x_1, \ldots, x_t\rangle$ is isomorphic to the ring obtained by adjoining the divided power variables $x_1, \ldots, x_t$ one by one.

Let $A\langle x\rangle_+$ be the ideal generated by $x, x^{[2]}, x^{[3]}, \ldots$. Note that $J = IA\langle x\rangle + A\langle x\rangle_+$ and that

$$IA\langle x\rangle \cap A\langle x\rangle_+ = IA\langle x\rangle \cdot A\langle x\rangle_+$$

Hence by Lemma 39.2.5 it suffices to show that there exist divided power structures on the ideals $IA\langle x\rangle$ and $A\langle x\rangle_+$. The existence of the first follows from Lemma 39.4.2 as

$A \to A\langle x\rangle$ is flat. For the second, note that if A is torsion free, then we can apply Lemma 39.2.2 (4) to see that δ exists. Namely, choosing as generators the elements $x^{[m]}$ we see that $(x^{[m]})^n = \frac{(nm)!}{(m!)^n} x^{[nm]}$ and $n!$ divides the integer $\frac{(nm)!}{(m!)^n}$. In general write $A = R/\mathfrak{a}$ for some torsion free ring R (e.g., a polynomial ring over $\mathbf{Z}$). The kernel of $R\langle x\rangle \to A\langle x\rangle$ is $\bigoplus \mathfrak{a} x^{[m]}$. Applying criterion (2)(c) of Lemma 39.4.3 we see that the divided power structure on $R\langle x\rangle_+$ extends to $A\langle x\rangle$ as desired.

Proof of the universal property. Given a homomorphism $\varphi : A \to C$ of divided power rings and $k_1, \ldots, k_t \in K$ we consider

$$A\langle x_1, \ldots, x_t\rangle \to C, \quad x_1^{[n_1]} \ldots x_t^{[n_t]} \longmapsto \epsilon_{n_1}(k_1) \ldots \epsilon_{n_t}(k_t)$$

using φ on coefficients. The only thing to check is that this is an A-algebra homomorphism (details omitted). The inverse construction is clear. $\square$

Remark 39.5.2. Let (A, I, γ) be a divided power ring. There is a variant of Lemma 39.5.1 for infinitely many variables. First note that if $s < t$ then there is a canonical map

$$A\langle x_1, \ldots, x_s\rangle \to A\langle x_1, \ldots, x_t\rangle$$

Hence if W is any set, then we set

$$A\langle x_w, w \in W\rangle = colim_{E \subset W} A\langle x_e, e \in E\rangle$$

(colimit over E finite subset of W) with transition maps as above. By the definition of a colimit we see that the universal mapping property of $A\langle x_w, w \in W\rangle$ is completely analogous to the mapping property stated in Lemma 39.5.1.

39.6. Divided power envelope

The construction of the following lemma will be dubbed the divided power envelope. It will play an important role later.

Lemma 39.6.1. *Let (A, I, γ) be a divided power ring. Let $A \to B$ be a ring map. Let $J \subset B$ be an ideal with $IB \subset J$. There exists a homomorphism of divided power rings*

$$(A, I, \gamma) \longrightarrow (D, \bar{J}, \bar{\gamma})$$

such that

$$Hom_{(A,I,\gamma)}((D, \bar{J}, \bar{\gamma}), (C, K, \delta)) = Hom_A((B, J), (C, K))$$

functorially in the divided power algebra (C, K, δ) over (A, I, γ).

Proof. Denote $\mathcal{C}$ the category of divided power rings (C, K, δ). Consider the functor $F : \mathcal{C} \longrightarrow Sets$ defined by

$$F(C, K, \delta) = \left\{ (\varphi, \psi) \middle| \begin{array}{l} \varphi : (A, I, \gamma) \to (C, K, \delta) \text{ homomorphism of divided power rings} \\ \psi : (B, J) \to (C, K) \text{ an } A\text{-algebra homomorphism with } \psi(J) \subset K \end{array} \right\}$$

We will show that Lemma 39.3.3 applies to this functor which will prove the lemma. Suppose that $(\varphi, \psi) \in F(C, K, \delta)$. Let $C' \subset C$ be the subring generated by $\varphi(A)$, $\psi(B)$, and $\delta_n(\psi(f))$ for all $f \in J$. Let $K' \subset K \cap C'$ be the ideal of C' generated by $\varphi(I)$ and $\delta_n(\psi(f))$ for $f \in J$. Then $(C', K', \delta|_{K'})$ is a divided power ring and C' has cardinality bounded by the cardinal $\kappa = |A| \otimes |B|^{\aleph_0}$. Moreover, φ factors as $A \to C' \to C$ and ψ factors as $B \to B' \to B$. This proves assumption (1) of Lemma 39.3.3 holds. Assumption (2) is clear as limits in the category of divided power rings commute with the forgetful functor $(C, K, \delta) \mapsto (C, K)$, see Lemma 39.3.2 and its proof. $\square$

Definition 39.6.2. Let (A, I, γ) be a divided power ring. Let $A \to B$ be a ring map. Let $J \subset B$ be an ideal with $IB \subset J$. The divided power algebra $(D, \bar{J}, \bar{\gamma})$ constructed in Lemma 39.6.1 is called the *divided power envelope of J in B relative to* (A, I, γ) and is denoted $D_B(J)$ or $D_{B,\gamma}(J)$.

Let $(A, I, \gamma) \to (C, K, \delta)$ be a homomorphism of divided power rings. The universal property of $D_{B,\gamma}(J) = (D, \bar{J}, \bar{\gamma})$ is

$$\begin{matrix}\text{ring maps } B \to C \\ \text{which map } J \text{ into } K\end{matrix} \longleftrightarrow \begin{matrix}\text{divided power homomorphisms} \\ (D, \bar{J}, \bar{\gamma}) \to (C, K, \delta)\end{matrix}$$

and the correspondence is given by precomposing with the map $B \to D$ which corresponds to id_D. Here are some properties of $(D, \bar{J}, \bar{\gamma})$ which follow directly from the universal property. There are A-algebra maps

$$B \longrightarrow D \longrightarrow B/J \tag{39.6.2.1}$$

The first arrow maps J into $\bar{J}$ and $\bar{J}$ is the kernel of the second arrow. The elements $\bar{\gamma}_n(x)$ where $n > 0$ and x is an element in the image of $J \to D$ generate $\bar{J}$ as an ideal in D and generate D as a B-algebra.

Lemma 39.6.3. *Let (A, I, γ) be a divided power ring. Let $\varphi : B' \to B$ be a surjection of A-algebras with kernel K. Let $IB \subset J \subset B$ be an ideal. Let $J' \subset B'$ be the inverse image of J. Write $D_{B',\gamma}(J') = (D', \bar{J}', \bar{\gamma})$. Then $D_{B,\gamma}(J) = (D'/K', \bar{J}'/K', \bar{\gamma})$ where K' is the ideal generated by the elements $\bar{\gamma}_n(k)$ for $n \geq 1$ and $k \in K$.*

Proof. Write $D_{B,\gamma}(J) = (D, \bar{J}, \bar{\gamma})$. The universal property of D' gives us a homomorphism $D' \to D$ of divided power algebras. As $B' \to B$ and $J' \to J$ are surjective, we see that $D' \to D$ is surjective (see remarks above). It is clear that $\bar{\gamma}_n(k)$ is in the kernel for $n \geq 1$ and $k \in K$, i.e., we obtain a homomorphism $D'/K' \to D$. Conversely, there exists a divided power structure on $\bar{J}'/K' \subset D'/K'$, see Lemma 39.4.3. Hence the universal property of D gives an inverse $D \to D'/K'$ and we win. $\square$

In the situation of Definition 39.6.2 we can choose a surjection $P \to B$ where P is a polynomial algebra over A and let $J' \subset P$ be the inverse image of J. The previous lemma describes $D_{B,\gamma}(J)$ in terms of $D_{P,\gamma}(J')$. Note that γ extends to a divided power structure γ' on IP by Lemma 39.4.2. Hence $D_{P,\gamma}(J') = D_{P,\gamma'}(J')$ is an example of a special case of divided power envelopes we describe in the following lemma.

Lemma 39.6.4. *Let (B, I, γ) be a divided power algebra. Let $I \subset J \subset B$ be an ideal. Let $(D, \bar{J}, \bar{\gamma})$ be the divided power envelope of J relative to γ. Choose elements $f_t \in J$, $t \in T$ such that $J = I + (f_t)$. Then there exists a surjection*

$$\Psi : B\langle x_t \rangle \longrightarrow D$$

of divided power rings mapping x_t to the image of f_t in D. The kernel of Ψ is generated by the elements $x_t - f_t$ and all

$$\delta_n\left(\sum r_t x_t - r_0\right)$$

whenever $\sum r_t f_t = r_0$ in B for some $r_t \in B$, $r_0 \in I$.

Proof. In the statement of the lemma we think of $B\langle x_t \rangle$ as a divided power ring with ideal $J' = IB\langle x_t \rangle + B\langle x_t \rangle_+$, see Remark 39.5.2. The existence of Ψ follows from the universal property of divided power polynomial rings. Surjectivity of Ψ follows from the fact that its image is a divided power subring of D, hence equal to D by the universal property of D. It is clear that $x_t - f_t$ is in the kernel. Set

$$\mathcal{R} = \{(r_0, r_t) \in I \oplus \bigoplus\nolimits_{t \in T} B \mid \sum r_t f_t = r_0 \text{ in } B\}$$

If $(r_0, r_t) \in \mathcal{R}$ then it is clear that $\sum r_t x_t - r_0$ is in the kernel. As Ψ is a homomorphism of divided power rings and $\sum r_t x_t = r_0 \in J'$ it follows that $\delta_n(\sum r_t x_t - r_0)$ is in the kernel as well. Let $K \subset B\langle x_t \rangle$ be the ideal generated by $x_t - f_t$ and the elements $\delta_n(\sum r_t x_t - r_0)$ for $(r_0, r_t) \in \mathcal{R}$. To show that $K = \text{Ker}(\Psi)$ it suffices to show that δ extends to $B\langle x_t \rangle / K$. Namely, if so the universal property of D gives a map $D \to B\langle x_t \rangle / K$ inverse to Ψ. Hence we have to show that $K \cap J'$ is preserved by δ_n, see Lemma 39.4.3. Let $K' \subset B\langle x_t \rangle$ be the ideal generated by the elements

(1) $\delta_m(\sum r_t x_t - r_0)$ where $m > 0$ and $(r_0, r_t) \in \mathcal{R}$,
(2) $x_{t'}^{[m]}(x_t - f_t)$ where $m > 0$ and $t', t \in I$.

We claim that $K' = K \cap J'$. The claim proves that $K \cap J'$ is preserved by δ_n, $n > 0$ by the criterion of Lemma 39.4.3 (2)(c) and a computation of δ_n of the elements listed which we leave to the reader. To prove the claim note that $K' \subset K \cap J'$. Conversely, if $h \in K \cap J'$ then, modulo K' we can write

$$h = \sum r_t(x_t - f_t)$$

for some $r_t \in B$. As $h \in K \cap J' \subset J'$ we see that $r_0 = \sum r_t f_t \in I$. Hence $(r_0, r_t) \in \mathcal{R}$ and we see that

$$h = \sum r_t x_t - r_0$$

is in K' as desired. □

Lemma 39.6.5. *Let (A, I, γ) be a divided power ring. Let B be an A-algebra and $IB \subset J \subset B$ an ideal. Let x_i be a set of variables. Then*

$$D_{B[x_i],\gamma}(JB[x_i] + (x_i)) = D_{B,\gamma}(J)\langle x_i \rangle$$

Proof. One possible proof is to deduce this from Lemma 39.6.4 as any relation between x_i in $B[x_i]$ is trivial. On the other hand, the lemma follows from the universal property of the divided power polynomial algebra and the universal property of divided power envelopes. □

Conditions (1) and (2) of the following lemma hold if $B \to B'$ is flat at all primes of $V(IB') \subset Spec(B')$ and is very closely related to that condition, see Algebra, Lemma 7.91.8. It in particular says that taking the divided power envelope commutes with localization.

Lemma 39.6.6. *Let (A, I, γ) be a divided power ring. Let $B \to B'$ be a homomorphism of A-algebras. Assume that*

(1) *$B/IB \to B'/IB'$ is flat, and*
(2) *$Tor_1^B(B', B/IB) = 0$.*

Then for any ideal $IB \subset J \subset B$ the canonical map

$$D_B(J) \otimes_B B' \longrightarrow D_{B'}(JB')$$

is an isomorphism.

Proof. Set $D = D_B(J)$ and denote $\bar{J} \subset D$ its divided power ideal with divided power structure $\bar{\gamma}$. The universal property of D produces a B-algebra map $D \to D_{B'}(JB')$, whence a map as in the lemma. It suffices to show that the divided powers $\bar{\gamma}$ extend to $D \otimes_B B'$ since then the universal property of $D_{B'}(JB')$ will produce a map $D_{B'}(JB') \to D \otimes_B B'$ inverse to the one in the lemma.

Choose a surjection $P \to B'$ where P is a polynomial algebra over B. In particular $B \to P$ is flat, hence $D \to D \otimes_B P$ is flat by Algebra, Lemma 7.35.6. Then $\bar{\gamma}$ extends to $D \otimes_B P$ by Lemma 39.4.2; we will denote this extension $\bar{\gamma}$ also. Set $\mathfrak{a} = \mathrm{Ker}(P \to B')$ so that we have the short exact sequence

$$0 \to \mathfrak{a} \to P \to B' \to 0$$

Thus $\mathrm{Tor}_1^B(B', B/IB) = 0$ implies that $\mathfrak{a} \cap IP = I\mathfrak{a}$. Now we have the following commutative diagram

$$\begin{tikzcd}
B/J \otimes_B \mathfrak{a} \arrow[r, "\beta"'] & B/J \otimes_B P \arrow[r] & B/J \otimes_B B' \\
D \otimes_B \mathfrak{a} \arrow[r, "\alpha"] \arrow[u] & D \otimes_B P \arrow[r] \arrow[u] & D \otimes_B B' \arrow[u] \\
\bar{J} \otimes_B \mathfrak{a} \arrow[r] \arrow[u] & \bar{J} \otimes_B P \arrow[r] \arrow[u] & \bar{J} \otimes_B B' \arrow[u]
\end{tikzcd}$$

This diagram is exact even with 0's added at the top and the right. We have to show the divided powers on the ideal $\bar{J} \otimes_B P$ preserve the ideal $\mathrm{Im}(\alpha) \cap \bar{J} \otimes_B P$, see Lemma 39.4.3. Consider the exact sequence

$$0 \to \mathfrak{a}/I\mathfrak{a} \to P/IP \to B'/IB' \to 0$$

(which uses that $\mathfrak{a} \cap IP = I\mathfrak{a}$ as seen above). As B'/IB' is flat over B/IB this sequence remains exact after applying $B/J \otimes_{B/IB} -$, see Algebra, Lemma 7.35.11. Hence

$$\mathrm{Ker}(B/J \otimes_{B/IB} \mathfrak{a}/I\mathfrak{a} \to B/J \otimes_{B/IB} P/IP) = \mathrm{Ker}(\mathfrak{a}/J\mathfrak{a} \to P/JP)$$

is zero. Thus β is injective. It follows that $\mathrm{Im}(\alpha) \cap \bar{J} \otimes_B P$ is the image of $\bar{J} \otimes \mathfrak{a}$. Now if $f \in \bar{J}$ and $a \in \mathfrak{a}$, then $\bar{\gamma}_n(f \otimes a) = \bar{\gamma}_n(f) \otimes a^n$ hence the result is clear. □

The following lemma is a special case of [**dJ95**, Proposition 2.1.7] which in turn is a generalization of [**Ber74**, Proposition 2.8.2].

Lemma 39.6.7. *Let $(B, I, \gamma) \to (B', I', \gamma')$ be a homomorphism of divided power rings. Let $I \subset J \subset B$ and $I' \subset J' \subset B'$ be ideals. Assume*

(1) *$B/I \to B'/I'$ is flat, and*
(2) *$J' = JB' + I'$.*

Then the canonical map

$$D_{B,\gamma}(J) \otimes_B B' \longrightarrow D_{B',\gamma'}(J')$$

is an isomorphism.

Proof. Set $D = D_B(J)$ and denote $\bar{J} \subset D$ its divided power ideal with divided power structure $\bar{\gamma}$. The universal property of D produces a homomorphism of divided power rings $D \to D_{B'}(J')$, whence a map as in the lemma. It suffices to show that there exist divided powers on the image of $D \otimes_B I' + \bar{J} \otimes_B B' \to D \otimes_B B'$ compatible with $\bar{\gamma}$ and γ' since then the universal property of $D_{B'}(J')$ will produce a map $D_{B'}(J') \to D \otimes_B B'$ inverse to the one in the lemma.

Choose elements $f_t \in J$ which generate J/I. Set $\mathcal{R} = \{(r_0, r_t) \in I \oplus \bigoplus_{t\in T} B \mid \sum r_t f_t = r_0 \text{ in } B\}$ as in the proof of Lemma 39.6.4. This lemma shows that

$$D = B\langle x_t \rangle / K$$

where K is generated by the elements $x_t - f_t$ and $\delta_n(\sum r_t x_t - r_0)$ for $(r_0, r_t) \in \mathcal{R}$. Thus we see that

$$D \otimes_B B' = B'\langle x_t \rangle / K' \tag{39.6.7.1}$$

where K' is generated by the images in $B'\langle x_t \rangle$ of the generators of K listed above. Let $f'_t \in B'$ be the image of f_t. By assumption (1) we see that the elements $f'_t \in J'$ generate J'/I' and we see that $x_t - f'_t \in K'$. Set

$$\mathcal{R}' = \{(r'_0, r'_t) \in I' \oplus \bigoplus\nolimits_{t\in T} B' \mid \sum r'_t f'_t = r'_0 \text{ in } B'\}$$

To finish the proof we have to show that $\delta'_n(\sum r'_t x_t - r'_0) \in K'$ for $(r'_0, r'_t) \in \mathcal{R}'$, because then the presentation (39.6.7.1) of $D \otimes_B B'$ is identical to the presentation of $D_{B',\gamma'}(J')$ obtain in Lemma 39.6.4 from the generators f'_t. Suppose that $(r'_0, r'_t) \in \mathcal{R}'$. Then $\sum r'_t f'_t = 0$ in B'/I'. As $B/I \to B'/I'$ is flat by assumption (1) we can apply the equational criterion of flatness (Algebra, Lemma 7.35.10) to see that there exist an $m > 0$ and $r_{jt} \in B$ and $c_j \in B'$, $j = 1, \ldots, m$ such that

$$r_{j0} = \sum r_{jt} f_t \in I \text{ for } j = 1, \ldots, m, \quad \text{and} \quad r'_t = \sum c_j r_{jt}.$$

Note that this also implies that $r'_0 = \sum c_j r_{j0}$. Then we have

$$\begin{aligned} \delta'_n(\sum r'_t x_t - r'_0) &= \delta'_n(\sum c_j(\sum r_{jt} x_t - r_{j0})) \\ &= \sum c_1^{n_1} \ldots c_m^{n_m} \delta_{n_1}(\sum r_{1t} x_t - r_{10}) \ldots \delta_{n_m}(\sum r_{mt} x_t - r_{m0}) \end{aligned}$$

where the sum is over $n_1 + \ldots + n_m = n$. This proves what we want. ☐

39.7. Some explicit divided power thickenings

The constructions in this section will help us to define the connection on a crystal in modules on the crystalline site.

Lemma 39.7.1. *Let (A, I, γ) be a divided power ring. Let M be an A-module. Let $B = A \oplus M$ as an A-algebra where M is an ideal of square zero and set $J = I \oplus M$. Set*

$$\delta_n(x + z) = \gamma_n(x) + \gamma_{n-1}(x)z$$

for $x \in I$ and $z \in M$. Then δ is a divided power structure and $A \to B$ is a homomorphism of divided power rings from (A, I, γ) to (B, J, δ).

Proof. We have to check conditions (1) -- (5) of Definition 39.2.1. We will prove this directly for this case, but please see the proof of the next lemma for a method which avoids calculations. Conditions (1) and (3) are clear. Condition (2) follows from

$$\begin{aligned} \delta_n(x + z)\delta_m(x + z) &= (\gamma_n(x) + \gamma_{n-1}(x)z)(\gamma_m(x) + \gamma_{m-1}(x)z) \\ &= \gamma_n(x)\gamma_m(x) + \gamma_n(x)\gamma_{m-1}(x)z + \gamma_{n-1}(x)\gamma_m(x)z \\ &= \frac{(n+m)!}{n!\,m!}\gamma_{n+m}(x) + \left(\frac{(n+m-1)!}{n!\,(m-1)!} + \frac{(n+m-1)!}{(n-1)!\,m!}\right)\gamma_{n+m-1}(x)z \\ &= \frac{(n+m)!}{n!\,m!}\delta_{n+m}(x + z) \end{aligned}$$

Condition (5) follows from

$$\begin{aligned} \delta_n(\delta_m(x+z)) &= \delta_n(\gamma_m(x) + \gamma_{m-1}(x)z) \\ &= \gamma_n(\gamma_m(x)) + \gamma_{n-1}(\gamma_m(x))\gamma_{m-1}(x)z \\ &= \frac{(nm)!}{n!\,(m!\,)^n}\gamma_{nm}(x) + \frac{((n-1)m)!}{(n-1)!\,(m!\,)^{n-1}}\gamma_{(n-1)m}(x)\gamma_{m-1}(x)z \\ &= \frac{(nm)!}{n!\,(m!\,)^n}(\gamma_{nm}(x) + \gamma_{nm-1}(x)z) \end{aligned}$$

by elementary number theory. To prove (4) we have to see that

$$\delta_n(x + x' + z + z') = \gamma_n(x + x') + \gamma_{n-1}(x + x')(z + z')$$

is equal to

$$\sum\nolimits_{i=0}^{n} (\gamma_i(x) + \gamma_{i-1}(x)z)(\gamma_{n-i}(x') + \gamma_{n-i-1}(x')z')$$

This follows easily on collecting the coefficients of 1, z, and z' and using condition (4) for γ. ☐

Lemma 39.7.2. *Let (A, I, γ) be a divided power ring. Let M, N be A-modules. Let $q : M \times M \to N$ be an A-bilinear map. Let $B = A \oplus M \oplus N$ as an A-algebra with multiplication*

$$(x, z, w) \cdot (x', z', w') = (xx', xz' + x'z, xw' + x'w + q(z, z') + q(z', z))$$

and set $J = I \oplus M \oplus N$. Set

$$\delta_n(x, z, w) = (\gamma_n(x), \gamma_{n-1}(x)z, \gamma_{n-1}(z)w + \gamma_{n-2}(x)q(z, z))$$

for $(a, m, n) \in J$. Then δ is a divided power structure and $A \to B$ is a homomorphism of divided power rings from (A, I, γ) to (B, J, δ).

Proof. Suppose we want to prove that property (4) of Definition 39.2.1 is satisfied. Pick (x, z, w) and (x', z', w') in J. Pick a map

$$A_0 = \mathbf{Z}\langle s, s' \rangle \longrightarrow A, \quad s \longmapsto x, s' \longmapsto x'$$

which is possible by the universal property of divided power polynomial rings. Set $M_0 = A_0 \oplus A_0$ and $N_0 = A_0 \oplus A_0 \oplus M_0 \otimes_{A_0} M_0$. Let $q_0 : M_0 \times M_0 \to N_0$ be the obvious map. Define $M_0 \to M$ as the A_0-linear map which sends the basis vectors of M_0 to z and z'. Define $N_0 \to N$ as the A_0 linear map which sends the first two basis vectors of N_0 to w and w' and uses $M_0 \otimes_{A_0} M_0 \to M \otimes_A M \xrightarrow{q} N$ on the last summand. Then we see that it suffices to prove the identitity (4) for the situation (A_0, M_0, N_0, q_0). Similarly for the other identities. This reduces us to the case of a $\mathbf{Z}$-torsion free ring and $\mathbf{A}$-torsion free modules. In this case all we have to do is show that

$$n!\,\delta_n(x, z, w) = (x, z, w)^n$$

in the ring A, see Lemma 39.2.2. To see this note that

$$(x, z, w)^2 = (x^2, 2xz, 2xw + 2q(z, z))$$

and by induction

$$(x, z, w)^n = (x^n, nx^{n-1}z, nx^{n-1}w + n(n-1)x^{n-2}q(z, z))$$

On the other hand,

$$n!\,\delta_n(x, z, w) = (n!\,\gamma_n(x), n!\,\gamma_{n-1}(x)z, n!\,\gamma_{n-1}(x)w + n!\,\gamma_{n-2}(x)q(z, z))$$

which matches. This finishes the proof. ☐

39.8. Compatibility

This section isn't required reading; it explains how our discussion fits with that of [**Ber74**]. Consider the following technical notion.

Definition 39.8.1. Let (A, I, γ) and (B, J, δ) be divided power rings. Let $A \to B$ be a ring map. We say δ *is compatible with* γ if there exists a divided power structure $\bar{\gamma}$ on $J + IB$ such that

$$(A, I, \gamma) \to (B, J + IB, \bar{\gamma}) \quad \text{and} \quad (B, J, \delta) \to (B, J + IB, \bar{\gamma})$$

are homomorphisms of divided power rings.

Let p be a prime number. Let (A, I, γ) be a divided power ring. Let $A \to C$ be a ring map with p nilpotent in C. Assume that γ extends to IC (see Lemma 39.4.2). In this situation, the (big affine) crystalline site of $Spec(C)$ over $Spec(A)$ as defined in [**Ber74**] is the opposite of the category of systems

$$(B, J, \delta, A \to B, C \to B/J)$$

where

1. (B, J, δ) is a divided power ring with p nilpotent in B,
2. δ is compatible with γ, and
3. the diagram
$$\begin{tikzcd} B \arrow[r] & B/J \\ A \arrow[u] \arrow[r] & C \arrow[u] \end{tikzcd}$$
is commutative.

The conditions ``γ extends to C and δ compatible with γ" are used in [**Ber74**] to insure that the crystalline cohomology of $Spec(C)$ is the same as the crystalline cohomology of $Spec(C/IC)$. We will avoid this issue by working exclusively with C such that $IC = 0$[1]. In this case, for a system $(B, J, \delta, A \to B, C \to B/J)$ as above, the commutativity of the displayed diagram above implies $IB \subset J$ and compatibility is equivalent to the condition that $(A, I, \gamma) \to (B, J, \delta)$ is a homomorphism of divided power rings.

39.9. Affine crystalline site

In this section we discuss the algebraic variant of the crystalline site. Our basic situation in which we discuss this material will be as follows.

Situation 39.9.1. Here p is a prime number, (A, I, γ) is a divided power ring such that A is a $\mathbf{Z}_{(p)}$-algebra, and $A \to C$ is a ring map such that $IC = 0$ and such that p is nilpotent in C.

Usually the prime number p will be contained in the divided power ideal I.

Definition 39.9.2. In Situation 39.9.1.

1. A *divided power thickening* of C over (A, I, γ) is a homomorphism of divided power algebras $(A, I, \gamma) \to (B, J, \delta)$ such that p is nilpotent in B and a ring map

[1] Of course there will be a price to pay.

$C \to B/J$ such that

$$\begin{tikzcd} B \arrow[r] & B/J \\ & C \arrow[u] \\ A \arrow[uu] \arrow[r] & A/I \arrow[u] \end{tikzcd}$$

is commutative.

(2) A *homomorphism of divided power thickenings*

$$(B, J, \delta, C \to B/J) \longrightarrow (B', J', \delta', C \to B'/J')$$

is a homomorphism $\varphi : B \to B'$ of divided power A-algebras such that $C \to B/J \to B'/J'$ is the given map $C \to B'/J'$.

(3) We denote $\text{CRIS}(C/A, I, \gamma)$ or simply $\text{CRIS}(C/A)$ the category of divided power thickenings of C over (A, I, γ).

(4) We denote $\text{Cris}(C/A, I, \gamma)$ or simply $\text{Cris}(C/A)$ the full subcategory consisting of $(B, J, \delta, C \to B/J)$ such that $C \to B/J$ is an isomorphism. We often denote such an object $(B \to C, \delta)$ with $J = \text{Ker}(B \to C)$ being understood.

Note that for a divided power thickening (B, J, δ) as above the ideal J is locally nilpotent, see Lemma 39.2.6. There is a canonical functor

$$\text{CRIS}(C/A) \longrightarrow C\text{-algebras}, \quad (B, J, \delta) \longmapsto B/J \tag{39.9.2.1}$$

This category does not have equalizers or fibre products in general. It also doesn't have an initial object (= empty colimit) in general.

Lemma 39.9.3. *In Situation 39.9.1.*

(1) *$CRIS(C/A)$ has products,*
(2) *$CRIS(C/A)$ has all finite nonempty colimits and (39.9.2.1) commutes with these, and*
(3) *$Cris(C/A)$ has all finite nonempty colimits and $Cris(C/A) \to CRIS(C/A)$ commutes with them.*

Proof. The empty product is $(C, 0, \emptyset)$. If (B_t, J_t, δ_t) is a family of objects of $\text{CRIS}(C/A)$ then we can form the product $(\prod B_t, \prod J_t, \prod \delta_t)$ as in Lemma 39.3.4. The map $C \to \prod B_t/\prod J_t = \prod B_t/J_t$ is clear.

Given two objects (B, J, γ) and (B', J', γ') of $\text{CRIS}(C/A)$ we can form a cocartesian diagram

$$\begin{tikzcd} (B, J, \delta) \arrow[r] & (B'', J'', \delta'') \\ (A, I, \gamma) \arrow[u] \arrow[r] & (B', J', \delta') \arrow[u] \end{tikzcd}$$

in the category of divided power rings. Then we see that we have

$$B''/J'' = B/J \otimes_{A/I} B'/J' \longleftarrow C \otimes_{A/I} C$$

see Remark 39.3.5. Denote $J'' \subset K \subset B''$ the ideal such that

$$\begin{tikzcd} B''/J'' \arrow[r] & B''/K \\ C \otimes_{A/I} C \arrow[u] \arrow[r] & C \arrow[u] \end{tikzcd}$$

is a pushout, i.e., $B''/K \cong B/J \otimes_C B'/J'$. Let $D_{B''}(K) = (D, \bar{K}, \bar{\delta})$ be the divided power envelope of K in B'' relative to (B'', J'', δ''). Then it is easily verified that $(D, \bar{K}, \bar{\delta})$ is a coproduct of (B, J, δ) and (B', J', δ') in CRIS(C/A).

Next, we come to coequalizers. Let $\alpha, \beta : (B, J, \delta) \to (B', J', \delta')$ be morphisms of CRIS(C/A). Consider $B'' = B'/(\alpha(b) - \beta(b))$. Let $J'' \subset B''$ be the image of J'. Let $D_{B''}(J'') = (D, \bar{J}, \bar{\delta})$ be the divided power envelope of J'' in B'' relative to (B', J', δ'). Then it is easily verified that $(D, \bar{J}, \bar{\delta})$ is the coequalizer of (B, J, δ) and (B', J', δ') in CRIS(C/A).

By Categories, Lemma 4.16.6 we have all finite nonempty colimits in CRIS(C/A). The constructions above shows that (39.9.2.1) commutes with them. This formally implies part (3) as Cris(C/A) is the fibre category of (39.9.2.1) over C. ☐

Remark 39.9.4. In Situation 39.9.1 we denote Cris^(C/A) the category whose objects are pairs $(B \to C, \delta)$ such that

(1) B is a p-adically complete A-algebra,
(2) $B \to C$ is a surjection of A-algebras,
(3) δ is a divided power structure on Ker$(B \to C)$,
(4) $A \to B$ is a homomorphism of divided power rings.

Morphisms are defined as in Definition 39.9.2. Then Cris$(C/A) \subset$ Cris^(C/A) is the full subcategory consisting of those B such that p is nilpotent in B. Conversely, any object $(B \to C, \delta)$ of Cris^(C/A) is equal to the limit

$$(B \to C, \delta) = lim_e (B/p^e B \to C, \delta)$$

where for $e \gg 0$ the object $(B/p^e B \to C, \delta)$ lies in Cris(C/A), see Lemma 39.4.5. In particular, we see that Cris^(C/A) is a full subcategory of the category of pro-objects of Cris(C/A), see Categories, Remark 4.20.4.

Lemma 39.9.5. *In Situation 39.9.1. Let $P \to C$ be a surjection of A-algebras with kernel J. Write $D_{P,\gamma}(J) = (D, \bar{J}, \bar{\gamma})$. Let $(D^\wedge, J^\wedge, \bar{\gamma}^\wedge)$ be the p-adic completion of D, see Lemma 39.4.5. For every $e \geq 1$ set $P_e = P/p^e P$ and $J_e \subset P_e$ the image of J and write $D_{P_e,\gamma}(J_e) = (D_e, \bar{J}_e, \bar{\gamma})$. Then for all e large enough we have*

(1) *$p^e D \subset \bar{J}$ and $p^e D^\wedge \subset \bar{J}^\wedge$ are preserved by divided powers,*
(2) *$D^\wedge/p^e D^\wedge = D/p^e D = D_e$ as divided power rings,*
(3) *$(D_e, \bar{J}_e, \bar{\gamma})$ is an object of Cris(C/A),*
(4) *$(D^\wedge, \bar{J}^\wedge, \bar{\gamma}^\wedge)$ is equal to $lim_e (D_e, \bar{J}_e, \bar{\gamma})$, and*
(5) *$(D^\wedge, \bar{J}^\wedge, \bar{\gamma}^\wedge)$ is an object of Cris^(C/A).*

Proof. Part (1) follows from Lemma 39.4.5. It is a general property of p-adic completion that $D/p^e D = D^\wedge/p^e D^\wedge$. Since $D/p^e D$ is a divided power ring and since $P \to D/p^e D$ factors through P_e, the universal property of D_e produces a map $D_e \to D/p^e D$. Conversely, the universal property of D produces a map $D \to D_e$ which factors through $D/p^e D$. We omit the verification that these maps are mutually inverse. This proves (2). If e is large enough, then $p^e C = 0$, hence we see (3) holds. Part (4) follows from Lemma 39.4.5. Part (5) is clear from the definitions. ☐

Lemma 39.9.6. *In Situation 39.9.1. Let P be a polynomial algebra over A and let $P \to C$ be a surjection of A-algebras with kernel J. With $(D_e, \bar{J}_e, \bar{\gamma})$ as in Lemma 39.9.5: for every object (B, J_B, δ) of $CRIS(C/A)$ there exists an e and a morphsm $D_e \to B$ of $CRIS(C/A)$.*

Proof. We can find an A-algebra homomorphism $P \to B$ lifting the map $C \to B/J_B$. By our definition of CRIS(C/A) we see that $p^e B = 0$ for some e hence $P \to B$ factors as $P \to P_e \to B$. By the universal property of the divided power envelope we conclude that $P_e \to B$ factors through D_e. □

Lemma 39.9.7. *In Situation 39.9.1. Let P be a polynomial algebra over A and let $P \to C$ be a surjection of A-algebras with kernel J. Let $(D, \bar{J}, \bar{\gamma})$ be the p-adic completion of $D_{P,\gamma}(J)$. For every object $(B \to C, \delta)$ of $Cris^\wedge(C/A)$ there exists a morphsm $D \to B$ of $Cris^\wedge(C/A)$.*

Proof. We can find an A-algebra homomorphism $P \to B$ compatible with maps to C. By our definition of Cris(C/A) we see that $P \to B$ factors as $P \to D_{P,\gamma}(J) \to B$. As B is p-adically complete we can factor this map through D. □

39.10. Module of differentials

In this section we develop a theory of modules of differentials for divided power rings.

Definition 39.10.1. Let A be a ring. Let (B, J, δ) be a divided power ring. Let $A \to B$ be a ring map. Let M be an B-module. A *divided power A-derivation* into M is a map $\theta : B \to M$ which is additive, annihilates the elements of A, satisfies the Leibniz rule $\theta(bb') = b\theta(b') + b'\theta(b)$ and satisfies

$$\theta(\gamma_n(x)) = \gamma_{n-1}(x)\theta(x)$$

for all $n \geq 1$ and all $x \in J$.

In the situation of the definition, just as in the case of usual derivations, there exists a *universal divided power A-derivation*

$$\mathrm{d}_{B/A,\delta} : B \to \Omega_{B/A,\delta}$$

such that any divided power A-derivation $\theta : B \to M$ is equal to $\theta = \xi \circ d_{B/A,\delta}$ for some B-linear map $\Omega_{B/A,\delta} \to M$. If $(A, I, \gamma) \to (B, J, \delta)$ is a homomorphism of divided power rings, then we can forget the divided powers on A and consider the divided power derivations of B over A. Here are some basic properties of the divided power module of differentials.

Lemma 39.10.2. *Let A be a ring. Let (B, J, δ) be a divided power ring and $A \to B$ a ring map.*

1. *Consider $B[x]$ with divided power ideal $(JB[x], \delta')$ where δ' is the extension of δ to $B[x]$. Then*
$$\Omega_{B[x]/A,\delta'} = \Omega_{B/A,\delta} \otimes_B B[x] \oplus B[x]dx.$$
2. *Consider $B\langle x\rangle$ with divided power ideal $(JB\langle x\rangle + B\langle x\rangle_+, \delta')$. Then*
$$\Omega_{B\langle x\rangle/A,\delta'} = \Omega_{B/A,\delta} \otimes_B B\langle x\rangle \oplus B\langle x\rangle dx.$$
3. *Let $K \subset J$ be an ideal preserved by δ_n for all $n > 0$. Set $B' = B/K$ and denote δ' the induced divided power on J/K. Then $\Omega_{B'/A,\delta'}$ is the quotient of $\Omega_{B/A,\delta} \otimes_B B'$ by the B'-submodule generated by dk for $k \in K$.*

Proof. These are proved directly from the construction of $\Omega_{B/A,\delta}$ as the free B-module on the elements $\mathrm{d}b$ modulo the relations

(1) $\mathrm{d}(b + b') = \mathrm{d}b + \mathrm{d}b'$, $b, b' \in B$,
(2) $\mathrm{d}a = 0$, $a \in A$,
(3) $\mathrm{d}(bb') = b\mathrm{d}b' + b'\mathrm{d}b$, $b, b' \in B$,
(4) $\mathrm{d}\delta_n(f) = \delta_{n-1}(f)\mathrm{d}f$, $f \in J$, $n > 1$.

Note that the last relation explains why we get ``the same" answer for the divided power polynomial algebra and the usual polynomial algebra: in the first case x is an element of the divided power ideal and hence $\mathrm{d}x^{[n]} = x^{[n-1]}\mathrm{d}x$. □

Let (A, I, γ) be a divided power ring. In this setting the correct version of the powers of I is given by the divided powers

$$I^{[n]} = \text{ideal generate by } \gamma_{e_1}(x_1) \ldots \gamma_{e_t}(x_t) \text{ with } \sum e_j \geq n \text{ and } x_j \in I.$$

Of course we have $I^n \subset I^{[n]}$. Note that $I^{[1]} = I$. Sometimes we also set $I^{[0]} = A$.

Lemma 39.10.3. *Let $(A, I, \gamma) \to (B, J, \delta)$ be a homomorphism of divided power rings. Let $(B(1), J(1), \delta(1))$ be the coproduct of (B, J, δ) with itself over (A, I, γ), i.e., such that*

$$\begin{tikzcd}
(B, J, \delta) \arrow[r] & (B(1), J(1), \delta(1)) \\
(A, I, \gamma) \arrow[u] \arrow[r] & (B, J, \delta) \arrow[u]
\end{tikzcd}$$

is cocartesian. Denote $K = Ker(B(1) \to B)$. Then $K \cap J(1) \subset J(1)$ is preserved by the divided power structure and

$$\Omega_{B/A,\delta} = K/\left(K^2 + (K \cap J(1))^{[2]}\right)$$

canonically.

Proof. The fact that $K \cap J(1) \subset J(1)$ is preserved by the divided power structure follows from the fact that $B(1) \to B$ is a homomorphism of divided power rings.

Recall that K/K^2 has a canonical B-module structure. Denote $s_0, s_1 : B \to B(1)$ the two coprojections and consider the map $\mathrm{d} : B \to K/K^2 + (K \cap J(1))^{[2]}$ given by $b \mapsto s_1(b) - s_0(b)$. It is clear that d is additive, annihilates A, and satisfies the Leibniz rule. We claim that d is an A-derivation. Let $x \in J$. Set $y = s_1(x)$ and $z = s_0(x)$. Denote δ the divided power structure on $J(1)$. We have to show that $\delta_n(y) - \delta_n(z) = \delta_{n-1}(y)(y - z)$ modulo $K^2 + (K \cap J(1))^{[2]}$ for $n \geq 1$. We will show this by induction on n. It is true for $n = 1$. Let $n > 1$ and that it holds for all smaller values. Note that

$$\delta_n(z - y) = \sum\nolimits_{i=0}^{n} (-1)^{n-i}\delta_i(z)\delta_{n-i}(y)$$

is an element of $K^2 + (K \cap J(1))^{[2]}$. From this and induction we see that working modulo $K^2 + (K \cap J(1))^{[2]}$ we have

$$\begin{aligned}
&\delta_n(y) - \delta_n(z) \\
&= \delta_n(y) + \sum\nolimits_{i=0}^{n-1} (-1)^{n-i}\delta_i(z)\delta_{n-i}(y) \\
&= \delta_n(y) + (-1)^n\delta_n(y) + \sum\nolimits_{i=1}^{n-1} (-1)^{n-i}(\delta_i(y) - \delta_{i-1}(y)(y - z))\delta_{n-i}(y)
\end{aligned}$$

Using that $\delta_i(y)\delta_{n-i}(y) = \binom{n}{i}\delta_n(y)$ and that $\delta_{i-1}(y)\delta_{n-i}(y) = \binom{n-1}{i}\delta_{n-1}(y)$ the reader easily verifies that this expression comes out to give $\delta_{n-1}(y)(y - z)$ as desired.

Let M be a B-module. Let $\theta : B \to M$ be a divided power A-derivation. Set $D = B \oplus M$ where M is an ideal of square zero. Define a divided power structure on $J \oplus M \subset D$ by setting $\delta_n(x + m) = \delta_n(x) + \delta_{n-1}(x)m$ for $n > 1$, see Lemma 39.7.1. There are two divided power algebra homomorphisms $B \to D$: the first is given by the inclusion and the second by the map $b \mapsto b + \theta(b)$. Hence we get a canonical homomorphism $B(1) \to D$ of divided power algebras over (A, I, γ). This induces a map $K \to M$ which annihilates K^2 (as M is an ideal of square zero) and $(K \cap J(1))^{[2]}$ as $M^{[2]} = 0$. The composition $B \to K/K^2 + (K \cap J(1))^{[2]} \to M$ equals θ by construction. It follows that d is a universal divided power A-derivation and we win. □

Remark 39.10.4. Let $A \to B$ be a ring map and let (J, δ) be a divided power structure on B. The universal module $\Omega_{B/A,\delta}$ comes with a little bit of extra structure, namely the B-submodule N of $\Omega_{B/A,\delta}$ generated by $\mathrm{d}_{B/A,\delta}(J)$. In terms of the isomorphism given in Lemma 39.10.3 this corresponds to the image of $K \cap J(1)$ in $\Omega_{B/A,\delta}$. Consider the A-algebra $D = B \oplus \Omega^1_{B/A,\delta}$ with ideal $\bar{J} = J \oplus N$ and divided powers $\bar{\delta}$ as in the proof of the lemma. Then $(D, \bar{J}, \bar{\delta})$ is a divided power ring and the two maps $B \to D$ given by $b \mapsto b$ and $b \mapsto b + \mathrm{d}_{B/A,\delta}(b)$ are homomorphisms of divided power rings over A. Moreover, N is the smallest submodule of $\Omega_{B/A,\delta}$ such that this is true.

Lemma 39.10.5. *In Situation 39.9.1. Let (B, J, δ) be an object of CRIS(C/A). Let $(B(1), J(1), \delta(1))$ be the coproduct of (B, J, δ) with itself in CRIS(C/A). Denote $K = Ker(B(1) \to B)$. Then $K \cap J(1) \subset J(1)$ is preserved by the divided power structure and*

$$\Omega_{B/A,\delta} = K/\left(K^2 + (K \cap J(1))^{[2]}\right)$$

canonically.

Proof. Word for word the same as the proof of Lemma 39.10.3. The only point that has to be checked is that the divided power ring $D = B \oplus M$ is an object of CRIS(C/A) and that the two maps $B \to C$ are morphisms of CRIS(C/A). Since $D/(J \oplus M) = B/J$ we can use $C \to B/J$ to view D as an object of CRIS(C/A) and the statement on morphisms is clear from the construction. □

Lemma 39.10.6. *Let (A, I, γ) be a divided power ring. Let $A \to B$ be a ring map and let $IB \subset J \subset B$ be an ideal. Let $D_{B,\gamma}(J) = (D, \bar{J}, \bar{\gamma})$ be the divided power envelope. Then we have*

$$\Omega_{D/A,\bar{\gamma}} = \Omega_{B/A} \otimes_B D$$

Proof. We will prove this first when B is flat over A. In this case γ extends to a divided power structure γ' on IB, see Lemma 39.4.2. Hence $D = D_{B',\gamma'}(J)$ is equal to a quotient of the divided power ring (D', J', δ) where $D' = B\langle x_t\rangle$ and $J' = IB\langle x_t\rangle + B\langle x_t\rangle_+$ by the elements $x_t - f_t$ and $\delta_n(\sum r_t x_t - r_0)$, see Lemma 39.6.4 for notation and explanation. Write $\mathrm{d} : D' \to \Omega_{D'/A,\delta}$ for the universal derivation. Note that

$$\Omega_{D'/A,\delta} = \Omega_{B/A} \otimes_B D' \oplus \bigoplus D' \mathrm{d}x_t,$$

see Lemma 39.10.2. We conclude that $\Omega_{D/A,\bar{\gamma}}$ is the quotient of $\Omega_{D'/A,\delta} \otimes_{D'} D$ by the submodule generated by d applied to the generators of the kernel of $D' \to D$ listed above, see Lemma 39.10.2. Since $\mathrm{d}(x_t - f_t) = -\mathrm{d}f_t + \mathrm{d}x_t$ we see that we have $\mathrm{d}x_t = \mathrm{d}f_t$ in the quotient. In particular we see that $\Omega_{B/A} \otimes_B D \to \Omega_{D/A,\gamma}$ is surjective with kernel given by the images of d applied to the elements $\delta_n(\sum r_t x_t - r_0)$. However, given a relation

$\sum r_t f_t - r_0 = 0$ in B with $r_t \in B$ and $r_0 \in IB$ we see that

$$\begin{aligned} \mathrm{d}\delta_n(\sum r_t x_t - r_0) &= \delta_{n-1}(\sum r_t x_t - r_0)\mathrm{d}(\sum r_t x_t - r_0) \\ &= \delta_{n-1}(\sum r_t x_t - r_0)\left(\sum r_t \mathrm{d}(x_t - f_t) + \sum (x_t - f_t)\mathrm{d}r_t\right) \end{aligned}$$

because $\sum r_t f_t - r_0 = 0$ in B. Hence this is already zero in $\Omega_{B/A} \otimes_A D$ and we win in the case that B is flat over A.

In the general case we write B as a quotient of a polynomial ring $P \to B$ and let $J' \subset P$ be the inverse image of J. Then $D = D'/K'$ with notation as in Lemma 39.6.3. By the case handled in the first paragraph of the proof we have $\Omega_{D'/A,\bar\gamma'} = \Omega_{P/A} \otimes_P D'$. Then $\Omega_{D/A,\bar\gamma}$ is the quotient of $\Omega_{P/A} \otimes_P D$ by the submodule generated by $\mathrm{d}\bar\gamma'_n(k)$ where k is an element of the kernel of $P \to B$, see Lemma 39.10.2 and the description of K' from Lemma 39.6.3. Since $\mathrm{d}\bar\gamma'_n(k) = \bar\gamma'_{n-1}(k)\mathrm{d}k$ we see again that it suffices to divided by the submodule generated by $\mathrm{d}k$ with $k \in \mathrm{Ker}(P \to B)$ and since $\Omega_{B/A}$ is the quotient of $\Omega_{P/A} \otimes_A B$ by these elements (Algebra, Lemma 7.122.9) we win. □

Remark 39.10.7. Let B be a ring. Write $\Omega_B = \Omega_{B/\mathbf{Z}}$ for the absolute[2] module of differentials of B. Let $\mathrm{d} : B \to \Omega_B$ denote the universal derivation. Set $\Omega^i_B = \wedge^i_B(\Omega_B)$ as in Algebra, Section 7.12. The absolute *de Rham complex*

$$\Omega^0_B \to \Omega^1_B \to \Omega^2_B \to \ldots$$

Here $\mathrm{d} : \Omega^p_B \to \Omega^{p+1}_B$ is defined by the rule

$$\mathrm{d}\left(b_0\mathrm{d}b_1 \wedge \ldots \wedge \mathrm{d}b_p\right) = \mathrm{d}b_0 \wedge \mathrm{d}b_1 \wedge \ldots \wedge \mathrm{d}b_p$$

which we will show is well defined; note that $\mathrm{d}\circ\mathrm{d} = 0$ so we get a complex. Recall that Ω_B is the B-module generated by elements $\mathrm{d}b$ subject to the relations $\mathrm{d}(a + b) = \mathrm{d}a + \mathrm{d}b$ and $\mathrm{d}(ab) = b\mathrm{d}a + a\mathrm{d}b$ for $a, b \in B$. To prove that our map is well defined for $p = 1$ we have to show that the elements

$$a\mathrm{d}(b + c) - a\mathrm{d}b - a\mathrm{d}c \quad \text{and} \quad a\mathrm{d}(bc) - ac\mathrm{d}b - ab\mathrm{d}c, \quad a, b, c \in B$$

are mapped to zero by our rule. This is clear by direct computation (using the Leibniz rule). Thus we get a map

$$\Omega_B \otimes_{\mathbf{Z}} \ldots \otimes_{\mathbf{Z}} \Omega_B \longrightarrow \Omega^{p+1}_B$$

defined by the formula

$$\omega_1 \otimes \ldots \otimes \omega_p \longmapsto \sum (-1)^{i+1}\omega_1 \wedge \ldots \wedge \mathrm{d}(\omega_i) \wedge \ldots \wedge \omega_p$$

which matches our rule above on elements of the form $b_0\mathrm{d}b_1 \otimes \mathrm{d}b_2 \otimes \ldots \otimes \mathrm{d}b_p$. It is clear that this map is alternating. To finish we have to show that

$$\omega_1 \otimes \ldots \otimes f\omega_i \otimes \ldots \otimes \omega_p \quad \text{and} \quad \omega_1 \otimes \ldots \otimes f\omega_j \otimes \ldots \otimes \omega_p$$

are mapped to the same element. By $\mathbf{Z}$-linearity and the alternating property, it is enough to show this for $p = 2$, $i = 1$, $j = 2$, $\omega_1 = a_1\mathrm{d}b_1$ and $\omega_2 = a_2\mathrm{d}b_2$. Thus we need to show that

$$\begin{aligned} &\mathrm{d}fa_1 \wedge \mathrm{d}b_1 \wedge a_2\mathrm{d}b_2 - fa_1\mathrm{d}b_1 \wedge \mathrm{d}a_2 \wedge \mathrm{d}b_2 \\ &= \mathrm{d}a_1 \wedge \mathrm{d}b_1 \wedge fa_2\mathrm{d}b_2 - a_1\mathrm{d}b_1 \wedge \mathrm{d}fa_2 \wedge \mathrm{d}b_2 \end{aligned}$$

[2] This actually makes sense: if Ω_B is the module of differentials where we only assume the Leibniz rule and not the vanishing of d1, then the Leibniz rule gives $\mathrm{d}1 = \mathrm{d}(1 \cdot 1) = 1\mathrm{d}1 + 1\mathrm{d}1 = 2\mathrm{d}1$ and hence $\mathrm{d}1 = 0$ in Ω_B.

in other words that

$$(a_2 \mathrm{d}fa_1 + fa_1 \mathrm{d}a_2 - fa_2 \mathrm{d}a_1 - a_1 \mathrm{d}fa_2) \wedge \mathrm{d}b_1 \wedge \mathrm{d}b_2 = 0.$$

This follows from the Leibniz rule.

Lemma 39.10.8. *Let B be a ring. Let $\pi : \Omega_B \to \Omega$ be a surjective B-module map. Denote $d : B \to \Omega$ the composition of π with $d_B : B \to \Omega_B$. Set $\Omega^i = \wedge^i_B(\Omega)$. Assume that the kernel of π is generated, as a B-module, by elements $\omega \in \Omega_B$ such that $d_B(\omega) \in \Omega^2_B$ maps to zero in Ω^2. Then there is a de Rham complex*

$$\Omega^0 \to \Omega^1 \to \Omega^2 \to \dots$$

whose differential is defined by the rule

$$d : \Omega^p \to \Omega^{p+1}, \quad d\left(f_0 df_1 \wedge \dots \wedge df_p\right) = df_0 \wedge df_1 \wedge \dots \wedge df_p$$

Proof. We will show that there exists a commutative diagram

$$\begin{tikzcd}
\Omega^0_B \arrow[r, "\mathrm{d}_B"'] \arrow[d] & \Omega^1_B \arrow[r, "\mathrm{d}_B"'] \arrow[d, "\pi"'] & \Omega^2_B \arrow[r, "\mathrm{d}_B"'] \arrow[d, "\wedge^2\pi"'] & \dots \\
\Omega^0 \arrow[r, "\mathrm{d}"] & \Omega^1 \arrow[r, "\mathrm{d}"] & \Omega^2 \arrow[r, "\mathrm{d}"] & \dots
\end{tikzcd}$$

the description of the map d will follow from the construction of d_B in Remark 39.10.7. Since the left most vertical arrow is an isomorphism we have the first square. Because π is surjective, to get the second square it suffices to show that d_B maps the kernel of π into the kernel of $\wedge^2\pi$. We are given that any element of the kernel of π is of the form $\sum b_i\omega_i$ with $\pi(\omega_i) = 0$ and $\wedge^2\pi(\mathrm{d}_B(\omega_i)) = 0$. By the Leibniz rule for d_B we have $\mathrm{d}_B(\sum b_i\omega_i) = \sum b_i \mathrm{d}_B(\omega_i) + \sum \mathrm{d}_B(b_i) \wedge \omega_i$. Hence this maps to zero under $\wedge^2\pi$.

For $i > 1$ we note that $\wedge^i\pi$ is surjective with kernel the image of $\mathrm{Ker}(\pi) \wedge \Omega^{i-1}_B \to \Omega^i_B$. For $\omega_1 \in \mathrm{Ker}(\pi)$ and $\omega_2 \in \Omega^{i-1}_B$ we have

$$\mathrm{d}_B(\omega_1 \wedge \omega_2) = \mathrm{d}_B(\omega_1) \wedge \omega_2 - \omega_1 \wedge \mathrm{d}_B(\omega_2)$$

which is in the kernel of $\wedge^{i+1}\pi$ by what we just proved above. Hence we get the $(i+1)$st square in the diagram above. This concludes the proof. □

Remark 39.10.9. Let $A \to B$ be a ring map and let (J, δ) be a divided power structure on B. Set $\Omega^i_{B/A,\delta} = \wedge^i_B \Omega_{B/A,\delta}$ where $\Omega_{B/A,\delta}$ is the target of the universal divided power A-derivation $\mathrm{d} = \mathrm{d}_{B/A} : B \to \Omega_{B/A,\delta}$. Note that $\Omega_{B/A,\delta}$ is the quotient of Ω_B by the B-submodule generated by the elements $\mathrm{d}a = 0$ for $a \in A$ and $\mathrm{d}\delta_n(x) - \delta_{n-1}(x)\mathrm{d}x$ for $x \in J$. We claim Lemma 39.10.8 applies. To see this it suffices to verify the elements $\mathrm{d}a$ and $\mathrm{d}\delta_n(x) - \delta_{n-1}(x)\mathrm{d}x$ of Ω_B are mapped to zero in $\Omega^2_{B/A,\delta}$. This is clear for the first, and for the last we observe that

$$\mathrm{d}(\delta_{n-1}(x)) \wedge \mathrm{d}x = \delta_{n-2}(x)\mathrm{d}x \wedge \mathrm{d}x = 0$$

in $\Omega^2_{B/A,\delta}$ as desired. Hence we obtain a *divided power de Rham complex*

$$\Omega^0_{B/A,\delta} \to \Omega^1_{B/A,\delta} \to \Omega^2_{B/A,\delta} \to \dots$$

which will play an important role in the sequel.

Remark 39.10.10. Let B be a ring. Let $\Omega_B \to \Omega$ be a quotient satisfying the assumptions of Lemma 39.10.8. Let M be a B-module. A *connection* is an additive map

$$\nabla : M \longrightarrow M \otimes_B \Omega$$

such that $\nabla(bm) = b\nabla(m) + m \otimes \mathrm{d}b$ for $b \in B$ and $m \in M$. In this situation we can define maps

$$\nabla : M \otimes_B \Omega^i \longrightarrow M \otimes_B \Omega^{i+1}$$

by the rule $\nabla(m \otimes \omega) = \nabla(m) \wedge \omega + m \otimes \mathrm{d}\omega$. This works because if $b \in B$, then

$$\begin{aligned}\nabla(bm \otimes \omega) - \nabla(m \otimes b\omega) &= \nabla(bm) \otimes \omega + bm \otimes \mathrm{d}\omega - \nabla(m) \otimes b\omega - m \otimes \mathrm{d}(b\omega) \\ &= b\nabla(m) \otimes \omega + m \otimes \mathrm{d}b \wedge \omega + bm \otimes \mathrm{d}\omega \\ &\quad - b\nabla(m) \otimes \omega - bm \otimes \mathrm{d}(\omega) - m \otimes \mathrm{d}b \wedge \omega = 0\end{aligned}$$

As is customary we say the connection is *integrable* if and only if the composition

$$M \xrightarrow{\nabla} M \otimes_B \Omega^1 \xrightarrow{\nabla} M \otimes_B \Omega^2$$

is zero. In this case we obtain a complex

$$M \xrightarrow{\nabla} M \otimes_B \Omega^1 \xrightarrow{\nabla} M \otimes_B \Omega^2 \xrightarrow{\nabla} M \otimes_B \Omega^3 \xrightarrow{\nabla} M \otimes_B \Omega^4 \to \ldots$$

which is called the de Rham complex of the connection.

Remark 39.10.11. Let $\varphi : B \to B'$ be a ring map. Let $\Omega_B \to \Omega$ and $\Omega_{B'} \to \Omega'$ be quotients satisfying the assumptions of Lemma 39.10.8. Assume that the map $\Omega_B \to \Omega_{B'}$, $b_1 \mathrm{d}b_2 \mapsto \varphi(b_1)\mathrm{d}\varphi(b_2)$ fits into a commutative diagram

$$\begin{tikzcd} B \arrow[r] \arrow[d] & \Omega_B \arrow[r] \arrow[d] & \Omega \arrow[d, "\varphi"] \\ B' \arrow[r] & \Omega_{B'} \arrow[r] & \Omega' \end{tikzcd}$$

In this situation, given any pair (M, ∇) where M is a B-module and $\nabla : M \to M \otimes_B \Omega$ is a connection we obtain a *base change* $(M \otimes_B B', \nabla')$ where

$$\nabla' : M \otimes_B B' \longrightarrow (M \otimes_B B') \otimes_{B'} \Omega' = M \otimes_B \Omega'$$

is defined by the rule

$$\nabla'(m \otimes b') = \sum m_i \otimes b' \mathrm{d}\varphi(b_i) + m \otimes \mathrm{d}b'$$

if $\nabla(m) = \sum m_i \otimes \mathrm{d}b_i$. If ∇ is integrable, then so is ∇', and in this case there is a canonical map of de Rham complexes

$$M \otimes_B \Omega^\bullet \longrightarrow (M \otimes_B B') \otimes_{B'} (\Omega')^\bullet = M \otimes_B (\Omega')^\bullet \tag{39.10.11.1}$$

which maps $m \otimes \eta$ to $m \otimes \varphi(\eta)$.

Lemma 39.10.12. *Let $A \to B$ be a ring map and let (J, δ) be a divided power structure on B. Let p be a prime number. Assume that A is a $\mathbf{Z}_{(p)}$-algebra and that p is nilpotent in B/J. Then we have*

$$lim_e\, \Omega_{B_e/A,\bar\delta} = lim_e\, \Omega_{B/A,\delta}/p^e\Omega_{B/A,\delta} = lim_e\, \Omega_{B^\wedge/A,\delta^\wedge}/p^e\Omega_{B^\wedge/A,\delta^\wedge}$$

see proof for notation and explanation.

Proof. By Lemma 39.4.5 we see that δ extends to $B_e = B/p^e B$ for all sufficiently large e. Hence the first limit make sense. The lemma also produces a divided power structure $\delta^\wedge$ on the completion $B^\wedge = lim_e B_e$, hence the last limit makes sense. By Lemma 39.10.2 and the fact that $\mathrm{d}p^e = 0$ (always) we see that the surjection $\Omega_{B/A,\delta} \to \Omega_{B_e/A,\bar{\delta}}$ has kernel $p^e\Omega_{B/A,\delta}$. Similarly for the kernel of $\Omega_{B^\wedge/A,\delta^\wedge} \to \Omega_{B_e/A,\bar{\delta}}$. Hence the lemma is clear. □

39.11. Divided power schemes

Some remarks on how to globalize the previous notions.

Definition 39.11.1. Let $\mathcal{C}$ be a site. Let $\mathcal{O}$ be a sheaf of rings on $\mathcal{C}$. Let $\mathcal{I} \subset \mathcal{O}$ be a sheaf of ideals. A *divided power structure* γ on $\mathcal{I}$ is a sequence of maps $\gamma_n : \mathcal{I} \to \mathcal{I}$, $n \geq 1$ such that for any object U of $\mathcal{C}$ the triple

$$(\mathcal{O}(U), \mathcal{I}(U), \gamma)$$

is a divided power ring.

To be sure this applies in particular to sheaves of rings on topological spaces. But it's good to be a little bit more general as the structure sheaf of the crystalline site lives on a... site! A triple $(\mathcal{C}, \mathcal{I}, \gamma)$ as in the definition above is sometimes called a *divided power topos* in this chapter. Given a second $(\mathcal{C}', \mathcal{I}', \gamma')$ and given a morphism of ringed topoi $(f, f^\sharp) : (Sh(\mathcal{C}), \mathcal{O}) \to (Sh(\mathcal{C}'), \mathcal{O}')$ we say that $(f, f^\sharp)$ induces a *morphism of divided power topoi* if $f^\sharp(f^{-1}\mathcal{I}') \subset \mathcal{I}$ and the diagrams

$$\begin{tikzcd} f^{-1}\mathcal{I}' \arrow[r, "f^\sharp"'] \arrow[d, "f^{-1}\gamma'_n"'] & \mathcal{I} \arrow[d, "\gamma_n"] \\ f^{-1}\mathcal{I}' \arrow[r, "f^\sharp"] & \mathcal{I} \end{tikzcd}$$

are commutative for all $n \geq 1$. If f comes from a morphism of sites induced by a functor $u : \mathcal{C}' \to \mathcal{C}$ then this just means that

$$(\mathcal{O}'(U'), \mathcal{I}'(U'), \gamma') \longrightarrow (\mathcal{O}(u(U')), \mathcal{I}(u(U')), \gamma)$$

is a homomorphism of divided power rings for all $U' \in Ob(\mathcal{C}')$.

In the case of schemes we require the divided power ideal to be **quasi-coherent**. But apart from this the definition is exactly the same as in the case of topoi. Here it is.

Definition 39.11.2. A *divided power scheme* is a triple $(S, \mathcal{I}, \gamma)$ where S is a scheme, $\mathcal{I}$ is a quasi-coherent sheaf of ideals, and γ is a divided power structure on $\mathcal{I}$. A *morphism of divided power schemes* $(S, \mathcal{I}, \gamma) \to (S', \mathcal{I}', \gamma')$ is a morphism of schemes $f : S \to S'$ such that $f^{-1}\mathcal{I}'\mathcal{O}_S \subset \mathcal{I}$ and such that

$$(\mathcal{O}_S(U'), \mathcal{I}(U'), \gamma) \longrightarrow (\mathcal{O}_{S'}(f^{-1}U'), \mathcal{I}(f^{-1}U'), \gamma)$$

is a homomorphism of divided power rings for all $U' \subset S'$ open.

Recall that there is a 1-to-1 correspondence between quasi-coherent sheaves of ideals and closed immersions, see Morphisms, Section 24.2. Thus given a divided power scheme $(T, \mathcal{J}, \gamma)$ we get a canonical closed immersion $U \to T$ defined by $\mathcal{J}$. Conversely, given a closed immersion $U \to T$ and a divided power structure γ on the sheaf of ideals $\mathcal{J}$ associated to $U \to T$ we obtain a divided power scheme $(T, \mathcal{J}, \gamma)$. In many situations we only want to consider such triples (U, T, γ) when the morphism $U \to T$ is a thickening, see More on Morphisms, Definition 33.2.1.

Definition 39.11.3. A triple (U, T, γ) as above is called a *divided power thickening* if $U \to T$ is a thickening.

Fibre products of divided power schemes exist when one of the three is a divided power thickening. Here is a formal statement.

Lemma 39.11.4. *Let $(U', T', \delta') \to (S'_0, S', \gamma')$ and $(S_0, S, \gamma) \to (S'_0, S', \gamma')$ be morphisms of divided power schemes. If (U', T', δ') is a divided power thickening, then there exists a divided power scheme (T_0, T, δ) and*

$$\begin{tikzcd} T \arrow[r] \arrow[d] & T' \arrow[d] \\ S \arrow[r] & S' \end{tikzcd}$$

which is a cartesian diagram in the category of divided power schemes.

Proof. Omitted. Hints: If T exists, then $T_0 = S_0 \times_{S'_0} U'$ (argue as in Remark 39.3.5). Since T' is a divided power thickening, we see that T (if it exists) will be a divided power thickening too. Hence we can define T as the scheme with underlying topological space the underlying topological space of $T_0 = S_0 \times_{S'_0} U'$ and as structure sheaf on affine pieces the ring given by Lemma 39.9.3. □

We make the following observation. Suppose that (U, T, γ) is triple as above. Assume that T is a scheme over $\mathbf{Z}_{(p)}$ and that p is locally nilpotent on U. Then

(1) p locally nilpotent on $T \Leftrightarrow U \to T$ is a thickening (see Lemma 39.2.6), and
(2) $p^e \mathcal{O}_T$ is locally on T preserved by γ for $e \gg 0$ (see Lemma 39.4.5).

This suggest that good results on divided power thickenings will be available under the following hypotheses.

Situation 39.11.5. Here p is a prime number and $(S, \mathcal{I}, \gamma)$ is a divided power scheme over $\mathbf{Z}_{(p)}$. We set $S_0 = V(\mathcal{I}) \subset S$. Finally, $X \to S_0$ is a morphism of schemes such that p is locally nilpotent on X.

It is in this situation that we will define the big and small crystalline sites.

39.12. The big crystalline site

We first define the big site. Given a divided power scheme $(S, \mathcal{I}, \gamma)$ we say $(T, \mathcal{J}, \delta)$ is a divided power scheme over $(S, \mathcal{I}, \gamma)$ if T comes endowed with a morphism $T \to S$ of divided power schemes. Similarly, we say a divided power thickening (U, T, δ) is a divided power thickening over $(S, \mathcal{I}, \gamma)$ if T comes endowed with a morphism $T \to S$ of divided power schemes.

Definition 39.12.1. In Situation 39.11.5.

(1) A *divided power thickening of X relative to* $(S, \mathcal{I}, \gamma)$ is given by a divided power thickening (U, T, δ) over $(S, \mathcal{I}, \gamma)$ and an S-morphism $U \to X$.
(2) A *morphism of divided power thickenings of X relative to* $(S, \mathcal{I}, \gamma)$ is defined in the obvious manner.

The category of divided power thickenings of X relative to $(S, \mathcal{I}, \gamma)$ is denoted $\text{CRIS}(X/S, \mathcal{I}, \gamma)$ or simply $\text{CRIS}(X/S)$.

For any (U, T, δ) in $\text{CRIS}(X/S)$ we have that p is locally nilpotent on T, see discussion after Definition 39.11.3. A good way to visualize all the data associated to (U, T, δ) is the commutative diagram

$$\begin{tikzcd} T \arrow[dd] & U \arrow[l] \arrow[d] \\ & X \arrow[d] \\ S & S_0 \arrow[l] \end{tikzcd}$$

where $S_0 = V(\mathcal{J}) \subset S$. Morphisms of $\text{CRIS}(X/S)$ can be similarly visualized as huge commutative diagrams. In particular, there is a canonical forgetful functor

$$\text{CRIS}(X/S) \longrightarrow Sch/X, \quad (U, T, \delta) \longmapsto U \tag{39.12.1.1}$$

as well as its one sided inverse (and left adjoint)

$$Sch/X \longrightarrow \text{CRIS}(X/S), \quad U \longmapsto (U, U, \emptyset) \tag{39.12.1.2}$$

which is sometimes useful.

Lemma 39.12.2. *In Situation 39.11.5. The category $CRIS(X/S)$ has all finite nonempty limits, in particular products of pairs and fibre products. The functor (39.12.1.1) commutes with limits.*

Proof. Omitted. Hint: See Lemma 39.9.3 for the affine case. See also Remark 39.3.5. $\square$

Lemma 39.12.3. *In Situation 39.11.5. Let*

$$\begin{tikzcd} (U_3, T_3, \delta_3) \arrow[r] \arrow[d] & (U_2, T_2, \delta_2) \arrow[d] \\ (U_1, T_1, \delta_1) \arrow[r] & (U, T, \delta) \end{tikzcd}$$

be a fibre square in the category of divided power thickenings of X relative to $(S, \mathcal{J}, \gamma)$. If $T_2 \to T$ is flat, then $T_3 = T_1 \times_T T_2$ (as schemes).

Proof. This is true because a divided power structure extends uniquely along a flat ring map. See Lemma 39.4.2. $\square$

The lemma above means that the base change of a flat morphism of divided power thickenings is another flat morphism, and in fact is the ``usual'' base change of the morphism. This implies that the following definition makes sense.

Definition 39.12.4. In Situation 39.11.5.

(1) A family of morphisms $\{(U_i, T_i, \delta_i) \to (U, T, \delta)\}$ of divided power thickenings of X/S is a *Zariski, étale, smooth, syntomic, or fppf covering* if and only if the family of morphisms of schemes $\{T_i \to T\}$ is one.
(2) The *big crystalline site* of X over $(S, \mathcal{J}, \gamma)$, is the category $\text{CRIS}(X/S)$ endowed with the Zariski topology.
(3) The topos of sheaves on $\text{CRIS}(X/S)$ is denoted $(X/S)_{\text{CRIS}}$ or sometimes $(X/S, \mathcal{J}, \gamma)_{\text{CRIS}}$[3].

There are some obvious functorialities concerining these topoi.

[3]This clashes with our convention to denote the topos associated to a site $\mathcal{C}$ by $Sh(\mathcal{C})$.

Remark 39.12.5 (Functoriality)**.** Let p be a prime number. Let $(S, \mathcal{I}, \gamma) \to (S', \mathcal{I}', \gamma')$ be a morphism of divided power schemes over $\mathbf{Z}_{(p)}$. Set $S_0 = V(\mathcal{I})$ and $S'_0 = V(\mathcal{I}')$. Let

$$\begin{tikzcd} X \arrow[r, "f"] \arrow[d] & Y \arrow[d] \\ S_0 \arrow[r] & S'_0 \end{tikzcd}$$

be a commutative diagram of morphisms of schemes and assume p is locally nilpotent on X and Y. Then we get a continuous and cocontinuous functor

$$\mathrm{CRIS}(X/S) \longrightarrow \mathrm{CRIS}(Y/S')$$

by letting (U, T, δ) correspond to (U, T, δ) with $U \to X \to Y$ as the S'-morphism from U to Y. Hence we get a morphism of topoi

$$f_{\mathrm{CRIS}} : (X/S)_{\mathrm{CRIS}} \longrightarrow (Y/S')_{\mathrm{CRIS}}$$

see Sites, Section 9.19.

Remark 39.12.6 (Comparison with Zariski site)**.** In Situation 39.11.5. The functor (39.12.1.1) is continuous, cocontinuous, and commutes with products and fibred products. Hence we obtain a morphism of topoi

$$U_{X/S} : (X/S)_{\mathrm{CRIS}} \longrightarrow Sh((Sch/X)_{Zar})$$

from the big crystalline topos of X/S to the big Zarisk topos of X. See Sites, Section 9.19.

Remark 39.12.7 (Structure morphism)**.** In Situation 39.11.5. Consider the closed subscheme $S_0 = V(\mathcal{I}) \subset S$. If we assume that p is locally nilpotent on S_0 (which is always the case in practice) then we obtain a situation as in Definition 39.12.1 with S_0 instead of X. Hence we get a site $\mathrm{CRIS}(S_0/S)$. If $f : X \to S_0$ is the structure morphism of X over S, then we get a commutative diagram of morphisms of ringed topoi

$$\begin{tikzcd} (X/S)_{\mathrm{CRIS}} \arrow[r, "f_{\mathrm{CRIS}}"] \arrow[d, "U_{X/S}"] & (S_0/S)_{\mathrm{CRIS}} \arrow[d, "U_{S_0/S}"] & \\ Sh((Sch/X)_{Zar}) \arrow[r, "f_{big}"] & Sh((Sch/S_0)_{Zar}) \arrow[dr] & \\ & & Sh((Sch/S)_{Zar}) \end{tikzcd}$$

by Remark 39.12.5. We think of the composition $(X/S)_{\mathrm{CRIS}} \to Sh((Sch/S)_{Zar})$ as the structure morphism of the big crystalline site. Even if p is not locally nilpotent on S_0 the structure morphism

$$(X/S)_{\mathrm{CRIS}} \longrightarrow Sh((Sch/S)_{Zar})$$

is defined as we can take the lower route through the diagram above. Thus it is the morphism of topoi corresponding to the cocontinuous functor $\mathrm{CRIS}(X/S) \to (Sch/S)_{Zar}$ given by the rule $(U, T, \delta)/S \mapsto T/S$, see Sites, Section 9.19.

Remark 39.12.8 (Compatibilities)**.** The morphisms defined above satisfy numerous compatibilities. For example, in the situation of Remark 39.12.5 we obtain a commutative diagram of ringed topoi

$$\begin{tikzcd} (X/S)_{\mathrm{CRIS}} \arrow[r] \arrow[d] & (Y/S')_{\mathrm{CRIS}} \arrow[d] \\ Sh((Sch/S)_{Zar}) \arrow[r] & Sh((Sch/S')_{Zar}) \end{tikzcd}$$

where the vertical arrows are the structure morphisms.

39.13. The crystalline site

Since (39.12.1.1) commutes with products and fibre products, we see that looking at those (U, T, δ) such that $U \to X$ is an open immersion defines a full subcategory preserved under fibre products (and more generally finite nonempty limits). Hence the following definition makes sense.

Definition 39.13.1. In Situation 39.11.5.

(1) The (small) *crystalline site* of X over $(S, \mathcal{I}, \gamma)$, denoted $\mathrm{Cris}(X/S, \mathcal{I}, \gamma)$ or simply $\mathrm{Cris}(X/S)$ is the full subcategory of $\mathrm{CRIS}(X/S)$ consisting of those (U, T, δ) in $\mathrm{CRIS}(X/S)$ such that $U \to X$ is an open immersion. It comes endowed with the Zariski topology.
(2) The topos of sheaves on $\mathrm{Cris}(X/S)$ is denoted $(X/S)_{\mathrm{cris}}$ or sometimes $(X/S, \mathcal{I}, \gamma)_{\mathrm{cris}}$[4].

For any (U, T, δ) in $\mathrm{Cris}(X/S)$ the morphism $U \to X$ defines an object of the small Zariski site X_{Zar} of X. Hence a canonical forgetful functor

$$\mathrm{Cris}(X/S) \longrightarrow X_{Zar}, \quad (U, T, \delta) \longmapsto U \tag{39.13.1.1}$$

and a left adjoint

$$X_{Zar} \longrightarrow \mathrm{Cris}(X/S), \quad U \longmapsto (U, U, \emptyset) \tag{39.13.1.2}$$

which is sometimes useful.

We can compare the small and big crystalline sites, just like we can compare the small and big Zariski sites of a scheme, see Topologies, Lemma 30.3.13.

Lemma 39.13.2. *Assumptions as in Definition 39.12.1. The inclusion functor*

$$Cris(X/S) \to CRIS(X/S)$$

commutes with finite nonempty limits, is fully faithful, continuous, and cocontinuous. There are morphisms of topoi

$$(X/S)_{cris} \xrightarrow{i} (X/S)_{CRIS} \xrightarrow{\pi} (X/S)_{cris}$$

whose composition is the identity and of which the first is induced by the inclusion functor. Moreover, $\pi_* = i^{-1}$.

Proof. For the first assertion see Lemma 39.12.2. This gives us a morphism of topoi $i : (X/S)_{\mathrm{cris}} \to (X/S)_{\mathrm{CRIS}}$ and a left adjoint $i_!$ such that $i^{-1}i_! = i^{-1}i_* = \mathrm{id}$, see Sites, Lemmas 9.19.5, 9.19.6, and 9.19.7. We claim that $i_!$ is exact. If this is true, then we can define π by the rules $\pi^{-1} = i_!$ and $\pi_* = i^{-1}$ and everything is clear. To prove the claim, note that we already know that $i_!$ is right exact and preserves fibre products (see references given). Hence it suffices to show that $i_! * = *$ where $*$ indicates the final object in the category

[4]This clashes with our convention to denote the topos associated to a site $\mathcal{C}$ by $Sh(\mathcal{C})$.

of sheaves of sets. To see this it suffices to produce a set of objects (U_i, T_i, δ_i), $i \in I$ of Cris(X/S) such that

$$\coprod\nolimits_{i \in I} h_{(U_i, T_i, \delta_i)} \to *$$

is surjective in $(X/S)_{\text{CRIS}}$ (details omitted; hint: use that Cris(X/S) has products and that the functor Cris(X/S) → CRIS(X/S) commutes with them). In the affine case this follows from Lemma 39.9.6. We omit the proof in general. □

Remark 39.13.3 (Functoriality)**.** Let p be a prime number. Let $(S, \mathcal{I}, \gamma) \to (S', \mathcal{I}', \gamma')$ be a morphism of divided power schemes over $\mathbf{Z}_{(p)}$. Let

$$\begin{tikzcd} X \arrow[r, "f"'] \arrow[d] & Y \arrow[d] \\ S_0 \arrow[r] & S'_0 \end{tikzcd}$$

be a commutative diagram of morphisms of schemes and assume p is locally nilpotent on X and Y. By analogy with Topologies, Lemma 30.3.16 we define

$$f_{\text{cris}} : (X/S)_{\text{cris}} \longrightarrow (Y/S')_{\text{cris}}$$

by the formula $f_{\text{cris}} = \pi_Y \circ f_{\text{CRIS}} \circ i_X$ where i_X and π_Y are as in Lemma 39.13.2 for X and Y and where f_{CRIS} is as in Remark 39.12.5.

Remark 39.13.4 (Comparison with Zariski site)**.** In Situation 39.11.5. The functor (39.13.1.1) is continuous, cocontinuous, and commutes with products and fibred products. Hence we obtain a morphism of topoi

$$u_{X/S} : (X/S)_{\text{cris}} \longrightarrow Sh(X_{Zar})$$

relating the small crystalline topos of X/S with the small Zarisk topos of X. See Sites, Section 9.19.

Lemma 39.13.5. *In Situation 39.11.5. Let $X' \subset X$ and $S' \subset S$ be open subschemes such that X' maps into S'. Then there is a fully faithful functor $Cris(X'/S') \to Cris(X/S)$ which gives rise to a morphism of topoi fitting into the commutative diagram*

$$\begin{tikzcd} (X'/S')_{cris} \arrow[r] \arrow[d, "u_{X'/S'}"'] & (X/S)_{cris} \arrow[d, "u_{X/S}"] \\ Sh(X'_{Zar}) \arrow[r] & Sh(X_{Zar}) \end{tikzcd}$$

Moreover, this diagram is an example of localization of morphisms of topoi as in Sites, Lemma 9.27.1.

Proof. The fully faithful functor comes from thinking of objects of Cris(X'/S') as divided power thickenings (U, T, δ) of X where $U \to X$ factors through $X' \subset X$ (since then automatically $T \to S$ will factor through S'). This functor is clearly cocontinuous hence we obtain a morphism of topoi as indicated. Let $h_{X'} \in Sh(X_{Zar})$ be the representable sheaf associated to X' viewed as an object of X_{Zar}. It is clear that $Sh(X'_{Zar})$ is the localization $Sh(X_{Zar})/h_{X'}$. On the other hand, the category Cris(X/S)$/u_{X/S}^{-1}h_{X'}$ (see Sites, Lemma 9.26.3) is canonically identified with Cris(X'/S') by the functor above. This finishes the proof. □

Remark 39.13.6 (Structure morphism)**.** In Situation 39.11.5. Consider the closed subscheme $S_0 = V(\mathcal{I}) \subset S$. If we assume that p is locally nilpotent on S_0 (which is always the case in practice) then we obtain a situation as in Definition 39.12.1 with S_0 instead of X. Hence we get a site $\text{Cris}(S_0/S)$. If $f : X \to S_0$ is the structure morphism of X over S, then we get a commutative diagram of ringed topoi

$$\begin{tikzcd}
(X/S)_{\text{cris}} \arrow[r, "f_{\text{cris}}"'] \arrow[d, "u_{X/S}"'] & (S_0/S)_{\text{cris}} \arrow[d, "u_{S_0/S}"] & \\
Sh(X_{Zar}) \arrow[r, "f_{small}"] & Sh(S_{0,Zar}) \arrow[dr] & \\
& & Sh(S_{Zar})
\end{tikzcd}$$

see Remark 39.13.3. We think of the compostion $(X/S)_{\text{cris}} \to Sh(S_{Zar})$ as the structure morphism of the crystalline site. Even if p is not locally nilpotent on S_0 the structure morphism

$$\tau_{X/S} : (X/S)_{\text{cris}} \longrightarrow Sh(S_{Zar})$$

is defined as we can take the lower route through the diagram above.

Remark 39.13.7 (Compatibilities)**.** The morphisms defined above satisfy numerous compatibilities. For example, in the situation of Remark 39.13.3 we obtain a commutative diagram of ringed topoi

$$\begin{tikzcd}
(X/S)_{\text{cris}} \arrow[r] \arrow[d] & (Y/S')_{\text{cris}} \arrow[d] \\
Sh((Sch/S)_{Zar}) \arrow[r] & Sh((Sch/S')_{Zar})
\end{tikzcd}$$

where the vertical arrows are the structure morphisms.

39.14. Sheaves on the crystalline site

Notation and assumptions as in Situation 39.11.5. In order to discuss the small and big crystalline sites of X/S simultaneously in this section we let

$$\mathcal{C} = \text{CRIS}(X/S) \quad \text{or} \quad \mathcal{C} = \text{Cris}(X/S).$$

A sheaf $\mathcal{F}$ on $\mathcal{C}$ gives rise to a *restriction* $\mathcal{F}_T$ for every object (U, T, δ) of $\mathcal{C}$. Namely, $\mathcal{F}_T$ is the Zariski sheaf on the scheme T defined by the rule

$$\mathcal{F}_T(W) = \mathcal{F}(U \cap W, W, \delta|_W)$$

for $W \subset T$ is open. Moreover, if $f : T \to T'$ is a morphism between objects (U, T, δ) and (U', T', δ') of $\mathcal{C}$, then there is a canonical *comparison* map

$$c_f : f^{-1}\mathcal{F}_{T'} \longrightarrow \mathcal{F}_T. \tag{39.14.0.1}$$

Namely, if $W' \subset T'$ is open then f induces a morphism

$$f|_{f^{-1}W'} : (U \cap f^{-1}(W'), f^{-1}W', \delta|_{f^{-1}W'}) \longrightarrow (U' \cap W', W', \delta|_{W'})$$

of $\mathcal{C}$, hence we can use the restriction mapping $(f|_{f^{-1}W'})^*$ of $\mathcal{F}$ to define a map $\mathcal{F}_{T'}(W') \to \mathcal{F}_T(f^{-1}W')$. These maps are clearly compatible with further restriction, hence define an f-map from $\mathcal{F}_{T'}$ to $\mathcal{F}_T$ (see Sheaves, Section 6.21 and especially Sheaves, Definition 6.21.7).

Thus a map c_f as in (39.14.0.1). Note that if f is an open immersion, then c_f is an isomorphism, because in that case $\mathcal{F}_T$ is just the restriction of $\mathcal{F}_{T'}$ to T.

Conversely, given Zariski sheaves $\mathcal{F}_T$ for every object (U, T, δ) of $\mathcal{C}$ and comparion maps c_f as above which (a) are isomorphisms for open immersions, and (b) satisfy a suitable cocycle condition, we obtain a sheaf on $\mathcal{C}$. This is proved exactly as in Topologies, Lemma 30.3.18.

The *structure sheaf* on $\mathcal{C}$ is the sheaf $\mathcal{O}_{X/S}$ defined by the rule

$$\mathcal{O}_{X/S} : (U, T, \delta) \longmapsto \Gamma(T, \mathcal{O}_T)$$

This is a sheaf by the definition of coverings in $\mathcal{C}$. Suppose that $\mathcal{F}$ is a sheaf of $\mathcal{O}_{X/S}$-modules. In this case the comparison mappings (39.14.0.1) define a comparison map

$$c_f : f^*\mathcal{F}_T \longrightarrow \mathcal{F}_{T'} \tag{39.14.0.2}$$

of $\mathcal{O}_{T'}$-modules.

Another type of example comes by starting with a sheaf $\mathcal{G}$ on $(Sch/X)_{Zar}$ or X_{Zar} (depending on whether $\mathcal{C} = \mathrm{CRIS}(X/S)$ or $\mathcal{C} = \mathrm{Cris}(X/S)$). Then $\underline{\mathcal{G}}$ defined by the rule

$$\underline{\mathcal{G}} : (U, T, \delta) \longmapsto \mathcal{G}(U)$$

is a sheaf on $\mathcal{C}$. In particular, if we take $\mathcal{G} = \mathbf{G}_a = \mathcal{O}_X$, then we obtain

$$\underline{\mathbf{G}_a} : (U, T, \delta) \longmapsto \Gamma(U, \mathcal{O}_U)$$

There is a surjective map of sheaves $\mathcal{O}_{X/S} \to \underline{\mathbf{G}_a}$ defined by the canonical maps $\Gamma(T, \mathcal{O}_T) \to \Gamma(U, \mathcal{O}_U)$ for objects (U, T, δ). The kernel of this map is denoted $\mathcal{J}_{X/S}$, hence a short exact sequence

$$0 \to \mathcal{J}_{X/S} \to \mathcal{O}_{X/S} \to \underline{\mathbf{G}_a} \to 0$$

Note that $\mathcal{J}_{X/S}$ comes equipped with a canonical divided power structure. After all, for each object (U, T, δ) the third component δ *is* a divided power structure on the kernel of $\mathcal{O}_T \to \mathcal{O}_U$. Hence the (big) crystalline topos is a divided power topos.

39.15. Crystals in modules

It turns out that a crystal is a very general gadget. However, the definition may be a bit hard to parse, so we first give the definition in the case of modules on the crystalline sites.

Definition 39.15.1. In Situation 39.11.5. Let $\mathcal{C} = \mathrm{CRIS}(X/S)$ or $\mathcal{C} = \mathrm{Cris}(X/S)$. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{X/S}$-modules on $\mathcal{C}$.

(1) We say $\mathcal{F}$ is *locally quasi-coherent* if for every object (U, T, δ) of $\mathcal{C}$ the restriction $\mathcal{F}_T$ is a quasi-coherent $\mathcal{O}_T$-module.
(2) We say $\mathcal{F}$ is *quasi-coherent* if it is quasi-coherent in the sense of Modules on Sites, Definition 16.23.1.
(3) We say $\mathcal{F}$ is a *crystal in $\mathcal{O}_{X/S}$-modules* if all the comparison maps (39.14.0.2) are isomorphisms.

It turns out that we can relate these notions as follows.

Lemma 39.15.2. *With notation $X/S, \mathcal{J}, \gamma, \mathcal{C}, \mathcal{F}$ as in Definition 39.15.1. The following are equivalent*

(1) *$\mathcal{F}$ is quasi-coherent, and*
(2) *$\mathcal{F}$ is locally quasi-coherent and a crystal in $\mathcal{O}_{X/S}$-modules.*

Proof. Assume (1). Let $f : (U', T', \delta') \to (U, T, \delta)$ be an object of $\mathcal{C}$. We have to prove (a) $\mathcal{F}_T$ is a quasi-coherent $\mathcal{O}_T$-module and (b) $c_f : f^*\mathcal{F}_T \to \mathcal{F}_{T'}$ is an isomorphism. The assumption means that we can find a covering $\{(T_i, U_i, \delta_i) \to (T, U, \delta)\}$ and for each i the restriction of $\mathcal{F}$ to $\mathcal{C}/(T_i, U_i, \delta_i)$ has a global presentation. Since it suffices to prove (a) and (b) Zariski locally, we may replace $f : (T', U', \delta') \to (T, U, \delta)$ by the base change to (T_i, U_i, δ_i) and assume that $\mathcal{F}$ restricted to $\mathcal{C}/(T, U, \delta)$ has a global presentation

$$\bigoplus\nolimits_{j\in J} \mathcal{O}_{X/S}|_{\mathcal{C}/(U,T,\delta)} \longrightarrow \bigoplus\nolimits_{i\in I} \mathcal{O}_{X/S}|_{\mathcal{C}/(U,T,\delta)} \longrightarrow \mathcal{F}|_{\mathcal{C}/(U,T,\delta)} \longrightarrow 0$$

It is clear that this gives a presentation

$$\bigoplus\nolimits_{j\in J} \mathcal{O}_T \longrightarrow \bigoplus\nolimits_{i\in I} \mathcal{O}_T \longrightarrow \mathcal{F}_T \longrightarrow 0$$

and hence (a) holds. Moreover, the presentation restricts to T' to give a similar presentation of $\mathcal{F}_{T'}$, whence (b) holds.

Assume (2). Let (U, T, δ) be an object of $\mathcal{C}$. We have to find a covering of (U, T, δ) such that $\mathcal{F}$ has a global presentation when we restrict to the localization of $\mathcal{C}$ at the members of the covering. Thus we may assume that T is affine. In this case we can choose a presentation

$$\bigoplus\nolimits_{j\in J} \mathcal{O}_T \longrightarrow \bigoplus\nolimits_{i\in I} \mathcal{O}_T \longrightarrow \mathcal{F}_T \longrightarrow 0$$

as $\mathcal{F}_T$ is assumed to be a quasi-coherent $\mathcal{O}_T$-module. Then by the crystal property of $\mathcal{F}$ we see that this pulls back to a presentation of $\mathcal{F}_{T'}$ for any morphism $f : (U', T', \delta') \to (U, T, \delta)$ of $\mathcal{C}$. Thus the desired presentation of $\mathcal{F}|_{\mathcal{C}/(U,T,\delta)}$. □

Definition 39.15.3. If $\mathcal{F}$ satisfies the equivalent conditions of Lemma 39.15.2, then we say that $\mathcal{F}$ is a *crystal in quasi-coherent modules*. We say that $\mathcal{F}$ is a *crystal in finite locally free modules* if, in addition, $\mathcal{F}$ is finite locally free.

Of course, as Lemma 39.15.2 shows, this notation is somewhat heavy since a quasi-coherent module is always a crystal. But it is standard terminology in the literature.

Remark 39.15.4. To formulate the general notion of a crystal we use the language of stacks and strongly cartesian morphisms, see Stacks, Definition 50.4.1 and Categories, Definition 4.30.1. In Situation 39.11.5 let $p : \mathcal{C} \to \text{Cris}(X/S)$ be a stack. A *crystal in objects of $\mathcal{C}$ on X relative to S* is a *cartesian section* $\sigma : \text{Cris}(X/S) \to \mathcal{C}$, i.e., a functor σ such that $p \circ \sigma = \text{id}$ and such that $\sigma(f)$ is strongly cartesian for all morphisms f of $\text{Cris}(X/S)$. Similarly for the big crystalline site.

39.16. Sheaf of differentials

In this section we will stick with the (small) crystalline site as it seems more natural. We globalize Definition 39.10.1 as follows.

Definition 39.16.1. In Situation 39.11.5 let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{X/S}$-modules on $\text{Cris}(X/S)$. An *S-derivation* $D : \mathcal{O}_{X/S} \to \mathcal{F}$ is a map of sheaves such that for every object (U, T, δ) of $\text{Cris}(X/S)$ the map

$$D : \Gamma(T, \mathcal{O}_T) \longrightarrow \Gamma(T, \mathcal{F})$$

is a divided power $\Gamma(V, \mathcal{O}_V)$-derivation where $V \subset S$ is any open such that $T \to S$ factors through V.

This means that D is additive, satisfies the Leibniz rule, annihilates functions coming from S, and satisfies $D(f^{[n]}) = f^{[n-1]}D(f)$ for a local section f of the divided power ideal $\mathcal{J}_{X/S}$. This is a special case of a very general notion which we now describe.

Please compare the following discussion with Modules on Sites, Section 16.29. Let $\mathcal{C}$ be a site, let $\mathcal{A} \to \mathcal{B}$ be a map of sheaves of rings on $\mathcal{C}$, let $\mathcal{J} \subset \mathcal{B}$ be a sheaf of ideals, let δ be a divided power structure on $\mathcal{J}$, and let $\mathcal{F}$ be a sheaf of $\mathcal{B}$-modules. Then there is a notion of a *divided power $\mathcal{A}$-derivation* $D : \mathcal{B} \to \mathcal{F}$. This means that D is $\mathcal{A}$-linear, satisfies the Leibnize rule, and satisfies $D(\delta_n(x)) = \delta_{n-1}(x)D(x)$ for local sections x of $\mathcal{J}$. In this situation there exists a *universal divided power $\mathcal{A}$-derivation*

$$\mathrm{d}_{\mathcal{B}/\mathcal{A},\delta} : \mathcal{B} \longrightarrow \Omega_{\mathcal{B}/\mathcal{A},\delta}$$

Moreover, $\mathrm{d}_{\mathcal{B}/\mathcal{A},\delta}$ is the compostion

$$\mathcal{B} \longrightarrow \Omega_{\mathcal{B}/\mathcal{A}} \longrightarrow \Omega_{\mathcal{B}/\mathcal{A},\delta}$$

where the first map is the universal derivation constructed in the proof of Modules on Sites, Lemma 16.29.2 and the second arrow is the quotient by the submodule generated by the local sections $\mathrm{d}_{\mathcal{B}/\mathcal{A}}(\delta_n(x)) - \delta_{n-1}(x)\mathrm{d}_{\mathcal{B}/\mathcal{A}}(x)$.

We translate this into a relative notion as follows. Suppose $(f, f^\sharp) : (Sh(\mathcal{C}), \mathcal{O}) \to (Sh(\mathcal{C}'), \mathcal{O}')$ is a morphism of ringed topoi, $\mathcal{J} \subset \mathcal{O}$ a sheaf of ideals, δ a divided power structure on $\mathcal{J}$, and $\mathcal{F}$ a sheaf of $\mathcal{O}$-modules. In this situation we say $D : \mathcal{O} \to \mathcal{F}$ is a divided power $\mathcal{O}'$-derivation if D is a divided power $f^{-1}\mathcal{O}'$-derivation as defined above. Moreover, we write

$$\Omega_{\mathcal{O}/\mathcal{O}',\delta} = \Omega_{\mathcal{O}/f^{-1}\mathcal{O}',\delta}$$

which is the receptacle of the universal divided power $\mathcal{O}'$-derivation.

Appying this to the structure morphism

$$(X/S)_{\text{Cris}} \longrightarrow Sh(S_{Zar})$$

(see Remark 39.13.6) we recover the notion of Definition 39.16.1 above. In particular, there is a universal divided power derivation

$$d_{X/S} : \mathcal{O}_{X/S} \to \Omega_{X/S}$$

Note that we omit from the notation the decoration indicating the module of differentials is compatible with divided powers (it seems unlikely anybody would ever consider the usual module of differentials of the structure sheaf on the crystalline site).

Lemma 39.16.2. *Let $(T, \mathcal{J}, \delta)$ be a divided power scheme. Let $T \to S$ be a morphism of schemes. The quotient $\Omega_{T/S} \to \Omega_{T/S,\delta}$ described above is a quasi-coherent $\mathcal{O}_T$-module. For $W \subset T$ affine open mapping into $V \subset S$ affine open we have*

$$\Gamma(W, \Omega_{T/S,\delta}) = \Omega_{\Gamma(W,\mathcal{O})/\Gamma(V,\mathcal{O}_V),\delta}$$

where the right hand side is as constructed in Section 39.10.

Proof. Omitted. □

Lemma 39.16.3. *In Situation 39.11.5. For (U, T, δ) in $Cris(X/S)$ the restriction $(\Omega_{X/S})_T$ to T is $\Omega_{T/S,\delta}$ and the restriction $d_{X/S}|_T$ is equal to $d_{T/S,\delta}$.*

Proof. Omitted. □

Lemma 39.16.4. *In Situation 39.11.5. For any affine object (U, T, δ) of $Cris(X/S)$ mapping into an affine open $V \subset S$ we have*

$$\Gamma((U, T, \delta), \Omega_{X/S}) = \Omega_{\Gamma(T,\mathcal{O})/\Gamma(V,\mathcal{O}_V),\delta}$$

where the right hand side is as constructed in Section 39.10.

Proof. Combine Lemmas 39.16.2 and 39.16.3. □

Lemma 39.16.5. *In Situation 39.11.5. Let (U, T, δ) be an object of $Cris(X/S)$. Let*

$$(U(1), T(1), \delta(1)) = (U, T, \delta) \times (U, T, \delta)$$

in $Cris(X/S)$. Let $\mathcal{K} \subset \mathcal{O}_{T(1)}$ be the quasi-coherent sheaf of ideals corresponding to the closed immersion $\Delta : T \to T(1)$. Then $\mathcal{K} \subset \mathcal{J}_{T(1)}$ is preserved by the divided structure on $\mathcal{J}_{T(1)}$ and we have

$$(\Omega_{X/S})_T = \mathcal{K}/\mathcal{K}^{[2]}$$

Proof. Note that $U = U(1)$ as $U \to X$ is an open immersion and as (39.13.1.1) commutes with products. Hence we see that $\mathcal{K} \subset \mathcal{J}_{T(1)}$. Given this fact the lemma follows by working affine locally on T and using Lemmas 39.16.4 and 39.10.5. □

It turns out that $\Omega_{X/S}$ is not a crystal in quasi-coherent $\mathcal{O}_{X/S}$-modules. But it does satisfy two closely related properties (compare with Lemma 39.15.2).

Lemma 39.16.6. *In Situation 39.11.5. The sheaf of differentials $\Omega_{X/S}$ has the following two properties:*

1. *$\Omega_{X/S}$ is locally quasi-coherent, and*
2. *for any morphism $(U, T, \delta) \to (U', T', \delta')$ of $Cris(X/S)$ where $f : T \to T'$ is a closed immersion the map $c_f : f^*(\Omega_{X/S})_{T'} \to (\Omega_{X/S})_T$ is surjective.*

Proof. Part (1) follows from a combination of Lemmas 39.16.2 and 39.16.3. Part (2) follows from the fact that $(\Omega_{X/S})_T = \Omega_{T/S,\delta}$ is a quotient of $\Omega_{T/S}$ and that $f^*\Omega_{T'/S} \to \Omega_{T/S}$ is surjective. □

39.17. Two universal thickenings

The constructions in this section will help us define a connection on a crystal in modules on the crystalline site. In some sense the constructions here are the ``sheafified, universal'' versions of the constructions in Section 39.7.

Remark 39.17.1. In Situation 39.11.5. Let (U, T, δ) be an object of $Cris(X/S)$. Write $\Omega_{T/S,\delta} = (\Omega_{X/S})_T$, see Lemma 39.16.3. We explicitly describe a first order thickening T' of T. Namely, set

$$\mathcal{O}_{T'} = \mathcal{O}_T \oplus \Omega_{T/S,\delta}$$

with algebra structure such that $\Omega_{T/S,\delta}$ is an ideal of square zero. Let $\mathcal{J} \subset \mathcal{O}_T$ be the ideal sheaf of the closed immersion $U \to T$. Set $\mathcal{J}' = \mathcal{J} \oplus \Omega_{T/S,\delta}$. Define a divided power structure on $\mathcal{J}'$ by setting

$$\delta_n'(f, \omega) = (\delta_n(f), \delta_{n-1}(f)\omega),$$

see Lemma 39.7.1. There are two ring maps

$$p_0, p_1 : \mathcal{O}_T \to \mathcal{O}_{T'}$$

The first is given by $f \mapsto (f, 0)$ and the second by $f \mapsto (f, \mathrm{d}_{T/S,\delta}f)$. Note that both are compatible with the divided power structures on $\mathcal{J}$ and $\mathcal{J}'$ and so is the quotient map $\mathcal{O}_{T'} \to \mathcal{O}_T$. Thus we get an object (U, T', δ') of $\mathrm{Cris}(X/S)$ and a commutative diagram

$$\begin{tikzcd} & T \arrow[dl, "\mathrm{id}"'] \arrow[d, "i"] \arrow[dr, "\mathrm{id}"] & \\ T & T' \arrow[l, "p_0"'] \arrow[r, "p_1"] & T \end{tikzcd}$$

of $\mathrm{Cris}(X/S)$ such that i is a first order thickening whose ideal sheaf is identified with $\Omega_{T/S,\delta}$ and such that $p_1^* - p_0^* : \mathcal{O}_T \to \mathcal{O}_{T'}$ is identified with the universal derivation $\mathrm{d}_{T/S,\delta}$ composed with the inclusion $\Omega_{T/S,\delta} \to \mathcal{O}_{T'}$.

Remark 39.17.2. In Situation 39.11.5. Let (U, T, δ) be an object of $\mathrm{Cris}(X/S)$. Write $\Omega_{T/S,\delta} = (\Omega_{X/S})_T$, see Lemma 39.16.3. We also write $\Omega^2_{T/S,\delta}$ for its second exterior power. We explicitly describe a second order thickening T'' of T. Namely, set

$$\mathcal{O}_{T''} = \mathcal{O}_T \oplus \Omega_{T/S,\delta} \oplus \Omega_{T/S,\delta} \oplus \Omega^2_{T/S,\delta}$$

with algebra structure defined in the following way

$$(f, \omega_1, \omega_2, \eta)\cdot(f', \omega_1', \omega_2', \eta') = (ff', f\omega_1' + f'\omega_1, f\omega_2' + f'\omega_2', f\eta' + f'\eta + \omega_1 \wedge \omega_2' + \omega_1' \wedge \omega_2).$$

Let $\mathcal{J} \subset \mathcal{O}_T$ be the ideal sheaf of the closed immersion $U \to T$. Let $\mathcal{J}''$ be the inverse image of $\mathcal{J}$ under the projection $\mathcal{O}_{T''} \to \mathcal{O}_T$. Define a divided power structure on $\mathcal{J}''$ by setting

$$\delta_n''(f, \omega_1, \omega_2, \eta) = (\delta_n(f), \delta_{n-1}(f)\omega_1, \delta_{n-1}(f)\omega_2, \delta_{n-1}(f)\eta + \delta_{n-2}(f)\omega_1 \wedge \omega_2)$$

see Lemma 39.7.2. There are three ring maps $q_0, q_1, q_2 : \mathcal{O}_T \to \mathcal{O}_{T''}$ given by

$$\begin{aligned} q_0(f) &= (f, 0, 0, 0), \\ q_1(f) &= (f, \mathrm{d}f, 0, 0), \\ q_2(f) &= (f, \mathrm{d}f, \mathrm{d}f, 0) \end{aligned}$$

where $\mathrm{d} = \mathrm{d}_{T/S,\delta}$. Note that all three are compatible with the divided power structures on $\mathcal{J}$ and $\mathcal{J}''$. There are three ring maps $q_{01}, q_{12}, q_{02} : \mathcal{O}_{T'} \to \mathcal{O}_{T''}$ where $\mathcal{O}_{T'}$ is as in Remark 39.17.1. Namely, set

$$\begin{aligned} q_{01}(f, \omega) &= (f, \omega, 0, 0), \\ q_{12}(f, \omega) &= (f, \mathrm{d}f, \omega, \mathrm{d}\omega), \\ q_{02}(f, \omega) &= (f, \omega, \omega, 0) \end{aligned}$$

These are also compatible with the given divided power structures. Let's do the verifications for q_{12}: Note that q_{12} is a ring homomorphism as

$$\begin{aligned} q_{12}(f, \omega)q_{12}(g, \eta) &= (f, \mathrm{d}f, \omega, \mathrm{d}\omega)(g, \mathrm{d}g, \eta, \mathrm{d}\eta) \\ &= (fg, f\mathrm{d}g + g\mathrm{d}f, f\eta + g\omega, f\mathrm{d}\eta + g\mathrm{d}\omega + \mathrm{d}f \wedge \eta + \mathrm{d}g \wedge \omega) \\ &= q_{12}(fg, f\eta + g\omega) = q_{12}((f, \omega)(g, \eta)) \end{aligned}$$

Note that q_{12} is compatible with divided powers because

$$\begin{aligned} \delta_n''(q_{12}(f, \omega)) &= \delta_n''((f, \mathrm{d}f, \omega, \mathrm{d}\omega)) \\ &= (\delta_n(f), \delta_{n-1}(f)\mathrm{d}f, \delta_{n-1}(f)\omega, \delta_{n-1}(f)\mathrm{d}\omega + \delta_{n-2}(f)\mathrm{d}(f) \wedge \omega) \\ &= q_{12}((\delta_n(f), \delta_{n-1}(f)\omega)) = q_{12}(\delta_n'(f, \omega)) \end{aligned}$$

The verifications for q_{01} and q_{02} are easier. Note that $q_0 = q_{01} \circ p_0$, $q_1 = q_{01} \circ p_1$, $q_1 = q_{12} \circ p_0$, $q_2 = q_{12} \circ p_1$, $q_0 = q_{02} \circ p_0$, and $q_2 = q_{02} \circ p_1$. Thus (U, T'', δ'') is an object of $\text{Cris}(X/S)$ and we get morphisms

$$T'' \substack{\longrightarrow \\ \longrightarrow \\ \longrightarrow} T' \substack{\longrightarrow \\ \longrightarrow} T$$

of $\text{Cris}(X/S)$ satisfying the relations described above. In applications we will use $q_i : T'' \to T$ and $q_{ij} : T'' \to T'$ to denote the morphisms associated to the ring maps described above.

39.18. The de Rham complex

In Situation 39.11.5. Working on the (small) crystalline site, we define $\Omega^i_{X/S} = \wedge^i_{\mathcal{O}_{X/S}} \Omega_{X/S}$ for $i \geq 0$. The universal S-derivation $\text{d}_{X/S}$ gives rise to the *de Rham complex*

$$\mathcal{O}_{X/S} \to \Omega^1_{X/S} \to \Omega^2_{X/S} \to \ldots$$

on $\text{Cris}(X/S)$, see Lemma 39.16.4 and Remark 39.10.9.

39.19. Connections

In Situation 39.11.5. Given an $\mathcal{O}_{X/S}$-module $\mathcal{F}$ on $\text{Cris}(X/S)$ a *connection* is a map of abelian sheaves

$$\nabla : \mathcal{F} \longrightarrow \mathcal{F} \otimes_{\mathcal{O}_{X/S}} \Omega_{X/S}$$

such that $\nabla(fs) = f\nabla(s) + s \otimes \text{d}f$ for local sections s, f of $\mathcal{F}$ and $\mathcal{O}_{X/S}$. Given a connection there are canonical maps $\nabla : \mathcal{F} \otimes_{\mathcal{O}_{X/S}} \Omega^i_{X/S} \longrightarrow \mathcal{F} \otimes_{\mathcal{O}_{X/S}} \Omega^{i+1}_{X/S}$ defined by the rule $\nabla(s \otimes \omega) = \nabla(s) \wedge \omega + s \otimes \text{d}\omega$ as in Remark 39.10.10. We say the connection is *integrable* if $\nabla \circ \nabla = 0$. If ∇ is integrable we obtain the *de Rham complex*

$$\mathcal{F} \to \mathcal{F} \otimes_{\mathcal{O}_{X/S}} \Omega^1_{X/S} \to \mathcal{F} \otimes_{\mathcal{O}_{X/S}} \Omega^2_{X/S} \to \ldots$$

on $\text{Cris}(X/S)$. It turns out that any crystal in $\mathcal{O}_{X/S}$-modules comes equipped with a canonical integrable connection.

Lemma 39.19.1. *In Situation 39.11.5. Let $\mathcal{F}$ be a crystal in $\mathcal{O}_{X/S}$-modules on $\text{Cris}(X/S)$. Then $\mathcal{F}$ comes equipped with a canonical integrable connection.*

Proof. Say (U, T, δ) is an object of $\text{Cris}(X/S)$. Let (U, T', δ') be the infinitesimal thickening of T by $(\Omega_{X/S})_T = \Omega_{T/S,\delta}$ constructed in Remark 39.17.1. It comes with projections $p_0, p_1 : T' \to T$ and a diagonal $i : T \to T(1)$. By assumption we get isomorphisms

$$p_0^*\mathcal{F}_T \xrightarrow{c_0} \mathcal{F}_{T'} \xleftarrow{c_1} p_1^*\mathcal{F}_T$$

of $\mathcal{O}_{T'}$-modules. Pulling $c = c_1^{-1} \circ c_0$ back to T by i we obtain the identity map of $\mathcal{F}_T$. Hence if $s \in \Gamma(T, \mathcal{F}_T)$ then $\nabla(s) = p_1^*s - c(p_0^*s)$ is a section of $p_1^*\mathcal{F}_T$ which vanishes on pulling back by Δ. Hence $\nabla(s)$ is a section of

$$\mathcal{F}_T \otimes_{\mathcal{O}_T} \Omega_{T/S,\delta}$$

because this is the kernel of $p_1^*\mathcal{F}_T \to \mathcal{F}_T$ as $\Omega_{T/S,\delta}$ is the kernel of $\mathcal{O}_{T'} \to \mathcal{O}_T$ by construction.

The collection of maps

$$\nabla : \Gamma(T, \mathcal{F}_T) \to \Gamma(T, \mathcal{F}_T \otimes_{\mathcal{O}_T} \Omega_{T/S,\delta})$$

so obtained is functorial in T because the construction of T' is functorial in T. Hence we obtain a connection.

To show that the connection is integrable we consider the object (U, T'', δ'') constructed in Remark 39.17.2. Because $\mathcal{F}$ is a sheaf we see that

$$\begin{tikzcd} q_0^*\mathcal{F}_T \arrow[rr, "q_{01}^*c"] \arrow[dr, "q_{02}^*c"'] & & q_1^*\mathcal{F}_T \arrow[dl, "q_{12}^*c"] \\ & q_2^*\mathcal{F}_T & \end{tikzcd}$$

is a commutative map of $\mathcal{O}_{T''}$-modules. For $s \in \Gamma(T, \mathcal{F}_T)$ we have $c(p_0^*s) = p_1^*s - \nabla(s)$. Write $\nabla(s) = \sum p_1^*s_i \cdot \omega_i$ where s_i is a local section of $\mathcal{F}_T$ and ω_i is a local section of $\Omega_{T/S,\delta}$. We think of ω_i as a local section of the structure sheaf of $\mathcal{O}_{T'}$ and hence we write product instead of tensor product. On the one hand

$$\begin{aligned} q_{12}^*c \circ q_{01}^*c(q_0^*s) &= q_{12}^*c(q_1^*s - \sum q_1^*s_i \cdot q_{01}^*\omega_i) \\ &= q_2^*s - \sum q_2^*s_i \cdot q_{12}^*\omega_i - \sum q_2^*s_i \cdot q_{01}^*\omega_i + \sum q_{12}^*\nabla(s_i) \cdot q_{01}^*\omega_i \end{aligned}$$

and on the other hand

$$q_{02}^*c(q_0^*s) = q_2^*s - \sum q_2^*s_i \cdot q_{02}^*\omega_i.$$

From the formulae of Remark 39.17.2 we see that $q_{01}^*\omega_i + q_{12}^*\omega_i - q_{02}^*\omega_i = \mathrm{d}\omega_i$. Hence the difference of the two expressions above is

$$\sum q_2^*s_i \cdot \mathrm{d}\omega_i - \sum q_{12}^*\nabla(s_i) \cdot q_{01}^*\omega_i$$

Note that $q_{12}^*\omega \cdot q_{01}^*\omega' = \omega' \wedge \omega = -\omega \wedge \omega'$ by the definition of the multiplication on $\mathcal{O}_{T''}$. Thus the expression above is $\nabla^2(s)$ viewed as a section of the subsheaf $\mathcal{F}_T \otimes \Omega^2_{T/S,\delta}$ of $q_2^*\mathcal{F}$. Hence we get the integrability condition. $\square$

39.20. Cosimplicial algebra

This section should be moved somewhere else. A *cosimplicial ring* is a cosimplicial object in the category of rings. Given a ring R, a *cosimplicial R-algebra* is a cosimplicial object in the category of R-algebras. A *cosimplicial ideal* in a cosimplicial ring A_* is given by an ideal $I_n \subset A_n$ for all n such that $A(f)(I_n) \subset I_m$ for all $f : [n] \to [m]$ in Δ.

Let A_* be a cosimplicial ring. Let $\mathcal{C}$ be the category of pairs (A, M) where A is a ring and M is a module over A. A morphism $(A, M) \to (A', M')$ consists of a ring map $A \to A'$ and an A-module map $M \to M'$ where M' is viewed as an A-module via $A \to A'$ and the A'-module structure on M'. Having said this we can define a *cosimplicial module M_* over A_** as a cosimplicial object (A_*, M_*) of $\mathcal{C}$ whose first entry is equal to A_*. A *homomorphism $\varphi_* : M_* \to N_*$ of cosimplicial modules over A_** is a morphism $(A_*, M_*) \to (A_*, N_*)$ of cosimplicial objects in $\mathcal{C}$ whose first component is 1_{A_*}.

A *homotopy* between homomorphisms $\varphi_*, \psi_* : M_* \to N_*$ of cosimplicial modules over A_* is a homotopy between the associated maps $(A_*, M_*) \to (A_*, N_*)$ whose first component is the trival homotopy (dual to Simplicial, Example 14.24.3). We spell out what this means. Such a homotopy is a homotopy

$$h : M_* \longrightarrow \mathrm{Hom}(\Delta[1], N_*)$$

between φ_* and ψ_* as homomorphisms of cosimplicial abelian groups such that for each n the map $h_n : M_n \to \prod_{\alpha \in \Delta[1]_n} N_n$ is A_n-linear. The following lemma is a version of Simplicial, Lemma 14.26.3 for cosimplicial modules.

Lemma 39.20.1. *Let A_* be a cosimplicial ring. Let $\varphi_*, \psi_* : K_* \to M_*$ be homomorphisms of cosimplicial A_*-modules.*

(1) *If φ_* and ψ_* are homotopic, then*
$$\varphi_* \otimes 1, \psi_* \otimes 1 : K_* \otimes_{A_*} L_* \longrightarrow M_* \otimes_{A_*} L_*$$
are homotopic for any cosimplicial A_*-module L_*.

(2) *If φ_* and ψ_* are homotopic, then*
$$\wedge^i(\varphi_*), \wedge^i(\psi_*) : \wedge^i(K_*) \longrightarrow \wedge^i(M_*)$$
are homotopic.

(3) *If φ_* and ψ_* are homotopic, and $A_* \to B_*$ is a homomorphism of cosimplicial rings, then*
$$\varphi_* \otimes 1, \psi_* \otimes 1 : K_* \otimes_{A_*} B_* \longrightarrow M_* \otimes_{A_*} B_*$$
are homotopic as homomorphisms of cosimplicial B_*-modules.

(4) *If $I_* \subset A_*$ is a cosimplicial ideal, then the induced maps*
$$\varphi_*^\wedge, \psi_*^\wedge : K_*^\wedge \longrightarrow M_*^\wedge$$
between completions are homotopic.

(5) *Add more here as needed, for example symmetric powers.*

Proof. Let $h : M_* \longrightarrow \text{Hom}(\Delta[1], N_*)$ be the given homotopy. In degree n we have
$$h_n = (h_{n,\alpha}) : K_n \longrightarrow \prod\nolimits_{\alpha \in \Delta[1]_n} K_n$$
see Simplicial, Section 14.26. In order for a collection of $h_{n,\alpha}$ to form a homotopy, it is necessary and sufficient if for every $f : [n] \to [m]$ we have
$$h_{m,\alpha} \circ M_*(f) = N_*(f) \circ h_{n,\alpha \circ f}$$
see Simplicial, Equation (14.26.1.1). We also should have that $\psi_n = h_{n,0:[n]\to[1]}$ and $\varphi_n = h_{n,1:[n]\to[1]}$.

In each of the cases of the lemma we can produce the corresponding maps. Case (1). We can use the homotopy $h \otimes 1$ defined in degree n by setting
$$(h \otimes 1)_{n,\alpha} = h_{n,\alpha} \otimes 1_{L_n} : K_n \otimes_{A_n} L_n \longrightarrow M_n \otimes_{A_n} L_n.$$
Case (2). We can use the homotopy $\wedge^i h$ defined in degree n by setting
$$\wedge^i(h)_{n,\alpha} = \wedge^i(h_{n,\alpha}) : \wedge_{A_n}(K_n) \longrightarrow \wedge^i_{A_n}(M_n).$$
Case (3). We can use the homotopy $h \otimes 1$ defined in degree n by setting
$$(h \otimes 1)_{n,\alpha} = h_{n,\alpha} \otimes 1 : K_n \otimes_{A_n} B_n \longrightarrow M_n \otimes_{A_n} B_n.$$
Case (4). We can use the homotopy $h^\wedge$ defined in degree n by setting
$$(h^\wedge)_{n,\alpha} = h_{n,\alpha}^\wedge : K_n^\wedge \longrightarrow M_n^\wedge.$$
This works because each $h_{n,\alpha}$ is A_n-linear. $\square$

39.21. Notes on Rlim

This section should be moved somewhere else. We briefly discuss $R^1\, lim$. Consider the category $\mathbf{N}$ whose objects are natural numbers and whose morphisms are unique arrows $i \to j$ if $j \geq i$. Endow $\mathbf{N}$ with the chaotic topology so that a sheaf $\mathcal{F}$ is the same thing as an inverse system

$$\mathcal{F}_1 \leftarrow \mathcal{F}_2 \leftarrow \mathcal{F}_3 \leftarrow \ldots$$

over $\mathbf{N}$. Note that $\Gamma(\mathbf{N}, \mathcal{F}) = lim\, \mathcal{F}_n$. For an inverse system of abelian groups $\mathcal{F}_n$ we define

$$R^p\, lim\, \mathcal{F}_n = H^p(\mathbf{N}, \mathcal{F}).$$

Actually, it turns out that $R^p\, lim = 0$ for $p > 1$. Namely, note that the morphisms $i \to j$ are monomorphisms, which are turned into surjections by an injective sheaf of abelian groups (this is a generality about injective sheaves on any site). In particular, injective modules satisfy the Mittag-Leffler condition (see Homology, Section 10.23). Apply Derived Categories, Lemma 11.15.6 using Homology, Lemma 10.23.3 to the collection of inverse systems of abelian groups having ML, to conclude that $R^p\, lim$, $p > 0$ vanishes on all systems with ML. Applying Homology, Lemma 10.23.3 one more time we see that any inverse system of abelian groups has a two term resolution by systems having ML, which proves that $R^p\, lim = 0$ for $p > 1$.

Next, let's consider the derived functor

$$R\, lim : D(Ab(\mathbf{N})) \longrightarrow D(Ab)$$

as defined in Cohomology on Sites, Section 19.19. Another possible reference for the existence of $R\, lim$ is Derived Categories, Lemma 11.29.2. An object of $D(Ab(\mathbf{N}))$ is a complex of inverse systems of abelian groups. You can also think of this as an inverse system $(K_e^\bullet)$ of complexes. However, this is **not** the same thing as an inverse system of objects of $D(Ab)$; we will come back and explain the difference later.

Lemma 39.21.1. *Let $K = (K_e^\bullet)$ be an object of $D(Ab(\mathbf{N}))$. If for each n the inverse system (K_e^n) satisfies the Mittag-Leffler condition, then $R\, lim\, K$ is represented by the complex whose term in degree n is $lim_e\, K_e^n$.*

Proof. In the case that K is in $D^+(Ab(\mathbf{N}))$ this follows from the fact that each system $(K_e^n)_e$ is acyclic for $R\, lim$ (see above) and Derived Categories, Proposition 11.15.8. In fact, the same result holds for unbounded complexes, see Derived Categories, Lemma 11.29.2. $\square$

The products in the following lemma can be seen as termwise products of complexes or as products in the derived category $D(Ab)$, see Injectives, Remark 17.17.6.

Lemma 39.21.2. *Let $K = (K_e^\bullet)$ be an object of $D(Ab(\mathbf{N}))$. There exists a canonical distinguished triangle*

$$R\, lim\, K \to \prod\nolimits_e K_e^\bullet \to \prod\nolimits_e K_e^\bullet \to R\, lim\, K[1]$$

in $D(Ab)$ where the middle map fits into the commutative diagrams

$$\begin{tikzcd} \prod_e K_e^\bullet \arrow[r] \arrow[d] & \prod_e K_e^\bullet \arrow[d] \\ K_e^\bullet \oplus K_{e+1}^\bullet \arrow[r, "1-\pi"] & K_e^\bullet \end{tikzcd}$$

whose vertical maps are projections and where $\pi : K_{e+1}^\bullet \to K_e^\bullet$ is the transition map of the system.

Proof. Suppose that all the transition maps $K_{e+1}^\bullet \to K_e^\bullet$ are surjective. Then the map of complexes $\prod_e K_e^\bullet \to \prod_e K_e^\bullet$ of the statement of the lemma is surjective with kernel equal to the complex with term $lim_e K_e^n$ in degree n. Since this complex computes $R\,lim\,K$ by Lemma 39.21.1 we see that the lemma holds in this case.

In general one uses that there exists a quasi-isomorphism $K \to K'$ in $D(Ab(\mathbf{N}))$ such that the preceding argument applies to K'. Namely, given any complex in $Ab(\mathbf{N})$ there exists a quasi-isomorphism to a complex whose terms are injective objects of $Ab(\mathbf{N})$, see for example Injectives, Theorem 17.16.6. (We encourage the reader to find a direct argument him/herself in this special case.) Note that $\prod K_e^\bullet$ is quasi-isomorphic to $\prod (K')_e^\bullet$ as products are exact in Ab, whence the result for K' does imply the result for K. □

Lemma 39.21.3. *With notation as in Lemma 39.21.2 the long exact cohomology sequence associated to the distinguished triangle breaks up into short exact sequences*

$$0 \to R^1\,lim_e\, H^{p-1}(K_e^\bullet) \to H^p(R\,lim\,K) \to lim_e\, H^p(K_e^\bullet) \to 0$$

Proof. The long exact sequence of the distinguished triangle is

$$\ldots \to H^p(R\,lim\,K) \to \prod\nolimits_e H^p(K_e^\bullet) \to \prod\nolimits_e H^p(K_e^\bullet) \to H^{p+1}(R\,lim\,K) \to \ldots$$

The map in the middle has kernel $lim_e\, H^p(K_e^\bullet)$ by its explict description given in the lemma. Moreover, the cokernel of this map is $R^1\,lim_e\, H^p(K_e^\bullet)$ by an application of Lemma 39.21.2 to the case of an inverse system of abelian groups (placed in degree 0). The lemma follows. □

A sheaf of rings on $\mathbf{N}$ is just an inverse system of rings (A_e). A sheaf of modules over (A_e) is an inverse system (M_e) of abelian groups such that each M_e is an A_e-module and the transition maps $M_{e+1} \to M_e$ are A_{e+1}-module maps. The results on cohomology above apply to sheaves of modules as it is true in general that cohomology of groups and modules agree, see Cohomology on Sites, Lemma 19.12.4. Alternatively, one can rerun the arguments above for the case of modules. In particular we obtain a derived $R\,lim$ on modules

$$R\,lim : D(Mod(\mathbf{N}, (A_e))) \longrightarrow D(A)$$

where $A = lim\,A_e$ is the global sections of our given sheaf of modules. As in the case of abelian groups an object $M = (M_e^\bullet)$ of $D(Mod(\mathbf{N}, (A_e)))$ is an inverse system of complexes of modules, which is not the same thing as an inverse system of objects in the derived categories. However, it turns out one can still define $R\,lim$ of such a system well defined up to noncanonical isomorphism.

Remark 39.21.4. Suppose that we have an inverse system of rings (A_e) as above. Now suppose that we have an inverse system of objects $K_e^\bullet$ of $D(A_e)$. More precisely, suppose that we are given

(1) for every e an object $K_e^\bullet$ of $D(A_e)$, and
(2) for every e a map $\varphi_e : K_{e+1}^\bullet \to K_e^\bullet$ of $D(A_{e+1})$ where we think of $K_e^\bullet$ as an object of $D(A_{e+1})$ by restriction via the restriction map $A_{e+1} \to A_e$.

To be completely clear, by our definitions each $K_e^\bullet$ is a complex of A_e-modules, but the maps φ_e are in the derived category, hence may not be given by maps of complexes. We claim that there exists an object $M = (M_e^\bullet) \in D(Mod(\mathbf{N}, (A_e)))$ and isomorphisms $\psi_e : M_e^\bullet \to K_e^\bullet$ in

$D(A_e)$ such that the diagrams

$$\begin{tikzcd} M_{e+1}^\bullet \arrow[r, "\psi_{e+1}"'] \arrow[d] & K_{e+1}^\bullet \arrow[d, "\varphi_e"] \\ M_e^\bullet \arrow[r, "\psi_e"] & K_e^\bullet \end{tikzcd}$$

commute in $D(A_{e+1})$. Namely, set $M_1^\bullet = K_1^\bullet$. Suppose we have constructed $M_n^\bullet \to M_{n-1}^\bullet \to \ldots \to M_1^\bullet$ and maps of complexes $\psi_e : M_e^\bullet \to K_e^\bullet$ such that the diagrams above commute for all $e < n$. Then we consider the diagram

$$\begin{tikzcd} & M_n^\bullet \arrow[d, "\psi_n"] \\ K_{n+1}^\bullet \arrow[r, "\varphi_n"] & K_n^\bullet \end{tikzcd}$$

in $D(A_{n+1})$. By the definition of morphisms in $D(A_{n+1})$ we can find a quasi-isomorphism $\psi_{n+1} : M_{n+1}^\bullet \to K_{n+1}^\bullet$ of complexes of A_{n+1}-modules such that there exists a morphism of complexes $M_{n+1}^\bullet \to M_n^\bullet$ of A_{n+1}-modules representing the composition $\psi_n^{-1} \circ \varphi_n \circ \psi_{n+1}$ in $D(A_{n+1})$. Thus the claim holds by induction.

A priori there are many isomorphism classes of objects M of $D(Mod(\mathbf{N}, (A_e)))$ which give rise to the system $(K_e^\bullet, \varphi_e)$ as above. For each such M we can consider the complex $R\,lim\,M \in D(A)$ where $A = lim\,A_e$. By Lemma 39.21.2 there exists a canonical distinguished triangle

$$R\,lim\,M \to \prod\nolimits_e K_e^\bullet \to \prod\nolimits_e K_e^\bullet \to R\,lim\,M[1]$$

in $D(A)$. Hence we see that the isomorphism class of $R\,lim\,M$ in $D(A)$ is independent of the choices made in constructing M, by axiom TR3 of triangulated categories and Derived Categories, Lemma 11.4.3.

39.22. Crystals in quasi-coherent modules

In Situation 39.9.1. Set $X = Spec(C)$ and $S = Spec(A)$. We are going to classify crystals in quasi-coherent modules on Cris(X/S). Before we do so we fix some notation.

Choose a polynomial ring $P = A[x_i]$ over A and a surjection $P \to C$ of A-algebras with kernel $J = \mathrm{Ker}(P \to C)$. Set

(39.22.0.1) $$D = lim_e\, D_{P,\gamma}(J)/p^e D_{P,\gamma}(J)$$

for the p-adically completed divided power envelope. This ring comes with a divided power ideal $\bar{J}$ and divided power structure $\bar{\gamma}$, see Lemma 39.9.5. Set $D_e = D/p^e D$ and denote $\bar{J}_e$ the image of $\bar{J}$ in D_e. We will use the short hand

(39.22.0.2) $$\Omega_D = lim_e\, \Omega_{D_e/A,\bar{\gamma}} = lim_e\, \Omega_{D/A,\bar{\gamma}}/p^e\Omega_{D/A,\bar{\gamma}}$$

for the p-adic completion of the module of divided power differentials, see Lemma 39.10.12. It is also the p-adic completion of $\Omega_{D_{P,\gamma}(J)/A,\bar{\gamma}}$ which is free on $\mathrm{d}x_i$, see Lemma 39.10.6. Hence any element of Ω_D can be written uniquely as a sum $\sum f_i \mathrm{d}x_i$ with for all e only finitely many f_i not in $p^e D$. Moreover, the maps $\mathrm{d}_{D_e/A,\bar{\gamma}} : D_e \to \Omega_{D_e/A,\bar{\gamma}}$ fit together to define a divided power A-derivation

(39.22.0.3) $$\mathrm{d} : D \longrightarrow \Omega_D$$

on p-adic completions.

We will also need the ``products $Spec(D(n))$ of $Spec(D)$", see Proposition 39.26.1 and its proof for an explanation. Formally these are defined as follows. For $n \geq 0$ let $J(n) = \text{Ker}(P \otimes_A \ldots \otimes_A P \to C)$ where the tensor product has $n+1$ factors. We set

$$D(n) = lim_e \, D_{P\otimes_A \ldots \otimes_A P,\gamma}(J(n))/p^e D_{P\otimes_A \ldots \otimes_A P,\gamma}(J(n)) \tag{39.22.0.4}$$

equal to the p-adic completion of the divided power envelope. We denote $\bar{J}(n)$ its divided power ideal and $\bar{\gamma}(n)$ its divided powers. We also introduce $D(n)_e = D(n)/p^e D(n)$ as well as the p-adically completed module of differentials

$$\Omega_{D(n)} = lim_e \, \Omega_{D(n)_e/A,\bar{\gamma}} = lim_e \, \Omega_{D(n)/A,\bar{\gamma}}/p^e \Omega_{D(n)/A,\bar{\gamma}} \tag{39.22.0.5}$$

and derivation

$$\mathrm{d} : D(n) \longrightarrow \Omega_{D(n)} \tag{39.22.0.6}$$

Of course we have $D = D(0)$. Note that the rings $D(0), D(1), D(2), \ldots$ form a cosimplicial object in the category of divided power rings.

Lemma 39.22.1. *Let D and $D(n)$ be as in (39.22.0.1) and (39.22.0.4). The coprojection $P \to P \otimes_A \ldots \otimes_A P$, $f \mapsto f \otimes 1 \otimes \ldots \otimes 1$ induces an isomorphism*

$$D(n) = lim_e \, D\langle \xi_i(j)\rangle / p^e D\langle \xi_i(j)\rangle \tag{39.22.1.1}$$

of algebras over D with

$$\xi_i(j) = x_i \otimes 1 \otimes \ldots \otimes 1 - 1 \otimes \ldots \otimes 1 \otimes x_i \otimes 1 \otimes \ldots \otimes 1$$

for $j = 1, \ldots, n$.

Proof. We have

$$P \otimes_A \ldots \otimes_A P = P[\xi_i(j)]$$

and $J(n)$ is generated by J and the elements $\xi_i(j)$. Hence the lemma follows from Lemma 39.6.5. □

Lemma 39.22.2. *Let D and $D(n)$ be as in (39.22.0.1) and (39.22.0.4). Then $(D, \bar{J}, \bar{\gamma})$ and $(D(n), \bar{J}(n), \bar{\gamma}(n))$ are objects of $Cris^\wedge(C/A)$, see Remark 39.9.4, and*

$$D(n) = \coprod\nolimits_{j=0,\ldots,n} D$$

in $Cris^\wedge(C/A)$.

Proof. The first assertion is clear. For the second, if $(B \to C, \delta)$ is an object of $\text{Cris}^\wedge(C/A)$, then we have

$$\text{Mor}_{\text{Cris}^\wedge(C/A)}(D, B) = \text{Hom}_A((P, J), (B, \text{Ker}(B \to C)))$$

and similarly for $D(n)$ replacing (P, J) by $(P \otimes_A \ldots \otimes_A P, J(n))$. The property on coproducts follows as $P \otimes_A \ldots \otimes_A P$ is a coproduct. □

In the lemma below we will consider pairs (M, ∇) satisfying the following conditions

(1) M is a p-adically complete D-module,
(2) $\nabla : M \to M \otimes^\wedge_D \Omega_D$ is a connection, i.e., $\nabla(fm) = m \otimes \mathrm{d}f + f\nabla(m)$,
(3) ∇ is integrable (see Remark 39.10.10), and
(4) ∇ is *topologically quasi-nilpotent*: If we write $\nabla(m) = \sum \theta_i(m)\mathrm{d}x_i$ for some operators $\theta_i : M \to M$, then for any $m \in M$ there are only finitely many pairs (i, k) such that $\theta_i^k(m) \notin pM$.

The operators θ_i are sometimes denoted $\nabla_{\partial/\partial x_i}$ in the literature. In the following lemma we construct a functor from crystals in quasi-coherent modules on $\text{Cris}(X/S)$ to the category of such pairs. We will show this functor is an equivalent in Proposition 39.22.4.

Lemma 39.22.3. *In the situation above there is a functor*

$$\begin{matrix} \textit{crystals in quasi-coherent} \\ \mathcal{O}_{X/S}\textit{-modules on } \mathit{Cris}(X/S) \end{matrix} \longrightarrow \begin{matrix} \textit{pairs } (M, \nabla) \textit{ satisfying} \\ \textit{(1), (2), (3), and (4)} \end{matrix}$$

Proof. Let $\mathcal{F}$ be a crystal in quasi-coherent modules on X/S. Set $T_e = \mathit{Spec}(D_e)$ so that $(X, T_e, \bar\gamma)$ is an object of $\text{Cris}(X/S)$ for $e \gg 0$. We have morphisms

$$(X, T_e, \bar\gamma) \to (X, T_{e+1}, \bar\gamma) \to \ldots$$

which are closed immersions. We set

$$M = \mathit{lim}_e\, \Gamma((X, T_e, \bar\gamma), \mathcal{F}) = \mathit{lim}_e\, \Gamma(T_e, \mathcal{F}_{T_e}) = \mathit{lim}_e\, M_e$$

Note that since $\mathcal{F}$ is locally quasi-coherent we have $\mathcal{F}_{T_e} = \widetilde{M_e}$. Since $\mathcal{F}$ is a crystal we have $M_e = M_{e+1}/p^e M_{e+1}$. Hence we see that $M_e = M/p^e M$ and that M is p-adically complete.

By Lemma 39.19.1 we know that $\mathcal{F}$ comes endowed with a canonical integrable connection $\nabla : \mathcal{F} \to \mathcal{F} \otimes \Omega_{X/S}$. If we evaluate this connection on the objects T_e constructed above we obtain a canonical integrable connection

$$\nabla : M \longrightarrow M \otimes^\wedge_D \Omega_D$$

To see that this is topologically nilpotent we work out what this means.

Now we can do the same procedure for the rings $D(n)$. This produces a p-adically complete $D(n)$-module $M(n)$. Again using the crystal property of $\mathcal{F}$ we obtain isomorphisms

$$M \otimes^\wedge_{D, p_0} D(1) \to M(1) \leftarrow M \otimes^\wedge_{D, p_1} D(1)$$

compare with the proof of Lemma 39.19.1. Denote c the composition from left to right. Pick $m \in M$. Write $\xi_i = x_i \otimes 1 - 1 \otimes x_i$. Using (39.22.1.1) we can write uniquely

$$c(m \otimes 1) = \sum\nolimits_K \theta_K(m) \otimes \prod \xi_i^{[k_i]}$$

for some $\theta_K(m) \in M$ where the sum is over multi-indices $K = (k_i)$ with $k_i \geq 0$ and $\sum k_i < \infty$. Set $\theta_i = \theta_K$ where K has a 1 in the ith spot and zeros elsewhere. We have

$$\nabla(m) = \sum \theta_i(m) \mathrm{d}x_i.$$

as can be seen by comparing with the definition of ∇. Namely, the defining equation is $p_1^*m = \nabla(m) - c(p_0^*m)$ in Lemma 39.19.1 but the sign works out because in the stacks project we consistently use $\mathrm{d}f = p_1(f) - p_0(f)$ modulo the ideal of the diagonal squared, and hence $\xi_i = x_i \otimes 1 - 1 \otimes x_i$ maps to $-\mathrm{d}x_i$ modulo the ideal of the diagonal squared.

Denote $q_i : D \to D(2)$ and $q_{ij} : D(1) \to D(2)$ the coprojections corresponding to the indices i, j. As in the last paragraph of the proof of Lemma 39.19.1 we see that

$$q_{02}^* c = q_{12}^* c \circ q_{01}^* c.$$

This means that

$$\sum\nolimits_{K''} \theta_{K''}(m) \otimes \prod \zeta_i''^{[k_i'']} = \sum\nolimits_{K', K} \theta_{K'}(\theta_K(m)) \otimes \prod \zeta_i'^{[k_i']} \prod \zeta_i^{[k_i]}$$

in $M \otimes^{\wedge}_{D,q_2} D(2)$ where

$$\zeta_i = x_i \otimes 1 \otimes 1 - 1 \otimes x_i \otimes 1,$$
$$\zeta_i' = 1 \otimes x_i \otimes 1 - 1 \otimes 1 \otimes x_i,$$
$$\zeta_i'' = x_i \otimes 1 \otimes 1 - 1 \otimes 1 \otimes x_i.$$

In particular $\zeta_i'' = \zeta_i + \zeta_i'$ and we have that $D(2)$ is the p-adic completion of the divided power polynomial ring in ζ_i, ζ_i' over $q_2(D)$, see Lemma 39.22.1. Comparing coefficients in the expression above it follows immediately that $\theta_i \circ \theta_j = \theta_j \circ \theta_i$ (this provides an alternative proof of the integrability of ∇) and that

$$\theta_K(m) = (\prod \theta_i^{k_i})(m).$$

In particular, as the sum expressing $c(m \otimes 1)$ above has to converge p-adically we conclude that for each i and each $m \in M$ only a finite number of $\theta_i^k(m)$ are allowed to be nonzero modulo p. □

Proposition 39.22.4. *The functor*

$$\begin{matrix} \textit{crystals in quasi-coherent} \\ \mathcal{O}_{X/S}\textit{-modules on } \mathrm{Cris}(X/S) \end{matrix} \longrightarrow \begin{matrix} \textit{pairs } (M, \nabla) \textit{ satisfying} \\ \textit{(1), (2), (3), and (4)} \end{matrix}$$

of Lemma 39.22.3 is an equivalence of categories.

Proof. Let (M, ∇) be given. We are going to construct a crystal in quasi-coherent modules $\mathcal{F}$. Write $\nabla(m) = \sum \theta_i(m) \mathrm{d}x_i$. Then $\theta_i \circ \theta_j = \theta_j \circ \theta_i$ and we can set $\theta_K(m) = (\prod \theta_i^{k_i})(m)$ for any multi-index $K = (k_i)$ with $k_i \geq 0$ and $\sum k_i < \infty$.

Let (U, T, δ) be any object of $\mathrm{Cris}(X/S)$ with T affine. Say $T = Spec(B)$ and the ideal of $U \to T$ is $J_B \subset B$. By Lemma 39.9.6 there exists an integer e and a morphism

$$f : (U, T, \delta) \longrightarrow (X, T_e, \bar{\gamma})$$

where $T_e = Spec(D_e)$ as in the proof of Lemma 39.22.3. Choose such an e and f; denote $f : D \to B$ also the corresponding divided power A-algebra map. We will set $\mathcal{F}_T$ equal to the quasi-coherent sheaf of $\mathcal{O}_T$-modules associated to the B-module

$$M \otimes_{D,f} B.$$

However, we have to show that this is independent of the choice of f. Suppose that $g : D \to B$ is a second such morphism. Since f and g are morphisms in $\mathrm{Cris}(X/S)$ we see that the image of $f - g : D \to B$ is contained in the divided power ideal J_B. Write $\xi_i = f(x_i) - g(x_i) \in J_B$. By analogy with the proof of Lemma 39.22.3 we define an isomorphism

$$c_{f,g} : M \otimes_{D,f} B \longrightarrow M \otimes_{D,g} B$$

by the formula

$$m \otimes 1 \longmapsto \sum\nolimits_K \theta_K(m) \otimes \prod \xi_i^{[k_i]}$$

which makes sense by our remarks above and the fact that ∇ is topologically quasi-nilpotent (so the sum is finite!). A computation shows that

$$c_{g,h} \circ c_{f,g} = c_{f,h}$$

if given a third morphism $h : (U, T, \delta) \longrightarrow (X, T_e, \bar{\gamma})$. It is also true that $c_{f,f} = 1$. Hence these maps are all isomorphisms and we see that the module $\mathcal{F}_T$ is independent of the choice of f.

If $a : (U', T', \delta') \to (U, T, \delta)$ is a morphism of affine objects of $\text{Cris}(X/S)$, then choosing $f' = f \circ a$ it is clear that there exists a canonical isomorphism $a^*\mathcal{F}_T \to \mathcal{F}_{T'}$. We omit the verification that this map is independent of the choice of f. Using these maps as the restriction maps it is clear that we obtain a crystal in quasi-coherent modules on the full subcategory of $\text{Cris}(X/S)$ consisting of affine objects. We omit the proof that this extends to a crystal on all of $\text{Cris}(X/S)$. We also omit the proof that this procedure is a functor and that it is quasi-inverse to the functor constructed in Lemma 39.22.3. □

Lemma 39.22.5. *In Situation 39.9.1. Let $A \to P' \to C$ be ring maps with $A \to P'$ smooth and $P' \to C$ surjective with kernel J'. Let D' be the p-adic completion of $D_{P',\gamma}(J')$. There are homomorphisms of divided power A-algebras*

$$a : D \longrightarrow D', \quad b : D' \longrightarrow D$$

compatible with the maps $D \to C$ and $D' \to C$ such that $a \circ b = \text{id}_{D'}$. These maps induce an equivalence of categories of pairs (M, ∇) satisfying (1), (2), (3), and (4) over D and pairs (M', ∇') satisfying (1), (2), (3), and (4) over D'. In particular, the equivalence of categories of Proposition 39.22.4 also holds for the corresponding functor towards pairs over D'.

Proof. We can pick the map $P = A[x_i] \to C$ such that it factors through a surjection of A-algebras $P \to P'$ (we may have to increase the number of variables in P to do this). Hence we obtain a surjective map $a : D \to D'$ by functoriality of divided power envelopes and completion. Pick e large enough so that D_e is a divided power thickening of C over A. Then $D_e \to C$ is a surjection whose kernel is locally nilpotent, see Lemma 39.2.6. Setting $D'_e = D'/p^e D'$ we see that the kernel of $D_e \to D'_e$ is locally nilpotent. Hence by Algebra, Lemma 7.127.16 we can find a lift $\beta_e : P' \to D_e$ of the map $P' \to D'_e$. Note that $D_{e+i+1} \to D_{e+i} \times_{D'_{e+i}} D'_{e+i+1}$ is surjective with square zero kernel for any $i \geq 0$ because $p^{e+i}D \to p^{e+i}D'$ is surjective. Applying the usual lifting property (Algebra, Proposition 7.127.13) succesively to the diagrams

$$\begin{tikzcd} P' \arrow[r] & D_{e+i} \times_{D'_{e+i}} D'_{e+i+1} \\ A \arrow[u] \arrow[r] & D_{e+i+1} \arrow[u] \end{tikzcd}$$

we see that we can find an A-algebra map $\beta : P' \to D$ whose composition with a is the given map $P' \to D'$. By the universal property of the divided power envelope we obtain a map $D_{P',\gamma}(J') \to D$. As D is p-adically complete we obtain $b : D' \to D$ such that $a \circ b = \text{id}_{D'}$.

Consider the base change functor

$$(M, \nabla) \longmapsto (M \otimes^\wedge_D D', \nabla')$$

from pairs for D to pairs for D', see Remark 39.10.11. Similarly, we have the base change functor corresponding to the divided power homomorphism $D' \to D$. To finish the proof of the lemma we have to show that the base change for the compositions $b \circ a : D \to D$ and $a \circ b : D' \to D'$ are isomorphic to the identity functor. This is clear for the second as $a \circ b = \text{id}_{D'}$. To prove it for the first, we use the functorial isomorphism

$$c_{\text{id}_D, b\circ a} : M \otimes_{D,\text{id}_D} D \longrightarrow M \otimes_{D,b\circ a} D$$

of the proof of Proposition 39.22.4. The only thing to prove is that these maps are horizontal, which we omit.

The last statement of the proof now follows. □

Remark 39.22.6. The equivalence of Proposition 39.22.4 holds if we start with a surjection $P \to C$ where P/A satisfies the strong lifting property of Algebra, Lemma 7.127.16. To prove this we can argue as in the proof of Lemma 39.22.5. (Details will be added here if we ever need this.) Presumably there is also a direct proof of this result, but the advantage of using polynomial rings is that the rings $D(n)$ are p-adic completions of divided power polynomial rings and the algebra is simplified.

39.23. General remarks on cohomology

In this section we do a bit of work to translate the cohomology of modules on the cristalline site of an affine scheme into an algebraic question.

Lemma 39.23.1. *In Situation 39.11.5. Let $\mathcal{F}$ be a locally quasi-coherent $\mathcal{O}_{X/S}$-module on $Cris(X/S)$. Then we have*

$$H^p((U,T,\delta),\mathcal{F}) = 0$$

for all $p > 0$ and all (U,T,δ) with T or U affine.

Proof. As $U \to T$ is a thickening we see that U is affine if and only if T is affine, see Limits, Lemma 27.7.1. Having said this, let us apply Cohomology on Sites, Lemma 19.11.8 to the collection $\mathcal{B}$ of affine objects (U,T,δ) and the collection Cov of affine open coverings $\mathcal{U} = \{(U_i,T_i,\delta_i) \to (U,T,\delta)\}$. The Čech complex $\check{C}^*(\mathcal{U},\mathcal{F})$ for such a covering is simply the Cech complex of the quasi-coherent $\mathcal{O}_T$-module $\mathcal{F}_T$ (here we are using the assumption that $\mathcal{F}$ is locally quasi-coherent) with respect to the affine open covering $\{T_i \to T\}$ of the affine scheme T. Hence the Čech cohomology is zero by Coherent, Lemma 25.2.4 and 25.2.2. Thus the hypothesis of Cohomology on Sites, Lemma 19.11.8 are satisfied and we win. □

Lemma 39.23.2. *In Situation 39.11.5. Assume moreover X and S are affine schemes. Consider the full subcategory $\mathcal{C} \subset Cris(X/S)$ consisting of divided power thickenings (X,T,δ) endowed with the chaotic topology (see Sites, Example 9.6.6). For any locally quasi-coherent $\mathcal{O}_{X/S}$-module $\mathcal{F}$ we have*

$$R\Gamma(\mathcal{C},\mathcal{F}|_\mathcal{C}) = R\Gamma(Cris(X/S),\mathcal{F})$$

Proof. We will use without further mention that $\mathcal{C}$ and $\text{Cris}(X/S)$ have products and fibre products, see Lemma 39.12.2. Note that the inclusion functor $u : \mathcal{C} \to \text{Cris}(X/S)$ is fully faithful, continuous and commutes with products and fibre products. We claim it defines a morphism of ringed sites

$$f : (\text{Cris}(X/S),\mathcal{O}_{X/S}) \longrightarrow (Sh(\mathcal{C}),\mathcal{O}_{X/S}|_\mathcal{C})$$

To see this we will use Sites, Lemma 9.14.5. Note that $\mathcal{C}$ has fibre products and u commutes with them so the categories $\mathcal{I}^u_{(U,T,\delta)}$ are disjoint unions of directed categories (by Sites, Lemma 9.5.1 and Categories, Lemma 4.17.3). Hence it suffices to show that $\mathcal{I}^u_{(U,T,\delta)}$ is nonempty and directed. Nonempty follows from Lemma 39.9.6 and connected follows from the fact that $\mathcal{C}$ has products and that u commutes with them (compare with the proof of Sites, Lemma 9.5.2).

Note that $f_*\mathcal{F} = \mathcal{F}|_{\mathcal{C}}$. Hence the lemma follows if $R^p f_*\mathcal{F} = 0$ for $p > 0$, see Cohomology on Sites, Lemma 19.14.5. By Cohomology on Sites, Lemma 19.8.4 it suffices to show that $H^p((X, T, \delta), \mathcal{F}) = 0$ for all (X, T, δ). This follows from Lemma 39.23.1. □

Lemma 39.23.3. *In Situation 39.9.1. Set $\mathcal{C} = (Cris(C/A))^{opp}$ and $\mathcal{C}^\wedge = (Cris^\wedge(C/A))^{opp}$ endowed with the chaotic topology, see Remark 39.9.4 for notation. There is a morphism of topoi*

$$g : Sh(\mathcal{C}) \longrightarrow Sh(\mathcal{C}^\wedge)$$

such that if $\mathcal{F}$ is a sheaf of abelian groups on $\mathcal{C}$, then

$$R^p g_*\mathcal{F}(B \to C, \delta) = \begin{cases} lim_e\, \mathcal{F}(B_e \to C, \delta) & \text{if } p = 0 \\ R^1\, lim_e\, \mathcal{F}(B_e \to C, \delta) & \text{if } p = 1 \\ 0 & \text{else} \end{cases}$$

where $B_e = B/p^e B$ for $e \gg 0$.

Proof. Any functor between categories defines a morphism between chaotic topoi in the same direction, for example because such a functor can be considered as a cocontinuous functor between sites, see Sites, Section 9.19. Proof of the description of $g_*\mathcal{F}$ is omitted. Note that in the statement we take $(B_e \to C, \delta)$ is an object of Cris(C/A) only for e large enough. Let $\mathcal{I}$ be an injective abelian sheaf on $\mathcal{C}$. Then the transition maps

$$\mathcal{I}(B_e \to C, \delta) \leftarrow \mathcal{I}(B_{e+1} \to C, \delta)$$

are surjective as the morphisms

$$(B_e \to C, \delta) \longrightarrow (B_{e+1} \to C, \delta)$$

are monomorphisms in the category $\mathcal{C}$. Hence for an injective abelian sheaf both sides of the displayed formula of the lemma agree. Taking an injective resolution of $\mathcal{F}$ one easily obtains the result (sheaves are presheaves, so exactness is measured on the level of groups of sections over objects). □

Lemma 39.23.4. *Let $\mathcal{C}$ be a category endowed with the chaotic topology. Let X be an object of $\mathcal{C}$ such that every object of $\mathcal{C}$ has a morphism towards X. Assume that $\mathcal{C}$ has products. Then for every abelian sheaf $\mathcal{F}$ on $\mathcal{C}$ the total cohomology $R\Gamma(\mathcal{C}, \mathcal{F})$ is represented by the complex*

$$\mathcal{F}(X) \to \mathcal{F}(X \times X) \to \mathcal{F}(X \times X \times X) \to \ldots$$

associated to the cosimplicial abelian group $[n] \mapsto \mathcal{F}(X^n)$.

Proof. Note that $H^q(X^p, \mathcal{F}) = 0$ for all $q > 0$ as sheaves are presheaves on $\mathcal{C}$. The assumption on X is that $h_X \to *$ is surjective. Using that $H^q(X, \mathcal{F}) = H^p(h_X, \mathcal{F})$ and $H^p(\mathcal{C}, \mathcal{F}) = H^p(*, \mathcal{F})$ we see that our statement is a special case of Cohomology on Sites, Lemma 19.13.2. □

39.24. Cosimplicial preparations

In this section we compare crystalline cohomology with de Rham cohomology. We follow [**Bd11**].

Example 39.24.1. Suppose that A_* is any cosimplicial ring. Consider the cosimplicial module M_* defined by the rule

$$M_n = \bigoplus\nolimits_{i=0,\ldots,n} A_n e_i$$

For a map $f : [n] \to [m]$ define $M_*(f) : M_n \to M_m$ to be the unique $A_*(f)$-linear map which maps e_i to $e_{f(i)}$. We claim the identity on M_* is homotopic to 0. Namely, a homotopy is given by a map of cosimplicial modules

$$h : M_* \longrightarrow \mathrm{Hom}(\Delta[1], M_*)$$

see Section 39.20. For $j \in \{0, \ldots, n+1\}$ we let $\alpha^n_j : [n] \to [1]$ be the map defined by $\alpha^n_j(i) = 0 \Leftrightarrow i < j$. Then $\Delta[1]_n = \{\alpha^n_0, \ldots, \alpha^n_{n+1}\}$ and correspondingly $\mathrm{Hom}(\Delta[1], M_*)_n = \prod_{j=0,\ldots,n+1} M_n$, see Simplicial, Sections 14.24 and 14.26. Instead of using this product representation, we think of an element in $\mathrm{Hom}(\Delta[1], M_*)_n$ as a function $\Delta[1]_n \to M_n$. Using this notation, we define h in degree n by the rule

$$h_n(e_i)(\alpha^n_j) = \begin{cases} e_i & \text{if} \quad i < j \\ 0 & \text{else} \end{cases}$$

We first check h is a morphism of cosimplicial modules. Namely, for $f : [n] \to [m]$ we will show that

$$h_m \circ M_*(f) = \mathrm{Hom}(\Delta[1], M_*)(f) \circ h_n \tag{39.24.1.1}$$

The left hand side of (39.24.1.1) evaluted at e_i and then in turn evaluated at α^m_j is

$$h_m(e_{f(i)})(\alpha^m_j) = \begin{cases} e_{f(i)} & \text{if} \quad f(i) < j \\ 0 & \text{else} \end{cases}$$

Note that $\alpha^m_j \circ f = \alpha^n_{j'}$, where $0 \leq j' \leq n+1$ is the unique index such that $f(i) < j$ if and only if $i < j'$. Thus the right hand side of (39.24.1.1) evaluted at e_i and then in turn evaluated at α^m_j is

$$M_*(f)(h_n(e_i)(\alpha^m_j \circ f) = M_*(f)(h_n(e_i)(\alpha^n_{j'})) = \begin{cases} e_{f(i)} & \text{if} \quad i < j' \\ 0 & \text{else} \end{cases}$$

It follows from our description of j' that the two answers are equal. Hence h is a map of cosimplicial modules. Let $0 : \Delta[0] \to \Delta[1]$ and $1 : \Delta[0] \to \Delta[1]$ be the obvious maps, and denote $ev_0, ev_1 : \mathrm{Hom}(\Delta[1], M_*) \to M_*$ the corresponding evaluation maps. The reader verifies readily that the the compositions

$$ev_0 \circ h, ev_1 \circ h : M_* \longrightarrow M_*$$

are 0 and 1 respectively, whence h is the desired homotopy between 0 and 1.

Lemma 39.24.2. *With notation as in (39.22.0.5) the complex*

$$\Omega_{D(0)} \to \Omega_{D(1)} \to \Omega_{D(2)} \to \cdots$$

is homotopic to zero as a $D(*)$-cosimplicial module.

Proof. We are going to use the principle of Simplicial, Lemma 14.26.3 and more specifically Lemma 39.20.1 which tells us that homotopic maps between (co)simplicial objects are transformed by any functor into homotopic maps. The complex of the lemma is equal to the p-adic completion of the base change of the cosimplicial module

$$M_* = \left(\Omega_{P/A} \to \Omega_{P\otimes_A P/A} \to \Omega_{P\otimes_A P\otimes_A P/A} \to \cdots\right)$$

via the cosimplicial ring map $P \otimes_A \ldots \otimes_A P \to D(n)$. This follows from Lemma 39.10.6, see comments following (39.22.0.2). Hence it suffices to show that the cosimplicial module M_* is homotopic to zero (uses base change and p-adic completion). We can even assume

$A = \mathbf{Z}$ and $P = \mathbf{Z}[\{x_i\}_{i \in I}]$ as we can use base change with $\mathbf{Z} \to A$. In this case $P^{\otimes n+1}$ is the polynomial algebra on the elements

$$x_i(e) = 1 \otimes \cdots \otimes x_i \otimes \cdots \otimes 1$$

with x_i in the eth slot. The modules of the complex are free on the generators $\mathrm{d}x_i(e)$. Note that if $f : [n] \to [m]$ is a map then we see that

$$M_*(f)(\mathrm{d}x_i(e)) = \mathrm{d}x_i(f(e))$$

Hence we see that M_* is a direct sum over I of copies of the module studied in Example 39.24.1 and we win. □

Lemma 39.24.3. *With notation as in (39.22.0.4) and (39.22.0.5), given any cosimplicial module M_* over $D(*)$ and $i > 0$ the cosimplicial module*

$$M_0 \otimes^\wedge_{D(0)} \Omega^i_{D(0)} \to M_1 \otimes^\wedge_{D(1)} \Omega^i_{D(1)} \to M_2 \otimes^\wedge_{D(2)} \Omega^i_{D(2)} \to \ldots$$

is homotopic to zero, where $\Omega^i_{D(n)}$ is the p-adic completion of the ith exterior power of $\Omega_{D(n)}$.

Proof. By Lemma 39.24.2 the endomorphisms 0 and 1 of $\Omega_{D(*)}$ are homotopic. If we apply the functor $\wedge^i$ we see that the same is true for the cosimplicial module $\wedge^i\Omega_{D(*)}$, see Lemma 39.20.1. Another application of the same lemma shows the p-adic completion $\Omega^i_{D(*)}$ is homotopy equivalent to zero. Tensoring with M_* we see that $M_* \otimes_{D(*)} \Omega^i_{D(*)}$ is homotopic to zero, see Lemma 39.20.1 again. A final application of the p-adic completion functor finishes the proof. □

39.25. Divided power Poincaré lemma

Just the simplest possible version.

Lemma 39.25.1. *Let A be a ring. Let $P = A\langle x_i\rangle$ be a divided power polynomial ring over A. For any A-module M the complex*

$$0 \to M \to M \otimes_A P \to M \otimes_A \Omega^1_{P/A,\delta} \to M \otimes_A \Omega^2_{P/A,\delta} \to \ldots$$

is exact. Let D be the p-adic completion of P. Let Ω^i_D be the p-adic completion of the ith exterior power of $\Omega_{D/A,\delta}$. For any p-adically complete A-module M the complex

$$0 \to M \to M \otimes^\wedge_A D \to M \otimes^\wedge_A \Omega^1_D \to M \otimes^\wedge_A \Omega^2_D \to \ldots$$

is exact.

Proof. It suffices to show that the complex

$$E : (0 \to A \to P \to \Omega^1_{P/A,\delta} \to \Omega^2_{P/A,\delta} \to \ldots)$$

is homotopy equivalent to zero as a complex of A-modules. For every multi-index $K = (k_i)$ we can consider the subcomplex $E(K)$ which in degree j consists of

$$\bigoplus\nolimits_{I=\{i_1,\ldots,i_j\}\subset \mathrm{Supp}(K)} A \prod\nolimits_{i \not\in I} x_i^{[k_i]} \prod\nolimits_{i\in I} x_i^{[k_i-1]} \mathrm{d}x_{i_1} \wedge \ldots \wedge \mathrm{d}x_{i_j}$$

Since $E = \bigoplus E(K)$ we see that it suffices to prove each of the complexes $E(K)$ is homotopic to zero. If $K = 0$, then $E(K) : (A \to A)$ is homotopic to zero. If K has nonempty (finite) support S, then the complex $E(K)$ is isomorphic to the complex

$$0 \to A \to \bigoplus\nolimits_{s\in S} A \to \wedge^2(\bigoplus\nolimits_{s\in S} A) \to \ldots \to \wedge^{\#S}(\bigoplus\nolimits_{s\in S} A) \to 0$$

which is homotopic to zero, for example by More on Algebra, Lemma 12.21.5. □

An alternative (more direct) approach to the following lemma is explained in Example 39.30.2.

Lemma 39.25.2. *Let A be a ring. Let (B, J, δ) be a divided power ring. Let $P = B\langle x_i\rangle$ be a divided power polynomial ring over B with divided power ideal $J = IP + B\langle x_i\rangle_+$ as usual. Let M be a B-module endowed with an integrable connection $\nabla : M \to M \otimes_B \Omega^1_{B/A,\delta}$. Then the map of de Rham complexes*

$$M \otimes_B \Omega^*_{B/A,\delta} \longrightarrow M \otimes_P \Omega^*_{P/A,\delta}$$

is a quasi-isomorphism. Let D, resp. D' be the p-adic completion of B, resp. P and let Ω^i_D, resp. $\Omega^i_{D'}$ be the p-adic completion of $\Omega^i_{B/A,\delta}$, resp. $\Omega^i_{P/A,\delta}$. Let M be a p-adically complete D-module endowed with an integral connection $\nabla : M \to M \otimes^\wedge_D \Omega^1_D$. Then the map of de Rham complexes

$$M \otimes^\wedge_D \Omega^*_D \longrightarrow M \otimes^\wedge_D \Omega^*_{D'}$$

is a quasi-isomorphism.

Proof. Consider the decreasing filtration F^* on $\Omega^*_{B/A,\delta}$ given by the subcomplexes $F^i(\Omega^*_{B/A,\delta}) = \sigma_{\geq i}\Omega^*_{B/A,\delta}$. See Homology, Section 10.11. This induces a decreasing filtration F^* on $\Omega^*_{P/A,\delta}$ by setting

$$F^i(\Omega^*_{P/A,\delta}) = F^i(\Omega^*_{B/A,\delta}) \wedge \Omega^*_{P/A,\delta}.$$

We have a split short exact sequence

$$0 \to \Omega^1_{B/A,\delta} \otimes_B P \to \Omega^1_{P/A,\delta} \to \Omega^1_{P/B,\delta} \to 0$$

and the last module is free on $\mathrm{d}x_i$. It follows from this that $F^i(\Omega^*_{P/A,\delta}) \to \Omega^*_{P/A,\delta}$ is a termwise split injection and that

$$\mathrm{gr}^i_F(\Omega^*_{B/A,\delta}) = \Omega^i_{B/A,\delta} \otimes_B \Omega^*_{P/B,\delta}$$

as complexes. Thus we can define a filtration F^* on $M \otimes_B \Omega^*_{B/A,\delta}$ by setting

$$F^i(M \otimes_B \Omega^*_{P/A,\delta}) = M \otimes_B F^i(\Omega^*_{P/A,\delta})$$

and we have

$$\mathrm{gr}^i_F(M \otimes_B \Omega^*_{P/A,\delta}) = M \otimes_B \Omega^i_{B/A,\delta} \otimes_B \Omega^*_{P/B,\delta}$$

as complexes. By Lemma 39.25.1 each of these complexes is quasi-isomorphic to $M \otimes_B \Omega^i_{B/A,\delta}$ placed in degree 0. Hence we see that the first displayed map of the lemma is a morphism of filtered complexes which induces a quasi-isomorphism on graded pieces. This implies that it is a quasi-isomorphism, for example by the spectral sequence associated to a filtered complex, see Homology, Section 10.18.

The proof of the second quasi-isomorphism is exactly the same. □

39.26. Cohomology in the affine case

Let's go back to the situation studied in Section 39.22. We start with (A, I, γ) and $A/I \to C$ and set $X = Spec(C)$ and $S = Spec(A)$. Then we choose a polynomial ring P over A and a surjection $P \to C$ with kernel J. We obtain D and $D(n)$ see (39.22.0.1) and (39.22.0.4). Set $T(n)_e = \mathrm{Spec}(D(n)/p^e D(n))$ so that $(X, T(n)_e, \delta(n))$ is an object of $\mathrm{Cris}(X/S)$. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_{X/S}$-modules and set

$$M(n) = lim_e\, \Gamma((X, T(n)_e, \delta(n)), \mathcal{F})$$

for $n = 0, 1, 2, 3, \ldots$. This forms a cosimplicial module over the cosimplicial ring $D(0), D(1), D(2), \ldots$.

Proposition 39.26.1. *With notations as above assume that*

(1) *$\mathcal{F}$ is locally quasi-coherent, and*
(2) *for any morphism $(U, T, \delta) \to (U', T', \delta')$ of Cris(X/S) where $f : T \to T'$ is a closed immersion the map $c_f : f^*\mathcal{F}_{T'} \to \mathcal{F}_T$ is surjective.*

Then the complex

$$M(0) \to M(1) \to M(2) \to \ldots$$

computes $R\Gamma(Cris(X/S), \mathcal{F})$.

Proof. Using assumption (1) and Lemma 39.23.2 we see that $R\Gamma(\text{Cris}(X/S), \mathcal{F})$ is isomorphic to $R\Gamma(\mathcal{C}, \mathcal{F})$. Note that the categories $\mathcal{C}$ used in Lemmas 39.23.2 and 39.23.3 agree. Let $f : T \to T'$ be a closed immersion as in (2). Surjectivity of $c_f : f^*\mathcal{F}_{T'} \to \mathcal{F}_T$ is equivalent to surjectivity of $\mathcal{F}_{T'} \to f_*\mathcal{F}_T$. Hence, if $\mathcal{F}$ satisfies (1) and (2), then we obtain a short exact sequence

$$0 \to \mathcal{K} \to \mathcal{F}_{T'} \to f_*\mathcal{F}_T \to 0$$

of quasi-coherent $\mathcal{O}_{T'}$-modules on T', see Schemes, Section 21.24 and in particular Lemma 21.24.1. Thus, if T' is affine, then we conclude that the restriction map $\mathcal{F}(U', T', \delta') \to \mathcal{F}(U, T, \delta)$ is surjective by the vanishing of $H^1(T', \mathcal{K})$, see Coherent, Lemma 25.2.2. Hence the transition maps of the inverse systems in Lemma 39.23.3 are surjective. We conclude that that $R^pg_*(\mathcal{F}|_{\mathcal{C}}) = 0$ for all $p \geq 1$ where g is as in Lemma 39.23.3. The object D of the category $\mathcal{C}^\wedge$ satisfies the assumption of Lemma 39.23.4 by Lemma 39.9.7 with

$$D \times \ldots \times D = D(n)$$

in $\mathcal{C}$ because $D(n)$ is the $n + 1$-fold coproduct of D in Cris$^\wedge(C/A)$, see Lemma 39.22.2. Thus we win. $\square$

Lemma 39.26.2. *Assumptions and notation as in Proposition 39.26.1. Then*

$$H^j(Cris(X/S), \mathcal{F} \otimes_{\mathcal{O}_{X/S}} \Omega^i_{X/S}) = 0$$

for all $i > 0$ and all $j \geq 0$.

Proof. Using Lemma 39.16.6 it follows that $\mathcal{H} = \mathcal{F} \otimes_{\mathcal{O}_{X/S}} \Omega^i_{X/S}$ also satisfies assumptions (1) and (2) of Proposition 39.26.1. Write $M(n)_e = \Gamma((X, T(n)_e, \delta(n)), \mathcal{F})$ so that $M(n) = lim_e\, M(n)_e$. Then

$$\begin{aligned} lim_e\, \Gamma((X, T(n)_e, \delta(n)), \mathcal{H}) &= lim_e\, M(n)_e \otimes_{D(n)_e} \Omega_{D(n)}/p^e\Omega_{D(n)} \\ &= lim_e\, M(n)_e \otimes_{D(n)} \Omega_{D(n)} \end{aligned}$$

By Lemma 39.24.3 the cosimplicial modules

$$M(0)_e \otimes_{D(0)} \Omega^i_{D(0)} \to M(1)_e \otimes_{D(1)} \Omega^i_{D(1)} \to M(2)_e \otimes_{D(2)} \Omega^i_{D(2)} \to \ldots$$

are homotopic to zero. Because the transition maps $M(n)_{e+1} \to M(n)_e$ are surjective, we see that the inverse limit of the associated complexes are acyclic[5]. Hence the vanshing of cohomology of $\mathcal{H}$ by Proposition 39.26.1. $\square$

[5]Actually, they are even homotopic to zero as the homotopies fit together, but we don't need this. The reason for this roundabout argument is that the limit $lim_e\, M(n)_e \otimes_{D(n)} \Omega^i_{D(n)}$ isn't the p-adic completion of $M(n) \otimes_{D(n)} \Omega^i_{D(n)}$ as with the assumptions of the lemma we don't know that $M(n)_e = M(n)_{e+1}/p^eM(n)_{e+1}$. If $\mathcal{F}$ is a crystal then this does hold.

Proposition 39.26.3. *Assumptions as in Proposition 39.26.1 but now assume that $\mathcal{F}$ is a crystal in quasi-coherent modules. Let (M, ∇) be the corresponding module with connection over D, see Proposition 39.22.4. Then the complex*

$$M \otimes^{\wedge}_D \Omega^*_D$$

computes $R\Gamma(Cris(X/S), \mathcal{F})$.

Proof. We will prove this using the two spectral sequences associated to the double complex $K^{*,*}$ with terms

$$K^{a,b} = M \otimes^{\wedge}_D \Omega^a_{D(b)}$$

What do we know so far? Well, Lemma 39.24.3 tells us that each column $K^{a,*}$, $a > 0$ is acyclic. Proposition 39.26.1 tells us that the first column $K^{0,*}$ is quasi-isomorphic to $R\Gamma(\text{Cris}(X/S), \mathcal{F})$. Hence the first spectral sequence associated to the double complex shows that there is a canonical quasi-isomorphism of $R\Gamma(\text{Cris}(X/S), \mathcal{F})$ with $\text{Tot}(K^{*,*})$.

Next, let's consider the rows $K^{*,b}$. By Lemma 39.22.1 each of the $b+1$ maps $D \to D(b)$ presents $D(b)$ as the p-adic completion of a divided power polynomial algebra over D. Hence Lemma 39.25.2 shows that the map

$$M \otimes^{\wedge}_D \Omega^*_D \longrightarrow M \otimes^{\wedge}_{D(b)} \Omega^*_{D(b)} = K^{*,b}$$

is a quasi-isomorphism. Note that each of these maps defines the *same* map on cohomology (and even the same map in the derived category) as the inverse is given by the co-diagonal map $D(b) \to D$ (corresponding to the multiplication map $P \otimes_A \ldots \otimes_A P \to P$). Hence if we look at the E_1 page of the second spectral sequence we obtain

$$E_1^{a,b} = H^a(M \otimes^{\wedge}_D \Omega^*_D)$$

with differentals

$$E_1^{a,0} \xrightarrow{0} E_1^{a,1} \xrightarrow{1} E_1^{a,2} \xrightarrow{0} E_1^{a,3} \xrightarrow{1} \ldots$$

as each of these is the alternation sum of the given identifications $H^a(M \otimes^{\wedge}_D \Omega^*_D) = E_1^{a,0} = E_1^{a,1} = \ldots$. Thus we see that the E_2 page is equal $H^a(M \otimes^{\wedge}_D \Omega^*_D)$ on the first row and zero elsewhere. It follows that the identification of $M \otimes^{\wedge}_D \Omega^*_D$ with the first row induces a quasi-isomorphism of $M \otimes^{\wedge}_D \Omega^*_D$ with $\text{Tot}(K^{*,*})$. □

Lemma 39.26.4. *Assumptions as in Proposition 39.26.3. Let $A \to P' \to C$ be ring maps with $A \to P'$ smooth and $P' \to C$ surjective with kernel J'. Let D' be the p-adic completion of $D_{P',\gamma}(J')$. Let (M', ∇') be the pair over D' corresponding to $\mathcal{F}$, see Lemma 39.22.5. Then the complex*

$$M' \otimes^{\wedge}_{D'} \Omega^*_{D'}$$

computes $R\Gamma(Cris(X/S), \mathcal{F})$.

Proof. Choose $a : D \to D'$ and $b : D' \to D$ as in Lemma 39.22.5. Note that the base change $M = M' \otimes_{D',b} D$ with its connection ∇ corresponds to $\mathcal{F}$. Hence we know that $M \otimes^{\wedge}_D \Omega^*_D$ computes the crystalline cohomology of $\mathcal{F}$, see Proposition 39.26.3. Hence it suffices to show that the base change maps (induced by a and b)

$$M' \otimes^{\wedge}_{D'} \Omega^*_{D'} \longrightarrow M \otimes^{\wedge}_D \Omega^*_D \quad \text{and} \quad M \otimes^{\wedge}_D \Omega^*_D \longrightarrow M' \otimes^{\wedge}_{D'} \Omega^*_{D'}$$

are quasi-isomorphisms. Since $a \circ b = \text{id}_{D'}$ we see that the composition one way around is the identity on the complex $M' \otimes^{\wedge}_{D'} \Omega^*_{D'}$. Hence it suffices to show that the map

$$M \otimes^{\wedge}_D \Omega^*_D \longrightarrow M \otimes^{\wedge}_D \Omega^*_D$$

induced by $b \circ a : D \to D$ is a quasi-isomorphism. (Note that we have the same complex on both sides as $M = M' \otimes^\wedge_{D',b} D$, hence $M \otimes^\wedge_{D,b\circ a} D = M' \otimes^\wedge_{D',b\circ a\circ b} D = M' \otimes^\wedge_{D',b} D = M$.) In fact, we claim that for any divided power A-algebra homomorphism $\rho : D \to D$ compatible with the augmentation to C the induced map $M \otimes^\wedge_D \Omega^*_D \to M \otimes^\wedge_{D,\rho} \Omega^*_D$ is a quasi-isomorphism.

Write $\rho(x_i) = x_i + z_i$. The elements z_i are in the divided power ideal of D because ρ is compatible with the augmentation to C. Hence we can factor the map ρ as a composition

$$D \xrightarrow{\sigma} D\langle \xi_i \rangle^\wedge \xrightarrow{\tau} D$$

where the first map is given by $x_i \mapsto x_i + \xi_i$ and the second map is the divided power D-algebra map which maps ξ_i to z_i. (This uses the universal properties of polynomial algebra, divided power polynomial algebras, divided power envelopes, and p-adic completion.) Note that there exists an *automorphism* α of $D\langle \xi_i \rangle^\wedge$ with $\alpha(x_i) = x_i - \xi_i$ and $\alpha(\xi_i) = \xi_i$. Applying Lemma 39.25.2 to $\alpha \circ \sigma$ (which maps x_i to x_i) and using that α is an isomorphism we conclude that σ induces a quasi-isomorphism of $M \otimes^\wedge_D \Omega^*_D$ with $M \otimes^\wedge_{D,\sigma} \Omega^*_{D\langle x_i \rangle^\wedge}$. On the other hand the map τ has as a left inverse the map $D \to D\langle x_i \rangle^\wedge$, $x_i \mapsto x_i$ and we conclude (using Lemma 39.25.2 once more) that τ induces a quasi-isomorphism of $M \otimes^\wedge_{D,\sigma} \Omega^*_{D\langle x_i \rangle^\wedge}$ with $M \otimes^\wedge_{D,\tau\circ\sigma} \Omega^*_D$. Composing these two quasi-isomorphisms we obtain that ρ induces a quasi-isomorphism $M \otimes^\wedge_D \Omega^*_D \to M \otimes^\wedge_{D,\rho} \Omega^*_D$ as desired. □

39.27. Two counter examples

Before we turn to some of the successes of crystalline cohomology, let us give two examples which explain why crystalline cohomology does not work very well if the schemes in question are either not proper over the base, or singular. The first example can be found in [**BO83**].

Example 39.27.1. Let $A = \mathbf{Z}_p$ with divided power ideal (p) endowed with its unique divided powers γ. Let $C = \mathbf{F}_p[x, y]/(x^2, xy, y^2)$. We choose the presentation

$$C = P/J = \mathbf{Z}_p[x, y]/(x^2, xy, y^2, p)$$

Let $D = D_{P,\gamma}(J)^\wedge$ with divided power ideal $(\bar{J}, \bar{\gamma})$ as in Section 39.22. We will denote x, y also the images of x and y in D. Consider the element

$$\tau = \bar{\gamma}_p(x^2)\bar{\gamma}_p(y^2) - \bar{\gamma}_p(xy)^2 \in D$$

We note that $p\tau = 0$ as

$$p!\,\bar{\gamma}_p(x^2)\bar{\gamma}_p(y^2) = x^{2p}\bar{\gamma}_p(y^2) = \bar{\gamma}_p(x^2y^2) = x^py^p\bar{\gamma}_p(xy) = p!\,\bar{\gamma}_p(xy)^2$$

in D. We also note that $\mathrm{d}\tau = 0$ in Ω_D as

$$\begin{aligned}
\mathrm{d}(\bar{\gamma}_p(x^2)\bar{\gamma}_p(y^2)) &= \bar{\gamma}_{p-1}(x^2)\bar{\gamma}_p(y^2)\mathrm{d}x^2 + \bar{\gamma}_p(x^2)\bar{\gamma}_{p-1}(y^2)\mathrm{d}y^2 \\
&= 2x\bar{\gamma}_{p-1}(x^2)\bar{\gamma}_p(y^2)\mathrm{d}x + 2y\bar{\gamma}_p(x^2)\bar{\gamma}_{p-1}(y^2)\mathrm{d}y \\
&= 2/(p-1)!\,(x^{2p-1}\bar{\gamma}_p(y^2)\mathrm{d}x + y^{2p-1}\bar{\gamma}_p(x^2)\mathrm{d}y) \\
&= 2/(p-1)!\,(x^{p-1}\bar{\gamma}_p(xy^2)\mathrm{d}x + y^{p-1}\bar{\gamma}_p(x^2y)\mathrm{d}y) \\
&= 2/(p-1)!\,(x^{p-1}y^p\bar{\gamma}_p(xy)\mathrm{d}x + x^py^{p-1}\bar{\gamma}_p(xy)\mathrm{d}y) \\
&= 2\bar{\gamma}_{p-1}(xy)\bar{\gamma}_p(xy)(y\mathrm{d}x + x\mathrm{d}y) \\
&= \mathrm{d}(\bar{\gamma}_p(xy)^2)
\end{aligned}$$

Finally, we claim that $\tau \neq 0$ in D. To see this it suffices to produce an object $(B \to \mathbf{F}_p[x, y]/(x^2, xy, y^2), \delta)$ of $\text{Cris}(C/S)$ such that τ does not map to zero in B. To do this take

$$B = \mathbf{F}_p[x, y, u, v]/(x^3, x^2y, xy^2, y^3, xu, yu, xv, yv, u^2, v^2)$$

with the obvious surjection to C. Let $K = \text{Ker}(B \to C)$ and consider the map

$$\delta_p : K \longrightarrow K, \quad ay^2 + bxy + cy^2 + du + ev + fuv \longmapsto a^p u + c^p v$$

One checks this satisfies the assumptions (1), (2), (3) of Lemma 39.2.7 and hence defines a divided power structure. Moreover, we see that τ maps to uv which is not zero in B. Set $X = Spec(C)$ and $S = Spec(A)$. We draw the following conclusions

(1) $H^0(\text{Cris}(X/S), \mathcal{O}_{X/S})$ has p-torsion, and
(2) pull back by frobenius $F^* : H^0(\text{Cris}(X/S), \mathcal{O}_{X/S}) \to H^0(\text{Cris}(X/S), \mathcal{O}_{X/S})$ is not injective.

Namely, τ defines a nonzero torsion element of $H^0(\text{Cris}(X/S), \mathcal{O}_{X/S})$ by Proposition 39.26.3. Similarly, $F^*(\tau) = \sigma(\tau)$ where $\sigma : D \to D$ is the map induced by any lift of Frobenius on P. If we choose $\sigma(x) = x^p$ and $\sigma(y) = y^p$, then an easy computation shows that $F^*(\tau) = 0$.

The next example shows that even for affine n-space crystalline cohomology does not give the correct thing.

Example 39.27.2. Let $A = \mathbf{Z}_p$ with divided power ideal (p) endowed with its unique divided powers γ. Let $C = \mathbf{F}_p[x_1, \ldots, x_r]$. We choose the presentation

$$C = P/J = P/pP \quad \text{with} \quad P = \mathbf{Z}_p[x_1, \ldots, x_r]$$

Note that pP has divided powers by Lemma 39.4.2. Hence setting $D = P^\wedge$ with divided power ideal (p) we obtain a situation as in Section 39.22. We conclude that $R\Gamma(\text{Cris}(X/S), \mathcal{O}_{X/S})$ is represented by the complex

$$D \to \Omega^1_D \to \Omega^2_D \to \ldots \to \Omega^r_D$$

see Proposition 39.26.3. Assuming $r > 0$ we conclude the following

(1) The cristalline cohomology of the cristalline structure sheaf of $X = \mathbf{A}^r_{\mathbf{F}_p}$ over $S = Spec(\mathbf{Z}_p)$ is zero except in degrees $0, \ldots, r$.
(2) We have $H^0(\text{Cris}(X/S), \mathcal{O}_{X/S}) = \mathbf{Z}_p$.
(3) The cohomology group $H^r(\text{Cris}(X/S), \mathcal{O}_{X/S})$ is infinite and is not a torsion abelian group.
(4) The cohomology group $H^r(\text{Cris}(X/S), \mathcal{O}_{X/S})$ is not separated for the p-adic topology.

While the first two statements are reasonable, parts (3) and (4) are disconcerting! The truth of these statements follows immediately from working out what the complex displayed above looks like. Let's just do this in case $r = 1$. Then we are just looking at the two term complex of p-adically complete modules

$$\text{d} : D = \left(\bigoplus\nolimits_{n \geq 0} \mathbf{Z}_p x^n\right)^\wedge \longrightarrow \Omega^1_D = \left(\bigoplus\nolimits_{n \geq 1} \mathbf{Z}_p x^{n-1} \text{d}x\right)^\wedge$$

The map is given by $\text{diag}(0, 1, 2, 3, 4, \ldots)$ except that the first summand is missing on the right hand side. Now it is clear that $\bigoplus_{n>0} \mathbf{Z}_p/n\mathbf{Z}_p$ is a subgroup of the cokernel, hence the cokernel is infinite. In fact, the element

$$\omega = \sum\nolimits_{e>0} p^e x^{p^{2e}-1} \text{d}x$$

is clearly not a torsion element of the cokernel. But it gets worse. Namely, consider the element

$$\eta = \sum\nolimits_{e>0} p^e x^{p^e - 1} \mathrm{d}x$$

For every $t > 0$ the element η is congruent to $\sum_{e>t} p^e x^{p^e-1}\mathrm{d}x$ modulo the image of d which is divisible by p^t. But η is not in the image of d because it would have to be the image of $a + \sum_{e>0} x^{p^e}$ for some $a \in \mathbf{Z}_p$ which is not an element of the left hand side. In fact, $p^N\eta$ is similarly not in the image of d for any integer N. This implies that η ``generates" a copy of $\mathbf{Q}_p$ inside of $H^1_{\text{cris}}(\mathbf{A}^1_{\mathbf{F}_p}/Spec(\mathbf{Z}_p))$.

39.28. Applications

In this section we collect some applications of the material in the previous sections.

Proposition 39.28.1. *In Situation 39.11.5. Let $\mathcal{F}$ be a crystal in quasi-coherent modules on $Cris(X/S)$. The truncation map of complexes*

$$(\mathcal{F} \to \mathcal{F} \otimes_{\mathcal{O}_{X/S}} \Omega^1_{X/S} \to \mathcal{F} \otimes_{\mathcal{O}_{X/S}} \Omega^2_{X/S} \to \ldots) \longrightarrow \mathcal{F}[0],$$

while not a quasi-isomorphism, becomes a quasi-isomorphism after applying $Ru_{X/S,*}$. In fact, for any $i > 0$, we have

$$Ru_{X/S,*}(\mathcal{F} \otimes_{\mathcal{O}_{X/S}} \Omega^i_{X/S}) = 0.$$

Proof. By Lemma 39.19.1 we get a de Rham complex as indicated in the lemma. We abbreviate $\mathcal{H} = \mathcal{F} \otimes \Omega^i_{X/S}$. Let $X' \subset X$ be an affine open subscheme which maps into an affine open subscheme $S' \subset S$. Then

$$(Ru_{X/S,*}\mathcal{H})|_{X'_{Zar}} = Ru_{X'/S',*}(\mathcal{H}|_{\mathrm{Cris}(X'/S')}),$$

see Lemma 39.13.5. Thus Lemma 39.26.2 shows that $Ru_{X/S,*}\mathcal{H}$ is a complex of sheaves on X_{Zar} whose cohomology on any affine open is trivial. As X has a basis for its topology consisting of affine opens this implies that $Ru_{X/S,*}\mathcal{H}$ is quasi-isomorphic to zero. $\square$

Remark 39.28.2. The proof of Proposition 39.28.1 shows that the conclusion

$$Ru_{X/S,*}(\mathcal{F} \otimes_{\mathcal{O}_{X/S}} \Omega^i_{X/S}) = 0$$

for $i > 0$ is true for any $\mathcal{O}_{X/S}$-module $\mathcal{F}$ which satisfies conditions (1) and (2) of Proposition 39.26.1. This applies to the following non-crystals: $\Omega^i_{X/S}$ for all i, and any sheaf of the form $\underline{\mathcal{F}}$, where $\mathcal{F}$ is a quasi-coherent $\mathcal{O}_X$-module. In particular, it applies to the sheaf $\underline{\mathcal{O}_X} = \underline{\mathbf{G}_a}$. But note that we need something like Lemma 39.19.1 to produce a de Rham complex which requires $\mathcal{F}$ to be a crystal. Hence (currently) the collection of sheaves of modules for which the full statement of Proposition 39.28.1 holds is exactly the category of crystals in quasi-coherent modules.

In Situation 39.11.5. Let $\mathcal{F}$ be a crystal in quasi-coherent modules on $\mathrm{Cris}(X/S)$. Let (U, T, δ) be an object of $\mathrm{Cris}(X/S)$. Proposition 39.28.1 allows us to construct a canonical map

$$R\Gamma(\mathrm{Cris}(X/S), \mathcal{F}) \longrightarrow R\Gamma(T, \mathcal{F}_T \otimes_{\mathcal{O}_T} \Omega^*_{T/S,\delta}) \tag{39.28.2.1}$$

Namely, we have $R\Gamma(\mathrm{Cris}(X/S), \mathcal{F}) = R\Gamma(\mathrm{Cris}(X/S), \mathcal{F} \otimes \Omega^*_{X/S})$, we can restrict global cohomology classes to T, and $\Omega_{X/S}$ restricts to $\Omega_{T/S,\delta}$ by Lemma 39.16.3.

39.29. Some further results

In this section we mention some results whose proof is missing. We will formulate these as a series of remarks and we will convert them into actual lemmas and propositions only when we add detailed proofs.

Remark 39.29.1 (Higher direct images)**.** Let p be a prime number. Let $(S, \mathcal{I}, \gamma) \to (S', \mathcal{I}', \gamma')$ be a morphism of divided power schemes over $\mathbf{Z}_{(p)}$. Let

$$\begin{tikzcd} X \arrow[r, "f"] \arrow[d] & X' \arrow[d] \\ S_0 \arrow[r] & S'_0 \end{tikzcd}$$

be a commutative diagram of morphisms of schemes and assume p is locally nilpotent on X and X'. Let $\mathcal{F}$ be an $\mathcal{O}_{X/S}$-module on $\text{Cris}(X/S)$. Then $Rf_{\text{cris},*}\mathcal{F}$ can be computed as follows.

Given an object (U', T', δ') of $\text{Cris}(X'/S')$ set $U = X \times_{X'} U' = f^{-1}(U')$ (an open subscheme of X). Denote (T_0, T, δ) the divided power scheme over S such that

$$\begin{tikzcd} T \arrow[r] \arrow[d] & T' \arrow[d] \\ S \arrow[r] & S' \end{tikzcd}$$

is cartesian in the category of divided power schemes, see Lemma 39.11.4. There is an induced morphism $U \to T_0$ and we obtain a morphism $(U/T)_{\text{cris}} \to (X/S)_{\text{cris}}$, see Remark 39.13.3. Let $\mathcal{F}_U$ be the pullback of $\mathcal{F}$. Let $\tau_{U/T} : (U/T)_{\text{cris}} \to T_{Zar}$ be the structure morphism. Then we have

$$\left(Rf_{\text{cris},*}\mathcal{F}\right)_{T'} = R(T \to T')_* \left(R\tau_{U/T,*}\mathcal{F}_U\right) \tag{39.29.1.1}$$

where the left hand side is the restriction (see Section 39.14).

Hints: First, show that $\text{Cris}(U/T)$ is the localization (in the sense of Sites, Lemma 9.26.3) of $\text{Cris}(X/S)$ at the sheaf of sets $f_{\text{cris}}^{-1}h_{(U',T',\delta')}$. Next, reduce the statement to the case where $\mathcal{F}$ is an injective module and push forward of modules using that the pullback of an injective $\mathcal{O}_{X/S}$-module is an injective $\mathcal{O}_{U/T}$-module on $\text{Cris}(U/T)$. Finally, check the result holds for plain push forward.

Remark 39.29.2 (Mayer-Vietoris)**.** In the situation of Remark 39.29.1 suppose we have an open covering $X = X' \cup X''$. Denote $X''' = X' \cap X''$. Let f', f'', and f'' be the restriction of f to X', X'', and X'''. Moreover, Let $\mathcal{F}'$, $\mathcal{F}''$, and $\mathcal{F}'''$ be the restriction of $\mathcal{F}$ to the crystalline sites of X', X'', and X'''. Then there exists a distinguished triangle

$$Rf_{\text{cris},*}\mathcal{F} \longrightarrow Rf'_{\text{cris},*}\mathcal{F}' \oplus Rf''_{\text{cris},*}\mathcal{F}'' \longrightarrow Rf'''_{\text{cris},*}\mathcal{F}''' \longrightarrow Rf_{\text{cris},*}\mathcal{F}[1]$$

in $D(\mathcal{O}_{X'/S'})$.

Hints: This is a formal consequence of the fact that the subcategories $\text{Cris}(X'/S)$, $\text{Cris}(X''/S)$, $\text{Cris}(X'''/S)$ correspond to open subobjects of the final sheaf on $\text{Cris}(X/S)$ and that the last is the intersection of the first two.

Remark 39.29.3 (Čech complex)**.** Let p be a prime number. Let (A, I, γ) be a divided power ring with A a $\mathbf{Z}_{(p)}$-algebra. Set $S = Spec(A)$ and $S_0 = Spec(A/I)$. Let X be a separated[6] scheme over S_0 such that p is locally nilpotent on X. Let $\mathcal{F}$ be a crystal in quasi-coherent $\mathcal{O}_{X/S}$-modules.

Choose an affine open covering $X = \bigcup_{\lambda \in \Lambda} U_\lambda$ of X. Write $U_\lambda = Spec(C_\lambda)$. Choose a polynomial algebra P_λ over A and a surjection $P_\lambda \to C_\lambda$. Having fixed these choices we can construct a Čech complex which computes $R\Gamma(\text{Cris}(X/S), \mathcal{F})$.

Given $n \geq 0$ and $\lambda_0, \ldots, \lambda_n \in \Lambda$ write $U_{\lambda_0 \ldots \lambda_n} = U_{\lambda_0} \cap \ldots \cap U_{\lambda_n}$. This is an affine scheme by assumption. Write $U_{\lambda_0 \ldots \lambda_n} = Spec(C_{\lambda_0 \ldots \lambda_n})$. Set

$$P_{\lambda_0 \ldots \lambda_n} = P_{\lambda_0} \otimes_A \ldots \otimes_A P_{\lambda_n}$$

which comes with a canonical surjection onto $C_{\lambda_0 \ldots \lambda_n}$. Denote the kernel $J_{\lambda_0 \ldots \lambda_n}$ and set $D_{\lambda_0 \ldots \lambda_n}$ the p-adically completed divided power envelope of $J_{\lambda_0 \ldots \lambda_n}$ in $P_{\lambda_0 \ldots \lambda_n}$ relative to γ. Denote $\Omega_{\lambda_0 \ldots \lambda_n}$ the p-adically completed module of differentials of $D_{\lambda_0 \ldots \lambda_n}$ over A compatible with the divided power structure. Let $M_{\lambda_0 \ldots \lambda_n}$ be the $P_{\lambda_0 \ldots \lambda_n}$-module corresponding to the restriction of $\mathcal{F}$ to $\text{Cris}(U_{\lambda_0 \ldots \lambda_n}/S)$ via Proposition 39.22.4. By construction we obtain a cosimplicial divided power ring $D(*)$ having in degree n the ring

$$D(n) = \prod\nolimits_{\lambda_0 \ldots \lambda_n} D_{\lambda_0 \ldots \lambda_n}$$

(use that divided power envelopes are functorial and the trivial cosimplicial structure on the ring $P(*)$ defined similarly). Since $M_{\lambda_0 \ldots \lambda_n}$ is the ``value'' of $\mathcal{F}$ on the objects $Spec(D_{\lambda_0 \ldots \lambda_n})$ we see that $M(*)$ defined by the rule

$$M(n) = \prod\nolimits_{\lambda_0 \ldots \lambda_n} M_{\lambda_0 \ldots \lambda_n}$$

forms a cosimplicial $D(*)$-module. Now we claim that we have

$$R\Gamma(\text{Cris}(X/S), \mathcal{F}) = s(M(*))$$

Here $s(-)$ denotes the cochain complex associated to a cosimplicial module (see Simplicial, Section 14.23).

Hints: The proof of this is similar to the proof of Proposition 39.26.1 (in particular the result holds for any module satisfying the assumptions of that proposition).

Remark 39.29.4 (Alternating Čech complex)**.** Let p be a prime number. Let (A, I, γ) be a divided power ring with A a $\mathbf{Z}_{(p)}$-algebra. Set $S = Spec(A)$ and $S_0 = Spec(A/I)$. Let X be a separated quasi-compact scheme over S_0 such that p is locally nilpotent on X. Let $\mathcal{F}$ be a crystal in quasi-coherent $\mathcal{O}_{X/S}$-modules.

Choose a finite affine open covering $X = \bigcup_{\lambda \in \Lambda} U_\lambda$ of X and a total ordering on Λ. Write $U_\lambda = Spec(C_\lambda)$. Choose a polynomial algebra P_λ over A and a surjection $P_\lambda \to C_\lambda$. Having fixed these choices we can construct an alternating Čech complex which computes $R\Gamma(\text{Cris}(X/S), \mathcal{F})$.

We are going to use the notation introduced in Remark 39.29.3. Denote $\Omega_{\lambda_0 \ldots \lambda_n}$ the p-adically completed module of differentials of $D_{\lambda_0 \ldots \lambda_n}$ over A compatible with the divided power

[6] This assumption is not strictly necessary, as using hypercoverings the construction of the remark can be extended to the general case.

structure. Let ∇ be the integrable connection on $M_{\lambda_0\ldots\lambda_n}$ coming from Proposition 39.22.4. Consider the double complex $M^{\bullet,\bullet}$ with terms

$$M^{n,m} = \bigoplus\nolimits_{\lambda_0<\ldots<\lambda_n} M_{\lambda_0\ldots\lambda_n} \otimes^\wedge_{D_{\lambda_0\ldots\lambda_n}} \Omega^m_{D_{\lambda_0\ldots\lambda_n}}.$$

For the differential d_1 (increasing n) we use the usual Čech differential and for the differential d_2 we use the connection, i.e., the differential of the de Rham complex. We claim that

$$R\Gamma(\mathrm{Cris}(X/S), \mathcal{F}) = \mathrm{Tot}(M^{\bullet,\bullet})$$

Here $\mathrm{Tot}(-)$ denotes the total complex associated to a double complex, see Homology, Definition 10.19.2.

Hints: We have

$$R\Gamma(\mathrm{Cris}(X/S), \mathcal{F}) = R\Gamma(\mathrm{Cris}(X/S), \mathcal{F} \otimes_{\mathcal{O}_{X/S}} \Omega^\bullet_{X/S})$$

by Proposition 39.28.1. The right hand side of the formula is simply the alternating Čech complex for the covering $X = \bigcup_{\lambda\in\Lambda} U_\lambda$ (which induces an open covering of the final sheaf of $\mathrm{Cris}(X/S)$) and the complex $\mathcal{F} \otimes_{\mathcal{O}_{X/S}} \Omega^\bullet_{X/S}$, see Proposition 39.26.3. Now the result follows from a general result in cohomology on sites, namely that the alternating Čech complex computes the cohomology provided it gives the correct answer on all the pieces (insert future reference here).

Remark 39.29.5 (Quasi-coherence)**.** In the situation of Remark 39.29.1 assume that $S \to S'$ is quasi-compact and quasi-separated and that $X \to S_0$ is quasi-compact and quasi-separated. Then for a crystal in quasi-coherent $\mathcal{O}_{X/S}$-modules $\mathcal{F}$ the sheaves $R^i f_{\mathrm{cris},*}\mathcal{F}$ are locally quasi-coherent.

Hints: We have to show that the restrictions to T' are quasi-coherent $\mathcal{O}_{T'}$-modules, where (U', T', δ') is any object of $\mathrm{Cris}(X'/S')$. It suffices to do this when T' is affine. We use the formula (39.29.1.1), the fact that $T \to T'$ is quasi-compact and quasi-separated (as T is affine over the base change of T' by $S \to S'$), and Coherent, Lemma 25.5.3 to see that it suffices to show that the sheaves $R^i\tau_{U/T,*}\mathcal{F}_U$ are quasi-coherent. Note that $U \to T_0$ is also quasi-compact and quasi-separated, see Schemes, Lemmas 21.21.15 and 21.21.15.

This reduces us to proving that $R^i\tau_{X/S,*}\mathcal{F}$ is quasi-coherent on S in the case that p locally nilpotent on S. Here $\tau_{X/S}$ is the structure morphism, see Remark 39.13.6. We may work locally on S, hence we may assume S affine (see Lemma 39.13.5). Induction on the number of affines covering X and Mayer-Vietoris (Remark 39.29.2) reduces the question to the case where X is also affine (as in the proof of Coherent, Lemma 25.5.3). Say $X = Spec(C)$ and $S = Spec(A)$ so that (A, I, γ) and $A \to C$ are as in Situation 39.9.1. Choose a polynomial algebra P over A and a surjection $P \to C$ as in Section 39.22. Let (M, ∇) be the module corresponding to $\mathcal{F}$, see Proposition 39.22.4. Applying Proposition 39.26.3 we see that $R\Gamma(\mathrm{Cris}(X/S), \mathcal{F})$ is represented by $M \otimes_D \Omega^*_D$. Note that completion isn't necessary as p is nilpotent in A! We have to show that this is compatible with taking principal opens in $S = Spec(A)$. Suppose that $g \in A$. Then we conclude that similarly $R\Gamma(\mathrm{Cris}(X_g/S_g), \mathcal{F})$ is computed by $M_g \otimes_{D_g} \Omega^*_{D_g}$ (again this uses that p-adic completion isn't necessary). Hence we conclude because localization is an exact functor on A-modules.

Remark 39.29.6 (Boundedness)**.** In the situation of Remark 39.29.1 assume that $S \to S'$ is quasi-compact and quasi-separated and that $X \to S_0$ is of finite type and quasi-separated. Then there exists an integer i_0 such that for any crystal in quasi-coherent $\mathcal{O}_{X/S}$-modules $\mathcal{F}$ we have $R^i f_{\mathrm{cris},*}\mathcal{F} = 0$ for all $i > i_0$.

Hints: Arguing as in Remark 39.29.5 (using Coherent, Lemma 25.5.3) we reduce to proving that $H^i(\text{Cris}(X/S), \mathcal{F}) = 0$ for $i \gg 0$ in the situation of Proposition 39.26.3 when C is a finite type algebra over A. This is clear as we can choose a finite polynomial algebra and we see that $\Omega^i_D = 0$ for $i \gg 0$.

Remark 39.29.7 (Specific boundedness)**.** In Situation 39.11.5 let $\mathcal{F}$ be a crystal in quasi-coherent $\mathcal{O}_{X/S}$-modules. Assume that S_0 has a unique point and that $X \to S_0$ is of finite presentation.

(1) If $\dim X = d$ and X/S_0 has embedding dimension e, then $H^i(\text{Cris}(X/S), \mathcal{F}) = 0$ for $i > d + e$.
(2) If X is separated and can be covered by q affines, and X/S_0 has embedding dimension e, then $H^i(\text{Cris}(X/S), \mathcal{F}) = 0$ for $i > q + e$.

Hints: In case (1) we can use that

$$H^i(\text{Cris}(X/S), \mathcal{F}) = H^i(X_{Zar}, Ru_{X/S,*}\mathcal{F})$$

and that $Ru_{X/S,*}\mathcal{F}$ is locally calculated by a de Rham complex constructed using an embedding of X into a smooth scheme of dimension e over S (see Lemma 39.26.4). These de Rham complexes are zero in all degrees $> e$. Hence (1) follows from Cohomology, Lemma 18.16.5. In case (2) we use the alternating Čech complex (see Remark 39.29.4) to reduce to the case X affine. In the affine case we prove the result using the de Rham complex associated to an embedding of X into a smooth scheme of dimension e over S (it takes some work to construct such a thing).

Remark 39.29.8 (Base change map)**.** In the situation of Remark 39.29.1 assume $S = Spec(A)$ and $S' = Spec(A')$ are affine. Let $\mathcal{F}'$ be an $\mathcal{O}_{X'/S'}$-module. Let $\mathcal{F}$ be the pullback of $\mathcal{F}'$. Then there is a canonical base change map

$$L(S' \to S)^* R\tau_{X'/S',*}\mathcal{F}' \longrightarrow R\tau_{X/S,*}\mathcal{F}$$

where $\tau_{X/S}$ and $\tau_{X'/S'}$ are the structure morphisms, see Remark 39.13.6. On global sections this gives a base change map

$$R\Gamma(\text{Cris}(X'/S'), \mathcal{F}') \otimes^{\mathbf{L}}_{A'} A \longrightarrow R\Gamma(\text{Cris}(X/S), \mathcal{F}) \tag{39.29.8.1}$$

in $D(A)$.

Hint: Compose the very general base change map of Cohomology on Sites, Remark 19.19.2 with the canonical map $Lf^*_{\text{cris}}\mathcal{F}' \to f^*_{\text{cris}}\mathcal{F}' = \mathcal{F}$.

Remark 39.29.9 (Base change isomorphism)**.** The map (39.29.8.1) is an isomorphism provided all of the following conditions are satisfied:

(1) p is nilpotent in A',
(2) $\mathcal{F}'$ is a crystal in quasi-coherent $\mathcal{O}_{X'/S'}$-modules,
(3) $X' \to S'_0$ is a quasi-compact, quasi-separated morphism,
(4) $X = X' \times_{S'_0} S_0$,
(5) $\mathcal{F}'$ is a flat $\mathcal{O}_{X'/S'}$-module,
(6) $X' \to S'_0$ is a local complete intersection morphism (see More on Morphisms, Definition 33.38.2; this holds for example if $X' \to S'_0$ is syntomic or smooth),
(7) X' and S_0 are Tor independent over S'_0 (see More on Algebra, Definition 12.5.1; this holds for example if either $S_0 \to S'_0$ or $X' \to S'_0$ is flat).

Hints: Condition (1) means that in the arguments below p-adic completion does nothing and can be ignored. Using condition (3) and Mayer Vietoris (see Remark 39.29.2) this reduces to the case where X' is affine. In fact by condition (6), after shrinking further, we can assume that $X' = Spec(C')$ and we are given a presentation $C' = A'/I'[x_1, \ldots, x_n]/(\bar{f}'_1, \ldots, \bar{f}'_c)$ where $\bar{f}'_1, \ldots, \bar{f}'_c$ is a Koszul-regular sequence in A'/I'. (This means that smooth locally $\bar{f}'_1, \ldots, \bar{f}'_c$ forms a regular sequence, see More on Algebra, Lemma 12.22.16.) We choose a lift of $\bar{f}'_i$ to an element $f'_i \in A'[x_1, \ldots, x_n]$. By (4) we see that $X = Spec(C)$ with $C = A/I[x_1, \ldots, x_n]/(\bar{f}_1, \ldots, \bar{f}_c)$ where $f_i \in A[x_1, \ldots, x_n]$ is the image of f'_i. By property (7) we see that $\bar{f}_1, \ldots, \bar{f}_c$ is a Koszul-regular sequence in $A/I[x_1, \ldots, x_n]$. The divided power envelope of $I'A'[x_1, \ldots, x_n] + (f'_1, \ldots, f'_c)$ in $A'[x_1, \ldots, x_n]$ relative to γ' is

$$D' = A'[x_1, \ldots, x_n]\langle \xi_1, \ldots, \xi_c\rangle/(\xi_i - f'_i)$$

see Lemma 39.6.4. Then you check that $\xi_1 - f'_1, \ldots, \xi_n - f'_n$ is a Koszul-regular sequence in the ring $A'[x_1, \ldots, x_n]\langle \xi_1, \ldots, \xi_c\rangle$. Similarly the divided power envelope of $IA[x_1, \ldots, x_n] + (f_1, \ldots, f_c)$ in $A[x_1, \ldots, x_n]$ relative to γ is

$$D = A[x_1, \ldots, x_n]\langle \xi_1, \ldots, \xi_c\rangle/(\xi_i - f_i)$$

and $\xi_1 - f_1, \ldots, \xi_n - f_n$ is a Koszul-regular sequence in the ring $A[x_1, \ldots, x_n]\langle \xi_1, \ldots, \xi_c\rangle$. It follows that $D' \otimes^{\mathbf{L}}_{A'} A = D$. Condition (2) implies $\mathcal{F}'$ corresponds to a pair (M', ∇) consisting of a D'-module with connection, see Proposition 39.22.4. Then $M = M' \otimes_{D'} D$ corresponds to the pullback $\mathcal{F}$. By assumption (5) we see that M' is a flat D'-module, hence

$$M = M' \otimes_{D'} D = M' \otimes_{D'} D' \otimes^{\mathbf{L}}_{A'} A = M' \otimes^{\mathbf{L}}_{A'} A$$

Since the modules of differentials $\Omega_{D'}$ and Ω_D (as defined in Section 39.22) are free D'-modules on the same generators we see that

$$M \otimes_D \Omega^\bullet_D = M' \otimes_{D'} \Omega^\bullet_{D'} \otimes_{D'} D = M' \otimes_{D'} \Omega^\bullet_{D'} \otimes^{\mathbf{L}}_{A'} A$$

which proves what we want by Proposition 39.26.3.

Remark 39.29.10 (Rlim)**.** Let p be a prime number. Let (A, I, γ) be a divided power ring with A an algebra over $\mathbf{Z}_{(p)}$ with p nilpotent in A/I. Set $S = Spec(A)$ and $S_0 = Spec(A/I)$. Let X be a scheme over S_0 with p locally nilpotent on X. Let $\mathcal{F}$ be any $\mathcal{O}_{X/S}$-module. For $e \gg 0$ we have $(p^e) \subset I$ is preserved by γ, see Lemma 39.4.5. Set $S_e = Spec(A/p^eA)$ for $e \gg 0$. Then $\text{Cris}(X/S_e)$ is a full subcategory of $\text{Cris}(X/S)$ and we denote $\mathcal{F}_e$ the restriction of $\mathcal{F}$ to $\text{Cris}(X/S_e)$. Then

$$R\Gamma(\text{Cris}(X/S), \mathcal{F}) = R\,lim_e\, R\Gamma(\text{Cris}(X/S_e), \mathcal{F}_e)$$

Hints: Suffices to prove this for $\mathcal{F}$ injective. In this case the sheaves $\mathcal{F}_e$ are injective modules too, the transition maps $\Gamma(\mathcal{F}_{e+1}) \to \Gamma(\mathcal{F}_e)$ are surjective, and we have $\Gamma(\mathcal{F}) = lim_e\, \Gamma(\mathcal{F}_e)$ because any object of $\text{Cris}(X/S)$ is locally an object of one of the categories $\text{Cris}(X/S_e)$ by definition of $\text{Cris}(X/S)$.

Remark 39.29.11 (Comparison)**.** Let p be a prime number. Let (A, I, γ) be a divided power ring with p nilpotent in A. Set $S = Spec(A)$ and $S_0 = Spec(A/I)$. Let Y be a smooth scheme over S and set $X = Y \times_S S_0$. Let $\mathcal{F}$ be a crystal in quasi-coherent $\mathcal{O}_{X/S}$-modules. Then

1. γ extends to a divided power structure on the ideal of X in Y so that (X, Y, γ) is an object of $\text{Cris}(X/S)$,
2. the restriction $\mathcal{F}_Y$ (see Section 39.14) comes endowed with a canonical integrable connection $\nabla : \mathcal{F}_Y \to \mathcal{F}_Y \otimes_{\mathcal{O}_Y} \Omega_{Y/S}$, and

(3) we have
$$R\Gamma(\mathrm{Cris}(X/S), \mathcal{F}) = R\Gamma(Y, \mathcal{F}_Y \otimes_{\mathcal{O}_Y} \Omega^\bullet_{Y/S})$$
in $D(A)$.

Hints: See Lemma 39.4.2 for (1). See Lemma 39.19.1 for (2). For Part (3) note that there is a map, see (39.28.2.1). This map is an isomorphism when X is affine, see Lemma 39.26.4. This shows that $Ru_{X/S,*}\mathcal{F}$ and $\mathcal{F}_Y \otimes \Omega^\bullet_{Y/S}$ are quasi-isomorphic as complexes on $Y_{Zar} = X_{Zar}$. Since $R\Gamma(\mathrm{Cris}(X/S), \mathcal{F}) = R\Gamma(X_{Zar}, Ru_{X/S,*}\mathcal{F})$ the result follows.

Remark 39.29.12 (Perfectness)**.** Let p be a prime number. Let (A, I, γ) be a divided power ring with p nilpotent in A. Set $S = Spec(A)$ and $S_0 = Spec(A/I)$. Let X be a proper smooth scheme over S_0. Let $\mathcal{F}$ be a crystal in finite locally free quasi-coherent $\mathcal{O}_{X/S}$-modules. Then $R\Gamma(\mathrm{Cris}(X/S), \mathcal{F})$ is a perfect object of $D(A)$.

Hints: By Remark 39.29.9 we have
$$R\Gamma(\mathrm{Cris}(X/S), \mathcal{F}) \otimes^{\mathbf{L}}_A A/I \cong R\Gamma(\mathrm{Cris}(X/S_0), \mathcal{F}|_{\mathrm{Cris}(X/S_0)})$$
By Remark 39.29.11 we have
$$R\Gamma(\mathrm{Cris}(X/S_0), \mathcal{F}|_{\mathrm{Cris}(X/S_0)}) = R\Gamma(X, \mathcal{F}_X \otimes \Omega^\bullet_{X/S_0})$$
Using the stupid filtration on the de Rham complex we see that the last displayed complex is perfect in $D(A/I)$ as soon as the complexes
$$R\Gamma(X, \mathcal{F}_X \otimes \Omega^q_{X/S_0})$$
are perfect complexes in $D(A/I)$, see More on Algebra, Lemma 12.42.4. This is true by standard arguments in coherent cohomology using that $\mathcal{F}_X \otimes \Omega^q_{X/S_0}$ is a finite locally free sheaf and $X \to S_0$ is proper and flat (insert future reference here). Applying More on Algebra, Lemma 12.43.4 we see that
$$R\Gamma(\mathrm{Cris}(X/S), \mathcal{F}) \otimes^{\mathbf{L}}_A A/I^n$$
is a perfect object of $D(A/I^n)$ for all n. This isn't quite enough unless A is Noetherian. Namely, even though I is locally nilpotent by our assumption that p is nilpotent, see Lemma 39.2.6, we cannot conclude that $I^n = 0$ for some n. A counter example is $\mathbf{F}_p\langle x\rangle$. To prove it in general when $\mathcal{F} = \mathcal{O}_{X/S}$ the argument of `http://math.columbia.edu/~dejong/wordpress/?p=2227` works. When the coefficients $\mathcal{F}$ are non-trivial the argument of [**Fal99**] seems to be as follows. Reduce to the case $pA = 0$ by More on Algebra, Lemma 12.43.4. In this case the Frobenius map $A \to A$, $a \mapsto a^p$ factors as $A \to A/I \xrightarrow{\varphi} A$ (as $x^p = 0$ for $x \in I$). Set $X^{(1)} = X \otimes_{A/I,\varphi} A$. The absolute Frobenius morphism of X factors through a morphism $F_X : X \to X^{(1)}$ (a kind of relative Frobenius). Affine locally if $X = Spec(C)$ then $X^{(1)} = Spec(C \otimes_{A/I,\varphi} A)$ and F_X corresponds to $C \otimes_{A/I,\varphi} A \to C$, $c \otimes a \mapsto c^p a$. This defines morphisms of ringed topoi
$$(X/S)_{\mathrm{cris}} \xrightarrow{(F_X)_{\mathrm{cris}}} (X^{(1)}/S)_{\mathrm{cris}} \xrightarrow{u_{X^{(1)}/S}} Sh(X^{(1)}_{Zar})$$
whose composition is denoted Frob_X. One then shows that $R\mathrm{Frob}_{X,*}\mathcal{F}$ is representable by a perfect complex of $\mathcal{O}_{X^{(1)}}$-modules(!) by a local calculation.

Remark 39.29.13 (Complete perfectness)**.** Let p be a prime number. Let (A, I, γ) be a divided power ring with A a Noetherian p-adically complete ring and p nilpotent in A/I. Set $S = Spec(A)$ and $S_0 = Spec(A/I)$. Let X be a proper smooth scheme over S_0. Let $\mathcal{F}$ be a crystal in finite locally free quasi-coherent $\mathcal{O}_{X/S}$-modules. Then $R\Gamma(\mathrm{Cris}(X/S), \mathcal{F})$ is a perfect object of $D(A)$.

Hints: We know that $K = R\Gamma(\text{Cris}(X/S), \mathcal{F})$ is the derived limit $K = R\,lim\, K_e$ of the cohomologies over A/p^eA, see Remark 39.29.10. Each K_e is a perfect complex of $D(A/p^eA)$ by Remark 39.29.12. Since A is Noetherian and p-adically complete the result follows from (insert future reference here).

Remark 39.29.14 (Complete comparison)**.** Let p be a prime number. Let (A, I, γ) be a divided power ring with A a Noetherian p-adically complete ring and p nilpotent in A/I. Set $S = Spec(A)$ and $S_0 = Spec(A/I)$. Let Y be a proper smooth scheme over S and set $X = Y \times_S S_0$. Let $\mathcal{F}$ be a finite type crystal in quasi-coherent $\mathcal{O}_{X/S}$-modules. Then

(1) there exists a coherent $\mathcal{O}_Y$-module $\mathcal{F}_Y$ endowed with integrable connection
$$\nabla : \mathcal{F}_Y \longrightarrow \mathcal{F}_Y \otimes_{\mathcal{O}_Y} \Omega_{Y/S}$$
such that $\mathcal{F}_Y/p^e\mathcal{F}_Y$ is the module with connection over A/p^eA found in Remark 39.29.11, and

(2) we have
$$R\Gamma(\text{Cris}(X/S), \mathcal{F}) = R\Gamma(Y, \mathcal{F}_Y \otimes_{\mathcal{O}_Y} \Omega^\bullet_{Y/S})$$
in $D(A)$.

Hints: The existence of $\mathcal{F}_Y$ is Grothendieck's existence theorem (insert future reference here). The isomorphism of cohomologies follows as both sides are computed as $R\,lim$ of the versions modulo p^e (see Remark 39.29.10 for the left hand side; use the theorem on formal functions, see Coherent, Theorem 25.19.5 for the right hand side). Each of the versions modulo p^e are isomorphic by Remark 39.29.11.

39.30. Pulling back along α_p-covers

By an α_p-cover we mean a morphism of the form
$$X' = Spec(C[z]/(z^p - c)) \longrightarrow Spec(C) = X$$
where C is an $\mathbf{F}_p$-algebra and $c \in C$. Equivalently, X' is an α_p-torsor over X. An *iterated α_p-cover*[7] is a morphism of schemes in characteristic p which is locally on the target a composition of finitely many α_p-covers. In this section we prove that pullback along such a morphism induces a quasi-isomorphism on crystalline cohomology after inverting the prime p. In fact, we prove a precise version of this result. We being with a preliminary lemma whose formulation need some notation.

Assume we have a ring map $B \to B'$ and quotients $\Omega_B \to \Omega$ and $\Omega_{B'} \to \Omega'$ satisfying the assumptions of Remark 39.10.11. Thus (39.10.11.1) provides a canonical map of complexes
$$c^\bullet_M : M \otimes_B \Omega^\bullet \longrightarrow M \otimes_B (\Omega')^\bullet$$
for all B-modules M endowed with integrable connection $\nabla : M \to M \otimes_B \Omega_B$.

Suppose we have $a \in B$, $z \in B'$, and a map $\theta : B' \to B'$ satisfying the following assumptions

(1) $\mathrm{d}(a) = 0$,
(2) $\Omega' = B' \otimes_B \Omega \oplus B'\mathrm{d}z$; we write $\mathrm{d}(f) = \mathrm{d}_1(f) + \partial_z(f)\mathrm{d}z$ with $\mathrm{d}_1(f) \in B' \otimes \Omega$ and $\partial_z(f) \in N'$ for all $f \in B'$,
(3) $\theta : B' \to B'$ is B-linear,
(4) $\partial_z \circ \theta = a$,
(5) $B \to B'$ is universally injective (and hence $\Omega \to \Omega'$ is injective),

[7] This is nonstandard notation.

(6) $af - \theta(\partial_z(f)) \in B$ for all $f \in B'$,
(7) $(\theta \otimes 1)(\mathrm{d}_1(f)) - \mathrm{d}_1(\theta(f)) \in \Omega$ for all $f \in B'$ where $\theta \otimes 1 : B' \otimes \Omega \to B' \otimes \Omega$

These conditions are not logically independent. For example, assumption (4) implies that $\partial_z(af - \theta(\partial_z(f))) = 0$. Hence if the image of $B \to B'$ is the collection of elements annihilated by ∂_z, then (6) follows. A similar argument can be made for condition (7).

Lemma 39.30.1. *In the situation above there exists a map of complexes*

$$e_M^\bullet : M \otimes_B (\Omega')^\bullet \longrightarrow M \otimes_B \Omega^\bullet$$

such that $c_M^\bullet \circ e_M^\bullet$ and $e_M^\bullet \circ c_M^\bullet$ are homotopic to multiplication by a.

Proof. In this proof all tensor products are over B. Assumption (2) implies that

$$M \otimes (\Omega')^i = (B' \otimes M \otimes \Omega^i) \oplus (B'\mathrm{d}z \otimes M \otimes \Omega^{i-1})$$

for all $i \geq 0$. A collection of additive generators for $M \otimes (\Omega')^i$ is formed by elements of the form $f\omega$ and elements of the form $f\mathrm{d}z \wedge \eta$ where $f \in B'$, $\omega \in M \otimes \Omega^i$, and $\eta \in M \otimes \Omega^{i-1}$.

For $f \in B'$ we write

$$\epsilon(f) = af - \theta(\partial_z(f)) \quad \text{and} \quad \epsilon'(f) = (\theta \otimes 1)(\mathrm{d}_1(f)) - \mathrm{d}_1(\theta(f))$$

so that $\epsilon(f) \in B$ and $\epsilon'(f) \in \Omega$ by assumptions (6) and (7). We define $e_M^\bullet$ by the rules $e_M^i(f\omega) = \epsilon(f)\omega$ and $e_M^i(f\mathrm{d}z \wedge \eta) = \epsilon'(f) \wedge \eta$. We will see below that the collection of maps e_M^i is a map of complexes.

We define

$$h^i : M \otimes_B (\Omega')^i \longrightarrow M \otimes_B (\Omega')^{i-1}$$

by the rules $h^i(f\omega) = 0$ and $h^i(f\mathrm{d}z \wedge \eta) = \theta(f)\eta$ for elements as above. We claim that

$$\mathrm{d} \circ h + h \circ \mathrm{d} = a - c_M^\bullet \circ e_M^\bullet$$

Note that multiplication by a is a map of complexes by (1). Hence, since $c_M^\bullet$ is an injective map of complexes by assumption (5), we conclude that $e_M^\bullet$ is a map of complexes. To prove the claim we compute

$$\begin{aligned}(\mathrm{d} \circ h + h \circ \mathrm{d})(f\omega) &= h\,(\mathrm{d}(f) \wedge \omega + f\nabla(\omega)) \\ &= \theta(\partial_z(f))\omega \\ &= af\omega - \epsilon(f)\omega \\ &= af\omega - c_M^i(e_M^i(f\omega))\end{aligned}$$

The second equality because $\mathrm{d}z$ does not occur in $\nabla(\omega)$ and the third equality by assumption (6). Similarly, we have

$$\begin{aligned}(\mathrm{d} \circ h + h \circ \mathrm{d})(f\mathrm{d}z \wedge \eta) &= \mathrm{d}(\theta(f)\eta) + h\,(\mathrm{d}(f) \wedge \mathrm{d}z \wedge \eta - f\mathrm{d}z \wedge \nabla(\eta)) \\ &= \mathrm{d}(\theta(f)) \wedge \eta + \theta(f)\nabla(\eta) - (\theta \otimes 1)(\mathrm{d}_1(f)) \wedge \eta - \theta(f)\nabla(\eta) \\ &= \mathrm{d}_1(\theta(f)) \wedge \eta + \partial_z(\theta(f))\mathrm{d}z \wedge \eta - (\theta \otimes 1)(\mathrm{d}_1(f)) \wedge \eta \\ &= af\mathrm{d}z \wedge \eta - \epsilon'(f) \wedge \eta \\ &= af\mathrm{d}z \wedge \eta - c_M^i(e_M^i(f\mathrm{d}z \wedge \eta))\end{aligned}$$

The second equality because $\mathrm{d}(f) \wedge \mathrm{d}z \wedge \eta = -\mathrm{d}z \wedge \mathrm{d}_1(f) \wedge \eta$. The fourth equality by assumption (4). On the other hand it is immediate from the definitions that $e_M^i(c_M^i(\omega)) = \epsilon(1)\omega = a\omega$. This proves the lemma. □

Example 39.30.2. A standard example of the situation above occurs when $B' = B\langle z\rangle$ is the divided power polynomial ring over a divided power ring (B, J, δ) with divided powers δ' on $J' = B'_+ + JB' \subset B'$. Namely, we take $\Omega = \Omega_{B,\delta}$ and $\Omega' = \Omega_{B',\delta'}$. In this case we can take $a = 1$ and

$$\theta(\sum b_m z^{[m]}) = \sum b_m z^{[m+1]}$$

Note that

$$f - \theta(\partial_z(f)) = f(0)$$

equals the constant term. It follows that in this case Lemma 39.30.1 recovers the crystalline Poincaré lemma (Lemma 39.25.2).

Lemma 39.30.3. *In Situation 39.9.1. Assume D and Ω_D are as in (39.22.0.1) and (39.22.0.2). Let $\lambda \in D$. Let D' be the p-adic completion of*

$$D[z]\langle\xi\rangle/(\xi - (z^p - \lambda))$$

and let $\Omega_{D'}$ be the p-adic completion of the module of divided power differentials of D' over A. For any pair (M, ∇) over D satisfying (1), (2), (3), and (4) the canonical map of complexes (39.10.11.1)

$$c^\bullet_M : M \otimes^\wedge_D \Omega^\bullet_D \longrightarrow M \otimes^\wedge_D \Omega^\bullet_{D'}$$

has the following property: There exists a map $e^\bullet_M$ in the opposite direction such that both $c^\bullet_M \circ e^\bullet_M$ and $e^\bullet_M \circ c^\bullet_M$ are homotopic to multiplication by p.

Proof. We will prove this using Lemma 39.30.1 with $a = p$. Thus we have to find $\theta : D' \to D'$ and prove (1), (2), (3), (4), (5), (6), (7). We first collect some information about the rings D and D' and the modules Ω_D and $\Omega_{D'}$.

Writing

$$D[z]\langle\xi\rangle/(\xi - (z^p - \lambda)) = D\langle\xi\rangle[z]/(z^p - \xi - \lambda)$$

we see that D' is the p-adic completion of the free D-module

$$\bigoplus\nolimits_{i=0,\ldots,p-1} \bigoplus\nolimits_{n\geq 0} z^i \xi^{[n]} D$$

where $\xi^{[0]} = 1$. It follows that $D \to D'$ has a continuous D-linear section, in particular $D \to D'$ is universally injective, i.e., (5) holds. We think of D' as a divided power algebra over A with divided power ideal $\bar{J}' = \bar{J}D' + (\xi)$. Then D' is also the p-adic completion of the divided power envelope of the ideal generated by $z^p - \lambda$ in D, see Lemma 39.6.4. Hence

$$\Omega_{D'} = \Omega_D \otimes^\wedge_D D' \oplus D'\mathrm{d}z$$

by Lemma 39.10.6. This proves (2). Note that (1) is obvious.

At this point we construct θ. (We wrote a PARI/gp script theta.gp verifying some of the formulas in this proof which can be found in the scripts subdirectory of the stacks project.) Before we do so we compute the derivative of the elements $z^i\xi^{[n]}$. We have $\mathrm{d}z^i = iz^{i-1}\mathrm{d}z$. For $n \geq 1$ we have

$$\mathrm{d}\xi^{[n]} = \xi^{[n-1]}\mathrm{d}\xi = -\xi^{[n-1]}\mathrm{d}\lambda + pz^{p-1}\xi^{[n-1]}\mathrm{d}z$$

because $\xi = z^p - \lambda$. For $0 < i < p$ and $n \geq 1$ we have

$$\begin{aligned} \mathrm{d}(z^i\xi^{[n]}) &= iz^{i-1}\xi^{[n]}\mathrm{d}z + z^i\xi^{[n-1]}\mathrm{d}\xi \\ &= iz^{i-1}\xi^{[n]}\mathrm{d}z + z^i\xi^{[n-1]}\mathrm{d}(z^p - \lambda) \\ &= -z^i\xi^{[n-1]}\mathrm{d}\lambda + (iz^{i-1}\xi^{[n]} + pz^{i+p-1}\xi^{[n-1]})\mathrm{d}z \\ &= -z^i\xi^{[n-1]}\mathrm{d}\lambda + (iz^{i-1}\xi^{[n]} + pz^{i-1}(\xi+\lambda)\xi^{[n-1]})\mathrm{d}z \\ &= -z^i\xi^{[n-1]}\mathrm{d}\lambda + ((i+pn)z^{i-1}\xi^{[n]} + p\lambda z^{i-1}\xi^{[n-1]})\mathrm{d}z \end{aligned}$$

the last equality because $\xi\xi^{[n-1]} = n\xi^{[n]}$. Thus we see that

$$\begin{aligned} \partial_z(z^i) &= iz^{i-1} \\ \partial_z(\xi^{[n]}) &= pz^{p-1}\xi^{[n-1]} \\ \partial_z(z^i\xi^{[n]}) &= (i+pn)z^{i-1}\xi^{[n]} + p\lambda z^{i-1}\xi^{[n-1]} \end{aligned}$$

Motivated by these formulas we define θ by the rules

$$\begin{array}{ccccc} \theta(z^j) & = & p\frac{z^{j+1}}{j+1} & & j = 0, \ldots p-1, \\ \theta(z^{p-1}\xi^{[m]}) & = & \xi^{[m+1]} & & m \geq 1, \\ \theta(z^j\xi^{[m]}) & = & \frac{pz^{j+1}\xi^{[m]} - \theta(p\lambda z^j\xi^{[m-1]})}{(j+1+pm)} & & 0 \leq j < p-1, m \geq 1 \end{array}$$

where in the last line we use induction on m to define our choice of θ. Working this out we get (for $0 \leq j < p-1$ and $1 \leq m$)

$$\theta(z^j\xi^{[m]}) = \frac{pz^{j+1}\xi^{[m]}}{(j+1+pm)} - \frac{p^2\lambda z^{j+1}\xi^{[m-1]}}{(j+1+pm)(j+1+p(m-1))} + \ldots + \frac{(-1)^m p^{m+1}\lambda^m z^{j+1}}{(j+1+pm)\ldots(j+1)}$$

although we will not use this expression below. It is clear that θ extends uniquely to a p-adically continuous D-linear map on D'. By construction we have (3) and (4). It remains to prove (6) and (7).

Proof of (6) and (7). As θ is D-linear and continuous it suffices to prove that $p - \theta \circ \partial_z$, resp. $(\theta \otimes 1) \circ \mathrm{d}_1 - \mathrm{d}_1 \circ \theta$ gives an element of D, resp. Ω_D when evaluated on the elements $z^i\xi^{[n]}$[8]. Set $D_0 = \mathbf{Z}_{(p)}[\lambda]$ and $D_0' = \mathbf{Z}_{(p)}[z, \lambda]\langle\xi\rangle/(\xi - z^p + \lambda)$. Observe that each of the expressions above is an element of D_0' or $\Omega_{D_0'}$. Hence it suffices to prove the result in the case of $D_0 \to D_0'$. Note that D_0 and D_0' are torsion free rings and that $D_0 \otimes \mathbf{Q} = \mathbf{Q}[\lambda]$ and $D_0' \otimes \mathbf{Q} = \mathbf{Q}[z, \lambda]$. Hence $D_0 \subset D_0'$ is the subring of elements annihilated by ∂_z and (6) follows from (4), see the discussion directly preceding Lemma 39.30.1. Similarly, we have $\mathrm{d}_1(f) = \partial_\lambda(f)\mathrm{d}\lambda$ hence

$$\left((\theta \otimes 1) \circ \mathrm{d}_1 - \mathrm{d}_1 \circ \theta\right)(f) = \left(\theta(\partial_\lambda(f)) - \partial_\lambda(\theta(f))\right)\mathrm{d}\lambda$$

Applying ∂_z to the coefficient we obtain

$$\begin{aligned} \partial_z\left(\theta(\partial_\lambda(f)) - \partial_\lambda(\theta(f))\right) &= p\partial_\lambda(f) - \partial_z(\partial_\lambda(\theta(f))) \\ &= p\partial_\lambda(f) - \partial_\lambda(\partial_z(\theta(f))) \\ &= p\partial_\lambda(f) - \partial_\lambda(pf) = 0 \end{aligned}$$

whence the coefficient does not depend on z as desired. This finishes the proof of the lemma. □

[8]This can be done by direct computation: It turns out that $p - \theta \circ \partial_z$ evaluated on $z^i\xi^{[n]}$ gives zero except for 1 which is mapped to p and ξ which is mapped to $-p\lambda$. It turns out that $(\theta \otimes 1) \circ \mathrm{d}_1 - \mathrm{d}_1 \circ \theta$ evaluated on $z^i\xi^{[n]}$ gives zero except for $z^{p-1}\xi$ which is mapped to $-\lambda$.

Note that an interated α_p-cover $X' \to X$ (as defined in the introduction to this section) is finite locally free. Hence if X is connected the degree of $X' \to X$ is constant and is a power of p.

Lemma 39.30.4. *Let p be a prime number. Let $(S, \mathcal{I}, \gamma)$ be a divided power scheme over $\mathbf{Z}_{(p)}$ with $p \in \mathcal{I}$. We set $S_0 = V(\mathcal{I}) \subset S$. Let $f : X' \to X$ be an iterated α_p-cover of schemes over S_0 with constant degree q. Let $\mathcal{F}$ be any crystal in quasi-coherent sheaves on X and set $\mathcal{F}' = f_{cris}^*\mathcal{F}$. In the distinguished triangle*

$$Ru_{X/S,*}\mathcal{F} \longrightarrow f_*Ru_{X'/S,*}\mathcal{F}' \longrightarrow E \longrightarrow Ru_{X/S,*}\mathcal{F}[1]$$

the object E has cohomology sheaves annihilated by q.

Proof. Note that $X' \to X$ is a homeomorphism hence we can identify the underlying topological spaces of X and X'. The question is clearly local on X, hence we may assume X, X', and S affine and $X' \to X$ given as a composition

$$X' = X_n \to X_{n-1} \to X_{n-2} \to \ldots \to X_0 = X$$

where each morphism $X_{i+1} \to X_i$ is an α_p-cover. Denote $\mathcal{F}_i$ the pullback of $\mathcal{F}$ to X_i. It suffices to prove that each of the maps

$$R\Gamma(\text{Cris}(X_i/S), \mathcal{F}_i) \longrightarrow R\Gamma(\text{Cris}(X_{i+1}/S), \mathcal{F}_{i+1})$$

fits into a triangle whose third member has cohomology groups annihilated by p. (This uses axiom TR4 for the triangulated category $D(X)$. Details omitted.)

Hence we may assume that $S = Spec(A)$, $X = Spec(C)$, $X' = Spec(C')$ and $C' = C[z]/(z^p - c)$ for some $c \in C$. Choose a polynomial algebra P over A and a surjection $P \to C$. Let D be the p-adically completed divided power envelop of $\text{Ker}(P \to C)$ in P as in (39.22.0.1). Set $P' = P[z]$ with surjection $P' \to C'$ mapping z to the class of z in C'. Choose a lift $\lambda \in D$ of $c \in C$. Then we see that the p-adically completed divided power envelope D' of $\text{Ker}(P' \to C')$ in P' is isomorphic to the p-adic completion of $D[z]\langle\xi\rangle/(\xi - (z^p - \lambda))$, see Lemma 39.30.3 and its proof. Thus we see that the result follows from this lemma by the computation of cohomology of crystals in quasi-coherent modules in Proposition 39.26.3. $\square$

The bound in the following lemma is probably not optimal.

Lemma 39.30.5. *With notations and assumptions as in Lemma 39.30.4 the map*

$$f^* : H^i(Cris(X/S), \mathcal{F}) \longrightarrow H^i(Cris(X'/S), \mathcal{F}')$$

has kernel and cokernel annihilated by q^{i+1}.

Proof. This follows from the fact that E has nonzero cohomology sheaves in degrees -1 and up, so that the spectral sequence $H^a(\mathcal{H}^b(E)) \Rightarrow H^{a+b}(E)$ coverges. This combined with the long exact cohomology sequence associated to a distinguished triangle gives the bound. $\square$

In Situation 39.11.5 assume that $p \in \mathcal{I}$. Set

$$X^{(1)} = X \times_{S_0, F_{S_0}} S_0.$$

Denote $F_{X/S_0} : X \to X^{(1)}$ the relative Frobenius morphism.

Lemma 39.30.6. *In the situation above, assume that $X \to S_0$ is smooth of relative dimension d. Then F_{X/S_0} is an iterated α_p-cover of degree p^d. Hence Lemmas 39.30.4 and 39.30.5 apply to this situation. In particular, for any crystal in quasi-coherent modules $\mathcal{G}$ on $Cris(X^{(1)}/S)$ the map*

$$F_{X/S_0}^* : H^i(Cris(X^{(1)}/S), \mathcal{G}) \longrightarrow H^i(Cris(X/S), F_{X/S_0,cris}^*\mathcal{G})$$

has kernel and cokernel annihilated by $p^{d(i+1)}$.

Proof. It suffices to prove the first statement. To see this we may assume that X is étale over $\mathbf{A}^d_{S_0}$, see Morphisms, Lemma 24.35.20. Denote $\varphi : X \to \mathbf{A}^d_{S_0}$ this étale morphism. In this case the relative Frobenius of X/S_0 fits into a diagram

$$\begin{tikzcd} X \arrow[r] \arrow[d] & X^{(1)} \arrow[d] \\ \mathbf{A}^d_{S_0} \arrow[r] & \mathbf{A}^d_{S_0} \end{tikzcd}$$

where the lower horizontal arrow is the relative frobenius morphism of $\mathbf{A}^d_{S_0}$ over S_0. This is the morphism which raises all the coordinates to the pth power, hence it is an iterated α_p-cover. The proof is finished by observing that the diagram is a fibre square, see the proof of Étale Cohomology, Theorem 38.66.2. $\square$

39.31. Frobenius action on crystalline cohomology

In this section we prove that Frobenius pullback induces a quasi-isomorphism on crystalline cohomology after inverting the prime p. But in order to even formulate this we need to work in a special situation.

Situation 39.31.1. In Situation 39.11.5 assume the following

(1) $S = Spec(A)$ for some divided power ring (A, I, γ) with $p \in I$,
(2) there is given a homomorphism of divided power rings $\sigma : A \to A$ such that $\sigma(x) = x^p \bmod pA$ for all $x \in A$.

In Situation 39.31.1 the morphism $Spec(\sigma) : S \to S$ is a lift of the absolute Frobenius $F_{S_0} : S_0 \to S_0$ and since the diagram

$$\begin{tikzcd} X \arrow[r, "F_X"'] \arrow[d] & X \arrow[d] \\ S_0 \arrow[r, "F_{S_0}"] & S_0 \end{tikzcd}$$

is commutative where $F_X : X \to X$ is the absolute Frobenius morphism of X. Thus we obtain a morphism of crystalline topoi

$$(F_X)_{\text{cris}} : (X/S)_{\text{cris}} \longrightarrow (X/S)_{\text{cris}}$$

see Remark 39.13.3. Here is the terminology concerning F-crystals following the notation of Saavedra, see [**SR72**].

Definition 39.31.2. In Situation 39.31.1 an *F-crystal on X/S (relative to σ)* is a pair $(\mathcal{E}, F_{\mathcal{E}})$ given by a crystal in finite locally free $\mathcal{O}_{X/S}$-modules $\mathcal{E}$ together with a map

$$F_{\mathcal{E}} : (F_X)_{\text{cris}}^*\mathcal{E} \longrightarrow \mathcal{E}$$

An F-crystal is called *nondegenerate* if there exists an integer $i \geq 0$ a map $V : \mathcal{E} \to (F_X)^*_{\text{cris}}\mathcal{E}$ such that $V \circ F_{\mathcal{E}} = p^i\text{id}$.

Remark 39.31.3. Let $(\mathcal{E}, F)$ be an F-crystal as in Definition 39.31.2. In the literature the nondegeneracy condition is often part of the definition of an F-crystal. Moreover, often it is also assumed that $F \circ V = p^n\text{id}$. What is needed for the result below is that there exists an integer $j \geq 0$ such that $\text{Ker}(F)$ and $\text{Coker}(F)$ are killed by p^j. If the rank of $\mathcal{E}$ is bounded (for example if X is quasi-compact), then both of these conditions follow from the nondegeneracy condition as formulated in the definition. Namely, suppose R is a ring, $r \geq 1$ is an integer and $K, L \in \text{Mat}(r \times r, R)$ are matrices with $KL = p^i 1_{r\times r}$. Then $\det(K)\det(L) = p^{ri}$. Let L' be the adjugate matrix of L, i.e., $L'L = LL' = \det(L)$. Set $K' = p^{ri}K$ and $j = ri + i$. Then we have $K'L = p^j 1_{r\times r}$ as $KL = p^i$ and

$$LK' = LK\det(L)\det(M) = LKLL'\det(M) = Lp^iL'\det(M) = p^j 1_{r\times r}$$

It follows that if V is as in Definition 39.31.2 then setting $V' = p^N V$ where $N > i \cdot \text{rank}(\mathcal{E})$ we get $V' \circ F = p^{N+i}$ and $F \circ V' = p^{N+i}$.

Theorem 39.31.4. *In Situation 39.31.1 let $(\mathcal{E}, F_{\mathcal{E}})$ be a nondegenerate F-crystal. Assume A is a p-adically complete Noetherian ring and that $X \to S_0$ is proper smooth. Then the canonical map*

$$F_{\mathcal{E}} \circ (F_X)^*_{cris} : R\Gamma(Cris(X/S), \mathcal{E}) \otimes^{\mathbf{L}}_{A,\sigma} A \longrightarrow R\Gamma(Cris(X/S), \mathcal{E})$$

becomes an isomorphism after inverting p.

Proof. We first write the arrow as a composition of three arrows. Namely, set

$$X^{(1)} = X \times_{S_0, F_{S_0}} S_0$$

and denote $F_{X/S_0} : X \to X^{(1)}$ the relative Frobenius morphism. Denote $\mathcal{E}^{(1)}$ the base change of $\mathcal{E}$ by $Spec(\sigma)$, in other words the pullback of $\mathcal{E}$ to $\text{Cris}(X^{(1)}/S)$ by the morphism of crystalline topoi associated to the commutative diagram

$$\begin{tikzcd} X^{(1)} \arrow[r] \arrow[d] & X \arrow[d] \\ S \arrow[r, "Spec(\sigma)"] & S \end{tikzcd}$$

Then we have the base change map

$$R\Gamma(\text{Cris}(X/S), \mathcal{E}) \otimes^{\mathbf{L}}_{A,\sigma} A \longrightarrow R\Gamma(\text{Cris}(X^{(1)}/S), \mathcal{E}^{(1)}) \tag{39.31.4.1}$$

see Remark 39.29.8. Note that the composition of $F_{X/S_0} : X \to X^{(1)}$ with the projection $X^{(1)} \to X$ is the absolute Frobenius morphism F_X. Hence we see that $F^*_{X/S_0}\mathcal{E}^{(1)} = (F_X)^*_{\text{cris}}\mathcal{E}$. Thus pullback by F_{X/S_0} is a map

$$F^*_{X/S_0} : R\Gamma(\text{Cris}(X^{(1)}/S), \mathcal{E}^{(1)}) \longrightarrow R\Gamma(\text{Cris}(X/S), (F_X)^*_{\text{cris}}\mathcal{E}) \tag{39.31.4.2}$$

Finally we can use $F_{\mathcal{E}}$ to get a map

$$R\Gamma(\text{Cris}(X/S), (F_X)^*_{\text{cris}}\mathcal{E}) \longrightarrow R\Gamma(\text{Cris}(X/S), \mathcal{E}) \tag{39.31.4.3}$$

The map of the theorem is the composition of the three maps (39.31.4.1), (39.31.4.2), and (39.31.4.3) above. The first is a quasi-isomorphism modulo all powers of p by Remark 39.29.9. Hence it is a quasi-isomorphism since the complexes involved are perfect in $D(A)$

see Remark 39.29.13. The third map is a quasi-ismorphism after inverting p simply because $F_{\mathcal{G}}$ has an inverse up to a power of p, see Remark 39.31.3. Finally, the second is an isomorphism after inverting p by Lemma 39.30.6. □

CHAPTER 40

Algebraic Spaces

40.1. Introduction

Algebraic spaces were first introduced by Michael Artin, see [**Art69c**], [**Art70a**], [**Art73a**], [**Art71c**], [**Art71a**], [**Art69a**], [**Art69e**], and [**Art74a**]. Some of the foundational material was developed jointly with Knutson, who produced the book [**Knu71a**]. Artin defined (see [**Art69e**, Definition 1.3]) an algebraic space as a sheaf for the étale topology which is locally in the étale topology representable. In most of Artin's work the categories of schemes considered are schemes locally of finite type over a fixed excellent Noetherian base.

Our definition is slightly different. First of all we consider sheaves for the fppf topology. This is just a technical point and scarcely makes any difference. Second, we include the condition that the diagonal is representable.

After defining algebraic spaces we make some foundational observations. The main result in this chapter is that with our definitions an algebraic space is the same thing as an étale equivalence relation, see the discussion in Section 40.9 and Theorem 40.10.5. The analogue of this theorem in Artin's setting is [**Art69e**, Theorem 1.5], or [**Knu71a**, Proposition II.1.7]. In other words, the sheaf defined by an étale equivalence relation has a representable diagonal. It follows that our definition agrees with Artin's original definition in a broad sense. It also means that one can give examples of algebraic spaces by simply writing down an étale equivalence relation.

In Section 40.13 we introduce various separation axioms on algebraic spaces that we have found in the literatur. Finally in Section 40.14 we give some weird and not so weird examples of algebraic spaces.

40.2. General remarks

We work in a suitable big fppf site Sch_{fppf} as in Topologies, Definition 30.7.6. So, if not explicitly stated otherwise all schemes will be objects of Sch_{fppf}. We will record elsewhere what changes if you change the big fppf site (insert future reference here).

We will always work relative to a base S contained in Sch_{fppf}. And we will then work with the big fppf site $(Sch/S)_{fppf}$, see Topologies, Definition 30.7.8. The absolute case can be recovered by taking $S = Spec(\mathbf{Z})$.

If U, T are schemes over S, then we denote $U(T)$ for the set of T-valued points *over* S. In a formula: $U(T) = Mor_S(T, U)$.

Note that any fpqc covering is a universal effective epimorphism, see Descent, Lemma 31.9.3. Hence the topology on Sch_{fppf} is weaker than the canonical topology and all representable presheaves are sheaves.

40.3. Representable morphisms of presheaves

Let S be a scheme contained in Sch_{fppf}. Let $F, G : (Sch/S)_{fppf}^{opp} \to Sets$. Let $a : F \to G$ be a representable transformation of functors, see Categories, Definition 4.8.2. This means that for every $U \in Ob((Sch/S)_{fppf})$ and any $\xi \in G(U)$ the fiber product $h_U \times_{\xi, G} F$ is representable. Choose a representing object V_ξ and an isomorphism $h_{V_\xi} \to h_U \times_G F$. By the Yoneda lemma, see Categories, Lemma 4.3.5, the projection $h_{V_\xi} \to h_U \times_G F \to h_U$ comes from a unique morphism of schemes $a_\xi : V_\xi \to U$. Suggestively we could represent this by the diagram

$$\begin{tikzcd} V_\xi \arrow[r, squiggly] \arrow[d, "a_\xi"'] & h_{V_\xi} \arrow[r] \arrow[d] & F \arrow[d, "a"] \\ U \arrow[r, squiggly] & h_U \arrow[r, "\xi"] & G \end{tikzcd}$$

where the squiggly arrows represent the Yoneda embedding. Here are some lemmas about this notion that work in great generality.

Lemma 40.3.1. *Let S, X, Y be objects of Sch_{fppf}. Let $f : X \to Y$ be a morphism of schemes. Then*

$$h_f : h_X \longrightarrow h_Y$$

is a representable transformation of functors.

Proof. This is formal and relies only on the fact that the category $(Sch/S)_{fppf}$ has fibre products. □

Lemma 40.3.2. *Let S be a scheme contained in Sch_{fppf}. Let $F, G, H : (Sch/S)_{fppf}^{opp} \to Sets$. Let $a : F \to G$, $b : G \to H$ be representable transformations of functors. Then*

$$b \circ a : F \longrightarrow H$$

is a representable transformation of functors.

Proof. This is entirely formal and works in any category. □

Lemma 40.3.3. *Let S be a scheme contained in Sch_{fppf}. Let $F, G, H : (Sch/S)_{fppf}^{opp} \to Sets$. Let $a : F \to G$ be a representable transformations of functors. Let $b : H \to G$ be any transformation of functors. Consider the fibre product diagram*

$$\begin{tikzcd} H \times_{b,G,a} F \arrow[r, "b'"'] \arrow[d, "a'"'] & F \arrow[d, "a"] \\ H \arrow[r, "b"] & G \end{tikzcd}$$

Then the base change a' is a representable transformation of functors.

Proof. This is entirely formal and works in any category. □

Lemma 40.3.4. *Let S be a scheme contained in Sch_{fppf}. Let $F_i, G_i : (Sch/S)_{fppf}^{opp} \to Sets$, $i = 1, 2$. Let $a_i : F_i \to G_i$, $i = 1, 2$ be representable transformations of functors. Then*

$$a_1 \times a_2 : F_1 \times F_2 \longrightarrow G_1 \times G_2$$

is a representable transformation of functors.

Proof. Write $a_1 \times a_2$ as the composition $F_1 \times F_2 \to G_1 \times F_2 \to G_1 \times G_2$. The first arrow is the base change of a_1 by the map $G_1 \times F_2 \to G_1$, and the second arrow is the base change of a_2 by the map $G_1 \times G_2 \to G_2$. Hence this lemma is a formal consequence of Lemmas 40.3.2 and 40.3.3. □

Lemma 40.3.5. *Let S be a scheme contained in Sch_{fppf}. Let $F, G : (Sch/S)_{fppf}^{opp} \to Sets$. Let $a : F \to G$ be a representable transformation of functors. If G is a sheaf, then so is F.*

Proof. Let $\{\varphi_i : T_i \to T\}$ be a covering of the site $(Sch/S)_{fppf}$. Let $s_i \in F(T_i)$ which satisfy the sheaf condition. Then $\sigma_i = a(s_i) \in G(T_i)$ satisfy the sheaf condition also. Hence there exists a unique $\sigma \in G(T)$ such that $\sigma_i = \sigma|_{T_i}$. By assumption $F' = h_T \times_{\sigma, G, a} F$ is a representable presheaf and hence (see remarks in Section 40.2) a sheaf. Note that $(\varphi_i, s_i) \in F'(T_i)$ satisfy the sheaf condition also, and hence come from some unique $(\mathrm{id}_T, s) \in F'(T)$. Clearly s is the section of F we are looking for. □

Lemma 40.3.6. *Let S be a scheme contained in Sch_{fppf}. Let $F, G : (Sch/S)_{fppf}^{opp} \to Sets$. Let $a : F \to G$ be a representable transformation of functors. Then $\Delta_{F/G} : F \to F \times_G F$ is representable.*

Proof. Let $U \in Ob((Sch/S)_{fppf})$. Let $\xi = (\xi_1, \xi_2) \in (F \times_G F)(U)$. Set $\xi' = a(\xi_1) = a(\xi_2) \in G(U)$. By assumption there exist a scheme V and a morphism $V \to U$ representing the fibre product $h_U \times_{\xi', G} F$. In particular, the elements ξ_1, ξ_2 give morphisms $f_1, f_2 : U \to V$ over U. Because V represents the fibre product $h_U \times_{\xi', G} F$ and because $\xi' = a \circ \xi_1 = a \circ \xi_2$ we see that if $g : U' \to U$ is a morphism then

$$g^*\xi_1 = g^*\xi_2 \Leftrightarrow f_1 \circ g = f_2 \circ g.$$

In other words, we see that $h_U \times_{\xi, F \times_G F} F$ is represented by $V \times_{\Delta, V \times V, (f_1, f_2)} U$ which is a scheme. □

40.4. Lists of useful properties of morphisms of schemes

For ease of reference we list in the following remarks the properties of morphisms which possess some of the properties required of them in later results.

Remark 40.4.1. Here is a list of properties/types of morphisms which are *stable under arbitrary base change*:

(1) closed, open, and locally closed immersions, see Schemes, Lemma 21.18.2,
(2) quasi-compact, see Schemes, Lemma 21.19.3,
(3) universally closed, see Schemes, Definition 21.20.1,
(4) (quasi-)separated, see Schemes, Lemma 21.21.13,
(5) monomorphism, see Schemes, Lemma 21.23.5
(6) surjective, see Morphisms, Lemma 24.9.4,
(7) universally injective, see Morphisms, Lemma 24.10.2,
(8) affine, see Morphisms, Lemma 24.11.8,

(22) finite locally free, see Morphisms, Lemma 24.44.3.

Add more as needed.

Remark 40.4.3. Of the properties mentioned which are stable under base change (as listed in Remark 40.4.1) the following are also *fpqc local on the base* (and a fortiori fppf local on the base):

(1) for immersions we have this for
    (a) closed immersions, see Descent, Lemma 31.19.17,
    (b) open immersions, see Descent, Lemma 31.19.14, and
    (c) quasi-compact immersions, see Descent, Lemma 31.19.19,
(2) quasi-compact, see Descent, Lemma 31.19.1,
(3) universally closed, see Descent, Lemma 31.19.3,
(4) (quasi-)separated, see Descent, Lemmas 31.19.2, and 31.19.5,
(5) monomorphism, see Descent, Lemma 31.19.29,
(6) surjective, see Descent, Lemma 31.19.6,
(7) universally injective, see Descent, Lemma 31.19.7,

(8) affine, see Descent, Lemma 31.19.16,
(9) quasi-affine, see Descent, Lemma 31.19.18,
(10) (locally) of finite type, see Descent, Lemmas 31.19.8, and 31.19.10,
(11) (locally) quasi-finite, see Descent, Lemma 31.19.22,
(12) (locally) of finite presentation, see Descent, Lemmas 31.19.9, and 31.19.11,
(13) locally of finite type of relative dimension d, see Descent, Lemma 31.19.23,
(14) universally open, see Descent, Lemma 31.19.4,
(15) flat, see Descent, Lemma 31.19.13,
(16) syntomic, see Descent, Lemma 31.19.24,
(17) smooth, see Descent, Lemma 31.19.25,
(18) unramified (resp. G-unramified), see Descent, Lemma 31.19.26,
(19) étale, see Descent, Lemma 31.19.27,
(20) proper, see Descent, Lemma 31.19.12,
(21) finite or integral, see Descent, Lemma 31.19.21,
(22) finite locally free, see Descent, Lemma 31.19.28.

Note that the property of being an ``immersion'' may not be fpqc local on the base, but in Descent, Lemma 31.20.1 we proved that it is fppf local on the base.

40.5. Properties of representable morphisms of presheaves

Here is the definition that makes this work.

Definition 40.5.1. With S, and $a : F \to G$ representable as above. Let $\mathcal{P}$ be a property of morphisms of schemes which

(1) is preserved under any base change, see Schemes, Definition 21.18.3, and
(2) is fppf local on the base, see Descent, Definition 31.18.1.

In this case we say that a has *property $\mathcal{P}$* if for every $U \in Ob((Sch/S)_{fppf})$ and any $\xi \in G(U)$ the resulting morphism of schemes $V_\xi \to U$ has property $\mathcal{P}$.

It is important to note that we will only use this definition for properties of morphisms that are stable under base change, and local in the fppf topology on the base. This is not because the definition doesn't make sense otherwise; rather it is because we may want to give a different definition which is better suited to the property we have in mind.

Remark 40.5.2. Consider the property $\mathcal{P}$=``surjective''. In this case there could be some ambiguity if we say ``let $F \to G$ be a surjective map''. Namely, we could mean the notion defined in Definition 40.5.1 above, or we could mean a surjective map of presheaves, see Sites, Definition 9.3.1, or, if both F and G are sheaves, we could mean a surjective map of sheaves, see Sites, Definition 9.11.1, If not mentioned otherwise when discussing morphisms of algebraic spaces we will always mean the first. See Lemma 40.5.9 for a case where surjectivity implies surjectivity as a map of sheaves.

Here is a sanity check.

Lemma 40.5.3. *Let S, X, Y be objects of Sch_{fppf}. Let $f : X \to Y$ be a morphism of schemes. Let $\mathcal{P}$ be as in Definition 40.5.1. Then $h_X \longrightarrow h_Y$ has propery $\mathcal{P}$ if and only if f has property $\mathcal{P}$.*

Proof. Note that the lemma makes sense by Lemma 40.3.1. Proof omitted. □

Lemma 40.5.4. *Let S be a scheme contained in Sch_{fppf}. Let $F, G, H : (Sch/S)_{fppf}^{opp} \to Sets$. Let $\mathcal{P}$ be a property as in Definition 40.5.1 which is stable under composition. Let*

$a : F \to G$, $b : G \to H$ be representable transformations of functors. If a and b have property $\mathcal{P}$ so does $b \circ a : F \longrightarrow H$.

Proof. Note that the lemma makes sense by Lemma 40.3.2. Proof omitted. □

Lemma 40.5.5. *Let S be a scheme contained in Sch_{fppf}. Let $F, G, H : (Sch/S)_{fppf}^{opp} \to Sets$. Let $\mathcal{P}$ be a property as in Definition 40.5.1. Let $a : F \to G$ be a representable transformations of functors. Let $b : H \to G$ be any transformation of functors. Consider the fibre product diagram*

$$\begin{tikzcd} H \times_{b,G,a} F \arrow[r, "b'"] \arrow[d, "a'"'] & F \arrow[d, "a"] \\ H \arrow[r, "b"] & G \end{tikzcd}$$

If a has property $\mathcal{P}$ then also the base change a' has property $\mathcal{P}$.

Proof. Note that the lemma makes sense by Lemma 40.3.3. Proof omitted. □

Lemma 40.5.6. *Let S be a scheme contained in Sch_{fppf}. Let $F, G, H : (Sch/S)_{fppf}^{opp} \to Sets$. Let $\mathcal{P}$ be a property as in Definition 40.5.1. Let $a : F \to G$ be a representable transformations of functors. Let $b : H \to G$ be any transformation of functors. Consider the fibre product diagram*

$$\begin{tikzcd} H \times_{b,G,a} F \arrow[r, "b'"] \arrow[d, "a'"'] & F \arrow[d, "a"] \\ H \arrow[r, "b"] & G \end{tikzcd}$$

Assume that b induces a surjective map of fppf sheaves $H^\# \to G^\#$. In this case, if a' has property $\mathcal{P}$, then also a has property $\mathcal{P}$.

Proof. First we remark that by Lemma 40.3.3 the transformation a' is representable. Let $U \in Ob((Sch/S)_{fppf})$, and let $\xi \in G(U)$. By assumption there exists an fppf covering $\{U_i \to U\}_{i \in I}$ and elements $\xi_i \in H(U_i)$ mapping to $\xi|_U$ via b. From general category theory it follows that for each i we have a fibre product diagram

$$\begin{tikzcd} U_i \times_{\xi_i, H, a'} (H \times_{b,G,a} F) \arrow[r] \arrow[d] & U \times_{\xi, G, a} F \arrow[d] \\ U_i \arrow[r] & U \end{tikzcd}$$

By assumption the left vertical arrow is a morphism of schemes which has property $\mathcal{P}$. Since $\mathcal{P}$ is local in the fppf topology this implies that also the right vertical arrow has property $\mathcal{P}$ as desired. □

Lemma 40.5.7. *Let S be a scheme contained in Sch_{fppf}. Let $F_i, G_i : (Sch/S)_{fppf}^{opp} \to Sets$, $i = 1, 2$. Let $a_i : F_i \to G_i$, $i = 1, 2$ be representable transformations of functors. Let $\mathcal{P}$ be a property as in Definition 40.5.1 which is stable under composition. If a_1 and a_2 have property $\mathcal{P}$ so does $a_1 \times a_2 : F_1 \times F_2 \longrightarrow G_1 \times G_2$.*

Proof. Note that the lemma makes sense by Lemma 40.3.4. Proof omitted. □

Lemma 40.5.8. *Let S be a scheme contained in Sch_{fppf}. Let $F, G : (Sch/S)_{fppf}^{opp} \to Sets$. Let $a : F \to G$ be a representable transformation of functors. Let $\mathcal{P}$, $\mathcal{P}'$ be properties* *as in Definition 40.5.1. Suppose that for any morphism of schemes $f : X \to Y$ we have $\mathcal{P}(f) \Rightarrow \mathcal{P}'(f)$. If a has property $\mathcal{P}$ then a has property $\mathcal{P}'$.*

Proof. Formal. □

Lemma 40.5.9. *Let S be a scheme. Let $F, G : (Sch/S)_{fppf}^{opp} \to Sets$ be sheaves. Let $a : F \to G$ be representable, flat, locally of finite presentation, and surjective. Then $a : F \to G$ is surjective as a map of sheaves.*

Proof. Let T be a scheme over S and let $g : T \to G$ be a T-valued point of G. By assumption $T' = F \times_G T$ is (representable by) a scheme and the morphism $T' \to T$ is a flat, locally of finite presentation, and surjective. Hence $\{T' \to T\}$ is an fppf covering such that $g|_{T'} \in G(T')$ comes from an element of $F(T')$, namely the map $T' \to F$. This proves the map is surjective as a map of sheaves, see Sites, Definition 9.11.1. □

Here is a characterization of those functors for which the diagonal is representable.

Lemma 40.5.10. *Let S be a scheme contained in Sch_{fppf}. Let F be a presheaf of sets on $(Sch/S)_{fppf}$. The following are equivalent:*

(1) *The diagonal $F \to F \times F$ is representable.*
(2) *For every scheme U over S, $U/S \in Ob((Sch/S)_{fppf})$ and any $\xi \in F(U)$ the map $\xi : h_U \to F$ is representable.*

Proof. This is completely formal, see Categories, Lemma 4.8.4. It depends only on the fact that the category $(Sch/S)_{fppf}$ has products of pairs of objects and fibre products, see Topologies, Lemma 30.7.10. □

In the situation of the lemma, for any morphism $\xi : h_U \to F$ as in the lemma, it makes sense to say that ξ has property $\mathcal{P}$, for any property as in Definition 40.5.1. In particular this holds for $\mathcal{P}$ = ``surjective'' and $\mathcal{P}$ = ``étale'', see Remark 40.4.3 above. We will use these in the definition of algebraic spaces below.

40.6. Algebraic spaces

Here is the definition.

Definition 40.6.1. Let S be a scheme contained in Sch_{fppf}. An *algebraic space over S* is a presheaf

$$F : (Sch/S)_{fppf}^{opp} \longrightarrow Sets$$

with the following properties

(1) The presheaf F is a sheaf.
(2) The diagonal morphism $F \to F \times F$ is representable.
(3) There exists a scheme $U \in Ob(Sch_{fppf})$ and a map $h_U \to F$ which is surjective, and étale.

There are two differences with the ``usual'' definition, for example the definition in Knutson's book [**Knu71a**].

The first is that we require F to be a sheaf in the fppf topology. One reason for doing this is that many natural examples of algebraic spaces satisfy the sheaf condition for the fppf coverings (and even for fpqc coverings). Also, one of the reasons that algebraic spaces have been so useful is via Michael Artin's results on algebraic spaces. Built into his method is a condition which guarantees the result is locally of finite presentation over S. Combined it somehow seems to us that the fppf topology is the natural topology to work with. In the end the category of algebraic spaces ends up being the same. See Bootstrap, Section 54.12.

The second is that we only require the diagonal map for F to be representable, whereas in [**Knu71a**] it is required that it also be quasi-compact. If $F = h_U$ for some scheme U over S this corresponds to the condition that S be quasi-separated. Our point of view is to try to prove a certain number of the results that follow only assuming that the diagonal of F be representable, and simply add an addition hypothesis wherever this is necessary. In any case it has the pleasing consquence that the following lemma is true.

Lemma 40.6.2. *A scheme is an algebraic space. More precisely, given a scheme $T \in Ob((Sch/S)_{fppf})$ the representable functor h_T is an algebraic space.*

Proof. The functor h_T is a sheaf by our remarks in Section 40.2. The diagonal $h_T \to h_T \times h_T = h_{T\times T}$ is representable because $(Sch/S)_{fppf}$ has fibre products. The identity map $h_T \to h_T$ is surjective étale. □

Definition 40.6.3. Let F, F' be algebraic spaces over S. A *morphism $f : F \to F'$ of algebraic spaces over S* is a transformation of functors from F to F'.

The category of algebraic spaces over S contains the category $(Sch/S)_{fppf}$ as a full subcategory via the Yoneda embedding $T/S \mapsto h_T$. From now on we no longer distinghuish between a scheme T/S and the algebraic space it represents. Thus when we say ``Let $f : T \to F$ be a morphism from the scheme T to the algebraic space F", we mean that $T \in Ob((Sch/S)_{fppf})$, that F is an algebraic space over S, and that $f : h_T \to F$ is a morphism of algebraic spaces over S.

40.7. Fibre products of algebraic spaces

The category of algebraic spaces over S has both products and fibre products.

Lemma 40.7.1. *Let S be a scheme contained in Sch_{fppf}. Let F, G be algebraic spaces over S. Then $F \times G$ is an algebraic space, and is a product in the category of algebraic spaces over S.*

Proof. It is clear that $H = F\times G$ is a sheaf. The diagonal of H is simply the product of the diagonals of F and G. Hence it is representable by Lemma 40.3.4. Finally, if $U \to F$ and $V \to G$ are surjective étale morphisms, with $U, V \in Ob((Sch/S)_{fppf})$, then $U \times V \to F \times G$ is surjective étale by Lemma 40.5.7. □

Lemma 40.7.2. *Let S be a scheme contained in Sch_{fppf}. Let H be a sheaf on $(Sch/S)_{fppf}$ whose diagonal is representable. Let F, G be algebraic spaces over S. Let $F \to H$, $G \to H$ be maps of sheaves. Then $F \times_H G$ is an algebraic space.*

Proof. We check the 3 conditions of Definition 40.6.1. A fibre product of sheaves is a sheaf, hence $F \times_H G$ is a sheaf. The diagonal of $F \times_H G$ is the left vertical arrow in

$$\begin{tikzcd} F \times_H G \arrow[r] \arrow[d, "\Delta"] & F \times G \arrow[d, "\Delta_F \times \Delta_G"] \\ (F \times F) \times_{(H\times H)} (G \times G) \arrow[r] & (F \times F) \times (G \times G) \end{tikzcd}$$

which is cartesian. Hence Δ is representable as the base change of the morphism on the right which is representable, see Lemmas 40.3.4 and 40.3.3. Finally, let $U, V \in Ob((Sch/S)_{fppf})$

and $a : U \to F$, $b : V \to G$ be surjective and étale. As Δ_H is representable, we see that $U \times_H V$ is a scheme. The morphism

$$U \times_H V \longrightarrow F \times_H G$$

is surjective and étale as a composition of the base changes $U \times_H V \to U \times_H G$ and $U \times_H G \to F \times_H G$ of the étale surjective morphisms $U \to F$ and $V \to G$, see Lemmas 40.3.2 and 40.3.3. This proves the last condition of Definition 40.6.1 holds and we conclude that $F \times_H G$ is an algebraic space. □

Lemma 40.7.3. *Let S be a scheme contained in Sch_{fppf}. Let $F \to H$, $G \to H$ be morphisms of algebraic spaces over S. Then $F \times_H G$ is an algebraic space, and is a fibre product in the category of algebraic spaces over S.*

Proof. It follows from the stronger Lemma 40.7.2 that $F \times_H G$ is an algebraic space. It is clear that $F \times_H G$ is a fibre product in the category of algebraic spaces over S since that is a full subcategory of the category of (pre)sheaves of sets on $(Sch/S)_{fppf}$. □

40.8. Glueing algebraic spaces

In this section we really start abusing notation and not distinguish between schemes and the spaces they represent.

Lemma 40.8.1. *Let $S \in Ob(Sch_{fppf})$. Let $U \in Ob((Sch/S)_{fppf})$. Given a set I and sheaves F_i on $Ob((Sch/S)_{fppf})$, if $U \cong \coprod_{i \in I} F_i$ as sheaves, then each F_i is representable by an open and closed subscheme U_i and $U \cong \coprod U_i$ as schemes.*

Proof. By assumption this means there exists an fppf covering $\{U_j \to U\}_{j \in J}$ such that each $U_j \to U$ factors through $F_{i(j)}$ for some $i(j) \in I$. Denote $V_j = \mathrm{Im}(U_j \to U)$. This is an open of U by Morphisms, Lemma 24.24.9, and $\{U_j \to V_j\}$ is an fppf covering. Hence it follows that $V_j \to U$ factors through $F_{i(j)}$ since $F_{i(j)}$ is a subsheaf. It follows from $F_i \cap F_{i'} = \emptyset$, $i \neq i'$ that $V_j \cap V_{j'} = \emptyset$ unless $i(j) = i(j')$. Hence we can take $U_i = \bigcup_{j,\ i(j)=i} V_j$ and everything is clear. □

Lemma 40.8.2. *Let $S \in Ob(Sch_{fppf})$. Let F be an algebraic space over S. Given a set I and sheaves F_i on $Ob((Sch/S)_{fppf})$, if $F \cong \coprod_{i \in I} F_i$ as sheaves, then each F_i is an algebraic space over S.*

Proof. It follows directly from the representability of $F \to F \times F$ that each diagonal morphism $F_i \to F_i \times F_i$ is representable. Choose a scheme U in $(Sch/S)_{fppf}$ and a surjective étale morphism $U \to \coprod F_i$ (this exist by hypothesis). By considering the inverse image of F_i we get a decomposition of U (as a sheaf) into a coproduct of sheaves. By Lemma 40.8.1 we get correspondingly $U \cong \coprod U_i$. Then it follows easily that $U_i \to F_i$ is surjective and étale (from the corresponding property of $U \to F$). □

The condition on the size of I and the F_i in the following lemma may be ignored by those not worried about set theoretic questions.

Lemma 40.8.3. *Let $S \in Ob(Sch_{fppf})$. Suppose given a set I and algebraic spaces F_i, $i \in I$. Then $F = \coprod_{i \in I} F_i$ is an algebraic space provided I, and the F_i are not too ``large'': for example if we can choose surjective étale morphisms $U_i \to F_i$ such that $\coprod_{i \in I} U_i$ is isomorphic to an object of $(Sch/S)_{fppf}$, then F is an algebraic space.*

Proof. By construction F is a sheaf. We omit the verification that the diagonal morphism of F is representable. Finally, if U is an object of $(Sch/S)_{fppf}$ isomorphic to $\coprod_{i\in I} U_i$ then it is straightforward to verify that the resulting map $U \to \coprod F_i$ is surjective and étale. □

Here is the analogue of Schemes, Lemma 21.15.4.

Lemma 40.8.4. *Let $S \in Ob(Sch_{fppf})$. Let F be a presheaf of sets on $(Sch/S)_{fppf}$. Assume*

1. *F is a sheaf,*
2. *there exists an index set I and subfunctors $F_i \subset F$ such that*
   (a) *each F_i is an algebraic space,*
   (b) *each $F_i \to F$ is a representable,*
   (c) *each $F_i \to F$ is an open immersion (see Definition 40.5.1),*
   (d) *the map of sheaves $\coprod F_i \to F$ is surjective, and*
   (e) *$\coprod F_i$ is an algebraic space (set theoretic condition, see Lemma 40.8.3).*

Then F is an algebraic space.

Proof. Let T, T' be objects of $(Sch/S)_{fppf}$. Let $T \to F$, $T' \to F$ morphisms. The assumptions imply that there exists an open covering $T = \bigcup V_i$ such that $V_i = T \times_F F_i$. Note that this in particular implies that $\coprod F_i \to F$ is surjective in the Zariski topology! Also write similarly $T' = \bigcup V'_i$ with $V'_i = T' \times_F F_i$.

To show that the diagonal $F \to F \times F$ is representable we have to show that $G = T \times_F T'$ is representable. Consider the subfunctors $G_i = G \times_F F_i$. Note that $G_i = V_i \times_{F_i} V'_i$, and hence is representable as F_i is an algebraic space. By the above the G_i form a Zariski covering of F. Hence by Schemes, Lemma 21.15.4 we see G is representable.

Choose a scheme $U \in Ob((Sch/S)_{fppf})$ and a surjective étale morphism $U \to \coprod F_i$ (this exist by hypothesis). We may write $U = \coprod U_i$ with U_i the inverse image of F_i, see Lemma 40.8.1. We claim that $U \to F$ is surjective and étale. Surjectivity follows as $\coprod F_i \to F$ is surjective. Consider the fibre product $U \times_F T$ where $T \to F$ is as above. We have to show that $U \times_F T \to T$ is étale. Since $U \times_F T = \coprod U_i \times_F T$ it suffices to show each $U_i \times_F T \to T$ is étale. Since $U_i \times_F T = U_i \times_{F_i} V_i$ this follows from the fact that $U_i \to F_i$ is étale and $V_i \to T$ is an open immersion (and Morphisms, Lemmas 24.35.9 and 24.35.3). □

40.9. Presentations of algebraic spaces

Given an algebraic space we can find a ``presentation" of it.

Lemma 40.9.1. *Let F be an algebraic space over S. Let $f : U \to F$ be a surjective étale morphism from a scheme to F. Set $R = U \times_F U$. Then*

1. *$j : R \to U \times_S U$ defines an equivalence relation on U over S (see Groupoids, Definition 35.3.1).*
2. *the morphisms $s, t : R \to U$ are étale, and*
3. *the diagram*
$$R \rightrightarrows U \longrightarrow F$$
is a coequalizer diagram in $Sh((Sch/S)_{fppf})$.

Proof. Let T/S be an object of $(Sch/S)_{fppf}$. Then $R(T) = \{(a, b) \in U(T) \times U(T) \mid f \circ a = f \circ b\}$ which is clearly defines an equivalence relation on $U(T)$. The morphisms $s, t : R \to U$ are étale because the morphism $U \to F$ is étale.

To prove (3) we first show that $U \to F$ is a surjection of sheaves, see Sites, Definition 9.11.1. Let $\xi \in F(T)$ with T as above. Let $V = T \times_{\xi, F, f} U$. By assumption V is a scheme and $V \to T$ is surjective étale. Hence $\{V \to T\}$ is a covering for the fppf topology. Since $\xi|_V$ factors through U by construction we conclude $U \to F$ is surjective. To conclude we have to show that given any two morphisms $a, b : T \to U$ such that $f \circ a = f \circ b$ there is a morphism $c : T \to R$ such that $a = \mathrm{pr}_0 \circ c$ and $b = \mathrm{pr}_1 \circ b$. This is clear from the definition of R. $\square$

This lemma suggests the following definitions.

Definition 40.9.2. Let S be a scheme. Let U be a scheme over S. An *étale equivalence relation* on U over S is an equivalence relation $j : R \to U \times_S U$ such that $s, t : R \to U$ are étale morphisms of schemes.

Definition 40.9.3. Let F be an algebraic space over S. A *presentation* of F is given by a scheme U over S and an étale equivalence relation R on U over S, and a surjective étale morphism $U \to F$ such that $R = U \times_F U$.

Equivalently we could ask for the existence of an isomorphism

$$U/R \cong F$$

where the quotient U/R is as defined in Groupoids, Section 35.17. To construct algebraic spaces we will study the converse question, namely, for which equivalence relations the quotient sheaf U/R is an algebraic space. It will finally turn out this is always the case if R is an étale equivalence relation on U over S, see Theorem 40.10.5.

40.10. Algebraic spaces and equivalence relations

Suppose given a scheme U over S and an étale equivalence relation R on U over S. We would like to show this defines an algebraic space. We will produce a series of lemmas that prove the quotient sheaf U/R (see Groupoids, Definition 35.17.1) has all the properties required of it in Definition 40.6.1.

Lemma 40.10.1. *Let S be a scheme. Let U be a scheme over S. Let $j = (s, t) : R \to U \times_S U$ be an étale equivalence relation on U over S. Let $U' \to U$ be an étale morphism. Let R' be the restriction of R to U', see Groupoids, Definition 35.3.3. Then $j' : R' \to U' \times_S U'$ is an étale equivalence relation also.*

Proof. It is clear from the description of s', t' in Groupoids, Lemma 35.15.1 that $s', t' : R' \to U'$ are étale as compositions of base changes of étale morphisms (see Morphisms, Lemma 24.35.4 and 24.35.3). $\square$

We will often use the following lemma to find open subspaces of algebraic spaces. A slight improvement (with more general hypotheses) of this lemma is Bootstrap, Lemma 54.7.1.

Lemma 40.10.2. *Let S be a scheme. Let U be a scheme over S. Let $j = (s, t) : R \to U \times_S U$ be a pre-relation. Let $g : U' \to U$ be a morphism. Assume*

1. *j is an equivalence relation,*
2. *$s, t : R \to U$ are surjective, flat and locally of finite presentation,*
3. *g is flat and locally of finite presentation.*

Let $R' = R|_{U'}$ be the restriction of R to U. Then $R'/U' \to R/U$ is representable, and is an open immersion.

Proof. By Groupoids, Lemma 35.3.2 the morphism $j' = (t', s') : R' \to U' \times_S U'$ defines an equivalence relation. Since g is flat and locally of finite presentation we see that g is universally open as well (Morphisms, Lemma 24.24.9). For the same reason s, t are universally open as well. Let $W^1 = g(U') \subset U$, and let $W = t(s^{-1}(W^1))$. Then W^1 and W are open in U. Moreover, as j is an equivalence relation we have $t(s^{-1}(W)) = W$ (see Groupoids, Lemma 35.16.2 for example).

By Groupoids, Lemma 35.17.5 the map of sheaves $F' = U'/R' \to F = U/R$ is injective. Let $a : T \to F$ be a morphism from a scheme into U/R. We have to show that $T \times_F F'$ is representable by an open subscheme of T.

The morphism a is given by the following data: an fppf covering $\{\varphi_j : T_j \to T\}_{j \in J}$ of T and morphsms $a_j : T_j \to U$ such that the maps

$$a_j \times a_{j'} : T_j \times_T T_{j'} \longrightarrow U \times_S U$$

factor through $j : R \to U \times_S U$ via some (unique) maps $r_{jj'} : T_j \times_T T_{j'} \to R$. The system (a_j) corresponds to a in the sense that the diagrams

$$\begin{tikzcd} T_j \arrow[r, "a_j"'] \arrow[d] & U \arrow[d] \\ T \arrow[r, "a"] & F \end{tikzcd}$$

commute.

Consider the open subsets $W_j = a_j^{-1}(W) \subset T_j$. Since $t(s^{-1}(W)) = W$ we see that

$$W_j \times_T T_{j'} = r_{jj'}^{-1}(t^{-1}(W)) = r_{jj'}^{-1}(s^{-1}(W)) = T_j \times_T W_{j'}.$$

By Descent, Lemma 31.9.2 this means there exists an open $W_T \subset T$ such that $\varphi_j^{-1}(W_T) = W_j$ for all $j \in J$. We claim that $W_T \to T$ represents $T \times_F F' \to T$.

First, let us show that $W_T \to T \to F$ is an element of $F'(W_T)$. Since $\{W_j \to W_T\}_{j \in J}$ is an fppf covering of W_T, it is enough to show that each $W_j \to U \to F$ is an element of $F'(W_j)$ (as F' is a sheaf for the fppf topology). Consider the commutative diagram

$$\begin{tikzcd} W'_j \arrow[rr] \arrow[dr] \arrow[dd] & & U' \arrow[d, "g"] \\ & s^{-1}(W^1) \arrow[r, "s"'] \arrow[d, "t"] & W^1 \arrow[d] \\ W_j \arrow[r, "a_j|_{W_j}"] & W \arrow[r] & F \end{tikzcd}$$

where $W'_j = W_j \times_W s^{-1}(W^1) \times_{W^1} U'$. Since t and g are surjective, flat and locally of finite presentation, so is $W'_j \to W_j$. Hence the restriction of the element $W_j \to U \to F$ to W'_j is an element of F' as desired.

Suppose that $f : T' \to T$ is a morphism of schemes such that $a|_{T'} \in F'(T')$. We have to show that f factors through the open W_T. Since $\{T' \times_T T_j \to T\}$ is an fppf covering of T' it is enough to show each $T' \times_T T_j \to T$ factors through W_T. Hence we may assume f factors as $\varphi_j \circ f_j : T' \to T_j \to T$ for some j. In this case the condition $a|_{T'} \in F'(T')$ means that there exists some fppf covering $\{\psi_i : T'_i \to T'\}_{i \in I}$ and some morphisms $b_i : T'_i \to U'$

such that

$$\begin{tikzcd} T_i' \arrow[r, "b_i"'] \arrow[d, "f_j\circ\psi_i"'] & U' \arrow[r, "g"'] & U \arrow[d] \\ T_j \arrow[r, "a_j"] & U \arrow[r] & F \end{tikzcd}$$

is commutative. This commutativity means that there exists a morphism $r_i' : T_i' \to R$ such that $t \circ r_i' = a_j \circ f_j \circ \psi_i$, and $s \circ r_i' = g \circ b_i$. This implies that $\mathrm{Im}(f_j \circ \psi_i) \subset W_j$ and we win. $\square$

The following lemma is not completely trivial although it looks like it should be trivial.

Lemma 40.10.3. *Let S be a scheme. Let U be a scheme over S. Let $j = (s,t) : R \to U \times_S U$ be an étale equivalence relation on U over S. If the quotient U/R is an algebraic space, then $U \to U/R$ is étale and surjective. Hence $(U, R, U \to U/R)$ is a presentation of the algebraic space U/R.*

Proof. Denote $c : U \to U/R$ the morphism in question. Let T be a scheme and let $a : T \to U/R$ be a morphism. We have to show that the morphism (of schemes) $\pi : T \times_{a,R/U,c} U \to T$ is étale and surjective. The morphism a corresponds to an fppf covering $\{\varphi_i : T_i \to T\}$ and morphisms $a_i : T_i \to U$ such that $a_i \times a_{i'} : T_i \times_T T_{i'} \to U \times_S U$ factors through R, and such that $c \circ a_i = \varphi_i \circ a$. Hence

$$T_i \times_{\varphi_i,T} T \times_{a,R/U,c} U = T_i \times_{c\circ a_i,R/U,c} U = T_i \times_{a_i,U} U \times_{c,R/U,c} U = T_i \times_{a_i,U,t} R.$$

Since t is étale and surjective we conclude that the base change of π to T_i is surjective and étale. Since the property of being surjective and étale is local on the base in the fpqc topology (see Remark 40.4.3) we win. $\square$

Lemma 40.10.4. *Let S be a scheme. Let U be a scheme over S. Let $j = (s,t) : R \to U \times_S U$ be an étale equivalence relation on U over S. Assume that U is affine. Then the quotient $F = U/R$ is an algebraic space, and $U \to F$ is étale and surjective.*

Proof. Since $j : R \to U \times_S U$ is a monomorphism we see that j is separated (see Schemes, Lemma 21.23.3). Since U is affine we see that $U \times_S U$ (which comes equipped with a monomorphism into the affine scheme $U \times U$) is separated. Hence we see that R is separated. In particular the morphisms s, t are separated as well as étale.

Since the compostition $R \to U \times_S U \to U$ is locally of finite type we conclude that j is locally of finite type (see Morphisms, Lemma 24.14.8). As j is also a monomorphism it has finite fibres and we see that j is locally quasi-finite by Morphisms, Lemma 24.19.7. Alltogether we see that j is separated and locally quasi-finite.

Our first step is to show that the quotient map $c : U \to F$ is representable. Consider a scheme T and a morphism $a : T \to F$. We have to show that the sheaf $G = T \times_{a,F,c} U$ is representable. As seen in the proofs of Lemmas 40.10.2 and 40.10.3 there exists an fppf covering $\{\varphi_i : T_i \to T\}_{i \in I}$ and morphisms $a_i : T_i \to U$ such that $a_i \times a_{i'} : T_i \times_T T_{i'} \to U \times_S U$ factors through R, and such that $c \circ a_i = \varphi_i \circ a$. As in the proof of Lemma 40.10.3 we see that

$$\begin{aligned} T_i \times_{\varphi_i,T} G &= T_i \times_{\varphi_i,T} T \times_{a,R/U,c} U \\ &= T_i \times_{c\circ a_i,R/U,c} U \\ &= T_i \times_{a_i,U} U \times_{c,R/U,c} U \\ &= T_i \times_{a_i,U,t} R \end{aligned}$$

Since t is separated and étale, and in particular separated and locally quasi-finite (by Morphisms, Lemmas 24.34.10 and 24.35.16) we see that the restriction of G to each T_i is representable by a morphism of schemes $X_i \to T_i$ which is separated and locally quasi-finite. By Descent, Lemma 31.35.1 we obtain a descent datum $(X_i, \varphi_{ii'})$ relative to the fppf-covering $\{T_i \to T\}$. Since each $X_i \to T_i$ is separated and locally quasi-finite we see by More on Morphisms, Lemma 33.35.1 that this descent datum is effective. Hence by Descent, Lemma 31.35.1 (2) we conclude that G is representable as desired.

The second step of the proof is to show that $U \to F$ is surjective and étale. This is clear from the above since in the first step above we saw that $G = T \times_{a,F,c} U$ is a scheme over T which base changes to schemes $X_i \to T_i$ which are surjective and étale. Thus $G \to T$ is surjective and étale (see Remark 40.4.3). Alternatively one can reread the proof of Lemma 40.10.3 in the current situation.

The third and final step is to show that the diagonal map $F \to F \times F$ is representable. We first observe that the diagram

$$\begin{tikzcd} R \arrow[r] \arrow[d, "j"'] & F \arrow[d, "\Delta"] \\ U \times_S U \arrow[r] & F \times F \end{tikzcd}$$

is a fibre product square. By Lemma 40.3.4 the morphism $U \times_S U \to F \times F$ is representable (note that $h_U \times h_U = h_{U \times_S U}$). Moreover, by Lemma 40.5.7 the morphism $U \times_S U \to F \times F$ is surjective and étale (note also that étale and surjective occur in the lists of Remarks 40.4.3 and 40.4.2). It follows either from Lemma 40.3.3 and the diagram above, or by writing $R \to F$ as $R \to U \to F$ and Lemmas 40.3.1 and 40.3.2 that $R \to F$ is representable as well. Let T be a scheme and let $a : T \to F \times F$ be a morphism. We have to show that $G = T \times_{a,F \times F,\Delta} F$ is representable. By what was said above the morphism (of schemes)

$$T' = (U \times_S U) \times_{F \times F,a} T \longrightarrow T$$

is surjective and étale. Hence $\{T' \to T\}$ is an étale covering of T. Note also that

$$T' \times_T G = T' \times_{U \times_S U,j} R$$

as can be seen contemplating the following cube

$$\begin{tikzcd} & R \arrow[rr] \arrow[dd] & & F \arrow[dd] \\ T' \times_T G \arrow[ur] \arrow[rr] \arrow[dd] & & G \arrow[ur] \arrow[dd] & \\ & U \times_S U \arrow[rr] & & F \times F \\ T' \arrow[ur] \arrow[rr] & & T \arrow[ur] & \end{tikzcd}$$

Hence we see that the restriction of G to T' is representable by a scheme X, and moreover that the morphism $X \to T'$ is a base change of the morphism j. Hence $X \to T'$ is separated and locally quasi-finite (see second paragraph of the proof). By Descent, Lemma 31.35.1 we obtain a descent datum (X, φ) relative to the fppf-covering $\{T' \to T\}$. Since $X \to T$ is separated and locally quasi-finite we see by More on Morphisms, Lemma 33.35.1 that this descent datum is effective. Hence by Descent, Lemma 31.35.1 (2) we conclude that G is representable as desired. □

Theorem 40.10.5. *Let S be a scheme. Let U be a scheme over S. Let $j = (s,t) : R \to U \times_S U$ be an étale equivalence relation on U over S. Then the quotient U/R is an algebraic space, and $U \to U/R$ is étale and surjective, in other words $(U, R, U \to U/R)$ is a presentation of U/R.*

Proof. By Lemma 40.10.3 it suffice to just prove that U/R is an algebraic space. Let $U' \to U$ be a surjective, étale morphism. Then $\{U' \to U\}$ is in particular an fppf covering. Let R' be the restriction of R to U', see Groupoids, Definition 35.3.3. According to Groupoids, Lemma 35.17.6 we see that $U/R \cong U'/R'$. By Lemma 40.10.1 R' is an étale equivalence relation on U'. Thus we may replace U by U'.

We apply the previous remark to $U' = \coprod U_i$, where $U = \bigcup U_i$ is an affine open covering of S. Hence we may and do assume that $U = \coprod U_i$ where each U_i is an affine scheme.

Consider the restriction R_i of R to U_i. By Lemma 40.10.1 this is an étale equivalence relation. Set $F_i = U_i/R_i$ and $F = U/R$. It is clear that $\coprod F_i \to F$ is surjective. By Lemma 40.10.2 each $F_i \to F$ is representable, and an open immersion. By Lemma 40.10.4 applied to (U_i, R_i) we see that F_i is an algebraic space. Then by Lemma 40.10.3 we see that $U_i \to F_i$ is étale and surjective. From Lemma 40.8.3 it follows that $\coprod F_i$ is an algebraic space. Finally, we have verified all hypotheses of Lemma 40.8.4 and it follows that $F = U/R$ is an algebraic space. □

40.11. Algebraic spaces, retrofitted

We start building our arsenal of lemmas dealing with algebraic spaces.

Lemma 40.11.1. *Let S be a scheme contained in Sch_{fppf}. Let F be an algebraic space over S. Let $G \to F$ be a representable transformation of functors. Then G is an algebraic space.*

Proof. By Lemma 40.3.5 we see that G is a sheaf. The diagram

$$\begin{tikzcd}
G \times_F G \arrow[r] \arrow[d] & F \arrow[d, "\Delta_F"] \\
G \times G \arrow[r] & F \times F
\end{tikzcd}$$

is cartesian. Hence we see that $G \times_F G \to G \times G$ is representable by Lemma 40.3.3. By Lemma 40.3.6 we see that $G \to G \times_F G$ is representable. Hence $\Delta_G : G \to G \times G$ is representable as a composition of representable transformations, see Lemma 40.3.2. Finally, let U be an object of $(Sch/S)_{fppf}$ and let $U \to F$ be surjective and étale. By assumption $U \times_F G$ is representable by a scheme U'. By Lemma 40.5.5 the morphism $U' \to G$ is surjective and étale. This verifies the final condition of Definition 40.6.1 and we win. □

Lemma 40.11.2. *Let S be a scheme contained in Sch_{fppf}. Let F, G be algebraic spaces over S. Let $G \to F$ be a representable morphism. Let $U \in Ob((Sch/S)_{fppf})$, and $q : U \to F$ surjective and étale. Set $V = G \times_F U$. Finally, let $\mathcal{P}$ be a property of morphisms of schemes as in Definition 40.5.1. Then $G \to F$ has property $\mathcal{P}$ if and only if $V \to U$ has property $\mathcal{P}$.*

Proof. (This lemma follows from Lemmas 40.5.5 and 40.5.6, but we give a direct proof here also.) It is clear from the definitions that if $G \to F$ has property $\mathcal{P}$, then $V \to U$ has property $\mathcal{P}$. Conversely, assume $V \to U$ has property $\mathcal{P}$. Let $T \to F$ be a morphism from a scheme to F. Let $T' = T \times_F G$ which is a scheme since $G \to F$ is representable. We have to show that $T' \to T$ has property T. Consider the commutative diagram of schemes

$$\begin{tikzcd} V \arrow[d] & T \times_F V \arrow[l] \arrow[r] \arrow[d] & T \times_F G \arrow[d] \arrow[r, equal] & T' \\ U & T \times_F U \arrow[l] \arrow[r] & T & \end{tikzcd}$$

where both squares are fibre product squares. Hence we conclude the middle arrow has property $\mathcal{P}$ as a base change of $V \to U$. Finally, $\{T \times_F U \to T\}$ is a fppf covering as it is surjective étale, and hence we conclude that $T' \to T$ has property $\mathcal{P}$ as it is local on the base in the fppf topology. $\square$

Lemma 40.11.3. *Let S be a scheme contained in Sch_{fppf}. Let $G \to F$ be a transformation of presheaves on $(Sch/S)_{fppf}$. Let $\mathcal{P}$ be a property of morphisms of schemes. Assume*

(1) *$\mathcal{P}$ is preserved under any base change, fppf local on the base, and morphisms of type $\mathcal{P}$ satisfy descent for fppf coverings, see Descent, Definition 31.32.1,*
(2) *G is a sheaf,*
(3) *F is an algebraic space,*
(4) *there exists a $U \in Ob((Sch/S)_{fppf})$ and a surjective étale morphism $U \to F$ such that $V = G \times_F U$ is representable, and*
(5) *$V \to U$ has $\mathcal{P}$.*

Then G is an algebraic space, $G \to F$ is representable and has property $\mathcal{P}$.

Proof. Let $R = U \times_F U$, and denote $t, s : R \to U$ the projection morphisms as usual. Let T be a scheme and let $T \to F$ be a morphism. Then $U \times_F T \to T$ is surjective étale, hence $\{U \times_F T \to T\}$ is a covering for the étale topology. Consider

$$W = G \times_F (U \times_F T) = V \times_F T = V \times_U (U \times_F T).$$

It is a scheme since F is an algebraic space. The morphism $W \to U \times_F T$ has property $\mathcal{P}$ since it is a base change of $V \to U$. There is an isomorphism

$$\begin{aligned} W \times_T (U \times_F T) &= (G \times_F (U \times_F T)) \times_T (U \times_F T) \\ &= (U \times_F T) \times_T (G \times_F (U \times_F T)) \\ &= (U \times_F T) \times_T W \end{aligned}$$

over $(U \times_F T) \times_T (U \times_F T)$. The middle equality maps $((g, (u_1, t)), (u_2, t))$ to $((u_1, t), (g, (u_2, t)))$. This defines a descent datum for $W/U \times_F T/T$, see Descent, Definition 31.30.1. This follows from Descent, Lemma 31.35.1. Namely we have a sheaf $G \times_F T$, whose base change to $U \times_F T$ is represented by W and the isomorphism above is the one from the proof of Descent, Lemma 31.35.1. By assumption on $\mathcal{P}$ the descent datum above is representable. Hence by the last statement of Descent, Lemma 31.35.1 we see that $G \times_F T$ is representable. This proves that $G \to F$ is a representable transformation of functors.

As $G \to F$ is representable, we see that G is an algebraic space by Lemma 40.11.1. The fact that $G \to F$ has property $\mathcal{P}$ now follows from Lemma 40.11.2. $\square$

Lemma 40.11.4. *Let S be a scheme contained in Sch_{fppf}. Let F, G be algebraic spaces over S. Let $a : F \to G$ be a morphism. Given any $V \in Ob((Sch/S)_{fppf})$ and a surjective* *étale morphism $q : V \to G$ there exists a $U \in Ob((Sch/S)_{fppf})$ and a commutative diagram*

$$\begin{tikzcd} U \arrow[r, "\alpha"] \arrow[d, "p"] & V \arrow[d, "q"] \\ F \arrow[r, "a"] & G \end{tikzcd}$$

with p surjective and étale.

Proof. First choose $W \in Ob((Sch/S)_{fppf})$ with surjective étale morphism $W \to F$. Next, put $U = W \times_G V$. Since G is an algebraic space we see that U is isomorphic to an object of $(Sch/S)_{fppf}$. As q is surjective étale, we see that $U \to W$ is surjective étale (see Lemma 40.5.5). Thus $U \to F$ is surjective étale as a composition of surjective étale morphisms (see Lemma 40.5.4). □

40.12. Immersions and Zariski coverings of algebraic spaces

At this point an intersting phenomenon occurs. We have already defined the notion of an open immersion of algebraic spaces (through Definition 40.5.1) but we have yet to define the notion of a *point*[1]. Thus the *Zariski topology* of an algebraic space has already been defined, but there is no space yet!

Perhaps superfluously we formally introduce immersions as follows.

Definition 40.12.1. Let $S \in Ob(Sch_{fppf})$ be a scheme. Let F be an algebraic space over S.

(1) A morphism of algebraic spaces over S is called an *open immersion* if it is representable, and an open immersion in the sense of Definition 40.5.1.
(2) An *open subspace* of F is a subfunctor $F' \subset F$ such that F' is an algebraic space and $F' \to F$ is an open immersion.
(3) A morphism of algebraic spaces over S is called a *closed immersion* if it is representable, and a closed immersion in the sense of Definition 40.5.1.
(4) A *closed subspace* of F is a subfunctor $F' \subset F$ such that F' is an algebraic space and $F' \to F$ is a closed immersion.
(5) A morphism of algebraic spaces over S is called an *immersion* if it is representable, and an immersion in the sense of Definition 40.5.1.
(6) A *locally closed subspace* of F is a subfunctor $F' \subset F$ such that F' is an algebraic space and $F' \to F$ is an immersion.

We note that these definitions make sense since an immersion is in particular a monomorphism (see Schemes, Lemma 21.23.7 and Lemma 40.5.8), and hence the image of an immersion $G \to F$ of algebraic spaces is a subfunctor $F' \subset F$ which is (canonically) isomorphic to G. Thus some of the discussion of Schemes, Section 21.10 carries over to the setting of algebraic spaces.

Lemma 40.12.2. *Let $S \in Ob(Sch_{fppf})$ be a scheme. A composition of (closed, resp. open) immersions of algebraic spaces over S is a (closed, resp. open) immersion of algebraic spaces over S.*

Proof. See Lemma 40.5.4 and Remarks 40.4.3 (see very last line of that remark) and 40.4.2. □

[1] We will associate a topological space to an algebraic space in Properties of Spaces, Section 41.4, and its opens will correspond exactly to the open subspaces defined below.

Lemma 40.12.3. *Let $S \in Ob(Sch_{fppf})$ be a scheme. A base change of a (closed, resp. open) immersion of algebraic spaces over S is a (closed, resp. open) immersion of algebraic spaces over S.*

Proof. See Lemma 40.5.5 and Remark 40.4.3 (see very last line of that remark). □

Lemma 40.12.4. *Let $S \in Ob(Sch_{fppf})$ be a scheme. Let F be an algebraic space over S. Let F_1, F_2 be locally closed subspaces of F. If $F_1 \subset F_2$ as subfunctors of F, then F_1 is a locally closed subspace of F_2. Similarly for closed and open subspaces.*

Proof. Let $T \to F_2$ be a morphism with T a scheme. Since $F_2 \to F$ is a monomorphism, we see that $T \times_{F_2} F_1 = T \times_F F_1$. The lemma follows formally from this. □

Let us formally define the notion of a Zariski open covering of algebraic spaces. Note that in Lemma 40.8.4 we have already encountered such open coverings as a method for constructing algebraic spaces.

Definition 40.12.5. Let $S \in Ob(Sch_{fppf})$ be a scheme. Let F be an algebraic space over S. A *Zariski covering* $\{F_i \subset F\}_{i \in I}$ of F is given by a set I, a collection of open subspaces $F_i \subset F$ such that $\coprod F_i \to F$ is a surjective map of sheaves.

Note that if T is a schemes, and $a : T \to F$ is a morphism, then each of the fibre products $T \times_F F_i$ is identified with an open subscheme $T_i \subset T$. The final condition of the definition signifies exactly that $T = \bigcup_{i \in I} T_i$.

It is clear that the collection $\mathcal{T}$ of open subspaces of F is a set (as $(Sch/S)_{fppf}$ is a site, hence a set). Moreover, we can turn $\mathcal{T}$ into a category by letting the morphisms be inclusions of subfunctors (which are automatically open immersions by Lemma 40.12.4). Finally, Definition 40.12.5 provides the notion of a Zariski covering $\{F_i \to F'\}_{i \in I}$ in the category $\mathcal{T}$. Hence, just as in the case of a topological space (see Sites, Example 9.6.4) by suitably choosing a set of coverings we may obtain a Zariski site of the algebraic space F.

Definition 40.12.6. Let $S \in Ob(Sch_{fppf})$ be a scheme. Let F be an algebraic space over S. A *small Zariski site* F_{Zar} of an algebraic space F is one of the sites $\mathcal{T}$ described above.

Hence this gives a notion of what it means for something to be true Zariski locally on an algebraic space, which is how we will use this notion. In general the Zariski topology is not fine enough for our purposes. For example we can consider the category of Zariski sheaves on an algebraic space. It will turn out that this is not the correct thing to consider, even for quasi-coherent sheaves. One only gets the desired result when using the étale or fppf site of F to define quasi-coherent sheaves.

40.13. Separation conditions on algebraic spaces

A separation condition on an algebraic space F is a condition on the diagonal morphism $F \to F \times F$. Let us first list the properties the diagonal has automatically. Since the diagonal is representable by definition the following lemma makes sense (through Definition 40.5.1).

Lemma 40.13.1. *Let S be a scheme contained in Sch_{fppf}. Let F be an algebraic space over S. Let $\Delta : F \to F \times F$ be the diagonal morphism. Then*

(1) Δ *is locally of finite type,*
(2) Δ *is a monomorphism,*
(3) Δ *is separated, and*
(4) Δ *is locally quasi-finite.*

Proof. Let $F = U/R$ be a presentation of F. As in the proof of Lemma 40.10.4 the diagram

$$\begin{tikzcd} R \arrow[r] \arrow[d, "j"'] & F \arrow[d, "\Delta"] \\ U \times_S U \arrow[r] & F \times F \end{tikzcd}$$

is cartesian. Hence according to Lemma 40.11.2 it suffices to show that j has the properties listed in the lemma. (Note that each of the properties (1) -- (4) occur in the lists of Remarks 40.4.1 and 40.4.3.) Since j is an equivalence relation it is a monomorphism. Hence it is separated by Schemes, Lemma 21.23.3. As R is an étale equivalence relation we see that $s, t : R \to U$ are étale. Hence s, t are locally of finite type. Then it follows from Morphisms, Lemma 24.14.8 that j is locally of finite type. Finally, as it is a monomorphism its fibres are finite. Thus we conclude that it is locally quasi-finite by Morphisms, Lemma 24.19.7. $\square$

Here are some common types of separation conditions, relative to the base scheme S. There is also an absolute notion of these conditions which we will discuss in Properties of Spaces, Section 41.3. Moreover, we will discuss separation conditions for a morphism of algebraic spaces in Morphisms of Spaces, Section 42.5.

Definition 40.13.2. Let S be a scheme contained in Sch_{fppf}. Let F be an algebraic space over S. Let $\Delta : F \to F \times F$ be the diagonal morphism.

(1) We say F is *separated over S* if Δ is a closed immersion.
(2) We say F is *locally separated over S*[2] if Δ is an immersion.
(3) We say F is *quasi-separated over S* if Δ is quasi-compact.
(4) We say F is *Zariski locally quasi-separated over S*[3] if there exists a Zariski covering $F = \bigcup_{i \in I} F_i$ such that each F_i is quasi-separated.

Note that if the diagonal is quasi-compact (when F is separated or quasi-separated) then the diagonal is actually quasi-finite and separated, hence quasi-affine (by More on Morphisms, Lemma 33.29.3).

40.14. Examples of algebraic spaces

In this section we construct some examples of algebraic spaces. Some of these were suggested by B. Conrad. Since we do not yet have a lot of theory at our disposal the discussion is a bit awkward in some places.

Example 40.14.1. Let k be a field. Let $U = \mathbf{A}^1_k$. Set

$$j : R = \Delta \coprod \Gamma \longrightarrow U \times_k U$$

where $\Delta = \{(x, x) \mid x \in \mathbf{A}^1_k\}$ and $\Gamma = \{(x, -x) \mid x \in \mathbf{A}^1_k, x \neq 0\}$. It is clear that $s, t : R \to U$ are étale, and hence j is an étale equivalence relation. The quotient $X = U/R$ is an algebraic space by Theorem 40.10.5. Since R is quasi-compact we see that X is quasi-separated. On the other hand, X is not locally separated because the morphism j is not an immersion.

Example 40.14.2. Let k be a field. Let $k \subset k'$ be a degree 2 Galois extension with $\mathrm{Gal}(k'/k) = \{1, \sigma\}$. Let $S = Spec(k[x])$ and $U = Spec(k'[x])$. Note that

$$U \times_S U = Spec((k' \otimes_k k')[x]) = \Delta(U) \coprod \Delta'(U)$$

[2]In the literature this often refers to quasi-separated and locally separated algebraic spaces.

[3]This definition was suggested by B. Conrad.

where $\Delta' = (1, \sigma) : U \to U \times_S U$. Take

$$R = \Delta(U) \coprod \Delta'(U \setminus \{0_U\})$$

where $0_U \in U$ denotes the k'-rational point whose x-coordinate is zero. It is easy to see that R is an étale equivalence relation on U over S and hence $X = U/R$ is an algebraic space by Theorem 40.10.5. Here are some properties of X (some of which will not make sense until later):

1. $X \to S$ is an isomorphism over $S \setminus \{0_S\}$,
2. the morphism $X \to S$ is étale (see Properties of Spaces, Definition 41.13.2)
3. the fibre 0_X of $X \to S$ over 0_S is isomorphic to $Spec(k') = 0_U$,
4. X is not a scheme (because if it where, then $\mathcal{O}_{X,0_X}$ would be a local domain $(\mathcal{O}, \mathfrak{m}, \kappa)$ with fraction field $k(x)$, with $x \in \mathfrak{m}$ and residue field $\kappa = k'$ which is impossible),
5. the algebraic space X is not separated, but it is locally separated and hence quasi-separated,
6. there exists a surjective, finite, étale morphism $S' \to S$ such that the base change $X' = S' \times_S X$ is a scheme (namely, if we base change to $S' = Spec(k'[x])$ then U splits into two copies of S' and X' becomes isomorphic to the affine line with 0 doubled, see Schemes, Example 21.14.3), and
7. if we think of X as a finite type algebraic space over $Spec(k)$, then similarly the base change $X_{k'}$ is a scheme but X is not a scheme.

In particular, this gives an example of a descent datum for schemes relative to the covering $\{Spec(k') \to Spec(k)\}$ which is not effective.

We will use the following lemma as a convenient way to construct algebraic spaces as quotients of schemes by free group actions.

Lemma 40.14.3. *Let $U \to S$ be a morphism of Sch_{fppf}. Let G be an abstract group. Let $G \to Aut_S(U)$ be a group homomorphism. Assume*

(∗) *if $u \in U$ is a point, and $g(u) = u$ for some non-identity element $g \in G$, then g induces a nontrivial automorphism of $\kappa(u)$.*

Then

$$j : R = \coprod\nolimits_{g \in G} U \longrightarrow U \times_S U, \quad (g, x) \longmapsto (g(x), x)$$

is an étale equivalence relation and hence

$$F = U/R$$

is an algebraic space by Theorem 40.10.5.

Proof. In the statement of the lemma the symbol $\mathrm{Aut}_S(U)$ denotes the group of automorphisms of U over S. Assume (∗) holds. Let us show that

$$j : R = \coprod\nolimits_{g \in G} U \longrightarrow U \times_S U, \quad (g, x) \longmapsto (g(x), x)$$

is a monomorphism. This signifies that if T is a nonempty scheme, and $h : T \to U$ is a T-valued point such that $g \circ h = g' \circ h$ then $g = g'$. Suppose $T \neq \emptyset$, $h : T \to U$ and $g \circ h = g' \circ h$. Let $t \in T$. Consider the composition $Spec(\kappa(t)) \to Spec(\kappa(h(t))) \to U$. Then we conclude that $g' \circ g^{-1}$ fixes $u = h(t)$ and acts as the identity on its residue field. Hence $g = g'$ by (∗).

Thus if (∗) holds we see that j is a relation (see Groupoids, Definition 35.3.1). Moreover, it is an equivalence relation since on T-valued points for a connected scheme T we see that

$R(T) = G \times U(T) \to U(T) \times U(T)$ (recall that we always work over S). Moreover, the morphisms $s, t : R \to U$ are étale since R is a disjoint product of copies of U. This proves that $j : R \to U \times_S U$ is an étale equivalence relation. □

Given a scheme U and an action of a group G on U we say the action of G on U is *free* if condition $(*)$ of Lemma 40.14.3 holds. Thus the lemma says that quotients of schemes by free actions of groups exist in the category of algebraic spaces.

Definition 40.14.4. Notation $U \to S$, G, R as in Lemma 40.14.3. If the action of G on U satisfies $(*)$ we say G *acts freely* on the scheme U. In this case the algebraic space U/R is denoted U/G and is called the *quotient of U by G*.

This notation is consistent with the notation U/G introduced in Groupoids, Definition 35.17.1. We will later make sense of the quotient as an algebraic stack without any assumptions on the action whatsoever; when we do this we will use the notation $[U/G]$. Before we discuss the examples we prove some more lemmas to facilitate the discussion. Here is a lemma discussing the various separation conditions for this quotient when G is finite.

Lemma 40.14.5. *Notation and assumptions as in Lemma 40.14.3. Assume G is finite. Then*

(1) *if $U \to S$ is quasi-separated, then U/G is quasi-separated, and*
(2) *if $U \to S$ is separated, then U/G is separated.*

Proof. In the proof of Lemma 40.13.1 we saw that it suffices to prove the corresponding properties for the morphism $j : R \to U \times_S U$. If $U \to S$ is quasi-separated, then for every affine open $V \subset U$ the opens $g(V) \cap V$ are quasi-compact. It follows that j is quasi-compact. If $U \to S$ is separated, the the diagonal $\Delta_{U/S}$ is a closed immersion. Hence $j : R \to U \times_S U$ is a finite coproduct of closed immersions with disjoint images. Hence j is a closed immersion. □

Lemma 40.14.6. *Notation and assumptions as in Lemma 40.14.3. If $Spec(k) \to U/G$ is a morphism, then there exist*

(1) *a finite Galois extension $k \subset k'$,*
(2) *a finite subgroup $H \subset G$,*
(3) *an isomorphism $H \to Gal(k'/k)$, and*
(4) *an H-equivariant morphism $Spec(k') \to U$.*

Conversely, such data determine a morphism $Spec(k) \to U/G$.

Proof. Consider the fibre product $V = Spec(k) \times_{U/G} U$. Here is a diagram

$$\begin{tikzcd} V \arrow[r] \arrow[d] & U \arrow[d] \\ Spec(k) \arrow[r] & U/G \end{tikzcd}$$

This is a nonempty scheme étale over $Spec(k)$ and hence is a disjoint union of spectra of fields finite separable over k (Morphisms, Lemma 24.35.7). So write $V = \coprod_{i \in I} Spec(k_i)$. The action of G on U induces an action of G on $V = \coprod Spec(k_i)$. Pick an i, and let $H \subset G$ be the stabilizer of i. Since

$$V \times_{Spec(k)} V = Spec(k) \times_{U/G} U \times_{U/G} U = Spec(k) \times_{U/G} U \times G = V \times G$$

we see that (a) the orbit of $Spec(k_i)$ is V and (b) $Spec(k_i \otimes_k k_i) = Spec(k_i) \times H$. Thus H is finite and is the Galois group of k_i/k. We omit the converse construction. □

It follows from this lemma for example that if k'/k is a finite Galois extension, then $Spec(k')/\text{Gal}(k'/k) \cong Spec(k)$. What happens if the extension is infinite? Here is an example.

Example 40.14.7. Let $S = Spec(\mathbf{Q})$. Let $U = Spec(\overline{\mathbf{Q}})$. Let $G = \text{Gal}(\overline{\mathbf{Q}}/\mathbf{Q})$ with obvious action on U. Then by construction property $(*)$ of Lemma 40.14.3 holds and we obtain an algebraic space

$$X = Spec(\overline{\mathbf{Q}})/G \longrightarrow S = Spec(\mathbf{Q}).$$

Of course this is totally ridiculus as an approximation of S! Namely, by the Artin-Schreier theorem, see [**Jac64**, Theorem 17, page 316], the only finite subgroups of $\text{Gal}(\overline{\mathbf{Q}}/\mathbf{Q})$ are $\{1\}$ and the conjugates of the order two group $\text{Gal}(\overline{\mathbf{Q}}/\overline{\mathbf{Q}} \cap \mathbf{R})$. Hence, if $Spec(k) \to X$ is a morphism with k algebraic over $\mathbf{Q}$, then it follows from Lemma 40.14.6 and the theorem just mentioned that either k is $\overline{\mathbf{Q}}$ or isomorphic to $\overline{\mathbf{Q}} \cap \mathbf{R}$.

What is wrong with the example above is that the Galois group comes equipped with a topology, and this should somehow be part of any construction of a quotient of $Spec(\overline{\mathbf{Q}})$. The following example is much more reasonable in my opinion and may actually occur in ``nature''.

Example 40.14.8. Let k be a field of characteristic zero. Let $U = \mathbf{A}^1_k$ and let $G = \mathbf{Z}$. As action we take $n(x) = x + n$, i.e., the action of $\mathbf{Z}$ on the affine line by translation. The only fixed point is the generic point and it is clearly the case that $\mathbf{Z}$ injects into the automorphism group of the field $k(x)$. (This is where we use the characteristic zero assumption.) Consider the morphism

$$\gamma : Spec(k(x)) \longrightarrow X = \mathbf{A}^1_k/\mathbf{Z}$$

of the generic point of the affine line into the quotient. We claim that this morphism does not factor through any monomorphism $Spec(L) \to X$ of the spectrum of a field to X. (Contrary to what happens for schemes, see Schemes, Section 21.13.) In fact, since $\mathbf{Z}$ does not have any finite subgroups we see from Lemma 40.14.6 that for any such factorization $k(x) = L$. Finally, γ is not a monomorphism since

$$Spec(k(x)) \times_{\gamma, X, \gamma} Spec(k(x)) \cong Spec(k(x)) \times \mathbf{Z}.$$

This example suggests that in order to define points of an algebraic space X we should consider equivalence classes of morphisms from spectra of fields into X and not the set of monomorphisms from spectra of fields.

We finish with a truly awful example.

Example 40.14.9. Let k be a field. Let $A = \prod_{n \in \mathbf{N}} k$ be the infinite product. Set $U = Spec(A)$ seen as a scheme over $S = Spec(k)$. Note that the projection maps $\text{pr}_n : A \to k$ define open and closed immersions $f_n : S \to U$. Set

$$R = U \amalg \coprod\nolimits_{(n,m) \in \mathbf{N}^2,\ n \neq m} S$$

with morphism j equal to $\Delta_{U/S}$ on the component U and $j = (f_n, f_m)$ on the component S corresponding to (m, m). It is clear from the remark above that s, t are étale. It is also clear that j is an equivalence relation. Hence we obtain an algebraic space

$$X = U/R.$$

To see what this means we specialize to the case where the field k is finite with q elements. Let us first discuss the topological space $|U|$ associated to the scheme U a little bit. All elements of A satisfy $x^q = x$. Hence every residue field of A is isomorphic to k, and all points of U are closed. But the topology on U isn't the discrete topology. Let $u_n \in |U|$ be the point corresponding to f_n. As mentioned above the points u_n are the open points (and hence isolated). This implies there have to be other points since we know U is quasi-compact, see Algebra, Lemma 7.16.10 (hence not equal to an infinite discrete set). Another way to see this is because the (proper) ideal

$$I = \{x = (x_n) \in A \mid \text{all but a finite number of } x_n \text{ are zero}\}$$

is contained in a maximal ideal. Note also that every element x of A is of the form $x = ue$ where u is a unit and e is an idempotent. Hence a basis for the topology of A consists of open and closed subsets (see Algebra, Lemma 7.18.1.) So the topology on $|U|$ is totally disconnected, but nontrivial. Finally, note that $\{u_n\}$ is dense in $|U|$.

We will later define a topological space $|X|$ associated to X, see Properties of Spaces, Section 41.4. What can we say about $|X|$? It turns out that the map $|U| \to |X|$ is surjective and continuous. All the points u_n map to the same point x_0 of $|X|$, and none of the other points get identified. Since $\{u_n\}$ is dense in $|U|$ we conclude that the closure of x_0 in $|X|$ is $|X|$. In other words $|X|$ is irreducible and x_0 is a generic point of $|X|$. This seems bizarre since also x_0 is the image of a section $S \to X$ of the structure morphism $X \to S$ (and in the case of schemes this would imply it was a closed point, see Morphisms, Lemma 24.19.2).

Whatever you think is actually going on in this example, it certainly shows that some care has to be exercised when defining irreducible components, connectedness, etc of algebraic spaces.

40.15. Change of big site

In this section we briefly discuss what happens when we change big sites. The upshot is that we can always enlarge the big site at will, hence we may assume any set of schemes we want to consider is contained in the big fppf site over which we consider our algebraic space. Here is a precise statement of the result.

Lemma 40.15.1. *Suppose given big sites Sch_{fppf} and Sch'_{fppf}. Assume that Sch_{fppf} is contained in Sch'_{fppf}, see Topologies, Section 30.10. Let S be an object of Sch_{fppf}. Let*

$$g : Sh((Sch/S)_{fppf}) \longrightarrow Sh((Sch'/S)_{fppf}),$$
$$f : Sh((Sch'/S)_{fppf}) \longrightarrow Sh((Sch/S)_{fppf})$$

be the morphisms of topoi of Topologies, Lemma 30.10.2. Let F be a sheaf of sets on $(Sch/S)_{fppf}$. Then

1. *if F is representable by a scheme $X \in Ob((Sch/S)_{fppf})$ over S, then $f^{-1}F$ is representable too, in fact it is representable by the same scheme X, now viewed as an object of $(Sch'/S)_{fppf}$, and*
2. *if F is an algebraic space over S, then $f^{-1}F$ is an algebraic space over S also.*

Proof. Let $X \in Ob((Sch/S)_{fppf})$. Let us write h_X for the representable sheaf on $(Sch/S)_{fppf}$ associated to X, and h'_X for the representable sheaf on $(Sch'/S)_{fppf}$ associated to X. By the description of f^{-1} in Topologies, Section 30.10 we see that $f^{-1}h_X = h'_X$. This proves (1).

Next, suppose that F is an algebraic space over S. By Lemma 40.9.1 this means that $F = h_U/h_R$ for some étale equivalence relation $R \to U \times_S U$ in $(Sch/S)_{fppf}$. Since f^{-1} is an exact functor we conclude that $f^{-1}F = h'_U/h'_R$. Hence $f^{-1}F$ is an algebraic space over S by Theorem 40.10.5. □

Note that this lemma is purely set theoretical and has virtually no content. Moreover, it is not true (in general) that the restriction of an algebraic space over the bigger site is an algebraic space over the smaller site (simply by reasons of cardinality). Hence we can only ever use a simple lemma of this kind to enlarge the base category and never to shrink it.

Lemma 40.15.2. *Suppose Sch_{fppf} is contained in Sch'_{fppf}. Let S be an object of Sch_{fppf}. Denote $Spaces/S$ the category of algebraic spaces over S defined using Sch_{fppf}. Similarly, denote $Spaces'/S$ the category of algebraic spaces over S defined using Sch'_{fppf}. The construction of Lemma 40.15.1 defines a fully faithful functor*

$$Spaces/S \longrightarrow Spaces'/S$$

whose essential image consists of those $X' \in Ob(Spaces'/S)$ such that there exists an object $U \in Ob((Sch/S)_{fppf})$ and a surjective étale morphism $U \to X'$ in the category $Sh((Sch'/S)_{fppf})$.

Proof. In Sites, Lemma 9.19.8 we have seen that the functor $f^{-1} : Sh((Sch/S)_{fppf}) \to Sh((Sch'/S)_{fppf})$ is fully faithful. Hence we see that the displayed functor of the lemma is fully faithful. Suppose that $X' \in Ob(Spaces'/S)$ such that there exists an object $U \in Ob((Sch/S)_{fppf})$ and a surjective étale morphism $h'_U \to X$ (with notation as in the proof of Lemma 40.15.1). Let R be an object of $(Sch'/S)_{fppf}$ representing $h'_U \times_X h'_U$. Note that $R \to U \times_S U$ is a monomorphism of schemes. Hence by Sets, Lemma 3.9.9 the scheme R is isomorphic to an object of $(Sch/S)_{fppf}$ and hence we may (after replacing R by an isomorphic scheme) assume $R \in Ob((Sch/S)_{fppf})$. Now we use Lemma 40.9.1 and Theorem 40.10.5 to see that $X = h_U/h_R$ is an object of $Spaces/S$ such that $f^{-1}X \cong X'$ as desired. □

40.16. Change of base scheme

In this section we briefly discuss what happens when we change base schemes. The upshot is that given a morphism $S \to S'$ of base schemes, any algebraic space over S can be viewed as an algebraic space over S'. And, given an algebraic space F' over S' there is a base change F'_S which is an algebraic space over S. We explain only what happens in case $S \to S'$ is a morphism of the big fppf site under consideration, if only S or S' is contained in the big site, then one first enlarges the big site as in Section 40.15.

Lemma 40.16.1. *Suppose given a big site Sch_{fppf}. Let $g : S \to S'$ be morphism of Sch_{fppf}. Let $j : (Sch/S)_{fppf} \to (Sch/S')_{fppf}$ be the corresponding localization functor. Let F be a sheaf of sets on $(Sch/S)_{fppf}$. Then*

1. *for a scheme T' over S' we have $j_!F(T'/S') = \coprod_{\varphi : T' \to S} F(T' \xrightarrow{\varphi} S)$,*
2. *if F is representable by a scheme $X \in Ob((Sch/S)_{fppf})$, then $j_!F$ is representable by $j(X)$ which is X viewed as a scheme over S', and*
3. *if F is an algebraic space over S, then $j_!F$ is an algebraic space over S', and if $F = U/R$ is a presentation, then $j_!F = j(U)/j(R)$ is a presentation.*

Let F' be a sheaf of sets on $(Sch/S')_{fppf}$. Then

4. *for a scheme T over S we have $j^{-1}F'(T/S) = F'(T/S')$,*
5. *if F' is representable by a scheme $X' \in Ob((Sch/S')_{fppf})$, then $j^{-1}F'$ is representable, namely by $X'_S = S \times_{S'} X'$, and*
6. *if F' is an algebraic space, then $j^{-1}F'$ is an algebraic space, and if $F' = U'/R'$ is a presentation, then $j^{-1}F' = U'_S/R'_S$ is a presentation.*

Proof. The functors $j_!$, j_* and j^{-1} are defined in Sites, Lemma 9.21.7 where it is also shown that $j = j_{S/S'}$ is the localization of $(Sch/S')_{fppf}$ at the object S/S'. Hence all of the material on localization functors is available for j. The formula in (1) is Sites, Lemma 9.23.1. By definition $j_!$ is the left adjoint to restriction j^{-1}, hence $j_!$ is right exact. By Sites, Lemma 9.21.5 it also commutes with fibre products and equalizers. By Sites, Lemma 9.21.3 we see that $j_!h_X = h_{j(X)}$ hence (2) holds. If F is an algebraic space over S, then we can write $F = U/R$ (Lemma 40.9.1) and we get

$$j_!F = j(U)/j(R)$$

because $j_!$ being right exact commutes with coequalizers, and moreover $j(R) = j(U) \times_{j_!F} j(U)$ as $j_!$ commutes with fibre products. Since the morphisms $j(s), j(t) : j(R) \to j(U)$ are simply the morphisms $s, t : R \to U$ (but viewed as morphisms of schemes over S'), they are still étale. Thus $(j(U), j(R), s, t)$ is an étale equivalence relation. Hence by Theorem 40.10.5 we conclude that $j_!F$ is an algebraic space.

Proof of (4), (5), and (6). The description of j^{-1} is in Sites, Section 9.21. The restriction of the representable sheaf associated to X'/S' is the representable sheaf associated to $X'_S = S \times_{S'} Y'$ by Sites, Lemma 9.23.2. The restriction functor j^{-1} is exact, hence $j^{-1}F' = U'_S/R'_S$. Again by exactness the sheaf R'_S is still an equivalence relation on U'_S. Finally the two maps $R'_S \to U'_S$ are étale as base changes of the étale morphisms $R' \to U'$. Hence $j^{-1}F' = U'_S/R'_S$ is an algebraic space by Theorem 40.10.5 and we win. $\square$

Note how the presentation $j_!F = j(U)/j(R)$ is just the presentation of F but viewed as a presentation by schemes over S'. Hence the following definition makes sense.

Definition 40.16.2. Let Sch_{fppf} be a big fppf site. Let $S \to S'$ be a morphism of this site.

(1) If F' is an algebraic space over S', then the *base change of F' to S* is the algebraic space $j^{-1}F'$ described in Lemma 40.16.1. We denote it F'_S.
(2) If F is an algebraic space over S, then *F viewed as an algebraic space over S'* is the algebraic space $j_!F$ over S' described in Lemma 40.16.1. We often simply denote this F; if not then we will write $j_!F$.

The algebraic space $j_!F$ comes equipped with a canonical morphism $j_!F \to S$ of algebraic spaces over S'. This is true simply because the sheaf $j_!F$ maps to h_S (see for example the explicit description in Lemma 40.16.1). In fact, in Sites, Lemma 9.21.4 we have seen that the category of sheaves on $(Sch/S)_{fppf}$ is equivalent to the category of pairs $(\mathcal{F}', \mathcal{F}' \to h_S)$ consisting of a sheaf on $(Sch/S')_{fppf}$ and a map of sheaves $\mathcal{F}' \to h_S$. The equivalence assigns to the sheaf $\mathcal{F}$ the pair $(j_!\mathcal{F}, j_!\mathcal{F} \to h_S)$. This, combined with the above, leads to the following result for categories of algebraic spaces.

Lemma 40.16.3. *Let Sch_{fppf} be a big fppf site. Let $S \to S'$ be a morphism of this site. The construction above give an equivalence of categories*

$$\left\{\begin{matrix}\textit{category of algebraic}\\ \textit{spaces over } S\end{matrix}\right\} \leftrightarrow \left\{\begin{matrix}\textit{category of pairs } (F', F' \to S) \textit{ consisting}\\ \textit{of an algebraic space } F' \textit{ over } S' \textit{ and a}\\ \textit{morphism } F' \to S \textit{ of algebraic spaces over } S'\end{matrix}\right\}$$

Proof. Let F be an algebraic space over S. The functor from left to right assigns the pair $(j_!F, j_!F \to S)$ ot F which is an object of the right hand side by Lemma 40.16.1. Since this defines an equivalence of categories of sheaves by Sites, Lemma 9.21.4 to finish the proof it suffices to show: if F is a sheaf and $j_!F$ is an algebraic space, then F is an algebraic space. To do this, write $j_!F = U'/R'$ as in Lemma 40.9.1 with $U', R' \in Ob((Sch/S')_{fppf})$. Then the compositions $U' \to j_! F \to S$ and $R' \to j_! F \to S$ are morphisms of schemes over S'. Denote U, R the corresponding objects of $(Sch/S)_{fppf}$. The two morphisms $R' \to U'$ are morphisms over S and hence correspond to morpisms $R \to U$. Since these are simply the same morphisms (but viewed over S) we see that we get an étale equivalence relation over S. As $j_!$ defines an equivalence of categories of sheaves (see reference above) we see that $F = U/R$ and by Theorem 40.10.5 we see that F is an algebraic space. □

The following lemma is a slight rephrasing of the above.

Lemma 40.16.4. *Let Sch_{fppf} be a big fppf site. Let $S \to S'$ be a morphism of this site. Let F' be a sheaf on $(Sch/S')_{fppf}$. The following are equivalent:*

1. *The restriction $F'|_{(Sch/S)_{fppf}}$ is an algebraic space over S, and*
2. *the sheaf $h_S \times F'$ is an algebraic space over S'.*

Proof. The restriction and the product match under the equivalence of categories of Sites, Lemma 9.21.4 so that Lemma 40.16.3 above gives the result. □

We finish this section with a lemma on a compatibility.

Lemma 40.16.5. *Let Sch_{fppf} be a big fppf site. Let $S \to S'$ be a morphism of this site. Let F be an algebraic space over S. Let T be a scheme over S and let $f : T \to F$ be a morphism over S. Let $f' : T' \to F'$ be the morphism over S' we get from f by applying the equivalence of categories described in Lemma 40.16.3. For any property $\mathcal{P}$ as in Definition 40.5.1 we have $\mathcal{P}(f') \Leftrightarrow \mathcal{P}(f)$.*

Proof. Suppose that U is a scheme over S, and $U \to F$ is a surjective étale morphism. Denote U' the scheme U viewed as a scheme over S'. In Lemma 40.16.1 we have seen that $U' \to F'$ is surjective étale. Since

$$j(T \times_{f, F} U) = T' \times_{f', F'} U'$$

the morphism of schemes $T \times_{f,F} U \to U$ is identified with the morphism of schemes $T' \times_{f',F'} U' \to U'$. It is the same morphism, just viewed over different base schemes. Hence the lemma follows from Lemma 40.11.2. □

CHAPTER 41

Properties of Algebraic Spaces

41.1. Introduction

Please see Spaces, Section 40.1 for a brief introduction to algebraic spaces, and please read some of that chapter for our basic definitions and conventions concerning algebraic spaces. In this chapter we start introducing some basic notions and properties of algebraic spaces. A fundamental reference for the case of quasi-separated algebraic spaces is [**Knu71a**].

The discussion is somewhat awkward at times since we made the design descision to first talk about properties of algebraic spaces by themselves, and only later about properties of morphisms of algebraic spaces. We make an exception for this rule regarding *étale morphisms* of algebraic spaces, which we introduce in Section 41.13. But until that section whenever we say a morphism has a certain property, it automatically means the source of the morphism is a scheme (or perhaps the morphism is representable).

Some of the material in the chapter (especially regarding points) will be improved upon in the chapter on decent algebraic spaces.

41.2. Conventions

The standing assumption is that all schemes are contained in a big fppf site Sch_{fppf}. And all rings A considered have the property that $Spec(A)$ is (isomorphic) to an object of this big site.

Let S be a scheme and let X be an algebraic space over S. In this chapter and the following we will write $X \times_S X$ for the product of X with itself (in the category of algebraic spaces over S), instead of $X \times X$. The reason is that we want to avoid confusion when changing base schemes, as in Spaces, Section 40.16.

41.3. Separation axioms

In this section we collect all the ``absolute" separation conditions of algebraic spaces. Since in our language any algebraic space is an algebraic space over some definite base scheme, any absolute property of X over S corresponds to a conditions imposed on X viewed as an algebraic space over $Spec(\mathbf{Z})$. Here is the precise formulation.

Definition 41.3.1. (Compare Spaces, Definition 40.13.2.) Consider a big fppf site $Sch_{fppf} = (Sch/Spec(\mathbf{Z}))_{fppf}$. Let X be an algebraic space over $Spec(\mathbf{Z})$. Let $\Delta : X \to X \times X$ be the diagonal morphism.

1. We say X is *separated* if Δ is a closed immersion.
2. We say X is *locally separated*[1] if Δ is an immersion.
3. We say X is *quasi-separated* if Δ is quasi-compact.

[1]In the literature this often refers to quasi-separated and locally separated algebraic spaces.

(4) We say X is *Zariski locally quasi-separated*[2] if there exists a Zariski covering $X = \bigcup_{i \in I} X_i$ (see Spaces, Definition 40.12.5) such that each X_i is quasi-separated.

Let S is a scheme contained in Sch_{fppf}, and let X be an algebraic space over S. Then we say X is *separated*, *locally separated*, *quasi-separated*, or *Zariski locally quasi-separated* if X viewed as an algebraic space over $Spec(\mathbf{Z})$ (see Spaces, Definition 40.16.2) has the corresponding property.

It is true that an algebraic space X over S which is separated (in the absolute sense above) is separated over S (and similarly for the other absolute separation properties above). This will be discussed in great detail in Morphisms of Spaces, Section 42.5. We will see in Lemma 41.6.5 that being Zariski locally separated is independent of the base scheme (hence equivalent to the absolute notion).

Lemma 41.3.2. *Let S be a scheme. Let X be an algebraic space over S. We have the following implications among the separation axioms of Definition 41.3.1:*

(1) *separated implies all the others,*
(2) *quasi-separated implies Zariski locally quasi-separated.*

Proof. Omitted. □

41.4. Points of algebraic spaces

As is clear from Spaces, Example 40.14.8 a point of an algebraic space should not be defined as a monomorphism from the spectrum of a field. Instead we define them as equivalence classes of morphisms of specra of fields as equivalence classes of morphisms from spectra of fields. exactly as explained in Schemes, Section 21.13.

Let S be a scheme. Let F be a presheaf on $(Sch/S)_{fppf}$. Let K is a field. Consider a morphism

$$Spec(K) \longrightarrow F.$$

By the Yoneda Lemma this is given by an element $p \in F(Spec(K))$. We say that two such pairs $(Spec(K), p)$ and $(Spec(L), q)$ are *equivalent* if there exists a third field Ω and a commutative diagram

$$\begin{tikzcd} Spec(\Omega) \arrow[r] \arrow[d] & Spec(L) \arrow[d, "q"] \\ Spec(K) \arrow[r, "p"] & F. \end{tikzcd}$$

In other words, there are field extensions $K \to \Omega$ and $L \to \Omega$ such that p and q map to the same element of $F(Spec(\Omega))$. We omit the verification that this defines an equivalence relation.

Definition 41.4.1. Let S be a scheme. Let X be an algebraic space over S. A *point* of X is an equivalence class of morphisms from spectra of fields into X. The set of points of X is denoted $|X|$.

Note that if $f : X \to Y$ is a morphism of algebraic spaces over S, then there is an induced map $|f| : |X| \to |Y|$ which maps a representative $x : Spec(K) \to X$ to the representative $f \circ x : Spec(K) \to Y$.

Lemma 41.4.2. *Let S be a scheme. Let X be a scheme over S. The points of X as a scheme are in canonical 1-1 correspondence with the points of X as an algebraic space.*

[2] This notion was suggested by B. Conrad.

Proof. This is Schemes, Lemma 21.13.3. □

Lemma 41.4.3. *Let S be a scheme. Let*

$$\begin{tikzcd} Z \times_Y X \arrow[r] \arrow[d] & X \arrow[d] \\ Z \arrow[r] & Y \end{tikzcd}$$

be a cartesian diagram of algebraic spaces. Then the map of sets of points

$$|Z \times_Y X| \longrightarrow |Z| \times_{|Y|} |X|$$

is surjective.

Proof. Namely, suppose given fields K, L and morphisms $Spec(K) \to X$, $Spec(L) \to Z$, then the assumption that they agree as elements of $|Y|$ means that there is a common extension $K \subset M$ and $L \subset M$ such that $Spec(M) \to Spec(K) \to X \to Y$ and $Spec(M) \to Spec(L) \to Z \to Y$ agree. And this is exactly the condition which says you get a morphism $Spec(M) \to Z \times_Y X$. □

Lemma 41.4.4. *Let S be a scheme. Let X be an algebraic space over S. Let $f : T \to X$ be a morphism from a scheme to X. The following are equivalent*

(1) *$f : T \to X$ is surjective (according to Spaces, Definition 40.5.1), and*
(2) *$|f| : |T| \to |X|$ is surjective.*

Proof. Assume (1). Let $x : Spec(K) \to X$ be a morphism from the spectrum of a field into X. By assumption the morphism of schemes $Spec(K) \times_X T \to Spec(K)$ is surjective. Hence there exists a field extension $K \subset K'$ and a morphism $Spec(K') \to Spec(K) \times_X T$ such that the left square in the diagram

$$\begin{tikzcd} Spec(K') \arrow[r] \arrow[d] & Spec(K) \times_X T \arrow[r] \arrow[d] & T \arrow[d] \\ Spec(K) \arrow[r, equal] & Spec(K) \arrow[r, "x"] & X \end{tikzcd}$$

is commutative. This shows that $|f| : |T| \to |X|$ is surjective.

Assume (2). Let $Z \to X$ be a morphism where Z is a scheme. We have to show that the morphism of schemes $Z \times_X T \to T$ is surjective, i.e., that $|Z \times_X T| \to |Z|$ is surjective. This follows from (2) and Lemma 41.4.3. □

Lemma 41.4.5. *Let S be a scheme. Let X be an algebraic space over S. Let $X = U/R$ be a presentation of X, see Spaces, Definition 40.9.3. Then the image of $|R| \to |U| \times |U|$ is an equivalence relation and $|X|$ is the quotient of $|U|$ by this equivalence relation.*

Proof. The assumption means that U is a scheme, $p : U \to X$ is a surjective, étale morphism, $R = U \times_X U$ is a scheme and defines an étale equivalence relation on U such that $X = U/R$ as sheaves. By Lemma 41.4.4 we see that $|U| \to |X|$ is surjective. By Lemma 41.4.3 the map

$$|R| \longrightarrow |U| \times_{|X|} |U|$$

is surjective. Hence the image of $|R| \to |U| \times |U|$ is exactly the set of pairs $(u_1, u_2) \in |U| \times |U|$ such that u_1 and u_2 have the same image in $|X|$. Combining these two statements we get the result of the lemma. □

Lemma 41.4.6. *Let S be a scheme. There exists a unique topology on the set of points of algebraic spaces over S with the following properties:*

(1) *for every morphism of algebraic spaces $X \to Y$ over S the map $|X| \to |Y|$ is continuous, and*
(2) *for every étale morphism $U \to X$ with U a scheme the map of topological spaces $|U| \to |X|$ is continuous and open.*

Proof. Let X be an algebraic space over S. Let $p : U \to X$ be a surjective étale morphism where U is a scheme over S. We define $W \subset |X|$ is open if and only if $|p|^{-1}(W)$ is an open subset of $|U|$. This is a topology on $|X|$.

Let us prove that the topology is independent of the choice of the presentation. To do this it suffices to show that if U' is a scheme, and $U' \to X$ is an étale morphism, then the map $|U'| \to |X|$ (with topology on $|X|$ defined using $U \to X$ as above) is open and continuous; which in addition will prove that (2) holds. Set $U'' = U \times_X U'$, so that we have the commutative diagram

$$\begin{tikzcd} U'' \arrow[r] \arrow[d] & U' \arrow[d] \\ U \arrow[r] & X \end{tikzcd}$$

As $U \to X$ and $U' \to X$ are étale we see that both $U'' \to U$ and $U'' \to U'$ are étale morphisms of schemes. Moreover, $U'' \to U'$ is surjective. Hence we get a commutative diagram of maps of sets

$$\begin{tikzcd} |U''| \arrow[r] \arrow[d] & |U'| \arrow[d] \\ |U| \arrow[r] & |X| \end{tikzcd}$$

The lower horizontal arrow is surjective (see Lemma 41.4.4 or Lemma 41.4.5) and continuous by definition of the topology on $|X|$. The top horizontal arrow is surjective, continuous, and open by Morphisms, Lemma 24.35.13. The left vertical arrow is continuous and open (by Morphisms, Lemma 24.35.13 again.) Hence it follows formally that the right vertical arrow is continuous and open.

To finish the proof we prove (1). Let $a : X \to Y$ be a morphism of algebraic spaces. According to Spaces, Lemma 40.11.4 we can find a diagram

$$\begin{tikzcd} U \arrow[r, "\alpha"'] \arrow[d, "p"'] & V \arrow[d, "q"] \\ X \arrow[r, "a"] & Y \end{tikzcd}$$

where U and V are schemes, and p and q are surjective and étale. This gives rise to the diagram

$$\begin{tikzcd} |U| \arrow[r, "\alpha"'] \arrow[d, "p"'] & |V| \arrow[d, "q"] \\ |X| \arrow[r, "a"] & |Y| \end{tikzcd}$$

where all but the lower horizontal arrows are known to be continuous and the two vertical arrows are surjective and open. It follows that the lower horizontal arrow is continuous as desired. $\square$

Definition 41.4.7. Let S be a scheme. Let X be an algebraic space over S. The underlying *topological space* of X is the set of points $|X|$ endowed with the topology constructed in Lemma 41.4.6.

It turns out that this topological space carries the same information as the small Zariski site X_{Zar} of Spaces, Definition 40.12.6.

Lemma 41.4.8. *Let S be a scheme. Let X be an algebraic space over S.*

(1) *The rule $X' \mapsto |X'|$ defines an inclusion preserving bijection between open subspaces X' (see Spaces, Definition 40.12.1) of X, and opens of the topological space $|X|$.*
(2) *A family $\{X_i \subset X\}_{i\in I}$ of open subspaces of X is a Zariski covering (see Spaces, Definition 40.12.5) if and only if $|X| = \bigcup |X_i|$.*

In other words, the small Zariski site X_{Zar} of X is canonically identified with a site associated to the topological space $|X|$ (see Sites, Example 9.6.4).

Proof. In order to prove (1) let us construct the inverse of the rule. Namely, suppose that $W \subset |X|$ is open. Choose a presentation $X = U/R$ corresponding to the surjective étale map $p : U \to X$ and étale maps $s, t : R \to U$. By construction we see that $|p|^{-1}(W)$ is an open of U. Denote $W' \subset U$ the corresponding open subscheme. It is clear that $R' = s^{-1}(W') = t^{-1}(W')$ is a Zariski open of R which defines an étale equivalence relation on W'. By Spaces, Lemma 40.10.2 the morphism $X' = W'/R' \to X$ is an open immersion. Hence X' is an algebraic space by Spaces, Lemma 40.11.1. By construction $|X'| = W$, i.e., X' is a subspace of X corresponding to W. Thus (1) is proved.

To prove (2), note that if $\{X_i \subset X\}_{i\in I}$ is a collection of open subspaces, then it is a Zariski covering if and only if the $U = \bigcup U \times_X X_i$ is an open covering. This follows from the definition of a Zariski covering and the fact that the morphism $U \to X$ is surjective as a map of presheaves on $(Sch/S)_{fppf}$. On the other hand, we see that $|X| = \bigcup |X_i|$ if and only if $U = \bigcup U \times_X X_i$ by Lemma 41.4.5 (and the fact that the projections $U \times_X X_i \to X_i$ are surjective and étale). Thus the equivalence of (2) follows. □

Lemma 41.4.9. *Let S be a scheme. Let X, Y be algebraic spaces over S. Let $X' \subset X$ be an open subspace. Let $f : Y \to X$ be a morphism of algebraic spaces over S. Then f factors through X' if and only if $|f| : |Y| \to |X|$ factors through $|X'| \subset |X|$.*

Proof. By Spaces, Lemma 40.12.3 we see that $Y' = Y \times_X X' \to Y$ is an open immersion. If $|f|(|Y|) \subset |X'|$, then clearly $|Y'| = |Y|$. Hence $Y' = Y$ by Lemma 41.4.8. □

Lemma 41.4.10. *Let S be a scheme. Let X be an algebraic spaces over S. Let U be a scheme and let $f : U \to X$ be an étale morphism. Let $X' \subset X$ be the open subspace corresponding to the open $|f|(|U|) \subset |X|$ via Lemma 41.4.8. Then f factors through a surjective étale morphism $f' : U \to X'$. Moreover, if $R = U \times_X U$, then $R = U \times_{X'} U$ and X' has the presentation $X' = U/R$.*

Proof. The existence of the factorization follows from Lemma 41.4.9. The morphism f' is surjective according to Lemma 41.4.4. To see f' is étale, suppose that $T \to X'$ is a morphism where T is a scheme. Then $T \times_X U = T \times_{X'} U$ as $X" \to X$ is a monomorphism of sheaves. Thus the projection $T \times_{X'} U \to T$ is étale as we assumed f étale. We have $U \times_X U = U \times_{X'} U$ as $X' \to X$ is a monomorphism. Then $X' = U/R$ follows from Spaces, Lemma 40.9.1. □

Lemma 41.4.11. *Let S be a scheme. Let X be an algebraic space over S. Consider the map*

$$\{Spec(k) \to X \text{ monomorphism}\} \longrightarrow |X|$$

This map is injective.

Proof. Suppose that $\varphi_i : Spec(k_i) \to X$ are monomorphisms for $i = 1, 2$. If φ_1 and φ_2 define the same point of $|X|$, then we see that the scheme

$$Y = Spec(k_1) \times_{\varphi_1, X, \varphi_2} Spec(k_2)$$

is nonempty. Since the base change of a monomorphism is a monomorphism this means that the projection morphisms $Y \to Spec(k_i)$ are monomorphisms. Hence $Spec(k_1) = Y = Spec(k_2)$ as schemes over X, see Schemes, Lemma 21.23.10. We conclude that $\varphi_1 = \varphi_2$, which proves the lemma. □

We will see in Decent Spaces, Lemma 43.9.1 that this map is a bijection when X is very reasonable.

41.5. Quasi-compact spaces

Definition 41.5.1. Let S be a scheme. Let X be an algebraic space over S. We say X is *quasi-compact* if there exists a surjective étale morphism $U \to X$ with U quasi-compact.

Lemma 41.5.2. *Let S be a scheme. Let X be an algebraic space over S. Then X is quasi-compact if and only if $|X|$ is quasi-compact.*

Proof. Choose a scheme U and an étale surjective morphism $U \to X$. We will use Lemma 41.4.4. If U is quasi-compact, then since $|U| \to |X|$ is surjective we conclude that $|X|$ is quasi-compact. If $|X|$ is quasi-compact, then since $|U| \to |X|$ is open we see that there exists a quasi-compact open $U' \subset U$ such that $|U'| \to |X|$ is surjective (and still étale). Hence we win. □

Lemma 41.5.3. *A finite disjoint union of quasi-compact algebraic spaces is a quasi-compact algebraic space.*

Proof. This is clear from Lemma 41.5.2 and the corresponding topological fact. □

Example 41.5.4. The space $\mathbf{A}^1_{\mathbf{Q}}/\mathbf{Z}$ is quasi-compact but not very reasonable.

Lemma 41.5.5. *Let S be a scheme. Let X be an algebraic space over S. Every point of $|X|$ has a fundamental system of open quasi-compact neighbourhoods. In particular $|X|$ is locally quasi-compact in the sense of Topology, Definition 5.18.1.*

Proof. This follows formally from the fact that there exists a scheme U and a surjective, open, continuous map $U \to |X|$ of topological spaces. To be a bit more precise, if $u \in U$ maps to $x \in |X|$, then the images of the affine neighbourhoods of u will give a fundamental system of quasi-compact open neighbourhoods of x. □

41.6. Special coverings

In this section we collect some straightforward lemmas on the existence of étale surjective coverings of algebraic spaces.

Lemma 41.6.1. *Let S be a scheme. Let X be an algebraic space over S. There exists a surjective étale morphism $U \to X$ where U is a disjoint union of affine schemes. We may in addition assume each of these affines maps into an affine open of S.*

Proof. Let $V \to X$ be a surjective étale morphism. Let $V = \bigcup_{i \in I} V_i$ be a Zariski open covering such that each V_i maps into an affine open of S. Then set $U = \coprod_{i \in I} V_i$ with induced morphism $U \to V \to X$. This is étale and surjective as a composition of étale and surjective representable transformations of functors (via the general principle Spaces, Lemma 40.5.4 and Morphisms, Lemmas 24.9.2 and 24.35.3). $\square$

Lemma 41.6.2. *Let S be a scheme. Let X be an algebraic space over S. There exists a Zariski covering $X = \bigcup X_i$ such that each algebraic space X_i has a surjective étale covering by an affine scheme. We may in addition assume each X_i maps into an affine open of S.*

Proof. By Lemma 41.6.1 we can find a surjective étale morphism $U = \coprod U_i \to X$, with U_i affine and mapping into an affine open of S. Let $X_i \subset X$ be the open subspace of X such that $U_i \to X$ factors through an étale surjective morphism $U_i \to X_i$, see Lemma 41.4.10. Since $U = \bigcup U_i$ we see that $X = \bigcup X_i$. As $U_i \to X_i$ is surjective it follows that $X_i \to S$ maps into an affine open of S. $\square$

Lemma 41.6.3. *Let S be a scheme. Let X be an algebraic space over S. Then X is quasi-compact if and only if there exists an étale surjective morphism $U \to X$ with U an affine scheme.*

Proof. If there exists an étale surjective morphism $U \to X$ with U affine then X is quasi-compact by Definition 41.5.1. Conversely, if X is quasi-compact, then $|X|$ is quasi-compact. Let $U = \coprod_{i \in I} U_i$ be a disjoint union of affine schemes with an étale and surjective map $\varphi : U \to X$ (Lemma 41.6.1). Then $|X| = \bigcup \varphi(|U_i|)$ and by quasi-compactness there is a finite subset $i_1, \ldots, i_n$ such that $|X| = \bigcup \varphi(|U_{i_j}|)$. Hence $U_{i_1} \cup \ldots \cup U_{i_n}$ is an affine scheme with a finite surjective morphism towards X. $\square$

The following lemma will be obsoleted by the discussion of separated morphisms in the chapter on morphisms of algebraic spaces.

Lemma 41.6.4. *Let S be a scheme. Let X be an algebraic space over S. Let U be a separated scheme and $U \to X$ étale. Then $U \to X$ is separated, and $R = U \times_X U$ is a separated scheme.*

Proof. Let $X' \subset X$ be the open subscheme such that $U \to X$ factors through an étale surjection $U \to X'$, see Lemma 41.4.10. If $U \to X'$ is separated, then so is $U \to X$, see Spaces, Lemma 40.5.4 (as the open immersion $X' \to X$ is separated by Spaces, Lemma 40.5.8 and Schemes, Lemma 21.23.7). Moreover, since $U \times_{X'} U = U \times_X U$ it suffices to prove the result after replacing X by X', i.e., we may assume $U \to X$ surjective. Consider the commutative diagram

$$\begin{tikzcd} R = U \times_X U \arrow[r] \arrow[d] & U \arrow[d] \\ U \arrow[r] & X \end{tikzcd}$$

In the proof of Spaces, Lemma 40.13.1 we have seen that $j : R \to U \times_S U$ is separated. The morphism of schemes $U \to S$ is separated as U is a separated scheme, see Schemes, Lemma 21.21.14. Hence $U \times_S U \to U$ is separated as a base change, see Schemes, Lemma 21.21.13. Hence the scheme $U \times_S U$ is separated (by the same lemma). Since j is separated we see in the same way that R is separated. Hence $R \to U$ is a separated morphism (by Schemes, Lemma 21.21.14 again). Thus by Spaces, Lemma 40.11.2 and the diagram above we conclude that $U \to X$ is separated. $\square$

Lemma 41.6.5. *Let S be a scheme. Let X be an algebraic space over S. The following are equivalent*

(1) *X is Zariski locally quasi-separated over S,*
(2) *X is Zariski locally quasi-separated,*
(3) *there exists a Zariski open covering $X = \bigcup X_i$ such that for each i there exists an affine scheme U_i and a quasi-compact surjective étale morphism $U_i \to X_i$, and*
(4) *there exists a Zariski open covering $X = \bigcup X_i$ such that for each i there exists an affine scheme U_i which maps into an affine open of S and a quasi-compact surjective étale morphism $U_i \to X_i$.*

Proof. Assume $U_i \to X_i \subset X$ are as in (3). To prove (4) choose for each i a finite affine open covering $U_i = U_{i1} \cup \ldots \cup U_{in_i}$ such that each U_{ij} maps into an affine open of S. The compositions $U_{ij} \to U_i \to X_i$ are étale and quasi-compact (see Spaces, Lemma 40.5.4). Let $X_{ij} \subset X_i$ be the open subspace corresponding to the image of $|U_{ij}| \to |X_i|$, see Lemma 41.4.10. Note that $U_{ij} \to X_{ij}$ is quasi-compact as $X_{ij} \subset X_i$ is a monomorphism and as $U_{ij} \to X$ is quasi-compact. Then $X = \bigcup X_{ij}$ is a covering as in (4). The implication (4) $\Rightarrow$ (3) is immediate.

Assume (4). To show that X is Zariski locally quasi-separated over S it suffices to show that X_i is quasi-separated over S. Hence we may assume there exists an affine scheme U mapping into an affine open of S and a quasi-compact surjective étale morphism $U \to X$. Consider the fibre product square

$$\begin{tikzcd} U \times_X U \arrow[r] \arrow[d] & U \times_S U \arrow[d] \\ X \arrow[r, "\Delta_{X/S}"] & X \times_S X \end{tikzcd}$$

The right vertical arrow is surjective étale (see Spaces, Lemma 40.5.7) and $U \times_S U$ is affine (as U maps into an affine open of S, see Schemes, Section 21.17), and $U \times_X U$ is quasi-compact because the projection $U \times_X U \to U$ is quasi-compact as a base change of $U \to X$. It follows from Spaces, Lemma 40.11.2 that $\Delta_{X/S}$ is quasi-compact as desired.

Assume (1). To prove (3) there is an immediate reduction to the case where X is quasi-separated over S. By Lemma 41.6.2 we can find a Zariski open covering $X = \bigcup X_i$ such that each X_i maps into an affine open of S, and such that there exist affine schemes U_i and surjective étale morphisms $U_i \to X_i$. Since $U_i \to S$ maps into an affine open of S we see that $U_i \times_S U_i$ is affine, see Schemes, Section 21.17. As X is quasi-separated over S, the morphisms

$$R_i = U_i \times_{X_i} U_i = U_i \times_X U_i \longrightarrow U_i \times_S U_i$$

as base changes of $\Delta_{X/S}$ are quasi-compact. Hence we conclude that R_i is a quasi-compact scheme. This in turn implies that each projection $R_i \to U_i$ is quasi-compact. Hence, applying Spaces, Lemma 40.11.2 to the covering $U_i \to X_i$ and the morphism $U_i \to X_i$ we conclude that the morphisms $U_i \to X_i$ are quasi-compact as desired.

At this point we see that (1), (3), and (4) are equivalent. Since (3) does not refer to the base scheme we conclude that these are also equivalent with (2). □

41.7. Properties of Spaces defined by properties of schemes

Any étale local property of schemes gives rise to a corresponding property of algebraic spaces via the following lemma.

Lemma 41.7.1. *Let S be a scheme. Let X be an algebraic space over S. Let $\mathcal{P}$ be a property of schemes which is local in the étale topology, see Descent, Definition 31.11.1. The following are equivalent*

1. *for some scheme U and surjective étale morphism $U \to X$ the scheme U has property $\mathcal{P}$, and*
2. *for every scheme U and every étale morphism $U \to X$ the scheme U has property $\mathcal{P}$.*

If X is representable this is equivalent to $\mathcal{P}(X)$.

Proof. Omitted. □

Definition 41.7.2. Let $\mathcal{P}$ be a property of schemes which is local in the étale topology. Let S be a scheme. Let X be an algebraic space over S. We say *X has property $\mathcal{P}$* if any of the equivalent conditions of Lemma 41.7.1 hold.

Remark 41.7.3. Here is a list of properties which are local for the étale topology (keep in mind that the fpqc, fppf, syntomic, and smooth topologies are stronger than the étale topology):

1. locally Noetherian, see Descent, Lemma 31.12.1,
2. Jacobson, see Descent, Lemma 31.12.2,
3. locally Noetherian and (S_k), see Descent, Lemma 31.13.1,
4. Cohen-Macaulay, see Descent, Lemma 31.13.2,
5. reduced, see Descent, Lemma 31.14.1,
6. normal, see Descent, Lemma 31.14.2,
7. locally Noetherian and (R_k), see Descent, Lemma 31.14.3,
8. regular, see Descent, Lemma 31.14.4,
9. Nagata, see Descent, Lemma 31.14.5.

Any étale local property of germs of schemes gives rise to a corresponding property of algebraic spaces. Here is the obligatory lemma.

Lemma 41.7.4. *Let $\mathcal{P}$ be a property of germs of schemes which is étale local, see Descent, Definition 31.17.1. Let S be a scheme. Let X be an algebraic space over S. Let $x \in |X|$ be a point of X. Consider étale morphisms $a : U \to X$ where U is a scheme. The following are equivalent*

1. *for any $U \to X$ as above and $u \in U$ with $a(u) = x$ we have $\mathcal{P}(U, u)$, and*
2. *for some $U \to X$ as above and $u \in U$ with $a(u) = x$ we have $\mathcal{P}(U, u)$.*

If X is representable, then this is equivalent to $\mathcal{P}(X, x)$.

Proof. Omitted. □

Definition 41.7.5. Let S be a scheme. Let X be an algebraic space over S. Let $x \in |X|$. Let $\mathcal{P}$ be a property of germs of schemes which is étale local. We say *X has property $\mathcal{P}$ at x* if any of the equivalent conditions of Lemma 41.7.4 hold.

41.8. Dimension at a point

We can use Descent, Lemma 31.17.2 to define the dimension of an algebraic space X at a point x. This will give us a different notion than the topological one (i.e., the dimension of $|X|$ at x).

Definition 41.8.1. Let S be a scheme. Let X be an algebraic space over S. Let $x \in |X|$ be a point of X. We define the *dimension of X at x* to be the element $\dim_x(X) \in \{0, 1, 2, \ldots, \infty\}$ such that $\dim_x(X) = \dim_u(U)$ for any (equivalently some) pair $(a : U \to X, u)$ consisting of an étale morphism $a : U \to X$ from a scheme to X and a point $u \in U$ with $a(u) = x$. See Definition 41.7.5, Lemma 41.7.4, and Descent, Lemma 31.17.2.

Warning: It is **not** the case that $\dim_x(X) = \dim_x(|X|)$ in general. A counter example is the algebraic space X of Spaces, Example 40.14.9. Namely, in this example we have $\dim_x(X) = 0$ and $\dim_x(|X|) = 1$ (this holds for any $x \in |X|$). In particular, it also means that the dimension of X (as defined below) is different from the dimension of $|X|$.

Definition 41.8.2. Let S be a scheme. Let X be an algebraic space over S. The *dimension* $\dim(X)$ of X is defined by the rule

$$\dim(X) = \sup_{x \in |X|} \dim_x(X)$$

By Properties, Lemma 23.10.2 we see that this is the usual notion if X is a scheme. There is another integer that measures the dimension of a scheme at a point, namely the dimension of the local ring. This invariant is compatible with étale morphisms also, see Section 41.20.

41.9. Reduced spaces

We have already defined reduced algebraic spaces in Section 41.7. Here we just prove some simple lemmas regarding reduced algebraic spaces.

Lemma 41.9.1. *Let S be a scheme. Let X be an algebraic space over S. Let $T \subset |X|$ be a closed subset. There exists a unique closed subspace $Z \subset X$ with the following properties: (a) we have $|Z| = T$, and (b) Z is reduced.*

Proof. Let $U \to X$ be a surjective étale morphism, where U is a scheme. Set $R = U \times_X U$, so that $X = U/R$, see Spaces, Lemma 40.9.1. As usual we denote $s, t : R \to U$ the two projection morphisms. By Lemma 41.4.5 we see that T corresponds to a closed subset $T' \subset |U|$ such that $s^{-1}(T') = t^{-1}(T')$. Let $Z' \subset U$ be the reduced induced scheme structure on T'. In this case the fibre products $Z' \times_{U,t} R$ and $Z' \times_{U,s} R$ are closed subschemes of R (Schemes, Lemma 21.18.2) which are étale over Z' (Morphisms, Lemma 24.35.4), and hence reduced (because being reduced is local in the étale topology, see Remark 41.7.3). Since they have the same underlying topological space (see above) we conclude that $Z' \times_{U,t} R = Z' \times_{U,s} R$. Hence the common value R' is the restriction of R to Z', see Groupoids, Definition 35.15.2. By Spaces, Theorem 40.10.5 we see that $Z = Z'/R'$ is an algebraic space. By Groupoids, Lemma 35.17.6 we see that $Z \to X$ is a monomorphism. By construction we have $U \times_X Z = Z'$, so $U \times_X Z \to Z$ is a closed immersion. This means all the hypotheses of Spaces, Lemma 40.11.3 are satisfied for the transformation $Z \to X$, $\mathcal{P}$=``closed immersion'' (closed immersions satisfy descent for étale coverings, see Descent, Lemma 31.33.2), and the étale surjective morphism $U \to X$. We conclude that $Z \to X$ is representable, a monomorphism and a closed immersion, which is the definition of a closed subspace (see Spaces, Definition 40.12.1). By construction $|Z| = T$ and Z is reduced. This proves existence. We omit the proof of uniqueness. $\square$

Lemma 41.9.2. *Let S be a scheme. Let X, Y be algebraic spaces over S. Let $Z \subset X$ be a closed subspace. Assume Y is reduced. A morphism $f : Y \to X$ factors through Z if and only if $f(|Y|) \subset |Z|$.*

Proof. Assume $f(|Y|) \subset |Z|$. Choose a diagram

$$\begin{tikzcd} V \arrow[r, "h"] \arrow[d, "b"'] & U \arrow[d, "a"] \\ Y \arrow[r, "f"] & X \end{tikzcd}$$

where U, V are schemes, and the vertical arrows are surjective and étale. The scheme V is reduced, see Lemma 41.7.1. Hence h factors through $a^{-1}(Z)$ by Schemes, Lemma 21.12.6. So $a \circ h$ factors through Z. As $Z \subset X$ is a subsheaf, and $V \to Y$ is a surjection of sheaves on $(Sch/S)_{fppf}$ we conclude that $X \to Y$ factors through Z. □

Definition 41.9.3. Let S be a scheme, and let X be an algebraic space over S. Let $Z \subset |X|$ be a closed subset. An *algebraic space structure on* Z is given by a closed subspace Z' of X with $|Z'|$ equal to Z. The *reduced induced algebraic space structure* on Z is the one constructed in Lemma 41.9.1. The *reduction* X_{red} *of* X is the reduced induced algebraic space structure on $|X|$.

41.10. The schematic locus

Every algebraic space has a largest open subspace which is a scheme; this is more or less clear but we also write out the proof below. Of course this subspace may be empty, for example if $X = \mathbf{A}^1_{\mathbf{Q}}/\mathbf{Z}$ (the universal counter example). On the other hand, if X is very reasonable, then this largest open subscheme is actually dense in X!

Lemma 41.10.1. *Let S be a scheme. Let X be an algebraic space over S. There exists a largest open subspace $X' \subset X$ which is a scheme.*

Proof. Let $U \to X$ be an étale surjective morphism, where U is a scheme. Let $R = U \times_X U$. The open subspaces of X correspond $1-1$ with open subschemes of U which are R-invariant. Hence there is a set of them. Let X_i, $i \in I$ be the set of open subspaces of X which are schemes, i.e., are representable. Consider the open subspace $X' \subset X$ whose underlying set of points is the open $\bigcup |X_i|$ of $|X|$. By Lemma 41.4.4 we see that

$$\coprod X_i \longrightarrow X'$$

is a surjective map of sheaves on $(Sch/S)_{fppf}$. But since each $X_i \to X'$ is representable by open immersions we see that in fact the map is surjective in the Zariski topology. (Because if $T \to X'$ is a morphism from a scheme into X', then $X_i \times'_X T$ is an open subscheme of T.) Hence we can apply Schemes, Lemma 21.15.4 to see that X' is a scheme. □

In the rest of this section we say that an open subspace X' of an algebraic space X is *dense* if the corresponding open subset $|X'| \subset |X|$ is dense.

Lemma 41.10.2. *Let S be a scheme. Let X be an algebraic space over S. If there exists a finite, étale, surjective morphism $U \to X$ where U is a scheme, then there exists a dense open subspace of X which is a scheme.*

Proof. Assume X is an algebraic space, U a scheme, and $U \to X$ is a finite étale surjective morphism. Write $R = U \times_X U$ and denote $s, t : R \to U$ the projections as usual. Note that s, t are surjective, finite and étale. Claim: The union of the R-invariant affine opens of U is topologically dense in U.

Proof of the claim[3]. Let $W \subset U$ be an affine open. Set $W' = t(s^{-1}(W)) \subset U$. Since $s^{-1}(W)$ is affine (hence quasi-compact) we see that $W' \subset U$ is a quasi-compact open. By Properties, Lemma 23.26.3 there exists a dense open $W'' \subset W'$ which is a separated scheme. Set $\Delta' = W' \setminus W''$. This is a nowhere dense closed subset of W''. Since $t|_{s^{-1}(W)} : s^{-1}(W) \to W'$ is open (because it is étale) we see that the inverse image $(t|_{s^{-1}(W)})^{-1}(\Delta') \subset s^{-1}(W)$ is a nowhere dense closed subset (see Topology, Lemma 5.17.6). Hence, by Morphisms, Lemma 24.44.7 we see that

$$\Delta = s\left((t|_{s^{-1}(W)})^{-1}(\Delta')\right)$$

is a nowhere dense closed subset of W. Pick any point $\eta \in W$, $\eta \notin \Delta$ which is a generic point of an irreducible component of W (and hence of U). By our choices above the finite set $t(s^{-1}(\{\eta\})) = \{\eta_1, \ldots, \eta_n\}$ is contained in the separated scheme W''. Note that the fibres of s is are finite discrete spaces, and that generalizations lift along the étale morphism t, see Morphisms, Lemmas 24.35.12 and 24.24.8. In this way we see that each η_i is a generic point of an irreducible component of W''. Thus, by Properties, Lemma 23.26.1 we can find an affine open $V \subset W''$ such that $\{\eta_1, \ldots, \eta_n\} \subset V$. By Groupoids, Lemma 35.20.1 this implies that η is contained in an R-invariant affine open subscheme of U. The claim follows as W was chosen as an arbitrary affine open of U and because the set of generic points of irreducible components of $W \setminus \Delta$ is dense in W.

Using the claim we can finish the proof. Namely, if $W \subset U$ is an R-invariant affine open, then the restriction R_W of R to W equals $R_W = s^{-1}(W) = t^{-1}(W)$ (see Groupoids, Definition 35.16.1 and discussion following it). In particular the maps $R_W \to W$ are finite étale also. It follows in particular that R_W is affine. Thus we see that W/R_W is a scheme, by Groupoids, Proposition 35.19.8. On the other hand, W/R_W is an open subspace of X by Spaces, Lemma 40.10.2. Hence having a dense collection of points contained in R-invariant affine open of U certainly implies that the schematic locus of X (see Lemma 41.10.1) is open dense in X. □

We will improve the following proposition to the case of very reasonable algebraic spaces in Decent Spaces, Proposition 43.8.1.

Proposition 41.10.3. *Let S be a scheme. Let X be an algebraic space over S. If X is Zariski locally quasi-separated (e.g., X is quasi-separated), then there exists a dense open subspace of X which is a scheme.*

Proof. By Lemma 41.10.1 and Lemma 41.6.5 we may assume that there exists an affine scheme U and a surjective, quasi-compact, étale morphism $U \to X$. Set $R = U \times_X U$, and denote $s, t : R \to U$ the projections as usual. Note that s, t are surjective, quasi-compact and étale, hence also quasi-finite (see Étale Morphisms, Section 37.11). By More on Morphisms, Lemma 33.29.7 there exists a dense open subscheme $W \subset U$ such that $s^{-1}(W) \to W$ is finite. By Descent, Lemma 31.19.21 being finite is fpqc (and in particular étale) local on the target. Hence we may apply More on Groupoids, Lemma 36.5.4 which says that the largest open $W \subset U$ over which s is finite is R-invariant. It is still dense of course. The restriction R_W of R to W equals $R_W = s^{-1}(W) = t^{-1}(W)$ (see Groupoids, Definition 35.16.1 and discussion following it). By construction $s_W, t_W : R_W \to W$ are finite étale. If we can show the open subspace $W/R_W \subset X$ (see Spaces, Lemma 40.10.2) contains a dense open subspace which is a scheme, then the proposition follows for X. This reduces us to Lemma 41.10.2. □

[3]The claim is easier to prove if U is assumed quasi-separated, since in that case Properties, Lemma 23.26.1 may be applied immediately to the R-equivalence class of any generic point of U.

41.11. Points on quasi-separated spaces

Points can behave very badly on algebraic spaces in the generality introduced in the stacks project. However, for quasi-separated spaces their behaviour is mostly like the behaviour of points on schemes. We prove a few results on this in this section.

The following lemma is a key lemma which we will use to prove that certain algebraic spaces are isomorphic to the spectrum of a field.

Lemma 41.11.1. *Let S be a scheme. Let k be a field. Let X be an algebraic space over S and assume that there exists a surjective étale morphism $Spec(k) \to X$. If X is quasi-separated, then $X \cong Spec(k')$ where $k' \subset k$ is a finite separable extension.*

Proof. Set $R = Spec(k) \times_X Spec(k)$, so that we have a fibre product diagram

$$\begin{tikzcd} R \arrow[r, "s"'] \arrow[d, "t"'] & Spec(k) \arrow[d] \\ Spec(k) \arrow[r] & X \end{tikzcd}$$

By Spaces, Lemma 40.9.1 we know $X = Spec(k)/R$ is the quotient sheaf. Because $Spec(k) \to X$ is étale, the morphisms s and t are étale. Hence $R = \coprod_{i \in I} Spec(k_i)$ is a disjoint union of spectra of fields, and both s and t induce finite separable field extensions $s, t : k \subset k_i$, see Morphisms, Lemma 24.35.7. Because

$$R = Spec(k) \times_X Spec(k) = (Spec(k) \times_S Spec(k)) \times_{X \times_S X, \Delta} X$$

and since Δ is quasi-compact by assumption we conclude that $R \to Spec(k) \times_S Spec(k)$ is quasi-compact. Hence R is quasi-compact as $Spec(k) \times_S Spec(k)$ is affine. We conclude that I is finite. This implies that s and t are finite locally free morphisms. Hence by Groupoids, Proposition 35.19.8 we conclude that $Spec(k)/R$ is represented by $Spec(k')$, with $k' \subset k$ finite locally free where

$$k' = \{x \in k \mid s_i(x) = t_i(x) \text{ for all } i \in I\}$$

It is easy to see that k' is a field. □

Remark 41.11.2. For improvements of the lemma above, see Decent Spaces, Lemmas 43.9.2 and 43.11.1. It is possible that Lemma 41.11.1 also holds when X is locally separated. To prove this one would have to show that the index set I in the proof of Lemma 41.11.1 is finite, if we only assume that $R \to Spec(k) \times_S Spec(k)$ is an immersion (and an étale equivalence relation of course).

Lemma 41.11.3. *Let S be a scheme. Let X be an algebraic space over S. Let U be a scheme. Let $\varphi : U \to X$ be an étale morphism such that the projections $R = U \times_X U \to U$ are quasi-compact; for example if φ is quasi-compact. Then the fibres of*

$$|U| \to |X| \quad \textit{and} \quad |R| \to |X|$$

are finite.

Proof. Denote $R = U \times_X U$, and $s, t : R \to U$ the projections. Let $u \in U$ be a point, and let $x \in |X|$ be its image. The fibre of $|U| \to |X|$ over x is equal to $s(t^{-1}(\{u\}))$ by Lemma 41.4.3, and the fibre of $|R| \to |X|$ over x is $t^{-1}(s(t^{-1}(\{u\})))$. Since $t : R \to U$ is étale and quasi-compact, it has finite fibres (as its fibres are disjoint unions of spectra of fields by Morphisms, Lemma 24.35.7 and quasi-compact). Hence we win. □

Lemma 41.11.4. *Let S be a scheme. Let X be a Zariski locally quasi-separated algebraic space over S. Then the topological space $|X|$ is sober (see Topology, Definition 5.5.4).*

Proof. Combining Topology, Lemma 5.5.5 and Lemma 41.6.5 we see that we may assume that there exists an affine scheme U and a surjective, quasi-compact, étale morphism $U \to X$. Set $R = U \times_X U$ with projection maps $s, t : R \to U$. Applying Lemma 41.11.3 we see that the fibres of s, t are finite. It follows all the assumptions of Topology, Lemma 5.14.7 are met, and we conclude that $|X|$ is Kolmogorov[4].

It remains to show that every irreducible closed subset $T \subset |X|$ has a generic point. By Lemma 41.9.1 there exists a closed subspace $Z \subset X$ with $|Z| = |T|$. Note that $U \times_X Z \to Z$ is a quasi-compact, surjective, étale morphism from an affine scheme to Z, hence Z is Zariski locally quasi-separated by Lemma 41.6.5. By Proposition 41.10.3 we see that there exists an open dense subspace $Z' \subset Z$ which is a scheme. This means that $|Z'| \subset T$ is open dense. Hence the topological space $|Z'|$ is irreducible, which means that Z' is an irreducible scheme. By Schemes, Lemma 21.11.1 we conclude that $|Z'|$ is the closure of a single point $\eta \in |Z'| \subset T$ and hence also $T = \overline{\{\eta\}}$, and we win. □

41.12. Noetherian spaces

We have already defined locally Noetherian algebraic spaces in Section 41.7.

Definition 41.12.1. Let S be a scheme. Let X be an algebraic space over S. We say X is *Noetherian* if X is quasi-compact, quasi-separated and locally Noetherian.

Note that a Noetherian algebraic space X is not just quasi-compact and locally Noetherian, but also quasi-separated. This does not conflict with the definition of a Noetherian scheme, as a locally Noetherian scheme is quasi-separated, see Properties, Lemma 23.5.4. This does not hold for algebraic spaces. Namely, $X = \mathbf{A}^1_k/\mathbf{Z}$, see Spaces, Example 40.14.8 is locally Noetherian and quasi-compact but not quasi-separated (hence not Noetherian according to our definitions).

A consequence of the choice made above is that an algebraic space of finite type over a Noetherian algebraic space is not automatically Noetherian, i.e., the analogue of Morphisms, Lemma 24.14.6 does not hold. The correct statement is that an algebraic space of finite presentation over a Noetherian algebraic space is Noetherian (see Morphisms of Spaces, Lemma 42.26.6).

A Noetherian algebraic space X is very close to being a scheme. In the rest of this section we collect some lemmas to illustrate this.

Lemma 41.12.2. *Let S be a scheme. Let X be an algebraic space over S.*

(1) *If X is locally Noetherian then $|X|$ is a locally Noetherian topological space.*
(2) *If X is quasi-compact and locally Noetherian, then $|X|$ is a Noetherian toplogical space.*

Proof. Assume X is locally Noetherian. Choose a scheme U and a surjective étale morphism $U \to X$. As X is locally Noetherian we see that U is locally Noetherian. By Properties, Lemma 23.5.5 this means that $|U|$ is a locally Noetherian topological space. Since $|U| \to |X|$ is open and surjective we conclude that $|X|$ is locally Noetherian by Topology,

[4] Actually we use here also Schemes, Lemma 21.11.1 (soberness schemes), Morphisms, Lemmas 24.35.12 and 24.24.8 (generalizations lift along étale morphisms), Lemma 41.4.5 (points on an algebraic space in terms of a presentation), and Lemma 41.4.6 (openness quotient map).

Lemma 5.6.3. This proves (1). If X is quasi-compact and locally Noetherian, then $|X|$ is quasi-compact and locally Noetherian. Hence $|X|$ is Noetherian by Topology, Lemma 5.9.10. □

Lemma 41.12.3. *Let S be a scheme. Let X be an algebraic space over S. If X is Noetherian, then $|X|$ is a sober Noetherian topological space.*

Proof. A quasi-separated algebraic space has an underlying sober topological space, see Lemma 41.11.4. It is Noetherian by Lemma 41.12.2. □

41.13. Étale morphisms of algebraic spaces

This section really belongs in the chapter on morphisms of algebraic spaces, but we need the notion of an algebraic space étale over another in order to define the small étale site of an algebraic space. Thus we need to do some preliminary work on étale morphisms from schemes to algebraic spaces, and étale morphisms between algebraic spaces. For more about étale morphisms of algebraic spaces, see Morphisms of Spaces, Section 42.35.

Lemma 41.13.1. *Let S be a scheme. Let X be an algebraic space over S. Let U, U' be schemes over S.*

1. *If $U \to U'$ is an étale morphism of schemes, and if $U' \to X$ is an étale morphism from U' to X, then the composition $U \to X$ is an étale morphism from U to X.*
2. *If $\varphi : U \to X$ and $\varphi' : U' \to X$ are étale morphisms towards X, and if $\chi : U \to U'$ is a morphism of schemes such that $\varphi = \varphi' \circ \chi$, then χ is an étale morphism of schemes.*

Proof. Recall that our definition of an étale morphism from a scheme into an algebraic space comes from Spaces, Definition 40.5.1 via the fact that any morphism from a scheme into an algebraic space is representable. Part (1) of the lemma follows from this, the fact that étale morphisms are preserved under composition (Morphisms, Lemma 24.35.3) and Spaces, Lemmas 40.5.4 and 40.5.3 (which are formal). To prove part (2) choose a scheme W over S and a surjective étale morphism $W \to X$. Consider the base change $\chi_W : W \times_X U \to W \times_X U'$ of χ. As $W \times_X U$ and $W \times_X U'$ are étale over W, we conclude that χ_W is étale, by Morphisms, Lemma 24.35.19. On the other hand, in the commutative diagram

$$\begin{tikzcd} W \times_X U \arrow[r] \arrow[d] & W \times_X U' \arrow[d] \\ U \arrow[r] & U' \end{tikzcd}$$

the two vertical arrows are étale and surjective. Hence by Descent, Lemma 31.10.4 we conclude that $U \to U'$ is étale. □

Definition 41.13.2. Let S be a scheme. A morphism $f : X \to Y$ between algebraic spaces over S is called *étale* if and only if for every étale morphism $\varphi : U \to X$ where U is a scheme, the composition $\varphi \circ f$ is étale also.

If X and Y are schemes, then this agree with the usual notion of an étale morphism of schemes. In fact, whenever $X \to Y$ is a representable morphism of algebraic spaces, then this agrees with the notion defined via Spaces, Definition 40.5.1. This follows by combining Lemma 41.13.3 below and Spaces, Lemma 40.11.2.

Lemma 41.13.3. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. The following are equivalent:*

(1) *f is étale,*
(2) *there exists a surjective étale morphism $\varphi : U \to X$, where U is a scheme, such that the composition $f \circ \varphi$ is étale (as a morphism of algebraic spaces),*
(3) *there exists a surjective étale morphism $\psi : V \to Y$, where V is a scheme, such that the base change $V \times_X Y \to V$ is étale (as a morphism of algebraic spaces),*
(4) *there exists a commutative diagram*

$$\begin{tikzcd} U \arrow[r] \arrow[d] & V \arrow[d] \\ X \arrow[r] & Y \end{tikzcd}$$

where U, V are schemes, the vertical arrows are étale, and the left vertical arrow is surjective such that the horizontal arrow is étale.

Proof. Let us prove that (4) implies (1). Assume a diagram as in (4) given. Let $W \to X$ be an étale morphism with W a scheme. Then we see that $W \times_X U \to U$ is étale. Hence $W \times_X U \to V$ is étale, and also $W \times_X U \to Y$ is étale by Lemma 41.13.1 (1). Since also the projection $W \times_X U \to W$ is surjective and étale, we conclude from Lemma 41.13.1 (2) that $W \to Y$ is étale.

Let us prove that (1) implies (4). Assume (1). Choose a commutative diagram

$$\begin{tikzcd} U \arrow[r] \arrow[d] & V \arrow[d] \\ X \arrow[r] & Y \end{tikzcd}$$

where $U \to X$ and $V \to Y$ are surjective and étale, see Spaces, Lemma 40.11.4. By assumption the morphism $U \to Y$ is étale, and hence $U \to V$ is étale by Lemma 41.13.1 (2).

We omit the proof that (2) and (3) are also equivalent to (1). $\square$

Lemma 41.13.4. *The composition of two étale morphisms of algebraic spaces is étale.*

Proof. This is immediate from the definition. $\square$

Lemma 41.13.5. *The base change of an étale morphism of algebraic spaces by any morphism of algebraic spaces is étale.*

Proof. Let $X \to Y$ be an étale morphism of algebraic spaces over S. Let $Z \to Y$ be a morphism of algebraic spaces. Choose a scheme U and a surjective étale morphism $U \to X$. Choose a scheme W and a surjective étale morphism $W \to Z$. Then $U \to Y$ is étale, hence in the diagram

$$\begin{tikzcd} W \times_Y U \arrow[r] \arrow[d] & W \arrow[d] \\ Z \times_Y X \arrow[r] & Z \end{tikzcd}$$

the top horizontal arrow is étale. Moreover, the left vertical arrow is surjective and étale (verification omitted). Hence we conclude that the lower horizontal arrow is étale by Lemma 41.13.3. $\square$

Lemma 41.13.6. *Let S be a scheme. Let X, Y, Z be algebraic spaces. Let $g : X \to Z$, $h : Y \to Z$ be étale morphisms and let $f : X \to Y$ be a morphism such that $h \circ f = g$. Then f is étale.*

Proof. Choose a commutative diagram

$$\begin{tikzcd} U \arrow[r, "\chi"'] \arrow[d] & V \arrow[d] \\ X \arrow[r] & Y \end{tikzcd}$$

where $U \to X$ and $V \to Y$ are surjective and étale, see Spaces, Lemma 40.11.4. By assumption the morphisms $\varphi : U \to X \to Z$ and $\psi : V \to Y \to Z$ are étale. Moreover, $\psi \circ \chi = \varphi$ by our assumption on f, g, h. Hence $U \to V$ is étale by Lemma 41.13.1 part (2). $\square$

Lemma 41.13.7. *Let S be a scheme. If $X \to Y$ is an étale morphism of algebraic spaces over S, then the associated map $|X| \to |Y|$ of topological spaces is open.*

Proof. This is clear from the diagram in Lemma 41.13.3 and Lemma 41.4.6. $\square$

Finally, here is a fun lemma. It is not true that an algebraic space with an étale morphism towards a scheme is a scheme, see Spaces, Example 40.14.2. But it is true if the target is the spectrum of a field.

Lemma 41.13.8. *Let S be a scheme. Let $X \to Spec(k)$ be étale morphism over S, where k is a field. Then X is a scheme.*

Proof. Let U be an affine scheme, and let $U \to X$ be an étale morphism. By Definition 41.13.2 we see that $U \to Spec(k)$ is an étale morphism. Hence $U = \coprod_{i=1,\ldots,n} Spec(k_i)$ is a finite disjoint union of spectra of finite separable extensions k_i of k, see Morphisms, Lemma 24.35.7. The $R = U \times_X U \to U \times_{Spec(k)} U$ is a monomorphism and $U \times_{Spec(k)} U$ is also a finite disjoint union of spectra of finite separable extensions of k. Hence by Schemes, Lemma 21.23.10 we see that R is similarly a finite disjoint union of spectra of finite separable extensions of k. This U and R are affine and both projections $R \to U$ are finite locally free. Hence U/R is a scheme by Groupoids, Proposition 35.19.8. By Spaces, Lemma 40.10.2 it is also an open subspace of X. By Lemma 41.10.1 we conclude that X is a scheme. $\square$

41.14. Spaces and fpqc coverings

Let S be a scheme. An algebraic space over S is defined as a sheaf in the fppf topology with additional properties. Hence it is not clear that it satisfies the sheaf property for the fpqc topology (see Topologies, Definition 30.8.12). In this section we discuss this question. However, when we say that the algebraic space X satisfies the sheaf property for the fpqc topology we really only consider fpqc coverings $\{f_i : T_i \to T\}_{i \in I}$ such that T, T_i are objects of the big site $(Sch/S)_{fppf}$ (as per our conventions, see Section 41.2). We first address the question as to whether an algebraic space is separated as a presheaf for the fpqc topology.

Lemma 41.14.1. *Let S be a scheme. Let X be an algebraic space over S. Let $\{f_i : T_i \to T\}_{i \in I}$ be a fpqc covering of schemes over S. Then the map*

$$Mor_S(T, X) \longrightarrow \prod\nolimits_{i \in I} Mor_S(T_i, X)$$

is injective.

Proof. Let $a, b : T \to X$ be two morphisms such that $a \circ f_i = b \circ f_i$ for all i. Consider the fibre product

$$T' = X \times_{\Delta_{X/S}, X \times_S X, (a,b)} T.$$

By Spaces, Lemma 40.13.1 the morphism $\Delta_{X/S}$ is a representable monomorphism which is locally of finite type. Hence $T' \to T$ is a monomorphism of schemes which is locally of finite type. Our assumption that $a \circ f_i = b \circ f_i$ implies that each $T_i \to T$ factors (uniquely) through T'. Consider the commutative diagram

$$\begin{tikzcd} T_i \times_T T' \arrow[r] \arrow[d] & T' \arrow[d] \\ T_i \arrow[r] \arrow[ur] \arrow[u, bend left=60] & T \end{tikzcd}$$

Since the projection $T_i \times_T T' \to T_i$ is a monomorphism with a section we conclude it is an isomorphism. Hence we conclude that $T' \to T$ is an isomorphism by Descent, Lemma 31.19.15. This means $a = b$ as desired. $\square$

Lemma 41.14.2. *Let S be a scheme. Let X be an algebraic space over S. Let $X = \bigcup_{j \in J} X_j$ be a Zariski covering, see Spaces, Definition 40.12.5. If each X_j satisfies the sheaf property for the fpqc topology then X satisfies the sheaf property for the fpqc topology.*

Proof. Assume each X_j satisfies the sheaf property for the fpqc topology. Let $\{f_i : T_i \to T\}_{i \in I}$ be a fpqc covering of schemes over S. Let $a_i \in Mor_S(T_i, X)$ be such that $a_i \circ \mathrm{pr}_0 = a_{i'} \circ \mathrm{pr}_1$ as morphisms $T_i \times_T T_{i'} \to X$. We have to prove that these morphisms come from a morphism $a : T \to X$. Consider the open subsets $T_{i,j} = a_i^{-1}(X_j)$. Then it is clear that $\mathrm{pr}_0^{-1}(T_{i,j}) = \mathrm{pr}_1^{-1}(T_{i',j})$ as open subsets of $T_i \times_T T_{i'}$. Hence there exist open subsets $U_j \subset T$ such that $T_{i,j} = f_i^{-1}(U_j)$, see Descent, Lemma 31.9.2. In particular, $\{T_{i,j} \to U_j\}_{i \in I}$ is a fpqc covering of U_j, and the morphisms $a_{i,j} = a_i|_{T_{i,j}}$ are morphisms into X_j. By assumption there exist morphisms $\alpha_j : U_j \to X_j$ such that $T_{i,j} \to U_j \to X_j$ agrees with $a_{i,j}$. By Lemma 41.14.1 we conclude that $\alpha_j|_{U_j \cap U_{j'}}$ agrees with $\alpha_{j'}|_{U_j \cap U_{j'}}$. Hence, since X is a sheaf for the Zariski topology we conclude that the α_j glue to a morphism $a : T \to X$. By construction we have $a \circ f_i|_{T_{i,j}} = a_{i,j} = a_i|_{T_{i,j}}$. Using the sheaf condition for the Zariski topology one more time we conclude that $a \circ f_i = a_i$ as desired. $\square$

Lemma 41.14.3. *Let S be a scheme. Let X be an algebraic space over S. If X is Zariski locally quasi-separated over S, then X satisfies the sheaf condition for the fpqc topology.*

Proof. By Lemmas 41.6.5 and 41.14.2 we may assume there exists an affine scheme U and a surjective étale quasi-compact morphism $\varphi : U \to X$. By Lemma 41.6.4 the morphism $U \to X$ is also separated.

Let $\{f_i : T_i \to T\}_{i \in I}$ be a fpqc covering of schemes over S. Let $a_i \in Mor_S(T_i, X)$ be such that $a_i \circ \mathrm{pr}_0 = a_j \circ \mathrm{pr}_1$ as morphisms $T_i \times_T T_j \to X$. We have to prove that these morphisms come from a morphism $a : T \to X$. Consider the schemes

$$W_i = T_i \times_{a_i, X, \varphi} U.$$

The strucure morphisms $W_i \to T_i$ are surjective, separated, quasi-compact and étale, in particular also quasi-finite (see Morphisms, Lemma 24.35.6). Hence each $W_i \to T_i$ is quasi-affine, see More on Morphisms, Lemma 33.29.3. For each pair of indices $i, j \in I$ we have canonical isomorphisms

$$\begin{aligned} W_i \times_T T_j &= (T_i \times_{a_i, X, \varphi} U) \times_T T_j \\ &= (T_i \times_T T_j) \times_{a_i \circ \mathrm{pr}_0, X, \varphi} U \\ &= (T_i \times_T T_j) \times_{a_j \circ \mathrm{pr}_1, X, \varphi} U \\ &= T_i \times_T (T_j \times_{a_j, X, \varphi} U) \\ &= T_i \times_T W_j. \end{aligned}$$

These isomorphisms satsify the cocycle condition of Descent, Definition 31.30.3 as a_i, a_j and a_k agree over $T_i \times_T T_j \times_T T_k$ (some details omitted). By Descent, Lemma 31.34.1 this descent datum is effective and we conclude that there exists a scheme $W \to T$ and isomorphisms $T_i \times_T W = W_i$ compatible with the canonical descent datum and the one given above. In particular we see that $\{W_i \to W\}_{i \in I}$ is the base change of a fpqc covering, and hence a fpqc covering. Note that by construction the morphisms $b_i : W_i = T_i \times_X U \to U$ have the property $b_i \circ \mathrm{pr}_0 = b_j \circ \mathrm{pr}_1$ as morphisms $W_i \times_W W_j \to U$. Hence by Descent, Lemma 31.9.3 we see that there exists a morphism of schemes $b : W \to U$ which restricts to b_i on W_i for all i.

By Descent, Lemmas 31.19.6 and 31.19.27 the morphism $W \to T$ is surjective and étale. Hence, in order to see that b gives rise to the morphism $a : T \to X$ we are looking for, it suffices to show that $b \circ \mathrm{pr}_0 = b \circ \mathrm{pr}_1$ as morphisms $W \times_T W \to X$. For this we note that we do know that $b_i \circ \mathrm{pr}_0 = b_j \circ \mathrm{pr}_1$ as morphisms $W_i \times_T W_j \to X$, because

$$W_i \times_T W_j = (T_i \times_T T_j) \times_{(a_i, a_j), X \times_S X} U \times_S U$$

and $(a_i, a_j) : T_i \times_T T_j \to X \times_S X$ factors through $\Delta_{X/S}$ by assumption. In other words we conclude that over the members of the fpqc covering $\{W_i \times_T W_j \to W \times_T W\}$ the morphisms $b \circ \mathrm{pr}_0$ and $b \circ \mathrm{pr}_1$ agree, and hence by Lemma 41.14.1 they agree. As X is a sheaf for the fppf topology we obtain a unique morphism $a : T \to X$ whose composition with $W \to T$ agrees with b. We omit the final verification that $a|_{T_i} = a_i$. □

Remark 41.14.4. The proof of Lemma 41.14.3 works for any algebraic space which has a Zariski covering $X = \bigcup X_i$ such that for each i there exists a surjective étale separated quasi-compact morphism $U_i \to X_i$ where U_i is a scheme. This condition is slightly stronger than the condition of being very reasonable, and the current proof does not work even for very reasonable spaces. There are results in the literature, see David Rydh's paper [**Ryd07b**] and its references, to remedy this. On the other hand, it seems that the question for general algebraic spaces as defined in the stacks project is still open. If this is no longer the case, please email stacks.project@gmail.com so we can update this remark.

41.15. The étale site of an algebraic space

In this section we define the small étale site of an algebraic space. This is the analogue of the small étale site $S_{étale}$ of a scheme. Lemma 41.13.1 implies that in the definition below any morphism between objects of the étale site of X is étale, and that any scheme étale over an object of $X_{étale}$ is also an object of $X_{étale}$.

Definition 41.15.1. Let S be a scheme. Let Sch_{fppf} be a big fppf site containing S, and let $Sch_{étale}$ be the corresponding big étale site (i.e., having the same underlying category). Let X be an algebraic space over S. The *small étale site* $X_{étale}$ of X is defined as follows:

(1) An object of $X_{étale}$ is a morphism $\varphi : U \to X$ where $U \in Ob((Sch/S)_{étale})$ is a scheme and φ is an étale morphism,
(2) a morphism $(\varphi : U \to X) \to (\varphi' : U' \to X)$ is given by a morphism of schemes $\chi : U \to U'$ such that $\varphi = \varphi' \circ \chi$, and
(3) a family of morphisms $\{(U_i \to X) \to (U \to X)\}_{i \in I}$ of $X_{étale}$ is a covering if and only if $\{U_i \to U\}_{i \in I}$ is a covering of $(Sch/S)_{étale}$.

A consequence of our choice is that the étale site of an algebraic space in general does not have a final object! On the other hand, if X happens to be a scheme, then the definition above agrees with Topologies, Definition 30.4.8.

There are several other choices we could have made here. For example we could have considered all *algebraic spaces* U which are étale over X, or we could have considered all *affine schemes* U which are étale over X. We decided not to do so, since we like to think of plain old schemes as the fundamental objects of algebraic geometry. On the other hand, we do need these notions also, since the small étale site of an algebraic space is not sufficiently flexible, especially when discussing functoriality of the small étale site, see Lemma 41.15.7 below.

Definition 41.15.2. Let S be a scheme. Let Sch_{fppf} be a big fppf site containing S, and let $Sch_{étale}$ be the corresponding big étale site (i.e., having the same underlying category). Let X be an algebraic space over S. The site $X_{spaces,étale}$ of X is defined as follows:

(1) An object of $X_{spaces,étale}$ is a morphism $\varphi : U \to X$ where U is an algebraic space over S and φ is an étale morphism of algebraic spaces over S,
(2) a morphism $(\varphi : U \to X) \to (\varphi' : U' \to X)$ of $X_{spaces,étale}$ is given by a morphism of algebraic spaces $\chi : U \to U'$ such that $\varphi = \varphi' \circ \chi$, and
(3) a family of morphisms $\{\varphi_i : (U_i \to X) \to (U \to X)\}_{i \in I}$ of $X_{spaces,étale}$ is a covering if and only if $|U| = \bigcup \varphi_i(|U_i|)$.

(As usual we choose a set of coverings of this type, including at least the coverings in $X_{étale}$, as in Sets, Lemma 3.11.1 to turn $X_{spaces,étale}$ into a site.)

Since the identity morphism of X is étale it is clear that $X_{spaces,étale}$ does have a final object. Let us show right away that the corresponding topos equals the small étale topos of X.

Lemma 41.15.3. *The functor*

$$X_{étale} \longrightarrow X_{spaces,étale}, \quad U/X \longmapsto U/X$$

is a special cocontinuous functor (Sites, Definition 9.25.2) and hence induces an equivalence of topoi $Sh(X_{étale}) \to Sh(X_{spaces,étale})$.

Proof. We have to show that the functor satisfies the assumptions (1) -- (5) of Sites, Lemma 9.25.1. It is clear that the functor is continuous and cocontinuous, which proves assumptions (1) and (2). Assumptions (3) and (4) hold simply because the functor is fully faithful. Assumption (5) holds, because an algebraic space by definition has a covering by a scheme. $\square$

Remark 41.15.4. Let us explain the meaning of Lemma 41.15.3. Let S be a scheme, and let X be an algebraic space over S. Let $\mathcal{F}$ be a sheaf on the small étale site $X_{étale}$ of X. The lemma says that there exists a unique sheaf $\mathcal{F}'$ on $X_{spaces,étale}$ which restricts back to $\mathcal{F}$ on the subcategory $X_{étale}$. If $U \to X$ is an étale morphism of algebraic spaces, then how do we compute $\mathcal{F}'(U)$? Well, by definition of an algebraic space there exists a scheme U'

and a surjective étale morphism $U' \to U$. Then $\{U' \to U\}$ is a covering in $X_{spaces,étale}$ and hence we get an equalizer diagram

$$\mathcal{F}'(U) \longrightarrow \mathcal{F}(U') \rightrightarrows \mathcal{F}(U' \times_U U').$$

Note that $U' \times_U U'$ is a scheme, and hence we may write $\mathcal{F}$ and not $\mathcal{F}'$. Thus we see how to compute $\mathcal{F}'$ when given the sheaf $\mathcal{F}$.

Lemma 41.15.5. *Let S be a scheme. Let X be an algebraic space over S. Let $X_{affine,étale}$ denote the full subcategory of $X_{étale}$ whose objects are those $U/X \in Ob(X_{étale})$ with U affine. A covering of $X_{affine,étale}$ will be a standard étale covering, see Topologies, Definition 30.4.5. Then restriction*

$$\mathcal{F} \longmapsto \mathcal{F}|_{X_{affine,étale}}$$

defines an equivalence of topoi $Sh(S_{étale}) \cong Sh(S_{affine,étale})$.

Proof. This you can show directly from the definitions, and is a good exercise. But it also follows immediately from Sites, Lemma 9.25.1 by checking that the inclusion functor $X_{affine,étale} \to X_{étale}$ is a special cocontinuous functor as in Sites, Definition 9.25.2. $\square$

Definition 41.15.6. Let S be a scheme. Let X be an algebraic space over S. The *étale topos* of X, or more precisely the *small étale topos* of X is the category $Sh(X_{étale})$ of sheaves of sets on $X_{étale}$.

By Lemma 41.15.3 we have $Sh(X_{étale}) = Sh(X_{spaces,étale})$, so we can also think of this as the category of sheaves of sets on $X_{spaces,étale}$. Similarly, by Lemma 41.15.5 we see that $Sh(X_{étale}) = Sh(X_{affine,étale})$. It turns out that the topos is functorial with respect to morphisms of algebraic spaces. Here is a precise statement.

Lemma 41.15.7. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S.*

(1) *The continuous functor*

$$Y_{spaces,étale} \longrightarrow X_{spaces,étale}, \quad V \longmapsto X \times_Y V$$

induces a morphism of sites

$$f_{spaces,étale} : X_{spaces,étale} \to Y_{spaces,étale}.$$

(2) *The rule $f \mapsto f_{spaces,étale}$ is compatible with compositions, in other words $(f \circ g)_{spaces,étale} = f_{spaces,étale} \circ g_{spaces,étale}$ (see Sites, Definition 9.14.4).*
(3) *The morphism of topoi associated to $f_{spaces,étale}$ induces, via Lemma 41.15.3, a morphism of topoi $f_{small} : Sh(X_{étale}) \to Sh(Y_{étale})$ whose construction is compatible with compositions.*
(4) *If f is a representable morphism of algebraic spaces, then f_{small} comes from a morphism of sites $X_{étale} \to Y_{étale}$, corresponding to the continuous functor $V \mapsto X \times_Y V$.*

Proof. Let us show that the functor described in (1) satisfies the assumptions of Sites, Proposition 9.14.6. Thus we have to show that $Y_{spaces,étale}$ has a final object (namely Y) and that the functor transforms this into a final object in $X_{spaces,étale}$ (namely X). This is clear as $X \times_Y Y = X$ in any category. Next, we have to show that $Y_{spaces,étale}$ has fibre products. This is true since the category of algebraic spaces has fibre products, and since $V \times_Y V'$ is étale over Y if V and V' are étale over Y (see Lemmas 41.13.4 and 41.13.5 above). OK, so the proposition applies and we see that we get a morphism of sites as described in (1).

Part (2) you get by unwinding the definitions. Part (3) is clear by using the equivalences for X and Y from Lemma 41.15.3 above. Part (4) follows, because if f is representable, then the functors above fit into a commutative diagram

$$\begin{tikzcd} X_{étale} \arrow[r] & X_{spaces,étale} \\ Y_{étale} \arrow[r] \arrow[u] & Y_{spaces,étale} \arrow[u] \end{tikzcd}$$

of categories. $\square$

We can do a little bit better than the lemma above in describing the relationship between sheaves on X and sheaves on Y. Namely, we can formulate this in turns of f-maps, compare Sheaves, Definition 6.21.7, as follows.

Definition 41.15.8. Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Let $\mathcal{F}$ be a sheaf of sets on $X_{étale}$ and let $\mathcal{G}$ be a sheaf of sets on $Y_{étale}$. An *f-map* $\varphi : \mathcal{G} \to \mathcal{F}$ is a collection of maps $\varphi_{(U,V,g)} : \mathcal{G}(V) \to \mathcal{F}(U)$ indexed by commutative diagrams

$$\begin{tikzcd} U \arrow[r] \arrow[d, "g"'] & X \arrow[d, "f"] \\ V \arrow[r] & Y \end{tikzcd}$$

where $U \in X_{étale}$, $V \in Y_{étale}$ such that whenever given an extended diagram

$$\begin{tikzcd} U' \arrow[r] \arrow[d, "g'"'] & U \arrow[r] \arrow[d, "g"'] & X \arrow[d, "f"] \\ V' \arrow[r] & V \arrow[r] & Y \end{tikzcd}$$

with $V' \to V$ and $U' \to U$ étale morphisms of schemes the diagram

$$\begin{tikzcd} \mathcal{G}(V) \arrow[r, "\varphi_{(U,V,g)}"'] \arrow[d, "\text{restriction of } \mathcal{G}"'] & \mathcal{F}(U) \arrow[d, "\text{restriction of } \mathcal{F}"] \\ \mathcal{G}(V') \arrow[r, "\varphi_{(U',V',g')}"] & \mathcal{F}(U') \end{tikzcd}$$

commutes.

Lemma 41.15.9. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Let $\mathcal{F}$ be a sheaf of sets on $X_{étale}$ and let $\mathcal{G}$ be a sheaf of sets on $Y_{étale}$. There are canonical bijections between the following three sets:*

(1) *The set of maps $\mathcal{G} \to f_{small,*}\mathcal{F}$.*
(2) *The set of maps $f_{small}^{-1}\mathcal{G} \to \mathcal{F}$.*
(3) *The set of f-maps $\varphi : \mathcal{G} \to \mathcal{F}$.*

Proof. Note that (1) and (2) are the same because the functors $f_{small,*}$ and f_{small}^{-1} are a pair of adjoint functors. Suppose that $\alpha : f_{small}^{-1}\mathcal{G} \to \mathcal{F}$ is a map of sheaves on $Y_{étale}$. Let a diagram

$$\begin{tikzcd} U \arrow[r, "j_U"'] \arrow[d, "g"'] & X \arrow[d, "f"] \\ V \arrow[r, "j_V"] & Y \end{tikzcd}$$

as in Definition 41.15.8 be given. By the commutativity of the diagram we also get a map $g_{small}^{-1}(j_V)^{-1}\mathcal{G} \to (j_U)^{-1}\mathcal{F}$ (compare Sites, Section 9.21 for the description of the localization functors). Hence we certainly get a map $\varphi_{(V,U,g)} : \mathcal{G}(V) = (j_V)^{-1}\mathcal{G}(V) \to (j_U)^{-1}\mathcal{F}(U) = \mathcal{F}(U)$. We omit the verification that this rule is compatible with further restrictions and defines an f-map from $\mathcal{G}$ to $\mathcal{F}$.

Conversely, suppose that we are given an f-map $\varphi = (\varphi_{(U,V,g)})$. Let $\mathcal{G}'$ (resp. $\mathcal{F}'$) denote the extension of $\mathcal{G}$ (resp. $\mathcal{F}$) to $Y_{spaces,étale}$ (resp. $X_{spaces,étale}$), see Lemma 41.15.3. Then we have to construct a map of sheaves

$$\mathcal{G}' \longrightarrow (f_{spaces,étale})_*\mathcal{F}'$$

To do this, let $V \to Y$ be an étale morphism of algebraic spaces. We have to construct a map of sets

$$\mathcal{G}'(V) \to \mathcal{F}'(X \times_Y V)$$

Choose an étale surjective morphism $V' \to V$ with V' a scheme, and after that choose an étale surjective morphsm $U' \to X \times_U V'$ with U' a scheme. We get a morphism of schemes $g' : U' \to V'$ and also a morphism of schemes

$$g'' : U' \times_{X \times_Y V} U' \longrightarrow V' \times_V V'$$

Consider the following diagram

$$\begin{tikzcd}
\mathcal{F}'(X \times_Y V) \arrow[r] & \mathcal{F}(U') \arrow[r, shift left] \arrow[r, shift right] & \mathcal{F}(U' \times_{X \times_Y V} U') \\
\mathcal{G}'(X \times_Y V) \arrow[r] \arrow[u, dotted] & \mathcal{G}(V') \arrow[r, shift left] \arrow[r, shift right] \arrow[u, "\varphi_{(U',V',g')}"'] & \mathcal{G}(V' \times_V V') \arrow[u, "\varphi_{(U'',V'',g'')}"']
\end{tikzcd}$$

The compatibility of the maps $\varphi_{\ldots}$ with restriction shows that the two right squares commute. The definition of coverings in $X_{spaces,étale}$ shows that the horizontal rows are equalizer diagrams. Hence we get the dotted arrow. We leave it to the reader to show that these arrows are compatible with the restriction mappings. □

If the morphism of algebraic spaces $X \to Y$ is étale, then the morphism of topoi $Sh(X_{étale}) \to Sh(Y_{étale})$ is a localization. Here is a statement.

Lemma 41.15.10. *Let S be a scheme, and let $f : X \to Y$ be a morphism of algebraic spaces over S. Assume f is étale. In this case there is a functor*

$$j : X_{étale} \to Y_{étale}, \quad (\varphi : U \to X) \mapsto (f \circ \varphi : U \to Y)$$

which is cocontinuous. The morphism of topoi f_{small} is the morphism of topoi associated to j, see Sites, Lemma 9.19.1. Moreover, j is continuous as well, hence Sites, Lemma 9.19.5 applies. In particular $f_{small}^{-1}\mathcal{G}(U) = \mathcal{G}(jU)$ for all sheaves $\mathcal{G}$ on $Y_{étale}$.

Proof. Note that by our very definition of an étale morphism of algebraic spaces (Definition 41.13.2) it is indeed the case that the rule given defines a functor j as indicated. It is clear that j is cocontinuous and continuous, simply because a covering $\{U_i \to U\}$ of $j(\varphi : U \to X)$ in $Y_{étale}$ is the same thing as a covering of $(\varphi : U \to X)$ in $X_{étale}$. It remains to show that j induces the same morphism of topoi as f_{small}. To see this we consider the diagram

$$\begin{tikzcd}
X_{étale} \arrow[r] \arrow[d, "j"] & X_{spaces,étale} \arrow[d, bend right, "j_{spaces}"'] \\
Y_{étale} \arrow[r] & Y_{spaces,étale} \arrow[u, bend right, "v : V \mapsto X \times_Y V"']
\end{tikzcd}$$

of categories. Here the functor j_{spaces} is the obvious extension of j to the category $X_{spaces,étale}$. Thus the inner square is commutative. In fact j_{spaces} can be identified with the localization functor $j_X : Y_{spaces,étale}/X \to Y_{spaces,étale}$ discussed in Sites, Section 9.21. Hence, by Sites, Lemma 9.23.2 the cocontinuous functor j_{spaces} and the functor v of the diagram induce the same morphism of topoi. By Sites, Lemma 9.19.2 the commutativity of the inner square (consisting of cocontinuous functors between sites) gives a commutative diagram of associated morphisms of topoi. Hence, by the construction of f_{small} in Lemma 41.15.7 we win. $\square$

The lemma above says that the pullback of $\mathcal{G}$ via an étale morphism $f : X \to Y$ of algebraic spaces is simply the restriction of $\mathcal{G}$ to the category $X_{étale}$. We will often use the short hand

$$\mathcal{G}|_{X_{étale}} = f_{small}^{-1}\mathcal{G} \tag{41.15.10.1}$$

to indicate this. Note that the functor $j : X_{étale} \to Y_{étale}$ of the lemma in this situation is faithful, but not fully faithful in general. We will discuss this in a more technical fashion in Section 41.24.

Lemma 41.15.11. *Let S be a scheme. Let*

$$\begin{tikzcd} X' \arrow[r] \arrow[d, "f'"'] & X \arrow[d, "f"] \\ Y' \arrow[r, "g"] & Y \end{tikzcd}$$

be a cartesian square of algebraic spaces over S. Let $\mathcal{F}$ be a sheaf on $X_{étale}$. If g is étale, then

(1) *$f'_{small,*}(\mathcal{F}|_{X'}) = (f_{small,*}\mathcal{F})|_{Y'}$ in $Sh(Y'_{étale})$[5], and*
(2) *if $\mathcal{F}$ is an abelian sheaf, then $R^i f'_{small,*}(\mathcal{F}|_{X'}) = (R^i f_{small,*}\mathcal{F})|_{Y'}$.*

Proof. Consider the following diagram of functors

$$\begin{tikzcd} X'_{spaces,étale} \arrow[r, "j"] & X_{spaces,étale} \\ Y'_{spaces,étale} \arrow[r, "j"] \arrow[u, "V' \mapsto V' \times_{Y'} X'"] & Y_{spaces,étale} \arrow[u, "V \mapsto V \times_Y X"'] \end{tikzcd}$$

The horizontal arrows are localizations and the vertical arrows induce morphisms of sites. Hence the last statement of Sites, Lemma 9.24.1 gives (1). To see (2) apply (1) to an injective resolution of $\mathcal{F}$ and use that restriction is exact and preserves injectives (see Cohomology on Sites, Lemma 19.8.1). $\square$

The following lemma says that you can think of a sheaf on the small étale site of an algebraic space as a compatible collection of sheaves on the small étale sites of schemes étale over the space. Please note that all the comparison mappings c_f in the lemma are isomorphisms, which is compatible with Topologies, Lemma 30.4.18 and the fact that all morphisms between objects of $X_{étale}$ are étale.

Lemma 41.15.12. *Let S be a scheme. Let X be an algebraic space over S. A sheaf $\mathcal{F}$ on $X_{étale}$ is given by the following data:*

(1) *for every $U \in Ob(X_{étale})$ a sheaf $\mathcal{F}_U$ on $U_{étale}$,*
(2) *for every $f : U' \to U$ in $X_{étale}$ an isomorphism $c_f : f_{small}^{-1}\mathcal{F}_U \to \mathcal{F}_{U'}$.*

[5] Also $(f')_{small}^{-1}(\mathcal{G}|_{Y'}) = (f_{small}^{-1}\mathcal{G})|_{X'}$ because of commutativity of the diagram and (41.15.10.1)

These data are subject to the condition that given any $f : U' \to U$ and $g : U'' \to U'$ in $X_{étale}$ the composition $g_{small}^{-1}c_f \circ c_g$ is equal to $c_{f\circ g}$.

Proof. Given a sheaf $\mathcal{F}$ on $X_{étale}$ and an object $\varphi : U \to X$ of $X_{étale}$ we set $\mathcal{F}_U = \varphi_{small}^{-1}\mathcal{F}$. If $\varphi' : U' \to X$ is a second object of $X_{étale}$, and $f : U' \to U$ is a morphism between them, then the isomorphism c_f comes from the fact that $f_{small}^{-1} \circ \varphi_{small}^{-1} = (\varphi')_{small}^{-1}$, see Lemma 41.15.7. The condition on the transitivity of the isomorphisms c_f follows from the functoriality of the small étale sites also; verification omitted.

Conversely, suppose we are given a collection of data $(\mathcal{F}_U, c_f)$ as in the lemma. In this case we simply define $\mathcal{F}$ by the rule $U \mapsto \mathcal{F}_U(U)$. Details omitted. □

Let S be a scheme. Let X be an algebraic space over S. Let $X = U/R$ be a presentation of X coming from any surjective étale morphism $\varphi : U \to X$, see Spaces, Definition 40.9.3. In particular, we obtain a groupoid (U, R, s, t, c, e, i) such that $j = (t, s) : R \to U \times_S U$, see Groupoids, Lemma 35.11.3.

Lemma 41.15.13. *With S, $\varphi : U \to X$, and (U, R, s, t, c, e, i) as above. For any sheaf $\mathcal{F}$ on $X_{étale}$ the sheaf[6] $\mathcal{G} = \varphi^{-1}\mathcal{F}$ comes equipped with a canonical isomorphism*

$$\alpha : t^{-1}\mathcal{G} \longrightarrow s^{-1}\mathcal{G}$$

such that the diagram

$$\begin{tikzcd}
 & pr_1^{-1}t^{-1}\mathcal{G} \arrow[r, "pr_1^{-1}\alpha"'] \arrow[dl, equal] & pr_1^{-1}s^{-1}\mathcal{G} \arrow[dr, equal] & \\
pr_0^{-1}s^{-1}\mathcal{G} & & & c^{-1}s^{-1}\mathcal{G} \\
 & pr_0^{-1}t^{-1}\mathcal{G} \arrow[ul, "pr_0^{-1}\alpha"] \arrow[r, equal] & c^{-1}t^{-1}\mathcal{G} \arrow[ur, "c^{-1}\alpha"'] &
\end{tikzcd}$$

is a commutative. The functor $\mathcal{F} \mapsto (\mathcal{G}, \alpha)$ defines an equivalence of categories between sheaves on $X_{étale}$ and pairs $(\mathcal{G}, \alpha)$ as above.

First proof of Lemma 41.15.13. Let $\mathcal{C} = X_{spaces,étale}$. By Lemma 41.15.10 and its proof we have $U_{spaces,étale} = \mathcal{C}/U$ and the pullback functor φ^{-1} is just the restriction functor. Moreover, $\{U \to X\}$ is a covering of the site $\mathcal{C}$ and $R = U \times_X U$. The isomorphism α is just the canonical identification

$$\left(\mathcal{F}|_{\mathcal{C}/U}\right)|_{\mathcal{C}/U\times_X U} = \left(\mathcal{F}|_{\mathcal{C}/U}\right)|_{\mathcal{C}/U\times_X U}$$

and the commutativity of the diagram is the cocylce condition for glueing data. Hence this lemma is a special case of glueing of sheaves, see Sites, Section 9.22. □

Second proof of Lemma 41.15.13. The existence of α comes from the fact that $\varphi \circ t = \varphi \circ s$ and that pullback is functorial in the morphism, see Lemma 41.15.7. In exacty the same way, i.e., by functoriality of pullback, we see that the isomorphism α fits into the commutative diagram. The construction $\mathcal{F} \mapsto (\varphi^{-1}\mathcal{F}, \alpha)$ is clearly functorial in the sheaf $\mathcal{F}$. Hence we obtain the functor.

Conversely, suppose that $(\mathcal{G}, \alpha)$ is a pair. Let $V \to X$ be an object of $X_{étale}$. In this case the morphism $V' = U \times_X V \to V$ is a surjective étale morphism of schemes, and hence $\{V' \to V\}$

[6]In this lemma and its proof we write simply φ^{-1} instead of φ_{small}^{-1} and similarly for all the other pullbacks.

is an étale covering of V. Set $\mathcal{G}' = (V' \to V)^{-1}\mathcal{G}$. Since $R = U \times_X U$ with $t = \mathrm{pr}_0$ and $s = \mathrm{pr}_0$ we see that $V' \times_V V' = R \times_X V$ with projection maps $s', t' : V' \times_V V' \to V'$ equal to the pullbacks of t and s. Hence α pulls back to an isomorphism $\alpha' : (t')^{-1}\mathcal{G}' \to (s')^{-1}\mathcal{G}'$. Having said this we simply define

$$\mathcal{F}(V) = \!=\!= \mathrm{Equalizer}(\mathcal{G}(V') \rightrightarrows \mathcal{G}(V' \times_V V')).$$

We omit the verification that this defines a sheaf. To see that $\mathcal{G}(V) = \mathcal{F}(V)$ if there exists a morphism $V \to U$ note that in this case the equalizer is $H^0(\{V' \to V\}, \mathcal{G}) = \mathcal{G}(V)$. □

41.16. Points of the small étale site

This section is the analogue of Étale Cohomology, Section 38.29.

Definition 41.16.1. Let S be a scheme. Let X be an algebraic space over S.

(1) A *geometric point* of X is a morphism $\overline{x} : Spec(k) \to X$, where k is an algebraically closed field. We often abuse notation and write $\overline{x} = Spec(k)$.
(2) For every geometric point $\overline{x}$ we have the corresponding ``image'' point $x \in |X|$. We say that $\overline{x}$ is a *geometric point lying over x*.

It turns out that we can take stalks of sheaves on $X_{étale}$ at geometric point exactly in the same way as was done in the case of the small étale site of a scheme. In order to do this we define the notion of an étale neighbourhood as follows.

Definition 41.16.2. Let S be a scheme. Let X be an algebraic space over S. Let $\overline{x}$ be a geometric point of X.

(1) An *étale neighborhood* of $\overline{x}$ of X is a commutative diagram

$$\begin{tikzcd} & U \arrow[d, "\varphi"] \\ \bar{x} \arrow[ur, "\bar{u}"] \arrow[r, "\bar{x}"] & X \end{tikzcd}$$

where φ is an étale morphism of algebraic spaces over S. We will use the notation $\varphi : (U, \overline{u}) \to (X, \overline{x})$ to indicate this situation.
(2) A *morphism of étale neighborhoods* $(U, \overline{u}) \to (U', \overline{u}')$ is an X-morphism $h : U \to U'$ such that $\overline{u}' = h \circ \overline{u}$.

Note that we allow U to be an algebraic space. When we take stalks of a sheaf on $X_{étale}$ we have to restrict to those U which are in $X_{étale}$, and so in this case we will only consider the case where U is a scheme. Alternately we can work with the site $X_{space,étale}$ and consider all étale neighbourhoods. And there won't be any difference because of the last assertion in the following lemma.

Lemma 41.16.3. *Let S be a scheme. Let X be an algebraic space over S. Let $\overline{x}$ be a geometric point of X. The category of étale neighborhoods is cofiltered. More precisely:*

(1) *Let $(U_i, \overline{u}_i)_{i=1,2}$ be two étale neighborhoods of $\overline{x}$ in X. Then there exists a third étale neighborhood $(U, \overline{u})$ and morphisms $(U, \overline{u}) \to (U_i, \overline{u}_i)$, $i = 1, 2$.*
(2) *Let $h_1, h_2 : (U, \overline{u}) \to (U', \overline{u}')$ be two morphisms between étale neighborhoods of $\overline{s}$. Then there exist an étale neighborhood $(U'', \overline{u}'')$ and a morphism $h : (U'', \overline{u}'') \to (U, \overline{u})$ which equalizes h_1 and h_2, i.e., such that $h_1 \circ h = h_2 \circ h$.*

Moreover, given any étale neighbourhood $(U, \overline{u}) \to (X, \overline{x})$ there exists a morphism of étale neighbourhoods $(U', \overline{u}') \to (U, \overline{u})$ where U' is a scheme.

Proof. For part (1), consider the fibre product $U = U_1 \times_X U_2$. It is étale over both U_1 and U_2 because étale morphisms are preserved under base change and composition, see Lemmas 41.13.5 and 41.13.4. The map $\overline{u} \to U$ defined by $(\overline{u}_1, \overline{u}_2)$ gives it the structure of an étale neighborhood mapping to both U_1 and U_2.

For part (2), define U'' as the fibre product

$$\begin{tikzcd} U'' \arrow[r] \arrow[d] & U \arrow[d, "{(h_1,h_2)}"] \\ U' \arrow[r, "\Delta"] & U' \times_X U'. \end{tikzcd}$$

Since $\overline{u}$ and $\overline{u}'$ agree over X with $\overline{x}$, we see that $\overline{u}'' = (\overline{u}, \overline{u}')$ is a geometric point of U''. In particular $U'' \neq \emptyset$. Moreover, since U' is étale over X, so is the fibre product $U' \times_X U'$ (as seen above in the case of $U_1 \times_X U_2$). Hence the vertical arrow (h_1, h_2) is étale by Lemma 41.13.6. Therefore U'' is étale over U' by base change, and hence also étale over X (because compositions of étale morphisms are étale). Thus $(U'', \overline{u}'')$ is a solution to the problem posed by (2).

To see the final assertion, choose any surjective étale morphism $U' \to U$ where U' is a scheme. Then $U' \times_U \overline{u}$ is a scheme surjective and étale over $\overline{u} = Spec(k)$ with k algebraically closed. It follows (see Morphisms, Lemma 24.35.7) that $U' \times_U \overline{u} \to \overline{u}$ has a section which gives us the desired $\overline{u}'$. ☐

Lemma 41.16.4. *Let S be a scheme. Let X be an algebraic space over S. Let $\overline{x} : Spec(k) \to X$ be a geometric point of X lying over $x \in |X|$. Let $\varphi : U \to X$ be an étale morphism of algebraic spaces and let $u \in |U|$ with $\varphi(u) = x$. Then there exists a geometric point $\overline{u} : Spec(k) \to U$ lying over u with $\overline{x} = f \circ \overline{u}$.*

Proof. Choose an affine scheme U' with $u' \in U'$ and an étale morphism $U' \to U$ which maps u' to u. If we can prove the lemma for $(U', u') \to (X, x)$ then the lemma follows. Hence we may assume that U is a scheme, in particular that $U \to X$ is representable. Then look at the cartesian diagram

$$\begin{tikzcd} Spec(k) \times_{\overline{x},X,\varphi} U \arrow[r, "\mathrm{pr}_2"'] \arrow[d, "\mathrm{pr}_1"'] & U \arrow[d, "\varphi"] \\ Spec(k) \arrow[r, "\overline{x}"] & X \end{tikzcd}$$

The projection pr_1 is the base change of an étale morphisms so it is étale, see Lemma 41.13.5. Therefore, the scheme $Spec(k) \times_{\overline{x},X,\varphi} U$ is a disjoint union of finite separable extensions of k, see Morphisms, Lemma 24.35.7. But k is algebraically closed, so all these extensions are trivial, so $Spec(k) \times_{\overline{x},X,\varphi} U$ is a disjoint union of copies of $Spec(k)$ and each of these corresponds to a geometric point $\overline{u}$ with $f \circ \overline{u} = \overline{x}$. By Lemma 41.4.3 the map

$$|Spec(k) \times_{\overline{x},X,\varphi} U| \longrightarrow |Spec(k)| \times_{|X|} |U|$$

is surjective, hence we can pick $\overline{u}$ to lie over u. ☐

Lemma 41.16.5. *Let S be a scheme. Let X be an algebraic space over S. Let $\overline{x}$ be a geometric point of X. Let $(U, \overline{u})$ an étale neighborhood of $\overline{x}$. Let $\{\varphi_i : U_i \to U\}_{i \in I}$ be an étale covering in $X_{spaces,étale}$. Then there exist $i \in I$ and $\overline{u}_i : \overline{x} \to U_i$ such that $\varphi_i : (U_i, \overline{u}_i) \to (U, \overline{u})$ is a morphism of étale neighborhoods.*

Proof. Let $u \in |U|$ be the image of $\overline{u}$. As $|U| = \bigcup_{i \in I} \varphi_i(|U_i|)$ there exists an i and a point $u_i \in U_i$ mapping to x. Apply Lemma 41.16.4 to $(U_i, u_i) \to (U, u)$ and $\overline{u}$ to get the desired geometric point. $\square$

Definition 41.16.6. Let S be a scheme. Let X be an algebraic space over S. Let $\mathcal{F}$ be a presheaf on $X_{étale}$. Let $\overline{x}$ be a geometric point of X. The *stalk* of $\mathcal{F}$ at $\overline{x}$ is

$$\mathcal{F}_{\overline{x}} = colim_{(U,\overline{u})} \mathcal{F}(U)$$

where $(U, \overline{u})$ runs over all étale neighborhoods of $\overline{x}$ in X with $U \in Ob(X_{étale})$.

By Lemma 41.16.3, this colimit is over a filtered index category, namely the oppsite of the category of étale neighborhoods in $X_{étale}$. More precisely Lemma 41.16.3 says the opposite of the category of all étale neighbourhoods is filtered, and the full subcategory of those which are in $X_{étale}$ is a cofinal subcategory hence also filtered.

This means an element of $\mathcal{F}_{\overline{x}}$ can be thought of as a triple $(U, \overline{u}, \sigma)$ where $U \in Ob(X_{étale})$ and $\sigma \in \mathcal{F}(U)$. Two triples $(U, \overline{u}, \sigma)$, $(U', \overline{u}', \sigma')$ define the same element of the stalk if there exists a third étale neighbourhood $(U'', \overline{u}'')$, $U'' \in Ob(X_{étale})$ and morphisms of étale neighbourhoods $h : (U'', \overline{u}'') \to (U, \overline{u})$, $h' : (U'', \overline{u}'') \to (U', \overline{u}')$ such that $h^*\sigma = (h')^*\sigma'$ in $\mathcal{F}(U'')$. See Categories, Section 4.17.

This also implies that if $\mathcal{F}'$ is the sheaf on $X_{spaces,étale}$ corresponding to $\mathcal{F}$ on $X_{étale}$, then

$$\mathcal{F}_{\overline{x}} = colim_{(U,\overline{u})} \mathcal{F}'(U) \tag{41.16.6.1}$$

where now the colimit is over all the étale neighbourhoods of $\overline{x}$. We will often jump between the point of view of using $X_{étale}$ and $X_{spaces,étale}$ without further mention.

In particular this means that if $\mathcal{F}$ is a presheaf of abelian groups, rings, etc then $\mathcal{F}_{\overline{x}}$ is an abelian group, ring, etc simply by the usual way of defining the group structure on a directed colimit of abelian groups, rings, etc.

Lemma 41.16.7. *Let S be a scheme. Let X be an algebraic space over S. Let $\overline{x}$ be a geometric point of X. Consider the functor*

$$u : X_{étale} \longrightarrow Sets, \quad U \longmapsto |U_{\overline{x}}|$$

Then u defines a point p of the site $X_{étale}$ (Sites, Definition 9.28.2) and its associated stalk functor $\mathcal{F} \mapsto \mathcal{F}_p$ (Sites, Equation 9.28.1.1) is the functor $\mathcal{F} \mapsto \mathcal{F}_{\overline{x}}$ defined above.

Proof. In the proof of Lemma 41.16.5 we have seen that the scheme $U_{\overline{x}}$ is a disjoint union of schemes isomorphic to $\overline{x}$. Thus we can also think of $|U_{\overline{x}}|$ as the set of geometric points of U lying over $\overline{x}$, i.e., as the collection of morphisms $\overline{u} : \overline{x} \to U$ fitting into the diagram of Definition 41.16.1. From this it follows that $u(X)$ is a singleton, and that $u(U \times_V W) = u(U) \times_{u(V)} u(W)$ whenever $U \to V$ and $W \to V$ are morphisms in $X_{étale}$. And, given a covering $\{U_i \to U\}_{i \in I}$ in $X_{étale}$ we see that $\coprod u(U_i) \to u(U)$ is surjective by Lemma 41.16.5. Hence Sites, Proposition 9.29.2 applies, so p is a point of the site $X_{étale}$. Finally, the our functor $\mathcal{F} \mapsto \mathcal{F}_{\overline{s}}$ is given by exactly the same colimit as the functor $\mathcal{F} \mapsto \mathcal{F}_p$ associated to p in Sites, Equation 9.28.1.1 which proves the final assertion. $\square$

Lemma 41.16.8. *Let S be a scheme. Let X be an algebraic space over S. Let $\overline{x}$ be a geometric point of X.*

1. *The stalk functor $PAb(X_{étale}) \to Ab$, $\mathcal{F} \mapsto \mathcal{F}_{\overline{x}}$ is exact.*
2. *We have $(\mathcal{F}^\#)_{\overline{x}} = \mathcal{F}_{\overline{x}}$ for any presheaf of sets $\mathcal{F}$ on $X_{étale}$.*
3. *The functor $Ab(X_{étale}) \to Ab$, $\mathcal{F} \mapsto \mathcal{F}_{\overline{x}}$ is exact.*

(4) *Similarly the functors $PSh(X_{étale}) \to Sets$ and $Sh(X_{étale}) \to Sets$ given by the stalk functor $\mathcal{F} \mapsto \mathcal{F}_{\overline{x}}$ are exact (see Categories, Definition 4.21.1) and commute with arbitrary colimits.*

Proof. This result follows from the general material in Modules on Sites, Section 16.30. This is true because $\mathcal{F} \mapsto \mathcal{F}_{\overline{x}}$ comes from a point of the small étale site of X, see Lemma 41.16.7. See the proof of Étale Cohomology, Lemma 38.29.9 for a direct proof of some of these statements in the setting of the small étale site of a scheme. □

We will see below that the stalk functor $\mathcal{F} \mapsto \mathcal{F}_{\overline{x}}$ is really the pullback along the morphism $\overline{x}$. In that sense the following lemma is a generalization of the lemma above.

Lemma 41.16.9. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S.*

(1) *The functor $f_{small}^{-1} : Ab(Y_{étale}) \to Ab(X_{étale})$ is exact.*
(2) *The functor $f_{small}^{-1} : Sh(Y_{étale}) \to Sh(X_{étale})$ is exact, i.e., it commutes with finite limits and colimits, see Categories, Definition 4.21.1.*
(3) *For any étale morphism $V \to Y$ of algebraic spaces we have $f_{small}^{-1} h_V = h_{X \times_Y V}$.*
(4) *Let $\overline{x} \to X$ be a geometric point. Let $\mathcal{G}$ be a sheaf on $Y_{étale}$. Then there is a canonical identification*
$$(f_{small}^{-1}\mathcal{G})_{\overline{x}} = \mathcal{G}_{\overline{y}}.$$
where $\overline{y} = f \circ \overline{x}$.

Proof. Recall that f_{small} is defined via $f_{spaces,small}$ in Lemma 41.15.7. Parts (1), (2) and (3) are general consequences of the fact that $f_{spaces,étale} : X_{spaces,étale} \to Y_{spaces,étale}$ is a morphism of sites, see Sites, Definition 9.14.1 for (2), Modules on Sites, Lemma 16.27.2 for (1), and Sites, Lemma 9.13.5 for (3).

Proof of (4). This statement is a special case of Sites, Lemma 9.30.1 via Lemma 41.16.7. We also provide a direct proof. Note that by Lemma 41.16.8. taking stalks commutes with sheafification. Let $\mathcal{G}'$ be the sheaf on $Y_{spaces,étale}$ whose restriction to $Y_{étale}$ is $\mathcal{G}$. Recall that $f_{spaces,étale}^{-1}\mathcal{G}'$ is the sheaf associated to the presheaf
$$U \longrightarrow colim_{U \to X \times_Y V} \mathcal{G}'(V),$$
see Sites, Sections 9.13 and 9.5. Thus we have
$$\begin{aligned}
(f_{spaces,étale}^{-1}\mathcal{G}')_{\overline{x}} &= colim_{(U,\overline{u})}\, f_{spaces,étale}^{-1}\mathcal{G}'(U) \\
&= colim_{(U,\overline{u})}\, colim_{a : U \to X \times_Y V} \mathcal{G}'(V) \\
&= colim_{(V,\overline{v})}\, \mathcal{G}'(V) \\
&= \mathcal{G}'_{\overline{y}}
\end{aligned}$$
in the third equality the pair $(U, \overline{u})$ and the map $a : U \to X \times_Y V$ corresponds to the pair $(V, a \circ \overline{u})$. Since the stalk of $\mathcal{G}'$ (resp. $f_{spaces,étale}^{-1}\mathcal{G}'$) agrees with the stalk of $\mathcal{G}$ (resp. $f_{small}^{-1}\mathcal{G}$), see Equation (41.16.6.1) the result follows. □

Remark 41.16.10. This remark is the analogue of Étale Cohomology, Remark 38.56.6. Let S be a scheme. Let X be an algebraic space over S. Let $\overline{x} : Spec(k) \to X$ be a geometric point of X. By Étale Cohomology, Theorem 38.56.3 the category of sheaves on

$Spec(k)_{étale}$ is equivalent to the category of sets (by taking a sheaf to its global sections). Hence it follows from Lemma 41.16.9 part (4) applied to the morphism $\overline{x}$ that the functor

$$Sh(X_{étale}) \longrightarrow Sets, \quad \mathcal{F} \longmapsto \mathcal{F}_{\overline{x}}$$

is isomorphic to the functor

$$Sh(X_{étale}) \longrightarrow Sh(Spec(k)_{étale}) = Sets, \quad \mathcal{F} \longmapsto \overline{x}^*\mathcal{F}$$

Hence we may view the stalk functors as pullback functors along geometric morphisms (and not just some abstract morphisms of topoi as in the result of Lemma 41.16.7).

Remark 41.16.11. Let S be a scheme. Let X be an algebraic space over S. Let $x \in |X|$. We claim that for any pair of geometric points $\overline{x}$ and $\overline{x}'$ lying over x the stalk functors are isomorphic. By definition of $|X|$ we can find a third geometric point $\overline{x}''$ so that there exists a commutative diagram

$$\begin{tikzcd} \overline{x}'' \arrow[r] \arrow[d] \arrow[dr, "\overline{x}''"] & \overline{x}' \arrow[d, "\overline{x}'"] \\ \overline{x} \arrow[r, "\overline{x}"] & X. \end{tikzcd}$$

Since the stalk functor $\mathcal{F} \mapsto \mathcal{F}_{\overline{x}}$ is given by pullback along the morphism $\overline{x}$ (and similarly for the others) we conclude by functoriality of pullbacks.

The following theorem says that the small étale site of an algebraic space has enough points.

Theorem 41.16.12. *Let S be a scheme. Let X be an algebraic space over S. A map $a : \mathcal{F} \to \mathcal{G}$ of sheaves of sets is injective (resp. surjective) if and only if the map on stalks $a_{\overline{x}} : \mathcal{F}_{\overline{x}} \to \mathcal{G}_{\overline{x}}$ is injective (resp. surjective) for all geometric points of X. A sequence of abelian sheaves on $X_{étale}$ is exact if and only if it is exact on all stalks at geometric points of S.*

Proof. We know the theorem is true if X is a scheme, see Étale Cohomology, Theorem 38.29.10. Choose a surjective étale morphism $f : U \to X$ where U is a scheme. Since $\{U \to X\}$ is a covering (in $X_{spaces,étale}$) we can check whether a map of sheaves is injective, or surjective by restricting to U. Now if $\overline{u} : Spec(k) \to U$ is a geometric point of U, then $(\mathcal{F}|_U)_{\overline{u}} = \mathcal{F}_{\overline{x}}$ where $\overline{x} = f \circ \overline{u}$. (This is clear from the colimits defining the stalks at $\overline{u}$ and $\overline{x}$, but it also follows from Lemma 41.16.9.) Hence the result for U implies the result for X and we win. $\square$

The following lemma should be skipped on a first reading.

Lemma 41.16.13. *Let S be a scheme. Let X be an algebraic space over S. Let $p : Sh(pt) \to Sh(X_{étale})$ be a point of the small étale topos of X. Then there exists a geometric point $\overline{x}$ of X such that the stalk functor $\mathcal{F} \mapsto \mathcal{F}_p$ is isomorphic to the stalk functor $\mathcal{F} \mapsto \mathcal{F}_{\overline{x}}$.*

Proof. By Sites, Lemma 9.28.7 there is a one to one correspondence between points of the site and points of the associated topos. Hence we may assume that p is given by a functor $u : X_{étale} \to Sets$ which defines a point of the site $X_{étale}$. Let $U \in Ob(X_{étale})$ be an object whose structure morphism $j : U \to X$ is surjective. Note that h_U is a sheaf which surjects onto the final sheaf. Since taking stalks is exact we see that $(h_U)_p = u(U)$ is not empty (use Sites, Lemma 9.28.3). Pick $x \in u(U)$. By Sites, Lemma 9.31.1 we obtain a point $q : Sh(pt) \to Sh(U_{étale})$ such that $p = j_{small} \circ q$, so that $\mathcal{F}_p = (\mathcal{F}|_U)_q$ functorially. By Étale Cohomology, Lemma 38.29.12 there is a geometric point $\overline{u}$ of U and a functorial isomorphism $\mathcal{G}_q = \mathcal{G}_{\overline{u}}$ for $\mathcal{G} \in Sh(U_{étale})$. Set $\overline{x} = j \circ \overline{u}$. Then we see that $\mathcal{F}_{\overline{x}} \cong (\mathcal{F}|_U)_{\overline{u}}$ functorially in $\mathcal{F}$ on $X_{étale}$ by Lemma 41.16.9 and we win. $\square$

41.17. Supports of abelian sheaves

First we talk about supports of local sections.

Lemma 41.17.1. *Let S be a scheme. Let X be an algebraic space over S. Let $\mathcal{F}$ be a subsheaf of the final object of the étale topos of X (see Sites, Example 9.10.2). Then there exists a unique open $W \subset X$ such that $\mathcal{F} = h_W$.*

Proof. The condition means that $\mathcal{F}(U)$ is a singleton or empty for all $\varphi : U \to X$ in $Ob(X_{spaces,étale})$. In particular local sections always glue. If $\mathcal{F}(U) \neq \emptyset$, then $\mathcal{F}(\varphi(U)) \neq \emptyset$ because $\varphi(U) \subset X$ is an open subspace (Lemma 41.13.7) and $\{\varphi : U \to \varphi(U)\}$ is a covering in $X_{spaces,étale}$. Take $W = \bigcup_{\varphi : U \to S, \mathcal{F}(U) \neq \emptyset} \varphi(U)$ to conclude. □

Lemma 41.17.2. *Let S be a scheme. Let X be an algebraic space over S. Let $\mathcal{F}$ be an abelian sheaf on $X_{spaces,étale}$. Let $\sigma \in \mathcal{F}(U)$ be a local section. There exists an open subspace $W \subset U$ such that*

1. *$W \subset U$ is the largest open subspace of U such that $\sigma|_W = 0$,*
2. *for every $\varphi : V \to U$ in $X_{étale}$ we have*
$$\sigma|_V = 0 \Leftrightarrow \varphi(V) \subset W,$$
3. *for every geometric point $\overline{u}$ of U we have*
$$(U, \overline{u}, \sigma) = 0 \text{ in } \mathcal{F}_{\overline{s}} \Leftrightarrow \overline{u} \in W$$
where $\overline{s} = (U \to S) \circ \overline{u}$.

Proof. Since $\mathcal{F}$ is a sheaf in the étale topology the restriction of $\mathcal{F}$ to U_{Zar} is a sheaf on U in the Zariski topology. Hence there exists a Zariski open W having property (1), see Modules, Lemma 15.5.2. Let $\varphi : V \to U$ be an arrow of $X_{étale}$. Note that $\varphi(V) \subset U$ is an open subspace (Lemma 41.13.7) and that $\{V \to \varphi(V)\}$ is an étale covering. Hence if $\sigma|_V = 0$, then by the sheaf condition for $\mathcal{F}$ we see that $\sigma|_{\varphi(V)} = 0$. This proves (2). To prove (3) we have to show that if $(U, \overline{u}, \sigma)$ defines the zero element of $\mathcal{F}_{\overline{s}}$, then $\overline{u} \in W$. This is true because the assumption means there exists a morphism of étale neighbourhoods $(V, \overline{v}) \to (U, \overline{u})$ such that $\sigma|_V = 0$. Hence by (2) we see that $V \to U$ maps into W, and hence $\overline{u} \in W$. □

Let S be a scheme. Let X be an algebraic space over S. Let $x \in |X|$. Let $\mathcal{F}$ be a sheaf on $X_{étale}$. By Remark 41.16.11 the isomorphism class of the stalk of the sheaf $\mathcal{F}$ at a geometric points lying over x is well defined.

Definition 41.17.3. Let S be a scheme. Let X be an algebraic space over S. Let $\mathcal{F}$ be an abelian sheaf on $X_{étale}$.

1. The *support of $\mathcal{F}$* is the set of points $x \in |X|$ such that $\mathcal{F}_{\overline{x}} \neq 0$ for any (some) geometric point $\overline{x}$ lying over x.
2. Let $\sigma \in \mathcal{F}(U)$ be a section. The *support of σ* is the closed subset $U \setminus W$, where $W \subset U$ is the largest open subset of U on which σ restricts to zero (see Lemma 41.17.2).

Lemma 41.17.4. *Let S be a scheme. Let X be an algebraic space over S. Let $\mathcal{F}$ be an abelian sheaf on $X_{étale}$. Let $U \in Ob(X_{étale})$ and $\sigma \in \mathcal{F}(U)$.*

1. *The support of σ is closed in $|X|$.*
2. *The support of $\sigma + \sigma'$ is contained in the union of the supports of $\sigma, \sigma' \in \mathcal{F}(X)$.*
3. *If $\varphi : \mathcal{F} \to \mathcal{G}$ is a map of abelian sheaves on $X_{étale}$, then the support of $\varphi(\sigma)$ is contained in the support of $\sigma \in \mathcal{F}(U)$.*

(4) *The support of $\mathcal{F}$ is the union of the images of the supports of all local sections of $\mathcal{F}$.*
(5) *If $\mathcal{F} \to \mathcal{G}$ is surjective then the support of $\mathcal{G}$ is a subset of the support of $\mathcal{F}$.*
(6) *If $\mathcal{F} \to \mathcal{G}$ is injective then the support of $\mathcal{F}$ is a subset of the support of $\mathcal{G}$.*

Proof. Part (1) holds by definition. Parts (2) and (3) hold because they holds for the restriction of $\mathcal{F}$ and $\mathcal{G}$ to U_{Zar}, see Modules, Lemma 15.5.2. Part (4) is a direct consequence of Lemma 41.17.2 part (3). Parts (5) and (6) follow from the other parts. □

Lemma 41.17.5. *The support of a sheaf of rings on the small étale site of an algebraic space is closed.*

Proof. This is true because (according to our conventions) a ring is 0 if and only if $1 = 0$, and hence the support of a sheaf of rings is the support of the unit section. □

41.18. The structure sheaf of an algebraic space

The structure sheaf of an algebraic space is the sheaf of rings of the following lemma.

Lemma 41.18.1. *Let S be a scheme. Let X be an algebraic space over S. The rule $U \mapsto \Gamma(U, \mathcal{O}_U)$ defines a sheaf of rings on $X_{étale}$.*

Proof. Immediate from the definition of a covering and Descent, Lemma 31.6.1. □

Definition 41.18.2. Let S be a scheme. Let X be an algebraic space over S. The *structure sheaf* of X is the sheaf of rings $\mathcal{O}_X$ on the small étale site $X_{étale}$ described in Lemma 41.18.1.

According to Lemma 41.15.12 the sheaf $\mathcal{O}_X$ corresponds to a system of étale sheaves $(\mathcal{O}_X)_U$ for U ranging through the objects of $X_{étale}$. It is clear from the proof of that lemma and our definition that we have simply $(\mathcal{O}_X)_U = \mathcal{O}_U$ where $\mathcal{O}_U$ is the structure sheaf of $U_{étale}$ as introduced in Descent, Definition 31.6.2. In particular, if X is a scheme we recover the sheaf $\mathcal{O}_X$ on the small étale site of X.

Via the equivalence $Sh(X_{étale}) = Sh(X_{spaces,étale})$ of Lemma 41.15.3 we may also think of $\mathcal{O}_X$ as a sheaf of rings on $X_{spaces,étale}$. It is explained in Remark 41.15.4 how to compute $\mathcal{O}_X(Y)$, and in particular $\mathcal{O}_X(X)$, when $Y \to X$ is an object of $X_{spaces,étale}$.

Lemma 41.18.3. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Then there is a canonical map $f^\sharp : f_{small}^{-1}\mathcal{O}_Y \to \mathcal{O}_X$ such that*

$$(f_{small}, f^\sharp) : (X_{étale}, \mathcal{O}_X) \longrightarrow (Y_{étale}, \mathcal{O}_Y)$$

is a morphism of ringed topoi. Furthermore,
(1) *The construction $f \mapsto (f_{small}, f^\sharp)$ is compatible with compositions.*
(2) *If f is a morphism of schemes, then $f^\sharp$ is the map described in Descent, Remark 31.6.4.*

Proof. By Lemma 41.15.9 it suffices to give an f-map from $\mathcal{O}_Y$ to $\mathcal{O}_X$. In other words, for every commutative diagram

$$\begin{tikzcd} U \arrow[r] \arrow[d, "g"'] & X \arrow[d, "f"] \\ V \arrow[r] & Y \end{tikzcd}$$

where $U \in X_{étale}$, $V \in Y_{étale}$ we have to give a map of rings $(f^\sharp)_{(U,V,g)} : \Gamma(V, \mathcal{O}_V) \to \Gamma(U, \mathcal{O}_U)$. Of course we just take $(f^\sharp)_{(U,V,g)} = g^\sharp$. It is clear that this is compatible with restriction mappings and hence indeed gives an f-map. We omit checking compatibility with compositions and agreement with the construction in Descent, Remark 31.6.4. $\square$

41.19. Stalks of the structure sheaf

This section is the analogue of Étale Cohomology, Section 41.19.

Lemma 41.19.1. *Let S be a scheme. Let X be an algebraic space over S. Let $\overline{x}$ be a geometric point of X. Let $(U, \overline{u})$ be an étale neighbourhood of $\overline{x}$ where U is a scheme. Then we have*

$$\mathcal{O}_{X,\overline{x}} = \mathcal{O}_{U,\overline{u}} = \mathcal{O}_{U,u}^{sh}$$

where the left hand side is the stalk of the structure sheaf of X, and the right hand side is the strict henselization of the local ring of U at the point u at which $\overline{u}$ is centered.

Proof. We know that the structure sheaf $\mathcal{O}_U$ on $U_{étale}$ is the restriction of the structure sheaf of X. Hence the first equality follows from Lemma 41.16.9 part (4). The second equality is explained in Étale Cohomology, Lemma 38.33.1. $\square$

Definition 41.19.2. Let S be a scheme. Let X be an algebraic space over S. Let $\overline{x}$ be a geometric point of X lying over the point $x \in |X|$.

(1) The *étale local ring of X at $\overline{x}$* is the stalk of the structure sheaf $\mathcal{O}_X$ on $X_{étale}$ at $\overline{x}$. Notation: $\mathcal{O}_{X,\overline{x}}$.
(2) The *strict henselization of X at $\overline{x}$* is the scheme $Spec(\mathcal{O}_{X,\overline{x}})$.

The isomorphism type of the strict henselization of X at $\overline{x}$ (as a scheme over X) depends only on the point $x \in |X|$ and not on the choice of the geometric point lying over x, see Remark 41.16.11.

Lemma 41.19.3. *Let S be a scheme. Let X be an algebraic space over S. The small étale site $X_{étale}$ endowed with its structure sheaf $\mathcal{O}_X$ is a locally ringed site, see Modules on Sites, Definition 16.34.4.*

Proof. This follows because the stalks $\mathcal{O}_{X,\overline{x}}$ are local, and because $S_{étale}$ has enough points, see Lemmas 41.19.1 and Theorem 41.16.12. See Modules on Sites, Lemma 16.34.2 and 16.34.3 for the fact that this implies the small étale site is locally ringed. $\square$

41.20. Dimension of local rings

It turns out the dimension of the local ring of an algebraic space is a well defined concept.

Lemma 41.20.1. *Let S be a scheme. Let X be an algebraic space over S. Let $x \in |X|$ be a point. Let $d \in \{0, 1, 2, \ldots, \infty\}$. The following are equivalent*

(1) *for some scheme U and étale morphism $a : U \to X$ and point $u \in U$ with $a(u) = x$ we have $\dim(\mathcal{O}_{U,u}) = d$,*
(2) *for any scheme U, any étale morphism $a : U \to X$, and any point $u \in U$ with $a(u) = x$ we have $\dim(\mathcal{O}_{U,u}) = d$,*
(3) *$\dim(\mathcal{O}_{X,\overline{x}}) = d$ for some geometric point $\overline{x}$ lying over x, and*
(4) *$\dim(\mathcal{O}_{X,\overline{x}}) = d$ for any geometric point $\overline{x}$ lying over x.*

Proof. The equivalence of (1) and (2) follows from a combination of Lemma 41.7.4 and Descent, Lemma 31.17.3. The equivalence of (3) and (4) follows from the fact that the isomorphism type of $\mathcal{O}_{X,\overline{x}}$ only depends on $x \in |X|$, see Remark 41.16.11.

Using Lemma 41.19.1 the equivalence of (1)+(2) and (3)+(4) comes down to the following statement: Given any local ring R we have $\dim(R) = \dim(R^{sh})$. This is Étale Cohomology, Lemma 38.32.12. □

Definition 41.20.2. Let S be a scheme. Let X be an algebraic space over S. Let $x \in |X|$ be a point. The *dimension of the local ring of X at x* is the element $d \in \{0, 1, 2, \ldots, \infty\}$ satisfying the equivalent conditions of Lemma 41.20.1.

41.21. Local irreducibility

A point on an algebraic space has a well defined étale local ring, which corresponds to the strict henselization of the local ring in the case of a scheme. In general it is impossible to read of from the étale local ring the irreducible components of the algebraic stack passing through the given point. Here is something we can do.

Lemma 41.21.1. *Let S be a scheme. Let X be an algebraic space over S. Let $x \in |X|$ be a point. The following are equivalent*

1. *for any scheme U and étale morphism $a : U \to X$ and $u \in U$ with $a(u) = x$ the local ring $\mathcal{O}_{U,u}$ has a unique minimal prime,*
2. *for any scheme U and étale morphism $a : U \to X$ and $u \in U$ with $a(u) = x$ there is a unique irreducible component of U through u, and*
3. *$\mathcal{O}_{X,\overline{x}}$ has a unique minimal prime for any geometric point $\overline{x}$ lying over x.*

Proof. The equivalence of (1) and (2) follows from the fact that irreducible components of U passing through u are in $1-1$ correspondence with minimal primes of the local ring of U at u. Let $a : U \to X$ and $u \in U$ be as in (1). Then $\mathcal{O}_{U,u} \to \mathcal{O}_{X,\overline{x}}$ is flat in particular injective. Hence if $f, g \in \mathcal{O}_{U,u}$ are non-nilpotent elements such that $fg = 0$, then the same is true in $\mathcal{O}_{X,\overline{x}}$. Conversely, suppose that $f, g \in \mathcal{O}_{X,\overline{x}}$ are non-nilpotent such that $fg = 0$. Since $\mathcal{O}_{X,\overline{x}}$ is the filtered colimit of the rings $\mathcal{O}_{U,u}$ we see that f, g are the images of elements of $\mathcal{O}_{U,u}$ for some choice of $a : U \to X$. Hence we see that $\mathcal{O}_{U,u}$ doesn't have a unique minimal prime. In this way we see the equivalence of (1) and (3). □

Definition 41.21.2. Let S be a scheme. Let X be an algebraic space over S. Let $x \in |X|$. We say that X is *geometrically unibranch at x* if the equivalent conditions of Lemma 41.21.1 hold. We say that X is *geometrically unibranch* if X is geometrically unibranch at every $x \in |X|$.

To prove this is consistent with the definition of [**DG67**] for schemes we offer the following lemma (see [**Art66**, Lemma 2.2]).

Lemma 41.21.3. *Let A be a local ring. Let A^{sh} be a strict henselization of A. The following are equivalent*

1. *A^{sh} has a unique minimal prime, and*
2. *A has a unique minimal prime $\mathfrak{p}$ and the integral closure A' of $A/\mathfrak{p}$ in its fraction field is a local ring whose residue field is purely inseparable over the residue field of A.*

Proof. Denote $\mathfrak{m}$ the maximal ideal of the ring A. Denote κ, κ^{sh} the residue field of A, A^{sh}.

Assume (1). Let $\mathfrak{p}^{sh}$ be the unique minimal prime of A^{sh}. The flatness of $A \to A^{sh}$ implies that $\mathfrak{p} = A \cap \mathfrak{p}^{sh}$ is the unique minimal prime of A (by going down, see Algebra, Lemma 7.35.17). Also, since $A^{sh}/\mathfrak{p}A^{sh} = (A/\mathfrak{p})^{sh}$ (see Algebra, Lemma 7.139.22) is reduced by

Étale Cohomology, Lemma 38.32.9 we see that $\mathfrak{p}^{sh} = \mathfrak{p}A^{sh}$. Since $A \to A'$ is integral, every maximal ideal of A' lies over $\mathfrak{m}$ (by going up for integral ring maps, see Algebra, Lemma 7.32.20). If A' is not local, then we can find distinct maximal ideals $\mathfrak{m}_1$, $\mathfrak{m}_2$. Choosing elements $f_1, f_2 \in A'$ with $f_i \in \mathfrak{m}_i$, $f_i \not\in \mathfrak{m}_{3-i}$ we find a finite subalgebra $B = A[f_1, f_2] \subset A'$ with distinct maximal ideals $B \cap \mathfrak{m}_i$, $i = 1, 2$. If A' is local with maximal ideal $\mathfrak{m}'$, but $A/\mathfrak{m} \subset A'/\mathfrak{m}'$ is not purely inseparable, then we can find a $f \in A'$ whose image in $A'/\mathfrak{m}'$ generates finite, not purely inseparable extension of $A/\mathfrak{m}$ and we find a finite local subalgebra $B = A[f] \subset A'$ whose residue field is not a purely inseparable extension of $A/\mathfrak{m}$. Note that the inclusions

$$A/\mathfrak{p} \subset B \subset \kappa(\mathfrak{p})$$

give, on tensoring with the flat ring map $A \to A^{sh}$ the inclusions

$$A^{sh}/\mathfrak{p}^{sh} \subset B \otimes_A A^{sh} \subset \kappa(\mathfrak{p}) \otimes_A A^{sh} \subset \kappa(\mathfrak{p}^{sh})$$

the last inclusion because $\kappa(\mathfrak{p}) \otimes_A A^{sh} = \kappa(\mathfrak{p}) \otimes_{A/\mathfrak{p}} A^{sh}/\mathfrak{p}^{sh}$ is a localization of the domain $A^{sh}/\mathfrak{p}^{sh}$. Note that $B \otimes_A \kappa^{sh}$ has at least two maximal ideals because $B/\mathfrak{m}B$ either has two maximal ideals or one whose residue field is not purely inseparable over κ, and because κ^{sh} is separably algebraically closed. Hence, as A^{sh} is strictly henselian we see that $B \otimes_A A^{sh}$ is a product of ≥ 2 local rings, see Algebra, Lemma 7.139.7. But we've just seen that $B \otimes_A A^{sh}$ is a subring of a domain and we get a contradiction.

Assume (2). Let $A \to B$ be a local map of local rings which is a localization of an étale A-algebra. In particular $\mathfrak{m}_B$ is the unique prime containing $\mathfrak{m}_A B$. Then $B' = A' \otimes_A B$ is integral over B and the assumption that $A \to A'$ is local with purely inseparable residue field extension implies that B' is local. On the other hand, $A' \to B'$ is the localization of an étale ring map, hence B' is normal, see Algebra, Lemma 7.145.7. Thus B' is a (local) normal domain. Finally, we have

$$B/\mathfrak{p}B \subset B \otimes_A \kappa(\mathfrak{p}) = B' \otimes_{A'} f.f.(A') \subset f.f.(B')$$

Hence $B/\mathfrak{p}B$ is a domain, which implies that B has a unique minimal prime (since by flatness of $A \to B$ these all have to lie over $\mathfrak{p}$). Hence, by Lemma 41.21.1 we see that A^{sh} has a unique minimal prime. □

41.22. Regular algebraic spaces

We have already defined regular algebraic spaces in Section 41.7.

Lemma 41.22.1. *Let S be a scheme. Let X be a locally Noetherian algebraic space over S. The following are equivalent*

(1) *X is regular, and*
(2) *every étale local ring $\mathcal{O}_{X,\overline{x}}$ is regular.*

Proof. Let U be a scheme and let $U \to X$ be a surjective étale morphism. By assumption U is locally Noetherian. Moreover, every étale local ring $\mathcal{O}_{X,\overline{x}}$ is the strict henselization of a local ring on U and conversely, see Lemma 41.19.1. Thus by Étale Cohomology, Lemma 38.32.15 we see that (2) is equivalent to every local ring of U being regular, i.e., U being a regular scheme (see Properties, Lemma 23.9.2). This equivalent to (1) by Definition 41.7.2. □

41.23. Sheaves of modules on algebraic spaces

If X is an algebraic space, then a sheaf of modules on X is a sheaf of $\mathcal{O}_X$-modules on the small étale site of X where $\mathcal{O}_X$ is the structure sheaf of X. The category of sheaves of modules is denoted $Mod(\mathcal{O}_X)$.

Given a morphism $f : X \to Y$ of algebraic spaces, by Lemma 41.18.3 we get a morphism of ringed topoi and hence by Modules on Sites, Definition 16.13.1 we get well defined pullback and direct image functors

$$f^* : Mod(\mathcal{O}_Y) \longrightarrow Mod(\mathcal{O}_X), \quad f_* : Mod(\mathcal{O}_X) \longrightarrow Mod(\mathcal{O}_Y) \tag{41.23.0.1}$$

which are adjoint in the usual way. If $g : Y \to Z$ is another morphism of algebraic spaces over S, then we have $(g \circ f)^* = f^* \circ g^*$ and $(g \circ f)_* = g_* \circ f_*$ simply because the morphisms of ringed topoi compose in the corresponding way (by the lemma).

Lemma 41.23.1. *Let S be a scheme. Let $f : X \to Y$ be an étale morphism of algebraic spaces over S. Then $f^{-1}\mathcal{O}_Y = \mathcal{O}_X$, and $f^*\mathcal{G} = f_{small}^{-1}\mathcal{G}$ for any sheaf of $\mathcal{O}_Y$-modules $\mathcal{G}$. In particular, $f^* : Mod(\mathcal{O}_X) \to Mod(\mathcal{O}_Y)$ is exact.*

Proof. By the description of inverse image in Lemma 41.15.10 and the definition of the structure sheaves it is clear that $f_{small}^{-1}\mathcal{O}_Y = \mathcal{O}_X$. Since the pullback

$$f^*\mathcal{G} = f_{small}^{-1}\mathcal{G} \otimes_{f_{small}^{-1}\mathcal{O}_Y} \mathcal{O}_X$$

by definition we conclude that $f^*\mathcal{G} = f_{small}^{-1}\mathcal{G}$. The exactness is clear because f_{small}^{-1} is exact, as f_{small} is a morphism of topoi. $\square$

We continue our abuse of notation introduced in Equation (41.15.10.1) by writing

$$\mathcal{G}|_{X_{\acute{e}tale}} = f^*\mathcal{G} = f_{small}^{-1}\mathcal{G} \tag{41.23.1.1}$$

in the situation of the lemma above. We will discuss this in a more technical fashion in Section 41.24.

Lemma 41.23.2. *Let S be a scheme. Let*

$$\begin{tikzcd} X' \arrow[r] \arrow[d, "f'"'] & X \arrow[d, "f"] \\ Y' \arrow[r, "g"] & Y \end{tikzcd}$$

be a cartesian square of algebraic spaces over S. Let $\mathcal{F} \in Mod(\mathcal{O}_X)$. If g is étale, then $f'_*(\mathcal{F}|_{X'}) = (f_*\mathcal{F})|_{Y'}$ and $R^i f'_*(\mathcal{F}|_{X'}) = (R^i f_*\mathcal{F})|_{Y'}$ in $Mod(\mathcal{O}_{Y'})$.

Proof. This is a reformulation of Lemma 41.15.11 in the case of modules. $\square$

Lemma 41.23.3. *Let S be a scheme. Let X be an algebraic space over S. A sheaf $\mathcal{F}$ of $\mathcal{O}_X$-modules is given by the following data:*

1. *for every $U \in Ob(X_{\acute{e}tale})$ a sheaf $\mathcal{F}_U$ of $\mathcal{O}_U$-modules on $U_{\acute{e}tale}$,*
2. *for every $f : U' \to U$ in $X_{\acute{e}tale}$ an isomorphism $c_f : f_{small}^*\mathcal{F}_U \to \mathcal{F}_{U'}$.*

These data are subject to the condition that given any $f : U' \to U$ and $g : U'' \to U'$ in $X_{\acute{e}tale}$ the composition $g_{small}^{-1}c_f \circ c_g$ is equal to $c_{f \circ g}$.

Proof. Combine Lemmas 41.23.1 and 41.15.12, and use the fact that any morphism between objects of $X_{\acute{e}tale}$ is an étale morphism of schemes. $\square$

41.24. Étale localization

Reading this section should be avoided at all cost.

Let $X \to Y$ be an étale morphism of algebraic spaces. Then X is an object of $Y_{spaces,étale}$ and it is immediate from the definitions, see also the proof of Lemma 41.15.10, that

$$X_{spaces,étale} = Y_{spaces,étale}/X \tag{41.24.0.1}$$

where the right hand side is the localization of the site $Y_{spaces,étale}$ at the object X, see Sites, Definition 9.21.1. Moreover, this identification is compatible with the structure sheaves by Lemma 41.23.1. Hence the ringed site $(X_{spaces,étale}, \mathcal{O}_X)$ is identified with the localization of the ringed site $(Y_{spaces,étale}, \mathcal{O}_Y)$ at the object X:

$$(X_{spaces,étale}, \mathcal{O}_X) = (Y_{spaces,étale}/X, \mathcal{O}_Y|_{Y_{spaces,étale}/X}) \tag{41.24.0.2}$$

The localization of a ringed site used on the right hand side is defined in Modules on Sites, Definition 16.19.1.

Assume now $X \to Y$ is an étale morphism of algebraic spaces and X is a scheme. Then X is an object of $Y_{étale}$ and it follows that

$$X_{étale} = Y_{étale}/X \tag{41.24.0.3}$$

and

$$(X_{étale}, \mathcal{O}_X) = (Y_{étale}/X, \mathcal{O}_Y|_{Y_{étale}/X}) \tag{41.24.0.4}$$

as above.

Finally, if $X \to Y$ is an étale morphism of algebraic spaces and X is an affine scheme, then X is an object of $Y_{affine,étale}$ and

$$X_{affine,étale} = Y_{affine,étale}/X \tag{41.24.0.5}$$

and

$$(X_{affine,étale}, \mathcal{O}_X) = (Y_{affine,étale}/X, \mathcal{O}_Y|_{Y_{affine,étale}/X}) \tag{41.24.0.6}$$

as above.

Next, we show that these localizations are compatible with morphisms.

Lemma 41.24.1. *Let S be a scheme. Let*

$$\begin{tikzcd} U \arrow[r, "g"] \arrow[d, "p"'] & V \arrow[d, "q"] \\ X \arrow[r, "f"] & Y \end{tikzcd}$$

be a commutative diagram of algebraic spaces over S with p and q étale. Via the identifications (41.24.0.2) for $U \to X$ and $V \to Y$ the morphism of ringed topoi

$$(g_{spaces,étale}, g^\sharp) : (Sh(U_{spaces,étale}), \mathcal{O}_U) \longrightarrow (Sh(V_{spaces,étale}), \mathcal{O}_V)$$

is 2-isomorphic to the morphism $(f_{spaces,étale,c}, f_c^\sharp)$ constructed in Modules on Sites, Lemma 16.20.2 starting with the morphism of ringed sites $(f_{spaces,étale}, f^\sharp)$ and the map $c : U \to V \times_Y X$ corresponding to g.

Proof. The morphism $(f_{spaces,étale,c}, f_c^\sharp)$ is defined as a composition $f' \circ j$ of a localization and a base change map. Similarly g is a composition $U \to V \times_Y X \to V$. Hence it suffices to prove the lemma in the following two cases: (1) $f = \text{id}$, and (2) $U = X \times_Y V$. In case (1) the morphism $g : U \to V$ is étale, see Lemma 41.13.6. Hence $(g_{spaces,étale}, g^\sharp)$ is a localization morphism by the discussion surrounding Equations (41.24.0.1) and (41.24.0.2) which is exactly the content of the lemma in this case. In case (2) the morphism $g_{spaces,étale}$ comes from the morphism of ringed sites given by the functor $V_{spaces,étale} \to U_{spaces,étale}$, $V'/V \mapsto V' \times_V U/U$ which is also what the morphism f' is defined by, see Sites, Lemma 9.24.1. We omit the verification that $(f')^\sharp = g^\sharp$ in this case (both are the restriction of $f^\sharp$ to $U_{spaces,étale}$). $\square$

Lemma 41.24.2. *Same notation and assumptions as in Lemma 41.24.1 except that we also assume U and V are schemes. Via the identifications (41.24.0.4) for $U \to X$ and $V \to Y$ the morphism of ringed topoi*

$$(g_{small}, g^\sharp) : (Sh(U_{étale}), \mathcal{O}_U) \longrightarrow (Sh(V_{étale}), \mathcal{O}_V)$$

is 2-isomorphic to the morphism $(f_{small,s}, f_s^\sharp)$ constructed in Modules on Sites, Lemma 16.22.3 starting with $(f_{small}, f^\sharp)$ and the map $s : h_U \to f_{small}^{-1} h_V$ corresponding to g.

Proof. Note that $(g_{small}, g^\sharp)$ is 2-isomorphic as a morphism of ringed topoi to the morphism of ringed topoi associated to the morphism of ringed sites $(g_{spaces,étale}, g^\sharp)$. Hence we conclude by Lemma 41.24.1 and Modules on Sites, Lemma 16.22.4. $\square$

41.25. Recovering morphisms

In this section we prove that the rule which associates to an algebraic space its locally ringed small étale topos is fully faithful in a suitable sense, see Theorem 41.25.4.

Lemma 41.25.1. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. The morphism of ringed topoi $(f_{small}, f^\sharp)$ associated to f is a morphism of locally ringed topoi, see Modules on Sites, Definition 16.34.8.*

Proof. Note that the assertion makes sense since we have seen that $(X_{étale}, \mathcal{O}_{X_{étale}})$ and $(Y_{étale}, \mathcal{O}_{Y_{étale}})$ are locally ringed sites, see Lemma 41.19.3. Moreover, we know that $X_{étale}$ has enough points, see Theorem 41.16.12. Hence it suffices to prove that $(f_{small}, f^\sharp)$ satisfies condition (3) of Modules on Sites, Lemma 16.34.7. To see this take a point p of $X_{étale}$. By Lemma 41.16.13 p corresponds to a geometric point $\overline{x}$ of X. By Lemma 41.16.9 the point $q = f_{small} \circ p$ corresponds to the geometric point $\overline{y} = f \circ \overline{x}$ of Y. Hence the assertion we have to prove is that the induced map of étale local rings

$$\mathcal{O}_{Y,\overline{y}} \longrightarrow \mathcal{O}_{X,\overline{x}}$$

is a local ring map. You can prove this directly, but instead we deduce it from the corresponding result for schemes. To do this choose a commutative diagram

$$\begin{tikzcd} U \arrow[r, "\psi"'] \arrow[d] & V \arrow[d] \\ X \arrow[r] & Y \end{tikzcd}$$

where U and V are schemes, and the vertical arrows are surjective étale (see Spaces, Lemma 40.11.4). Choose a lift $\overline{u} : \overline{x} \to U$ (possible by Lemma 41.16.5). Set $\overline{v} = \psi \circ \overline{u}$. We obtain a commutative diagram of étale local rings

$$\begin{tikzcd} \mathcal{O}_{U,\bar{u}} & \mathcal{O}_{V,\bar{v}} \arrow[l] \\ \mathcal{O}_{X,\bar{x}} \arrow[u] & \mathcal{O}_{Y,\bar{y}}. \arrow[l] \arrow[u] \end{tikzcd}$$

By Étale Cohomology, Lemma 38.40.1 the top horizontal arrow is a local ring map. Finally by Lemma 41.19.1 the vertical arrows are isomorphisms. Hence we win. $\square$

Lemma 41.25.2. *Let S be a scheme. Let X, Y be algebraic spaces over S. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Let t be a 2-morphism from $(f_{small}, f^\sharp)$ to itself, see Modules on Sites, Definition 16.8.1. Then $t = id$.*

Proof. Let X', resp. Y' be X viewed as an algebraic space over $Spec(\mathbf{Z})$, see Spaces, Definition 40.16.2. It is clear from the construction that $(X_{small}, \mathcal{O})$ is equal to $(X'_{small}, \mathcal{O})$ and similarly for Y. Hence we may work with X' and Y'. In other words we may assume that $S = Spec(\mathbf{Z})$.

Assume $S = Spec(\mathbf{Z})$, $f : X \to Y$ and t are as in the lemma. This means that $t : f_{small}^{-1} \to f_{small}^{-1}$ is a transformation of functors such that the diagram

$$\begin{tikzcd} f_{small}^{-1}\mathcal{O}_Y \arrow[dr, "f^\sharp"'] & & f_{small}^{-1}\mathcal{O}_Y \arrow[ll, "t"'] \arrow[dl, "f^\sharp"] \\ & \mathcal{O}_X & \end{tikzcd}$$

is commutative. Suppose $V \to Y$ is étale with V affine. Write $V = Spec(B)$. Choose generators $b_j \in B$, $j \in J$ for B as a $\mathbf{Z}$-algebra. Set $T = Spec(\mathbf{Z}[\{x_j\}_{j\in J}])$. In the following we will use that $Mor_{Sch}(U, T) = \prod_{j\in J} \Gamma(U, \mathcal{O}_U)$ for any scheme U without further mention. The surjective ring map $\mathbf{Z}[x_j] \to B$, $x_j \mapsto b_j$ corresponds to a closed immersion $V \to T$. We obtain a monomorphism

$$i : V \longrightarrow T_Y = T \times Y$$

of algebraic spaces over Y. In terms of sheaves on $Y_{étale}$ the morphism i induces an injection $h_i : h_V \to \prod_{j\in J} \mathcal{O}_Y$ of sheaves. The base change $i' : X \times_Y V \to T_X$ of i to X is a monomorphism too (Spaces, Lemma 40.5.5). Hence $i' : X \times_Y V \to T_X$ is a monomorphism, which in turn means that $h_{i'} : h_{X\times_Y V} \to \prod_{j\in J} \mathcal{O}_X$ is an injection of sheaves. Via the identification $f_{small}^{-1} h_V = h_{X\times_Y V}$ of Lemma 41.16.9 the map $h_{i'}$ is equal to

$$f_{small}^{-1} h_V \xrightarrow{f^{-1}h_i} \prod\nolimits_{j\in J} f_{small}^{-1}\mathcal{O}_Y \xrightarrow{\prod f^\sharp} \prod\nolimits_{j\in J} \mathcal{O}_X$$

(verification omitted). This means that the map $t : f_{small}^{-1} h_V \to f_{small}^{-1} h_V$ fits into the commutative diagram

$$\begin{tikzcd} f_{small}^{-1} h_V \arrow[r, "f^{-1}h_i"] \arrow[d, "t"] & \prod_{j\in J} f_{small}^{-1}\mathcal{O}_Y \arrow[r, "\prod f^\sharp"] \arrow[d, "\prod t"] & \prod_{j\in J} \mathcal{O}_X \arrow[d, "\mathrm{id}"] \\ f_{small}^{-1} h_V \arrow[r, "f^{-1}h_i"] & \prod_{j\in J} f_{small}^{-1}\mathcal{O}_Y \arrow[r, "\prod f^\sharp"] & \prod_{j\in J} \mathcal{O}_X \end{tikzcd}$$

The commutativity of the right square holds by our assumption on t explained above. Since the composition of the horizontal arrows is injective by the discussion above we conclude that the left vertical arrow is the identity map as well. Any sheaf of sets on $Y_{\acute{e}tale}$ admits a surjection from a (huge) coproduct of sheaves of the form h_V with V affine (combine Lemma 41.15.5 with Sites, Lemma 9.12.4). Thus we conclude that $t : f_{small}^{-1} \to f_{small}^{-1}$ is the identity transformation as desired. $\square$

Lemma 41.25.3. *Let S be a scheme. Let X, Y be algebraic spaces over S. Any two morphisms $a, b : X \to Y$ of algebraic spaces over S for which there exists a 2-isomorphism $(a_{small}, a^\sharp) \cong (b_{small}, b^\sharp)$ in the 2-category of ringed topoi are equal.*

Proof. Let $t : a_{small}^{-1} \to b_{small}^{-1}$ be the 2-isomorphism. We may equivalently think of t as a transformation $t : a_{spaces,\acute{e}tale}^{-1} \to b_{spaces,\acute{e}tale}^{-1}$ since there is not difference between sheaves on $X_{\acute{e}tale}$ and sheaves on $X_{spaces,\acute{e}tale}$. Choose a commutative diagram

$$\begin{tikzcd} U \arrow[r, "\alpha"'] \arrow[d, "p"'] & V \arrow[d, "q"] \\ X \arrow[r, "a"] & Y \end{tikzcd}$$

where U and V are schemes, and p and q are surjective étale. Consider the diagram

$$\begin{tikzcd} h_U \arrow[r, "\alpha"'] \arrow[d, equal] & a_{spaces,\acute{e}tale}^{-1} h_V \arrow[d, "t"] \\ h_U \arrow[r, dotted] & b_{spaces,\acute{e}tale}^{-1} h_V \end{tikzcd}$$

Since the sheaf $b_{spaces,\acute{e}tale}^{-1} h_V$ is isomorphic to $h_{V \times_{Y,b} X}$ we see that the dotted arrow comes from a morphism of schemes $\beta : U \to V$ fitting into a commutative diagram

$$\begin{tikzcd} U \arrow[r, "\beta"'] \arrow[d, "p"'] & V \arrow[d, "q"] \\ X \arrow[r, "b"] & Y \end{tikzcd}$$

We claim that there exists a sequence of 2-isomorphisms

$$\begin{aligned} (\alpha_{small}, \alpha^\sharp) & \cong (\alpha_{spaces,\acute{e}tale}, \alpha^\sharp) \\ & \cong (a_{spaces,\acute{e}tale,c}, a_c^\sharp) \\ & \cong (b_{spaces,\acute{e}tale,d}, b_d^\sharp) \\ & \cong (\beta_{spaces,\acute{e}tale}, \beta^\sharp) \\ & \cong (\beta_{small}, \beta^\sharp) \end{aligned}$$

The first and the last 2-isomorphisms come from the identifications between sheaves on $U_{spaces,\acute{e}tale}$ and sheaves on $U_{\acute{e}tale}$ and similarly for V. The second and fourth 2-isomorphisms are those of Lemma 41.24.1 with $c : U \to X \times_{a,Y} V$ induced by α and $d : U \to X \times_{b,Y} V$ induced by β. The middle 2-isomorphism comes from the transformation t. Namely, the functor $a_{spaces,\acute{e}tale,c}^{-1}$ corresponds to the functor

$$(\mathcal{H} \to h_V) \longmapsto (a_{spaces,\acute{e}tale}^{-1}\mathcal{H} \times_{a_{spaces,\acute{e}tale}^{-1} h_V, \alpha} h_U \to h_U)$$

and similarly for $b^{-1}_{spaces,étale,d}$, see Sites, Lemma 9.24.3. This uses the identification of sheaves on $Y_{spaces,étale}/V$ as arrows $(\mathcal{H} \to h_V)$ in $Sh(Y_{spaces,étale})$ and similarly for U/X, see Sites, Lemma 9.21.4. Via this identification the structure sheaf $\mathcal{O}_V$ corresponds to the pair $(\mathcal{O}_Y \times h_V \to h_V)$ and similarly for $\mathcal{O}_U$, see Modules on Sites, Lemma 16.21.3. Since t switches α and β we see that t induces an isomorphism

$$t : a^{-1}_{spaces,étale}\mathcal{H} \times_{a^{-1}_{spaces,étale}h_V,\alpha} h_U \longrightarrow b^{-1}_{spaces,étale}\mathcal{H} \times_{b^{-1}_{spaces,étale}h_V,\beta} h_U$$

over h_U functorially in $(\mathcal{H} \to h_V)$. Also, t is compatible with $a^\sharp_c$ and $b^\sharp_d$ as t is compatible with $a^\sharp$ and $b^\sharp$ by our description of the structure sheaves $\mathcal{O}_U$ and $\mathcal{O}_V$ above. Hence, the morphisms of ringed topoi $(\alpha_{small}, \alpha^\sharp)$ and $(\beta_{small}, \beta^\sharp)$ are 2-isomorphic. By Étale Cohomology, Lemma 38.40.3 we conclude $\alpha = \beta$! Since $p : U \to X$ is a surjection of sheaves it follows that $a = b$. □

Here is the main result of this section.

Theorem 41.25.4. *Let X, Y be algebraic spaces over $Spec(\mathbf{Z})$. Let*

$$(g, g^\sharp) : (Sh(X_{étale}), \mathcal{O}_X) \longrightarrow (Sh(Y_{étale}), \mathcal{O}_Y)$$

be a morphism of locally ringed topoi. Then there exists a unique morphism of algebraic spaces $f : X \to Y$ such that $(g, g^\sharp)$ is isomorphic to $(f_{small}, f^\sharp)$. In other words, the construction

$$Spaces/Spec(\mathbf{Z}) \longrightarrow Locally\ ringed\ topoi, \quad X \longrightarrow (X_{étale}, \mathcal{O}_X)$$

is fully faithful (morphisms up to 2-isomorphisms on the right hand side).

Proof. The uniqueness we have seen in Lemma 41.25.3. Thus it suffices to prove existence. In this proof we will freely use the identifications of Equation (41.24.0.4) as well as the result of Lemma 41.24.2.

Let $U \in Ob(X_{étale})$, let $V \in Ob(Y_{étale})$ and let $s \in g^{-1}h_V(U)$ be a section. We may think of s as a map of sheaves $s : h_U \to g^{-1}h_V$. By Modules on Sites, Lemma 16.22.3 we obtain a commutative diagram of morphisms of ringed topoi

$$\begin{tikzcd}
(Sh(X_{étale}/U), \mathcal{O}_U) \arrow[r, "{(j,j^\sharp)}"'] \arrow[d, "{(g_s,g_s^\sharp)}"'] & (Sh(X_{étale}), \mathcal{O}_X) \arrow[d, "{(g,g^\sharp)}"] \\
(Sh(V_{étale}), \mathcal{O}_V) \arrow[r] & (Sh(Y_{étale}), \mathcal{O}_Y).
\end{tikzcd}$$

By Étale Cohomology, Theorem 38.40.5 we obtain a unique morphism of schemes $f_s : U \to V$ such that $(g_s, g_s^\sharp)$ is 2-isomorphic to $(f_{s,small}, f_s^\sharp)$. The construction $(U, V, s) \rightsquigarrow f_s$ just explained satisfies the following functoriality property: Suppose given morphisms $a : U' \to U$ in $X_{étale}$ and $b : V' \to V$ in $Y_{étale}$ and a map $s' : h_{U'} \to g^{-1}h_{V'}$ such that the diagram

$$\begin{tikzcd}
h_{U'} \arrow[r, "s'"'] \arrow[d, "a"'] & g^{-1}h_{V'} \arrow[d, "g^{-1}b"] \\
h_U \arrow[r, "s"] & g^{-1}h_V
\end{tikzcd}$$

commutes. Then the diagram

$$\begin{tikzcd} U' \arrow[r, "f_{s'}"'] \arrow[d, "a"'] & u(V') \arrow[d, "u(b)"] \\ U \arrow[r, "f_s"] & u(V) \end{tikzcd}$$

of schemes commutes. The reason this is true is that the same condition holds for the morphisms $(g_s, g_s^\sharp)$ constructed in Modules on Sites, Lemma 16.22.3 and the uniqueness in Étale Cohomology, Theorem 38.40.5.

The problem is to glue the morphisms f_s to a morphism of algebraic spaces. To do this first choose a scheme V and a surjective étale morphism $V \to Y$. This means that $h_V \to *$ is surjective and hence $g^{-1}h_V \to *$ is surjective too. This means there exists a scheme U and a surjective étale morphism $U \to X$ and a morphism $s : h_U \to g^{-1}h_V$. Next, set $R = V \times_Y V$ and $R' = U \times_X U$. Then we get $g^{-1}h_R = g^{-1}h_V \times g^{-1}h_V$ as g^{-1} is exact. Thus s induces a morphism $s \times s : h_{R'} \to g^{-1}h_R$. Applying the constructions above we see that we get a commutative diagram of morphisms of schemes

$$\begin{tikzcd} R' \arrow[r, "f_{s\times s}"'] \arrow[d, shift right] \arrow[d, shift left] & R \arrow[d, shift right] \arrow[d, shift left] \\ U \arrow[r, "f_s"] & V \end{tikzcd}$$

Since we have $X = U/R'$ and $Y = V/R$ (see Spaces, Lemma 40.9.1) we conclude that this diagram defines a morphism of algebraic spaces $f : X \to Y$ fitting into an obvious commutative diagram. Now we still have to show that $(f_{small}, f^\sharp)$ is 2-isomorphic to $(g, g^\sharp)$. Let $t_V : f_{s,small}^{-1} \to g_s^{-1}$ and $t_R : f_{s\times s,small}^{-1} \to g_{s\times s}^{-1}$ be the 2-isomorphisms which are given to us by the construction above. Let $\mathcal{G}$ be a sheaf on $Y_{étale}$. Then we see that t_V defines an isomorphism

$$f_{small}^{-1}\mathcal{G}|_{U_{étale}} = f_{s,small}^{-1}\mathcal{G}|_{V_{étale}} \xrightarrow{t_V} g_s^{-1}\mathcal{G}|_{V_{étale}} = g^{-1}\mathcal{G}|_{U_{étale}}.$$

Moreover, this isomorphism pulled back to R' via either projection $R' \to U$ is the isomorphism

$$f_{small}^{-1}\mathcal{G}|_{R'_{étale}} = f_{s\times s,small}^{-1}\mathcal{G}|_{R_{étale}} \xrightarrow{t_R} g_{s\times s}^{-1}\mathcal{G}|_{R_{étale}} = g^{-1}\mathcal{G}|_{R'_{étale}}.$$

Since $\{U \to X\}$ is a covering in the site $X_{spaces,étale}$ this means the first displayed isomorphism descends to an isomorphism $t : f_{small}^{-1}\mathcal{G} \to g^{-1}\mathcal{G}$ of sheaves (small detail omitted). The isomorphism is functorial in $\mathcal{G}$ since t_V and t_R are transformations of functors. Finally, t is compatible with $f^\sharp$ and $g^\sharp$ as t_V and t_R are (some details omitted). This finishes the proof of the theorem. $\square$

Lemma 41.25.5. *Let X, Y be algebraic spaces over* $\mathbf{Z}$. *If*

$$(g, g^\sharp) : (Sh(X_{étale}), \mathcal{O}_X) \longrightarrow (Sh(Y_{étale}), \mathcal{O}_Y)$$

is an isomorphism of ringed topoi, then there exists a unique morphism $f : X \to Y$ of algebraic spaces such that $(g, g^\sharp)$ is isomorphic to $(f_{small}, f^\sharp)$ and moreover f is an isomorphism of algebraic spaces.

Proof. By Theorem 41.25.4 it suffices to show that $(g, g^\sharp)$ is a morphism of locally ringed topoi. By Modules on Sites, Lemma 16.34.7 (and since the site $X_{étale}$ has enough points) it suffices to check that the map $\mathcal{O}_{Y,q} \to \mathcal{O}_{X,p}$ induced by $g^\sharp$ is a local ring map where $q = f \circ p$ and p is any point of $X_{\acute{e}tale}$. As it is an isomorphism this is clear. $\square$

41.26. Quasi-coherent sheaves on algebraic spaces

In Descent, Section 31.6 we have seen that for a scheme U, there is no difference between a quasi-coherent $\mathcal{O}_U$-module on U, or a quasi-coherent $\mathcal{O}$-module on the small étale site of U. Hence the following definition is compatible with our original notion of a quasi-coherent sheaf on a scheme (Schemes, Section 21.24), when applied to a representable algebraic space.

Definition 41.26.1. Let S be a scheme. Let X be an algebraic space over S. A *quasi-coherent $\mathcal{O}_X$-module* is a quasi-coherent module on the ringed site $(X_{\acute{e}tale}, \mathcal{O}_X)$ in the sense of Modules on Sites, Definition 16.23.1. The category of quasi-coherent sheaves on X is denoted $QCoh(\mathcal{O}_X)$ or $QCoh(X)$.

Note that as being quasi-coherent is an intrinsic notion (see Modules on Sites, Lemma 16.23.2) this is equivalent to saying that the corresponding $\mathcal{O}_X$-module on $X_{spaces,\acute{e}tale}$ is quasi-coherent.

As usual, quasi-coherent sheaves behave well with respect to pullback.

Lemma 41.26.2. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. The pullback functor $f^* : Mod(\mathcal{O}_Y) \to Mod(\mathcal{O}_X)$ preserves quasi-coherent sheaves.*

Proof. This is a general fact, see Modules on Sites, Lemma 16.23.4. $\square$

Note that this pullback functor agrees with the usual pullback functor between quasi-coherent sheaves of modules if X and Y happen to be schemes, see Descent, Proposition 31.6.14. Here is the obligatory lemma comparing this with quasi-coherent sheaves on the objects of the small étale site of X.

Lemma 41.26.3. *Let S be a scheme. Let X be an algebraic space over S. A quasi-coherent $\mathcal{O}_X$-module $\mathcal{F}$ is given by the following data:*

1. *for every $U \in Ob(X_{\acute{e}tale})$ a quasi-coherent $\mathcal{O}_U$-module $\mathcal{F}_U$ on $U_{\acute{e}tale}$,*
2. *for every $f : U' \to U$ in $X_{\acute{e}tale}$ an isomorphism $c_f : f^*_{small}\mathcal{F}_U \to \mathcal{F}_{U'}$.*

These data are subject to the condition that given any $f : U' \to U$ and $g : U'' \to U'$ in $X_{\acute{e}tale}$ the composition $g^{-1}_{small}c_f \circ c_g$ is equal to $c_{f\circ g}$.

Proof. Combine Lemmas 41.26.2 and 41.23.3. $\square$

Lemma 41.26.4. *Let S be a scheme. Let X be an algebraic space over S. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Let $x \in |X|$ be a point and let $\overline{x}$ be a geometric point lying over x. Finally, let $\varphi : (U, \overline{u}) \to (X, \overline{x})$ be an étale neighbourhood where U is a scheme. Then*

$$(\varphi^*\mathcal{F})_u \otimes_{\mathcal{O}_{U,u}} \mathcal{O}_{X,\overline{x}} = \mathcal{F}_{\overline{x}}$$

where $u \in U$ is the image of $\overline{u}$.

Proof. Note that $\mathcal{O}_{X,\overline{x}} = \mathcal{O}^{sh}_{U,u}$ by Lemma 41.19.1 hence the tensor product makes sense. Moreover, from Definition 41.16.6 it is clear that

$$\mathcal{F}_{\overline{u}} = colim(\varphi^*\mathcal{F})_u$$

where the colimit is over $\varphi : (U, \overline{u}) \to (X, \overline{x})$ as in the lemma. Hence there is a canonical map from left to right in the statement of the lemma. We have a similar colimit description for $\mathcal{O}_{X,\overline{x}}$ and by Lemma 41.26.3 we have

$$((\varphi')^*\mathcal{F})_{u'} = (\varphi^*\mathcal{F})_u \otimes_{\mathcal{O}_{U,u}} \mathcal{O}_{U',u'}$$

whenever $(U', \overline{u}') \to (U, \overline{u})$ is a morphism of étale neighbourhoods. To complete the proof we use that $\otimes$ commutes with colimits. □

Lemma 41.26.5. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Let $\mathcal{G}$ be a quasi-coherent $\mathcal{O}_Y$-module. Let $\overline{x}$ be a geometric point of X and let $\overline{y} = f \circ \overline{x}$ be the image in Y. Then there is a canonical isomorphism*

$$(f^*\mathcal{G})_{\overline{x}} = \mathcal{G}_{\overline{y}} \otimes_{\mathcal{O}_{Y,\overline{y}}} \mathcal{O}_{X,\overline{x}}$$

of the stalk of the pullback with the tensor product of the stalk with the local ring of X at $\overline{x}$.

Proof. Since $f^*\mathcal{G} = f_{small}^{-1}\mathcal{G} \otimes_{f_{small}^{-1}\mathcal{O}_Y} \mathcal{O}_X$ this follows from the description of stalks of pullbacks in Lemma 41.16.9 and the fact that taking stalks commutes with tensor products. A more direct way to see this is as follows. Choose a commutative diagram

$$\begin{tikzcd} U \arrow[r, "\alpha"] \arrow[d, "p"] & V \arrow[d, "q"] \\ X \arrow[r, "a"] & Y \end{tikzcd}$$

where U and V are schemes, and p and q are surjective étale. By Lemma 41.16.4 we can choose a geometric point $\overline{u}$ of U such that $\overline{x} = p \circ \overline{u}$. Set $\overline{v} = \alpha \circ \overline{u}$. Then we see that

$$\begin{aligned} (f^*\mathcal{G})_{\overline{x}} &= (p^*f^*\mathcal{G})_u \otimes_{\mathcal{O}_{U,u}} \mathcal{O}_{X,\overline{x}} \\ &= (\alpha^*q^*\mathcal{G})_u \otimes_{\mathcal{O}_{U,u}} \mathcal{O}_{X,\overline{x}} \\ &= (q^*\mathcal{G})_v \otimes_{\mathcal{O}_{V,v}} \mathcal{O}_{U,u} \otimes_{\mathcal{O}_{U,u}} \mathcal{O}_{X,\overline{x}} \\ &= (q^*\mathcal{G})_v \otimes_{\mathcal{O}_{V,v}} \mathcal{O}_{X,\overline{x}} \\ &= (q^*\mathcal{G})_v \otimes_{\mathcal{O}_{V,v}} \mathcal{O}_{Y,\overline{y}} \otimes_{\mathcal{O}_{Y,\overline{y}}} \mathcal{O}_{X,\overline{x}} \\ &= \mathcal{G}_{\overline{y}} \otimes_{\mathcal{O}_{Y,\overline{y}}} \mathcal{O}_{X,\overline{x}} \end{aligned}$$

Here we have used Lemma 41.26.4 (twice) and the corresponding result for pullbacks of quasi-coherent sheaves on schemes, see Sheaves, Lemma 6.26.4. □

Lemma 41.26.6. *Let S be a scheme. Let X be an algebraic space over S. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_X$-modules. The following are equivalent*

1. *$\mathcal{F}$ is a quasi-coherent $\mathcal{O}_X$-module,*
2. *there exists an étale morphism $f : Y \to X$ of algebraic spaces over S with $|f| : |Y| \to |X|$ surjective such that $f^*\mathcal{F}$ is quasi-coherent on Y,*
3. *there exists a scheme U and a surjective étale morphism $\varphi : U \to X$ such that $\varphi^*\mathcal{F}$ is a quasi-coherent $\mathcal{O}_U$-module, and*
4. *for every affine scheme U and étale morphism $\varphi : U \to X$ the restriction $\varphi^*\mathcal{F}$ is a quasi-coherent $\mathcal{O}_U$-module.*

Proof. It is clear that (1) implies (2) by considering id_X. Assume $f : Y \to X$ is as in (2), and let $V \to Y$ be a surjective étale morphism from a scheme towards Y. Then the composition $V \to X$ is surjective étale as well and by Lemma 41.26.2 the pullback of $\mathcal{F}$ to V is quasi-coherent as well. Hence we see that (2) implies (3).

Let $U \to X$ be as in (3). Let us use the abuse of notation introduced in Equation (41.23.1.1). As $\mathcal{F}|_{U_{étale}}$ is quasi-coherent there exists an étale covering $\{U_i \to U\}$ such that $\mathcal{F}|_{U_{i,étale}}$ has a global presentation, see Modules on Sites, Definition 16.17.1 and Lemma 16.23.3. Let $V \to X$ be an object of $X_{étale}$. Since $U \to X$ is surjective and étale, the family of maps $\{U_i \times_X V \to V\}$ is an étale covering of V. Via the morphisms $U_i \times_X V \to U_i$ we can restrict the global presentations of $\mathcal{F}|_{U_{i,étale}}$ to get a global presentation of $\mathcal{F}|_{(U_i \times_X V)_{étale}}$ Hence the sheaf $\mathcal{F}$ on $X_{étale}$ satisfies the condition of Modules on Sites, Definition 16.23.1 and hence is quasi-coherent.

The equivalence of (3) and (4) comes from the fact that any scheme has an affine open covering. □

Lemma 41.26.7. *Let S be a scheme. Let X be an algebraic space over S. The category $QCoh(\mathcal{O}_X)$ of quasi-coherent sheaves on X has the following properties:*

(1) *Any direct sum of quasi-coherent sheaves is quasi-coherent.*
(2) *Any colimit of quasi-coherent sheaves is quasi-coherent.*
(3) *The kernel and cokernel of a morphism of quasi-coherent sheaves is quasi-coherent.*
(4) *Given a short exact sequence of $\mathcal{O}_X$-modules $0 \to \mathcal{F}_1 \to \mathcal{F}_2 \to \mathcal{F}_3 \to 0$ if two out of three are quasi-coherent so is the third.*
(5) *Given two quasi-coherent $\mathcal{O}_X$-modules the tensor product is quasi-coherent.*
(6) *Given two quasi-coherent $\mathcal{O}_X$-modules $\mathcal{F}$, $\mathcal{G}$ such that $\mathcal{F}$ is of finite presentation (see Section 41.27), then the internal hom $\mathcal{H}om_{\mathcal{O}_X}(\mathcal{F}, \mathcal{G})$ is quasi-coherent.*

Proof. Note that we have the corresponding result for quasi-coherent modules on schemes, see Schemes, Section 21.24. We will reduce the lemma to this case by étale localization. Choose a scheme U and a surjective étale morphism $\varphi : U \to X$. In order to formulate this proof correctly, we temporarily go back to making the (pedantic) distinction between a quasi-coherent sheaf $\mathcal{G}$ on the scheme U and the associated quasi-coherent sheaf $\mathcal{G}^a$ (see Descent, Definition 31.6.2) on $U_{étale}$ We have a commutative diagram

$$\begin{tikzcd} QCoh(\mathcal{O}_X) \arrow[r] \arrow[d] & QCoh(\mathcal{O}_U) \arrow[d] \\ Mod(\mathcal{O}_X) \arrow[r] & Mod(\mathcal{O}_U) \end{tikzcd}$$

The bottom horizontal arrow is the restriction functor (41.23.1.1) $\mathcal{G} \mapsto \mathcal{G}|_{U_{étale}}$. This functor has both a left adjoint and a right adjoint, see Modules on Sites, Section 16.19, hence commutes with all limits and colimits. Moreover, we know that an object of $Mod(\mathcal{O}_X)$ is in $QCoh(\mathcal{O}_X)$ if and only if its restriction to U is in $QCoh(\mathcal{O}_U)$, see Lemma 41.26.6. Let $\mathcal{F}_i$ be a family of quasi-coherent $\mathcal{O}_X$-modules. Then $\bigoplus \mathcal{F}_i$ is an $\mathcal{O}_X$-module whose restriction to U is the direct sum of the restrictions. Let $\mathcal{G}_i$ be a quasi-coherent sheaf on U with $\mathcal{F}_i|_{U_{étale}} = \mathcal{G}_i^a$. Combining the above with Descent, Lemma 31.6.13 we see that

$$\left(\bigoplus \mathcal{F}_i\right)|_{U_{étale}} = \bigoplus \mathcal{F}_i|_{U_{étale}} = \bigoplus \mathcal{G}_i^a = \left(\bigoplus \mathcal{G}_i\right)^a$$

hence $\bigoplus \mathcal{F}_i$ is quasi-coherent and (1) follows. The other statements are proved just so (using the same references). □

It is in general not the case that the pushforward of a quasi-coherent sheaf along a morphism of algebraic spaces is quasi-coherent. We will return to this issue in Morphisms of Spaces, Section 42.15.

41.27. Properties of modules

In Modules on Sites, Sections 16.17, 16.23, and Definition 16.26.1 we have defined a number of intrinsic properties of modules of $\mathcal{O}$-module on any ringed topos. If X is an algebraic space, we will apply these notions freely to modules on the ringed site $(X_{étale}, \mathcal{O}_X)$, or equivalently on the ringed site $(X_{spaces,étale}, \mathcal{O}_X)$.

Global properties $\mathcal{P}$:

(1) *free*,
(2) *finite free*,
(3) *generated by global sections*,
(4) *generated by finitely many global sections*,
(5) having a *global presentation*, and
(6) having a *global finite presentation*.

Local properties $\mathcal{P}$:

(1) *locally free*,
(2) *finite locally free*,
(3) *locally generated by sections*,
(4) *finite type*,
(5) *quasi-coherent* (see Section 41.26),
(6) *of finite presentation*,
(7) *coherent*, and
(8) *flat*.

In each case, except for $\mathcal{P}$ =``coherent'', the property is preserved under pullback, see Modules on Sites, Lemma 16.17.2, Modules on Sites, Lemma 16.23.4, and Modules on Sites, Lemma 16.33.3. In particular, if $\mathcal{F}$ is an $\mathcal{O}_X$-module on $X_{étale}$ satisfying one of the properties $\mathcal{P}$ above and $\varphi : U \to X$ is a surjective étale morphism with U a scheme, then the pullback $\varphi^*\mathcal{F}$ has property $\mathcal{P}$ as a sheaf of modules on $U_{étale}$. Moreover, for each of the local properties $\mathcal{P}$, the fact that $\varphi^*\mathcal{G}$ has $\mathcal{P}$ implies that $\mathcal{G}$ has $\mathcal{P}$. This follows as $\{U \to X\}$ is a covering in $X_{spaces,étale}$ and Modules on Sites, Lemma 16.23.3. Finally, if $\mathcal{G}$ is assumed quasi-coherent and for any $\mathcal{P}$ except $\mathcal{P}$ =``coherent'' or ``locally free'', then $\mathcal{P}$ for $\varphi^*\mathcal{G}$ on $U_{étale}$ is equivalent to the corresponding property for $\varphi^*\mathcal{G}|_{U_{Zar}}$, i.e., it corresponds to $\mathcal{P}$ for $\varphi^*\mathcal{G}$ when we think of it as a quasi-coherent sheaf on the scheme U. See Descent, Lemma 31.6.12.

41.28. Locally projective modules

Recall that in Properties, Section 23.19 we defined the notion of a locally projective quasi-coherent module.

Lemma 41.28.1. *Let S be a scheme. Let X be an algebraic space over S. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. The following are equivalent*

(1) *for some scheme U and surjective étale morphism $U \to X$ the restriction $\mathcal{F}|_U$ is locally projective on U, and*
(2) *for any scheme U and any étale morphism $U \to X$ the restriction $\mathcal{F}|_U$ is locally projective on U.*

Proof. Let $U \to X$ be as in (1) and let $V \to X$ be étale where V is a scheme. Then $\{U \times_X V \to V\}$ is an fppf covering of schemes. Hence if $\mathcal{F}|_U$ is locally projective, then $\mathcal{F}|_{U \times_X V}$ is locally projective (see Properties, Lemma 23.19.3) and hence $\mathcal{F}|_V$ is locally projective, see Descent, Lemma 31.5.5. $\square$

Definition 41.28.2. Let S be a scheme. Let X be an algebraic space over S. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. We say $\mathcal{F}$ is *locally projective* if the equivalent conditions of Lemma 41.28.1 are satisfied.

Lemma 41.28.3. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Let $\mathcal{G}$ be a quasi-coherent $\mathcal{O}_Y$-module. If $\mathcal{G}$ is locally projective on Y, then $f^*\mathcal{G}$ is locally projective on X.*

Proof. Choose a surjective étale morphism $V \to Y$ with V a scheme. Choose a surjective étale morphism $U \to V \times_Y X$ with U a scheme. Denote $\psi : U \to V$ the induced morphism. Then

$$f^*\mathcal{G}|_U = \psi^*(\mathcal{G}|_V)$$

Hence the lemma follows from the definition and the result in the case of schemes, see Properties, Lemma 23.19.3. □

41.29. Quasi-coherent sheaves and presentations

Let S be a scheme. Let X be an algebraic space over S. Let $X = U/R$ be a presentation of X coming from any surjective étale morphism $\varphi : U \to X$, see Spaces, Definition 40.9.3. In particular, we obtain a groupoid (U, R, s, t, c), such that $j = (t, s) : R \to U \times_S U$, see Groupoids, Lemma 35.11.3. In Groupoids, Definition 35.12.1 we have the defined the notion of a quasi-coherent sheaf on an arbitrary groupoid. With these notions in place we have the following observation.

Proposition 41.29.1. *With S, $\varphi : U \to X$, and (U, R, s, t, c) as above. For any quasi-coherent $\mathcal{O}_X$-module $\mathcal{F}$ the sheaf $\varphi^*\mathcal{F}$ comes equipped with a canonical isomorphism*

$$\alpha : t^*\varphi^*\mathcal{F} \longrightarrow s^*\varphi^*\mathcal{F}$$

which satisfies the conditions of Groupoids, Definition 35.12.1 and therefore defines a quasi-coherent sheaf on (U, R, s, t, c). The functor $\mathcal{F} \mapsto (\varphi^*\mathcal{F}, \alpha)$ defines an equivalence of categories

$$\begin{matrix} \textit{Quasi-coherent} \\ \mathcal{O}_X\textit{-modules} \end{matrix} \longleftrightarrow \begin{matrix} \textit{Quasi-coherent modules} \\ \textit{on } (U, R, s, t, c) \end{matrix}$$

Proof. In the statement of the proposition, and in this proof we think of a quasi-coherent sheaf on a scheme as a quasi-coherent sheaf on the small étale site of that scheme. This is permissible by the results of Descent, Section 31.6.

The existence of α comes from the fact that $\varphi \circ t = \varphi \circ s$ and that pullback is functorial in the morphism, see discussion surrounding Equation (41.23.0.1). In exacty the same way, i.e., by functoriality of pullback, we see that the isomorphism α satisfies condition (1) of Groupoids, Definition 35.12.1. To see condition (2) of the definition it suffices to see that α is an isomorphism which is clear. The construction $\mathcal{F} \mapsto (\varphi^*\mathcal{F}, \alpha)$ is clearly functorial in the quasi-coherent sheaf $\mathcal{F}$. Hence we obtain the functor from left to right in the displayed formula of the lemma.

Conversely, suppose that $(\mathcal{F}, \alpha)$ is a quasi-coherent sheaf on (U, R, s, t, c). Let $V \to X$ be an object of $X_{étale}$. In this case the morphism $V' = U \times_X V \to V$ is a surjective étale morphism of schemes, and hence $\{V' \to V\}$ is an étale covering of V. Moreover, the quasi-coherent sheaf $\mathcal{F}$ pulls back to a quasi-coherent sheaf $\mathcal{F}'$ on V'. Since $R = U \times_X U$ with $t = \text{pr}_0$ and $s = \text{pr}_0$ we see that $V' \times_V V' = R \times_X V$ with projection maps $V' \times_V V' \to V'$ equal to the pullbacks of t and s. Hence α pulls back to an isomorphism $\alpha' : \text{pr}_0^*\mathcal{F}' \to \text{pr}_1^*\mathcal{F}'$, and the pair $(\mathcal{F}', \alpha')$ is a descend datum for quasi-coherent sheaves with respect to $\{V' \to V\}$. By

Descent, Proposition 31.4.2 this descent datum is effective, and we obtain a quasi-coherent $\mathcal{O}_V$-module $\mathcal{F}_V$ on $V_{étale}$. To see that this gives a quasi-coherent sheaf on $X_{étale}$ we have to show (by Lemma 41.26.3) that for any morphism $f : V_1 \to V_2$ in $X_{étale}$ there is a canonical isomorphism $c_f : \mathcal{F}_{V_1} \to \mathcal{F}_{V_2}$ compatible with compositions of morphisms. We omit the verification. We also omit the verification that this defines a functor from the category on the right to the category on the left which is inverse to the functor described above. □

Proposition 41.29.2. *Let S be a scheme Let X be an algebraic space over S. The inclusion functor* $QCoh(\mathcal{O}_X) \to Mod(\mathcal{O}_X)$ *has a right adjoint*

$$Q^7 : Mod(\mathcal{O}_X) \longrightarrow QCoh(\mathcal{O}_X)$$

such that for every quasi-coherent sheaf $\mathcal{F}$ *the adjunction mapping* $Q(\mathcal{F}) \to \mathcal{F}$ *is an isomorphism. Moreover, the category* $QCoh(\mathcal{O}_X)$ *has limits and enough injectives.*

Proof. This proof is a repeat of the proof in the case of schemes, see Properties, Proposition 23.21.4. We urge the reader to read that proof first.

The two assertions about $Q(\mathcal{F}) \to \mathcal{F}$ and limits in $QCoh(\mathcal{O}_X)$ are formal consequences of the existence of Q, the fact that the inclusion is fully faithful, and the fact that $Mod(\mathcal{O}_X)$ has limits (see Modules on Sites, Lemma 16.14.2). The existence of injectives follows from the existence of injectives in $Mod(\mathcal{O}_X)$ (see Injectives, Theorem 17.12.4) and Homology, Lemma 10.22.3. Thus it suffices to construct Q.

Choose a presentation $X = U/R$ so that (U, R, s, t, c) is an étale groupoid scheme and in particular s and t are flat morphisms of schemes. Pick a cardinal κ as in Groupoids, Lemma 35.12.7. Pick a collection $(\mathcal{E}_t, \alpha_t)_{t\in T}$ of κ-generated quasi-coherent modules on (U, R, s, t, c) as in Groupoids, Lemma 35.12.6. Let $\mathcal{F}_t$ be the quasi-coherent module on X which corresponds to the quasi-coherent module $(\mathcal{E}_t, \alpha_t)$ via the equivalence of categories of Proposition 41.29.1. Then we see that every quasi-coherent module $\mathcal{H}$ is the directed colimit of its quasi-coherent submodules which are isomorphic to one of the $\mathcal{F}_t$.

Given an object $\mathcal{G}$ of $QCoh(\mathcal{O}_X)$ we set

$$Q(\mathcal{G}) = colim_{(t,\psi)} \mathcal{F}_t$$

The colimit is over the category of pairs (t, ψ) where $t \in T$ and $\psi : \mathcal{F}_t \to \mathcal{G}$ is a morphism of $\mathcal{O}_X$-modules. A morphism $(t, \psi) \to (t', \psi')$ is given by a morphism $\beta : \mathcal{F}_t \to \mathcal{F}_{t'}$ such that $\psi' \circ \beta = \psi$. By Lemma 41.26.7 the colimit is quasi-coherent. Note that there is a canonical map $Q(\mathcal{G}) \to \mathcal{G}$ by definition of the colimit. The formula

$$Hom(\mathcal{H}, Q(\mathcal{G})) = Hom(\mathcal{H}, \mathcal{G})$$

holds for $\mathcal{H} = \mathcal{F}_t$ by construction. It follows formally from this and the fact that every $\mathcal{H}$ is a directed colimit of $\mathcal{O}_X$-modules isomorphic to $\mathcal{F}_t$ that this equality holds for any quasi-coherent module $\mathcal{H}$ on X. This finishes the proof. □

41.30. Morphisms towards schemes

Here is the analogue of Schemes, Lemma 21.6.4.

Lemma 41.30.1. *Let X be an algebraic space over* $\mathbf{Z}$. *Let T be an affine scheme. The map*

$$Mor(X, T) \longrightarrow Hom(\Gamma(T, \mathcal{O}_T), \Gamma(X, \mathcal{O}_X))$$

which maps f *to* $f^\sharp$ *(on global sections) is bijective.*

[7] This functor is sometimes called the *coherator*.

Proof. We construct the inverse of the map. Let $\varphi : \Gamma(T, \mathcal{O}_T) \to \Gamma(X, \mathcal{O}_X)$ be a ring map. Choose a presentation $X = U/R$, see Spaces, Definition 40.9.3. By Schemes, Lemma 21.6.4 the composition

$$\Gamma(T, \mathcal{O}_T) \to \Gamma(X, \mathcal{O}_X) \to \Gamma(U, \mathcal{O}_U)$$

corresponds to a unique morphism of schemes $g : U \to T$. By the same lemma the two compositions $R \to U \to T$ are equal. Hence we obtain a morphism $f : X = U/R \to T$ such that $U \to X \to T$ equals g. By construction the diagram

$$\begin{tikzcd} \Gamma(U, \mathcal{O}_U) & \Gamma(X, \mathcal{O}_X) \arrow[l, "f^\sharp"'] \\ & \Gamma(T, \mathcal{O}_T) \arrow[ul, "g^\sharp"] \arrow[u, "\varphi"'] \end{tikzcd}$$

commutes. Hence $f^\sharp$ equals φ because $U \to X$ is an étale covering and $\mathcal{O}_X$ is a sheaf on $X_{étale}$. The uniqueness of f follows from the uniqueness of g. $\square$

41.31. Quotients by free actions

Let S be a scheme. Let X be an algebraic space over S. Let G be an abstract group. Let $a : G \to \text{Aut}(X)$ be a homomorphism, i.e., a is an *action* of G on X. We will say the action is *free* if for every scheme T over S the map

$$G \times X(T) \longrightarrow X(T)$$

is free. (We cannot use a criterion as in Spaces, Lemma 40.14.3 because points may not have well defined residue fields.) In case the action is free we're going to construct the quotient X/G as an algebraic space. This is a special case of the general Bootstrap, Lemma 54.11.5 that we will prove later.

Lemma 41.31.1. *Let S be a scheme. Let X be an algebraic space over S. Let G be an abstract group with a free action on X. Then the quotient sheaf X/G is an algebraic space.*

Proof. The statement means that the sheaf F associated to the presheaf

$$T \longmapsto X(T)/G$$

is an algebraic space. To see this we will construct a presentation. Namely, choose a scheme U and a surjective étale morphism $\varphi : U \to X$. Set $V = \coprod_{g \in G} U$ and set $\psi : V \to X$ equal to $a(g) \circ \varphi$ on the component corresponding to $g \in G$. Let G act on V by permuting the components, i.e., $g_0 \in G$ maps the component corresponding to g to the component corresponding to $g_0 g$ via the identity morphism of U. Then ψ is a G-equivariant morphism, i.e., we reduce to the case dealt with in the next paragraph.

Assume that there exists a G-action on U and that $U \to X$ is surjective, étale and G-equivariant. In this case there is an induced action of G on $R = U \times_X U$ compatible with the projection mappings $t, s : R \to U$. Now we claim that

$$X/G = U/\coprod\nolimits_{g \in G} R$$

where the map

$$j : \coprod\nolimits_{g \in G} R \longrightarrow U \times_S U$$

is given by $(r, g) \mapsto (t(r), g(s(r)))$. Note that j is a monomorphism: If $(t(r), g(s(r))) = (t(r'), g'(s(r')))$, then $t(r) = t(r')$, hence r and r' have the same image in X under both s and t, hence $g = g'$ (as G acts freely on X), hence $s(r) = s(r')$, hence $r = r'$ (as R is an equivalence relation on U). Moreover j is an equivalence relation (details omitted). Both projections $\coprod_{g \in G} R \to U$ are étale, as s and t are étale. Thus j is an étale equivalence relation and $U/\coprod_{g \in G} R$ is an algebaic space by Spaces, Theorem 40.10.5. There is a map

$$U/\coprod\nolimits_{g \in G} R \longrightarrow X/G$$

induced by the map $U \to X$. We omit the proof that it is an isomorphism of sheaves. $\square$

CHAPTER 42

Morphisms of Algebraic Spaces

42.1. Introduction

In this chapter we introduce some types of morphisms of algebraic spaces. A reference is [**Knu71a**].

The goal is to extend the definition of each of the types of morphisms of schemes defined in the chapters on schemes, and on morphisms of schemes to the category of algebraic spaces. Each case is slightly different and it seems best to treat them all separately.

42.2. Conventions

The standing assumption is that all schemes are contained in a big fppf site Sch_{fppf}. And all rings A considered have the property that $Spec(A)$ is (isomorphic) to an object of this big site.

Let S be a scheme and let X be an algebraic space over S. In this chapter and the following we will write $X \times_S X$ for the product of X with itself (in the category of algebraic spaces over S), instead of $X \times X$.

42.3. Properties of representable morphisms

Let S be a scheme. Let $f : X \to Y$ be a representable morphism of algebraic spaces. In Spaces, Section 40.5 we defined what it means for f to have property $\mathcal{P}$ in case $\mathcal{P}$ is a property of morphisms of schemes which

(1) is preserved under any base change, see Schemes, Definition 21.18.3, and
(2) is fppf local on the base, see Descent, Definition 31.18.1.

Namely, in this case we say f has property $\mathcal{P}$ if and only if for every scheme U and any morphism $U \to Y$ the morphism of schemes $X \times_Y U \to U$ has property $\mathcal{P}$.

According to the lists in Spaces, Section 40.4 this applies to the following properties: (1)(a) closed immersions, (1)(b) open immersions, (1)(c) quasi-compact immersions, (2) quasi-compact, (3) universally-closed, (4) (quasi-)separated, (5) monomorphism, (6) surjective, (7) universally injective, (8) affine, (9) quasi-affine, (10) (locally) of finite type, (11) (locally) quasi-finite, (12) (locally) of finite presentation, (13) locally of finite type of relative dimension d, (14) universally open, (15) flat, (16) syntomic, (17) smooth, (18) unramified (resp. G-unramified), (19) étale, (20) proper, (21) finite or integral, (22) finite locally free, and (23) immersion.

In this chapter we will redefine these notions for not necessarily representable morphisms of algebraic spaces. Whenever we do this we will make sure that the new definition agrees with the old one, in order to avoid ambiguity.

Note that the definition above applies whenever X is a scheme, since a morphism from a scheme to an algebraic space is representable. And in particular it applies when both X

and Y are schemes. In Spaces, Lemma 40.5.3 we have seen that in this case the definitions match, and no ambiguity arise.

Furthermore, in Spaces, Lemma 40.5.5 we have seen that the property of representable morphisms of algebraic spaces so defined is stable under arbitrary base change by a morphism of algebraic spaces. And finally, in Spaces, Lemmas 40.5.4 and 40.5.7 we have seen that if $\mathcal{P}$ is stable under compositions, which holds for the properties (1)(a), (1)(b), (1)(c), (2) -- (23), except (13) above, then taking products of representable morphisms preserves property $\mathcal{P}$ and compositions of representable morphisms preserves property $\mathcal{P}$.

We will use these facts below, and whenever we do we will simply refer to this section as a reference.

42.4. Immersions

Open, closed and locally closed immersions of algebraic spaces were defined in Spaces, Section 40.12. Namely, a morphism of algebraic spaces is a *closed immersion* (resp. *open immersion*, resp. *immersion*) if it is representable and a closed immersion (resp. open immersion, resp. immersion) in the sense of Section 42.3.

In particular these types of morphisms are stable under base change and compositions of morphisms in the category of algebraic spaces over S, see Spaces, Lemmas 40.12.2 and 40.12.3.

Lemma 42.4.1. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. The following are equivalent:*

1. *f is a closed immersion (resp. open immersion, resp. immersion),*
2. *for every scheme Z and any morphism $Z \to Y$ the morphism $Z \times_Y X \to Z$ is a closed immersion (resp. open immersion, resp. immersion),*
3. *for every affine scheme Z and any morphism $Z \to Y$ the morphism $Z \times_Y X \to Z$ is a closed immersion (resp. open immersion, resp. immersion),*
4. *there exists a scheme V and a surjective étale morphism $V \to Y$ such that $V \times_Y X \to V$ is a closed immersion (resp. open immersion, resp. immersion), and*
5. *there exists a Zariski covering $Y = \bigcup Y_i$ such that each of the morphisms $f^{-1}(Y_i) \to Y_i$ is a closed immersion (resp. open immersion, resp. immersion).*

Proof. Using that a base change of a closed immersion (resp. open immersion, resp. immersion) is another one it is clear that (1) implies (2) and (2) implies (3). Also (3) implies (4) since we can take V to be a disjoint union of affines, see Properties of Spaces, Lemma 41.6.1.

Assume $V \to Y$ is as in (4). Let $\mathcal{P}$ be the property closed immersion (resp. open immersion, resp. immersion) of morphisms of schemes. Note that property $\mathcal{P}$ is preserved under any base change and fppf local on the base (see Section 42.3). Moreover, morphisms of type $\mathcal{P}$ are separated and locally quasi-finite (in each of the three cases, see Schemes, Lemma 21.23.7, and Morphisms, Lemma 24.19.14). Hence by More on Morphisms, Lemma 33.35.1 the morphisms of type $\mathcal{P}$ satisfy descent for fppf covering. Thus Spaces, Lemma 40.11.3 applies and we see that $X \to Y$ is representable and has property $\mathcal{P}$, in other words (1) holds.

The equivalence of (1) and (5) follows from the fact that $\mathcal{P}$ is Zariski local on the target (since we saw above that $\mathcal{P}$ is in fact fppf local on the target). $\square$

Lemma 42.4.2. *Let S be a scheme. Let $i : Z \to X$ be an immersion of algebraic spaces over S. Then $|i|(|Z|) \subset |X|$ is a locally closed subset, and i is a closed immersion if and only if $|i|(|Z|) \subset |X|$ is a closed subset.*

Proof. Let U be a scheme and let $U \to X$ be a surjective étale morphism. By assumption $T = U \times_X Z$ is a scheme and the morphism $j : T \to U$ is an immersion of schemes. Moreover, note that $|j|(|T|) \subset |U|$ is the inverse image of $|i|(|Z|) \subset |X|$, see Properties of Spaces, Lemma 41.4.3. Recall that $|U| \to |X|$ is surjective and open, see Properties of Spaces, Lemma 41.4.6. Hence since $|T|$ is locally closed in $|U|$ it follows that $|i|(|Z|)$ is locally closed in $|X|$, see Topology, Lemma 5.15.2. And in the same way we see that $|i|(|Z|) \subset |X|$ is closed if and only if $T \subset U$ is closed, Thus we can combine Lemma 42.4.1 above and Schemes, Lemma 21.10.4 to finish the proof. □

Remark 42.4.3. Let S be a scheme. Let $i : Z \to X$ be an immersion of algebraic spaces over S. Since i is a monomorphism we may think of $|Z|$ as a subset of $|X|$; in the rest of this remark we do so. Let $\partial|Z|$ be the boundary of $|Z|$ in the topological space $|X|$. In a formula

$$\partial|Z| = \overline{|Z|} \setminus |Z|.$$

Let ∂Z be the reduced closed subspace of X with $|\partial Z| = \partial|Z|$ obtained by taking the reduced induced closed subspace structure, see Properties of Spaces, Definition 41.9.3. By construction we see that $|Z|$ is closed in $|X| \setminus |\partial Z| = |X \setminus \partial Z|$. Hence it is true that any immersion of algebraic spaces can be factored as a closed immmersion followed by an open immersion (but not the other way in general, see Morphisms, Example 24.2.10).

Remark 42.4.4. Let S be a scheme. Let X be an algebraic space over S. Let $T \subset |X|$ be a locally closed subset. Let ∂T be the boundary of T in the topological space $|X|$. In a formula

$$\partial T = \overline{T} \setminus T.$$

Let $U \subset X$ be the open subspace of X with $|U| = |X| \setminus \partial T$, see Properties of Spaces, Lemma 41.4.8. Let Z be the reduced closed subspace of U with $|Z| = T$ obtained by taking the reduced induced closed subspace structure, see Properties of Spaces, Definition 41.9.3. By construction $Z \to U$ is a closed immersion of algebraic spaces and $U \to X$ is an open immersion, hence $Z \to X$ is an immersion of algebraic spaces over S (see Spaces, Lemma 40.12.2). Note that Z is a reduced algebraic space and that $|Z| = T$ as subsets of $|X|$. We sometimes say Z is the *reduced induced subspace structure* on T.

42.5. Separation axioms

It makes sense to list some a priori properties of the diagonal of a morphism of algebraic spaces.

Lemma 42.5.1. *Let S be a scheme contained in Sch_{fppf}. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Let $\Delta_{X/Y} : X \to X \times_Y X$ be the diagonal morphism. Then*

(1) *$\Delta_{X/Y}$ is representable,*
(2) *$\Delta_{X/Y}$ is locally of finite type,*
(3) *$\Delta_{X/Y}$ is a monomorphism,*
(4) *$\Delta_{X/Y}$ is separated, and*
(5) *$\Delta_{X/Y}$ is locally quasi-finite.*

Proof. We are going to use the fact that $\Delta_{X/S}$ is representable (by definition of an algebraic space) and that it satisfies properties (2) -- (5), see Spaces, Lemma 40.13.1. Note that we have a factorization

$$X \longrightarrow X \times_Y X \longrightarrow X \times_S X$$

of the diagonal $\Delta_{X/S} : X \to X \times_S X$. Since $X \times_Y X \to X \times_S X$ is a monomorphism, and since $\Delta_{X/S}$ is representable, it follows formally that $\Delta_{X/Y}$ is representable. In particular, the rest of the statements now make sense, see Section 42.3.

Choose a surjective étale morphism $U \to X$, with U a scheme. Consider the diagram

$$\begin{tikzcd} R = U \times_X U \arrow[r] \arrow[d] & U \times_Y U \arrow[r] \arrow[d] & U \times_S U \arrow[d] \\ X \arrow[r] & X \times_Y X \arrow[r] & X \times_S X \end{tikzcd}$$

Both squares are cartesian, hence so is the outer rectangle. The top row consists of schemes, and the vertical arrows are surjective étale morphisms. By Spaces, Lemma 40.11.2 the properties (2) -- (5) for $\Delta_{X/Y}$ are equivalent to those of $R \to U \times_Y U$. In the proof of Spaces, Lemma 40.13.1 we have seen that $R \to U \times_S U$ has properties (2) -- (5). The morphism $U \times_Y U \to U \times_S U$ is a monomorphism of schemes. These facts imply that $R \to U \times_S U$ have properties (2) -- (5).

Namely: For (3), note that $R \to U \times_Y U$ is a monomorphism as the composition $R \to U \times_S U$ is a monomorphism. For (2), note that $R \to U \times_Y U$ is locally of finite type, as the composition $R \to U \times_S U$ is locally of finite type (Morphisms, Lemma 24.14.8). A monomorphism which is locally of finite type is locally quasi-finite because it has finite fibres (Morphisms, Lemma 24.19.7), hence (5). A monomorphism is separated (Schemes, Lemma 21.23.3), hence (4). □

Definition 42.5.2. Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Let $\Delta_{X/Y} : X \to X \times_Y X$ be the diagonal morphism.

(1) We say f is *separated* if $\Delta_{X/Y}$ is a closed immersion.
(2) We say f is *locally separated*[1] if $\Delta_{X/Y}$ is an immersion.
(3) We say f is *quasi-separated* if $\Delta_{X/Y}$ is quasi-compact.

This definition makes sense since $\Delta_{X/Y}$ is representable, and hence we know what it means for it to have one of the properties described in the definition. We will see below (Lemma 42.5.13) that this definition matches the ones we already have for morphisms of schemes and representable morphisms.

Lemma 42.5.3. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. If f is separated, then f is locally separated and f is quasi-separated.*

Proof. This is true, via the general principle Spaces, Lemma 40.5.8, because a closed immersion of schemes is an immersion and is quasi-compact. □

Lemma 42.5.4. *All of the separation axioms listed in Definition 42.5.2 are stable under base change.*

[1]In the literature this term often refers to quasi-separated and locally separated morphisms.

Proof. Let $f : X \to Y$ and $Y' \to Y$ be morphisms of algebraic spaces. Let $f' : X' \to Y'$ be the base change of f by $Y' \to Y$. Then $\Delta_{X'/Y'}$ is the base change of $\Delta_{X/Y}$ by the morphism $X' \times_{Y'} X' \to X \times_Y X$. By the results of Section 42.3 each of the properties of the diagonal used in Definition 42.5.2 is stable under base change. Hence the lemma is true. $\square$

Lemma 42.5.5. *Let S be a scheme. Let $f : X \to Z$, $g : Y \to Z$ and $Z \to T$ be morphisms of algebraic spaces over S. Consider the induced morphism $i : X \times_Z Y \to X \times_T Y$. Then*

1. *i is representable, locally of finite type, locally quasi-finite, separated and a monomorphism,*
2. *if $Z \to T$ is locally separated, then i is an immersion,*
3. *if $Z \to T$ is separated, then i is a closed immersion, and*
4. *if $Z \to T$ is quasi-separated, then i is quasi-compact.*

Proof. By general category theory the following diagram

$$\begin{tikzcd} X \times_Z Y \arrow[r, "i"'] \arrow[d] & X \times_T Y \arrow[d] \\ Z \arrow[r, "\Delta_{Z/T}"] & Z \times_T Z \end{tikzcd}$$

is a fibre product diagram. Hence i is the base change of the diagonal morphism $\Delta_{Z/T}$. Thus the lemma follows from Lemma 42.5.1, and the material in Section 42.3. $\square$

Lemma 42.5.6. *Let S be a scheme. Let T be an algebraic space over S. Let $g : X \to Y$ be a morphism of algebraic spaces over T. Consider the graph $i : X \to X \times_T Y$ of g. Then*

1. *i is representable, locally of finite type, locally quasi-finite, separated and a monomorphism,*
2. *if $Y \to T$ is locally separated, then i is an immersion,*
3. *if $Y \to T$ is separated, then i is a closed immersion, and*
4. *if $Y \to T$ is quasi-separated, then i is quasi-compact.*

Proof. This is a special case of Lemma 42.5.5 applied to the morphism $X = X \times_Y Y \to X \times_T Y$. $\square$

Lemma 42.5.7. *Let S be a schemes. Let $f : X \to T$ be a morphism of algebraic spaces over S. Let $s : T \to X$ be a section of f (in a formula $f \circ s = id_T$). Then*

1. *s is representable, locally of finite type, locally quasi-finite, separated and a monomorphism,*
2. *if f is locally separated, then s is an immersion,*
3. *if f is separated, then s is a closed immersion, and*
4. *if f is quasi-separated, then s is quasi-compact.*

Proof. This is a special case of Lemma 42.5.6 applied to $g = s$ so the morphism $i = s : T \to T \times_T X$. $\square$

Lemma 42.5.8. *All of the separation axioms listed in Definition 42.5.2 are stable under composition of morphisms.*

Proof. Let $f : X \to Y$ and $g : Y \to Z$ be morphisms of algebraic spaces to which the axiom in question applies. The diagonal $\Delta_{X/Z}$ is the composition

$$X \longrightarrow X \times_Y X \longrightarrow X \times_Z X.$$

Our separation axiom is defined by requiring the diagonal to have some property $\mathcal{P}$. By Lemma 42.5.5 above we see that the second arrow also has this property. Hence the lemma follows since the composition of (representable) morphisms with property $\mathcal{P}$also is a morphism with property $\mathcal{P}$, see Section 42.3. □

Lemma 42.5.9. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S.*

(1) *If Y is separated and f is separated, then X is separated.*
(2) *If Y is quasi-separated and f is quasi-separated, then X is quasi-separated.*
(3) *If Y is locally separated and f is locally separated, then X is locally separated.*
(4) *If Y is separated over S and f is separated, then X is separated over S.*
(5) *If Y is quasi-separated over S and f is quasi-separated, then X is quasi-separated over S.*
(6) *If Y is locally separated over S and f is locally separated, then X is locally separated over S.*

Proof. Parts (4), (5), and (6) follow immediately from Lemma 42.5.8 and Spaces, Definition 40.13.2. Parts (1), (2), and (3) reduce to parts (4), (5), and (6) by thinking of X and Y as algebraic spaces over $Spec(\mathbf{Z})$, see Properties of Spaces, Definition 41.3.1. □

Lemma 42.5.10. *Let S be a scheme. Let $f : X \to Y$ and $g : Y \to Z$ be morphisms of algebraic spaces over S.*

(1) *If $g \circ f$ is separated then so is f.*
(2) *If $g \circ f$ is locally separated then so is f.*
(3) *If $g \circ f$ is quasi-separated then so is f.*

Proof. Consider the factorization

$$X \to X \times_Y X \to X \times_Z X$$

of the diagonal morphism of $g \circ f$. In any case the last morphism is a monomorphism. Hence for any scheme T and morphism $T \to X \times_Y X$ we have the equality

$$X \times_{(X \times_Y X)} T = X \times_{(X \times_Z X)} T.$$

Hence the result is clear. □

Lemma 42.5.11. *Let S be a scheme. Let X be an algebraic space over S.*

(1) *If X is separated then X is separated over S.*
(2) *If X is locally separated then X is locally separated over S.*
(3) *If X is quasi-separated then X is quasi-separated over S.*

Let $f : X \to Y$ be a morphism of algebraic spaces over S.

(4) *If X is separated over S then f is separated.*
(5) *If X is locally separated over S then f is locally separated.*
(6) *If X is quasi-separated over S then f is quasi-separated.*

Proof. Parts (4), (5), and (6) follow immediately from Lemma 42.5.10 and Spaces, Definition 40.13.2. Parts (1), (2), and (3) follow from parts (4), (5), and (6) by thinking of X and Y as algebraic spaces over $Spec(\mathbf{Z})$, see Properties of Spaces, Definition 41.3.1. □

Lemma 42.5.12. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Let $\mathcal{P}$ be any of the separation axioms of Definition 42.5.2. The following are equivalent*

(1) *f is $\mathcal{P}$,*

(2) *for every scheme Z and morphism $Z \to Y$ the base change $Z \times_Y X \to Z$ of f is $\mathcal{P}$,*
(3) *for every affine scheme Z and every morphism $Z \to Y$ the base change $Z \times_Y X \to Z$ of f is $\mathcal{P}$,*
(4) *for every affine scheme Z and every morphism $Z \to Y$ the algebraic space $Z \times_Y X$ is $\mathcal{P}$ (see Properties of Spaces, Definition 41.3.1),*
(5) *there exists a scheme V and a surjective étale morphism $V \to Y$ such that the base change $V \times_Y X \to V$ has $\mathcal{P}$, and*
(6) *there exists a Zariski covering $Y = \bigcup Y_i$ such that each of the morphisms $f^{-1}(Y_i) \to Y_i$ has $\mathcal{P}$.*

Proof. We will repeatedly use Lemma 42.5.4 without further mention. In particular, it is clear that (1) implies (2) and (2) implies (3).

Let us prove that (3) and (4) are equivalent. Note that if Z is an affine scheme, then the morphism $Z \to Spec(\mathbf{Z})$ is a separated morphism as a morphism of algebraic spaces over $Spec(\mathbf{Z})$. If $Z \times_Y X \to Z$ is $\mathcal{P}$, then $Z \times_Y X \to Spec(\mathbf{Z})$ is $\mathcal{P}$ as a composition (see Lemma 42.5.8). Hence the algebraic space $Z \times_Y X$ is $\mathcal{P}$. Conversely, if the algebraic space $Z \times_Y X$ is $\mathcal{P}$, then $Z \times_Y X \to Spec(\mathbf{Z})$ is $\mathcal{P}$, and hence by Lemma 42.5.10 we see that $Z \times_Y X \to Z$ is $\mathcal{P}$.

Let us prove that (3) implies (5). Assume (3). Let V be a scheme and let $V \to Y$ be étale surjective. We have to show that $V \times_Y X \to V$ has property $\mathcal{P}$. In other words, we have to show that the morphism

$$V \times_Y X \longrightarrow (V \times_Y X) \times_V (V \times_Y X) = V \times_Y X \times_Y X$$

has the corresponding property (i.e., is a closed immersion, immersion, or quasi-compact). Let $V = \bigcup V_j$ be an affine open covering of V. By assumption we know that each of the morphisms

$$V_j \times_Y X \longrightarrow V_j \times_Y X \times_Y X$$

does have the corresponding property. Since being a closed immersion, immersion, quasi-compact immersion, or quasi-compact is Zariski local on the target, and since the V_j cover V we get the desired conclusion.

Let us prove that (5) implies (1). Let $V \to Y$ be as in (5). Then we have the fibre product diagram

$$\begin{tikzcd}
V \times_Y X \arrow[r] \arrow[d] & X \arrow[d] \\
V \times_Y X \times_Y X \arrow[r] & X \times_Y X
\end{tikzcd}$$

By assumption the left vertical arrow is a closed immersion, immersion, quasi-compact immersion, or quasi-compact. It follows from Spaces, Lemma 40.5.6 that also the right vertical arrow is a closed immersion, immersion, quasi-compact immersion, or quasi-compact.

It is clear that (1) implies (6) by taking the covering $Y = Y$. Assume $Y = \bigcup Y_i$ is as in (6). Choose schemes V_i and surjective étale morphisms $V_i \to Y_i$. Note that the morphisms $V_i \times_Y X \to V_i$ have $\mathcal{P}$ as they are base changes of the morphisms $f^{-1}(Y_i) \to Y_i$. Set $V = \coprod V_i$. Then $V \to Y$ is a morphism as in (5) (details omitted). Hence (6) implies (5) and we are done. $\square$

Lemma 42.5.13. *Let S be a scheme. Let $f : X \to Y$ be a representable morphism of algebraic spaces over S.*

1. *The morphism f is locally separated.*
2. *The morphism f is (quasi-)separated in the sense of Definition 42.5.2 above if and only if f is (quasi-)separated in the sense of Section 42.3.*

In particular, if $f : X \to Y$ is a morphism of schemes over S, then f is (quasi-)separated in the sense of Definition 42.5.2 if and only if f is (quasi-)separated as a morphism of schemes.

Proof. This is the equivalence of (1) and (2) of Lemma 42.5.12 combined with the fact that any morphism of schemes is locally separated, see Schemes, Lemma 21.21.2. ☐

42.6. Surjective morphisms

We have already defined in Section 42.3 what it means for a representable morphism of algebraic spaces to be surjective.

Lemma 42.6.1. *Let S be a scheme. Let $f : X \to Y$ be a representable morphism of algebraic spaces over S. Then f is surjective if and only if $|f| : |X| \to |Y|$ is surjective.*

Proof. Namely, if $f : X \to Y$ is representable, then it is surjective if and only if for every scheme T and every morphism $T \to Y$ the base change $f_T : T \times_Y X \to T$ of f is a surjective morphism of schemes, in other words, if and only if $|f_T|$ is surjective. By Properties of Spaces, Lemma 41.4.3 the map $|T \times_Y X| \to |T| \times_{|Y|} |X|$ is always surjective. Hence $|f_T| : |T \times_Y X| \to |T|$ is surjective if $|f| : |X| \to |Y|$ is surjective. Conversely, if $|f_T|$ is surjective for every $T \to Y$ as above, then by taking T to be the spectrum of a field we conclude that $|X| \to |Y|$ is surjective. ☐

This clears the way for the following definition.

Definition 42.6.2. Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. We say f is *surjective* if the map $|f| : |X| \to |Y|$ of associated topological spaces is surjective.

Lemma 42.6.3. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. The following are equivalent:*

1. *f is surjective,*
2. *for every scheme Z and any morphism $Z \to Y$ the morphism $Z \times_Y X \to Z$ is surjective,*
3. *for every affine scheme Z and any morphism $Z \to Y$ the morphism $Z \times_Y X \to Z$ is surjective,*
4. *there exists a scheme V and a surjective étale morphism $V \to Y$ such that $V \times_Y X \to V$ is a surjective morphism,*
5. *there exists a scheme U and a surjective étale morphism $\varphi : U \to X$ such that the composition $f \circ \varphi$ is surjective,*
6. *there exists a commutative diagram*

$$\begin{tikzcd} U \arrow[r] \arrow[d] & V \arrow[d] \\ X \arrow[r] & Y \end{tikzcd}$$

where U, V are schemes and the vertical arrows are surjective étale such that the top horizontal arrow is surjective, and

(7) *there exists a Zariski covering $Y = \bigcup Y_i$ such that each of the morphisms $f^{-1}(Y_i) \to Y_i$ is surjective.*

Proof. Omitted. $\square$

Lemma 42.6.4. *The composition of surjective morphisms is surjective.*

Proof. This is immediate from the definition. $\square$

Lemma 42.6.5. *The base change of a surjective morphism is surjective.*

Proof. Follows immediately from Properties of Spaces, Lemma 41.4.3. $\square$

42.7. Open morphisms

For a representable morphism of algebraic spaces we have already defined (in Section 42.3) what it means to be universally open. Hence before we give the natural definition we check that it agrees with this in the representable case.

Lemma 42.7.1. *Let S be a scheme. Let $f : X \to Y$ be a representable morphism of algebraic spaces over S. The following are equivalent*

(1) *f is universally open, and*
(2) *for every morphism of algebraic spaces $Z \to Y$ the morphism of topological spaces $|Z \times_Y X| \to |Z|$ is open.*

Proof. Assume (1), and let $Z \to Y$ be as in (2). Choose a scheme V and a surjective étale morphism $V \to Y$. By assumption the morphism of schemes $V \times_Y X \to V$ is universally open. By Properties of Spaces, Section 41.4 in the commutative diagram

$$\begin{tikzcd} {|V \times_Y X|} \arrow[r] \arrow[d] & {|Z \times_Y X|} \arrow[d] \\ {|V|} \arrow[r] & {|Z|} \end{tikzcd}$$

the horizontal arrows are open and surjective, and moreover

$$|V \times_Y X| \longrightarrow |V| \times_{|Z|} |Z \times_Y X|$$

is surjective. Hence as the left vertical arrow is open it follows that the right vertical arrow is open. This proves (2). The implication (2) $\Rightarrow$ (1) is immediate from the definitions. $\square$

Thus we may use the following natural definition.

Definition 42.7.2. Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S.

(1) We say f is *open* if the map of topological spaces $|f| : |X| \to |Y|$ is open.
(2) We say f is *universally open* if for every morphism of algebraic spaces $Z \to Y$ the morphism of topological spaces

$$|Z \times_Y X| \to |Z|$$

is open, i.e., the base change $Z \times_Y X \to Z$ is open.

Note that an étale morphism of algebraic spaces is universally open, see Properties of Spaces, Definition 41.13.2 and Lemmas 41.13.7 and 41.13.5.

Lemma 42.7.3. *The base change of a universally open morphism of algebraic spaces by any morphism of algebraic spaces is universally open.*

Proof. This is immediate from the definition. □

Lemma 42.7.4. *The composition of a pair of (universally) open morphisms of algebraic spaces is (universally) open.*

Proof. Omitted. □

Lemma 42.7.5. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. The following are equivalent*

(1) *f is universally open,*
(2) *for every scheme Z and every morphism $Z \to Y$ the projection $|Z \times_Y X| \to |Z|$ is open,*
(3) *for every affine scheme Z and every morphism $Z \to Y$ the projection $|Z \times_Y X| \to |Z|$ is open, and*
(4) *there exists a scheme V and a surjective étale morphism $V \to Y$ such that $V \times_Y X \to V$ is a universally open morpism of algebraic spaces, and*
(5) *there exists a Zariski covering $Y = \bigcup Y_i$ such that each of the morphisms $f^{-1}(Y_i) \to Y_i$ is universally open.*

Proof. We omit the proof that (1) implies (2), and that (2) implies (3).

Assume (3). Choose a surjective étale morphism $V \to Y$. We are going to show that $V \times_Y X \to V$ is a universally open morphism of algebraic spaces. Let $Z \to V$ be a morphism from an algebraic space to V. Let $W \to Z$ be a surjective étale morphism where $W = \coprod W_i$ is a disjoint union of affine schemes, see Properties of Spaces, Lemma 41.6.1. Then we have the following commutative diagram

$$\begin{tikzcd}
\coprod_i |W_i \times_Y X| \arrow[r, equal] \arrow[d] & |W \times_Y X| \arrow[r] \arrow[d] & |Z \times_Y X| \arrow[r, equal] \arrow[d] & |Z \times_V (V \times_Y X)| \arrow[dl] \\
\coprod |W_i| \arrow[r, equal] & |W| \arrow[r] & |Z| &
\end{tikzcd}$$

We have to show the south-east arrow is open. The middle horizontal arrows are surjective and open (Properties of Spaces, Lemma 41.13.7). By assumption (3), and the fact that W_i is affine we see that the left vertical arrows are open. Hence it follows that the right vertical arrow is open.

Assume $V \to Y$ is as in (4). We will show that f is universally open. Let $Z \to Y$ be a morphism of algebraic spaces. Consider the diagram

$$\begin{tikzcd}
|(V \times_Y Z) \times_V (V \times_Y X)| \arrow[r, equal] \arrow[dr] & |V \times_Y X| \arrow[r] \arrow[d] & |Z \times_Y X| \arrow[d] \\
& |V \times_Y Z| \arrow[r] & |Z|
\end{tikzcd}$$

The south-west arrow is open by assumption. The horizontal arrows are surjective and open because the corresponding morphisms of algebraic spaces are étale (see Properties of Spaces, Lemma 41.13.7). It follows that the right vertical arrow is open.

Of course (1) implies (5) by taking the covering $Y = Y$. Assume $Y = \bigcup Y_i$ is as in (5). Then for any $Z \to Y$ we get a corresponding Zariski covering $Z = \bigcup Z_i$ such that the base change of f to Z_i is open. By a simple topological argument this implies that $Z \times_Y X \to Z$ is open. Hence (1) holds. □

Lemma 42.7.6. *Let S be a scheme. Let $p : X \to Spec(k)$ be a morphism of algebraic spaces over S where k is a field. Then $p : X \to Spec(k)$ is universally open.*

Proof. Choose a scheme U and a surjective étale morphism $U \to X$. The composition $U \to Spec(k)$ is universally open (as a morphism of schemes) by Morphisms, Lemma 24.22.4. Let $Z \to Spec(k)$ be a morphism of schemes. Then $U \times_{Spec(k)} Z \to X \times_{Spec(k)} Z$ is surjective, see Lemma 42.6.5. Hence the first of the maps

$$|U \times_{Spec(k)} Z| \to |X \times_{Spec(k)} Z| \to |Z|$$

is surjective. Since the composition is open by the above we conclude that the second map is open as well. Whence p is universally open by Lemma 42.7.5. □

42.8. Submersive morphisms

Definition 42.8.1. Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S.

(1) We say f is *submersive*[2] if the continuous map $|X| \to |Y|$ is submersive, see Topology, Definition 5.15.1.
(2) We say f is *universally submersive* if for every morphism of algebraic spaces $Y' \to Y$ the base change $Y' \times_Y X \to Y'$ is submersive.

We note that a submersive morphism is in particular surjective.

42.9. Quasi-compact morphisms

By Section 42.3 we know what it means for a representable morphism of algebraic spaces to be quasi-compact. In order to formulate the definition for a general morphism of algebraic spaces we make the following observation.

Lemma 42.9.1. *Let S be a scheme. Let $f : X \to Y$ be a representable morphism of algebraic spaces over S. The following are equivalent:*

(1) *f is quasi-compact, and*
(2) *for every quasi-compact algebraic space Z and any morphism $Z \to Y$ the algebraic space $Z \times_Y X$ is quasi-compact.*

Proof. Assume (1), and let $Z \to Y$ be a morphism of algebraic spaces with Z quasi-compact. By Properties of Spaces, Definition 41.5.1 there exists a quasi-compact scheme U and a surjective étale morphism $U \to Z$. Since f is representable and quasi-compact we see by definition that $U \times_Y X$ is a scheme, and that $U \times_Y X \to U$ is quasi-compact. Hence $U \times_Y X$ is a quasi-compact scheme. The morphism $U \times_Y X \to Z \times_Y X$ is étale and surjective (as the base change of the representable étale and surjective morphism $U \to Z$, see Section 42.3). Hence by definition $Z \times_Y X$ is quasi-compact.

Assume (2). Let $Z \to Y$ be a morphism, where Z is a scheme. We have to show that $p : Z \times_Y X \to Z$ is quasi-compact. Let $U \subset Z$ be affine open. Then $p^{-1}(U) = U \times_Y Z$ and the scheme $U \times_Y Z$ is quasi-compact by assumption (2). Hence p is quasi-compact, see Schemes, Section 21.19. □

This motivates the following definition.

Definition 42.9.2. Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. We say f is *quasi-compact* if for every quasi-compact algebraic space Z and morphism $Z \to Y$ the fibre product $Z \times_Y X$ is quasi-compact.

[2] This is very different from the notion of a submersion of differential manifolds.

By Lemma 42.9.1 above this agrees with the already existing notion for representable morphisms of algebraic spaces.

Lemma 42.9.3. *The base change of a quasi-compact morphism of algebraic spaces by any morphism of algebraic spaces is quasi-compact.*

Proof. Omitted. □

Lemma 42.9.4. *The composition of a pair of quasi-compact morphisms of algebraic spaces is quasi-compact.*

Proof. Omitted. □

Lemma 42.9.5. *Let S be a scheme.*

(1) *If $X \to Y$ is a surjective morphism of algebraic spaces over S, and X is quasi-compact then Y is quasi-compact.*
(2) *If*

$$\begin{tikzcd} X \arrow[rr, "f"] \arrow[dr, "p"'] & & Y \arrow[dl, "q"] \\ & Z & \end{tikzcd}$$

is a commutative diagram of morphisms of algebraic spaces over S and f is surjective and p is quasi-compact, then q is quasi-compact.

Proof. Assume X is quasi-compact and $X \to Y$ is surjective. By Definition 42.6.2 the map $|X| \to |Y|$ is surjective, hence we see Y is quasi-compact by Properties of Spaces, Lemma 41.5.2 and the topological fact that the image of a quasi-compact space under a continuous map is quasi-compact, see Topology, Lemma 5.9.5. Let f, p, q be as in (2). Let $T \to Z$ be a morphism whose source is a quasi-compact algebraic space. By assumption $T \times_Z X$ is quasi-compact. By Lemma 42.6.5 the morphism $T \times_Z X \to T \times_Z Y$ is surjective. Hence by part (1) we see $T \times_Z Y$ is quasi-compact too. Thus q is quasi-compact. □

Lemma 42.9.6. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Let $g : Y' \to Y$ be a universally open and surjective morphism of algebraic spaces such that the base change $f' : X' \to Y'$ is quasi-compact. Then f is quasi-compact.*

Proof. Let $Z \to Y$ be a morphism of algebraic spaces with Z quasi-compact. As g is universally open and surjective, we see that $Y' \times_Y Z \to Z$ is open and surjective. As every point of $|Y' \times_Y Z|$ has a fundamental system of quasi-compact open neighbourhoods (see Properties of Spaces, Lemma 41.5.5) we can find a quasi-compact open $W \subset |Y' \times_Y Z|$ which surjects onto Z. Denote $f'' : W \times_Y X \to W$ the base change of f' by $W \to Y'$. By assumption $W \times_Y X$ is quasi-compact. As $W \to Z$ is surjective we see that $W \times_Y X \to Z \times_Y X$ is surjective. Hence $Z \times_Y X$ is quasi-compact by Lemma 42.9.5. Thus f is quasi-compact. □

Lemma 42.9.7. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. The following are equivalent:*

(1) *f is quasi-compact,*
(2) *for every scheme Z and any morphism $Z \to Y$ the morphism of algebraic spaces $Z \times_Y X \to Z$ is quasi-compact,*
(3) *for every affine scheme Z and any morphism $Z \to Y$ the algebraic space $Z \times_Y X$ is quasi-compact,*

(4) *there exists a scheme V and a surjective étale morphism $V \to Y$ such that $V \times_Y X \to V$ is a quasi-compact morphism of algebraic spaces, and*
(5) *there exists a surjective étale morphism $Y' \to Y$ of algebraic spaces such that $Y' \times_Y X \to Y'$ is a quasi-compact morphism of algebraic spaces, and*
(6) *there exists a Zariski covering $Y = \bigcup Y_i$ such that each of the morphisms $f^{-1}(Y_i) \to Y_i$ is quasi-compact.*

Proof. We will use Lemma 42.9.3 without further mention. It is clear that (1) implies (2) and that (2) implies (3). Assume (3). Let Z be a quasi-compact algebraic space over S, and let $Z \to Y$ be a morphism. By Properties of Spaces, Lemma 41.6.3 there exists an affine scheme U and a surjective étale morphism $U \to Z$. Then $U \times_Y X \to Z \times_Y X$ is a surjective morphism of algebraic spaces, see Lemma 42.6.5. By assumption $|U \times_Y X|$ is quasi-compact. It surjects onto $|Z \times_Y X|$, hence we conclude that $|Z \times_Y X|$ is quasi-compact, see Topology, Lemma 5.9.5. This proves that (3) implies (1).

The implications (1) ⇒ (4), (4) ⇒ (5) are clear. The implication (5) ⇒ (1) follows from Lemma 42.9.6 and the fact that an étale morphism of algebraic spaces is universally open (see discussion following Definition 42.7.2).

Of course (1) implies (6) by taking the covering $Y = Y$. Assume $Y = \bigcup Y_i$ is as in (6). Let Z be affine and let $Z \to Y$ be a morphism. Then there exists a finite standard affine covering $Z = Z_1 \cup \ldots \cup Z_n$ such that each $Z_j \to Y$ factors through Y_{i_j} for some i_j. Hence the algebraic space

$$Z_j \times_Y X = Z_j \times_{Y_{i_j}} f^{-1}(Y_{i_j})$$

is quasi-compact. Since $Z \times_Y X = \bigcup_{j=1,\ldots,n} Z_j \times_Y X$ is a Zariski covering we see that $|Z \times_Y X| = \bigcup_{j=1,\ldots,n} |Z_j \times_Y X|$ (see Properties of Spaces, Lemma 41.4.8) is a finite union of quasi-compact spaces, hence quasi-compact. Thus we see that (6) implies (3). □

The following (and the next) lemma guarantees in particular that a morphism $X \to Spec(A)$ is quasi-compact as soon as X is a quasi-compact algebraic space

Lemma 42.9.8. *Let S be a scheme. Let $f : X \to Y$ and $g : Y \to Z$ be morphisms of algebraic spaces over S. If $g \circ f$ is quasi-compact and g is quasi-separated then f is quasi-compact.*

Proof. This is true because f equals the composition $(1, f) : X \to X \times_Z Y \to Y$. The first map is quasi-compact by Lemma 42.5.7 because it is a section of the quasi-separated morphism $X \times_Z Y \to X$ (a base change of g, see Lemma 42.5.4). The second map is quasi-compact as it is the base change of f, see Lemma 42.9.3. And compositions of quasi-compact morphisms are quasi-compact, see Lemma 42.9.4. □

Lemma 42.9.9. *Let $f : X \to Y$ be a morphism of algebraic spaces over a scheme S.*
(1) *If X is quasi-compact and Y is quasi-separated, then f is quasi-compact.*
(2) *If X is quasi-compact and quasi-separated and Y is quasi-separated, then f is quasi-compact and quasi-separated.*
(3) *A fibre product of quasi-compact and quasi-separated algebraic spaces is quasi-compact and quasi-separated.*

Proof. Part (1) follows from Lemma 42.9.8 with $Z = S = Spec(\mathbf{Z})$. Part (2) follows from (1) and Lemma 42.5.10. For (3) let $X \to Y$ and $Z \to Y$ be morphisms of quasi-compact and quasi-separated algebraic spaces. Then $X \times_Y Z \to Z$ is quasi-compact and quasi-separated as a base change of $X \to Y$ using (2) and Lemmas 42.9.3 and 42.5.4. Hence $X \times_Y Z$ is quasi-compact and quasi-separated as an algebraic space quasi-compact and quasi-separated over Z, see Lemmas 42.5.9 and 42.9.4. ☐

42.10. Universally closed morphisms

For a representable morphism of algebraic spaces we have already defined (in Section 42.3) what it means to be universally closed. Hence before we give the natural definition we check that it agrees with this in the representable case.

Lemma 42.10.1. *Let S be a scheme. Let $f : X \to Y$ be a representable morphism of algebraic spaces over S. The following are equivalent*

(1) *f is universally closed, and*
(2) *for every morphism of algebraic spaces $Z \to Y$ the morphism of topological spaces $|Z \times_Y X| \to |Z|$ is closed.*

Proof. Assume (1), and let $Z \to Y$ be as in (2). Choose a scheme V and a surjective étale morphism $V \to Y$. By assumption the morphism of schemes $V \times_Y X \to V$ is universally closed. By Properties of Spaces, Section 41.4 in the commutative diagram

$$\begin{tikzcd} {|V \times_Y X|} \arrow[r] \arrow[d] & {|Z \times_Y X|} \arrow[d] \\ {|V|} \arrow[r] & {|Z|} \end{tikzcd}$$

the horizontal arrows are open and surjective, and moreover

$$|V \times_Y X| \longrightarrow |V| \times_{|Z|} |Z \times_Y X|$$

is surjective. Hence as the left vertical arrow is closed it follows that the right vertical arrow is closed. This proves (2). The implication (2) $\Rightarrow$ (1) is immediate from the definitions. ☐

Thus we may use the following natural definition.

Definition 42.10.2. Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S.

(1) We say f is *closed* if the map of topological spaces $|X| \to |Y|$ is closed.
(2) We say f is *universally closed* if for every morphism of algebraic spaces $Z \to Y$ the morphism of topological spaces
$$|Z \times_Y X| \to |Z|$$
is closed, i.e., the base change $Z \times_Y X \to Z$ is closed.

Lemma 42.10.3. *The base change of a universally closed morphism of algebraic spaces by any morphism of algebraic spaces is universally closed.*

Proof. This is immediate from the definition. ☐

Lemma 42.10.4. *The composition of a pair of (universally) closed morphisms of algebraic spaces is (universally) closed.*

Proof. Omitted. ☐

Lemma 42.10.5. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. The following are equivalent*

(1) *f is universally closed,*

(2) *for every scheme* Z *and every morphism* $Z \to Y$ *the projection* $|Z \times_Y X| \to |Z|$ *is closed,*
(3) *for every affine scheme* Z *and every morphism* $Z \to Y$ *the projection* $|Z \times_Y X| \to |Z|$ *is closed,*
(4) *there exists a scheme* V *and a surjective étale morphism* $V \to Y$ *such that* $V \times_Y X \to V$ *is a universally closed morpism of algebraic spaces, and*
(5) *there exists a Zariski covering* $Y = \bigcup Y_i$ *such that each of the morphisms* $f^{-1}(Y_i) \to Y_i$ *is universally closed.*

Proof. We omit the proof that (1) implies (2), and that (2) implies (3).

Assume (3). Choose a surjective étale morphism $V \to Y$. We are going to show that $V \times_Y X \to V$ is a universally closed morpism of algebraic spaces. Let $Z \to V$ be a morphism from an algebraic space to V. Let $W \to Z$ be a surjective étale morphism where $W = \coprod W_i$ is a disjoint union of affine schemes, see Properties of Spaces, Lemma 41.6.1. Then we have the following commutative diagram

$$\begin{tikzcd}
\coprod_i |W_i \times_Y X| \arrow[r, equal] \arrow[d] & |W \times_Y X| \arrow[r] \arrow[d] & |Z \times_Y X| \arrow[r, equal] \arrow[d] & |Z \times_V (V \times_Y X)| \arrow[dl] \\
\coprod |W_i| \arrow[r, equal] & |W| \arrow[r] & |Z| &
\end{tikzcd}$$

We have to show the south-east arrow is closed. The middle horizontal arrows are surjective and open (Properties of Spaces, Lemma 41.13.7). By assumption (3), and the fact that W_i is affine we see that the left vertical arrows are closed. Hence it follows that the right vertical arrow is closed.

Assume (4). We will show that f is universally closed. Let $Z \to Y$ be a morphism of algebraic spaces. Consider the diagram

$$\begin{tikzcd}
|(V \times_Y Z) \times_V (V \times_Y X)| \arrow[r, equal] \arrow[dr] & |V \times_Y X| \arrow[r] \arrow[d] & |Z \times_Y X| \arrow[d] \\
& |V \times_Y Z| \arrow[r] & |Z|
\end{tikzcd}$$

The south-west arrow is closed by assumption. The horizontal arrows are surjective and open because the corresponding morphisms of algebraic spaces are étale (see Properties of Spaces, Lemma 41.13.7). It follows that the right vertical arrow is closed.

Of course (1) implies (5) by taking the covering $Y = Y$. Assume $Y = \bigcup Y_i$ is as in (5). Then for any $Z \to Y$ we get a corresponding Zariski covering $Z = \bigcup Z_i$ such that the base change of f to Z_i is closed. By a simple topological argument this implies that $Z \times_Y X \to Z$ is closed. Hence (1) holds. ☐

Example 42.10.6. Strange example of a universally closed morphism. Let $\mathbf{Q} \subset k$ be a field of characteristic zero. Let $X = \mathbf{A}^1_k/\mathbf{Z}$ as in Spaces, Example 40.14.8. We claim the structure morphism $p : X \to Spec(k)$ is universally closed. Namely, if Z/k is a scheme, and $T \subset |X \times_k Z|$ is closed, then T corresponds to a $\mathbf{Z}$-invariant closed subset of $T' \subset |\mathbf{A}^1 \times Z|$. It is easy to see that this implies that T' is the inverse image of a subset T'' of Z. By Morphisms, Lemma 24.24.10 we have that $T'' \subset Z$ is closed. Of course T'' is the image of T. Hence p is universally closed by Lemma 42.10.5.

Lemma 42.10.7. *Let S be a scheme. A universally closed morphism of algebraic spaces over S is quasi-compact.*

Proof. This proof is a repeat of the proof in the case of schemes, see Morphisms, Lemma 24.40.9. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Assume that f is not quasi-compact. Our goal is to show that f is not universally closed. By Lemma 42.9.7 there exists an affine scheme Z and a morphism $Z \to Y$ such that $Z \times_Y X \to Z$ is not quasi-compact. To achieve our goal it suffices to show that $Z \times_Y X \to Z$ is not universally closed, hence we may assume that $Y = Spec(B)$ for some ring B.

Write $X = \bigcup_{i \in I} X_i$ where the X_i are quasi-compact open subspaces of X. For example, choose a surjective étale morphism $U \to X$ where U is a scheme, choose an affine open covering $U = \bigcup U_i$ and let $X_i \subset X$ be the image of U_i. We will use later that the morphisms $X_i \to Y$ are quasi-compact, see Lemma 42.9.8. Let $T = Spec(B[a_i; i \in I])$. Let $T_i = D(a_i) \subset T$. Let $Z \subset T \times_Y X$ be the reduced closed subspace whose underlying closed set of points is $|T \times_Y Z| \setminus \bigcup_{i \in I} |T_i \times_Y X_i|$, see Properties of Spaces, Lemma 41.9.1. (Note that by the results of Section 42.4 the algebraic spaces $T_i \times_Y X_i$ are open subspaces of $T \times_Y X$.) Here is a diagram

$$\begin{tikzcd} Z \arrow[r] \arrow[rd] & T \times_Y X \arrow[r, "q"'] \arrow[d, "f_T"] & X \arrow[d, "f"] \\ & T \arrow[r, "p"] & Y \end{tikzcd}$$

It suffices to prove that the image $f_T(|Z|)$ is not closed in $|T|$.

We claim there exists a point $y \in Y$ such that there is no affine open neighborhood V of y in Y such that X_V is quasi-compact. If not then we can cover Y with finitely many such V and for each V the morphism $Y_V \to V$ is quasi-compact by Lemma 42.9.8 and then Lemma 42.9.7 implies f quasi-compact, a contradiction. Fix a $y \in Y$ as in the claim.

Let $t \in T$ be the point lying over y with $\kappa(t) = \kappa(y)$ such that $a_i = 1$ in $\kappa(t)$ for all i. Suppose $z \in |Z|$ with $f_T(z) = t$. Then $q(t) \in X_i$ for some i. Hence $f_T(z) \notin T_i$ by construction of Z, which contradicts the fact that $t \in T_i$ by construction. Hence we see that $t \in |T| \setminus f_T(|Z|)$.

Assume $f_T(|Z|)$ is closed in $|T|$. Then there exists an element $g \in B[a_i; i \in I]$ with $f_T(|Z|) \subset V(g)$ but $t \notin V(g)$. Hence the image of g in $\kappa(t)$ is nonzero. In particular some coefficient of g has nonzero image in $\kappa(y)$. Hence this coefficient is invertible on some affine open neighborhood V of y. Let J be the finite set of $j \in I$ such that the variable a_j appears in g. Since X_V is not quasi-compact and each $X_{i,V}$ is quasi-compact, we may choose a point $x \in |X_V| \setminus \bigcup_{j \in J} |X_{j,V}|$. In other words, $x \in |X| \setminus \bigcup_{j \in J} |X_j|$ and x lies above some $v \in V$. Since g has a coefficient that is invertible on V, we can find a point $t' \in T$ lying above v such that $t' \notin V(g)$ and $t' \in V(a_i)$ for all $i \notin J$. This is true because $V(a_i; i \in I \setminus J) = Spec(B[a_j; j \in J])$ and the set of points of this scheme lying over v is bijective with $Spec(\kappa(v)[a_j; j \in J])$ and g restricts to a nonzero element of this polynomial ring by construction. In other words $t' \notin T_i$ for each $i \notin J$. By Properties of Spaces, Lemma 41.4.3 we can find a point z of $X \times_Y T$ mapping to $x \in X$ and to $t' \in T$. Since $x \notin |X_j|$ for $j \in J$ and $t' \notin T_i$ for $i \in I \setminus J$ we see that $z \in |Z|$. On the other hand $f_T(z) = t' \notin V(g)$ which contradicts $f_T(Z) \subset V(g)$. Thus the assumption "$f_T(|Z|)$ closed" is wrong and we conclude indeed that f_T is not closed as desired. □

The target of a separated algebraic space under a surjective universally closed morphism is separated.

Lemma 42.10.8. *Let S be a scheme. Let B be an algebraic space over S. Let $f : X \to Y$ be a surjective universally closed morphism of algebraic spaces over B.*

(1) *If X is quasi-separated, then Y is quasi-separated.*
(2) *If X is separated, then Y is separated.*
(3) *If X is quasi-separated over B, then Y is quasi-separated over B.*
(4) *If X is separated over B, then Y is separated over B.*

Proof. Parts (1) and (2) are a consequence of (3) and (4) for $S = B = Spec(\mathbf{Z})$ (see Properties of Spaces, Definition 41.3.1). Consider the commutative diagram

$$\begin{tikzcd} X \arrow[r, "\Delta_{X/B}"'] \arrow[d] & X \times_B X \arrow[d] \\ Y \arrow[r, "\Delta_{Y/B}"] & Y \times_B Y \end{tikzcd}$$

The left vertical arrow is surjective (i.e., universally surjective). The right vertical arrow is universally closed as a composition of the universally closed morphisms $X \times_B X \to X \times_B Y \to Y \times_B Y$. Hence it is also quasi-compact, see Lemma 42.10.7.

Assume X is quasi-separated over B, i.e., $\Delta_{X/B}$ is quasi-compact. Then if Z is quasi-compact and $Z \to Y \times_B Y$ is a morphism, then $Z \times_{Y \times_B Y} X \to Z \times_{Y \times_B Y} Y$ is surjective and $Z \times_{Y \times_B Y} X$ is quasi-compact by our remarks above. We conclude that $\Delta_{Y/B}$ is quasi-compact, i.e., Y is quasi-separated over B.

Assume X is quasi-separated over B, i.e., $\Delta_{X/B}$ is a closed immersion. Then if Z is affine, and $Z \to Y \times_B Y$ is a morphism, then $Z \times_{Y \times_B Y} X \to Z \times_{Y \times_B Y} Y$ is surjective and $Z \times_{Y \times_B Y} X \to Z$ is universally closed by our remarks above. We conclude that $\Delta_{Y/B}$ is universally closed. It follows that $\Delta_{Y/B}$ is representable, locally of finite type, a monomorphism (see Lemma 42.5.1) and universally closed, hence a closed immersion, see Étale Morphisms, Lemma 37.7.2 (and also the abstract principle Spaces, Lemma 40.5.8). Thus Y is separated over B. □

42.11. Valuative criteria

The formulation of the existence part of the valuative criterion is slightly different for morphisms of algebraic spaces, since it may be necessary to extend the fraction field of the valuation ring. See Example 42.11.4. Here is the definition.

Definition 42.11.1. Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. We say *f satisfies the uniqueness part of the valuative criterion* if given any commutative solid diagram

$$\begin{tikzcd} Spec(K) \arrow[r] \arrow[d] & X \arrow[d] \\ Spec(A) \arrow[r] \arrow[ru, dashed] & Y \end{tikzcd}$$

where A is a valuation ring with field of fractions K, there exists at most one dotted arrow (without requiring existence). We say *f satisfies the existence part of the valuative criterion* if given any solid diagram as above there exists an extension $K \subset K'$ of fields, a valuation ring $A' \subset K'$ dominating A and a morphism $Spec(A') \to X$ such that the following diagram commutes

$$\begin{tikzcd} Spec(K') \arrow[r] \arrow[d] & Spec(K) \arrow[r] & X \arrow[d] \\ Spec(A') \arrow[r] \arrow[urr] & Spec(A) \arrow[r] & Y \end{tikzcd}$$

We say f *satisfies the valuative criterion* if f satisfies both the existence and uniqueness part.

It turns out that for algebraic spaces, it always sufffices to take a finite separable extension $K \subset K'$ above. See Lemma 42.11.3. Before we prove it we show that the criterion is identical to the criterion as formulated for morphisms of schemes in case the morphism of algebraic spaces is representable.

Lemma 42.11.2. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Assume f is representable. The following are equivalent*

(1) *f satisfies the existence part of the valuation criterion as in Definition 42.11.1 above, and*
(2) *given any commutative solid diagram*

$$\begin{tikzcd} Spec(K) \arrow[r] \arrow[d] & X \arrow[d] \\ Spec(A) \arrow[r] \arrow[ur, dashed] & Y \end{tikzcd}$$

where A is a valuation ring with field of fractions K, there exists a dotted arrow, i.e., f satisfies the existence part of the valuative criterion as in Schemes, Definition 21.20.3.

Proof. It suffices to show that given a commutative diagram of the form

$$\begin{tikzcd} Spec(K') \arrow[r] \arrow[d] & Spec(K) \arrow[r] & X \arrow[d] \\ Spec(A') \arrow[r] \arrow[urr, "\varphi"] & Spec(A) \arrow[r] & Y \end{tikzcd}$$

as in Definition 42.11.1, then we can find a morphism $Spec(A) \to X$ fitting into the diagram too. Set $X_A = Spec(A) \times_Y Y$. As f is representable we see that X_A is a scheme. The morphism φ gives a morphism $\varphi' : Spec(A') \to X_A$. Let $x \in X_A$ be the image of the closed point of $\varphi' : Spec(A') \to X_A$. Then we have the following commutative diagram of rings

$$\begin{tikzcd} K' & K \arrow[l] & \mathcal{O}_{X_A,x} \arrow[l] \arrow[dll] \\ A' \arrow[u] & A \arrow[l] & A \arrow[l] \arrow[u] \end{tikzcd}$$

Since A is a valuation ring, and since A' dominates A, we see that $K \cap A' = A$. Hence the ring map $\mathcal{O}_{X_A,x} \to K$ has image contained in A. Whence a morphism $Spec(A) \to X_A$ (see Schemes, Section 21.13) as desired. $\square$

Lemma 42.11.3. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. The following are equivalent*

(1) *f satisfies the existence part of the valuation criterion as in Definition 42.11.1, and*
(2) *f satisfies the existence part of the valuation criterion as in Definition 42.11.1 modified by requiring the extension $K \subset K'$ to be finite separable.*

Proof. We have to show that (1) implies (2). Suppose given a diagram

$$\begin{tikzcd} Spec(K') \arrow[r] \arrow[d] & Spec(K) \arrow[r] & X \arrow[d] \\ Spec(A') \arrow[r] \arrow[urr] & Spec(A) \arrow[r] & Y \end{tikzcd}$$

as in Definition 42.11.1 with $K \subset K'$ arbitrary. Choose a scheme U and a surjective étale morphism $U \to X$. Then

$$Spec(A') \times_X U \longrightarrow Spec(A')$$

is surjective étale. Let p be a point of $Spec(A') \times_X U$ mapping to the closed point of $Spec(A')$. Let $p' \rightsquigarrow p$ be a generalization of p mapping to the generic point of $Spec(A')$. Such a generalization exists because generalizations lift along flat morphisms of schemes, see Morphisms, Lemma 24.24.8. Then p' corresponds to a point of the scheme $Spec(K') \times_X U$. Note that

$$Spec(K') \times_X U = Spec(K') \times_{Spec(K)} (Spec(K) \times_X U)$$

Hence p' maps to a point $q' \in Spec(K) \times_X U$ whose residue field is a finite separable extension of K. Finally, $p' \rightsquigarrow p$ maps to a specialization $u' \rightsquigarrow u$ on the scheme U. With all this notation we get the following diagram of rings

$$\begin{tikzcd} \kappa(p') & & \kappa(q') \arrow[ll] & \kappa(u') \arrow[l] \\ & \mathcal{O}_{Spec(A') \times_X U, p} \arrow[ul] & & \mathcal{O}_{U,u} \arrow[ll] \arrow[u] \\ K' \arrow[uu] & A' \arrow[l] \arrow[u] & A \arrow[l] \arrow[uu] & \end{tikzcd}$$

This means that the ring $B \subset \kappa(q')$ generated by the images of A and $\mathcal{O}_{U,u}$ maps to a subring of $\kappa(p')$ contained in the image B' of $\mathcal{O}_{Spec(A') \times_X U, p} \to \kappa(p')$. Note that B' is a local ring. Let $\mathfrak{m} \subset B$ be the maximal ideal. By construction $A \cap \mathfrak{m}$, (resp. $\mathcal{O}_{U,u} \cap \mathfrak{m}$, resp. $A' \cap \mathfrak{m}$) is the maximal ideal of A (resp. $\mathcal{O}_{U,u}$, resp. A'). Set $\mathfrak{q} = B \cap \mathfrak{m}$. This is a prime ideal such that $A \cap \mathfrak{q}$ is the maximal ideal of A. Hence $B_{\mathfrak{q}} \subset \kappa(q')$ is a local ring dominating A. By Algebra, Lemma 7.46.2 we can find a valuation ring $A_1 \subset \kappa(q')$ with field of fractions $\kappa(q')$ dominating $B_{\mathfrak{q}}$. The (local) ring map $\mathcal{O}_{U,u} \to A_1$ gives a morphism $Spec(A_1) \to U \to X$ such that the diagram

$$\begin{tikzcd} Spec(\kappa(q')) \arrow[r] \arrow[d] & Spec(K) \arrow[r] & X \arrow[d] \\ Spec(A_1) \arrow[r] \arrow[urr] & Spec(A) \arrow[r] & Y \end{tikzcd}$$

is commutative. Since $f.f.(A_1) = \kappa(q') \supset K$ is finite separable by construction the lemma is proved. $\square$

Example 42.11.4. Consider the algebraic space X constructed in Spaces, Example 40.14.2. Recall that it is the affine line with zero doubled in a Galois twisted relative to a degree two Galois extension $k \subset k'$. As such it comes with a morphism

$$\pi : X \longrightarrow S = \mathbf{A}^1_k$$

which is quasi-compact. We claim that π is universally closed. Namely, after base change by $Spec(k') \to Spec(k)$ the morphism π is identified with the morphism

$$\text{affine line with zero doubled} \longrightarrow \text{affine line}$$

which is universally closed (some details omitted). Since the morphism $Spec(k') \to Spec(k)$ is universally closed and surjective, a diagram chase shows that π is universally closed. On the other hand, consider the diagram

$$\begin{tikzcd}
Spec(k((x))) \arrow[r] \arrow[d] & X \arrow[d, "\pi"] \\
Spec(k[[x]]) \arrow[r] \arrow[ur, dotted] & \mathbf{A}^1_k
\end{tikzcd}$$

Since the unique point of X above $0 \in \mathbf{A}^1_k$ corresponds to a monomorphism $Spec(k') \to X$ it is clear there cannot exist a dotted arrow! This shows that a finite separable field extension is needed in general.

Lemma 42.11.5. *The base change of a morphism of algebraic spaces which satisfies the existence part of (resp. uniqueness part of) the valuative criterion by any morphism of algebraic spaces satisfies the existence part of (resp. uniqueness part of) the valuative criterion.*

Proof. Let $f : X \to Y$ be a morphism of algebraic spaces over the scheme S. Let $Z \to Y$ be any morphism of algebraic spaces over S. Consider a solid commutative diagram of the following shape

$$\begin{tikzcd}
Spec(K) \arrow[r] \arrow[d] & Z \times_Y X \arrow[r] \arrow[d] & X \arrow[d] \\
Spec(A) \arrow[r] \arrow[ur, dashed] \arrow[urr, dashed] & Z \arrow[r] & Y
\end{tikzcd}$$

Then the set of north-west dotted arrows making the diagram commute is in 1-1 correspondence with the set of west-north-west dotted arrows making the diagram commute. This proves the lemma in the case of ``uniqueness''. For the existence part, assume f satisfies the existence part of the valuative criterion. If we are given a solid commutative diagram as above, then by assumption there exists an extension $K \subset K'$ of fields and a valuation ring $A' \subset K'$ dominating A and a morphism $Spec(A') \to X$ fitting into the following commutative diagram

$$\begin{tikzcd}
Spec(K') \arrow[r] \arrow[d] & Spec(K) \arrow[r] & Z \times_Y X \arrow[r] & X \arrow[d] \\
Spec(A') \arrow[r] \arrow[urrr] & Spec(A) \arrow[r] & Z \arrow[r] & Y
\end{tikzcd}$$

And by the remarks above the skew arrow corresponds to an arrow $Spec(A') \to Z \times_Y X$ as desired. $\square$

Lemma 42.11.6. *The composition of two morphisms of algebraic spaces which satisfy the (existence part of, resp. uniqueness part of) the valuative criterion satisfies the (existence part of, resp. uniqueness part of) the valuative criterion.*

Proof. Let $f : X \to Y$, $g : Y \to Z$ be morphisms of algebraic spaces over the scheme S. Consider a solid commutative diagram of the following shape

$$\begin{tikzcd}
Spec(K) \arrow[r] \arrow[dd] & X \arrow[d, "f"] \\
 & Y \arrow[d, "g"] \\
Spec(A) \arrow[r] \arrow[ruu, dashed] \arrow[ru, dashed] & Z
\end{tikzcd}$$

If we have the uniqueness part for g, then there exists at most one north-west dotted arrow making the diagram commute. If we also have the uniqueness part for f, then we have at most one north-north-west dotted arrow making the diagram commute. The proof in the existence case comes from contemplating the following diagram

$$\begin{tikzcd}
Spec(K'') \arrow[r] \arrow[dd] & Spec(K') \arrow[r] & Spec(K) \arrow[r] & X \arrow[d, "f"] \\
 & & & Y \arrow[d, "g"] \\
Spec(A'') \arrow[r] \arrow[rrruu] & Spec(A') \arrow[r] \arrow[rru] & Spec(A) \arrow[r] & Z
\end{tikzcd}$$

Namely, the existence part for g gives us the extension K', the valuation ring A' and the arrow $Spec(A') \to Y$, whereupon the existence part for f gives us the extension K'', the valuation ring A'' and the arrow $Spec(A'') \to X$. $\square$

42.12. Valuative criterion for universal closedness

This is a little more involved than in the case of schemes, especially since the most optimistic guess is wrong. See discussion below.

Lemma 42.12.1. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Assume*

(1) *f is quasi-compact, and*
(2) *f satisfies the existence part of the valuative criterion.*

Then f is universally closed.

Proof. By Lemmas 42.9.3 and 42.11.5 properties (1) and (2) are preserved under any base change. By Lemma 42.10.5 we only have to show that $T \times_Y X \to T$ is universally closed, whenever T is an affine scheme over S mapping into Y. Hence it suffices to prove: If Y is an affine scheme, $f : X \to Y$ is quasi-compact and satisfies the existence part of the valuative criterion, then $f : |X| \to |Y|$ is closed. In this situation X is a quasi-compact algebraic space. By Properties of Spaces, Lemma 41.6.3 there exists an affine scheme U and a surjective étale morphism $\varphi : U \to X$. Let $T \subset |X|$ closed. The inverse image $\varphi^{-1}(T) \subset U$ is closed, and hence is the set of points of an affine closed subscheme $Z \subset U$.

Thus, by Algebra, Lemma 7.36.5 we see that $f(T) = f(\varphi(|Z|)) \subset |Y|$ is closed if it is closed under specialization.

Let $y' \rightsquigarrow y$ be a specialization in Y with $y' \in f(T)$. Choose a point $x' \in T \subset |X|$ mapping to y' under f. We may represent x' by a morphism $Spec(K) \to X$ for some field K. Thus we have the following diagram

$$\begin{tikzcd} Spec(K) \arrow[r, "x'"'] \arrow[d] & X \arrow[d, "f"] \\ Spec(\mathcal{O}_{Y,y}) \arrow[r] & Y, \end{tikzcd}$$

see Schemes, Section 21.13 for the existence of the left vertical map. Choose a valuation ring $A \subset K$ dominating the image of the ring map $\mathcal{O}_{Y,y} \to K$ (this is possible since the image is a local ring and not a field as $y' \neq y$, see Algebra, Lemma 7.46.2). By assumption there exists a field extension $K \subset K'$ and a valuation ring $A' \subset K'$ dominating A, and a morphism $Spec(A') \to X$ fitting into the commutative diagram. Since A' dominates A, and A dominates $\mathcal{O}_{Y,y}$ we see that the closed point of $Spec(A')$ maps to a point $x \in X$ with $f(x) = y$ which is a specialization of x'. Hence $x \in T$ as T is closed, and hence $y \in f(T)$ as desired. □

We also want to prove the converse of Lemma 42.12.1. Namely, we would like to show, under additional conditions, that a quasi-compact morphism is universallly closed if and only if the existence part of the valuative criterion holds. Example 42.10.6 shows that $\mathbf{A}^1_k/\mathbf{Z} \to Spec(k)$ is universally closed, but it is easy to see that the existence part of the valuative criterion fails. Hence some additional hypothesis is needed. We address this in Decent Spaces, Section 43.12 when the source of the morphism is a decent space. See also Decent Spaces, Lemma 43.13.8 for a slight weakening of the hypothesis.

42.13. Valuative criterion of separatedness

Lemma 42.13.1. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. If f is separated, then f satisfies the uniqueness part of the valuative criterion.*

Proof. Let a diagram as in Definition 42.11.1 be given. Suppose there are two distinct morphisms $a, b : Spec(A) \to X$ fitting into the diagram. Let $Z \subset Spec(A)$ be the equalizer of a and b. Then $Z = Spec(A) \times_{(a,b), X \times_Y X, \Delta} X$. If f is separated, then Δ is a closed immersion, and this is a closed subscheme of $Spec(A)$. By assumption it contains the generic point of $Spec(A)$. Since A is a domain this implies $Z = Spec(A)$. Hence $a = b$ as desired. □

Lemma 42.13.2. *(Valuative criterion separatedness.) Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Assume*

(1) *the morphism f is quasi-separated, and*
(2) *the morphism f satisfies the uniqueness part of the valuative criterion.*

Then f is separated.

Proof. Assumption (1) means $\Delta_{X/Y}$ is quasi-compact. We claim the morphism $\Delta_{X/Y} : X \to X \times_Y X$ satisfies the existence part of the valuative criterion. Let a solid commutative

diagram

$$\begin{tikzcd} Spec(K) \arrow[r] \arrow[d] & X \arrow[d] \\ Spec(A) \arrow[r] \arrow[ru, dashed] & X \times_Y X \end{tikzcd}$$

be given. The lower right arrow corresponds to a pair of morphisms $a, b : Spec(A) \to X$ over Y. By assumption (2) we see that $a = b$. Hence using a as the dotted arrow works. Hence Lemma 42.12.1 applies, and we see that $\Delta_{X/Y}$ is universally closed. Since always $\Delta_{X/Y}$ is locally of finite type and separated, we conclude from More on Morphisms, Lemma 33.29.5 that $\Delta_{X/Y}$ is a finite morphism (also, use the general principle of Spaces, Lemma 40.5.8). At this point $\Delta_{X/Y}$ is a representable, finite monomorphism, hence a closed immersion by Morphisms, Lemma 24.42.13. □

42.14. Monomorphisms

A representable morphism $X \to Y$ of algebraic spaces is a monomorphism according to Section 42.3 if for every scheme Z and morphism $Z \to Y$ the morphism $Z \times_Y X \to Z$ is representable by a monomorphism of schemes. This means exactly that $Z \times_Y X \to Z$ is an injective map of sheaves on $(Sch/S)_{fppf}$. Since this is supposed to hold for all Z and all maps $Z \to Y$ this is in turn equivalent to the map $X \to Y$ being an injective map of sheaves on $(Sch/S)_{fppf}$. Thus we may define a monomorphism of a (possibly nonrepresentable[3]) morphism of algebraic spaces as follows.

Definition 42.14.1. Let S be a scheme. A morphism of algebraic spaces over S is called a *monomorphism* if it is an injective map of sheaves, i.e., a monomorphism in the category of sheaves on $(Sch/S)_{fppf}$.

The following lemma shows that this also means that it is a monomorphism in the category of algebraic spaces over S.

Lemma 42.14.2. *Let S be a scheme. Let $j : X \to Y$ be a morphism of algebraic spaces over S. The following are equivalent:*

(1) *j is a monomorphism (as in Definition 42.14.1),*
(2) *j is a monomorphism in the category of algebraic spaces over S, and*
(3) *the diagonal morphism $\Delta_{X/Y} : X \to X \times_Y X$ is an isomorphism.*

Proof. Note that $X \times_Y X$ is both the fibre product in the category of sheaves on $(Sch/S)_{fppf}$ and the fibre product in the category of algebraic spaces over S, see Spaces, Lemma 40.7.3. The equivalence of (1) and (3) is a general characterization of injective maps of sheaves on any site. The equivalence of (2) and (3) is a characterization of monomorphisms in any category with fibre products. □

Lemma 42.14.3. *A monomorphism of algebraic spaces is separated.*

Proof. This is true because an isomorphism is a closed immersion, and Lemma 42.14.2 above. □

Lemma 42.14.4. *A composition of monomorphisms is a monomorphism.*

Proof. True because a composition of injective sheaf maps is injective. □

[3]We do not know whether or not every monomorphism of algebraic spaces is representable. If you do, please email stacks.project@gmail.com.

Lemma 42.14.5. *The base change of a monomorphism is a monomorphism.*

Proof. This is a general fact about fibre products in a category of sheaves. □

Lemma 42.14.6. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. The following are equivalent*

(1) *f is a monomorphism,*
(2) *for every scheme Z and morphism $Z \to Y$ the base change $Z \times_Y X \to Z$ of f is a monomorphism,*
(3) *for every affine scheme Z and every morphism $Z \to Y$ the base change $Z \times_Y X \to Z$ of f is a monomorphism,*
(4) *there exists a scheme V and a surjective étale morphism $V \to Y$ such that the base change $V \times_Y X \to V$ is a monomorphism, and*
(5) *there exists a Zariski covering $Y = \bigcup Y_i$ such that each of the morphisms $f^{-1}(Y_i) \to Y_i$ is a monomorphism.*

Proof. We will use without further mention that a base change of a monomorphism is a monomorphism, see Lemma 42.14.5. In particular it is clear that (1) ⇒ (2) ⇒ (3) ⇒ (4) (by taking V to be a disjoint union of affine schemes étale over Y, see Properties of Spaces, Lemma 41.6.1). Let V be a scheme, and let $V \to Y$ be a surjective étale morphism. If $V \times_Y X \to V$ is a monomorphism, then it follows that $X \to Y$ is a monomorphism. Namely, given any cartesian diagram of sheaves

$$\begin{tikzcd} \mathcal{F} \arrow[r, "a"] \arrow[d, "b"] & \mathcal{G} \arrow[d, "c"] \\ \mathcal{H} \arrow[r, "d"] & \mathcal{I} \end{tikzcd} \qquad \mathcal{F} = \mathcal{H} \times_{\mathcal{I}} \mathcal{G}$$

if c is a surjection of sheaves, and a is injective, then also d is injective. Thus (4) implies (1). Proof of the equivalence of (5) and (1) is omitted. □

Lemma 42.14.7. *An immersion of algebraic spaces is a monomorphism. In particular, any immersion is separated.*

Proof. Let $f : X \to Y$ be an immersion of algebraic spaces. For any morphism $Z \to Y$ with Z representable the base change $Z \times_Y X \to Z$ is an immersion of schemes, hence a monomorphism, see Schemes, Lemma 21.23.7. Hence f is representable, and a monomorphism. □

We will improve on the following lemma in Decent Spaces, Lemma 43.14.1.

Lemma 42.14.8. *Let S be a scheme. Let k be a field and let $Z \to Spec(k)$ be a monomorphism of algebraic spaces over S. Then either $Z = \emptyset$ or $Z = Spec(k)$.*

Proof. By Lemmas 42.14.3 and 42.5.9 we see that Z is a separated algebraic space. Hence there exists an open dense subspace $Z' \subset Z$ which is a scheme, see Properties of Spaces, Proposition 41.10.3. By Schemes, Lemma 21.23.10 we see that either $Z' = \emptyset$ or $Z' \cong Spec(k)$. In the first case we conclude that $Z = \emptyset$ and in the second case we conclude that $Z' = Z = Spec(k)$ as $Z \to Spec(k)$ is a monomorphism which is an isomorphism over Z'. □

Lemma 42.14.9. *Let S be a scheme. If $X \to Y$ is a monomorphism of algebraic spaces over S, then $|X| \to |Y|$ is injective.*

Proof. Immediate from the definitions. □

42.15. Pushforward of quasi-coherent sheaves

We first prove a simple lemma that relates pushforward of sheaves of modules for a morphism of algebraic spaces to pushforward of sheaves of modules for a morphism of schemes.

Lemma 42.15.1. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Let $U \to X$ be a surjective étale morphism from a scheme to X. Set $R = U \times_X U$ and denote $t, s : R \to U$ the projection morphisms as usual. Denote $a : U \to Y$ and $b : R \to Y$ the induced morphisms. For any object $\mathcal{F}$ of $Mod(\mathcal{O}_X)$ there exists an exact sequence*

$$0 \to f_*\mathcal{F} \to a_*(\mathcal{F}|_U) \to b_*(\mathcal{F}|_R)$$

where the second arrow is the difference $t^* - s^*$.

Proof. We denote $\mathcal{F}$ also its extension to a sheaf of modules on $X_{spaces,étale}$, see Properties of Spaces, Remark 41.15.4. Let $V \to Y$ be an object of $Y_{étale}$. Then $V \times_Y X$ is an object of $X_{spaces,étale}$, and by definition $f_*\mathcal{F}(V) = \mathcal{F}(V \times_Y X)$. Since $U \to X$ is surjective étale, we see that $\{V \times_Y U \to V \times_Y X\}$ is a covering. Also, we have $(V \times_Y U) \times_X (V \times_Y U) = V \times_Y R$. Hence, by the sheaf condition of $\mathcal{F}$ on $X_{spaces,étale}$ we have a short exact sequence

$$0 \to \mathcal{F}(V \times_Y X) \to \mathcal{F}(V \times_Y U) \to \mathcal{F}(V \times_Y R)$$

where the second arrow is the difference of restricting via t or s. This exact sequence is functorial in V and hence we obtain the lemma. □

Let S be a scheme. Let $f : X \to Y$ be a quasi-compact and quasi-separated morphism of representable algebraic spacdes X and Y over S. By Descent, Proposition 31.6.14 the functor $f_* : QCoh(X) \to QCoh(Y)$ agrees with the usual functor if we think of X and Y as schemes.

More generally, suppose $f : X \to Y$ is a representable, quasi-compact, and quasi-separated morphism of algebraic spaces over S. Let V be a scheme and let $V \to Y$ be an étale surjective morphism. Let $U = V \times_Y X$ and let $f' : U \to V$ be the base change of f. Then for any quasi-coherent $\mathcal{O}_X$-module $\mathcal{F}$ we have

$$f'_*(\mathcal{F}|_U) = (f_*\mathcal{F})|_V, \tag{42.15.1.1}$$

see Properties of Spaces, Lemma 41.23.2. And because $f' : U \to V$ is a quasi-compact and quasi-separated morphism of schemes, by the remark of the preceding paragraph we may compute $f'_*(\mathcal{F}|_U)$ by thinking of $\mathcal{F}|_U$ as a quasi-coherent sheaf on the scheme U, and f' as a morphism of schemes. We will frequently use this without further mention.

The next level of generality is to consider an arbitrary quasi-compact and quasi-separated morphism of algebraic spaces.

Lemma 42.15.2. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. If f is quasi-compact and quasi-separated, then f_* transforms quasi-coherent $\mathcal{O}_X$-modules into quasi-coherent $\mathcal{O}_Y$-modules.*

Proof. Let $\mathcal{F}$ be a quasi-coherent sheaf on X. We have to show that $f_*\mathcal{F}$ is a quasi-coherent sheaf on Y. For this it suffices to show that for any affine scheme V and étale morphism $V \to Y$ the restriction of $f_*\mathcal{F}$ to V is quasi-coherent, see Properties of Spaces, Lemma 41.26.6. Let $f' : V \times_Y X \to V$ be the base change of f by $V \to Y$. Note that f' is also quasi-compact and quasi-separated, see Lemmas 42.9.3 and 42.5.4. By (42.15.1.1) we know that the restriction of $f_*\mathcal{F}$ to V is f'_* of the restriction of $\mathcal{F}$ to $V \times_Y X$. Hence we may replace f by f', and assume that Y is an affine scheme.

Assume Y is an affine scheme. Since f is quasi-compact we see that X is quasi-compact. Thus we may choose an affine scheme U and a surjective étale morphism $U \to X$, see Properties of Spaces, Lemma 41.6.3. By Lemma 42.15.1 we get an exact sequence

$$0 \to f_*\mathcal{F} \to a_*(\mathcal{F}|_U) \to b_*(\mathcal{F}|_R).$$

where $R = U \times_X U$. As $X \to Y$ is quasi-separated we see that $R \to U \times_Y U$ is a quasi-compact monomorphism. This implies that R is a quasi-compact separated scheme (as U and Y are affine at this point). Hence $a : U \to Y$ and $b : R \to Y$ are quasi-compact and quasi-separated morphisms of schemes. Thus by Descent, Proposition 31.6.14 the sheaves $a_*(\mathcal{F}|_U)$ and $b_*(\mathcal{F}|_R)$ are quasi-coherent (see also the discussion preceding this lemma). This implies that $f_*\mathcal{F}$ is a kernel of quasi-coherent modules, and hence itself quasi-coherent, see Properties of Spaces, Lemma 41.26.7. □

Higher direct images are discussed in Cohomology of Spaces, Section 49.4.

42.16. Closed immersions

In this section we elucidate some of the results obtained previously on immersions of algebraic spaces; it should parallel Morphisms, Section 24.2.

Lemma 42.16.1. *Let S be a scheme. Let X be an algebraic space over S. For every closed immersion $i : Z \to X$ the sheaf $i_*\mathcal{O}_Z$ is a quasi-coherent $\mathcal{O}_X$-module, the map $i^\sharp : \mathcal{O}_X \to i_*\mathcal{O}_Z$ is surjective and its kernel is a quasi-coherent sheaf of ideals. The rule $Z \mapsto Ker(\mathcal{O}_X \to i_*\mathcal{O}_Z)$ defines an inclusion reversing bijection*

$$\begin{matrix} \textit{closed subschemes} \\ Z \subset X \end{matrix} \longrightarrow \begin{matrix} \textit{quasi-coherent sheaves} \\ \textit{of ideals } \mathcal{I} \subset \mathcal{O}_X \end{matrix}$$

Moreover, given a closed subscheme Z corresponding to the quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_X$ a morphism of algebraic spaces $h : Y \to X$ factors through Z if and only if the map $h^*\mathcal{I} \to h^*\mathcal{O}_X = \mathcal{O}_Y$ is zero.

Proof. Let $U \to X$ be a surjective étale morphism whose source is a scheme. Consider the diagram

$$\begin{tikzcd} U \times_X Z \arrow[r] \arrow[d, "i'"] & Z \arrow[d, "i"] \\ U \arrow[r] & X \end{tikzcd}$$

By Lemma 42.4.1 we see that i is a closed immersion if and only if i' is a closed immersion. By Properties of Spaces, Lemma 41.23.2 we see that $i'_*\mathcal{O}_{U \times_X Z}$ is the restriction of $i_*\mathcal{O}_Z$ to U. Hence the assertions on $\mathcal{O}_X \to i_*\mathcal{O}_Z$ are equivalent to the corresponding assertions on $\mathcal{O}_U \to i'_*\mathcal{O}_{U \times_X Z}$. And since i' is a closed immersion of schemes, these results follow from Morphisms, Lemma 24.2.1.

Let us prove that given a quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_X$ the formula

$$Z(T) = \{h : T \to X \mid h^*\mathcal{I} \to \mathcal{O}_T \text{ is zero}\}$$

defines a closed subspace of X. It is clearly a subfunctor of X. To show that $Z \to X$ is representable by closed immersions, let $\varphi : U \to X$ be a morphism from a scheme towards X. Then $Z \times_X U$ is represented by the analogous subfunctor of U corresponding to the sheaf of ideals $\mathrm{Im}(\varphi^*\mathcal{I} \to \mathcal{O}_U)$. By Properties of Spaces, Lemma 41.26.2 the $\mathcal{O}_U$-module $\varphi^*\mathcal{I}$ is quasi-coherent on on U, and hence $\mathrm{Im}(\varphi^*\mathcal{I} \to \mathcal{O}_U)$ is a quasi-coherent sheaf of ideals on U. By Schemes, Lemma 21.4.6 we conclude that $Z \times_X U$ is represented by the closed subscheme of U associated to $\mathrm{Im}(\varphi^*\mathcal{I} \to \mathcal{O}_U)$. Thus Z is a closed subspace of X.

In the formula for Z above the inputs T are schemes since algebraic spaces are sheaves on $(Sch/S)_{fppf}$. We omit the verification that the same formula remains true if T is an algebraic space. □

Lemma 42.16.2. *A closed immersion of algebraic spaces is quasi-compact.*

Proof. This follows from Schemes, Lemma 21.19.5 by general principles, see Spaces, Lemma 40.5.8. □

Lemma 42.16.3. *A closed immersion of algebraic spaces is separated.*

Proof. This follows from Schemes, Lemma 21.23.7 by general principles, see Spaces, Lemma 40.5.8. □

Lemma 42.16.4. *Let S be a scheme. Let $i : Z \to X$ be a closed immersion of algebraic spaces over S.*

(1) *The functor*
$$i_{small,*} : Sh(Z_{\acute{e}tale}) \longrightarrow Sh(X_{\acute{e}tale})$$
is fully faithful and its essential image is those sheaves of sets $\mathcal{F}$ on $X_{\acute{e}tale}$ whose restriction to $X \setminus Z$ is isomorphic to $*$, and

(2) *the functor*
$$i_{small,*} : Ab(Z_{\acute{e}tale}) \longrightarrow Ab(X_{\acute{e}tale})$$
is fully faithful and its essential image is those abelian sheaves on $X_{\acute{e}tale}$ whose support is contained in Z.

In both cases i_{small}^{-1} is a left inverse to the functor $i_{small,*}$.

Proof. Let U be a scheme and let $U \to X$ be surjective étale. Set $V = Z \times_X U$. Then V is a scheme and $i' : V \to U$ is a closed immersion of schemes. By Properties of Spaces, Lemma 41.15.11 for any sheaf $\mathcal{G}$ on Z we have
$$(i_{small}^{-1} i_{small,*}\mathcal{G})|_V = (i')^{-1}_{small} i'_{small,*}(\mathcal{G}|_V)$$
By Étale Cohomology, Proposition 38.46.4 the map $(i')^{-1}_{small} i'_{small,*}(\mathcal{G}|_V) \to \mathcal{G}|_V$ is an isomorphism. Since $V \to Z$ is surjective and étale this implies that $i_{small}^{-1} i_{small,*}\mathcal{G} \to \mathcal{G}$ is an isomorphism. This clearly implies that $i_{small,*}$ is fully faithful, see Sites, Lemma 9.36.1. To prove the statement on the essential image, consider a sheaf of sets $\mathcal{F}$ on $X_{\acute{e}tale}$ whose restriction to $X \setminus Z$ is isomorphic to $*$. As in the proof of Étale Cohomology, Proposition 38.46.4 we consider the adjunction mapping
$$\mathcal{F} \longrightarrow i_{small,*} i_{small}^{-1} \mathcal{F}.$$
As in the first part we see that the restriction of this map to U is an isomorphism by the corresponding result for the case of schemes. Since U is an étale covering of X we conclude it is an isomorphism. □

The following lemma holds more generally in the setting of a closed immersion of topoi (insert future reference here).

Lemma 42.16.5. *Let S be a scheme. Let $i : Z \to X$ be a closed immersion of algebraic spaces over S. Let $\mathcal{A}$ be a sheaf of rings on $X_{étale}$. Let $\mathcal{B}$ be a sheaf of rings on $Z_{étale}$. Let $\varphi : \mathcal{A} \to i_{small,*}\mathcal{B}$ (or what is the same thing $\varphi : i_{small}^{-1}\mathcal{A} \to \mathcal{B}$) be a homomorphism of sheaves of rings. Then for any sheaf of $\mathcal{A}$-modules $\mathcal{F}$ the adjunction mapping $\mathcal{F} \to i_{small,*}i_{small}^{-1}\mathcal{F}$ induces an isomorphism*

$$\mathcal{F} \otimes_{\mathcal{A}} i_{small,*}\mathcal{B} \longrightarrow i_{small,*}(i_{small}^{-1}\mathcal{F} \otimes_{i_{small}^{-1}\mathcal{A}} \mathcal{B}).$$

Proof. During this proof we drop the subscript $_{small}$ from the notation. There is a map $i^{-1}\mathcal{F} \to i^{-1}\mathcal{F} \otimes_{i^{-1}\mathcal{A}} \mathcal{B}$ to which we can apply i_* and compose with the adjunction map:

$$\mathcal{F} \longrightarrow i_*(i^{-1}\mathcal{F}) \longrightarrow i_*(i^{-1}\mathcal{F} \otimes_{i^{-1}\mathcal{A}} \mathcal{B}).$$

The composition is $\mathcal{A}$-linear where $\mathcal{A}$ acts on the target via φ. Note that this target $i_*(i^{-1}\mathcal{F} \otimes_{i^{-1}\mathcal{A}} \mathcal{B})$ has a canonical $i_*\mathcal{B}$-module structure. Hence by the universal property of tensor product we obtain a map as in the lemma.

Let $\mathcal{G}$ be a sheaf of $i_*\mathcal{B}$-modules on $X_{étale}$. Since the support of the sheaf of rings $i_*\mathcal{B}$ is contained in Z we see that the support of $\mathcal{G}$ is contained in Z. Hence by Lemma 42.16.4 we conclude that there exists a unique sheaf of $\mathcal{B}$-modules $\mathcal{H}$ and an isomorphism $i_*\mathcal{H} = \mathcal{G}$ as $i_*\mathcal{B}$-modules. To show that the map of the lemma is an isomorphism we show that the right hand side of the arrow satisfies the universal property enjoyed by the tensor product on the left (i.e., we will use Yoneda's lemma, see Categories, Lemma 4.3.5). To see this we have to show that maps into $\mathcal{G}$ agree. This can be seen using the following sequence of canonical isomorphisms

$$\begin{aligned}
Hom_{i_*\mathcal{B}}(\mathcal{F} \otimes_{\mathcal{A}} i_*\mathcal{B}, \mathcal{G}) &= Hom_{\mathcal{A}}(\mathcal{F}, \mathcal{G}) \\
&= Hom_{\mathcal{A}}(\mathcal{F}, i_*(\mathcal{H})) \\
&= Hom_{i^{-1}\mathcal{A}}(i^{-1}\mathcal{F}, \mathcal{H}) \\
&= Hom_{\mathcal{B}}(i^{-1}\mathcal{F} \otimes_{i^{-1}\mathcal{A}} \mathcal{B}, \mathcal{H}) \\
&= Hom_{i_*\mathcal{B}}(i_*(i^{-1}\mathcal{F} \otimes_{i^{-1}\mathcal{A}} \mathcal{B}), i_*\mathcal{H}) \\
&= Hom_{i_*\mathcal{B}}(i_*(i^{-1}\mathcal{F} \otimes_{i^{-1}\mathcal{A}} \mathcal{B}), \mathcal{G})
\end{aligned}$$

The fifth equality holds because of the equivalence of categories in Lemma 42.16.4. □

42.17. Closed immersions and quasi-coherent sheaves

This section is the analogue of Morphisms, Section 24.3.

Lemma 42.17.1. *Let S be a scheme. Let $i : Z \to X$ be a closed immersion of algebraic spaces over S. Let $\mathcal{I} \subset \mathcal{O}_X$ be the quasi-coherent sheaf of ideals cutting out Z.*

1. *For any $\mathcal{O}_X$-module $\mathcal{F}$ the adjunction map $\mathcal{F} \to i_*i^*\mathcal{F}$ induces an isomorphism $\mathcal{F}/\mathcal{I}\mathcal{F} \cong i_*i^*\mathcal{F}$.*
2. *The functor i^* is a left inverse to i_*, i.e., for any $\mathcal{O}_Z$-module $\mathcal{G}$ the adjunction map $i^*i_*\mathcal{G} \to \mathcal{G}$ is an isomorphism.*
3. *The functor*
$$i_* : QCoh(\mathcal{O}_Z) \longrightarrow QCoh(\mathcal{O}_X)$$
is exact, fully faithful, with essential image those quasi-coherent $\mathcal{O}_X$-modules $\mathcal{F}$ such that $\mathcal{I}\mathcal{F} = 0$.

Proof. During this proof we work exclusively with sheaves on the small étale sites, and we use $i_*, i^{-1}, \ldots$ to denote pushforward and pullback of sheaves of abelian groups instead of $i_{small,*}, i_{small}^{-1}$.

Let $\mathcal{F}$ be an $\mathcal{O}_X$-module. By Lemma 42.16.5 we see that $i_*i^*\mathcal{F} = \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{O}_Z$. By Lemma 42.16.1 we see that we have a short exact sequence

$$0 \to \mathcal{I} \to \mathcal{O}_X \to i_*\mathcal{O}_Z \to 0$$

It follows from properties of the tensor product that $\mathcal{F} \otimes_{\mathcal{O}_X} i_*\mathcal{O}_Z = \mathcal{F}/\mathcal{I}\mathcal{F}$. This proves (1) (except that we omit the verification that the map is induced by the adjunction mapping).

Let $\mathcal{G}$ be any $\mathcal{O}_Z$-module. By Lemma 42.16.4 we see that $i^{-1}i_*\mathcal{G} = \mathcal{G}$. Hence to prove (2) we have to show that the canonical map $\mathcal{G} \otimes_{i^{-1}\mathcal{O}_X} \mathcal{O}_Z \to \mathcal{G}$ is an isomorphism. This follows from general properties of tensor products if we can show that $i^{-1}\mathcal{O}_X \to \mathcal{O}_Z$ is surjective. By Lemma 42.16.4 it suffices to prove that $i_*i^{-1}\mathcal{O}_X \to i_*\mathcal{O}_Z$ is surjective. Since the surjective map $\mathcal{O}_X \to i_*\mathcal{O}_Z$ factors through this map we see that (2) holds.

Finally we prove the most interesting part of the lemma, namely part (3). A closed immersion is quasi-compact and separated, see Lemmas 42.16.2 and 42.16.3. Hence Lemma 42.15.2 applies and the pushforward of a quasi-coherent sheaf on Z is indeed a quasi-coherent sheaf on X. Thus we obtain our functor $i_*^{QCoh} : QCoh(\mathcal{O}_Z) \to QCoh(\mathcal{O}_X)$. It is clear from part (2) that i_*^{QCoh} is fully faithful since it has a left inverse, namely i^*.

Now we turn to the description of the essential image of the functor i_*. It is clear that $\mathcal{I}(i_*\mathcal{G}) = 0$ for any $\mathcal{O}_Z$-module, since $\mathcal{I}$ is the kernel of the map $\mathcal{O}_X \to i_*\mathcal{O}_Z$ which is the map we use to put an $\mathcal{O}_X$-module structure on $i_*\mathcal{G}$. Next, suppose that $\mathcal{F}$ is any quasi-coherent $\mathcal{O}_X$-module such that $\mathcal{I}\mathcal{F} = 0$. Then we see that $\mathcal{F}$ is an $i_*\mathcal{O}_Z$-module because $i_*\mathcal{O}_Z = \mathcal{O}_X/\mathcal{I}$. Hence in particular its support is contained in Z. We apply Lemma 42.16.4 to see that $\mathcal{F} \cong i_*\mathcal{G}$ for some $\mathcal{O}_Z$-module $\mathcal{G}$. The only small detail left over is to see why $\mathcal{G}$ is quasi-coherent. This is true because $\mathcal{G} \cong i^*\mathcal{F}$ by part (2) and Properties of Spaces, Lemma 41.26.2. $\square$

Let $i : Z \to X$ be a closed immersion of algebraic spaces. Because of the lemma above we often, by abuse of notation, denote $\mathcal{F}$ the sheaf $i_*\mathcal{F}$ on X.

Lemma 42.17.2. *Let S be a scheme. Let X be an algebraic space over S. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Let $\mathcal{G} \subset \mathcal{F}$ be a $\mathcal{O}_X$-submodule. There exists a unique quasi-coherent $\mathcal{O}_X$-submodule $\mathcal{G}' \subset \mathcal{G}$ with the following property: For every quasi-coherent $\mathcal{O}_X$-module $\mathcal{H}$ the map*

$$Hom_{\mathcal{O}_X}(\mathcal{H}, \mathcal{G}') \longrightarrow Hom_{\mathcal{O}_X}(\mathcal{H}, \mathcal{G})$$

is bijective. In particular $\mathcal{G}'$ is the largest quasi-coherent $\mathcal{O}_X$-submodule of $\mathcal{F}$ contained in $\mathcal{G}$.

Proof. Let $\mathcal{G}_a$, $a \in A$ be the set of quasi-coherent $\mathcal{O}_X$-submodules contained in $\mathcal{G}$. Then the image $\mathcal{G}'$ of

$$\bigoplus\nolimits_{a\in A} \mathcal{G}_a \longrightarrow \mathcal{F}$$

is quasi-coherent as the image of a map of quasi-coherent sheaves on X is quasi-coherent and since a direct sum of quasi-coherent sheaves is quasi-coherent, see Properties of Spaces, Lemma 41.26.7. The module $\mathcal{G}'$ is contained in $\mathcal{G}$. Hence this is the largest quasi-coherent $\mathcal{O}_X$-module contained in $\mathcal{G}$.

To prove the formula, let $\mathcal{H}$ be a quasi-coherent $\mathcal{O}_X$-module and let $\alpha : \mathcal{H} \to \mathcal{G}$ be an $\mathcal{O}_X$-module map. The image of the composition $\mathcal{H} \to \mathcal{G} \to \mathcal{F}$ is quasi-coherent as the image of a map of quasi-coherent sheaves. Hence it is contained in $\mathcal{G}'$. Hence α factors through $\mathcal{G}'$ as desired. $\square$

Lemma 42.17.3. *Let S be a scheme. Let $i : Z \to X$ be a closed immersion of algebraic spaces over S. There is a functor[4] $i^! : QCoh(\mathcal{O}_X) \to QCoh(\mathcal{O}_Z)$ which is a right adjoint to i_*. (Compare Modules, Lemma 15.6.3.)*

Proof. Given quasi-coherent $\mathcal{O}_X$-module $\mathcal{G}$ we consider the subsheaf $\mathcal{H}_Z(\mathcal{G})$ of $\mathcal{G}$ of local sections annihilated by $\mathcal{I}$. By Lemma 42.17.2 there is a canonical largest quasi-coherent $\mathcal{O}_X$-submodule $\mathcal{H}_Z(\mathcal{G})'$. By construction we have

$$Hom_{\mathcal{O}_X}(i_*\mathcal{F}, \mathcal{H}_Z(\mathcal{G})') = Hom_{\mathcal{O}_X}(i_*\mathcal{F}, \mathcal{G})$$

for any quasi-coherent $\mathcal{O}_Z$-module $\mathcal{F}$. Hence we can set $i^!\mathcal{G} = i^*(\mathcal{H}_Z(\mathcal{G})')$. Details omitted. $\square$

42.18. Universally injective morphisms

We have already defined in Section 42.3 what it means for a representable morphism of algebraic spaces to be universally injective. For a field K over S (recall this means that we are given a structure morphism $Spec(K) \to S$) and an algebraic space X over S we write $X(K) = Mor_S(Spec(K), X)$. We first translate the condition for representable morphisms into a condition on the functor of points.

Lemma 42.18.1. *Let S be a scheme. Let $f : X \to Y$ be a representable morphism of algebraic spaces over S. Then f is universally injective if and only if for all fields K the map $X(K) \to Y(K)$ is injective.*

Proof. We are going to use Morphisms, Lemma 24.10.2 without further mention. Suppose that f is universally injective. Then for any field K and any morphism $Spec(K) \to Y$ the morphism of schemes $Spec(K) \times_Y X \to Spec(K)$ is universally injective. Hence there exists at most one section of the morphism $Spec(K) \times_Y X \to Spec(K)$. Hence the map $X(K) \to Y(K)$ is injective. Conversely, suppose that for every field K the map $X(K) \to Y(K)$ is injective. Let $T \to Y$ be a morphism from a scheme into Y, and consider the base change $f_T : T \times_Y X \to T$. For any field K we have

$$(T \times_Y X)(K) = T(K) \times_{Y(K)} X(K)$$

by definition of the fibre product, and hence the injectivity of $X(K) \to Y(K)$ garantees the injectivity of $(T \times_Y X)(K) \to T(K)$ which means that f_T is universally injective as desired. $\square$

Next, we translate the property that the transformation between field valued points is injective into something more geometric.

Lemma 42.18.2. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. The following are equivalent:*

1. *the map $X(K) \to Y(K)$ is injective for every field K over S*
2. *for every morphism $Y' \to Y$ of algebraic spaces over S the induced map $|Y' \times_Y X| \to |Y'|$ is injective, and*
3. *the diagonal morphism $X \to X \times_Y X$ is surjective.*

[4] This is likely nonstandard notation.

Proof. Assume (1). Let $g : Y' \to Y$ be a morphism of algebraic spaces, and denote $f' : Y' \times_Y X \to Y'$ the base change of f. Let K_i, $i = 1, 2$ be fields and let $\varphi_i : Spec(K_i) \to Y' \times_Y X$ be morphisms such that $f' \circ \varphi_1$ and $f' \circ \varphi_2$ define the same element of $|Y'|$. By definition this means there exists a field Ω and embeddings $\alpha_i : K_i \subset \Omega$ such that the two morphisms $f' \circ \varphi_i \circ \alpha_i : Spec(\Omega) \to Y'$ are equal. Here is the corresponding commutative diagram

$$\begin{tikzcd}
Spec(\Omega) \arrow[r, "\alpha_2"'] \arrow[rd, "\alpha_1"] \arrow[rrd, bend right, to=3-3] & Spec(K_2) \arrow[rd, "\varphi_2"] & & \\
& Spec(K_1) \arrow[r, "\varphi_1"] & Y' \times_Y X \arrow[r, "g'"] \arrow[d, "f'"] & X \arrow[d, "f"] \\
& & Y' \arrow[r, "g"] & Y.
\end{tikzcd}$$

In particular the compositions $g \circ f' \circ \varphi_i \circ \alpha_i$ are equal. By assumption (1) this implies that the morphism $g' \circ \varphi_i \circ \alpha_i$ are equal, where $g' : Y' \times_Y X \to X$ is the projection. By the universal property of the fibre product we conclude that the morphisms $\varphi_i \circ \alpha_i : Spec(\Omega) \to Y' \times_Y X$ are equal. In other words φ_1 and φ_2 define the same point of $Y' \times_Y X$. We conclude that (2) holds.

Assume (2). Let K be a field over S, and let $a, b : Spec(K) \to X$ be two morphisms such that $f \circ a = f \circ b$. Denote $c : Spec(K) \to Y$ the common value. By assumption $|Spec(K) \times_{c,Y} X| \to |Spec(K)|$ is injective. This means there exists a field Ω and embeddings $\alpha_i : K \to \Omega$ such that

$$\begin{tikzcd}
Spec(\Omega) \arrow[r, "\alpha_1"'] \arrow[d, "\alpha_2"'] & Spec(K) \arrow[d, "a"] \\
Spec(K) \arrow[r, "b"] & Spec(K) \times_{c,Y} X
\end{tikzcd}$$

is commutative. Composing with the projection to $Spec(K)$ we see that $\alpha_1 = \alpha_2$. Denote the common value α. Then we see that $\{\alpha : Spec(\Omega) \to Spec(K)\}$ is a fpqc covering of $Spec(K)$ such that the two morphisms a, b become equal on the members of the covering. By Properties of Spaces, Lemma 41.14.1 we conclude that $a = b$. We conclude that (1) holds.

Assume (3). Let $x, x' \in |X|$ be a pair of points such that $f(x) = f(x')$ in $|Y|$. By Properties of Spaces, Lemma 41.4.3 we see there exists a $x'' \in |X \times_Y X|$ whose projections are x and x'. By assumption and Properties of Spaces, Lemma 41.4.4 there exists a $x''' \in |X|$ with $\Delta_{X/Y}(x''') = x''$. Thus $x = x'$. In other words f is injective. Since condition (3) is stable under base change we see that f satsifies (2).

Assume (2). Then in particular $|X \times_Y X| \to |X|$ is injective which implies immediately that $|\Delta_{X/Y}| : |X| \to |X \times_Y X|$ is surjective, which implies that $\Delta_{X/Y}$ is surjective by Properties of Spaces, Lemma 41.4.4. □

By the two lemmas above the following definition does not conflict with the already defined notion of a universally injective representable morphism of algebraic spaces.

Definition 42.18.3. Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. We say f is *universally injective* if for every morphism $Y' \to Y$ the induced map $|Y' \times_Y X| \to |Y'|$ is injective.

To be sure this means that any or all of the equivalent conditions of Lemma 42.18.2 hold.

Remark 42.18.4. A universally injective morphism of schemes is separated, see Morphisms, Lemma 24.10.3. This is not the case for morphisms of algebraic spaces. Namely, the algebraic space $X = \mathbf{A}^1_k/\{x \sim -x \mid x \neq 0\}$ constructed in Spaces, Example 40.14.1 comes equipped with a morphsm $X \to \mathbf{A}^1_k$ which maps the point with coordinate x to the point with coordinate x^2. This is an isomorphism away from 0, and there is a unique point of X lying above 0. As X isn't separated this is a universally injective morphism of algebraic spaces which is not separated.

Lemma 42.18.5. *The base change of a universally injective morphism is universally injective.*

Proof. Omitted. Hint: This is formal. $\square$

Lemma 42.18.6. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. The following are equivalent:*

1. *f is universally injective,*
2. *for every scheme Z and any morphism $Z \to Y$ the morphism $Z \times_Y X \to Z$ is universally injective,*
3. *for every affine scheme Z and any morphism $Z \to Y$ the morphism $Z \times_Y X \to Z$ is universally injective,*
4. *there exists a scheme Z and a surjective morphism $Z \to Y$ such that $Z \times_Y X \to Z$ is universally injective, and*
5. *there exists a Zariski covering $Y = \bigcup Y_i$ such that each of the morphisms $f^{-1}(Y_i) \to Y_i$ is universally injective.*

Proof. We will use that being universally injective is preserved under base change (Lemma 42.18.5) without further mention in this proof. It is clear that (1) $\Rightarrow$ (2) $\Rightarrow$ (3) $\Rightarrow$ (4).

Assume $g : Z \to Y$ as in (4). Let $y : Spec(K) \to Y$ be a morphism from the spectrum of a field into Y. By assumption we can find an extension field $\alpha : K \subset K'$ and a morphism $z : Spec(K') \to Z$ such that $y \circ \alpha = g \circ z$ (with obvious abuse of notation). By assumption the morphism $Z \times_Y X \to Z$ is universally injective, hence there is at most one lift of $g \circ z : Spec(K') \to Y$ to a morphism into X. Since $\{\alpha : Spec(K') \to Spec(K)\}$ is a fpqc covering this implies there is at most one lift of $y : Spec(K) \to Y$ to a morphism into X, see Properties of Spaces, Lemma 41.14.1. Thus we see that (1) holds.

We omit the verification that (5) is equivalent to (1). $\square$

Lemma 42.18.7. *A composition of universally injective morphisms is universally injective.*

Proof. Omitted. $\square$

42.19. Affine morphisms

We have already defined in Section 42.3 what it means for a representable morphism of algebraic spaces to be affine.

Lemma 42.19.1. *Let S be a scheme. Let $f : X \to Y$ be a representable morphism of algebraic spaces over S. Then f is affine if and only if for all affine schemes Z and morphisms $Z \to Y$ the scheme $X \times_Y Z$ is affine.*

Proof. This follows directly from the definition of an affine morphism of schemes (Morphisms, Definition 24.11.1). $\square$

This clears the way for the following definition.

Definition 42.19.2. Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. We say f is *affine* if for every affine scheme Z and morphism $Z \to Y$ the algebraic space $X \times_Y Z$ is representable by an affine scheme.

Lemma 42.19.3. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. The following are equivalent:*

(1) *f is representable and affine,*
(2) *f is affine,*
(3) *there exists a scheme V and a surjective étale morphism $V \to Y$ such that $V \times_Y X \to V$ is affine, and*
(4) *there exists a Zariski covering $Y = \bigcup Y_i$ such that each of the morphisms $f^{-1}(Y_i) \to Y_i$ is affine.*

Proof. It is clear that (1) implies (2) and that (2) implies (3) by taking V to be a disjoint union of affines étale over Y, see Properties of Spaces, Lemma 41.6.1. Assume $V \to Y$ is as in (3). Then for every affine open W of V we see that $W \times_Y X$ is an affine open of $V \times_Y X$. Hence by Properties of Spaces, Lemma 41.10.1 we conclude that $V \times_Y X$ is a scheme. Moreover the morphism $V \times_Y X \to V$ is affine. This means we can apply Spaces, Lemma 40.11.3 because the class of affine morphisms satisfies all the required properties (see Morphisms, Lemmas 24.11.8 and Descent, Lemmas 31.19.16 and 31.33.1). The conclusion of applying this lemma is that f is representable and affine, i.e., (1) holds.

The equivalence of (1) and (4) follows from the fact that being affine is Zariski local on the target (the reference above shows that being affine is in fact fpqc local on the target). □

Lemma 42.19.4. *The composition of affine morphisms is affine.*

Proof. Omitted. □

Lemma 42.19.5. *The base change of an affine morphism is affine.*

Proof. Omitted. □

42.20. Quasi-affine morphisms

We have already defined in Section 42.3 what it means for a representable morphism of algebraic spaces to be quasi-affine.

Lemma 42.20.1. *Let S be a scheme. Let $f : X \to Y$ be a representable morphism of algebraic spaces over S. Then f is quasi-affine if and only if for all affine schemes Z and morphisms $Z \to Y$ the scheme $X \times_Y Z$ is quasi-affine.*

Proof. This follows directly from the definition of a quasi-affine morphism of schemes (Morphisms, Definition 24.12.1). □

This clears the way for the following definition.

Definition 42.20.2. Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. We say f is *quasi-affine* if for every affine scheme Z and morphism $Z \to Y$ the algebraic space $X \times_Y Z$ is representable by a quasi-affine scheme.

Lemma 42.20.3. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. The following are equivalent:*

(1) *f is representable and quasi-affine,*
(2) *f is quasi-affine,*

(3) *there exists a scheme V and a surjective étale morphism $V \to Y$ such that $V \times_Y X \to V$ is quasi-affine, and*
(4) *there exists a Zariski covering $Y = \bigcup Y_i$ such that each of the morphisms $f^{-1}(Y_i) \to Y_i$ is quasi-affine.*

Proof. It is clear that (1) implies (2) and that (2) implies (3) by taking V to be a disjoint union of affines étale over Y, see Properties of Spaces, Lemma 41.6.1. Assume $V \to Y$ is as in (3). Then for every affine open W of V we see that $W \times_Y X$ is a quasi-affine open of $V \times_Y X$. Hence by Properties of Spaces, Lemma 41.10.1 we conclude that $V \times_Y X$ is a scheme. Moreover the morphism $V \times_Y X \to V$ is quasi-affine. This means we can apply Spaces, Lemma 40.11.3 because the class of quasi-affine morphisms satisfies all the required properties (see Morphisms, Lemmas 24.12.5 and Descent, Lemmas 31.19.18 and 31.34.1). The conclusion of applying this lemma is that f is representable and quasi-affine, i.e., (1) holds.

The equivalence of (1) and (4) follows from the fact that being quasi-affine is Zariski local on the target (the reference above shows that being quasi-affine is in fact fpqc local on the target). □

Lemma 42.20.4. *The composition of quasi-affine morphisms is quasi-affine.*

Proof. Omitted. □

Lemma 42.20.5. *The base change of a quasi-affine morphism is quasi-affine.*

Proof. Omitted. □

42.21. Types of morphisms étale local on source-and-target

Given a property of morphisms of schemes which is *étale local on the source-and-target*, see Descent, Definition 31.28.3 we may use it to define a corresponding property of morphisms of algebraic spaces, namely by imposing either of the equivalent conditions of the lemma below.

Lemma 42.21.1. *Let $\mathcal{P}$ be a property of morphisms of schemes which is étale local on the source-and-target. Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Consider commutative diagrams*

$$\begin{tikzcd} U \arrow[r, "h"] \arrow[d, "a"'] & V \arrow[d, "b"] \\ X \arrow[r, "f"] & Y \end{tikzcd}$$

where U and V are schemes and the vertical arrows are étale. The following are equivalent

(1) *for any diagram as above the morphism h has property $\mathcal{P}$, and*
(2) *for some diagram as above with $a : U \to X$ surjective the morphism h has property $\mathcal{P}$.*

If X and Y are representable, then this is also equivalent to f (as a morphism of schemes) having property $\mathcal{P}$. If $\mathcal{P}$ is also preserved under any base change, and fppf local on the base, then for representable morphisms f this is also equivalent to f having property $\mathcal{P}$ in the sense of Section 42.3.

Proof. Let us prove the equivalence of (1) and (2). The implication (1) ⇒ (2) is immediate (taking into account Spaces, Lemma 40.11.4). Assume

$$\begin{tikzcd} U \arrow[r, "h"] \arrow[d] & V \arrow[d] \\ X \arrow[r, "f"] & Y \end{tikzcd} \qquad \begin{tikzcd} U' \arrow[r, "h'"] \arrow[d] & V' \arrow[d] \\ X \arrow[r, "f"] & Y \end{tikzcd}$$

are two diagrams as in the lemma. Assume $U \to X$ is surjective and h has propery $\mathcal{P}$. To show that (2) implies (1) we have to prove that h' has $\mathcal{P}$. To do this consider the diagram

$$\begin{tikzcd} U \arrow[d, "h"] & U \times_X U' \arrow[l] \arrow[r] \arrow[d, "(h,h')"] & U' \arrow[d, "h'"] \\ V & V \times_Y V' \arrow[l] \arrow[r] & V' \end{tikzcd}$$

By Descent, Lemma 31.28.5 we see that h has $\mathcal{P}$implies (h, h') has $\mathcal{P}$and since $U \times_X U' \to U'$ is surjective this implies (by the same lemma) that h' has $\mathcal{P}$.

If X and Y are representable, then Descent, Lemma 31.28.5 applies which shows that (1) and (2) are equivalent to f having $\mathcal{P}$.

Finally, suppose f is representable, and U, V, a, b, h are as in part (2) of the lemma, and that $\mathcal{P}$is preserved under arbitrary base change. We have to show that for any scheme Z and morphism $Z \to X$ the base change $Z \times_Y X \to Z$ has property $\mathcal{P}$. Consider the diagram

$$\begin{tikzcd} Z \times_Y U \arrow[r] \arrow[d] & Z \times_Y V \arrow[d] \\ Z \times_Y X \arrow[r] & Z \end{tikzcd}$$

Note that the top horizontal arrow is a base change of h and hence has property $\mathcal{P}$. The left vertical arrow is étale and surjective and the right vertical arrow is étale. Thus Descent, Lemma 31.28.5 once again kicks in and shows that $Z \times_Y X \to Z$ has property $\mathcal{P}$. □

Definition 42.21.2. Let S be a scheme. Let $\mathcal{P}$be a property of morphisms of schemes which is étale local on the source-and-target. We say a morphism $f : X \to Y$ of algebraic spaces over S *has property* $\mathcal{P}$if the equivalent conditions of Lemma 42.21.1 hold.

Given a property of morphisms of germs of schemes which is *étale local on the source-and-target*, see Descent, Definition 31.29.1 we may use it to define a corresponding property of morphisms of algebraic spaces at a point, namely by imposing either of the equivalent conditions of the lemma below.

Lemma 42.21.3. *Let $\mathcal{Q}$ be a property of morphisms of germs which is étale local on the source-and-target. Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Let $x \in |X|$ be a point of X. Consider the diagrams*

$$\begin{tikzcd} U \arrow[r, "h"] \arrow[d, "a"'] & V \arrow[d, "b"] \\ X \arrow[r, "f"] & Y \end{tikzcd} \qquad \begin{tikzcd} u \arrow[r] \arrow[d] & v \arrow[d] \\ x \arrow[r] & y \end{tikzcd}$$

where U and V are schemes, a, b are étale, and u, v, x, y are points of the corresponding spaces. The following are equivalent

(1) *for any diagram as above we have* $\mathcal{Q}((U,u) \to (V,v))$*, and*
(2) *for some diagram as above we have* $\mathcal{Q}((U,u) \to (V,v))$*.*

If X *and* Y *are representable, then this is also equivalent to* $\mathcal{Q}((X,x) \to (Y,y))$*.*

Proof. Omitted. Hint: Very similar to the proof of Lemma 42.21.1. □

Definition 42.21.4. Let $\mathcal{Q}$ be a property of morphisms of germs of schemes which is étale local on the source-and-target. Let S be a scheme. Given a morphism $f : X \to Y$ of algebraic spaces over S and a point $x \in |X|$ we say that *f has property $\mathcal{Q}$ at x* if the equivalent conditions of Lemma 42.21.3 hold.

The following lemma should not be used blindly to go from a property of morphisms to a property of morphisms at a point. For example if $\mathcal{P}$ is the property of being flat, then the property Q in the following lemma means ``$f$ is flat in an open neighbourhood of $x$'' which is not the same as ``f is flat at x''.

Lemma 42.21.5. *Let $\mathcal{P}$ be a property of morphisms of schemes which is étale local on the source-and-target. Consider the property $\mathcal{Q}$ of morphisms of germs associated to $\mathcal{P}$ in Descent, Lemma 31.29.2. Then*

(1) *$\mathcal{Q}$ is étale local on the source-and-target.*
(2) *given a morphism of algebraic spaces $f : X \to Y$ and $x \in |X|$ the following are equivalent*
    (a) *f has $\mathcal{Q}$ at x, and*
    (b) *there is an open neighbourhood $X' \subset X$ of x such that $X' \to Y$ has $\mathcal{P}$.*
(3) *given a morphism of algebraic spaces $f : X \to Y$ the following are equivalent:*
    (a) *f has $\mathcal{P}$,*
    (b) *for every $x \in |X|$ the morphism f has $\mathcal{Q}$ at x.*

Proof. See Descent, Lemma 31.29.2 for (1). The implication (1)(a) ⇒ (2)(b) follows on letting $X' = a(U) \subset X$ given a diagram as in Lemma 42.21.3. The implication (2)(b) ⇒ (1)(a) is clear. The equivalence of (3)(a) and (3)(b) follows from the corresponding result for morphisms of schemes, see Descent, Lemma 31.29.3. □

Remark 42.21.6. We will apply Lemma 42.21.5 above to all cases listed in Descent, Remark 31.28.7 except ``flat''. In each case we will do this by defining f to have property $\mathcal{P}$ at x if f has $\mathcal{P}$ in a neighbourhood of x.

42.22. Morphisms of finite type

The property ``locally of finite type'' of morphisms of schemes is étale local on the source-and-target, see Descent, Remark 31.28.7. It is also stable under base change and fpqc local on the target, see Morphisms, Lemma 24.14.4, and Descent, Lemmas 31.19.8. Hence, by Lemma 42.21.1 above, we may define what it means for a morphism of algebraic spaces to be locally of finite type as follows and it agrees with the already existing notion defined in Section 42.3 when the morphism is representable.

Definition 42.22.1. Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S.

(1) We say *f locally of finite type* if the equivalent conditions of Lemma 42.21.1 hold with $\mathcal{P}$= locally of finite type.
(2) Let $x \in |X|$. We say f is of *finite type at x* if there exists an open neighbourhood $X' \subset X$ of x such that $f|_{X'} : X' \to Y$ is locally of finite type.

(3) We say f is *of finite type* if it is locally of finite type and quasi-compact.

Consider the algebraic space $\mathbf{A}^1_k/\mathbf{Z}$ of Spaces, Example 40.14.8. The morphism $\mathbf{A}^1_k/\mathbf{Z} \to Spec(k)$ is of finite type.

Lemma 42.22.2. *The composition of finite type morphisms is of finite type. The same holds for locally of finite type.*

Proof. Omitted. □

Lemma 42.22.3. *A base change of a finite type morphism is finite type. The same holds for locally of finite type.*

Proof. Omitted. □

Lemma 42.22.4. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. The following are equivalent:*

(1) *f is locally of finite type,*
(2) *for every $x \in |X|$ the morphism f is of finite type at x,*
(3) *for every scheme Z and any morphism $Z \to Y$ the morphism $Z \times_Y X \to Z$ is locally of finite type,*
(4) *for every affine scheme Z and any morphism $Z \to Y$ the morphism $Z \times_Y X \to Z$ is locally of finite type,*
(5) *there exists a scheme V and a surjective étale morphism $V \to Y$ such that $V \times_Y X \to V$ is locally of finite type,*
(6) *there exists a scheme U and a surjective étale morphism $\varphi : U \to X$ such that the composition $f \circ \varphi$ is locally of finite type,*
(7) *for every commutative diagram*

$$\begin{tikzcd} U \arrow[r] \arrow[d] & V \arrow[d] \\ X \arrow[r] & Y \end{tikzcd}$$

where U, V are schemes and the vertical arrows are étale the top horizontal arrow is locally of finite type,
(8) *there exists a commutative diagram*

$$\begin{tikzcd} U \arrow[r] \arrow[d] & V \arrow[d] \\ X \arrow[r] & Y \end{tikzcd}$$

where U, V are schemes, the vertical arrows are étale, $U \to X$ is surjective, and the top horizontal arrow is locally of finite type, and
(9) *there exist Zariski coverings $Y = \bigcup_{i \in I} Y_i$, and $f^{-1}(Y_i) = \bigcup X_{ij}$ such that each morphism $X_{ij} \to Y_i$ is locally of finite type.*

Proof. Omitted. □

Lemma 42.22.5. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. If f is locally of finite type and Y is locally Noetherian, then X is locally Noetherian.*

Proof. Let

$$\begin{tikzcd} U \arrow[r] \arrow[d] & V \arrow[d] \\ X \arrow[r] & Y \end{tikzcd}$$

be a commutative diagram where U, V are schemes and the vertical arrows are surjective étale. If f is locally of finite type, then $U \to V$ is locally of finite type. If Y is locally Noetherian, then V is locally Noetherian. By Morphisms, Lemma 24.14.6 we see that U is locally Noetherian, which means that X is locally Noetherian. □

Lemma 42.22.6. *Let S be a scheme. Let $f : X \to Y$, $g : Y \to Z$ be morphisms of algebraic spaces over S. If $g \circ f : X \to Z$ is locally of finite type, then $f : X \to Y$ is locally of finite type.*

Proof. We can find a diagram

$$\begin{tikzcd} U \arrow[r] \arrow[d] & V \arrow[r] \arrow[d] & W \arrow[d] \\ X \arrow[r] & Y \arrow[r] & Z \end{tikzcd}$$

where U, V, W are schemes, the vertical arrows are étale and surjective, see Spaces, Lemma 40.11.4. At this point we can use Lemma 42.22.4 and Morphisms, Lemma 24.14.8 to conclude. □

Lemma 42.22.7. *An immersion is locally of finite type.*

Proof. Follows from the general principle Spaces, Lemma 40.5.8 and Morphisms, Lemmas 24.14.5. □

42.23. Points and geometric points

In this section we make some remarks on points and geometric points (see Properties of Spaces, Definition 41.16.1). One way to think about a geometric point of X is to consider a geometric point $\overline{s} : Spec(k) \to S$ of S and a lift of $\overline{s}$ to a morphism $\overline{x}$ into X. Here is a diagram

$$\begin{tikzcd} Spec(k) \arrow[r, "\overline{x}"'] \arrow[rd, "\overline{s}"'] & X \arrow[d] \\ & S. \end{tikzcd}$$

We often say ``let k be an algebraically closed field over S'' to indicate that $Spec(k)$ comes equipped with a morphism $Spec(k) \to S$. In this situation we write

$$X(k) = Mor_S(Spec(k), X) = \{\overline{x} \in X \text{ lying over } \overline{s}\}$$

for the set of k-valued points of X. In this case the map $X(k) \to |X|$ maps into the subset $|X_s| \subset |X|$. Here $X_s = Spec(\kappa(s)) \times_S X$, where $s \in S$ is the point corresponding to $\overline{s}$. As $Spec(\kappa(s)) \to S$ is a monomorphism, also the base change $X_s \to X$ is a monomorphism, and $|X_s|$ is indeed a subset of $|X|$.

Lemma 42.23.1. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Assume f is locally of finite type. The following are equivalent:*

(1) *f is surjective, and*

(2) *for every algebraically closed field k over S the induced map $X(k) \to Y(k)$ is surjective.*

Proof. Choose a diagram

$$\begin{tikzcd} U \arrow[r] \arrow[d] & V \arrow[d] \\ X \arrow[r] & Y \end{tikzcd}$$

with U, V schemes over S and vertical arrows surjective and étale, see Spaces, Lemma 40.11.4. Since f is locally of finite type we see that $U \to V$ is locally of finite type.

Assume (1) and let $\overline{y} \in Y(k)$. Then $U \to Y$ is surjective and locally of finite type by Lemmas 42.6.4 and 42.22.2. Let $Z = U \times_{Y,\overline{y}} Spec(k)$. This is a scheme. The projection $Z \to Spec(k)$ is surjective and locally of finite type by Lemmas 42.6.5 and 42.22.3. It follows from Varieties, Lemma 28.12.1 that Z has a k valued point $\overline{z}$. The image $\overline{x} \in X(k)$ of $\overline{z}$ maps to $\overline{y}$ as desired.

Assume (2). By Properties of Spaces, Lemma 41.4.4 it suffices to show that $|X| \to |Y|$ is surjective. Let $y \in |Y|$. Choose a $u \in U$ mapping to y. Let $k \supset \kappa(u)$ be an algebraic closure. Denote $\overline{u} \in U(k)$ the corresponding point and $\overline{y} \in Y(k)$ its image. By assumption there exists a $\overline{x} \in X(k)$ mapping to $\overline{y}$. Then it is clear that the image $x \in |X|$ of $\overline{x}$ maps to y. $\square$

In order to state the next lemma we introduce the following notation. Given a scheme T we denote

$$\lambda(T) = \sup\{\aleph_0, |\kappa(t)|; t \in T\}.$$

In words $\lambda(T)$ is the smallest infinite cardinal bounding all the cardinalities of residue fields ot T. Note that if R is a ring then the cardinality of any residue field $\kappa(\mathfrak{p})$ of R is bounded by the cardinality of R (details omitted). This implies that $\lambda(T) \leq \text{size}(T)$ where $\text{size}(T)$ is the size of the scheme T as introduced in Sets, Section 3.9. If $K \subset L$ is a finitely generated field extension then $|K| \leq |L| \leq \max\{\aleph_0, |K|\}$. It follows that if $T' \to T$ is a morphism of schemes which is locally of finite type then $\lambda(T') \leq \lambda(T)$, and if $T' \to T$ is also surjective then equality holds. Next, suppose that S is a scheme and that X is an algebraic space over S. In this case we define

$$\lambda(X) := \lambda(U)$$

where U is any scheme over S which has a surjective étale morphism towards X. The reason that this is independent of the choice of U is that given a pair of such schemes U and U' the fibre product $U \times_X U'$ is a scheme which admits a surjective étale morphism to both U and U', whence $\lambda(U) = \lambda(U \times_X U') = \lambda(U')$ by the discussion above.

Lemma 42.23.2. *Let S be a scheme. Let X, Y be algebraic spaces over S.*

(1) *As k ranges over all algebraically closed fields over S the collection of geometric points $\overline{y} \in Y(k)$ cover all of $|Y|$.*
(2) *As k ranges over all algebraically closed fields over S with $|k| \geq \lambda(Y)$ and $|k| > \lambda(X)$ the geometric points $\overline{y} \in Y(k)$ cover all of $|Y|$.*
(3) *For any geometric point $\overline{s} : Spec(k) \to S$ where k has cardinality $> \lambda(X)$ the map*

$$X(k) \longrightarrow |X_s|$$

is surjective.

(4) *Let $X \to Y$ be a morphism of algebraic spaces over S. For any geometric point $\overline{s} : Spec(k) \to S$ where k has cardinality $> \lambda(X)$ the map*

$$X(k) \longrightarrow |X| \times_{|Y|} Y(k)$$

is surjective.

(5) *Let $X \to Y$ be a morphism of algebraic spaces over S. The following are equivalent:*
   (a) *the map $X \to Y$ is surjective,*
   (b) *for all algebraically closed fields k over S with $|k| > \lambda(X)$, and $|k| \geq \lambda(Y)$ the map $X(k) \to Y(k)$ is surjective.*

Proof. To prove part (1) choose a surjective étale morphism $V \to Y$ where V is a scheme. For each $v \in V$ choose an algebraic closure $\kappa(v) \subset k_v$. Consider the morphisms $\overline{x} : Spec(k_v) \to V \to Y$. By construction of $|Y|$ these cover $|Y|$.

To prove part (2) we will use the following two facts whose proofs we omit: (i) If K is a field and $\overline{K}$ is algebraic closure then $|\overline{K}| \leq \max\{\aleph_0, |K|\}$. (ii) For any algebraically closed field k and any cardinal $\aleph$, $\aleph \geq |k|$ there exists an extension of algebraically closed fields $k \subset k'$ with $|k'| = \aleph$. Now we set $\aleph = \max\{\lambda(X), \lambda(Y)\}^+$. Here $\lambda^+ > \lambda$ indicates the next bigger cardinal, see Sets, Section 3.6. Now (i) implies that the fields k_u constructed in the first paragraph of the proof all have cardinality bounded by $\lambda(X)$. Hence by (ii) we can find extensions $k_u \subset k'_u$ such that $|k'_u| = \aleph$. The morphisms $\overline{x}' : Spec(k'_u) \to X$ cover $|X|$ as desired. To really finish the proof of (2) we need to show that the schemes $Spec(k'_u)$ are (isomorphic to) objects of Sch_{fppf} because our conventions are that all schemes are objects of Sch_{fppf}; the rest of this paragraph should be skipped by anyone who is not interested in set theoretical considerations. By construction there exists an object T of Sch_{fppf} such that $\lambda(X)$ and $\lambda(Y)$ are bounded by size(T). By our construction of the category Sch_{fppf} in Topologies, Definitions 30.7.6 as the category Sch_α constructed in Sets, Lemma 3.9.2 we see that any scheme whose size is $\leq$ size$(T)^+$ is isomorphic to an object of Sch_{fppf}. See the expression for the function *Bound* in Sets, Equation (3.9.1.1). Since $\aleph \leq$ size$(T)^+$ we conclude.

The notation X_s in part (3) means the fibre product $Spec(\kappa(s)) \times_S X$, where $s \in S$ is the point corresponding to $\overline{s}$. Hence part (2) follows from (4) with $Y = Spec(\kappa(s))$.

Let us prove (4). Let $X \to Y$ be a morphism of algebraic spaces over S. Let k be an algebraically closed field over S of cardinality $> \lambda(X)$. Let $\overline{y} \in Y(k)$ and $x \in |X|$ which map to the same element y of $|Y|$. We have to find $\overline{x} \in X(k)$ mapping to x and $\overline{y}$. Choose a commutative diagram

$$\begin{tikzcd} U \arrow[r] \arrow[d] & V \arrow[d] \\ X \arrow[r] & Y \end{tikzcd}$$

with U, V schemes over S and vertical arrows surjective and étale, see Spaces, Lemma 40.11.4. Choose a $u \in |U|$ which maps to x, and denote $v \in |V|$ the image. We will think of $u = Spec(\kappa(u))$ and $v = Spec(\kappa(v))$ as schemes. Note that $V \times_Y Spec(k)$ is a scheme étale over k. Hence it is a disjoint union of spectra of finite separable extensions of k, see Morphisms, Lemma 24.35.7. As v maps to y we see that $v \times_Y Spec(k)$ is a nonempty scheme. As $v \to V$ is a monomorphism, we see that $v \times_Y Spec(k) \to V \times_Y Spec(k)$ is a monomorphism. Hence $v \times_Y Spec(k)$ is a disjoint union of spectra of finite separable extensions of k, by Schemes, Lemma 21.23.10. We conclude that the morphism $v \times_Y Spec(k) \to Spec(k)$ has a section, i.e., we can find a morphism $\overline{v} : Spec(k) \to V$ lying over v and over $\overline{y}$. Finally we consider the scheme

$$u \times_{V,\overline{v}} Spec(k) = Spec(\kappa(u) \otimes_{\kappa(v)} k)$$

where $\kappa(v) \to k$ is the field map defining the morphism $\overline{v}$. Since the cardinality of k is larger than the cardinality of $\kappa(u)$ by assumption we may apply Algebra, Lemma 7.31.12 to see that any maximal ideal $\mathfrak{m} \subset \kappa(u) \otimes_{\kappa(v)} k$ has a residue field which is algebraic over k and hence equal to k. Such a maximal ideal will hence produce a morphism $\overline{u} : Spec(k) \to U$ lying over u and mapping to $\overline{v}$. The composition $Spec(k) \to U \to X$ will be the desired geometric point $\overline{x} \in X(k)$. This concludes the proof of part (4).

Part (5) is a formal consequence of parts (2) and (4) and Properties of Spaces, Lemma 41.4.4. □

42.24. Points of finite type

Let S be a scheme. Let X be an algebraic space over S. A finite type point $x \in |X|$ is a point which can be represented by a morphism $Spec(k) \to X$ which is locally of finite type. Finite type points are a suitable replacement of closed points for algebraic spaces and algebraic stacks. There are always ``enough of them'' for example.

Lemma 42.24.1. *Let S be a scheme. Let X be an algebraic space over S. Let $x \in |X|$. The following are equivalent:*

(1) *There exists a morphism $Spec(k) \to X$ which is locally of finite type and represents x.*
(2) *There exists a scheme U, a closed point $u \in U$, and an étale morphism $\varphi : U \to X$ such that $\varphi(u) = x$.*

Proof. Let $u \in U$ and $U \to X$ be as in (2). Then $Spec(\kappa(u)) \to U$ is of finite type, and $U \to X$ is representable and locally of finite type (by the general principle Spaces, Lemma 40.5.8 and Morphisms, Lemmas 24.35.11 and 24.20.8). Hence we see (1) holds by Lemma 42.22.2.

Conversely, assume $Spec(k) \to X$ is locally of finite type and represents x. Let $U \to X$ be a surjective étale morphism where U is a scheme. By assumption $U \times_X Spec(k) \to U$ is locally of finite type. Pick a finite type point v of $U \times_X Spec(k)$ (there exists at least one, see Morphisms, Lemma 24.15.4). By Morphisms, Lemma 24.15.5 the image $u \in U$ of v is a finite type point of U. Hence by Morphisms, Lemma 24.15.4 after shrinking U we may assume that u is a closed point of U, i.e., (2) holds. □

Definition 42.24.2. Let S be a scheme. Let X be an algebraic space over S. We say a point $x \in |X|$ is a *finite type point*[5] if the equivalent conditions of Lemma 42.24.1 are satisfied. We denote $X_{\text{ft-pts}}$ the set of finite type points of X.

We can describe the set of finite type points as follows.

Lemma 42.24.3. *Let S be a scheme. Let X be an algebraic space over S. We have*

$$X_{\textit{ft-pts}} = \bigcup\nolimits_{\varphi : U \to X \textit{ étale}} |\varphi|(U_0)$$

where U_0 is the set of closed points of U. Here we may let U range over all schemes étale over X or over all affine schemes étale over X.

[5]This is a slight abuse of language as it would perhaps be more correct to say ``locally finite type point''.

Proof. Immediate from Lemma 42.24.1. □

Lemma 42.24.4. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. If f is locally of finite type, then $f(X_{ft\text{-}pts}) \subset Y_{ft\text{-}pts}$.*

Proof. Take $x \in X_{\text{ft-pts}}$. Represent x by a locally finite type morphism $x : Spec(k) \to X$. Then $f \circ x$ is locally of finite type by Lemma 42.22.2. Hence $f(x) \in Y_{\text{ft-pts}}$. □

Lemma 42.24.5. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. If f is locally of finite type and surjective, then $f(X_{ft\text{-}pts}) = Y_{ft\text{-}pts}$.*

Proof. We have $f(X_{\text{ft-pts}}) \subset Y_{\text{ft-pts}}$ by Lemma 42.24.4. Let $y \in |Y|$ be a finite type point. Represent y by a morphism $Spec(k) \to Y$ which is locally of finite type. As f is surjective the algebraic space $X_k = Spec(k) \times_Y X$ is nonempty, therefore has a finite type point $x \in |X_k|$ by Lemma 42.24.3. Now $X_k \to X$ is a morphism which is locally of finite type as a base change of $Spec(k) \to Y$ (Lemma 42.22.3). Hence the image of x in X is a finite type point by Lemma 42.24.4 which maps to y by construction. □

Lemma 42.24.6. *Let S be a scheme. Let X be an algebraic space over S. For any locally closed subset $T \subset |X|$ we have*

$$T \neq \emptyset \Rightarrow T \cap X_{ft\text{-}pts} \neq \emptyset.$$

In particular, for any closed subset $T \subset |X|$ we see that $T \cap X_{ft\text{-}pts}$ is dense in T.

Proof. Let $i : Z \to X$ be the reduced induce subspace structure on T, see Remark 42.4.4. Any immersion is locally of finite type, see Lemma 42.22.7. Hence by Lemma 42.24.4 we see $Z_{\text{ft-pts}} \subset X_{\text{ft-pts}} \cap T$. Finally, any nonempty affine scheme U with an étale morphism towards Z has at least one closed point. Hence Z has at least one finite type point by Lemma 42.24.3. The lemma follows. □

Here is another, more technical, characterization of a finite type point on an algebraic space.

Lemma 42.24.7. *Let S be a scheme. Let X be an algebraic space over S. Let $x \in |X|$. The following are equivalent:*

(1) *x is a finite type point,*
(2) *there exists an algebraic space Z whose underlying topological space $|Z|$ is a singleton, and a morphism $f : Z \to X$ which is locally of finite type such that $\{x\} = |f|(|Z|)$, and*
(3) *there exists an algebraic space Z and a morphism $f : Z \to X$ with the following properties:*
    (a) *there is a surjective étale morphism $z : Spec(k) \to Z$ where k is a field,*
    (b) *f is locally of finite type,*
    (c) *f is a monomorphism, and*
    (d) *$x = f(z)$.*

Proof. Assume x is a finite type point. Choose an affine scheme U, a closed point $u \in U$, and an étale morphism $\varphi : U \to X$ with $\varphi(u) = x$, see Lemma 42.24.3. Set $u = Spec(\kappa(u))$ as usual. The projection morphisms $u \times_X u \to u$ are the compositions

$$u \times_X u \to u \times_X U \to u \times_X X = u$$

where the first arrow is a closed immersion (a base change of $u \to U$) and the second arrow is étale (a base change of the étale morphism $U \to X$). Hence $u \times_X U$ is a disjoint union of spectra of finite separable extensions of k (see Morphisms, Lemma 24.35.7) and therefore the closed subscheme $u \times_X u$ is a disjoint union of finite separable extension of k, i.e., $u \times_X u \to u$ is étale. By Spaces, Theorem 40.10.5 we see that $Z = u/u \times_X u$ is an algebraic space. By construction the diagram

$$\begin{tikzcd} u \arrow[r] \arrow[d] & U \arrow[d] \\ Z \arrow[r] & X \end{tikzcd}$$

is commutative with étale vertical arrows. Hence $Z \to X$ is locally of finite type (see Lemma 42.22.4). By construction the morphism $Z \to X$ is a monomorphism and the image of z is x. Thus (3) holds.

It is clear that (3) implies (2). If (2) holds then x is a finite type point of X by Lemma 42.24.4 (and Lemma 42.24.6 to see that $Z_{\text{ft-pts}}$ is nonempty, i.e., the unique point of Z is a finite type point of Z). □

42.25. Quasi-finite morphisms

The property ``locally quasi-finite" of morphisms of schemes is étale local on the source-and-target, see Descent, Remark 31.28.7. It is also stable under base change and fpqc local on the target, see Morphisms, Lemma 24.19.13, and Descent, Lemma 31.19.22. Hence, by Lemma 42.21.1 above, we may define what it means for a morphism of algebraic spaces to be locally quasi-finite as follows and it agrees with the already existing notion defined in Section 42.3 when the morphism is representable.

Definition 42.25.1. Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S.

(1) We say f is *locally quasi-finite* if the equivalent conditions of Lemma 42.21.1 hold with $\mathcal{P}$= locally quasi-finite.
(2) Let $x \in |X|$. We say f is *quasi-finite at* x if there exists an open neighbourhood $X' \subset X$ of x such that $f|_{X'} : X' \to Y$ is locally quasi-finite.
(3) A morphism of algebraic spaces $f : X \to Y$ is *quasi-finite* if it is locally quasi-finite and quasi-compact.

The last part is compatible with the notion of quasi-finiteness for morphisms of schemes by Morphisms, Lemma 24.19.9.

Lemma 42.25.2. *The composition of quasi-finite morphisms is quasi-finite. The same holds for locally quasi-finite.*

Proof. Omitted. □

Lemma 42.25.3. *A base change of a quasi-finite morphism is quasi-finite. The same holds for locally quasi-finite.*

Proof. Omitted. □

The following lemma characterizes locally quasi-finite morphisms as those morphisms which are locally of finite type and have ``discrete fibres". However, it isn't enough to assume that $|X| \to |Y|$ has discrete fibres as the discussion in Examples, Section 64.30 shows.

Lemma 42.25.4. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces. Assume f is locally of finite type. The following are equivalent*

(1) *f is locally quasi-finite,*
(2) *for every morphism $Spec(k) \to Y$ where k is a field the space $|X_k|$ is discrete. Here $X_k = Spec(k) \times_Y X$.*

Proof. Assume f is locally quasi-finite. Let $Spec(k) \to Y$ be as in (2). Choose a surjective étale morphism $U \to X$ where U is a scheme. Then $U_k = Spec(k) \times_Y U \to X_k$ is an étale morphism of algebraic spaces by Properties of Spaces, Lemma 41.13.5. By Lemma 42.25.3 we see that $X_k \to Spec(k)$ is locally quasi-finite. By definition this means that $U_k \to Spec(k)$ is locally quasi-finite. Hence $|U_k|$ is discrete by Morphisms, Lemma 24.19.8. Since $|U_k| \to |X_k|$ is surjective and open we conclude that $|X_k|$ is discrete.

Conversely, assume (2). Choose a surjective étale morphism $V \to Y$ where V is a scheme. Choose a surjective étale morphism $U \to V \times_Y X$ where U is a scheme. Note that $U \to V$ is locally of finite type as f is locally of finite type. Picture

$$\begin{tikzcd} U \arrow[r] \arrow[dr] & X \times_Y V \arrow[r] \arrow[d] & V \arrow[d] \\ & X \arrow[r] & Y \end{tikzcd}$$

If f is not locally quasi-finite then $U \to V$ is not locally quasi-finite. Hence there exists a specialization $u \rightsquigarrow u'$ for some $u, u' \in U$ lying over the same point $v \in V$, see Morphisms, Lemma 24.19.6. We claim that u, u' do not have the same image in $X_v = Spec(\kappa(v)) \times_Y X$ which will contradict the assumption that $|X_v|$ is discrete as desired. Let $d = \text{trdeg}_{\kappa(v)}(\kappa(u))$ and $d' = \text{trdeg}_{\kappa(v)}(\kappa(u'))$. Then we see that $d > d'$ by Morphisms, Lemma 24.27.6. Note that U_v (the fibre of $U \to V$ over v) is the fibre product of U and X_v over $X \times_Y V$, hence $U_v \to X_v$ is étale (as a base change of the étale morphism $U \to X \times_Y V$). If $u, u' \in U_v$ map to the same element of $|X_v|$ then there exists a point $r \in R_v = U_v \times_{X_v} U_v$ with $t(r) = u$ and $s(r) = u'$, see Properties of Spaces, Lemma 41.4.3. Note that $s, t : R_v \to U_v$ are étale morphisms of schemes over $\kappa(v)$, hence $\kappa(u) \subset \kappa(r) \supset \kappa(u')$ are finite separable extensions of fields over $\kappa(v)$ (see Morphisms, Lemma 24.35.7). We conclude that the transcendence degrees are equal. This contradiction finishes the proof. $\square$

Lemma 42.25.5. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. The following are equivalent:*

(1) *f is locally quasi-finite,*
(2) *for every $x \in |X|$ the morphism f is quasi-finite at x,*
(3) *for every scheme Z and any morphism $Z \to Y$ the morphism $Z \times_Y X \to Z$ is locally quasi-finite,*
(4) *for every affine scheme Z and any morphism $Z \to Y$ the morphism $Z \times_Y X \to Z$ is locally quasi-finite,*
(5) *there exists a scheme V and a surjective étale morphism $V \to Y$ such that $V \times_Y X \to V$ is locally quasi-finite,*
(6) *there exists a scheme U and a surjective étale morphism $\varphi : U \to X$ such that the composition $f \circ \varphi$ is locally quasi-finite,*
(7) *for every commutative diagram*

$$\begin{tikzcd} U \arrow[r] \arrow[d] & V \arrow[d] \\ X \arrow[r] & Y \end{tikzcd}$$

where U, V are schemes and the vertical arrows are étale the top horizontal arrow is locally quasi-finite,

(8) *there exists a commutative diagram*

$$\begin{tikzcd} U \arrow[r] \arrow[d] & V \arrow[d] \\ X \arrow[r] & Y \end{tikzcd}$$

where U, V are schemes, the vertical arrows are étale, and $U \to X$ is surjective such that the top horizontal arrow is locally quasi-finite, and

(9) *there exist Zariski coverings $Y = \bigcup_{i \in I} Y_i$, and $f^{-1}(Y_i) = \bigcup X_{ij}$ such that each morphism $X_{ij} \to Y_i$ is locally quasi-finite.*

Proof. Omitted. $\square$

Lemma 42.25.6. *An immersion is locally quasi-finite.*

Proof. Omitted. $\square$

Lemma 42.25.7. *Let S be a scheme. Let $X \to Y \to Z$ be morphisms of algebraic spaces over S. If $X \to Z$ is locally quasi-finite, then $X \to Y$ is locally quasi-finite.*

Proof. Choose a commutative diagram

$$\begin{tikzcd} U \arrow[r] \arrow[d] & V \arrow[r] \arrow[d] & W \arrow[d] \\ X \arrow[r] & Y \arrow[r] & Z \end{tikzcd}$$

with vertical arrows étale and surjective. (See Spaces, Lemma 40.11.4.) Apply Morphisms, Lemma 24.19.15 to the top row. $\square$

Lemma 42.25.8. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. If f is locally of finite type and a monomorphism, then f is separated and locally quasi-finite.*

Proof. A monomorphism is separated, see Lemma 42.14.3. By Lemma 42.25.5 it suffices to prove the lemma after performing a base change by $Z \to Y$ with Z affine. Hence we may assume that Y is an affine scheme. Choose an affine scheme U and an étale morphism $U \to X$. Since $X \to Y$ is locally of finite type the morphism of affine schemes $U \to Y$ is of finite type. Since $X \to Y$ is a monomorphism we have $U \times_X U = U \times_Y U$. In particular the maps $U \times_Y U \to U$ are étale. Let $y \in Y$. Then either U_y is empty, or $Spec(\kappa(u)) \times_{Spec(\kappa(y))} U_y$ is isomorphic to the fibre of $U \times_Y U \to U$ over u for some $u \in U$ lying over y. This implies that the fibres of $U \to Y$ are finite discrete sets (as $U \times_Y U \to U$ is an étale morphism of affine schemes, see Morphisms, Lemma 24.35.7). Hence $U \to Y$ is quasi-finite, see Morphisms, Lemma 24.19.6. As $U \to X$ was an arbitrary étale morphism with U affine this implies that $X \to Y$ is locally quasi-finite. $\square$

42.26. Morphisms of finite presentation

The property ``locally of finite presentation'' of morphisms of schemes is étale local on the source-and-target, see Descent, Remark 31.28.7. It is also stable under base change and fpqc local on the target, see Morphisms, Lemma 24.20.4, and Descent, Lemma 31.19.9. Hence, by Lemma 42.21.1 above, we may define what it means for a morphism of algebraic spaces to be locally of finite presentation as follows and it agrees with the already existing notion defined in Section 42.3 when the morphism is representable.

Definition 42.26.1. Let S be a scheme. Let $X \to Y$ be a morphism of algebraic spaces over S.

(1) We say f is *locally of finite presentation* if the equivalent conditions of Lemma 42.21.1 hold with $\mathcal{P}$=``locally of finite presentation".
(2) Let $x \in |X|$. We say f is of *finite presentation at* x if there exists an open neighbourhood $X' \subset X$ of x such that $f|_{X'} : X' \to Y$ is locally of finite presentation[6].
(3) A morphism of algebraic spaces $f : X \to Y$ is *of finite presentation* if it is locally of finite presentation, quasi-compact and quasi-separated.

Note that a morphism of finite presentation is **not** just a quasi-compact morphism which is locally of finite presentation.

Lemma 42.26.2. *The composition of morphisms of finite presentation is of finite presentation. The same holds for locally of finite presentation.*

Proof. Omitted. $\square$

Lemma 42.26.3. *A base change of a morphism of finite presentation is of finite presentation The same holds for locally of finite presentation.*

Proof. Omitted. $\square$

Lemma 42.26.4. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. The following are equivalent:*

(1) *f is locally of finite presentation,*
(2) *for every $x \in |X|$ the morphism f is of finite presentation at x,*
(3) *for every scheme Z and any morphism $Z \to Y$ the morphism $Z \times_Y X \to Z$ is locally of finite presentation,*
(4) *for every affine scheme Z and any morphism $Z \to Y$ the morphism $Z \times_Y X \to Z$ is locally of finite presentation,*
(5) *there exists a scheme V and a surjective étale morphism $V \to Y$ such that $V \times_Y X \to V$ is locally of finite presentation,*
(6) *there exists a scheme U and a surjective étale morphism $\varphi : U \to X$ such that the composition $f \circ \varphi$ is locally of finite presentation,*
(7) *for every commutative diagram*

$$\begin{tikzcd} U \arrow[r] \arrow[d] & V \arrow[d] \\ X \arrow[r] & Y \end{tikzcd}$$

where U, V are schemes and the vertical arrows are étale the top horizontal arrow is locally of finite presentation,

[6] It seems awkward to use ``locally of finite presentation at $x$", but the current terminology may be misleading in the sense that ``of finite presentation at x" does **not** mean that there is an open neighbourhood $X' \subset X$ such that $f|_{X'}$ is of finite presentation.

(8) *there exists a commutative diagram*

$$\begin{tikzcd} U \arrow[r] \arrow[d] & V \arrow[d] \\ X \arrow[r] & Y \end{tikzcd}$$

where U, V are schemes, the vertical arrows are étale, and $U \to X$ is surjective such that the top horizontal arrow is locally of finite presentation, and

(9) *there exist Zariski coverings $Y = \bigcup_{i \in I} Y_i$, and $f^{-1}(Y_i) = \bigcup X_{ij}$ such that each morphism $X_{ij} \to Y_i$ is locally of finite presentation.*

Proof. Omitted. □

Lemma 42.26.5. *A morphism which is locally of finite presentation is locally of finite type. A morphism of finite presentation is of finite type.*

Proof. Let $f : X \to Y$ be a morphism of algebraic spaces which is locally of finite presentation. This means there exists a diagram as in Lemma 42.21.1 with h locally of finite presentation and surjective vertical arrow a. By Morphisms, Lemma 24.20.8 h is locally of finite type. Hence $X \to Y$ is locally of finite type by definition. If f is of finite presentation then it is quasi-compact and it follows that f is of finite type. □

Lemma 42.26.6. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. If f is of finite presentation and Y is Noetherian, then X is Noetherian.*

Proof. Assume f is of finite presentation and Y Noetherian. By Lemmas 42.26.5 and 42.22.5 we see that X is locally Noetherian. As f is quasi-compact and Y is quasi-compact we see that X is quasi-compact. As f is of finite presentation it is quasi-separated (see Definition 42.26.1) and as Y is Noetherian it is quasi-separated (see Properties of Spaces, Definition 41.12.1). Hence X is quasi-separated by Lemma 42.5.9. Hence we have checked all three conditions of Properties of Spaces, Definition 41.12.1 and we win. □

Lemma 42.26.7. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S.*

(1) *If Y is locally Noetherian and f locally of finite type then f is locally of finite presentation.*
(2) *If Y is locally Noetherian and f of finite type and quasi-separated then f is of finite presentation.*

Proof. Assume $f : X \to Y$ locally of finite type and Y locally Noetherian. This means there exists a diagram as in Lemma 42.21.1 with h locally of finite type and surjective vertical arrow a. By Morphisms, Lemma 24.20.9 h is locally of finite presentation. Hence $X \to Y$ is locally of finite presentation by definition. This proves (1). If f is of finite type and quasi-separated then it is also quasi-compact and quasi-separated and (2) follows immediately. □

Lemma 42.26.8. *Let S be a scheme. Let Y be an algebraic space over S which is quasi-compact and quasi-separated. If X is of finite presentation over Y, then X is quasi-compact and quasi-separated.*

Proof. Omitted. □

Lemma 42.26.9. *Let S be a scheme. Let $f : X \to Y$ and $Y \to Z$ be morphisms of algebraic spaces over S. If X is locally of finite presentation over Z, and Y is locally of finite type over Z, then f is locally of finite presentation.*

Proof. Choose a scheme W and a surjective étale morphism $W \to Z$. Then choose a scheme V and a surjective étale morphism $V \to W \times_Z Y$. Finally choose a scheme U and a surjective étale morphism $U \to V \times_Y X$. By definition U is locally of finite presentation over W and V is locally of finite type over W. By Morphisms, Lemma 24.20.11 the morphism $U \to V$ is locally of finite presentation. Hence f is locally of finite presentation. □

Lemma 42.26.10. *An open immersion of algebraic spaces is locally of finite presentation.*

Proof. An open immersion is by definition representable, hence we can use the general principle Spaces, Lemma 40.5.8 and Morphisms, Lemma 24.20.5. □

42.27. Flat morphisms

The property ``flat'' of morphisms of schemes is étale local on the source-and-target, see Descent, Remark 31.28.7. It is also stable under base change and fpqc local on the target, see Morphisms, Lemma 24.24.7 and Descent, Lemma 31.19.13. Hence, by Lemma 42.21.1 above, we may define the notion of a flat morphism of algebraic spaces as follows and it agrees with the already existing notion defined in Section 42.3 when the morphism is representable.

Definition 42.27.1. Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S.

(1) We say f is *flat* if the equivalent conditions of Lemma 42.21.1 with $\mathcal{P}$=``flat''.
(2) Let $x \in |X|$. We say f is *flat at x* if the equivalent conditions of Lemma 42.21.3 holds with $\mathcal{Q}$ =``induced map local rings is flat''.

Note that the second part makes sense by Descent, Lemma 31.29.4.

Lemma 42.27.2. *The composition of flat morphisms is flat.*

Proof. Omitted. □

Lemma 42.27.3. *The base change of a flat morphism is flat.*

Proof. Omitted. □

Lemma 42.27.4. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. The following are equivalent:*

(1) *f is flat,*
(2) *for every $x \in |X|$ the morphism f is flat at x,*
(3) *for every scheme Z and any morphism $Z \to Y$ the morphism $Z \times_Y X \to Z$ is flat,*
(4) *for every affine scheme Z and any morphism $Z \to Y$ the morphism $Z \times_Y X \to Z$ is flat,*
(5) *there exists a scheme V and a surjective étale morphism $V \to Y$ such that $V \times_Y X \to V$ is flat,*
(6) *there exists a scheme U and a surjective étale morphism $\varphi : U \to X$ such that the composition $f \circ \varphi$ is flat,*

(7) *for every commutative diagram*

$$\begin{tikzcd} U \arrow[r] \arrow[d] & V \arrow[d] \\ X \arrow[r] & Y \end{tikzcd}$$

where U, V are schemes and the vertical arrows are étale the top horizontal arrow is flat,

(8) *there exists a commutative diagram*

$$\begin{tikzcd} U \arrow[r] \arrow[d] & V \arrow[d] \\ X \arrow[r] & Y \end{tikzcd}$$

where U, V are schemes, the vertical arrows are étale, and $U \to X$ is surjective such that the top horizontal arrow is flat, and

(9) *there exists a Zariski coverings $Y = \bigcup Y_i$ and $f^{-1}(Y_i) = \bigcup X_{ij}$ such that each morphism $X_{ij} \to Y_i$ is flat.*

Proof. Omitted. □

Lemma 42.27.5. *A flat morphism locally of finite presentation is universally open.*

Proof. Let $f : X \to Y$ be a flat morphism locally of finite presentation of algebraic spaces over S. Choose a diagram

$$\begin{tikzcd} U \arrow[r, "\alpha"'] \arrow[d] & V \arrow[d] \\ X \arrow[r] & Y \end{tikzcd}$$

where U and V are schemes and the vertical arrows are surjective and étale, see Spaces, Lemma 40.11.4. By Lemmas 42.27.4 and 42.26.4 the morphism α is flat and locally of finite presentation. Hence by Morphisms, Lemma 24.24.9 we see that α is universally open. Hence $X \to Y$ is universally open according to Lemma 42.7.5. □

Lemma 42.27.6. *Let S be a scheme. Let $f : X \to Y$ be a flat, quasi-compact, surjective morphism of algebraic spaces over S. A subset $T \subset |Y|$ is open (resp. closed) if and only $f^{-1}(|T|)$ is open (resp. closed) in $|X|$. In other words f is submersive, and in fact universally submersive.*

Proof. Choose affine schemes V_i and étale morphisms $V_i \to Y$ such that $V = \coprod V_i \to Y$ is surjective, see Properties of Spaces, Lemma 41.6.1. For each i the algebraic space $V_i \times_Y X$ is quasi-compact. Hence we can find an affine scheme U_i and a surjective étale morphism $U_i \to V_i \times_Y X$, see Properties of Spaces, Lemma 41.6.3. Then the composition $U_i \to V_i \times_Y X \to V_i$ is a surjective, flat morphism of affines. Of course then $U = \coprod U_i \to X$ is surjective and étale and $U = V \times_Y X$. Moreover, the morphism $U \to V$ is the disjoint union of the morphisms $U_i \to V_i$. Hence $U \to V$ is surjective, quasi-compact and flat. Consider the diagram

$$\begin{tikzcd} U \arrow[r] \arrow[d] & X \arrow[d] \\ V \arrow[r] & Y \end{tikzcd}$$

By definition of the topology on $|Y|$ the set T is closed (resp. open) if and only if $g^{-1}(T) \subset |V|$ is closed (resp. open). The same holds for $f^{-1}(T)$ and its inverse image in $|U|$. Since $U \to V$ is quasi-compact, surjective, and flat we win by Morphisms, Lemma 24.24.10. $\square$

Lemma 42.27.7. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Let $\overline{x}$ be a geometric point of X lying over the point $x \in |X|$. Let $\overline{y} = f \circ \overline{x}$. The following are equivalent*

(1) *f is flat at x, and*
(2) *the map on étale local rings $\mathcal{O}_{Y,\overline{y}} \to \mathcal{O}_{X,\overline{x}}$ is flat.*

Proof. Choose a commutative diagram

$$\begin{tikzcd} U \arrow[r, "h"] \arrow[d, "a"'] & V \arrow[d, "b"] \\ X \arrow[r, "f"] & Y \end{tikzcd}$$

where U and V are schemes, a, b are étale, and $u \in U$ mapping to x. We can find a geometric point $\overline{u} : Spec(k) \to U$ lying over u with $\overline{x} = a \circ \overline{u}$, see Properties of Spaces, Lemma 41.16.4. Set $\overline{v} = h \circ \overline{u}$ with image $v \in V$. We know that

$$\mathcal{O}_{X,\overline{x}} = \mathcal{O}^{sh}_{U,u} \quad \text{and} \quad \mathcal{O}_{Y,\overline{y}} = \mathcal{O}^{sh}_{V,v}$$

see Properties of Spaces, Lemma 41.19.1. We obtain a commutative diagram

$$\begin{tikzcd} \mathcal{O}_{U,u} \arrow[r] & \mathcal{O}_{X,\overline{x}} \\ \mathcal{O}_{V,v} \arrow[r] \arrow[u] & \mathcal{O}_{Y,\overline{y}} \arrow[u] \end{tikzcd}$$

of local rings with flat horizontal arrows. We have to show that the left vertical arrow is flat if and only if the right vertical arrow is. Algebra, Lemma 7.35.8 tells us $\mathcal{O}_{U,u}$ is flat over $\mathcal{O}_{V,v}$ if and only if $\mathcal{O}_{X,\overline{x}}$ is flat over $\mathcal{O}_{V,v}$. Hence the result follows from More on Flatness, Lemma 34.3.5. $\square$

Lemma 42.27.8. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Then f is flat if and only if the morphism of sites $(f_{small}, f^\sharp) : (X_{étale}, \mathcal{O}_X) \to (Y_{étale}, \mathcal{O}_Y)$ associated to f is flat.*

Proof. Flatness of $(f_{small}, f^\sharp)$ is defined in terms of flatness of $\mathcal{O}_X$ as a $f_{small}^{-1}\mathcal{O}_Y$-module. This can be checked at stalks, see Modules on Sites, Lemma 16.33.2 and Properties of Spaces, Theorem 41.16.12. But we've already seen that flatness of f can be checked on stalks, see Lemma 42.27.7. $\square$

42.28. Flat modules

In this section we define what it means for a module to be flat at a point. To do this we will use the notion of the stalk of a sheaf on the small étale site $X_{étale}$ of an algebraic space, see Properties of Spaces, Definition 41.16.6.

Lemma 42.28.1. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Let $\mathcal{F}$ be a quasi-coherent sheaf on X. Let $x \in |X|$. The following are equivalent*

(1) *for some commutative diagram*

$$\begin{tikzcd} U \arrow[r, "h"] \arrow[d, "a"] & V \arrow[d, "b"] \\ X \arrow[r, "f"] & Y \end{tikzcd}$$

where U and V are schemes, a, b are étale, and $u \in U$ mapping to x the module $a^*\mathcal{F}$ is flat at u over V,

(2) *the stalk $\mathcal{F}_{\overline{x}}$ is flat over the étale local ring $\mathcal{O}_{Y,\overline{y}}$ where $\overline{x}$ is any geometric point lying over x and $\overline{y} = f \circ \overline{x}$.*

Proof. During this proof we fix a geometric proof $\overline{x} : Spec(k) \to X$ over x and we denote $\overline{y} = f \circ \overline{x}$ its image in Y. Given a diagram as in (1) we can find a geometric point $\overline{u} : Spec(k) \to U$ lying over u with $\overline{x} = a \circ \overline{u}$, see Properties of Spaces, Lemma 41.16.4. Set $\overline{v} = h \circ \overline{u}$ with image $v \in V$. We know that

$$\mathcal{O}_{X,\overline{x}} = \mathcal{O}_{U,u}^{sh} \quad \text{and} \quad \mathcal{O}_{Y,\overline{y}} = \mathcal{O}_{V,v}^{sh}$$

see Properties of Spaces, Lemma 41.19.1. We obtain a commutative diagram

$$\begin{tikzcd} \mathcal{O}_{U,u} \arrow[r] & \mathcal{O}_{X,\overline{x}} \\ \mathcal{O}_{V,v} \arrow[r] \arrow[u] & \mathcal{O}_{Y,\overline{y}} \arrow[u] \end{tikzcd}$$

of local rings. Finally, we have

$$\mathcal{F}_{\overline{x}} = (\varphi^*\mathcal{F})_u \otimes_{\mathcal{O}_{U,u}} \mathcal{O}_{X,\overline{x}}$$

by Properties of Spaces, Lemma 41.26.4. Thus Algebra, Lemma 7.35.8 tells us $(\varphi^*\mathcal{F})_u$ is flat over $\mathcal{O}_{V,v}$ if and only if $\mathcal{F}_{\overline{x}}$ is flat over $\mathcal{O}_{V,v}$. Hence the result follows from More on Flatness, Lemma 34.3.5. ☐

Definition 42.28.2. Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Let $\mathcal{F}$ be a quasi-coherent sheaf on X.

(1) Let $x \in |X|$. We say $\mathcal{F}$ is *flat at x over Y* if the equivalent conditions of Lemma 42.28.1 hold.
(2) We say $\mathcal{F}$ is *flat over Y* if $\mathcal{F}$ is flat over Y at all $x \in |X|$.

Having defined this we have the obligatory base change lemma. This lemma implies that formation of the flat locus of a quasi-coherent sheaf commutes with flat base change.

Lemma 42.28.3. *Let S be a scheme. Let*

$$\begin{tikzcd} X' \arrow[r, "g'"] \arrow[d, "f'"] & X \arrow[d, "f"] \\ Y' \arrow[r, "g"] & Y \end{tikzcd}$$

be a cartesian diagram of algebraic spaces over S. Let $x' \in |X'|$ with image $x \in |X|$. Let $\mathcal{F}$ be a quasi-coherent sheaf on X and denote $\mathcal{F}' = (g')^*\mathcal{F}$.

(1) *If $\mathcal{F}$ is flat at x over Y then $\mathcal{F}'$ is flat at x' over Y'.*
(2) *If g is flat at $f'(x')$ and $\mathcal{F}'$ is flat at x' over Y', then $\mathcal{F}$ is flat at x over Y.*

In particular, if $\mathcal{F}$ is flat over Y, then $\mathcal{F}'$ is flat over Y'.

Proof. Choose a scheme V and a surjective étale morphism $V \to Y$. Choose a scheme U and a surjective étale morphism $U \to V \times_Y X$. Choose a scheme V' and a surjective étale morphism $V' \to V \times_Y Y'$. Then $U' = V' \times_V U$ is a scheme endowed with a surjective étale morphism $U' = V' \times_V U \to Y' \times_Y X = X'$. Pick $u' \in U'$ mapping to $x' \in |X'|$. Then we can check flatness of $\mathcal{F}'$ at x' over Y' in terms of flatness of $\mathcal{F}'|_{U'}$ at u' over V'. Hence the lemma follows from More on Morphisms, Lemma 33.11.2. □

The following lemma discusses ``composition'' of flat morphisms in terms of modules. It also shows that flatness satisfies a kind of top down descent.

Lemma 42.28.4. *Let S be a scheme. Let $X \to Y \to Z$ be morphisms of algebraic spaces over S. Let $\mathcal{F}$ be a quasi-coherent sheaf on X. Let $x \in |X|$ with image $y \in |Y|$.*

1. *If $\mathcal{F}$ is flat at x over Y and Y is flat at y over Z, then $\mathcal{F}$ is flat at x over Z.*
2. *Let $x : Spec(K) \to X$ be a representative of x. If*
   (a) *$\mathcal{F}$ is flat at x over Y,*
   (b) *$x^*\mathcal{F} \neq 0$, and*
   (c) *$\mathcal{F}$ is flat at x over Z,*
   then Y is flat at y over Z.
3. *Let $\overline{x}$ be a geometric point of X lying over x with image $\overline{y}$ in Y. If $\mathcal{F}_{\overline{x}}$ is a faithfully flat $\mathcal{O}_{Y,\overline{y}}$-module and $\mathcal{F}$ is flat at x over Z, then Y is flat at y over Z.*

Proof. Pick $\overline{x}$ and $\overline{y}$ as in part (3) and denote $\overline{z}$ the induced geometric point of Z. Via the characterization of flatness in Lemmas 42.28.1 and 42.27.7 the lemma reduces to a purely algebraic question on the local ring map $\mathcal{O}_{Z,\overline{z}} \to \mathcal{O}_{Y,\overline{y}}$ and the module $\mathcal{F}_{\overline{x}}$. Part (1) follows from Algebra, Lemma 7.35.3. We remark that condition (2)(b) guarantees that $\mathcal{F}_{\overline{x}}/\mathfrak{m}_{\overline{y}}\mathcal{F}_{\overline{x}}$ is nonzero. Hence (2)(a) + (2)(b) imply that $\mathcal{F}_{\overline{x}}$ is a faithfully flat $\mathcal{O}_{Y,\overline{y}}$-module, see Algebra, Lemma 7.35.14. Thus (2) is a special case of (3). Finally, (3) follows from Algebra, Lemma 7.35.9. □

Sometimes the base change happens ``up on top''. Here is a precise statement.

Lemma 42.28.5. *Let S be a scheme. Let $f : X \to Y$, $g : Y \to Z$ be morphisms of algebraic spaces over S. Let $\mathcal{G}$ be a quasi-coherent sheaf on Y. Let $x \in |X|$ with image $y \in |Y|$. If f is flat at x, then*

$$\mathcal{G} \text{ flat over } Z \text{ at } y \Leftrightarrow f^*\mathcal{G} \text{ flat over } Z \text{ at } x.$$

In particular: If f is surjective and flat, then $\mathcal{G}$ is flat over Z, if and only if $f^*\mathcal{G}$ is flat over Z.

Proof. Pick a geometric point $\overline{x}$ of X and denote $\overline{y}$ the image in Y and $\overline{z}$ the image in Z. Via the characterization of flatness in Lemmas 42.28.1 and 42.27.7 and the description of the stalk of $f^*\mathcal{G}$ at $\overline{x}$ of Properties of Spaces, Lemma 41.26.5 the lemma reduces to a purely algebraic question on the local ring maps $\mathcal{O}_{Z,\overline{z}} \to \mathcal{O}_{Y,\overline{y}} \to \mathcal{O}_{X,\overline{x}}$ and the module $\mathcal{G}_{\overline{y}}$. This algebraic statement is Algebra, Lemma 7.35.8. □

42.29. Generic flatness

This section is the analogue of Morphisms, Section 24.26.

Proposition 42.29.1. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Let $\mathcal{F}$ be a quasi-coherent sheaf of $\mathcal{O}_X$-modules. Assume*

1. *Y is reduced,*
2. *f is of finite type, and*

(3) *$\mathcal{F}$ is a finite type $\mathcal{O}_X$-module.*

Then there exists an open dense subspace $W \subset Y$ such that the base change $X_W \to W$ of f is flat, locally of finite presentation, and quasi-compact and such that $\mathcal{F}|_{X_W}$ is flat over W and of finite presentation over $\mathcal{O}_{X_W}$.

Proof. Let V be a scheme and let $V \to Y$ be a surjective étale morphism. Let $X_V = V \times_Y X$ and let $\mathcal{F}_V$ be the restriction of $\mathcal{F}$ to X_V. Suppose that the result holds for the morphism $X_V \to V$ and the sheaf $\mathcal{F}_V$. Then there exists an open subscheme $V' \subset V$ such that $X_{V'} \to V'$ is flat and of finite presentation and $\mathcal{F}_{V'}$ is an $\mathcal{O}_{X_{V'}}$-module of finite presentation flat over V'. Let $W \subset Y$ be the image of the étale morphism $V' \to Y$, see Properties of Spaces, Lemma 41.4.10. Then $V' \to W$ is a surjective étale morphism, hence we see that $X_W \to W$ is flat, locally of finite presentation, and quasi-compact by Lemmas 42.26.4, 42.27.4, and 42.9.7. By the discussion in Properties of Spaces, Section 41.27 we see that $\mathcal{F}_W$ is of finite presentation as a $\mathcal{O}_{X_W}$-module and by Lemma 42.28.3 we see that $\mathcal{F}_W$ is flat over W. This argument reduces the proposition to the case where Y is a scheme.

Suppose we can prove the proposition when Y is an affine scheme. Let $f : X \to Y$ be a finite type morphism of algebraic spaces over S with Y a scheme, and let $\mathcal{F}$ be a finite type, quasi-coherent $\mathcal{O}_X$-module. Choose an affine open covering $Y = \bigcup V_j$. By assumption we can find dense open $W_j \subset V_j$ such that $X_{W_j} \to W_j$ is flat, locally of finite presentation, and quasi-compact and such that $\mathcal{F}|_{X_{W_j}}$ is flat over W_j and of finite presentation as an $\mathcal{O}_{X_{W_j}}$-module. In this situation we simply take $W = \bigcup W_j$ and we win. Hence we reduce the proposition to the case where Y is an affine scheme.

Let Y be an affine scheme over S, let $f : X \to Y$ be a finite type morphism of algebraic spaces over S, and let $\mathcal{F}$ be a finite type, quasi-coherent $\mathcal{O}_X$-module. Since f is of finite type it is quasi-compact, hence X is quasi-compact. Thus we can find an affine scheme U and a surjective étale morphism $U \to X$, see Properties of Spaces, Lemma 41.6.3. Note that $U \to Y$ is of finite type (this is what it means for f to be of finite type in this case). Hence we can apply Morphisms, Proposition 24.26.2 to see that there exists a dense open $W \subset Y$ such that $U_W \to W$ is flat and of finite presentation and such that $\mathcal{F}|_{U_W}$ is flat over W and of finite presentation as an $\mathcal{O}_{U_W}$-module. According to our definitions this means that the base change $X_W \to W$ of f is flat, locally of finite presentation, and quasi-compact and $\mathcal{F}|_{X_W}$ is flat over W and of finite presentation over $\mathcal{O}_{X_W}$. □

We cannot improve the result of the lemma above to requiring $X_W \to W$ to be of finite presentation as $\mathbf{A}^1_{\mathbf{Q}}/\mathbf{Z} \to Spec(\mathbf{Q})$ gives a counter example. The problem is that the diagonal morphism $\Delta_{X/Y}$ may not be quasi-compact, i.e., f may not be quasi-separated. Clearly, this is also the only problem.

Proposition 42.29.2. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Let $\mathcal{F}$ be a quasi-coherent sheaf of $\mathcal{O}_X$-modules. Assume*

(1) *Y is reduced,*
(2) *f is quasi-separated,*
(3) *f is of finite type, and*
(4) *$\mathcal{F}$ is a finite type $\mathcal{O}_X$-module.*

Then there exists an open dense subspace $W \subset Y$ such that the base change $X_W \to W$ of f is flat and of finite presentation and such that $\mathcal{F}|_{X_W}$ is flat over W and of finite presentation over $\mathcal{O}_{X_W}$.

Proof. This follows immediately from Proposition 42.29.1 and the fact that ``of finite presentation" = ``locally of finite presentation" + ``quasi-compact" + ``quasi-separated". $\square$

42.30. Relative dimension

In this section we define the relative dimension of a morphism of algebraic spaces at a point, and some closely related properties.

Definition 42.30.1. Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Let $x \in |X|$. Let $d, r \in \{0, 1, 2, \ldots, \infty\}$.

(1) We say the *dimension of the local ring of the fibre of f at x* is d if the equivalent conditions of Lemma 42.21.3 hold for the property $\mathcal{P}_d$ described in Descent, Lemma 31.29.6.
(2) We say the *transcendence degree of $x/f(x)$* is r if the equivalent conditions of Lemma 42.21.3 hold for the property $\mathcal{P}_r$ described in Descent, Lemma 31.29.7.
(3) We say the *f has relative dimension d at x* if the equivalent conditions of Lemma 42.21.3 hold for the property $\mathcal{P}_d$ described in Descent, Lemma 31.29.8.

Let us spell out what this means. Namely, choose some diagrams

$$\begin{tikzcd} U \arrow[r, "h"] \arrow[d, "a"'] & V \arrow[d, "b"] \\ X \arrow[r, "f"] & Y \end{tikzcd} \qquad \begin{tikzcd} u \arrow[r] \arrow[d] & v \arrow[d] \\ x \arrow[r] & y \end{tikzcd}$$

as in Lemma 42.21.3. Then we have

$$\begin{array}{ccc} \text{relative dimension of } f \text{ at } x & = & \dim_u(U_v) \\ \text{dimension of local ring of the fibre of } f \text{ at } x & = & \dim(\mathcal{O}_{U_v,u}) \\ \text{transcendence degree of } x/f(x) & = & \text{trdeg}_{\kappa(v)}(\kappa(u)) \end{array}$$

Note that if $Y = Spec(k)$ is the spectrum of a field, then the relative dimension of X/Y at x is the same as $\dim_x(X)$, the transcendence degree of $x/f(x)$ is the transcendence degree over k, and the dimension of the local ring of the fibre of f at x is just the dimension of the local ring at x, i.e., the relative notions become absolute notions in that case.

Definition 42.30.2. Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Let $d \in \{0, 1, 2, \ldots\}$.

(1) We say f has *relative dimension $\leq d$* if f has relative dimension $\leq d$ at all $x \in |X|$.
(2) We say f has *relative dimension d* if f has relative dimension d at all $x \in |X|$.

Having relative dimension *equal* to d means roughly speaking that all nonempty fibres are equidimensional of dimension d.

Lemma 42.30.3. *Let S be a scheme. Let $X \to Y \to Z$ be morphisms of algebraic spaces over S. Let $x \in |X|$ and let $y \in |Y|$, $z \in |Z|$ be the images. Assume $X \to Y$ is locally quasi-finite and $Y \to Z$ locally of finite type. Then the transcendence degree of x/z is equal to the transcendence degree of y/z.*

Proof. We can choose commutative diagrams

$$\begin{tikzcd} U \arrow[r] \arrow[d] & V \arrow[r] \arrow[d] & W \arrow[d] \\ X \arrow[r] & Y \arrow[r] & Z \end{tikzcd} \qquad \begin{tikzcd} u \arrow[r] \arrow[d] & v \arrow[r] \arrow[d] & w \arrow[d] \\ x \arrow[r] & y \arrow[r] & z \end{tikzcd}$$

where U, V, W are schemes and the vertical arrows are étale. By definition the morphism $U \to V$ is locally quasi-finite which implies that $\kappa(v) \subset \kappa(u)$ is finite, see Morphisms, Lemma 24.19.5. Hence the result is clear. $\square$

42.31. Morphisms and dimensions of fibres

This section is the analogue of Morphisms, Section 24.27. The formulations in this section are a bit awkward since we do not have local rings of algebraic spaces at points.

Lemma 42.31.1. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Let $x \in |X|$. Assume f is locally of finite type. Then we have*

$$\begin{gathered}\text{relative dimension of } f \text{ at } x \\ = \\ \text{dimension of local ring of the fibre of } f \text{ at } x \\ + \\ \text{transcendence degree of } x/f(x)\end{gathered}$$

where the notation is as in Definition 42.30.1.

Proof. This follows immediately from Morphisms, Lemma 24.27.1 applied to $h : U \to V$ and $u \in U$ as in Lemma 42.21.3. $\square$

Lemma 42.31.2. *Let S be a scheme. Let $f : X \to Y$ and $g : Y \to Z$ be morphisms of algebraic spaces over S. Let $x \in |X|$ and set $y = f(x)$. Assume f and g locally of finite type. Then*

$$\begin{gathered}\text{relative dimension of } g \circ f \text{ at } x \\ \leq \\ \text{relative dimension of } f \text{ at } x \\ + \\ \text{relative dimension of } g \text{ at } y\end{gathered}$$

Moreover, equality holds if for some morphism $Spec(k) \to Z$ from the spectrum of a field in the class of $g(f(x)) = g(y)$ The morphism $X_k \to Y_k$ is flat at x. This holds for example if f is flat at x.

Proof. Choose a diagram

$$\begin{tikzcd} U \arrow[r] \arrow[d] & V \arrow[r] \arrow[d] & W \arrow[d] \\ X \arrow[r] & Y \arrow[r] & Z \end{tikzcd}$$

with U, V, W schemes and vertical arrows étale and surjective. (See Spaces, Lemma 40.11.4.) Choose $u \in U$ mapping to x. Set v, w equal to the images of u in V, W. Apply Morphisms, Lemma 24.27.2 to the top row and the points u, v, w. Details omitted. $\square$

Lemma 42.31.3. *Let S be a scheme. Let*

$$\begin{tikzcd} X' \arrow[r, "g'"] \arrow[d, "f'"'] & X \arrow[d, "f"] \\ Y' \arrow[r, "g"] & Y \end{tikzcd}$$

be a fibre product diagram of algebraic spaces over S. Let $x' \in |X'|$. Set $x = g'(x')$. Assume f locally of finite type. Then we have

$$\text{relative dimension of } f \text{ at } x = \text{relative dimension of } f' \text{ at } x'$$

Proof. Choose a surjective étale morphism $V \to Y$ with V a scheme. By Spaces, Lemma 40.11.4 we may choose morphisms of schemes $V' \to V$ lifting the morphism g and $U \to V$ lifting the morphism f such that $V' \to Y'$ and $U \to X$ are also surjective and étale. Set $U' = V' \times_V U$. Then the induced morphism $U' \to X'$ is also surjective and étale (argument omitted). Hence we can choose a $u' \in U'$ mapping to x'. At this point the result follows by applying Morphisms, Lemma 24.27.3 to the diagram of schemes involving U', U, V', V and the point u'. $\square$

Lemma 42.31.4. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Let $n \geq 0$. Assume f is locally of finite type. The set*

$$W_n = \{x \in |X| \text{ such that the relative dimension of } f \text{ at } x \leq n\}$$

is open in $|X|$.

Proof. Choose a diagram

$$\begin{tikzcd} U \arrow[r, "h"] \arrow[d, "a"] & V \arrow[d] \\ X \arrow[r] & Y \end{tikzcd}$$

where U and V are schemes and the vertical arrows are surjective and étale, see Spaces, Lemma 40.11.4. By Morphisms, Lemma 24.27.4 the set U_n of points where h has relative dimension $\leq n$ is open in U. By our definition of relative dimension for morphisms of algebraic spaces at points we see that $U_n = a^{-1}(W_n)$. The lemma follows by definition of the toplogy on $|X|$. $\square$

Lemma 42.31.5. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S Let $n \geq 0$. Assume f is locally of finite presentation. The open*

$$W_n = \{x \in |X| \text{ such that the relative dimension of } f \text{ at } x \leq n\}$$

of Lemma 42.31.4 is retrocompact in $|X|$. (See Topology, Definition 5.9.1.)

Proof. Choose a diagram

$$\begin{tikzcd} U \arrow[r, "h"] \arrow[d, "a"] & V \arrow[d] \\ X \arrow[r] & Y \end{tikzcd}$$

where U and V are schemes and the vertical arrows are surjective and étale, see Spaces, Lemma 40.11.4. In the proof of Lemma 42.31.4 we have seen that $a^{-1}(W_n) = U_n$ is the corresponding set for the morphism h. By Morphisms, Lemma 24.27.5 we see that U_n is retrocompact in U. The lemma follows by definition of the toplogy on $|X|$, compare with Properties of Spaces, Lemma 41.5.5 and its proof. $\square$

Lemma 42.31.6. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Assume f is locally of finite type. Then f is locally quasi-finite if and only if f has relative dimension 0 at each $x \in |X|$.*

Proof. Choose a diagram

$$\begin{tikzcd} U \arrow[r, "h"] \arrow[d, "a"'] & V \arrow[d] \\ X \arrow[r] & Y \end{tikzcd}$$

where U and V are schemes and the vertical arrows are surjective and étale, see Spaces, Lemma 40.11.4. The definitions imply that h is locally quasi-finite if and only if f is locally quasi-finite, and that f has relative dimension 0 at all $x \in |X|$ if and only if h has relative dimension 0 at all $u \in U$. Hence the result follows from the result for h which is Morphisms, Lemma 24.28.5. □

Lemma 42.31.7. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Assume f is locally of finite type. Then there exists a canonical open subspace $X' \subset X$ such that $f|_{X'} : X' \to Y$ is locally quasi-finite, and such that the relative dimension of f at any $x \in |X|$, $x \notin |X'|$ is ≥ 1. Formation of X' commutes with arbitrary base change.*

Proof. Combine Lemmas 42.31.4, 42.31.6, and 42.31.3. □

Lemma 42.31.8. *Let S be a scheme. Consider a cartesian diagram*

$$\begin{tikzcd} X \arrow[d] & F \arrow[l, "p"'] \arrow[d] \\ Y & Spec(k) \arrow[l] \end{tikzcd}$$

where $X \to Y$ is a morphism of algebraic spaces over S which is locally of finite type and where k is a field over S. Let $z \in |F|$ be such that $\dim_z(F) = 0$. Then, after replacing X by an open subspace containing $p(z)$, the morphism

$$X \longrightarrow Y$$

is locally quasi-finite.

Proof. Let $X' \subset X$ be the open subspace over which f is locally quasi-finite found in Lemma 42.31.7. Since the formation of X' commutes with arbotrary base change we see that $z \in X' \times_Y Spec(k)$. Hence the lemma is clear. □

42.32. Syntomic morphisms

The property ``syntomic'' of morphisms of schemes is étale local on the source-and-target, see Descent, Remark 31.28.7. It is also stable under base change and fpqc local on the target, see Morphisms, Lemma 24.30.4 and Descent, Lemma 31.19.24. Hence, by Lemma 42.21.1 above, we may define the notion of a syntomic morphism of algebraic spaces as follows and it agrees with the already existing notion defined in Section 42.3 when the morphism is representable.

Definition 42.32.1. Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S.

(1) We say f is *syntomic* if the equivalent conditions of Lemma 42.21.1 hold with $\mathcal{P}$=``syntomic''.
(2) Let $x \in |X|$. We say f is *syntomic at x* if there exists an open neighbourhood $X' \subset X$ of x such that $f|_{X'} : X' \to Y$ is syntomic.

Lemma 42.32.2. *The composition of syntomic morphisms is syntomic.*

Proof. Omitted. ☐

Lemma 42.32.3. *The base change of a syntomic morphism is syntomic.*

Proof. Omitted. ☐

Lemma 42.32.4. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. The following are equivalent:*

(1) *f is syntomic,*
(2) *for every $x \in |X|$ the morphism f is syntomic at x,*
(3) *for every scheme Z and any morphism $Z \to Y$ the morphism $Z \times_Y X \to Z$ is syntomic,*
(4) *for every affine scheme Z and any morphism $Z \to Y$ the morphism $Z \times_Y X \to Z$ is syntomic,*
(5) *there exists a scheme V and a surjective étale morphism $V \to Y$ such that $V \times_Y X \to V$ is a syntomic morphism,*
(6) *there exists a scheme U and a surjective étale morphism $\varphi : U \to X$ such that the composition $f \circ \varphi$ is syntomic,*
(7) *for every commutative diagram*

$$\begin{tikzcd} U \arrow[r] \arrow[d] & V \arrow[d] \\ X \arrow[r] & Y \end{tikzcd}$$

where U, V are schemes and the vertical arrows are étale the top horizontal arrow is syntomic,
(8) *there exists a commutative diagram*

$$\begin{tikzcd} U \arrow[r] \arrow[d] & V \arrow[d] \\ X \arrow[r] & Y \end{tikzcd}$$

where U, V are schemes, the vertical arrows are étale, and $U \to X$ is surjective such that the top horizontal arrow is syntomic, and
(9) *there exist Zariski coverings $Y = \bigcup_{i \in I} Y_i$, and $f^{-1}(Y_i) = \bigcup X_{ij}$ such that each morphism $X_{ij} \to Y_i$ is syntomic.*

Proof. Omitted. ☐

42.33. Smooth morphisms

The property ``syntomic'' of morphisms of schemes is étale local on the source-and-target, see Descent, Remark 31.28.7. It is also stable under base change and fpqc local on the target, see Morphisms, Lemma 24.33.5 and Descent, Lemma 31.19.25. Hence, by Lemma 42.21.1 above, we may define the notion of a smooth morphism of algebraic spaces as follows and it agrees with the already existing notion defined in Section 42.3 when the morphism is representable.

Definition 42.33.1. Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S.

(1) We say f is *smooth* if the equivalent conditions of Lemma 42.21.1 hold with $\mathcal{P}$=``smooth''.

(2) Let $x \in |X|$. We say f is *smooth at x* if there exists an open neighbourhood $X' \subset X$ of x such that $f|_{X'} : X' \to Y$ is smooth.

Lemma 42.33.2. *The composition of smooth morphisms is smooth.*

Proof. Omitted. □

Lemma 42.33.3. *The base change of a smooth morphism is smooth.*

Proof. Omitted. □

Lemma 42.33.4. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. The following are equivalent:*

(1) *f is smooth,*
(2) *for every $x \in |X|$ the morphism f is smooth at x,*
(3) *for every scheme Z and any morphism $Z \to Y$ the morphism $Z \times_Y X \to Z$ is smooth,*
(4) *for every affine scheme Z and any morphism $Z \to Y$ the morphism $Z \times_Y X \to Z$ is smooth,*
(5) *there exists a scheme V and a surjective étale morphism $V \to Y$ such that $V \times_Y X \to V$ is a smooth morphism,*
(6) *there exists a scheme U and a surjective étale morphism $\varphi : U \to X$ such that the composition $f \circ \varphi$ is smooth,*
(7) *for every commutative diagram*

$$\begin{tikzcd} U \arrow[r] \arrow[d] & V \arrow[d] \\ X \arrow[r] & Y \end{tikzcd}$$

where U, V are schemes and the vertical arrows are étale the top horizontal arrow is smooth,
(8) *there exists a commutative diagram*

$$\begin{tikzcd} U \arrow[r] \arrow[d] & V \arrow[d] \\ X \arrow[r] & Y \end{tikzcd}$$

where U, V are schemes, the vertical arrows are étale, and $U \to X$ is surjective such that the top horizontal arrow is smooth, and
(9) *there exist Zariski coverings $Y = \bigcup_{i \in I} Y_i$, and $f^{-1}(Y_i) = \bigcup X_{ij}$ such that each morphism $X_{ij} \to Y_i$ is smooth.*

Proof. Omitted. □

Lemma 42.33.5. *A smooth morphism of algebraic spaces is locally of finite presentation.*

Proof. Let $X \to Y$ be a smooth morphism of algebraic spaces. By definition this means there exists a diagram as in Lemma 42.21.1 with h smooth and surjective vertical arrow a. By Morphisms, Lemma 24.33.8 h is locally of finite presentation. Hence $X \to Y$ is locally of finite presentation by definition. □

Lemma 42.33.6. *A smooth morphism of algebraic spaces is locally of finite type.*

Proof. Combine Lemmas 42.33.5 and 42.26.5. □

Lemma 42.33.7. *A smooth morphism of algebraic spaces is flat.*

Proof. Let $X \to Y$ be a smooth morphism of algebraic spaces. By definition this means there exists a diagram as in Lemma 42.21.1 with h smooth and surjective vertical arrow a. By Morphisms, Lemma 24.33.8 h is flat. Hence $X \to Y$ is flat by definition. $\square$

Lemma 42.33.8. *A smooth morphism of algebraic spaces is syntomic.*

Proof. Let $X \to Y$ be a smooth morphism of algebraic spaces. By definition this means there exists a diagram as in Lemma 42.21.1 with h smooth and surjective vertical arrow a. By Morphisms, Lemma 24.33.7 h is syntomic. Hence $X \to Y$ is syntomic by definition. $\square$

42.34. Unramified morphisms

The property ``unramified'' (resp. ``G-unramified'') of morphisms of schemes is étale local on the source-and-target, see Descent, Remark 31.28.7. It is also stable under base change and fpqc local on the target, see Morphisms, Lemma 24.34.5 and Descent, Lemma 31.19.26. Hence, by Lemma 42.21.1 above, we may define the notion of an unramified morphism (resp. G-unramified morphism) of algebraic spaces as follows and it agrees with the already existing notion defined in Section 42.3 when the morphism is representable.

Definition 42.34.1. Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S.

(1) We say f is *unramified* if the equivalent conditions of Lemma 42.21.1 hold with $\mathcal{P}=$ unramified.
(2) Let $x \in |X|$. We say f is *unramified at x* if there exists an open neighbourhood $X' \subset X$ of x such that $f|_{X'} : X' \to Y$ is unramified.
(3) We say f is *G-unramified* if the equivalent conditions of Lemma 42.21.1 hold with $\mathcal{P}=$ G-unramified.
(4) Let $x \in |X|$. We say f is *G-unramified at x* if there exists an open neighbourhood $X' \subset X$ of x such that $f|_{X'} : X' \to Y$ is G-unramified.

Because of the following lemma, from here on we will only develop theory for unramified morphisms, and whenever we want to use a G-unramified morphism we will simply say ``an unramified morphism locally of finite presentation''.

Lemma 42.34.2. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Then f is G-unramified if and only if f is unramified and locally of finite presentation.*

Proof. Consider any diagram as in Lemma 42.21.1. Then all we are saying is that the morphism h is G-unramified if and only if it is unramified and locally of finite presentation. This is clear from Morphisms, Definition 24.34.1. $\square$

Lemma 42.34.3. *The composition of unramified morphisms is unramified.*

Proof. Omitted. $\square$

Lemma 42.34.4. *The base change of an unramified morphism is unramified.*

Proof. Omitted. $\square$

Lemma 42.34.5. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. The following are equivalent:*

(1) *f is unramified,*

(2) *for every $x \in |X|$ the morphism f is unramified at x,*
(3) *for every scheme Z and any morphism $Z \to Y$ the morphism $Z \times_Y X \to Z$ is unramified,*
(4) *for every affine scheme Z and any morphism $Z \to Y$ the morphism $Z \times_Y X \to Z$ is unramified,*
(5) *there exists a scheme V and a surjective étale morphism $V \to Y$ such that $V \times_Y X \to V$ is an unramified morphism,*
(6) *there exists a scheme U and a surjective étale morphism $\varphi : U \to X$ such that the composition $f \circ \varphi$ is unramified,*
(7) *for every commutative diagram*

$$\begin{tikzcd} U \arrow[r] \arrow[d] & V \arrow[d] \\ X \arrow[r] & Y \end{tikzcd}$$

where U, V are schemes and the vertical arrows are étale the top horizontal arrow is unramified,
(8) *there exists a commutative diagram*

$$\begin{tikzcd} U \arrow[r] \arrow[d] & V \arrow[d] \\ X \arrow[r] & Y \end{tikzcd}$$

where U, V are schemes, the vertical arrows are étale, and $U \to X$ is surjective such that the top horizontal arrow is unramified, and
(9) *there exist Zariski coverings $Y = \bigcup_{i \in I} Y_i$, and $f^{-1}(Y_i) = \bigcup X_{ij}$ such that each morphism $X_{ij} \to Y_i$ is unramified.*

Proof. Omitted. □

Lemma 42.34.6. *An unramified morphism of algebraic spaces is locally of finite type.*

Proof. Via a diagram as in Lemma 42.21.1 this translates into Morphisms, Lemma 24.34.9. □

Lemma 42.34.7. *If f is unramified at x then f is quasi-finite at x. In particular, an unramified morphism is locally quasi-finite.*

Proof. Via a diagram as in Lemma 42.21.1 this translates into Morphisms, Lemma 24.34.10. □

Lemma 42.34.8. *An immersion of algebraic spaces is unramified.*

Proof. Let $i : X \to Y$ be an immersion of algebraic spaces. Choose a scheme V and a surjective étale morphism $V \to Y$. Then $V \times_Y X \to V$ is an immersion of schemes, hence unramified (see Morphisms, Lemmas 24.34.7 and 24.34.8). Thus by definition i is unramified. □

Lemma 42.34.9. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S.*

(1) *If f is unramified, then the diagonal morphism $\Delta_{X/Y} : X \to X \times_Y X$ is an open immersion.*
(2) *If f is locally of finite type and $\Delta_{X/Y}$ is an open immersion, then f is unramified.*

Proof. We know in any case that $\Delta_{X/Y}$ is a representable monomorphism, see Lemma 42.5.1. Choose a scheme V and a surjective étale morphism $V \to Y$. Choose a scheme U and a surjective étale morphism $U \to X \times_Y V$. Consider the commutative diagram

$$\begin{tikzcd} U \arrow[r, "\Delta_{U/V}"'] \arrow[d] & U \times_V U \arrow[r] \arrow[d] & V \arrow[d, "\Delta_{V/Y}"] \\ X \arrow[r, "\Delta_{X/Y}"] & X \times_Y X \arrow[r] & V \times_Y V \end{tikzcd}$$

with cartesian right square. The left vertical arrow is surjective étale. The right vertical arrow is étale as a morphism between schemes étale over Y, see Properties of Spaces, Lemma 41.13.6. Hence the middle vertical arrow is étale too (but it need not be surjective).

Assume f is unramified. Then $U \to V$ is unramified, hence $\Delta_{U/V}$ is an open immersion by Morphisms, Lemma 24.34.13. Looking at the left square of the diagram above we conclude that $\Delta_{X/Y}$ is an étale morphism, see Properties of Spaces, Lemma 41.13.3. Hence $\Delta_{X/Y}$ is a representable étale monomorphism, which implies that it is an open immersion by Étale Morphisms, Theorem 37.14.1. (See also Spaces, Lemma 40.5.8 for the translation from schemes language into the language of functors.)

Assume that f is locally of finite type and that $\Delta_{X/Y}$ is an open immersion. This implies that $U \to V$ is locally of finite type too (by definition of a morphism of algebraic spaces which is locally of finite type). Looking at the displayed diagram above we conclude that $\Delta_{U/V}$ is étale as a morphism between schemes étale over $X \times_Y X$, see Properties of Spaces, Lemma 41.13.6. But since $\Delta_{U/V}$ is the diagonal of a morphism between schemes we see that it is in any case an immersion, see Schemes, Lemma 21.21.2. Hence it is an open immersion, and we conclude that $U \to V$ is unramified by Morphisms, Lemma 24.34.13. This in turn means that f is unramified by definition. □

Lemma 42.34.10. *Let S be a scheme. Consider a commutative diagram*

$$\begin{tikzcd} X \arrow[rr, "f"'] \arrow[dr, "p"'] & & Y \arrow[dl, "q"] \\ & Z & \end{tikzcd}$$

of algebraic spaces over S. Assume that $X \to Z$ is locally of finite type. Then there exists an open subspace $U(f) \subset X$ such that $|U(f)| \subset |X|$ is the set of points where f is unramified. Moreover, for any morphism of algebraic spaces $Z' \to Z$, if $f' : X' \to Y'$ is the base change of f by $Z' \to Z$, then $U(f')$ is the inverse image of $U(f)$ under the projection $X' \to X$.

Proof. This lemma is the analogue of Morphisms, Lemma 24.34.15 and in fact we will deduce the lemma from it. By Definition 42.34.1 the set $\{x \in |X| : f \text{ is unramified at } x\}$ is open in X. Hence we only need to prove the final statement. By Lemma 42.22.6 the morphism $X \to Y$ is locally of finite type. By Lemma 42.22.3 the morphism $X' \to Y'$ is locally of finite type.

Choose a scheme W and a surjective étale morphism $W \to Z$. Choose a scheme V and a surjective étale morphism $V \to W \times_Z Y$. Choose a scheme U and a surjective étale morphism $U \to V \times_Y X$. Finally, choose a scheme W' and a surjective étale morphism $W' \to W \times_Z Z'$. Set $V' = W' \times_W V$ and $U' = W' \times_W U$, so that we obtain surjective étale morphisms $V' \to Y'$ and $U' \to X'$. We will use without further mention an étale morphism of algebraic spaces induces an open map of associated topological spaces (see Properties of Spaces, Lemma 41.13.7). This combined with Lemma 42.34.5 implies that $U(f)$ is the image in $|X|$ of the set T of points in U where the morphism $U \to V$ is unramified. Similarly, $U(f')$ is the image in $|X'|$ of the set T' of points in U' where the morphism $U' \to V'$ is unramified. Now, by construction the diagram

$$\begin{tikzcd} U' \arrow[r] \arrow[d] & U \arrow[d] \\ V' \arrow[r] & V \end{tikzcd}$$

is cartesian (in the category of schemes). Hence the aforementioned Morphisms, Lemma 24.34.15 applies to show that T' is the inverse image of T. Since $|U'| \to |X'|$ is surjective this implies the lemma. $\square$

Lemma 42.34.11. *Let S be a scheme. Let $X \to Y \to Z$ be morphisms of algebraic spaces over S. If $X \to Z$ is unramified, then $X \to Y$ is unramified.*

Proof. Choose a commutative diagram

$$\begin{tikzcd} U \arrow[r] \arrow[d] & V \arrow[r] \arrow[d] & W \arrow[d] \\ X \arrow[r] & Y \arrow[r] & Z \end{tikzcd}$$

with vertical arrows étale and surjective. (See Spaces, Lemma 40.11.4.) Apply Morphisms, Lemma 24.34.16 to the top row. $\square$

42.35. Étale morphisms

The notion of an étale morphism of algebraic spaces was defined in Properties of Spaces, Definition 41.13.2. Here is the what it means for a morphism to be étale at a point.

Definition 42.35.1. Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Let $x \in |X|$. We say f is *étale at x* if there exists an open neighbourhood $X' \subset X$ of x such that $f|_{X'} : X' \to Y$ is étale

Lemma 42.35.2. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. The following are equivalent:*

1. *f is étale,*
2. *for every $x \in |X|$ the morphism f is étale at x,*
3. *for every scheme Z and any morphism $Z \to Y$ the morphism $Z \times_Y X \to Z$ is étale,*
4. *for every affine scheme Z and any morphism $Z \to Y$ the morphism $Z \times_Y X \to Z$ is étale,*
5. *there exists a scheme V and a surjective étale morphism $V \to Y$ such that $V \times_Y X \to V$ is an étale morphism,*
6. *there exists a scheme U and a surjective étale morphism $\varphi : U \to X$ such that the composition $f \circ \varphi$ is étale,*
7. *for every commutative diagram*

$$\begin{tikzcd} U \arrow[r] \arrow[d] & V \arrow[d] \\ X \arrow[r] & Y \end{tikzcd}$$

where U, V are schemes and the vertical arrows are étale the top horizontal arrow is étale,

(8) *there exists a commutative diagram*

$$\begin{tikzcd} U \arrow[r] \arrow[d] & V \arrow[d] \\ X \arrow[r] & Y \end{tikzcd}$$

where U, V are schemes, the vertical arrows are étale, and $U \to X$ surjective such that the top horizontal arrow is étale, and

(9) *there exist Zariski coverings $Y = \bigcup Y_i$ and $f^{-1}(Y_i) = \bigcup X_{ij}$ such that each morphism $X_{ij} \to Y_i$ is étale.*

Proof. Combine Properties of Spaces, Lemmas 41.13.3, 41.13.5 and 41.13.4. Some details omitted. ☐

Lemma 42.35.3. *The composition of two étale morphisms of algebraic spaces is étale.*

Proof. This is a copy of Properties of Spaces, Lemma 41.13.4. ☐

Lemma 42.35.4. *The base change of an étale morphism of algebraic spaces by any morphism of algebraic spaces is étale.*

Proof. This is a copy of Properties of Spaces, Lemma 41.13.5. ☐

Lemma 42.35.5. *An étale morphism of algebraic spaces is locally quasi-finite.*

Proof. Let $X \to Y$ be an étale morphism of algebraic spaces, see Properties of Spaces, Definition 41.13.2. By Properties of Spaces, Lemma 41.13.3 we see this means there exists a diagram as in Lemma 42.21.1 with h étale and surjective vertical arrow a. By Morphisms, Lemma 24.35.6 h is locally quasi-finite. Hence $X \to Y$ is locally quasi-finite by definition. ☐

Lemma 42.35.6. *An étale morphism of algebraic spaces is smooth.*

Proof. The proof is identical to the proof of Lemma 42.35.5. It uses the fact that an étale morphism of schemes is smooth (by definition of an étale morphism of schemes). ☐

Lemma 42.35.7. *An étale morphism of algebraic spaces is flat.*

Proof. The proof is identical to the proof of Lemma 42.35.5. It uses Morphisms, Lemma 24.35.12. ☐

Lemma 42.35.8. *An étale morphism of algebraic spaces is locally of finite presentation.*

Proof. The proof is identical to the proof of Lemma 42.35.5. It uses Morphisms, Lemma 24.35.11. ☐

Lemma 42.35.9. *An étale morphism of algebraic spaces is locally of finite type.*

Proof. An étale morphism is locally of finite presentation and a morphism locally of finite presentation is locally of finite type, see Lemmas 42.35.8 and 42.26.5. ☐

Lemma 42.35.10. *An étale morphism of algebraic spaces is unramified.*

Proof. The proof is identical to the proof of Lemma 42.35.5. It uses Morphisms, Lemma 24.35.5. ☐

Lemma 42.35.11. *Let S be a scheme. Let X, Y be algebraic spaces étale over an algebraic space Z. Any morphism $X \to Y$ over Z is étale.*

Proof. This is a copy of Properties of Spaces, Lemma 41.13.6. □

Lemma 42.35.12. *A locally finitely presented, flat, unramified morphism of algebraic spaces is étale.*

Proof. Let $X \to Y$ be a locally finitely presented, flat, unramified morphism of algebraic spaces. By Properties of Spaces, Lemma 41.13.3 we see this means there exists a diagram as in Lemma 42.21.1 with h locally finitely presented, flat, unramified and surjective vertical arrow a. By Morphisms, Lemma 24.35.16 h is étale. Hence $X \to Y$ is étale by definition. □

42.36. Proper morphisms

The notion of a proper morphism plays an important role in algebraic geometry. Here is the definition of a proper morphism of algebraic spaces.

Definition 42.36.1. Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. We say f is *proper* if f is separated, finite type, and universally closed.

Some of the results in this section are results on universally closed morphisms.

Lemma 42.36.2. *A base change of a proper morphism is proper.*

Proof. See Lemmas 42.5.4, 42.22.3, and 42.10.3. □

Lemma 42.36.3. *A composition of proper morphisms is proper.*

Proof. See Lemmas 42.5.8, 42.22.2, and 42.10.4. □

Lemma 42.36.4. *A closed immersion of algebraic spaces is a proper morphism of algebraic spaces.*

Proof. As a closed immersion is by definition representable this follows from Spaces, Lemma 40.5.8 and the corresponding result for morphisms of schemes, see Morphisms, Lemma 24.40.6. □

Lemma 42.36.5. *Let S be a scheme. Consider a commutative diagram of algebraic spaces*

$$\begin{tikzcd} X \arrow[rr] \arrow[dr] & & Y \arrow[dl] \\ & B & \end{tikzcd}$$

over S.

(1) *If $X \to B$ is universally closed and $Y \to B$ is separated, then the morphism $X \to Y$ is universally closed. In particular, the image of $|X|$ in $|Y|$ is closed.*
(2) *If $X \to B$ is proper and $Y \to B$ is separated, then the morphism $X \to Y$ is proper.*

Proof. Assume $X \to B$ is universally closed and $Y \to B$ is separated. We factor the morphism as $X \to X \times_B Y \to Y$. The first morphism is a closed immersion, see Lemma 42.5.6 hence universally closed. The projection $X \times_B Y \to Y$ is the base change of a unviversally closed morphism and hence universally closed, see Lemma 42.10.3. Thus $X \to Y$ is universally closed as the composition of universally closed morphisms, see Lemma 42.10.4. This proves (1). To deduce (2) combine (1) with Lemmas 42.5.10, 42.9.8, and 42.22.6. □

Lemma 42.36.6. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. The following are equivalent:*

(1) *f is separated,*
(2) *$\Delta_{X/Y} : X \to X \times_Y X$ is universally closed, and*
(3) *$\Delta_{X/Y} : X \to X \times_Y X$ is proper.*

Proof. The implication (1) $\Rightarrow$ (3) follows from Lemma 42.36.4. We will use Spaces, Lemma 40.5.8 without further mention in the rest of the proof. Recall that $\Delta_{X/Y}$ is a representable monomorphism which is locally of finite type, see Lemma 42.5.1. Since proper $\Rightarrow$ universally closed for morphisms of schemes we conclude that (3) implies (2). If $\Delta_{X/Y}$ is universally closed then Étale Morphisms, Lemma 37.7.2 implies that it is a closed immersion. Thus (2) $\Rightarrow$ (1) and we win. □

42.37. Integral and finite morphisms

We have already defined in Section 42.3 what it means for a representable morphism of algebraic spaces to be integral (resp. finite).

Lemma 42.37.1. *Let S be a scheme. Let $f : X \to Y$ be a representable morphism of algebraic spaces over S. Then f is integral (resp. finite) if and only if for all affine schemes Z and morphisms $Z \to Y$ the scheme $X \times_Y Z$ is affine and integral (resp. finite) over Z.*

Proof. This follows directly from the definition of an integral (resp. finite) morphism of schemes (Morphisms, Definition 24.42.1). □

This clears the way for the following definition.

Definition 42.37.2. Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S.

(1) We say that f is *integral* if for every affine scheme Z and morphisms $Z \to Y$ the algebraic space $X \times_Y Z$ is representable by an affine scheme integral over Z.
(2) We say that f is *finite* if for every affine scheme Z and morphisms $Z \to Y$ the algebraic space $X \times_Y Z$ is representable by an affine scheme finite over Z.

Lemma 42.37.3. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. The following are equivalent:*

(1) *f is representable and integral (resp. finite),*
(2) *f is integral (resp. finite),*
(3) *there exists a scheme V and a surjective étale morphism $V \to Y$ such that $V \times_Y X \to V$ is integral (resp. finite), and*
(4) *there exists a Zariski covering $Y = \bigcup Y_i$ such that each of the morphisms $f^{-1}(Y_i) \to Y_i$ is integral (resp. finite).*

Proof. It is clear that (1) implies (2) and that (2) implies (3) by taking V to be a disjoint union of affines étale over Y, see Properties of Spaces, Lemma 41.6.1. Assume $V \to Y$ is as in (3). Then for every affine open W of V we see that $W \times_Y X$ is an affine open of $V \times_Y X$. Hence by Properties of Spaces, Lemma 41.10.1 we conclude that $V \times_Y X$ is a scheme. Moreover the morphism $V \times_Y X \to V$ is affine. This means we can apply Spaces, Lemma 40.11.3 because the class of integral (resp. finite) morphisms satisfies all the required properties (see Morphisms, Lemmas 24.42.6 and Descent, Lemmas 31.19.20, 31.19.21, and 31.33.1). The conclusion of applying this lemma is that f is representable and integral (resp. finite), i.e., (1) holds.

The equivalence of (1) and (4) follows from the fact that being integral (resp. finite) is Zariski local on the target (the reference above shows that being integral or finite is in fact fpqc local on the target). □

Lemma 42.37.4. *The composition of integral (resp. finite) morphisms is integral (resp. finite).*

Proof. Omitted. □

Lemma 42.37.5. *The base change of an integral (resp. finite) morphism is integral (resp. finite).*

Proof. Omitted. □

Lemma 42.37.6. *A finite morphism of algebraic spaces is integral. An integral morphism of algebraic spaces which is locally of finite type is finite.*

Proof. In both cases the morphism is representable, and you can check the condition after a base change by an affine scheme mapping into Y, see Lemmas 42.37.3. Hence this lemma follows from the same lemma for the case of schemes, see Morphisms, Lemma 24.42.4. □

Lemma 42.37.7. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. The following are equivalent*

(1) *f is integral, and*
(2) *f is affine and universally closed.*

Proof. In both cases the morphism is representable, and you can check the condition after a base change by an affine scheme mapping into Y, see Lemmas 42.37.3, 42.19.3, and 42.10.5. Hence the result follows from Morphisms, Lemma 24.42.7. □

Lemma 42.37.8. *A finite morphism of algebraic spaces is quasi-finite.*

Proof. Let $f : X \to Y$ be a morphism of algebraic spaces. By Definition 42.37.2 and Lemmas 42.9.7 and 42.25.5 both properties may be checked after base change to an affine over Y, i.e., we may assume Y affine. If f is finite then X is a scheme. Hence the result follows from the corresponding result for schemes, see Morphisms, Lemma 24.42.9. □

Lemma 42.37.9. *A finite morphism of algebraic spaces is proper.*

Proof. Let $f : X \to Y$ be a morphism of algebraic spaces. We think of proper as synonymous to ``finite type, separated, and universally closed''. By Definition 42.37.2 and Lemmas 42.22.4, 42.5.12, and 42.10.5 both properties may be checked after base change to an affine over Y, i.e., we may assume Y affine. If f is finite then X is a scheme. Hence the result follows from the corresponding result for schemes, see Morphisms, Lemma 24.42.10. □

42.38. Finite locally free morphisms

We have already defined in Section 42.3 what it means for a representable morphism of algebraic spaces to be finite locally free.

Lemma 42.38.1. *Let S be a scheme. Let $f : X \to Y$ be a representable morphism of algebraic spaces over S. Then f is finite locally free if and only if f is affine and the sheaf $f_*\mathcal{O}_X$ is a finite locally free $\mathcal{O}_Y$-module.*

Proof. Assume f is finite locally free (as defined in Section 42.3). This means that for every morphism $V \to Y$ whose source is a scheme the base change $f' : V \times_Y X \to V$ is a finite locally free morphism of schemes. This in turn means (by the definition of a finite locally free morphism of schemes) that $f'_*\mathcal{O}_{V\times_Y X}$ is a finite locally free $\mathcal{O}_V$-module. We may choose $V \to Y$ to be surjective and étale. By Properties of Spaces, Lemma 41.23.2 we conclude the restriction of $f_*\mathcal{O}_X$ to V is finite locally free. Hence by Modules on Sites, Lemma 16.23.3 applied to the sheaf $f_*\mathcal{O}_X$ on $Y_{spaces,étale}$ we conclude that $f_*\mathcal{O}_X$ is finite locally free.

Conversely, assume f is affine and that $f_*\mathcal{O}_X$ is a finite locally free $\mathcal{O}_Y$-module. Let V be a scheme, and let $V \to Y$ be a surjective étale morphism. Again by Properties of Spaces, Lemma 41.23.2 we see that $f'_*\mathcal{O}_{V\times_Y X}$ is finite locally free. Hence $f' : V \times_Y X \to V$ is finite locally free (as it is also affine). By Spaces, Lemma 40.11.3 we conclude that f is finite locally free (use Morphisms, Lemma 24.44.4 Descent, Lemmas 31.19.28 and 31.33.1). Thus we win. □

This clears the way for the following definition.

Definition 42.38.2. Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. We say that f is *finite locally free* if f is affine and $f_*\mathcal{O}_X$ is a finite locally free $\mathcal{O}_Y$-module. In this case we say f is has *rank* or *degree* d if the sheaf $f_*\mathcal{O}_X$ is finite locally free of rank d.

Lemma 42.38.3. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. The following are equivalent:*

(1) *f is representable and finite locally free,*
(2) *f is finite locally free,*
(3) *there exists a scheme V and a surjective étale morphism $V \to Y$ such that $V \times_Y X \to V$ is finite locally free, and*
(4) *there exists a Zariski covering $Y = \bigcup Y_i$ such that each morphism $f^{-1}(Y_i) \to Y_i$ is finite locally free.*

Proof. It is clear that (1) implies (2) and that (2) implies (3) by taking V to be a disjoint union of affines étale over Y, see Properties of Spaces, Lemma 41.6.1. Assume $V \to Y$ is as in (3). Then for every affine open W of V we see that $W \times_Y X$ is an affine open of $V \times_Y X$. Hence by Properties of Spaces, Lemma 41.10.1 we conclude that $V \times_Y X$ is a scheme. Moreover the morphism $V \times_Y X \to V$ is affine. This means we can apply Spaces, Lemma 40.11.3 because the class of finite locally free morphisms satisfies all the required properties (see Morphisms, Lemma 24.44.4 Descent, Lemmas 31.19.28 and 31.33.1). The conclusion of applying this lemma is that f is representable and finite locally free, i.e., (1) holds.

The equivalence of (1) and (4) follows from the fact that being finite locally free is Zariski local on the target (the reference above shows that being finite locally free is in fact fpqc local on the target). □

Lemma 42.38.4. *The composition of finite locally free morphisms is finite locally free.*

Proof. Omitted. □

Lemma 42.38.5. *The base change of a finite locally free morphism is finite locally free.*

Proof. Omitted. □

Lemma 42.38.6. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. The following are equivalent:*

1. *f is finite locally free,*
2. *f is finite, flat, and locally of finite presentation.*

If Y is locally Noetherian these are also equivalent to

3. *f is finite and flat.*

Proof. In each of the three cases the morphism is representable and you can check the property after base change by a surjective étale morphism $V \to Y$, see Lemmas 42.37.3, 42.38.3, 42.27.4, and 42.26.4. If Y is locally Noetherian, then V is locally Noetherian. Hence the result follows from the corresponding result in the schemes case, see Morphisms, Lemma 24.44.2. □

42.39. Separated, locally quasi-finite morphisms

We prove a result that is so interesting it deserves its own section. The result is that an algebraic space which is locally quasi-finite and separated over a scheme is a scheme. It implies that a separated and locally quasi-finite morphism is representable. But first... a lemma (which will be obsoleted by Proposition 42.39.2).

Lemma 42.39.1. *Let S be a scheme. Consider a commutative diagram*

$$\begin{tikzcd} V' \arrow[r] \arrow[rd] & T' \times_T X \arrow[r] \arrow[d] & X \arrow[d] \\ & T' \arrow[r] & T \end{tikzcd}$$

Assume

1. *$T' \to T$ is an étale morphism of affine schemes,*
2. *X is an algebraic space,*
3. *$X \to T$ is a separated, locally quasi-finite morphism,*
4. *V' is an open subspace of $T' \times_T X$, and*
5. *$V' \to T'$ is quasi-affine.*

In this situation the image U of V' in X is a quasi-compact open subspace of X which is representable.

Proof. We first make some trivial observations. Note that V' is a representable by Lemma 42.20.3. It is also quasi-compact (as a quasi-affine scheme over an affine scheme, see Morphisms, Lemma 24.12.2). Since $T' \times_T X \to X$ is étale (Properties of Spaces, Lemma 41.13.5) the map $|T' \times_T X| \to |X|$ is open, see Properties of Spaces, Lemma 41.13.7. Let $U \subset X$ be the open subspace corresponding to the image of $|V'|$, see Properties of Spaces, Lemma 41.4.8. As $|V'|$ is quasi-compact we see that $|U|$ is quasi-compact, hence U is a quasi-compact algebraic spaces, by Properties of Spaces, Lemma 41.5.2.

By Morphisms, Lemma 24.48.8 the morphism $T' \to T$ is universally bounded. Hence we can do induction on the integer n bounding the degree of the fibres of $T' \to T$, see Morphisms, Lemma 24.48.7 for a description of this integer in the case of an étale morphism. If $n = 1$, then $T' \to T$ is an open immersion (see Étale Morphisms, Theorem 37.14.1), and the result is clear. Assume $n > 1$.

Consider the affine scheme $T'' = T' \times_T T'$. As $T' \to T$ is étale we have a decomposition (into open and closed affine subschemes) $T'' = \Delta(T') \amalg T^*$. Namely $\Delta = \Delta_{T'/T}$ is open by

Morphisms, Lemma 24.34.13 and closed because $T' \to T$ is separated as a morphism of affines. As a base change the degrees of the fibres of the second projection $\text{pr}_1 : T' \times_T T' \to T'$ are bounded by n, see Morphisms, Lemma 24.48.4. On the other hand, $\text{pr}_1|_{\Delta(T')} : \Delta(T') \to T'$ is an isomorphism and every fibre has exactly one point. Thus, on applying Morphisms, Lemma 24.48.7 we conclude the degrees of the fibres of the restriction $\text{pr}_1|_{T^*} : T^* \to T'$ are bounded by $n - 1$. Hence the induction hypothesis applied to the diagram

$$\begin{tikzcd} p_0^{-1}(V') \cap X^* \arrow[r] \arrow[dr] & X^* \arrow[r, "p_1|_{X^*}"'] \arrow[d] & X' \arrow[d] \\ & T^* \arrow[r, "\text{pr}_1|_{T^*}"] & T' \end{tikzcd}$$

gives that $p_1(p_0^{-1}(V') \cap X^*)$ is a quasi-compact scheme. Here we set $X'' = T'' \times_T X$, $X^* = T^* \times_T X$, and $X' = T' \times_T X$, and $p_0, p_1 : X'' \to X'$ are the base changes of pr_0, pr_1. Most of the hypotheses of the lemma imply by base change the corresponding hypothesis for the diagram above. For example $p_0^{-1}(V') = T'' \times_{T'} V'$ is a scheme quasi-affine over T'' as a base change. Some verifications omitted.

By Properties of Spaces, Lemma 41.10.1 we conclude that

$$p_1(p_0^{-1}(V')) = V' \cup p_1(p_0^{-1}(V') \cap X^*)$$

is a quasi-compact scheme. Moreover, it is clear that $p_1(p_0^{-1}(V'))$ is the inverse image of the quasi-compact open subspace $U \subset X$ discussed in the first paragraph of the proof. In other words, $T' \times_T U$ is a scheme! Note that $T' \times_T U$ is quasi-compact and separated and locally quasi-finite over T', as $T' \times_T X \to T'$ is locally quasi-finite and separated being a base change of the original morphism $X \to T$ (see Lemmas 42.5.4 and 42.25.3). This implies by More on Morphisms, Lemma 33.29.3 that $T' \times_T U \to T'$ is quasi-affine.

By Descent, Lemma 31.35.1 this gives a descent datum on $T' \times_T U/T'$ relative to the étale covering $\{T' \to W\}$, where $W \subset T$ is the image of the morphism $T' \to T$. Because U' is quasi-affine over T' we see from Descent, Lemma 31.34.1 that this datum is effective, and by the last part of Descent, Lemma 31.35.1 this implies that U is a scheme as desired. Some minor details omitted. □

Proposition 42.39.2. *Let S be a scheme. Let $f : X \to T$ be a morphism of algebraic spaces. Assume*

(1) *T is representable,*
(2) *f is locally quasi-finite, and*
(3) *f is separated.*

Then X is representable.

Proof. Let $T = \bigcup T_i$ be an affine open covering of the scheme T. If we can show that the open subspaces $X_i = f^{-1}(T_i)$ are representable, then X is representable, see Properties of Spaces, Lemma 41.10.1. Note that $X_i = T_i \times_T X$ and that locally quasi-finite and separated are both stable under base change, see Lemmas 42.5.4 and 42.25.3. Hence we may assume T is an affine scheme.

By Properties of Spaces, Lemma 41.6.2 there exists a Zariski covering $X = \bigcup X_i$ such that each X_i has a surjective étale covering by an affine scheme. By Properties of Spaces, Lemma 41.10.1 again it suffices to prove the propostion for each X_i. Hence we may assume there exists an affine scheme U and a surjective étale morphism $U \to X$. This reduces us to the situation in the next paragraph.

Assume we have

$$U \longrightarrow X \longrightarrow T$$

where U and T are affine schemes, $U \to X$ is étale surjective, and $X \to T$ is separated and locally quasi-finite. By Lemmas 42.35.5 and 42.25.2 the morphism $U \to T$ is locally quasi-finite. Since U and T are affine it is quasi-finite. Set $R = U \times_X U$. Then $X = U/R$, see Spaces, Lemma 40.9.1. As $X \to T$ is separated the morphism $R \to U \times_T U$ is a closed immersion, see Lemma 42.5.5. In particular R is an affine scheme also. As $U \to X$ is étale the projection morphisms $t, s : R \to U$ are étale as well. In particular s and t are quasi-finite, flat and of finite presentation (see Morphisms, Lemmas 24.35.6, 24.35.12 and 24.35.11).

Let (U, R, s, t, c) be the groupoid associated to the étale equivalence relation R on U. Let $u \in U$ be a point, and denote $p \in T$ its image. We are going to use More on Groupoids, Lemma 36.12.2 for the groupoid (U, R, s, t, c) over the scheme T with points p and u as above. By the discussion in the previous paragraph all the assumptions (1) -- (7) of that lemma are satisfied. Hence we get an étale neighbourhood $(T', p') \to (T, p)$ and disjoint union decompositions

$$U_{T'} = U' \amalg W, \quad R_{T'} = R' \amalg W'$$

and $u' \in U'$ satisfying conclusions (a), (b), (c), (d), (e), (f), (g), and (h) of the aforementioned More on Groupoids, Lemma 36.12.2. We may and do assume that T' is affine (after possibly shrinking T'). Conclusion (h) implies that $R' = U' \times_{X_{T'}} U'$ with projection mappings identified with the restrictions of s' and t'. Thus $(U', R', s'|_{R'}, t'|_{R'}, c'|_{R' \times_{t', U', s'} R'})$ of conclusion (g) is an étale equivalence relation. By Spaces, Lemma 40.10.2 we conclude that U'/R' is an open subspace of $X_{T'}$. By conclusion (d) the schemes U', R' are affine and the morphisms $s'|_{R'}, t'|_{R'}$ are finite étale. Hence Groupoids, Proposition 35.19.8 kicks in and we see that U'/R' is an affine scheme.

We conclude that for every pair of points (u, p) as above we can find an étale neighbourhood $(T', p') \to (T, p)$ with $\kappa(p) = \kappa(p')$ and a point $u' \in U_{T'}$ mapping to u such that the image x' of u' in $|X_{T'}|$ has an open neighbourhood V' in $X_{T'}$ which is an affine scheme. We apply Lemma 42.39.1 to obtain an open subspace $W \subset X$ which is a scheme, and which contains x (the image of u in $|X|$). Since this works for every x we see that X is a scheme by Properties of Spaces, Lemma 41.10.1. This ends the proof. □

42.40. Applications

Here is another formulation of the result above.

Lemma 42.40.1. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. If f is locally quasi-finite and separated, then f is representable.*

Proof. This is immediate from Proposition 42.39.2 and the fact that being locally quasi-finite and separated is preserved under any base change, see Lemmas 42.25.3 and 42.5.4. □

Lemma 42.40.2. *Let S be a scheme. Let $f : X \to Y$ be an étale and universally injective morphism of algebraic spaces over S. Then f is an open immersion.*

Proof. Let $T \to Y$ be a morphism from a scheme into Y. If we can show that $X \times_Y T \to T$ is an open immersion, then we are done. Since being étale and being universally injective are properties of morphisms stable under base change (see Lemmas 42.35.4 and 42.18.5) we may assume that Y is a scheme. Note that the diagonal $\Delta_{X/Y} : X \to X \times_Y X$ is étale, a monomorphism, and surjective by Lemma 42.18.2. Hence we see that $\Delta_{X/Y}$ is an isomorphism (see Spaces, Lemma 40.5.9), in particular we see that X is separated over Y. It follows that X is a scheme too, by Proposition 42.39.2. Finally, $X \to Y$ is an open immersion by the fundamental theorem for étale morphisms of schemes, see Étale Morphisms, Theorem 37.14.1. □

42.41. Universal homeomorphisms

In Morphisms, Section 24.43 we have shown that a morphism of schemes is a universal homeomorphism if and only if it is integral, universally injective and surjective. In particular the class of universal homeomorphisms of schemes is closed under composition and arbtriary base change and is fppf local on the base (as this is true for integral, universally injective, and surjective morphisms). Thus, if we apply the discussion in Section 42.3 to this notion we see that we know what it means for a representable morphism of algebraic spaces to be a universal homeomorphism.

Lemma 42.41.1. *Let S be a scheme. Let $f : X \to Y$ be a representable morphism of algebraic spaces over S. Then f is a universal homeomorphism (as discussed above) if and only if for every morphism of algebraic spaces $Z \to Y$ the base change map $Z \times_Y X \to Z$ induces a homeomorphism $|Z \times_Y X| \to |Z|$.*

Proof. If for every morphism of algebraic spaces $Z \to Y$ the base change map $Z \times_Y X \to Z$ induces a homeomorphism $|Z \times_Y X| \to |Z|$, then the same is true whenever Z is a scheme, which formally implies that f is a universal homeomorphism in the sense of Section 42.3. Conversely, if f is a universal homeomorphism in the sense of Section 42.3 then $X \to Y$ is integral, universally injective and surjective (see discussion above). Hence f is universally closed, see Lemma 42.37.7 and universally injective and (universally) surjective, i.e., f is a universal homeomorphism. □

Definition 42.41.2. Let S be a scheme. A morphisms $f : X \to Y$ of algebraic spaces over S is called a *universal homeomorphism* if and only if for every morphism of algebraic spaces $Z \to Y$ the base change $Z \times_Y X \to Z$ induces a homeomorphism $|Z \times_Y X| \to |Z|$.

This definition does not clash with the pre-existing definition for representable morphisms of algebraic spaces by our Lemma 42.41.1. For morphisms of algebraic spaces it is not the case that universal homeomorphisms are always integral.

Example 42.41.3. This is a continuation of Remark 42.18.4. Consider the algebraic space $X = \mathbf{A}^1_k/\{x \sim -x \mid x \neq 0\}$. There are morphisms

$$\mathbf{A}^1_k \longrightarrow X \longrightarrow \mathbf{A}^1_k$$

such that the first arrow is étale surjective, the second arrow is universally injective, and the composition is the map $x \mapsto x^2$. Hence the composition is universally closed. Thus it follows that the map $X \to \mathbf{A}^1_k$ is a universal homeomorphism, but $X \to \mathbf{A}^1_k$ is not separated.

Let S be a scheme. Let $f : X \to Y$ be a universal homeomorphism of algebraic spaces over S. Then f is universally closed, hence is quasi-compact, see Lemma 42.10.7. But f need not be separated (see example above), and not even quasi-separated: an example is to take infinite dimensional affine space $\mathbf{A}^\infty = \mathit{Spec}(k[x_1, x_2, \ldots])$ modulo the equivalence relation given by flipping finitely many signs of nonzero coordinates (details omitted).

CHAPTER 43

Decent Algebraic Spaces

43.1. Introduction

In this chapter we talk study ``local" properties of general algebraic spaces, i.e., those algebraic spaces which aren't quasi-separated. Quasi-separated algebraic spaces are studied in [**Kol96**]. It turns out that essentially new phenomena happen, especially regarding points and specializations of points, on more general algebraic spaces. On the other hand, for most basic results on algebraic spaces, one needn't worry about these phenomena, which is why we have decided to have this material in a separate chapter following the standard development of the theory.

43.2. Conventions

The standing assumption is that all schemes are contained in a big fppf site Sch_{fppf}. And all rings A considered have the property that $Spec(A)$ is (isomorphic) to an object of this big site.

Let S be a scheme and let X be an algebraic space over S. In this chapter and the following we will write $X \times_S X$ for the product of X with itself (in the category of algebraic spaces over S), instead of $X \times X$.

43.3. Universally bounded fibres

We briefly discuss what it means for a morphism from a scheme to an algebraic space to have universally bounded fibres. Please refer to Morphisms, Section 24.48 for similar definitions and results on morphisms of schemes.

Definition 43.3.1. Let S be a scheme. Let X be an algebraic space over S, and let U be a scheme over S. Let $f : U \to X$ be a morphism over S. We say the *fibres of f are universally bounded*[1] if there exists an integer n such that for all fields k and all morphisms $Spec(k) \to X$ the fibre product $Spec(k) \times_X U$ is a finite scheme over k whose degree over k is $\leq n$.

This definition makes sense because the fibre product $Spec(k) \times_Y X$ is a scheme. Moreover, if Y is a scheme we recover the notion of Morphisms, Definition 24.48.1 by virtue of Morphisms, Lemma 24.48.2.

Lemma 43.3.2. *Let S be a scheme. Let X be an algebraic space over S. Let $V \to U$ be a morphism of schemes over S, and let $U \to X$ be a morphism from U to X. If the fibres of $V \to U$ and $U \to X$ are universally bounded, then so are the fibres of $V \to X$.*

[1] This is probably nonstandard notation.

Proof. Let n be an integer which works for $V \to U$, and let m be an integer which works for $U \to X$ in Definition 43.3.1. Let $Spec(k) \to X$ be a morphism, where k is a field. Consider the morphisms

$$Spec(k) \times_X V \longrightarrow Spec(k) \times_X U \longrightarrow Spec(k).$$

By assumption the scheme $Spec(k) \times_X U$ is finite of degree at most m over k, and n is an integer which bounds the degree of the fibres of the first morphism. Hence by Morphisms, Lemma 24.48.3 we conclude that $Spec(k) \times_X V$ is finite over k of degree at most nm. $\square$

Lemma 43.3.3. *Let S be a scheme. Let $Y \to X$ be a representable morphism of algebraic spaces over S. Let $U \to X$ be a morphism from a scheme to X. If the fibres of $U \to X$ are universally bounded, then the fibres of $U \times_X Y \to Y$ are universally bounded.*

Proof. This is clear from the definition, and properties of fibre products. (Note that $U \times_X Y$ is a scheme as we assumed $Y \to X$ representable, so the definition applies.) $\square$

Lemma 43.3.4. *Let S be a scheme. Let $g : Y \to X$ be a representable morphism of algebraic spaces over S. Let $f : U \to X$ be a morphism from a scheme towards X. Let $f' : U \times_X Y \to Y$ be the base change of f. If*

$$Im(|f| : |U| \to |X|) \subset Im(|g| : |Y| \to |X|)$$

and f' has universally bounded fibres, then f has universally bounded fibres.

Proof. Let $n \geq 0$ be an integer bounding the degrees of the fibre products $Spec(k) \times_Y (U \times_X Y)$ as in Definition 43.3.1 for the morphism f'. We claim that n works for f also. Namely, suppose that $x : Spec(k) \to X$ is a morphism from the spectrum of a field. Then either $Spec(k) \times_X U$ is empty (and there is nothing to prove), or x is in the image of $|f|$. By Properties of Spaces, Lemma 41.4.3 and the assumption of the lemma we see that this means there exists a field extension $k \subset k'$ and a commutative diagram

$$\begin{tikzcd} Spec(k') \arrow[r] \arrow[d] & Y \arrow[d] \\ Spec(k) \arrow[r] & X \end{tikzcd}$$

Hence we see that

$$Spec(k') \times_Y (U \times_X Y) = Spec(k') \times_{Spec(k)} (Spec(k) \times_X U)$$

Since the scheme $Spec(k') \times_Y (U \times_X Y)$ is assumed finite of degree $\leq n$ over k' it follows that also $Spec(k) \times_X U$ is finite of degree $\leq n$ over k as desired. (Some details omitted.) $\square$

Lemma 43.3.5. *Let S be a scheme. Let X be an algebraic space over S. Consider a commutative diagram*

$$\begin{tikzcd} U \arrow[rr, "f"] \arrow[rd, "g"'] & & V \arrow[ld, "h"] \\ & X & \end{tikzcd}$$

where U and V are schemes. If g has universally bounded fibres, and f is surjective and flat, then also h has universally bounded fibres.

Proof. Assume g has universally bounded fibres, and f is surjective and flat. Say $n \geq 0$ is an integer which bounds the degrees of the schemes $Spec(k) \times_X U$ as in Definition 43.3.1. We claim n also works for h. Let $Spec(k) \to X$ be a morphism from the spectrum of a field to X. Consider the morphism of schemes

$$Spec(k) \times_X V \longrightarrow Spec(k) \times_X U$$

It is flat and surjective. By assumption the scheme on the left is finite of degree $\leq n$ over $Spec(k)$. It follows from Morphisms, Lemma 24.48.9 that the degree of the scheme on the right is also bounded by n as desired. □

Lemma 43.3.6. *Let S be a scheme. Let X be an algebraic space over S, and let U be a scheme over S. Let $\varphi : U \to X$ be a morphism over S. If the fibres of φ are universally bounded, then there exists an integer n such that each fibre of $|U| \to |X|$ has at most n elements.*

Proof. The integer n of Definition 43.3.1 works. Namely, pick $x \in |X|$. Represent x by a morphism $x : Spec(k) \to X$. Then we get a commutative diagram

$$\begin{tikzcd} Spec(k) \times_X U \arrow[r] \arrow[d] & U \arrow[d] \\ Spec(k) \arrow[r, "x"] & X \end{tikzcd}$$

which shows (via Properties of Spaces, Lemma 41.4.3) that the inverse image of x in $|U|$ is the image of the top horizontal arrow. Since $Spec(k) \times_X U$ is finite of degree $\leq n$ over k it has at most n points. □

43.4. Finiteness conditions and points

In this section we elaborate on the question of when points can be represented by monomorphisms from spectra of fields into the space.

Remark 43.4.1. Before we give the proof of the next lemma let us recall some facts about étale morphisms of schemes:

(1) An étale morphism is flat and hence generalizations lift along an étale morphism (Morphisms, Lemmas 24.35.12 and 24.24.8).
(2) An étale morphism is unramified, an unramified morphism is locally quasi-finite, hence fibres are discrete (Morphisms, Lemmas 24.35.16, 24.34.10, and 24.19.6).
(3) A quasi-compact étale morphism is quasi-finite and in particular has finite fibres (Morphisms, Lemmas 24.19.9 and 24.19.10).
(4) An étale scheme over a field k is a disjoint union of spectra of finite separable field extension of k (Morphisms, Lemma 24.35.7).

For a general discussion of étale morphisms, please see Étale Morphisms, Section 37.11.

Lemma 43.4.2. *Let S be a scheme. Let X be an algebraic space over S. Let $x \in |X|$. The following are equivalent:*

(1) *there exists a family of schemes U_i and étale morphisms $\varphi_i : U_i \to X$ such that $\coprod \varphi_i : \coprod U_i \to X$ is surjective, and such that for each i the fibre of $|U_i| \to |X|$ over x is finite, and*
(2) *for every affine scheme U and étale morphism $\varphi : U \to X$ the fibre of $|U| \to |X|$ over x is finite.*

Proof. The implication (2) $\Rightarrow$ (1) is trivial. Let $\varphi_i : U_i \to X$ be a family of étale morphisms as in (1). Let $\varphi : U \to X$ be an étale morphism from an affine scheme towards X. Consider the fibre product diagrams

$$\begin{tikzcd} U \times_X U_i \arrow[r, "p_i"] \arrow[d, "q_i"] & U_i \arrow[d, "\varphi_i"] \\ U \arrow[r, "\varphi"] & X \end{tikzcd} \qquad \begin{tikzcd} \coprod U \times_X U_i \arrow[r, "\coprod p_i"] \arrow[d, "\coprod q_i"] & \coprod U_i \arrow[d, "\coprod \varphi_i"] \\ U \arrow[r, "\varphi"] & X \end{tikzcd}$$

Since q_i is étale it is open (see Remark 43.4.1). Moreover, the morphism $\coprod q_i$ is surjective. Hence there exist finitely many indices $i_1, \ldots, i_n$ and a quasi-compact opens $W_{i_j} \subset U \times_X U_{i_j}$ which surject onto U. The morphism p_i is étale, hence locally quasi-finite (see remark on étale morphisms above). Thus we may apply Morphisms, Lemma 24.48.8 to see the fibres of $p_{i_j}|_{W_{i_j}} : W_{i_j} \to U_i$ are finite. Hence by Properties of Spaces, Lemma 41.4.3 and the assumption on φ_i we conclude that the fibre of φ over x is finite. In other words (2) holds. $\square$

Lemma 43.4.3. *Let S be a scheme. Let X be an algebraic space over S. Let $x \in |X|$. The following are equivalent:*

(1) *there exists a scheme U, an étale morphism $\varphi : U \to X$, and points $u, u' \in U$ mapping to x such that setting $R = U \times_X U$ the fibre of*
$$|R| \to |U| \times_{|X|} |U|$$
over (u, u') is finite,
(2) *for every scheme U, étale morphism $\varphi : U \to X$ and any points $u, u' \in U$ mapping to x setting $R = U \times_X U$ the fibre of*
$$|R| \to |U| \times_{|X|} |U|$$
over (u, u') is finite,
(3) *there exists a morphism $Spec(k) \to X$ with k a field in the equivalence class of x such that the projections $Spec(k) \times_X Spec(k) \to Spec(k)$ are étale and quasi-compact, and*
(4) *there exists a monomorphism $Spec(k) \to X$ with k a field in the equivalence class of x.*

Proof. Assume (1), i.e., let $\varphi : U \to X$ be an étale morphism from a scheme towards X, and let u, u' be points of U lying over x such that the fibre of $|R| \to |U| \times_{|X|} |U|$ over (u, u') is a finite set. In this proof we think of a point $u = Spec(\kappa(u))$ as a scheme. Note that $u \to U$, $u' \to U$ are monomorphisms (see Schemes, Lemma 21.23.6), hence $u \times_X u' \to R = U \times_X U$ is a monomorphism. In this language the assumption really means that $u \times_X u'$ is a scheme whose underlying topological space has finitely many points. Let $\psi : W \to X$ be an étale morphism from a scheme towards X. Let $w, w' \in W$ be points of W mapping to x. We have to show that $w \times_X w'$ is a scheme whose underlying topological space has finitely many points. Consider the fibre product diagram

$$\begin{tikzcd} W \times_X U \arrow[r, "p"] \arrow[d, "q"] & U \arrow[d, "\varphi"] \\ W \arrow[r, "\psi"] & X \end{tikzcd}$$

As x is the image of u and u' we may pick points $\tilde{w}, \tilde{w}'$ in $W \times_X U$ with $q(\tilde{w}) = w$, $q(\tilde{w}') = w'$, $u = p(\tilde{w})$ and $u' = p(\tilde{w}')$, see Properties of Spaces, Lemma 41.4.3. As p, q

are étale the field extensions $\kappa(w) \subset \kappa(\tilde{w}) \supset \kappa(u)$ and $\kappa(w') \subset \kappa(\tilde{w}') \supset \kappa(u')$ are finite separable, see Remark 43.4.1. Then we get a commutative diagram

$$\begin{tikzcd} w \times_X w' \arrow[d] & \tilde{w} \times_X \tilde{w}' \arrow[l] \arrow[r] \arrow[d] & u \times_X u' \arrow[d] \\ w \times_X w' & \tilde{w} \times_S \tilde{w}' \arrow[l] \arrow[r] & u \times_S u' \end{tikzcd}$$

where the squares are fibre product squares. The lower horizontal morpisms are étale and quasi-compact, as any scheme of the form $Spec(k) \times_S Spec(k')$ is affine, and by our observations about the field extensions above. Thus we see that the top horizontal arrows are étale and quasi-compact and hence have finite fibres. We have seen above that $|u \times_X u'|$ is finite, so we conclude that $|w \times_X w'|$ is finite. In other words, (2) holds.

Assume (2). Let $U \to X$ be an étale morphism from a scheme U such that x is in the image of $|U| \to |X|$. Let $u \in U$ be a point mapping to x. Then we have seen in the previous paragraph that $u = Spec(\kappa(u)) \to X$ has the property that $u \times_X u$ has a finite underlying topological space. On the other hand, the projection maps $u \times_X u \to u$ are the composition

$$u \times_X u \longrightarrow u \times_X U \longrightarrow u \times_X X = u,$$

i.e., the composition of a monomorphism (the base change of the monomorphism $u \to U$) by an étale morphism (the base change of the étale morphism $U \to X$). Hence $u \times_X U$ is a disjoint union of spectra of fields finite separable over $\kappa(u)$ (see Remark 43.4.1). Since $u \times_X u$ is finite the image of it in $u \times_X U$ is a finite disjoint union of spectra of fields finite separable over $\kappa(u)$. By Schemes, Lemma 21.23.10 we conclude that $u \times_X u$ is a finite disjoint union of spectra of fields finite separable over $\kappa(u)$. In other words, we see that $u \times_X u \to u$ is quasi-compact and étale. This means that (3) holds.

Let us prove that (3) implies (4). Let $Spec(k) \to X$ be a morphism from the spectrum of a field into X, in the equivalence class of x such that the two projections $t, s : R = Spec(k) \times_X Spec(k) \to Spec(k)$ are quasi-compact and étale. This means in particular that R is an étale equivalence relation on $Spec(k)$. By Spaces, Theorem 40.10.5 we know that the quotient sheaf $X' = Spec(k)/R$ is an algebraic space. By Groupoids, Lemma 35.17.6 the map $X' \to X$ is a monomorphism. Since s, t are quasi-compact, we see that R is quasi-compact and hence Properties of Spaces, Lemma 41.11.1 applies to X', and we see that $X' = Spec(k')$ for some field k'. Hence we get a factorization

$$Spec(k) \longrightarrow Spec(k') \longrightarrow X$$

which shows that $Spec(k') \to X$ is a monomorphism mapping to $x \in |X|$. In other words (4) holds.

Finally, we prove that (4) implies (1). Let $Spec(k) \to X$ be a monomorphism with k a field in the equivalence class of x. Let $U \to X$ be a surjectve étale morphism from a scheme U to X. Let $u \in U$ be a point over x. Since $Spec(k) \times_X u$ is nonempty, and since $Spec(k) \times_X u \to u$ is a monomorphism we conclude that $Spec(k) \times_X u = u$ (see Schemes, Lemma 21.23.10). Hence $u \to U \to X$ factors through $Spec(k) \to X$, here is a picture

$$\begin{tikzcd} u \arrow[r] \arrow[d] & U \arrow[d] \\ Spec(k) \arrow[r] & X \end{tikzcd}$$

Since the right vertical arrow is étale this implies that $k \subset \kappa(u)$ is a finite separable extension. Hence we conclude that

$$u \times_X u = u \times_{Spec(k)} u$$

is a finite scheme, and we win by the discussion of the meaning of property (1) in the first paragraph of this proof. □

Lemma 43.4.4. *Let S be a scheme. Let X be an algebraic space over S. Let $x \in |X|$. Let U be a scheme and let $\varphi : U \to X$ be an étale morphism. The following are equivalent:*

(1) *x is in the image of $|U| \to |X|$, and setting $R = U \times_X U$ the fibres of both*

$$|U| \longrightarrow |X| \quad \text{and} \quad |R| \longrightarrow |X|$$

over x are finite,

(2) *there exists a monomorphism $Spec(k) \to X$ with k a field in the equivalence class of x, and the fibre product $Spec(k) \times_X U$ is a finite nonempty scheme over k.*

Proof. Assume (1). This clearly implies the first condition of Lemma 43.4.3 and hence we obtain a monomorphism $Spec(k) \to X$ in the class of x. Taking the fibre product we see that $Spec(k) \times_X U \to Spec(k)$ is a scheme étale over $Spec(k)$ with finitely many points, hence a finite nonempty scheme over k, i.e., (2) holds.

Assume (2). By assumption x is in the image of $|U| \to |X|$. The finiteness of the fibre of $|U| \to |X|$ over x is clear since this fibre is equal to $|Spec(k) \times_X U|$ by Properties of Spaces, Lemma 41.4.3. The finiteness of the fibre of $|R| \to |X|$ above x is also clear since it is equal to the set underlying the scheme

$$(Spec(k) \times_X U) \times_{Spec(k)} (Spec(k) \times_X U)$$

which is finite over k. Thus (1) holds. □

Lemma 43.4.5. *Let S be a scheme. Let X be an algebraic space over S. Let $x \in |X|$. The following are equivalent:*

(1) *for every affine scheme U, any étale morphism $\varphi : U \to X$ setting $R = U \times_X U$ the fibres of both*

$$|U| \longrightarrow |X| \quad \text{and} \quad |R| \longrightarrow |X|$$

over x are finite,

(2) *there exist schemes U_i and étale morphisms $U_i \to X$ such that $\coprod U_i \to X$ is surjective and for each i, setting $R_i = U_i \times_X U_i$ the fibres of both*

$$|U_i| \longrightarrow |X| \quad \text{and} \quad |R_i| \longrightarrow |X|$$

over x are finite,

(3) *there exists a monomorphism $Spec(k) \to X$ with k a field in the equivalence class of x, and for any affine scheme U and étale morphism $U \to X$ the fibre product $Spec(k) \times_X U$ is a finite scheme over k, and*

(4) *there exists a quasi-compact monomorphism $Spec(k) \to X$ with k a field in the equivalence class of x.*

Proof. The equivalence of (1) and (3) follows on applying Lemma 43.4.4 to every étale morphism $U \to X$ with U affine. It is clear that (3) implies (2). Assume $U_i \to X$ and R_i are as in (2). We conclude from Lemma 43.4.2 that for any affine scheme U and étale morphism $U \to X$ the fibre of $|U| \to |X|$ over x is finite. Say this fibre is $\{u_1, \ldots, u_n\}$. Then, as Lemma 43.4.3 (1) applies to $U_i \to X$ for some i such that x is in the image of

$|U_i| \to |X|$, we see that the fibre of $|R = U \times_X U| \to |U| \times_{|X|} |U|$ is finite over (u_a, u_b), $a, b \in \{1, \ldots, n\}$. Hence the fibre of $|R| \to |X|$ over x is finite. In this way we see that (1) holds. At this point we know that (1), (2), and (3) are equivalent.

If (4) holds, then for any affine scheme U and étale morphism $U \to X$ the scheme $Spec(k) \times_X U$ is on the one hand étale over k (hence a disjoint union of spectra of finite separable extensions of k by Remark 43.4.1) and on the other hand quasi-compact over U (hence quasi-compact). Thus we see that (3) holds. Conversely, if $U_i \to X$ is as in (2) and $Spec(k) \to X$ is a monomorphism as in (3), then

$$\coprod Spec(k) \times_X U_i \longrightarrow \coprod U_i$$

is quasi-compact (because over each U_i we see that $Spec(k) \times_X U_i$ is a finite disjoint union spectra of fields). Thus $Spec(k) \to X$ is quasi-compact by Morphisms of Spaces, Lemma 42.9.7. $\square$

Lemma 43.4.6. *Let S be a scheme. Let X be an algebraic space over S. The following are equivalent:*

1. *there exist schemes U_i and étale morphisms $U_i \to X$ such that $\coprod U_i \to X$ is surjective and each $U_i \to X$ has universally bounded fibres, and*
2. *for every affine scheme U and étale morphism $\varphi : U \to X$ the fibres of $U \to X$ are universally bounded.*

Proof. The implication (2) $\Rightarrow$ (1) is trivial. Assume (1). Let $(\varphi_i : U_i \to X)_{i \in I}$ be a collection of étale morphisms from schemes towards X, covering X, such that each φ_i has universally bounded fibres. Let $\psi : U \to X$ be an étale morphism from an affine scheme towards X. For each i consider the fibre product diagram

$$\begin{tikzcd} U \times_X U_i \arrow[r, "p_i"'] \arrow[d, "q_i"'] & U_i \arrow[d, "\varphi_i"] \\ U \arrow[r, "\psi"] & X \end{tikzcd}$$

Since q_i is étale it is open (see Remark 43.4.1). Moreover, we have $U = \bigcup \mathrm{Im}(q_i)$, since the family $(\varphi_i)_{i \in I}$ is surjective. Since U is affine, hence quasi-compact we can finite finitely many $i_1, \ldots, i_n \in I$ and quasi-compact opens $W_j \subset U \times_X U_{i_j}$ such that $U = \bigcup p_{i_j}(W_j)$. The morphism p_{i_j} is étale, hence locally quasi-finite (see remark on étale morphisms above). Thus we may apply Morphisms, Lemma 24.48.8 to see the fibres of $p_{i_j}|_{W_j} : W_j \to U_{i_j}$ are universally bounded. Hence by Lemma 43.3.2 we see that the fibres of $W_j \to X$ are universally bounded. Thus also $\coprod_{j=1,\ldots,n} W_j \to X$ has universally bounded fibres. Since $\coprod_{j=1,\ldots,n} W_j \to X$ factors through the surjective étale map $\coprod q_{i_j}|_{W_j} : \coprod_{j=1,\ldots,n} W_j \to U$ we see that the fibres of $U \to X$ are universally bounded by Lemma 43.3.5. In other words (2) holds. $\square$

Lemma 43.4.7. *Let S be a scheme. Let X be an algebraic space over S. The following are equivalent:*

1. *there exists a Zariski covering $X = \bigcup X_i$ and for each i a scheme U_i and a quasi-compact surjective étale morphism $U_i \to X_i$, and*
2. *there exist schemes U_i and étale morphisms $U_i \to X$ such that the projections $U_i \times_X U_i \to U_i$ are quasi-compact and $\coprod U_i \to X$ is surjective.*

Proof. If (1) holds then the morphisms $U_i \to X_i \to X$ are étale (combine Morphisms, Lemma 24.35.3 and Spaces, Lemmas 40.5.4 and 40.5.3). Moreover, as $U_i \times_X U_i = U_i \times_{X_i} U_i$, both projections $U_i \times_X U_i \to U_i$ are quasi-compact.

If (2) holds then let $X_i \subset X$ be the open subspace corresponding to the image of the open map $|U_i| \to |X|$, see Properties of Spaces, Lemma 41.4.10. The morphisms $U_i \to X_i$ are surjective. Hence $U_i \to X_i$ is surjective étale, and the projections $U_i \times_{X_i} U_i \to U_i$ are quasi-compact, because $U_i \times_{X_i} U_i = U_i \times_X U_i$. Thus by Spaces, Lemma 40.11.2 the morphisms $U_i \to X_i$ are quasi-compact. □

43.5. Conditions on algebraic spaces

In this section we discuss the relationship between various natural conditions on algebraic spaces we have seen above. Please read Section 43.6 to get a feeling for the meaning of these conditions.

Lemma 43.5.1. *Let S be a scheme. Let X be an algebraic space over S. Consider the following conditions on X:*

(α) *For every $x \in |X|$, the equivalent conditions of Lemma 43.4.2 hold.*
(β) *For every $x \in |X|$, the equivalent conditions of Lemma 43.4.3 hold.*
(γ) *For every $x \in |X|$, the equivalent conditions of Lemma 43.4.5 hold.*
(δ) *The equivalent conditions of Lemma 43.4.6 hold.*
(ϵ) *The equivalent conditions of Lemma 43.4.7 hold.*
(ζ) *The space X is Zariski locally quasi-separated.*
(η) *The space X is quasi-separated*
(θ) *The space X is representable, i.e., X is a scheme.*
(ι) *The space X is a quasi-separated scheme.*

We have

$$\begin{tikzcd} & (\theta) \arrow[dr, Rightarrow] & & & & & \\ (\iota) \arrow[ur, Rightarrow] \arrow[dr, Rightarrow] & & (\zeta) \arrow[r, Rightarrow] & (\epsilon) \arrow[r, Rightarrow] & (\delta) \arrow[r, Rightarrow] & (\gamma) \arrow[r, Leftrightarrow] & (\alpha)+(\beta) \\ & (\eta) \arrow[ur, Rightarrow] & & & & & \end{tikzcd}$$

Proof. The implication $(\gamma) \Leftrightarrow (\alpha) + (\beta)$ is immediate. The implications in the diamond on the left are clear from the definitions.

Assume (ζ), i.e., that X is Zariski locally quasi-separated. Then (ϵ) holds by Properties of Spaces, Lemma 41.6.5.

Assume (ϵ). By Lemma 43.4.7 there exists a Zariski open covering $X = \bigcup X_i$ such that for each i there exists a scheme U_i and a quasi-compact surjective étale morphism $U_i \to X_i$. Choose an i and an affine open subscheme $W \subset U_i$. It suffices to show that $W \to X$ has universally bounded fibres, since then the family of all these morphisms $W \to X$ covers X. To do this we consider the diagram

$$\begin{tikzcd} W \times_X U_i \arrow[r, "p"] \arrow[d, "q"'] & U_i \arrow[d] \\ W \arrow[r] & X \end{tikzcd}$$

Since $W \to X$ factors through X_i we see that $W \times_X U_i = W \times_{X_i} U_i$, and hence q is quasi-compact. Since W is affine this implies that the scheme $W \times_X U_i$ is quasi-compact. Thus we may apply Morphisms, Lemma 24.48.8 and we conclude that p has universally bounded fibres. From Lemma 43.3.4 we conclude that $W \to X$ has universally bounded fibres as well.

Assume (δ). Let U be an affine scheme, and let $U \to X$ be an étale morphism. By assumption the fibres of the morphism $U \to X$ are universally bounded. Thus also the fibres of both projections $R = U \times_X U \to U$ are universally bounded, see Lemma 43.3.3. And by Lemma 43.3.2 also the fibres of $R \to X$ are universally bounded. Hence for any $x \in X$ the fibres of $|U| \to |X|$ and $|R| \to |X|$ over x are finite, see Lemma 43.3.6. In other words, the equivalent conditions of Lemma 43.4.5 hold. This proves that $(\delta) \Rightarrow (\gamma)$. $\square$

Lemma 43.5.2. *Let S be a scheme. Let $\mathcal{P}$ be one of the properties (α), (β), (γ), (δ), (ϵ), (ζ), or (θ) of algebraic spaces listed in Lemma 43.5.1. Then if X is an algebraic space over S, and $X = \bigcup X_i$ is a Zariski open covering such that each X_i has $\mathcal{P}$, then X has $\mathcal{P}$.*

Proof. Let X be an algebraic space over S, and let $X = \bigcup X_i$ is a Zariski open covering such that each X_i has $\mathcal{P}$.

The case $\mathcal{P} = (\alpha)$. The condition (α) for X_i means that for every $x \in |X_i|$ and every affine scheme U, and étale morphism $\varphi : U \to X_i$ the fibre of $\varphi : |U| \to |X_i|$ over x is finite. Consider $x \in X$, an affine scheme U and an étale morphism $U \to X$. Since $X = \bigcup X_i$ is a Zariski open covering there exits a finite affine open covering $U = U_1 \cup \ldots \cup U_n$ such that each $U_j \to X$ factors through some X_{i_j}. By assumption the fibres of $|U_j| \to |X_{i_j}|$ over x are finite for $j = 1, \ldots, n$. Clearly this means that the fibre of $|U| \to |X|$ over x is finite. This proves the result for (α).

The case $\mathcal{P} = (\beta)$. The condition (β) for X_i means that every $x \in |X_i|$ is represented by a monomorphism from the spectrum of a field towards X_i. Hence the same follows for X as $X_i \to X$ is a monomorphism and $X = \bigcup X_i$.

The case $\mathcal{P} = (\gamma)$. Note that $(\gamma) = (\alpha) + (\beta)$ by Lemma 43.5.1 hence the lemma for (γ) follows from the cases treated above.

The case $\mathcal{P} = (\delta)$. The condition (δ) for X_i means there exist schemes U_{ij} and étale morphisms $U_{ij} \to X_i$ with universally bounded fibres which cover X_i. These schemes also give an étale surjective morphism $\coprod U_{ij} \to X$ and $U_{ij} \to X$ still has universally bounded fibres.

The case $\mathcal{P} = (\epsilon)$. The condition (ϵ) for X_i means we can find a set J_i and morphisms $\varphi_{ij} : U_{ij} \to X_i$ such that each φ_{ij} is étale, both projections $U_{ij} \times_{X_i} U_{ij} \to U_{ij}$ are quasi-compact, and $\coprod_{j \in J_i} U_{ij} \to X_i$ is surjective. In this case the compositions $U_{ij} \to X_i \to X$ are étale (combine Morphisms, Lemmas 24.35.3 and 24.35.9 and Spaces, Lemmas 40.5.4 and 40.5.3). Since $X_i \subset X$ is a subspace we see that $U_{ij} \times_{X_i} U_{ij} = U_{ij} \times_X U_{ij}$, and hence the condition on fibre products is preserved. And clearly $\coprod_{i,j} U_{ij} \to X$ is surjective. Hence X satisfies (ϵ).

The case $\mathcal{P} = (\zeta)$. The condition (ζ) for X_i means that X_i is Zariski locally quasi-separated. It is immediately clear that this means X is Zariski locally quasi-separated.

For (θ), see Properties of Spaces, Lemma 41.10.1. $\square$

Lemma 43.5.3. *Let S be a scheme. Let $\mathcal{P}$ be one of the properties (β), (γ), (δ), (ϵ), or (θ) of algebraic spaces listed in Lemma 43.5.1. Let X, Y be algebraic spaces over S. Let $X \to Y$ be a representable morphism. If Y has property $\mathcal{P}$, so does X.*

Proof. Assume $f : X \to Y$ is a representable morphism of algebraic spaces, and assume that Y has $\mathcal{P}$. Let $x \in |X|$, and set $y = f(x) \in |Y|$.

The case $\mathcal{P} = (\beta)$. Condition (β) for Y means there exists a monomorphism $Spec(k) \to Y$ representing y. The fibre product $X_y = Spec(k) \times_Y X$ is a scheme, and x corresponds to a point of X_y, i.e., to a monomorphism $Spec(k') \to X_y$. As $X_y \to X$ is a monomorphism also we see that x is represented by the monomorphism $Spec(k') \to X_y \to X$. In other words (β) holds for X.

The case $\mathcal{P} = (\gamma)$. Since $(\gamma) \Rightarrow (\beta)$ we have seen in the preceding paragraph that y and x can be represented by monomorphisms as in the following diagram

$$\begin{tikzcd} Spec(k') \arrow[r, "x"'] \arrow[d] & X \arrow[d] \\ Spec(k) \arrow[r, "y"] & Y \end{tikzcd}$$

Also, by definition of property (γ) via Lemma 43.4.5 (2) there exist schemes V_i and étale morphisms $V_i \to Y$ such that $\coprod V_i \to Y$ is surjective and for each i, setting $R_i = V_i \times_Y V_i$ the fibres of both

$$|V_i| \longrightarrow |Y| \quad \text{and} \quad |R_i| \longrightarrow |Y|$$

over y are finite. This means that the schemes $(V_i)_y$ and $(R_i)_y$ are finite schemes over $y = Spec(k)$. As $X \to Y$ is representable, the fibre products $U_i = V_i \times_Y X$ are schemes. The morphisms $U_i \to X$ are étale, and $\coprod U_i \to X$ is surjective. Finally, for each i we have

$$(U_i)_x = (V_i \times_Y X)_x = (V_i)_y \times_{Spec(k)} Spec(k')$$

and

$$(U_i \times_X U_i)_x = \big((V_i \times_Y X) \times_X (V_i \times_Y X)\big)_x = (R_i)_y \times_{Spec(k)} Spec(k')$$

hence these are finite over k' as base changes of the finite schemes $(V_i)_y$ and $(R_i)_y$. This implies that (γ) holds for X, again via the second condition of Lemma 43.4.5.

The case $\mathcal{P} = (\delta)$. Let $V \to Y$ be an étale morphism with V an affine scheme. Since Y has property (δ) this morphism has universally bounded fibres. By Lemma 43.3.3 the base change $V \times_Y X \to X$ also has universally bounded fibres. Hence the first part of Lemma 43.4.6 applies and we see that Y also has property (δ).

The case $\mathcal{P} = (\epsilon)$. We will repeatedly use Spaces, Lemma 40.5.5. Let $V_i \to Y$ be as in Lemma 43.4.7 (2). Set $U_i = X \times_Y V_i$. The morphisms $U_i \to X$ are étale, and $\coprod U_i \to X$ is surjective. Because $U_i \times_X U_i = X \times_Y (V_i \times_Y V_i)$ we see that the projections $U_i \times_Y U_i \to U_i$ are base changes of the projections $V_i \times_Y V_i \to V_i$, and so quasi-compact as well. Hence X satisfies Lemma 43.4.7 (2).

The case $\mathcal{P} = (\theta)$. In this case the result is Categories, Lemma 4.8.3. $\square$

43.6. Reasonable and decent algebraic spaces

In Lemma 43.5.1 we have seen a number of conditions on algebraic spaces related to the behaviour of étale morphisms from affine schemes into X and related to the existence of special étale coverings of X by schemes. We tabulate the different types of conditions here:

(α)	fi
(β)	points come from monomorphisms of spectra of fields
(γ)	points come from quasi-compact monomorphisms of spectra of fields
(δ)	fi
(ϵ)	cover by etale morphisms from schemes quasi-compact onto their image

The conditions in the following definition are not exactly conditions on the diagonal of X, but they are in some sense separation conditions on X.

Definition 43.6.1. Let S be a scheme. Let X be an algebraic space over S.

(1) We say X is *decent* if for every point $x \in X$ the equivalent conditions of Lemma 43.4.5 hold, in other words property (γ) of Lemma 43.5.1 holds.
(2) We say X is *reasonable* if the equivalent conditions of Lemma 43.4.6 hold, in other words property (δ) of Lemma 43.5.1 holds.
(3) We say X is *very reasonable* if the equivalent conditions of Lemma 43.4.7 hold, i.e., property (ϵ) of Lemma 43.5.1 holds.

In particular we have

$$\text{very reasonable} \Rightarrow \text{reasonable} \Rightarrow \text{decent}.$$

The notion of a very reasonable algebraic space was introduced because the assumption was sufficient to prove some of the results below, especially Proposition 43.8.1 and Proposition 43.9.6. We hope (in the future) to strengthen these results to the case where the space X is reasonable or even just decent. If there exists a scheme U and a surjective, étale, quasi-compact morphism $U \to X$, then X is very reasonable, see Lemma 43.4.7.

Lemma 43.6.2. *A scheme is very reasonable.*

Proof. This is true because the identity map is a quasi-compact, surjective étale morphism. □

Lemma 43.6.3. *Let S be a scheme. Let X be an algebraic space over S. If there exists a Zariski open covering $X = \bigcup X_i$ such that each X_i is very reasonable, then X is very reasonable.*

Proof. This is case (ϵ) of Lemma 43.5.2. □

Lemma 43.6.4. *An algebraic space which is Zariski locally quasi-separated is very reasonable. In particular any quasi-separated algebraic space is very reasonable.*

Proof. This is one of the implications of Lemma 43.5.1. □

Lemma 43.6.5. *Let S be a scheme. Let X, Y be algebraic spaces over S. Let $Y \to X$ be a representable morphism. If X is very reasonable, so is Y.*

Proof. This is case (ϵ) of Lemma 43.5.3. □

Remark 43.6.6. Very reasonable algebraic spaces form a stricly larger collection than Zariski locally quasi-separated algebraic spaces. Consider an algebraic space of the form $X = [U/G]$ (see Spaces, Definition 40.14.4) where G is a finite group acting without fixed points on a non-quasi-separated scheme U. Namely, in this case $U \times_X U = U \times G$ and clearly both projections to U are quasi-compact, hence X is very reasonable. On the other hand, the diagonal $U \times_X U \to U \times U$ is not quasi-compact, hence this algebraic space is not quasi-separated. Now, take U the infinite affine space over a field k of characteristic $\neq 2$ with zero doubled, see Schemes, Example 21.21.4. Let $0_1, 0_2$ be the two zeros of U. Let $G = \{+1, -1\}$, and let -1 act by -1 on all coordinates, and by switching 0_1 and 0_2. Then $[U/G]$ is very reasonable but not Zariski locally quasi-separated (details omitted).

Example 43.6.7. The algebraic space $\mathbf{A}^1_{\mathbf{Q}}/\mathbf{Z}$ constructed in Spaces, Example 40.14.8 is not decent as its ``generic point'' cannot be represented by a monomorphism from the spectrum of a point.

Remark 43.6.8. Reasonable algebraic spaces are technically easier to work with than very reasonable algebraic spaces. For example, if $X \to Y$ is a quasi-compact étale surjective morphism of algebraic spaces and X is reasonable, then so is Y, see Lemma 43.13.5 but we don't know if this is true for the property ``very reasonble''. On the other hand, we do not know whether a reasonable algebraic space has an open dense subspace which is a scheme, and we also do not know whether its underlying topological space is sober, whereas we do know that very reasonable spaces have those properties (see Proposition 43.8.1 and Proposition 43.9.6). Below we give another technical property enjoyed by reasonable algebraic spaces.

Lemma 43.6.9. *Let S be a scheme. Let X be a quasi-compact reasonable algebraic space. Then there exists a directed system of quasi-compact and quasi-separated algebraic spaces X_i such that $X = colim_i X_i$ (colimit in the category of sheaves).*

Proof. We sketch the proof. By Properties of Spaces, Lemma 41.6.3 we have $X = U/R$ with U affine. In this case, reasonable means $U \to X$ is universally bounded. Hence there exists an integer N such that the ``fibres'' of $U \to X$ have degree at most N, see Definition 43.3.1. Denote $s, t : R \to U$ and $c : R \times_{s,U,t} R \to R$ the groupoid structural maps.

Claim: for every quasi-compact open $A \subset R$ there exists an open $R' \subset R$ such that

(1) $A \subset R'$,
(2) R' is quasi-compact, and
(3) $(U, R', s|_{R'}, t|_{R'}, c|_{R' \times_{s,U,t} R'})$ is a groupoid scheme.

Note that $e : U \to R$ is open as it is a section of the étale morphism $s : R \to U$, see Étale Morphisms, Proposition 37.6.1. Moreover U is affine hence quasi-compact. Hence we may replace A by $A \cup e(U) \subset R$, and assume that A contains $e(U)$. Next, we define inductively $A^1 = A$, and

$$A^n = c(A^{n-1} \times_{s,U,t} A) \subset R$$

for $n \geq 2$. Arguing inductively, we see that A^n is quasi-compact for all $n \geq 2$, as the image of the quasi-compact fibre product $A^{n-1} \times_{s,U,t} A$. If k is an algebraically closed field over S, and we consider k-points then

$$A^n(k) = \left\{ (u, u') \in U(k) : \begin{matrix} \text{there exist } u = u_1, u_2, \ldots, u_n \in U(k) \text{ with} \\ (u_i, u_{i+1}) \in A \text{ for all } i = 1, \ldots, n-1. \end{matrix} \right\}$$

But as the fibres of $U(k) \to X(k)$ have size at most N we see that if $n > N$ then we get a repeat in the sequence above, and we can shorten it proving $A^N = A^n$ for all $n \geq N$. This implies that $R' = A^N$ gives a groupoid scheme $(U, R', s|_{R'}, t|_{R'}, c|_{R' \times_{s,U,t} R'})$, proving the claim above.

Consider the map of sheaves on $(Sch/S)_{fppf}$

$$colim_{R' \subset R} U/R' \longrightarrow U/R$$

where $R' \subset R$ runs over the quasi-compact open subschemes of R which give étale equivalence relations as above. Each of the quotients U/R' is an algebraic space (see Spaces, Theorem 40.10.5). Since R' is quasi-compact, and U affine the morphism $R' \to U \times_{Spec(\mathbf{Z})} U$ is quasi-compact, and hence U/R' is quasi-separated. Finally, if T is a quasi-compact scheme, then

$$colim_{R' \subset R} U(T)/R'(T) \longrightarrow U(T)/R(T)$$

is a bijection, since every morphism from T into R ends up in one of the open subrelations R' by the claim above. This clearly implies that the colimit of the sheaves U/R' is U/R. In other words the algebraic space $X = U/R$ is the colimit of the quasi-separated algebraic spaces U/R'. □

Warning: The following lemma should be used with caution, as the schemes U_i in it are not necessarily separated or even quasi-separated.

Lemma 43.6.10. *Let S be a scheme. Let X be a very reasonable algebraic space over S. There exists a set of schemes U_i and morphisms $U_i \to X$ such that*

(1) *each U_i is a quasi-compact scheme,*
(2) *each $U_i \to X$ is étale,*
(3) *both projections $U_i \times_X U_i \to U_i$ are quasi-compact, and*
(4) *the morphism $\coprod U_i \to X$ is surjective (and étale).*

Proof. Definition 43.6.1 says that there exist $U_i \to X$ such that (2), (3) and (4) hold. Fix i, and set $R_i = U_i \times_X U_i$, and denote $s, t : R_i \to U_i$ the projections. For any affine open $W \subset U_i$ the open $W' = t(s^{-1}(W)) \subset U_i$ is a quasi-compact R_i-invariant open (see Groupoids, Lemma 35.16.2). Hence W' is a quasi-compact scheme, $W' \to X$ is étale, and $W' \times_X W' = s^{-1}(W') = t^{-1}(W')$ so both projections $W' \times_X W' \to W'$ are quasi-compact. This means the family of $W' \to X$, where $W \subset U_i$ runs through the members of affine open coverings of the U_i gives what we want. □

43.7. Points and specializations

There exists an étale morphism of algebraic spaces $f : X \to Y$ and a nontrivial specializations between points in a fibre of $|f| : |X| \to |Y|$, see Examples, Lemma 64.30.1. If the source of the morphism is a scheme we can avoid this by imposing condition (α) on Y.

Lemma 43.7.1. *Let S be a scheme. Let X be an algebraic space over S. Let $U \to X$ be an étale morphism from a scheme to X. Assume $u, u' \in |U|$ map to the same point x of $|X|$, and $u' \rightsquigarrow u$. If the pair (X, x) satisfies the equivalent conditions of Lemma 43.4.2 then $u = u'$.*

Proof. Assume the pair (X, x) satisfies the equivalent conditions for Lemma 43.4.2. Let U be a scheme, $U \to X$ étale, and let $u, u' \in |U|$ map to x of $|X|$, and $u' \rightsquigarrow u$. We may and do replace U by an affine neighbourhood of u. Let $t, s : R = U \times_X U \to U$ be the étale projection maps.

Pick a point $r \in R$ with $t(r) = u$ and $s(r) = u'$. This is possible by Properties of Spaces, Lemma 41.4.5. Because generalizations lift along the étale morphism t (Remark 43.4.1) we can find a specialization $r' \rightsquigarrow r$ with $t(r') = u'$. Set $u'' = s(r')$. Then $u'' \rightsquigarrow u'$. Thus we may repeat and find $r'' \rightsquigarrow r'$ with $t(r'') = u''$. Set $u''' = s(r'')$, and so on. Here is a picture:

$$\begin{tikzcd} & r'' \arrow[dl, "t"'] \arrow[d, squiggly] \arrow[dr, "s"] & \\ u'' \arrow[d, squiggly] & r' \arrow[dl, "t"'] \arrow[d, squiggly] \arrow[dr, "s"] & u''' \arrow[d, squiggly] \\ u' \arrow[d, squiggly] & r \arrow[dl, "t"'] \arrow[dr, "s"] & u'' \arrow[d, squiggly] \\ u & & u' \end{tikzcd}$$

In Remark 43.4.1 we have seen that there are no specializations among points in the fibres of the étale morphism s. Hence if $u^{(n+1)} = u^{(n)}$ for some n, then also $r^{(n)} = r^{(n-1)}$ and hence also (by taking t) $u^{(n)} = u^{(n-1)}$. This then forces the whole tower to collapse, in particular $u = u'$. Thus we see that if $u \neq u'$, then all the specializations are strict and $\{u, u', u'', \ldots\}$ is an infinite set of points in U which map to the point x in $|X|$. As we chose U affine this contradicts the second part of Lemma 43.4.2, as desired. $\square$

Lemma 43.7.2. *Let S be an algebraic space. Let X be an algebraic space over S. Let $x, x' \in |X|$ and assume $x' \rightsquigarrow x$, i.e., x is a specialization of x'. Assume the pair (X, x') satisfies the equivalent conditions of Lemma 43.4.5. Then for every étale morphism $\varphi : U \to X$ from a scheme U and any $u \in U$ with $\varphi(u) = x$, exists a point $u' \in U$, $u' \rightsquigarrow u$ with $\varphi(u') = x'$.*

Proof. We may replace U by an affine open neighbourhood of u. Hence we may assume that U is affine. As x is in the image of the open map $|U| \to |X|$, so is x'. Thus we may replace X by the Zariski open subspace corresponding to the image of $|U| \to |X|$, see Properties of Spaces, Lemma 41.4.10. In other words we may assume that $U \to X$ is surjective and étale. Let $s, t : R = U \times_X U \to U$ be the projections. By our assumption that (X, x') satisfies the equivalent conditions of Lemma 43.4.5 we see that the fibres of $|U| \to |X|$ and $|R| \to |X|$ over x' are finite. Say $\{u'_1, \ldots, u'_n\} \subset U$ and $\{r'_1, \ldots, r'_m\} \subset R$ form the complete inverse image of $\{x'\}$. Consider the closed sets

$$T = \overline{\{u'_1\}} \cup \ldots \cup \overline{\{u'_n\}} \subset |U|, \quad T' = \overline{\{r'_1\}} \cup \ldots \cup \overline{\{r'_m\}} \subset |R|.$$

Trivially we have $s(T') \subset T$. Because R is an equivalence relation we also have $t(T') = s(T')$ as the set $\{r'_j\}$ is invariant under the inverse of R by construction. Let $w \in T$ be any point. Then $u'_i \rightsquigarrow w$ for some i. Choose $r \in R$ with $s(r) = w$. Since generalizations lift along $s : R \to U$, see Remark 43.4.1, we can find $r' \rightsquigarrow r$ with $s(r') = u'_i$. Then $r' = r'_j$ for some j and we conclude that $w \in s(T')$. Hence $T = s(T') = t(T')$ is an $|R|$-invariant closed set in $|U|$. This means T is the inverse image of a closed (!) subset $T'' = \varphi(T)$ of $|X|$, see Properties of Spaces, Lemmas 41.4.5 and 41.4.6. Hence $T'' = \overline{\{x'\}}$. Thus T contains some point u_1 mapping to x as $x \in T''$. I.e., we see that for some i there exists a specialization $u'_i \rightsquigarrow u_1$ which maps to the given specialization $x' \rightsquigarrow x$.

To finish the proof, choose a point $r \in R$ such that $s(r) = u$ and $t(r) = u_1$ (using Properties of Spaces, Lemma 41.4.3). As generalizations lift along t, and $u'_i \rightsquigarrow u_1$ we can find a specialization $r' \rightsquigarrow r$ such that $t(r') = u'_i$. Set $u' = s(r')$. Then $u' \rightsquigarrow u$ and $\varphi(u') = x'$ as desired. $\square$

Lemma 43.7.3. *Let S be a scheme. Let X be an algebraic space over S. Assume that X is decent. Then $|X|$ is Kolmogorov (see Topology, Definition 5.5.4).*

Proof. Let $x_1, x_2 \in |X|$ with $x_1 \rightsquigarrow x_2$ and $x_2 \rightsquigarrow x_1$. We have to show that $x_1 = x_2$. Pick a scheme U and an étale morphism $U \to X$ such that x_1, x_2 are both in the image of $|U| \to |X|$. By Lemma 43.7.2 we can find a specialization $u_1 \rightsquigarrow u_2$ in U mapping to $x_1 \rightsquigarrow x_2$. By Lemma 43.7.2 we can find $u_2' \rightsquigarrow u_1$ mapping to $x_2 \rightsquigarrow x_1$. This means that $u_2' \rightsquigarrow u_2$ is a specialization between points of U mapping to the same point of X, namely x_2. This is not possible, unless $u_2' = u_2$, see Lemma 43.7.1. Hence also $u_1 = u_2$ as desired. □

43.8. Schematic locus

Proposition 43.8.1. *Let S be a scheme. Let X be an algebraic space over S. If X is very reasonable, then there exists a dense open subspace of X which is a scheme.*

Proof. By Properties of Spaces, Lemma 41.10.1 and Lemma 43.4.7 we may assume that there exists a scheme U and a surjective quasi-compact, étale morphism $U \to X$. Set $R = U \times_X U$, and denote $s, t : R \to U$ the projections as usual. Note that s, t are surjective, quasi-compact and étale, hence also quasi-finite (see Étale Morphisms, Section 37.11). By More on Morphisms, Lemma 33.29.7 there exists a dense open subscheme $W \subset U$ such that $s^{-1}(W) \to W$ is finite. By Descent, Lemma 31.19.21 being finite is fpqc (and in particular étale) local on the target. Hence we may apply More on Groupoids, Lemma 36.5.4 which says that the largest open $W \subset U$ over which s is finite is R-invariant. It is still dense of course. The restriction R_W of R to W equals $R_W = s^{-1}(W) = t^{-1}(W)$ (see Groupoids, Definition 35.16.1 and discussion following it). By construction $s_W, t_W : R_W \to W$ are finite étale. If we can show the open subspace $W/R_W \subset X$ (see Spaces, Lemma 40.10.2) contains a dense open subspace which is a scheme, then the proposition follows for X. This reduces us to Properties of Spaces, Lemma 41.10.2. □

43.9. Points on very reasonable spaces

In this section we prove some properties of points on very reasonable algebraic spaces.

Lemma 43.9.1. *Let S be a scheme. Let X be an algebraic space over S. Consider the map*

$$\{Spec(k) \to X \text{ monomorphism}\} \longrightarrow |X|$$

This map is always injective. If X is very reasonable then this map is a bijection.

Proof. We have seen in Properties of Spaces, Lemma 41.4.11 that the map is an injection in general. By Lemma 43.5.1 it is surjective when X is very reasonable. □

The following lemma is a tiny bit stronger than Properties of Spaces, Lemma 41.11.1. We will improve this lemma in Lemma 43.11.1.

Lemma 43.9.2. *Let S be a scheme. Let k be a field. Let X be an algebraic space over S and assume that there exists a surjective étale morphism $Spec(k) \to X$. If X is very reasonable, then $X \cong Spec(k')$ where $k' \subset k$ is a finite separable extension.*

Proof. This can be proved directly by adding a few words to the proof of Properties of Spaces, Lemma 41.11.1, but we think it is fun to deduce it from the results obtained so far. By Lemma 43.9.1 we see that $Spec(k) \to X$ factors as $Spec(k) \to Spec(k') \to X$ where $Spec(k') \to X$ is a monomorphism. But since $Spec(k) \to X$ is a surjection of sheaves on $(Sch/S)_{fppf}$, we see that also $Spec(k') \to X$ is surjective (as a map of sheaves). But a map of sheaves which is both injective and surjective is an isomorphism. Finally, the fact that

$Spec(k) \to X$ is étale means that $k \otimes_{k'} k$ is étale over k, which implies easily that $k' \subset k$ is a finite separable extension. □

The following lemma shows that specialization of points behaves in a reasonable manner on very reasonable algebraic spaces. Spaces, Example 40.14.9 shows that this is **not** true in general.

Lemma 43.9.3. *Let S be a scheme. Let X be a very reasonable algebraic space over S. Let $U \to X$ be an étale morphism from a scheme to X. If $u, u' \in |U|$ map to the same point of $|X|$, and $u' \rightsquigarrow u$, then $u = u'$.*

Proof. Combine Lemmas 43.5.1 and 43.7.1. □

Lemma 43.9.4. *Let S be an algebraic space. Let X be an algebraic space over S. Let $x, x' \in |X|$ and assume $x' \rightsquigarrow x$, i.e., x is a specialization of x'. Assume X is very reasonable. Then for every étale morphism $\varphi : U \to X$ from a scheme U and any $u \in U$ with $\varphi(u) = x$, exists a point $u' \in U$, $u' \rightsquigarrow u$ with $\varphi(u') = x'$.*

Proof. Combine Lemmas 43.5.1 and 43.7.2. □

Lemma 43.9.5. *Let S be a scheme. Let X be a very reasonable algebraic space over S. Then $|X|$ is Kolmogorov (see Topology, Definition 5.5.4).*

Proof. Combine Lemmas 43.5.1 and 43.7.3. □

Proposition 43.9.6. *Let S be a scheme. Let X be a very reasonable algebraic space over S. Then the topological space $|X|$ is sober (see Topology, Definition 5.5.4).*

Proof. We have seen in Lemma 43.9.5 that $|X|$ is Kolmogorov. Hence it remains to show that every irreducible closed subset $T \subset |X|$ has a generic point. By Properties of Spaces, Lemma 41.9.1 there exists a closed subspace $Z \subset X$ with $|Z| = |T|$. By definition this means that $Z \to X$ is a representable morphism of algebraic spaces. Hence Z is a very reasonable algebraic space by Lemma 43.6.5. By Proposition 43.8.1 we see that there exists an open dense subspace $Z' \subset Z$ which is a scheme. This means that $|Z'| \subset T$ is open dense. Hence the topological space $|Z'|$ is irreducible, which means that Z' is an irreducible scheme. By Schemes, Lemma 21.11.1 we conclude that $|Z'|$ is the closure of a single point $\eta \in T$ and hence also $T = \overline{\{\eta\}}$, and we win. □

43.10. Reduced singleton spaces

A *singleton* space is an algebraic space X such that $|X|$ is a singleton. It turns out that these can be more interesting than just being the spectrum of a field, see Spaces, Example 40.14.7. We develop a tiny bit of machinery to be able to talk about these.

Lemma 43.10.1. *Let S be a scheme. Let Z be an algebraic space over S. Let k be a field and let $Spec(k) \to Z$ be surjective and flat. Then any morphism $Spec(k') \to Z$ where k' is a field is surjective and flat.*

Proof. Consider the fibre square

$$\begin{tikzcd} T \arrow[r] \arrow[d] & Spec(k) \arrow[d] \\ Spec(k') \arrow[r] & Z \end{tikzcd}$$

Note that $T \to Spec(k')$ is flat and surjective hence T is not empty. On the other hand $T \to Spec(k)$ is flat as k is a field. Hence $T \to Z$ is flat and surjective. It follows from Morphisms of Spaces, Lemma 42.28.5 that $Spec(k') \to Z$ is flat. It is surjective as by assumption $|Z|$ is a singleton. $\square$

Lemma 43.10.2. *Let S be a scheme. Let Z be an algebraic space over S. The following are equivalent*

(1) *Z is reduced and $|Z|$ is a singleton,*
(2) *there exists a surjective flat morphism $Spec(k) \to Z$ where k is a field, and*
(3) *there exists a locally of finite type, surjective, flat morphism $Spec(k) \to Z$ where k is a field.*

Proof. Assume (1). Let W be a scheme and let $W \to Z$ be a surjective étale morphism. Then W is a reduced scheme. Let $\eta \in W$ be a generic point of an irreducible component of W. Since W is reduced we have $\mathcal{O}_{W,\eta} = \kappa(\eta)$. It follows that the canonical morphism $\eta = Spec(\kappa(\eta)) \to W$ is flat. We see that the composition $\eta \to Z$ is flat (see Morphisms of Spaces, Lemma 42.27.2). It is also surjective as $|Z|$ is a singleton. In other words (2) holds.

Assume (2). Let W be a scheme and let $W \to Z$ be a surjective étale morphism. Choose a field k and a surjective flat morphism $Spec(k) \to Z$. Then $W \times_Z Spec(k)$ is a scheme étale over k. Hence $W \times_Z Spec(k)$ is a disjoint union of spectra of fields (see Remark 43.4.1), in particular reduced. Since $W \times_Z Spec(k) \to W$ is surjective and flat we conclude that W is reduced (Descent, Lemma 31.15.1). In other words (1) holds.

It is clear that (3) implies (2). Finally, assume (2). Pick a nonempty affine scheme W and an étale morphism $W \to Z$. Pick a closed point $w \in W$ and set $k = \kappa(w)$. The composition

$$Spec(k) \xrightarrow{w} W \longrightarrow Z$$

is locally of finite type by Morphisms of Spaces, Lemmas 42.22.2 and 42.35.9. It is also flat and surjective by Lemma 43.10.1. Hence (3) holds. $\square$

The following lemma singles out a slightly better class of singleton algebraic spaces than the preceding lemma.

Lemma 43.10.3. *Let S be a scheme. Let Z be an algebraic space over S. The following are equivalent*

(1) *Z is reduced, locally Noetherian, and $|Z|$ is a singleton, and*
(2) *there exists a locally finitely presented, surjective, flat morphism $Spec(k) \to Z$ where k is a field.*

Proof. Assume (2) holds. By Lemma 43.10.2 we see that Z is reduced and $|Z|$ is a singleton. Let W be a scheme and let $W \to Z$ be a surjective étale morphism. Choose a field k and a locally finitely presented, surjective, flat morphism $Spec(k) \to Z$. Then $W \times_Z Spec(k)$ is a scheme étale over k, hence a disjoint union of spectra of fields (see Remark 43.4.1), hence locally Noetherian. Since $W \times_Z Spec(k) \to W$ is flat, surjective, and locally of finite presentation, we see that $\{W \times_Z Spec(k) \to W\}$ is an fppf covering and we conclude that W is locally Noetherian (Descent, Lemma 31.12.1). In other words (1) holds.

Assume (1). Pick a nonempty affine scheme W and an étale morphism $W \to Z$. Pick a closed point $w \in W$ and set $k = \kappa(w)$. Because W is locally Noetherian the morphism

$w : Spec(k) \to W$ is of finite presentation, see Morphisms, Lemma 24.20.7. Hence the composition

$$Spec(k) \xrightarrow{w} W \longrightarrow Z$$

is locally of finite presentation by Morphisms of Spaces, Lemmas 42.26.2 and 42.35.8. It is also flat and surjective by Lemma 43.10.1. Hence (2) holds. □

Lemma 43.10.4. *Let S be a scheme. Let $Z' \to Z$ be a monomorphism of algebraic spaces over S. Assume there exists a field k and a locally finitely presented, surjective, flat morphism $Spec(k) \to Z$. Then either Z' is empty or $Z' = Z$.*

Proof. We may assume that Z' is nonempty. In this case the fibre product $T = Z' \times_Z Spec(k)$ is nonempty, see Properties of Spaces, Lemma 41.4.3. Now T is an algebraic space and the projection $T \to Spec(k)$ is a monomorphism. Hence $T = Spec(k)$, see Morphisms of Spaces, Lemma 42.14.8. We conclude that $Spec(k) \to Z$ factors through Z'. But as $Spec(k) \to Z$ is surjective, flat and locally of finite presentation, we see that $Spec(k) \to Z$ is surjective as a map of sheaves on $(Sch/S)_{fppf}$ (see Spaces, Remark 40.5.2) and we conclude that $Z' = Z$. □

The following lemma says that to each point of an algebraic space we can associate a canonical reduced, locally Noetherian singleton algebraic space.

Lemma 43.10.5. *Let S be a scheme. Let X be an algebraic space over S. Let $x \in |X|$. Then there exists a unique monomorphism $Z \to X$ of algebraic spaces over S such that Z is an algebraic space which satisfies the equivalent conditions of Lemma 43.10.3 and such that the image of $|Z| \to |X|$ is $\{x\}$.*

Proof. Choose a scheme U and a surjective étale morphism $U \to X$. Set $R = U \times_X U$ so that $X = U/R$ is a presentation (see Spaces, Section 40.9). Set

$$U' = \coprod\nolimits_{u \in U \text{ lying over } x} Spec(\kappa(u)).$$

The canonical morphism $U' \to U$ is a monomorphism. Let

$$R' = U' \times_X U' = R \times_{(U \times_S U)} (U' \times_S U').$$

Because $U' \to U$ is a monomorphism we see that the projections $s', t' : R' \to U'$ factor as a monomorphism followed by an étale morphism. Hence, as U' is a disjoint union of spectra of fields, using Remark 43.4.1, and using Schemes, Lemma 21.23.10 we conclude that R' is a disjoint union of spectra of fields and that the morphisms $s', t' : R' \to U'$ are étale. Hence $Z = U'/R'$ is an algebraic space by Spaces, Theorem 40.10.5. As R' is the restriction of R by $U' \to U$ we see $Z \to X$ is a monomorphism by Groupoids, Lemma 35.17.6. Since $Z \to X$ is a monomorphism we see that $|Z| \to |X|$ is injective, see Morphisms of Spaces, Lemma 42.14.9. By Properties of Spaces, Lemma 41.4.3 we see that

$$|U'| = |Z \times_X U'| \to |Z| \times_{|X|} |U'|$$

is surjective which implies (by our choice of U') that $|Z| \to |X|$ has image $\{x\}$. We conclude that $|Z|$ is a singleton. Finally, by construction U' is locally Noetherian and reduced, i.e., we see that Z satisfies the equivalent conditions of Lemma 43.10.3.

Let us prove uniqueness of $Z \to X$. Suppose that $Z' \to X$ is a second such monomorphism of algebraic spaces. Then the projections

$$Z' \longleftarrow Z' \times_X Z \longrightarrow Z$$

are monomorphisms. The algebraic space in the middle is nonempty by Properties of Spaces, Lemma 41.4.3. Hence the two projections are isomorphisms by Lemma 43.10.4 and we win. □

We introduce the following terminology which foreshadows the residual gerbes we will introduce later, see Properties of Stacks, Definition 60.11.8.

Definition 43.10.6. Let S be a scheme. Let X be an algebraic space over S. Let $x \in |X|$. The *residual space of X at x*[2] is the monomorphism $Z_x \to X$ constructed in Lemma 43.10.5.

In particular we know that Z_x is a locally Noetherian, reduced, singleton algebraic space and that there exists a field and a surjective, flat, locally finitely presented morphism

$$Spec(k) \longrightarrow Z_x.$$

It turns out that Z_x is a regular algebraic space as follows from the following lemma.

Lemma 43.10.7. *A reduced, locally Noetherian singleton algebraic space Z is regular.*

Proof. Let Z be a reduced, locally Noetherian singleton algebraic space over a scheme S. Let $W \to Z$ be a surjective étale morphism where W is a scheme. Let k be a field and let $Spec(k) \to Z$ be surjective, flat, and locally of finite presentation (see Lemma 43.10.3). The scheme $T = W \times_Z Spec(k)$ is étale over k in particular regular, see Remark 43.4.1. Since $T \to W$ is locally of finite presentation, flat, and surjective it follows that W is regular, see Descent, Lemma 31.15.2. By definition this means that Z is regular. □

43.11. Decent spaces

In this section we collect some useful facts on decent spaces.

Lemma 43.11.1. *Let S be a scheme. Let X be a decent reduced algebraic space over S. Assume that $|X|$ is a singleton. Then $X \cong Spec(k)$ for some field k.*

Proof. As $|X|$ is a singleton X is quasi-compact, see Properties of Spaces, Lemma 41.5.2. Let $U \to X$ be surjective étale with U an affine scheme, see Properties of Spaces, Lemma 41.6.3. Since X is reduced we see that U is reduced, see Properties of Spaces, Section 41.7. As X is decent there exists a monomorphism $Spec(k) \to X$ and $V = Spec(k) \times_X U$ is a scheme finite étale over $Spec(k)$. Namely, this follows from the definition of decent, see Definition 43.6.1, which says that the equivalent conditions of Lemma 43.4.5 hold at the unique point of X. Hence V is a finite disjoint union of spectra of finite separable field extensions of k, see Morphisms, Lemma 24.35.7. On the other hand $V \to U$ is a monomorphism (as $Spec(k) \to X$ is a monomorphism) and surjective (as $Spec(k) \to X$ is surjective by Properties of Spaces, Lemma 41.4.4). In particular U has finitely many points. By Lemma 43.7.1 there are no specializations among the points of U (note that decent implies the condition of that lemma are satisfied in view of Lemma 43.5.1). It follows that U is a finite discrete topological space. As U is also reduced it follows that U is a disjoint union of spectra of fields. By Schemes, Lemma 21.23.10 we conclude that $V \to U$ is an isomorphism. Hence we see that $U \to X$ factors through $Spec(k)$ which implies that $Spec(k) \to X$ is also a surjection of sheaves, whence an isomorphism as desired. □

Remark 43.11.2. We will see later (insert future reference here) that an algebraic space whose reduction is a scheme is a scheme. Hence it follows from Lemma 43.11.1 that a decent algebraic space with one point is a scheme.

[2] This is nonstandard notation.

43.12. Valuative criterion

For a quasi-compact morphism from a decent space the valuative criterion is necessary in order for the morphism to be universally closed.

Proposition 43.12.1. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Assume*

(1) *f is quasi-compact, and*
(2) *X is decent.*

Then f is universally closed if and only if the existence part of the valuative criterion holds.

Proof. In Morphisms of Spaces, Lemma 42.12.1 we have seen one of the implications. To prove the other, assume that f is universally closed. Let

$$\begin{tikzcd} Spec(K) \arrow[r] \arrow[d] & X \arrow[d] \\ Spec(A) \arrow[r] & Y \end{tikzcd}$$

be a diagram as in Morphisms of Spaces, Definition 42.11.1. Let $X_A = Spec(A) \times_Y X$, so that we have

$$\begin{tikzcd} Spec(K) \arrow[r] \arrow[rd] & X_A \arrow[d] \\ & Spec(A) \end{tikzcd}$$

By Morphisms of Spaces, Lemma 42.9.3 we see that $X_A \to Spec(A)$ is quasi-compact. Since $X_A \to X$ is representable, we see that X_A has is decent also, see Lemma 43.5.3. Moreover, as f is universally closed, we see that $X_A \to Spec(A)$ is universally closed. Hence we may and do replace X by X_A and Y by $Spec(A)$.

Let $x' \in |X|$ be the equivalence class of $Spec(K) \to X$. Let $y \in |Y| = |Spec(A)|$ be the closed point. Set $y' = f(x')$; it is the generic point of $Spec(A)$. Since f is universally closed we see that $f(\overline{\{x'\}})$ contains $\overline{\{y'\}}$, and hence contains y. Let $x \in \overline{\{x'\}}$ be a point such that $f(x) = y$. Let U be a scheme, and $\varphi : U \to X$ an étale morphism such that there exists a $u \in U$ with $\varphi(u) = x$. By Lemma 43.7.2 and our assumption that X is decent there exists a specialization $u' \rightsquigarrow u$ on U with $\varphi(u') = x'$. This means that there exists a common field extension $K \subset K' \supset \kappa(u')$ such that

$$\begin{tikzcd} Spec(K') \arrow[r] \arrow[d] & U \arrow[d] \\ Spec(K) \arrow[r] \arrow[rd] & X \arrow[d] \\ & Spec(A) \end{tikzcd}$$

is commutative. This gives the following commutative diagram of rings

$$\begin{tikzcd} K' & \mathcal{O}_{U,u} \arrow[l] \\ K \arrow[u] & \\ & A \arrow[ul] \arrow[uu] \end{tikzcd}$$

By Algebra, Lemma 7.46.2 we can find a valuation ring $A' \subset K'$ dominating the image of $\mathcal{O}_{U,u}$ in K'. Since by construction $\mathcal{O}_{U,u}$ dominates A we see that A' dominates A also. Hence we obtain a diagram resembling the second diagram of Morphisms of Spaces, Definition 42.11.1 and the proposition is proved. $\square$

43.13. Relative conditions

This is a (yet another) technical section dealing with conditions on algebraic spaces having to do with points. It is probably a good idea to skip this section.

Definition 43.13.1. Let S be a scheme. We say an algebraic space X over S *has property* (β) if X has the corresponding property of Lemma 43.5.1. Let $f : X \to Y$ be a morphism of algebraic spaces over S.

(1) We say f *has property* (β) if for any scheme T and morphism $T \to Y$ the fibre product $T \times_Y X$ has property (β).
(2) We say f is *decent* if for any scheme T and morphism $T \to Y$ the fibre product $T \times_Y X$ is a decent algebraic space.
(3) We say f is *reasonable* if for any scheme T and morphism $T \to Y$ the fibre product $T \times_Y X$ is a reasonable algebraic space.
(4) We say f is *very reasonable* if for any scheme T and morphism $T \to Y$ the fibre product $T \times_Y X$ is a very reasonable algebraic space.

We refer to Remark 43.13.7 for an informal discussion. It will turn out that the class of very reasonable morphisms is not so useful, but that the classes of decent and reasonable morphisms are useful.

Lemma 43.13.2. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. We have the following implications among the conditions on f:*

$$\begin{tikzcd} \textit{representable} \arrow[dr, Rightarrow] & & & \\ & \textit{very reasonable} \arrow[r, Rightarrow] & \textit{reasonable} \arrow[r, Rightarrow] & \textit{decent} \arrow[r, Rightarrow] & (\beta) \\ \textit{quasi-separated} \arrow[ur, Rightarrow] & & & \end{tikzcd}$$

Proof. This is clear from the definitions, Lemma 43.5.1 and Morphisms of Spaces, Lemma 42.5.12. $\square$

Lemma 43.13.3. *Having property (β), (γ), (δ), or (ϵ) is preserved under arbitrary base change.*

Proof. Omitted. □

Lemma 43.13.4. *Having property (β), being decent, or being reasonable is preserved under compositions.*

Proof. Let $\omega \in \{\beta, decent, reasonable\}$. Let $f : X \to Y$ and $g : Y \to Z$ be morphisms of algebraic spaces over the scheme S. Assume f and g both have property (ω). Then we have to show that for any scheme T and morphism $T \to Z$ the space $T \times_Z X$ has (ω). By Lemma 43.13.3 this reduces us to the following claim: Suppose that Y is an algebraic space having property (ω), and that $f : X \to Y$ is a morphism with (ω). Then X has (ω).

Let us prove the claim in case $\omega = \beta$. In this case we have to show that any $x \in |X|$ is represented by a monomorphism from the spectrum of a field into X. Let $y = f(x) \in |Y|$. By assumption there exists a field k and a monomorphism $Spec(k) \to Y$ representing y. Then x corresponds to a point x' of $Spec(k) \times_Y X$. By assumption x' is represented by a monomorphism $Spec(k') \to Spec(k) \times_Y X$. Clearly the composition $Spec(k') \to X$ is a monomorphism representing x.

Let us prove the claim in case $\omega = decent$. Let $x \in |X|$ and $y = f(x) \in |Y|$. By the result of the preceding paragraph we can choose a diagram

$$\begin{tikzcd} Spec(k') \arrow[r, "x"'] \arrow[d] & X \arrow[d, "f"] \\ Spec(k) \arrow[r, "y"] & Y \end{tikzcd}$$

whose horizontal arrows monomorphisms. As Y is decent the morphism y is quasi-compact. As f is decent the algebraic space $Spec(k) \times_Y X$ is decent. Hence the monomorphism $Spec(k') \to Spec(k) \times_Y X$ is quasi-compact. Then the monomorphism $x : Spec(k') \to X$ is quasi-compact as a composition of quasi-compact morphisms (use Morphisms of Spaces, Lemmas 42.9.3 and 42.9.4). As the point x was arbitrary this implies X is decent.

Let us prove the claim in case $\omega = reasonable$. Choose $V \to Y$ étale with V an affine scheme. Choose $U \to V \times_Y X$ étale with U an affine scheme. By assumption $V \to Y$ has universally bounded fibres. By Lemma 43.3.3 the morphism $V \times_Y X \to X$ has universally bounded fibres. By assumption on f we see that $U \to V \times_Y X$ has universally bounded fibres. By Lemma 43.3.2 the composition $U \to X$ has universally bounded fibres. Hence there exists sufficiently many étale morphisms $U \to X$ from schemes with universally bounded fibres, and we conclude that X is reasonable. □

Lemma 43.13.5. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Let $\mathcal{P} \in \{(\beta), decent, reasonable\}$. Assume*

(1) *f is quasi-compact,*
(2) *f is étale,*
(3) *$|f| : |X| \to |Y|$ is surjective, and*
(4) *the algebraic space X has property $\mathcal{P}$.*

Then Y has property $\mathcal{P}$.

Proof. Let us prove this in case $\mathcal{P} = (\beta)$. Let $y \in |Y|$ be a point. We have to show that y can be represented by a monomorphism from a field. Choose a point $x \in |X|$ with $f(x) = y$. By assumption we may represent x by a monomorphism $Spec(k) \to X$, with k a field. By

Lemma 43.4.3 it suffices to show that the projections $Spec(k) \times_Y Spec(k) \to Spec(k)$ are étale and quasi-compact. We can factor the first projection as

$$Spec(k) \times_Y Spec(k) \longrightarrow Spec(k) \times_Y X \longrightarrow Spec(k)$$

The first morphism is a monomorphism, and the second is étale and quasi-compact. By Properties of Spaces, Lemma 41.13.8 we see that $Spec(k) \times_Y X$ is a scheme. Hence it is a finite disjoint union of spectra of finite separable field extensions of k. By Schemes, Lemma 21.23.10 we see that the first arrow identifies $Spec(k) \times_Y Spec(k)$ with a finite disjoint union of spectra of finite separable field extensions of k. Hence the projection morphism is étale and quasi-compact.

Let us prove this in case $\mathcal{P} = decent$. We have already seen in the first paragraph of the proof that this implies that every $y \in |Y|$ can be represented by a monomorphism $y : Spec(k) \to Y$. Pick such a y. Pick an affine scheme U and an étale morphism $U \to X$ such that the image of $|U| \to |Y|$ contains y. By Lemma 43.4.5 it suffices to show that U_y is a finite scheme over k. The fibre product $X_y = Spec(k) \times_Y X$ is a quasi-compact étale algebraic space over k. Hence by Properties of Spaces, Lemma 41.13.8 it is a scheme. So it is a finite disjoint union of spectra of finite separable extensions of k. Say $X_y = \{x_1, \ldots, x_n\}$ so x_i is given by $x_i : Spec(k_i) \to X$ with $[k_i : k] < \infty$. By assumption X is decent, so the schemes $U_{x_i} = Spec(k_i) \times_X U$ are finite over k_i. Finally, we note that $U_y = \coprod U_{x_i}$ as a scheme and we conclude that U_y is finite over k as desired.

Let us prove this in case $\mathcal{P} = reasonable$. Pick an affine scheme V and an étale morphism $V \to Y$. We have the show the fibres of $V \to Y$ are universally bounded. The algebraic space $V \times_Y X$ is quasi-compact. Thus we can find an affine scheme W and a surjective étale morphism $W \to V \times_Y X$, see Properties of Spaces, Lemma 41.6.3. Here is a picture (solid diagram)

$$\begin{tikzcd} W \arrow[r] \arrow[dr] & V \times_Y X \arrow[r] \arrow[d] & X \arrow[d, "f"] & Spec(k) \arrow[l, dotted, "x"'] \arrow[dl, dotted, "y"] \\ & V \arrow[r] & Y & \end{tikzcd}$$

The morphism $W \to X$ is universally bounded by our assumption that the space X is reasonable. Let n be an integer bounding the degrees of the fibres of $W \to X$. We claim that the same integer works for bounding the fibres of $V \to Y$. Namely, suppose $y \in |Y|$ is a point. Then there exists a $x \in |X|$ with $f(x) = y$ (see above). This means we can find a field k and morphisms x, y given as dotted arrows in the diagram above. In particular we get a surjective étale morphism

$$Spec(k) \times_{x,X} W \to Spec(k) \times_{x,X} (V \times_Y X) = Spec(k) \times_{y,Y} V$$

which shows that the degree of $Spec(k) \times_{y,Y} V$ over k is less than or equal to the degree of $Spec(k) \times_{x,X} W$ over k, i.e., $\leq n$, and we win. (This last part of the argument is the same as the argument in the proof of Lemma 43.3.4. Unfortunately that lemma is not general enough because it only applies to representable morphisms.) □

Lemma 43.13.6. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Let $\mathcal{P} \in \{(\beta), decent, reasonable, very\ reasonable\}$. The following are equivalent*

(1) *f is $\mathcal{P}$,*
(2) *for every affine scheme Z and every morphism $Z \to Y$ the base change $Z \times_Y X \to Z$ of f is $\mathcal{P}$,*

(3) *for every affine scheme Z and every morphism $Z \to Y$ the algebraic space $Z \times_Y X$ is $\mathcal{P}$; and*
(4) *there exists a Zariski covering $Y = \bigcup Y_i$ such that each morphism $f^{-1}(Y_i) \to Y_i$ has $\mathcal{P}$.*

If $\mathcal{P} \in \{(\beta), decent, reasonable\}$, then this is also equivalent to

(5) *there exists a scheme V and a surjective étale morphism $V \to Y$ such that the base change $V \times_Y X \to V$ has $\mathcal{P}$.*

Proof. The implications (1) ⇒ (2) ⇒ (3) ⇒ (4) are trivial. The implication (3) ⇒ (1) can be seen as follows. Let $Z \to Y$ be a morphism whose source is a scheme over S. Consider the algebraic space $Z \times_Y X$. If we assume (3), then for any affine open $W \subset Z$, the open subspace $W \times_Y X$ of $Z \times_Y X$ has property $\mathcal{P}$. Hence by Lemma 43.5.2 the space $Z \times_Y X$ has property $\mathcal{P}$, i.e., (1) holds. A similar argument (omitted) shows that (4) implies (1).

The implication (1) ⇒ (5) is trivial. Let $V \to Y$ be an étale morphism from a scheme as in (5). Let Z be an affine scheme, and let $Z \to Y$ be a morphism. Consider the diagram

$$\begin{tikzcd} Z \times_Y V \arrow[r, "q"'] \arrow[d, "p"'] & V \arrow[d] \\ Z \arrow[r] & Y \end{tikzcd}$$

Since p is étale, and hence open, we can choose finitely many affine open subschemes $W_i \subset Z \times_Y V$ such that $Z = \bigcup p(W_i)$. Consider the commutative diagram

$$\begin{tikzcd} V \times_Y X \arrow[d] & (\coprod W_i) \times_Y X \arrow[l] \arrow[r] \arrow[d] & Z \times_Y X \arrow[d] \\ V & \coprod W_i \arrow[l] \arrow[r] & Z \end{tikzcd}$$

We know $V \times_Y X$ has property $\mathcal{P}$. By Lemma 43.5.3 we see that $(\coprod W_i) \times_Y X$ has property $\mathcal{P}$. Note that the morphism $(\coprod W_i) \times_Y X \to Z \times_Y X$ is étale and quasi-compact as the base change of $\coprod W_i \to Z$. Hence by Lemma 43.13.5 we conclude that $Z \times_Y X$ has property $\mathcal{P}$. □

Remark 43.13.7. An informal description of the properties (β), decent, reasonable, very reasonable was given in Section 43.6. A morphism has one of these properties if (very) loosely speaking the fibres of the morphism have the corresponding properties. Being decent is useful to prove things about specializations of points on $|X|$. Being reasonable is a bit stronger, and technically quite easy to work with. Very reasonable is a good condition in the sense that it implies that X has a dense open subspace which is a scheme, and that $|X|$ is a sober topological space. This is not clear for reasonable spaces and probably not true; although Lemma 43.6.9 shows reasonable spaces are very close to being quasi-separated. On the other hand, we do not know whether the class of very reasonable morphisms is closed under composition, and we do not know whether very reasonable spaces satisfy a descent property as the one in Lemma 43.13.5 (even with f assumed representable).

Here is a lemma we promised earlier which uses decent morphisms.

Lemma 43.13.8. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Assume f is quasi-compact and decent. (For example if f is representable, or quasi-separated, see Lemma 43.13.2.) Then f is universally closed if and only if the existence part of the valuative criterion holds.*

Proof. In Morphisms of Spaces, Lemma 42.12.1 we proved that any quasi-compact morphism which satsifies the existence part of the valuative criterion is universally closed. To prove the other, assume that f is universally closed. In the proof of Proposition 43.12.1 we have seen that it suffices to show, for any valuation ring A, and any morphism $Spec(A) \to Y$, that the base change $f_A : X_A \to Spec(A)$ satisfies the existence part of the valuative criterion. By definition the algebraic space X_A has property (γ) and hence Proposition 43.12.1 applies to the morphism f_A and we win. □

43.14. Monomorphisms

Here is another case where monomorphisms are representable.

Lemma 43.14.1. *Let S be a scheme. Let Y be a disjoint union of spectra of zero dimensional local rings over S. Let $f : X \to Y$ be a monomorphism of algebraic spaces over S. Then f is representable, i.e., X is a scheme.*

Proof. This immediately reduces to the case $Y = Spec(A)$ where A is a zero dimensional local ring, i.e., $Spec(A) = \{\mathfrak{m}_A\}$ is a singleton. If $X = \emptyset$, then there is nothing to prove. If not, choose a nonempty affine scheme $U = Spec(B)$ and an étale morphism $U \to X$. As $|X|$ is a singleton (as a subset of $|Y|$, see Morphisms of Spaces, Lemma 42.14.9) we see that $U \to X$ is surjective. Note that $U \times_X U = U \times_Y U = Spec(B \otimes_A B)$. Thus we see that the ring maps $B \to B \otimes_A B$ are étale. Since

$$(B \otimes_A B)/\mathfrak{m}_A(B \otimes_A B) = (B/\mathfrak{m}_A B) \otimes_{A/\mathfrak{m}_A} (B/\mathfrak{m}_A B)$$

we see that $B/\mathfrak{m}_A B \to (B \otimes_A B)/\mathfrak{m}_A(B \otimes_A B)$ is flat and in fact free of rank equal to the dimension of $B/\mathfrak{m}_A B$ as a $A/\mathfrak{m}_A$-vector space. Since $B \to B \otimes_A B$ is étale, this can only happen if this dimension is finite (see for example Morphisms, Lemmas 24.48.7 and 24.48.8). Every prime of B lies over $\mathfrak{m}_A$ (the unique prime of A). Hence $Spec(B) = Spec(B/\mathfrak{m}_A)$ as a topological space, and this space is a finite discrete set as $B/\mathfrak{m}_A B$ is an Artinian ring, see Algebra, Lemmas 7.49.2 and 7.49.8. Hence all prime ideals of B are maximal and $B = B_1 \times \ldots \times B_n$ is a product of finitely many local rings of dimension zero, see Algebra, Lemma 7.49.7. Thus $B \to B \otimes_A B$ is finite étale as all the local rings B_i are henselian by Algebra, Lemma 7.139.11. Thus X is an affine scheme by Groupoids, Proposition 35.19.8. □

CHAPTER 44

Topologies on Algebraic Spaces

44.1. Introduction

In this chapter we introduce some topologies on the category of algebraic spaces. Compare with the material in [**Gro71**], [**BLR90**], [**LMB00a**] and [**Knu71a**]. Before doing so we would like to point out that there are many different choices of sites (as defined in Sites, Definition 9.6.2) which give rise to the same notion of sheaf on the underlying category. Hence our choices may be slightly different from those in the references but ultimately lead to the same cohomology groups, etc.

44.2. The general procedure

In this section we explain a general procedure for producing the sites we will be working with. This discussion will make little or no sense unless the reader has read Topologies, Section 30.2.

Let S be a base scheme. Take any category Sch_α constructed as in Sets, Lemma 3.9.2 starting with S and any set of schemes over S you want to be included. Choose any set of coverings Cov_{fppf} on Sch_α as in Sets, Lemma 3.11.1 starting with the category Sch_α and the class of fppf coverings. Let Sch_{fppf} denote the big fppf site so obtained, and let $(Sch/S)_{fppf}$ denote the corresponding big fppf site of S. (The above is entirely as prescribed in Topologies, Section 30.7.)

Given choices as above the category of algebraic spaces over S has a set of isomorphism classes. One way to see this is to use the fact that any algebraic space over S is of the form U/R for some étale equivalence relation $j : R \to U \times_S U$ with $U, R \in Ob((Sch/S)_{fppf})$, see Spaces, Lemma 40.9.1. Hence we can find a full subcategory $Spaces/S$ of the category of algebraic spaces over S which has a set of objects such that each algebraic space is isomorphic to an object of $Spaces/S$. We fix a choice of such a category.

In the sections below, given a topology τ, the big site $(Spaces/S)_\tau$ (resp. the big site $(Spaces/X)_\tau$ of an algebraic space X over S) has as underlying category the category $Spaces/S$ (resp. the subcategory $Spaces/X$ of $Spaces/S$, see Categories, Example 4.2.13). The procedure for turning this into a site is as usual by defining a class of τ-coverings and using Sets, Lemma 3.11.1 to choose a sufficiently large set of coverings which defines the topology.

We point out that the *small étale site $X_{étale}$ of an algebraic space X* has already been defined in Properties of Spaces, Definition 41.15.1. Its objects are schemes étale over X, of which there are plenty by definition of an algebraic spaces. However, a more natural site, from the perspective of this chapter (compare Topologies, Definition 30.4.8) is the site $X_{spaces,étale}$ of Properties of Spaces, Definition 41.15.2. These two sites define the same topos, see Properties of Spaces, Lemma 41.15.3. We will not redefine these in this chapter; instead we will simply use them.

Finally, we intend not to define the Zariski sites, since these do not seem particularly useful (allthough the Zariski topology is occasionally useful).

44.3. Fpqc topology

We briefly discuss the notion of an fpqc covering of algebraic spaces. Please compare with Topologies, Section 30.8. We will show in Descent on Spaces, Proposition 45.4.1 that quasi-coherent sheaves descent along these.

Definition 44.3.1. Let S be a scheme, and let X be an algebraic space over S. An *fpqc covering of* X is a family of morphisms $\{f_i : X_i \to X\}_{i\in I}$ of algebraic spaces such that each f_i is flat and such that for every affine scheme Z and morphism $h : Z \to X$ there exists a standard fpqc covering $\{g_j : Z_j \to Z\}_{j=1,\ldots,n}$ which refines the family $\{X_i \times_X Z \to Z\}_{i\in I}$.

In other words, there exists indices $i_1, \ldots, i_n \in I$ and morphisms $h_j : U_j \to X_{i_j}$ such that $f_{i_j} \circ h_j = h \circ g_j$. Note that if X and all X_i are representable, this is the same as a fpqc covering of schemes by Topologies, Lemma 30.8.11.

Lemma 44.3.2. *Let S be a scheme. Let X be an algebraic space over S.*

1. *If $X' \to X$ is an isomorphism then $\{X' \to X\}$ is an fpqc covering of X.*
2. *If $\{X_i \to X\}_{i\in I}$ is an fpqc covering and for each i we have an fpqc covering $\{X_{ij} \to X_i\}_{j\in J_i}$, then $\{X_{ij} \to X\}_{i\in I, j\in J_i}$ is an fpqc covering.*
3. *If $\{X_i \to X\}_{i\in I}$ is an fpqc covering and $X' \to X$ is a morphism of algebraic spaces then $\{X' \times_X X_i \to X'\}_{i\in I}$ is an fpqc covering.*

Proof. Part (1) is clear. Consider $g : X' \to X$ and $\{X_i \to X\}_{i\in I}$ an fpqc covering as in (3). By Morphisms of Spaces, Lemma 42.27.3 the morphisms $X' \times_X X_i \to X'$ are flat. If $h' : Z \to X'$ is a morphism from an affine scheme towards X', then set $h = g \circ h' : Z \to X$. The assumption on $\{X_i \to X\}_{i\in I}$ means there exists a standard fpqc covering $\{Z_j \to Z\}_{j=1,\ldots,n}$ and morphisms $Z_j \to X_{i(j)}$ covering h for certain $i(j) \in I$. By the universal property of the fibre product we obtain morphisms $Z_j \to X' \times_X X_{i(j)}$ over h' also. Hence $\{X' \times_X X_i \to X'\}_{i\in I}$ is an fpqc covering. This proves (3).

Let $\{X_i \to X\}_{i\in I}$ and $\{X_{ij} \to X_i\}_{j\in J_i}$ be as in (2). Let $h : Z \to X$ be a morphism from an affine scheme towards X. By assumption there exists a standard fpqc covering $\{Z_j \to Z\}_{j=1,\ldots,n}$ and morphisms $h_j : Z_j \to X_{i(j)}$ covering h for some indices $i(j) \in I$. By assumption there exist standard fpqc coverings $\{Z_{j,l} \to Z_j\}_{l=1,\ldots,n(j)}$ and morphisms $Z_{j,l} \to X_{i(j)j(l)}$ covering h_j for some indices $j(l) \in J_{i(j)}$. By Topologies, Lemma 30.8.10 the family $\{Z_{j,l} \to Z\}$ is a standard fpqc covering. Hence we conclude that $\{X_{ij} \to X\}_{i\in I, j\in J_i}$ is an fpqc covering. □

Lemma 44.3.3. *Let S be a scheme, and let X be an algebraic space over S. Suppose that $\{f_i : X_i \to X\}_{i\in I}$ is a family of morphisms of algebraic spaces with target X. Let $U \to X$ be a surjective étale morphism from a scheme towards X. Then $\{f_i : X_i \to X\}_{i\in I}$ is an fpqc covering of X if and only if $\{U \times_X X_i \to U\}_{i\in I}$ is an fpqc covering of U.*

Proof. If $\{X_i \to X\}_{i\in I}$ is an fpqc covering, then so is $\{U \times_X X_i \to U\}_{i\in I}$ by Lemma 44.3.2. Assume that $\{U \times_X X_i \to U\}_{i\in I}$ is an fpqc covering. Let $h : Z \to X$ be a morphism from an affine scheme towards X. Then we see that $U \times_X Z \to Z$ is a surjective étale morphism of schemes, in particular open. Hence we can find finitely many affine opens $W_1, \ldots, W_t$ of $U \times_X Z$ whose images cover Z. For each j we may apply the condition that $\{U \times_X X_i \to U\}_{i\in I}$ is an fpqc covering to the morphism $W_j \to U$, and obtain a standard fpqc covering $\{W_{jl} \to W_j\}$ which refines $\{W_j \times_X X_i \to W_j\}_{i \in I}$. Hence $\{W_{jl} \to Z\}$ is a standard fpqc covering of Z (see Topologies, Lemma 30.8.10) which refines $\{Z \times_X X_i \to X\}$ and we win. □

Lemma 44.3.4. *Let S be a scheme, and let X be an algebraic space over S. Suppose that $\mathcal{U} = \{f_i : X_i \to X\}_{i \in I}$ is an fpqc covering of X. Then there exists a refinement $\mathcal{V} = \{g_i : T_i \to X\}$ of $\mathcal{U}$ which is an fpqc covering such that each T_i is a scheme.*

Proof. Omitted. Hint: For each i choose a scheme T_i and a surjective étale morphism $T_i \to X_i$. Then check that $\{T_i \to X\}$ is an fpqc covering. □

44.4. Fppf topology

In this section we discuss the notion of an fppf covering of algebraic spaces, and we define the big fppf site of an algebraic space. Please compare with Topologies, Section 30.7.

Definition 44.4.1. Let S be a scheme, and let X be an algebraic space over S. An *fppf covering of X* is a family of morphisms $\{f_i : X_i \to X\}_{i \in I}$ of algebraic spaces such that each f_i is flat and locally of finite presentation and such that $\bigcup_{i \in I} f_i(X_i) = X$.

This is exactly the same as Topologies, Definition 30.7.1. In particular, if X and all the X_i are schemes, then we recover the usual notion of an fppf covering of schemes.

Lemma 44.4.2. *Let S be a scheme. Let X be an algebraic space over S.*

(1) *If $X' \to X$ is an isomorphism then $\{X' \to X\}$ is an fppf covering of X.*
(2) *If $\{X_i \to X\}_{i \in I}$ is an fppf covering and for each i we have an fppf covering $\{X_{ij} \to X_i\}_{j \in J_i}$, then $\{X_{ij} \to X\}_{i \in I, j \in J_i}$ is an fppf covering.*
(3) *If $\{X_i \to X\}_{i \in I}$ is an fppf covering and $X' \to X$ is a morphism of algebraic spaces then $\{X' \times_X X_i \to X'\}_{i \in I}$ is an fppf covering.*

Proof. Omitted. □

Lemma 44.4.3. *Let S be a scheme, and let X be an algebraic space over S. Suppose that $\mathcal{U} = \{f_i : X_i \to X\}_{i \in I}$ is an fppf covering of X. Then there exists a refinement $\mathcal{V} = \{g_i : T_i \to X\}$ of $\mathcal{U}$ which is an fppf covering such that each T_i is a scheme.*

Proof. Omitted. Hint: For each i choose a scheme T_i and a surjective étale morphism $T_i \to X_i$. Then check that $\{T_i \to X\}$ is an fppf covering. □

Lemma 44.4.4. *Let S be a scheme. Let $\{f_i : X_i \to X\}_{i \in I}$ be an fppf covering of algebraic spaces over S. Then the map of sheaves*

$$\coprod X_i \longrightarrow X$$

is surjective.

Proof. Omitted. See Spaces, Remark 40.5.2 if you are confused about the meaning of this simple lemma. □

To be continued...

44.5. Syntomic topology

In this section we discuss the notion of a syntomic covering of algebraic spaces, and we define the big syntomic site of an algebraic space. Please compare with Topologies, Section 30.6.

Definition 44.5.1. Let S be a scheme, and let X be an algebraic space over S. A *syntomic covering of* X is a family of morphisms $\{f_i : X_i \to X\}_{i\in I}$ of algebraic spaces such that each f_i is syntomic and such that $\bigcup_{i\in I} f_i(X_i) = X$.

This is exactly the same as Topologies, Definition 30.6.1. In particular, if X and all the X_i are schemes, then we recover the usual notion of a syntomic covering of schemes.

Lemma 44.5.2. *Let S be a scheme. Let X be an algebraic space over S.*

(1) *If $X' \to X$ is an isomorphism then $\{X' \to X\}$ is a syntomic covering of X.*
(2) *If $\{X_i \to X\}_{i\in I}$ is a syntomic covering and for each i we have a syntomic covering $\{X_{ij} \to X_i\}_{j\in J_i}$, then $\{X_{ij} \to X\}_{i\in I, j\in J_i}$ is a syntomic covering.*
(3) *If $\{X_i \to X\}_{i\in I}$ is a syntomic covering and $X' \to X$ is a morphism of algebraic spaces then $\{X' \times_X X_i \to X'\}_{i\in I}$ is a syntomic covering.*

Proof. Omitted. □

To be continued...

44.6. Smooth topology

In this section we discuss the notion of a smooth covering of algebraic spaces, and we define the big smooth site of an algebraic space. Please compare with Topologies, Section 30.5.

Definition 44.6.1. Let S be a scheme, and let X be an algebraic space over S. A *smooth covering of* X is a family of morphisms $\{f_i : X_i \to X\}_{i\in I}$ of algebraic spaces such that each f_i is smooth and such that $\bigcup_{i\in I} f_i(X_i) = X$.

This is exactly the same as Topologies, Definition 30.5.1. In particular, if X and all the X_i are schemes, then we recover the usual notion of a smooth covering of schemes.

Lemma 44.6.2. *Let S be a scheme. Let X be an algebraic space over S.*

(1) *If $X' \to X$ is an isomorphism then $\{X' \to X\}$ is a smooth covering of X.*
(2) *If $\{X_i \to X\}_{i\in I}$ is a smooth covering and for each i we have a smooth covering $\{X_{ij} \to X_i\}_{j\in J_i}$, then $\{X_{ij} \to X\}_{i\in I, j\in J_i}$ is a smooth covering.*
(3) *If $\{X_i \to X\}_{i\in I}$ is a smooth covering and $X' \to X$ is a morphism of algebraic spaces then $\{X' \times_X X_i \to X'\}_{i\in I}$ is a smooth covering.*

Proof. Omitted. □

To be continued...

44.7. Étale topology

In this section we discuss the notion of a étale covering of algebraic spaces, and we define the big étale site of an algebraic space. Please compare with Topologies, Section 30.4.

Definition 44.7.1. Let S be a scheme, and let X be an algebraic space over S. A *étale covering of* X is a family of morphisms $\{f_i : X_i \to X\}_{i\in I}$ of algebraic spaces such that each f_i is étale and such that $\bigcup_{i\in I} f_i(X_i) = X$.

This is exactly the same as Topologies, Definition 30.4.1. In particular, if X and all the X_i are schemes, then we recover the usual notion of a étale covering of schemes.

Lemma 44.7.2. *Let S be a scheme. Let X be an algebraic space over S.*

1. *If $X' \to X$ is an isomorphism then $\{X' \to X\}$ is a étale covering of X.*
2. *If $\{X_i \to X\}_{i\in I}$ is a étale covering and for each i we have a étale covering $\{X_{ij} \to X_i\}_{j\in J_i}$, then $\{X_{ij} \to X\}_{i\in I, j\in J_i}$ is a étale covering.*
3. *If $\{X_i \to X\}_{i\in I}$ is a étale covering and $X' \to X$ is a morphism of algebraic spaces then $\{X' \times_X X_i \to X'\}_{i\in I}$ is a étale covering.*

Proof. Omitted. □

To be continued...

44.8. Zariski topology

In Spaces, Section 40.12 we introduced the notion of a Zariski covering of an algebraic space by open subspaces. Here is the corresponding notion with open subspaces replaces by open immersions.

Definition 44.8.1. Let S be a scheme, and let X be an algebraic space over S. A *Zariski covering of X* is a family of morphisms $\{f_i : X_i \to X\}_{i\in I}$ of algebraic spaces such that each f_i is an open immersion and such that $\bigcup_{i\in I} f_i(X_i) = X$.

Allthough Zariski coverings are occasionally useful the corresponding topology on the category of algebraic spaces is really too coarse, and not particularly useful. Still, it does define a site.

Lemma 44.8.2. *Let S be a scheme. Let X be an algebraic space over S.*

1. *If $X' \to X$ is an isomorphism then $\{X' \to X\}$ is a Zariski covering of X.*
2. *If $\{X_i \to X\}_{i\in I}$ is a Zariski covering and for each i we have a Zariski covering $\{X_{ij} \to X_i\}_{j\in J_i}$, then $\{X_{ij} \to X\}_{i\in I, j\in J_i}$ is a Zariski covering.*
3. *If $\{X_i \to X\}_{i\in I}$ is a Zariski covering and $X' \to X$ is a morphism of algebraic spaces then $\{X' \times_X X_i \to X'\}_{i\in I}$ is a Zariski covering.*

Proof. Omitted. □

CHAPTER 45

Descent and Algebraic Spaces

45.1. Introduction

In the chapter on topologies on algebraic spaces (see Topologies on Spaces, Section 44.1) we introduced étale, fppf, smooth, syntomic and fpqc coverings of algebraic spaces. In this chapter we discuss what kind of structures over algebraic spaces can be descended through such coverings. See for example [**Gro95a**], [**Gro95b**], [**Gro95e**], [**Gro95f**], [**Gro95c**], and [**Gro95d**].

45.2. Conventions

The standing assumption is that all schemes are contained in a big fppf site Sch_{fppf}. And all rings A considered have the property that $Spec(A)$ is (isomorphic) to an object of this big site.

Let S be a scheme and let X be an algebraic space over S. In this chapter and the following we will write $X \times_S X$ for the product of X with itself (in the category of algebraic spaces over S), instead of $X \times X$.

45.3. Descent data for quasi-coherent sheaves

This section is the analogue of Descent, Section 31.2 for algebraic spaces. It makes sense to read that section first.

Definition 45.3.1. Let S be a scheme. Let $\{f_i : X_i \to X\}_{i \in I}$ be a family of morphisms of algebraic spaces over S with fixed target X.

(1) A *descent datum* $(\mathcal{F}_i, \varphi_{ij})$ *for quasi-coherent sheaves* with respect to the given family is given by a quasi-coherent sheaf $\mathcal{F}_i$ on X_i for each $i \in I$, an isomorphism of quasi-coherent $\mathcal{O}_{X_i \times_X X_j}$-modules $\varphi_{ij} : \mathrm{pr}_0^*\mathcal{F}_i \to \mathrm{pr}_1^*\mathcal{F}_j$ for each pair $(i, j) \in I^2$ such that for every triple of indices $(i, j, k) \in I^3$ the diagram

$$\begin{tikzcd} \mathrm{pr}_0^*\mathcal{F}_i \arrow[rr, "\mathrm{pr}_{02}^*\varphi_{ik}"'] \arrow[dr, "\mathrm{pr}_{01}^*\varphi_{ij}"'] & & \mathrm{pr}_2^*\mathcal{F}_k \\ & \mathrm{pr}_1^*\mathcal{F}_j \arrow[ur, "\mathrm{pr}_{12}^*\varphi_{jk}"'] & \end{tikzcd}$$

of $\mathcal{O}_{X_i \times_X X_j \times_X X_k}$-modules commutes. This is called the *cocycle condition*.

(2) A *morphism* $\psi : (\mathcal{F}_i, \varphi_{ij}) \to (\mathcal{F}'_i, \varphi'_{ij})$ *of descent data* is given by a family $\psi = (\psi_i)_{i\in I}$ of morphisms of $\mathcal{O}_{X_i}$-modules $\psi_i : \mathcal{F}_i \to \mathcal{F}'_i$ such that all the diagrams

$$\begin{tikzcd} \mathrm{pr}_0^*\mathcal{F}_i \arrow[r, "\varphi_{ij}"'] \arrow[d, "\mathrm{pr}_0^*\psi_i"'] & \mathrm{pr}_1^*\mathcal{F}_j \arrow[d, "\mathrm{pr}_1^*\psi_j"] \\ \mathrm{pr}_0^*\mathcal{F}'_i \arrow[r, "\varphi'_{ij}"] & \mathrm{pr}_1^*\mathcal{F}'_j \end{tikzcd}$$

commute.

Lemma 45.3.2. *Let S be a scheme. Let $\mathcal{U} = \{U_i \to U\}_{i\in I}$ and $\mathcal{V} = \{V_j \to V\}_{j\in J}$ be families of morphisms of algebraic spaces over S with fixed targets. Let $(g, \alpha : I \to J, (g_i)) : \mathcal{U} \to \mathcal{V}$ be a morphism of families of maps with fixed target, see Sites, Definition 9.8.1. Let $(\mathcal{F}_j, \varphi_{jj'})$ be a descent datum for quasi-coherent sheaves with respect to the family $\{V_j \to V\}_{j\in J}$. Then*

(1) *The system*
$$\left(g_i^*\mathcal{F}_{\alpha(i)}, (g_i \times g_{i'})^*\varphi_{\alpha(i)\alpha(i')}\right)$$
is a descent datum with respect to the family $\{U_i \to U\}_{i\in I}$.

(2) *This construction is functorial in the descent datum $(\mathcal{F}_j, \varphi_{jj'})$.*

(3) *Given a second morphism $(g', \alpha' : I \to J, (g'_i))$ of families of maps with fixed target with $g = g'$ there exists a functorial isomorphism of descent data*
$$(g_i^*\mathcal{F}_{\alpha(i)}, (g_i \times g_{i'})^*\varphi_{\alpha(i)\alpha(i')}) \cong ((g'_i)^*\mathcal{F}_{\alpha'(i)}, (g'_i \times g'_{i'})^*\varphi_{\alpha'(i)\alpha'(i')}).$$

Proof. Omitted. Hint: The maps $g_i^*\mathcal{F}_{\alpha(i)} \to (g'_i)^*\mathcal{F}_{\alpha'(i)}$ which give the ismorphism of descent data in part (3) are the pullbacks of the maps $\varphi_{\alpha(i)\alpha'(i)}$ by the morphisms $(g_i, g'_i) : U_i \to V_{\alpha(i)} \times_V V_{\alpha'(i)}$. □

Let $g : U \to V$ be a morphism of algebraic spaces. The lemma above tells us that there is a well defined pullback functor between the categories of descent data relative to families of maps with target V and U provided there is a morphism between those families of maps which ``lives over g''.

Definition 45.3.3. Let S be a scheme. Let $\{U_i \to U\}_{i\in I}$ be a family of morphisms of algebraic spaces over S with fixed target.

(1) Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_U$-module. We call the unique descent on $\mathcal{F}$ datum with respect to the covering $\{U \to U\}$ the *trivial descent datum*.
(2) The pullback of the trival descent datum to $\{U_i \to U\}$ is called the *canonical descent datum*. Notation: $(\mathcal{F}|_{U_i}, can)$.
(3) A descent datum $(\mathcal{F}_i, \varphi_{ij})$ for quasi-coherent sheaves with respect to the given family is said to be *effective* if there exists a quasi-coherent sheaf $\mathcal{F}$ on U such that $(\mathcal{F}_i, \varphi_{ij})$ is isomorphic to $(\mathcal{F}|_{U_i}, can)$.

Lemma 45.3.4. *Let S be a scheme. Let U be an algebraic space over S. Let $\{U_i \to U\}$ be a Zariski covering of U, see Topologies on Spaces, Definition 44.8.1. Any descent datum on quasi-coherent sheaves for the family $\mathcal{U} = \{U_i \to U\}$ is effective. Moreover, the functor from the category of quasi-coherent $\mathcal{O}_U$-modules to the category of descent data with respect to $\{U_i \to U\}$ is fully faithful.*

Proof. Omitted. □

45.4. Fpqc descent of quasi-coherent sheaves

The main application of flat descent for modules is the corresponding descent statement for quasi-coherent sheaves with respect to fpqc-coverings.

Proposition 45.4.1. *Let S be a scheme. Let $\{X_i \to X\}$ be an fpqc covering of algebraic spaces over S, see Topologies on Spaces, Definition 44.3.1. Any descent datum on quasi-coherent sheaves for $\{X_i \to X\}$ is effective. Moreover, the functor from the category of quasi-coherent $\mathcal{O}_X$-modules to the category of descent data with respect to $\{X_i \to X\}$ is fully faithful.*

Proof. This is more or less a formal consequence of the corresponding result for schemes, see Descent, Proposition 31.4.2. Here is a strategy for a proof:

(1) The fact that $\{X_i \to X\}$ is a refinement of the trivial covering $\{X \to X\}$ gives, via Lemma 45.3.2, a functor $QCoh(X) \to DD(\{X_i \to X\})$ from the category of quasi-coherent $\mathcal{O}_X$-modules to the category of descent data for the given family.
(2) In order to prove the proposition we will construct a quasi-inverse functor $back : DD(\{X_i \to X\}) \to QCoh(X)$.
(3) Applying again Lemma 45.3.2 we see that there is a functor $DD(\{X_i \to X\}) \to DD(\{T_j \to X\})$ if $\{T_j \to X\}$ is a refinement of the given family. Hence in order to construct the functor *back* we may assume that each X_i is a scheme, see Topologies on Spaces, Lemma 44.3.4. This reduces us to the case where all the X_i are schemes.
(4) A quasi-coherent sheaf on X is by definition a quasi-coherent $\mathcal{O}_X$-module on $X_{étale}$. Now for any $U \in Ob(X_{étale})$ we get an fppf covering $\{U_i \times_X X_i \to U\}$ by schemes and a morphism $g : \{U_i \times_X X_i \to U\} \to \{X_i \to X\}$ of coverings lying over $U \to X$. Given a descent datum $\xi = (\mathcal{F}_i, \varphi_{ij})$ we obtain a quasi-coherent $\mathcal{O}_U$-module $\mathcal{F}_{\xi,U}$ corresponding to the pullback $g^*\xi$ of Lemma 45.3.2 to the covering of U and using effectivity for fppf covering of schemes, see Descent, Proposition 31.4.2.
(5) Check that $\xi \mapsto \mathcal{F}_{\xi,U}$ is functorial in ξ. Omitted.
(6) Check that $\xi \mapsto \mathcal{F}_{\xi,U}$ is compatible with morphisms $U \to U'$ of the site $X_{étale}$, so that the system of sheaves $\mathcal{F}_{\xi,U}$ corresponds to a quasi-coherent $\mathcal{F}_\xi$ on $X_{étale}$, see Properties of Spaces, Lemma 41.26.3. Details omitted.
(7) Check that $back : \xi \mapsto \mathcal{F}_\xi$ is quasi-inverse to the functor constructed in (1). Omitted.

This finishes the proof. □

45.5. Descent of finiteness properties of modules

This section is the analogue for the case of algebraic spaces of Descent, Section 31.5. The goal is to show that one can check a quasi-coherent module has a certain finiteness conditions by checking on the members of a covering. We will repeatedly use the following proof scheme. Suppose that X is an algebraic space, and that $\{X_i \to X\}$ is a fppf (resp. fpqc) covering. Let $U \to X$ be a surjective étale morphism such that U is a scheme. Then there exists an fppf (resp. fpqc) covering $\{Y_j \to X\}$ such that

(1) $\{Y_j \to X\}$ is a refinement of $\{X_i \to X\}$,
(2) each Y_j is a scheme, and
(3) each morphism $Y_j \to X$ factors though U, and
(4) $\{Y_j \to U\}$ is an fppf (resp. fpqc) covering of U.

Namely, first refine $\{X_i \to X\}$ by an fppf (resp. fpqc) covering such that each X_i is a scheme, see Topologies on Spaces, Lemma 44.4.3, resp. Lemma 44.3.4. Then set $Y_i = U \times_X X_i$. A quasi-coherent $\mathcal{O}_X$-module $\mathcal{F}$ is of finite type, of finite presentation, etc if and only if the quasi-coherent $\mathcal{O}_U$-module $\mathcal{F}|_U$ is of finite type, of finite presentation, etc. Hence we can use the existence of the refinement $\{Y_j \to X\}$ to reduce the proof of the following lemmas to the case of schemes. We will indicate this by saying that ``*the result follows from the case of schemes by étale localization*".

Lemma 45.5.1. *Let X be an algebraic space over a scheme S. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Let $\{f_i : X_i \to X\}_{i\in I}$ be an fpqc covering such that each $f_i^*\mathcal{F}$ is a finite type $\mathcal{O}_{X_i}$-module. Then $\mathcal{F}$ is a finite type $\mathcal{O}_X$-module.*

Proof. This follows from the case of schemes, see Descent, Lemma 31.5.1, by étale localization. □

Lemma 45.5.2. *Let X be an algebraic space over a scheme S. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Let $\{f_i : X_i \to X\}_{i\in I}$ be an fpqc covering such that each $f_i^*\mathcal{F}$ is an $\mathcal{O}_{X_i}$-module of finite presentation. Then $\mathcal{F}$ is an $\mathcal{O}_X$-module of finite presentation.*

Proof. This follows from the case of schemes, see Descent, Lemma 31.5.2, by étale localization. □

Lemma 45.5.3. *Let X be an algebraic space over a scheme S. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Let $\{f_i : X_i \to X\}_{i\in I}$ be an fpqc covering such that each $f_i^*\mathcal{F}$ is a flat $\mathcal{O}_{X_i}$-module. Then $\mathcal{F}$ is a flat $\mathcal{O}_X$-module.*

Proof. This follows from the case of schemes, see Descent, Lemma 31.5.3, by étale localization. □

Lemma 45.5.4. *Let X be an algebraic space over a scheme S. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Let $\{f_i : X_i \to X\}_{i\in I}$ be an fpqc covering such that each $f_i^*\mathcal{F}$ is a finite locally free $\mathcal{O}_{X_i}$-module. Then $\mathcal{F}$ is a finite locally free $\mathcal{O}_X$-module.*

Proof. This follows from the case of schemes, see Descent, Lemma 31.5.4, by étale localization. □

The definition of a locally projective quasi-coherent sheaf can be found in Properties of Spaces, Section 41.28. It is also proved there that this notion is preserved under pullback.

Lemma 45.5.5. *Let X be an algebraic space over a scheme S. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Let $\{f_i : X_i \to X\}_{i\in I}$ be an fpqc covering such that each $f_i^*\mathcal{F}$ is a locally projective $\mathcal{O}_{X_i}$-module. Then $\mathcal{F}$ is a locally projective $\mathcal{O}_X$-module.*

Proof. This follows from the case of schemes, see Descent, Lemma 31.5.5, by étale localization. □

We also add here two results which are related to the results above, but are of a slightly different nature.

Lemma 45.5.6. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Assume f is a finite morphism. Then $\mathcal{F}$ is an $\mathcal{O}_X$-module of finite type if and only if $f_*\mathcal{F}$ is an $\mathcal{O}_Y$-module of finite type.*

Proof. As f is finite it is representable. Choose a scheme V and a surjective étale morphism $V \to Y$. Then $U = V \times_Y X$ is a scheme with a surjective étale morphism towards X and a finite morphism $\psi : U \to V$ (the base change of f). Since $\psi_*(\mathcal{F}|_U) = f_*\mathcal{F}|_V$ the result of the lemma follows immediately from the schemes version which is Descent, Lemma 31.5.7. $\square$

Lemma 45.5.7. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Assume f is finite and of finite presentation. Then $\mathcal{F}$ is an $\mathcal{O}_X$-module of finite presentation if and only if $f_*\mathcal{F}$ is an $\mathcal{O}_Y$-module of finite presentation.*

Proof. As f is finite it is representable. Choose a scheme V and a surjective étale morphism $V \to Y$. Then $U = V \times_Y X$ is a scheme with a surjective étale morphism towards X and a finite morphism $\psi : U \to V$ (the base change of f). Since $\psi_*(\mathcal{F}|_U) = f_*\mathcal{F}|_V$ the result of the lemma follows immediately from the schemes version which is Descent, Lemma 31.5.8. $\square$

45.6. Fpqc coverings

This section is the analogue of Descent, Section 31.9. At the moment we do not know if all of the material for fpqc coverings of schemes holds also for algebraic spaces.

Lemma 45.6.1. *Let S be a scheme. Let $\{f_i : T_i \to T\}_{i\in I}$ be an fpqc covering of algebraic spaces over S. Suppose that for each i we have an open subspace $W_i \subset T_i$ such that for all $i, j \in I$ we have $pr_0^{-1}(W_i) = pr_1^{-1}(W_j)$ as open subspaces of $T_i \times_T T_j$. Then there exists a unique open subspace $W \subset T$ such that $W_i = f_i^{-1}(W)$ for each i.*

Proof. By Topologies on Spaces, Lemma 44.3.4 we may assume each T_i is a scheme. Choose a scheme U and a surjective étale morphism $U \to T$. Then $\{T_i \times_T U \to U\}$ is an fpqc covering of U and $T_i \times_T U$ is a scheme for each i. Hence we see that the collection of opens $W_i \times_T U$ comes from a unique open subscheme $W' \subset U$ by Descent, Lemma 31.9.2. As $U \to X$ is open we can define $W \subset X$ the Zariski open which is the image of W', see Properties of Spaces, Section 41.4. We omit the verification that this works, i.e., that W_i is the inverse image of W for each i. $\square$

We do not know whether the following lemma holds for fpqc instead of fppf, see Properties of Spaces, Remark 41.14.4.

Lemma 45.6.2. *Let S be a scheme. Let $\{T_i \to T\}$ be an fppf covering of algebraic spaces over S, see Topologies on Spaces, Definition 44.4.1. Then given an algebraic space B over S the sequence*

$$Mor_S(T, B) \longrightarrow \prod_i Mor_S(T_i, B) \rightrightarrows \prod_{i,j} Mor_S(T_i \times_T T_j, B)$$

is an equalizer diagram. In other words, every representable functor on the category of algebraic spaces over S satisfies the sheaf condition for the fppf topology.

Proof. We have seen in Topologies on Spaces, Lemma 44.4.4 that $\coprod T_i \to T$ is surjective as a map of sheaves. Also note that $T_i \times_T T_j$ is the fibre product as sheaves. Since we have

$$Mor_S(T, B) = Mor_{Sh((Sch/S)_{fppf})}(T, B)$$

by definition the lemma follows formally. $\square$

45.7. Descent of finiteness properties of morphisms

The following type of lemma is occasionally useful.

Lemma 45.7.1. *Let S be a scheme. Let $X \to Y \to Z$ be morphism of algebraic spaces. Let P be one of the following properties of morphisms of algebraic spaces over S: flat, locally finite type, locally finite presentation. Assume that $X \to Z$ has P and that $X \to Y$ is a surjection of sheaves on $(Sch/S)_{fppf}$. Then $Y \to Z$ is P.*

Proof. Choose a scheme W and a surjective étale morphism $W \to Z$. Choose a scheme V and a surjective étale morphism $V \to W \times_Z Y$. Choose a scheme U and a surjective étale morphism $U \to V \times_Y X$. By assumption we can find an fppf covering $\{V_i \to V\}$ and lifts $V_i \to X$ of the morphism $V_i \to Y$. Since $U \to X$ is surjective étale we see that over the members of the fppf covering $\{V_i \times_X U \to V\}$ we have lifts into U. Hence $U \to V$ induces a surjection of sheaves on $(Sch/S)_{fppf}$. By our definition of what it means to have property P for a morphism of algebraic spaces (see Morphisms of Spaces, Definition 42.27.1, Definition 42.22.1, and Definition 42.26.1) we see that $U \to W$ has P and we have to show $V \to W$ has P. Thus we reduce the question to the case of morphisms of schemes which is treated in Descent, Lemma 31.10.8. □

45.8. Descending properties of spaces

In this section we put some results of the following kind.

Lemma 45.8.1. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Let $x \in |X|$. If f is flat at x and X is geometrically unibranch at x, then Y is geometrically unibranch at $f(x)$.*

Proof. Consider the map of étale local rings $\mathcal{O}_{Y,f(\overline{x})} \to \mathcal{O}_{X,\overline{x}}$. By Morphisms of Spaces, Lemma 42.27.7 this is flat. Hence if $\mathcal{O}_{X,\overline{x}}$ has a unique minimal prime, so does $\mathcal{O}_{Y,f(\overline{x})}$ (by going down, see Algebra, Lemma 7.35.17). □

Lemma 45.8.2. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. If f is flat and surjective and X is reduced, then Y is reduced.*

Proof. Choose a scheme V and a surjective étale morphism $V \to Y$. Choose a scheme U and a surjective étale morphism $U \to X \times_Y V$. As f is surjective and flat, the morphism of schemes $U \to V$ is surjective and flat. In this way we reduce the problem to the case of schemes (as reducedness of X and Y is defined in terms of reducedness of U and V, see Properties of Spaces, Section 41.7). The case of schemes is Descent, Lemma 31.15.1. □

Lemma 45.8.3. *Let $f : X \to Y$ be a morphism of algebraic spaces. If f is locally of finite presentation, flat, and surjective and X is locally Noetherian, then Y is locally Noetherian.*

Proof. Choose a scheme V and a surjective étale morphism $V \to Y$. Choose a scheme U and a surjective étale morphism $U \to X \times_Y V$. As f is surjective, flat, and locally of finite presentation the morphism of schemes $U \to V$ is surjective, flat, and locally of finite presentation. In this way we reduce the problem to the case of schemes (as being locally Noetherian for X and Y is defined in terms of being locally Noetherian of U and V, see Properties of Spaces, Section 41.7). In the case of schemes the result follows from Descent, Lemma 31.12.1. □

Lemma 45.8.4. *Let $f : X \to Y$ be a morphism of algebraic spaces. If f is locally of finite presentation, flat, and surjective and X is regular, then Y is regular.*

Proof. By Lemma 45.8.3 we know that Y is locally Noetherian. Choose a scheme V and a surjective étale morphism $V \to Y$. It suffices to prove that the local rings of V are all regular local rings, see Properties, Lemma 23.9.2. Choose a scheme U and a surjective étale morphism $U \to X \times_Y V$. As f is surjective and flat the morphism of schemes $U \to V$ is surjective and flat. By assumption U is a regular scheme in particular all of its local rings are regular (by the lemma above). Hence the lemma follows from Algebra, Lemma 7.102.8. □

45.9. Descending properties of morphisms

In this section we introduce the notion of when a property of morphisms of algebraic spaces is local on the target in a topology. Please compare with Descent, Section 31.18.

Definition 45.9.1. Let S be a scheme. Let $\mathcal{P}$ be a property of morphisms of algebraic spaces over S. Let $\tau \in \{fpqc, fppf, syntomic, smooth, étale\}$. We say $\mathcal{P}$ is *τ local on the base*, or *τ local on the target*, or *local on the base for the τ-topology* if for any τ-covering $\{Y_i \to Y\}_{i\in I}$ of algebraic spaces and any morphism of algebraic spaces $f : X \to Y$ we have

$$f \text{ has } \mathcal{P} \Leftrightarrow \text{each } Y_i \times_Y X \to Y_i \text{ has } \mathcal{P}.$$

To be sure, since isomorphisms are always coverings we see (or require) that property $\mathcal{P}$ holds for $X \to Y$ if and only if it holds for any arrow $X' \to Y'$ isomorphic to $X \to Y$. If a property is τ-local on the target then it is preserved by base changes by morphisms which occur in τ-coverings. Here is a formal statement.

Lemma 45.9.2. *Let S be a scheme. Let $\tau \in \{fpqc, fppf, syntomic, smooth, étale\}$. Let $\mathcal{P}$ be a property of morphisms of algebraic spaces over S which is τ local on the target. Let $f : X \to Y$ have property $\mathcal{P}$. For any morphism $Y' \to Y$ which is flat, resp. flat and locally of finite presentation, resp. syntomic, resp. étale, the base change $f' : Y' \times_Y X \to Y'$ of f has property $\mathcal{P}$.*

Proof. This is true because we can fit $Y' \to Y$ into a family of morphisms which forms a τ-covering. □

A simple often used consequence of the above is that if $f : X \to Y$ has property $\mathcal{P}$ which is τ-local on the target and $f(X) \subset V$ for some open subspace $V \subset Y$, then also the induced morphism $X \to V$ has $\mathcal{P}$. Proof: The base change f by $V \to Y$ gives $X \to V$.

Lemma 45.9.3. *Let S be a scheme. Let $\tau \in \{fppf, syntomic, smooth, étale\}$. Let $\mathcal{P}$ be a property of morphisms of algebraic spaces over S which is τ local on the target. For any morphism of algebraic spaces $f : X \to Y$ over S there exists a largest open subspace $W(f) \subset Y$ such that the restriction $X_{W(f)} \to W(f)$ has $\mathcal{P}$. Moreover,*

1. *if $g : Y' \to Y$ is a morphism of algebraic spaces which is flat and locally of finite presentation, syntomic, smooth, or étale and the base change $f' : X_{Y'} \to Y'$ has $\mathcal{P}$, then g factors through $W(f)$,*
2. *if $g : Y' \to Y$ is flat and locally of finite presentation, syntomic, smooth, or étale, then $W(f') = g^{-1}(W(f))$, and*
3. *if $\{g_i : Y_i \to Y\}$ is a τ-covering, then $g_i^{-1}(W(f)) = W(f_i)$, where f_i is the base change of f by $Y_i \to Y$.*

Proof. Consider the union $W_{set} \subset |Y|$ of the images $g(|Y'|) \subset |Y|$ of morphisms $g : Y' \to Y$ with the properties:

1. g is flat and locally of finite presentation, syntomic, smooth, or étale, and

(2) the base change $Y' \times_{g,Y} X \to Y'$ has property $\mathcal{P}$.

Since such a morphism g is open (see Morphisms of Spaces, Lemma 42.27.5) we see that W_{set} is an open subset of $|Y|$. Denote $W \subset Y$ the open subspace whose underlying set of points is W_{set}, see Properties of Spaces, Lemma 41.4.8. Since $\mathcal{P}$ is local in the τ topology the restriction $X_W \to W$ has property $\mathcal{P}$ because we are given a covering $\{Y' \to W\}$ of W such that the pullbacks have $\mathcal{P}$. This proves the existence and proves that $W(f)$ has property (1). To see property (2) note that $W(f') \supset g^{-1}(W(f))$ because $\mathcal{P}$ is stable under base change by flat and locally of finite presentation, syntomic, smooth, or étale morphisms, see Lemma 45.9.2. On the other hand, if $Y'' \subset Y'$ is an open such that $X_{Y''} \to Y''$ has property $\mathcal{P}$, then $Y'' \to Y$ factors through W by construction, i.e., $Y'' \subset g^{-1}(W(f))$. This proves (2). Assertion (3) follows from (2) because each morphism $Y_i \to Y$ is flat and locally of finite presentation, syntomic, smooth, or étale by our definition of a τ-covering. ☐

Lemma 45.9.4. *Let S be a scheme. Let $\mathcal{P}$ be a property of morphisms of algebraic spaces over S. Assume*

(1) *if $X_i \to Y_i$, $i = 1, 2$ have property $\mathcal{P}$ so does $X_1 \amalg X_2 \to Y_1 \amalg Y_2$,*
(2) *a morphism of algebraic spaces $f : X \to Y$ has property $\mathcal{P}$ if and only if for every affine scheme Z and morphism $Z \to Y$ the base change $Z \times_Y X \to Z$ of f has property $\mathcal{P}$, and*
(3) *for any surjective flat morphism of affine schemes $Z' \to Z$ over S and a morphism $f : X \to Z$ from an algebraic space to Z we have*

$$f' : Z' \times_Z X \to Z' \text{ has } \mathcal{P} \Rightarrow f \text{ has } \mathcal{P}.$$

Then $\mathcal{P}$ is fpqc local on the base.

Proof. If $\mathcal{P}$ has property (2), then it is automatically stable under any base change. Hence the direct implication in Definition 45.9.1.

Let $\{Y_i \to Y\}_{i\in I}$ be an fpqc covering of algebraic spaces over S. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Assume each base change $f_i : Y_i \times_Y X \to Y_i$ has property $\mathcal{P}$. Our goal is to show that f has $\mathcal{P}$. Let Z be an affine scheme, and let $Z \to Y$ be a morphism. By (2) it suffices to show that the morphism of algebraic spaces $Z \times_Y X \to Z$ has $\mathcal{P}$. Since $\{Y_i \to Y\}_{i\in I}$ is an fpqc covering we know there exists a standard fpqc covering $\{Z_j \to Z\}_{j=1,\ldots,n}$ and morphisms $Z_j \to Y_{i_j}$ over Y for suitable indices $i_j \in I$. Since f_{i_j} has $\mathcal{P}$ we see that

$$Z_j \times_Y X = Z_j \times_{Y_{i_j}} (Y_{i_j} \times_Y X) \longrightarrow Z_j$$

has $\mathcal{P}$ as a base change of f_{i_j} (see first remark of the proof). Set $Z' = \coprod_{j=1,\ldots,n} Z_j$, so that $Z' \to Z$ is a flat and surjective morphism of affine schemes over S. By (1) we conclude that $Z' \times_Y X \to Z'$ has property $\mathcal{P}$. Since this is the base change of the morphism $Z \times_Y X \to Z$ by the morphism $Z' \to Z$ we conclude that $Z \times_Y X \to Z$ has property $\mathcal{P}$ as desired. ☐

45.10. Descending properties of morphisms in the fpqc topology

In this section we find a large number of properties of morphisms of algebraic spaces which are local on the base in the fpqc topology. Please compare with Descent, Section 31.19 for the case of morphisms of schemes.

Lemma 45.10.1. *Let S be a scheme. The property $\mathcal{P}(f) =$``f is quasi-compact'' is fpqc local on the base on algebraic spaces over S.*

Proof. We will use Lemma 45.9.4 to prove this. Assumptions (1) and (2) of that lemma follow from Morphisms of Spaces, Lemma 42.9.7. Let $Z' \to Z$ be a surjective flat morphism of affine schemes over S. Let $f : X \to Z$ be a morphism of algebraic spaces, and assume that the base change $f' : Z' \times_Z X \to Z'$ is quasi-compact. We have to show that f is quasi-compact. To see this, using Morphisms of Spaces, Lemma 42.9.7 again, it is enough to show that for every affine scheme Y and morphism $Y \to Z$ the fibre product $Y \times_Z X$ is quasi-compact. Here is a picture:

(45.10.1.1)
$$\begin{tikzcd}
Y \times_Z Z' \times_Z X \arrow[rr] \arrow[dd] \arrow[dr] & & Z' \times_Z X \arrow[dd, "f'"] \arrow[dr] & \\
& Y \times_Z X \arrow[rr] \arrow[dd] & & X \arrow[dd, "f"] \\
Y \times_Z Z' \arrow[rr] \arrow[dr] & & Z' \arrow[dr] & \\
& Y \arrow[rr] & & Z
\end{tikzcd}$$

Note that all squares are cartesian and the bottom square consists of affine schemes. The assumption that f' is quasi-compact combined with the fact that $Y \times_Z Z'$ is affine implies that $Y \times_Z Z' \times_Z X$ is quasi-compact. Since

$$Y \times_Z Z' \times_Z X \longrightarrow Y \times_Z X$$

is surjective as a base change of $Z' \to Z$ we conclude that $Y \times_Z X$ is quasi-compact, see Morphisms of Spaces, Lemma 42.9.5. This finishes the proof. □

Lemma 45.10.2. *Let S be a scheme. The property $\mathcal{P}(f) =$``f is quasi-separated'' is fpqc local on the base on algebraic spaces over S.*

Proof. A base change of a quasi-separated morphism is quasi-separated, see Morphisms of Spaces, Lemma 42.5.4. Hence the direct implication in Definition 45.9.1.

Let $\{Y_i \to Y\}_{i \in I}$ be an fpqc covering of algebraic spaces over S. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Assume each base change $X_i := Y_i \times_Y X \to Y_i$ is quasi-separated. This means that each of the morphisms

$$\Delta_i : X_i \longrightarrow X_i \times_{Y_i} X_i = Y_i \times_Y (X \times_Y X)$$

is quasi-compact. The base change of a fpqc covering is an fpqc covering, see Topologies on Spaces, Lemma 44.3.2 hence $\{Y_i \times_Y (X \times_Y X) \to X \times_Y X\}$ is an fpqc covering of algebraic spaces. Moreover, each Δ_i is the base change of the morphism $\Delta : X \to X \times_Y X$. Hence it follows from Lemma 45.10.1 that Δ is quasi-compact, i.e., f is quasi-separated. □

Lemma 45.10.3. *Let S be a scheme. The property $\mathcal{P}(f) =$``f is universally closed'' is fpqc local on the base on algebraic spaces over S.*

Proof. We will use Lemma 45.9.4 to prove this. Assumptions (1) and (2) of that lemma follow from Morphisms of Spaces, Lemma 42.10.5. Let $Z' \to Z$ be a surjective flat morphism of affine schemes over S. Let $f : X \to Z$ be a morphism of algebraic spaces, and assume that the base change $f' : Z' \times_Z X \to Z'$ is universally closed. We have to show that f is universally closed. To see this, using Morphisms of Spaces, Lemma 42.10.5 again, it is enough to show that for every affine scheme Y and morphism $Y \to Z$ the map

$|Y \times_Z X| \to |Y|$ is closed. Consider the cube (45.10.1.1). The assumption that f' is universally closed implies that $|Y \times_Z Z' \times_Z X| \to |Y \times_Z Z'|$ is closed. As $Y \times_Z Z' \to Y$ is surjective and flat as a base change of $Z' \to Z$ we see the map $|Y \times_Z Z'| \to |Y|$ is submersive, see Morphisms, Lemma 24.24.10. Moreover the map

$$|Y \times_Z Z' \times_Z X| \longrightarrow |Y \times_Z Z'| \times_{|Y|} |Y \times_Z X|$$

is surjective, see Properties of Spaces, Lemma 41.4.3. It follows by elementary topology that $|Y \times_Z X| \to |Y|$ is closed. □

Lemma 45.10.4. *Let S be a scheme. The property $\mathcal{P}(f)$ =``f is universally open'' is fpqc local on the base on algebraic spaces over S.*

Proof. The proof is the same as the proof of Lemma 45.10.3. □

Lemma 45.10.5. *The property $\mathcal{P}(f)$ =``f is surjective'' is fpqc local on the base.*

Proof. Omitted. (Hint: Use Properties of Spaces, Lemma 41.4.3.) □

Lemma 45.10.6. *The property $\mathcal{P}(f)$ =``f is universally injective'' is fpqc local on the base.*

Proof. We will use Lemma 45.9.4 to prove this. Assumptions (1) and (2) of that lemma follow from Morphisms of Spaces, Lemma 42.10.5. Let $Z' \to Z$ be a flat surjective morphism of affine schemes over S and let $f : X \to Z$ be a morphism from an algebraic space to Z. Assume that the base change $f' : X' \to Z'$ is universally injective. Let K be a field, and let $a, b : Spec(K) \to X$ be two morphisms such that $f \circ a = f \circ b$. As $Z' \to Z$ is surjective there exists a field extension $K \subset K'$ and a morphism $Spec(K') \to Z'$ such that the following solid diagram commutes

$$\begin{tikzcd}
Spec(K') \arrow[dd] \arrow[dr, dashed, "{a',b'}"'] \arrow[drr] & & \\
& X' \arrow[r] \arrow[d] & Z' \arrow[d] \\
Spec(K) \arrow[r, "{a,b}"] & X \arrow[r] & Z
\end{tikzcd}$$

As the square is cartesian we get the two dotted arrows a', b' making the diagram commute. Since $X' \to Z'$ is universally injective we get $a' = b'$. This forces $a = b$ as $\{Spec(K') \to Spec(K)\}$ is an fpqc covering, see Properties of Spaces, Lemma 41.14.1. Hence f is universally injective as desired. □

Lemma 45.10.7. *The property $\mathcal{P}(f)$ =``f is locally of finite type'' is fpqc local on the base.*

Proof. We will use Lemma 45.9.4 to prove this. Assumptions (1) and (2) of that lemma follow from Morphisms of Spaces, Lemma 42.22.4. Let $Z' \to Z$ be a surjective flat morphism of affine schemes over S. Let $f : X \to Z$ be a morphism of algebraic spaces, and assume that the base change $f' : Z' \times_Z X \to Z'$ is locally of finite type. We have to show that f is locally of finite type. Let U be a scheme and let $U \to X$ be surjective and étale. By Morphisms of Spaces, Lemma 42.22.4 again, it is enough to show that $U \to Z$ is locally of finite type. Since f' is locally of finite type, and since $Z' \times_Z U$ is a scheme étale over $Z' \times_Z X$ we conclude (by the same lemma again) that $Z' \times_Z U \to Z'$ is locally of finite type. As $\{Z' \to Z\}$ is an fpqc covering we conclude that $U \to Z$ is locally of finite type by Descent, Lemma 31.19.8 as desired. □

Lemma 45.10.8. *The property $\mathcal{P}(f)$ =``f is locally of finite presentation'' is fpqc local on the base.*

Proof. We will use Lemma 45.9.4 to prove this. Assumptions (1) and (2) of that lemma follow from Morphisms of Spaces, Lemma 42.26.4. Let $Z' \to Z$ be a surjective flat morphism of affine schemes over S. Let $f : X \to Z$ be a morphism of algebraic spaces, and assume that the base change $f' : Z' \times_Z X \to Z'$ is locally of finite presentation. We have to show that f is locally of finite presentation. Let U be a scheme and let $U \to X$ be surjective and étale. By Morphisms of Spaces, Lemma 42.26.4 again, it is enough to show that $U \to Z$ is locally of finite presentation. Since f' is locally of finite presentation, and since $Z' \times_Z U$ is a scheme étale over $Z' \times_Z X$ we conclude (by the same lemma again) that $Z' \times_Z U \to Z'$ is locally of finite presentation. As $\{Z' \to Z\}$ is an fpqc covering we conclude that $U \to Z$ is locally of finite presentation by Descent, Lemma 31.19.9 as desired. □

Lemma 45.10.9. *The property $\mathcal{P}(f)$ =``f is of finite type'' is fpqc local on the base.*

Proof. Combine Lemmas 45.10.1 and 45.10.7. □

Lemma 45.10.10. *The property $\mathcal{P}(f)$ =``f is of finite presentation'' is fpqc local on the base.*

Proof. Combine Lemmas 45.10.1, 45.10.2 and 45.10.8. □

Lemma 45.10.11. *The property $\mathcal{P}(f)$ =``f is flat'' is fpqc local on the base.*

Proof. We will use Lemma 45.9.4 to prove this. Assumptions (1) and (2) of that lemma follow from Morphisms of Spaces, Lemma 42.27.4. Let $Z' \to Z$ be a surjective flat morphism of affine schemes over S. Let $f : X \to Z$ be a morphism of algebraic spaces, and assume that the base change $f' : Z' \times_Z X \to Z'$ is flat. We have to show that f is flat. Let U be a scheme and let $U \to X$ be surjective and étale. By Morphisms of Spaces, Lemma 42.27.4 again, it is enough to show that $U \to Z$ is flat. Since f' is flat, and since $Z' \times_Z U$ is a scheme étale over $Z' \times_Z X$ we conclude (by the same lemma again) that $Z' \times_Z U \to Z'$ is flat. As $\{Z' \to Z\}$ is an fpqc covering we conclude that $U \to Z$ is flat by Descent, Lemma 31.19.13 as desired. □

Lemma 45.10.12. *The property $\mathcal{P}(f)$ =``f is an open immersion'' is fpqc local on the base.*

Proof. We will use Lemma 45.9.4 to prove this. Assumptions (1) and (2) of that lemma follow from Morphisms of Spaces, Lemma 42.4.1. Consider a cartesian diagram

$$\begin{tikzcd} X' \arrow[r] \arrow[d] & X \arrow[d] \\ Z' \arrow[r] & Z \end{tikzcd}$$

of algebraic spaces over S where $Z' \to Z$ is a surjective flat morphism of affine schemes, and $X' \to Z'$ is an open immersion. We have to show that $X \to Z$ is an open immersion. Note that $|X'| \subset |Z'|$ corresponds to an open subscheme $U' \subset Z'$ (isomorphic to X') with the property that $\mathrm{pr}_0^{-1}(U') = \mathrm{pr}_1^{-1}(U')$ as open subschemes of $Z' \times_Z Z'$. Hence there exists an open subscheme $U \subset Z$ such that $X' = (Z' \to Z)^{-1}(U)$, see Descent, Lemma 31.9.2. As $X' \to Z'$ is quasi-separated also $X \to Z$ is quasi-separated, by Lemma 45.10.2. Hence X is quasi-separated over S (since Z is affine, hence separated, hence $Z \to S$ is separated, hence $X \to Z \to S$ is quasi-separated by Morphisms of Spaces, Lemma 42.5.8).

Thus by Properties of Spaces, Lemma 41.14.3 we see that X satisfies the sheaf condition for the fpqc topology. Now we have the fpqc covering $\mathcal{U} = \{U' \to U\}$ and the element $U' \to X' \to X \in \check{H}^0(\mathcal{U}, X)$. By the sheaf condition we obtain a morphism $U \to X$ such that

$$\begin{tikzcd} U' \arrow[r] \arrow[d, "\cong"] \arrow[dd, bend right] & U \arrow[d] \arrow[dd, bend left] \\ X' \arrow[r] \arrow[d] & X \arrow[d] \\ Z' \arrow[r] & Z \end{tikzcd}$$

is commutative. On the other hand, we know that for any scheme T pver S and T-valued point $T \to X$ the composition $T \to X \to Z$ is a morphism such that $Z' \times_Z T \to Z'$ factors through U'. Clearly this means that $T \to Z$ factors through U. In other words the map of sheaves $U \to X$ is bijective and we win. □

Lemma 45.10.13. *The property $\mathcal{P}(f)$ =``f is an isomorphism" is fpqc local on the base.*

Proof. Combine Lemmas 45.10.5 and 45.10.12. □

Lemma 45.10.14. *The property $\mathcal{P}(f)$ =``f is affine" is fpqc local on the base.*

Proof. We will use Lemma 45.9.4 to prove this. Assumptions (1) and (2) of that lemma follow from Morphisms of Spaces, Lemma 42.19.3. Let $Z' \to Z$ be a surjective flat morphism of affine schemes over S. Let $f : X \to Z$ be a morphism of algebraic spaces, and assume that the base change $f' : Z' \times_Z X \to Z'$ is affine. This implies that $Z' \times_Z X$ is representable, and that $Z' \times_Z X \to Z'$ is quasi-separated. Hence we conclude that $X \to Z$ is quasi-separated by Lemma 45.10.2. In particular X is quasi-separated over S, and satisfies the sheaf condition for the fpqc topology, see Properties of Spaces, Lemma 41.14.3.

Let X' be a scheme representing $Z' \times_Z X$. We obtain a canonical isomorphism

$$\varphi : X' \times_Z Z' \longrightarrow Z' \times_Z X'$$

since both schemes represent the algebraic space $Z' \times_Z Z' \times_Z X$. This is a descent datum for $X'/Z'/Z$, see Descent, Definition 31.30.1 (verification omitted, compare with Descent, Lemma 31.35.1). Since $X' \to Z'$ is affine this descent datum is effective, see Descent, Lemma 31.33.1. Thus there exists a scheme $Y \to Z$ over Z and an isomorphism $\psi : Z' \times_Z Y \to X'$ compatible with descent data. Of course $Y \to Z$ is affine (by construction or by Descent, Lemma 31.19.16). Note that $\mathcal{Y} = \{Z' \times_Z Y \to Y\}$ is a fpqc covering, and interpreting ψ as an element of $X(Z' \times_Z Y)$ we see that $\psi \in \check{H}^0(\mathcal{Y}, X)$. By the sheaf condition for X (see above) we obtain a morphism $Y \to X$. By construction the base change of this to Z' is an isomorphism, hence an isomorphism by Lemma 45.10.13. This proves that X is representable by an affine scheme and we win. □

Lemma 45.10.15. *The property $\mathcal{P}(f)$ =``f is a closed immersion" is fpqc local on the base.*

Proof. We will use Lemma 45.9.4 to prove this. Assumptions (1) and (2) of that lemma follow from Morphisms of Spaces, Lemma 42.4.1. Consider a cartesian diagram

$$\begin{tikzcd} X' \arrow[r] \arrow[d] & X \arrow[d] \\ Z' \arrow[r] & Z \end{tikzcd}$$

of algebraic spaces over S where $Z' \to Z$ is a surjective flat morphism of affine schemes, and $X' \to Z'$ is a closed immersion. We have to show that $X \to Z$ is a closed immersion. The morphism $X' \to Z'$ is affine. Hence by Lemma 45.10.14 we see that X is a scheme and $X \to Z$ is affine. It follows from Descent, Lemma 31.19.17 that $X \to Z$ is a closed immersion as desired. $\square$

Lemma 45.10.16. *The property $\mathcal{P}(f) =$ "f is separated" is fpqc local on the base.*

Proof. A base change of a separated morphism is separated, see Morphisms of Spaces, Lemma 42.5.4. Hence the direct implication in Definition 45.9.1.

Let $\{Y_i \to Y\}_{i \in I}$ be an fpqc covering of algebraic spaces over S. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Assume each base change $X_i := Y_i \times_Y X \to Y_i$ is separated. This means that each of the morphisms

$$\Delta_i : X_i \longrightarrow X_i \times_{Y_i} X_i = Y_i \times_Y (X \times_Y X)$$

is a closed immersion. The base change of a fpqc covering is an fpqc covering, see Topologies on Spaces, Lemma 44.3.2 hence $\{Y_i \times_Y (X \times_Y X) \to X \times_Y X\}$ is an fpqc covering of algebraic spaces. Moreover, each Δ_i is the base change of the morphism $\Delta : X \to X \times_Y X$. Hence it follows from Lemma 45.10.15 that Δ is a closed immersion, i.e., f is separated. $\square$

Lemma 45.10.17. *The property $\mathcal{P}(f) =$ "f is proper" is fpqc local on the base.*

Proof. The lemma follows by combining Lemmas 45.10.3, 45.10.16 and 45.10.9. $\square$

Lemma 45.10.18. *The property $\mathcal{P}(f) =$ "f is quasi-affine" is fpqc local on the base.*

Proof. We will use Lemma 45.9.4 to prove this. Assumptions (1) and (2) of that lemma follow from Morphisms of Spaces, Lemma 42.20.3. Let $Z' \to Z$ be a surjective flat morphism of affine schemes over S. Let $f : X \to Z$ be a morphism of algebraic spaces, and assume that the base change $f' : Z' \times_Z X \to Z'$ is quasi-affine. This implies that $Z' \times_Z X$ is representable, and that $Z' \times_Z X \to Z'$ is quasi-separated. Hence we conclude that $X \to Z$ is quasi-separated by Lemma 45.10.2. In particular X is quasi-separated over S, and satisfies the sheaf condition for the fpqc topology, see Properties of Spaces, Lemma 41.14.3.

Let X' be a scheme representing $Z' \times_Z X$. We obtain a canonical isomorphism

$$\varphi : X' \times_Z Z' \longrightarrow Z' \times_Z X'$$

since both schemes represent the algebraic space $Z' \times_Z Z' \times_Z X$. This is a descent datum for $X'/Z'/Z$, see Descent, Definition 31.30.1 (verification omitted, compare with Descent, Lemma 31.35.1). Since $X' \to Z'$ is quasi-affine this descent datum is effective, see Descent, Lemma 31.34.1. Thus there exists a scheme $Y \to Z$ over Z and an isomorphism $\psi : Z' \times_Z Y \to X'$ compatible with descent data. Of course $Y \to Z$ is quasi-affine (by construction or by Descent, Lemma 31.19.18). Note that $\mathcal{Y} = \{Z' \times_Z Y \to Y\}$ is a fpqc covering, and interpreting ψ as an element of $X(Z' \times_Z Y)$ we see that $\psi \in \check{H}^0(\mathcal{Y}, X)$. By the sheaf condition for X (see above) we obtain a morphism $Y \to X$. By construction the base change of this to Z' is an isomorphism, hence an isomorphism by Lemma 45.10.13. This proves that X is representable by a quasi-affine scheme and we win. $\square$

Lemma 45.10.19. *The property $\mathcal{P}(f) =$ "f is a quasi-compact immersion" is fpqc local on the base.*

Proof. We will use Lemma 45.9.4 to prove this. Assumptions (1) and (2) of that lemma follow from Morphisms of Spaces, Lemmas 42.4.1 and 42.9.7. Consider a cartesian diagram

$$\begin{tikzcd} X' \arrow[r] \arrow[d] & X \arrow[d] \\ Z' \arrow[r] & Z \end{tikzcd}$$

of algebraic spaces over S where $Z' \to Z$ is a surjective flat morphism of affine schemes, and $X' \to Z'$ is a quasi-compact immersion. We have to show that $X \to Z$ is a closed immersion. The morphism $X' \to Z'$ is quasi-affine. Hence by Lemma 45.10.18 we see that X is a scheme and $X \to Z$ is quasi-affine. It follows from Descent, Lemma 31.19.19 that $X \to Z$ is a quasi-compact immersion as desired. $\square$

Lemma 45.10.20. *The property $\mathcal{P}(f) =$``f is integral'' is fpqc local on the base.*

Proof. An integral morphism is the same thing as an affine, universally closed morphism. See Morphisms of Spaces, Lemma 42.37.7. Hence the lemma follows on combining Lemmas 45.10.3 and 45.10.14. $\square$

Lemma 45.10.21. *The property $\mathcal{P}(f) =$``f is finite'' is fpqc local on the base.*

Proof. An finite morphism is the same thing as an integral, morphism which is locally of finite type. See Morphisms of Spaces, Lemma 42.37.6. Hence the lemma follows on combining Lemmas 45.10.7 and 45.10.20. $\square$

Lemma 45.10.22. *The properties $\mathcal{P}(f) =$``$f$ is locally quasi-finite'' and $\mathcal{P}(f) =$``f is quasi-finite'' are fpqc local on the base.*

Proof. We have already seen that ``quasi-compact'' is fpqc local on the base, see Lemma 45.10.1. Hence it is enough to prove the lemma for ``locally quasi-finite''. We will use Lemma 45.9.4 to prove this. Assumptions (1) and (2) of that lemma follow from Morphisms of Spaces, Lemma 42.25.5. Let $Z' \to Z$ be a surjective flat morphism of affine schemes over S. Let $f : X \to Z$ be a morphism of algebraic spaces, and assume that the base change $f' : Z' \times_Z X \to Z'$ is locally quasi-finite. We have to show that f is locally quasi-finite. Let U be a scheme and let $U \to X$ be surjective and étale. By Morphisms of Spaces, Lemma 42.25.5 again, it is enough to show that $U \to Z$ is locally quasi-finite. Since f' is locally quasi-finite, and since $Z' \times_Z U$ is a scheme étale over $Z' \times_Z X$ we conclude (by the same lemma again) that $Z' \times_Z U \to Z'$ is locally quasi-finite. As $\{Z' \to Z\}$ is an fpqc covering we conclude that $U \to Z$ is locally quasi-finite by Descent, Lemma 31.19.22 as desired. $\square$

Lemma 45.10.23. *The property $\mathcal{P}(f) =$``f is syntomic'' is fpqc local on the base.*

Proof. We will use Lemma 45.9.4 to prove this. Assumptions (1) and (2) of that lemma follow from Morphisms of Spaces, Lemma 42.32.4. Let $Z' \to Z$ be a surjective flat morphism of affine schemes over S. Let $f : X \to Z$ be a morphism of algebraic spaces, and assume that the base change $f' : Z' \times_Z X \to Z'$ is syntomic. We have to show that f is syntomic. Let U be a scheme and let $U \to X$ be surjective and étale. By Morphisms of Spaces, Lemma 42.32.4 again, it is enough to show that $U \to Z$ is syntomic. Since f' is syntomic, and since $Z' \times_Z U$ is a scheme étale over $Z' \times_Z X$ we conclude (by the same lemma again) that $Z' \times_Z U \to Z'$ is syntomic. As $\{Z' \to Z\}$ is an fpqc covering we conclude that $U \to Z$ is syntomic by Descent, Lemma 31.19.24 as desired. $\square$

Lemma 45.10.24. *The property $\mathcal{P}(f)$ =``f is smooth'' is fpqc local on the base.*

Proof. We will use Lemma 45.9.4 to prove this. Assumptions (1) and (2) of that lemma follow from Morphisms of Spaces, Lemma 42.33.4. Let $Z' \to Z$ be a surjective flat morphism of affine schemes over S. Let $f : X \to Z$ be a morphism of algebraic spaces, and assume that the base change $f' : Z' \times_Z X \to Z'$ is smooth. We have to show that f is smooth. Let U be a scheme and let $U \to X$ be surjective and étale. By Morphisms of Spaces, Lemma 42.33.4 again, it is enough to show that $U \to Z$ is smooth. Since f' is smooth, and since $Z' \times_Z U$ is a scheme étale over $Z' \times_Z X$ we conclude (by the same lemma again) that $Z' \times_Z U \to Z'$ is smooth. As $\{Z' \to Z\}$ is an fpqc covering we conclude that $U \to Z$ is smooth by Descent, Lemma 31.19.25 as desired. □

Lemma 45.10.25. *The property $\mathcal{P}(f)$ =``f is unramified'' is fpqc local on the base.*

Proof. We will use Lemma 45.9.4 to prove this. Assumptions (1) and (2) of that lemma follow from Morphisms of Spaces, Lemma 42.34.5. Let $Z' \to Z$ be a surjective flat morphism of affine schemes over S. Let $f : X \to Z$ be a morphism of algebraic spaces, and assume that the base change $f' : Z' \times_Z X \to Z'$ is unramified. We have to show that f is unramified. Let U be a scheme and let $U \to X$ be surjective and étale. By Morphisms of Spaces, Lemma 42.34.5 again, it is enough to show that $U \to Z$ is unramified. Since f' is unramified, and since $Z' \times_Z U$ is a scheme étale over $Z' \times_Z X$ we conclude (by the same lemma again) that $Z' \times_Z U \to Z'$ is unramified. As $\{Z' \to Z\}$ is an fpqc covering we conclude that $U \to Z$ is unramified by Descent, Lemma 31.19.26 as desired. □

Lemma 45.10.26. *The property $\mathcal{P}(f)$ =``f is étale'' is fpqc local on the base.*

Proof. We will use Lemma 45.9.4 to prove this. Assumptions (1) and (2) of that lemma follow from Morphisms of Spaces, Lemma 42.35.2. Let $Z' \to Z$ be a surjective flat morphism of affine schemes over S. Let $f : X \to Z$ be a morphism of algebraic spaces, and assume that the base change $f' : Z' \times_Z X \to Z'$ is étale. We have to show that f is étale. Let U be a scheme and let $U \to X$ be surjective and étale. By Morphisms of Spaces, Lemma 42.35.2 again, it is enough to show that $U \to Z$ is étale. Since f' is étale, and since $Z' \times_Z U$ is a scheme étale over $Z' \times_Z X$ we conclude (by the same lemma again) that $Z' \times_Z U \to Z'$ is étale. As $\{Z' \to Z\}$ is an fpqc covering we conclude that $U \to Z$ is étale by Descent, Lemma 31.19.27 as desired. □

Lemma 45.10.27. *The property $\mathcal{P}(f)$ =``f is finite locally free'' is fpqc local on the base.*

Proof. Being finite locally free is equivalent to being finite, flat and locally of finite presentation (Morphisms of Spaces, Lemma 42.38.6). Hence this follows from Lemmas 45.10.21, 45.10.11, and 45.10.8. □

Lemma 45.10.28. *The property $\mathcal{P}(f)$ =``f is a monomorphism'' is fpqc local on the base.*

Proof. Let $f : X \to Y$ be a morphism of algebraic spaces. Let $\{Y_i \to Y\}$ be an fpqc covering, and assume each of the base changes $f_i : X_i \to Y_i$ of f is a monomorphism. We have to show that f is a monomorphism.

First proof. Note that f is a monomorphism if and only if $\Delta : X \to X \times_Y X$ is an isomorphism. By applying this to f_i we see that each of the morphisms

$$\Delta_i : X_i \longrightarrow X_i \times_{Y_i} X_i = Y_i \times_Y (X \times_Y X)$$

is an isomorphism. The base change of an fpqc covering is an fpqc covering, see Topologies on Spaces, Lemma 44.3.2 hence $\{Y_i \times_Y (X \times_Y X) \to X \times_Y X\}$ is an fpqc covering of algebraic spaces. Moreover, each Δ_i is the base change of the morphism $\Delta : X \to X \times_Y X$. Hence it follows from Lemma 45.10.13 that Δ is an isomorphism, i.e., f is a monomorphism.

Second proof. Let V be a scheme, and let $V \to Y$ be a surjective étale morphism. If we can show that $V \times_Y X \to V$ is a monomorphism, then it follows that $X \to Y$ is a monomorphism. Namely, given any cartesian diagram of sheaves

$$\begin{tikzcd} \mathcal{F} \arrow[r, "a"'] \arrow[d, "b"'] & \mathcal{G} \arrow[d, "c"] \\ \mathcal{H} \arrow[r, "d"] & \mathcal{I} \end{tikzcd} \qquad \mathcal{F} = \mathcal{H} \times_{\mathcal{I}} \mathcal{G}$$

if c is a surjection of sheaves, and a is injective, then also d is injective. This reduces the problem to the case where Y is a scheme. Moreover, in this case we may assume that the algebraic spaces Y_i are schemes also, since we can always refine the covering to place ourselves in this situation, see Topologies on Spaces, Lemma 44.3.4.

Assume $\{Y_i \to Y\}$ is an fpqc covering of schemes. Let $a, b : T \to X$ be two morphisms such that $f \circ a = f \circ b$. We have to show that $a = b$. Since f_i is a monomorphism we see that $a_i = b_i$, where $a_i, b_i : Y_i \times_Y T \to X_i$ are the base changes. In particular the compositions $Y_i \times_Y T \to T \to X$ are equal. Since $\{Y_i \times_Y T \to T\}$ is an fpqc covering we deduce that $a = b$ from Properties of Spaces, Lemma 41.14.1. $\square$

45.11. Descending properties of morphisms in the fppf topology

In this section we find some properties of morphisms of algebraic spaces for which we could not (yet) show they are local on the base in the fpqc topology which, however, are local on the base in the fppf topology.

Lemma 45.11.1. *The property $\mathcal{P}(f)$ = "f is an immersion" is fppf local on the base.*

Proof. Let $f : X \to Y$ be a morphism of algebraic spaces. Let $\{Y_i \to Y\}_{i \in I}$ be an fppf covering of Y. Let $f_i : X_i \to Y_i$ be the base change of f.

If f is an immersion, then each f_i is an immersion by Spaces, Lemma 40.12.3. This proves the direct implication in Definition 45.9.1.

Conversely, assume each f_i is an immersion. By Morphisms of Spaces, Lemma 42.14.7 this implies each f_i is separated. By Morphisms of Spaces, Lemma 42.25.6 this implies each f_i is locally quasi-finite. Hence we see that f is locally quasi-finite and separated, by applying Lemmas 45.10.16 and 45.10.22. By Morphisms of Spaces, Lemma 42.40.1 this implies that f is representable!

By Morphisms of Spaces, Lemma 42.4.1 it suffices to show that for every scheme Z and morphism $Z \to Y$ the base change $Z \times_Y X \to Z$ is an immersion. By Topologies on Spaces, Lemma 44.4.3 we can find an fppf covering $\{Z_i \to Z\}$ by schemes which refines the pull back of the covering $\{Y_i \to Y\}$ to Z. Hence we see that $Z \times_Y X \to Z$ (which is a morphism of schemes according to the result of the preceding paragraph) becomes an immersion after pulling back to the members of an fppf (by schemes) of Z. Hence $Z \times_Y X \to Z$ is an immersion by the result for schemes, see Descent, Lemma 31.20.1. $\square$

Lemma 45.11.2. *The property $\mathcal{P}(f)$ = "f is locally separated" is fppf local on the base.*

Proof. A base change of a locally separated morphism is locally separated, see Morphisms of Spaces, Lemma 42.5.4. Hence the direct implication in Definition 45.9.1.

Let $\{Y_i \to Y\}_{i\in I}$ be an fppf covering of algebraic spaces over S. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Assume each base change $X_i := Y_i \times_Y X \to Y_i$ is locally separated. This means that each of the morphisms

$$\Delta_i : X_i \longrightarrow X_i \times_{Y_i} X_i = Y_i \times_Y (X \times_Y X)$$

is an immersion. The base change of a fppf covering is an fppf covering, see Topologies on Spaces, Lemma 44.4.2 hence $\{Y_i \times_Y (X \times_Y X) \to X \times_Y X\}$ is an fppf covering of algebraic spaces. Moreover, each Δ_i is the base change of the morphism $\Delta : X \to X \times_Y X$. Hence it follows from Lemma 45.11.1 that Δ is a immersion, i.e., f is locally separated. $\square$

45.12. Properties of morphisms local on the source

In this section we define what it means for a property of morphisms of algebraic spaces to be local on the source. Please compare with Descent, Section 31.22.

Definition 45.12.1. Let S be a scheme. Let $\mathcal{P}$ be a property of morphisms of algebraic spaces over S. Let $\tau \in \{fpqc, fppf, syntomic, smooth, étale\}$. We say $\mathcal{P}$ is *τ local on the source*, or *local on the source for the τ-topology* if for any morphism $f : X \to Y$ of algebraic spaces over S, and any τ-covering $\{X_i \to X\}_{i\in I}$ of algebraic spaces we have

$$f \text{ has } \mathcal{P} \Leftrightarrow \text{each } X_i \to Y \text{ has } \mathcal{P}.$$

To be sure, since isomorphisms are always coverings we see (or require) that property $\mathcal{P}$ holds for $X \to Y$ if and only if it holds for any arrow $X' \to Y'$ isomorphic to $X \to Y$. If a property is τ-local on the source then it is preserved by precomposing with morphisms which occur in τ-coverings. Here is a formal statement.

Lemma 45.12.2. *Let S be a scheme. Let $\tau \in \{fpqc, fppf, syntomic, smooth, étale\}$. Let $\mathcal{P}$ be a property of morphisms of algebraic spaces over S which is τ local on the source. Let $f : X \to Y$ have property $\mathcal{P}$. For any morphism $a : X' \to X$ which is flat, resp. flat and locally of finite presentation, resp. syntomic, resp. smooth, resp. étale, the composition $f \circ a : X' \to Y$ has property $\mathcal{P}$.*

Proof. This is true because we can fit $X' \to X$ into a family of morphisms which forms a τ-covering. $\square$

Lemma 45.12.3. *Let S be a scheme. Let $\tau \in \{fpqc, fppf, syntomic, smooth, étale\}$. Suppose that $\mathcal{P}$ is a property of morphisms of schemes over S which is étale local on the source-and-target. Denote $\mathcal{P}_{spaces}$ the corresponding property of morphisms of algebraic spaces over S, see Morphisms of Spaces, Definition 42.21.2. If $\mathcal{P}$ is local on the source for the τ-topology, then $\mathcal{P}_{spaces}$ is local on the source for the τ-topology.*

Proof. Let $f : X \to Y$ be a morphism of of algebraic spaces over S. Let $\{X_i \to X\}_{i\in I}$ be a τ-covering of algebraic spaces. Choose a scheme V and a surjective étale morphism $V \to Y$. Choose a scheme U and a surjective étale morphism $U \to X \times_Y V$. For each i choose a scheme U_i and a surjective étale morphism $U_i \to X_i \times_X U$.

Note that $\{X_i \times_X U \to U\}_{i\in I}$ is a τ-covering. Note that each $\{U_i \to X_i \times_X U\}$ is an étale covering, hence a τ-covering. Hence $\{U_i \to U\}_{i\in I}$ is a τ-covering of algebraic spaces over S. But since U and each U_i is a scheme we see that $\{U_i \to U\}_{i\in I}$ is a τ-covering of schemes over S.

Now we have

$$\begin{aligned} f \text{ has } \mathcal{P}_{spaces} &\Leftrightarrow U \to V \text{ has } \mathcal{P} \\ &\Leftrightarrow \text{each } U_i \to V \text{ has } \mathcal{P} \\ &\Leftrightarrow \text{each } X_i \to Y \text{ has } \mathcal{P}_{spaces}. \end{aligned}$$

the first and last equivalence by the definition of $\mathcal{P}_{spaces}$ the middle equivalence because we assumed $\mathcal{P}$is local on the source in the τ-topology. ☐

45.13. Properties of morphisms local in the fpqc topology on the source

Here are some properties of morphisms that are fpqc local on the source.

Lemma 45.13.1. *The property $\mathcal{P}(f) =$``f is flat'' is fpqc local on the source.*

Proof. Follows from Lemma 45.12.3 using Morphisms of Spaces, Definition 42.27.1 and Descent, Lemma 31.23.1. ☐

45.14. Properties of morphisms local in the fppf topology on the source

Here are some properties of morphisms that are fppf local on the source.

Lemma 45.14.1. *The property $\mathcal{P}(f) =$``f is locally of finite presentation'' is fppf local on the source.*

Proof. Follows from Lemma 45.12.3 using Morphisms of Spaces, Definition 42.26.1 and Descent, Lemma 31.24.1. ☐

Lemma 45.14.2. *The property $\mathcal{P}(f) =$``f is locally of finite type'' is fppf local on the source.*

Proof. Follows from Lemma 45.12.3 using Morphisms of Spaces, Definition 42.22.1 and Descent, Lemma 31.24.2. ☐

Lemma 45.14.3. *The property $\mathcal{P}(f) =$``f is open'' is fppf local on the source.*

Proof. Follows from Lemma 45.12.3 using Morphisms of Spaces, Definition 42.7.2 and Descent, Lemma 31.24.3. ☐

Lemma 45.14.4. *The property $\mathcal{P}(f) =$``f is universally open'' is fppf local on the source.*

Proof. Follows from Lemma 45.12.3 using Morphisms of Spaces, Definition 42.7.2 and Descent, Lemma 31.24.4. ☐

45.15. Properties of morphisms local in the syntomic toplogy on the source

Here are some properties of morphisms that are syntomic local on the source.

Lemma 45.15.1. *The property $\mathcal{P}(f) =$``f is syntomic'' is syntomic local on the source.*

Proof. Follows from Lemma 45.12.3 using Morphisms of Spaces, Definition 42.32.1 and Descent, Lemma 31.25.1. ☐

45.16. Properties of morphisms local in the smooth topology on the source

Here are some properties of morphisms that are smooth local on the source.

Lemma 45.16.1. *The property $\mathcal{P}(f) =$``f is smooth'' is smooth local on the source.*

Proof. Follows from Lemma 45.12.3 using Morphisms of Spaces, Definition 42.33.1 and Descent, Lemma 31.26.1. ☐

45.17. Properties of morphisms local in the étale topology on the source

Here are some properties of morphisms that are étale local on the source.

Lemma 45.17.1. *The property $\mathcal{P}(f)$ = "f is étale" is étale local on the source.*

Proof. Follows from Lemma 45.12.3 using Morphisms of Spaces, Definition 42.35.1 and Descent, Lemma 31.27.1. □

Lemma 45.17.2. *The property $\mathcal{P}(f)$ = "f is locally quasi-finite" is étale local on the source.*

Proof. Follows from Lemma 45.12.3 using Morphisms of Spaces, Definition 42.25.1 and Descent, Lemma 31.27.2. □

Lemma 45.17.3. *The property $\mathcal{P}(f)$ = "f is unramified" is étale local on the source.*

Proof. Follows from Lemma 45.12.3 using Morphisms of Spaces, Definition 42.34.1 and Descent, Lemma 31.27.3. □

45.18. Properties of morphisms smooth local on source-and-target

Let $\mathcal{P}$ be a property of morphisms of algebraic spaces. There is an intuitive meaning to the phrase "$\mathcal{P}$ is smooth local on the source and target". However, it turns out that this notion is not the same as asking $\mathcal{P}$ to be both smooth local on the source and smooth local on the target. We have discussed a similar phenomenon (for the étale topology and the category of schemes) in great detail in Descent, Section 31.28 (for a quick overview take a look at Descent, Remark 31.28.8). However, there is an important difference between the case of the smooth and the étale topology. To see this difference we encourage the reader to ponder the difference beween Descent, Lemma 31.28.4 and Lemma 45.18.2 as well as the difference between Descent, Lemma 31.28.5 and Lemma 45.18.3. Namely, in the étale setting the choice of the étale "covering" of the target is immaterial, whereas in the smooth setting it is not.

Definition 45.18.1. Let S be a scheme. Let $\mathcal{P}$ be a property of morphisms of algebraic spaces over S. We say $\mathcal{P}$ is *smooth local on source-and-target* if

1. (stable under precomposing with smooth maps) if $f : X \to Y$ is smooth and $g : Y \to Z$ has $\mathcal{P}$, then $g \circ f$ has $\mathcal{P}$,
2. (stable under smooth base change) if $f : X \to Y$ has $\mathcal{P}$ and $Y' \to Y$ is smooth, then the base change $f' : Y' \times_Y X \to Y'$ has $\mathcal{P}$, and
3. (locality) given a morphism $f : X \to Y$ the following are equivalent
   (a) f has $\mathcal{P}$,
   (b) for every $x \in |X|$ there exists a commutative diagram
$$\begin{tikzcd} U \arrow[r, "h"] \arrow[d, "a"] & V \arrow[d, "b"] \\ X \arrow[r, "f"] & Y \end{tikzcd}$$
   with smooth vertical arrows and $u \in |U|$ with $a(u) = x$ such that h has $\mathcal{P}$.

The above serves as our definition. In the lemmas below we will show that this is equivalent to $\mathcal{P}$ being local on the target, local on the source, and stable under post-composing by smooth morphisms.

Lemma 45.18.2. *Let S be a scheme. Let $\mathcal{P}$ be a property of morphisms of algebraic spaces over S which is smooth local on source-and-target. Then*

(1) *$\mathcal{P}$ is smooth local on the source,*
(2) *$\mathcal{P}$ is smooth local on the target,*
(3) *$\mathcal{P}$ is stable under postcomposing with smooth morphisms: if $f : X \to Y$ has $\mathcal{P}$ and $g : Y \to Z$ is smooth, then $g \circ f$ has $\mathcal{P}$, and*

Proof. We write everything out completely.

Proof of (1). Let $f : X \to Y$ be a morphism of algebraic spaces over S. Let $\{X_i \to X\}_{i \in I}$ be a smooth covering of X. If each composition $h_i : X_i \to Y$ has $\mathcal{P}$, then for each $|x| \in X$ we can find an $i \in I$ and a point $x_i \in |X_i|$ mapping to x. Then $(X_i, x_i) \to (X, x)$ is a smooth morphism of pairs, and $\mathrm{id}_Y : Y \to Y$ is a smooth morphism, and h_i is as in part (3) of Definition 45.18.1. Thus we see that f has $\mathcal{P}$. Conversely, if f has $\mathcal{P}$ then each $X_i \to Y$ has $\mathcal{P}$ by Definition 45.18.1 part (1).

Proof of (2). Let $f : X \to Y$ be a morphism of algebraic spaces over S. Let $\{Y_i \to Y\}_{i \in I}$ be a smooth covering of Y. Write $X_i = Y_i \times_Y X$ and $h_i : X_i \to Y_i$ for the base change of f. If each $h_i : X_i \to Y_i$ has $\mathcal{P}$, then for each $x \in |X|$ we pick an $i \in I$ and a point $x_i \in |X_i|$ mapping to x. Then $(X_i, x_i) \to (X, x)$ is a smooth morphism of pairs, $Y_i \to Y$ is smooth, and h_i is as in part (3) of Definition 45.18.1. Thus we see that f has $\mathcal{P}$. Conversely, if f has $\mathcal{P}$, then each $X_i \to Y_i$ has $\mathcal{P}$ by Definition 45.18.1 part (2).

Proof of (3). Assume $f : X \to Y$ has $\mathcal{P}$ and $g : Y \to Z$ is smooth. For every $x \in |X|$ we can think of $(X, x) \to (X, x)$ as a smooth morphism of pairs, $Y \to Z$ is a smooth morphism, and $h = f$ is as in part (3) of Definition 45.18.1. Thus we see that $g \circ f$ has $\mathcal{P}$. □

The following lemma is the analogue of Morphisms, Lemma 24.13.4.

Lemma 45.18.3. *Let S be a scheme. Let $\mathcal{P}$ be a property of morphisms of algebraic spaces over S which is smooth local on source-and-target. Let $f : X \to Y$ be a morphism of algebraic spaces over S. The following are equivalent:*

(a) *f has property $\mathcal{P}$,*
(b) *for every $x \in |X|$ there exists a smooth morphism of pairs $a : (U, u) \to (X, x)$, a smooth morphism $b : V \to Y$, and a morphism $h : U \to V$ such that $f \circ a = b \circ h$ and h has $\mathcal{P}$,*
(c) *for some commutative diagram*

$$\begin{tikzcd} U \arrow[r, "h"] \arrow[d, "a"'] & V \arrow[d, "b"] \\ X \arrow[r, "f"] & Y \end{tikzcd}$$

with a, b smooth and a surjective the morphism h has $\mathcal{P}$,
(d) *for any commutative diagram*

$$\begin{tikzcd} U \arrow[r, "h"] \arrow[d, "a"'] & V \arrow[d, "b"] \\ X \arrow[r, "f"] & Y \end{tikzcd}$$

with b smooth and $U \to X \times_Y V$ smooth the morphism h has $\mathcal{P}$,
(e) *there exists a smooth covering $\{Y_i \to Y\}_{i \in I}$ such that each base change $Y_i \times_Y X \to Y_i$ has $\mathcal{P}$,*
(f) *there exists a smooth covering $\{X_i \to X\}_{i \in I}$ such that each composition $X_i \to Y$ has $\mathcal{P}$,*

(g) *there exists a smooth covering* $\{Y_i \to Y\}_{i \in I}$ *and for each* $i \in I$ *a smooth covering* $\{X_{ij} \to Y_i \times_Y X\}_{j \in J_i}$ *such that each morphism* $X_{ij} \to Y_i$ *has* $\mathcal{P}$.

Proof. The equivalence of (a) and (b) is part of Definition 45.18.1. The equivalence of (a) and (e) is Lemma 45.18.2 part (2). The equivalence of (a) and (f) is Lemma 45.18.2 part (1). As (a) is now equivalent to (e) and (f) it follows that (a) equivalent to (g).

It is clear that (c) implies (b). If (b) holds, then for any $x \in |X|$ we can choose a smooth morphism of pairs $a_x : (U_x, u_x) \to (X, x)$, a smooth morphism $b_x : V_x \to Y$, and a morphism $h_x : U_x \to V_x$ such that $f \circ a_x = b_x \circ h_x$ and h_x has $\mathcal{P}$. Then $h = \coprod h_x : \coprod U_x \to \coprod V_x$ with $a = \coprod a_x$ and $b = \coprod b_x$ is a diagram as in (c). (Note that h has property $\mathcal{P}$ as $\{V_x \to \coprod V_x\}$ is a smooth covering and $\mathcal{P}$ is smooth local on the target.) Thus (b) is equivalent to (c).

Now we know that (a), (b), (c), (e), (f), and (g) are equivalent. Suppose (a) holds. Let U, V, a, b, h be as in (d). Then $X \times_Y V \to V$ has $\mathcal{P}$ as $\mathcal{P}$ is stable under smooth base change, whence $U \to V$ has $\mathcal{P}$ as $\mathcal{P}$ is stable under precomposing with smooth morphisms. Conversely, if (d) holds, then setting $U = X$ and $V = Y$ we see that f has $\mathcal{P}$. □

Lemma 45.18.4. *Let S be a scheme. Let $\mathcal{P}$ be a property of morphisms of algebraic spaces over S. Assume*

(1) *$\mathcal{P}$ is smooth local on the source,*
(2) *$\mathcal{P}$ is smooth local on the target, and*
(3) *$\mathcal{P}$ is stable under postcomposing with smooth morphisms: if $f : X \to Y$ has $\mathcal{P}$ and $Y \subset Z$ is a smooth morphism then $X \to Z$ has $\mathcal{P}$.*

Then $\mathcal{P}$ is smooth local on the source-and-target.

Proof. Let $\mathcal{P}$ be a property of morphisms of algebraic spaces which satisfies conditions (1), (2) and (3) of the lemma. By Lemma 45.12.2 we see that $\mathcal{P}$ is stable under precomposing with smooth morphisms. By Lemma 45.9.2 we see that $\mathcal{P}$ is stable under smooth base change. Hence it suffices to prove part (3) of Definition 45.18.1 holds.

More precisely, suppose that $f : X \to Y$ is a morphism of algebraic spaces over S which satisfies Definition 45.18.1 part (3)(b). In other words, for every $x \in X$ there exists a smooth morphism $a_x : U_x \to X$, a point $u_x \in |U_x|$ mapping to x, a smooth morphism $b_x : V_x \to Y$, and a morphism $h_x : U_x \to V_x$ such that $f \circ a_x = b_x \circ h_x$ and h_x has $\mathcal{P}$. The proof of the lemma is complete once we show that f has $\mathcal{P}$. Set $U = \coprod U_x$, $a = \coprod a_x$, $V = \coprod V_x$, $b = \coprod b_x$, and $h = \coprod h_x$. We obtain a commutative diagram

$$\begin{tikzcd} U \arrow[r, "h"] \arrow[d, "a"] & V \arrow[d, "b"] \\ X \arrow[r, "f"] & Y \end{tikzcd}$$

with a, b smooth, a surjective. Note that h has $\mathcal{P}$ as each h_x does and $\mathcal{P}$ is smooth local on the target. Because a is surjective and $\mathcal{P}$ is smooth local on the source, it suffices to prove that $b \circ h$ has $\mathcal{P}$. This follows as we assumed that $\mathcal{P}$ is stable under postcomposing with a smooth morphism and as b is smooth. □

Remark 45.18.5. Using Lemma 45.18.4 and the work done in the earlier sections of this chapter it is easy to make a list of types of morphisms which are smooth local on the source-and-target. In each case we list the lemma which implies the property is smooth local on the source and the lemma which implies the property is smooth local on the target. In each case the third assumption of Lemma 45.18.4 is trivial to check, and we omit it. Here is the list:

(1) flat, see Lemmas 45.13.1 and 45.10.11,
(2) locally of finite presentation, see Lemmas 45.14.1 and 45.10.8,
(3) locally finite type, see Lemmas 45.14.2 and 45.10.7,

CHAPTER 46

More on Morphisms of Spaces

46.1. Introduction

In this chapter we continue our study of properties of morphisms of algebraic spaces. A fundamental reference is [**Knu71a**].

46.2. Conventions

The standing assumption is that all schemes are contained in a big fppf site Sch_{fppf}. And all rings A considered have the property that $Spec(A)$ is (isomorphic) to an object of this big site.

Let S be a scheme and let X be an algebraic space over S. In this chapter and the following we will write $X \times_S X$ for the product of X with itself (in the category of algebraic spaces over S), instead of $X \times X$.

46.3. Radicial morphisms

It turns out that a radicial morphism is not the same thing as a universally injective morphism, contrary to what happens with morphisms of schemes. In fact it is a bit stronger.

Definition 46.3.1. Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. We say f is *radicial* if for any morphism $Spec(K) \to Y$ where K is a field the reduction $(Spec(K) \times_Y X)_{red}$ is either empty or representable by the spectrum of a purely inseparable field extension of K.

Lemma 46.3.2. *A radicial morphism of algebraic spaces is universally injective.*

Proof. Let S be a scheme. Let $f : X \to Y$ be a radicial morphism of algebraic spaces over S. It is clear from the definition that given a morphism $Spec(K) \to Y$ there is at most one lift of this morphism to a morphism into X. Hence we conclude that f is universally injective by Morphisms of Spaces, Lemma 42.18.2. □

Example 46.3.3. It is no longer true that universally injective is equivalent to radicial. For example the morphism

$$X = [Spec(\overline{\mathbf{Q}})/\mathrm{Gal}(\overline{\mathbf{Q}}/\mathbf{Q})] \longrightarrow S = Spec(\mathbf{Q})$$

of Spaces, Example 40.14.7 is universally injective, but is not radicial in the sense above.

Nonetheless it is often the case that the reverse implication holds.

Lemma 46.3.4. *Let S be a scheme. Let $f : X \to Y$ be a universally injective morphism of algebraic spaces over S.*

(1) *If f is decent then f is radicial.*
(2) *If f is quasi-separated then f is radicial.*
(3) *If f is locally separated then f is radicial.*

Proof. Let $\mathcal{P}$ be a property of morphisms of algebraic spaces which is stable under base change and composition and holds for closed immersions. Assume $f : X \to Y$ has $\mathcal{P}$ and is universally injective. Then, in the situation of Definition 46.3.1 the morphism $(Spec(K) \times_Y X)_{red} \to Spec(K)$ is universally injective and has $\mathcal{P}$. This reduces the problem of proving

$$\mathcal{P} + \text{universally injective} \Rightarrow \text{radicial}$$

to the problem of proving that any nonempty reduced algebraic space X over field whose structure morphism $X \to Spec(K)$ is universally injective and $\mathcal{P}$ is representable by the spectrum of a field. Namely, then $X \to Spec(K)$ will be a morphism of schemes and we conclude by the equivalence of radicial and universally injective for morphisms of schemes, see Morphisms, Lemma 24.10.2.

Let us prove (1). Assume f is decent and universally injective. By Decent Spaces, Lemmas 43.13.3, 43.13.4, and 43.13.2 (to see that an immersion is decent) we see that the discussion in the first pararagraph applies. Let X be a nonempty decent reduced algebraic space universally injective over a field K. In particular we see that $|X|$ is a singleton. By Decent Spaces, Lemma 43.11.1 we conclude that $X \cong Spec(L)$ for some extension $K \subset L$ as desired.

A quasi-separated morphism is decent, see Decent Spaces, Lemma 43.13.2. Hence (1) implies (2).

Let us prove (3). Recall that the separation axioms are stable under base change and composition and that closed immersions are separated, see Morphisms of Spaces, Lemmas 42.5.4, 42.5.8, and 42.14.7. Thus the discussion in the first paragraph of the proof applies. Let X be a reduced algebraic space universally injective and locally separated over a field K. In particular $|X|$ is a singleton hence X is quasi-compact, see Properties of Spaces, Lemma 41.5.2. We can find a surjective étale morphism $U \to X$ with U affine, see Properties of Spaces, Lemma 41.6.3. Consider the morphism of schemes

$$j : U \times_X U \longrightarrow U \times_{Spec(K)} U$$

As $X \to Spec(K)$ is universally injective j is surjective, and as $X \to Spec(K)$ is locally separated j is an immersion. A surjective immersion is a closed immersion, see Schemes, Lemma 21.10.4. Hence $R = U \times_X U$ is affine as a closed subscheme of an affine scheme. In particular R is quasi-compact. It follows that $X = U/R$ is quasi-separated, and the result follows from (2). □

Remark 46.3.5. Let $X \to Y$ be a morphism of algebraic spaces. For some applications (of radicial morphisms) it is enough to require that for every $Spec(K) \to Y$ where K is a field

(1) the space $|Spec(K) \times_Y X|$ is a singleton,
(2) there exists a monomorphism $Spec(L) \to Spec(K) \times_Y X$, and
(3) $K \subset L$ is purely inseparable.

If needed later we will may call such a morphism *weakly radicial*. For example if $X \to Y$ is a surjective weakly radicial morphism then $X(k) \to Y(k)$ is surjective for every algebraically closed field k. Note that the base change $X_{\overline{\mathbf{Q}}} \to Spec(\overline{\mathbf{Q}})$ of the morphism in Example 46.3.3 is weakly radicial, but not radicial. The analogue of Lemma 46.3.4 is that if $X \to Y$ has property (β) and is universally injective, then it is weakly radicial (proof omitted).

46.4. Morphisms of finite presentation

In this section we generalize Limits, Proposition 27.4.1 to morphisms of algebraic spaces. The motivation for the following definition comes from the proposition just cited.

Definition 46.4.1. Let S be a scheme.

(1) A functor $F : (Sch/S)_{fppf}^{opp} \to Sets$ is said to be *locally of finite presentation* or *limit preserving* if for every affine scheme T over S which is a limit $T = lim\, T_i$ of a directed inverse system of affine schemes T_i over S, we have
$$F(T) = colim\, F(T_i).$$
We sometimes say that F is *locally of finite presentation over S*.

(2) Let $F, G : (Sch/S)_{fppf}^{opp} \to Sets$. A transformation of functors $a : F \to G$ is *locally of finite presentation* if for every scheme T over S and every $y \in G(T)$ the functor
$$F_y : (Sch/T)_{fppf}^{opp} \longrightarrow Sets, \quad T'/T \longmapsto \{x \in F(T') \mid a(x) = y|_{T'}\}$$
is locally of finite presentation over T[1]. We sometimes say that F is *relatively limit preserving* over G.

The functor F_y is in some sense the fiber of $a : F \to G$ over y, except that it is a presheaf on the big fppf site of T. A formula for this functor is:

$$F_y = F|_{(Sch/T)_{fppf}} \times_{G|_{(Sch/T)_{fppf}}} * \tag{46.4.1.1}$$

Here $*$ is the final object in the category of (pre)sheaves on $(Sch/T)_{fppf}$ (see Sites, Example 9.10.2) and the map $* \to G|_{(Sch/T)_{fppf}}$ is given by y. Note that if $j : (Sch/T)_{fppf} \to (Sch/S)_{fppf}$ is the localization functor, then the formula above becomes $F_y = j^{-1}F \times_{j^{-1}G} *$ and $j_!F_y$ is just the fiber product $F \times_{G,y} T$. (See Sites, Section 9.21, for information on localization, and especially Sites, Remark 9.21.9 for information on $j_!$ for presheaves.)

At this point we temporarily have two definitions of what it means for a morphism $X \to Y$ of algebraic spaces over S to be locally of finite presentation. Namely, one by Morphisms of Spaces, Definition 42.26.1 and one using that $X \to Y$ is a transformation of functors so that Definition 46.4.1 applies. We will show in Proposition 46.4.9 that these two definitions agree.

Lemma 46.4.2. *Let S be a scheme. Let $a : F \to G$ be a transformation of functors $(Sch/S)_{fppf}^{opp} \to Sets$. The following are equivalent*

(1) *F is relatively limit preserving over G, and*

(2) *for every every affine scheme T over S which is a limit $T = lim\, T_i$ of a directed inverse system of affine schemes T_i over S the diagram of sets*
$$\begin{tikzcd} colim_i\, F(T_i) \arrow[r] \arrow[d, "a"] & F(T) \arrow[d, "a"] \\ colim_i\, G(T_i) \arrow[r] & G(T) \end{tikzcd}$$
is a fibre product diagram.

[1] The characterization (2) in Lemma 46.4.2 may be easier to parse.

Proof. Assume (1). Consider $T = lim_{i\in I} T_i$ as in (2). Let (y, x_T) be an element of the fibre product $colim_i\, G(T_i) \times_{G(T)} F(T)$. Then y comes from $y_i \in G(T_i)$ for some i. Consider the functor F_{y_i} on $(Sch/T_i)_{fppf}$ as in Definition 46.4.1. We see that $x_T \in F_{y_i}(T)$. Moreover $T = lim_{i'\geq i} T_{i'}$ is a directed system of affine schemes over T_i. Hence (1) implies that x_T the image of a unique element x of $colim_{i'\geq i} F_{y_i}(T_{i'})$. Thus x is the unique element of $colim\, F(T_i)$ which maps to the pair (y, x_T). This proves that (2) holds.

Assume (2). Let T be a scheme and $y_T \in G(T)$. We have to show that F_{y_T} is limit preserving. Let $T' = lim_{i\in I} T'_i$ be an affine scheme over T which is the directed limit of affine scheme T'_i over T. Let $x_{T'} \in F_{y_T}$. Pick $i \in I$ which is possible as I is a directed partially ordered set. Denote $y_i \in F(T'_i)$ the image of $y_{T'}$. Then we see that $(y_i, x_{T'})$ is an element of the fibre product $colim_i\, G(T'_i) \times_{G(T')} F(T')$. Hence by (2) we get a unique element x of $colim_i\, F(T'_i)$ mapping to $(y_i, x_{T'})$. It is clear that x defines an element of $colim_i\, F_y(T'_i)$ mapping to $x_{T'}$ and we win. □

Lemma 46.4.3. *Let S be a scheme contained in Sch_{fppf}. Let $F, G, H : (Sch/S)^{opp}_{fppf} \to Sets$. Let $a : F \to G$, $b : G \to H$ be transformations of functors. If a and b are locally of finite presentation, then*

$$b \circ a : F \longrightarrow H$$

is locally of finite presentation.

Proof. Let $T = lim_{i\in I} T_i$ as in characterization (2) of Lemma 46.4.2. Consider the diagram

$$\begin{tikzcd} colim_i\, F(T_i) \arrow[r] \arrow[d, "a"] & F(T) \arrow[d, "a"] \\ colim_i\, G(T_i) \arrow[r] \arrow[d, "b"] & G(T) \arrow[d, "b"] \\ colim_i\, H(T_i) \arrow[r] & H(T) \end{tikzcd}$$

By assumption the two squares are fibre product squares. Hence the outer rectangle is a fibre product diagram too which proves the lemma. □

Lemma 46.4.4. *Let S be a scheme contained in Sch_{fppf}. Let $F, G, H : (Sch/S)^{opp}_{fppf} \to Sets$. Let $a : F \to G$, $b : H \to G$ be transformations of functors. Consider the fibre product diagram*

$$\begin{tikzcd} H \times_{b,G,a} F \arrow[r, "b'"'] \arrow[d, "a'"] & F \arrow[d, "a"] \\ H \arrow[r, "b"] & G \end{tikzcd}$$

If a is locally of finite presentation, then the base change a' is locally of finite presentation.

Proof. Omitted. Hint: This is formal. □

Lemma 46.4.5. *Let T be an affine scheme which is written as a limit $T = lim_{i\in I} T_i$ of a directed inverse system of affine schemes.*

(1) *Let $\mathcal{V} = \{V_j \to T\}_{j=1,\ldots,m}$ be a standard fppf covering of T, see Topologies, Definition 30.7.5. Then there exists an index i and a standard fppf covering $\mathcal{V}_i = \{V_{i,j} \to T_i\}_{j=1,\ldots,m}$ whose base change $T \times_{T_i} \mathcal{V}_i$ to T is isomorphic to $\mathcal{V}$.*

(2) *Let $\mathcal{V}_i$, $\mathcal{V}'_i$ be a pair of standard fppf coverings of T_i. If $f : T \times_{T_i} \mathcal{V} \to T \times_{T_i} \mathcal{V}'_i$ is a morphism of coverings of T, then there exists an index $i' \geq i$ and a morphism $f_{i'} : T_{i'} \times_{T_i} \mathcal{V} \to T_{i'} \times_{T_i} \mathcal{V}'_i$ whose base change to T is f.*

(3) *If $f, g : \mathcal{V} \to \mathcal{V}'_i$ are morphisms of standard fppf coverings of T_i whose base changes f_T, g_T to T are equal then there exists an index $i' \geq i$ such that $f_{T_{i'}} = g_{T_{i'}}$.*

In other words, the category of standard fppf coverings of T is the colimit over I of the categories of standard fppf coverings of T_i

Proof. By Limits, Lemma 27.6.1 the category of schemes of finite presentation over T is the colimit over I of the categories of finite presentation over T_i. By Limits, Lemmas 27.6.2 and 27.6.3 the same is true for category of schemes which are affine, flat and of finite presentation over T. To finish the proof of the lemma it suffices to show that if $\{V_{j,i} \to T_i\}_{j=1,\ldots,m}$ is a finite family of flat finitely presented morphisms with $V_{j,i}$ affine, and the base change $\coprod_j T \times_{T_i} V_{j,i} \to T$ is surjective, then for some $i' \geq i$ the morphism $\coprod T_{i'} \times_{T_i} V_{j,i} \to T_{i'}$ is surjective. Denote $W_{i'} \subset T_{i'}$, resp. $W \subset T$ the image. Of course $W = T$ by assumption. Since the morphisms are flat and of finite presentation we see that W_i is a quasi-compact open of T_i, see Morphisms, Lemma 24.24.9. Moreover, $W = T \times_{T_i} W_i$ (formation of image commutes with base change). Hence by Limits, Lemma 27.3.5 we conclude that $W_{i'} = T_{i'}$ for some large enough i' and we win. □

Lemma 46.4.6. *Let S be a scheme contained in Sch_{fppf}. Let $F : (Sch/S)_{fppf}^{opp} \to Sets$ be a functor. If F is locally of finite presentation over S then its sheafification $F^\#$ is locally of finite presentation over S.*

Proof. Assume F is locally of finite presentation. It suffices to show that F^+ is locally of finite presentation, since $F^\# = (F^+)^+$, see Sites, Theorem 9.10.10. Let T be an affine scheme over S, and let $T = lim T_i$ be written as the directed limit of an inverse system of affine S schemes. Recall that $F^+(T)$ is the colimit of $\check{H}^0(\mathcal{V}, F)$ where the limit is over all coverings of T in $(Sch/S)_{fppf}$. Any fppf covering of an affine scheme can be refined by a standard fppf covering, see Topologies, Lemma 30.7.4. Hence we can write

$$F^+(T) = colim_{\mathcal{V} \text{ standard covering } T} \check{H}^0(\mathcal{V}, F).$$

By Lemma 46.4.5 we may rewrite this as

$$colim_{i \in I}\, colim_{\mathcal{V}_i \text{ standard covering } T_i} \check{H}^0(T \times_{T_i} \mathcal{V}_i, F).$$

(The order of the colimits is irrelevant by Categories, Lemma 4.13.9.) Given a standard fppf covering $\mathcal{V}_i = \{V_j \to T_i\}_{j=1,\ldots,m}$ of T_i we see that

$$T \times_{T_i} V_j = lim_{i' \geq i} T_{i'} \times_T V_j$$

by Limits, Lemma 27.2.4, and similarly

$$T \times_{T_i} (V_j \times_{T_i} V_{j'}) = lim_{i' \geq i} T_{i'} \times_T (V_j \times_{T_i} V_{j'}).$$

As the presheaf F is locally of finite presentation this means that

$$\check{H}^0(T \times_{T_i} \mathcal{V}_i, F) = colim_{i' \geq i} \check{H}^0(T_{i'} \times_{T_i} \mathcal{V}_i, F).$$

Hence the colimit expression for $F^+(T)$ above collapses to

$$colim_{i \in I}\, colim_{\mathcal{V} \text{ standard covering } T_i} \check{H}^0(\mathcal{V}, F). = colim_{i \in I} F^+(T_i).$$

In other words $F^+(T) = colim_i F^+(T_i)$ and hence the lemma holds. □

Lemma 46.4.7. *Let S be a scheme. Let $F : (Sch/S)_{fppf}^{opp} \to Sets$ be a functor. Assume that*

(1) *F is a sheaf, and*
(2) *there exists an fppf covering $\{U_j \to S\}_{j\in J}$ such that $F|_{(Sch/U_j)_{fppf}}$ is locally of finite presentation.*

Then F is locally of finite presentation.

Proof. Let T be an affine scheme over S. Let I be a directed partially ordered set, and let T_i be an inverse system of affine schemes over S such that $T = lim\, T_i$. We have to show that the canonical map $colim\, F(T_i) \to F(T)$ is bijective.

Choose some $0 \in I$ and choose a standard fppf covering $\{V_{0,k} \to T_0\}_{k=1,\ldots,m}$ which refines the pullback $\{U_j \times_S T_0 \to T_0\}$ of the given fppf covering of S. For each $i \geq 0$ we set $V_{i,k} = T_i \times_{T_0} V_{0,k}$, and we set $V_k = T \times_{T_0} V_{0,k}$. Note that $V_k = lim_{i\geq 0} V_{i,k}$, see Limits, Lemma 27.2.4.

Suppose that $x, x' \in colim\, F(T_i)$ map to the same element of $F(T)$. Say x, x' are given by elements $x_i, x_i' \in F(T_i)$ for some $i \in I$ (we may choose the same i for both as I is directed). By assumption (2) and the fact that x_i, x_i' map to the same element of $F(T)$ this implies that

$$x_i|_{V_{i',k}} = x_i'|_{V_{i',k}}$$

for some suitably large $i' \in I$. We can choose the same i' for each k as $k \in \{1, \ldots, m\}$ ranges over a finite set. Since $\{V_{i',k} \to T_{i'}\}$ is an fppf covering and F is a sheaf this implies that $x_i|_{T_{i'}} = x_i'|_{T_{i'}}$ as desired. This proves that the map $colim\, F(T_i) \to F(T)$ is injective.

To show surjectivity we argue in a similar fashion. Let $x \in F(T)$. By assumption (2) for each k we can choose a i such that $x|_{V_k}$ comes from an element $x_{i,k} \in F(V_{i,k})$. As before we may choose a single i which works for all k. By the injectivity proved above we see that

$$x_{i,k}|_{V_{i',k}\times_{T_{i'}} V_{i',l}} = x_{i,l}|_{V_{i',k}\times_{T_{i'}} V_{i',l}}$$

for some large enough i'. Hence by the sheaf condition of F the elements $x_{i,k}|_{V_{i',k}}$ glue to an element $x_{i'} \in F(T_{i'})$ as desired. □

Lemma 46.4.8. *Let S be a scheme contained in Sch_{fppf}. Let $F, G : (Sch/S)_{fppf}^{opp} \to Sets$ be functors. If $a : F \to G$ is a transformation which is locally of finite presentation, then the induced transformation of sheaves $F^\# \to G^\#$ is of finite presentation.*

Proof. Suppose that T is a scheme and $y \in G^\#(T)$. We have to show the functor $F^\#_y : (Sch/T)_{fppf}^{opp} \to Sets$ constructed from $F^\# \to G^\#$ and y as in Definition 46.4.1 is locally of finite presentation. By Equation (46.4.1.1) we see that $F^\#_y$ is a sheaf. Choose an fppf covering $\{V_j \to T\}_{j\in J}$ such that $y|_{V_j}$ comes from an element $y_j \in F(V_j)$. Note that the restriction of $F^\#$ to $(Sch/V_j)_{fppf}$ is just $F^\#_{y_j}$. If we can show that $F^\#_{y_j}$ is locally of finite presentation then Lemma 46.4.7 garantees that $F^\#_y$ is locally of finite presentation and we win. This reduces us to the case $y \in G(T)$.

Let $y \in G(T)$. In this case we claim that $F^\#_y = (F_y)^\#$. This follows from Equation (46.4.1.1). Thus this case follows from Lemma 46.4.6. □

Proposition 46.4.9. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. The following are equivalent:*

(1) *The morphism f is a morphism of algebraic spaces which is locally of finite presentation, see Morphisms of Spaces, Definition 42.26.1.*

(2) *The morphism $f : X \to Y$ is locally of finite presentation as a transformation of functors, see Definition 46.4.1.*

Proof. Assume (1). Let T be a scheme and let $y \in Y(T)$. We have to show that $T \times_X Y$ is locally of finite presentation over T in the sense of Definition 46.4.1. Hence we are reduced to proving that if X is an algebraic space which is locally of finite presentation over S as an algebraic space, then it is locally of finite presentation as a functor $X : (Sch/S)_{fppf}^{opp} \to Sets$. To see this choose a presentation $X = U/R$, see Spaces, Definition 40.9.3. It follows from Morphisms of Spaces, Definition 42.26.1 that both U and R are schemes which are locally of finite presentation over S. Hence by Limits, Proposition 27.4.1 we have

$$U(T) = colim\, U(T_i), \quad R(T) = colim\, R(T_i)$$

whenever $T = lim_i T_i$ in $(Sch/S)_{fppf}$. It follows that the presheaf

$$(Sch/S)_{fppf}^{opp} \longrightarrow Sets, \quad W \longmapsto U(W)/R(W)$$

is locally of finite presentation. Hence by Lemma 46.4.6 its sheafification $X = U/R$ is locally of finite presentation too.

Assume (2). Choose a scheme V and a surjective étale morphism $V \to Y$. Next, choose a scheme U and a surjective étale morphism $U \to V \times_Y X$. By Lemma 46.4.4 the transformation of functors $V \times_Y X \to V$ is locally of finite presentation. By Morphisms of Spaces, Lemma 42.35.8 the morphism of algebraic spaces $U \to V \times_Y X$ is locally of finite presentation, hence locally of finite presentation as a transformation of functors by the first part of the proof. By Lemma 46.4.3 the composition $U \to V \times_Y X \to V$ is locally of finite presentation as a transformation of functors. Hence the morphism of schemes $U \to V$ is locally of finite presentation by Limits, Proposition 27.4.1 (modulo a set theoretic remark, see last paragraph of the proof). This means, by definition, that (1) holds.

Set theoretic remark. Let $U \to V$ be a morphism of $(Sch/S)_{fppf}$. In the statement of Limits, Proposition 27.4.1 we characterize $U \to V$ as being locally of finite presentation if for *all* directed inverse systems $(T_i, f_{ii'})$ of affine schemes over V we have $U(T) = colim\, V(T_i)$, but in the current setting we may only consider affine schemes T_i over V which are (isomorphic to) an object of $(Sch/S)_{fppf}$. So we have to make sure that there are enough affines in $(Sch/S)_{fppf}$ to make the proof work. Inspecting the proof of (2) ⇒ (1) of Limits, Proposition 27.4.1 we see that the question reduces to the case that U and V are affine. Say $U = Spec(A)$ and $V = Spec(B)$. By construction of $(Sch/S)_{fppf}$ the spectrum of any ring of cardinality $\leq |B|$ is isomorphic to an object of $(Sch/S)_{fppf}$. Hence it suffices to observe that in the "only if" part of the proof of Algebra, Lemma 7.118.2 only A-algebras of cardinality $\leq |B|$ are used. □

Remark 46.4.10. Here is an important special case of Proposition 46.4.9. Let S be a scheme. Let X be an algebraic space over S. Then X is locally of finite presentation over S if and only if X, as a functor $(Sch/S)^{opp} \to Sets$, is limit preserving. Compare with Limits, Remark 27.4.2.

46.5. Conormal sheaf of an immersion

Let S be a scheme. Let $i : Z \to X$ be a closed immersion of algebraic spaces over S. Let $\mathcal{I} \subset \mathcal{O}_X$ be the corresponding quasi-coherent sheaf of ideals, see Morphisms of Spaces, Lemma 42.16.1. Consider the short exact sequence

$$0 \to \mathcal{I}^2 \to \mathcal{I} \to \mathcal{I}/\mathcal{I}^2 \to 0$$

of quasi-coherent sheaves on X. Since the sheaf $\mathcal{I}/\mathcal{I}^2$ is annihilated by $\mathcal{I}$ it corresponds to a sheaf on Z by Morphisms of Spaces, Lemma 42.17.1. This quasi-coherent $\mathcal{O}_Z$-module is the *conormal sheaf of Z in X* and is often denoted $\mathcal{I}/\mathcal{I}^2$ by the abuse of notation mentioned in Morphisms of Spaces, Section 42.17.

In case $i : Z \to X$ is a (locally closed) immersion we define the conormal sheaf of i as the conormal sheaf of the closed immersion $i : Z \to X \setminus \partial Z$, see Morphisms of Spaces, Remark 42.4.3. It is often denoted $\mathcal{I}/\mathcal{I}^2$ where $\mathcal{I}$ is the ideal sheaf of the closed immersion $i : Z \to X \setminus \partial Z$.

Definition 46.5.1. Let $i : Z \to X$ be an immersion. The *conormal sheaf $\mathcal{C}_{Z/X}$ of Z in X* or the *conormal sheaf of i* is the quasi-coherent $\mathcal{O}_Z$-module $\mathcal{I}/\mathcal{I}^2$ described above.

In [**DG67**, IV Definition 16.1.2] this sheaf is denoted $\mathcal{N}_{Z/X}$. We will not follow this convention since we would like to reserve the notation $\mathcal{N}_{Z/X}$ for the *normal sheaf of the immersion*. It is defined as

$$\mathcal{N}_{Z/X} = \mathcal{H}om_{\mathcal{O}_Z}(\mathcal{C}_{Z/X}, \mathcal{O}_Z) = \mathcal{H}om_{\mathcal{O}_Z}(\mathcal{I}/\mathcal{I}^2, \mathcal{O}_Z)$$

provided the conormal sheaf is of finite presentation (otherwise the normal sheaf may not even be quasi-coherent). We will come back to the normal sheaf later (insert future reference here).

Lemma 46.5.2. *Let S be a scheme. Let $i : Z \to X$ be an immersion. Let $\varphi : U \to X$ be an étale morphism where U is a scheme. Set $Z_U = U \times_X Z$ which is a locally closed subscheme of U. Then*

$$\mathcal{C}_{Z/X}|_{Z_U} = \mathcal{C}_{Z_U/U}$$

canonically and functorially in U.

Proof. Let $T \subset X$ be a closed subspace such that i defines a closed immersion into $X \setminus T$. Let $\mathcal{I}$ be the quasi-coherent sheaf of ideals on $X \setminus T$ defining Z. Then the lemma just states that $\mathcal{I}|_{U \setminus \varphi^{-1}(T)}$ is the sheaf of ideals of the immersion $Z' \to U \setminus \varphi^{-1}(T)$. This is clear from the construction of $\mathcal{I}$ in Morphisms of Spaces, Lemma 42.16.1. $\square$

Lemma 46.5.3. *Let S be a scheme. Let*

$$\begin{tikzcd} Z \arrow[r, "i"] \arrow[d, "f"'] & X \arrow[d, "g"] \\ Z' \arrow[r, "i'"] & X' \end{tikzcd}$$

be a commutative diagram of algebraic spaces over S. Assume i, i' immersions. There is a canonical map of $\mathcal{O}_Z$-modules

$$f^*\mathcal{C}_{Z'/X'} \longrightarrow \mathcal{C}_{Z/X}$$

Proof. First find open subspaces $U' \subset X'$ and $U \subset X$ such that $g(U) \subset U'$ and such that $i(Z) \subset U$ and $i(Z') \subset U'$ are closed (proof existence omitted). Replacing X by U and X' by U' we may assume that i and i' are closed immersions. Let $\mathcal{I}' \subset \mathcal{O}_{X'}$ and $\mathcal{I} \subset \mathcal{O}_X$ be the quasi-coherent sheaves of ideals associated to i' and i, see Morphisms of Spaces, Lemma 42.16.1. Consider the composition

$$g^{-1}\mathcal{I}' \to g^{-1}\mathcal{O}_{X'} \xrightarrow{g^\sharp} \mathcal{O}_X \to \mathcal{O}_X/\mathcal{I} = i_*\mathcal{O}_Z$$

Since $g(i(Z)) \subset Z'$ we conclude this composition is zero (see statement on factorizations in Morphisms of Spaces, Lemma 42.16.1). Thus we obtain a commutative diagram

$$\begin{tikzcd} 0 \arrow[r] & \mathcal{I} \arrow[r] & \mathcal{O}_X \arrow[r] & i_*\mathcal{O}_Z \arrow[r] & 0 \\ 0 \arrow[r] & g^{-1}\mathcal{I}' \arrow[r] \arrow[u] & g^{-1}\mathcal{O}_{X'} \arrow[r] \arrow[u] & g^{-1}i'_*\mathcal{O}_{Z'} \arrow[r] \arrow[u] & 0 \end{tikzcd}$$

The lower row is exact since g^{-1} is an exact functor. By exactness we also see that $(g^{-1}\mathcal{I}')^2 = g^{-1}((\mathcal{I}')^2)$. Hence the diagram induces a map $g^{-1}(\mathcal{I}'/(\mathcal{I}')^2) \to \mathcal{I}/\mathcal{I}^2$. Pulling back (using i^{-1} for example) to Z we obtain $i^{-1}g^{-1}(\mathcal{I}'/(\mathcal{I}')^2) \to \mathcal{C}_{Z/X}$. Since $i^{-1}g^{-1} = f^{-1}(i')^{-1}$ this gives a map $f^{-1}\mathcal{C}_{Z'/X'} \to \mathcal{C}_{Z/X}$, which induces the desired map. $\square$

Lemma 46.5.4. *Let S be a scheme. The conormal sheaf of Definition 46.5.1, and its functoriality of Lemma 46.5.3 satisfy the following properties:*

1. *If $Z \to X$ is an immersion of schemes over S, then the conormal sheaf agrees with the one from Morphisms, Definition 24.31.1.*
2. *If in Lemma 46.5.3 all the spaces are schemes, then the map $f^*\mathcal{C}_{Z'/X'} \to \mathcal{C}_{Z/X}$ is the same as the one constructed in Morphisms, Lemma 24.31.3.*
3. *Given a commutative diagram*

$$\begin{tikzcd} Z \arrow[r, "i"'] \arrow[d, "f"'] & X \arrow[d, "g"] \\ Z' \arrow[r, "i'"] \arrow[d, "f'"'] & X' \arrow[d, "g'"] \\ Z'' \arrow[r, "i''"] & X'' \end{tikzcd}$$

then the map $(f' \circ f)^*\mathcal{C}_{Z''/X''} \to \mathcal{C}_{Z/X}$ is the same as the composition of $f^*\mathcal{C}_{Z'/X'} \to \mathcal{C}_{Z/X}$ with the pullback by f of $(f')^*\mathcal{C}_{Z''/X''} \to \mathcal{C}_{Z'/X'}$

Proof. Omitted. Note that Part (1) is a special case of Lemma 46.5.2. $\square$

Lemma 46.5.5. *Let S be a scheme. Let*

$$\begin{tikzcd} Z \arrow[r, "i"'] \arrow[d, "f"'] & X \arrow[d, "g"] \\ Z' \arrow[r, "i'"] & X' \end{tikzcd}$$

be a fibre product diagram of algebraic spaces over S. Assume i, i' immersions. Then the canonical map $f^*\mathcal{C}_{Z'/X'} \to \mathcal{C}_{Z/X}$ of Lemma 46.5.3 is surjective. If g is flat, then it is an isomorphism.

Proof. Choose a commutative diagram

$$\begin{tikzcd} U \arrow[r] \arrow[d] & X \arrow[d] \\ U' \arrow[r] & X' \end{tikzcd}$$

where U, U' are schemes and the horizontal arrows are surjective and étale, see Spaces, Lemma 40.11.4. Then using Lemmas 46.5.2 and 46.5.4 we see that the question reduces to the case of a morphism of schemes. In the schemes case this is Morphisms, Lemma 24.31.4. ☐

Lemma 46.5.6. *Let S be a scheme. Let $Z \to Y \to X$ be immersions of algebraic spaces. Then there is a canonical exact sequence*

$$i^*\mathcal{C}_{Y/X} \to \mathcal{C}_{Z/X} \to \mathcal{C}_{Z/Y} \to 0$$

where the maps come from Lemma 46.5.3 and $i : Z \to Y$ is the first morphism.

Proof. Let U be a scheme and let $U \to X$ be a surjective étale morphism. Via Lemmas 46.5.2 and 46.5.4 the exactness of the sequence translates immediately into the exactness of the corresponding sequence for the immersions of schemes $Z \times_X U \to Y \times_X U \to U$. Hence the lemma follows from Morphisms, Lemma 24.31.5. ☐

46.6. Sheaf of differentials of a morphism

We suggest the reader take a look at the corresponding section in the chapter on commutative algebra (Algebra, Section 7.122), the corresponding section in the chapter on morphism of schemes (Morphisms, Section 24.32) as well as Modules on Sites, Section 16.29. We first show that the notion of sheaf of differentials for a morphism of schemes agrees with the corresponding morphism of small étale (ringed) sites.

To clearly state the following lemma we temporarily go back to denoting $\mathcal{F}^a$ the sheaf of $\mathcal{O}_{X_{étale}}$-modules associated to a quasi-coherent $\mathcal{O}_X$-module $\mathcal{F}$ on the scheme X, see Descent, Definition 31.6.2.

Lemma 46.6.1. *Let $f : X \to Y$ be a morphism of schemes. Let $f_{small} : X_{étale} \to Y_{étale}$ be the associated morphism of small étale sites, see Descent, Remark 31.6.4. Then there is a canonical isomorphism*

$$(\Omega_{X/Y})^a = \Omega_{X_{étale}/Y_{étale}}$$

compatible with universal derivations. Here the first module is the sheaf on $X_{étale}$ associated to the quasi-coherent $\mathcal{O}_X$-module $\Omega_{X/Y}$, see Morphisms, Definition 24.32.4, and the second module is the one from Modules on Sites, Definition 16.29.3.

Proof. Let $h : U \to X$ be an étale morphism. In this case the natural map $h^*\Omega_{X/Y} \to \Omega_{U/Y}$ is an isomorphism, see More on Morphisms, Lemma 33.7.7. This means that there is a natural $\mathcal{O}_{Y_{étale}}$-derivation

$$\mathrm{d}^a : \mathcal{O}_{X_{étale}} \longrightarrow (\Omega_{X/Y})^a$$

since we have just seen that the value of $(\Omega_{X/Y})^a$ on any object U of $X_{étale}$ is canonically identified with $\Gamma(U, \Omega_{U/Y})$. By the universal property of $\mathrm{d}_{X/Y} : \mathcal{O}_{X_{étale}} \to \Omega_{X_{étale}/Y_{étale}}$ there is a unique $\mathcal{O}_{X_{étale}}$-linear map $c : \Omega_{X_{étale}/Y_{étale}} \to (\Omega_{X/Y})^a$ such that $\mathrm{d}^a = c \circ \mathrm{d}_{X/Y}$.

Conversely, suppose that $\mathcal{F}$ is an $\mathcal{O}_{X_{étale}}$-module and $D : \mathcal{O}_{X_{étale}} \to \mathcal{F}$ is a $\mathcal{O}_{Y_{étale}}$-derivation. Then we can simply restrict D to the small Zariski site X_{Zar} of X. Since sheaves on X_{Zar} agree with sheaves on X, see Descent, Remark 31.6.3, we see that $D|_{X_{Zar}} : \mathcal{O}_X \to \mathcal{F}|_{X_{Zar}}$ is just a ``usual" Y-derivation. Hence we obtain a map $\psi : \Omega_{X/Y} \longrightarrow \mathcal{F}|_{X_{Zar}}$ such that $D|_{X_{Zar}} = \psi \circ \mathrm{d}$. In particular, if we apply this with $\mathcal{F} = \Omega_{X_{étale}/Y_{étale}}$ we obtain a map

$$c' : \Omega_{X/Y} \longrightarrow \Omega_{X_{étale}/Y_{étale}}|_{X_{Zar}}$$

Denote $\mathrm{id}_{étale,Zar} : X_{étale} \to X_{Zar}$ the morphism of ringed sites discussed in Descent, Remark 31.6.4 and Lemma 31.6.5. Since the restriction functor $\mathcal{F} \mapsto \mathcal{F}|_{X_{Zar}}$ is equal to

$\mathrm{id}_{\acute{e}tale,Zar,*}$, since $\mathrm{id}_{\acute{e}tale,Zar}^*$ is left adjoint to $\mathrm{id}_{\acute{e}tale,Zar,*}$ and since $(\Omega_{X/Y})^a = \mathrm{id}_{\acute{e}tale,Zar}^*\Omega_{X/Y}$ we see that c' is adjoint to a map

$$c'' : (\Omega_{X/Y})^a \longrightarrow \Omega_{X_{\acute{e}tale}/Y_{\acute{e}tale}}.$$

We claim that c'' and c' are mutually inverse. This claim finishes the proof of the lemma. To see this it is enough to show that $c''(\mathrm{d}(f)) = \mathrm{d}_{X/Y}(f)$ and $c(\mathrm{d}_{X/Y}(f)) = \mathrm{d}(f)$ if f is a local section of $\mathcal{O}_X$ over an open of X. We omit the verification. □

This clears the way for the following definition. For an alternative, see Remark 46.6.5.

Definition 46.6.2. Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. The *sheaf of differentials* $\Omega_{X/Y}$ *of* X *over* Y is sheaf of differentials (Modules on Sites, Definition 16.29.6) for the morphism of ringed topoi

$$(f_{small}, f^\sharp) : (X_{\acute{e}tale}, \mathcal{O}_X) \to (Y_{\acute{e}tale}, \mathcal{O}_Y)$$

of Properties of Spaces, Lemma 41.18.3. The *universal Y-derivation* will be denoted $\mathrm{d}_{X/Y} : \mathcal{O}_X \to \Omega_{X/Y}$.

By Lemma 46.6.1 this does not conflict with the already existing notion in case X and Y are representable. From now on, if X and Y are representable, we no longer distinguish between the sheaf of differentials defined above and the one defined in Morphisms, Definition 24.32.4. We want to relate this to the usual modules of differentials for morphisms of schemes. Here is the key lemma.

Lemma 46.6.3. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Consider any commutative diagram*

$$\begin{tikzcd} U \arrow[r, "\psi"'] \arrow[d, "a"'] & V \arrow[d, "b"] \\ X \arrow[r, "f"] & Y \end{tikzcd}$$

where the vertical arrows are étale morphisms of algebraic spaces. Then

$$\Omega_{X/Y}|_{U_{\acute{e}tale}} = \Omega_{U/V}$$

In particular, if U, V are schemes, then this is equal to the usual sheaf of differentials of the morphism of schemes $U \to V$.

Proof. By Properties of Spaces, Lemma 41.15.10 and Equation (41.15.10.1) we may think of the restriction of a sheaf on $X_{\acute{e}tale}$ to $U_{\acute{e}tale}$ as the pullback by a_{small}. Similarly for b. By Modules on Sites, Lemma 16.29.4 we have

$$\Omega_{X/Y}|_{U_{\acute{e}tale}} = \Omega_{\mathcal{O}_{U_{\acute{e}tale}}/a_{small}^{-1}f_{small}^{-1}\mathcal{O}_{Y_{\acute{e}tale}}}$$

Since $a_{small}^{-1}f_{small}^{-1}\mathcal{O}_{Y_{\acute{e}tale}} = \psi_{small}^{-1}b_{small}^{-1}\mathcal{O}_{Y_{\acute{e}tale}} = \psi_{small}^{-1}\mathcal{O}_{V_{\acute{e}tale}}$ we see that the lemma holds. □

Lemma 46.6.4. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Then $\Omega_{X/Y}$ is a quasi-coherent $\mathcal{O}_X$-module.*

Proof. Choose a diagram as in Lemma 46.6.3 with a and b surjective and U and V schemes. Then we see that $\Omega_{X/Y}|_U = \Omega_{U/V}$ which is quasi-coherent by Morphisms, Definition 24.32.4. Hence we conclude that $\Omega_{X/Y}$ is quasi-coherent by Properties of Spaces, Lemma 41.26.6. □

Remark 46.6.5. Now that we know that $\Omega_{X/Y}$ is quasi-coherent we can attempt to construct it in another manner. For example we can use the result of Properties of Spaces, Section 41.29 to construct the sheaf of differentials by glueing. For example if Y is a scheme and if $U \to X$ is a surjective étale morphism from a scheme towards X, then we see that $\Omega_{U/Y}$ is a quasi-coherent $\mathcal{O}_U$-module, and since $s, t : R \to U$ are étale we get an isomorphism

$$\alpha : s^*\Omega_{U/Y} \to \Omega_{R/Y} \to t^*\Omega_{U/Y}$$

by using Morphisms, Lemma 24.33.16. You check that this satisfies the cocycle condition and you're done. If Y is not a scheme, then you define $\Omega_{U/Y}$ as the cokernel of the map $(U \to Y)^*\Omega_{Y/S} \to \Omega_{U/S}$, and proceed as before. This two step process is a little bit ugly. Another possibility is to glue the sheaves $\Omega_{U/V}$ for any diagram as in Lemma 46.6.3 but this is not very elegant either. Both approaches will work however, and will give a slightly more elementary construction of the sheaf of differentials.

Lemma 46.6.6. *Let S be a scheme. Let*

$$\begin{tikzcd} X' \arrow[r, "f"] \arrow[d] & X \arrow[d] \\ Y' \arrow[r] & Y \end{tikzcd}$$

be a commutative diagram of algebraic spaces. The map $f^\sharp : \mathcal{O}_X \to f_*\mathcal{O}_{X'}$ composed with the map $f_*d_{X'/Y'} : f_*\mathcal{O}_{X'} \to f_*\Omega_{X'/Y'}$ is a Y-derivation. Hence we obtain a canonical map of $\mathcal{O}_X$-modules $\Omega_{X/Y} \to f_*\Omega_{X'/Y'}$, and by adjointness of f_* and f^* a canonical $\mathcal{O}_{X'}$-module homomorphism

$$c_f : f^*\Omega_{X/Y} \longrightarrow \Omega_{X'/Y'}.$$

It is uniquely characterized by the property that $f^*d_{X/Y}(t)$ mapsto $d_{X'/Y'}(f^*t)$ for any local section t of $\mathcal{O}_X$.

Proof. This is a special case of Modules on Sites, Lemma 16.29.7. □

Lemma 46.6.7. *Let S be a scheme. Let*

$$\begin{tikzcd} X'' \arrow[r, "g"] \arrow[d] & X' \arrow[r, "f"] \arrow[d] & X \arrow[d] \\ Y'' \arrow[r] & Y' \arrow[r] & Y \end{tikzcd}$$

be a commutative diagram of algebraic spaces over S. Then we have

$$c_{f\circ g} = c_g \circ g^*c_f$$

as maps $(f \circ g)^*\Omega_{X/Y} \to \Omega_{X''/Y''}$.

Proof. Omitted. Hint: Use the characterization of $c_f, c_g, c_{f\circ g}$ in terms of the effect these maps have on local sections. □

Lemma 46.6.8. *Let S be a scheme. Let $f : X \to Y$, $g : Y \to B$ be morphisms of algebraic spaces over S. Then there is a canonical exact sequence*

$$f^*\Omega_{Y/B} \to \Omega_{X/B} \to \Omega_{X/Y} \to 0$$

where the maps come from applications of Lemma 46.6.6.

Proof. Follows from the schemes version, see Morphisms, Lemma 24.32.11, of this result via étale localization, see Lemma 46.6.3. □

Lemma 46.6.9. *Let S be a scheme. If $X \to Y$ is an immersion of algebraic spaces over S then $\Omega_{X/S}$ is zero.*

Proof. Follows from the schemes version, see Morphisms, Lemma 24.32.16, of this result via étale localization, see Lemma 46.6.3. □

Lemma 46.6.10. *Let S be a scheme. Let B be an algebraic space over S. Let $i : Z \to X$ be an immersion of algebraic spaces over B. There is a canonical exact sequence*

$$\mathcal{C}_{Z/X} \to i^*\Omega_{X/B} \to \Omega_{Z/B} \to 0$$

where the first arrow is induced by $\mathrm{d}_{X/B}$ and the second arrow comes from Lemma 46.6.6.

Proof. This is the algebraic spaces version of Morphisms, Lemma 24.32.17 and will be a consequence of that lemma by étale localization, see Lemmas 46.6.3 and 46.5.2. However, we should make sure we can define the first arrow globally. Hence we explain the meaning of ``induced by $\mathrm{d}_{X/B}$'' here. Namely, we may assume that i is a closed immersion after replacing X by an open subspace. Let $\mathcal{I} \subset \mathcal{O}_X$ be the quasi-coherent sheaf of ideals corresponding to $Z \subset X$. Then $\mathrm{d}_{X/S} : \mathcal{I} \to \Omega_{X/S}$ maps the subsheaf $\mathcal{I}^2 \subset \mathcal{I}$ to $\mathcal{I}\Omega_{X/S}$. Hence it induces a map $\mathcal{I}/\mathcal{I}^2 \to \Omega_{X/S}/\mathcal{I}\Omega_{X/S}$ which is $\mathcal{O}_X/\mathcal{I}$-linear. By Morphisms of Spaces, Lemma 42.17.1 this corresponds to a map $\mathcal{C}_{Z/X} \to i^*\Omega_{X/S}$ as desired. □

Lemma 46.6.11. *Let S be a scheme. Let B be an algebraic space over S. Let $i : Z \to X$ be an immersion of schemes over B, and assume i (étale locally) has a left inverse. Then the canonical sequence*

$$0 \to \mathcal{C}_{Z/X} \to i^*\Omega_{X/B} \to \Omega_{Z/B} \to 0$$

of Lemma 46.6.10 is (étale locally) split exact.

Proof. Clarification: we claim that if $g : X \to Z$ is a left inverse of i, then i^*c_g is a right inverse of the map $i^*\Omega_{X/B} \to \Omega_{Z/B}$. Having said this, the result follows from the corresponding result for morphisms of schemes by étale localization, see Lemmas 46.6.3 and 46.5.2. □

Lemma 46.6.12. *Let S be a scheme. Let $X \to Y$ be a morphism of algebraic spaces over S. Let $g : Y' \to Y$ be a morphism of algebraic spaces over S. Let $X' = X_{Y'}$ be the base change of X. Denote $g' : X' \to X$ the projection. Then the map*

$$(g')^*\Omega_{X/Y} \to \Omega_{X'/Y'}$$

of Lemma 46.6.6 is an isomorphism.

Proof. Follows from the schemes version, see Morphisms, Lemma 24.32.12 and étale localization, see Lemma 46.6.3. □

Lemma 46.6.13. *Let S be a scheme. Let $f : X \to B$ and $g : Y \to B$ be morphisms of algebraic spaces over S with the same target. Let $p : X \times_B Y \to X$ and $q : X \times_B Y \to Y$ be the projection morphisms. The maps from Lemma 46.6.6*

$$p^*\Omega_{X/S} \oplus q^*\Omega_{Y/S} \longrightarrow \Omega_{X \times_S Y/S}$$

give an isomorphism.

Proof. Follows from the schemes version, see Morphisms, Lemma 24.32.13 and étale localization, see Lemma 46.6.3. □

Lemma 46.6.14. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. If f is locally of finite type, then $\Omega_{X/Y}$ is a finite type $\mathcal{O}_X$-module.*

Proof. Follows from the schemes version, see Morphisms, Lemma 24.32.14 and étale localization, see Lemma 46.6.3. ☐

Lemma 46.6.15. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. If f is locally of finite type, then $\Omega_{X/Y}$ is an $\mathcal{O}_X$-module of finite presentation.*

Proof. Follows from the schemes version, see Morphisms, Lemma 24.32.15 and étale localization, see Lemma 46.6.3. ☐

46.7. Topological invariance of an étale site

We show that the site $X_{spaces,étale}$ is a ``topological invariant''. We will prove later that actually also $X_{étale}$, which consists of the representable objects in $X_{spaces,étale}$, is a topological invariant too (insert future reference here).

Theorem 46.7.1. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Assume f is integral, universally injective and surjective. The functor*

$$V \longmapsto V_X = X \times_Y V$$

defines an equivalence of categories $Y_{spaces,étale} \to X_{spaces,étale}$.

Proof. The morphism f is representable and a universal homeomorphism, see Morphisms of Spaces, Section 42.41.

We first prove that the functor is faithful. Suppose that V', V are objects of $Y_{spaces,étale}$ and that $a, b : V' \to V$ are distinct morphisms over Y. Since V', V are étale over Y the equalizer

$$E = V' \times_{(a,b), V\times_Y V, \Delta_{V/Y}} V$$

of a, b is étale over Y also. Hence $E \to V'$ is an étale monomorphism (i.e., an open immersion) which is an isomorphism if and only if it is surjective. Since $X \to Y$ is a universal homeomorphism we see that this is the case if and only if $E_X = V'_X$, i.e., if and only if $a_X = b_X$.

Next, we prove that the functor is fully faithful. Suppose that V', V are objects of $Y_{spaces,étale}$ and that $c : V'_X \to V_X$ is a morphism over X. We want to construct a morphism $a : V' \to V$ over Y such that $a_X = c$. Let $a' : V'' \to V'$ be a surjective étale morphism such that V'' is a separated algebraic space. If we can construct a morphism $a'' : V'' \to V$ such that $a''_X = c \circ a'_X$, then the two compositions

$$V'' \times_{V'} V'' \xrightarrow{\text{pr}_i} V'' \xrightarrow{a''} V$$

will be equal by the faithfulness of the functor proved in the first paragraph. Hence a'' will factor through a unique morphism $a : V' \to V$ as V' is (as a sheaf) the quotient of V'' by the equivalence relation $V'' \times_{V'} V''$. Hence we may assume that V' is separated. In this case the graph

$$\Gamma_c \subset (V' \times_Y V)_X$$

is open and closed (details omitted). Since $X \to Y$ is a universal homeomorphism, there exists an open and closed subspace $\Gamma \subset V' \times_Y V$ such that $\Gamma_X = \Gamma_c$. The projection $\Gamma \to V'$ is an étale morphism whose base change to X is an isomorphism. Hence $\Gamma \to V'$ is étale, universally injective, and surjective, so an isomorphism by Morphisms of Spaces, Lemma 42.40.2. Thus Γ is the graph of a morphism $a : V' \to V$ as desired.

Finally, we prove that the functor is essentially surjective. Suppose that U is an object of $X_{spaces,étale}$. We have to find an object V of $Y_{spaces,étale}$ such that $V_X \cong U$. Let $U' \to U$ be a surjective étale morphism such that $U' \cong V'_X$ and $U' \times_U U' \cong V''_X$ for some objects V'', V' of $Y_{spaces,étale}$. Then by fully faithfulness of the functor we obtain morphisms $s, t : V'' \to V'$ with $t_X = \text{pr}_0$ and $s_X = \text{pr}_1$ as morphisms $U' \times_U U' \to U'$. Using that $(\text{pr}_0, \text{pr}_1) : U' \times_U U' \to U' \times_S U'$ is an étale equivalence relation, and that $U' \to V'$ and $U' \times_U U' \to V''$ are universally injective and surjective we deduce that $(t, s) : V'' \to V' \times_S V'$ is an étale equivalence relation. Then the quotient $V = V'/V''$ (see Spaces, Theorem 40.10.5) is an algebraic space V over Y. There is a morphism $V' \to V$ such that $V'' = V' \times_V V'$. Thus we obtain a morphism $V \to Y$ (see Descent on Spaces, Lemma 45.6.2). On base change to X we see that we have a morphism $U' \to V_X$ and a compatibe isomorphism $U' \times_{V_X} U' = U' \times_U U'$, which implies that $V_X \cong U$ (by the lemma just cited once more).

Pick a scheme W and a surjective étale morphism $W \to Y$. Pick a scheme U' and a surjective étale morphism $U' \to U \times_X W_X$. Note that U' and $U' \times_U U'$ are schemes étale over X whose structure morphism to X factors through the scheme W_X. Hence by Étale Cohomology, Theorem 38.45.1 there exist schemes V', V'' étale over W whose base change to W_X is isomorphic to respectively U' and $U' \times_U U'$. This finishes the proof. □

Remark 46.7.2. A universal homeomorphism of algebraic spaces need not be representable, see Morphisms of Spaces, Example 42.41.3. The argument in the proof of Theorem 46.7.1 above cannot be used in this case. In fact we do not know whether given a universal homeomorphism of algebraic spaces $f : X \to Y$ the categories $X_{spaces,étale}$ and $Y_{spaces,étale}$ are equivalent. If you do, please email stacks.project@gmail.com.

46.8. Thickenings

The following terminology may not be completely standard, but it is convenient.

Definition 46.8.1. Thickenings. Let S be a scheme.

(1) We say an algebraic space X' is a *thickening* of an algebraic space X if X is a closed subspace of X' and the associated topological spaces are equal.
(2) We say X' is a *first order thickening* of X if X is a closed subspace of X' and the quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_{X'}$ defining X has square zero.
(3) Given two thickenings $X \subset X'$ and $Y \subset Y'$ a *morphism of thickenings* is a morphism $f' : X' \to Y'$ such that $f(X) \subset Y$, i.e., such that $f'|_X$ factors through the closed subspace Y. In this situation we set $f = f'|_X : X \to Y$ and we say that $(f, f') : (X \subset X') \to (Y \subset Y')$ is a morphism of thickenings.
(4) Let B be an algebraic space. We similarly define *thickenings over* B, and *morphisms of thickenings over* B. This means that the spaces X, X', Y, Y' above are algebraic spaces endowed with a structure morphism to B, and that the morphisms $X \to X'$, $Y \to Y'$ and $f' : X' \to Y'$ are morphisms over B.

The fundamental equivalence. Note that if $X \subset X'$ is a thickening, then $X \to X'$ is integral and universally bijective. This implies that

$$X_{spaces,étale} = X'_{spaces,étale} \tag{46.8.1.1}$$

via the pullback functor, see Theorem 46.7.1. Hence we may think of $\mathcal{O}_{X'}$ as a sheaf on $X_{spaces,étale}$. Thus a canonical equivalence of locally ringed topoi

$$(Sh(X'_{spaces,étale}), \mathcal{O}_{X'}) \cong (Sh(X_{spaces,étale}), \mathcal{O}_{X'}) \tag{46.8.1.2}$$

Below we will frequently combine this with the fully faithfulness result of Properties of Spaces, Theorem 41.25.4. For example the closed immersion $i_X : X \to X'$ corresponds to the surjective map $i_X^\sharp : \mathcal{O}_{X'} \to \mathcal{O}_X$.

Let S be a scheme, and let B be an algebraic space over S. Let $(f, f') : (X \subset X') \to (Y \subset Y')$ be a morphism of thickenings over B. Note that the diagram of continuous functors

$$
\begin{tikzcd}
X_{spaces,étale} & Y_{spaces,étale} \arrow[l] \\
X'_{spaces,étale} \arrow[u] & Y'_{spaces,étale} \arrow[l] \arrow[u]
\end{tikzcd}
$$

is commutative and the vertical arrows are equivalences. Hence $f_{spaces,étale}$, f_{small}, $f'_{spaces,étale}$, and f'_{small} all define the same morphism of topoi. Thus we may think of

$$(f')^\sharp : f_{spaces,étale}^{-1}\mathcal{O}_{Y'} \longrightarrow \mathcal{O}_{X'}$$

as a map of sheaves of $\mathcal{O}_B$-algebras fitting into the commutative diagram

$$
\begin{tikzcd}
f_{spaces,étale}^{-1}\mathcal{O}_Y \arrow[r, "f^\sharp"'] & \mathcal{O}_X \\
f_{spaces,étale}^{-1}\mathcal{O}_{Y'} \arrow[u, "i_Y^\sharp"] \arrow[r, "(f')^\sharp"] & \mathcal{O}_{X'} \arrow[u, "i_X^\sharp"']
\end{tikzcd}
$$

Here $i_X : X \to X'$ and $i_Y : Y \to Y'$ are the names of the given closed immersions.

Lemma 46.8.2. *Let S be a scheme. Let B be an algebraic space over S. Let $X \subset X'$ and $Y \subset Y'$ be thickenings of algebraic spaces over B. Let $f : X \to Y$ be a morphism of algebraic spaces over B. Given any map of $\mathcal{O}_B$-algebras*

$$\alpha : f_{spaces,étale}^{-1}\mathcal{O}_{Y'} \to \mathcal{O}_{X'}$$

such that

$$
\begin{tikzcd}
f_{spaces,étale}^{-1}\mathcal{O}_Y \arrow[r, "f^\sharp"'] & \mathcal{O}_X \\
f_{spaces,étale}^{-1}\mathcal{O}_{Y'} \arrow[u, "i_Y^\sharp"] \arrow[r, "\alpha"] & \mathcal{O}_{X'} \arrow[u, "i_X^\sharp"']
\end{tikzcd}
$$

commutes, there exists a unique morphism of (f, f') of thickenings over B such that $\alpha = (f')^\sharp$.

Proof. To find f', by Properties of Spaces, Theorem 41.25.4, all we have to do is show that the morphism of ringed topoi

$$(f_{spaces,étale}, \alpha) : (Sh(X_{spaces,étale}), \mathcal{O}_{X'}) \longrightarrow (Sh(Y_{spaces,étale}), \mathcal{O}_{Y'})$$

is a morphism of locally ringed topoi. This follows directly from the definition of morphisms of locally ringed topoi (Modules on Sites, Definition 16.34.8), the fact that $(f, f^\sharp)$ is a morphism of locally ringed topoi (Properties of Spaces, Lemma 41.25.1), that α fits into the given commutative diagram, and the fact that the kernels of $i_X^\sharp$ and $i_Y^\sharp$ are locally nilpotent. Finally, the fact that $f' \circ i_X = i_Y \circ f$ follows from the commutativity of the diagram and another application of Properties of Spaces, Theorem 41.25.4. We omit the verification that f' is a morphism over B. $\square$

Lemma 46.8.3. *Let S be a scheme. Let $X \subset X'$ be a thickening of algebraic spaces over S. For any open subspace $U \subset X$ there exists a unique open subspace $U' \subset X'$ such that $U = X \times_{X'} U'$.*

Proof. Let $U' \to X'$ be the object of $X'_{spaces,étale}$ corresponding to the object $U \to X$ of $X_{spaces,étale}$ via (46.8.1.1). The morphism $U' \to X'$ is étale and universally injective, hence an open immersion, see Morphisms of Spaces, Lemma 42.40.2. □

Finite order thickenings. Let $i_X : X \to X'$ be a thickening of algebraic spaces. Any local section of the kernel $\mathcal{I} = \text{Ker}(i_X^\sharp) \subset \mathcal{O}_{X'}$ is locally nilpotent. Let us say that $X \subset X'$ is a *finite order thickening* if the ideal sheaf $\mathcal{I}$ is ``globally" nilpotent, i.e., if there exists an $n \geq 0$ such that $\mathcal{I}^{n+1} = 0$. Technically the class of finite order thickenings $X \subset X'$ is much easier to handle than the general case. Namely, in this case we have a filtration

$$0 \subset \mathcal{I}^n \subset \mathcal{I}^{n-1} \subset \ldots \subset \mathcal{I} \subset \mathcal{O}_{X'}$$

and we see that X' is filtered by closed subspaces

$$X = X_0 \subset X_1 \subset \ldots \subset X_{n-1} \subset X_{n+1} = X'$$

such that each pair $X_i \subset X_{i+1}$ is a first order thickening over B. Using simple induction arguments many results proved for first order thickenings can be rephrased as results on finite order thickenings.

Lemma 46.8.4. *Let S be a scheme. Let $X \subset X'$ be a finite order thickening of algebraic spaces over S. Let U be an affine object of $X_{spaces,étale}$. Then*

$$\Gamma(U, \mathcal{O}_{X'}) \to \Gamma(U, \mathcal{O}_X)$$

is surjective where we think of $\mathcal{O}_{X'}$ as a sheaf on $X_{spaces,étale}$ via (46.8.1.2).

Proof. We may assume that $X \subset X'$ is a first order thickening by the principle explained above. Denote $\mathcal{I}$ the kernel of the surjection $\mathcal{O}_{X'} \to \mathcal{O}_X$. As $\mathcal{I}$ is a quasi-coherent $\mathcal{O}_{X'}$-module and since $\mathcal{I}^2 = 0$ by the definition of a first order thickening we may apply Morphisms of Spaces, Lemma 42.17.1 to see that $\mathcal{I}$ is a quasi-coherent $\mathcal{O}_X$-module. Hence the lemma follows from the long exact cohomology sequence associated to the short exact sequence

$$0 \to \mathcal{I} \to \mathcal{O}_{X'} \to \mathcal{O}_X \to 0$$

and the fact that $H^1_{étale}(U, \mathcal{I}) = 0$ as $\mathcal{I}$ is quasi-coherent, see Descent, Proposition 31.6.10 and Coherent, Lemma 25.2.2. □

Lemma 46.8.5. *Let S be a scheme. Let $X \subset X'$ be a finite order thickening of algebraic spaces over S. If X is (representable by) a scheme, then so is X'.*

Proof. It suffices to prove this when X' is a first order thickening of X. By Properties of Spaces, Lemma 41.10.1 there is a largest open subspace of X' which is a scheme. Thus we have to show that every point x of $|X'| = |X|$ is contained in an open subspace of X' which is a scheme. Using Lemma 46.8.3 we may replace $X \subset X'$ by $U \subset U'$ with $x \in U$ and U an affine scheme. Hence we may assume that X is affine. Thus we reduce to the case discussed in the next paragraph.

Assume $X \subset X'$ is a first order thickening where X is an affine scheme. Set $A = \Gamma(X, \mathcal{O}_X)$ and $A' = \Gamma(X', \mathcal{O}_{X'})$. By Lemma 46.8.4 the map $A \to A'$ is surjective. The kernel I is an ideal of square zero. By Properties of Spaces, Lemma 41.30.1 we obtain a canonical morphism $f : X' \to Spec(A')$ which fits into the following commutative diagram

$$\begin{tikzcd} X \arrow[r] \arrow[d, equal] & X' \arrow[d, "f"] \\ Spec(A) \arrow[r] & Spec(A') \end{tikzcd}$$

Because the horizontal arrows are thickenings it is clear that f is universally injective and surjective. Hence it suffices to show that f is étale, since then Morphisms of Spaces, Lemma 42.40.2 will imply that f is an isomorphism.

To prove that f is étale choose an affine scheme U' and an étale morphism $U' \to X'$. It suffices to show that $U' \to X' \to Spec(A')$ is étale, see Properties of Spaces, Definition 41.13.2. Write $U' = Spec(B')$. Set $U = X \times_{X'} U'$. Since U is a closed subspace of U', it is a closed subscheme, hence $U = Spec(B)$ with $B' \to B$ surjective. Denote $J = \mathrm{Ker}(B' \to B)$ and note that $J = \Gamma(U, \mathcal{I})$ where $\mathcal{I} = \mathrm{Ker}(\mathcal{O}_{X'} \to \mathcal{O}_X)$ on $X_{spaces,étale}$ as in the proof of Lemma 46.8.4. The morphism $U' \to X' \to Spec(A')$ induces a commutative diagram

$$\begin{tikzcd} 0 \arrow[r] & J \arrow[r] & B' \arrow[r] & B \arrow[r] & 0 \\ 0 \arrow[r] & I \arrow[r] \arrow[u] & A' \arrow[r] \arrow[u] & A \arrow[r] \arrow[u] & 0 \end{tikzcd}$$

Now, since $\mathcal{I}$ is a quasi-coherent $\mathcal{O}_X$-module we have $\mathcal{I} = (\tilde{I})^a$, see Descent, Definition 31.6.2 for notation and Descent, Proposition 31.6.11 for why this is true. Hence we see that $J = I \otimes_A B$. Finally, note that $A \to B$ is étale as $U \to X$ is étale as the base change of the étale morphism $U' \to X'$. We conclude that $A' \to B'$ is étale by Algebra, Lemma 7.132.11. □

The following lemma will be superseded by the more general (insert future reference here).

Lemma 46.8.6. *Let S be a scheme. Let $X \subset X'$ be a first order thickening of algebraic spaces over S. The functor*

$$V' \longmapsto V = X \times_{X'} V'$$

defines an equivalence of categories $X'_{étale} \to X_{étale}$.

Proof. The functor $V' \mapsto V$ defines an equivalence of categories $X'_{spaces,étale} \to X_{spaces,étale}$, see Theorem 46.7.1. Thus it suffices to show that V is a scheme if and only if V' is a scheme. This is the content of Lemma 46.8.5. □

First order thickening are described as follows.

Lemma 46.8.7. *Let S be a scheme. Let $f : X \to B$ be a morphism of algebraic spaces over S. Consider a short exact sequence*

$$0 \to \mathcal{I} \to \mathcal{A} \to \mathcal{O}_X \to 0$$

of sheaves on $X_{étale}$ where $\mathcal{A}$ is a sheaf of $f^{-1}\mathcal{O}_B$-algebras, $\mathcal{A} \to \mathcal{O}_X$ is a surjection of sheaves of $f^{-1}\mathcal{O}_B$-algebras, and $\mathcal{I}$ is its kernel. If

(1) *$\mathcal{I}$ is an ideal of square zero in $\mathcal{A}$, and*
(2) *$\mathcal{I}$ is quasi-coherent as an $\mathcal{O}_X$-module*

then there exists a first order thickening $X \subset X'$ over B and an isomorphism $\mathcal{O}_{X'} \to \mathcal{A}$ of $f^{-1}\mathcal{O}_B$-algebras compatible with the surjections to $\mathcal{O}_X$.

Proof. In this proof we redo some of the arguments used in the proofs of Lemmas 46.8.4 and 46.8.5. We first handle the case $B = S = Spec(\mathbf{Z})$. Let U be an affine scheme, and let $U \to X$ be étale. Then

$$0 \to \mathcal{I}(U) \to \mathcal{A}(U) \to \mathcal{O}_X(U) \to 0$$

is exact as $H^1(U_{étale}, \mathcal{I}) = 0$ as $\mathcal{I}$ is quasi-coherent, see Descent, Proposition 31.6.10 and Coherent, Lemma 25.2.2. If $V \to U$ is a morphism of affine objects of $X_{spaces,étale}$ then

$$\mathcal{I}(V) = \mathcal{I}(U) \otimes_{\mathcal{O}_X(U)} \mathcal{O}_X(V)$$

since $\mathcal{I}$ is a quasi-coherent $\mathcal{O}_X$-module, see Descent, Proposition 31.6.11. Hence $\mathcal{A}(U) \to \mathcal{A}(V)$ is an étale ring map, see Algebra, Lemma 7.132.11. Hence we see that

$$U \longmapsto U' = Spec(\mathcal{A}(U))$$

is a functor from $X_{affine,étale}$ to the category of affine schemes and étale morphisms. In fact, we claim that this functor can be extended to a functor $U \mapsto U'$ on all of $X_{étale}$. To see this, if U is an object of $X_{étale}$, note that

$$0 \to \mathcal{I}|_{U_{Zar}} \to \mathcal{A}|_{U_{Zar}} \to \mathcal{O}_X|_{U_{Zar}} \to 0$$

and $\mathcal{I}|_{U_{Zar}}$ is a quasi-coherent sheaf on U, see Descent, Proposition 31.6.14. Hence by More on Morphisms, Lemma 33.2.2 we obtain a first order thickening $U \subset U'$ of schemes such that $\mathcal{O}_{U'}$ is isomorphic to $\mathcal{A}|_{U_{Zar}}$. It is clear that this construction is compatible with the construction for affines above.

Choose a presentation $X = U/R$, see Spaces, Definition 40.9.3 so that $s, t : R \to U$ define an étale equivalence relation. Applying the functor above we obtain an étale equivalence relation $s', t' : R' \to U'$ in schemes. Consider the algebraic space $X' = U'/R'$ (see Spaces, Theorem 40.10.5). The morphism $X = U/R \to U'/R' = X'$ is a first order thickening. Consider $\mathcal{O}_{X'}$ viewed as a sheaf on $X_{étale}$. By construction we have an isomorphism

$$\gamma : \mathcal{O}_{X'}|_{U_{étale}} \longrightarrow \mathcal{A}|_{U_{étale}}$$

such that $s^{-1}\gamma$ agrees with $t^{-1}\gamma$ on $R_{étale}$. Hence by Properties of Spaces, Lemma 41.15.13 this implies that γ comes from a unique isomorphism $\mathcal{O}_{X'} \to \mathcal{A}$ as desired.

To handle the case of a general base algebraic space B, we first construct X' as an algebraic space over $\mathbf{Z}$ as above. Then we use the isomorphism $\mathcal{O}_{X'} \to \mathcal{A}$ to define $f^{-1}\mathcal{O}_B \to \mathcal{O}_{X'}$. According to Lemma 46.8.2 this defines a morphism $X' \to B$ compatible with the given morphism $X \to B$ and we are done. □

46.9. First order infinitesimal neighbourhood

A natural construction of first order thickenings is the following. Suppose that $i : Z \to X$ be an immersion of algebraic spaces. Choose an open subspace $U \subset X$ such that i identifies Z with a closed subspace $Z \subset U$ (see Morphisms of Spaces, Remark 42.4.3). Let $\mathcal{I} \subset \mathcal{O}_U$ be the quasi-coherent sheaf of ideals defining Z in U, see Morphisms of Spaces, Lemma 42.16.1. Then we can consider the closed subspace $Z' \subset U$ defined by the quasi-coherent sheaf of ideals $\mathcal{I}^2$.

Definition 46.9.1. Let $i : Z \to X$ be an immersion of algebraic spaces. The *first order infinitesimal neighbourhood* of Z in X is the first order thickening $Z \subset Z'$ over X described above.

This thickening has the following universal property (which will assuage any fears that the construction above depends on the choice of the open U).

Lemma 46.9.2. *Let $i : Z \to X$ be an immersion of algebraic spaces. The first order infinitesimal neighbourhood Z' of Z in X has the following universal property: Given any commutative diagram*

$$\begin{tikzcd} Z \arrow[d, "i"'] & T \arrow[l, "a"'] \arrow[d] \\ X & T' \arrow[l, "b"] \end{tikzcd}$$

where $T \subset T'$ is a first order thickening over X, there exists a unique morphism $(a', a) : (T \subset T') \to (Z \subset Z')$ of thickenings over X.

Proof. Let $U \subset X$ be the open subspace used in the construction of Z', i.e., an open such that Z is identified with a closed subspace of U cut out by the quasi-coherent sheaf of ideals $\mathcal{I}$. Since $|T| = |T'|$ we see that $|b|(|T'|) \subset |U|$. Hence we can think of b as a morphism into U, see Properties of Spaces, Lemma 41.4.9. Let $\mathcal{J} \subset \mathcal{O}_{T'}$ be the square zero quasi-coherent sheaf of ideals cutting out T. By the commutativity of the diagram we have $b|_T = i \circ a$ where $i : Z \to U$ is the closed immersion. We conclude that $b^\sharp(b^{-1}\mathcal{I}) \subset \mathcal{J}$ by Morphisms of Spaces, Lemma 42.16.1. As T' is a first order thickening of T we see that $\mathcal{J}^2 = 0$ hence $b^\sharp(b^{-1}(\mathcal{I}^2)) = 0$. By Morphisms of Spaces, Lemma 42.16.1 this implies that b factors through Z'. Letting $a' : T' \to Z'$ be this factorization we win. $\square$

Lemma 46.9.3. *Let $i : Z \to X$ be an immersion of algebraic spaces. Let $Z \subset Z'$ be the first order infinitesimal neighbourhood of Z in X. Then the diagram*

$$\begin{tikzcd} Z \arrow[r] \arrow[d] & Z' \arrow[d] \\ Z \arrow[r] & X \end{tikzcd}$$

induces a map of conormal sheaves $\mathcal{C}_{Z/X} \to \mathcal{C}_{Z/Z'}$ by Lemma 46.5.3. This map is an isomorphism.

Proof. This is clear from the construction of Z' above. $\square$

46.10. Formally smooth, étale, unramified transformations

Recall that a ring map $R \to A$ is called *formally smooth*, resp. *formally étale*, resp. *formally unramified* (see Algebra, Definition 7.127.1, resp. Definition 7.137.1, resp. Definition 7.135.1) if for every commutative solid diagram

$$\begin{tikzcd} A \arrow[r] \arrow[rd, dashed] & B/I \\ R \arrow[u] \arrow[r] & B \arrow[u] \end{tikzcd}$$

where $I \subset B$ is an ideal of square zero, there exists a, resp. exists a unique, resp. exists at most one dotted arrow which makes the diagram commute. This motivates the following analogue for morphisms of algebraic spaces, and more generally functors.

Definition 46.10.1. Let S be a scheme. Let $a : F \to G$ be a transformation of functors $F, G : (Sch/S)_{fppf}^{opp} \to Sets$. Consider commutative solid diagrams of the form

$$\begin{tikzcd} F & T \arrow[l] \arrow[d, "i"] \\ G \arrow[from=u, "a"'] & T' \arrow[l] \arrow[ul, dashed] \end{tikzcd}$$

where T and T' are affine schemes and i is a closed immersion defined by an ideal of square zero.

(1) We say a is *formally smooth* if given any solid diagram as above there exists a dotted arrow making the diagram commute[2].
(2) We say a is *formally étale* if given any solid diagram as above there exists exactly one dotted arrow making the diagram commute.
(3) We say a is *formally unramified* if given any solid diagram as above there exists at most one dotted arrow making the diagram commute.

Lemma 46.10.2. *Let S be a scheme. Let $a : F \to G$ be a transformation of functors $F, G : (Sch/S)_{fppf}^{opp} \to Sets$. Then a is formally étale if and only if a is both formally smooth and formally unramified.*

Proof. Formal from the definition. □

Lemma 46.10.3. *Composition.*

(1) *A composition of formally smooth transformations of functors is formally smooth.*
(2) *A composition of formally étale transformations of functors is formally étale.*
(3) *A composition of formally unramified transformations of functors is formally unramified.*

Proof. This is formal. □

Lemma 46.10.4. *Let S be a scheme contained in Sch_{fppf}. Let $F, G, H : (Sch/S)_{fppf}^{opp} \to Sets$. Let $a : F \to G$, $b : H \to G$ be transformations of functors. Consider the fibre product diagram*

$$\begin{tikzcd} H \times_{b,G,a} F \arrow[r, "b'"'] \arrow[d, "a'"'] & F \arrow[d, "a"] \\ H \arrow[r, "b"] & G \end{tikzcd}$$

(1) *If a is formally smooth, then the base change a' is formally smooth.*
(2) *If a is formally étale, then the base change a' is formally étale.*
(3) *If a is formally unramified, then the base change a' is formally unramified.*

Proof. This is formal. □

Lemma 46.10.5. *Let S be a scheme. Let $F, G : (Sch/S)_{fppf}^{opp} \to Sets$. Let $a : F \to G$ be a representable tranformation of functors.*

(1) *If a is smooth then a is formally smooth.*
(2) *If a is étale, then a is formally étale.*
(3) *If a is unramified, then a is formally unramified.*

[2]This is just one possible definition that one can make here. Another slightly weaker condition would be to require that the dotted arrow exists fppf locally on T'. This weaker notion has in some sense better formal properties.

Proof. Consider a solid commutative diagram

$$\begin{tikzcd} F \arrow[d, "a"'] & T \arrow[l] \arrow[d, "i"] \\ G & T' \arrow[l] \arrow[ul, dashed] \end{tikzcd}$$

as in Definition 46.10.1. Then $F \times_G T'$ is a scheme smooth (resp. étale, resp. unramified) over T'. Hence by More on Morphisms, Lemma 33.9.7 (resp. Lemma 33.6.9, resp. Lemma 33.4.8) we can fill in (resp. uniquely fill in, resp. fill in in at most one way) the dotted arrow in the diagram

$$\begin{tikzcd} F \times_G T' \arrow[d] & T \arrow[l] \arrow[d, "i"] \\ T' & T' \arrow[l] \arrow[ul, dashed] \end{tikzcd}$$

an hence we also obtain the corresponding assertion in the first diagram. □

Lemma 46.10.6. *Let S be a scheme contained in Sch_{fppf}. Let $F, G, H : (Sch/S)_{fppf}^{opp} \to Sets$. Let $a : F \to G$, $b : G \to H$ be transformations of functors. Assume that a is representable, surjective, and étale.*

(1) *If b is formally smooth, then $b \circ a$ is formally smooth.*
(2) *If b is formally étale, then $b \circ a$ is formally étale.*
(3) *If b is formally unramified, then $b \circ a$ is formally unramified.*

Conversely, consider a solid commutative diagram

$$\begin{tikzcd} G \arrow[d, "b"'] & T \arrow[l] \arrow[d, "i"] \\ H & T' \arrow[l] \arrow[ul, dashed] \end{tikzcd}$$

with T' an affine scheme over S and $i : T \to T'$ a closed immersion defined by an ideal of square zero.

(4) *If $b \circ a$ is formally smooth, then for every $t \in T$ there exists an étale morphism of affines $U' \to T'$ and a morphism $U' \to G$ such that*

$$\begin{tikzcd} G \arrow[d, "b"'] & T \arrow[l] & T \times_{T'} U' \arrow[l] \arrow[d] \\ H & T' \arrow[l] & U' \arrow[l] \arrow[ull] \end{tikzcd}$$

commutes and t is in the image of $U' \to T'$.

(5) *If $b \circ a$ is formally unramified, then there exists at most one dotted arrow in the diagram above, i.e., b is formally unramified.*
(6) *If $b \circ a$ is formally étale, then there exists exactly one dotted arrow in the diagram above, i.e., b is formally étale.*

Proof. Assume b is formally smooth (resp. formally étale, resp. formally unramified). Since an étale morphism is both smooth and unramified we see that a is representable and smooth (resp. étale, resp. unramified). Hence parts (1), (2) and (3) follow from a combination of Lemma 46.10.5 and Lemma 46.10.3.

Assume that $b \circ a$ is formally smooth. Consider a diagram as in the statement of the lemma. Let $W = F \times_G T$. By assumption W is a scheme surjective étale over T. By Étale Morphisms, Theorem 37.15.2 there exists a scheme W' étale over T' such that $W = T \times_{T'} W'$. Choose an affine open subscheme $U' \subset W'$ such that t is in the image of $U' \to T'$. Because $b \circ a$ is formally smooth we see that the exist morphisms $U' \to F$ such that

$$\begin{tikzcd} F \arrow[d, "b \circ a"'] & W \arrow[l] & T \times_{T'} U' \arrow[l] \arrow[d] \\ H & T' \arrow[l] & U' \arrow[l] \arrow[ull] \end{tikzcd}$$

commutes. Taking the composition $U' \to F \to G$ gives a map as in part (5) of the lemma.

Assume that $f, g : T' \to G$ are two dotted arrows fitting into the diagram of the lemma. Let $W = F \times_G T$. By assumption W is a scheme surjective étale over T. By Étale Morphisms, Theorem 37.15.2 there exists a scheme W' étale over T' such that $W = T \times_{T'} W'$. Since a is formally étale the compositions

$$W' \to T' \xrightarrow{f} G \quad \text{and} \quad W' \to T' \xrightarrow{g} G$$

lift to morphisms $f', g' : W' \to F$ (lift on affine opens and glue by uniqueness). Now if $b \circ a : F \to H$ is formally unramified, then $f' = g'$ and hence $f = g$ as $W' \to T'$ is an étale covering. This proves part (6) of the lemma.

Assume that $b \circ a$ is formally étale. Then by part (4) we can étale locally on T' find a dotted arrow fitting into the diagram and by part (5) this dotted arrow is unique. Hence we may glue the local solutions to get assertion (6). Some details omitted. □

Remark 46.10.7. It is tempting to think that in the situation of Lemma 46.10.6 we have ``$b$ formally smooth'' $\Leftrightarrow$ ``$b \circ a$ formally smooth''. However, this is likely not true in general.

Lemma 46.10.8. *Let S be a scheme. Let $F, G, H : (Sch/S)_{fppf}^{opp} \to Sets$. Let $a : F \to G$, $b : G \to H$ be transformations of functors. Assume b is formally unramified.*

(1) *If $b \circ a$ is formally unramified then a is formally unramified.*
(2) *If $b \circ a$ is formally étale then a is formally étale.*
(3) *If $b \circ a$ is formally smooth then a is formally smooth.*

Proof. Let $T \subset T'$ be a closed immersion of affine schemes defined by an ideal of square zero. Let $g' : T' \to G$ and $f : T \to F$ be given such that $g'|_T = a \circ f$. Because b is formally unramified, there is a one to one correspondence between

$$\{f' : T' \to F \mid f = f'|_T \text{ and } a \circ f' = g'\}$$

and

$$\{f' : T' \to F \mid f = f'|_T \text{ and } b \circ a \circ f' = b \circ g'\}.$$

From this the lemma follows formally. □

46.11. Formally unramified morphisms

In this section we work out what it means that a morphism of algebraic spaces is formally unramified.

Definition 46.11.1. Let S be a scheme. A morphism $f : X \to Y$ of algebraic spaces over S is said to be *formally unramified* if it is formally unramified as a transformation of functors as in Definition 46.10.1.

We will not restate the results proved in the more general setting of formally unramified transformations of functors in Section 46.10. It turns out we can characterize this property in terms of vanishing of the module of relative differentials, see Lemma 46.11.6.

Lemma 46.11.2. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. The following are equivalent:*

(1) *f is formally unramified,*
(2) *for every diagram*

$$\begin{tikzcd} U \arrow[r, "\psi"'] \arrow[d] & V \arrow[d] \\ X \arrow[r, "f"] & Y \end{tikzcd}$$

where U and V are schemes and the vertical arrows are étale the morphism of schemes ψ is formally unramified (as in More on Morphisms, Definition 33.4.1), and

(3) *for one such diagram with surjective vertical arrows the morphism ψ is formally unramified.*

Proof. Assume f is formally unramified. By Lemma 46.10.5 the morphisms $U \to X$ and $V \to Y$ are formally unramified. Thus by Lemma 46.10.3 the composition $U \to Y$ is formally unramified. Then it follows from Lemma 46.10.8 that $U \to V$ is formally unramified. Thus (1) implies (2). And (2) implies (3) trivially

Assume given a diagram as in (3). By Lemma 46.10.5 the morphism $V \to Y$ is formally unramified. Thus by Lemma 46.10.3 the composition $U \to Y$ is formally unramified. Then it follows from Lemma 46.10.6 that $X \to Y$ is formally unramified, i.e., (1) holds. □

Lemma 46.11.3. *Let S be a scheme. If $f : X \to Y$ is a formally unramified morphism of algebraic spaces over S, then given any solid commutative diagram*

$$\begin{tikzcd} X \arrow[d, "f"'] & T \arrow[l] \arrow[d, "i"] \\ S & T' \arrow[l] \arrow[ul, dashed] \end{tikzcd}$$

where $T \subset T'$ is a first order thickening of algebraic spaces over S there exists at most one dotted arrow making the diagram commute. In other words, in Definition 46.11.1 the condition that T be an affine scheme may be dropped.

Proof. This is true because there exists a surjective étale morphism $U' \to T'$ where U' is a disjoint union of affine schemes (see Properties of Spaces, Lemma 41.6.1) and a morphism $T' \to X$ is determined by its restriction to U'. □

Lemma 46.11.4. *A composition of formally unramified morphisms is formally unramified.*

Proof. This is formal. □

Lemma 46.11.5. *A base change of a formally unramified morphism is formally unramified.*

Proof. This is formal. □

Lemma 46.11.6. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. The following are equivalent:*

(1) *f is formally unramified, and*

(2) $\Omega_{X/Y} = 0$.

Proof. This is a combination of Lemma 46.11.2, More on Morphisms, Lemma 33.4.7, and Lemma 46.6.3. □

Lemma 46.11.7. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. The following are equivalent:*

(1) *The morphism f is unramified,*
(2) *the morphism f is locally of finite type and $\Omega_{X/Y} = 0$, and*
(3) *the morphism f is locally of finite type and formally unramified.*

Proof. Choose a diagram

$$\begin{tikzcd} U \arrow[r, "\psi"] \arrow[d] & V \arrow[d] \\ X \arrow[r, "f"] & Y \end{tikzcd}$$

where U and V are schemes and the vertical arrows are étale and surjective. Then we see

$$\begin{aligned} f \text{ unramified} &\Leftrightarrow \psi \text{ unramified} \\ &\Leftrightarrow \psi \text{ locally finite type and } \Omega_{U/V} = 0 \\ &\Leftrightarrow f \text{ locally finite type and } \Omega_{X/Y} = 0 \\ &\Leftrightarrow f \text{ locally finite type and formally unramified} \end{aligned}$$

Here we have used Morphisms, Lemma 24.34.2 and Lemma 46.11.6. □

Lemma 46.11.8. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. The following are equivalent:*

(1) *f is unramified and a monomorphism,*
(2) *f is unramified and universally injective,*
(3) *f is locally of finite type and a monomorphism,*
(4) *f is universally injective, locally of finite type, and formally unramified.*

Moreover, in this case f is also representable, separated, and locally quasi-finite.

Proof. We have seen in Lemma 46.11.7 that being formally unramified and locally of finite type is the same thing as being unramified. Hence (4) is equivalent to (2). A monomorphism is certainly formally unramified hence (3) implies (4). It is clear that (1) implies (3). Finally, if (2) holds, then $\Delta : X \to X \times_Y X$ is both an open immersion (Morphisms of Spaces, Lemma 42.34.9) and surjective (Morphisms of Spaces, Lemma 42.18.2) hence an isomorphism, i.e., f is a monomorphism. In this way we see that (2) implies (1). Finally, we see that f is representable, separated, and locally quasi-finite by Morphisms of Spaces, Lemmas 42.25.8 and 42.40.1. □

46.12. Universal first order thickenings

Let S be a scheme. Let $h : Z \to X$ be a morphism of algebraic spaces over S. A *universal first order thickening* of Z over X is a first order thickening $Z \subset Z'$ over X such that given any first order thickening $T \subset T'$ over X and a solid commutative diagram

(46.12.0.1)
$$\begin{tikzcd} & Z \arrow[ld] & & T \arrow[ll, "a"'] \arrow[rd] & \\ Z' \arrow[rrd] & & & & T' \arrow[llll, dotted, "a'"'] \arrow[lld, "b"] \\ & & X & & \end{tikzcd}$$

there exists a unique dotted arrow making the diagram commute. Note that in this situation $(a, a') : (T \subset T') \to (Z \subset Z')$ is a morphism of thickenings over X. Thus if a universal first order thickening exists, then it is unique up to unique isomorphism. In general a universal first order thickening does not exist, but if h is formally unramified then it does. Before we prove this, let us show that a universal first order thickening in the category of schemes is a universal first order thickening in the category of algebraic spaces.

Lemma 46.12.1. *Let S be a scheme. Let $h : Z \to X$ be a morphism of algebraic spaces over S. Let $Z \subset Z'$ be a first order thickening over X. The following are equivalent*

(1) *$Z \subset Z'$ is a universal first order thickening,*
(2) *for any diagram (46.12.0.1) with T' a scheme a unique dotted arrow exists making the diagram commute, and*
(3) *for any diagram (46.12.0.1) with T' an affine scheme a unique dotted arrow exists making the diagram commute.*

Proof. The implications (1) ⇒ (2) ⇒ (3) are formal. Assume (3) a assume given an arbitrary diagram (46.12.0.1). Choose a presentation $T' = U'/R'$, see Spaces, Definition 40.9.3. We may assume that $U' = \coprod U'_i$ is a disjoint union of affines, so $R' = U' \times_{T'} U' = \coprod_{i,j} U'_i \times'_T U'_j$. For each pair (i, j) choose an affine open covering $U'_i \times'_T U'_j = \bigcup_k R'_{ijk}$. Denote U_i, R_{ijk} the fibre products with T over T'. Then each $U_i \subset U'_i$ and $R_{ijk} \subset R'_{ijk}$ is a first order thickening of affine schemes. Denote $a_i : U_i \to Z$, resp. $a_{ijk} : R_{ijk} \to Z$ the composition of $a : T \to Z$ with the morphism $U_i \to T$, resp. $R_{ijk} \to T$. By (3) applied to $a_i : U_i \to Z$ we obtain unique morphisms $a'_i : U'_i \to Z'$. By (3) applied to a_{ijk} we see that the two compositions $R'_{ijk} \to R'_i \to Z'$ and $R'_{ijk} \to R'_j \to Z'$ are equal. Hence $a' = \coprod a'_i : U' = \coprod U'_i \to Z'$ descends to the quotient sheaf $T' = U'/R'$ and we win. □

Lemma 46.12.2. *Let S be a scheme. Let $Z \to Y \to X$ be morphisms of algebraic spaces over S. If $Z \subset Z'$ is a universal first order thickening of Z over Y and $Y \to X$ is formally étale, then $Z \subset Z'$ is a universal first order thickening of Z over X.*

Proof. This is formal. Namely, by Lemma 46.12.1 it suffices to consider solid commutative diagrams (46.12.0.1) with T' an affine scheme. The composition $T \to Z \to Y$ lifts uniquely to $T' \to Y$ as $Y \to X$ is assumed formally étale. Hence the fact that $Z \subset Z'$ is a universal first order thickening over Y produces the desired morphism $a' : T' \to Z'$. □

Lemma 46.12.3. *Let S be a scheme. Let $Z \to Y \to X$ be morphisms of algebraic spaces over S. Assume $Z \to Y$ is étale.*

(1) *If $Y \subset Y'$ is a universal first order thickening of Y over X, then the unique étale morphism $Z' \to Y'$ such that $Z = Y \times_{Y'} Z'$ (see Theorem 46.7.1) is a universal first order thickening of Z over X.*

(2) *If $Z \to Y$ is surjective and $(Z \subset Z') \to (Y \subset Y')$ is an étale morphism of first order thickenings over X and Z' is a universal first order thickening of Z over X, then Y' is a universal first order thickening of Y over X.*

Proof. Proof of (1). By Lemma 46.12.1 it suffices to consider solid commutative diagrams (46.12.0.1) with T' an affine scheme. The composition $T \to Z \to Y$ lifts uniquely to $T' \to Y'$ as Y' is the universal first order thickening. Then the fact that $Z' \to Y'$ is étale implies (see Lemma 46.10.5) that $T' \to Y'$ lifts to the desired morphism $a' : T' \to Z'$.

Proof of (2). Let $T \subset T'$ be a first order thickening over X and let $a : T \to Y$ be a morphism. Set $W = T \times_Y Z$ and denote $c : W \to Z$ the projection Let $W' \to T'$ be the unique étale morphism such that $W = T \times_{T'} W'$, see Theorem 46.7.1. Note that $W' \to T'$ is surjective as $Z \to Y$ is surjective. By assumption we obtain a unique morphism $c' : W' \to Z'$ over X restricting to c on W. By uniqueness the two restrictions of c' to $W' \times_{T'} W'$ are equal (as the two restrictions of c to $W \times_T W$ are equal). Hence c' descends to a unique morphism $a' : T' \to Y'$ and we win. □

Lemma 46.12.4. *Let S be a scheme. Let $h : Z \to X$ be a formally unramified morphism of algebraic spaces over S. There exists a universal first order thickening $Z \subset Z'$ of Z over X.*

Proof. Choose any commutative diagram

$$\begin{tikzcd} V \arrow[r] \arrow[d] & U \arrow[d] \\ Z \arrow[r] & X \end{tikzcd}$$

where V and U are schemes and the vertical arrows are étale. Note that $V \to U$ is a formally unramified morphism of schemes, see Lemma 46.11.2. Combining Lemma 46.12.1 and More on Morphisms, Lemma 33.5.1 we see that a universal first order thickening $V \subset V'$ of V over U exists. By Lemma 46.12.2 part (1) V' is a universal first order thickening of V over X.

Fix a scheme U and a surjective étale morphism $U \to X$. The argument above shows that for any $V \to Z$ étale with V a scheme such that $V \to Z \to X$ factors through U a universal first order thickening $V \subset V'$ of V over X exists (but does not depend on the chosen factorization of $V \to X$ through U). Now we may choose V such that $V \to Z$ is surjective étale (see Spaces, Lemma 40.11.4). Then $R = V \times_Z V$ a scheme étale over Z such that $R \to X$ factors through U also. Hence we obtain universal first order thickenings $V \subset V'$ and $R \subset R'$ over X. As $V \subset V'$ is a universal first order thickening, the two projections $s, t : R \to V$ lift to morphisms $s', t' : R' \to V'$. By Lemma 46.12.3 as R' is the universal first order thickening of R over X these morphisms are étale. Then $(t', s') : R' \to V'$ is an étale equivalence relation and we can set $Z' = V'/R'$. Since $V' \to Z'$ is surjective étale and v' is the universal first order thickening of V over X we conclude from Lemma 46.12.2 part (2) that Z' is a universal first order thickening of Z over X. □

Definition 46.12.5. Let S be a scheme. Let $h : Z \to X$ be a formally unramified morphism of algebraic spaces over S.

(1) The *universal first order thickening* of Z over X is the thickening $Z \subset Z'$ constructed in Lemma 46.12.4.
(2) The *conormal sheaf of Z over X* is the conormal sheaf of Z in its universal first order thickening Z' over X.

We often denote the conormal sheaf $\mathcal{C}_{Z/X}$ in this situation.

Thus we see that there is a short exact sequence of sheaves

$$0 \to \mathcal{C}_{Z/X} \to \mathcal{O}_{Z'} \to \mathcal{O}_Z \to 0$$

on $Z_{étale}$ and $\mathcal{C}_{Z/X}$ is a quasi-coherent $\mathcal{O}_Z$-module. The following lemma proves that there is no conflict between this definition and the definition in case $Z \to X$ is an immersion.

Lemma 46.12.6. *Let S be a scheme. Let $i : Z \to X$ be an immersion of algebraic spaces over S. Then*

(1) *i is formally unramified,*
(2) *the universal first order thickening of Z over X is the first order infinitesimal neighbourhood of Z in X of Definition 46.9.1,*
(3) *the conormal sheaf of i in the sense of Definition 46.5.1 agrees with the conormal sheaf of i in the sense of Definition 46.12.5.*

Proof. An immersion of algebraic spaces is by definition a representable morphism. Hence by Morphisms, Lemmas 24.34.7 and 24.34.8 an immersion is unramified (via the abstract principle of Spaces, Lemma 40.5.8). Hence it is formally unramified by Lemma 46.11.7. The other assertions follow by combining Lemmas 46.9.2 and 46.9.3 and the definitions. □

Lemma 46.12.7. *Let S be a scheme. Let $Z \to X$ be a formally unramified morphism of algebraic spaces over S. Then the universal first order thickening Z' is formally unramified over X.*

Proof. Let $T \subset T'$ be a first order thickening of affine schemes over X. Let

$$\begin{tikzcd} Z' \arrow[d] & T \arrow[l, "c"'] \arrow[d] \\ X & T' \arrow[l] \arrow[ul, "a,b"'] \end{tikzcd}$$

be a commutative diagram. Set $T_0 = c^{-1}(Z) \subset T$ and $T'_a = a^{-1}(Z)$ (scheme theoretically). Since Z' is a first order thickening of Z, we see that T' is a first order thickening of T'_a. Moreover, since $c = a|_T$ we see that $T_0 = T \cap T'_a$ (scheme theoretically). As T' is a first order thickening of T it follows that T'_a is a first order thickening of T_0. Now $a|_{T'_a}$ and $b|_{T'_a}$ are morphisms of T'_a into Z' over X which agree on T_0 as morphisms into Z. Hence by the universal property of Z' we conclude that $a|_{T'_a} = b|_{T'_a}$. Thus a and b are morphism from the first order thickening T' of T'_a whose restrictions to T'_a agree as morphisms into Z. Thus using the universal property of Z' once more we conclude that $a = b$. In other words, the defining property of a formally unramified morphism holds for $Z' \to X$ as desired. □

Lemma 46.12.8. *Let S be a scheme Consider a commutative diagram of algebraic spaces over S*

$$\begin{tikzcd} Z \arrow[r, "h"] \arrow[d, "f"'] & X \arrow[d, "g"] \\ W \arrow[r, "h'"] & Y \end{tikzcd}$$

with h and h' formally unramified. Let $Z \subset Z'$ be the universal first order thickening of Z over X. Let $W \subset W'$ be the universal first order thickening of W over Y. There exists a *canonical morphism $(f, f') : (Z, Z') \to (W, W')$ of thickenings over Y which fits into the following commutative diagram*

$$
\begin{tikzcd}
 & & & Z' \arrow[dl] \arrow[d, "f'"] \\
Z \arrow[urrr] \arrow[rr] \arrow[d, "f"] & & X \arrow[d] & W' \arrow[dl] \\
W \arrow[urrr] \arrow[rr] & & Y &
\end{tikzcd}
$$

In particular the morphism (f, f') of thickenings induces a morphism of conormal sheaves $f^*\mathcal{C}_{W/Y} \to \mathcal{C}_{Z/X}$.

Proof. The first assertion is clear from the universal property of W'. The induced map on conormal sheaves is the map of Lemma 46.5.3 applied to $(Z \subset Z') \to (W \subset W')$. □

Lemma 46.12.9. *Let S be a scheme. Let*

$$
\begin{tikzcd}
Z \arrow[r, "h"'] \arrow[d, "f"'] & X \arrow[d, "g"] \\
W \arrow[r, "h'"] & Y
\end{tikzcd}
$$

be a fibre product diagram of algebraic spaces over S with h' formally unramified. Then h is formally unramified and if $W \subset W'$ is the universal first order thickening of W over Y, then $Z = X \times_Y W \subset X \times_Y W'$ is the universal first order thickening of Z over X. In particular the canonical map $f^*\mathcal{C}_{W/Y} \to \mathcal{C}_{Z/X}$ of Lemma 46.12.8 is surjective.

Proof. The morphism h is formally unramified by Lemma 46.11.5. It is clear that $X \times_Y W'$ is a first order thickening. It is straightforward to check that it has the universal property because W' has the universal property (by mapping properties of fibre products). See Lemma 46.5.5 for why this implies that the map of conormal sheaves is surjective. □

Lemma 46.12.10. *Let S be a scheme. Let*

$$
\begin{tikzcd}
Z \arrow[r, "h"'] \arrow[d, "f"'] & X \arrow[d, "g"] \\
W \arrow[r, "h'"] & Y
\end{tikzcd}
$$

be a fibre product diagram of algebraic spaces over S with h' formally unramified and g flat. In this case the corresponding map $Z' \to W'$ of universal first order thickenings is flat, and $f^*\mathcal{C}_{W/Y} \to \mathcal{C}_{Z/X}$ is an isomorphism.

Proof. Flatness is preserved under base change, see Morphisms of Spaces, Lemma 42.27.3. Hence the first statement follows from the description of W' in Lemma 46.12.9. It is clear that $X \times_Y W'$ is a first order thickening. It is straightforward to check that it has the universal property because W' has the universal property (by mapping properties of fibre products). See Lemma 46.5.5 for why this implies that the map of conormal sheaves is an isomorphism. □

Lemma 46.12.11. *Taking the universal first order thickenings commutes with étale localization. More precisely, let $h : Z \to X$ be a formally unramified morphism of algebraic* *spaces over a base scheme S. Let*

$$\begin{array}{ccc} V & \longrightarrow & U \\ \downarrow & & \downarrow \\ Z & \longrightarrow & X \end{array}$$

be a commutative diagram with étale vertical arrows. Let Z' be the universal first order thickening of Z over X. Then $V \to U$ is formally unramified and the universal first order thickening V' of V over U is étale over Z'. In particular, $\mathcal{C}_{Z/X}|_V = \mathcal{C}_{V/U}$.

Proof. The first statement is Lemma 46.11.2. The compatibility of universal first order thickenings is a consequence of Lemmas 46.12.2 and 46.12.3. □

Lemma 46.12.12. *Let S be a scheme. Let B be an algebraic space over S. Let $h : Z \to X$ be a formally unramified morphism of algebraic spaces over B. Let $Z \subset Z'$ be the universal first order thickening of Z over X with structure morphism $h' : Z' \to X$. The canonical map*

$$dh' : (h')^*\Omega_{X/B} \to \Omega_{Z'/B}$$

induces an isomorphism $h^*\Omega_{X/B} \to \Omega_{Z'/B} \otimes \mathcal{O}_Z$.

Proof. The map $c_{h'}$ is the map defined in Lemma 46.6.6. If $i : Z \to Z'$ is the given closed immersion, then $i^*c_{h'}$ is a map $h^*\Omega_{X/S} \to \Omega_{Z'/S} \otimes \mathcal{O}_Z$. Checking that it is an isomorphism reduces to the case of schemes by étale localization, see Lemma 46.12.11 and Lemma 46.6.3. In this case the result is More on Morphisms, Lemma 33.5.9. □

Lemma 46.12.13. *Let S be a scheme. Let B be an algebraic space over S. Let $h : Z \to X$ be a formally unramified morphism of algebraic spaces over B. There is a canonical exact sequence*

$$\mathcal{C}_{Z/X} \to h^*\Omega_{X/B} \to \Omega_{Z/B} \to 0.$$

The first arrow is induced by $d_{Z'/B}$ where Z' is the universal first order neighbourhood of Z over X.

Proof. We know that there is a canonical exact sequence

$$\mathcal{C}_{Z/Z'} \to \Omega_{Z'/S} \otimes \mathcal{O}_Z \to \Omega_{Z/S} \to 0.$$

see Lemma 46.6.10. Hence the result follows on applying Lemma 46.12.12. □

Lemma 46.12.14. *Let S be a scheme. Let*

$$\begin{array}{ccc} Z & \xrightarrow{i} & X \\ & \searrow^{j} & \downarrow \\ & & Y \end{array}$$

be a commutative diagram of algebraic spaces over S where i and j are formally unramified. Then there is a canonical exact sequence

$$\mathcal{C}_{Z/Y} \to \mathcal{C}_{Z/X} \to i^*\Omega_{X/Y} \to 0$$

where the first arrow comes from Lemma 46.12.8 and the second from Lemma 46.12.13.

Proof. Since the maps have been defined, checking the sequence is exact reduces to the case of schemes by étale localization, see Lemma 46.12.11 and Lemma 46.6.3. In this case the result is More on Morphisms, Lemma 33.5.11. □

Lemma 46.12.15. *Let S be a scheme. Let $Z \to Y \to X$ be formally unramified morphisms of algebraic spaces over S.*

1. *If $Z \subset Z'$ is the universal first order thickening of Z over X and $Y \subset Y'$ is the universal first order thickening of Y over X, then there is a morphism $Z' \to Y'$ and $Y \times_{Y'} Z'$ is the universal first order thickening of Z over Y.*
2. *There is a canonical exact sequence*
$$i^*\mathcal{C}_{Y/X} \to \mathcal{C}_{Z/X} \to \mathcal{C}_{Z/Y} \to 0$$
where the maps come from Lemma 46.12.8 and $i : Z \to Y$ is the first morphism.

Proof. The map $h : Z' \to Y'$ in (1) comes from Lemma 46.12.8. The assertion that $Y \times_{Y'} Z'$ is the universal first order thickening of Z over Y is clear from the universal properties of Z' and Y'. By Lemma 46.5.6 we have an exact sequence
$$(i')^*\mathcal{C}_{Y\times_{Y'} Z'/Z'} \to \mathcal{C}_{Z/Z'} \to \mathcal{C}_{Z/Y\times_{Y'} Z'} \to 0$$
where $i' : Z \to Y\times_{Y'} Z'$ is the given morphism. By Lemma 46.5.5 there exists a surjection $h^*\mathcal{C}_{Y/Y'} \to \mathcal{C}_{Y\times_{Y'} Z'/Z'}$. Combined with the equalities $\mathcal{C}_{Y/Y'} = \mathcal{C}_{Y/X}$, $\mathcal{C}_{Z/Z'} = \mathcal{C}_{Z/X}$, and $\mathcal{C}_{Z/Y\times_{Y'} Z'} = \mathcal{C}_{Z/Y}$ this proves the lemma. □

46.13. Formally étale morphisms

In this section we work out what it means that a morphism of algebraic spaces is formally étale.

Definition 46.13.1. Let S be a scheme. A morphism $f : X \to Y$ of algebraic spaces over S is said to be *formally étale* if it is formally étale as a transformation of functors as in Definition 46.10.1.

We will not restate the results proved in the more general setting of formally étale transformations of functors in Section 46.10.

Lemma 46.13.2. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. The following are equivalent:*

1. *f is formally étale,*
2. *for every diagram*
$$\begin{tikzcd} U \arrow[r, "\psi"'] \arrow[d] & V \arrow[d] \\ X \arrow[r, "f"] & Y \end{tikzcd}$$
where U and V are schemes and the vertical arrows are étale the morphism of schemes ψ is formally étale (as in More on Morphisms, Definition 33.6.1), and
3. *for one such diagram with surjective vertical arrows the morphism ψ is formally étale.*

Proof. Assume f is formally étale. By Lemma 46.10.5 the morphisms $U \to X$ and $V \to Y$ are formally étale. Thus by Lemma 46.10.3 the composition $U \to Y$ is formally étale. Then it follows from Lemma 46.10.8 that $U \to V$ is formally étale. Thus (1) implies (2). And (2) implies (3) trivially

Assume given a diagram as in (3). By Lemma 46.10.5 the morphism $V \to Y$ is formally étale. Thus by Lemma 46.10.3 the composition $U \to Y$ is formally étale. Then it follows from Lemma 46.10.6 that $X \to Y$ is formally étale, i.e., (1) holds. □

Lemma 46.13.3. *Let S be a scheme. Let $f : X \to Y$ be a formally étale morphism of algebraic spaces over S. Then given any solid commutative diagram*

$$\begin{tikzcd} X \arrow[d, "f"'] & T \arrow[l, "a"'] \arrow[d, "i"] \\ Y & T' \arrow[l] \arrow[lu, dashed] \end{tikzcd}$$

where $T \subset T'$ is a first order thickening of algebraic spaces over Y there exists exactly one dotted arrow making the diagram commute. In other words, in Definition 46.13.1 the condition that T be affine may be dropped.

Proof. Let $U' \to T'$ be a surjective étale morphism where $U' = \coprod U'_i$ is a disjoint union of affine schemes. Let $U_i = T \times_{T'} U'_i$. Then we get morphisms $a'_i : U'_i \to X$ such that $a'_i|_{U_i}$ equals the composition $U_i \to T \to X$. By uniqueness (see Lemma 46.11.3) we see that a'_i and a'_j agree on the fibre product $U'_i \times_{T'} U'_j$. Hence $\coprod a'_i : U' \to X$ descends to give a unique morphism $a' : T' \to X$. $\square$

Lemma 46.13.4. *A composition of formally étale morphisms is formally étale.*

Proof. This is formal. $\square$

Lemma 46.13.5. *A base change of a formally étale morphism is formally étale.*

Proof. This is formal. $\square$

Lemma 46.13.6. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S The following are equivalent:*

(1) *f is formally étale,*
(2) *f is formally unramified and the universal first order thickening of X over Y is equal to X,*
(3) *f is formally unramified and $\mathcal{C}_{X/Y} = 0$, and*
(4) *$\Omega_{X/Y} = 0$ and $\mathcal{C}_{X/Y} = 0$.*

Proof. Actually, the last assertion only make sense because $\Omega_{X/Y} = 0$ implies that $\mathcal{C}_{X/Y}$ is defined via Lemma 46.11.6 and Definition 46.12.5. This also makes it clear that (3) and (4) are equivalent.

Either of the assumptions (1), (2), and (3) imply that f is formally unramified. Hence we may assume f is formally unramified. The equivalence of (1), (2), and (3) follow from the universal property of the universal first order thickening X' of X over S and the fact that $X = X' \Leftrightarrow \mathcal{C}_{X/Y} = 0$ since after all by definition $\mathcal{C}_{X/Y} = \mathcal{C}_{X/X'}$ is the ideal sheaf of X in X'. $\square$

Lemma 46.13.7. *An unramified flat morphism is formally étale.*

Proof. Follows from the case of schemes, see More on Morphisms, Lemma 33.6.7 and étale localization, see Lemmas 46.11.2 and 46.13.2 and Morphisms of Spaces, Lemma 42.27.4. $\square$

Lemma 46.13.8. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. The following are equivalent:*

(1) *The morphism f is étale, and*
(2) *the morphism f is locally of finite presentation and formally étale.*

Proof. Follows from the case of schemes, see More on Morphisms, Lemma 33.6.9 and étale localization, see Lemma 46.13.2 and Morphisms of Spaces, Lemmas 42.26.4 and 42.35.2. □

46.14. Infinitesimal deformations of maps

In this section we explain how a derivation can be used to infinitesimally move a map. Throughout this section we use that a sheaf on a thickening X' of X can be seen as a sheaf on X, see Equations (46.8.1.1) and (46.8.1.2).

Lemma 46.14.1. *Let S be a scheme. Let B be an algebraic space over S. Let $X \subset X'$ and $Y \subset Y'$ be two first order thickenings of algebraic spaces over B. Let $(a, a'), (b, b') : (X \subset X') \to (Y \subset Y')$ be two morphisms of thickenings over B. Assume that*

(1) *$a = b$, and*
(2) *the two maps $a^*\mathcal{C}_{Y/Y'} \to \mathcal{C}_{X/X'}$ (Lemma 46.5.3) are equal.*

Then the map $(a')^\sharp - (b')^\sharp$ factors as

$$\mathcal{O}_{Y'} \to \mathcal{O}_Y \xrightarrow{D} a_*\mathcal{C}_{X/X'} \to a_*\mathcal{O}_{X'}$$

where D is an $\mathcal{O}_B$-derivation.

Proof. Instead of working on Y we work on X. The advantage is that the pullback functor a^{-1} is exact. Using (1) and (2) we obtain a commutive diagram with exact rows

$$\begin{tikzcd} 0 \arrow[r] & \mathcal{C}_{X/X'} \arrow[r] & \mathcal{O}_{X'} \arrow[r] & \mathcal{O}_X \arrow[r] & 0 \\ 0 \arrow[r] & a^{-1}\mathcal{C}_{Y/Y'} \arrow[r] \arrow[u] & a^{-1}\mathcal{O}_{Y'} \arrow[r] \arrow[u, shift left, "(a')^\sharp"'] \arrow[u, shift right, "(b')^\sharp"'] & a^{-1}\mathcal{O}_Y \arrow[r] \arrow[u] & 0 \end{tikzcd}$$

Now it is a general fact that in such a situation the difference of the $\mathcal{O}_B$-algebra maps $(a')^\sharp$ and $(b')^\sharp$ is an $\mathcal{O}_B$-derivation from $a^{-1}\mathcal{O}_Y$ to $\mathcal{C}_{X/X'}$. By adjointness of the functors a^{-1} and a_* this is the same thing as an $\mathcal{O}_B$-derivation from $\mathcal{O}_Y$ into $a_*\mathcal{C}_{X/X'}$. Some details omitted. □

Note that in the situation of the lemma above we may write D as

$$D = \mathrm{d}_{Y/B} \circ \theta \tag{46.14.1.1}$$

where θ is an $\mathcal{O}_Y$-linear map $\theta : \Omega_{Y/B} \to a_*\mathcal{C}_{X/X'}$. Of course, then by adjunction again we may view θ as an $\mathcal{O}_X$-linear map $\theta : a^*\Omega_{Y/B} \to \mathcal{C}_{X/X'}$.

Lemma 46.14.2. *Let S be a scheme. Let B be an algebraic space over S. Let $(a, a') : (X \subset X') \to (Y \subset Y')$ be a morphism of first order thickenings over B. Let*

$$\theta : a^*\Omega_{Y/B} \to \mathcal{C}_{X/X'}$$

be an $\mathcal{O}_X$-linear map. Then there exists a unique morphism of pairs $(b, b') : (X \subset X') \to (Y \subset Y')$ such that (1) and (2) of Lemma 46.14.1 hold and the derivation D and θ are related by Equation (46.14.1.1).

Proof. Consider the map

$$\alpha = (a')^\sharp + D : a^{-1}\mathcal{O}_{Y'} \to \mathcal{O}_{X'}$$

where D is as in Equation (46.14.1.1). As D is an $\mathcal{O}_B$-derivation it follows that α is a map of sheaves of $\mathcal{O}_B$-algebras. By construction we have $i_X^\sharp \circ \alpha = a^\sharp \circ i_Y^\sharp$ where $i_X : X \to X'$

and $i_Y : Y \to Y'$ are the given closed immersions. By Lemma 46.8.2 we obtain a unique morphism $(a, b') : (X \subset X') \to (Y \subset Y')$ of thickenings over B such that $\alpha = (b')^\sharp$. Setting $b = a$ we win. $\square$

Lemma 46.14.3. *Let S be a scheme. Let B be an algebraic space over S. Let $X \subset X'$ and $Y \subset Y'$ be first order thickenings over B. Assume given a morphism $a : X \to Y$ and a map $A : a^*\mathcal{C}_{Y/Y'} \to \mathcal{C}_{X/X'}$ of $\mathcal{O}_X$-modules. For an object U' of $(X')_{spaces,étale}$ with $U = X \times_{X'} U'$ consider morphisms $a' : U' \to Y'$ such that*

1. *a' is a morphism over B,*
2. *$a'|_U = a|_U$, and*
3. *the induced map $a^*\mathcal{C}_{Y/Y'}|_U \to \mathcal{C}_{X/X'}|_U$ is the restriction of A to U.*

Then the rule

$$U' \mapsto \{a' : U' \to Y' \text{ such that (1), (2), (3) hold.}\} \quad (46.14.3.1)$$

defines a sheaf of sets on $(X')_{spaces,étale}$.

Proof. Denote $\mathcal{F}$ the rule of the lemma. The restriction mapping $\mathcal{F}(U') \to \mathcal{F}(V')$ for $V' \subset U' \subset X'$ of $\mathcal{F}$ is really the restriction map $a' \mapsto a'|_{V'}$. With this definition in place it is clear that $\mathcal{F}$ is a sheaf since morphisms of algebraic spaces satisfy étale descent, see Descent on Spaces, Lemma 45.6.2. $\square$

Lemma 46.14.4. *Same notation and assumptions as in Lemma 46.14.3. We identify sheaves on X and X' via (46.8.1.1). There is an action of the sheaf*

$$\mathcal{H}om_{\mathcal{O}_X}(a^*\Omega_{Y/B}, \mathcal{C}_{X/X'})$$

on the sheaf (46.14.3.1). Moreover, the action is simply transitive for any object U' of $(X')_{spaces,étale}$ over which the sheaf (46.14.3.1) has a section.

Proof. This is a combination of Lemmas 46.14.1, 46.14.2, and 46.14.3. $\square$

Remark 46.14.5. A special case of Lemmas 46.14.1, 46.14.2, 46.14.3, and 46.14.4 is where $Y = Y'$. In this case the map A is always zero. The sheaf of Lemma 46.14.3 is just given by the rule

$$U' \mapsto \{a' : U' \to Y \text{ over } S \text{ with } a'|_U = a|_U\}$$

and we act on this by the sheaf $\mathcal{H}om_{\mathcal{O}_X}(a^*\Omega_{Y/B}, \mathcal{C}_{X/X'})$. The action of a local section θ on a' is sometimes indicated by $\theta \cdot a'$. Note that this means nothing else than the fact that $(a')^\sharp$ and $(\theta \cdot a')^\sharp$ differ by a derivation D which is related to θ by Equation (46.14.1.1).

46.15. Infinitesimal deformations of algebraic spaces

The following simple lemma is often a convenient tool to check whether an infinitesimal deformation of a map is flat.

Lemma 46.15.1. *Let S be a scheme. Let $(f, f') : (X \subset X') \to (Y \subset Y')$ be a morphism of first order thickenings of algebraic spaces over S. Assume that f is flat. Then the following are equivalent*

1. *f' is flat and $X = Y \times_{Y'} X'$, and*
2. *the canonical map $f^*\mathcal{C}_{Y/Y'} \to \mathcal{C}_{X/X'}$ is an isomorphism.*

Proof. Choose a scheme V' and a surjective étale morphism $V' \to Y'$. Choose a scheme U' and a surjective étale morphism $U' \to X' \times_{Y'} V'$. Set $U = X \times_{X'} U'$ and $V = Y \times_{Y'} V'$. According to our definition of a flat morphism of algebraic spaces we see that the induced map $g : U \to V$ is a flat morphism of schemes and that f' is flat if and only if the corresponding morphism $g' : U' \to V'$ is flat. Also, $X = Y \times_{Y'} X'$ if and only if $U = V \times_{V'} V'$. Finally, the map $f^*\mathcal{C}_{Y/Y'} \to \mathcal{C}_{X/X'}$ is an isomorphism if and only if $g^*\mathcal{C}_{V/V'} \to \mathcal{C}_{U/U'}$ is an isomorphism. Hence the lemma follows from its analogue for morphisms of schemes, see More on Morphisms, Lemma 33.8.1. □

46.16. Formally smooth morphisms

In this section we introduce the notion of a formally smooth morphism $X \to Y$ of algebraic spaces. Such a morphism is characterized by the property that T-valued points of X lift to inifinitesimal thickenings of T provided T is affine. The main result is that a morphism which is formally smooth and locally of finite presentation is smooth, see Lemma 46.16.6. It turns out that this criterion is often easier to use than the Jacobian criterion.

Definition 46.16.1. Let S be a scheme. A morphism $f : X \to Y$ of algebraic spaces over S is said to be *formally smooth* if it is formally smooth as a transformation of functors as in Definition 46.10.1.

In the cases of formally unramified and formally étale morphisms the condition that T' be affine could be dropped, see Lemmas 46.11.3 and 46.13.3. This is no longer true in the case of formally smooth morphisms. In fact, a slightly more natural condition would be that we should be able to fill in the dotted arrow étale locally on T'. In fact, analyzing the proof of Lemma 46.16.6 shows that this would be equivalent to the definition as it currently stands. It is also true that requiring the existence of the dotted arrow fppf locally on T' would be sufficient, but that is slightly more difficult to prove.

We will not restate the results proved in the more general setting of formally smooth transformations of functors in Section 46.10.

Lemma 46.16.2. *A composition of formally smooth morphisms is formally smooth.*

Proof. Omitted. □

Lemma 46.16.3. *A base change of a formally smooth morphism is formally smooth.*

Proof. Omitted, but see Algebra, Lemma 7.127.2 for the algebraic version. □

Lemma 46.16.4. *Let $f : X \to S$ be a morphism of schemes. Then f is formally étale if and only if f is formally smooth and formally unramified.*

Proof. Omitted. □

Here is a helper lemma which will be superseded by Lemma 46.16.9.

Lemma 46.16.5. *Let S be a scheme. Let*

$$\begin{tikzcd} U \arrow[r, "\psi"'] \arrow[d] & V \arrow[d] \\ X \arrow[r, "f"] & Y \end{tikzcd}$$

be a commutative diagram of morphisms of algebraic spaces over S. If the vertical arrows are étale and f is formally smooth, then ψ is formally smooth.

Proof. By Lemma 46.10.5 the morphisms $U \to X$ and $V \to Y$ are formally étale. By Lemma 46.10.3 the composition $U \to Y$ is formally smooth. By Lemma 46.10.8 we see $\psi : U \to V$ is formally smooth. $\square$

The following lemma is the main result of this section. It implies, combined with Proposition 46.4.9, that we can recognize whether a morphism of algebraic spaces $f : X \to Y$ is smooth in terms of ``simple'' properties of the transformation of functors $X \to Y$.

Lemma 46.16.6. *(Infinitesimal lifting criterion) Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. The following are equivalent:*

1. *The morphism f is smooth.*
2. *The morphism f is locally of finite presentation, and formally smooth.*

Proof. Assume $f : X \to S$ is locally of finite presentation and formally smooth. Consider a commutative diagram

$$\begin{tikzcd} U \arrow[r, "\psi"] \arrow[d] & V \arrow[d] \\ X \arrow[r, "f"] & Y \end{tikzcd}$$

where U and V are schemes and the vertical arrows are étale and surjective. By Lemma 46.16.5 we see $\psi : U \to V$ is formally smooth. By Morphisms of Spaces, Lemma 42.26.4 the morphism ψ is locally of finite presentation. Hence by the case of schemes the morphism ψ is smooth, see More on Morphisms, Lemma 33.9.7. Hence f is smooth, see Morphisms of Spaces, Lemma 42.33.4.

Conversely, assume that $f : X \to Y$ is smooth. Consider a solid commutative diagram

$$\begin{tikzcd} X \arrow[d, "f"'] & T \arrow[l, "a"'] \arrow[d, "i"] \\ Y & T' \arrow[l] \arrow[ul, dashed] \end{tikzcd}$$

as in Definition 46.16.1. We will show the dotted arrow exists thereby proving that f is formally smooth. Let $\mathcal{F}$ be the sheaf of sets on $(T')_{spaces,étale}$ of Lemma 46.14.3, see also Remark 46.14.5. Let

$$\mathcal{H} = \mathcal{H}om_{\mathcal{O}_T}(a^*\Omega_{X/Y}, \mathcal{C}_{T/T'})$$

be the sheaf of $\mathcal{O}_T$-modules on $T_{étale}$ introduced in Lemma 46.14.4. The action $\mathcal{H} \times \mathcal{F} \to \mathcal{F}$ turns $\mathcal{F}$ into a pseudo $\mathcal{H}$-torsor, see Cohomology on Sites, Definition 19.5.1. Our goal is to show that $\mathcal{F}$ is a trivial $\mathcal{H}$-torsor. There are two steps: (I) To show that $\mathcal{F}$ is a torsor we have to show that $\mathcal{F}$ has étale locally a section. (II) To show that $\mathcal{F}$ is the trivial torsor it suffices to show that $H^1(T_{étale}, \mathcal{H}) = 0$, see Cohomology on Sites, Lemma 19.5.3.

First we prove (I). To see this choose a commutative diagram

$$\begin{tikzcd} U \arrow[r, "\psi"] \arrow[d] & V \arrow[d] \\ X \arrow[r, "f"] & Y \end{tikzcd}$$

where U and V are schemes and the vertical arrows are étale and surjective. As f is assumed smooth we see that ψ is smooth and hence formally smooth by Lemma 46.10.5. By the same lemma the morphism $V \to Y$ is formally étale. Thus by Lemma 46.10.3 the composition $U \to Y$ is formally smooth. Then (I) follows from Lemma 46.10.6 part (4).

Finally we prove (II). By Lemma 46.6.15 we see that $\Omega_{X/S}$ is of finite presentation. Hence $a^*\Omega_{X/S}$ is of finite presentation (see Properties of Spaces, Section 41.27). Hence the sheaf $\mathcal{H} = \mathcal{H}om_{\mathcal{O}_T}(a^*\Omega_{X/Y}, \mathcal{C}_{T/T'})$ is quasi-coherent by Properties of Spaces, Lemma 41.26.7. Thus by Descent, Proposition 31.6.10 and Coherent, Lemma 25.2.2 we have

$$H^1(T_{spaces,\acute{e}tale}, \mathcal{H}) = H^1(T_{\acute{e}tale}, \mathcal{H}) = H^1(T, \mathcal{H}) = 0$$

as desired. □

We do a bit more work to show that being formally smooth is étale local on the source. To begin we show that a formally smooth morphism has a nice sheaf of differentials. The notion of a locally projective quasi-coherent module is defined in Properties of Spaces, Section 41.28.

Lemma 46.16.7. *Let S be a scheme. Let $f : X \to Y$ be a formally smooth morphism of algebraic spaces over S. Then $\Omega_{X/Y}$ is locally projective on X.*

Proof. Choose a diagram

$$\begin{tikzcd} U \arrow[r, "\psi"'] \arrow[d] & V \arrow[d] \\ X \arrow[r, "f"] & Y \end{tikzcd}$$

where U and V are affine(!) schemes and the vertical arrows are étale. By Lemma 46.16.5 we see $\psi : U \to V$ is formally smooth. Hence $\Gamma(V, \mathcal{O}_V) \to \Gamma(U, \mathcal{O}_U)$ is a formally smooth ring map, see More on Morphisms, Lemma 33.9.6. Hence by Algebra, Lemma 7.127.7 the $\Gamma(U, \mathcal{O}_U)$-module $\Omega_{\Gamma(U,\mathcal{O}_U)/\Gamma(V,\mathcal{O}_V)}$ is projective. Hence $\Omega_{U/V}$ is locally projective, see Properties, Section 23.19. Since $\Omega_{X/Y}|_U = \Omega_{U/V}$ we see that $\Omega_{X/Y}$ is locally projective too. (Because we can find an étale covering of X by the affine U's fitting into diagrams as above -- details omitted.) □

Lemma 46.16.8. *Let T be an affine scheme. Let $\mathcal{F}$, $\mathcal{G}$ be quasi-coherent $\mathcal{O}_T$-modules on $T_{\acute{e}tale}$. Consider the internal hom sheaf $\mathcal{H} = \mathcal{H}om_{\mathcal{O}_T}(\mathcal{F}, \mathcal{G})$ on $T_{\acute{e}tale}$. If $\mathcal{F}$ is locally projective, then $H^1(T_{\acute{e}tale}, \mathcal{H}) = 0$.*

Proof. By the definition of a locally projective sheaf on an algebraic space (see Properties of Spaces, Definition 41.28.2) we see that $\mathcal{F}_{Zar} = \mathcal{F}|_{T_{Zar}}$ is a locally projective sheaf on the scheme T. Thus $\mathcal{F}_{Zar}$ is a direct summand of a free $\mathcal{O}_{T_{Zar}}$-module. Whereupon we conclude (as $\mathcal{F} = (\mathcal{F}_{Zar})^a$, see Descent, Proposition 31.6.11) that $\mathcal{F}$ is a direct summand of a free $\mathcal{O}_T$-module on $T_{\acute{e}tale}$. Hence we may assume that $\mathcal{F} = \bigoplus_{i \in I} \mathcal{O}_T$ is a free module. In this case $\mathcal{H} = \prod_{i \in I} \mathcal{G}$ is a product of quasi-coherent modules. By Cohomology on Sites, Lemma 19.12.5 we conclude that $H^1 = 0$ because the cohomology of a quasi-coherent sheaf on an affine scheme is zero, see Descent, Proposition 31.6.10 and Coherent, Lemma 25.2.2. □

Lemma 46.16.9. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. The following are equivalent:*

(1) *f is formally smooth,*
(2) *for every diagram*

$$\begin{tikzcd} U \arrow[r, "\psi"'] \arrow[d] & V \arrow[d] \\ X \arrow[r, "f"] & Y \end{tikzcd}$$

where U and V are schemes and the vertical arrows are étale the morphism of schemes ψ is formally smooth (as in More on Morphisms, Definition 33.4.1), and

(3) *for one such diagram with surjective vertical arrows the morphism ψ is formally smooth.*

Proof. We have seen that (1) implies (2) and (3) in Lemma 46.16.5. Assume (3). The proof that f is formally smooth is entirely similar to the proof of (1) $\Rightarrow$ (2) of Lemma 46.16.6.

Consider a solid commutative diagram

$$\begin{tikzcd} X \arrow[d, "f"'] & T \arrow[l, "a"'] \arrow[d, "i"] \\ Y & T' \arrow[l] \arrow[ul, dashed] \end{tikzcd}$$

as in Definition 46.16.1. We will show the dotted arrow exists thereby proving that f is formally smooth. Let $\mathcal{F}$ be the sheaf of sets on $(T')_{spaces,étale}$ of Lemma 46.14.3, see also Remark 46.14.5. Let

$$\mathcal{H} = \mathcal{H}om_{\mathcal{O}_T}(a^*\Omega_{X/Y}, \mathcal{C}_{T/T'})$$

be the sheaf of $\mathcal{O}_T$-modules on $T_{étale}$ introduced in Lemma 46.14.4. The action $\mathcal{H} \times \mathcal{F} \to \mathcal{F}$ turns $\mathcal{F}$ into a pseudo $\mathcal{H}$-torsor, see Cohomology on Sites, Definition 19.5.1. Our goal is to show that $\mathcal{F}$ is a trivial $\mathcal{H}$-torsor. There are two steps: (I) To show that $\mathcal{F}$ is a torsor we have to show that $\mathcal{F}$ has étale locally a section. (II) To show that $\mathcal{F}$ is the trivial torsor it suffices to show that $H^1(T_{étale}, \mathcal{H}) = 0$, see Cohomology on Sites, Lemma 19.5.3.

First we prove (I). To see this consider a diagram (which exists because we are assuming (3))

$$\begin{tikzcd} U \arrow[r, "\psi"] \arrow[d] & V \arrow[d] \\ X \arrow[r, "f"] & Y \end{tikzcd}$$

where U and V are schemes, the vertical arrows are étale and surjective, and ψ is formally smooth. By Lemma 46.10.5 the morphism $V \to Y$ is formally étale. Thus by Lemma 46.10.3 the composition $U \to Y$ is formally smooth. Then (I) follows from Lemma 46.10.6 part (4).

Finally we prove (II). By Lemma 46.16.7 we see that $\Omega_{U/V}$ locally projective. Hence $\Omega_{X/Y}$ is locally projective, see Descent on Spaces, Lemma 45.5.5. Hence $a^*\Omega_{X/Y}$ is locally projective, see Properties of Spaces, Lemma 41.28.3. Hence

$$H^1(T_{étale}, \mathcal{H}) = H^1(T_{étale}, \mathcal{H}om_{\mathcal{O}_T}(a^*\Omega_{X/Y}, \mathcal{C}_{T/T'}) = 0$$

by Lemma 46.16.8 as desired. $\square$

Lemma 46.16.10. *The property $\mathcal{P}(f)=$"f is formally smooth" is fpqc local on the base.*

Proof. Let $f : X \to Y$ be a morphism of algebraic spaces over a scheme S. Choose an index set I and diagrams

$$\begin{tikzcd} U_i \arrow[r, "\psi_i"] \arrow[d] & V_i \arrow[d] \\ X \arrow[r, "f"] & Y \end{tikzcd}$$

with étale vertical arrows and U_i, V_i affine schemes. Moreover, assume that $\coprod U_i \to X$ and $\coprod V_i \to Y$ are surjective, see Properties of Spaces, Lemma 41.6.1. By Lemma 46.16.9 we see that f is formally smooth if and only if each of the morphisms ψ_i are formally smooth. Hence we reduce to the case of a morphism of affine schemes. In this case the result follows from Algebra, Lemma 7.127.15. Some details omitted. □

Lemma 46.16.11. *Let S be a scheme. Let $f : X \to Y$, $g : Y \to Z$ be morphisms of algebraic spaces over S. Assume f is formally smooth. Then*

$$0 \to f^*\Omega_{Y/Z} \to \Omega_{X/Z} \to \Omega_{X/Z} \to 0$$

Lemma 46.6.8 is short exact.

Proof. Follows from the case of schemes, see More on Morphisms, Lemma 33.9.9, by étale localization, see Lemmas 46.16.9 and 46.6.3. □

Lemma 46.16.12. *Let S be a scheme. Let B be an algebraic space over S. Let $h : Z \to X$ be a formally unramified morphism of algebraic spaces over B. Assume that Z is formally smooth over B. Then the canonical exact sequence*

$$0 \to \mathcal{C}_{Z/X} \to i^*\Omega_{X/B} \to \Omega_{Z/B} \to 0$$

of Lemma 46.12.13 is short exact.

Proof. Let $Z \to Z'$ be the universal first order thickening of Z over X. From the proof of Lemma 46.12.13 we see that our sequence is identified with the sequence

$$\mathcal{C}_{Z/Z'} \to \Omega_{Z'/B} \otimes \mathcal{O}_Z \to \Omega_{Z/B} \to 0.$$

Since $Z \to S$ is formally smooth we can étale locally on Z' find a left inverse $Z' \to Z$ over B to the inclusion map $Z \to Z'$. Thus the sequence is étale locally split, see Lemma 46.6.11. □

Lemma 46.16.13. *Let S be a scheme. Let*

$$\begin{tikzcd} Z \arrow[r, "i"'] \arrow[rd, "j"'] & X \arrow[d, "f"] \\ & Y \end{tikzcd}$$

be a commutative diagram of algebraic spaces over S where i and j are formally unramified and f is formally smooth. Then the canonical exact sequence

$$0 \to \mathcal{C}_{Z/Y} \to \mathcal{C}_{Z/X} \to i^*\Omega_{X/Y} \to 0$$

of Lemma 46.12.14 is exact and locally split.

Proof. Denote $Z \to Z'$ the universal first order thickening of Z over X. Denote $Z \to Z''$ the universal first order thickening of Z over Y. By Lemma 46.12.13 here is a canonical morpism $Z' \to Z''$ so that we have a commutative diagram

$$\begin{tikzcd} Z \arrow[r, "i'"'] \arrow[rd, "j'"'] & Z' \arrow[r, "a"'] \arrow[d, "k"] & X \arrow[d, "f"] \\ & Z'' \arrow[r, "b"] & Y \end{tikzcd}$$

The sequence above is identified with the sequence

$$\mathcal{C}_{Z/Z''} \to \mathcal{C}_{Z/Z'} \to (i')^*\Omega_{Z'/Z''} \to 0$$

via our definitions concering conormal sheaves of formally unramified morphisms. Let $U'' \to Z''$ be an étale morphism with U'' affine. Denote $U \to Z$ and $U' \to Z'$ the corresponding affine schemes étale over Z and Z'. As f is formally smooth there exists a morphism $h : U'' \to X$ which agrees with i on U and such that $f \circ h$ equals $b|_{U''}$. Since Z' is the universal first order thickening we obtain a unique morphism $g : U'' \to Z'$ such that $g = a \circ h$. The universal property of Z'' implies that $k \circ g$ is the inclusion map $U'' \to Z''$. Hence g is a left inverse to k. Picture

$$\begin{tikzcd} U \arrow[r] \arrow[d] & Z' \arrow[d, "k"] \\ U'' \arrow[r] \arrow[ur, "g"] & Z'' \end{tikzcd}$$

Thus g induces a map $\mathcal{C}_{Z/Z'}|_U \to \mathcal{C}_{Z/Z''}|_U$ which is a left inverse to the map $\mathcal{C}_{Z/Z''} \to \mathcal{C}_{Z/Z'}$ over U. ☐

46.17. Openness of the flat locus

This section is analogue of More on Morphisms, Section 33.11. Note that we have defined the notion of flatness for quasi-coherent modules on algebraic spaces in Morphisms of Spaces, Section 42.28.

Theorem 46.17.1. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Let $\mathcal{F}$ be a quasi-coherent sheaf on X. Assume f is locally of finite presentation and that $\mathcal{F}$ is an $\mathcal{O}_X$-module which is locally of finite presentation. Then*

$$\{x \in |X| : \mathcal{F} \text{ is flat over } Y \text{ at } x\}$$

is open in $|X|$.

Proof. Choose a commutative diagram

$$\begin{tikzcd} U \arrow[r, "\alpha"'] \arrow[d, "p"'] & V \arrow[d, "q"] \\ X \arrow[r, "a"] & Y \end{tikzcd}$$

with U, V schemes and p, q surjective and étale as in Spaces, Lemma 40.11.4. By More on Morphisms, Theorem 33.11.1 the set $U' = \{u \in |U| : p^*\mathcal{F} \text{ is flat over } V \text{ at } u\}$ is open in U. By Morphisms of Spaces, Definition 42.28.2 the image of U' in $|X|$ is the set of the theorem. Hence we are done because the map $|U| \to |X|$ is open, see Properties of Spaces, Lemma 41.4.6. ☐

Lemma 46.17.2. *Let S be a scheme. Let*

$$\begin{tikzcd} X' \arrow[r, "g'"'] \arrow[d, "f'"'] & X \arrow[d, "f"] \\ Y' \arrow[r, "g"] & Y \end{tikzcd}$$

be a cartesian diagram of algebraic spaces over S. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Assume g is flat, f is locally of finite presentation, and $\mathcal{F}$ is locally of finite presentation. Then

$$\{x' \in |X'| : (g')^*\mathcal{F} \text{ is flat over } Y' \text{ at } x'\}$$

is the inverse image of the open subset of Theorem 46.17.1 under the continuous map $|g'| : |X'| \to |X|$.

Proof. This follows from Morphisms of Spaces, Lemma 42.28.3. ☐

46.18. Critère de platitude par fibres

Let S be a scheme. Consider a commutative diagram of algebraic spaces over S

$$\begin{tikzcd} X \arrow[rr, "f"] \arrow[rd, "g"'] & & Y \arrow[ld, "h"] \\ & Z & \end{tikzcd}$$

and a quasi-coherent $\mathcal{O}_X$-module $\mathcal{F}$. Given a point $x \in |X|$ we consider the question as to whether $\mathcal{F}$ is flat over Y at x. If $\mathcal{F}$ is flat over Z at x, then the theorem below states this question is intimately related to the question of whether the restriction of $\mathcal{F}$ to the fibre of $X \to Z$ over $g(x)$ is flat over the fibre of $Y \to Z$ over $g(x)$. To make sense out of this we offer the following preliminary lemma.

Lemma 46.18.1. *In the situation above the following are equivalent*

(1) *Pick a geometric point $\overline{x}$ of X lying over x. Set $\overline{y} = f \circ \overline{x}$ and $\overline{z} = g \circ \overline{x}$. Then the module $\mathcal{F}_{\overline{x}}/\mathfrak{m}_{\overline{z}}\mathcal{F}_{\overline{x}}$ is flat over $\mathcal{O}_{Y,\overline{y}}/\mathfrak{m}_{\overline{z}}\mathcal{O}_{Y,\overline{y}}$.*

(2) *Pick a morphism $x : Spec(K) \to X$ in the equivalence class of x. Set $z = g \circ x$, $X_z = Spec(K) \times_{z,Z} X$, $Y_z = Spec(K) \times_{z,Z} Y$, and $\mathcal{F}_z$ the pullback of $\mathcal{F}$ to X_z. Then $\mathcal{F}_z$ is flat at x over Y_z (as defined in Morphisms of Spaces, Definition 42.28.2).*

(3) *Pick a commutative diagram*

$$\begin{tikzcd} & & U \arrow[r] \arrow[lld, "a"'] \arrow[rd] & V \arrow[lld, "b"] \arrow[d] \\ X \arrow[r, "f"] \arrow[rd, "g"'] & Y \arrow[d, "h"] & & W \arrow[llld, "c"] \\ & Z & & \end{tikzcd}$$

where U, V, W are schemes, and a, b, c are étale, and a point $u \in U$ mapping to x. Let $w \in W$ be the image of u. Let $\mathcal{F}_w$ be the pullback of $\mathcal{F}$ to the fibre U_w of $U \to W$ at w. Then $\mathcal{F}_w$ is flat over V_w at u.

Proof. Note that in (2) the morphism $x : Spec(K) \to X$ defines a K-rational point of X_z, hence the statement makes sense. Moreover, note that we can always choose a diagram as in (3) by: first choosing a scheme W and a surjective étale morphism $W \to Z$, then choosing a scheme V and a surjective étale morphism $V \to W \times_Z Y$, and finally choosing a scheme U and a surjective étale morphism $U \to V \times_Y X$. Having made these choices we set $U \to W$ equal to the composition $U \to V \to W$ and we can pick a point $u \in U$ mapping to x because the morphism $U \to X$ is surjective.

Suppose given both a diagram as in (3) and a geometric point $\overline{x} : Spec(k) \to X$ as in (1). By Properties of Spaces, Lemma 41.16.4 we can choose a geometric point $\overline{u} : Spec(k) \to U$ lying over u such that $\overline{x} = a \circ \overline{u}$. Denote $\overline{v} : Spec(k) \to V$ and $\overline{w} : Spec(k) \to W$ the induced geometric points of V and W. In this setting we know that $\mathcal{O}_{X,\overline{x}} = \mathcal{O}_{U,u}^{sh}$ and similarly for Y and Z, see Properties of Spaces, Lemma 41.19.1. In the same vein we have

$$\mathcal{F}_{\overline{x}} = (a^*\mathcal{F})_u \otimes_{\mathcal{O}_{U,u}} \mathcal{O}_{U,u}^{sh}$$

see Properties of Spaces, Lemma 41.26.4. Note that the stalk of $\mathcal{F}_w$ at u is given by

$$(\mathcal{F}_w)_u = (a^*\mathcal{F})_u/\mathfrak{m}_w(a^*\mathcal{F})_u$$

and the local ring of V_w at v is given by

$$\mathcal{O}_{V_w,v} = \mathcal{O}_{V,v}/\mathfrak{m}_w\mathcal{O}_{V,v}.$$

Since $\mathfrak{m}_{\overline{z}} = \mathfrak{m}_w\mathcal{O}_{Z,\overline{z}} = \mathfrak{m}_w\mathcal{O}^{sh}_{W,w}$ we see that

$$\begin{aligned}
\mathcal{F}_{\overline{x}}/\mathfrak{m}_{\overline{z}}\mathcal{F}_{\overline{x}} &= (a^*\mathcal{F})_u \otimes_{\mathcal{O}_{U,u}} \mathcal{O}_{X,\overline{x}}/\mathfrak{m}_{\overline{z}}\mathcal{O}_{X,\overline{x}} \\
&= (\mathcal{F}_w)_u \otimes_{\mathcal{O}_{U_w,u}} \mathcal{O}^{sh}_{U,u}/\mathfrak{m}_w\mathcal{O}^{sh}_{U,u} \\
&= (\mathcal{F}_w)_u \otimes_{\mathcal{O}_{U_w,u}} \mathcal{O}^{sh}_{U_w,\overline{u}} \\
&= (\mathcal{F}_w)_{\overline{u}}
\end{aligned}$$

the penultimate equality by Algebra, Lemma 7.139.22 and the last equality by Properties of Spaces, Lemma 41.26.4. The same arguments applied to the structure sheaves of V and Y show that

$$\mathcal{O}^{sh}_{V_w,\overline{v}} = \mathcal{O}^{sh}_{V,v}/\mathfrak{m}_w\mathcal{O}^{sh}_{V,v} = \mathcal{O}_{Y,\overline{y}}/\mathfrak{m}_{\overline{z}}\mathcal{O}_{Y,\overline{y}}.$$

OK, and now we can use Morphisms of Spaces, Lemma 42.28.1 to see that (1) is equivalent to (3).

Finally we prove the equivalence of (2) and (3). To do this we pick a field extension $\tilde{K}$ of K and and a morphism $\tilde{x} : Spec(\tilde{K}) \to U$ which lies over u (this is possible because $u \times_{X,x} Spec(K)$ is a nonempty scheme). Set $\tilde{z} : Spec(\tilde{K}) \to U \to W$ be the composition. We obtain a commutative diagram

$$\begin{tikzcd}
 & & & U_w \times_w \tilde{z} \arrow[rr] \arrow[dlll, "a"'] \arrow[dr] & & V_w \times_w \tilde{z} \arrow[dlll, "b"'] \arrow[dl] \\
X_z \arrow[rr, "f"'] \arrow[dr, "g"'] & & Y_z \arrow[dl, "h"] & & \tilde{z} \arrow[dlll, "c"'] & \\
 & z & & & &
\end{tikzcd}$$

where $z = Spec(K)$ and $w = Spec(\kappa(w))$. Now it is clear that $\mathcal{F}_w$ and $\mathcal{F}_z$ pull back to the same module on $U_w \times_w \tilde{z}$. This leads to a commutative diagram

$$\begin{tikzcd}
X_z \arrow[d] & U_w \times_w \tilde{z} \arrow[l] \arrow[r] \arrow[d] & U_w \arrow[d] \\
Y_z & V_w \times_w \tilde{z} \arrow[l] \arrow[r] & V_w
\end{tikzcd}$$

both of whose squares are cartesian and whose bottom horizontal arrows are flat: the lower left horizontal arrow is the composition of the morphism $Y \times_Z \tilde{z} \to Y \times_Z z = Y_z$ (base change of a flat morphism), the étale morphism $V \times_Z \tilde{z} \to Y \times_Z \tilde{z}$, and the étale morphism $V \times_W \tilde{z} \to V \times_Z \tilde{z}$. Thus it follows from Morphisms of Spaces, Lemma 42.28.3 that

$$\mathcal{F}_z \text{ flat at } x \text{ over } Y_z \Leftrightarrow \mathcal{F}|_{U_w \times_w \tilde{z}} \text{ flat at } \tilde{x} \text{ over } V_w \times_w \tilde{z} \Leftrightarrow \mathcal{F}_w \text{ flat at } u \text{ over } V_w$$

and we win. $\square$

Definition 46.18.2. Let S be a scheme. Let $X \to Y \to Z$ be morphisms of algebraic spaces over S. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Let $x \in |X|$ be a point and denote $z \in |Z|$ its image.

(1) We say *the restriction of $\mathcal{F}$ to its fibre over z is flat at x over the fibre of Y over z* if the equivalent conditions of Lemma 46.18.1 are satisfied.

(2) We say *the fibre of X over z is flat at x over the fibre of Y over z* if the quivalent conditions of Lemma 46.18.1 holds with $\mathcal{F} = \mathcal{O}_X$.
(3) We say *the fibre of X over z is flat over the fibre of Y over z* if for all $x \in |X|$ lying over z the fibre of X over z is flat at x over the fibre of Y over z

With this definition in hand we can state the criterion as follows. (We leave the Noetherian version for later; insert future reference here.)

Theorem 46.18.3. *Let S be a scheme. Let $f : X \to Y$ and $Y \to Z$ be a morphisms of algebraic spaces over S. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Assume*

(1) *X is locally of finite presentation over Z,*
(2) *$\mathcal{F}$ an $\mathcal{O}_X$-module of finite presentation, and*
(3) *Y is locally of finite type over Z.*

Let $x \in |X|$ and let $y \in |Y|$ and $z \in |Z|$ be the images of x. If $\mathcal{F}_{\overline{x}} \neq 0$, then the following are equivalent:

(1) *$\mathcal{F}$ is flat over Z at x and the restriction of $\mathcal{F}$ to its fibre over z is flat at x over the fibre of Y over z, and*
(2) *Y is flat over Z at y and $\mathcal{F}$ is flat over Y at x.*

Moreover, the set of points x where (1) and (2) hold is open in $Supp(\mathcal{F})$.

Proof. Choose a diagram as in Lemma 46.18.1 part (3). It follows from the definitions that this reduces to the corresponding theorem for the morphisms of schemes $U \to V \to W$, the quasi-coherent sheaf $a^*\mathcal{F}$, and the point $u \in U$. Thus the theorem follows from the corresponding result for schemes which is More on Morphisms, Theorem 33.12.2. □

Lemma 46.18.4. *Let S be a scheme. Let $f : X \to Y$ and $Y \to Z$ be a morphism of algebraic spaces over S. Assume*

(1) *X is locally of finite presentation over Z,*
(2) *X is flat over Z,*
(3) *for every $z \in |Z|$ the fibre of X over z is flat over the fibre of Y over z, and*
(4) *Y is locally of finite type over Z.*

Then f is flat. If f is also surjective, then Y is flat over Z.

Proof. This is a special case of Theorem 46.18.3. □

Lemma 46.18.5. *Let S be a scheme. Let $f : X \to Y$ and $Y \to Z$ be morphisms of algebraic spaces over S. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Assume*

(1) *X is locally of finite presentation over Z,*
(2) *$\mathcal{F}$ an $\mathcal{O}_X$-module of finite presentation,*
(3) *$\mathcal{F}$ is flat over Z, and*
(4) *Y is locally of finite type over Z.*

Then the set

$$A = \{x \in |X| : \mathcal{F} \textit{ flat at } x \textit{ over } Y\}.$$

is open in $|X|$ and its formation commutes with arbitrary base change: If $Z' \to Z$ is a morphism of algebraic spaces, and A' is the set of points of $X' = X \times_Z Z'$ where $\mathcal{F}' = \mathcal{F} \times_Z Z'$ is flat over $Y' = Y \times_Z Z'$, then A' is the inverse image of A under the continuous map $|X'| \to |X|$.

Proof. One way to prove this is to translate the proof as given in More on Morphisms, Lemma 33.12.4 into the category of algebraic spaces. Instead we will prove this by reducing to the case of schemes instead. Namely, choose a diagram as in Lemma 46.18.1 part (3) such that a, b, and c are surjective. It follows from the definitions that this reduces to the corresponding theorem for the morphisms of schemes $U \to V \to W$, the quasi-coherent sheaf $a^*\mathcal{F}$, and the point $u \in U$. The only minor point to make is that given a morphism of algebraic spaces $Z' \to Z$ we choose a scheme W' and a surjective étale morphism $W' \to W \times_Z Z'$. Then we set $U' = W' \times_W U$ and $V' = W' \times_W V$. We write a', b', c' for the morphisms from U', V', W' to X', Y', Z'. In this case A, resp. A' are images of the open subsets of U, resp. U' associated to $a^*\mathcal{F}$, resp. $(a')^*\mathcal{F}'$. This indeed does reduce the lemma to More on Morphisms, Lemma 33.12.4. □

Lemma 46.18.6. *Let S be a scheme. Let $f : X \to Y$ and $Y \to Z$ be a morphism of algebraic spaces over S. Assume*

(1) *X is locally of finite presentation over Z,*
(2) *X is flat over Z, and*
(3) *Y is locally of finite type over Z.*

Then the set

$$\{x \in |X| : X \text{ flat at } x \text{ over } Y\}.$$

is open in $|X|$ and its formation commutes with arbitrary base change $Z' \to Z$.

Proof. This is a special case of Lemma 46.18.5. □

46.19. Slicing Cohen-Macaulay morphisms

Let S be a scheme. Let X be an algebraic space over S. Let $f_1, \ldots, f_r \in \Gamma(X, \mathcal{O}_X)$. In this case we denote $V(f_1, \ldots, f_r)$ the *closed subspace of X cut out by $f_1, \ldots, f_r$*. More precisely, we can define $V(f_1, \ldots, f_r)$ as the closed subspace of X corresponding to the quasi-coherent sheaf of ideals generated by $f_1, \ldots, f_r$, see Morphisms of Spaces, Lemma 42.16.1. Alternatively, we can choose a presentation $X = U/R$ and consider the closed subscheme $Z \subset U$ cut out by $f_1|U, \ldots, f_r|_U$. It is clear that Z is an R-invariant (see Groupoids, Definition 35.16.1) closed subscheme and we may set $V(f_1, \ldots, f_r) = Z/R_Z$.

Lemma 46.19.1. *Let S be a scheme. Consider a cartesian diagram*

$$\begin{tikzcd} X \arrow[d] & F \arrow[l, "p"'] \arrow[d] \\ Y & Spec(k) \arrow[l] \end{tikzcd}$$

where $X \to Y$ is a morphism of algebraic spaces over S which is flat and locally of finite presentation, and where k is a field over S. Let $f_1, \ldots, f_r \in \Gamma(X, \mathcal{O}_X)$ and $z \in |F|$ such that $f_1, \ldots, f_r$ map to a regular sequence in the local ring $\mathcal{O}_{F,\bar{z}}$. Then, after replacing X by an open subspace containing $p(z)$, the morphism

$$V(f_1, \ldots, f_r) \longrightarrow Y$$

is flat and locally of finite presentation.

Proof. Set $Z = V(f_1, \ldots, f_r)$. It is clear that $Z \to X$ is locally of finite presentation, hence the composition $Z \to Y$ is locally of finite presentation, see Morphisms of Spaces, Lemma 42.26.2. Hence it suffices to show that $Z \to Y$ is flat in a neighbourhood of $p(z)$. Let $k \subset k'$ be an extension field. Then $F' = F \times_{Spec(k)} Spec(k')$ is surjective and flat over F, hence we can find a point $z' \in |F'|$ mapping to z and the local ring map $\mathcal{O}_{F,\bar{z}} \to \mathcal{O}_{F',\bar{z}'}$ is flat, see Morphisms of Spaces, Lemma 42.27.7. Hence the image of $f_1, \ldots, f_r$ in $\mathcal{O}_{F',\bar{z}'}$ is a regular sequence too, see Algebra, Lemma 7.65.7. Thus, during the proof we may replace

k by an extension field. In particular, we may assume that $z \in |F|$ comes from a section $z : Spec(k) \to F$ of the structure morphism $F \to Spec(k)$.

Choose a scheme V and a surjective étale morphism $V \to Y$. Choose a scheme U and a surjective étale morphism $U \to X \times_Y V$. After possibly enlarging k once more we may assume that $Spec(k) \to F \to X$ factors through U (as $U \to X$ is surjective). Let $u : Spec(k) \to U$ be such a factorization and denote $v \in V$ the image of u. Note that the morphisms

$$U_v \times_{Spec(\kappa(v))} Spec(k) = U \times_V Spec(k) \to U \times_Y Spec(k) \to F$$

are étale (the first as the base change of $V \to V \times_Y V$ and the second as the base change of $U \to X$). Moreover, by construction the point $u : Spec(k) \to U$ gives a point of the left most space which maps to z on the right. Hence the elements $f_1, \ldots, f_r$ map to a regular sequence in the local ring on the right of the following map

$$\mathcal{O}_{U_v,u} \longrightarrow \mathcal{O}_{U_v \times_{Spec(\kappa(v))} Spec(k), \bar{u}} = \mathcal{O}_{U \times_V Spec(k), \bar{u}}.$$

But since the displayed arrow is flat (combine More on Flatness, Lemma 34.3.5 and Morphisms of Spaces, Lemma 42.27.7) we see from Algebra, Lemma 7.65.7 that $f_1, \ldots, f_r$ maps to a regular sequence in $\mathcal{O}_{U_v,u}$. By More on Morphisms, Lemma 33.16.2 we conclude that the morphism of schemes

$$V(f_1, \ldots, f_r) \times_X U = V(f_1|_U, \ldots, f_r|_U) \to V$$

is flat in an open neighbourhood U' of u. Let $X' \subset X$ be the open subspace corresponding to the image of $|U'| \to |X|$ (see Properties of Spaces, Lemmas 41.4.6 and 41.4.8). We conclude that $V(f_1, \ldots, f_r) \cap X' \to Y$ is flat (see Morphisms of Spaces, Definition 42.27.1) as we have the commutative diagram

$$\begin{tikzcd} V(f_1, \ldots, f_r) \times_X U' \arrow[r] \arrow[d, "a"'] & V \arrow[d, "b"] \\ V(f_1, \ldots, f_r) \cap X' \arrow[r] & Y \end{tikzcd}$$

with a, b étale and a surjective. □

46.20. The structure of quasi-finite morphisms

Lemma 46.20.1. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. The following are equivalent:*

1. *f is a closed immersion,*
2. *f is universally closed, unramified, and a monomorphism,*
3. *f is universally closed, unramified, and universally injective,*
4. *f is universally closed, locally of finite type, and a monomorphism,*
5. *f is universally closed, universally injective, locally of finite type, and formally unramified.*

Proof. The equivalence of (2) -- (5) follows immediately from Lemma 46.11.8. Moreover, if (2) -- (5) are satisfied then f is representable. Similarly, if (1) is satified then f is representable. Hence the result follows from the case of schemes, see Étale Morphisms, Lemma 37.7.2. □

46.21. Regular immersions

This section is the analogue of Divisors, Section 26.13 for morphisms of schemes. The reader is encouraged to read up on regular immersions of schemes in that section first.

In Divisors, Section 26.13 we defined four types of regular immersions for morphisms of schemes. Of these only three are (as far as we know) local on the target for the étale topology; as usual plain old regular immersions aren't. This is why for morphisms of algebraic spaces we cannot actually define regular immersions. (These kinds of annoyances prompted Grothendieck and his school to replace original notion of a regular immersion by a Koszul-regular immersions, see [**BGI71**, Exposee VII, Definition 1.4].) But we can define Koszul-regular, H_1-regular, and quasi-regular immersions. Another remark is that since Koszul-regular immersions are not preserved by arbitrary base change, we cannot use the strategy of Morphisms of Spaces, Section 42.3 to define them. Similarly, as Koszul-regular immersions are not étale local on the source, we cannot use Morphisms of Spaces, Lemma 42.21.1 to define them either. We replace this lemma instead by the following.

Lemma 46.21.1. *Let $\mathcal{P}$ be a property of morphisms of schemes which is étale local on the target. Let S be a scheme. Let $f : X \to Y$ be a representable morphism of algebraic spaces over S. Consider commutative diagrams*

$$\begin{tikzcd} X \times_Y V \arrow[r] \arrow[d] & V \arrow[d] \\ X \arrow[r, "f"] & Y \end{tikzcd}$$

where V is a scheme and $V \to Y$ is étale. The following are equivalent

1. *for any diagram as above the projection $X \times_Y V \to V$ has property $\mathcal{P}$, and*
2. *for some diagram as above with $V \to Y$ surjective the projection $X \times_Y V \to V$ has property $\mathcal{P}$.*

If X and Y are representable, then this is also equivalent to f (as a morphism of schemes) having property $\mathcal{P}$.

Proof. Let us prove the equivalence of (1) and (2). The implication (1) $\Rightarrow$ (2) is immediate. Assume

$$\begin{tikzcd} X \times_Y V \arrow[r] \arrow[d] & V \arrow[d] \\ X \arrow[r, "f"] & Y \end{tikzcd} \qquad \begin{tikzcd} X \times_Y V' \arrow[r] \arrow[d] & V' \arrow[d] \\ X \arrow[r, "f"] & Y \end{tikzcd}$$

are two diagrams as in the lemma. Assume $V \to Y$ is surjective and $X \times_Y V \to V$ has propery $\mathcal{P}$. To show that (2) implies (1) we have to prove that $X \times_Y V' \to V'$ has $\mathcal{P}$. To do this consider the diagram

$$\begin{tikzcd} X \times_Y V \arrow[d] & (X \times_Y V) \times_X (X \times_Y V') \arrow[l] \arrow[r] \arrow[d] & X \times_Y V' \arrow[d] \\ V & V \times_Y V' \arrow[l] \arrow[r] & V' \end{tikzcd}$$

By our assumption that $\mathcal{P}$ is étale local on the source, we see that $\mathcal{P}$ is preserved under étale base change, see Descent, Lemma 31.18.2. Hence if the left vertical arrow has $\mathcal{P}$ the so does the middle vertical arrow. Since $U \times_X U' \to U'$ is surjective and étale (hence defines an étale covering of U') this implies (as $\mathcal{P}$ is assumed local for the étale topology on the target) that the left vertical arrow has $\mathcal{P}$.

If X and Y are representable, then we can take $\text{id}_Y : Y \to Y$ as our étale covering to see the final statement of the lemma is true. □

Note that ``being a Koszul-regular (resp. H_1-regular, resp. quasi-regular) immersion" is a property of morphisms of schemes which is fpqc local on the target, see Descent, Lemma 31.19.30. Hence the following definition now makes sense.

Definition 46.21.2. Let S be a scheme. Let $i : X \to Y$ be a morphism of algebraic spaces over S.

(1) We say i is a *Koszul-regular immersion* if i is representable and the equivalent conditions of Lemma 46.21.1 hold with $\mathcal{P}(f)$ =``f is a Koszul-regular immersion".
(2) We say i is an H_1*-regular immersion* if i is representable and the equivalent conditions of Lemma 46.21.1 hold with $\mathcal{P}(f)$ =``f is an H_1-regular immersion".
(3) We say i is a *quasi-regular immersion* if i is representable and the equivalent conditions of Lemma 46.21.1 hold with $\mathcal{P}(f)$ =``f is a quasi-regular immersion".

Lemma 46.21.3. *Let S be a scheme. Let $i : Z \to X$ be an immersion of algebraic spaces over S. We have the following implications: i is Koszul-regular $\Rightarrow$ i is H_1-regular $\Rightarrow$ i is quasi-regular.*

Proof. Via the definition this lemma immediately reduces to Divisors, Lemma 26.13.2. □

To be continued...

46.22. Pseudo-coherent morphisms

This section is the analogue of More on Morphisms, Section 33.36 for morphisms of schemes. The reader is encouraged to read up on pseudo-coherent morphisms of schemes in that section first.

The property ``pseudo-coherent" of morphisms of schemes is étale local on the source-and-target. To see this use More on Morphisms, Lemmas 33.36.9 and 33.36.12 and Descent, Lemma 31.28.6. By Morphisms of Spaces, Lemma 42.21.1 we may define the notion of a pseudo-coherent morphism of algebraic spaces as follows and it agrees with the already existing notion defined in More on Morphisms, Section 33.36 when the algebraic spaces in question are representable.

Definition 46.22.1. Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S.

(1) We say f is *pseudo-coherent* if the equivalent conditions of Morphisms of Spaces, Lemma 42.21.1 hold with $\mathcal{P}$=``pseudo-coherent".
(2) Let $x \in |X|$. We say f is *pseudo-coherent at x* if there exists an open neighbourhood $X' \subset X$ of x such that $f|_{X'} : X' \to Y$ is pseudo-coherent.

Beware that a base change of a pseudo-coherent morphism is not pseudo-coherent in general.

Lemma 46.22.2. *A flat base change of a pseudo-coherent morphism is pseudo-coherent.*

Proof. Omitted. Hint: Use the schemes version of this lemma, see More on Morphisms, Lemma 33.36.3. ☐

Lemma 46.22.3. *A composition of pseudo-coherent morphisms of schemes is pseudo-coherent.*

Proof. Omitted. Hint: Use the schemes version of this lemma, see More on Morphisms, Lemma 33.36.4. ☐

Lemma 46.22.4. *A pseudo-coherent morphism is locally of finite presentation.*

Proof. Immediate from the definitions. ☐

Lemma 46.22.5. *A flat morphism which is locally of finite presentation is pseudo-coherent.*

Proof. Omitted. Hint: Use the schemes version of this lemma, see More on Morphisms, Lemma 33.36.6. ☐

Lemma 46.22.6. *Let $f : X \to Y$ be a morphism of algebraic spaces pseudo-coherent over a base algebraic space B. Then f is pseudo-coherent.*

Proof. Omitted. Hint: Use the schemes version of this lemma, see More on Morphisms, Lemma 33.36.7. ☐

Lemma 46.22.7. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. If Y is locally Noetherian, then f is pseudo-coherent if and only if f is locally of finite type.*

Proof. Omitted. Hint: Use the schemes version of this lemma, see More on Morphisms, Lemma 33.36.8. ☐

46.23. Perfect morphisms

This section is the analogue of More on Morphisms, Section 33.37 for morphisms of schemes. The reader is encouraged to read up on perfect morphisms of schemes in that section first.

The property ``perfect'' of morphisms of schemes is étale local on the source-and-target. To see this use More on Morphisms, Lemmas 33.37.10 and 33.37.12 and Descent, Lemma 31.28.6. By Morphisms of Spaces, Lemma 42.21.1 we may define the notion of a perfect morphism of algebraic spaces as follows and it agrees with the already existing notion defined in More on Morphisms, Section 33.37 when the algebraic spaces in question are representable.

Definition 46.23.1. Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S.

(1) We say f is *perfect* if the equivalent conditions of Morphisms of Spaces, Lemma 42.21.1 hold with $\mathcal{P}$=``perfect''.
(2) Let $x \in |X|$. We say f is *perfect at x* if there exists an open neighbourhood $X' \subset X$ of x such that $f|_{X'} : X' \to Y$ is perfect.

Note that a perfect morphism is pseudo-coherent, hence locally of finite presentation. Beware that a base change of a perfect morphism is not perfect in general.

Lemma 46.23.2. *A flat base change of a perfect morphism is perfect.*

Proof. Omitted. Hint: Use the schemes version of this lemma, see More on Morphisms, Lemma 33.37.3. ☐

Lemma 46.23.3. *A composition of perfect morphisms of schemes is perfect.*

Proof. Omitted. Hint: Use the schemes version of this lemma, see More on Morphisms, Lemma 33.37.4. □

Lemma 46.23.4. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. The following are equivalent*

(1) *f is flat and perfect, and*
(2) *f is flat and locally of finite presentation.*

Proof. Omitted. Hint: Use the schemes version of this lemma, see More on Morphisms, Lemma 33.37.5. □

46.24. Local complete intersection morphisms

This section is the analogue of More on Morphisms, Section 33.38 for morphisms of schemes. The reader is encouraged to read up on local complete intersection morphisms of schemes in that section first.

The property ``being a local complete intersection morphism" of morphisms of schemes is étale local on the source-and-target. To see this use More on Morphisms, Lemmas 33.38.11 and 33.38.12 and Descent, Lemma 31.28.6. By Morphisms of Spaces, Lemma 42.21.1 we may define the notion of a local complete intersection morphism of algebraic spaces as follows and it agrees with the already existing notion defined in More on Morphisms, Section 33.38 when the algebraic spaces in question are representable.

Definition 46.24.1. Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S.

(1) We say f is a *Koszul morphism*, or that f is a *local complete intersection morphism* if the equivalent conditions of Morphisms of Spaces, Lemma 42.21.1 hold with $\mathcal{P}(f) =$``f is a local complete intersection morphism".
(2) Let $x \in |X|$. We say f is *Koszul at x* if there exists an open neighbourhood $X' \subset X$ of x such that $f|_{X'} : X' \to Y$ is a local complete intersection morphism.

In some sense the defining property of a local complete intersection morphism is the result of the following lemma.

Lemma 46.24.2. *Let S be a scheme. Let $f : X \to Y$ be a local complete intersection morphism of algebraic spaces over S. Let P be an algebraic space smooth over Y. Let $U \to X$ be an étale morphism of algebraic spaces and let $i : U \to P$ an immersion of algebraic spaces over Y. Picture:*

$$\begin{tikzcd} X \arrow[dr] & U \arrow[l] \arrow[r, "i"'] \arrow[d] & P \arrow[dl] \\ & Y & \end{tikzcd}$$

Then i is a Koszul-regular immersion of algebraic spaces.

Proof. Choose a scheme V and a surjective étale morphism $V \to Y$. Choose a scheme W and a surjective étale morphism $W \to P \times_Y V$. Set $U' = U \times_P W$, which is a scheme étale over U. We have to show that $U' \to W$ is a Koszul-regular immersion of schemes, see Definition 46.21.2. By Definition 46.24.1 above the morphism of schemes $U' \to V$ is a local complete intersection morphism. Hence the result follows from More on Morphisms, Lemma 33.38.3. □

It seems like a good idea to collect here some properties in common with all Koszul morphisms.

Lemma 46.24.3. *Let S be a scheme. Let $f : X \to Y$ be a local complete intersection morphism of algebraic spaces over S. Then*

(1) *f is locally of finite presentation,*
(2) *f is pseudo-coherent, and*
(3) *f is perfect.*

Proof. Omitted. Hint: Use the schemes version of this lemma, see More on Morphisms, Lemma 33.38.4. $\square$

Beware that a base change of a Koszul morphism is not Koszul in general.

Lemma 46.24.4. *A flat base change of a local complete intersection morphism is a local complete intersection morphism.*

Proof. Omitted. Hint: Use the schemes version of this lemma, see More on Morphisms, Lemma 33.38.6. $\square$

Lemma 46.24.5. *A composition of local complete intersection morphisms of schemes is a local complete intersection morphism.*

Proof. Omitted. Hint: Use the schemes version of this lemma, see More on Morphisms, Lemma 33.38.7. $\square$

Lemma 46.24.6. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. The following are equivalent*

(1) *f is flat and a local complete intersection morphism, and*
(2) *f is syntomic.*

Proof. Omitted. Hint: Use the schemes version of this lemma, see More on Morphisms, Lemma 33.38.8. $\square$

Lemma 46.24.7. *Let S be a scheme. Consider a commutative diagram*

$$\begin{tikzcd} X \arrow[rr, "f"] \arrow[dr, "p"'] & & Y \arrow[dl, "q"] \\ & Z & \end{tikzcd}$$

of algebraic spaces over S. Assume that both p and q are flat and locally of finite presentation. Then there exists an open subspace $U(f) \subset X$ such that $|U(f)| \subset |X|$ is the set of points where f is Koszul. Moreover, for any morphism of algebraic spaces $Z' \to Z$, if $f' : X' \to Y'$ is the base change of f by $Z' \to Z$, then $U(f')$ is the inverse image of $U(f)$ under the projection $X' \to X$.

Proof. This lemma is the analogue of More on Morphisms, Lemma 33.38.13 and in fact we will deduce the lemma from it. By Definition 46.24.1 the set $\{x \in |X| : f \text{ is Koszul at } x\}$ is open in $|X|$ hence by Properties of Spaces, Lemma 41.4.8 it corresponds to an open subspace $U(f)$ of X. Hence we only need to prove the final statement.

Choose a scheme W and a surjective étale morphism $W \to Z$. Choose a scheme V and a surjective étale morphism $V \to W \times_Z Y$. Choose a scheme U and a surjective étale morphism $U \to V \times_Y X$. Finally, choose a scheme W' and a surjective étale morphism $W' \to W \times_Z Z'$. Set $V' = W' \times_W V$ and $U' = W' \times_W U$, so that we obtain surjective étale morphisms $V' \to Y'$ and $U' \to X'$. We will use without further mention an étale morphism of algebraic spaces induces an open map of associated topological spaces (see Properties of Spaces, Lemma 41.13.7). Note that by definition $U(f)$ is the image in $|X|$ of the set T of points in U where the morphism of schemes $U \to V$ is Koszul. Similarly, $U(f')$ is the image in $|X'|$ of the set T' of points in U' where the morphism of schemes $U' \to V'$ is Koszul. Now, by construction the diagram

$$\begin{tikzcd} U' \arrow[r] \arrow[d] & U \arrow[d] \\ V' \arrow[r] & V \end{tikzcd}$$

is cartesian (in the category of schemes). Hence the aforementioned More on Morphisms, Lemma 33.38.13 applies to show that T' is the inverse image of T. Since $|U'| \to |X'|$ is surjective this implies the lemma. □

Lemma 46.24.8. *Let S be a scheme. Let $f : X \to Y$ be a local complete intersection morphism of algebraic spaces over S. Then f is unramified if and only if f is formally unramified and in this case the conormal sheaf $\mathcal{C}_{X/Y}$ is finite locally free on X.*

Proof. This follows from the corresponding result for morphisms of schemes, see More on Morphisms, Lemma 33.38.14, by étale localization, see Lemma 46.12.11. (Note that in the situation of this lemma the morphism $V \to U$ is unramified and a local complete intersection morphism by definition.) □

Lemma 46.24.9. *Let S be a scheme. Let $Z \to Y \to X$ be formally unramified morphisms of algebraic spaces over S. Assume that $Z \to Y$ is a local complete intersection morphism. The exact sequence*

$$0 \to i^*\mathcal{C}_{Y/X} \to \mathcal{C}_{Z/X} \to \mathcal{C}_{Z/Y} \to 0$$

of Lemma 46.5.6 is short exact.

Proof. Choose a scheme U and a surjective étale morphism $U \to X$. Choose a scheme V and a surjective étale morphism $V \to U \times_X Y$. Choose a scheme W and a surjective étale morphism $W \to V \times_Y Z$. By Lemma 46.12.11 the morphisms $W \to V$ and $V \to U$ are formally unramified. Moreover the sequence $i^*\mathcal{C}_{Y/X} \to \mathcal{C}_{Z/X} \to \mathcal{C}_{Z/Y} \to 0$ restricts to the corresponding sequence $i^*\mathcal{C}_{V/U} \to \mathcal{C}_{W/U} \to \mathcal{C}_{W/V} \to 0$ for $W \to V \to U$. Hence the result follows from the result for schemes (More on Morphisms, Lemma 33.38.15) as by definition the morphism $W \to V$ is a local complete intersection morphism. □

46.25. Exact sequences of differentials and conormal sheaves

In this section we collect some results on exact sequences of conormal sheaves and sheaves of differentials. In some sense these are all realizations of the triangle of cotangent complexes associated to composable morphisms of algebraic spaces.

In the sequences below each of the maps are as constructed in either Lemma 46.6.6 or Lemma 46.12.8. Let S be a scheme. Let $g : Z \to Y$ and $f : Y \to X$ be morphisms of algebraic spaces over S.

(1) There is a canonical exact sequence

$$g^*\Omega_{Y/X} \to \Omega_{Z/X} \to \Omega_{Z/Y} \to 0,$$

see Lemma 46.6.8. If $g : Z \to Y$ is formally smooth, then this sequence is a short exact sequence, see Lemma 46.16.11.

(2) If g is formally unramified, then there is a canonical exact sequence
$$\mathcal{C}_{Z/Y} \to g^*\Omega_{Y/X} \to \Omega_{Z/X} \to 0,$$
see Lemma 46.12.13. If $f \circ g : Z \to X$ is formally smooth, then this sequence is a short exact sequence, see Lemma 46.16.12.

(3) if g and $f \circ g$ are formally unramified, then there is a canonical exact sequence
$$\mathcal{C}_{Z/X} \to \mathcal{C}_{Z/Y} \to g^*\Omega_{Y/X} \to 0,$$
see Lemma 46.12.14. If $f : Y \to X$ is formally smooth, then this sequence is a short exact sequence, see Lemma 46.16.13.

(4) if g and f are formally unramified, then there is a canonical exact sequence
$$g^*\mathcal{C}_{Y/X} \to \mathcal{C}_{Z/X} \to \mathcal{C}_{Z/Y} \to 0.$$
see Lemma 46.12.15. If $g : Z \to Y$ is a local complete intersection morphism, then this sequence is a short exact sequence, see Lemma 46.24.9.

CHAPTER 47

Quot and Hilbert Spaces

47.1. Introduction

The purpose of this chapter is to write about Quot and Hilbert functors and to prove that these are algebraic spaces provided certain technical conditions are satisfied. In this chapter we will discuss this in the setting of algebraic space. A reference is Grothendieck's lectures, see [**Gro95a**], [**Gro95b**], [**Gro95e**], [**Gro95f**], [**Gro95c**], and [**Gro95d**]. Another reference is the paper [**OS03a**], allthough this paper discusses the more general case of Quot and Hilbert spaces associated to a morphism of algebraic stacks which we will discuss in another chapter, see (insert future reference here).

In the case of Hilbert spaces there is a more general notion of ``Hilbert stacks'' which we will discuss in a separate chapter, see (insert future reference here).

47.2. Conventions

The standing assumption is that all schemes are contained in a big fppf site Sch_{fppf}. And all rings A considered have the property that $Spec(A)$ is (isomorphic) to an object of this big site.

Let S be a scheme and let X be an algebraic space over S. In this chapter and the following we will write $X \times_S X$ for the product of X with itself (in the category of algebraic spaces over S), instead of $X \times X$.

47.3. When is a morphism an isomorphism?

More generally we can ask: ``When does a morphism have property $\mathcal{P}$?'' A more precise question is the following. Suppose given a commutative diagram

$$\begin{tikzcd} X \arrow[rr, "f"] \arrow[dr, "p"'] & & Y \arrow[dl, "q"] \\ & Z & \end{tikzcd}$$

of algebraic spaces. Does there exist a monomorphism of algebraic spaces $W \to Z$ with the following two properties:

(1) the base change $f_W : X_W \to Y_W$ has property $\mathcal{P}$, and
(2) any morphism $Z' \to Z$ of algebraic spaces factors through W if and only if the base change $f_{Z'} : X_{Z'} \to Y_{Z'}$ has property $\mathcal{P}$.

In many cases, if $W \to Z$ exists, then it is an immersion, open immersion, or closed immersion.

The answer to this question may depend on auxiliary properties of the morphisms f, p, and q. An example is $\mathcal{P}(f)$ =``$f$ is flat'' which we have discussed for morphisms of schemes in the case $Y = S$ in great detail in the chapter ``More on Flatness", starting with More on Flatness, Section 34.20.

Lemma 47.3.1. *Consider a commutative diagram*

$$\begin{tikzcd} X \arrow[rr, "f"] \arrow[dr, "p"'] & & Y \arrow[dl, "q"] \\ & Z & \end{tikzcd}$$

of algebraic spaces. Assume that p is locally of finite type and closed. Then there exists an open subspace $W \subset Z$ such that a morphism $Z' \to Z$ factors through W if and only if the base change $f_{Z'} : X_{Z'} \to Y_{Z'}$ is unramified.

Proof. By Morphisms of Spaces, Lemma 42.34.10 there exists an open subspace $U(f) \subset X$ which is the set of points where f is unramified. Moreover, formation of $U(f)$ commutes with arbitrary base change. Let $W \subset Z$ be the open subspace (see Properties of Spaces, Lemma 41.4.8) with underlying set of points

$$|W| = |Z| \setminus |p|\left(|X| \setminus |U(f)|\right)$$

i.e., $z \in |Z|$ is a point of W if and only if f is unramified at every point of X above z. Note that this is open because we assumed that p is closed. Since the formation of $U(f)$ commutes with arbitrary base change we immediately see (using Properties of Spaces, Lemma 41.4.9) that W has the desired universal property. $\square$

Lemma 47.3.2. *Consider a commutative diagram*

$$\begin{tikzcd} X \arrow[rr, "f"] \arrow[dr, "p"'] & & Y \arrow[dl, "q"] \\ & Z & \end{tikzcd}$$

of algebraic spaces. Assume that

1. *p is locally of finite type,*
2. *p is closed, and*
3. *$p_2 : X \times_Y X \to Z$ is closed.*

Then there exists an open subspace $W \subset Z$ such that a morphism $Z' \to Z$ factors through W if and only if the base change $f_{Z'} : X_{Z'} \to Y_{Z'}$ is unramified and universally injective.

Proof. After replacing Z by the open subspace found in Lemma 47.3.1 we may assume that f is already unramified; note that this does not destroy assumption (2) or (3). By Morphisms of Spaces, Lemma 42.34.9 we see that $\Delta_{X/Y} : X \to X \times_Y X$ is an open immersion. This remains true after any base change. Hence by Morphisms of Spaces, Lemma 42.18.2 we see that $f_{Z'}$ is universally injective if and only if the base change of the diagonal $X_{Z'} \to (X \times_Y X)_{Z'}$ is an isomorphism. Let $W \subset Z$ be the open subspace (see Properties of Spaces, Lemma 41.4.8) with underlying set of points

$$|W| = |Z| \setminus |p_2|\left(|X \times_Y X| \setminus \mathrm{Im}(|\Delta_{X/Y}|)\right)$$

i.e., $z \in |Z|$ is a point of W if and only if the fibre of $|X \times_Y X| \to |Z|$ over z is in the image of $|X| \to |X \times_Y X|$. Then it is clear from the discussion above that the restriction $p^{-1}(W) \to q^{-1}(W)$ of f is unramified and universally injective.

Conversely, suppose that $f_{Z'}$ is unramified and universally injective. In order to show that $Z' \to Z$ factors through W it suffices to show that $|Z'| \to |Z|$ has image contained in $|W|$, see Properties of Spaces, Lemma 41.4.9. Hence it suffices to prove the result when Z' is the spectrum of a field. Denote $z \in |Z|$ the image of $|Z'| \to |Z|$. The discussion above shows that

$$|X_{Z'}| \longrightarrow |(X \times_Y X)_{Z'}|$$

is surjective. By Properties of Spaces, Lemma 41.4.3 in the commutative diagram

$$\begin{tikzcd} |X_{Z'}| \arrow[r] \arrow[d] & |(X \times_Y X)_{Z'}| \arrow[d] \\ |p|^{-1}(\{z\}) \arrow[r] & |p_2|^{-1}(\{z\}) \end{tikzcd}$$

the vertical arrows are surjective. It follows that $z \in |W|$ as desired. $\square$

Lemma 47.3.3. *Consider a commutative diagram*

$$\begin{tikzcd} X \arrow[rr, "f"] \arrow[dr, "p"'] & & Y \arrow[dl, "q"] \\ & Z & \end{tikzcd}$$

of algebraic spaces. Assume that

(1) *p is locally of finite type,*
(2) *p is universally closed, and*
(3) *$q : Y \to Z$ is separated.*

Then there exists an open subspace $W \subset Z$ such that a morphism $Z' \to Z$ factors through W if and only if the base change $f_{Z'} : X_{Z'} \to Y_{Z'}$ is a closed immersion.

Proof. We will use the characterization of closed immersions as universally closed, unramified, and universally injective morphisms, see More on Morphisms of Spaces, Lemma 46.20.1. First, note that since p is universally closed and q is separated, we see that f is universally closed, see Morphisms of Spaces, Lemma 42.36.5. It follows that any base change of f is universally closed, see Morphisms of Spaces, Lemma 42.10.3. Thus to finish the proof of the lemma it suffices to prove that the assumptions of Lemma 47.3.2 are satisfied. The projection $\text{pr}_0 : X \times_Y X \to X$ is universally closed as a base change of f, see Morphisms of Spaces, Lemma 42.10.3. Hence $X \times_Y X \to Z$ is universally closed as a composition of universally closed morphisms (see Morphisms of Spaces, Lemma 42.10.4). This finishes the proof of the lemma. $\square$

Lemma 47.3.4. *Consider a commutative diagram*

$$\begin{tikzcd} X \arrow[rr, "f"] \arrow[dr, "p"'] & & Y \arrow[dl, "q"] \\ & Z & \end{tikzcd}$$

of algebraic spaces. Assume that

(1) *p is locally of finite presentation,*
(2) *p is flat,*
(3) *p is closed, and*
(4) *q is locally of finite type.*

Then there exists an open subspace $W \subset Z$ such that a morphism $Z' \to Z$ factors through W if and only if the base change $f_{Z'} : X_{Z'} \to Y_{Z'}$ is flat.

Proof. By More on Morphisms of Spaces, Lemma 46.18.6 the set

$$A = \{x \in |X| : X \text{ flat at } x \text{ over } Y\}.$$

is open in $|X|$ and its formation commutes with arbitrary base change. Let $W \subset Z$ be the open subspace (see Properties of Spaces, Lemma 41.4.8) with underlying set of points

$$|W| = |Z| \setminus |p|(|X| \setminus A)$$

i.e., $z \in |Z|$ is a point of W if and only if the whole fibre of $|X| \to |Z|$ over z is contained in A. This is open because p is closed. Since the formation of A commutes with arbitrary base change it follows that W works. $\square$

Lemma 47.3.5. *Consider a commutative diagram*

$$\begin{tikzcd} X \arrow[rr, "f"] \arrow[dr, "p"'] & & Y \arrow[dl, "q"] \\ & Z & \end{tikzcd}$$

of algebraic spaces. Assume that

(1) *p is locally of finite presentation,*
(2) *p is flat,*
(3) *p is closed,*
(4) *q is locally of finite type, and*
(5) *q is closed.*

Then there exists an open subspace $W \subset Z$ such that a morphism $Z' \to Z$ factors through W if and only if the base change $f_{Z'} : X_{Z'} \to Y_{Z'}$ is surjective and flat.

Proof. By Lemma 47.3.4 we may assume that f is flat. Note that f is locally of finite presentation by Morphisms of Spaces, Lemma 42.26.9. Hence f is open, see Morphisms of Spaces, Lemma 42.27.5. Let $W \subset Z$ be the open subspace (see Properties of Spaces, Lemma 41.4.8) with underlying set of points

$$|W| = |Z| \setminus |q|\left(|Y| \setminus |f|(|X|)\right).$$

in other words for $z \in |Z|$ we have $z \in |W|$ if and only if the whole fibre of $|Y| \to |Z|$ over z is in the image of $|X| \to |Y|$. Since q is closed this set is open in $|Z|$. The morphism $X_W \to Y_W$ is surjective by construction. Finally, suppose that $X_{Z'} \to Y_{Z'}$ is surjective. In order to show that $Z' \to Z$ factors through W it suffices to show that $|Z'| \to |Z|$ has image contained in $|W|$, see Properties of Spaces, Lemma 41.4.9. Hence it suffices to prove the result when Z' is the spectrum of a field. Denote $z \in |Z|$ the image of $|Z'| \to |Z|$. By Properties of Spaces, Lemma 41.4.3 in the commutative diagram

$$\begin{tikzcd} {|X_{Z'}|} \arrow[r] \arrow[d] & {|Y_{Z'}|} \arrow[d] \\ {|p|^{-1}(\{z\})} \arrow[r] & {|q|^{-1}(\{z\})} \end{tikzcd}$$

the vertical arrows are surjective. It follows that $z \in |W|$ as desired. $\square$

Lemma 47.3.6. *Consider a commutative diagram*

$$\begin{tikzcd} X \arrow[rr, "f"] \arrow[dr, "p"'] & & Y \arrow[dl, "q"] \\ & Z & \end{tikzcd}$$

of algebraic spaces. Assume that

(1) *p is locally of finite presentation,*
(2) *p is flat,*
(3) *p is universally closed,*
(4) *q is locally of finite type,*
(5) *q is closed, and*
(6) *q is separated.*

Then there exists an open subspace $W \subset Z$ such that a morphism $Z' \to Z$ factors through W if and only if the base change $f_{Z'} : X_{Z'} \to Y_{Z'}$ is an isomorphism.

Proof. By Lemma 47.3.5 there exists an open subspace $W_1 \subset Z$ such that $f_{Z'}$ is surjective and flat if and only if $Z' \to Z$ factors through W_1. By Lemma 47.3.3 there exists an open subspace $W_2 \subset Z$ such that $f_{Z'}$ is a closed immersion if and only if $Z' \to Z$ factors through W_2. We claim that $W = W_1 \cap W_2$ works. Certainly, if $f_{Z'}$ is an isomorphism, then $Z' \to Z$ factors through W. Hence it suffices to show that f_W is an isomorphism. By construction f_W is a surjective flat closed immersion. In particular f_W is representable. Since a surjective flat closed immersion of schemes is an isomorphism (see Morphisms, Lemma 24.25.1) we win. (Note that actually f_W is locally of finite presentation, whence open, so you can avoid the use of this lemma if you like.) $\square$

Lemma 47.3.7. *Consider a commutative diagram*

$$\begin{tikzcd} X \arrow[rr, "f"] \arrow[dr, "p"'] & & Y \arrow[dl, "q"] \\ & Z & \end{tikzcd}$$

of algebraic spaces. Assume that

(1) *p is flat and locally of finite presentation,*
(2) *p is closed, and*
(3) *q is flat and locally of finite presentation,*

Then there exists an open subspace $W \subset Z$ such that a morphism $Z' \to Z$ factors through W if and only if the base change $f_{Z'} : X_{Z'} \to Y_{Z'}$ is a local complete intersection morphism.

Proof. By More on Morphisms of Spaces, Lemma 46.24.7 there exists an open subspace $U(f) \subset X$ which is the set of points where f is Koszul. Moreover, formation of $U(f)$ commutes with arbitrary base change. Let $W \subset Z$ be the open subspace (see Properties of Spaces, Lemma 41.4.8) with underlying set of points

$$|W| = |Z| \setminus |p| (|X| \setminus |U(f)|)$$

i.e., $z \in |Z|$ is a point of W if and only if f is Koszul at every point of X above z. Note that this is open because we assumed that p is closed. Since the formation of $U(f)$ commutes with arbitrary base change we immediately see (using Properties of Spaces, Lemma 41.4.9) that W has the desired universal property. $\square$

CHAPTER 48

Algebraic Spaces over Fields

48.1. Introduction

This chapter is the analogue of the chapter on varieties in the setting of algebraic spaces. A reference for algebraic spaces is [**Kol96**].

48.2. Conventions

The standing assumption is that all schemes are contained in a big fppf site Sch_{fppf}. And all rings A considered have the property that $Spec(A)$ is (isomorphic) to an object of this big site.

Let S be a scheme and let X be an algebraic space over S. In this chapter and the following we will write $X \times_S X$ for the product of X with itself (in the category of algebraic spaces over S), instead of $X \times X$.

48.3. Geometric components

Lemma 48.3.1. *Let k be an algebraically closed field. Let A, B be strictly henselian local k-algebras with residue field equal to k. Let C be the strict henselization of $A \otimes_k B$ at the maximal ideal $\mathfrak m_A \otimes_k B + A \otimes_k \mathfrak m_B$. Then the minimal primes of C correspond 1-to-1 to pairs of minimal primes of A and B.*

Proof. First note that a minimal prime $\mathfrak r$ of C maps to a minimal prime $\mathfrak p$ in A and to a minimal prime $\mathfrak q$ of B because the ring maps $A \to C$ and $B \to C$ are flat (by going down for flat ring map Algebra, Lemma 7.35.17). Hence it suffices to show that the strict henselization of $(A/\mathfrak p \otimes_k B/\mathfrak q)_{\mathfrak m_A \otimes_k B + A \otimes_k \mathfrak m_B}$ has a unique minimal prime ideal. By Algebra, Lemma 7.139.22 the rings $A/\mathfrak p$, $B/\mathfrak q$ are strictly henselian. Hence we may assume that A and B are strictly henselian local domains and our goal is to show that C has a unique minimal prime. By Properties of Spaces, Lemma 41.21.3. we see that the integral closure A' of A in its fraction field is a normal local domain with residue field k and similarly for the integral closure B' of B into its fraction field. By Algebra, Lemma 7.147.4 we see that $A' \otimes_k B'$ is a normal ring. Hence its localization

$$R = (A' \otimes_k B')_{\mathfrak m_{A'} \otimes_k B' + A' \otimes_k \mathfrak m_{B'}}$$

is a normal local domain. Note that $A \otimes_k B \to A' \otimes_k B'$ is integral (hence gong up holds -- Algebra, Lemma 7.32.20) and that $\mathfrak m_{A'} \otimes_k B' + A' \otimes_k \mathfrak m_{B'}$ is the unique maximal ideal of $A' \otimes_k B'$ lying over $\mathfrak m_A \otimes_k B + A \otimes_k \mathfrak m_B$. Hence we see that

$$R = (A' \otimes_k B')_{\mathfrak m_A \otimes_k B + A \otimes_k \mathfrak m_B}$$

by Algebra, Lemma 7.36.11. It follows that

$$(A \otimes_k B)_{\mathfrak m_A \otimes_k B + A \otimes_k \mathfrak m_B} \longrightarrow R$$

is integral. We conclude that R is the integral closure of $(A \otimes_k B)_{\mathfrak{m}_A \otimes_k B + A \otimes_k \mathfrak{m}_B}$ in its fraction field, and by Properties of Spaces, Lemma 41.21.3 once again we conclude that C has a unique prime ideal. $\square$

48.4. Schematic locus

Lemma 48.4.1. *Let k be a field. Let X be an algebraic space over $Spec(k)$. If X is locally of finite type over k and has dimension 0, then X is a scheme.*

Proof. Let U be an affine scheme and let $U \to X$ be an étale morphism. Set $R = U \times_X U$. Note that the two projection morphisms $s, t : R \to U$ are étale morphisms of schemes. By Properties of Spaces, Definition 41.8.2 we see that $\dim(U) = 0$ and similarly $\dim(R) = 0$. On the other hand, the morphism $U \to Spec(k)$ is locally of finite type as the composition of the étale morphism $U \to X$ and $X \to Spec(k)$, see Morphisms of Spaces, Lemmas 42.22.2 and 42.35.9. Similarly, $R \to Spec(k)$ is locally of finite type. Hence by Varieties, Lemma 28.13.2 we see that U and R are disjoint unions of spectra of local Artinian k-algebras A finite over k. In particular, as

$$R = U \times_X U \longrightarrow U \times_{Spec(k)} U$$

is a monomorphism, we see that R is a finite union of spectra of finite k-algebras. It follows that R is affine, see Schemes, Lemma 21.6.8. Applying Varieties, Lemma 28.13.2 once more we see that R is finite over k. Hence s, t are finite, see Morphisms, Lemma 24.42.12. Thus Groupoids, Proposition 35.19.8 shows that the open subspace U/R of X is an affine scheme. Since the schematic locus of X is an open subspace (see Properties of Spaces, Lemma 41.10.1), and since $U \to X$ was an arbtrary étale morphisms from an affine scheme we conclude that X is a scheme. $\square$

Lemma 48.4.2. *Let k be a field. Let X be an algebraic space over k. The following are equivalent*

(1) *X is locally quasi-finite over k,*
(2) *X is locally of finite type over k and has dimension 0,*
(3) *X is a scheme and is locally quasi-finite over k,*
(4) *X is a scheme and is locally of finite type over k and has dimension 0, and*
(5) *X is a disjoint union of spectra of Artinian local k-algebras A over k with $\dim_k(A) < \infty$.*

Proof. Because we are over a field relative dimension of X/k is the same as the dimension of X. Hence by Morphisms of Spaces, Lemma 42.31.6 we see that (1) and (2) are equivalent. Hence it follows from Lemma 48.4.1 (and trivial implications) that (1) -- (4) are equivalent. Finally, Varieties, Lemma 28.13.2 shows that (1) -- (4) are equivalent with (5). $\square$

Lemma 48.4.3. *Let k be a field. Let $f : X \to Y$ be a monomorphism of algebraic spaces over k. If Y is locally quasi-finite over k so is X.*

Proof. Assume Y is locally quasi-finite over k. By Lemma 48.4.2 we see that $Y = \coprod Spec(A_i)$ where each A_i is an Artinian local ring finite over k. By Decent Spaces, Lemma 43.14.1 we see that X is a scheme. Consider $X_i = f^{-1}(Spec(A_i))$. Then X_i has either one or zero points. If X_i has zero points there is nothing to prove. If X_i has one point, then $X_i = Spec(B_i)$ with B_i a zero dimensional local ring and $A_i \to B_i$ is an epimorphism of rings. In particular $A_i/\mathfrak{m}_{A_i} = B_i/\mathfrak{m}_{A_i}B_i$ and we see that $A_i \to B_i$ is surjective by Nakayama's lemma, Algebra, Lemma 7.14.5 (because $\mathfrak{m}_{A_i}$ is a nilpotent ideal!). Thus B_i

is a finite local k-algebra, and we conclude by Lemma 48.4.2 that $X \to Spec(k)$ is locally quasi-finite. ☐

48.5. Spaces smooth over fields

Lemma 48.5.1. *Let k be a field. Let X be an algebraic space smooth over k. Then X is a regular algebraic space.*

Proof. Choose a scheme U and a surjective étale morphism $U \to X$. The morphism $U \to Spec(k)$ is smooth as a composition of an étale (hence smooth) morphism and a smooth morphism (see Morphisms of Spaces, Lemmas 42.35.6 and 42.33.2). Hence U is regular by Varieties, Lemma 28.15.3. By Properties of Spaces, Definition 41.7.2 this means that X is regular. ☐

CHAPTER 49

Cohomology of Algebraic Spaces

49.1. Introduction

In this chapter we write about cohomology of algebraic spaces. This mean in particular cohomology of quasi-coherent sheaves, i.e., we prove analogues of the results in the chapter entitled ``Coherent Cohomology''. Some of the results in this chapter can be found in [**Knu71b**].

49.2. Conventions

The standing assumption is that all schemes are contained in a big fppf site Sch_{fppf}. And all rings A considered have the property that $Spec(A)$ is (isomorphic) to an object of this big site.

Let S be a scheme and let X be an algebraic space over S. In this chapter and the following we will write $X \times_S X$ for the product of X with itself (in the category of algebraic spaces over S), instead of $X \times X$.

49.3. Derived category of quasi-coherent modules

Let S be a scheme. In Descent, Lemma 31.8.1 we proved that the category $D_{QCoh}(\mathcal{O}_S)$ can be defined in terms of complexes of $\mathcal{O}_S$-modules on the scheme S or by complexes of $\mathcal{O}$-modules on the small étale site of S. Hence the following definition is compatible with the definition in the case of schemes.

Definition 49.3.1. Let S be a scheme. Let X be an algebraic space over S. The *derived category of $\mathcal{O}_X$-modules with quasi-coherent cohomology sheaves* is denoted $D_{QCoh}(\mathcal{O}_X)$.

This makes sense by Properties of Spaces, Lemma 41.26.7 and Derived Categories, Section 11.12.

49.4. Higher direct images

Let S be a scheme. Let $f : X \to Y$ be a quasi-compact and quasi-separated morphism of representable algebraic spaces X and Y over S. Let $\mathcal{F}$ be a quasi-coherent module on X. By Descent, Lemma 31.6.15 the sheaf $R^i f_*\mathcal{F}$ agrees with the usual higher direct image (computed for the Zariski topologies) if we think of X and Y as schemes.

More generally, suppose $f : X \to Y$ is a representable, quasi-compact, and quasi-separated morphism of algebraic spaces over S. Let V be a scheme and let $V \to Y$ be an étale surjective morphism. Let $U = V \times_Y X$ and let $f' : U \to V$ be the base change of f. Then for any quasi-coherent $\mathcal{O}_X$-module $\mathcal{F}$ we have

$$R^i f'_*(\mathcal{F}|_U) = (R^i f_*\mathcal{F})|_V, \tag{49.4.0.1}$$

see Properties of Spaces, Lemma 41.23.2. And because $f' : U \to V$ is a quasi-compact and quasi-separated morphism of schemes, by the remark of the preceding paragraph we may compute $R^i f'_*(\mathcal{F}|_U)$ by thinking of $\mathcal{F}|_U$ as a quasi-coherent sheaf on the scheme U, and f' as a morphism of schemes. We will frequently use this without further mention.

Next, we prove that higher direct images of quasi-coherent sheaves are quasi-coherent for any quasi-compact and quasi-separated morphism of algebraic spaces. In the proof we use a trick; a ``better'' proof would use a relative Cech complex, as discussed in Sheaves on Stacks, Sections 58.17 and 58.18 ff.

Lemma 49.4.1. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. If f is quasi-compact and quasi-separated, then $R^i f_*$ transforms quasi-coherent $\mathcal{O}_X$-modules into quasi-coherent $\mathcal{O}_Y$-modules and induces a functor $Rf_* : D^+_{QCoh}(\mathcal{O}_X) \to D^+_{QCoh}(\mathcal{O}_Y)$.*

Proof. Let $V \to Y$ be an étale morphism where V is an affine scheme. Set $U = V \times_Y X$ and denote $f' : U \to V$ the induced morphism. Let $\mathcal{I}^\bullet$ be a bounded above complex of injective $\mathcal{O}_X$-modules. By Properties of Spaces, Lemma 41.23.2 we have

$$f'_*(\mathcal{I}^\bullet|_U) = (f_*\mathcal{I}^\bullet)|_V.$$

The complex $\mathcal{I}^\bullet|_U$ is a bounded below complex of injective $\mathcal{O}_U$-modules, see Cohomology on Sites, Lemma 19.8.1. Since the property of being a quasi-coherent module is local in the étale topology on Y (see Properties of Spaces, Lemma 41.26.6) we may replace Y by V, i.e., we may assume Y is an affine scheme.

Assume Y is affine. Since f is quasi-compact we see that X is quasi-compact. Thus we may choose an affine scheme U and a surjective étale morphism $g : U \to X$, see Properties of Spaces, Lemma 41.6.3. Note that the morphism $g : U \to X$ is representable, separated and quasi-compact because X is quasi-separated. Hence the lemma holds for g (either by the discussion above the lemma or by applying the reduction in the first paragraph of this proof). It also holds for $f \circ g : U \to Y$ (as this is a morphism of affine schemes). Moreover, for an injective $\mathcal{O}_U$-module $\mathcal{I}$ the module $g_*\mathcal{I}$ is injective (see Homology, Lemma 10.22.1) whence $Rf_* \circ Rg_* = R(g \circ f)_*$, see Derived Categories, Lemma 11.21.1.

In the situation described in the previous paragraph we will show by induction on n that IH_n: for any quasi-coherent sheaf $\mathcal{F}$ on X the sheaves $R^i f\mathcal{F}$ are quasi-coherent for $i \leq n$. The case $n = 0$ follows from Morphisms of Spaces, Lemma 42.15.2. Assume IH_n. In the rest of the proof we show that IH_{n+1} holds.

The hypothesis IH_n implies, via the spectral sequence of Derived Categories, Lemma 11.20.3, that $R^i f_*\mathcal{G}^\bullet$ is quasi-coherent for $i \leq n$ if $\mathcal{G}^\bullet$ is a complex of $\mathcal{O}_X$-modules with $H^j(\mathcal{G}^\bullet) = 0$ for $j < 0$ and $H^j(\mathcal{G}^\bullet)$ is quasi-coherent for all j. Suppose $\mathcal{H}$ is a quasi-coherent $\mathcal{O}_U$-module. Consider the distinguished triangle

$$g_*\mathcal{H} \to Rg_*\mathcal{H} \to \tau_{\geq 1} Rg_*\mathcal{H} \to g_*\mathcal{H}[1].$$

Note that $Rg_*\mathcal{H}$ and $Rf_*Rg_*\mathcal{H} = R(f \circ g)_*\mathcal{H}$ have quasi-coherent cohomology sheaves (see above). Combined with the remark above we conclude that IH_n implies that $R^i f_*g_*\mathcal{H}$ is quasi-coherent for $i \leq n+1$.

Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Consider the exact sequence

$$0 \to \mathcal{F} \to g_*g^*\mathcal{F} \to \mathcal{G} \to 0$$

where $\mathcal{G}$ is the cokernel of the first map. Applying the long exact cohomology sequence we obtain

$$R^n f_*g_*g^*\mathcal{F} \to R^n f_*\mathcal{G} \to R^{n+1} f_*\mathcal{F} \to R^{n+1} f_*g_*g^*\mathcal{F} \to R^{n+1} f_*\mathcal{G}$$

By the above we see that $R^{n+1}f_*g_*g^*\mathcal{F}$ is quasi-coherent. Thus $R^{n+1}f_*\mathcal{F}$ has a 2-step filtration where the first step is quasi-coherent and the second a subsheaf of a quasi-coherent sheaf. Applying this to $R^{n+1}f_*\mathcal{G}$ we find an exact sequence $0 \to \mathcal{A} \to R^{n+1}f_*\mathcal{G} \to \mathcal{B}$ wit $\mathcal{A}$, $\mathcal{B}$ quasi-coherent $\mathcal{O}_Y$-modules. Then the kernel $\mathcal{K}$ of $R^{n+1}f_*g_*g^*\mathcal{F} \to R^{n+1}f_*\mathcal{G} \to \mathcal{B}$ is quasi-coherent, whereupon we obtain a map $\mathcal{K} \to \mathcal{A}$ whose kernel $\mathcal{K}'$ is quasi-coherent too. Hence $R^{n+1}f_*\mathcal{F}$ sits in an exact sequence

$$R^n f_*g_*g^*\mathcal{F} \to R^n f_*\mathcal{G} \to R^{n+1}f_*\mathcal{F} \to \mathcal{K}' \to 0$$

and we win. □

49.5. Colimits and cohomology

The following lemma in particular applies to diagrams of quasi-coherent sheaves.

Lemma 49.5.1. *Let S be a scheme. Let X be an algebraic space over S. If X is quasi-compact and quasi-separated, then*

$$colim_i\, H^p(X, \mathcal{F}_i) \longrightarrow H^p(X, colim_i\, \mathcal{F}_i)$$

for every filtered diagram of abelian sheaves on $X_{étale}$.

Proof. This follows from Cohomology on Sites, Lemma 19.16.2. Namely, let $\mathcal{B} \subset Ob(X_{spaces,étale})$ be the set of quasi-compact and quasi-separated spaces étale over X. Note that if $U \in \mathcal{B}$ then, because U is quasi-compact, the collection of finite coverings $\{U_i \to U\}$ with $U_i \in \mathcal{B}$ is cofinal in the set of coverings of U in $X_{étale}$. By Morphisms of Spaces, Lemma 42.9.9 the set $\mathcal{B}$ satisfies all the assumptions of Cohomology on Sites, Lemma 19.16.2. Since $X \in \mathcal{B}$ we win. □

49.6. The alternating Čech complex

Let S be a scheme. Let $f : U \to X$ be an étale morphism of algebraic spaces over S. The functor

$$j : U_{spaces,étale} \longrightarrow X_{spaces,étale}, \quad V/U \longmapsto V/X$$

induces an equivalence of $U_{spaces,étale}$ with the localization $X_{spaces,étale}/U$, see Properties of Spaces, Section 41.24. Hence there exist functors

$$f_! : Ab(U_{étale}) \longrightarrow Ab(X_{étale}), \quad f_! : Mod(\mathcal{O}_U) \longrightarrow Mod(\mathcal{O}_X),$$

which are left adjoint to

$$f^{-1} : Ab(X_{étale}) \longrightarrow Ab(U_{étale}), \quad f^* : Mod(\mathcal{O}_X) \longrightarrow Mod(\mathcal{O}_U)$$

see Modules on Sites, Section 16.19. Warning: This functor, a priori, has nothing to do with cohomology with compact supports! We dubbed this functor ``extension by zero" in the reference above. Note that the two versions of $f_!$ agree as $f^* = f^{-1}$ for sheaves of $\mathcal{O}_X$-modules.

As we are going to use this construction below let us recall some of its properties. Given an abelian sheaf $\mathcal{G}$ on $U_{étale}$ the sheaf $f_!$ is the sheafification of the presheaf

$$V/X \longmapsto f_!\mathcal{G}(V) = \bigoplus\nolimits_{\varphi \in Mor_X(V,U)} \mathcal{G}(V \xrightarrow{\varphi} U),$$

see Modules on Sites, Lemma 16.19.2. Moreover, if $\mathcal{G}$ is an $\mathcal{O}_U$-module, then $f_!\mathcal{G}$ is the sheafification of the exact same presheaf of abelian groups which is endowed with an

$\mathcal{O}_X$-module structure in an obvious way (see loc. cit.). Let $\overline{x} : Spec(k) \to X$ be a geometric point. Then there is a canonical identification

$$(f_!\mathcal{G})_{\overline{x}} = \bigoplus\nolimits_{\overline{u}} \mathcal{G}_{\overline{u}}$$

where the sum is over all $\overline{u} : Spec(k) \to U$ such that $f \circ \overline{u} = \overline{x}$, see Modules on Sites, Lemma 16.32.1. In the following we are going to study the sheaf $f_!\underline{\mathbf{Z}}$. Here $\underline{\mathbf{Z}}$ denotes the constant sheaf on $X_{\acute{e}tale}$ or $U_{\acute{e}tale}$.

Lemma 49.6.1. *Let S be a scheme. Let $f_i : U_i \to X$ be étale morphisms of algebraic spaces over S. Then there are isomorphisms*

$$f_{1,!}\underline{\mathbf{Z}} \otimes_{\mathbf{Z}} f_{2,!}\underline{\mathbf{Z}} \longrightarrow f_{12,!}\underline{\mathbf{Z}}$$

where $f_{12} : U_1 \times_X U_2 \to X$ is the structure morphism and

$$(f_1 \amalg f_2)_!\underline{\mathbf{Z}} \longrightarrow f_{1,!}\underline{\mathbf{Z}} \oplus f_{2,!}\underline{\mathbf{Z}}$$

Proof. Once we have defined the map it will be an isomorphism by our description of stalks above. To define the map it suffices to work on the level of presheaves. Thus we have to define a map

$$\left(\bigoplus\nolimits_{\varphi_1 \in Mor_X(V,U_1)} \mathbf{Z}\right) \otimes_{\mathbf{Z}} \left(\bigoplus\nolimits_{\varphi_2 \in Mor_X(V,U_2)} \mathbf{Z}\right) \longrightarrow \bigoplus\nolimits_{\varphi \in Mor_X(V,U_1 \times_X U_2)} \mathbf{Z}$$

We map the element $1_{\varphi_1} \otimes 1_{\varphi_2}$ to the element $1_{\varphi_1 \times \varphi_2}$ with obvious notation. We omit the proof of the second equality. $\square$

Another important feature is the trace map

$$\mathrm{Tr}_f : f_!\underline{\mathbf{Z}} \longrightarrow \underline{\mathbf{Z}}.$$

The trace map is adjoint to the map $\mathbf{Z} \to f^{-1}\underline{\mathbf{Z}}$ (which is an isomorphism). If $\overline{x}$ is above, then Tr_f on stalks at $\overline{x}$ is the map

$$(\mathrm{Tr}_f)_{\overline{x}} : (f_!\underline{\mathbf{Z}})_{\overline{x}} = \bigoplus\nolimits_{\overline{u}} \mathbf{Z} \longrightarrow \mathbf{Z} = \underline{\mathbf{Z}}_{\overline{x}}$$

which sums the given integers. This is true because it is adjoint to the map $1 : \mathbf{Z} \to f^{-1}\underline{\mathbf{Z}}$. In particular, if f is surjective as well as étale then Tr_f is surjective.

Assume that $f : U \to X$ is a surjective étale morphism of algebraic spaces. Consider the *Koszul complex* associated to the trace map we discussed above

$$\ldots \to \wedge^3 f_!\underline{\mathbf{Z}} \to \wedge^2 f_!\underline{\mathbf{Z}} \to f_!\underline{\mathbf{Z}} \to \underline{\mathbf{Z}} \to 0$$

Here the exterior powers are over the sheaf of rings $\underline{\mathbf{Z}}$. The maps are defined by the rule

$$e_1 \wedge \ldots \wedge e_n \longmapsto \sum\nolimits_{i=1,\ldots,n} (-1)^{i+1} \mathrm{Tr}_f(e_i) e_1 \wedge \ldots \wedge \widehat{e_i} \wedge \ldots \wedge e_n$$

where $e_1, \ldots, e_n$ are local sections of $f_!\underline{\mathbf{Z}}$. Let $\overline{x}$ be a geometric point of X and set $M_{\overline{x}} = (f_!\underline{\mathbf{Z}})_{\overline{x}} = \bigoplus_{\overline{u}} \mathbf{Z}$. Then the stalk of the complex above at $\overline{x}$ is the complex

$$\ldots \to \wedge^3 M_{\overline{x}} \to \wedge^2 M_{\overline{x}} \to M_{\overline{x}} \to \mathbf{Z} \to 0$$

which is exact because $M_{\overline{x}} \to \mathbf{Z}$ is surjective, see More on Algebra, Lemma 12.21.5. Hence if we let $K^\bullet = K^\bullet(f)$ be the complex with $K^i = \wedge^{i+1} f_!\underline{\mathbf{Z}}$, then we obtain a quasi-isomorphism

$$K^\bullet \longrightarrow \underline{\mathbf{Z}}[0] \tag{49.6.1.1}$$

We use the complex $K^\bullet$ to define what we call the alternating Čech complex associated to $f : U \to X$.

Definition 49.6.2. Let S be a scheme. Let $f : U \to X$ be a surjective étale morphism of algebraic spaces over S. Let $\mathcal{F}$ be an object of $Ab(X_{étale})$. The *alternating Čech complex*[1] $\check{\mathcal{C}}^\bullet_{alt}(f, \mathcal{F})$ associated to $\mathcal{F}$ and f is the complex

$$Hom(K^0, \mathcal{F}) \to Hom(K^1, \mathcal{F}) \to Hom(K^2, \mathcal{F}) \to \ldots$$

with Hom groups computed in $Ab(X_{étale})$.

The reader may verify that if $U = \coprod U_i$ and $f|_{U_i} : U_i \to X$ is the open immersion of a subspace, then $\check{\mathcal{C}}^\bullet_{alt}(f, \mathcal{F})$ agrees with the complex introduced in Cohomology, Section 18.17 for the Zariski covering $X = \bigcup U_i$ and the restriction of $\mathcal{F}$ to the Zariski site of X. What is more important however, is to relate the cohomology of the alternating Čech complex to the cohomology.

Lemma 49.6.3. *Let S be a scheme. Let $f : U \to X$ be a surjective étale morphism of algebraic spaces over S. Let $\mathcal{F}$ be an object of $Ab(X_{étale})$. There exists a canonical map*

$$\check{\mathcal{C}}^\bullet_{alt}(f, \mathcal{F}) \longrightarrow R\Gamma(X, \mathcal{F})$$

in $D(Ab)$. Moreover, there is a spectral sequence with E_1-page

$$E_1^{p,q} = Ext^q_{Ab(X_{étale})}(K^p, \mathcal{F})$$

converging to $H^{p+q}(X, \mathcal{F})$ where $K^p = \wedge^{p+1} f_!\underline{\mathbf{Z}}$.

Proof. Recall that we have the quasi-isomorphism $K^\bullet \to \underline{\mathbf{Z}}[0]$, see (49.6.1.1). Choose an injective resolution $\mathcal{F} \to \mathcal{I}^\bullet$ in $Ab(X_{étale})$. Consider the double complex $A^{\bullet,\bullet}$ with terms

$$A^{p,q} = Hom(K^p, \mathcal{I}^q)$$

where the differential $d_1^{p,q} : A^{p,q} \to A^{p+1,q}$ is the one coming from the differential $K^{p+1} \to K^p$ and the differential $d_2^{p,q} : A^{p,q} \to A^{p,q+1}$ is the one coming from the differential $\mathcal{I}^q \to \mathcal{I}^{q+1}$. Denote $sA^\bullet$ the total complex associated to the double complex $A^{\bullet,\bullet}$. We will use the two spectral sequences $({}'E_r, {}'d_r)$ and $({}''E_r, {}''d_r)$ associated to this double complex, see Homology, Section 10.19.

Because $K^\bullet$ is a resolution of $\underline{\mathbf{Z}}$ we see that the complexes

$$A^{\bullet,q} : Hom(K^0, \mathcal{I}^q) \to Hom(K^1, \mathcal{I}^q) \to Hom(K^2, \mathcal{I}^q) \to \ldots$$

are acyclic in positive degrees and have H^0 equal to $\Gamma(X, \mathcal{I}^q)$. Hence by Homology, Lemma 10.19.6 and its proof the spectral sequence $({}''E_r, {}''d_r)$ degenerates, and the natural map

$$\mathcal{I}^\bullet(X) \longrightarrow sA^\bullet$$

is a quasi-isomorphism of complexes of abelian groups. In particular we conclude that $H^n(sA^\bullet) = H^n(X, \mathcal{F})$.

The map $\check{\mathcal{C}}^\bullet_{alt}(f, \mathcal{F}) \to R\Gamma(X, \mathcal{F})$ of the lemma is the composition of $\check{\mathcal{C}}^\bullet_{alt}(f, \mathcal{F}) \to SA^\bullet$ with the inverse of the displayed quasi-isomorphism.

Finally, consider the spectral sequence $({}'E_r, {}'d_r)$. We have

$$E_1^{p,q} = q\text{th cohomology of } Hom(K^p, \mathcal{I}^0) \to Hom(K^p, \mathcal{I}^1) \to Hom(K^p, \mathcal{I}^2) \to \ldots$$

This proves the lemma. □

It follows from the lemma that it is important to understand the ext groups $\mathrm{Ext}_{Ab(X_{étale})}(K^p, \mathcal{F})$, i.e., the right derived functors of $\mathcal{F} \mapsto Hom(K^p, \mathcal{F})$.

[1] This may be nonstandard notation

Lemma 49.6.4. *Let S be a scheme. Let $f : U \to X$ be a surjective, étale, and separated morphism of algebraic spaces over S. For $p \geq 0$ set*

$$W_p = U \times_X \ldots \times_X U \setminus \textit{all diagonals}$$

where the fibre product has $p+1$ factors. There is a free action of S_{p+1} on W_p over X and

$$Hom(K^p, \mathcal{F}) = S_{p+1}\textit{-anti-invariant elements of } \mathcal{F}(W_p)$$

functorially in $\mathcal{F}$ where $K^p = \wedge^{p+1} f_! \underline{\mathbf{Z}}$.

Proof. Because $U \to X$ is separated the diagonal $U \to U \times_X U$ is a closed immersion. Since $U \to X$ is étale the diagonal $U \to U \times_X U$ is an open immersion, see Morphisms of Spaces, Lemmas 42.35.10 and 42.34.9. Hence W_p is an open and closed subspace of $U^{p+1} = U \times_X \ldots \times_X U$. The action of S_{p+1} on W_p is free as we've thrown out the fixed points of the action. By Lemma 49.6.1 we see that

$$(f_! \underline{\mathbf{Z}})^{\otimes p+1} = f^{p+1}_! \underline{\mathbf{Z}} = (W_p \to X)_! \underline{\mathbf{Z}} \oplus Rest$$

where $f^{p+1} : U^{p+1} \to X$ is the structure morphism. Looking at stalks over a geometric point $\overline{x}$ of X we see that

$$\left(\bigoplus\nolimits_{\overline{u} \mapsto \overline{x}} \mathbf{Z}\right)^{\otimes p+1} \longrightarrow (W_p \to X)_! \underline{\mathbf{Z}}_{\overline{x}}$$

is the quotient whose kernel is generated by all tensors $1_{\overline{u}_0} \otimes \ldots \otimes 1_{\overline{u}_p}$ where $\overline{u}_i = \overline{u}_j$ for some $i \neq j$. Thus the quotient map

$$(f_! \underline{\mathbf{Z}})^{\otimes p+1} \longrightarrow \wedge^{p+1} f_! \underline{\mathbf{Z}}$$

factors through $(W_p \to X)_! \underline{\mathbf{Z}}$, i.e., we get

$$(f_! \underline{\mathbf{Z}})^{\otimes p+1} \longrightarrow (W_p \to X)_! \underline{\mathbf{Z}} \longrightarrow \wedge^{p+1} f_! \underline{\mathbf{Z}}$$

This already proves that $Hom(K^p, \mathcal{F})$ is (functorially) a subgroup of

$$Hom((W_p \to X)_! \underline{\mathbf{Z}}, \mathcal{F}) = \mathcal{F}(W_p)$$

To identify it with the S_{p+1}-anti-invariants we have to prove that the surjection $(W_p \to X)_! \underline{\mathbf{Z}} \to \wedge^{p+1} f_! \underline{\mathbf{Z}}$ is the maximal S_{p+1}-anti-invariant quotient. In other words, we have to show that $\wedge^{p+1} f_! \underline{\mathbf{Z}}$ is the quotient of $(W_p \to X)_! \underline{\mathbf{Z}}$ by the subsheaf generated by the local sections $s - \text{sign}(\sigma)\sigma(s)$ where s is a local section of $(W_p \to X)_! \underline{\mathbf{Z}}$. This can be checked on the stacks, where it is clear. □

Lemma 49.6.5. *Let S be a scheme. Let W be an algebraic space over S. Let G be a finite group acting freely on W. Let $U = W/G$, see Properties of Spaces, Lemma 41.31.1. Let $\chi : G \to \{+1, -1\}$ be a character. Then there exists a rank 1 locally free sheaf of $\mathbf{Z}$-modules $\underline{\mathbf{Z}}(\chi)$ on $U_{étale}$ such that for every abelian sheaf $\mathcal{F}$ on $U_{étale}$ we have*

$$H^0(W, \mathcal{F}|_W)^\chi = H^0(U, \mathcal{F} \otimes_{\mathbf{Z}} \underline{\mathbf{Z}}(\chi))$$

Proof. The quotient morphism $q : W \to U$ is a G-torsor, i.e., there exists a surjective étale morphism $U' \to U$ such that $W \times_U U' = \coprod_{g \in G} U'$ as spaces with G-action over U'. (Namely, $U' = W$ works.) Hence $q_* \underline{\mathbf{Z}}$ is a finite locally free $\mathbf{Z}$-module with an action of G. For any geometric point $\overline{u}$ of U, then we get G-equivariant isomorphisms

$$(q_* \underline{\mathbf{Z}})_{\overline{u}} = \bigoplus\nolimits_{\overline{w} \mapsto \overline{u}} \mathbf{Z} = \bigoplus\nolimits_{g \in G} \mathbf{Z} = \mathbf{Z}[G]$$

where the second = uses a geometric point $\overline{w}_0$ lying over $\overline{u}$ and maps the summand corresponding to $g \in G$ to the summand corresponding to $g(\overline{w}_0)$. We have

$$H^0(W, \mathcal{F}|_W) = H^0(U, \mathcal{F} \otimes_{\mathbf{Z}} q_*\underline{\mathbf{Z}})$$

because $q_*\mathcal{F}|_W = \mathcal{F} \otimes_{\mathbf{Z}} q_*\underline{\mathbf{Z}}$ as one can check by restricting to U'. Let

$$\underline{\mathbf{Z}}(\chi) = (q_*\underline{\mathbf{Z}})^\chi \subset q_*\underline{\mathbf{Z}}$$

be the subsheaf of sections that transform according to χ. For any geometric point $\overline{u}$ of U we have

$$\underline{\mathbf{Z}}(\chi)_{\overline{u}} = \mathbf{Z} \cdot \sum\nolimits_g \chi(g)g \subset \mathbf{Z}[G] = (q_*\underline{\mathbf{Z}})_{\overline{u}}$$

It follows that $\underline{\mathbf{Z}}(\chi)$ is locally free of rank 1 (more precisely, this should be checked after restricting to U'). Note that for any $\mathbf{Z}$-module M the χ-semi-invariants of $M[G]$ are the elements of the form $m \cdot \sum_g \chi(g)g$. Thus we see that for any abelian sheaf $\mathcal{F}$ on U we have

$$\left(\mathcal{F} \otimes_{\mathbf{Z}} q_*\underline{\mathbf{Z}}\right)^\chi = \mathcal{F} \otimes_{\mathbf{Z}} \underline{\mathbf{Z}}(\chi)$$

because we have equality at all stalks. The result of the lemma follows by taking global sections. □

Now we can put everything together and obtain the following pleasing result.

Lemma 49.6.6. *Let S be a scheme. Let $f : U \to X$ be a surjective, étale, and separated morphism of algebraic spaces over S. For $p \geq 0$ set*

$$W_p = U \times_X \ldots \times_X U \setminus \textit{all diagonals}$$

(with $p + 1$ factors) as in Lemma 49.6.4. Let $\chi_p : S_{p+1} \to \{+1, -1\}$ be the sign character. Let $U_p = W_p/S_{p+1}$ and $\underline{\mathbf{Z}}(\chi_p)$ be as in Lemma 49.6.5. Then the spectral sequence of Lemma 49.6.3 has E_1-page

$$E_1^{p,q} = H^q(U_p, \mathcal{F}|_{U_p} \otimes_{\mathbf{Z}} \underline{\mathbf{Z}}(\chi_p))$$

and converges to $H^{p+q}(X, \mathcal{F})$.

Proof. Note that since the action of S_{p+1} on W_p is over X we do obtain a morphism $U_p \to X$. Since $W_p \to X$ is étale and since $W_p \to U_p$ is surjective étale, it follows that also $U_p \to X$ is étale, see Descent on Spaces, Lemma 45.17.1. Therefore an injective object of $Ab(X_{étale})$ restricts to an injective object of $Ab(U_{p,étale})$, see Cohomology on Sites, Lemma 19.8.1. Moreover, the functor $\mathcal{G} \mapsto \mathcal{G} \otimes_{\mathbf{Z}} \underline{\mathbf{Z}}(\chi_p))$ is an auto-equivalence of $Ab(U_p)$, whence transforms injective objects into injective objects and is exact (because $\underline{\mathbf{Z}}(\chi_p)$ is an invertible $\underline{\mathbf{Z}}$-module). Thus given an injective resolution $\mathcal{F} \to \mathcal{I}^\bullet$ in $Ab(X_{étale})$ the complex

$$\Gamma(U_p, \mathcal{I}^0|_{U_p} \otimes_{\mathbf{Z}} \underline{\mathbf{Z}}(\chi_p)) \to \Gamma(U_p, \mathcal{I}^1|_{U_p} \otimes_{\mathbf{Z}} \underline{\mathbf{Z}}(\chi_p)) \to \Gamma(U_p, \mathcal{I}^2|_{U_p} \otimes_{\mathbf{Z}} \underline{\mathbf{Z}}(\chi_p)) \to \ldots$$

computes $H^*(U_p, \mathcal{F}|_{U_p} \otimes_{\mathbf{Z}} \underline{\mathbf{Z}}(\chi_p))$. On the other hand, by Lemma 49.6.5 it is equal to the complex of S_{p+1}-anti-invariants in

$$\Gamma(W_p, \mathcal{I}^0) \to \Gamma(W_p, \mathcal{I}^1) \to \Gamma(W_p, \mathcal{I}^2) \to \ldots$$

which by Lemma 49.6.4 is equal to the complex

$$Hom(K^p, \mathcal{I}^0) \to Hom(K^p, \mathcal{I}^1) \to Hom(K^p, \mathcal{I}^2) \to \ldots$$

which computes $\mathrm{Ext}^*_{Ab(X_{étale})}(K^p, \mathcal{F})$. Putting everything together we win. □

49.7. Higher vanishing for quasi-coherent sheaves

In this section we show that given a quasi-compact and quasi-separated algebraic space X there exists an integer $n = n(X)$ such that the cohomology of any quasi-coherent sheaf on X vanishes beyond degree n.

Lemma 49.7.1. *With S, W, G, U, χ as in Lemma 49.6.5. If $\mathcal{F}$ is a quasi-coherent $\mathcal{O}_U$-module, then so is $\mathcal{F} \otimes_{\mathbf{Z}} \underline{\mathbf{Z}}(\chi)$.*

Proof. The $\mathcal{O}_U$-module structure is clear. To check that $\mathcal{F} \otimes_{\mathbf{Z}} \underline{\mathbf{Z}}(\chi)$ is quasi-coherent it suffices to check étale locally. Hence the lemma follows as $\underline{\mathbf{Z}}(\chi)$ is finite locally free as a $\underline{\mathbf{Z}}$-module. □

The following proposition is interesting even if X is a scheme. It is the natural generalization of Coherent, Lemma 25.5.1. Before we state it, observe that given an étale morphism $f : U \to X$ from an affine scheme towards a quasi-separated algebraic space X the fibres of f are universally bounded, in particular there exists an integer d such that the fibres of $|U| \to |X|$ all have size at most d; this is the implication $(\eta) \Rightarrow (\delta)$ of Decent Spaces, Lemma 43.5.1.

Proposition 49.7.2. *Let S be a scheme. Let X be an algebraic space over S. Assume X is quasi-compact and separated. Let U be an affine scheme, and let $f : U \to X$ be a surjective étale morphism. Let d be an upper bound for the size of the fibres of $|U| \to |X|$. Then for any quasi-coherent $\mathcal{O}_X$-module $\mathcal{F}$ we have $H^q(X, \mathcal{F}) = 0$ for $q \geq d$.*

Proof. We will use the spectral sequence of Lemma 49.6.6. The lemma applies since f is separated as U is separated, see Morphisms of Spaces, Lemma 42.5.10. Since X is separated the scheme $U \times_X \ldots \times_X U$ is a closed subscheme of $U \times_{Spec(\mathbf{Z})} \ldots \times_{Spec(\mathbf{Z})} U$ hence is affine. Thus W_p is affine. Hence $U_p = W_p/S_{p+1}$ is an affine scheme by Groupoids, Proposition 35.19.8. The discussion in Section 49.4 shows that cohomology of quasi-coherent sheaves on W_p (as an algebraic space) agrees with the cohomology of the corresponding quasi-coherent sheaf on the underlying affine scheme, hence vanishes in positive degrees by Coherent, Lemma 25.2.2. By Lemma 49.7.1 the sheaves $\mathcal{F}|_{U_p} \otimes_{\mathbf{Z}} \underline{\mathbf{Z}}(\chi_p)$ are quasi-coherent. Hence $H^q(W_p, \mathcal{F}|_{U_p} \otimes_{\mathbf{Z}} \underline{\mathbf{Z}}(\chi_p))$ is zero when $q > 0$. By our definition of the integer d we see that $W_p = \emptyset$ for $p \geq d$. Hence also $H^0(W_p, \mathcal{F}|_{U_p} \otimes_{\mathbf{Z}} \underline{\mathbf{Z}}(\chi_p))$ is zero when $p \geq d$. This proves the proposition. □

In the following lemma we esthablish that a quasi-compact and quasi-separated algebraic space has finite cohomological dimension for quasi-coherent modules. We are explicit about the bound only because we will use it later to prove a similar result for higher direct images.

Lemma 49.7.3. *Let S be a scheme. Let X be an algebraic space over S. Assume X is quasi-compact and quasi-separated. Then we can choose*

1. *an affine scheme U,*
2. *a surjective étale morphism $f : U \to X$,*
3. *an integer d bounding the degrees of the fibres of $U \to X$,*
4. *for every $p = 0, 1, \ldots, d$ a surjective étale morphism $V_p \to U_p$ from an affine scheme V_p where U_p is as in Lemma 49.6.6, and*
5. *an integer d_p bounding the degree of the fibres of $V_p \to U_p$.*

Then for any quasi-coherent $\mathcal{O}_X$-module $\mathcal{F}$ we have $H^q(X, \mathcal{F}) = 0$ for $q \geq \max(d_p + p)$.

Proof. Since X is quasi-compact we can find a surjective étale morphism $U \to X$ with U affine, see Properties of Spaces, Lemma 41.6.3. By Decent Spaces, Lemma 43.5.1 the fibres of f are universally bounded, hence we can find d. We have $U_p = W_p/S_{p+1}$ and $W_p \subset U \times_X \ldots \times_X U$ is open and closed. Since X is quasi-separated the schemes W_p are quasi-compact, hence U_p is quasi-compact. Since U is separated, the schemes W_p are separated, hence U_p is separated by (the absolute version of) Spaces, Lemma 40.14.5. By Properties of Spaces, Lemma 41.6.3 we can find the morphisms $V_p \to W_p$. By Decent Spaces, Lemma 43.5.1 we can find the integers d_p.

At this point the proof uses the spectral sequence

$$E_1^{p,q} = H^q(U_p, \mathcal{F}|_{U_p} \otimes_{\mathbf{Z}} \underline{\mathbf{Z}}(\chi_p)) \Rightarrow H^{p+q}(X, \mathcal{F})$$

see Lemma 49.6.6. By definition of the integer d we see that $U_p = 0$ for $p \geq d$. By Proposition 49.7.2 and Lemma 49.7.1 we see that $H^q(U_p, \mathcal{F}|_{U_p} \otimes_{\mathbf{Z}} \underline{\mathbf{Z}}(\chi_p))$ is zero for $q \geq d_p$ for $p = 0, \ldots, d$. Whence the lemma. □

49.8. Vanishing for higher direct images

We apply the results of Section 49.7 to obtain vanishing of higher direct images of quasi-coherent sheaves for quasi-compact and quasi-separated morphisms. This is useful because it allows one to argue by descending induction on the cohomological degree in certain situations.

Lemma 49.8.1. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Assume that*

1. *f is quasi-compact and quasi-separated, and*
2. *Y is quasi-compact.*

Then there exists an integer $n(X \to Y)$ such that for any algebraic space Y', any morphism $Y' \to Y$ and any quasi-coherent sheaf $\mathcal{F}'$ on $X' = Y' \times_Y X$ the higher direct images $R^i f'_*\mathcal{F}'$ are zero for $i \geq n(X \to Y)$.

Proof. Let $V \to Y$ be a surjective étale morphism where V is an affine scheme, see Properties of Spaces, Lemma 41.6.3. Suppose we prove the result for the base change $f_V : V \times_Y X \to V$. Then the result holds for f with $n(X \to Y) = n(X_V \to V)$. Namely, if $Y' \to Y$ and $\mathcal{F}'$ are as in the lemma, then $R^i f'_*\mathcal{F}'|_{V \times_Y Y'}$ is equal to $R^i f'_{V,*}\mathcal{F}'|_{X'_V}$ where $f'_V : X'_V = V \times_Y Y' \times_Y X \to V \times_Y Y' = Y'_V$, see Properties of Spaces, Lemma 41.23.2. Thus we may assume that Y is an affine scheme.

Moreover, to prove the vanishing for all $Y' \to Y$ and $\mathcal{F}'$ it suffices to do so when Y' is an affine scheme. In this case, $R^i f'_*\mathcal{F}'$ is quasi-coherent by Lemma 49.4.1. Hence it suffices to prove that $H^i(X', \mathcal{F}') = 0$, because $H^i(X', \mathcal{F}') = H^0(Y', R^i f'_*\mathcal{F}')$ by Cohomology on Sites, Lemma 19.14.5 and the vanishing of higher cohomology of quasi-coherent sheaves on affine algebraic spaces (Proposition 49.7.2).

Choose $U \to X$, d, $V_p \to U_p$ and d_p as in Lemma 49.7.3. For any affine scheme Y' and morphism $Y' \to Y$ denote $X' = Y' \times_Y X$, $U' = Y' \times_Y U$, $V'_p = Y' \times_Y V_p$. Then $U' \to X'$, $d' = d$, $V'_p \to U'_p$ and $d'_p = d$ is a collection of choices as in Lemma 49.7.3 for the algebraic space X' (details omitted). Hence we see that $H^i(X', \mathcal{F}') = 0$ for $i \geq \max(p + d_p)$ and we win. □

Lemma 49.8.2. *Let S be a scheme. Let $f : X \to Y$ be an affine morphism of algebraic spaces over S. Then $R^i f_*\mathcal{F} = 0$ for $i > 0$ and any quasi-coherent $\mathcal{O}_X$-module $\mathcal{F}$.*

Proof. Recall that an affine morphism of algebraic spaces is representable. Hence this follows from (49.4.0.1) and Coherent, Lemma 25.2.3. □

49.9. Cohomology and base change, I

Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Let $\mathcal{F}$ be a quasi-coherent sheaf on X. Suppose further that $g : Y' \to Y$ is a morphism of algebraic spaces over S. Denote $X' = X_{Y'} = Y' \times_Y X$ the base change of X and denote $f' : X' \to Y'$ the base change of f. Also write $g' : X' \to X$ the projection, and set $\mathcal{F}' = (g')^*\mathcal{F}$. Here is a diagram representing the situation:

(49.9.0.1)
$$\begin{tikzcd} \mathcal{F}' = (g')^*\mathcal{F} & X' \arrow[r, "g'"] \arrow[d, "f'"'] & X \arrow[d, "f"] & \mathcal{F} \\ Rf'_*\mathcal{F}' & Y' \arrow[r, "g"] & Y & Rf_*\mathcal{F} \end{tikzcd}$$

Here is the basic result for a flat base change.

Lemma 49.9.1. *In the situation above, assume that g is flat and that f is quasi-compact and quasi-separated. Then the base change map for any $i \geq 0$ we have*

$$R^p f'_*\mathcal{F}' = g^* R^p f_*\mathcal{F}$$

with notation as in (49.9.0.1).

Proof. The morphism g' is flat by Morphisms of Spaces, Lemma 42.27.3. Note that flatness of g and g' is equivalent to flatness of the morphisms of small étale ringed sites, see Morphisms of Spaces, Lemma 42.27.8. Hence we can apply Cohomology on Sites, Lemma 19.15.1 to obtain a base change map

$$g^* R^p f_*\mathcal{F} \longrightarrow R^p f'_*\mathcal{F}'$$

To prove this map is an isomorphism we can work locally in the étale topology on Y'. Thus we may assume that Y and Y' are affine schemes. Say $Y = \text{Spec}(A)$ and $Y' = \text{Spec}(B)$. In this case we are really trying to show that the map

$$H^p(X, \mathcal{F}) \otimes_A B \longrightarrow H^p(X_B, \mathcal{F}_B)$$

is an isomorphism where $X_B = \text{Spec}(B) \times_{\text{Spec}(A)} X$ and $\mathcal{F}_B$ is the pullback of $\mathcal{F}$ to X_B.

Fix $A \to B$ a flat ring map and let X be a quasi-compact and quasi-separated algebraic space over A. Note that $g' : X_B \to X$ is affine as a base change of $Spec(B) \to Spec(A)$. Hence the higher direct images $R^i(g')_*\mathcal{F}_B$ are zero by Lemma 49.8.2. Thus $H^p(X_B, \mathcal{F}_B) = H^p(X, g'_*\mathcal{F}_B)$, see Cohomology on Sites, Lemma 19.14.5. Moreover, we have

$$g'_*\mathcal{F}_B = \mathcal{F} \otimes_{\underline{A}} \underline{B}$$

where $\underline{A}$, $\underline{B}$ denotes the constant sheaf of rings with value A, B. Namely, it is clear that there is a map from right to left. For any affine scheme U étale over X we have

$$\begin{aligned} g'_*\mathcal{F}_B(U) &= \mathcal{F}_B(Spec(B) \times_{Spec(A)} U) \\ &= \Gamma(Spec(B) \times_{Spec(A)} U, (Spec(B) \times_{Spec(A)} U \to U)^*\mathcal{F}|_U) \\ &= B \otimes_A \mathcal{F}(U) \end{aligned}$$

hence the map is an isomorphism. Write $B = colim\, M_i$ as a filtered colimit of finite free A-modules M_i using Lazard's theorem, see Algebra, Theorem 7.75.4. We deduce that

$$\begin{aligned} H^p(X, g'_*\mathcal{F}_B) &= H^p(X, \mathcal{F} \otimes_{\underline{A}} \underline{B}) \\ &= H^p(X, colim_i\, \mathcal{F} \otimes_{\underline{A}} \underline{M_i}) \\ &= colim_i\, H^p(X, \mathcal{F} \otimes_{\underline{A}} \underline{M_i}) \\ &= colim_i\, H^p(X, \mathcal{F}) \otimes_A M_i \\ &= H^p(X, \mathcal{F}) \otimes_A colim_i\, M_i \\ &= H^p(X, \mathcal{F}) \otimes_A B \end{aligned}$$

The first equality because $g'_*\mathcal{F}_B = \mathcal{F} \otimes_{\underline{A}} \underline{B}$ as seen above. The second because $\otimes$ commutes with colimits. The third equality because cohomology on X commutes with colimits (see Lemma 49.5.1). The fourth equality because M_i is finite free (i.e., because cohomology commutes with finite direct sums). The fith because $\otimes$ commutes with colimits. The sixth by choice of our system. □

CHAPTER 50

Stacks

50.1. Introduction

In this very short chapter we introduce stacks, and stacks in groupoids. See [**DM69a**], and [**Vis**].

50.2. Presheaves of morphisms associated to fibred categories

Let $\mathcal{C}$ be a category. Let $p : \mathcal{S} \to \mathcal{C}$ be a fibred category, see Categories, Section 4.30. Suppose that $x, y \in Ob(\mathcal{S}_U)$ are objects in the fibre category over U. We are going to define a functor

$$Mor(x, y) : (\mathcal{C}/U)^{opp} \longrightarrow Sets.$$

In other words this will be a presheaf on $\mathcal{C}/U$, see Sites, Definition 9.2.2. Make a choice of pullbacks as in Categories, Definition 4.30.5. Then, for $f : V \to U$ we set

$$Mor(x, y)(f : V \to U) = Mor_{\mathcal{S}_V}(f^*x, f^*y).$$

Let $f' : V' \to U$ be a second object of $\mathcal{C}/U$. We also have to define the restriction map corresponding to a morphism $g : V'/U \to V/U$ in $\mathcal{C}/U$, in other words $g : V' \to V$ and $f' = f \circ g$. This will be a map

$$Mor_{\mathcal{S}_V}(f^*x, f^*y) \longrightarrow Mor_{\mathcal{S}_{V'}}(f'^*x, f'^*y), \quad \phi \longmapsto \phi|_{V'}$$

This map will basically be g^*, except that this transforms an element ϕ of the left hand side into an element $g^*\phi$ of $Mor_{\mathcal{S}_{V'}}(g^*f^*x, g^*f^*y)$. At this point we use the transformation $\alpha_{g,f}$ of Categories, Lemma 4.30.6. In a formula, the restriction map is described by

$$\phi|_{V'} = (\alpha_{g,f})_y^{-1} \circ g^*\phi \circ (\alpha_{g,f})_x.$$

Of course, nobody thinks of this restriction map in this way. We will only do this once in order to verify the following lemma.

Lemma 50.2.1. *This actually does give a presheaf.*

Proof. Let $g : V'/U \to V/U$ be as above and similarly $g' : V''/U \to V'/U$ be morphisms in $\mathcal{C}/U$. So $f' = f \circ g$ and $f'' = f' \circ g' = f \circ g \circ g'$. Let $\phi \in Mor_{\mathcal{S}_V}(f^*x, f^*y)$. Then we have

$$\begin{aligned}
& (\alpha_{g\circ g',f})_y^{-1} \circ (g \circ g')^*\phi \circ (\alpha_{g\circ g',f})_x \\
= \quad & (\alpha_{g\circ g',f})_y^{-1} \circ (\alpha_{g',g})_{f^*y}^{-1} \circ (g')^*g^*\phi \circ (\alpha_{g',g})_{f^*x} \circ (\alpha_{g\circ g',f})_x \\
= \quad & (\alpha_{g',f'})_y^{-1} \circ (g')^*(\alpha_{g,f})_y^{-1} \circ (g')^*g^*\phi \circ (g')^*(\alpha_{g,f})_x \circ (\alpha_{g',f'})_x \\
= \quad & (\alpha_{g',f'})_y^{-1} \circ (g')^*\Big((\alpha_{g,f})_y^{-1} \circ g^*\phi \circ (\alpha_{g,f})_x\Big) \circ (\alpha_{g',f'})_x
\end{aligned}$$

which is what we want, namely $\phi|_{V''} = (\phi|_{V'})|_{V''}$. The first equality holds because $\alpha_{g',g}$ is a transformation of functors, and hence

$$\begin{tikzcd} (g \circ g')^* f^* x \arrow[r, "(g \circ g')^* \phi"'] \arrow[d, "(\alpha_{g',g})_{f^* x}"'] & (g \circ g')^* f^* y \arrow[d, "(\alpha_{g',g})_{f^* y}"] \\ (g')^* g^* f^* x \arrow[r, "(g')^* g^* \phi"] & (g')^* g^* f^* y \end{tikzcd}$$

commutes. The second equality holds because of property (d) of a pseudo functor since $f' = f \circ g$ (see Categories, Definition 4.26.5). The last equality follows from the fact that $(g')^*$ is a functor. $\square$

From now on we often omit mentioning the transformations $\alpha_{g,f}$ and we simply identify the functors $g^* \circ f^*$ and $(f \circ g)^*$. In particular, given $g : V'/U \to V/U$ the restriction mappings for the presheaf $Mor(x, y)$ will sometimes be denoted $\phi \mapsto g^*\phi$. We formalize the construction in a definition.

Definition 50.2.2. Let $\mathcal{C}$ be a category. Let $p : \mathcal{S} \to \mathcal{C}$ be a fibred category, see Categories, Section 4.30. Given an object U of $\mathcal{C}$ and objects x, y of the fibre category, the *presheaf of morphisms from x to y* is the presheaf

$$(f : V \to U) \longmapsto Mor_{\mathcal{S}_V}(f^*x, f^*y)$$

described above. It is denoted $Mor(x, y)$. The subpresheaf $Isom(x, y)$ whose values over V is the set of isomorphisms $f^*x \to f^*y$ in the fibre category $\mathcal{S}_V$ is called the *presheaf of isomorphisms from x to y*.

If $\mathcal{S}$ is fibred in groupoids then of course $Isom(x, y) = Mor(x, y)$, and it is customary to use the $Isom$ notation.

Lemma 50.2.3. *Let $F : \mathcal{S}_1 \to \mathcal{S}_2$ be a 1-morphism of fibred categories over the category $\mathcal{C}$. Let $U \in Ob(\mathcal{C})$ and $x, y \in Ob(\mathcal{S}_U)$. Then F defines a canonical morphism of presheaves*

$$Mor_{\mathcal{S}_1}(x, y) \longrightarrow Mor_{\mathcal{S}_2}(F(x), F(y))$$

on $\mathcal{C}/U$.

Proof. By Categories, Definition 4.30.8 the functor F maps strongly cartesian morphisms to strongly cartesian morphisms. Hence if $f : V \to U$ is a morphism in $\mathcal{C}$, then there are canonical isomorphisms $\alpha_V : f^*F(x) \to F(f^*x)$, $\beta_V : f^*F(y) \to F(f^*y)$ such that $f^*F(x) \to F(f^*x) \to F(x)$ is the canonical morphism $f^*F(x) \to F(x)$, and similarly for β_V. Thus we may define

$$\begin{tikzcd} Mor_{\mathcal{S}_1}(x, y)(f : V \to U) \arrow[r, equal] & Mor_{\mathcal{S}_{1,V}}(f^*x, f^*y) \arrow[d] \\ Mor_{\mathcal{S}_2}(F(x), F(y))(f : V \to U) \arrow[r, equal] & Mor_{\mathcal{S}_{2,V}}(f^*F(x), f^*F(y)) \end{tikzcd}$$

by $\phi \mapsto \beta_V^{-1} \circ F(\phi) \circ \alpha_V$. We omit the verification that this is compatible with the restriction mappings. $\square$

Remark 50.2.4. Suppose that $p : \mathcal{S} \to \mathcal{C}$ is fibred in groupoids. In this case we can prove Lemma 50.2.1 using Categories, Lemma 4.33.4 which says that $\mathcal{S} \to \mathcal{C}$ is equivalent to the category associated to a contravariant functor $F : \mathcal{C} \to$ Groupoids. In the case of the fibred category associated to F we have $g^* \circ f^* = (f \circ g)^*$ on the nose and there is no need to use the maps $\alpha_{g,f}$. In this case the lemma is (even more) trivial. Of course then one uses that the $Mor(x, y)$ presheaf is unchanged when passing to an equivalent fibred category which follows from Lemma 50.2.3.

Lemma 50.2.5. *Let $\mathcal{C}$ be a category. Let $p : \mathcal{S} \to \mathcal{C}$ be a fibred category, see Categories, Section 4.30. Let $U \in Ob(\mathcal{C})$ and let $x, y \in Ob(\mathcal{S}_U)$. Denote $x, y : \mathcal{C}/U \to \mathcal{S}$ also the corresponding 1-morphisms, see Categories, Lemma 4.38.1. Then*

(1) *the 2-fibre product $\mathcal{S} \times_{\mathcal{S}\times\mathcal{S},(x,y)} \mathcal{C}/U$ is fibred in setoids over $\mathcal{C}/U$, and*
(2) *$Isom(x, y)$ is the presheaf of sets corresponding to this category fibred in setoids, see Categories, Lemma 4.36.6.*

Proof. Omitted. Hint: Objects of the 2-fibre product are $(a : V \to U, z, a : V \to U, (\alpha, \beta))$ where $\alpha : z \to a^*x$ and $\beta : z \to a^*y$ are isomorphisms in $\mathcal{S}_V$. Thus the relationship with $Isom(x, y)$ comes by assigning to such an object the isomorphism $\beta \circ \alpha^{-1}$. □

50.3. Descent data in fibred categories

In this section we define the notion of a descent datum in the abstract setting of a fibred category. Before we do so we point out that this is completely analogous to descent data for quasi-coherent sheaves (Descent, Section 31.2) and descent data for schemes over schemes (Descent, Section 31.30).

We will use the convention where the projection maps $\mathrm{pr}_i : X \times \ldots \times X \to X$ are labeled starting with $i = 0$. Hence we have $\mathrm{pr}_0, \mathrm{pr}_1 : X \times X \to X$, $\mathrm{pr}_0, \mathrm{pr}_1, \mathrm{pr}_2 : X \times X \times X \to X$, etc.

Definition 50.3.1. Let $\mathcal{C}$ be a category. Let $p : \mathcal{S} \to \mathcal{C}$ be a fibred category. Make a choice of pullbacks as in Categories, Definition 4.30.5. Let $\mathcal{U} = \{f_i : U_i \to U\}_{i\in I}$ be a family of morphisms of $\mathcal{C}$. Assume all the fibre products $U_i \times_U U_j$, and $U_i \times_U U_j \times_U U_k$ exist.

(1) A *descent datum (X_i, φ_{ij}) in $\mathcal{S}$ relative to the family $\{f_i : U_i \to U\}$* is given by an object X_i of $\mathcal{S}_{U_i}$ for each $i \in I$, an isomorphism $\varphi_{ij} : \mathrm{pr}_0^*X_i \to \mathrm{pr}_1^*X_j$ in $\mathcal{S}_{U_i\times_U U_j}$ for each pair $(i, j) \in I^2$ such that for every triple of indices $(i, j, k) \in I^3$ the diagram
$$\begin{tikzcd} \mathrm{pr}_0^*X_i \arrow[rr, "\mathrm{pr}_{02}^*\varphi_{ik}"'] \arrow[dr, "\mathrm{pr}_{01}^*\varphi_{ij}"'] & & \mathrm{pr}_2^*X_k \\ & \mathrm{pr}_1^*X_j \arrow[ur, "\mathrm{pr}_{12}^*\varphi_{jk}"'] & \end{tikzcd}$$
in the category $\mathcal{S}_{U_i\times_U U_j\times_U U_k}$ commutes. This is called the *cocycle condition*.
(2) A *morphism $\psi : (X_i, \varphi_{ij}) \to (X'_i, \varphi'_{ij})$ of descent data* is given by a family $\psi = (\psi_i)_{i\in I}$ of morphisms $\psi_i : X_i \to X'_i$ in $\mathcal{S}_{U_i}$ such that all the diagrams
$$\begin{tikzcd} \mathrm{pr}_0^*X_i \arrow[r, "\varphi_{ij}"'] \arrow[d, "\mathrm{pr}_0^*\psi_i"'] & \mathrm{pr}_1^*X_j \arrow[d, "\mathrm{pr}_1^*\psi_j"] \\ \mathrm{pr}_0^*X'_i \arrow[r, "\varphi'_{ij}"] & \mathrm{pr}_1^*X'_j \end{tikzcd}$$
in the categories $\mathcal{S}_{U_i\times_U U_j}$ commute.
(3) The category of descent data relative to $\mathcal{U}$ is denoted $DD(\mathcal{U})$.

The fibre products $U_i \times_U U_j$ and $U_i \times_U U_j \times_U U_k$ will exist if each of the morphisms $f_i : U_i \to U$ is *representable*, see Categories, Definition 4.6.3. Recall that in a site one of the conditions for a covering $\{U_i \to U\}$ is that each of the morphisms is representable, see Sites, Definition 9.6.2 part (3). In fact the main interest in the definition above is where $\mathcal{C}$ is a site and $\{U_i \to U\}$ is a covering of $\mathcal{C}$. However, a descent datum is just an abstract gadget that can be defined as above. This is useful: for example, given a fibred category over $\mathcal{C}$ one can look at the collection of families with respect to which descent data are effective, and try to use these as the family of coverings for a site.

Remarks 50.3.2. Two remarks on Definition 50.3.1 are in order. Let $p : \mathcal{S} \to \mathcal{C}$ be a fibred category. Let $\{f_i : U_i \to U\}_{i\in I}$, and (X_i, φ_{ij}) be as in Definition 50.3.1.

(1) There is a diagonal morphism $\Delta : U_i \to U_i \times_U U_i$. We can pull back φ_{ii} via this morphism to get an automorphism $\Delta^*\varphi_{ii} \in \mathrm{Aut}_{U_i}(x_i)$. On pulling back the cocycle condition for the triple (i, i, i) by $\Delta_{123} : U_i \to U_i \times_U U_i \times_U U_i$ we deduce that $\Delta^*\varphi_{ii} \circ \Delta^*\varphi_{ii} = \Delta^*\varphi_{ii}$; thus $\Delta^*\varphi_{ii} = \mathrm{id}_{x_i}$.
(2) There is a morphism $\Delta_{13} : U_i \times_U U_j \to U_i \times_U U_j \times_U U_i$ and we can pull back the cocycle condition for the triple (i, j, i) to get the identity $(\sigma^*\varphi_{ji}) \circ \varphi_{ij} = \mathrm{id}_{\mathrm{pr}_0^* x_i}$, where $\sigma : U_i \times_U U_j \to U_j \times_U U_i$ is the switching morphism.

Lemma 50.3.3. *(Pullback of descent data.) Let $\mathcal{C}$ be a category. Let $p : \mathcal{S} \to \mathcal{C}$ be a fibred category. Make a choice pullbacks as in Categories, Definition 4.30.5. Let $\mathcal{U} = \{f_i : U_i \to U\}_{i\in I}$, and $\mathcal{V} = \{V_j \to V\}_{j\in J}$ be a families of morphisms of $\mathcal{C}$ with fixed target. Assume all the fibre products $U_i \times_U U_{i'}$, $U_i \times_U U_{i'} \times_U U_{i''}$, $V_j \times_V V_{j'}$, and $V_j \times_V V_{j'} \times_V V_{j''}$ exist. Let $\alpha : I \to J$, $h : U \to V$ and $g_i : U_i \to V_{\alpha(i)}$ be a morphism of families of maps with fixed target, see Sites, Definition 9.8.1.*

(1) *Let $(Y_j, \varphi_{jj'})$ be a descent datum relative to the family $\{V_j \to V\}$. The system*
$$\left(g_i^* Y_{\alpha(i)}, (g_i \times g_{i'})^* \varphi_{\alpha(i)\alpha(i')}\right)$$
is a descent datum relative to $\mathcal{U}$.
(2) *This construction defines a functor between descent data relative to $\mathcal{V}$ and descent data relative to $\mathcal{U}$.*
(3) *Given a second $\alpha' : I \to J$, $h' : U \to V$ and $g'_i : U_i \to V_{\alpha'(i)}$ morphism of families of maps with fixed target, then if $h = h'$ the two resulting functors between descent data are canonically isomorphic.*

Proof. Omitted. $\square$

Definition 50.3.4. With $\mathcal{U} = \{U_i \to U\}_{i\in I}$, $\mathcal{V} = \{V_j \to V\}_{j\in J}$, $\alpha : I \to J$, $h : U \to V$, and $g_i : U_i \to V_{\alpha(i)}$ as in Lemma 50.3.3 the functor
$$(Y_j, \varphi_{jj'}) \longmapsto (g_i^* Y_{\alpha(i)}, (g_i \times g_{i'})^* \varphi_{\alpha(i)\alpha(i')})$$
constructed in that lemma is called the *pullback functor* on descent data.

Given $h : U \to V$, if there exists a morphism $\tilde{h} : \mathcal{U} \to \mathcal{V}$ covering h then $\tilde{h}^*$ is independent of the choice of $\tilde{h}$ as we saw in Lemma 50.3.3. Hence we will sometimes simply write h^* to indicate the pullback functor.

Definition 50.3.5. Let $\mathcal{C}$ be a category. Let $p : \mathcal{S} \to \mathcal{C}$ be a fibred category. Make a choice of pullbacks as in Categories, Definition 4.30.5. Let $\mathcal{U} = \{f_i : U_i \to U\}_{i\in I}$ be a family of morphisms with target U. Assume all the fibre products $U_i \times_U U_j$ and $U_i \times_U U_j \times_U U_k$ exist.

(1) Given an object X of $\mathcal{S}_U$ the *trivial descent datum* is the descent datum (X, id_X) with respect to the family $\{\text{id}_U : U \to U\}$.
(2) Given an object X of $\mathcal{S}_U$ we have a *canonical descent datum* on the family of objects f_i^*X by pulling back the trivial descent datum (X, id_X) via the obvious map $\{f_i : U_i \to U\} \to \{\text{id}_U : U \to U\}$. We denote this descent datum (f_i^*X, can).
(3) A descent datum (X_i, φ_{ij}) relative to $\{f_i : U_i \to U\}$ is called *effective* if there exists an object X of $\mathcal{S}_U$ such that (X_i, φ_{ij}) is isomorphic to (f_i^*X, can).

Note that the rule that associates to $X \in \mathcal{S}_U$ its canonical descent datum relative to $\mathcal{U}$ defines a functor

$$\mathcal{S}_U \longrightarrow DD(\mathcal{U}).$$

A descent datum is effective if and only if it is in the essential image of this functor. Let us make explicit the canonical descent datum as follows.

Lemma 50.3.6. *In the situation of Definition 50.3.5 part (2) the maps $can_{ij} : pr_0^*f_i^*X \to pr_1^*f_j^*X$ are equal to $(\alpha_{pr_1, f_j})_X \circ (\alpha_{pr_0, f_i})_X^{-1}$ where $\alpha_{\cdot,\cdot}$ is as in Categories, Lemma 4.30.6 and where we use the equality $f_i \circ pr_0 = f_j \circ pr_1$ as maps $U_i \times_U U_j \to U$.*

Proof. Omitted. □

50.4. Stacks

Here is the definition of a stack. It mixes the notion of a fibred category with the notion of descent.

Definition 50.4.1. Let $\mathcal{C}$ be a site. A *stack* over $\mathcal{C}$ is a category $p : \mathcal{S} \to \mathcal{C}$ over $\mathcal{C}$ which satisfies the following conditions:

(1) $p : \mathcal{S} \to \mathcal{C}$ is a fibred category, see Categories, Definition 4.30.4,
(2) for any $U \in Ob(\mathcal{C})$ and any $x, y \in \mathcal{S}_U$ the presheaf $Mor(x, y)$ (see Definition 50.2.2) is a sheaf on the site $\mathcal{C}/U$, and
(3) for any covering $\mathcal{U} = \{f_i : U_i \to U\}_{i \in I}$ of the site $\mathcal{C}$, any descent datum in $\mathcal{S}$ relative to $\mathcal{U}$ is effective.

We find the formulation above the most convenient way to think about a stack. Namely, given a category over $\mathcal{C}$ in order to verify that it is a stack you proceed to check properties (1), (2) and (3) in that order. Certainly properties (2) and (3) do not make sense if the category isn't fibred. Without (2) we cannot prove that the descent in (3) is unique up to unique isomorphism and functorial.

The following lemma provides an alternative definition.

Lemma 50.4.2. *Let $\mathcal{C}$ be a site. Let $p : \mathcal{S} \to \mathcal{C}$ be a fibred category over $\mathcal{C}$. The following are equivalent*

(1) *$\mathcal{S}$ is a stack over $\mathcal{C}$, and*
(2) *for any covering $\mathcal{U} = \{f_i : U_i \to U\}_{i \in I}$ of the site $\mathcal{C}$ the functor*

$$\mathcal{S}_U \longrightarrow DD(\mathcal{U})$$

which associates to an object its canonical descent datum is an equivalence.

Proof. Omitted. □

Lemma 50.4.3. *Let $p : \mathcal{S} \to \mathcal{C}$ be a stack over the site $\mathcal{C}$. Let $\mathcal{S}'$ be a subcategory of $\mathcal{S}$. Assume*

(1) *if* $\varphi : y \to x$ *is a strongly cartesian morphism of* $\mathcal{S}$ *and* x *is an object of* $\mathcal{S}'$*, then* y *is isomorphic to an object of* $\mathcal{S}'$*,*
(2) $\mathcal{S}'$ *is a full subcategory of* $\mathcal{S}$*, and*
(3) *if* $\{f_i : U_i \to U\}$ *is a covering of* $\mathcal{C}$*, and* x *an object of* $\mathcal{S}$ *over* U *such that* f_i^*x *is isomorphic to an object of* $\mathcal{S}'$ *for each* i*, then* x *is isomorphic to an object of* $\mathcal{S}'$*.*

Then $\mathcal{S}' \to \mathcal{C}$ *is a stack.*

Proof. Omitted. Hints: The first condition garantees that $\mathcal{S}'$ is a fibred category. The second condition garantees that the $Isom$-presheaves of $\mathcal{S}'$ are sheaves (as they are identical to their counter parts in $\mathcal{S}$). The third condition garantees that the descent condition holds in $\mathcal{S}'$ as we can first descend in $\mathcal{S}$ and then (3) implies the resulting object is isomorphic to an object of $\mathcal{S}'$. $\square$

Lemma 50.4.4. *Let* $\mathcal{C}$ *be a site. Let* $\mathcal{S}_1$*,* $\mathcal{S}_2$ *be categories over* $\mathcal{C}$*. Suppose that* $\mathcal{S}_1$ *and* $\mathcal{S}_2$ *are equivalent as categories over* $\mathcal{C}$*. Then* $\mathcal{S}_1$ *is a stack over* $\mathcal{C}$ *if and only if* $\mathcal{S}_2$ *is a stack over* $\mathcal{C}$*.*

Proof. Let $F : \mathcal{S}_1 \to \mathcal{S}_2$, $G : \mathcal{S}_2 \to \mathcal{S}_1$ be functors over $\mathcal{C}$, and let $i : F \circ G \to \mathrm{id}_{\mathcal{S}_2}$, $j : G \circ F \to \mathrm{id}_{\mathcal{S}_1}$ be isomorphisms of functors over $\mathcal{C}$. By Categories, Lemma 4.30.7 we see that $\mathcal{S}_1$ is fibred if and only if $\mathcal{S}_2$ is fibred over $\mathcal{C}$. Hence we may assume that both $\mathcal{S}_1$ and $\mathcal{S}_2$ are fibred. Moreover, the proof of Categories, Lemma 4.30.7 shows that F and G map strongly cartesian morphisms to strongly cartesian morphisms, i.e., F and G are 1-morphisms of fibred cateogires over $\mathcal{C}$. This means that given $U \in Ob(\mathcal{C})$, and $x, y \in \mathcal{S}_{1,U}$ then the presheaves

$$Mor_{\mathcal{S}_1}(x, y), Mor_{\mathcal{S}_1}(F(x), F(y)) : (\mathcal{C}/U)^{opp} \longrightarrow Sets.$$

are identified, see Lemma 50.2.3. Hence the first is a sheaf if and only if the second is a sheaf. Finally, we have to show that if every descent datum in $\mathcal{S}_1$ is effective, then so is every descent datum in $\mathcal{S}_2$. To do this, let $(X_i, \varphi_{ii'})$ be a descent datum in $\mathcal{S}_2$ relative the covering $\{U_i \to U\}$ of the site $\mathcal{C}$. Then $(G(X_i), G(\varphi_{ii'}))$ is a descent datum in $\mathcal{S}_1$ relative the covering $\{U_i \to U\}$. Let X be an object of $\mathcal{S}_{1,U}$ such that the descent datum (f_i^*X, can) is isomorphic to $(G(X_i), G(\varphi_{ii'}))$. Then $F(X)$ is an object of $\mathcal{S}_{2,U}$ such that the descent datum $(f_i^*F(X), can)$ is isomorphic to $(F(G(X_i)), F(G(\varphi_{ii'})))$ which in turn is isomorphic to the original descent datum $(X_i, \varphi_{ii'})$ using i. $\square$

The 2-category of stacks over $\mathcal{C}$ is defined as follows.

Definition 50.4.5. Let $\mathcal{C}$ be a site. The 2-*category of stacks over* $\mathcal{C}$ is the sub 2-category of the 2-category of fibred categories over $\mathcal{C}$ (see Categories, Definition 4.30.8) defined as follows:

(1) Its objects will be stacks $p : \mathcal{S} \to \mathcal{C}$.
(2) Its 1-morphisms $(\mathcal{S}, p) \to (\mathcal{S}', p')$ will be functors $G : \mathcal{S} \to \mathcal{S}'$ such that $p' \circ G = p$ and such that G maps strongly cartesian morphisms to strongly cartesian morphisms.
(3) Its 2-morphisms $t : G \to H$ for $G, H : (\mathcal{S}, p) \to (\mathcal{S}', p')$ will be morphisms of functors such that $p'(t_x) = \mathrm{id}_{p(x)}$ for all $x \in Ob(\mathcal{S})$.

Lemma 50.4.6. *Let* $\mathcal{C}$ *be a site. The* $(2,1)$*-category of stacks over* $\mathcal{C}$ *has 2-fibre products, and they are described as in Categories, Lemma 4.29.3.*

Proof. Let $f : \mathcal{X} \to \mathcal{S}$ and $g : \mathcal{Y} \to \mathcal{S}$ be 1-morphisms of stacks over $\mathcal{C}$ as defined above. The category $\mathcal{X} \times_{\mathcal{S}} \mathcal{Y}$ described in Categories, Lemma 4.29.3 is a fibred category according to Categories, Lemma 4.30.9. (This is where we use that f and g preserve strongly cartesian morphisms.) It remains to show that the morphism presheaves are sheaves and that descent relative to coverings of $\mathcal{C}$ is effective.

Recall that an object of $\mathcal{X} \times_{\mathcal{S}} \mathcal{Y}$ is given by a quadruple (U, x, y, ϕ). It lies over the object U of $\mathcal{C}$. Next, let (U, x', y', ϕ') be second object lying over U. Recall that $\phi : f(x) \to g(y)$, and $\phi' : f(x') \to g(y')$ are isomorphisms in the category $\mathcal{S}_U$. Let us use these isomorphisms to identify $z = f(x) = g(y)$ and $z' = f(x') = g(y')$. With this identifications it is clear that

$$Mor((U, x, y, \phi), (U, x', y', \phi')) = Mor(x, x') \times_{Mor(z,z')} Mor(y, y')$$

as presheaves. However, as the fibred product in the category of presheaves preserves sheaves (Sites, Lemma 9.10.1) we see that this is a sheaf.

Let $\mathcal{U} = \{f_i : U_i \to U\}_{i\in I}$ be a covering of the site $\mathcal{C}$. Let (X_i, χ_{ij}) be a descent datum in $\mathcal{X} \times_{\mathcal{S}} \mathcal{Y}$ relative to $\mathcal{U}$. Write $X_i = (U_i, x_i, y_i, \phi_i)$ as above. Write $\chi_{ij} = (\varphi_{ij}, \psi_{ij})$ as in the definition of the category $\mathcal{X} \times_{\mathcal{S}} \mathcal{Y}$ (see Categories, Lemma 4.29.3). It is clear that (x_i, φ_{ij}) is a descent datum in $\mathcal{X}$ and that (y_i, ψ_{ij}) is a descent datum in $\mathcal{Y}$. Since $\mathcal{X}$ and $\mathcal{Y}$ are stacks these descent data are effective. Thus we get $x \in Ob(\mathcal{X}_U)$, and $y \in Ob(\mathcal{Y}_U)$ with $x_i = x|_{U_i}$, and $y_i = y|_{U_i}$ compatibly with descent data. Set $z = f(x)$ and $z' = g(y)$ which are both objects of $\mathcal{S}_U$. The morphisms ϕ_i are elements of $Isom(z, z')(U_i)$ with the property that $\phi_i|_{U_i\times_U U_j} = \phi_j|_{U_i\times_U U_j}$. Hence by the sheaf property of $Isom(z, z')$ we obtain an isomorphism $\phi : z = f(x) \to z' = g(y)$. We omit the verification that the canonical descent datum associated to the object (U, x, y, ϕ) of $(\mathcal{X}\times_{\mathcal{S}}\mathcal{Y})_U$ is isomorphic to the descent datum we started with. □

Lemma 50.4.7. *Let $\mathcal{C}$ be a site. Let $\mathcal{S}_1$, $\mathcal{S}_2$ be stacks over $\mathcal{C}$. Let $F : \mathcal{S}_1 \to \mathcal{S}_2$ be a 1-morphism. Then the following are equivalent*

1. *F is fully faithful,*
2. *for every $U \in Ob(\mathcal{C})$ and for every $x, y \in Ob(\mathcal{S}_{1,U})$ the map*
$$F : Mor_{\mathcal{S}_1}(x, y) \longrightarrow Mor_{\mathcal{S}_2}(x, y)$$
is an isomorphism of sheaves on $\mathcal{C}/U$.

Proof. Omitted. □

Lemma 50.4.8. *Let $\mathcal{C}$ be a site. Let $\mathcal{S}_1$, $\mathcal{S}_2$ be stacks over $\mathcal{C}$. Let $F : \mathcal{S}_1 \to \mathcal{S}_2$ be a 1-morphism which is fully faithful. Then the following are equivalent*

1. *F is an equivalence,*
2. *for every $U \in Ob(\mathcal{C})$ and for every $x \in Ob(\mathcal{S}_{2,U})$ there exists a covering $\{f_i : U_i \to U\}$ such that f_i^*x is in the essential image of the functor $F : \mathcal{S}_{1,U_i} \to \mathcal{S}_{2,U_i}$.*

Proof. The implication (1) ⇒ (2) is immediate. To see that (2) implies (1) we have to show that every x as in (2) is in the essential image of the functor F. To do this choose a covering as in (2), $x_i \in Ob(\mathcal{S}_{1,U_i})$, and isomorphisms $\varphi_i : F(x_i) \to f_i^*x$. Then we get a descent datum for $\mathcal{S}_1$ relative to $\{f_i : U_i \to U\}$ by taking

$$\varphi_{ij} : x_i|_{U_i\times_U U_j} \longrightarrow x_j|_{U_i\times_U U_j}$$

the arrow such that $F(\varphi_{ij}) = \varphi_j^{-1} \circ \varphi_i$. This descent datum is effective by the axioms of a stack, and hence we obtain an object x_1 of $\mathcal{S}_1$ over U. We omit the verification that $F(x_1)$ is isomorphic to x over U. □

Remark 50.4.9. (Cutting down a ``big'' stack to get a stack.) Let $\mathcal{C}$ be a site. Suppose that $p : \mathcal{S} \to \mathcal{C}$ is functor from a ``big'' category to $\mathcal{C}$, i.e., suppose that the collection of objects of $\mathcal{S}$ forms a proper class. Finally, suppose that $p : \mathcal{S} \to \mathcal{C}$ satisfies conditions (1), (2), (3) of Definition 50.4.1. In general there is no way to replace $p : \mathcal{S} \to \mathcal{C}$ by a equivalent category such that we obtain a stack. The reason is that it can happen that a fibre categories $\mathcal{S}_U$ may have a proper class of isomorphism classes of objects. On the other hand, suppose that

(4) for every $U \in Ob(\mathcal{C})$ there exists a set $S_U \subset Ob(\mathcal{S}_U)$ such that every object of $\mathcal{S}_U$ is isomorphic in $\mathcal{S}_U$ to an element of S_U.

In this case we can find a full subcategory $\mathcal{S}_{small}$ of $\mathcal{S}$ such that, setting $p_{small} = p|_{\mathcal{S}_{small}}$, we have

(a) the functor $p_{small} : \mathcal{S}_{small} \to \mathcal{C}$ defines a stack, and
(b) the inclusion $\mathcal{S}_{small} \to \mathcal{S}$ is fully faithful and essentially surjective.

(Hint: For every $U \in Ob(\mathcal{C})$ let $\alpha(U)$ denote the smallest ordinal such that $Ob(\mathcal{S}_U) \cap V_{\alpha(U)}$ surjects onto the set of isomorphism classes of $\mathcal{S}_U$, and set $\alpha = \sup_{U \in Ob(\mathcal{C})} \alpha(U)$. Then take $Ob(\mathcal{S}_{small}) = Ob(\mathcal{S}) \cap V_\alpha$. For notation used see Sets, Section 3.5.)

50.5. Stacks in groupoids

Among stacks those which are fibred in groupoids are somewhat easier to comprehend. We redefine them as follows.

Definition 50.5.1. A *stack in groupoids* over a site $\mathcal{C}$ is a category $p : \mathcal{S} \to \mathcal{C}$ over $\mathcal{C}$ such that

(1) $p : \mathcal{S} \to \mathcal{C}$ is fibred in groupoids over $\mathcal{C}$ (see Categories, Definition 4.32.1),
(2) for all $U \in Ob(\mathcal{C})$, for all $x, y \in Ob(\mathcal{S}_U)$ the presheaf $Isom(x, y)$ is a sheaf on the site $\mathcal{C}/U$, and
(3) for all coverings $\mathcal{U} = \{U_i \to U\}$ in $\mathcal{C}$, all descent data (x_i, ϕ_{ij}) for $\mathcal{U}$ are effective.

Usually the hardest part to check is the third condition. Here is the lemma comparing this with the notion of a stack.

Lemma 50.5.2. *Let $\mathcal{C}$ be a site. Let $p : \mathcal{S} \to \mathcal{C}$ be a category over $\mathcal{C}$. The following are equivalent*

(1) *$\mathcal{S}$ is a stack in groupoids over $\mathcal{C}$,*
(2) *$\mathcal{S}$ is a stack over $\mathcal{C}$ and all fibre categories are groupoids, and*
(3) *$\mathcal{S}$ is fibred in groupoids over $\mathcal{C}$ and is a stack over $\mathcal{C}$.*

Proof. Omitted, but see Categories, Lemma 4.32.2. ☐

Lemma 50.5.3. *Let $\mathcal{C}$ be a site. Let $p : \mathcal{S} \to \mathcal{C}$ be a stack. Let $p' : \mathcal{S}' \to \mathcal{C}$ be the category fibred in groupoids associated to $\mathcal{S}$ constructed in Categories, Lemma 4.32.3. Then $p' : \mathcal{S}' \to \mathcal{C}$ is a stack in groupoids.*

Proof. Recall that the morphisms in $\mathcal{S}'$ are exactly the strongly cartesian morphisms of $\mathcal{S}$, and that any isomorphism of $\mathcal{S}$ is such a morphism. Hence descent data in $\mathcal{S}'$ are exactly the same thing as descent data in $\mathcal{S}$. Now apply Lemma 50.4.2. Some details omitted. ☐

Lemma 50.5.4. *Let $\mathcal{C}$ be a site. Let $\mathcal{S}_1$, $\mathcal{S}_2$ be categories over $\mathcal{C}$. Suppose that $\mathcal{S}_1$ and $\mathcal{S}_2$ are equivalent as categories over $\mathcal{C}$. Then $\mathcal{S}_1$ is a stack in groupoids over $\mathcal{C}$ if and only if $\mathcal{S}_2$ is a stack in groupoids over $\mathcal{C}$.*

Proof. Follows by combining Lemmas 50.5.2 and 50.4.4. $\square$

The 2-category of stacks in groupoids over $\mathcal{C}$ is defined as follows.

Definition 50.5.5. Let $\mathcal{C}$ be a site. The 2-*category of stacks in groupoids over* $\mathcal{C}$ is the sub 2-category of the 2-category of stacks over $\mathcal{C}$ (see Definition 50.4.5) defined as follows:

(1) Its objects will be stacks in groupoids $p : \mathcal{S} \to \mathcal{C}$.
(2) Its 1-morphisms $(\mathcal{S}, p) \to (\mathcal{S}', p')$ will be functors $G : \mathcal{S} \to \mathcal{S}'$ such that $p' \circ G = p$. (Since every morphism is strongly cartesian every functor preserves them.)
(3) Its 2-morphisms $t : G \to H$ for $G, H : (\mathcal{S}, p) \to (\mathcal{S}', p')$ will be morphisms of functors such that $p'(t_x) = \mathrm{id}_{p(x)}$ for all $x \in Ob(\mathcal{S})$.

Note that any 2-morphism is automatically an isomorphism, so that in fact the 2-category of stacks in groupoids over $\mathcal{C}$ is a (strict) $(2, 1)$-category.

Lemma 50.5.6. *Let $\mathcal{C}$ be a category. The* 2*-category of stacks in groupoids over $\mathcal{C}$ has 2-fibre products, and they are described as in Categories, Lemma 4.29.3.*

Proof. This is clear from Categories, Lemma 4.32.7 and Lemmas 50.5.2 and 50.4.6. $\square$

50.6. Stacks in setoids

This is just a brief section saying that a stack in sets is the same thing as a sheaf of sets. Please consult Categories, Section 4.36 for notation.

Definition 50.6.1. Let $\mathcal{C}$ be a site.

(1) A *stack in setoids* over $\mathcal{C}$ is a stack over $\mathcal{C}$ all of whose fibre categories are setoids.
(2) A *stack in sets*, or a *stack in discrete categories* is a stack over $\mathcal{C}$ all of whose fibre categories are discrete.

From the discussion in Section 50.5 this is the same thing as a stack in groupoids whose fibre categories are setoids (resp. discrete). Moreover, it is also the same thing as a category fibred in setoids (resp. sets) which is a stack.

Lemma 50.6.2. *Let $\mathcal{C}$ be a site. Under the equivalence*

$$\left\{\begin{matrix} \textit{the category of presheaves} \\ \textit{of sets over } \mathcal{C} \end{matrix}\right\} \leftrightarrow \left\{\begin{matrix} \textit{the category of categories} \\ \textit{fi}\mathcal{C} \end{matrix}\right\}$$

of Categories, Lemma 4.35.6 the stacks in sets correspond precisely to the sheaves.

Proof. Omitted. Hint: Show that effectivity of descent corresponds exactly to the sheaf condition. $\square$

Lemma 50.6.3. *Let $\mathcal{C}$ be a site. Let $\mathcal{S}$ be a category fibred in setoids over $\mathcal{C}$. Then $\mathcal{S}$ is a stack in setoids if and only if the unique equivalent category $\mathcal{S}'$ fibred in sets (see Categories, Lemma 4.36.5) is a stack in sets. In other words, if and only if the presheaf*

$$U \longmapsto Ob(\mathcal{S}_U)/\cong$$

is a sheaf.

Proof. Omitted. $\square$

Lemma 50.6.4. *Let $\mathcal{C}$ be a site. Let $\mathcal{S}_1$, $\mathcal{S}_2$ be categories over $\mathcal{C}$. Suppose that $\mathcal{S}_1$ and $\mathcal{S}_2$ are equivalent as categories over $\mathcal{C}$. Then $\mathcal{S}_1$ is a stack in setoids over $\mathcal{C}$ if and only if $\mathcal{S}_2$ is a stack in setoids over $\mathcal{C}$.*

Proof. By Categories, Lemma 4.36.5 we see that a category $\mathcal{S}$ over $\mathcal{C}$ is fibred in setoids over $\mathcal{C}$ if and only if it is equivalent over $\mathcal{C}$ to a category fibred in sets. Hence we see that $\mathcal{S}_1$ is fibred in setoids over $\mathcal{C}$ if and only if $\mathcal{S}_2$ is fibred in setoids over $\mathcal{C}$. Hence now the lemma follows from Lemma 50.6.3. ☐

The 2-category of stacks in setoids over $\mathcal{C}$ is defined as follows.

Definition 50.6.5. Let $\mathcal{C}$ be a site. The 2-*category of stacks in setoids over* $\mathcal{C}$ is the sub 2-category of the 2-category of stacks over $\mathcal{C}$ (see Definition 50.4.5) defined as follows:

(1) Its objects will be stacks in setoids $p : \mathcal{S} \to \mathcal{C}$.
(2) Its 1-morphisms $(\mathcal{S}, p) \to (\mathcal{S}', p')$ will be functors $G : \mathcal{S} \to \mathcal{S}'$ such that $p' \circ G = p$. (Since every morphism is strongly cartesian every functor preserves them.)
(3) Its 2-morphisms $t : G \to H$ for $G, H : (\mathcal{S}, p) \to (\mathcal{S}', p')$ will be morphisms of functors such that $p'(t_x) = \mathrm{id}_{p(x)}$ for all $x \in Ob(\mathcal{S})$.

Note that any 2-morphism is automatically an isomorphism, so that in fact the 2-category of stacks in setoids over $\mathcal{C}$ is a (strict) (2, 1)-category.

Lemma 50.6.6. *Let $\mathcal{C}$ be a site. The 2-category of stacks in setoids over $\mathcal{C}$ has 2-fibre products, and they are described as in Categories, Lemma 4.29.3.*

Proof. This is clear from Categories, Lemmas 4.32.7 and 4.36.4 and Lemmas 50.5.2 and 50.4.6. ☐

Lemma 50.6.7. *Let $\mathcal{C}$ be a site. Let $\mathcal{S}, \mathcal{T}$ be stacks in groupoids over $\mathcal{C}$ and let $\mathcal{R}$ be a stack in setoids over $\mathcal{C}$. Let $f : \mathcal{T} \to \mathcal{S}$ and $g : \mathcal{R} \to \mathcal{S}$ be 1-morphisms. If f is faithful, then the 2-fibre product*

$$\mathcal{T} \times_{f,\mathcal{S},g} \mathcal{R}$$

is a stack in setoids over $\mathcal{C}$.

Proof. Immediate from the explict description of the 2-fibre product in Categories, Lemma 4.29.3. ☐

Lemma 50.6.8. *Let $\mathcal{C}$ be a site. Let $\mathcal{S}$ be a stack in groupoids over $\mathcal{C}$ and let $\mathcal{S}_i$, $i = 1, 2$ be stacks in setoids over $\mathcal{C}$. Let $f_i : \mathcal{S}_i \to \mathcal{S}$ be 1-morphisms. Then the 2-fibre product*

$$\mathcal{S}_1 \times_{f_1,\mathcal{S},f_2} \mathcal{S}_2$$

is a stack in setoids over $\mathcal{C}$.

Proof. This is a special case of Lemma 50.6.7 as f_2 is faithful. ☐

Lemma 50.6.9. *Let $\mathcal{C}$ be a site. Let*

$$\begin{tikzcd} \mathcal{T}_2 \arrow[r] \arrow[d, "G'"'] & \mathcal{T}_1 \arrow[d, "G"] \\ \mathcal{S}_2 \arrow[r, "F"] & \mathcal{S}_1 \end{tikzcd}$$

be a 2-cartesian diagram of stacks in groupoids over $\mathcal{C}$. Assume

(1) *for every $U \in Ob(\mathcal{C})$ and $x \in Ob((\mathcal{S}_1)_U)$ there exists a covering $\{U_i \to U\}$ such that $x|_{U_i}$ is in the essential image of $F : (\mathcal{S}_2)_{U_i} \to (\mathcal{S}_1)_{U_i}$, and*
(2) *G' is faithful,*

then G is faithful.

Proof. We may assume that $\mathcal{T}_2$ is the category $\mathcal{S}_2 \times_{\mathcal{S}_1} \mathcal{T}_1$ described in Categories, Lemma 4.29.3. By Categories, Lemma 4.32.8 the faithfulness of G, G' can be checked on fibre categories. Suppose that y, y' are objects of $\mathcal{T}_1$ over the object U of $\mathcal{C}$. Let $\alpha, \beta : y \to y'$ be morphisms of $(\mathcal{T}_1)_U$ such that $G(\alpha) = G(\beta)$. Our object is to show that $\alpha = \beta$. Considering instead $\gamma = \alpha^{-1} \circ \beta$ we see that $G(\gamma) = \mathrm{id}_{G(y)}$ and we have to show that $\gamma = \mathrm{id}_y$. By assumption we can find a covering $\{U_i \to U\}$ such that $G(y)|_{U_i}$ is in the essential image of $F : (\mathcal{S}_2)_{U_i} \to (\mathcal{S}_1)_{U_i}$. Since it suffices to show that $\gamma|_{U_i} = \mathrm{id}$ for each i, we may therefore assume that we have $f : F(x) \to G(y)$ for some object x of $\mathcal{S}_2$ over U and morphisms f of $(\mathcal{S}_1)_U$. In this case we get a morphism

$$(1, \gamma) : (U, x, y, f) \longrightarrow (U, x, y, f)$$

in the fibre category of $\mathcal{S}_2 \times_{\mathcal{S}_1} \mathcal{T}_1$ over U whose image under G' in $\mathcal{S}_1$ is id_x. As G' is faithful we conclude that $\gamma = \mathrm{id}_y$ and we win. $\square$

Lemma 50.6.10. *Let $\mathcal{C}$ be a site. Let*

$$\begin{tikzcd} \mathcal{T}_2 \arrow[r] \arrow[d] & \mathcal{T}_1 \arrow[d, "G"] \\ \mathcal{S}_2 \arrow[r, "F"] & \mathcal{S}_1 \end{tikzcd}$$

be a 2-cartesian diagram of stacks in groupoids over $\mathcal{C}$. If

(1) *$F : \mathcal{S}_2 \to \mathcal{S}_1$ is fully faithful,*
(2) *for every $U \in Ob(\mathcal{C})$ and $x \in Ob((\mathcal{S}_1)_U)$ there exists a covering $\{U_i \to U\}$ such that $x|_{U_i}$ is in the essential image of $F : (\mathcal{S}_2)_{U_i} \to (\mathcal{S}_1)_{U_i}$, and*
(3) *$\mathcal{T}_2$ is a stack in setoids.*

then $\mathcal{T}_1$ is a stack in setoids.

Proof. We may assume that $\mathcal{T}_2$ is the category $\mathcal{S}_2 \times_{\mathcal{S}_1} \mathcal{T}_1$ described in Categories, Lemma 4.29.3. Pick $U \in Ob(\mathcal{C})$ and $y \in Ob((\mathcal{T}_1)_U)$. We have to show that the sheaf $Aut(y)$ on $\mathcal{C}/U$ is trivial. To to this we may replace U by the members of a covering of U. Hence by assumption (2) we may assume that there exists an object $x \in Ob((\mathcal{S}_2)_U)$ and an isomorphism $f : F(x) \to G(y)$. Then $y' = (U, x, y, f)$ is an object of $\mathcal{T}_2$ over U which is mapped to y under the projection $\mathcal{T}_2 \to \mathcal{T}_1$. Because F is fully faithful by (1) the map $Aut(y') \to Aut(y)$ is surjective, use the explicit description of morphisms in $\mathcal{T}_2$ in Categories, Lemma 4.29.3. Since by (3) the sheaf $Aut(y')$ is trivial we get the the result of the lemma. $\square$

50.7. The inertia stack

Let $p : \mathcal{S} \to \mathcal{C}$ and $p' : \mathcal{S}' \to \mathcal{C}$ be fibred categories over the category $\mathcal{C}$. Let $F : \mathcal{S} \to \mathcal{S}'$ be a 1-morphism of fibred categories over $\mathcal{C}$. Recall that we have defined in Categories, Definition 4.31.2 an *relative inertia fibred category* $\mathcal{I}_{\mathcal{S}/\mathcal{S}'} \to \mathcal{C}$ as the category whose objects are pairs (x, α) where $x \in Ob(\mathcal{S})$ and $\alpha : x \to x$ with $F(\alpha) = \mathrm{id}_{F(x)}$. There is also an absolute version, namely the *inertia* $\mathcal{I}_{\mathcal{S}}$ of $\mathcal{S}$. These inertia categories are actually stacks over $\mathcal{C}$ provided that $\mathcal{S}$ and $\mathcal{S}'$ are stacks.

Lemma 50.7.1. *Let $\mathcal{C}$ be a site. Let $p : \mathcal{S} \to \mathcal{C}$ and $p' : \mathcal{S}' \to \mathcal{C}$ be stacks over the site $\mathcal{C}$. Let $F : \mathcal{S} \to \mathcal{S}'$ be a 1-morphism of stacks over $\mathcal{C}$.*

(1) *The inertia $\mathcal{I}_{\mathcal{S}/\mathcal{S}'}$ and $\mathcal{I}_{\mathcal{S}}$ are stacks over $\mathcal{C}$.*
(2) *If $\mathcal{S}, \mathcal{S}'$ are stacks in groupoids over $\mathcal{S}$, then so are $\mathcal{I}_{\mathcal{S}/\mathcal{S}'}$ and $\mathcal{I}_{\mathcal{S}}$.*
(3) *If $\mathcal{S}, \mathcal{S}'$ are stacks in setoids over $\mathcal{S}$, then so are $\mathcal{I}_{\mathcal{S}/\mathcal{S}'}$ and $\mathcal{I}_{\mathcal{S}}$.*

Proof. The first three assertions follow from Lemmas 50.4.6, 50.5.6, and 50.6.6 and the equivalence in Categories, Lemma 4.31.1 part (1). □

Lemma 50.7.2. *Let $\mathcal{C}$ be a site. If $\mathcal{S}$ is a stack in groupoids, then the canonical* 1*-morphism $\mathcal{I}_\mathcal{S} \to \mathcal{S}$ is an equivalence if and only if $\mathcal{S}$ is a stack in setoids.*

Proof. Follows directly from Categories, Lemma 4.36.7. □

50.8. Stackification of fibred categories

Here is the result.

Lemma 50.8.1. *Let $\mathcal{C}$ be a site. Let $p : \mathcal{S} \to \mathcal{C}$ be a fibred category over $\mathcal{C}$. There exists a stack $p' : \mathcal{S}' \to \mathcal{C}$ and a* 1*-morphism $G : \mathcal{S} \to \mathcal{S}'$ of fibred categories over $\mathcal{C}$ (see Categories, Definition 4.30.8) such that*

1. *for every $U \in Ob(\mathcal{C})$, and any $x, y \in Ob(\mathcal{S}_U)$ the map*
$$Mor(x, y) \longrightarrow Mor(G(x), G(y))$$
induced by G identifies the right hand side with the sheafification of the left hand side, and
2. *for every $U \in Ob(\mathcal{C})$, and any $x' \in Ob(\mathcal{S}'_U)$ there exists a covering $\{U_i \to U\}_{i\in I}$ such that for every $i \in I$ the object $x'|_{U_i}$ is in the essential image of the functor $G : \mathcal{S}_U \to \mathcal{S}'_U$.*

Moreover the stack $\mathcal{S}'$ is determined up to unique 2*-isomorphism by these conditions.*

Proof by naive method. In this proof method we proceed in stages:

First, given x lying over U and any object y of $\mathcal{S}$, we say that two morphisms $a, b : x \to y$ of $\mathcal{S}$ lying over the same arrow of $\mathcal{C}$ are *locally equal* if there exists a covering $\{f_i : U_i \to U\}$ of $\mathcal{C}$ such that the compositions
$$f_i^*x \to x \xrightarrow{a} y, \quad f_i^*x \to x \xrightarrow{b} y$$
are equal. This gives an equivalence relation $\sim$ on arrows of $\mathcal{S}$. If $b \sim b'$ then $a\circ b\circ c \sim a\circ b'\circ c$ (verification omitted). Hence we can quotient out by this equivalence relation to obtain a new category $\mathcal{S}^1$ over $\mathcal{C}$ to gether with a morphism $G^1 : \mathcal{S} \to \mathcal{S}^1$.

One checks that G^1 preserves strongly cartesian morphisms and that $\mathcal{S}^1$ is a fibred category over $\mathcal{C}$. Checks omitted. Thus we reduce to the case where locally equal morphisms are equal.

Next, we add morphisms as follows. Given x lying over U and any object y of lying over V a *locally defined morphism from x to y* is given by

1. a morphism $f : U \to V$,
2. a covering $\{f_i : U_i \to U\}$ of U, and
3. morphisms $a_i : f_i^*x \to Y$ with $p(a_i) = h \circ f_i$

with the property that the compositions
$$(f_i \times f_j)^*x \to f_i^*x \xrightarrow{a_i} y, \quad (f_i \times f_j)^*x \to f_j^*x \xrightarrow{a_j} y$$
are equal. Note that a usual morphism $a : x \to y$ gives a locally defined morphism $(p(a) : U \to V, \{\mathrm{id}_U\}, a)$. We say two locally defined morphisms $(f, \{f_i : U_i \to U\}, a_i)$ and $(g, \{g_j : U_i \to U\}, b_j)$ are *equal* if $f = g$ and the compositions
$$(f_i \times g_j)^*x \to f_i^*x \xrightarrow{a_i} y, \quad (f_i \times g_j)^*x \to g_j^*x \xrightarrow{b_j} y$$

are equal (this is the right condition since we are in the situation where locally equal morphisms are equal). To compose locally defined morphisms $(f, \{f_i : U_i \to U\}, a_i)$ from x to y and $(g, \{g_j : V_j \to V\}, b_j)$ from y to z lying over W, just take $g \circ f : U \to W$, the covering $\{U_i \times_V V_j \to U\}$, and as maps the compositions

$$x|_{U_i \times_V V_j} \xrightarrow{\text{pr}_0^* a_i} y|_{V_j} \xrightarrow{b_j} z$$

We omit the verification that this is a locally defined morphism.

One checks that $\mathcal{S}^2$ with the same objects as $\mathcal{S}$ and with locally defined morphisms as morphisms is a category over $\mathcal{C}$, that there is a functor $G^2 : \mathcal{S} \to \mathcal{S}^2$ over $\mathcal{C}$, that this functor preserves strongly cartesian objects, and that $\mathcal{S}^2$ is a fibred category over $\mathcal{C}$. Checks omitted. This reduces one to the case where the morphism presheaves of $\mathcal{S}$ are all sheaves, by checking that the effect of using locally defined morphisms is to take the sheafification of the (separated) morphisms presheaves.

Finally, in the case where the morphism presheaves are all sheaves we have to add objects in order to make sure descent conditions are effective in the end result. The simplest way to do this is to consider the category $\mathcal{S}'$ whose objects are pairs $(\mathcal{U}, \xi)$ where $\mathcal{U} = \{U_i \to U\}$ is a covering of $\mathcal{C}$ and $\xi = (X_i, \varphi_{ii'})$ is a descent datum relative $\mathcal{U}$. Suppose given two such data $(\mathcal{U}, \xi) = (\{f_i : U_i \to U\}, x_i, \varphi_{ii'})$ and $(\mathcal{V}, \eta) = (\{g_j : V_j \to V\}, y_j, \psi_{jj'})$. We define

$$Mor_{\mathcal{S}'}((\mathcal{U}, \xi), (\mathcal{V}, \eta))$$

as the set of (f, a_{ij}), where $f : U \to V$ and

$$a_{ij} : x_i|_{U_i \times_V V_j} \longrightarrow y_j$$

are morphisms of $\mathcal{S}$ lying over $U_i \times_V V_j \to V_j$. These have to satisfy the following condition: for any $i, i' \in I$ and $j, j' \in J$ set $W = (U_i \times_U U_{i'}) \times_V (V_j \times_V V_{j'})$. Then

$$\begin{tikzcd} x_i|_W \arrow[r, "a_{ij}|_W"'] \arrow[d, "\varphi_{ii'}|_W"'] & y_j|_W \arrow[d, "\psi_{jj'}|_W"] \\ x_{i'}|_W \arrow[r, "a_{i'j'}|_W"] & y_{j'}|_W \end{tikzcd}$$

commutes. At this point you have to verify the following things:

(1) there is a well defined composition on morphisms as above,
(2) this turns $\mathcal{S}'$ into a category over $\mathcal{C}$,
(3) there is a functor $G : \mathcal{S} \to \mathcal{S}'$ over $\mathcal{C}$,
(4) for x, y objects of $\mathcal{S}$ we have $Mor_{\mathcal{S}}(x, y) = Mor_{\mathcal{S}'}(G(x), G(y))$,
(5) any object of $\mathcal{S}'$ locally comes from an object of $\mathcal{S}$, i.e., part (2) of the lemma holds,
(6) G preserves strongly cartesian morphisms,
(7) $\mathcal{S}'$ is a fibred category over $\mathcal{C}$, and
(8) $\mathcal{S}'$ is a stack over $\mathcal{C}$.

This is all not hard but there is a lot of it. Details omitted. □

Less naive proof. Here is a less naive proof. By Categories, Lemma 4.33.4 there exists an equivalence of fibred categories $\mathcal{S} \to \mathcal{S}'$ where $\mathcal{S}'$ is a split fibred category, i.e., one in which the pullback functors compose on the nose. Obviously the lemma for $\mathcal{S}'$ implies the lemma for $\mathcal{S}$. Hence we may think of $\mathcal{S}$ as a presheaf in categories.

Consider the 2-category *Cat* temporarily as a category by forgetting about 2-morphisms. Let us think of a category as a quintuple $(\text{Ob}, \text{Arrows}, s, t, \circ)$ as in Categories, Section 4.2. Consider the forgetful functor

$$forget : Cat \to Sets, \quad (\text{Ob}, \text{Arrows}, s, t, \circ) \mapsto \text{Ob} \coprod \text{Arrows}.$$

Then $forget$ is faithful, *Cat* has limits and $forget$ commutes with them, *Cat* has directed colimits and $forget$ commutes with them, and $forget$ reflects isomorphisms. Hence, according to the first part of Sites, Section 9.38 we can sheafify presheaves with values in *Cat*, and the result commutes with $forget$. Applying this to $\mathcal{S}$ we obtain a sheafification $\mathcal{S}^\#$ which has a sheaf of objects and a sheaf of morphisms both of which are the sheafifications of the corresponding presheaves for $\mathcal{S}$. In this case it is quite easy to see that the map $\mathcal{S} \to \mathcal{S}^\#$ has the properties (1) and (2) of the lemma.

However, the category $\mathcal{S}^\#$ may not yet be a stack since, allthough the presheaf of objects is a sheaf, the descent condition may not yet be satisfied. To remedy this we have to add more objects. But the argument above does reduce us to the case where $\mathcal{S} = \mathcal{S}_F$ for some sheaf(!) $F : \mathcal{C}^{opp} \to Cat$ of categories. In this case consider the functor $F' : \mathcal{C}^{opp} \to Cat$ defined by

1. The set $Ob(F'(U))$ is the set of pairs $(\mathcal{U}, \xi)$ where $\mathcal{U} = \{U_i \to U\}$ is a covering of U and $\xi = (x_i, \varphi_{ii'})$ is a descent datum relative to $\mathcal{U}$.
2. A morphism in $F'(U)$ from $(\mathcal{U}, \xi)$ to $(\mathcal{V}, \eta)$ is an element of
$$colim\ Mor_{DD(\mathcal{W})}(a^*\xi, b^*\eta)$$
where the colimit is over all common refinements $a : \mathcal{W} \to \mathcal{U}$, $b : \mathcal{W} \to \mathcal{V}$. This colimit is filtered (verification omitted). Hence composition of morphisms in $F(U)$ is defined by finding a common refinement and composing in $DD(\mathcal{W})$.
3. Given $h : V \to U$ and an object $(\mathcal{U}, \xi)$ of $F'(U)$ we set $F'(h)(\mathcal{U}, \xi)$ equal to $(V \times_U \mathcal{U}, \text{pr}_1^*\xi)$. More precisely, if $\mathcal{U} = \{U_i \to U\}$ and $\xi = (x_i, \varphi_{ii'})$, then $V \times_U \mathcal{U} = \{V \times_U U_i \to V\}$ which comes with a canonical morphism $\text{pr}_1 : V \times_U \mathcal{U} \to \mathcal{U}$ and $\text{pr}_1^*\xi$ is the pullback of ξ with respect to this morphism (see Definition 50.3.4).
4. Given $h : V \to U$, objects $(\mathcal{U}, \xi)$ and $(\mathcal{V}, \eta)$ and a morphism between them, represented by $a : \mathcal{W} \to \mathcal{U}$, $b : \mathcal{W} \to \mathcal{V}$, and $\alpha : a^*\xi \to b^*\eta$, then $F'(h)(\alpha)$ is represented by $a' : V \times_U \mathcal{W} \to V \times_U \mathcal{U}$, $b' : V \times_U \mathcal{W} \to V \times_U \mathcal{V}$, and the pullback α' of the morphism α via the map $V \times_U \mathcal{W} \to \mathcal{W}$. This works since pullbacks in $\mathcal{S}_F$ commute on the nose.

There is a map $F \to F'$ given by associating to an object x of $F(U)$ the object $(\{U \to U\}, (x, triv))$ of $F'(U)$. At this point you have to check that the corresponding functor $\mathcal{S}_F \to \mathcal{S}_{F'}$ has properties (1) and (2) of the lemma, and finally that $\mathcal{S}_{F'}$ is a stack. Details omitted. □

Lemma 50.8.2. *Let $\mathcal{C}$ be a site. Let $p : \mathcal{S} \to \mathcal{C}$ be a fibred category over $\mathcal{C}$. Let $p' : \mathcal{S}' \to \mathcal{C}$ and $G : \mathcal{S} \to \mathcal{S}'$ the the stack and 1-morphism constructed in Lemma 50.8.1. This construction has the following universal property: Given a stack $q : \mathcal{X} \to \mathcal{C}$ and a 1-morphism $F : \mathcal{S} \to \mathcal{S}'$ of fibred categories over $\mathcal{C}$ there exists a 1-morphism $H : \mathcal{S}' \to \mathcal{X}$ such that the diagram*

$$\begin{tikzcd} \mathcal{S} \arrow[rr, "F"] \arrow[dr, "G"'] & & \mathcal{X} \\ & \mathcal{S}' \arrow[ur, "H"'] & \end{tikzcd}$$

is 2*-commutative.*

Proof. Omitted. Hint: Suppose that $x' \in Ob(\mathcal{S}'_U)$. By the result of Lemma 50.8.1 there exists a covering $\{U_i \to U\}_{i \in I}$ such that $x'|_{U_i} = G(x_i)$ for some $x_i \in Ob(\mathcal{S}_{U_i})$. Moreover, there exist coverings $\{U_{ijk} \to U_i \times_U U_j\}$ and isomorphisms $\alpha_{ijk} : x_i|_{U_{ijk}} \to x_j|_{U_{ijk}}$ with $G(\alpha_{ijk}) = \mathrm{id}_{x'|_{U_{ijk}}}$. Set $y_i = F(x_i)$. Then you can check that

$$F(\alpha_{ijk}) : y_i|_{U_{ijk}} \to y_j|_{U_{ijk}}$$

agree on overlaps and therefore (as $\mathcal{X}$ is a stack) define a morphism $\beta_{ij} : y_i|_{U_i \times_U U_j} \to y_j|_{U_i \times_U U_j}$. Next, you check that the β_{ij} define a descent datum. Since $\mathcal{X}$ is a stack these descent data are effective and we find an object y of $\mathcal{X}_U$ agreeing with $G(x_i)$ over U_i. The hint is to set $H(x') = y$. $\square$

Lemma 50.8.3. *Notation and assumptions as in Lemma 50.8.2. There is a canonical equivalence of categories*

$$Mor_{Fib/\mathcal{C}}(\mathcal{S}, \mathcal{X}) = Mor_{Stacks/\mathcal{C}}(\mathcal{S}', \mathcal{X})$$

given by the constructions in the proof of the aforementioned lemma.

Proof. Omitted. $\square$

Lemma 50.8.4. *Let $\mathcal{C}$ be a site. Let $f : \mathcal{X} \to \mathcal{Y}$ and $g : \mathcal{Z} \to \mathcal{Y}$ be morphisms of fibred categories over $\mathcal{C}$. In this case the stackification of the* 2*-fibre product is the* 2*-fibre product of the stackifications.*

Proof. Let us denote $\mathcal{X}', \mathcal{Y}', \mathcal{Z}'$ the stackifications and $\mathcal{W}$ the stackification of $\mathcal{X} \times_{\mathcal{Y}} \mathcal{Z}$. By construction of 2-fibre products there is a canonical 1-morphism $\mathcal{X} \times_{\mathcal{Y}} \mathcal{Z} \to \mathcal{X}' \times_{\mathcal{Y}'} \mathcal{Z}'$. As the second 2-fibre product is a stack (see Lemma 50.4.6) this 1-morphism induces a 1-morphism $h : \mathcal{W} \to \mathcal{X}' \times_{\mathcal{Y}'} \mathcal{Z}'$ by the universal property of stackification, see Lemma 50.8.2. Now h is a morphism of stacks, and we may check that it is an equivalence using Lemmas 50.4.7 and 50.4.8.

Thus we first prove that h induces isomorphisms of Mor-sheaves. Let ξ, ξ' be objects of $\mathcal{W}$ over $U \in Ob(\mathcal{C})$. We want to show that

$$h : Mor(\xi, \xi') \longrightarrow Mor(h(\xi), h(\xi'))$$

is an isomorphism. To do this we may work locally on U (see Sites, Section 9.22). Hence by construction of $\mathcal{W}$ (see Lemma 50.8.1) we may assume that ξ, ξ' actually come from objects (x, y, α) and (x', y', α') of $\mathcal{X} \times_{\mathcal{Y}} \mathcal{Z}$ over U. By the same lemma once more we see that in this case $Mor(\xi, \xi')$ is the sheafification of

$$V/U \longmapsto Mor_{\mathcal{X}_V}(x|_V, x'|_V) \times_{Mor_{\mathcal{Z}_V}(f(x)|_V, f(x')|_V)} Mor_{\mathcal{Y}_V}(y|_V, y'|_V)$$

and that $Mor(h(\xi), h(\xi'))$ is equal to the fibre product

$$Mor(i(x), i(x')) \times_{Mor(k(f(x)), k(f(x')))} Mor(j(x), j(x'))$$

where $i : \mathcal{X} \to \mathcal{X}'$, $j : \mathcal{Y} \to \mathcal{Y}'$, and $k : \mathcal{Z} \to \mathcal{Z}'$ are the canonical functors. Thus the first displayed map of this paragraph is an isomorphism as sheafification is exact (and hence the sheafification of a fibre product of presheaves is the fibre product of the sheafifications).

Finally, we have to check that any object of $\mathcal{X}' \times_{\mathcal{Y}'} \mathcal{Z}'$ over U is locally on U in the essential image of h. Write such an object as a triple (x', y', α). Then x' locally comes from an object of $\mathcal{X}$, y' locally comes from an object of $\mathcal{Y}$, and having made suitable replacements for x', y' the morphism α of $\mathcal{Z}'_U$ locally comes from a morphism of $\mathcal{Z}$. In other words, we have shown that any object of $\mathcal{X}' \times_{\mathcal{Y}'} \mathcal{Z}'$ over U is locally on U in the essential image of $\mathcal{X} \times_{\mathcal{Y}} \mathcal{Z} \to \mathcal{X}' \times_{\mathcal{Y}'} \mathcal{Z}'$, hence a fortiori it is locally in the essential image of h. $\square$

Lemma 50.8.5. *Let $\mathcal{C}$ be a site. Let $\mathcal{X}$ be a fibred category over $\mathcal{C}$. The stackification of the inertia fibred category $\mathcal{I}_{\mathcal{X}}$ is intertia of the stackification of $\mathcal{X}$.*

Proof. This follows from the fact that stackification is compatible with 2-fibre products by Lemma 50.8.4 and the fact that there is a formula for the inertia in terms of 2-fibre products of categories over $\mathcal{C}$, see Categories, Lemma 4.31.1. $\square$

50.9. Stackification of categories fibred in groupoids

Here is the result.

Lemma 50.9.1. *Let $\mathcal{C}$ be a site. Let $p : \mathcal{S} \to \mathcal{C}$ be a category fibred in groupoids over $\mathcal{C}$. There exists a stack in groupoids $p' : \mathcal{S}' \to \mathcal{C}$ and a 1-morphism $G : \mathcal{S} \to \mathcal{S}'$ of categories fibred in groupoids over $\mathcal{C}$ (see Categories, Definition 4.32.6) such that*

(1) *for every $U \in Ob(\mathcal{C})$, and any $x, y \in Ob(\mathcal{S}_U)$ the map*
$$Mor(x, y) \longrightarrow Mor(G(x), G(y))$$
induced by G identifies the right hand side with the sheafification of the left hand side, and

(2) *for every $U \in Ob(\mathcal{C})$, and any $x' \in Ob(\mathcal{S}'_U)$ there exists a covering $\{U_i \to U\}_{i\in I}$ such that for every $i \in I$ the object $x'|_{U_i}$ is in the essential image of the functor $G : \mathcal{S}_{U_i} \to \mathcal{S}'_{U_i}$.*

Moreover the stack in groupoids $\mathcal{S}'$ is determined up to unique 2-isomorphism by these conditions.

Proof. Apply Lemma 50.8.1. The result will be a stack in groupoids by applying Lemma 50.5.2. $\square$

Lemma 50.9.2. *Let $\mathcal{C}$ be a site. Let $p : \mathcal{S} \to \mathcal{C}$ be a category fibred in groupoids over $\mathcal{C}$. Let $p' : \mathcal{S}' \to \mathcal{C}$ and $G : \mathcal{S} \to \mathcal{S}'$ the the stack in groupoids and 1-morphism constructed in Lemma 50.9.1. This construction has the following universal property: Given a stack in groupoids $q : \mathcal{X} \to \mathcal{C}$ and a 1-morphism $F : \mathcal{S} \to \mathcal{X}$ of categories over $\mathcal{C}$ there exists a 1-morphism $H : \mathcal{S}' \to \mathcal{X}$ such that the diagram*

$$\begin{tikzcd} \mathcal{S} \arrow[rr, "F"] \arrow[dr, "G"'] & & \mathcal{X} \\ & \mathcal{S}' \arrow[ur, "H"'] & \end{tikzcd}$$

is 2-commutative.

Proof. This is a special case of Lemma 50.8.2. $\square$

Lemma 50.9.3. *Let $\mathcal{C}$ be a site. Let $f : \mathcal{X} \to \mathcal{Y}$ and $g : \mathcal{Y} \to \mathcal{Z}$ be morphisms categories fibred in groupoids over $\mathcal{C}$. In this case the stackification of the 2-fibre product is the 2-fibre product of the stackifications.*

Proof. This is a special case of Lemma 50.8.4. $\square$

50.10. Inherited topologies

It turns out that a fibred category over a site inherits a canonical topology from the underlying site.

Lemma 50.10.1. *Let $\mathcal{C}$ be a site. Let $p : \mathcal{S} \to \mathcal{C}$ be a fibred category. Let $Cov(\mathcal{S})$ be the set of families $\{x_i \to x\}_{i \in I}$ of morphisms in $\mathcal{S}$ with fixed target such that (a) each $x_i \to x$ is strongly cartesian, and (b) $\{p(x_i) \to p(x)\}_{i\in I}$ is a covering of $\mathcal{C}$. Then $(\mathcal{S}, Cov(\mathcal{S}))$ is a site.*

Proof. We have to check the three conditions of Sites, Definition 9.6.2.

(1) If $x \to y$ is an isomorphism of $\mathcal{S}$, then it is strongly cartesian by Categories, Lemma 4.30.2 and $p(x) \to p(y)$ is an isomorphism of $\mathcal{C}$. Thus $\{p(x) \to p(y)\}$ is a covering of $\mathcal{C}$ whence $\{x \to y\} \in \text{Cov}(\mathcal{S})$.
(2) If $\{x_i \to x\}_{i\in I} \in \text{Cov}(\mathcal{S})$ and for each i we have $\{y_{ij} \to x_i\}_{j \in J_i} \in \text{Cov}(\mathcal{S})$, then each composition $p(y_{ij}) \to p(x)$ is strongly cartesian by Categories, Lemma 4.30.2 and $\{p(y_{ij}) \to p(x)\}_{i\in I, j\in J_i} \in \text{Cov}(\mathcal{C})$. Hence also $\{y_{ij} \to x\}_{i\in I, j \in J_i} \in \text{Cov}(\mathcal{S})$.
(3) Suppose $\{x_i \to x\}_{i\in I} \in \text{Cov}(\mathcal{S})$ and $y \to x$ is a morphism of $\mathcal{S}$. As $\{p(x_i) \to p(x)\}$ is a covering of $\mathcal{C}$ we see that $p(x_i) \times_{p(x)} p(y)$ exists. Hence Categories, Lemma 4.30.11 implies that $x_i \times_x y$ exists, that $p(x_i \times_x y) = p(x_i) \times_{p(x)} p(y)$, and that $x_i \times_x y \to y$ is strongly cartesian. Since also $\{p(x_i) \times_{p(x)} p(y) \to p(y)\}_{i \in I} \in \text{Cov}(\mathcal{C})$ we conclude that $\{x_i \times_x y \to y\}_{i\in I} \in \text{Cov}(\mathcal{S})$

This finishes the proof. □

Note that if $p : \mathcal{S} \to \mathcal{C}$ is fibred in groupoids, then the coverings of the site $\mathcal{S}$ in Lemma 50.10.1 are characterized by

$$\{x_i \to x\} \in \text{Cov}(\mathcal{S}) \Leftrightarrow \{p(x_i) \to p(x)\} \in \text{Cov}(\mathcal{C})$$

because every morphism of $\mathcal{S}$ is strongly cartesian.

Definition 50.10.2. Let $\mathcal{C}$ be a site. Let $p : \mathcal{S} \to \mathcal{C}$ be a fibred category. We say $(\mathcal{S}, \text{Cov}(\mathcal{S}))$ as in Lemma 50.10.1 is the *structure of site on $\mathcal{S}$ inherited from $\mathcal{C}$*. We sometimes indicate this by saying that *$\mathcal{S}$ is endowed with the topology inherited from $\mathcal{C}$*.

In particular we obtain a topos of sheaves $Sh(\mathcal{S})$ in this situation. It turns out that this topos is functorial with respect to 1-morphisms of fibred categories.

Lemma 50.10.3. *Let $\mathcal{C}$ be a site. Let $F : \mathcal{X} \to \mathcal{Y}$ be a 1-morphism of fibred categories over $\mathcal{C}$. Then F is a continuous and cocontinuous functor between the structure of sites inherited from $\mathcal{C}$. Hence F induces a morphism of topoi $f : Sh(\mathcal{X}) \to Sh(\mathcal{Y})$ with $f_* = {}_sF = {}_pF$ and $f^{-1} = F^s = F^p$. In particular $f^{-1}(\mathcal{G})(x) = \mathcal{G}(F(x))$ for a sheaf $\mathcal{G}$ on $\mathcal{Y}$ and object x of $\mathcal{X}$.*

Proof. We first prove that F is continuous. Let $\{x_i \to x\}_{i\in I}$ be a covering of $\mathcal{X}$. By Categories, Definition 4.30.8 the functor F transforms strongly cartesian morphisms into strongly cartesian morphisms, hence $\{F(x_i) \to F(x)\}_{i\in I}$ is a covering of $\mathcal{Y}$. This proves part (1) of Sites, Definition 9.13.1. Moreover, let $x' \to x$ be a morphism of $\mathcal{X}$. By Categories, Lemma 4.30.11 the fibre product $x_i \times_x x'$ exists and $x_i \times_x x' \to x'$ is strongly cartesian. Hence $F(x_i \times_x x') \to F(x')$ is strongly cartesian. By Categories, Lemma 4.30.11 applied to $\mathcal{Y}$ this means that $F(x_i \times_x x') = F(x_i) \times_{F(x)} F(x')$. This proves part (2) of Sites, Definition 9.13.1 and we conclude that F is continuous.

Next we prove that F is cocontinuous. Let $x \in Ob(\mathcal{X})$ and let $\{y_i \to F(x)\}_{i \in I}$ be a covering in $\mathcal{Y}$. Denote $\{U_i \to U\}_{i \in I}$ the corresponding covering of $\mathcal{C}$. For each i choose a strongly cartesian morphism $x_i \to x$ in $\mathcal{X}$ lying over $U_i \to U$. Then $F(x_i) \to F(x)$ and $y_i \to F(x)$ are both a strongly cartesian morphisms in $\mathcal{Y}$ lying over $U_i \to U$. Hence there exists a unique isomorphism $F(x_i) \to y_i$ in $\mathcal{Y}_{U_i}$ compatible with the maps to $F(x)$. Thus $\{x_i \to x\}_{i \in I}$ is a covering of $\mathcal{X}$ such that $\{F(x_i) \to F(x)\}_{i \in I}$ is isomorphic to $\{y_i \to F(x)\}_{i \in I}$. Hence F is cocontinuous, see Sites, Definition 9.18.1.

The final assertion follows from the first two, see Sites, Lemmas 9.19.1, 9.18.2, and 9.19.5. □

Lemma 50.10.4. *Let $\mathcal{C}$ be a site. Let $p : \mathcal{X} \to \mathcal{C}$ and $q : \mathcal{Y} \to \mathcal{C}$ be stacks in groupoids. Let $F : \mathcal{X} \to \mathcal{Y}$ be a 1-morphism of categories over $\mathcal{C}$. If F turns $\mathcal{X}$ into a category fibred in groupoids over $\mathcal{Y}$, then $\mathcal{X}$ is a stack in groupoids over $\mathcal{Y}$ (with topology inherited from $\mathcal{C}$).*

Proof. Let us prove descent for objects. Let $\{y_i \to y\}$ be a covering of $\mathcal{Y}$. Let (x_i, φ_{ij}) be a descent datum in $\mathcal{X}$ with respect to this covering. Then (x_i, φ_{ij}) is also a descent datum with respect to the covering $\{q(y_i) \to q(y)\}$ of $\mathcal{C}$. As $\mathcal{X}$ is a stack in groupoids we obtain an object x over $q(y)$ and isomorphisms $\psi_i : x|_{q(y_i)} \to x_i$ over $q(y_i)$ compatible with the φ_{ij}, i.e., such that

$$\varphi_{ij} = \psi_j|_{q(y_i)\times_{q(y)}q(y_j)} \circ \psi_i^{-1}|_{q(y_i)\times_{q(y)}q(y_j)}.$$

Consider the sheaf $I = Isom_{\mathcal{Y}}(F(x), y)$ on $\mathcal{C}/p(x)$. Note that $s_i = F(\psi_i) \in I(q(x_i))$ because $F(x_i) = y_i$. Because $F(\varphi_{ij}) = \text{id}$ (as we started with a descent datum over $\{y_i \to y\}$) the displayed formula shows that $s_i|_{q(y_i)\times_{q(y)}q(y_j)} = s_j|_{q(y_i)\times_{q(y)}q(y_j)}$. Hence the local sections s_i glue to $s : F(x) \to y$. As F is fibred in groupoids we see that x is isomorphic to an object x' with $F(x') = y$. We omit the verification that x' in the fibre category of $\mathcal{X}$ over y is a solution to the problem of descent posed by the descent datum (x_i, φ_{ij}). We also omit the proof of the sheaf property of the $Isom$-presheaves of $\mathcal{X}/\mathcal{Y}$. □

50.11. Gerbes

Gerbes are a special kind of stacks in groupoids.

Definition 50.11.1. A *gerbe* over a site $\mathcal{C}$ is a category $p : \mathcal{S} \to \mathcal{C}$ over $\mathcal{C}$ such that

1. $p : \mathcal{S} \to \mathcal{C}$ is a stack in groupoids over $\mathcal{C}$ (see Definition 50.5.1),
2. for $U \in Ob(\mathcal{C})$ there exists a covering $\{U_i \to U\}$ in $\mathcal{C}$ such that $\mathcal{S}_{U_i}$ is nonempty, and
3. for $U \in Ob(\mathcal{C})$ and $x, y \in Ob(\mathcal{S}_U)$ there exists a covering $\{U_i \to U\}$ in $\mathcal{C}$ such that $x|_{U_i} \cong y|_{U_i}$ in $\mathcal{S}_{U_i}$.

In other words, a gerbe is a stack in groupoids such that any two objects are locally isomorphic and such that objects exist locally.

Lemma 50.11.2. *Let $\mathcal{C}$ be a site. Let $\mathcal{S}_1$, $\mathcal{S}_2$ be categories over $\mathcal{C}$. Suppose that $\mathcal{S}_1$ and $\mathcal{S}_2$ are equivalent as categories over $\mathcal{C}$. Then $\mathcal{S}_1$ is a gerbe over $\mathcal{C}$ if and only if $\mathcal{S}_2$ is a gerbe over $\mathcal{C}$.*

Proof. Assume $\mathcal{S}_1$ is a gerbe over $\mathcal{C}$. By Lemma 50.5.4 we see $\mathcal{S}_2$ is a stack in groupoids over $\mathcal{C}$. Let $F : \mathcal{S}_1 \to \mathcal{S}_2$, $G : \mathcal{S}_2 \to \mathcal{S}_1$ be equivalences of categories over $\mathcal{C}$. Given $U \in Ob(\mathcal{C})$ we see that there exists a covering $\{U_i \to U\}$ such that $(\mathcal{S}_1)_{U_i}$ is nonempty. Applying F we see that $(\mathcal{S}_2)_{U_i}$ is nonempty. Given $U \in Ob(\mathcal{C})$ and $x, y \in Ob((\mathcal{S}_2)_U)$ there exists a covering $\{U_i \to U\}$ in $\mathcal{C}$ such that $G(x)|_{U_i} \cong G(y)|_{U_i}$ in $(\mathcal{S}_1)_{U_i}$. By Categories, Lemma 4.32.8 this implies $x|_{U_i} \cong y|_{U_i}$ in $(\mathcal{S}_2)_{U_i}$. $\square$

We want to generalize the definition of gerbes a bit. Namely, let $F : \mathcal{X} \to \mathcal{Y}$ be a 1-morphism of stacks in groupoids over a site $\mathcal{C}$. We want to say what it means for $\mathcal{X}$ to be a gerbe over $\mathcal{Y}$. By Section 50.10 the category $\mathcal{Y}$ inherits the structure of a site from $\mathcal{C}$. A naive guess is: Just require that $\mathcal{X} \to \mathcal{Y}$ *is* a gerbe in the sense above. Except the notion so obtained is not invariants under replacing $\mathcal{X}$ by an equivalent stack in groupoids over $\mathcal{C}$; this is even the case for the property of being fibred in groupoids over $\mathcal{Y}$. However, it turns out that we can replace $\mathcal{X}$ by an equivalent stack in groupoids over $\mathcal{Y}$ which is fibred in groupoids over $\mathcal{Y}$, and then the property of being a gerbe over $\mathcal{Y}$ is independent of this choice. Here is the precise formulation.

Lemma 50.11.3. *Let $\mathcal{C}$ be a site. Let $p : \mathcal{X} \to \mathcal{C}$ and $q : \mathcal{Y} \to \mathcal{C}$ be stacks in groupoids. Let $F : \mathcal{X} \to \mathcal{Y}$ be a 1-morphism of categories over $\mathcal{C}$. The following are equivalent*

(1) *For some (equivalently any) factorization $F = F' \circ a$ where $a : \mathcal{X} \to \mathcal{X}'$ is an equivalence of categories over $\mathcal{C}$ and F' is fibred in groupoids, the map $F' : \mathcal{X}' \to \mathcal{Y}$ is a gerbe (with the topology on $\mathcal{Y}$ inherited from $\mathcal{C}$).*
(2) *The following two conditions are satisfied*
    (a) *for $y \in Ob(\mathcal{Y})$ lying over $U \in Ob(\mathcal{C})$ there exists a covering $\{U_i \to U\}$ in $\mathcal{C}$ and objects x_i of $\mathcal{X}$ over U_i such that $F(x_i) \cong y|_{U_i}$ in $\mathcal{Y}_{U_i}$, and*
    (b) *for $U \in Ob(\mathcal{C})$, $x, x' \in Ob(\mathcal{X}_U)$, and $b : F(x) \to F(x')$ in $\mathcal{Y}_U$ there exists a covering $\{U_i \to U\}$ in $\mathcal{C}$ and morphisms $a_i : x|_{U_i} \to x'|_{U_i}$ in $\mathcal{X}_{U_i}$ with $F(a_i) = b|_{U_i}$.*

Proof. By Categories, Lemma 4.32.14 there exists a factorization $F = F' \circ a$ where $a : \mathcal{X} \to \mathcal{X}'$ is an equivalence of categories over $\mathcal{C}$ and F' is fibred in groupoids. By Categories, Lemma 4.32.15 given any two such factorizations $F = F' \circ a = F'' \circ b$ we have that $\mathcal{X}'$ is equivalent to $\mathcal{X}''$ as categories over $\mathcal{Y}$. Hence Lemma 50.11.2 guarantees that the condition (1) is independent of the choice of the factorization. Moreover, this means that we may assume $\mathcal{X}' = \mathcal{X} \times_{F,\mathcal{Y},\text{id}} \mathcal{Y}$ as in the proof of Categories, Lemma 4.32.14
