Let S be a graded ring. Let M be a graded S-module. We saw in the previous section how to construct a quasi-coherent sheaf of modules $\widetilde{M}$ on $\text{Proj}(S)$ and a map

$$M_0 \longrightarrow \Gamma(\text{Proj}(S), \widetilde{M})$$

of the degree 0 part of M to the global sections of $\widetilde{M}$. The degree 0 part of the nth twist $M(n)$ of the graded module M (see Algebra, Section 7.52) is equal to M_n. Hence we can get maps

$$M_n \longrightarrow \Gamma(\text{Proj}(S), \widetilde{M(n)}).$$

We would like to be able to perform this operation for any quasi-coherent sheaf $\mathcal{F}$ on Proj(S). We will do this by tensoring with the nth twist of the structure sheaf, see Definition 22.10.1. In order to relate the two notions we will use the following lemma.

Lemma 22.9.1. *Let S be a graded ring. Let $(X, \mathcal{O}_X) = (Proj(S), \mathcal{O}_{Proj(S)})$ be the scheme of Lemma 22.8.7. Let $f \in S_+$ be homogeneous. Let $x \in X$ be a point corresponding to the homogeneous prime $\mathfrak{p} \subset S$. Let M, N be graded S-modules. There is a canonical map of $\mathcal{O}_{Proj(S)}$-modules*

$$\widetilde{M} \otimes_{\mathcal{O}_X} \widetilde{N} \longrightarrow \widetilde{M \otimes_S N}$$

which induces the canonical map $M_{(f)} \otimes_{S_{(f)}} N_{(f)} \to (M \otimes_S N)_{(f)}$ on sections over $D_+(f)$ and the canonical map $M_{(\mathfrak{p})} \otimes_{S_{(\mathfrak{p})}} N_{(\mathfrak{p})} \to (M \otimes_S N)_{(\mathfrak{p})}$ on stalks at x. Moreover, the following diagram

$$\begin{tikzcd}
M_0 \otimes_{S_0} N_0 \arrow[r] \arrow[d] & (M \otimes_S N)_0 \arrow[d] \\
\Gamma(X, \widetilde{M} \otimes_{\mathcal{O}_X} \widetilde{N}) \arrow[r] & \Gamma(X, \widetilde{M \otimes_R N})
\end{tikzcd}$$

is commutative.

Proof. To construct a morphism as displayed is the same as constructing a $\mathcal{O}_X$-bilinear map

$$\widetilde{M} \times \widetilde{N} \longrightarrow \widetilde{M \otimes_R N}$$

see Modules, Section 15.15. It suffices to define this on sections over the opens $D_+(f)$ compatible with restriction mappings. On $D_+(f)$ we use the $S_{(f)}$-bilinear map $M_{(f)} \times N_{(f)} \to (M \otimes_S N)_{(f)}$, $(x/f^n, y/f^m) \mapsto (x \otimes y)/f^{n+m}$. Details omitted. □

Remark 22.9.2. In general the map constructed in Lemma 22.9.1 above is not an isomorphism. Here is an example. Let k be a field. Let $S = k[x, y, z]$ with k in degree 0 and $\deg(x) = 1$, $\deg(y) = 2$, $\deg(z) = 3$. Let $\mathfrak{p} = (x, y) \in \text{Proj}(S)$. Let $M = S(1)$ and $N = S(2)$, see Algebra, Section 7.52 for notation. Then $M \otimes_S N = S(3)$. Note that

$$\begin{aligned}
S_z &= k[x, y, z, 1/z] \\
S_{(z)} &= k[x^3/z, xy/z, y^3/z^2] \cong k[u, v, w]/(uw - v^3) \\
M_{(z)} &= S_{(z)} \cdot x + S_{(z)} \cdot y^2/z \subset S_z \\
N_{(z)} &= S_{(z)} \cdot y + S_{(z)} \cdot x^2 \subset S_z \\
S(3)_{(z)} &= S_{(z)} \cdot z \subset S_z
\end{aligned}$$

Consider the maximal ideal $\mathfrak{m} = (u, v, w) \subset S_{(z)}$. It is not hard to see that both $M_{(z)}/\mathfrak{m}M_{(z)}$ and $N_{(z)}/\mathfrak{m}N_{(z)}$ have dimension 2 over $\kappa(\mathfrak{m})$. But $S(3)_{(z)}/\mathfrak{m}S(3)_{(z)}$ has dimension 1. Thus the map $M_{(z)} \otimes N_{(z)} \to S(3)_{(z)}$ is not an isomorphism.

22.10. Invertible sheaves on Proj

Recall from Algebra, Section 7.52 the construction of the twisted module $M(n)$ associated to a graded module over a graded ring.

Definition 22.10.1. Let S be a graded ring. Let $X = \text{Proj}(S)$.

(1) We define $\mathcal{O}_X(n) = \widetilde{S(n)}$. This is called the nth *twist of the structure sheaf of Proj(S)*.
(2) For any sheaf of $\mathcal{O}_X$-modules $\mathcal{F}$ we set $\mathcal{F}(n) = \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{O}_X(n)$.

We are going to use Lemma 22.9.1 to construct some canonical maps. Since $S(n) \otimes_S S(m) = S(n+m)$ we see that there are canonical maps

$$\mathcal{O}_X(n) \otimes_{\mathcal{O}_X} \mathcal{O}_X(m) \longrightarrow \mathcal{O}_X(n+m). \tag{22.10.1.1}$$

These maps are not isomorphisms in general, see the example in Remark 22.9.2. The same example shows that $\mathcal{O}_X(n)$ is *not* an invertible sheaf on X in general. Tensoring with an arbitrary $\mathcal{O}_X$-module $\mathcal{F}$ we get maps

$$\mathcal{O}_X(n) \otimes_{\mathcal{O}_X} \mathcal{F}(m) \longrightarrow \mathcal{F}(n+m). \tag{22.10.1.2}$$

The maps (22.10.1.1) on global sections give a map of graded rings

$$S \longrightarrow \bigoplus\nolimits_{n \geq 0} \Gamma(X, \mathcal{O}_X(n)). \tag{22.10.1.3}$$

And for an arbitrary $\mathcal{O}_X$-module $\mathcal{F}$ the maps (22.10.1.2) give a graded module structure

$$\bigoplus\nolimits_{n \geq 0} \Gamma(X, \mathcal{O}_X(n)) \times \bigoplus\nolimits_{m \in \mathbf{Z}} \Gamma(X, \mathcal{F}(m)) \longrightarrow \bigoplus\nolimits_{m \in \mathbf{Z}} \Gamma(X, \mathcal{F}(m)) \tag{22.10.1.4}$$

and via (22.10.1.3) also a S-module structure. More generally, given any graded S-module M we have $M(n) = M \otimes_S S(n)$. Hence we get maps

$$\widetilde{M}(n) = \widetilde{M} \otimes_{\mathcal{O}_X} \mathcal{O}_X(n) \longrightarrow \widetilde{M(n)}. \tag{22.10.1.5}$$

On global sections we get a map of graded S-modules

$$M \longrightarrow \bigoplus\nolimits_{n \in \mathbf{Z}} \Gamma(X, \widetilde{M(n)}). \tag{22.10.1.6}$$

Here is an important fact which follows basically immediately from the definitions.

Lemma 22.10.2. *Let S be a graded ring. Set $X = Proj(S)$. Let $f \in S$ be homogeneous of degree $d > 0$. The sheaves $\mathcal{O}_X(nd)|_{D_+(f)}$ are invertible, and in fact trivial for all $n \in \mathbf{Z}$ (see Modules, Definition 15.21.1). The maps (22.10.1.1) restricted to $D_+(f)$*

$$\mathcal{O}_X(nd)|_{D_+(f)} \otimes_{\mathcal{O}_{D_+(f)}} \mathcal{O}_X(m)|_{D_+(f)} \longrightarrow \mathcal{O}_X(nd+m)|_{D_+(f)}$$

and the maps (22.10.1.5) restricted to $D_+(f)$

$$\widetilde{M}(nd)|_{D_+(f)} = \widetilde{M}|_{D_+(f)} \otimes_{\mathcal{O}_{D_+(f)}} \mathcal{O}_X(nd)|_{D_+(f)} \longrightarrow \widetilde{M(nd)}|_{D_+(f)}$$

are isomorphisms for all $n, m \in \mathbf{Z}$.

Proof. The (not graded) S-module maps $S \to S(n)$, and $M \to M(n)$, given by $x \mapsto f^{n/d}x$ become isomorphisms after inverting f. The first shows that $S_{(f)} \cong S(n)_{(f)}$ which gives an isomorphism $\mathcal{O}_{D_+(f)} \cong \mathcal{O}_X(n)|_{D_+(f)}$. The second shows that the map $S(n)_{(f)} \otimes_{S_{(f)}} M_{(f)} \to M(n)_{(f)}$ is an isomorphism. $\square$

Lemma 22.10.3. *Let S be a graded ring generated as an S_0-algebra by the elements of S_1. Set $X = Proj(S)$. In this case the sheaves $\mathcal{O}_X(n)$ are all invertible, and all the maps (22.10.1.1) and (22.10.1.5) are isomorphisms. In particular, these maps induce isomorphisms*

$$\mathcal{O}_X(n) \cong \mathcal{O}_X(1)^{\otimes n} \quad \textit{and} \quad \widetilde{M(n)} = \widetilde{M} \otimes_{\mathcal{O}_X} \mathcal{O}_X(1)^{\otimes n}.$$

In fact the lemma holds more generally if X is covered by the standard opens $D_+(f)$ with $f \in S_1$.

Proof. Under the assumptions of the lemma X is covered by the open subsets $D_+(f)$ with $f \in S_1$ and the lemma is a consequence of Lemma 22.10.2 above. □

Lemma 22.10.4. *Let S be a graded ring. Set $X = Proj(S)$. Fix $d \geq 1$ an integer. The following open subsets of X are equal:*

1. *The largest open subset $W = W_d \subset X$ such that each $\mathcal{O}_X(dn)|_W$ is invertible and all the multiplication maps $\mathcal{O}_X(nd)|_W \otimes_{\mathcal{O}_W} \mathcal{O}_X(md)|_W \to \mathcal{O}_X(nd + md)|_W$ (see 22.10.1.1) are isomorphisms.*
2. *The union of the open subsets $D_+(fg)$ with $f, g \in S$ homogeneous and $\deg(f) = \deg(g) + d$.*

Moreover, all the maps $\widetilde{M}(nd)|_W = \widetilde{M}|_W \otimes_{\mathcal{O}_W} \mathcal{O}_X(nd)|_W \to \widetilde{M(nd)}|_W$ (see 22.10.1.5) are isomorphisms.

Proof. If $x \in D_+(fg)$ with $\deg(f) = \deg(g) + d$ then on $D_+(fg)$ the sheaves $\mathcal{O}_X(dn)$ are generated by the element $(f/g)^n = f^{2n}/(fg)^n$. This implies x is in the open subset W defined in (1) by arguing as in the proof of Lemma 22.10.2.

Conversely, suppose that $\mathcal{O}_X(d)$ is free of rank 1 in an open neighbourhood V of $x \in X$ and all the multiplication maps $\mathcal{O}_X(nd)|_V \otimes_{\mathcal{O}_V} \mathcal{O}_X(md)|_V \to \mathcal{O}_X(nd + md)|_V$ are isomorphisms. We may choose $h \in S_+$ homogeneous such that $D_+(h) \subset V$. By the definition of the twists of the structure sheaf we conclude there exists an element s of $(S_h)_d$ such that s^n is a basis of $(S_h)_{nd}$ as a module over $S_{(h)}$ for all $n \in \mathbf{Z}$. We may write $s = f/h^m$ for some $m \geq 1$ and $f \in S_{d+m\deg(h)}$. Set $g = h^m$ so $s = f/g$. Note that $x \in D(g)$ by construction. Note that $g^d \in (S_h)_{-d\deg(g)}$. By assumption we can write this as a multiple of $s^{\deg(g)} = f^{\deg(g)}/g^{\deg(g)}$, say $g^d = a/g^e \cdot f^{\deg(g)}/g^{\deg(g)}$. Then we conclude that $g^{d+e+\deg(g)} = af^{\deg(g)}$ and hence also $x \in D_+(f)$. So x is an element of the set defined in (2).

The existence of the generating section $s = f/g$ over the affine open $D_+(fg)$ whose powers freely generate the sheaves of modules $\mathcal{O}_X(nd)$ easily implies that the multiplication maps $\widetilde{M}(nd)|_W = \widetilde{M}|_W \otimes_{\mathcal{O}_W} \mathcal{O}_X(nd)|_W \to \widetilde{M(nd)}|_W$ (see 22.10.1.5) are isomorphisms. Compare with the proof of Lemma 22.10.2. □

Recall from Modules, Lemma 15.21.7 that given an invertible sheaf $\mathcal{L}$ on a locally ringed space X, and given a global section s of $\mathcal{L}$ the set $X_s = \{x \in X \mid s \notin \mathfrak{m}_x \mathcal{L}_x\}$ is open.

Lemma 22.10.5. *Let S be a graded ring. Set $X = Proj(S)$. Fix $d \geq 1$ an integer. Let $W = W_d \subset X$ be the open subscheme defined in Lemma 22.10.4. Let $n \geq 1$ and $f \in S_{nd}$. Denote $s \in \Gamma(W, \mathcal{O}_W(nd))$ the section which is the image of f via (22.10.1.3) restricted to W. Then*

$$W_s = D_+(f) \cap W.$$

Proof. Let $D_+(ab) \subset W$ be a standard affine open with $a, b \in S$ homogeneous and $\deg(a) = \deg(b) + d$. Note that $D_+(ab) \cap D_+(f) = D_+(abf)$. On the other hand the restriction of s to $D_+(ab)$ corresponds to the element $f/1 = b^n f/a^n (a/b)^n \in (S_{ab})_{nd}$. We have seen in the proof of Lemma 22.10.4 that $(a/b)^n$ is a generator for $\mathcal{O}_W(nd)$ over $D_+(ab)$. We conclude that $W_s \cap D_+(ab)$ is the principal open associated to $b^n f/a^n \in \mathcal{O}_X(D_+(ab))$. Thus the result of the lemma is clear. □

The following lemma states the properties that we will later use to characterize schemes with an ample invertible sheaf.

Lemma 22.10.6. *Let S be a graded ring. Let $X = Proj(S)$. Let $Y \subset X$ be a quasi-compact open subscheme. Denote $\mathcal{O}_Y(n)$ the restriction of $\mathcal{O}_X(n)$ to Y. There exists an integer $d \geq 1$ such that*

1. *the subscheme Y is contained in the open W_d defined in Lemma 22.10.4,*
2. *the sheaf $\mathcal{O}_Y(dn)$ is invertible for all $n \in \mathbf{Z}$,*
3. *all the maps $\mathcal{O}_Y(nd) \otimes_{\mathcal{O}_Y} \mathcal{O}_Y(m) \longrightarrow \mathcal{O}_Y(nd + m)$ of Equation (22.10.1.1) are isomorphisms,*
4. *all the maps $\widetilde{M}(nd)|_Y = \widetilde{M}|_Y \otimes_{\mathcal{O}_Y} \mathcal{O}_X(nd)|_Y \to \widetilde{M(n)}|_Y$ (see 22.10.1.5) are isomorphisms,*
5. *given $f \in S_{nd}$ denote $s \in \Gamma(Y, \mathcal{O}_Y(nd))$ the image of f via (22.10.1.3) restricted to Y, then $D_+(f) \cap Y = Y_s$,*
6. *a basis for the topology on Y is given by the collection of opens Y_s, where $s \in \Gamma(Y, \mathcal{O}_Y(nd))$, $n \geq 1$, and*
7. *a basis for the topology of Y is given by those opens $Y_s \subset Y$, for $s \in \Gamma(Y, \mathcal{O}_Y(nd))$, $n \geq 1$ which are affine.*

Proof. Since X is quasi-compact there exist finitely many homogeneous $f_i \in S_+$, $i = 1, \ldots, n$ such that the standard opens $D_+(f_i)$ give an open covering of X. Let $d_i = \deg(f_i)$ and set $d = d_1 \ldots d_n$. Note that $D_+(f_i) = D_+(f_i^{d/d_i})$ and hence we see immediately that $Y \subset W_d$, by characterization (2) in Lemma 22.10.4 or by (1) using Lemma 22.10.2. Note that (1) implies (2), (3) and (4) by Lemma 22.10.4. (Note that (3) is a special case of (4).) Assertion (5) follows from Lemma 22.10.5. Assertions (6) and (7) follow because the open subsets $D_+(f)$ form a basis for the topology of X and are affine. $\square$

22.11. Functoriality of Proj

A graded ring map $\psi : A \to B$ does not always give rise to a morphism of associated projective homogeneous spectra. The reason is that the inverse image $\psi^{-1}(\mathfrak{q})$ of a homogeneous prime $\mathfrak{q} \subset B$ may contain the irrelevant prime A_+ even if $\mathfrak{q}$ does not contain B_+. The correct result is stated as follows.

Lemma 22.11.1. *Let A, B be two graded rings. Set $X = Proj(A)$ and $Y = Proj(B)$. Let $\psi : A \to B$ be a graded ring map. Set*

$$U(\psi) = \bigcup\nolimits_{f \in A_+ \ homogeneous} D_+(\psi(f)) \subset Y.$$

Then there is a canonical morphism of schemes

$$r_\psi : U(\psi) \longrightarrow X$$

and a map of $\mathbf{Z}$-graded $\mathcal{O}_{U(\psi)}$-algebras

$$\theta = \theta_\psi : r_\psi^*\left(\bigoplus\nolimits_{d \in \mathbf{Z}} \mathcal{O}_X(d)\right) \longrightarrow \bigoplus\nolimits_{d \in \mathbf{Z}} \mathcal{O}_{U(\psi)}(d).$$

The triple $(U(\psi), r_\psi, \theta)$ is characterized by the following properties:

1. *For every $d \geq 0$ the diagram*

$$\begin{tikzcd} A_d \arrow[rr, "\psi"] \arrow[d] & & B_d \arrow[d] \\ \Gamma(X, \mathcal{O}_X(d)) \arrow[r, "\theta"] & \Gamma(U(\psi), \mathcal{O}_Y(d)) & \Gamma(Y, \mathcal{O}_Y(d)) \arrow[l] \end{tikzcd}$$

   is commutative.

(2) *For any* $f \in A_+$ *homogeneous we have* $r_\psi^{-1}(D_+(f)) = D_+(\psi(f))$ *and the restriction of* r_ψ *to* $D_+(\psi(f))$ *corresponds to the ring map* $A_{(f)} \to B_{(\psi(f))}$ *induced by* ψ.

Proof. Clearly condition (2) uniquely determines the morphism of schemes and the open subset $U(\psi)$. Pick $f \in A_d$ with $d \geq 1$. Note that $\mathcal{O}_X(n)|_{D_+(f)}$ corresponds to the $A_{(f)}$-module $(A_f)_n$ and that $\mathcal{O}_Y(n)|_{D_+(\psi(f))}$ corresponds to the $B_{(\psi(f))}$-module $(B_{\psi(f)})_n$. In other words θ when restricted to $D_+(\psi(f))$ corresponds to a map of $\mathbf{Z}$-graded $B_{(\psi(f))}$-algebras

$$A_f \otimes_{A_{(f)}} B_{(\psi(f))} \longrightarrow B_{\psi(f)}$$

Condition (1) determines the images of all elements of A. Since f is an invertible element which is mapped to $\psi(f)$ we see that $1/f^m$ is mapped to $1/\psi(f)^m$. It easily follows from this that θ is uniquely determined, namely it is given by the rule

$$a/f^m \otimes b/\psi(f)^e \longmapsto \psi(a)b/\psi(f)^{m+e}.$$

To show existence we remark that the proof of uniqueness above gave a well defined prescription for the morphism r and the map θ when restricted to every standard open of the form $D_+(\psi(f)) \subset U(\psi)$ into $D_+(f)$. Call these r_f and θ_f. Hence we only need to verify that if $D_+(f) \subset D_+(g)$ for some $f, g \in A_+$ homogeneous, then the restriction of r_g to $D_+(\psi(f))$ matches r_f. This is clear from the formulas given for r and θ above. $\square$

Lemma 22.11.2. *Let A, B, and C be graded rings. Set $X = Proj(A)$, $Y = Proj(B)$ and $Z = Proj(C)$. Let $\varphi : A \to B$, $\psi : B \to C$ be graded ring maps. Then we have*

$$U(\psi \circ \varphi) = r_\varphi^{-1}(U(\psi)) \quad \textit{and} \quad r_{\psi\circ\varphi} = r_\varphi \circ r_\psi|_{U(\psi\circ\varphi)}.$$

In addition we have

$$\theta_\psi \circ r_\psi^* \theta_\varphi = \theta_{\psi\circ\varphi}$$

with obvious notation.

Proof. Omitted. $\square$

Lemma 22.11.3. *With hypotheses and notation as in Lemma 22.11.1 above. Assume $A \to B$ is surjective. Then*

(1) $U(\psi) = Y$,
(2) $r_\psi : Y \to X$ *is a closed immersion, and*
(3) *the maps* $\theta : r_\psi^* \mathcal{O}_X(n) \to \mathcal{O}_Y(n)$ *are surjective but not isomorphisms in general.*

Proof. Write $B = A/I$ for some graded ideal $I \subset A$. Part (1) is obvious from the definition of $U(\psi)$. For $f \in A_+$ homogeneous we see that $A_{(f)} \to B_{(f)} = A_{(f)}/I_{(f)}$ is surjective. This proves (2). Also the map

$$A_f \otimes_{A_{(f)}} A_{(f)}/I_{(f)} \to (A/I)_f$$

is surjective which proves the surjectivity of θ. For an example where this map is not an isomorphism consider the graded ring $A = k[x, y]$ where k is a field and $\deg(x) = 1$, $\deg(y) = 2$. Set $I = (x)$, so that $B = k[y]$. Note that $\mathcal{O}_Y(1) = 0$ in this case. But it is easy to see that $r_\psi^* \mathcal{O}_Y(1)$ is not zero. (There are less silly examples.) $\square$

Lemma 22.11.4. *With hypotheses and notation as in Lemma 22.11.1 above. Assume $A \to B$ is surjective, and assume that A is generated by A_1 over A_0. Then*

(1) $U(\psi) = Y$,
(2) $r_\psi : Y \to X$ *is a closed immersion, and*
(3) *the maps* $\theta : r_\psi^* \mathcal{O}_X(n) \to \mathcal{O}_Y(n)$ *are isomorphisms.*

Proof. We apply Lemma 22.11.3. By Lemma 22.10.3 we see that both $\mathcal{O}_X(n)$ and $\mathcal{O}_Y(n)$ are invertible. Hence θ is an isomorphism. $\square$

Lemma 22.11.5. *With hypotheses and notation as in Lemma 22.11.1 above. Assume there exists a ring map $R \to A_0$ and a ring map $R \to R'$ such that $B = R' \otimes_R A$. Then*

(1) *$U(\psi) = Y$,*
(2) *the diagram*
$$\begin{tikzcd} Y = Proj(B) \arrow[r, "r_\psi"'] \arrow[d] & Proj(A) = X \arrow[d] \\ Spec(R') \arrow[r] & Spec(R) \end{tikzcd}$$
is a fibre product square, and
(3) *the maps $\theta : r_\psi^*\mathcal{O}_X(n) \to \mathcal{O}_Y(n)$ are isomorphisms.*

Proof. This follows immediately by looking at what happens over the standard opens $D_+(f)$ for $f \in A_+$. $\square$

Lemma 22.11.6. *With hypotheses and notation as in Lemma 22.11.1 above. Assume there exists a $g \in A_0$ such that ψ induces an isomorphism $A_g \to B$. Then $U(\psi) = Y$, $r_\psi : Y \to X$ is an open immersion which induces an isomorphism of Y with the inverse image of $D(g) \subset Spec(A_0)$. Moreover the map θ is an isomorphism.*

Proof. This is a special case of Lemma 22.11.5 above. $\square$

22.12. Morphisms into Proj

Let S be a graded ring. Let $X = \text{Proj}(S)$ be the homogeneous spectrum of S. Let $d \geq 1$ be an integer. Consider the open subscheme

(22.12.0.1) $$U_d = \bigcup\nolimits_{f \in S_d} D_+(f) \quad \subset \quad X = \text{Proj}(S)$$

Note that $d | d' \Rightarrow U_d \subset U_{d'}$ and $X = \bigcup_d U_d$. Neither X nor U_d need be quasi-compact, see Algebra, Lemma 7.53.3. Let us write $\mathcal{O}_{U_d}(n) = \mathcal{O}_X(n)|_{U_d}$. By Lemma 22.10.2 we know that $\mathcal{O}_{U_d}(nd)$, $n \in \mathbf{Z}$ is an invertible $\mathcal{O}_{U_d}$-module and that all the multiplication maps $\mathcal{O}_{U_d}(nd) \otimes_{\mathcal{O}_{U_d}} \mathcal{O}_X(m) \to \mathcal{O}_{U_d}(nd + m)$ of (22.10.1.1) are isomorphisms. In particular we have $\mathcal{O}_{U_d}(nd) \cong \mathcal{O}_{U_d}(d)^{\otimes n}$. The graded ring map (22.10.1.3) on global sections combined with restriction to U_d give a homomorphism of graded rings

(22.12.0.2) $$\psi^d : S^{(d)} \longrightarrow \Gamma_*(U_d, \mathcal{O}_{U_d}(d)).$$

For the notation $S^{(d)}$, see Algebra, Section 7.52. For the notation Γ_* see Modules, Definition 15.21.4. Moreover, since U_d is covered by the opens $D_+(f)$, $f \in S_d$ we see that $\mathcal{O}_{U_d}(d)$ is globally generated by the sections in the image of $\psi^d_1 : S^{(d)}_1 = S_d \to \Gamma(U_d, \mathcal{O}_{U_d}(d))$, see Modules, Definition 15.4.1.

Let Y be a scheme, and let $\varphi : Y \to X$ be a morphism of schemes. Assume the image $\varphi(Y)$ is contained in the open subscheme U_d of X. By the discussion following Modules, Definition 15.21.4 we obtain a homomorphism of graded rings

$$\Gamma_*(U_d, \mathcal{O}_{U_d}(d)) \longrightarrow \Gamma_*(Y, \varphi^*\mathcal{O}_X(d)).$$

The composition of this and ψ^d gives a graded ring homomorphism

(22.12.0.3) $$\psi^d_\varphi : S^{(d)} \longrightarrow \Gamma_*(Y, \varphi^*\mathcal{O}_X(d))$$

which has the property that the invertible sheaf $\varphi^*\mathcal{O}_X(d)$ is globally generated by the sections in the image of $(S^{(d)})_1 = S_d \to \Gamma(Y, \varphi^*\mathcal{O}_X(d))$.

Lemma 22.12.1. *Let S be a graded ring, and $X = Proj(S)$. Let $d \geq 1$ and $U_d \subset X$ as above. Let Y be a scheme. Let $\mathcal{L}$ be an invertible sheaf on Y. Let $\psi : S^{(d)} \to \Gamma_*(Y, \mathcal{L})$ be a graded ring homomorphism such that $\mathcal{L}$ is generated by the sections in the image of $\psi|_{S_d} : S_d \to \Gamma(Y, \mathcal{L})$. Then there exists a morphism $\varphi : Y \to X$ such that $\varphi(Y) \subset U_d$ and an isomorphism $\alpha : \varphi^*\mathcal{O}_{U_d}(d) \to \mathcal{L}$ such that ψ^d_φ agrees with ψ via α:*

$$\begin{tikzcd}
\Gamma_*(Y, \mathcal{L}) & \Gamma_*(Y, \varphi^*\mathcal{O}_{U_d}(d)) \arrow[l, "\alpha"'] & \Gamma_*(U_d, \mathcal{O}_{U_d}(d)) \arrow[l, "\varphi^*"'] \\
S^{(d)} \arrow[u, "\psi"] & & S^{(d)} \arrow[ll, "id"'] \arrow[u, "\psi^d"'] \arrow[ul, "\psi^d_\varphi"]
\end{tikzcd}$$

commutes. Moreover, the pair (φ, α) is unique.

Proof. Pick $f \in S_d$. Denote $s = \psi(f) \in \Gamma(Y, \mathcal{L})$. On the open set Y_s where s does not vanish multiplication by s induces an isomorphism $\mathcal{O}_{Y_s} \to \mathcal{L}|_{Y_s}$, see Modules, Lemma 15.21.7. We will denote the inverse of this map $x \mapsto x/s$, and similarly for powers of $\mathcal{L}$. Using this we define a ring map $\psi_{(f)} : S_{(f)} \to \Gamma(Y_s, \mathcal{O})$ by mapping the fraction a/f^n to $\psi(a)/s^n$. By Schemes, Lemma 21.6.4 this corresponds to a morphism $\varphi_f : Y_s \to Spec(S_{(f)}) = D_+(f)$. We also introduce the isomorphism $\alpha_f : \varphi_f^*\mathcal{O}_{D_+(f)}(d) \to \mathcal{L}|_{Y_s}$ which maps the pullback of the trivializing section f over $D_+(f)$ to the trivializing section s over Y_s. With this choice the commutativity of the diagram in the lemma holds with Y replace by Y_s, φ replaced by φ_f, and α replaced by α_f; verification omitted.

Suppose that $f' \in S_d$ is a second element, and denote $s' = \psi(f') \in \Gamma(Y, \mathcal{L})$. Then $Y_s \cap Y_{s'} = Y_{ss'}$ and similarly $D_+(f) \cap D_+(f') = D_+(ff')$. In Lemma 22.10.6 we saw that $D_+(f') \cap D_+(f)$ is the same as the set of points of $D_+(f)$ where the section of $\mathcal{O}_X(d)$ defined by f' does not vanish. Hence $\varphi_f^{-1}(D_+(f') \cap D_+(f)) = Y_s \cap Y_{s'} = \varphi_{f'}^{-1}(D_+(f') \cap D_+(f))$. On $D_+(f) \cap D_+(f')$ the fraction f/f' is an invertible section of the structure sheaf with inverse f'/f. Note that $\psi_{(f')}(f/f') = \psi(f)/s' = s/s'$ and $\psi_{(f)}(f'/f) = \psi(f')/s = s'/s$. We claim there is a unique ring map $S_{(ff')} \to \Gamma(Y_{ss'}, \mathcal{O})$ making the following diagram commute

$$\begin{tikzcd}
\Gamma(Y_s, \mathcal{O}) \arrow[r] & \Gamma(Y_{ss'}, \mathcal{O}) & \Gamma(Y_{s'}, \mathcal{O}) \arrow[l] \\
S_{(f)} \arrow[u, "\psi_{(f)}"] \arrow[r] & S_{(ff')} \arrow[u] & S_{(f')} \arrow[l] \arrow[u, "\psi_{(f')}"']
\end{tikzcd}$$

It exists because we may use the rule $x/(ff')^n \mapsto \psi(x)/(ss')^n$, which ``works" by the formulas above. Uniqueness follows as Proj(S) is separated, see Lemma 22.8.8 and its proof. This shows that the morphisms φ_f and $\varphi_{f'}$ agree over $Y_s \cap Y_{s'}$. The restrictions of α_f and $\alpha_{f'}$ agree over $Y_s \cap Y_{s'}$ because the regular functions s/s' and $\psi_{(f')}(f)$ agree. This proves that the morphisms ψ_f glue to a global morphism from Y into $U_d \subset X$, and that the maps α_f glue to an isomorphism satsifying the conditions of the lemma.

We still have to show the pair (φ, α) is unique. Suppose (φ', α') is a second such pair. Let $f \in S_d$. By the commutativity of the diagrams in the lemma we have that the inverse images of $D_+(f)$ under both φ and φ' are equal to $Y_{\psi(f)}$. Since the opens $D_+(f)$ are a basis for the topology on X, and since X is a sober topological space (see Schemes, Lemma 21.11.1) this means the maps φ and φ' are the same on underlying topological spaces. Let us use $s = \psi(f)$ to trivialize the invertible sheaf $\mathcal{L}$ over $Y_{\psi(f)}$. By the commutativity of the diagrams we have that $\alpha^{\otimes n}(\psi^d_\varphi(x)) = \psi(x) = (\alpha')^{\otimes n}(\psi^d_{\varphi'}(x))$ for all $x \in S_{nd}$. By construction of ψ^d_φ and $\psi^d_{\varphi'}$ we have $\psi^d_\varphi(x) = \varphi^\sharp(x/f^n)\psi^d_\varphi(f^n)$ over $Y_{\psi(f)}$, and similarly for $\psi^d_{\varphi'}$. by the commutativity of the diagrams of the lemma we deduce that $\varphi^\sharp(x/f^n) = (\varphi')^\sharp(x/f^n)$. This proves that φ and φ' induce the same morphism from $Y_{\psi(f)}$ into the affine scheme $D_+(f) = Spec(S_{(f)})$. Hence φ and φ' are the same as morphisms. Finally, it remains to show that the commutativity of the diagram of the lemma singles out, given φ, a unique α. We omit the verification. □

We continue the discussion from above the lemma. Let S be a graded ring. Let Y be a scheme. We will consider *triples* $(d, \mathcal{L}, \psi)$ where

(1) $d \geq 1$ is an integer,
(2) $\mathcal{L}$ is an invertible $\mathcal{O}_Y$-module, and
(3) $\psi : S^{(d)} \to \Gamma_*(Y, \mathcal{L})$ is a graded ring homomorphism such that $\mathcal{L}$ is generated by the global sections $\psi(f)$, with $f \in S_d$.

Given a morphism $h : Y' \to Y$ and a triple $(d, \mathcal{L}, \psi)$ over Y we can pull it back to the triple $(d, h^*\mathcal{L}, h^* \circ \psi)$. Given two triples $(d, \mathcal{L}, \psi)$ and $(d, \mathcal{L}', \psi')$ with the same integer d we say they are *strictly equivalent* if there exists an isomorphism $\beta : \mathcal{L} \to \mathcal{L}'$ such that $\beta \circ \psi = \psi'$ as graded ring maps $S^{(d)} \to \Gamma_*(Y, \mathcal{L}')$.

For each integer $d \geq 1$ we define

$$\begin{aligned} F_d : Sch^{opp} &\longrightarrow Sets, \\ Y &\longmapsto \{\text{strict equivalence classes of triples } (d, \mathcal{L}, \psi) \text{ as above}\} \end{aligned}$$

with pullbacks as defined above.

Lemma 22.12.2. *Let S be a graded ring. Let $X = Proj(S)$. The open subscheme $U_d \subset X$ (22.12.0.1) represents the functor F_d and the triple $(d, \mathcal{O}_{U_d}(d), \psi^d)$ defined above is the universal family (see Schemes, Section 21.15).*

Proof. This is a reformulation of Lemma 22.12.1 □

Lemma 22.12.3. *Let S be a graded ring generated as an S_0-algebra by the elements of S_1. In this case the scheme $X = Proj(S)$ represents the functor which associates to a scheme Y the set of pairs $(\mathcal{L}, \psi)$, where*

(1) *$\mathcal{L}$ is an invertible $\mathcal{O}_Y$-module, and*
(2) *$\psi : S \to \Gamma_*(Y, \mathcal{L})$ is a graded ring homomorphism such that $\mathcal{L}$ is generated by the global sections $\psi(f)$, with $f \in S_1$*

up to strict equivalence as above.

Proof. Under the assumptions of the lemma we have $X = U_1$ and the lemma is a reformulation of Lemma 22.12.2 above. □

We end this section with a discussion of a functor corresponding to Proj(S) for a general graded ring S. We advise the reader to skip the rest of this section.

Fix an arbitrary graded ring S. Let T be a scheme. We will say two triples $(d, \mathcal{L}, \psi)$ and $(d', \mathcal{L}', \psi')$ over T with possibly different integers d, d' are *equivalent* if there exists an isomorphism $\beta : \mathcal{L}^{\otimes d'} \to (\mathcal{L}')^{\otimes d}$ of invertible sheaves over T such that $\beta \circ \psi|_{S^{(dd')}}$ and $\psi'|_{S^{(dd')}}$ agree as graded ring maps $S^{(dd')} \to \Gamma_*(Y, (\mathcal{L}')^{\otimes dd'})$.

Lemma 22.12.4. *Let S be a graded ring. Set $X = Proj(S)$. Let T be a scheme. Let $(d, \mathcal{L}, \psi)$ and $(d', \mathcal{L}', \psi')$ be two triples over T. The following are equivalent:*

(1) *Let $n = lcm(d, d')$. Write $n = ad = a'd'$. There exists an isomorphism $\beta : \mathcal{L}^{\otimes a} \to (\mathcal{L}')^{\otimes a'}$ with the property that $\beta \circ \psi|_{S^{(n)}}$ and $\psi'|_{S^{(n)}}$ agree as graded ring maps $S^{(n)} \to \Gamma_*(Y, (\mathcal{L}')^{\otimes n})$.*
(2) *The triples $(d, \mathcal{L}, \psi)$ and $(d', \mathcal{L}', \psi')$ are equivalent.*
(3) *For some positive integer $n = ad = a'd'$ there exists an isomorphism $\beta : \mathcal{L}^{\otimes a} \to (\mathcal{L}')^{\otimes a'}$ with the property that $\beta \circ \psi|_{S^{(n)}}$ and $\psi'|_{S^{(n)}}$ agree as graded ring maps $S^{(n)} \to \Gamma_*(Y, (\mathcal{L}')^{\otimes n})$.*
(4) *The morphisms $\varphi : T \to X$ and $\varphi' : T \to X$ assocated to $(d, \mathcal{L}, \psi)$ and $(d', \mathcal{L}', \psi')$ are equal.*

Proof. Clearly (1) implies (2) and (2) implies (3) by restricting to more divisible degrees and powers of invertible sheaves. Also (3) implies (4) by the uniqueness statement in Lemma 22.12.1. Thus we have to prove that (4) implies (1). Assume (4), in other words $\varphi = \varphi'$. Note that this implies that we may write $\mathcal{L} = \varphi^*\mathcal{O}_X(d)$ and $\mathcal{L}' = \varphi^*\mathcal{O}_X(d')$. Moreover, via these identifications we have that the graded ring maps ψ and ψ' correspond to the restriction of the canonical graded ring map

$$S \longrightarrow \bigoplus\nolimits_{n\geq 0} \Gamma(X, \mathcal{O}_X(n))$$

to $S^{(d)}$ and $S^{(d')}$ composed with pullback by φ (by Lemma 22.12.1 again). Hence taking β to be the isomorphism

$$(\varphi^*\mathcal{O}_X(d))^{\otimes a} = \varphi^*\mathcal{O}_X(n) = (\varphi^*\mathcal{O}_X(d'))^{\otimes a'}$$

works. □

Let S be a graded ring. Let $X = \text{Proj}(S)$. Over the open subscheme scheme $U_d \subset X = \text{Proj}(S)$ (22.12.0.1) we have the triple $(d, \mathcal{O}_{U_d}(d), \psi^d)$. Clearly, if $d|d'$ the triples $(d, \mathcal{O}_{U_d}(d), \psi^d)$ and $(d', \mathcal{O}_{U_{d'}}(d'), \psi^{d'})$ are equivalent when restricted to the open U_d (which is a subset of $U_{d'}$). This, combined with Lemma 22.12.1 shows that morphisms $Y \to X$ correspond roughly to equivalence classes of triples over Y. This is not quite true since if Y is not quasi-compact, then there may not be a single triple which works. Thus we have to be slightly careful in defining the corresponding functor.

Here is one possible way to do this. Suppose $d' = ad$. Consider the transformation of functors $F_d \to F_{d'}$ which assigns to the triple $(d, \mathcal{L}, \psi)$ over T the triple $(d', \mathcal{L}^{\otimes a}, \psi|_{S^{(d')}})$. One of the implications of Lemma 22.12.4 is that the transformation $F_d \to F_{d'}$ is injective! For a quasi-compact scheme T we define

$$F(T) = \bigcup\nolimits_{d\in\mathbf{N}} F_d(T)$$

with transition maps as explained above. This clearly defines a contravariant functor on the category of quasi-compact schemes with values in sets. For a general scheme T we define

$$F(T) = lim_{V\subset T \text{ quasi-compact open}} F(V).$$

In other words, an element ξ of $F(T)$ corresponds to a compatible system of choices of elements $\xi_V \in F(V)$ where V ranges over the quasi-compact opens of T. We omit the definition of the pullback map $F(T) \to F(T')$ for a morphism $T' \to T$ of schemes. Thus we have defined our functor

$$F : Sch^{opp} \longrightarrow Sets$$

Lemma 22.12.5. *Let S be a graded ring. Let $X = Proj(S)$. The functor F defined above is representable by the scheme X.*

Proof. We have seen above that the functor F_d corresponds to the open subscheme $U_d \subset X$. Moreover the transformation of functors $F_d \to F_{d'}$ (if $d|d'$) defined above corresponds to the inclusion morphism $U_d \to U_{d'}$ (see discussion above). Hence to show that F is represented by X it suffices to show that $T \to X$ for a quasi-compact scheme T ends up in some U_d, and that for a general scheme T we have

$$Mor(T, X) = lim_{V \subset T \text{ quasi-compact open}} Mor(V, X).$$

These verifications are omitted. □

22.13. Projective space

Projective space is one of the fundamental objects studied in algebraic geometry. In this section we just give its construction as Proj of a polynomial ring. Later we will discover many of its beautiful properties.

Lemma 22.13.1. *Let $S = \mathbf{Z}[T_0, \ldots, T_n]$ with $\deg(T_i) = 1$. The scheme*

$$\mathbf{P}^n_{\mathbf{Z}} = Proj(S)$$

represents the functor which associates to a scheme Y the pairs $(\mathcal{L}, (s_0, \ldots, s_n))$ where

(1) *$\mathcal{L}$ is an invertible $\mathcal{O}_Y$-module, and*
(2) *$s_0, \ldots, s_n$ are global sections of $\mathcal{L}$ which generate $\mathcal{L}$*

up to the following equivalence: $(\mathcal{L}, (s_0, \ldots, s_n)) \sim (\mathcal{N}, (t_0, \ldots, t_n)) \Leftrightarrow$ there exists an isomorphism $\beta : \mathcal{L} \to \mathcal{N}$ with $\beta(s_i) = t_i$ for $i = 0, \ldots, n$.

Proof. This is a special case of Lemma 22.12.3 above. Namely, for any graded ring A we have

$$\begin{array}{rcl} Mor_{gradedrings}(\mathbf{Z}[T_0, \ldots, T_n], A) & = & A_1 \times \ldots \times A_1 \\ \psi & \mapsto & (\psi(T_0), \ldots, \psi(T_n)) \end{array}$$

and the degree 1 part of $\Gamma_*(Y, \mathcal{L})$ is just $\Gamma(Y, \mathcal{L})$. □

Definition 22.13.2. The scheme $\mathbf{P}^n_{\mathbf{Z}} = \text{Proj}(\mathbf{Z}[T_0, \ldots, T_n])$ is called *projective n-space over* $\mathbf{Z}$. Its base change $\mathbf{P}^n_S$ to a scheme S is called *projective n-space over S*. If R is a ring the base change to $Spec(R)$ is denoted $\mathbf{P}^n_R$ and called *projective n-space over R*.

Given a scheme Y over S and a pair $(\mathcal{L}, (s_0, \ldots, s_n))$ as in Lemma 22.13.1 the induced morphism to $\mathbf{P}^n_S$ is denoted

$$\varphi_{(\mathcal{L}, (s_0, \ldots, s_n))} : Y \longrightarrow \mathbf{P}^n_S$$

This makes sense since the pair defines a morphism into $\mathbf{P}^n_{\mathbf{Z}}$ and we already have the structure morphism into S so combined we get a morphism into $\mathbf{P}^n_S = \mathbf{P}^n_{\mathbf{Z}} \times S$. Note that this is the S-morphism characterized by

$$\mathcal{L} = \varphi^*_{(\mathcal{L}, (s_0, \ldots, s_n))} \mathcal{O}_{\mathbf{P}^n_R}(1) \quad \text{and} \quad s_i = \varphi^*_{(\mathcal{L}, (s_0, \ldots, s_n))} T_i$$

where we think of T_i as a global section of $\mathcal{O}_{\mathbf{P}^n_S}(1)$ via (22.10.1.3).

Lemma 22.13.3. *Projective n-space over $\mathbf{Z}$ is covered by $n + 1$ standard opens*

$$\mathbf{P}^n_{\mathbf{Z}} = \bigcup\nolimits_{i=0, \ldots, n} D_+(T_i)$$

where each $D_+(T_i)$ is isomorphic to $\mathbf{A}^n_{\mathbf{Z}}$ affine n-space over $\mathbf{Z}$.

Proof. This is true because $\mathbf{Z}[T_0, \ldots, T_n]_+ = (T_0, \ldots, T_n)$ and since

$$Spec\left(\mathbf{Z}\left[\frac{T_0}{T_i}, \ldots, \frac{T_n}{T_i}\right]\right) \cong \mathbf{A}^n_{\mathbf{Z}}$$

in an obvious way. □

Lemma 22.13.4. *Let S be a scheme. The structure morphism $\mathbf{P}^n_S \to S$ is*

(1) *separated,*
(2) *quasi-compact,*
(3) *satisfies the existence and uniqueness parts of the valuative criterion, and*
(4) *universally closed.*

Proof. All these properties are stable under base change (this is clear for the last two and for the other two see Schemes, Lemmas 21.21.13 and 21.19.3). Hence it suffices to prove them for the morphism $\mathbf{P}^n_{\mathbf{Z}} \to Spec(\mathbf{Z})$. Separatedness is Lemma 22.8.8. Quasi-compactness follows from Lemma 22.13.3. Existence and uniqueness of the valuative criterion follow from Lemma 22.8.11. Universally closed follows from the above and Schemes, Proposition 21.20.6. □

Remark 22.13.5. What's missing in the list of properties above? Well to be sure the property of being of finite type. The reason we do not list this here is that we have not yet defined the notion of finite type at this point. (Another property which is missing is ``smoothness''. And I'm sure there are many more you can think of.)

We finish this section with two simple lemmas. These lemmas are special cases of more general results later, but perhaps it makes sense to prove these directly here now.

Lemma 22.13.6. *Let R be a ring. Let $Z \subset \mathbf{P}^n_R$ be a closed subscheme. Let*

$$I_d = Ker\left(R[T_0, \ldots, T_n]_d \longrightarrow \Gamma(Z, \mathcal{O}_{\mathbf{P}^n_R}(d)|_Z)\right)$$

Then $I = \bigoplus I_d \subset R[T_0, \ldots, T_n]$ is a graded ideal and $Z = Proj(R[T_0, \ldots, T_n]/I)$.

Proof. It is clear that I is a graded ideal. Set $Z' = \text{Proj}(R[T_0, \ldots, T_n]/I)$. By Lemma 22.11.4 we see that Z' is a closed subscheme of $\mathbf{P}^n_R$. To see the equality $Z = Z'$ it suffices to check on an standard affine open $D_+(T_i)$. By renumbering the homogeneous coordinates we may assume $i = 0$. Say $Z \cap D_+(T_0)$, resp. $Z' \cap D_+(T_0)$ is cut out by the ideal J, resp. J' of $R[T_1/T_0, \ldots, T_n/T_0]$. Then J' is the ideal generated by the elements $F/T_0^{\deg(F)}$ where $F \in I$ is homogeneous. Suppose the degree of $F \in I$ is d. Since F vanishes as a section of $\mathcal{O}_{\mathbf{P}^n_R}(d)$ restricted to Z we see that F/T_0^d is an element of J. Thus $J' \subset J$.

Conversely, suppose that $f \in J$. If f has total degree d in $T_1/T_0, \ldots, T_n/T_0$, then we can write $f = F/T_0^d$ for some $F \in R[T_0, \ldots, T_n]_d$. Pick $i \in \{1, \ldots, n\}$. Then $Z \cap D_+(T_i)$ is cut out by some ideal $J_i \subset R[T_0/T_i, \ldots, T_n/T_i]$. Moreover,

$$J \cdot R\left[\frac{T_1}{T_0}, \ldots, \frac{T_n}{T_0}, \frac{T_0}{T_i}, \ldots, \frac{T_n}{T_i}\right] = J_i \cdot R\left[\frac{T_1}{T_0}, \ldots, \frac{T_n}{T_0}, \frac{T_0}{T_i}, \ldots, \frac{T_n}{T_i}\right]$$

The left hand side is the localization of J with respect to the element T_i/T_0 and the right hand side is the localization of J_i with respect to the element T_0/T_i. It follows that $T_0^{d_i} F/T_i^{d+d_i}$ is an element of J_i for some d_i sufficiently large. This proves that $T_0^{\max(d_i)} F$ is an element of I, because its restriction to each standard affine open $D_+(T_i)$ vanishes on the closed subscheme $Z \cap D_+(T_i)$. Hence $f \in J'$ and we conclude $J \subset J'$ as desired. □

The following lemma is a special case of the more general Properties, Lemma 23.25.3.

Lemma 22.13.7. *Let R be a ring. Let $\mathcal{F}$ be a quasi-coherent sheaf on $\mathbf{P}^n_R$. For $d \geq 0$ set*

$$M_d = \Gamma(\mathbf{P}^n_R, \mathcal{F} \otimes_{\mathcal{O}_{\mathbf{P}^n_R}} \mathcal{O}_{\mathbf{P}^n_R}(d)) = \Gamma(\mathbf{P}^n_R, \mathcal{F}(d))$$

Then $M = \bigoplus_{d \geq 0} M_d$ is a graded $R[T_0, \ldots, R_n]$-module and there is a canonical isomorphism $\mathcal{F} = \widetilde{M}$.

Proof. The multiplication maps

$$R[T_0, \ldots, R_n]_e \times M_d \longrightarrow M_{d+e}$$

come from the natural isomorphisms

$$\mathcal{O}_{\mathbf{P}^n_R}(e) \otimes_{\mathcal{O}_{\mathbf{P}^n_R}} \mathcal{F}(d) \longrightarrow \mathcal{F}(e + d)$$

see Equation (22.10.1.4). Let us construct the map $c : \widetilde{M} \to \mathcal{F}$. On each of the standard affines $U_i = D_+(T_i)$ we see that $\Gamma(U_i, \widetilde{M}) = (M[1/T_i])_0$ where the subscript $_0$ means degree 0 part. An element of this can be written as m/T_i^d with $m \in M_d$. Since T_i is a generator of $\mathcal{O}(1)$ over U_i we can always write $m|_{U_i} = m_i \otimes T_i^d$ where $m_i \in \Gamma(U_i, \mathcal{F})$ is a unique section. Thus a natural guess is $c(m/T_i^d) = m_i$. A small argument, which is omitted here, shows that this gives a well defined map $c : \widetilde{M} \to \mathcal{F}$ if we can show that

$$(T_i/T_j)^d m_i|_{U_i \cap U_j} = m_j|_{U_i \cap U_j}$$

in $M[1/T_iT_j]$. But this is clear since on the overlap the generators T_i and T_j of $\mathcal{O}(1)$ differ by the invertible function T_i/T_j.

Injectivity of c. We may check for injectivity over the affine opens U_i. Let $i \in \{0, \ldots, n\}$ and let s be an element $s = m/T_i^d \in \Gamma(U_i, \widetilde{M})$ such that $c(m/T_i^d) = 0$. By the description of c above this means that $m_i = 0$, hence $m|_{U_i} = 0$. Hence $T_i^e m = 0$ in M for some e. Hence $s = m/T_i^d = T_i^e/T_i^{e+d} = 0$ as desired.

Surjectivity of c. We may check for surjectivity over the affine opens U_i. By renumbering it suffices to check it over U_0. Let $s \in \mathcal{F}(U_0)$. Let us write $\mathcal{F}|_{U_i} = \widetilde{N_i}$ for some $R[T_0/T_i, \ldots, T_0/T_i]$-module N_i, which is possible because $\mathcal{F}$ is quasi-coherent. So s corresponds to an element $x \in N_0$. Then we have that

$$(N_i)_{T_j/T_i} \cong (N_j)_{T_i/T_j}$$

(where the subscripts mean ``principal localization at") as modules over the ring

$$R\left[\frac{T_0}{T_i}, \ldots, \frac{T_n}{T_i}, \frac{T_0}{T_j}, \ldots, \frac{T_n}{T_j}\right].$$

This means that for some large integer d there exist elements $s_i \in N_i$, $i = 1, \ldots, n$ such that

$$s = (T_i/T_0)^d s_i$$

on $U_0 \cap U_i$. Next, we look at the difference

$$t_{ij} = s_i - (T_j/T_i)^d s_j$$

on $U_i \cap U_j$, $0 < i < j$. By our choice of s_i we know that $t_{ij}|_{U_0 \cap U_i \cap U_j} = 0$. Hence there exists a large integer e such that $(T_0/T_i)^e t_{ij} = 0$. Set $s_i' = (T_0/T_i)^e s_i$, and $s_0' = s$. Then we will have

$$s_a' = (T_b/T_a)^{e+d} s_b'$$

on $U_a \cap U_b$ for all a, b. This is exactly the condition that the elements s'_a glue to a global section $m \in \Gamma(\mathbf{P}^n_R, \mathcal{F}(e+d))$. And moreover $c(m/T_0^{e+d}) = s$ by construction. Hence c is surjective and we win. $\square$

22.14. Invertible sheaves and morphisms into Proj

Let T be a scheme and let $\mathcal{L}$ be an invertible sheaf on T. For a section $s \in \Gamma(T, \mathcal{L})$ we denote T_s the open subset of points where s does not vanish. See Modules, Lemma 15.21.7. We can view the following lemma as a slight generalization of Lemma 22.12.3. It also is a generalization of Lemma 22.11.1.

Lemma 22.14.1. *Let A be a graded ring. Set $X = Proj(A)$. Let T be a scheme. Let $\mathcal{L}$ be an invertible $\mathcal{O}_T$-module. Let $\psi : A \to \Gamma_*(T, \mathcal{L})$ be a homomorphism of graded rings. Set*

$$U(\psi) = \bigcup\nolimits_{f \in A_+ \ homogeneous} T_{\psi(f)}$$

The morphism ψ induces a canonical morphism of schemes

$$r_{\mathcal{L},\psi} : U(\psi) \longrightarrow X$$

together with a map of $\mathbf{Z}$-graded $\mathcal{O}_T$-algebras

$$\theta : r^*_{\mathcal{L},\psi}\left(\bigoplus\nolimits_{d \in \mathbf{Z}} \mathcal{O}_X(d)\right) \longrightarrow \bigoplus\nolimits_{d \in \mathbf{Z}} \mathcal{L}^{\otimes d}|_{U(\psi)}.$$

The triple $(U(\psi), r_{\mathcal{L},\psi}, \theta)$ is characterized by the following properties:

1. *For $f \in A_+$ homogeneous we have $r^{-1}_{\mathcal{L},\psi}(D_+(f)) = T_{\psi(f)}$.*
2. *For every $d \geq 0$ the diagram*

$$\begin{tikzcd} A_d \arrow[r, "\psi"] \arrow[d, "(22.10.1.3)"'] & \Gamma(T, \mathcal{L}^{\otimes d}) \arrow[d, "restrict"] \\ \Gamma(X, \mathcal{O}_X(d)) \arrow[r, "\theta"] & \Gamma(U(\psi), \mathcal{L}^{\otimes d}) \end{tikzcd}$$

   is commutative.

Moreover, for any $d \geq 1$ and any open subscheme $V \subset T$ such that the sections in $\psi(A_d)$ generate $\mathcal{L}^{\otimes d}|_V$ the morphism $r_{\mathcal{L},\psi}|_V$ agrees with the morphism $\varphi : V \to Proj(A)$ and the map $\theta|_V$ agrees with the map $\alpha : \varphi^*\mathcal{O}_X(d) \to \mathcal{L}^{\otimes d}|_V$ where (φ, α) is the pair of Lemma 22.12.1 associated to $\psi|_{A^{(d)}} : A^{(d)} \to \Gamma_*(V, \mathcal{L}^{\otimes d})$.

Proof. Suppose that we have two triples $(U, r : U \to X, \theta)$ and $(U', r' : U' \to X, \theta')$ satisfying (1) and (2). Property (1) implies that $U = U' = U(\psi)$ and that $r = r'$ as maps of underlying topological spaces, since the opens $D_+(f)$ form a basis for the topology on X, and since X is a sober topological space (see Algebra, Section 7.53 and Schemes, Lemma 21.11.1). Let $f \in A_+$ be homogeneous. Note that $\Gamma(D_+(f), \bigoplus_{n \in \mathbf{Z}} \mathcal{O}_X(n)) = A_f$ as a $\mathbf{Z}$-graded algebra. Consider the two $\mathbf{Z}$-graded ring maps

$$\theta, \theta' : A_f \longrightarrow \Gamma(T_{\psi(f)}, \bigoplus \mathcal{L}^{\otimes n}).$$

We know that multiplication by f (resp. $\psi(f)$) is an isomorphism on the left (resp. right) hand side. We also know that $\theta(x/1) = \theta'(x/1) = \psi(x)|_{T_{\psi(f)}}$ by (2) for all $x \in A$. Hence we deduce easily that $\theta = \theta'$ as desired. Considering the degree 0 parts we deduce that $r^\sharp = (r')^\sharp$, i.e., that $r = r'$ as morphisms of schemes. This proves the uniqueness.

Now we come to existence. By the uniqueness just proved, it is enought to construct the pair (r, θ) locally on T. Hence we may assume that $T = Spec(R)$ is affine, that $\mathcal{L} = \mathcal{O}_T$ and that for some $f \in A_+$ homogeneous we have $\psi(f)$ generates $\mathcal{O}_T = \mathcal{O}_T^{\otimes \deg(f)}$. In other words, $\psi(f) = u \in R^*$ is a unit. In this case the map ψ is a graded ring map

$$A \longrightarrow R[x] = \Gamma_*(T, \mathcal{O}_T)$$

which maps f to $ux^{\deg(f)}$. Clearly this extends (uniquely) to a $\mathbf{Z}$-graded ring map $\theta : A_f \to R[x, x^{-1}]$ by mapping $1/f$ to $u^{-1}x^{-\deg(f)}$. This map in degree zero gives the ring map $A_{(f)} \to R$ which gives the morphism $r : T = Spec(R) \to Spec(A_{(f)}) = D_+(f) \subset X$. Hence we have constructed (r, θ) in this special case.

Let us show the last statement of the lemma. According to Lemma 22.12.1 the morphism constructed there is the unique one such that the displayed diagram in its statement commutes. The commutativity of the diagram in the lemma implies the commutativity when restricted to V and $A^{(d)}$. Whence the result. □

Remark 22.14.2. Assumptions as in Lemma 22.14.1 above. The image of the morphism $r_{\mathcal{L},\psi}$ need not be contained in the locus where the sheaf $\mathcal{O}_X(1)$ is invertible. Here is an example. Let k be a field. Let $S = k[A, B, C]$ graded by $\deg(A) = 1$, $\deg(B) = 2$, $\deg(C) = 3$. Set $X = \text{Proj}(S)$. Let $T = \mathbf{P}^2_k = \text{Proj}(k[X_0, X_1, X_2])$. Recall that $\mathcal{L} = \mathcal{O}_T(1)$ is invertible and that $\mathcal{O}_T(n) = \mathcal{L}^{\otimes n}$. Consider the composition ψ of the maps

$$S \to k[X_0, X_1, X_2] \to \Gamma_*(T, \mathcal{L}).$$

Here the first map is $A \mapsto X_0^6$, $B \mapsto X_1^3$, $C \mapsto X_2^3$ and the second map is (22.10.1.3). By the lemma this corresponds to a morphism $r_{\mathcal{L},\psi} : T \to X = \text{Proj}(S)$ which is easily seen to be surjective. On the other hand, in Remark 22.9.2 we showed that the sheaf $\mathcal{O}_X(1)$ is not invertible at all points of X.

22.15. Relative Proj via glueing

Situation 22.15.1. Here S is a scheme, and $\mathcal{A}$ is a quasi-coherent graded $\mathcal{O}_S$-algebra.

In this section we outline how to construct a morphism of schemes

$$\underline{\text{Proj}}_S(\mathcal{A}) \longrightarrow S$$

by glueing the homogeneous spectra $\text{Proj}(\Gamma(U, \mathcal{A}))$ where U ranges over the affine opens of S. We first show that the homogeneous spectra of the values of $\mathcal{A}$ over affines form a suitable collection of schemes, as in Lemma 22.2.1.

Lemma 22.15.2. *In Situation 22.15.1. Suppose $U \subset U' \subset S$ are affine opens. Let $A = \mathcal{A}(U)$ and $A' = \mathcal{A}(U')$. The map of graded rings $A' \to A$ induces a morphism $r : Proj(A) \to Proj(A')$, and the diagram*

$$\begin{array}{ccc} Proj(A) & \longrightarrow & Proj(A') \\ \downarrow & & \downarrow \\ U & \longrightarrow & U' \end{array}$$

is cartesian. Moreover there are canonical isomorphisms $\theta : r^*\mathcal{O}_{Proj(A')}(n) \to \mathcal{O}_{Proj(A)}(n)$ compatible with multiplication maps.

Proof. Let $R = \mathcal{O}_S(U)$ and $R' = \mathcal{O}_S(U')$. Note that the map $R \otimes_{R'} A' \to A$ is an isomorphism as $\mathcal{A}$ is quasi-coherent (see Schemes, Lemma 21.7.3 for example). Hence the lemma follows from Lemma 22.11.5. $\square$

In particular the morphism $\text{Proj}(A) \to \text{Proj}(A')$ of the lemma is an open immersion.

Lemma 22.15.3. *In Situation 22.15.1. Suppose $U \subset U' \subset U'' \subset S$ are affine opens. Let $A = \mathcal{A}(U)$, $A' = \mathcal{A}(U')$ and $A'' = \mathcal{A}(U'')$. The composition of the morphisms $r : Proj(A) \to Proj(A')$, and $r' : Proj(A') \to Proj(A'')$ of Lemma 22.15.2 gives the morphism $r'' : Proj(A) \to Proj(A'')$ of Lemma 22.15.2. A similar statement holds for the isomorphisms θ.*

Proof. This follows from Lemma 22.11.2 since the map $A'' \to A$ is the composition of $A'' \to A'$ and $A' \to A$. $\square$

Lemma 22.15.4. *In Situation 22.15.1. There exists a morphism of schemes*

$$\pi : \underline{Proj}_S(\mathcal{A}) \longrightarrow S$$

with the following properties:

(1) *for every affine open $U \subset S$ there exists an isomorphism $i_U : \pi^{-1}(U) \to Proj(A)$ with $A = \mathcal{A}(U)$, and*
(2) *for $U \subset U' \subset S$ affine open the composition*

$$Proj(A) \xrightarrow{i_U^{-1}} \pi^{-1}(U) \xrightarrow{inclusion} \pi^{-1}(U') \xrightarrow{i_{U'}} Proj(A')$$

with $A = \mathcal{A}(U)$, $A' = \mathcal{A}(U')$ is the open immersion of Lemma 22.15.2 above.

Proof. Follows immediately from Lemmas 22.2.1, 22.15.2, and 22.15.3. $\square$

Lemma 22.15.5. *In Situation 22.15.1. The morphism $\pi : \underline{Proj}_S(\mathcal{A}) \to S$ of Lemma 22.15.4 comes with the following additional structure. There exists a quasi-coherent $\mathbf{Z}$-graded sheaf of $\mathcal{O}_{\underline{Proj}_S(\mathcal{A})}$-algebras $\bigoplus_{n\in\mathbf{Z}} \mathcal{O}_{\underline{Proj}_S(\mathcal{A})}(n)$, and a morphism of graded $\mathcal{O}_S$-algebras*

$$\psi : \mathcal{A} \longrightarrow \bigoplus\nolimits_{n\geq 0} \pi_*\left(\mathcal{O}_{\underline{Proj}_S(\mathcal{A})}(n)\right)$$

uniquely determined by the following property: For every affine open $U \subset S$ with $A = \mathcal{A}(U)$ there is an isomorphism

$$\theta_U : i_U^*\left(\bigoplus\nolimits_{n\in\mathbf{Z}} \mathcal{O}_{Proj(A)}(n)\right) \longrightarrow \left(\bigoplus\nolimits_{n\in\mathbf{Z}} \mathcal{O}_{\underline{Proj}_S(\mathcal{A})}(n)\right)|_{\pi^{-1}(U)}$$

of $\mathbf{Z}$-graded $\mathcal{O}_{\pi^{-1}(U)}$-algebras such that

$$\begin{tikzcd} A_n \arrow[rr, "\psi"] \arrow[dr, "(22.10.1.3)"'] & & \Gamma(\pi^{-1}(U), \mathcal{O}_{\underline{Proj}_S(\mathcal{A})}(n)) \\ & \Gamma(Proj(A), \mathcal{O}_{Proj(A)}(n)) \arrow[ur, "\theta_U"'] & \end{tikzcd}$$

is commutative.

Proof. We are going to use Lemma 22.2.2 to glue the sheaves of $\mathbf{Z}$-graded algebras $\bigoplus_{n\in\mathbf{Z}} \mathcal{O}_{\text{Proj}(A)}(n)$ for $A = \mathcal{A}(U)$, $U \subset S$ affine open over the scheme $\underline{\text{Proj}}_S(\mathcal{A})$. We have constructed the data necessary for this in Lemma 22.15.2 and we have checked condition (d) of Lemma 22.2.2 in Lemma 22.15.3. Hence we get the sheaf of $\mathbf{Z}$-graded $\mathcal{O}_{\underline{\text{Proj}}_S(\mathcal{A})}$-algebras $\bigoplus_{n\in\mathbf{Z}} \mathcal{O}_{\underline{\text{Proj}}_S(\mathcal{A})}(n)$

together with the isomorphisms θ_U for all $U \subset S$ affine open and all $n \in \mathbf{Z}$. For every affine open $U \subset S$ with $A = \mathcal{A}(U)$ we have a map $A \to \Gamma(\text{Proj}(A), \bigoplus_{n \geq 0} \mathcal{O}_{\text{Proj}(A)}(n))$. Hence the map ψ exists by functoriality of relative glueing, see Remark 22.2.3. The diagram of the lemma commutes by construction. This characterizes the sheaf of $\mathbf{Z}$-graded $\mathcal{O}_{\underline{\text{Proj}}_S(\mathcal{A})}$-algebras $\bigoplus \mathcal{O}_{\underline{\text{Proj}}_S(\mathcal{A})}(n)$ because the proof of Lemma 22.11.1 shows that having these diagrams commute uniquely determines the maps θ_U. Some details omitted. $\square$

22.16. Relative Proj as a functor

We place ourselves in Situation 22.15.1. So S is a scheme and $\mathcal{A} = \bigoplus_{d \geq 0} \mathcal{A}_d$ is a quasi-coherent graded $\mathcal{O}_S$-algebra. In this section we relativize the construction of Proj by constructing a functor which the relative homogeneous spectrum will represent. As a result we will construct a morphism of schemes

$$\underline{\text{Proj}}_S(\mathcal{A}) \longrightarrow S$$

which above affine opens of S will look like the homogeneous spectrum of a graded ring. The discussion will be modeled after our discussion of the relative spectrum in Section 22.4. The easier method using glueing schemes of the form Proj(A), $A = \Gamma(U, \mathcal{A})$, $U \subset S$ affine open, is explained in Section 22.15, and the result in this section will be shown to be isomorphic to that one.

Fix for the moment an integer $d \geq 1$. We denote $\mathcal{A}^{(d)} = \bigoplus_{n \geq 0} \mathcal{A}_{nd}$ similarly to the notation in Algebra, Section 7.52. Let T be a scheme. Let us consider *quadruples* $(d, f : T \to S, \mathcal{L}, \psi)$ *over* T where

(1) d is the integer we fixed above,
(2) $f : T \to S$ is a morphism of schemes,
(3) $\mathcal{L}$ is an invertible $\mathcal{O}_T$-module, and
(4) $\psi : f^*\mathcal{A}^{(d)} \to \bigoplus_{n \geq 0} \mathcal{L}^{\otimes n}$ is a homomorphism of graded $\mathcal{O}_T$-algebras such that $f^*\mathcal{A}_d \to \mathcal{L}$ is surjective.

Given a morphism $h : T' \to T$ and a quadruple $(d, f, \mathcal{L}, \psi)$ over T we can pull it back to the quadruple $(d, f \circ h, h^*\mathcal{L}, h^*\psi)$ over T'. Given two quadruples $(d, f, \mathcal{L}, \psi)$ and $(d, f', \mathcal{L}', \psi')$ over T with the same integer d we say they are *strictly equivalent* if $f = f'$ and there exists an isomorphism $\beta : \mathcal{L} \to \mathcal{L}'$ such that $\beta \circ \psi = \psi'$ as graded $\mathcal{O}_T$-algebra maps $f^*\mathcal{A}^{(d)} \to \bigoplus_{n \geq 0} (\mathcal{L}')^{\otimes n}$.

For each integer $d \geq 1$ we define

$$\begin{array}{rcl} F_d : Sch^{opp} & \longrightarrow & Sets, \\ T & \longmapsto & \{\text{strict equivalence classes of } (d, f : T \to S, \mathcal{L}, \psi) \text{ as above}\} \end{array}$$

with pullbacks as defined above.

Lemma 22.16.1. *In Situation 22.15.1. Let $d \geq 1$. Let F_d be the functor associated to $(S, \mathcal{A})$ above. Let $g : S' \to S$ be a morphism of schemes. Set $\mathcal{A}' = g^*\mathcal{A}$. Let F'_d be the functor associated to $(S', \mathcal{A}')$ above. Then there is a canonical isomorphism*

$$F'_d \cong h_{S'} \times_{h_S} F_d$$

of functors.

Proof. A quadruple $(d, f' : T \to S', \mathcal{L}', \psi' : (f')^*(\mathcal{A}')^{(d)} \to \bigoplus_{n \geq 0} (\mathcal{L}')^{\otimes n})$ is the same as a quadruple $(d, f, \mathcal{L}, \psi : f^*\mathcal{A}^{(d)} \to \bigoplus_{n \geq 0} \mathcal{L}^{\otimes n})$ together with a factorization of f as

$f = g \circ f'$. Namely, the correspondence is $f = g \circ f'$, $\mathcal{L} = \mathcal{L}'$ and $\psi = \psi'$ via the identifications $(f')^*(\mathcal{A}')^{(d)} = (f')^* g^*(\mathcal{A}^{(d)}) = f^*\mathcal{A}^{(d)}$. Hence the lemma. $\square$

Lemma 22.16.2. *In Situation 22.15.1. Let F_d be the functor associated to $(d, S, \mathcal{A})$ above. If S is affine, then F_d is representable by the open subscheme U_d (22.12.0.1) of the scheme $Proj(\Gamma(S, \mathcal{A}))$.*

Proof. Write $S = Spec(R)$ and $A = \Gamma(S, \mathcal{A})$. Then A is a graded R-algebra and $\mathcal{A} = \widetilde{A}$. To prove the lemma we have to identify the functor F_d with the functor $F_d^{triples}$ of triples defined in Section 22.12.

Let $(d, f : T \to S, \mathcal{L}, \psi)$ be a quadruple. We may think of ψ as a $\mathcal{O}_S$-module map $\mathcal{A}^{(d)} \to \bigoplus_{n \geq 0} f_*\mathcal{L}^{\otimes n}$. Since $\mathcal{A}^{(d)}$ is quasi-coherent this is the same thing as an R-linear homomorphism of graded rings $A^{(d)} \to \Gamma(S, \bigoplus_{n \geq 0} f_*\mathcal{L}^{\otimes n})$. Clearly, $\Gamma(S, \bigoplus_{n \geq 0} f_*\mathcal{L}^{\otimes n}) = \Gamma_*(T, \mathcal{L})$. Thus we may associate to the quadruple the triple $(d, \mathcal{L}, \psi)$.

Conversely, let $(d, \mathcal{L}, \psi)$ be a triple. The composition $R \to A_0 \to \Gamma(T, \mathcal{O}_T)$ determines a morphism $f : T \to S = Spec(R)$, see Schemes, Lemma 21.6.4. With this choice of f the map $A^{(d)} \to \Gamma(S, \bigoplus_{n \geq 0} f_*\mathcal{L}^{\otimes n})$ is R-linear, and hence corresponds to a ψ which we can use for a quadruple $(d, f : T \to S, \mathcal{L}, \psi)$. We omit the verification that this establishes an isomorphism of functors $F_d = F_d^{triples}$. $\square$

Lemma 22.16.3. *In Situation 22.15.1. The functor F_d is representable by a scheme.*

Proof. We are going to use Schemes, Lemma 21.15.4.

First we check that F_d satisfies the sheaf property for the Zariski topology. Namely, suppose that T is a scheme, that $T = \bigcup_{i \in I} U_i$ is an open covering, and that $(d, f_i, \mathcal{L}_i, \psi_i) \in F_d(U_i)$ such that $(d, f_i, \mathcal{L}_i, \psi_i)|_{U_i \cap U_j}$ and $(d, f_j, \mathcal{L}_j, \psi_j)|_{U_i \cap U_j}$ are strictly equivalent. This implies that the morphisms $f_i : U_i \to S$ glue to a morphism of schemes $f : T \to S$ such that $f|_{I_i} = f_i$, see Schemes, Section 21.14. Thus $f_i^*\mathcal{A}^{(d)} = f^*\mathcal{A}^{(d)}|_{U_i}$. It also implies there exist isomorphisms $\beta_{ij} : \mathcal{L}_i|_{U_i \cap U_j} \to \mathcal{L}_j|_{U_i \cap U_j}$ such that $\beta_{ij} \circ \psi_i = \psi_j$ on $U_i \cap U_j$. Note that the isomorphisms β_{ij} are uniquely determined by this requirement because the maps $f_i^*\mathcal{A}_d \to \mathcal{L}_i$ are surjective. In particular we see that $\beta_{jk} \circ \beta_{ij} = \beta_{ik}$ on $U_i \cap U_j \cap U_k$. Hence by Sheaves, Section 6.33 the invertible sheaves $\mathcal{L}_i$ glue to an invertible $\mathcal{O}_T$-module $\mathcal{L}$ and the morphisms ψ_i glue to morphism of $\mathcal{O}_T$-algebras $\psi : f^*\mathcal{A}^{(d)} \to \bigoplus_{n \geq 0} \mathcal{L}^{\otimes n}$. This proves that F_d satisfies the sheaf condition with respect to the Zariski topology.

Let $S = \bigcup_{i \in I} U_i$ be an affine open covering. Let $F_{d,i} \subset F_d$ be the subfunctor consisting of those pairs $(f : T \to S, \varphi)$ such that $f(T) \subset U_i$.

We have to show each $F_{d,i}$ is representable. This is the case because $F_{d,i}$ is identified with the functor associated to U_i equipped with the quasi-coherent graded $\mathcal{O}_{U_i}$-algebra $\mathcal{A}|_{U_i}$) by Lemma 22.16.1. Thus the result follows from Lemma 22.16.2.

Next we show that $F_{d,i} \subset F_d$ is representable by open immersions. Let $(f : T \to S, \varphi) \in F_d(T)$. Consider $V_i = f^{-1}(U_i)$. It follows from the definition of $F_{d,i}$ that given $a : T' \to T$ we gave $a^*(f, \varphi) \in F_{d,i}(T')$ if and only if $a(T') \subset V_i$. This is what we were required to show.

Finally, we have to show that the collection $(F_{d,i})_{i \in I}$ covers F_d. Let $(f : T \to S, \varphi) \in F_d(T)$. Consider $V_i = f^{-1}(U_i)$. Since $S = \bigcup_{i \in I} U_i$ is an open covering of S we see that $T = \bigcup_{i \in I} V_i$ is an open covering of T. Moreover $(f, \varphi)|_{V_i} \in F_{d,i}(V_i)$. This finishes the proof of the lemma. $\square$

At this point we can redo the material at the end of Section 22.12 in the current relative setting and define a functor which is representable by $\underline{\text{Proj}}_S(\mathcal{A})$. To do this we introduce the notion of equivalence between two quadruples $(d, f : T \to S, \mathcal{L}, \psi)$ and $(d', f' : T \to S, \mathcal{L}', \psi')$ with possibly different values of the integers d, d'. Namely, we say these are *equivalent* if $f = f'$, and there exists an isomorphism $\beta : \mathcal{L}^{\otimes d'} \to (\mathcal{L}')^{\otimes d}$ such that $\beta \circ \psi|_{f^*\mathcal{A}^{(dd')}} = \psi'|_{f^*\mathcal{A}^{(dd')}}$. The following lemma implies that this defines an equivalence relation. (This is not a complete triviality.)

Lemma 22.16.4. *In Situation 22.15.1. Let T be a scheme. Let $(d, f, \mathcal{L}, \psi)$, $(d', f', \mathcal{L}', \psi')$ be two quadruples over T. The following are equivalent:*

(1) *Let $m = lcm(d, d')$. Write $m = ad = a'd'$. We have $f = f'$ and there exists an isomorphism $\beta : \mathcal{L}^{\otimes a} \to (\mathcal{L}')^{\otimes a'}$ with the property that $\beta \circ \psi|_{f^*\mathcal{A}^{(m)}}$ and $\psi'|_{f^*\mathcal{A}^{(m)}}$ agree as graded ring maps $f^*\mathcal{A}^{(m)} \to \bigoplus_{n \geq 0} (\mathcal{L}')^{\otimes mn}$.*
(2) *The quadruples $(d, f, \mathcal{L}, \psi)$ and $(d', f', \mathcal{L}', \psi')$ are equivalent.*
(3) *We have $f = f'$ and for some positive integer $m = ad = a'd'$ there exists an isomorphism $\beta : \mathcal{L}^{\otimes a} \to (\mathcal{L}')^{\otimes a'}$ with the property that $\beta \circ \psi|_{f^*\mathcal{A}^{(m)}}$ and $\psi'|_{f^*\mathcal{A}^{(m)}}$ agree as graded ring maps $f^*\mathcal{A}^{(m)} \to \bigoplus_{n \geq 0} (\mathcal{L}')^{\otimes mn}$.*

Proof. Clearly (1) implies (2) and (2) implies (3) by restricting to more divisible degrees and powers of invertible sheaves. Assume (3) for some integer $m = ad = a'd'$. Let $m_0 = \text{lcm}(d, d')$ and write it as $m_0 = a_0 d = a_0' d'$. We are given an isomorphism $\beta : \mathcal{L}^{\otimes a} \to (\mathcal{L}')^{\otimes a'}$ with the property described in (3). We want to find an isomorphism $\beta_0 : \mathcal{L}^{\otimes a_0} \to (\mathcal{L}')^{\otimes a_0'}$ having that property as well. Since by assumption the maps $\psi : f^*\mathcal{A}_d \to \mathcal{L}$ and $\psi' : (f')^*\mathcal{A}_{d'} \to \mathcal{L}'$ are surjective the same is true for the maps $\psi : f^*\mathcal{A}_{m_0} \to \mathcal{L}^{\otimes a_0}$ and $\psi' : (f')^*\mathcal{A}_{m_0} \to (\mathcal{L}')^{\otimes a_0}$. Hence if β_0 exists it is uniquely determined by the condition that $\beta_0 \circ \psi = \psi'$. This means that we may work locally on T. Hence we may assume that $f = f' : T \to S$ maps into an affine open, in other words we may assume that S is affine. In this case the result follows from the corresponding result for triples (see Lemma 22.12.4) and the fact that triples and quadruples correspond in the affine base case (see proof of Lemma 22.16.2). $\square$

Suppose $d' = ad$. Consider the transformation of functors $F_d \to F_{d'}$ which assigns to the quadruple $(d, f, \mathcal{L}, \psi)$ over T the quadruple $(d', f, \mathcal{L}^{\otimes a}, \psi|_{f^*\mathcal{A}^{(d')}})$. One of the implications of Lemma 22.16.4 is that the transformation $F_d \to F_{d'}$ is injective! For a quasi-compact scheme T we define

$$F(T) = \bigcup\nolimits_{d \in \mathbf{N}} F_d(T)$$

with transition maps as explained above. This clearly defines a contravariant functor on the category of quasi-compact schemes with values in sets. For a general scheme T we define

$$F(T) = lim_{V \subset T \text{ quasi-compact open}} F(V).$$

In other words, an element ξ of $F(T)$ corresponds to a compatible system of choices of elements $\xi_V \in F(V)$ where V ranges over the quasi-compact opens of T. We omit the definition of the pullback map $F(T) \to F(T')$ for a morphism $T' \to T$ of schemes. Thus we have defined our functor

$$F : Sch^{opp} \longrightarrow Sets \qquad (22.16.4.1)$$

Lemma 22.16.5. *In Situation 22.15.1. The functor F above is representable by a scheme.*

Proof. Let $U_d \to S$ be the scheme representing the functor F_d defined above. Let $\mathcal{L}_d, \psi^d : \pi_d^*\mathcal{A}^{(d)} \to \bigoplus_{n \geq 0} \mathcal{L}_d^{\otimes n}$ be the universal object. If $d|d'$, then we may consider the quadruple $(d', \pi_d, \mathcal{L}_d^{\otimes d'/d}, \psi^d|_{\mathcal{A}^{(d')}})$ which determines a canonical morphism $U_d \to U_{d'}$ over S. By construction this morphism corresponds to the transformation of functors $F_d \to F_{d'}$ defined above.

For every affine open $Spec(R) = V \subset S$ setting $A = \Gamma(V, \mathcal{A})$ we have a canonical identification of the base change $U_{d,V}$ with the corresponding open subscheme of $\text{Proj}(A)$, see Lemma 22.16.2. Moreover, the morphisms $U_{d,V} \to U_{d',V}$ constructed above correspond to the inclusions of opens in $\text{Proj}(A)$. Thus we conclude that $U_d \to U_{d'}$ is an open immersion.

This allows us to construct X by glueing the schemes U_d along the open immersions $U_d \to U_{d'}$. Technically, it is convenient to choose a sequence $d_1|d_2|d_3|\ldots$ such that every positive integer divides one of the d_i and to simply take $X = \bigcup U_{d_i}$ using the open immersions above. It is then a simple matter to prove that X represents the functor F. □

Lemma 22.16.6. *In Situation 22.15.1. The scheme $\pi : \underline{Proj}_S(\mathcal{A}) \to S$ constructed in Lemma 22.15.4 and the scheme representing the functor F are canonically isomorphic as schemes over S.*

Proof. Let X be the scheme representing the functor F. Note that X is a scheme over S since the functor F comes equipped with a natural transformation $F \to h_S$. Write $Y = \underline{\text{Proj}}_S(\mathcal{A})$. We have to show that $X \cong Y$ as S-schemes. We give two arguments.

The first argument uses the construction of X as the union of the schemes U_d representing F_d in the proof of Lemma 22.16.5. Over each affine open of S we can identify X with the homogeneous spectrum of the sections of $\mathcal{A}$ over that open, since this was true for the opens U_d. Moreover, these identifications are compatible with further restrictions to smaller affine opens. On the other hand, Y was constructed by glueing these homogeneous spectra. Hence we can glue these isomorphisms to an isomorphism between X and $\underline{\text{Proj}}_S(\mathcal{A})$ as desired. Details omitted.

Here is the second argument. Lemma 22.15.5 shows that there exists a morphism of graded algebras

$$\psi : \pi^*\mathcal{A} \longrightarrow \bigoplus\nolimits_{n \geq 0} \mathcal{O}_Y(n)$$

over Y which on sections over affine opens of S agrees with (22.10.1.3). Hence for every $y \in Y$ there exists an open neighbourhood $V \subset Y$ of y and an integer $d \geq 1$ such that for $d|n$ the sheaf $\mathcal{O}_Y(n)|_V$ is invertible and the multiplication maps $\mathcal{O}_Y(n)|_V \otimes_{\mathcal{O}_V} \mathcal{O}_Y(m)|_V \to \mathcal{O}_Y(n+m)|_V$ are isomorphisms. Thus ψ restricted to the sheaf $\pi^*\mathcal{A}^{(d)}|_V$ gives an element of $F_d(V)$. Since the opens V cover Y we see ``ψ'' gives rise to an element of $F(Y)$. Hence a canonical morphism $Y \to X$ over S. Because this construction is completely canonical to see that it is an isomorphism we may work locally on S. Hence we reduce to the case S affine where the result is clear. □

Definition 22.16.7. Let S be a scheme. Let $\mathcal{A}$ be a quasi-coherent sheaf of graded $\mathcal{O}_S$-algebras. The *relative homogeneous spectrum of $\mathcal{A}$ over S*, or the *homogeneous spectrum of $\mathcal{A}$ over S*, or the *relative Proj of $\mathcal{A}$ over S* is the scheme constructed in Lemma 22.15.4 which represents the functor F (22.16.4.1), see Lemma 22.16.6. We denote it $\pi : \underline{\text{Proj}}_S(\mathcal{A}) \to S$.

The relative Proj comes equipped with a quasi-coherent sheaf of $\mathbf{Z}$-graded algebras $\bigoplus_{n\in\mathbf{Z}} \mathcal{O}_{\underline{\text{Proj}}_S(\mathcal{A})}(n)$ (the twists of the structure sheaf) and a ``universal'' homomorphism of graded algebras

$$\psi_{univ} : \mathcal{A} \longrightarrow \pi_*\left(\bigoplus\nolimits_{n\geq 0} \mathcal{O}_{\underline{\text{Proj}}_S(\mathcal{A})}(n)\right)$$

see Lemma 22.15.5. We may also think of this as a homomorphism

$$\psi_{univ} : \pi^*\mathcal{A} \longrightarrow \bigoplus\nolimits_{n\geq 0} \mathcal{O}_{\underline{\text{Proj}}_S(\mathcal{A})}(n)$$

if we like. The following lemma is a formulation of the universality of this object.

Lemma 22.16.8. *In Situation 22.15.1. Let $(f : T \to S, d, \mathcal{L}, \psi)$ be a quadruple. Let $r_{d,\mathcal{L},\psi} : T \to \underline{Proj}_S(\mathcal{A})$ be the associated S-morphism. There exists an isomorphism of $\mathbf{Z}$-graded $\mathcal{O}_T$-algebras*

$$\theta : r^*_{d,\mathcal{L},\psi}\left(\bigoplus\nolimits_{n\in\mathbf{Z}} \mathcal{O}_{\underline{Proj}_S(\mathcal{A})}(nd)\right) \longrightarrow \bigoplus\nolimits_{n\in\mathbf{Z}} \mathcal{L}^{\otimes n}$$

such that the following diagram commutes

$$\begin{tikzcd}
\mathcal{A}^{(d)} \arrow[rr, "\psi"] \arrow[dr, "\psi_{univ}"'] & & f_*\left(\bigoplus_{n\in\mathbf{Z}} \mathcal{L}^{\otimes n}\right) \\
& \pi_*\left(\bigoplus_{n\geq 0} \mathcal{O}_{\underline{Proj}_S(\mathcal{A})}(nd)\right) \arrow[ur, "\theta"'] &
\end{tikzcd}$$

The commutativity of this diagram uniquely determines θ.

Proof. Note that the quadruple $(f : T \to S, d, \mathcal{L}, \psi)$ defines an element of $F_d(T)$. Let $U_d \subset \underline{\text{Proj}}_S(\mathcal{A})$ be the locus where the sheaf $\mathcal{O}_{\underline{\text{Proj}}_S(\mathcal{A})}(d)$ is invertible and generated by the image of $\psi_{univ} : \pi^*\mathcal{A}_d \to \mathcal{O}_{\underline{\text{Proj}}_S(\mathcal{A})}(d)$. Recall that U_d represents the functor F_d, see the proof of Lemma 22.16.5. Hence the result will follow if we can show the quadruple $(U_d \to S, d, \mathcal{O}_{U_d}(d), \psi_{univ}|_{\mathcal{A}^{(d)}})$ is the universal family, i.e., the representing object in $F_d(U_d)$. We may do this after restricting to an affine open of S because (a) the formation of the functors F_d commutes with base change (see Lemma 22.16.1), and (b) the pair $(\bigoplus_{n\in\mathbf{Z}} \mathcal{O}_{\underline{\text{Proj}}_S(\mathcal{A})}(n), \psi_{univ})$ is constructed by glueing over affine opens in S (see Lemma 22.15.5). Hence we may assume that S is affine. In this case the functor of quadruples F_d and the functor of triples F_d agree (see proof of Lemma 22.16.2) and moreover Lemma 22.12.2 shows that $(d, \mathcal{O}_{U_d}(d), \psi^d)$ is the universal triple over U_d. Going backwards through the identifications in the proof of Lemma 22.16.2 shows that $(U_d \to S, d, \mathcal{O}_{U_d}(d), \psi_{univ}|_{\mathcal{A}^{(d)}})$ is the universal quadruple as desired. $\square$

Lemma 22.16.9. *Let S be a scheme and $\mathcal{A}$ be a quasi-coherent sheaf of graded $\mathcal{O}_S$-algebras. The morphism $\pi : \underline{Proj}_S(\mathcal{A}) \to S$ is separated.*

Proof. To prove a morphism is separated we may work locally on the base, see Schemes, Section 21.21. By construction $\underline{\text{Proj}}_S(\mathcal{A})$ is over any affine $U \subset S$ isomorphic to $\text{Proj}(A)$ with $A = \mathcal{A}(U)$. By Lemma 22.8.8 we see that $\text{Proj}(A)$ is separated. Hence $\text{Proj}(A) \to U$ is separated (see Schemes, Lemma 21.21.14) as desired. $\square$

Lemma 22.16.10. *Let S be a scheme and $\mathcal{A}$ be a quasi-coherent sheaf of graded $\mathcal{O}_S$-algebras. Let $g : S' \to S$ be any morphism of schemes. Then there is a canonical isomorphism*

$$\underline{Proj}_{S'}(g^*\mathcal{A}) \longrightarrow S' \times_S \underline{Proj}_S(\mathcal{A})$$

Proof. This follows from Lemma 22.16.1 and the construction of $\underline{\text{Proj}}_S(\mathcal{A})$ in Lemma 22.16.5 as the union of the schemes U_d representing the functors F_d. $\square$

Lemma 22.16.11. *Let S be a scheme. Let $\mathcal{A}$ be a quasi-coherent sheaf of graded $\mathcal{O}_S$-modules generated as an $\mathcal{A}_0$-algebra by $\mathcal{A}_1$. In this case the scheme $X = \underline{Proj}_S(\mathcal{A})$ represents the functor F_1 which associates to a scheme $f : T \to S$ over S the set of pairs $(\mathcal{L}, \psi)$, where*

1. *$\mathcal{L}$ is an invertible $\mathcal{O}_T$-module, and*
2. *$\psi : f^*\mathcal{A} \to \bigoplus_{n\geq 0} \mathcal{L}^{\otimes n}$ is a graded $\mathcal{O}_T$-algebra homomorphism such that $f^*\mathcal{A}_1 \to \mathcal{L}$ is surjective*

up to strict equivalence as above. Moreover, in this case all the quasi-coherent sheaves $\mathcal{O}_{\underline{Proj}(\mathcal{A})}(n)$ are invertible $\mathcal{O}_{\underline{Proj}(\mathcal{A})}$-modules and the multiplication maps induce isomorphsms $\mathcal{O}_{\underline{Proj}(\mathcal{A})}(n) \otimes_{\mathcal{O}_{\underline{Proj}(\mathcal{A})}} \mathcal{O}_{\underline{Proj}(\mathcal{A})}(m) = \mathcal{O}_{\underline{Proj}(\mathcal{A})}(n+m)$.

Proof. Under the assumptions of the lemma the sheaves $\mathcal{O}_{\underline{\text{Proj}}(\mathcal{A})}(n)$ are invertible and the multiplication maps isomorphisms by Lemma 22.16.5 and Lemma 22.12.3 over affine opens of S. Thus X actually represents the functor F_1, see proof of Lemma 22.16.5. $\square$

22.17. Quasi-coherent sheaves on relative Proj

We briefly discuss how to deal with graded modules in the relative setting.

We plave ourselves in Situation 22.15.1. So S is a scheme, and $\mathcal{A}$ is a quasi-coherent graded $\mathcal{O}_S$-algebra. Let $\mathcal{M} = \bigoplus_{n\in\mathbf{Z}} \mathcal{M}_n$ be a graded $\mathcal{A}$-module, quasi-coherent as an $\mathcal{O}_S$-module. We are going to describe the associated quasi-coherent sheaf of modules on $\underline{\text{Proj}}_S(\mathcal{A})$. We first describe the value of this sheaf schemes T mapping into the relative Proj.

Let T be a scheme. Let $(d, f : T \to S, \mathcal{L}, \psi)$ be a quadruple over T, as in Section 22.16. We define a quasi-coherent sheaf $\widetilde{\mathcal{M}}_T$ of $\mathcal{O}_T$-modules as follows

$$\widetilde{\mathcal{M}}_T = \left(f^*\mathcal{M}^{(d)} \otimes_{f^*\mathcal{A}^{(d)}} \left(\bigoplus\nolimits_{n\in\mathbf{Z}} \mathcal{L}^{\otimes n}\right)\right)_0 \quad (22.17.0.1)$$

So $\widetilde{\mathcal{M}}_T$ is the degree 0 part of the tensor product of the graded $f^*\mathcal{A}^{(d)}$-modules $\mathcal{M}^{(d)}$ and $\bigoplus_{n\in\mathbf{Z}} \mathcal{L}^{\otimes n}$. Note that the sheaf $\widetilde{\mathcal{M}}_T$ depends on the quadruple even though we suppressed this in the notation. This construction has the pleasing property that given any morphism $g : T' \to T$ we have $\widetilde{\mathcal{M}}_{T'} = g^*\widetilde{\mathcal{M}}_T$ where $\widetilde{\mathcal{M}}_{T'}$ denotes the quasi-coherent sheaf associated to the pullback quadruple $(d, f \circ g, g^*\mathcal{L}, g^*\psi)$.

Since all sheaves in (22.17.0.1) are quasi-coherent we can spell out the construction over an affine open $Spec(C) = V \subset T$ which maps into an affine open $Spec(R) = U \subset S$. Namely, suppose that $\mathcal{A}|_U$ corresponds to the graded R-algebra A, that $\mathcal{M}|_U$ corresponds to the graded A-module M, and that $\mathcal{L}|_V$ corresponds to the invertible C-module L. The map ψ gives rise to a graded R-algebra map $\gamma : A^{(d)} \to \bigoplus_{n\geq 0} L^{\otimes n}$. (Tensor powers of L over C.) Then $(\widetilde{\mathcal{M}}_T)|_V$ is the quasi-coherent sheaf associated to the C-module

$$N_{R,C,A,M,\gamma} = \left(M^{(d)} \otimes_{A^{(d)},\gamma} \left(\bigoplus\nolimits_{n\in\mathbf{Z}} L^{\otimes n}\right)\right)_0$$

By assumption we may even cover T by affine opens V such that there exists some $a \in A_d$ such that $\gamma(a) \in L$ is a C-basis for the module L. In that case any element of $N_{R,C,A,M,\gamma}$ is a sum of pure tensors $\sum m_i \otimes \gamma(a)^{-n_i}$ with $m \in M_{n_i d}$. In fact we may multiply each m_i with a suitable positive power of a and collect terms to see that each element of $N_{R,C,A,M,\gamma}$ can be written as $m \otimes \gamma(a)^{-n}$ with $m \in M_{nd}$ and $n \gg 0$. In other words we see that in this case

$$N_{R,C,A,M,\gamma} = M_{(a)} \otimes_{A_{(a)}} C$$

where the map $A_{(a)} \to C$ is the map $x/a^n \mapsto \gamma(x)/\gamma(a)^n$. In other words, this is the value of $\widetilde{M}$ on $D_+(a) \subset \text{Proj}(A)$ pulled back to $Spec(C)$ via the morphism $Spec(C) \to D_+(a)$ coming from γ.

Lemma 22.17.1. *In Situation 22.15.1. For any quasi-coherent sheaf of graded $\mathcal{A}$-modules $\mathcal{M}$ on S, there exists a canonical associated sheaf of $\mathcal{O}_{\underline{Proj}_S(\mathcal{A})}$-modules $\widetilde{\mathcal{M}}$ with the following properties:*

(1) *Given a scheme T and a quadruple $(T \to S, d, \mathcal{L}, \psi)$ over T corresponding to a morphism $h : T \to \underline{Proj}_S(\mathcal{A})$ there is a canonical isomorphism $\widetilde{\mathcal{M}}_T = h^*\widetilde{\mathcal{M}}$ where $\widetilde{\mathcal{M}}_T$ is defined by (22.17.0.1).*
(2) *The isomorphisms of (1) are compatible with pullbacks.*
(3) *There is a canonical map*

$$\pi^*\mathcal{M}_0 \longrightarrow \widetilde{\mathcal{M}}.$$

(4) *The construction $\mathcal{M} \mapsto \widetilde{\mathcal{M}}$ is functorial in $\mathcal{M}$.*
(5) *The construction $\mathcal{M} \mapsto \widetilde{\mathcal{M}}$ is exact.*
(6) *There are canonical maps*

$$\widetilde{\mathcal{M}} \otimes_{\mathcal{O}_{\underline{Proj}_S(\mathcal{A})}} \widetilde{\mathcal{N}} \longrightarrow \widetilde{\mathcal{M} \otimes_{\mathcal{A}} \mathcal{N}}$$

as in Lemma 22.9.1.
(7) *There exist canonical maps*

$$\pi^*\mathcal{M} \longrightarrow \bigoplus\nolimits_{n \in \mathbf{Z}} \widetilde{\mathcal{M}(n)}$$

generalizing (22.10.1.6).
(8) *The formation of $\widetilde{\mathcal{M}}$ commutes with base change.*

Proof. Omitted. We should split this lemma into parts and prove the parts separately. □

22.18. Invertible sheaves and morphisms into relative Proj

It seems that we may need the following lemma somewhere. The situation is the following:

(1) Let S be a scheme.
(2) Let $\mathcal{A}$ be a quasi-coherent graded $\mathcal{O}_S$-algebra.
(3) Denote $\pi : \underline{\text{Proj}}_S(\mathcal{A}) \to S$ the relative homogeneous spectrum over S.
(4) Let $f : X \to S$ be a morphism of schemes.
(5) Let $\mathcal{L}$ be an invertible $\mathcal{O}_X$-module.
(6) Let $\psi : f^*\mathcal{A} \to \bigoplus_{d \geq 0} \mathcal{L}^{\otimes d}$ be a homomorphism of graded $\mathcal{O}_X$-algebras.

Given this data set

$$U(\psi) = \bigcup\nolimits_{(U,V,a)} U_{\psi(a)}$$

where (U, V, a) satisfies:

(1) $V \subset S$ affine open,
(2) $U = f^{-1}(V)$, and
(3) $a \in \mathcal{A}(V)_+$ is homogeneous.

Namely, then $\psi(a) \in \Gamma(U, \mathcal{L}^{\otimes \deg(a)})$ and $U_{\psi(a)}$ is the corresponding open (see Modules, Lemma 15.21.7).

Lemma 22.18.1. *With assumptions and notation as above. The morphism ψ induces a canonical morphism of schemes over S*

$$r_{\mathcal{L},\psi} : U(\psi) \longrightarrow \underline{Proj}_S(\mathcal{A})$$

together with a map of graded $\mathcal{O}_{U(\psi)}$-algebras

$$\theta : r^*_{\mathcal{L},\psi}\left(\bigoplus\nolimits_{d\geq 0} \mathcal{O}_{\underline{Proj}_S(\mathcal{A})}(d)\right) \longrightarrow \bigoplus\nolimits_{d\geq 0} \mathcal{L}^{\otimes d}|_{U(\psi)}$$

characterized by the following properties:

(1) *For every open $V \subset S$ and every $d \geq 0$ the diagram*

$$\begin{CD} \mathcal{A}_d(V) @>{\psi}>> \Gamma(f^{-1}(V), \mathcal{L}^{\otimes d}) \\ @V{\psi}VV @VV{restrict}V \\ \Gamma(\pi^{-1}(V), \mathcal{O}_{\underline{Proj}_S(\mathcal{A})}(d)) @>{\theta}>> \Gamma(f^{-1}(V) \cap U(\psi), \mathcal{L}^{\otimes d}) \end{CD}$$

is commutative.

(2) *For any $d \geq 1$ and any open subscheme $W \subset X$ such that $\psi|_W : f^*\mathcal{A}_d|_W \to \mathcal{L}^{\otimes d}|_W$ is surjective the restriction of the morphism $r_{\mathcal{L},\psi}$ agrees with the morphism $W \to \underline{Proj}_S(\mathcal{A})$ which exists by the construction of the relative homogeneous spectrum, see Definition 22.16.7.*

(3) *For any affine open $V \subset S$, the restriction*

$$(U(\psi) \cap f^{-1}(V), r_{\mathcal{L},\psi}|_{U(\psi)\cap f^{-1}(V)}, \theta|_{U(\psi)\cap f^{-1}(V)})$$

agrees via i_V (see Lemma 22.15.4) with the triple $(U(\psi'), r_{\mathcal{L},\psi'}, \theta')$ of Lemma 22.14.1 associated to the map $\psi' : A = \mathcal{A}(V) \to \Gamma_*(f^{-1}(V), \mathcal{L}|_{f^{-1}(V)})$ induced by ψ.

Proof. Use characterization (3) to construct the morphism $r_{\mathcal{L},\psi}$ and θ locally over S. Use the uniqueness of Lemma 22.14.1 to show that the construction glues. Details omitted. $\square$

22.19. Twisting by invertible sheaves and relative Proj

Let S be a scheme. Let $\mathcal{A} = \bigoplus_{d\geq 0} \mathcal{A}_d$ be a quasi-coherent graded $\mathcal{O}_S$-algebra. Let $\mathcal{L}$ be an invertible sheaf on S. In this situation we obtain another quasi-coherent graded $\mathcal{O}_S$-algebra, namely

$$\mathcal{B} = \bigoplus\nolimits_{d\geq 0} \mathcal{A}_d \otimes_{\mathcal{O}_S} \mathcal{L}^{\otimes d}$$

It turns out that $\mathcal{A}$ and $\mathcal{B}$ have isomorphic relative homogeneous spectra.

Lemma 22.19.1. *With notation S, $\mathcal{A}$, $\mathcal{L}$ and $\mathcal{B}$ as above. There is a canonical isomorphism*

$$\begin{tikzcd} P = \underline{Proj}_S(\mathcal{A}) \arrow[rr, "g"] \arrow[dr, "\pi"'] & & \underline{Proj}_S(\mathcal{B}) = P' \arrow[dl, "\pi'"] \\ & S & \end{tikzcd}$$

with the following properties

(1) *There are isomorphisms* $\theta_n : g^*\mathcal{O}_{P'}(n) \to \mathcal{O}_P(n) \otimes \pi^*\mathcal{L}^{\otimes n}$ *which fit together to give an isomorphism of* $\mathbf{Z}$*-graded algebras*

$$\theta : g^*\left(\bigoplus\nolimits_{n\in\mathbf{Z}} \mathcal{O}_{P'}(n)\right) \longrightarrow \bigoplus\nolimits_{n\in\mathbf{Z}} \mathcal{O}_P(n) \otimes \pi^*\mathcal{L}^{\otimes n}$$

(2) *For every open* $V \subset S$ *the diagrams*

$$\begin{tikzcd} \mathcal{A}_n(V) \otimes \mathcal{L}^{\otimes n}(V) \arrow[rr, "multiply"'] \arrow[d, "\psi\otimes\pi^*"] & & \mathcal{B}_n(V) \arrow[dd, "\psi"] \\ \Gamma(\pi^{-1}V, \mathcal{O}_P(n)) \otimes \Gamma(\pi^{-1}V, \pi^*\mathcal{L}^{\otimes n}) \arrow[d, "multiply"] & & \\ \Gamma(\pi^{-1}V, \mathcal{O}_P(n) \otimes \pi^*\mathcal{L}^{\otimes n}) & & \Gamma(\pi'^{-1}V, \mathcal{O}_{P'}(n)) \arrow[ll, "\theta_n"'] \end{tikzcd}$$

are commutative.

(3) *Add more here as necessary.*

Proof. This is the identity map when $\mathcal{L} \cong \mathcal{O}_S$. In general choose an open covering of S such that $\mathcal{L}$ is trivialized over the pieces and glue the corresponding maps. Details omitted. □

22.20. Projective bundles

Let S be a scheme. Let $\mathcal{E}$ be a quasi-coherent sheaf of $\mathcal{O}_S$-modules. By Modules, Lemma 15.18.6 the symmetric algebra $\mathrm{Sym}(\mathcal{E})$ of $\mathcal{E}$ over $\mathcal{O}_S$ is a quasi-coherent sheaf of $\mathcal{O}_S$-algebras. Note that it is generated in degree 1 over $\mathcal{O}_S$. Hence it makes sense to apply the construction of the previous section to it, specifically Lemmas 22.16.5 and 22.16.11.

Definition 22.20.1. Let S be a scheme. Let $\mathcal{E}$ be a quasi-coherent $\mathcal{O}_S$-module[3]. We denote

$$\pi : \mathbf{P}(\mathcal{E}) = \underline{\mathrm{Proj}}_S(\mathrm{Sym}(\mathcal{E})) \longrightarrow S$$

and we call it the *projective bundle associated to* $\mathcal{E}$. The symbol $\mathcal{O}_{\mathbf{P}(\mathcal{E})}(n)$ indicates the invertible $\mathcal{O}_{\mathbf{P}(\mathcal{E})}$-modules introduced in Lemma 22.16.5 and is called the nth *twist of the structure sheaf*.

Note that according to Lemma 22.16.5 there are canonical $\mathcal{O}_S$-module homomorphisms

$$\mathrm{Sym}^n(\mathcal{E}) \longrightarrow \pi_*(\mathcal{O}_{\mathbf{P}(\mathcal{E})}(n))$$

for all $n \geq 0$. This, combined with the fact that $\mathcal{O}_{\mathbf{P}(\mathcal{E})}(1)$ is the canonical relatively ample invertible sheaf on $\mathbf{P}(\mathcal{E})$, is a good way to remember how we have normalized our construction of $\mathbf{P}(\mathcal{E})$. Namely, in some references the space $\mathbf{P}(\mathcal{E})$ is only defined for $\mathcal{E}$ finite locally free on S, and sometimes $\mathbf{P}(\mathcal{E})$ is actually defined as our $\mathbf{P}(\mathcal{E}^\wedge)$ where $\mathcal{E}^\wedge$ is the dual of the sheaf $\mathcal{E}$.

Example 22.20.2. The map $\mathrm{Sym}^n(\mathcal{E}) \to \pi_*(\mathcal{O}_{\mathbf{P}(\mathcal{E})}(n))$ is an isomorphism if $\mathcal{E}$ is locally free, but in general need not be an isomorphism. In fact we will give an example where this map is not injective for $n = 1$. Set $S = Spec(A)$ with

$$A = k[u, v, s_1, s_2, t_1, t_2]/I$$

[3]The reader may expect here the condition that $\mathcal{E}$ is finite locally free. We do not do so in order to be consistent with [**DG67**, II, Definition 4.1.1].

where k is a field and

$$I = (-us_1 + vt_1 + ut_2, vs_1 + us_2 - vt_2, vs_2, ut_1).$$

Denote $\overline{u}$ the class of u in A and similarly for the other variables. Let $M = (Ax \oplus Ay)/A(\overline{u}x + \overline{v}y)$ so that

$$\mathrm{Sym}(M) = A[x, y]/(\overline{u}x + \overline{v}y) = k[x, y, u, v, s_1, s_2, t_1, t_2]/J$$

where

$$J = (-us_1 + vt_1 + ut_2, vs_1 + us_2 - vt_2, vs_2, ut_1, ux + vy).$$

In this case the projective bundle associated to the quasi-coherent sheaf $\mathcal{E} = \widetilde{M}$ on $S = Spec(A)$ is the scheme

$$P = \mathrm{Proj}(\mathrm{Sym}(M)).$$

Note that this scheme as an affine open covering $P = D_+(x) \cup D_+(y)$. Consider the element $m \in M$ which is the image of the element $us_1x + vt_2y$. Note that

$$x(us_1x + vt_2y) = (s_1x + s_2y)(ux + vy) \bmod I$$

and

$$y(us_1x + vt_2y) = (t_1x + t_2y)(ux + vy) \bmod I.$$

The first equation implies that m maps to zero as a section of $\mathcal{O}_P(1)$ on $D_+(x)$ and the second that it maps to zero as a section of $\mathcal{O}_P(1)$ on $D_+(y)$. This shows that m maps to zero in $\Gamma(P, \mathcal{O}_P(1))$. On the other hand we claim that $m \neq 0$, so that m gives an example of a nonzero global section of $\mathcal{E}$ mapping to zero in $\Gamma(P, \mathcal{O}_P(1))$. Assume $m = 0$ to get a contradiction. In this case there exists an element $f \in k[u, v, s_1, s_2, t_1, t_2]$ such that

$$us_1x + vt_2y = f(ux + vy) \bmod I$$

Since I is generated by homogeneous polynomials of degree 2 we may decompose f into its homogeneous components and take the degree 1 component. In other words we may assume that

$$f = au + bv + \alpha_1 s_1 + \alpha_2 s_2 + \beta_1 t_1 + \beta_2 t_2$$

for some $a, b, \alpha_1, \alpha_2, \beta_1, \beta_2 \in k$. The resulting conditions are that

$$\begin{aligned} us_1 - u(au + bv + \alpha_1 s_1 + \alpha_2 s_2 + \beta_1 t_1 + \beta_2 t_2) &\in I \\ vt_2 - v(au + bv + \alpha_1 s_1 + \alpha_2 s_2 + \beta_1 t_1 + \beta_2 t_2) &\in I \end{aligned}$$

There are no terms u^2, uv, v^2 in the generators of I and hence we see $a = b = 0$. Thus we get the relations

$$\begin{aligned} us_1 - u(\alpha_1 s_1 + \alpha_2 s_2 + \beta_1 t_1 + \beta_2 t_2) &\in I \\ vt_2 - v(\alpha_1 s_1 + \alpha_2 s_2 + \beta_1 t_1 + \beta_2 t_2) &\in I \end{aligned}$$

We may use the first generator of I to replace any occurence of us_1 by $vt_1 + ut_2$, the second generator of I to replace any occurence of vs_1 by $-us_2 + vt_2$, the third generator to remove occurences of vs_2 and the third to remove occurences of ut_1. Then we get the relations

$$\begin{aligned} (1 - \alpha_1)vt_1 + (1 - \alpha_1)ut_2 - \alpha_2 us_2 - \beta_2 ut_2 &= 0 \\ (1 - \alpha_1)vt_2 + \alpha_1 us_2 - \beta_1 vt_1 - \beta_2 vt_2 &= 0 \end{aligned}$$

This implies that α_1 should be both 0 and 1 which is a contradiction as desired.

Lemma 22.20.3. *Let S be a scheme. The structure morphism $\mathbf{P}(\mathcal{E}) \to S$ of a projective bundle over S is separated.*

Proof. Immediate from Lemma 22.16.9. $\square$

Lemma 22.20.4. *Let S be a scheme. Let $n \geq 0$. Then $\mathbf{P}^n_S$ is a projective bundle over S.*

Proof. Note that

$$\mathbf{P}^n_{\mathbf{Z}} = \text{Proj}(\mathbf{Z}[T_0, \ldots, T_n]) = \underline{\text{Proj}}_{Spec(\mathbf{Z})}\left(\widetilde{\mathbf{Z}[T_0, \ldots, T_n]}\right)$$

where the grading on the ring $\mathbf{Z}[T_0, \ldots, T_n]$ is given by $\deg(T_i) = 1$ and the elements of $\mathbf{Z}$ are in degree 0. Recall that $\mathbf{P}^n_S$ is defined as $\mathbf{P}^n_{\mathbf{Z}} \times_{Spec(\mathbf{Z})} S$. Moreover, forming the relative homogeneous spectrum commutes with base change, see Lemma 22.16.10. For any scheme $g : S \to Spec(\mathbf{Z})$ we have $g^*\mathcal{O}_{Spec(\mathbf{Z})}[T_0, \ldots, T_n] = \mathcal{O}_S[T_0, \ldots, T_n]$. Combining the above we see that

$$\mathbf{P}^n_S = \underline{\text{Proj}}_S(\mathcal{O}_S[T_0, \ldots, T_n]).$$

Finally, note that $\mathcal{O}_S[T_0, \ldots, T_n] = \text{Sym}(\mathcal{O}_S^{\oplus n+1})$. Hence we see that $\mathbf{P}^n_S$ is a projective bundle over S. □

22.21. Blowing up

Definition 22.21.1. Let X be a scheme. Let $\mathcal{I} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals, and let $Z \subset X$ be the closed subscheme corresponding to $\mathcal{I}$, see Schemes, Definition 21.10.2. The *blowing up of X along Z*, or the *blowing up of X in the ideal sheaf $\mathcal{I}$* is the morphism

$$b : \underline{\text{Proj}}_X\left(\bigoplus\nolimits_{n \geq 0} \mathcal{I}^n\right) \longrightarrow X$$

We will see later, that blowing up turns any closed subscheme into an effective Cartier divisor, see Divisors, Lemma 26.9.18.

Lemma 22.21.2. *Let X be a scheme. Let $\mathcal{I} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals. If X is integral, then the blow up X' of X in $\mathcal{I}$ is integral.*

Proof. If A is a domain, and $I \subset A$ an ideal, then $\bigoplus_{n \geq 0} I^n$ is a domain. Details omitted. □

CHAPTER 23

Properties of Schemes

23.1. Introduction

In this chapter we introduce some absolute properties of schemes. A foundational reference is [**DG67**].

23.2. Constructible sets

Constructible and locally construcible sets are introduced in Topology, Section 5.10. We may characterize locally constructible subsets of schemes as follows.

Lemma 23.2.1. *Let X be a scheme. A subset E of X is locally constructible in X if and only if $E \cap U$ is constructible in U for every affine open U of X.*

Proof. Assume E is locally constructible. Then there exists an open covering $X = \bigcup U_i$ such that $E \cap U_i$ is constructible in U_i for each i. Let $V \subset X$ be any affine open. We can find a finite open affine covering $V = V_1 \cup \ldots \cup V_m$ such that for each j we have $V_j \subset U_i$ for some $i = i(j)$. By Topology, Lemma 5.10.4 we see that each $E \cap V_j$ is construcible in V_j. Since the inclusions $V_j \to V$ are quasi-compact (see Schemes, Lemma 21.19.2) we conclude that $E \cap V$ is constructible in V by Topology, Lemma 5.10.5. The converse implication is immediate. □

Lemma 23.2.2. *Let X be a quasi-separated scheme. The intersection of any two quasi-compact opens of X is a quasi-compact open of X. Every quasi-compact open of X is retrocompact in X.*

Proof. If U and V are quasi-compact open then $U \cap V = \Delta^{-1}(U \times V)$, where $\Delta : X \to X \times X$ is the diagonal. As X is quasi-separated we see that Δ is quasi-compact. Hence we see that $U \cap V$ is quasi-compact as $U \times V$ is quasi-compact (details omitted; use Schemes, Lemma 21.17.4 to see $U \times V$ is a finite union of affines). The second assertion follows from the first and the definitions. □

Lemma 23.2.3. *Let X be a quasi-compact and quasi-separated scheme. Any locally constructible subset of X is constructible.*

Proof. As X is quasi-compact we can choose a finite affine open covering $X = V_1 \cup \ldots \cup V_m$. As X is quasi-separated each V_i is retrocompact in X by Lemma 23.2.2. Hence by Topology, Lemma 5.10.5 we see that $E \subset X$ is constructible in X if and only if $E \cap V_j$ is constructible in V_j. Thus we win by Lemma 23.2.1. □

23.3. Integral, irreducible, and reduced schemes

Definition 23.3.1. Let X be a scheme. We say X is *integral* if it is nonempty and for every nonempty affine open $Spec(R) = U \subset X$ the ring R is an integral domain.

Lemma 23.3.2. *Let X be a scheme. The following are equivalent.*

(1) *The scheme X is reduced, see Schemes, Definition 21.12.1.*
(2) *There exists an affine open covering $X = \bigcup U_i$ such that each $\Gamma(U_i, \mathcal{O}_X)$ is reduced.*
(3) *For every affine open $U \subset X$ the ring $\mathcal{O}_X(U)$ is reduced.*
(4) *For every open $U \subset X$ the ring $\mathcal{O}_X(U)$ is reduced.*

Proof. See Schemes, Lemmas 21.12.2 and 21.12.3. □

Lemma 23.3.3. *Let X be a scheme. The following are equivalent.*
(1) *The scheme X is irreducible.*
(2) *There exists an affine open covering $X = \bigcup_{i \in I} U_i$ such that I is not empty, U_i is irreducible for all $i \in I$, and $U_i \cap U_j \neq \emptyset$ for all $i, j \in I$.*
(3) *The scheme X is nonempty and every nonempty affine open $U \subset X$ is irreducible.*

Proof. Assume (1). By Schemes, Lemma 21.11.1 we see that X has a unique generic point η. Then $X = \overline{\{\eta\}}$. Hence η is an element of every nonempty affine open $U \subset X$. This implies that $U = \overline{\{\eta\}}$ and that any two nonempty affines meet. Thus (1) implies both (2) and (3).

Assume (2). Suppose $X = Z_1 \cup Z_2$ is a union of two closed subsets. For every i we see that either $U_i \subset Z_1$ or $U_i \subset Z_2$. Pick some $i \in I$ and assume $U_i \subset Z_1$ (possibly after renumbering Z_1, Z_2). For any $j \in I$ the open subset $U_i \cap U_j$ is dense in U_j and contained in the closed subset $Z_1 \cap U_j$. We conclude that also $U_j \subset Z_1$. Thus $X = Z_1$ as desired.

Assume (3). Choose an affine open covering $X = \bigcup_{i \in I} U_i$. We may assume that each U_i is nonempty. Since X is nonempty we see that I is not empty. By assumption each U_i is irreducible. Suppose $U_i \cap U_j = \emptyset$ for some pair $i, j \in I$. Then the open $U_i \coprod U_j = U_i \cup U_j$ is affine, see Schemes, Lemma 21.6.8. Hence it is irreducible by assumption which is absurd. We conclude that (3) implies (2). The lemma is proved. □

Lemma 23.3.4. *A scheme X is integral if and only if it is reduced and irreducible.*

Proof. If X is irreducible, then every affine open $Spec(R) = U \subset X$ is irreducible. If X is reduced, then R is reduced, by Lemma 23.3.2 above. Hence R is reduced and (0) is a prime ideal, i.e., R is an integral domain.

If X is integral, then for every nonempty affine open $Spec(R) = U \subset X$ the ring R is reduced and hence X is reduced by Lemma 23.3.2. Moreover, every nonempty affine open is irreducible. Hence X is irreducible, see Lemma 23.3.3. □

Example 23.3.5. We give an example of an affine scheme $X = Spec(A)$ which is connected, all of whose local rings are domains, but which is not integral. Connectedness for A means A has no nontrivial idempotents, see Algebra, Lemma 7.18.3. Integrality means A is a domain (see above). Local rings being domains means that whenever $fg = 0$ in A, every point of X has a neighborhood where either f or g vanishes.

Roughly speaking, the construction is as follows: let X_0 be the cross (the union of coordinate axes) on the affine plane. Then let X_1 be the (reduced) full preimage of X_0 on the blow-up of the plane (X_1 has three rational components forming a chain). Then blow up the resulting surface at the two singularities of X_1, and let X_2 be the reduced preimage of X_1 (which has five rational components), etc. Take X to be the inverse limit. The only problem with this construction is that blow-ups glue in a projective line, so X_1 is not affine. Let us correct this by glueing in an affine line instead (so our scheme will be an open subset in what was described above).

Here is a completely algebraic construction: For every $k \geq 0$, let A_k be the following ring: its elements are collections of polynomials $p_i \in \mathbf{C}[x]$ where $i = 0, \ldots, 2^k$ such that $p_i(1) = p_{i+1}(0)$. Set $X_k = Spec(A_k)$. Observe that X_k is a union of $2^k + 1$ affine lines that meet transversally in a chain. Define a ring homomorphism $A_k \to A_{k+1}$ by

$$(p_0, \ldots, p_{2^k}) \longmapsto (p_0, p_0(1), p_1, p_1(1), \ldots, p_{2^k}),$$

in other words, every other polynomial is constant. This identifies A_k with a subring of A_{k+1}. Let A be the direct limit of A_k (basically, their union). Set $X = Spec(A)$. For every k, we have a natural embedding $A_k \to A$, that is, a map $X \to X_k$. Each A_k is connected but not integral; this implies that A is connected but not integral. It remains to show that the local rings of A are domains.

Take $f, g \in A$ with $fg = 0$ and $x \in X$. Let us construct a neighborhood of x on which one of f and g vanishes. Choose k such that $f, g \in A_{k-1}$ (note the $k - 1$ index). Let y be the image of x in X_k. It suffices to prove that y has a neighborhood on which either f or g viewed as sections of $\mathcal{O}_{X_k}$ vanishes. If y is a smooth point of X_k, that is, it lies on only one of the $2^k + 1$ lines, this is obvious. We can therefore assume that y is one of the 2^k singular points, so two components of X_k pass through y. However, on one of these two components (the one with odd index), both f and g are constant, since they are pullbacks of functions on X_{k-1}. Since $fg = 0$ everywhere, either f or g (say, f) vanishes on the other component. This implies that f vanishes on both components, as required.

23.4. Types of schemes defined by properties of rings

In this section we study what properties of rings allow one to define local properties of schemes.

Definition 23.4.1. Let P be a property of rings. We say that P is *local* if the following hold:

(1) For any ring R, and any $f \in R$ we have $P(R) \Rightarrow P(R_f)$.
(2) For any ring R, and $f_i \in R$ such that $(f_1, \ldots, f_n) = R$ then $\forall i, P(R_{f_i}) \Rightarrow P(R)$.

Definition 23.4.2. Let P be a property of rings. Let X be a scheme. We say X is *locally P* if for any $x \in X$ there exists an affine open neighbourhood U of x in X such that $\mathcal{O}_X(U)$ has property P.

This is only a good notion if the property is local. Even if P is a local property we will not automatically use this definition to say that a scheme is ``locally P'' unless we also explicitly state the definition elsewhere.

Lemma 23.4.3. *Let X be a scheme. Let P be a local property of rings. The following are equivalent:*

(1) *The scheme X is locally P.*
(2) *For every affine open $U \subset X$ the property $P(\mathcal{O}_X(U))$ holds.*
(3) *There exists an affine open covering $X = \bigcup U_i$ such that each $\mathcal{O}_X(U_i)$ satisfies P.*
(4) *There exists an open covering $X = \bigcup X_j$ such that each open subscheme X_j is locally P.*

Moreover, if X is locally P then every open subscheme is locally P.

Proof. Of course (1) $\Leftrightarrow$ (3) and (2) $\Rightarrow$ (1). If (3) $\Rightarrow$ (2), then the final statement of the lemma holds and it follows easily that (4) is also equivalent to (1). Thus we show (3) $\Rightarrow$ (2).

Let $X = \bigcup U_i$ be an affine open covering, say $U_i = Spec(R_i)$. Assume $P(R_i)$. Let $Spec(R) = U \subset X$ be an arbitrary affine open. By Schemes, Lemma 21.11.6 there exists a standard covering of $U = Spec(R)$ by standard opens $D(f_j)$ such that each ring R_{f_j} is a principal localization of one of the rings R_i. By Definition 23.4.1 (1) we get $P(R_{f_j})$. Whereupon $P(R)$ by Definition 23.4.1 (2). □

Here is a sample application.

Lemma 23.4.4. *Let X be a scheme. Then X is reduced if and only if X is ``locally reduced" in the sense of Definition 23.4.2.*

Proof. This is clear from Lemma 23.3.2. □

Lemma 23.4.5. *The following properties of a ring R are local.*

(1) *(Cohen-Macauley.) The ring R is Noetherian and CM, see Algebra, Definition 7.96.6.*
(2) *(Regular.) The ring R is Noetherian and regular, see Algebra, Definition 7.102.6.*
(3) *(Absolutely Noetherian.) The ring R is of finite type over Z.*
(4) *Add more here as needed.*[1]

Proof. Omitted. □

23.5. Noetherian schemes

Recall that a ring R is *Noetherian* if it satsifies the ascending chain condition of ideals. Equivalently every ideal of R is finitely generated.

Definition 23.5.1. Let X be a scheme.

(1) We say X is *locally Noetherian* if every $x \in X$ has an affine open neighbourhood $Spec(R) = U \subset X$ such that the ring R is Noetherian.
(2) We say X is *Noetherian* if X is Noetherian and quasi-compact.

Here is the standard result characterizing locally Noetherian schemes.

Lemma 23.5.2. *Let X be a scheme. The following are equivalent:*

(1) *The scheme X is locally Noetherian.*
(2) *For every affine open $U \subset X$ the ring $\mathcal{O}_X(U)$ is Noetherian.*
(3) *There exists an affine open covering $X = \bigcup U_i$ such that each $\mathcal{O}_X(U_i)$ is Noetherian.*
(4) *There exists an open covering $X = \bigcup X_j$ such that each open subscheme X_j is locally Noetherian.*

Moreover, if X is locally Noetherian then every open subscheme is locally Noetherian.

Proof. To show this it suffices to show that being Noetherian is a local property of rings, see Lemma 23.4.3. Any localization of a Noetherian ring is Noetherian, see Algebra, Lemma 7.28.1. By Algebra, Lemma 7.21.2 we see the second property to Definition 23.4.1. □

Lemma 23.5.3. *Any immersion $Z \to X$ with X locally Noetherian is quasi-compact.*

[1] But we only list those properties here which we have not already dealt with separately somewhere else.

Proof. A closed immersion is clearly quasi-compact. A composition of quasi-compact morphisms is quasi-compact, see Topology, Lemma 5.9.2. Hence it suffices to show that an open immersion into a locally Noetherian scheme is quasi-compact. Using Schemes, Lemma 21.19.2 we reduce to the case where X is affine. Any open subset of the spectrum of a Noetherian ring is quasi-compact (for example combine Algebra, Lemma 7.28.5 and Topology, Lemmas 5.6.2 and 5.9.9). ☐

Lemma 23.5.4. *A locally Noetherian scheme is quasi-separated.*

Proof. By Schemes, Lemma 21.21.7 we have to show that the intersection $U \cap V$ of two affine opens of X is quasi-compact. This follows from Lemma 23.5.3 above on considering the open immersion $U \cap V \to U$ for example. (But really it is just because any open of the spectrum of a Noetherian ring is quasi-compact.) ☐

Lemma 23.5.5. *A (locally) Noetherian scheme has a (locally) Noetherian underlying topological space, see Topology, Definition 5.6.1.*

Proof. This is because a Noetherian scheme is a finite union of spectra of Noetherian rings and Algebra, Lemma 7.28.5 and Topology, Lemma 5.6.4. ☐

Lemma 23.5.6. *Any morphism of schemes $f : X \to Y$ with X Noetherian is quasi-compact.*

Proof. Use Lemma 23.5.5 and use that any subset of a Noetherian topological space is quasi-compact (see Topology, Lemmas Lemmas 5.6.2 and 5.9.9). ☐

Lemma 23.5.7. *Any locally closed subscheme of a (locally) Noetherian scheme is (locally) Noetherian.*

Proof. Omitted. Hint: Any quotient, and any localization of a Noetherian ring is Noetherian. For the Noetherian case use again that any subset of a Noetherian space is a Noetherian space (with induced topology). ☐

Here is a fun lemma. It says that every locally Noetherian scheme has plenty of closed points (at least one in every closed subset).

Lemma 23.5.8. *Any locally Noetherian scheme has a closed point. Any closed subset of a locally Noetherian scheme has a closed point. Equivalently, any point of a locally Noetherian scheme specializes to a closed point.*

Proof. The second assertion follows from the first (using Schemes, Lemma 21.12.4 and Lemma 23.5.7). Consider any nonempty affine open $U \subset X$. Let $x \in U$ be a closed point. If x is a closed point of X then we are done. If not, let $y \in \overline{\{x\}}$ be a specialization of x. Note that $y \in X \setminus U$. Consider the local ring $R = \mathcal{O}_{X,y}$. This is a Noetherian local ring. Denote $V \subset Spec(R)$ the inverse image of U in $Spec(R)$ by the canonical morphism $Spec(R) \to X$ (see Schemes, Section 21.13.) By construction V is a singleton with unique point corresponding to x (use Schemes, Lemma 21.13.2). Say $V = \{\mathfrak{q}\}$. Consider the Noetherian local domain $R/\mathfrak{q}$. By Algebra, Lemma 7.58.1 we see that $\dim(R/\mathfrak{q}) = 1$. In other words, we see that y is an immediate specialization of x (see Topology, Definition 5.16.1). In other words, any point $y \neq x$ such that $x \rightsquigarrow y$ is an immediate specialization of x. Clearly each of these points is a closed point, and we win. ☐

Lemma 23.5.9. *Let X be a locally Noetherian scheme. Let $x' \rightsquigarrow x$ be a specialization of points of X. Then*

(1) *there exists a discrete valuation ring R and a morphism $f : Spec(R) \to X$ such that the generic point η of $Spec(R)$ maps to x' and the special point maps to x, and*
(2) *given a finitely generated field extension $\kappa(x') \subset K$ we may arrange it so that the extension $\kappa(x') \subset \kappa(\eta)$ induced by f is isomorphic to the given one.*

Proof. Let $x' \rightsquigarrow x$ be a specialization in X, and let $\kappa(x') \subset K$ be a finitely generated extension of fields. By Schemes, Lemma 21.13.2 and the discussion following Schemes, Lemma 21.13.3 this leads to ring maps $\mathcal{O}_{X,x} \to \kappa(x') \to K$. Let $R \subset K$ be any discrete valuation ring whose field of fractions is K and which dominates the image of $\mathcal{O}_{X,x} \to K$, see Algebra, Lemma 7.110.11. The ring map $\mathcal{O}_{X,x} \to R$ induces the morphism $f : Spec(R) \to X$, see Schemes, Lemma 21.13.1. This morphism has all the desired properties by construction. □

23.6. Jacobson schemes

Recall that a space is said to be *Jacobson* if the closed points are dense in every closed subset, see Topology, Section 5.13.

Definition 23.6.1. A scheme S is said to be *Jacobson* if its underlying topological space is Jacobson.

Recall that a ring R is Jacobson if every radical ideal of R is the intersection of maximal ideals, see Algebra, Definition 7.31.1.

Lemma 23.6.2. *An affine scheme $Spec(R)$ is Jacobson if and only if the ring R is Jacobson.*

Proof. This is Algebra, Lemma 7.31.4. □

Here is the standard result characterizing Jacobson schemes. Intuitively it claims that Jacobson ⇔ locally Jacobson.

Lemma 23.6.3. *Let X be a scheme. The following are equivalent:*

(1) *The scheme X is Jacobson.*
(2) *The scheme X is ``locally Jacobson'' in the sense of Definition 23.4.2.*
(3) *For every affine open $U \subset X$ the ring $\mathcal{O}_X(U)$ is Jacobson.*
(4) *There exists an affine open covering $X = \bigcup U_i$ such that each $\mathcal{O}_X(U_i)$ is Jacobson.*
(5) *There exists an open covering $X = \bigcup X_j$ such that each open subscheme X_j is Jacobson.*

Moreover, if X is Jacobson then every open subscheme is Jacobson.

Proof. The final assertion of the lemma holds by Topology, Lemma 5.13.5. The equivalence of (5) and (1) is Topology, Lemma 5.13.4. Hence, using Lemma 23.6.2, we see that (1) ⇔ (2). To finish proving the lemma it suffices to show that ``Jacobson'' is a local property of rings, see Lemma 23.4.3. Any localization of a Jacobson ring at an element is Jacobson, see Algebra, Lemma 7.31.14. Suppose R is a ring, $f_1, \ldots, f_n \in R$ generate the unit ideal and each R_{f_i} is Jacobson. Then we see that $Spec(R) = \bigcup D(f_i)$ is a union of open subsets which are all Jacobson, and hence $Spec(R)$ is Jacobson by Topology, Lemma 5.13.4 again. This proves the second property of Definition 23.4.1. □

Many schemes used commonly in algebraic geometry are Jacobson, see Morphisms, Lemma 24.15.10. We mention here the following interesting case.

Lemma 23.6.4. *Let R be a Noetherian local ring with maximal ideal $\mathfrak{m}$. In this case the scheme $S = Spec(R) \setminus \{\mathfrak{m}\}$ is Jacobson.*

Proof. Since $Spec(R)$ is a Noetherian scheme, hence S is a Noetherian scheme (Lemma 23.5.7). Hence S is a sober, Noetherian topological space (use Schemes, Lemma 21.11.1). Assume S is not Jacobson to get a contradiction. By Topology, Lemma 5.13.3 there exists some non-closed point $\xi \in S$ such that $\{\xi\}$ is locally closed. This corresponds to a prime $\mathfrak{p} \subset R$ such that (1) there exists a prime $\mathfrak{q}$, $\mathfrak{p} \subset \mathfrak{q} \subset \mathfrak{m}$ with both inclusions strict, and (2) $\{\mathfrak{p}\}$ is open in $Spec(R/\mathfrak{p})$. This is impossible by Algebra, Lemma 7.58.1. □

23.7. Normal schemes

Recall that a ring R is said to be normal if all its local rings are normal domains, see Algebra, Definition 7.33.10. A normal domain is a domain which is integrally closed in its field of fractions, see Algebra, Definition 7.33.1. Thus it makes sense to define a normal scheme as follows.

Definition 23.7.1. A scheme X is *normal* if and only if for all $x \in X$ the local ring $\mathcal{O}_{X,x}$ is a normal domain.

This seems to be the definition used in EGA, see [**DG67**, 0, 4.1.4]. Suppose $X = Spec(A)$, and A is reduced. Then saying that X is normal is not equivalent to saying that A is integrally closed in its total ring of fractions. However, if A is Noetherian then this is the case (see Algebra, Lemma 7.33.14).

Lemma 23.7.2. *Let X be a scheme. The following are equivalent:*

(1) *The scheme X is normal.*
(2) *For every affine open $U \subset X$ the ring $\mathcal{O}_X(U)$ is normal.*
(3) *There exists an affine open covering $X = \bigcup U_i$ such that each $\mathcal{O}_X(U_i)$ is normal.*
(4) *There exists an open covering $X = \bigcup X_j$ such that each open subscheme X_j is normal.*

Moreover, if X is normal then every open subscheme is normal.

Proof. This is clear from the definitions. □

Lemma 23.7.3. *A normal scheme is reduced.*

Proof. Immediate from the defintions. □

Lemma 23.7.4. *Let X be an integral scheme. Then X is normal if and only if for every affine open $U \subset X$ the ring $\mathcal{O}_X(U)$ is a normal domain.*

Proof. This follows from Algebra, Lemma 7.33.9. □

Lemma 23.7.5. *Let X be a scheme with a finite number of irreducible components. The following are equivalent:*

(1) *X is normal, and*
(2) *X is a finite disjoint union of normal integral schemes.*

Proof. It is immediate from the definitions that (2) implies (1). Let X be a normal scheme with a finite number of irreducible components. If X is affine then X satisfies (2) by Algebra, Lemma 7.33.14. For a general X, let $X = \bigcup X_i$ be an affine open covering. Note that also each X_i has but a finite number of irreducible components, and the lemma holds for each X_i. Let $T \subset X$ be an irreducible component. By the affine case each intersection $T \cap X_i$

is open in X_i and an integral normal scheme. Hence $T \subset X$ is open, and an integral normal scheme. This proves that X is the disjoint union of its irreducible components, which are integral normal schemes. There are only finitely many by assumption. ☐

Lemma 23.7.6. *Let X be a Noetherian scheme. The following are equivalent:*

(1) *X is normal, and*
(2) *X is a finite disjoint union of normal integral schemes.*

Proof. This is a special case of Lemma 23.7.5 because a Noetherian scheme has a Noetherian underlying topological space (Lemma 23.5.5 and Topology, Lemma 5.6.2. ☐

Lemma 23.7.7. *Let X be a locally Noetherian normal scheme. The following are equivalent:*

(1) *X is normal, and*
(2) *X is a disjoint union of integral normal schemes.*

Proof. Omitted. Hint: This is purely topological from Lemma 23.7.6. ☐

Remark 23.7.8. Let X be a normal scheme. If X is locally Noetherian then we see that X is integral if and only if X is connected, see Lemma 23.7.7. But there exists a connected affine scheme X such that $\mathcal{O}_{X,x}$ is a domain for all $x \in X$, but X is not irreducible, see Example 23.3.5. This example is even a normal scheme (proof omitted), so beware!

Lemma 23.7.9. *Let X be an integral normal scheme. Then $\Gamma(X, \mathcal{O}_X)$ is a normal domain.*

Proof. Set $R = \Gamma(X, \mathcal{O}_X)$. It is clear that R is a domain. Suppose $f = a/b$ is an element of its fraction field which is integral over R. Say we have $f^d + \sum_{i=1,\ldots,d} a_i f^i = 0$ with $a_i \in R$. Let $U \subset X$ be affine open. Since $b \in R$ is not zero and since X is integral we see that also $b|_U \in \mathcal{O}_X(U)$ is not zero. Hence a/b is an element of the fraction field of $\mathcal{O}_X(U)$ which is integral over $\mathcal{O}_X(U)$ (because we can use the same polynomial $f^d + \sum_{i=1,\ldots,d} a_i|_U f^i = 0$ on U). Since $\mathcal{O}_X(U)$ is a normal domain (Lemma 23.7.2), we see that $f_U = (a|_U)/(b|_U) \in \mathcal{O}_X(U)$. It is easy to see that $f_U|_V = f_V$ whenever $V \subset U \subset X$ are affine open. Hence the local sections f_U glue to a global section f as desired. ☐

23.8. Cohen-Macaulay schemes

Recall, see Algebra, Definition 7.96.1, that a local Noetherian ring $(R, \mathfrak{m})$ is said to be Cohen-Macaulay if $\text{depth}_{\mathfrak{m}}(R) = \dim(R)$. Recall that a Noetherian ring R is said to be Cohen-Macaulay if every local ring $R_{\mathfrak{p}}$ of R is Cohen-Macaulay, see Algebra, Definition 7.96.6.

Definition 23.8.1. Let X be a scheme. We say X is *Cohen-Macaulay* if for every $x \in X$ there exists an affine open neighbourhood $U \subset X$ of x such that the ring $\mathcal{O}_X(U)$ is Noetherian and Cohen-Macaulay.

Lemma 23.8.2. *Let X be a scheme. The following are equivalent:*

(1) *X is Cohen-Macaulay,*
(2) *X is locally Noetherian and all of its local rings are Cohen-Macaulay, and*
(3) *X is locally Noetherian and for any closed point $x \in X$ the local ring $\mathcal{O}_{X,x}$ is Cohen-Macaulay.*

Proof. Algebra, Lemma 7.96.5 says that the localization of a Cohen-Macaulay local ring is Cohen-Macaulay. The lemma follows by combining this with Lemma 23.5.2, with the existence of closed points on locally Noetherian schemes (Lemma 23.5.8), and the definitions. ☐

Lemma 23.8.3. *Let X be a scheme. The following are equivalent:*

1. *The scheme X is Cohen-Macaulay.*
2. *For every affine open $U \subset X$ the ring $\mathcal{O}_X(U)$ is Noetherian and Cohen-Macaulay.*
3. *There exists an affine open covering $X = \bigcup U_i$ such that each $\mathcal{O}_X(U_i)$ is Noetherian and Cohen-Macaulay.*
4. *There exists an open covering $X = \bigcup X_j$ such that each open subscheme X_j is Cohen-Macaulay.*

Moreover, if X is Cohen-Macaulay then every open subscheme is Cohen-Macaulay.

Proof. Combine Lemmas 23.5.2 and 23.8.2. □

More information on Cohen-Macaulay schemes and depth can be found in Coherent, Section 25.13.

23.9. Regular schemes

Recall, see Algebra, Definition 7.57.9, that a local Noetherian ring $(R, \mathfrak{m})$ is said to be *regular* if $\mathfrak{m}$ can be generated by $\dim(R)$ elements. Recall that a Noetherian ring R is said to be *regular* if every local ring $R_{\mathfrak{p}}$ of R is regular, see Algebra, Definition 7.102.6.

Definition 23.9.1. Let X be a scheme. We say X is *regular*, or *nonsingular* if for every $x \in X$ there exists an affine open neighbourhood $U \subset X$ of x such that the ring $\mathcal{O}_X(U)$ is Noetherian and regular.

Lemma 23.9.2. *Let X be a scheme. The following are equivalent:*

1. *X is regular,*
2. *X is locally Noetherian and all of its local rings are regular, and*
3. *X is locally Noetherian and for any closed point $x \in X$ the local ring $\mathcal{O}_{X,x}$ is regular.*

Proof. By the discussion in Algebra preceding Algebra, Definition 7.102.6 we know that the localization of a regular local ring is regular. The lemma follows by combining this with Lemma 23.5.2, with the existence of closed points on locally Noetherian schemes (Lemma 23.5.8), and the definitions. □

Lemma 23.9.3. *Let X be a scheme. The following are equivalent:*

1. *The scheme X is regular.*
2. *For every affine open $U \subset X$ the ring $\mathcal{O}_X(U)$ is Noetherian and regular.*
3. *There exists an affine open covering $X = \bigcup U_i$ such that each $\mathcal{O}_X(U_i)$ is Noetherian and regular.*
4. *There exists an open covering $X = \bigcup X_j$ such that each open subscheme X_j is regular.*

Moreover, if X is regular then every open subscheme is regular.

Proof. Combine Lemmas 23.5.2 and 23.9.2. □

Lemma 23.9.4. *A regular scheme is normal.*

Proof. See Algebra, Lemma 7.140.5. □

23.10. Dimension

The dimension of a scheme is just the dimension of its underlying topological space.

Definition 23.10.1. Let X be a scheme.

(1) The *dimension* of X is just the dimension of X as a topological spaces, see Topology, Definition 5.7.1.
(2) For $x \in X$ we denote $\dim_x(X)$ the dimension of the underlying topological space of X at x as in Topology, Definition 5.7.1. We say $\dim_x(X)$ is the *dimension of X at x*.

As a scheme has a sober underlying topological space (Schemes, Lemma 21.11.1) we may compute the dimension of X as the supremum of the lengths n of chains

$$T_0 \subset T_1 \subset \ldots \subset T_n$$

of irreducible closed subsets of X, or as the supremum of the lengths n of chains of specializations

$$\xi_n \leadsto \xi_{n-1} \leadsto \ldots \leadsto \xi_0$$

of points of X.

Lemma 23.10.2. *Let X be a scheme. The following are equal*

(1) *The dimension of X.*
(2) *The supremum of the dimensions of the local rings of X.*
(3) *The supremum of* $\dim_x(X)$ *for $x \in X$.*

Proof. Note that given a chain of specializations

$$\xi_n \leadsto \xi_{n-1} \leadsto \ldots \leadsto \xi_0$$

of points of X all of the points ξ_i correspond to prime ideals of the local ring of X at ξ_0 by Schemes, Lemma 21.13.2. Hence we see that the dimension of X is the supremum of the dimensions of its local rings. In particular $\dim_x(X) \geq \dim(\mathcal{O}_{X,x})$ as $\dim_x(X)$ is the minimum of the dimensions of open neighbourhoods of x. Thus $\sup_{x \in X} \dim_x(X) \geq \dim(X)$. On the other hand, it is clear that $\sup_{x\in X} \dim_x(X) \leq \dim(X)$ as $\dim(U) \leq \dim(X)$ for any open subset of X. $\square$

23.11. Catenary schemes

Recall that a topological space X is called *catenary* if for every pair of irreducible closed subsets $T \subset T'$ there exist a maximal chain of irreducible closed subsets

$$T = T_0 \subset T_1 \subset \ldots \subset T_e = T'$$

and every such chain has the same length. See Topology, Definition 5.8.1.

Definition 23.11.1. Let S be a scheme. We say S is *catenary* if the underlying topological space of S is catenary.

Recall that a ring A is called *catenary* if for any pair of prime ideals $\mathfrak{p} \subset \mathfrak{q}$ there exists a maximal chain of primes

$$\mathfrak{p} = \mathfrak{p}_0 \subset \ldots \subset \mathfrak{p}_e = \mathfrak{q}$$

and all of these have the same length. See Algebra, Definition 7.97.1.

Lemma 23.11.2. *Let S be a scheme. The following are equivalent*

(1) *S is catenary,*

(2) *there exists an open covering of S all of whose members are catenary schemes,*
(3) *for every affine open $Spec(R) = U \subset S$ the ring R is catenary, and*
(4) *there exists an affine open covering $S = \bigcup U_i$ such that each U_i is the spectrum of a catenary ring.*

Moreover, in this case any locally closed subscheme of S is catenary as well.

Proof. Combine Topology, Lemma 5.8.2, and Algebra, Lemma 7.97.2. $\square$

Lemma 23.11.3. *Let S be a locally Noetherian scheme. The following are equivalent:*

(1) *S is catenary, and*
(2) *locally in the Zariski topology there exists a dimension function on S (see Topology, Definition 5.16.1).*

Proof. This follows from Topology, Lemmas 5.8.2, 5.16.2, and 5.16.4, Schemes, Lemma 21.11.1 and finally Lemma 23.5.5. $\square$

Lemma 23.11.4. *Let X be a scheme. Let $Y \subset X$ be an irreducible closed subset. Let $\xi \in Y$ be the generic point. Then*

$$codim(Y, X) = \dim(\mathcal{O}_{X,\xi})$$

where the codimension is as defined in Topology, Definition 5.8.3.

Proof. By Topology, Lemma 5.8.4 we may replace X by an affine open neighbourhood of ξ. In this case the result follows easily from Algebra, Lemma 7.23.2. $\square$

In particular the dimension of a scheme is the supremum of the dimensions of all of its local rings. It turns out that we can use this lemma to characterize a catenary scheme as a scheme all of whose local rings are catenary.

Lemma 23.11.5. *Let X be a scheme. The following are equivalent*

(1) *X is catenary, and*
(2) *for any $x \in X$ the local ring $\mathcal{O}_{X,x}$ is catenary.*

Proof. Assume X is catenary. Let $x \in X$. By Lemma 23.11.2 we may replace X by an affine open neighbourhood of x, and then $\Gamma(X, \mathcal{O}_X)$ is a catenary ring. By Algebra, Lemma 7.97.3 any localization of a catenary ring is catenary. Whence $\mathcal{O}_{X,x}$ is catenary.

Conversely assume all local rings of X are catenary. Let $Y \subset Y'$ be an inclusion of irreducible closed subsets of X. Let $\xi \in Y$ be the generic point. Let $\mathfrak{p} \subset \mathcal{O}_{X,\xi}$ be the prime corresponding to the generic point of Y', see Schemes, Lemma 21.13.2. By that same lemma the irreducible closed subsets of X in between Y and Y' correspond to primes $\mathfrak{q} \subset \mathcal{O}_{X,\xi}$ with $\mathfrak{p} \subset \mathfrak{q} \subset \mathfrak{m}_\xi$. Hence we see all maximal chains of these are finite and have the same length as $\mathcal{O}_{X,\xi}$ is a catenary ring. $\square$

23.12. Serre's conditions

Here are two technical notions that are often useful. See also Coherent, Section 25.13.

Definition 23.12.1. Let X be a locally Noetherian scheme. Let $k \geq 0$.

(1) We say X is *regular in codimension k*, or we say X has property (R_k) if for every $x \in X$ we have
$$\dim(\mathcal{O}_{X,x}) \leq k \Rightarrow \mathcal{O}_{X,x} \text{ is regular}$$
(2) We say X has property (S_k) if for every $x \in X$ we have $\text{depth}(\mathcal{O}_{X,x}) \geq \min(k, \dim(\mathcal{O}_{X,x}))$.

The phrase ``regular in codimension k'' makes sense since we have seen in Section 23.11 that if $Y \subset X$ is irreducible closed with generic point x, then $\dim(\mathcal{O}_{X,x}) = \text{codim}(Y, X)$. For example condition (R_0) means that for every generic point $\eta \in X$ of an irreducible component of X the local ring $\mathcal{O}_{X,\eta}$ is a field. But for general Noetherian schemes it can happen that the regular locus of X is badly behaved, so care has to be taken.

Lemma 23.12.2. *Let X be a locally Noetherian scheme. Then X is Cohen-Macaulay if and only if X has (S_k) for all $k \geq 0$.*

Proof. By Lemma 23.8.2 we reduce to looking at local rings. Hence the lemma is true because a Noetherian local ring is Cohen-Macaulay if and only if it has depth equal to its dimension. □

Lemma 23.12.3. *Let X be a locally Noetherian scheme. Then X is reduced if and only if X has properties (S_1) and (R_0).*

Proof. This is Algebra, Lemma 7.140.3. □

Lemma 23.12.4. *Let X be a locally Noetherian scheme. Then X is normal if and only if X has properties (S_2) and (R_1).*

Proof. This is Algebra, Lemma 7.140.4. □

23.13. Japanese and Nagata schemes

The notions considered in this section are not prominently defined in EGA. A ``universally Japanese scheme'' is mentioned and defined in [**DG67**, IV Corollary 5.11.4]. A ``Japanese scheme'' is mentioned in [**DG67**, IV Remark 10.4.14 (ii)] but no definition is given. A Nagata scheme (as given below) occurs in a few places in the literature (see for example [**Liu02**, Definition 8.2.30] and [**Gre76**, Page 142]).

We briefly recall that a domain R is called *Japanese* if the integral closure of R in any finite extension of its fraction field is finite over R. A ring R is called *universally Japanese* if for any finite type ring map $R \to S$ with S a domain S is Japanese. A ring R is called *Nagata* if it is Noetherian and $R/\mathfrak{p}$ is Japanese for every prime $\mathfrak{p}$ of R.

Definition 23.13.1. Let X be a scheme.

(1) Assume X integral. We say X is *Japanese* if for every $x \in X$ there exists an affine open neighbourhood $x \in U \subset X$ such that the ring $\mathcal{O}_X(U)$ is Japanese (see Algebra, Definition 7.144.1).
(2) We say X is *universally Japanese* if for every $x \in X$ there exists an affine open neighbourhood $x \in U \subset X$ such that the ring $\mathcal{O}_X(U)$ is universally Japanese (see Algebra, Definition 7.144.15).
(3) We say X is *Nagata* if for every $x \in X$ there exists an affine open neighbourhood $x \in U \subset X$ such that the ring $\mathcal{O}_X(U)$ is Nagata (see Algebra, Definition 7.144.15).

Being Nagata is the same thing as being locally Noetherian and universally Japanese, see Lemma 23.13.8.

Remark 23.13.2. In [**Hoo72**] a (locally Noetherian) scheme X is called Japanese if for every $x \in X$ and every associated prime $\mathfrak{p}$ of $\mathcal{O}_{X,x}$ the ring $\mathcal{O}_{X,x}/\mathfrak{p}$ is Japanese. We do not use this definition since it is not clear that this gives the same notion as above for Noetherian integral schemes. In other words, we do not know whether a Noetherian domain all of whose local rings are Japanese is Japanese. If you do please email stacks.project@gmail.com. On the other hand, we could circumvent this problem by calling a scheme X Japanese if for every affine open $Spec(A) \subset X$ the ring $A/\mathfrak{p}$ is Japanese for every associated prime $\mathfrak{p}$ of A.

Lemma 23.13.3. *A Nagata scheme is locally Noetherian.*

Proof. This is true because a Nagata ring is Noetherian by definition. □

Lemma 23.13.4. *Let X be an integral scheme. The following are equivalent:*

(1) *The scheme X is Japanese.*
(2) *For every affine open $U \subset X$ the domain $\mathcal{O}_X(U)$ is Japanese.*
(3) *There exists an affine open covering $X = \bigcup U_i$ such that each $\mathcal{O}_X(U_i)$ is Japanese.*
(4) *There exists an open covering $X = \bigcup X_j$ such that each open subscheme X_j is Japanese.*

Moreover, if X is Japanese then every open subscheme is Japanese.

Proof. This follows from Lemma 23.4.3 and Algebra, Lemmas 7.144.3 and 7.144.4. □

Lemma 23.13.5. *Let X be a scheme. The following are equivalent:*

(1) *The scheme X is universally Japanese.*
(2) *For every affine open $U \subset X$ the ring $\mathcal{O}_X(U)$ is universally Japanese.*
(3) *There exists an affine open covering $X = \bigcup U_i$ such that each $\mathcal{O}_X(U_i)$ is universally Japanese.*
(4) *There exists an open covering $X = \bigcup X_j$ such that each open subscheme X_j is universally Japanese.*

Moreover, if X is universally Japanese then every open subscheme is universally Japanese.

Proof. This follows from Lemma 23.4.3 and Algebra, Lemmas 7.144.18 and 7.144.21. □

Lemma 23.13.6. *Let X be a scheme. The following are equivalent:*

(1) *The scheme X is Nagata.*
(2) *For every affine open $U \subset X$ the ring $\mathcal{O}_X(U)$ is Nagata.*
(3) *There exists an affine open covering $X = \bigcup U_i$ such that each $\mathcal{O}_X(U_i)$ is Nagata.*
(4) *There exists an open covering $X = \bigcup X_j$ such that each open subscheme X_j is Nagata.*

Moreover, if X is Nagata then every open subscheme is Nagata.

Proof. This follows from Lemma 23.4.3 and Algebra, Lemmas 7.144.20 and 7.144.21. □

Lemma 23.13.7. *Let X be a locally Noetherian scheme. Then X is Nagata if and only if every integral closed subscheme $Z \subset X$ is Japanese.*

Proof. Assume X is Nagata. Let $Z \subset X$ be an integral closed subscheme. Let $z \in Z$. Let $Spec(A) = U \subset X$ be an affine open containing z such that A is Nagata. Then $Z \cap U \cong Spec(A/\mathfrak{p})$ for some prime $\mathfrak{p}$, see Schemes, Lemma 21.10.1 (and Definition 23.3.1). By Algebra, Definition 7.144.15 we see that $A/\mathfrak{p}$ is Japanese. Hence Z is Japanese by definition.

Assume every integral closed subscheme of X is Japanese. Let $Spec(A) = U \subset X$ be any affine open. As X is locally Noetherian we see that A is Noetherian (Lemma 23.5.2). Let $\mathfrak{p} \subset A$ be a prime ideal. We have to show that $A/\mathfrak{p}$ is Japanese. Let $T \subset U$ be the closed subset $V(\mathfrak{p}) \subset Spec(A)$. Let $\overline{T} \subset X$ be the closure. Then $\overline{T}$ is irreducible as the closure of an irreducible subset. Hence the reduced closed subscheme defined by $\overline{T}$ is an integral closed subscheme (called $\overline{T}$ again), see Schemes, Lemma 21.12.4. In other words, $Spec(A/\mathfrak{p})$

is an affine open of an integral closed subscheme of X. This subscheme is Japanese by assumption and by Lemma 23.13.4 we see that $A/\mathfrak{p}$ is Japanese. □

Lemma 23.13.8. *Let X be a scheme. The following are equivalent:*

(1) *X is Nagata, and*
(2) *X is locally Noetherian and universally Japanese.*

Proof. This is Algebra, Proposition 7.144.30. □

This discussion will be continued in Morphisms, Section 24.17.

23.14. The singular locus

Here is the definition.

Definition 23.14.1. Let X be a locally Noetherian scheme. The *regular locus* $\text{Reg}(X)$ of X is the set of $x \in X$ such that $\mathcal{O}_{X,x}$ is a regular local ring. The *singular locus* $\text{Sing}(X)$ is the complement $X \setminus \text{Reg}(X)$, i.e., the set of points $x \in X$ such that $\mathcal{O}_{X,x}$ is not a regular local ring.

The regular locus of a locally Noetherian scheme is stable under generalizations, see the discussion preceding Algebra, Definition 7.102.6. However, for general locally Noetherian schemes the regular locus need not be open. In More on Algebra, Section 12.35 the reader can find some criteria for when this is the case. We will discuss this further in Morphisms, Section 24.18.

23.15. Quasi-affine schemes

Definition 23.15.1. A scheme X is called *quasi-affine* if it is quasi-compact and isomorphic to an open subscheme of an affine scheme.

Lemma 23.15.2. *Let X be a scheme. Let $f \in \Gamma(X, \mathcal{O}_X)$. Denote X_f the maximal open subscheme of X where f is invertible, see Schemes, Lemma 21.6.2 or Modules, Lemma 15.21.7. If X is quasi-compact and quasi-separated, the canonical map*

$$\Gamma(X, \mathcal{O}_X)_f \longrightarrow \Gamma(X_f, \mathcal{O}_X)$$

is an isomorphism. Moreover, if $\mathcal{F}$ is a quasi-coherent sheaf of $\mathcal{O}_X$-modules the map

$$\Gamma(X, \mathcal{F})_f \longrightarrow \Gamma(X_f, \mathcal{F})$$

is an isomorphism.

Proof. Write $R = \Gamma(X, \mathcal{O}_X)$. Consider the canonical morphism

$$\varphi : X \longrightarrow Spec(R)$$

of schemes, see Schemes, Lemma 21.6.4. Then the inverse image of the standard open $D(f)$ on the right hand side is X_f on the left hand side. Moreover, since X is assumed quasi-compact and quasi-separated the morphism φ is quasi-compact and quasi-separated, see Schemes, Lemma 21.19.2 and 21.21.14. Hence by Schemes, Lemma 21.24.1 we see that $\varphi_*\mathcal{F}$ is quasi-coherent. Hence we see that $\varphi_*\mathcal{F} = \widetilde{M}$ with $M = \Gamma(X, \mathcal{F})$ as an R-module. Thus we see that

$$\Gamma(X_f, \mathcal{F}) = \Gamma(D(f), \varphi_*\mathcal{F}) = \Gamma(D(f), \widetilde{M}) = M_f$$

which is exactly the content of the lemma. The case of $\mathcal{F} = \mathcal{O}_X$ will given the first displayed isomorphism of the lemma. □

Lemma 23.15.3. *Let X be a scheme. Let $f \in \Gamma(X, \mathcal{O}_X)$. Assume X is quasi-compact and quasi-separated and assume that X_f is affine. Then the canonical morphism*

$$j : X \longrightarrow Spec(\Gamma(X, \mathcal{O}_X))$$

from Schemes, Lemma 21.6.4 induces an isomorphism of $X_f = j^{-1}(D(f))$ onto the standard affine open $D(f) \subset Spec(\Gamma(X, \mathcal{O}_X))$.

Proof. This is clear as j induces an isomorphism of rings $\Gamma(X, \mathcal{O}_X)_f \to \mathcal{O}_X(X_f)$ by Lemma 23.15.2 above. □

Lemma 23.15.4. *Let X be a scheme. Then X is quasi-affine if and only if the canonical morphism*

$$X \longrightarrow Spec(\Gamma(X, \mathcal{O}_X))$$

from Schemes, Lemma 21.6.4 is a quasi-compact open immersion.

Proof. If the displayed morphism is a quasi-compact open immersion then X is ismorphic to a quasi-compact open subscheme of $Spec(\Gamma(X, \mathcal{O}_X))$ and clearly X is quasi-affine.

Assume X is quasi-affine, say $X \subset Spec(R)$ is quasi-compact open. This in particular implies that X is separated, see Schemes, Lemma 21.23.8. Let $A = \Gamma(X, \mathcal{O}_X)$. Consider the ring map $R \to A$ coming from $R = \Gamma(Spec(R), \mathcal{O}_{Spec(R)})$ and the restriction mapping of the sheaf $\mathcal{O}_{Spec(R)}$. By Schemes, Lemma 21.6.4 we obtain a factorization:

$$X \longrightarrow Spec(A) \longrightarrow Spec(R)$$

of the inclusion morphism. Let $x \in X$. Choose $r \in R$ such that $x \in D(r)$ and $D(r) \subset X$. Denote $f \in A$ the image of r in A. The open X_f of Lemma 23.15.2 above is equal to $D(r) \subset X$ and hence $A_f \cong R_r$ by the conclusion of that lemma. Hence $D(r) \to Spec(A)$ is an isomorphism onto the standard affine open $D(f)$ of $Spec(A)$. Since X can be covered by such affine opens $D(f)$ we win. □

23.16. Characterizing modules of finite type and finite presentation

Let X be a scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. The following lemma implies that $\mathcal{F}$ is of finite type (see Modules, Definition 15.9.1) if and only if $\mathcal{F}$ is on each open affine $Spec(A) = U \subset X$ of the form $\widetilde{M}$ for some finite type A-module M. Similarly, $\mathcal{F}$ is of finite presentation (see Modules, Definition 15.11.1) if and only if $\mathcal{F}$ is on each open affine $Spec(A) = U \subset X$ of the form $\widetilde{M}$ for some finitely presented A-module M.

Lemma 23.16.1. *Let $X = Spec(R)$ be an affine scheme. The quasi-coherent sheaf of $\mathcal{O}_X$-modules $\widetilde{M}$ is a finite type $\mathcal{O}_X$-module if and only if M is a finite R-module.*

Proof. Assume $\widetilde{M}$ is a finite type $\mathcal{O}_X$-module. This means there exists an open covering of X such that $\widetilde{M}$ restricted to the members of this covering is globally generated by finitely many sections. Thus there also exists a standard open covering $X = \bigcup_{i=1,\ldots,n} D(f_i)$ such that $\widetilde{M}|_{D(f_i)}$ is generated by finitely many sections. Thus M_{f_i} is finitely generated for each i. Hence we conclude by Algebra, Lemma 7.21.2. □

Lemma 23.16.2. *Let $X = Spec(R)$ be an affine scheme. The quasi-coherent sheaf of $\mathcal{O}_X$-modules $\widetilde{M}$ is an $\mathcal{O}_X$-module of finite presentation if and only if M is an R-module of finite presentation.*

Proof. Assume $\widetilde{M}$ is an $\mathcal{O}_X$-module of finite presentation. By Lemma 23.16.1 we see that M is a finite R-module. Choose a surjection $R^n \to M$ with kernel K. By Schemes, Lemma 21.5.4 there is a short exact sequence

$$0 \to \widetilde{K} \to \bigoplus \mathcal{O}_X^{\oplus n} \to \widetilde{M} \to 0$$

By Modules, Lemma 15.11.3 we see that $\widetilde{K}$ is a finite type $\mathcal{O}_X$-module. Hence by Lemma 23.16.1 again we see that K is a finite R-module. Hence M is an R-module of finite presentation. □

23.17. Flat modules

On any ringed space $(X, \mathcal{O}_X)$ we know what it means for an $\mathcal{O}_X$-module to be flat (at a point), see Modules, Definition 15.16.1 (Definition 15.16.3). On an affine scheme this matches the notion defined in the algebra chapter.

Lemma 23.17.1. *Let $X = Spec(R)$ be an affine scheme. Let $\mathcal{F} = \widetilde{M}$ for some R-module M. The quasi-coherent sheaf $\mathcal{F}$ is a flat $\mathcal{O}_X$-module of if and only if M is a flat R-module.*

Proof. Flatness of $\mathcal{F}$ may be checked on the stalks, see Modules, Lemma 15.16.2. The same is true in the case of modules over a ring, see Algebra, Lemma 7.35.19. And since $\mathcal{F}_x = M_{\mathfrak{p}}$ if x corresponds to $\mathfrak{p}$ the lemma is true. □

23.18. Locally free modules

On any ringed space we know what it means for an $\mathcal{O}_X$-module to be (finite) locally free. On an affine scheme this matches the notion defined in the algebra chapter.

Lemma 23.18.1. *Let $X = Spec(R)$ be an affine scheme. Let $\mathcal{F} = \widetilde{M}$ for some R-module M. The quasi-coherent sheaf $\mathcal{F}$ is a (finite) locally free $\mathcal{O}_X$-module of if and only if M is a (finite) locally free R-module.*

Proof. Follows from the definitions, see Modules, Definition 15.14.1 and Algebra, Definition 7.72.1. □

We can characterize finite locally free modules in many different ways.

Lemma 23.18.2. *Let X be a scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. The following are equivalent:*

(1) *$\mathcal{F}$ is a flat $\mathcal{O}_X$-module of finite presentation,*
(2) *$\mathcal{F}$ is $\mathcal{O}_X$-module of finite presentation and for all $x \in X$ the stalk $\mathcal{F}_x$ is a free $\mathcal{O}_{X,x}$-module,*
(3) *$\mathcal{F}$ is a locally free, finite type $\mathcal{O}_X$-module,*
(4) *$\mathcal{F}$ is a finite locally free $\mathcal{O}_X$-module, and*
(5) *$\mathcal{F}$ is an $\mathcal{O}_X$-module of finite type, for every $x \in X$ the the stalk $\mathcal{F}_x$ is a free $\mathcal{O}_{X,x}$-module, and the function*

$$\rho_{\mathcal{F}} : X \to \mathbf{Z}, \quad x \longmapsto \dim_{\kappa(x)} \mathcal{F}_x \otimes_{\mathcal{O}_{X,x}} \kappa(x)$$

is locally constant in the Zariski topology on X.

Proof. This lemma immediately reduces to the affine case. In this case the lemma is a reformulation of Algebra, Lemma 7.72.2. The translation uses Lemmas 23.16.1, 23.16.2, 23.17.1, and 23.18.1. □

23.19. Locally projective modules

A consequence of the work done in the algebra chapter is that it makes sense to define a locally projective module as follows.

Definition 23.19.1. Let X be a scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. We say $\mathcal{F}$ is *locally projective* if for every affine open $U \subset X$ the $\mathcal{O}_X(U)$-module $\mathcal{F}(U)$ is projective.

Lemma 23.19.2. *Let X be a scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. The following are equivalent*

1. *$\mathcal{F}$ is locally projective, and*
2. *there exists an affine open covering $X = \bigcup U_i$ such that the $\mathcal{O}_X(U_i)$-module $\mathcal{F}(U_i)$ is projective for every i.*

In particular, if $X = Spec(A)$ and $\mathcal{F} = \widetilde{M}$ then $\mathcal{F}$ is locally projective if and only if M is a projective A-module.

Proof. First, note that if M is a projective A-module and $A \to B$ is a ring map, then $M \otimes_A B$ is a projective B-module, see Algebra, Lemma 7.88.1. Hence if U is an affine open such that $\mathcal{F}(U)$ is a projective $\mathcal{O}_X(U)$-module, then the standard open $D(f)$ is an affine open such that $\mathcal{F}(D(f))$ is a projective $\mathcal{O}_X(D(f))$-module for all $f \in \mathcal{O}_X(U)$. Assume (2) holds. Let $U \subset X$ be an arbitrary affine open. We can find an open covering $U = \bigcup_{j=1,\ldots,m} D(f_j)$ by finitely many standard opens $D(f_j)$ such that for each j the open $D(f_j)$ is a standard open of some U_i, see Schemes, Lemma 21.11.5. Hence, if we set $A = \mathcal{O}_X(U)$ and if M is an A-module such that $\mathcal{F}|_U$ corresponds to M, then we see that M_{f_j} is a projective A_{f_j}-module. It follows that $A \to B = \prod A_{f_j}$ is a faithfully flat ring map such that $M \times_A B$ is a projective B-module. Hence M is projective by Algebra, Theorem 7.89.5. $\square$

Lemma 23.19.3. *Let $f : X \to Y$ be a morphism of schemes. Let $\mathcal{G}$ be a quasi-coherent $\mathcal{O}_Y$-module. If $\mathcal{G}$ is locally projective on Y, then $f^*\mathcal{G}$ is locally projective on X.*

Proof. See Algebra, Lemma 7.88.1. $\square$

23.20. Extending quasi-coherent sheaves

It is sometimes useful to be able to show that a given quasi-coherent sheaf on an open subscheme extends to the whole scheme.

Lemma 23.20.1. *Let $j : U \to X$ be a quasi-compact open immersion of schemes.*

1. *Any quasi-coherent sheaf on U extends to a quasi-coherent sheaf on X.*
2. *Let $\mathcal{F}$ be a quasi-coherent sheaf on X. Let $\mathcal{G} \subset \mathcal{F}|_U$ be a quasi-coherent subsheaf. There exists a quasi-coherent subsheaf $\mathcal{H}$ of $\mathcal{F}$ such that $\mathcal{H}|_U = \mathcal{G}$ as subsheaves of $\mathcal{F}|_U$.*
3. *Let $\mathcal{F}$ be a quasi-coherent sheaf on X. Let $\mathcal{G}$ be a quasi-coherent sheaf on U. Let $\varphi : \mathcal{G} \to \mathcal{F}|_U$ be a morphism of $\mathcal{O}_U$-modules. There exists a quasi-coherent sheaf $\mathcal{H}$ of $\mathcal{O}_X$-modules and a map $\psi : \mathcal{H} \to \mathcal{F}$ such that $\mathcal{H}|_U = \mathcal{G}$ and that $\psi|_U = \varphi$.*

Proof. An immersion is separated (see Schemes, Lemma 21.23.7) and j is quasi-compact by assumption. Hence for any quasi-coherent sheaf $\mathcal{G}$ on U the sheaf $j_*\mathcal{G}$ is an extension to X. See Schemes, Lemma 21.24.1 and Sheaves, Section 6.31.

Assume $\mathcal{F}$, $\mathcal{G}$ are as in (2). Then $j_*\mathcal{G}$ is a quasi-coherent sheaf on X (see above). It is a subsheaf of $j_*j^*\mathcal{F}$. Hence the kernel

$$\mathcal{H} = \ker(\mathcal{F} \oplus j_*\mathcal{G} \longrightarrow j_*j^*\mathcal{F})$$

is quasi-coherent as well, see Schemes, Section 21.24. It is formal to check that $\mathcal{H} \subset \mathcal{F}$ and that $\mathcal{H}|_U = \mathcal{G}$ (using the material in Sheaves, Section 6.31 again).

The same proof as above works. Just take $\mathcal{H} = \ker(\mathcal{F} \oplus j_*\mathcal{G} \to j_*j^*\mathcal{F})$ with its obvious map to $\mathcal{F}$ and its obvious identification with $\mathcal{G}$ over U. $\square$

Lemma 23.20.2. *Let X be a quasi-compact and quasi-separated scheme. Let $U \subset X$ be a quasi-compact open. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Let $\mathcal{G} \subset \mathcal{F}|_U$ be a quasi-coherent $\mathcal{O}_U$-submodule which is of finite type. Then there exists a quasi-coherent submodule $\mathcal{G}' \subset \mathcal{F}$ which is of finite type such that $\mathcal{G}'|_U = \mathcal{G}$.*

Proof. Let n be the minimal number of affine opens $U_i \subset X$, $i = 1, \ldots, n$ such that $X = U \cup \bigcup U_i$. (Here we use that X is quasi-compact.) Suppose we can prove the lemma for the case $n = 1$. Then we can successively extend $\mathcal{G}$ to a $\mathcal{G}_1$ over $U \cup U_1$ to a $\mathcal{G}_2$ over $U \cup U_1 \cup U_2$ to a $\mathcal{G}_3$ over $U \cup U_1 \cup U_2 \cup U_3$, and so on. Thus we reduce to the case $n = 1$.

Thus we may assume that $X = U \cup V$ with V affine. Since X is quasi-separated and U, V are quasi-compact open, we see that $U \cap V$ is a quasi-compact open. It suffices to prove the lemma for the system $(V, U \cap V, \mathcal{F}|_V, \mathcal{G}|_{U\cap V})$ since we can glue the resulting sheaf $\mathcal{G}'$ over V to the given sheaf $\mathcal{G}$ over U along the common value over $U \cap V$. Thus we reduce to the case where X is affine.

Assume $X = Spec(R)$. Write $\mathcal{F} = \widetilde{M}$ for some R-module M. By Lemma 23.20.1 above we may find a quasi-coherent subsheaf $\mathcal{H} \subset \mathcal{F}$ which restricts to $\mathcal{G}$ over U. Write $\mathcal{H} = \widetilde{N}$ for some R-module N. For every $u \in U$ there exists an $f \in R$ such that $u \in D(f) \subset U$ and such that N_f is finitely generated, see Lemma 23.16.1. Since U is quasi-compact we can cover it by finitely many $D(f_i)$ such that N_{f_i} is generated by finitely many elements, say $x_{i,1}/f_i^N, \ldots, x_{i,r_i}/f_i^N$. Let $N' \subset N$ be the submodule generated by the elements $x_{i,j}$. Then the subsheaf $\mathcal{G} := \widetilde{N'} \subset \mathcal{H} \subset \mathcal{F}$ works. $\square$

Lemma 23.20.3. *Let X be a quasi-compact and quasi-separated scheme. Any quasi-coherent sheaf of $\mathcal{O}_X$-modules is the directed colimit of its quasi-coherent $\mathcal{O}_X$-submodules which are of finite type.*

Proof. The colimit is direct because if $\mathcal{G}_1, \mathcal{G}_2$ are quasi-coherent subsheaves of finite type, then $\mathcal{G}_1 + \mathcal{G}_2 \subset \mathcal{F}$ is a quasi-coherent subsheaf of finite type. Let $U \subset X$ be any affine open, and let $s \in \Gamma(U, \mathcal{F})$ be any section. Let $\mathcal{G} \subset \mathcal{F}|_U$ be the subsheaf generated by s. Then clearly $\mathcal{G}$ is quasi-coherent and has finite type as an $\mathcal{O}_U$-module. By Lemma 23.20.2 we see that $\mathcal{G}$ is the restriction of a quasi-coherent subsheaf $\mathcal{G}' \subset \mathcal{F}$ which has finite type. Since X has a basis for the topology consisting of affine opens we conclude that every local section of $\mathcal{F}$ is locally contained in a quasi-coherent submodule of finite type. Thus we win. $\square$

Lemma 23.20.4. *Let X be a scheme. Assume X is quasi-compact and quasi-separated. For any quasi-compact open $U \subset X$ there exists a quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_X$ which is of finite type such that the corresponding closed subscheme $Z \subset X$ has the property $X = U \coprod Z$ (set theoretically).*

Proof. Let $T = X \setminus U$. By Schemes, Lemma 21.12.4 there exists a unique quasi-coherent sheaf of ideals $\mathcal{J}$ cutting out the reduced induced closed subscheme structure on T. Note that $\mathcal{J}|_U = \mathcal{O}_U$ which is an $\mathcal{O}_U$-modules of finite type. By Lemma 23.20.2 there exists a quasi-coherent subsheaf $\mathcal{I} \subset \mathcal{J}$ which is of finite type and has the property that $\mathcal{I}|_U = \mathcal{J}|_U$. It is easy to see that $\mathcal{I}$ has the required properties. $\square$

Lemma 23.20.5. *(Variant of Lemma 23.20.2 dealing with modules of finite presentation.) Let X be a quasi-compact and quasi-separated scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Let $U \subset X$ be a quasi-compact open. Let $\mathcal{G}$ be an $\mathcal{O}_U$-module which of finite presentation. Let $\varphi : \mathcal{G} \to \mathcal{F}|_U$ be a morphism of $\mathcal{O}_U$-modules. Then there exists an $\mathcal{O}_X$-module $\mathcal{G}'$ of finite presentation, and a morphism of $\mathcal{O}_X$-modules $\varphi' : \mathcal{G}' \to \mathcal{F}$ such that $\mathcal{G}'|_U = \mathcal{G}$ and such that $\varphi'|_U = \varphi$.*

Proof. The beginning of the proof is a repeat of the beginning of the proof of Lemma 23.20.2. We write it out carefully anyway.

Let n be the minimal number of affine opens $U_i \subset X$, $i = 1, \ldots, n$ such that $X = U \cup \bigcup U_i$. (Here we use that X is quasi-compact.) Suppose we can prove the lemma for the case $n = 1$. Then we can successively extend the pair $(\mathcal{G}, \varphi)$ to a pair $(\mathcal{G}_1, \varphi_1)$ over $U \cup U_1$ to a pair $(\mathcal{G}_2, \varphi_2)$ over $U \cup U_1 \cup U_2$ to a pair $(\mathcal{G}_3, \varphi_3)$ over $U \cup U_1 \cup U_2 \cup U_3$, and so on. Thus we reduce to the case $n = 1$.

Thus we may assume that $X = U \cup V$ with V affine. Since X is quasi-separated and U quasi-compact, we see that $U \cap V \subset V$ is quasi-compact. Suppose we prove the lemma for the system $(V, U \cap V, \mathcal{F}|_V, \mathcal{G}|_{U \cap V}, \varphi|_{U \cap V})$ thereby producing $(\mathcal{G}', \varphi')$ over V. Then we can glue $\mathcal{G}'$ over V to the given sheaf $\mathcal{G}$ over U along the common value over $U \cap V$, and similarly we can glue the map φ' to the map φ along the common value over $U \cap V$. Thus we reduce to the case where X is affine.

Assume $X = Spec(R)$. By Lemma 23.20.1 above we may find a quasi-coherent sheaf $\mathcal{H}$ with a map $\psi : \mathcal{H} \to \mathcal{F}$ over X which restricts to $\mathcal{G}$ and φ over U. By Lemma 23.20.2 we can find a finite type quasi-coherent $\mathcal{O}_X$-submodule $\mathcal{H}' \subset \mathcal{H}$ such that $\mathcal{H}'|_U = \mathcal{G}$. Thus after replacing $\mathcal{H}$ by $\mathcal{H}'$ and ψ by the restriction of ψ to $\mathcal{H}'$ we may assume that $\mathcal{H}$ is of finite type. By Lemma 23.16.2 we conclude that $\mathcal{H} = \widetilde{N}$ with N a finitely generated R-module. Hence there exists a surjection as in the following short exact sequence of quasi-coherent $\mathcal{O}_X$-modules

$$0 \to \mathcal{K} \to \mathcal{O}_X^{\oplus n} \to \mathcal{H} \to 0$$

where $\mathcal{K}$ is defined as the kernel. Since $\mathcal{G}$ is of finite presentation and $\mathcal{H}|_U = \mathcal{G}$ by Modules, Lemma 15.11.3 the restriction $\mathcal{K}|_U$ is an $\mathcal{O}_U$-module of finite type. Hence by Lemma 23.20.2 again we see that there exists a finite type quasi-coherent $\mathcal{O}_X$-submodule $\mathcal{K}' \subset \mathcal{K}$ such that $\mathcal{K}'|_U = \mathcal{K}|_U$. The solution to the problem posed in the lemma is to set

$$\mathcal{G}' = \mathcal{O}_X^{\oplus n}/\mathcal{K}'$$

which is clearly of finite presentation and restricts to give $\mathcal{G}$ on U with φ' equal to the composition

$$\mathcal{G}' = \mathcal{O}_X^{\oplus n}/\mathcal{K}' \to \mathcal{O}_X^{\oplus n}/\mathcal{K} = \mathcal{H} \xrightarrow{\psi} \mathcal{F}.$$

This finishes the proof of the lemma. □

The following lemma says that every quasi-coherent sheaf on a quasi-compact and quasi-separated scheme is a filtered colimit of $\mathcal{O}$-modules of finite presentation. Actually, we reformulate this in (perhaps more familiar) terms of directed colimits over posets in the next lemma.

Lemma 23.20.6. *Let X be a scheme. Assume X is quasi-compact and quasi-separated. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. There exist*

(1) *a filtered index category $\mathcal{I}$ (see Categories, Definition 4.17.1),*
(2) *a diagram $\mathcal{I} \to Mod(\mathcal{O}_X)$ (see Categories, Section 4.13), $i \mapsto \mathcal{F}_i$,*

(3) *morphisms of $\mathcal{O}_X$-modules $\varphi_i : \mathcal{F}_i \to \mathcal{F}$*

such that each $\mathcal{F}_i$ is of finite presentation and such that the morphisms φ_i induce an isomorphism

$$colim_i \mathcal{F}_i = \mathcal{F}.$$

Proof. Choose a set I and for each $i \in I$ an $\mathcal{O}_X$-module of finite presentation and a homomorphism of $\mathcal{O}_X$-modules $\varphi_i : \mathcal{F}_i \to \mathcal{F}$ with the following property: For any $\psi : \mathcal{G} \to \mathcal{F}$ with $\mathcal{G}$ of finite presentation there is an $i \in I$ such that there exists an isomorphism $\alpha : \mathcal{F}_i \to \mathcal{G}$ with $\varphi_i = \psi \circ \alpha$. It is clear from Modules, Lemma 15.9.8 that such a set exists (see also its proof). We denote $\mathcal{I}$ the category with $Ob(\mathcal{I}) = I$ and given $i, i' \in I$ we set

$$Mor_{\mathcal{I}}(i, i') = \{\alpha : \mathcal{F}_i \to \mathcal{F}_{i'} \mid \alpha \circ \varphi_{i'} = \varphi_i\}.$$

We claim that $\mathcal{I}$ filtered category and that $\mathcal{F} = colim_i \mathcal{F}_i$.

Let $i, i' \in I$. Then we can consider the morphism

$$\mathcal{F}_i \oplus \mathcal{F}_{i'} \longrightarrow \mathcal{F}$$

which is the direct sum of φ_i and $\varphi_{i'}$. Since a direct sum of finitely presented $\mathcal{O}_X$-modules is finitely presented we see that there exists some $i'' \in I$ such that $\varphi_{i''} : \mathcal{F}_{i''} \to \mathcal{F}$ is isomorphic to the displayed arrow towards $\mathcal{F}$ above. Since there are commutative diagrams

$$\begin{tikzcd} \mathcal{F}_i \arrow[r] \arrow[d] & \mathcal{F} \arrow[d, equal] \\ \mathcal{F}_i \oplus \mathcal{F}_{i'} \arrow[r] & \mathcal{F} \end{tikzcd} \quad \text{and} \quad \begin{tikzcd} \mathcal{F}_{i'} \arrow[r] \arrow[d] & \mathcal{F} \arrow[d, equal] \\ \mathcal{F}_i \oplus \mathcal{F}_{i'} \arrow[r] & \mathcal{F} \end{tikzcd}$$

we see that there are morphisms $i \to i''$ and $i' \to i''$ in $\mathcal{I}$. Next, suppose that we have $i, i' \in I$ and morphisms $\alpha, \beta : i \to i'$ (corresponding to $\mathcal{O}_X$-module maps $\alpha, \beta : \mathcal{F}_i \to \mathcal{F}_{i'}$). In this case consider the coequalizer

$$\mathcal{G} = \text{Coker}(\mathcal{F}_i \xrightarrow{\alpha-\beta} \mathcal{F}_{i'})$$

Note that $\mathcal{G}$ is an $\mathcal{O}_X$-module of finite presentation. Since by definition of morphisms in the category $\mathcal{I}$ we have $\varphi_{i'} \circ \alpha = \varphi_{i'} \circ \beta$ we see that we get an induced map $\psi : \mathcal{G} \to \mathcal{F}$. Hence again the pair $(\mathcal{G}, \psi)$ is isomorphic to the pair $(\mathcal{F}_{i''}, \varphi_{i''})$ for some i''. Hence we see that there exists a morphism $i' \to i''$ in $\mathcal{I}$ which equalizes α and β. Thus we have shown that the category $\mathcal{I}$ is filtered.

We still have to show that the colimit of the diagram is $\mathcal{F}$. By definition of the colimit, and by our definition of the category $\mathcal{I}$ there is a canonical map

$$\varphi : colim_i \mathcal{F}_i \longrightarrow \mathcal{F}.$$

Pick $x \in X$. Let us show that φ_x is an isomorphism. Recall that

$$(colim_i \mathcal{F}_i)_x = colim_i \mathcal{F}_{i,x},$$

see Sheaves, Section 6.29. First we show that the map φ_x is injective. Suppose that $s \in \mathcal{F}_{i,x}$ is an element such that s maps to zero in $\mathcal{F}_x$. Then there exists a quasi-compact open U such that s comes from $s \in \mathcal{F}_i(U)$ and such that $\varphi_i(s) = 0$ in $\mathcal{F}(U)$. By Lemma 23.20.2 we can find a finite type quasi-coherent subsheaf $\mathcal{K} \subset \text{Ker}(\varphi_i)$ which restricts to the quasi-coherent $\mathcal{O}_U$-submodule of $\mathcal{F}_i$ generated by s: $\mathcal{K}|_U = \mathcal{O}_U \cdot s \subset \mathcal{F}_i|_U$. Clearly, $\mathcal{F}_i/\mathcal{K}$ is of finite presentation and the map φ_i factors through the quotient map $\mathcal{F}_i \to \mathcal{F}_i/\mathcal{K}$. Hence we can find an $i' \in I$ and a morphism $\alpha : \mathcal{F}_i \to \mathcal{F}_{i'}$ in $\mathcal{I}$ which can be identified with the quotient map $\mathcal{F}_i \to \mathcal{F}_i/\mathcal{K}$. Then it follows that the section s maps to zero in $\mathcal{F}_{i'}(U)$ and in particular in $(colim_i \mathcal{F}_i)_x = colim_i \mathcal{F}_{i,x}$. The injectivity follows. Finally, we show that the map φ_x is surjective. Pick $s \in \mathcal{F}_x$. Choose a quasi-compact open neighbourhood $U \subset X$ of x such that s corresponds to a section $s \in \mathcal{F}(U)$. Consider the map $s : \mathcal{O}_U \to \mathcal{F}$ (multiplication by s). By Lemma 23.20.5 there exists an $\mathcal{O}_X$-module $\mathcal{G}$ of finite presentation and an $\mathcal{O}_X$-module map $\mathcal{G} \to \mathcal{F}$ such that $\mathcal{G}|_U \to \mathcal{F}|_U$ is identified with $s : \mathcal{O}_U \to \mathcal{F}$. Again by definition of $\mathcal{I}$ there exists an $i \in I$ such that $\mathcal{G} \to \mathcal{F}$ is isomorphic to $\varphi_i : \mathcal{F}_i \to \mathcal{F}$. Clearly there exists a section $s' \in \mathcal{F}_i(U)$ mapping to $s \in \mathcal{F}(U)$. This proves surjectivity and the proof of the lemma is complete. □

Lemma 23.20.7. *Let X be a scheme. Assume X is quasi-compact and quasi-separated. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. There exist*

(1) *a directed partially ordered set I (see Categories, Definition 4.19.2),*
(2) *a system $(\mathcal{F}_i, \varphi_{ii'})$ over I in $Mod(\mathcal{O}_X)$ (see Categories, Definition 4.19.1)*
(3) *morphisms of $\mathcal{O}_X$-modules $\varphi_i : \mathcal{F}_i \to \mathcal{F}$*

such that each $\mathcal{F}_i$ is of finite presentation and such that the morphisms φ_i induce an isomorphism

$$colim_i \mathcal{F}_i = \mathcal{F}.$$

Proof. This is a direct consequence of Lemma 23.20.6 and Categories, Lemma 4.19.3 (combined with the fact that colimits exist in the category of sheaves of $\mathcal{O}_X$-modules, see Sheaves, Section 6.29). □

Lemma 23.20.8. *Let X be a scheme. Assume X is quasi-compact and quasi-separated. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Then $\mathcal{F}$ is the directed colimit of its finite type quasi-coherent submodules.*

Proof. If $\mathcal{G}, \mathcal{H} \subset \mathcal{F}$ are finite type quasi-coherent $\mathcal{O}_X$-submodules then the image of $\mathcal{G} \oplus \mathcal{H} \to \mathcal{F}$ is another finite type quasi-coherent $\mathcal{O}_X$-submodule which contains both of them. In this way we see that the system is directed. To show that $\mathcal{F}$ is the colimit of this system, write $\mathcal{F} = colim_i \mathcal{F}_i$ as a directed colimit of finitely presented quasi-coherent sheaves as in Lemma 23.20.7. Then the images $\mathcal{G}_i = \text{Im}(\mathcal{F}_i \to \mathcal{F})$ are finite type quasi-coherent subsheaves of $\mathcal{F}$. Since $\mathcal{F}$ is the colimit of these the result follows. □

Let X be a scheme. In the following lemma we use the notion of a *quasi-coherent $\mathcal{O}_X$-algebra $\mathcal{A}$ of finite presentation*. This means that for every affine open $Spec(R) \subset X$ we have $\mathcal{A} = \widetilde{A}$ where A is a (commutative) R-algebra which is of finite presentation as an R-algebra.

Lemma 23.20.9. *Let X be a scheme. Assume X is quasi-compact and quasi-separated. Let $\mathcal{A}$ be a quasi-coherent $\mathcal{O}_X$-algebra. There exist*

(1) *a directed partially ordered set I (see Categories, Definition 4.19.2),*
(2) *a system $(\mathcal{A}_i, \varphi_{ii'})$ over I in the category of $\mathcal{O}_X$-algebras,*
(3) *morphisms of $\mathcal{O}_X$-algebras $\varphi_i : \mathcal{A}_i \to \mathcal{A}$*

such that each $\mathcal{A}_i$ is a quasi-coherent $\mathcal{O}_X$-algebra of finite presentation and such that the morphisms φ_i induce an isomorphism

$$colim_i \mathcal{A}_i = \mathcal{A}.$$

Proof. First we write $\mathcal{A} = colim_i \mathcal{F}_i$ as a directed colimit of finitely presented quasi-coherent sheaves as in Lemma 23.20.7. For each i let $\mathcal{B}_i = \text{Sym}(\mathcal{F}_i)$ be the symmetric algebra on $\mathcal{F}_i$ over $\mathcal{O}_X$. Write $\text{I}_i = \ker(\mathcal{B}_i \to \mathcal{A})$. Write $\mathcal{I}_i = colim_j \mathcal{F}_{i,j}$ where $\mathcal{F}_{i,j}$ is a finite type quasi-coherent submodule of $\mathcal{I}_i$, see Lemma 23.20.8. Set $\mathcal{I}_{i,j} \subset \mathcal{I}_i$ equal to the $\mathcal{B}_i$-ideal generated by $\mathcal{F}_{i,j}$. Set $\mathcal{A}_{i,j} = \mathcal{B}_i/\mathcal{I}_{i,j}$. Then $\mathcal{A}_{i,j}$ is a quasi-coherent finitely presented $\mathcal{O}_X$-algebra. Define $(i,j) \leq (i',j')$ if $i \leq i'$ and the map $\mathcal{B}_i \to \mathcal{B}_{i'}$ maps the ideal $\mathcal{I}_{i,j}$ into the ideal $\mathcal{I}_{i',j'}$. Then it is clear that $\mathcal{A} = colim_{i,j}\mathcal{A}_{i,j}$. $\square$

Let X be a scheme. In the following lemma we use the notion of a *quasi-coherent $\mathcal{O}_X$-algebra $\mathcal{A}$ of finite type*. This means that for every affine open $Spec(R) \subset X$ we have $\mathcal{A} = \widetilde{A}$ where A is a (commutative) R-algebra which is of finite type as an R-algebra.

Lemma 23.20.10. *Let X be a scheme. Assume X is quasi-compact and quasi-separated. Let $\mathcal{A}$ be a quasi-coherent $\mathcal{O}_X$-algebra. Then $\mathcal{A}$ is the directed colimit of its finite type quasi-coherent $\mathcal{O}_X$-subalgebras.*

Proof. Omitted. Hint: Compare with the proof of Lemma 23.20.8. $\square$

23.21. Gabber's result

In this section we prove a result of Gabber which guarantees that on every scheme there exists a cardinal κ such that every quasi-coherent module $\mathcal{F}$ is the union of its quasi-coherent κ-generated subsheaves. It follows that the category of quasi-coherent sheaves on a scheme is a Grothendieck abelian category having limits and enough injectives[2].

Definition 23.21.1. Let $(X, \mathcal{O}_X)$ be a ringed space. Let κ be an infinite cardinal. We say a sheaf of $\mathcal{O}_X$-modules $\mathcal{F}$ is *κ-generated* if there exists an open covering $X = \bigcup U_i$ such that $\mathcal{F}|_{U_i}$ is generated by a subset $R_i \subset \mathcal{F}(U_i)$ whose cardinality is at most κ.

Note that a direct sum of at most κ κ-generated modules is again κ-generated because $\kappa \otimes \kappa = \kappa$, see Sets, Section 3.6. In particular this holds for the direct sum of two κ-generated modules. Moreover, a quotient of a κ-generated sheaf is κ-generated. (But the same needn't be true for submodules.)

Lemma 23.21.2. *Let $(X, \mathcal{O}_X)$ be a ringed space. Let κ be a cardinal. There exists a set T and a family $(\mathcal{F}_t)_{t\in T}$ of κ-generated $\mathcal{O}_X$-modules such that every κ-generated $\mathcal{O}_X$-module is isomorphic to one of the $\mathcal{F}_t$.*

Proof. There is a set of coverings of X (provided we disallow repeats). Suppose $X = \bigcup U_i$ is a covering and suppose $\mathcal{F}_i$ is an $\mathcal{O}_{U_i}$-module. Then there is a set of isomorphism classes of $\mathcal{O}_X$-modules $\mathcal{F}$ with the property that $\mathcal{F}|_{U_i} \cong \mathcal{F}_i$ since there is a set of glueing maps. This reduces us to proving there is a set of (isomorphism classes of) quotients $\bigoplus_{k\in\kappa}\mathcal{O}_X \to \mathcal{F}$ for any ringed space X. This is clear. $\square$

Here is the result the title of this section refers to.

Lemma 23.21.3. *Let X be a scheme. There exists a cardinal κ such that every quasi-coherent module $\mathcal{F}$ is the directed colimit of its quasi-coherent κ-generated quasi-coherent subsheaves.*

Proof. Choose an affine open covering $X = \bigcup_{i\in I} U_i$. For each pair i, j choose an affine open covering $U_i \cap U_j = \bigcup_{k\in I_{ij}} U_{ijk}$. Write $U_i = \mathrm{Spec}(A_i)$ and $U_{ijk} = \mathrm{Spec}(A_{ijk})$. Let κ be any infinite cardinal $\geq$ than the cardinality of any of the sets I, I_{ij}.

Let $\mathcal{F}$ be a quasi-coherent sheaf. Set $M_i = \mathcal{F}(U_i)$ and $M_{ijk} = \mathcal{F}(U_{ijk})$. Note that

$$M_i \otimes_{A_i} A_{ijk} = M_{ijk} = M_j \otimes_{A_j} A_{ijk}.$$

[2]Nicely explained in a blog post by Akhil Mathew.

see Schemes, Lemma 21.7.3. Using the axiom of choice we choose a map

$$(i, j, k, m) \mapsto S(i, j, k, m)$$

which associates to every $i, j \in I$, $k \in I_{ij}$ and $m \in M_i$ a finite subset $S(i, j, k, m) \subset M_j$ such that we have

$$m \otimes 1 = \sum\nolimits_{m' \in S(i,j,k,m)} m' \otimes a_{m'}$$

in M_{ijk} for some $a_{m'} \in A_{ijk}$. Moreover, let's agree that $S(i, i, k, m) = \{m\}$ for all $i, j = i, k, m$ as above. Fix such a map.

Given a family $\mathcal{S} = (S_i)_{i\in I}$ of subsets $S_i \subset M_i$ of cardinality at most κ we set $\mathcal{S}' = (S'_i)$ where

$$S'_j = \bigcup\nolimits_{(i,j,k,m) \text{ such that } m\in S_i} S(i, j, k, m)$$

Note that $S_i \subset S'_i$. Note that S'_i has cardinality at most κ because it is a union over a set of cardinality at most κ of finite sets. Set $\mathcal{S}^{(0)} = \mathcal{S}$, $\mathcal{S}^{(1)} = \mathcal{S}'$ and by induction $\mathcal{S}^{(n+1)} = (\mathcal{S}^{(n)})'$. Then set $\mathcal{S}^{(\infty)} = \bigcup_{n\geq 0} \mathcal{S}^{(n)}$. Writing $\mathcal{S}^{(\infty)} = (S_i^{(\infty)})$ we see that for any element $m \in S_i^{(\infty)}$ the image of m in M_{ijk} can be written as a finite sum $\sum m' \otimes a_{m'}$ with $m' \in S_j^{(\infty)}$. In this way we see that setting

$$N_i = A_i\text{-submodule of } M_i \text{ generated by } S_i^{(\infty)}$$

we have

$$N_i \otimes_{A_i} A_{ijk} = N_j \otimes_{A_j} A_{ijk}.$$

as submodules of M_{ijk}. Thus there exists a quasi-coherent subsheaf $\mathcal{G} \subset \mathcal{F}$ with $\mathcal{G}(U_i) = N_i$. Moreover, by construction the sheaf $\mathcal{G}$ is κ-generated.

Let $\{\mathcal{G}_t\}_{t\in T}$ be the set of κ-generated quasi-coherent subsheaves. If $t, t' \in T$ then $\mathcal{G}_t + \mathcal{G}_{t'}$ is also a κ-generated quasi-coherent subsheaf as it is the image of the map $\mathcal{G}_t \oplus \mathcal{G}_{t'} \to \mathcal{F}$. Hence the system (ordered by inclusion) is directed. The arguments above show that every section of $\mathcal{F}$ over U_i is in one of the $\mathcal{G}_t$ (because we can start with $\mathcal{S}$ such that the given section is an element of S_i). Hence $colim_t \mathcal{G}_t \to \mathcal{F}$ is both injective and surjective as desired. $\square$

Proposition 23.21.4. *Let X be a scheme. The inclusion functor $QCoh(\mathcal{O}_X) \to Mod(\mathcal{O}_X)$ has a right adjoint*

$$Q^3 : Mod(\mathcal{O}_X) \longrightarrow QCoh(\mathcal{O}_X)$$

such that for every quasi-coherent sheaf $\mathcal{F}$ the adjunction mapping $Q(\mathcal{F}) \to \mathcal{F}$ is an isomorphism. Moreover, the category $QCoh(\mathcal{O}_X)$ has limits and enough injectives.

Proof. The two assertions about $Q(\mathcal{F}) \to \mathcal{F}$ and limits in $QCoh(\mathcal{O}_X)$ are formal consequences of the existence of Q, the fact that the inclusion is fully faithful, and the fact that $Mod(\mathcal{O}_X)$ has limits (see Modules, Section 15.3). The existence of injectives follows from the existence of injectives in $Mod(\mathcal{O}_X)$ (see Injectives, Lemma 17.9.1) and Homology, Lemma 10.22.3. Thus it suffices to construct Q.

Pick a cardinal κ as in Lemma 23.21.3. Pick a collection $(\mathcal{F}_t)_{t\in T}$ of κ-generated quasi-coherent sheaves as in Lemma 23.21.2. Given an object $\mathcal{G}$ of $QCoh(\mathcal{O}_X)$ we set

$$Q(\mathcal{G}) = colim_{(t,\alpha)} \mathcal{F}_t$$

The colimit is over the category of pairs (t, α) where $t \in T$ and $\alpha : \mathcal{F}_t \to \mathcal{G}$ is a morphism of $\mathcal{O}_X$-modules. A morphism $(t, \alpha) \to (t', \alpha')$ is given by a morphism $\beta : \mathcal{F}_t \to \mathcal{F}_{t'}$ such

[3] This functor is sometimes called the *coherator*.

that $\alpha' \circ \beta = \alpha$. By Schemes, Section 21.24 the colimit is quasi-coherent. Note that there is a canonical map $Q(\mathcal{G}) \to \mathcal{G}$ by definition of the colimit. The formula

$$Hom(\mathcal{H}, Q(\mathcal{G})) = Hom(\mathcal{H}, \mathcal{G})$$

holds for κ-generated quasi-coherent modules $\mathcal{H}$ by choice of the system $(\mathcal{F}_t)_{t\in T}$. It follows formally from Lemma 23.21.3 that this equality continuous to hold for any quasi-coherent module $\mathcal{H}$ on X. This finishes the proof. □

23.22. Sections of quasi-coherent sheaves

Here is a computation of sections of a quasi-coherent sheaf on a quasi-compact open of an affine spectrum.

Lemma 23.22.1. *Let A be a ring. Let $I \subset A$ be a finitely generated ideal. Let M be an A-module. Then there is a canonical map*

$$colim_n\, Hom_A(I^n, M) \longrightarrow \Gamma(Spec(A) \setminus V(I), \widetilde{M}).$$

This map is always injective. If for all $x \in M$ we have $Ix = 0 \Rightarrow x = 0$ then this map is an isomorphism. In general, set $M_n = \{x \in M \mid I^n x = 0\}$, then there is an isomorphism

$$colim_n\, Hom_A(I^n, M/M_n) \longrightarrow \Gamma(Spec(A) \setminus V(I), \widetilde{M}).$$

Proof. Since $I^n \subset I^{n+1}$ and $M_n \subset M_{n+1}$ we can use composition via these maps to get canonical maps of A-modules

$$Hom_A(I^n, M) \longrightarrow Hom_A(I^{n+1}, M)$$

and

$$Hom_A(I^n, M/M_n) \longrightarrow Hom_A(I^{n+1}, M/M_{n+1})$$

which we will use as the transition maps in the systems. Given an A-module map $\varphi : I^n \to M$, then we get a map of sheaves $\widetilde{\varphi} : \tilde{I} \to \widetilde{M}$ which we can restrict to the open $Spec(A) \setminus V(I)$. Since $\tilde{I}$ restricted to this open gives the structure sheaf we get an element of $\Gamma(Spec(A) \setminus V(I), \widetilde{M})$. We omit the verification that this is compatible with the transition maps in the system $Hom_A(I^n, M)$. This gives the first arrow. To get the second arrow we note that $\widetilde{M}$ and $\widetilde{M/M_n}$ agree over the open $Spec(A) \setminus V(I)$ since the sheaf $\widetilde{M_n}$ is clearly supported on $V(I)$. Hence we can use the same mechanism as before.

Next, we work out how to define this arrow in terms of algebra. Say $I = (f_1, \ldots, f_t)$. Then $Spec(A) \setminus V(I) = \bigcup_{i=1,\ldots,t} D(f_i)$. Hence

$$0 \to \Gamma(Spec(A) \setminus V(I), \widetilde{M}) \to \bigoplus\nolimits_i M_{f_i} \to \bigoplus\nolimits_{i,j} M_{f_i f_j}$$

is exact. Suppose that $\varphi : I^n \to M$ is an A-module map. Consider the vector of elements $\varphi(f_i^n)/f_i^n \in M_{f_i}$. It is easy to see that this vector maps to zero in the second direct sum of the exact sequence above. Whence an element of $\Gamma(Spec(A) \setminus V(I), \widetilde{M})$. We omit the verification that this description agrees with the one given above.

Let us show that the first arrow is injective using this description. Namely, if φ maps to zero, then for each i the element $\varphi(f_i^n)/f_i^n$ is zero in M_{f_i}. In other words we see that for each i we have $f_i^m \varphi(f_i^n) = 0$ for some $m \geq 0$. We may choose a single m which works for all i. Then we see that $\varphi(f_i^{n+m}) = 0$ for all i. It is easy to see that this means that $\varphi|_{I^{t(n+m-1)+1}} = 0$ in other words that φ maps to zero in the $t(n + m - 1) + 1$st term of the colimit. Hence injectivity follows.

Note that each $M_n = 0$ in case we have $Ix = 0 \Rightarrow x = 0$ for $x \in M$. Thus to finish the proof of the lemma it suffices to show that the second arrow is an isomorphism.

Let us attempt to construct an inverse of the second map of the lemma. Let $s \in \Gamma(Spec(A) \setminus V(I), \widetilde{M})$. This corresponds to a vector x_i/f_i^n with $x_i \in M$ of the first direct sum of the exact sequence above. Hence for each i, j there exists $m \geq 0$ such that $f_i^m f_j^m (f_j^n x_i - f_i^n x_j) = 0$ in M. We may choose a single m which works for all pairs i, j. After replacing x_i by $f_i^m x_i$ and n by $n + m$ we see that we get $f_j^n x_i = f_i^n x_j$ in M for all i, j. Let us introduce

$$K_n = \{x \in M \mid f_1^n x = \ldots = f_t^n x = 0\}$$

We claim there is an A-module map

$$\varphi : I^{t(n-1)+1} \longrightarrow M/K_n$$

which maps the monomial $f_1^{e_1} \ldots f_t^{e_t}$ with $\sum e_i = t(n-1) + 1$ to the class modulo K_n of the expression $f_1^{e_1} \ldots f_i^{e_i - n} \ldots f_t^{e_t} x_i$ where i is chosen such that $e_i \geq n$ (note that there is at least one such i). To see that this is indeed the case suppose that

$$\sum\nolimits_{E=(e_1,\ldots,e_t),|E|=t(n-1)+1} a_E f_1^{e_1} \ldots f_t^{e_t} = 0$$

is a relation between the monomials with coefficients a_E in A. Then we would map this to

$$z = \sum\nolimits_{E=(e_1,\ldots,e_t),|E|=t(n-1)+1} a_E f_1^{e_1} \ldots f_{i(E)}^{e_{i(E)}-n} \ldots f_t^{e_t} x_i$$

where for each multiindex E we have chosen a particular $i(E)$ such that $e_{i(E)} \geq n$. Note that if we multiply this by f_j^n for any j, then we get zero, since by the relations $f_j^n x_i = f_i^n x_j$ above we get

$$\begin{aligned} f_j^n z &= \sum\nolimits_{E=(e_1,\ldots,e_t),|E|=t(n-1)+1} a_E f_1^{e_1} \ldots f_j^{e_j+n} \ldots f_{i(E)}^{e_{i(E)}-n} \ldots f_t^{e_t} x_i \\ &= \sum\nolimits_{E=(e_1,\ldots,e_t),|E|=t(n-1)+1} a_E f_1^{e_1} \ldots f_t^{e_t} x_j = 0. \end{aligned}$$

Hence $z \in K_n$ and we see that every relation gets mapped to zero in M/K_n. This proves the claim.

Note that $K_n \subset M_{t(n-1)+1}$. Hence the map φ in particular gives rise to a A-module map $I^{t(n-1)+1} \to M/M_{t(n-1)+1}$. This proves the second arrow of the lemma is surjective. We omit the proof of injectivity. $\square$

Example 23.22.2. Let k be a field. Consider the ring

$$A = k[f, g, x, y, \{a_n, b_n\}_{n \geq 1}]/(fy - gx, \{a_n f^n + b_n g^n\}_{n \geq 1}).$$

Then $x/f \in A_f$ and $y/g \in A_g$ map to the same element of A_{fg}. Hence these define a section s of the structure sheaf of $Spec(A)$ over $D(f) \cup D(g) = Spec(A) \setminus V(I)$. Here $I = (f, g) \subset A$. However, there is no $n \geq 0$ such that s comes from an A-module map $\varphi : I^n \to A$ as in the source of the first displayed arrow of Lemma 23.22.1. Namely, given such a module map set $x_n = \varphi(f^n)$ and $y_n = \varphi(g^n)$. Then $f^m x_n = f^{n+m-1} x$ and $g^m y_n = g^{n+m-1} y$ for some $m \geq 0$ (see proof of the lemma). But then we would have $0 = \varphi(0) = \varphi(a_{n+m} f^{n+m} + b_{n+m} g^{n+m}) = a_{n+m} f^{n+m-1} x + b_{n+m} g^{n+m-1} y$ which is not the case in the ring A.

Lemma 23.22.3. *Let X be a scheme. Let $\mathcal{I} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Consider the sheaf of $\mathcal{O}_X$-modules $\mathcal{F}'$ which associates to every open $U \subset X$*

$$\mathcal{F}'(U) = \{s \in \mathcal{F}(U) \mid \mathcal{I}s = 0\}$$

Assume $\mathcal{I}$ is of finite type. Then

(1) *$\mathcal{F}'$ is a quasi-coherent sheaf of $\mathcal{O}_X$-modules,*
(2) *on any affine open $U \subset X$ we have $\mathcal{F}'(U) = \{s \in \mathcal{F}(U) \mid \mathcal{I}(U)s = 0\}$, and*
(3) *$\mathcal{F}'_x = \{s \in \mathcal{F}_x \mid \mathcal{I}_x s = 0\}$.*

Proof. It is clear that the rule defining $\mathcal{F}'$ gives a subsheaf of $\mathcal{F}$ (the sheaf condition is easy to verify). Hence we may work locally on X to verify the other statements. In other words we may assume that $X = Spec(A)$, $\mathcal{F} = \widetilde{M}$ and $\mathcal{I} = \tilde{I}$. It is clear that in this case $\mathcal{F}'(U) = \{x \in M \mid Ix = 0\} =: M'$ because $\tilde{I}$ is generated by its global sections I which proves (2). To show $\mathcal{F}'$ is quasi-coherent it suffices to show that for every $f \in A$ we have $\{x \in M_f \mid I_f x = 0\} = (M')_f$. Write $I = (g_1, \ldots, g_t)$, which is possible because $\mathcal{I}$ is of finite type, see Lemma 23.16.1. If $x = y/f^n$ and $I_f x = 0$, then that means that for every i there exists an $m \geq 0$ such that $f^m g_i x = 0$. We may choose one m which works for all i (and this is where we use that I is finitely generated). Then we see that $f^m x \in M'$ and $x/f^n = f^m x/f^{n+m}$ in $(M')_f$ as desired. The proof of (3) is similar and omitted. □

Definition 23.22.4. Let X be a scheme. Let $\mathcal{I} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals of finite type. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. The subsheaf $\mathcal{F}' \subset \mathcal{F}$ defined in Lemma 23.22.3 above is called the *subsheaf of sections annihilated by $\mathcal{I}$*.

Lemma 23.22.5. *Let X be a scheme. Let $\mathcal{I} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals. Let $Z \subset X$ be the closed subscheme defined by $\mathcal{I}$ and set $U = X \setminus Z$. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Assume that X is quasi-compact and quasi-separated and that $\mathcal{I}$ is of finite type. Let $\mathcal{F}_n \subset \mathcal{F}$ be subsheaf of sections annihilated by $\mathcal{I}^n$. The canonical map*

$$colim_n\, Hom_{\mathcal{O}_X}(\mathcal{I}^n, \mathcal{F}) \longrightarrow \Gamma(U, \mathcal{F})$$

is injective and the canonical map

$$colim_n\, Hom_{\mathcal{O}_X}(\mathcal{I}^n, \mathcal{F}/\mathcal{F}_n) \longrightarrow \Gamma(U, \mathcal{F})$$

is an isomorphism.

Proof. Let $Spec(A) = W \subset X$ be an affine open. Write $\mathcal{F}|_W = \widetilde{M}$ for some A-module M and $\mathcal{I}|_W = \tilde{I}$ for some ideal $I \subset A$. We omit the verification that $\mathcal{F}_n = \widetilde{M_n}$ where $M_n \subset M$ is defined as in Lemma 23.22.1. This proves (1). It also follows from Lemma 23.22.1 that we have an injection

$$colim_n\, Hom_{\mathcal{O}_W}(\mathcal{I}^n|_W, \mathcal{F}|_W) \longrightarrow \Gamma(U \cap W, \mathcal{F})$$

and a bijection

$$colim_n\, Hom_{\mathcal{O}_W}(\mathcal{I}^n|_W, (\mathcal{F}/\mathcal{F}_n)|_W) \longrightarrow \Gamma(U \cap W, \mathcal{F})$$

for any such affine open W.

To see (2) we choose a finite affine open covering $X = \bigcup_{j=1,\ldots,m} W_j$. The injectivity of the first arrow of (2) follows immediately from the above and the finiteness of the covering. Moreover for each pair j, j' we choose a finite affine open covering

$$W_j \cap W_{j'} = \bigcup\nolimits_{k=1,\ldots,m_{jj'}} W_{jj'k}.$$

Let $s \in \Gamma(U, \mathcal{F})$. As seen above for each j there exists an n_j and a map $\varphi_j : \mathcal{I}^{n_j}|_{W_j} \to (\mathcal{F}/\mathcal{F}_{n_j})|_{W_j}$ which corresponds to $s|_{W_j}$. By the same token for each triple (j, j', k) there exists an integer $n_{jj'k}$ such that the restriction of φ_j and $\varphi_{j'}$ as maps $\mathcal{I}^{n_{jj'k}} \to \mathcal{F}/\mathcal{F}_{n_{jj'k}}$

agree over $W_{jj'l}$. Let $n = \max\{n_j, n_{jj'k}\}$ and we see that the φ_j glue as maps $\mathcal{I}^n \to \mathcal{F}/\mathcal{F}_n$ over X. This proves surjectivity of the map. We omit the proof of injectivity. $\square$

23.23. Ample invertible sheaves

Recall from Modules, Lemma 15.21.7 that given an invertible sheaf $\mathcal{L}$ on a locally ringed space X, and given a global section s of $\mathcal{L}$ the set $X_s = \{x \in X \mid s \not\in \mathfrak{m}_x\mathcal{L}_x\}$ is open. A general remark is that $X_s \cap X_{s'} = X_{ss'}$, where ss' denote the section $s \otimes s' \in \Gamma(X, \mathcal{L} \otimes \mathcal{L}')$.

Definition 23.23.1. Let X be a scheme. Let $\mathcal{L}$ be an invertible $\mathcal{O}_X$-module. We say $\mathcal{L}$ is *ample* if

(1) X is quasi-compact, and
(2) for every $x \in X$ there exists an $n \geq 1$ and $s \in \Gamma(X, \mathcal{L}^{\otimes n})$ such that $x \in X_s$ and X_s is affine.

Lemma 23.23.2. *Let X be a scheme. Let $\mathcal{L}$ be an invertible $\mathcal{O}_X$-module. Let $n \geq 1$. Then $\mathcal{L}$ is ample if and only if $\mathcal{L}^{\otimes n}$ is ample.*

Proof. This follows from the fact that $X_{s^n} = X_s$. $\square$

Lemma 23.23.3. *Let X be a scheme. Let $\mathcal{L}$ be an ample invertible $\mathcal{O}_X$-module. For any closed subscheme $Z \subset X$ the restriction of $\mathcal{L}$ to Z is ample.*

Proof. This is clear since a closed subset of a quasi-compact space is quasi-compact and a closed subscheme of an affine scheme is affine (see Schemes, Lemma 21.8.2). $\square$

Lemma 23.23.4. *Let X be a scheme. Let $\mathcal{L}$ be an invertible $\mathcal{O}_X$-module. Let $s \in \Gamma(X, \mathcal{L})$. For any affine $U \subset X$ the intersection $U \cap X_s$ is affine.*

Proof. This translates into the following algebra problem. Let R be a ring. Let N be an invertible R-module (i.e., locally free of rank 1). Let $s \in N$ be an element. Then $U = \{\mathfrak{p} \mid s \not\in \mathfrak{p}N\}$ is an affine open subset of $Spec(R)$. This you can see as follows. Think of s as an R-module map $R \to N$. This gives rise to R-module maps $N^{\otimes k} \to N^{\otimes k+1}$. Consider

$$R' = colim_n \, N^{\otimes n}$$

with transition maps as above. Define an R-algebra structure on R' by the rule $x \cdot y = x \otimes y \in N^{\otimes n+m}$ if $x \in N^{\otimes n}$ and $y \in N^{\otimes m}$. We claim that $Spec(R') \to Spec(R)$ is an open immersion with image U.

To prove this is a local question on $Spec(R)$. Let $\mathfrak{p} \in Spec(R)$. Pick $f \in R$, $f \not\in \mathfrak{p}$ such that $N_f \cong R_f$ as a module. Replacing R by R_f, N by N_f and R' by $R'_f = colim\, N_f^{\otimes n}$ we may assume that $N \cong R$. Say $N = R$. In this case s is an element of R and it is easy to see that $R' \cong R_s$. Thus the lemma follows. $\square$

Recall that given a scheme X and an invertible sheaf $\mathcal{L}$ on X we get a graded ring $\Gamma_*(X, \mathcal{L}) = \bigoplus_{n \geq 0} \Gamma(X, \mathcal{L}^{\otimes n})$, see Modules, Definition 15.21.4. Also, given a sheaf of $\mathcal{O}_X$-modules we have the graded $\Gamma_*(X, \mathcal{L})$-module $\Gamma_*(X, \mathcal{F}) = \Gamma_*(X, \mathcal{L}, \mathcal{F})$.

Lemma 23.23.5. *Let X be a scheme. Let $\mathcal{L}$ be an invertible sheaf on X. Let $s \in \Gamma(X, \mathcal{L})$. If X is quasi-compact and quasi-separated, the canonical map*

$$\Gamma_*(X, \mathcal{L})_{(s)} \longrightarrow \Gamma(X_s, \mathcal{O})$$

which maps a/s^n to $a \otimes s^{-n}$ is an isomorphism. Moreover, if $\mathcal{F}$ is a quasi-coherent $\mathcal{O}_X$-module then the map

$$\Gamma_*(X, \mathcal{L}, \mathcal{F})_{(s)} \longrightarrow \Gamma(X_s, \mathcal{F})$$

is an isomorphism.

Proof. Consider the scheme

$$\pi : L^* = \underline{Spec}_X \left(\bigoplus\nolimits_{n \in \mathbf{Z}} \mathcal{L}^{\otimes n} \right) \longrightarrow X$$

see Constructions, Section 22.4. Since the inverse image $\pi^{-1}(U)$ of every affine open $U \subset X$ is affine (see Constructions, Lemma 22.4.6), it follows that L^* quasi-compact and separated, since X is assumed quasi-compact and separated (use Schemes, Lemma 21.21.7). Note that s gives rise to an element $f \in \Gamma(L^*, \mathcal{O})$, via $\pi_*\mathcal{O}_{L^*} = \bigoplus_{n\in\mathbf{Z}} \mathcal{L}^{\otimes n}$. Note that $(L^*)_f = \pi^{-1}(X_s)$. Hence we have

$$\begin{aligned} \left(\bigoplus\nolimits_{n \in \mathbf{Z}} \Gamma(X, \mathcal{L}^{\otimes n}) \right)_s &= \Gamma(L^*, \mathcal{O}_{L^*})_f \\ &= \Gamma((L^*)_f, \mathcal{O}_{L^*}) \\ &= \bigoplus\nolimits_{n \in \mathbf{Z}} \Gamma(X_s, \mathcal{L}^{\otimes n}) \end{aligned}$$

where the middle "=" is Lemma 23.15.2. The first statement of the lemma follows from this equality by looking at degree zero terms. The second statement also follows from Lemma 23.15.2 applied to the quasi-coherent sheaf of $\mathcal{O}_{L^*}$-modules $\pi^*\mathcal{F}$ using that

$$\pi_*\pi^*\mathcal{F} = \mathcal{F} \otimes_{\mathcal{O}_X} \left(\bigoplus\nolimits_{n \in \mathbf{Z}} \mathcal{L}^{\otimes n} \right) = \bigoplus\nolimits_{n \in \mathbf{Z}} \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L}^{\otimes n}$$

which is proved by computing both sides on affine opens of X. □

Lemma 23.23.6. *Let X be a scheme. Let $\mathcal{L}$ be an invertible $\mathcal{O}_X$-module. Assume the open sets X_s, where $s \in \Gamma(X, \mathcal{L}^{\otimes n})$ and $n \geq 1$, form a basis for the topology on X. Then among those opens, the open sets X_s which are affine form a basis for the topology on X.*

Proof. Let $x \in X$. Choose an affine open neighbourhood $Spec(R) = U \subset X$ of x. By assumption, there exists a $n \geq 1$ and a $s \in \Gamma(X, \mathcal{L}^{\otimes n})$ such that $X_s \subset U$. By Lemma 23.23.4 above the intersection $X_s = U \cap X_s$ is affine. Since U can be chosen arbitrarily small we win. □

Lemma 23.23.7. *Let X be a scheme. Let $\mathcal{L}$ be an invertible $\mathcal{O}_X$-module. Assume for every point x of X there exists $n \geq 1$ and $s \in \Gamma(X, \mathcal{L}^{\otimes n})$ such that $x \in X_s$ and X_s is affine. Then X is quasi-separated.*

Proof. By assumption we can find a covering of X by affine opens of the form X_s. By Schemes, Lemma 21.21.7 it suffices to show that $X_s \cap X_{s'}$ is quasi-compact whenever X_s is affine. This is true by Lemma 23.23.4. □

Lemma 23.23.8. *Let X be a scheme. Let $\mathcal{L}$ be an invertible $\mathcal{O}_X$-module. Set $S = \Gamma_*(X, \mathcal{L})$ as a graded ring. If every point of X is contained in one of the open subschemes X_s, for some $s \in S_+$ homogeneous, then there is a canonical morphism of schemes*

$$f : X \longrightarrow Y = Proj(S),$$

to the homogeneous spectrum of S (see Constructions, Section 22.8). This morphism has the following properties

1. *$f^{-1}(D_+(s)) = X_s$ for any $s \in S_+$ homogeneous,*
2. *there are $\mathcal{O}_Y$-module maps $f^*\mathcal{O}_Y(n) \to \mathcal{L}^{\otimes n}$ compatible with multiplication maps, see Constructions, Equation (22.10.1.1),*
3. *the compositions $S_n \to \Gamma(Y, \mathcal{O}_Y(n)) \to \Gamma(X, \mathcal{L}^{\otimes n})$ are equal to the identity maps, and*

(4) *for every $x \in X$ there is an integer $d \geq 1$ and an open neighbourhood $U \subset X$ of x such that $f^*\mathcal{O}_Y(dn)|_U \to \mathcal{L}^{\otimes dn}|_U$ is an isomorphism for all $n \in \mathbf{Z}$.*

Proof. Denote $\psi : S \to \Gamma_*(X, \mathcal{L})$ the identity map. We are going to use the triple $(U(\psi), r_{\mathcal{L},\psi}, \theta)$ of Constructions, Lemma 22.14.1. By assumption the open subscheme $U(\psi)$ of equals X. Hence $r_{\mathcal{L},\psi} : U(\psi) \to Y$ is defined on all of X. We set $f = r_{\mathcal{L},\psi}$. The maps in part (2) are the components of θ. Part (3) follows from condition (2) in the lemma cited above. Part (1) follows from (3) combined with condition (1) in the lemma cited above. Part (4) follows from the last statement in Constructions, Lemma 22.14.1 since the map α mentioned there is an isomorphism. □

Lemma 23.23.9. *Let X be a scheme. Let $\mathcal{L}$ be an invertible $\mathcal{O}_X$-module. Set $S = \Gamma_*(X, \mathcal{L})$. Assume (a) every point of X is contained in one of the open subschemes X_s, for some $s \in S_+$ homogeneous, and (b) X is quasi-compact. Then the canonical morphism of schemes $f : X \longrightarrow Proj(S)$ of Lemma 23.23.8 above is quasi-compact.*

Proof. It suffices to show that $f^{-1}(D_+(s))$ is quasi-compact for any $s \in S_+$ homogeneous. Write $X = \bigcup_{i=1,\ldots,n} X_i$ as a finite union of affine opens. By Lemma 23.23.4 each intersection $X_s \cap X_i$ is affine. Hence $X_s = \bigcup_{i=1,\ldots,n} X_s \cap X_i$ is quasi-compact. □

Lemma 23.23.10. *Let X be a scheme. Let $\mathcal{L}$ be an invertible $\mathcal{O}_X$-module. Set $S = \Gamma_*(X, \mathcal{L})$. Assume $\mathcal{L}$ is ample. Then the canonical morphism of schemes $f : X \longrightarrow Proj(S)$ of Lemma 23.23.8 is an open immersion.*

Proof. By Lemma 23.23.7 we see that X is quasi-separated. Choose finitely many $s_1, \ldots, s_n \in S_+$ homogeneous such that X_{s_i} are affine, and $X = \bigcup X_{s_i}$. Say s_i has degree d_i. The inverse image of $D_+(s_i)$ under f is X_{s_i}, see Lemma 23.23.8. By Lemma 23.23.5 the ring map

$$(S^{(d_i)})_{(s_i)} = \Gamma(D_+(s_i), \mathcal{O}_{\mathrm{Proj}(S)}) \longrightarrow \Gamma(X_{s_i}, \mathcal{O}_X)$$

is an isomorphism. Hence f induces an isomorphism $X_{s_i} \to D_+(s_i)$. Thus f is an isomorphism of X onto the open subscheme $\bigcup_{i=1,\ldots,n} D_+(s_i)$ of $\mathrm{Proj}(S)$. □

Lemma 23.23.11. *Let X be a scheme. Let S be a graded ring. Assume X is quasi-compact, and assume there exists an open immersion*

$$j : X \longrightarrow Y = Proj(S).$$

Then $j^*\mathcal{O}_Y(d)$ is an invertible ample sheaf for some $d > 0$.

Proof. This is Constructions, Lemma 22.10.6. □

Proposition 23.23.12. *Let X be a quasi-compact scheme. Let $\mathcal{L}$ be an invertible sheaf on X. Set $S = \Gamma_*(X, \mathcal{L})$. The following are equivalent:*

(1) *$\mathcal{L}$ is ample,*
(2) *the open sets X_s, with $s \in S_+$ homogeneous, cover X and the associated morphism $X \to Proj(S)$ is an open immersion,*
(3) *the open sets X_s, with $s \in S_+$ homogeneous, form a basis for the topology of X,*
(4) *the open sets X_s, with $s \in S_+$ homogeneous, which are affine form a basis for the topology of X,*
(5) *for every quasi-coherent sheaf $\mathcal{F}$ on X the sum of the images of the canonical maps*

$$\Gamma(X, \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L}^{\otimes n}) \otimes_{\mathbf{Z}} \mathcal{L}^{\otimes -n} \longrightarrow \mathcal{F}$$

with $n \geq 1$ equals $\mathcal{F}$,

(6) *same property as (5) with $\mathcal{F}$ ranging over all quasi-coherent sheaves of ideals,*
(7) *X is quasi-separated and for every quasi-coherent sheaf $\mathcal{F}$ of finite type on X there exists an integer n_0 such that $\mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L}^{\otimes n}$ is globally generated for all $n \geq n_0$,*
(8) *X is quasi-separated and for every quasi-coherent sheaf $\mathcal{F}$ of finite type on X there exist integers $n > 0$, $k \geq 0$ such that $\mathcal{F}$ is a quotient of a direct sum of k copies of $\mathcal{L}^{\otimes -n}$, and*
(9) *same as in (8) with $\mathcal{F}$ ranging over all sheaves of ideals of finite type on X.*

Proof. Lemma 23.23.10 is (1) $\Rightarrow$ (2). Lemmas 23.23.2 and 23.23.11 provide the implication (1) $\Leftarrow$ (2). The implications (2) $\Rightarrow$ (4) $\Rightarrow$ (3) are clear from Constructions, Section 22.8. Lemma 23.23.6 is (3) $\Rightarrow$ (1). Thus we see that the first 4 conditions are all equivalent.

Assume the equivalent conditions (1) -- (4). Note that in particular X is separated (as an open subscheme of the separated scheme $\text{Proj}(S)$). Let $\mathcal{F}$ be a quasi-coherent sheaf on X. Choose $s \in S_+$ homogeneous such that X_s is affine. We claim that any section $m \in \Gamma(X_s, \mathcal{F})$ is in the image of one of the maps displayed in (5) above. This will imply (5) since these affines X_s cover X. Namely, by Lemma 23.23.5 we may write m as the image of $m' \otimes s^{-n}$ for some $n \geq 1$, some $m' \in \Gamma(X, \mathcal{F} \otimes \mathcal{L}^{\otimes n})$. This proves the claim.

Clearly (5) $\Rightarrow$ (6). Let us assume (6) and prove $\mathcal{L}$ is ample. Pick $x \in X$. Let $U \subset X$ be an affine open which contains x. Set $Z = X \setminus U$. We may think of Z as a reduced closed subscheme, see Schemes, Section 21.12. Let $\mathcal{I} \subset \mathcal{O}_X$ be the quasi-coherent sheaf of ideals corresponding to the closed subscheme Z. By assumption (6), there exists an $n \geq 1$ and a section $s \in \Gamma(X, \mathcal{I} \otimes \mathcal{L}^{\otimes n})$ such that s does not vanish at x (more precisely such that $s \not\in \mathfrak{m}_x \mathcal{I}_x \otimes \mathcal{L}_x^{\otimes n}$). We may think of s as a section of $\mathcal{L}^{\otimes n}$. Since it clearly vanishes along Z we see that $X_s \subset U$. Hence X_s is affine, see Lemma 23.23.4. This proves that $\mathcal{L}$ is ample. At this point we have proved that (1) -- (6) are equivalent.

Assume the equivalent conditions (1) -- (6). In the following we will use the fact that the tensor product of two sheaves of modules which are globally generated is globally generated without further mention (see Modules, Lemma 15.4.3). By (1) we can find elements $s_i \in S_{d_i}$ with $d_i \geq 1$ such that $X = \bigcup_{i=1,\ldots,n} X_{s_i}$. Set $d = d_1 \ldots d_n$. It follows that $\mathcal{L}^{\otimes d}$ is globally generated by

$$s_1^{d/d_1}, \ldots, s_n^{d/d_n}.$$

This means that if $\mathcal{L}^{\otimes j}$ is globally generated then so is $\mathcal{L}^{\otimes j+dn}$ for all $n \geq 0$. Fix a $j \in \{0, \ldots, d-1\}$. For any point $x \in X$ there exists an $n \geq 1$ and a global section s of $\mathcal{L}^{j+dn}$ which does not vanish at x, as follows from (5) applied to $\mathcal{F} = \mathcal{L}^{\otimes j}$ and ample invertible sheaf $\mathcal{L}^{\otimes d}$. Since X is quasi-compact there we may find a finite list of integers n_i and global sections s_i of $\mathcal{L}^{\otimes j+dn_i}$ which do not vanish at any point of X. Since $\mathcal{L}^{\otimes d}$ is globally generated this means that $\mathcal{L}^{\otimes j+dn}$ is globally generated where $n = \max\{n_i\}$. Since we proved this for every congruence class mod d we conclude that there exists an $n_0 = n_0(\mathcal{L})$ such that $\mathcal{L}^{\otimes n}$ is globally generated for all $n \geq n_0$. At this point we see that if $\mathcal{F}$ is globally generated then so is $\mathcal{F} \otimes \mathcal{L}^{\otimes n}$ for all $n \geq n_0$.

We continue to assume the equivalent conditions (1) -- (6). Let $\mathcal{F}$ be a quasi-coherent sheaf of $\mathcal{O}_X$-modules of finite type. Denote $\mathcal{F}_n \subset \mathcal{F}$ the image of the canonical map of (5). By construction $\mathcal{F}_n \otimes \mathcal{L}^{\otimes n}$ is globally generated. By (5) we see $\mathcal{F}$ is the sum of the subsheaves $\mathcal{F}_n$, $n \geq 1$. By Modules, Lemma 15.9.7 we see that $\mathcal{F} = \sum_{n=1,\ldots,N} \mathcal{F}_n$ for some $N \geq 1$. It follows that $\mathcal{F} \otimes \mathcal{L}^{\otimes n}$ is globally generated whenever $n \geq N + n_0(\mathcal{L})$ with $n_0(\mathcal{L})$ as above. We conclude that (1) -- (6) implies (7).

Assume (7). Let $\mathcal{F}$ be a quasi-coherent sheaf of $\mathcal{O}_X$-modules of finite type. By (7) there exists an integer $n \geq 1$ such that the canonical map

$$\Gamma(X, \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L}^{\otimes n}) \otimes_{\mathbf{Z}} \mathcal{L}^{\otimes -n} \longrightarrow \mathcal{F}$$

is surjective. Let I be the set of finite subsets of $\Gamma(X, \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L}^{\otimes n})$ partially ordered by inclusion. Then I is a directed partially ordered set. For $i = \{s_1, \ldots, s_{r(i)}\}$ let $\mathcal{F}_i \subset \mathcal{F}$ be the image of the map

$$\bigoplus\nolimits_{j=1,\ldots,r(i)} \mathcal{L}^{\otimes -n} \longrightarrow \mathcal{F}$$

which is multiplication by s_j on the jth factor. The surjectivity above implies that $\mathcal{F} = \operatorname{colim}_{i \in I} \mathcal{F}_i$. Hence Modules, Lemma 15.9.7 applies and we conclude that $\mathcal{F} = \mathcal{F}_i$ for some i. Hence we have proved (8). In other words, (7) $\Rightarrow$ (8).

The implication (8) $\Rightarrow$ (9) is trivial.

Finally, assume (9). Let $\mathcal{I} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals. By Lemma 23.20.3 (this is where we use the condition that X be quasi-separated) we see that $\mathcal{I} = \operatorname{colim}_\alpha I_\alpha$ with each I_α quasi-coherent of finite type. Since by assumption each of the I_α is a quotient of negative tensor powers of $\mathcal{L}$ we conclude the same for $\mathcal{I}$ (but of course without the finiteness or boundedness of the powers). Hence we conclude that (9) implies (6). This ends the proof of the proposition. □

23.24. Affine and quasi-affine schemes

Lemma 23.24.1. *Let X be a scheme. Then X is quasi-affine if and only if $\mathcal{O}_X$ is ample.*

Proof. Suppose that X is quasi-affine. Consider the open immersion

$$j : X \longrightarrow Spec(\Gamma(X, \mathcal{O}_X))$$

from Lemma 23.15.4. Note that $Spec(A) = \text{Proj}(A[T])$, see Constructions, Example 22.8.14. Hence we can apply Lemma 23.23.11 to deduce that $\mathcal{O}_X$ is ample.

Suppose that $\mathcal{O}_X$ is ample. Note that $\Gamma_*(X, \mathcal{O}_X) \cong \Gamma(X, \mathcal{O}_X)[T]$ as graded rings. Hence the result follows from Lemmas 23.23.10 and 23.15.4 taking into account that $Spec(A) = \text{Proj}(A[T])$ for any ring A as seen above. □

Lemma 23.24.2. *Let X be a scheme. Suppose that there exist finitely many elements $f_1, \ldots, f_n \in \Gamma(X, \mathcal{O}_X)$ such that*

1. *each X_{f_i} is an affine open of X, and*
2. *the ideal generated by $f_1, \ldots, f_n$ in $\Gamma(X, \mathcal{O}_X)$ is equal to the unit ideal.*

Then X is affine.

Proof. Assume we have $f_1, \ldots, f_n$ as in the lemma. We may write $1 = \sum g_i f_i$ for some $g_j \in \Gamma(X, \mathcal{O}_X)$ and hence it is clear that $X = \bigcup X_{f_i}$. (The f_i's cannot all vanish at a point.) Since each X_{f_i} is quasi-compact (being affine) it follows that X is quasi-compact. Hence we see that X is quasi-affine by Lemma 23.24.1 above. Consider the open immersion

$$j : X \to Spec(\Gamma(X, \mathcal{O}_X)),$$

see Lemma 23.15.4. The inverse image of the standard open $D(f_i)$ on the right hand side is equal to X_{f_i} on the left hand side and the morphism j induces an isomorphism $X_{f_i} \cong D(f_i)$, see Lemma 23.15.3. Since the f_i generate the unit ideal we see that $Spec(\Gamma(X, \mathcal{O}_X)) = \bigcup_{i=1,\ldots,n} D(f_i)$. Thus j is an isomorphism. □

23.25. Quasi-coherent sheaves and ample invertible sheaves

Situation 23.25.1. Let X be a scheme. Let $\mathcal{L}$ be an invertible sheaf on X. Assume $\mathcal{L}$ is ample. Set $S = \Gamma_*(X, \mathcal{L})$ as a graded ring. Set $Y = \text{Proj}(S)$. Let $f : X \to Y$ be the canonical morphism of Lemma 23.23.8. It comes equipped with a $\mathbf{Z}$-graded $\mathcal{O}_X$-algebra map $\bigoplus f^*\mathcal{O}_Y(n) \to \bigoplus \mathcal{L}^{\otimes n}$.

The following lemma is really a special case of the next lemma but it seems like a good idea to point out its validity first.

Lemma 23.25.2. *In Situation 23.25.1. The canonical morphism $f : X \to Y$ maps X into the open subscheme $W = W_1 \subset Y$ where $\mathcal{O}_Y(1)$ is invertible and where all multiplication maps $\mathcal{O}_Y(n) \otimes_{\mathcal{O}_Y} \mathcal{O}_Y(m) \to \mathcal{O}_Y(n+m)$ are isomorphisms (see Constructions, Lemma 22.10.4). Moreover, the maps $f^*\mathcal{O}_Y(n) \to \mathcal{L}^{\otimes n}$ are all isomorphisms.*

Proof. By Proposition 23.23.12 there exists an integer n_0 such that $\mathcal{L}^{\otimes n}$ is globally generated for all $n \geq n_0$. Let $x \in X$ be a point. By the above we can find $a \in S_{n_0}$ and $b \in S_{n_0+1}$ such that a and b do not vanish at x. Hence $f(x) \in D_+(a) \cap D_+(b) = D_+(ab)$. By Constructions, Lemma 22.10.4 we see that $f(x) \in W_1$ as desired. By Constructions, Lemma 22.14.1 which was used in the construction of the map f the maps $f^*\mathcal{O}_Y(n_0) \to \mathcal{L}^{\otimes n_0}$ and $f^*\mathcal{O}_Y(n_0+1) \to \mathcal{L}^{\otimes n_0+1}$ are isomorphisms in a neighbourhood of x. By compatibility with the algebra structure and the fact that f maps into W we conclude all the maps $f^*\mathcal{O}_Y(n) \to \mathcal{L}^{\otimes n}$ are isomorphisms in a neighbourhood of x. Hence we win. $\square$

Recall from Modules, Definition 15.21.4 that given a locally ringed space X, an invertible sheaf $\mathcal{L}$, and a $\mathcal{O}_X$-module $\mathcal{F}$ we have the graded $\Gamma_*(X, \mathcal{L})$-module

$$\Gamma(X, \mathcal{L}, \mathcal{F}) = \bigoplus\nolimits_{n \in \mathbf{Z}} \Gamma(X, \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L}^{\otimes n}).$$

The following lemma says that, in Situation 23.25.1, we can recover a quasi-coherent $\mathcal{O}_X$-module $\mathcal{F}$ from this graded module. Take a look also at Constructions, Lemma 22.13.7 where we prove this lemma in the special case $X = \mathbf{P}^n_R$.

Lemma 23.25.3. *In Situation 23.25.1. Let $\mathcal{F}$ be a quasi-coherent sheaf on X. Set $M = \Gamma_*(X, \mathcal{L}, \mathcal{F})$ as a graded S-module. There are isomorphisms*

$$f^*\widetilde{M} \longrightarrow \mathcal{F}$$

functorial in $\mathcal{F}$ such that $M_0 \to \Gamma(Proj(S), \widetilde{M}) \to \Gamma(X, \mathcal{F})$ is the identity map.

Proof. Let $s \in S_+$ be homogeneous such that X_s is affine open in X. Recall that $\widetilde{M}|_{D_+(s)}$ corresponds to the $S_{(s)}$-module $M_{(s)}$, see Constructions, Lemma 22.8.4. Recall that $f^{-1}(D_+(s)) = X_s$. As X carries an ample invertible sheaf it is quasi-compact and quasi-separated, see Section 23.23. By Lemma 23.23.5 there is a canonical isomorphism $M_{(s)} = \Gamma_*(X, \mathcal{L}, \mathcal{F})_{(s)} \to \Gamma(X_s, \mathcal{F})$. Since $\mathcal{F}$ is quasi-coherent this leads to a canonical isomorphism

$$f^*\widetilde{M}|_{X_s} \to \mathcal{F}|_{X_s}$$

Since $\mathcal{L}$ is ample on X we know that X is covered by the affine opens of the form X_s. Hence it suffices to prove that the displayed maps glue on overlaps. Proof of this is omitted. $\square$

Remark 23.25.4. With assumptions and notation of Lemma 23.25.3. Denote the displayed map of the lemma by $\theta_{\mathcal{F}}$. Note that the isomorphism $f^*\mathcal{O}_Y(n) \to \mathcal{L}^{\otimes n}$ of Lemma 23.25.2 is just $\theta_{\mathcal{L}^{\otimes n}}$. Consider the multiplication maps

$$\widetilde{M} \otimes_{\mathcal{O}_Y} \mathcal{O}_Y(n) \longrightarrow \widetilde{M(n)}$$

see Constructions, Equation (22.10.1.5). Pull this back to X and consider

$$\begin{tikzcd} f^*\widetilde{M} \otimes_{\mathcal{O}_X} f^*\mathcal{O}_Y(n) \arrow[r] \arrow[d, "\theta_{\mathcal{F}} \otimes \theta_{\mathcal{L}^{\otimes n}}"'] & f^*\widetilde{M(n)} \arrow[d, "\theta_{\mathcal{F}\otimes\mathcal{L}^{\otimes n}}"] \\ \mathcal{F} \otimes \mathcal{L}^{\otimes n} \arrow[r, "\mathrm{id}"] & \mathcal{F} \otimes \mathcal{L}^{\otimes n} \end{tikzcd}$$

Here we have used the obvious identification $M(n) = \Gamma_*(X, \mathcal{L}, \mathcal{F} \otimes \mathcal{L}^{\otimes n})$. This diagram commutes. Proof omitted.

23.26. Finding suitable affine opens

In this section we collect some results on the existence of affine opens in more and less general situations.

Lemma 23.26.1. *Let X be a quasi-separated scheme. Let $Z_1, \ldots, Z_n$ be pairwise distinct irreducible components of X, see Topology, Section 5.5. Let $\eta_i \in Z_i$ be their generic points, see Schemes, Lemma 21.11.1. There exist affine open neighbourhoods $\eta_i \in U_i$ such that $U_i \cap U_j = \emptyset$ for all $i \neq j$. In particular, $U = U_1 \cup \ldots \cup U_n$ is an affine open containing all of the points $\eta_1, \ldots, \eta_n$.*

Proof. Let V_i be any affine open containing η_i and disjoint from the closed set $Z_1 \cup \ldots \hat{Z}_i \ldots \cup Z_n$. Since X is quasi-separated for each i the union $W_i = \bigcup_{j, j \neq i} V_i \cap V_j$ is a quasi-compact open of V_i not containing η_i. We can find open neighbourhoods $U_i \subset V_i$ containing η_i and disjoint from W_i by Algebra, Lemma 7.23.4. Finally, U is affine since it is the spectrum of the ring $R_1 \times \ldots \times R_n$ where $R_i = \mathcal{O}_X(U_i)$, see Schemes, Lemma 21.6.8. □

Remark 23.26.2. Lemma 23.26.1 above is false if X is not quasi-separated. Here is an example. Take $R = \mathbf{Q}[x, y_1, y_2, \ldots]/((x-i)y_i)$. Consider the minimal prime ideal $\mathfrak{p} = (y_1, y_2, \ldots)$ of R. Glue two copies of $Spec(R)$ along the (not quasi-compact) open $Spec(R) \setminus V(\mathfrak{p})$ to get a scheme X (glueing as in Schemes, Example 21.14.3). Then the two maximal points of X corresponding to $\mathfrak{p}$ are not contained in a common affine open. The reason is that any open of $Spec(R)$ containing $\mathfrak{p}$ contains infinitely many of the ``lines'' $x = i$, $y_j = 0$, $j \neq i$ with parameter y_i. Details omitted.

Notwithstanding the example above, for ``most'' finite sets of irreducible closed subsets one can apply Lemma 23.26.1 above, at least if X is quasi-compact. This is true because X contains a dense open which is separated.

Lemma 23.26.3. *Let X be a quasi-compact scheme. There exists a dense open $V \subset X$ which is separated.*

Proof. Say $X = \bigcup_{i=1,\ldots,n} U_i$ is a union of n affine open subschemes. We will prove the lemma by induction on n. It is trivial for $n = 1$. Let $V' \subset \bigcup_{i=1,\ldots,n-1} U_i$ be a separated dense open subscheme, which exists by induction hypothesis. Consider

$$V = V' \coprod (U_n \setminus \overline{V'}).$$

It is clear that V is separated and a dense open subscheme of X. □

Here is a slight refinement of Lemma 23.26.1 above.

Lemma 23.26.4. *Let X be a quasi-separated scheme. Let $Z_1, \ldots, Z_n$ be pairwise distinct irreducible components of X. Let $\eta_i \in Z_i$ be their generic points. Let $x \in X$ be arbitrary. There exists an affine open $U \subset X$ containing x and all the η_i.*

Proof. Suppose that $x \in Z_1 \cap \ldots \cap Z_r$ and $x \not\in Z_{r+1}, \ldots, Z_n$. Then we may choose an affine open $W \subset X$ such that $x \in W$ and $W \cap Z_i = \emptyset$ for $i = r+1, \ldots, n$. Note that clearly $\eta_i \in W$ for $i = 1, \ldots, r$. By Lemma 23.26.1 we may choose affine opens $U_i \subset X$ which are pairwise disjoint such that $\eta_i \in U_i$ for $i = r+1, \ldots, n$. Since X is quasi-separated the opens $W \cap U_i$ are quasi-compact and do not contain η_i for $i = r+1, \ldots, n$. Hence by Algebra, Lemma 7.23.4 we may shrink U_i such that $W \cap U_i = \emptyset$ for $i = r+1, \ldots, n$. Then the union $U = W \cup \bigcup_{i=r+1,\ldots,n} U_i$ is disjoint and hence (by Schemes, Lemma 21.6.8) a suitable affine open. $\square$

Lemma 23.26.5. *Let X be a scheme. Assume either*

1. *The scheme X is quasi-affine.*
2. *The scheme X is isomorphic to an open subscheme of an affine scheme.*
3. *There exists an ample invertible sheaf on X.*
4. *The scheme X is isomorphic to an open subscheme of $Proj(S)$ for some graded ring S.*

Then for any finite subset $E \subset X$ there exists an affine open $U \subset X$ with $E \subset U$.

Proof. By Properties, Definition 23.15.1 a quasi-affine scheme is a quasi-compact open subscheme of an affine scheme. Any affine scheme $Spec(R)$ is isomorphic to $\text{Proj}(R[X])$ where $R[X]$ is graded by setting $\deg(X) = 1$. By Properties, Proposition 23.23.12 if X has an ample invertible sheaf then X is isomorphic to an open subscheme of $\text{Proj}(S)$ for some graded ring S. Hence, it suffices to prove the lemma in case (4). Thus assume $X \subset \text{Proj}(S)$ is an open subscheme where S is some graded ring. Since E is finite we may assume $E \subset D_+(f_1) \cup \ldots \cup D_+(f_n) \subset X$ for some finite number of homogeneous elements $f_i \in S_+$. Suppose that $E = \{\mathfrak{p}_1, \ldots, \mathfrak{p}_m\}$ as a subset of $\text{Proj}(S)$. Consider the ideal $I = (f_1, \ldots, f_n) \subset S$. Since $I \not\subset \mathfrak{p}_j$ for all $j = 1, \ldots, m$ we see from Algebra, Lemma 7.53.6 that there exists a homogeneous element $f \in I$, $f \not\in \mathfrak{p}_j$ for all $j = 1, \ldots, m$. Then $E \subset D_+(f) \subset D_+(f_1) \cup \ldots \cup D_+(f_n)$ is an affine open as desired. $\square$

CHAPTER 24

Morphisms of Schemes

24.1. Introduction

In this chapter we introduce some types of morphisms of schemes. A basic reference is [**DG67**].

24.2. Closed immersions

In this section we elucidate some of the results obtained previously on closed immersions of schemes. Recall that a morphism of schemes $i : Z \to X$ is defined to be a closed immersion if (a) i induces a homeomorphism onto a closed subset of X, (b) $i^\sharp : \mathcal{O}_X \to i_*\mathcal{O}_Z$ is surjective, and (c) the kernel of $i^\sharp$ is locally generated by sections, see Schemes, Definitions 21.10.2 and 21.4.1. It turns out that, given that Z and X are schemes, there are many different ways of characterizing a closed immersion.

Lemma 24.2.1. *Let $i : Z \to X$ be a morphism of schemes. The following are equivalent:*

(1) *The morphism i is a closed immersion.*
(2) *For every affine open $Spec(R) = U \subset X$, there exists an ideal $I \subset R$ such that $i^{-1}(U) = Spec(R/I)$ as schemes over $U = Spec(R)$.*
(3) *There exists an affine open covering $X = \bigcup_{j\in J} U_j$, $U_j = Spec(R_j)$ and for every $j \in J$ there exists an ideal $I_j \subset R_j$ such that $i^{-1}(U_j) = Spec(R_j/I_j)$ as schemes over $U_j = Spec(R_j)$.*
(4) *The morphism i induces a homeomorphism of Z with a closed subset of X and $i^\sharp : \mathcal{O}_X \to i_*\mathcal{O}_Z$ is surjective.*
(5) *The morphism i induces a homeomorphism of Z with a closed subset of X, the map $i^\sharp : \mathcal{O}_X \to i_*\mathcal{O}_Z$ is surjective, and the kernel $Ker(i^\sharp) \subset \mathcal{O}_X$ is a quasi-coherent sheaf of ideals.*
(6) *The morphism i induces a homeomorphism of Z with a closed subset of X, the map $i^\sharp : \mathcal{O}_X \to i_*\mathcal{O}_Z$ is surjective, and the kernel $Ker(i^\sharp) \subset \mathcal{O}_X$ is a sheaf of ideals which is locally generated by sections.*

Proof. Condition (6) is our definition of a closed immersion, see Schemes, Definitions 21.4.1 and 21.10.2. So (6) $\Leftrightarrow$ (1). We have (1) $\Rightarrow$ (2) by Schemes, Lemma 21.10.1. Trivially (2) $\Rightarrow$ (3).

Assume (3). Each of the morphisms $Spec(R_j/I_j) \to Spec(R_j)$ is a closed immersion, see Schemes, Example 21.8.1. Hence $i^{-1}(U_j) \to U_j$ is a homeomorphism onto its image and $i^\sharp|_{U_j}$ is surjective. Hence i is a homeomorphism onto its image and $i^\sharp$ is surjective since this may be checked locally. We conclude that (3) $\Rightarrow$ (4).

The implication (4) $\Rightarrow$ (1) is Schemes, Lemma 21.24.2. The implication (5) $\Rightarrow$ (6) is trivial. And the implication (6) $\Rightarrow$ (5) follows from Schemes, Lemma 21.10.1. $\square$

Lemma 24.2.2. *Let X be a scheme. Suppose $i : Z \to X$ and $i' : Z' \to X$ are closed immersions corresponding to the quasi-coherent ideal sheaves $\mathcal{I} = Ker(i^\sharp)$ and $\mathcal{I}' = Ker((i')^\sharp)$ of $\mathcal{O}_X$.*

1. *The morphism $i : Z \to X$ factors as $Z \to Z' \to X$ for some $a : Z \to Z'$ if and only if $\mathcal{I}' \subset \mathcal{I}$. If this happens, then a is a closed immersion.*
2. *We have $Z \cong Z'$ as schemes over X if and only if $\mathcal{I} = \mathcal{I}'$.*

Proof. This follows from our discussion of closed subspaces in Schemes, Section 21.4 especially Schemes, Lemma 21.4.6. It also follows in a straightforward way from characterization (3) in Lemma 24.2.1 above. $\square$

Lemma 24.2.3. *Let X be a scheme. Let $\mathcal{I} \subset \mathcal{O}_X$ be a sheaf of ideals. The following are equivalent:*

1. *The sheaf of ideals $\mathcal{I}$ is locally generated by sections as a sheaf of $\mathcal{O}_X$ modules.*
2. *The sheaf of ideals $\mathcal{I}$ is quasi-coherent as a sheaf of $\mathcal{O}_X$-modules.*
3. *There exists a closed immersion $i : Z \to X$ whose corresponding sheaf of ideals $Ker(i^\sharp)$ is equal to $\mathcal{I}$.*

Proof. In Schemes, Section 21.4 we constructed the closed subspace associated to a sheaf of ideals locally generated by sections. This closed subspace is a scheme by Schemes, Lemma 21.10.1. Hence we see that (1) $\Rightarrow$ (3) by our definition of a closed immersion of schemes. By Lemma 24.2.1 above we see that (3) $\Rightarrow$ (2). And of course (2) $\Rightarrow$ (1). $\square$

Lemma 24.2.4. *The base change of a closed immersion is a closed immersion.*

Proof. See Schemes, Lemma 21.18.2. $\square$

Lemma 24.2.5. *A composition of closed immersions is a closed immersion.*

Proof. We have seen this in Schemes, Lemma 21.24.3, but here is another proof. Namely, it follows from the characterization (3) of closed immersions in Lemma 24.2.1. Since if $I \subset R$ is an ideal, and $\overline{J} \subset R/I$ is an ideal, then $\overline{J} = J/I$ for some ideal $J \subset R$ which contains I and $(R/I)/\overline{J} = R/J$. $\square$

Lemma 24.2.6. *A closed immersion is quasi-compact.*

Proof. This lemma is a duplicate of Schemes, Lemma 21.19.5. $\square$

Lemma 24.2.7. *A closed immersion is separated.*

Proof. This lemma is a special case of Schemes, Lemma 21.23.7. $\square$

Lemma 24.2.8. *Let $h : Z \to X$ be an immersion. If h is quasi-compact, then we can factor $h = i \circ j$ with $j : Z \to \overline{Z}$ an open immersion and $i : \overline{Z} \to X$ a closed immersion.*

Proof. Note that h is quasi-compact and quasi-separated (see Schemes, Lemma 21.23.7). Hence $h_*\mathcal{O}_Z$ is a quasi-coherent sheaf of $\mathcal{O}_X$-modules by Schemes, Lemma 21.24.1. This implies that $\mathcal{I} = \text{Ker}(\mathcal{O}_X \to h_*\mathcal{O}_Z)$ is a quasi-coherent sheaf of ideals, see Schemes, Section 21.24. Let $\overline{Z} \subset X$ be the closed subscheme corresponding to $\mathcal{I}$, see Lemma 24.2.3. By Schemes, Lemma 21.4.6 the morphism h factors as $h = i \circ j$ where $i : \overline{Z} \to X$ is the inclusion morphism. To see that j is an open immersion, choose an open subscheme $U \subset X$ such that h induces a closed immersion of Z into U. Then it is clear that $\mathcal{I}|_U$ is the sheaf of ideals corresponding to the closed immersion $Z \to U$. Hence we see that $Z = \overline{Z} \cap U$. $\square$

Lemma 24.2.9. *Let $h : Z \to X$ be an immersion. If Z is reduced, then we can factor $h = i \circ j$ with $j : Z \to \overline{Z}$ an open immersion and $i : \overline{Z} \to X$ a closed immersion.*

Proof. Let $\overline{Z} \subset X$ be the closure of $h(Z)$ with the reduced induced closed subscheme structure, see Schemes, Definition 21.12.5. By Schemes, Lemma 21.12.6 the morphism h factors as $h = i \circ j$ with $i : \overline{Z} \to X$ the inclusion morphism and $j : Z \to \overline{Z}$. From the definition of an immersion we see there exists an open subscheme $U \subset X$ such that h factors through a closed immersion into U. Hence $\overline{Z} \cap U$ and $h(Z)$ are reduced closed subschemes of U with the same underlying closed set. Hence by the uniqueness in Schemes, Lemma 21.12.4 we see that $h(Z) \cong \overline{Z} \cap U$. So j induces an isomorphism of Z with $\overline{Z} \cap U$. In other words j is an open immersion. □

Example 24.2.10. Here is an example of an immersion which is not a composition of an open immersion followed by a closed immersion. Let k be a field. Let $X = Spec(k[x_1, x_2, x_3, \ldots])$. Let $U = \bigcup_{n=1}^{\infty} D(x_n)$. Then $U \to X$ is an open immersion. Consider the ideals

$$I_n = (x_1^n, x_2^n, \ldots, x_{n-1}^n, x_n - 1, x_{n+1}, x_{n+2}, \ldots) \subset k[x_1, x_2, x_3, \ldots][1/x_n].$$

Note that $I_n k[x_1, x_2, x_3, \ldots][1/x_n x_m] = (1)$ for any $m \neq n$. Hence the quasi-coherent ideals $\tilde{I}_n$ on $D(x_n)$ agree on $D(x_n x_m)$, namely $\tilde{I}_n|_{D(x_n x_m)} = \mathcal{O}_{D(x_n x_m)}$ if $n \neq m$. Hence these ideals glue to a quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_U$. Let $Z \subset U$ be the closed subscheme corresponding to $\mathcal{I}$. Thus $Z \to X$ is an immersion.

We claim that we cannot factor $Z \to X$ as $Z \to \overline{Z} \to X$, where $\overline{Z} \to X$ is closed and $Z \to \overline{Z}$ is open. Namely, $\overline{Z}$ would have to be defined by an ideal $I \subset k[x_1, x_2, x_3, \ldots]$ such that $I_n = Ik[x_1, x_2, x_3, \ldots][1/x_n]$. But the only element $f \in k[x_1, x_2, x_3, \ldots]$ which ends up in all I_n is 0! Hence I does not exist.

24.3. Closed immersions and quasi-coherent sheaves

The following lemma finally does for quasi-coherent sheaves on schemes what Modules, Lemma 15.6.1 does for abelian sheaves. See also the discussion in Modules, Section 15.13.

Lemma 24.3.1. *Let $i : Z \to X$ be a closed immersion of schemes. Let $\mathcal{I} \subset \mathcal{O}_X$ be the quasi-coherent sheaf of ideals cutting out Z. The functor*

$$i_* : QCoh(\mathcal{O}_Z) \longrightarrow QCoh(\mathcal{O}_X)$$

is exact, fully faithful, with essential image those quasi-coherent $\mathcal{O}_X$-modules $\mathcal{G}$ such that $\mathcal{I}\mathcal{G} = 0$.

Proof. A closed immersion is quasi-compact and separated, see Lemmas 24.2.6 and 24.2.7. Hence Schemes, Lemma 21.24.1 applies and the pushforward of a quasi-coherent sheaf on Z is indeed a quasi-coherent sheaf on X.

By Modules, Lemma 15.6.1 the functor i_* is faithful. We claim that for any quasi-coherent sheaf $\mathcal{F}$ on Z the canonical map

$$i^* i_* \mathcal{F} \longrightarrow \mathcal{F}$$

is an isomorphism. This claim implies in particular that i_* is fully faithful. To prove the claim let $U = Spec(R)$ be any affine open of X, and write $Z \cap U = Spec(R/I)$, see Lemma 24.2.1 above. We may write $\mathcal{F}|_{U \cap Z} = \widetilde{M}$ where M is an R/I-module (see Schemes, Section 21.24). By Schemes, Lemma 21.7.3 we see that $i_*\mathcal{F}|_U$ corresponds to M_R and then $i^*i_*\mathcal{F}|_{Z\cap U}$ corresponds to $M_R \otimes_R R/I$. In other words, we have to see that for any R/I-module M the canonical map

$$M_R \otimes_R R/I \longrightarrow M, \quad m \otimes f \longmapsto fm$$

is an isomorphism. Proof of this easy algebra fact is omitted.

Now we turn to the description of the essential image of the functor i_*. It is clear that $\mathcal{I}(i_*\mathcal{F}) = 0$ for any quasi-coherent $\mathcal{O}_Z$-module, for example by our local description above. Next, suppose that $\mathcal{G}$ is any quasi-coherent $\mathcal{O}_X$-module such that $\mathcal{I}\mathcal{G} = 0$. It suffices to show that the canonical map

$$\mathcal{G} \longrightarrow i_*i^*\mathcal{G}$$

is an isomorphism. By exactly the same arguments as above we see that it suffices to prove the following algebraic statement: Given a ring R, an ideal I and an R-module N such that $IN = 0$ the canonical map

$$N \longrightarrow N \otimes_R R/I, \quad n \longmapsto n \otimes 1$$

is an isomorphism of R-modules. Proof of this easy algebra fact is omitted. □

Let $i : Z \to X$ be a closed immersion. Because of the lemma above we often, by abuse of notation, denote $\mathcal{F}$ the sheaf $i_*\mathcal{F}$ on X.

Lemma 24.3.2. *Let X be a scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Let $\mathcal{G} \subset \mathcal{F}$ be a $\mathcal{O}_X$-submodule. There exists a unique quasi-coherent $\mathcal{O}_X$-submodule $\mathcal{G}' \subset \mathcal{G}$ with the following property: For every quasi-coherent $\mathcal{O}_X$-module $\mathcal{H}$ the map*

$$Hom_{\mathcal{O}_X}(\mathcal{H}, \mathcal{G}') \longrightarrow Hom_{\mathcal{O}_X}(\mathcal{H}, \mathcal{G})$$

is bijective. In particular $\mathcal{G}'$ is the largest quasi-coherent $\mathcal{O}_X$-submodule of $\mathcal{F}$ contained in $\mathcal{G}$.

Proof. Let $\mathcal{G}_a$, $a \in A$ be the set of quasi-coherent $\mathcal{O}_X$-submodules contained in $\mathcal{G}$. Then the image $\mathcal{G}'$ of

$$\bigoplus\nolimits_{a\in A} \mathcal{G}_a \longrightarrow \mathcal{F}$$

is quasi-coherent as the image of a map of quasi-coherent sheaves on X is quasi-coherent and since a direct sum of quasi-coherent sheaves is quasi-coherent, see Schemes, Section 21.24. The module $\mathcal{G}'$ is contained in $\mathcal{G}$. Hence this is the largest quasi-coherent $\mathcal{O}_X$-module contained in $\mathcal{G}$.

To prove the formula, let $\mathcal{H}$ be a quasi-coherent $\mathcal{O}_X$-module and let $\alpha : \mathcal{H} \to \mathcal{G}$ be an $\mathcal{O}_X$-module map. The image of the composition $\mathcal{H} \to \mathcal{G} \to \mathcal{F}$ is quasi-coherent as the image of a map of quasi-coherent sheaves. Hence it is contained in $\mathcal{G}'$. Hence α factors through $\mathcal{G}'$ as desired. □

Lemma 24.3.3. *Let $i : Z \to X$ be a closed immersion of schemes. There is a functor*[1] *$i^! : QCoh(\mathcal{O}_X) \to QCoh(\mathcal{O}_Z)$ which is a right adjoint to i_*. (Compare Modules, Lemma 15.6.3.)*

Proof. Given quasi-coherent $\mathcal{O}_X$-module $\mathcal{G}$ we consider the subsheaf $\mathcal{H}_Z(\mathcal{G})$ of $\mathcal{G}$ of local sections annihilated by $\mathcal{I}$. By Lemma 24.3.2 there is a canonical largest quasi-coherent $\mathcal{O}_X$-submodule $\mathcal{H}_Z(\mathcal{G})'$. By construction we have

$$Hom_{\mathcal{O}_X}(i_*\mathcal{F}, \mathcal{H}_Z(\mathcal{G})') = Hom_{\mathcal{O}_X}(i_*\mathcal{F}, \mathcal{G})$$

[1] This is likely nonstandard notation.

for any quasi-coherent $\mathcal{O}_Z$-module $\mathcal{F}$. Hence we can set $i^!\mathcal{G} = i^*(\mathcal{H}_Z(\mathcal{G})')$. Details omitted. ☐

24.4. Scheme theoretic image

Lemma 24.4.1. *Let $f : X \to Y$ be a morphism of schemes. There exists a closed subscheme $Z \subset Y$ such that f factors through Z and such that for any other closed subscheme $Z' \subset Y$ such that f factors through Z' we have $Z \subset Z'$.*

Proof. Let $\mathcal{I} = \mathrm{Ker}(\mathcal{O}_Y \to f_*\mathcal{O}_X)$. If $\mathcal{I}$ is quasi-coherent then we just take Z to be the closed subscheme determined by $\mathcal{I}$, see Lemma 24.2.3. This works by Schemes, Lemma 21.4.6. In general the same lemma requires us to show that there exists a largest quasi-coherent sheaf of ideals $\mathcal{I}'$ contained in $\mathcal{I}$. This follows from Lemma 24.3.2. ☐

Definition 24.4.2. Let $f : X \to Y$ be a morphism of schemes. The *scheme theoretic image* of f is the smallest closed subscheme $Z \subset Y$ through which f factors, see Lemma 24.4.1 above.

We often just denote $f : X \to Z$ the factorization of f. If the morphism f is not quasi-compact, then (in general) the construction of the scheme theoretic image does not commute with restriction to open subschemes to Y. Namely, if f is the immersion $Z \to X$ of Example 24.2.10 above then the scheme theoretic image of $Z \to X$ is X. But clearly the scheme theoretic image of $Z = Z \cap U \to U$ is just Z.

Lemma 24.4.3. *Let $f : X \to Y$ be a morphism of schemes. Let $Z \subset Y$ be the scheme theoretic image of f. If f is quasi-compact then*

1. *the sheaf of ideals $\mathcal{I} = Ker(\mathcal{O}_Y \to f_*\mathcal{O}_X)$ is quasi-coherent,*
2. *the scheme theoretic image Z is the closed subscheme determined by $\mathcal{I}$,*
3. *for any open $U \subset Y$ the scheme theoretic image of $f|_{f^{-1}(U)} : f^{-1}(U) \to U$ is equal to $Z \cap U$, and*
4. *the image $f(X) \subset Z$ is a dense subset of Z, in other words the morphism $X \to Z$ is dominant (see Definition 24.6.1).*

Proof. Part (4) follows from part (3). To show (3) it suffices to prove (1) since the formation of $\mathcal{I}$ commutes with restriction to open subschemes of Y. And if (1) holds then in the proof of Lemma 24.4.1 we showed (2). Thus it suffices to prove that $\mathcal{I}$ is quasi-coherent. Since the property of being quasi-coherent is local we may assume Y is affine. As f is quasi-compact, we can find a finite affine open covering $X = \bigcup_{i=1,\ldots,n} U_i$. Denote f' the composition

$$X' = \coprod U_i \longrightarrow X \longrightarrow Y.$$

Then $f_*\mathcal{O}_X$ is a subsheaf of $f'_*\mathcal{O}_{X'}$, and hence $\mathcal{I} = \mathrm{Ker}(\mathcal{O}_Y \to \mathcal{O}_{X'})$. By Schemes, Lemma 21.24.1 the sheaf $f'_*\mathcal{O}_{X'}$ is quasi-coherent on Y. Hence we win. ☐

Example 24.4.4. If $A \to B$ is a ring map with kernel I, then the scheme theoretic image of $Spec(B) \to Spec(A)$ is the closed subscheme $Spec(A/I)$ of $Spec(A)$. This follows from Lemma 24.4.3.

If the morphism is quasi-compact, then the scheme theoretic image only adds points which are specializations of points in the image.

Lemma 24.4.5. *Let $f : X \to Y$ be a quasi-compact morphism. Let Z be the scheme theoretic image of f. Let $z \in Z$. There exists a valuation ring A with fraction field K and a commutative diagram*

$$\begin{tikzcd} Spec(K) \arrow[rr] \arrow[d] & & X \arrow[dl] \arrow[d] \\ Spec(A) \arrow[r] & Z \arrow[r] & Y \end{tikzcd}$$

such that the closed point of $Spec(A)$ maps to z. In particular any point of Z is the specialization of a point of $f(X)$.

Proof. Let $z \in Spec(R) = V \subset Y$ be an affine open neighbourhood of z. By Lemma 24.4.3 we have $Z \cap V$ is the scheme theoretic closure of $f^{-1}(V) \to V$, and hence we may replace Y by V and assume $Y = Spec(R)$ is affine. In this case X is quasi-compact as f is quasi-compact. Say $X = U_1 \cup \ldots \cup U_n$ is a finite affine open covering. Write $U_i = Spec(A_i)$. Let $I = \text{Ker}(R \to A_1 \times \ldots \times A_n)$. By Lemma 24.4.3 again we see that Z corresponds to the closed subscheme $Spec(R/I)$ of Y. If $\mathfrak{p} \subset R$ is the prime corresponding to z, then we see that $I_\mathfrak{p} \subset R_\mathfrak{p}$ is not an equality. Hence (as localization is exact, see Algebra, Proposition 7.9.12) we see that $R_\mathfrak{p} \to (A_1)_\mathfrak{p} \times \ldots \times (A_1)_\mathfrak{p}$ is not zero. Hence one of the rings $(A_i)_\mathfrak{p}$ is not zero. Hence there exists an i and a prime $\mathfrak{q}_i \subset A_i$ lying over a prime $\mathfrak{p}_i \subset \mathfrak{p}$. By Algebra, Lemma 7.46.2 we can choose a valuation ring $A \subset K = f.f.(A_i/\mathfrak{q}_i)$ dominating the local ring $R_\mathfrak{p}/\mathfrak{p}_1 R_\mathfrak{p} \subset f.f.(A_i/\mathfrak{q}_i)$. This gives the desired diagram. Some details omitted. ☐

Lemma 24.4.6. *Let $f_1 : X \to Y_1$ and $Y_1 \to Y_2$ be morphisms of schemes. Let $f_2 : X \to Y_2$ be the composition. Let $Z_i \subset Y_i$, $i = 1, 2$ be the scheme theoretic image of f_i. Then the morphism $Y_1 \to Y_2$ induces a morphism $Z_1 \to Z_2$ and a commutative diagram*

$$\begin{tikzcd} X \arrow[r] \arrow[dr] & Z_1 \arrow[r] \arrow[d] & Y_1 \arrow[d] \\ & Z_2 \arrow[r] & Y_2 \end{tikzcd}$$

Proof. See Schemes, Lemma 21.4.6. ☐

Lemma 24.4.7. *Let $f : X \to Y$ be a morphism of schemes. If X is reduced, then the scheme theoretic image of f is the reduced induced scheme structure on $\overline{f(X)}$.*

Proof. This is true because the reduced induced scheme structure on $\overline{f(X)}$ is clearly the smallest closed subscheme of Y through which f factors, see Schemes, Lemma 21.12.6. ☐

24.5. Scheme theoretic closure and density

Definition 24.5.1. Let X be a scheme. Let $U \subset X$ be an open subscheme.

(1) The scheme theoretic image of the morphism $U \to X$ is called the *scheme theoretic closure of U in X*.
(2) We say U is *scheme theoretically dense in X* if for every open $V \subset X$ the scheme theoretic closure of $U \cap V$ in V is equal to V.

This is [**DG67**, IV, Definition 11.10.2]. With this definition it is **not** the case that U is scheme theoretically dense in X if and only if the scheme theoretic closure of U is X, see Example 24.5.2. This is somewhat inelegant; but see Lemmas 24.5.3 and 24.5.8 below. On the other hand, with this definition U is scheme theoretically dense in X if and only if for every $V \subset X$ open the ring map $\mathcal{O}_X(V) \to \mathcal{O}_X(U \cap V)$ is injective, see Lemma 24.5.5 below. In particular we see that scheme theoretically dense implies dense which is pleasing.

Example 24.5.2. Here is an example where scheme theoretic closure being X does not imply dense for the underlying topological spaces. Let k be a field. Set $A = k[x, z_1, z_2, \ldots]/(x^n z_n)$ Set $I = (z_1, z_2, \ldots) \subset A$. Consider the affine scheme $X = Spec(A)$ and the open subscheme $U = X \setminus V(I)$. Since $A \to \prod_n A_{z_n}$ is injective we see that the scheme theoretic closure of U is X. Consider the morphism $X \to Spec(k[x])$. This morphism is surjective (set all $z_n = 0$ to see this). But the restriction of this morphism to U is not surjective because it maps to the point $x = 0$. Hence U cannot be topologically dense in X.

Lemma 24.5.3. *Let X be a scheme. Let $U \subset X$ be an open subscheme. If the inclusion morphism $U \to X$ is quasi-compact, then U is scheme theoretically dense in X if and only if the scheme theoretic closure of U in X is X.*

Proof. Follows from Lemma 24.4.3 part (3). $\square$

Example 24.5.4. Let A be a ring and $X = Spec(A)$. Let $f_1, \ldots, f_n \in A$ and let $U = D(f_1) \cup \ldots \cup D(f_n)$. Let $I = \text{Ker}(A \to \prod A_{f_i})$. Then the scheme theoretic closure of U in X is the closed subscheme $Spec(A/I)$ of X. Note that $U \to X$ is quasi-compact. Hence by Lemma 24.5.3 we see U is scheme theoretically dense in X if and only if $I = 0$.

Lemma 24.5.5. *Let $j : U \to X$ be an open immersion of schemes. Then U is scheme theoretically dense in X if and only if $\mathcal{O}_X \to j_*\mathcal{O}_U$ is injective.*

Proof. If $\mathcal{O}_X \to j_*\mathcal{O}_U$ is injective, then the same is true when restricted to any open V of X. Hence the scheme theoretic closure of $U \cap V$ in V is equal to V, see Lemma 24.4.3 for example. Conversely, suppose that the scheme theoretic closure of $U \cap V$ is equal to V for all opens V. Suppose that $\mathcal{O}_X \to j_*\mathcal{O}_U$ is not injective. Then we can find an affine open, say $Spec(A) = V \subset X$ and a nonzero element $f \in A$ such that f maps to zero in $\Gamma(V \cap U, \mathcal{O}_X)$. In this case the scheme theoretic closure of $V \cap U$ in V is clearly contained in $Spec(A/(f))$ a contradiction. $\square$

Lemma 24.5.6. *Let X be a scheme. If U, V are scheme theoretically dense open subschemes of X, then so is $U \cap V$.*

Proof. Let $W \subset X$ be any open. Consider the map $\mathcal{O}_X(W) \to \mathcal{O}_X(W \cap V) \to \mathcal{O}_X(W \cap V \cap U)$. By Lemma 24.5.5 both maps are injective. Hence the composite is injective. Hence by Lemma 24.5.5 $U \cap V$ is scheme theoretically dense in X. $\square$

Lemma 24.5.7. *Let $Z \to X$ be an immersion. Assume either $Z \to X$ is quasi-compact or Z is reduced. Let $\overline{Z} \subset X$ be the scheme theoretic image of h. Then the morphism $Z \to \overline{Z}$ is an open immersion which identifies Z with a scheme theoretically dense open subscheme of $\overline{Z}$. Moreover, Z is topologically dense in $\overline{Z}$.*

Proof. By Lemma 24.2.8 or Lemma 24.2.9 we can factor $Z \to X$ as $Z \to \overline{Z}_1 \to X$ with $Z \to \overline{Z}_1$ open and $\overline{Z}_1 \to X$ closed. On the other hand, let $Z \to \overline{Z} \subset X$ be the scheme theoretic closure of $Z \to X$. We conclude that $\overline{Z} \subset \overline{Z}_1$. Since Z is an open subscheme of $\overline{Z}_1$ it follows that Z is an open subscheme of $\overline{Z}$ as well. In the case that Z is reduced we know that $Z \subset \overline{Z}_1$ is topologically dense by the construction of $\overline{Z}_1$ in the proof of Lemma 24.2.9. Hence $\overline{Z}_1$ and $\overline{Z}$ have the same underlying topological spaces. Thus $\overline{Z} \subset \overline{Z}_1$ is a closed immersion into a reduced scheme which induces a bijection on underlying topological spaces, and hence it is an isomorphism. In the case that $Z \to X$ is quasi-compact we argue as follows: The assertion that Z is scheme theoretically dense in $\overline{Z}$ follows from Lemma 24.4.3 part (3). The last assertion follows from Lemma 24.4.3 part (4). $\square$

Lemma 24.5.8. *Let X be a reduced scheme and let $U \subset X$ be an open subscheme. Then the following are equivalent*

(1) *U is topologically dense in X,*
(2) *the scheme theoretic closure of U in X is X, and*
(3) *U is scheme theoretically dense in X.*

Proof. This follows from Lemma 24.5.7 and the fact that the a closed subscheme Z of X whose underlying topological space equals X must be equal to X as a scheme. $\square$

Lemma 24.5.9. *Let X be a scheme and let $U \subset X$ be a reduced open subscheme. Then the following are equivalent*

(1) *the scheme theoretic closure of U in X is X, and*
(2) *U is scheme theoretically dense in X.*

If this holds then X is a reduced scheme.

Proof. This follows from Lemma 24.5.7 and the fact that the scheme theoretic closure of U in X is reduced by Lemma 24.4.7. $\square$

Lemma 24.5.10. *Let S be a scheme. Let X, Y be schemes over S. Let $f, g : X \to Y$ be morphisms of schemes over S. Let $U \subset X$ be an open subscheme such that $f|_U = g|_U$. If the scheme theoretic closure of U in X is X and $Y \to S$ is separated, then $f = g$.*

Proof. Follows from the definitions and Schemes, Lemma 21.21.5. $\square$

24.6. Dominant morphisms

The definition of a morphism of schemes being dominant is a little different from what you might expect if you are used to the notion of a dominant morphism of varieties.

Definition 24.6.1. A morphism $f : X \to S$ of schemes is called *dominant* if the image of f is a dense subset of S.

So for example, if k is an infinite field and $\lambda_1, \lambda_2, \ldots$ is a countable collection of elements of k, then the morphism

$$\coprod\nolimits_{i=1,2,\ldots} Spec(k) \longrightarrow Spec(k[x])$$

with ith factor mapping to the point $x = \lambda_i$ is dominant.

Lemma 24.6.2. *Let $f : X \to S$ be a morphism of schemes. If every generic point of every irreducible component of S is in the image of f, then f is dominant.*

Proof. This is a topological fact which follows directly from the fact that the topological space underlying a scheme is sober, see Schemes, Lemma 21.11.1, and that every point of S is contained in an irreducible component of S, see Topology, Lemma 5.5.3. $\square$

The expectation that morphisms are dominant only if generic points of the target are in the image does hold if the morphism is quasi-compact.

Lemma 24.6.3. *Let $f : X \to S$ be a quasi-compact morphism of schemes. Then f is dominant (if and) only if for every irreducible component $Z \subset S$ the generic point of Z is in the image of f.*

Proof. Let $V \subset S$ be an affine open. Because f is quasi-compact we may choose finitely many affine opens $U_i \subset f^{-1}(V)$, $i = 1, \ldots, n$ covering $f^{-1}(V)$. Consider the morphism of affines

$$f' : \coprod_{i=1,\ldots,n} U_i \longrightarrow V.$$

A disjoint union of affines is affine, see Schemes, Lemma 21.6.8. Generic points of irreducible components of V are exactly the generic points of the irreducible components of S that meet V. Also, f is dominant if and only f' is dominant no matter what choices of V, n, U_i we make above. Thus we have reduced the lemma to the case of a morphism of affine schemes. The affine case is Algebra, Lemma 7.27.6. □

Here is a slightly more useful variant of the lemma above.

Lemma 24.6.4. *Let $f : X \to S$ be a quasi-compact morphism of schemes. Let $\eta \in S$ be a generic point of an irreducible component of S. If $\eta \notin f(X)$ then there exists an open neighbourhood $V \subset S$ of η such that $f^{-1}(V) = \emptyset$.*

Proof. Let $Z \subset S$ be the scheme theoretic image of f. We have to show that $\eta \notin Z$. This follows from Lemma 24.4.5 but can also be seen as follows. By Lemma 24.4.3 the morphism $X \to Z$ is dominant, which by Lemma 24.6.3 means all the generic points of all irreducible components of Z are in the image of $X \to Z$. By assumption we see that $\eta \notin Z$ since η would be the generic point of some irreducible component of Z if it were in Z. □

There is another case where dominant is the same as having all generic points of irreducible components in the image.

Lemma 24.6.5. *Let $f : X \to S$ be a morphism of schemes. Suppose that X has finitely many irreducible components. Then f is dominant (if and) only if for every irreducible component $Z \subset S$ the generic point of Z is in the image of f. If so, then S has finitely many irreducible components as well.*

Proof. Assume f is dominant. Say $X = Z_1 \cup Z_2 \cup \ldots \cup Z_n$ is the decomposition of X into irreducible components. Let $\xi_i \in Z_i$ be its generic point, so $Z_i = \overline{\{\xi_i\}}$. Note that $f(Z_i)$ is an irreducible subset of S. Hence

$$S = \overline{f(X)} = \bigcup \overline{f(Z_i)} = \bigcup \overline{\{f(\xi_i)\}}$$

is a finite union of irreducible subsets whose generic points are in the image of f. The lemma follows. □

24.7. Birational morphisms

You may be used to the notion of a birational map of varieties having the property that it is an isomorphism over an open subset of the target. However, in general a birational morphism may not be an isomorphism over any nonempty open, see Example 24.7.3. Here is the formal definition.

Definition 24.7.1. Let X, Y be schemes. Assume X and Y have finitely many irreducible components. We say a morphism $f : X \to Y$ is *birational* if

(1) f induces a bijection between the set of generic points of irreducible components of X and the set of generic points of the irreducible components of Y, and
(2) for every generic point $\eta \in X$ of an irreducible component of X the local ring map $\mathcal{O}_{Y,f(\eta)} \to \mathcal{O}_{X,\eta}$ is an isomorphism.

Lemma 24.7.2. *Let $f : X \to Y$ be a morphism of schemes having finitely many irreducible components. If f is birational then f is dominant.*

Proof. Follows immediately from the definitions. □

Example 24.7.3. Here is an example of a birational morphism which is not an isomorphism over any open of the target. Let k be an infinite field. Let $A = k[x]$. Let $B = k[x, \{y_\alpha\}_{\alpha \in k}]/((x - \alpha)y_\alpha, y_\alpha y_\beta)$. There is an inclusion $A \subset B$ and a retraction $B \to A$ setting all y_α equal to zero. Both the morphism $Spec(A) \to Spec(B)$ and the morphism $Spec(B) \to Spec(A)$ are birational but not an isomorphism over any open.

24.8. Rational maps

Let X be a scheme. Note that if U, V are dense open in X, then so is $U \cap V$.

Definition 24.8.1. Let X, Y be schemes.

(1) Let $f : U \to Y$, $g : V \to Y$ be morphisms of schemes defined on dense open subsets U, V of X. We say that f is *equivalent* to g if $f|_W = g|_W$ for some $W \subset U \cap V$ dense open in X.
(2) A *rational map from X to Y* is an equivalence class for the equivalence relation defined in (1).
(3) If X, Y are schemes over a base scheme S we say that a rational map from X to Y is an *S-rational map from X to Y* if there exists a representative $f : U \to Y$ of the equivalence class which is an S-morphism.

We say that two morphisms f, g as in (1) of the definition define the same rational map instead of saying that they are equivalent.

Definition 24.8.2. Let X be a scheme. A *rational function on X* is a rational morphism from X to $\mathbf{A}^1_{\mathbf{Z}}$.

See Constructions, Definition 22.5.1 for the definition of the affine line $\mathbf{A}^1$. Let X be a scheme over S. For any open $U \subset X$ a morphism $U \to \mathbf{A}^1_{\mathbf{Z}}$ is the same as a morphism $U \to \mathbf{A}^1_S$ over S. Hence a rational function is also the same as a S-rational map from X into $\mathbf{A}^1_S$.

Recall that we have the canonical identification $Mor(T, \mathbf{A}^1_{\mathbf{Z}}) = \Gamma(T, \mathcal{O}_T)$ for any scheme T, see Schemes, Example 21.15.2. Hence $\mathbf{A}^1_{\mathbf{Z}}$ is a ring-object in the category of schemes. More precisely, the morphisms

$$\begin{array}{rcl} + : \mathbf{A}^1_{\mathbf{Z}} \times \mathbf{A}^1_{\mathbf{Z}} & \longrightarrow & \mathbf{A}^1_{\mathbf{Z}} \\ (f, g) & \longmapsto & f + g \\ * : \mathbf{A}^1_{\mathbf{Z}} \times \mathbf{A}^1_{\mathbf{Z}} & \longrightarrow & \mathbf{A}^1_{\mathbf{Z}} \\ (f, g) & \longmapsto & fg \end{array}$$

satisfy all the axioms of the addition and multiplication in a ring (commutative with 1 as always). Hence also the set of rational maps into $\mathbf{A}^1_{\mathbf{Z}}$ has a natural ring structure.

Definition 24.8.3. Let X be a scheme. The *ring of rational functions on X* is the ring $R(X)$ whose elements are rational functions with addition and multiplication as just described.

Lemma 24.8.4. *Let X be an irreducible scheme. Let $\eta \in X$ be the generic point of X. There is a canonical identification $R(X) \cong \mathcal{O}_{X,\eta}$. If X is integral then $R(X) = \kappa(\eta) = \mathcal{O}_{X,\eta}$ is a field.*

Proof. Omitted. □

Definition 24.8.5. Let X be an integral scheme. The *function field*, or the *field of rational functions* of X is the field $R(X)$.

We may occasionally indicate this field $k(X)$ instead of $R(X)$.

Remark 24.8.6. There is a variant of Definition 24.8.1 where we consider only those morphism $U \to Y$ defined on scheme theoretically dense open subschemes $U \subset X$. We use Lemma 24.5.6 to see that we obtain an equivalence relation. An equivalence class of these is called a *pseudo-morphism from X to Y*. If X is reduced the two notions coincide.

Here is a fun application of these notions. Note that by Lemma 24.8.4 on an integral scheme every local ring $\mathcal{O}_{X,x}$ may be viewed as a local subring of $R(X)$.

Lemma 24.8.7. *Let X be an integral separated scheme. Let Z_1, Z_2 be distinct irreducible closed subsets of X. Let η_i be the generic point of Z_i. If $Z_1 \not\subset Z_2$, then $\mathcal{O}_{X,\eta_1} \not\subset \mathcal{O}_{X,\eta_2}$ as subrings of $R(X)$. In particular, if $Z_1 = \{x\}$ consists of one closed point x, there exists a function regular in a neighborhood of x which is not in $\mathcal{O}_{X,\eta_2}$.*

Proof. First observe that under the assumption of X being seperated, there is a unique map of schemes $Spec(\mathcal{O}_{X,\eta_2}) \to X$ over X such that the composition

$$Spec(R(X)) \longrightarrow Spec(\mathcal{O}_{X,\eta_2}) \longrightarrow X$$

is the canonical map $Spec(R(X)) \to X$. Namely, there is the canonical map $can : Spec(\mathcal{O}_{X,\eta_2}) \to X$, see Schemes, Equation (21.13.1.1). Given a second morphism a to X, we have that a agrees with can on the generic point of $Spec(\mathcal{O}_{X,\eta_2})$ by assumption. Now being X being seperated guarantees that the subset in $Spec(\mathcal{O}_{X,\eta_2})$ where these two maps agree is closed, see Schemes, Lemma 21.21.5. Hence $a = can$ on all of $Spec(\mathcal{O}_{X,\eta_2})$.

Assume $Z_1 \not\subset Z_2$ and assume on the contrary that $\mathcal{O}_{X,\eta_1} \subset \mathcal{O}_{X,\eta_2}$ as subrings of $R(X)$. Then we would obtain a second morphism

$$Spec(\mathcal{O}_{X,\eta_2}) \longrightarrow Spec(\mathcal{O}_{X,\eta_1}) \longrightarrow X.$$

By the above this composition would have to be equal to can. This implies that η_2 specializes to η_1 (see Schemes, Lemma 21.13.2). But this contradicts our assumption $Z_1 \not\subset Z_2$. □

24.9. Surjective morphisms

Definition 24.9.1. A morphism of schemes is said to be *surjective* if it is surjective on underlying topological spaces.

Lemma 24.9.2. *The composition of surjective morphisms is surjective.*

Proof. Omitted. □

Lemma 24.9.3. *Let X and Y be schemes over a base scheme S. Given points $x \in X$ and $y \in Y$, there is a point of $X \times_S Y$ mapping to x and y under the projections if and only if x and y lie above the same point of S.*

Proof. The condition is obviously necessary, and the converse follows from the proof of Schemes, Lemma 21.17.5. □

Lemma 24.9.4. *The base change of a surjective morphism is surjective.*

Proof. Let $f : X \to Y$ be a morphism of schemes over a base scheme S. If $S' \to S$ is a morphism of schemes, let $p : X_{S'} \to X$ and $q : Y_{S'} \to Y$ be the canonical projections. The commutative square

$$\begin{tikzcd} X_{S'} \arrow[r, "p"] \arrow[d, "f_{S'}"'] & X \arrow[d, "f"] \\ Y_{S'} \arrow[r, "q"] & Y. \end{tikzcd}$$

identifies $X_{S'}$ as a fibre product of $X \to Y$ and $Y_{S'} \to Y$. Let Z be a subset of the underlying topological space of X. Then $q^{-1}(f(Z)) = f_{S'}(p^{-1}(Z))$, because $y' \in q^{-1}(f(Z))$ if and only if $q(y') = f(x)$ for some $x \in Z$, if and only if, by Lemma 24.9.3, there exists $x' \in X_{S'}$ such that $f_{S'}(x') = y'$ and $p(x') = x$. In particular taking $Z = X$ we see that if f is surjective so is the base change $f_{S'} : X_{S'} \to Y_{S'}$. □

Example 24.9.5. Bijectivity is not stable under base change, and so neither is injectivity. For example consider the bijection $Spec(\mathbf{C}) \to Spec(\mathbf{R})$. The base change $Spec(\mathbf{C}\otimes_{\mathbf{R}}\mathbf{C}) \to Spec(\mathbf{C})$ is not injective, since there is an isomorphism $\mathbf{C}\otimes_{\mathbf{R}}\mathbf{C} \cong \mathbf{C}\times\mathbf{C}$ (the decomposition comes from the idempotent $\frac{1\otimes 1+i\otimes i}{2}$) and hence $Spec(\mathbf{C}\otimes_{\mathbf{R}}\mathbf{C})$ has two points.

Lemma 24.9.6. *Let*

$$\begin{tikzcd} X \arrow[rr, "f"] \arrow[dr, "p"'] & & Y \arrow[dl, "q"] \\ & Z & \end{tikzcd}$$

be a commutative diagram of morphisms of schemes. If f is surjective and p is quasi-compact, then q is quasi-compact.

Proof. Let $W \subset Z$ be a quasi-compact open. By assumption $p^{-1}(W)$ is quasi-compact. Hence by Topology, Lemma 5.9.5 the inverse image $q^{-1}(W) = f(p^{-1}(W))$ is quasi-compact too. This proves the lemma. □

24.10. Radicial and universally injective morphisms

In this section we define what it means for a morphism of schemes to be *radicial* and what it means for a morphism of schemes to be *universally injective*. We then show that these notions agree. The reason for introducing both is that in the case of algebraic spaces there are corresponding notions which may not always agree.

Definition 24.10.1. Let $f : X \to S$ be a morphism.

(1) We say that f is *universally injective* if and only if for any morphism of schemes $S' \to S$ the base change $f' : X_{S'} \to S'$ is injective (on underlying topological spaces).
(2) We say f is *radicial* if f is injective as a map of topological spaces, and for every $x \in X$ the field extension $\kappa(x) \supset \kappa(f(x))$ is purely inseparable.

Lemma 24.10.2. *Let $f : X \to S$ be a morphism of schemes. The following are equivalent:*

(1) *For every field K the induced map $Mor(Spec(K), X) \to Mor(Spec(K), S)$ is injective.*
(2) *The morphism f is universally injective.*
(3) *The morphism f is radicial.*
(4) *The diagonal morphism $\Delta_{X/S} : X \longrightarrow X \times_S X$ is surjective.*

Proof. Let K be a field, and let $s : Spec(K) \to S$ be a morphism. Giving a morphism $x : Spec(K) \to X$ such that $f \circ x = s$ is the same as giving a section of the projection $X_K = Spec(K) \times_S X \to Spec(K)$, which in turn is the same as giving a point $x \in X_K$ whose residue field is K. Hence we see that (2) implies (1).

Conversely, suppose that (1) holds. Assume that $x, x' \in X_{S'}$ map to the same point $s' \in S'$. Choose a commutative diagram

$$\begin{tikzcd} K & \kappa(x) \arrow[l] \\ \kappa(x') \arrow[u] & \kappa(s') \arrow[l] \arrow[u] \end{tikzcd}$$

of fields. By Schemes, Lemma 21.13.3 we get two morphisms $a, a' : Spec(K) \to X_{S'}$. One corresponding to the point x and the embedding $\kappa(x) \subset K$ and the other corresponding to the point x' and the embedding $\kappa(x') \subset K$. Also we have $f' \circ a = f' \circ a'$. Condition (1) now implies that the compositions of a and a' with $X_{S'} \to X$ are equal. Since $X_{S'}$ is the fibre product of S' and X over S we see that $a = a'$. Hence $x = x'$. Thus (1) implies (2).

If there are two different points $x, x' \in X$ mapping to the same point of s then (2) is violated. If for some $s = f(x)$, $x \in X$ the field extension $\kappa(s) \subset \kappa(x)$ is not purely inseparable, then we may find a field extension $\kappa(s) \subset K$ such that $\kappa(x)$ has two $\kappa(s)$-homomorphisms into K. By Schemes, Lemma 21.13.3 this implies that the map $Mor(Spec(K), X) \to Mor(Spec(K), S)$ is not injective, and hence (1) is violated. Thus we see that the equivalent conditions (1) and (2) imply f is radicial, i.e., they imply (3).

Assume (3). By Schemes, Lemma 21.13.3 a morphism $Spec(K) \to X$ is given by a pair $(x, \kappa(x) \to K)$. Property (3) says exactly that associating to the pair $(x, \kappa(x) \to K)$ the pair $(s, \kappa(s) \to \kappa(x) \to K)$ is injective. In other words (1) holds. At this point we know that (1), (2) and (3) are all equivalent.

Finally, we prove the equivalence of (4) with (1), (2) and (3). A point of $X \times_S X$ is given by a quadruple $(x_1, x_2, s, \mathfrak{p})$, where $x_1, x_2 \in X$, $f(x_1) = f(x_2) = s$ and $\mathfrak{p} \subset \kappa(x_1) \otimes_{\kappa(s)} \kappa(x_2)$ is a prime ideal, see Schemes, Lemma 21.17.5. If f is universally injective, then by taking $S' = X$ in the definition of universally injective, $\Delta_{X/S}$ must be surjective since it is a section of the injective morphism $X \times_S X \longrightarrow X$. Conversely, if $\Delta_{X/S}$ is surjective, then always $x_1 = x_2 = x$ and there is exactly one such prime ideal $\mathfrak{p}$, which means that $\kappa(s) \subset \kappa(x)$ is purely inseparable. Hence f is radicial. Alternatively, if $\Delta_{X/S}$ is surjective, then for any $S' \to S$ the base change $\Delta_{X_{S'}/S'}$ is surjective which implies that f is universally injective. This finishes the proof of the lemma. □

Lemma 24.10.3. *A universally injective morphism is separated.*

Proof. Combine Lemma 24.10.2 with the remark that $X \to S$ is separated if and only if the image of $\Delta_{X/S}$ is closed in $X \times_S X$, see Schemes, Definition 21.21.3 and the discussion following it. □

Lemma 24.10.4. *A base change of a universally injective morphism is universally injective.*

Proof. This is formal. □

Lemma 24.10.5. *A composition of radicial morphisms is radicial, and so the same holds for the equivalent condition of being universally injective.*

Proof. Omitted. □

24.11. Affine morphisms

Definition 24.11.1. A morphism of schemes $f : X \to S$ is called *affine* if the inverse image of every affine open of S is an affine open of X.

Lemma 24.11.2. *An affine morphism is separated and quasi-compact.*

Proof. Let $f : X \to S$ be affine. Quasi-compactness is immediate from Schemes, Lemma 21.19.2. We will show f is separated using Schemes, Lemma 21.21.8. Let $x_1, x_2 \in X$ be points of X which map to the same point $s \in S$. Choose any affine open $W \subset S$ containing s. By assumption $f^{-1}(W)$ is affine. Apply the lemma cited with $U = V = f^{-1}(W)$. $\square$

Lemma 24.11.3. *Let $f : X \to S$ be a morphism of schemes. The following are equivalent*

(1) *The morphism f is affine.*
(2) *There exists an affine open covering $S = \bigcup W_j$ such that each $f^{-1}(W_j)$ is affine.*
(3) *There exists a quasi-coherent sheaf of $\mathcal{O}_S$-algebras $\mathcal{A}$ and an isomorphism $X \cong \underline{Spec}_S(\mathcal{A})$ of schemes over S. See Constructions, Section 22.4 for notation.*

Moreover, in this case $X = \underline{Spec}_S(f_*\mathcal{O}_X)$.

Proof. It is obvious that (1) implies (2).

Assume $S = \bigcup_{j\in J} W_j$ is an affine open covering such that each $f^{-1}(W_j)$ is affine. By Schemes, Lemma 21.19.2 we see that f is quasi-compact. By Schemes, Lemma 21.21.7 we see the morphism f is quasi-separated. Hence by Schemes, Lemma 21.24.1 the sheaf $\mathcal{A} = f_*\mathcal{O}_X$ is a quasi-coherent sheaf of $\mathcal{O}_X$-algebras. Thus we have the scheme $g : Y = \underline{Spec}_S(\mathcal{A}) \to S$ over S. The identity map $\mathrm{id} : \mathcal{A} = f_*\mathcal{O}_X \to f_*\mathcal{O}_X$ provides, via the definition of the relative spectrum, a morphism $can : X \to Y$ over S, see Constructions, Lemma 22.4.7. By assumption and the lemma just cited the restriction $can|_{f^{-1}(W_j)} : f^{-1}(W_j) \to g^{-1}(W_j)$ is an isomorphism. Thus can is an isomorphism. We have shown that (2) implies (3).

Assume (3). By Constructions, Lemma 22.4.6 we see that the inverse image of every affine open is affine, and hence the morphism is affine by definition. $\square$

Remark 24.11.4. We can also argue directly that (2) implies (1) in Lemma 24.11.3 above as follows. Assume $S = \bigcup W_j$ is an affine open covering such that each $f^{-1}(W_j)$ is affine. First argue that $\mathcal{A} = f_*\mathcal{O}_X$ is quasi-coherent as in the proof above. Let $Spec(R) = V \subset S$ be affine open. We have to show that $f^{-1}(V)$ is affine. Set $A = \mathcal{A}(V) = f_*\mathcal{O}_X(V) = \mathcal{O}_X(f^{-1}(V))$. By Schemes, Lemma 21.6.4 there is a canonical morphism $\psi : f^{-1}(V) \to Spec(A)$ over $Spec(R) = V$. By Schemes, Lemma 21.11.6 there exists an integer $n \geq 0$, a standard open covering $V = \bigcup_{i=1,\ldots,n} D(h_i)$, $h_i \in R$, and a map $a : \{1, \ldots, n\} \to J$ such that each $D(h_i)$ is also a standard open of the affine scheme $W_{a(i)}$. The inverse image of a standard open under a morphism of affine schemes is standard open, see Algebra, Lemma 7.16.4. Hence we see that $f^{-1}(D(h_i))$ is a standard open of $f^{-1}(W_{a(i)})$, in particular that $f^{-1}(D(h_i))$ is affine. Because $\mathcal{A}$ is quasi-coherent we have $A_{h_i} = \mathcal{A}(D(h_i)) = \mathcal{O}_X(f^{-1}(D(h_i)))$, so $f^{-1}(D(h_i))$ is the spectrum of A_{h_i}. It follows that the morphism ψ induces an isomorphism of the open $f^{-1}(D(h_i))$ with the open $Spec(A_{h_i})$ of $Spec(A)$. Since $f^{-1}(V) = \bigcup f^{-1}(D(h_i))$ and $Spec(A) = \bigcup Spec(A_{h_i})$ we win.

Lemma 24.11.5. *Let S be a scheme. There is an anti-equivalence of categories*

$$\begin{matrix} \textit{Schemes affine} \\ \textit{over } S \end{matrix} \longleftrightarrow \begin{matrix} \textit{quasi-coherent sheaves} \\ \textit{of } \mathcal{O}_S\textit{-algebras} \end{matrix}$$

which associates to $f : X \to S$ the sheaf $f_*\mathcal{O}_X$.

Proof. Omitted. $\square$

Lemma 24.11.6. *Let $f : X \to S$ be an affine morphism of schemes. Let $\mathcal{A} = f_*\mathcal{O}_X$. The functor $\mathcal{F} \mapsto f_*\mathcal{F}$ induces an equivalence of categories*

$$\left\{\begin{matrix} \textit{category of quasi-coherent} \\ \mathcal{O}_X\textit{-modules}\end{matrix}\right\} \longrightarrow \left\{\begin{matrix} \textit{category of quasi-coherent} \\ \mathcal{A}\textit{-modules}\end{matrix}\right\}$$

Moreover, an $\mathcal{A}$-module is quasi-coherent as an $\mathcal{O}_S$-module if and only if it is quasi-coherent as an $\mathcal{A}$-module.

Proof. Omitted. $\square$

Lemma 24.11.7. *The composition of affine morphisms is affine.*

Proof. Let $f : X \to Y$ and $g : Y \to Z$ be affine morphisms. Let $U \subset Z$ be affine open. Then $g^{-1}(U)$ is affine by assumption on g. Whereupon $f^{-1}(g^{-1}(U))$ is affine by assumption on f. Hence $(g \circ f)^{-1}(U)$ is affine. $\square$

Lemma 24.11.8. *The base change of an affine morphism is affine.*

Proof. Let $f : X \to S$ be an affine morphism. Let $S' \to S$ be any morphism. Denote $f' : X_{S'} = S' \times_S X \to S'$ the base change of f. For every $s' \in S'$ there exists an open affine neighbourhood $s' \in V \subset S'$ which maps into some open affine $U \subset S$. By assumption $f^{-1}(U)$ is affine. By the material in Schemes, Section 21.17 we see that $f^{-1}(U)_V = V \times_U f^{-1}(U)$ is affine and equal to $(f')^{-1}(V)$. This proves that S' has an open covering by affines whose inverse image under f' is affine. We conclude by Lemma 24.11.3 above. $\square$

Lemma 24.11.9. *A closed immersion is affine.*

Proof. The first indication of this is Schemes, Lemma 21.8.2. See Schemes, Lemma 21.10.1 for a complete statement. $\square$

Lemma 24.11.10. *Let X be a scheme. Let $\mathcal{L}$ be an invertible $\mathcal{O}_X$-module. Let $s \in \Gamma(X, \mathcal{L})$. The inclusion morphism $j : X_s \to X$ is affine.*

Proof. This follows from Properties, Lemma 23.23.4 and the definition. $\square$

Lemma 24.11.11. *Suppose $g : X \to Y$ is a morphism of schemes over S. If X is affine over S and Y is separated over S, then g is affine. In particular, any morphism from an affine scheme to a separated scheme is affine.*

Proof. The base change $X \times_S Y \to Y$ is affine by Lemma 24.11.8. The morphism $X \to X \times_S Y$ is a closed immersion as $Y \to S$ is separated, see Schemes, Lemma 21.21.12. A closed immersion is affine (see Lemma 24.11.9) and the composition of affine morphisms is affine (see Lemma 24.11.7). Thus we win. $\square$

Lemma 24.11.12. *A morphism between affine schemes is affine.*

Proof. Immediate from Lemma 24.11.11 with $S = Spec(\mathbf{Z})$. It also follows directly from the equivalence of (1) and (2) in Lemma 24.11.3. $\square$

Lemma 24.11.13. *Let S be a scheme. Let A be an Artinian ring. Any morphism $Spec(A) \to S$ is affine.*

Proof. Omitted. $\square$

24.12. Quasi-affine morphisms

Recall that a scheme X is called *quasi-affine* if it is quasi-compact and isomorphic to an open subscheme of an affine scheme, see Properties, Definition 23.15.1.

Definition 24.12.1. A morphism of schemes $f : X \to S$ is called *quasi-affine* if the inverse image of every affine open of S is a quasi-affine scheme.

Lemma 24.12.2. *A quasi-affine morphism is separated and quasi-compact.*

Proof. Let $f : X \to S$ be quasi-affine. Quasi-compactness is immediate from Schemes, Lemma 21.19.2. We will show f is separated using Schemes, Lemma 21.21.8. Let $x_1, x_2 \in X$ be points of X which map to the same point $s \in S$. Choose any affine open $W \subset S$ containing s. By assumption $f^{-1}(W)$ is isomorphic to an open subscheme of an affine scheme, say $f^{-1}(W) \to Y$ is such an open immersion. Choose affine open neighbourhoods $x_1 \in U \subset f^{-1}(W)$ and $x_2 \in V \subset f^{-1}(W)$. We may think of U and V as open subschemes of Y and hence we see that $U \cap V$ is affine and that $\mathcal{O}(U) \otimes_{\mathbf{Z}} \mathcal{O}(V) \to \mathcal{O}(U \cap V)$ is surjective (by the lemma cited above applied to U, V in Y). Hence by the lemma cited we conclude that f is separated. $\square$

Lemma 24.12.3. *Let $f : X \to S$ be a morphism of schemes. The following are equivalent*

(1) *The morphism f is quasi-affine.*
(2) *There exists an affine open covering $S = \bigcup W_j$ such that each $f^{-1}(W_j)$ is quasi-affine.*
(3) *There exists a quasi-coherent sheaf of $\mathcal{O}_S$-algebras $\mathcal{A}$ and a quasi-compact open immersion*

$$\begin{tikzcd} X \arrow[rr] \arrow[dr] & & \underline{Spec}_S(\mathcal{A}) \arrow[dl] \\ & S & \end{tikzcd}$$

over S.
(4) *Same as in (3) but with $\mathcal{A} = f_*\mathcal{O}_X$ and the horizontal arrow the canonical morphism of Constructions, Lemma 22.4.7.*

Proof. It is obvious that (1) implies (2) and that (4) implies (3).

Assume $S = \bigcup_{j \in J} W_j$ is an affine open covering such that each $f^{-1}(W_j)$ is quasi-affine. By Schemes, Lemma 21.19.2 we see that f is quasi-compact. By Schemes, Lemma 21.21.7 we see the morphism f is quasi-separated. Hence by Schemes, Lemma 21.24.1 the sheaf $\mathcal{A} = f_*\mathcal{O}_X$ is a quasi-coherent sheaf of $\mathcal{O}_X$-algebras. Thus we have the scheme $g : Y = \underline{Spec}_S(\mathcal{A}) \to S$ over S. The identity map $\text{id} : \mathcal{A} = f_*\mathcal{O}_X \to f_*\mathcal{O}_X$ provides, via the definition of the relative spectrum, a morphism $can : X \to Y$ over S, see Constructions, Lemma 22.4.7. By assumption, the lemma just cited, and Properties, Lemma 23.15.4 the restriction $can|_{f^{-1}(W_j)} : f^{-1}(W_j) \to g^{-1}(W_j)$ is a quasi-compact open immersion. Thus can is a quasi-compact open immersion. We have shown that (2) implies (4).

Assume (3). Choose any affine open $U \subset S$. By Constructions, Lemma 22.4.6 we see that the inverse image of U in the relative spectrum is affine. Hence we conclude that $f^{-1}(U)$ is quasi-affine (note that quasi-compactness is encoded in (3) as well). Thus (3) implies (1). $\square$

Lemma 24.12.4. *The composition of quasi-affine morphisms is quasi-affine.*

Proof. Let $f : X \to Y$ and $g : Y \to Z$ be quasi-affine morphisms. Let $U \subset Z$ be affine open. Then $g^{-1}(U)$ is quasi-affine by assumption on g. Let $j : g^{-1}(U) \to V$ be a quasi-compact open immersion into an affine scheme V. By Lemma 24.12.3 above we see that $f^{-1}(g^{-1}(U))$ is a quasi-compact open subscheme of the relative spectrum $\underline{Spec}_{g^{-1}(U)}(\mathscr{A})$ for some quasi-coherent sheaf of $\mathcal{O}_{g^{-1}(U)}$-algebras $\mathscr{A}$. By Schemes, Lemma 21.24.1 the sheaf $\mathscr{A}' = j_*\mathscr{A}$ is a quasi-coherent sheaf of $\mathcal{O}_V$-algebras with the property that $j^*\mathscr{A}' = \mathscr{A}$. Hence we get a commutative diagram

$$\begin{tikzcd}
f^{-1}(g^{-1}(U)) \arrow[r] & \underline{Spec}_{g^{-1}(U)}(\mathscr{A}) \arrow[r] \arrow[d] & \underline{Spec}_V(\mathscr{A}') \arrow[d] \\
 & g^{-1}(U) \arrow[r, "j"] & V
\end{tikzcd}$$

with the square being a fibre square, see Constructions, Lemma 22.4.6. Note that the upper right corner is an affine scheme. Hence $(g \circ f)^{-1}(U)$ is quasi-affine. $\square$

Lemma 24.12.5. *The base change of a quasi-affine morphism is quasi-affine.*

Proof. Let $f : X \to S$ be a quasi-affine morphism. By Lemma 24.12.3 above we can find a quasi-coherent sheaf of $\mathcal{O}_S$-algebras $\mathscr{A}$ and a quasi-compact open immersion $X \to \underline{Spec}_S(\mathscr{A})$ over S. Let $g : S' \to S$ be any morphism. Denote $f' : X_{S'} = S' \times_S X \to S'$ the base change of f. Since the base change of a quasi-compact open immersion is a quasi-compact open immersion we see that $X_{S'} \to \underline{Spec}_{S'}(g^*\mathscr{A})$ is a quasi-compact open immersion (we have used Schemes, Lemmas 21.19.3 and 21.18.2 and Constructions, Lemma 22.4.6). By Lemma 24.12.3 again we conclude that $X_{S'} \to S'$ is quasi-affine. $\square$

Lemma 24.12.6. *A quasi-compact immersion is quasi-affine.*

Proof. Let $X \to S$ be a quasi-compact immersion. We have to show the inverse image of every affine open is quasi-affine. Hence, assuming S is an affine scheme, we have to show X is quasi-affine. By Lemma 24.5.7 the morphism $X \to S$ factors as $X \to Z \to S$ where Z is a closed subscheme of S and $X \subset Z$ is a quasi-compact open. Since S is affine Lemma 24.2.1 implies Z is affine. Hence we win. $\square$

Lemma 24.12.7. *Let S be a scheme. Let X be an affine scheme. A morphism $f : X \to S$ is quasi-affine if and only if it is quasi-compact. In particular any morphism from an affine scheme to a quasi-separated scheme is quasi-affine.*

Proof. Let $V \subset S$ be an affine open. Then $f^{-1}(V)$ is an open subscheme of the affine scheme X, hence quasi-affine if and only if it is quasi-compact. This proves the first assertion. The quasi-compactness of any $f : X \to S$ where X is affine and S quasi-separated follows from Schemes, Lemma 21.21.15 applied to $X \to S \to Spec(\mathbf{Z})$. $\square$

Lemma 24.12.8. *Suppose $g : X \to Y$ is a morphism of schemes over S. If X is quasi-affine over S and Y is quasi-separated over S, then g is quasi-affine. In particular, any morphism from a quasi-affine scheme to a quasi-separated scheme is quasi-affine.*

Proof. The base change $X \times_S Y \to Y$ is quasi-affine by Lemma 24.12.5. The morphism $X \to X \times_S Y$ is a quasi-compact immersion as $Y \to S$ is quasi-separated, see Schemes, Lemma 21.21.12. A quasi-compact immersion is quasi-affine by Lemma 24.12.6 and the composition of quasi-affine morphisms is quasi-affine (see Lemma 24.12.4). Thus we win. $\square$

24.13. Types of morphisms defined by properties of ring maps

In this section we study what properties of ring maps allow one to define local properties of morphisms of schemes.

Definition 24.13.1. Let P be a property of ring maps.

1. We say that P is *local* if the following hold:
   (a) For any ring map $R \to A$, and any $f \in R$ we have $P(R \to A) \Rightarrow P(R_f \to A_f)$.
   (b) For any rings R, A, any $f \in R$, $a \in A$, and any ring map $R_f \to A$ we have $P(R_f \to A) \Rightarrow P(R \to A_a)$.
   (c) For any ring map $R \to A$, and $a_i \in A$ such that $(a_1, \ldots, a_n) = A$ then $\forall i, P(R \to A_{a_i}) \Rightarrow P(R \to A)$.
2. We say that P is *stable under base change* if for any ring maps $R \to A$, $R \to R'$ we have $P(R \to A) \Rightarrow P(R' \to R' \otimes_R A)$.
3. We say that P is *stable under composition* if for any ring maps $A \to B$, $B \to C$ we have $P(A \to B) \wedge P(B \to C) \Rightarrow P(A \to C)$.

Definition 24.13.2. Let P be a property of ring maps. Let $f : X \to S$ be a morphisms of schemes. We say f is *locally of type P* if for any $x \in X$ there exists an affine open neighbourhood U of x in X which maps into an affine open $V \subset S$ such that the induced ring map $\mathcal{O}_S(V) \to \mathcal{O}_X(U)$ has property P.

This is not a ``good'' definition unless the property $P$ is a local property. Even if $P$ is a local property we will not automatically use this definition to say that a morphism is ``locally of type P' unless we also explicitly state the definition elsewhere.

Lemma 24.13.3. *Let $f : X \to S$ be a morphism of schemes. Let P be a property of ring maps. Let U be an affine open of X, and V an affine open of S such that $f(U) \subset V$. If f is locally of type P and P is local, then $P(\mathcal{O}_S(V) \to \mathcal{O}_X(U))$ holds.*

Proof. As f is locally of type P for every $u \in U$ there exists an affine open $U_u \subset X$ mapping into an affine open $V_u \subset S$ such that $P(\mathcal{O}_S(V_u) \to \mathcal{O}_X(U_u))$ holds. Choose an open neighbourhood $U'_u \subset U \cap U_u$ of u which is standard affine open in both U and U_u, see Schemes, Lemma 21.11.5. By Definition 24.13.1 (1)(b) we see that $P(\mathcal{O}_S(V_u) \to \mathcal{O}_X(U'_u))$ holds. Hence we may assume that $U_u \subset U$ is a standard affine open. Choose an open neighbourhood $V'_u \subset V \cap V_u$ of $f(u)$ which is standard affine open in both V and V_u, see Schemes, Lemma 21.11.5. Then $U'_u = f^{-1}(V'_u) \cap U_u$ is a standard affine open of U_u (hence of U) and we have $P(\mathcal{O}_S(V'_u) \to \mathcal{O}_X(U'_u))$ by Definition 24.13.1 (1)(a). Hence we may assume both $U_u \subset U$ and $V_u \subset V$ are standard affine open. Applying Definition 24.13.1 (1)(b) one more time we conclude that $P(\mathcal{O}_S(V) \to \mathcal{O}_X(U_u))$ holds. Because U is quasi-compact we may choose a finite number of points $u_1, \ldots, u_n \in U$ such that

$$U = U_{u_1} \cup \ldots \cup U_{u_n}.$$

By Definition 24.13.1 (1)(c) we conclude that $P(\mathcal{O}_S(V) \to \mathcal{O}_X(U))$ holds. □

Lemma 24.13.4. *Let P be a local property of ring maps. Let $f : X \to S$ be a morphism of schemes. The following are equivalent*

1. *The morphism f is locally of type P.*
2. *For every affine opens $U \subset X$, $V \subset S$ with $f(U) \subset V$ we have $P(\mathcal{O}_S(V) \to \mathcal{O}_X(U))$.*

(3) *There exists an open covering* $S = \bigcup_{j \in J} V_j$ *and open coverings* $f^{-1}(V_j) = \bigcup_{i \in I_j} U_i$ *such that each of the morphisms* $U_i \to V_j$, $j \in J, i \in I_j$ *is locally of type* P.
(4) *There exists an affine open covering* $S = \bigcup_{j \in J} V_j$ *and affine open coverings* $f^{-1}(V_j) = \bigcup_{i \in I_j} U_i$ *such that* $P(\mathcal{O}_S(V_j) \to \mathcal{O}_X(U_i))$ *holds, for all* $j \in J, i \in I_j$.

Moreover, if f *is locally of type* P *then for any open subschemes* $U \subset X$, $V \subset S$ *with* $f(U) \subset V$ *the restriction* $f|_U : U \to V$ *is locally of type* P.

Proof. This follows from Lemma 24.13.3 above. □

Lemma 24.13.5. *Let* P *be a property of ring maps. Assume* P *is local and stable under composition. The composition of morphisms locally of type* P *is locally of type* P.

Proof. Let $f : X \to Y$ and $g : Y \to Z$ be morphisms locally of type P. Let $x \in X$. Choose an affine open neighbourhood $W \subset Z$ of $g(f(x))$. Choose an affine open neighbourhood $V \subset g^{-1}(W)$ of $f(x)$. Choose an affine open neighbourhood $U \subset f^{-1}(V)$ of x. By Lemma 24.13.4 the ring maps $\mathcal{O}_Z(W) \to \mathcal{O}_Y(V)$ and $\mathcal{O}_Y(V) \to \mathcal{O}_X(U)$ satisfy P. Hence $\mathcal{O}_Z(W) \to \mathcal{O}_X(U)$ satisfies P as P is assumed stable under composition. □

Lemma 24.13.6. *Let* P *be a property of ring maps. Assume* P *is local and stable under base change. The base change of a morphism locally of type* P *is locally of type* P.

Proof. Let $f : X \to S$ be a morphism locally of type P. Let $S' \to S$ be any morphism. Denote $f' : X_{S'} = S' \times_S X \to S'$ the base change of f. For every $s' \in S'$ there exists an open affine neighbourhood $s' \in V' \subset S'$ which maps into some open affine $V \subset S$. By Lemma 24.13.4 the open $f^{-1}(V)$ is a union of affines U_i such that the ring maps $\mathcal{O}_S(V) \to \mathcal{O}_X(U_i)$ all satisfy P. By the material in Schemes, Section 21.17 we see that $f^{-1}(U)_{V'} = V' \times_V f^{-1}(V)$ is the union of the affine opens $V' \times_V U_i$. Since $\mathcal{O}_{X_{S'}}(V' \times_V U_i) = \mathcal{O}_{S'}(V') \otimes_{\mathcal{O}_S(V)} \mathcal{O}_X(U_i)$ we see that the ring maps $\mathcal{O}_{S'}(V') \to \mathcal{O}_{X_{S'}}(V' \times_V U_i)$ satisfy P as P is assumed stable under base change. □

Lemma 24.13.7. *The following properties of a ring map* $R \to A$ *are local.*

(1) *(Isomorphism on local rings.) For every prime* $\mathfrak{q}$ *of* A *lying over* $\mathfrak{p} \subset R$ *the ring map* $R \to A$ *induces an isomorphism* $R_{\mathfrak{p}} \to A_{\mathfrak{q}}$.
(2) *(Open immersion.) For every prime* $\mathfrak{q}$ *of* A *there exists an* $f \in R$, $\varphi(f) \not\in \mathfrak{q}$ *such that the ring map* $\varphi : R \to A$ *induces an isomorphism* $R_f \to A_f$.
(3) *(Reduced fibres.) For every prime* $\mathfrak{p}$ *of* R *the fibre ring* $A \otimes_R \kappa(\mathfrak{p})$ *is reduced.*
(4) *(Fibres of dimension at most n.) For every prime* $\mathfrak{p}$ *of* R *the fibre ring* $A \otimes_R \kappa(\mathfrak{p})$ *has Krull dimension at most n.*
(5) *(Locally Noetherian on the target.) The ring map* $R \to A$ *has the property that* A *is Noetherian.*
(6) *Add more here as needed*[2].

Proof. Omitted. □

Lemma 24.13.8. *The following properties of ring maps are stable under base change.*

(1) *(Isomorphism on local rings.) For every prime* $\mathfrak{q}$ *of* A *lying over* $\mathfrak{p} \subset R$ *the ring map* $R \to A$ *induces an isomorphism* $R_{\mathfrak{p}} \to A_{\mathfrak{q}}$.

[2] But only those properties that are not already dealt with separately elsewhere.

(2) *(Open immersion.) For every prime $\mathfrak{q}$ of A there exists an $f \in R$, $\varphi(f) \notin \mathfrak{q}$ such that the ring map $\varphi : R \to A$ induces an isomorphism $R_f \to A_f$.*
(3) *(Reduced fibres.) For every prime $\mathfrak{p}$ of R the fibre ring $A \otimes_R \kappa(\mathfrak{p})$ is reduced.*

(2) *(Open immersion.) For every prime $\mathfrak{q}$ of A there exists an $f \in R$, $\varphi(f) \notin \mathfrak{q}$ such that the ring map $\varphi : R \to A$ induces an isomorphism $R_f \to A_f$.*
(3) *(Locally Noetherian on the target.) The ring map $R \to A$ has the property that A is Noetherian.*
(4) *Add more here as needed*[4].

Proof. Omitted. □

24.14. Morphisms of finite type

Recall that a ring map $R \to A$ is said to be of finite type if A is isomorphic to a quotient of $R[x_1, \ldots, x_n]$ as an R-algebra, see Algebra, Definition 7.6.1.

Definition 24.14.1. Let $f : X \to S$ be a morphism of schemes.
(1) We say that f is of *finite type at $x \in X$* if there exists an affine open neighbourhood $Spec(A) = U \subset X$ of x and and an affine open $Spec(R) = V \subset S$ with $f(U) \subset V$ such that the induced ring map $R \to A$ is of finite type.
(2) We say that f is *locally of finite type* if it is of finite type at every point of X.
(3) We say that f is of *finite type* if it is locally of finite type and quasi-compact.

Lemma 24.14.2. *Let $f : X \to S$ be a morphism of schemes. The following are equivalent*
(1) *The morphism f is locally of finite type.*
(2) *For every affine opens $U \subset X$, $V \subset S$ with $f(U) \subset V$ the ring map $\mathcal{O}_S(V) \to \mathcal{O}_X(U)$ is of finite type.*
(3) *There exists an open covering $S = \bigcup_{j \in J} V_j$ and open coverings $f^{-1}(V_j) = \bigcup_{i \in I_j} U_i$ such that each of the morphisms $U_i \to V_j$, $j \in J, i \in I_j$ is locally of finite type.*
(4) *There exists an affine open covering $S = \bigcup_{j \in J} V_j$ and affine open coverings $f^{-1}(V_j) = \bigcup_{i \in I_j} U_i$ such that the ring map $\mathcal{O}_S(V_j) \to \mathcal{O}_X(U_i)$ is of finite type, for all $j \in J, i \in I_j$.*

Moreover, if f is locally of finite type then for any open subschemes $U \subset X$, $V \subset S$ with $f(U) \subset V$ the restriction $f|_U : U \to V$ is locally of finite type.

Proof. This follows from Lemma 24.13.3 if we show that the property "$R \to A$ is of finite type" is local. We check conditions (a), (b) and (c) of Definition 24.13.1. By Algebra, Lemma 7.13.2 being of finite type is stable under base change and hence we conclude (a)

[3] But only those properties that are not already dealt with separately elsewhere.
[4] But only those properties that are not already dealt with separately elsewhere.

holds. By the same lemma being of finite type is stable under composition and trivially for any ring R the ring map $R \to R_f$ is of finite type. We conclude (b) holds. Finally, property (c) is true according to Algebra, Lemma 7.21.3. $\square$

Lemma 24.14.3. *The composition of two morphisms which locally of finite type is locally of finite type. The same is true for morphisms of finite type.*

Proof. In the proof of Lemma 24.14.2 we saw that being of finite type is a local property of ring maps. Hence the first statement of the lemma follows from Lemma 24.13.5 combined with the fact that being of finite type is a property of ring maps that is stable under composition, see Algebra, Lemma 7.6.2. By the above and the fact that compositions of quasi-compact morphisms are quasi-compact, see Schemes, Lemma 21.19.4 we see that the composition of morphisms of finite type is of finite type. $\square$

Lemma 24.14.4. *The base change of a morphism which is locally of finite type is locally of finite type. The same is true for morphisms of finite type.*

Proof. In the proof of Lemma 24.14.2 we saw that being of finite type is a local property of ring maps. Hence the first statement of the lemma follows from Lemma 24.13.5 combined with the fact that being of finite type is a property of ring maps that is stable under base change, see Algebra, Lemma 7.13.2. By the above and the fact that a base change of a quasi-compact morphism is quasi-compact, see Schemes, Lemma 21.19.3 we see that the base change of a morphism of finite type is a morphism of finite type. $\square$

Lemma 24.14.5. *A closed immersion is of finite type. An immersion is locally of finite type.*

Proof. This is true because an open immersion is a local isomorphism, and a closed immersion is obviously of finite type. $\square$

Lemma 24.14.6. *Let $f : X \to S$ be a morphism. If S is (locally) Noetherian and f (locally) of finite type then X is (locally) Noetherian.*

Proof. This follows immediately from the fact that a ring of finite type over a Noetherian ring is Noetherian, see Algebra, Lemma 7.28.1. (Also: use the fact that the source of a quasi-compact morphism with quasi-compact target is quasi-compact.) $\square$

Lemma 24.14.7. *Let $f : X \to S$ be locally of finite type with S locally Noetherian. Then f is quasi-separated.*

Proof. In fact, it is true that X is quasi-separated, see Properties, Lemma 23.5.4 and Lemma 24.14.6 above. Then apply Schemes, Lemma 21.21.14 to conclude that f is quasi-separated. $\square$

Lemma 24.14.8. *Let $X \to Y$ be a morphism of schemes over a base scheme S. If X is locally of finite type over S, then $X \to Y$ is locally of finite type.*

Proof. Via Lemma 24.14.2 this translates into the following algebra fact: Given ring maps $A \to B \to C$ such that $A \to C$ is of finite type, then $B \to C$ is of finite type. (See Algebra, Lemma 7.6.2). $\square$

24.15. Points of finite type and Jacobson schemes

Let S be a scheme. A finite type point s of S is a point such that the morphism $Spec(\kappa(s)) \to S$ is of finite type. The reason for studying this is that finite type points can replace closed points in a certain sense and in certain situations. There are always enough of them for example. Moreover, a scheme is Jacobson if and only if all finite type points are closed points.

Lemma 24.15.1. *Let S be a scheme. Let k be a field. Let $f : Spec(k) \to S$ be a morphism. The following are equivalent:*

(1) *The morphism f is of finite type.*
(2) *The morphism f is locally of finite type.*
(3) *There exists an affine open $U = Spec(R)$ of S such that f corresponds to a finite ring map $R \to k$.*
(4) *There exists an affine open $U = Spec(R)$ of S such that the image of f consists of a closed point u in U and the field extension $\kappa(u) \subset k$ is finite.*

Proof. The equivalence of (1) and (2) is obvious as $Spec(k)$ is a singleton and hence any morphism from it is quasi-compact.

Suppose f is locally of finite type. Choose any affine open $Spec(R) = U \subset S$ such that the image of f is contained in U, and the ring map $R \to k$ is of finite type. Let $\mathfrak{p} \subset R$ be the kernel. Then $R/\mathfrak{p} \subset k$ is of finite type. By Algebra, Lemma 7.30.2 there exist a $\overline{f} \in R/\mathfrak{p}$ such that $(R/\mathfrak{p})_{\overline{f}}$ is a field and $(R/\mathfrak{p})_{\overline{f}} \to k$ is a finite field extension. If $f \in R$ is a lift of $\overline{f}$, then we see that k is a finite R_f-module. Thus (2) $\Rightarrow$ (3).

Suppose that $Spec(R) = U \subset S$ is an affine open such that f corresponds to a finite ring map $R \to k$. Then f is locally of finite type by Lemma 24.14.2. Thus (3) $\Rightarrow$ (2).

Suppose $R \to k$ is finite. The image of $R \to k$ is a field over which k is finite by Algebra, Lemma 7.32.16. Hence the kernel of $R \to k$ is a maximal ideal. Thus (3) $\Rightarrow$ (4).

The implication (4) $\Rightarrow$ (3) is immediate. $\square$

Lemma 24.15.2. *Let S be a scheme. Let A be an Artinian local ring with residue field κ. Let $f : Spec(A) \to S$ be a morphism of schemes. Then f is of finite type if and only if the composition $Spec(\kappa) \to Spec(A) \to S$ is of finite type.*

Proof. Since the morphism $Spec(\kappa) \to Spec(A)$ is of finite type it is clear that if f is of finite type so is the composition $Spec(\kappa) \to S$ (see Lemma 24.14.3). For the converse, note that $Spec(A) \to S$ maps into some affine open $U = Spec(B)$ of S as $Spec(A)$ has only one point. To finish apply Algebra, Lemma 7.50.3 to $B \to A$. $\square$

Recall that given a point s of a scheme S there is a canonical morphism $Spec(\kappa(s)) \to S$, see Schemes, Section 21.13.

Definition 24.15.3. Let S be a scheme. Let us say that a point s of S is a *finite type point* if the canonical morphism $Spec(\kappa(s)) \to S$ is of finite type. We denote $S_{\text{ft-pts}}$ the set of finite type points of S.

We can describe the set of finite type points as follows.

Lemma 24.15.4. *Let S be a scheme. We have*

$$S_{ft\text{-}pts} = \bigcup\nolimits_{U \subset S \ open} U_0$$

where U_0 is the set of closed points of U. Here we may let U range over all opens or over all affine opens of S.

Proof. Immediate from Lemma 24.15.1. □

Lemma 24.15.5. *Let $f : T \to S$ be a morphism of schemes. If f is locally of finite type, then $f(T_{ft\text{-}pts}) \subset S_{ft\text{-}pts}$.*

Proof. If T is the spectrum of a field this is Lemma 24.15.1. In general it follows since the composition of morphisms locally of finite type is locally of finite type (Lemma 24.14.3). □

Lemma 24.15.6. *Let $f : T \to S$ be a morphism of schemes. If f is locally of finite type and surjective, then $f(T_{ft\text{-}pts}) = S_{ft\text{-}pts}$.*

Proof. We have $f(T_{\text{ft-pts}}) \subset S_{\text{ft-pts}}$ by Lemma 24.15.5. Let $s \in S$ be a finite type point. As f is surjective the scheme $T_s = Spec(\kappa(s)) \times_S T$ is nonempty, therefore has a finite type point $t \in T_s$ by Lemma 24.15.4. Now $T_s \to T$ is a morphism of finite type as a base change of $s \to S$ (Lemma 24.14.4). Hence the image of t in T is a finite type point by Lemma 24.15.5 which maps to s by construction. □

Lemma 24.15.7. *Let S be a scheme. For any locally closed subset $T \subset S$ we have*

$$T \neq \emptyset \Rightarrow T \cap S_{ft\text{-}pts} \neq \emptyset.$$

In particular, for any closed subset $T \subset S$ we see that $T \cap S_{ft\text{-}pts}$ is dense in T.

Proof. Note that T carries a scheme structure (see Schemes, Lemma 21.12.4) such that $T \to S$ is a locally closed immersion. Any locally closed immersion is locally of finite type, see Lemma 24.14.5. Hence by Lemma 24.15.5 we see $T_{\text{ft-pts}} \subset S_{\text{ft-pts}}$. Finally, any nonempty affine open of T has at least one closed point which is a finite type point of T by Lemma 24.15.4. □

It follows that most of the material from Topology, Section 5.13 goes through with the set of closed points replaced by the set of points of finite type. In fact, if S is Jacobson then we recover the closed points as the finite type points.

Lemma 24.15.8. *Let S be a scheme. The following are equivalent:*

(1) *For every finite type morphism $f : Spec(k) \to S$ with k a field the image consists of a closed point of S. In the terminology introduced above: finite type points of S are closed points of S.*
(2) *For every locally finite type morphism $T \to S$ closed points map to closed points.*
(3) *For every locally finite type morphism $f : T \to S$ any closed point $t \in T$ maps to a closed point $s \in S$ and $\kappa(s) \subset \kappa(t)$ is finite.*
(4) *The scheme S is Jacobson.*

Proof. We have trivially (3) ⇒ (2) ⇒ (1). The discussion above shows that (1) implies (4). Hence it suffices to show that (4) implies (3). Suppose that $T \to S$ is locally of finite type. Choose $t \in T$ with $s = f(t)$ as in (3). Choose affine open neighbourhoods $Spec(R) = U \subset S$ of s and $Spec(A) = V \subset T$ of t with $f(V) \subset U$. The induced ring map $R \to A$ is of finite type (see Lemma 24.14.2) and R is Jacobson by Properties, Lemma 23.6.3. Thus the result follows from Algebra, Proposition 7.31.18. □

Lemma 24.15.9. *Let S be a Jacobson scheme. Any scheme locally of finite type over S is Jacobson.*

Proof. This is clear from Algebra, Proposition 7.31.18 (and Properties, Lemma 23.6.3 and Lemma 24.14.2). ☐

Lemma 24.15.10. *The following types of schemes are Jacobson.*

(1) *Any scheme locally of finite type over a field.*
(2) *Any scheme locally of finite type over* $\mathbf{Z}$*.*
(3) *Any scheme locally of finite type over a* 1*-dimensional Noetherian domain with infinitely many primes.*
(4) *A scheme of the form* $Spec(R) \setminus \{\mathfrak m\}$ *where* $(R, \mathfrak m)$ *is a Noetherian local ring. Also any scheme locally of finite type over it.*

Proof. We will use Lemma 24.15.9 without mention. The spectrum of a field is clearly Jacobson. The spectrum of $\mathbf{Z}$ is Jacobson, see Algebra, Lemma 7.31.6. For (3) see Algebra, Lemma 7.58.2. For (4) see Properties, Lemma 23.6.4. ☐

24.16. Universally catenary schemes

Recall that a topological space X is called *catenary* if for every pair of irreducible closed subsets $T \subset T'$ there exist a maximal chain of irreducible closed subsets

$$T = T_0 \subset T_1 \subset \ldots \subset T_e = T'$$

and every such chain has the same length. See Topology, Definition 5.8.1. Recall that a scheme is catenary if its underlying topological space is catenary. See Properties, Definition 23.11.1.

Definition 24.16.1. Let S be a scheme. Assume S is locally Noetherian. We say S is *universally catenary* if for every morphism $X \to S$ locally of finite type the scheme X is catenary.

This is a ``better'' notion than catenary as there exist Noetherian schemes which are catenary but not universally catenary. See Examples, Section 64.9. Many schemes are universally catenary, see Lemma 24.16.4 below.

Recall that a ring A is called *catenary* if for any pair of prime ideals $\mathfrak p \subset \mathfrak q$ there exists a maximal chain of primes

$$\mathfrak p = \mathfrak p_0 \subset \ldots \subset \mathfrak p_e = \mathfrak q$$

and all of these have the same length. See Algebra, Definition 7.97.1. We have seen the relationship between catenary schemes and catenary rings in Properties, Section 23.11. Recall that a ring A is called *universally catenary* if A is Noetherian and for every finite type ring map $A \to B$ the ring B is catenary. See Algebra, Definition 7.97.5. Many interesting rings which come up in algebraic geometry satisfy this property.

Lemma 24.16.2. *Let S be a locally Noetherian scheme. The following are equivalent*

(1) *S is universally catenary,*
(2) *there exists an open covering of S all of whose members are universally catenary schemes,*
(3) *for every affine open $Spec(R) = U \subset S$ the ring R is universally catenary, and*
(4) *there exists an affine open covering $S = \bigcup U_i$ such that each U_i is the spectrum of a universally catenary ring.*

Moreover, in this case any scheme locally of finite type over S is universally catenary as well.

Proof. By Lemma 24.14.5 an open immersion is locally of finite type. A composition of morphisms locally of finite type is locally of finite type (Lemma 24.14.3). Thus it is clear that if S is universally catenary then any open and any scheme locally of finite type over S is universally catenary as well. This proves the final statement of the lemma and that (1) implies (2).

If $Spec(R)$ is a universally catenary scheme, then every scheme $Spec(A)$ with A a finite type R-algebra is catenary. Hence all these rings A are catenary by Algebra, Lemma 7.97.2. Thus R is universally catenary. Combined with the remarks above we conclude that (1) implies (3), and (2) implies (4). Of course (3) implies (4) trivially.

To finish the proof we show that (4) implies (1). Assume (4) and let $X \to S$ be a morphism locally of finite type. We can find an affine open covering $X = \bigcup V_j$ such that each $V_j \to S$ maps into one of the U_i. By Lemma 24.14.2 the induced ring map $\mathcal{O}(U_i) \to \mathcal{O}(V_j)$ is of finite type. Hence $\mathcal{O}(V_j)$ is catenary. Hence X is catenary by Properties, Lemma 23.11.2. □

Lemma 24.16.3. *Let S be a locally Noetherian scheme. The following are equivalent:*

1. *S is universally catenary, and*
2. *all local rings $\mathcal{O}_{S,s}$ of S are universally catenary.*

Proof. Assume that all local rings of S are universally catenary. Let $f : X \to S$ be locally of finite type. We know that X is catenary if and only if $\mathcal{O}_{X,x}$ is catenary for all $x \in X$. If $f(x) = s$, then $\mathcal{O}_{X,x}$ is essentially of finite type over $\mathcal{O}_{S,s}$. Hence $\mathcal{O}_{X,x}$ is catenary by the assumption that $\mathcal{O}_{S,s}$ is universally catenary.

Conversly, assume that S is universally catenary. Let $s \in S$. We may replace S by an affine open neighbourhood of s by Lemma 24.16.2. Say $S = Spec(R)$ and s corresponds to the prime ideal $\mathfrak{p}$. Any finite type $R_{\mathfrak{p}}$-algebra A' is of the form $A_{\mathfrak{p}}$ for some finite type R-algebra A. By assumption (and Lemma 24.16.2 if you like) the ring A is catenary, and hence A' (a localization of A) is catenary. Thus $R_{\mathfrak{p}}$ is universally catenary. □

Lemma 24.16.4. *The following types of schemes are universally catenary.*

1. *Any scheme locally of finite type over a field.*
2. *Any scheme locally of finite type over a Cohen-Macaulay scheme.*
3. *Any scheme locally of finite type over $\mathbf{Z}$.*
4. *Any scheme locally of finite type over a 1-dimensional Noetherian domain.*
5. *And so on.*

Proof. All of these follow from the fact that a Cohen-Macaulay ring is universally catenary, see Algebra, Lemma 7.97.6. Also, use the last assertion of Lemma 24.16.2. Some details omitted. □

24.17. Nagata schemes, reprise

See Properties, Section 23.13 for the definitions and basic properties of Nagata and universally Japanese schemes.

Lemma 24.17.1. *Let $f : X \to S$ be a morphism. If S is Nagata and f locally of finite type then X is Nagata. If S is universally Japanese and f locally of finite type then X is universally Japanese.*

Proof. For ``universally Japanese'' this follows from Algebra, Lemma 7.144.18. For ``Nagata'' this follows from Algebra, Proposition 7.144.30. □

Lemma 24.17.2. *The following types of schemes are Nagata.*

1. *Any scheme locally of finite type over a field.*
2. *Any scheme locally of finite type over a Noetherian complete local ring.*
3. *Any scheme locally of finite type over* $\mathbf{Z}$*.*
4. *Any scheme locally of finite type over a Dedeking ring of characteristic zero.*
5. *And so on.*

Proof. By Lemma 24.17.1 we only need to show that the rings mentioned above are Nagata rings. For this see Algebra, Proposition 7.144.31. $\square$

24.18. The singular locus, reprise

We look for a criterion that implies openness of the regular locus for any scheme locally of finite type over the base. Here is the definition.

Definition 24.18.1. Let X be a locally Noetherian scheme. We say X is *J-2* if for every morphism $Y \to X$ which is locally of finite type the regular locus $\text{Reg}(Y)$ is open in Y.

This is the analogue of the corresponding notion for Noetherian rings, see More on Algebra, Definition 12.35.1.

Lemma 24.18.2. *Let X be a locally Noetherian scheme. The following are equivalent*

1. *X is J-2,*
2. *there exists an open covering of X all of whose members are J-2 schemes,*
3. *for every affine open $Spec(R) = U \subset X$ the ring R is J-2, and*
4. *there exists an affine open covering $S = \bigcup U_i$ such that each $\mathcal{O}(U_i)$ is J-2 for all i.*

Moreover, in this case any scheme locally of finite type over X is J-2 as well.

Proof. By Lemma 24.14.5 an open immersion is locally of finite type. A composition of morphisms locally of finite type is locally of finite type (Lemma 24.14.3). Thus it is clear that if X is J-2 then any open and any scheme locally of finite type over X is J-2 as well. This proves the final statement of the lemma.

If $Spec(R)$ is J-2, then for every finite type R-algebra A the regular locus of the scheme $Spec(A)$ is open. Hence R is J-2, by definition (see More on Algebra, Definition 12.35.1). Combined with the remarks above we conclude that (1) implies (3), and (2) implies (4). Of course (1) $\Rightarrow$ (2) and (3) $\Rightarrow$ (4) trivially.

To finish the proof we show that (4) implies (1). Assume (4) and let $Y \to X$ be a morphism locally of finite type. We can find an affine open covering $Y = \bigcup V_j$ such that each $V_j \to X$ maps into one of the U_i. By Lemma 24.14.2 the induced ring map $\mathcal{O}(U_i) \to \mathcal{O}(V_j)$ is of finite type. Hence the regular locus of $V_j = Spec(\mathcal{O}(V_j))$ is open. Since $\text{Reg}(Y) \cap V_j = \text{Reg}(V_j)$ we conclude that $\text{Reg}(Y)$ is open as desired. $\square$

Lemma 24.18.3. *The following types of schemes are J-2.*

1. *Any scheme locally of finite type over a field.*
2. *Any scheme locally of finite type over a Noetherian complete local ring.*
3. *Any scheme locally of finite type over* $\mathbf{Z}$*.*
4. *Any scheme locally of finite type over a Dedeking ring of characteristic zero.*
5. *And so on.*

Proof. By Lemma 24.18.2 we only need to show that the rings mentioned above are J-2. For this see More on Algebra, Proposition 12.36.6. $\square$

24.19. Quasi-finite morphisms

A solid treatment of quasi-finite morphisms is the basis of many developments further down the road. It will lead to various versions of Zariski's Main Theorem, behaviour of dimensions of fibres, descent for étale morphisms, etc, etc. Before reading this section it may be a good idea to take a look at the algebra results in Algebra, Section 7.113.

Recall that a finite type ring map $R \to A$ is quasi-finite at a prime $\mathfrak{q}$ if $\mathfrak{q}$ defines an isolated point of its fibre, see Algebra, Definition 7.113.3.

Definition 24.19.1. Let $f : X \to S$ be a morphism of schemes.

(1) We say that f is *quasi-finite at a point* $x \in X$ if there exist an affine neighbourhood $Spec(A) = U \subset X$ of x and an affine open $Spec(R) = V \subset S$ such that $f(U) \subset V$, the ring map $R \to A$ is of finite type, and $R \to A$ is quasi-finite at the prime of A corresponding to x (see above).
(2) We say f is *locally quasi-finite* if f is quasi-finite at every point x of X.
(3) We say that f is *quasi-finite* if f is of finite type and every point x is an isolated point of its fibre.

Trivially, a locally quasi-finite morphism is locally of finite type. We will see below that a morphism f which is locally of finite type is quasi-finite at x if and only if x is isolated in its fibre. Moreover, the set of points at which a morphism is quasi-finite is open; we will see this in Section 24.47 on Zariski's Main Theorem.

Lemma 24.19.2. *Let $f : X \to S$ be a morphism of schemes. Let $x \in X$ be a point. Set $s = f(x)$. If $\kappa(s) \supset \kappa(x)$ is an algebraic field extension, then*

(1) *x is a closed point of its fibre, and*
(2) *if in addition s is a closed point of S, then x is a closed point of X.*

Proof. The second statement follows from the first by elementary topology. According to Schemes, Lemma 21.18.5 to prove the first statement we may replace X by X_s and S by $Spec(\kappa(s))$. Thus we may assume that $S = Spec(k)$ is the spectrum of a field. In this case, let $Spec(A) = U \subset X$ be any affine open containing x. The point x corresponds to a prime ideal $\mathfrak{q} \subset A$ such that $k \subset \kappa(\mathfrak{q})$ is an algebraic field extension. By Algebra, Lemma 7.31.9 we see that $\mathfrak{q}$ is a maximal ideal, i.e., $x \in U$ is a closed point. Since the affine opens form a basis of the topology of X we conclude that $\{x\}$ is closed. $\square$

The following lemma is a version of the Hilbert Nullstellensatz.

Lemma 24.19.3. *Let $f : X \to S$ be a morphism of schemes. Let $x \in X$ be a point. Set $s = f(x)$. Assume f is locally of finite type. Then x is a closed point of its fibre if and only if $\kappa(s) \subset \kappa(x)$ is a finite field extension.*

Proof. If the extension is finite, then x is a closed point of the fibre by Lemma 24.19.2 above. For the converse, assume that x is a closed point of its fibre. Choose affine opens $Spec(A) = U \subset X$ and $Spec(R) = V \subset S$ such that $f(U) \subset V$. By Lemma 24.14.2 the ring map $R \to A$ is of finite type. Let $\mathfrak{q} \subset A$, resp. $\mathfrak{p} \subset R$ be the prime ideal corresponding to x, resp. s. Consider the fibre ring $\overline{A} = A \otimes_R \kappa(\mathfrak{p})$. Let $\overline{\mathfrak{q}}$ be the prime of $\overline{A}$ corresponding to $\mathfrak{q}$. The assumption that x is a closed point of its fibre implies that $\overline{\mathfrak{q}}$ is a maximal ideal of $\overline{A}$. Since $\overline{A}$ is an algebra of finite type over the field $\kappa(\mathfrak{p})$ we see by the Hilbert Nullstellensatz, see Algebra, Theorem 7.30.1, that $\kappa(\overline{\mathfrak{q}})$ is a finite extension of $\kappa(\mathfrak{p})$. Since $\kappa(s) = \kappa(\mathfrak{p})$ and $\kappa(x) = \kappa(\mathfrak{q}) = \kappa(\overline{\mathfrak{q}})$ we win. $\square$

Lemma 24.19.4. *Let $f : X \to S$ be a morphism of schemes which is locally of finite type. Let $g : S' \to S$ be any morphism. Denote $f' : X' \to S'$ the base change. If $x' \in X'$ maps to a point $x \in X$ which is closed in $X_{f(s)}$ then x' is closed in $X'_{f'(x')}$.*

Proof. The residue field $\kappa(x')$ is a quotient of $\kappa(f'(x')) \otimes_{\kappa(f(x))} \kappa(x)$, see Schemes, Lemma 21.17.5. Hence it is a finite extension of $\kappa(f'(x'))$ as $\kappa(x)$ is a finite extension of $\kappa(f(x))$ by Lemma 24.19.3. Thus we see that x' is closed in its fibre by applying that lemma one more time. □

Lemma 24.19.5. *Let $f : X \to S$ be a morphism of schemes. Let $x \in X$ be a point. Set $s = f(x)$. If f is quasi-finite at x, then the residue field extension $\kappa(s) \subset \kappa(x)$ is finite.*

Proof. This is clear from Algebra, Definition 7.113.3. □

Lemma 24.19.6. *Let $f : X \to S$ be a morphism of schemes. Let $x \in X$ be a point. Set $s = f(x)$. Let X_s be the fibre of f at s. Assume f is locally of finite type. The following are equivalent:*

(1) *The morphism f is quasi-finite at x.*
(2) *The point x is isolated in X_s.*
(3) *The point x is closed in X_s and there is no point $x' \in X_s$, $x' \neq x$ which specializes to x.*
(4) *For any pair of affine opens $Spec(A) = U \subset X$, $Spec(R) = V \subset S$ with $f(U) \subset V$ and $x \in U$ corresponding to $\mathfrak{q} \subset A$ the ring map $R \to A$ is quasi-finite at $\mathfrak{q}$.*

Proof. Assume f is quasi-finite at x. By assumption there exist opens $U \subset X$, $V \subset S$ such that $f(U) \subset V$, $x \in U$ and x an isolated point of U_s. Hence $\{x\} \subset U_s$ is an open subset. Since $U_s = U \cap X_s \subset X_s$ is also open we conclude that $\{x\} \subset X_s$ is an open subset also. Thus we conclude that x is an isolated point of X_s.

Note that X_s is a Jacobson scheme by Lemma 24.15.10 (and Lemma 24.14.4). If x is isolated in X_s, i.e., $\{x\} \subset X_s$ is open, then $\{x\}$ contains a closed point (by the Jacobson property), hence x is closed in X_s. It is clear that there is no point $x' \in X_s$, distinct from x, specializing to x.

Assume that x is closed in X_s and that there is no point $x' \in X_s$, distinct from x, specializing to x. Consider a pair of affine opens $Spec(A) = U \subset X$, $Spec(R) = V \subset S$ with $f(U) \subset V$ and $x \in U$. Let $\mathfrak{q} \subset A$ correspond to x and $\mathfrak{p} \subset R$ correspond to s. By Lemma 24.14.2 the ring map $R \to A$ is of finite type. Consider the fibre ring $\overline{A} = A \otimes_R \kappa(\mathfrak{p})$. Let $\overline{\mathfrak{q}}$ be the prime of $\overline{A}$ corresponding to $\mathfrak{q}$. Since $Spec(\overline{A})$ is an open subscheme of the fibre X_s we see that $\overline{q}$ is a maximal ideal of $\overline{A}$ and that there is no point of $Spec(\overline{A})$ specializing to $\overline{\mathfrak{q}}$. This implies that $\dim(\overline{A}_{\overline{q}}) = 0$. Hence by Algebra, Definition 7.113.3 we see that $R \to A$ is quasi-finite at $\mathfrak{q}$, i.e., $X \to S$ is quasi-finite at x by definition.

At this point we have shown conditions (1) -- (3) are all equivalent. It is clear that (4) implies (1). And it is also clear that (2) implies (4) since if x is an isolated point of X_s then it is also an isolated point of U_s for any open U which contains it. □

Lemma 24.19.7. *Let $f : X \to S$ be a morphism of schemes. Let $s \in S$. Assume that*

(1) *f is locally of finite type, and*
(2) *$f^{-1}(\{s\})$ is a finite set.*

Then X_s is a finite discrete topological space, and f is quasi-finite at each point of X lying over s.

Proof. Suppose T is a scheme which (a) is locally of finite type over a field k, and (b) has finitely many points. Then Lemma 24.15.10 shows T is a Jacobson scheme. A finite sober Jacobson space is discrete, see Topology, Lemma 5.13.6. Apply this remark to the fibre X_s which is locally of finite type over $Spec(\kappa(s))$ to see the first statement. Finally, apply Lemma 24.19.6 to see the second. □

Lemma 24.19.8. *Let $f : X \to S$ be a morphism of schemes. Assume f is locally of finite type. Then the following are equivalent*

(1) *f is locally quasi-finite,*
(2) *for every $s \in S$ the fibre X_s is a discrete topological space, and*
(3) *for every morphism $Spec(k) \to S$ where k is a field the base change X_k has an underlying discrete topological space.*

Proof. It is immediate that (3) implies (2). Lemma 24.19.6 shows that (2) is equivalent to (1). Assume (2) and let $Spec(k) \to S$ be as in (3). Denote $s \in S$ the image of $Spec(k) \to S$. Then X_k is the base change of X_s via $Spec(k) \to Spec(\kappa(s))$. Hence every point of X_k is closed by Lemma 24.19.4. As $X_k \to Spec(k)$ is locally of finite type (by Lemma 24.14.4), we may apply Lemma 24.19.6 to conclude that every point of X_k is isolated, i.e., X_k has a discrete underlying topological space. □

Lemma 24.19.9. *Let $f : X \to S$ be a morphism of schemes. Then f is quasi-finite if and only if f is locally quasi-finite and quasi-compact.*

Proof. Assume f is quasi-finite. It is quasi-compact by Definition 24.14.1. Let $x \in X$. We see that f is quasi-finite at x by Lemma 24.19.6. Hence f is quasi-compact and locally quasi-finite.

Assume f is quasi-compact and locally quasi-finite. Then f is of finite type. Let $x \in X$ be a point. By Lemma 24.19.6 we see that x is an isolated point of its fibre. The lemma is proved. □

Lemma 24.19.10. *Let $f : X \to S$ be a morphism of schemes. The following are equivalent:*

(1) *f is quasi-finite, and*
(2) *f is locally of finite type, quasi-compact, and has finite fibres.*

Proof. Assume f is quasi-finite. In particular f is locally of finite type and quasi-compact (since it is of finite type). Let $s \in S$. Since every $x \in X_s$ is isolated in X_s we see that $X_s = \bigcup_{x \in X_s} \{x\}$ is an open covering. As f is quasi-compact, the fibre X_s is quasi-compact. Hence we see that X_s is finite.

Conversely, assume f is locally of finite type, quasi-compact and has finite fibres. Then it is locally quasi-finite by Lemma 24.19.7. Hence it is quasi-finite by Lemma 24.19.9. □

Recall that a ring map $R \to A$ is quasi-finite if it is of finite type and quasi-finite at *all* primes of A, see Algebra, Definition 7.113.3.

Lemma 24.19.11. *Let $f : X \to S$ be a morphism of schemes. The following are equivalent*

(1) *The morphism f is locally quasi-finite.*
(2) *For every pair of affine opens $U \subset X$, $V \subset S$ with $f(U) \subset V$ the ring map $\mathcal{O}_S(V) \to \mathcal{O}_X(U)$ is quasi-finite.*

(3) *There exists an open covering $S = \bigcup_{j\in J} V_j$ and open coverings $f^{-1}(V_j) = \bigcup_{i\in I_j} U_i$ such that each of the morphisms $U_i \to V_j$, $j \in J, i \in I_j$ is locally quasi-finite.*
(4) *There exists an affine open covering $S = \bigcup_{j\in J} V_j$ and affine open coverings $f^{-1}(V_j) = \bigcup_{i\in I_j} U_i$ such that the ring map $\mathcal{O}_S(V_j) \to \mathcal{O}_X(U_i)$ is quasi-finite, for all $j \in J, i \in I_j$.*

Moreover, if f is locally quasi-finite then for any open subschemes $U \subset X$, $V \subset S$ with $f(U) \subset V$ the restriction $f|_U : U \to V$ is locally quasi-finite.

Proof. For a ring map $R \to A$ let us define $P(R \to A)$ to mean ``$R \to A$ is quasi-finite'' (see remark above lemma). We claim that $P$ is a local property of ring maps. We check conditions (a), (b) and (c) of Definition 24.13.1. In the proof of Lemma 24.14.2 we have seen that (a), (b) and (c) hold for the property of being ``of finite type''. Note that, for a finite type ring map $R \to A$, the property $R \to A$ is quasi-finite at $\mathfrak{q}$ depends only on the local ring $A_\mathfrak{q}$ as an algebra over $R_\mathfrak{p}$ where $\mathfrak{p} = R \cap \mathfrak{q}$ (usual abuse of notation). Using these remarks (a), (b) and (c) of Definition 24.13.1 follow immediately. For example, suppose $R \to A$ is a ring map such that all of the ring maps $R \to A_{a_i}$ are quasi-finite for $a_1, \ldots, a_n \in A$ generating the unit ideal. We conclude that $R \to A$ is of finite type. Also, for any prime $\mathfrak{q} \subset A$ the local ring $A_\mathfrak{q}$ is isomorphic as an R-algebra to the local ring $(A_{a_i})_{\mathfrak{q}_i}$ for some i and some $\mathfrak{q}_i \subset A_{a_i}$. Hence we conclude that $R \to A$ is quasi-finite at $\mathfrak{q}$.

We conclude that Lemma 24.13.3 applies with P as in the previous paragraph. Hence it suffices to prove that f is locally quasi-finite is equivalent to f is locally of type P. Since $P(R \to A)$ is ``$R \to A$ is quasi-finite'' which means $R \to A$ is quasi-finite at every prime of A, this follows from Lemma 24.19.6. $\square$

Lemma 24.19.12. *The composition of two morphisms which are locally quasi-finite is locally quasi-finite. The same is true for quasi-finite morphisms.*

Proof. In the proof of Lemma 24.19.11 we saw that P =``quasi-finite'' is a local property of ring maps, and that a morphism of schemes is locally quasi-finite if and only if it is locally of type P as in Definition 24.13.2. Hence the first statement of the lemma follows from Lemma 24.13.5 combined with the fact that being quasi-finite is a property of ring maps that is stable under composition, see Algebra, Lemma 7.113.7. By the above, Lemma 24.19.9 and the fact that compositions of quasi-compact morphisms are quasi-compact, see Schemes, Lemma 21.19.4 we see that the composition of quasi-finite morphisms is quasi-finite. $\square$

Lemma 24.19.13. *Let $f : X \to S$ be a morphism of schemes. Let $g : S' \to S$ be a morphism of schemes. Denote $f' : X_{S'} \to S'$ the base change of f by g and denote $g' : X_{S'} \to X$ the projection. Assume X is locally of finite type over S.*

(1) *Let $U \subset X$ (resp. $U' \subset X'$) be the set of points where f (resp. f') is quasi-finite. Then $U' = U_{S'} = (g')^{-1}(U)$.*
(2) *The base change of a locally quasi-finite morphism is locally quasi-finite.*
(3) *The base change of a quasi-finite morphism is quasi-finite.*

Proof. The first and second assertion follow from the corresponding algebra result, see Algebra, Lemma 7.113.8 (combined with the fact that f' is also locally of finite type by Lemma 24.14.4). By the above, Lemma 24.19.9 and the fact that a base change of a quasi-compact morphism is quasi-compact, see Schemes, Lemma 21.19.3 we see that the base change of a quasi-finite morphism is quasi-finite. $\square$

Lemma 24.19.14. *Any immersion is locally quasi-finite.*

Proof. This is true because an open immersion is a local isomorphism and a closed immersion is clearly quasi-finite. □

Lemma 24.19.15. *Let $X \to Y$ be a morphism of schemes over a base scheme S. Let $x \in X$. If $X \to S$ is quasi-finite at x, then $X \to Y$ is quasi-finite at x. If X is locally quasi-finite over S, then $X \to Y$ is locally quasi-finite.*

Proof. Via Lemma 24.19.11 this translates into the following algebra fact: Given ring maps $A \to B \to C$ such that $A \to C$ is quasi-finite, then $B \to C$ is quasi-finite. This follows from Algebra, Lemma 7.113.6 with $R = A$, $S = S' = C$ and $R' = B$. □

24.20. Morphisms of finite presentation

Recall that a ring map $R \to A$ is of finite presentation if A is isomorphic to $R[x_1, \ldots, x_n]/(f_1, \ldots, f_m)$ as an R-algebra for some n, m and some polynomials f_j, see Algebra, Definition 7.6.1.

Definition 24.20.1. Let $f : X \to S$ be a morphism of schemes.

1. We say that f is of *finite presentation at $x \in X$* if there exists a affine open neighbourhood $Spec(A) = U \subset X$ of x and and affine open $Spec(R) = V \subset S$ with $f(U) \subset V$ such that the induced ring map $R \to A$ is of finite presentation.
2. We say that f is *locally of finite presentation* if it is of finite presentation at every point of X.
3. We say that f is of *finite presentation* if it is locally of finite presentation, quasi-compact and quasi-separated.

Note that a morphism of finite presentation is **not** just a quasi-compact morphism which is locally of finite presentation. Later we will characterize morphisms which are locally of finite presentation as those morphisms such that

$$colim\, Mor_S(T_i, X) = Mor_S(lim\, T_i, X)$$

for any directed system of affine schemes T_i over S. See Limits, Proposition 27.4.1. In Limits, Section 27.6 we show that, if $S = lim_i S_i$ is a limit of affine schemes, any scheme X of finite presentation over S descends to a scheme X_i over S_i for some i.

Lemma 24.20.2. *Let $f : X \to S$ be a morphism of schemes. The following are equivalent*

1. *The morphism f is locally of finite presentation.*
2. *For every affine opens $U \subset X$, $V \subset S$ with $f(U) \subset V$ the ring map $\mathcal{O}_S(V) \to \mathcal{O}_X(U)$ is of finite presentation.*
3. *There exists an open covering $S = \bigcup_{j \in J} V_j$ and open coverings $f^{-1}(V_j) = \bigcup_{i \in I_j} U_i$ such that each of the morphisms $U_i \to V_j$, $j \in J, i \in I_j$ is locally of finite presentation.*
4. *There exists an affine open covering $S = \bigcup_{j \in J} V_j$ and affine open coverings $f^{-1}(V_j) = \bigcup_{i \in I_j} U_i$ such that the ring map $\mathcal{O}_S(V_j) \to \mathcal{O}_X(U_i)$ is of finite presentation, for all $j \in J, i \in I_j$.*

Moreover, if f is locally of finite presentation then for any open subschemes $U \subset X$, $V \subset S$ with $f(U) \subset V$ the restriction $f|_U : U \to V$ is locally of finite presentation.

Proof. This follows from Lemma 24.13.3 if we show that the property ``$R \to A$ is of finite presentation" is local. We check conditions (a), (b) and (c) of Definition 24.13.1. By Algebra, Lemma 7.13.2 being of finite presentation is stable under base change and hence we conclude (a) holds. By the same lemma being of finite presentation is stable under composition and trivially for any ring R the ring map $R \to R_f$ is of finite presentation. We conclude (b) holds. Finally, property (c) is true according to Algebra, Lemma 7.21.3. $\square$

Lemma 24.20.3. *The composition of two morphisms which locally of finite presentation is locally of finite presentation. The same is true for morphisms of finite presentation.*

Proof. In the proof of Lemma 24.20.2 we saw that being of finite presentation is a local property of ring maps. Hence the first statement of the lemma follows from Lemma 24.13.5 combined with the fact that being of finite presentation is a property of ring maps that is stable under composition, see Algebra, Lemma 7.6.2. By the above and the fact that compositions of quasi-compact, quasi-separated morphisms are quasi-compact and quasi-separated, see Schemes, Lemmas 21.19.4 and 21.21.13 we see that the composition of morphisms of finite presentation is of finite presentation. $\square$

Lemma 24.20.4. *The base change of a morphism which is locally of finite presentation is locally of finite presentation. The same is true for morphisms of finite presentation.*

Proof. In the proof of Lemma 24.20.2 we saw that being of finite presentation is a local property of ring maps. Hence the first statement of the lemma follows from Lemma 24.13.5 combined with the fact that being of finite presentation is a property of ring maps that is stable under base change, see Algebra, Lemma 7.13.2. By the above and the fact that a base change of a quasi-compact, quasi-separated morphism is quasi-compact and quasi-separated, see Schemes, Lemmas 21.19.3 and 21.21.13 we see that the base change of a morphism of finite presentation is a morphism of finite presentation. $\square$

Lemma 24.20.5. *Any open immersion is locally of finite presentation.*

Proof. This is true because an open immersion is a local isomorphism. $\square$

Lemma 24.20.6. *Any open immersion is of finite presentation if and only if it is quasi-compact.*

Proof. We have seen (Lemma 24.20.5) that an open immersion is locally of finite presentation. We have see (Schemes, Lemma 21.23.7) that an immersion is separated and hence quasi-separated. From this and Definition 24.20.1 the lemma follows. $\square$

Lemma 24.20.7. *Any closed immersion $i : Z \to X$ is of finite presentation if and only if the associated quasi-coherent sheaf of ideals $\mathcal{I} = Ker(\mathcal{O}_X \to i_*\mathcal{O}_Z)$ is of finite type (as an $\mathcal{O}_X$-module).*

Proof. On any affine open $Spec(R) \subset X$ we have $i^{-1}(Spec(R)) = Spec(R/I)$ and $\mathcal{I} = \tilde{I}$. Moreover, $\mathcal{I}$ is of finite type if and only if I is a finite R-module for every such affine open (see Properties, Lemma 23.16.1). And R/I is of finite presentation over R if and only if I is a finite R-module. Hence we win. $\square$

Lemma 24.20.8. *A morphism which is locally of finite presentation is locally of finite type. A morphism of finite presentation is of finite type.*

Proof. Omitted. $\square$

Lemma 24.20.9. *Let $f : X \to S$ be a morphism.*

(1) *If S is locally Noetherian and f locally of finite type then f is locally of finite presentation.*
(2) *If S is locally Noetherian and f of finite type then f is of finite presentation.*

Proof. The first statement follows from the fact that a ring of finite type over a Noetherian ring is of finite presentation, see Algebra, Lemma 7.28.4. Suppose that f is of finite type and S is locally Noetherian. Then f is quasi-compact and locally of finite presentation by (1). Hence it suffices to prove that f is quasi-separated. This follows from Lemma 24.14.7 (and Lemma 24.20.8). ☐

Lemma 24.20.10. *Let S be a scheme which is quasi-compact and quasi-separated. If X is of finite presentation over S, then X is quasi-compact and quasi-separated.*

Proof. Omitted. ☐

Lemma 24.20.11. *Let $f : X \to Y$ be a morphism of schemes over S. If X is locally of finite presentation over S, and Y is locally of finite type over S, then f is locally of finite presentation.*

Proof. Via Lemma 24.20.2 this translates into the following algebra fact: Given ring maps $A \to B \to C$ such that $A \to C$ is of finite presentation and $A \to B$ is of finite type, then $B \to C$ is of finite type. (See Algebra, Lemma 7.6.2). ☐

24.21. Constructible sets

Constructible and locally construcible sets of schemes have been discussed in Properties, Section 23.2. In this section we prove some results concerning images and inverse images of (locally) constructible sets. The main result is Chevalley's theorem which states that the image of a locally constructible set under a morphism of finite presentation is locally constructible.

Lemma 24.21.1. *Let $f : X \to Y$ be a morphism of schemes. Let $E \subset Y$ be a subset. If E is (locally) construcible in Y, then $f^{-1}(E)$ is (locally) constructible in X.*

Proof. To show that the inverse image of every construcible subset is constructible it suffices to show that the inverse image of every retrocompact open V of Y is retrocompact in X, see Topology, Lemma 5.10.3. The significance of V being retrocompact in Y is just that the open immersion $V \to Y$ is quasi-compact. Hence the base change $f^{-1}(V) = X \times_Y V \to X$ is quasi-compact too, see Schemes, Lemma 21.19.3. Hence we see $f^{-1}(V)$ is retrocompact in X. Suppose E is locally constructible in Y. Choose $x \in X$. Choose an affine neighbourhood V of $f(x)$ and an affine neighbourhood $U \subset X$ of x such that $f(U) \subset V$. Thus we think of $f|_U : U \to V$ as a morphism into V. By Properties, Lemma 23.2.1 we see that $E \cap V$ is constructible in V. By the constructible case we see that $(f|_U)^{-1}(E \cap V)$ is constructible in U. Since $(f|_U)^{-1}(E \cap V) = f^{-1}(E) \cap U$ we win. ☐

Lemma 24.21.2. *Let $f : X \to Y$ be a morphism of schemes. Assume*

(1) *f is quasi-compact and locally of finite presentation, and*
(2) *Y is quasi-compact and quasi-separated.*

Then the image of every constructible subset of X is constructible in Y.

Proof. By Properties, Lemma 23.2.3 it suffices to prove this lemma in case Y is affine. In this case X is quasi-compact. Hence we can write $X = U_1 \cup \ldots \cup U_n$ with each U_i affine open in X. If $E \subset X$ is constructible, then each $E \cap U_i$ is constructible too, see Topology, Lemma 5.10.4. Hence, since $f(E) = \bigcup f(E \cap U_i)$ and since finite unions of constructible sets are constructible, this reduces us to the case where X is affine. In this case the result is Algebra, Theorem 7.26.9. ☐

Theorem 24.21.3. *(Chevalley's Theorem.) Let $f : X \to Y$ be a morphism of schemes. Assume f is quasi-compact and locally of finite presentation. Then the image of every locally constructible subset is locally constructible.*

Proof. Let $E \subset X$ be locally constructible. We have to show that $f(E)$ is locally constructible too. We will show that $f(E) \cap V$ is constructible for any affine open $V \subset Y$. Thus we reduce to the case where Y is affine. In this case X is quasi-compact. Hence we can write $X = U_1 \cup \ldots \cup U_n$ with each U_i affine open in X. If $E \subset X$ is locally constructible, then each $E \cap U_i$ is constructible, see Properties, Lemma 23.2.1. Hence, since $f(E) = \bigcup f(E \cap U_i)$ and since finite unions of constructible sets are constructible, this reduces us to the case where X is affine. In this case the result is Algebra, Theorem 7.26.9. □

Lemma 24.21.4. *Let X be a scheme. Let $x \in X$. Let $E \subset X$ be a locally constructible subset. If $\{x' \mid x' \leadsto x\} \subset E$, then E contains an open neighbourhood of x.*

Proof. Assume $\{x' \mid x' \leadsto x\} \subset E$. We may assume X is affine. In this case E is constructible, see Properties, Lemma 23.2.1. In particular, also the complement E^c is constructible. By Algebra, Lemma 7.26.3 we can find a morphism of affine schemes $f : Y \to X$ such that $E^c = f(Y)$. Let $Z \subset X$ be the scheme theoretic image of f. By Lemma 24.4.5 and the assumption $\{x' \mid x' \leadsto x\} \subset E$ we see that $x \notin Z$. Hence $X \setminus Z \subset E$ is an open neighbourhood of x contained in E. □

24.22. Open morphisms

Definition 24.22.1. Let $f : X \to S$ be a morphism.

(1) We say f is *open* if the map on underlying topological spaces is open.
(2) We say f is *universally open* if for any morphism of schemes $S' \to S$ the base change $f' : X_{S'} \to S'$ is open.

According to Topology, Lemma 5.14.6 generalizations lift along certain types of open maps of topological spaces. In fact generalizations lift along any open morphism of schemes (see Lemma 24.22.5). Also, we will see that generalizations lift along flat morphisms of schemes (Lemma 24.24.8). This sometimes in turn implies that the morphism is open.

Lemma 24.22.2. *Let $f : X \to S$ be a morphism.*

(1) *If f is locally of finite presentation and generalizations lift along f, then f is open.*
(2) *If f is locally of finite presentation and generalizations lift along every base change of f, then f is universally open.*

Proof. It suffices to prove the first assertion. This reduces to the case where both X and S are affine. In this case the result follows from Algebra, Lemma 7.36.3 and Proposition 7.36.8. □

See also Lemma 24.24.9 for the case of a morphism flat of finite presentation.

Lemma 24.22.3. *A composition of (universally) open morphisms is (universally) open.*

Proof. Omitted. □

Lemma 24.22.4. *Let k be a field. Let X be a scheme over k. The structure morphism $X \to Spec(k)$ is universally open.*

Proof. Let $S \to Spec(k)$ be a morphism. We have to show that the base change $X_S \to S$ is open. The question is local on S and X, hence we may assume that S and X are affine. In this case the result is Algebra, Lemma 7.36.10. □

Lemma 24.22.5. *Let $\varphi : X \to Y$ be a morphism of schemes. If φ is open, then φ is generizing (i.e., generalizations lift along φ). If φ is universally open, then φ is universally generizing.*

Proof. Assume φ is open. Let $y' \rightsquigarrow y$ be a specialization of points of Y. Let $x \in X$ with $\varphi(x) = y$. Choose affine opens $U \subset X$ and $V \subset Y$ such that $\varphi(U) \subset V$ and $x \in U$. Then also $y' \in V$. Hence we may replace X by U and Y by V and assume X, Y affine. The affine case is Algebra, Lemma 7.36.2 (combined with Algebra, Lemma 7.36.3). $\square$

Lemma 24.22.6. *Let $f : X \to Y$ be a morphism of schemes. Let $g : Y' \to Y$ be open and surjective such that the base change $f' : X' \to Y'$ is quasi-compact. Then f is quasi-compact.*

Proof. Let $V \subset Y$ be a quasi-compact open. As g is open and surjective we can find a quasi-compact open $W' \subset W$ such that $g(W') = V$. By assumption $(f')^{-1}(W')$ is quasi-compact. The image of $(f')^{-1}(W')$ in X is equal to $f^{-1}(V)$, see Lemma 24.9.3. Hence $f^{-1}(V)$ is quasi-compact as the image of a quasi-compact space, see Topology, Lemma 5.9.5. Thus f is quasi-compact. $\square$

24.23. Submersive morphisms

Definition 24.23.1. Let $f : X \to Y$ be a morphism of schemes.

(1) We say f is *submersive*[5] if the continuous map of underlying topological spaces is submersive, see Topology, Definition 5.15.1.
(2) We say f is *universally submersive* if for every morphism of schemes $Y' \to Y$ the base change $Y' \times_Y X \to Y'$ is submersive.

We note that a submersive morphism is in particular surjective.

24.24. Flat morphisms

Flatness is one of the most important technical tools in algebraic geometry. In this section we introduce this notion. We intentionally limit the discussion to straightforward observations, apart from Lemma 24.24.9. A very important class of results, namely criteria for flatness will be discussed (insert future reference here).

Recall that a module M over a ring R is *flat* if the functor $- \otimes_R M : \text{Mod}_R \to \text{Mod}_R$ is exact. A ring map $R \to A$ is said to be *flat* if A is flat as an R-module. See Algebra, Definition 7.35.1.

Definition 24.24.1. Let $f : X \to S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent sheaf of $\mathcal{O}_X$-modules.

(1) We say f is *flat at a point* $x \in X$ if the local ring $\mathcal{O}_{X,x}$ is flat over the local ring $\mathcal{O}_{S,f(x)}$.
(2) We say that $\mathcal{F}$ is *flat over S at a point* $x \in X$ if the stalk $\mathcal{F}_x$ is a flat $\mathcal{O}_{S,f(x)}$-module.
(3) We say f is *flat* if f is flat at every point of X.
(4) We say that $\mathcal{F}$ is *flat over S* if $\mathcal{F}$ is flat over S at every point x of X.

Thus we see that f is flat if and only if the structure sheaf $\mathcal{O}_X$ is flat over S.

Lemma 24.24.2. *Let $f : X \to S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent sheaf of $\mathcal{O}_X$-modules. The following are equivalent*

[5]This is very different from the notion of a submersion of differential manifolds.

(1) *The sheaf* $\mathcal{F}$ *is flat over* S.
(2) *For every affine opens* $U \subset X$, $V \subset S$ *with* $f(U) \subset V$ *the* $\mathcal{O}_S(V)$*-module* $\mathcal{F}(U)$ *is flat.*
(3) *There exists an open covering* $S = \bigcup_{j \in J} V_j$ *and open coverings* $f^{-1}(V_j) = \bigcup_{i \in I_j} U_i$ *such that each of the modules* $\mathcal{F}|_{U_i}$ *is flat over* V_j*, for all* $j \in J, i \in I_j$.
(4) *There exists an affine open covering* $S = \bigcup_{j \in J} V_j$ *and affine open coverings* $f^{-1}(V_j) = \bigcup_{i \in I_j} U_i$ *such that* $\mathcal{F}(U_i)$ *is a flat* $\mathcal{O}_S(V_j)$*-module, for all* $j \in J, i \in I_j$.

Moreover, if $\mathcal{F}$ *is flat over* S *then for any open subschemes* $U \subset X$, $V \subset S$ *with* $f(U) \subset V$ *the restriction* $\mathcal{F}|_U$ *is flat over* V.

Proof. Let $R \to A$ be a ring map. Let M be an A-module. If M is R-flat, then for all primes $\mathfrak{q}$ the module $M_\mathfrak{q}$ is flat over $R_\mathfrak{p}$ with $\mathfrak{p}$ the prime of R lying under $\mathfrak{q}$. Conversely, if $M_\mathfrak{q}$ is flat over $R_\mathfrak{p}$ for all primes $\mathfrak{q}$ of A, then M is flat over R. See Algebra, Lemma 7.35.19. This equivalence easily implies the statements of the lemma. $\square$

Lemma 24.24.3. *Let* $f : X \to S$ *be a morphism of schemes. The following are equivalent*

(1) *The morphism* f *is flat.*
(2) *For every affine opens* $U \subset X$, $V \subset S$ *with* $f(U) \subset V$ *the ring map* $\mathcal{O}_S(V) \to \mathcal{O}_X(U)$ *is flat.*
(3) *There exists an open covering* $S = \bigcup_{j \in J} V_j$ *and open coverings* $f^{-1}(V_j) = \bigcup_{i \in I_j} U_i$ *such that each of the morphisms* $U_i \to V_j$, $j \in J, i \in I_j$ *is flat.*
(4) *There exists an affine open covering* $S = \bigcup_{j \in J} V_j$ *and affine open coverings* $f^{-1}(V_j) = \bigcup_{i \in I_j} U_i$ *such that* $\mathcal{O}_S(V_j) \to \mathcal{O}_X(U_i)$ *is flat, for all* $j \in J, i \in I_j$.

Moreover, if f *is flat then for any open subschemes* $U \subset X$, $V \subset S$ *with* $f(U) \subset V$ *the restriction* $f|_U : U \to V$ *is flat.*

Proof. This is a special case of Lemma 24.24.2 above. $\square$

Lemma 24.24.4. *Let* $X \to Y \to Z$ *be morphisms of schemes. Let* $\mathcal{F}$ *be a quasi-coherent* $\mathcal{O}_X$*-module. If* $\mathcal{F}$ *is flat over* Y*, and* Y *is flat over* Z*, then* $\mathcal{F}$ *is flat over* Z.

Proof. See Algebra, Lemma 7.35.3. $\square$

Lemma 24.24.5. *The composition of flat morphisms is flat.*

Proof. This is a special case of Lemma 24.24.4. $\square$

Lemma 24.24.6. *Let* $f : X \to S$ *be a morphism of schemes. Let* $\mathcal{F}$ *be a quasi-coherent sheaf of* $\mathcal{O}_X$*-modules. Let* $g : S' \to S$ *be a morphism of schemes. Denote* $g' : X' = X_{S'} \to X$ *the projection. Let* $x' \in X'$ *be a point with image* $x = g(x') \in X$. *If* $\mathcal{F}$ *is flat over* S *at* x*, then* $(g')^*\mathcal{F}$ *is flat over* S' *at* x'. *In particular, if* $\mathcal{F}$ *is flat over* S*, then* $(g')^*\mathcal{F}$ *is flat over* S'.

Proof. See Algebra, Lemma 7.35.6. $\square$

Lemma 24.24.7. *The base change of a flat morphism is flat.*

Proof. This is a special case of Lemma 24.24.6. $\square$

Lemma 24.24.8. *Let* $f : X \to S$ *be a flat morphism of schemes. Then generalizations lift along* f*, see Topology, Definition 5.14.3.*

Proof. See Algebra, Section 7.36. $\square$

Lemma 24.24.9. *A flat morphism locally of finite presentation is universally open.*

Proof. This follows from Lemmas 24.24.8 and Lemma 24.22.2 above. We can also argue directly as follows.

Let $f : X \to S$ be flat locally of finite presentation. To show f is open it suffices to show that we may cover X by open affines $X = \bigcup U_i$ such that $U_i \to S$ is open. By definition we may cover X by affine opens $U_i \subset X$ such that each U_i maps into an affine open $V_i \subset S$ and such that the induced ring map $\mathcal{O}_S(V_i) \to \mathcal{O}_X(U_i)$ is of finite presentation. Thus $U_i \to V_i$ is open by Algebra, Proposition 7.36.8. The lemma follows. □

Lemma 24.24.10. *Let $f : X \to Y$ be a quasi-compact, surjective, flat morphism. A subset $T \subset Y$ is open (resp. closed) if and only $f^{-1}(T)$ is open (resp. closed). In other words, f is a submersive morphism.*

Proof. The question is local on Y, hence we may assume that Y is affine. In this case X is quasi-compact as f is quasi-compact. Write $X = X_1 \cup \ldots \cup X_n$ as a finite union of affine opens. Then $f' : X' = X_1 \coprod \ldots \coprod X_n \to Y$ is a surjective flat morphism of affine schemes. Note that for $T \subset Y$ we have $(f')^{-1}(T) = f^{-1}(T) \cap X_1 \coprod \ldots \coprod f^{-1}(T) \cap X_n$. Hence, $f^{-1}(T)$ is open if and only if $(f')^{-1}(T)$ is open. Thus we may assume both X and Y are affine.

Let $f : Spec(B) \to Spec(A)$ be a surjective morphism of affine schemes corresponding to a flat ring map $A \to B$. Suppose that $f^{-1}(T)$ is closed, say $f^{-1}(T) = V(I)$ for $I \subset A$ an ideal. Then $T = f(f^{-1}(T)) = f(V(I))$ is the image of $Spec(A/I) \to Spec(B)$ (here we use that f is surjective). On the other hand, generalizations lift along f (Lemma 24.24.8). Hence by Topology, Lemma 5.14.5 we see that $Y \setminus T = f(X \setminus f^{-1}(T))$ is stable under generalization. Hence T is stable under specialization (Topology, Lemma 5.14.2). Thus T is closed by Algebra, Lemma 7.36.5. □

Lemma 24.24.11. *Let $h : X \to Y$ be a morphism of schemes over S. Let $\mathcal{G}$ be a quasi-coherent sheaf on Y. Let $x \in X$ with $y = h(x) \in Y$. If h is flat at x, then*

$$\mathcal{G} \text{ flat over } S \text{ at } y \Leftrightarrow h^*\mathcal{G} \text{ flat over } S \text{ at } x.$$

In particular: If h is surjective and flat, then $\mathcal{G}$ is flat over S, if and only if $h^*\mathcal{G}$ is flat over S. If h is surjective and flat, and X is flat over S, then Y is flat over S.

Proof. You can prove this by applying Algebra, Lemma 7.35.8. Here is a direct proof. Let $s \in S$ be the image of y. Consider the local ring maps $\mathcal{O}_{S,s} \to \mathcal{O}_{Y,y} \to \mathcal{O}_{X,x}$. By assumption the ring map $\mathcal{O}_{Y,y} \to \mathcal{O}_{X,x}$ is faithfully flat, see Algebra, Lemma 7.35.16. Let $N = \mathcal{G}_y$. Note that $h^*\mathcal{G}_x = N \otimes_{\mathcal{O}_{Y,y}} \mathcal{O}_{X,x}$, see Sheaves, Lemma 6.26.4. Let $M' \to M$ be an injection of $\mathcal{O}_{S,s}$-modules. By the faithful flatness mentioned above we have

$$\begin{aligned} & \mathrm{Ker}(M' \otimes_{\mathcal{O}_{S,s}} N \to M \otimes_{\mathcal{O}_{S,s}} N) \otimes_{\mathcal{O}_{Y,y}} \mathcal{O}_{X,x} \\ = {} & \mathrm{Ker}(M' \otimes_{\mathcal{O}_{S,s}} N \otimes_{\mathcal{O}_{Y,y}} \mathcal{O}_{X,x} \to M \otimes_{\mathcal{O}_{S,s}} N \otimes_{\mathcal{O}_{Y,y}} \mathcal{O}_{X,x}) \end{aligned}$$

Hence the equivalence of the lemma follows from the second characterization of flatness in Algebra, Lemma 7.35.4. □

24.25. Flat closed immersions

Connected components of schemes are not always open. But they do always have a canonical scheme structure. We explain this in this section.

Lemma 24.25.1. *Let X be a scheme. The rule which associates to a closed subscheme of X its underlying closed subset defines a bijection*

$$\left\{ \begin{array}{c} \text{closed subschemes } Z \subset X \\ \text{such that } Z \to X \text{ is flat} \end{array} \right\} \leftrightarrow \left\{ \begin{array}{c} \text{closed subsets } Z \subset X \\ \text{closed under generalizations} \end{array} \right\}$$

Proof. The affine case is Algebra, Lemma 7.100.4. In general the lemma follows by covering X by affines and glueing. Details omitted. $\square$

Note that a connected component T of a scheme X is a closed subset stable under generalization. Hence the following definition makes sense.

Definition 24.25.2. Let X be a scheme. Let $T \subset X$ be a connected component. The *canonical scheme structure on T* is the unique scheme structure on T such that the closed immersion $T \to X$ is flat, see Lemma 24.25.1.

It turns out that we can determine when every finite flat $\mathcal{O}_X$-module is finite locally free using the previous lemma.

Lemma 24.25.3. *Let X be a scheme. The following are equivalent*

(1) *every finite flat quasi-coherent $\mathcal{O}_X$-module is finite locally free, and*
(2) *every closed subset $Z \subset X$ which is closed under generalizations is open.*

Proof. In the affine case this is Algebra, Lemma 7.100.6. The scheme case does not follow directly from the affine case, so we simply repeat the arguments.

Assume (1). Consider a closed immersion $i : Z \to X$ such that i is flat. Then $i_*\mathcal{O}_Z$ is quasi-coherent and flat, hence finite locally free by (1). Thus $Z = \text{Supp}(i_*\mathcal{O}_Z)$ is also open and we see that (2) holds. Hence the implication (1) $\Rightarrow$ (2) follows from the characterization of flat closed immersions in Lemma 24.25.1.

For the converse assume that X satisfies (2). Let $\mathcal{F}$ be a finite flat quasi-coherent $\mathcal{O}_X$-module. The support $Z = \text{Supp}(\mathcal{F})$ of $\mathcal{F}$ is closed, see Modules, Lemma 15.9.6. On the other hand, if $x \rightsquigarrow x'$ is a specialization, then by Algebra, Lemma 7.72.4 the module $\mathcal{F}_{x'}$ is free over $\mathcal{O}_{X,x'}$, and

$$\mathcal{F}_x = \mathcal{F}_{x'} \otimes_{\mathcal{O}_{X,x'}} \mathcal{O}_{X,x}.$$

Hence $x' \in \text{Supp}(\mathcal{F}) \Rightarrow x \in \text{Supp}(\mathcal{F})$, in other words, the support is closed under generalization. As X satisfies (2) we see that the support of $\mathcal{F}$ is open and closed. The modules $\wedge^i(\mathcal{F})$, $i = 1, 2, 3, \ldots$ are finite flat quasi-coherent $\mathcal{O}_X$-modules also, see Modules, Section 15.18. Note that $\text{Supp}(\wedge^{i+1}(\mathcal{F})) \subset \text{Supp}(\wedge^i(\mathcal{F}))$. Thus we see that there exists a decomposition

$$X = U_0 \coprod U_1 \coprod U_2 \coprod \ldots$$

by open and closed subsets such that the support of $\wedge^i(\mathcal{F})$ is $U_i \cup U_{i+1} \cup \ldots$ for all i. Let x be a point of X, and say $x \in U_r$. Note that $\wedge^i(\mathcal{F})_x \otimes \kappa(x) = \wedge^i(\mathcal{F}_x \otimes \kappa(x))$. Hence, $x \in U_r$ implies that $\mathcal{F}_x \otimes \kappa(x)$ is a vector space of dimension r. By Nakayama's lemma, see Algebra, Lemma 7.14.5 we can choose an affine open neighbourhood $U \subset U_r \subset X$ of x and sections $s_1, \ldots, s_r \in \mathcal{F}(U)$ such that the induced map

$$\mathcal{O}_U^{\oplus r} \longrightarrow \mathcal{F}|_U, \quad (f_1, \ldots, f_r) \longmapsto \sum f_i s_i$$

is surjective. This means that $\wedge^r(\mathcal{F}|_U)$ is a finite flat quasi-coherent $\mathcal{O}_U$-module whose support is all of U. By the above it is generated by a single element, namely $s_1 \wedge \ldots \wedge s_r$. Hence $\wedge^r(\mathcal{F}|_U) \cong \mathcal{O}_U/\mathcal{I}$ for some quasi-coherent sheaf of ideals $\mathcal{I}$ such that $\mathcal{O}_U/\mathcal{I}$ is flat over $\mathcal{O}_U$ and such that $V(\mathcal{I}) = U$. It follows that $\mathcal{I} = 0$ by applying Lemma 24.25.1. Thus

$s_1 \wedge \ldots \wedge s_r$ is a basis for $\wedge^r(\mathcal{F}|_U)$ and it follows that the displayed map is injective as well as surjective. This proves that $\mathcal{F}$ is finite locally free as desired. □

24.26. Generic flatness

A scheme of finite type over an integral base is flat over a dense open of the base. In Algebra, Section 24.26 we proved a Noetherian version, a version for morphisms of finite presentation, and a general version. We only state and prove the general version here. However, it turns out that this will be superseded by Proposition 24.26.2 which shows the result holds if we only assume the base is reduced.

Proposition 24.26.1. *(Generic flatness) Let $f : X \to S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent sheaf of $\mathcal{O}_X$-modules. Assume*

1. *S is integral,*
2. *f is of finite type, and*
3. *$\mathcal{F}$ is a finite type $\mathcal{O}_X$-module.*

Then there exists an open dense subscheme $U \subset S$ such that $X_U \to U$ is flat and of finite presentation and such that $\mathcal{F}|_{X_U}$ is flat over U and of finite presentation over $\mathcal{O}_{X_U}$.

Proof. As S is integral it is irreducible (see Properties, Lemma 23.3.4) and any nonempty open is dense. Hence we may replace S by an affine open of S and assume that $S = Spec(A)$ is affine. As S is integral we see that A is a domain. As f is of finite type, it is quasi-compact, so X is quasi-compact. Hence we can find a finite affine open cover $X = \bigcup_{i=1,\ldots,n} X_i$. Write $X_i = Spec(B_i)$. Then B_i is a finite type A-algebra, see Lemma 24.14.2. Moreover there are finite type B_i-modules M_i such that $\mathcal{F}|_{X_i}$ is the quasi-coherent sheaf associated to the B_i-module M_i, see Properties, Lemma 23.16.1. Next, for each pair of indices i, j choose an ideal $I_{ij} \subset B_i$ such that $X_i \setminus X_i \cap X_j = V(I_{ij})$ inside $X_i = Spec(B_i)$. Set $M_{ij} = B_i/I_{ij}$ and think of it as a B_i-module. Then $V(I_{ij}) = \text{Supp}(M_{ij})$ and M_{ij} is a finite B_i-module.

At this point we apply Algebra, Lemma 7.109.3 the pairs $(A \to B_i, M_{ij})$ and to the pairs $(A \to B_i, M_i)$. Thus we obtain nonzero $f_{ij}, f_i \in A$ such that (a) $A_{f_{ij}} \to B_{i,f_{ij}}$ is flat and of finite presentation and $M_{ij,f_{ij}}$ is flat over $A_{f_{ij}}$ and of finite presentation over $B_{i,f_{ij}}$, and (b) B_{i,f_i} is flat and of finite presentation over A_f and M_{i,f_i} is flat and of finite presentation over B_{i,f_i}. Set $f = (\prod f_i)(\prod f_{ij})$. We claim that taking $U = D(f)$ works.

To prove our claim we may replace A by A_f, i.e., perform the base change by $U = Spec(A_f) \to S$. After this base change we see that each of $A \to B_i$ is flat and of finite presentation and that M_i, M_{ij} are flat over A and of finite presentation over B_i. This already proves that $X \to S$ is quasi-compact, locally of finite presentation, flat, and that $\mathcal{F}$ is flat over S and of finite presentation over $\mathcal{O}_X$, see Lemma 24.20.2 and Properties, Lemma 23.16.2. Since M_{ij} is of finite presentation over B_i we see that $X_i \cap X_j = X_i \setminus \text{Supp}(M_{ij})$ is a quasi-compact open of X_i, see Algebra, Lemma 7.59.5. Hence we see that $X \to S$ is quasi-separated by Schemes, Lemma 21.21.7. This proves the proposition. □

It actually turns out that there is also a version of generic flatness over an arbitrary reduced base. Here it is.

Proposition 24.26.2. *(Generic flatness, reduced case) Let $f : X \to S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent sheaf of $\mathcal{O}_X$-modules. Assume*

1. *S is reduced,*
2. *f is of finite type, and*
3. *$\mathcal{F}$ is a finite type $\mathcal{O}_X$-module.*

Then there exists an open dense subscheme $U \subset S$ such that $X_U \to U$ is flat and of finite presentation and such that $\mathcal{F}|_{X_U}$ is flat over U and of finite presentation over $\mathcal{O}_{X_U}$.

Proof. For the impatient reader: This proof is a repeat of the proof of Proposition 24.26.1 using Algebra, Lemma 7.109.7 instead of Algebra, Lemma 7.109.3.

Since being flat and being of finite presentation is local on the base, see Lemmas 24.24.2 and 24.20.2, we may work affine locally on S. Thus we may assume that $S = Spec(A)$, where A is a reduced ring (see Properties, Lemma 23.3.2). As f is of finite type, it is quasi-compact, so X is quasi-compact. Hence we can find a finite affine open cover $X = \bigcup_{i=1,\ldots,n} X_i$. Write $X_i = Spec(B_i)$. Then B_i is a finite type A-algebra, see Lemma 24.14.2. Moreover there are finite type B_i-modules M_i such that $\mathcal{F}|_{X_i}$ is the quasi-coherent sheaf associated to the B_i-module M_i, see Properties, Lemma 23.16.1. Next, for each pair of indices i, j choose an ideal $I_{ij} \subset B_i$ such that $X_i \setminus X_i \cap X_j = V(I_{ij})$ inside $X_i = Spec(B_i)$. Set $M_{ij} = B_i/I_{ij}$ and think of it as a B_i-module. Then $V(I_{ij}) = \text{Supp}(M_{ij})$ and M_{ij} is a finite B_i-module.

At this point we apply Algebra, Lemma 7.109.7 the pairs $(A \to B_i, M_{ij})$ and to the pairs $(A \to B_i, M_i)$. Thus we obtain dense opens $U(A \to B_i, M_{ij}) \subset S$ and dense opens $U(A \to B_i, M_i) \subset S$ with notation as in Algebra, Equation (7.109.3.2). Since a finite intersection of dense opens is dense open, we see that

$$U = \bigcap\nolimits_{i,j} U(A \to B_i, M_{ij}) \quad \cap \quad \bigcap\nolimits_i U(A \to B_i, M_i)$$

is open and dense in S. We claim that U is the desired open.

Pick $u \in U$. By definition of the loci $U(A \to B_i, M_{ij})$ and $U(A \to B, M_i)$ there exist $f_{ij}, f_i \in A$ such that (a) $u \in D(f_i)$ and $u \in D(f_{ij})$, (b) $A_{f_{ij}} \to B_{i,f_{ij}}$ is flat and of finite presentation and $M_{ij,f_{ij}}$ is flat over $A_{f_{ij}}$ and of finite presentation over $B_{i,f_{ij}}$, and (c) B_{i,f_i} is flat and of finite presentation over A_f and M_{i,f_i} is flat and of finite presentation over B_{i,f_i}. Set $f = (\prod f_i)(\prod f_{ij})$. Now it suffices to prove that $X \to S$ is flat and of finite presentation over $D(f)$ and that $\mathcal{F}$ restricted to $X_{D(f)}$ is flat over $D(f)$ and of finite presentation over the structure sheaf of $X_{D(f)}$.

Hence we may replace A by A_f, i.e., perform the base change by $Spec(A_f) \to S$. After this base change we see that each of $A \to B_i$ is flat and of finite presentation and that M_i, M_{ij} are flat over A and of finite presentation over B_i. This already proves that $X \to S$ is quasi-compact, locally of finite presentation, flat, and that $\mathcal{F}$ is flat over S and of finite presentation over $\mathcal{O}_X$, see Lemma 24.20.2 and Properties, Lemma 23.16.2. Since M_{ij} is of finite presentation over B_i we see that $X_i \cap X_j = X_i \setminus \text{Supp}(M_{ij})$ is a quasi-compact open of X_i, see Algebra, Lemma 7.59.5. Hence we see that $X \to S$ is quasi-separated by Schemes, Lemma 21.21.7. This proves the proposition. □

Remark 24.26.3. The results above are a first step towards more refined flattening techniques for morphisms of schemes. The article [**GR71**] by Raynaud and Gruson contains many wonderful results in this direction.

24.27. Morphisms and dimensions of fibres

Let X be a topological space, and $x \in X$. Recall that we have defined $\dim_x(X)$ as the minimum of the dimensions of the open neighbourhoods of x in X. See Topology, Definition 5.7.1.

Lemma 24.27.1. *Let $f : X \to S$ be a morphism of schemes. Let $x \in X$ and set $s = f(x)$. Assume f is locally of finite type. Then*

$$\dim_x(X_s) = \dim(\mathcal{O}_{X_s,x}) + trdeg_{\kappa(s)}(\kappa(x)).$$

Proof. This immediately reduces to the case $S = s$, and X affine. In this case the result follows from Algebra, Lemma 7.107.3. □

Lemma 24.27.2. *Let $f : X \to Y$ and $g : Y \to S$ be morphisms of schemes. Let $x \in X$ and set $y = f(x)$, $s = g(y)$. Assume f and g locally of finite type. Then*

$$\dim_x(X_s) \leq \dim_x(X_y) + \dim_y(Y_s).$$

Moreover, equality holds if $\mathcal{O}_{X_s,x}$ is flat over $\mathcal{O}_{Y_s,y}$, which holds for example if $\mathcal{O}_{X,x}$ is flat over $\mathcal{O}_{Y,y}$.

Proof. Note that $\text{trdeg}_{\kappa(s)}(\kappa(x)) = \text{trdeg}_{\kappa(y)}(\kappa(x)) + \text{trdeg}_{\kappa(s)}(\kappa(y))$. Thus by Lemma 24.27.1 the statement is equivalent to

$$\dim(\mathcal{O}_{X_s,x}) \leq \dim(\mathcal{O}_{X_y,x}) + \dim(\mathcal{O}_{Y_s,y}).$$

For this see Algebra, Lemma 7.103.6. For the flat case see Algebra, Lemma 7.103.7. □

Lemma 24.27.3. *Let*

$$\begin{tikzcd} X' \arrow[r, "g'"'] \arrow[d, "f'"'] & X \arrow[d, "f"] \\ S' \arrow[r, "g"] & S \end{tikzcd}$$

be a fibre product diagram of schemes. Assume f locally of finite type. Suppose that $x' \in X'$, $x = g'(x')$, $s' = f'(x')$ and $s = g(s') = f(x)$. Then $\dim_x(X_s) = \dim_{x'}(X'_{s'})$.

Proof. Follows immediately from Algebra, Lemma 7.107.6. □

The following lemma follows from a nontrivial algebraic result. Namely, the algebraic version of Zariski's main theorem.

Lemma 24.27.4. *Let $f : X \to S$ be a morphism of schemes. Let $n \geq 0$. Assume f is locally of finite type. The set*

$$U_n = \{x \in X \mid \dim_x X_{f(x)} \leq n\}$$

is open in X.

Proof. This is immediate from Algebra, Lemma 7.116.6 □

Lemma 24.27.5. *Let $f : X \to S$ be a morphism of schemes. Let $n \geq 0$. Assume f is locally of finite presentation. The open*

$$U_n = \{x \in X \mid \dim_x X_{f(x)} \leq n\}$$

of Lemma 24.27.4 is retrocompact in X. (See Topology, Definition 5.9.1.)

Proof. The topological space X has a basis for its topology consisting of affine opens $U \subset X$ such that the infuced morphism $f|_U : U \to S$ factors through an affine open $V \subset S$. Hence it is enough to show that $U \cap U_n$ is quasi-compact for such a U. Note that $U_n \cap U$ is the same as the open $\{x \in U \mid \dim_x U_{f(x)} \leq n\}$. This reduces us to the case where X and S are affine. In this case the lemma follows from Algebra, Lemma 7.116.8 (and Lemma 24.20.2). □

Lemma 24.27.6. *Let $f : X \to S$ be a morphism of schemes. Let $x \rightsquigarrow x'$ be a nontrivial specialization of points in X lying over the same point $s \in S$. Assume f is locally of finite type. Then*

(1) $\dim_x(X_s) \leq \dim_{x'}(X_s)$,
(2) $trdeg_{\kappa(s)}(\kappa(x)) > trdeg_{\kappa(s)}(\kappa(x'))$, *and*
(3) $\dim(\mathcal{O}_{X_s,x}) < \dim(\mathcal{O}_{X_s,x'})$.

Proof. The first inequality follows from Lemma 24.27.4. The third inequality follows since $\mathcal{O}_{X_s,x}$ is a localization of $\mathcal{O}_{X_s,x}$ in a prime ideal, hence any chain of prime ideals in $\mathcal{O}_{X_s,x}$ is part of a strictly longer chain of primes in $\mathcal{O}_{X_s,x'}$. The second inequality follows from Algebra, Lemma 7.107.2. □

24.28. Morphisms of given relative dimension

In order to be able to speak comfortably about morphisms of a given relative dimension we introduce the following notion.

Definition 24.28.1. Let $f : X \to S$ be a morphism of schemes. Assume f is locally of finite type.

(1) We say f is of *relative dimension $\leq d$ at x* if $\dim_x(X_{f(x)}) \leq d$.
(2) We say f is of *relative dimension $\leq d$* if $\dim_x(X_{f(x)}) \leq d$ for all $x \in X$.
(3) We say f is of *relative dimension d* if all nonempty fibres X_s are equidimensional of dimension d.

This is not a particularly well behaved notion, but it works well in a number of situations.

Lemma 24.28.2. *Let $f : X \to S$ be a morphism of schemes which is locally of finite type. If f has relative dimension d, then so does any base change of f. Same for relative dimension $\leq d$.*

Proof. This is immediate from Lemma 24.27.3. □

Lemma 24.28.3. *Let $f : X \to Y$, $g : Y \to Z$ be locally of finite type. If f has relative dimension $\leq d$ and g has relative dimension $\leq e$ then $g \circ f$ has relative dimension $\leq d + e$. If*

(1) *f has relative dimension d,*
(2) *g has relative dimension e, and*
(3) *f is flat,*

then $g \circ f$ has relative dimension $d + e$.

Proof. This is immediate from Lemma 24.27.2. □

In general it is not possible to decompose a morphism into its pieces where the relative dimension is a given one. However, it is possible if the morphism has Cohen-Macaulay fibres and is flat of finite presentation.

Lemma 24.28.4. *Let $f : X \to S$ be a morphism of schemes. Assume that*

(1) *f is flat,*
(2) *f is locally of finite presentation, and*
(3) *for all $s \in S$ the fibre X_s is Cohen-Macaulay (Properties, Definition 23.8.1)*

Then there exist open and closed subschemes $X_d \subset X$ such that $X = \coprod_{d \geq 0} X_d$ and $f|_{X_d} : X_d \to S$ has relative dimension d.

Proof. This is immediate from Algebra, Lemma 7.121.8. □

Lemma 24.28.5. *Let $f : X \to S$ be a morphism of schemes. Assume f is locally of finite type. Let $x \in X$ with $s = f(x)$. Then f is quasi-finite at x if and only if $\dim_x(X_s) = 0$. In particular, f is locally quasi-finite if and only if f has relative dimension 0.*

Proof. If f is quasi-finite at x then $\kappa(x)$ is a finite extension of $\kappa(s)$ (by Lemma 24.19.5) and x is isolated in X_s (by Lemma 24.19.6), hence $\dim_x(X_s) = 0$ by Lemma 24.27.1. Conversely, if $\dim_x(X_s) = 0$ then by Lemma 24.27.1 we see $\kappa(s) \subset \kappa(x)$ is algebraic and there are no other points of X_s specializing to x. Hence x is closed in its fibre by Lemma 24.19.2 and by Lemma 24.19.6 (3) we conclude that f is quasi-finite at x. □

24.29. The dimension formula

For morphisms between Noetherian schemes we can say a little more about dimensions of local rings. Here is an important (and not so hard to prove) result. Recall that $R(X)$ denotes the function field of an integral scheme X.

Lemma 24.29.1. *Let S be a scheme. Let $f : X \to S$ be a morphism of schemes. Let $x \in X$, and set $s = f(x)$. Assume*

1. *S is locally Noetherian,*
2. *f is locally of finite type,*
3. *X and S integral, and*
4. *f dominant.*

We have

$$\dim(\mathcal{O}_{X,x}) \leq \dim(\mathcal{O}_{S,s}) + trdeg_{R(S)} R(X) - trdeg_{\kappa(s)} \kappa(x). \tag{24.29.1.1}$$

Moreover, equality holds if S is universally catenary.

Proof. The corresponding algebra statement is Algebra, Lemma 7.104.1. □

An application is the construction of a dimension function on any scheme of finite type over a universally catenary scheme endowed with a dimension function. For the definition of dimension functions, see Topology, Definition 5.16.1.

Lemma 24.29.2. *Let S be a universally catenary scheme. Let $\delta : S \to \mathbf{Z}$ be a dimension function. Let $f : X \to S$ be a morphism of schemes. Assume f locally of finite type. Then the map*

$$\begin{aligned} \delta = \delta_{X/S} : X &\longrightarrow \mathbf{Z} \\ x &\longmapsto \delta(f(x)) + trdeg_{\kappa(f(x))} \kappa(x) \end{aligned}$$

is a dimension function on X.

Proof. Let $f : X \to S$ be locally of finite type. Let $x \rightsquigarrow y$, $x \neq y$ be a specialization in X. We have to show that $\delta_{X/S}(x) > \delta_{X/S}(y)$ and that $\delta_{X/S}(x) = \delta_{X/S}(y) + 1$ if y is an immediate specialization of x.

Choose an affine open $V \subset S$ containing the image of y and choose an affine open $U \subset X$ mapping into V and containing y. We may clearly replace X by U and S by V. Thus we may assume that $X = Spec(A)$ and $S = Spec(R)$ and that f is given by a ring map $R \to A$. The ring R is universally catenary (Lemma 24.16.2) and the map $R \to A$ is of finite type (Lemma 24.14.2).

Let $\mathfrak{q} \subset A$ be the prime ideal corresponding to the point x and let $\mathfrak{p} \subset R$ be the prime ideal corresponding to $f(x)$. The restriction δ' of δ to $S' = Spec(R/\mathfrak{p}) \subset S$ is a dimension function. The ring $R/\mathfrak{p}$ is universally catenary. The restriction of $\delta_{X/S}$ to $X' = Spec(A/\mathfrak{q})$ is clearly equal to the function $\delta_{X'/S'}$ constructed using the dimension function δ'. Hence we may assume in addition to the above that $R \subset A$ are domains, in other words that X and S are integral schemes.

Note that $\mathcal{O}_{X,x}$ is a localization of $\mathcal{O}_{X,y}$ at a non-maximal prime (Schemes, Lemma 21.13.2). Hence $\dim(\mathcal{O}_{X,x}) < \dim(\mathcal{O}_{X,y})$ and $\dim(\mathcal{O}_{X,x}) = \dim(\mathcal{O}_{X,y}) - 1$ if y is an immediate specialization of x.

Write $s = f(x) \neq f(y) = s'$. We see, using equality in (24.29.1.1), that

$$\begin{aligned}\delta_{X/S}(x) - \delta_{X/S}(y) = \delta(s) - \delta(s') & \\ + \dim(\mathcal{O}_{S,s}) - \dim(\mathcal{O}_{S,s'}) & \\ - \dim(\mathcal{O}_{X,x}) + \dim(\mathcal{O}_{X,y}). &\end{aligned}$$

Since δ is a dimension function on the scheme S the difference $\delta(s) - \delta(s')$ is equal to $\text{codim}(\overline{\{s'\}}, \overline{\{s\}})$ by Topology, Lemma 5.16.2. As S is integral, catenary this is equal to $\text{codim}(\overline{\{s'\}}, S) - \text{codim}(\overline{\{s\}}, S)$ (Topology, Lemma 5.8.6). And this in turn is equal to $\dim(\mathcal{O}_{S,s'}) - \dim(\mathcal{O}_{S,s})$ by Properties, Lemma 23.11.4. Hence we conclude that

$$\delta_{X/S}(x) - \delta_{X/S}(y) = -\dim(\mathcal{O}_{X,x}) + \dim(\mathcal{O}_{X,y})$$

and hence the lemma follows from our remarks about the dimensions of these local rings above. □

Another application of the dimension formula is that the dimension does not change under ``alterations'' (to be defined later).

Lemma 24.29.3. *Let $f : X \to Y$ be a morphism of schemes. Assume that*

(1) *Y is locally Noetherian,*
(2) *X and Y are integral schemes,*
(3) *f is dominant, and*
(4) *f is locally of finite type.*

Then we have

$$\dim(X) \leq \dim(Y) + trdeg_{R(Y)} R(X).$$

If f is closed[6] *then equality holds.*

Proof. Let $f : X \to Y$ be as in the lemma. Let $\xi_0 \rightsquigarrow \xi_1 \rightsquigarrow \ldots \rightsquigarrow \xi_e$ be a sequence of specializations in X. We may assume that $x = \xi_e$ is a closed point of X, see Properties, Lemma 23.5.8. In particular, setting $y = f(x)$, we see x is a closed point of its fibre X_y. By the Hilbert Nullstellensatz we see that $\kappa(x)$ is a finite extension of $\kappa(y)$, see Lemma 24.19.3. By the dimension formula, Lemma 24.29.1, we see that

$$\dim(\mathcal{O}_{X,x}) \leq \dim(\mathcal{O}_{Y,y}) + \text{trdeg}_{R(Y)} R(X)$$

Hence we conclude that $e \leq \dim(Y) + \text{trdeg}_{R(Y)} R(X)$ as desired.

Next, assume f is also closed. Say $\overline{\xi}_0 \rightsquigarrow \overline{\xi}_1 \rightsquigarrow \ldots \rightsquigarrow \overline{\xi}_d$ is a sequence of specializations in Y. We want to show that $\dim(X) \geq d + r$. We may assume that $\overline{\xi}_0 = \eta$ is the generic point of Y. The generic fibre X_η is a scheme locally of finite type over $\kappa(\eta) = R(Y)$. It is

[6] For example if f is proper, see Definition 24.40.1.

nonempty as f is dominant. Hence by Lemma 24.15.10 it is a Jacobson scheme. Thus by Lemma 24.15.8 we can find a closed point $\xi_0 \in X_\eta$ and the extension $\kappa(\eta) \subset \kappa(\xi_0)$ is a finite extension. Note that $\mathcal{O}_{X,\xi_0} = \mathcal{O}_{X_\eta,\xi_0}$ because η is the generic point of Y. Hence we see that $\dim(\mathcal{O}_{X,\xi_0}) = r$ by Lemma 24.29.1 applied to the scheme X_η over the universally catenary scheme $Spec(\kappa(\eta))$ (see Lemma 24.16.4) and the point ξ_0. This means that we can find $\xi_{-r} \rightsquigarrow \ldots \rightsquigarrow \xi_{-1} \rightsquigarrow \xi_0$ in X. On the other hand, as f is closed specializations lift along f, see Topology, Lemma 5.14.6. Thus, as ξ_0 lies over $\eta = \overline{\xi}_0$ we can find specializations $\xi_0 \rightsquigarrow \xi_1 \rightsquigarrow \ldots \rightsquigarrow \xi_d$ lying over $\overline{\xi}_0 \rightsquigarrow \overline{\xi}_1 \rightsquigarrow \ldots \rightsquigarrow \overline{\xi}_d$. In other words we have

$$\xi_{-r} \rightsquigarrow \ldots \rightsquigarrow \xi_{-1} \rightsquigarrow \xi_0 \rightsquigarrow \xi_1 \rightsquigarrow \ldots \rightsquigarrow \xi_d$$

which means that $\dim(X) \geq d + r$ as desired. □

24.30. Syntomic morphisms

An algebra A over a field k is called a *global complete intersection over* k if $A \cong k[x_1, \ldots, x_n]/(f_1, \ldots, f_c)$ and $\dim(A) = n - c$. An algebra A over a field k is called a *local complete intersection* if $Spec(A)$ can be covered by standard opens each of which are global complete intersections over k. See Algebra, Section 7.124. Recall that a ring map $R \to A$ is *syntomic* if it is of finite presentation, flat with local complete intersection rings as fibres, see Algebra, Definition 7.125.1.

Definition 24.30.1. Let $f : X \to S$ be a morphism of schemes.

(1) We say that f is *syntomic at* $x \in X$ if there exists a affine open neighbourhood $Spec(A) = U \subset X$ of x and and affine open $Spec(R) = V \subset S$ with $f(U) \subset V$ such that the induced ring map $R \to A$ is syntomic.
(2) We say that f is *syntomic* if it is syntomic at every point of X.
(3) If $S = Spec(k)$ and f is syntomic, then we say that X is a *local complete intersection over* k.
(4) A morphism of affine schemes $f : X \to S$ is called *standard syntomic* if there exists a global relative complete intersection $R \to R[x_1, \ldots, x_n]/(f_1, \ldots, f_c)$ (see Algebra, Definition 7.125.5) such that $X \to S$ is isomorphic to

$$Spec(R[x_1, \ldots, x_n]/(f_1, \ldots, f_c)) \to Spec(R).$$

In the literature a syntomic morphism is sometimes referred to as a *flat local complete intersection morphism*. It turns out this is a convenient class of morphisms. For example one can define a syntomic topology using these, which is finer than the smooth and étale topologies, but has many of the same formal properties.

A global relative complete intersection (which we used to define standard syntomic ring maps) is in particular flat. In More on Morphisms, Section 33.38 we will consider morphisms $X \to S$ which locally are of the form

$$Spec(R[x_1, \ldots, x_n]/(f_1, \ldots, f_c)) \to Spec(R).$$

for some Koszul-regular sequence $f_1, \ldots, f_r$ in $R[x_1, \ldots, x_n]$. Such a morphism will be called a *local complete intersection morphism*. One we have this definition in place it will be the case that a morphism is syntomic if and only if it is a flat, local complete intersection morphism.

Note that there is no separation or quasi-compactness hypotheses in the definition of a syntomic morphism. Hence the question of being syntomic is local in nature on the source. Here is the precise result.

Lemma 24.30.2. *Let $f : X \to S$ be a morphism of schemes. The following are equivalent*

(1) *The morphism f is syntomic.*
(2) *For every affine opens $U \subset X$, $V \subset S$ with $f(U) \subset V$ the ring map $\mathcal{O}_S(V) \to \mathcal{O}_X(U)$ is syntomic.*
(3) *There exists an open covering $S = \bigcup_{j \in J} V_j$ and open coverings $f^{-1}(V_j) = \bigcup_{i \in I_j} U_i$ such that each of the morphisms $U_i \to V_j$, $j \in J, i \in I_j$ is syntomic.*
(4) *There exists an affine open covering $S = \bigcup_{j \in J} V_j$ and affine open coverings $f^{-1}(V_j) = \bigcup_{i \in I_j} U_i$ such that the ring map $\mathcal{O}_S(V_j) \to \mathcal{O}_X(U_i)$ is syntomic, for all $j \in J, i \in I_j$.*

Moreover, if f is syntomic then for any open subschemes $U \subset X$, $V \subset S$ with $f(U) \subset V$ the restriction $f|_U : U \to V$ is syntomic.

Proof. This follows from Lemma 24.13.3 if we show that the property "$R \to A$ is syntomic" is local. We check conditions (a), (b) and (c) of Definition 24.13.1. By Algebra, Lemma 7.125.3 being syntomic is stable under base change and hence we conclude (a) holds. By Algebra, Lemma 7.125.18 being syntomic is stable under composition and trivially for any ring R the ring map $R \to R_f$ is syntomic. We conclude (b) holds. Finally, property (c) is true according to Algebra, Lemma 7.125.4. □

Lemma 24.30.3. *The composition of two morphisms which are syntomic is syntomic.*

Proof. In the proof of Lemma 24.30.2 we saw that being syntomic is a local property of ring maps. Hence the first statement of the lemma follows from Lemma 24.13.5 combined with the fact that being syntomic is a property of ring maps that is stable under composition, see Algebra, Lemma 7.125.18. □

Lemma 24.30.4. *The base change of a morphism which is syntomic is syntomic.*

Proof. In the proof of Lemma 24.30.2 we saw that being syntomic is a local property of ring maps. Hence the lemma follows from Lemma 24.13.5 combined with the fact that being syntomic is a property of ring maps that is stable under base change, see Algebra, Lemma 7.125.3. □

Lemma 24.30.5. *Any open immersion is syntomic.*

Proof. This is true because an open immersion is a local isomorphism. □

Lemma 24.30.6. *A syntomic morphism is locally of finite presentation.*

Proof. True because a syntomic ring map is of finite presentation by definition. □

Lemma 24.30.7. *A syntomic morphism is flat.*

Proof. True because a syntomic ring map is flat by definition. □

Lemma 24.30.8. *A syntomic morphism is universally open.*

Proof. Combine Lemmas 24.30.6, 24.30.7, and 24.24.9. □

Let k be a field. Let A be a local k-algebra essentially of finite type over k. Recall that A is called a *complete intersection over k* if we can write $A \cong R/(f_1, \ldots, f_c)$ where R is a regular local ring essentially of finite type over k, and $f_1, \ldots, f_c$ is a regular sequence in R, see Algebra, Definition 7.124.5.

Lemma 24.30.9. *Let k be a field. Let X be a scheme locally of finite type over k. The following are equivalent:*

1. *X is a local complete intersection over k,*
2. *for every $x \in X$ there exists an affine open $U = Spec(R) \subset X$ neighbourhood of x such that $R \cong k[x_1, \ldots, x_n]/(f_1, \ldots, f_c)$ is a global complete intersection over k, and*
3. *for every $x \in X$ the local ring $\mathcal{O}_{X,x}$ is a complete intersection over k.*

Proof. The corresponding algebra results can be found in Algebra, Lemmas 7.124.8 and 7.124.9. □

The following lemma says locally any syntomic morphism is standard syntomic. Hence we can use standard syntomic morphisms as a *local model* for a syntomic morphism. Moreover, it says that a flat morphism of finite presentation is syntomic if and only if the fibres are local complete intersection schemes.

Lemma 24.30.10. *Let $f : X \to S$ be a morphism of schemes. Assume f locally of finite presentation. Let $x \in X$ be a point. Set $s = f(x)$. The following are equivalent*

1. *The morphism f is syntomic at x.*
2. *There exist affine opens $U \subset X$, and $V \subset S$ such that $x \in U$, $f(U) \subset V$ and the induced morphism $f|_U : U \to V$ is standard syntomic.*
3. *The local ring map $\mathcal{O}_{S,s} \to \mathcal{O}_{X,x}$ is flat and $\mathcal{O}_{X,x}/\mathfrak{m}_s\mathcal{O}_{X,x}$ is a complete intersection over $\kappa(s)$ (see Algebra, Definition 7.124.5).*

Proof. Follows from the definitions and Algebra, Lemma 7.125.16. □

Lemma 24.30.11. *Let $f : X \to S$ be a morphism of schemes. If f is flat, locally of finite presentation, and all fibres X_s are local complete intersections, then f is syntomic.*

Proof. Clear from Lemmas 24.30.9 and 24.30.10 and the isomorphisms of local rings $\mathcal{O}_{X,x}/\mathfrak{m}_s\mathcal{O}_{X,x} \cong \mathcal{O}_{X_s,x}$. □

Lemma 24.30.12. *Let $f : X \to S$ be a morphism of schemes. Assume f locally of finite type. Formation of the set*

$$T = \{x \in X \mid \mathcal{O}_{X_{f(x)},x} \text{ is a complete intersection over } \kappa(f(x))\}$$

commutes with arbitrary base change: For any morphism $g : S' \to S$, consider the base change $f' : X' \to S'$ of f and the projection $g' : X' \to X$. Then the corresponding set T' for the morphism f' is equal to $T' = (g')^{-1}(T)$. In particular, if f is assumed flat, and locally of finite presentation then the same holds for the open set of points where f is syntomic.

Proof. Let $s' \in S'$ be a point, and let $s = g(s')$. Then we have

$$X'_{s'} = Spec(\kappa(s')) \times_{Spec(\kappa(s))} X_s$$

In other words the fibres of the base change are the base changes of the fibres. Hence the first part is equivalent to Algebra, Lemma 7.124.10. The second part follows from the first because in that case T is the set of points where f is syntomic according to Lemma 24.30.10. □

Lemma 24.30.13. *Let R be a ring. Let $R \to A = R[x_1, \ldots, x_n]/(f_1, \ldots, f_c)$ be a relative global complete intersection. Set $S = Spec(R)$ and $X = Spec(A)$. Consider the morphism $f : X \to S$ associated to the ring map $R \to A$. The function $x \mapsto \dim_x(X_{f(x)})$ is constant with value $n - c$.*

Proof. By Algebra, Definition 7.125.5 $R \to A$ being a relative global complete intersection means all nonzero fibre rings have dimension $n - c$. Thus for a prime $\mathfrak{p}$ of R the fibre ring $\kappa(\mathfrak{p})[x_1, \ldots, x_n]/(\overline{f}_1, \ldots, \overline{f}_c)$ is either zero or a global complete intersection ring of dimension $n - c$. By the discussion following Algebra, Definition 7.124.1 this implies it is equidimensional of dimension $n - c$. Whence the lemma. $\square$

Lemma 24.30.14. *Let $f : X \to S$ be a syntomic morphism. The function $x \mapsto \dim_x(X_{f(x)})$ is locally constant on X.*

Proof. By Lemma 24.30.10 the morphism f locally looks like a standard syntomic morphism of affines. Hence the result follows from Lemma 24.30.13. $\square$

Lemma 24.30.14 says that the following definition makes sense.

Definition 24.30.15. Let $d \geq 0$ be an integer. We say a morphism of schemes $f : X \to S$ is *syntomic of relative dimension d* if f is syntomic and the function $\dim_x(X_{f(x)}) = d$ for all $x \in X$.

In other words, f is syntomic and the nonempty fibres are equidimensional of dimension d.

Lemma 24.30.16. *Let*

$$\begin{tikzcd} X \arrow[rr, "f"] \arrow[dr, "p"'] & & Y \arrow[dl, "q"] \\ & S & \end{tikzcd}$$

be a commutative diagram of morphisms of schemes. Assume that

(1) *f is surjective and syntomic,*
(2) *p is syntomic, and*
(3) *q is locally of finite presentation*[7].

Then q is syntomic.

Proof. By Lemma 24.24.11 we see that q is flat. Hence it suffices to show that the fibres of $Y \to S$ are local complete intersections, see Lemma 24.30.11. Let $s \in S$. Consider the morphism $X_s \to Y_s$. This is a base change of the morphism $X \to Y$ and hence surjective, and syntomic (Lemma 24.30.4). For the same reason X_s is syntomic over $\kappa(s)$. Moreover, Y_s is locally of finite type over $\kappa(s)$ (Lemma 24.14.4). In this way we reduce to the case where S is the spectrum of a field.

Assume $S = Spec(k)$. Let $y \in Y$. Choose an affine open $Spec(A) \subset Y$ neighbourhood of y. Let $Spec(B) \subset X$ be an affine open such that $f(Spec(B)) \subset Spec(A)$, containing a point $x \in X$ such that $f(x) = y$. Choose a surjection $k[x_1, \ldots, x_n] \to A$ with kernel I. Choose a surjection $A[y_1, \ldots, y_m] \to B$, which gives rise in turn to a surjection $k[x_i, y_j] \to B$ with kernel J. Let $\mathfrak{q} \subset k[x_i, y_j]$ be the prime corresponding to $y \in Spec(B)$ and let $\mathfrak{p} \subset k[x_i]$ the prime corresponding to $x \in Spec(A)$. Since x maps to y we have $\mathfrak{p} = \mathfrak{q} \cap k[x_i]$. Consider the following commutative diagram of local rings:

$$\begin{tikzcd} \mathcal{O}_{X,x} \arrow[r, equal] & B_{\mathfrak{q}} & k[x_1, \ldots, x_n, y_1, \ldots, y_m]_{\mathfrak{q}} \arrow[l] \\ \mathcal{O}_{Y,y} \arrow[r, equal] \arrow[u] & A_{\mathfrak{p}} \arrow[u] & k[x_1, \ldots, x_n]_{\mathfrak{p}} \arrow[l] \arrow[u] \end{tikzcd}$$

[7] In fact this is implied by (1) and (2), see Descent, Lemma 31.10.3. See also Descent, Remark 31.10.7 for further discussion.

We claim that the hypotheses of Algebra, Lemma 7.124.12 are satisfied. Conditions (1) and (2) are trivial. Condition (4) follows as $X \to Y$ is flat. Condition (3) follows as the rings $\mathcal{O}_{Y,y}$ and $\mathcal{O}_{X_y,x} = \mathcal{O}_{X,x}/\mathfrak{m}_y\mathcal{O}_{X,x}$ are complete intersection rings by our assumptions that f and p are syntomic, see Lemma 24.30.10. The output of Algebra, Lemma 7.124.12 is exactly that $\mathcal{O}_{Y,y}$ is a complete intersection ring! Hence by Lemma 24.30.10 again we see that Y is syntomic over k at y as desired. □

24.31. Conormal sheaf of an immersion

Let $i : Z \to X$ be a closed immersion. Let $\mathcal{I} \subset \mathcal{O}_X$ be the corresponding quasi-coherent sheaf of ideals. Consider the short exact sequence

$$0 \to \mathcal{I}^2 \to \mathcal{I} \to \mathcal{I}/\mathcal{I}^2 \to 0$$

of quasi-coherent sheaves on X. Since the sheaf $\mathcal{I}/\mathcal{I}^2$ is annihilated by $\mathcal{I}$ it corresponds to a sheaf on Z by Lemma 24.3.1. This quasi-coherent $\mathcal{O}_Z$-module is called the *conormal sheaf of Z in X* and is often simply denoted $\mathcal{I}/\mathcal{I}^2$ by the abuse of notation mentioned in Section 24.3.

In case $i : Z \to X$ is a (locally closed) immersion we define the conormal sheaf of i as the conormal sheaf of the closed immersion $i : Z \to X \setminus \partial Z$, where $\partial Z = \overline{Z} \setminus Z$. It is often denoted $\mathcal{I}/\mathcal{I}^2$ where $\mathcal{I}$ is the ideal sheaf of the closed immersion $i : Z \to X \setminus \partial Z$.

Definition 24.31.1. Let $i : Z \to X$ be an immersion. The *conormal sheaf $\mathcal{C}_{Z/X}$ of Z in X* or the *conormal sheaf of i* is the quasi-coherent $\mathcal{O}_Z$-module $\mathcal{I}/\mathcal{I}^2$ described above.

In [**DG67**, IV Definition 16.1.2] this sheaf is denoted $\mathcal{N}_{Z/X}$. We will not follow this convention since we would like to reserve the notation $\mathcal{N}_{Z/X}$ for the *normal sheaf of the immersion*. It is defined as

$$\mathcal{N}_{Z/X} = \mathcal{H}om_{\mathcal{O}_Z}(\mathcal{C}_{Z/X}, \mathcal{O}_Z) = \mathcal{H}om_{\mathcal{O}_Z}(\mathcal{I}/\mathcal{I}^2, \mathcal{O}_Z)$$

provided the conormal sheaf is of finite presentation (otherwise the normal sheaf may not even be quasi-coherent). We will come back to the normal sheaf later (insert future reference here).

Lemma 24.31.2. *Let $i : Z \to X$ be an immersion. The conormal sheaf of i has the following properties:*

(1) *Let $U \subset X$ be any open such that $i(Z)$ is a closed subset of U. Let $\mathcal{I} \subset \mathcal{O}_U$ be the sheaf of ideals corresponding to the closed subscheme $i(Z) \subset U$. Then*
$$\mathcal{C}_{Z/X} = i^*\mathcal{I} = i^{-1}(\mathcal{I}/\mathcal{I}^2)$$
(2) *For any affine open $Spec(R) = U \subset X$ such that $Z \cap U = Spec(R/I)$ there is a canonical isomorphism $\Gamma(Z \cap U, \mathcal{C}_{Z/X}) = I/I^2$.*

Proof. Mostly clear from the definitions. Note that given a ring R and an ideal I of R we have $I/I^2 = I \otimes_R R/I$. Details omitted. □

Lemma 24.31.3. *Let*

$$\begin{tikzcd} Z \arrow[r, "i"] \arrow[d, "f"'] & X \arrow[d, "g"] \\ Z' \arrow[r, "i'"] & X' \end{tikzcd}$$

be a commutative diagram in the category of schemes. Assume i, i' immersions. There is a canonical map of $\mathcal{O}_Z$-modules

$$f^*\mathcal{C}_{Z'/X'} \longrightarrow \mathcal{C}_{Z/X}$$

characterized by the following property: For every pair of affine opens $(Spec(R) = U \subset X, Spec(R') = U' \subset X')$ with $f(U) \subset U'$ such that $Z \cap U = Spec(R/I)$ and $Z' \cap U' = Spec(R'/I')$ the induced map

$$\Gamma(Z' \cap U', \mathcal{C}_{Z'/X'}) = I'/I'^2 \longrightarrow I/I^2 = \Gamma(Z \cap U, \mathcal{C}_{Z/X})$$

is the one induced by the ring map $f^\sharp : R' \to R$ which has the property $f^\sharp(I') \subset I$.

Proof. Let $\partial Z' = \overline{Z'} \setminus Z'$ and $\partial Z = \overline{Z} \setminus Z$. These are closed subsets of X' and of X. Replacing X' by $X' \setminus \partial Z'$ and X by $X \setminus \big(g^{-1}(\partial Z') \cup \partial Z\big)$ we see that we may assume that i and i' are closed immersions.

The fact that $g \circ i$ factors through i' implies that $g^*\mathcal{I}'$ maps into $\mathcal{I}$ under the canonical map $g^*\mathcal{I}' \to \mathcal{O}_X$, see Schemes, Lemmas 21.4.6 and 21.4.7. Hence we get an induced map of quasi-coherent sheaves $g^*(\mathcal{I}'/(\mathcal{I}')^2) \to \mathcal{I}/\mathcal{I}^2$. Pulling back by i gives $i^*g^*(\mathcal{I}'/(\mathcal{I}')^2) \to i^*(\mathcal{I}/\mathcal{I}^2)$. Note that $i^*(\mathcal{I}/\mathcal{I}^2) = \mathcal{C}_{Z/X}$. On the other hand, $i^*g^*(\mathcal{I}'/(\mathcal{I}')^2) = f^*(i')^*(\mathcal{I}'/(\mathcal{I}')^2) = f^*\mathcal{C}_{Z'/X'}$. This gives the desired map.

Checking that the map is locally described as the given map $I'/(I')^2 \to I/I^2$ is a matter of unwinding the definitions and is omitted. Another observation is that given any $x \in i(Z)$ there do exist affine open neighbourhoods U, U' with $f(U) \subset U'$ and $Z \cap U$ as well as $U' \cap Z'$ closed such that $x \in U$. Proof omitted. Hence the requirement of the lemma indeed characterizes the map (and could have been used to define it). $\square$

Lemma 24.31.4. *Let*

$$\begin{tikzcd} Z \arrow[r, "i"] \arrow[d, "f"'] & X \arrow[d, "g"] \\ Z' \arrow[r, "i'"] & X' \end{tikzcd}$$

be a fibre product diagram in the category of schemes with i, i' immersions. Then the canonical map $f^*\mathcal{C}_{Z'/X'} \to \mathcal{C}_{Z/X}$ of Lemma 24.31.3 is surjective. If g is flat, then it is an isomorphism.

Proof. Let $R' \to R$ be a ring map, and $I' \subset R'$ an ideal. Set $I = I'R$. Then $I'/(I')^2 \otimes_{R'} R \to I/I^2$ is surjective. If $R' \to R$ is flat, then $I = I' \otimes_{R'} R$ and $I^2 = (I')^2 \otimes_{R'} R$ and we see the map is an isomorphism. $\square$

Lemma 24.31.5. *Let $Z \to Y \to X$ be immersions of schemes. Then there is a canonical exact sequence*

$$i^*\mathcal{C}_{Y/X} \to \mathcal{C}_{Z/X} \to \mathcal{C}_{Z/Y} \to 0$$

where the maps come from Lemma 24.31.3 and $i : Z \to Y$ is the first morphism.

Proof. Via Lemma 24.31.3 this translates into the following algebra fact. Suppose that $C \to B \to A$ are surjective ring maps. Let $I = \mathrm{Ker}(B \to A)$, $J = \mathrm{Ker}(C \to A)$ and $K = \mathrm{Ker}(C \to B)$. Then there is an exact sequence

$$K/K^2 \otimes_B A \to J/J^2 \to I/I^2 \to 0.$$

This follows immediately from the observation that $I = J/K$. $\square$

24.32. Sheaf of differentials of a morphism

We suggest the reader take a look at the corresponding section in the chapter on commutative algebra (Algebra, Section 7.122).

Definition 24.32.1. Let $f : X \to S$ be a morphism of schemes. Let $\mathcal{F}$ be an $\mathcal{O}_X$-module. A *derivation* or more precisely an *S-derivation* into $\mathcal{F}$ is a map $D : \mathcal{O}_X \to \mathcal{F}$ which is additive, annihilates the image of $f^{-1}\mathcal{O}_S \to \mathcal{O}_X$, and satisfies the *Leibniz rule*

$$D(ab) = aD(b) + D(a)b$$

for all a, b local sections of $\mathcal{O}_X$ (wherever they are both defined). We denote

$$\mathrm{Der}_S(\mathcal{O}_X, \mathcal{F})$$

the set of S-derivations into $\mathcal{F}$.

This is the sheaf theoretic analogue of Algebra, Definition 24.32.1. Given a derivation $D : \mathcal{O}_X \to \mathcal{F}$ as in the definition the map on global sections

$$D : \Gamma(X, \mathcal{O}_X) \longrightarrow \Gamma(X, \mathcal{F})$$

clearly is a $\Gamma(S, \mathcal{O}_S)$-derivation as in the algebra definition.

Lemma 24.32.2. *Let $R \to A$ be a ring map. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_X$-modules on $X = Spec(A)$. Set $S = Spec(R)$. The rule which associates to an S-derivation on $\mathcal{F}$ its action on global sections defines a bijection between the set of S-derivations of $\mathcal{F}$ and the set of R-derivations on $M = \Gamma(X, \mathcal{F})$.*

Proof. Let $D : A \to M$ be an R-derivation. We have to show there exists a unique S-derivation on $\mathcal{F}$ which gives rise to D on global sections. Let $U = D(f) \subset X$ be a standard affine open. Any element of $\Gamma(U, \mathcal{O}_X)$ is of the form a/f^n for some $a \in A$ and $n \geq 0$. By the Leibniz rule we have

$$D(a)|_U = a/f^n D(f^n)|_U + f^n D(a/f^n)$$

in $\Gamma(U, \mathcal{F})$. Since f acts invertibly on $\Gamma(U, \mathcal{F})$ this completely determines the value of $D(a/f^n) \in \Gamma(U, \mathcal{F})$. This proves uniqueness. Existence follows by simply defining

$$D(a/f^n) := (1/f^n)D(a)|_U - a/f^{2n} D(f^n)|_U$$

and proving this has all the desired properties (on the basis of standard opens of X). Details omitted. $\square$

Here is a particular situation where derivations come up naturally.

Lemma 24.32.3. *Let $f : X \to S$ be a morphism of schemes. Consider a short exact sequence*

$$0 \to \mathcal{I} \to \mathcal{A} \to \mathcal{O}_X \to 0$$

Here $\mathcal{A}$ is a sheaf of $f^{-1}\mathcal{O}_S$-algebras, $\pi : \mathcal{A} \to \mathcal{O}_X$ is a surjection of sheaves of $f^{-1}\mathcal{O}_S$-algebras, and $\mathcal{I} = Ker(\pi)$ is its kernel. Assume $\mathcal{I}$ an ideal sheaf with square zero in $\mathcal{A}$. So $\mathcal{I}$ has a natural structure of an $\mathcal{O}_X$-module. A section $s : \mathcal{O}_X \to \mathcal{A}$ of π is a $f^{-1}\mathcal{O}_S$-algebra map such that $\pi \circ s = id$. Given any section $s : \mathcal{O}_X \to \mathcal{I}$ of π and any S-derivation $D : \mathcal{O}_X \to \mathcal{I}$ the map

$$s + D : \mathcal{O}_X \to \mathcal{A}$$

is a section of π and every section s' is of the form $s + D$ for a unique S-derivation D.

Proof. Recall that the $\mathcal{O}_X$-module structure on $\mathcal{I}$ is given by $h\tau = \tilde{h}\tau$ (multiplication in $\mathcal{A}$) where h is a local section of $\mathcal{O}_X$, and $\tilde{h}$ is a local lift of h to a local section of $\mathcal{A}$, and τ is a local section of $\mathcal{I}$. In particular, given s, we may use $\tilde{h} = s(h)$. To verify that $s + D$ is a homomorphism of sheaves of rings we compute

$$\begin{aligned}(s+D)(ab) &= s(ab) + D(ab)\\ &= s(a)s(b) + aD(b) + D(a)b\\ &= s(a)s(b) + s(a)D(b) + D(a)s(b)\\ &= (s(a)+D(a))(s(b)+D(b))\end{aligned}$$

by the Leibniz rule. In the same manner one shows $s + D$ is a $f^{-1}\mathcal{O}_S$-algebra map because D is an S-derivation. Conversely, given s' we set $D = s' - s$. Details omitted. □

Let $f : X \to S$ be a morphism of schemes. We now esthablish the existence of a couple of ``global'' sheaves and maps of sheaves, and in the next paragraph we describe the constructions over some affine opens.

Recall that $\Delta = \Delta_{X/S} : X \to X \times_S X$ is an immersion, see Schemes, Lemma 21.21.2. Let $\mathcal{J}$ be the ideal sheaf of the immersion. It lives over any open subscheme U of $X \times_S X$ such that $\Delta(X) \subset U$ is closed. For example the one from the proof of the lemma just cited; if f is separated then we can take $U = X \times_S X$. Note that the sheaf of rings $\mathcal{O}_U/\mathcal{J}^2$ is supported on $\Delta(X)$. Moreover it sits in a short exact sequence of sheaves

$$0 \to \mathcal{J}/\mathcal{J}^2 \to \mathcal{O}_U/\mathcal{J}^2 \to \Delta_*\mathcal{O}_X \to 0.$$

Using Δ^{-1} we can think of this as a surjection of sheaves of $f^{-1}\mathcal{O}_S$-algebras with kernel the conormal sheaf of Δ (see Definition 24.31.1 and Lemma 24.31.2).

$$0 \to \mathcal{C}_{X/X\times_S X} \to \Delta^{-1}(\mathcal{O}_U/\mathcal{J}^2) \to \mathcal{O}_X \to 0$$

This places us in the sitation of Lemma 24.32.3. The projection morphisms $p_i : X \times_S X \to X$, $i = 1, 2$ induce maps of sheaves of rings $p_i^\sharp : p_i^{-1}\mathcal{O}_X \to \mathcal{O}_{X\times_S X}$. We may restrict to U and divide by $\mathcal{J}^2$ to get $p_i^{-1}\mathcal{O}_X \to \mathcal{O}_U/\mathcal{J}^2$. Since $\Delta^{-1}p_i^{-1}\mathcal{O}_X = \mathcal{O}_X$ we get maps

$$s_i : \mathcal{O}_X \to \Delta^{-1}(\mathcal{O}_U/\mathcal{J}^2).$$

Both s_1 and s_2 are sections to the map $\Delta^{-1}(\mathcal{O}_U/\mathcal{J}^2) \to \mathcal{O}_X$, as in Lemma 24.32.3. Thus we get an S-derivation $\mathrm{d} = s_2 - s_1 : \mathcal{O}_X \to \mathcal{C}_{X/X\times_S X}$.

Let us work this out on a suitable affine open. We can cover X by affine opens $Spec(A) = W \subset X$ whose image is contained in an affine open $Spec(R) = V \subset S$. According to the proof of Schemes, Lemma 21.21.2 $W \times_V W \subset X \times_S X$ is an affine open contained in the open U mentioned above. Also $W \times_V W = Spec(A \otimes_R A)$. The sheaf $\mathcal{J}$ corresponds to the ideal $J = \mathrm{Ker}(A \otimes_R A \to A)$. The short exact sequence to the short exact sequence of $A \otimes_R A$-modules

$$0 \to J/J^2 \to (A \otimes_R A)/J^2 \to A \to 0$$

The sections s_i correspond to the ring maps

$$A \longrightarrow (A \otimes_R A)/J^2,\ \ s_1 : a \mapsto a \otimes 1,\ \ s_2 : a \mapsto 1 \otimes a.$$

By Lemma 24.31.2 the conormal sheaf of $\Delta_{X/S}$ restricted to $U \times_V U$ is the quasi-coherent sheaf associated to the A-module J/J^2. Comparing with Algebra, Lemma 7.122.13 (or by a direct computation) we see that the induced map $\mathrm{d} : A \to J/J^2$ is isomorphic to the universal R-derivation on A. Thus the following definition makes sense.

Definition 24.32.4. Let $f : X \to S$ be a morphism of schemes.

(1) The *sheaf of differentials* $\Omega_{X/S}$ *of* X *over* S is the conormal sheaf of the immersion $\Delta_{X/S} : X \to X \times_S X$, see Definition 24.31.1.
(2) The *universal* S*-derivation* is the S-derivation
$$\mathrm{d}_{X/S} : \mathcal{O}_X \longrightarrow \Omega_{X/S}$$
which maps a local section f of $\mathcal{O}_X$ to the class of the local section $\mathrm{d}(f) = \mathrm{d}_{X/S}(f) = s_2(f) - s_1(f)$ with s_2 and s_1 as described above.

Here is the universal property of the universal derivation. If you have any other construction of the sheaf of relative differentials which satisfies this universal property then, by the Yoneda lemma, it will be canonically isomorphic to the one defined above.

Lemma 24.32.5. *Let* $f : X \to S$ *be a morphism of schemes. The map*
$$Hom_{\mathcal{O}_X}(\Omega_{X/S}, \mathcal{F}) \longrightarrow Der_S(\mathcal{O}_X, \mathcal{F}), \quad \alpha \longmapsto \alpha \circ d_{X/S}$$
is an isomorphism of functors from the category of $\mathcal{O}_X$*-modules to the category of sets.*

Proof. Let $\mathcal{F}$ be an $\mathcal{O}_X$-module. Let $D \in \mathrm{Der}_S(\mathcal{O}_X, \mathcal{F})$. We have to show there exists a unique $\mathcal{O}_X$-linear map $\alpha : \Omega_{X/S} \to \mathcal{F}$ such that $D = \alpha \circ \mathrm{d}_{X/S}$.

We claim that the image of $\mathrm{d}_{X/S} : \mathcal{O}_X \to \Omega_{X/S}$ generates $\Omega_{X/S}$ as an $\mathcal{O}_X$-module. To see this it suffices to prove this is true on suitable affine opens. We can cover X by affine opens $Spec(A) = W \subset X$ whose image is contained in an affine open $Spec(R) = V \subset S$. As seen in the discussion leading up to Definition 24.32.4 we have
$$\Omega_{X/S}|_W = \widetilde{J/J^2}$$
with $J = \mathrm{Ker}(A \otimes_R A \to A)$. Now clearly J is generated by the elements $1 \otimes f - f \otimes 1$. Hence the claim follows. This claim implies immediately that α, if it exists, is unique.

Next, we come to existence of α. Note that the construction of the pair $(\Omega_{X/S}, \mathrm{d}_{X/S})$ commutes with restriction to open subschemes (in both X and S). Proof omitted. By the uniqueness just shown, it therefore suffices to prove existence in case both X and S are affine. Thus we may write $X = Spec(A)$, $S = Spec(S)$ and $M = \Gamma(X, \mathcal{F})$. Set as usual $J = \mathrm{Ker}(A \otimes_R A \to A)$ so that $\Omega_{X/S} = \widetilde{J/J^2}$. According to Algebra, Lemmas 7.122.3 and 7.122.13 there exists a unique A-linear map $\alpha' : J/J^2 \to M$ such that the composition $\mathrm{d} \circ \alpha' : A \to J/J^2 \to M$ is equal to the action of D on global sections over X. By Schemes, Lemma 21.7.1 the A-linear map α' corresponds to a map $\alpha : \Omega_{X/S} = \widetilde{J/J^2} \to \mathcal{F}$. Then the derivations $\alpha \circ \mathrm{d}_{X/S}$ and D have the same effect on global sections and hence agree by Lemma 24.32.2. This proves existence and we win. □

Lemma 24.32.6. *Let* $f : X \to S$ *be a morphism of schemes. Let* $U \subset X$*,* $V \subset S$ *be open subschemes such that* $f(U) \subset V$*. Then there is a unique isomorphism* $\Omega_{X/S}|_U = \Omega_{U/V}$ *of* $\mathcal{O}_U$*-modules such that* $d_{X/S}|_U = d_{U/V}$*.*

Proof. The existence of the isomorphism is clear from the construction of $\Omega_{X/S}$. Uniqueness comes from the fact, seen in the proof of Lemma 24.32.5, that the image of $\mathrm{d}_{X/S} : \mathcal{O}_X \to \Omega_{X/S}$ generates $\Omega_{X/S}$ as an $\mathcal{O}_X$-module. □

From now on we will use these canonical identifications and simply write $\Omega_{U/S}$ or $\Omega_{U/V}$ for the restriction of $\Omega_{X/S}$ to U.

Lemma 24.32.7. *Let $f : X \to S$ be a morphism of schemes. For any pair of affine opens $Spec(A) = U \subset X$, $Spec(R) = V \subset S$ with $f(U) \subset V$ there is a unique isomorphism*

$$\Gamma(U, \mathcal{O}_{X/S}) = \Omega_{A/R}.$$

compatible with $d_{X/S}$ and $d : A \to \Omega_{A/R}$.

Proof. During the construction of $\Omega_{X/S}$ we have seen that the restriction of $\Omega_{X/S}$ to U is isomorphic to the quasi-coherent sheaf associated to the A-module J/J^2 where $J = \mathrm{Ker}(A \otimes_R A \to A)$. Hence the result follows from Algebra, Lemma 7.122.13.

An alternative proof is to show that the A-module $M = \Gamma(U, \Omega_{X/S}) = \Gamma(U, \Omega_{U/V})$ together with $\mathrm{d}_{X/S} = \mathrm{d}_{U/V} : A \to M$ is a universal R-derivation of A. This follows by combining Lemmas 24.32.2 and 24.32.5 above. The universal property of $\mathrm{d} : A \to \Omega_{A/R}$ (see Algebra, Lemma 7.122.3) and the Yoneda lemma (Categories, Lemma 4.3.5) imply there is a unique isomorphism of A-modules $M \cong \Omega_{A/R}$ compatible with derivations. This gives the second proof. □

Remark 24.32.8. The lemma above gives a second way of constructing the module of differentials. Namely, let $f : X \to S$ be a morphism of schemes. Consider the collection of all affine opens $U \subset X$ which map into an affine open of S. These form a basis for the topology on X. Thus it suffices to define $\Gamma(U, \Omega_{X/S})$ for such U. We simply set $\Gamma(U, \Omega_{X/S}) = \Omega_{A/R}$ if A, R are as in Lemma 24.32.7 above. This works, but it takes somewhat more algebraic preliminaries to construct the restriction mappings and to verify the sheaf condition with this ansatz.

Lemma 24.32.9. *Let*

$$\begin{tikzcd} X' \arrow[r, "f"] \arrow[d] & X \arrow[d] \\ S' \arrow[r] & S \end{tikzcd}$$

be a commutative diagram of schemes. The canonical map $\mathcal{O}_X \to f_*\mathcal{O}_{X'}$ composed with the map $f_*d_{X'/S'} : f_*\mathcal{O}_{X'} \to f_*\Omega_{X'/S'}$ is a S-derivation. Hence we obtain a canonical map of $\mathcal{O}_X$-modules $\Omega_{X/S} \to f_*\Omega_{X'/S'}$, and by adjointness of f_* and f^* a canonical $\mathcal{O}_{X'}$-module homomorphism

$$c_f : f^*\Omega_{X/S} \longrightarrow \Omega_{X'/S'}.$$

It is uniquely characterized by the property that $f^*d_{X/S}(h)$ mapsto $d_{X'/S'}(f^*h)$ for any local section h of $\mathcal{O}_X$.

Proof. Everything but the last assertion of the lemma is proven in the lemma; the universal property of $\Omega_{X/S}$ is Lemma 24.32.5. The last assertion means that c_f is the unique $\mathcal{O}_{X'}$-linear map such that whenever $U \subset X$ is open and $h \in \mathcal{O}_X(U)$, then the pullback $f^*h \in \mathcal{O}_{X'}(f^{-1}U)$ of h satisfies $\mathrm{d}_{X'/S'}(f^*h) = c_f(f^*\mathrm{d}_{X/S}(h))$. We omit the proof. We can also use the functoriality of the conormal sheaves (see Lemma 24.31.3) to define c_f. Or we can use the characterization in the last line of the lemma to glue maps defined on affine patches (see Algebra, Equation (7.122.5.1)). □

Lemma 24.32.10. *Let*

$$\begin{tikzcd} X'' \arrow[r, "g"] \arrow[d] & X' \arrow[r, "f"] \arrow[d] & X \arrow[d] \\ S'' \arrow[r] & S' \arrow[r] & S \end{tikzcd}$$

be a commutative diagram of schemes. Then we have

$$c_{f\circ g} = c_g \circ g^* c_f$$

as maps $(f \circ g)^*\Omega_{X/S} \to \Omega_{X''/S''}$.

Proof. Omitted. One way to see this is to restrict to affine opens. □

Lemma 24.32.11. *Let* $f : X \to Y$, $g : Y \to S$ *be morphisms of schemes. Then there is a canonical exact sequence*

$$f^*\Omega_{Y/S} \to \Omega_{X/S} \to \Omega_{X/Y} \to 0$$

where the maps come from applications of Lemma 24.32.9.

Proof. This is the sheafified version of Algebra, Lemma 7.122.7. □

Lemma 24.32.12. *Let* $X \to S$ *be a morphism of schemes. Let* $g : S' \to S$ *be a morphism of schemes. Let* $X' = X_{S'}$ *be the base change of* X*. Denote* $g' : X' \to X$ *the projection. Then the map*

$$(g')^*\Omega_{X/S} \to \Omega_{X'/S'}$$

of Lemma 24.32.9 is an isomorphism.

Proof. This is the sheafified version of Algebra, Lemma 7.122.12. □

Lemma 24.32.13. *Let* $f : X \to S$ *and* $g : Y \to S$ *be morphisms of schemes with the same target. Let* $p : X \times_S Y \to X$ *and* $q : X \times_S Y \to Y$ *be the projection morphisms. The maps from Lemma 24.32.9*

$$p^*\Omega_{X/S} \oplus q^*\Omega_{Y/S} \longrightarrow \Omega_{X\times_S Y/S}$$

give an isomorphism.

Proof. By Lemma 24.32.12 the composition $p^*\Omega_{X/S} \to \Omega_{X\times_S Y/S} \to \Omega_{X\times_S Y/Y}$ is an isomorphism, and similarly for q. Moreover, the cokernel of $p^*\Omega_{X/S} \to \Omega_{X\times_S Y/S}$ is $\Omega_{X\times_S Y/X}$ by Lemma 24.32.11. The result follows. □

Lemma 24.32.14. *Let* $f : X \to S$ *be a morphism of schemes. If* f *is locally of finite type, then* $\Omega_{X/S}$ *is a finite type* $\mathcal{O}_X$*-module.*

Proof. Immediate from Algebra, Lemma 7.122.16, Lemma 24.32.7, Lemma 24.14.2, and Properties, Lemma 23.16.1. □

Lemma 24.32.15. *Let* $f : X \to S$ *be a morphism of schemes. If* f *is locally of finite type, then* $\Omega_{X/S}$ *is an* $\mathcal{O}_X$*-module of finite presentation.*

Proof. Immediate from Algebra, Lemma 7.122.15, Lemma 24.32.7, Lemma 24.20.2, and Properties, Lemma 23.16.2. □

Lemma 24.32.16. *If* $X \to S$ *is an immersion, or more generally a monomorphism, then* $\Omega_{X/S}$ *is zero.*

Proof. This is true because $\Delta_{X/S}$ is an isomorphism in this case and hence has trivial conormal sheaf. The algebraic version is Algebra, Lemma 7.122.5. □

Lemma 24.32.17. *Let* $i : Z \to X$ *be an immersion of schemes over* S*. There is a canonical exact sequence*

$$\mathcal{C}_{Z/X} \to i^*\Omega_{X/S} \to \Omega_{Z/S} \to 0$$

where the first arrow is induced by $\mathrm{d}_{X/S}$ *and the second arrow comes from Lemma 24.32.9.*

Proof. This is the sheafified version of Algebra, Lemma 7.122.9. However we should make sure we can define the first arrow globally. Hence we explain the meaning of ``induced by $\text{d}_{X/S}$'' here. Namely, we may assume that i is a closed immersion by shrinking X. Let $\mathcal{I} \subset \mathcal{O}_X$ be the sheaf of ideals corresponding to $Z \subset X$. Then $\text{d}_{X/S} : \mathcal{I} \to \Omega_{X/S}$ maps the subsheaf $\mathcal{I}^2 \subset \mathcal{I}$ to $\mathcal{I}\Omega_{X/S}$. Hence it induces a map $\mathcal{I}/\mathcal{I}^2 \to \Omega_{X/S}/\mathcal{I}\Omega_{X/S}$ which is $\mathcal{O}_X/\mathcal{I}$-linear. By Lemma 24.3.1 this corresponds to a map $\mathcal{C}_{Z/X} \to i^*\Omega_{X/S}$ as desired. $\square$

Lemma 24.32.18. *Let $i : Z \to X$ be an immersion of schemes over S, and assume i (locally) has a left inverse. Then the canonical sequence*

$$0 \to \mathcal{C}_{Z/X} \to i^*\Omega_{X/S} \to \Omega_{Z/S} \to 0$$

of Lemma 24.32.17 is (locally) split exact. In particular, if $s : S \to X$ is a section of the structure morphism $X \to S$ then the map $\mathcal{C}_{S/X} \to s^*\Omega_{X/S}$ induced by $d_{X/S}$ is an isomorphism.

Proof. Follows from Algebra, Lemma 7.122.10. Clarification: if $g : X \to Z$ is a left inverse of i, then i^*c_g is a right inverse of the map $i^*\Omega_{X/S} \to \Omega_{Z/S}$. Also, if s is a section, then it is an immersion $s : Z = S \to X$ over S (see Schemes, Lemma 21.21.12) and in that case $\Omega_{Z/S} = 0$. $\square$

Remark 24.32.19. Let $X \to S$ be a morphism of schemes. According to Lemma 24.32.13 we have

$$\Omega_{X \times_S X/S} = \text{pr}_1^*\Omega_{X/S} \oplus \text{pr}_2^*\Omega_{X/S}$$

On the other hand, the diagonal morphism $\Delta : X \to X \times_S X$ is an immersion, which locally has a left inverse. Hence by Lemma 24.32.18 we obtain a canonical short exact sequence

$$0 \to \mathcal{C}_{X/X \times_S X} \to \Omega_{X/S} \oplus \Omega_{X/S} \to \Omega_{X/S} \to 0$$

Note that the right arrow is $(1, 1)$ which is indeed a split surjection. On the other hand, by our very definition we have $\Omega_{X/S} = \mathcal{C}_{X/X \times_S X}$. Because we chose $\text{d}_{X/S}(f) = s_2(f) - s_1(f)$ in Definition 24.32.4 it turns out that the left arrow is the map $(-1, 1)$[8].

Lemma 24.32.20. *Let*

$$\begin{tikzcd} Z \arrow[r, "i"] \arrow[dr, "j"'] & X \arrow[d] \\ & Y \end{tikzcd}$$

be a commutative diagram of schemes where i and j are immersions. Then there is a canonical exact sequence

$$\mathcal{C}_{Z/Y} \to \mathcal{C}_{Z/X} \to i^*\Omega_{X/Y} \to 0$$

where the first arrow comes from Lemma 24.31.3 and the second from Lemma 24.32.17.

Proof. The algebraic version of this is Algebra, Lemma 7.123.5. $\square$

[8]Namely, the local section $\text{d}_{X/S}(f) = 1 \otimes f - f \otimes 1$ of the ideal sheaf of Δ maps via $\text{d}_{X \times_S X/X}$ to the local section $1 \otimes 1 \otimes 1 \otimes f - 1 \otimes f \otimes 1 \otimes 1 - 1 \otimes 1 \otimes f \otimes 1 + f \otimes 1 \otimes 1 \otimes 1 = \text{pr}_2^*\text{d}_{X/S}(f) - \text{pr}_1^*\text{d}_{X/S}(f)$.

24.33. Smooth morphisms

Let $f : X \to Y$ be a map of topological spaces. Consider the following condition:

(*) For every $x \in X$ there exist open neighbourhoods $x \in U \subset X$ and $f(x) \in V \subset Y$, and an integer d such that $f(U) = V$ and such that there is an isomorphism

$$\begin{tikzcd} V \times B_d(0,1) \arrow[r, "\cong"] \arrow[d] & U \arrow[r] \arrow[d] & X \arrow[d] \\ V \arrow[r, equal] & V \arrow[r] & Y \end{tikzcd}$$

where $B_d(0,1) \subset \mathbf{R}^d$ is a ball of radius 1 around 0.

Smooth morphisms are the analogue of such morphisms in the category of schemes. See Lemma 24.33.11 and Lemma 24.35.20.

Contrary to expectations (perhaps) the notion of a smooth ring map is not defined solely in terms of the module of differentials. Namely, recall that $R \to A$ is a *smooth ring map* if A is of finite presentation over R and if the naive cotangent complex of A over R is quasi-isomorphic to a projective module placed in degree 0, see Algebra, Definition 7.126.1.

Definition 24.33.1. Let $f : X \to S$ be a morphism of schemes.

(1) We say that f is *smooth at* $x \in X$ if there exists a affine open neighbourhood $Spec(A) = U \subset X$ of x and and affine open $Spec(R) = V \subset S$ with $f(U) \subset V$ such that the induced ring map $R \to A$ is smooth.
(2) We say that f is *smooth* if it is smooth at every point of X.
(3) A morphism of affine schemes $f : X \to S$ is called *standard smooth* there exists a standard smooth ring map $R \to R[x_1, \ldots, x_n]/(f_1, \ldots, f_c)$ (see Algebra, Definition 7.126.6) such that $X \to S$ is isomorphic to

$$Spec(R[x_1, \ldots, x_n]/(f_1, \ldots, f_c)) \to Spec(R).$$

A pleasing feature of this definition is that the set of points where a morphism is smooth is automatically open.

Note that there is no separation or quasi-compactness hypotheses in the definition. Hence the question of being smooth is local in nature on the source. Here is the precise result.

Lemma 24.33.2. *Let $f : X \to S$ be a morphism of schemes. The following are equivalent*

(1) *The morphism f is smooth.*
(2) *For every affine opens $U \subset X$, $V \subset S$ with $f(U) \subset V$ the ring map $\mathcal{O}_S(V) \to \mathcal{O}_X(U)$ is smooth.*
(3) *There exists an open covering $S = \bigcup_{j \in J} V_j$ and open coverings $f^{-1}(V_j) = \bigcup_{i \in I_j} U_i$ such that each of the morphisms $U_i \to V_j$, $j \in J, i \in I_j$ is smooth.*
(4) *There exists an affine open covering $S = \bigcup_{j \in J} V_j$ and affine open coverings $f^{-1}(V_j) = \bigcup_{i \in I_j} U_i$ such that the ring map $\mathcal{O}_S(V_j) \to \mathcal{O}_X(U_i)$ is smooth, for all $j \in J, i \in I_j$.*

Moreover, if f is smooth then for any open subschemes $U \subset X$, $V \subset S$ with $f(U) \subset V$ the restriction $f|_U : U \to V$ is smooth.

Proof. This follows from Lemma 24.13.3 if we show that the property "$R \to A$ is smooth" is local. We check conditions (a), (b) and (c) of Definition 24.13.1. By Algebra, Lemma 7.126.4 being smooth is stable under base change and hence we conclude (a) holds. By

Algebra, Lemma 7.126.14 being smooth is stable under composition and for any ring R the ring map $R \to R_f$ is (standard) smooth. We conclude (b) holds. Finally, property (c) is true according to Algebra, Lemma 7.126.13. $\square$

The following lemma characterizes a smooth morphism as a flat, finitely presented morphism with smooth fibres. Note that schemes smooth over a field are discussed in more detail in Varieties, Section 28.15.

Lemma 24.33.3. *Let $f : X \to S$ be a morphism of schemes. If f is flat, locally of finite presentation, and all fibres X_s are smooth, then f is smooth.*

Proof. Follows from Algebra, Lemma 7.126.16. $\square$

Lemma 24.33.4. *The composition of two morphisms which are smooth is smooth.*

Proof. In the proof of Lemma 24.33.2 we saw that being smooth is a local property of ring maps. Hence the first statement of the lemma follows from Lemma 24.13.5 combined with the fact that being smooth is a property of ring maps that is stable under composition, see Algebra, Lemma 7.126.14. $\square$

Lemma 24.33.5. *The base change of a morphism which is smooth is smooth.*

Proof. In the proof of Lemma 24.33.2 we saw that being smooth is a local property of ring maps. Hence the lemma follows from Lemma 24.13.5 combined with the fact that being smooth is a property of ring maps that is stable under base change, see Algebra, Lemma 7.126.4. $\square$

Lemma 24.33.6. *Any open immersion is smooth.*

Proof. This is true because an open immersion is a local isomorphism. $\square$

Lemma 24.33.7. *A smooth morphism is syntomic.*

Proof. See Algebra, Lemma 7.126.10. $\square$

Lemma 24.33.8. *A smooth morphism is locally of finite presentation.*

Proof. True because a smooth ring map is of finite presentation by definition. $\square$

Lemma 24.33.9. *A smooth morphism is flat.*

Proof. Combine Lemmas 24.30.7 and 24.33.7. $\square$

Lemma 24.33.10. *A smooth morphism is universally open.*

Proof. Combine Lemmas 24.33.9, 24.33.8, and 24.24.9. Or alternatively, combine Lemmas 24.33.7, 24.30.8. $\square$

The following lemma says locally any smooth morphism is standard smooth. Hence we can use standard smooth morphisms as a *local model* for a smooth morphism.

Lemma 24.33.11. *Let $f : X \to S$ be a morphism of schemes. Let $x \in X$ be a point. Set $s = f(x)$. The following are equivalent*

(1) *The morphism f is smooth at x.*
(2) *There exist affine opens $U \subset X$, and $V \subset S$ such that $x \in U$, $f(U) \subset V$ and the induced morphism $f|_U : U \to V$ is standard smooth.*

Proof. Follows from the definitions and Algebra, Lemmas 7.126.7 and 7.126.10. $\square$

Lemma 24.33.12. *Let $f : X \to S$ be a morphism of schemes. Assume f is smooth. Then the module of differentials $\Omega_{X/S}$ of X over S is finite locally free and*

$$rank_x(\Omega_{X/S}) = \dim_x(X_{f(x)})$$

for every $x \in X$.

Proof. The statement is local on X and S. By Lemma 24.33.11 above we may assume that f is a standard smooth morphism of affines. In this case the result follows from Algebra, Lemma 7.126.7 (and the definition of a relative global complete intersection, see Algebra, Definition 7.125.5). □

Lemma 24.33.12 says that the following definition makes sense.

Definition 24.33.13. Let $d \geq 0$ be an integer. We say a morphism of schemes $f : X \to S$ is *smooth of relative dimension d* if f is smooth and $\Omega_{X/S}$ is finite locally free of constant rank d.

In other words, f is smooth and the nonempty fibres are equidimensional of dimension d. By Lemma 24.33.14 below this is also the same as requiring: (a) f is locally of finite presentation, (b) f is flat, (c) all nonempty fibres equidimensional of dimension d, and (d) $\Omega_{X/S}$ finite locally free of rank d. It is not enough to simply assume that f is flat, of finite presentation, and $\Omega_{X/S}$ is finite locally free of rank d. A counter example is given by $Spec(\mathbf{F}_p[t]) \to Spec(\mathbf{F}_p[t^p])$.

Here is a differential criterion of smoothness at a point. There are many variants of this result all of which may be useful at some point. We will just add them here as needed.

Lemma 24.33.14. *Let $f : X \to S$ be a morphism of schemes. Let $x \in X$. Set $s = f(x)$. Assume f is locally of finite presentation. The following are equivalent:*

(1) *The morphism f is smooth at x.*
(2) *The local ring map $\mathcal{O}_{S,s} \to \mathcal{O}_{X,x}$ is flat and the $\mathcal{O}_{X,x}$-module $\Omega_{X/S,x}$ can be generated by at most $\dim_x(X_{f(x)})$ elements.*
(3) *The local ring map $\mathcal{O}_{S,s} \to \mathcal{O}_{X,x}$ is flat and the $\kappa(x)$-vector space*
$$\Omega_{X_s/s,x} \otimes_{\mathcal{O}_{X_s,x}} \kappa(x) = \Omega_{X/S,x} \otimes_{\mathcal{O}_{X,x}} \kappa(x)$$
can be generated by at most $\dim_x(X_{f(x)})$ elements.
(4) *There exist affine opens $U \subset X$, and $V \subset S$ such that $x \in U$, $f(U) \subset V$ and the induced morphism $f|_U : U \to V$ is standard smooth.*
(5) *There exist affine opens $Spec(A) = U \subset X$ and $Spec(R) = V \subset S$ with $x \in U$ corresponding to $\mathfrak{q} \subset A$, and $f(U) \subset V$ such that there exists a presentation*
$$A = R[x_1, \ldots, x_n]/(f_1, \ldots, f_c)$$
with
$$g = \det \begin{pmatrix} \partial f_1/\partial x_1 & \partial f_2/\partial x_1 & \ldots & \partial f_c/\partial x_1 \\ \partial f_1/\partial x_2 & \partial f_2/\partial x_2 & \ldots & \partial f_c/\partial x_2 \\ \ldots & \ldots & \ldots & \ldots \\ \partial f_1/\partial x_c & \partial f_2/\partial x_c & \ldots & \partial f_c/\partial x_c \end{pmatrix}$$
mapping to an element of A not in $\mathfrak{q}$.

Proof. Note that if f is smooth at x, then we see from Lemma 24.33.11 that (4) holds, and (5) is a slightly weakened version of (4). Moreover, this implies that the ring map $\mathcal{O}_{S,s} \to \mathcal{O}_{X,x}$ is flat (see Lemma 24.33.9) and that $\Omega_{X/S}$ is finite locally free of rank equal to $\dim_x(X_s)$ (see Lemma 24.33.12). This implies (2) and (3).

By Lemma 24.32.12 the module of differentials $\Omega_{X_s/s}$ of the fibre X_s over $\kappa(s)$ is the pullback of the module of differentials $\Omega_{X/S}$ of X over S. Hence the displayed equality in part (3) of the lemma. By Lemma 24.32.14 these modules are of finite type. Hence the mimimal number of generators of the modules $\Omega_{X/S,x}$ and $\Omega_{X_s/s,x}$ is the same and equal to the dimension of this $\kappa(x)$-vector space by Nakayama's Lemma (Algebra, Lemma 7.14.5). This in particular shows that (2) and (3) are equivalent.

Combining Algebra, Lemmas 7.126.16 and 7.129.3 shows that (2) and (3) imply (1). Finally, (5) implies (4) see for example Algebra, Example 7.126.8. □

Lemma 24.33.15. *Let $f : X \to S$ be a morphism of schemes. Assume f locally of finite type. Formation of the set*

$$T = \{x \in X \mid X_{f(x)} \text{ is smooth over } \kappa(f(x)) \text{ at } x\}$$

commutes with arbitrary base change: For any morphism $g : S' \to S$, consider the base change $f' : X' \to S'$ of f and the projection $g' : X' \to X$. Then the corresponding set T' for the morphism f' is equal to $T' = (g')^{-1}(T)$. In particular, if f is assumed flat, and locally of finite presentation then the same holds for the open set of points where f is smooth.

Proof. Let $s' \in S'$ be a point, and let $s = g(s')$. Then we have

$$X'_{s'} = Spec(\kappa(s')) \times_{Spec(\kappa(s))} X_s$$

In other words the fibres of the base change are the base changes of the fibres. Hence the first part is equivalent to Algebra, Lemma 7.126.18. The second part follows from the first because in that case T is the (open) set of points where f is smooth according to Lemma 24.33.3. □

Here is a lemma that actually uses the vanishing of H^{-1} of the naive cotangent complex for a smooth ring map.

Lemma 24.33.16. *Let $f : X \to Y$, $g : Y \to S$ be morphisms of schemes. Assume f is smooth. Then*

$$0 \to f^*\Omega_{Y/S} \to \Omega_{X/S} \to \Omega_{X/Y} \to 0$$

(see Lemma 24.32.11) is short exact.

Proof. The algebraic version of this lemma is the following: Given ring maps $A \to B \to C$ with $B \to C$ smooth, then the sequence

$$0 \to C \otimes_B \Omega_{B/A} \to \Omega_{C/A} \to \Omega_{C/B} \to 0$$

of Algebra, Lemma 7.122.7 is exact. This is Algebra, Lemma 7.128.1. □

Lemma 24.33.17. *Let $i : Z \to X$ be an immersion of schemes over S. Assume that Z is smooth over S. Then the canonical exact sequence*

$$0 \to \mathcal{C}_{Z/X} \to i^*\Omega_{X/S} \to \Omega_{Z/S} \to 0$$

of Lemma 24.32.17 is short exact.

Proof. The algebraic version of this lemma is the following: Given ring maps $A \to B \to C$ with $A \to C$ smooth and $B \to C$ surjective with kernel J, then the sequence

$$0 \to J/J^2 \to C \otimes_B \Omega_{B/A} \to \Omega_{C/A} \to 0$$

of Algebra, Lemma 7.122.9 is exact. This is Algebra, Lemma 7.128.2. □

Lemma 24.33.18. *Let*

$$\begin{tikzcd} Z \arrow[r, "i"] \arrow[rd, "j"'] & X \arrow[d] \\ & Y \end{tikzcd}$$

be a commutative diagram of schemes where i and j are immersions and $X \to Y$ is smooth. Then the canonical exact sequence

$$0 \to \mathcal{C}_{Z/Y} \to \mathcal{C}_{Z/X} \to i^*\Omega_{X/Y} \to 0$$

of Lemma 24.32.20 is exact.

Proof. The algebraic version of this lemma is the following: Given ring maps $A \to B \to C$ with $A \to C$ surjective and $A \to B$ smooth, then the sequence

$$0 \to I/I^2 \to J/J^2 \to C \otimes_B \Omega_{B/A} \to 0$$

of Algebra, Lemma 7.123.5 is exact. This is Algebra, Lemma 7.128.3. □

Lemma 24.33.19. *Let*

$$\begin{tikzcd} X \arrow[rr, "f"] \arrow[rd, "p"'] & & Y \arrow[ld, "q"] \\ & S & \end{tikzcd}$$

be a commutative diagram of morphisms of schemes. Assume that

(1) *f is surjective, and smooth,*
(2) *p is smooth, and*
(3) *q is locally of finite presentation*[9].

Then q is smooth.

Proof. By Lemma 24.24.11 we see that q is flat. Pick a point $y \in Y$. Pick a point $x \in X$ mapping to y. Suppose f has relative dimension a at x and p has relative dimension b at x. By Lemma 24.33.12 this means that $\Omega_{X/S,x}$ is free of rank b and $\Omega_{X/Y,x}$ is free of rank a. By the short exact sequence of Lemma 24.33.16 this means that $(f^*\Omega_{Y/S})_x$ is free of rank $b - a$. By Nakayama's Lemma this implies that $\Omega_{Y/S,y}$ can be generated by $b - a$ elements. Also, by Lemma 24.27.2 we see that $\dim_y(Y_s) = b - a$. Hence we conclude that $Y \to S$ is smooth at y by Lemma 24.33.14 part (2). □

In the situation of the following lemma the image of σ is locally on X cut out by a regular sequence, see Divisors, Lemma 26.14.7.

Lemma 24.33.20. *Let $f : X \to S$ be a morphism of schemes. Let $\sigma : S \to X$ be a section of f. Let $s \in S$ be a point such that f is smooth at $x = \sigma(s)$. Then there exist affine open neighbourhoods $Spec(A) = U \subset S$ of s and $Spec(B) = V \subset X$ of x such that*

(1) *$f(V) \subset U$ and $\sigma(U) \subset V$,*
(2) *with $I = Ker(\sigma^\# : B \to A)$ the module I/I^2 is a free A-module, and*
(3) *$B^\wedge \cong A[[x_1, \ldots, x_d]]$ as A-algebras where $B^\wedge$ denotes the completion of B with respect to I.*

---

[9]In fact this is implied by (1) and (2), see Descent, Lemma 31.10.3. Moreover, it suffices to assume f is surjective, flat and locally of finite presentation, see Descent, Lemma 31.10.5.

Proof. Pick an affine open $U \subset S$ containing s Pick an affine open $V \subset f^{-1}(U)$ containing x. Pick an affine open $U' \subset \sigma^{-1}(V)$ containing s. Note that $V' = f^{-1}(U') \cap V$ is affine as it is equal to the fibre product $V' = U' \times_U V$. Then U' and V' satisfy (1). Write $U' = Spec(A')$ and $V' = Spec(B')$. By Algebra, Lemma 7.128.4 the module $I'/(I')^2$ is finite locally free as a A'-module. Hence after replacing U' by a smaller affine open $U'' \subset U'$ and V' by $V'' = V' \cap f^{-1}(U'')$ we obtain the situation where $I''/(I'')^2$ is free, i.e., (2) holds. In this case (3) holds also by Algebra, Lemma 7.128.4. □

24.34. Unramified morphisms

We briefly discuss unramified morphisms before the (perhaps) more interesting class of étale morphisms. Recall that a ring map $R \to A$ is *unramified* if it is of finite type and $\Omega_{A/R} = 0$ (this is the definition of [**Ray70**]). A ring map $R \to A$ is called *G-unramified* if it is of finite presentation and $\Omega_{A/R} = 0$ (this is the definition of [**DG67**]). See Algebra, Definition 7.138.1.

Definition 24.34.1. Let $f : X \to S$ be a morphism of schemes.

(1) We say that f is *unramified at $x \in X$* if there exists a affine open neighbourhood $Spec(A) = U \subset X$ of x and and affine open $Spec(R) = V \subset S$ with $f(U) \subset V$ such that the induced ring map $R \to A$ is unramified.
(2) We say that f is *G-unramified at $x \in X$* if there exists a affine open neighbourhood $Spec(A) = U \subset X$ of x and and affine open $Spec(R) = V \subset S$ with $f(U) \subset V$ such that the induced ring map $R \to A$ is G-unramified.
(3) We say that f is *unramified* if it is unramified at every point of X.
(4) We say that f is *G-unramified* if it is G-unramified at every point of X.

Note that a G-unramified morphism is unramified. Hence any result for unramified morphisms implies the corresponding result for G-unramified morphisms. Moreover, if S is locally Noetherian then there is no difference between G-unramified and unramified morphisms, see Lemma 24.34.6. A pleasing feature of this definition is that the set of points where a morphism is unramified (resp. G-unramified) is automatically open.

Lemma 24.34.2. *Let $f : X \to S$ be a morphism of schemes. Then*

(1) *f is unramified if and only if f is locally of finite type and $\Omega_{X/S} = 0$, and*
(2) *f is G-unramified if and only if f is locally of finite presentation and $\Omega_{X/S} = 0$.*

Proof. By definition a ring map $R \to A$ is unramified (resp. G-unramified) if and only if it is of finite type (resp. finite presentation) and $\Omega_{A/R} = 0$. Hence the lemma follows directly from the definitions and Lemma 24.32.7. □

Note that there is no separation or quasi-compactness hypotheses in the definition. Hence the question of being unramified is local in nature on the source. Here is the precise result.

Lemma 24.34.3. *Let $f : X \to S$ be a morphism of schemes. The following are equivalent*

(1) *The morphism f is unramified (resp. G-unramified).*
(2) *For every affine opens $U \subset X$, $V \subset S$ with $f(U) \subset V$ the ring map $\mathcal{O}_S(V) \to \mathcal{O}_X(U)$ is unramified (resp. G-unramified).*
(3) *There exists an open covering $S = \bigcup_{j \in J} V_j$ and open coverings $f^{-1}(V_j) = \bigcup_{i \in I_j} U_i$ such that each of the morphisms $U_i \to V_j$, $j \in J, i \in I_j$ is unramified (resp. G-unramified).*

(4) *There exists an affine open covering $S = \bigcup_{j \in J} V_j$ and affine open coverings $f^{-1}(V_j) = \bigcup_{i \in I_j} U_i$ such that the ring map $\mathcal{O}_S(V_j) \to \mathcal{O}_X(U_i)$ is unramified (resp. G-unramified), for all $j \in J, i \in I_j$.*

Moreover, if f is unramified (resp. G-unramified) then for any open subschemes $U \subset X$, $V \subset S$ with $f(U) \subset V$ the restriction $f|_U : U \to V$ is unramified (resp. G-unramified).

Proof. This follows from Lemma 24.13.3 if we show that the property "$R \to A$ is unramified" is local. We check conditions (a), (b) and (c) of Definition 24.13.1. These properties are proved in Algebra, Lemma 7.138.3. □

Lemma 24.34.4. *The composition of two morphisms which are unramified is unramified. The same holds for G-unramified morphisms.*

Proof. The proof of Lemma 24.34.3 shows that being unramified (resp. G-unramified) is a local property of ring maps. Hence the first statement of the lemma follows from Lemma 24.13.5 combined with the fact that being unramified (resp. G-unramified) is a property of ring maps that is stable under composition, see Algebra, Lemma 7.138.3. □

Lemma 24.34.5. *The base change of a morphism which is unramified is unramified. The same holds for G-unramified morphisms.*

Proof. The proof of Lemma 24.34.3 shows that being unramified (resp. G-unramified) is a local property of ring maps. Hence the lemma follows from Lemma 24.13.5 combined with the fact that being unramified (resp. G-unramified) is a property of ring maps that is stable under base change, see Algebra, Lemma 7.138.3. □

Lemma 24.34.6. *Let $f : X \to S$ be a morphism of schemes. Assume S is locally Noetherian. Then f is unramified if and only if f is G-unramified.*

Proof. Follows from the definitions and Lemma 24.20.9. □

Lemma 24.34.7. *Any open immersion is G-unramified.*

Proof. This is true because an open immersion is a local isomorphism. □

Lemma 24.34.8. *A closed immersion $i : Z \to X$ is unramified. It is G-unramified if and only if the associated quasi-coherent sheaf of ideals $\mathcal{I} = Ker(\mathcal{O}_X \to i_*\mathcal{O}_Z)$ is of finite type (as an $\mathcal{O}_X$-module).*

Proof. Follows from Lemma 24.20.7 and Algebra, Lemma 7.138.3. □

Lemma 24.34.9. *An unramified morphism is locally of finite type. A G-unramified morphism is locally of finite presentation.*

Proof. An unramified ring map is of finite type by definition. A G-unramified ring map is of finite presentation by definition. □

Lemma 24.34.10. *Let $f : X \to S$ be a morphism of schemes. If f is unramified at x then f is quasi-finite at x. In particular, an unramified morphism is locally quasi-finite.*

Proof. See Algebra, Lemma 7.138.6. □

Lemma 24.34.11. *Fibres of unramified morphisms.*

(1) *Let X be a scheme over a field k. The structure morphism $X \to Spec(k)$ is unramified if and only if X is a disjoint union of spectra of finite separable field extensions of k.*

(2) *If $f : X \to S$ is an unramified morphism then for every $s \in S$ the fibre X_s is a disjoint union of spectra of finite separable field extensions of $\kappa(s)$.*

Proof. Part (2) follows from part (1) and Lemma 24.34.5. Let us prove part (1). We first use Algebra, Lemma 7.138.7. This lemma implies that if X is a disjoint union of spectra of finite separable field extensions of k then $X \to Spec(k)$ is unramified. Conversely, suppose that $X \to Spec(k)$ is unramified. By Algebra, Lemma 7.138.5 for every $x \in X$ the residue field extension $k \subset \kappa(x)$ is finite separable. Hence all points of X are closed points (see Lemma 24.19.2 for example). Thus X is a discrete space, in particular the disjoint union of the spectra of its local rings. By Algebra, Lemma 7.138.5 again these local rings are fields, and we win. □

The following lemma characterizes an unramified morphisms as morphisms locally of finite type with unramified fibres.

Lemma 24.34.12. *Let $f : X \to S$ be a morphism of schemes.*

(1) *If f is unramified then for any $x \in X$ the field extension $\kappa(f(x)) \subset \kappa(x)$ is finite separable.*
(2) *If f is locally of finite type, and for every $s \in S$ the fibre X_s is a disjoint union of spectra of finite separable field extensions of $\kappa(s)$ then f is unramified.*
(3) *If f is locally of finite presentation, and for every $s \in S$ the fibre X_s is a disjoint union of spectra of finite separable field extensions of $\kappa(s)$ then f is G-unramified.*

Proof. Follows from Algebra, Lemmas 7.138.5 and 7.138.7. □

Here is a characterization of unramified morphisms in terms of the diagonal morphism.

Lemma 24.34.13. *Let $f : X \to S$ be a morphism.*

(1) *If f is unramified, then the diagonal morphism $\Delta : X \to X \times_S X$ is an open immersion.*
(2) *If f is locally of finite type and Δ is an open immersion, then f is unramified.*
(3) *If f is locally of finite presentation and Δ is an open immersion, then f is G-unramified.*

Proof. The first statement follows from Algebra, Lemma 7.138.4. The second statement from the fact that $\Omega_{X/S}$ (see Definition 24.32.4) is the conormal sheaf of the diagonal morphism and hence clearly zero if Δ is an open immersion. □

Lemma 24.34.14. *Let $f : X \to S$ be a morphism of schemes. Let $x \in X$. Set $s = f(x)$. Assume f is locally of finite type (resp. locally of finite presentation). The following are equivalent:*

(1) *The morphism f is unramified (resp. G-unramified) at x.*
(2) *The fibre X_s is unramified over $\kappa(s)$ at x.*
(3) *The $\mathcal{O}_{X,x}$-module $\Omega_{X/S,x}$ is zero.*
(4) *The $\mathcal{O}_{X_s,x}$-module $\Omega_{X_s/s,x}$ is zero.*
(5) *The $\kappa(x)$-vector space*

$$\Omega_{X_s/s,x} \otimes_{\mathcal{O}_{X_s,x}} \kappa(x) = \Omega_{X/S,x} \otimes_{\mathcal{O}_{X,x}} \kappa(x)$$

is zero.
(6) *We have $\mathfrak{m}_s \mathcal{O}_{X,x} = \mathfrak{m}_x$ and the field extension $\kappa(s) \subset \kappa(x)$ is finite separable.*

Proof. Note that if f is unramified at x, then we see that $\Omega_{X/S} = 0$ in a neighbourhood of x by the definitions and the results on modules of differentials in Section 24.32. Hence (1) implies (3) and the vanishing of the right hand vector space in (5). It also implies (2) because by Lemma 24.32.12 the module of differentials $\Omega_{X_s/s}$ of the fibre X_s over $\kappa(s)$ is the pullback of the module of differentials $\Omega_{X/S}$ of X over S. This fact on modules of differentials also implies the displayed equality of vector spaces in part (4). By Lemma 24.32.14 the modules $\Omega_{X/S,x}$ and $\Omega_{X_s/s,x}$ are of finite type. Hence he modules $\Omega_{X/S,x}$ and $\Omega_{X_s/s,x}$ are zero if and only if the corresponding $\kappa(x)$-vector space in (4) is zero by Nakayama's Lemma (Algebra, Lemma 7.14.5). This in particular shows that (3), (4) and (5) are equivalent. The support of $\Omega_{X/S}$ is closed in X, see Modules, Lemma 15.9.6. Assumption (3) implies that x is not in the support. Hence $\Omega_{X/S}$ is zero in a neighbourhood of x, which implies (1). The equivalence of (1) and (3) applied to $X_s \to s$ implies the equivalence of (2) and (4). At this point we have seen that (1) -- (5) are equivalent.

Alternatively you can use Algebra, Lemma 7.138.3 to see the equivalence of (1) -- (5) more directly.

The equivalence of (1) and (6) follows from Lemma 24.34.12. It also follows more directly from Algebra, Lemmas 7.138.5 and 7.138.7. ☐

Lemma 24.34.15. *Let $f : X \to S$ be a morphism of schemes. Assume f locally of finite type. Formation of the open set*

$$\begin{aligned} T &= \{x \in X \mid X_{f(x)} \text{ is unramified over } \kappa(f(x)) \text{ at } x\} \\ &= \{x \in X \mid X \text{ is unramified over } S \text{ at } x\} \end{aligned}$$

commutes with arbitrary base change: For any morphism $g : S' \to S$, consider the base change $f' : X' \to S'$ of f and the projection $g' : X' \to X$. Then the corresponding set T' for the morphism f' is equal to $T' = (g')^{-1}(T)$. If f is assumed locally of finite presentation then the same holds for the open set of points where f is G-unramified.

Proof. Let $s' \in S'$ be a point, and let $s = g(s')$. Then we have

$$X'_{s'} = Spec(\kappa(s')) \times_{Spec(\kappa(s))} X_s$$

In other words the fibres of the base change are the base changes of the fibres. In particular

$$\Omega_{X_s/s,x} \otimes_{\mathcal{O}_{X_s,x}} \kappa(x') = \Omega_{X'_{s'}/s',x'} \otimes_{\mathcal{O}_{X'_{s'},x'}} \kappa(x')$$

see Lemma 24.32.12. Whence $x' \in T'$ if and only if $x \in T$ by Lemma 24.34.14. The second part follows from the first because in that case T is the (open) set of points where f is G-unramified according to Lemma 24.34.14. ☐

Lemma 24.34.16. *Let $f : X \to Y$ be a morphism of schemes over S.*

(1) *If X is unramified over S, then f is unramified.*
(2) *If X is G-unramified over S and Y of finite type over S, then f is G-unramified.*

Proof. Assume that X is unramified over S. By Lemma 24.14.8 we see that f is locally of finite type. By assumption we have $\Omega_{X/S} = 0$. Hence $\Omega_{X/Y} = 0$ by Lemma 24.32.11. Thus f is unramified. If X is G-unramified over S and Y of finite type over S, then by Lemma 24.20.11 we see that f is locally of finite presentation and we conclude that f is G-unramified. ☐

Lemma 24.34.17. *Let S be a scheme. Let X, Y be schemes over S. Let $f, g : X \to Y$ be morphisms over S. Let $x \in X$. Assume that*

(1) *the structure morphism $Y \to S$ is unramified,*
(2) *$f(x) = g(x)$ in Y, say $y = f(x) = g(x)$, and*
(3) *the induced maps $f^\sharp, g^\sharp : \kappa(y) \to \kappa(x)$ are equal.*

Then there exists an open neighbourhood of x in X on which f and g are equal.

Proof. Consider the morphism $(f, g) : X \to Y \times_S Y$. By assumption (1) and Lemma 24.34.13 the inverse image of $\Delta_{Y/S}(Y)$ is open in X. And assumptions (2) and (3) imply that x is in this open subset. □

24.35. Étale morphisms

The Zariski topology of a scheme is a very coarse topology. This is particularly clear when looking at varieties over $\mathbf{C}$. It turns out that declaring an étale morphism to be the analogue of a local isomorphism in topology introduces a much finer topology. On varieties over $\mathbf{C}$ this topology gives rise to the ``correct'' betti numbers when computing cohomology with finite coefficients. Another observable is that if $f : X \to Y$ is an étale morphism of varieties over $\mathbf{C}$, and if x is a closed point of X, then f induces an isomorphism $\mathcal{O}^\wedge_{Y,f(x)} \to \mathcal{O}^\wedge_{X,x}$ of complete local rings.

In this section we start our study of these matters. In fact we deliberately restrict our discussion to a minimum since we will discuss more interesting results elsewhere. Recall that a ring map $R \to A$ is said to be *étale* if it is smooth and $\Omega_{A/R} = 0$, see Algebra, Definition 7.132.1.

Definition 24.35.1. Let $f : X \to S$ be a morphism of schemes.

(1) We say that f is *étale at $x \in X$* if there exists a affine open neighbourhood $Spec(A) = U \subset X$ of x and and affine open $Spec(R) = V \subset S$ with $f(U) \subset V$ such that the induced ring map $R \to A$ is étale.
(2) We say that f is *étale* if it is étale at every point of X.
(3) A morphism of affine schemes $f : X \to S$ is called *standard étale* if $X \to S$ is isomorphic to
$$Spec(R[x]_g/(f)) \to Spec(R)$$
where $R \to R[x]_g/(f)$ is a standard étale ring map, see Algebra, Definition 7.132.13, i.e., f is monic and f' invertible in $R[x]_g$.

A morphism is étale if and only if it is smooth of relative dimension 0 (see Definition 24.33.13). A pleasing feature of the definition is that the set of points where a morphism is étale is automatically open.

Note that there is no separation or quasi-compactness hypotheses in the definition. Hence the question of being étale is local in nature on the source. Here is the precise result.

Lemma 24.35.2. *Let $f : X \to S$ be a morphism of schemes. The following are equivalent*

(1) *The morphism f is étale.*
(2) *For every affine opens $U \subset X$, $V \subset S$ with $f(U) \subset V$ the ring map $\mathcal{O}_S(V) \to \mathcal{O}_X(U)$ is étale.*
(3) *There exists an open covering $S = \bigcup_{j \in J} V_j$ and open coverings $f^{-1}(V_j) = \bigcup_{i \in I_j} U_i$ such that each of the morphisms $U_i \to V_j$, $j \in J, i \in I_j$ is étale.*
(4) *There exists an affine open covering $S = \bigcup_{j \in J} V_j$ and affine open coverings $f^{-1}(V_j) = \bigcup_{i \in I_j} U_i$ such that the ring map $\mathcal{O}_S(V_j) \to \mathcal{O}_X(U_i)$ is étale, for all $j \in J, i \in I_j$.*

Moreover, if f is étale then for any open subschemes $U \subset X$, $V \subset S$ with $f(U) \subset V$ the restriction $f|_U : U \to V$ is étale.

Proof. This follows from Lemma 24.13.3 if we show that the property ``$R \to A$ is étale'' is local. We check conditions (a), (b) and (c) of Definition 24.13.1. These all follow from Algebra, Lemma 7.132.3. □

Lemma 24.35.3. *The composition of two morphisms which are étale is étale.*

Proof. In the proof of Lemma 24.35.2 we saw that being étale is a local property of ring maps. Hence the first statement of the lemma follows from Lemma 24.13.5 combined with the fact that being étale is a property of ring maps that is stable under composition, see Algebra, Lemma 7.132.3. □

Lemma 24.35.4. *The base change of a morphism which is étale is étale.*

Proof. In the proof of Lemma 24.35.2 we saw that being étale is a local property of ring maps. Hence the lemma follows from Lemma 24.13.5 combined with the fact that being étale is a property of ring maps that is stable under base change, see Algebra, Lemma 7.132.3. □

Lemma 24.35.5. *Let $f : X \to S$ be a morphism of schemes. Let $x \in X$. Then f is étale at x if and only if f is smooth and unramified at x.*

Proof. This follows immediately from the definitions. □

Lemma 24.35.6. *An étale morphism is locally quasi-finite.*

Proof. By Lemma 24.35.5 an étale morphism is unramified. By Lemma 24.34.10 an unramified morphism is locally quasi-finite. □

Lemma 24.35.7. *Fibres of étale morphisms.*

(1) *Let X be a scheme over a field k. The structure morphism $X \to Spec(k)$ is étale if and only if X is a disjoint union of spectra of finite separable field extensions of k.*
(2) *If $f : X \to S$ is an étale morphism, then for every $s \in S$ the fibre X_s is a disjoint union of spectra of finite separable field extensions of $\kappa(s)$.*

Proof. You can deduce this from Lemma 24.34.11 via Lemma 24.35.5 above. Here is a direct proof.

We will use Algebra, Lemma 7.132.4. Hence it is clear that if X is a disjoint union of spectra of finite separable field extensions of k then $X \to Spec(k)$ is étale. Conversely, suppose that $X \to Spec(k)$ is étale. Then for any affine open $U \subset X$ we see that U is a finite disjoint union of spectra of finite separable field extensions of k. Hence all points of X are closed points (see Lemma 24.19.2 for example). Thus X is a discrete space and we win. □

The following lemma characterizes an étale morphism as a flat, finitely presented morphism with ``étale fibres''.

Lemma 24.35.8. *Let $f : X \to S$ be a morphism of schemes. If f is flat, locally of finite presentation, and for every $s \in S$ the fibre X_s is a disjoint union of spectra of finite separable field extensions of $\kappa(s)$, then f is étale.*

Proof. You can deduce this from Algebra, Lemma 7.132.7. Here is another proof.

By Lemma 24.35.7 a fibre X_s is étale and hence smooth over s. By Lemma 24.33.3 we see that $X \to S$ is smooth. By Lemma 24.34.12 we see that f is unramified. We conclude by Lemma 24.35.5. ☐

Lemma 24.35.9. *Any open immersion is étale.*

Proof. This is true because an open immersion is a local isomorphism. ☐

Lemma 24.35.10. *An étale morphism is syntomic.*

Proof. See Algebra, Lemma 7.126.10 and use that an étale morphism is the same as a smooth morphism of relative dimension 0. ☐

Lemma 24.35.11. *An étale morphism is locally of finite presentation.*

Proof. True because an étale ring map is of finite presentation by definition. ☐

Lemma 24.35.12. *An étale morphism is flat.*

Proof. Combine Lemmas 24.30.7 and 24.35.10. ☐

Lemma 24.35.13. *An étale morphism is open.*

Proof. Combine Lemmas 24.35.12, 24.35.11, and 24.24.9. ☐

The following lemma says locally any étale morphism is standard étale. This is actually kind of a tricky result to prove in complete generality. The tricky parts are hidden in the chapter on commutative algebra. Hence a standard étale morphism is a *local model* for a general étale morphism.

Lemma 24.35.14. *Let $f : X \to S$ be a morphism of schemes. Let $x \in X$ be a point. Set $s = f(x)$. The following are equivalent*

1. *The morphism f is étale at x.*
2. *There exist affine opens $U \subset X$, and $V \subset S$ such that $x \in U$, $f(U) \subset V$ and the induced morphism $f|_U : U \to V$ is standard étale (see Definition 24.35.1).*

Proof. Follows from the definitions and Algebra, Proposition 7.132.16. ☐

Here is a differential criterion of étaleness at a point. There are many variants of this result all of which may be useful at some point. We will just add them here as needed.

Lemma 24.35.15. *Let $f : X \to S$ be a morphism of schemes. Let $x \in X$. Set $s = f(x)$. Assume f is locally of finite presentation. The following are equivalent:*

1. *The morphism f is étale at x.*
2. *The local ring map $\mathcal{O}_{S,s} \to \mathcal{O}_{X,x}$ is flat and the $\mathcal{O}_{X,x}$-module $\Omega_{X/S,x}$ is zero.*
3. *The local ring map $\mathcal{O}_{S,s} \to \mathcal{O}_{X,x}$ is flat and the $\kappa(x)$-vector space*
$$\Omega_{X_s/s,x} \otimes_{\mathcal{O}_{X_s,x}} \kappa(x) = \Omega_{X/S,x} \otimes_{\mathcal{O}_{X,x}} \kappa(x)$$
is zero.
4. *The local ring map $\mathcal{O}_{S,s} \to \mathcal{O}_{X,x}$ is flat, we have $\mathfrak{m}_s\mathcal{O}_{X,x} = \mathfrak{m}_x$ and the field extension $\kappa(s) \subset \kappa(x)$ is finite separable.*
5. *There exist affine opens $U \subset X$, and $V \subset S$ such that $x \in U$, $f(U) \subset V$ and the induced morphism $f|_U : U \to V$ is standard smooth of relative dimension 0.*

(6) *There exist affine opens $Spec(A) = U \subset X$ and $Spec(R) = V \subset S$ with $x \in U$ corresponding to $\mathfrak{q} \subset A$, and $f(U) \subset V$ such that there exists a presentation*

$$A = R[x_1, \ldots, x_n]/(f_1, \ldots, f_n)$$

with

$$g = \det \begin{pmatrix} \partial f_1/\partial x_1 & \partial f_2/\partial x_1 & \ldots & \partial f_n/\partial x_1 \\ \partial f_1/\partial x_2 & \partial f_2/\partial x_2 & \ldots & \partial f_n/\partial x_2 \\ \ldots & \ldots & \ldots & \ldots \\ \partial f_1/\partial x_n & \partial f_2/\partial x_n & \ldots & \partial f_n/\partial x_n \end{pmatrix}$$

mapping to an element of A not in $\mathfrak{q}$.

(7) *There exist affine opens $U \subset X$, and $V \subset S$ such that $x \in U$, $f(U) \subset V$ and the induced morphism $f|_U : U \to V$ is standard étale.*

(8) *There exist affine opens $Spec(A) = U \subset X$ and $Spec(R) = V \subset S$ with $x \in U$ corresponding to $\mathfrak{q} \subset A$, and $f(U) \subset V$ such that there exists a presentation*

$$A = R[x]_Q/(P) = R[x, 1/Q]/(P)$$

with $P, Q \in R[x]$, P monic and $P' = dP/dx$ mapping to an element of A not in $\mathfrak{q}$.

Proof. Use Lemma 24.35.14 and the definitions to see that (1) implies all of the other conditions. For each of the conditions (2) -- (7) combine Lemmas 24.33.14 and 24.34.14 to see that (1) holds by showing f is both smooth and unramified at x and applying Lemma 24.35.5. Some details omitted. □

Lemma 24.35.16. *A morphism is étale at a point if and only if it is flat and G-unramified at that point. A morphism is étale if and only if it is flat and G-unramified.*

Proof. This is clear from Lemmas 24.35.15 and 24.34.14. □

Lemma 24.35.17. *Let $f : X \to S$ be a morphism of schemes. Assume f locally of finite type. Formation of the set*

$$T = \{x \in X \mid X_{f(x)} \text{ is étale over } \kappa(f(x)) \text{ at } x\}$$

commutes with arbitrary base change: For any morphism $g : S' \to S$, consider the base change $f' : X' \to S'$ of f and the projection $g' : X' \to X$. Then the corresponding set T' for the morphism f' is equal to $T' = (g')^{-1}(T)$. In particular, if f is assumed locally of finite presentation and flat then the same holds for the open set of points where f is étale.

Proof. Combine Lemmas 24.35.16 and 24.34.15. □

Our proof of the following lemma is somewhat complicated. It uses the ``Critère de platitude par fibres" to see that a morphism $X \to Y$ over S between schemes étale over S is automatically flat. The details are in the chapter on commutative algebra.

Lemma 24.35.18. *Let $f : X \to Y$ be a morphism of schemes over S. If X and Y are étale over S, then f is étale.*

Proof. See Algebra, Lemma 7.132.8. □

Lemma 24.35.19. *Let*

$$\begin{tikzcd} X \arrow[rr, "f"] \arrow[dr, "p"'] & & Y \arrow[dl, "q"] \\ & S & \end{tikzcd}$$

be a commutative diagram of morphisms of schemes. Assume that

(1) *f is surjective, and étale,*
(2) *p is étale, and*
(3) *q is locally of finite presentation*[10].

Then q is étale.

Proof. By Lemma 24.33.19 we see that q is smooth. Thus we only need to see that q has relative dimension 0. This follows from Lemma 24.27.2 and the fact that f and p have relative dimension 0. $\square$

A final characterization of smooth morphisms is that a smooth morphism $f : X \to S$ is locally the composition of an étale morphism by a projection $\mathbf{A}^d_S \to S$.

Lemma 24.35.20. *Let $\varphi : X \to Y$ be a morphism of schemes. Let $x \in X$. If φ is smooth at x, then there exist exist an integer $d \geq 0$ and affine opens $V \subset Y$ and $U \subset X$ with $x \in U$ and $\varphi(U) \subset V$ such that there exists a commutative diagram*

$$\begin{tikzcd} X \arrow[d] & U \arrow[l] \arrow[r, "\pi"'] \arrow[d] & \mathbf{A}^d_V \arrow[dl] \\ Y & V \arrow[l] & \end{tikzcd}$$

where π is étale.

Proof. By Lemma 24.33.11 we can find affine opens U and V as in the lemma such that $\varphi|_U : U \to V$ is standard smooth. Write $U = Spec(A)$ and $V = Spec(R)$ so that we can write

$$A = R[x_1, \ldots, x_n]/(f_1, \ldots, f_c)$$

with

$$g = \det \begin{pmatrix} \partial f_1/\partial x_1 & \partial f_2/\partial x_1 & \ldots & \partial f_c/\partial x_1 \\ \partial f_1/\partial x_2 & \partial f_2/\partial x_2 & \ldots & \partial f_c/\partial x_2 \\ \ldots & \ldots & \ldots & \ldots \\ \partial f_1/\partial x_c & \partial f_2/\partial x_c & \ldots & \partial f_c/\partial x_c \end{pmatrix}$$

mapping to an invertible element of A. Then it is clear that $R[x_{c+1}, \ldots, x_n] \to A$ is standard smooth of relative dimension 0. Hence it is smooth of relative dimension 0. In other words the ring map $R[x_{c+1}, \ldots, x_n] \to A$ is étale. As $\mathbf{A}^{n-c}_V = Spec(R[x_{c+1}, \ldots, x_n])$ the lemma with $d = n - c$. $\square$

24.36. Relatively ample sheaves

Let X be a scheme and $\mathcal{L}$ an invertible sheaf on X. Then $\mathcal{L}$ is ample on X if X is quasi-compact and every point of X is contained in an affine open of the form X_s, where $s \in \Gamma(X, \mathcal{L}^{\otimes n})$ and $n \geq 1$, see Properties, Definition 23.23.1. We relativize this as follows.

Definition 24.36.1. Let $f : X \to S$ be a morphism of schemes. Let $\mathcal{L}$ be an invertible $\mathcal{O}_X$-module. We say $\mathcal{L}$ is *relatively ample*, or *f-relatively ample*, or *ample on X/S*, or *f-ample* if $f : X \to S$ is quasi-compact, and if for every affine open $V \subset S$ the restriction of $\mathcal{L}$ to the open subscheme $f^{-1}(V)$ of X is ample.

We note that the existence of a relatively ample sheaf on X does not force the morphism $X \to S$ to be of finite type.

[10] In fact this is implied by (1) and (2), see Descent, Lemma 31.10.3. Moreover, it suffices to assume that f is surjective, flat and locally of finite presentation, see Descent, Lemma 31.10.5.

Lemma 24.36.2. *Let $X \to S$ be a morphism of schemes. Let $\mathcal{L}$ be an invertible $\mathcal{O}_X$-module. Let $n \geq 1$. Then $\mathcal{L}$ is f-ample if and only if $\mathcal{L}^{\otimes n}$ is f-ample.*

Proof. This follows from Properties, Lemma 23.23.2. □

Lemma 24.36.3. *Let $f : X \to S$ be a morphism of schemes. If there exists an f-ample invertible sheaf, then f is separated.*

Proof. Being separated is local on the base (see Schemes, Lemma 21.21.8 for example; it also follows easily from the definition). Hence we may assume S is affine and X has an ample invertible sheaf. In this case the result follows from Properties, Lemma 23.23.10 and Constructions, Lemma 22.8.8. □

There are many ways to charactarize relatively ample invertible sheaves, by relativizing any of the list of equivalent conditions in Properties, Proposition 23.23.12. We will add these here as needed.

Lemma 24.36.4. *Let $f : X \to S$ be a quasi-compact morphism of schemes. Let $\mathcal{L}$ be an invertible sheaf on X. The following are equivalent:*

(1) *The invertible sheaf $\mathcal{L}$ is f-ample.*
(2) *There exists an open covering $S = \bigcup V_i$ such that each $\mathcal{L}|_{f^{-1}(V_i)}$ is ample relative to $f^{-1}(V_i) \to V_i$.*
(3) *There exists an affine open covering $S = \bigcup V_i$ such that each $\mathcal{L}|_{f^{-1}(V_i)}$ is ample.*
(4) *There exists a quasi-coherent graded $\mathcal{O}_S$-algebra $\mathcal{A}$ and a map of graded $\mathcal{O}_X$-algebras $\psi : f^*\mathcal{A} \to \bigoplus_{d \geq 0} \mathcal{L}^{\otimes d}$ such that $U(\psi) = X$ and*
$$r_{\mathcal{L},\psi} : X \longrightarrow \underline{Proj}_S(\mathcal{A})$$
is an open immersion (see Constructions, Lemma 22.18.1 for notation).
(5) *The morphism f is quasi-separated and part (4) above holds with $\mathcal{A} = f_*(\bigoplus_{d \geq 0} \mathcal{L}^{\otimes d})$ and ψ the adjunction mapping.*
(6) *Same as (4) but just requiring $r_{\mathcal{L},\psi}$ to be an immersion.*

Proof. It is immediate from the definition that (1) implies (2) and (2) implies (3). It is clear that (5) implies (4).

Assume (3) holds for the affine open covering $S = \bigcup V_i$. We are going to show (5) holds. Since each $f^{-1}(V_i)$ has an ample invertible sheaf we see that $f^{-1}(V_i)$ is separated (see Properties, Lemma 23.23.10 and Constructions, Lemma 22.8.8). Hence f is separated. By Schemes, Lemma 21.24.1 we see that $\mathcal{A} = f_*(\bigoplus_{d \geq 0} \mathcal{L}^{\otimes d})$ is a quasi-coherent graded $\mathcal{O}_S$-algebra. Denote $\psi : f^*\mathcal{A} \to \bigoplus_{d \geq 0} \mathcal{L}^{\otimes d}$ the adjunction mapping. The description of the open $U(\psi)$ in Constructions, Section 22.18 and the definition of ampleness of $\mathcal{L}|_{f^{-1}(V_i)}$ show that $U(\psi) = X$. Moreover, Constructions, Lemma 22.18.1 part (3) shows that the restriction of $r_{\mathcal{L},\psi}$ to $f^{-1}(V_i)$ is the same as the morphism from Properties, Lemma 23.23.8 which is an open immersion according to Properties, Lemma 23.23.10. Hence (5) holds.

Let us show that (4) implies (1). Assume (4). Denote $\pi : \underline{\mathrm{Proj}}_S(\mathcal{A}) \to S$ the structure morphism. Choose $V \subset S$ affine open. By Constructions, Definition 22.16.7 we see that $\pi^{-1}(V) \subset \underline{\mathrm{Proj}}_S(\mathcal{A})$ is equal to $\mathrm{Proj}(A)$ where $A = \mathcal{A}(V)$ as a graded ring. Hence $r_{\mathcal{L},\psi}$ maps $f^{-1}(V)$ isomorphically onto a quasi-compact open of $\mathrm{Proj}(A)$. Moreover, $\mathcal{L}^{\otimes d}$ is isomorphic to the pullback of $\mathcal{O}_{\mathrm{Proj}(A)}(d)$ for some $d \geq 1$. (See part (3) of Constructions, Lemma 22.18.1 and the final statement of Constructions, Lemma 22.14.1.) This implies that $\mathcal{L}|_{f^{-1}(V)}$ is ample by Properties, Lemmas 23.23.11 and 23.23.2.

Assume (6). By the equivalence of (1) - (5) above we see that the property of being relatively ample on X/S is local on S. Hence we may assume that S is affine, and we have to show that $\mathcal{L}$ is ample on X. In this case the morphism $r_{\mathcal{L},\psi}$ is identified with the morphism, also denoted $r_{\mathcal{L},\psi} : X \to \text{Proj}(A)$ associated to the map $\psi : A = \mathcal{A}(V) \to \Gamma_*(X, \mathcal{L})$. (See references above.) As above we also see that $\mathcal{L}^{\otimes d}$ is the pullback of the sheaf $\mathcal{O}_{\text{Proj}(A)}(d)$ for some $d \geq 1$. Moreover, since X is quasi-compact we see that X gets identified with a closed subscheme of a quasi-compact open subscheme $Y \subset \text{Proj}(A)$. By Constructions, Lemma 22.10.6 (see also Properties, Lemma 23.23.11) we see that $\mathcal{O}_Y(d')$ is an ample invertible sheaf on Y for some $d' \geq 1$. Since the restriction of an ample sheaf to a closed subscheme is ample, see Properties, Lemma 23.23.3 we conclude that the pullback of $\mathcal{O}_Y^{d'}$ is ample. Combining these results with Properties, Lemma 23.23.2 we conclude that $\mathcal{L}$ is ample as desired. $\square$

Lemma 24.36.5. *Let $f : X \to S$ be a morphism of schemes. Let $\mathcal{L}$ be an invertible $\mathcal{O}_X$-module. Assume S affine. Then $\mathcal{L}$ is f-relatively ample if and only if $\mathcal{L}$ is ample on X.*

Proof. Immediate from Lemma 24.36.4 and the definitions. $\square$

24.37. Very ample sheaves

Recall that given a quasi-coherent sheaf $\mathcal{E}$ on a scheme S the *projective bundle* associated to $\mathcal{E}$ is the morphism $\mathbf{P}(\mathcal{E}) \to S$, where $\mathbf{P}(\mathcal{E}) = \underline{\text{Proj}}_S(\text{Sym}(\mathcal{E}))$, see Constructions, Definition 22.20.1.

Definition 24.37.1. Let $f : X \to S$ be a morphism of schemes. Let $\mathcal{L}$ be an invertible $\mathcal{O}_X$-module. We say $\mathcal{L}$ is *relatively very ample* or more precisely *f-relatively very ample*, or *very ample on X/S*, or *f-very ample* if there exist a quasi-coherent $\mathcal{O}_S$-module $\mathcal{E}$ and an immersion $i : X \to \mathbf{P}(\mathcal{E})$ over S such that $\mathcal{L} \cong i^*\mathcal{O}_{\mathbf{P}(\mathcal{E})}(1)$.

Since there is no assumption of quasi-compactness in this definition it is not true in general that a relatively very ample invertible sheaf is a relatively ample invertible sheaf.

Lemma 24.37.2. *Let $f : X \to S$ be a morphism of schemes. Let $\mathcal{L}$ be an invertible $\mathcal{O}_X$-module. If f is quasi-compact and $\mathcal{L}$ is a relatively very ample invertible sheaf, then $\mathcal{L}$ is a relatively ample invertible sheaf.*

Proof. By definition there exists quasi-coherent $\mathcal{O}_S$-module $\mathcal{E}$ and an immersion $i : X \to \mathbf{P}(\mathcal{E})$ over S such that $\mathcal{L} \cong i^*\mathcal{O}_{\mathbf{P}(\mathcal{E})}(1)$. Set $\mathcal{A} = \text{Sym}(\mathcal{E})$, so $\mathbf{P}(\mathcal{E}) = \underline{\text{Proj}}_S(\mathcal{A})$ by definition. The graded $\mathcal{O}_S$-algebra $\mathcal{A}$ comes equipped with a map

$$\psi : \mathcal{A} \to \bigoplus\nolimits_{n \geq 0} \pi_*\mathcal{O}_{\mathbf{P}(\mathcal{E})}(n) \to \bigoplus\nolimits_{n \geq 0} f_*\mathcal{L}^{\otimes n}$$

where the second arrow uses the identification $\mathcal{L} \cong i^*\mathcal{O}_{\mathbf{P}(\mathcal{E})}(1)$. By adjointness of f_* and f^* we get a morphism $\psi : f^*\mathcal{A} \to \bigoplus_{n \geq 0} \mathcal{L}^{\otimes n}$. We omit the verification that the morphism $r_{\mathcal{L},\psi}$ associated to this map is exactly the immersion i. Hence the result follows from part (6) of Lemma 24.36.4. $\square$

To arrive at the correct converse of this lemma we ask whether given a relatively ample invertible sheaf $\mathcal{L}$ there exists an integer $n \geq 1$ such that $\mathcal{L}^{\otimes n}$ is relatively very ample? In general this is false. There are several things that prevent this from being true:

1. Even if S is affine, it can happen that no finite integer n works because $X \to S$ is not of finite type, see Example 24.37.3.

(2) The base not being quasi-compact means the result can be prevented from being true even with f finite type. Namely, given a field k there exists a scheme X_d of finite type over k with an ample invertible sheaf $\mathcal{O}_{X_d}(1)$ so that the smallest tensor power of $\mathcal{O}_{X_d}(1)$ which is very ample is the dth power. See Example 24.37.4. Taking f to be the disjoint union of the schemes X_d mapping to the disjoint union of copies of $Spec(k)$ gives an example.

To see our version of the converse take a look at Lemma 24.38.5 below. We will do some preliminary work before proving it.

Example 24.37.3. Let k be a field. Consider the graded k-algebra

$$A = k[U, V, Z_1, Z_2, Z_3, \ldots]/I \quad \text{with} \quad I = (U^2 - Z_1^2, U^4 - Z_2^2, U^6 - Z_3^2, \ldots)$$

with grading given by $\deg(U) = \deg(V) = \deg(Z_1) = 1$ and $\deg(Z_d) = d$. Note that $X = \text{Proj}(A)$ is covered by $D_+(U)$ and $D_+(V)$. Hence the sheaves $\mathcal{O}_X(n)$ are all invertible and isomorphic to $\mathcal{O}_X(1)^{\otimes n}$. In particular $\mathcal{O}_X(1)$ is ample and f-ample for the morphism $f : X \to Spec(k)$. We claim that no power of $\mathcal{O}_X(1)$ is f-relatively very ample. Namely, it is easy to see that $\Gamma(X, \mathcal{O}_X(n))$ is the degree n summand of the algebra A. Hence if $\mathcal{O}_X(n)$ were very ample, then X would be a closed subscheme of a projective space over k and hence of finite type over k. On the other hand $D_+(V)$ is the spectrum of $k[t, t_1, t_2, \ldots]/(t^2 - t_1^2, t^4 - t_2^2, t^6 - t_3^2, \ldots)$ which is not of finite type over k.

Example 24.37.4. Let k be an infinite field. Let $\lambda_1, \lambda_2, \lambda_3, \ldots$ be pairwise distinct elements of k^*. (This is not strictly necessary, and in fact the example works perfectly well even if all λ_i are equal to 1.) Consider the graded k-algebra

$$A_d = k[U, V, Z]/I_d \quad \text{with} \quad I_d = (Z^2 - \prod\nolimits_{i=1}^{2d}(U - \lambda_i V)).$$

with grading given by $\deg(U) = \deg(V) = 1$ and $\deg(Z) = d$. Then $X_d = \text{Proj}(A_d)$ has ample invertible sheaf $\mathcal{O}_{X_d}(1)$. We claim that if $\mathcal{O}_{X_d}(n)$ is very ample, then $n \geq d$. The reason for this is that Z has degree d, and hence $\Gamma(X_d, \mathcal{O}_{X_d}(n)) = k[U, V]_n$ for $n < d$. Details omitted.

Lemma 24.37.5. *Let $f : X \to S$ be a morphism of schemes. Let $\mathcal{L}$ be an invertible sheaf on X. If $\mathcal{L}$ is relatively very ample on X/S then f is separated.*

Proof. Being separated is local on the base (see Schemes, Section 21.21). An immersion is separated (see Schemes, Lemma 21.23.7). Hence the lemma follows since locally X has an immersion into the homogeneous spectrum of a graded ring which is separated, see Constructions, Lemma 22.8.8. □

Lemma 24.37.6. *Let $f : X \to S$ be a morphism of schemes. Let $\mathcal{L}$ be an invertible sheaf on X. Assume f is quasi-compact. The following are equivalent*

(1) *$\mathcal{L}$ is relatively very ample on X/S,*
(2) *there exists an open covering $S = \bigcup V_j$ such that $\mathcal{L}|_{f^{-1}(V_j)}$ is relatively very ample on $f^{-1}(V_j)/V_j$ for all j,*
(3) *there exists a quasi-coherent sheaf of graded $\mathcal{O}_S$-algebras $\mathcal{A}$ generated in degree 1 over $\mathcal{O}_S$ and a map of graded $\mathcal{O}_X$-algebras $\psi : f^*\mathcal{A} \to \bigoplus_{n\geq 0} \mathcal{L}^{\otimes n}$ such that $f^*\mathcal{A}_1 \to \mathcal{L}$ is surjective and the associated morphism $r_{\mathcal{L},\psi} : X \to \underline{Proj}_S(\mathcal{A})$ is an immersion, and*
(4) *f is quasi-separated, the canonical map $\psi : f^*f_*\mathcal{L} \to \mathcal{L}$ is surjective, and the associated map $r_{\mathcal{L},\psi} : X \to \mathbf{P}(f_*\mathcal{L})$ is an immersion.*

Proof. It is clear that (1) implies (2). It is also clear that (4) implies (1); the hypothesis of quasi-spearation in (4) is used to garantee that $f_*\mathcal{L}$ is quasi-coherent via Schemes, Lemma 21.24.1.

Assume (2). We will prove (4). Let $S = \bigcup V_j$ be an open covering as in (2). Set $X_j = f^{-1}(V_j)$ and $f_j : X_j \to V_j$ the restriction of f. We see that f is separated by Lemma 24.37.5 (as being separated is local on the base). Consider the map $\psi : f^*f_*\mathcal{L} \to \mathcal{L}$. On each V_j there exists a quasi-coherent sheaf $\mathcal{E}_j$ and an embedding $i : X_j \to \mathbf{P}(\mathcal{E}_j)$ with $\mathcal{L}_{X_j} \cong i^*\mathcal{O}_{\mathbf{P}(\mathcal{E}_j)}(1)$. In other words there is a map $\mathcal{E}_j \to (f_*\mathcal{L})|_{X_j}$ such that the composition

$$f_j^*\mathcal{E}_j \to (f^*f_*\mathcal{L})|_{X_j} \to \mathcal{L}|_{X_j}$$

is surjective. Hence we conclude that ψ is surjective. Let $r_{\mathcal{L},\psi} : X \to \mathbf{P}(f_*\mathcal{L})$ be the associated morphism. Using the maps $\mathcal{E}_j \to (f_*\mathcal{L})|_{X_j}$ we see that there is a factorization

$$X_j \xrightarrow{r_{\mathcal{L},\psi}} \mathbf{P}(f_*\mathcal{L})|_{V_j} \longrightarrow \mathbf{P}(\mathcal{E}_j)$$

which shows that $r_{\mathcal{L},\psi}$ is an immersion.

At this point we see that (1), (2) and (4) are equivalent. Clearly (4) implies (3). Assume (3). We will prove (1). Let $\mathcal{A}$ be a quasi-coherent sheaf of graded $\mathcal{O}_S$-algebras generated in degree 1 over $\mathcal{O}_S$. Consider the map of graded $\mathcal{O}_S$-algebras $\text{Sym}(\mathcal{A}_1) \to \mathcal{A}$. This is surjective by hypothesis and hence induces a closed immersion

$$\underline{\text{Proj}}_S(\mathcal{A}) \longrightarrow \mathbf{P}(\mathcal{A}_1)$$

which pulls back $\mathcal{O}(1)$ to $\mathcal{O}(1)$, see (insert future reference here -- but see Constructions, Lemma 22.11.3 for the case where S is affine). Hence it is clear that (3) implies (1). □

24.38. Ample and very ample sheaves relative to finite type morphisms

In fact most of the material in this section is about the notion of a (quasi-)projective morphism which we have not defined yet.

Lemma 24.38.1. *Let $f : X \to S$ be a morphism of schemes. Let $\mathcal{L}$ be an invertible sheaf on X. Assume that*

1. *the invertible sheaf $\mathcal{L}$ is very ample on X/S,*
2. *the morphism $X \to S$ is of finite type, and*
3. *S is affine.*

Then there exists an $n \geq 0$ and an immersion $i : X \to \mathbf{P}^n_S$ over S such that $\mathcal{L} \cong i^*\mathcal{O}_{\mathbf{P}^n_S}(1)$.

Proof. Assume (1), (2) and (3). Condition (3) means $S = Spec(R)$ for some ring R. Condition (1) means by definition there exists a quasi-coherent $\mathcal{O}_S$-module $\mathcal{E}$ and an immersion $\alpha : X \to \mathbf{P}(\mathcal{E})$ such that $\mathcal{L} = \alpha^*\mathcal{O}_{\mathbf{P}(\mathcal{E})}(1)$. Write $\mathcal{E} = \widetilde{M}$ for some R-module M. Thus we have

$$\mathbf{P}(\mathcal{E}) = \text{Proj}(\text{Sym}_R(M)).$$

Since α is an immersion, and since the topology of $\text{Proj}(\text{Sym}_R(M))$ is generated by the standard opens $D_+(f)$, $f \in \text{Sym}^d_R(M)$, $d \geq 1$, we can find for each $x \in X$ an $f \in \text{Sym}^d_R(M)$, $d \geq 1$, with $\alpha(x) \in D_+(f)$ such that

$$\alpha|_{\alpha^{-1}(D_+(f))} : \alpha^{-1}(D_+(f)) \to D_+(f)$$

is a closed immersion. Condition (2) implies X is quasi-compact. Hence we can find a finite collection of elements $f_j \in \text{Sym}^{d_j}_R(M)$, $d_j \geq 1$ such that for each $f = f_j$ the displayed map above is a closed immersion and such that $\alpha(X) \subset \bigcup D_+(f_j)$. Write $U_j = \alpha^{-1}(D_+(f_j))$. Note that U_j is affine as a closed subscheme of the affine scheme $D_+(f_j)$. Write $U_j = Spec(A_j)$. Condition (2) also implies that A_j is of finite type over R, see Lemma 24.14.2. Choose finitely many $x_{j,k} \in A_j$ which generate A_j as a R-algebra. Since $\alpha|_{U_j}$ is a closed immersion we see that $x_{j,k}$ is the image of an element

$$f_{j,k}/f_j^{e_{j,k}} \in \mathrm{Sym}_R(M)_{(f_j)} = \Gamma(D_+(f_j), \mathcal{O}_{\mathrm{Proj}(\mathrm{Sym}_R(M))}).$$

Finally, choose $n \geq 1$ and elements $y_0, \ldots, y_n \in M$ such that each of the polynomials $f_j, f_{j,k} \in \mathrm{Sym}_R(M)$ is a polynomial in the elements y_t with coefficients in R. Consider the graded ring map

$$\psi : R[Y_0, \ldots, Y_n] \longrightarrow \mathrm{Sym}_R(M), \quad Y_i \longmapsto y_i.$$

Denote F_j, $F_{j,k}$ the elements of $R[Y_0, \ldots, Y_n]$ such that $\psi(F_j) = f_j$ and $\psi(F_{j,k}) = f_{j,k}$. By Constructions, Lemma 22.11.1 we obtain an open subscheme

$$U(\psi) \subset \mathrm{Proj}(\mathrm{Sym}_R(M))$$

and a morphism $r_\psi : U(\psi) \to \mathbf{P}^n_R$. This morphism satisfies $r_\psi^{-1}(D_+(F_j)) = D_+(f_j)$, and hence we see that $\alpha(X) \subset U(\psi)$. Moreover, it is clear that

$$i = r_\psi \circ \alpha : X \longrightarrow \mathbf{P}^n_R$$

is still an immersion since $i^\sharp(F_{j,k}/F_j^{e_{j,k}}) = x_{j,k} \in A_j = \Gamma(U_j, \mathcal{O}_X)$ by construction. Moreover, the morphism r_ψ comes equipped with a map $\theta : r_\psi^*\mathcal{O}_{\mathbf{P}^n_R}(1) \to \mathcal{O}_{\mathrm{Proj}(\mathrm{Sym}_R(M))}(1)|_{U(\psi)}$ which is an isomorphism in this case (for construction θ see lemma cited above; some details omitted). Since the original map α was assumed to have the property that $\mathcal{L} = \alpha^*\mathcal{O}_{\mathrm{Proj}(\mathrm{Sym}_R(M))}(1)$ we win. □

Lemma 24.38.2. *Let $\pi : X \to S$ be a morphism of schemes. Assume that X is quasi-affine and that π is locally of finite type. Then there exist $n \geq 0$ and an immersion $i : X \to \mathbf{A}^n_S$ over S.*

Proof. Let $A = \Gamma(X, \mathcal{O}_X)$. By assumption X is quasi-compact and is identified with an open subscheme of $Spec(A)$, see Properties, Lemma 23.15.4. Moreover, the set of opens X_f, for those $f \in A$ such that X_f is affine, forms a basis for the topology of X, see the proof of Properties, Lemma 23.15.4. Hence we can find a finite number of $f_j \in A$, $j = 1, \ldots, m$ such that $X = \bigcup X_{f_j}$, and such that $\pi(X_{f_j}) \subset V_j$ for some affine open $V_j \subset S$. By Lemma 24.14.2 the ring maps $\mathcal{O}(V_j) \to \mathcal{O}(X_{f_j}) = A_{f_j}$ are of finite type. Thus we may choose $a_1, \ldots, a_N \in A$ such that the elements $a_1, \ldots, a_N, f_1, \ldots, f_m, 1/f_j$ generate A_{f_j} over $\mathcal{O}(V_j)$ for each j. Take $n = N + m$ and let

$$i : X \longrightarrow \mathbf{A}^n_S$$

be the morphism given by the global sections $a_1, \ldots, a_n, f_1, \ldots, f_n$ of the structure sheaf of X. Let $D(x_j) \subset \mathbf{A}^n_S$ be the open subscheme where the jth coordinate function is nonzero. Then it is clear that $i^{-1}(D(x_j))$ is X_{f_j} and that the induced morphism $X_{f_j} \to D(x_j)$ factors through the affine open $Spec(\mathcal{O}(V_j)[x_1, \ldots, x_n, 1/x_j])$ of $D(x_j)$. Since the ring map $\mathcal{O}(V_j)[x_1, \ldots, x_n, 1/x_j] \to A_{f_j}$ is surjective by construction we conclude that the restriction of i to X_{f_j} is an immersion as desired. □

Lemma 24.38.3. *Let $f : X \to S$ be a morphism of schemes. Let $\mathcal{L}$ be an invertible sheaf on X. Assume that*

(1) *the invertible sheaf $\mathcal{L}$ is ample on X, and*

(2) *the morphism $X \to S$ is locally of finite type.*

Then there exists a $d_0 \geq 1$ such that for every $d \geq d_0$ there exists an $n \geq 0$ and an immersion $i : X \to \mathbf{P}^n_S$ over S such that $\mathcal{L}^{\otimes d} \cong i^*\mathcal{O}_{\mathbf{P}^n_S}(1)$.

Proof. Let $A = \Gamma_*(X, \mathcal{L}) = \bigoplus_{d \geq 0} \Gamma(X, \mathcal{L}^{\otimes d})$. By Properties, Proposition 23.23.12 the set of affine opens X_a with $a \in A_+$ homogeneous forms a basis for the topology of X. Hence we can find finitely many such elements $a_0, \ldots, a_n \in A_+$ such that

(1) we have $X = \bigcup_{i=0,\ldots,n} X_{a_i}$,
(2) each X_{a_i} is affine, and
(3) each X_{a_i} maps into an affine open $V_i \subset S$.

By Lemma 24.14.2 we see that the ring maps $\mathcal{O}_S(V_i) \to \mathcal{O}_X(X_{a_i})$ are of finite type. Hence we can find finitely many elements $f_{ij} \in \mathcal{O}_X(X_{a_i})$, $j = 1, \ldots, n_i$ which generate $\mathcal{O}_X(X_{a_i})$ as an $\mathcal{O}_S(V_i)$-algebra. By Properties, Lemma 23.23.5 we may write each f_{ij} as $a_{ij}/a_i^{e_{ij}}$ for some $a_{ij} \in A_+$ homogeneous. Let N be a positive integer which is a common multiple of all the degrees of the elements a_i, a_{ij}. Consider the elements

$$a_i^{N/\deg(a_i)},\ a_{ij}a_i^{(N/\deg(a_i))-e_{ij}} \in A_N.$$

By construction these generate the invertible sheaf $\mathcal{L}^{\otimes N}$ over X. Hence they give rise to a morphism

$$j : X \longrightarrow \mathbf{P}^m_S \quad \text{with } m = n + \sum n_i$$

over S, see Constructions, Lemma 22.13.1 and Definition 22.13.2. Moreover, $j^*\mathcal{O}_{\mathbf{P}_S}(1) = \mathcal{L}^{\otimes N}$. We name the homogeneous coordinates $T_0, \ldots, T_n, T_{ij}$ instead of $T_0, \ldots, T_m$. For $i = 0, \ldots, n$ we have $i^{-1}(D_+(T_i)) = X_{a_i}$. Moreover, pulling back the element T_{ij}/T_i via $j^\sharp$ we get the element $f_{ij} \in \mathcal{O}_X(X_{a_i})$. Hence the morphism j restricted to X_{a_i} gives a closed immersion of X_{a_i} into the affine open $D_+(T_i) \cap \mathbf{P}^m_{V_i}$ of $\mathbf{P}^N_S$. Hence we conclude that the morphism j is an immersion. This implies the lemma holds for some d and n which is enough in virtually all applications.

This proves that for one $d_2 \geq 1$ (namely $d_2 = N$ above), some $m \geq 0$ there exists some immersion $j : X \to \mathbf{P}^m_S$ given by global sections $s'_0, \ldots, s'_m \in \Gamma(X, \mathcal{L}^{\otimes d_2})$. By Properties, Proposition 23.23.12 we know there exists an integer d_1 such that $\mathcal{L}^{\otimes d}$ is globally generated for all $d \geq d_1$. Set $d_0 = d_1 + d_2$. We claim that the lemma holds with this value of d_0. Namely, given an integer $d \geq d_0$ we may choose $s''_1, \ldots, s''_t \in \Gamma(X, \mathcal{L}^{\otimes d - d_2})$ which generate $\mathcal{L}^{\otimes d - d_2}$ over X. Set $n = (m + 1)t$ and denote $s_0, \ldots, s_n$ the collection of sections $s'_\alpha s''_\beta$, $\alpha = 0, \ldots, m$, $\beta = 1, \ldots, t$. These generate $\mathcal{L}^{\otimes d}$ over X and therefore define a morphism

$$i : X \longrightarrow \mathbf{P}^n_S$$

such that $i^*\mathcal{O}_{\mathbf{P}^n_S}(1) \cong \mathcal{L}^{\otimes d}$. We omit the verification that since j was an immersion also the morphism i so obtained is an immersion also. (Hint: Segre embedding.) □

Lemma 24.38.4. *Let $f : X \to S$ be a morphism of schemes. Let $\mathcal{L}$ be an invertible $\mathcal{O}_X$-module. Assume S affine and f of finite type. The following are equivalent*

(1) *$\mathcal{L}$ is ample on X,*
(2) *$\mathcal{L}$ is f-ample,*
(3) *$\mathcal{L}^{\otimes d}$ is f-very ample for some $d \geq 1$,*
(4) *$\mathcal{L}^{\otimes d}$ is f-very ample for all $d \gg 1$,*

(5) *for some* $d \geq 1$ *there exist* $n \geq 1$ *and an immersion* $i : X \to \mathbf{P}^n_S$ *such that* $\mathcal{L}^{\otimes d} \cong i^*\mathcal{O}_{\mathbf{P}^n_S}(1)$, *and*
(6) *for all* $d \gg 1$ *there exist* $n \geq 1$ *and an immersion* $i : X \to \mathbf{P}^n_S$ *such that* $\mathcal{L}^{\otimes d} \cong i^*\mathcal{O}_{\mathbf{P}^n_S}(1)$.

Proof. The equivalence of (1) and (2) is Lemma 24.36.5. The implication (2) ⇒ (6) is Lemma 24.38.3. Trivially (6) implies (5). As $\mathbf{P}^n_S$ is a projective bundle over S (see Constructions, Lemma 22.20.4) we see that (5) implies (3) and (6) implies (4) from the definition of a relatively very ample sheaf. Trivially (4) implies (3). To finish we have to show that (3) implies (2) which follows from Lemma 24.37.2 and Lemma 24.36.2. □

Lemma 24.38.5. *Let* $f : X \to S$ *be a morphism of schemes. Let* $\mathcal{L}$ *be an invertible* $\mathcal{O}_X$*-module. Assume* S *quasi-compact and* f *of finite type. The following are equivalent*

(1) $\mathcal{L}$ *is* f*-ample,*
(2) $\mathcal{L}^{\otimes d}$ *is* f*-very ample for some* $d \geq 1$,
(3) $\mathcal{L}^{\otimes d}$ *is* f*-very ample for all* $d \gg 1$.

Proof. Trivially (3) implies (2). Lemma 24.37.2 garantees that (2) implies (1) since a morphism of finite type is quasi-compact by definition. Assume that $\mathcal{L}$ is f-ample. Choose a finite affine open covering $S = V_1 \cup \ldots \cup V_m$. Write $X_i = f^{-1}(V_i)$. By Lemma 24.38.4 above we see there exists a d_0 such that $\mathcal{L}^{\otimes d}$ is relatively very ample on X_i/V_i for all $d \geq d_0$. Hence we conclude (1) implies (3) by Lemma 24.37.6. □

The following two lemmas provide the most used and most useful characterizations of relatively very ample and relatively ample invertible sheaves when the morphism is of finite type.

Lemma 24.38.6. *Let* $f : X \to S$ *be a morphism of schemes. Let* $\mathcal{L}$ *be an invertible sheaf on* X. *Assume* f *is of finite type. The following are equivalent:*

(1) $\mathcal{L}$ *is* f*-relatively very ample, and*
(2) *there exist an open covering* $S = \bigcup V_j$, *for each* j *an integer* n_j, *and immersions*

$$i_j : X_j = f^{-1}(V_j) = V_j \times_S X \longrightarrow \mathbf{P}^{n_j}_{V_j}$$

over V_j *such that* $\mathcal{L}|_{X_j} \cong i_j^*\mathcal{O}_{\mathbf{P}^{n_j}_{V_j}}(1)$.

Proof. We see that (1) implies (2) by taking an affine open covering of S and applying Lemma 24.38.1 to each of the restrictions of f and $\mathcal{L}$. We see that (2) implies (1) by Lemma 24.37.6. □

Lemma 24.38.7. *Let* $f : X \to S$ *be a morphism of schemes. Let* $\mathcal{L}$ *be an invertible sheaf on* X. *Assume* f *is of finite type. The following are equivalent:*

(1) $\mathcal{L}$ *is* f*-relatively ample, and*
(2) *there exist an open covering* $S = \bigcup V_j$, *for each* j *an integers* $d_j \geq 1$, $n_j \geq 0$, *and immersions*

$$i_j : X_j = f^{-1}(V_j) = V_j \times_S X \longrightarrow \mathbf{P}^{n_j}_{V_j}$$

over V_j *such that* $\mathcal{L}^{\otimes d_j}|_{X_j} \cong i_j^*\mathcal{O}_{\mathbf{P}^{n_j}_{V_j}}(1)$.

Proof. We see that (1) implies (2) by taking an affine open covering of S and applying Lemma 24.38.4 to each of the restrictions of f and $\mathcal{L}$. We see that (2) implies (1) by Lemma 24.36.4. □

24.39. Quasi-projective morphisms

The discussion in the previous section suggests the following definitions. We take our definition of quasi-projective from [**DG67**]. The version with the letter ``H'' is the definition in [**Har77**].

Definition 24.39.1. Let $f : X \to S$ be a morphism of schemes.

1. We say f is *quasi-projective* if f is of finite type and there exists an f-relatively ample invertible $\mathcal{O}_X$-module.
2. We say f is *H-quasi-projective* if f if there exists a quasi-compact immersion $X \to \mathbf{P}^n_S$ over S for some n.[11]
3. We say f is *locally quasi-projective* if there exists an open covering $S = \bigcup V_j$ such that each $f^{-1}(V_j) \to V_j$ is quasi-projective.

As this definition suggests the property of being quasi-projective is not local on S.

Lemma 24.39.2. *Let $f : X \to S$ be a morphism of schemes. If f is quasi-projective, or H-quasi-projective or locally quasi-projective, then f is separated of finite type.*

Proof. Omitted. □

Lemma 24.39.3. *A H-quasi-projective morphism is quasi-projective.*

Proof. Omitted. □

Lemma 24.39.4. *Let $f : X \to S$ be a morphism of schemes. The following are equivalent:*

1. *The morphism f is locally quasi-projective.*
2. *There exists an open covering $S = \bigcup V_j$ such that each $f^{-1}(V_j) \to V_j$ is H-quasi-projective.*

Proof. By Lemma 24.39.3 we see that (2) implies (1). Assume (1). The question is local on S and hence we may assume S is affine, X of finite type over S and $\mathcal{L}$ is a relatively ample invertible sheaf on X/S. By Lemma 24.38.4 we may assume $\mathcal{L}$ is ample on X. By Lemma 24.38.3 we see that there exists an immersion of X into a projective space over S, i.e., X is H-quasi-projective over S as desired. □

24.40. Proper morphisms

The notion of a proper morphism plays an important role in algebraic geometry. An important example of a proper morphism will be the structure morphism $\mathbf{P}^n_S \to S$ of projective n-space, and this is in fact the motivating example leading to the definition.

Definition 24.40.1. Let $f : X \to S$ be a morphism of schemes. We say f is *proper* if f is separated, finite type, and universally closed.

The morphism from the affine line with zero doubled to the affine line is of finite type and universally closed, so the separation condition is necessary in the definition above. In the rest of this section we prove some of the basic properties of proper morphisms and of universally closed morphisms.

Lemma 24.40.2. *Let $f : X \to S$ be a morphism of schemes. The following are equivalent:*

[11] This is not exactly the same as the definition in Hartshorne. Namely, the definition in Hartshorne (8th corrected printing, 1997) is that f should be the composition of an open immersion followed by a H-projective morphism (see Definition 24.41.1), which does not imply f is quasi-compact. See Lemma 24.41.3 for the implication in the other direction.

(1) *The morphism f is universally closed.*
(2) *There exists an open covering $S = \bigcup V_j$ such that $f^{-1}(V_j) \to V_j$ is universally closed for all indices j.*

Proof. This is clear from the definition. □

Lemma 24.40.3. *Let $f : X \to S$ be a morphism of schemes. The following are equivalent:*

(1) *The morphism f is proper.*
(2) *There exists an open covering $S = \bigcup V_j$ such that $f^{-1}(V_j) \to V_j$ is proper for all indices j.*

Proof. Omitted. □

Lemma 24.40.4. *The composition of proper morphisms is proper. The same is true for universally closed morphisms.*

Proof. A composition of closed morphisms is closed. If $X \to Y \to Z$ are universally closed morphisms and $Z' \to Z$ is any morphism, then we see that $Z' \times_Z X = (Z' \times_Z Y) \times_Y X \to Z' \times_Z Y$ is closed and $Z' \times_Z Y \to Z'$ is closed. Hence the result for universally closed morphisms. We have seen that ``separated'' and ``finite type'' are preserved under compositions (Schemes, Lemma 21.21.13 and Lemma 24.14.3). Hence the result for proper morphisms. □

Lemma 24.40.5. *The base change of a proper morphism is proper. The same is true for universally closed morphisms.*

Proof. This is true by definition for universally closed morphisms. It is true for separated morphisms (Schemes, Lemma 21.21.13). It is true for morphisms of finite type (Lemma 24.14.4). Hence it is true for proper morphisms. □

Lemma 24.40.6. *A closed immersion is proper, hence a fortiori universally closed.*

Proof. The base change of a closed immersion is a closed immersion (Schemes, Lemma 21.18.2). Hence it is universally closed. A closed immersion is separated (Schemes, Lemma 21.23.7). A closed immersion is of finite type (Lemma 24.14.5). Hence a closed immersion is proper. □

Lemma 24.40.7. *Suppose given a commutative diagram of schemes*

$$\begin{tikzcd} X \arrow[rr] \arrow[dr] & & Y \arrow[dl] \\ & S & \end{tikzcd}$$

with Y separated over S.

(1) *If $X \to S$ is universally closed, then the morphism $X \to Y$ is universally closed.*
(2) *If X proper over S, then the morphism $X \to Y$ is proper.*

In particular, in both cases the image of X in Y is closed.

Proof. Assume that $X \to S$ is universally closed (resp. proper). We factor the morphism as $X \to X \times_S Y \to Y$. The first morphism is a closed immersion, see Schemes, Lemma 21.21.11. Hence the first morphism is proper (Lemma 24.40.6). The projection $X \times_S Y \to Y$ is the base change of a unviversally closed (resp. proper) morphism and hence universally closed (resp. proper), see Lemma 24.40.5. Thus $X \to Y$ is universally closed (resp. proper) as the composition of universally closed (resp. proper) morphisms (Lemma 24.40.4). □

The following lemma says that the image of a proper scheme (in a separated scheme of finite type over the base) is proper.

Lemma 24.40.8. *Let S be a scheme. Let $f : X \to Y$ be a morphism of schemes over S. If X is universally closed over S and f is surjective then Y is universally closed over S. In particular, if also Y is separated and of finite type over S, then Y is proper over S.*

Proof. Assume X is universally closed and f surjective. Denote $p : X \to S$, $q : Y \to S$ the structure morphisms. Let $S' \to S$ be a morphism of schemes. The base change $f' : X_{S'} \to Y_{S'}$ is surjective (Lemma 24.9.4), and the base change $p' : X_{S'} \to S'$ is closed. If $T \subset Y_{S'}$ is closed, then $(f')^{-1}(T) \subset X_{S'}$ is closed, hence $p'((f')^{-1}(T)) = q'(T)$ is closed. So q' is closed. □

The proof of the following lemma is due to Bjorn Poonen, see this location.

Lemma 24.40.9. *A universally closed morphism of schemes is quasi-compact.*

Proof. Let $f : X \to S$ be a morphism. Assume that f is not quasi-compact. Our goal is to show that f is not universally closed. By Schemes, Lemma 21.19.2 there exists an affine open $V \subset S$ such that $f^{-1}(V)$ is not quasi-compact. To achieve our goal it suffices to show that $f^{-1}(V) \to V$ is not universally closed, hence we may assume that $S = Spec(A)$ for some ring A.

Write $X = \bigcup_{i \in I} X_i$ where the X_i are affine open subschemes of X. Let $T = Spec(A[y_i; i \in I])$. Let $T_i = D(y_i) \subset T$. Let Z be the closed set $(X \times_S T) - \bigcup_{i \in I}(X_i \times_S T_i)$. It suffices to prove that the image $f_T(Z)$ of Z under $f_T : X \times_S T \to T$ is not closed.

There exists a point $s \in S$ such that there is no neighborhood U of s in S such that X_U is quasi-compact. Otherwise we could cover S with finitely many such U and Schemes, Lemma 21.19.2 would imply f quasi-compact. Fix such an $s \in S$.

First we check that $f_T(Z_s) \neq T_s$. Let $t \in T$ be the point lying over s with $\kappa(t) = \kappa(s)$ such that $y_i = 1$ in $\kappa(t)$ for all i. Then $t \in T_i$ for all i, and the fiber of $Z_s \to T_s$ above t is isomorphic to $(X - \bigcup_{i \in I} X_i)_s$, which is empty. Thus $t \in T_s - f_T(Z_s)$.

Assume $f_T(Z)$ is closed in T. Then there exists an element $g \in A[y_i; i \in I]$ with $f_T(Z) \subset V(g)$ but $t \notin V(g)$. Hence the image of g in $\kappa(t)$ is nonzero. In particular some coefficient of g has nonzero image in $\kappa(s)$. Hence this coefficient is invertible on some neighborhood U of s. Let J be the finite set of $j \in I$ such that y_j appears in g. Since X_U is not quasi-compact, we may choose a point $x \in X - \bigcup_{j \in J} X_j$ lying above some $u \in U$. Since g has a coefficient that is invertible on U, we can find a point $t' \in T$ lying above u such that $t' \notin V(g)$ and $t' \in V(y_i)$ for all $i \notin J$. This is true because $V(y_i; i \in I, i \notin J) = Spec(A[t_j; j \in J])$ and the set of points of this scheme lying over u is bijective with $Spec(\kappa(u)[t_j; j \in J])$. In other words $t' \notin T_i$ for each $i \notin J$. By Schemes, Lemma 21.17.5 we can find a point z of $X \times_S T$ mapping to $x \in X$ and to $t' \in T$. Since $x \notin X_j$ for $j \in J$ and $t' \notin T_i$ for $i \in I \setminus J$ we see that $z \in Z$. On the other hand $f_T(z) = t' \notin V(g)$ which contradicts $f_T(Z) \subset V(g)$. Thus the assumption ``$f_T(Z)$ closed'' is wrong and we conclude indeed that f_T is not closed, as desired. □

24.41. Projective morphisms

We will use the definition of a projective morphism from [**DG67**]. The version of the definition with the ``H'' is the one from [**Har77**]. The resulting definitions are different. Both are useful.

Definition 24.41.1. Let $f : X \to S$ be a morphism of schemes.

(1) We say f is *projective* if X is isomorphic as an S-scheme to a closed subscheme of a projective bundle $\mathbf{P}(\mathcal{E})$ for some quasi-coherent, finite type $\mathcal{O}_S$-module $\mathcal{E}$.
(2) We say f is *H-projective* if there exists and integer n and a closed immersion $X \to \mathbf{P}^n_S$ over S.
(3) We say f is *locally projective* if there exists an open covering $S = \bigcup U_i$ such that each $f^{-1}(U_i) \to U_i$ is projective.

Lemma 24.41.2. *An H-projective morphism is projective.*

Proof. This is true as $\mathbf{P}^n_S$ is a projective bundle over S, see Constructions, Lemma 22.20.4. $\square$

Lemma 24.41.3. *Let $f : X \to S$ be a H-quasi-projective morphism. Then f factors as $X \to X' \to S$ where $X \to X'$ is an open immersion and $X' \to S$ is H-projective.*

Proof. By definition we can factor f as a quasi-compact immersion $i : X \to \mathbf{P}^n_S$ followed by the projection $\mathbf{P}^n_S \to S$. By Lemma 24.5.7 there exists a closed subscheme $X' \subset \mathbf{P}^n_S$ such that i factors through an open immersion $X \to X'$. The lemma follows. $\square$

Lemma 24.41.4. *Let $f : X \to S$ be a morphism of schemes. The following are equivalent:*

(1) *The morphism f is locally projective.*
(2) *There exists an open covering $S = \bigcup U_i$ such that each $f^{-1}(U_i) \to U_i$ is H-projective.*

Proof. By Lemma 24.41.2 we see that (2) implies (1). Assume (1). For every point $s \in S$ we can find $Spec(R) = U \subset S$ an affine open neighbourhood of s such that X_U is isomorphic to a closed subscheme of $\mathbf{P}(\mathcal{E})$ for some finite type, quasi-coherent sheaf of $\mathcal{O}_U$-modules $\mathcal{E}$. Write $\mathcal{E} = \widetilde{M}$ for some finite type R-module M (see Properties, Lemma 23.16.1). Choose generators $x_0, \ldots, x_n \in M$ of M as an R-module. Consider the surjective graded R-algebra map

$$R[X_0, \ldots, X_n] \longrightarrow \text{Sym}_R(M).$$

According to Constructions, Lemma 22.11.3 the corresponding morphism

$$\mathbf{P}(\mathcal{E}) \to \mathbf{P}^n_R$$

is a closed immersion. Hence we conclude that $f^{-1}(U)$ is isomorphic to a closed subscheme of $\mathbf{P}^n_U$ (as a scheme over U). In other words: (2) holds. $\square$

Lemma 24.41.5. *A locally projective morphism is proper.*

Proof. Let $f : X \to S$ be locally projective. In order to show that f is proper we may work locally on the base, see Lemma 24.40.3. Hence, by Lemma 24.41.4 above we may assume there exists a closed immersion $X \to \mathbf{P}^n_S$. By Lemmas 24.40.4 and 24.40.6 it suffices to prove that $\mathbf{P}^n_S \to S$ is proper. Since $\mathbf{P}^n_S \to S$ is the base change of $\mathbf{P}^n_{\mathbf{Z}} \to Spec(\mathbf{Z})$ it suffices to show that $\mathbf{P}^n_{\mathbf{Z}} \to Spec(\mathbf{Z})$ is proper, see Lemma 24.40.5. By Constructions, Lemma 22.8.8 the scheme $\mathbf{P}^n_{\mathbf{Z}}$ is separated. By Constructions, Lemma 22.8.9 the scheme $\mathbf{P}^n_{\mathbf{Z}}$ is quasi-compact. It is clear that $\mathbf{P}^n_{\mathbf{Z}} \to Spec(\mathbf{Z})$ is locally of finite type since $\mathbf{P}^n_{\mathbf{Z}}$ is covered by the affine opens $D_+(X_i)$ each of which is the spectrum of the finite type $\mathbf{Z}$-algebra

$$\mathbf{Z}[X_0/X_i, \ldots, X_n/X_i].$$

Finally, we have to show that $\mathbf{P}^n_{\mathbf{Z}} \to Spec(\mathbf{Z})$ is universally closed. This follows from Constructions, Lemma 22.8.11 and the valuative criterion (see Schemes, Proposition 21.20.6). $\square$

Lemma 24.41.6. *Let S be a scheme. There exists a closed immersion*

$$\mathbf{P}^n_S \times_S \mathbf{P}^m_S \longrightarrow \mathbf{P}^{nm+n+m}_S$$

called the Segre embedding.

Proof. It suffices to prove this when $S = Spec(\mathbf{Z})$. Hence we will drop the index S and work in the absolute setting. Write $\mathbf{P}^n = \text{Proj}(\mathbf{Z}[X_0, \ldots, X_n])$, $\mathbf{P}^m = \text{Proj}(\mathbf{Z}[Y_0, \ldots, Y_m])$, and $\mathbf{P}^{nm+n+m} = \text{Proj}(\mathbf{Z}[Z_0, \ldots, Z_{nm+n+m}])$. In order to map into $\mathbf{P}^{nm+n+m}$ we have to write down an invertible sheaf $\mathcal{L}$ on the left hand side and $(n+1)(m+1)$ sections s_i which generate it. See Constructions, Lemma 22.13.1. The invertible sheaf we take is

$$\mathcal{L} = \text{pr}_1^*\mathcal{O}_{\mathbf{P}^n}(1) \otimes \text{pr}_2^*\mathcal{O}_{\mathbf{P}^m}(1)$$

The sections we take are

$$s_0 = X_0Y_0,\ s_1 = X_1Y_0, \ldots,\ s_n = X_nY_0,\ s_{n+1} = X_0Y_1, \ldots,\ s_{nm+n+m} = X_nY_m.$$

These generate $\mathcal{L}$ since the sections X_i generate $\mathcal{O}_{\mathbf{P}^n}(1)$ and the sections Y_j generate $\mathcal{O}_{\mathbf{P}^m}(1)$. The induced morphism φ has the property that

$$\varphi^{-1}(D_+(Z_{i+(n+1)j})) = D_+(X_i) \times D_+(Y_j).$$

Hence it is an affine morphism. The corresponding ring map in case $(i,j) = (0,0)$ is the map

$$\mathbf{Z}[Z_1/Z_0, \ldots, Z_{nm+n+m}/Z_0] \longrightarrow \mathbf{Z}[X_1/X_0, \ldots, X_n/X_0, Y_1/Y_0, \ldots, Y_n/Y_0]$$

which maps Z_i/Z_0 to the element X_i/X_0 for $i \leq n$ and the element $Z_{(n+1)j}/Z_0$ to the element Y_j/Y_0. Hence it is surjective. A similar argument works for the other affine open subsets. Hence the morphism φ is a closed immersion. □

Lemma 24.41.7. *A composition of H-projective morphisms is H-projective.*

Proof. Suppose $X \to Y$ and $Y \to Z$ are H-projective. Then there exist closed immersions $X \to \mathbf{P}^n_Y$ over Y, and $Y \to \mathbf{P}^m_Z$ over Z. Consider the following diagram

$$\begin{tikzcd}
X \arrow[r] \arrow[d] & \mathbf{P}^n_Y \arrow[r] \arrow[dl] & \mathbf{P}^n_{\mathbf{P}^m_Z} \arrow[r, equal] \arrow[dl] & \mathbf{P}^n_Z \times_Z \mathbf{P}^m_Z \arrow[r] & \mathbf{P}^{nm+n+m}_Z \arrow[ddllll] \\
Y \arrow[r] \arrow[d] & \mathbf{P}^m_Z \arrow[dl] & & & \\
Z & & & &
\end{tikzcd}$$

Here the rightmost top horizontal arrow is the Segre embedding, see Lemma 24.41.6. The diagram identifies X as a closed subscheme of $\mathbf{P}^{nm+n+m}_Z$ as desired. □

Lemma 24.41.8. *A base change of a H-projective morphism is H-projective.*

Proof. This is true because the base change of projective space over a scheme is projective space, and the fact that the base change of a closed immersion is a closed immersion, see Schemes, Lemma 21.18.2. □

Lemma 24.41.9. *A base change of a (locally) projective morphism is (locally) projective.*

Proof. This is true because the base change of a projective bundle over a scheme is a projective bundle, the pullback of a finite type $\mathcal{O}$-module is of finite type (Modules, Lemma 15.9.2) and the fact that the base change of a closed immersion is a closed immersion, see Schemes, Lemma 21.18.2. Some details omitted. □

Lemma 24.41.10. *Le X be a scheme. Let $\mathcal{I} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals. If $\mathcal{I}$ is of finite type, then the blowing up of X in the ideal sheaf $\mathcal{I}$ is a projective morphism $b : \underline{Proj}_X(\bigoplus_{n \geq 0} \mathcal{I}^n) \to X$.*

Proof. Omitted. Hint: Use $\mathcal{I}$ as the sheaf $\mathcal{E}$ of the definition of a projective morphism. □

24.42. Integral and finite morphisms

Recall that a ring map $R \to A$ is said to be *integral* if every element of A satisfies a monic equation with coefficients in R. Recall that a ring map $R \to A$ is said to be finite if A is *finite* as an R-module. See Algebra, Definition 7.32.1.

Definition 24.42.1. Let $f : X \to S$ be a morphism of schemes.

1. We say that f is *integral* if f is affine and if for every affine open $Spec(R) = V \subset S$ with inverse image $Spec(A) = f^{-1}(V) \subset X$ the associated ring map $R \to A$ is integral.
2. We say that f is *finite* if f is affine and if for every affine open $Spec(R) = V \subset S$ with inverse image $Spec(A) = f^{-1}(V) \subset X$ the associated ring map $R \to A$ is finite.

It is clear that integral/finite morphisms are separated and quasi-compact. It is also clear that a finite morphism is a morphism of finite type. Most of the lemmas in this section are completely standard. But note the fun Lemma 24.42.7 at the end of the section.

Lemma 24.42.2. *Let $f : X \to S$ be a morphism of schemes. The following are equivalent:*

1. *The morphism f is integral.*
2. *There exists an affine open covering $S = \bigcup U_i$ such that each $f^{-1}(U_i)$ is affine and $\mathcal{O}_S(U_i) \to \mathcal{O}_X(f^{-1}(U_i))$ is integral.*
3. *There exists an open covering $S = \bigcup S_j$ such that each $f^{-1}(U_i) \to U_i$ is integral.*

Moreover, if f is integral then for every open subscheme $U \subset S$ the morphism $f : f^{-1}(U) \to U$ is integral.

Proof. See Algebra, Lemma 7.32.12. Some details omitted. □

Lemma 24.42.3. *Let $f : X \to S$ be a morphism of schemes. The following are equivalent:*

1. *The morphism f is finite.*
2. *There exists an affine open covering $S = \bigcup U_i$ such that each $f^{-1}(U_i)$ is affine and $\mathcal{O}_S(U_i) \to \mathcal{O}_X(f^{-1}(U_i))$ is finite.*
3. *There exists an open covering $S = \bigcup S_j$ such that each $f^{-1}(U_i) \to U_i$ is finite.*

Moreover, if f is finite then for every open subscheme $U \subset S$ the morphim $f : f^{-1}(U) \to U$ is finite.

Proof. See Algebra, Lemma 7.32.12. Some details omitted. □

Lemma 24.42.4. *A finite morphism is integral. An integral morphism which is locally of finite type is finite.*

Proof. See Algebra, Lemma 7.32.3 and Lemma 7.32.5. □

Lemma 24.42.5. *A composition of finite morphisms is finite. Same is true for integral morphisms.*

Proof. See Algebra, Lemmas 7.7.3 and 7.32.6. ☐

Lemma 24.42.6. *A base change of a finite morphism is finite. Same is true for integral morphisms.*

Proof. See Algebra, Lemma 7.32.11. ☐

Lemma 24.42.7. *Let $f : X \to S$ be a morphism of schemes. The following are equivalent*

(1) *f is integral, and*
(2) *f is affine and universally closed.*

Proof. Assume (1). An integral morphism is affine by definition. A base change of an integral morphism is integral so in order to prove (2) it suffices to show that an integral morphism is closed. This follows from Algebra, Lemmas 7.32.20 and 7.36.6.

Assume (2). We may assume f is the morphism $f : Spec(A) \to Spec(R)$ coming from a ring map $R \to A$. Let a be an element of A. We have to show that a is integral over R, i.e. that in the kernel I of the map $R[x] \to A$ sending x to a there is a monic polynomial. Consider the ring $B = A[x]/(ax - 1)$ and let J be the kernel of the composition $R[x] \to A[x] \to B$. If $f \in J$ there exists $q \in A[x]$ such that $f = (ax - 1)q$ in $A[x]$ so if $f = \sum_i f_i x^i$ and $q = \sum_i q_i x^i$, for all $i \geq 0$ we have $f_i = aq_{i-1} - q_i$. For $n \geq \deg q + 1$ the polynomial

$$\sum_{i \geq 0} f_i x^{n-i} = \sum_{i \geq 0} (aq_{i-1} - q_i) x^{n-i} = (a - x) \sum_{i \geq 0} q_i x^{n-i-1}$$

is clearly in I; if $f_0 = 1$ this polynomial is also monic, so we are reduced to prove that J contains a polynomial with constant term 1. We do it by proving $Spec(R[x]/(J + (x))$ is empty.

Since f is universally closed the base change $Spec(A[x]) \to Spec(R[x])$ is closed. Hence the image of the closed subset $Spec(B) \subset Spec(A[x])$ is the closed subset $Spec(R[x]/J) \subset Spec(R[x])$, see Example 24.4.4 and Lemma 24.4.3. In particular $Spec(B) \to Spec(R[x]/J)$ is surjective. Consider the following diagram where every square is a pullback:

$$\begin{tikzcd} Spec(B) \arrow[r, two heads, "g"] & Spec(R[x]/J) \arrow[r] & Spec(R[x]) \\ \emptyset \arrow[u] \arrow[r] & Spec(R[x]/(J + (x))) \arrow[u] \arrow[r] & Spec(R) \arrow[u, "0"'] \end{tikzcd}$$

The bottom left corner is empty because it is the spectrum of $R \otimes_{R[x]} B$ where the map $R[x] \to B$ sends x to an invertible element and $R[x] \to R$ sends x to 0. Since g is surjective this implies $Spec(R[x]/(J + (x)))$ is empty, as we wanted to show. ☐

Lemma 24.42.8. *Let $f : X \to S$ be an integral morphism. Then every point of X is closed in its fibre.*

Proof. See Algebra, Lemma 7.32.18. ☐

Lemma 24.42.9. *A finite morphism is quasi-finite.*

Proof. This is implied by Algebra, Lemma 7.113.4 and Lemma 24.19.9. Alternatively, all points in fibres are closed points by Lemma 24.42.8 (and the fact that a finite morphism is integral) and use Lemma 24.19.6 (3) to see that f is quasi-finite at x for all $x \in X$. ☐

Lemma 24.42.10. *A finite morphism is proper.*

Proof. A finite morphism is integral and hence universally closed by Lemma 24.42.7. It is also clearly separated and of finite type. Hence it is proper by definition. □

Lemma 24.42.11. *A closed immersion is finite (and a fortiori integral).*

Proof. True because a closed immersion is affine (Lemma 24.11.9) and a surjective ring map is finite and integral. □

Lemma 24.42.12. *Let $f : X \to Y$ and $g : Y \to Z$ be morphisms.*

(1) *If $g \circ f$ is finite and g separated then f is finite.*
(2) *If $g \circ f$ is integral and g separated then f is integral.*

Proof. Assume $g \circ f$ is finite (resp. integral) and g separated. The base change $X \times_Z Y \to Y$ is finite (resp. integral) by Lemma 24.42.6. The morphism $X \to X \times_Z Y$ is a closed immersion as $Y \to Z$ is separated, see Schemes, Lemma 21.21.12. A closed immersion is finite (resp. integral), see Lemma 24.42.11. The composition of finite (resp. integral) morphisms is finite (resp. integral), see Lemma 24.42.5. Thus we win. □

Lemma 24.42.13. *Let $f : X \to Y$ be a morphism of schemes. If f is finite and a monomorphism, then f is a closed immersion.*

Proof. This reduces to Algebra, Lemma 7.99.6. □

24.43. Universal homeomorphisms

The following definition is really superfluous since a universal homeomorphism is really just an integral, universally injective and surjective morphism, see Lemma 24.43.3.

Definition 24.43.1. A morphisms $f : X \to Y$ of schemes is called a *universal homeomorphism* if the base change $f' : Y' \times_Y X \to Y'$ is a homeomorphism for every morphism $Y' \to Y$.

Lemma 24.43.2. *Let $f : X \to Y$ be a morphism of schemes. If f is a homeomorphism then f is affine.*

Proof. Let $y \in Y$ be a point. Let $y \in V$ be an affine open neighbourhood. let $x \in X$ be the unique point of X mapping to y. Let $U \subset X$ be an affine open neighbourhood of x which maps into V. Since $f(U) \subset V$ is open we may choose a $h \in \Gamma(V, \mathcal{O}_Y)$ such that $y \in D(h) \subset f(U)$. Denote $h' \in \Gamma(U, \mathcal{O}_X)$ the restriction of $f^\sharp(h)$ to U. Then we see that $D(h') \subset U$ is equal to $f^{-1}(D(h))$. In other words, every point of Y has an open neighbourhood whose inverse image is affine. Thus f is affine, see Lemma 24.11.3. □

Lemma 24.43.3. *Let $f : X \to Y$ be a morphism of schemes. The following are equivalent:*

(1) *f is a universal homeomorphism, and*
(2) *f is integral, universally injective and surjective.*

Proof. Assume f is a universal homeomorphism. By Lemma 24.43.2 we see that f is affine. Since f is clearly universally closed we see that f is integral by Lemma 24.42.7. It is also clear that f is universally injective and surjective.

Assume f is integral, universally injective and surjective. By Lemma 24.42.7 f is universally closed. Since it is also universally bijective (see Lemma 24.9.4) we see that it is a universal homeomorphism. □

Lemma 24.43.4. *Let X be a scheme. The canonical closed immersion $X_{red} \to X$ (see Schemes, Definition 21.12.5) is a universal homeomorphism.*

Proof. Omitted. □

24.44. Finite locally free morphisms

In many papers the authors use finite flat morphisms when they really mean finite locally free morphisms. The reason is that if the base is locally Noetherian then this is the same thing. But in general it is not, see Exercises, Exercise 65.4.3.

Definition 24.44.1. Let $f : X \to S$ be a morphism of schemes. We say f is *finite locally free* if f is affine and $f_*\mathcal{O}_X$ is a finite locally free $\mathcal{O}_S$-module. In this case we say f is has *rank* or *degree* d if the sheaf $f_*\mathcal{O}_X$ is finite locally free of degree d.

Note that if $f : X \to S$ is finite locally free then S is the disjoint union of open and closed subschemes S_d such that $f^{-1}(S_d) \to S_d$ is finite locally free of degree d.

Lemma 24.44.2. *Let $f : X \to S$ be a morphism of schemes. The following are equivalent:*

(1) *f is finite locally free,*
(2) *f is finite, flat, and locally of finite presentation.*

If S is locally Noetherian these are also equivalent to

(3) *f is finite and flat.*

Proof. See Algebra, Lemma 7.72.2. The Noetherian case follows as a finite module over a Noetherian ring is a finitely presented module, see Algebra, Lemma 7.28.4. □

Lemma 24.44.3. *A composition of finite locally free morphisms is finite locally free.*

Proof. Omitted. □

Lemma 24.44.4. *A base change of a finite locally free morphism is finite locally free.*

Proof. Omitted. □

Lemma 24.44.5. *Let $f : X \to S$ be a finite locally free morphism of schemes. There exists a disjoint union decomposition $S = \coprod_{d \geq 0} S_d$ by open and closed subschemes such that setting $X_d = f^{-1}(S_d)$ the restrictions $f|_{X_d}$ are finite locally free morphisms $X_d \to S_d$ of degree d.*

Proof. This is true because a finite locally free sheaf locally has a well defined rank. Details omittted. □

Lemma 24.44.6. *Let $f : Y \to X$ be a finite morphism with X affine. There exists a diagram*

$$\begin{tikzcd} Z' \arrow[rd] & Y' \arrow[l, "i"'] \arrow[r] \arrow[d] & Y \arrow[d] \\ & X' \arrow[r] & X \end{tikzcd}$$

where

(1) *$Y' \to Y$ and $X' \to X$ are surjective finite locally free,*
(2) *$Y' = X' \times_X Y$,*
(3) *$i : Y' \to Z'$ is a closed immersion,*
(4) *$Z' \to X'$ is finite locally free, and*

(5) $Z' = \bigcup_{j=1,\ldots,m} Z'_j$ *is a (set theoretic) finite union of closed subschemes, each of which maps isomorphically to* X'.

Proof. Write $X = Spec(A)$ and $Y = Spec(B)$. See also More on Algebra, Section 12.16. Let $x_1, \ldots, x_n \in B$ be generators of B over A. For each i we can choose a monic polynomial $P_i(T) \in A[T]$ such that $P(x_i) = 0$ in B. By Algebra, Lemma 7.125.9 (applied n times) there exists a finite locally free ring extension $A \subset A'$ such that each P_i splits completely:

$$P_i(T) = \prod\nolimits_{k=1,\ldots,d_i}(T - \alpha_{ik})$$

for certain $\alpha_{ik} \in A'$. Set

$$C = A'[T_1, \ldots, T_n]/(P_1(T_1), \ldots, P_n(T_n))$$

and $B' = A' \otimes_A B$. The map $C \to B'$, $T_i \mapsto 1 \otimes x_i$ is an A'-algebra surjection. Setting $X' = Spec(A')$, $Y' = Spec(B')$ and $Z' = Spec(C)$ we see that (1) -- (4) hold. Part (5) holds because set theoretically $Spec(C)$ is the union of the closed subschemes cut out by the ideals

$$(T_1 - \alpha_{1k_1}, T_2 - \alpha_{2k_2}, \ldots, T_n - \alpha_{nk_n})$$

for any $1 \leq k_i \leq d_i$. □

The following lemma is stated in the correct generality in Lemma 24.47.4 below.

Lemma 24.44.7. *Let $f : Y \to X$ be a finite morphism of schemes. Let $T \subset Y$ be a closed nowhere dense subset of Y. Then $f(T) \subset X$ is a closed nowhere dense subset of X.*

Proof. By Lemma 24.42.10 we know that $f(T) \subset X$ is closed. Let $X = \bigcup X_i$ be an affine covering. Since T is nowhere dense in Y, we see that also $T \cap f^{-1}(X_i)$ is nowhere dense in $f^{-1}(X_i)$. Hence if we can prove the theorem in the affine case, then we see that $f(T) \cap X_i$ is nowhere dense. This then implies that T is nowhere dense in X by Topology, Lemma 5.17.4.

Assume X is affine. Choose a diagram

$$\begin{tikzcd} Z' \arrow[dr] & Y' \arrow[l, "i"'] \arrow[r, "a"] \arrow[d, "f'"] & Y \arrow[d, "f"] \\ & X' \arrow[r, "b"] & X \end{tikzcd}$$

as in Lemma 24.44.6. The morphisms a, b are open since they are finite locally free (Lemmas 24.44.2 and 24.24.9). Hence $T' = a^{-1}(T)$ is nowhere dense, see Topology, Lemma 5.17.6. The morphism b is surjective and open. Hence, if we can prove $f'(T') = b^{-1}(f(T))$ is nowhere dense, then $f(T)$ is nowhere dense, see Topology, Lemma 5.17.6. As i is a closed immersion, by Topology, Lemma 5.17.5 we see that $i(T') \subset Z'$ is closed and nowhere dense. Thus we have reduced the problem to the case discussed in the following paragraph.

Assume that $Y = \bigcup_{i=1,\ldots,n} Y_i$ is a finite union of closed subsets, each mapping isomorphically to X. Consider $T_i = Y_i \cap T$. If each of the T_i is nowhere dense in Y_i, then each $f(T_i)$ is nowhere dense in X as $Y_i \to X$ is an isomorphism. Hence $f(T) = f(T_i)$ is a finite union of nowhere dense closed subsets of X and we win, see Topology, Lemma 5.17.2. Suppose not, say T_1 contains a nonempty open $V \subset Y_1$. We are going to show this leads to a contradiction. Consider $Y_2 \cap V \subset V$. This is either a proper closed subset, or equal to V. In the first case we replace V by $V \setminus V \cap Y_2$, so $V \subset T_1$ is open in Y_1 and does not meet Y_2. In the second case we have $V \subset Y_1 \cap Y_2$ is open in both Y_1 and Y_2. Repeat sequentially with $i = 3, \ldots, n$. The result is a disjoint union decomposition

$$\{1, \ldots, n\} = I_1 \coprod I_2, \quad 1 \in I_1$$

and an open V of Y_1 contained in T_1 such that $V \subset Y_i$ for $i \in I_1$ and $V \cap Y_i = \emptyset$ for $i \in I_2$. Set $U = f(V)$. This is an open of X since $f|_{Y_1} : Y_1 \to X$ is an isomorphism. Then

$$f^{-1}(U) = V \coprod \bigcup\nolimits_{i \in I_2} (Y_i \cap f^{-1}(U))$$

As $\bigcup_{i \in I_2} Y_i$ is closed, this implies that $V \subset f^{-1}(U)$ is open, hence $V \subset Y$ is open. This contradicts the assumption that T is nowhere dense in Y, as desired. □

24.45. Generically finite morphisms

In this section we characterize maps between schemes which are locally of finite type and which are ``generically finite'' in some sense.

Lemma 24.45.1. *Let X, Y be schemes. Let $f : X \to Y$ be locally of finite type. Let $\eta \in Y$ be a generic point of an irreducible component of Y. The following are equivalent:*

1. *the set $f^{-1}(\{\eta\})$ is finite,*
2. *there exist affine opens $U_i \subset X$, $i = 1, \ldots, n$ and $V \subset Y$ with $f(U_i) \subset V$, $\eta \in V$ and $f^{-1}(\{\eta\}) \subset \bigcup U_i$ such that each $f|_{U_i} : U_i \to V$ is finite.*

If f is quasi-separated, then these are also equivalent to

3. *there exist affine opens $V \subset Y$, and $U \subset X$ with $f(U) \subset V$, $\eta \in V$ and $f^{-1}(\{\eta\}) \subset U$ such that $f|_U : U \to V$ is finite.*

If f is quasi-compact and quasi-separated, then these are also equivalent to

4. *there exists an affine open $V \subset Y$, $\eta \in V$ such that $f^{-1}(V) \to V$ is finite.*

Proof. The question is local on the base. Hence we may replace Y by an affine neighbourhood of η, and we may and do assume throughout the proof below that Y is affine, say $Y = Spec(R)$.

It is clear that (2) implies (1). Assume that $f^{-1}(\{\eta\}) = \{\xi_1, \ldots, \xi_n\}$ is finite. Choose affine opens $U_i \subset X$ with $\xi_i \in U_i$. By Algebra, Lemma 7.113.9 we see that after replacing Y by a standard open in Y each of the morphisms $U_i \to Y$ is finite. In other words (2) holds.

It is clear that (3) implies (1). Assume $f^{-1}(\{\eta\}) = \{\xi_1, \ldots, \xi_n\}$ and assume that f is quasi-separated. Since Y is affine this implies that X is quasi-separated. Since each ξ_i maps to a generic point of an irreducible component of Y, we see that each ξ_i is a generic point of an irreducible component of X. By Properties, Lemma 23.26.1 we can find an affine open $U \subset X$ containing each ξ_i. By Algebra, Lemma 7.113.9 we see that after replacing Y by a standard open in Y the morphisms $U \to Y$ is finite. In other words (3) holds.

It is clear that (4) implies all of (1) -- (3) with no further assumptions on f. Suppose that f is quasi-compact and quasi-separated. We have to show that the equivalent conditions (1) -- (3) imply (4). Let U, V be as in (3). Replace Y by V. Since f is quasi-compact and Y is quasi-compact (being affine) we see that X is quasi-compact. Hence $Z = X \setminus U$ is quasi-compact, hence the morphism $f|_Z : Z \to Y$ is quasi-compact. By construction of Z we see that $\eta \notin f(Z)$. Hence by Lemma 24.6.4 we see that there exists an affine open neighbourhood V' of η in Y such that $f^{-1}(V') \cap Z = \emptyset$. Then we have $f^{-1}(V') \subset U$ and this means that $f^{-1}(V') \to V'$ is finite. □

Example 24.45.2. Let $A = \prod_{n \in \mathbf{N}} \mathbf{F}_2$. Every element of A is an idempotent. Hence every prime ideal is maximal with residue field $\mathbf{F}_2$. Thus the topology on $X = Spec(A)$ is totally disconnected and quasi-compact. The projection maps $A \to \mathbf{F}_2$ define open points of $Spec(A)$. It cannot be the case that all the points of X are open since X is quasi-compact. Let $x \in X$ be a closed point which is not open. Then we can form a scheme Y which is two copies of X glued along $X \setminus \{x\}$. In other words, this is X with x doubled, compare Schemes, Example 21.14.3. The morphism $f : Y \to X$ is quasi-compact, finite type and has finite fibres but is not quasi-separated. The point $x \in X$ is a generic point of an irreducible component of X (since X is totally disconnected). But properties (3) and (4) of Lemma 24.45.1 do not hold. The reason is that for any open neighbourhood $x \in U \subset X$ the inverse image $f^{-1}(U)$ is not affine because functions on $f^{-1}(U)$ cannot separated the two points lying over x (proof omitted; this is a nice exercise). Hence the condition that f is quasi-separated is necessary in parts (3) and (4) of the lemma.

Remark 24.45.3. An alternative to Lemma 24.45.1 is the statement that a quasi-finite morphism is finite over a dense open of the target. This will be shown in More on Morphisms, Section 33.29.

Lemma 24.45.4. *Let X, Y be integral schemes. Let $f : X \to Y$ be locally of finite type. Assume f is dominant. The following are equivalent:*

1. *the extension $R(Y) \subset R(X)$ has transcendence degree* 0*,*
2. *the extension $R(Y) \subset R(X)$ is finite,*
3. *there exist nonempty affine opens $U \subset X$ and $V \subset Y$ such that $f(U) \subset V$ and $f|_U : U \to V$ is finite, and*
4. *the generic point of X is the only point of X mapping to the generic point of Y.*

If f is separated, or if f is quasi-compact, then these are also equivalent to

5. *there exists a nonempty affine open $V \subset Y$ such that $f^{-1}(V) \to V$ is finite.*

Proof. Choose any affine opens $Spec(A) = U \subset X$ and $Spec(R) = V \subset Y$ such that $f(U) \subset V$. Then R and A are domains by definition. The ring map $R \to A$ is of finite type Lemma 24.14.2). Let $K = f.f.(R) = R(Y)$ and $L = f.f.(A) = R(X)$. Then $K \subset L$ is a finitely generated field extension. Hence we see that (1) is equivalent to (2).

Suppose (2) holds. Let $x_1, \ldots, x_n \in A$ be generators of A over R. By assumption there exist nonzero polynomials $P_i(X) \in R[X]$ such that $P_i(x_i) = 0$. Let $f_i \in R$ be the leading coefficient of P_i. Then we conclude that $R_{f_1 \ldots f_n} \to A_{f_1 \ldots f_n}$ is finite, i.e., (3) holds. Note that (3) implies (2). So now we see that (1), (2) and (3) are all equivalent.

Let η be the generic point of X, and let $\eta' \in Y$ be the generic point of Y. Assume (4). Then $\dim_\eta(X_{\eta'}) = 0$ and we see that $R(X) = \kappa(\eta)$ has transcendence degree 0 over $R(Y) = \kappa(\eta')$ by Lemma 24.27.1. In other words (1) holds. Assume the equivalent conditions (1), (2) and (3). Suppose that $x \in X$ is a point mapping to η'. As x is a specialization of η, this gives inclusions $R(Y) \subset \mathcal{O}_{X,x} \subset R(X)$, which implies $\mathcal{O}_{X,x}$ is a field, see Algebra, Lemma 7.32.17. Hence $x = \eta$. Thus we see that (1) -- (4) are all equivalent.

It is clear that (5) implies (3) with no additional assumptions on f. What remains is to prove that if f is either separated or quasi-compact, then the equivalent conditions (1) -- (4) imply (5).

Assume U, V as in (3) and assume f is separated. Then $U \to f^{-1}(V)$ is a morphism from a scheme proper over VLemma 24.42.10) into a scheme separated over V. Hence $U \subset f^{-1}(V)$ is closed Lemma 24.40.7. Since X is irreducible we conclude $U = f^{-1}(V)$. This proves (5).

Assume f is quasi-compact. Let U, V be as in (3). Then $f^{-1}(V)$ is quasi-compact. Consider the closed subset $Z = f^{-1}(V) \setminus U$. Since Z does not contain the generic point of X we see that the quasi-compact morphism $f : Z \to V$ is not dominant by Lemma 24.6.3. Hence after shrinking V we may assume that $f^{-1}(V) = U$ which implies that (5) holds. $\square$

Definition 24.45.5. Let X and Y be integral schemes. Let $f : X \to Y$ be locally of finite type and dominant. Assume $[R(X) : R(Y)] < \infty$, or any other of the equivalent conditions (1) -- (4) of Lemma 24.45.4. Then the positive integer

$$\deg(X/Y) = [R(X) : R(Y)]$$

is called the *degree of X over Y*.

It is possible to extend this notion to a morphism $f : X \to Y$ if (a) Y is integral with generic point η, (b) f is locally of finite type, and (c) $f^{-1}(\{\eta\})$ is finite. Namely, in this case we can define

$$\deg(X/Y) = \sum\nolimits_{\xi \in X,\ f(\xi)=\eta} \dim_{R(Y)}(\mathcal{O}_{X,\xi}).$$

Namely, given that $R(Y) = \kappa(\eta) = \mathcal{O}_{Y,\eta}$ (Lemma 24.8.4) the dimensions above are finite by Lemma 24.45.1 above. However, for most applications the definition given above is the right one.

Lemma 24.45.6. *Let X, Y, Z be integral schemes. Let $f : X \to Y$ and $g : Y \to Z$ be dominant morphisms locally of finite type. Assume that $[R(X) : R(Y)] < \infty$ and $[R(Y) : R(Z)] < \infty$. Then*

$$\deg(X/Z) = \deg(X/Y)\deg(Y/Z).$$

Proof. This comes from the multiplicativity of degrees in towers of finite extensions of fields. $\square$

Remark 24.45.7. Let $f : X \to Y$ be a morphism of schemes which is locally of finite type. There are (at least) two properties that we could use to define *generically finite* morphisms. These correspond to whether you want the property to be local on the source or local on the target:

(1) (Local on the target; suggested by Ravi Vakil.) Assume every quasi-compact open of Y has finitely many irreducible components (for example if Y is locally Noetherian). The requirement is that the inverse image of each generic point is finite, see Lemma 24.45.1.
(2) (Local on the source.) The requirement is that there exists a dense open $U \subset X$ such that $U \to Y$ is locally quasi-finite.

In case (1) the requirement can be formulated without the auxiliary condition on Y, but probably doesn't give the right notion for general schemes. Property (2) as formulated doesn't imply that the fibres over generic points are finite; however, if f is quasi-compact and Y is as in (1) then it does.

24.46. Normalization

In this section we construct the *normalization*, and the *normalization of one scheme in another*.

Lemma 24.46.1. *Let X be a scheme. Let $\mathcal{A}$ be a quasi-coherent sheaf of $\mathcal{O}_X$-algebras. The subsheaf $\mathcal{A}' \subset \mathcal{A}$ defined by the rule*

$$U \longmapsto \{f \in \mathcal{A}(U) \mid f_x \in \mathcal{A}_x \text{ integral over } \mathcal{O}_{X,x} \text{ for all } x \in U\}$$

is a quasi-coherent $\mathcal{O}_X$-algebra, and for any affine open $U \subset X$ the ring $\mathcal{A}'(U) \subset \mathcal{A}(U)$ is the integral closure of $\mathcal{O}_X(U)$ in $\mathcal{A}(U)$.

Proof. This is a subsheaf by the local nature of the conditions. It is an $\mathcal{O}_X$-algebra by Algebra, Lemma 7.32.7. Let $U \subset X$ be an affine open. Say $U = Spec(R)$ and say $\mathcal{A}$ is the quasi-coherent sheaf associated to the R-algebra A. Then according to Algebra, Lemma 7.32.10 the value of $\mathcal{A}'$ over U is given by the integral closure A' of R in A. This proves the last assertion of the lemma. To prove that $\mathcal{A}'$ is quasi-coherent, it suffices to show that $\mathcal{A}'(D(f)) = A'_f$. This follows from the fact that integral closure and localization commute, see Algebra, Lemma 7.32.9. $\square$

Definition 24.46.2. Let X be a scheme. Let $\mathcal{A}$ be a quasi-coherent sheaf of $\mathcal{O}_X$-algebras. The *integral closure of $\mathcal{O}_X$ in $\mathcal{A}$* is the quasi-coherent $\mathcal{O}_X$-subalgebra $\mathcal{A}' \subset \mathcal{A}$ constructed in Lemma 24.46.1 above.

In the setting of the definition above we can consider the morphism of relative spectra

$$\begin{tikzcd} Y = \underline{Spec}_X(\mathcal{A}) \arrow[rr] \arrow[dr] & & X' = \underline{Spec}_X(\mathcal{A}') \arrow[dl] \\ & X & \end{tikzcd}$$

see Lemma 24.11.5. The scheme $X' \to X$ will be the normalization of X in the scheme Y. Here is a slightly more general setting. Suppose we have a quasi-compact and quasi-separated morphism $f : Y \to X$ of schemes. In this case the sheaf of $\mathcal{O}_X$-algebras $f_*\mathcal{O}_Y$ is quasi-coherent, see Schemes, Lemma 21.24.1. Taking the integral closure $\mathcal{O}' \subset f_*\mathcal{O}_Y$ we obtain a quasi-coherent sheaf of $\mathcal{O}_X$-algebras whose relative spectrum is the normalization of X in Y. Here is the formal definition.

Definition 24.46.3. Let $f : Y \to X$ be a quasi-compact and quasi-separated morphism of schemes. Let $\mathcal{O}'$ be the integral closure of $\mathcal{O}_X$ in $f_*\mathcal{O}_Y$. The *normalization of X in Y* is the scheme[12]

$$\nu : X' = \underline{Spec}_X(\mathcal{O}') \to X$$

over X. It comes equipped with a natural factorization

$$Y \xrightarrow{f'} X' \xrightarrow{\nu} X$$

of the initial morphism f.

The factorization is the composition of the canonical morphism $Y \to \underline{Spec}(f_*\mathcal{O}_Y)$ (see Constructions, Lemma 22.4.7) and the morphism of relative spectra coming from the inclusion map $\mathcal{O}' \to f_*\mathcal{O}_Y$. We can characterize the normalization as follows.

Lemma 24.46.4. *Let $f : Y \to X$ be a quasi-compact and quasi-separated morphism of schemes. The factorization $f = \nu \circ f'$, where $\nu : X' \to X$ is the normalization of X in Y is characterized by the following two properties:*

(1) *the morphism ν is integral, and*

[12]The scheme X' need not be normal, for example if $Y = X$ and $f = \mathrm{id}_X$, then $X' = X$.

(2) *for any factorization* $f = \pi \circ g$*, with* $\pi : Z \to X$ *integral, there exists a commutative diagram*

$$\begin{tikzcd} Y \arrow[r, "g"] \arrow[d, "f'"'] & Z \arrow[d, "\pi"] \\ X' \arrow[r, "\nu"] \arrow[ur, "h"] & X \end{tikzcd}$$

for some unique morphism $h : X' \to Z$.

Moreover, in (2) the morphism $h : X' \to Z$ *is the normalization of* Z *in* Y.

Proof. Let $\mathcal{O}' \subset f_*\mathcal{O}_Y$ be the integral closure of $\mathcal{O}_X$ as in Definition 24.46.3. The morphism ν is integral by construction, which proves (1). Assume given a factorization $f = \pi \circ g$ with $\pi : Z \to X$ integral as in (2). By Definition 24.42.1 Then π is affine, and hence Z is the relative spectrum of a quasi-coherent sheaf of $\mathcal{O}_X$-algebras $\mathcal{B}$. The morphism $g : X \to Z$ corresponds to a map of $\mathcal{O}_X$-algebras $\chi : \mathcal{B} \to f_*\mathcal{O}_Y$. Since $\mathcal{B}(U)$ is integral over $\mathcal{O}_X(U)$ for every affine open $U \subset X$ (by Definition 24.42.1) we see from Lemma 24.46.1 that $\chi(\mathcal{B}) \subset \mathcal{O}'$. By the functoriality of the relative spectrum Lemma 24.11.5 this provides us with a unique morphism $h : X' \to Z$. We omit the verification that the diagram commutes.

It is clear that (1) and (2) characterize the factorization $f = \nu \circ f'$ since it characterizes it as an initial object in a category. The morphism h in (2) is integral by Lemma 24.42.12. Given a factorization $g = \pi' \circ g'$ with $\pi' : Z' \to Z$ integral, we get a factorization $f = (\pi \circ \pi') \circ g'$ and we get a morphism $h' : X' \to Z'$. Uniqueness implies that $\pi' \circ h' = h$. Hence the characterization (1), (2) applies to the morphism $h : X' \to Z$ which gives the last statement of the lemma. □

Lemma 24.46.5. *Let*

$$\begin{tikzcd} Y_2 \arrow[r] \arrow[d, "f_2"'] & Y_1 \arrow[d, "f_1"] \\ X_2 \arrow[r] & X_1 \end{tikzcd}$$

be a commutative diagram of morphisms of schemes. Assume f_1, f_2 *quasi-compact and quasi-separated. Let* $f_i = \nu_i \circ f'_i$, $i = 1, 2$ *be the canonical factorizations, where* $\nu_i : X'_i \to X_i$ *is the normalization of* X_i *in* Y_i. *Then there exists a canonical commutative diagram*

$$\begin{tikzcd} Y_2 \arrow[r] \arrow[d, "f'_2"'] & Y_1 \arrow[d, "f'_1"] \\ X'_2 \arrow[r] \arrow[d, "\nu_2"'] & X'_1 \arrow[d, "\nu_1"] \\ X_2 \arrow[r] & X_1 \end{tikzcd}$$

Proof. By Lemmas 24.46.4 (1) and 24.42.6 the base change $X_2 \times_{X_1} X'_1 \to X_2$ is integral. Note that f_2 factors through this morphism. Hence we get a canonical morphism $X'_2 \to X_2 \times_{X_1} X'_1$ from Lemma 24.46.4 (2). This gives the middle horizontal arrow in the last diagram. □

Lemma 24.46.6. *Let* $f : Y \to X$ *be a quasi-compact and quasi-separated morphism of schemes. Let* $U \subset X$ *be an open subscheme and set* $V = f^{-1}(U)$. *Then the normalization of* U *in* V *is the inverse image of* U *in the normalization of* X *in* Y.

Proof. Clear from the construction. □

Lemma 24.46.7. *Let $f : Y \to X$ be a quasi-compact and quasi-separated morphism of schemes. Suppose that $Y = Y_1 \coprod Y_2$ is a disjoint union of two schemes. Write $f_i = f_{Y_i}$. Let X_i' be the normalization of X in Y_i. Then $Y_1' \coprod Y_2'$ is the normalization of X in Y.*

Proof. In terms of integral closures this corresponds to the following fact: Let $A \to B$ be a ring map. Suppose that $B = B_1 \times B_2$. Let A_i' be the integral closure of A in B_i. Then $A_1' \times A_2'$ is the integral closure of A in B. The reason this works is that the elements $(1, 0)$ and $(0, 1)$ of B are idempotents and hence integral over A. Thus the integral closure A' of A in B is a product and it is not hard to see that the factors are the integral closures A_i' as described above (some details omitted). □

Lemma 24.46.8. *Let $f : Y \to X$ be an integral morphism. Then the integral closure of X in Y is equal to Y.*

Proof. Omitted. □

The following lemma is a generalization of the preceding one.

Lemma 24.46.9. *Let $f : X \to S$ be a quasi-compact, quasi-separated and universally closed morphisms of schemes. Then $f_*\mathcal{O}_X$ is integral over $\mathcal{O}_S$. In other words, the normalization of S in X is equal to the factorization*

$$X \longrightarrow \underline{Spec}_S(f_*\mathcal{O}_X) \longrightarrow S$$

of Constructions, Lemma 22.4.7.

Proof. The question is local on S, hence we may assume $S = Spec(R)$ is affine. Let $h \in \Gamma(X, \mathcal{O}_X)$. We have to show that h satisfies a monic equation over R. Think of h as a morphism as in the following commutative diagram

$$\begin{tikzcd} X \arrow[rr, "h"] \arrow[dr, "f"'] & & \mathbf{A}^1_S \arrow[dl] \\ & S & \end{tikzcd}$$

Let $Z \subset \mathbf{A}^1_S$ be the scheme theoretic image of h, see Definition 24.4.2. The morphism h is quasi-compact as f is quasi-compact and $\mathbf{A}^1_S \to S$ is separated, see Schemes, Lemma 21.21.15. By Lemma 24.4.3 the morphism $X \to Z$ is dominant. By Lemma 24.40.7 the morphism $X \to Z$ is closed. Hence $h(X) = Z$ (set theoretically). Thus we can use Lemma 24.40.8 to conclude that $Z \to S$ is universally closed (and even proper). Since $Z \subset \mathbf{A}^1_S$, we see that $Z \to S$ is affine and proper, hence integral by Lemma 24.42.7. Writing $\mathbf{A}^1_S = Spec(R[T])$ we conclude that the ideal $I \subset R[T]$ of Z contains a monic polynomial $P(T) \in R[T]$. Hence $P(h) = 0$ and we win. □

Lemma 24.46.10. *Let $f : Y \to X$ be a quasi-compact and quasi-separated morphism of schemes. Assume*

(1) *Y is a normal scheme,*
(2) *any quasi-compact open $V \subset Y$ has a finite number of irreducible components.*

Then the normalization X' of X in Y is a normal scheme. Moreover, the morphism $Y \to X'$ is dominant and induces a bijection of irreducible components.

Proof. We first prove that X' is normal. Let $U \subset X$ be an affine open. It suffices to prove that the inverse image of U in X' is normal (see Properties, Lemma 23.7.2). By Lemma 24.46.6 we may replace X by U, and hence we may assume $X = Spec(A)$ affine. In this case Y is quasi-compact, and hence has a finite number of irreducible components by assumption. Hence $Y = \coprod_{i=1,\ldots n} Y_i$ is a finite disjoint union of normal integral schemes by Properties, Lemma 23.7.5. By Lemma 24.46.7 we see that $X' = \coprod_{i=1,\ldots,n} X'_i$, where X'_i is the normalization of X in Y_i. By Properties, Lemma 23.7.9 we see that $B_i = \Gamma(Y_i, \mathcal{O}_{Y_i})$ is a normal domain. Note that $X'_i = Spec(A'_i)$, where $A'_i \subset B_i$ is the integral closure of A in B_i, see Lemma 24.46.1. By Algebra, Lemma 7.33.2 we see that $A'_i \subset B_i$ is a normal domain. Hence $X' = \coprod X'_i$ is a finite union of normal schemes and hence is normal.

It is clear from the description of X' above that $Y \to X'$ is dominant and induces a bijection on irreducible components if X is affine. The result in general follows from this by a topological argument (omitted). $\square$

Lemma 24.46.11. *Let $f : X \to S$ be a morphism. Assume that*

(1) *S is a Nagata scheme,*
(2) *f is of finite type*[13]*, and*
(3) *X is reduced.*

Then the normalization $\nu : S' \to S$ of S in X is finite.

Proof. There is an immediate reduction to the case $S = Spec(R)$ where R is a Nagata ring. In this case we have to show that the integral closure A of R in $\Gamma(X, \mathcal{O}_X)$ is finite over R. Since f is of finite type we can write $X = \bigcup_{i=1,\ldots,n} U_i$ with each U_i affine. Say $U_i = Spec(B_i)$. Each B_i is a reduced ring of finite type over R (Lemma 24.14.2). Moreover, $\Gamma(X, \mathcal{O}_X) \subset B = B_1 \times \ldots \times B_n$. So A is contained in the integral closure A' of R in B. Note that B is a reduced finite type R-algebra. Since R is Noetherian it suffices to prove that A' is finite over R. This is Algebra, Lemma 7.144.16. $\square$

Next, we come to the normalization of a scheme X. We only define/construct it when X has locally finitely many irreducible components. Let X be a scheme such that every quasi-compact open has finitely many irreducible components. Let $X^{(0)} \subset X$ be the set of generic points of irreducible components of X. Let

$$f : Y = \coprod\nolimits_{\eta \in X^{(0)}} Spec(\kappa(\eta)) \longrightarrow X \tag{24.46.11.1}$$

be the inclusion of the generic points into X using the canonical maps of Schemes, Section 21.13. Note that this morphism is quasi-compact by assumption and quasi-separated as Y is separated (see Schemes, Section 21.21).

Definition 24.46.12. Let X be a scheme such that every quasi-compact open has finitely many irreducible components. We define the *normalization* of X as the morphism

$$\nu : X^\nu \longrightarrow X$$

which is the normalization of X in the morphism $f : Y \to X$ (24.46.11.1) constructed above.

Any locally Noetherian scheme has a locally finite set of irreducible components and the definition applies to it. Usually the normalization is defined only for reduced schemes. With the definition above the normalization of X is the same as the normalization of the reduction X_{red} of X.

[13]The proof shows that the lemma holds if f is quasi-compact and ``essentially of finite type''.

Lemma 24.46.13. *Let X be a scheme such that every quasi-compact open has finitely many irreducible components. The normalization morphism ν factors through the reduction X_{red} and $X^\nu \to X_{red}$ is the normalization of X_{red}.*

Proof. Let $f : Y \to X$ be the morphism (24.46.11.1). We get a factorization $Y \to X_{red} \to X$ of f from Schemes, Lemma 21.12.6. By Lemma 24.46.4 we obtain a canonical morphism $X^\nu \to X_{red}$ and that X^ν is the normalization of X_{red} in Y. The lemma follows as $Y \to X_{red}$ is identical to the morphism (24.46.11.1) constructed for X_{red}. □

If X is reduced, then the normalization of X is the same as the relative spectrum of the integral closure of $\mathcal{O}_X$ in the sheaf of meromorphic functions $\mathcal{K}_X$ (see Divisors, Section 26.15). Namely, $\mathcal{K}_X = f_*\mathcal{O}_Y$ in this case, see Divisors, Lemma 26.15.7 and its proof. We describe this here explicitly.

Lemma 24.46.14. *Let X be a reduced scheme such that every quasi-compact open has finitely many irreducible components. Let $Spec(A) = U \subset X$ be an affine open. Then*

1. *A has finitely many minimal primes $\mathfrak{q}_1, \ldots, \mathfrak{q}_t$,*
2. *the total ring of fractions $Q(A)$ of A is $Q(A/\mathfrak{q}_1) \times \ldots \times Q(A/\mathfrak{q}_t)$,*
3. *the integral closure A' of A in $Q(A)$ is the product of the integral closures of the domains $A/\mathfrak{q}_i$ in the fields $Q(A/\mathfrak{q}_i)$, and*
4. *$\nu^{-1}(U)$ is identified with the spectrum of A'.*

Proof. Minimal primes correspond to irreducible components (Algebra, Lemma 7.23.1), hence we have (1) by assumption. Then $(0) = \mathfrak{q}_1 \cap \ldots \cap \mathfrak{q}_t$ because A is reduced (Algebra, Lemma 7.16.2). Then we have $Q(A) = \prod A_{\mathfrak{q}_i} = \prod \kappa(\mathfrak{q}_i)$ by Algebra, Lemmas 7.22.2 and 7.23.3. This proves (2). Part (3) follows from Algebra, Lemma 7.33.14, or Lemma 24.46.7. Part (4) holds because it is clear that $f^{-1}(U) \to U$ is the morphism

$$Spec\left(\prod \kappa(\mathfrak{q}_i)\right) \longrightarrow Spec(A)$$

where $f : Y \to X$ is the morphism (24.46.11.1). □

Lemma 24.46.15. *Let X be a scheme such that every quasi-compact open has finitely many irreducible components.*

1. *The normalization X^ν is a normal scheme.*
2. *The morphism $\nu : X^\nu \to X$ is integral, surjective, and induces a bijection on irreducible components.*
3. *For any integral, birational[14] morphism $X' \to X$ there exists a factorization $X^\nu \to X' \to X$ and $X^\nu \to X'$ is the normalization of X'.*
4. *For any morphism $Z \to X$ with Z a normal scheme such that each irreducible component of Z dominates an irreducible component of X there exists a unique factorization $Z \to X^\nu \to X$.*

Proof. Let $f : Y \to X$ be as in (24.46.11.1). Part (1) follows from Lemma 24.46.10 and the fact that Y is normal. It also follows from the description of the affine opens in Lemma 24.46.14.

The morphism ν is integral by Lemma 24.46.4. By Lemma 24.46.10 the morphism $Y \to X^\nu$ induces a bijection on irreducible components, and by construction of Y this implies that $X^\nu \to X$ induces a bijection on irreducible components. By construction $f : Y \to X$ is

[14]It suffices if $X'_{red} \to X_{red}$ is birational.

dominant, hence also ν is dominant. Since an integral morphism is closed (Lemma 24.42.7) this implies that ν is surjective. This proves (2).

Suppose that $\alpha : X' \to X$ is integral and birational. Any quasi-compact open U' of X' maps to a quasi-compact open of X, hence we see that U' has only finitely many irreducible components. Let $f' : Y' \to X'$ be the morphism (24.46.11.1) constructed starting with X'. As α is birational it is clear that $Y' = Y$ and $f = \alpha \circ f'$. Hence the factorization $X^\nu \to X' \to X$ exists and $X^\nu \to X'$ is the normalization of X' by Lemma 24.46.4. This proves (3).

Let $g : Z \to X$ be a morphism whose domain is a normal scheme and such that every irreducible component dominates an irreducible component of X. By Lemma 24.46.13 we have $X^\nu = X^\nu_{red}$ and by Schemes, Lemma 21.12.6 $Z \to X$ factors through X_{red}. Hence we may replace X by X_{red} and assume X is reduced. Moreover, as the factorization is unique it suffices to construct it locally on Z. Let $W \subset Z$ and $U \subset X$ be affine opens such that $g(W) \subset U$. Write $U = Spec(A)$ and $W = Spec(B)$, with $g|_W$ given by $\varphi : A \to B$. We will use the results of Lemma 24.46.14 freely. Let $\mathfrak p_1, \ldots, \mathfrak p_t$ be the minimal primes of A. As Z is normal, we see that B is a normal ring, in particular reduced. Moreover, by assumption any minimal prime $\mathfrak q \subset B$ we have that $\varphi^{-1}(\mathfrak q)$ is a minimal prime of A. Hence if $x \in A$ is a nonzero divisor, i.e., $x \not\in \bigcup \mathfrak p_i$, then $\varphi(x)$ is a nonzero divisor in B. Thus we obtain a canonical ring map $Q(A) \to Q(B)$. As B is normal it is equal to its integral closure in $Q(B)$ (see Algebra, Lemma 7.33.11). Hence we see that the integral closure $A' \subset Q(A)$ of A maps into B via the canonical map $Q(A) \to Q(B)$. Since $\nu^{-1}(U) = Spec(A')$ this gives the canonical factorization $W \to \nu^{-1}(U) \to U$ of $\nu|_W$. We omit the verification that it is unique. □

Lemma 24.46.16. *Let X be an integral, Japanese scheme. The normalization $\nu : X^\nu \to X$ is a finite morphism.*

Proof. Follows from the definitions and Lemma 24.46.14. Namely, in this case the lemma says that $\nu^{-1}(Spec(A))$ is the spectrum of the integral closure of A in its field of fractions. □

Lemma 24.46.17. *Let X be a nagata scheme. The normalization $\nu : X^\nu \to X$ is a finite morphism.*

Proof. Note that a Nagata scheme is locally Noetherian, thus Definition 24.46.12 does apply. Write $X^\nu \to X$ as the composition $X^\nu \to X_{red} \to X$. As $X_{red} \to X$ is a closed immersion it is finite. Hence it suffices to prove the lemma for a reduced Nagata scheme (by Lemma 24.42.5). Let $Spec(A) = U \subset X$ be an affine open. By Lemma 24.46.14 we have $\nu^{-1}(U) = Spec(\prod A'_i)$ where A'_i is the integral closure of $A/\mathfrak q_i$ in its fraction field. As A is a Nagata ring (see Properties, Lemma 23.13.6) each of the ring extensions $A/\mathfrak q_i \subset A'_i$ are finite. Hence $A \to \prod A'_i$ is a finite ring map and we win. □

24.47. Zariski's Main Theorem (algebraic version)

This is the version you can prove using purely algebraic methods. Before we can prove more powerful versions (for non-affine morphisms) we need to develop more tools. See Coherent, Section 25.20 and More on Morphisms, Section 33.29.

Theorem 24.47.1. *(Algebraic version of Zariski's Main Theorem) Let $f : Y \to X$ be an affine morphism of schemes. Assume f is of finite type. Let X' be the normalization of X*

in Y. Picture:

$$\begin{tikzcd} Y \arrow[rr, "f'"] \arrow[dr, "f"'] & & X' \arrow[dl, "\nu"] \\ & X & \end{tikzcd}$$

Then there exists an open subscheme $U' \subset X'$ such that

(1) $(f')^{-1}(U') \to U'$ *is an isomorphism, and*
(2) $(f')^{-1}(U') \subset Y$ *is the set of points at which f is quasi-finite.*

Proof. There is an immediate reduction to the case where X and hence Y are affine. Say $X = Spec(R)$ and $Y = Spec(A)$. Then $X' = Spec(A')$, where A' is the integral closure of R in A, see Definitions 24.46.2 and 24.46.3. By Algebra, Theorem 7.114.13 for every $y \in Y$ at which f is quasi-finite, there exists an open $U'_y \subset X'$ such that $(f')^{-1}(U'_y) \to U'_y$ is an isomorphism. Set $U' = \bigcup U'_y$ where $y \in Y$ ranges over all points where f is quasi-finite. It remains to show that f is quasi-finite at all points of $(f')^{-1}(U')$. If $y \in (f')^{-1}(U')$ with image $x \in X$, then we see that $Y_x \to X'_x$ is an isomorphism in a neighbourhood of y. Hence there is no point of Y_x which specializes to y, since this is true for $f'(y)$ in X'_x, see Lemma 24.42.8. By Lemma 24.19.6 part (3) this implies f is quasi-finite at y. □

We can use the algebraic version of Zariski's Main Theorem to show that the set of points where a morphism is quasi-finite is open.

Lemma 24.47.2. *Let $f : X \to S$ be a morphism of schemes. The set of points of X where f is quasi-finite is an open $U \subset X$. The induced morphism $U \to S$ is locally quasi-finite.*

Proof. Suppose f is quasi-finite at x. Let $x \in U = Spec(R) \subset X$, $V = Spec(A) \subset S$ be affine opens as in Definition 24.19.1. By either Theorem 24.47.1 above or Algebra, Lemma 7.114.14, the set of primes $\mathfrak{q}$ at which $R \to A$ is quasi-finite is open in $Spec(A)$. Since these all correspond to points of X where f is quasi-finite we get the first statement. The second statement is obvious. □

We will improve the following lemma to general quasi-finite separated morphisms later, see More on Morphisms, Lemma 33.29.4.

Lemma 24.47.3. *Let $f : Y \to X$ be a morphism of schemes. Assume*

(1) *X and Y are affine, and*
(2) *f is quasi-finite.*

Then there exists a diagram

$$\begin{tikzcd} Y \arrow[rr, "j"] \arrow[dr, "f"'] & & Z \arrow[dl, "\pi"] \\ & X & \end{tikzcd}$$

with Z affine, π finite and j an open immersion.

Proof. This is Algebra, Lemma 7.114.15 reformulated in the laguage of schemes. □

Lemma 24.47.4. *Let $f : Y \to X$ be a quasi-finite morphism of schemes. Let $T \subset Y$ be a closed nowhere dense subset of Y. Then $f(T) \subset X$ is a nowhere dense subset of X.*

Proof. As in the proof of Lemma 24.44.7 this reduces immediately to the case where the base X is affine. In this case $Y = \bigcup_{i=1,\ldots,n} Y_i$ is a finite union of affine opens (as f is quasi-compact). Since each $T \cap Y_i$ is nowhere dense, and since a finite union of nowhere dense sets is nowhere dense (see Topology, Lemma 5.17.2), it suffices to prove that the image $f(T \cap Y_i)$ is nowhere dense in X. This reduces us to the case where both X and Y are affine. At this point we apply Lemma 24.47.3 above to get a diagram

$$\begin{tikzcd} Y \arrow[rr, "j"] \arrow[dr, "f"'] & & Z \arrow[dl, "\pi"] \\ & X & \end{tikzcd}$$

with Z affine, π finite and j an open immersion. Set $\overline{T} = \overline{j(T)} \subset Z$. By Topology, Lemma 5.17.3 we see $\overline{T}$ is nowhere dense in Z. Since $f(T) \subset \pi(\overline{T})$ the lemma follows from the corresponding result in the finite case, see Lemma 24.44.7. □

24.48. Universally bounded fibres

Let X be a scheme over a field k. If X is finite over k, then $X = Spec(A)$ where A is a finite k-algebra. Another way to say this is that X is finite locally free over $Spec(k)$, see Definition 24.44.1. Hence $X \to Spec(k)$ has a *degree* which is an integer $d \geq 0$, namely $d = \dim_k(A)$. We sometime call this the *degree* of the (finite) scheme X over k.

Definition 24.48.1. Let $f : X \to Y$ be a morphism of schemes.

(1) We say the integer *n bounds the degrees of the fibres of f* if for all $y \in Y$ the fibre X_y is a finite scheme over $\kappa(y)$ whose degree over $\kappa(y)$ is $\leq n$.
(2) We say the *fibres of f are universally bounded*[15] if there exists an integer n which bounds the degrees of the fibres of f.

Note that in particular the number of points in a fibre is bounded by n as well. (The converse does not hold, even if all fibres are finite reduced schemes.)

Lemma 24.48.2. *Let $f : X \to Y$ be a morphism of schemes. Let $n \geq 0$. The following are equivalent:*

(1) *the integer n bounds the degrees of the fibres of f, and*
(2) *for every morphism $Spec(k) \to Y$, where k is a field, the fibre product $X_k = Spec(k) \times_Y X$ is finite over k of degree $\leq n$.*

In this case f is universally bounded and the schemes X_k have at most n points.

Proof. The implication (2) ⇒ (1) is trivial. The other implication holds because if the image of $Spec(k) \to Y$ is y, then $X_k = Spec(k) \times_{Spec(\kappa(y))} X_y$. □

Lemma 24.48.3. *A composition of morphisms with universally bounded fibres is a morphism with universally bounded fibres. More precisely, assume that n bounds the degrees of the fibres of $f : X \to Y$ and m bounds the degrees of $g : Y \to Z$. Then nm bounds the degrees of the fibres of $g \circ f : X \to Z$.*

Proof. Let $f : X \to Y$ and $g : Y \to Z$ have universally bounded fibres. Say that $\deg(X_y/\kappa(y)) \leq n$ for all $y \in Y$, and that $\deg(Y_z/\kappa(z)) \leq m$ for all $z \in Z$. Let $z \in Z$ be a point. By assumption the scheme Y_z is finite over $Spec(\kappa(z))$. In particular, the underlying topological space of Y_z is a finite discrete set. The fibres of the morphism $f_z : X_z \to Y_z$ are the fibres of f at the corresponding points of Y, which are finite discrete sets by the reasoning above. Hence we conclude that the underlying topological space of X_z is a finite discrete set as well. Thus X_z is an affine scheme (this is a nice exercise; it also follows

[15]This is probably nonstandard notation.

for example from Properties, Lemma 23.26.1 applied to the set of all points of X_z). Write $X_z = Spec(A)$, $Y_z = Spec(B)$, and $k = \kappa(z)$. Then $k \to B \to A$ and we know that (a) $\dim_k(B) \leq m$, and (b) for every maximal ideal $\mathfrak{m} \subset B$ we have $\dim_{\kappa(\mathfrak{m})}(A/\mathfrak{m}A) \leq n$. We claim this implies that $\dim_k(A) \leq nm$. Note that B is the product of its localizations $B_{\mathfrak{m}}$, for example because Y_z is a disjoint union of 1-point schemes, or by Algebra, Lemmas 7.49.2 and 7.49.8. So we see that $\dim_k(B) = \sum_{\mathfrak{m}}(B_{\mathfrak{m}})$ and $\dim_k(A) = \sum_{\mathfrak{m}}(A_{\mathfrak{m}})$ where in both cases $\mathfrak{m}$ runs over the maximal ideals of B (not of A). By the above, and Nakayama's Lemma (Algebra, Lemma 7.14.5) we see that each $A_{\mathfrak{m}}$ is a quotient of $B_{\mathfrak{m}}^{\oplus n}$ as a $B_{\mathfrak{m}}$-module. Hence $\dim_k(A_{\mathfrak{m}}) \leq n \dim_k(B_{\mathfrak{m}})$. Putting everything together we see that

$$\dim_k(A) = \sum\nolimits_{\mathfrak{m}}(A_{\mathfrak{m}}) \leq \sum\nolimits_{\mathfrak{m}} n \dim_k(B_{\mathfrak{m}}) = n \dim_k(B) \leq nm$$

as desired. □

Lemma 24.48.4. *A base change of a morphism with universally bounded fibres is a morphism with universally bounded fibres. More precisely, if n bounds the degrees of the fibres of $f : X \to Y$ and $Y' \to Y$ is any morphism, then the degrees of the fibres of the base change $f' : Y' \times_Y X \to Y' \to Y'$ is also bounded by n.*

Proof. This is clear from the result of Lemma 24.48.2. □

Lemma 24.48.5. *Let $f : X \to Y$ be a morphism of schemes. Let $Y' \to Y$ be a morphism of schemes, and let $f' : X' = X_{Y'} \to Y'$ be the base change of f. If $Y' \to Y$ is surjective and f' has universally bounded fibres, then f has universally bounded fibres. More precisely, if n bounds the degree of the fibres of f', then also n bounds the degrees of the fibres of f.*

Proof. Let $n \geq 0$ be an integer bounding the degrees of the fibres of f'. We claim that n works for f also. Namely, if $y \in Y$ is a point, then choose a point $y' \in Y'$ lying over y and observe that

$$X'_{y'} = Spec(\kappa(y')) \times_{Spec(\kappa(y))} X_y.$$

Since $X'_{y'}$ is assumed finite of degree $\leq n$ over $\kappa(y')$ it follows that also X_y is finite of degree $\leq n$ over $\kappa(y)$. (Some details omitted.) □

Lemma 24.48.6. *An immersion has universally bounded fibres.*

Proof. The integer $n = 1$ works in the definition. □

Lemma 24.48.7. *Let $f : X \to Y$ be an étale morphism of schemes. Let $n \geq 0$. The following are equivalent*

(1) *the integer n bounds the degrees of the fibres,*
(2) *for every field k and morphism $Spec(k) \to Y$ the base change $X_k = Spec(k) \times_Y X$ has at most n points, and*
(3) *for every $y \in Y$ and every separable algebraic closure $\kappa(y) \subset \kappa(y)^{sep}$ the scheme $X_{\kappa(y)^{sep}}$ has at most n points.*

Proof. This follows from Lemma 24.48.2 and the fact that the fibres X_y are disjoint unions of spectra of finite separable field extensions of $\kappa(y)$, see Lemma 24.35.7. □

Having universally bounded fibres is an absolute notion and not a relative notion. This is why the condition in the following lemma is that X is quasi-compact, and not that f is quasi-compact.

Lemma 24.48.8. *Let $f : X \to Y$ be a morphism of schemes. Assume that*

(1) *f is locally quasi-finite, and*

(2) *X is quasi-compact.*

Then f has universally bounded fibres.

Proof. Since X is quasi-compact, there exists a finite affine open covering $X = \bigcup_{i=1,\ldots,n} U_i$ and affine opens $V_i \subset Y$, $i = 1, \ldots, n$ such that $f(U_i) \subset V_i$. Because of the local nature of ``local quasi-finiteness'' (see Lemma 24.19.6 part (4)) we see that the morphisms $f|_{U_i} : U_i \to V_i$ are locally quasi-finite morphisms of affines, hence quasi-finite, see Lemma 24.19.9. For $y \in Y$ it is clear that $X_y = \bigcup_{y \in V_i} (U_i)_y$ is an open covering. Hence it suffices to prove the lemma for a quasi-finite morphism of affines (namely, if n_i works for the morphism $f|_{U_i} : U_i \to V_i$, then $\sum n_i$ works for f).

Assume $f : X \to Y$ is a quasi-finite morphism of affines. By Lemma 24.47.3 we can find a diagram

$$\begin{tikzcd} X \arrow[rr, "j"] \arrow[dr, "f"'] & & Z \arrow[dl, "\pi"] \\ & Y & \end{tikzcd}$$

with Z affine, π finite and j an open immersion. Since j has universally bounded fibres (Lemma 24.48.6) this reduces us to showing that π has universally bounded fibres (Lemma 24.48.3).

This reduces us to a morphism of the form $Spec(B) \to Spec(A)$ where $A \to B$ is finite. Say B is generated by $x_1, \ldots, x_n$ over A and say $P_i(T) \in A[T]$ is a monic polynomial of degree d_i such that $P_i(x_i) = 0$ in B (a finite ring extension is integral, see Algebra, Lemma 7.32.3). With these notations it is clear that

$$\bigoplus_{0 \leq e_i < d_i, i=1,\ldots n} A \longrightarrow B, \quad (a_{(e_1,\ldots,e_n)}) \longmapsto \sum a_{(e_1,\ldots,e_n)} x_1^{e_1} \ldots x_n^{e_n}$$

is a surjective A-module map. Thus for any prime $\mathfrak{p} \subset A$ this induces a surjective map $\kappa(\mathfrak{p})$-vector spaces

$$\kappa(\mathfrak{p})^{\oplus d_1 \ldots d_n} \longrightarrow B \otimes_A \kappa(\mathfrak{p})$$

In other words, the integer $d_1 \ldots d_n$ works in the definition of a morphism with universally bounded fibres. $\square$

Lemma 24.48.9. *Consider a commutative diagram of morphisms of schemes*

$$\begin{tikzcd} X \arrow[rr, "f"] \arrow[dr, "g"'] & & Y \arrow[dl, "h"] \\ & Z & \end{tikzcd}$$

If g has universally bounded fibres, and f is surjective and flat, then also h has universally bounded fibres. More precisely, if n bounds the degree of the fibres of g, then also n bounds the degree of the fibres of h.

Proof. Assume g has universally bounded fibres, and f is surjective and flat. Say the degree of the fibres of g is bounded by $n \in \mathbf{N}$. We claim n also works for h. Let $z \in Z$. Consider the morphism of schemes $X_z \to Y_z$. It is flat and surjective. By assumption X_z is a finite scheme over $\kappa(z)$, in particular it is the spectrum of an Artinian ring (by Algebra, Lemma 7.49.2). By Lemma 24.11.13 the morphism $X_z \to Y_z$ is affine in particular quasi-compact. It follows from Lemma 24.24.10 that Y_z is a finite discrete as this holds for X_z. Hence Y_z is an affine scheme (this is a nice exercise; it also follows for example from Properties, Lemma

23.26.1 applied to the set of all points of Y_z). Write $Y_z = Spec(B)$ and $X_z = Spec(A)$. Then A is faithfully flat over B, so $B \subset A$. Hence $\dim_k(B) \leq \dim_k(A) \leq n$ as desired. □

CHAPTER 25

Coherent Cohomology

25.1. Introduction

The title of this chapter is a bit of a lie because we will first prove a number of results on the cohomology of quasi-coherent sheaves. A fundamental reference is [**DG67**]. Having done this we wil elaborate on cohomology of coherent sheaves in the Noetherian setting. See also [**Ser55b**].

25.2. Cech cohomology of quasi-coherent sheaves

Let X be a scheme. Let $U \subset X$ be an affine open. Recall that a *standard open covering* of U is a covering of the form $\mathcal{U} : U = \bigcup_{i=1}^n D(f_i)$ where $f_1, \ldots, f_n \in \Gamma(U, \mathcal{O}_X)$ generate the unit ideal, see Schemes, Definition 21.5.2.

Lemma 25.2.1. *Let X be a scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Let $\mathcal{U} : U = \bigcup_{i=1}^n D(f_i)$ be a standard open covering of an affine open of X. Then $\check{H}^p(\mathcal{U}, \mathcal{F}) = 0$ for all $p > 0$.*

Proof. Write $U = Spec(A)$ for some ring A. In other words, $f_1, \ldots, f_n$ are elements of A which generate the unit ideal of A. Write $\mathcal{F}|_U = \widetilde{M}$ for some A-module M. Clearly the Cech complex $\check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{F})$ is identified with the complex

$$\prod_{i_0} M_{f_{i_0}} \to \prod_{i_0 i_1} M_{f_{i_0} f_{i_1}} \to \prod_{i_0 i_1 i_2} M_{f_{i_0} f_{i_1} f_{i_2}} \to \ldots$$

We are asked to show that the extended complex

$$0 \to M \to \prod_{i_0} M_{f_{i_0}} \to \prod_{i_0 i_1} M_{f_{i_0} f_{i_1}} \to \prod_{i_0 i_1 i_2} M_{f_{i_0} f_{i_1} f_{i_2}} \to \ldots \tag{25.2.1.1}$$

(whose truncation we have studied in Algebra, Lemma 7.20.2) is exact. It suffices to show that (25.2.1.1) is exact after localizing at a prime $\mathfrak{p}$, see Algebra, Lemma 7.21.1. In fact we will show that the extended complex localized at $\mathfrak{p}$ is homotopic to zero.

There exists an index i such that $f_i \not\in \mathfrak{p}$. Choose and fix such an element i_{fix}. Note that $M_{f_{i_{\text{fix}}}, \mathfrak{p}} = M_{\mathfrak{p}}$. Similarly for a localization at a product $f_{i_0} \ldots f_{i_p}$ and $\mathfrak{p}$ we can drop any f_{i_j} for which $i_j = i_{\text{fix}}$. Let us define a homotopy

$$h : \prod\nolimits_{i_0 \ldots i_{p+1}} M_{f_{i_0} \ldots f_{i_{p+1}}, \mathfrak{p}} \longrightarrow \prod\nolimits_{i_0 \ldots i_p} M_{f_{i_0} \ldots f_{i_p}, \mathfrak{p}}$$

by the rule

$$h(s)_{i_0 \ldots i_p} = s_{i_{\text{fix}} i_0 \ldots i_p}$$

(This is ``dual" to the homotopy in the proof of Cohomology, Lemma 18.10.4.) In other words, $h : \prod_{i_0} M_{f_{i_0}, \mathfrak{p}} \to M$ is projection onto the factor $M_{f_{i_{\text{fix}}}, \mathfrak{p}} = M_{\mathfrak{p}}$ and in general the map h equal projection onto the factors $M_{f_{i_{\text{fix}}} f_{i_1} \ldots f_{i_{p+1}}, \mathfrak{p}} = M_{f_{i_1} \ldots f_{i_{p+1}}, \mathfrak{p}}$. We compute

$$\begin{aligned}(dh + hd)(s)_{i_0 \ldots i_p} &= \sum_{j=0}^{p} (-1)^j h(s)_{i_0 \ldots \hat{i}_j \ldots i_p} + d(s)_{i_{\text{fix}} i_0 \ldots i_p} \\ &= \sum_{j=0}^{p} (-1)^j s_{i_{\text{fix}} i_0 \ldots \hat{i}_j \ldots i_p} + s_{i_0 \ldots i_p} + \sum_{j=0}^{p} (-1)^{j+1} s_{i_{\text{fix}} i_0 \ldots \hat{i}_j \ldots i_p} \\ &= s_{i_0 \ldots i_p}\end{aligned}$$

This proves the identity map is homotopic to zero as desired. □

The following lemma says in particular that for any affine scheme X and any quasi-coherent sheaf $\mathcal{F}$ on X we have

$$H^p(X, \mathcal{F}) = 0$$

for all $p > 0$.

Lemma 25.2.2. *Let X be a scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. For any affine open $U \subset X$ we have $H^p(U, \mathcal{F}) = 0$ for all $p > 0$.*

Proof. We are going to apply Cohomology, Lemma 18.11.8. As our basis $\mathcal{B}$ for the topology of X we are going to use the affine opens of X. As our set Cov of open coverings we are going to use the standard open coverings of affine opens of X. Next we check that conditions (1), (2) and (3) of Cohomology, Lemma 18.11.8 hold. Note that the intersection of standard opens in an affine is another standard open. Hence property (1) holds. The coverings form a cofinal system of open coverings of any element of $\mathcal{B}$, see Schemes, Lemma 21.5.1. Hence (2) holds. Finally, condition (3) of the lemma follows from Lemma 25.2.1. □

Here is a relative version of the vanishing of cohomology of quasi-coherent sheaves on affines.

Lemma 25.2.3. *Let $f : X \to S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. If f is affine then $R^i f_* \mathcal{F} = 0$ for all $i > 0$.*

Proof. According to Cohomology, Lemma 18.6.3 the sheaf $R^i f_* \mathcal{F}$ is the sheaf associated to the presheaf $V \mapsto H^i(f^{-1}(V), \mathcal{F}|_{f^{-1}(V)})$. By assumption, whenever V is affine we have that $f^{-1}(V)$ is affine, see Morphisms, Definition 24.11.1. By Lemma 25.2.2 we conclude that $H^i(f^{-1}(V), \mathcal{F}|_{f^{-1}(V)}) = 0$ whenever V is affine. Since S has a basis consisting of affine opens we win. □

Lemma 25.2.4. *Let X be a scheme. Let $\mathcal{U} : X = \bigcup_{i \in I} U_i$ be an open covering such that $U_{i_0 \ldots i_p}$ is affine open for all $p \geq 0$ and all $i_0, \ldots, i_p \in I$ In this case for any quasi-coherent sheaf $\mathcal{F}$ we have*

$$\check{H}^p(\mathcal{U}, \mathcal{F}) = H^p(X, \mathcal{F})$$

as $\Gamma(X, \mathcal{O}_X)$-modules for all p.

Proof. In view of Lemma 25.2.2 this is a special case of Cohomology, Lemma 18.11.5. □

25.3. Vanishing of cohomology

We have seen that on an affine scheme the higher cohomology groups of any quasi-coherent sheaf vanish (Lemma 25.2.2). It turns out that this also characterizes affine schemes. We give two versions allthough the first covers all conceivable cases.

Lemma 25.3.1. *Let X be a scheme. Assume that*

(1) *X is quasi-compact,*
(2) *for every quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_X$ we have $H^1(X, \mathcal{I}) = 0$.*

Then X is affine.

Proof. Let $x \in X$ be a closed point. Let $U \subset X$ be an affine open neighbourhood of x. Write $U = Spec(A)$ and let $\mathfrak{m} \subset A$ be the maximal ideal corresponding to x. Set $Z = X \setminus U$ and $Z' = Z \cup \{x\}$. By Schemes, Lemma 21.12.4 there are quasi-coherent sheaves of ideals $\mathcal{I}$, resp. $\mathcal{I}'$ cutting out the reduced closed subschemes Z, resp. Z'. Consider the short exact sequence

$$0 \to \mathcal{I}' \to \mathcal{I} \to \mathcal{I}/\mathcal{I}' \to 0.$$

Since x is a closed point of X and $x \notin Z$ we see that $\mathcal{I}/\mathcal{I}'$ is supported at x. In fact, the restriction of $\mathcal{I}/\mathcal{I}'$ to U corresponds to the A-module $A/\mathfrak{m}$. Hence we see that $\Gamma(X, \mathcal{I}/\mathcal{I}') = A/\mathfrak{m}$. Since by assumption $H^1(X, \mathcal{I}') = 0$ we see there exists a global section $f \in \Gamma(X, \mathcal{I})$ which maps to the element $1 \in A/\mathfrak{m}$ as a section of $\mathcal{I}/\mathcal{I}'$. Clearly we have $x \in X_f \subset U$. This implies that $X_f = D(f_A)$ where f_A is the image of f in $A = \Gamma(U, \mathcal{O}_X)$. In particular X_f is affine.

Consider the union $W = \bigcup X_f$ over all $f \in \Gamma(X, \mathcal{O}_X)$ such that X_f is affine. Obviously W is open in X. By the arguments above every closed point of X is contained in W. The closed subset $X \setminus W$ of X is also quasi-compact (see Topology, Lemma 5.9.3). Hence it has a closed point if it is nonempty (see Topology, Lemma 5.9.6). This is a would contradict the fact that all closed points are in W. Hence we conclude $X = W$.

Choose finitely many $f_1, \ldots, f_n \in \Gamma(X, \mathcal{O}_X)$ such that $X = X_{f_1} \cup \ldots \cup X_{f_n}$ and such that each X_{f_i} is affine. This is possible as we've seen above. By Properties, Lemma 23.24.2 to finish the proof it suffices to show that $f_1, \ldots, f_n$ generate the unit ideal in $\Gamma(X, \mathcal{O}_X)$. Conisder the short exact sequence

$$0 \longrightarrow \mathcal{F} \longrightarrow \mathcal{O}_X^{\oplus n} \xrightarrow{f_1, \ldots, f_n} \mathcal{O}_X \longrightarrow 0$$

The arrow defined by $f_1, \ldots, f_n$ is surjective since the opens X_{f_i} cover X. We let $\mathcal{F}$ be the kernel of this surjective map. Observe that $\mathcal{F}$ has a filtration

$$0 = \mathcal{F}_0 \subset \mathcal{F}_1 \subset \ldots \subset \mathcal{F}_n = \mathcal{F}$$

so that each subquotient $\mathcal{F}_i/\mathcal{F}_{i-1}$ is isomorphic to a quasi-coherent sheaf of ideals. Namely we can take $\mathcal{F}_i$ to be the intersection of the first i direct summands of $\mathcal{O}_X^{\oplus n}$. The assumption of the lemma implies that $H^1(X, \mathcal{F}_i/\mathcal{F}_{i-1}) = 0$ for all i. This implies that $H^1(X, \mathcal{F}_2) = 0$ because it is sandwiched between $H^1(X, \mathcal{F}_1)$ and $H^1(X, \mathcal{F}_2/\mathcal{F}_1)$. Continuing like this we deduce that $H^1(X, \mathcal{F}) = 0$. Therefore we conclude that the map

$$\bigoplus\nolimits_{i=1,\ldots,n} \Gamma(X, \mathcal{O}_X) \xrightarrow{f_1, \ldots, f_n} \Gamma(X, \mathcal{O}_X)$$

is surjective as desired. $\square$

Note that if X is a Noetherian scheme then every quasi-coherent sheaf of ideals is automatically a coherent sheaf of ideals and a finite type quasi-coherent sheaf of ideals. Hence the preceding lemma and the next lemma both apply in this case.

Lemma 25.3.2. *Let X be a scheme. Assume that*

(1) *X is quasi-compact,*
(2) *X is quasi-separated, and*
(3) *$H^1(X, \mathcal{I}) = 0$ for every quasi-coherent sheaf of ideals $\mathcal{I}$ of finite type.*

Then X is affine.

Proof. By Properties, Lemma 23.20.3 every quasi-coherent sheaf of ideals is a directed colimit of quasi-coherent sheaves of ideals of finite type. By Cohomology, Lemma 18.15.1 taking cohomology on X commutes with directed colimits. Hence we see that $H^1(X, \mathcal{I}) = 0$ for every quasi-coherent sheaf of ideals on X. In other words we see that Lemma 25.3.1 applies. $\square$

25.4. Derived category of quasi-coherent modules

In this section we briefly discuss the relationship between quasi-coherent modules and all modules on a scheme S. (This should be elaborated on and generalized.) A reference is [**TT90**, Appendix B]. By the discussion in Schemes, Section 21.24 the embedding $QCoh(\mathcal{O}_S) \subset Mod(\mathcal{O}_S)$ exhibits $QCoh(\mathcal{O}_S)$ as a weak Serre subcategory of the category of $\mathcal{O}_S$-modules. Denote $D_{QCoh}(\mathcal{O}_S) \subset D(\mathcal{O}_S)$ the subcategory of complexes whose cohomology sheaves are quasi-coherent, see Derived Categories, Section 11.12. Thus we obtain a canonical functor

$$D(QCoh(\mathcal{O}_S)) \longrightarrow D_{QCoh}(\mathcal{O}_S) \tag{25.4.0.1}$$

see Derived Categories, Equation (11.12.1.1).

Lemma 25.4.1. *If $S = Spec(A)$ is an affine scheme, then (25.4.0.1) is an equivalence.*

Proof. The key to this lemma is to prove that the functor $R\Gamma(S, -)$ gives a quasi-inverse. For complexes bounded below this is straightforward using the vanishing of cohomology of Lemma 25.2.2. To prove it also for unbounded complexes we have to be a little bit careful: namely, even if you accept that the unbounded derived functor $R\Gamma(S, -)$ exists, then it isn't obvious how to compute it!

Let $\mathcal{F}^\bullet$ be an object of $D_{QCoh}(\mathcal{O}_S))$ and denote $\mathcal{H}^i = H^i(\mathcal{F}^\bullet)$ its ith cohomology sheaf. Let $\mathcal{B}$ be the set of affine open subsets of S. Then $H^p(U, \mathcal{H}^i) = 0$ for all $p > 0$, all $i \in \mathbf{Z}$, and all $U \in \mathcal{B}$, see Lemma 25.2.2. According to Cohomology, Section 18.23 this implies there exists a quasi-isomorphism $\mathcal{F}^\bullet \to \mathcal{I}^\bullet$ where $\mathcal{I}^\bullet$ is a K-injective complex, $\mathcal{I}^\bullet = lim\, \mathcal{I}_n^\bullet$, each $\mathcal{I}_n^\bullet$ is a bounded below complex of injectives, the maps in the system $\ldots \to \mathcal{I}_2^\bullet \to \mathcal{I}_1^\bullet$ are termwise split surjections, and each $\mathcal{I}_n^\bullet$ is quasi-isomorphic to $\tau_{\geq -n}\mathcal{F}^\bullet$. In particular, we conclude that $R\Gamma(S, -)$ is defined at each object of $D_{QCoh}(\mathcal{O}_S))$, see Derived Categories, Lemma 11.28.4, with values $R\Gamma(S, \mathcal{F}^\bullet) = \Gamma(S, \mathcal{I}^\bullet)$. This defines an exact functor of triangulated categories

$$R\Gamma(S, -) : D_{QCoh}(\mathcal{O}_S) \longrightarrow D(A), \tag{25.4.1.1}$$

see Derived Categories, Proposition 11.14.8. In the proof of Cohomology, Lemma 18.23.1 we have seen that $H^m(\Gamma(S, \mathcal{I}^\bullet))$ is the limit of the cohomology groups $H^m(\Gamma(S, \mathcal{I}_n^\bullet))$. For $n > -m$ these groups are equal to $\Gamma(S, \mathcal{H}^m)$ by the vanishing of higer cohomology and the spectral sequence of Derived Categories, Lemma 11.20.3. Combined with the (assumed) equality

$$\mathcal{H}^m = \Gamma(\widetilde{S, \mathcal{H}^m})$$

we conclude the canonical map of complexes

$$\Gamma(\widetilde{S, \mathcal{I}^\bullet}) \longrightarrow \mathcal{I}^\bullet$$

(see Schemes, Lemma 21.7.1) is a quasi-isomorphism. We claim the composition

$$D(A) \cong D(QCoh(\mathcal{O}_S)) \longrightarrow D_{QCoh}(\mathcal{O}_S) \longrightarrow D(A)$$

is isomorphic to the identity functor. Namely, given a complex of A-modules $M^\bullet$, let $\mathcal{F}^\bullet = \widetilde{M^\bullet}$, choose $\mathcal{F}^\bullet \to \mathcal{I}^\bullet$ as above, and finally take $\Gamma(S, \mathcal{I}^\bullet)$. The arguments above show that $M^\bullet = \Gamma(S, \mathcal{F}^\bullet) \to \Gamma(S, \mathcal{I}^\bullet)$ is a quasi-isomorphism. This is functorial in $M^\bullet$, hence we conclude that the composition of functors is isomorphic to the identity functor on $D(A)$. On the other hand, we have seen above that the composition

$$D_{QCoh}(\mathcal{O}_S) \longrightarrow D(A) \cong D(QCoh(\mathcal{O}_S)) \longrightarrow D_{QCoh}(\mathcal{O}_S)$$

is isomorphic to the identity functor, via the quasi-isomorphisms $\Gamma(\widetilde{S, \mathcal{I}^\bullet}) \to \mathcal{I}^\bullet$ above. This finishes the proof. $\square$

Actually it is true that the comparison map $D(QCoh(\mathcal{O}_S)) \to D_{QCoh}(\mathcal{O}_S)$ is an equivalence for any quasi-compact and (semi-)separated scheme (insert future reference here).

25.5. Quasi-coherence of higher direct images

We have seen that the higher cohomology groups of a quasi-coherent module on an affine is zero. For (quasi-)separated quasi-compact schemes X this implies vanishing of cohomology groups of quasi-coherent sheaves beyond a certain degree. However, it may not be the case that X has finite cohomological dimension, because that is defined in terms of vanishing of cohomology of *all* $\mathcal{O}_X$-modules.

Lemma 25.5.1. *Let X be a quasi-compact separated scheme. Let $t = t(X)$ be the minimal number of affine opens needed to cover X. Then $H^n(X, \mathcal{F}) = 0$ for all $n \geq t$ and all quasi-coherent sheaves $\mathcal{F}$.*

Proof. First proof. By induction on t. If $t = 1$ the result follows from Lemma 25.2.2. If $t > 1$ write $X = U \cup V$ with V affine open and $U = U_1 \cup \ldots \cup U_{t-1}$ a union of $t-1$ open affines. Note that in this case $U \cap V = (U_1 \cap V) \cup \ldots (U_{t-1} \cap V)$ is also a union of $t-1$ affine open subschemes, see Schemes, Lemma 21.21.8. We apply the Mayer-Vietoris long exact sequence

$$0 \to H^0(X, \mathcal{F}) \to H^0(U, \mathcal{F}) \oplus H^0(V, \mathcal{F}) \to H^0(U \cap V, \mathcal{F}) \to H^1(X, \mathcal{F}) \to \ldots$$

see Cohomology, Lemma 18.8.2. By induction we see that the groups $H^i(U, \mathcal{F})$, $H^i(U, \mathcal{F})$, $H^i(U, \mathcal{F})$ are zero for $i \geq t-1$. It follows immediately that $H^i(X, \mathcal{F})$ is zero for $i \geq t$.

Second proof. Let $\mathcal{U} : X = \bigcup_{i=1}^t U_i$ be a finite affine open covering. Since X is separated the multiple intersections $U_{i_0 \ldots i_p}$ are all affine, see Schemes, Lemma 21.21.8. By Lemma 25.2.4 the Cech cohomology groups $\check{H}^p(\mathcal{U}, \mathcal{F})$ agree with the cohomology groups. By Cohomology, Lemma 18.17.6 the Cech cohomology groups may be computed using the alternating Cech complex $\check{\mathcal{C}}^\bullet_{alt}(\mathcal{U}, \mathcal{F})$. As the covering consists of t elements we see immediately that $\check{\mathcal{C}}^p_{alt}(\mathcal{U}, \mathcal{F}) = 0$ for all $p \geq t$. Hence the result follows. $\square$

Lemma 25.5.2. *Let X be a quasi-compact quasi-separated scheme. Let $X = U_1 \cup \ldots \cup U_t$ be an affine open covering. Set*

$$d = \max_{I \subset \{1,\ldots,t\}} |I| + t(\bigcap\nolimits_{i \in I} U_i)$$

where $t(U)$ is the minimal number of affines needed to cover the scheme U. Then $H^n(X, \mathcal{F}) = 0$ for all $n \geq d$ and all quasi-coherent sheaves $\mathcal{F}$.

Proof. Note that since X is quasi-separated the numbers $t(\bigcap_{i \in I} U_i)$ are finite. Let $\mathcal{U} : X = \bigcup_{i=1}^t U_i$. By Cohomology, Lemma 18.11.4 there is a spectral sequence

$$E_2^{p,q} = \check{H}^p(\mathcal{U}, \underline{H}^q(\mathcal{F}))$$

converging to $H^{p+q}(U, \mathcal{F})$. By Cohomology, Lemma 18.17.6 we have

$$E_2^{p,q} = H^p(\check{\mathcal{C}}_{alt}^\bullet(\mathcal{U}, \underline{H}^q(\mathcal{F}))$$

The alternating Čech complex with values in the presheaf $\underline{H}^q(\mathcal{F})$ vanishes in high degrees by Lemma 25.5.1, more precisely $E_2^{p,q} = 0$ for $p + q \geq d$. Hence the result follows. □

Lemma 25.5.3. *Let $f : X \to S$ be a morphism of schemes. Assume that f is quasi-separated and quasi-compact.*

1. *For any quasi-coherent $\mathcal{O}_X$-module $\mathcal{F}$ the higher direct images $R^p f_*\mathcal{F}$ are quasi-coherent on S.*
2. *If S is quasi-compact, there exists an integer $n = n(X, S, f)$ such that $R^p f_*\mathcal{F} = 0$ for all $p \geq n$ and any quasi-coherent sheaf $\mathcal{F}$ on X.*
3. *In fact, if S is quasi-compact we can find $n = n(X, S, f)$ such that for every morphism of schemes $S' \to S$ we have $R^p(f')_*\mathcal{F}' = 0$ for $p \geq n$ and any quasi-coherent sheaf $\mathcal{F}'$ on X'. Here $f' : X' = S' \times_S X \to S'$ is the base change of f.*

Proof. We first prove (1). Note that under the hypotheses of the lemma the sheaf $R^0 f_*\mathcal{F} = f_*\mathcal{F}$ is quasi-coherent by Schemes, Lemma 21.24.1. Using Cohomology, Lemma 18.6.4 we see that forming higher direct images commutes with restriction to open subschemes. Since being quasi-coherent is local on S we may assume S is affine.

Assume S is affine and f quasi-compact and separated. Let $t \geq 1$ be the minimal number of affine opens needed to cover X. We will prove this case of (1) by induction on t. If $t = 1$ then the morphism f is affine by Morphisms, Lemma 24.11.12 and (1) follows from Lemma 25.2.3. If $t > 1$ write $X = U \cup V$ with V affine open and $U = U_1 \cup \ldots \cup U_{t-1}$ a union of $t - 1$ open affines. Note that in this case $U \cap V = (U_1 \cap V) \cup \ldots (U_{t-1} \cap V)$ is also a union of $t - 1$ affine open subschemes, see Schemes, Lemma 21.21.8. We will apply the relative Mayer-Vietoris sequence

$$0 \to f_*\mathcal{F} \to a_*(\mathcal{F}|_U) \oplus b_*(\mathcal{F}|_V) \to c_*(\mathcal{F}|_{U \cap V}) \to R^1 f_*\mathcal{F} \to \ldots$$

see Cohomology, Lemma 18.8.3. By induction we see that $R^p a_*\mathcal{F}$, $R^p b_*\mathcal{F}$ and $R^p c_*\mathcal{F}$ are all quasi-coherent. This implies that each of the sheaves $R^p f_*\mathcal{F}$ is quasi-coherent since it sits in the middle of a short exact sequence with a cokernel of a map between quasi-coherent sheaves on the left and a kernel of a map between quasi-coherent sheaves on the right. Using the results on quasi-coherent sheaves in Schemes, Section 21.24 we see conclude $R^p f_*\mathcal{F}$ is quasi-coherent.

Assume S is affine and f quasi-compact and quasi-separated. Let $t \geq 1$ be the minimal number of affine opens needed to cover X. We will prove (1) by induction on t. In case

$t = 1$ the morphism f is separated and we are back in the previous case (see previous paragraph). If $t > 1$ write $X = U \cup V$ with V affine open and U a union of $t-1$ open affines. Note that in this case $U \cap V$ is an open subscheme of an affine scheme and hence separated (see Schemes, Lemma 21.21.6). We will apply the relative Mayer-Vietoris sequence

$$0 \to f_*\mathcal{F} \to a_*(\mathcal{F}|_U) \oplus b_*(\mathcal{F}|_V) \to c_*(\mathcal{F}|_{U\cap V}) \to R^1 f_*\mathcal{F} \to \ldots$$

see Cohomology, Lemma 18.8.3. By induction and the result of the previous paragraph we see that $R^p a_*\mathcal{F}$, $R^p b_*\mathcal{F}$ and $R^p c_*\mathcal{F}$ are quasi-coherent. As in the previous paragraph this implies each of sheaves $R^p f_*\mathcal{F}$ is quasi-coherent.

Next, we prove (3) and a fortiori (2). Choose a finite affine open covering $S = \bigcup_{j=1,\ldots m} S_j$. For each i choose a finite affine open covering $f^{-1}(S_j) = \bigcup_{i=1,\ldots t_j} U_{ji}$. Let

$$d_j = \max_{I \subset \{1,\ldots,t_j\}} |I| + t(\bigcap\nolimits_{i\in I} U_{ji})$$

be the integer found in Lemma 25.5.2. We claim that $n(X, S, f) = \max d_j$ works.

Namely, let $S' \to S$ be a morphism of schemes and let $\mathcal{F}'$ be a quasi-coherent sheaf on $X' = S' \times_S X$. We want to show that $R^p f'_*\mathcal{F}' = 0$ for $p \geq n(X, S, f)$. Since this question is local on S' we may assume that S' is affine and maps into S_j for some j. Then $X' = S' \times_{S_j} f^{-1}(S_j)$ is covered by the open affines $S' \times_{S_j} U_{ji}$, $i = 1, \ldots t_j$ and the intersections

$$\bigcap\nolimits_{i\in I} S' \times_{S_j} U_{ji} = S' \times_{S_j} \bigcap\nolimits_{i\in I} U_{ji}$$

are covered by the same number of affines as before the base change. Applying Lemma 25.5.2 we get $H^p(X', \mathcal{F}') = 0$. By the first part of the proof we already know that each $R^q f'_*\mathcal{F}'$ is quasi-coherent hence has vanishing higher cohomology groups on our affine scheme S', thus we see that $H^0(S', R^p f'_*\mathcal{F}') = H^p(X', \mathcal{F}') = 0$ by Cohomology, Lemma 18.12.6. Since $R^p f'_*\mathcal{F}'$ is quasi-coherent we conclude that $R^p f'_*\mathcal{F}' = 0$. □

Lemma 25.5.4. *Let $f : X \to S$ be a morphism of schemes. Assume that f is quasi-separated and quasi-compact. Assume S is affine. For any quasi-coherent $\mathcal{O}_X$-module $\mathcal{F}$ we have*

$$H^q(X, \mathcal{F}) = H^0(S, R^q f_*\mathcal{F})$$

for all $q \in \mathbf{Z}$.

Proof. Consider the Leray spectral sequence $E_2^{p,q} = H^p(S, R^q f_*\mathcal{F})$ converging to $H^{p+q}(X, \mathcal{F})$, see Cohomology, Lemma 18.12.4. By Lemma 25.5.3 we see that the sheaves $R^q f_*\mathcal{F}$ are quasi-coherent. By Lemma 25.2.2 we see that $E_2^{p,q} = 0$ when $p > 0$. Hence the spectral sequence degenerates at E_2 and we win. See also Cohomology, Lemma 18.12.6 (2) for the general principle. □

25.6. Cohomology and base change, I

Let $f : X \to S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent sheaf on X. Suppose further that $g : S' \to S$ is any morphism of schemes. Denote $X' = X_{S'} = S' \times_S X$ the base change of X and denote $f' : X' \to S'$ the base change of f. Also write $g' : X' \to X$ the projection, and set $\mathcal{F}' = (g')^*\mathcal{F}$. Here is a diagram representing the situation:

(25.6.0.1)
$$\begin{tikzcd} \mathcal{F}' = (g')^*\mathcal{F} & X' \arrow[r, "g'"] \arrow[d, "f'"'] & X \arrow[d, "f"] & \mathcal{F} \\ Rf'_*\mathcal{F}' & S' \arrow[r, "g"] & S & Rf_*\mathcal{F} \end{tikzcd}$$

Here is the simplest case of the base change property we have in mind.

Lemma 25.6.1. *Let $f : X \to S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Assume f is affine. In this case $f_*\mathcal{F} \cong Rf_*\mathcal{F}$ is a quasi-coherent sheaf, and for every base change diagram (25.6.0.1) we have*

$$g^* f_*\mathcal{F} = f'_*(g')^*\mathcal{F}.$$

Proof. The vanishing of higher direct images is Lemma 25.2.3. The statement is local on S and S'. Hence we may assume $X = Spec(A)$, $S = Spec(R)$, $S' = Spec(R')$ and $\mathcal{F} = \widetilde{M}$ for some A-module M. We use Schemes, Lemma 21.7.3 to describe pullbacks and pushforwards of $\mathcal{F}$. Namely, $X' = Spec(R' \otimes_R A)$ and $\mathcal{F}'$ is the quasi-coherent sheaf associated to $(R' \otimes_R A) \otimes_A M$. Thus we see that the lemma boils down to the equality

$$(R' \otimes_R A) \otimes_A M = R' \otimes_R M$$

as R'-modules. $\square$

In many situations it is sufficient to know about the following special case of cohomology and base change. It follows immediately from the stronger results in the next section, but since it is so important it deserves its own proof.

Lemma 25.6.2. *Let $f : X \to S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent sheaf on X. Let $g : S' \to S$ be a morphism of schemes. Assume that g is flat and that f is quasi-compact and quasi-separated. Then for any $i \geq 0$ we have*

$$R^i f'_*\mathcal{F}' = g^* R^i f_*\mathcal{F}$$

with notation as in (25.6.0.1). Moreover, the induced isomorphism is the map given by the base change map of Cohomology, Lemma 18.14.1.

Proof. The statement is local on S' and hence we may assume S and S' are affine. Say $S = \text{Spec}(A)$ and $S' = \text{Spec}(B)$. In this case we are really trying to show that the map

$$H^i(X, \mathcal{F}) \otimes_A B \longrightarrow H^i(X_B, \mathcal{F}_B)$$

(given by the reference in the statement of the lemma) is an isomorphism where $X_B = \text{Spec}(B) \times_{\text{Spec}(A)} X$ and $\mathcal{F}_B$ is the pullback of $\mathcal{F}$ to X_B.

In case X is separated, choose an affine open covering $\mathcal{U} : X = U_1 \cup \ldots \cup U_t$ and recall that

$$\check{H}^p(\mathcal{U}, \mathcal{F}) = H^p(X, \mathcal{F}),$$

see Lemma 25.2.4. If $\mathcal{U}_B : X_B = (U_1)_B \cup \ldots \cup (U_t)_B$ we obtain by base change, then it is still the case that each $(U_i)_B$ is affine and that X_B is separated. Thus we obtain

$$\check{H}^p(\mathcal{U}_B, \mathcal{F}_B) = H^p(X_B, \mathcal{F}_B).$$

We have the following relation between the Čech complexes

$$\check{\mathcal{C}}^\bullet(\mathcal{U}_B, \mathcal{F}_B) = \check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{F}) \otimes_A B$$

as follows from Lemma 25.6.1. Since $A \to B$ is flat, the same thing remains true on taking cohomology.

In case X is quasi-separated, choose an affine open covering $\mathcal{U} : X = U_1 \cup \ldots \cup U_t$. We will use the Čech-to-cohomology spectral sequence Cohomology, Lemma 18.11.4. The reader who wishes to avoid this spectral sequence can use Majer-Vietoris and induction on t as in the proof of Lemma 25.5.3. The spectral sequence has E_2-page $E_2^{p,q} = \check{H}^p(\mathcal{U}, \underline{H}^q(\mathcal{F}))$ and converges to $H^{p+q}(X, \mathcal{F})$. Similarly, we have a spectral sequence with

E_2-page $E_2^{p,q} = \check{H}^p(\mathcal{U}_B, \underline{H}^q(\mathcal{F}_B))$ and converges to $H^{p+q}(X_B, \mathcal{F}_B)$. Since the intersections $U_{i_0\ldots i_p}$ are quasi-compact and separated, the result of the second paragraph of the proof gives $\check{H}^p(\mathcal{U}_B, \underline{H}^q(\mathcal{F}_B)) = \check{H}^p(\mathcal{U}, \underline{H}^q(\mathcal{F})) \otimes_A B$. Using that $A \to B$ is flat we conclude that $H^i(X, \mathcal{F}) \otimes_A B \to H^i(X_B, \mathcal{F}_B)$ is an isomorphism for all i and we win. □

25.7. Cohomology and base change, II

We would like to prove a little more in situation (25.6.0.1). Namely, if f is quasi-compact and quasi-separated we would like to represent $Rf_*\mathcal{F}$ by a complex of quasi-coherent sheaves on S. This can be done in some cases, for example if S is quasi-compact and (semi-)separated, by relating it to the question of whether $D^+_{QCoh}(S)$ is equivalent to $D^+(QCoh(\mathcal{O}_S))$, see Section 25.4.

In this section we will use a different approach which produces a complex having a good base change property. First of all the result is very easy if f and S are separated. Since this is the case which by far the most often used we treat it separately.

Lemma 25.7.1. *Let $f : X \to S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Assume X and S are separated and quasi-compact. In this case we can compute $Rf_*\mathcal{F}$ as follows:*

1. *Choose a finite affine open covering $\mathcal{U} : X = \bigcup_{i=1,\ldots,n} U_i$.*
2. *For $i_0, \ldots, i_p \in \{1, \ldots, n\}$ denote $f_{i_0\ldots i_p} : U_{i_0\ldots i_p} \to S$ the restriction of f to the intersection $U_{i_0\ldots i_p} = U_{i_0} \cap \ldots \cap U_{i_p}$.*
3. *Set $\mathcal{F}_{i_0\ldots i_p}$ equal to the restriction of $\mathcal{F}$ to $U_{i_0\ldots i_p}$.*
4. *Set*
$$\check{\mathcal{C}}^p(\mathcal{U}, f, \mathcal{F}) = \bigoplus\nolimits_{i_0\ldots i_p} f_{i_0\ldots i_p *}\mathcal{F}_{i_0\ldots i_p}$$
and define differentials $d : \check{\mathcal{C}}^p(\mathcal{U}, f, \mathcal{F}) \to \check{\mathcal{C}}^{p+1}(\mathcal{U}, f, \mathcal{F})$ as in Cohomology, Equation (18.9.0.1).

Then the complex $\check{\mathcal{C}}^\bullet(\mathcal{U}, f, \mathcal{F})$ is a complex of quasi-coherent sheaves on S which comes equipped with an isomorphism
$$\check{\mathcal{C}}^\bullet(\mathcal{U}, f, \mathcal{F}) \longrightarrow Rf_*\mathcal{F}$$
in $D^+(S)$. This isomorphism is functorial in the quasi-coherent sheaf $\mathcal{F}$.

Proof. Omitted. Hint: Use the resolution $\mathcal{F} \to \mathfrak{C}^\bullet(\mathcal{U}, \mathcal{F})$ of Cohomology, Lemma 18.18.3. Observe that $\check{\mathcal{C}}^\bullet(\mathcal{U}, f, \mathcal{F}) = f_*\mathfrak{C}^\bullet(\mathcal{U}, \mathcal{F})$. Also observe that both the inclusion morphisms $j_{i_0\ldots i_p} : U_{i_0\ldots i_p} \to X$ and the morphisms $f_{i_0\ldots i_p} : U_{i_0\ldots i_p} \to S$ are affine because S and X and $f : X \to S$ are separated, see Morphisms, Lemma 24.11.11. Hence $R^q(j_{i_0\ldots i_p})_*\mathcal{F}_{i_0\ldots i_p}$ as well as $R^q(f_{i_0\ldots i_p})_*\mathcal{F}_{i_0\ldots i_p}$ are zero for $q > 0$. Finally, put all of this information together (e.g. use a spectral sequence, for example by choosing a Cartan-Eilenberg resolution of the complex $\mathfrak{C}^\bullet(\mathcal{U}, \mathcal{F})$). □

Next, we are going to consider what happens if we do a base change.

Lemma 25.7.2. *With notation as in diagram (25.6.0.1). Assume $f : X \to S$ and $\mathcal{F}$ satisfy the hypotheses of Lemma 25.7.1. Choose a finite affine open covering $\mathcal{U} : X = \bigcup U_i$ of X. There is a canonical isomorphism*
$$g^*\check{\mathcal{C}}^\bullet(\mathcal{U}, f, \mathcal{F}) \longrightarrow Rf'_*\mathcal{F}'$$

in $D^+(S')$. Moreover, if $S' \to S$ is affine, then in fact

$$g^*\check{\mathcal{C}}^\bullet(\mathcal{U}, f, \mathcal{F}) = \check{\mathcal{C}}^\bullet(\mathcal{U}', f', \mathcal{F}')$$

with $\mathcal{U}' : X' = \bigcup U'_i$ where $U'_i = (g')^{-1}(U_i) = U_{i,S'}$ is also affine.

Proof. In fact we may define $U'_i = (g')^{-1}(U_i) = U_{i,S'}$ no matter whether S' is affine over S or not. Let $\mathcal{U}' : X' = \bigcup U'_i$ be the induced covering of X'. In this case we claim that

$$g^*\check{\mathcal{C}}^\bullet(\mathcal{U}, f, \mathcal{F}) = \check{\mathcal{C}}^\bullet(\mathcal{U}', f', \mathcal{F}')$$

with $\check{\mathcal{C}}^\bullet(\mathcal{U}', f', \mathcal{F}')$ defined in exactly the same manner as in Lemma 25.7.1. This is clear from the case of affine morphisms (Lemma 25.6.1) by working locally on S'. Moreover, exactly as in the proof of Lemma 25.7.1 one sees that there is an isomorphism

$$\check{\mathcal{C}}^\bullet(\mathcal{U}', f', \mathcal{F}') \longrightarrow Rf'_*\mathcal{F}'$$

in $D^+(S')$ since the morphisms $U'_i \to X'$ and $U'_i \to S'$ are still affine (being base changes of affine morphisms). Details omitted. □

The lemma above says that the complex

$$\mathcal{K}^\bullet = \check{\mathcal{C}}^\bullet(\mathcal{U}, f, \mathcal{F})$$

is a bounded below complex of quasi-coherent sheaves on S which *universally* computes the higher direct images of $f : X \to S$. This is something about this particular complex and it is not preserved by replacing $\check{\mathcal{C}}^\bullet(\mathcal{U}, f, \mathcal{F})$ by a quasi-isomorphic complex in general! In other words, this is not a statement that makes sense in the derived category. The reason is that the pullback $g^*\mathcal{K}^\bullet$ is *not* equal to the derived pullback $Lg^*\mathcal{K}^\bullet$ of $\mathcal{K}^\bullet$ in general!

Here is a more general case where we can prove this statement. We remark that the condition of S being separated is harmless in most applications, since this is usually used to prove some local property of the total derived image. The proof is significantly more involved and uses hypercoverings; it is a nice example of how you can use them sometimes.

Lemma 25.7.3. *Let $f : X \to S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent sheaf on X. Assume that f is quasi-compact and quasi-separated and that S is quasi-compact and separated. There exists a bounded below complex $\mathcal{K}^\bullet$ of quasi-coherent $\mathcal{O}_S$-modules with the following property: For every morphism $g : S' \to S$ the complex $g^*\mathcal{K}^\bullet$ is a representative for $Rf'_*\mathcal{F}'$ with notation as in diagram (25.6.0.1).*

Proof. (If f is separated as well, please see Lemma 25.7.2.) The assumptions imply in particular that X is quasi-compact and quasi-separated as a scheme. Let $\mathcal{B}$ be the set of affine opens of X. By Hypercoverings, Lemma 20.9.4 we can find a hypercovering $K = (I, \{U_i\})$ such that each I_n is finite and each U_i is an affine open of X. By Hypercoverings, Lemma 20.7.3 there is a spectral sequence with E_2-page

$$E_2^{p,q} = \check{H}^p(K, \underline{H}^q(\mathcal{F}))$$

converging to $H^{p+q}(X, \mathcal{F})$. Note that $\check{H}^p(K, \underline{H}^q(\mathcal{F}))$ is the pth cohomology group of the complex

$$\prod\nolimits_{i \in I_0} H^q(U_i, \mathcal{F}) \to \prod\nolimits_{i \in I_1} H^q(U_i, \mathcal{F}) \to \prod\nolimits_{i \in I_2} H^q(U_i, \mathcal{F}) \to \ldots$$

Since each U_i is affine we see that this is zero unless $q = 0$ in which case we obtain

$$\prod\nolimits_{i \in I_0} \mathcal{F}(U_i) \to \prod\nolimits_{i \in I_1} \mathcal{F}(U_i) \to \prod\nolimits_{i \in I_2} \mathcal{F}(U_i) \to \ldots$$

Thus we conclude that $R\Gamma(X, \mathcal{F})$ is computed by this complex.

For any n and $i \in I_n$ denote $f_i : U_i \to S$ the restriction of f to U_i. As S is separated and U_i is affine this morphism is affine. Consider the complex of quasi-coherent sheaves

$$\mathcal{K}^\bullet = (\prod\nolimits_{i\in I_0} f_{i,*}\mathcal{F}|_{U_i} \to \prod\nolimits_{i\in I_1} f_{i,*}\mathcal{F}|_{U_i} \to \prod\nolimits_{i\in I_2} f_{i,*}\mathcal{F}|_{U_i} \to \ldots)$$

on S. As in Hypercoverings, Lemma 20.7.3 we obtain a map $\mathcal{K}^\bullet \to Rf_*\mathcal{F}$ in $D(\mathcal{O}_S)$ by choosing an injective resolution of $\mathcal{F}$ (details omitted). Consider any affine scheme V and a morphism $g : V \to S$. Then the base change X_V has a hypercovering $K_V = (I, \{U_{i,V}\})$ obtained by base change. Moreover, $g^*f_{i,*}\mathcal{F} = f_{i,V,*}(g')^*\mathcal{F}|_{U_{i,V}}$. Thus the arguments above prove that $\Gamma(V, g^*\mathcal{K}^\bullet)$ computes $R\Gamma(X_V, (g')^*\mathcal{F})$. This finishes the proof of the lemma as it suffices to prove the equality of complexes Zariski locally on S'. □

25.8. Ample invertible sheaves and cohomology

Given a ringed space X, an invertible $\mathcal{O}_X$-module $\mathcal{L}$, a section $s \in \Gamma(X, \mathcal{L})$ and an $\mathcal{O}_X$-module $\mathcal{F}$ we get a map $\mathcal{F} \to \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L}$, $t \mapsto t \otimes s$ which we call multiplication by s. We usually denote it $t \mapsto st$.

Lemma 25.8.1. *Let X be a scheme. Let $\mathcal{L}$ be an invertible $\mathcal{O}_X$-module. Let $s \in \Gamma(X, \mathcal{L})$ be a section. Let $\mathcal{F}' \subset \mathcal{F}$ be quasi-coherent $\mathcal{O}_X$-modules. Assume that*

1. *X is quasi-compact,*
2. *$\mathcal{F}$ is of finite type, and*
3. *$\mathcal{F}'|_{X_s} = \mathcal{F}|_{X_s}$.*

Then there exists an $n \geq 0$ such that multiplication by s^n on $\mathcal{F}$ factors through $\mathcal{F}'$.

Proof. In other words we claim that $s^n\mathcal{F} \subset \mathcal{F}' \otimes_{\mathcal{O}_X} \mathcal{L}^{\otimes n}$ for some $n \geq 0$. If this is true for n_0 then it is true for all $n \geq n_0$. Hence it suffices to show there is a finite open covering such that the result holds for each of the members of this open covering. Since X is quasi-compact we may therefore assume that X is affine and that $\mathcal{L} \cong \mathcal{O}_X$. Thus the lemma translates into the following algebra problem (use Properties, Lemma 23.16.1): Let A be a ring. Let $f \in A$. Let $M' \subset M$ be A-modules. Assume M is a finite A-module, and assume that $(M')_f = M_f$. Then there exists an $n \geq 0$ such that $f^nM \subset M'$. The proof of this is omitted. □

Let X be a scheme. Let $\mathcal{L}$ be an invertible $\mathcal{O}_X$-module. Let $s \in \Gamma(X, \mathcal{L})$ be a section. Assume X quasi-compact and quasi-separated. The following lemma says roughly that the category of finitely presented $\mathcal{O}_{X_s}$-modules is the category of finitely presented $\mathcal{O}_X$-modules where the map multiplication by s has been inverted.

Lemma 25.8.2. *Let X be a scheme. Let $\mathcal{L}$ be an invertible $\mathcal{O}_X$-module. Let $s \in \Gamma(X, \mathcal{L})$ be a section. Let $\mathcal{F}$, $\mathcal{F}'$ be quasi-coherent $\mathcal{O}_X$-modules. Let $\psi : \mathcal{F}|_{X_s} \to \mathcal{F}'|_{X_s}$ be a map of $\mathcal{O}_{X_s}$-modules. Assume that*

1. *X is quasi-compact and quasi-separated, and*
2. *$\mathcal{F}$ is of finitely presented.*

Then there exists an $n \geq 0$ and a morphism $\alpha : \mathcal{F} \to \mathcal{F}' \otimes_{\mathcal{O}_X} \mathcal{L}^{\otimes n}$ whose restriction to X_s equals ψ via the identification $\mathcal{L}^{\otimes n}|_{X_s} = \mathcal{O}_{X_s}$ coming from s. Moreover, given a pair of solutions (n, α) and (n', α') there exists an $m \geq \max(n, n')$ such that $s^{m-n}\alpha = s^{m-n'}\alpha'$.

Proof. If the lemma holds for n_0 with map α_0 then it holds for all $n \geq n_0$ simply by taking $\alpha = s^{n-n_0}\alpha_0$. Choose a finite affine open covering $X = \bigcup U_i$ such that $\mathcal{L}|_{U_i}$ is trivial. Choose finite affine open coverings $U_i \cap U_{i'} = \bigcup U_{ii'j}$. Suppose we can prove the lemma when X is affine and $\mathcal{L}$ is trivial. Then we can find $n_i \geq 0$ $\alpha_i : \mathcal{F}|_{U_i} \to \mathcal{F}'|_{U_i} \otimes_{\mathcal{O}_{U_i}} \mathcal{L}^{\otimes n_i}|_{U_i}$ satisfying the relation over U_i. By the uniqueness assertion of the lemma, and the finiteness of the number of affines $U_{ii'j}$ we can find a single large integer m such that the maps $s^{m-n_i}\alpha_i$ and $s^{m-n_{i'}}\alpha_{i'}$ agree over $U_{ii'j}$ and hence over $U_i \cap U_{i'}$. Thus the morphisms $s^{m-n_i}\alpha_i$ glue to give our global map α. Proof of the uniqueness statement is omitted.

Assume X affine and that $\mathcal{L} \cong \mathcal{O}_X$. Then the lemma translates into the following algebra problem (use Properties, Lemma 23.16.2): Let A be a ring. Let $f \in A$. Let $\psi : M_f \to (M')_f$ be a map of A_f-modules. Assume M is a finitely presented A-module. Then there exists an $n \geq 0$ and an A-module map $\alpha : M \to M'$ such that $\alpha \otimes 1_{A_f} = f^n\psi$. Moreover, given any second solution (n', α') there exists an $m \geq \max(n, n')$ such that $f^{m-n}\alpha = f^{m-n'}\alpha'$. The proof of this algebraic fact is omitted. □

Cohomology is functorial. In particular, given a ringed space X, an invertible $\mathcal{O}_X$-module $\mathcal{L}$, a section $s \in \Gamma(X, \mathcal{L})$ we get maps

$$H^p(X, \mathcal{F}) \longrightarrow H^p(X, \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L}), \quad \xi \longmapsto s\xi$$

induced by the map $\mathcal{F} \to \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L}$ which is multiplication by s.

Lemma 25.8.3. *Let X be a scheme. Let $\mathcal{L}$ be an invertible $\mathcal{O}_X$-module. Let $s \in \Gamma(X, \mathcal{L})$ be a section. Assume that*

(1) *X is quasi-compact and quasi-separated, and*
(2) *X_s is affine.*

Then for every quasi-coherent $\mathcal{O}_X$-module $\mathcal{F}$ and every $p > 0$ and all $\xi \in H^p(X, \mathcal{F})$ there exists an $n \geq 0$ such that $s^n\xi = 0$ in $H^p(X, \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L}^{\otimes n})$.

Proof. You can prove this lemma using a Mayer-Vietoris type argument and induction on the number of affines needed to cover X similar to the proof of Lemma 25.5.3. This may be preferable to the proof that follows.

Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Cohomology on X commutes with directed colimits of sheaves of $\mathcal{O}_X$-modules, see Cohomology, Lemma 18.15.1. By Properties, Lemma 23.20.7 we can write $\mathcal{F}$ as a directed colimit of $\mathcal{O}_X$-submodules of finite presentation. Hence every $\xi \in H^p(X, \mathcal{F})$ is the image of $\xi' \in H^p(X, \mathcal{F}')$ for some $\mathcal{O}_X$-submodule of finite presentation. Thus we may replace $\mathcal{F}$ by $\mathcal{F}'$ and assume $\mathcal{F}$ is of finite presentation.

Let $j : X_s \to X$ be the inclusion morphism. Morphisms, Lemma 24.11.10 says that j is an affine morphism. Hence $R^q j_*(j^*\mathcal{F}) = 0$ for all $q > 0$, see Lemma 25.2.3. Since also $H^p(X_s, j^*\mathcal{F}) = 0$ by Lemma 25.2.2, we conclude that $H^p(X, j_*j^*\mathcal{F}) = 0$ for all $p > 0$ for example by the Leray spectral sequence (Cohomology, Lemma 18.12.4). Write

$$j_*j^*\mathcal{F} = colim_{\lambda \in \Lambda} \mathcal{F}_\lambda$$

as a directed colimit of $\mathcal{O}_X$-modules $\mathcal{F}_\lambda$ of finite presentation (Properties, Lemma 23.20.7 again). By Modules, Lemma 15.11.6 there exists a $\lambda \in \Lambda$ such that $\mathcal{F} \to j_*j^*\mathcal{F}$ factors through $\mathcal{F}_\lambda$. After shrinking Λ we may assume that we have a compatible collection of morphisms $\chi_\lambda : \mathcal{F} \to \mathcal{F}_\lambda$ for all $\lambda \in \Lambda$ which when taking the colimit gives the canonical map $\mathcal{F} \to j_*j^*\mathcal{F}$.

With these preparations the proof goes as follows. Take $\xi \in H^p(X, \mathcal{F})$ for some $p > 0$. It maps to zero in $H^p(X, j_*j^*\mathcal{F})$ because we saw above this group is zero. By Cohomology, Lemma 18.15.1 again it follows that ξ maps to zero in $H^p(X, \mathcal{F}_\lambda)$ via the map χ_λ for some λ. Note that since $\mathcal{F} \to j_*j^*\mathcal{F}$ is an isomorphism over X_s we see that there is an $\mathcal{O}_{X_s}$-module map $\psi : \mathcal{F}_\lambda|_{X_s} \to \mathcal{F}|_{X_s}$ which is a left inverse to $\chi_\lambda : \mathcal{F} \to \mathcal{F}_\lambda$. By Lemma 25.8.2 there exists an n and a map $\alpha : \mathcal{F}_\lambda \to \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L}^{\otimes n}$ such that α restricts to ψ on X_s (via $\mathcal{L}^{\otimes n}|_{X_s} \cong \mathcal{O}_{X_s}$). By the uniqueness part of Lemma 25.8.2 applied to $\alpha \circ \chi_\lambda$ which restricts to multiplication by s^n on X_s we may assume (after increasing n) that the composition

$$\mathcal{F} \xrightarrow[\chi_\lambda]{} \mathcal{F}_\lambda \xrightarrow[\alpha]{} \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L}^{\otimes n}$$

is equal to multiplication by s^n on $\mathcal{F}$. Hence we see that $s^n\xi = 0$. □

25.9. Cohomology of projective space

In this section we compute the cohomology of the twists of the structure sheaf on $\mathbf{P}^n_S$ over a scheme S. Recall that $\mathbf{P}^n_S$ was defined as the fibre product $\mathbf{P}^n_S = S \times_{Spec(\mathbf{Z})} \mathbf{P}^n_{\mathbf{Z}}$ in Constructions, Definition 22.13.2. It was shown to be equal to

$$\mathbf{P}^n_S = \underline{\mathrm{Proj}}_S(\mathcal{O}_S[T_0, \ldots, T_n])$$

in Constructions, Lemma 22.20.4. In particular, projective space is a particular case of a projective bundle. If $S = Spec(R)$ is affine then we have

$$\mathbf{P}^n_S = \mathbf{P}^n_R = \mathrm{Proj}(R[T_0, \ldots, T_n]).$$

All these identifications are compatible and compatible with the constructions of the twisted structure sheaves $\mathcal{O}_{\mathbf{P}^n_S}(d)$.

Before we state the result we need some notation. Let R be a ring. Recall that $R[T_0, \ldots, T_n]$ is a graded R-algebra where each T_i is homogenous of degree 1. Denote $(R[T_0, \ldots, T_n])_d$ the degree d summand. It is a finite free R-module of rank $\binom{n+d}{d}$ when $d \geq 0$ and zero else. It has a basis consisting of monomials $T_0^{e_0} \ldots T_n^{e_n}$ with $\sum e_i = d$. We will also use the following notation: $R[\frac{1}{T_0}, \ldots, \frac{1}{T_n}]$ denotes the $\mathbf{Z}$-graded ring with $\frac{1}{T_i}$ in degree -1. In particular the $\mathbf{Z}$-graded $R[\frac{1}{T_0}, \ldots, \frac{1}{T_n}]$ module

$$\frac{1}{T_0 \ldots T_n} R[\frac{1}{T_0}, \ldots, \frac{1}{T_n}]$$

which shows up in the statement below is zero in degrees $\geq -n$, is free on the generator $\frac{1}{T_0 \ldots T_n}$ in degree $-n-1$ and is free of rank $(-1)^n\binom{n+d}{d}$ for $d \leq -n-1$.

Lemma 25.9.1. *Let R be a ring. Let $n \geq 0$ be an integer. We have*

$$H^q(\mathbf{P}^n, \mathcal{O}_{\mathbf{P}^n_R}(d)) = \begin{cases} (R[T_0, \ldots, T_n])_d & \text{if} \quad q = 0 \\ 0 & \text{if} \quad q \neq 0, n \\ \left(\frac{1}{T_0 \ldots T_n} R[\frac{1}{T_0}, \ldots, \frac{1}{T_n}]\right)_d & \text{if} \quad q = n \end{cases}$$

as R-modules.

Proof. We will use the standard affine open convering

$$\mathcal{U} : \mathbf{P}^n_R = \bigcup\nolimits_{i=0}^n D_+(T_i)$$

to compute the cohomology using the Cech complex. This is permissible by Lemma 25.2.4 since any intersection of finitely many affine $D_+(T_i)$ is also a standard affine open (see Constructions, Section 22.8). In fact, we can use the alternating or ordered Cech complex according to Cohomology, Lemmas 18.17.3 and 18.17.6.

The ordering we will use on $\{0, \ldots, n\}$ is the usual one. Hence the complex we are looking at has terms

$$\check{\mathcal{C}}^p_{ord}(\mathcal{U}, \mathcal{O}_{\mathbf{P}_R}(d)) = \bigoplus\nolimits_{i_0 < \ldots < i_p} (R[T_0, \ldots, T_n, \frac{1}{T_{i_0} \ldots T_{i_p}}])_d$$

Moreover, the maps are given by the usual formula

$$d(s)_{i_0 \ldots i_{p+1}} = \sum\nolimits_{j=0}^{p+1} (-1)^j s_{i_0 \ldots \hat{i}_j \ldots i_{p+1}}$$

see Cohomology, Section 18.17. Note that each term of this complex has a natural $\mathbf{Z}^{n+1}$-grading. Namely, we get this by declaring a monomial $T_0^{e_0} \ldots T_n^{e_n}$ to be homogeneous with weight $(e_0, \ldots, e_n) \in \mathbf{Z}^{n+1}$. It is clear that the differential given above respects the grading. In a formula we have

$$\check{\mathcal{C}}^\bullet_{ord}(\mathcal{U}, \mathcal{O}_{\mathbf{P}_R}(d)) = \bigoplus\nolimits_{\vec{e} \in \mathbf{Z}^{n+1}} \check{\mathcal{C}}^\bullet(\vec{e})$$

where not all summand on the right hand side occur (see below). Hence in order to compute the cohomology modules of the complex it suffices to compute the cohomology of the graded pieces and take the direct sum at the end.

Fix $\vec{e} = (e_0, \ldots, e_n) \in \mathbf{Z}^{n+1}$. In order for this weight to occur in the complex above we need to assume $e_0 + \ldots + e_n = d$ (if not then it occurs for a different twist of the structure sheaf of course). Assuming this set

$$NEG(\vec{e}) = \{i \in \{0, \ldots, n\} \mid e_i < 0\}.$$

With this notation the weight $\vec{e}$ summand $\check{\mathcal{C}}^\bullet(\vec{e})$ of the Cech complex above has the following terms

$$\check{\mathcal{C}}^p(\vec{e}) = \bigoplus\nolimits_{i_0 < \ldots < i_p,\ NEG(\vec{e}) \subset \{i_0, \ldots, i_p\}} R \cdot T_0^{e_0} \ldots T_n^{e_n}$$

In other words, the terms corresponding to $i_0 < \ldots < i_p$ such that $NEG(\vec{e})$ is not contained in $\{i_0 \ldots i_p\}$ are zero. The differential of the complex $\check{\mathcal{C}}^\bullet(\vec{e})$ is still given by the exact same formula as above.

Suppose that $NEG(\vec{e}) = \{0, \ldots, n\}$, i.e., that all exponents e_i are negative. In this case the complex $\check{\mathcal{C}}^\bullet(\vec{e})$ has only one term, namely $\check{\mathcal{C}}^n(\vec{e}) = R \cdot \frac{1}{T^{-e_0} \ldots T^{-e_n}}$. Hence in this case

$$H^q(\check{\mathcal{C}}^\bullet(\vec{e})) = \begin{cases} R \cdot \frac{1}{T^{-e_0} \ldots T^{-e_n}} & \text{if} \quad q = n \\ 0 & \text{if} \quad \text{else} \end{cases}$$

The direct sum of all of these terms clearly gives the value

$$\left(\frac{1}{T_0 \ldots T_n} R[\frac{1}{T_0}, \ldots, \frac{1}{T_n}] \right)_d$$

in degree n as stated in the lemma. Moreover these terms do not contribute to cohomology in other degrees (also in accordance with the statement of the lemma).

Assume $NEG(\vec{e}) = \emptyset$. In this case the complex $\check{\mathcal{C}}^\bullet(\vec{e})$ has a summand R corresponding to all $i_0 < \ldots < i_p$. Let us compare the complex $\check{\mathcal{C}}^\bullet(\vec{e})$ to another complex. Namely, consider the affine open open covering

$$\mathcal{V} : Spec(R) = \bigcup\nolimits_{i \in \{0, \ldots, n\}} V_i$$

where $V_i = Spec(R)$ for all i. Consider the alternating Cech complex

$$\check{\mathcal{C}}^\bullet_{ord}(\mathcal{V}, \mathcal{O}_{Spec(R)})$$

By the same reasoning as above this computes the cohomology of the structure sheaf on $Spec(R)$. Hence we see that $H^p(\check{\mathcal{C}}^\bullet_{ord}(\mathcal{V}, \mathcal{O}_{Spec(R)})) = R$ if $p = 0$ and is 0 whenever $p > 0$. For these facts, see Lemma 25.2.1 and its proof. Note that also $\check{\mathcal{C}}^\bullet_{ord}(\mathcal{V}, \mathcal{O}_{Spec(R)})$ has a summand R for every $i_0 < \ldots < i_p$ and has exactly the same differential as $\check{\mathcal{C}}^\bullet(\vec{e})$. In other words these complexes are isomorphic complexes and hence have the same cohomology. We conclude that

$$H^q(\check{\mathcal{C}}^\bullet(\vec{e})) = \begin{cases} R \cdot T^{e_0} \ldots T^{e_n} & \text{if} \quad q = 0 \\ 0 & \text{if} \quad \text{else} \end{cases}$$

in the case that $NEG(\vec{e}) = \emptyset$. The direct sum of all of these terms clearly gives the value

$$(R[T_0, \ldots, T_n])_d$$

in degree 0 as stated in the lemma. Moreover these terms do not contribute to cohomology in other degrees (also in accordance with the statement of the lemma).

To finish the proof of the lemma we have to show that the complexes $\check{\mathcal{C}}^\bullet(\vec{e})$ are acyclic when $NEG(\vec{e})$ is neither empty nor equal to $\{0, \ldots, n\}$. Pick an index $i_{\text{fix}} \not\in NEG(\vec{e})$ (such an index exists). Consider the map

$$h : \check{\mathcal{C}}^{p+1}(\vec{e}) \to \check{\mathcal{C}}^p(\vec{e})$$

given by the rule

$$h(s)_{i_0 \ldots i_p} = s_{i_{\text{fix}} i_0 \ldots i_p}$$

(compare with the proof of Lemma 25.2.1). It is clear that this is well defined since

$$NEG(\vec{e}) \subset \{i_0, \ldots, i_p\} \Leftrightarrow NEG(\vec{e}) \subset \{i_{\text{fix}}, i_0, \ldots, i_p\}$$

Also $\check{\mathcal{C}}^0(\vec{e}) = 0$ so that this formula does work for all p including $p = -1$. The exact same (combinatorial) computation as in the proof of Lemma 25.2.1 shows that

$$(hd + dh)(s)_{i_0 \ldots i_p} = s_{i_0 \ldots i_p}$$

Hence we see that the identity map of the complex $\check{\mathcal{C}}^\bullet(\vec{e})$ is homotopic to zero which implies that it is acyclic. $\square$

In the following lemma we are going to use the pairing of free R-modules

$$R[T_0, \ldots, T_n] \times \frac{1}{T_0 \ldots T_n} R[\frac{1}{T_0}, \ldots, \frac{1}{T_n}] \longrightarrow R$$

which is defined by the rule

$$(f, g) \longmapsto \text{coefficient of } \frac{1}{T_0 \ldots T_n} \text{ in } fg.$$

In other words, the basis element $T_0^{e_0} \ldots T_n^{e_n}$ pairs with the basis element $T_0^{d_0} \ldots T_n^{d_n}$ to give 1 if and only if $e_i + d_i = -1$ for all i, and pairs to zero in all other cases. Using this pairing we get an identification

$$\left(\frac{1}{T_0 \ldots T_n} R[\frac{1}{T_0}, \ldots, \frac{1}{T_n}]\right)_d = Hom_R((R[T_0, \ldots, T_n])_{-n-1-d}, R)$$

Thus we can reformulate the result of Lemma 25.9.1 as saying that

(25.9.1.1) $$H^q(\mathbf{P}^n, \mathcal{O}_{\mathbf{P}^n_R}(d)) = \begin{cases} (R[T_0, \ldots, T_n])_d & \text{if} \quad q = 0 \\ 0 & \text{if} \quad q \neq 0, n \\ Hom_R((R[T_0, \ldots, T_n])_{-n-1-d}, R) & \text{if} \quad q = n \end{cases}$$

Lemma 25.9.2. *The identifications of Equation (25.9.1.1) are compatible with base change w.r.t. ring maps $R \to R'$. Moreover, for any $f \in R[T_0, \ldots, T_n]$ homogeneous of degree m the map multiplication by f*

$$\mathcal{O}_{\mathbf{P}^n_R}(d) \longrightarrow \mathcal{O}_{\mathbf{P}^n_R}(d+m)$$

induces the map on the cohomology group via the identifications of Equation (25.9.1.1) which is multiplication by f for H^0 and the contragredient of multiplication by f

$$(R[T_0, \ldots, T_n])_{-n-1-(d+m)} \longrightarrow (R[T_0, \ldots, T_n])_{-n-1-d}$$

on H^n.

Proof. Suppose that $R \to R'$ is a ring map. Let $\mathcal{U}$ be the standard affine open convering of $\mathbf{P}^n_R$, and let $\mathcal{U}'$ be the standard affine open convering of $\mathbf{P}^n_{R'}$. Note that $\mathcal{U}'$ is the pullback of the covering $\mathcal{U}$ under the canonical morphism $\mathbf{P}^n_{R'} \to \mathbf{P}^n_R$. Hence there is a map of Cech complexes

$$\gamma : \check{\mathcal{C}}^\bullet_{ord}(\mathcal{U}, \mathcal{O}_{\mathbf{P}_R}(d)) \longrightarrow \check{\mathcal{C}}^\bullet_{ord}(\mathcal{U}', \mathcal{O}_{\mathbf{P}_{R'}}(d))$$

which is compatible with the map on cohomology by Cohomology, Lemma 18.13.3. It is clear from the computations in the proof of Lemma 25.9.1 that this map of Cech complexes is compatible with the identifications of the cohomology groups in question. (Namely the basis elements for the Cech complex over R simply map to the corresponding basis elements for the Cech complex over R'.) Whence the first statement of the lemma.

Now fix the ring R and consider two homogeneous polynomials $f, g \in R[T_0, \ldots, T_n]$ both of the same degree m. Since cohomology is an additive functor, it is clear that the map induced by multiplication by $f + g$ is the same as the sum of the maps induced by multiplication by f and the map induced by multiplication by g. Moreover, since cohomology is a functor a similar result holds for multiplication by a product fg where f, g are both homogeneous (but not necessarily of the same degree). Hence to verify the second statement of the lemma it suffices to prove this when $f = x \in R$ or when $f = T_i$. In the case of multiplication by an element $x \in R$ the result follows since every cohomology groups or complex in sight has the structuce or an R-module or complex of R-modules. Finally, we consider the case of multiplication by T_i as a $\mathcal{O}_{\mathbf{P}^n_R}$-linear map

$$\mathcal{O}_{\mathbf{P}^n_R}(d) \longrightarrow \mathcal{O}_{\mathbf{P}^n_R}(d+1)$$

The statement on H^0 is clear. For the statement on H^n consider multiplication by T_i as a map on Cech complexes

$$\check{\mathcal{C}}^\bullet_{ord}(\mathcal{U}, \mathcal{O}_{\mathbf{P}_R}(d)) \longrightarrow \check{\mathcal{C}}^\bullet_{ord}(\mathcal{U}, \mathcal{O}_{\mathbf{P}_R}(d+1))$$

We are going to use the notation introduced in the proof of Lemma 25.9.1. We consider the effect of multiplication by T_i in terms of the decompositions

$$\check{\mathcal{C}}^\bullet_{ord}(\mathcal{U}, \mathcal{O}_{\mathbf{P}_R}(d)) = \bigoplus\nolimits_{\vec{e} \in \mathbf{Z}^{n+1},\ \sum e_i = d} \check{\mathcal{C}}^\bullet(\vec{e})$$

and

$$\check{\mathcal{C}}^\bullet_{ord}(\mathcal{U}, \mathcal{O}_{\mathbf{P}_R}(d+1)) = \bigoplus\nolimits_{\vec{e} \in \mathbf{Z}^{n+1},\ \sum e_i = d+1} \check{\mathcal{C}}^\bullet(\vec{e})$$

It is clear that it maps the subcomplex $\check{\mathcal{C}}^\bullet(\vec{e})$ to the subcomplex $\check{\mathcal{C}}^\bullet(\vec{e} + \vec{b}_i)$ where $\vec{b}_i = (0, \ldots, 0, 1, 0, \ldots, 0))$ the ith basis vector. In other words, it maps the summand of H^n corresponding to $\vec{e}$ with $e_i < 0$ and $\sum e_i = d$ to the summand of H^n corresponding to $\vec{e} + \vec{b}_i$

(which is zero if $e_i + b_i \geq 0$). It is easy to see that this corresponds exactly to the action of the contragredient of multiplication by T_i as a map

$$(R[T_0, \ldots, T_n])_{-n-1-(d+1)} \longrightarrow (R[T_0, \ldots, T_n])_{-n-1-d}$$

This proves the lemma. □

Before we state the relative version we need some notation. Namely, recall that $\mathcal{O}_S[T_0, \ldots, T_n]$ is a graded $\mathcal{O}_S$-module where each T_i is homogenous of degree 1. Denote $(\mathcal{O}_S[T_0, \ldots, T_n])_d$ the degree d summand. It is a finite locally free sheaf of rank $\binom{n+d}{d}$ on S.

Lemma 25.9.3. *Let S be a scheme. Let $n \geq 0$ be an integer. Consider the structure morphism*

$$f : \mathbf{P}^n_S \longrightarrow S.$$

We have

$$R^q f_*(\mathcal{O}_{\mathbf{P}^n_S}(d)) = \begin{cases} (\mathcal{O}_S[T_0, \ldots, T_n])_d & \text{if } \quad q = 0 \\ 0 & \text{if } \quad q \neq 0, n \\ \mathcal{H}om_{\mathcal{O}_S}((\mathcal{O}_S[T_0, \ldots, T_n])_{-n-1-d}, \mathcal{O}_S) & \text{if } \quad q = n \end{cases}$$

Proof. Omitted. Hint: This follows since the identifications in (25.9.1.1) are compatible with affine base change by Lemma 25.9.2. □

Next we state the version for projective bundles associated to finite locally free sheaves. Let S be a scheme. Let $\mathcal{E}$ be a finite locally free $\mathcal{O}_S$-module of constant rank $n + 1$, see Modules, Section 15.14. In this case we think of $\text{Sym}(\mathcal{E})$ as a graded $\mathcal{O}_S$-module where $\mathcal{E}$ is the graded part of degree 1. And $\text{Sym}^d(\mathcal{E})$ is the degree d summand. It is a finite locally free sheaf of rank $\binom{n+d}{d}$ on S. Recall that our normalization is that

$$\pi : \mathbf{P}(\mathcal{E}) = \underline{\text{Proj}}_S(\text{Sym}(\mathcal{E})) \longrightarrow S$$

and that there are natural maps $\text{Sym}^d(\mathcal{E}) \to \pi_*\mathcal{O}_{\mathbf{P}(\mathcal{E})}(d)$.

Lemma 25.9.4. *Let S be a scheme. Let $n \geq 1$. Let $\mathcal{E}$ be a finite locally free $\mathcal{O}_S$-module of constant rank $n + 1$. Consider the structure morphism*

$$\pi : \mathbf{P}(\mathcal{E}) \longrightarrow S.$$

We have

$$R^q \pi_*(\mathcal{O}_{\mathbf{P}(\mathcal{E})}(d)) = \begin{cases} Sym^d(\mathcal{E}) & \text{if } \quad q = 0 \\ 0 & \text{if } \quad q \neq 0, n \\ \mathcal{H}om_{\mathcal{O}_S}(Sym^{-n-1-d}(\mathcal{E}) \otimes_{\mathcal{O}_S} \wedge^{n+1}\mathcal{E}, \mathcal{O}_S) & \text{if } \quad q = n \end{cases}$$

These identifications are compatible with base change and isomorphism between locally free sheaves.

Proof. Consider the canonical map

$$\pi^*\mathcal{E} \longrightarrow \mathcal{O}_{\mathbf{P}(\mathcal{E})}(1)$$

and twist down by 1 to get

$$\pi^*(\mathcal{E})(-1) \longrightarrow \mathcal{O}_{\mathbf{P}(\mathcal{E})}$$

This is a surjective map from a locally free rank $n+1$ sheaf onto the structure sheaf. Hence the corresponding Koszul complex is exact (insert future reference here). In other words there is an exact complex

$$0 \to \pi^*(\wedge^{n+1}\mathcal{E})(-n-1) \to \ldots \to \pi^*(\wedge^i\mathcal{E})(-i) \to \ldots \to \mathcal{E}(-1) \to \mathcal{O}_{\mathbf{P}(\mathcal{E})} \to 0$$

We will think of the term $\pi^*(\wedge^i \mathcal{E})(-i)$ as being in degree $-i$. We are going to compute the higher direct images of this acyclic complex using the first spectral sequence of Derived Categories, Lemma 11.20.3. Namely, we see that there is a spectral sequence with terms

$$E_2^{p,q} = H^p(L^{\bullet,q}) \quad \text{with} \quad L^{-i,q} = R^q\pi_*\left(\pi^*(\wedge^i\mathcal{E})(-i)\right)$$

converging to zero! By the projection formula (Cohomology, Lemma 18.7.2) we have

$$L^{-i,q} = \wedge^i\mathcal{E} \otimes_{\mathcal{O}_S} R^q\pi_*\left(\mathcal{O}_{\mathbf{P}(\mathcal{E})}(-i)\right).$$

Note that locally on S the sheaf $\mathcal{E}$ is trivial, i.e., isomorphic to $\mathcal{O}_S^{\oplus n+1}$, hence locally on S the morphism $\mathbf{P}(\mathcal{E}) \to S$ can be identified with $\mathbf{P}^n_S \to S$. Hence locally on S we can use the result of Lemmas 25.9.1, 25.9.2, or 25.9.3. It follows that $L^{-i,q} = 0$ unless $i = q = 0$ or $i = n+1$ and $q = n$. This in turn implies that $E_2^{p,q} = 0$ unless $(p,q) = (0,0)$ or $(p,q) = (-n-1, n)$, and

$$E_2^{0,0} = \pi_*\mathcal{O}_{\mathbf{P}(\mathcal{E})} = \mathcal{O}_S$$
$$E_2^{-n-1,n} = \wedge^{n+1}\mathcal{E} \otimes_{\mathcal{O}_S} R^n\pi_*\left(\mathcal{O}_{\mathbf{P}(\mathcal{E})}(-n-1)\right).$$

Hence there can only be one nonzero differential in the spectral sequence namely the map d_{n+1} inducing a map

$$d_{n+1}^{0,0} : \mathcal{O}_S \longrightarrow \wedge^{n+1}\mathcal{E} \otimes_{\mathcal{O}_S} R^n\pi_*\left(\mathcal{O}_{\mathbf{P}(\mathcal{E})}(-n-1)\right)$$

which has to be an isomorphism (because the spectral sequence converges to the 0 sheaf). Since $\wedge^{n+1}\mathcal{E}$ is an invertible sheaf, this implies that $R^n\pi_*\mathcal{O}_{\mathbf{P}(\mathcal{E})}(-n-1)$ is invertible as well and canonically isomorphic to the inverse of $\wedge^{n+1}\mathcal{E}$. In other words we have proved the case $d = -n-1$ of the lemma.

Working locally on S we see immediately from the computation of cohomology in Lemmas 25.9.1, 25.9.2, or 25.9.3 the statements on vanishing of the lemma. Moreover the result on $R^0\pi_*$ is clear as well, since there are canonical maps $\mathrm{Sym}^d(\mathcal{E}) \to \pi_*\mathcal{O}_{\mathbf{P}(\mathcal{E})}(d)$ for all d. It remains to show that the description of $R^n\pi_*\mathcal{O}_{\mathbf{P}(\mathcal{E})}(d)$ is correct for $d < -n-1$. In other to do this we consider the map

$$\pi^*(\mathrm{Sym}^{-d+n+1}(\mathcal{E})) \otimes_{\mathcal{O}_{\mathbf{P}(\mathcal{E})}} \mathcal{O}_{\mathbf{P}(\mathcal{E})}(d) \longrightarrow \mathcal{O}_{\mathbf{P}(\mathcal{E})}(-n-1)$$

Applying $R^n\pi_*$ and the projection formula (see above) we get a map

$$\mathrm{Sym}^{-d+n+1}(\mathcal{E}) \otimes_{\mathcal{O}_S} R^n\pi_*(\mathcal{O}_{\mathbf{P}(\mathcal{E})}(d)) \longrightarrow R^n\pi_*\mathcal{O}_{\mathbf{P}(\mathcal{E})}(-n-1) = (\wedge^{n+1}\mathcal{E})^{\otimes -1}$$

(the last equality we have shown above). Again by the local calculations of Lemmas 25.9.1, 25.9.2, or 25.9.3 it follows that this map induces a perfect pairing between $R^n\pi_*(\mathcal{O}_{\mathbf{P}(\mathcal{E})}(d))$ and $\mathrm{Sym}^{-d+n+1}(\mathcal{E}) \otimes \wedge^{n+1}(\mathcal{E})$ as desired. $\square$

25.10. Supports of modules

In this section we collect some elementary results on supports of quasi-coherent modules on schemes. Recall that the support of a sheaf of modules has been defined in Modules, Section 15.5. On the other hand, the support of a module was defined in Algebra, Section 7.59. These match.

Lemma 25.10.1. *Let X be a scheme. Let $\mathcal{F}$ be a quasi-coherent sheaf on X. Let $Spec(A) = U \subset X$ be an affine open, and set $M = \Gamma(U, \mathcal{F})$. Let $x \in U$, and let $\mathfrak{p} \subset A$ be the corresponding prime. The following are equivalent*

(1) *$\mathfrak{p}$ is in the support of M, and*

(2) *x is in the support of $\mathcal{F}$.*

Proof. This follows from the equality $\mathcal{F}_x = M_{\mathfrak{p}}$, see Schemes, Lemma 21.5.4 and the definitions. □

Lemma 25.10.2. *Let X be a scheme. Let $\mathcal{F}$ be a quasi-coherent sheaf on X. The support of $\mathcal{F}$ is closed under specialization.*

Proof. If $x' \rightsquigarrow x$ is a specialization and $\mathcal{F}_x = 0$ then $\mathcal{F}_{x'}$ is zero, as $\mathcal{F}_{x'}$ is a localization of the module $\mathcal{F}_x$. Hence the complement of $\text{Supp}(\mathcal{F})$ is closed under generalization. □

For finite type quasi-coherent modules the support is closed, can be checked on fibres, and commutes with base change.

Lemma 25.10.3. *Let $\mathcal{F}$ be a finite type quasi-coherent module on a scheme X. Then*

(1) *The support of $\mathcal{F}$ is closed.*
(2) *For $x \in X$ we have*

$$x \in Supp(\mathcal{F}) \Leftrightarrow \mathcal{F}_x \neq 0 \Leftrightarrow \mathcal{F}_x \otimes_{\mathcal{O}_{X,x}} \kappa(x) \neq 0.$$

(3) *For any morphism of schemes $f : Y \to X$ the pullback $f^*\mathcal{F}$ is of finite type as well and we have $Supp(f^*\mathcal{F}) = f^{-1}(Supp(\mathcal{F}))$.*

Proof. Part (1) is a reformulation of Modules, Lemma 15.9.6. You can also combine Lemma 25.10.1, Properties, Lemma 23.16.1, and Algebra, Lemma 7.59.4 to see this. The first equivalence in (2) is the definition of support, and the second equivalence follows from Nakayama's lemma, see Algebra, Lemma 7.14.5. Let $f : Y \to X$ be a morphism of schemes. Note that $f^*\mathcal{F}$ is of finite type by Modules, Lemma 15.9.2. For the final assertion, let $y \in Y$ with image $x \in X$. Recall that

$$(f^*\mathcal{F})_y = \mathcal{F}_x \otimes_{\mathcal{O}_{X,x}} \mathcal{O}_{Y,y},$$

see Sheaves, Lemma 6.26.4. Hence $(f^*\mathcal{F})_y \otimes \kappa(y)$ is nonzero if and only if $\mathcal{F}_x \otimes \kappa(x)$ is nonzero. By (2) this implies $x \in \text{Supp}(\mathcal{F})$ if and only if $y \in \text{Supp}(f^*\mathcal{F})$, which is the content of assertion (3). □

Lemma 25.10.4. *Let $\mathcal{F}$ be a finite type quasi-coherent module on a scheme X. There exists a smallest closed subscheme $i : Z \to X$ such that there exists a quasi-coherent $\mathcal{O}_Z$-module $\mathcal{G}$ with $i_*\mathcal{G} \cong \mathcal{F}$. Moreover:*

(1) *If $Spec(A) \subset X$ is any affine open, and $\mathcal{F}|_{Spec(A)} = \widetilde{M}$ then $Z \cap Spec(A) = Spec(A/I)$ where $I = Ann_A(M)$.*
(2) *The quasi-coherent sheaf $\mathcal{G}$ is unique up to unique isomorphism.*
(3) *The quasi-coherent sheaf $\mathcal{G}$ is of finite type.*
(4) *The support of $\mathcal{G}$ and of $\mathcal{F}$ is Z.*

Proof. Suppose that $i' : Z' \to X$ is a closed subscheme which satisfies the description on open affines from the lemma. Then by Morphisms, Lemma 24.3.1 we see that $\mathcal{F} \cong i'_*\mathcal{G}'$ for some unique quasi-coherent sheaf $\mathcal{G}'$ on Z'. Furthermore, it is clear that Z' is the smallest closed subscheme with this property (by the same lemma). Finally, using Properties, Lemma 23.16.1 and Algebra, Lemma 7.5.6 it follows that $\mathcal{G}'$ is of finite type. We have $\text{Supp}(\mathcal{G}') = Z$ by Algebra, Lemma 7.59.4. Hence, in order to prove the lemma it suffices to show that the characterization in (1) actually does define a closed subscheme. And, in order to do this it suffices to prove that the given rule produces a quasi-coherent sheaf of ideals, see Morphisms, Lemma 24.2.3. This comes down to the following algebra fact: If A is a ring, $f \in A$, and M is a finite A-module, then $\text{Ann}_A(M)_f = \text{Ann}_{A_f}(M_f)$. We omit the proof. □

Definition 25.10.5. Let X be a scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module of finite type. The *scheme theoretic support of* $\mathcal{F}$ is the closed subscheme $Z \subset X$ constructed in Lemma 25.10.4.

In this situation we often think of $\mathcal{F}$ as a quasi-coherent sheaf of finite type on Z (via the equivalence of categories of Morphisms, Lemma 24.3.1).

25.11. Coherent sheaves on locally Noetherian schemes

We have defined the notion of a coherent module on any ringed space in Modules, Section 15.12. Allthough it is possible to consider coherent sheaves on non-Noetherian schemes we will always assume the base scheme is locally Noetherian when we consider coherent sheaves. Here is a characterization of coherent sheaves on locally Noetherian schemes.

Lemma 25.11.1. *Let X be a locally Noetherian scheme. Let $\mathcal{F}$ be an $\mathcal{O}_X$-module. The following are equivalent*

(1) *$\mathcal{F}$ is coherent,*
(2) *$\mathcal{F}$ is a quasi-coherent, finite type $\mathcal{O}_X$-module,*
(3) *$\mathcal{F}$ is a finitely presented $\mathcal{O}_X$-module,*
(4) *for any affine open $Spec(A) = U \subset X$ we have $\mathcal{F}|_U = \widetilde{M}$ with M a finite A-module, and*
(5) *there exists an affine open covering $X = \bigcup U_i$, $U_i = Spec(A_i)$ such that each $\mathcal{F}|_{U_i} = \widetilde{M}_i$ with M_i a finite A_i-module.*

In particular $\mathcal{O}_X$ is coherent, any invertible $\mathcal{O}_X$-module is coherent, and more generally any finite locally free $\mathcal{O}_X$-module is invertible.

Proof. The implications (1) ⇒ (2) and (1) ⇒ (3) hold in general, see Modules, Lemma 15.12.2. If $\mathcal{F}$ is finitely presented then $\mathcal{F}$ is quasi-coherent, see Modules, Lemma 15.11.2. Hence also (3) ⇒ (2).

Assume $\mathcal{F}$ is a quasi-coherent, finite type $\mathcal{O}_X$-module. By Properties, Lemma 23.16.1 we see that on any affine open $Spec(A) = U \subset X$ we have $\mathcal{F}|_U = \widetilde{M}$ with M a finite A-module. Since A is Noetherian we see that M has a finite resolution

$$A^{\oplus m} \to A^{\oplus n} \to M \to 0.$$

Hence $\mathcal{F}$ is of finite presentation by Properties, Lemma 23.16.2. In other words (2) ⇒ (3).

By Modules, Lemma 15.12.5 it suffices to show that $\mathcal{O}_X$ is coherent in order to show that (3) implies (1). Thus we have to show: given any open $U \subset X$ and any finite collection of sections $f_i \in \mathcal{O}_X(U)$, $i = 1, \ldots, n$ the kernel of the map $\bigoplus_{i=1,\ldots,n} \mathcal{O}_U \to \mathcal{O}_U$ is of finite type. Since being of finite type is a local property it suffices to check this in a neighbourhood of any $x \in U$. Thus we may assume $U = Spec(A)$ is affine. In this case $f_1, \ldots, f_n \in A$ are elements of A. Since A is Noetherian, see Properties, Lemma 23.5.2 the kernel K of the map $\bigoplus_{i=1,\ldots,n} A \to A$ is a finite A-module. See for example Algebra, Lemma 7.47.1. As the functor~ is exact, see Schemes, Lemma 21.5.4 we get an exact sequence

$$\widetilde{K} \to \bigoplus\nolimits_{i=1,\ldots,n} \mathcal{O}_U \to \mathcal{O}_U$$

and by Properties, Lemma 23.16.1 again we see that $\widetilde{K}$ is of finite type. We conclude that (1), (2) and (3) are all equivalent.

It follows from Properties, Lemma 23.16.1 that (2) implies (4). It is trivial that (4) implies (5). The discussion in Schemes, Section 21.24 show that (5) implies that $\mathcal{F}$ is quasi-coherent and it is clear that (5) implies that $\mathcal{F}$ is of finite type. Hence (5) implies (2) and we win. □

Lemma 25.11.2. *Let X be a locally Noetherian scheme. The category of coherent $\mathcal{O}_X$-modules is abelian. More precisely, the kernel and cokernel of a map of coherent $\mathcal{O}_X$-modules are coherent. Any extension of coherent sheaves is coherent.*

Proof. This is a restatement of Modules, Lemma 15.12.4 in a particular case. □

The following lemma does not always hold for the category of coherent $\mathcal{O}_X$-modules on a general ringed space X.

Lemma 25.11.3. *Let X be a locally Noetherian scheme. Let $\mathcal{F}$ be a coherent $\mathcal{O}_X$-module. Any quasi-coherent submodule of $\mathcal{F}$ is coherent. Any quasi-coherent quotient module of $\mathcal{F}$ is coherent.*

Proof. We may assume that X is affine, say $X = Spec(A)$. Properties, Lemma 23.5.2 implies that A is Noetherian. Lemma 25.11.1 turns this into algebra. The algebraic counter part of the lemma is that a quotient, or a submodule of a finite A-module is a finite A-module, see for example Algebra, Lemma 7.47.1. □

Lemma 25.11.4. *Let X be a locally Noetherian scheme. Let $\mathcal{F}$, $\mathcal{G}$ be coherent $\mathcal{O}_X$-modules. The $\mathcal{O}_X$-modules $\mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{G}$ and $\mathcal{H}om_{\mathcal{O}_X}(\mathcal{F}, \mathcal{G})$ are coherent.*

Proof. It is shown in Modules, Lemma 15.19.4 that $\mathcal{H}om_{\mathcal{O}_X}(\mathcal{F}, \mathcal{G})$ is coherent. The result for tensor products is Modules, Lemma 15.15.5 □

Lemma 25.11.5. *Let X be a locally Noetherian scheme. Let $\mathcal{F}$, $\mathcal{G}$ be coherent $\mathcal{O}_X$-modules. Let $\varphi : \mathcal{G} \to \mathcal{F}$ be a homomorphism of $\mathcal{O}_X$-modules. Let $x \in X$.*

(1) *If $\mathcal{F}_x = 0$ then there exists an open neighbourhood $U \subset X$ of x such that $\mathcal{F}|_U = 0$.*
(2) *If $\varphi_x : \mathcal{G}_x \to \mathcal{F}_x$ is injective, then there exists an open neighbourhood $U \subset X$ of x such that $\varphi|_U$ is injective.*
(3) *If $\varphi_x : \mathcal{G}_x \to \mathcal{F}_x$ is surjective, then there exists an open neighbourhood $U \subset X$ of x such that $\varphi|_U$ is surjective.*
(4) *If $\varphi_x : \mathcal{G}_x \to \mathcal{F}_x$ is bijective, then there exists an open neighbourhood $U \subset X$ of x such that $\varphi|_U$ is an isomorphism.*

Proof. See Modules, Lemmas 15.9.4, 15.9.5, and 15.12.6. □

Lemma 25.11.6. *Let X be a locally Noetherian scheme. Let $\mathcal{F}$, $\mathcal{G}$ be coherent $\mathcal{O}_X$-modules. Let $x \in X$. Suppose $\psi : \mathcal{G}_x \to \mathcal{F}_x$ is a map of $\mathcal{O}_{X,x}$-modules. Then there exists an open neighbourhood $U \subset X$ of x and a map $\varphi : \mathcal{G}|_U \to \mathcal{F}|_U$ such that $\varphi_x = \psi$.*

Proof. In view of Lemma 25.11.1 this is a reformulation of Modules, Lemma 15.19.3. □

Lemma 25.11.7. *Let X be a locally Noetherian scheme. Let $\mathcal{F}$ be a coherent $\mathcal{O}_X$-module. Then $Supp(\mathcal{F})$ is closed, and $\mathcal{F}$ comes from a coherent sheaf on the scheme theoretic support of $\mathcal{F}$, see Definition 25.10.5.*

Proof. Let $i : Z \to X$ be the scheme theoretic support of $\mathcal{F}$ and let $\mathcal{G}$ be the finite type quasi-coherent sheaf on Z such that $i_*\mathcal{G} \cong \mathcal{F}$. Since $Z = \text{Supp}(\mathcal{F})$ we see that the support is closed. The scheme Z is locally Noetherian by Morphisms, Lemmas 24.14.5 and 24.14.6. Finally, $\mathcal{G}$ is a coherent $\mathcal{O}_Z$-module by Lemma 25.11.1 □

Lemma 25.11.8. *Let $f : X \to Y$ be a morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Assume f is finite and Y locally Noetherian. Then $R^p f_*\mathcal{F} = 0$ for $p > 0$ and $f_*\mathcal{F}$ is coherent if $\mathcal{F}$ is coherent.*

Proof. The higher direct images vanish by Lemma 25.2.3 and because a finite morphism is affine (by definition). Note that the assumptions imply that also X is locally Noetherian (see Morphisms, Lemma 24.14.6) and hence the statement makes sense. Let $Spec(A) = V \subset Y$ be an affine open subset. By Morphisms, Definition 24.42.1 we see that $f^{-1}(V) = Spec(B)$ with $A \to B$ finite. Lemma 25.11.1 turns the statement of the lemma into the following algebra fact: If M is a finite B-module, then M is also finite viewed as a A-module, see Algebra, Lemma 7.7.2. □

In the situation of the lemma also the higher direct images are coherent since they vanish. We will show that this is always the case for a proper morphism between locally Noetherian schemes (insert future reference here).

25.12. Coherent sheaves on Noetherian schemes

In this section we mention some properties of coherent sheaves on Noetherian schemes.

Lemma 25.12.1. *Let X be a Noetherian scheme. Let $\mathcal{F}$ be a coherent $\mathcal{O}_X$-module. The ascending chain condition holds for quasi-coherent submodules of $\mathcal{F}$. In other words, give any sequence*

$$\mathcal{F}_1 \subset \mathcal{F}_2 \subset \ldots \subset \mathcal{F}$$

of quasi-coherent submodules, then $\mathcal{F}_n = \mathcal{F}_{n+1} = \ldots$ for some $n \geq 0$.

Proof. Choose a finite affine open covering. On each member of the covering we get stabilization by Algebra, Lemma 7.47.1. Hence the lemma follows. □

Lemma 25.12.2. *Let X be a Noetherian scheme. Let $\mathcal{F}$ be a coherent sheaf on X. Let $\mathcal{I} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals corresponding to a closed subscheme $Z \subset X$. Then there is some $n \geq 0$ such that $\mathcal{I}^n\mathcal{F} = 0$ if and only if $Supp(\mathcal{F}) \subset Z$ (set theoretically).*

Proof. This follows immediately from Algebra, Lemma 7.59.9 because X has a finite covering by spectra of Noetherian rings. □

Lemma 25.12.3. *(Artin-Rees.) Let X be a Noetherian scheme. Let $\mathcal{F}$ be a coherent sheaf on X. Let $\mathcal{G} \subset \mathcal{F}$ be a quasi-coherent subsheaf. Let $\mathcal{I} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals. Then there exists a $c \geq 0$ such that for all $n \geq c$ we have*

$$\mathcal{I}^{n-c}(\mathcal{I}^c\mathcal{F} \cap \mathcal{G}) = \mathcal{I}^n\mathcal{F}$$

Proof. This follows immediately from Algebra, Lemma 7.47.4 because X has a finite covering by spectra of Noetherian rings. □

Lemma 25.12.4. *Let X be a Noetherian scheme. Let $\mathcal{F}$, $\mathcal{G}$ be coherent $\mathcal{O}_X$-modules. Let $\mathcal{I} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals. Denote $Z \subset X$ the corresponding closed subscheme and set $U = X \setminus Z$. There is a canonical isomorphism*

$$colim_n \, Hom_{\mathcal{O}_X}(\mathcal{I}^n\mathcal{G}, \mathcal{F}) \longrightarrow Hom_{\mathcal{O}_U}(\mathcal{G}|_U, \mathcal{F}|_U).$$

In particular we have an isomorphism

$$colim_n \, Hom_{\mathcal{O}_X}(\mathcal{I}^n, \mathcal{F}) \longrightarrow \Gamma(U, \mathcal{F}).$$

Proof. We first prove the second equality. Let $\mathcal{F}_n$ denote the quasi-coherent subsheaf of $\mathcal{F}$ consisting of sections annihilated by $\mathcal{I}^n$, see Properties, Lemma 23.22.5. Since $\mathcal{F}_1 \subset \mathcal{F}_2 \subset \ldots$ we see that $\mathcal{F}_n = \mathcal{F}_{n+1} = \ldots$ for some $n \geq 0$ by Lemma 25.12.1. Set $\mathcal{H} = \mathcal{F}_n$ for this n. By Artin-Rees (Lemma 25.12.3) there exists an $c \geq 0$ such that $\mathcal{I}^m\mathcal{F} \cap \mathcal{G} \subset \mathcal{I}^{m-c}\mathcal{G}$. Picking $m = n + c$ we get $\mathcal{I}^m\mathcal{F} \cap \mathcal{G} \subset \mathcal{I}^n\mathcal{G} = 0$. Thus if we set $\mathcal{F}' = \mathcal{I}^m\mathcal{F}$ then we see that $\mathcal{F}' \cap \mathcal{F}_n = 0$ and $\mathcal{F}'|_U = \mathcal{F}|_U$. Note in particular that the subsheaf $(\mathcal{F}')_N$ of sections annihilated by $\mathcal{I}^N$ is zero for all $N \geq 0$. Hence by Properties, Lemma 23.22.5 we deduce that the top horizontal arrow in the following commutative diagram is a bijection:

$$\begin{tikzcd} colim_n\, Hom_{\mathcal{O}_X}(\mathcal{I}^n, \mathcal{F}') \arrow[r] \arrow[d] & \Gamma(U, \mathcal{F}') \arrow[d] \\ colim_n\, Hom_{\mathcal{O}_X}(\mathcal{I}^n, \mathcal{F}) \arrow[r] & \Gamma(U, \mathcal{F}) \end{tikzcd}$$

Since also the right vertical arrow is a bijection we conclude that the bottom horizontal arrow is surjective. The bottom horizontal arrow is injective by Properties, Lemma 23.22.5. This proves the bottom arrow is a bijection as desired.

Next, we come to the general case. By Lemma 25.11.4 the sheaf $\mathcal{H} = \mathcal{H}om_{\mathcal{O}_X}(\mathcal{G}, \mathcal{F})$ is coherent. By definition we have

$$\mathcal{H}(U) = Hom_{\mathcal{O}_U}(\mathcal{G}|_U, \mathcal{F}|_U)$$

Pick a ψ in the right hand side of the first arrow of the lemma, i.e., $\psi \in \mathcal{H}(U)$. The result just proved applies to $\mathcal{H}$ and hence there exists an $n \geq 0$ and an $\varphi : \mathcal{I}^n \to \mathcal{H}$ which recovers ψ on restricition to U. By Modules, Lemma 15.19.1 φ corresponds to a map

$$\varphi : \mathcal{I}^{\otimes n} \otimes_{\mathcal{O}_X} \mathcal{G} \longrightarrow \mathcal{F}.$$

This is almost what we want except that the source of the arrow is the tensor product of $\mathcal{I}^n$ and $\mathcal{G}$ and not the product. We will show that, at the cost of increasing n, the difference is irrelevant. Consider the short exact sequence

$$0 \to \mathcal{K} \to \mathcal{I}^n \otimes_{\mathcal{O}_X} \mathcal{G} \to \mathcal{I}^n\mathcal{G} \to 0$$

where $\mathcal{K}$ is defined as the kernel. Note that $\mathcal{I}^n\mathcal{K} = 0$ (proof omitted). By Artin-Rees again we see that

$$\mathcal{K} \cap \mathcal{I}^m(\mathcal{I}^n \otimes_{\mathcal{O}_X} \mathcal{G}) = 0$$

for some m large enough. In other words we see that

$$\mathcal{I}^m(\mathcal{I}^n \otimes_{\mathcal{O}_X} \mathcal{G}) \longrightarrow \mathcal{I}^{n+m}\mathcal{G}$$

is an isomorphism. Let φ' be the restriction of φ to this submodule thought of as a map $\mathcal{I}^{m+n}\mathcal{G} \to \mathcal{F}$. Then φ' gives an element of the left hand side of the first arrow of the lemma which maps to ψ via the arrow. In other words we have prove surjectivity of the arrow. We omit the proof of injectivity. □

25.13. Depth

In this section we talk a little bit about depth and property (S_k) for coherent modules on locally Noetherian schemes. Note that we have already discussed this notion for locally Noetherian schemes in Properties, Section 23.12.

Definition 25.13.1. Let X be a locally Noetherian scheme. Let $\mathcal{F}$ be a coherent $\mathcal{O}_X$-module. Let $k \geq 0$ be an integer.

(1) We say $\mathcal{F}$ has *depth k at a point x* of X if $\text{depth}_{\mathcal{O}_{X,x}}(\mathcal{F}_x) = k$.
(2) We say X has *depth k at a point x* of X if $\text{depth}(\mathcal{O}_{X,x}) = k$.
(3) We say $\mathcal{F}$ has property (S_k) if
$$\text{depth}_{\mathcal{O}_{X,x}}(\mathcal{F}_x) \geq \min(k, \dim(\mathcal{F}_x))$$
for all $x \in X$.
(4) We say X has property (S_k) if $\mathcal{O}_X$ has property (S_k).

Any coherent sheaf satisfies condition (S_0). Condition (S_1) is equivalent to having no embedded associated points, see Divisors, Lemma 26.4.3.

We have seen in Properties, Lemma 23.12.2 that a locally Noetherian scheme is Cohen-Macaulay if and only if (S_k) holds for all k. Thus it makes sense to introduce the following definition, which is equivalent to the condition that all stalks are Cohen-Macaulay modules.

Definition 25.13.2. Let X be a locally Noetherian scheme. Let $\mathcal{F}$ be a coherent $\mathcal{O}_X$-module. We say $\mathcal{F}$ is *Cohen-Macaulay* if and only if (S_k) holds for all $k \geq 0$.

25.14. Devissage of coherent sheaves

Let X be a Noetherian scheme. Consider an integral closed subscheme $i : Z \to X$. It is often convenient to consider coherent sheaves of the form $i_*\mathcal{G}$ where $\mathcal{G}$ is a coherent sheaf on Z. In particular we are interested in these sheaves when $\mathcal{G}$ is a torsion free rank 1 sheaf. For example $\mathcal{G}$ could be a nonzero sheaf of ideals on Z, or even more specifically $\mathcal{G} = \mathcal{O}_Z$.

Throughout this section we will use that a coherent sheaf is the same thing as a finite type quasi-coherent sheaf and that a quasi-coherent subquotient of a coherent sheaf is coherent, see Section 25.11. The support of a coherent sheaf is closed, see Modules, Lemma 15.9.6.

Lemma 25.14.1. *Let X be a Noetherian scheme. Let $\mathcal{F}$ be a coherent sheaf on X. Suppose that $Supp(\mathcal{F}) = Z \cup Z'$ with Z, Z' closed. Then there exists a short exact sequence of coherent sheaves*
$$0 \to \mathcal{G}' \to \mathcal{F} \to \mathcal{G} \to 0$$
with $Supp(\mathcal{G}') \subset Z'$ and $Supp(\mathcal{G}) \subset Z$.

Proof. Throughout the proof we will use that a coherent sheaf is the same thing as a finite type quasi-coherent sheaf and that a quasi-coherent subquotient of a coherent sheaf is coherent, see Section 25.11. The support of a coherent sheaf is closed, see Modules, Lemma 15.9.6. Let $\mathcal{I} \subset \mathcal{O}_X$ be the sheaf of ideals defining the reduced induced closed subscheme structure on Z, see Schemes, Lemma 21.12.4. Consider the subsheaves $\mathcal{G}'_n = \mathcal{I}^n\mathcal{F}$ and the quotients $\mathcal{G}_n = \mathcal{F}/\mathcal{I}^n\mathcal{F}$. For each n we have a short exact sequence
$$0 \to \mathcal{G}'_n \to \mathcal{F} \to \mathcal{G}_n \to 0$$
For every point x of $Z' \setminus Z$ we have $\mathcal{I}_x = \mathcal{O}_{X,x}$ and hence $\mathcal{G}_{n,x} = 0$. Thus we see that $\text{Supp}(\mathcal{G}_n) \subset Z$. Note that $X \setminus Z'$ is a Noetherian scheme. Hence by Lemma 25.12.2 there exists an n such that $\mathcal{G}'_n|_{X\setminus Z'} = \mathcal{I}^n\mathcal{F}|_{X\setminus Z'} = 0$. For such an n we see that $\text{Supp}(\mathcal{G}'_n) \subset Z'$. Thus setting $\mathcal{G}' = \mathcal{G}'_n$ and $\mathcal{G} = \mathcal{G}_n$ works. □

Lemma 25.14.2. *Let X be a Noetherian scheme. Let $i : Z \to X$ be an integral closed subscheme. Let $\xi \in Z$ be the generic point. Let $\mathcal{F}$ be a coherent sheaf on X. Assume that $\mathcal{F}_\xi$ is annihilated by $\mathfrak{m}_\xi$. Then there exists an integer $r \geq 0$ and a sheaf of ideals $\mathcal{I} \subset \mathcal{O}_Z$ and an injective map of coherent sheaves*
$$i_*\left(\mathcal{I}^{\oplus r}\right) \to \mathcal{F}$$

which is an isomorphism in a neighbourhood of ξ.

Proof. Let $\mathcal{J} \subset \mathcal{O}_X$ be the ideal sheaf of Z. Let $\mathcal{F}' \subset \mathcal{F}$ be the subsheaf of local sections of $\mathcal{F}$ which are annihilated by $\mathcal{J}$. It is a quasi-coherent sheaf by Properties, Lemma 23.22.3. Moreover, $\mathcal{F}'_\xi = \mathcal{F}_\xi$ because $\mathcal{J}_\xi = \mathfrak{m}_\xi$ and part (3) of Properties, Lemma 23.22.3. By Lemma 25.11.5 we see that $\mathcal{F}' \to \mathcal{F}$ induces an isomorphism in a neighbourhood of ξ. Hence we may replace $\mathcal{F}$ by $\mathcal{F}'$ and assume that $\mathcal{F}$ is annihilated by $\mathcal{J}$.

Assume $\mathcal{J}\mathcal{F} = 0$. By Morphisms, Lemma 24.3.1 we can write $\mathcal{F} = i_*\mathcal{G}$ for some quasi-coherent sheaf $\mathcal{G}$ on Z. By Modules, Lemma 15.13.3 combined with the results of Section 25.11 we also see $\mathcal{G}$ is coherent on Z. Suppose we can find a morphism $\mathcal{I}^{\oplus r} \to \mathcal{G}$ which is an isomorphism in a neighbourhood of the generic point ξ of Z. Then applying i_* (which is left exact) we get the result of the lemma. Hence we have reduced to the case $X = Z$.

Suppose $Z = X$ is an integral Noetherian scheme with generic point ξ. Note that $\mathcal{O}_{X,\xi} = \kappa(\xi)$ is the function field of X in this case. Since $\mathcal{F}_\xi$ is a finite $\mathcal{O}_\xi$-module we see that $r = \dim_{\kappa(\xi)} \mathcal{F}_\xi$ is finite. Hence the sheaves $\mathcal{O}_X^{\oplus r}$ and $\mathcal{F}$ have isomorphic stalks at ξ. By Lemma 25.11.6 there exists a nonempty open $U \subset X$ and a morphism $\psi : \mathcal{O}_X^{\oplus r}|_U \to \mathcal{F}|_U$ which is an isomorphism at ξ, and hence an isomorphism in a neighbourhood of ξ by Lemma 25.11.5. By Schemes, Lemma 21.12.4 there exists a quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_X$ whose associated closed subscheme $Z \subset X$ is the complement of U. By Lemma 25.12.4 there exists an $n \geq 0$ and a morphism $\mathcal{I}^n(\mathcal{O}_X)^{\oplus r}) \to \mathcal{F}$ which recovers our ψ over U. Since $\mathcal{I}^n(\mathcal{O}_X)^{\oplus r}) = (\mathcal{I}^n)^{\oplus r}$ we get a map as in the lemma. It is injective because X is integral and it is injective at the generic point of X (easy proof omitted). $\square$

Lemma 25.14.3. *Let X be a Noetherian scheme. Let $\mathcal{F}$ be a coherent sheaf on X. There exists a filtration*

$$0 = \mathcal{F}_0 \subset \mathcal{F}_1 \subset \ldots \subset \mathcal{F}_m = \mathcal{F}$$

by coherent subsheaves such that for each $j = 1, \ldots, m$ there exists an integral closed subscheme $Z_j \subset X$ and a sheaf of ideals $\mathcal{I}_j \subset \mathcal{O}_{Z_j}$ such that

$$\mathcal{F}_j/\mathcal{F}_{j-1} \cong (Z_j \to X)_*\mathcal{I}_j$$

Proof. Consider the collection

$$\mathcal{T} = \left\{ \begin{matrix} Z \subset X \text{ closed such that there exists a coherent sheaf } \mathcal{F} \\ \text{with } \operatorname{Supp}(\mathcal{F}) = Z \text{ for which the lemma is wrong} \end{matrix} \right\}$$

We are trying to show that $\mathcal{T}$ is empty. If not, then because X is Noetherian we can choose a minimal element $Z \in \mathcal{T}$. This means that there exists a coherent sheaf $\mathcal{F}$ on X whose support is Z and for which the lemma does not hold. Clearly $Z \neq \emptyset$ since the only sheaf whose support is empty is the zero sheaf for which the lemma does hold (with $m = 0$).

If Z is not irreducible, then we can write $Z = Z_1 \cup Z_2$ with Z_1, Z_2 closed and strictly smaller than Z. Then we can apply Lemma 25.14.1 to get a short exact sequence of coherent sheaves

$$0 \to \mathcal{G}_1 \to \mathcal{F} \to \mathcal{G}_2 \to 0$$

with $\operatorname{Supp}(\mathcal{G}_i) \subset Z_i$. By minimality of Z each of $\mathcal{G}_i$ has a filtration as in the statement of the lemma. By considering the induced filtration on $\mathcal{F}$ we arrive at a contradiction. Hence we conclude that Z is irreducible.

Suppose Z is irreducible. Let $\mathcal{J}$ be the sheaf of ideals cutting out the reduced induced closed subscheme structure of Z, see Schemes, Lemma 21.12.4. By Lemma 25.12.2 we see there exists an $n \geq 0$ such that $\mathcal{J}^n\mathcal{F} = 0$. Hence we obtain a filtration

$$0 = \mathcal{I}^n\mathcal{F} \subset \mathcal{I}^{n-1}\mathcal{F} \subset \ldots \subset \mathcal{I}\mathcal{F} \subset \mathcal{F}$$

each of whose succesive subquotients is annihilated by $\mathcal{J}$. Hence if each of these subquotients has a filtration as in the statement of the lemma then also $\mathcal{F}$ does. In other words we may assume that $\mathcal{J}$ does annihilate $\mathcal{F}$.

In the case where Z is irreducible and $\mathcal{J}\mathcal{F} = 0$ we can apply Lemma 25.14.2. This gives a short exact sequence

$$0 \to i_*(\mathcal{I}^{\oplus r}) \to \mathcal{F} \to \mathcal{Q} \to 0$$

where $\mathcal{Q}$ is defined as the quotient. Since $\mathcal{Q}$ is zero in a neighbourhood of ξ by the lemma just cited we see that the support of $\mathcal{Q}$ is strictly smaller than Z. Hence we see that $\mathcal{Q}$ has a filtration of the desired type by minimality of Z. But then clearly $\mathcal{F}$ does too, which is our final contradiction. $\square$

Lemma 25.14.4. *Let X be a Noetherian scheme. Let $\mathcal{P}$ be a property of coherent sheaves on X such that*

(1) *For any short exact sequence of coherent sheaves*

$$0 \to \mathcal{F}_1 \to \mathcal{F} \to \mathcal{F}_2 \to 0$$

if $\mathcal{F}_i$, $i = 1, 2$ have property $\mathcal{P}$ then so does $\mathcal{F}$.

(2) *For every integral closed subscheme $Z \subset X$ and every quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_Z$ we have $\mathcal{P}$ for $i_*\mathcal{I}$.*

Then property $\mathcal{P}$ holds for every coherent sheaf on X.

Proof. First note that if $\mathcal{F}$ is a coherent sheaf with a filtration

$$0 = \mathcal{F}_0 \subset \mathcal{F}_1 \subset \ldots \subset \mathcal{F}_m = \mathcal{F}$$

by coherent subsheaves such that each of $\mathcal{F}_i/\mathcal{F}_{i-1}$ has property $\mathcal{P}$, then so does $\mathcal{F}$. This follows from the property (1) for $\mathcal{P}$. On the other hand, by Lemma 25.14.3 we can filter any $\mathcal{F}$ with succesive subquotients as in (2). Hence the lemma follows. $\square$

Lemma 25.14.5. *Let X be a Noetherian scheme. Let $Z_0 \subset X$ be an irreducible closed subset with generic point ξ. Let $\mathcal{P}$ be a property of coherent sheaves on X such that*

(1) *For any short exact sequence of coherent sheaves if two out of three of them have property $\mathcal{P}$ then so does the third.*

(2) *For every integral closed subscheme $Z \subset Z_0 \subset X$, $Z \neq Z_0$ and every quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_Z$ we have $\mathcal{P}$ for $(Z \to X)_*\mathcal{I}$.*

(3) *There exists some coherent sheaf $\mathcal{G}$ on X such that*
   (a) *$Supp(\mathcal{G}) = Z_0$,*
   (b) *$\mathcal{G}_\xi$ is annihilated by $\mathfrak{m}_\xi$,*
   (c) $\dim_{\kappa(\xi)} \mathcal{G}_\xi = 1$, *and*
   (d) *property $\mathcal{P}$ holds for $\mathcal{G}$.*

Then property $\mathcal{P}$ holds for every coherent sheaf $\mathcal{F}$ on X whose support is contained in Z_0.

Proof. First note that if $\mathcal{F}$ is a coherent sheaf with a filtration

$$0 = \mathcal{F}_0 \subset \mathcal{F}_1 \subset \ldots \subset \mathcal{F}_m = \mathcal{F}$$

by coherent subsheaves such that each of $\mathcal{F}_i/\mathcal{F}_{i-1}$ has property $\mathcal{P}$, then so does $\mathcal{F}$. Or, if $\mathcal{F}$ has property $\mathcal{P}$ and all but one of the $\mathcal{F}_i/\mathcal{F}_{i-1}$ has property $\mathcal{P}$ then so does the last one. This follows from the two-out-of-three property (1) for $\mathcal{P}$.

As a first application of these remarks we conclude that any coherent sheaf whose support is strictly contained in Z_0 has property $\mathcal{P}$. Namely, such a sheaf has a filtration (see Lemma 25.14.3) whose subquotients have property $\mathcal{P}$ according to (2).

As a second application we apply this remark to the sheaf $\mathcal{G}$ from assumption (3) and a filtration

$$0 = \mathcal{G}_0 \subset \mathcal{G}_1 \subset \ldots \subset \mathcal{G}_m = \mathcal{G}$$

by coherent subsheaves as in Lemma 25.14.3. Let $Z_j \to X$ be the integral closed subschemes, and $\mathcal{I}_i \subset \mathcal{O}_{Z_i}$ the quasi-coherent sheaves of ideals such that $\mathcal{G}_i/\mathcal{G}_{i-1} \cong (Z_i \to X)_*\mathcal{I}_i$. We may obviously assume all the $\mathcal{I}_i$ are nonzero. Since $\dim_{\kappa(\xi)} \mathcal{G}_\xi = 1$ we see that there is exactly one $i = i_0$ such that $Z_{i_0} = Z_0$ and all other $Z_i \subset Z_0$ are proper irreducible closed subsets of Z_0. By the remark above and (2) we see that $(Z_{i_0} \to X)_*\mathcal{I}_{i_0}$ has property $\mathcal{P}$. We conclude that there exists at least one quasi-coherent sheaf of ideals $\mathcal{I}$ (namely $\mathcal{I}_{i_0}$) on Z_0 such that $(Z_0 \to X)_*\mathcal{I}$ has property $\mathcal{P}$.

Next, suppose that $\mathcal{I}'$ is another quasi-coherent sheaf of ideals Z_0. Then we can consider the intersection $\mathcal{I}'' = \mathcal{I}' \cap \mathcal{I}$ and we get two short exact sequences

$$0 \to (Z_0 \to X)_*\mathcal{I}'' \to (Z_0 \to X)_*\mathcal{I} \to \mathcal{Q} \to 0$$

and

$$0 \to (Z_0 \to X)_*\mathcal{I}' \to (Z_0 \to X)_*\mathcal{I} \to \mathcal{Q}' \to 0.$$

Note that the support of the coherent sheaves $\mathcal{Q}$ and $\mathcal{Q}'$ are strictly contained in Z_0. Hence $\mathcal{Q}$ and $\mathcal{Q}$ have property $\mathcal{P}$ (see above). Hence we conclude using (1) that $(Z_0 \to X)_*\mathcal{I}''$ and $(Z_0 \to X)_*\mathcal{I}'$ both have $\mathcal{P}$ as well.

The final step of the proof is to note that any coherent sheaf $\mathcal{F}$ on X whose support is contained in Z_0 has a filtration (see Lemma 25.14.3 again) whose subquotients all have property $\mathcal{P}$ by what we just said. □

Lemma 25.14.6. *Let X be a Noetherian scheme. Let $\mathcal{P}$ be a property of coherent sheaves on X such that*

(1) *For any short exact sequence of coherent sheaves if two out of three of them have property $\mathcal{P}$ then so does the third.*
(2) *For every integral closed subscheme $Z \subset X$ with generic point ξ there exists some coherent sheaf $\mathcal{G}$ such that*
   (a) *$Supp(\mathcal{G}) = Z$,*
   (b) *$\mathcal{G}_\xi$ is annihilated by $\mathfrak{m}_\xi$,*
   (c) *$\dim_{\kappa(\xi)} \mathcal{G}_\xi = 1$, and*
   (d) *property $\mathcal{P}$ holds for $\mathcal{G}$.*

Then property $\mathcal{P}$ holds for every coherent sheaf on X.

Proof. According to Lemma 25.14.4 it suffices to show that given any integral closed subscheme $Z \subset X$ and every quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_Z$ we have $\mathcal{P}$ for $(Z \to X)_*\mathcal{I}$. If this fails, then since X is Noetherian there is a minimal integral closed subscheme $Z_0 \subset X$ such that $\mathcal{P}$ fails for $(Z_0 \to X)_*\mathcal{I}$ for some quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_{Z_0}$. In other words, the result does hold for any integral closed subscheme of Z. According to Lemma 25.14.5 this cannot happen. □

Lemma 25.14.7. *(Variant of Lemma 25.14.5.) Let X be a Noetherian scheme. Let $Z_0 \subset X$ be an irreducible closed subset with generic point ξ. Let $\mathcal{P}$ be a property of coherent sheaves on X such that*

1. *For any short exact sequence of coherent sheaves if two out of three of them have property $\mathcal{P}$ then so does the third.*
2. *If $\mathcal{P}$ holds for a direct sum of coherent sheaves then it holds for both.*
3. *For every integral closed subscheme $Z \subset Z_0 \subset X$, $Z \neq Z_0$ and every quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_Z$ we have $\mathcal{P}$ for $(Z \to X)_*\mathcal{I}$.*
4. *There exists some coherent sheaf $\mathcal{G}$ on X such that*
   (a) *$Supp(\mathcal{G}) = Z_0$,*
   (b) *$\mathcal{G}_\xi$ is annihilated by $\mathfrak{m}_\xi$, and*
   (c) *property $\mathcal{P}$ holds for $\mathcal{G}$.*

Then property $\mathcal{P}$ holds for every coherent sheaf $\mathcal{F}$ on X whose support is contained in Z_0.

Proof. The proof is a variant on the proof of Lemma 25.14.5. In exactly the same manner as in that proof we see that any coherent sheaf whose support is strictly contained in Z_0 has property $\mathcal{P}$.

Consider a coherent sheaf $\mathcal{G}$ as in (3). By Lemma 25.14.2 there exists a sheaf of ideals $\mathcal{I}$ on Z_0 and a short exact sequence

$$0 \to \left((Z_0 \to X)_*\mathcal{I}\right)^{\oplus r} \to \mathcal{G} \to \mathcal{Q} \to 0$$

where the support of $\mathcal{Q}$ is stricly contained in Z_0. In particular $r > 0$ and $\mathcal{I}$ is nonzero because the support of $\mathcal{G}$ is equal to Z. Since $\mathcal{Q}$ has property $\mathcal{P}$ we conclude that also $\left((Z_0 \to X)_*\mathcal{I}\right)^{\oplus r}$ has property $\mathcal{P}$. By (2) we deduce property $\mathcal{P}$ for $(Z_0 \to X)_*\mathcal{I}$. Slotting this into the proof of Lemma 25.14.5 at the appropriate point gives the lemma. Some details omitted. $\square$

Lemma 25.14.8. *(Variant of Lemma 25.14.6.) Let X be a Noetherian scheme. Let $\mathcal{P}$ be a property of coherent sheaves on X such that*

1. *For any short exact sequence of coherent sheaves if two out of three of them have property $\mathcal{P}$ then so does the third.*
2. *If $\mathcal{P}$ holds for a direct sum of coherent sheaves then it holds for both.*
3. *For every integral closed subscheme $Z \subset X$ with generic point ξ there exists some coherent sheaf $\mathcal{G}$ such that*
   (a) *$Supp(\mathcal{G}) = Z$,*
   (b) *$\mathcal{G}_\xi$ is annihilated by $\mathfrak{m}_\xi$, and*
   (c) *property $\mathcal{P}$ holds for $\mathcal{G}$.*

Then property $\mathcal{P}$ holds for every coherent sheaf on X.

Proof. This follows from Lemma 25.14.7 by exactly the same argument as used in the proof of Lemma 25.14.6. $\square$

Lemma 25.14.9. *(Cohomological variant of Lemma 25.14.7.) Let X be a Noetherian scheme. Let $Z_0 \subset X$ be an irreducible closed subset with generic point ξ. Let $\mathcal{P}$ be a property of coherent sheaves on X such that*

1. *For any short exact sequence of coherent sheaves*
   $$0 \to \mathcal{F}_1 \to \mathcal{F} \to \mathcal{F}_2 \to 0$$
   if $\mathcal{F}_i$, $i = 1, 2$ have property $\mathcal{P}$ then so does $\mathcal{F}$.
2. *If $\mathcal{P}$ holds for a direct sum of coherent sheaves then it holds for both.*

(3) *For every integral closed subscheme $Z \subset Z_0 \subset X$, $Z \neq Z_0$ and every quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_Z$ we have $\mathcal{P}$ for $(Z \to X)_*\mathcal{I}$.*
(4) *There exists some coherent sheaf $\mathcal{G}$ such that*
  (a) *$Supp(\mathcal{G}) = Z_0$,*
  (b) *$\mathcal{G}_\xi$ is annihilated by $\mathfrak{m}_\xi$, and*
  (c) *for every quasi-coherent sheaf of ideals $\mathcal{J} \subset \mathcal{O}_X$ such that $\mathcal{J}_\xi = \mathcal{O}_{X,\xi}$ there exists a quasi-coherent subsheaf $\mathcal{G}' \subset \mathcal{J}\mathcal{G}$ with $\mathcal{G}'_\xi = \mathcal{G}_\xi$ and such that $\mathcal{P}$ holds for $\mathcal{G}'$.*

Then property $\mathcal{P}$ holds for every coherent sheaf $\mathcal{F}$ on X whose support is contained in Z_0.

Proof. The proof is a variant on the proof of Lemma 25.14.5. In exactly the same manner as in that proof we see that any coherent sheaf whose support is strictly contained in Z_0 has property $\mathcal{P}$. Note that this does not use the full strength of the two-out-of-three property of that lemma, only the weaker variant (1) above which is in force in the current situation.

Let us denote $i : Z_0 \to X$ the closed immersion. Consider a coherent sheaf $\mathcal{G}$ as in (4). By Lemma 25.14.2 there exists a sheaf of ideals $\mathcal{I}$ on Z_0 and a short exact sequence

$$0 \to i_*\mathcal{I}^{\oplus r} \to \mathcal{G} \to \mathcal{Q} \to 0$$

where the support of $\mathcal{Q}$ is stricly contained in Z_0. In particular $r > 0$ and $\mathcal{I}$ is nonzero because the support of $\mathcal{G}$ is equal to Z_0. Let $\mathcal{I}' \subset \mathcal{I}$ be any nonzero quasi-coherent sheaf of ideals on Z contained in $\mathcal{I}$. Then we also get a short exact sequence

$$0 \to i_*(\mathcal{I}')^{\oplus r} \to \mathcal{G} \to \mathcal{Q}' \to 0$$

where $\mathcal{Q}'$ has support properly contained in Z_0. Let $\mathcal{J} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals cuttting out the support of $\mathcal{Q}'$ (for example the ideal corresponding to the reduced induced closed subscheme structure on the the support of $\mathcal{Q}'$). Then $\mathcal{J}_\xi = \mathcal{O}_{X,\xi}$. By Lemma 25.12.2 we see that $\mathcal{J}^n\mathcal{Q}' = 0$ for some n. Hence $\mathcal{J}^n\mathcal{G} \subset i_*(\mathcal{I}')^{\oplus r}$. By assumption (4)(c) of the lemma we see there exists a quasi-coherent subsheaf $\mathcal{G}' \subset \mathcal{J}^n\mathcal{G}$ with $\mathcal{G}'_\xi = \mathcal{G}_\xi$ for which property $\mathcal{P}$ holds. Hence we get a short exact sequence

$$0 \to \mathcal{G}' \to i_*(\mathcal{I}')^{\oplus r} \to \mathcal{Q}'' \to 0$$

where $\mathcal{Q}''$ has support properly contained in Z_0. Thus by our initial remarks and property (1) of the lemma we conclude that $i_*(\mathcal{I}')^{\oplus r}$ satisfies $\mathcal{P}$. Hence we see that $i_*\mathcal{I}'$ satisfies $\mathcal{P}$ by (2). Finally, for an arbitrary quasi-coherent sheaf of ideals $\mathcal{I}'' \subset \mathcal{O}_{Z_0}$ we can set $\mathcal{I} = \mathcal{I}'' \cap \mathcal{I}$ and we get a short exact sequence

$$0 \to i_*(\mathcal{I}') \to i_*(\mathcal{I}'') \to \mathcal{Q}''' \to 0$$

where $\mathcal{Q}'''$ has support properly contained in Z_0. Hence we conclude that property $\mathcal{P}$ holds for $i_*\mathcal{I}''$ as well. Slotting this into the proof of Lemma 25.14.5 at the appropriate point gives the lemma. Some details omitted. □

Lemma 25.14.10. *(Cohomological variant of Lemma 25.14.8.) Let X be a Noetherian scheme. Let $\mathcal{P}$ be a property of coherent sheaves on X such that*

(1) *For any short exact sequence of coherent sheaves*

$$0 \to \mathcal{F}_1 \to \mathcal{F} \to \mathcal{F}_2 \to 0$$

if $\mathcal{F}_i$, $i = 1, 2$ have property $\mathcal{P}$ then so does $\mathcal{F}$.
(2) *If $\mathcal{P}$ holds for a direct sum of coherent sheaves then it holds for both.*
(3) *For every integral closed subscheme $Z \subset X$ with generic point ξ there exists some coherent sheaf $\mathcal{G}$ such that*

(a) *Supp*$(\mathcal{G}) = Z$,
(b) $\mathcal{G}_\xi$ *is annihilated by* $\mathfrak{m}_\xi$, *and*
(c) *for every quasi-coherent sheaf of ideals* $\mathcal{J} \subset \mathcal{O}_X$ *such that* $\mathcal{J}_\xi = \mathcal{O}_{X,\xi}$ *there exists a quasi-coherent subsheaf* $\mathcal{G}' \subset \mathcal{J}\mathcal{G}$ *with* $\mathcal{G}'_\xi = \mathcal{G}_\xi$ *and such that* $\mathcal{P}$ *holds for* $\mathcal{G}'$.

Then property $\mathcal{P}$ *holds for every coherent sheaf on* X.

Proof. Identical to the proofs of Lemmas 25.14.8 and 25.14.6. □

25.15. Finite morphisms and affines

In this section we use the results of the preceding sections to show that the image of a Noetherian affine scheme under a finite morphism is affine. We will see later that this result holds more generally (see Limits, Lemma 27.7.1).

Lemma 25.15.1. *Let* $f : Y \to X$ *be a morphism of schemes. Assume* f *is finite, surjective and* X *locally Noetherian. Let* $Z \subset X$ *be an integral closed subscheme with generic point* ξ. *Then there exists a coherent sheaf* $\mathcal{F}$ *on* Y *such that the support of* $f_*\mathcal{F}$ *is equal to* Z *and* $(f_*\mathcal{F})_\xi$ *is annihilated by* $\mathfrak{m}_\xi$.

Proof. Note that Y is locally Noetherian by Morphisms, Lemma 24.14.6. Because f is surjective the fibre Y_ξ is not empty. Pick $\xi' \in Y$ mapping to ξ. Let $Z' = \overline{\{\xi'\}}$. We may think of $Z' \subset Y$ as a reduced closed subscheme, see Schemes, Lemma 21.12.4. Hence the sheaf $\mathcal{F} = (Z' \to Y)_*\mathcal{O}_{Z'}$ is a coherent sheaf on Y (see Lemma 25.11.8). Look at the commutative diagram

$$\begin{tikzcd} Z' \arrow[r, "i'"] \arrow[d, "f'"'] & Y \arrow[d, "f"] \\ Z \arrow[r, "i"] & X \end{tikzcd}$$

We see that $f_*\mathcal{F} = i_*f'_*\mathcal{O}_{Z'}$. Hence the stalk of $f_*\mathcal{F}$ at ξ is the stalk of $f'_*\mathcal{O}_{Z'}$ at ξ. Note that since Z' is integral with generic point ξ' we have that ξ' is the only point of Z' lying over ξ, see Algebra, Lemmas 7.32.3 and 7.32.18. Hence the stalk of $f'_*\mathcal{O}_{Z'}$ at ξ equal $\mathcal{O}_{Z',\xi'} = \kappa(\xi')$. In particular the stalk of $f_*\mathcal{F}$ at ξ is not zero. This combined with the fact that $f_*\mathcal{F}$ is of the form $i_*f'_*$(something) implies the lemma. □

Lemma 25.15.2. *Let* $f : Y \to X$ *be a morphism of schemes. Let* $\mathcal{F}$ *be a quasi-coherent sheaf on* Y. *Let* $\mathcal{I}$ *be a quasi-coherent sheaf of ideals on* X. *If the morphism* f *is affine then* $\mathcal{I}f_*\mathcal{F} = f_*(f^{-1}\mathcal{I}\mathcal{F})$.

Proof. The notation means the following. Since f^{-1} is an exact functor we see that $f^{-1}\mathcal{I}$ is a sheaf of ideals of $f^{-1}\mathcal{O}_X$. Via the map $f^\sharp : f^{-1}\mathcal{O}_X \to \mathcal{O}_Y$ this acts on $\mathcal{F}$. Then $f^{-1}\mathcal{I}\mathcal{F}$ is the subsheaf generated by sums of local sections of the form as where a is a local section of $f^{-1}\mathcal{I}$ and s is a local section of $\mathcal{F}$. It is a quasi-coherent $\mathcal{O}_Y$-submodule of $\mathcal{F}$ because it is also the image of a natural map $f^*\mathcal{I} \otimes_{\mathcal{O}_Y} \mathcal{F} \to \mathcal{F}$.

Having said this the proof is straightforward. Namely, the question is local and hence we may assume X is affine. Since f is affine we see that Y is affine too. Thus we may write $Y = Spec(B)$, $X = Spec(A)$, $\mathcal{F} = \widetilde{M}$, and $\mathcal{I} = \tilde{I}$. The assertion of the lemma in this case boils down to the statement that

$$I(M_A) = ((IB)M)_A$$

where M_A indicates the A-module associated to the B-module M. □

Lemma 25.15.3. *Let $f : Y \to X$ be a morphism of schemes. Assume*

(1) *f finite,*
(2) *f surjective,*
(3) *Y affine, and*
(4) *X Noetherian.*

Then X is affine.

Proof. We will prove that under the assumptions of the lemma for any coherent $\mathcal{O}_X$-module $\mathcal{F}$ we have $H^1(X, \mathcal{F}) = 0$. Since this will in particular imply that $H^1(X, \mathcal{I}) = 0$ for every quasi-coherent sheaf of ideals of $\mathcal{O}_X$. Then it will follows that X is affine from either Lemma 25.3.1 or Lemma 25.3.2.

Let $\mathcal{P}$ be the property of coherent sheaves $\mathcal{F}$ on X defined by the rule

$$\mathcal{P}(\mathcal{F}) \Leftrightarrow H^1(X, \mathcal{F}) = 0.$$

We are going to apply Lemma 25.14.10. Thus we have to verify (1), (2) and (3) of that lemma for $\mathcal{P}$. Property (1) follows from the long exact cohomology sequence associated to a short exact sequence of sheaves. Property (2) follows since $H^1(X, -)$ is an additive functor. To see (3) let $Z \subset X$ be an integral closed subscheme with generic point ξ. Let $\mathcal{F}$ be a coherent sheaf on Y such that the support of $f_*\mathcal{F}$ is equal to Z and $(f_*\mathcal{F})_\xi$ is annihilated by $\mathfrak{m}_\xi$, see Lemma 25.15.1. We claim that taking $\mathcal{G} = f_*\mathcal{F}$ works. We only have to verify part (3)(c) of Lemma 25.14.10. Hence assume that $\mathcal{J} \subset \mathcal{O}_X$ is a quasi-coherent sheaf of ideals such that $\mathcal{J}_\xi = \mathcal{O}_{X,\xi}$. A finite morphism is affine hence by Lemma 25.15.2 we see that $\mathcal{J}\mathcal{G} = f_*(f^{-1}\mathcal{J}\mathcal{F})$. Also, as pointed out in the proof of Lemma 25.15.2 the sheaf $f^{-1}\mathcal{J}\mathcal{F}$ is a quasi-coherent $\mathcal{O}_Y$-module. Since Y is affine we see that $H^1(Y, f^{-1}\mathcal{J}\mathcal{F}) = 0$, see Lemma 25.2.2. Since f is finite, hence affine, we see that $R^q f_*(f^{-1}\mathcal{J}\mathcal{F}) = 0$ for all $q \geq 1$ by Lemma 25.2.3. By Cohomology, Lemma 18.12.6 we see that

$$H^1(X, \mathcal{J}\mathcal{G}) = H^1(X, f_*(f^{-1}\mathcal{J}\mathcal{F})) = H^1(Y, f^{-1}\mathcal{J}\mathcal{F}) = 0.$$

Hence the quasi-coherent subsheaf $\mathcal{G}' = \mathcal{J}\mathcal{G}$ satisfies $\mathcal{P}$. This verifies property (3)(c) of Lemma 25.14.10 as desired. □

25.16. Coherent sheaves and projective morphisms

It seems illuminating to formulate an all-in-one result for projective space over a Noetherian ring.

Lemma 25.16.1. *Let R be a Noetherian ring. Let $n \geq 0$ be an integer. For every coherent sheaf $\mathcal{F}$ on $\mathbf{P}^n_R$ we have the following:*

(1) *There exists an $r \geq 0$ and $d_1, \ldots, d_r \in \mathbf{Z}$ and a surjection*
$$\bigoplus\nolimits_{j=1,\ldots,r} \mathcal{O}_{\mathbf{P}^n_R}(d_j) \longrightarrow \mathcal{F}.$$
(2) *We have $H^i(\mathbf{P}^n_R, \mathcal{F}) = 0$ unless $0 \leq i \leq n$.*
(3) *For any i the cohomology group $H^i(\mathbf{P}^n_R, \mathcal{F})$ is a finite R-module.*
(4) *If $i > 0$, then $H^i(\mathbf{P}^n_R, \mathcal{F}(d)) = 0$ for all d large enough.*
(5) *For any $k \in \mathbf{Z}$ the graded $R[T_0, \ldots, T_n]$-module*
$$\bigoplus\nolimits_{d \geq k} H^0(\mathbf{P}^n_R, \mathcal{F}(d))$$
is a finite $R[T_0, \ldots, T_n]$-module.

Proof. We will use that $\mathcal{O}_{\mathbf{P}^n_R}(1)$ is an ample invertible sheaf on the scheme $\mathbf{P}^n_R$. This follows directly from the definition since $\mathbf{P}^n_R$ covered by the standard affine opens $D_+(T_i)$. Hence by Properties, Proposition 23.23.12 every finite type quasi-coherent $\mathcal{O}_{\mathbf{P}^n_R}$-module is a quotient of a finite direct sum of tensor powers of $\mathcal{O}_{\mathbf{P}^n_R}(1)$. On the other hand a coherent sheaves and finite type quasi-coherent sheaves are the same thing on projective space over R by Lemma 25.11.1. Thus we see (1).

Projective n-space $\mathbf{P}^n_R$ is covered by $n+1$ affines, namely the standard opens $D_+(T_i)$, $i = 0, \ldots, n$, see Constructions, Lemma 22.13.3. Hence we see that for any quasi-coherent sheaf $\mathcal{F}$ on $\mathbf{P}^n_R$ we have $H^i(\mathbf{P}^n_R, \mathcal{F}) = 0$ for $i \geq n+1$, see Lemma 25.5.1. Hence (2) holds.

Let us prove (3) and (4) simultaneously for all coherent sheaves on $\mathbf{P}^n_R$ by descending induction on i. Clearly the result holds for $i \geq n+1$ by (2). Suppose we know the result for $i+1$ and we want to show the result for i. (If $i = 0$, then part (4) is vacuous.) Let $\mathcal{F}$ be a coherent sheaf on $\mathbf{P}^n_R$. Choose a surjection as in (1) and denote $\mathcal{G}$ the kernel so that we have a short exact sequence

$$0 \to \mathcal{G} \to \bigoplus\nolimits_{j=1,\ldots,r} \mathcal{O}_{\mathbf{P}^n_R}(d_j) \to \mathcal{F} \to 0$$

By Lemma 25.11.2 we see that $\mathcal{G}$ is coherent. The long exact cohomology sequence gives an exact sequence

$$H^i(\mathbf{P}^n_R, \bigoplus\nolimits_{j=1,\ldots,r} \mathcal{O}_{\mathbf{P}^n_R}(d_j)) \to H^i(\mathbf{P}^n_R, \mathcal{F}) \to H^{i+1}(\mathbf{P}^n_R, \mathcal{G}).$$

By induction assumption the right R-module is finite and by Lemma 25.9.1 the left R-module is finite. Since R is Noetherian it follows immediately that $H^i(\mathbf{P}^n_R, \mathcal{F})$ is a finite R-module. This proves the induction step for assertion (3). Since $\mathcal{O}_{\mathbf{P}^n_R}(d)$ is invertible we see that twisting on $\mathbf{P}^n_R$ is an exact functor (since you get it by tensoring with an invertible sheaf, see Constructions, Definition 22.10.1). This means that for all $d \in \mathbf{Z}$ the sequence

$$0 \to \mathcal{G}(d) \to \bigoplus\nolimits_{j=1,\ldots,r} \mathcal{O}_{\mathbf{P}^n_R}(d_j + d) \to \mathcal{F}(d) \to 0$$

is short exact. The resulting cohomology sequence is

$$H^i(\mathbf{P}^n_R, \bigoplus\nolimits_{j=1,\ldots,r} \mathcal{O}_{\mathbf{P}^n_R}(d_j + d)) \to H^i(\mathbf{P}^n_R, \mathcal{F}(d)) \to H^{i+1}(\mathbf{P}^n_R, \mathcal{G}(d)).$$

By induction assumption we see the module on the right is zero for $d \gg 0$ and by the computation in Lemma 25.9.1 the module on the left is zero as soon as $d \geq -\min\{d_j\}$ and $i \geq 1$. Hence the induction step for assertion (4). This concludes the proof of (3) and (4).

In order to prove (5) note that for all sufficiently large d the map

$$H^0(\mathbf{P}^n_R, \bigoplus\nolimits_{j=1,\ldots,r} \mathcal{O}_{\mathbf{P}^n_R}(d_j + d)) \to H^0(\mathbf{P}^n_R, \mathcal{F}(d))$$

is surjective by the vanishing of $H^1(\mathbf{P}^n_R, \mathcal{G}(d))$ we just proved. In other words, the module

$$M_k = \bigoplus\nolimits_{d \geq k} H^0(\mathbf{P}^n_R, \mathcal{F}(d))$$

is for k large enough a quotient of the corresponding module

$$N_k = \bigoplus\nolimits_{d \geq k} H^0(\mathbf{P}^n_R, \bigoplus\nolimits_{j=1,\ldots,r} \mathcal{O}_{\mathbf{P}^n_R}(d_j + d))$$

When k is sufficiently small (e.g. $k < -d_j$ for all j) then

$$N_k = \bigoplus\nolimits_{j=1,\ldots,r} R[T_0, \ldots, T_n](d_j)$$

by our computations in Section 25.9. In particular it is finitely generated. Suppose $k \in \mathbf{Z}$ is arbitrary. Choose $k_- \ll k \ll k_+$. Consider the diagram

$$\begin{tikzcd} N_{k_-} & N_{k_+} \arrow[l] \arrow[d] \\ M_k & M_{k_+} \arrow[l] \end{tikzcd}$$

where the vertical arrow is the surjective map above and the horizontal arrows are the obvious inclusion maps. By what was said above we see that N_{k_-} is a finitely generated $R[T_0, \ldots, T_n]$-module. Hence N_{k_+} is a finitely generated $R[T_0, \ldots, T_n]$-module because it is a submodule of a finitely generated module and the ring $R[T_0, \ldots, T_n]$ is Noetherian. Since the vertical arrow is surjective we conclude that M_{k_+} is a finitely generated $R[T_0, \ldots, T_n]$-module. The quotient M_k/M_{k_+} is finite as an R-module since it is a finite direct sum of the finite R-modules $H^0(\mathbf{P}^n_R, \mathcal{F}(d))$ for $k \leq d < k_+$. Note that we use part (3) for $i = 0$ here. Hence M_k/M_{k_+} is a fortiori a finite $R[T_0, \ldots, T_n]$-module. In other words, we have sandwiched M_k between two finite $R[T_0, \ldots, T_n]$-modules and we win. $\square$

Lemma 25.16.2. *Let $f : X \to S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Let $\mathcal{L}$ be an invertible sheaf on X. Assume that*

(1) *S is Noetherian,*
(2) *f is proper,*
(3) *$\mathcal{F}$ is coherent, and*
(4) *$\mathcal{L}$ is relatively ample on X/S.*

Then there exists an n_0 such that for all $n \geq n_0$ we have

$$R^p f_*\left(\mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L}^{\otimes n}\right) = 0$$

for all $p > 0$.

Proof. A proper morphism is of finite type by definition. By Morphisms, Lemma 24.38.7 there exists an open covering $S = \bigcup V_j$ and immersions $i_j : X_j \to \mathbf{P}^{n_j}_{V_j}$, where $X_j = f^{-1}(V_j)$ such that $i_j^*\mathcal{O}(1)$ is a power of $\mathcal{L}$. Since S is quasi-compact we may assume the covering is finite. Clearly, if we solve the question for each of the finitely many systems $(X_j \to V_j, \mathcal{L}|_{X_j}, \mathcal{F}|_{V_j})$ then the result follows. Hence we may assume there exists an immersion $i : X \to \mathbf{P}^n_S$ such that $\mathcal{L}^{\otimes d} = i^*\mathcal{O}(1)$ for some $d \geq 1$.

Repeating the argument above with a finite affine open covering of S we see that we may also assume that S is affine. In this case the vanishing of $R^p f_*(\mathcal{F} \otimes \mathcal{L}^{\otimes n})$ is equivalent to the vanishing of $H^p(X, \mathcal{F} \otimes \mathcal{L}^{\otimes n})$, see Lemma 25.5.4.

Since f is proper we see that i is a closed immersion (Morphisms, Lemma 24.40.7). Hence we see that $R^p i_*(\mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L}^{\otimes n}) = 0$ for all $p \geq 1$ (see Lemma 25.11.8 for example). This implies that

$$H^p(X, \mathcal{F} \otimes \mathcal{L}^{\otimes n}) = H^p(\mathbf{P}^n_S, i_*(\mathcal{F} \otimes \mathcal{L}^{\otimes n}))$$

by the Leray spectral sequence (Cohomology, Lemma 18.12.4). Moreover, by the projection formula (Cohomology, Lemma 18.7.2) we have

$$i_*(\mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L}^{\otimes n}) = i_*(\mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L}^{\otimes \langle n \rangle_d}) \otimes_{\mathcal{O}_{\mathbf{P}^n_S}} \mathcal{O}(\lfloor n/d \rfloor)$$

for all $n \in \mathbf{Z}$ where $\langle n \rangle_d \in \{0, 1, \ldots, d-1\}$ is the unique element congruent to n module d. The sheaves $\mathcal{F}_j = i_*(\mathcal{F} \otimes \mathcal{L}^{\otimes j})$, $j \in \{0, 1, \ldots, d-1\}$ are coherent by Lemma 25.11.8. Thus we see that for all n large enough the cohomology groups $H^p(\mathbf{P}^n_S, \mathcal{F}_j(n))$ vanish by Lemma 25.16.1. Putting everything together this implies the lemma. $\square$

25.17. Chow's Lemma

In this section we prove Chow's lemma in the Noetherian case (Lemma 25.17.1). In Limits, Section 27.8 we prove some variants for the non-Noetherian case.

Lemma 25.17.1. *Let S be a Noetherian scheme. Let $f : X \to S$ be a separated morphism of finite type. Then there exists an $n \geq 0$ and a diagram*

$$\begin{tikzcd} X \arrow[dr] & X' \arrow[l, "\pi"'] \arrow[r] \arrow[d] & \mathbf{P}^n_S \arrow[dl] \\ & S & \end{tikzcd}$$

where $X' \to \mathbf{P}^n_S$ is an immersion, and $\pi : X' \to X$ is proper and surjective. Moreover, we may arrange it such that there exists a dense open subscheme $U \subset X$ such that $\pi^{-1}(U) \to U$ is an isomorphism.

Proof. All of the schemes we will encounter during the rest of the proof are going to be of finite type over the Noetherian scheme S and hence Noetherian (see Morphisms, Lemma 24.14.6). All morphisms between them will automatically be quasi-compact, locally of finite type and quasi-separated, see Morphisms, Lemma 24.14.8 and Properties, Lemmas 23.5.4 and 23.5.6.

The underlying topological space of X is Noetherian (see Properties, Lemma 23.5.5) and we conclude that X has only finitely many irreducible components (see Topology, Lemma 5.6.2). Say $X = X_1 \cup \ldots \cup X_r$ is the decomposition of X into irreducible components. Let $\eta_i \in X_i$ be the generic point. For every point $x \in X$ there exists an affine open $U_x \subset X$ which contains x and each of the generic points η_i. See Properties, Lemma 23.26.4. Since X is quasi-compact, we can find a finite affine open covering $X = U_1 \cup \ldots \cup U_m$ such that each U_i contains $\eta_1, \ldots, \eta_r$. In particular we conclude that the open $U = U_1 \cap \ldots \cap U_m \subset X$ is a dense open. This and the fact that the U_i are affine opens covering X is all that we will use below.

Let $X^* \subset X$ be the scheme theoretic closure of $U \to X$, see Morphisms, Definition 24.4.2. Let $U_i^* = X^* \cap U_i$. Note that U_i^* is a closed subscheme of U_i. Hence U_i^* is affine. Since U is dense in X the morphism $X^* \to X$ is a surjective closed immersion. It is an isomorphism over U. Hence we may replace X by X^* and U_i by U_i^* and assume that U is scheme theoretically dense in X, see Morphisms, Definition 24.5.1.

By Morphisms, Lemma 24.38.3 we can find an immersion $j_i : U_i \to \mathbf{P}^{n_i}_S$ for each i. By Morphisms, Lemma 24.5.7 we can find closed subschemes $Z_i \subset \mathbf{P}^{n_i}_S$ such that $j_i : U_i \to Z_i$ is a scheme theoretically dense open immersion. Note that $Z_i \to S$ is proper, see Morphisms, Lemma 24.41.5. Consider the morphism

$$j = (j_1|_U, \ldots, j_n|_U) : U \longrightarrow \mathbf{P}^{n_1}_S \times_S \ldots \times_S \mathbf{P}^{n_n}_S.$$

By the lemma cited above we can find a closed subscheme Z of $\mathbf{P}^{n_1}_S \times_S \ldots \times_S \mathbf{P}^{n_n}_S$ such that $j : U \to Z$ is an open immersion and such that U is scheme theoretically dense in Z. The morphism $Z \to S$ is proper. Consider the ith projection

$$\mathrm{pr}_i|_Z : Z \longrightarrow \mathbf{P}^{n_i}_S.$$

This morphism factors through Z_i (see Morphisms, Lemma 24.4.6). Denote $p_i : Z \to Z_i$ the induced morphism. This is a proper morphism, see Morphisms, Lemma 24.40.7 for example. At this point we have that $U \subset U_i \subset Z_i$ are scheme theoretically dense open immersions. Moreover, we can think of Z as the scheme theoretic image of the ``diagonal'' morphism $U \to Z_1 \times_S \ldots \times_S Z_n$.

Set $V_i = p_i^{-1}(U_i)$. Note that $p_i|_{V_i} : V_i \to U_i$ is proper. Set $X' = V_1 \cup \ldots \cup V_n$. By construction X' has an immersion into the scheme $\mathbf{P}^{n_1}_S \times_S \ldots \times_S \mathbf{P}^{n_n}_S$. Thus by the Segre embedding (see Morphisms, Lemma 24.41.6) we see that X' has an immersion into a projective space over S.

We claim that the morphisms $p_i|_{V_i} : V_i \to U_i$ glue to a morphism $X' \to X$. Namely, it is clear that $p_i|_U$ is the identity map from U to U. Since $U \subset X'$ is scheme theoretically dense by construction, it is also scheme theoretically dense in the open subscheme $V_i \cap V_j$. Thus we see that $p_i|_{V_i \cap V_j} = p_j|_{V_i \cap V_j}$ as morphisms into the separated S-scheme X, see Morphisms, Lemma 24.5.10. We denote the resulting morphism $\pi : X' \to X$.

We claim that $\pi^{-1}(U_i) = V_i$. Since $\pi|_{V_i} = p_i|_{V_i}$ it follows that $V_i \subset \pi^{-1}(U_i)$. Consider the diagram

$$\begin{tikzcd} V_i \arrow[r] \arrow[dr, "p_i|_{V_i}"'] & \pi^{-1}(U_i) \arrow[d] \\ & U_i \end{tikzcd}$$

Since $V_i \to U_i$ is proper we see that the image of the horizontal arrow is closed, see Morphisms, Lemma 24.40.7. Since $V_i \subset \pi^{-1}(U_i)$ is scheme theoretically dense (as it contains U) we conclude that $V_i = \pi^{-1}(U_i)$ as claimed.

This shows that $\pi^{-1}(U_i) \to U_i$ is identified with the proper morphism $p_i|_{V_i} : V_i \to U_i$. Hence we see that X has a finite affine covering $X = \bigcup U_i$ such that the restriction of π is proper on each member of the covering. Thus by Morphisms, Lemma 24.40.3 we see that π is proper.

Finally we have to show that $\pi^{-1}(U) = U$. To see this we argue in the same way as above using the diagram

$$\begin{tikzcd} U \arrow[r] \arrow[dr] & \pi^{-1}(U) \arrow[d] \\ & U \end{tikzcd}$$

and using that $\mathrm{id}_U : U \to U$ is proper and that U is scheme theoretically dense in $\pi^{-1}(U)$. □

Remark 25.17.2. In the situation of Chow's Lemma 25.17.1:

(1) The morphism π is actually H-projective (hence projective, see Morphisms, Lemma 24.41.2) since the morphism $X' \to \mathbf{P}^n_S \times_S X = \mathbf{P}^n_X$ is a closed immersion (use the fact that π is proper, see Morphisms, Lemma 24.40.7).

(2) We may assume that $\pi^{-1}(U)$ is scheme theoretically dense in X'. Namely, we can simply replace X' by the scheme theoretic closure of $\pi^{-1}(U)$. In this case we can think of U as a scheme theoretically dense open subscheme of X'. See Morphisms, Section 24.4.
(3) If X is reduced then we may choose X' reduced. This is clear from (2).

25.18. Higher direct images of coherent sheaves

In this section we prove the fundamental fact that the higher direct images of a coherent sheaf under a proper morphism are coherent.

Lemma 25.18.1. *Let S be a locally Noetherian scheme. Let $f : X \to S$ be a locally projective morphism. Let $\mathcal{F}$ be a coherent $\mathcal{O}_X$-module. Then $R^i f_* \mathcal{F}$ is a coherent $\mathcal{O}_S$-module for all $i \geq 0$.*

Proof. We first remark that a locally projective morphism is proper (Morphisms, Lemma 24.41.5) and hence of finite type. In particular X is locally Noetherian (Morphisms, Lemma 24.14.6) and hence the statement makes sense. Moreover, by Lemma 25.5.3 the sheaves $R^p f_* \mathcal{F}$ are quasi-coherent.

Having said this the statement is local on S (for example by Cohomology, Lemma 18.6.4). Hence we may assume $S = Spec(R)$ is the spectrum of a Noetherian ring, and X is a closed subscheme of $\mathbf{P}^n_R$ for some n, see Morphisms, Lemma 24.41.4. In this case, the sheaves $R^p f_* \mathcal{F}$ are the quasi-coherent sheaves associated to the R-modules $H^p(X, \mathcal{F})$, see Lemma 25.5.4. Hence it suffices to show that R-modules $H^p(X, \mathcal{F})$ are finite R-modules (Lemma 25.11.1). Denote $i : X \to \mathbf{P}^n_R$ the closed immersion. Note that $R^p i_* \mathcal{F} = 0$ by Lemma 25.11.8. Hence the Leray spectral sequence (Cohomology, Lemma 18.12.4) for $i : X \to \mathbf{P}^n_R$ degenerates, and we see that $H^p(X, \mathcal{F}) = H^p(\mathbf{P}^n_R, i_* \mathcal{F})$. Since the sheaf $i_* \mathcal{F}$ is coherent by Lemma 25.11.8 we see that the lemma follows from Lemma 25.16.1. $\square$

Here is the general statement.

Lemma 25.18.2. *Let S be a locally Noetherian scheme. Let $f : X \to S$ be a proper morphism. Let $\mathcal{F}$ be a coherent $\mathcal{O}_X$-module. Then $R^i f_* \mathcal{F}$ is a coherent $\mathcal{O}_S$-module for all $i \geq 0$.*

Proof. Since the problem is local on S we may assume that S is a Noetherian scheme. Since a proper morphism is of finite type we see that in this case X is a Noetherian scheme also. Consider the property $\mathcal{P}$ of coherent sheaves on X defined by the rule

$$\mathcal{P}(\mathcal{F}) \Leftrightarrow R^p f_* \mathcal{F} \text{ is coherent for all } p \geq 0$$

We are going to use the result of Lemma 25.14.6 to prove that $\mathcal{P}$ holds for every coherent sheaf on X.

Let

$$0 \to \mathcal{F}_1 \to \mathcal{F}_2 \to \mathcal{F}_3 \to 0$$

be a short exact sequence of coherent sheaves on X. Consider the long exact sequence of higher direct images

$$R^{p-1} f_* \mathcal{F}_3 \to R^p f_* \mathcal{F}_1 \to R^p f_* \mathcal{F}_2 \to R^p f_* \mathcal{F}_3 \to R^{p+1} f_* \mathcal{F}_1$$

Then it is clear that if 2-out-of-3 of the sheaves $\mathcal{F}_i$ have property $\mathcal{P}$, then the higher direct images of the third are sandwiched in this exact complex between two coherent sheaves. Hence these higher direct images are also coherent by Lemma 25.11.2 and 25.11.3. Hence property $\mathcal{P}$ holds for the third as well.

Let $Z \subset X$ be an integral closed subscheme. We have to find a coherent sheaf $\mathcal{F}$ on X whose support is contained in Z, whose stalk at the generic point ξ of Z is a 1-dimensional vector space over $\kappa(\xi)$ such that $\mathcal{P}$holds for $\mathcal{F}$. Denote $g = f|_Z : Z \to S$ the restriction of f. Suppose we can find a coherent sheaf $\mathcal{G}$ on Z such that (a) $\mathcal{G}_\xi$ is a 1-dimensional vector space over $\kappa(\xi)$, (b) $R^p g_*\mathcal{G} = 0$ for $p > 0$, and (c) $g_*\mathcal{G}$ is coherent. Then we can consider $\mathcal{F} = (Z \to X)_*\mathcal{G}$. As $Z \to X$ is a closed immersion we see that $(Z \to X)_*\mathcal{G}$ is coherent on X and $R^p(Z \to X)_*\mathcal{G} = 0$ for $p > 0$ (Lemma 25.11.8). Hence by the relative Leray spectral sequence (Cohomology, Lemma 18.12.8) we will have $R^p f_*\mathcal{F} = R^p g_*\mathcal{G} = 0$ for $p > 0$ and $f_*\mathcal{F} = g_*\mathcal{G}$ is coherent. Finally $\mathcal{F}_\xi = ((Z \to X)_*\mathcal{G})_\xi = \mathcal{G}_\xi$ which verifies the condition on the stalk at ξ. Hence everything depends on finding a coherent sheaf $\mathcal{G}$ on Z which has properties (a), (b), and (c).

We can apply Chow's Lemma 25.17.1 to the morphism $Z \to S$. Thus we get a diagram

$$\begin{tikzcd} Z \arrow[dr, "g"'] & Z' \arrow[l, "\pi"'] \arrow[r, "i"] \arrow[d, "g'"] & \mathbf{P}^n_S \arrow[dl] \\ & S & \end{tikzcd}$$

as in the statement of Chow's lemma. Also, let $U \subset Z$ be the dense open subscheme such that $\pi^{-1}(U) \to U$ is an isomorphism. By the discussion in Remark 25.17.2 we see that $i' = (i, \pi) : \mathbf{P}^n_S \times_S Z' = \mathbf{P}^n_Z$ is a closed immersion. Hence

$$\mathcal{L} = i^*\mathcal{O}_{\mathbf{P}^n_X}(1) \cong (i')^*\mathcal{O}_{\mathbf{P}^n_Z}(1)$$

is g'-relatively ample and π-relatively ample (for example by Morphisms, Lemma 24.38.7). Hence by Lemma 25.16.2 there exists an $n \geq 0$ such that both $R^p\pi_*\mathcal{L}^{\otimes n} = 0$ for all $p > 0$ and $R^p(g')_*\mathcal{L}^{\otimes n} = 0$ for all $p > 0$. Set $\mathcal{G} = \pi_*\mathcal{L}^{\otimes n}$. Property (a) holds because $\pi_*\mathcal{L}^{\otimes}|_U$ is an invertible sheaf (as $\pi^{-1}(U) \to U$ is an isomorphism). Properties (b) and (c) hold because by the relative Leray spectral sequence (Cohomology, Lemma 18.12.8) we have

$$E_2^{p,q} = R^p g_* R^q \pi_* \mathcal{L}^{\otimes n} \Rightarrow R^{p+q}(g')_*\mathcal{L}^{\otimes n}$$

and by choice of n the only nonzero terms in $E_2^{p,q}$ are those with $q = 0$ and the only nonzero terms of $R^{p+q}(g')_*\mathcal{L}^{\otimes n}$ are those with $p = q = 0$. This implies that $R^p g_*\mathcal{G} = 0$ for $p > 0$ and that $g_*\mathcal{G} = (g')_*\mathcal{L}^{\otimes n}$. Finally, applying the previous Lemma 25.18.1 we see that $g_*\mathcal{G} = (g')_*\mathcal{L}^{\otimes n}$ is coherent as desired. □

Lemma 25.18.3. *Let $S = Spec(A)$ with A a Noetherian ring. Let $f : X \to S$ be a proper morphism. Let $\mathcal{F}$ be a coherent $\mathcal{O}_X$-module. Then $H^i(X, \mathcal{F})$ is finite A-module for all $i \geq 0$.*

Proof. This is just the affine case of Lemma 25.18.2. Namely, by Lemmas 25.5.3 and 25.5.4 we know that $R^i f_*\mathcal{F}$ is the quasi-coherent sheaf associated to the A-module $H^i(X, \mathcal{F})$ and by Lemma 25.11.1 this is a coherent sheaf if and only if $H^i(X, \mathcal{F})$ is an A-module of finite type. □

25.19. The theorem on formal functions

In this section we study the behaviour of cohomology of sequences of sheaves either of the form $\{I^n\mathcal{F}\}_{n\geq 0}$ or of the form $\{\mathcal{F}/I^n\mathcal{F}\}_{n\geq 0}$ as n-varies.

Here and below we use the following notation. Given a morphism of schemes $f : X \to Y$, a quasi-coherent sheaf $\mathcal{F}$ on X, and a quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_Y$ we denote

$\mathcal{I}^n\mathcal{F}$ the quasi-coherent subsheaf generated by products of local sections of $f^{-1}(\mathcal{I}^n)$ and $\mathcal{F}$. In a formula

$$\mathcal{I}^n\mathcal{F} = \mathrm{Im}\left(f^*(\mathcal{I}^n) \otimes_{\mathcal{O}_X} \mathcal{F} \longrightarrow \mathcal{F}\right).$$

Note that there are natural maps

$$f^{-1}(\mathcal{I}^n) \otimes_{f^{-1}\mathcal{O}_Y} \mathcal{I}^m\mathcal{F} \longrightarrow f^*(\mathcal{I}^n) \otimes_{\mathcal{O}_X} \mathcal{I}^m\mathcal{F} \longrightarrow \mathcal{I}^{n+m}\mathcal{F}$$

Hence a section of $\mathcal{I}^n$ will give rise to a map $R^pf_*(\mathcal{I}^m\mathcal{F}) \to R^pf_*(\mathcal{I}^{n+m}\mathcal{F})$ by functoriality of higher direct images. Localizing and then sheafifying we see that there are $\mathcal{O}_Y$-module maps

$$\mathcal{I}^n \otimes_{\mathcal{O}_Y} R^pf_*(\mathcal{I}^m\mathcal{F}) \longrightarrow R^pf_*(\mathcal{I}^{n+m}\mathcal{F}).$$

In other words we see that $\bigoplus_{n\geq 0} R^pf_*(\mathcal{I}^n\mathcal{F})$ is a graded $\bigoplus_{n\geq 0}\mathcal{I}^n$-module.

If $Y = Spec(A)$ and $\mathcal{I} = \tilde{I}$ we denote $\mathcal{I}^n\mathcal{F}$ simply $I^n\mathcal{F}$. The maps introduced above give $M = \bigoplus H^p(X, I^n\mathcal{F})$ the structure of a graded $S = \bigoplus I^n$-module. If f is proper, A is Noetherian and $\mathcal{F}$ is coherent, then this turns out to be a module of finite type.

Lemma 25.19.1. *Let A be a Noetherian ring. Let $I \subset A$ be an ideal. Set $S = \bigoplus_{n\geq 0} I^n$. Let $f : X \to Spec(A)$ be a proper morphism. Let $\mathcal{F}$ be a coherent sheaf on X. Then for every $p \geq 0$ the graded S-module $\bigoplus_{n\geq 0} H^p(X, I^n\mathcal{F})$ is a finite S-module.*

Proof. To prove this we consider the fibre product diagram

$$\begin{array}{ccc} X' = Spec(S) \times_{Spec(A)} X & \longrightarrow & X \\ \big\downarrow{\scriptstyle f'} & & \big\downarrow{\scriptstyle f} \\ Spec(S) & \longrightarrow & Spec(A) \end{array}$$

Note that f' is a proper morphism, see Morphisms, Lemma 24.40.5. Also, S is a finitely generated A-algebra, and hence Noetherian (Algebra, Lemma 7.28.1). Thus the result will follow from Lemma 25.18.3 if we can show there exists a coherent sheaf $\mathcal{F}'$ on X' whose cohomology groups $H^p(X', \mathcal{F}')$ are identified with $\bigoplus_{n\geq 0} H^p(X, I^n\mathcal{F})$.

To do this note that the morphism $\pi : X' \to X$ is affine, see Morphisms, Lemma 24.11.8. Hence $H^p(X', \mathcal{F}') = H^p(X, \pi_*\mathcal{F}')$. In other words, it suffices to construct a coherent $\mathcal{O}_{X'}$-module $\mathcal{F}'$ such that $\pi_*\mathcal{F}' = \bigoplus_{n\geq 0} I^n\mathcal{F}$. Note that $\pi_*\mathcal{O}_{X'} = \bigoplus_{n\geq 0} I^n \otimes_A \mathcal{O}_X$ hence the sheaf $\bigoplus_{n\geq 0} I^n\mathcal{F}$ has a natural structure of $\pi_*\mathcal{O}_{X'}$-module. By Morphisms, Lemma 24.11.6 we see that there is a unique quasi-coherent $\mathcal{O}_{X'}$-module $\mathcal{F}'$ such that $\pi_*\mathcal{F}' \cong \bigoplus_{n\geq 0} I^n\mathcal{F}$ as $\pi_*\mathcal{O}_{X'}$-modules. Finally, we have to show that $\mathcal{F}'$ is a coherent $\mathcal{O}_{X'}$-module.

Let $Spec(B) = U \subset X$ be any affine open. Say $\mathcal{F}|_U$ is the coherent $\mathcal{O}_U$-module associated to the finite B-module M. By definition $\pi^{-1}(U) = Spec(S \otimes_A B)$. Since $B' = S \otimes_A B = \bigoplus_{n\geq 0} I^n \otimes_A B$ it is clear that $\mathcal{F}'$ corresponds to the B'-module $\bigoplus I^n M$ which is clearly finitely generated. □

Lemma 25.19.2. *Given a morphism of schemes $f : X \to Y$, a quasi-coherent sheaf $\mathcal{F}$ on X, and a quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_Y$. Assume Y locally Noetherian, f proper, and $\mathcal{F}$ coherent. Then*

$$\mathcal{M} = \bigoplus_{n\geq 0} R^pf_*(\mathcal{I}^n\mathcal{F})$$

is a graded $\mathcal{A} = \bigoplus_{n\geq 0}\mathcal{I}^n$-module which is quasi-coherent and of finite type.

Proof. The statement is local on Y, hence this reduces to the case where Y is affine. In the affine case the result follows from Lemma 25.19.1. Details omitted. □

Lemma 25.19.3. *Let A be a Noetherian ring. Let $I \subset A$ be an ideal. Let $f : X \to Spec(A)$ be a proper morphism. Let $\mathcal{F}$ be a coherent sheaf on X. Then for every $p \geq 0$ there exists an integer $c \geq 0$ such that*

1. *the multiplication map $I^{n-c} \otimes H^p(X, I^c\mathcal{F}) \to H^p(X, I^n\mathcal{F})$ is surjective for all $n \geq c$, and*
2. *the image of $H^p(X, I^{n+m}\mathcal{F}) \to H^p(X, I^n\mathcal{F})$ is contained in the submodule $I^{m-c}H^p(X, I^n\mathcal{F})$ for all $n \geq 0$, $m \geq c$.*

Proof. By Lemma 25.19.1 we can find $d_1, \ldots, d_t \geq 0$, and $x_i \in H^p(X, I^{d_i}\mathcal{F})$ such that $\bigoplus_{n\geq 0} H^p(X, I^n\mathcal{F})$ is generated by $x_1, \ldots, x_t$ over $S = \bigoplus_{n\geq 0} I^n$. Take $c = \max\{d_i\}$. It is clear that (1) holds. For (2) let $b = \max(0, n - c)$. Consider the commutative diagram of A-modules

$$\begin{tikzcd}
I^{n+m-c-b} \otimes I^b \otimes H^p(X, I^c\mathcal{F}) \arrow[r] \arrow[d] & I^{n+m-c} \otimes H^p(X, I^c\mathcal{F}) \arrow[r] & H^p(X, I^{n+m}\mathcal{F}) \arrow[d] \\
I^{n+m-c-b} \otimes H^p(X, I^n\mathcal{F}) \arrow[rr] & & H^p(X, I^n\mathcal{F})
\end{tikzcd}$$

By part (1) of the lemma the composition of the horizontal arrows is surjective if $n+m \geq c$. On the other hand, it is clear that $n + m - c - b \geq m - c$. Hence part (2). □

In the situation of Lemmas 25.19.1 and 25.19.3 consider the inverse system

$$\mathcal{F}/I\mathcal{F} \leftarrow \mathcal{F}/I^2\mathcal{F} \leftarrow \mathcal{F}/I^3\mathcal{F} \leftarrow \ldots$$

We would like to know what happens to the cohomology groups. Here is a first result.

Lemma 25.19.4. *Let A be a Noetherian ring. Let $I \subset A$ be an ideal. Let $f : X \to Spec(A)$ be a proper morphism. Let $\mathcal{F}$ be a coherent sheaf on X. Fix $p \geq 0$.*

1. *There exists a $c_1 \geq 0$ such that for all $n \geq c_1$ we have*
$$Ker(H^p(X, \mathcal{F}) \to H^p(X, \mathcal{F}/I^n\mathcal{F})) \subset I^{n-c_1}H^p(X, \mathcal{F}).$$
2. *The inverse system*
$$\left(H^p(X, \mathcal{F}/I^n\mathcal{F})\right)_{n\in\mathbf{N}}$$
satisfies the Mittag-Leffler condition (see Homology, Definition 10.23.2).
3. *In fact for any p and n there exists a $c_2(n) \geq n$ such that*
$$Im(H^p(X, \mathcal{F}/I^k\mathcal{F}) \to H^p(X, \mathcal{F}/I^n\mathcal{F})) = Im(H^p(X, \mathcal{F}) \to H^p(X, \mathcal{F}/I^n\mathcal{F}))$$
for all $k \geq c_2(n)$.

Proof. Let $c_1 = \max\{c_p, c_{p+1}\}$, where c_p, c_{p+1} are the integers found in Lemma 25.19.3 for H^p and H^{p+1}. We will use this constant in the proofs of (1), (2) and (3).

Let us prove part (1). Consider the short exact sequence

$$0 \to I^n\mathcal{F} \to \mathcal{F} \to \mathcal{F}/I^n\mathcal{F} \to 0$$

From the long exact cohomology sequence we see that

$$\mathrm{Ker}(H^p(X, \mathcal{F}) \to H^p(X, \mathcal{F}/I^n\mathcal{F})) = \mathrm{Im}(H^p(X, I^n\mathcal{F}) \to H^p(X, \mathcal{F}))$$

Hence by our choice of c_1 we see that this is contained in $I^{n-c_1}H^p(X, \mathcal{F})$ for $n \geq c_1$.

Note that part (3) implies part (2) by definition of the Mittag-Leffler condition.

Let us prove part (3). Fix an n throughout the rest of the proof. Consider the commutative diagram

$$\begin{tikzcd} 0 \arrow[r] & I^n\mathcal{F} \arrow[r] & \mathcal{F} \arrow[r] & \mathcal{F}/I^n\mathcal{F} \arrow[r] & 0 \\ 0 \arrow[r] & I^{n+m}\mathcal{F} \arrow[r] \arrow[u] & \mathcal{F} \arrow[r] \arrow[u] & \mathcal{F}/I^{n+m}\mathcal{F} \arrow[r] \arrow[u] & 0 \end{tikzcd}$$

This gives rise to the following commutative diagram

$$\begin{tikzcd} H^p(X, I^n\mathcal{F}) \arrow[r] & H^p(X,\mathcal{F}) \arrow[r] & H^p(X,\mathcal{F}/I^n\mathcal{F}) \arrow[r, "\delta"'] & H^{p+1}(X, I^n\mathcal{F}) \\ H^p(X, I^{n+m}\mathcal{F}) \arrow[r] \arrow[u] & H^p(X,\mathcal{F}) \arrow[r] \arrow[u, "1"] & H^p(X,\mathcal{F}/I^{n+m}\mathcal{F}) \arrow[r] \arrow[u] & H^{p+1}(X, I^{n+m}\mathcal{F}) \arrow[u, "a"] \end{tikzcd}$$

If $m \geq c_1$ we see that the image of a is contained in $I^{m-c_1}H^{p+1}(X, I^n\mathcal{F})$. By the Artin-Rees lemma (see Algebra, Lemma 7.47.5) there exists an integer $c_3(n)$ such that

$$I^N H^{p+1}(X, I^n\mathcal{F}) \cap \mathrm{Im}(\delta) \subset \delta\left(I^{N-c_3(n)}H^p(X,\mathcal{F}/I^n\mathcal{F})\right)$$

for all $N \geq c_3(n)$. As $H^p(X,\mathcal{F}/I^n\mathcal{F})$ is annihilated by I^n, we see that if $m \geq c_3(n) + c_1 + n$, then

$$\mathrm{Im}(H^p(X,\mathcal{F}/I^{n+m}\mathcal{F}) \to H^p(X,\mathcal{F}/I^n\mathcal{F})) = \mathrm{Im}(H^p(X,\mathcal{F}) \to H^p(X,\mathcal{F}/I^n\mathcal{F}))$$

In other words, part (3) holds with $c_2(n) = c_3(n) + c_1 + n$. □

Theorem 25.19.5. *(Theorem on formal functions) Let A be a Noetherian ring. Let $I \subset A$ be an ideal. Let $f : X \to Spec(A)$ be a proper morphism. Let $\mathcal{F}$ be a coherent sheaf on X. Fix $p \geq 0$. The system of maps*

$$H^p(X,\mathcal{F})/I^nH^p(X,\mathcal{F}) \longrightarrow H^p(X,\mathcal{F}/I^n\mathcal{F})$$

define an isomorphism of limits

$$H^p(X,\mathcal{F})^\wedge \longrightarrow lim_n\, H^p(X,\mathcal{F}/I^n\mathcal{F})$$

where the left hand side is the completion of the A-module $H^p(X,\mathcal{F})$ with respect to the ideal I, see Algebra, Section 7.90. Moreover, this is in fact a homeomorphism for the limit topologies.

Proof. In fact, this follows immediately from Lemma 25.19.4. We spell out the details. Set $M = H^p(X,\mathcal{F})$ and $M_n = H^p(X,\mathcal{F}/I^n\mathcal{F})$. Denote $N_n = \mathrm{Im}(M \to M_n)$. By the description of the limit in Homology, Section 10.23 we have

$$lim_n\, M_n = \{(x_n) \in \prod M_n \mid \varphi_i(x_n) = x_{n-1},\ n = 2, 3, \ldots\}$$

Pick an element $x = (x_n) \in lim_n\, M_n$. By Lemma 25.19.4 part (3) we have $x_n \in N_n$ for all n since by definition x_n is the image of some $x_{n+m} \in M_{n+m}$ for all m. By Lemma 25.19.4 part (1) we see that there exists a factorization

$$M \to N_n \to M/I^{n-c_1}M$$

of the reduction map. Denote $y_n \in M/I^{n-c_1}M$ the image of x_n for $n \geq c_1$. Since for $n' \geq n$ the composition $M \to M_{n'} \to M_n$ is the given map $M \to M_n$ we see that $y_{n'}$ maps to y_n under the canonical map $M/I^{n'-c_1}M \to M/I^{n-c_1}M$. Hence $y = (y_{n+c_1})$ defines an element of $lim_n\, M/I^nM$. We omit the verification that y maps to x under the map

$$M^\wedge = lim_n\, M/I^nM \longrightarrow lim_n\, M_n$$

of the lemma. We also omit the verification on topologies. □

Lemma 25.19.6. *Given a morphism of schemes $f : X \to Y$, a quasi-coherent sheaf $\mathcal{F}$ on X, and a quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_Y$. Assume*

(1) *Y locally Noetherian,*
(2) *f proper, and*
(3) *$\mathcal{F}$ coherent.*

Let $y \in Y$ be a point. Consider the infinitesimal neighbourhoods

$$\begin{tikzcd} X_n = Spec(\mathcal{O}_{Y,y}/\mathfrak{m}_y^n) \times_Y X \arrow[r, "i_n"'] \arrow[d, "f_n"'] & X \arrow[d, "f"] \\ Spec(\mathcal{O}_{Y,y}/\mathfrak{m}_y^n) \arrow[r, "c_n"] & Y \end{tikzcd}$$

of the fibre $X_1 = X_y$ and set $\mathcal{F}_n = i_n^*\mathcal{F}$. Then we have

$$\left(R^p f_*\mathcal{F}\right)_y^\wedge \cong lim_n\, H^p(X_n, \mathcal{F}_n)$$

as $\mathcal{O}_{Y,y}^\wedge$-modules.

Proof. This is just a reformulation of a special case of the theorem on formal functions, Theorem 25.19.5. Let us spell it out. Note that $\mathcal{O}_{Y,y}$ is a Noetherian local ring. Consider the canonical morphism $c : Spec(\mathcal{O}_{Y,y}) \to Y$, see Schemes, Equation (21.13.1.1). This is a flat morphism as it identifies local rings. Denote momentarily $f' : X' \to Spec(\mathcal{O}_{Y,y})$ the base change of f to this local ring. We see that $c^*R^p f_*\mathcal{F} = R^p f'_*\mathcal{F}'$ by Lemma 25.6.2. Moreover, the infinitesimal neighbourhoods of the fibre X_y and X'_y are identified (verification omitted; hint: the morphisms c_n factor through c).

Hence we may assume that $Y = Spec(A)$ is the spectrum of a Noetherian local ring A with maximal ideal $\mathfrak{m}$ and that $y \in Y$ corresponds to the closed point (i.e., to $\mathfrak{m}$). In particular it follows that

$$\left(R^p f_*\mathcal{F}\right)_y = \Gamma(Y, R^p f_*\mathcal{F}) = H^p(X, \mathcal{F}).$$

In this case also, the morphisms c_n are each closed immersions. Hence their base changes i_n are closed immersions as well. Note that $i_{n,*}\mathcal{F}_n = i_{n,*}i_n^*\mathcal{F} = \mathcal{F}/\mathfrak{m}^n\mathcal{F}$. By the Leray spectral sequence for i_n, and Lemma 25.11.8 we see that

$$H^p(X_n, \mathcal{F}_n) = H^p(X, i_{n,*}\mathcal{F}) = H^p(X, \mathcal{F}/\mathfrak{m}^n\mathcal{F})$$

Hence we may indeed apply the theorem on formal functions to compute the limit in the statement of the lemma and we win. □

Here is a lemma which we will generalize later to fibres of dimension > 0, namely the next lemma.

Lemma 25.19.7. *Let $f : X \to Y$ be a morphism of schemes. Let $y \in Y$. Assume*

(1) *Y locally Noetherian,*
(2) *f is proper, and*
(3) *$f^{-1}(\{y\})$ is finite.*

Then for any coherent sheaf $\mathcal{F}$ on X we have $(R^p f_*\mathcal{F})_y = 0$ for all $p > 0$.

Proof. The fibre X_y is finite, and by Morphisms, Lemma 24.19.7 it is a finite discrete space. Moreover, the underlying topological space of each infinitesimal neighourhood X_n is the same. Hence each of the schemes X_n is affine according to Schemes, Lemma 21.11.7. Hence it follows that $H^p(X_n, \mathcal{F}_n) = 0$ for all $p > 0$. Hence we see that $(R^p f_* \mathcal{F})^\wedge_y = 0$ by Lemma 25.19.6. Note that $R^p f_* \mathcal{F}$ is coherent by Lemma 25.18.2 and hence $R^p f_* \mathcal{F}_y$ is a finite $\mathcal{O}_{Y,y}$-module. By Algebra, Lemma 7.90.2 this implies that $(R^p f_* \mathcal{F})_y = 0$. □

Lemma 25.19.8. *Let $f : X \to Y$ be a morphism of schemes. Let $y \in Y$. Assume*

(1) *Y locally Noetherian,*
(2) *f is proper, and*
(3) $\dim(X_y) = d$.

Then for any coherent sheaf $\mathcal{F}$ on X we have $(R^p f_* \mathcal{F})_y = 0$ for all $p > d$.

Proof. The fibre X_y is of finite type over $Spec(\kappa(y))$. Hence X_y is a Noetherian scheme by Morphisms, Lemma 24.14.6. Hence the underlying topological space of X_y is Noetherian, see Properties, Lemma 23.5.5. Moreover, the underlying topological space of each infinitesimal neighourhood X_n is the same as that of X_y. Hence $H^p(X_n, \mathcal{F}_n) = 0$ for all $p > d$ by Cohomology, Lemma 18.16.5. Hence we see that $(R^p f_* \mathcal{F})^\wedge_y = 0$ by Lemma 25.19.6 for $p > d$. Note that $R^p f_* \mathcal{F}$ is coherent by Lemma 25.18.2 and hence $R^p f_* \mathcal{F}_y$ is a finite $\mathcal{O}_{Y,y}$-module. By Algebra, Lemma 7.90.2 this implies that $(R^p f_* \mathcal{F})_y = 0$. □

25.20. Applications of the theorem on formal functions

We will add more here as needed. For the moment we need the following characterization of finite morphisms (in the Noetherian case -- for a more general version see the chapter More on Morphisms, Section 33.29).

Lemma 25.20.1. *(For a more general version see More on Morphisms, Lemma 33.29.5). Let $f : X \to S$ be a morphism of schemes. Assume S is locally Noetherian. The following are equivalent*

(1) *f is finite, and*
(2) *f is proper with finite fibres.*

Proof. A finite morphism is proper according to Morphisms, Lemma 24.42.10. A finite morphism is quasi-finite according to Morphisms, Lemma 24.42.9. A quasi-finite morphism has finite fibres, see Morphisms, Lemma 24.19.10. Hence a finite morphism is proper and has finite fibres.

Assume f is proper with finite fibres. We want to show f is finite. In fact it suffices to prove f is affine. Namely, if f is affine, then it follows that f is integral by Morphisms, Lemma 24.42.7 whereupon it follows from Morphisms, Lemma 24.42.4 that f is finite.

To show that f is affine we may assume that S is affine, and our goal is to show that X is affine too. Since f is proper we see that X is separated and quasi-compact. Hence we may use the criterion of Lemma 25.3.2 to prove that X is affine. To see this let $\mathcal{I} \subset \mathcal{O}_X$ be a finite type ideal sheaf. In particular $\mathcal{I}$ is a coherent sheaf on X. By Lemma 25.19.7 we conclude that $R^1 f_* \mathcal{I}_s = 0$ for all $s \in S$. In other words, $R^1 f_* \mathcal{I} = 0$. Hence we see from the Leray Spectral Sequence for f that $H^1(X, \mathcal{I}) = H^1(S, f_* \mathcal{I})$. Since S is affine, and $f_* \mathcal{I}$ is quasi-coherent (Schemes, Lemma 21.24.1) we conclude $H^1(S, f_* \mathcal{I}) = 0$ from Lemma 25.2.2 as desired. Hence $H^1(X, \mathcal{I}) = 0$ as desired. □

As a consequence we have the following useful result.

Lemma 25.20.2. *(For a more general version see More on Morphisms, Lemma 33.29.6). Let $f : X \to S$ be a morphism of schemes. Let $s \in S$. Assume*

1. *S is locally Noetherian,*
2. *f is proper, and*
3. *$f^{-1}(\{s\})$ is a finite set.*

Then there exists an open neighbourhood $V \subset S$ of s such that $f|_{f^{-1}(V)} : f^{-1}(V) \to V$ is finite.

Proof. The morphism f is quasi-finite at all the points of $f^{-1}(\{s\})$ by Morphisms, Lemma 24.19.7. By Morphisms, Lemma 24.47.2 the set of points at which f is quasi-finite is an open $U \subset X$. Let $Z = X \setminus U$. Then $s \notin f(Z)$. Since f is proper the set $f(Z) \subset S$ is closed. Choose any open neighbourhood $V \subset S$ of s with $Z \cap V = \emptyset$. Then $f^{-1}(V) \to V$ is locally quasi-finite and proper. Hence it is quasi-finite (Morphisms, Lemma 24.19.9), hence has finite fibres (Morphisms, Lemma 24.19.10), hence is finite by Lemma 25.20.1. □

CHAPTER 26

Divisors

26.1. Introduction

In this chapter we study some very basic questions related to defining divisors, etc. A basic reference is [**DG67**].

26.2. Associated points

Let R be a ring and let M be an R-module. Recall that a prime $\mathfrak{p} \subset R$ is *associated* to M if there exists an element of M whose annihilator is $\mathfrak{p}$. See Algebra, Definition 7.60.1. Here is the definition of associated points for quasi-coherent sheaves on schemes as given in [**DG67**, IV Definition 3.1.1].

Definition 26.2.1. Let X be a scheme. Let $\mathcal{F}$ be a quasi-coherent sheaf on X.

(1) We say $x \in X$ is *associated* to $\mathcal{F}$ if the maximal ideal $\mathfrak{m}_x$ is associated to the $\mathcal{O}_{X,x}$-module $\mathcal{F}_x$.
(2) We denote $\text{Ass}(\mathcal{F})$ or $\text{Ass}_X(\mathcal{F})$ the set of associated points of $\mathcal{F}$.
(3) The *associated points of* X are the associated points of $\mathcal{O}_X$.

These definitions are most useful when X is locally Noetherian and $\mathcal{F}$ of finite type. For example it may happen that a generic point of an irreducible component of X is not associated to X, see Example 26.2.7. In the non-Noetherian case it may be more convenient to use weakly associated points, see Section 26.5. Let us link the scheme theoretic notion with the algebraic notion on affine opens; note that this correspondence works perfectly only for locally Noetherian schemes.

Lemma 26.2.2. *Let X be a scheme. Let $\mathcal{F}$ be a quasi-coherent sheaf on X. Let $Spec(A) = U \subset X$ be an affine open, and set $M = \Gamma(U, \mathcal{F})$. Let $x \in U$, and let $\mathfrak{p} \subset A$ be the corresponding prime.*

(1) *If $\mathfrak{p}$ is associated to M, then x is associated to $\mathcal{F}$.*
(2) *If $\mathfrak{p}$ is finitely generated, then the coverse holds as well.*

In particular, if X is locally Noetherian, then the equivalence

$$\mathfrak{p} \in Ass(M) \Leftrightarrow x \in Ass(\mathcal{F})$$

holds for all pairs $(\mathfrak{p}, x)$ as above.

Proof. This follows from Algebra, Lemma 7.60.14. But we can also argue directly as follows. Suppose $\mathfrak{p}$ is associated to M. Then there exists an $m \in M$ whose annihilator is $\mathfrak{p}$. Since localization is exact we see that $\mathfrak{p}A_{\mathfrak{p}}$ is the annihilator of $m/1 \in M_{\mathfrak{p}}$. Since $M_{\mathfrak{p}} = \mathcal{F}_x$ (Schemes, Lemma 21.5.4) we conclude that x is associated to $\mathcal{F}$.

Conversely, assume that x is associated to $\mathcal{F}$, and $\mathfrak{p}$ is finitely generated. As x is associated to $\mathcal{F}$ there exists an element $m' \in M_{\mathfrak{p}}$ whose annihilator is $\mathfrak{p}A_{\mathfrak{p}}$. Write $m' = m/f$ for some $f \in A$, $f \notin \mathfrak{p}$. The annihilator I of m is an ideal of A such that $IA_{\mathfrak{p}} = \mathfrak{p}A_{\mathfrak{p}}$. Hence $I \subset \mathfrak{p}$, and $(\mathfrak{p}/I)_{\mathfrak{p}} = 0$. Since $\mathfrak{p}$ is finitely generated, there exists a $g \in A$, $g \notin \mathfrak{p}$ such that $g(\mathfrak{p}/I) = 0$. Hence the annihilator of gm is $\mathfrak{p}$ and we win.

If X is locally Noetherian, then A is Noetherian (Properties, Lemma 23.5.2) and $\mathfrak{p}$ is always finitely generated. □

Lemma 26.2.3. *Let X be a scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Then $Ass(\mathcal{F}) \subset Supp(\mathcal{F})$.*

Proof. This is immediate from the definitions. □

Lemma 26.2.4. *Let X be a scheme. Let $0 \to \mathcal{F}_1 \to \mathcal{F}_2 \to \mathcal{F}_3 \to 0$ be a short exact sequence of quasi-coherent sheaves on X. Then $Ass(\mathcal{F}_2) \subset Ass(\mathcal{F}_1) \cup Ass(\mathcal{F}_3)$ and $Ass(\mathcal{F}_1) \subset Ass(\mathcal{F}_2)$.*

Proof. For every point $x \in X$ the sequence of stalks $0 \to \mathcal{F}_{1,x} \to \mathcal{F}_{2,x} \to \mathcal{F}_{3,x} \to 0$ is a short exact sequence of $\mathcal{O}_{X,x}$-modules. Hence the lemma follows from Algebra, Lemma 7.60.3. □

Lemma 26.2.5. *Let X be a locally Noetherian scheme. Let $\mathcal{F}$ be a coherent $\mathcal{O}_X$-module. Then $Ass(\mathcal{F}) \cap U$ is finite for every quasi-compact open $U \subset X$.*

Proof. This is true because the set of associated primes of a finite module over a Noetherian ring is finite, see Algebra, Lemma 7.60.5. To translate from schemes to algebra use that U is a finite union of affine opens, each of these opens is the spectrum of a Noetherian ring (Properties, Lemma 23.5.2), $\mathcal{F}$ corresponds to a finite module over this ring (Coherent, Lemma 25.11.1), and finally use Lemma 26.2.2. □

Lemma 26.2.6. *Let X be a locally Noetherian scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Then*

$$\mathcal{F} = 0 \Leftrightarrow Ass(\mathcal{F}) = \emptyset.$$

Proof. If $\mathcal{F} = 0$, then $\text{Ass}(\mathcal{F}) = \emptyset$ by definition. Conversely, if $\text{Ass}(\mathcal{F}) = \emptyset$, then $\mathcal{F} = 0$ by Algebra, Lemma 7.60.7. To translate from schemes to algebra, restrict to any affine and use Lemma 26.2.2. □

Example 26.2.7. Let k be a field. The ring $R = R[x_1, x_2, x_3, \ldots]/(x_i^2)$ is local with locally nilpotent maximal ideal $\mathfrak{m}$. There exists no element of R which has annihilator $\mathfrak{m}$. Hence $\text{Ass}(R) = \emptyset$, and $X = Spec(R)$ is an example of a scheme which has no associated points.

Lemma 26.2.8. *Let X be a locally Noetherian scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Let $x \in Supp(\mathcal{F})$ be a point in the support of $\mathcal{F}$ which is not a specialization of another point of $Supp(\mathcal{F})$. Then $x \in Ass(\mathcal{F})$. In particular, any generic point of an irreducible component of X is an associated point of X.*

Proof. Since $x \in \text{Supp}(\mathcal{F})$ the module $\mathcal{F}_x$ is not zero. Hence $\text{Ass}(\mathcal{F}_x) \subset Spec(\mathcal{O}_{X,x})$ is nonempty by Algebra, Lemma 7.60.7. On the other hand, by assumption $\text{Supp}(\mathcal{F}_x) = \{\mathfrak{m}_x\}$. Since $\text{Ass}(\mathcal{F}_x) \subset \text{Supp}(\mathcal{F}_x)$ (Algebra, Lemma 7.60.2) we see that $\mathfrak{m}_x$ is associated to $\mathcal{F}_x$ and we win. □

26.3. Morphisms and associated points

Lemma 26.3.1. *Let $f : X \to S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent sheaf on X which is flat over S. Let $\mathcal{G}$ be a quasi-coherent sheaf on S. Then we have*

$$Ass_X(\mathcal{F} \otimes_{\mathcal{O}_X} f^*\mathcal{G}) \supset \bigcup\nolimits_{s \in Ass_S(\mathcal{G})} Ass_{X_s}(\mathcal{F}_s)$$

and equality holds if S is locally Noetherian.

Proof. Let $x \in X$ and let $s = f(x) \in S$. Set $B = \mathcal{O}_{X,x}$, $A = \mathcal{O}_{S,s}$, $N = \mathcal{F}_x$, and $M = \mathcal{G}_s$. Note that the stalk of $\mathcal{F} \otimes_{\mathcal{O}_X} f^*\mathcal{G}$ at x is equal to the B-module $M \otimes_A N$. Hence $x \in \text{Ass}_X(\mathcal{F} \otimes_{\mathcal{O}_X} f^*\mathcal{G})$ if and only if $\mathfrak{m}_B$ is in $\text{Ass}_B(M \otimes_A N)$. Similarly $s \in \text{Ass}_S(\mathcal{G})$ and $x \in \text{Ass}_{X_s}(\mathcal{F}_s)$ if and only if $\mathfrak{m}_A \in \text{Ass}_A(M)$ and $\mathfrak{m}_B/\mathfrak{m}_A B \in \text{Ass}_{B \otimes \kappa(\mathfrak{m}_A)}(N \otimes \kappa(\mathfrak{m}_A))$. Thus the lemma follows from Algebra, Lemma 7.62.5. □

26.4. Embedded points

Let R be a ring and let M be an R-module. Recall that a prime $\mathfrak{p} \subset R$ is an *embedded associated* to M if it is an associated prime of M which is not minimal among the associated primes of M. See Algebra, Definition 7.64.1. Here is the definition of embedded associated points for quasi-coherent sheaves on schemes as given in [**DG67**, IV Definition 3.1.1].

Definition 26.4.1. Let X be a scheme. Let $\mathcal{F}$ be a quasi-coherent sheaf on X.

(1) An *embedded associated point* of $\mathcal{F}$ is an associated point which is not maximal among the associated points of $\mathcal{F}$, i.e., it is the specialization of another associated point of $\mathcal{F}$.
(2) A point x of X is called an *embedded point* if x is an embedded associated point of $\mathcal{O}_X$.
(3) An *embedded component* of X is an irreducible closed subset $Z = \overline{\{x\}}$ where x is an embedded point of X.

In the Noetherian case when $\mathcal{F}$ is coherent we have the following.

Lemma 26.4.2. *Let X be a locally Noetherian scheme. Let $\mathcal{F}$ be a coherent $\mathcal{O}_X$-module. Then*

(1) *the generic points of irreducible components of Supp($\mathcal{F}$) are associated points of $\mathcal{F}$, and*
(2) *an associated point of $\mathcal{F}$ is embedded if and only if it is not a generic point of an irreducible component of Supp($\mathcal{F}$).*

In particular an embedded point of X is an associated point of X which is not a generic point of an irreducible component of X.

Proof. Recall that in this case $Z = \text{Supp}(\mathcal{F})$ is closed, see Coherent, Lemma 25.10.3 and that the generic points of irreducible components of Z are associated points of $\mathcal{F}$, see Lemma 26.2.8. Finally, we have $\text{Ass}(\mathcal{F}) \subset Z$, by Lemma 26.2.3. These results, combined with the fact that Z is a sober topological space and hence every point of Z is a specialization of a generic point of Z, imply (1) and (2). □

Lemma 26.4.3. *Let X be a locally Noetherian scheme. Let $\mathcal{F}$ be a coherent sheaf on X. Then the following are equivalent:*

(1) *$\mathcal{F}$ has no embedded associated points, and*
(2) *$\mathcal{F}$ has property (S_1).*

Proof. This is Algebra, Lemma 7.140.2, combined with Lemma 26.2.2 above. □

Lemma 26.4.4. *Let X be a locally Noetherian scheme. Let $\mathcal{F}$ be a coherent sheaf on X. The set of coherent subsheaves*

$$\{\mathcal{K} \subset \mathcal{F} \mid Supp(\mathcal{K}) \text{ is nowhere dense in } Supp(\mathcal{F})\}$$

has a maximal element $\mathcal{K}$. Setting $\mathcal{F}' = \mathcal{F}/\mathcal{K}$ we have the following

(1) *$Supp(\mathcal{F}') = Supp(\mathcal{F})$,*
(2) *$\mathcal{F}'$ has no embedded associated points, and*
(3) *there exists a dense open $U \subset X$ such that $U \cap Supp(\mathcal{F})$ is dense in $Supp(\mathcal{F})$ and $\mathcal{F}'|_U \cong \mathcal{F}|_U$.*

Proof. This follows from Algebra, Lemmas 7.64.2 and 7.64.3. Note that U can be taken as the complement of the closure of the set of embedded associated points of $\mathcal{F}$. □

Lemma 26.4.5. *Let X be a locally Noetherian scheme. Let $\mathcal{F}$ be a coherent $\mathcal{O}_X$-module without embedded associated points. Set*

$$\mathcal{I} = Ker(\mathcal{O}_X \longrightarrow \mathcal{H}om_{\mathcal{O}_X}(\mathcal{F}, \mathcal{F})).$$

This is a coherent sheaf of ideals which defines a closed subscheme $Z \subset X$ without embedded points. Moreover there exists a coherent sheaf $\mathcal{G}$ on Z such that (a) $\mathcal{F} = (Z \to X)_*\mathcal{G}$, (b) $\mathcal{G}$ has no associated embedded points, and (c) $Supp(\mathcal{G}) = Z$ (as sets).

Proof. Some of the statements we have seen in the proof of Coherent, Lemma 25.11.7. The others follow from Algebra, Lemma 7.64.4. □

26.5. Weakly associated points

Let R be a ring and let M be an R-module. Recall that a prime $\mathfrak{p} \subset R$ is *weakly associated* to M if there exists an element m of M such that $\mathfrak{p}$ is minimal among the primes containing the annihilator of m. See Algebra, Definition 7.63.1. If R is a local ring with maximal ideal $\mathfrak{m}$, then $\mathfrak{m}$ is associated to M if and only if there exists an element $m \in M$ whose annihilator has radical $\mathfrak{m}$, see Algebra, Lemma 7.63.2.

Definition 26.5.1. Let X be a scheme. Let $\mathcal{F}$ be a quasi-coherent sheaf on X.

(1) We say $x \in X$ is *weakly associated* to $\mathcal{F}$ if the maximal ideal $\mathfrak{m}_x$ is weakly associated to the $\mathcal{O}_{X,x}$-module $\mathcal{F}_x$.
(2) We denote WeakAss($\mathcal{F}$) the set of weakly associated points of $\mathcal{F}$.
(3) The *weakly associated points of X* are the weakly associated points of $\mathcal{O}_X$.

In this case, on any affine open, this corresponds exactly to the weakly associated primes as defined above. Here is the precise statement.

Lemma 26.5.2. *Let X be a scheme. Let $\mathcal{F}$ be a quasi-coherent sheaf on X. Let $Spec(A) = U \subset X$ be an affine open, and set $M = \Gamma(U, \mathcal{F})$. Let $x \in U$, and let $\mathfrak{p} \subset A$ be the corresponding prime. The following are equivalent*

(1) *$\mathfrak{p}$ is weakly associated to M, and*
(2) *x is weakly associated to $\mathcal{F}$.*

Proof. This follows from Algebra, Lemma 7.63.2. □

Lemma 26.5.3. *Let X be a scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Then*

$$Ass(\mathcal{F}) \subset WeakAss(\mathcal{F}) \subset Supp(\mathcal{F}).$$

Proof. This is immediate from the definitions. □

Lemma 26.5.4. *Let X be a scheme. Let $0 \to \mathcal{F}_1 \to \mathcal{F}_2 \to \mathcal{F}_3 \to 0$ be a short exact sequence of quasi-coherent sheaves on X. Then $WeakAss(\mathcal{F}_2) \subset WeakAss(\mathcal{F}_1) \cup WeakAss(\mathcal{F}_3)$ and $WeakAss(\mathcal{F}_1) \subset WeakAss(\mathcal{F}_2)$.*

Proof. For every point $x \in X$ the sequence of stalks $0 \to \mathcal{F}_{1,x} \to \mathcal{F}_{2,x} \to \mathcal{F}_{3,x} \to 0$ is a short exact sequence of $\mathcal{O}_{X,x}$-modules. Hence the lemma follows from Algebra, Lemma 7.63.3. □

Lemma 26.5.5. *Let X be a scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Then*

$$\mathcal{F} = (0) \Leftrightarrow WeakAss(\mathcal{F}) = \emptyset$$

Proof. Follows from Lemma 26.5.2 and Algebra, Lemma 7.63.4 □

Lemma 26.5.6. *Let X be a scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Let $x \in Supp(\mathcal{F})$ be a point in the support of $\mathcal{F}$ which is not a specialization of another point of $Supp(\mathcal{F})$. Then $x \in WeakAss(\mathcal{F})$. In particular, any generic point of an irreducible component of X is weakly associated to $\mathcal{O}_X$.*

Proof. Since $x \in \text{Supp}(\mathcal{F})$ the module $\mathcal{F}_x$ is not zero. Hence $\text{WeakAss}(\mathcal{F}_x) \subset Spec(\mathcal{O}_{X,x})$ is nonempty by Algebra, Lemma 7.63.4. On the other hand, by assumption $\text{Supp}(\mathcal{F}_x) = \{\mathfrak{m}_x\}$. Since $\text{WeakAss}(\mathcal{F}_x) \subset \text{Supp}(\mathcal{F}_x)$ (Algebra, Lemma 7.63.5) we see that $\mathfrak{m}_x$ is weakly associated to $\mathcal{F}_x$ and we win. □

Lemma 26.5.7. *Let X be a scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. If $\mathfrak{m}_x$ is a finitely generated ideal of $\mathcal{O}_{X,x}$, then*

$$x \in Ass(\mathcal{F}) \Leftrightarrow x \in WeakAss(\mathcal{F}).$$

In particular, if X is locally Noetherian, then $Ass(\mathcal{F}) = WeakAss(\mathcal{F})$.

Proof. See Algebra, Lemma 7.63.8. □

26.6. Morphisms and weakly associated points

Lemma 26.6.1. *Let $f : X \to S$ be an affine morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Then we have*

$$WeakAss_S(f_*\mathcal{F}) \subset f(WeakAss_X(\mathcal{F}))$$

Proof. We may assume X and S affine, so $X \to S$ comes from a ring map $A \to B$. Then $\mathcal{F} = \widetilde{M}$ for some B-module M. By Lemma 26.5.2 the weakly associated points of $\mathcal{F}$ correspond exactly to the weakly associated primes of M. Similarly, the weakly associated points of $f_*\mathcal{F}$ correspond exactly to the weakly associated primes of M as an A-module. Hence the lemma follows from Algebra, Lemma 7.63.10. □

Lemma 26.6.2. *Let $f : X \to S$ be an affine morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. If X is locally Noetherian, then we have*

$$f(Ass_X(\mathcal{F})) = Ass_S(f_*\mathcal{F}) = WeakAss_S(f_*\mathcal{F}) = f(WeakAss_X(\mathcal{F}))$$

Proof. We may assume X and S affine, so $X \to S$ comes from a ring map $A \to B$. As X is locally Noetherian the ring B is Noetherian, see Properties, Lemma 23.5.2. Write $\mathcal{F} = \widetilde{M}$ for some B-module M. By Lemma 26.2.2 the associated points of $\mathcal{F}$ correspond exactly to the associated primes of M, and any associated prime of M as an A-module is an associated points of $f_*\mathcal{F}$. Hence the inclusion

$$f(\mathrm{Ass}_X(\mathcal{F})) \subset \mathrm{Ass}_S(f_*\mathcal{F})$$

follows from Algebra, Lemma 7.60.12. We have the inclusion

$$\mathrm{Ass}_S(f_*\mathcal{F}) \subset \mathrm{WeakAss}_S(f_*\mathcal{F})$$

by Lemma 26.5.3. We have the inclusion

$$\mathrm{WeakAss}_S(f_*\mathcal{F}) \subset f(\mathrm{WeakAss}_X(\mathcal{F}))$$

by Lemma 26.6.1. The outer sets are equal by Lemma 26.5.7 hence we have equality everywhere. □

Lemma 26.6.3. *Let $f : X \to S$ be a finite morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Then $\mathit{WeakAss}(f_*\mathcal{F}) = f(\mathit{WeakAss}(\mathcal{F}))$.*

Proof. We may assume X and S affine, so $X \to S$ comes from a finite ring map $A \to B$. Write $\mathcal{F} = \widetilde{M}$ for some B-module M. By Lemma 26.5.2 the weakly associated points of $\mathcal{F}$ correspond exactly to the weakly associated primes of M. Similarly, the weakly associated points of $f_*\mathcal{F}$ correspond exactly to the weakly associated primes of M as an A-module. Hence the lemma follows from Algebra, Lemma 7.63.12. □

Lemma 26.6.4. *Let $f : X \to S$ be a morphism of schemes. Let $\mathcal{G}$ be a quasi-coherent $\mathcal{O}_S$-module. Let $x \in X$ with $s = f(x)$. If f is flat at x, the point x is a generic point of the fibre X_s, and $s \in \mathit{WeakAss}_S(\mathcal{G})$, then $x \in \mathit{WeakAss}(f^*\mathcal{G})$.*

Proof. Let $A = \mathcal{O}_{S,s}$, $B = \mathcal{O}_{X,x}$, and $M = \mathcal{G}_s$. Let $m \in M$ be an element whose annihilator $I = \{a \in A \mid am = 0\}$ has radical $\mathfrak{m}_A$. Then $m \otimes 1$ has annihilator IB as $A \to B$ is faithfully flat. Thus it suffices to see that $\sqrt{IB} = \mathfrak{m}_B$. This follows from the fact that the maximal ideal of $B/\mathfrak{m}_A B$ is locally nilpotent (see Algebra, Lemma 7.23.3) and the assumption that $\sqrt{I} = \mathfrak{m}_A$. Some details omitted. □

26.7. Relative assassin

Definition 26.7.1. Let $f : X \to S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. The *relative assassin of $\mathcal{F}$ in X over S* is the set

$$\mathrm{Ass}_{X/S}(\mathcal{F}) = \bigcup\nolimits_{s \in S} \mathrm{Ass}_{X_s}(\mathcal{F}_s)$$

where $\mathcal{F}_s = (X_s \to X)^*\mathcal{F}$ is the restriction of $\mathcal{F}$ to the fibre of f at s.

Again there is a caveat that this is best used when the fibres of f are locally Noetherian and $\mathcal{F}$ is of finite type. In the general case we should probably use the relative weak assassin (defined in the next section).

Lemma 26.7.2. *Let $f : X \to S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Let $g : S' \to S$ be a morphism of schemes. Consider the base change diagram*

$$\begin{array}{ccc} X' & \xrightarrow{g'} & X \\ \downarrow & & \downarrow \\ S' & \xrightarrow{g} & S \end{array}$$

and set $\mathcal{F}' = (g')^*\mathcal{F}$. Let $x' \in X'$ be a point with images $x \in X$, $s' \in S'$ and $s \in S$. Assume f locally of finite type. Then $x' \in Ass_{X'/S'}(\mathcal{F}')$ if and only if $x \in Ass_{X/S}(\mathcal{F})$ and x' corresponds to a generic point of an irreducible component of $Spec(\kappa(s') \otimes_{\kappa(s)} \kappa(x))$.

Proof. Consider the morphism $X'_{s'} \to X_s$ of fibres. As $X_{s'} = X_s \times_{Spec(\kappa(s))} Spec(\kappa(s'))$ this is a flat morphism. Moreover $\mathcal{F}'_{s'}$ is the pullback of $\mathcal{F}_s$ via this morphism. As X_s is locally of finite type over the Noetherian scheme $Spec(\kappa(s))$ we have that X_s is locally Noetherian, see Morphisms, Lemma 24.14.6. Thus we may apply Lemma 26.3.1 and we see that

$$\mathrm{Ass}_{X'_{s'}}(\mathcal{F}'_{s'}) = \bigcup\nolimits_{x \in \mathrm{Ass}(\mathcal{F}_s)} \mathrm{Ass}((X'_{s'})_x).$$

Thus to prove the lemma it suffices to show that the associated points of the fibre $(X'_{s'})_x$ of the morphism $X'_{s'} \to X_s$ over x are its generic points. Note that $(X'_{s'})_x = Spec(\kappa(s') \otimes_{\kappa(s)} \kappa(x))$ as schemes. By Algebra, Lemma 7.149.1 the ring $\kappa(s') \otimes_{\kappa(s)} \kappa(x)$ is a Noetherian Cohen-Macaulay ring. Hence its associated primes are its minimal primes, see Algebra, Proposition 7.60.6 (minimal primes are associated) and Algebra, Lemma 7.140.2 (no embedded primes). $\square$

Remark 26.7.3. With notation and assumptions as in Lemma 26.7.2 we see that it is always the case that $(g')^{-1}(\mathrm{Ass}_{X/S}(\mathcal{F})) \supset \mathrm{Ass}_{X'/S'}(\mathcal{F}')$. If the morphism $S' \to S$ is locally quasi-finite, then we actually have

$$(g')^{-1}(\mathrm{Ass}_{X/S}(\mathcal{F})) = \mathrm{Ass}_{X'/S'}(\mathcal{F}')$$

because in this case the field extensions $\kappa(s) \subset \kappa(s')$ are always finite. In fact, this holds more generally for any morphism $g : S' \to S$ such that all the field extensions $\kappa(s) \subset \kappa(s')$ are algebraic, because in this case all prime ideals of $\kappa(s') \otimes_{\kappa(s)} \kappa(x)$ are maximal (and minimal) primes, see Algebra, Lemma 7.32.17.

26.8. Relative weak assassin

Definition 26.8.1. Let $f : X \to S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. The *relative weak assassin of $\mathcal{F}$ in X over S* is the set

$$\mathrm{WeakAss}_{X/S}(\mathcal{F}) = \bigcup\nolimits_{s \in S} \mathrm{WeakAss}(\mathcal{F}_s)$$

where $\mathcal{F}_s = (X_s \to X)^*\mathcal{F}$ is the restriction of $\mathcal{F}$ to the fibre of f at s.

Lemma 26.8.2. *Let $f : X \to S$ be a morphism of schemes which is locally of finite type. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Then $WeakAss_{X/S}(\mathcal{F}) = Ass_{X/S}(\mathcal{F})$.*

Proof. This is true becase the fibres of f are locally Noetherian schemes, and associated and weakly associated points agree on locally Noetherian schemes, see Lemma 26.5.7. $\square$

26.9. Effective Cartier divisors

For some reason it seem convenient to define the notion of an effective Cartier divisor before anything else.

Definition 26.9.1. Let S be a scheme.

(1) A *locally principal closed subscheme* of S is a closed subscheme whose sheaf of ideals is locally generated by a single element.
(2) An *effective Cartier divisor* on S is a closed subscheme $D \subset S$ such that the ideal sheaf $\mathcal{I}_D \subset \mathcal{O}_X$ is an invertible $\mathcal{O}_X$-module.

Thus an effective Cartier divisor is a locally principal closed subscheme, but the converse is not always true. Effective Cartier divisors are closed subschemes of pure codimension 1 in the strongest possible sense. Namely they are locally cut out by a single element which is not a zero divisor. In particular they are nowhere dense.

Lemma 26.9.2. *Let S be a scheme. Let $D \subset S$ be a closed subscheme. The following are equivalent:*

(1) *The subscheme D is an effective Cartier divisor on S.*
(2) *For every $x \in D$ there exists an affine open neighbourhood $Spec(A) = U \subset X$ of x such that $U \cap D = Spec(A/(f))$ with $f \in A$ not a zero divisor.*

Proof. Assume (1). For every $x \in D$ there exists an affine open neighbourhood $Spec(A) = U \subset X$ of x such that $\mathcal{I}_D|_U \cong \mathcal{O}_U$. In other words, there exists a section $f \in \Gamma(U, \mathcal{I}_D)$ which freely generates the restriction $\mathcal{I}_D|_U$. Hence $f \in A$, and the multiplication map $f : A \to A$ is injective. Also, since $\mathcal{I}_D$ is quasi-coherent we see that $D \cap U = Spec(A/(f))$.

Assume (2). Let $x \in D$. By assumption there exists an affine open neighbourhood $Spec(A) = U \subset X$ of x such that $U \cap D = Spec(A/(f))$ with $f \in A$ not a zero divisor. Then $\mathcal{I}_D|_U \cong \mathcal{O}_U$ since it is equal to $\widetilde{(f)} \cong \widetilde{A} \cong \mathcal{O}_U$. Of course $\mathcal{I}_D$ restricted to the open subscheme $S \setminus D$ is isomorphic to $\mathcal{O}_{X \setminus D}$. Hence $\mathcal{I}_D$ is an invertible $\mathcal{O}_S$-module. □

Lemma 26.9.3. *Let S be a scheme. Let $D \subset S$ be an effective Cartier divisor. Let $s \in D$. If $\dim_s(S) < \infty$, then $\dim_s(D) < \dim_s(S)$.*

Proof. Assume $\dim_s(S) < \infty$. Let $U = Spec(A) \subset S$ be an affine open neighbourhood of X such that $\dim(U) = \dim_s(S)$ and such that $D = V(f)$ for some nonzero divisor $f \in A$ (see Lemma 26.9.2). Recall that $\dim(U)$ is the Krull dimension of the ring A and that $\dim(U \cap D)$ is the Krull dimension of the ring $A/(f)$. Then f is not contained in any minimal prime of A. Hence any maximal chain of primes in $A/(f)$, viewed as a chain of primes in A, can be extended by adding a minimal prime. □

Definition 26.9.4. Let S be a scheme. Given effective Cartier divisors D_1, D_2 on S we set $D = D_1 + D_2$ equal to the closed subscheme of S corresponding to the quasi-coherent sheaf of ideals $\mathcal{I}_{D_1}\mathcal{I}_{D_2} \subset \mathcal{O}_S$. We call this the *sum of the effective Cartier divisors D_1 and D_2*.

It is clear that we may define the sum $\sum n_i D_i$ given finitely many effective Cartier divisors D_i on X and nonnegative integers n_i.

Lemma 26.9.5. *The sum of two effective Cartier divisors is an effective Cartier divisor.*

Proof. Omitted. Locally $f_1, f_2 \in A$ are nonzero divisors, then also $f_1 f_2 \in A$ is a nonzero divisor. □

Lemma 26.9.6. *Let X be a scheme. Let D, D' be two effective Cartier divisors on X. If $D \subset D'$ (as closed subschemes of X), then there exists an effective Cartier divisor D'' such that $D' = D + D''$.*

Proof. Omitted. □

Recall that we have defined the inverse image of a closed subscheme under any morphism of schemes in Schemes, Definition 21.17.7.

Lemma 26.9.7. *Let $f : S' \to S$ be a morphism of schemes. Let $Z \subset S$ be a locally principal closed subscheme. Then the inverse image $f^{-1}(Z)$ is a locally principal closed subscheme of S'.*

Proof. Omitted. □

Definition 26.9.8. Let $f : S' \to S$ be a morphism of schemes. Let $D \subset S$ be an effective Cartier divisor. We say the *pullback of D by f is defined* if the closed subscheme $f^{-1}(D) \subset S'$ is an effective Cartier divisor. In this case we denote it either f^*D or $f^{-1}(D)$ and we call it the *pullback of the effective Cartier divisor*.

The condition that $f^{-1}(D)$ is an effective Cartier divisor is often satisfied in practice. Here is an example lemma.

Lemma 26.9.9. *Let $f : X \to Y$ be a morphism of schemes. Let $D \subset Y$ be an effective Cartier divisor. The pullback of D by f is defined in each of the following cases:*

(1) *X, Y integral and f dominant,*
(2) *X reduced, and for any generic point ξ of any irreducible component of X we have $f(\xi) \notin D$,*
(3) *X is locally Noetherian and for any associated point x of X we have $f(x) \notin D$,*
(4) *X is locally Noetherian, has no embedded points, and for any generic point ξ of any irreducible component of X we have $f(\xi) \notin D$,*
(5) *f is flat, and*
(6) *add more here as needed.*

Proof. The question is local on X, and hence we reduce to the case where $X = Spec(A)$, $Y = Spec(R)$, f is given by $\varphi : R \to A$ and $D = Spec(R/(t))$ where $t \in R$ is not a zero divisor. The goal in each case is to show that $\varphi(t) \in A$ is not a zero divisor.

In case (2) this follows as the intersection of all minimal primes of a ring is the nilradical of the ring, see Algebra, Lemma 7.16.2.

Let us prove (3). By Lemma 26.2.2 the associated points of X correspond to the primes $\mathfrak{p} \in \text{Ass}(A)$. By Algebra, Lemma 7.60.9 we have $\bigcup_{\mathfrak{p} \in \text{Ass}(A)} \mathfrak{p}$ is the set of zero divisors of A. The hypothesis of (3) is that $\varphi(t) \notin \mathfrak{p}$ for all $\mathfrak{p} \in \text{Ass}(A)$. Hence $\varphi(t)$ is a nonzero divisor as desired.

Part (4) follows from (3) and the definitions. □

Lemma 26.9.10. *Let $f : S' \to S$ be a morphism of schemes. Let D_1, D_2 be effective Cartier divisors on S. If the pullbacks of D_1 and D_2 are defined then the pullback of $D = D_1 + D_2$ is defined and $f^*D = f^*D_1 + f^*D_2$.*

Proof. Omitted. □

Definition 26.9.11. Let S be a scheme and let D be an effective Cartier divisor. The *invertible sheaf $\mathcal{O}_S(D)$ associated to D* is given by

$$\mathcal{O}_S(D) := \mathcal{H}om_{\mathcal{O}_S}(\mathcal{I}_D, \mathcal{O}_S) = \mathcal{I}_D^{\otimes -1}.$$

The canonical section, usually denoted 1 or 1_D, is the global section of $\mathcal{O}_S(D)$ corresponding to the inclusion mapping $\mathcal{I}_D \to \mathcal{O}_S$.

Lemma 26.9.12. *Let S be a scheme. Let D_1, D_2 be effective Cartier divisors on S. Let $D = D_1 + d_2$. Then there is a unique isomorphism*

$$\mathcal{O}_S(D_1) \otimes_{\mathcal{O}_S} \mathcal{O}_S(D_2) \longrightarrow \mathcal{O}_S(D)$$

which maps $1_{D_1} \otimes 1_{D_2}$ to 1_D.

Proof. Omitted. □

Definition 26.9.13. Let $(X, \mathcal{O}_X)$ be a locally ringed space. Let $\mathcal{L}$ be an invertible sheaf on X. A global section $s \in \Gamma(X, \mathcal{L})$ is called a *regular section* if the map $\mathcal{O}_X \to \mathcal{L}$, $f \mapsto fs$ is injective.

Lemma 26.9.14. *Let X be a locally ringed space. Let $f \in \Gamma(X, \mathcal{O}_X)$. The following are equivalent:*

(1) *f is a regular section, and*
(2) *for any $x \in X$ the image $f \in \mathcal{O}_{X,x}$ is not a zero divisor.*

If X is a scheme these are also equivalent to

(3) *for any affine open $Spec(A) = U \subset X$ the image $f \in A$ is not a zero divisor, and*
(4) *there exists an affine open covering $X = \bigcup Spec(A_i)$ such that the image of f in A_i is not a zero divisor for all i.*

Proof. Omitted. □

Note that a global section s of an invertible $\mathcal{O}_X$-module $\mathcal{L}$ may be seen as an $\mathcal{O}_X$-module map $s : \mathcal{O}_X \to \mathcal{L}$. Its dual is therefore a map $s : \mathcal{L}^{\otimes -1} \to \mathcal{O}_X$. (See Modules, Definition 15.21.3 for the definition of the dual invertible sheaf.)

Definition 26.9.15. Let X be a scheme. Let $\mathcal{L}$ be an invertible sheaf. Let $s \in \Gamma(X, \mathcal{L})$. The *zero scheme* of s is the closed subscheme $Z(s) \subset X$ defined by the quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_X$ which is the image of the map $s : \mathcal{L}^{\otimes -1} \to \mathcal{O}_X$.

Lemma 26.9.16. *Let X be a scheme. Let $\mathcal{L}$ be an invertible sheaf. Let $s \in \Gamma(X, \mathcal{L})$.*

(1) *Consider closed immersions $i : Z \to X$ such that $i^*s \in \Gamma(Z, i^*\mathcal{L}))$ is zero ordered by inclusion. The zero scheme $Z(s)$ is the minimal element of this set.*
(2) *For any morphism of schemes $f : Y \to X$ we have $f^*s = 0$ in $\Gamma(Y, f^*\mathcal{L})$ if and only if f factors through $Z(s)$.*
(3) *The zero scheme $Z(s)$ is a locally principal closed subscheme.*
(4) *The zero scheme $Z(s)$ is an effective Cartier divisor if and only if s is a regular section of $\mathcal{L}$.*

Proof. Omitted. □

Lemma 26.9.17. *Let S be a scheme.*

(1) *If $D \subset S$ is an effective Cartier divisor, then the canonical section 1_D of $\mathcal{O}_S(D)$ is regular.*
(2) *Conversely, if s is a regular section of the invertible sheaf $\mathcal{L}$, then there exists a unique effective Cartier divisor $D = Z(s) \subset S$ and a unique isomorphism $\mathcal{O}_S(D) \to \mathcal{L}$ which maps 1_D to s.*

The constructions $D \mapsto (\mathcal{O}_X(D), 1_D)$ and $(\mathcal{L}, s) \mapsto Z(s)$ give mutually inverse maps

$$\left\{\textit{effective Cartier divisors on } X\right\} \leftrightarrow \left\{\begin{array}{c}\textit{pairs } (\mathcal{L}, s) \textit{ consisting of an invertible} \\ \mathcal{O}_X\textit{-module and a regular global section}\end{array}\right\}$$

Proof. Omitted. □

Here is a way to produce effective Cartier divisors.

Lemma 26.9.18. *Let X be a scheme. Let $Z \subset X$ be a closed subscheme. The blow up $b : X' \to X$ of Z has the following properties:*

(1) *$b|_{b^{-1}(X \setminus Z)} : b^{-1}(X \setminus Z) \to X \setminus Z$ is an isomorphism, and*
(2) *$E = b^{-1}(Z)$ is an effective Cartier divisor on X'.*

Proof. Proof omitted. Here are some hints: If $X = Spec(A)$ and $Z = Spec(A/I)$, then $X' = \text{Proj}(\bigoplus_{n\geq 0} I^n)$. Write $S = \bigoplus_{n\geq 0} I^n$ as a graded ring. Pick an element $f \in I$ and denote $F \in S_1$ the corresponding element in degree one of S. It is clear that the standard opens $D_+(F)$ cover X' in this case. Each $D_+(F)$ is the spectrum of the ring $S_{(F)}$. Note that f is a nonzero divisor on $S_{(F)}$ since $fa/F^d = 0$ (some $a \in S_d$) implies also that Fa/F^{d+1} is zero. Moreover, $IS_{(F)}$ is generated by the elements $g = fG/F$ where $G \in S_1$ is the degree 1 element of S corresponding to g. Hence it is indeed the case that $IS_{(F)}$ is generated by a single nonzero divisor as desired. $\square$

26.10. Relative effective Cartier divisors

The following lemma shows that an effective Cartier divisor which is flat over the base is reall a ``family of effective Cartier divisors" over the base. For example the restriction to any fibre is an effective Cartier divisor.

Lemma 26.10.1. *Let $f : X \to S$ be a morphism of schemes. Let $D \subset X$ be a closed subscheme. Assume*

(1) *D is an effective Cartier divisor, and*
(2) *$D \to S$ is a flat morphism.*

Then for every morphism of schemes $g : S' \to S$ the pullback $(g')^{-1}D$ is an effective Cartier divisor on $X' = S' \times_S X$.

Proof. Using Lemma 26.9.2 we translate this as follows into algebra. Let $A \to B$ be a ring map and $h \in B$. Assume h is a nonzero divisor and that B/hB is flat over A. Then

$$0 \to B \xrightarrow{h} B \to B/hB \to 0$$

is a short exact sequence of A-modules with B/hB flat over A. By Algebra, Lemma 7.35.11 this sequence remains exact on tensoring over A with any module, in particular with any A-algebra A'. $\square$

This lemma is the motivation for the following definition.

Definition 26.10.2. Let $f : X \to S$ be a morphism of schemes. A *relative effective Cartier divisor* on X/S is an effective Cartier divisor $D \subset X$ such that $D \to S$ is a flat morphism of schemes.

We warn the reader that this may be nonstandard notation. In particular, in [**DG67**, IV, Section 21.15] the notion of a relative divisor is discussed only when $X \to S$ is flat and locally of finite presentation. Our definition is a bit more general. However, it turns out that if $x \in D$ then $X \to S$ is flat at x in many cases (but not always).

Lemma 26.10.3. *Let $f : X \to S$ be a morphism of schemes. Let $D \subset X$ be a relative effective Cartier divisor on X/S. If $x \in D$ and $\mathcal{O}_{X,x}$ is Noetherian, then f is flat at x.*

Proof. Set $A = \mathcal{O}_{S,f(x)}$ and $B = \mathcal{O}_{X,x}$. Let $h \in B$ be an element which generates the ideal of D. Then h is a nonzero divisor in B such that B/hB is a flat local A-algebra. Let $I \subset A$ be a finitely generated ideal. Consider the commutative diagram

$$\begin{tikzcd}
0 \arrow[r] & B \arrow[r, "h"'] & B \arrow[r] & B/hB \arrow[r] & 0 \\
0 \arrow[r] & B \otimes_A I \arrow[r, "h"] \arrow[u] & B \otimes_A I \arrow[r] \arrow[u] & B/hB \otimes_A I \arrow[r] \arrow[u] & 0
\end{tikzcd}$$

The lower sequence is short exact as B/hB is flat over A, see Algebra, Lemma 7.35.11. The right vertical arrow is injective as B/hB is flat over A, see Algebra, Lemma 7.35.4. Hence multiplication by h is surjective on the kernel K of the middle vertical arrow. By Nakayama's lemma, see Algebra, Lemma 7.14.5 we conclude that $K = 0$. Hence B is flat over A, see Algebra, Lemma 7.35.4. □

The following lemma relies on the algebraic version of openness of the flat locus. The scheme theoretic version can be found in More on Morphisms, Section 33.11.

Lemma 26.10.4. *Let $f : X \to S$ be a morphism of schemes. Let $D \subset X$ be a relative effective Cartier divisor. If f is locally of finite presentation, then there exists an open subscheme $U \subset X$ such that $D \subset U$ and such that $f|_U : U \to S$ is flat.*

Proof. Pick $x \in D$. It suffices to find an open neighbourhood $U \subset X$ of x such that $f|_U$ is flat. Hence the lemma reduces to the case that $X = Spec(B)$ and $S = Spec(A)$ are affine and that D is given by a nonzero divisor $h \in B$. By assumption B is a finitely presented A-algebra and B/hB is a flat A-algebra. We are going to use absolute Noetherian approximation.

Write $B = A[x_1, \ldots, x_n]/(g_1, \ldots, g_m)$. Assume h is the image of $h' \in A[x_1, \ldots, x_n]$. Choose a finite type $\mathbf{Z}$-subalgebra $A_0 \subset A$ such that all the coefficients of the polynomials $h', g_1, \ldots, g_m$ are in A_0. Then we can set $B_0 = A_0[x_1, \ldots, x_n]/(g_1, \ldots, g_m)$ and h_0 the image of h' in B_0. Then $B = B_0 \otimes_{A_0} A$. Set

$$J_0 = \{b \in B_0 \mid \exists n > 0,\ h_0^n b = 0\}$$

and $C_0 = B_0/J_0$. The image $\overline{h}_0$ of h_0 is a nonzero divisor in C_0 (see More on Algebra, Lemma 12.8.6). As h is a nonzero divisor in B we see that $B_0 \to B$ annihilates J_0. Hence the isomorphism $B_0 \otimes_{A_0} A \to B$ factors through the surjective map $B_0 \otimes_{A_0} A \to C_0 \otimes_{A_0} A$ whence also $C_0 \otimes_{A_0} A \cong B$. Thus the ring map $A \to B$ is approximated by the ring maps $A_0 \to C_0$. By Algebra, Lemma 7.120.5 we may, after enlarging A_0, assume that $C_0/\overline{h}_0 C_0$ is flat over A_0.

Set $f_0 : X_0 \to S_0$ equal to $Spec$ of the ring map $A_0 \to C_0$. Set $D_0 = Spec(C_0/\overline{h}_0 C_0)$. Since $B = C_0 \otimes_{A_0} A$, i.e., $X = X_0 \times_{S_0} S$, it now suffices to prove the lemma for $X_0 \to S_0$ and the relative effective Cartier divisor D_0, see Morphisms, Lemma 24.24.6. Hence we have reduced to the case where A is a Noetherian ring. In this case we know that the ring map $A \to B$ is flat at every prime $\mathfrak{q}$ of $V(h)$ by Lemma 26.10.3. Combined with the fact that the flat locus is open in this case, see Algebra, Theorem 7.120.4 we win. □

There is also the following lemma (whose idea is apparantly due to Michael Artin, see [**Nob77**]) which needs no finiteness assumptions at all.

Lemma 26.10.5. *Let $f : X \to S$ be a morphism of schemes. Let $D \subset X$ be a relative effective Cartier divisor on X/S. If f is flat at all points of $X \setminus D$, then f is flat.*

Proof. This translates into the following algebra fact: Let $A \to B$ be a ring map and $h \in B$. Assume h is a nonzero divisor, that B/hB is flat over A, and that the localization B_h is flat over A. Then B is flat over A. The reason is that we have a short exact sequence

$$0 \to B \to B_h \to colim_n (1/h^n)B/B \to 0$$

and that the second and third terms are flat over A, which implies that B is flat over A (see Algebra, Lemma 7.35.12). Note that a filtered colimit of flat modules is flat (see Algebra, Lemma 7.35.2) and that by induction on n each $(1/h^n)B/B \cong B/h^nB$ is flat over A since it fits into the short exact sequence

$$0 \to B/h^{n-1}B \xrightarrow{h} B/h^nB \to B/hB \to 0$$

Some details omitted. □

Example 26.10.6. Here is an example of a relative effective Cartier divisor D where the ambient scheme is not flat in a neighbourhood of D. Namely, let $A = k[t]$ and

$$B = k[t, x, y, x^{-1}y, x^{-2}y, \ldots]/(ty, tx^{-1}y, tx^{-2}y, \ldots)$$

Then B is not flat over A but $B/xB \cong A$ is flat over A. Moreover x is a nonzero divisor and hence defines a relative effective Cartier divisor in $Spec(B)$ over $Spec(A)$.

If the ambient scheme is flat and locally of finite presentation over the base, then we can characterize a relative effective Cartier divisor in terms of its fibres. See also More on Morphisms, Lemma 33.16.1 for a slightly different take on this lemma.

Lemma 26.10.7. *Let $\varphi : X \to S$ be a flat morphism which is locally of finite presentation. Let $Z \subset X$ be a closed subscheme. Let $x \in Z$ with image $s \in S$.*

1. *If $Z_s \subset X_s$ is a Cartier divisor in a neighbourhood of x, then there exists an open $U \subset X$ and a relative effective Cartier divisor $D \subset U$ such that $Z \cap U \subset D$.*
2. *If $Z_s \subset X_s$ is a Cartier divisor in a neighbourhood of x, the morphism $Z \to X$ is of finite presentation, and $Z \to S$ is flat at x, then we can choose U and D such that $Z \cap U = D$.*
3. *If $Z_s \subset X_s$ is a Cartier divisor in a neighbourhood of x and Z is a locally principal closed subscheme of X in a neighbourhood of x, then we can choose U and D such that $Z \cap U = D$.*

In particular, if $Z \to S$ is locally of finite presentation and flat and all fibres $Z_s \subset X_s$ are effective Cartier divisors, then Z is a relative effective Cartier divisor. Similarly, if Z is a locally principal closed subscheme of X such that all fibres $Z_s \subset X_s$ are effective Cartier divisors, then Z is a relative effective Cartier divisor.

Proof. Choose affine open neighbourhoods $Spec(A)$ of s and $Spec(B)$ of x such that $\varphi(Spec(B)) \subset Spec(A)$. Let $\mathfrak{p} \subset A$ be the prime ideal corresponding to s. Let $\mathfrak{q} \subset B$ be the prime ideal corresponding to x. Let $I \subset B$ be the ideal corresponding to Z. By the initial assumption of the lemma we know that $A \to B$ is flat and of finite presentation. The assumption in (1) means that, after shrinking $Spec(B)$, we may assume $I(B \otimes_A \kappa(\mathfrak{p}))$ is generated by a single element which is a nonzero divisor in $B \otimes_A \kappa(\mathfrak{p})$. Say $f \in I$ maps to this generator. We claim that after inverting an element $g \in B$, $g \notin \mathfrak{q}$ the closed subscheme $D = V(f) \subset Spec(B_g)$ is a relative effective Cartier divisor.

By Algebra, Lemma 7.120.5 we can find a flat finite type ring map $A_0 \to B_0$ of Noetherian rings, an element $f_0 \in B_0$, a ring map $A_0 \to A$ and an isomorphism $A \otimes_{A_0} B_0 \cong B$. If $\mathfrak{p}_0 = A_0 \cap \mathfrak{p}$ then we see that

$$B \otimes_A \kappa(\mathfrak{p}) = \left(B_0 \otimes_{A_0} \kappa(\mathfrak{p}_0)\right) \otimes_{\kappa(\mathfrak{p}_0))} \kappa(\mathfrak{p})$$

hence f_0 is a nonzero divisor in $B_0 \otimes_{A_0} \kappa(\mathfrak{p}_0)$. By Algebra, Lemma 7.91.2 we see that f_0 is a nonzero divisor in $(B_0)_{\mathfrak{q}_0}$ where $\mathfrak{q}_0 = B_0 \cap \mathfrak{q}$ and that $(B_0/f_0B_0)_{\mathfrak{q}_0}$ is flat over A_0. Hence by Algebra, Lemma 7.65.8 and Algebra, Theorem 7.120.4 there exists a $g_0 \in B_0$, $g_0 \notin \mathfrak{q}_0$ such that f_0 is a nonzero divisor in $(B_0)_{g_0}$ and such that $(B_0/f_0B_0)_{g_0}$ is flat over A_0. Hence we see that $D_0 = V(f_0) \subset Spec((B_0)_{g_0})$ is a relative effective Cartier divisor. Since we know that this property is preserved under base change, see Lemma 26.10.1, we obtain the claim mentioned above with g equal to the image of g_0 in B.

At this point we have proved (1). To see (2) consider the closed immersion $Z \to D$. The surjective ring map $u : \mathcal{O}_{D,x} \to \mathcal{O}_{Z,x}$ is a map of flat local $\mathcal{O}_{S,s}$-algebras which are essentially of finite presentation, and which becomes an isomorphisms after dividing by $\mathfrak{m}_s$. Hence it is an isomorphism, see Algebra, Lemma 7.119.4. It follows that $Z \to D$ is an isomorphism in a neighbourhood of x, see Algebra, Lemma 7.117.6. To see (3), after possibly shrinking U we may assume that the ideal of D is generated by a single nonzero divisor f and the ideal of Z is generated by an element g. Then $f = gh$. But $g|_{U_s}$ and $f|_{U_s}$ cut out the same effective Cartier divisor in a neighbourhood of x. Hence $h|_{X_s}$ is a unit in $\mathcal{O}_{X_s,x}$, hence h is a unit in $\mathcal{O}_{X,x}$ hence h is a unit in an open neighbourhood of x. I.e., $Z \cap U = D$ after shrinking U.

The final statements of the lemma follow immediately from parts (2) and (3), combined with the fact that $Z \to S$ is locally of finite presentation if and only if $Z \to X$ is of finite presentation, see Morphisms, Lemmas 24.20.3 and 24.20.11. □

26.11. The normal cone of an immersion

Let $i : Z \to X$ be a closed immersion. Let $\mathcal{I} \subset \mathcal{O}_X$ be the corresponding quasi-coherent sheaf of ideals. Consider the quasi-coherent sheaf of graded $\mathcal{O}_X$-algebras $\bigoplus_{n\geq 0} \mathcal{I}^n/\mathcal{I}^{n+1}$. Since the sheaves $\mathcal{I}^n/\mathcal{I}^{n+1}$ are each annihilated by $\mathcal{I}$ this graded algebra corresponds to a quasi-coherent sheaf of graded $\mathcal{O}_Z$-algebras by Morphisms, Lemma 24.3.1. This quasi-coherent graded $\mathcal{O}_Z$-algebra is called the *conormal algebra of Z in X* and is often simply denoted $\bigoplus_{n\geq 0} \mathcal{I}^n/\mathcal{I}^{n+1}$ by the abuse of notation mentioned in Morphisms, Section 24.3.

Let $f : Z \to X$ be an immersion. We define the conormal algebra of f as the conormal sheaf of the closed immersion $i : Z \to X \setminus \partial Z$, where $\partial Z = \overline{Z} \setminus Z$. It is often denoted $\bigoplus_{n\geq 0} \mathcal{I}^n/\mathcal{I}^{n+1}$ where $\mathcal{I}$ is the ideal sheaf of the closed immersion $i : Z \to X \setminus \partial Z$.

Definition 26.11.1. Let $f : Z \to X$ be an immersion. The *conormal algebra $\mathcal{C}_{Z/X,*}$ of Z in X* or the *conormal algebra of f* is the quasi-coherent sheaf of graded $\mathcal{O}_Z$-algebras $\bigoplus_{n\geq 0} \mathcal{I}^n/\mathcal{I}^{n+1}$ described above.

Thus $\mathcal{C}_{Z/X,1} = \mathcal{C}_{Z/X}$ is the conormal sheaf of the immersion. Also $\mathcal{C}_{Z/X,0} = \mathcal{O}_Z$ and $\mathcal{C}_{Z/X,n}$ is a quasi-coherent $\mathcal{O}_Z$-module characterized by the property

$$i_*\mathcal{C}_{Z/X,n} = \mathcal{I}^n/\mathcal{I}^{n+1} \tag{26.11.1.1}$$

where $i : Z \to X \setminus \partial Z$ and $\mathcal{I}$ is the ideal sheaf of i as above. Finally, note that there is a canonical surjective map

$$\mathrm{Sym}^*(\mathcal{C}_{Z/X}) \longrightarrow \mathcal{C}_{Z/X,*} \tag{26.11.1.2}$$

of quasi-coherent graded $\mathcal{O}_Z$-algebras which is an isomorphism in degrees 0 and 1.

Lemma 26.11.2. *Let $i : Z \to X$ be an immersion. The conormal algebra of i has the following properties:*

(1) *Let $U \subset X$ be any open such that $i(Z)$ is a closed subset of U. Let $\mathcal{I} \subset \mathcal{O}_U$ be the sheaf of ideals corresponding to the closed subscheme $i(Z) \subset U$. Then*
$$\mathcal{C}_{Z/X,*} = i^*\left(\bigoplus\nolimits_{n\geq 0} \mathcal{I}^n\right) = i^{-1}\left(\bigoplus\nolimits_{n\geq 0} \mathcal{I}^n/\mathcal{I}^{n+1}\right)$$
(2) *For any affine open $Spec(R) = U \subset X$ such that $Z \cap U = Spec(R/I)$ there is a canonical isomorphism $\Gamma(Z \cap U, \mathcal{C}_{Z/X,*}) = \bigoplus_{n\geq 0} I^n/I^{n+1}$.*

Proof. Mostly clear from the definitions. Note that given a ring R and an ideal I of R we have $I^n/I^{n+1} = I^n \otimes_R R/I$. Details omitted. $\square$

Lemma 26.11.3. *Let*

$$\begin{tikzcd} Z \arrow[r, "i"] \arrow[d, "f"'] & X \arrow[d, "g"] \\ Z' \arrow[r, "i'"] & X' \end{tikzcd}$$

be a commutative diagram in the category of schemes. Assume i, i' immersions. There is a canonical map of graded $\mathcal{O}_Z$-algebras

$$f^*\mathcal{C}_{Z'/X',*} \longrightarrow \mathcal{C}_{Z/X,*}$$

characterized by the following property: For every pair of affine opens $(Spec(R) = U \subset X, Spec(R') = U' \subset X')$ with $f(U) \subset U'$ such that $Z \cap U = Spec(R/I)$ and $Z' \cap U' = Spec(R'/I')$ the induced map

$$\Gamma(Z' \cap U', \mathcal{C}_{Z'/X',*}) = \bigoplus (I')^n/(I')^{n+1} \longrightarrow \bigoplus\nolimits_{n\geq 0} I^n/I^{n+1} = \Gamma(Z \cap U, \mathcal{C}_{Z/X,*})$$

is the one induced by the ring map $f^\sharp : R' \to R$ which has the property $f^\sharp(I') \subset I$.

Proof. Let $\partial Z' = \overline{Z'} \setminus Z'$ and $\partial Z = \overline{Z} \setminus Z$. These are closed subsets of X' and of X. Replacing X' by $X' \setminus \partial Z'$ and X by $X \setminus \left(g^{-1}(\partial Z') \cup \partial Z\right)$ we see that we may assume that i and i' are closed immersions.

The fact that $g \circ i$ factors through i' implies that $g^*\mathcal{I}'$ maps into $\mathcal{I}$ under the canonical map $g^*\mathcal{I}' \to \mathcal{O}_X$, see Schemes, Lemmas 21.4.6 and 21.4.7. Hence we get an induced map of quasi-coherent sheaves $g^*((\mathcal{I}')^n/(\mathcal{I}')^{n+1}) \to \mathcal{I}^n/\mathcal{I}^{n+1}$. Pulling back by i gives $i^*g^*((\mathcal{I}')^n/(\mathcal{I}')^{n+1}) \to i^*(\mathcal{I}^n/\mathcal{I}^{n+1})$. Note that $i^*(\mathcal{I}^n/\mathcal{I}^{n+1}) = \mathcal{C}_{Z/X,n}$. On the other hand, $i^*g^*((\mathcal{I}')^n/(\mathcal{I}')^{n+1}) = f^*(i')^*((\mathcal{I}')^n/(\mathcal{I}')^{n+1}) = f^*\mathcal{C}_{Z'/X',n}$. This gives the desired map.

Checking that the map is locally described as the given map $(I')^n/(I')^{n+1} \to I^n/I^{n+1}$ is a matter of unwinding the definitions and is omitted. Another observation is that given any $x \in i(Z)$ there do exist affine open neighbourhoods U, U' with $f(U) \subset U'$ and $Z \cap U$ as well as $U' \cap Z'$ closed such that $x \in U$. Proof omitted. Hence the requirement of the lemma indeed characterizes the map (and could have been used to define it). $\square$

Lemma 26.11.4. *Let*

$$\begin{tikzcd} Z \arrow[r, "i"] \arrow[d, "f"'] & X \arrow[d, "g"] \\ Z' \arrow[r, "i'"] & X' \end{tikzcd}$$

be a fibre product diagram in the category of schemes with i, i' immersions. Then the canonical map $f^*\mathcal{C}_{Z'/X',*} \to \mathcal{C}_{Z/X,*}$ of Lemma 26.11.3 is surjective. If g is flat, then it is an isomorphism.

Proof. Let $R' \to R$ be a ring map, and $I' \subset R'$ an ideal. Set $I = I'R$. Then $(I')^n/(I')^{n+1} \otimes_{R'} R \to I^n/I^{n+1}$ is surjective. If $R' \to R$ is flat, then $I^n = (I')^n \otimes_{R'} R$ and we see the map is an isomorphism. $\square$

Definition 26.11.5. Let $i : Z \to X$ be an immersion of schemes. The *normal cone* C_ZX of Z in X is

$$C_ZX = \underline{Spec}_Z(\mathcal{C}_{Z/X,*})$$

see Constructions, Definitions 22.7.1 and 22.7.2. The *normal bundle* of Z in X is the vector bundle

$$N_Z X = \underline{Spec}_Z(\mathrm{Sym}(\mathcal{C}_{Z/X}))$$

see Constructions, Definitions 22.6.1 and 22.6.2.

Thus $C_Z X \to Z$ is a cone over Z and $N_Z X \to Z$ is a vector bundle over Z (recall that in our terminology this does not imply that the conormal sheaf is a finite locally free sheaf). Moreover, the canonical surjection (26.11.1.2) of graded algebras defines a canonical closed immersion

$$C_Z X \longrightarrow N_Z X \tag{26.11.5.1}$$

of cones over Z.

26.12. Regular ideal sheaves

In this section we generalize the notion of an effective Cartier divisor to higher codimension. Recall that a sequence of elements $f_1, \ldots, f_r$ of a ring R is a *regular sequence* if for each $i = 1, \ldots, r$ the element f_i is a nonzero divisor on $R/(f_1, \ldots, f_{i-1})$ and $R/(f_1, \ldots, f_r) \neq 0$, see Algebra, Definition 7.65.1. There are three closely related weaker conditions that we can impose. The first is to assume that $f_1, \ldots, f_r$ is a *Koszul-regular sequence*, i.e., that $H_i(K_\bullet(f_1, \ldots, f_r)) = 0$ for $i > 0$, see More on Algebra, Definition 12.22.1. The sequence is called an *H_1-regular sequence* if $H_1(K_\bullet(f_1, \ldots, f_r)) = 0$. Another condition we can impose is that with $J = (f_1, \ldots, f_r)$, the map

$$R/J[T_1, \ldots, T_r] \longrightarrow \bigoplus\nolimits_{n \geq 0} J^n/J^{n+1}$$

which maps T_i to $f_i \bmod J^2$ is an isomorphism. In this case we say that $f_1, \ldots, f_r$ is a *quasi-regular sequence*, see Algebra, Definition 7.66.1. Given an R-module M there is also a notion of M-regular and M-quasi-regular sequence.

We can generalize this to the case of ringed spaces as follows. Let X be a ringed space and let $f_1, \ldots, f_r \in \Gamma(X, \mathcal{O}_X)$. We say that $f_1, \ldots, f_r$ is a *regular sequence* if for each $i = 1, \ldots, r$ the map

$$f_i : \mathcal{O}_X/(f_1, \ldots, f_{i-1}) \longrightarrow \mathcal{O}_X/(f_1, \ldots, f_{i-1}) \tag{26.12.0.2}$$

is an injective map of sheaves. We say that $f_1, \ldots, f_r$ is a *Koszul-regular sequence* if the Koszul complex

$$K_\bullet(\mathcal{O}_X, f_\bullet), \tag{26.12.0.3}$$

see Modules, Definition 15.20.2, is acyclic in degrees > 0. We say that $f_1, \ldots, f_r$ is a *H_1-regular sequence* if the Koszul complex $K_\bullet(\mathcal{O}_X, f_\bullet)$ is exact in degree 1. Finally, we say that $f_1, \ldots, f_r$ is a *quasi-regular* sequence if the map

$$\mathcal{O}_X/\mathcal{J}[T_1, \ldots, T_r] \longrightarrow \bigoplus\nolimits_{d \geq 0} \mathcal{J}^d/\mathcal{J}^{d+1} \tag{26.12.0.4}$$

is an isomorphism of sheaves where $\mathcal{J} \subset \mathcal{O}_X$ is the sheaf of ideals generated by $f_1, \ldots, f_r$. (There is also a notion of $\mathcal{F}$-regular and $\mathcal{F}$-quasi-regular sequence for a given $\mathcal{O}_X$-module $\mathcal{F}$ which we will introduce here if we ever need it.)

Lemma 26.12.1. *Let X be a ringed space. Let $f_1, \ldots, f_r \in \Gamma(X, \mathcal{O}_X)$. We have the following implications $f_1, \ldots, f_r$ is a regular sequence $\Rightarrow$ $f_1, \ldots, f_r$ is a Koszul-regular sequence $\Rightarrow$ $f_1, \ldots, f_r$ is an H_1-regular sequence $\Rightarrow$ $f_1, \ldots, f_r$ is a quasi-regular sequence.*

Proof. Since we may check exactness at stalks, a sequence $f_1, \ldots, f_r$ is a regular sequence if and only if the maps

$$f_i : \mathcal{O}_{X,x}/(f_1, \ldots, f_{i-1}) \longrightarrow \mathcal{O}_{X,x}/(f_1, \ldots, f_{i-1})$$

are injective for all $x \in X$. In other words, the image of the sequence $f_1, \ldots, f_r$ in the ring $\mathcal{O}_{X,x}$ is a regular sequence for all $x \in X$. The other types of regularity can be checked stalkwise as well (details omitted). Hence the implications follow from More on Algebra, Lemmas 12.22.2 and 12.22.5. $\square$

Definition 26.12.2. Let X be a ringed space. Let $\mathcal{J} \subset \mathcal{O}_X$ be a sheaf of ideals.

(1) We say $\mathcal{J}$ is *regular* if for every $x \in \text{Supp}(\mathcal{O}_X/\mathcal{J})$ there exists an open neighbourhood $x \in U \subset X$ and a regular sequence $f_1, \ldots, f_r \in \mathcal{O}_X(U)$ such that $\mathcal{J}|_U$ is generated by $f_1, \ldots, f_r$.
(2) We say $\mathcal{J}$ is *Koszul-regular* if for every $x \in \text{Supp}(\mathcal{O}_X/\mathcal{J})$ there exists an open neighbourhood $x \in U \subset X$ and a Koszul-regular sequence $f_1, \ldots, f_r \in \mathcal{O}_X(U)$ such that $\mathcal{J}|_U$ is generated by $f_1, \ldots, f_r$.
(3) We say $\mathcal{J}$ is *H_1-regular* if for every $x \in \text{Supp}(\mathcal{O}_X/\mathcal{J})$ there exists an open neighbourhood $x \in U \subset X$ and a H_1-regular sequence $f_1, \ldots, f_r \in \mathcal{O}_X(U)$ such that $\mathcal{J}|_U$ is generated by $f_1, \ldots, f_r$.
(4) We say $\mathcal{J}$ is *quasi-regular* if for every $x \in \text{Supp}(\mathcal{O}_X/\mathcal{J})$ there exists an open neighbourhood $x \in U \subset X$ and a quasi-regular sequence $f_1, \ldots, f_r \in \mathcal{O}_X(U)$ such that $\mathcal{J}|_U$ is generated by $f_1, \ldots, f_r$.

Many properties of this notion immediately follow from the corresponding notions for regular and quasi-regular sequences in rings.

Lemma 26.12.3. *Let X be a ringed space. Let $\mathcal{J}$ be a sheaf of ideals. We have the following implications: $\mathcal{J}$ is regular $\Rightarrow$ $\mathcal{J}$ is Koszul-regular $\Rightarrow$ $\mathcal{J}$ is H_1-regular $\Rightarrow$ $\mathcal{J}$ is quasi-regular.*

Proof. The lemma immediately reduces to Lemma 26.12.1. $\square$

Lemma 26.12.4. *Let X be a locally ringed space. Let $\mathcal{J} \subset \mathcal{O}_X$ be a sheaf of ideals. Then $\mathcal{J}$ is quasi-regular if and only if the following conditions are satisfied:*

(1) *$\mathcal{J}$ is an $\mathcal{O}_X$-module of finite type,*
(2) *$\mathcal{J}/\mathcal{J}^2$ is a finite locally free $\mathcal{O}_X/\mathcal{J}$-module, and*
(3) *the canonical maps*

$$Sym^n_{\mathcal{O}_X/\mathcal{J}}(\mathcal{J}/\mathcal{J}^2) \longrightarrow \mathcal{J}^n/\mathcal{J}^{n+1}$$

are isomorphisms for all $n \geq 0$.

Proof. It is clear that if $U \subset X$ is an open such that $\mathcal{J}|_U$ is generated by a quasi-regular sequence $f_1, \ldots, f_r \in \mathcal{O}_X(U)$ then $\mathcal{J}|_U$ is of finite type, $\mathcal{J}|_U/\mathcal{J}^2|_U$ is free with basis $f_1, \ldots, f_r$, and the maps in (3) are isomorphisms because they are coordinate free formulation of the degree n part of (26.12.0.4). Hence it is clear that being quasi-regular implies conditions (1), (2), and (3).

Conversely, suppose that (1), (2), and (3) hold. Pick a point $x \in \text{Supp}(\mathcal{O}_X/\mathcal{J})$. Then there exists a neighbourhood $U \subset X$ of x such that $\mathcal{J}|_U/\mathcal{J}^2|_U$ is free of rank r over $\mathcal{O}_U/\mathcal{J}|_U$. After possibly shrinking U we may assume there exist $f_1, \ldots, f_r \in \mathcal{J}(U)$ which map to a basis of $\mathcal{J}|_U/\mathcal{J}^2|_U$ as an $\mathcal{O}_U/\mathcal{J}|_U$-module. In particular we see that the images of $f_1, \ldots, f_r$ in $\mathcal{J}_x/\mathcal{J}_x^2$ generate. Hence by Nakayama's lemma (Algebra, Lemma 7.14.5) we see that $f_1, \ldots, f_r$ generate the stalk $\mathcal{J}_x$. Hence, since $\mathcal{J}$ is of finite type, by Modules, Lemma

15.9.4 after shrinking U we may assume that $f_1, \ldots, f_r$ generate $\mathcal{J}$. Finally, from (3) and the isomorphism $\mathcal{J}|_U/\mathcal{J}^2|_U = \bigoplus \mathcal{O}_U/\mathcal{J}|_U f_i$ it is clear that $f_1, \ldots, f_r \in \mathcal{O}_X(U)$ is a quasi-regular sequence. $\square$

Lemma 26.12.5. *Let $(X, \mathcal{O}_X)$ be a locally ringed space. Let $\mathcal{J} \subset \mathcal{O}_X$ be a sheaf of ideals. Let $x \in X$ and $f_1, \ldots, f_r \in \mathcal{J}_x$ whose images give a basis for the $\kappa(x)$-vector space $\mathcal{J}_x/\mathfrak{m}_x\mathcal{J}_x$.*

1. *If $\mathcal{J}$ is quasi-regular, then there exists an open neighbourhood such that $f_1, \ldots, f_r \in \mathcal{O}_X(U)$ form a quasi-regular sequence generating $\mathcal{J}|_U$.*
2. *If $\mathcal{J}$ is H_1-regular, then there exists an open neighbourhood such that $f_1, \ldots, f_r \in \mathcal{O}_X(U)$ form an H_1-regular sequence generating $\mathcal{J}|_U$.*
3. *If $\mathcal{J}$ is Koszul-regular, then there exists an open neighbourhood such that $f_1, \ldots, f_r \in \mathcal{O}_X(U)$ form an Koszul-regular sequence generating $\mathcal{J}|_U$.*

Proof. First assume that $\mathcal{J}$ is quasi-regular. We may choose an open neighbourhood $U \subset X$ of x and a quasi-regular sequence $g_1, \ldots, g_s \in \mathcal{O}_X(U)$ which generates $\mathcal{J}|_U$. Note that this implies that $\mathcal{J}/\mathcal{J}^2$ is free of rank s over $\mathcal{O}_U/\mathcal{J}|_U$ (see Lemma 26.12.4 and its proof) and hence $r = s$. We may shrink U and assume $f_1, \ldots, f_r \in \mathcal{J}(U)$. Thus we may write

$$f_i = \sum a_{ij} g_j$$

for some $a_{ij} \in \mathcal{O}_X(U)$. By assumption the matrix $A = (a_{ij})$ maps to an invertible matrix over $\kappa(x)$. Hence, after shrinking U once more, we may assume that (a_{ij}) is invertible. Thus we see that $f_1, \ldots, f_r$ give a basis for $(\mathcal{J}/\mathcal{J}^2)|_U$ which proves that $f_1, \ldots, f_r$ is a quasi-regular sequence over U.

Note that in order to prove (2) and (3) we may, because the assumptions of (2) and (3) are stronger than the assumption in (1), already assume that $f_1, \ldots, f_r \in \mathcal{J}(U)$ and $f_i = \sum a_{ij} g_j$ with (a_{ij}) invertible as above, where now $g_1, \ldots, g_r$ is a H_1-regular or Koszul-regular sequence. Since the Koszul complex on $f_1, \ldots, f_r$ is isomorphic to the Koszul complex on $g_1, \ldots, g_r$ via the matrix (a_{ij}) (see More on Algebra, Lemma 12.21.4) we conclude that $f_1, \ldots, f_r$ is H_1-regular or Koszul-regular as desired. $\square$

Lemma 26.12.6. *Any regular, Koszul-regular, H_1-regular, or quasi-regular sheaf of ideals on a scheme is a finite type quasi-coherent sheaf of ideals.*

Proof. This follows as such a sheaf of ideals is locally generated by finitely many sections. And any sheaf of ideals locally generated by sections on a scheme is quasi-coherent, see Schemes, Lemma 21.10.1. $\square$

Lemma 26.12.7. *Let X be a scheme. Let $\mathcal{J}$ be a sheaf of ideals. Then $\mathcal{J}$ is regular (resp. Koszul-regular, H_1-regular, quasi-regular) if and only if for every $x \in Supp(\mathcal{O}_X/\mathcal{J})$ there exists an affine open neighbourhood $x \in U \subset X$, $U = Spec(A)$ such that $\mathcal{J}|_U = \tilde{I}$ and such that I is generated by a regular (resp. Koszul-regular, H_1-regular, quasi-regular) sequence $f_1, \ldots, f_r \in A$.*

Proof. By assumption we can find an open neighbourhood U of x over which $\mathcal{J}$ is generated by a regular (resp. Koszul-regular, H_1-regular, quasi-regular) sequence $f_1, \ldots, f_r \in \mathcal{O}_X(U)$. After shrinking U we may assume that U is affine, say $U = Spec(A)$. Since $\mathcal{J}$ is quasi-coherent by Lemma 26.12.6 we see that $\mathcal{J}|_U = \tilde{I}$ for some ideal $I \subset A$. Now we can use the fact that

$$\tilde{\ } : \text{Mod}_A \longrightarrow QCoh(U)$$

is an equivalence of categories which preserves exactness. For example the fact that the functions f_i generate $\mathcal{J}$ means that the f_i, seen as elements of A generate I. The fact that (26.12.0.2) is injective (resp. (26.12.0.3) is exact, (26.12.0.3) is exact in degree 1, (26.12.0.4) is an isomorphism) implies the correponding property of the map $A/(f_1, \ldots, f_{i-1}) \to A/(f_1, \ldots, f_{i-1})$ (resp. the complex $K_\bullet(A, f_1, \ldots, f_r)$, the map $A/I[T_1, \ldots, T_r] \to \bigoplus I^n/I^{n+1}$). Thus $f_1, \ldots, f_r \in A$ is a regular (resp. Koszul-regular, H_1-regular, quasi-regular) sequence of the ring A. □

Lemma 26.12.8. *Let X be a locally Noetherian scheme. Let $\mathcal{J} \subset \mathcal{O}_X$ be a quasi-coherent sheaf of ideals. Let x be a point of the support of $\mathcal{O}_X/\mathcal{J}$. The following are equivalent*

(1) *$\mathcal{J}_x$ is generated by a regular sequence in $\mathcal{O}_{X,x}$,*
(2) *$\mathcal{J}_x$ is generated by a Koszul-regular sequence in $\mathcal{O}_{X,x}$,*
(3) *$\mathcal{J}_x$ is generated by an H_1-regular sequence in $\mathcal{O}_{X,x}$,*
(4) *$\mathcal{J}_x$ is generated by a quasi-regular sequence in $\mathcal{O}_{X,x}$,*
(5) *there exists an affine neighbourhood $U = Spec(A)$ of x such that $\mathcal{J}|_U = \tilde{I}$ and I is generated by a regular sequence in A, and*
(6) *there exists an affine neighbourhood $U = Spec(A)$ of x such that $\mathcal{J}|_U = \tilde{I}$ and I is generated by a Koszul-regular sequence in A, and*
(7) *there exists an affine neighbourhood $U = Spec(A)$ of x such that $\mathcal{J}|_U = \tilde{I}$ and I is generated by an H_1-regular sequence in A, and*
(8) *there exists an affine neighbourhood $U = Spec(A)$ of x such that $\mathcal{J}|_U = \tilde{I}$ and I is generated by a quasi-regular sequence in A,*
(9) *there exists a neighbourhood U of x such that $\mathcal{J}|_U$ is regular, and*
(10) *there exists a neighbourhood U of x such that $\mathcal{J}|_U$ is Koszul-regular, and*
(11) *there exists a neighbourhood U of x such that $\mathcal{J}|_U$ is H_1-regular, and*
(12) *there exists a neighbourhood U of x such that $\mathcal{J}|_U$ is quasi-regular.*

In particular, on a locally Noetherian scheme the notions of regular, Koszul-regular, H_1-regular, or quasi-regular ideal sheaf all agree.

Proof. It follows from Lemma 26.12.7 that (5) ⇔ (9), (6) ⇔ (10), (7) ⇔ (11), and (8) ⇔ (12). It is clear that (5) ⇒ (1), (6) ⇒ (2), (7) ⇒ (3), and (8) ⇒ (4). We have (1) ⇒ (5) by Algebra, Lemma 7.65.8. We have (9) ⇒ (10) ⇒ (11) ⇒ (12) by Lemma 26.12.3. Finally, (4) ⇒ (1) by Algebra, Lemma 7.66.6. Now all 12 statements are equivalent. □

26.13. Regular immersions

Let $i : Z \to X$ be an immersion of schemes. By definition this means there exists an open subscheme $U \subset X$ such that Z is identified with a closed subscheme of U. Let $\mathcal{I} \subset \mathcal{O}_U$ be the corresponding quasi-coherent sheaf of ideals. Suppose $U' \subset X$ is a second such open subscheme, and denote $\mathcal{I}' \subset \mathcal{O}_{U'}$ the corresponding quasi-coherent sheaf of ideals. Then $\mathcal{I}|_{U \cap U'} = \mathcal{I}'|_{U \cap U'}$. Moreover, the support of $\mathcal{O}_U/\mathcal{I}$ is Z which is contained in $U \cap U'$ and is also the support of $\mathcal{O}_{U'}/\mathcal{I}'$. Hence it follows from Definition 26.12.2 that $\mathcal{I}$ is a regular ideal if and only if $\mathcal{I}'$ is a regular ideal. Similarly for being Koszul-regular, H_1-regular, or quasi-regular.

Definition 26.13.1. Let $i : Z \to X$ be an immersion of schemes. Choose an open subscheme $U \subset X$ such that i identifies Z with a closed subscheme of U and denote $\mathcal{I} \subset \mathcal{O}_U$ the corresponding quasi-coherent sheaf of ideals.

(1) We say i is a *regular immersion* if $\mathcal{I}$ is regular.
(2) We say i is a *Koszul-regular immersion* if $\mathcal{I}$ is Koszul-regular.

(3) We say i is a *H_1-regular immersion* if $\mathcal{I}$ is H_1-regular.
(4) We say i is a *quasi-regular immersion* if $\mathcal{I}$ is quasi-regular.

The discussion above shows that this is independent of the choice of U. The conditions are listed in decreasing order of strength, see Lemma 26.13.2. A Koszul-regular closed immersion is smooth locally a regular immersion, see Lemma 26.13.11. In the locally Noetherian case all four notions agree, see Lemma 26.12.8.

Lemma 26.13.2. *Let $i : Z \to X$ be an immersion of schemes. We have the following implications: i is regular $\Rightarrow$ i is Koszul-regular $\Rightarrow$ i is H_1-regular $\Rightarrow$ i is quasi-regular.*

Proof. The lemma immediately reduces to Lemma 26.12.3. ☐

Lemma 26.13.3. *Let $i : Z \to X$ be an immersion of schemes. Assume X is locally Noetherian. Then i is regular $\Leftrightarrow$ i is Koszul-regular $\Leftrightarrow$ i is H_1-regular $\Leftrightarrow$ i is quasi-regular.*

Proof. Follows immediately from Lemma 26.13.2 and Lemma 26.12.8. ☐

Lemma 26.13.4. *Let $i : Z \to X$ be a regular (resp. Koszul-regular, H_1-regular, quasi-regular) immersion. Let $X' \to X$ be a flat morphism. Then the base change $i' : Z \times_X X' \to X'$ is a regular (resp. Koszul-regular, H_1-regular, quasi-regular) immersion.*

Proof. Via Lemma 26.12.7 this translates into the algebraic statements in Algebra, Lemmas 7.65.7 and 7.66.3 and More on Algebra, Lemma 12.22.4. ☐

Lemma 26.13.5. *Let $i : Z \to X$ be an immersion of schemes. Then i is a quasi-regular immersion if and only if the following conditions are satisfied*

(1) *i is locally of finite presentation,*
(2) *the conormal sheaf $\mathcal{C}_{Z/X}$ is finite locally free, and*
(3) *the map (26.11.1.2) is an isomorphism.*

Proof. An open immersion is locally of finite presentation. Hence we may replace X by an open subscheme $U \subset X$ such that i identifies Z with a closed subscheme of U, i.e., we may assume that i is a closed immersion. Let $\mathcal{I} \subset \mathcal{O}_X$ be the corresponding quasi-coherent sheaf of ideals. Recall, see Morphisms, Lemma 24.20.7 that $\mathcal{I}$ is of finite type if and only if i is locally of finite presentation. Hence the equivalence follows from Lemma 26.12.4 and unwinding the definitions. ☐

Lemma 26.13.6. *Let $Z \to Y \to X$ be immersions of schemes. Assume that $Z \to Y$ is H_1-regular. Then the canonical sequence of Morphisms, Lemma 24.31.5*

$$0 \to i^*\mathcal{C}_{Y/X} \to \mathcal{C}_{Z/X} \to \mathcal{C}_{Z/Y} \to 0$$

is exact and locally split.

Proof. Since $\mathcal{C}_{Z/Y}$ is finite locally free (see Lemma 26.13.5 and Lemma 26.12.3) it suffices to prove that the sequence is exact. By what was proven in Morphisms, Lemma 24.31.5 it suffices to show that the first map is injective. Working affine locally this reduces to the following question: Suppose that we have a ring A and ideals $I \subset J \subset A$. Assume that $J/I \subset A/I$ is generated by an H_1-regular sequence. Does this imply that $I/I^2 \otimes_A A/J \to J/J^2$ is injective? Note that $I/I^2 \otimes_A A/J = I/IJ$. Hence we are trying to prove that $I \cap J^2 = IJ$. This is the result of More on Algebra, Lemma 12.22.7. ☐

A composition of quasi-regular immersions may not be quasi-regular, see Algebra, Remark 7.66.8. The other types of regular immersions are preserved under composition.

Lemma 26.13.7. *Let $i : Z \to Y$ and $j : Y \to X$ be immersions of schemes.*

(1) *If i and j are regular immersions, so is $j \circ i$.*
(2) *If i and j are Koszul-regular immersions, so is $j \circ i$.*
(3) *If i and j are H_1-regular immersions, so is $j \circ i$.*
(4) *If i is an H_1-regular immersion and j is a quasi-regular immersion, then $j \circ i$ is a quasi-regular immersion.*

Proof. The algebraic version of (1) is Algebra, Lemma 7.65.9. The algebraic version of (2) is More on Algebra, Lemma 12.22.11. The algebraic version of (3) is More on Algebra, Lemma 12.22.9. The algebraic version of (4) is More on Algebra, Lemma 12.22.8. □

Lemma 26.13.8. *Let $i : Z \to Y$ and $j : Y \to X$ be immersions of schemes. Assume that the sequence*

$$0 \to i^*\mathcal{C}_{Y/X} \to \mathcal{C}_{Z/X} \to \mathcal{C}_{Z/Y} \to 0$$

of Morphisms, Lemma 24.31.5 is exact and locally split.

(1) *If $j \circ i$ is a quasi-regular immersion, so is i.*
(2) *If $j \circ i$ is a H_1-regular immersion, so is i.*
(3) *If both j and $j \circ i$ are Koszul-regular immersions, so is i.*

Proof. After shrinking Y and X we may assume that i and j are closed immersions. Denote $\mathcal{I} \subset \mathcal{O}_X$ the ideal sheaf of Y and $\mathcal{J} \subset \mathcal{O}_X$ the ideal sheaf of Z. The conormal sequence is $0 \to \mathcal{I}/\mathcal{I}\mathcal{J} \to \mathcal{J}/\mathcal{J}^2 \to \mathcal{J}/(\mathcal{I} + \mathcal{J}^2) \to 0$. Let $z \in Z$ and set $y = i(z)$, $x = j(y) = j(i(z))$. Choose $f_1, \ldots, f_n \in \mathcal{I}_x$ which map to a basis of $\mathcal{I}_x/\mathfrak{m}_z\mathcal{I}_x$. Extend this to $f_1, \ldots, f_n, g_1, \ldots, g_m \in \mathcal{J}_x$ which map to a basis of $\mathcal{J}_x/\mathfrak{m}_z\mathcal{J}_x$. This is possible as we have assumed that the sequence of conormal sheaves is split in a neighbourhood of z, hence $\mathcal{I}_x/\mathfrak{m}_x\mathcal{I}_x \to \mathcal{J}_x/\mathfrak{m}_x\mathcal{J}_x$ is injective.

Proof of (1). By Lemma 26.12.5 we can find an affine open neighbourhood U of x such that $f_1, \ldots, f_n, g_1, \ldots, g_m$ forms a quasi-regular sequence generating $\mathcal{J}$. Hence by Algebra, Lemma 7.66.5 we see that $g_1, \ldots, g_m$ induces a quasi-regular sequence on $Y \cap U$ cutting out Z.

Proof of (2). Exactly the same as the proof of (1) except using More on Algebra, Lemma 12.22.10.

Proof of (3). By Lemma 26.12.5 (applied twice) we can find an affine open neighbourhood U of x such that $f_1, \ldots, f_n$ forms a Koszul-regular sequence generating $\mathcal{I}$ and $f_1, \ldots, f_n, g_1, \ldots, g_m$ forms a Koszul-regular sequence generating $\mathcal{J}$. Hence by More on Algebra, Lemma 12.22.12 we see that $g_1, \ldots, g_m$ induces a Koszul-regular sequence on $Y \cap U$ cutting out Z. □

Lemma 26.13.9. *Let $i : Z \to Y$ and $j : Y \to X$ be immersions of schemes. Pick $z \in Z$ and denote $y \in Y$, $x \in X$ the corresponding points. Assume X is locally Noetherian. The following are equivalent*

(1) *i is a regular immersion in a neighbourhood of z and j is a regular immersion in a neighbourhood of y,*
(2) *i and $j \circ i$ are regular immersions in a neighbourhood of z,*
(3) *$j \circ i$ is a regular immersion in a neighbourhood of z and the conormal sequence*

$$0 \to i^*\mathcal{C}_{Y/X} \to \mathcal{C}_{Z/X} \to \mathcal{C}_{Z/Y} \to 0$$

is split exact in a neighbourhood of z.

Proof. Since X (and hence Y) is locally Noetherian all 4 types of regular immersions agree, and moreover we may check whether a morphism is a regular immersion on the level of local rings, see Lemma 26.12.8. The implication (1) ⇒ (2) is Lemma 26.13.7. The implication (2) ⇒ (3) is Lemma 26.13.6. Thus it suffices to prove that (3) implies (1).

Assume (3). Set $A = \mathcal{O}_{X,x}$. Denote $I \subset A$ the kernel of the surjective map $\mathcal{O}_{X,x} \to \mathcal{O}_{Y,y}$ and denote $J \subset A$ the kernel of the surjective map $\mathcal{O}_{X,x} \to \mathcal{O}_{Z,z}$. Note that any mimimal sequence of elements generating J in A is a quasi-regular hence regular sequence, see Lemma 26.12.5. By assumption the conormal sequence

$$0 \to I/IJ \to J/J^2 \to J/(I + J^2 \to 0$$

is split exact as a sequence of A/J-modules. Hence we can pick a minimal system of generators $f_1, \ldots, f_n, g_1, \ldots, g_m$ of J with $f_1, \ldots, f_n \in I$ a minimal system of generators of I. As pointed out above $f_1, \ldots, f_n, g_1, \ldots, g_m$ is a regular sequence in A. It follows directly from the definition of a regular sequence that $f_1, \ldots, f_n$ is a regular sequence in A and $\overline{g}_1, \ldots, \overline{g}_m$ is a regular sequence in A/I. Thus j is a regular immersion at y and i is a regular immersion at z. □

Remark 26.13.10. In the situation of Lemma 26.13.9 parts (1), (2), (3) are **not** equivalent to ``$j \circ i$ and j are regular immersions at z and y''. An example is $X = \mathbf{A}^1_k = Spec(k[x])$, $Y = Spec(k[x]/(x^2))$ and $Z = Spec(k[x]/(x))$.

Lemma 26.13.11. *Let $i : Z \to X$ be a Koszul regular closed immersion. Then there exists a surjective smooth morphism $X' \to X$ such that the base change $i' : Z \times_X X' \to X'$ of i is a regular immersion.*

Proof. We may assume that X is affine and the ideal of Z generated by a Koszul-regular sequence by replacing X by the members of a suitable affine open covering (affine opens as in Lemma 26.12.7). The affine case is More on Algebra, Lemma 12.22.16. □

26.14. Relative regular immersions

In this section we consider the base change property for regular immersions. The following lemma does not hold for regular immersions or for Koszul immersions, see Examples, Lemma 64.6.2.

Lemma 26.14.1. *Let $f : X \to S$ be a morphism of schemes. Let $i : Z \subset X$ be an immersion. Assume*

(1) *i is an H_1-regular (resp. quasi-regular) immersion, and*
(2) *$Z \to S$ is a flat morphism.*

Then for every morphism of schemes $g : S' \to S$ the base change $Z' = S' \times_S Z \to X' = S' \times_S X$ is an H_1-regular (resp. quasi-regular) immersion.

Proof. Unwinding the definitions and using Lemma 26.12.7 we translate this into algebra as follows. Let $A \to B$ be a ring map and $f_1, \ldots, f_r \in B$. Assume $B/(f_1, \ldots, f_r)B$ is flat over A. Consider a ring map $A \to A'$. Set $B' = B \otimes_A A'$ and $J' = JB'$.

Case I: $f_1, \ldots, f_r$ is quasi-regular. Set $J = (f_1, \ldots, f_r)$. By assumption J^n/J^{n+1} is isomorphic to a direct sum of copies of B/J hence flat over A. By induction and Algebra, Lemma 7.35.12 we conclude that B/J^n is flat over A. The ideal $(J')^n$ is equal to $J^n \otimes_A A'$, see Algebra, Lemma 7.35.11. Hence $(J')^n/(J')^{n+1} = J^n/J^{n+1} \otimes_A A'$ which clearly implies that $f_1, \ldots, f_r$ is a quasi-regular sequence in B'.

Case II: $f_1, \ldots, f_r$ is H_1-regular. By More on Algebra, Lemma 12.22.14 the vanishing of the Koszul homology group $H_1(K_\bullet(B, f_1, \ldots, f_r))$ implies the vanshing of $H_1(K_\bullet(B', f'_1, \ldots, f'_r))$ and we win. □

This lemma is the motivation for the following definition.

Definition 26.14.2. Let $f : X \to S$ be a morphism of schemes. Let $i : Z \to X$ be an immersion.

(1) We say i is a *relative quasi-regular immersion* if $Z \to S$ is flat and i is a quasi-regular immersion.
(2) We say i is a *relative H_1-regular immersion* if $Z \to S$ is flat and i is an H_1-regular immersion.

We warn the reader that this may be nonstandard notation. Lemma 26.14.1 guarantees that relative quasi-regular (resp. H_1-regular) immersions are preserved under any base change. A relative H_1-regular immersion is a relative quasi-regular immersion, see Lemma 26.13.2. Please take a look at Lemma 26.14.5 (or Lemma 26.14.4) which shows that if $Z \to X$ is a relative H_1-regular (or quasi-regular) immersion and the ambient scheme is (flat and) locally of finite presentation over S, then $Z \to X$ is actually a regular immersion and the same remains true after any base change.

Lemma 26.14.3. *Let $f : X \to S$ be a morphism of schemes. Let $Z \to X$ be a relative quasi-regular immersion. If $x \in Z$ and $\mathcal{O}_{X,x}$ is Noetherian, then f is flat at x.*

Proof. Let $f_1, \ldots, f_r \in \mathcal{O}_{X,x}$ be a quasi-regular sequence cutting out the ideal of Z at x. By Algebra, Lemma 7.66.6 we know that $f_1, \ldots, f_r$ is a regular sequence. Hence f_r is a nonzero divisor on $\mathcal{O}_{X,x}/(f_1, \ldots, f_{r-1})$ such that the quotient is a flat $\mathcal{O}_{S,f(x)}$-module. By Lemma 26.10.3 we conclude that $\mathcal{O}_{X,x}/(f_1, \ldots, f_{r-1})$ is a flat $\mathcal{O}_{S,f(x)}$-module. Continuing by induction we find that $\mathcal{O}_{X,x}$ is a flat $\mathcal{O}_{S,s}$-module. □

Lemma 26.14.4. *Let $X \to S$ be a morphism of schemes. Let $Z \to X$ be an immersion. Assume*

(1) *$X \to S$ is flat and locally of finite presentation,*
(2) *$Z \to X$ is a relative quasi-regular immersion.*

Then $Z \to X$ is a regular immersion and the same remains true after any base change.

Proof. Pick $x \in Z$ with image $s \in S$. To prove this it suffices to find an affine neighbourhood of x contained in U such that the result holds on that affine open. Hence we may assume that X is affine and there exist a quasi-regular sequence $f_1, \ldots, f_r \in \Gamma(X, \mathcal{O}_X)$ such that $Z = V(f_1, \ldots, f_r)$. By Lemma 26.14.1 and its proof the sequence $f_1|_{X_s}, \ldots, f_r|_{X_s}$ is a quasi-regular sequence in $\Gamma(X_s, \mathcal{O}_{X_s})$. Since X_s is Noetherian, this implies, possibly after shrinking X a bit, that $f_1|_{X_s}, \ldots, f_r|_{X_s}$ is a regular sequence, see Algebra, Lemmas 7.66.6 and 7.65.8. By Lemma 26.10.7 it follows that $Z_1 = V(f_1) \subset X$ is a relative effective Cartier divisor, again after possibly shrinking X a bit. Applying the same lemma again, but now to $Z_2 = V(f_1, f_2) \subset Z_1$ we see that $Z_2 \subset Z_1$ is a relative effective Cartier divisor. And so on until on reaches $Z = Z_n = V(f_1, \ldots, f_n)$. Since being a relative effective Cartier divisor is preserved under arbitrary base change, see Lemma 26.10.1, we also see that the final statement of the lemma holds. □

Lemma 26.14.5. *Let $X \to S$ be a morphism of schemes. Let $Z \to X$ be a relative H_1-regular immersion. Assume $X \to S$ is locally of finite presentation. Then*

(1) *there exists an open subscheme $U \subset X$ such that $Z \subset U$ and such that $U \to S$ is flat, and*
(2) *$Z \to X$ is a regular immersion and the same remains true after any base change.*

Proof. Pick $x \in Z$. To prove (1) suffices to find an open neighbourhood $U \subset X$ of x such that $U \to S$ is flat. Hence the lemma reduces to the case that $X = Spec(B)$ and $S = Spec(A)$ are affine and that Z is given by an H_1-regular sequence $f_1, \ldots, f_r \in B$. By assumption B is a finitely presented A-algebra and $B/(f_1, \ldots, f_r)B$ is a flat A-algebra. We are going to use absolute Noetherian approximation.

Write $B = A[x_1, \ldots, x_n]/(g_1, \ldots, g_m)$. Assume f_i is the image of $f_i' \in A[x_1, \ldots, x_n]$. Choose a finite type $\mathbf{Z}$-subalgebra $A_0 \subset A$ such that all the coefficients of the polynomials $f_1', \ldots, f_r', g_1, \ldots, g_m$ are in A_0. We set $B_0 = A_0[x_1, \ldots, x_n]/(g_1, \ldots, g_m)$ and we denote $f_{i,0}$ the image of f_i' in B_0. Then $B = B_0 \otimes_{A_0} A$ and

$$B/(f_1, \ldots, f_r) = B_0/(f_{0,1}, \ldots, f_{0,r}) \otimes_{A_0} A.$$

By Algebra, Lemma 7.120.5 we may, after enlarging A_0, assume that $B_0/(f_{0,1}, \ldots, f_{0,r})$ is flat over A_0. It may not be the case at this point that the Koszul cohomology group $H_1(K_\bullet(B_0, f_{0,1}, \ldots, f_{0,r}))$ is zero. On the other hand, as B_0 is Noetherian, it is a finitely generated B_0-module. Let $\xi_1, \ldots, \xi_n \in H_1(K_\bullet(B_0, f_{0,1}, \ldots, f_{0,r}))$ be generators. Let $A_0 \subset A_1 \subset A$ be a larger finite type $\mathbf{Z}$-subalgebra of A. Denote $f_{1,i}$ the image of $f_{0,i}$ in $B_1 = B_0 \otimes_{A_0} A_1$. By More on Algebra, Lemma 12.22.14 the map

$$H_1(K_\bullet(B_0, f_{0,1}, \ldots, f_{0,r})) \otimes_{A_0} A_1 \longrightarrow H_1(K_\bullet(B_1, f_{1,1}, \ldots, f_{1,r}))$$

is surjective. Furthermore, it is clear that the colimit (over all choices of A_1 as above) of the complexes $K_\bullet(B_1, f_{1,1}, \ldots, f_{1,r})$ is the complex $K_\bullet(B, f_1, \ldots, f_r)$ which is acyclic in degree 1. Hence

$$colim_{A_0 \subset A_1 \subset A} H_1(K_\bullet(B_1, f_{1,1}, \ldots, f_{1,r})) = 0$$

by Algebra, Lemma 7.8.9. Thus we can find a choice of A_1 such that $\xi_1, \ldots, \xi_n$ all map to zero in $H_1(K_\bullet(B_1, f_{1,1}, \ldots, f_{1,r}))$. In other words, the Koszul cohomology group $H_1(K_\bullet(B_1, f_{1,1}, \ldots, f_{1,r}))$ is zero.

Consider the morphism of affine schemes $X_1 \to S_1$ equal to $Spec$ of the ring map $A_1 \to B_1$ and $Z_1 = Spec(B_1/(f_{1,1}, \ldots, f_{1,r}))$. Since $B = B_1 \otimes_{A_1} A$, i.e., $X = X_1 \times_{S_1} S$, and similarly $Z = Z_1 \times_S S_1$, it now suffices to prove (1) for $X_1 \to S_1$ and the relative H_1-regular immersion $Z_1 \to X_1$, see Morphisms, Lemma 24.24.6. Hence we have reduced to the case where $X \to S$ is a finite type morphism of Noetherian schemes. In this case we know that $X \to S$ is flat at every point of Z by Lemma 26.14.3. Combined with the fact that the flat locus is open in this case, see Algebra, Theorem 7.120.4 we see that (1) holds. Part (2) then follows from an application of Lemma 26.14.4. □

If the ambient scheme is flat and locally of finite presentation over the base, then we can characterize a relative quasi-regular immersion in terms of its fibres.

Lemma 26.14.6. *Let $\varphi : X \to S$ be a flat morphism which is locally of finite presentation. Let $T \subset X$ be a closed subscheme. Let $x \in T$ with image $s \in S$.*

(1) *If $T_s \subset X_s$ is a quasi-regular immersion in a neighbourhood of x, then there exists an open $U \subset X$ and a relative quasi-regular immersion $Z \subset U$ such that $Z_s = T_s \cap U_s$ and $T \cap U \subset Z$.*
(2) *If $T_s \subset X_s$ is a quasi-regular immersion in a neighbourhood of x, the morphism $T \to X$ is of finite presentation, and $T \to S$ is flat at x, then we can choose U and Z as in (1) such that $T \cap U = Z$.*

(3) *If $T_s \subset X_s$ is a quasi-regular immersion in a neighbourhood of x, and T is cut out by c equations in a neighbourhood of x, where $c = \dim_x(X_s) - \dim_x(T_s)$, then we can choose U and Z as in (1) such that $T \cap U = Z$.*

In each case $Z \to U$ is a regular immersion by Lemma 26.14.4. In particular, if $T \to S$ is locally of finite presentation and flat and all fibres $T_s \subset X_s$ are quasi-regular immersions, then $T \to X$ is a relative quasi-regular immersion.

Proof. Choose affine open neighbourhoods $Spec(A)$ of s and $Spec(B)$ of x such that $\varphi(Spec(B)) \subset Spec(A)$. Let $\mathfrak{p} \subset A$ be the prime ideal corresponding to s. Let $\mathfrak{q} \subset B$ be the prime ideal corresponding to x. Let $I \subset B$ be the ideal corresponding to T. By the initial assumption of the lemma we know that $A \to B$ is flat and of finite presentation. The assumption in (1) means that, after shrinking $Spec(B)$, we may assume $I(B \otimes_A \kappa(\mathfrak{p}))$ is generated by a quasi-regular sequence of elements. After possibly localizing B at some $g \in B$, $g \not\in \mathfrak{q}$ we may assume there exist $f_1, \ldots, f_r \in I$ which map to a quasi-regular sequence in $B \otimes_A \kappa(\mathfrak{p})$ which generates $I(B \otimes_A \kappa(\mathfrak{p}))$. By Algebra, Lemmas 7.66.6 and 7.65.8 we may assume after another localization that $f_1, \ldots, f_r \in I$ form a regular sequence in $B \otimes_A \kappa(\mathfrak{p})$. By Lemma 26.10.7 it follows that $Z_1 = V(f_1) \subset Spec(B)$ is a relative effective Cartier divisor, again after possibly localizing B. Applying the same lemma again, but now to $Z_2 = V(f_1, f_2) \subset Z_1$ we see that $Z_2 \subset Z_1$ is a relative effective Cartier divisor. And so on until one reaches $Z = Z_n = V(f_1, \ldots, f_n)$. Then $Z \to Spec(B)$ is a regular immersion and Z is flat over S, in particular $Z \to Spec(B)$ is a relative quasi-regular immersion over $Spec(A)$. This proves (1).

To see (2) consider the closed immersion $Z \to D$. The surjective ring map $u : \mathcal{O}_{D,x} \to \mathcal{O}_{Z,x}$ is a map of flat local $\mathcal{O}_{S,s}$-algebras which are essentially of finite presentation, and which becomes an isomorphisms after dividing by $\mathfrak{m}_s$. Hence it is an isomorphism, see Algebra, Lemma 7.119.4. It follows that $Z \to D$ is an isomorphism in a neighbourhood of x, see Algebra, Lemma 7.117.6.

To see (3), after possibly shrinking U we may assume that the ideal of Z is generated by a regular sequence $f_1, \ldots, f_r$ (see our construction of Z above) and the ideal of T is generated by $g_1, \ldots, g_c$. We claim that $c = r$. Namely,

$$\begin{aligned} \dim_x(X_s) &= \dim(\mathcal{O}_{X_s,x}) + \operatorname{trdeg}_{\kappa(s)}(\kappa(x)), \\ \dim_x(T_s) &= \dim(\mathcal{O}_{T_s,x}) + \operatorname{trdeg}_{\kappa(s)}(\kappa(x)), \\ \dim(\mathcal{O}_{X_s,x}) &= \dim(\mathcal{O}_{T_s,x}) + r \end{aligned}$$

the first two equalities by Algebra, Lemma 7.107.3 and the second by r times applying Algebra, Lemma 7.57.11. As $T \subset Z$ we see that $f_i = \sum b_{ij} g_j$. But the ideals of Z and T cut out the same quasi-regular closed subscheme of X_s in a neighbourhood of x. Hence the matrix (b_{ij}) mod $\mathfrak{m}_x$ is invertible (some details omitted). Hence (b_{ij}) is invertible in an open neighbourhood of x. In other words, $T \cap U = Z$ after shrinking U.

The final statements of the lemma follow immediately from part (2), combined with the fact that $Z \to S$ is locally of finite presentation if and only if $Z \to X$ is of finite presentation, see Morphisms, Lemmas 24.20.3 and 24.20.11. ☐

The following lemma is an enhancement of Morphisms, Lemma 24.33.20.

Lemma 26.14.7. *Let $f : X \to S$ be a smooth morphism of schemes. Let $\sigma : S \to X$ be a section of f. Then σ is a regular immersion.*

Proof. By Schemes, Lemma 21.21.11 the morphism σ is an immersion. After replacing X by an open neighbourhood of $\sigma(S)$ we may assume that σ is a closed immersion. Let $T = \sigma(S)$ be the corresponding closed subscheme of X. Since $T \to S$ is an isomorphism it is flat and of finite presentation. Also a smooth morphism is flat and locally of finite presentation, see Morphisms, Lemmas 24.33.9 and 24.33.8. Thus, according to Lemma 26.14.6, it suffices to show that $T_s \subset X_s$ is a quasi-regular closed subscheme. This follows immediately from Morphisms, Lemma 24.33.20 but we can also see it directly as follows. Let k be a field and let A be a smooth k-algebra. Let $\mathfrak m \subset A$ be a maximal ideal whose residue field is k. Then $\mathfrak m$ is generated by a quasi-regular sequence, possibly after replacing A by A_g for some $g \in A$, $g \notin \mathfrak m$. In Algebra, Lemma 7.129.3 we proved that $A_{\mathfrak m}$ is a regular local ring, hence $\mathfrak m A_{\mathfrak m}$ is generated by a regular sequence. This does indeed imply that $\mathfrak m$ is generated by a regular sequence (after replacing A by A_g for some $g \in A$, $g \notin \mathfrak m$), see Algebra, Lemma 7.65.8. □

The following lemma has a kind of converse, see Lemma 26.14.11.

Lemma 26.14.8. *Let*

$$\begin{tikzcd} Y \arrow[rr, "i"] \arrow[dr, "j"'] & & X \arrow[dl] \\ & S & \end{tikzcd}$$

be a commutative diagram of morphisms of schemes. Assume $X \to S$ smooth, and i, j immersions. If j is a regular (resp. Koszul-regular, H_1-regular, quasi-regular) immersion, then so is i.

Proof. We can write i as the composition

$$Y \to Y \times_S X \to X$$

By Lemma 26.14.7 the first arrow is a regular immersion. The second arrow is a flat base change of $Y \to S$, hence is a regular (resp. Koszul-regular, H_1-regular, quasi-regular) immersion, see Lemma 26.13.4. We conclude by an application of Lemma 26.13.7. □

Lemma 26.14.9. *Let*

$$\begin{tikzcd} Y \arrow[rr, "i"] \arrow[dr] & & X \arrow[dl] \\ & S & \end{tikzcd}$$

be a commutative diagram of morphisms of schemes. Assume that $Y \to S$ is syntomic, $X \to S$ smooth, and i an immersion. Then i is a regular immersion.

Proof. After replacing X by an open neighbourhood of $i(Y)$ we may assume that i is a closed immersion. Let $T = i(Y)$ be the corresponding closed subscheme of X. Since $T \cong Y$ the morphism $T \to S$ is flat and of finite presentation (Morphisms, Lemmas 24.30.6 and 24.30.7). Also a smooth morphism is flat and locally of finite presentation (Morphisms, Lemmas 24.33.9 and 24.33.8). Thus, according to Lemma 26.14.6, it suffices to show that $T_s \subset X_s$ is a quasi-regular closed subscheme. As X_s is locally of finite type over a field, it is Noetherian (Morphisms, Lemma 24.14.6). Thus we can check that $T_s \subset X_s$ is a quasi-regular immersion at points, see Lemma 26.12.8. Take $t \in T_s$. By Morphisms, Lemma 24.30.9 the local ring $\mathcal{O}_{T_s,t}$ is a local complete intersection over $\kappa(s)$. The local ring $\mathcal{O}_{X_s,t}$ is regular, see Algebra, Lemma 7.129.3. By Algebra, Lemma 7.124.7 we see that the kernel of the surjection $\mathcal{O}_{X_s,t} \to \mathcal{O}_{T_s,t}$ is generated by a regular sequence, which is what we had to show. $\square$

Lemma 26.14.10. *Let*

$$\begin{tikzcd} Y \arrow[rr, "i"] \arrow[dr] & & X \arrow[dl] \\ & S & \end{tikzcd}$$

be a commutative diagram of morphisms of schemes. Assume that $Y \to S$ is smooth, $X \to S$ smooth, and i an immersion. Then i is a regular immersion.

Proof. This is a special case of Lemma 26.14.9 because a smooth morphism is syntomic, see Morphisms, Lemma 24.33.7. $\square$

Lemma 26.14.11. *Let*

$$\begin{tikzcd} Y \arrow[rr, "i"] \arrow[dr, "j"'] & & X \arrow[dl] \\ & S & \end{tikzcd}$$

be a commutative diagram of morphisms of schemes. Assume $X \to S$ smooth, and i, j immersions. If i is a Koszul-regular (resp. H_1-regular, quasi-regular) immersion, then so is j.

Proof. Let $y \in Y$ be any point. Set $x = i(y)$ and set $s = j(y)$. It suffices to prove the result after replacing X, S by open neighbourhoods U, V of x, s and Y by an open neighbourhood of y in $i^{-1}(U) \cap j^{-1}(V)$. Hence we may assume that Y, X and S are affine. In this case we can choose a closed immersion $h : X \to \mathbf{A}^n_S$ over S for some n. Note that h is a regular immersion by Lemma 26.14.10. Hence $h \circ i$ is a Koszul-regular (resp. H_1-regular, quasi-regular) immersion, see Lemmas 26.13.7 and 26.13.2. In this way we reduce to the case $X = \mathbf{A}^n_S$ and S affine.

After replacing S by an affine open V and replacing Y by $j^{-1}(V)$ we may assume that i is a closed immersion and S affine. Write $S = Spec(A)$. Then $j : Y \to S$ defines an isomorphism of Y to the closed subscheme $Spec(A/I)$ for some ideal $I \subset A$. The map $i : Y = Spec(A/I) \to \mathbf{A}^n_S = Spec(A[x_1, \ldots, x_n])$ corresponds to an A-algebra homomorphism $i^\sharp : A[x_1, \ldots, x_n] \to A/I$. Choose $a_i \in A$ which map to $i^\sharp(x_i)$ in A/I. Observe that the ideal of the closed immersion i is

$$J = (x_1 - a_1, \ldots, x_n - a_n) + IA[x_1, \ldots, x_n].$$

Set $K = (x_1 - a_1, \ldots, x_n - a_n)$. We claim the sequence

$$0 \to K/KJ \to J/J^2 \to J/(K + J^2) \to 0$$

is split exact. To see this note that K/K^2 is free with basis $x_i - a_i$ over the ring $A[x_1, \ldots, x_n]/K \cong A$. Hence K/KJ is free with the same basis over the ring $A[x_1, \ldots, x_n]/J \cong A/I$. On the other hand, taking derivatives gives a map

$$\mathrm{d}_{A[x_1,\ldots,x_n]/A} : J/J^2 \longrightarrow \Omega_{A[x_1,\ldots,x_n]/A} \otimes_{A[x_1,\ldots,x_n]} A[x_1, \ldots, x_n]/J$$

which maps the generators $x_i - a_i$ to the basis elements $\mathrm{d}x_i$ of the free module on the right. The claim follows. Moreover, note that $x_1 - a_1, \ldots, x_n - a_n$ is a regular sequence in

$A[x_1, \ldots, x_n]$ with quotient ring $A[x_1, \ldots, x_n]/(x_1 - a_1, \ldots, x_n - a_n) \cong A$. Thus we have a factorization

$$Y \to V(x_1 - a_1, \ldots, x_n - a_n) \to \mathbf{A}^n_S$$

of our closed immersion i where the composition is Koszul-regular (resp. H_1-regular, quasi-regular), the second arrow is a regular immersion, and the associated conormal sequence is split. Now the result follows from Lemma 26.13.8. $\square$

26.15. Meromorphic functions and sections

See [**Kle79**] for some possible pitfalls[1].

Let $(X, \mathcal{O}_X)$ be a locally ringed space. For any open $U \subset X$ we have defined the set $\mathcal{S}(U) \subset \mathcal{O}_X(U)$ of regular sections of $\mathcal{O}_X$ over U, see Definition 26.9.13. The restriction of a regular section to a smaller open is regular. Hence $\mathcal{S} : U \mapsto \mathcal{S}(U)$ is a subsheaf (of sets) of $\mathcal{O}_X$. We sometimes denote $\mathcal{S} = \mathcal{S}_X$ if we want to indicate the dependence on X. Moreover, $\mathcal{S}(U)$ is a multiplicative subset of the ring $\mathcal{O}_X(U)$ for each U. Hence we may consider the presheaf of rings

$$U \longmapsto \mathcal{S}(U)^{-1}\mathcal{O}_X(U),$$

see Modules, Lemma 15.22.1.

Definition 26.15.1. Let $(X, \mathcal{O}_X)$ be a locally ringed space. The *sheaf of meromorphic functions on X* is the sheaf $\mathcal{K}_X$ associated to the presheaf displayed above. A *meromorphic function* on X is a global section of $\mathcal{K}_X$.

Since each element of each $\mathcal{S}(U)$ is a nonzero divisor on $\mathcal{O}_X(U)$ we see that the natural map of sheaves of rings $\mathcal{O}_X \to \mathcal{K}_X$ is injective.

Example 26.15.2. Let $A = \mathbf{C}[x, \{y_\alpha\}_{\alpha \in \mathbf{C}}]/((x - \alpha)y_\alpha, y_\alpha y_\beta)$. Any element of A can be written uniquely as $f(x) + \sum \lambda_\alpha y_\alpha$ with $f(x) \in \mathbf{C}[x]$ and $\lambda_\alpha \in \mathbf{C}$. Let $X = Spec(A)$. In this case $\mathcal{O}_X = \mathcal{K}_X$, since on any affine open $D(f)$ the ring A_f any nonzero divisor is a unit (proof omitted).

Definition 26.15.3. Let $f : (X, \mathcal{O}_X) \to (Y, \mathcal{O}_Y)$ be a morphism of locally ringed spaces. We say that *pulbacks of meromorphic functions are defined for f* if for every pair of open $U \subset X$, $V \subset Y$ such that $f(U) \subset V$, and any section $s \in \Gamma(V, \mathcal{S}_Y)$ the pullback $f^\sharp(s) \in \Gamma(U, \mathcal{O}_X)$ is an element of $\Gamma(U, \mathcal{S}_X)$.

In this case there is an induced map $f^\sharp : f^{-1}\mathcal{K}_Y \to \mathcal{K}_X$, in other words we obtain a commutative diagram of morphisms of ringed spaces

$$\begin{tikzcd} (X, \mathcal{K}_X) \arrow[r] \arrow[d, "f"] & (X, \mathcal{O}_X) \arrow[d, "f"] \\ (Y, \mathcal{K}_Y) \arrow[r] & (Y, \mathcal{O}_X) \end{tikzcd}$$

We sometimes denote $f^*(s) = f^\sharp(s)$ for a section $s \in \Gamma(Y, \mathcal{K}_Y)$.

Lemma 26.15.4. *Let $f : X \to Y$ be a morphism of schemes. In each of the following cases pullbacks of meromorphic sections are defined.*

(1) *X, Y are integral and f is dominant,*

[1] Danger, Will Robinson!

(2) *X is integral and the generic point of X maps to a generic point of an irreducible component of Y,*
(3) *X is reduced and every generic point of every irreducible component of X maps to the generic point of an irreducible component of Y,*
(4) *X is locally Noetherian, and any associated point of X maps to a generic point of an irreducible component of Y, and*
(5) *X is locally Noetherian, has no embedded points and any generic point of an irreducible component of X maps to the generic point of an irreducible component of Y.*

Proof. Omitted. Hint: Similar to the proof of Lemma 26.9.9, using the following fact (on Y): if an element $x \in R$ maps to a nonzero divisor in $R_{\mathfrak p}$ for a minimal prime $\mathfrak p$ of R, then $x \not\in \mathfrak p$. See Algebra, Lemma 7.23.3. □

Let $(X, \mathcal{O}_X)$ be a locally ringed space. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_X$-modules. Consider the presheaf $U \mapsto \mathcal{S}(U)^{-1}\mathcal{F}(U)$. Its sheafification is the sheaf $\mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{K}_X$, see Modules, Lemma 15.22.2.

Definition 26.15.5. Let X be a locally ringed space. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_X$-modules.

(1) We denote $\mathcal{K}_X(\mathcal{F})$ the sheaf of $\mathcal{K}_X$-modules which is the sheafification of the presheaf $U \mapsto \mathcal{S}(U)^{-1}\mathcal{F}(U)$. Equivalently $\mathcal{K}_X(\mathcal{F}) = \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{K}_X$ (see above).
(2) A *meromorphic section of $\mathcal{F}$* is a global section of $\mathcal{K}_X(\mathcal{F})$.

In particular we have
$$\mathcal{K}_X(\mathcal{F})_x = \mathcal{F}_x \otimes_{\mathcal{O}_{X,x}} \mathcal{K}_{X,x} = \mathcal{S}_x^{-1}\mathcal{F}_x$$
for any point $x \in X$. However, one has to be careful since it may not be the case that $\mathcal{S}_x$ is the set of nonzero divisors in the local ring $\mathcal{O}_{X,x}$. Namely, there is always an injective map
$$\mathcal{K}_{X,x} \longrightarrow Q(\mathcal{O}_{X,x})$$
to the total quotient ring. It is also surjective if and only if $\mathcal{S}_x$ is the set of nonzero divisors in $\mathcal{O}_{X,x}$.

Lemma 26.15.6. *Let X be a locally Noetherian scheme.*

(1) *For any $x \in X$ we have $\mathcal{S}_x \subset \mathcal{O}_{X,x}$ is the set of nonzero divisors, and $\mathcal{K}_{X,x}$ is the total quotient ring of $\mathcal{O}_{X,x}$.*
(2) *For any affine open $Spec(A) = U \subset X$ we have that $\mathcal{K}_X(U)$ equals the total quotient ring of A.*

Proof. Let A be a Noetherian ring. Let $\mathfrak p \subset A$ be a prime ideal. Let $f, g \in A$, $g \not\in \mathfrak p$. Let $I = \{x \in A \mid fx = 0\}$. Suppose f/g is a nonzero divisor in $A_{\mathfrak p}$. Then we see that $I_{\mathfrak p} = 0$ by exactness of localization. Since A is Noetherian we see that I is finitely generated and hence that $g'I = 0$ for some $g' \in A$, $g' \not\in \mathfrak p$. Hence f is a nonzero divisor in $A_{g'}$, i.e., in a Zariski open neighbourhood of $\mathfrak p$. This proves (1).

Let $f \in \Gamma(X, \mathcal{K}_{X,x})$ be a meromorphic function on $X = Spec(A)$. Set $I = \{x \in A \mid xf \in A\}$. For every prime $\mathfrak p \subset A$ we can write the image of f in the stalk at $\mathfrak p$ as a/b, $a, b \in A_{\mathfrak p}$ with $b \in A_{\mathfrak p}$ not a zero divisor. Hence, clearing denominators, we find there exists an element $x \in I$ such that x maps to a nonzero divisor on $A_{\mathfrak p}$. Let $\text{Ass}(A) = \{\mathfrak q_1, \ldots, \mathfrak q_t\}$ be the associated primes of A. By looking at $IA_{\mathfrak q_i}$ and using Algebra, Lemma 7.60.14 the above says that $I \not\subset \mathfrak q_i$ for each i. By Algebra, Lemma 7.14.3 there exists an element $x \in I$, $x \not\in \bigcup \mathfrak q_i$. By Algebra, Lemma 7.60.9 we see that x is not a zero divisor on A. Hence $f = (xf)/x$ is an element of the total ring of fractions of A. This proves (2). □

Lemma 26.15.7. *Let X be a scheme. Assume X is reduced and any quasi-compact open $U \subset X$ has a finite number of irreducible components.*

(1) *The sheaf $\mathcal{K}_X$ is a quasi-coherent sheaf of $\mathcal{O}_X$-algebras.*
(2) *For any $x \in X$ we have $\mathcal{S}_x \subset \mathcal{O}_{X,x}$ is the set of nonzero divisors. In particular $\mathcal{K}_{X,x}$ is the total quotient ring of $\mathcal{O}_{X,x}$.*
(3) *For any affine open $Spec(A) = U \subset X$ we have that $\mathcal{K}_X(U)$ equals the total quotient ring of A.*

Proof. Let X be as in the lemma. Let $X^{(0)} \subset X$ be the set of generic points of irreducible components of X. Let

$$f : Y = \coprod\nolimits_{\eta \in X^{(0)}} Spec(\kappa(\eta)) \longrightarrow X$$

be the inclusion of the generic points into X using the canonical maps of Schemes, Section 21.13. (This morphism was used in Morphisms, Definition 24.46.12 to define the normalization of X.) We claim that $\mathcal{K}_X = f_*\mathcal{O}_Y$. First note that $\mathcal{K}_Y = \mathcal{O}_Y$ as Y is a disjoint union of spectra of field. Next, note that pullbacks of meromorphic functions are defined for f, by Lemma 26.15.4. This gives a map

$$\mathcal{K}_X \longrightarrow f_*\mathcal{O}_Y.$$

Let $Spec(A) = U \subset X$ be an affine open. Then A is a reduced ring with finitely many minimal primes $\mathfrak{q}_1, \ldots, \mathfrak{q}_t$. Then we have $Q(A) = \prod A_{\mathfrak{q}_i} = \prod \kappa(\mathfrak{q}_i)$ by Algebra, Lemmas 7.22.2 and 7.23.3. In other words, already the value of the presheaf $U \mapsto \mathcal{S}(U)^{-1}\mathcal{O}_X(U)$ agrees with $f_*\mathcal{O}_Y(U)$ on our affine open U. Hence the displayed map is an isomorphism.

Now we are ready to prove (1), (2) and (3). The morphism f is quasi-compact by our assumption that the set of irreducible components of X is locally finite. Hence f is quasi-compact and quasi-separated (as Y is separated). By Schemes, Lemma 21.24.1 $f_*\mathcal{O}_Y$ is quasi-coherent. This proves (1). Let $x \in X$. Then

$$(f_*\mathcal{O}_Y)_x = \prod\nolimits_{\eta \in X^{(0)},\ x \in \overline{\{\eta\}}} \kappa(\eta)$$

On the other hand, $\mathcal{O}_{X,x}$ is reduced and has finitely minimal primes $\mathfrak{q}_i$ corresponding exactly to those $\eta \in X^{(0)}$ such that $x \in \overline{\{\eta\}}\kappa(\eta)$. Hence by Algebra, Lemmas 7.22.2 and 7.23.3 again we see that $Q(\mathcal{O}_{X,x}) = \prod \kappa(\mathfrak{q}_i)$ is the same as $(f_*\mathcal{O}_Y)_x$. This proves (2). Part (3) we saw during the course of the proof that $\mathcal{K}_X = f_*\mathcal{O}_Y$. $\square$

Lemma 26.15.8. *Let X be a scheme. Assume X is reduced and any quasi-compact open $U \subset X$ has a finite number of irreducible components. Then the normalization morphism $\nu : X^\nu \to X$ is the morphism*

$$\underline{Spec}_X(\mathcal{O}') \longrightarrow X$$

where $\mathcal{O}' \subset \mathcal{K}_X$ is the integral closure of $\mathcal{O}_X$ in the sheaf of meromorphic functions.

Proof. Compare the definition of the normalization morphism $\nu : X^\nu \to X$ (see Morphisms, Definition 24.46.12) with the result $\mathcal{K}_X = f_*\mathcal{O}_Y$ obtained in the proof of Lemma 26.15.7 above. $\square$

Lemma 26.15.9. *Let X be an integral scheme with generic point η. We have*

(1) *the sheaf of meromorphic functions is isomorphic to the constant sheaf with value the function field (see Morphisms, Definition 24.8.5) of X.*
(2) *for any quasi-coherent sheaf $\mathcal{F}$ on X the sheaf $\mathcal{K}_X(\mathcal{F})$ is isomorphic to the constant sheaf with value $\mathcal{F}_\eta$.*

Proof. Omitted. □

Definition 26.15.10. Let X be a locally ringed space. Let $\mathcal{L}$ be an invertible $\mathcal{O}_X$-module. A meromorphic section s of $\mathcal{L}$ is said to be *regular* if the induced map $\mathcal{K}_X \to \mathcal{K}_X(\mathcal{L})$ is injective. (In other words, this means that s is a regular section of the invertible $\mathcal{K}_X$-module $\mathcal{K}_X(\mathcal{L})$. See Definition 26.9.13.)

First we spell out when (regular) meromorphic sections can be pulled back. After that we discuss the existence of regular meromorphic sections and consequences.

Lemma 26.15.11. *Let $f : X \to Y$ be a morphism of locally ringed spaces. Assume that pullbacks of meromorphic functions are defined for f (see Definition 26.15.3).*

(1) *Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_Y$-modules. There is a canonical pullback map $f^* : \Gamma(Y, \mathcal{K}_Y(\mathcal{F})) \to \Gamma(X, \mathcal{K}_X(f^*\mathcal{F}))$ for meromorphic sections of $\mathcal{F}$.*
(2) *Let $\mathcal{L}$ be an invertible $\mathcal{O}_X$-module. A regular meromorphic section s of $\mathcal{L}$ pulls back to a regular meromorphic section f^*s of $f^*\mathcal{L}$.*

Proof. Omitted. □

In some cases we can show regular meromorphic sections exist.

Lemma 26.15.12. *Let X be a scheme. Let $\mathcal{L}$ be an invertible $\mathcal{O}_X$-module. In each of the following cases $\mathcal{L}$ has a regular meromorphic section:*

(1) *X is integral,*
(2) *X is reduced and any quasi-compact open has a finite number of irreducible components, and*
(3) *X is locally Noetherian and has no embedded points.*

Proof. In case (1) we have seen in Lemma 26.15.9 that $\mathcal{K}_X(\mathcal{L})$ is a constant sheaf with value $\mathcal{L}_\eta$, and hence the result is clear.

Suppose X is a scheme. Let $G \subset X$ be the set of generic points of irreducible components of X. For each $\eta \in G$ denote $j_\eta : \eta \to X$ the canonical morphism of $\eta = Spec(\kappa(\eta))$ into X (see Schemes, Lemma 21.13.3). Consider the sheaf

$$\mathcal{G}_X(\mathcal{L}) = \prod\nolimits_{\eta \in G} j_{\eta,*}(\mathcal{L}_\eta).$$

There is a canonical map

$$\varphi : \mathcal{K}_X(\mathcal{L}) \longrightarrow \mathcal{G}_X(\mathcal{L})$$

coming from the maps $\mathcal{K}_X(\mathcal{L})_\eta \to \mathcal{L}_\eta$ and adjunction (see Sheaves, Lemma 6.27.3).

We claim that in cases (2) and (3) the map φ is an isomorphism for any invertible sheaf $\mathcal{L}$. Before proving this let us show that cases (2) and (3) follow from this. Namely, we can choose $s_\eta \in \mathcal{L}_\eta$ which generate $\mathcal{L}_\eta$, i.e., such that $\mathcal{L}_\eta = \mathcal{O}_{X,\eta}s_\eta$. Since the claim applied to $\mathcal{O}_X$ gives $\mathcal{K}_X = \mathcal{G}_X(\mathcal{O}_X)$ it is clear that the global section $s = \prod_{\eta \in G} s_\eta$ is regular as desired.

To prove that φ is an isomorphism we may work locally on X. For example it suffices to show that sections of $\mathcal{K}_X(\mathcal{L})$ and $\mathcal{G}_X(\mathcal{L})$ agree over small affine opens U. Say $U = Spec(A)$ and $\mathcal{L}|_U \cong \mathcal{O}_U$. By Lemmas 26.15.6 and 26.15.7 we see that $\Gamma(U, \mathcal{K}_X) = Q(A)$ is the total ring of fractions of A. On the other hand, $\Gamma(U, \mathcal{G}_X(\mathcal{O}_X)) = \prod_{\mathfrak{q} \subset A \text{ minimal}} A_\mathfrak{q}$. In both cases we see that the set of minimal primes of A is finite, say $\mathfrak{q}_1, \ldots, \mathfrak{q}_t$, and that the set of zero divisors of A is equal to $\mathfrak{q}_1 \cup \ldots \cup \mathfrak{q}_t$ (see Algebra, Lemma 7.60.9). Hence the result follows from Algebra, Lemma 7.22.2. □

Lemma 26.15.13. *Let X be a scheme. Let $\mathcal{L}$ be an invertible $\mathcal{O}_X$-module. Let s be a regular meromorphic section of $\mathcal{L}$. Let us denote $\mathcal{I} \subset \mathcal{O}_X$ the sheaf of ideals defined by the rule*

$$\mathcal{I}(V) = \{f \in \mathcal{O}_Z(V) \mid fs \in \mathcal{L}(V)\}.$$

The formula makes sense since $\mathcal{L}(V) \subset \mathcal{K}_X(\mathcal{L})(V)$. Then $\mathcal{I}$ is a quasi-coherent sheaf of ideals and we have injective maps

$$1 : \mathcal{I} \longrightarrow \mathcal{O}_X, \quad s : \mathcal{I} \longrightarrow \mathcal{L}$$

whose cokernels are supported on closed nowhere dense subsets of X.

Proof. The question is local on X. Hence we may assume that $X = Spec(A)$, and $\mathcal{L} = \mathcal{O}_X$. After shrinking furhter we may assume that $s = x/y$ with $a, b \in A$ *both* nonzero divisors in A. Set $I = \{x \in A \mid x(a/b) \in A\}$.

To show that $\mathcal{I}$ is quasi-coherent we have to show that $I_f = \{x \in A_f \mid x(a/b) \in A_f\}$ for every $f \in A$. If $c/f^n \in A_f$, $(c/f^n)(a/b) \in A_f$, then we see that $f^m c(a/b) \in A$ for some m, hence $c/f^n \in I_f$. Conversely it is easy to see that I_f is contained in $\{x \in A_f \mid x(a/b) \in A_f\}$. This proves quasi-coherence.

Let us prove the final statement. It is clear that $(b) \subset I$. Hence $V(I) \subset V(b)$ is a nowhere dense subset as b is a nonzero divisor. Thus the cokernel of 1 is supported in a nowhere dense closed set. The same argument works for the cokerenel of s since $s(b) = (a) \subset sI \subset A$. □

Definition 26.15.14. Let X be a scheme. Let $\mathcal{L}$ be an invertible $\mathcal{O}_X$-module. Let s be a regular meromorphic section of $\mathcal{L}$. The sheaf of ideals $\mathcal{I}$ constructed in Lemma 26.15.13 is called the *ideal sheaf of denominators of s*.

Here is a lemma which will be used later.

Lemma 26.15.15. *Suppose given*

(1) *X a locally Noetherian scheme,*
(2) *$\mathcal{L}$ an invertible $\mathcal{O}_X$-module,*
(3) *s a regular meromorphic section of $\mathcal{L}$, and*
(4) *$\mathcal{F}$ coherent on X without embedded associated points and $Supp(\mathcal{F}) = X$.*

Let $\mathcal{I} \subset \mathcal{O}_X$ be the ideal of denominators of s. Let $T \subset X$ be the union of the supports of $\mathcal{O}_X/\mathcal{I}$ and $\mathcal{L}/s(\mathcal{I})$ which is a nowhere dense closed subset $T \subset X$ according to Lemma 26.15.13. Then there are canonical injective maps

$$1 : \mathcal{I}\mathcal{F} \to \mathcal{F}, \quad s : \mathcal{I}\mathcal{F} \to \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L}$$

whose cokernels are supported on T.

Proof. Reduce to the affine case with $\mathcal{L} \cong \mathcal{O}_X$, and $s = a/b$ with $a, b \in A$ both nonzero divisors. Proof of reduction step omitted. Write $\mathcal{F} = \widetilde{M}$. Let $I = \{x \in A \mid x(a/b) \in A\}$ so that $\mathcal{I} = \tilde{I}$ (see proof of Lemma 26.15.13). Note that $T = V(I) \cup V((a/b)I)$. For any A-module M consider the map $1 : IM \to M$; this is the map that gives rise to the map 1 of the lemma. Consider on the other hand the map $\sigma : IM \to M_b, x \mapsto ax/b$. Since b is not a zero divisor in A, and since M has support $Spec(A)$ and no embedded primes we see that b is a nonzero divisor on M also. Hence $M \subset M_b$. By definition of I we have $\sigma(IM) \subset M$ as submodules of M_b. Hence we get an A-module map $s : IM \to M$ (namely the unique map such that $s(z)/1 = \sigma(z)$ in M_b for all $z \in IM$). It is injective because a is a nonzero divisor also (on both A and M). It is clear that M/IM is annihilated by I and that $M/s(IM)$ is annihilated by $(a/b)I$. Thus the lemma follows. □

CHAPTER 27

Limits of Schemes

27.1. Introduction

In this chapter we start proving some basic theorems of algebraic geometry. A basic reference is [**DG67**].

27.2. Directed limits of schemes with affine transition maps

In this section we construct the limit.

Lemma 27.2.1. *Let I be a directed partially ordered set. Let $(S_i, f_{ii'})$ be an inverse system of schemes over I. If all the schemes S_i are affine, then the limit $S = lim_i S_i$ exists in the category of schemes. In fact S is affine and $S = Spec(colim_i R_i)$ with $R_i = \Gamma(S_i, \mathcal{O})$.*

Proof. Just define $S = Spec(colim_i R_i)$. It follows from Schemes, Lemma 21.6.4 that S is the limit even in the category of locally ringed spaces. □

Lemma 27.2.2. *Let I be a directed partially ordered set. Let $(S_i, f_{ii'})$ be an inverse system of schemes over I. If all the morphisms $f_{ii'} : S_i \to S_{i'}$ are affine, then the limit $S = lim_i S_i$ exists in the category of schemes. Moreover,*

1. *each of the morphisms $f_i : S \to S_i$ is affine,*
2. *for any $i \in I$ and any open subscheme $U_i \subset S_i$ we have*

$$f_i^{-1}(U_i) = lim_{i' \geq i} f_{i'i}^{-1}(U_i).$$

Proof. Choose $i_0 \in I$. Note that I is nonempty as the limit is directed. For convenience write $S_0 = S_{i_0}$ and $i_0 = 0$. For every $i \geq 0$ consider the quasi-coherent sheaf of $\mathcal{O}_{S_0}$-algebras $\mathcal{A}_i = f_{i0,*}\mathcal{O}_{S_i}$. Recall that $S_i = \underline{Spec}_{S_0}(\mathcal{A})$, see Morphisms, Lemma 24.11.3. Set $\mathcal{A} = colim_{i \geq 0} \mathcal{A}_i$. This is a quasi-coherent sheaf of $\mathcal{O}_{S_0}$-algebras, see Schemes, Section 21.24. Set $S = \underline{Spec}_{S_0}(\mathcal{A})$. By Morphisms, Lemma 24.11.5 we get for $i \geq 0$ morphisms $f_i : S \to S_i$ compatible with the transition morphisms. Note that the morphisms f_i are affine by Morphisms, Lemma 24.11.11 for example. By Lemma 27.2.1 above we see that for any affine open $U_0 \subset S_0$ the inverse image $U = f_0^{-1}(U_0) \subset S$ is the limit of the system of opens $U_i = f_i^{-1}(U_0)$, $i \geq 0$ in the category of schemes.

Let T be a scheme. Let $g_i : T \to S_i$ be a compatible system of morphisms. To show that $S = lim_i S_i$ we have to prove there is a unique morphism $g : T \to S$ with $g_i = f_i \circ g$ for all $i \in I$. For every $t \in T$ there exists an affine open $U_0 \subset S_0$ containing $g_0(t)$. Let $V \subset g_0^{-1}(U_0)$ be an affine open neighbourhood containing t. By the remarks above we obtain a unique morphism $g_V : V \to U = f_0^{-1}(U_0)$ such that $f_i \circ g_V = g_i|_{U_i}$ for all i. The open sets $V \subset T$ so constructed form a basis for the topology of T. The morphisms g_V glue to a morphism $g : T \to S$ because of the uniqueness property. This gives the desired morphism $g : T \to S$. □

Lemma 27.2.3. *Let I be a directed partially ordered set. Let $(S_i, f_{ii'})$ be an inverse system of schemes over I. Assume all the morphisms $f_{ii'} : S_i \to S_{i'}$ are affine, Let $S = lim_i\, S_i$.*

(1) *We have $S_{set} = lim_i\, S_{i,set}$ where S_{set} indicates the underlying set of the scheme S.*
(2) *If $s, s' \in S$ and s' is not a specialization of s then for some $i \in I$ the image $s'_i \in S_i$ of s' is not a specialization of the image $s_i \in S_i$ of s.*
(3) *Add more easy facts on topology of S here. (Requirement: whatever is added should be easy in the affine case.)*

Proof. Proof of (1). Pick $i \in I$. Take $U_i \subset S_i$ an affine open. Denote $U_{i'} = f_{i'i}^{-1}(U_i)$ and $U = f_i^{-1}(U_i)$. Suppose we can show that $U_{set} = lim_{i' \geq i}\, U_{i',set}$. Then assertion (1) follows by a simple argument using an affine covering of S_i. Hence we may assume all S_i and S affine. This reduces us to the following algebra question: Suppose given a system of rings $(A_i, \varphi_{ii'})$ over I. Set $A = colim_i\, A_i$ with canonical maps $\varphi_i : A_i \to A$. Then

$$Spec(A) = lim_i\, Spec(A_i)$$

Namely, suppose that we are given primes $\mathfrak{p}_i \subset A_i$ such that $\mathfrak{p}_i = \varphi_{ii'}^{-1}(\mathfrak{p}_{i'})$ for all $i' \geq i$. Then we simply set

$$\mathfrak{p} = \{x \in A \mid \exists i, x_i \in \mathfrak{p}_i \text{ with } \varphi(x_i) = x\}$$

It is clear that this is an ideal and has the property that $\varphi_i^{-1}(\mathfrak{p}) = \mathfrak{p}_i$. Then it follows easily that it is a prime ideal as well. This proves (1).

Proof of (2). Pick $i \in I$. Pick an affine open $U_i \subset S_i$ containing $f_i(s')$. If $f_i(s) \notin S_i$ then we are done. Hence reduce to the affine case by considering the inverse images of U_i as above. This reduces us to the following algebra question: Suppose given a system of rings $(A_i, \varphi_{ii'})$ over I. Set $A = colim_i\, A_i$ with canonical maps $\varphi_i : A_i \to A$. Suppose given primes $\mathfrak{p}$, $\mathfrak{p}'$ of A. Suppose that $\mathfrak{p} \not\subset \mathfrak{p}'$. Then for some i we have $\varphi_i^{-1}(\mathfrak{p}) \not\subset \varphi_i^{-1}(\mathfrak{p}')$. This is clear. □

Lemma 27.2.4. *Let I be a directed partially ordered set. Let $(S_i, f_{ii'})$ be an inverse system of schemes over I. Assume all the morphisms $f_{ii'} : S_i \to S_{i'}$ are affine, Let $S = lim_i\, S_i$. Let $i \in I$. Suppose that X_i is a scheme over S_i. Set $X_j = S_j \times_{S_i} X_i$ for $j \geq i$ and set $X = S \times_{S_i} X_i$. Then*

$$X = colim_{j \geq i}\, X_j$$

Proof. The transition morphisms of the system $\{X_j\}_{j \geq i}$ are affine as they are base changes of the affine morphisms between the S_j, see Morphisms, Lemma 24.11.8. Hence we know the limit of the system $\{X_j\}_{j \geq i}$ exists. There is a canonical morphism $X \to lim\, X_j$. To see that it is an isomorphism we may work locally. Hence we may assume that $X_i = Spec(B_i)$ is an affine such that the morphism $X_i \to S_i$ has image contained in an affine open subscheme U of S_i. In this case we may also replace each S_j by the inverse image of U in S_j, in other words we may assume all the $S_j = Spec(A_j)$ are affine. Then we have $X_j = Spec(A_j \otimes_{A_i} B_i)$. In this case the statement becomes the equality

$$colim_{j \geq i}(A_j \otimes_{A_i} B_i) = (colim_{j \geq i}\, A_j) \otimes_{A_i} B_i$$

which follows from Algebra, Lemma 7.11.8. □

Lemma 27.2.5. *Let I be a directed partially ordered set. Let $(S_i, f_{ii'})$ be an inverse system of schemes over I. Assume*

(1) *all the morphisms $f_{ii'} : S_i \to S_{i'}$ are affine,*

(2) *all the schemes S_i are quasi-compact and quasi-separated.*

Let $S = lim_i S_i$. Let $i \in I$. Suppose that $\mathcal{F}_i$ is a quasi-coherent sheaf on S_i. Set $\mathcal{F}_j = f_{ji}^*\mathcal{F}_i$ for $j \geq i$ and set $\mathcal{F} = f_i^*\mathcal{F}_i$. Then

$$\Gamma(S, \mathcal{F}) = colim_{j \geq i} \Gamma(S_j, \mathcal{F}_j)$$

Proof. Write $\mathcal{A}_j = f_{ji,*}\mathcal{O}_{S_j}$. This is a quasi-coherent sheaf of $\mathcal{O}_{S_i}$-algebras (see Morphisms, Lemma 24.11.5) and S_j is the relative spectrum of $\mathcal{A}_j$ over S_i. In the proof of Lemma 27.2.2 we constructed S as the relative spectrum of $\mathcal{A} = colim_{j \geq i} \mathcal{A}_j$ over S_i. Set

$$\mathcal{M}_j = \mathcal{F}_i \otimes_{\mathcal{O}_{S_i}} \mathcal{A}_j$$

and

$$\mathcal{M} = \mathcal{F}_i \otimes_{\mathcal{O}_{S_i}} \mathcal{A}.$$

Then we have $f_{ji,*}\mathcal{F}_j = \mathcal{M}_j$ and $f_{i,*}\mathcal{F} = \mathcal{M}$. Since $\mathcal{A}$ is the colimit of the sheaves $\mathcal{A}_j$ and since tensor product commutes with directed colimits, we conclude that $\mathcal{M} = colim_{j \geq i} \mathcal{M}_j$. Since S_i is quasi-compact and quasi-separated we see that

$$\begin{aligned} \Gamma(S, \mathcal{F}) &= \Gamma(S_i, \mathcal{M}) \\ &= \Gamma(S_i, colim_{j \geq i} \mathcal{M}_j) \\ &= colim_{j \geq i} \Gamma(S_i, \mathcal{M}_j) \\ &= colim_{j \geq i} \Gamma(S_j, \mathcal{F}_j) \end{aligned}$$

see Sheaves, Lemma 6.29.1 and Topology, Lemma 5.18.2 for the middle equality. □

27.3. Absolute Noetherian Approximation

A nice reference for this section is Appendix C of the article by Thomason and Trobaugh [**TT90**]. See Categories, Section 4.19 for our conventions regarding directed systems. We will use the existence result and properties of the limit from Section 27.2 without further mention.

Lemma 27.3.1. *Let I be a directed partially ordered set. Let $(S_i, f_{ii'})$ be an inverse system of schemes over I. Assume*

(1) *all the morphisms $f_{ii'} : S_i \to S_{i'}$ are affine,*
(2) *all the schemes S_i are quasi-compact, and*
(3) *all the schemes S_i are nonempty.*

Then the limit $S = lim_i S_i$ is nonempty.

Proof. Choose $i_0 \in I$. Note that I is nonempty as the limit is directed. For convenience write $S_0 = S_{i_0}$ and $i_0 = 0$. Choose an affine open covering $S_0 = \bigcup_{j=1,\ldots,m} U_j$. Since I is directed there exists a $j \in \{1, \ldots, m\}$ such that $f_{i0}^{-1}(U_j) \neq \emptyset$ for all $i \geq 0$. Hence $lim_{i \geq 0} f_{i0}^{-1}(U_j)$ is not empty since a directed colimit of nonzero rings is nonzero (because $1 \neq 0$). As $lim_{i \geq 0} f_{i0}^{-1}(U_j)$ is an open subscheme of the limit we win. □

Lemma 27.3.2. *Let I be a directed partially ordered set. Let $(S_i, f_{ii'})$ be an inverse system of schemes over I. Assume*

(1) *all the morphisms $f_{ii'} : S_i \to S_{i'}$ are affine, and*
(2) *all the schemes S_i are quasi-compact.*

Let $S = lim_i S_i$. Suppose for each i we are given a nonempty closed subset $Z_i \subset S_i$ with $f_{ii'}(Z_i) \subset Z_{i'}$. Then there exists a point $s \in S$ with $f_i(s) \in Z_i$ for all i.

Proof. Let $Z_i \subset S_i$ also denote the reduced closed subscheme associated to Z_i, see Schemes, Definition 21.12.5. A closed immersion is affine, and a composition of affine morphisms is affine (see Morphisms, Lemmas 24.11.9 and 24.11.7), and hence $Z_i \to S_{i'}$ is affine when $i \geq i'$. We conclude that the morphism $f_{ii'} : Z_i \to Z_{i'}$ is affine by Morphisms, Lemma 24.11.11. Each of the schemes Z_i is quasi-compact as a closed subscheme of a quasi-compact scheme. Hence we may apply Lemma 27.3.1 to see that $Z = lim_i Z_i$ is nonempty. Since there is a canonical morphism $Z \to S$ we win. □

Lemma 27.3.3. *Let I be a directed partially ordered set. Let $(S_i, f_{ii'})$ be an inverse system of schemes over I. Assume all the morphisms $f_{ii'} : S_i \to S_{i'}$ are affine. Let $S = lim_i S_i$. Suppose we are given an i and a morphism $T \to S_i$ such that*

(1) *$T \times_{S_i} S = \emptyset$, and*
(2) *T is quasi-compact.*

Then $T \times_{S_i} S_{i'} = \emptyset$ for all sufficiently large i'.

Proof. By Lemma 27.2.4 we see that $T \times_{S_i} S = lim_{i' \geq i} T \times_{S_i} S_{i'}$. Hence the result follows from Lemma 27.3.1. □

Lemma 27.3.4. *Let I be a directed partially ordered set. Let $(S_i, f_{ii'})$ be an inverse system of schemes over I. Assume all the morphisms $f_{ii'} : S_i \to S_{i'}$ are affine, and all the schemes S_i are quasi-compact. Let $S = lim_i S_i$ with projection morphisms $f_i : S \to S_i$. Suppose we are given an i and a locally constructible subset $E \subset S_i$ such that $f_i(S) \subset E$. Then $f_{ii'}(S_{i'}) \subset E$ for all sufficiently large i'.*

Proof. Writing S_i as a finite union of open affine subschemes reduces the question to the case that S_i is affine and E is constructible, see Lemma 27.2.2 and Properties, Lemma 23.2.1. In this case the complement $S_i \setminus E$ is contstructible too. Hence there exists an affine scheme T and a morphism $T \to S_i$ whose image is $S_i \setminus E$, see Algebra, Lemma 7.26.3. By Lemma 27.3.3 we see that $T \times_{S_i} S_{i'}$ is empty for all sufficiently large i', and hence $f_{ii'}(S_{i'}) \subset E$ for all sufficiently large i'. □

Lemma 27.3.5. *Let I be a directed partially ordered set. Let $(S_i, f_{ii'})$ be an inverse system of schemes over I. Assume*

(1) *all the morphisms $f_{ii'} : S_i \to S_{i'}$ are affine,*
(2) *all the schemes S_i are quasi-compact and quasi-separated.*

Then we have the following:

(1) *Given any quasi-compact open $V \subset S = lim_i S_i$ there exists an $i \in I$ and a quasi-compact open $V_i \subset S_i$ such that $f_i^{-1}(V_i) = V$.*
(2) *Given $V_i \subset S_i$ and $V_{i'} \subset S_{i'}$ quasi-compact opens such that $f_i^{-1}(V_i) = f_{i'}^{-1}(V_{i'})$ there exists an index $i'' \geq i, i'$ such that $f_{i''i}^{-1}(V_i) = f_{i''i'}^{-1}(V_{i'})$.*
(3) *If $V_{1,i}, \ldots, V_{n,i} \subset S_i$ are quasi-compact opens and $S = f_i^{-1}(V_{1,i}) \cup \ldots \cup f_i^{-1}(V_{n,i})$ then $S_{i'} = f_{i'i}^{-1}(V_{1,i}) \cup \ldots \cup f_{i'i}^{-1}(V_{n,i})$ for some $i' \geq i$.*

Proof. Choose $i_0 \in I$. Note that I is nonempty as the limit is directed. For convenience we write $S_0 = S_{i_0}$ and $i_0 = 0$. Choose an affine open covering $S_0 = U_{1,0} \cup \ldots \cup U_{m,0}$. Denote $U_{j,i} \subset S_i$ the inverse image of $U_{j,0}$ under the transition morphism for $i \geq 0$. Denote U_j the inverse image of $U_{j,0}$ in S. Note that $U_j = lim_i U_{j,i}$ is a limit of affine schemes.

We first prove the uniqueness statement: Let $V_i \subset S_i$ and $V_{i'} \subset S_{i'}$ quasi-compact opens such that $f_i^{-1}(V_i) = f_{i'}^{-1}(V_{i'})$. It suffices to show that $f_{i''i}^{-1}(V_i \cap U_{j,i''})$ and $f_{i''i'}^{-1}(V_{i'} \cap U_{j,i''})$

become equal for i'' large enough. Hence we reduce to the case of a limit of affine schemes. In this case write $S = Spec(R)$ and $S_i = Spec(R_i)$ for all $i \in I$. We may write $V_i = S_i \setminus V(h_1, \ldots, h_m)$ and $V_{i'} = S_{i'} \setminus V(g_1, \ldots, g_n)$. The assumption means that the ideals $\sum g_j R$ and $\sum h_j R$ have the same radical in R. This means that $g_j^N = \sum a_{jj'} h_{j'}$ and $h_j^N = \sum b_{jj'} g_{j'}$ for some $N \gg 0$ and $a_{jj'}$ and $b_{jj'}$ in R. Since $R = colim_i R_i$ we can chose an index $i'' \geq i$ such that the equations $g_j^N = \sum a_{jj'} h_{j'}$ and $h_j^N = \sum b_{jj'} g_{j'}$ hold in $R_{i''}$ for some $a_{jj'}$ and $b_{jj'}$ in $R_{i''}$. This implies that the ideals $\sum g_j R_{i''}$ and $\sum h_j R_{i''}$ have the same radical in $R_{i''}$ as desired.

We prove existence. We may apply the uniqueness statement to the limit of schemes $U_{j_1} \cap U_{j_2} = lim_i U_{j_1,i} \cap U_{j_2,i}$ since these are still quasi-compact due to the fact that the S_i were assumed quasi-separated. Hence it is enough to prove existence in the affine case. In this case write $S = Spec(R)$ and $S_i = Spec(R_i)$ for all $i \in I$. Then $V = S \setminus V(g_1, \ldots, g_n)$ for some $g_1, \ldots, g_n \in R$. Choose any i large enough so that each of the g_j comes from an element $g_{j,i} \in R_i$ and take $V_i = S_i \setminus V(g_{1,i}, \ldots, g_{n,i})$.

The statement on coverings follows from the uniqueness statement for the opens $V_{1,i} \cup \ldots \cup V_{n,i}$ and S_i of S_i. □

Lemma 27.3.6. *Let I be a directed partially ordered set. Let $(S_i, f_{ii'})$ be an inverse system of schemes over I. Assume*

(1) *all the morphisms $f_{ii'} : S_i \to S_{i'}$ are affine,*
(2) *all the schemes S_i are quasi-compact and quasi-separated, and*
(3) *the limit $S = lim_i S_i$ is quasi-affine.*

Then for some $i_0 \in I$ the schemes S_i for $i \geq i_0$ are quasi-affine.

Proof. Choose $i_0 \in I$. Note that I is nonempty as the limit is directed. For convenience we write $S_0 = S_{i_0}$ and $i_0 = 0$. Let $s \in S$. We may choose an affine open $U_0 \subset S_0$ containing $f_0(s)$. Since S is quasi-affine we may choose an element $a \in \Gamma(S, \mathcal{O}_S)$ such that $s \in D(a) \subset f_0^{-1}(U_0)$, and such that $D(a)$ is affine. By Lemma 27.2.5 there exists an $i \geq 0$ such that a comes from an element $a_i \in \Gamma(S_i, \mathcal{O}_{S_i})$. For any index $j \geq i$ we denote a_j the image of a_i in the global sections of the structure sheaf of S_j. Consider the opens $D(a_j) \subset S_j$ and $U_j = f_{j0}^{-1}(U_0)$. Note that U_j is affine and $D(a_j)$ is a quasi-compact open of S_j, see Properties, Lemma 23.23.4 for example. Hence we may apply Lemma 27.3.5 to the opens U_j and $U_j \cup D(a_j)$ to conclude that $D(a_j) \subset U_j$ for some $j \geq i$. For such an index j we see that $D(a_j) \subset S_j$ is an affine open (because $D(a_j)$ is a standard affine open of the affine open U_j) containing the image $f_j(s)$.

We conclude that for every $s \in S$ there exist an index $i \in I$, and a global section $a \in \Gamma(S_i, \mathcal{O}_{S_i})$ such that $D(a) \subset S_i$ is an affine open containing $f_i(s)$. Because S is quasi-compact we may choose a single index $i \in I$ and global sections $a_1, \ldots, a_m \in \Gamma(S_i, \mathcal{O}_{S_i})$ such that each $D(a_j) \subset S_i$ is affine open and such that $f_i : S \to S_i$ has image contained in the union $W_i = \bigcup_{j=1,\ldots,m} D(a_j)$. For $i' \geq i$ set $W_{i'} = f_{i'i}^{-1}(W_i)$. Since $f_i^{-1}(W_i)$ is all of S we see (by Lemma 27.3.5 again) that for a suitable $i' \geq i$ we have $S_{i'} = W_{i'}$. Thus we may replace i by i' and assume that $S_i = \bigcup_{j=1,\ldots,m} D(a_j)$. This implies that $\mathcal{O}_{S_i}$ is an ample invertible sheaf on S_i (see Properties, Definition 23.23.1) and hence that S_i is quasi-affine, see Properties, Lemma 23.24.1. Hence we win. □

Lemma 27.3.7. *Let I be a directed partially ordered set. Let $(S_i, f_{ii'})$ be an inverse system of schemes over I. Assume*

(1) *all the morphisms $f_{ii'} : S_i \to S_{i'}$ are affine,*
(2) *all the schemes S_i are quasi-compact and quasi-separated, and*
(3) *the limit $S = lim_i S_i$ is affine.*

Then for some $i_0 \in I$ the schemes S_i for $i \geq i_0$ are affine.

Proof. By Lemma 27.3.6 we may assume that S_i is quasi-affine for all i. Set $R_i = \Gamma(S_i, \mathcal{O}_{S_i})$. Then S_i is a quasi-compact open of $\overline{S_i} := Spec(R_i)$. Write $S = Spec(R)$. We have $R = colim_i R_i$ by Lemma 27.2.5. Hence also $S = lim_i \overline{S_i}$. Let $Z_i \subset \overline{S_i}$ be the closed subset such that $\overline{S_i} = Z_i \coprod S_i$. We have to show that Z_i is empty for some i. Assume Z_i is nonempty for all i to get a contradiction. By Lemma 27.3.2 there exists a point s of S which maps to a point of Z_i for every i. But $S = lim_i S_i$, and hence we get a contradiction. □

Lemma 27.3.8. *Let W be a quasi-affine scheme of finite type over $\mathbf{Z}$. Suppose $W \to Spec(R)$ is an open immersion into an affine scheme. There exists a finite type $\mathbf{Z}$-algebra $A \subset R$ which induces an open immersion $W \to Spec(A)$. Moreover, R is the directed colimit of such subalgebras.*

Proof. Choose an affine open covering $W = \bigcup_{i=1,\ldots,n} W_i$ such that each W_i is a standard affine open in $Spec(R)$. In other words, if we write $W_i = Spec(R_i)$ then $R_i = R_{f_i}$ for some $f_i \in R$. Choose finitely many $x_{ij} \in R_i$ which generate R_i over $\mathbf{Z}$. Pick an $N \gg 0$ such that each $f_i^N x_{ij}$ comes from an element of R, say $y_{ij} \in R$. Set A equal to the $\mathbf{Z}$-algebra generated by the f_i and the y_{ij} and (optionally) finitely many additional elements of R. Then A works. Details omitted. □

Lemma 27.3.9. *Suppose given a cartesian diagram of rings*

$$\begin{tikzcd} B \arrow[r, "s"] & R \\ B' \arrow[u] \arrow[r] & R' \arrow[u, "t"'] \end{tikzcd}$$

Suppose $h \in B'$ corresponds to $g \in B$ and $f \in R'$ such that $s(g) = t(f)$. Then the diagram

$$\begin{tikzcd} B_g \arrow[r, "s"] & R_{s(g)} = R_{t(f)} \\ (B')_h \arrow[u] \arrow[r] & (R')_f \arrow[u, "t"'] \end{tikzcd}$$

is cartesian too.

Proof. Note that $B' = \{(b, r') \in B \times R' \mid s(b) = t(r')\}$. So $h = (g, f) \in B'$. First we show that $(B')_h$ maps injectively into $B_g \times (R')_f$. Namely, suppose that $(x, y)/h^n$ maps to zero. This means that $(g^N x, f^N y)$ is zero for some N. Which clearly implies that x/g^n and y/f^n are both zero. Next, suppose that x/g^n and y/f^m are elements which map to the same element of $R_{s(g)}$. This means that $s(g)^N(t(f)^m s(x) - s(g)^n t(y)) = 0$ in R' for some $N \gg 0$. We can rewrite this as $s(g^{m+N}x) = t(f^{n+N}y)$. Hence we see that the pair $(x/g^n, y/f^m)$ is the image of the element $(g^{m+N}x, t(f^{n+N}y))/(g, f)^{n+m+N}$ of $(B')_h$. □

Lemma 27.3.10. *Suppose given a cartesian diagram of rings*

$$\begin{tikzcd} B \arrow[r, "s"'] & R \\ B' \arrow[u] \arrow[r] & R' \arrow[u, "t"'] \end{tikzcd}$$

Let $W' \subset Spec(R')$ be an open of the form $W' = D(f_1) \cup \ldots \cup D(f_n)$ such that $t(f_i) = s(g_i)$ for some $g_i \in B$ and $B_{g_i} \cong R_{s(g_i)}$. Then $B' \to R'$ induces an open immersion of W' into $Spec(B')$.

Proof. Set $h_i = (g_i, f_i) \in B'$. Lemma 27.3.9 above shows that $(B')_{h_i} \cong (R')_{f_i}$ as desired. □

Proposition 27.3.11. *Let S be a quasi-compact and quasi-separated scheme. There exist a directed partially ordered set I and an inverse system of schemes $(S_i, f_{ii'})$ over I such that*

(1) *the transition morphisms $f_{ii'}$ are affine*
(2) *each S_i is of finite type over $\mathbf{Z}$, and*
(3) *$S = lim_i S_i$.*

Proof. Choose an affine open covering $S = \bigcup_{j=1,\ldots,m} U_j$ with m minimal. We will prove the lemma by induction on m. The lemma is obvious when $m = 1$ since any ring is the directed colimit of its finitely generated $\mathbf{Z}$-subalgebras.

Thus we may assume

(1) $S = U \cup V$,
(2) U affine open in S,
(3) V quasi-compact open in S, and
(4) $V = lim_i V_i$ with $(V_i, f_{ii'})$ an inverse system over a directed set I, each $f_{ii'}$ affine and each V_i of finite type over $\mathbf{Z}$.

Set $W = U \cap V$. This is a quasi-compact open of V. By Lemma 27.3.5 (and after shrinking I) we may assume that there exist opens $W_i \subset V_i$ such that $f_{ij}^{-1}(W_j) = W_i$ and such that $f_i^{-1}(W_i) = W$. Since W is a quasi-compact open of U it is quasi-affine. Hence we may assume (after shrinking I again) that W_i is quasi-affine for all i, see Lemma 27.3.6.

Write $U = Spec(B)$. Set $R = \Gamma(W, \mathcal{O}_W)$, and $R_i = \Gamma(W_i, \mathcal{O}_{W_i})$. By Lemma 27.2.5 we have $R = colim_i R_i$. Now we have the maps of rings

$$\begin{tikzcd} B \arrow[r, "s"'] & R \\ & R_i \arrow[u, "t_i"'] \end{tikzcd}$$

We set $B_i = \{(b, r) \in B \times R_i \mid s(b) = t_i(t)\}$ so that we have a cartesian diagram

$$\begin{tikzcd} B \arrow[r, "s"'] & R \\ B_i \arrow[u] \arrow[r] & R_i \arrow[u, "t_i"'] \end{tikzcd}$$

for each i. The transition maps $R_i \to R_{i'}$ induce maps $B_i \to B_{i'}$. It is clear that $B = colim_i B_i$.

As W is a quasi-compact open of $U = Spec(B)$ we can find a finitely many elements $g_j \in B$, $j = 1, \ldots, m$ such that $D(g_j) \subset W$ and such that $W = \bigcup_{j=1,\ldots,m} D(g_j)$. Note that this implies $D(g_j) = W_{s(g_j)}$ as open subsets of U, where $W_{s(g_j)}$ denotes the largest open subset of W on which $s(g_j)$ is invertible. Hence

$$B_{g_j} = \Gamma(D(g_j), \mathcal{O}_U) = \Gamma(W_{s(g_j)}, \mathcal{O}_W) = R_{s(g_j)},$$

where the last equality is Properties, Lemma 23.15.2. Since $W_{s(g_j)}$ is affine this also implies that $D(s(g_j)) = W_{s(g_j)}$ as open subsets of $Spec(R)$. Since $R = colim_i R_i$ we can (after shrinking I) assume there exist $g_{j,i} \in R_i$ for all $i \in I$ such that $s(g_j) = t_i(g_{j,i})$. Of course we choose the $g_{j,i}$ such that $g_{j,i}$ maps to $g_{j,i'}$ under the transition maps $R_i \to R_{i'}$. Then, by Lemma 27.3.5 we can (after shrinking I again) assume the corresponding opens $D(g_{j,i}) \subset Spec(R_i)$ are contained in W_i, $j = 1, \ldots, m$ and cover W_i. At this point we may apply Lemma 27.3.10 to conclude that the morphism $W_i \to Spec(R_i) \to Spec(B_i)$ is an open immersion.

By Lemma 27.3.8 we can write each B_i as a directed colimit of subalgebras $A_{i,l} \subset B_i$, $l \in L_i$ each of finite type over $\mathbf{Z}$ and such that W_i is identified with an open subscheme of $Spec(A_{i,l})$. Let $S_{i,l}$ be the scheme obtained by glueing V_i and $Spec(A_{i,l})$ along the open W_i, see Schemes, Section 21.14. Here is the resulting commutative diagram of schemes:

$$\begin{tikzcd}
 & & V \arrow[dll] \arrow[d] & W \arrow[l] \arrow[dll] \arrow[d] \\
V_i \arrow[d] & W_i \arrow[l] \arrow[d] & S \arrow[dll] & U \arrow[l] \arrow[dll] \\
S_{i,l} & Spec(A_{i,l}) \arrow[l] & &
\end{tikzcd}$$

The morphism $S \to S_{i,l}$ arises because the upper right square is a push out in the category of schemes. Note that $S_{i,l}$ is of finite type over $\mathbf{Z}$ since it has a finite affine open covering whose members are spectra of finite type $\mathbf{Z}$-algebras. We define a partial ordering on $J = \coprod_{i \in I} L_i$ by the rule $(i', l') \geq (i, l)$ if and only if $i' \geq i$ and the map $B_i \to B_{i'}$ maps $A_{i,l}$ into $A_{i',l'}$. This is exactly the condition needed to define a morphism $S_{i',l'} \to S_{i,l}$: namely make a commutative diagram as above using the transition morphisms $V_{i'} \to V_i$ and $W_{i'} \to W_i$ and the morphism $Spec(A_{i',l'}) \to Spec(A_{i,l})$ induced by the ring map $A_{i,l} \to A_{i',l'}$. The relevant commutativities have been built into the constructions. We claim that S is the directed limit of the schemes $S_{i,l}$. Since by construction the schemes V_i have limit V this boils down to the fact that B is the limit of the rings $A_{i,l}$ which is true by construction. $\square$

27.4. Limits and morphisms of finite presentation

The following is a generalization of Algebra, Lemma 7.118.2.

Proposition 27.4.1. *Let $f : X \to S$ be a morphism of schemes. The following are equivalent:*

1. *The morphism f is locally of finite presentation.*
2. *For any directed partially ordered set I, and any inverse system $(T_i, f_{ii'})$ of S-schemes over I with each T_i affine, we have*

$$Mor_S(lim_i T_i, X) = colim_i Mor_S(T_i, X)$$

(3) *For any directed partially ordered set I, and any inverse system $(T_i, f_{ii'})$ of S-schemes over I with each $f_{ii'}$ affine and every T_i quasi-compact and quasi-separated as a scheme, we have*
$$Mor_S(lim_i T_i, X) = colim_i Mor_S(T_i, X)$$

Proof. It is clear that (3) implies (2).

Let us prove that (2) implies (1). Assume (2). Choose any affine opens $U \subset X$ and $V \subset S$ such that $f(U) \subset V$. We have to show that $\mathcal{O}_S(V) \to \mathcal{O}_X(U)$ is of finite presentation. Let $(A_i, \varphi_{ii'})$ be a directed system of $\mathcal{O}_S(V)$-algebras. Set $A = colim_i A_i$. According to Algebra, Lemma 7.118.2 we have to show that
$$Hom_{\mathcal{O}_S(V)}(\mathcal{O}_X(U), A) = colim_i Hom_{\mathcal{O}_S(V)}(\mathcal{O}_X(U), A_i)$$
Consider the schemes $T_i = Spec(A_i)$. They form an inverse system of V-schemes over I with transition morphisms $f_{ii'} : T_i \to T_{i'}$ induced by the $\mathcal{O}_S(V)$-algebra maps $\varphi_{i'i}$. Set $T := Spec(A) = lim_i T_i$. The formula above becomes in terms of morphism sets of schemes
$$Mor_V(lim_i T_i, U) = colim_i Mor_V(T_i, U).$$
We first observe that $Mor_V(T_i, U) = Mor_S(T_i, U)$ and $Mor_V(T, U) = Mor_S(T, U)$. Hence we have to show that
$$Mor_S(lim_i T_i, U) = colim_i Mor_S(T_i, U)$$
and we are given that
$$Mor_S(lim_i T_i, X) = colim_i Mor_S(T_i, X).$$
Hence it suffices to prove that given a morphism $g_i : T_i \to X$ over S such that the composition $T \to T_i \to X$ ends up in U there exists some $i' \geq i$ such that the composition $g_{i'} : T_{i'} \to T_i \to X$ ends up in U. Denote $Z_{i'} = g_{i'}^{-1}(X \setminus U)$. Assume each $Z_{i'}$ is nonempty to get a contradiction. By Lemma 27.3.2 there exists a point t of T which is mapped into $Z_{i'}$ for all $i' \geq i$. Such a point is not mapped into U. A contradiction.

Finally, let us prove that (1) implies (3). Assume (1). Let an inverse directed system $(T_i, f_{ii'})$ of S-schemes be given. Assume the morphisms $f_{ii'}$ are affine and each T_i is quasi-compact and quasi-separated as a scheme. Let $T = lim_i T_i$. Denote $f_i : T \to T_i$ the projection morphisms. We have to show:

(a) Given morphisms $g_i, g_i' : T_i \to X$ over S such that $g_i \circ f_i = g_i' \circ f_i$, then there exists an $i' \geq i$ such that $g_i \circ f_{i'i} = g_i' \circ f_{i'i}$.
(b) Given any morphism $g : T \to X$ over S there exists an $i \in I$ and a morphism $g_i : T_i \to X$ such that $g = f_i \circ g_i$.

First let us prove the uniqueness part (a). Let $g_i, g_i' : T_i \to X$ be morphisms such that $g_i \circ f_i = g_i' \circ f_i$. For any $i' \geq i$ we set $g_{i'} = g_i \circ f_{i'i}$ and $g_{i'}' = g_i' \circ f_{i'i}$. We also set $g = g_i \circ f_i = g_i' \circ f_i$. Consider the morphism $(g_i, g_i') : T_i \to X \times_S X$. Set
$$W = \bigcup\nolimits_{U \subset X \text{ affine open}, V \subset S \text{ affine open}, f(U) \subset V} U \times_V U.$$
This is an open in $X \times_S X$, with the property that the morphism $\Delta_{X/S}$ factors through a closed immersion into W, see the proof of Schemes, Lemma 21.21.2. Note that the composition $(g_i, g_i') \circ f_i : T \to X \times_S X$ is a morphism into W because it factors through the diagonal by assumption. Set $Z_{i'} = (g_{i'}, g_{i'}')^{-1}(X \times_S X \setminus W)$. If each $Z_{i'}$ is nonempty, then by Lemma 27.3.2 there exists a point $t \in T$ which maps to $Z_{i'}$ for all $i' \geq i$. This is a contradiction with the fact that T maps into W. Hence we may increase i and assume that $(g_i, g_i') : T_i \to X \times_S X$

is a morphism into W. By construction of W, and since T_i is quasi-compact we can find a finite affine open covering $T_i = T_{1,i} \cup \ldots \cup T_{n,i}$ such that $(g_i, g_i')|_{T_{j,i}}$ is a morphism into $U \times_V U$ for some pair (U, V) as in the definition of W above. Since it suffices to prove that $g_{i'}$ and $g'_{i'}$ agree on each of the $f_{i'i}^{-1}(T_{j,i})$ this reduces us to the affine case. The affine case follows from Algebra, Lemma 7.118.2 and the fact that the ring map $\mathcal{O}_S(V) \to \mathcal{O}_X(U)$ is of finite presentation (see Morphisms, Lemma 24.20.2).

Finally, we prove the existence part (b). Let $g : T \to X$ be a morphism of schemes over S. We can find a finite affine open covering $T = W_1 \cup \ldots \cup W_n$ such that for each $j \in \{1, \ldots, n\}$ there exist affine opens $U_j \subset X$ and $V_j \subset S$ with $f(U_j) \subset V_j$ and $g(W_j) \subset U_j$. By Lemmas 27.3.5 and 27.3.7 (after possibly shrinking I) we may assume that there exist affine open coverings $T_i = W_{1,i} \cup \ldots \cup W_{n,i}$ compatible with transition maps such that $W_j = lim_i\, W_{j,i}$. We apply Algebra, Lemma 7.118.2 to the rings corresponding to the affine schemes U_j, V_j, $W_{j,i}$ and W_j using that $\mathcal{O}_S(V_j) \to \mathcal{O}_X(U_j)$ is of finite presentation (see Morphisms, Lemma 24.20.2). Thus we can find for each j an index $i_j \in I$ and a morphism $g_{j,i_j} : W_{j,i_j} \to X$ such that $g_{j,i_j} \circ f_i|_{W_j} : W_j \to W_{j,i} \to X$ equals $g|_{W_j}$. By part (a) proved above, using the quasi-compactness of $W_{j_1,i} \cap W_{j_2,i}$ which follows as T_i is quasi-separated, we can find an index $i' \in I$ larger than all i_j such that

$$g_{j_1,i_{j_1}} \circ f_{i'i_{j_1}}|_{W_{j_1,i'} \cap W_{j_2,i'}} = g_{j_2,i_{j_2}} \circ f_{i'i_{j_2}}|_{W_{j_1,i'} \cap W_{j_2,i'}}$$

for all $j_1, j_2 \in \{1, \ldots, n\}$. Hence the morphisms $g_{j,i_j} \circ f_{i'i_j}|_{W_{j,i'}}$ glue to given the desired morphism $T_{i'} \to X$. □

Remark 27.4.2. Let S be a scheme. Let us say that a functor $F : (Sch/S)^{opp} \to Sets$ is *limit preserving* if for every directed inverse system $\{T_i\}_{i \in I}$ of affine schemes with limit T we have $F(T) = colim_i\, F(T_i)$. Let X be a scheme over S, and let $h_X : (Sch/S)^{opp} \to Sets$ be its functor of points, see Schemes, Section 21.15. In this terminology Proposition 27.4.1 says that a scheme X is locally of finite presentation over S if and only if h_X is limit preserving.

27.5. Finite type closed in finite presentation

A reference is [**Con07**].

Lemma 27.5.1. *Let $f : X \to S$ be a morphism of schemes. Assume:*

(1) *The morphism f is locally of finite type.*
(2) *The scheme X is quasi-compact and quasi-separated.*

Then there exists a morphism of finite presentation $f' : X' \to S$ and an immersion $X \to X'$ of schemes over S.

Proof. By Proposition 27.3.11 we can write $X = lim_i\, X_i$ with each X_i of finite type over $\mathbf{Z}$ and with transition morphisms $f_{ii'} : X_i \to X_{i'}$ affine. Consider the commutative diagram

$$\begin{tikzcd} X \arrow[r] \arrow[dr] & X_{i,S} \arrow[r] \arrow[d] & X_i \arrow[d] \\ & S \arrow[r] & Spec(\mathbf{Z}) \end{tikzcd}$$

Note that X_i is of finite presentation over $Spec(\mathbf{Z})$, see Morphisms, Lemma 24.20.9. Hence the base change $X_{i,S} \to S$ is of finite presentation by Morphisms, Lemma 24.20.4. Thus it suffices to show that the arrow $X \to X_{i,S}$ is an immersion for some i sufficiently large.

To do this we choose a finite affine open covering $X = V_1 \cup \ldots \cup V_n$ such that f maps each V_j into an affine open $U_j \subset S$. Let $h_{j,a} \in \mathcal{O}_X(V_j)$ be a finite set of elements which generate $\mathcal{O}_X(V_j)$ as an $\mathcal{O}_S(U_j)$-algebra, see Morphisms, Lemma 24.14.2. By Lemmas 27.3.5 and 27.3.7 (after possibly shrinking I) we may assume that there exist affine open coverings $X_i = V_{1,i} \cup \ldots \cup V_{n,i}$ compatible with transition maps such that $V_j = lim_i V_{j,i}$. By Lemma 27.2.5 we can choose i so large that each $h_{j,a}$ comes from an element $h_{j,a,i} \in \mathcal{O}_{X_i}(V_{j,i})$. At this point it is clear that

$$V_j \longrightarrow U_j \times_{Spec(\mathbf{Z})} V_{j,i} = (V_{j,i})_{U_j} \subset (V_{j,i})_S \subset X_{i,S}$$

is a closed immersion. Since the union of the schemes which appear as the targets of these morphisms form an open of $X_{i,S}$ we win. □

Remark 27.5.2. We cannot do better than this if we do not assume more on S and the morphism $f : X \to S$. For example, in general it will not be possible to find a *closed* immersion $X \to X'$ as in the lemma. The reason is that this would imply that f is quasi-compact which may not be the case. An example is to take S to be infinite dimensional affine space with 0 doubled and X to be one of the two infinite dimensional affine spaces.

Lemma 27.5.3. *Let $f : X \to S$ be a morphism of schemes. Assume:*

(1) *The morphism f is of locally of finite type.*
(2) *The scheme X is quasi-compact and quasi-separated, and*
(3) *The scheme S is quasi-separated.*

Then there exists a morphism of finite presentation $f' : X' \to S$ and a closed immersion $X \to X'$ of schemes over S.

Proof. By Lemma 27.5.1 above there exists a morphism $Y \to S$ of finite presentation and an immersion $i : X \to Y$ of schemes over S. For every point $x \in X$, there exists an affine open $V_x \subset Y$ such that $i^{-1}(V_x) \to V_x$ is a closed immersion. Since X is quasi-compact we can find finitely may affine opens $V_1, \ldots, V_n \subset Y$ such that $i(X) \subset V_1 \cup \ldots \cup V_n$ and $i^{-1}(V_j) \to V_j$ is a closed immersion. In other words such that $i : X \to X' = V_1 \cup \ldots \cup V_n$ is a closed immersion of schemes over S. Since S is quasi-separated and Y is quasi-separated over S we deduce that Y is quasi-separated, see Schemes, Lemma 21.21.13. Hence the open immersion $X' = V_1 \cup \ldots \cup V_n \to Y$ is quasi-compact. This implies that $X' \to Y$ is of finite presentation, see Morphisms, Lemma 24.20.6. We conclude since then $X' \to Y \to S$ is a composition of morphisms of finite presentation, and hence of finite presentation (see Morphisms, Lemma 24.20.3). □

Lemma 27.5.4. *Let S be a scheme. Let I be a directed partially ordered set. Let $(X_i, f_{ii'})$ be an inverse system of schemes over S indexed by I. Assume*

(1) *the scheme S is quasi-separated,*
(2) *each X_i is locally of finite type over S,*
(3) *all the morphisms $f_{ii'} : X_i \to X_{i'}$ are affine,*
(4) *all the schemes X_i are quasi-compact and quasi-separated,*
(5) *the morphism $X = lim_i X_i \to S$ is separated.*

Then $X_i \to S$ is separated for all i large enough.

Proof. Let $i_0 \in I$. Note that I is nonempty as the limit is directed. For convenience write $X_0 = X_{i_0}$ and $i_0 = 0$. As X_0 is quasi-compact we can find finitely many affine opens $U_1, \ldots, U_n \subset S$ such that $X_0 \to S$ maps into $U_1 \cup \ldots \cup U_n$. Denote $h_i : X_i \to S$ the structure morphism. It suffices to check that for some $i \geq 0$ the morphisms $h_i^{-1}(U_j) \to U_j$

are separated for all $j = 1, \ldots, n$. Since S is quasi-separated the morphisms $U_j \to S$ are quasi-compact. Hence $h_i^{-1}(U_j)$ is quasi-compact and quasi-separated. In this way we reduce to the case S affine.

Assume S affine. Choose a finite affine open covering $X_0 = V_{1,0} \cup \ldots \cup V_{m,0}$. As usual we denote $V_{j,i}$ the inverse image of $V_{j,0}$ in X_i for $i \geq 0$. We also denote V_j the inverse image of $V_{j,0}$ in X. By assumption the intersections $V_{j_1,i} \cap V_{j_2,i}$ are quasi-compact opens. Since X is separated we see that $V_{j_1} \cap V_{j_2}$ is affine. Hence we see that $V_{j_1,i} \cap V_{j_2,i}$ are all affine for i big enough by Lemma 27.3.7. After increasing $i_0 = 0$ we may assume this holds for all $i \geq 0$. By Schemes, Lemma 21.21.8 we have to show that for some i big enough the ring map

$$\mathcal{O}_{X_i}(V_{j_1,i}) \otimes_{\mathcal{O}_S(S)} \mathcal{O}_{X_i}(V_{j_2,i}) \longrightarrow \mathcal{O}_{X_i}(V_{j_1,i} \cap V_{j_2,i})$$

is surjective. Since $V_{j,i}$ is the inverse image of $V_{j,0}$ under the affine transition maps f_{i0} we see that

$$V_{j_1,i} \cap V_{j_2,i} = V_{j_1,i} \times_{V_{j_1,0}} (V_{j_1,0} \cap V_{j_2,0})$$

Choose generators $x_{j_1,j_2,\alpha} \in \mathcal{O}_{X_0}(V_{j_1,0} \cap V_{j_2,0})$ as an algebra over $\mathcal{O}_{X_0}(V_{j_1,0})$. We can choose finitely many of these since $\mathcal{O}_{X_0}(V_{j_1,0} \cap V_{j_2,0})$ is a finite type $\mathcal{O}_S(S)$-algebra, see Morphisms, Lemma 24.14.2. By the displayed equality of fibre products, the images of $x_{j_1,j_2,\alpha}$ generate $\mathcal{O}_{X_i}(V_{j_1,i} \cap V_{j_2,i})$ as an algebra over $\mathcal{O}_{X_i}(V_{j_1,i})$ also. Since X is separated the ring maps

$$\mathcal{O}_X(V_{j_1}) \otimes_{\mathcal{O}_S(S)} \mathcal{O}_X(V_{j_2,i}) \longrightarrow \mathcal{O}_X(V_{j_1} \cap V_{j_2})$$

are surjective. Hence we can find finite sums

$$\sum y_{j_1,j_2,\alpha,\beta} \otimes z_{j_1,j_2,\alpha,\beta}$$

in the left hand side which map to the elements $x_{j_1,j_2,\alpha}$ of the right hand side. Using Lemma 27.2.5 we may choose i large enough so that each of the (finitely many) elements $y_{j_1,j_2,\alpha,\beta}$ (resp. $z_{j_1,j_2,\alpha,\beta}$) comes from a corresponding element $y_{j_1,j_2,\alpha,\beta,i}$ (resp. $z_{j_1,j_2,\alpha,\beta,i}$) of $\mathcal{O}_{X_i}(V_{j_1,i})$ (resp. $\mathcal{O}_{X_i}(V_{j_2,i})$ and moreover such that the image of

$$\sum y_{j_1,j_2,\alpha,\beta,i} \otimes z_{j_1,j_2,\alpha,\beta,i}$$

is the image of the element $x_{j_1,j_2,\alpha}$ in $\mathcal{O}_{X_i}(V_{j_1,i} \cap V_{j_2,i})$. This clearly implies the desired surjectivity and we win. □

Remark 27.5.5. Is there an easy example to show that the finite type condition for the morphisms $X_i \to S$ is necessary? Email if you have one.

A less technical version of the results above is the following.

Proposition 27.5.6. *Let $f : X \to S$ be a morphism of schemes. Assume:*

1. *The morphism f is of finite type and separated.*
2. *The scheme S is quasi-compact and quasi-separated.*

Then there exists a separated morphism of finite presentation $f' : X' \to S$ and a closed immersion $X \to X'$ of schemes over S.

Proof. We have seen that there is a closed immersion $X \to Y$ with Y/S of finite presentation. Let $\mathcal{I} \subset \mathcal{O}_Y$ be the quasi-coherent sheaf of ideals defining X as a closed subscheme of Y. By Properties, Lemma 23.20.3 we can write $\mathcal{I}$ as a directed colimit $\mathcal{I} = colim_{a \in A} \mathcal{I}_a$ of its quasi-coherent sheaves of ideals of finite type. Let $X_a \subset Y$ be the closed subscheme defined by $\mathcal{I}_a$. These form an inverse system of schemes indexed by A. The transition morphisms $X_a \to X_{a'}$ are affine because they are closed immersions. Each X_a is quasi-compact and quasi-separated since it is a closed subscheme of Y and Y is quasi-compact and quasi-separated by our assumptions. We have $X = lim_a X_a$ as follows directly from the fact that $\mathcal{I} = colim_{a\in A} \mathcal{I}_a$. Each of the morphisms $X_a \to Y$ is of finite presentation, see Morphisms, Lemma 24.20.7. Hence the morphisms $X_a \to S$ are of finite presentation. Thus it suffices to show that $X_a \to S$ is separated for some $a \in A$. This follows from Lemma 27.5.4 as we have assumed that $X \to S$ is separated. □

We end this section with a variant concerning finite morphisms.

Lemma 27.5.7. *Let $f : X \to S$ be a morphism of schemes. Assume:*

(1) *The morphism f is finite.*
(2) *The scheme S is quasi-compact and quasi-separated.*

Then there exists a morphism which is finite and of finite presentation $f' : X' \to S$ and a closed immersion $X \to X'$ of schemes over S.

Proof. By Proposition 27.5.6 there is a closed immersion $X \to Y$ with $g : Y \to S$ separated and of finite presentation. Let $\mathcal{I} \subset \mathcal{O}_Y$ be the quasi-coherent sheaf of ideals defining X as a closed subscheme of Y. By Properties, Lemma 23.20.3 we can write $\mathcal{I}$ as a directed colimit $\mathcal{I} = colim_{a\in A} \mathcal{I}_a$ of its quasi-coherent sheaves of ideals of finite type. Let $X_a \subset Y$ be the closed subscheme defined by $\mathcal{I}_a$ and denote $f_a : X_a \to S$ the structure morphism. These form an inverse system of schemes indexed by A. The transition morphisms $X_a \to X_{a'}$ are affine because they are closed immersions. Each X_a is quasi-compact and separated over S since it is a closed subscheme of Y and Y is quasi-compact and separated over S. We have $X = lim_a X_a$ as follows directly from the fact that $\mathcal{I} = colim_{a\in A} \mathcal{I}_a$. Each of the morphisms $X_a \to Y$ is of finite presentation, see Morphisms, Lemma 24.20.7. Hence the morphisms $X_a \to S$ are of finite presentation. Thus it suffices to show that $f_a : X_a \to S$ is finite for some $a \in A$.

Choose a finite affine open covering $S = \bigcup_{j=1,\ldots,n} V_j$. For each j the scheme $f^{-1}(V_j) = lim_a f_a^{-1}(V_j)$ is affine (as a finite morphism is affine by definition). Hence by Lemma 27.3.7 there exists an $a \in A$ such that each $f_a^{-1}(V_j)$ is affine. In other words, $f_a : X_a \to S$ is affine, see Morphisms, Lemma 24.11.3. By replacing Y with X_a we may assume $g : Y \to S$ is affine.

For each $j = 1, \ldots, m$ the ring $\mathcal{O}_Y(g^{-1}(V_j))$ is a finitely presented $\mathcal{O}_S(V_j)$-algebra. Say it is generated by x_{ji}, $i = 1, \ldots, n_j$. Note that the images of x_{ji} in $\mathcal{O}_X(f_a^{-1}(V_j))$, resp. $\mathcal{O}_X(f^{-1}(V_j))$ generate over $\mathcal{O}_S(V_j)$ as well. Since $f : X \to S$ is finite, the image of x_{ji} in $\mathcal{O}_X(f^{-1}(V_j))$ satisfies a monic polynomial P_{ij} whose coefficients are elements of $\mathcal{O}_S(V_j)$. Since $\mathcal{O}_X(f^{-1}(V_j)) = colim_{a\in A} \mathcal{O}_{X_a}(f_a^{-1}(V_j))$ we see there exists an $a \in A$ such that $P_{ji}(x_{ij})$ maps to zero in $\mathcal{O}_{X_a}(f_a^{-1}(V_j))$ for all j, i. It follows from Morphisms, Lemma 24.42.3 that the morphism $f_a : X_a \to S$ is finite for this a. □

27.6. Descending relative objects

The following lemma is typical of the type of results in this section. We write out the ``standard'' proof completely. It may be faster to convince yourself that the result is true than to read this proof.

Lemma 27.6.1. *Let I be a directed partially ordered set. Let $(S_i, f_{ii'})$ be an inverse system of schemes over I. Assume*

(1) *all the morphisms $f_{ii'} : S_i \to S_{i'}$ are affine,*
(2) *all the schemes S_i are quasi-compact and quasi-separated.*

Let $S = lim_i S_i$. Then we have the following:

(1) *For any morphism of finite presentation $X \to S$ there exists an index $i \in I$ and a morphism of finite presentation $X_i \to S_i$ such that $X \cong X_{i,S}$ as schemes over S.*
(2) *Suppose given an index $i \in I$, schemes X_i, Y_i of finite presentation over S_i and a morphism $\varphi : X_{i,S} \to Y_{i,S}$ over S. Then there exists an index $i' \geq i$ and a morphism $\varphi_{i'} : X_{i,S_{i'}} \to Y_{i,S_{i'}}$ whose base change to S is φ.*
(3) *Suppose given an index $i \in I$, schemes X_i, Y_i of finite presentation over S_i and a pair of morphisms $\varphi_i, \psi_i : X_i \to Y_i$. Assume that the base changes are equal: $\varphi_{i,S} = \psi_{i,S}$. Then there exists an index $i' \geq i$ such that $\varphi_{i,S_{i'}} = \psi_{i,S_{i'}}$.*

In other words, the category of schemes of finite presentation over S is the colimit over I of the categories of schemes of finite presentation over S_i.

Proof. In case each of the schemes S_i is affine, and we consider only affine schemes of finite presentation over S_i, resp. S this lemma is equivalent to Algebra, Lemma 7.118.6. We claim that the affine case implies the lemma in general.

Let us prove (3). Suppose given an index $i \in I$, schemes X_i, Y_i of finite presentation over S_i and a pair of morphisms $\varphi_i, \psi_i : X_i \to Y_i$. Assume that the base changes are equal: $\varphi_{i,S} = \psi_{i,S}$. We will use the notation $X_{i'} = X_{i,S_{i'}}$ and $Y_{i'} = Y_{i,S_{i'}}$ for $i' \geq i$. We also set $X = X_{i,S}$ and $Y = Y_{i,S}$. Note that according to Lemma 27.2.4 we have $X = lim_{i' \geq i} X_{i'}$ and similarly for Y. Additionally we denote $\varphi_{i'}$ and $\psi_{i'}$ (resp. φ and ψ) the base change of φ_i and ψ_i to $S_{i'}$ (resp. S). So our assumption means that $\varphi = \psi$. Since Y_i and X_i are of finite presentation over S_i, and since S_i is quasi-compact and quasi-separated, also X_i and Y_i are quasi-compact and quasi-separated (see Morphisms, Lemma 24.20.10). Hence we may choose a finite affine open covering $Y_i = \bigcup V_{j,i}$ such that each $V_{j,i}$ maps into an affine open of S. As above, denote $V_{j,i'}$ the inverse image of $V_{j,i}$ in $Y_{i'}$ and V_j the inverse image in Y. The immersions $V_{j,i'} \to Y_{i'}$ are quasi-compact, and the inverse images $U_{j,i'} = \varphi_i^{-1}(V_{j,i'})$ and $U'_{j,i'} = \psi_i^{-1}(V_{j,i'})$ are quasi-compact opens of $X_{i'}$. By assumption the inverse images of V_j under φ and ψ in X are equal. Hence by Lemma 27.3.5 there exists an index $i' \geq i$ such that of $U_{j,i'} = U'_{j,i'}$ in $X_{i'}$. Choose an finite affine open covering $U_{j,i'} = U'_{j,i'} = \bigcup W_{j,k,i'}$ which induce coverings $U_{j,i''} = U'_{j,i''} = \bigcup W_{j,k,i''}$ for all $i'' \geq i'$. By the affine case there exists an index i'' such that $\varphi_{i''}|_{W_{j,k,i''}} = \psi_{i''}|_{W_{j,k,i''}}$ for all j, k. Then i'' is an index such that $\varphi_{i''} = \psi_{i''}$ and (3) is proved.

Let us prove (2). Suppose given an index $i \in I$, schemes X_i, Y_i of finite presentation over S_i and a morphism $\varphi : X_{i,S} \to Y_{i,S}$. We will use the notation $X_{i'} = X_{i,S_{i'}}$ and $Y_{i'} = Y_{i,S_{i'}}$ for $i' \geq i$. We also set $X = X_{i,S}$ and $Y = Y_{i,S}$. Note that according to Lemma 27.2.4 we have $X = lim_{i' \geq i} X_{i'}$ and similarly for Y. Since Y_i and X_i are of finite presentation over S_i, and since S_i is quasi-compact and quasi-separated, also X_i and Y_i are quasi-compact and quasi-separated (see Morphisms, Lemma 24.20.10). Hence we may choose a finite affine open covering $Y_i = \bigcup V_{j,i}$ such that each $V_{j,i}$ maps into an affine open of S. As above, denote $V_{j,i'}$ the inverse image of $V_{j,i}$ in $Y_{i'}$ and V_j the inverse image in Y. The immersions $V_j \to Y$ are quasi-compact, and the inverse images $U_j = \varphi^{-1}(V_j)$ are quasi-compact opens of X. Hence by Lemma 27.3.5 there exists an index $i' \geq i$ and quasi-compact opens $U_{j,i'}$ of $X_{i'}$ whose inverse image in X is U_j. Choose an finite affine open covering $U_{j,i'} = \bigcup W_{j,k,i'}$ which induce affine open coverings $U_{j,i''} = \bigcup W_{j,k,i''}$ for all $i'' \geq i'$ and an affine open covering $U_j = \bigcup W_{j,k}$. By the affine case there exists an index i'' and morphisms $\varphi_{j,k,i''} : W_{j,k,i''} \to V_{j,i''}$ such that $\varphi|_{W_{j,k}} = \varphi_{j,k,i'',S}$ for all j, k. By part (3) proved above, there is a further index $i''' \geq i''$ such that

$$\varphi_{j_1,k_1,i'',S_{i'''}}|_{W_{j_1,k_1,i'''} \cap W_{j_2,k_2,i'''}} = \varphi_{j_2,k_2,i'',S_{i'''}}|_{W_{j_1,k_1,i'''} \cap W_{j_2,k_2,i'''}}$$

for all j_1, j_2, k_1, k_2. Then i''' is an index such that there exists a morphism $\varphi_{i'''} : X_{i'''} \to Y_{i'''}$ whose base change to S gives φ. Hence (2) holds.

Let us prove (1). Suppose given a scheme X of finite presentation over S. Since X is of finite presentation over S, and since S is quasi-compact and quasi-separated, also X is quasi-compact and quasi-separated (see Morphisms, Lemma 24.20.10). Choose a finite affine open covering $X = \bigcup U_j$ such that each U_j maps into an affine open $V_j \subset S$. Denote $U_{j_1 j_2} = U_{j_1} \cap U_{j_2}$ and $U_{j_1 j_2 j_3} = U_{j_1} \cap U_{j_2} \cap U_{j_3}$. By Lemmas 27.3.5 and 27.3.7 we can find an index i_1 and affine opens $V_{j,i_1} \subset S_{i_1}$ such that each V_j is the inverse of this in S. Let $V_{j,i}$ be the inverse image of V_{j,i_1} in S_i for $i \geq i_1$. By the affine case we may find an index $i_2 \geq i_1$ and affine schemes $U_{j,i_2} \to V_{j,i_2}$ such that $U_j = S \times_{S_{i_2}} U_{j,i_2}$ is the base change. Denote $U_{j,i} = S_i \times_{S_{i_2}} U_{j,i_2}$ for $i \geq i_2$. By Lemma 27.3.5 there exists an index $i_3 \geq i_2$ and open subschemes $W_{j_1,j_2,i_3} \subset U_{j_1,i_3}$ whose base change to S is equal to $U_{j_1 j_2}$. Denote $W_{j_1,j_2,i} = S_i \times_{S_{i_3}} W_{j_1,j_2,i_3}$ for $i \geq i_3$. By part (2) shown above there exists an index $i_4 \geq i_3$ and morphisms $\varphi_{j_1,j_2,i_4} : W_{j_1,j_2,i_4} \to W_{j_2,j_1,i_4}$ whose base change to S gives the identity morphism $U_{j_1 j_2} = U_{j_2 j_1}$ for all j_1, j_2. For all $i \geq i_4$ denote $\varphi_{j_1,j_2,i} = \mathrm{id}_S \times \varphi_{j_1,j_2,i_4}$ the base change. We claim that for some $i_5 \geq i_4$ the system $((U_{j,i_5})_j, (W_{j_1,j_2,i_5})_{j_1,j_2}, (\varphi_{j_1,j_2,i_5})_{j_1,j_2})$ forms a glueing datum as in Schemes, Section 21.14. In order to see this we have to verify that for i large enough we have

$$\varphi_{j_1,j_2,i}^{-1}(W_{j_1,j_2,i} \cap W_{j_1,j_3,i}) = W_{j_1,j_2,i} \cap W_{j_1,j_3,i}$$

and that for large enough i the cocycle condition holds. The first condition follows from Lemma 27.3.5 and the fact that $U_{j_2 j_1 j_3} = U_{j_1 j_2 j_3}$. The second from part (1) of the lemma proved above and the fact that the cocycle condition holds for the maps $\mathrm{id} : U_{j_1 j_2} \to U_{j_2 j_1}$. Ok, so now we can use Schemes, Lemma 21.14.2 to glue the system $((U_{j,i_5})_j, (W_{j_1,j_2,i_5})_{j_1,j_2}, (\varphi_{j_1,j_2,i_5})_{j_1,j_2})$ to get a scheme $X_{i_5} \to S_{i_5}$. By construction the base change of X_{i_5} to S is formed by glueing the open affines U_j along the opens $U_{j_1} \leftarrow U_{j_1 j_2} \to U_{j_2}$. Hence $S \times_{S_{i_5}} X_{i_5} \cong X$ as desired. □

Lemma 27.6.2. *With notation and assumptions as in Lemma 27.6.1. Let $i \in I$. Suppose that $\varphi_i : X_i \to Y_i$ is a morphism of schemes of finite presentation over S_i. If the base change of φ_i to S is affine, then there exists an index $i' \geq i$ such that $id_{S_{i'}} \times \varphi_i : X_{i,S_{i'}} \to Y_{i,S_{i'}}$ is affine.*

Proof. For $i' \geq i$ denote $X_{i'} = S_{i'} \times_{S_i} X_i$ and similarly for $Y_{i'}$. Denote $\varphi_{i'}$ the base change of φ_i to $S_{i'}$. Also set $X = S \times_{S_i} X_i$, $Y = S \times_{S_i} X_i$, and φ the base change of φ_i to S. Let $Y_i = \bigcup V_{j,i}$ be a finite affine open covering. Set $U_{j,i} = \varphi_i^{-1}(V_{j,i})$. For $i' \geq i$ we denote $V_{j,i'}$ the inverse image of $V_{j,i}$ in $Y_{i'}$ and $U_{j,i'} = \varphi_{i'}^{-1}(V_{j,i'})$. Similarly we have $U_j = \varphi^{-1}(V_j)$. Then $U_j = lim_{i' \geq i} U_{j,i'}$ (see Lemma 27.2.2). Since U_j is affine by assumption we see that each $U_{j,i'}$ is affine for i' large enough, see Lemma 27.3.7. Thus $\varphi_{i'}$ is affine for i' large enough, see Morphisms, Lemma 24.11.3. □

Lemma 27.6.3. *With notation and assumptions as in Lemma 27.6.1. Let $i \in I$. Suppose that $\varphi_i : X_i \to Y_i$ is a morphism of schemes of finite presentation over S_i. If the base change* *of φ_i to S is flat, then there exists an index $i' \geq i$ such that $id_{S_{i'}} \times \varphi_i : X_{i,S_{i'}} \to Y_{i,S_{i'}}$ is flat.*

Proof. For $i' \geq i$ denote $X_{i'} = S_{i'} \times_{S_i} X_i$ and similarly for $Y_{i'}$. Denote $\varphi_{i'}$ the base change of φ_i to $S_{i'}$. Also set $X = S \times_{S_i} X_i$, $Y = S \times_{S_i} X_i$, and φ the base change of φ_i to S. Let $Y_i = \bigcup_{j=1,\ldots,m} V_{j,i}$ be a finite affine open covering such that each $V_{j,i}$ maps into some affine open of S_i. For each $j = 1, \ldots m$ let $\varphi_i^{-1}(V_{j,i}) = \bigcup_{k=1,\ldots,m(j)} U_{k,j,i}$ be a finite affine open covering. For $i' \geq i$ we denote $V_{j,i'}$ the inverse image of $V_{j,i}$ in $Y_{i'}$ and $U_{k,j,i'}$ the inverse image of $U_{k,j,i}$ in $X_{i'}$. Similarly we have $U_{k,j} \subset X$ and $V_j \subset Y$. Then $U_{k,j} = lim_{i' \geq i} U_{k,j,i'}$ and $V_j = lim_{i' \geq i} V_j$ (see Lemma 27.2.2). Hence we see that the lemma reduces to the case that X_i and Y_i are affine and map into an affine open of S_i, i.e., we may also assume that S is affine.

In the affine case we reduce to the following algebra result. Suppose that $R = colim_{i \in I} R_i$. For some $i \in I$ suppose given a map $A_i \to B_i$ of finitely presented R_i-algebras. Then, if $R \otimes_{R_i} A_i \to R \otimes_{R_i} B_i$ is flat, then for some $i' \geq i$ the map $R_{i'} \otimes_{R_i} A_i \to R_{i'} \otimes_{R_i} B_i$ is flat. This follows from Algebra, Lemma 7.120.5 part (3). □

Lemma 27.6.4. *With notation and assumptions as in Lemma 27.6.1. Let $i \in I$. Suppose that $\varphi_i : X_i \to Y_i$ is a morphism of schemes of finite presentation over S_i. If the base change of φ_i to S is a finite morphism, then there exists an index $i' \geq i$ such that $id_{S_{i'}} \times \varphi_i : X_{i,S_{i'}} \to Y_{i,S_{i'}}$ is a finite morphism.*

Proof. A finite morphism is affine, see Morphisms, Definition 24.42.1. Hence by Lemma 27.6.2 above we may assume that φ_i is affine. By writing Y_i as a finite union of affines we reduce to proving the result when X_i and Y_i are affine and map into a common affine $W_i \subset S_i$. The corresponding algebraic statement is the following: Suppose that $A = colim_i A_i$ is a directed colimit of rings, i an index, $A_i \to B_i$ and $A_i \to C_i$ ring maps of finite presentation, and $\varphi_i : B_i \to C_i$ a map of A_i-algebras such that

$$colim_{i' \geq i}(A_{i'} \otimes_{A_i} B_i) \longrightarrow colim_{i' \geq i}(A_{i'} \otimes_{A_i} C_i)$$

is finite. Then for some i' the map

$$A_{i'} \otimes_{A_i} B_i \longrightarrow A_{i'} \otimes_{A_i} C_i$$

is finite. The proof of this statement is omitted. (Hint: It suffices for C_i to be of finite type over A_i). □

Lemma 27.6.5. *With notation and assumptions as in Lemma 27.6.1. Let $i \in I$. Suppose that $\varphi_i : X_i \to Y_i$ is a morphism of schemes of finite presentation over S_i. If the base change of φ_i to S is a closed immersion, then there exists an index $i' \geq i$ such that $id_{S_{i'}} \times \varphi_i : X_{i,S_{i'}} \to Y_{i,S_{i'}}$ is a closed immersion.*

Proof. A closed immersion is affine, see Morphisms, Lemma 24.11.9. Hence by Lemma 27.6.2 above we may assume that φ_i is affine. By writing Y_i as a finite union of affines we reduce to proving the result when X_i and Y_i are affine and map into a common affine $W_i \subset S_i$. The corresponding algebraic statement is the following: Suppose that $A = colim_i A_i$ is a directed colimit of rings, i an index, $A_i \to B_i$ and $A_i \to C_i$ ring maps of finite presentation, and $\varphi_i : B_i \to C_i$ a map of A_i-algebras such that

$$colim_{i' \geq i}(A_{i'} \otimes_{A_i} B_i) \longrightarrow colim_{i' \geq i}(A_{i'} \otimes_{A_i} C_i)$$

is surjective. Then for some i' the map

$$A_{i'} \otimes_{A_i} B_i \longrightarrow A_{i'} \otimes_{A_i} C_i$$

is surjective. The proof of this statement is omitted. (Hint: It suffices for C_i to be of finite type over A_i). □

Lemma 27.6.6. *With notation and assumptions as in Lemma 27.6.1. Let $i \in I$. Suppose that X_i is a scheme of finite presentation over S_i. If the base change of X_i to S is separated over S then there exists an index $i' \geq i$ such that $X_{i,S_{i'}}$ is separated over $S_{i'}$.*

Proof. Apply Lemma 27.6.5 above to the diagonal morphism $\Delta_{X_i/S_i} : X_i \to X_i \times_{S_i} X_i$. □

Lemma 27.6.7. *With notation and assumptions as in Lemma 27.6.1. Let $i \in I$. Suppose that $\varphi_i : X_i \to Y_i$ is a morphism of schemes of finite presentation over S. If the base change of φ_i to S is finite locally free (of degree d) then there exists an index $i' \geq i$ such that the base change of φ_i to $S_{i'}$ is finite locally free (of degree d).*

Proof. By Lemmas 27.6.3 and 27.6.4 we see that we may reduce to the case that φ_i is flat and finite. On the other hand, φ_i is locally of finite presentation by Morphisms, Lemma 24.20.11. Hence φ_i is finite locally free by Morphisms, Lemma 24.44.2. If moreover $\varphi_i \times S$ is finite locally free of degree d, then the image of $Y_i \times_{S_i} S \to Y_i$ is contained in the open and closed locus $W_d \subset Y_i$ over which φ_i has degree d. By Lemma 27.3.4 we see that for some $i' \gg i$ the image of $Y_{i'} \to Y_i$ is contained in W_d. Then the base change of φ_i to $S_{i'}$ will be finite locally free of degree d. □

Lemma 27.6.8. *Let I be a directed partially ordered set. Let $(S_i, f_{ii'})$ be an inverse system of schemes over I. Assume*

1. *all the morphisms $f_{ii'} : S_i \to S_{i'}$ are affine,*
2. *all the schemes S_i are quasi-compact and quasi-separated.*

Let $S = lim_i S_i$. Then we have the following:

1. *For any sheaf of $\mathcal{O}_S$-modules $\mathcal{F}$ of finite presentation there exists an index $i \in I$ and a sheaf of $\mathcal{O}_{S_i}$-modules of finite presentation $\mathcal{F}_i$ such that $\mathcal{F} \cong f_i^*\mathcal{F}_i$.*
2. *Suppose given an index $i \in I$, sheaves of $\mathcal{O}_{S_i}$-modules $\mathcal{F}_i$, $\mathcal{G}_i$ of finite presentation and a morphism $\varphi : f_i^*\mathcal{F}_i \to f_i^*\mathcal{G}_i$ over S. Then there exists an index $i' \geq i$ and a morphism $\varphi_{i'} : f_{i'i}^*\mathcal{F}_i \to f_{i'i}^*\mathcal{G}_i$ whose base change to S is φ.*
3. *Suppose given an index $i \in I$, sheaves of $\mathcal{O}_{S_i}$-modules $\mathcal{F}_i$, $\mathcal{G}_i$ of finite presentation and a pair of morphisms $\varphi_i, \psi_i : \mathcal{F}_i \to \mathcal{G}_i$. Assume that the base changes are equal: $f_i^*\varphi_i = f_i^*\psi_i$. Then there exists an index $i' \geq i$ such that $f_{i'i}^*\varphi_i = f_{i'i}^*\psi_i$.*

In other words, the category of modules of finite presentation over S is the colimit over I of the categories modules of finite presentation over S_i.

Proof. Omitted. Since we have written out completely the proof of Lemma 27.6.1 above it seems wise to use this here and not completely write this proof out also. For example we can use:

1. there is an equivalence of categories between quasi-coherent $\mathcal{O}_S$-modules and vector bundles over S, see Constructions, Section 22.6.
2. a vector bundle $\mathbf{V}(\mathcal{F}) \to S$ is of finite presentation over S if and only if $\mathcal{F}$ is an $\mathcal{O}_S$-module of finite presentation.

Then you can descend morphisms in terms of morphisms of the associated vectorbundles. Similarly for objects. □

Lemma 27.6.9. *With notation and assumptions as in Lemma 27.6.1. Let $i \in I$. Suppose that $\varphi_i : X_i \to Y_i$ is a morphism of schemes of finite presentation over S_i and that $\mathcal{F}_i$ is a quasi-coherent $\mathcal{O}_{X_i}$-module of finite presentation. If the pullback of $\mathcal{F}_i$ to $X_i \times_{S_i} S$ is flat* *over $Y_i \times_{S_i} S$, then there exists an index $i' \geq i$ such that the pullback of $\mathcal{F}_i$ to $X_i \times_{S_i} S_{i'}$ is flat over $Y_i \times_{S_i} S_{i'}$.*

Proof. (This lemma is the analogue of Lemma 27.6.3 for modules.) For $i' \geq i$ denote $X_{i'} = S_{i'} \times_{S_i} X_i$, $\mathcal{F}_{i'} = (X_{i'} \to X_i)^*\mathcal{F}_i$ and similarly for $Y_{i'}$. Denote $\varphi_{i'}$ the base change of φ_i to $S_{i'}$. Also set $X = S \times_{S_i} X_i$, $Y = S \times_{S_i} X_i$, $\mathcal{F} = (X \to X_i)^*\mathcal{F}_i$ and φ the base change of φ_i to S. Let $Y_i = \bigcup_{j=1,\ldots,m} V_{j,i}$ be a finite affine open covering such that each $V_{j,i}$ maps into some affine open of S_i. For each $j = 1, \ldots m$ let $\varphi_i^{-1}(V_{j,i}) = \bigcup_{k=1,\ldots,m(j)} U_{k,j,i}$ be a finite affine open covering. For $i' \geq i$ we denote $V_{j,i'}$ the inverse image of $V_{j,i}$ in $Y_{i'}$ and $U_{k,j,i'}$ the inverse image of $U_{k,j,i}$ in $X_{i'}$. Similarly we have $U_{k,j} \subset X$ and $V_j \subset Y$. Then $U_{k,j} = lim_{i' \geq i} U_{k,j,i'}$ and $V_j = lim_{i' \geq i} V_j$ (see Lemma 27.2.2). Since $X_{i'} = \bigcup_{k,j} U_{k,j,i'}$ is a finite open covering it suffices to prove the lemma for each of the morphisms $U_{k,j,i} \to V_{j,i}$ and the sheaf $\mathcal{F}_i|_{U_{k,j,i}}$. Hence we see that the lemma reduces to the case that X_i and Y_i are affine and map into an affine open of S_i, i.e., we may also assume that S is affine.

In the affine case we reduce to the following algebra result. Suppose that $R = colim_{i \in I} R_i$. For some $i \in I$ suppose given a map $A_i \to B_i$ of finitely presented R_i-algebras. Let N_i be a finitely presented B_i-module. Then, if $R \otimes_{R_i} N_i$ is flat over $R \otimes_{R_i} A_i$, then for some $i' \geq i$ the module $R_{i'} \otimes_{R_i} N_i$ is flat over $R_{i'} \otimes_{R_i} A$. This is exactly the result proved in Algebra, Lemma 7.120.5 part (3). $\square$

27.7. Characterizing affine schemes

If $f : X \to S$ is a surjective integral morphism of schemes such that X is an affine scheme then S is affine too. See [**Con07**, A.2]. Our proof relies on the Noetherian case which we stated and proved in Coherent, Lemma 25.15.3. See also [**DG67**, II 6.7.1].

Lemma 27.7.1. *Let $f : X \to S$ be a morphism of schemes. Assume that f is surjective and finite, and assume that X is affine. Then S is affine.*

Proof. Since f is surjective and X is quasi-compact we see that S is quasi-compact. Consider the commutative diagram

$$\begin{tikzcd} X \arrow[r, "\Delta"] \arrow[d] & X \times X \arrow[d] \\ S \arrow[r, "\Delta"] & S \times S \end{tikzcd}$$

(products over $Spec(\mathbf{Z})$). Since X is separated the image of the top horizontal arrow is closed. The right vertical arrow is the composition of $X \times X \to X \times S \to S \times S$ and hence is finite (see Morphisms, Lemmas 24.42.5 and 24.42.6). Hence it is proper (see Morphisms, Lemma 24.42.10). Thus the image of $\Delta(X)$ in $S \times S$ is closed. But as $X \to S$ is surjective we conclude that $\Delta(S)$ is closed as well. Hence S is separated.

By Lemma 27.5.7 there exists a factorization $X \to Y \to S$, with $X \to Y$ a closed immersion and $Y \to S$ finite and of finite presentation. Let $\mathcal{I} \subset \mathcal{O}_Y$ be the quasi-coherent sheaf of ideals cutting out the closed subscheme X in Y. By Properties, Lemma 23.20.3 we can write $\mathcal{I}$ as a directed colimit $\mathcal{I} = colim_{a \in A} \mathcal{I}_a$ of its quasi-coherent sheaves of ideals of finite type. Let $X_a \subset Y$ be the closed subscheme defined by $\mathcal{I}_a$. These form an inverse system of schemes indexed by A. The transition morphisms $X_a \to X_{a'}$ are affine because they are closed immersions. Each X_a is quasi-compact and quasi-separated since it is a closed subscheme of Y and Y is quasi-compact and quasi-separated. Each of the morphisms $X_a \to Y$ is of finite presentation, see Morphisms, Lemma 24.20.7. Hence the morphisms $X_a \to S$ are of finite presentation, and also finite as the composition of a closed immersion and a finite morphism. We have $X = lim_a X_a$ as follows directly from the fact that $\mathcal{I} = colim_{a \in A} \mathcal{I}_a$. Hence by Lemma 27.3.7 we see that X_a is affine for some $a \in A$. Replacing X by X_a we may assume that $X \to S$ is surjective, finite, of finite presentation and that X is affine.

By Proposition 27.3.11 we may write $S = lim_{i \in I} S_i$ as a directed limits as schemes of finite type over $\mathbf{Z}$. By Lemma 27.6.1 we can after shrinking I assume there exist schemes $X_i \to S_i$ of finite presentation such that $X_{i'} = X_i \times_S S_{i'}$ for $i' \geq i$ and such that $X = lim_i X_i$. By Lemma 27.6.4 we may assume that $X_i \to S_i$ is finite for all $i \in I$ as well. By Lemma 27.3.7 once again we may assume that X_i is affine for all $i \in I$. Hence the result follows from the Noetherian case, see Coherent, Lemma 25.15.3. □

Proposition 27.7.2. *Let $f : X \to S$ be a morphism of schemes. Assume that f is surjective and integral, and assume that X is affine. Then S is affine.*

Proof. Since f is surjective and X is quasi-compact we see that S is quasi-compact. Consider the commutative diagram

$$\begin{tikzcd} X \arrow[r, "\Delta"'] \arrow[d] & X \times X \arrow[d] \\ S \arrow[r, "\Delta"] & S \times S \end{tikzcd}$$

(products over $Spec(\mathbf{Z})$). Since X is separated the image of the top horizontal arrow is closed. The right vertical arrow is the composition of $X \times X \to X \times S \to S \times S$ and hence is integral (see Morphisms, Lemmas 24.42.5 and 24.42.6). Hence it is universally closed (see Morphisms, Lemma 24.42.7). Thus the image of $\Delta(X)$ in $S \times S$ is closed. But as $X \to S$ is surjective we conclude that $\Delta(S)$ is closed as well. Hence S is separated. This in particular implies that f is an affine morphism, see Morphisms, Lemma 24.11.11.

Consider the sheaf $\mathcal{A} = f_* \mathcal{O}_X$. This is a quasi-coherent sheaf of $\mathcal{O}_S$-algebras, see Schemes, Lemma 21.24.1. By Properties, Lemma 23.20.3 we can write $\mathcal{A} = colim_i \mathcal{F}_i$ as a filtered colimit of finite type $\mathcal{O}_X$-modules. Let $\mathcal{A}_i \subset \mathcal{A}$ be the $\mathcal{O}_X$-subalgebra generated by $\mathcal{F}_i$. Since the map of algebras $\mathcal{O}_X \to \mathcal{A}$ is integral, we see that each $\mathcal{A}_i$ is a finite quasi-coherent $\mathcal{O}_S$-algebra. Hence

$$X_i = \underline{Spec}_S(\mathcal{A}_i) \longrightarrow S$$

is a finite morphism of schemes. It is clear that $X = lim_i X_i$. Hence by Lemma 27.3.7 we see that for i sufficiently large the scheme X_i is affine. Moreover, since $X \to S$ factors through each X_i we see that $X_i \to S$ is surjective. Hence we conclude that S is affine by Lemma 27.7.1. □

27.8. Variants of Chow's Lemma

In this section we prove a number of variants of Chow's lemma. The most interesting version is probably just the Noetherian case, which we stated and proved in Coherent, Section 25.17.

Lemma 27.8.1. *Let S be a quasi-compact and quasi-separated scheme. Let $f : X \to S$ be a separated morphism of finite type. Then there exists an $n \geq 0$ and a diagram*

$$\begin{tikzcd} X \arrow[dr] & X' \arrow[l, "\pi"'] \arrow[r] \arrow[d] & \mathbf{P}^n_S \arrow[dl] \\ & S & \end{tikzcd}$$

where $X' \to \mathbf{P}^n_S$ is an immersion, and $\pi : X' \to X$ is proper and surjective.

Proof. By Proposition 27.5.6 we can find a closed immersion $X \to Y$ where Y is separated and of finite presentation over S. Clearly, if we prove the assertion for Y, then the result follows for X. Hence we may assume that X is of finite presentation over S.

Write $S = lim_i S_i$ as a directed limit of Noetherian schemes, see Proposition 27.3.11. By Lemma 27.6.1 we can find an index $i \in I$ and a scheme $X_i \to S_i$ of finite presentation so that $X = S \times_{S_i} X_i$. By Lemma 27.6.6 we may assume that $X_i \to S_i$ is separated. Clearly, if we prove the assertion for X_i over S_i, then the assertion holds for X. The case $X_i \to S_i$ is treated by Coherent, Lemma 25.17.1. $\square$

Here is a variant of Chow's lemma where we assume the scheme on top has finitely many irreducible components.

Lemma 27.8.2. *Let S be a quasi-compact and quasi-separated scheme. Let $f : X \to S$ be a separated morphism of finite type. Assume that X has finitely many irreducible components. Then there exists an $n \geq 0$ and a diagram*

$$\begin{tikzcd} X \arrow[dr] & X' \arrow[l, "\pi"'] \arrow[r] \arrow[d] & \mathbf{P}^n_S \arrow[dl] \\ & S & \end{tikzcd}$$

where $X' \to \mathbf{P}^n_S$ is an immersion, and $\pi : X' \to X$ is proper and surjective. Moreover, there exists an open dense subscheme $U \subset X$ such that $\pi^{-1}(U) \to U$ is an isomorphism of schemes.

Proof. Let $X = Z_1 \cup \ldots \cup Z_n$ be the decomposition of X into irreducible components. Let $\eta_j \in Z_j$ be the generic point.

There are (at least) two ways to proceed with the proof. The first is to redo the proof of Coherent, Lemma 25.17.1 using the general Properties, Lemma 23.26.4 to find suitable affine opens in X. (This is the ``standard'' proof.) The second is to use absolute Noetherian approximation as in the proof of Lemma 27.8.1 above. This is what we will do here.

By Proposition 27.5.6 we can find a closed immersion $X \to Y$ where Y is separated and of finite presentation over S. Write $S = lim_i S_i$ as a directed limit of Noetherian schemes, see Proposition 27.3.11. By Lemma 27.6.1 we can find an index $i \in I$ and a scheme $Y_i \to S_i$ of finite presentation so that $Y = S \times_{S_i} Y_i$. By Lemma 27.6.6 we may assume that $Y_i \to S_i$ is separated. We have the following diagram

$$\begin{tikzcd} \eta_j \in Z_j \arrow[r] & X \arrow[r] \arrow[dr] & Y \arrow[r] \arrow[d] & Y_i \arrow[d] \\ & & S \arrow[r] & S_i \end{tikzcd}$$

Denote $h : X \to Y_i$ the composition.

For $i' \geq i$ write $Y_{i'} = S_{i'} \times_{S_i} Y_i$. Then $Y = lim_{i' \geq i} Y_{i'}$, see Lemma 27.2.4. Choose $j, j' \in \{1, \ldots, n\}$, $j \neq j'$. Note that η_j is not a specialization of $\eta_{j'}$. By Lemma 27.2.3 we can replace i by a bigger index and assume that $h(\eta_j)$ is not a specialization of $h(\eta_{j'})$ for all pairs (j, j') as above. For such an index, let $Y' \subset Y_i$ be the scheme theoretic image of $h : X \to Y_i$, see Morphisms, Definition 24.4.2. The morphism h is quasi-compact as the composition of the quasi-compact morphisms $X \to Y$ and $Y \to Y_i$ (which is affine). Hence by Morphisms, Lemma 24.4.3 the morphism $X \to Y'$ is dominant. Thus the generic points of Y' are all contained in the set $\{h(\eta_1), \ldots, h(\eta_n)\}$, see Morphisms, Lemma 24.6.3. Since none of the $h(\eta_j)$ is the specialization of another we see that the points $h(\eta_1), \ldots, h(\eta_n)$ are pairwise distinct and are each a generic point of Y'.

We apply Coherent, Lemma 25.17.1 above to the morphism $Y' \to S_i$. This gives a diagram

$$\begin{tikzcd} Y' \arrow[dr] & Y^* \arrow[l, "\pi"'] \arrow[r] \arrow[d] & \mathbf{P}^n_{S_i} \arrow[dl] \\ & S_i & \end{tikzcd}$$

such that π is proper and surjective and an isomorphism over a dense open subscheme $V \subset Y'$. By our choice of i above we know that $h(\eta_1), \ldots, h(\eta_n) \in V$. Consider the commutative diagram

$$\begin{tikzcd} X' \arrow[r, equal] & X \times_{Y'} Y^* \arrow[r] \arrow[d] & Y^* \arrow[r] \arrow[d] & \mathbf{P}^n_{S_i} \arrow[ddl] \\ & X \arrow[r] \arrow[d] & Y' \arrow[d] & \\ & S \arrow[r] & S_i & \end{tikzcd}$$

Note that $X' \to X$ is an isomorphism over the open subscheme $U = h^{-1}(V)$ which contains each of the η_j and hence is dense in X. We conclude $X \leftarrow X' \to \mathbf{P}^n_S$ is a solution to the problem posed in the lemma. □

27.9. Applications of Chow's lemma

We can use Chow's lemma to investigate the notions of proper and separated morphisms. As a first application we have the following.

Lemma 27.9.1. *Let S be a scheme. Let $f : X \to S$ be a separated morphism of finite type. The following are equivalent:*

(1) *The morphism f is proper.*
(2) *For any morphism $S' \to S$ which is locally of finite type the base change $X_{S'} \to S'$ is closed.*
(3) *For every $n \geq 0$ the morphism $\mathbf{A}^n \times X \to \mathbf{A}^n \times S$ is closed.*

Proof. Clearly (1) implies (2), and (2) implies (3), so we just need to show (3) implies (1). First we reduce to the case when S is affine. Assume that (3) implies (1) when the base is affine. Now let $f : X \to S$ be a separated morphism of finite type. Being proper is local on the base (see Morphisms, Lemma 24.40.3), so if $S = \bigcup_\alpha S_\alpha$ is an open affine cover, and if we denote $X_\alpha := f^{-1}(S_\alpha)$, then it is enough to show that $f|_{X_\alpha} : X_\alpha \to S_\alpha$ is proper for all α. Since S_α is affine, if the map $f|_{X_\alpha}$ satisfies (3), then it will satisfy (1) by assumption, and will be proper. To finish the reduction to the case S is affine, we must show that if $f : X \to S$ is separated of finite type satisfying (3), then $f|_{X_\alpha} : X_\alpha \to S_\alpha$ is separated of finite type satisfying (3). Separatedness and finite type are clear. To see (3), notice that $\mathbf{A}^n \times X_\alpha$ is the open preimage of $\mathbf{A}^n \times S_\alpha$ under the map $1 \times f$. Fix a closed set $Z \subset \mathbf{A}^n \times X_\alpha$. Let $\bar{Z}$ denote the closure of Z in $\mathbf{A}^n \times X$. Then for topological reasons,

$$1 \times f(\bar{Z}) \cap \mathbf{A}^n \times S_\alpha = 1 \times f(Z).$$

Hence $1 \times f(Z)$ is closed, and we have reduced the proof of (3) ⇒ (1) to the affine case.

Assume S affine, and $f : X \to S$ separated of finite type. We can apply Chow's Lemma 27.8.1 to get $\pi : X' \to X$ proper surjective and $X' \to \mathbf{P}^n_S$ an immersion. If X is proper over S, then $X' \to S$ is proper (Morphisms, Lemma 24.40.4). Since $\mathbf{P}^n_S \to S$ is separated, we conclude that $X' \to \mathbf{P}^n_S$ is proper (Morphisms, Lemma 24.40.7) and hence a closed immersion (Schemes, Lemma 21.10.4). Conversely, assume $X' \to \mathbf{P}^n_S$ is a closed immersion. Consider the diagram:

(27.9.1.1)
$$\begin{tikzcd} X' \arrow[r] \arrow[d, "\pi"'] & \mathbf{P}^n_S \arrow[d] \\ X \arrow[r, "f"] & S \end{tikzcd}$$

All maps are a priori proper except for $X \to S$. Hence we conclude that $X \to S$ is proper by Morphisms, Lemma 24.40.8. Therefore, we have shown that $X \to S$ is proper if and only if $X' \to \mathbf{P}^n_S$ is a closed immersion.

Assume S is affine and (3) holds, and let n, X', π be as above. Since being a closed morphism is local on the base, the map $X \times \mathbf{P}^n \to S \times \mathbf{P}^n$ is closed since by (3) $X \times \mathbf{A}^n \to S \times \mathbf{A}^n$ is closed and since projective space is covered by copies of affine n-space, see Constructions, Lemma 22.13.3. By Morphisms, Lemma 24.40.5 the morphism

$$X' \times_S \mathbf{P}^n_S \to X \times_S \mathbf{P}^n_S = X \times \mathbf{P}^n$$

is proper. Since $\mathbf{P}^n$ is separated, the projection

$$X' \times_S \mathbf{P}^n_S = \mathbf{P}^n_{X'} \to X'$$

will be separated as it is just a base change of a separated morphism. Therefore, the map $X' \to X' \times_S \mathbf{P}^n_S$ is proper, since it is a section to a separated map (see Schemes, Lemma 21.21.12). Composing all these proper morphisms

$$X' \to X' \times_S \mathbf{P}^n_S \to X \times_S \mathbf{P}^n_S = X \times \mathbf{P}^n \to S \times \mathbf{P}^n = \mathbf{P}^n_S$$

we see that the map $X' \to \mathbf{P}^n_S$ is proper, and hence a closed immersion. □

If the base is Noetherian we can show that the valuative criterion holds using only discrete valuation rings. First we state the result concerning separation. We will often use solid commutative diagrams of morphisms of schemes having the following shape

(27.9.1.2)
$$\begin{tikzcd} Spec(K) \arrow[r] \arrow[d] & X \arrow[d] \\ Spec(A) \arrow[r] \arrow[ur, dashed] & S \end{tikzcd}$$

with A a valuation ring and K its field of fractions.

Lemma 27.9.2. *Let S be a locally Noetherian scheme. Let $f : X \to S$ be a morphism of schemes. Assume f is locally of finite type. The following are equivalent:*

(1) *The morphism f is separated.*
(2) *For any diagram (27.9.1.2) there is at most one dotted arrow.*
(3) *For all diagrams (27.9.1.2) with A a discrete valuation ring there is at most one dotted arrow.*

(4) *For any irreducible component X_0 of X with generic point $\eta \in X_0$, for any discrete valuation ring $A \subset K = \kappa(\eta)$ with fraction field K and any diagram (27.9.1.2) such that the morphism $Spec(K) \to X$ is the canonical one (see Schemes, Section 21.13) there is at most one dotted arrow.*

Proof. Clearly (1) implies (2), (2) implies (3), and (3) implies (4). It remains to show (4) implies (1). Assume (4). We begin by reducing to S affine. Being separated is a local on the base (see Schemes, Lemma 21.21.8). Hence, as in the proof of Lemma 27.9.1, if we can show that whenever $X \to S$ has (4) that the restriction $X_\alpha \to S_\alpha$ has (4) where $S_\alpha \subset S$ is an (affine) open subset and $X_\alpha := f^{-1}(S_\alpha)$, then we will be done. The generic points of the irreducible components of X_α will be the generic points of irreducible components of X, since X_α is open in X. Therefore, any two distinct dotted arrows in the diagram

(27.9.2.1)
$$\begin{tikzcd} Spec(K) \arrow[r] \arrow[d] & X_\alpha \arrow[d] \\ Spec(A) \arrow[r] \arrow[ur, dashed] & S_\alpha \end{tikzcd}$$

would then give two distinct arrows in diagram (27.9.1.2) via the maps $X_\alpha \to X$ and $S_\alpha \to S$, which is a contradiction. Thus we have reduced to the case S is affine. We remark that in the course of this reduction, we prove that if $X \to S$ has (4) then the restriction $U \to V$ has (4) for opens $U \subset X$ and $V \subset S$ with $f(U) \subset V$.

We next wish to reduce to the case $X \to S$ is finite type. Assume that we know (4) implies (1) when X is finite type. Since S is Noetherian and X is locally of finite type over S we see X is locally Noetherian as well (see Morphisms, Lemma 24.14.6). Thus, $X \to S$ is quasi-separated (see Properties, Lemma 23.5.4), and therefore we may apply the valuative criterion to check whether X is separated (see Schemes, Lemma 21.22.2). Let $X = \bigcup_\alpha X_\alpha$ be an affine open cover of X. Given any two dotted arrows, in a diagram (27.9.1.2), the image of the closed points of Spec A will fall in two sets X_α and X_β. Since $X_\alpha \cup X_\beta$ is open, for topological reasons it must contain the image of $Spec(A)$ under both maps. Therefore, the two dotted arrows factor through $X_\alpha \cup X_\beta \to X$, which is a scheme of finite type over S. Since $X_\alpha \cup X_\beta$ is an open subset of X, by our previous remark, $X_\alpha \cup X_\beta$ satisfies (4), so by assumption, is separated. This implies the two given dotted arrows are the same. Therefore, we have reduced to $X \to S$ is finite type.

Assume $X \to S$ of finite type and assume (4). Since $X \to S$ is finite type, and S is an affine Noetherian scheme, X is also Noetherian (see Morphisms, Lemma 24.14.6). Therefore, $X \to X \times_S X$ will be a quasi-compact immersion of Noetherian schemes. We proceed by contradiction. Assume that $X \to X \times_S X$ is not closed. Then, there is some $y \in X \times_S X$ in the closure of the image that is not in the image. As X is Noetherian it has finitely many irreducible components. Therefore, y is in the closure of the image of one of the irreducible components $X_0 \subset X$. Give X_0 the reduced induced structure. The composition $X_0 \to X \to X \times_S X$ factors through the closed subscheme $X_0 \times_S X_0 \subset X \times_S X$. Denote the closure of $\Delta(X_0)$ in $X_0 \times_S X_0$ by $\bar{X}_0$ (again as a reduced closed subscheme). Thus $y \in \bar{X}_0$. Since $X_0 \to X_0 \times_S X_0$ is an immersion, the image of X_0 will be open in $\bar{X}_0$. Hence X_0 and $\bar{X}_0$ are birational. Since $\bar{X}_0$ is a closed subscheme of a Noetherian scheme, it is Noetherian. Thus, the local ring $\mathcal{O}_{\bar{X}_0,y}$ is a local Noetherian domain with fraction field K equal to the function field of X_0. By the Krull-Akizuki theorem (see Algebra, Lemma 7.110.11), there exists a discrete valuation ring A dominating $\mathcal{O}_{\bar{X}_0,y}$ with fraction field K. This allows to to construct a diagram:

(27.9.2.2)
$$\begin{tikzcd} \operatorname{Spec} K \arrow[r] \arrow[d] & X_0 \arrow[d, "\Delta"] \\ A \arrow[r] \arrow[ur, dashed] & X_0 \times_S X_0 \end{tikzcd}$$

which sends Spec K to the generic point of $\Delta(X_0)$ and the closed point of A to $y \in X_0 \times_S X_0$ (use the material in Schemes, Section 21.13 to construct the arrows). There cannot even exist a set theoretic dotted arrow, since y is not in the image of Δ by our choice of y. By categorical means, the existence of the dotted arrow in the above diagram is equivalent to the uniqueness of the dotted arrow in the following diagram:

(27.9.2.3)
$$\begin{tikzcd} \operatorname{Spec} K \arrow[r] \arrow[d] & X_0 \arrow[d] \\ A \arrow[r] \arrow[ur, dashed] & S \end{tikzcd}$$

Therefore, we have non-uniqueness in this latter diagram by the nonexistence in the first. Therefore, X_0 does not satisfy uniqueness for discrete valuation rings, and since X_0 is an irreducible component of X, we have that $X \to S$ does not satisfy (4). Therefore, we have shown (4) implies (1). □

Lemma 27.9.3. *Let S be a locally Noetherian scheme. Let $f : X \to S$ be a morphism of finite type. The following are equivalent:*

(1) *The morphism f is proper.*
(2) *For any diagram (27.9.1.2) there exists exactly one dotted arrow.*
(3) *For all diagrams (27.9.1.2) with A a discrete valuation ring there exists exactly one dotted arrow.*
(4) *For any irreducible component X_0 of X with generic point $\eta \in X_0$, for any discrete valuation ring $A \subset K = \kappa(\eta)$ with fraction field K and any diagram (27.9.1.2) such that the morphism $Spec(K) \to X$ is the canonical one (see Schemes, Section 21.13) there exists exactly one dotted arrow.*

Proof. (1) implies (2) implies (3) implies (4). We will now show (4) implies (1). As in the proof of Lemma 27.9.2, we can reduce to the case S is affine, since properness is local on the base, and if $X \to S$ satisfies (4), then $X_\alpha \to S_\alpha$ does as well for open $S_\alpha \subset S$ and $X_\alpha = f^{-1}(S_\alpha)$.

Now S is a Noetherian scheme, and so X is as well, since $X \to S$ is of finite type. Now we may use Chow's lemma (Coherent, Lemma 25.17.1) to get a surjective, proper, birational $X' \to X$ and an immersion $X' \to \mathbf{P}^n_S$. We wish to show $X \to S$ is universally closed. As in the proof of Lemma 27.9.1, it is enough to check that $X' \to \mathbf{P}^n_S$ is a closed immersion. For the sake of contradiction, assume that $X' \to \mathbf{P}^n_S$ is not a closed immersion. Then there is some $y \in \mathbf{P}^n_S$ that is in the closure of the image of X', but is not in the image. So y is in the closure of the image of an irreducible component X'_0 of X', but not in the image. Let $\bar{X}'_0 \subset \mathbf{P}^n_S$ be the closure of the image of X'_0. As $X' \to \mathbf{P}^n_S$ is an immersion of Noetherian schemes, the morphism $X'_0 \to \bar{X}'_0$ is open and dense. By Algebra, Lemma 7.110.11 or Properties, Lemma 23.5.9 we can find a discrete valuation ring A dominating $\mathcal{O}_{\bar{X}'_0,y}$ and with identical field of fractions K. It is clear that K is the residue field at the generic point of X'_0. Thus the solid commutative diagram

$$\begin{tikzcd} \mathrm{Spec}\, K \arrow[r] \arrow[d] & X' \arrow[r] \arrow[d] & \mathbf{P}^n_S \arrow[d] \\ \mathrm{Spec}\, A \arrow[r, dashed] \arrow[ur, dashed] \arrow[urr] & X \arrow[r] & S \end{tikzcd} \tag{27.9.3.1}$$

Note that the closed point of A maps to $y \in \mathbf{P}^n_S$. By construction, there does not exist a set theoretic lift to X'. As $X' \to X$ is birational, the image of X'_0 in X is an irreducible component X_0 of X and K is also identified with the function field of X_0. Hence, as $X \to S$ is assumed to satisfy (4), the dotted arrow $Spec(A) \to X$ exists. Since $X' \to X$ is proper, the dotted arrow lifts to the dotted arrow $Spec(A) \to X'$ (use Schemes, Proposition 21.20.6). We can compose this with the immersion $X' \to \mathbf{P}^n_S$ to obtain another morphism (not depicted in the diagram) from $Spec(A) \to \mathbf{P}^n_S$. Since $\mathbf{P}^n_S$ is proper over S, it satisfies (2), and so these two morphisms agree. This is a contradiction, for we have constructed the forbidden lift of our original map $Spec(A) \to \mathbf{P}^n_S$ to X'. □

27.10. Universally closed morphisms

In this section we discuss when a quasi-compact but not necessarily separated morphism is universally closed. We first prove a lemma which will allow us to check universal closedness after a base change which is locally of finite presentation.

Lemma 27.10.1. *Let $f : X \to S$ be a quasi-compact morphism of schemes. Let $g : T \to S$ be a morphism of schemes. Let $t \in T$ be a point and $Z \subset X_T$ be a closed subscheme such that $Z \cap X_t = \emptyset$. Then there exists an open neighbourhood $V \subset T$ of t, a commutative diagram*

$$\begin{tikzcd} V \arrow[r, "a"] \arrow[d] & T' \arrow[d, "b"] \\ T \arrow[r, "g"] & S, \end{tikzcd}$$

and a closed subscheme $Z' \subset X_{T'}$ such that

1. *the morphism $b : T' \to S$ is locally of finite presentation,*
2. *with $t' = a(t)$ we have $Z' \cap X_{t'} = \emptyset$, and*
3. *$Z \cap X_V$ maps into Z' via the morphism $X_V \to X_{T'}$.*

Proof. Let $s = g(t)$. During the proof we may always replace T by an open neighbourhood of t. Hence we may also replace S by an open neighbourhood of s. Thus we may and do assume that T and S are affine. Say $S = Spec(A)$, $T = Spec(B)$, g is given by the ring map $A \to B$, and t correspond to the prime ideal $\mathfrak{q} \subset B$.

As $X \to S$ is quasi-compact and S is affine we may write $X = \bigcup_{i=1,\ldots,n} U_i$ as a finite union of affine opens. Write $U_i = Spec(C_i)$. In particular we have $X_T = \bigcup_{i=1,\ldots,n} U_{i,T} = \bigcup_{i=1,\ldots n} Spec(C_i \otimes_A B)$. Let $I_i \subset C_i \otimes_A B$ be the ideal corresponding to the closed subscheme $Z \cap U_{i,T}$. The condition that $Z \cap X_t = \emptyset$ signifies that I_i generates the unit ideal in the ring

$$C_i \otimes_A \kappa(\mathfrak{q}) = (B \setminus \mathfrak{q})^{-1} \left(C_i \otimes_A B/\mathfrak{q}C_i \otimes_A B\right)$$

Since $I_i(B \setminus \mathfrak{q})^{-1}(C_i \otimes_A B) = (B \setminus \mathfrak{q})^{-1} I_i$ this means that $1 = x_i/g_i$ for some $x_i \in I_i$ and $g_i \in B$, $g_i \not\in \mathfrak{q}$. Thus, clearing denominators we can find a relation of the form

$$x_i + \sum\nolimits_j f_{i,j} c_{i,j} = g_i$$

with $x_i \in I_i$, $f_{i,j} \in \mathfrak{q}$, $c_{i,j} \in C_i \otimes_A B$, and $g_i \in B$, $g_i \not\in \mathfrak{q}$. After replacing B by $B_{g_1 \ldots g_n}$, i.e., after replacing T by a smaller affine neighbourhood of t, we may assume the equations read

$$x_i + \sum\nolimits_j f_{i,j} c_{i,j} = 1$$

with $x_i \in I_i$, $f_{i,j} \in \mathfrak{q}$, $c_{i,j} \in C_i \otimes_A B$.

To finish the argument write B as a colimit of finitely presented A-algebras B_λ over a directed partially ordered set Λ. For each λ set $\mathfrak{q}_\lambda = (B_\lambda \to B)^{-1}(\mathfrak{q})$. For sufficiently large $\lambda \in \Lambda$ we can find

(1) an element $x_{i,\lambda} \in C_i \otimes_A B_\lambda$ which maps to x_i,
(2) elements $f_{i,j,\lambda} \in \mathfrak{q}_{i,\lambda}$ mapping to $f_{i,j}$, and
(3) elements $c_{i,j,\lambda} \in C_i \otimes_A B_\lambda$ mapping to $c_{i,j}$.

After increasing λ a bit more the equation

$$x_{i,\lambda} + \sum\nolimits_j f_{i,j,\lambda} c_{i,j,\lambda} = 1$$

will hold. Fix such a λ and set $T' = Spec(B_\lambda)$. Then $t' \in T'$ is the point corresponding to the prime $\mathfrak{q}_\lambda$. Finally, let $Z' \subset X_{T'}$ be the scheme theoretic closure of $Z \to X_T \to X_{T'}$. As $X_T \to X_{T'}$ is affine, we can compute Z' on the affine open pieces $U_{i,T'}$ as the closed subscheme associated to $\mathrm{Ker}(C_i \otimes_A B_\lambda \to C_i \otimes_A B/I_i)$, see Morphisms, Example 24.4.4. Hence $x_{i,\lambda}$ is in the ideal defining Z'. Thus the last displayed equation shows that $Z' \cap X_{t'}$ is empty. □

Lemma 27.10.2. *Let $f : X \to S$ be a quasi-compact morphism of schemes. The following are equivalent*

(1) *f is universally closed,*
(2) *for every morphism $S' \to S$ which is locally of finite presentation the base change $X_{S'} \to S'$ is closed, and*
(3) *for every n the morphism $\mathbf{A}^n \times X \to \mathbf{A}^n \times S$ is closed.*

Proof. It is clear that (1) implies (2). Let us prove that (2) implies (1). Suppose that the base change $X_T \to T$ is not closed for some scheme T over S. By Schemes, Lemma 21.19.8 this means that there exists some specialization $t_1 \rightsquigarrow t$ in T and a point $\xi \in X_T$ mapping to t_1 such that ξ does not specialize to a point in the fibre over t. Set $Z = \overline{\{\xi\}} \subset X_T$. Then $Z \cap X_t = \emptyset$. Apply Lemma 27.10.1. We find an open neighbourhood $V \subset T$ of t, a commutative diagram

$$\begin{tikzcd} V \arrow[r, "a"] \arrow[d] & T' \arrow[d, "b"] \\ T \arrow[r, "g"] & S, \end{tikzcd}$$

and a closed subscheme $Z' \subset X_{T'}$ such that

(1) the morphism $b : T' \to S$ is locally of finite presentation,
(2) with $t' = a(t)$ we have $Z' \cap X_{t'} = \emptyset$, and
(3) $Z \cap X_V$ maps into Z' via the morphism $X_V \to X_{T'}$.

Clearly this means that $X_{T'} \to T'$ maps the closed subset Z' to a subset of T' which contains $a(t_1)$ but not $t' = a(t)$. Since $a(t_1) \rightsquigarrow a(t) = t'$ we conclude that $X_{T'} \to T'$ is not closed. Hence we have shown that $X \to S$ not universally closed implies that $X_{T'} \to T'$ is not closed for some $T' \to S$ which is locally of finite presentation. In order words (2) implies (1).

Assume that $\mathbf{A}^n \times X \to \mathbf{A}^n \times S$ is closed for every integer n. We want to prove that $X_T \to T$ is closed for every scheme T which is locally of finite presentation over S. We may of course assume that T is affine and maps into an affine open V of S (since $X_T \to T$ being a closed is local on T). In this case there exists a closed immersion $T \to \mathbf{A}^n \times V$ because $\mathcal{O}_T(T)$ is a finitely presented $\mathcal{O}_S(V)$-algebra, see Morphisms, Lemma 24.20.2. Then $T \to \mathbf{A}^n \times S$ is a locally closed immersion. Hence we get a cartesian diagram

$$\begin{tikzcd} X_T \arrow[r] \arrow[d, "f_T"'] & \mathbf{A}^n \times X \arrow[d, "f_n"] \\ T \arrow[r] & \mathbf{A}^n \times S \end{tikzcd}$$

of schemes where the horizontal arrows are locally closed immersions. Hence any closed subset $Z \subset X_T$ can be written as $X_T \cap Z'$ for some closed subset $Z' \subset \mathbf{A}^n \times X$. Then $f_T(Z) = T \cap f_n(Z')$ and we see that if f_n is closed, then also f_T is closed. □

Lemma 27.10.3. *Let $f : X \to S$ be a finite type morphism of schemes. Assume S is locally Noetherian. Then the following are equivalent*

(1) *f is universally closed,*
(2) *for every n the morphism $\mathbf{A}^n \times X \to \mathbf{A}^n \times S$ is closed,*
(3) *for any diagram (27.9.1.2) there exists some dotted arrow,*
(4) *for all diagrams (27.9.1.2) with A a discrete valuation ring there exists some dotted arrow.*

Proof. The equivalence of (1) and (2) is a special case of Lemma 27.10.2. The equivalence of (1) and (3) is a special case of Schemes, Proposition 21.20.6. Trivially (3) implies (4). Thus all we have to do is prove that (4) implies (2). We will prove that $\mathbf{A}^n \times X \to \mathbf{A}^n \times S$ is closed by the criterion of Schemes, Lemma 21.19.8. Pick n and a specialization $z \rightsquigarrow z'$ of points in $\mathbf{A}^n \times S$ and a point $y \in \mathbf{A}^n \times X$ lying over z. Note that $\kappa(y)$ is a finitely generated field extension of $\kappa(z)$ as $\mathbf{A}^n \times X \to \mathbf{A}^n \times S$ is of finite type. Hence by Properties, Lemma 23.5.9 or Algebra, Lemma 7.110.11 implies that there exists a discrete valuation ring $A \subset \kappa(y)$ with fraction field $\kappa(z)$ dominating the image of $\mathcal{O}_{\mathbf{A}^n \times S, z'}$ in $\kappa(z)$. This gives a commutative diagram

$$\begin{tikzcd} Spec(\kappa(y)) \arrow[r] \arrow[d] & \mathbf{A}^n \times X \arrow[r] \arrow[d] & X \arrow[d] \\ Spec(A) \arrow[r] & \mathbf{A}^n \times S \arrow[r] & S \end{tikzcd}$$

Now property (4) implies that there exists a morphism $Spec(A) \to X$ which fits into this diagram. Since we already have the morphism $Spec(A) \to \mathbf{A}^n$ from the left lower horizontal arrow we also get a morphism $Spec(A) \to \mathbf{A}^n \times X$ fitting into the left square. Thus the image $y' \in \mathbf{A}^n \times X$ of the closed point is a specialization of y lying over z'. This proves that specializations lift along $\mathbf{A}^n \times X \to \mathbf{A}^n \times S$ and we win. □

27.11. Limits and dimensions of fibres

The following lemma is most often used in the situation of Lemma 27.6.1 to assure that if the fibres of the limit have dimension $\leq d$, then the fibres at some finite stage have dimension $\leq d$.

Lemma 27.11.1. *Let I be a directed partially ordered set. Let $(f_i : X_i \to S_i)$ be an inverse system of morphisms of schemes over I. Assume*

(1) *all the morphisms $S_{i'} \to S_i$ are affine,*
(2) *all the schemes S_i are quasi-compact and quasi-separated,*
(3) *the morphisms f_i are of finite type, and*
(4) *the morphisms $X_{i'} \to X_i \times_{S_i} S_{i'}$ are closed immersions.*

Let $f : X = lim_i X_i \to S = lim_i S_i$ be the limit. Let $d \geq 0$. If every fibre of f has dimension $\leq d$, then for some i every fibre of f_i has dimension $\leq d$.

Proof. For each i let $U_i = \{x \in X_i \mid \dim_x((X_i)_{f_i(x)}) \leq d\}$. This is an open subset of X_i, see Morphisms, Lemma 24.27.4. Set $Z_i = X_i \setminus U_i$ (with reduced induced scheme structure). We have to show that $Z_i = \emptyset$ for some i. If not, then $Z = lim\, Z_i \neq \emptyset$, see Lemma 27.3.1. Say $z \in Z$ is a point. Note that $Z \subset X$ is a closed subscheme. Set $s = f(z)$. For each i let $s_i \in S_i$ be the image of s. We remark that Z_s is the limit of the schemes $(Z_i)_{s_i}$ and Z_s is also the limit of the schemes $(Z_i)_{s_i}$ base changed to $\kappa(s)$. Moreover, all the morphisms

$$Z_s \longrightarrow (Z_{i'})_{s_{i'}} \times_{Spec(\kappa(s_{i'}))} Spec(\kappa(s)) \longrightarrow (Z_i)_{s_i} \times_{Spec(\kappa(s_i))} Spec(\kappa(s)) \longrightarrow X_s$$

are closed immersions by assumption (4). Hence Z_s is the scheme theoretic intersection of the closed subschemes $(Z_i)_{s_i} \times_{Spec(\kappa(s_i))} Spec(\kappa(s))$ in X_s. Since all the irreducible components of the schemes $(Z_i)_{s_i} \times_{Spec(\kappa(s_i))} Spec(\kappa(s))$ have dimension $> d$ and contain z we conclude that Z_s contains an irreducible component of dimension $> d$ passing through z which contradicts the fact that $Z_s \subset X_s$ and $\dim(X_s) \leq d$. □

Lemma 27.11.2. *Let S be a quasi-compact and quasi-separated scheme. Let $f : X \to S$ be a morphism of finite presentation. Let $d \geq 0$ be an integer. If $Z \subset X$ be a closed subscheme such that $\dim(Z_s) \leq d$ for all $s \in S$, then there exists a closed subscheme $Z' \subset X$ such that*

(1) *$Z \subset Z'$,*
(2) *$Z' \to X$ is of finite presentation, and*
(3) *$\dim(Z'_s) \leq d$ for all $s \in S$.*

Proof. By Proposition 27.3.11 we can write $S = lim\, S_i$ as the limit of a directed inverse system of Noetherian schemes with affine transition maps. By Lemma 27.6.1 we may assume that there exist a system of morphisms $f_i : X_i \to S_i$ of finite presentation such that $X_{i'} = X_i \times_{S_i} S_{i'}$ for all $i' \geq i$ and such that $X = X_i \times_{S_i} S$. Let $Z_i \subset X_i$ be the scheme theoretic image of $Z \to X \to X_i$. Then for $i' \geq i$ the morphism $X_{i'} \to X_i$ maps $Z_{i'}$ into Z_i and the induced morphism $Z_{i'} \to Z_i \times_{S_i} S_{i'}$ is a closed immersion. By Lemma 27.11.1 we see that the dimension of the fibres of $Z_i \to S_i$ all have dimension $\leq d$ for a suitable $i \in I$. Fix such an i and set $Z' = Z_i \times_{S_i} S \subset X$. Since S_i is Noetherian, we see that X_i is Noetherian, and hence the morphism $Z_i \to X_i$ is of finite presentation. Therefore also the base change $Z' \to X$ is of finite presentation. Moreover, the fibres of $Z' \to S$ are base changes of the fibres of $Z_i \to S_i$ and hence have dimension $\leq d$. □

CHAPTER 28

Varieties

28.1. Introduction

In this chapter we start studying varieties and more generally schemes over a field. A fundamental reference is [**DG67**].

28.2. Notation

Throughout this chapter we use the letter k to denote the ground field.

28.3. Varieties

In the stacks project we will use the following as our definition of a variety.

Definition 28.3.1. Let k be a field. A *variety* is a scheme X over k such that X is integral and the structure morphism $X \to Spec(k)$ is separated and of finite type.

This definition has the following drawback. Suppose that $k \subset k'$ is an extension of fields. Suppose that X is a variety over k. Then the base change $X_{k'} = X \times_{Spec(k)} Spec(k')$ is not necessarily a variety over k'. This phenomenon (in greater generality) will be discussed in detail in the following sections. The product of two varieties need not be a variety (this is really the same phenomenon). Here is an example.

Example 28.3.2. Let $k = \mathbf{Q}$. Let $X = Spec(\mathbf{Q}(i))$ and $Y = Spec(\mathbf{Q}(i))$. Then the product $X \times_{Spec(k)} Y$ of the varieties X and Y is not a variety, since it is reducible. (It is isomorphic to the disjoint union of two copies of X.)

If the ground field is algebraically closed however, then the product of varieties is a variety. This follows from the results in the algebra chapter, but there we treat much more general situations. There is also a simple direct proof of it which we present here.

Lemma 28.3.3. *Let k be an algebraically closed field. Let X, Y be varieties over k. Then $X \times_{Spec(k)} Y$ is a variety over k.*

Proof. The morphism $X \times_{Spec(k)} Y \to Spec(k)$ is of finite type and separated because it is the composition of the morphisms $X \times_{Spec(k)} Y \to Y \to Spec(k)$ which are separated and of finite type, see Morphisms, Lemmas 24.14.4 and 24.14.3 and Schemes, Lemma 21.21.13. To finish the proof it suffices to show that $X \times_{Spec(k)} Y$ is integral. Let $X = \bigcup_{i=1,\ldots,n} U_i$, $Y = \bigcup_{j=1,\ldots,m} V_j$ be finite affine open coverings. If we can show that each $U_i \times_{Spec(k)} V_j$ is integral, then we are done by Properties, Lemmas 23.3.2, 23.3.3, and 23.3.4. This reduces us to the affine case.

The affine case translates into the following algebra statement: Suppose that A, B are integral domains and finitely generated k-algebras. Then $A \otimes_k B$ is an integral domain. To get a contradiction suppose that

$$(\sum\nolimits_{i=1,\ldots,n} a_i \otimes b_i)(\sum\nolimits_{j=1,\ldots,m} c_j \otimes d_j) = 0$$

in $A \otimes_k B$ with both factors nonzero in $A \otimes_k B$. We may assume that $b_1, \ldots, b_n$ are k-linearly independent in B, and that $d_1, \ldots, d_m$ are k-linearly independent in B. Of course we may also assume that a_1 and c_1 are nonzero in A. Hence $D(a_1c_1) \subset Spec(A)$ is nonempty. By the Hilbert Nullstellensatz (Algebra, Theorem 7.30.1) we can find a maximal ideal $\mathfrak{m} \subset A$ contained in $D(a_1c_1)$ and $A/\mathfrak{m} = k$ as k is algebraically closed. Denote $\overline{a}_i, \overline{c}_j$ the residue classes of a_i, c_j in $A/\mathfrak{m} = k$. Then equation above becomes

$$(\sum\nolimits_{i=1,\ldots,n} \overline{a}_i b_i)(\sum\nolimits_{j=1,\ldots,m} \overline{c}_j d_j) = 0$$

which is a contradiction with $\mathfrak{m} \in D(a_1c_1)$, the linear independence of $b_1, \ldots, b_n$ and $d_1, \ldots, d_m$, and the fact that B is a domain. □

28.4. Geometrically reduced schemes

If X is a reduced scheme over a field, then it can happen that X becomes nonreduced after extending the ground field. This does not happen for geometrically reduced schemes.

Definition 28.4.1. Let k be a field. Let X be a scheme over k. Let $x \in X$ be a point.

1. Let $x \in X$ be a point. We say X is *geometrically reduced at x* if for any field extension $k \subset k'$ and any point $x' \in X_{k'}$ lying over x the local ring $\mathcal{O}_{X_{k'},x'}$ is reduced.
2. We say X is *geometrically reduced* over k if X is geometrically reduced at every point of X.

This may seem a little mysterious at first, but it is really the same thing as the notion discussed in the algebra chapter. Here are some basic results explaining the connection.

Lemma 28.4.2. *Let k be a field. Let X be a scheme over k. Let $x \in X$. The following are equivalent*

1. *X is geometrically reduced at x, and*
2. *the ring $\mathcal{O}_{X,x}$ is geometrically reduced over k (see Algebra, Definition 7.40.1).*

Proof. Assume (1). This in particular implies that $\mathcal{O}_{X,x}$ is reduced. Let $k \subset k'$ be a finite purely inseparable field extension. Consider the ring $\mathcal{O}_{X,x} \otimes_k k'$. By Algebra, Lemma 7.43.2 its spectrum is the same as the spectrum of $\mathcal{O}_{X,x}$. Hence it is a local ring also (Algebra, Lemma 7.17.2). Therefore there is a unique point $x' \in X_{k'}$ lying over x and $\mathcal{O}_{X_{k'},x'} \cong \mathcal{O}_{X,x} \otimes_k k'$. By assumption this is a reduced ring. Hence we deduce (2) by Algebra, Lemma 7.41.3.

Assume (2). Let $k \subset k'$ be a field extension. Since $Spec(k') \to Spec(k)$ is surjective, also $X_{k'} \to X$ is surjective (Morphisms, Lemma 24.9.4). Let $x' \in X_{k'}$ be any point lying over x. The local ring $\mathcal{O}_{X_{k'},x'}$ is a localization of the ring $\mathcal{O}_{X,x} \otimes_k k'$. Hence it is reduced by assumption and (1) is proved. □

The notion isn't interesting in characteristic zero.

Lemma 28.4.3. *Let X be a scheme over a perfect field k (e.g. k has characteristic zero). Let $x \in X$. If $\mathcal{O}_{X,x}$ is reduced, then X is geometrically reduced at x. If X is reduced, then X is geometrically reduced over k.*

Proof. The first statement follows from Lemma 28.4.2 and Algebra, Lemma 7.40.6 and the definition of a perfect field (Algebra, Definition 7.42.1). The second statement follows from the first. □

Lemma 28.4.4. *Let k be a field of characteristic $p > 0$. Let X be a scheme over k. The following are equivalent*

(1) *X is geometrically reduced,*
(2) *$X_{k'}$ is reduced for every field extension $k \subset k'$,*
(3) *$X_{k'}$ is reduced for every finite purely inseparable field extension $k \subset k'$,*
(4) *$X_{k^{1/p}}$ is reduced,*
(5) *$X_{k^{perf}}$ is reduced,*
(6) *$X_{\bar{k}}$ is reduced,*
(7) *for every affine open $U \subset X$ the ring $\mathcal{O}_X(U)$ is geometrically reduced (see Algebra, Definition 7.40.1).*

Proof. Assume (1). Then for every field extension $k \subset k'$ and every point $x' \in X_{k'}$ the local ring of $X_{k'}$ at x' is reduced. In other words $X_{k'}$ is reduced. Hence (2).

Assume (2). Let $U \subset X$ be an affine open. Then for every field extension $k \subset k'$ the scheme $X_{k'}$ is reduced, hence $U_{k'} = Spec(\mathcal{O}(U) \otimes_k k')$ is reduced, hence $\mathcal{O}(U) \otimes_k k'$ is reduced (see Properties, Section 23.3). In other words $\mathcal{O}(U)$ is geometrically reduced, so (7) holds.

Assume (7). For any field extension $k \subset k'$ the base change $X_{k'}$ is gotten by gluing the spectra of the rings $\mathcal{O}_X(U) \otimes_k k'$ where U is affine open in X (see Schemes, Section 21.17). Hence $X_{k'}$ is reduced. So (1) holds.

This proves that (1), (2), and (7) are equivalent. These are equivalent to (3), (4), (5), and (6) because we can apply Algebra, Lemma 7.41.3 to $\mathcal{O}_X(U)$ for $U \subset X$ affine open. □

Lemma 28.4.5. *Let k be a field of characteristic $p > 0$. Let X be a scheme over k. Let $x \in X$. The following are equivalent*

(1) *X is geometrically reduced at x,*
(2) *$\mathcal{O}_{X_{k'},x'}$ is reduced for every finite purely inseparable field extension k' of k and $x' \in X_{k'}$ the unique point lying over x,*
(3) *$\mathcal{O}_{X_{k^{1/p}},x'}$ is reduced for $x' \in X_{k'}$ the unique point lying over x, and*
(4) *$\mathcal{O}_{X_{k^{perf}},x'}$ is reduced for $x' \in X_{k^{perf}}$ the unique point lying over x.*

Proof. Note that if $k \subset k'$ is purely inseparable, then $X_{k'} \to X$ induces a homeomorphism on underlying topological spaces, see Algebra, Lemma 7.43.2. Whence the uniqueness of x' lying over x mentioned in the statement. Moreover, in this case $\mathcal{O}_{X_{k'},x'} = \mathcal{O}_{X,x} \otimes_k k'$. Hence the lemma follows from Lemma 28.4.2 above and Algebra, Lemma 7.41.3. □

Lemma 28.4.6. *Let k be a field. Let X be a scheme over k. Let k'/k be a field extension. Let $x \in X$ be a point, and let $x' \in X_{k'}$ be a point lying over x. The following are equivalent*

(1) *X is geometrically reduced at x,*
(2) *$X_{k'}$ is geometrically reduced at x'.*

In particular, X is geometrically reduced over k if and only if $X_{k'}$ is geometrically reduced over k'.

Proof. It is clear that (1) implies (2). Assume (2). Let $k \subset k''$ be a finite purely inseparable field extension and let $x'' \in X_{k''}$ be a point lying over x (actually it is unique). We can find a common field extension $k \subset k'''$ (i.e. with both $k' \subset k'''$ and $k'' \subset k'''$) and a point $x''' \in X_{k'''}$ lying over both x' and x''. Consider the map of local rings

$$\mathcal{O}_{X_{k''},x''} \longrightarrow \mathcal{O}_{X_{k'''},x'''}.$$

This is a flat local ring homomorphism and hence faithfully flat. By (2) we see that the local ring on the right is reduced. Thus by Algebra, Lemma 7.146.2 we conlude that $\mathcal{O}_{X_{k''},x''}$ is reduced. Thus by Lemma 28.4.5 we conclude that X is geometrically reduced at x. □

Lemma 28.4.7. *Let k be a field. Let X, Y be schemes over k.*

(1) *If X is geometrically reduced at x, and Y reduced, then $X \times_k Y$ is reduced at every point lying over x.*
(2) *If X geometrically reduced over k and Y reduced. Then $X \times_k Y$ is reduced.*

Proof. Combine, Lemmas 28.4.2 and 28.4.4 and Algebra, Lemma 7.40.5. □

Lemma 28.4.8. *Let k be a field. Let X be a scheme over k.*

(1) *If $x' \rightsquigarrow x$ is a specialization and X is geometrically reduced at x, then X is geometrically reduced at x'.*
(2) *If $x \in X$ such that (a) $\mathcal{O}_{X,x}$ is reduced, and (b) for each specialization $x' \rightsquigarrow x$ where x' is a generic point of an irreducible component of X the scheme X is geometrically reduced at x', then X is geometrically reduced at x.*
(3) *If X is reduced and geometrically reduced at all generic points of irreducible components of X, then X is geometrically reduced.*

Proof. Part (1) follows from Lemma 28.4.2 and the fact that if A is a geometrically reduced k-algebra, then $S^{-1}A$ is a geometrically reduced k-algebra for any multiplicative subset S of A, see Algebra, Lemma 7.40.3.

Let $A = \mathcal{O}_{X,x}$. The assumptions (a) and (b) of (2) imply that A is reduced, and that $A_{\mathfrak{q}}$ is geometrically reduced over k for every minimal prime $\mathfrak{q}$ of A. Hence A is geometrically reduced over k, see Algebra, Lemma 7.40.7. Thus X is geometrically reduced at x, see Lemma 28.4.2.

Part (3) follows trivially from part (2). □

Lemma 28.4.9. *Let k be a field. Let X be a scheme over k. Let $x \in X$. Assume X locally Noetherian and geometrically reduced at x. Then there exists an open neighbourhood $U \subset X$ of x which is geometrically reduced over k.*

Proof. Let R be a Noetherian k-algebra. Let $\mathfrak{p} \subset R$ be a prime. Let $I = \text{Ker}(R \to R_{\mathfrak{p}}$. Since $IR_{\mathfrak{p}} = R_{\mathfrak{p}}$ and I is finitely generated there exists an $f \in R$, $f \notin \mathfrak{p}$ such that $fI = 0$. Hence $R_f \subset R_{\mathfrak{p}}$.

Assume X locally Noetherian and geometrically reduced at x. If we apply the above to $R = \mathcal{O}_X(U)$ for some affine open neighbourhood of x, and $\mathfrak{p} \subset R$ the prime corresponding to x, then we see that after shrinking U we may assume $R \subset R_{\mathfrak{p}}$. By Lemma 28.4.2 the assumption means that $R_{\mathfrak{p}}$ is geometrically reduced over k. By Algebra, Lemma 7.40.2 this implies that R is geometrically reduced over k, which in turn implies that U is geometrically reduced. □

Example 28.4.10. Let $k = \mathbf{F}_p(s,t)$, i.e., a purely transcendental extension of the prime field. Consider the variety $X = Spec(k[x,y]/(1 + sx^p + ty^p))$. Let $k \subset k'$ be any extension such that both s and t have a pth root in k'. Then the base change $X_{k'}$ is not reduced. Namely, the ring $k'[x,y]/(1 + sx^p + ty^p)$ contains the element $1 + s^{1/p}x + t^{1/p}y$ whose pth power is zero but which is not zero (since the ideal $(1 + sx^p + ty^p)$ certainly does not contain any nonzero element of degree $< p$).

Lemma 28.4.11. *Let k be a field. Let $X \to Spec(k)$ be locally of finite type. Assume X has finitely many irreducible components. Then there exists a finite purely inseparable extension $k \subset k'$ such that $(X_{k'})_{red}$ is geometrically reduced over k'.*

Proof. To prove this lemma we may replace X by its reduction X_{red}. Hence we may assume that X is reduced and locally of finite type over k. Let $x_1, \ldots, x_n \in X$ be the generic points of the irreducible components of X. Note that for every purely inseparable algebraic extension $k \subset k'$ the morphism $(X_{k'})_{red} \to X$ is a homeomorphism, see Algebra, Lemma 7.43.2. Hence the points $x'_1, \ldots, x'_n$ lying over $x_1, \ldots, x_n$ are the generic points of the irreducible components of $(X_{k'})_{red}$. As X is reduced the local rings $K_i = \mathcal{O}_{X,x_i}$ are fields, see Algebra, Lemma 7.23.3. As X is locally of finite type over k the field extensions $k \subset K_i$ are finitely generated field extensions. Finally, the local rings $\mathcal{O}_{X_{k'},x'_i}$ are the fields $(K_i \otimes_k k')_{red}$. By Algebra, Lemma 7.42.3 we can find a finite purely inseparable extension $k \subset k'$ such that $(K_i \otimes_k k')_{red}$ are separable field extensions of k'. In particular each $(K_i \otimes_k k')_{red}$ is geometrically reduced over k' by Algebra, Lemma 7.41.1. At this point Lemma 28.4.8 part (3) implies that $(X_{k'})_{red}$ is geometrically reduced. $\square$

28.5. Geometrically connected schemes

If X is a connected scheme over a field, then it can happen that X becomes disconnected after extending the ground field. This does not happen for geometrically connected schemes.

Definition 28.5.1. Let X be a scheme over the field k. We say X is *geometrically connected* over k if the scheme $X_{k'}$ is connected[1] for every field extension k' of k.

Here is an example of a variety which is not geometrically connected.

Example 28.5.2. Let $k = \mathbf{Q}$. The scheme $X = Spec(\mathbf{Q}(i))$ is a variety over $Spec(\mathbf{Q})$. But the base change $X_{\mathbf{C}}$ is the spectrum of $\mathbf{C} \otimes_{\mathbf{Q}} \mathbf{Q}(i) \cong \mathbf{C} \times \mathbf{C}$ which is the disjoint union of two copies of $Spec(\mathbf{C})$. So in fact, this is an example of a non-geometrically connected variety.

Lemma 28.5.3. *Let X be a scheme over the field k. Let $k \subset k'$ be a field extension. Then X is geometrically connected over k if and only if $X_{k'}$ is geometrically connected over k'.*

Proof. If X is geometrically connected over k, then it is clear that $X_{k'}$ is geometrically connected over k'. For the converse, note that for any field extension $k \subset k''$ there exists a common field extension $k' \subset k'''$ and $k'' \subset k'''$. As the morphism $X_{k'''} \to X_{k''}$ is surjective (as a base change of a surjective morphism between spectra of fields) we see that the connectedness of $X_{k'''}$ implies the connectedness of $X_{k''}$. Thus if $X_{k'}$ is geometrically connected over k' then X is geometrically connected over k. $\square$

Lemma 28.5.4. *Let k be a field. Let X, Y be schemes over k. Assume X is geometrically connected over k. Then the projection morphism*

$$p : X \times_k Y \longrightarrow Y$$

induces a bijection between connected components.

Proof. The scheme theoretic fibres of p are connected and nonempty, since they are base changes of the geometrically connected scheme X by field extensions. Moreover the scheme theoretic fibres are homeomorphic to the set theoretic fibres, see Schemes, Lemma 21.18.5. By Morphisms, Lemma 24.22.4 the map p is open. Thus we may apply Topology, Lemma 5.4.5 to conclude. $\square$

[1] An empty topological space is connected.

Lemma 28.5.5. *Let k be a field. Let A be a k-algebra. Then $X = Spec(A)$ is geometrically connected over k if and only if A is geometrically connected over k (see Algebra, Definition 7.44.3).*

Proof. Immediate from the definitions. $\square$

Lemma 28.5.6. *Let $k \subset k'$ be an extension of fields. Let X be a scheme over k. Assume k separably algebraically closed. Then the morphism $X_{k'} \to X$ induces a bijection of connected components. In particular, X is geometrically connected over k if and only if X is connected.*

Proof. Since k is separably algebraically closed we see that k' is geometrically connected over k, see Algebra, Lemma 7.44.4. Hence $Z = Spec(k')$ is geometrically connected over k by Lemma 28.5.5 above. Since $X_{k'} = Z \times_k X$ the result is a special case of Lemma 28.5.4. $\square$

Lemma 28.5.7. *Let k be a field. Let X be a scheme over k. Let $\overline{k}$ be a separable algebraic closure of k. Then X is geometrically connected if and only if the base change $X_{\overline{k}}$ is connected.*

Proof. Assume $X_{\overline{k}}$ is connected. Let $k \subset k'$ be a field extension. There exists a field extension $\overline{k} \subset \overline{k}'$ such that k' embeds into $\overline{k}'$ as an extension of k. By Lemma 28.5.6 we see that $X_{\overline{k}'}$ is connected. Since $X_{\overline{k}'} \to X_{k'}$ is surjective we conclude that $X_{k'}$ is connected as desired. $\square$

Lemma 28.5.8. *Let k be a field. Let X be a scheme over k. Let A be a k-algebra. Let $V \subset X_A$ be a quasi-compact open. Then there exists a finitely generated k-subalgebra $A' \subset A$ and a quasi-compact open $V' \subset X_{A'}$ such that $V = V'_A$.*

Proof. We remark that if X is also quasi-separated this follows from Limits, Lemma 27.3.5. Let $U_1, \ldots, U_n$ be finitely many affine opens of X such that $V \subset \bigcup U_{i,A}$. Say $U_i = Spec(R_i)$. Since V is quasi-compact we can find finitely many $f_{ij} \in R_i \otimes_k A$, $j = 1, \ldots, n_i$ such that $V = \bigcup_i \bigcup_{j=1,\ldots,n_i} D(f_{ij})$ where $D(f_{ij}) \subset U_{i,A}$ is the corresponding standard open. (We do not claim that $V \cap U_{i,A}$ is the union of the $D(f_{ij})$, $j = 1, \ldots, n_i$.) It is clear that we can find a finitely generated k-subalgebra $A' \subset A$ such that f_{ij} is the image of some $f'_{ij} \in R_i \otimes_k A'$. Set $V' = \bigcup D(f'_{ij})$ which is a quasi-compact open of $X_{A'}$. Denote $\pi : X_A \to X_{A'}$ the canonical morphism. We have $\pi(V) \subset V'$ as $\pi(D(f_{ij})) \subset D(f'_{ij})$. If $x \in X_A$ with $\pi(x) \in V'$, then $\pi(x) \in D(f'_{ij})$ for some i, j and we see that $x \in D(f_{ij})$ as f'_{ij} maps to f_{ij}. Thus we see that $V = \pi^{-1}(V')$ as desired. $\square$

Let k be a field. Let $k \subset \overline{k}$ be a (possibly infinite) Galois extension. For example $\overline{k}$ could be the separable algebraic closure of k. For any $\sigma \in \mathrm{Gal}(\overline{k}/k)$ we get a corresponding automorphism $Spec(\sigma) : Spec(\overline{k}) \longrightarrow Spec(\overline{k})$. Note that $Spec(\sigma) \circ Spec(\tau) = Spec(\tau \circ \sigma)$. Hence we get an action

$$\mathrm{Gal}(\overline{k}/k)^{opp} \times Spec(\overline{k}) \longrightarrow Spec(\overline{k})$$

of the opposite group on the scheme $Spec(\overline{k})$. Let X be a scheme over k. Since $X_{\overline{k}} = Spec(\overline{k}) \times_{Spec(k)} X$ by definition we see that the action above induces a canonical action

$$\mathrm{Gal}(\overline{k}/k)^{opp} \times X_{\overline{k}} \longrightarrow X_{\overline{k}}. \tag{28.5.8.1}$$

Lemma 28.5.9. *Let k be a field. Let X be a scheme over k. Let $\overline{k}$ be a (possibly infinite) Galois extension of k. Let $V \subset X_{\overline{k}}$ be a quasi-compact open. Then*

(1) *there exists a finite subextension $k \subset k' \subset \overline{k}$ and a quasi-compact open $V' \subset X_{k'}$ such that $V = (V')_{\overline{k}}$,*
(2) *there exists an open subgroup $H \subset Gal(\overline{k}/k)$ such that $\sigma(V) = V$ for all $\sigma \in H$.*

Proof. By Lemma 28.5.8 there exists a finite subextension $k \subset k' \subset \overline{k}$ and an open $V' \subset X_{k'}$ which pulls back to V. This proves (1). Since $\text{Gal}(\overline{k}/k')$ is open in $\text{Gal}(\overline{k}/k)$ part (2) is clear as well. $\square$

Lemma 28.5.10. *Let k be a field. Let $k \subset \overline{k}$ be a (possibly infinite) Galois extension. Let X be a scheme over k. Let $\overline{T} \subset X_{\overline{k}}$ have the following properties*

(1) *$\overline{T}$ is a closed subset of $X_{\overline{k}}$,*
(2) *for every $\sigma \in Gal(\overline{k}/k)$ we have $\sigma(\overline{T}) = \overline{T}$.*

Then there exists a closed subset $T \subset X$ whose inverse image in $X_{k'}$ is $\overline{T}$.

Proof. This lemma immediately reduces to the case where $X = Spec(A)$ is affine. In this case, let $\overline{I} \subset A \otimes_k \overline{k}$ be the radical ideal corresponding to $\overline{T}$. Assumption (2) implies that $\sigma(\overline{I}) = \overline{I}$ for all $\sigma \in \text{Gal}(\overline{k}/k)$. Pick $x \in \overline{I}$. There exists a finite Galois extension $k \subset k'$ contained in $\overline{k}$ such that $x \in A \otimes_k k'$. Set $G = \text{Gal}(k'/k)$. Set

$$P(T) = \prod\nolimits_{\sigma \in G}(T - \sigma(x)) \in (A \otimes_k k')[T]$$

It is clear that $P(T)$ is monic and is actually an element of $(A \otimes_k k')^G[T] = A[T]$ (by basic Galois theory). Moreover, if we write $P(T) = T^d + a_1T^{d-1} + \ldots + a_0$ the we see that $a_i \in I := A \cap \overline{I}$. By Algebra, Lemma 7.34.5 we see that x is contained in the radical of $I(A \otimes_k \overline{k})$. Hence $\overline{I}$ is the radical of $I(A \otimes_k \overline{k})$ and setting $T = V(I)$ is a solution. $\square$

Lemma 28.5.11. *Let k be a field. Let X be a scheme over k. The following are equivalent*

(1) *X is geometrically connected,*
(2) *for every finite separable field extension $k \subset k'$ the scheme $X_{k'}$ is connected.*

Proof. It follows immediately from the definition that (1) implies (2). Assume that X is not geometrically connected. Let $k \subset \overline{k}$ be a separable algebraic closure of k. By Lemma 28.5.7 it follows that $X_{\overline{k}}$ is disconnected. Say $X_{\overline{k}} = \overline{U} \amalg \overline{V}$ with $\overline{U}$ and $\overline{V}$ open, closed, and nonempty.

Suppose that $W \subset X$ is any quasi-compact open. Then $W_{\overline{k}} \cap \overline{U}$ and $W_{\overline{k}} \cap \overline{V}$ are open and closed in $W_{\overline{k}}$. In particular $W_{\overline{k}} \cap \overline{U}$ and $W_{\overline{k}} \cap \overline{V}$ are quasi-compact, and by Lemma 28.5.9 both $W_{\overline{k}} \cap \overline{U}$ and $W_{\overline{k}} \cap \overline{V}$ are defined over a finite subextension and invariant under an open subgroup of $\text{Gal}(\overline{k}/k)$. We will use this without further mention in the following.

Pick $W_0 \subset X$ quasi-compact open such that both $W_{0,\overline{k}} \cap \overline{U}$ and $W_{0,\overline{k}} \cap \overline{V}$ are nonempty. Choose a finite subextension $k \subset k' \subset \overline{k}$ and a decompostion $W_{0,k'} = U'_0 \amalg V'_0$ into open and closed subsets such that $W_{0,\overline{k}} \cap \overline{U} = (U'_0)_{\overline{k}}$ and $W_{0,\overline{k}} \cap \overline{V} = (V'_0)_{\overline{k}}$. Let $H = \text{Gal}(\overline{k}/k') \subset \text{Gal}(\overline{k}/k)$. In particular $\sigma(W_{0,\overline{k}} \cap \overline{U}) = W_{0,\overline{k}} \cap \overline{U}$ and similarly for $\overline{V}$.

Having chosen W_0, k' as above, for every quasi-compact open $W \subset X$ we set

$$U_W = \bigcap\nolimits_{\sigma \in H} \sigma(W_{\overline{k}} \cap \overline{U}), \quad V_W = \bigcup\nolimits_{\sigma \in H} \sigma(W_{\overline{k}} \cap \overline{V}).$$

Now, since $W_{\overline{k}} \cap \overline{U}$ and $W_{\overline{k}} \cap \overline{V}$ are fixed by an open subgroup of $\text{Gal}(\overline{k}/k)$ we see that the union and intersection above are finite. Hence U_W and V_W are both open and closed. Also, by construction $W_{\bar{k}} = U_W \amalg V_W$.

We claim that if $W \subset W' \subset X$ are quasi-compact open, then $W_{\overline{k}} \cap U_{W'} = U_W$ and $W_{\overline{k}} \cap V_{W'} = V_W$. Verification omitted. Hence we see that upon defining $U = \bigcup_{W \subset X} U_W$ and $V = \bigcup_{W \subset X} V_W$ we obtain $X_{\overline{k}} = U \amalg V$ is a disjoint union of open and closed subsets. It is clear that V is nonempty as it is constructed by taking unions (locally). On the other hand, U is nonempty since it contains $W_0 \cap \overline{U}$ by construction. Finally, $U, V \subset X_{\bar{k}}$ are closed and H-invariant by construction. Hence by Lemma 28.5.10 we have $U = (U')_{\bar{k}}$, and $V = (V')_{\bar{k}}$ for some closed $U', V' \subset X_{k'}$. Clearly $X_{k'} = U' \amalg V'$ and we see that $X_{k'}$ is disconnected as desired. $\square$

Lemma 28.5.12. *Let k be a field. Let $k \subset \overline{k}$ be a (possibly infinite) Galois extension. Let $f : T \to X$ be a morphism of schemes over k. Assume $T_{\overline{k}}$ nonempty connected and $X_{\overline{k}}$ disconnected. Then X is disconnected.*

Proof. Write $X_{\overline{k}} = \overline{U} \coprod \overline{V}$ with $\overline{U}$ and $\overline{V}$ open and closed. Denote $\overline{f} : T_{\overline{k}} \to X_{\overline{k}}$ the base change of f. Since $T_{\overline{k}}$ is connected we see that $T_{\overline{k}}$ is contained in either $\overline{f}^{-1}(\overline{U})$ or $\overline{f}^{-1}(\overline{V})$. Say $T_{\overline{k}} \subset \overline{f}^{-1}(\overline{U})$.

Fix a quasi-compact open $W \subset X$. There exists a finite Galois subextension $k \subset k' \subset \overline{k}$ such that $\overline{U} \cap W_{\overline{k}}$ and $\overline{V} \cap W_{\overline{k}}$ come from quasi-compact opens $U', V' \subset W_{k'}$. Then also $W_{k'} = U' \coprod V'$. Consider

$$U'' = \bigcap\nolimits_{\sigma \in \text{Gal}(k'/k)} \sigma(U'), \quad V'' = \bigcup\nolimits_{\sigma \in \text{Gal}(k'/k)} \sigma(V').$$

These are Galois invariant, open and closed, and $W_{k'} = U'' \coprod V''$. By Lemma 28.5.10 we get open and closed subsets $U_W, V_W \subset W$ such that $U'' = (U_W)_{k'}$, $V'' = (V_W)_{k'}$ and $W = U_W \coprod V_W$.

We claim that if $W \subset W' \subset X$ are quasi-compact open, then $W \cap U_{W'} = U_W$ and $W \cap V_{W'} = V_W$. Verification omitted. Hence we see that upon defining $U = \bigcup_{W \subset X} U_W$ and $V = \bigcup_{W \subset X} V_W$ we obtain $X = U \coprod V$. It is clear that V is nonempty as it is constructed by taking unions (locally). On the other hand, U is nonempty since it contains $f(T)$ by construction. $\square$

Lemma 28.5.13. *Let k be a field. Let $T \to X$ be a morphism of schemes over k. Assume T is nonempty and geometrically connected and X connected. Then X is geometrically connected.*

Proof. This is a reformulation of Lemma 28.5.12. $\square$

Lemma 28.5.14. *Let k be a field. Let X be a scheme over k. Assume X is connected and has a point x such that k is algebraically closed in $\kappa(x)$. Then X is geometrically connected. In particular, if X has a k-rational point and X is connected, then X is geometrically connected.*

Proof. Set $T = Spec(\kappa(x))$. Let $k \subset \overline{k}$ be a separable algebraic closure of k. The assumption on $k \subset \kappa(x)$ implies that $T_{\overline{k}}$ is irreducible, see Algebra, Lemma 7.43.10. Hence by Lemma 28.5.13 we see that $X_{\overline{k}}$ is connected. By Lemma 28.5.7 we conclude that X is geometrically connected. $\square$

Lemma 28.5.15. *Let $k \subset K$ be an extension of fields. Let X be a scheme over k. For every connected component T of X the inverse image $T_K \subset X_K$ is a union of connected components of X_K.*

Proof. This is a purely topological statement. Denote $p : X_K \to X$ the projection morphism. Let $T \subset X$ be a connected component of X. Let $t \in T_K = p^{-1}(T)$. Let $C \subset X_K$ be a connected component containing t. Then $p(C)$ is a connected subset of X which meets T, hence $p(C) \subset T$. Hence $C \subset T_K$. $\square$

Remark 28.5.16. Let $k \subset K$ be an extension of fields. Let X be a scheme over k. Denote $p : X_K \to X$ the projection morphism. Let $\overline{T} \subset X_K$ be a connected component. Is it true that $p(\overline{T})$ is a connected component of X? We do not know the answer, even when $k \subset K$ is finite! If you do, or if you have a reference, please email stacks.project@gmail.com.

Let X be a scheme. We denote $\pi_0(X)$ the set of connected components of X.

Lemma 28.5.17. *Let k be a field, with separable algebraic closure $\overline{k}$. Let X be a scheme over k. There is an action*

$$Gal(\overline{k}/k)^{opp} \times \pi_0(X_{\overline{k}}) \longrightarrow \pi_0(X_{\overline{k}})$$

with the following properties:

(1) *An element $\overline{T} \in \pi_0(X_{\overline{k}})$ is fixed by the action if and only if there exists a connected component $T \subset X$, which is geometrically connected over k, such that $T_{\overline{k}} = \overline{T}$.*
(2) *For any field extension $k \subset k'$ with separable algebraic closure $\overline{k}'$ the diagram*

$$\begin{tikzcd} Gal(\overline{k}'/k') \times \pi_0(X_{\overline{k}'}) \arrow[r] \arrow[d] & \pi_0(X_{\overline{k}'}) \arrow[d] \\ Gal(\overline{k}/k) \times \pi_0(X_{\overline{k}}) \arrow[r] & \pi_0(X_{\overline{k}}) \end{tikzcd}$$

is commutative (where the right vertical arrow is a bijection according to Lemma 28.5.6).

Proof. The action (28.5.8.1) of $\mathrm{Gal}(\overline{k}/k)$ on $X_{\overline{k}}$ induces an action on its connected components. Connected components are always closed (Topology, Lemma 5.4.3). Hence if $\overline{T}$ is as in (1), then by Lemma 28.5.10 there exists a closed subset $T \subset X$ such that $\overline{T} = T_{\overline{k}}$. Note that T is geometrically connected over k, see Lemma 28.5.7. To see that T is a connected component of X, suppose that $T \subset T'$, $T \neq T'$ where T' is a connected component of X. In this case $T'_{\overline{k}}$, strictly contains $\overline{T}$ and hence is disconnnected. By Lemma 28.5.12 this means that T' is disconnected! Contradiction.

We omit the proof of the functoriality in (2). $\square$

Lemma 28.5.18. *Let k be a field, with separable algebraic closure $\overline{k}$. Let X be a scheme over k. Assume*

(1) *X is quasi-compact, and*
(2) *the connected components of $X_{\overline{k}}$ are open.*

Then

(a) *$\pi_0(X_{\overline{k}})$ is finite, and*
(b) *the action of $Gal(\overline{k}/k)$ on $\pi_0(X_{\overline{k}})$ is continuous.*

Moreover, assumptions (1) and (2) are satisfied when X is of finite type over k.

Proof. Since the connected components are open, cover $X_{\overline{k}}$ (Topology, Lemma 5.4.3) and $X_{\overline{k}}$ is quasi-compact, we conclude that there are only finitely many of them. Thus (a) holds. By Lemma 28.5.8 these connected components are each defined over a finite subextension of $k \subset \overline{k}$ and we get (b). If X is of finite type over k, then $X_{\overline{k}}$ is of finite type over $\overline{k}$ (Morphisms, Lemma 24.14.4). Hence $X_{\overline{k}}$ is a Noetherian scheme (Morphisms, Lemma 24.14.6) and has an underlying Noetherian topological space (Properties, Lemma 23.5.5). Thus $X_{\overline{k}}$ has finitely many irreducible components (Topology, Lemma 5.6.2) and a fortiori finitely many connected components (which are therefore open). □

28.6. Geometrically irreducible schemes

If X is an irreducible scheme over a field, then it can happen that X becomes reducible after extending the ground field. This does not happen for geometrically irreducible schemes.

Definition 28.6.1. Let X be a scheme over the field k. We say X is *geometrically irreducible* over k if the scheme $X_{k'}$ is irreducible[2] for any field extension k' of k.

Lemma 28.6.2. *Let X be a scheme over the field k. Let $k \subset k'$ be a field extension. Then X is geometrically irreducible over k if and only if $X_{k'}$ is geometrically irreducible over k'.*

Proof. If X is geometrically irreducible over k, then it is clear that $X_{k'}$ is geometrically irreducible over k'. For the converse, note that for any field extension $k \subset k''$ there exists a common field extension $k' \subset k'''$ and $k'' \subset k'''$. As the morphism $X_{k'''} \to X_{k''}$ is surjective (as a base change of a surjective morphism between spectra of fields) we see that the irreducibility of $X_{k'''}$ implies the irreducibility of $X_{k''}$. Thus if $X_{k'}$ is geometrically irreducible over k' then X is geometrically irreducible over k. □

Lemma 28.6.3. *Let X be a scheme over a separably closed field k. If X is irreducible, then X_K is irreducible for any field extension $k \subset K$. I.e., X is geometrically irreducible over k.*

Proof. Use Properties, Lemma 23.3.3 and Algebra, Lemma 7.43.4. □

Lemma 28.6.4. *Let k be a field. Let X, Y be schemes over k. Assume X is geometrically irreducible over k. Then the projection morphism*

$$p : X \times_k Y \longrightarrow Y$$

induces a bijection between irreducible components.

Proof. First, note that the scheme theoretic fibres of p are irreducible, since they are base changes of the geometrically irreducible scheme X by field extensions. Moreover the scheme theoretic fibres are homeomorphic to the set theoretic fibres, see Schemes, Lemma 21.18.5. By Morphisms, Lemma 24.22.4 the map p is open. Thus we may apply Topology, Lemma 5.5.8 to conclude. □

Lemma 28.6.5. *Let k be a field. Let X be a scheme over k. The following are equivalent*

(1) *X is geometrically irreducible over k,*
(2) *for every affine open U the k-algebra $\mathcal{O}_X(U)$ is geometrically irreducible over k (see Algebra, Definition 7.43.6),*
(3) *X is irreducible and there exists an affine open covering $X = \bigcup U_i$ such that each k-algebra $\mathcal{O}_X(U_i)$ is geometrically irreducible, and*

[2]An irreducible space is nonempty.

(4) *there exists an open covering $X = \bigcup_{i \in I} X_i$ such that X_i is geometrically irreducible for each i and such that $X_i \cap X_j \neq \emptyset$ for all $i, j \in I$.*

Moreover, if X is geometrically irreducible so is every open subscheme of X.

Proof. An affine scheme $Spec(A)$ over k is geometrically irreducible if and only if A is geometrically irreducible over k; this is immediate from the definitions. Recall that if a scheme is irreducible so is every nonempty open subscheme of X, any two nonempty open subsets have a nonempty intersection. Also, if every affine open is irreducible then the scheme is irreducible, see Properties, Lemma 23.3.3. Hence the final statement of the lemma is clear, as well as the implications (1) $\Rightarrow$ (2), (2) $\Rightarrow$ (3), and (3) $\Rightarrow$ (4). If (4) holds, then for any field extension k'/k the scheme $X_{k'}$ has a covering by irreducible opens which pairwise intersect. Hence $X_{k'}$ is irreducible. Hence (4) implies (1). $\square$

Lemma 28.6.6. *Let X be a geometrically irreducible scheme over the field k. Let $\xi \in X$ be its generic point. Then $\kappa(\xi)$ is a geometrically irreducible over k.*

Proof. Combining Lemma 28.6.5 and Algebra, Lemma 7.43.8 we see that $\mathcal{O}_{X,\xi}$ is geometrically irreducible over k. Since $\mathcal{O}_{X,\xi} \to \kappa(\xi)$ is a surjection with locally nilpotent kernel (see Algebra, Lemma 7.23.3) it follows that $\kappa(\xi)$ is geometrically irreducible, see Algebra, Lemma 7.43.2. $\square$

Lemma 28.6.7. *Let $k \subset k'$ be an extension of fields. Let X be a scheme over k. Set $X' = X_{k'}$. Assume k separably algebraically closed. Then the morphism $X' \to X$ induces a bijection of irreducible components.*

Proof. Since k is separably algebraically closed we see that k' is geometrically irreducible over k, see Algebra, Lemma 7.43.7. Hence $Z = Spec(k')$ is geometrically irreducible over k. by Lemma 28.6.5 above. Since $X' = Z \times_k X$ the result is a special case of Lemma 28.6.4. $\square$

Lemma 28.6.8. *Let k be a field. Let X be a scheme over k. Assume X is quasi-compact. The following are equivalent:*

(1) *X is geometrically irreducible over k,*
(2) *for every finite separable field extension $k \subset k'$ the scheme $X_{k'}$ is irreducible, and*
(3) *$X_{\overline{k}}$ is irreducible, where $k \subset \overline{k}$ is a separable algebraic closure of k.*

Proof. Assume $X_{\overline{k}}$ is irreducible, i.e., assume (3). Let $k \subset k'$ be a field extension. There exists a field extension $\overline{k} \subset \overline{k}'$ such that k' embeds into $\overline{k}'$ as an extension of k. By Lemma 28.6.7 we see that $X_{\overline{k}'}$ is irreducible. Since $X_{\overline{k}'} \to X_{k'}$ is surjective we conclude that $X_{k'}$ is irreducible. Hence (1) holds.

Let $k \subset \overline{k}$ be a separable algebraic closure of k. Assume not (3), i.e., assume $X_{\overline{k}}$ is reducible. Our goal is to show that also $X_{k'}$ is reducible for some finite subextension $k \subset k' \subset \overline{k}$. Let $X = \bigcup_{i \in I} U_i$ be an affine open covering with U_i not empty. If for some i the scheme U_i is reducible, or if for some pair $i \neq j$ the intersection $U_i \cap U_j$ is empty, then X is reducible (Properties, Lemma 23.3.3) and we are done. In particular we may assume that $U_{i,\overline{k}} \cap U_{j,\overline{k}}$ for all $i, j \in I$ is nonempty and we conclude that $U_{i,\overline{k}}$ has to be reducible for some i. According to Algebra, Lemma 7.43.5 this means that $U_{i,k'}$ is reducible for some finite separable field extension $k \subset k'$. Hence also $X_{k'}$ is reducible. Thus we see that (2) implies (3).

The implication (1) $\Rightarrow$ (2) is immediate. This proves the lemma. $\square$

Lemma 28.6.9. *Let $k \subset K$ be an extension of fields. Let X be a scheme over k. For every irreducible component T of X the inverse image $T_K \subset X_K$ is a union of irreducible components of X_K.*

Proof. Let $T \subset X$ be an irreducible component of X. The morphism $T_K \to T$ is flat, so generalizations lift along $T_K \to T$. Hence every $\xi \in T_K$ which is a generic point of an irreducible component of T_K maps to the generic point η of T. If $\xi' \rightsquigarrow \xi$ is a specialization in X_K then ξ' maps to η since there are no points specializing to η in X. Hence $\xi' \in T_K$ and we conclude that $\xi = \xi'$. In other words ξ is the generic point of an irreducible component of X_K. This means that the irreducible components of T_K are all irreducible components of X_K. □

For a scheme X we denote $\text{IrredComp}(X)$ the set of irreducible components of X.

Lemma 28.6.10. *Let $k \subset K$ be an extension of fields. Let X be a scheme over k. For every irreducible component $\overline{T} \subset X_K$ the image of $\overline{T}$ in X is an irreducible component in X. This defines a canonical map*

$$IrredComp(X_K) \longrightarrow IrredComp(X)$$

which is surjective.

Proof. Consider the diagram

$$\begin{tikzcd} X_K \arrow[d] & X_{\overline{K}} \arrow[l] \arrow[d] \\ X & X_{\overline{k}} \arrow[l] \end{tikzcd}$$

where $\overline{K}$ is the separable algebraic closure of K, and where $\overline{k}$ is the separable algebraic closure of k. By Lemma 28.6.7 the morphism $X_{\overline{K}} \to X_{\overline{k}}$ induces a bijection between irreducible components. Hence it suffices to show the lemma for the morphisms $X_{\overline{k}} \to X$ and $X_{\overline{K}} \to X_K$. In other words we may assume that $K = \overline{k}$.

The morphism $p : X_{\overline{k}} \to X$ is integral, flat and surjective. Flatness implies that generalizations lift along p, see Morphisms, Lemma 24.24.8. Hence generic points of irreducible components of $X_{\overline{k}}$ map to generic points of irreducible components of X. Integrality implies that p is universally closed, see Morphisms, Lemma 24.42.7. Hence we conclude that the image $p(\overline{T})$ of an irreducible component is a closed irreducible subset which contains a generic point of an irreducible component of X, hence $p(\overline{T})$ is an irreducible component of X. This proves the first assertion. If $T \subset X$ is an irreducible component, then $p^{-1}(T) = T_K$ is a nonempty union of irreducible components, see Lemma 28.6.9. Each of these necessarily maps onto T by the first part. Hence the map is surjective. □

Lemma 28.6.11. *Let k be a field, with separable algebraic closure $\overline{k}$. Let X be a scheme over k. There is an action*

$$Gal(\overline{k}/k)^{opp} \times IrredComp(X_{\overline{k}}) \longrightarrow IrredComp(X_{\overline{k}})$$

with the following properties:

(1) *An element $\overline{T} \in IrredComp(X_{\overline{k}})$ is fixed by the action if and only if there exists an irreducible component $T \subset X$, which is geometrically irreducible over k, such that $T_{\overline{k}} = \overline{T}$.*

(2) *For any field extension $k \subset k'$ with separable algebraic closure $\overline{k}'$ the diagram*

$$\begin{array}{ccc} Gal(\overline{k}'/k') \times IrredComp(X_{\overline{k}'}) & \longrightarrow & IrredComp(X_{\overline{k}'}) \\ \downarrow & & \downarrow \\ Gal(\overline{k}/k) \times IrredComp(X_{\overline{k}}) & \longrightarrow & IrredComp(X_{\overline{k}}) \end{array}$$

is commutative (where the right vertical arrow is a bijection according to Lemma 28.6.7).

Proof. The action (28.5.8.1) of $\text{Gal}(\overline{k}/k)$ on $X_{\overline{k}}$ induces an action on its irreducible components. Irreducible components are always closed (Topology, Lemma 5.4.3). Hence if $\overline{T}$ is as in (1), then by Lemma 28.5.10 there exists a closed subset $T \subset X$ such that $\overline{T} = T_{\overline{k}}$. Note that T is geometrically irreducible over k, see Lemma 28.6.8. To see that T is an irreducible component of X, suppose that $T \subset T'$, $T \neq T'$ where T' is an irreducible component of X. Let $\overline{\eta}$ be the generic point of $\overline{T}$. It maps to the generic point η of T. Then the generic point $\xi \in T'$ specializes to η. As $X_{\overline{k}} \to X$ is flat there exists a point $\overline{\xi} \in X_{\overline{k}}$ which maps to ξ and specializes to $\overline{\eta}$. It follows that the closure of the singleton $\{\overline{\xi}\}$ is an irreducible closed subset of $X_{\overline{\xi}}$ which strictly contains $\overline{T}$. This is the desired contradiction.

We omit the proof of the functoriality in (2). $\square$

Lemma 28.6.12. *Let k be a field, with separable algebraic closure $\overline{k}$. Let X be a scheme over k. The fibres of the map*

$$IrredComp(X_{\overline{k}}) \longrightarrow IrredComp(X)$$

of Lemma 28.6.10 are exactly the orbits of $Gal(\overline{k}/k)$ under the action of Lemma 28.6.11.

Proof. Let $T \subset X$ be an irreducible component of X. Let $\eta \in T$ be its generic point. By Lemmas 28.6.9 and 28.6.10 the generic points of irreducible components of $\overline{T}$ which map into T map to η. By Algebra, Lemma 7.43.12 the Galois group acts transitively on all of the points of $X_{\overline{k}}$ mapping to η. Hence the lemma follows. $\square$

Lemma 28.6.13. *Let k be a field. Assume $X \to Spec(k)$ locally of finite type. In this case*

(1) *the action*

$$Gal(\overline{k}/k)^{opp} \times IrredComp(X_{\overline{k}}) \longrightarrow IrredComp(X_{\overline{k}})$$

is continuous if we give $IrredComp(X_{\overline{k}})$ the discrete topology,

(2) *every irreducible component of $X_{\overline{k}}$ can be defined over a finite extension of k, and*

(3) *given any irreducible component $T \subset X$ the scheme $T_{\overline{k}}$ is a finite union of irreducible components of $X_{\overline{k}}$ which are all in the same $Gal(\overline{k}/k)$-orbit.*

Proof. Let $\overline{T}$ be an irreducible component of $X_{\overline{k}}$. We may choose an affine open $U \subset X$ such that $\overline{T} \cap U_{\overline{k}}$ is not empty. Write $U = Spec(A)$, so A is a finite type k-algebra, see Morphisms, Lemma 24.14.2. Hence $A_{\overline{k}}$ is a finite type $\overline{k}$-algebra, and in particular Noetherian. Let $\mathfrak{p} = (f_1, \ldots, f_n)$ be the prime ideal corresponding to $\overline{T} \cap U_{\overline{k}}$. Since $A_{\overline{k}} = A \otimes_k \overline{k}$ we see that there exists a finite subextension $k \subset k' \subset \overline{k}$ such that each $f_i \in A_{k'}$. It is clear that $\text{Gal}(\overline{k}/k')$ fixes $\overline{T}$, which proves (1).

Part (2) follows by applying Lemma 28.6.11 (1) to the situation over k' which implies the irreducible component $\overline{T}$ is of the form $T'_{\overline{k}}$ for some irreducible $T' \subset X_{k'}$.

To prove (3), let $T \subset X$ be an irreducible component. Choose an irreducible component $\overline{T} \subset X_{\overline{k}}$ which maps to T, see Lemma 28.6.10. By the above the orbit of $\overline{T}$ is finite, say it is $\overline{T}_1, \ldots, \overline{T}_n$. Then $\overline{T}_1 \cup \ldots \cup \overline{T}_n$ is a $\text{Gal}(\overline{k}/k)$-invariant closed subset of $X_{\overline{k}}$ hence of the form $W_{\overline{k}}$ for some $W \subset X$ closed by Lemma 28.5.10. Clearly $W = T$ and we win. □

Lemma 28.6.14. *Let k be a field. Let $X \to Spec(k)$ be locally of finite type. Assume X has finitely many irreducible components. Then there exists a finite separable extension $k \subset k'$ such that every irreducible component of $X_{k'}$ is geometrically irreducible over k'.*

Proof. Let $\overline{k}$ be a separable algebraic closure of k. The assumption that X has finitely many irreducible components combined with Lemma 28.6.13 (3) shows that $X_{\overline{k}}$ has finitely many irreducible components $\overline{T}_1, \ldots, \overline{T}_n$. By Lemma 28.6.13 (2) there exists a finite extension $k \subset k' \subset \overline{k}$ and irreducible components $T_i \subset X_{k'}$ such that $\overline{T}_i = T_{i,\overline{k}}$ and we win. □

Lemma 28.6.15. *Let X be a scheme over the field k. Assume X has finitely many irreducible components which are all geometrically irreducible. Then X has finitely many connected components each of which is geometrically connected.*

Proof. This is clear because a connected component is a union of irreducible components. Details omitted. □

28.7. Geometrically integral schemes

If X is an irreducible scheme over a field, then it can happen that X becomes reducible after extending the ground field. This does not happen for geometrically irreducible schemes.

Definition 28.7.1. Let X be a scheme over the field k.

(1) Let $x \in X$. We say X is *geometrically pointwise integral at x* if for every field extension $k \subset k'$ and every $x' \in X_{k'}$ lying over x the local ring $\mathcal{O}_{X_{k'},x'}$ is integral.
(2) We say X is *geometrically pointwise integral* if X is geometrically pointwise integral at every point.
(3) We say X is *geometrically integral* over k if the scheme $X_{k'}$ is integral for every field extension k' of k.

The distinction between notions (2) and (3) is necessary. For example if $k = \mathbf{R}$ and $X = Spec(\mathbf{C}[x])$, then X is geometrically pointwise integral over $\mathbf{R}$ but of course not geometrically integral.

Lemma 28.7.2. *Let k be a field. Let X be a scheme over k. Then X is geometrically integral over k if and only if X is both geometrically reduced and geometrically irreducible over k.*

Proof. See Properties, Lemma 23.3.4. □

28.8. Geometrically normal schemes

In Properties, Definition 23.7.1 we have defined the notion of a normal scheme. This notion is defined even for non-Noetherian schemes. Hence, contrary to our discussion of ``geometrically regular'' schemes we consider all field extensions of the ground field.

Definition 28.8.1. Let X be a scheme over the field k.

(1) Let $x \in X$. We say X is *geometrically normal at x* if for every field extension $k \subset k'$ and every $x' \in X_{k'}$ lying over x the local ring $\mathcal{O}_{X_{k'},x'}$ is normal.
(2) We say X is *geometrically normal* over k if X is geometrically normal at every $x \in X$.

Lemma 28.8.2. *Let k be a field. Let X be a scheme over k. Let $x \in X$. The following are equivalent*

(1) *X is geometrically normal at x,*
(2) *for every finite purely inseparable field extension k' of k and $x' \in X_{k'}$ lying over over x the local ring $\mathcal{O}_{X_{k'},x'}$ is normal, and*
(3) *the ring $\mathcal{O}_{X,x}$ is geometrically normal over k (see Algebra, Definition 7.147.2).*

Proof. It is clear that (1) implies (2). Assume (2). Let $k \subset k'$ be a finite purely inseparable field extension (for example $k = k'$). Consider the ring $\mathcal{O}_{X,x} \otimes_k k'$. By Algebra, Lemma 7.43.2 its spectrum is the same as the spectrum of $\mathcal{O}_{X,x}$. Hence it is a local ring also (Algebra, Lemma 7.17.2). Therefore there is a unique point $x' \in X_{k'}$ lying over x and $\mathcal{O}_{X_{k'},x'} \cong \mathcal{O}_{X,x} \otimes_k k'$. By assumption this is a normal ring. Hence we deduce (3) by Algebra, Lemma 7.147.1.

Assume (3). Let $k \subset k'$ be a field extension. Since $Spec(k') \to Spec(k)$ is surjective, also $X_{k'} \to X$ is surjective (Morphisms, Lemma 24.9.4). Let $x' \in X_{k'}$ be any point lying over x. The local ring $\mathcal{O}_{X_{k'},x'}$ is a localization of the ring $\mathcal{O}_{X,x} \otimes_k k'$. Hence it is normal by assumption and (1) is proved. $\square$

Lemma 28.8.3. *Let k be a field. Let X be a scheme over k. The following are equivalent*

(1) *X is geometrically normal,*
(2) *$X_{k'}$ is a normal scheme for every field extension $k \subset k'$,*
(3) *$X_{k'}$ is a normal scheme for every finitely generated field extension $k \subset k'$,*
(4) *$X_{k'}$ is a normal scheme for every finite purely inseparable field extension $k \subset k'$, and*
(5) *for every affine open $U \subset X$ the ring $\mathcal{O}_X(U)$ is geometrically normal (see Algebra, Definition 7.147.2).*

Proof. Assume (1). Then for every field extension $k \subset k'$ and every point $x' \in X_{k'}$ the local ring of $X_{k'}$ at x' is normal. By definition this means that $X_{k'}$ is normal. Hence (2).

It is clear that (2) implies (3) implies (4).

Assume (4) and let $U \subset X$ be an affine open subscheme. Then $U_{k'}$ is a normal scheme for any finite purely inseparable extension $k \subset k'$ (including $k = k'$). This means that $k' \otimes_k \mathcal{O}(U)$ is a normal ring for all finite purely inseparable extensions $k \subset k'$. Hence $\mathcal{O}(U)$ is a geometrically normal k-algebra by definition.

Assume (5). For any field extension $k \subset k'$ the base change $X_{k'}$ is gotten by gluing the spectra of the rings $\mathcal{O}_X(U) \otimes_k k'$ where U is affine open in X (see Schemes, Section 21.17). Hence $X_{k'}$ is normal. So (1) holds. $\square$

Lemma 28.8.4. *Let k be a field. Let X be a scheme over k. Let k'/k be a field extension. Let $x \in X$ be a point, and let $x' \in X_{k'}$ be a point lying over x. The following are equivalent*

(1) *X is geometrically normal at x,*
(2) *$X_{k'}$ is geometrically normal at x'.*

In particular, X is geometrically normal over k if and only if $X_{k'}$ is geometrically normal over k'.

Proof. It is clear that (1) implies (2). Assume (2). Let $k \subset k''$ be a finite purely inseparable field extension and let $x'' \in X_{k''}$ be a point lying over x (actually it is unique). We can find a common field extension $k \subset k'''$ (i.e. with both $k' \subset k'''$ and $k'' \subset k'''$) and a point $x''' \in X_{k'''}$ lying over both x' and x''. Consider the map of local rings

$$\mathcal{O}_{X_{k''},x''} \longrightarrow \mathcal{O}_{X_{k'''},x''''}.$$

This is a flat local ring homomorphism and hence faithfully flat. By (2) we see that the local ring on the right is normal. Thus by Algebra, Lemma 7.146.3 we conlude that $\mathcal{O}_{X_{k''},x''}$ is normal. By Lemma 28.8.2 we see that X is geometrically normal at x. □

Lemma 28.8.5. *Let k be a field. Let X be a geometrically normal scheme over k and let Y be a normal scheme over k. Then $X \times_k Y$ is a normal scheme.*

Proof. This reduces to Algebra, Lemma 7.147.4 by Lemma 28.8.3. □

28.9. Change of fields and locally Noetherian schemes

Let X a locally Noetherian scheme over a field k. It is not always that case that $X_{k'}$ is locally Noetherian too. For example if $X = Spec(\overline{\mathbf{Q}})$ and $k = \mathbf{Q}$, then $X_{\overline{\mathbf{Q}}}$ is the spectrum of $\overline{\mathbf{Q}} \otimes_{\mathbf{Q}} \overline{\mathbf{Q}}$ which is not Noetherian. (Hint: It has too many idempotents). But if we only base change using finitely generated field extensions then the Noetherian property is preserved. (Or if X is locally of finite type over k, since this proprety is preserved under base change.)

Lemma 28.9.1. *Let k be a field. Let X be a scheme over k. Let $k \subset k'$ be a finitely generated field extension. Then X is locally Noetherian if and only if $X_{k'}$ is locally Noetherian.*

Proof. Using Properties, Lemma 23.5.2 we reduce to the case where X is affine, say $X = Spec(A)$. In this case we have to prove that A is Noetherian if and only if $A_{k'}$ is Noetherian. Since $A \to A_{k'} = k' \otimes_k A$ is faithfully flat, we see that if $A_{k'}$ is Noetherian, then so is A, by Algebra, Lemma 7.146.1. Conversely, if A is Noetherian then $A_{k'}$ is Noetherian by Algebra, Lemma 7.28.7. □

28.10. Geometrically regular schemes

A geometrically regular scheme over a field k is a locally Noetherian scheme over k which remains regular upon suitable changes of base field. A finite type scheme over k is geometrically regular if and only if it is smooth over k (see Lemma 28.10.6). The notion of geometric regularity is most interesting in situations where smoothness cannot be used such as formal fibres (insert future reference here).

In the following definition we restrict ourselves to locally Noetherian schemes, since the property of being a regular local ring is only defined for Noetherian local rings. By Lemma 28.8.3 above, if we restrict ourselves to finitely generated field extensions then this property is preserved under change of base field. This comment will be used without further reference in this section. In particular the following definition makes sense.

Definition 28.10.1. Let k be a field. Let X be a locally Noetherian scheme over k.

(1) Let $x \in X$. We say X is *geometrically regular at x* over k if for every finitely generated field extension $k \subset k'$ and any $x' \in X_{k'}$ lying over x the local ring $\mathcal{O}_{X_{k'},x'}$ is regular.
(2) We say X is *geometrically regular over k* if X is geometrically regular at all of its points.

A similar definition works to define geometrically Cohen-Macaulay, (R_k), and (S_k) schemes over a field. We will add a section for these separately as needed.

Lemma 28.10.2. *Let k be a field. Let X be a locally Noetherian scheme over k. Let $x \in X$. The following are equivalent*

(1) *X is geometrically regular at x,*
(2) *for every finite purely inseparable field extension k' of k and $x' \in X_{k'}$ lying over over x the local ring $\mathcal{O}_{X_{k'},x'}$ is regular, and*
(3) *the ring $\mathcal{O}_{X,x}$ is geometrically regular over k (see Algebra, Definition 7.148.2).*

Proof. It is clear that (1) implies (2). Assume (2). This in particular implies that $\mathcal{O}_{X,x}$ is a regular local ring. Let $k \subset k'$ be a finite purely inseparable field extension. Consider the ring $\mathcal{O}_{X,x} \otimes_k k'$. By Algebra, Lemma 7.43.2 its spectrum is the same as the spectrum of $\mathcal{O}_{X,x}$. Hence it is a local ring also (Algebra, Lemma 7.17.2). Therefore there is a unique point $x' \in X_{k'}$ lying over x and $\mathcal{O}_{X_{k'},x'} \cong \mathcal{O}_{X,x} \otimes_k k'$. By assumption this is a regular ring. Hence we deduce (3) from the definition of a geometrically regular ring.

Assume (3). Let $k \subset k'$ be a field extension. Since $Spec(k') \to Spec(k)$ is surjective, also $X_{k'} \to X$ is surjective (Morphisms, Lemma 24.9.4). Let $x' \in X_{k'}$ be any point lying over x. The local ring $\mathcal{O}_{X_{k'},x'}$ is a localization of the ring $\mathcal{O}_{X,x} \otimes_k k'$. Hence it is regular by assumption and (1) is proved. □

Lemma 28.10.3. *Let k be a field. Let X be a locally Noetherian scheme over k. The following are equivalent*

(1) *X is geometrically regular,*
(2) *$X_{k'}$ is a regular scheme for every finitely generated field extension $k \subset k'$,*
(3) *$X_{k'}$ is a regular scheme for every finite purely inseparable field extension $k \subset k'$,*
(4) *for every affine open $U \subset X$ the ring $\mathcal{O}_X(U)$ is geometrically regular (see Algebra, Definition 7.148.2), and*
(5) *there exists an affine open covering $X = \bigcup U_i$ such that each $\mathcal{O}_X(U_i)$ is geometrically regular over k.*

Proof. Assume (1). Then for every finitely generated field extension $k \subset k'$ and every point $x' \in X_{k'}$ the local ring of $X_{k'}$ at x' is regular. By Properties, Lemma 23.9.2 this means that $X_{k'}$ is regular. Hence (2).

It is clear that (2) implies (3).

Assume (3) and let $U \subset X$ be an affine open subscheme. Then $U_{k'}$ is a regular scheme for any finite purely inseparable extension $k \subset k'$ (including $k = k'$). This means that $k' \otimes_k \mathcal{O}(U)$ is a regular ring for all finite purely inseparable extensions $k \subset k'$. Hence $\mathcal{O}(U)$ is a geometrically regular k-algebra and we see that (4) holds.

It is clear that (4) implies (5). Let $X = \bigcup U_i$ be an affine open covering as in (5). For any field extension $k \subset k'$ the base change $X_{k'}$ is gotten by gluing the spectra of the rings $\mathcal{O}_X(U_i) \otimes_k k'$ (see Schemes, Section 21.17). Hence $X_{k'}$ is regular. So (1) holds. □

Lemma 28.10.4. *Let k be a field. Let X be a scheme over k. Let k'/k be a finitely generated field extension. Let $x \in X$ be a point, and let $x' \in X_{k'}$ be a point lying over x. The following are equivalent*

(1) *X is geometrically regular at x,*
(2) *$X_{k'}$ is geometrically regular at x'.*

In particular, X is geometrically regular over k if and only if $X_{k'}$ is geometrically regular over k'.

Proof. It is clear that (1) implies (2). Assume (2). Let $k \subset k''$ be a finite purely inseparable field extension and let $x'' \in X_{k''}$ be a point lying over x (actually it is unique). We can find a common, finitely generated, field extension $k \subset k'''$ (i.e. with both $k' \subset k'''$ and $k'' \subset k'''$) and a point $x''' \in X_{k'''}$ lying over both x' and x''. Consider the map of local rings

$$\mathcal{O}_{X_{k''},x''} \longrightarrow \mathcal{O}_{X_{k'''},x''''}.$$

This is a flat local ring homomorphism of Noetherian local rings and hence faithfully flat. By (2) we see that the local ring on the right is regular. Thus by Algebra, Lemma 7.102.8 we conlude that $\mathcal{O}_{X_{k''},x''}$ is regular. By Lemma 28.10.2 we see that X is geometrically regular at x. $\square$

The following lemma is a geometric variant of Algebra, Lemma 7.148.3.

Lemma 28.10.5. *Let k be a field. Let $f : X \to Y$ be a morphism of locally Noetherian schemes over k. Let $x \in X$ be a point and set $y = f(x)$. If X is geometrically regular at x and f is flat at x then Y is geometrically regular at y. In particular, if X is geometrically regular over k and f is flat and surjective, then Y is geometrically regular over k.*

Proof. Let k' be finite purely inseparable extension of k. Let $f' : X_{k'} \to Y_{k'}$ be the base change of f. Let $x' \in X_{k'}$ be the unique point lying over x. If we show that $Y_{k'}$ is regular at $y' = f'(x')$, then Y is geometrically regular over k at y', see Lemma 28.10.3. By Morphisms, Lemma 24.24.6 the morphism $X_{k'} \to Y_{k'}$ is flat at x'. Hence the ring map

$$\mathcal{O}_{Y_{k'},y'} \longrightarrow \mathcal{O}_{X_{k'},x'}$$

is a flat local homommorphism of local Noetherian rings with right hand side regular by assumption. Hence the left hand side is a regular local ring by Algebra, Lemma 7.102.8. $\square$

Lemma 28.10.6. *Let k be a field. Let X be a scheme of finite type over k. Let $x \in X$. Then X is geometrically regular at x if and only if $X \to Spec(k)$ is smooth at x (Morphisms, Definition 24.33.1).*

Proof. The question is local around x, hence we may assume that $X = Spec(A)$ for some finite type k-algebra. Let x correspond to the prime $\mathfrak{p}$.

If A is smooth over k at $\mathfrak{p}$, then we may localize A and assume that A is smooth over k. In this case $k' \otimes_k A$ is smooth over k' for all extension fields k'/k, and each of these Noetherian rings is regular by Algebra, Lemma 7.129.3.

Assume X is geometrically regular at x. Consider the residue field $K := \kappa(x) = \kappa(\mathfrak{p})$ of x. It is a finitely generated extension of k. By Algebra, Lemma 7.42.3 there exists a finite purely inseparable extension $k \subset k'$ such that the compositum $k'K$ is a separable field extension of k'. Let $\mathfrak{p}' \subset A' = k' \otimes_k A$ be a prime ideal lying over $\mathfrak{p}$. It is the unique prime lying over $\mathfrak{p}$, see Algebra, Lemma 7.43.2. Hence the residue field $K' := \kappa(\mathfrak{p}')$ is the compositum $k'K$. By assumption the local ring $(A')_{\mathfrak{p}'}$ is regular. Hence by Algebra, Lemma 7.129.5 we see that $k' \to A'$ is smooth at $\mathfrak{p}'$. This in turn implies that $k \to A$ is smooth at $\mathfrak{p}$ by Algebra, Lemma 7.126.18. The lemma is proved. $\square$

Example 28.10.7. Let $k = \mathbf{F}_p(t)$. It is quite easy to give an example of a regular variety V over k which is not geometrically reduced. For example we can take $Spec(k[x]/(x^p - t))$. In fact, there exists an example of a regular variety V which is geometrically reduced, but not even geometrically normal. Namely, take for $p > 2$ the scheme $V = Spec(k[x, y]/(y^2 - x^p + t))$. This is a variety as the polynomial $y^2 - x^p + t \in k[x, y]$ is irreducible. The morphism $V \to Spec(k)$ is smooth at all points except at the point $v_0 \in V$ corresponding to the maximal ideal $(y, x^p - t)$ (because $2y$ is invertible). In particular we see that V is (geometrically) regular at all points, except possibly v_0. The local ring

$$\mathcal{O}_{V,v_0} = \big(k[x, y]/(y^2 - x^p + t)\big)_{(y,x^p-t)}$$

is a domain of dimension 1. Its maximal ideal is generated by 1 element, namely $x^p - t$. Hence it is a discrete valuation ring and regular. Let $k' = k[t^{1/p}]$. Denote $t' = t^{1/p} \in k'$, $V' = V_{k'}$, $v'_0 \in V'$ the unique point lying over v_0. Over k' we can write $x^p - t = (x - t')^p$, but the polynomial $y^2 - (x - t')^p$ is still irreducible and V' is still a variety. But the element

$$\frac{y}{x - t'} \in f.f.(\mathcal{O}_{V',v'_0})$$

is integral over $\mathcal{O}_{V',v'_0}$ (just compute its square) and not contained in it, so V' is not normal at v'_0. This concludes the example.

28.11. Change of fields and the Cohen-Macaulay property

The following lemma says that it does not make sense to define geometrically Cohen-Macaulay schemes, since these would be the same as Cohen-Macaulay schemes.

Lemma 28.11.1. *Let X be a locally Noetherian scheme over the field k. Let $k \subset k'$ be a finitely generated field extension. Let $x \in X$ be a point, and let $x' \in X_{k'}$ be a point lying over x. Then we have*

$$\mathcal{O}_{X,x} \text{ is Cohen-Macaulay} \Leftrightarrow \mathcal{O}_{X_{k'},x'} \text{ is Cohen-Macaulay}$$

If X is locally of finite type over k, the same holds for any field extension $k \subset k'$.

Proof. The first case of the lemma follows from Algebra, Lemma 7.149.2. The second case of the lemma is equivalent to Algebra, Lemma 7.121.6. ☐

28.12. Change of fields and the Jacobson property

A scheme locally of finite type over a field has plenty of closed points, namely it is Jacobson. Moreover, the residue fields are finite extensions of the ground field.

Lemma 28.12.1. *Let X be a scheme which is locally of finite type over k. Then*

1. *for any closed point $x \in X$ the extension $k \subset \kappa(x)$ is algebraic, and*
2. *X is a Jacobson scheme (Properties, Definition 23.6.1).*

Proof. A scheme is Jacobson if and only if it has an affine open covering by Jacobson schemes, see Properties, Lemma 23.6.3. The property on residue fields at closed points is also local on X. Hence we may assume that X is affine. In this case the result is a consequence of the Hilbert Nullstellenstaz, see Algebra, Theorem 7.30.1. It also follows from a combination of Morphisms, Lemmas 24.15.8, 24.15.9, and 24.15.10. ☐

It turns out that if X is not locally of finite type, then we can achieve the same result after making a suitably large base field extension.

Lemma 28.12.2. *Let X be a scheme over a field k. For any field extension $k \subset K$ whose cardinality is large enough we have*

1. *for any closed point $x \in X_K$ the extension $K \subset \kappa(x)$ is algebraic, and*

(2) *X_K is a Jacobson scheme (Properties, Definition 23.6.1).*

Proof. Choose an affine open covering $X = \bigcup U_i$. By Algebra, Lemma 7.31.12 and Properties, Lemma 23.6.2 there exist cardinals κ_i such that $U_{i,K}$ has the desired properties over K if $\#(K) \geq \kappa_i$. Set $\kappa = \max\{\kappa_i\}$. Then if the cardinality of K is larger than κ we see that each $U_{i,K}$ satisfies the conclusions of the lemma. Hence X_K is Jacobson by Properties, Lemma 23.6.3. The statement on residue fields at closed points of X_K follows from the corresponding statements for residue fields of closed points of the $U_{i,K}$. □

28.13. Algebraic schemes

The following definition is taken from [**DG67**, I Definition 6.4.1].

Definition 28.13.1. Let k be a field. An *algebraic k-scheme* is a scheme X over k such that the structure morphism $X \to Spec(k)$ is of finite type. A *locally algebraic k-scheme* is a scheme X over k such that the structure morphism $X \to Spec(k)$ is locally of finite type.

Note that every (locally) algebraic k-scheme is (locally) Noetherian, see Morphisms, Lemma 24.14.6. The category of algebraic k-schemes has all products and fibre products (unlike the category of varieties over k). Similarly for the category of locally algebraic k-schemes.

Lemma 28.13.2. *Let k be a field. Let X be a locally algebraic k-scheme of dimension 0. Then X is a disjoint union of spectra of local Artinian k-algebras A with $\dim_k(A) < \infty$. If X is an algebraic k-scheme of dimension 0, then in addition X is affine and the morphism $X \to Spec(k)$ is finite.*

Proof. Let X be a locally algebraic k-scheme of dimension 0. Let $U = Spec(A) \subset X$ be an affine open subscheme. Since $\dim(X) = 0$ we see that $\dim(A) = 0$. By Noether normalization, see Algebra, Lemma 7.106.4 we see that there exists a finite injection $k \to A$, i.e., $\dim_k(A) < \infty$. Hence A is Artinian, see Algebra, Lemma 7.49.2. This implies that $A = A_1 \times \ldots \times A_r$ is a product of finitely many Artinian local rings, see Algebra, Lemma 7.49.8. Of course $\dim_k(A_i) < \infty$ for each i as the sum of these dimensions equals $\dim_k(A)$.

The arguments above show that X has an open covering whose members are finite discrete topological spaces. Hence X is a discrete topological space. It follows that X is isomorphic to the disjoint union of its connected components each of which is a singleton. Since a singleton scheme is affine we conclude (by the results of the paragraph above) that each of these singletons is the spectrum of a local Artinian k-algebra A with $\dim_k(A) < \infty$.

Finally, if X is an algebraic k-scheme of dimension 0, then X is quasi-compact hence is a finite disjoint union $X = Spec(A_1) \amalg \ldots \amalg Spec(A_r)$ hence affine (see Schemes, Lemma 21.6.8) and we have seen the finiteness of $X \to Spec(k)$ in the first paragraph of the proof. □

28.14. Closures of products

Some results on the relation between closure and products.

Lemma 28.14.1. *Let k be a field. Let X, Y be schemes over k, and let $A \subset X$, $B \subset Y$ be subsets. Set*

$$AB = \{z \in X \times_k Y \mid pr_X(\gamma) \in A,\ pr_Y(\gamma) \in B\} \subset X \times_k Y$$

Then set theoretically we have

$$\overline{A} \times_k \overline{B} = \overline{AB}$$

Proof. The inclusion $\overline{AB} \subset \overline{A} \times_k \overline{B}$ is immediate. We may replace X and Y by the reduced closed subschemes $\overline{A}$ and $\overline{B}$. Let $W \subset X \times_k Y$ be a nonempty open subset. By Morphisms, Lemma 24.22.4 the subset $U = \text{pr}_X(W)$ is nonempty open in X. Hence $A \cap U$ is nonempty. Pick $a \in A \cap U$. Denote $Y_{\kappa(a)} = \{a\} \times_k Y$ the fibre of $\text{pr}_X : X \times_k Y \to X$ over a. By Morphisms, Lemma 24.22.4 again the morphism $Y_a \to Y$ is open as $Spec(\kappa(a)) \to Spec(k)$ is universally open. Hence the nonempty open subset $W_a = W \times_{X \times_k Y} Y_a$ maps to a nonempty open subset of Y. We conclude there exists a $b \in B$ in the image. Hence $AB \cap W \neq \emptyset$ as desired. □

Lemma 28.14.2. *Let k be a field. Let $f : A \to X$, $g : B \to Y$ be morphisms of schemes over k. Then set theoretically we have*

$$\overline{f(A)} \times_k \overline{g(B)} = \overline{(f \times g)(A \times_k B)}$$

Proof. This follows from Lemma 28.14.1 as the image of $f \times g$ is $f(A)g(B)$ in the notation of that lemma. □

Lemma 28.14.3. *Let k be a field. Let $f : A \to X$, $g : B \to Y$ be quasi-compact morphisms of schemes over k. Let $Z \subset X$ be the scheme theoretic image of f, see Morphisms, Definition 24.4.2. Similarly, let $Z' \subset Y$ be the scheme theoretic image of g. Then $Z \times_k Z'$ is the scheme theoretic image of $f \times g$.*

Proof. Recall that Z is the smallest closed subscheme of X through which f factors. Similarly for Z'. Let $W \subset X \times_k Y$ be the scheme theoretic image of $f \times g$. As $f \times g$ factors through $Z \times_k Z'$ we see that $W \subset Z \times_k Z'$.

To prove the other inclusion let $U \subset X$ and $V \subset Y$ be affine opens. By Morphisms, Lemma 24.4.3 the scheme $Z \cap U$ is the scheme theoretic image of $f|_{f^{-1}(U)} : f^{-1}(U) \to U$, and similarly for $Z' \cap V$ and $W \cap U \times_k V$. Hence we may assume X and Y affine. As f and g are quasi-compact this implies that $A = \bigcup U_i$ is a finite union of affines and $B = \bigcup V_j$ is a finite union of affines. Then we may replace A by $\coprod U_i$ and B by $\coprod V_j$, i.e., we may assume that A and B are affine as well. In this case Z is cut out by $\text{Ker}(\Gamma(X, \mathcal{O}_X) \to \Gamma(A, \mathcal{O}_A))$ and similarly for Z' and W. Hence the result follows from the equality

$$\Gamma(A \times_k B, \mathcal{O}_{A \times_k B}) = \Gamma(A, \mathcal{O}_A) \otimes_k \Gamma(B, \mathcal{O}_B)$$

which holds as A and B are affine. Details omitted. □

28.15. Schemes smooth over fields

Here are two lemmas characterizing smooth schemes over fields.

Lemma 28.15.1. *Let k be a field. Let X be a scheme over k. Assume*

(1) *X is locally of finite type over k,*
(2) *$\Omega_{X/k}$ is locally free, and*
(3) *k has characteristic zero.*

Then the structure morphism $X \to Spec(k)$ is smooth.

Proof. This follows from Algebra, Lemma 7.129.7. □

In positive characteristic there exist nonreduced schemes of finite type whose sheaf of differentials is free, for example $Spec(\mathbf{F}_p[t]/(t^p))$ over $Spec(\mathbf{F}_p)$. If the ground field k is nonperfect of characteristic p, there exist reduced schemes X/k with free $\Omega_{X/k}$ which are nonsmooth, for example $Spec(k[t]/(t^p - a)$ where $a \in k$ is not a pth power.

Lemma 28.15.2. *Let k be a field. Let X be a scheme over k. Assume*

(1) *X is locally of finite type over k,*
(2) *$\Omega_{X/k}$ is locally free,*
(3) *X is reduced, and*
(4) *k is perfect.*

Then the structure morphism $X \to Spec(k)$ is smooth.

Proof. Let $x \in X$ be a point. As X is locally Noetherian (see Morphisms, Lemma 24.14.6) there are finitely many irreducible components $X_1, \ldots, X_n$ passing through x (see Properties, Lemma 23.5.5 and Topology, Lemma 5.6.2). Let $\eta_i \in X_i$ be the generic point. As X is reduced we have $\mathcal{O}_{X,\eta_i} = \kappa(\eta_i)$, see Algebra, Lemma 7.23.3. Moreover, $\kappa(\eta_i)$ is a finitely generated field extension of the perfect field k hence separably generated over k (see Algebra, Section 7.39). It follows that $\Omega_{X/k,\eta_i} = \Omega_{\kappa(\eta_i)/k}$ is free of rank the transcendence degree of $\kappa(\eta_i)$ over k. By Morphisms, Lemma 24.27.1 we conclude that $\dim_{\eta_i}(X_i) = \text{rank}_{\eta_i}(\Omega_{X/k})$. Since $x \in X_1 \cap \ldots \cap X_n$ we see that

$$\text{rank}_x(\Omega_{X/k}) = \text{rank}_{\eta_i}(\Omega_{X/k}) = \dim(X_i).$$

Therefore $\dim_x(X) = \text{rank}_x(\Omega_{X/k})$, see Algebra, Lemma 7.105.5. It follows that $X \to Spec(k)$ is smooth at x for example by Algebra, Lemma 7.129.3. □

Lemma 28.15.3. *Let $X \to Spec(k)$ be a smooth morphism where k is a field. Then X is a regular scheme.*

Proof. (See also Lemma 28.10.6.) By Algebra, Lemma 7.129.3 every local ring $\mathcal{O}_{X,x}$ is regular. And because X is locally of finite type over k it is locally Noetherian. Hence X is regular by Properties, Lemma 23.9.2. □

Lemma 28.15.4. *Let $X \to Spec(k)$ be a smooth morphism where k is a field. Then X is geometrically regular, geometrically normal, and geometrically reduced over k.*

Proof. (See also Lemma 28.10.6.) Let k' be a finite purely inseparable extension of k. It suffices to prove that $X_{k'}$ is regular, normal, reduced, see Lemmas 28.10.3, 28.8.3, and 28.4.5. By Morphisms, Lemma 24.33.5 the morphism $X_{k'} \to Spec(k')$ is smooth too. Hence it suffices to show that a scheme X smooth over a field is regular, normal, and reduced. We see that X is regular by Lemma 28.15.3. Hence Properties, Lemma 23.9.4 guarantees that X is normal. □

Lemma 28.15.5. *Let k be a field. Let $d \geq 0$. Let $W \subset \mathbf{A}^d_k$ be nonempty open. Then there exists a closed point $w \in W$ such that $k \subset \kappa(w)$ is finite separable.*

Proof. After possible shrinking W we may assume that $W = \mathbf{A}^d_k \setminus V(f)$ for some $f \in k[x_1, \ldots, x_n]$. If the lemma is wrong then $f(a_1, \ldots, a_n) = 0$ for all $(a_1, \ldots, a_n) \in (k^{sep})^n$. This is absurd as k^{sep} is an infinite field. □

Lemma 28.15.6. *Let k be a field. If X is smooth over $Spec(k)$ then the set*

$$\{x \in X \textit{ closed such that } k \subset \kappa(x) \textit{ is finite separable}\}$$

is dense in X.

Proof. It suffices to show that given a nonempty smooth X over k there exists at least one closed point whose residue field is finite separable over k. To see this, choose a diagram

$$X \longleftarrow U \xrightarrow{\pi} \mathbf{A}^d_k$$

with π étale, see Morphisms, Lemma 24.35.20. The morphism $\pi : U \to \mathbf{A}^d_k$ is open, see Morphisms, Lemma 24.35.13. By Lemma 28.15.5 we may choose a closed point $w \in \pi(V)$ whose residue field is finite separable over k. Pick any $x \in V$ with $\pi(x) = w$. By Morphisms, Lemma 24.35.7 the field extension $\kappa(w) \subset \kappa(x)$ is finite separable. Hence $k \subset \kappa(x)$ is finite separable. The point x is a closed point of X by Morphisms, Lemma 24.19.2. □

Lemma 28.15.7. *Let X be a scheme over a field k. If X is locally of finite type and geometrically reduced over k then X contains a dense open which is smooth over k.*

Proof. The problem is local on X, hence we may assume X is quasi-compact. Let $X = X_1 \cup \ldots \cup X_n$ be the irreducible components of X. Then $Z = \bigcup_{i \neq j} X_i \cap X_j$ is nowhere dense in X. Hence we may replace X by $X \setminus Z$. As $X \setminus Z$ is a disjoint union of irreducible schemes, this reduces us to the case where X is irreducible. As X is irreducible and reduced, it is integral, see Properties, Lemma 23.3.4. Let $\eta \in X$ be its generic point. Then the function field $K = k(X) = \kappa(\eta)$ is geometrically reduced over k, hence separable over k, see Algebra, Lemma 7.41.1. Let $U = Spec(A) \subset X$ be any nonempty affine open so that $K = f.f.(A) = A_{(0)}$. Apply Algebra, Lemma 7.129.5 to conclude that A is smooth at (0) over k. By definition this means that some principal localization of A is smooth over k and we win. □

Lemma 28.15.8. *Let k be a field. Let $f : X \to Y$ be a morphism of schemes locally of finite type over k. Let $x \in X$ be a point and set $y = f(x)$. If $X \to Spec(k)$ is smooth at x and f is flat at x then $Y \to Spec(k)$ is smooth at y. In particular, if X is smooth over k and f is flat and surjective, then Y is smooth over k.*

Proof. It suffices to show that Y is geometrically regular at y, see Lemma 28.10.6. This follows from Lemma 28.10.5 (and Lemma 28.10.6 applied to (X, x)). □

28.16. Types of varieties

Short section discussion some elementary global properties of varieties.

Definition 28.16.1. Let k be a field. Let X be a variety over k.

(1) We say X is an *affine variety* if X is an affine scheme. This is equivalent to requiring X it be isomorphic to a closed subscheme of $\mathbf{A}^n_k$ for some n.
(2) We say X is a *projective variety* if the structure morphism $X \to Spec(k)$ is projective. By Morphisms, Lemma 24.41.4 this is true if and only if X is isomorphic to a closed subscheme of $\mathbf{P}^n_k$ for some n.
(3) We say X is a *quasi-projective variety* if the structure morphism $X \to Spec(k)$ is quasi-projective. By Morphisms, Lemma 24.39.4 this is true if and only if X is isomorphic to a locally closed subscheme of $\mathbf{P}^n_k$ for some n.
(4) A *proper variety* is a variety such that the morphism $X \to Spec(k)$ is proper.

Note that a projective variety is a proper variety, see Morphisms, Lemma 24.41.5. Also, an affine variety is quasi-projective as $\mathbf{A}^n_k$ is isomorphic to an open subscheme of $\mathbf{P}^n_k$, see Constructions, Lemma 22.13.3.

Lemma 28.16.2. *Let X be a proper variety over k. Then $\Gamma(X, \mathcal{O}_X)$ is a field which is a finite extension of the field k.*

Proof. By Coherent, Lemma 25.18.2 we see that $\Gamma(X, \mathcal{O}_X)$ is a finite dimensional k-vector space. It is also a k-algebra without zero-divisors. Hence it is a field, see Algebra, Lemma 7.32.17. □

28.17. Groups of invertible functions

It is often (but not always) the case that $\mathcal{O}^*(X)/k^*$ is a finitely generated abelian group if X is a variety over k. We show this by a series of lemmas. Everything rests on the following special case.

Lemma 28.17.1. *Let k be an algebraically closed field. Let $\overline{X}$ be a proper variety over k. Let $X \subset \overline{X}$ be an open subscheme. Assume X is normal. Then $\mathcal{O}^*(X)/k^*$ is a finitely generated abelian group.*

Proof. We will use without further mention that for any affine open U of $\overline{X}$ the ring $\mathcal{O}(U)$ is a finitely generated k-algebra, which is Noetherian, a domain and normal, see Algebra, Lemma 7.28.1, Properties, Definition 23.3.1, Properties, Lemmas 23.5.2 and 23.7.2, Morphisms, Lemma 24.14.2.

Let $\xi_1, \ldots, \xi_r$ be the generic points of the complement of X in $\overline{X}$. There are finitely many since $\overline{X}$ has a Noetherian underlying topological space (see Morphisms, Lemma 24.14.6, Properties, Lemma 23.5.5, and Topology, Lemma 5.6.2). For each i the local ring $\mathcal{O}_i = \mathcal{O}_{X,\xi_i}$ is a normal Noetherian local domain (as a localization of a Noetherian normal domain). Let $J \subset \{1, \ldots, r\}$ be the set of indices i such that $\dim(\mathcal{O}_i) = 1$. For $j \in J$ the local ring $\mathcal{O}_j$ is a discrete valuation ring, see Algebra, Lemma 7.110.6. Hence we obtain a valuation

$$v_j : k(\overline{X})^* \longrightarrow \mathbf{Z}$$

with the property that $v_j(f) \geq 0 \Leftrightarrow f \in \mathcal{O}_j$.

Think of $\mathcal{O}(X)$ as a sub k-algebra of $k(X) = k(\overline{X})$. We claim that the kernel of the map

$$\mathcal{O}(X)^* \longrightarrow \prod\nolimits_{j \in J} \mathbf{Z}, \quad f \longmapsto \prod v_j(f)$$

is k^*. It is clear that this claim proves the lemma. Namely, suppose that $f \in \mathcal{O}(X)$ is an element of the kernel. Let $U = Spec(B) \subset \overline{X}$ be any affine open. Then B is a Noetherian normal domain. For every height one prime $\mathfrak{q} \subset B$ with corresponding point $\xi \in X$ we see that either $\xi = \xi_j$ for some $j \in J$ or that $\xi \in X$. The reason is that $\text{codim}(\overline{\{\xi\}}, \overline{X}) = 1$ by Properties, Lemma 23.11.4 and hence if $\xi \in \overline{X} \setminus X$ it must be a generic point of $\overline{X} \setminus X$, hence equal to some ξ_j, $j \in J$. We conclude that $f \in \mathcal{O}_{X,\xi} = B_{\mathfrak{q}}$ in either case as f is in the kernel of the map. Thus $f \in \bigcap_{\text{ht}(\mathfrak{q})=1} B_{\mathfrak{q}} = B$, see Algebra, Lemma 7.140.6. In other words, we see that $f \in \Gamma(\overline{X}, \mathcal{O}_{\overline{X}})$. But since k is algebraically closed we conclude that $f \in k$ by Lemma 28.16.2. $\square$

Next, we generalize the case above by some elementary arguments, still keeping the field algebraically closed.

Lemma 28.17.2. *Let k be an algebraically closed field. Let X be an integral scheme locally of finite type over k. Then $\mathcal{O}^*(X)/k^*$ is a finitely generated abelian group.*

Proof. As X is integral the restriction mapping $\mathcal{O}(X) \to \mathcal{O}(U)$ is injective for any nonempty open subscheme $U \subset X$. Hence we may assume that X is affine. Choose a closed immersion $X \to \mathbf{A}^n_k$ and denote $\overline{X}$ the closure of X in $\mathbf{P}^n_k$ via the usual immersion $\mathbf{A}^n_k \to \mathbf{P}^n_k$. Thus we may assume that X is an affine open of a projective variety $\overline{X}$.

Let $\nu : \overline{X}^\nu \to \overline{X}$ be the normalization morphism, see Morphisms, Definition 24.46.12. We know that ν is finite, dominant, and that $\overline{X}^\nu$ is a normal irreducible scheme, see Morphisms, Lemmas 24.46.15, 24.46.16, and 24.17.2. It follows that $\overline{X}^\nu$ is a proper variety, because $\overline{X} \to Spec(k)$ is proper as a composition of a finite and a proper morphism (see results in Morphisms, Sections 24.40 and 24.42). It also follows that ν is a surjective morphism, because the image of ν is closed and contains the generic point of $\overline{X}$. Hence setting $X^\nu = \nu^{-1}(X)$ we see that it suffices to prove the result for X^ν. In other words, we may assume that X is a nonempty open of a normal proper variety $\overline{X}$. This case is handled by Lemma 28.17.1. □

The preceding lemma implies the following slight generalization.

Lemma 28.17.3. *Let k be an algebraically closed field. Let X be a connected reduced scheme which is locally of finite type over k with finitely many irreducible components. Then $\mathcal{O}^*(X)/k^*$ is a finitely generated abelian group.*

Proof. Let $X = \bigcup X_i$ be the irreducible components. By Lemma 28.17.2 we see that $\mathcal{O}(X_i)^*/k^*$ is a finitely generated abelian group. Let $f \in \mathcal{O}(X)^*$ be in the kernel of the map

$$\mathcal{O}(X)^* \longrightarrow \prod \mathcal{O}(X_i)^*/k^*.$$

Then for each i there exists an element $\lambda_i \in k$ such that $f|_{X_i} = \lambda_i$. By restricting to $X_i \cap X_j$ we conclude that $\lambda_i = \lambda_j$ if $X_i \cap X_j \neq \emptyset$. Since X is connected we conclude that all λ_i agree and hence that $f \in k^*$. This proves that

$$\mathcal{O}(X)^*/k^* \subset \prod \mathcal{O}(X_i)^*/k^*$$

and the lemma follows as on the right we have a product of finitely many finitely generated abelian groups. □

Lemma 28.17.4. *Let k be a field. Let X be a scheme over k which is connected and reduced. Then the integral closure of k in $\Gamma(X, \mathcal{O}_X)$ is a field.*

Proof. Let $k' \subset \Gamma(X, \mathcal{O}_X)$ be the integral closure of k. Then $X \to Spec(k)$ factors through $Spec(k')$, see Schemes, Lemma 21.6.4. As X is reduced we see that k' has no nonzero nilpotent elements. As $k \to k'$ is integral we see that every prime ideal of k' is both a maximal ideal and a minimal prime, and $Spec(k')$ is totally disconnected, see Algebra, Lemmas 7.32.18 and 7.23.5. As X is connected the morphism $X \to Spec(k')$ is constant, say with image the point corresponding to $\mathfrak{p} \subset k'$. Then any $f \in k'$, $f \notin \mathfrak{p}$ maps to an invertible element of $\mathcal{O}_X$. By definition of k' this then forces f to be a unit of k'. Hence we see that k' is local with maximal ideal $\mathfrak{p}$, see Algebra, Lemma 7.17.2. Since we've already seen that k' is reduced this implies that k' is a field, see Algebra, Lemma 7.23.3. □

Proposition 28.17.5. *Let k be a field. Let X be a scheme over k. Assume that X is locally of finite type over k, connected, reduced, and has finitely many irreducible components. Then $\mathcal{O}(X)^*/k^*$ is a finitely generated abelian group if in addition to the conditions above at least one of the following conditions is satisfied:*

1. *the integral closure of k in $\Gamma(X, \mathcal{O}_X)$ is k,*
2. *X has a k-rational point, or*
3. *X is geometrically integral.*

Proof. Let $\overline{k}$ be an algebraic closure of k. Let Y be a connected component of $(X_{\overline{k}})_{red}$. Note that the canonical morphism $p : Y \to X$ is open (by Morphisms, Lemma 24.22.4) and closed (by Morphisms, Lemma 24.42.7). Hence $p(Y) = X$ as X was assumed connected. In particular, as X is reduced this implies $\mathcal{O}(X) \subset \mathcal{O}(Y)$. By Lemma 28.6.13 we see that Y has finitely many irreducible components. Thus Lemma 28.17.3 applies to Y. This implies that if $\mathcal{O}(X)^*/k^*$ is not a finitely generated abelian group, then there exist elements $f \in \mathcal{O}(X)$, $f \not\in k$ which map to an element of $\overline{k}$ via the map $\mathcal{O}(X) \to \mathcal{O}(Y)$. In this case f is algebraic over k, hence integral over k. Thus, if condition (1) holds, then this cannot happen. To finish the proof we show that conditions (2) and (3) imply (1).

Let $k \subset k' \subset \Gamma(X, \mathcal{O}_X)$ be the integral closure of k in $\Gamma(X, \mathcal{O}_X)$. By Lemma 28.17.4 we see that k' is a field. If $e : Spec(k) \to X$ is a k-rational point, then $e^\sharp : \Gamma(X, \mathcal{O}_X) \to k$ is a section to the inclusion map $k \to \Gamma(X, \mathcal{O}_X)$. In particular the restriction of $e^\sharp$ to k' is a field map $k' \to k$ over k, which clearly shows that (2) implies (1).

If the integral closure k' of k in $\Gamma(X, \mathcal{O}_X)$ is not trivial, then we see that X is either not geometrically connected (if $k \subset k'$ is not purely inseparable) or that X is not geometrically reduced (if $k \subset k'$ is nontrivial purely inseparable). Details omitted. Hence (3) implies (1). □

Lemma 28.17.6. *Let k be a field. Let X be a variety over k. The group $\mathcal{O}(X)^*/k^*$ is a finitely generated abelian group provided at least one of the following conditions holds:*

1. *k is integrally closed in $\Gamma(X, \mathcal{O}_X)$,*
2. *k is algebraically closed in $k(X)$,*
3. *X is geometrically integral over k, or*
4. *k is the ``intersection'' of the field extensions $k \subset \kappa(x)$ where x runs over the closed points of x.*

Proof. We see that (1) is enough by Proposition 28.17.5. We omit the verification that each of (2), (3), (4) implies (1). □

28.18. Uniqueness of base field

The phrase ``let X be a scheme over k'' means that X is a scheme which comes equipped with a morphism $X \to Spec(k)$. Now we can ask whether the field k is uniquely determined by the scheme X. Of course this is not the case, since for example $\mathbf{A}^1_{\mathbf{C}}$ which we ordinarily consider as a scheme over the field $\mathbf{C}$ of complex numbers, could also be considered as a scheme over $\mathbf{Q}$. But what if we ask that the morphism $X \to Spec(k)$ does not factor as $X \to Spec(k') \to Spec(k)$ for any nontrivial field extension $k \subset k'$? In other words we ask that k is somehow maximal such that X lives over k.

An example to show that this still does not garantee uniqueness of k is the scheme

$$X = Spec\left(\mathbf{Q}(x)[y]\left[\frac{1}{P(y)}, P \in \mathbf{Q}[y], P \neq 0\right]\right)$$

At first sight this seems to be a scheme over $\mathbf{Q}(x)$, but on a second look it is clear that it is also a scheme over $\mathbf{Q}(y)$. Moreover, the fields $\mathbf{Q}(x)$ and $\mathbf{Q}(y)$ are subfields of $R = \Gamma(X, \mathcal{O}_X)$ which are maximal among the subfields of R (details omitted). In particular, both $\mathbf{Q}(x)$ and $\mathbf{Q}(y)$ are maximal in the sense above. Note that both morphisms $X \to Spec(\mathbf{Q}(x))$ and $X \to Spec(\mathbf{Q}(y))$ are ``essentially of finite type'' (i.e., the corresponding ring map is essentially of finite type). Hence X is a Noetherian scheme of finite dimension, i.e., it is not completely pathological.

Another issue that can prevent uniqueness is that the scheme X may be nonreduced. In that case there can be many different morphisms from X to the spectrum of a given field.

As an explicit example consider the dual numbers $D = \mathbf{C}[y]/(y^2) = \mathbf{C} \oplus \epsilon\mathbf{C}$. Given any derivation $\theta : \mathbf{C} \to \mathbf{C}$ over $\mathbf{Q}$ we get a ring map

$$\mathbf{C} \longrightarrow D, \quad c \longmapsto c + \epsilon\theta(c).$$

The subfield of $\mathbf{C}$ on which all of these maps are the same is the algebraic closure of $\mathbf{Q}$. This means that taking the intersection of all the fields that X can live over may end up being a very small field if X is nonreduced.

One observation in this regard is the following: given a field k and two subfields k_1, k_2 of k such that k is finite over k_1 and over k_2, then in general it is *not* the case that k is finite over $k_1 \cap k_2$. An example is the field $k = \mathbf{Q}(t)$ and its subfields $k_1 = \mathbf{Q}(t^2)$ and $\mathbf{Q}((t+1)^2)$. Namely we have $k_1 \cap k_2 = \mathbf{Q}$ in this case. So in the following we have to be careful when taking intersections of fields.

Having said all of this we now show that if X is locally of finite type over a field, then some uniqueness holds. Here is the precise result.

Proposition 28.18.1. *Let X be a scheme. Let $a : X \to Spec(k_1)$ and $b : X \to Spec(k_2)$ be morphisms from X to spectra of fields. Assume a, b are locally of finite type, and X is reduced, and connected. Then we have $k_1' = k_2'$, where $k_i' \subset \Gamma(X, \mathcal{O}_X)$ is the integral closure of k_i in $\Gamma(X, \mathcal{O}_X)$.*

Proof. First, assume the lemma holds in case X is quasi-compact (we will do the quasi-compact case below). As X is locally of finite type over a field, it is locally Noetherian, see Morphisms, Lemma 24.14.6. In particular this means that it is locally connected, connected components of open subsets are open, and intersections of quasi-compact opens are quasi-compact, see Properties, Lemma 23.5.5, Topology, Lemma 5.4.8, Topology, Section 5.6, and Topology, Lemma 5.11.1. Pick an open covering $X = \bigcup_{i \in I} U_i$ such that each U_i is quasi-compact and connected. For each i let $K_i \subset \mathcal{O}_X(U_i)$ be the integral closure of k_1 and of k_2. For each pair $i, j \in I$ we decompose

$$U_i \cap U_j = \coprod U_{i,j,l}$$

into its finitely many connected components. Write $K_{i,j,l} \subset \mathcal{O}(U_{i,j,l})$ for the integral closure of k_1 and of k_2. By Lemma 28.17.4 the rings K_i and $K_{i,j,l}$ are fields. Now we claim that k_1' and k_2' both equal the kernel of the map

$$\prod K_i \longrightarrow \prod K_{i,j,l}, \quad (x_i)_i \longmapsto x_i|_{U_{i,j,l}} - x_j|_{U_{i,j,l}}$$

which proves what we want. Namely, it is clear that k_1' is contained in this kernel. On the other hand, suppose that $(x_i)_i$ is in the kernel. By the sheaf condition $(x_i)_i$ corresponds to $f \in \mathcal{O}(X)$. Pick some $i_0 \in I$ and let $P(T) \in k_1[T]$ be a monic polynomial with $P(x_{i_0}) = 0$. Then we claim that $P(f) = 0$ which proves that $f \in k_1$. To prove this we have to show that $P(x_i) = 0$ for all i. Pick $i \in I$. As X is connected there exists a sequence $i_0, i_1, \ldots, i_n = i \in I$ such that $U_{i_t} \cap U_{i_{t+1}} \neq \emptyset$. Now this means that for each t there exists an l_t such that x_{i_t} and $x_{i_{t+1}}$ map to the same element of the field $K_{i,j,l}$. Hence if $P(x_{i_t}) = 0$, then $P(x_{i_{t+1}}) = 0$. By induction, starting with $P(x_{i_0}) = 0$ we deduce that $P(x_i) = 0$ as desired.

To finish the proof of the lemma we prove the lemma under the additional hypothesis that X is quasi-compact. By Lemma 28.17.4 after replacing k_i by k_i' we may assume that k_i is integrally closed in $\Gamma(X, \mathcal{O}_X)$. This implies that $\mathcal{O}(X)^*/k_i^*$ is a finitely generated abelian group, see Proposition 28.17.5. Let $k_{12} = k_1 \cap k_2$ as a subring of $\mathcal{O}(X)$. Note that k_{12} is a field. Since

$$k_1^*/k_{12}^* \longrightarrow \mathcal{O}(X)^*/k_2^*$$

we see that k_1^*/k_{12}^* is a finitely generated abelian group as well. Hence there exist $\alpha_1, \ldots, \alpha_n \in k_1^*$ such that every element $\lambda \in k_1$ has the form

$$\lambda = c\alpha_1^{e_1} \ldots \alpha_n^{e_n}$$

for some $e_i \in \mathbf{Z}$ and $c \in k_{12}$. In particular, the ring map

$$k_{12}[x_1, \ldots, x_n, \frac{1}{x_1 \ldots x_n}] \longrightarrow k_1, \quad x_i \longmapsto \alpha_i$$

is surjective. By the Hilbert Nullstellensatz, Algebra, Theorem 7.30.1 we conclude that k_1 is a finite extension of k_{12}. In the same way we conclude that k_2 is a finite extension of k_{12}. In particular both k_1 and k_2 are contained in the integral closure k'_{12} of k_{12} in $\Gamma(X, \mathcal{O}_X)$. But since k'_{12} is a field by Lemma 28.17.4 and since we chose k_i to be integrally closed in $\Gamma(X, \mathcal{O}_X)$ we conclude that $k_1 = k_{12} = k_2$ as desired. □

CHAPTER 29

Chow Homology and Chern Classes

29.1. Introduction

In this chapter we discuss Chow homology groups and the construction of chern classes of vector bundles as elements of operational Chow cohomology groups (everything with $\mathbf{Z}$-coefficients). We follow the first few chapters of [**Ful98**], except that we have been less precise about the supports of the cycles involved. More classical discussions of Chow groups can be found in [**Sam56**], [**Che58a**], and [**Che58b**]. Of course there are many others.

To make the material a little bit more challenging we decided to treat a somewhat more general case than is usually done. Namely we assume our schemes X are locally of finite type over a fixed locally Noetherian base scheme which is universally catenary and has a given dimension function. This seems to be all that is needed to be able to define the Chow homology groups $A_*(X)$ and the action of capping with chern classes on them. This is an indication that we should be able to define these also for algebraic stacks locally of finite type over such a base.

In another chapter we will define the intersection products on $A_*(X)$ using Serre's Tor-formula in case X is nonsingular (see [**Ser00**], or [**Ser65**]) and we have a good moving lemma. See (insert future reference here).

29.2. Determinants of finite length modules

The material in this section is related to the material in the paper [**KM76**] and to the material in the thesis [**Ros09**]. If you have a good reference then please email stacks.project@gmail.com.

Given any field κ and any finite dimensional κ-vector space V we set $\det_\kappa(V)$ equal to $\det_\kappa(V) = \wedge^n(V)$ where $n = \dim_\kappa(V)$. We want to generalize this slightly.

Definition 29.2.1. Let R be a local ring with maximal ideal $\mathfrak m$ and residue field κ. Let M be a finite length R-module. Say $l = \text{length}_R(M)$.

(1) Given elements $x_1, \ldots, x_r \in M$ we denote $\langle x_1, \ldots, x_r\rangle = Rx_1 + \ldots + Rx_r$ the R-submodule of R generated by $x_1, \ldots, x_r$.
(2) We will say an l-tuples of elements $(e_1, \ldots, e_l)$ of M is *admissible* if $\mathfrak m e_i \in \langle e_1, \ldots, e_{i-1}\rangle$ for $i = 1, \ldots, l$.
(3) A *symbol* $[e_1, \ldots, e_l]$ will mean $(e_1, \ldots, e_l)$ is an admissible l-tuple.
(4) An *admissible relation* between symbols is one of the following:
    (a) if $(e_1, \ldots, e_l)$ is an admissible sequence and for some $1 \leq a \leq l$ we have $e_a \in \langle e_1, \ldots, e_{a-1}\rangle$, then $[e_1, \ldots, e_l] = 0$,
    (b) if $(e_1, \ldots, e_l)$ is an admissible sequence and for some $1 \leq a \leq l$ we have $e_a = \lambda e'_a + x$ with $\lambda \in R^*$, and $x \in \langle e_1, \ldots, e_{a-1}\rangle$, then

$$[e_1, \ldots, e_l] = \overline{\lambda}[e_1, \ldots, e_{a-1}, e'_a, e_{a+1}, \ldots, e_l]$$

where $\overline{\lambda} \in \kappa^*$ is the image of λ in the residue field, and

(c) if $(e_1, \ldots, e_l)$ is an admissible sequence and $\mathfrak{m}e_a \subset \langle e_1, \ldots, e_{a-2}\rangle$ then

$$[e_1, \ldots, e_l] = -[e_1, \ldots, e_{a-2}, e_a, e_{a-1}, e_{a+1}, \ldots, e_l].$$

(5) We define the *determinant of the finite length R-module* to be

$$\det_\kappa(M) = \left\{ \frac{\kappa\text{-vector space generated by symbols}}{\kappa\text{-linear combinations of admissible relations}} \right\}$$

We stress that always $l = \text{length}_R(M)$. We also stress that it does not follow that the symbol $[e_1, \ldots, e_l]$ is additive in the entries (this will typically not be the case). Before we can show that the determinant $\det_\kappa(M)$ actually has dimension 1 we have to show that it has dimension at most 1.

Lemma 29.2.2. *With notations as above we have* $\dim_\kappa(\det_\kappa(M)) \leq 1$.

Proof. Fix an admissible sequence $(f_1, \ldots, f_l)$ of M such that

$$\text{length}_R(\langle f_1, \ldots, f_i\rangle) = i$$

for $i = 1, \ldots, l$. Such an admissible sequence exists exactly because M has length l. We will show that any element of $\det_\kappa(M)$ is a κ-multiple of the symbol $[f_1, \ldots, f_l]$. This will prove the lemma.

Let $(e_1, \ldots, e_l)$ be an admissible sequence of M. It suffices to show that $[e_1, \ldots, e_l$ is a multiple of $[f_1, \ldots, f_l]$. First assume that $\langle e_1, \ldots, e_l\rangle \neq M$. Then there exists an $i \in [1, \ldots, l]$ such that $e_i \in \langle e_1, \ldots, e_{i-1}\rangle$. It immediately follows from the first admissible relation that $[e_1, \ldots, e_n] = 0$ in $\det_\kappa(M)$. Hence we may assume that $\langle e_1, \ldots, e_l\rangle = M$. In particular there exists a smallest index $i \in \{1, \ldots, l\}$ such that $f_1 \in \langle e_1, \ldots, e_i\rangle$. This means that $e_i = \lambda f_1 + x$ with $x \in \langle e_1, \ldots, e_{i-1}\rangle$ and $\lambda \in R^*$. By the second admissible relation this means that $[e_1, \ldots, e_l] = \overline{\lambda}[e_1, \ldots, e_{i-1}, f_1, e_{i+1}, \ldots, e_l]$. Note that $\mathfrak{m}f_1 = 0$. Hence by applying the third admissible relation $i-1$ times we see that

$$[e_1, \ldots, e_l] = (-1)^{i-1}\overline{\lambda}[f_1, e_1, \ldots, e_{i-1}, e_{i+1}, \ldots, e_l].$$

Note that it is also the case that $\langle f_1, e_1, \ldots, e_{i-1}, e_{i+1}, \ldots, e_l\rangle = M$. By induction suppose we have proven that our original symbol is equal to a scalar times

$$[f_1, \ldots, f_j, e_{j+1}, \ldots, e_l]$$

for some admissible sequence $(f_1, \ldots, f_j, e_{j+1}, \ldots, e_l)$ whose elements generate M, i.e., with $\langle f_1, \ldots, f_j, e_{j+1}, \ldots, e_l\rangle = M$. Then we find the smallest i such that $f_{j+1} \in \langle f_1, \ldots, f_j, e_{j+1}, \ldots, e_i\rangle$ and we go through the same process as above to see that

$$[f_1, \ldots, f_j, e_{j+1}, \ldots, e_l] = (\text{scalar})[f_1, \ldots, f_j, f_{j+1}, e_{j+1}, \ldots, \hat{e_i}, \ldots, e_l]$$

Continuing in this vein we obtain the desired result. □

Before we show that $\det_\kappa(M)$ always has dimension 1, let us show that it agree with the usual top exterior power in the case the module is a vector space over κ.

Lemma 29.2.3. *Let R be a local ring with maximal ideal $\mathfrak{m}$ and residue field κ. Let M be a finite length R-module which is annihilated by $\mathfrak{m}$. Let $l = n = \dim_\kappa(M)$. Then the map*

$$\det_\kappa(M) \longrightarrow \wedge^l_\kappa(M), \quad [e_1, \ldots, e_l] \longmapsto e_1 \wedge \ldots \wedge e_l$$

is an isomorphism.

Proof. It is clear that the rule described in the lemma gives a κ-linear map since all of the admissible relations are satisfied by the usual symbols $e_1 \wedge \ldots \wedge e_l$. It is also clearly a surjective map. Since by Lemma 29.2.2 the left hand side has dimension at most one we see that the map is an isomorphism. $\square$

Lemma 29.2.4. *Let R be a local ring with maximal ideal $\mathfrak{m}$ and residue field κ. Let M be a finite length R-module. The determinant $\det_\kappa(M)$ defined above is a κ-vector space of dimension 1. It is generated by the symbol $[f_1, \ldots, f_l]$ for any admissible sequence such that $\langle f_1, \ldots f_l\rangle = M$.*

Proof. We know $\det_\kappa(M)$ has dimension at most 1, and in fact that it is generated by $[f_1, \ldots, f_l]$, by Lemma 29.2.2 and its proof. We will show by induction on $l = \text{length}(M)$ that it is nonzero. For $l = 1$ it follows from Lemma 29.2.3. Choose a nonzero element $f \in M$ with $\mathfrak{m}f = 0$. Set $\overline{M} = M/\langle f\rangle$, and denote the quotient map $x \mapsto \overline{x}$. We will define a surjective map

$$\psi : \det_k(M) \to \det_\kappa(\overline{M})$$

which will prove the lemma since by induction the determinant of $\overline{M}$ is nonzero.

We define ψ on symbols as follows. Let $(e_1, \ldots, e_l)$ be an admissible sequence. If $f \not\in \langle e_1, \ldots, e_l\rangle$ then we simply set $\psi([e_1, \ldots, e_l]) = 0$. If $f \in \langle e_1, \ldots, e_l\rangle$ then we choose an i minimal such that $f \in \langle e_1, \ldots, e_i\rangle$ and write $e_i = \lambda f + x$ for some $\lambda \in R$ and $x \in \langle e_1, \ldots, e_{i-1}\rangle$. In this case we set

$$\psi([e_1, \ldots, e_l]) = \overline{\lambda}[\overline{e}_1, \ldots, \overline{e}_{i-1}, \overline{e}_{i+1}, \ldots, \overline{e}_l].$$

Note that it is indeed the case that $(\overline{e}_1, \ldots, \overline{e}_{i-1}, \overline{e}_{i+1}, \ldots, \overline{e}_l)$ is an admissible sequence in $\overline{M}$, so this makes sense. Let us show that extending this rule κ-linearly to linear combinations of symbolds does indeed lead to a map on determinants. To do this we have to show that the admissible relations are mapped to zero.

Type (a) relations. Suppose we have $(e_1, \ldots, e_l)$ an admissible sequence and for some $1 \leq a \leq l$ we have $e_a \in \langle e_1, \ldots, e_{a-1}\rangle$. Suppose that $f \in \langle e_1, \ldots, e_i\rangle$ with i minimal. Then it is immediate that $i \neq a$. Since it is also the case that $\overline{e}_a \in \langle \overline{e}_1, \ldots, \hat{\overline{e}_i}, \ldots, \overline{e}_{a-1}\rangle$ we see immediately that the same admissible relation for $\det_\kappa(\overline{M})$ forces the symbol $[\overline{e}_1, \ldots, \overline{e}_{i-1}, \overline{e}_{i+1}, \ldots, \overline{e}_l]$ to be zero as desired.

Type (b) relations. Suppose we have $(e_1, \ldots, e_l)$ an admissible sequence and for some $1 \leq a \leq l$ we have $e_a = \lambda e'_a + x$ with $\lambda \in R^*$, and $x \in \langle e_1, \ldots, e_{a-1}\rangle$. Suppose that $f \in \langle e_1, \ldots, e_i\rangle$ with i minimal. Say $e_i = \mu f + y$ with $y \in \langle e_1, \ldots, e_{i-1}\rangle$. If $i < a$ then the desired equality is

$$\overline{\lambda}[\overline{e}_1, \ldots, \overline{e}_{i-1}, \overline{e}_{i+1}, \ldots, \overline{e}_l] = \overline{\lambda}[\overline{e}_1, \ldots, \overline{e}_{i-1}, \overline{e}_{i+1}, \ldots, \overline{e}_{a-1}, \overline{e}'_a, \overline{e}_{a+1}, \ldots, \overline{e}_l]$$

which follows from $\overline{e}_a = \lambda\overline{e}'_a + \overline{x}$ and the corresponding admissible relation for $\det_\kappa(\overline{M})$. If $i > a$ then the desired equality is

$$\overline{\lambda}[\overline{e}_1, \ldots, \overline{e}_{i-1}, \overline{e}_{i+1}, \ldots, \overline{e}_l] = \overline{\lambda}[\overline{e}_1, \ldots, \overline{e}_{a-1}, \overline{e}'_a, \overline{e}_{a+1}, \ldots, \overline{e}_{i-1}, \overline{e}_{i+1}, \ldots, \overline{e}_l]$$

which follows from $\overline{e}_a = \lambda\overline{e}'_a + \overline{x}$ and the corresponding admissible relation for $\det_\kappa(\overline{M})$. The interesting case is when $i = a$. In this case we have $e_a = \lambda e'_a + x = \mu f + y$. Hence also $e'_a = \lambda^{-1}(\mu f + y - x)$. Thus we see that

$$\psi([e_1, \ldots, e_l]) = \overline{\mu}[\overline{e}_1, \ldots, \overline{e}_{i-1}, \overline{e}_{i+1}, \ldots, \overline{e}_l] = \psi(\overline{\lambda}[e_1, \ldots, e_{a-1}, e'_a, e_{a+1}, \ldots, e_l])$$

as desired.

Type (c) relations. Suppose that $(e_1, \ldots, e_l)$ is an admissible sequence and $\mathfrak{m}e_a \subset \langle e_1, \ldots, e_{a-2}\rangle$. Suppose that $f \in \langle e_1, \ldots, e_i\rangle$ with i minimal. Say $e_i = \lambda f + x$ with $x \in \langle e_1, \ldots, e_{i-1}\rangle$. If $i < a - 1$, then the desired equality is

$$\overline{\lambda}[\overline{e}_1, \ldots, \overline{e}_{i-1}, \overline{e}_{i+1}, \ldots, \overline{e}_l] = \overline{\lambda}[\overline{e}_1, \ldots, \overline{e}_{i-1}, \overline{e}_{i+1}, \ldots, \overline{e}_{a-2}, \overline{e}_a, \overline{e}_{a-1}, \overline{e}_{a+1}, \ldots, \overline{e}_l]$$

which follows from the type (c) admissible relation for $\det_\kappa(\overline{M})$. Similarly, if $i > a$, then the desired equality is

$$\overline{\lambda}[\overline{e}_1, \ldots, \overline{e}_{i-1}, \overline{e}_{i+1}, \ldots, \overline{e}_l] = \overline{\lambda}[\overline{e}_1, \ldots, \overline{e}_{a-2}, \overline{e}_a, \overline{e}_{a-1}, \overline{e}_{a+1}, \ldots, \overline{e}_{i-1}, \overline{e}_{i+1}, \ldots, \overline{e}_l]$$

which follows from the type (c) admissible relation for $\det_\kappa(\overline{M})$. If $i = a$, then the desired equality is

$$\overline{\lambda}[\overline{e}_1, \ldots, \overline{e}_{a-1}, \overline{e}_{a+1}, \ldots, \overline{e}_l] = \overline{\lambda}[\overline{e}_1, \ldots, \overline{e}_{a-2}, \overline{e}_{a-1}, \overline{e}_{a+1}, \ldots, \overline{e}_l]$$

which is tautological. Finally, the interesting case is $i = a - 1$. This case itself splits into two cases as to whether $f \in \langle e_1, \ldots, e_{a-2}, e_a\rangle$ or not. If not, then we see that the desired equality is

$$\overline{\lambda}[\overline{e}_1, \ldots, \overline{e}_{a-2}, \overline{e}_a, \ldots, \overline{e}_l] = \overline{\lambda}[\overline{e}_1, \ldots, \overline{e}_{a-2}, \overline{e}_a, \overline{e}_{a+1}, \ldots, \overline{e}_l]$$

which is tautological since after switching e_{a-1} and e_a the smallest index such that f is in the becomes equal to $i' = a$ and it is again e_a which is removed. On the other hand, suppose that $f \in \langle e_1, \ldots, e_{a-2}, e_a\rangle$. In this case we see that we can, besides the equality $e_{a-1} = \lambda f + x$ of above, also write $e_a = \mu f + y$ with $y \in \langle e_1, \ldots, e_{a-2}\rangle$. Clearly this means that both $e_a \in \langle e_1, \ldots, e_{a-1}\rangle$ and $e_{a-1} \in \langle e_1, \ldots, e_{a-2}, e_a\rangle$. Thus we can use relations of type (a) and the compatibility of ψ with these shown above to see that both

$$\psi([e_1, \ldots, e_l]) \quad \text{and} \quad \psi([e_1, \ldots, e_{a-2}, e_a, e_{a-1}, e_{a+1}, \ldots, e_l])$$

are zero, as desired.

At this point we have shown that ψ is well defined, and all that remains is to show that it is surjective. To see this let $(\overline{f}_2, \ldots, \overline{f}_l)$ be an admissible sequence in $\overline{M}$. We can choose lifts $f_2, \ldots, f_l \in M$, and then $(f, f_2, \ldots, f_l)$ is an admissible sequence in M. Since $\psi([f, f_2, \ldots, f_l]) = [f_2, \ldots, f_l]$ we win. □

Let R be a local ring with maximal ideal $\mathfrak{m}$ and residue field κ. Note that if $\varphi : M \to N$ is an isomorphism of finite length R-modules, then we get an isomorphism

$$\det_\kappa(\varphi) : \det_\kappa(M) \to \det_\kappa(N)$$

simply by the rule

$$\det_\kappa(\varphi)([e_1, \ldots, e_l]) = [\varphi(e_1), \ldots, \varphi(e_l)]$$

for any symbol $[e_1, \ldots, e_l]$ for M. Hence we see that $\det_\kappa$ is a functor

$$\left\{ \begin{matrix} \text{fi} \\ \text{with isomorphisms} \end{matrix} \right\} \longrightarrow \left\{ \begin{matrix} \text{1-dimensional } \kappa\text{-vector spaces} \\ \text{with isomorphisms} \end{matrix} \right\} \tag{29.2.4.1}$$

This is typical for a ``determinant functor'' (see [**Knu02**]), as is the following additivity property.

Lemma 29.2.5. *Let $(R, \mathfrak{m}, \kappa)$ be a local ring. For every short exact sequence*

$$0 \to K \to L \to M \to 0$$

of finite length R-modules there exists a canonical isomorphism

$$\gamma_{K \to L \to M} : \det_\kappa(K) \otimes_\kappa \det_\kappa(M) \longrightarrow \det_\kappa(L)$$

defined by the rule on nonzero symbols

$$[e_1, \ldots, e_k] \otimes [\overline{f}_1, \ldots, \overline{f}_m] \longrightarrow [e_1, \ldots, e_k, f_1, \ldots, f_m]$$

with the following properties:

(1) *For every isomorphism of short exact sequences, i.e., for every commutative diagram*

$$\begin{tikzcd} 0 \arrow[r] & K \arrow[r] \arrow[d, "u"] & L \arrow[r] \arrow[d, "v"] & M \arrow[r] \arrow[d, "w"] & 0 \\ 0 \arrow[r] & K' \arrow[r] & L' \arrow[r] & M' \arrow[r] & 0 \end{tikzcd}$$

with short exact rows and isomorphisms u, v, w we have

$$\gamma_{K' \to L' \to M'} \circ (\det_\kappa(u) \otimes \det_\kappa(w)) = \det_\kappa(v) \circ \gamma_{K \to L \to M},$$

(2) *for every commutative square of finite length R-modules with exact rows and columns*

$$\begin{tikzcd} & 0 \arrow[d] & 0 \arrow[d] & 0 \arrow[d] & \\ 0 \arrow[r] & A \arrow[r] \arrow[d] & B \arrow[r] \arrow[d] & C \arrow[r] \arrow[d] & 0 \\ 0 \arrow[r] & D \arrow[r] \arrow[d] & E \arrow[r] \arrow[d] & F \arrow[r] \arrow[d] & 0 \\ 0 \arrow[r] & G \arrow[r] \arrow[d] & H \arrow[r] \arrow[d] & I \arrow[r] \arrow[d] & 0 \\ & 0 & 0 & 0 & \end{tikzcd}$$

the following diagram is commutative

$$\begin{tikzcd} \det_\kappa(A) \otimes \det_\kappa(C) \otimes \det_\kappa(G) \otimes \det_\kappa(I) \arrow[r, "\gamma_{A \to B \to C} \otimes \gamma_{G \to H \to I}"'] \arrow[dd, "\epsilon"'] & \det_\kappa(B) \otimes \det_\kappa(H) \arrow[d, "\gamma_{B \to E \to H}"] \\ & \det_\kappa(E) \\ \det_\kappa(A) \otimes \det_\kappa(G) \otimes \det_\kappa(C) \otimes \det_\kappa(I) \arrow[r, "\gamma_{A \to D \to G} \otimes \gamma_{C \to F \to I}"] & \det_\kappa(D) \otimes \det_\kappa(F) \arrow[u, "\gamma_{D \to E \to F}"'] \end{tikzcd}$$

where ϵ is the switch of the factors in the tensor product times $(-1)^{cg}$ with $c = length_R(C)$ and $g = length_R(G)$, and

(3) *the map $\gamma_{K \to L \to M}$ agrees with the usual isomorphism if $0 \to K \to L \to M \to 0$ is actually a short exact sequence of κ-vector spaces.*

Proof. The significance of taking nonzero symbols in the explicit description of the map $\gamma_{K \to L \to M}$ is simply that if $(e_1, \ldots, e_l)$ is an admissible sequence in K, and $(\overline{f}_1, \ldots, \overline{f}_m)$ is an admissible sequence in M, then it is not garanteed that $(e_1, \ldots, e_l, f_1, \ldots, f_m)$ is an admissible sequence in L (where of course $f_i \in L$ signifies a lift of $\overline{f}_i$). However, if the symbol $[e_1, \ldots, e_l]$ is nonzero in $\det_\kappa(K)$, then necessarily $K = \langle e_1, \ldots, e_k\rangle$ (see proof of

Lemma 29.2.2), and in this case it is true that $(e_1, \ldots, e_k, f_1, \ldots, f_m)$ is an admissible sequence. Moreover, by the admissible relations of type (b) for $\det_\kappa(L)$ we see that the value of $[e_1, \ldots, e_k, f_1, \ldots, f_m]$ in $\det_\kappa(L)$ is independent of the choice of the lifts f_i in this case also. Given this remark, it is clear that an admissible relation for $e_1, \ldots, e_k$ in K translates into an admissible relation among $e_1, \ldots, e_k, f_1, \ldots, f_m$ in L, and similarly for an admissible relation among the $\overline{f}_1, \ldots, \overline{f}_m$. Thus γ defines a linear map of vector spaces as claimed in the lemma.

By Lemma 29.2.4 we know $\det_\kappa(L)$ is generated by any single symbol $[x_1, \ldots, x_{k+m}]$ such that $(x_1, \ldots, x_{k+m})$ is an admissible sequence with $L = \langle x_1, \ldots, x_{k+m}\rangle$. Hence it is clear that the map $\gamma_{K\to L\to M}$ is surjective and hence an isomorphism.

Property (1) holds because

$$\begin{aligned} & \det_\kappa(v)([e_1, \ldots, e_k, f_1, \ldots, f_m]) \\ = \; & [v(e_1), \ldots, v(e_k), v(f_1), \ldots, v(f_m)] \\ = \; & \gamma_{K'\to L'\to M'}([u(e_1), \ldots, u(e_k)] \otimes [w(f_1), \ldots, w(f_m)]). \end{aligned}$$

Property (2) means that given a symbol $[\alpha_1, \ldots, \alpha_a]$ generating $\det_\kappa(A)$, a symbol $[\gamma_1, \ldots, \gamma_c]$ generating $\det_\kappa(C)$, a symbol $[\zeta_1, \ldots, \zeta_g]$ generating $\det_\kappa(G)$, and a symbol $[\iota_1, \ldots, \iota_i]$ generating $\det_\kappa(I)$ we have

$$\begin{aligned} & [\alpha_1, \ldots, \alpha_a, \tilde{\gamma}_1, \ldots, \tilde{\gamma}_c, \tilde{\zeta}_1, \ldots, \tilde{\zeta}_g, \tilde{\iota}_1, \ldots, \tilde{\iota}_i] \\ = \; & (-1)^{cg}[\alpha_1, \ldots, \alpha_a, \tilde{\zeta}_1, \ldots, \tilde{\zeta}_g, \tilde{\gamma}_1, \ldots, \tilde{\gamma}_c, \tilde{\iota}_1, \ldots, \tilde{\iota}_i] \end{aligned}$$

(for suitable lifts $\tilde{x}$ in E) in $\det_\kappa(E)$. This holds because we may use the admissible relations of type (c) cg times in the following order: move the $\tilde{\zeta}_1$ past the elements $\tilde{\gamma}_c, \ldots, \tilde{\gamma}_1$ (allowed since $\mathfrak{m}\tilde{\zeta}_1 \subset A$), then move $\tilde{\zeta}_2$ past the elements $\tilde{\gamma}_c, \ldots, \tilde{\gamma}_1$ (allowed since $\mathfrak{m}\tilde{\zeta}_2 \subset A + R\tilde{\zeta}_1$), and so on.

Part (3) of the lemma is obvious. This finishes the proof. $\square$

We can use the maps γ of the lemma to define more general maps γ as follows. Suppose that $(R, \mathfrak{m}, \kappa)$ is a local ring. Let M be a finite length R-module and suppose we are given a finite filtration (see Homology, Definition 10.13.1)

$$M = F^n \supset F^{n+1} \supset \ldots \supset F^{m-1} \supset F^m = 0.$$

Then there is a canonical isomorphism

$$\gamma_{(M,F)} : \bigotimes\nolimits_i \det_\kappa(F^i/F^{i+1}) \longrightarrow \det_\kappa(M)$$

well defined up to sign(!). One can make the sign explicit either by giving a well defined order of the terms in the tensor product (starting with higher indices unfortunately), and by thinking of the target category for the functor $\det_\kappa$ as the category of 1-dimensional super vector spaces. See [**KM76**, Section 1].

Here is another typical result for determinant functors. It is not hard to show. The tricky part is usually to show the existence of a determinant functor.

Lemma 29.2.6. *Let $(R, \mathfrak{m}, \kappa)$ be any local ring. The functor*

$$\det_\kappa : \left\{ \begin{matrix} fi R\text{-modules} \\ \text{with isomorphisms} \end{matrix} \right\} \longrightarrow \left\{ \begin{matrix} 1\text{-dimensional } \kappa\text{-vector spaces} \\ \text{with isomorphisms} \end{matrix} \right\}$$

endowed with the maps $\gamma_{K\to L\to M}$ is characterized by the following properties

(1) *its restriction to the subcategory of modules annihilated by $\mathfrak{m}$ is isomorphic to the usual determinant functor (see Lemma 29.2.3), and*
(2) *(1), (2) and (3) of Lemma 29.2.5 hold.*

Proof. Omitted. □

Lemma 29.2.7. *Let $(R, \mathfrak{m}, \kappa)$ be a local ring. Let $I \subset \mathfrak{m}$ be an ideal, and set $R' = R/I$. Let $\det_{R,\kappa}$ denote the determinant functor on the category Mod^f_R finite length R-modules and denote $\det_{R',\kappa}$ the determinant on the category $Mod^f_{R'}$ of finite length R'-modules. Then $Mod^f_{R'} \subset Mod^f_R$ is a full subcategory and there exists an isomorphism of functors*

$$\det_{R,\kappa}|_{Mod^f_{R'}} = \det_{R',\kappa}$$

compatible with the isomorphisms $\gamma_{K\to L\to M}$ for either of these functors.

Proof. This can be shown by using the characterization of the pair $(\det_{R',\kappa}, \gamma)$ in Lemma 29.2.6. But really the isomorphism is obtained by mapping a symbol $[x_1, \ldots, x_l] \in \det_{R,\kappa}(M)$ to the corresponding symbol $[x_1, \ldots, x_l] \in \det_{R',\kappa}(M)$ which ``obviously'' works. □

Here is a case where we can compute the determinant of a linear map. In fact there is nothing mysterious about this in any case, see Example 29.2.9 for a random example.

Lemma 29.2.8. *Let R be a local ring with residue field κ. Let $u \in R^*$ be a unit. Let M be a module of finite length over R. Denote $u_M : M \to M$ the map multiplication by u. Then*

$$\det_\kappa(u_M) : \det_\kappa(M) \longrightarrow \det_\kappa(M)$$

is multiplication by $\overline{u}^l$ where $l = length_R(M)$ and $\overline{u} \in \kappa^*$ is the image of u.

Proof. Denote $f_M \in \kappa^*$ the element such that $\det_\kappa(u_M) = f_M \mathrm{id}_{\det_\kappa(M)}$. Suppose that $0 \to K \to L \to M \to 0$ is a short exact sequence of finite R-modules. Then we see that u_k, u_L, u_M give an isomorphism of short exact sequences. Hence by Lemma 29.2.5 (1) we conclude that $f_K f_M = f_L$. This means that by induction on length it suffices to prove the lemma in the case of length 1 where it is trivial. □

Example 29.2.9. Consider the local ring $R = \mathbf{Z}_p$. Set $M = \mathbf{Z}_p/(p^2) \oplus \mathbf{Z}_p/(p^3)$. Let $u : M \to M$ be the map given by the matrix

$$u = \begin{pmatrix} a & b \\ pc & d \end{pmatrix}$$

where $a, b, c, d \in \mathbf{Z}_p$, and $a, d \in \mathbf{Z}_p^*$. In this case $\det_\kappa(u)$ equals multiplication by $a^2 d^3 \bmod p \in \mathbf{F}_p^*$. This can easily be seen by consider the effect of u on the symbol $[p^2 e, pe, pf, e, f]$ where $e = (0, 1) \in M$ and $f = (1, 0) \in M$.

29.3. Periodic complexes

Of course there is a very general notion of periodic complexes. We can require periodicity of the maps, or periodicity of the objects. We will add these here as needed. For the moment we only need the following cases.

Definition 29.3.1. Let R be a ring.

(1) A 2-*periodic complex* over R is given by a quadruple (M, N, φ, ψ) consisting of R-modules M, N and R-module maps $\varphi : M \to N$, $\psi : N \to M$ such that

$$\ldots \longrightarrow M \xrightarrow{\varphi} N \xrightarrow{\psi} M \xrightarrow{\varphi} N \longrightarrow \ldots$$

is a complex. In this setting we define the *cohomology modules* of the complex to be the R-modules

$$H^0(M, N, \varphi, \psi) = \mathrm{Ker}(\varphi)/\mathrm{Im}(\psi), \quad \text{and} \quad H^1(M, N, \varphi, \psi) = \mathrm{Ker}(\psi)/\mathrm{Im}(\varphi).$$

We say the 2-periodic complex is *exact* if the cohomology groups are zero.

(2) A $(2,1)$-*periodic complex* over R is given by a triple (M, φ, ψ) consisting of an R-module M and R-module maps $\varphi : M \to M$, $\psi : M \to M$ such that

$$\ldots \longrightarrow M \xrightarrow{\varphi} M \xrightarrow{\psi} M \xrightarrow{\varphi} M \longrightarrow \ldots$$

is a complex. Since this is a special case of a 2-periodic complex we have its *cohomology modules* $H^0(M, \varphi, \psi)$, $H^1(M, \varphi, \psi)$ and a notion of exactness.

In the following we will use any result proved for 2-periodic complexes without further mention for $(2,1)$-periodic complexes. It is clear that the collection of 2-periodic complexes (resp. $(2,1)$-periodic complexes) forms a category with morphisms $(f, g) : (M, N, \varphi, \psi) \to (M', N', \varphi', \psi')$ pairs of morphisms $f : M \to M'$ and $g : N \to N'$ such that $\varphi' \circ f = f \circ \varphi$ and $\psi' \circ g = g \circ \psi$. In fact it is an abelian category, with kernels and cokernels as in Homology, Lemma 10.10.3. Also, note that a special case are the $(2,1)$-periodic complexes of the form $(M, 0, \psi)$. In this special case we have

$$H^0(M, 0, \psi) = \mathrm{Coker}(\psi), \quad \text{and} \quad H^1(M, 0, \psi) = \mathrm{Ker}(\psi).$$

Definition 29.3.2. Let R be a local ring. Let (M, N, φ, ψ) be a 2-periodic complex over R whose cohomology groups have finite length over R. In this case we define the *multiplicity* of (M, N, φ, ψ) to be the integer

$$e_R(M, N, \varphi, \psi) = \mathrm{length}_R(H^0(M, N, \varphi, \psi)) - \mathrm{length}_R(H^1(M, N, \varphi, \psi))$$

We will sometimes (especially in the case of a $(2,1)$-periodic complex with $\varphi = 0$) call this the *Herbrand quotient*[1].

Lemma 29.3.3. *Let R be a local ring.*

(1) *If (M, N, φ, ψ) is a 2-periodic complex such that M, N have finite length. Then $e_R(M, N, \varphi, \psi) = \mathrm{length}_R(M) - \mathrm{length}_R(N)$.*
(2) *If (M, φ, ψ) is a $(2,1)$-periodic complex such that M has finite length. Then $e_R(M, \varphi, \psi) = 0$.*
(3) *Suppose that we have a short exact sequence of $(2,1)$-periodic complexes*

$$0 \to (M_1, N_1, \varphi_1, \psi_1) \to (M_2, N_2, \varphi_2, \psi_2) \to (M_3, N_3, \varphi_3, \psi_3) \to 0$$

If two out of three have cohomology modules of finite length so does the third and we have

$$e_R(M_2, N_2, \varphi_2, \psi_2) = e_R(M_1, N_1, \varphi_1, \psi_1) + e_R(M_3, N_3, \varphi_3, \psi_3).$$

[1] If the residue field of R is finite with q elements it is customary to call the Herbrand quotient $h(M, N, \varphi, \psi) = q^{e_R(M,N,\varphi,\psi)}$ which is equal to the number of elements of H^0 divided by the number of elements of H^1.

Proof. Proof of (3). Abbreviate $A = (M_1, N_1, \varphi_1, \psi_1)$, $B = (M_2, N_2, \varphi_2, \psi_2)$ and $C = (M_3, N_3, \varphi_3, \psi_3)$. We have a long exact cohomology sequence

$$\ldots \to H^1(C) \to H^0(A) \to H^0(B) \to H^0(C) \to H^1(A) \to H^1(B) \to H^1(C) \to \ldots$$

This gives a finite exact sequence

$$0 \to I \to H^0(A) \to H^0(B) \to H^0(C) \to H^1(A) \to H^1(B) \to K \to 0$$

with $0 \to K \to H^1(C) \to I \to 0$ a filtration. By additivity of the length function (Algebra, Lemma 7.48.3) we see the result. The proofs of (1) and (2) are omitted. □

Let R be a local ring with residue field κ. Let (M, φ, ψ) be a $(2,1)$-periodic complex over R. Assume that M has finite length and that (M, φ, ψ) is exact. We are going to use the determinant construction to define an invariant of this situation. See Section 29.2. Let us abbreviate $K_\varphi = \mathrm{Ker}(\varphi)$, $I_\varphi = \mathrm{Im}(\varphi)$, $K_\psi = \mathrm{Ker}(\psi)$, and $I_\psi = \mathrm{Im}(\psi)$. The short exact sequences

$$0 \to K_\varphi \to M \to I_\varphi \to 0, \quad 0 \to K_\psi \to M \to I_\psi \to 0$$

give isomorphisms

$$\gamma_\varphi : \det_\kappa(K_\varphi) \otimes \det_\kappa(I_\varphi) \longrightarrow \det_\kappa(M), \quad \gamma_\psi : \det_\kappa(K_\psi) \otimes \det_\kappa(I_\psi) \longrightarrow \det_\kappa(M),$$

see Lemma 29.2.5. On the other hand the exactness of the complex gives equalities $K_\varphi = I_\psi$, and $K_\psi = I_\varphi$ and hence an isomorphism

$$\sigma : \det_\kappa(K_\varphi) \otimes \det_\kappa(I_\varphi) \longrightarrow \det_\kappa(K_\psi) \otimes \det_\kappa(I_\psi)$$

by switching the factors. Using this notation we can define our invariant.

Definition 29.3.4. Let R be a local ring with residue field κ. Let (M, φ, ψ) be a $(2,1)$-periodic complex over R. Assume that M has finite length and that (M, φ, ψ) is exact. The *determinant of* (M, φ, ψ) is the element

$$\det_\kappa(M, \varphi, \psi) \in \kappa^*$$

such that the composition

$$\det_\kappa(M) \xrightarrow{\gamma_\psi \circ \sigma \circ \gamma_\varphi^{-1}} \det_\kappa(M)$$

is multiplication by $(-1)^{\mathrm{length}_R(I_\varphi)\mathrm{length}_R(I_\psi)} \det_\kappa(M, \varphi, \psi)$.

Remark 29.3.5. Here is a more down to earth description of the determinant introduced above. Let R be a local ring with residue field κ. Let (M, φ, ψ) be a $(2,1)$-periodic complex over R. Assume that M has finite length and that (M, φ, ψ) is exact. Let us abbreviate $I_\varphi = \mathrm{Im}(\varphi)$, $I_\psi = \mathrm{Im}(\psi)$ as above. Assume that $\mathrm{length}_R(I_\varphi) = a$ and $\mathrm{length}_R(I_\psi) = b$, so that $a + b = \mathrm{length}_R(M)$ by exactness. Choose admissible sequences $x_1, \ldots, x_a \in I_\varphi$ and $y_1, \ldots, y_b \in I_\psi$ such that the symbol $[x_1, \ldots, x_a]$ generates $\det_\kappa(I_\varphi)$ and the symbol $[x_1, \ldots, x_b]$ generates $\det_\kappa(I_\psi)$. Choose $\tilde{x}_i \in M$ such that $\varphi(\tilde{x}_i) = x_i$. Choose $\tilde{y}_j \in M$ such that $\psi(\tilde{y}_j) = y_j$. Then $\det_\kappa(M, \varphi, \psi)$ is characterized by the equality

$$[x_1, \ldots, x_a, \tilde{y}_1, \ldots, \tilde{y}_b] = (-1)^{ab} \det_\kappa(M, \varphi, \psi)[y_1, \ldots, y_b, \tilde{x}_1, \ldots, \tilde{x}_a]$$

in $\det_\kappa(M)$. This also explains the sign.

Lemma 29.3.6. *Let R be a local ring with residue field κ. Let (M, φ, ψ) be a $(2,1)$-periodic complex over R. Assume that M has finite length and that (M, φ, ψ) is exact. Then*

$$\det_\kappa(M, \varphi, \psi) \det_\kappa(M, \psi, \varphi) = 1.$$

Proof. Omitted. □

Lemma 29.3.7. *Let R be a local ring with residue field κ. Let (M, φ, φ) be a $(2,1)$-periodic complex over R. Assume that M has finite length and that (M, φ, ψ) is exact. Then $length_R(M) = 2length_R(Im(\varphi))$ and*

$$\det_\kappa(M, \varphi, \psi) = (-1)^{length_R(Im(\varphi))} = (-1)^{\frac{1}{2}length_R(M)}$$

Proof. Follows directly from the sign rule in the definitions. $\square$

Lemma 29.3.8. *Let R be a local ring with residue field κ. Let M be a finite length R-module.*

(1) *if $\varphi : M \to M$ is an isomorphism then* $\det_\kappa(M, \varphi, 0) = \det_\kappa(\varphi)$.
(2) *if $\psi : M \to M$ is an isomorphism then* $\det_\kappa(M, 0, \psi) = \det_\kappa(\psi)^{-1}$.

Proof. Let us prove (1). Set $\psi = 0$. Then we may, with notation as above Definition 29.3.4, identify $K_\varphi = I_\psi = 0$, $I_\varphi = K_\psi = M$. With these identifications, the map

$$\gamma_\varphi : \kappa \otimes \det_\kappa(M) = \det_\kappa(K_\varphi) \otimes \det_\kappa(I_\varphi) \longrightarrow \det_\kappa(M)$$

is identified with $\det_\kappa(\varphi^{-1})$. On the other hand the map γ_ψ is identified with the identity map. Hence $\gamma_\psi \circ \sigma \circ \gamma_\varphi^{-1}$ is equal to $\det_\kappa(\varphi)$ in this case. Whence the result. We omit the proof of (2). $\square$

Lemma 29.3.9. *Let R be a local ring with residue field κ. Suppose that we have a short exact sequence of $(2,1)$-periodic complexes*

$$0 \to (M_1, \varphi_1, \psi_1) \to (M_2, \varphi_2, \psi_2) \to (M_3, \varphi_3, \psi_3) \to 0$$

with all M_i of finite length, and each (M_1, φ_1, ψ_1) exact. Then

$$\det_\kappa(M_2, \varphi_2, \psi_2) = \det_\kappa(M_1, \varphi_1, \psi_1) \det_\kappa(M_3, \varphi_3, \psi_3).$$

in κ^*.

Proof. Let us abbreviate $I_{\varphi,i} = \mathrm{Im}(\varphi_i)$, $K_{\varphi,i} = \mathrm{Ker}(\varphi_i)$, $I_{\psi,i} = \mathrm{Im}(\psi_i)$, and $K_{\psi,i} = \mathrm{Ker}(\psi_i)$. Observe that we have a commutative square

$$\begin{tikzcd}
 & 0 \arrow[d] & 0 \arrow[d] & 0 \arrow[d] & \\
0 \arrow[r] & K_{\varphi,1} \arrow[r] \arrow[d] & K_{\varphi,2} \arrow[r] \arrow[d] & K_{\varphi,3} \arrow[r] \arrow[d] & 0 \\
0 \arrow[r] & M_1 \arrow[r] \arrow[d] & M_2 \arrow[r] \arrow[d] & M_3 \arrow[r] \arrow[d] & 0 \\
0 \arrow[r] & I_{\varphi,1} \arrow[r] \arrow[d] & I_{\varphi,2} \arrow[r] \arrow[d] & I_{\varphi,3} \arrow[r] \arrow[d] & 0 \\
 & 0 & 0 & 0 &
\end{tikzcd}$$

of finite length R-modules with exact rows and columns. The top row is exact since it can be identified with the sequence $I_{\psi,1} \to I_{\psi,2} \to I_{\psi,3} \to 0$ of images, and similarly for the bottom row. There is a similar diagram involving the modules $I_{\psi,i}$ and $K_{\psi,i}$. By definition

$\det_\kappa(M_2, \varphi_2, \psi_2)$ corresponds, up to a sign, to the composition of the left vertical maps in the following diagram

$$\begin{tikzcd}
\det_\kappa(M_1) \otimes \det_\kappa(M_3) \arrow[r, "\gamma"] \arrow[d, "\gamma^{-1}\otimes\gamma^{-1}"] & \det_\kappa(M_2) \arrow[d, "\gamma^{-1}"] \\
\det_\kappa(K_{\varphi,1}) \otimes \det_\kappa(I_{\varphi,1}) \otimes \det_\kappa(K_{\varphi,3}) \otimes \det_\kappa(I_{\varphi,3}) \arrow[r, "\gamma\otimes\gamma"] \arrow[d, "\sigma\otimes\sigma"] & \det_\kappa(K_{\varphi,2}) \otimes \det_\kappa(I_{\varphi,2}) \arrow[d, "\sigma"] \\
\det_\kappa(K_{\psi,1}) \otimes \det_\kappa(I_{\psi,1}) \otimes \det_\kappa(K_{\psi,3}) \otimes \det_\kappa(I_{\psi,3}) \arrow[r, "\gamma\otimes\gamma"] \arrow[d, "\gamma\otimes\gamma"] & \det_\kappa(K_{\psi,2}) \otimes \det_\kappa(I_{\psi,2}) \arrow[d, "\gamma"] \\
\det_\kappa(M_1) \otimes \det_\kappa(M_3) \arrow[r, "\gamma"] & \det_\kappa(M_2)
\end{tikzcd}$$

The top and bottom squares are commutative up to sign by applying Lemma 29.2.5 (2). The middle square is trivially commutative (we are just switching factors). Hence we see that $\det_\kappa(M_2, \varphi_2, \psi_2) = \epsilon \det_\kappa(M_1, \varphi_1, \psi_1) \det_\kappa(M_3, \varphi_3, \psi_3)$ for some sign ϵ. And the sign can be worked out, namely the outer rectangle in the diagram above commutes up to

$$\begin{aligned}
\epsilon &= (-1)^{\text{length}(I_{\varphi,1})\text{length}(K_{\varphi,3}) + \text{length}(I_{\psi,1})\text{length}(K_{\psi,3})} \\
&= (-1)^{\text{length}(I_{\varphi,1})\text{length}(I_{\psi,3}) + \text{length}(I_{\psi,1})\text{length}(I_{\varphi,3})}
\end{aligned}$$

(proof omitted). It follows easily from this that the signs work out as well. ☐

Example 29.3.10. Let k be a field. Consider the ring $R = k[T]/(T^2)$ of dual numbers over k. Denote t the class of T in R. Let $M = R$ and $\varphi = ut$, $\psi = vt$ with $u, v \in k^*$. In this case $\det_k(M)$ has generator $e = [t, 1]$. We identify $I_\varphi = K_\varphi = I_\psi = K_\psi = (t)$. Then $\gamma_\varphi(t \otimes t) = u^{-1}[t, 1]$ (since $u^{-1} \in M$ is a lift of $t \in I_\varphi$) and $\gamma_\psi(t \otimes t) = v^{-1}[t, 1]$ (same reason). Hence we see that $\det_k(M, \varphi, \psi) = -u/v \in k^*$.

Example 29.3.11. Let $R = \mathbf{Z}_p$ and let $M = \mathbf{Z}_p/(p^l)$. Let $\varphi = p^b u$ and $\varphi = p^a v$ with $a, b \geq 0$, $a + b = l$ and $u, v \in \mathbf{Z}_p^*$. Then a computation as in Example 29.3.10 shows that

$$\begin{aligned}
\det_{\mathbf{F}_p}(\mathbf{Z}_p/(p^l), p^b u, p^a v) &= (-1)^{ab} u^a / v^b \bmod p \\
&= (-1)^{\text{ord}_p(\alpha)\text{ord}_p(\beta)} \frac{\alpha^{\text{ord}_p(\beta)}}{\beta^{\text{ord}_p(\alpha)}} \bmod p
\end{aligned}$$

with $\alpha = p^b u, \beta = p^a v \in \mathbf{Z}_p$. See Lemma 29.4.10 for a more general case (and a proof).

Example 29.3.12. Let $R = k$ be a field. Let $M = k^{\oplus a} \oplus k^{\oplus b}$ be $l = a + b$ dimensional. Let φ and ψ be the following diagonal matrices

$$\varphi = \text{diag}(u_1, \ldots, u_a, 0, \ldots, 0), \quad \psi = \text{diag}(0, \ldots, 0, v_1, \ldots, v_b)$$

with $u_i, v_j \in k^*$. In this case we have

$$\det_k(M, \varphi, \psi) = \frac{u_1 \ldots u_a}{v_1 \ldots v_b}.$$

This can be seen by a direct computation or by computing in case $l = 1$ and using the additivity of Lemma 29.3.9.

Example 29.3.13. Let $R = k$ be a field. Let $M = k^{\oplus a} \oplus k^{\oplus a}$ be $l = 2a$ dimensional. Let φ and ψ be the following block matrices

$$\varphi = \begin{pmatrix} 0 & U \\ 0 & 0 \end{pmatrix}, \quad \psi = \begin{pmatrix} 0 & V \\ 0 & 0 \end{pmatrix},$$

with $U, V \in \mathrm{Mat}(a \times a, k)$ invertible. In this case we have

$$\det_k(M, \varphi, \psi) = (-1)^a \frac{\det(U)}{\det(V)}.$$

This can be seen by a direct computation. The case $a = 1$ is similar to the computation in Example 29.3.10.

Example 29.3.14. Let $R = k$ be a field. Let $M = k^{\oplus 4}$. Let

$$\varphi = \begin{pmatrix} 0 & 0 & 0 & 0 \\ u_1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & u_2 & 0 \end{pmatrix} \quad \varphi = \begin{pmatrix} 0 & 0 & 0 & 0 \\ 0 & 0 & v_2 & 0 \\ 0 & 0 & 0 & 0 \\ v_1 & 0 & 0 & 0 \end{pmatrix}$$

with $u_1, u_2, v_1, v_2 \in k^*$. Then we have

$$\det_k(M, \varphi, \psi) = -\frac{u_1 u_2}{v_1 v_2}.$$

Next we come to the analogue of the fact that the determinant of a composition of linear endomorphisms is the product of the determinants. To avoid very long formulae we write $I_\varphi = \mathrm{Im}(\varphi)$, and $K_\varphi = \mathrm{Ker}(\varphi)$ for any R-module map $\varphi : M \to M$. We also denote $\varphi\psi = \varphi \circ \psi$ for a pair of morphisms $\varphi, \psi : M \to M$.

Lemma 29.3.15. *Let R be a local ring with residue field κ. Let M be a finite length R-module. Let α, β, γ be endomorphisms of M. Assume that*

1. *$I_\alpha = K_{\beta\gamma}$, and similarly for any permutation of α, β, γ,*
2. *$K_\alpha = I_{\beta\gamma}$, and similarly for any permutation of α, β, γ.*

Then

1. *The triple $(M, \alpha, \beta\gamma)$ is an exact $(2, 1)$-periodic complex.*
2. *The triple $(I_\gamma, \alpha, \beta)$ is an exact $(2, 1)$-periodic complex.*
3. *The triple $(M/K_\beta, \alpha, \gamma)$ is an exact $(2, 1)$-periodic complex.*
4. *We have*

$$\det_\kappa(M, \alpha, \beta\gamma) = \det_\kappa(I_\gamma, \alpha, \beta) \det_\kappa(M/K_\beta, \alpha, \gamma).$$

Proof. It is clear that the assumptions imply part (1) of the lemma.

To see part (1) note that the assumptions imply that $I_{\gamma\alpha} = I_{\alpha\gamma}$, and similarly for kernels and any other pair of morphisms. Moreover, we see that $I_{\gamma\beta} = I_{\beta\gamma} = K_\alpha \subset I_\gamma$ and similarly for any other pair. In particular we get a short exact sequence

$$0 \to I_{\beta\gamma} \to I_\gamma \xrightarrow{\alpha} I_{\alpha\gamma} \to 0$$

and similarly we get a short exact sequence

$$0 \to I_{\alpha\gamma} \to I_\gamma \xrightarrow{\beta} I_{\beta\gamma} \to 0.$$

This proves $(I_\gamma, \alpha, \beta)$ is an exact $(2, 1)$-periodic complex. Hence part (2) of the lemma holds.

To see that α, γ give well defined endomorphisms of M/K_β we have to check that $\alpha(K_\beta) \subset K_\beta$ and $\gamma(K_\beta) \subset K_\beta$. This is true because $\alpha(K_\beta) = \alpha(I_{\gamma\alpha}) = I_{\alpha\gamma\alpha} \subset I_{\alpha\gamma} = K_\beta$, and similarly in the other case. The kernel of the map $\alpha : M/K_\beta \to M/K_\beta$ is $K_{\beta\alpha}/K_\beta = I_\gamma/K_\beta$. Similarly, the kernel of $\gamma : M/K_\beta \to M/K_\beta$ is equal to I_α/K_β. Hence we conclude that (3) holds.

We introduce $r = \text{length}_R(K_\alpha)$, $s = \text{length}_R(K_\beta)$ and $t = \text{length}_R(K_\gamma)$. By the exact sequences above and our hypotheses we have $\text{length}_R(I_\alpha) = s + t$, $\text{length}_R(I_\beta) = r + t$, $\text{length}_R(I_\gamma) = r + s$, and $\text{length}(M) = r + s + t$. Choose

(1) an admissible sequence $x_1, \ldots, x_r \in K_\alpha$ generating K_α
(2) an admissible sequence $y_1, \ldots, y_s \in K_\beta$ generating K_β,
(3) an admissible sequence $z_1, \ldots, z_t \in K_\gamma$ generating K_γ,
(4) elements $\tilde{x}_i \in M$ such that $\beta\gamma\tilde{x}_i = x_i$,
(5) elements $\tilde{y}_i \in M$ such that $\alpha\gamma\tilde{y}_i = y_i$,
(6) elements $\tilde{z}_i \in M$ such that $\beta\alpha\tilde{z}_i = z_i$.

With these choices the sequence $y_1, \ldots, y_s, \alpha\tilde{z}_1, \ldots, \alpha\tilde{z}_t$ is an admissible sequence in I_α generating it. Hence, by Remark 29.3.5 the determinant $D = \det_\kappa(M, \alpha, \beta\gamma)$ is the unique element of κ^* such that

$$\begin{aligned}&[y_1, \ldots, y_s, \alpha\tilde{z}_1, \ldots, \alpha\tilde{z}_s, \tilde{x}_1, \ldots, \tilde{x}_r]\\ &= (-1)^{r(s+t)} D[x_1, \ldots, x_r, \gamma\tilde{y}_1, \ldots, \gamma\tilde{y}_s, \tilde{z}_1, \ldots, \tilde{z}_t]\end{aligned}$$

By the same remark, we see that $D_1 = \det_\kappa(M/K_\beta, \alpha, \gamma)$ is characterized by

$$[y_1, \ldots, y_s, \alpha\tilde{z}_1, \ldots, \alpha\tilde{z}_t, \tilde{x}_1, \ldots, \tilde{x}_r] = (-1)^{rt} D_1[y_1, \ldots, y_s, \gamma\tilde{x}_1, \ldots, \gamma\tilde{x}_r, \tilde{z}_1, \ldots, \tilde{z}_t]$$

By the same remark, we see that $D_2 = \det_\kappa(I_\gamma, \alpha, \beta)$ is characterized by

$$[y_1, \ldots, y_s, \gamma\tilde{x}_1, \ldots, \gamma\tilde{x}_r, \tilde{z}_1, \ldots, \tilde{z}_t] = (-1)^{rs} D_2[x_1, \ldots, x_r, \gamma\tilde{y}_1, \ldots, \gamma\tilde{y}_s, \tilde{z}_1, \ldots, \tilde{z}_t]$$

Combining the formulas above we see that $D = D_1 D_2$ as desired. □

Lemma 29.3.16. *Let R be a local ring with residue field κ. Let $\alpha : (M, \varphi, \psi) \to (M', \varphi', \psi')$ be a morphism of $(2, 1)$-periodic complexes over R. Assume*

(1) *M, M' have finite length,*
(2) *(M, φ, ψ), (M', φ', ψ') are exact,*
(3) *the maps φ, ψ induce the zero map on $K = Ker(\alpha)$, and*
(4) *the maps φ, ψ induce the zero map on $Q = Coker(\alpha)$.*

Denote $N = \alpha(M) \subset M'$. We obtain two short exact sequences of $(2, 1)$-periodic complexes

$$\begin{gathered}0 \to (N, \varphi', \psi') \to (M', \varphi', \psi') \to (Q, 0, 0) \to 0\\ 0 \to (K, 0, 0) \to (M, \varphi, \psi) \to (N, \varphi', \psi') \to 0\end{gathered}$$

which induce two isomorphisms $\alpha_i : Q \to K$, $i = 0, 1$. Then

$$\det_\kappa(M, \varphi, \psi) = \det_\kappa(\alpha_0^{-1} \circ \alpha_1) \det_\kappa(M', \varphi', \psi')$$

In particular, if $\alpha_0 = \alpha_1$, then $\det_\kappa(M, \varphi, \psi) = \det_\kappa(M', \varphi', \psi')$.

Proof. There are (at least) two ways to prove this lemma. One is to produce an enormous commutative diagram using the properties of the determinants. The other is to use the characterization of the determinants in terms of admissible sequences of elements. It is the second approach that we will use.

First let us explain precisely what the maps α_i are. Namely, α_0 is the composition

$$\alpha_0 : Q = H^0(Q, 0, 0) \to H^1(N, \varphi', \psi') \to H^2(K, 0, 0) = K$$

and α_1 is the composition

$$\alpha_1 : Q = H^1(Q, 0, 0) \to H^2(N, \varphi', \psi') \to H^3(K, 0, 0) = K$$

coming from the boundary maps of the short exact sequences of complexes displayed in the lemma. The fact that the complexes (M, φ, ψ), (M', φ', ψ') are exact implies these maps are isomorphisms.

We will use the notation $I_\varphi = \mathrm{Im}(\varphi)$, $K_\varphi = \mathrm{Ker}(\varphi)$ and similarly for the other maps. Exactness for M and M' means that $K_\varphi = I_\psi$ and three similar equalities. We introduce $k = \text{length}_R(K)$, $a = \text{length}_R(I_\varphi)$, $b = \text{length}_R(I_\psi)$. Then we see that $\text{length}_R(M) = a + b$, and $\text{length}_R(N) = a+b-k$, $\text{length}_R(Q) = k$ and $\text{length}_R(M') = a+b$. The exact sequences below will show that also $\text{length}_R(I_{\varphi'}) = a$ and $\text{length}_R(I_{\psi'}) = b$.

The assumption that $K \subset K_\varphi = I_\psi$ means that φ factors through N to give an exact sequence

$$0 \to \alpha(I_\psi) \to N \xrightarrow{\varphi\alpha^{-1}} I_\psi \to 0.$$

Here $\varphi\alpha^{-1}(x') = y$ means $x' = \alpha(x)$ and $y = \varphi(x)$. Similarly, we have

$$0 \to \alpha(I_\varphi) \to N \xrightarrow{\psi\alpha^{-1}} I_\varphi \to 0.$$

The assumption that ψ' induces the zero map on Q means that $I_{\psi'} = K_{\varphi'} \subset N$. This means the quotient $\varphi'(N) \subset I_{\varphi'}$ is identified with Q. Note that $\varphi'(N) = \alpha(I_\varphi)$. Hence we conclude there is an isomorphism

$$\varphi' : Q \to I_{\varphi'}/\alpha(I_\varphi)$$

simply described by $\varphi'(x' \bmod N) = \varphi'(x') \bmod \alpha(I_\varphi)$. In exactly the same way we get

$$\psi' : Q \to I_{\psi'}/\alpha(I_\psi)$$

Finally, note that α_0 is the composition

$$Q \xrightarrow{\varphi'} I_{\varphi'}/\alpha(I_\varphi) \xrightarrow{\psi\alpha^{-1}|_{I_{\varphi'}/\alpha(I_\varphi)}} K$$

and similarly $\alpha_1 = \varphi\alpha^{-1}|_{I_{\psi'}/\alpha(I_\psi)} \circ \psi'$.

To shorten the formulas below we are going to write αx instead of $\alpha(x)$ in the following. No confusion should result since all maps are indicated by greek letters and elements by roman letters. We are going to choose

(1) an admissible sequence $z_1, \ldots, z_k \in K$ generating K,
(2) elements $z_i' \in M$ such that $\varphi z_i' = z_i$,
(3) elements $z_i'' \in M$ such that $\psi z_i'' = z_i$,
(4) elements $x_{k+1}, \ldots, x_a \in I_\varphi$ such that $z_1, \ldots, z_k, x_{k+1}, \ldots, x_a$ is an admissible sequence generating I_φ,
(5) elements $\tilde{x}_i \in M$ such that $\varphi\tilde{x}_i = x_i$,
(6) elements $y_{k+1}, \ldots, y_b \in I_\psi$ such that $z_1, \ldots, z_k, y_{k+1}, \ldots, y_b$ is an admissible sequence generating I_ψ,
(7) elements $\tilde{y}_i \in M$ such that $\psi\tilde{y}_i = y_i$, and
(8) elements $w_1, \ldots, w_k \in M'$ such that $w_1 \bmod N, \ldots, w_k \bmod N$ are an admissible sequence in Q generating Q.

By Remark 29.3.5 the element $D = \det_\kappa(M, \varphi, \psi) \in \kappa^*$ is characterized by

$$\begin{aligned} & [z_1, \ldots, z_k, x_{k+1}, \ldots, x_a, z_1'', \ldots, z_k'', \tilde{y}_{k+1}, \ldots, \tilde{y}_b] \\ = \quad & (-1)^{ab} D[z_1, \ldots, z_k, y_{k+1}, \ldots, y_b, z_1', \ldots, z_k', \tilde{x}_{k+1}, \ldots, \tilde{x}_a] \end{aligned}$$

Note that by the discussion above $\alpha x_{k+1}, \ldots, \alpha x_a, \varphi w_1, \ldots, \varphi w_k$ is an admissible sequence generating $I_{\varphi'}$ and $\alpha y_{k+1}, \ldots, \alpha y_b, \psi w_1, \ldots, \psi w_k$ is an admissible sequence generating $I_{\psi'}$. Hence by Remark 29.3.5 the element $D' = \det_\kappa(M', \varphi', \psi') \in \kappa^*$ is characterized by

$$\begin{aligned} & [\alpha x_{k+1}, \ldots, \alpha x_a, \varphi' w_1, \ldots, \varphi' w_k, \alpha \tilde{y}_{k+1}, \ldots, \alpha \tilde{y}_b, w_1, \ldots, w_k] \\ = \quad & (-1)^{ab} D' [\alpha y_{k+1}, \ldots, \alpha y_b, \psi' w_1, \ldots, \psi' w_k, \alpha \tilde{x}_{k+1}, \ldots, \alpha \tilde{x}_a, w_1, \ldots, w_k] \end{aligned}$$

Note how in the first, resp. second displayed formula the the first, resp. last k entries of the symbols on both sides are the same. Hence these formulas are really equivalent to the equalities

$$\begin{aligned} & [\alpha x_{k+1}, \ldots, \alpha x_a, \alpha z''_1, \ldots, \alpha z''_k, \alpha \tilde{y}_{k+1}, \ldots, \alpha \tilde{y}_b] \\ = \quad & (-1)^{ab} D [\alpha y_{k+1}, \ldots, \alpha y_b, \alpha z'_1, \ldots, \alpha z'_k, \alpha \tilde{x}_{k+1}, \ldots, \alpha \tilde{x}_a] \end{aligned}$$

and

$$\begin{aligned} & [\alpha x_{k+1}, \ldots, \alpha x_a, \varphi' w_1, \ldots, \varphi' w_k, \alpha \tilde{y}_{k+1}, \ldots, \alpha \tilde{y}_b] \\ = \quad & (-1)^{ab} D' [\alpha y_{k+1}, \ldots, \alpha y_b, \psi' w_1, \ldots, \psi' w_k, \alpha \tilde{x}_{k+1}, \ldots, \alpha \tilde{x}_a] \end{aligned}$$

in $\det_\kappa(N)$. Note that $\varphi' w_1, \ldots, \varphi' w_k$ and $\alpha z''_1, \ldots, z''_k$ are admissible sequences generating the module $I_{\varphi'}/\alpha(I_\varphi)$. Write

$$[\varphi' w_1, \ldots, \varphi' w_k] = \lambda_0 [\alpha z''_1, \ldots, \alpha z''_k]$$

in $\det_\kappa(I_{\varphi'}/\alpha(I_\varphi))$ for some $\lambda_0 \in \kappa^*$. Similarly, write

$$[\psi' w_1, \ldots, \psi' w_k] = \lambda_1 [\alpha z'_1, \ldots, \alpha z'_k]$$

in $\det_\kappa(I_{\psi'}/\alpha(I_\psi))$ for some $\lambda_1 \in \kappa^*$. On the one hand it is clear that

$$\alpha_i([w_1, \ldots, w_k]) = \lambda_i [z_1, \ldots, z_k]$$

for $i = 0, 1$ by our description of α_i above, which means that

$$\det_\kappa(\alpha_0^{-1} \circ \alpha_1) = \lambda_1/\lambda_0$$

and on the other hand it is clear that

$$\begin{aligned} & \lambda_0 [\alpha x_{k+1}, \ldots, \alpha x_a, \alpha z''_1, \ldots, \alpha z''_k, \alpha \tilde{y}_{k+1}, \ldots, \alpha \tilde{y}_b] \\ = \quad & [\alpha x_{k+1}, \ldots, \alpha x_a, \varphi' w_1, \ldots, \varphi' w_k, \alpha \tilde{y}_{k+1}, \ldots, \alpha \tilde{y}_b] \end{aligned}$$

and

$$\begin{aligned} & \lambda_1 [\alpha y_{k+1}, \ldots, \alpha y_b, \alpha z'_1, \ldots, \alpha z'_k, \alpha \tilde{x}_{k+1}, \ldots, \alpha \tilde{x}_a] \\ = \quad & [\alpha y_{k+1}, \ldots, \alpha y_b, \psi' w_1, \ldots, \psi' w_k, \alpha \tilde{x}_{k+1}, \ldots, \alpha \tilde{x}_a] \end{aligned}$$

which imply $\lambda_0 D = \lambda_1 D'$. The lemma follows. □

29.4. Symbols

The correct generality for this construction is perhaps the situation of the following lemma.

Lemma 29.4.1. *Let A be a Noetherian local ring. Let M be a finite A-module of dimension 1. Assume $\varphi, \psi : M \to M$ are two injective A-module maps, and assume $\varphi(\psi(M)) = \psi(\varphi(M))$, for example if φ and ψ commute. Then $\text{length}_R(M/\varphi\psi M) < \infty$ and $(M/\varphi\psi M, \varphi, \psi)$ is an exact $(2,1)$-periodic complex.*

Proof. Let $\mathfrak{q}$ be a minimal prime of the support of M. Then $M_\mathfrak{q}$ is a finite length $A_\mathfrak{q}$-module, see Algebra, Lemma 7.59.8. Hence both φ and ψ induce isomorphisms $M_\mathfrak{q} \to M_\mathfrak{q}$. Thus the support of $M/\varphi\psi M$ is $\{\mathfrak{m}_A\}$ and hence it has finite length (see lemma cited above). Finally, the kernel of φ on $M/\varphi\psi M$ is clearly $\psi M/\varphi\psi M$, and hence the kernel of φ is the image of ψ on $M/\varphi\psi M$. Similarly the other way since $M/\varphi\psi M = M/\psi\varphi M$ by assumption. □

Lemma 29.4.2. *Let A be a Noetherian local ring. Let $a, b \in A$.*

(1) *if M is a finite A-module of dimension 1 such that a, b are nonzero divisors on M, then $length_A(M/abM) < \infty$ and $(M/abM, a, b)$ is a $(2,1)$-periodic exact complex.*
(2) *if a, b are nonzero divisors and $\dim(A) = 1$ then $length_A(A/(ab)) < \infty$ and $(A/(ab), a, b)$ is a $(2,1)$-periodic exact complex.*

In particular, in these case $\det_\kappa(M/abM, a, b) \in \kappa^*$, resp. $\det_\kappa(A/(ab), a, b) \in \kappa^*$ are defined.

Proof. Follows from Lemma 29.4.1. □

Definition 29.4.3. Let A be a Noetherian local ring with residue field κ. Let $a, b \in A$. Let M be a finite A-module of dimension 1 such that a, b are nonzero-divisors on M. We define the *symbol associated to* M, a, b to be the element

$$d_M(a, b) = \det_\kappa(M/abM, a, b) \in \kappa^*$$

Lemma 29.4.4. *Let A be a Noetherian local ring. Let $a, b, c \in A$. Let M be a finite A-module with $\dim(M) = 1$. Assume a, b, c are nonzero divisors on M. Then*

$$d_M(a, bc) = d_M(a, b)d_M(a, c)$$

and $d_M(a, b)d_M(b, a) = 1$.

Proof. The first statement is immediate from Lemma 29.3.15 above. The second comes from Lemma 29.3.6. □

Definition 29.4.5. Let A be a Noetherian local domain of dimension 1 with residue field κ. Let K be the fraction field of A. We define the *tame symbol* of A to be the map

$$K^* \times K^* \longrightarrow \kappa^*, \quad (x, y) \longmapsto d_A(x, y)$$

where $d_A(x, y)$ is extended to $K^* \times K^*$ by the multiplicativity of Lemma 29.4.4.

It is clear that we may extend more generally $d_M(-, -)$ to certain rings of fractions of A (even if A is not a domain).

Lemma 29.4.6. *Let A be a Noetherian local ring. Let M be a finite A-module of dimension 1. Let $b \in A$ be a nonzero divisor on M, and let $u \in A^*$. Then*

$$d_M(u, b) = u^{length_M(M/bM)} \bmod \mathfrak{m}_A.$$

In particular, if $M = A$, then $d_A(u, b) = u^{ord_A(b)} \bmod \mathfrak{m}_A$.

Proof. Note that in this case $M/ubM = M/bM$ on which multiplication by b is zero. Hence $d_M(u, b) = \det_\kappa(u|_{M/bM})$ by Lemma 29.3.8. The lemma then follows from Lemma 29.2.8. □

Lemma 29.4.7. *Let A be a Noetherian local ring. Let $a, b \in A$. Let*

$$0 \to M \to M' \to M'' \to 0$$

be a short exact sequence of A-modules of dimension 1 such that a, b are nonzero divisors on all three A-modules. Then

$$d_{M'}(a, b) = d_M(a, b) d_{M''}(a, b)$$

in κ^*.

Proof. It is easy to see that this leads to a short exact sequence of exact $(2, 1)$-periodic complexes

$$0 \to (M/abM, a, b) \to (M'/abM', a, b) \to (M''/abM'', a, b) \to 0$$

Hence the lemma follows from Lemma 29.3.9. □

Lemma 29.4.8. *Let A be a Noetherian local ring. Let $\alpha : M \to M'$ be a homomorphism of finite A-modules of dimension 1. Let $a, b \in A$. Assume*

(1) *a, b are nonzero divisors on both M and M', and*
(2) $\dim(Ker(\alpha)), \dim(Coker(\alpha)) \leq 0$.

Then $d_M(a, b) = d_{M'}(a, b)$.

Proof. If $a \in A^*$, then the equality follows from the equality $\text{length}(M/bM) = \text{length}(M'/bM')$ and Lemma 29.4.6. Similarly if b is a unit the lemma holds as well (by the symmetry of Lemma 29.4.4). Hence we may assume that $a, b \in \mathfrak{m}_A$. This in particular implies that $\mathfrak{m}$ is not an associated prime of M, and hence $\alpha : M \to M'$ is injective. This permits us to think of M as a submodule of M'. By assumption M'/M is a finite A-module with support $\{\mathfrak{m}_A\}$ and hence has finite length. Note that for any third module M'' with $M \subset M'' \subset M'$ the maps $M \to M''$ and $M'' \to M'$ satisfy the assumptions of the lemma as well. This reduces us, by induction on the length of M'/M, to the case where $\text{length}_A(M'/M) = 1$. Finally, in this case consider the map

$$\overline{\alpha} : M/abM \longrightarrow M'/abM'.$$

By construction the cokernel Q of $\overline{\alpha}$ has length 1. Since $a, b \in \mathfrak{m}_A$, they act trvially on Q. It also follows that the kernel K of $\overline{\alpha}$ has length 1 and hence also a, b act trivially on K. Hence we may apply Lemma 29.3.16. Thus it suffices to see that the two maps $\alpha_i : Q \to K$ are the same. In fact, both maps are equal to the map $q = x' \bmod \text{Im}(\overline{\alpha}) \mapsto abx' \in K$. We omit the verification. □

Lemma 29.4.9. *Let A be a Noetherian local ring. Let M be a finite A-module with $\dim(M) = 1$. Let $a, b \in A$ nonzero divisors on M. Let $\mathfrak{q}_1, \ldots, \mathfrak{q}_t$ be the minimal primes in the support of M. Then*

$$d_M(a, b) = \prod\nolimits_{i=1,\ldots,t} d_{A/\mathfrak{q}_i}(a, b)^{length_{A_{\mathfrak{q}_i}}(M_{\mathfrak{q}_i})}$$

as elements of κ^*.

Proof. Choose a filtration by A-submodules

$$0 = M_0 \subset M_1 \subset \ldots \subset M_n = M$$

such that each quotient M_j/M_{j-1} is isomorphic to $A/\mathfrak{p}_j$ for some prime ideal $\mathfrak{p}_j$ of A. See Algebra, Lemma 7.59.1. For each j we have either $\mathfrak{p}_j = \mathfrak{q}_i$ for some i, or $\mathfrak{p}_j = \mathfrak{m}_A$.

Moreover, for a fixed i, the number of j such that $\mathfrak{p}_j = \mathfrak{q}_i$ is equal to $\text{length}_{A_{\mathfrak{q}_i}}(M_{\mathfrak{q}_i})$ by Algebra, Lemma 7.59.10. Hence $d_{M_j}(a, b)$ is defined for each j and

$$d_{M_j}(a, b) = \begin{cases} d_{M_{j-1}}(a, b) d_{A/\mathfrak{q}_i}(a, b) & \text{if} \quad \mathfrak{p}_j = \mathfrak{q}_i \\ d_{M_{j-1}}(a, b) & \text{if} \quad \mathfrak{p}_j = \mathfrak{m}_A \end{cases}$$

by Lemma 29.4.7 in the first instance and Lemma 29.4.8 in the second. Hence the lemma. $\square$

Lemma 29.4.10. *Let A be a discrete valuation ring with fraction field K. For nonzero $x, y \in K$ we have*

$$d_A(x, y) = (-1)^{ord_A(x) ord_A(y)} \frac{x^{ord_A(y)}}{y^{ord_A(x)}} \bmod \mathfrak{m}_A,$$

in other words the symbol is equal to the usual tame symbol.

Proof. By multiplicativity it suffices to prove this when $x, y \in A$. Let $t \in A$ be a uniformizer. Write $x = t^b u$ and $y = t^b v$ for some $a, b \geq 0$ and $u, v \in A^*$. Set $l = a + b$. Then $t^{l-1}, \ldots, t^b$ is an admissible sequence in $(x)/(xy)$ and $t^{l-1}, \ldots, t^a$ is an admissible sequence in $(y)/(xy)$. Hence by Remark 29.3.5 we see that $d_A(x, y)$ is characterized by the equation

$$[t^{l-1}, \ldots, t^b, v^{-1} t^{b-1}, \ldots, v^{-1}] = (-1)^{ab} d_A(x, y) [t^{l-1}, \ldots, t^a, u^{-1} t^{a-1}, \ldots, u^{-1}].$$

Hence by the admissible relations for the symbols $[x_1, \ldots, x_l]$ we see that

$$d_A(x, y) = (-1)^{ab} u^a / v^b \bmod \mathfrak{m}_A$$

as desired. $\square$

We add the following lemma here. It is very similar to Algebra, Lemma 7.110.2.

Lemma 29.4.11. *Let R be a local Noetherian domain of dimension 1 with maximal ideal $\mathfrak{m}$. Let $a, b \in \mathfrak{m}$ be nonzero. There exists a finite ring extension $R \subset R'$ with same field of fractions, and $t, a', b' \in R'$ such that $a = ta'$ and $b = tb'$ and $R' = a'R' + b'R'$.*

Proof. Set $I = (a, b)$. The idea is to blow up R in I as in the proof of Algebra, Lemma 7.110.2. Instead of doing the algebraic argument we work geometrically. Let $X = \text{Proj}(\bigoplus I^d / I^{d+1})$. By Constructions, Lemma 22.21.2 this is an integral scheme. The morphism $X \to Spec(R)$ is projective by Morphisms, Lemma 24.41.10. By Algebra, Lemma 7.104.2 and the fact that X is quasi-compact we see that the fibre of $X \to Spec(R)$ over $\mathfrak{m}$ is finite. By Properties, Lemma 23.26.5 there exists an affine open $U \subset X$ containing this fibre. Hence $X = U$ because $X \to Spec(R)$ is closed. In other words X is affine, say $X = Spec(R')$. By Morphisms, Lemma 24.14.2 we see that $R \to R'$ is of finite type. Since $X \to Spec(R)$ is proper and affine it is integral (see Morphisms, Lemma 24.42.7). Hence $R \to R'$ is of finite type and integral, hence finite (Algebra, Lemma 7.32.5). By Divisors, Lemma 26.9.18 we see that IR' is a locally principal ideal. Since R' is semi-local we see that IR' is principal, see Algebra, Lemma 7.72.6, say $IR' = (t)$. Then we have $a = a't$ and $b = b't$ and everything is clear. $\square$

Lemma 29.4.12. *Let A be a Noetherian local ring. Let $a, b \in A$. Let M be a finite A-module of dimension 1 on which each of a, b, $b - a$ are nonzero divisors. Then*

$$d_M(a, b - a) d_M(b, b) = d_M(b, b - a) d_M(a, b)$$

in κ^*.

Proof. By Lemma 29.4.9 it suffices to show the relation when $M = A/\mathfrak{q}$ for some prime $\mathfrak{q} \subset A$ with $\dim(A/\mathfrak{q}) = 1$.

In case $M = A/\mathfrak{q}$ we may replace A by $A/\mathfrak{q}$ and a, b by their images in $A/\mathfrak{q}$. Hence we may assume $A = M$ and A a local Noetherian domain of dimension 1. The reason is that the residue field κ of A and $A/\mathfrak{q}$ are the same and that for any $A/\mathfrak{q}$-module M the determinant taken over A or over $A/\mathfrak{q}$ are canonically identified. See Lemma 29.2.7.

It suffices to show the relation when both a, b are in the maximal ideal. Namely, the case where one or both are units follows from Lemma 29.4.6.

Choose an extension $A \subset A'$ and factorizations $a = ta'$, $b = tb'$ as in Lemma 29.4.11. Note that also $b - a = t(b' - a')$ and that $A' = (a', b') = (a', b' - a') = (b' - a', b')$. Here and in the following we think of A' as an A-module and a, b, a', b', t as A-module endomorphisms of A'. We will use the notation $d^A_{A'}(a', b')$ and so on to indicate

$$d^A_{A'}(a', b') = \det_\kappa(A'/a'b'A', a', b')$$

which is defined by Lemma 29.4.1. The upper index ^{A} is used to distinguish this from the already defined symbol $d_{A'}(a', b')$ which is different (for example because it has values in the residue field of A' which may be different from κ). By Lemma 29.4.8 we see that $d_A(a, b) = d^A_{A'}(a, b)$, and similarly for the other combinations. Using this and multiplicativity we see that it suffices to prove

$$d^A_{A'}(a', b' - a')d^A_{A'}(b', b') = d^A_{A'}(b', b' - a')d^A_{A'}(a', b')$$

Now, since $(a', b') = A'$ and so on we have

$$\begin{array}{rcl} A'/(a'(b' - a')) & \cong & A'/(a') \oplus A'/(b' - a') \\ A'/(b'(b' - a')) & \cong & A'/(b') \oplus A'/(b' - a') \\ A'/(a'b') & \cong & A'/(a') \oplus A'/(b') \end{array}$$

Moreover, note that multiplication by $b' - a'$ on $A/(a')$ is equal to multiplication by b', and that multiplication by $b' - a'$ on $A/(b')$ is equal to multiplication by $-a'$. Using Lemmas 29.3.8 and 29.3.9 we conclude

$$\begin{array}{rcl} d^A_{A'}(a', b' - a') & = & \det_\kappa(b'|_{A'/(a')})^{-1} \det_\kappa(a'|_{A'/(b'-a')}) \\ d^A_{A'}(b', b' - a') & = & \det_\kappa(-a'|_{A'/(b')})^{-1} \det_\kappa(b'|_{A'/(b'-a')}) \\ d^A_{A'}(a', b') & = & \det_\kappa(b'|_{A'/(a')})^{-1} \det_\kappa(a'|_{A'/(b')}) \end{array}$$

Hence we conclude that

$$(-1)^{\text{length}_A(A'/(b'))}d^A_{A'}(a', b' - a') = d^A_{A'}(b', b' - a')d^A_{A'}(a', b')$$

the sign coming from the $-a'$ in the second equality above. On the other hand, by Lemma 29.3.7 we have $d^A_{A'}(b', b') = (-1)^{\text{length}_A(A'/(b'))}$, and the lemma is proved. □

The tame symbol is a Steinberg symbol.

Lemma 29.4.13. *Let A be a Noetherian local domain of dimension 1. Let $K = f.f.(A)$. For $x \in K \setminus \{0, 1\}$ we have*

$$d_A(x, 1 - x) = 1$$

Proof. Write $x = a/b$ with $a, b \in A$. The hypothesis implies, since $1 - x = (b - a)/b$, that also $b - a \neq 0$. Hence we compute

$$d_A(x, 1 - x) = d_A(a, b - a)d_A(a, b)^{-1}d_A(b, b - a)^{-1}d_A(b, b)$$

Thus we have to show that $d_A(a, b-a)d_A(b, b) = d_A(b, b-a)d_A(a, b)$. This is Lemma 29.4.12. □

29.5. Lengths and determinants

In this section we use the determinant to compare lattices. The key lemma is the following.

Lemma 29.5.1. *Let R be a noetherian local ring. Let $\mathfrak q \subset R$ be a prime with $\dim(R/\mathfrak q) = 1$. Let $\varphi : M \to N$ be a homomorphism of finite R-modules. Assume there exist $x_1, \ldots, x_l \in M$ and $y_1, \ldots, y_l \in M$ with the following properties*

(1) $M = \langle x_1, \ldots, x_l\rangle$,
(2) $\langle x_1, \ldots, x_i\rangle/\langle x_1, \ldots, x_{i-1}\rangle \cong R/\mathfrak q$ *for* $i = 1, \ldots, l$,
(3) $N = \langle y_1, \ldots, y_l\rangle$, *and*
(4) $\langle y_1, \ldots, y_i\rangle/\langle y_1, \ldots, y_{i-1}\rangle \cong R/\mathfrak q$ *for* $i = 1, \ldots, l$.

Then φ is injective if and only if $\varphi_{\mathfrak q}$ is an isomorphism, and in this case we have

$$length_R(Coker(\varphi)) = ord_{R/\mathfrak q}(f)$$

where $f \in \kappa(\mathfrak q)$ is the element such that

$$[\varphi(x_1), \ldots, \varphi(x_l)] = f[y_1, \ldots, y_l]$$

in $\det_{\kappa(\mathfrak q)}(N_{\mathfrak q})$.

Proof. First, note that the lemma holds in case $l = 1$. Namely, in this case x_1 is a basis of M over $R/\mathfrak q$ and y_1 is a basis of N over $R/\mathfrak q$ and we have $\varphi(x_1) = fy_1$ for some $f \in R$. Thus φ is injective if and only if $f \notin \mathfrak q$. Moreover, $\mathrm{Coker}(\varphi) = R/(f, \mathfrak q)$ and hence the lemma holds by definition of $\mathrm{ord}_{R/q}(f)$ (see Algebra, Definition 7.112.2).

In fact, suppose more generally that $\varphi(x_i) = f_i y_i$ for some $f_i \in R$, $f_i \notin \mathfrak q$. Then the induced maps

$$\langle x_1, \ldots, x_i\rangle/\langle x_1, \ldots, x_{i-1}\rangle \longrightarrow \langle y_1, \ldots, y_i\rangle/\langle y_1, \ldots, y_{i-1}\rangle$$

are all injective and have cokernels isomorphic to $R/(f_i, \mathfrak q)$. Hence we see that

$$\mathrm{length}_R(\mathrm{Coker}(\varphi)) = \sum \mathrm{ord}_{R/\mathfrak q}(f_i).$$

On the other hand it is clear that

$$[\varphi(x_1), \ldots, \varphi(x_l)] = f_1 \ldots f_l[y_1, \ldots, y_l]$$

in this case from the admissible relation (b) for symbols. Hence we see the result holds in this case also.

We prove the general case by induction on l. Assume $l > 1$. Let $i \in \{1, \ldots, l\}$ be minimal such that $\varphi(x_1) \in \langle y_1, \ldots, y_i\rangle$. We will argue by induction on i. If $i = 1$, then we get a commutative diagram

$$\begin{tikzcd}
0 \arrow[r] & \langle x_1\rangle \arrow[r] \arrow[d] & \langle x_1, \ldots, x_l\rangle \arrow[r] \arrow[d] & \langle x_1, \ldots, x_l\rangle/\langle x_1\rangle \arrow[r] \arrow[d] & 0 \\
0 \arrow[r] & \langle y_1\rangle \arrow[r] & \langle y_1, \ldots, y_l\rangle \arrow[r] & \langle y_1, \ldots, y_l\rangle/\langle y_1\rangle \arrow[r] & 0
\end{tikzcd}$$

and the lemma follows from the snake lemma and induction on l. Assume now that $i > 1$. Write $\varphi(x_1) = a_1y_1 + \ldots + a_{i-1}y_{i-1} + ay_i$ with $a_j, a \in R$ and $a \notin \mathfrak q$ (since otherwise i was not minimal). Set

$$x'_j = \begin{cases} x_j & \text{if} \quad j = 1 \\ ax_j & \text{if} \quad j \geq 2 \end{cases} \quad \text{and} \quad y'_j = \begin{cases} y_j & \text{if} \quad j < i \\ ay_j & \text{if} \quad j \geq i \end{cases}$$

Let $M' = \langle x'_1, \ldots, x'_l\rangle$ and $N' = \langle y'_1, \ldots, y'_l\rangle$. Since $\varphi(x'_1) = a_1 y'_1 + \ldots + a_{i-1}y'_{i-1} + y'_i$ by construction and since for $j > 1$ we have $\varphi(x'_j) = a\varphi(x_i) \in \langle y'_1, \ldots, y'_l\rangle$ we get a commutative diagram of R-modules and maps

$$\begin{tikzcd} M' \arrow[r, "\varphi'"'] \arrow[d] & N' \arrow[d] \\ M \arrow[r, "\varphi"] & N \end{tikzcd}$$

By the result of the second paragraph of the proof we know that $\text{length}_R(M/M') = (l - 1)\text{ord}_{R/\mathfrak q}(a)$ and similarly $\text{length}_R(M/M') = (l - i + 1)\text{ord}_{R/\mathfrak q}(a)$. By a diagram chase this implies that

$$\text{length}_R(\text{Coker}(\varphi')) = \text{length}_R(\text{Coker}(\varphi)) + i\ \text{ord}_{R/\mathfrak q}(a).$$

On the other hand, it is clear that writing

$$[\varphi(x_1), \ldots, \varphi(x_l)] = f[y_1, \ldots, y_l], \quad [\varphi'(x'_1), \ldots, \varphi(x'_l)] = f'[y'_1, \ldots, y'_l]$$

we have $f' = a^i f$. Hence it suffices to prove the lemma for the case that $\varphi(x_1) = a_1y_1 + \ldots a_{i-1}y_{i-1} + y_i$, i.e., in the case that $a = 1$. Next, recall that

$$[y_1, \ldots, y_l] = [y_1, \ldots, y_{i-1}, a_1y_1 + \ldots a_{i-1}y_{i-1} + y_i, y_{i+1}, \ldots, y_l]$$

by the admissible relations for symbols. The sequence $y_1, \ldots, y_{i-1}, a_1y_1 + \ldots + a_{i-1}y_{i-1} + y_i, y_{i+1}, \ldots, y_l$ satisfies the conditions (3), (4) of the lemma also. Hence, we may actually assume that $\varphi(x_1) = y_i$. In this case, note that we have $\mathfrak q x_1 = 0$ which implies also $\mathfrak q y_i = 0$. We have

$$[y_1, \ldots, y_l] = -[y_1, \ldots, y_{i-2}, y_i, y_{i-1}, y_{i+1}, \ldots, y_l]$$

by the third of the admissible relations defining $\det_{\kappa(\mathfrak q)}(N_{\mathfrak q})$. Hence we may replace $y_1, \ldots, y_l$ by the sequence $y'_1, \ldots, y'_l = y_1, \ldots, y_{i-2}, y_i, y_{i-1}, y_{i+1}, \ldots, y_l$ (which also satisfies conditions (3) and (4) of the lemma). Clearly this decreases the invariant i by 1 and we win by induction on i. □

To use the previous lemma we show that often sequences of elements with the required properties exist.

Lemma 29.5.2. *Let R be a local Noetherian ring. Let $\mathfrak q \subset R$ be a prime ideal. Let M be a finite R-module such that $\mathfrak q$ is one of the minimal primes of the support of M. Then there exist $x_1, \ldots, x_l \in M$ such that*

(1) *the support of $M/\langle x_1, \ldots, x_l\rangle$ does not contain $\mathfrak q$, and*
(2) *$\langle x_1, \ldots, x_i\rangle/\langle x_1, \ldots, x_{i-1}\rangle \cong R/\mathfrak q$ for $i = 1, \ldots, l$.*

Moreover, in this case $l = \text{length}_{R_{\mathfrak q}}(M_{\mathfrak q})$.

Proof. The condition that $\mathfrak q$ is a minimal prime in the support of M implies that $l = \text{length}_{R_{\mathfrak q}}(M_{\mathfrak q})$ is finite (see Algebra, Lemma 7.59.8). Hence we can find $y_1, \ldots, y_l \in M_{\mathfrak q}$ such that $\langle y_1, \ldots, y_i\rangle/\langle y_1, \ldots, y_{i-1}\rangle \cong \kappa(\mathfrak q)$ for $i = 1, \ldots, l$. We can find $f_i \in R$, $f_i \notin \mathfrak q$ such that f_iy_i is the image of some element $z_i \in M$. Moreover, as R is Noetherian we can write $\mathfrak q = (g_1, \ldots, g_t)$ for some $g_j \in R$. By assumption $g_jy_i \in \langle y_1, \ldots, y_{i-1}\rangle$ inside the module $M_{\mathfrak q}$. By our choice of z_i we can find some further elements $f_{ji} \in R$, $f_{ij} \notin \mathfrak q$ such that $f_{ij}g_jz_i \in \langle z_1, \ldots, z_{i-1}\rangle$ (equality in the module M). The lemma follows by taking

$$x_1 = f_{11}f_{12}\ldots f_{1t}z_1, \quad x_2 = f_{11}f_{12}\ldots f_{1t}f_{21}f_{22}\ldots f_{2t}z_2,$$

and so on. Namely, since all the elements f_i, f_{ij} are invertible in $R_\mathfrak{q}$ we still have that $R_\mathfrak{q}x_1 + \ldots + R_\mathfrak{q}x_i/R_\mathfrak{q}x_1 + \ldots + R_\mathfrak{q}x_{i-1} \cong \kappa(\mathfrak{q})$ for $i = 1, \ldots, l$. By construction, $\mathfrak{q}x_i \in \langle x_1, \ldots, x_{i-1}\rangle$. Thus $\langle x_1, \ldots, x_i\rangle/\langle x_1, \ldots, x_{i-1}\rangle$ is an R-module generated by one element, annihilated $\mathfrak{q}$ such that localizing at $\mathfrak{q}$ gives a q-dimensional vector space over $\kappa(\mathfrak{q})$. Hence it is isomorphic to $R/\mathfrak{q}$. □

Here is the main result of this section. We will see below the various different consequences of this proposition. The reader is encouraged to first prove the easier Lemma 29.5.4 his/herself.

Proposition 29.5.3. *Let R be a local Noetherian ring with residue field κ. Suppose that (M, φ, ψ) is a $(2,1)$-periodic complex over R. Assume*

(1) *M is a finite R-module,*
(2) *the cohomology modules of (M, φ, ψ) are of finite length, and*
(3) $\dim(Supp(M)) = 1$.

Let $\mathfrak{q}_i$, $i = 1, \ldots, t$ be the minimal primes of the support of M. Then we have[2]

$$-e_R(M, \varphi, \psi) = \sum\nolimits_{i=1,\ldots,t} ord_{R/\mathfrak{q}_i}\left(\det\nolimits_{\kappa(\mathfrak{q}_i)}(M_{\mathfrak{q}_i}, \varphi_{\mathfrak{q}_i}, \psi_{\mathfrak{q}_i})\right)$$

Proof. We first reduce to the case $t = 1$ in the following way. Note that $\text{Supp}(M) = \{\mathfrak{m}, \mathfrak{q}_1, \ldots, \mathfrak{q}_t\}$, where $\mathfrak{m} \subset R$ is the maximal ideal. Let M_i denote the image of $M \to M_{\mathfrak{q}_i}$, so $\text{Supp}(M_i) = \{\mathfrak{m}, \mathfrak{q}_i\}$. The map φ (resp. ψ) induces an R-module map $\varphi_i : M_i \to M_i$ (resp. $\psi_i : M_i \to M_i$). Thus we get a morphism of $(2,1)$-periodic complexes

$$(M, \varphi, \psi) \longrightarrow \bigoplus\nolimits_{i=1,\ldots,t}(M_i, \varphi_i, \psi_i).$$

The kernel and cokernel of this map have support equal to $\{\mathfrak{m}\}$ (or are zero). Hence by Lemma 29.3.3 these $(2,1)$-periodic complexes have multiplicity 0. In other words we have

$$e_R(M, \varphi, \psi) = \sum\nolimits_{i=1,\ldots,t} e_R(M_i, \varphi_i, \psi_i)$$

On the other hand we clearly have $M_{\mathfrak{q}_i} = M_{i,\mathfrak{q}_i}$, and hence the terms of the right hand side of the formula of the lemma are equal to the expressions

$$\text{ord}_{R/\mathfrak{q}_i}\left(\det\nolimits_{\kappa(\mathfrak{q}_i)}(M_{i,\mathfrak{q}_i}, \varphi_{i,\mathfrak{q}_i}, \psi_{i,\mathfrak{q}_i})\right)$$

In other words, if we can prove the lemma for each of the modules M_i, then the lemma holds. This reduces us to the case $t = 1$.

Assume we have a $(2,1)$-periodic complex (M, φ, ψ) over a Noetherian local ring with M a finite R-module, $\text{Supp}(M) = \{\mathfrak{m}, \mathfrak{q}\}$, and finite length cohomology modules. The proof in this case follows from Lemma 29.5.1 and careful bookkeeping. Denote $K_\varphi = \text{Ker}(\varphi)$, $I_\varphi = \text{Im}(\varphi)$, $K_\psi = \text{Ker}(\psi)$, and $I_\psi = \text{Im}(\psi)$. Since R is Noetherian these are all finite R-modules. Set

$$a = \text{length}_{R_\mathfrak{q}}(I_{\varphi,\mathfrak{q}}) = \text{length}_{R_\mathfrak{q}}(K_{\psi,\mathfrak{q}}), \quad b = \text{length}_{R_\mathfrak{q}}(I_{\psi,\mathfrak{q}}) = \text{length}_{R_\mathfrak{q}}(K_{\varphi,\mathfrak{q}}).$$

Equalities because the complex becomes exact after localizing at $\mathfrak{q}$. Note that $l = \text{length}_{R_\mathfrak{q}}(M_\mathfrak{q})$ is equal to $l = a + b$.

We are going to use Lemma 29.5.2 to choose sequences of elements in finite R-modules N with support contained in $\{\mathfrak{m}, \mathfrak{q}\}$. In this case $N_\mathfrak{q}$ has finite length, say $n \in \mathbf{N}$. Let us call a

[2] Obviously we could get rid of the minus sign by redefining $\det_\kappa(M, \varphi, \psi)$ as the inverse of its current value, see Definition 29.3.4.

sequence $w_1, \ldots, w_n \in N$ with properties (1) and (2) of Lemma 29.5.2 a ``good sequence". Note that the quotient $N/\langle w_1, \ldots, w_n\rangle$ of N by the submodule generated by a good sequence has support (contained in) $\{\mathfrak m\}$ and hence has finite length (Algebra, Lemma 7.59.8). Moreover, the symbol $[w_1, \ldots, w_n] \in \det_{\kappa(\mathfrak q)}(N_{\mathfrak q})$ is a generator, see Lemma 29.2.4.

Having said this we choose good sequences

$$\begin{matrix} x_1, \ldots, x_b & \text{in} & K_\varphi, & t_1, \ldots, t_a & \text{in} & K_\psi, \\ y_1, \ldots, y_a & \text{in} & I_\varphi \cap \langle t_1, \ldots t_a\rangle, & s_1, \ldots, s_b & \text{in} & I_\psi \cap \langle x_1, \ldots, x_b\rangle. \end{matrix}$$

We will adjust our choices a little bit as follows. Choose lifts $\tilde y_i \in M$ of $y_i \in I_\varphi$ and $\tilde s_i \in M$ of $s_i \in I_\psi$. It may not be the case that $\mathfrak q \tilde y_1 \subset \langle x_1, \ldots, x_b\rangle$ and it may not be the case that $\mathfrak q \tilde s_1 \subset \langle t_1, \ldots, t_a\rangle$. However, using that $\mathfrak q$ is finitely generated (as in the proof of Lemma 29.5.2) we can find a $d \in R$, $d \not\in \mathfrak q$ such that $\mathfrak q d\tilde y_1 \subset \langle x_1, \ldots, x_b\rangle$ and $\mathfrak q d\tilde s_1 \subset \langle t_1, \ldots, t_a\rangle$. Thus after replacing y_i by dy_i, $\tilde y_i$ by $d\tilde y_i$, s_i by ds_i and $\tilde s_i$ by $d\tilde s_i$ we see that we may assume also that $x_1, \ldots, x_b, \tilde y_1, \ldots, \tilde y_b$ and $t_1, \ldots, t_a, \tilde s_1, \ldots, \tilde s_b$ are good sequences in M.

Finally, we choose a good sequence $z_1, \ldots, z_l$ in the finite R-module

$$\langle x_1, \ldots, x_b, \tilde y_1, \ldots, \tilde y_a\rangle \cap \langle t_1, \ldots, t_a, \tilde s_1, \ldots, \tilde s_b\rangle.$$

Note that this is also a good sequence in M.

Since $I_{\varphi,\mathfrak q} = K_{\psi,\mathfrak q}$ there is a unique element $h \in \kappa(\mathfrak q)$ such that $[y_1, \ldots, y_a] = h[t_1, \ldots, t_a]$ inside $\det_{\kappa(\mathfrak q)}(K_{\psi,\mathfrak q})$. Similarly, as $I_{\psi,\mathfrak q} = K_{\varphi,\mathfrak q}$ there is a unique element $h \in \kappa(\mathfrak q)$ such that $[s_1, \ldots, s_b] = g[x_1, \ldots, x_b]$ inside $\det_{\kappa(\mathfrak q)}(K_{\varphi,\mathfrak q})$. We can also do this with the three good sequences we have in M. All in all we get the following identities

$$\begin{aligned} [y_1, \ldots, y_a] &= h[t_1, \ldots, t_a] \\ [s_1, \ldots, s_b] &= g[x_1, \ldots, x_b] \\ [z_1, \ldots, z_l] &= f_\varphi[x_1, \ldots, x_b, \tilde y_1, \ldots, \tilde y_a] \\ [z_1, \ldots, z_l] &= f_\psi[t_1, \ldots, t_a, \tilde s_1, \ldots, \tilde s_b] \end{aligned}$$

for some $g, h, f_\varphi, f_\psi \in \kappa(\mathfrak q)$.

Having set up all this notation let us compute $\det_{\kappa(\mathfrak q)}(M, \varphi, \psi)$. Namely, consider the element $[z_1, \ldots, z_l]$. Under the map $\gamma_\psi \circ \sigma \circ \gamma_\varphi^{-1}$ of Definition 29.3.4 we have

$$\begin{aligned} [z_1, \ldots, z_l] &= f_\varphi[x_1, \ldots, x_b, \tilde y_1, \ldots, \tilde y_a] \\ &\mapsto f_\varphi[x_1, \ldots, x_b] \otimes [y_1, \ldots, y_a] \\ &\mapsto f_\varphi h/g[t_1, \ldots, t_a] \otimes [s_1, \ldots, s_b] \\ &\mapsto f_\varphi h/g[t_1, \ldots, t_a, \tilde s_1, \ldots, \tilde s_b] \\ &= f_\varphi h/f_\psi g[z_1, \ldots, z_l] \end{aligned}$$

This means that $\det_{\kappa(\mathfrak q)}(M_{\mathfrak q}, \varphi_{\mathfrak q}, \psi_{\mathfrak q})$ is equal to $f_\varphi h/f_\psi g$ up to a sign.

We abbreviate the following quantities

$$\begin{aligned}
k_\varphi &= \text{length}_R(K_\varphi/\langle x_1, \ldots, x_b\rangle) \\
k_\psi &= \text{length}_R(K_\psi/\langle t_1, \ldots, t_a\rangle) \\
i_\varphi &= \text{length}_R(I_\varphi/\langle y_1, \ldots, y_a\rangle) \\
i_\psi &= \text{length}_R(I_\psi/\langle s_1, \ldots, s_a\rangle) \\
m_\varphi &= \text{length}_R(M/\langle x_1, \ldots, x_b, \tilde{y}_1, \ldots, \tilde{y}_a\rangle) \\
m_\psi &= \text{length}_R(M/\langle t_1, \ldots, t_a, \tilde{s}_1, \ldots, \tilde{s}_b\rangle) \\
\delta_\varphi &= \text{length}_R(\langle x_1, \ldots, x_b, \tilde{y}_1, \ldots, \tilde{y}_a\rangle\langle z_1, \ldots, z_l\rangle) \\
\delta_\psi &= \text{length}_R(\langle t_1, \ldots, t_a, \tilde{s}_1, \ldots, \tilde{s}_b\rangle\langle z_1, \ldots, z_l\rangle)
\end{aligned}$$

Using the exact sequences $0 \to K_\varphi \to M \to I_\varphi \to 0$ we get $m_\varphi = k_\varphi + i_\varphi$. Similarly we have $m_\psi = k_\psi + i_\psi$. We have $\delta_\varphi + m_\varphi = \delta_\psi + m_\psi$ since this is equal to the colength of $\langle z_1, \ldots, z_l\rangle$ in M. Finally, we have

$$\delta_\varphi = \text{ord}_{R/\mathfrak{q}}(f_\varphi), \quad \delta_\psi = \text{ord}_{R/\mathfrak{q}}(f_\psi)$$

by our first application of the key Lemma 29.5.1.

Next, let us compute the multiplicity of the periodic complex

$$\begin{aligned}
e_R(M, \varphi, \psi) &= \text{length}_R(K_\varphi/I_\psi) - \text{length}_R(K_\psi/I_\varphi) \\
&= \text{length}_R(\langle x_1, \ldots, x_b\rangle/\langle s_1, \ldots, s_b\rangle) + k_\varphi - i_\psi \\
&\quad -\text{length}_R(\langle t_1, \ldots, t_a\rangle/\langle y_1, \ldots, y_a\rangle) - k_\psi + i_\varphi \\
&= \text{ord}_{R/\mathfrak{q}}(g/h) + k_\varphi - i_\psi - k_\psi + i_\varphi \\
&= \text{ord}_{R/\mathfrak{q}}(g/h) + m_\varphi - m_\psi \\
&= \text{ord}_{R/\mathfrak{q}}(g/h) + \delta_\psi - \delta_\varphi \\
&= \text{ord}_{R/\mathfrak{q}}(f_\psi g/f_\varphi h)
\end{aligned}$$

where we used the key Lemma 29.5.1 twice in the third equality. By our computation of $\det_{\kappa(\mathfrak{q})}(M_\mathfrak{q}, \varphi_\mathfrak{q}, \psi_\mathfrak{q})$ this proves the proposition. □

In most applications the following lemma suffices.

Lemma 29.5.4. *Let R be a Noetherian local ring with maximal ideal $\mathfrak{m}$. Let M be a finite R-module, and let $\psi : M \to M$ be an R-module map. Assume that*

(1) *Ker(ψ) and Coker(ψ) have finite length, and*
(2) $\dim(Supp(M)) \leq 1$.

Write $Supp(M) = \{\mathfrak{m}, \mathfrak{q}_1, \ldots, \mathfrak{q}_t\}$ and denote $f_i \in \kappa(\mathfrak{q}_i)^*$ the element such that $\det_{\kappa(\mathfrak{q}_i)}(\psi_{\mathfrak{q}_i}) : \det_{\kappa(\mathfrak{q}_i)}(M_{\mathfrak{q}_i}) \to \det_{\kappa(\mathfrak{q}_i)}(M_{\mathfrak{q}_i})$ is multiplication by f_i. Then we have

$$length_R(Coker(\psi)) - length_R(Ker(\psi)) = \sum\nolimits_{i=1,\ldots,t} ord_{R/\mathfrak{q}_i}(f_i).$$

Proof. Recall that $H^0(M, 0, \psi) = \text{Coker}(\psi)$ and $H^1(M, 0, \psi) = \text{Ker}(\psi)$, see remarks above Definition 29.3.2. The lemma follows by combining Proposition 29.5.3 with Lemma 29.3.8.

Alternative proof. Reduce to the case $\text{Supp}(M) = \{\mathfrak{m}, \mathfrak{q}\}$ as in the proof of Proposition 29.5.3. Then directly combine Lemmas 29.5.1 and 29.5.2 to prove this specific case of Proposition 29.5.3. There is much less bookkeeping in this case, and the reader is encouraged to work this out. Details omitted. □

Lemma 29.5.5. *Let R be a Noetherian local ring with maximal ideal $\mathfrak{m}$. Let M be a finite R-module. Let $x \in R$. Assume that*

(1) $\dim(Supp(M)) \leq 1$, *and*
(2) $\dim(M/xM) \leq 0$.

Write $Supp(M) = \{\mathfrak{m}, \mathfrak{q}_1, \ldots, \mathfrak{q}_t\}$. Then

$$length_R(M_x) - length_R({}_xM) = \sum\nolimits_{i=1,\ldots,t} ord_{R/\mathfrak{q}_i}(x) length_{R_{\mathfrak{q}_i}}(M_{\mathfrak{q}_i}).$$

where $M_x = M/xM$ and ${}_xM = Ker(x : M \to M)$.

Proof. This is a special case of Lemma 29.5.4. To see that $f_i = x^{\text{length}_{R_{\mathfrak{q}_i}}(M_{\mathfrak{q}_i})}$ see Lemma 29.2.8. □

Lemma 29.5.6. *Let R be a Noetherian local ring with maximal ideal $\mathfrak{m}$. Let $I \subset R$ be an ideal and let $x \in R$. Assume x is a nonzero divisor on R/I and that* $\dim(R/I) = 1$. *Then*

$$length_R(R/(x, I)) = \sum\nolimits_i length_R(R/(x, \mathfrak{q}_i)) length_{R_{\mathfrak{q}_i}}((R/I)_{\mathfrak{q}_i})$$

where $\mathfrak{q}_1, \ldots, \mathfrak{q}_n$ are the minimal primes over I. More generally if M is any finite Cohen-Macaulay module of dimension 1 *over R and* $\dim(M/xM) = 0$, *then*

$$length_R(M/xM) = \sum\nolimits_i length_R(R/(x, \mathfrak{q}_i)) length_{R_{\mathfrak{q}_i}}(M_{\mathfrak{q}_i}).$$

where $\mathfrak{q}_1, \ldots, \mathfrak{q}_t$ are the minimal primes of the support of M.

Proof. These are special cases of Lemma 29.5.5. □

Lemma 29.5.7. *Let A be a Noetherian local ring. Let M be a finite A-module. Let $a, b \in A$. Assume*

(1) $\dim(A) = 1$,
(2) *both a and b are nonzero divisors in A,*
(3) *A has no embedded primes,*
(4) *M has no embedded associated primes,*
(5) *$Supp(M) = Spec(A)$.*

Let $I = \{x \in A \mid x(a/b) \in A\}$. Let $\mathfrak{q}_1, \ldots, \mathfrak{q}_t$ be the minimal primes of A. Then $(a/b)IM \subset M$ and

$$length_A(M/(a/b)IM) - length_A(M/IM) = \sum\nolimits_i length_{A_{\mathfrak{q}_i}}(M_{\mathfrak{q}_i}) ord_{A/\mathfrak{q}_i}(a/b)$$

Proof. Since M has no embedded associated primes, and since the support of M is $Spec(A)$ we see that $\text{Ass}(M) = \{\mathfrak{q}_1, \ldots, \mathfrak{q}_t\}$. Hence a, b are nonzero divisors on M. Note that

$$\begin{aligned}
&\text{length}_A(M/(a/b)IM) \\
&= \text{length}_A(bM/aIM) \\
&= \text{length}_A(M/aIM) - \text{length}_A(M/bM) \\
&= \text{length}_A(M/aM) + \text{length}_A(aM/aIM) - \text{length}_A(M/bM) \\
&= \text{length}_A(M/aM) + \text{length}_A(M/IM) - \text{length}_A(M/bM)
\end{aligned}$$

as the injective map $b : M \to bM$ maps $(a/b)IM$ to aIM and the injective map $a : M \to aM$ maps IM to aIM. Hence the left hand side of the equation of the lemma is equal to

$$\text{length}_A(M/aM) - \text{length}_A(M/bM).$$

Applying the second formula of Lemma 29.5.6 with $x = a, b$ respectively and using Algebra, Definition 7.112.2 of the ord-functions we get the result. □

29.6. Application to tame symbol

In this section we apply the results above to show the following lemma.

Lemma 29.6.1. *Let A be a 2-dimensional Noetherian local domain. Let $K = f.f.(A)$. Let $f, g \in K^*$. Let $\mathfrak{q}_1, \ldots, \mathfrak{q}_t$ be the height 1 primes $\mathfrak{q}$ of A such that either f or g is not an element of $A_{\mathfrak{q}}^*$. Then we have*

$$\sum\nolimits_{i=1,\ldots,t} ord_{A/\mathfrak{q}_i}(d_{A_{\mathfrak{q}_i}}(f, g)) = 0$$

We can also write this as

$$\sum\nolimits_{height(\mathfrak{q})=1} ord_{A/\mathfrak{q}}(d_{A_{\mathfrak{q}}}(f, g)) = 0$$

since at any height one prime $\mathfrak{q}$ of A where $f, g \in A_{\mathfrak{q}}^*$ we have $d_{A_{\mathfrak{q}}}(f, g) = 1$ by Lemma 29.4.6.

Proof. Since the tame symbols $d_{A_{\mathfrak{q}}}(f, g)$ are additive (Lemma 29.4.4) and the order functions $\text{ord}_{A/\mathfrak{q}}$ are additive (Algebra, Lemma 7.112.1) it suffices to prove the formula when $f = a \in A$ and $g = b \in A$. In this case we see that we have to show

$$\sum\nolimits_{\text{height}(\mathfrak{q})=1} \text{ord}_{A/\mathfrak{q}}(\det\nolimits_\kappa(A_{\mathfrak{q}}/(ab), a, b)) = 0$$

By Proposition 29.5.3 this is equivalent to showing that

$$e_A(A/(ab), a, b) = 0.$$

Since the complex $A/(ab) \xrightarrow{a} A/(ab) \xrightarrow{b} A/(ab) \xrightarrow{a} A/(ab)$ is exact we win. $\square$

29.7. Setup

We will throughout work over a locally Noetherian universally catenary base S endowed with a dimension function δ. Allthough it is likely possible to generalize (parts of) the discussion in the chapter, it seems that this is a good first approximation. We usually do not assume our schemes are separated or quasi-compact. Many interesting algebraic stacks are non-separated and/or non-quasi-compact and this is a good case study to see how to develop a reasonable theory for those as well. In order to reference these hypotheses we give it a number.

Situation 29.7.1. Here S is a locally Noetherian, and universally catenary scheme. Moreover, we assume S is endowed with a dimension function $\delta : S \longrightarrow \mathbf{Z}$.

See Morphisms, Definition 24.16.1 for the notion of a universally catenary scheme, and see Topology, Definition 5.16.1 for the notion of a dimension function. Recall that any locally Noetherian catenary scheme locally has a dimension function, see Properties, Lemma 23.11.3. Moreover, there are lots of schemes which are universally catenary, see Morphisms, Lemma 24.16.4.

Let (S, δ) be as in Situation 29.7.1. Any scheme X locally of finite type over S is locally Noetherian and catenary. In fact, X has a canonical dimension function

$$\delta = \delta_{X/S} : X \longrightarrow \mathbf{Z}$$

associated to $(f : X \to S, \delta)$ given by the rule $\delta_{X/S}(x) = \delta(f(x)) + \text{trdeg}_{\kappa(f(x))}\kappa(x)$. See Morphisms, Lemma 24.29.2. Moreover, if $h : X \to Y$ is a morphism of schemes locally of finite type over S, and $x \in X$, $y = h(x)$, then obviously $\delta_{X/S}(x) = \delta_{Y/S}(y) + \text{trdeg}_{\kappa(y)}\kappa(x)$. We will freely use this function and its properties in the following.

Here are the basic examples of setups as above. In fact, the main interest lies in the case where the base is the spectrum of a field, or the case where the base is the spectrum of a Dedekind ring (e.g. $\mathbf{Z}$, or a discrete valuation ring).

Example 29.7.2. Here $S = Spec(k)$ and k is a field. We set $\delta(pt) = 0$ where pt indicates the unique point of S. The pair (S, δ) is an example of a situation as in Situation 29.7.1 by Morphisms, Lemma 24.16.4.

Example 29.7.3. Here $S = Spec(A)$, where A is a Noetherian domain of dimension 1. For example we could consider $A = \mathbf{Z}$. We set $\delta(\mathfrak{p}) = 0$ if $\mathfrak{p}$ is a maximal ideal and $\delta(\mathfrak{p}) = 1$ if $\mathfrak{p} = (0)$ corresponds to the generic point. This is an example of Situation 29.7.1 by Morphisms, Lemma 24.16.4.

In good cases δ corresponds to the dimension function.

Lemma 29.7.4. *Let (S, δ) be as in Situation 29.7.1. Assume in addition S is a Jacobson scheme, and $\delta(s) = 0$ for every closed point s of S. Let X be locally of finite type over S. Let $Z \subset X$ be an integral closed subscheme and let $\xi \in Z$ be its generic point. The following integers are the same:*

(1) $\delta_{X/S}(\xi)$,
(2) $\dim(Z)$, *and*
(3) $\dim(\mathcal{O}_{Z,z})$ *where z is a closed point of Z.*

Proof. Let $X \to S$, $\xi \in Z \subset X$ be as in the lemma. Since X is locally of finite type over S we see that X is Jacobson, see Morphisms, Lemma 24.15.9. Hence closed points of X are dense in every closed subset of Z and map to closed points of S. Hence given any chain of irreducible closed subsets of Z we can end it with a closed point of Z. It follows that $\dim(Z) = \sup_z(\dim(\mathcal{O}_{Z,z})$ (see Properties, Lemma 23.11.4) where $z \in Z$ runs over the closed points of Z. Note that $\dim(\mathcal{O}_{Z,z}) = \delta(\xi) - \delta(z))$ by the properties of a dimension function. For each closed $z \in Z$ the field extension $\kappa(z) \supset \kappa(f(z))$ is finite, see Morphisms, Lemma 24.15.8. Hence $\delta_{X/S}(z) = \delta(f(z)) = 0$ for $z \in Z$ closed. It follows that all three integers are equal. □

In the situation of the lemma above the value of δ at the generic point of a closed irreducible subset is the dimension of the irreducible closed subset. However, in general we cannot expect the equality to hold. For example if $S = Spec(\mathbf{C}[[t]])$ and $X = Spec(\mathbf{C}((t)))$ then we would get $\delta(x) = 1$ for the unique point of X, but $\dim(X) = 0$. Still we want to think of $\delta_{X/S}$ as giving the dimension of the irreducible closed subschemes. Thus we introduce the following terminology.

Definition 29.7.5. Let (S, δ) as in Situation 29.7.1. For any scheme X locally of finite type over S and any irreducible closed subset $Z \subset X$ we define

$$\dim_\delta(Z) = \delta(\xi)$$

where $\xi \in Z$ is the generic point of Z. We will call this the *δ-dimension of Z*. If Z is a closed subscheme of X, then we define $\dim_\delta(Z)$ as the supremum of the δ-dimensions of its irreducible components.

29.8. Cycles

Since we are not assuming our schemes are quasi-compact we have to be a little careful when defining cycles. We have to allow infinite sums because a rational function may have infinitely many poles for example. In any case, if X is quasi-compact then a cycle is a finite sum as usual.

Definition 29.8.1. Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Let $k \in \mathbf{Z}$.

(1) A collection of closed subschemes $\{Z_i\}_{i \in I}$ of X is said to be *locally finite* if for every quasi-compact open $U \subset X$ the set
$$\#\{i \in I \mid Z_i \cap U \neq \emptyset\}$$
is finite.

(2) A *cycle on* X is a formal sum
$$\alpha = \sum n_Z [Z]$$
where the sum is over integral closed subschemes $Z \subset X$, each $n_Z \in \mathbf{Z}$, and the collection $\{Z; n_Z \neq 0\}$ is locally finite.

(3) A *k-cycle*, on X is a cycle
$$\alpha = \sum n_Z [Z]$$
where $n_Z \neq 0 \Rightarrow \dim_\delta(Z) = k$.

(4) The abelian group of all k-cycles on X is denoted $Z_k(X)$.

In other words, a k-cycle on X is a locally finite formal $\mathbf{Z}$-linear combination of integral closed subschemes of δ-dimension k. Addition of k-cycles $\alpha = \sum n_Z[Z]$ and $\beta = \sum m_Z[Z]$ is given by
$$\alpha + \beta = \sum (n_Z + m_Z)[Z],$$
i.e., by adding the coefficients.

29.9. Cycle associated to a closed subscheme

Lemma 29.9.1. *Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Let $Z \subset X$ be a closed subscheme.*

(1) *The collection of irreducible components of Z is locally finite.*

(2) *Let $Z' \subset Z$ be an irreducible component and let $\xi \in Z'$ be its generic point. Then*
$$length_{\mathcal{O}_{X,\xi}} \mathcal{O}_{Z,\xi} < \infty$$

(3) *If $\dim_\delta(Z) \leq k$ and $\xi \in Z$ with $\delta(\xi) = k$, then ξ is a generic point of an irreducible component of Z.*

Proof. Let $U \subset X$ be a quasi-compact open subscheme. Then U is a Noetherian scheme, and hence has a Noetherian underlying topological space (Properties, Lemma 23.5.5). Hence every subspace is Noetherian and has finitely many irreducible components (see Topology, Lemma 5.6.2). This proves (1).

Let $Z' \subset Z$, $\xi \in Z'$ be as in (2). Then $\dim(\mathcal{O}_{Z,\xi}) = 0$ (for example by Properties, Lemma 23.11.4). Hence $\mathcal{O}_{Z,\xi}$ is Noetherian local ring of dimension zero, and hence has finite length over itself (see Algebra, Proposition 7.57.6). Hence, it also has finite length over $\mathcal{O}_{X,\xi}$, see Algebra, Lemma 7.48.12.

Assume $\xi \in Z$ and $\delta(\xi) = k$. Consider the closure $Z' = \overline{\{\xi\}}$. It is an irreducible closed subscheme with $\dim_\delta(Z') = k$ by definition. Since $\dim_\delta(Z) = k$ it must be an irreducible component of Z. Hence we see (3) holds. $\square$

Definition 29.9.2. Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Let $Z \subset X$ be a closed subscheme.

(1) For any irreducible component $Z' \subset Z$ with generic point ξ the integer $m_{Z',Z} = \text{length}_{\mathcal{O}_{X,\xi}} \mathcal{O}_{Z,\xi}$ (Lemma 29.9.1) is called the *multiplicity of Z' in Z*.
(2) Assume $\dim_\delta(Z) \leq k$. The *k-cycle associated to Z* is

$$[Z]_k = \sum m_{Z',Z}[Z']$$

where the sum is over the irreducible components of Z of δ-dimension k. (This is a k-cycle by Lemma 29.9.1.)

It is important to note that we only define $[Z]_k$ if the δ-dimension of Z does not exceed k. In other words, by convention, if we write $[Z]_k$ then this implies that $\dim_\delta(Z) \leq k$.

29.10. Cycle associated to a coherent sheaf

Lemma 29.10.1. *Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Let $\mathcal{F}$ be a coherent $\mathcal{O}_X$-module.*

(1) *The collection of irreducible components of the support of $\mathcal{F}$ is locally finite.*
(2) *Let $Z' \subset Supp(\mathcal{F})$ be an irreducible component and let $\xi \in Z'$ be its generic point. Then*

$$length_{\mathcal{O}_{X,\xi}} \mathcal{F}_\xi < \infty$$

(3) *If $\dim_\delta(Supp(\mathcal{F})) \leq k$ and $\xi \in Z$ with $\delta(\xi) = k$, then ξ is a generic point of an irreducible component of $Supp(\mathcal{F})$.*

Proof. By Coherent, Lemma 25.11.7 the support Z of $\mathcal{F}$ is a closed subset of X. We may think of Z as a reduced closed subscheme of X (Schemes, Lemma 21.12.4). Hence (1) and (3) follow immediately by applying Lemma 29.9.1 to $Z \subset X$.

Let $\xi \in Z'$ be as in (2). In this case for any specialization $\xi' \rightsquigarrow \xi$ in X we have $\mathcal{F}_{\xi'} = 0$. Recall that the non-maximal primes of $\mathcal{O}_{X,\xi}$ correspond to the points of X specializing to ξ (Schemes, Lemma 21.13.2). Hence $\mathcal{F}_\xi$ is a finite $\mathcal{O}_{X,\xi}$-module whose support is $\{\mathfrak{m}_\xi\}$. Hence it has finite length by Algebra, Lemma 7.59.8. □

Definition 29.10.2. Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Let $\mathcal{F}$ be a coherent $\mathcal{O}_X$-module.

(1) For any irreducible component $Z' \subset \text{Supp}(\mathcal{F})$ with generic point ξ the integer $m_{Z',\mathcal{F}} = \text{length}_{\mathcal{O}_{X,\xi}} \mathcal{F}_\xi$ (Lemma 29.10.1) is called the *multiplicity of Z' in $\mathcal{F}$*.
(2) Assume $\dim_\delta(\text{Supp}(\mathcal{F})) \leq k$. The *$k$-cycle associated to $\mathcal{F}$* is

$$[\mathcal{F}]_k = \sum m_{Z',\mathcal{F}}[Z']$$

where the sum is over the irreducible components of $\text{Supp}(\mathcal{F})$ of δ-dimension k. (This is a k-cycle by Lemma 29.10.1.)

It is important to note that we only define $[\mathcal{F}]_k$ if $\mathcal{F}$ is coherent and the δ-dimension of $\text{Supp}(\mathcal{F})$ does not exceed k. In other words, by convention, if we write $[\mathcal{F}]_k$ then this implies that $\mathcal{F}$ is coherent on X and $\dim_\delta(\text{Supp}(\mathcal{F})) \leq k$.

Lemma 29.10.3. *Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Let $Z \subset X$ be a closed subscheme. If $\dim_\delta(Z) \leq k$, then $[Z]_k = [\mathcal{O}_Z]_k$.*

Proof. This is because in this case the multiplicities $m_{Z',Z}$ and $m_{Z',\mathcal{O}_Z}$ agree by definition. □

Lemma 29.10.4. *Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Let $0 \to \mathcal{F} \to \mathcal{G} \to \mathcal{H} \to 0$ be a short exact sequence of coherent sheaves on X. Assume that the δ-dimension of the supports of $\mathcal{F}$, $\mathcal{G}$, and $\mathcal{H}$ is $\leq k$. Then $[\mathcal{G}]_k = [\mathcal{F}]_k + [\mathcal{H}]_k$.*

Proof. Follows immediately from additivity of lengths, see Algebra, Lemma 7.48.3. □

29.11. Preparation for proper pushforward

Lemma 29.11.1. *Let (S, δ) be as in Situation 29.7.1. Let X, Y be locally of finite type over S. Let $f : X \to Y$ be a morphism. Assume X, Y integral and $\dim_\delta(X) = \dim_\delta(Y)$. Then either $f(X)$ is contained in a proper closed subscheme of Y, or f is dominant and the extension of function fields $R(Y) \subset R(X)$ is finite.*

Proof. The closure $\overline{f(X)} \subset Y$ is irreducible as X is irreducible. If $\overline{f(X)} \neq Y$, then we are done. If $\overline{f(X)} = Y$, then f is dominant and by Morphisms, Lemma 24.6.5 we see that the generic point η_Y of Y is in the image of f. Of course this implies that $f(\eta_X) = \eta_Y$, where $\eta_X \in X$ is the generic point of X. Since $\delta(\eta_X) = \delta(\eta_Y)$ we see that $R(Y) = \kappa(\eta_Y) \subset \kappa(\eta_X) = R(X)$ is an extension of transcendence degree 0. Hence Morphisms, Lemma 24.45.4 applies. □

Lemma 29.11.2. *Let (S, δ) be as in Situation 29.7.1. Let X, Y be locally of finite type over S. Let $f : X \to Y$ be a morphism. Assume f is quasi-compact, and $\{Z_i\}_{i \in I}$ is a locally finite collection of closed subsets of X. Then $\{\overline{f(Z_i)}\}_{i \in I}$ is a locally finite collection of closed subsets of Y.*

Proof. Let $V \subset Y$ be a quasi-compact open subset. Since f is quasi-compact the open $f^{-1}(V)$ is quasi-compact. Hence the set $\{i \in I \mid Z_i \cap f^{-1}(V) \neq \emptyset\}$ is finite by assumption. Since this is the same as the set $\{i \in I \mid f(Z_i) \cap V \neq \emptyset\}$ we win. □

29.12. Proper pushforward

Definition 29.12.1. Let (S, δ) be as in Situation 29.7.1. Let X, Y be locally of finite type over S. Let $f : X \to Y$ be a morphism. Assume f is proper.

(1) Let $Z \subset X$ be an integral closed subscheme with $\dim_\delta(Z) = k$. We define
$$f_*[Z] = \begin{cases} 0 & \text{if } \dim_\delta(f(Z)) < k, \\ \deg(Z/f(Z))[f(Z)] & \text{if } \dim_\delta(f(Z)) = k. \end{cases}$$
Here we think of $f(Z) \subset Y$ as an integral closed subscheme. The degree of Z over $f(Z)$ is finite if $\dim_\delta(f(Z)) = \dim_\delta(Z)$ by Lemma 29.11.1.

(2) Let $\alpha = \sum n_Z[Z]$ be a k-cycle on X. The *pushforward* of α as the sum
$$f_*\alpha = \sum n_Z f_*[Z]$$
where each $f_*[Z]$ is defined as above. The sum is locally finite by Lemma 29.11.2 above.

By definition the proper pushforward of cycles
$$f_* : Z_k(X) \longrightarrow Z_k(Y)$$
is a homomorphism of abelian groups. It turns $X \mapsto Z_k(X)$ into a covariant functor on the category of schemes locally of finite type over S with morphisms equal to proper morphisms.

Lemma 29.12.2. *Let (S, δ) be as in Situation 29.7.1. Let X, Y, and Z be locally of finite type over S. Let $f : X \to Y$ and $g : Y \to Z$ be proper morphisms. Then $g_* \circ f_* = (g \circ f)_*$ as maps $Z_k(X) \to Z_k(Z)$.*

Proof. Let $W \subset X$ be an integral closed subscheme of dimension k. Consider $W' = f(Z) \subset Y$ and $W'' = g(f(Z)) \subset Z$. Since f, g are proper we see that W' (resp. W'') is an integral closed subscheme of Y (resp. Z). We have to show that $g_*(f_*[W]) = (f \circ g)_*[W]$. If $\dim_\delta(W'') < k$, then both sides are zero. If $\dim_\delta(W'') = k$, then we see the induced morphisms

$$W \longrightarrow W' \longrightarrow W''$$

both satisfy the hypotheses of Lemma 29.11.1. Hence

$$g_*(f_*[W]) = \deg(W/W')\deg(W'/W'')[W''], \quad (f \circ g)_*[W] = \deg(W/W'')[W''].$$

Then we can apply Morphisms, Lemma 24.45.6 to conclude. □

Lemma 29.12.3. *Let (S, δ) be as in Situation 29.7.1. Let X, Y be locally of finite type over S. Let $f : X \to Y$ be a morphism. Assume f is proper.*

1. *Let $Z \subset X$ be a closed subscheme with $\dim_\delta(Z) \leq k$. Then*
$$f_*[Z]_k = [f_*\mathcal{O}_Z]_k.$$
2. *Let $\mathcal{F}$ be a coherent sheaf on X such that $\dim_\delta(Supp(\mathcal{F})) \leq k$. Then*
$$f_*[\mathcal{F}]_k = [f_*\mathcal{F}]_k.$$

Note that the statement makes sense since $f_*\mathcal{F}$ and $f_*\mathcal{O}_Z$ are coherent $\mathcal{O}_Y$-modules by Coherent, Lemma 25.18.2.

Proof. Part (1) follows from (2) and Lemma 29.10.3. Let $\mathcal{F}$ be a coherent sheaf on X. Assume that $\dim_\delta(\mathrm{Supp}(\mathcal{F})) \leq k$. By Coherent, Lemma 25.11.7 there exists a closed subscheme $i : Z \to X$ and a coherent $\mathcal{O}_Z$-module $\mathcal{G}$ such that $i_*\mathcal{G} \cong \mathcal{F}$ and such that the support of $\mathcal{F}$ is Z. Let $Z' \subset Y$ be the scheme theoretic image of $f|_Z : Z \to Y$.Consider the commutative diagram of schemes

$$\begin{tikzcd} Z \arrow[r, "i"'] \arrow[d, "f|_Z"'] & X \arrow[d, "f"] \\ Z' \arrow[r, "i'"] & Y \end{tikzcd}$$

We have $f_*\mathcal{F} = f_*i_*\mathcal{G} = i'_*(f|_Z)_*\mathcal{G}$ by going around the diagram in two ways. Suppose we know the result holds for closed immersions and for $f|_Z$. Then we see that

$$f_*[\mathcal{F}]_k = f_*i_*[\mathcal{G}]_k = (i')_*(f|_Z)_*[\mathcal{G}]_k = (i')_*[(f|_Z)_*\mathcal{G}]_k = [(i')_*(f|_Z)_*\mathcal{G}]_k = [f_*\mathcal{F}]_k$$

as desired. The case of a closed immersion is straightforward (omitted). Note that $f|_Z : Z \to Z'$ is a dominant morphism (see Morphisms, Lemma 24.4.3). Thus we have reduced to the case where $\dim_\delta(X) \leq k$ and $f : X \to Y$ is proper and dominant.

Assume $\dim_\delta(X) \leq k$ and $f : X \to Y$ is proper and dominant. Since f is dominant, for every irreducible component $Z \subset Y$ with generic point η there exists a point $\xi \in X$ such that $f(\xi) = \eta$. Hence $\delta(\eta) \leq \delta(\xi) \leq k$. Thus we see that in the expressions

$$f_*[\mathcal{F}]_k = \sum n_Z[Z], \quad \text{and} \quad [f_*\mathcal{F}]_k = \sum m_Z[Z].$$

whenever $n_Z \neq 0$, or $m_Z \neq 0$ the integral closed subscheme Z is actually an irreducible component of Y of δ-dimension k. Pick such an integral closed subscheme $Z \subset Y$ and denote η its generic point. Note that for any $\xi \in X$ with $f(\xi) = \eta$ we have $\delta(\xi) \geq k$ and hence ξ is a generic point of an irreducible component of X of δ-dimension k as well (see Lemma 29.9.1). Since f is quasi-compact and X is locally Noetherian, there can be only finitely many of these and hence $f^{-1}(\{\eta\})$ is finite. By Morphisms, Lemma 24.45.1 there exists an open neighbourhood $\eta \in V \subset Y$ such that $f^{-1}(V) \to V$ is finite. Replacing Y by V and X by $f^{-1}(V)$ we reduce to the case where Y is affine, and f is finite.

Write $Y = Spec(R)$ and $X = Spec(A)$ (possible as a finite morphism is affine). Then R and A are Noetherian rings and A is finite over R. Moreover $\mathcal{F} = \widetilde{M}$ for some finite A-module M. Note that $f_*\mathcal{F}$ corresponds to M viewed as an R-module. Let $\mathfrak{p} \subset R$ be the minimal prime corresponding to $\eta \in Y$. The coefficient of Z in $[f_*\mathcal{F}]_k$ is clearly $\text{length}_{R_\mathfrak{p}}(M_\mathfrak{p})$. Let $\mathfrak{q}_i$, $i = 1, \ldots, t$ be the primes of A lying over $\mathfrak{p}$. Then $A_\mathfrak{p} = \prod A_{\mathfrak{q}_i}$ since $A_\mathfrak{p}$ is an Artinian ring being finite over the dimension zero local Noetherian ring $R_\mathfrak{p}$. Clearly the coefficient of Z in $f_*[\mathcal{F}]_k$ is

$$\sum\nolimits_{i=1,\ldots,t}[\kappa(\mathfrak{q}_i) : \kappa(\mathfrak{p})]\text{length}_{A_{\mathfrak{q}_i}}(M_{\mathfrak{q}_i})$$

Hence the desired equality follows from Algebra, Lemma 7.48.12. □

29.13. Preparation for flat pullback

Recall that a morphism $f : X \to Y$ which is locally of finite type is said to have relative dimension r if every nonempty fibre is equidimensional of dimension r. See Morphisms, Definition 24.28.1.

Lemma 29.13.1. *Let (S, δ) be as in Situation 29.7.1. Let X, Y be locally of finite type over S. Let $f : X \to Y$ be a morphism. Assume f is flat of relative dimension r. For any closed subset $Z \subset Y$ we have*

$$\dim_\delta(f^{-1}(Z)) = \dim_\delta(Z) + r.$$

If Z is irreducible and $Z' \subset f^{-1}(Z)$ is an irreducible component, then Z' dominates Z and $\dim_\delta(Z') = \dim_\delta(Z) + r$.

Proof. It suffices to prove the final statement. We may replace Y by the integral closed subscheme Z and X by the scheme theoretic inverse image $f^{-1}(Z) = Z \times_Y X$. Hence we may assume $Z = Y$ is integral and f is a flat morphism of relative dimension r. Since Y is locally Noetherian the morphism f which is locally of finite type, is actually locally of finite presentation. Hence Morphisms, Lemma 24.24.9 applies and we see that f is open. Let $\xi \in X$ be a generic point of an irreducible component of X. By the openness of f we see that $f(\xi)$ is the generic point η of $Z = Y$. Note that $\dim_\xi(X_\eta) = r$ by assumption that f has relative dimension r. On the other hand, since ξ is a generic point of X we see that $\mathcal{O}_{X,\xi} = \mathcal{O}_{X_\eta,\xi}$ has only one prime ideal and hence has dimension 0. Thus by Morphisms, Lemma 24.27.1 we conclude that the transcendence degree of $\kappa(\xi)$ over $\kappa(\eta)$ is r. In other words, $\delta(\xi) = \delta(\eta) + r$ as desired. □

Here is the lemma that we will use to prove that the flat pullback of a locally finite collection of closed subschemes is locally finite.

Lemma 29.13.2. *Let (S, δ) be as in Situation 29.7.1. Let X, Y be locally of finite type over S. Let $f : X \to Y$ be a morphism. Assume $\{Z_i\}_{i \in I}$ is a locally finite collection of closed subsets of Y. Then $\{f^{-1}(Z_i)\}_{i \in I}$ is a locally finite collection of closed subsets of Y.*

Proof. Let $U \subset X$ be a quasi-compact open subset. Since the image $f(U) \subset Y$ is a quasi-compact subset there exists a quasi-compact open $V \subset Y$ such that $f(U) \subset V$. Note that

$$\{i \in I \mid f^{-1}(Z_i) \cap U \neq \emptyset\} \subset \{i \in I \mid Z_i \cap V \neq \emptyset\}.$$

Since the right hand side is finite by assumption we win. □

29.14. Flat pullback

In the following we use $f^{-1}(Z)$ to denote the *scheme theoretic inverse image* of a closed subscheme $Z \subset Y$ for a morphism of schemes $f : X \to Y$. We recall that the scheme theoretic inverse image is the fibre product

$$\begin{array}{ccc} f^{-1}(Z) & \longrightarrow & X \\ \downarrow & & \downarrow \\ Z & \longrightarrow & Y \end{array}$$

and it is also the closed subscheme of X cut out by the quasi-coherent sheaf of ideals $f^{-1}(\mathcal{I})\mathcal{O}_X$, if $\mathcal{I} \subset \mathcal{O}_Y$ is the quasi-coherent sheaf of ideals corresponding to Z in Y. (This is discussed in Schemes, Section 21.4 and Lemma 21.17.6 and Definition 21.17.7.)

Definition 29.14.1. Let (S, δ) be as in Situation 29.7.1. Let X, Y be locally of finite type over S. Let $f : X \to Y$ be a morphism. Assume f is flat of relative dimension r.

(1) Let $Z \subset Y$ be an integral closed subscheme of δ-dimension k. We define $f^*[Z]$ to be the $(k + r)$-cycle on X to the scheme theoretic inverse image

$$f^*[Z] = [f^{-1}(Z)]_{k+r}.$$

This makes sense since $\dim_\delta(f^{-1}(Z)) = k + r$ by Lemma 29.13.1.

(2) Let $\alpha = \sum n_i[Z_i]$ be a k-cycle on Y. The *flat pullback of α by f* is the sum

$$f^*\alpha = \sum n_i f^*[Z_i]$$

where each $f^*[Z_i]$ is defined as above. The sum is locally finite by Lemma 29.13.2.

(3) We denote $f^* : Z_k(Y) \to Z_{k+r}(Y)$ the map of abelian groups so obtained.

An open immersion is flat. This is an important though trivial special case of a flat morphism. If $U \subset X$ is open then sometimes the pullback by $j : U \to X$ of a cycle is called the *restriction* of the cycle to U. Note that in this case the maps

$$j^* : Z_k(X) \longrightarrow Z_k(U)$$

are all *surjective*. The reason is that given any integral closed subscheme $Z' \subset U$, we can take the closure of Z of Z' in X and think of it as a reduced closed subscheme of X (see Schemes, Lemma 21.12.4). And clearly $Z \cap U = Z'$, in other words $j^*[Z] = [Z']$ whence the surjectivity. In fact a little bit more is true.

Lemma 29.14.2. *Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Let $U \subset X$ be an open subscheme, and denote $i : Y = X \setminus U \to X$ as a reduced closed subscheme of X. For every $k \in \mathbf{Z}$ the sequence*

$$Z_k(Y) \xrightarrow{i_*} Z_k(X) \xrightarrow{j_*} Z_k(U) \longrightarrow 0$$

is an exact complex of abelian groups.

Proof. By the description above the basis elements $[Z]$ of the free abelian group $Z_k(X)$ map either to (distinct) basis elements $[Z \cap U]$ or to zero if $Z \subset Y$. Hence the lemma is clear. $\square$

Lemma 29.14.3. *Let (S, δ) be as in Situation 29.7.1. Let X, Y, Z be locally of finite type over S. Let $f : X \to Y$ and $g : Y \to Z$ be flat morphisms of relative dimensions r and s. Then $g \circ f$ is flat of relative dimension $r + s$ and*

$$f^* \circ g^* = (g \circ f)^*$$

as maps $Z_k(Z) \to Z_{k+r+s}(X)$.

Proof. The composition is flat of relative dimension $r + s$ by Morphisms, Lemma 24.28.3. Suppose that

(1) $W \subset Z$ is a closed integral subscheme of δ-dimension k,
(2) $W' \subset Y$ is a closed integral subscheme of δ-dimension $k + s$ with $W' \subset g^{-1}(W)$, and
(3) $W'' \subset Y$ is a closed integral subscheme of δ-dimension $k + s + r$ with $W'' \subset f^{-1}(W')$.

We have to show that the coefficient n of $[W'']$ in $(g \circ f)^*[W]$ agrees with the coefficient m of $[W'']$ in $f^*(g^*[W])$. That it suffices to check the lemma in these cases follows from Lemma 29.13.1. Let $\xi'' \in W''$, $\xi' \in W'$ and $\xi \in W$ be the generic points. Consider the local rings $A = \mathcal{O}_{Z,\xi}$, $B = \mathcal{O}_{Y,\xi'}$ and $C = \mathcal{O}_{X,\xi''}$. Then we have local flat ring maps $A \to B$, $B \to C$ and moreover

$$n = \text{length}_C(C/\mathfrak{m}_A C), \quad \text{and} \quad m = \text{length}_C(C/\mathfrak{m}_B C)\text{length}_B(B/\mathfrak{m}_A B)$$

Hence the equality follows from Algebra, Lemma 7.48.14. □

Lemma 29.14.4. *Let (S, δ) be as in Situation 29.7.1. Let X, Y be locally of finite type over S. Let $f : X \to Y$ be a flat morphism of relative dimension r.*

(1) *Let $Z \subset Y$ be a closed subscheme with $\dim_\delta(Z) \leq k$. Then we have $\dim_\delta(f^{-1}(Z)) \leq k + r$ and $[f^{-1}(Z)]_{k+r} = f^*[Z]_k$ in $Z_{k+r}(X)$.*
(2) *Let $\mathcal{F}$ be a coherent sheaf on Y with $\dim_\delta(Supp(\mathcal{F})) \leq k$. Then we have $\dim_\delta(Supp(f^*\mathcal{F})) \leq k + r$ and*

$$f^*[\mathcal{F}]_k = [f^*\mathcal{F}]_{k+r}$$

in $Z_{k+r}(X)$.

Proof. Part (1) follows from part (2) by Lemma 29.10.3 and the fact that $f^*\mathcal{O}_Z = \mathcal{O}_{f^{-1}(Z)}$.

Proof of (2). As X, Y are locally Noetherian we may apply Coherent, Lemma 25.11.1 to see that $\mathcal{F}$ is of finite type, hence $f^*\mathcal{F}$ is of finite type (Modules, Lemma 15.9.2), hence $f^*\mathcal{F}$ is coherent (Coherent, Lemma 25.11.1 again). Thus the lemma makes sense. Let $W \subset Y$ be an integral closed subscheme of δ-dimension k, and let $W' \subset X$ be an integral closed subscheme of dimension $k + r$ mapping into W under f. We have to show that the coefficient n of $[W]$ in $f^*[\mathcal{F}]_k$ agrees with the coefficient m of $[W]$ in $[f^*\mathcal{F}]_{k+r}$. Let $\xi \in W$ and $\xi' \in W'$ be the generic points. Let $A = \mathcal{O}_{Y,\xi}$, $B = \mathcal{O}_{X,\xi'}$ and set $M = \mathcal{F}_\xi$ as an A-module. (Note that M has finite length by our dimension assumptions, but we actually do not need to verify this. See Lemma 29.10.1.) We have $f^*\mathcal{F}_{\xi'} = B \otimes_A M$. Thus we see that

$$n = \text{length}_B(B \otimes_A M) \quad \text{and} \quad m = \text{length}_A(M)\text{length}_B(B/\mathfrak{m}_A B)$$

Thus the equality follows from Algebra, Lemma 7.48.13. □

29.15. Push and pull

In this section we verify that proper pushforward and flat pullback are compatible when this makes sense. By the work we did above this is a consequence of cohomology and base change.

Lemma 29.15.1. *Let (S, δ) be as in Situation 29.7.1. Let*

$$\begin{tikzcd} X' \arrow[r, "g'"] \arrow[d, "f'"'] & X \arrow[d, "f"] \\ Y' \arrow[r, "g"] & Y \end{tikzcd}$$

be a fibre product diagram of schemes locally of finite type over S. Assume $f : X \to Y$ proper and $g : Y' \to Y$ flat of relative dimension r. Then also f' is proper and g' is flat of relative dimension r. For any k-cycle α on X we have

$$g^* f_* \alpha = f'_*(g')^* \alpha$$

in $Z_{k+r}(Y')$.

Proof. The assertion that f' is proper follows from Morphisms, Lemma 24.40.5. The assertion that g' is flat of relative dimension r follows from Morphisms, Lemmas 24.28.2 and 24.24.7. It suffices to prove the equality of cycles when $\alpha = [W]$ for some integral closed subscheme $W \subset X$ of δ-dimension k. Note that in this case we have $\alpha = [\mathcal{O}_W]_k$, see Lemma 29.10.3. By Lemmas 29.12.3 and 29.14.4 it therefore suffices to show that $f'_*(g')^*\mathcal{O}_W$ is isomorphic to $g^* f_* \mathcal{O}_W$. This follows from cohomology and base change, see Coherent, Lemma 25.6.2. □

Lemma 29.15.2. *Let (S, δ) be as in Situation 29.7.1. Let X, Y be locally of finite type over S. Let $f : X \to Y$ be a finite locally free morphism of degree d (see Morphisms, Definition 24.44.1). Then f is both proper and flat of relative dimension 0, and*

$$f_* f^* \alpha = d\alpha$$

for every $\alpha \in Z_k(Y)$.

Proof. A finite locally free morphism is flat and finite by Morphisms, Lemma 24.44.2, and a finite morphism is proper by Morphisms, Lemma 24.42.10. We omit showing that a finite morphism has relative dimension 0. Thus the formula makes sense. To prove it, let $Z \subset Y$ be an integral closed subscheme of δ-dimension k. It suffices to prove the formula for $\alpha = [Z]$. Since the base change of a finite locally free morphism is finite locally free (Morphisms, Lemma 24.44.4) we see that $f_* f^* \mathcal{O}_Z$ is a finite locally free sheaf of rank d on Z. Hence

$$f_* f^*[Z] = f_* f^*[\mathcal{O}_Z]_k = [f_* f^* \mathcal{O}_Z]_k = d[Z]$$

where we have used Lemmas 29.14.4 and 29.12.3. □

29.16. Preparation for principal divisors

Recall that if Z is an irreducible closed subset of a scheme X, then the codimension of Z in X is equal to the dimension of the local ring $\mathcal{O}_{X,\xi}$, where $\xi \in Z$ is the generic point. See Properties, Lemma 23.11.4.

Definition 29.16.1. Let X be a locally Noetherian scheme. Assume X is integral. Let $f \in R(X)^*$. For every integral closed subscheme $Z \subset X$ of codimension 1 we define the *order of vanishing of f along Z* as the integer

$$\text{ord}_Z(f) = \text{ord}_{\mathcal{O}_{X,\xi}}(f)$$

where the right hand side is the notion of Algebra, Definition 7.112.2 and ξ is the generic point of Z.

Of course it can happen that $\text{ord}_Z(f) < 0$. In this case we say that f has a *pole* along Z and that $-\text{ord}_Z(f) > 0$ is the *order of pole of f along Z*. Note that for $f, g \in R(X)^*$ we have

$$\text{ord}_Z(fg) = \text{ord}_Z(f) + \text{ord}_Z(g).$$

Lemma 29.16.2. *Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Assume X is integral. If $Z \subset X$ is an integral closed subscheme of codimension 1, then $\dim_\delta(Z) = \dim_\delta(X) - 1$.*

Proof. This is more or less the defining property of a dimension function. □

Lemma 29.16.3. *Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Assume X is integral. Let $f \in R(X)^*$. Then the set*

$$\{Z \subset X \mid Z \textit{ is integral, closed of codimension } 1 \textit{ and } \textit{ord}_Z(f) \neq 0\}$$

is locally finite in X.

Proof. This is true simply because there exists a nonempty open subscheme $U \subset X$ such that f corresponds to a section of $\Gamma(U, \mathcal{O}_X^*)$, and hence the codimension 1 irreducibles which can occur in the set of the lemma are all irreducible components of $X \setminus U$. Hence Lemma 29.9.1 gives the desired result. □

Lemma 29.16.4. *Let $f : X \to Y$ be a morphism of schemes. Let $\xi \in Y$ be a point. Assume that*

1. *X, Y are integral,*
2. *X is locally Noetherian*
3. *f is proper, dominant and $R(X) \subset R(Y)$ is finite, and*
4. *$\dim(\mathcal{O}_{Y,\xi}) = 1$.*

Then there exists an open neighbourhood $V \subset Y$ of ξ such that $f|_{f^{-1}(V)} : f^{-1}(V) \to V$ is finite.

Proof. By Coherent, Lemma 25.20.2 it suffices to prove that $f^{-1}(\{\xi\})$ is finite. We replace Y by an affine open, say $Y = Spec(R)$. Note that R is Noetherian, as X is assumed locally Noetherian. Since f is proper it is quasi-compact. Hence we can find a finite affine open covering $X = U_1 \cup \ldots \cup U_n$ with each $U_i = Spec(A_i)$. Note that $R \to A_i$ is a finite type injective homomorphism of domains with $f.f.(R) \subset f.f.(A_i)$ finite. Thus the lemma follows from Algebra, Lemma 7.104.2. □

29.17. Principal divisors

The following definition is the key to everything that follows.

Definition 29.17.1. Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Assume X is integral with $\dim_\delta(X) = n$. Let $f \in R(X)^*$. The *principal divisor associated to f* is the $(n-1)$-cycle

$$\text{div}(f) = \text{div}_X(f) = \sum \text{ord}_Z(f)[Z]$$

where the sum is over integral closed subschemes of codimension 1 and $\text{ord}_Z(f)$ is as in Definition 29.16.1. This makes sense by Lemmas 29.16.2 and 29.16.3.

Lemma 29.17.2. *Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Assume X is integral with $\dim_\delta(X) = n$. Let $f, g \in R(X)^*$. Then*

$$div(fg) = div(f) + div(g)$$

in $Z_{n-1}(X)$.

Proof. This is clear from the additivity of the ord functions. □

An important role in the discussion of principal divisors is played by the ``universal" principal divisor $[0] - [\infty]$ on $\mathbf{P}^1_S$. To make this more precise, let us denote

$$D_0, D_\infty \subset \mathbf{P}^1_S = \underline{\text{Proj}}_S(\mathcal{O}_S[X_0, X_1])$$

the closed subscheme cut out by the section X_1, resp. X_0 of $\mathcal{O}(1)$. These are effective Cartier divisors, see Divisors, Definition 26.9.1 and Lemma 26.9.17. The following lemma says that loosely speaking we have ``$\text{div}(X_1/X_0) = [D_0] - [D_1]$" and that this is the universal principal divisor.

Lemma 29.17.3. *Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Assume X is integral and $n = \dim_\delta(X)$. Let $f \in R(X)^*$. Let $U \subset X$ be a nonempty open such that f corresponds to a section $f \in \Gamma(U, \mathcal{O}_X^*)$. Let $Y \subset X \times_S \mathbf{P}^1_S$ be the closure of the graph of $f : U \to \mathbf{P}^1_S$. Then*

1. *the projection morphism $p : Y \to X$ is proper,*
2. *$p|_{p^{-1}(U)} : p^{-1}(U) \to U$ is an isomorphism,*
3. *the pullbacks $q^{-1}D_0$ and $q^{-1}D_\infty$ via the morphism $q : Y \to \mathbf{P}^1_S$ are effective Cartier divisors on Y,*
4. *we have*
$$div_Y(f) = [q^{-1}D_0]_{n-1} - [q^{-1}D_\infty]_{n-1}$$
5. *we have*
$$div_X(f) = p_* div_Y(f)$$
6. *if we view $Y_0 = q^{-1}D_0$, and $Y_\infty = q^{-1}D_\infty$ as closed subschemes of X via the morphism p then we have*
$$div_X(f) = [Y_0]_{n-1} - [Y_\infty]_{n-1}$$

Proof. Since X is integral, we see that U is integral. Hence Y is integral, and $(1, f)(U) \subset Y$ is an open dense subscheme. Also, note that the closed subscheme $Y \subset X \times_S \mathbf{P}^1_S$ does not depend on the choice of the open U, since after all it is the closure of the one point set $\{\eta'\} = \{(1, f)(\eta)\}$ where $\eta \in X$ is the generic point. Having said this let us prove the assertions of the lemma.

For (1) note that p is the composition of the closed immersion $Y \to X \times_S \mathbf{P}^1_S = \mathbf{P}^1_X$ with the proper morphism $\mathbf{P}^1_X \to X$. As a composition of proper morphisms is proper (Morphisms, Lemma 24.40.4) we conclude.

It is clear that $Y \cap U \times_S \mathbf{P}^1_S = (1, f)(U)$. Thus (2) follows. It also follows that $\dim_\delta(Y) = n$.

Note that $q(\eta') = f(\eta)$ is not contained in D_0 or D_∞ since $f \in R(X)^*$. Hence $q^{-1}D_0$ and $q^{-1}D_\infty$ are effective Cartier divisors on Y by Divisors, Lemma 26.9.9. Thus we see (3). It also follows that $\dim_\delta(q^{-1}D_0) = n - 1$ and $\dim_\delta(q^{-1}D_\infty) = n - 1$.

Consider the effective Cartier divisor $q^{-1}D_0$. At every point $\xi \in q^{-1}D_0$ we have $f \in \mathcal{O}_{Y,\xi}$ and the local equation for $q^{-1}D_0$ is given by f. In particular, if $\delta(\xi) = n-1$ so ξ is the generic point of a integral closed subscheme Z of δ-dimension $n-1$, then we see that the coefficient of $[Z]$ in $\text{div}_Y(f)$ is

$$\text{ord}_Z(f) = \text{length}_{\mathcal{O}_{Y,\xi}}(\mathcal{O}_{Y,\xi}/f\mathcal{O}_{Y,\xi}) = \text{length}_{\mathcal{O}_{Y,\xi}}(\mathcal{O}_{q^{-1}D_0,\xi})$$

which is the coefficient of $[Z]$ in $[q^{-1}D_0]_{n-1}$. A similar argument using the rational function $1/f$ shows that $-[q^{-1}D_\infty]$ agrees with the terms with negative coefficients in the expression for $\text{div}_Y(f)$. Hence (4) follows.

Note that $D_0 \to S$ is an isomorphism. Hence we see that $X \times_S D_0 \to X$ is an isomorphism as well. Clearly we have $q^{-1}D_0 = Y \cap X \times_S D_0$ (scheme theoretic intersection) inside $X \times_S \mathbf{P}^1_S$. Hence it is really the case that $Y_0 \to X$ is a closed immersion. By the same token we see that

$$p_*\mathcal{O}_{q^{-1}D_0} = \mathcal{O}_{Y_0}$$

and hence by Lemma 29.12.3 we have $p_*[q^{-1}D_0]_{n-1} = [Y_0]_{n-1}$. Of course the same is true for D_∞ and Y_∞. Hence to finish the proof of the lemma it suffices to prove the last assertion.

Let $Z \subset X$ be an integral closed subscheme of δ-dimension $n-1$. We want to show that the coefficient of $[Z]$ in $\text{div}(f)$ is the same as the coefficient of $[Z]$ in $[Y_0]_{n-1} - [Y_\infty]_{n-1}$. We may apply Lemma 29.16.4 to the morphism $p : Y \to X$ and the generic point $\xi \in Z$. Hence we may replace X by an affine open neighbourhood of ξ and assume that $p : Y \to X$ is finite. Write $X = Spec(R)$ and $Y = Spec(A)$ with p induced by a finite homomorphism $R \to A$ of Noetherian domains which induces an isomorphism $f.f.(R) \cong f.f.(A)$ of fraction fields. Now we have $f \in f.f.(R)$ and a prime $\mathfrak{p} \subset R$ with $\dim(R_\mathfrak{p}) = 1$. The coefficient of $[Z]$ in $\text{div}_X(f)$ is $\text{ord}_{R_\mathfrak{p}}(f)$. The coefficient of $[Z]$ in $p_*\text{div}_Y(f)$ is

$$\sum\nolimits_{\mathfrak{q} \text{ lying over } \mathfrak{p}} [\kappa(\mathfrak{q}) : \kappa(\mathfrak{p})]\text{ord}_{A_\mathfrak{q}}(f)$$

The desired equality therefore follows from Algebra, Lemma 7.112.8. □

This lemma will be superseded by the more general Lemma 29.20.1.

Lemma 29.17.4. *Let (S, δ) be as in Situation 29.7.1. Let X, Y be locally of finite type over S. Assume X, Y are integral and $n = \dim_\delta(Y)$. Let $f : X \to Y$ be a flat morphism of relative dimension r. Let $g \in R(Y)^*$. Then*

$$f^*(div_Y(g)) = div_X(g)$$

in $Z_{n+r-1}(X)$.

Proof. Note that since f is flat it is dominant so that f induces an embedding $R(Y) \subset R(X)$, and hence we may think of g as an element of $R(X)^*$. Let $Z \subset X$ be an integral closed subscheme of δ-dimension $n+r-1$. Let $\xi \in Z$ be its generic point. If $\dim_\delta(f(Z)) > n-1$, then we see that the coefficient of $[Z]$ in the left and right hand side of the equation is zero. Hence we may assume that $Z' = \overline{f(Z)}$ is an intral closed subscheme of Y of δ-dimension $n-1$. Let $\xi' = f(\xi)$. It is the generic point of Z'. Set $A = \mathcal{O}_{Y,\xi'}$, $B = \mathcal{O}_{X,\xi}$. The ring map $A \to B$ is a flat local homomorphism of Noetherian local domains of dimension 1. We have $g \in f.f.(A)$. What we have to show is that

$$\text{ord}_A(g)\text{length}_B(B/\mathfrak{m}_A B) = \text{ord}_B(g).$$

This follows from Algebra, Lemma 7.48.13 (details omitted). □

29.18. Two fun results on principal divisors

The first lemma implies that the pushforward of a principal divisor along a generically finite morphism is a principal divisor.

Lemma 29.18.1. *Let (S, δ) be as in Situation 29.7.1. Let X, Y be locally of finite type over S. Assume X, Y are integral and $n = \dim_\delta(X) = \dim_\delta(Y)$. Let $p : X \to Y$ be a dominant proper morphism. Let $f \in R(X)^*$. Set*

$$g = Nm_{R(X)/R(Y)}(f).$$

Then we have $p_*div(f) = div(g)$.

Proof. Let $Z \subset Y$ be an integral closed subscheme of δ-dimension $n-1$. We want to show that the coefficient of $[Z]$ in $p_*\text{div}(f)$ and $\text{div}(g)$ are equal. We may apply Lemma 29.16.4 to the morphism $p : X \to X$ and the generic point $\xi \in Z$. Hence we may replace X by an affine open neighbourhood of ξ and assume that $p : Y \to X$ is finite. Write $X = Spec(R)$ and $Y = Spec(A)$ with p induced by a finite homomorphism $R \to A$ of Noetherian domains which induces an finite field extension $f.f.(R) \subset f.f.(A)$ of fraction fields. Now we have $f \in f.f.(A)$, $g = \text{Nm}(f) \in f.f.(R)$, and a prime $\mathfrak{p} \subset R$ with $\dim(R_\mathfrak{p}) = 1$. The coefficient of $[Z]$ in $\text{div}_Y(g)$ is $\text{ord}_{R_\mathfrak{p}}(g)$. The coefficient of $[Z]$ in $p_*\text{div}_X(f)$ is

$$\sum\nolimits_{\mathfrak{q} \text{ lying over } \mathfrak{p}} [\kappa(\mathfrak{q}) : \kappa(\mathfrak{p})]\text{ord}_{A_\mathfrak{q}}(f)$$

The desired equality therefore follows from Algebra, Lemma 7.112.8. □

The following lemma says that the degree of a principal divisor on a proper curve is zero.

Lemma 29.18.2. *Let K be any field. Let X be a 1-dimensional integral scheme endowed with a proper morphism $c : X \to Spec(K)$. Let $f \in K(X)^*$ be an invertible rational function. Then*

$$\sum\nolimits_{x \in X \ closed} [\kappa(x) : K] ord_{\mathcal{O}_{X,x}}(f) = 0$$

where ord is as in Algebra, Definition 7.112.2. In other words, $c_*div(f) = 0$.

Proof. Consider the diagram

$$\begin{tikzcd} Y \arrow[r, "p"] \arrow[d, "q"] & X \arrow[d, "c"] \\ \mathbf{P}^1_K \arrow[r, "c'"] & Spec(K) \end{tikzcd}$$

that we constructed in Lemma 29.17.3 starting with X and the rational function f over $S = Spec(K)$. We will use all the results of this lemma without further mention. We have to show that $c_*\text{div}_X(f) = p_*c_*\text{div}_Y(f) = 0$. This is the same as proving that $c'_*q_*\text{div}_Y(f) = 0$. If $q(Y)$ is a closed point of $\mathbf{P}^1_K$ then we see that $\text{div}_X(f) = 0$ and the lemma holds. Thus we may assume that q is dominant. Since $\text{div}_Y(f) = [q^{-1}D_0]_0 - [q^{-1}D_\infty]_0$ we see (by definition of flat pullback) that $\text{div}_Y(f) = q^*([D_0]_0 - [D_\infty]_0)$. Suppose we can show that $q : Y \to \mathbf{P}^1_K$ is finite locally free of degree d (see Morphisms, Definition 24.44.1). Then byy Lemma 29.15.2 we get $q_*\text{div}_Y(f) = d([D_0]_0 - [D_\infty]_0)$. Since clearly $c'_*[D_0]_0 = c'_*[D_\infty]_0$ we win.

It remains to show that q is finite locally free. (It will automatically have some given degree as $\mathbf{P}^1_K$ is connected.) Since $\dim(\mathbf{P}^1_K) = 1$ we see that q is finite for example by Lemma 29.16.4. All local rings of $\mathbf{P}^1_K$ at closed points are regular local rings of dimension 1 (in other words discrete valuation rings), since they are localizations of $K[T]$ (see Algebra, Lemma 7.105.1). Hence for $y \in Y$ closed the local ring $\mathcal{O}_{Y,y}$ will be flat over $\mathcal{O}_{\mathbf{P}^1_K, q(y)}$ as soon as it is torsion free. This is obviously the case as $\mathcal{O}_{Y,y}$ is a domain and q is dominant. Thus q is flat. Hence q is finite locally free by Morphisms, Lemma 24.44.2. □

29.19. Rational equivalence

In this section we define *rational equivalence* on k-cycles. We will allow locally finite sums of images of principal divisors (under closed immersions). This leads to some pretty strange phenomena, see Example 29.19.3. However, if we do not allow these then we do not know how to prove that capping with chern classes of line bundles factors through rational equivalence.

Definition 29.19.1. Let (S, δ) be as in Situation 29.7.1. Let X be a scheme locally of finite type over S. Let $k \in \mathbf{Z}$.

(1) Given any locally finite collection $\{W_j \subset X\}$ of integral closed subschemes with $\dim_\delta(W_j) = k + 1$, and any $f_j \in R(W_j)^*$ we may consider
$$\sum (i_j)_*\text{div}(f_j) \in Z_k(X)$$
where $i_j : W_j \to X$ is the inclusion morphism. This makes sense as the morphism $\coprod i_j : \coprod W_j \to X$ is proper.
(2) We say that $\alpha \in Z_k(X)$ is *rationally equivalent to zero* if α is a cycle of the form displayed above.
(3) We say $\alpha, \beta \in Z_k(X)$ are *rationally equivalent* and we write $\alpha \sim_{rat} \beta$ if $\alpha - \beta$ is rationally equivalent to zero.
(4) We define
$$A_k(X) = Z_k(X)/ \sim_{rat}$$
to be the *Chow group of k-cycles on X*. This is sometimes called the *Chow group of k-cycles module rational equivalence on X*.

There are many other interesting (adequate) equivalence relations. Rational equivalence is the coarsest one of them all. A very simple but important lemma is the following.

Lemma 29.19.2. *Let (S, δ) be as in Situation 29.7.1. Let X be a scheme locally of finite type over S. Let $U \subset X$ be an open subscheme, and denote $i : Y = X \setminus U \to X$ as a reduced closed subscheme of X. Let $k \in \mathbf{Z}$. Suppose $\alpha, \beta \in Z_k(X)$. If $\alpha|_U \sim_{rat} \beta|_U$ then there exist a cycle $\gamma \in Z_k(Y)$ such that*
$$\alpha \sim_{rat} \beta + i_*\gamma.$$
In other words, the sequence
$$A_k(Y) \xrightarrow{i_*} A_k(X) \xrightarrow{j_*} A_k(U) \longrightarrow 0$$
is an exact complex of abelian groups.

Proof. Let $\{W_j\}_{j\in J}$ be a locally finite collection of integral closed subschemes of δ-dimension $k + 1$, and let $f_j \in R(W_j)^*$ be elements such that $(\alpha - \beta)|_U = \sum (i_j)_*\text{div}(f_j)$ as in the definition. Set $W_j' \subset X$ equal to the closure of W_j. Suppose that $V \subset X$ is a quasi-compact open. Then also $V \cap U$ is quasi-compact open in U as V is Noetherian. Hence the set $\{j \in J \mid W_j \cap V \neq \emptyset\} = \{j \in J \mid W_j' \cap V \neq \emptyset\}$ is finite since $\{W_j\}$ is locally finite. In other words we see that $\{W_j'\}$ is also locally finite. Since $R(W_j) = R(W_j')$ we see that
$$\alpha - \beta - \sum (i_j')_*\text{div}(f_j)$$

is a cycle supported on Y and the lemma follows (see Lemma 29.14.2). □

Example 29.19.3. Here is a ``strange" example. Suppose that S is the spectrum of a field k with δ as in Example 29.7.2. Suppose that $X = C_1 \cup C_2 \cup \ldots$ is an infinite union of curves $C_j \cong \mathbf{P}^1_k$ glued together in the following way: The point $\infty \in C_j$ is glued transversally to the point $0 \in C_{j+1}$ for $j = 1, 2, 3, \ldots$. Take the point $0 \in C_1$. This gives a zero cycle $[0] \in Z_0(X)$. The ``strangeness" in this situation is that actually $[0] \sim_{rat} 0$! Namely we can choose the rational function $f_j \in R(C_j)$ to be the function which has a simple zero at 0 and a simple pole at ∞ and no other zeros or poles. Then we see that the sum $\sum (i_j)_*\text{div}(f_j)$ is exactly the 0-cycle [0]. In fact it turns out that $A_0(X) = 0$ in this example. If you find this too bizarre, then you can just make sure your spaces are always quasi-compact (so X does not even exist for you).

Remark 29.19.4. Let (S, δ) be as in Situation 29.7.1. Let X be a scheme locally of finite type over S. Suppose we have infinite collections $\alpha_i, \beta_i \in Z_k(X)$, $i \in I$ of k-cycles on X. Suppose that the supports of α_i and β_i form locally finite collections of closed subsets of X so that $\sum \alpha_i$ and $\sum \beta_i$ are defined as cycles. Moreover, assume that $\alpha_i \sim_{rat} \beta_i$ for each i. Then it is not clear that $\sum \alpha_i \sim_{rat} \sum \beta_i$. Namely, the problem is that the rational equivalences may be given by locally finite families $\{W_{i,j}, f_{i,j} \in R(W_{i,j})^*\}_{j \in J_i}$ but the union $\{W_{i,j}\}_{i \in I, j \in J_i}$ may not be locally finite.

In many cases in practice, one has a locally finite family of closed subsets $\{T_i\}_{i \in I}$ such that α_i, β_i are supported on T_i and such that $\alpha_i = \beta_i$ in $A_k(T_i)$, in other words, the families $\{W_{i,j}, f_{i,j} \in R(W_{i,j})^*\}_{j \in J_i}$ consist of subschemes $W_{i,j} \subset T_i$. In this case it is true that $\sum \alpha_i \sim_{rat} \sum \beta_i$ on X, simply because the family $\{W_{i,j}\}_{i \in I, j \in J_i}$ is automatically locally finite in this case.

29.20. Properties of rational equivalence

Lemma 29.20.1. *Let (S, δ) be as in Situation 29.7.1. Let X, Y be schemes locally of finite type over S. Let $f : X \to Y$ be a flat morphism of relative dimension r. Let $\alpha \sim_{rat} \beta$ be rationally equivalent k-cycles on Y. Then $f^*\alpha \sim_{rat} f^*\beta$ as $(k + r)$-cycles on X.*

Proof. What do we have to show? Well, suppose we are given a collection

$$i_j : W_j \longrightarrow Y$$

of closed immersions, with each W_j integral of δ-dimension $k + 1$ and rational functions $f_j \in R(W_j)^*$. Moreover, assume that the collection $\{i_j(W_j)\}_{j \in J}$ is locally finite on Y. Then we have to show that

$$f^*(\sum i_{j,*}\text{div}(f_j))$$

is rationally equivalent to zero on X.

Consider the fibre products

$$i'_j : W'_j = W_j \times_Y X \longrightarrow X.$$

For each j, consider the collection $\{W'_{j,l}\}_{l \in L_j}$ of irreducible components $W'_{j,l} \subset W'_j$ having δ-dimension $k + 1$. We may write

$$[W'_j]_{k+1} = \sum\nolimits_{l \in L_j} n_{j,l}[W'_{j,l}]_{k+1}$$

for some $n_{j,l} > 0$. By Lemma 29.13.1 we see that $W'_{j,l} \to W_j$ is dominant and hence we can let $f_{j,l} \in R(W'_{j,l})^*$ denote the image of f_j under the map of fields $R(W_j) \to R(W'_{j,l})$. We claim that

(1) the collection $\{W'_{j,l}\}_{j\in J, l\in L_j}$ is locally finite on X, and
(2) with obvious notation $f^*(\sum i_{j,*}\mathrm{div}(f_j)) = \sum i'_{j,l,*}\mathrm{div}(f_{j,l}^{n_{j,l}})$.

Clearly this claim implies the lemma.

To show (1), note that $\{W'_j\}$ is a locally finite collection of closed subschemes of X by Lemma 29.13.2. Hence if $U \subset X$ is quasi-compact, then U meets only finitely many W'_j. By Lemma 29.9.1 the collection of irreducible components of each W_j is locally finite as well. Hence we see only finitely many $W'_{j,l}$ meet U as desired.

Let $Z \subset X$ be an integral closed subscheme of δ-dimension $k + r$. We have to show that the coefficient n of $[Z]$ in $f^*(\sum i_{j,*}\mathrm{div}(f_j))$ is equal to the coefficient m of $[Z]$ in $\sum i'_{j,l,*}\mathrm{div}(f_{j,l}^{n_{j,l}})$. Let Z' be the closure of $f(Z)$ which is an integral closed subscheme of Y. By Lemma 29.13.1 we have $\dim_\delta(Z') \geq k$. If $\dim_\delta(Z') > k$, then the coefficients n and m are both zero, since the generic point of Z will not be contained in any W'_j or $W'_{j,l}$. Hence we may assume that $\dim_\delta(Z') = k$.

We are going to translate the equality of n and m into algebra. Namely, let $\xi' \in Z'$ and $\xi \in Z$ be the generic points. Set $A = \mathcal{O}_{Y,\xi'}$ and $B = \mathcal{O}_{X,\xi}$. Note that A, B are Noetherian, $A \to B$ is flat, local, and that $\mathfrak{m}_A B$ is an ideal of definition of the local ring B. There are finitely many j such that W_j passes through ξ', and these correspond to prime ideals

$$\mathfrak{p}_1, \ldots, \mathfrak{p}_T \subset A$$

with the property that $\dim(A/\mathfrak{p}_t) = 1$ for each $t = 1, \ldots, T$. The rational functions f_j correspond to elements $f_t \in \kappa(\mathfrak{p}_t)^*$. Say $\mathfrak{p}_t$ corresponds to W_j. By construction, the closed subschemes $W'_{j,l}$ which meet ξ correspond $1-1$ with minimal primes

$$\mathfrak{p}_t B \subset \mathfrak{q}_{t,1}, \ldots, \mathfrak{q}_{t,S_t} \subset B$$

over $\mathfrak{p}_t B$. The integers $n_{j,l}$ correspond to the integers

$$n_{t,s} = \mathrm{length}_{B_{\mathfrak{q}_{t,s}}}((B/\mathfrak{p}_t B)_{B_{\mathfrak{q}_{t,s}}})$$

The rational functions $f_{j,l}$ correspond to the images $f_{t,s} \in \kappa(\mathfrak{q}_{t,s})^*$ of the elements $f_t \in \kappa(\mathfrak{p}_t)^*$. Putting everything together we see that

$$n = \sum \mathrm{ord}_{A/\mathfrak{p}_t}(f_t)\mathrm{length}_B(B/\mathfrak{m}_A B)$$

and that

$$m = \sum \mathrm{ord}_{B/\mathfrak{q}_{t,s}}(f_{t,s})\mathrm{length}_{B_{\mathfrak{q}_{t,s}}}((B/\mathfrak{p}_t B)_{B_{\mathfrak{q}_{t,s}}})$$

Note that it suffices to prove the equality for each $t \in \{1, \ldots, T\}$ separately. Writing $f_t = x/y$ for some nonzero $\overline{x}, \overline{y} \in A/\mathfrak{p}_t$ coming from $x, y \in A$ we see that it suffices to prove

$$\mathrm{length}_{A/\mathfrak{p}_t}(A/(\mathfrak{p}_t, x))\mathrm{length}_B(B/\mathfrak{m}_A B) = \mathrm{length}_B(B/(x, \mathfrak{p}_t)B)$$

(equality uses Algebra, Lemma 7.48.13) equals

$$\sum\nolimits_{s=1,\ldots,S_t} \mathrm{ord}_{B/\mathfrak{q}_{t,s}}(B/(x, \mathfrak{q}_{t,s}))\mathrm{length}_{B_{\mathfrak{q}_{t,s}}}((B/\mathfrak{p}_t B)_{B_{\mathfrak{q}_{t,s}}})$$

and similarly for y. Note that as $x \notin \mathfrak{p}_t$ we see that x is a nonzero divisor on $A/\mathfrak{p}_t$. As $A \to B$ is flat it follows that x is a nonzero divisor on the module $M = B/\mathfrak{p}_t B$. Hence the equality above follows from Lemma 29.5.6. ☐

Lemma 29.20.2. *Let (S, δ) be as in Situation 29.7.1. Let X, Y be schemes locally of finite type over S. Let $p : X \to Y$ be a proper morphism. Suppose $\alpha, \beta \in Z_k(X)$ are rationally equivalent. Then $p_*\alpha$ is rationally equivalent to $p_*\beta$.*

Proof. What do we have to show? Well, suppose we are given a collection

$$i_j : W_j \longrightarrow X$$

of closed immersions, with each W_j integral of δ-dimension $k+1$ and rational functions $f_j \in R(W_j)^*$. Moreover, assume that the collection $\{i_j(W_j)\}_{j \in J}$ is locally finite on X. Then we have to show that

$$p_*\left(\sum i_{j,*}\mathrm{div}(f_j)\right)$$

is rationally equivalent to zero on X.

Note that the sum is equal to

$$\sum p_* i_{j,*}\mathrm{div}(f_j).$$

Let $W'_j \subset Y$ be the integral closed subscheme which is the image of $p \circ i_j$. The collection $\{W'_j\}$ is locally finite in Y by Lemma 29.11.2. Hence it suffices to show, for a given j, that either $p_* i_{j,*}\mathrm{div}(f_j) = 0$ or that it is equal to $i'_{j,*}\mathrm{div}(g_j)$ for some $g_j \in R(W'_j)^*$.

The arguments above therefore reduce us to the case of a since integral closed subscheme $W \subset X$ of δ-dimension $k+1$. Let $f \in R(W)^*$. Let $W' = p(W)$ as above. We get a commutative diagram of morphisms

$$\begin{tikzcd} W \arrow[r, "i"'] \arrow[d, "p'"'] & X \arrow[d, "p"] \\ W' \arrow[r, "i'"] & Y \end{tikzcd}$$

Note that $p_* i_* \mathrm{div}(f) = i'_*(p')_*\mathrm{div}(f)$ by Lemma 29.12.2. As explained above we have to show that $(p')_*\mathrm{div}(f)$ is the divisor of a rational function on W' or zero. There are three cases to distinguish.

The case $\dim_\delta(W') < k$. In this case automatically $(p')_*\mathrm{div}(f) = 0$ and there is nothing to prove.

The case $\dim_\delta(W') = k$. Let us show that $(p')_*\mathrm{div}(f) = 0$ in this case. Let $\eta \in W'$ be the generic point. Note that $c : W_\eta \to Spec(K)$ is a proper integral curve over $K = \kappa(\eta)$ whose function field $K(W_\eta)$ is identified with $R(W)$. Here is a diagram

$$\begin{tikzcd} W_\eta \arrow[r] \arrow[d, "c"'] & W \arrow[d, "p"] \\ Spec(K) \arrow[r] & W' \end{tikzcd}$$

Let us denote $f_\eta \in K(W_\eta)^*$ the rational function corresponding to $f \in R(W)^*$. Moreover, the closed points ξ of W_η correspond $1-1$ to the closed integral subschemes $Z = Z_\xi \subset W$ of δ-dimension k with $f(Z) = W'$. Note that the multiplicity of Z_ξ in $\mathrm{div}(f)$ is equal to $\mathrm{ord}_{\mathcal{O}_{W_\eta,\xi}}(f_\eta)$ simply because the local rings $\mathcal{O}_{W_\eta,\xi}$ and $\mathcal{O}_{W,\xi}$ are identified (as subrings of their fraction fields). Hence we see that the multiplicity of $[W']$ in $(p')_*\mathrm{div}(f)$ is equal to the multiplicity of $[Spec(K)]$ in $c_*\mathrm{div}(f_\eta)$. By Lemma 29.18.2 this is zero.

The case $\dim_\delta(W') = k+1$. In this case Lemma 29.18.1 applies, and we see that indeed $p'_*\mathrm{div}(f) = \mathrm{div}(g)$ for some $g \in R(W')^*$ as desired. $\square$

29.21. Different characterizations of rational equivalence

Let (S, δ) be as in Situation 29.7.1. Let X be a scheme locally of finite type over S. Given any closed subscheme $Z \subset X \times_S \mathbf{P}^1_S = X \times \mathbf{P}^1$ we let Z_0, resp. Z_∞ be the scheme theoretic closed subscheme $Z_0 = \mathrm{pr}_2^{-1}(D_0)$, resp. $Z_\infty = \mathrm{pr}_2^{-1}(D_\infty)$. Here D_0, D_∞ are as defined just above Lemma 29.17.3.

Lemma 29.21.1. *Let (S, δ) be as in Situation 29.7.1. Let X be a scheme locally of finite type over S. Let $W \subset X \times_S \mathbf{P}^1_S$ be an integral closed subscheme of δ-dimension $k + 1$. Assume $W \neq W_0$, and $W \neq W_\infty$. Then*

(1) *W_0, W_∞ are effective Cartier divisors of W,*
(2) *W_0, W_∞ can be viewed as closed subschemes of X and*
$$[W_0]_k \sim_{rat} [W_\infty]_k,$$
(3) *for any locally finite family of integral closed subschemes $W_i \subset X \times_S \mathbf{P}^1_S$ of δ-dimension $k+1$ with $W_i \neq (W_i)_0$ and $W_i \neq (W_i)_\infty$ we have $\sum([(W_i)_0]_k - [(W_i)_\infty]_k) \sim_{rat} 0$ on X, and*
(4) *for any $\alpha \in Z_k(X)$ with $\alpha \sim_{rat} 0$ there exists a locally finite family of integral closed subschemes $W_i \subset X \times_S \mathbf{P}^1_S$ as above such that $\alpha = \sum([(W_i)_0]_k - [(W_i)_\infty]_k)$.*

Proof. Part (1) follows from Divisors, Lemma 26.9.9 since the generic point of W is not mapped into D_0 or D_∞ under the projection $X \times_S \mathbf{P}^1_S \to \mathbf{P}^1_S$ by assumtion.

Since $X \times_S D_0 \to X$ is an isomorphism we see that W_0 is isomorphic to a closed subscheme of X. Similarly for W_∞. Consider the morphism $p : W \to X$. It is proper and on W we have $[W_0]_k \sim_{rat} [W_\infty]_k$. Hence part (2) follows from Lemma 29.20.2 as clearly $p_*[W_0]_k = [W_0]_k$ and similarly for W_∞.

The only content of statement (3) is, given parts (1) and (2), that the collection $\{(W_i)_0, (W_i)_\infty\}$ is a locally finite collection of closed subschemes of X. This is clear.

Suppose that $\alpha \sim_{rat} 0$. By definition this means there exist integral closed subschemes $V_i \subset X$ of δ-dimension $k + 1$ and rational functions $f_i \in R(V_i)^*$ such that the family $\{V_i\}_{i \in I}$ is locally finite in X and such that $\alpha = \sum (V_i \to X)_* \mathrm{div}(f_i)$. Let
$$W_i \subset V_i \times_S \mathbf{P}^1_S \subset X \times_S \mathbf{P}^1_S$$
be the closure of the graph of the rational map f_i as in Lemma 29.17.3. Then we have that $(V_i \to X)_* \mathrm{div}(f_i)$ is equal to $[(W_i)_0]_k - [(W_i)_\infty]_k$ by that same lemma. Hence the result is clear. □

Lemma 29.21.2. *Let (S, δ) be as in Situation 29.7.1. Let X be a scheme locally of finite type over S. Let Z be a closed subscheme of $X \times \mathbf{P}^1$. Assume $\dim_\delta(Z) \leq k + 1$, $\dim_\delta(Z_0) \leq k$, $\dim_\delta(Z_\infty) \leq k$ and assume any embedded point ξ (Divisors, Definition 26.4.1) of Z has $\delta(\xi) < k$. Then*
$$[Z_0]_k \sim_{rat} [Z_\infty]_k$$
as k-cycles on X.

Proof. Let $\{W_i\}_{i \in I}$ be the collection of irreducible components of Z which have δ-dimension $k + 1$. Write
$$[Z]_{k+1} = \sum n_i [W_i]$$

with $n_i > 0$ as per definition. Note that $\{W_i\}$ is a locally finite collection of closed subsets of $X \times_S \mathbf{P}^1_S$ by Lemma 29.9.1. We claim that

$$[Z_0]_k = \sum n_i[(W_i)_0]_k$$

and similarly for $[Z_\infty]_k$. If we prove this then the lemma follows from Lemma 29.21.1.

Let $Z' \subset X$ be an integral closed subscheme of δ-dimension k. To prove the equality above it suffices to show that the coefficient n of $[Z']$ in $[Z_0]_k$ is the same as the coefficient m of $[Z']$ in $\sum n_i[(W_i)_0]_k$. Let $\xi' \in Z'$ be the generic point. Set $\xi = (\xi', 0) \in X \times_S \mathbf{P}^1_S$. Consider the local ring $A = \mathcal{O}_{X\times_S\mathbf{P}^1_S,\xi}$. Let $I \subset A$ be the ideal cutting out Z, in other words so that $A/I = \mathcal{O}_{Z,\xi}$. Let $t \in A$ be the element cutting out $X \times_S D_0$ (i.e., the coordinate of $\mathbf{P}^1$ at zero pulled back). By our choice of $\xi' \in Z'$ we have $\delta(\xi) = k$ and hence $\dim(A/I) = 1$. Since ξ is not an embedded point by definition we see that A/I is Cohen-Macaulay. Since $\dim_\delta(Z_0) = k$ we see that $\dim(A/(t, I)) = 0$ which implies that t is a nonzero divisor on A/I. Finally, the irreducible closed subschemes W_i passing through ξ correspond to the minimal primes $I \subset \mathfrak{q}_i$ over I. The multiplicities n_i correspond to the lengths $\text{length}_{A_{\mathfrak{q}_i}}(A/I)_{\mathfrak{q}_i}$. Hence we see that

$$n = \text{length}_A(A/(t, I))$$

and

$$m = \sum \text{length}_A(A/(t, \mathfrak{q}_i))\text{length}_{A_{\mathfrak{q}_i}}(A/I)_{\mathfrak{q}_i}$$

Thus the result follows from Lemma 29.5.6. □

Lemma 29.21.3. *Let (S, δ) be as in Situation 29.7.1. Let X be a scheme locally of finite type over S. Let $\mathcal{F}$ be a coherent sheaf on $X \times \mathbf{P}^1$. Let $i_0, i_\infty : X \to X \times \mathbf{P}^1$ be the closed immersion such that $i_t(x) = (x, t)$. Denote $\mathcal{F}_0 = i_0^*\mathcal{F}$ and $\mathcal{F}_\infty = i_\infty^*\mathcal{F}$. Assume*

1. *$\dim_\delta(Supp(\mathcal{F})) \leq k + 1$,*
2. *$\dim_\delta(Supp(\mathcal{F}_0)) \leq k$, $\dim_\delta(Supp(\mathcal{F}_\infty)) \leq k$, and*
3. *any nonmaximal associated point (insert future reference here) $\xi \in Supp(\mathcal{F})$ of $\mathcal{F}$ has $\delta(\xi) < k$.*

Then

$$[\mathcal{F}_0]_k \sim_{rat} [\mathcal{F}_\infty]_k$$

as k-cycles on X.

Proof. Let $\{W_i\}_{i\in I}$ be the collection of irreducible components of $\text{Supp}(\mathcal{F})$ which have δ-dimension $k + 1$. Write

$$[\mathcal{F}]_{k+1} = \sum n_i[W_i]$$

with $n_i > 0$ as per definition. Note that $\{W_i\}$ is a locally finite collection of closed subsets of $X \times_S \mathbf{P}^1_S$ by Lemma 29.10.1. We claim that

$$[\mathcal{F}_0]_k = \sum n_i[(W_i)_0]_k$$

and similarly for $[\mathcal{F}_\infty]_k$. If we prove this then the lemma follows from Lemma 29.21.1.

Let $Z' \subset X$ be an integral closed subscheme of δ-dimension k. To prove the equality above it suffices to show that the coefficient n of $[Z']$ in $[\mathcal{F}_0]_k$ is the same as the coefficient m of $[Z']$ in $\sum n_i[(W_i)_0]_k$. Let $\xi' \in Z'$ be the generic point. Set $\xi = (\xi', 0) \in X \times_S \mathbf{P}^1_S$. Consider the local ring $A = \mathcal{O}_{X\times_S\mathbf{P}^1_S,\xi}$. Let $M = \mathcal{F}_\xi$ as an A-module. Let $t \in A$ be the element cutting out $X \times_S D_0$ (i.e., the coordinate of $\mathbf{P}^1$ at zero pulled back). By our choice of $\xi' \in Z'$ we have $\delta(\xi) = k$ and hence $\dim(M) = 1$. Since ξ is not an associated point of $\mathcal{F}$ by definition we see that M is Cohen-Macaulay module. Since $\dim_\delta(\text{Supp}(\mathcal{F}_0)) = k$ we see that $\dim(M/tM) = 0$ which implies that t is a nonzero divisor on M. Finally, the irreducible closed subschemes W_i passing through ξ correspond to the minimal primes $\mathfrak{q}_i$ of $\text{Ass}(M)$. The multiplicities n_i correspond to the lengths $\text{length}_{A_{\mathfrak{q}_i}} M_{\mathfrak{q}_i}$. Hence we see that

$$n = \text{length}_A(M/tM)$$

and

$$m = \sum \text{length}_A(A/(t, \mathfrak{q}_i)A)\text{length}_{A_{\mathfrak{q}_i}} M_{\mathfrak{q}_i}$$

Thus the result follows from Lemma 29.5.6. □

29.22. Rational equivalence and K-groups

In this section we compare the cycle groups $Z_k(X)$ and the Chow groups $A_k(X)$ with certain K_0-groups of abelian categories of coherent sheaves on X. We avoid having to talk about $K_1(\mathcal{A})$ for an abelian category $\mathcal{A}$ by dint of Homology, Lemma 10.8.3. In particular, the motivation for the precise form of Lemma 29.22.4 is that lemma.

Let us introduce the following notation. Let (S, δ) be as in Situation 29.7.1. Let X be a scheme locally of finite type over S. We denote $\text{Coh}(X) = \text{Coh}(\mathcal{O}_X)$ the category of coherent sheaves on X. It is an abelian category, see Coherent, Lemma 25.11.2. For any $k \in \mathbf{Z}$ we let $\text{Coh}_{\leq k}(X)$ be the full subcategory of $\text{Coh}(X)$ consisting of those coherent sheaves $\mathcal{F}$ having $\dim_\delta(\text{Supp}(\mathcal{F})) \leq k$.

Lemma 29.22.1. *Let us introduce the following notation. Let (S, δ) be as in Situation 29.7.1. Let X be a scheme locally of finite type over S. The categories $Coh_{\leq k}(X)$ are Serre subcategories of the abelian category $Coh(X)$.*

Proof. Omitted. The definition of a Serre subcateory is Homology, Definition 10.7.1. □

Lemma 29.22.2. *Let (S, δ) be as in Situation 29.7.1. Let X be a scheme locally of finite type over S. There are maps*

$$Z_k(X) \longrightarrow K_0(Coh_{\leq k}(X)/Coh_{\leq k-1}(X)) \longrightarrow Z_k(X)$$

whose composition is the identity. The first is the map

$$\sum n_Z[Z] \mapsto \left[\bigoplus\nolimits_{n_Z>0} \mathcal{O}_Z^{\oplus n_Z}\right] - \left[\bigoplus\nolimits_{n_Z<0} \mathcal{O}_Z^{\oplus -n_Z}\right]$$

and the second comes from the map $\mathcal{F} \mapsto [\mathcal{F}]_k$. If X is quasi-compact, then both maps are isomorphisms.

Proof. Note that the direct sum $\bigoplus_{n_Z>0} \mathcal{O}_Z^{\oplus n_Z}$ is indeed a coherent sheaf on X since the family $\{Z \mid n_Z > 0\}$ is locally finite on X. The map $\mathcal{F} \to [\mathcal{F}]_k$ is additive on $\text{Coh}_{\leq k}(X)$, see Lemma 29.10.4. And $[\mathcal{F}]_k = 0$ if $\mathcal{F} \in \text{Coh}_{\leq k-1}(X)$. This implies we have the left map as shown in the lemma. It is clear that their composition is the identity.

In case X is quasi-compact we will show that the right arrow is injective. Suppose that $q \in K_0(\text{Coh}_{\leq k}(X)/\text{Coh}_{\leq k+1}(X))$ maps to zero in $Z_k(X)$. By Homology, Lemma 10.8.3 we can find a $\tilde{q} \in K_0(\text{Coh}_{\leq k}(X))$ mapping to q. Write $\tilde{q} = [\mathcal{F}] - [\mathcal{G}]$ for some $\mathcal{F}, \mathcal{G} \in K_0(\text{Coh}_{\leq k}(X))$. Since X is quasi-compact we may apply Coherent, Lemma 25.14.3. This shows that there exist integral closed subschemes $Z_j, T_i \subset X$ and (nonzero) ideal sheaves $\mathcal{I}_j \subset \mathcal{O}_{Z_j}$, $\mathcal{J}_i \subset \mathcal{O}_{T_i}$ such that $\mathcal{F}$, resp. $\mathcal{G}$ have filtrations whose succesive quotients are the sheaves $\mathcal{I}_j$, resp. $\mathcal{J}_i$. In particular we see that $\dim_\delta(Z_j), \dim_\delta(T_i) \leq k$. In other words we have

$$[\mathcal{F}] = \sum\nolimits_j [\mathcal{I}_j], \quad [\mathcal{G}] = \sum\nolimits_i [\mathcal{J}_i],$$

in $K_0(\textit{Coh}_{\leq k}(X))$. Our assumption is that $\sum_j [\mathcal{I}_j]_k - \sum_i [\mathcal{J}_i]_k = 0$. It is clear that we may throw out the indices j, resp. i such that $\dim_\delta(Z_j) < k$, resp. $\dim_\delta(T_i) < k$, since the corresponding sheaves are in $\textit{Coh}_{k-1}(X)$ and also do not contribute to the cycle. Moreover, the exact sequences $0 \to \mathcal{I}_j \to \mathcal{O}_{Z_j} \to \mathcal{O}_{Z_j}/\mathcal{I}_j \to 0$ and $0 \to \mathcal{J}_i \to \mathcal{O}_{T_i} \to \mathcal{O}_{Z_i}/\mathcal{J}_i \to 0$ show similarly that we may replace $\mathcal{I}_j$, resp. $\mathcal{J}_i$ by $\mathcal{O}_{Z_j}$, resp. $\mathcal{O}_{T_i}$. OK, and finally, at this point it is clear that our assumption

$$\sum\nolimits_j [\mathcal{O}_{Z_j}]_k - \sum\nolimits_i [\mathcal{O}_{T_i}]_k = 0$$

implies that in $K_0(\textit{Coh}_k(X))$ we have also $\sum_j [\mathcal{O}_{Z_j}] - \sum_i [\mathcal{O}_{T_i}] = 0$ as desired. □

Remark 29.22.3. It seems likely that the arrows of Lemma 29.22.2 are not isomorphisms if X is not quasi-compact. For example, suppose X is an infinite disjoint union $X = \coprod_{n \in \mathbf{N}} \mathbf{P}^1_k$ over a field k. Let $\mathcal{F}$, resp. $\mathcal{G}$ be the coherent sheaf on X whose restriction to the nth summand is equal to the skyscraper sheaf at 0 associated to $\mathcal{O}_{\mathbf{P}^1_k, 0}/\mathfrak{m}_0^n$, resp. $\kappa(0)^{\oplus n}$. The cycle associated to $\mathcal{F}$ is equal to the cycle associated to $\mathcal{G}$, namely both are equal to $\sum n[0_n]$ where $0_n \in X$ denotes 0 on the nth component of X. But there seems to be no way to show that $[\mathcal{F}] = [\mathcal{G}]$ in $K_0(\textit{Coh}(X))$ since any proof we can envision uses infinitely many relations.

Lemma 29.22.4. *Let (S, δ) be as in Situation 29.7.1. Let X be a scheme locally of finite type over S. Let $\mathcal{F}$ be a coherent sheaf on X. Let*

$$\ldots \longrightarrow \mathcal{F} \xrightarrow{\varphi} \mathcal{F} \xrightarrow{\psi} \mathcal{F} \xrightarrow{\varphi} \mathcal{F} \longrightarrow \ldots$$

be a complex as in Homology, Equation (10.8.2.1). Assume that

(1) $\dim_\delta(\textit{Supp}(\mathcal{F})) \leq k + 1$.
(2) $\dim_\delta(\textit{Supp}(H^i(\mathcal{F}, \varphi, \psi))) \leq k$ *for* $i = 0, 1$.

Then we have

$$[H^0(\mathcal{F}, \varphi, \psi)]_k \sim_{rat} [H^1(\mathcal{F}, \varphi, \psi)]_k$$

as k-cycles on X.

Proof. Let $\{W_j\}_{j \in J}$ be the collection of irreducible components of $\text{Supp}(\mathcal{F})$ which have δ-dimension $k + 1$. Note that $\{W_j\}$ is a locally finite collection of closed subsets of X by Lemma 29.10.1. For every j, let $\xi_j \in W_j$ be the generic point. Set

$$f_j = \det\nolimits_{\kappa(\xi_j)}(\mathcal{F}_{\xi_j}, \varphi_{\xi_j}, \psi_{\xi_j}) \in R(W_j)^*.$$

See Definition 29.3.4 for notation. We claim that

$$-[H^0(\mathcal{F}, \varphi, \psi)]_k + [H^1(\mathcal{F}, \varphi, \psi)]_k = \sum (W_j \to X)_* \text{div}(f_j)$$

If we prove this then the lemma follows.

Let $Z \subset X$ be an integral closed subscheme of δ-dimension k. To prove the equality above it suffices to show that the coefficient n of $[Z]$ in $[H^0(\mathcal{F}, \varphi, \psi)]_k - [H^1(\mathcal{F}, \varphi, \psi)]_k$ is the same as the coefficient m of $[Z]$ in $\sum (W_j \to X)_* \text{div}(f_j)$. Let $\xi \in Z$ be the generic point. Consider the local ring $A = \mathcal{O}_{X,\xi}$. Let $M = \mathcal{F}_\xi$ as an A-module. Denote $\varphi, \psi : M \to M$ the action of φ, ψ on the stalk. By our choice of $\xi \in Z$ we have $\delta(\xi) = k$ and hence $\dim(M) = 1$. Finally, the integral closed subschemes W_j passing through ξ correspond to the minimal primes $\mathfrak{q}_i$ of $\text{Supp}(M)$. In each case the element $f_j \in R(W_j)^*$ corresponds to the element $\det_{\kappa(\mathfrak{q}_i)}(M_{\mathfrak{q}_i}, \varphi, \psi)$ in $\kappa(\mathfrak{q}_i)^*$. Hence we see that

$$n = -e_A(M, \varphi, \psi)$$

and

$$m = \sum \text{ord}_{A/\mathfrak{q}_i}(\det_{\kappa(\mathfrak{q}_i)}(M_{\mathfrak{q}_i}, \varphi, \psi))$$

Thus the result follows from Proposition 29.5.3. $\square$

Lemma 29.22.5. *Let (S, δ) be as in Situation 29.7.1. Let X be a scheme locally of finite type over S. Denote $B_k(X)$ the image of the map*

$$K_0(Coh_{\leq k}(X)/Coh_{\leq k-1}(X)) \longrightarrow K_0(Coh_{\leq k+1}(X)/Coh_{\leq k-1}(X)).$$

There is a commutative diagram

$$\begin{tikzcd} K_0\left(\frac{Coh_{\leq k}(X)}{Coh_{\leq k-1}(X)}\right) \arrow[r] \arrow[d] & B_k(X) \arrow[r, hook] \arrow[d] & K_0\left(\frac{Coh_{\leq k+1}(X)}{Coh_{\leq k-1}(X)}\right) \\ Z_k(X) \arrow[r] & A_k(X) & \end{tikzcd}$$

where the left vertical arrow is the one from Lemma 29.22.2. If X is quasi-compact then both vertical arrows are isomorphisms.

Proof. Suppose we have an element $[A] - [B]$ of $K_0(\text{Coh}_{\leq k}(X)/\text{Coh}_{\leq k-1}(X))$ which maps to zero in $B_k(X)$, i.e., in $K_0(\text{Coh}_{\leq k+1}(X)/\text{Coh}_{\leq k-1}(X))$. Suppose $[A] = [\mathcal{A}]$ and $[B] = [\mathcal{B}]$ for some coherent sheaves $\mathcal{A}, \mathcal{B}$ on X supported in δ-dimension $\leq k$. The assumption that $[A] - [B]$ maps to zero in the group $K_0(\text{Coh}_{\leq k+1}(X)/\text{Coh}_{\leq k-1}(X))$ means that there exists coherent sheaves $\mathcal{A}', \mathcal{B}'$ on X supported in δ-dimension $\leq k-1$ such that $[\mathcal{A} \oplus \mathcal{A}'] - [\mathcal{B} \oplus \mathcal{B}']$ is zero in $K_0(\text{Coh}_{k+1}(X))$ (use part (1) of Homology, Lemma 10.8.3). By part (2) of Homology, Lemma 10.8.3 this means there exists a $(2, 1)$-periodic complex $(\mathcal{F}, \varphi, \psi)$ in the category $\text{Coh}_{\leq k+1}(X)$ such that $\mathcal{A} \oplus \mathcal{A}' = H^0(\mathcal{F}, \varphi, \psi)$ and $\mathcal{B} \oplus \mathcal{B}' = H^1(\mathcal{F}, \varphi, \psi)$. By Lemma 29.22.4 this implies that

$$[\mathcal{A} \oplus \mathcal{A}']_k \sim_{rat} [\mathcal{B} \oplus \mathcal{B}']_k$$

This proves that $[A] - [B]$ maps to zero via the composition

$$K_0(\text{Coh}_{\leq k}(X)/\text{Coh}_{\leq k-1}(X)) \longrightarrow Z_k(X) \longrightarrow A_k(X).$$

In other words this proves the commutative diagram exists.

Next, assume that X is quasi-compact. By Lemma 29.22.2 the left vertical arrow is bijective. Hence it suffices to show any $\alpha \in Z_k(X)$ which is rationally equivalent to zero maps to zero in $B_k(X)$ via the inverse of the left vertical arrow composed with the horizontal arrow. By Lemma 29.21.1 we see that $\alpha = \sum([(W_i)_0]_k - [(W_i)_\infty]_k)$ for some closed integral subschemes $W_i \subset X \times_S \mathbf{P}^1_S$ of δ-dimension $k+1$. Moreover the family $\{W_i\}$ is finite because X is quasi-compact. Note that the ideal sheaves $\mathcal{I}_i, \mathcal{J}_i \subset \mathcal{O}_{W_i}$ of the effective Cartier divisors $(W_i)_0, (W_i)_\infty$ are isomorphic (as $\mathcal{O}_{W_i}$-modules). This is true because the ideal sheaves of D_0 and D_∞ on $\mathbf{P}^1$ are isomorphic and $\mathcal{I}_i, \mathcal{J}_i$ are the pullbacks of these. (Some details omitted.) Hence we have short exact sequences

$$0 \to \mathcal{I}_i \to \mathcal{O}_{W_i} \to \mathcal{O}_{(W_i)_0} \to 0, \quad 0 \to \mathcal{J}_i \to \mathcal{O}_{W_i} \to \mathcal{O}_{(W_i)_\infty} \to 0$$

of coherent $\mathcal{O}_{W_i}$-modules. Also, since $[(W_i)_0]_k = [p_*\mathcal{O}_{(W_i)_0}]_k$ in $Z_k(X)$ we see that the inverse of the left vertical arrow maps $[(W_i)_0]_k$ to the element $[p_*\mathcal{O}_{(W_i)_0}]$ in $K_0(\textit{Coh}_{\leq k}(X)/\textit{Coh}_{\leq k-1}(X))$. Thus we have

$$\begin{aligned} \alpha &= \sum \left([(W_i)_0]_k - [(W_i)_\infty]_k\right) \\ &\mapsto \sum \left([p_*\mathcal{O}_{(W_i)_0}] - [p_*\mathcal{O}_{(W_i)_\infty}]\right) \\ &= \sum \left([p_*\mathcal{O}_{W_i}] - [p_*\mathcal{I}_i] - [p_*\mathcal{O}_{W_i}] + [p_*\mathcal{J}_i]\right) \end{aligned}$$

in $K_0(\textit{Coh}_{\leq k+1}(X)/\textit{Coh}_{\leq k-1}(X))$. By what was said above this is zero, and we win. □

Remark 29.22.6. Let (S, δ) be as in Situation 29.7.1. Let X be a scheme locally of finite type over S. Assume X is quasi-compact. The result of Lemma 29.22.5 in particular gives a map

$$A_k(X) \longrightarrow K_0(\textit{Coh}(X)/\textit{Coh}_{\leq k-1}(X)).$$

We have not been able to find a statement or conjecture in the literature as to whether this map is should be injective or not. If X is connected nonsingular, then, using the isomorphism $K_0(X) = K^0(X)$ (see insert future reference here) and chern classes (see below), one can show that the map is an isomorphism up to $(p-1)!$-torsion where $p = \dim_\delta(X) - k$.

29.23. Preparation for the divisor associated to an invertible sheaf

For the following remarks, see Divisors, Section 26.15. Let X be a scheme. Let $\mathcal{L}$ be an invertible $\mathcal{O}_X$-module. Let $\xi \in X$ be a point. If $s_\xi, s'_\xi \in \mathcal{L}_\xi$ generate $\mathcal{L}_\xi$ as $\mathcal{O}_{X,\xi}$-module, then there exists a unit $u \in \mathcal{O}_{X,\xi}^*$ such that $s_\xi = u s'_\xi$. The stalk of the sheaf of meromorphic sections $\mathcal{K}_X(\mathcal{L})$ of $\mathcal{L}$ at x is equal to $\mathcal{K}_{X,x} \otimes_{\mathcal{O}_{X,x}} \mathcal{L}_x$. Thus the image of any meromorphic section s of $\mathcal{L}$ in the stalk at x can be written as $s = f s_\xi$ with $f \in \mathcal{K}_{X,x}$. Below we will abbreviate this by saying $f = s/s_\xi$. Also, if X is integral we have $\mathcal{K}_{X,x} = R(X)$ is equal to the function field of X, so $s/s_\xi \in R(X)$. If s is a *regular* meromorphic section (see Divisors, Definition 26.15.10), then actually $f \in R(X)^*$. (On an integral scheme a regular meromorphic section is the same thing as a nonzero meromorphic section.) Hence the following definition makes sense.

Definition 29.23.1. Let X be a locally Noetherian scheme. Assume X is integral. Let $\mathcal{L}$ be an invertible $\mathcal{O}_X$-module. Let $s \in \Gamma(X, \mathcal{K}_X(\mathcal{L}))$ be a regular meromorphic section of $\mathcal{L}$. For every integral closed subscheme $Z \subset X$ of codimension 1 we define the *order of vanishing of s along Z* as the integer

$$\text{ord}_{Z,\mathcal{L}}(s) = \text{ord}_{\mathcal{O}_{X,\xi}}(s/s_\xi)$$

where the right hand side is the notion of Algebra, Definition 7.112.2, $\xi \in Z$ is the generic point, and $s_\xi \in \mathcal{L}_\xi$ is a generator.

Lemma 29.23.2. *Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Assume X is integral. Let $\mathcal{L}$ be an invertible $\mathcal{O}_X$-module. Let $s \in \mathcal{K}_X(\mathcal{L})$ be a regular (i.e., nonzero) meromorphic section of $\mathcal{L}$. Then the set*

$$\{Z \subset X \mid Z \text{ is irreducible, closed of codimension } 1 \text{ and } \text{ord}_{Z,\mathcal{L}}(s) \neq 0\}$$

is locally finite in X.

Proof. This is true simply because there exists a nonempty open subscheme $U \subset X$ such that s corresponds to a section of $\Gamma(U, \mathcal{L})$ which generates $\mathcal{L}$ over U. Hence the codimension 1 irreducibles which can occur in the set of the lemma are all irreducible components of $X \setminus U$. Hence Lemma 29.9.1 gives the desired result. $\square$

Lemma 29.23.3. *Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Assume X is integral and $n = \dim_\delta(X)$. Let $\mathcal{L}$ be an invertible $\mathcal{O}_X$-module. Let $s, s' \in \mathcal{K}_X(\mathcal{L})$ be nonzero meromorphic sections of $\mathcal{L}$. Then $f = s/s'$ is an element of $R(X)^*$ and we have*

$$\sum ord_{Z,\mathcal{L}}(s)[Z] = \sum ord_{Z,\mathcal{L}}(s')[Z] + div(f)$$

(where the sums are over integral closed subschemes $Z \subset X$ of δ-dimension $n-1$) as elements of $Z_{n-1}(X)$.

Proof. This is clear from the definitions. Note that Lemma 29.23.2 garantees that the sums are indeed elements of $Z_{n-1}(X)$. $\square$

29.24. The divisor associated to an invertible sheaf

The material above allows us to define the divisor associated to an invertible sheaf.

Definition 29.24.1. Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Assume X is integral and $n = \dim_\delta(X)$. Let $\mathcal{L}$ be an invertible $\mathcal{O}_X$-module.

(1) For any nonzero meromorphic section s of $\mathcal{L}$ we define the *Weil divisor associated to s* as
$$\operatorname{div}_\mathcal{L}(s) := \sum \operatorname{ord}_{Z,\mathcal{L}}(s)[Z] \in Z_{n-1}(X)$$
where the sum is over integral closed subschemes $Z \subset X$ of δ-dimension $n-1$.

(2) We define *Weil divisor associated to $\mathcal{L}$*
$$c_1(\mathcal{L}) \cap [X] = \text{class of } \operatorname{div}_\mathcal{L}(s) \in A_{n-1}(X)$$
where s is any nonzero meromorphic section of $\mathcal{L}$ over X. This is well defined by Lemma 29.23.3.

There are some cases where it is easy to compute the Weil divisor associated to an invertible sheaf.

Lemma 29.24.2. *Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Assume X is integral and $n = \dim_\delta(X)$. Let $\mathcal{L}$ be an invertible $\mathcal{O}_X$-module. Let $s \in \Gamma(X, \mathcal{L})$ be a nonzero global section. Then*

$$div_\mathcal{L}(s) = [Z(s)]_{n-1}$$

in $Z_{n-1}(X)$ and

$$c_1(\mathcal{L}) \cap [X] = [Z(s)]_{n-1}$$

in $A_{n-1}(X)$.

Proof. Let $Z \subset X$ be an integral closed subscheme of δ-dimension $n-1$. Let $\xi \in Z$ be its generic point. Choose a generator $s_\xi \in \mathcal{L}_\xi$. Write $s = f s_\xi$ for some $f \in \mathcal{O}_{X,\xi}$. By definition of $Z(s)$, see Divisors, Definition 26.9.15 we see that $Z(s)$ is cut out by a quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_X$ such that $\mathcal{I}_\xi = (f)$. Hence $\text{length}_{\mathcal{O}_{X,x}}(\mathcal{O}_{Z(s),\xi}) = \text{length}_{\mathcal{O}_{X,x}}(\mathcal{O}_{X,\xi}/(f)) = \operatorname{ord}_{\mathcal{O}_{X,x}}(f)$ as desired. $\square$

Lemma 29.24.3. *Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Assume X is integral and $n = \dim_\delta(X)$. Let $\mathcal{L}$, $\mathcal{N}$ be invertible $\mathcal{O}_X$-modules. Then*

(1) *Let s, resp. t be a nonzero meromorphic section of $\mathcal{L}$, resp. $\mathcal{N}$. Then st is a nonzero meromorphic section of $\mathcal{L} \otimes \mathcal{N}$, and*
$$div_{\mathcal{L}\otimes\mathcal{N}}(st) = div_{\mathcal{L}}(s) + div_{\mathcal{N}}(t)$$
in $Z_{n-1}(X)$.
(2) *We have*
$$c_1(\mathcal{L}) \cap [X] + c_1(\mathcal{N}) \cap [X] = c_1(\mathcal{L} \otimes_{\mathcal{O}_X} \mathcal{N}) \cap [X]$$
in $A_{n-1}(X)$.

Proof. Let s, resp. t be a nonzero meromorphic section of $\mathcal{L}$, resp. $\mathcal{N}$. Then st is a nonzero meromorphic section of $\mathcal{L}\otimes\mathcal{N}$. Let $Z \subset X$ be an integral closed subscheme of δ-dimension $n-1$. Let $\xi \in Z$ be its generic point. Choose generators $s_\xi \in \mathcal{L}_\xi$, and $t_\xi \in \mathcal{N}_\xi$. Then $s_\xi t_\xi$ is a generator for $(\mathcal{L} \otimes \mathcal{N})_\xi$. So $st/(s_\xi t_\xi) = (s/s_\xi)(t/t_\xi)$. Hence we see that
$$\text{div}_{\mathcal{L}\otimes\mathcal{N},Z}(st) = \text{div}_{\mathcal{L},Z}(s) + \text{div}_{\mathcal{N},Z}(t)$$
by the additivity of the ord_Z function. □

The following lemma will be superseded by the more general Lemma 29.25.4.

Lemma 29.24.4. *Let (S, δ) be as in Situation 29.7.1. Let X, Y be locally of finite type over S. Assume X, Y are integral and $n = \dim_\delta(Y)$. Let $\mathcal{L}$ be an invertible $\mathcal{O}_Y$-module. Let $f : X \to Y$ be a flat morphism of relative dimension r. Let $\mathcal{L}$ be an invertible sheaf on Y. Then*
$$f^*(c_1(\mathcal{L}) \cap [Y]) = c_1(f^*\mathcal{L}) \cap [X]$$
in $A_{n+r-1}(X)$.

Proof. Let s be a nonzero meromorphic section of $\mathcal{L}$. We will show that actually $f^*\text{div}_{\mathcal{L}}(s) = \text{div}_{f^*\mathcal{L}}(f^*s)$ and hence the lemma holds. To see this let $\xi \in Y$ be a point and let $s_\xi \in \mathcal{L}_\xi$ be a generator. Write $s = gs_\xi$ with $g \in R(X)^*$. Then there is an open neighbourhood $V \subset Y$ of ξ such that $s_\xi \in \mathcal{L}(V)$ and such that s_ξ generates $\mathcal{L}|_V$. Hence we see that
$$\text{div}_{\mathcal{L}}(s)|_V = \text{div}(g)|_V.$$
In exactly the same way, since f^*s_ξ generates $\mathcal{L}$ over $f^{-1}(V)$ and since $f^*s = gf^*s_\xi$ we also have
$$\text{div}_{\mathcal{L}}(f^*s)|_{f^{-1}(V)} = \text{div}(g)|_{f^{-1}(V)}.$$
Thus the desired equality of cycles over $f^{-1}(V)$ follows from the corresponding result for pull backs of principal divisors, see Lemma 29.17.4. □

29.25. Intersecting with Cartier divisors

Definition 29.25.1. Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Let $\mathcal{L}$ be an invertible $\mathcal{O}_X$-module. We define, for every integer k, an operation
$$c_1(\mathcal{L}) \cap - : Z_{k+1}(X) \to A_k(X)$$
called *intersection with the first chern class of $\mathcal{L}$*.

(1) Given an integral closed subscheme $i : W \to X$ with $\dim_\delta(W) = k+1$ we define
$$c_1(\mathcal{L}) \cap [W] = i_*(c_1(i^*\mathcal{L}) \cap [W])$$
where the right hand side is defined in Definition 29.24.1.
(2) For a general $(k+1)$-cycle $\alpha = \sum n_i[W_i]$ we set
$$c_1(\mathcal{L}) \cap \alpha = \sum n_i c_1(\mathcal{L}) \cap [W_i]$$

Write each $c_1(\mathcal{L}) \cap W_i = \sum_j n_{i,j}[Z_{i,j}]$ with $\{Z_{i,j}\}_j$ a locally finite sum of integral closed subschemes of W_i. Since $\{W_i\}$ is a locally finite collection of integral closed subschemes on X, it follows easily that $\{Z_{i,j}\}_{i,j}$ is a locally finite collection of closed subschemes of X. Hence $c_1(\mathcal{L}) \cap \alpha = \sum n_i n_{i,j}[Z_{i,j}]$ is a cycle. Another, more convenient, way to think about this is to observe that the morphism $\coprod W_i \to X$ is proper. Hence $c_1(\mathcal{L}) \cap \alpha$ can be viewed as the pushforward of a class in $A_k(\coprod W_i) = \prod A_k(W_i)$. This also explains why the result is well defined up to rational equivalence on X.

The main goal for the next few sections is to show that intersecting with $c_1(\mathcal{L})$ factors through rational equivalence, and is commutative. This is not a trviality.

Lemma 29.25.2. *Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Let $\mathcal{L}$, $\mathcal{N}$ be an invertible sheaves on X. Then*

$$c_1(\mathcal{L}) \cap \alpha + c_1(\mathcal{N}) \cap \alpha = c_1(\mathcal{L} \otimes_{\mathcal{O}_X} \mathcal{N}) \cap \alpha$$

in $A_k(X)$ for every $\alpha \in Z_{k-1}(X)$. Moreover, $c_1(\mathcal{O}_X) \cap \alpha = 0$ for all α.

Proof. The additivity follows directly from Lemma 29.24.3 and the definitions. To see that $c_1(\mathcal{O}_X) \cap \alpha = 0$ consider the section $1 \in \Gamma(X, \mathcal{O}_X)$. This restricts to an everywhere nonzero section on any integral closed subscheme $W \subset X$. Hence $c_1(\mathcal{O}_X) \cap [W] = 0$ as desired. $\square$

The following lemma is a useful result in order to compute the intersection product of the c_1 of an invertible sheaf and the cycle associated to a closed subscheme. Recall that $Z(s) \subset X$ denotes the zero scheme of a global section s of an invertible sheaf on a scheme X, see Divisors, Definition 26.9.15.

Lemma 29.25.3. *Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Let $\mathcal{L}$ be an invertible $\mathcal{O}_X$-module. Let $Z \subset X$ be a closed subscheme. Assume* $\dim_\delta(Z) \leq k + 1$. *Let $s \in \Gamma(Z, \mathcal{L}|_Z)$. Assume*

(1) $\dim_\delta(Z(s)) \leq k$, *and*
(2) *for every generic point ξ of an irreducible component of $Z(s)$ of dimension k the multiplication by s induces an injection $\mathcal{O}_{Z,\xi} \to (\mathcal{L}|_Z)_\xi$.*

This holds for example if s is a regular section of $\mathcal{L}|_Z$. Then

$$[Z(s)]_k = c_1(\mathcal{L}) \cap [Z]_{k+1}$$

in $A_k(X)$.

Proof. Write

$$[Z]_{k+1} = \sum n_i[W_i]$$

where $W_i \subset Z$ are the irreducible components of Z of δ-dimension $k + 1$ and $n_i > 0$. By assumption the restriction $s_i = s|_{W_i} \in \Gamma(W_i, \mathcal{L}|_{W_i})$ is not zero, and hence is a regular section. By Lemma 29.24.2 we see that $[Z(s_i)]_k$ represents $c_1(\mathcal{L}|_{W_i})$. Hence by definition

$$c_1(\mathcal{L}) \cap [Z]_{k+1} = \sum n_i[Z(s_i)]_k$$

In fact, the proof below will show that we have

$$[Z(s)]_k = \sum n_i[Z(s_i)]_k \quad (29.25.3.1)$$

as k-cycles on X.

Let $Z' \subset X$ be an integral closed subscheme of δ-dimension k. Let $\xi' \in Z'$ be its generic point. We want to compare the coefficient n of $[Z']$ in the expression $\sum n_i[Z(s_i)]_k$ with the coefficient m of $[Z']$ in the expression $[Z(s)]_k$. Choose a generator $s_{\xi'} \in \mathcal{L}_\xi$. Let $\mathcal{I} \subset \mathcal{O}_X$

be the ideal sheaf of Z. Write $A = \mathcal{O}_{X,\xi'}$, $L = \mathcal{L}_{\xi'}$ and $I = \mathcal{I}_{\xi'}$. Then $L = As_{\xi'}$ and $L/IL = (A/I)s_{\xi'} = (\mathcal{L}|_Z)_{\xi'}$. Write $s = fs_{\xi'}$ for some (unique) $f \in A/I$. Hypothesis (2) means that $f : A/I \to A/I$ is injective. Since $\dim_\delta(Z) \leq k+1$ and $\dim_\delta(Z') = k$ we have $\dim(A/I) = 0$ or 1. We have

$$m = \text{length}_A(A/(f, I))$$

which is finite in either case.

If $\dim(A/I) = 0$, then $f : A/I \to A/I$ being injective implies that $f \in (A/I)^*$. Hence in this case m is zero. Moreover, the condition $\dim(A/I) = 0$ means that ξ' does not lie on any irreducible component of δ-dimension $k+1$, i.e., $n = 0$ as well.

Now, let $\dim(A/I) = 1$. Since A is a Noetherian local ring there are finitely many minimal primes $\mathfrak{q}_1, \ldots, \mathfrak{q}_t \supset I$ over I. These correspond 1-1 with W_i passing through ξ'. Moreover $n_i = \text{length}_{A_{\mathfrak{q}_i}}((A/I)_{\mathfrak{q}_i})$. Also, the multiplicity of $[Z']$ in $[Z(s_i)]_k$ is $\text{length}_A(A/(f, \mathfrak{q}_i))$. Hence the equation to prove in this case is

$$\text{length}_A(A/(f, I)) = \sum \text{length}_{A_{\mathfrak{q}_i}}((A/I)_{\mathfrak{q}_i})\text{length}_A(A/(f, \mathfrak{q}_i))$$

which follows from Lemma 29.5.6. □

Lemma 29.25.4. *Let (S, δ) be as in Situation 29.7.1. Let X, Y be locally of finite type over S. Let $f : X \to Y$ be a flat morphism of relative dimension r. Let $\mathcal{L}$ be an invertible sheaf on Y. Let α be a k-cycle on Y. Then*

$$f^*(c_1(\mathcal{L}) \cap \alpha) = c_1(f^*\mathcal{L}) \cap f^*\alpha$$

in $A_{k+r-1}(X)$.

Proof. Write $\alpha = \sum n_i[W_i]$. We claim it suffices to show that $f^*(c_1(\mathcal{L}) \cap [W_i]) = c_1(f^*\mathcal{L}) \cap f^*[W_i]$ for each i. Proof of this claim is omitted. (Remarks: it is clear in the quasi-compact case. Something similar happened in the proof of Lemma 29.20.1, and one can copy the method used there here. Another possibility is to check the cycles and rational equivalences used for all W_i combined at each step form a locally finite collection).

Let $W \subset Y$ be an integral closed subscheme of δ-dimension k. We have to show that $f^*(c_1(\mathcal{L}) \cap [W]) = c_1(f^*\mathcal{L}) \cap f^*[W]$. Consider the following fibre product diagram

$$\begin{tikzcd} W' = W \times_Y X \arrow[r] \arrow[d] & X \arrow[d] \\ W \arrow[r] & Y \end{tikzcd}$$

and let $W'_i \subset W'$ be the irreducible components of δ-dimension $k+r$. Write $[W']_{k+r} = \sum n_i[W'_i]$ with $n_i > 0$ as per definition. So $f^*[W] = \sum n_i[W'_i]$. Choose a nonzero meromorphic section s of $\mathcal{L}|_W$. Since each $W'_i \to W$ is dominant we see that $s_i = s|_{W'_i}$ is a nonzero meromorphic section for each i. We claim that we have the following equality of cycles

$$\sum n_i \text{div}_{\mathcal{L}|_{W_i}}(s_i) = f^*\text{div}_{\mathcal{L}|_W}(s)$$

in $Z_{k+r-1}(X)$.

Having formulated the problem as an equality of cycles we may work locally on Y. Hence we may assume Y and also W affine, and $s = p/q$ for some nonzero sections $p \in \Gamma(W, \mathcal{L})$ and $q \in \Gamma(W, \mathcal{O})$. If we can show both

$$\sum n_i \text{div}_{\mathcal{L}|_{W_i}}(p_i) = f^*\text{div}_{\mathcal{L}|_W}(p), \quad \text{and} \quad \sum n_i \text{div}_{\mathcal{O}|_{W_i}}(q_i) = f^*\text{div}_{\mathcal{O}|_W}(q)$$

(with obvious notations) then we win by the additivity, see Lemma 29.24.3. Thus we may assume that $s \in \Gamma(W, \mathcal{L}|_W)$. In this case we may apply the equality (29.25.3.1) obtained in the proof of Lemma 29.25.3 to see that

$$\sum n_i \text{div}_{\mathcal{L}|_{W_i}}(s_i) = [Z(s')]_{k+r-1}$$

where $s' \in f^*\mathcal{L}|_{W'}$ denotes the pull back of s to W'. On the other hand we have

$$f^*\text{div}_{\mathcal{L}|_W}(s) = f^*[Z(s)]_{k-1} = [f^{-1}(Z(s))]_{k+r-1},$$

by Lemmas 29.24.2 and 29.14.4. Since $Z(s') = f^{-1}(Z(s))$ we win. $\square$

Lemma 29.25.5. *Let (S, δ) be as in Situation 29.7.1. Let X, Y be locally of finite type over S. Let $f : X \to Y$ be a proper morphism. Let $\mathcal{L}$ be an invertible sheaf on Y. Let s be a nonzero meromorphic section s of $\mathcal{L}$ on Y. Assume X, Y integral, f dominant, and* $\dim_\delta(X) = \dim_\delta(Y)$. *Then*

$$f_*\left(div_{f^*\mathcal{L}}(f^*s)\right) = [R(X) : R(Y)]div_{\mathcal{L}}(s).$$

In particular

$$f_*(c_1(f^*\mathcal{L}) \cap [X]) = c_1(\mathcal{L}) \cap f_*[Y].$$

Proof. The last equation follows from the first since $f_*[X] = [R(X) : R(Y)][Y]$ by definition. It turns out that we can re-use Lemma 29.18.1 to prove this. Namely, since we are trying to prove an equality of cycles, we may work locally on Y. Hence we may assume that $\mathcal{L} = \mathcal{O}_Y$. In this case s corresponds to a rational function $g \in R(Y)$, and we are simply trying to prove

$$f_*\left(\text{div}_X(g)\right) = [R(X) : R(Y)]\text{div}_Y(g).$$

Comparing with the result of the aforementioned Lemma 29.18.1 we see this true since $\text{Nm}_{R(X)/R(Y)}(g) = g^{[R(X):R(Y)]}$ as $g \in R(Y)^*$. $\square$

Lemma 29.25.6. *Let (S, δ) be as in Situation 29.7.1. Let X, Y be locally of finite type over S. Let $p : X \to Y$ be a proper morphism. Let $\alpha \in Z_{k+1}(X)$. Let $\mathcal{L}$ be an invertible sheaf on Y. Then*

$$p_*(c_1(p^*\mathcal{L}) \cap \alpha) = c_1(\mathcal{L}) \cap p_*\alpha$$

in $A_k(Y)$.

Proof. Suppose that p has the property that for every integral closed subscheme $W \subset X$ the map $p|_W : W \to Y$ is a closed immersion. Then, by definition of capping wiht $c_1(\mathcal{L})$ the lemma holds.

We will use this remark to reduce to a special case. Namely, write $\alpha = \sum n_i[W_i]$ with $n_i \neq 0$ and W_i pairwise distinct. Let $W_i' \subset Y$ be the image of W_i (as an integral closed subscheme). Consider the diagram

$$\begin{tikzcd}
X' = \coprod W_i \arrow[r, "q"'] \arrow[d, "p'"'] & X \arrow[d, "p"] \\
Y' = \coprod W_i' \arrow[r, "q'"] & Y.
\end{tikzcd}$$

Since $\{W_i\}$ is locally finite on X, and p is proper we see that $\{W_i'\}$ is locally finite on Y and that q, q', p' are also proper morphisms. We may think of $\sum n_i[W_i]$ also as a k-cycle $\alpha' \in Z_k(X')$. Clearly $q_*\alpha' = \alpha$. We have $q_*(c_1(q^*p^*\mathcal{L}) \cap \alpha') = c_1(p^*\mathcal{L}) \cap q_*\alpha'$ and $(q')_*(c_1((q')^*\mathcal{L}) \cap p'_*\alpha') = c_1(\mathcal{L}) \cap q'_*p'_*\alpha'$ by the initial remark of the proof. Hence it suffices to prove the lemma for the morphism p' and the cycle $\sum n_i[W_i]$. Clearly, this means we may assume X, Y integral, $f : X \to Y$ dominant and $\alpha = [X]$. In this case the result follows from Lemma 29.25.5. □

29.26. Cartier divisors and K-groups

In this section we describe how the intersection with the first chern class of an invertible sheaf $\mathcal{L}$ corresponds to tensoring with $\mathcal{L} - \mathcal{O}$ in K-groups.

Lemma 29.26.1. *Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Let $\mathcal{L}$ be an invertible $\mathcal{O}_X$-module. Let $\mathcal{F}$ be a coherent $\mathcal{O}_X$-module. Let $s \in \Gamma(X, \mathcal{K}_X(\mathcal{L}))$ be a meromorphic section of $\mathcal{L}$. Assume*

(1) $\dim_\delta(X) \leq k + 1$,
(2) *X has no embedded points,*
(3) *$\mathcal{F}$ has no embedded associated points,*
(4) *the support of $\mathcal{F}$ is X, and*
(5) *the section s is regular meromorphic.*

In this situation let $\mathcal{I} \subset \mathcal{O}_X$ be the ideal of denominators of s, see Divisors, Definition 26.15.14. Then we have the following:

(1) *there are short exact sequences*
$$\begin{matrix} 0 & \to & \mathcal{I}\mathcal{F} & \xrightarrow{1} & \mathcal{F} & \to & \mathcal{Q}_1 & \to & 0 \\ 0 & \to & \mathcal{I}\mathcal{F} & \xrightarrow{s} & \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L} & \to & \mathcal{Q}_2 & \to & 0 \end{matrix}$$
(2) *the coherent sheaves $\mathcal{Q}_1$, $\mathcal{Q}_2$ are supported in δ-dimension $\leq k$,*
(3) *the section s restricts to a regular meromorphic section s_i on every irreducible component X_i of X of δ-dimension $k + 1$, and*
(4) *writing $[\mathcal{F}]_{k+1} = \sum m_i[X_i]$ we have*
$$[\mathcal{Q}_2]_k - [\mathcal{Q}_1]_k = \sum m_i(X_i \to X)_* div_{\mathcal{L}|_{X_i}}(s_i)$$
in $Z_k(X)$, in particular
$$[\mathcal{Q}_2]_k - [\mathcal{Q}_1]_k = c_1(\mathcal{L}) \cap [\mathcal{F}]_{k+1}$$
in $A_k(X)$.

Proof. Recall from Divisors, Lemma 26.15.15 the existence of injective maps $1 : \mathcal{I}\mathcal{F} \to \mathcal{F}$ and $s : \mathcal{I}\mathcal{F} \to \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L}$ whose cokernels are supported on a closed nowhere dense subsets T. Denote $\mathcal{Q}_i$ there cokernels as in the lemma. We conclude that $\dim_\delta(\text{Supp}(\mathcal{Q}_i)) \leq k$. By Divisors, Lemmas 26.15.4 and 26.15.11 the pullbacks s_i are defined and are regular meromorphic sections for $\mathcal{L}|_{X_i}$. The equality of cycles in (4) implies the equality of cycle classes in (4). Hence the only remaining thing to show is that
$$[\mathcal{Q}_2]_k - [\mathcal{Q}_1]_k = \sum m_i(X_i \to X)_* \text{div}_{\mathcal{L}|_{X_i}}(s_i)$$
holds in $Z_k(X)$. To see this, let $Z \subset X$ be an integral closed subscheme of δ-dimension k. Let $\xi \in Z$ be the generic point. Let $A = \mathcal{O}_{X,\xi}$ and $M = \mathcal{F}_\xi$. Moreover, choose a generator $s_\xi \in \mathcal{L}_\xi$. Then we can write $s = (a/b)s_\xi$ where $a, b \in A$ are nonzero divisors. In this case $I = \mathcal{I}_\xi = \{x \in A \mid x(a/b) \in A\}$. In this case the coefficient of $[Z]$ in the left hand side is
$$\text{length}_A(M/(a/b)IM) - \text{length}_A(M/IM)$$
and the coefficient of $[Z]$ in the right hand side is
$$\sum \text{length}_{A_{\mathfrak{q}_i}}(M_{\mathfrak{q}_i}) \text{ord}_{A/\mathfrak{q}_i}(a/b)$$

where $\mathfrak{q}_1, \ldots, \mathfrak{q}_t$ are the minimal primes of the 1-dimensional local ring A. Hence the result follows from Lemma 29.5.7. □

Lemma 29.26.2. *Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Let $\mathcal{L}$ be an invertible $\mathcal{O}_X$-module. Let $\mathcal{F}$ be a coherent $\mathcal{O}_X$-module. Assume* $\dim_\delta(\mathit{Support}(\mathcal{F})) \leq k+1$. *Then the element*

$$[\mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L}] - [\mathcal{F}] \in K_0(\mathit{Coh}_{\leq k+1}(X)/\mathit{Coh}_{\leq k-1}(X))$$

lies in the subgroup $B_k(X)$ of Lemma 29.22.5 and maps to the element $c_1(\mathcal{L}) \cap [\mathcal{F}]_{k+1}$ via the map $B_k(X) \to A_k(X)$.

Proof. Let

$$0 \to \mathcal{K} \to \mathcal{F} \to \mathcal{F}' \to 0$$

be the short exact sequence constructed in Divisors, Lemma 26.4.4. This in particular means that $\mathcal{F}'$ has no embedded associated points. Since the support of $\mathcal{K}$ is nowhere dense in the support of $\mathcal{F}$ we see that $\dim_\delta(\text{Supp}(\mathcal{K})) \leq k$. We may re-apply Divisors, Lemma 26.4.4 starting with $\mathcal{K}$ to get a short exact sequence

$$0 \to \mathcal{K}'' \to \mathcal{K} \to \mathcal{K}' \to 0$$

where now $\dim_\delta(\text{Supp}(\mathcal{K}'')) < k$ and $\mathcal{K}'$ has no embedded associated points. Suppose we can prove the lemma for the coherent sheaves $\mathcal{F}'$ and $\mathcal{K}'$. Then we see from the equations

$$[\mathcal{F}]_{k+1} = [\mathcal{F}']_{k+1} + [\mathcal{K}']_{k+1} + [\mathcal{K}'']_{k+1}$$

(use Lemma 29.10.4),

$$[\mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L}] - [\mathcal{F}] = [\mathcal{F}' \otimes_{\mathcal{O}_X} \mathcal{L}] - [\mathcal{F}'] + [\mathcal{K}' \otimes_{\mathcal{O}_X} \mathcal{L}] - [\mathcal{K}'] + [\mathcal{K}'' \otimes_{\mathcal{O}_X} \mathcal{L}] - [\mathcal{K}'']$$

(use the $\otimes \mathcal{L}$ is exact) and the trivial vanishing of $[\mathcal{K}'']_{k+1}$ and $[\mathcal{K}'' \otimes_{\mathcal{O}_X} \mathcal{L}] - [\mathcal{K}'']$ in $K_0(\text{Coh}_{\leq k+1}(X)/\text{Coh}_{\leq k-1}(X))$ that the result holds for $\mathcal{F}$. What this means is that we may assume that the sheaf $\mathcal{F}$ has no embedded associated points.

Assume X, $\mathcal{F}$ as in the lemma, and assume in addition that $\mathcal{F}$ has no embedded associated points. Consider the sheaf of ideals $\mathcal{I} \subset \mathcal{O}_X$, the corresponding closed subscheme $i : Z \to X$ and the coherent $\mathcal{O}_Z$-module $\mathcal{G}$ constructed in Divisors, Lemma 26.4.5. Recall that Z is a locally Noetherian scheme without embedded points, $\mathcal{G}$ is a coherent sheaf without embedded associated points, with $\text{Supp}(\mathcal{G}) = Z$ and such that $i_*\mathcal{G} = \mathcal{F}$. Moreover, set $\mathcal{N} = \mathcal{L}|_Z$.

By Divisors, Lemma 26.15.12 the invertible sheaf $\mathcal{N}$ has a regular meromorphic section s over Z. Let us denote $\mathcal{J} \subset \mathcal{O}_Z$ the sheaf of denominators of s. By Lemma 29.26.1 there exist short exact sequences

$$\begin{matrix} 0 & \to & \mathcal{J}\mathcal{G} & \xrightarrow{1} & \mathcal{G} & \to & \mathcal{Q}_1 & \to & 0 \\ 0 & \to & \mathcal{J}\mathcal{G} & \xrightarrow{s} & \mathcal{G} \otimes_{\mathcal{O}_Z} \mathcal{N} & \to & \mathcal{Q}_2 & \to & 0 \end{matrix}$$

such that $\dim_\delta(\text{Supp}(\mathcal{Q}_i)) \leq k$ and such that the cycle $[\mathcal{Q}_2]_k - [\mathcal{Q}_1]_k$ is a representative of $c_1(\mathcal{N}) \cap [\mathcal{G}]_{k+1}$. We see (using the fact that $i_*(\mathcal{G} \otimes \mathcal{N}) = \mathcal{F} \otimes \mathcal{L}$ by the projection formula, see Cohomology, Lemma 18.7.2) that

$$[\mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L}] - [\mathcal{F}] = [i_*\mathcal{Q}_2] - [i_*\mathcal{Q}_1]$$

in $K_0(\mathrm{Coh}_{\leq k+1}(X)/\mathrm{Coh}_{\leq k-1}(X))$. This already shows that $[\mathcal{F}\otimes_{\mathcal{O}_X}\mathcal{L}]-[\mathcal{F}]$ is an element of $B_k(X)$. Moreover we have

$$\begin{aligned} [i_*\mathcal{Q}_2]_k - [i_*\mathcal{Q}_1]_k &= i_*\left([\mathcal{Q}_2]_k - [\mathcal{Q}_1]_k\right) \\ &= i_*\left(c_1(\mathcal{N})\cap[\mathcal{G}]_{k+1}\right) \\ &= c_1(\mathcal{L})\cap i_*[\mathcal{G}]_{k+1} \\ &= c_1(\mathcal{L})\cap[\mathcal{F}]_{k+1} \end{aligned}$$

by the above and Lemmas 29.25.6 and 29.12.3. And this agree with the image of the element under $B_k(X)\to A_k(X)$ by definition. Hence the lemma is proved. □

29.27. Blowing up lemmas

In this section we prove some lemmas on representing Cartier divisors by suitable effective Cartier divisors on blow-ups. These lemmas can be found in [**Ful98**, Section 2.4]. We have adapted the formulation so they also work in the non-finite type setting. It may happen that the morphism b of Lemma 29.27.7 is a composition of infinitely many blow ups, but over any given quasi-compact open $W\subset X$ one needs only finitely many blow-ups (and this is the result of loc. cit.).

Lemma 29.27.1. *Let (S,δ) be as in Situation 29.7.1. Let X, Y be locally of finite type over S. Let $f : X\to Y$ be a proper morphism. Let $D\subset Y$ be an effective Cartier divisor. Assume X, Y integral, $n=\dim_\delta(X)=\dim_\delta(Y)$ and f dominant. Then*

$$f_*[f^{-1}(D)]_{n-1} = [R(X) : R(Y)][D]_{n-1}.$$

In particular if f is birational then $f_*[f^{-1}(D)]_{n-1}=[D]_{n-1}$.

Proof. Immediate from Lemma 29.25.5 and the fact that D is the zero scheme of the canonical section 1_D of $\mathcal{O}_X(D)$. □

Lemma 29.27.2. *Let (S,δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Assume X integral with $\dim_\delta(X)=n$. Let $\mathcal{L}$ be an invertible $\mathcal{O}_X$-module. Let s be a nonzero meromorphic section of $\mathcal{L}$. Let $U\subset X$ be the maximal open subscheme such that s corresponds to a section of $\mathcal{L}$ over U. There exists a projective morphism*

$$\pi : X'\longrightarrow X$$

such that

1. *X' is integral,*
2. *$\pi|_{\pi^{-1}(U)} : \pi^{-1}(U)\to U$ is an isomorphism,*
3. *there exist effective Cartier divisors $D, E\subset X'$ such that*
$$\pi^*\mathcal{L}=\mathcal{O}_{X'}(D-E),$$
4. *the meromorphic section s corresponds, via the isomorphism above, to the meromorphic section $1_D\otimes(1_E)^{-1}$ (see Divisors, Definition 26.9.11),*
5. *we have*
$$\pi_*([D]_{n-1}-[E]_{n-1}) = div_{\mathcal{L}}(s)$$
in $Z_{n-1}(X)$.

Proof. Let $\mathcal{I}\subset\mathcal{O}_X$ be the quasi-coherent ideal sheaf of denominators of s. Namely, we declare a local section f of $\mathcal{O}_X$ to be a local section of $\mathcal{I}$ if and only if fs is a local section of $\mathcal{L}$. On any affine open $U=Spec(A)$ of X write $\mathcal{L}|_U=\widetilde{L}$ for some invertible A-module L. Then A is a Noetherian domain with fraction field $K=R(X)$ and we may think of $s|_U$

as an element of $L \otimes_A K$ (see Divisors, Lemma 26.15.6). Let $I = \{x \in A \mid xs \in L\}$. Then we see that $\mathcal{I}|_U = \tilde{I}$ (details omitted) and hence $\mathcal{I}$ is quasi-coherent.

Consider the closed subscheme $Z \subset X$ defined by $\mathcal{I}$. It is clear that $U = X \setminus Z$. This suggests we should blow up Z. Let

$$\pi : X' = \underline{\text{Proj}}_X \left(\bigoplus\nolimits_{n \geq 0} \mathcal{I}^n \right) \longrightarrow X$$

be the blowing up of X along Z. The quasi-coherent sheaf of $\mathcal{O}_X$-algebras $\bigoplus_{n \geq 0} \mathcal{I}^n$ is generated in degree 1 over $\mathcal{O}_X$. Moreover, the degree 1 part is a coherent $\mathcal{O}_X$-module, in particular of finite type. Hence we see that π is projective and $\mathcal{O}_{X'}(1)$ is relatively very ample.

By Constructions, Lemma 22.21.2 we have X' is integral. By Divisors, Lemma 26.9.18 there exists an effective Cartier divisor $E \subset X'$ such that $\pi^{-1}\mathcal{I} \cdot \mathcal{O}_{X'} = \mathcal{I}_E$. Also, by the same lemma we see that $\pi^{-1}(U) \cong U$.

Denote s' the pullback of the meromorphic section s to a meromorphic section of $\mathcal{L}' = \pi^*\mathcal{L}$ over X'. It follows from the fact that $\mathcal{I}s \subset \mathcal{L}$ that $\mathcal{I}_E s' \subset \mathcal{L}'$. In other words, s' gives rise to an $\mathcal{O}_{X'}$-linear map $\mathcal{I}_E \to \mathcal{L}'$, or in other words a section $t \in \mathcal{L}' \otimes \mathcal{O}_{X'}(E)$. By Divisors, Lemma 26.9.17 we obtain a unique effective Cartier divisor $D \subset X'$ such that $\mathcal{L}' \otimes \mathcal{O}_{X'}(E) \cong \mathcal{O}_{X'}(D)$ with t corresponding to 1_D. Reversing this procedure we conclude that $\mathcal{L}' = \mathcal{O}_{X'}(-E) \cong \mathcal{O}_{X'}(D)$ with s' corresponding to $1_D \otimes 1_E^{-1}$ as in (4).

We still have to prove (5). By Lemma 29.25.5 we have

$$\pi_*(\text{div}_{\mathcal{L}'}(s')) = \text{div}_{\mathcal{L}}(s).$$

Hence it suffices to show that $\text{div}_{\mathcal{L}'}(s') = [D]_{n-1} - [E]_{n-1}$. This follows from the equality $s' = 1_D \otimes 1_E^{-1}$ and additivity, see Lemma 29.24.3. $\square$

Definition 29.27.3. Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Assume X integral and $\dim_\delta(X) = n$. Let D_1, D_2 be two effective Cartier divisors in X. Let $Z \subset X$ be an integral closed subscheme with $\dim_\delta(Z) = n - 1$. The *ϵ-invariant* of this situation is

$$\epsilon_Z(D_1, D_2) = n_Z \cdot m_Z$$

where n_Z, resp. m_Z is the coefficient of Z in the $(n-1)$-cycle $[D_1]_{n-1}$, resp. $[D_2]_{n-1}$.

Lemma 29.27.4. *Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Assume X integral and $\dim_\delta(X) = n$. Let D_1, D_2 be two effective Cartier divisors in X. Let Z be an open and closed subscheme of the scheme $D_1 \cap D_2$. Assume $\dim_\delta(D_1 \cap D_2 \setminus Z) \leq n - 2$. Then there exists a morphism $b : X' \to X$, and Cartier divisors D_1', D_2', E on X' with the following properties*

1. *X' is integral,*
2. *b is projective,*
3. *b is the blow up of X in the closed subscheme Z,*
4. *$E = b^{-1}(Z)$,*
5. *$b^{-1}(D_1) = D_1' + E$, and $b^{-1}D_2 = D_2' + E$,*
6. *$\dim_\delta(D_1' \cap D_2') \leq n - 2$, and if $Z = D_1 \cap D_2$ then $D_1' \cap D_2' = \emptyset$,*
7. *for every integral closed subscheme W' with $\dim_\delta(W') = n - 1$ we have*
   (a) *if $\epsilon_{W'}(D_1', E) > 0$, then setting $W = b(W')$ we have $\dim_\delta(W) = n - 1$ and*

$$\epsilon_{W'}(D_1', E) < \epsilon_W(D_1, D_2),$$

(b) *if* $\epsilon_{W'}(D'_2, E) > 0$*, then setting* $W = b(W')$ *we have* $\dim_\delta(W) = n - 1$ *and*
$$\epsilon_{W'}(D'_2, E) < \epsilon_W(D_1, D_2),$$

Proof. Note that the quasi-coherent ideal sheaf $\mathcal{I} = \mathcal{I}_{D_1} + \mathcal{I}_{D_2}$ defines the scheme theoretic intersection $D_1 \cap D_2 \subset X$. Since Z is a union of connected components of $D_1 \cap D_2$ we see that for every $z \in Z$ the kernel of $\mathcal{O}_{X,z} \to \mathcal{O}_{Z,z}$ is equal to $\mathcal{I}_z$. Let $b : X' \to X$ be the blow up of X in Z. (So Zariski locally around Z it is the blow up of X in $\mathcal{I}$.) Denote $E = b^{-1}(Z)$ the corresponding effective Cartier divisor, see Divisors, Lemma 26.9.18. Since $Z \subset D_1$ we have $E \subset f^{-1}(D_1)$ and hence $D_1 = D'_1 + E$ for some effective Cartier divisor $D'_1 \subset X'$, see Divisors, Lemma 26.9.6. Similarly $D_2 = D'_2 + E$. This takes care of assertions (1) -- (5).

Note that if W' is as in (7) (a) or (7) (b), then the image W of W' is contained in $D_1 \cap D_2$. If W is not contained in Z, then b is an isomorphism at the generic point of W and we see that $\dim_\delta(W) = \dim_\delta(W') = n - 1$ which contradicts the assumption that $\dim_\delta(D_1 \cap D_2 \setminus Z) \leq n - 2$. Hence $W \subset Z$. This means that to prove (6) and (7) we may work locally around Z on X.

Thus we may assume that $X = Spec(A)$ with A a Noetherian domain, and $D_1 = Spec(A/a)$, $D_2 = Spec(A/b)$ and $Z = D_1 \cap D_2$. Set $I = (a, b)$. Since A is a domain and $a, b \neq 0$ we can cover the blow up by two patches, namely $U = Spec(A[s]/(as - b))$ and $V = Spec(A[t]/(bt - a))$. These patches are glued using the isomorphism $A[s, s^{-1}]/(as - b) \cong A[t, t^{-1}]/(bt - a)$ which maps s to t^{-1}. The effective Cartier divisor E is described by $Spec(A[s]/(as - b, a)) \subset U$ and $Spec(A[t]/(bt - a, b)) \subset V$. The closed subscheme D'_1 corresponds to $Spec(A[t]/(bt - a, t)) \subset U$. The closed subscheme D'_2 corresponds to $Spec(A[s]/(as - b, s)) \subset V$. Since ``$ts = 1$'' we see that $D'_1 \cap D'_2 = \emptyset$.

Suppose we have a prime $\mathfrak{q} \subset A[s]/(as - b)$ of height one with $s, a \in \mathfrak{q}$. Let $\mathfrak{p} \subset A$ be the corresponding prime of A. Observe that $a, b \in \mathfrak{p}$. By the dimension formula we see that $\dim(A_\mathfrak{p}) = 1$ as well. The final assertion to be shown is that
$$\text{ord}_{A_\mathfrak{p}}(a) \text{ ord}_{A_\mathfrak{p}}(b) > \text{ord}_{B_\mathfrak{q}}(a) \text{ ord}_{B_\mathfrak{q}}(s)$$
where $B = A[s]/(as - b)$. By Algebra, Lemma 7.115.1 we have $\text{ord}_{A_\mathfrak{p}}(x) \geq \text{ord}_{B_\mathfrak{q}}(x)$ for $x = a, b$. Since $\text{ord}_{B_\mathfrak{q}}(s) > 0$ we win by additivity of the ord function and the fact that $as = b$. □

Definition 29.27.5. Let X be a scheme. Let $\{D_i\}_{i \in I}$ be a locally finite collection of effective Cartier divisors on X. Suppose given a function $I \to \mathbf{Z}_{\geq 0}$, $i \mapsto n_i$. The *sum of the effective Cartier divisors* $D = \sum n_i D_i$, is the unique effective Cartier divisor $D \subset X$ such that on any quasi-compact open $U \subset X$ we have $D|_U = \sum_{D_i \cap U \neq \emptyset} n_i D_i|_U$ is the sum as in Divisors, Definition 26.9.4.

Lemma 29.27.6. *Let* (S, δ) *be as in Situation 29.7.1. Let* X *be locally of finite type over* S*. Assume* X *integral and* $\dim_\delta(X) = n$*. Let* $\{D_i\}_{i \in I}$ *be a locally finite collection of effective Cartier divisors on* X*. Suppose given* $n_i \geq 0$ *for* $i \in I$*. Then*
$$[D]_{n-1} = \sum\nolimits_i n_i [D_i]_{n-1}$$
in $Z_{n-1}(X)$*.*

Proof. Since we are proving an equality of cycles we may work locally on X. Hence this reduces to a finite sum, and by induction to a sum of two effective Cartier divisors $D = D_1 + D_2$. By Lemma 29.24.2 we see that $D_1 = \text{div}_{\mathcal{O}_X(D_1)}(1_{D_1})$ where 1_{D_1} denotes the canonical section of $\mathcal{O}_X(D_1)$. Of course we have the same statement for D_2 and D. Since $1_D = 1_{D_1} \otimes 1_{D_2}$ via the identification $\mathcal{O}_X(D) = \mathcal{O}_X(D_1) \otimes \mathcal{O}_X(D_2)$ we win by Lemma 29.24.3. □

Lemma 29.27.7. *Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Assume X integral and $\dim_\delta(X) = d$. Let $\{D_i\}_{i\in I}$ be a locally finite collection of effective Cartier divisors on X. Assume that for all $\{i, j, k\} \subset I$, $\#\{i, j, k\} = 3$ we have $D_i \cap D_j \cap D_k = \emptyset$. Then there exist*

1. *an open subscheme $U \subset X$ with $\dim_\delta(X \setminus U) \leq d - 3$,*
2. *a morphism $b : U' \to U$, and*
3. *effective Cartier divisors $\{D'_j\}_{j\in J}$ on U'*

with the following properties:

1. *b is proper morphism $b : U' \to U$,*
2. *U' is integral,*
3. *b is an isomorphism over the complement of the union of the pairwise intersections of the $D_i|_U$,*
4. *$\{D'_j\}_{j\in J}$ is a locally finite collection of effective Cartier divisors on U',*
5. *$\dim_\delta(D'_j \cap D'_{j'}) \leq d - 2$ if $j \neq j'$, and*
6. *$b^{-1}(D_i|_U) = \sum n_{ij} D'_j$ for certain $n_{ij} \geq 0$.*

Moreover, if X is quasi-compact, then we may assume $U = X$ in the above.

Proof. Let us first prove this in the quasi-compact case, since it is perhaps the most interesting case. In this case we produce inductively a sequence of blowups

$$X = X_0 \xleftarrow{b_0} X_1 \xleftarrow{b_1} X_2 \leftarrow \ldots$$

and finite sets of effective Cartier divisors $\{D_{n,i}\}_{i\in I_n}$. At each stage these will have the property that any triple intersection $D_{n,i} \cap D_{n,j} \cap D_{n,k}$ is empty. Moreover, for each $n \geq 0$ we will have $I_{n+1} = I_n \coprod P(I_n)$ where $P(I_n)$ denotes the set of pairs of elements of I_n. Finally, we will have

$$b_n^{-1}(D_{n,i}) = D_{n+1,i} + \sum\nolimits_{i'\in I_n, i'\neq i} D_{n+1,\{i,i'\}}$$

We conclude that for each $n \geq 0$ we have $(b_0 \circ \ldots \circ b_n)^{-1}(D_i)$ is a nonnegative integer combination of the divisors $D_{n+1,j}$, $j \in I_{n+1}$.

To start the induction we set $X_0 = X$ and $I_0 = I$ and $D_{0,i} = D_i$.

Given $(X_n, \{D_{n,i}\}_{i\in I_n})$ let X_{n+1} be the blow up of X_n in the closed subscheme $Z_n = \bigcup_{\{i,i'\}\in P(I_n)} D_{n,i} \cap D_{n,i'}$. Note that the closed subschemes $D_{n,i} \cap D_{n,i'}$ are pairwise disjoint by our assumption on triple intersections. In other words we may write $Z_n = \coprod_{\{i,i'\}\in P(I_n)} D_{n,i} \cap D_{n,i'}$. Moreover, in a Zariski neighbourhood of $D_{n,i} \cap D_{n,i'}$ the morphism b_n is equal to the blow up of the scheme X_n in the closed subscheme $D_{n,i} \cap D_{n,i'}$, and the results of Lemma 29.27.4 apply. Hence setting $D_{n+1,\{i,i'\}} = b_n^{-1}(D_i \cap D_{i'})$ we get an effective Cartier divisor. The Cartier divisors $D_{n+1,\{i,i'\}}$ are pairwise disjoint. Clearly we have $b_n^{-1}(D_{n,i}) \supset D_{n+1,\{i,i'\}}$ for every $i' \in I_n$, $i' \neq i$. Hence, applying Divisors, Lemma 26.9.6 we see that indeed $b^{-1}(D_{n,i}) = D_{n+1,i} + \sum_{i'\in I_n, i'\neq i} D_{n+1,\{i,i'\}}$ for some effective Cartier divisor $D_{n+1,i}$ on X_{n+1}. In a neighbourhood of $D_{n+1,\{i,i'\}}$ these divisors $D_{n+1,i}$ play the role of the primed divisors of Lemma 29.27.4. In particular we conclude that $D_{n+1,i} \cap D_{n+1,i'} = \emptyset$ if $i \neq i'$,

$i, i' \in I_n$ by part (6) of Lemma 29.27.4. This already implies that triple intersections of the divisors $D_{n+1,i}$ are zero.

OK, and at this point we can use the quasi-compactness of X to conclude that the invariant

$$\epsilon(X, \{D_i\}_{i \in I}) = \max\{\epsilon_Z(D_i, D_{i'}) \mid Z \subset X, \dim_\delta(Z) = d - 1, \{i, i'\} \in \mathcal{P}(I)\} \quad (29.27.7.1)$$

is finite, since after all each D_i has at most finitely many irreducible components. We claim that for some n the invariant $\epsilon(X_n, \{D_{n,i}\}_{i \in I_n})$ is zero. Namely, if not then by Lemma 29.27.4 we have a strictly decreasing sequence

$$\epsilon(X, \{D_i\}_{i \in I}) = \epsilon(X_0, \{D_{0,i}\}_{i \in I_0}) > \epsilon(X_1, \{D_{1,i}\}_{i \in I_1}) > \ldots$$

of positive integers which is a contradiction. Take n with invariant $\epsilon(X_n, \{D_{n,i}\}_{i \in I_n})$ equal to zero. This means that there is no integral closed subscheme $Z \subset X_n$ and no pair of indices $i, i' \in I_n$ such that $\epsilon_Z(D_{n,i}, D_{n,i'}) > 0$. In other words, $\dim_\delta(D_{n,i}, D_{n,i'}) \leq d - 2$ for all pairs $\{i, i'\} \in \mathcal{P}(I_n)$ as desired.

Next, we come to the general case where we no longer assume that the scheme X is quasi-compact. The problem with the idea from the first part of the proof is that we may get and infinite sequence of blow ups with centers dominating a fixed point of X. In order to avoid this we cut out suitable closed subsets of codimension ≥ 3 at each stage. Namely, we will construct by induction a sequence of morphisms having the following shape

$$\begin{tikzcd}
X = X_0 & & & \\
U_0 \arrow[u, "j_0"] & X_1 \arrow[l, "b_0"'] & & \\
& U_1 \arrow[u, "j_1"] & X_2 \arrow[l, "b_1"'] & \\
& & U_2 \arrow[u, "j_2"] & X_3 \arrow[l, "b_2"']
\end{tikzcd}$$

Each of the morphisms $j_n : U_n \to X_n$ will be an open immersion. Each of the morphisms $b_n : X_{n+1} \to U_n$ will be a proper birational morphism of integral schemes. As in the quasi-compact case we will have effective Cartier divisors $\{D_{n,i}\}_{i \in I_n}$ on X_n. At each stage these will have the property that any triple intersection $D_{n,i} \cap D_{n,j} \cap D_{n,k}$ is empty. Moreover, for each $n \geq 0$ we will have $I_{n+1} = I_n \coprod \mathcal{P}(I_n)$ where $\mathcal{P}(I_n)$ denotes the set of pairs of elements of I_n. Finally, we will arrange it so that

$$b_n^{-1}(D_{n,i}|_{U_n}) = D_{n+1,i} + \sum\nolimits_{i' \in I_n, i' \neq i} D_{n+1,\{i,i'\}}$$

We start the induction by setting $X_0 = X$, $I_0 = I$ and $D_{0,i} = D_i$.

Given $(X_n, \{D_{n,i}\})$ we construct the open subscheme U_n as follows. For each pair $\{i, i'\} \in \mathcal{P}(I_n)$ consider the closed subscheme $D_{n,i} \cap D_{n,i'}$. This has ``good'' irreducible components which have $\delta$-dimension $d - 2$ and ``bad'' irreducible components which have δ-dimension $d - 1$. Let us set

$$\text{Bad}(i, i') = \bigcup\nolimits_{W \subset D_{n,i} \cap D_{n,i'} \text{ irred. comp. with } \dim_\delta(W) = d-1} W$$

and similarly

$$\mathrm{Good}(i,i') = \bigcup\nolimits_{W \subset D_{n,i} \cap D_{n,i'} \text{ irred. comp. with } \dim_\delta(W)=d-2} W.$$

Then $D_{n,i} \cap D_{n,i'} = \mathrm{Bad}(i,i') \cup \mathrm{Good}(i,i')$ and moreover we have $\dim_\delta(\mathrm{Bad}(i,i') \cap \mathrm{Good}(i,i')) \leq d-3$. Here is our choice of U_n:

$$U_n = X_n \setminus \bigcup\nolimits_{\{i,i'\} \in P(I_n)} \mathrm{Bad}(i,i') \cap \mathrm{Good}(i,i').$$

By our condition on triple intersections of the divisors $D_{n,i}$ we see that the union is actually a disjoint union. Moreover, we see that (as a scheme)

$$D_{n,i}|_{U_n} \cap D_{n,i'}|_{U_n} = Z_{n,i,i'} \coprod G_{n,i,i'}$$

where $Z_{n,i,i'}$ is δ-equidimension of dimension $d-1$ and $G_{n,i,i'}$ is δ-equidimensional of dimension $d-2$. (So toplogically $Z_{n,i,i'}$ is the union of the bad components but throw out intersections with good components.) Finally we set

$$Z_n = \bigcup\nolimits_{\{i,i'\} \in P(I_n)} Z_{n,i,i'} = \coprod\nolimits_{\{i,i'\} \in P(I_n)} Z_{n,i,i'},$$

and we let $b_n : X_{n+1} \to X_n$ be the blow up in Z_n. Note that Lemma 29.27.4 applies to the morphism $b_n : X_{n+1} \to X_n$ locally around each of the loci $D_{n,i}|_{U_n} \cap D_{n,i'}|_{U_n}$. Hence, exactly as in the first part of the proof we obtain effective Cartier divisors $D_{n+1,\{i,i'\}}$ for $\{i,i'\} \in P(I_n)$ and effective Cartier divisors $D_{n+1,i}$ for $i \in I_n$ such that $b_n^{-1}(D_{n,i}|_{U_n}) = D_{n+1,i} + \sum_{i' \in I_n, i' \neq i} D_{n+1,\{i,i'\}}$. For each n denote $\pi_n : X_n \to X$ the morphism obtained as the composition $j_0 \circ \ldots \circ j_{n-1} \circ b_{n-1}$.

Claim: given any quasi-compact open $V \subset X$ for all sufficiently large n the maps

$$\pi_n^{-1}(V) \leftarrow \pi_{n+1}^{-1}(V) \leftarrow \ldots$$

are all isomorphisms. Namely, if the map $\pi_n^{-1}(V) \leftarrow \pi_{n+1}^{-1}(V)$ is not an isomorphism, then $Z_{n,i,i'} \cap \pi_n^{-1}(V) \neq \emptyset$ for some $\{i,i'\} \in P(I_n)$. Hence there exists an irreducible component $W \subset D_{n,i} \cap D_{n,i'}$ with $\dim_\delta(W) = d-1$. In particular we see that $\epsilon_W(D_{n,i}, D_{n,i'}) > 0$. Applying Lemma 29.27.4 repeatedly we see that

$$\epsilon_W(D_{n,i}, D_{n,i'}) < \epsilon(V, \{D_i|_V\}) - n$$

with $\epsilon(V, \{D_i|_V\})$ as in (29.27.7.1). Since V is quasi-compact, we have $\epsilon(V, \{D_i|_V\}) < \infty$ and taking $n > \epsilon(V, \{D_i|_V\})$ we see the result.

Note that by construction the difference $X_n \setminus U_n$ has $\dim_\delta(X_n \setminus U_n) \leq d-3$. Let $T_n = \pi_n(X_n \setminus U_n)$ be its image in X. Traversing in the diagram of maps above using each b_n is closed it follows that $T_0 \cup \ldots \cup T_n$ is a closed subset of X for each n. Any $t \in T_n$ satisfies $\delta(t) \leq d-3$ by construction. Hence $\overline{T_n} \subset X$ is a closed subset with $\dim_\delta(T_n) \leq d-3$. By the claim above we see that for any quasi-compact open $V \subset X$ we have $T_n \cap V \neq \emptyset$ for at most finitely many n. Hence $\{\overline{T_n}\}_{n \geq 0}$ is a locally finite collection of closed subsets, and we may set $U = X \setminus \bigcup \overline{T_n}$. This will be U as in the lemma.

Note that $U_n \cap \pi_n^{-1}(U) = \pi_n^{-1}(U)$ by construction of U. Hence all the morphisms

$$b_n : \pi_{n+1}^{-1}(U) \longrightarrow \pi_n^{-1}(U)$$

are proper. Moreover, by the claim they eventually become isomorphisms over each quasi-compact open of X. Hence we can define

$$U' = lim_n \, \pi_n^{-1}(U).$$

The induced morphism $b : U' \to U$ is proper since this is local on U, and over each compact open the limit stabilizes. Similarly we set $J = \bigcup_{n\geq 0} I_n$ using the inclusions $I_n \to I_{n+1}$ from the construction. For $j \in J$ choose an n_0 such that j corresponds to $i \in I_{n_0}$ and define $D'_j = lim_{n\geq n_0} D_{n,i}$. Again this makes sense as locally over X the morphisms stabilize. The other claims of the lemma are verified as in the case of a quasi-compact X. □

29.28. Intersecting with effective Cartier divisors

To be able to prove the commutativity of intersection products we need a little more precision in terms of supports of the cycles. Here is the relevant notion.

Definition 29.28.1. Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Let D be an effective Cartier divisor on X, and denote $i : D \to X$ the closed immersion. We define, for every integer k, a *Gysin homomorphism*

$$i^* : Z_{k+1}(X) \to A_k(D).$$

(1) Given a integral closed subscheme $W \subset X$ with $\dim_\delta(W) = k + 1$ we define
 (a) if $W \not\subset D$, then $i^*[W] = [D \cap W]_k$ as a k-cycle on D, and
 (b) if $W \subset D$, then $i^*[W] = i'_*(c_1(\mathcal{O}_X(D)|_W) \cap [W])$, where $i' : W \to D$ is the induced closed immersion.
(2) For a general $(k + 1)$-cycle $\alpha = \sum n_j[W_j]$ we set
$$i^*\alpha = \sum n_j i^*[W_j]$$
(3) We denote $D \cdot \alpha = i_* i^*\alpha$ the pushforward of the class to a class on X.

In fact, as we will see later, this Gysin homomorphism i^* can be viewed as an example of a non-flat pull back. Thus we will sometimes informally call the class $i^*\alpha$ the *pullback* of the class α.

Lemma 29.28.2. *Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Let D be an effective Cartier divisor on X. Let α be a $(k + 1)$-cycle on X. Then $D \cdot \alpha = c_1(\mathcal{O}_X(D)) \cap \alpha$ in $A_k(X)$.*

Proof. Write $\alpha = \sum n_j[W_j]$ where $i_j : W_j \to X$ are integral closed subschemes with $\dim_\delta(W_j) = k$. Since D is the zero scheme of the canonical section 1_D of $\mathcal{O}_X(D)$ we see that $D \cap W_j$ is the zero scheme of the restriction $1_D|_{W_j}$. Hence for each j such that $W_j \not\subset D$ we have $c_1(\mathcal{O}_X(D)) \cap [W_j] = [D \cap W_j]_k$ by Lemma 29.25.3. So we have

$$c_1(\mathcal{O}_X(D)) \cap \alpha = \sum\nolimits_{W_j \not\subset D} n_j[D \cap W_j]_k + \sum\nolimits_{W_j \subset D} n_j i_{j,*}(c_1(\mathcal{O}_X(D)|_{W_j}) \cap [W_j])$$

in $A_k(X)$ by Definition 29.25.1. The right hand side matches (termwise) the push forward of the class $i^*\alpha$ on D from Definition 29.28.1. Hence we win. □

The following lemma will be superseded later.

Lemma 29.28.3. *Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Let D be an effective Cartier divisor on X. Let $W \subset X$ be a closed subscheme such that $D' = W \cap D$ is an effective Cartier divisor on W.*

$$\begin{tikzcd} D' \arrow[r, "i'"] \arrow[d, "i''"'] & W \arrow[d] \\ D \arrow[r, "i"] & X \end{tikzcd}$$

For any $(k + 1)$-cycle on W we have $i^*\alpha = (i'')_*(i')^*\alpha$ in $A_k(D)$.

Proof. Suppose $\alpha = [Z]$ for some integral closed subscheme $Z \subset W$. In case $Z \not\subset D$ we have $Z \cap D' = Z \cap D$ scheme theoretically. Hence the equality holds as cycles. In case $Z \subset D$ we also have $Z \subset D'$ and the equality holds since $\mathcal{O}_X(D)|_Z \cong \mathcal{O}_W(D')|_Z$ and the definition of i^* and $(i')^*$ in these cases. □

Lemma 29.28.4. *Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Let $i : D \to X$ be an effective Cartier divisor on X.*

(1) *Let $Z \subset X$ be a closed subscheme such that $\dim_\delta(Z) \leq k+1$ and such that $D \cap Z$ is an effective Cartier divisor on Z. Then $i^*[Z]_{k+1} = [D \cap Z]_k$.*
(2) *Let $\mathcal{F}$ be a coherent sheaf on X such that $\dim_\delta(\mathit{Support}(\mathcal{F})) \leq k+1$ and $1_D : \mathcal{F} \to \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{O}_X(D)$ is injective. Then*
$$i^*[\mathcal{F}]_{k+1} = [i^*\mathcal{F}]_k$$
in $A_k(D)$.

Proof. Assume $Z \subset X$ as in (1). Then set $\mathcal{F} = \mathcal{O}_Z$. The assumption that $D \cap Z$ is an effective Cartier divisor is equivalent to the assumption that $1_D : \mathcal{F} \to \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{O}_X(D)$ is injective. Moreover $[Z]_{k+1} = [\mathcal{F}]_{k+1}]$ and $[D \cap Z]_k = [\mathcal{O}_{D\cap Z}]_k = [i^*\mathcal{F}]_k$. See Lemma 29.10.3. Hence part (1) follows from part (2).

Write $[\mathcal{F}]_{k+1} = \sum m_j[W_j]$ with $m_j > 0$ and pairwise distinct integral closed subschemes $W_j \subset X$ of δ-dimension $k+1$. The assumption that $1_D : \mathcal{F} \to \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{O}_X(D)$ is injective implies that $W_j \not\subset D$ for all j. By definition we see that
$$i^*[\mathcal{F}]_{k+1} = \sum [D \cap W_j]_k.$$
We claim that
$$\sum [D \cap W_j]_k = [i^*\mathcal{F}]_k$$
as cycles. Let $Z \subset D$ be an integral closed subscheme of δ-dimension k. Let $\xi \in Z$ be its generic point. Let $A = \mathcal{O}_{X,\xi}$. Let $M = \mathcal{F}_\xi$. Let $f \in A$ be an element generating the ideal of D, i.e., such that $\mathcal{O}_{D,\xi} = A/fA$. By assumption $\dim(M) = 1$, $f : M \to M$ is injective, and $\text{length}_A(M/fM) < \infty$. Moreover, $\text{length}_A(M/fM)$ is the coefficient of $[Z]$ in $[i^*\mathcal{F}]_k$. On the other hand, let $\mathfrak{q}_1, \ldots, \mathfrak{q}_t$ be the minimal primes in the support of M. Then
$$\sum \text{length}_{A_{\mathfrak{q}_i}}(M_{\mathfrak{q}_i}) \text{ord}_{A/\mathfrak{q}_i}(f)$$
is the coefficient of $[Z]$ in $\sum [D \cap W_j]_k$. Hence we see the equality by Lemma 29.5.6. □

Lemma 29.28.5. *Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Let $\{i_j : D_j \to X\}_{j \in J}$ be a locally finite collection of effective Cartier divisors on X. Let $n_j > 0$, $j \in J$. Set $D = \sum_{j\in J} n_j D_j$, and denote $i : D \to X$ the inclusion morphism. Let $\alpha \in Z_{k+1}(X)$. Then*
$$p : \coprod\nolimits_{j \in J} D_j \longrightarrow D$$
is proper and
$$i^*\alpha = p_*\left(\sum n_j i_j^*\alpha\right)$$
in $A_k(D)$.

Proof. The proof of this lemma is made a bit longer than expected by a subtlety concerning infinite sums of rational equivalences. In the quasi-compact case the family D_j is finite and the result is altogether easy and a straightforward consequence of Lemmas 29.24.2 and 29.24.3 and the definitions.

The morphism p is proper since the family $\{D_j\}_{j\in J}$ is locally finite. Write $\alpha = \sum_{a\in A} m_a[W_a]$ with $W_a \subset X$ an integral closed subscheme of δ-dimension $k+1$. Denote $i_a : W_a \to X$ the closed immersion. We assume that $m_a \neq 0$ for all $a \in A$ such that $\{W_a\}_{a\in A}$ is locally finite on X.

Observe that by Definition 29.28.1 the class $i^*\alpha$ is the class of a cycle $\sum m_a\beta_a$ for certain $\beta_a \in Z_k(W_a \cap D)$. Namely, if $W_a \not\subset D$ then $\beta_a = [D \cap W_a]_k$ and if $W_a \subset D$, then β_a is a cycle representing $c_1(\mathcal{O}_X(D)) \cap [W_a]$.

For each $a \in A$ write $J = J_{a,1} \amalg J_{a,2} \amalg J_{a,3}$ where

(1) $j \in J_{a,1}$ if and only if $W_a \cap D_j = \emptyset$,
(2) $j \in J_{a,2}$ if and only if $W_a \neq W_a \cap D_1 \neq \emptyset$, and
(3) $j \in J_{a,3}$ if and only if $W_a \subset D_j$.

Since the family $\{D_j\}$ is locally finite we see that $J_{a,3}$ is a finite set. For every $a \in A$ and $j \in J$ we choose a cycle $\beta_{a,j} \in Z_k(W_a \cap D_j)$ as follows

(1) if $j \in J_{a,1}$ we set $\beta_{a,j} = 0$,
(2) if $j \in J_{a,2}$ we set $\beta_{a,j} = [D_j \cap W_a]_k$, and
(3) if $j \in J_{a,3}$ we choose $\beta_{a,j} \in Z_k(W_a)$ representing $c_1(i_a^*\mathcal{O}_X(D_j)) \cap [W_j]$.

We claim that

$$\beta_a \sim_{rat} \sum\nolimits_{j\in J} n_j\beta_{a,j}$$

in $A_k(W_a \cap D)$.

Case I: $W_a \not\subset D$. In this case $J_{a,3} = \emptyset$. Thus it suffices to show that $[D\cap W_a]_k = \sum n_j[D_j \cap W_a]_k$ as cycles. This is Lemma 29.27.6.

Case II: $W_a \subset D$. In this case β_a is a cycle representing $c_1(i_a^*\mathcal{O}_X(D)) \cap [W_a]$. Write $D = D_{a,1} + D_{a,2} + D_{a,3}$ with $D_{a,s} = \sum_{j\in J_{a,s}} n_jD_j$. By Lemma 29.24.3 we have

$$\begin{aligned} c_1(i_a^*\mathcal{O}_X(D)) \cap [W_a] &= c_1(i_a^*\mathcal{O}_X(D_{a,1})) \cap [W_a] + c_1(i_a^*\mathcal{O}_X(D_{a,2})) \cap [W_a] \\ &\quad + c_1(i_a^*\mathcal{O}_X(D_{a,3})) \cap [W_a]. \end{aligned}$$

It is clear that the first term of the sum is zero. Since $J_{a,3}$ is finite we see that the last term agrees with $\sum_{j\in J_{a,3}} n_jc_1(i_a^*\mathcal{L}_j) \cap [W_a]$, see Lemma 29.24.3. This is represented by $\sum_{j\in J_{a,3}} n_j\beta_{a,j}$. Finally, by Case I we see that the middle term is represented by the cycle $\sum_{j\in J_{a,2}} n_j[D_j \cap W_a]_k = \sum_{j\in J_{a,2}} n_j\beta_{a,j}$. Whence the claim in this case.

At this point we are ready to finish the proof of the lemma. Namely, we have $i^*D \sim_{rat} \sum m_a\beta_a$ by our choice of β_a. For each a we have $\beta_a \sim_{rat} \sum_j \beta_{a,j}$ with the rational equivalence taking place on $D \cap W_a$. Since the collection of closed subschemes $D \cap W_a$ is locally finite on D, we see that also $\sum m_a\beta_a \sim_{rat} \sum_{a,j} m_a\beta_{a,j}$ on D! (See Remark 29.19.4.) Ok, and now it is clear that $\sum_a m_a\beta_{a,j}$ (viewed as a cycle on D_j) represents $i_j^*\alpha$ and hence $\sum_{a,j} m_a\beta_{a,j}$ represents $p_*\sum_j i_j^*\alpha$ and we win. □

Lemma 29.28.6. *Let (S,δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Assume X integral and* $\dim_\delta(X) = n$. *Let D, D' be effective Cartier divisors on X. Assume* $\dim_\delta(D \cap D') = n-2$. *Let $i : D \to X$, resp. $i' : D' \to X$ be the corresponding closed immersions. Then*

(1) *there exists a cycle $\alpha \in Z_{n-2}(D \cap D')$ whose pushforward to D represents $i^*[D']_{n-1} \in A_{n-2}(D)$ and whose pushforward to D' represents $(i')^*[D]_{n-1} \in A_{n-2}(D')$, and*

(2) *we have*
$$D \cdot [D']_{n-1} = D' \cdot [D]_{n-1}$$
in $A_{n-2}(X)$.

Proof. Part (3) is a trivial consequence of parts (1) and (2). Because of symmetry we only need to prove (1). Let us write $[D]_{n-1} = \sum n_a[Z_a]$ and $[D']_{n-1} = \sum m_b[Z_b]$ with Z_a the irreducible components of D and $[Z_b]$ the irreducible components of D'. According to Definition 29.28.1, we have $i^*D' = \sum m_b i^*[Z_b]$ and $(i')^*D = \sum n_a(i')^*[Z_a]$. By assumption, none of the irreducible components Z_b is contained in D, and hence $i^*[Z_b] = [Z_b \cap D]_{n-2}$ by definition. Similarly $(i')^*[Z_a] = [Z_a \cap D']_{n-2}$. Hence we are trying to prove the equality of cycles
$$\sum n_a[Z_a \cap D']_{n-2} = \sum m_b[Z_b \cap D]_{n-2}$$
which are indeed supported on $D \cap D'$. Let $W \subset X$ be an integral closed subscheme with $\dim_\delta(W) = n-2$. Let $\xi \in W$ be its generic point. Set $R = \mathcal{O}_{X,\xi}$. It is a Noetherian local domain. Note that $\dim(R) = 2$. Let $f \in R$, resp. $f' \in R$ be an element defining the ideal of D, resp. D'. By assumption $\dim(R/(f, f')) = 0$. Let $\mathfrak{q}'_1, \ldots, \mathfrak{q}'_t \subset R$ be the minimal primes over (f'), let $\mathfrak{q}_1, \ldots, \mathfrak{q}_s \subset R$ be the minimal primes over (f). The equality above comes down to the equality
$$\sum_{i=1,\ldots,s} \text{length}_{R_{\mathfrak{q}_i}}(R_{\mathfrak{q}_i}/(f))\text{ord}_{R/\mathfrak{q}_i}(f') = \sum_{j=1,\ldots,t} \text{length}_{R_{\mathfrak{q}_j}}(R_{\mathfrak{q}'_j}/(f'))\text{ord}_{R/\mathfrak{q}_j}(f).$$
By Lemma 29.5.5 applied with $M = R/(f)$ the left hand side of this equation is equal to
$$\text{length}_R(R/(f, f')) - \text{length}_R(\text{Ker}(f' : R/(f) \to R/(f)))$$
OK, and now we note that $\text{Ker}(f' : R/(f) \to R/(f))$ is canonically isomorphic to $((f) \cap (f'))/(ff')$ via the map $x \bmod (f) \mapsto f'x \bmod (ff')$. Hence the left hand side is
$$\text{length}_R(R/(f, f')) - \text{length}_R((f) \cap (f')/(ff'))$$
Since this is symmetric in f and f' we win. □

Lemma 29.28.7. *Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Assume X integral and $\dim_\delta(X) = n$. Let $\{D_j\}_{j \in J}$ be a locally finite collection of effective Cartier divisors on X. Let $n_j, m_j \geq 0$ be collections of nonnegative integers. Set $D = \sum n_j D_j$ and $D' = \sum m_j D_j$. Assume that $\dim_\delta(D_j \cap D_{j'}) = n-2$ for every $j \neq j'$. Then $D \cdot [D']_{n-1} = D' \cdot [D]_{n-1}$ in $A_{n-2}(X)$.*

Proof. This lemma is a trivial consequence of Lemmas 29.27.6 and 29.28.6 in case the sums are finite, e.g., if X is quasi-compact. Hence we suggest the reader skip the proof.

Here is the proof in the general case. Let $i_j : D_j \to X$ be the closed immersions Let $p : \coprod D_j \to X$ denote coproduct of the morphisms i_j. Let $\{Z_a\}_{a \in A}$ be the collection of irreducible components of $\bigcup D_j$. For each j we write
$$[D_j]_{n-1} = \sum d_{j,a}[Z_a].$$
By Lemma 29.27.6 we have
$$[D]_{n-1} = \sum n_j d_{j,a}[Z_a], \quad [D']_{n-1} = \sum m_j d_{j,a}[Z_a].$$
By Lemma 29.28.5 we have
$$D \cdot [D']_{n-1} = p_*\left(\sum n_j i_j^*[D']_{n-1}\right), \quad D' \cdot [D]_{n-1} = p_*\left(\sum m_{j'} i_{j'}^*[D]_{n-1}\right).$$

As in the definition of the Gysin homomorphisms (see Definition 29.28.1) we choose cycles $\beta_{a,j}$ on $D_j \cap Z_a$ representing $i_j^*[Z_a]$. (Note that in fact $\beta_{a,j} = [D_j \cap Z_a]_{n-2}$ if Z_a is not contained in D_j, i.e., there is no choice in that case.) Now since p is a closed immersion when restricted to each of the D_j we can (and we will) view $\beta_{a,j}$ as a cycle on X. Plugging in the formulas for $[D]_{n-1}$ and $[D']_{n-1}$ obtained above we see that

$$D \cdot [D']_{n-1} = \sum\nolimits_{j,j',a} n_j m_{j'} d_{j',a} \beta_{a,j}, \quad D' \cdot [D]_{n-1} = \sum\nolimits_{j,j',a} m_{j'} n_j d_{j,a} \beta_{a,j'}.$$

Moreover, with the same conventions we also have

$$D_j \cdot [D_{j'}]_{n-1} = \sum d_{j',a} \beta_{a,j}.$$

In these terms Lemma 29.28.6 (see also its proof) says that for $j \neq j'$ the cycles $\sum d_{j',a}\beta_{a,j}$ and $\sum d_{j,a}\beta_{a,j'}$ are equal as cycles! Hence we see that

$$\begin{aligned} D \cdot [D']_{n-1} &= \sum\nolimits_{j,j',a} n_j m_{j'} d_{j',a} \beta_{a,j} \\ &= \sum\nolimits_{j \neq j'} n_j m_{j'} \left(\sum\nolimits_a d_{j',a} \beta_{a,j} \right) + \sum\nolimits_{j,a} n_j m_j d_{j,a} \beta_{a,j} \\ &= \sum\nolimits_{j \neq j'} n_j m_{j'} \left(\sum\nolimits_a d_{j,a} \beta_{a,j'} \right) + \sum\nolimits_{j,a} n_j m_j d_{j,a} \beta_{a,j} \\ &= \sum\nolimits_{j,j',a} m_{j'} n_j d_{j,a} \beta_{a,j'} \\ &= D' \cdot [D]_{n-1} \end{aligned}$$

and we win. □

Here is the key lemma of this chapter. A stronger version of this lemma asserts that $D \cdot [D']_{n-1} = D' \cdot [D]_{n-1}$ holds in $A_{n-2}(D \cap D')$ for suitable representatives of the dot products involved. The first proof of the lemma together with Lemmas 29.28.5, 29.28.6, and 29.28.7 can be modified to show this (see [**Ful98**]). It is not so clear how to modify the second proof to prove the refined version. An application of the refined version is a proof that the Gysin homomorphism factors through rational equivalence. We will show this by another method later.

Lemma 29.28.8. *Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Assume X integral and $\dim_\delta(X) = n$. Let D, D' be effective Cartier divisors on X. Then*

$$D \cdot [D']_{n-1} = D' \cdot [D]_{n-1}$$

in $A_{n-2}(X)$.

First proof of Lemma 29.28.8. First, let us prove this in case X is quasi-compact. In this case, apply Lemma 29.27.7 to X and the two element set $\{D, D'\}$ of effective Cartier divisors. Thus we get a proper morphism $b : X' \to X$, a finite collection of effective Cartier divisors $D'_j \subset X'$ intersecting pairwise in codimension ≥ 2, with $b^{-1}(D) = \sum n_j D'_j$, and $b^{-1}(D') = \sum m_j D'_j$. Note that $b_*[b^{-1}(D)]_{n-1} = [D]_{n-1}$ in $Z_{n-1}(X)$ and similarly for D', see Lemma 29.27.1. Hence, by Lemma 29.25.6 we have

$$D \cdot [D']_{n-1} = b_* \left(b^{-1}(D) \cdot [b^{-1}(D')]_{n-1} \right)$$

in $A_{n-2}(X)$ and similarly for the other term. Hence the lemma follows from the equality $b^{-1}(D) \cdot [b^{-1}(D')]_{n-1} = b^{-1}(D') \cdot [b^{-1}(D)]_{n-1}$ in $A_{n-2}(X')$ of Lemma 29.28.7.

Note that in the proof above, each referenced lemma works also in the general case (when X is not assumed quasi-compact). The only minor change in the general case is that the morphism $b : U' \to U$ we get from applying Lemma 29.27.7 has as its target an open $U \subset X$

whose complement has codimension ≥ 3. Hence by Lemma 29.19.2 we see that $A_{n-2}(U) = A_{n-2}(X)$ and after replacing X by U the rest of the proof goes through unchanged. $\square$

Second proof of Lemma 29.28.8. Let $\mathcal{I} = \mathcal{O}_X(-D)$ and $\mathcal{I}' = \mathcal{O}_X(-D')$ be the invertible ideal sheaves of D and D'. We denote $\mathcal{I}_{D'} = \mathcal{I} \otimes_{\mathcal{O}_X} \mathcal{O}_{D'}$ and $\mathcal{I}'_D = \mathcal{I}' \otimes_{\mathcal{O}_X} \mathcal{O}_D$. We can restrict the inclusion map $\mathcal{I} \to \mathcal{O}_X$ to D' to get a map

$$\varphi : \mathcal{I}_{D'} \longrightarrow \mathcal{O}_{D'}$$

and similarly

$$\psi : \mathcal{I}'_D \longrightarrow \mathcal{O}_D$$

It is clear that

$$\mathrm{Coker}(\varphi) \cong \mathcal{O}_{D \cap D'} \cong \mathrm{Coker}(\psi)$$

and

$$\mathrm{Ker}(\varphi) \cong \frac{\mathcal{I} \cap \mathcal{I}'}{\mathcal{I}\mathcal{I}'} \cong \mathrm{Ker}(\psi).$$

Hence we see that

$$\gamma = [\mathcal{I}_{D'}] - [\mathcal{O}_{D'}] = [\mathcal{I}'_D] - [\mathcal{O}_D]$$

in $K_0(\mathrm{Coh}_{\leq n-1}(X))$. On the other hand it is clear that

$$[\mathcal{I}'_D]_{n-1} = [D]_{n-1}, \quad [\mathcal{I}_{D'}]_{n-1} = [D']_{n-1}.$$

and that

$$\mathcal{O}_X(D') \otimes \mathcal{I}'_D = \mathcal{O}_D, \quad \mathcal{O}_X(D) \otimes \mathcal{I}_{D'} = \mathcal{O}_{D'}.$$

By Lemma 29.26.2 (applied two times) this means that the element γ is an element of $B_{n-2}(X)$, and maps to both $c_1(\mathcal{O}_X(D')) \cap [D]_{n-1}$ and to $c_1(\mathcal{O}_X(D)) \cap [D']_{n-1}$ and we win (since the map $B_{n-2}(X) \to A_{n-2}(X)$ is well defined -- which is the key to this proof). $\square$

29.29. Commutativity

At this point we can start using the material above and start proving more interesting results.

Lemma 29.29.1. *Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Assume X integral and $\dim_\delta(X) = n$. Let $\mathcal{L}$, $\mathcal{N}$ be invertible on X. Choose a nonzero meromorphic section s of $\mathcal{L}$ and a nonzero meromorphic section t of $\mathcal{N}$. Set $\alpha = div_{\mathcal{L}}(s)$ and $\beta = div_{\mathcal{N}}(t)$. Then*

$$c_1(\mathcal{N}) \cap \alpha = c_1(\mathcal{L}) \cap \beta$$

in $A_{n-2}(X)$.

Proof. By Lemma 29.27.2 (applied twice) there exists a proper morphism $\pi : X' \to X$ and effective Cartier divisors D_1, E_1, D_2, E_2 on X' such that

$$b^*\mathcal{L} = \mathcal{O}_{X'}(D_1 - E_1), \quad b^*\mathcal{N} = \mathcal{O}_{X'}(D_2 - E_2),$$

and such that

$$\alpha = \pi_*([D_1]_{n-1} - [E_1]_{n-1}), \quad \beta = \pi_*([D_2]_{n-1} - [E_2]_{n-1}).$$

By the projection formula of Lemma 29.25.6 and the additivity of Lemma 29.25.2 it is enough to show the equality

$$c_1(\mathcal{O}_{X'}(D_1)) \cap [D_2]_{n-1} = c_1(\mathcal{O}_{X'}(D_2)) \cap [D_1]_{n-1}$$

and three other similar equalities involving D_i and E_j. By Lemma 29.28.2 this is the same as showing that $D_1 \cdot [D_2]_{n-1} = D_2 \cdot [D_1]_{n-1}$ and so on. Thus the result follows from Lemma 29.28.8. $\square$

Lemma 29.29.2. *Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Let $\mathcal{L}$ be invertible on X. The operation $\alpha \mapsto c_1(\mathcal{L}) \cap \alpha$ factors through rational equivalence to give an operation*

$$c_1(\mathcal{L}) \cap - : A_{k+1}(X) \to A_k(X)$$

Proof. Let $\alpha \in Z_{k+1}(X)$, and $\alpha \sim_{rat} 0$. We have to show that $c_1(\mathcal{L}) \cap \alpha$ as defined in Definition 29.25.1 is zero. By Definition 29.19.1 there exists a locally finite family $\{W_j\}$ of integral closed subschemes with $\dim_\delta(W_j) = k+2$ and rational functions $f_j \in R(W_j)^*$ such that

$$\alpha = \sum (i_j)_* \mathrm{div}_{W_j}(f_j)$$

Note that $p : \coprod W_j \to X$ is a proper morphism, and hence $\alpha = p_*\alpha'$ where $\alpha' \in Z_{k+1}(\coprod W_j)$ is the sum of the principal divisors $\mathrm{div}_{W_j}(f_j)$. By the projection formula (Lemma 29.25.6) we have $c_1(\mathcal{L}) \cap \alpha = p_*(c_1(p^*\mathcal{L}) \cap \alpha')$. Hence it suffices to show that each $c_1(\mathcal{L}|_{W_j}) \cap \mathrm{div}_{W_j}(f_j)$ is zero. In other words we may assume that X is integral and $\alpha = \mathrm{div}_X(f)$ for some $f \in R(X)^*$.

Assume X is integral and $\alpha = \mathrm{div}_X(f)$ for some $f \in R(X)^*$. We can think of f as a regular meromorphic section of the invertible sheaf $\mathcal{N} = \mathcal{O}_X$. Choose a meromorphic section s of $\mathcal{L}$ and denote $\beta = \mathrm{div}_{\mathcal{L}}(s)$. By Lemma 29.29.1 we conclude that

$$c_1(\mathcal{L}) \cap \alpha = c_1(\mathcal{O}_X) \cap \beta.$$

However, by Lemma 29.25.2 we see that the right hand side is zero in $A_k(X)$ as desired. ☐

For any integer $s \geq 0$ we will denote

$$c_1(\mathcal{L})^s \cap - : A_{k+s}(X) \to A_k(X)$$

the s-fold iterate of the operation $c_1(\mathcal{L}) \cap -$. This makes sense by the lemma above.

Lemma 29.29.3. *Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Let $\mathcal{L}$, $\mathcal{N}$ be invertible on X. For any $\alpha \in A_{k+2}(X)$ we have*

$$c_1(\mathcal{L}) \cap c_1(\mathcal{N}) \cap \alpha = c_1(\mathcal{N}) \cap c_1(\mathcal{L}) \cap \alpha$$

as elements of $A_k(X)$.

Proof. Write $\alpha = \sum m_j[Z_j]$ for some lolcally finite collection of integral closed subschemes $Z_j \subset X$ with $\dim_\delta(Z_j) = k+2$. Consider the proper morphism $p : \coprod Z_j \to X$. Set $\alpha' = \sum m_j[Z_j]$ as a $(k+2)$-cycle on $\coprod Z_j$. By several applications of Lemma 29.25.6 we see that $c_1(\mathcal{L}) \cap c_1(\mathcal{N}) \cap \alpha = p_*(c_1(p^*\mathcal{L}) \cap c_1(p^*\mathcal{N}) \cap \alpha')$ and $c_1(\mathcal{N}) \cap c_1(\mathcal{L}) \cap \alpha = p_*(c_1(p^*\mathcal{N}) \cap c_1(p^*\mathcal{L}) \cap \alpha')$. Hence it suffices to prove the formula in case X is integral and $\alpha = [X]$. In this case the result follows from Lemma 29.29.1 and the definitions. ☐

29.30. Gysin homomorphisms

We want to show the Gysin homomorphisms factor through rational equivalence. One method (see [**Ful98**]) is to prove a more precise version of the key Lemma 29.28.8 keeping track of supports. Having obtained this one can find anlogues of the lemmas of Section 29.29 for the Gysin homomorphism and get the result. We will use another method.

Lemma 29.30.1. *Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Let X be integral and $n = \dim_\delta(X)$. Let $a \in \Gamma(X, \mathcal{O}_X)$ be a nonzero function. Let $i : D = Z(a) \to X$ be the closed immersion of the zero scheme of a. Let $f \in R(X)^*$. In this case $i^*\mathrm{div}_X(f) = 0$ in $A_{n-2}(D)$.*

Proof. Write $\text{div}_X(f) = \sum n_j[Z_j]$ for some integral closed subschemes $Z_j \subset X$ of δ-dimension $n-1$. We may assume that the family $\{Z_j\}_{j\in J}$ is locally finite and that $f \in \Gamma(U, \mathcal{O}_U^*)$ where $U = X \setminus \bigcup Z_j$ (see Lemma 29.16.3 and its proof).

Write $J = J_1 \coprod J_2$ where $J_1 = \{j \in J \mid Z_j \subset D\}$. Note that $\mathcal{O}_X(D) \cong \mathcal{O}_X$ because a^{-1} is a trivializing global section. Hence by Definition 29.28.1 of i^* we see that $i^*\text{div}_X(f)$ is represented by

$$\sum\nolimits_{j\in J_2} n_j[D \cap Z_j]_{n-2}.$$

Namely, the terms involving $c_1(\mathcal{O}_X(D)|_{Z_j}) \cap Z_j$ may be dropped since $c_1(\mathcal{O}) \cap -$ is the zero operation anyway (see Lemma 29.25.2).

For each j let $\xi_j \in Z_j$ be its generic point. Let $B_j = \mathcal{O}_{X,\xi_j}$, which has residue field $\kappa_j = \kappa(\xi_j) = R(Z_j)$. For $j \in J_1$, let

$$f_j = d_{B_j}(f, a)$$

be the tame symbol, see Definition 29.4.5. We claim that we have the following equality of cycles

$$\sum\nolimits_{j\in J_2} n_j[D \cap Z_j]_{n-2} = \sum\nolimits_{j\in J_1} (Z_j \to D)_*\text{div}_{Z_j}(f_j)$$

on D. Indeed, note that $[D \cap Z_j]_{n-2} = \text{div}_{Z_j}(a)$. Hence $n_j[D \cap Z_j]_{n-2} = \text{div}_{Z_j}(a^{n_j})$. Since $n_j = \text{ord}_{B_j}(f)$ we see that in fact also $n_j[D \cap Z_j]_{n-2} = \text{div}_{Z_j}(d_{B_j}(a, f))$, as a is a unit in B_j see Lemma 29.4.6. Note that $d_{B_j}(f, a) = d_{B_j}(a, f)^{-1}$, see Lemma 29.4.4. Hence altogether we are trying to show that

$$\sum\nolimits_{j\in J} (Z_j \to D)_*\text{div}_{Z_j}(d_{B_j}(a, f)) = 0$$

as an $(n-2)$-cycle. Consider any codimension 2 integral closed subscheme $W \subset X$ with generic point $\zeta \in X$. Set $A = \mathcal{O}_{X,\zeta}$. Applying Lemma 29.6.1 to (A, a, f) we see that the coefficient of $[W]$ in the expression above is zero as desired. □

Lemma 29.30.2. *Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Let X be integral and $n = \dim_\delta(X)$. Let $i : D \to X$ be an effective Cartier divisor. Let $f \in R(X)^*$. In this case $i^*div_X(f) = 0$ in $A_{n-2}(D)$.*

Proof. This proof is a repeat of the proof of Lemma 29.30.1. So make sure you've read that one first.

Write $\text{div}_X(f) = \sum n_j[Z_j]$ for some integral closed subschemes $Z_j \subset X$ of δ-dimension $n-1$. We may assume that the family $\{Z_j\}_{j\in J}$ is locally finite and that $f \in \Gamma(U, \mathcal{O}_U^*)$ where $U = X \setminus \bigcup Z_j$ (see Lemma 29.16.3 and its proof).

Write $J = J_1 \coprod J_2$ where $J_1 = \{j \in J \mid Z_j \subset D\}$. For each j let $\xi_j \in Z_j$ be its generic point. Let us write $\mathcal{L} = \mathcal{O}_X(D)$. Choose $\tilde{s}_j \in \mathcal{L}_{\xi_j}$ a generator. Denote $s_j \in \mathcal{L}_{\xi_j} \otimes \kappa(\xi_j)$ the corresponding nonzero meromorphic section of $\mathcal{L}|_{Z_j}$. Then by Definition 29.28.1 of i^* we see that $i^*\text{div}_X(f)$ is represented by the cycle

$$\sum\nolimits_{j\in J_2} n_j[D \cap Z_j]_{n-2} + \sum\nolimits_{j\in J_2} n_j\text{div}_{\mathcal{L}|_{Z_j}}(s_j)$$

on D. Our goal is to show that this is rationally equivalent to zero on D.

Let $B_j = \mathcal{O}_{X,\xi_j}$, which has residue field $\kappa_j = \kappa(\xi_j) = R(Z_j)$. Write $s = a_j\tilde{s}_j$ for some $a_j \in B_j$. For $j \in J_1$ let

$$f_j = d_{B_j}(f, a_j) \in \kappa_j^* = R(Z_j)^*$$

be the tame symbol, see Definition 29.4.5. We claim that we have the following equality of cycles

$$\sum\nolimits_{j\in J_2} n_j[D\cap Z_j]_{n-2} + \sum\nolimits_{j\in J_2} n_j\mathrm{div}_{\mathcal{L}|_{Z_j}}(s_j) = \sum\nolimits_{j\in J_1}(Z_j\to D)_*\mathrm{div}_{Z_j}(f_j)$$

on D. This will clearly prove the lemma.

Note that for $j\in J_2$ we have $[D\cap Z_j]_{n-2} = \mathrm{div}_{\mathcal{L}|_{Z_j}}(s|_{Z_j})$. Since $s|_{Z_j} = a_j|_{Z_j}s_j$ we see that $[D\cap Z_j]_{n-2} = \mathrm{div}_{\mathcal{L}|_{Z_j}}(s_j) + \mathrm{div}_{Z_j}(a_j|_{Z_j})$. Hence, still for $j\in J_2$, we have

$$n_j[D\cap Z_j]_{n-2} = n_j\mathrm{div}_{\mathcal{L}|_{Z_j}}(s_j) + \mathrm{div}_{Z_j}((a_j|_{Z_j})^{n_j})$$

Since $n_j = \mathrm{ord}_{B_j}(f)$ we see that $\mathrm{div}_{Z_j}((a_j|_{Z_j})^{n_j}) = \mathrm{div}_{Z_j}(d_{B_j}(a_j, f))$, as a_j is a unit in B_j (since $j\in J_2$), see Lemma 29.4.6. Note that $d_{B_j}(f, a_j) = d_{B_j}(a_j, f)^{-1}$, see Lemma 29.4.4. Hence altogether we are trying to show that

$$\sum\nolimits_{j\in J} n_j\mathrm{div}_{\mathcal{L}|_{Z_j}}(s_j) = \sum\nolimits_{j\in J}(Z_j\to D)_*\mathrm{div}_{Z_j}(d_{B_j}(a_j, f)) \tag{29.30.2.1}$$

as an $(n-2)$-cycle.

Consider any codimension 2 integral closed subscheme $W\subset X$ with generic point $\zeta\in X$. Set $A = \mathcal{O}_{X,\zeta}$. Choose a generator $s_\zeta\in\mathcal{L}_\zeta$. For those j such that $\zeta\in Z_j$ we may write $\tilde{s}_j = b_js_\zeta$ with $b_j\in B_j^*$. We may also write $s = a_\zeta s_\zeta$ for some $a_\zeta\in A$. Then we see that $a_j = b_ja_\zeta$. The coefficient of $[W]$ on the right hand side of Equation (29.30.2.1) is

$$\sum\nolimits_{\zeta\in Z_j} n_j\mathrm{ord}_{A/\mathfrak{q}_j}(\overline{b_j}).$$

where $\mathfrak{q}_j\subset A$ is the height one prime corresponding to Z_j. Note that $B_j = A_{\mathfrak{q}_j}$ in this case. The coefficient of $[W]$ on the left hand side of Equation (29.30.2.1) is

$$\sum\nolimits_{\zeta\in Z_j}\mathrm{ord}_{A/\mathfrak{q}_j}(d_{A_{\mathfrak{q}_j}}(b_ja_\zeta, f)).$$

Since b_j is a unit, and $n_j = \mathrm{ord}_{A_{\mathfrak{q}_j}}(f)$ we see that $d_{A_{\mathfrak{q}_j}}(b_ja_\zeta, f) = \overline{b_j}^{n_j}d_{A_{\mathfrak{q}_j}}(a_\zeta, f)$ by Lemmas 29.4.4 and 29.4.6. By additivity of ord we see that it suffices to prove

$$0 = \sum\nolimits_{\zeta\in Z_j}\mathrm{ord}_{A/\mathfrak{q}_j}(d_{A_{\mathfrak{q}_j}}(a_\zeta, f))$$

which is Lemma 29.6.1. □

Lemma 29.30.3. *Let (S,δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Let $i : D\to X$ be an effective Cartier divisor on X. The Gysin homomorphism factors through rational equivalence to give a map $i^* : A_{k+1}(X)\to A_k(D)$.*

Proof. Let $\alpha\in Z_{k+1}(X)$ and assume that $\alpha\sim_{rat} 0$. This means there exists a locally finite collection of integral closed subschemes $W_j\subset X$ of δ-dimension $k+2$ and $f_j\in R(W_j)^*$ such that $\alpha = \sum i_{j,*}\mathrm{div}_{W_j}(f_j)$. By construction of the map i^* we see that $i^*\alpha = \sum i^*i_{j,*}\mathrm{div}_{W_j}(f_j)$ where each cycle $i^*i_{j,*}\mathrm{div}_{W_j}(f_j)$ is supported on $D\cap W_j$. If we can show that each $i^*i_{j,*}\mathrm{div}_{W_j}(f_j)$ is rationally equivalent on $W_j\cap D$, then we see that $i^*\alpha\sim_{rat} 0$ (this is clear if the sum is finite, in general see Remark 29.19.4).

Pick an index j. If $W_j\subset D$, then we see that $i^*i_{j,*}\mathrm{div}_{W_j}(f_j)$ is simply equal to

$$i'_{j,*}c_1(\mathcal{O}_X(D)|_{W_j})\cap\mathrm{div}_{W_j}(f_j)$$

where $i'_j : W_j \to D$ is the inclusion map. This is rationally equivalent to zero by Lemma 29.29.2. If $W_j \not\subset D$, then we see that $i^* i_{j,*}\text{div}_{W_j}(f_j)$ is simply equal to

$$(i')^* \text{div}_{W_j}(f_j)$$

where $i' : D \cap W_j \to W_j$ is the corresponding closed immersion (see Lemma 29.28.3). Hence in this case Lemma 29.30.2 applies, and we win. □

29.31. Relative effective Cartier divisors

Lemma 29.31.1. *Let $A \to B$ be a ring map. Let $f \in B$. Assume that*

(1) *$A \to B$ is flat,*
(2) *f is a nonzero divisor, and*
(3) *$A \to B/fB$ is flat.*

Then for every ideal $I \subset A$ the map $f : B/IB \to B/IB$ is injective.

Proof. Note that $IB = I \otimes_A B$ and $I(B/fB) = I \otimes_A B/fB$ by the flatness of B and B/fB over A. In particular $IB/fIB \cong I \otimes_A B/fB$ maps injectively into B/fB. Hence the result follows from the snake lemma applied to the diagram

$$\begin{tikzcd} 0 \arrow[r] & I \otimes_A B \arrow[r] \arrow[d, "f"] & B \arrow[r] \arrow[d, "f"] & B/IB \arrow[r] \arrow[d, "f"] & 0 \\ 0 \arrow[r] & I \otimes_A B \arrow[r] & B \arrow[r] & B/IB \arrow[r] & 0 \end{tikzcd}$$

with exact rows. □

Lemma 29.31.2. *Let (S, δ) be as in Situation 29.7.1. Let X, Y be locally of finite type over S. Let $p : X \to Y$ be a flat morphism of relative dimension r. Let $i : D \to X$ be an effective Cartier divisor with the property that $p|_D : D \to Y$ is flat of relative dimension $r - 1$. Let $\mathcal{L} = \mathcal{O}_X(D)$. For any $\alpha \in A_{k+1}(Y)$ we have*

$$i^* p^* \alpha = (p|_D)^* \alpha$$

in $A_{k+r}(D)$ and

$$c_1(\mathcal{L}) \cap p^* \alpha = i_*((p|_D)^* \alpha)$$

in $A_{k+r}(X)$.

Proof. Let $W \subset Y$ be an integral closed subvariety of δ-dimension $k + 1$. By Lemma 29.31.1 we see that $D \cap p^{-1}W$ is an effective Cartier divisor on $p^{-1}W$. By Lemma 29.28.4 we see that $i^*[p^{-1}W]_{k+r+1} = [D \cap W]_{k+r} = [(p|_D)^{-1}(W)]_{k+r}$. Since by definition $p^*[W] = [p^{-1}W]_{k+r+1}$ and $(p|_D)^*[W] = [(p|_D)^{-1}(W)]_{k+r}$ we see we have equality of cycles. Hence if $\alpha = \sum m_j[W_j]$, then we get $i^*\alpha = \sum m_j i^*[W_j] = \sum m_j (p|_D)^*[W_j]$ as cycles. This proves then first equality. To deduce the second from the first apply Lemma 29.28.2. □

29.32. Affine bundles

Lemma 29.32.1. *Let (S, δ) be as in Situation 29.7.1. Let X, Y be locally of finite type over S. Let $f : X \to Y$ be a flat morphism of relative dimension r. Assume that for every $y \in Y$, there exists an open neighbourhood $U \subset Y$ such that $f|_{f^{-1}(U)} : f^{-1}(U) \to U$ is identified with the morphism $U \times \mathbf{A}^r \to U$. Then $f^* : A_k(Y) \to A_{k+r}(X)$ is surjective for all $k \in \mathbf{Z}$.*

Proof. Let $\alpha \in A_{k+r}(X)$. Write $\alpha = \sum m_j[W_j]$ with $m_j \neq 0$ and W_j pairwise distinct integral closed subschemes of δ-dimension $k+r$. Then the family $\{W_j\}$ is locally finite in X. For any quasi-compact open $V \subset Y$ we see that $f^{-1}(V) \cap W_j$ is nonempty only for finitely many j. Hence the collection $Z_j = \overline{f(W_j)}$ of closures of images is a locally finite collection of integral closed subschemes of Y.

Consider the fibre product diagrams

$$\begin{tikzcd} f^{-1}(Z_j) \arrow[r] \arrow[d, "f_j"'] & X \arrow[d, "f"] \\ Z_j \arrow[r] & Y \end{tikzcd}$$

Suppose that $[W_j] \in Z_{k+r}(f^{-1}(Z_j))$ is rationally equivalent to $f_j^*\beta_j$ for some k-cycle $\beta_j \in A_k(Z_j)$. Then $\beta = \sum m_j\beta_j$ will be a k-cycle on Y and $f^*\beta = \sum m_j f_j^*\beta_j$ will be rationally equivalent to α (see Remark 29.19.4). This reduces us to the case Y integral, and $\alpha = [W]$ for some integral closed subscheme of X dominating Y. In particular we may assume that $d = \dim_\delta(Y) < \infty$.

Hence we can use induction on $d = \dim_\delta(Y)$. If $d < k$, then $A_{k+r}(X) = 0$ and the lemma holds. By assumption there exists a dense open $V \subset Y$ such that $f^{-1}(V) \cong V \times \mathbf{A}^r$ as schemes over V. Suppose that we can show that $\alpha|_{f^{-1}(V)} = f^*\beta$ for some $\beta \in Z_k(V)$. By Lemma 29.14.2 we see that $\beta = \beta'|_V$ for some $\beta' \in Z_k(Y)$. By the exact sequence $A_k(f^{-1}(Y \setminus V)) \to A_k(X) \to A_k(f^{-1}(V))$ of Lemma 29.19.2 we see that $\alpha - f^*\beta'$ comes from a cycle $\alpha' \in A_{k+r}(f^{-1}(Y \setminus V))$. Since $\dim_\delta(Y \setminus V) < d$ we win by induction on d.

Thus we may assume that $X = Y \times \mathbf{A}^r$. In this case we can factor f as

$$X = Y \times \mathbf{A}^r \to Y \times \mathbf{A}^{r-1} \to \ldots \to Y \times \mathbf{A}^1 \to Y.$$

Hence it suffices to do the case $r = 1$. By the argument in the second paragraph of the proof we are reduced to the case $\alpha = [W]$, Y integral, and $W \to Y$ dominant. Again we can do induction on $d = \dim_\delta(Y)$. If $W = Y \times \mathbf{A}^1$, then $[W] = f^*[Y]$. Lastly, $W \subset Y \times \mathbf{A}^1$ is a proper inclusion, then $W \to Y$ induces a finite field extension $R(Y) \subset R(W)$. Let $P(T) \in R(Y)[T]$ be the monic irreducible polynomial such that the generic fibre of $W \to Y$ is cut out by P in $\mathbf{A}^1_{R(Y)}$. Let $V \subset Y$ be a nonempty open such that $P \in \Gamma(V, \mathcal{O}_Y)[T]$, and such that $W \cap f^{-1}(V)$ is still cut out by P. Then we see that $\alpha|_{f^{-1}(V)} \sim_{rat} 0$ and hence $\alpha \sim_{rat} \alpha'$ for some cycle α' on $(Y \setminus V) \times \mathbf{A}^1$. By induction on the dimension we win. $\square$

Remark 29.32.2. We will see later (Lemma 29.33.3) that if X is a vectorbundle over Y then the pullback map $A_k(Y) \to A_{k+r}(X)$ is an isomorphism. Is this true in general?

29.33. Projective space bundle formula

Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Consider a finite locally free $\mathcal{O}_X$-module $\mathcal{E}$ of rank r. Our convention is that the *projective bundle associated to* $\mathcal{E}$ is the morphism

$$\mathbf{P}(\mathcal{E}) = \underline{\mathrm{Proj}}_X(\mathrm{Sym}^*(\mathcal{E})) \xrightarrow{\pi} X$$

over X with $\mathcal{O}_{\mathbf{P}(\mathcal{E})}(1)$ normalized so that $\pi_*(\mathcal{O}_{\mathbf{P}(\mathcal{E})}(1)) = \mathcal{E}$. In particular there is a surjection $\pi^*\mathcal{E} \to \mathcal{O}_{\mathbf{P}(\mathcal{E})}(1)$. We will say informally ``let $(\pi : P \to X, \mathcal{O}_P(1))$ be the projective bundle associated to $\mathcal{E}$'' to denote the situation where $P = \mathbf{P}(\mathcal{E})$ and $\mathcal{O}_P(1) = \mathcal{O}_{\mathbf{P}(\mathcal{E})}(1)$.

Lemma 29.33.1. *Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Let $\mathcal{E}$ be a finite locally free $\mathcal{O}_X$-module $\mathcal{E}$ of rank r. Let $(\pi : P \to X, \mathcal{O}_P(1))$ be the projective bundle associated to $\mathcal{E}$. For any $\alpha \in A_k(X)$ we the element*

$$\pi_* \left(c_1(\mathcal{O}_P(1))^s \cap \pi^*\alpha \right) \in A_{k+r-1-s}(X)$$

is 0 if $s < r - 1$ and is equal to α when $s = r - 1$.

Proof. Let $Z \subset X$ be an integral closed subscheme of δ-dimension k. Note that $\pi^*[Z] = [\pi^{-1}(Z)]$ as $\pi^{-1}(Z)$ is integral of δ-dimension $r - 1$. If $s < r - 1$, then by construction $c_1(\mathcal{O}_P(1))^s \cap \pi^*[Z]$ is represented by a $(k + r - 1 - s)$-cycle supported on $\pi^{-1}(Z)$. Hence the pushforward of this cycle is zero for dimension reasons.

Let $s = r - 1$. By the argument given above we see that $\pi_*(c_1(\mathcal{O}_P(1))^s \cap \pi^*\alpha) = n[Z]$ for some $n \in \mathbf{Z}$. We want to show that $n = 1$. For the same dimension reasons as above it suffices to prove this result after replacing X by $X \setminus T$ where $T \subset Z$ is a proper closed subset. Let ξ be the generic point of Z. We can choose elements $e_1, \ldots, e_{r-1} \in \mathcal{E}_\xi$ which form part of a basis of $\mathcal{E}_\xi$. These give rational sections $s_1, \ldots, s_{r-1}$ of $\mathcal{O}_P(1)|_{\pi^{-1}(Z)}$ whose common zero set is the closure of the image a rational section of $\mathbf{P}(\mathcal{E}|_Z) \to Z$ union a closed subset whose support maps to a proper closed subset T of Z. After removing T from X (and correspondingly $\pi^{-1}(T)$ from P), we see that $s_1, \ldots, s_n$ form a sequence of global sections $s_i \in \Gamma(\pi^{-1}(Z), \mathcal{O}_{\pi^{-1}(Z)}(1))$ whose common zero set is the image of a section $Z \to \pi^{-1}(Z)$. Hence we see succesively that

$$\begin{array}{rcl} \pi^*[Z] & = & [\pi^{-1}(Z)] \\ c_1(\mathcal{O}_P(1)) \cap \pi^*[Z] & = & [Z(s_1)] \\ c_1(\mathcal{O}_P(1))^2 \cap \pi^*[Z] & = & [Z(s_1) \cap Z(s_2)] \\ \ldots & = & \ldots \\ c_1(\mathcal{O}_P(1))^{r-1} \cap \pi^*[Z] & = & [Z(s_1) \cap \ldots \cap Z(s_{r-1})] \end{array}$$

by repeated applications of Lemma 29.25.3. Since the pushforward by π of the image of a section of π over Z is clearly $[Z]$ we see the result when $\alpha = [Z]$. We omit the verification that these arguments imply the result for a general cycle $\alpha = \sum n_j[Z_j]$. $\square$

Lemma 29.33.2. *(Projective space bundle formula.) Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Let $\mathcal{E}$ be a finite locally free $\mathcal{O}_X$-module $\mathcal{E}$ of rank r. Let $(\pi : P \to X, \mathcal{O}_P(1))$ be the projective bundle associated to $\mathcal{E}$. The map*

$$\bigoplus\nolimits_{i=0}^{r-1} A_{k+i}(X) \longrightarrow A_{k+r-1}(P),$$

$$(\alpha_0, \ldots, \alpha_{r-1}) \longmapsto \pi^*\alpha_0 + c_1(\mathcal{O}_P(1)) \cap \pi^*\alpha_1 + \ldots + c_1(\mathcal{O}_P(1))^{r-1} \cap \pi^*\alpha_{r-1}$$

is an isomorphism.

Proof. Fix $k \in \mathbf{Z}$. We first show the map is injective. Suppose that $(\alpha_0, \ldots, \alpha_{r-1})$ is an element of the left hand side that maps to zero. By Lemma 29.33.1 we see that

$$0 = \pi_*(\pi^*\alpha_0 + c_1(\mathcal{O}_P(1)) \cap \pi^*\alpha_1 + \ldots + c_1(\mathcal{O}_P(1))^{r-1} \cap \pi^*\alpha_{r-1}) = \alpha_{r-1}$$

Next, we see that

$$0 = \pi_*(c_1(\mathcal{O}_P(1)) \cap (\pi^*\alpha_0 + c_1(\mathcal{O}_P(1)) \cap \pi^*\alpha_1 + \ldots + c_1(\mathcal{O}_P(1))^{r-2} \cap \pi^*\alpha_{r-2})) = \alpha_{r-2}$$

and so on. Hence the map is injective.

It remains to show the map is surjective. Let X_i, $i \in I$ be the irreducible components of X. Then $P_i = \mathbf{P}(\mathcal{E}|_{X_i})$, $i \in I$ are the irreducible components of P. If the map is surjective for each of the morphisms $P_i \to X_i$, then the map is surjective for $\pi : P \to X$. Details omitted. Hence we may assume X is irreducible. Thus $\dim_\delta(X) < \infty$ and in particular we may use induction on $\dim_\delta(X)$.

The result is clear if $\dim_\delta(X) < k$. Let $\alpha \in A_{k+r-1}(P)$. For any locally closed subscheme $T \subset X$ denote $\gamma_T : \bigoplus A_{k+i}(T) \to A_{k+r-1}(\pi^{-1}(T))$ the map

$$\gamma_T(\alpha_0, \ldots, \alpha_{r-1}) = \pi^*\alpha_0 + \ldots + c_1(\mathcal{O}_{\pi^{-1}(T)}(1))^{r-1} \cap \pi^*\alpha_{r-1}.$$

Suppose for some nonempty open $U \subset X$ we have $\alpha|_{\pi^{-1}(U)} = \gamma_U(\alpha_0, \ldots, \alpha_{r-1})$. Then we may choose lifts $\alpha'_i \in A_{k+i}(X)$ and we see that $\alpha - \gamma_X(\alpha'_0, \ldots, \alpha'_{r-1})$ is by Lemma 29.19.2 rationally equivalent to a k-cycle on $P_Y = \mathbf{P}(\mathcal{E}|_Y)$ where $Y = X \setminus U$ as a reduced closed subscheme. Note that $\dim_\delta(Y) < \dim_\delta(X)$. By induction the result holds for $P_Y \to Y$ and hence the result holds for α. Hence we may replace X by any nonempty open of X.

In particular we may assume that $\mathcal{E} \cong \mathcal{O}_X^{\oplus r}$. In this case $\mathbf{P}(\mathcal{E}) = X \times \mathbf{P}^{r-1}$. Let us use the stratification

$$\mathbf{P}^{r-1} = \mathbf{A}^{r-1} \coprod \mathbf{A}^{r-2} \coprod \ldots \coprod \mathbf{A}^0$$

The closure of each stratum is a $\mathbf{P}^{r-1-i}$ which is a representative of $c_1(\mathcal{O}(1))^i \cap [\mathbf{P}^{r-1}]$. Hence P has a similar stratification

$$P = U^{r-1} \coprod U^{r-2} \coprod \ldots \coprod U^0$$

Let P^i be the closure of U^i. Let $\pi^i : P^i \to X$ be the restriction of π to P^i. Let $\alpha \in A_{k+r-1}(P)$. By Lemma 29.32.1 we can write $\alpha|_{U^{r-1}} = \pi^*\alpha_0|_{U^{r-1}}$ for some $\alpha_0 \in A_k(X)$. Hence the difference $\alpha - \pi^*\alpha_0$ is the image of some $\alpha' \in A_{k+r-1}(P^{r-2})$. By Lemma 29.32.1 again we can write $\alpha'|_{U^{r-2}} = (\pi^{r-2})^*\alpha_1|_{U^{r-2}}$ for some $\alpha_1 \in A_{k+1}(X)$. By Lemma 29.31.2 we see that the image of $(\pi^{r-2})^*\alpha_1$ represents $c_1(\mathcal{O}_P(1)) \cap \pi^*\alpha_1$. We also see that $\alpha - \pi^*\alpha_0 - c_1(\mathcal{O}_P(1)) \cap \pi^*\alpha_1$ is the image of some $\alpha'' \in A_{k+r-1}(P^{r-3})$. And so on. □

Lemma 29.33.3. *Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Let $\mathcal{E}$ be a finite locally free sheaf of rank r on X. Let*

$$p : E = \underline{Spec}(Sym^*(\mathcal{E})) \longrightarrow X$$

be the associated vector bundle over X. Then $p^* : A_k(X) \to A_{k+r}(E)$ is an isomorphism for all k.

Proof. For surjectivity see Lemma 29.32.1. Let $(\pi : P \to X, \mathcal{O}_P(1))$ be the projective space bundle associated to the finite locally free sheaf $\mathcal{E} \oplus \mathcal{O}_X$. Let $s \in \Gamma(P, \mathcal{O}_P(1))$ correspond to the global section $(0, 1) \in \Gamma(X, \mathcal{E} \oplus \mathcal{O}_X)$. Let $D = Z(s) \subset P$. Note that $(\pi|_D : D \to X, \mathcal{O}_P(1)|_D)$ is the projective space bundle associated to $\mathcal{E}$. We denote $\pi_D = \pi|_D$ and $\mathcal{O}_D(1) = \mathcal{O}_P(1)|_D$. Moreover, D is an effective Cartier divisor on P. Hence $\mathcal{O}_P(D) = \mathcal{O}_P(1)$ (see Divisors, Lemma 26.9.17). Also there is an isomorphism $E \cong P \setminus D$. Denote $j : E \to P$ the corresponding open immersion. For injectivity we use that the kernel of

$$j^* : A_{k+r}(P) \longrightarrow A_{k+r}(E)$$

are the cycles supported in the effective Cartier divisor D, see Lemma 29.19.2. So if $p^*\alpha = 0$, then $\pi^*\alpha = i_*\beta$ for some $\beta \in A_{k+r}(D)$. By Lemma 29.33.2 we may write

$$\beta = \pi_D^*\beta_0 + \ldots + c_1(\mathcal{O}_D(1))^{r-1} \cap \pi_D^*\beta_{r-1}.$$

for some $\beta_i \in A_{k+i}(X)$. By Lemmas 29.31.2 and 29.25.6 this implies

$$\pi^*\alpha = i_*\beta = c_1(\mathcal{O}_P(1)) \cap \pi^*\beta_0 + \ldots + c_1(\mathcal{O}_D(1))^r \cap \pi^*\beta_{r-1}.$$

Since the rank of $\mathcal{E} \oplus \mathcal{O}_X$ is $r+1$ this contradicts Lemma 29.25.6 unless all α and all β_i are zero. □

29.34. The Chern classes of a vector bundle

We can use the projective space bundle formula to define the chern classes of a rank r vector bundle in terms of the expansion of $c_1(\mathcal{O}(1))^r$ in terms of the lower powers, see formula (29.34.1.1). The reason for the signs will be explained later.

Definition 29.34.1. Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Assume X is integral and $n = \dim_\delta(X)$. Let $\mathcal{E}$ be a finite locally free sheaf of rank r on X. Let $(\pi : P \to X, \mathcal{O}_P(1))$ be the projective space bundle associated to $\mathcal{E}$.

(1) By Lemma 29.33.2 there are elements $c_i \in A_{n-i}(X)$, $i = 0, \ldots, r$ such that $c_0 = [X]$, and

$$\sum\nolimits_{i=0}^{r} (-1)^i c_1(\mathcal{O}_P(1))^i \cap \pi^* c_{r-i} = 0. \tag{29.34.1.1}$$

(2) With notation as above we set $c_i(\mathcal{E}) \cap [X] = c_i$ as an element of $A_{n-i}(X)$. We call these the *chern classes of $\mathcal{E}$ on X*.

(3) The *total chern class of $\mathcal{E}$ on X* is the combination

$$c(\mathcal{E}) \cap [X] = c_0(\mathcal{E}) \cap [X] + c_1(\mathcal{E}) \cap [X] + \ldots + c_r(\mathcal{E}) \cap [X]$$

which is an element of $A_*(X) = \bigoplus_{k \in \mathbf{Z}} A_k(X)$.

Let us check that this does not give a new notion in case the vector bundle has rank 1.

Lemma 29.34.2. *Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Assume X is integral and $n = \dim_\delta(X)$. Let $\mathcal{L}$ be an invertible $\mathcal{O}_X$-module. The first chern class of $\mathcal{L}$ on X of Definition 29.34.1 is equal to the Weil divisor associated to $\mathcal{L}$ by Definition 29.24.1.*

Proof. In this proof we use $c_1(\mathcal{L}) \cap [X]$ to denote the construction of Definition 29.24.1. Since $\mathcal{L}$ has rank 1 we have $\mathbf{P}(\mathcal{L}) = X$ and $\mathcal{O}_{\mathbf{P}(\mathcal{L})}(1) = \mathcal{L}$ by our normalizations. Hence (29.34.1.1) reads

$$(-1)^1 c_1(\mathcal{L}) \cap c_0 + (-1)^0 c_1 = 0$$

Since $c_0 = [X]$, we conclude $c_1 = c_1(\mathcal{L}) \cap [X]$ as desired. □

Remark 29.34.3. We could also rewrite equation 29.34.1.1 as

$$\sum\nolimits_{i=0}^{r} c_1(\mathcal{O}_P(-1))^i \cap \pi^* c_{r-i} = 0. \tag{29.34.3.1}$$

but we find it easier to work with the tautological quotient sheaf $\mathcal{O}_P(1)$ instead of its dual.

29.35. Intersecting with chern classes

Definition 29.35.1. Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Let $\mathcal{E}$ be a finite locally free sheaf of rank r on X. We define, for every integer k and any $0 \leq j \leq r$, an operation

$$c_j(\mathcal{E}) \cap - : Z_k(X) \to A_{k-j}(X)$$

called *intersection with the jth chern class of $\mathcal{E}$*.

(1) Given an integral closed subscheme $i : W \to X$ of δ-dimension k we define

$$c_j(\mathcal{E}) \cap [W] = i_*(c_j(i^*\mathcal{E}) \cap [W]) \in A_{k-j}(X)$$

where $c_j(i^*\mathcal{E}) \cap [W]$ is as defined in Definition 29.34.1.

(2) For a general k-cycle $\alpha = \sum n_i[W_i]$ we set
$$c_j(\mathcal{E}) \cap \alpha = \sum n_i c_j(\mathcal{E}) \cap [W_i]$$

Again, if $\mathcal{E}$ has rank 1 then this agrees with our previous definition.

Lemma 29.35.2. *Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Let $\mathcal{E}$ be a finite locally free sheaf of rank r on X. Let $(\pi : P \to X, \mathcal{O}_P(1))$ be the projective bundle associated to $\mathcal{E}$. For $\alpha \in Z_k(X)$ the elements $c_j(\mathcal{E}) \cap \alpha$ are the unique elements α_j of $A_{k-j}(X)$ such that $\alpha_0 = \alpha$ and*
$$\sum\nolimits_{i=0}^r (-1)^i c_1(\mathcal{O}_P(1))^i \cap \pi^*(\alpha_{r-i}) = 0$$
holds in the Chow group of P.

Proof. The uniqueness of $\alpha_0, \ldots, \alpha_r$ such that $\alpha_0 = \alpha$ and such that the displayed equation holds follows from the projective space bundle formula Lemma 29.33.2. The identity holds by definition for $\alpha = [X]$. For a general k-cycle α on X write $\alpha = \sum n_a[W_a]$ with $n_a \neq 0$, and $i_a : W_a \to X$ pairwise distinct integral closed subschemes. Then the family $\{W_a\}$ is locally finite on X. Set $P_a = \pi^{-1}(W_a) = \mathbf{P}(\mathcal{E}|_{W_a})$. Denote $i'_a : P_a \to P$ the corresponding closed immersions. Consider the fibre product diagram
$$\begin{tikzcd} P' \arrow[r, equal] \arrow[d, "\pi'"'] & \coprod P_a \arrow[r, "i'_a"] \arrow[d, "\pi_a"'] & P \arrow[d, "\pi"] \\ X' \arrow[r, equal] & \coprod W_a \arrow[r, "i_a"] & X \end{tikzcd}$$
The morphism $p : X' \to X$ is proper. Moreover $\pi' : P' \to X'$ together with the invertible sheaf $\mathcal{O}_{P'}(1) = \coprod \mathcal{O}_{P_a}(1)$ which is also the pullback of $\mathcal{O}_P(1)$ is the projective bundle associated to $\mathcal{E}' = p^*\mathcal{E}$. By definition
$$c_j(\mathcal{E}) \cap [\alpha] = \sum i_{a,*}(c_j(\mathcal{E}|_{W_a}) \cap [W_a]).$$
Write $\beta_{a,j} = c_j(\mathcal{E}|_{W_a}) \cap [W_a]$ which is an element of $A_{k-j}(W_a)$. We have
$$\sum\nolimits_{i=0}^r (-1)^i c_1(\mathcal{O}_{P_a}(1))^i \cap \pi_a^*(\beta_{a,r-i}) = 0$$
for each a by definition. Thus clearly we have
$$\sum\nolimits_{i=0}^r (-1)^i c_1(\mathcal{O}_{P'}(1))^i \cap (\pi')^*(\beta_{r-i}) = 0$$
with $\beta_j = \sum n_a \beta_{a,j} \in A_{k-j}(X')$. Denote $p' : P' \to P$ the morphism $\coprod i'_a$. We have $\pi^* p_* \beta_j = p'_*(\pi')^*\beta_j$ by Lemma 29.15.1. By the projection formula of Lemma 29.25.6 we conclude that
$$\sum\nolimits_{i=0}^r (-1)^i c_1(\mathcal{O}_P(1))^i \cap \pi^*(p_*\beta_j) = 0$$
Since $p_*\beta_j$ is a representative of $c_j(\mathcal{E}) \cap \alpha$ we win. $\square$

This characterization of chern classes allows us to prove many more properties.

Lemma 29.35.3. *Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Let $\mathcal{E}$ be a finite locally free sheaf of rank r on X. If $\alpha \sim_{rat} \beta$ are rationally equivalent k-cycles on X then $c_j(\mathcal{E}) \cap \alpha = c_j(\mathcal{E}) \cap \beta$ in $A_{k-j}(X)$.*

Proof. By Lemma 29.35.2 the elements $\alpha_j = c_j(\mathcal{E}) \cap \alpha$, $j \geq 1$ and $\beta_j = c_j(\mathcal{E}) \cap \beta$, $j \geq 1$ are uniquely determined by the *same* equation in the chow group of the projective bundle associated to $\mathcal{E}$. (This of course relies on the fact that flat pullback is compatible with rational equivalence, see Lemma 29.20.1.) Hence they are equal. $\square$

In other words capping with chern classes of finite locally free sheaves factors through rational equivalence to give maps

$$c_j(\mathcal{E}) \cap - : A_k(X) \to A_{k-j}(X).$$

Lemma 29.35.4. *Let (S, δ) be as in Situation 29.7.1. Let X, Y be locally of finite type over S. Let $\mathcal{E}$ be a finite locally free sheaf of rank r on Y. Let $f : X \to Y$ be a flat morphism of relative dimension r. Let α be a k-cycle on Y. Then*

$$f^*(c_j(\mathcal{E}) \cap \alpha) = c_j(f^*\mathcal{E}) \cap f^*\alpha$$

Proof. Write $\alpha_j = c_j(\mathcal{E}) \cap \alpha$, so $\alpha_0 = \alpha$. By Lemma 29.35.2 we have

$$\sum\nolimits_{i=0}^{r} (-1)^i c_1(\mathcal{O}_P(1))^i \cap \pi^*(\alpha_{r-i}) = 0$$

in the chow group of the projective bundle $(\pi : P \to Y, \mathcal{O}_P(1))$ associated to $\mathcal{E}$. Consider the fibre product diagram

$$\begin{tikzcd} P_X = \mathbf{P}(f^*\mathcal{E}) \arrow[r, "f_P"'] \arrow[d, "\pi_X"'] & P \arrow[d, "\pi"] \\ X \arrow[r, "f"] & Y \end{tikzcd}$$

Note that $\mathcal{O}_{P_X}(1) = f_P^*\mathcal{O}_P(1)$. By Lemmas 29.25.4 and 29.14.3 we see that

$$\sum\nolimits_{i=0}^{r} (-1)^i c_1(\mathcal{O}_{P_X}(1))^i \cap \pi_X^*(f^*\alpha_{r-i}) = 0$$

holds in the chow group of P_X. Since $f^*\alpha_0 = f^*\alpha$ the lemma follows from the uniqueness in Lemma 29.35.2. $\square$

Lemma 29.35.5. *Let (S, δ) be as in Situation 29.7.1. Let X, Y be locally of finite type over S. Let $\mathcal{E}$ be a finite locally free sheaf of rank r on X. Let $p : X \to Y$ be a proper morphism. Let α be a k-cycle on X. Let $\mathcal{E}$ be a finite locally free sheaf on Y. Then*

$$p_*(c_j(p^*\mathcal{E}) \cap \alpha) = c_j(\mathcal{E}) \cap p_*\alpha$$

Proof. Write $\alpha_j = c_j(p^*\mathcal{E}) \cap \alpha$, so $\alpha_0 = \alpha$. By Lemma 29.35.2 we have

$$\sum\nolimits_{i=0}^{r} (-1)^i c_1(\mathcal{O}_P(1))^i \cap \pi_X^*(\alpha_{r-i}) = 0$$

in the chow group of the projective bundle $(\pi_X : P_X \to X, \mathcal{O}_{P_X}(1))$ associated to $p^*\mathcal{E}$. Let $(\pi : P \to Y, \mathcal{O}_P(1))$ be the projective bundle associated to $\mathcal{E}$. Consider the fibre product diagram

$$\begin{tikzcd} P_X = \mathbf{P}(p^*\mathcal{E}) \arrow[r, "p_P"'] \arrow[d, "\pi_X"'] & P \arrow[d, "\pi"] \\ X \arrow[r, "p"] & Y \end{tikzcd}$$

Note that $\mathcal{O}_{P_X}(1) = p_P^*\mathcal{O}_P(1)$. Pushing the displayed equality above to P and using Lemmas 29.15.1, 29.25.6 and 29.14.3 we see that

$$\sum\nolimits_{i=0}^{r} (-1)^i c_1(\mathcal{O}_P(1))^i \cap \pi^*(p_*\alpha_{r-i}) = 0$$

holds in the chow group of P. Since $p_*\alpha_0 = p_*\alpha$ the lemma follows from the uniqueness in Lemma 29.35.2. $\square$

Lemma 29.35.6. *Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Let $\mathcal{E}$, $\mathcal{F}$ be finite locally free sheaves on X of ranks r and s. For any $\alpha \in A_k(X)$ we have*

$$c_i(\mathcal{E}) \cap c_j(\mathcal{F}) \cap \alpha = c_j(\mathcal{F}) \cap c_i(\mathcal{E}) \cap \alpha$$

as elements of $A_{k-i-j}(X)$.

Proof. Consider

$$\pi : \mathbf{P}(\mathcal{E}) \times_X \mathbf{P}(\mathcal{F}) \longrightarrow X$$

with invertible sheaves $\mathcal{L} = \mathrm{pr}_1^*\mathcal{O}_{\mathbf{P}(\mathcal{E})}(1)$ and $\mathcal{N} = \mathrm{pr}_2^*\mathcal{O}_{\mathbf{P}(\mathcal{F})}(1)$. Write $\alpha_{i,j}$ for the left hand side and $\beta_{i,j}$ for the right hand side. Also write $\alpha_j = c_j(\mathcal{F}) \cap \alpha$ and $\beta_i = c_i(\mathcal{E}) \cap \alpha$. In particular this means that $\alpha_0 = \alpha = \beta_0$, and $\alpha_{0,j} = \alpha_j = \beta_{0,j}$, $\alpha_{i,0} = \beta_i = \beta_{i,0}$. From Lemma 29.35.2 (pulled back to the space above using Lemma 29.25.4 for the first two) we see that

$$\begin{aligned}
0 &= \sum\nolimits_{j=0,\ldots,s} (-1)^j c_1(\mathcal{N})^j \cap \pi^*\alpha_{s-j} \\
0 &= \sum\nolimits_{i=0,\ldots,r} (-1)^i c_1(\mathcal{L})^i \cap \pi^*\beta_{r-i} \\
0 &= \sum\nolimits_{i=0,\ldots,r} (-1)^i c_1(\mathcal{L})^i \cap \pi^*\alpha_{r-i,s-j} \\
0 &= \sum\nolimits_{j=0,\ldots,s} (-1)^j c_1(\mathcal{N})^j \cap \pi^*\beta_{r-i,s-j}
\end{aligned}$$

We can combine the first and the third of these to get

$$\begin{aligned}
& (-1)^{r+s} c_1(\mathcal{L})^r \cap c_1(\mathcal{N})^s \cap \pi^*\alpha \\
& = \sum\nolimits_{j=1,\ldots,s} (-1)^{r+j-1} c_1(\mathcal{L})^r \cap c_1(\mathcal{N})^j \cap \pi^*\alpha_{s-j} \\
& = \sum\nolimits_{j=1,\ldots,s} (-1)^{j-1+r} c_1(\mathcal{N})^j \cap c_1(\mathcal{L})^r \cap \pi^*\alpha_{0,s-j} \\
& = \sum\nolimits_{j=1}^s \sum\nolimits_{i=1}^r (-1)^{i+j} c_1(\mathcal{N})^j \cap c_1(\mathcal{L})^i \cap \pi^*\alpha_{r-i,s-j}
\end{aligned}$$

using that capping with $c_1(\mathcal{L})$ commutes with capping with $c_1(\mathcal{N})$. In exactly the same way one shows that

$$(-1)^{r+s} c_1(\mathcal{L})^r \cap c_1(\mathcal{N})^s \cap \pi^*\alpha = \sum\nolimits_{j=1}^s \sum\nolimits_{i=1}^r (-1)^{i+j} c_1(\mathcal{N})^j \cap c_1(\mathcal{L})^i \cap \pi^*\beta_{r-i,s-j}$$

By the projective space bundle formula Lemma 29.33.2 applied twice these representations are unique. Whence the result. ☐

29.36. Polynomial relations among chern classes

Definition 29.36.1. Let $P(x_{i,j}) \in \mathbf{Z}[x_{i,j}]$ be a polynomial. We write P as a finite sum

$$\sum\nolimits_s \sum\nolimits_{I=((i_1,j_1),(i_2,j_2),\ldots,(i_s,j_s))} a_I x_{i_1,j_1} \ldots x_{i_s,j_s}.$$

Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Let $\mathcal{E}_i$ be a finite collection of finite locally free sheaves on X. We say that P is a *polynomial relation among the chern classes* and we write $P(c_j(\mathcal{E}_i)) = 0$ if for any morphism $f : Y \to X$ of an integral scheme locally of finite type over S the cycle

$$\sum\nolimits_s \sum\nolimits_{I=((i_1,j_1),(i_2,j_2),\ldots,(i_s,j_s))} a_I \, c_{j_1}(f^*\mathcal{E}_{i_1}) \cap \ldots \cap c_{j_s}(f^*\mathcal{E}_{i_s}) \cap [Y]$$

is zero in $A_*(Y)$.

This is not an elegant definition but it will do for now. It makes sense because we showed in Lemma 29.35.6 that capping with chern classes of vector bundles is commutative. By our definitions and results above this is equivalent with requiring all the operations

$$\sum_s \sum_I a_I\, c_{j_1}(f^*\mathcal{E}_{i_1}) \cap \ldots \cap c_{j_s}(f^*\mathcal{E}_{i_s}) \cap - : A_*(Y) \to A_*(Y)$$

to be zero for all morphisms $f : Y \to X$ which are locally of finite type.

An example of such a relation is the relation

$$c_1(\mathcal{L} \otimes_{\mathcal{O}_X} \mathcal{N}) = c_1(\mathcal{L}) + c_1(\mathcal{N})$$

proved in Lemma 29.25.2. More generally, here is what happens when we tensor an arbitrary locally free sheaf by an invertible sheaf.

Lemma 29.36.2. *Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Let $\mathcal{E}$ be a finite locally free sheaf of rank r on X. Let $\mathcal{L}$ be an invertible sheaf on X. Then*

$$c_i(\mathcal{E} \otimes \mathcal{L}) = \sum\nolimits_{j=0}^{i} \binom{r-i+j}{j} c_{i-j}(\mathcal{E}) c_1(\mathcal{L})^j \quad (29.36.2.1)$$

is a valid polynomial relation in the sense described above.

Proof. This should hold for any triple $(X, \mathcal{E}, \mathcal{L})$. In particular it should hold when X is integral, and in fact by definition of a polynomial relation it is enough to prove it holds when capping with $[X]$ for such X. Thus assume that X is integral. Let $(\pi : P \to X, \mathcal{O}_P(1))$, resp. $(\pi' : P' \to X, \mathcal{O}_{P'}(1))$ be the projective space bundle associated to $\mathcal{E}$, resp. $\mathcal{E} \otimes \mathcal{L}$. Consider the canonical morphsm

$$\begin{tikzcd} P \arrow[rr, "g"] \arrow[dr, "\pi"'] & & P' \arrow[dl, "\pi'"] \\ & X & \end{tikzcd}$$

see Constructions, Lemma 22.19.1. It has the property that $g^*\mathcal{O}_{P'}(1) = \mathcal{O}_P(1) \otimes \pi^*\mathcal{L}$. This means that we have

$$\sum\nolimits_{i=0}^{r} (-1)^i (\xi + x)^i \cap \pi^*(c_{r-i}(\mathcal{E} \otimes \mathcal{L}) \cap [X]) = 0$$

in $A_*(P)$, where ξ represents $c_1(\mathcal{O}_P(1))$ and x represents $c_1(\pi^*\mathcal{L})$. By simple algebra this is equivalent to

$$\sum\nolimits_{i=0}^{r} (-1)^i \xi^i \left(\sum\nolimits_{j=i}^{r} (-1)^{j-i} \binom{j}{i} x^{j-i} \cap \pi^*(c_{r-j}(\mathcal{E} \otimes \mathcal{L}) \cap [X]) \right) = 0$$

Comparing with Equation (29.34.1.1) it follows from this that

$$c_{r-i}(\mathcal{E}) \cap [X] = \sum\nolimits_{j=i}^{r} \binom{j}{i} (-c_1(\mathcal{L}))^{j-i} \cap c_{r-j}(\mathcal{E} \otimes \mathcal{L}) \cap [X]$$

Reworking this (getting rid of minus signs, and renumbering) we get the desired relation. $\square$

Some example cases of (29.36.2.1) are

$$c_1(\mathcal{E}\otimes\mathcal{L}) = c_1(\mathcal{E}) + rc_1(\mathcal{L})$$

$$c_2(\mathcal{E}\otimes\mathcal{L}) = c_2(\mathcal{E}) + (r-1)c_1(\mathcal{E})c_1(\mathcal{L}) + \binom{r}{2}c_1(\mathcal{L})^2$$

$$c_3(\mathcal{E}\otimes\mathcal{L}) = c_3(\mathcal{E}) + (r-2)c_2(\mathcal{E})c_1(\mathcal{L}) + \binom{r-1}{2}c_1(\mathcal{E})c_1(\mathcal{L})^2 + \binom{r}{3}c_1(\mathcal{L})^3$$

29.37. Additivity of chern classes

All of the preliminary lemmas follow trivially from the final result.

Lemma 29.37.1. *Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Let $\mathcal{E}$, $\mathcal{F}$ be finite locally free sheaves on X of ranks r, $r-1$ which fit into a short exact sequence*

$$0 \to \mathcal{O}_X \to \mathcal{E} \to \mathcal{F} \to 0$$

Then

$$c_r(\mathcal{E}) = 0, \quad c_j(\mathcal{E}) = c_j(\mathcal{F}), \quad j = 0, \ldots, r-1$$

are valid polynomial relations among chern classes.

Proof. By Definition 29.36.1 it suffices to show that if X is integral then $c_j(\mathcal{E}) \cap [X] = c_j(\mathcal{F}) \cap [X]$. Let $(\pi : P \to X, \mathcal{O}_P(1))$, resp. $(\pi' : P' \to X, \mathcal{O}_{P'}(1))$ denote the projective space bundle associated to $\mathcal{E}$, resp. $\mathcal{F}$. The surjection $\mathcal{E} \to \mathcal{F}$ gives rise to a closed immersion

$$i : P' \longrightarrow P$$

over X. Moreover, the element $1 \in \Gamma(X, \mathcal{O}_X) \subset \Gamma(X, \mathcal{E})$ gives rise to a global section $s \in \Gamma(P, \mathcal{O}_P(1))$ whose zero set is exactly P'. Hence P' is an effective Cartier divisor on P such that $\mathcal{O}_P(P') \cong \mathcal{O}_P(1)$. Hence we see that

$$c_1(\mathcal{O}_P(1)) \cap \pi^*\alpha = i_*((\pi')^*\alpha)$$

for any cycle class α on X by Lemma 29.31.2. By Lemma 29.35.2 we see that $\alpha_j = c_j(\mathcal{F}) \cap [X]$, $j = 0, \ldots, r-1$ satisfy

$$\sum\nolimits_{j=0}^{r-1}(-1)^j c_1(\mathcal{O}_{P'}(1))^j \cap (\pi')^*\alpha_j = 0$$

Pushing this to P and using the remark above as well as Lemma 29.25.6 we get

$$\sum\nolimits_{j=0}^{r-1}(-1)^j c_1(\mathcal{O}_P(1))^{j+1} \cap \pi^*\alpha_j = 0$$

By the uniqueness of Lemma 29.35.2 we conclude that $c_r(\mathcal{E}) \cap [X] = 0$ and $c_j(\mathcal{E}) \cap [X] = \alpha_j = c_j(\mathcal{F}) \cap [X]$ for $j = 0, \ldots, r-1$. Hence the lemma holds. $\square$

Lemma 29.37.2. *Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Let $\mathcal{E}$, $\mathcal{F}$ be finite locally free sheaves on X of ranks r, $r-1$ which fit into a short exact sequence*

$$0 \to \mathcal{L} \to \mathcal{E} \to \mathcal{F} \to 0$$

where $\mathcal{L}$ is an invertible sheaf Then

$$c(\mathcal{E}) = c(\mathcal{L})c(\mathcal{F})$$

is a valid polynomial relation among chern classes.

Proof. This relation really just says that $c_i(\mathcal{E}) = c_i(\mathcal{F}) + c_1(\mathcal{L})c_{i-1}(\mathcal{F})$. By Lemma 29.37.1 we have $c_j(\mathcal{E} \otimes \mathcal{L}^{\otimes -1}) = c_j(\mathcal{E} \otimes \mathcal{L}^{\otimes -1})$ for $j = 0, \ldots, r$ (were we set $c_r(\mathcal{F}) = 0$ by convention). Applying Lemma 29.36.2 we deduce

$$\sum_{j=0}^{i} \binom{r-i+j}{j} (-1)^j c_{i-j}(\mathcal{E}) c_1(\mathcal{L})^j = \sum_{j=0}^{i} \binom{r-1-i+j}{j} (-1)^j c_{i-j}(\mathcal{F}) c_1(\mathcal{L})^j$$

Setting $c_i(\mathcal{E}) = c_i(\mathcal{F}) + c_1(\mathcal{L})c_{i-1}(\mathcal{F})$ gives a ``solution'' of this equation. The lemma follows if we show that this is the only possible solution. We omit the verification. □

Lemma 29.37.3. *Let (S, δ) be as in Situation 29.7.1. Let X be a scheme locally of finite type over S. Suppose that $\mathcal{E}$ sits in an exact sequence*

$$0 \to \mathcal{E}_1 \to \mathcal{E} \to \mathcal{E}_2 \to 0$$

of finite locally free sheaves $\mathcal{E}_i$ of rank r_i. Then

$$c(\mathcal{E}) = c(\mathcal{E}_1)c(\mathcal{E}_2)$$

is a polynomial relation among chern classes.

Proof. We may assume that X is integral and we have to show the identity when capping against $[X]$. By induction on r_1. The case $r_1 = 1$ is Lemma 29.37.2. Assuem $r_1 > 1$. Let $(\pi : P \to X, \mathcal{O}_P(1))$ denote the projective space bundle associated to $\mathcal{E}_1$. Note that

(1) $\pi^* : A_*(X) \to A_*(P)$ is injective, and
(2) $\pi^*\mathcal{E}_1$ sits in a short exact sequence $0 \to \mathcal{F} \to \pi^*\mathcal{E}_1 \to \mathcal{L} \to 0$ where $\mathcal{L}$ is invertible.

The first assertion follows from the projective space bundle formula and the second follows from the definition of a projective space bundle. (In fact $\mathcal{L} = \mathcal{O}_P(1)$.) Let $Q = \pi^*\mathcal{E}/\mathcal{F}$, which sits in an exact sequence $0 \to \mathcal{L} \to Q \to \pi^*\mathcal{E}_2 \to 0$. By induction we have

$$\begin{aligned} c(\pi^*\mathcal{E}) \cap [P] &= c(\mathcal{F}) \cap c(\pi^*\mathcal{E}/\mathcal{F}) \cap [P] \\ &= c(\mathcal{F}) \cap c(\mathcal{L}) \cap c(\pi^*\mathcal{E}_2) \cap [P] \\ &= c(\pi^*\mathcal{E}_1) \cap c(\pi^*\mathcal{E}_2) \cap [P] \end{aligned}$$

Since $[P] = \pi^*[X]$ we win by Lemma 29.35.4. □

Lemma 29.37.4. *Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Let $\mathcal{L}_i$, $i = 1, \ldots, r$ be invertible $\mathcal{O}_X$-modules on X. Let $\mathcal{E}$ be a finite locally free rank r $\mathcal{O}_X$-module endowed with a filtration*

$$0 = \mathcal{E}_0 \subset \mathcal{E}_1 \subset \mathcal{E}_2 \subset \ldots \subset \mathcal{E}_r = \mathcal{E}$$

such that $\mathcal{E}_i/\mathcal{E}_{i-1} \cong \mathcal{L}_i$. Set $c_1(\mathcal{L}_i) = x_i$. Then

$$c(\mathcal{E}) = \prod\nolimits_{i=1}^{r}(1 + x_i)$$

is a valid polynomial relation among chern classes in the sense of Definition 29.36.1.

Proof. Apply Lemma 29.37.2 and induction. □

29.38. The splitting principle

In our setting it is not so easy to say what the splitting principle exactly says/is. Here is a possible formulation.

Lemma 29.38.1. *Let (S, δ) be as in Situation 29.7.1. Let X be locally of finite type over S. Let $\mathcal{E}$ be a finite locally free sheaf $\mathcal{E}$ on X of rank r. There exists a projective flat morphism of relative dimension d $\pi : P \to X$ such that*

(1) *for any morphism $f : Y \to X$ the map $\pi_Y^* : A_*(Y) \to A_{*+r}(Y \times_X P)$ is injective, and*
(2) *$\pi^*\mathcal{E}$ has a filtration with succesive quotients $\mathcal{L}_1, \ldots, \mathcal{L}_r$ for some invertible $\mathcal{O}_P$-modules $\mathcal{L}_i$.*

Proof. Omitted. Hint: Use a composition of projective space bundles, i.e., a flag variety over X. □

The splitting principle refers to the practice of symbolically writing

$$c(\mathcal{E}) = \prod (1 + x_i)$$

with $x_i = c_1(\mathcal{L}_i)$. The expressions x_i are then called the *Chern roots* of $\mathcal{E}$. In order to prove polynomial relations amoing chern classes of vector bundles it is permissible to do calculations using the chern roots.

For example, let us calculate the chern classes of the dual vector bundle $\mathcal{E}^\wedge$. Note that if $\mathcal{E}$ has a filtration with subquotients invertible sheaves $\mathcal{L}_i$ then $\mathcal{E}^\wedge$ has a filtration with subquotients the invertible sheaves $\mathcal{L}_i^{-1}$. Hence if x_i are the chern roots of $\mathcal{E}$, then the $-x_i$ are the chern roots of $\mathcal{E}^\wedge$. It follows that

$$c_j(\mathcal{E}^\wedge) = (-1)^j c_j(\mathcal{E})$$

is a valid polynomial relation among chern classes.

In the same vain, let us compute the chern classes of a tensor product of vector bundles. Namely, suppose that $\mathcal{E}$, $\mathcal{F}$ are finite locally free of ranks r, s. Write

$$c(\mathcal{E}) = \prod\nolimits_{i=1}^r (1 + x_i), \quad c(\mathcal{E}) = \prod\nolimits_{j=1}^s (1 + y_j)$$

where x_i, y_j are the chern roots of $\mathcal{E}$, $\mathcal{F}$. Then we see that

$$c(\mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{F}) = \prod\nolimits_{i,j} (1 + x_i + y_j)$$

Here are some examples of what this means in terms of chern classes

$$c_1(\mathcal{E} \otimes \mathcal{F}) = rc_1(\mathcal{F}) + sc_1(\mathcal{E})$$
$$c_2(\mathcal{E} \otimes \mathcal{F}) = r^2 c_2(\mathcal{F}) + rsc_1(\mathcal{F})c_1(\mathcal{E}) + s^2 c_2(\mathcal{E})$$

29.39. Chern classes and tensor product

We define the *Chern character* of a finite locally free sheaf of rank r to be the formal expression

$$ch(\mathcal{E}) := \sum\nolimits_{i=1}^r e^{x_i}$$

if the x_i are the chern roots of $\mathcal{E}$. Writing this in terms of chern classes $c_i = c_i(\mathcal{E})$ we see that

$$ch(\mathcal{E}) = r + c_1 + \frac{1}{2}(c_1^2 - 2c_2) + \frac{1}{6}(c_1^3 - 3c_1c_2 + 3c_3) + \frac{1}{24}(c_1^4 - 4c_1^2c_2 + 4c_1c_3 + 2c_2^2 - 4c_4) + \ldots$$

What does it mean that the coefficients are rational numbers? Well this simply means that we think of these as operations

$$ch_j(\mathcal{E}) \cap - : A_k(X) \longrightarrow A_{k-j}(X) \otimes_{\mathbf{Z}} \mathbf{Q}$$

and we think of polynomial relations among them as relations between these operations with values in the groups $A_{k-j}(Y) \otimes_{\mathbf{Z}} \mathbf{Q}$ for varying Y. By the above we have in case of an exact sequence

$$0 \to \mathcal{E}_1 \to \mathcal{E} \to \mathcal{E}_2 \to 0$$

that

$$ch(\mathcal{E}) = ch(\mathcal{E}_1) + ch(\mathcal{E}_2)$$

Using the Chern character we can express the compatibility of the chern classes and tensor product as follows:

$$ch(\mathcal{E}_1 \otimes_{\mathcal{O}_X} \mathcal{E}_2) = ch(\mathcal{E}_1)ch(\mathcal{E}_2)$$

This follows directly from the discussion of the chern roots of the tensor product in the previous section.

29.40. Todd classes

A final class associated to a vector bundle $\mathcal{E}$ of rank r is its *Todd class* $Todd(\mathcal{E})$. In terms of the chern roots $x_1, \ldots, x_r$ it is defined as

$$Todd(\mathcal{E}) = \prod\nolimits_{i=1}^{r} \frac{x_i}{1 - e^{-x_i}}$$

In terms of the chern classes $c_i = c_i(\mathcal{E})$ we have

$$Todd(\mathcal{E}) = 1 + \frac{1}{2}c_1 + \frac{1}{12}(c_1^2 + c_2) + \frac{1}{24}c_1c_2 + \frac{1}{720}(-c_1^4 + 4c_1^2c_2 + 3c_2^2 + c_1c_3 - c_4) + \ldots$$

We have made the appropriate remaks about denominators in the previous section. It is the case that given an exact sequence

$$0 \to \mathcal{E}_1 \to \mathcal{E} \to \mathcal{E}_2 \to 0$$

we have

$$Todd(\mathcal{E}) = Todd(\mathcal{E}_1)Todd(\mathcal{E}_2).$$

29.41. Grothendieck-Riemann-Roch

Let (S, δ) be as in Situation 29.7.1. Let X, Y be locally of finite type over S. Let $\mathcal{E}$ be a finite locally free sheaf $\mathcal{E}$ on X of rank r. Let $f : X \to Y$ be a proper smooth morphism. Assume that $R^if_*\mathcal{E}$ are locally free sheaves on Y of finite rank (for example if Y is a point). The Grothendieck-Riemann-Roch theorem implies that in this case we have

$$f_*(Todd(T_{X/Y})ch(\mathcal{E})) = \sum (-1)^i ch(R^if_*\mathcal{E})$$

Here

$$T_{X/Y} = \mathcal{H}om_{\mathcal{O}_X}(\Omega_{X/Y}, \mathcal{O}_X)$$

is the relative tangent bundle of X over Y. The theorem is more general and becomes easier to prove when formulated in correct generality. We will return to this elsewhere (insert future reference here).

CHAPTER 30

Topologies on Schemes

30.1. Introduction

In this document we explain what the different topologies on the category of schemes are. Some references are [**Gro71**] and [**BLR90**]. Before doing so we would like to point out that there are many different choices of sites (as defined in Sites, Definition 9.6.2) which give rise to the same notion of sheaf on the underlying category. Hence our choices may be slightly different from those in the references but ultimately lead to the same cohomology groups, etc.

30.2. The general procedure

In this section we explain a general procedure for producing the sites we will be working with. Suppose we want to study sheaves over schemes with respect to some topology τ. In order to get a site, as in Sites, Definition 9.6.2, of schemes with that topology we have to do some work. Namely, we cannot simply say ``consider all schemes with the Zariski topology'' since that would give a ``big'' category. Instead, in each section of this chapter we will proceed as follows:

(1) We define a class Cov_τ of coverings of schemes satisfying the axioms of Sites, Definition 9.6.2. It will always be the case that a Zariski open covering of a scheme is a covering for τ.
(2) We single out a notion of standard τ-covering within the category of affine schemes.
(3) We define what is an ``absolute'' big τ-site Sch_τ. These are the sites one gets by appropriately choosing a set of schemes and a set of coverings.
(4) For any object S of Sch_τ we define the big τ-site $(Sch/S)_\tau$ and for suitable τ the small[1] τ-site S_τ.
(5) In addition there is a site $(Aff/S)_\tau$ using the notion of standard τ-covering of affines whose category of sheaves is equivalent to the category of sheaves on $(Sch/S)_\tau$.

The above is a little clumsy in that we do not end up with a canonical choice for the big τ-site of a scheme, or even the small τ-site of a scheme. If you are willing to ignore set theoretic difficulties, then you can work with classes and end up with canonical big and small sites...

30.3. The Zariski topology

Definition 30.3.1. Let T be a scheme. A *Zariski covering of T* is a family of morphisms $\{f_i : T_i \to T\}_{i\in I}$ of schemes such that each f_i is an open immersion and such that $T = \bigcup f_i(T_i)$.

This defines a (proper) class of coverings. Next, we show that this notion satisfies the conditions of Sites, Definition 9.6.2.

[1]The words big and small here do not relate to bigness/smallness of the corresponding categories.

Lemma 30.3.2. *Let T be a scheme.*

(1) *If $T' \to T$ is an isomorphism then $\{T' \to T\}$ is a Zariski covering of T.*
(2) *If $\{T_i \to T\}_{i\in I}$ is a Zariski covering and for each i we have a Zariski covering $\{T_{ij} \to T_i\}_{j\in J_i}$, then $\{T_{ij} \to T\}_{i\in I, j\in J_i}$ is a Zariski covering.*
(3) *If $\{T_i \to T\}_{i\in I}$ is a Zariski covering and $T' \to T$ is a morphism of schemes then $\{T' \times_T T_i \to T'\}_{i\in I}$ is a Zariski covering.*

Proof. Omitted. □

Lemma 30.3.3. *Let T be an affine scheme. Let $\{T_i \to T\}_{i\in I}$ be a Zariski covering of T. Then there exists a Zariski covering $\{U_j \to T\}_{j=1,\ldots,m}$ which is a refinement of $\{T_i \to T\}_{i\in I}$ such that each U_j is a standard open of T, see Schemes, Definition 21.5.2. Moreover, we may choose each U_j to be an open of one of the T_i.*

Proof. Follows as T is quasi-compact and standard opens form a basis for its topology. This is also proved in Schemes, Lemma 21.5.1. □

Thus we define the corresponding standard coverings of affines as follows.

Definition 30.3.4. Compare Schemes, Definition 21.5.2. Let T be an affine scheme. A *standard Zariski covering* of T is a a Zariski covering $\{U_j \to T\}_{j=1,\ldots,m}$ with each $U_j \to T$ inducing an isomorphism with a standard affine open of T.

Definition 30.3.5. A *big Zariski site* is any site Sch_{Zar} as in Sites, Definition 9.6.2 constructed as follows:

(1) Choose any set of schemes S_0, and any set of Zariski coverings Cov_0 among these schemes.
(2) As underlying category of Sch_{Zar} take any category Sch_α constructed as in Sets, Lemma 3.9.2 starting with the set S_0.
(3) As coverings of Sch_{Zar} choose any set of coverings as in Sets, Lemma 3.11.1 starting with the category Sch_α and the class of Zariski coverings, and the set Cov_0 chosen above.

It is shown in Sites, Lemma 9.8.6 that, after having chosen the category Sch_α, the category of sheaves on Sch_α does not depend on the choice of coverings chosen in (3) above. In other words, the topos $Sh(Sch_{Zar})$ only depends on the choice of the category Sch_α. It is shown in Sets, Lemma 3.9.9 that these categories are closed under many constructions of algebraic geometry, e.g., fibre products and taking open and closed subschemes. We can also show that the exact choice of Sch_α does not matter too much, see Section 30.10.

Another approach would be to assume the existence of a strongly inaccessible cardinal and to define Sch_{Zar} to be the category of schemes contained in a chosen universe with set of coverings the Zariski coverings contained in that same universe.

Before we continue with the introduction of the big Zariski site of a scheme S, let us point out that the topology on a big Zariski site Sch_{Zar} is in some sense induced from the Zariski topology on the category of all schemes.

Lemma 30.3.6. *Let Sch_{Zar} be a big Zariski site as in Definition 30.3.5. Let $T \in Ob(Sch_{Zar})$. Let $\{T_i \to T\}_{i\in I}$ be an arbitrary Zariski covering of T. There exists a covering $\{U_j \to T\}_{j\in J}$ of T in the site Sch_{Zar} which is tautologically equivalent (see Sites, Definition 9.8.2) to $\{T_i \to T\}_{i\in I}$*

Proof. Since each $T_i \to T$ is an open immersion, we see by Sets, Lemma 3.9.9 that each T_i is isomorphic to an object V_i of Sch_{Zar}. The covering $\{V_i \to T\}_{i \in I}$ is tautologically equivalent to $\{T_i \to T\}_{i \in I}$ (using the identity map on I both ways). Moreover, $\{V_i \to T\}_{i \in I}$ is combinatorially equivalent to a covering $\{U_j \to T\}_{j \in J}$ of T in the site Sch_{Zar} by Sets, Lemma 3.11.1. □

Definition 30.3.7. Let S be a scheme. Let Sch_{Zar} be a big Zariski site containing S.

(1) The *big Zariski site of S*, denoted $(Sch/S)_{Zar}$, is the site Sch_{Zar}/S introduced in Sites, Section 9.21.
(2) The *small Zariski site of S*, which we denote S_{Zar}, is the full subcategory of $(Sch/S)_{Zar}$ whose objects are those U/S such that $U \to S$ is an open immersion. A covering of S_{Zar} is any covering $\{U_i \to U\}$ of $(Sch/S)_{Zar}$ with $U \in Ob(S_{Zar})$.
(3) The *big affine Zariski site of S*, denoted $(Aff/S)_{Zar}$, is the full subcategory of $(Sch/S)_{Zar}$ whose objects are affine U/S. A covering of $(Aff/S)_{Zar}$ is any covering $\{U_i \to U\}$ of $(Sch/S)_{Zar}$ which is a standard Zariski covering.

It is not completely clear that the small Zariski site and the big affine Zariski site are sites. We check this now.

Lemma 30.3.8. *Let S be a scheme. Let Sch_{Zar} be a big Zariski site containing S. Both S_{Zar} and $(Aff/S)_{Zar}$ are sites.*

Proof. Let us show that S_{Zar} is a site. It is a category with a given set of families of morphisms with fixed target. Thus we have to show properties (1), (2) and (3) of Sites, Definition 9.6.2. Since $(Sch/S)_{Zar}$ is a site, it suffices to prove that given any covering $\{U_i \to U\}$ of $(Sch/S)_{Zar}$ with $U \in Ob(S_{Zar})$ we also have $U_i \in Ob(S_{Zar})$. This follows from the definitions as the composition of open immersions is an open immersion.

Let us show that $(Aff/S)_{Zar}$ is a site. Reasoning as above, it suffices to show that the collection of standard Zariski coverings of affines satisfies properties (1), (2) and (3) of Sites, Definition 9.6.2. Let R be a ring. Let $f_1, \ldots, f_n \in R$ generate the unit ideal. For each $i \in \{1, \ldots, n\}$ let $g_{i1}, \ldots, g_{in_i} \in R_{f_i}$ be elements generating the unit ideal of R_{f_i}. Write $g_{ij} = f_{ij}/f_i^{e_{ij}}$ which is possible. After replacing f_{ij} by $f_i f_{ij}$ if necessary, we have that $D(f_{ij}) \subset D(f_i) \cong Spec(R_{f_i})$ is equal to $D(g_{ij}) \subset Spec(R_{f_i})$. Hence we see that the family of morphisms $\{D(g_{ij}) \to Spec(R)\}$ is a standard Zariski covering. From these considerations it follows that (2) holds for standard Zariski coverings. We omit the verification of (1) and (3). □

Lemma 30.3.9. *Let S be a scheme. Let Sch_{Zar} be a big Zariski site containing S. The underlying categories of the sites Sch_{Zar}, $(Sch/S)_{Zar}$, S_{Zar}, and $(Aff/S)_{Zar}$ have fibre products. In each case the obvious functor into the category Sch of all schemes commutes with taking fibre products. The categories $(Sch/S)_{Zar}$, and S_{Zar} both have a final object, namely S/S.*

Proof. For Sch_{Zar} it is true by construction, see Sets, Lemma 3.9.9. Suppose we have $U \to S$, $V \to U$, $W \to U$ morphisms of schemes with $U, V, W \in Ob(Sch_{Zar})$. The fibre product $V \times_U W$ in Sch_{Zar} is a fibre product in Sch and is the fibre product of V/S with W/S over U/S in the category of all schemes over S, and hence also a fibre product in $(Sch/S)_{Zar}$. This proves the result for $(Sch/S)_{Zar}$. If $U \to S$, $V \to U$ and $W \to U$ are open immersions then so is $V \times_U W \to S$ and hence we get the result for S_{Zar}. If U, V, W are affine, so is $V \times_U W$ and hence the result for $(Aff/S)_{Zar}$. □

Next, we check that the big affine site defines the same topos as the big site.

Lemma 30.3.10. *Let S be a scheme. Let Sch_{Zar} be a big Zariski site containing S. The functor $(Aff/S)_{Zar} \to (Sch/S)_{Zar}$ is a special cocontinuous functor. Hence it induces an equivalence of topoi from $Sh((Aff/S)_{Zar})$ to $Sh((Sch/S)_{Zar})$.*

Proof. The notion of a special cocontinuous functor is introduced in Sites, Definition 9.25.2. Thus we have to verify assumptions (1) -- (5) of Sites, Lemma 9.25.1. Denote the inclusion functor $u : (Aff/S)_{Zar} \to (Sch/S)_{Zar}$. Being cocontinuous just means that any Zariski covering of T/S, T affine, can be refined by a standard Zariski covering of T. This is the content of Lemma 30.3.3. Hence (1) holds. We see u is continuous simply because a standard Zariski covering is a Zariski covering. Hence (2) holds. Parts (3) and (4) follow immediately from the fact that u is fully faithful. And finally condition (5) follows from the fact that every scheme has an affine open covering. □

Let us check that the notion of a sheaf on the small Zariski site corresponds to notion of a sheaf on S.

Lemma 30.3.11. *The category of sheaves on S_{Zar} is equivalent to the category of sheaves on the underlying topological space of S.*

Proof. We will use repeatedly that for any object U/S of S_{Zar} the morphism $U \to S$ is an isomorphism onto an open subscheme. Let $\mathcal{F}$ be a sheaf on S. Then we define a sheaf on S_{Zar} by the rule $\mathcal{F}'(U/S) = \mathcal{F}(\mathrm{Im}(U \to S))$. For the converse, we choose for every open subscheme $U \subset S$ an object $U'/S \in Ob(S_{Zar})$ with $\mathrm{Im}(U' \to S) = U$ (here you have to use Sets, Lemma 3.9.9). Given a sheaf $\mathcal{G}$ on S_{Zar} we define a sheaf on S by setting $\mathcal{G}(U) = \mathcal{G}(U'/S)$. To see that $\mathcal{G}'$ is a sheaf we use that for any open covering $U = \bigcup_{i\in I} U_i$ the covering $\{U_i \to U\}_{i\in I}$ is combinatorially equivalent to a covering $\{U'_j \to U'\}_{j\in J}$ in S_{Zar} by Sets, Lemma 3.11.1, and we use Sites, Lemma 9.8.4. Details omitted. □

From now on we will not make any distinction between a sheaf on S_{Zar} or a sheaf on S. We will always use the procedures of the proof of the lemma to go between the two notions. Next, we esthablish some relationships between the topoi associated to these sites.

Lemma 30.3.12. *Let Sch_{Zar} be a big Zariski site. Let $f : T \to S$ be a morphism in Sch_{Zar}. The functor $T_{Zar} \to (Sch/S)_{Zar}$ is cocontinuous and induces a morphism of topoi*

$$i_f : Sh(T_{Zar}) \longrightarrow Sh((Sch/S)_{Zar})$$

For a sheaf $\mathcal{G}$ on $(Sch/S)_{Zar}$ we have the formula $(i_f^{-1}\mathcal{G})(U/T) = \mathcal{G}(U/S)$. The functor i_f^{-1} also has a left adjoint $i_{f,!}$ which commutes with fibre products and equalizers.

Proof. Denote the functor $u : T_{Zar} \to (Sch/S)_{Zar}$. In other words, given and open immersion $j : U \to T$ corresponding to an object of T_{Zar} we set $u(U \to T) = (f \circ j : U \to S)$. This functor commutes with fibre products, see Lemma 30.3.9. Moreover, T_{Zar} has equalizers (as any two morphisms with the same source and target are the same) and u commutes with them. It is clearly cocontinuous. It is also continuous as u transforms coverings to coverings and commutes with fibre products. Hence the lemma follows from Sites, Lemmas 9.19.5 and 9.19.6. □

Lemma 30.3.13. *Let S be a scheme. Let Sch_{Zar} be a big Zariski site containing S. The inclusion functor $S_{Zar} \to (Sch/S)_{Zar}$ satisfies the hypotheses of Sites, Lemma 9.19.8 and hence induces a morphism of sites*

$$\pi_S : (Sch/S)_{Zar} \longrightarrow S_{Zar}$$

and a morphism of topoi

$$i_S : Sh(S_{Zar}) \longrightarrow Sh((Sch/S)_{Zar})$$

such that $\pi_S \circ i_S = id$. Moreover, $i_S = i_{id_S}$ with i_{id_S} as in Lemma 30.3.12. In particular the functor $i_S^{-1} = \pi_{S,*}$ is described by the rule $i_S^{-1}(\mathcal{G})(U/S) = \mathcal{G}(U/S)$.

Proof. In this case the functor $u : S_{Zar} \to (Sch/S)_{Zar}$, in addition to the properties seen in the proof of Lemma 30.3.12 above, also is fully faithful and transforms the final object into the final object. The lemma follows. □

Definition 30.3.14. In the situation of Lemma 30.3.13 the functor $i_S^{-1} = \pi_{S,*}$ is often called the *restriction to the small Zariski site*, and for a sheaf $\mathcal{F}$ on the big Zariski site we denote $\mathcal{F}|_{S_{Zar}}$ this restriction.

With this notation in place we have for a sheaf $\mathcal{F}$ on the big site and a sheaf $\mathcal{G}$ on the big site that

$$\begin{aligned} Mor_{Sh(S_{Zar})}(\mathcal{F}|_{S_{Zar}}, \mathcal{G}) &= Mor_{Sh((Sch/S)_{Zar})}(\mathcal{F}, i_{S,*}\mathcal{G}) \\ Mor_{Sh(S_{Zar})}(\mathcal{G}, \mathcal{F}|_{S_{Zar}}) &= Mor_{Sh((Sch/S)_{Zar})}(\pi_S^{-1}\mathcal{G}, \mathcal{F}) \end{aligned}$$

Moreover, we have $(i_{S,*}\mathcal{G})|_{S_{Zar}} = \mathcal{G}$ and we have $(\pi_S^{-1}\mathcal{G})|_{S_{Zar}} = \mathcal{G}$.

Lemma 30.3.15. *Let Sch_{Zar} be a big Zariski site. Let $f : T \to S$ be a morphism in Sch_{Zar}. The functor*

$$u : (Sch/T)_{Zar} \longrightarrow (Sch/S)_{Zar}, \quad V/T \longmapsto V/S$$

is cocontinuous, and has a continuous right adjoint

$$v : (Sch/S)_{Zar} \longrightarrow (Sch/T)_{Zar}, \quad (U \to S) \longmapsto (U \times_S T \to T).$$

They induce the same morphism of topoi

$$f_{big} : Sh((Sch/T)_{Zar}) \longrightarrow Sh((Sch/S)_{Zar})$$

We have $f_{big}^{-1}(\mathcal{G})(U/T) = \mathcal{G}(U/S)$. We have $f_{big,*}(\mathcal{F})(U/S) = \mathcal{F}(U \times_S T/T)$. Also, f_{big}^{-1} has a left adjoint $f_{big!}$ which commutes with fibre products and equalizers.

Proof. The functor u is cocontinuous, continuous, and commutes with fibre products and equalizers (details omitted; compare with proof of Lemma 30.3.12). Hence Sites, Lemmas 9.19.5 and 9.19.6 apply and we deduce the formula for f_{big}^{-1} and the existence of $f_{big!}$. Moreover, the functor v is a right adjoint because given U/T and V/S we have $Mor_S(u(U), V) = Mor_T(U, V \times_S T)$ as desired. Thus we may apply Sites, Lemmas 9.20.1 and 9.20.2 to get the formula for $f_{big,*}$. □

Lemma 30.3.16. *Let Sch_{Zar} be a big Zariski site. Let $f : T \to S$ be a morphism in Sch_{Zar}.*

1. *We have $i_f = f_{big} \circ i_T$ with i_f as in Lemma 30.3.12 and i_T as in Lemma 30.3.13.*
2. *The functor $S_{Zar} \to T_{Zar}$, $(U \to S) \mapsto (U \times_S T \to T)$ is continuous and induces a morphism of topoi*

$$f_{small} : Sh(T_{Zar}) \longrightarrow Sh(S_{Zar}).$$

The functors f_{small}^{-1} and $f_{small,*}$ agree with the usual notions f^{-1} and f_* is we identify sheaves on T_{Zar}, resp. S_{Zar} with sheaves on T, resp. S via Lemma 30.3.11.

(3) *We have a commutative diagram of morphisms of sites*

$$\begin{tikzcd} T_{Zar} \arrow[d, "f_{small}"'] & (Sch/T)_{Zar} \arrow[l, "\pi_T"'] \arrow[d, "f_{big}"] \\ S_{Zar} & (Sch/S)_{Zar} \arrow[l, "\pi_S"] \end{tikzcd}$$

so that $f_{small} \circ \pi_T = \pi_S \circ f_{big}$ as morphisms of topoi.

(4) *We have $f_{small} = \pi_S \circ f_{big} \circ i_T = \pi_S \circ i_f$.*

Proof. The equality $i_f = f_{big} \circ i_T$ follows from the equality $i_f^{-1} = i_T^{-1} \circ f_{big}^{-1}$ which is clear from the descriptions of these functors above. Thus we see (1).

Statement (2): See Sites, Example 9.14.2.

Part (3) follows because π_S and π_T are given by the inclusion functors and f_{small} and f_{big} by the base change functor $U \mapsto U \times_S T$.

Statement (4) follows from (3) by precomposing with i_T. □

In the situation of the lemma, using the terminology of Definition 30.3.14 we have: for $\mathcal{F}$ a sheaf on the big Zariski site of T

$$(f_{big,*}\mathcal{F})|_{S_{Zar}} = f_{small,*}(\mathcal{F}|_{T_{Zar}}),$$

This equality is clear from the commutativity of the diagram of sites of the lemma, since restriction to the small Zariski site of T, resp. S is given by $\pi_{T,*}$, resp. $\pi_{S,*}$. A similar formula involving pullbacks and restrictions is false.

Lemma 30.3.17. *Given schemes X, Y, Y in $(Sch/S)_{Zar}$ and morphisms $f : X \to Y$, $g : Y \to Z$ we have $g_{big} \circ f_{big} = (g \circ f)_{big}$ and $g_{small} \circ f_{small} = (g \circ f)_{small}$.*

Proof. This follows from the simple description of push forward and pull back for the functors on the big sites from Lemma 30.3.15. For the functors on the small sites this is Sheaves, Lemma 6.21.2 via the identification of Lemma 30.3.11. □

We can think about a sheaf on the big Zariski site of S as a collection of ``usual'' sheaves on all schemes over S.

Lemma 30.3.18. *Let S be a scheme contained in a big Zariski site Sch_{Zar}. A sheaf $\mathcal{F}$ on the big Zariski site $(Sch/S)_{Zar}$ is given by the following data:*

(1) *for every $T/S \in Ob((Sch/S)_{Zar})$ a sheaf $\mathcal{F}_T$ on T,*
(2) *for every $f : T' \to T$ in $(Sch/S)_{Zar}$ a map $c_f : f^{-1}\mathcal{F}_T \to \mathcal{F}_{T'}$.*

These data are subject to the following conditions:

(i) *given any $f : T' \to T$ and $g : T'' \to T'$ in $(Sch/S)_{Zar}$ the composition $g^{-1}c_f \circ c_g$ is equal to $c_{f\circ g}$, and*
(ii) *if $f : T' \to T$ in $(Sch/S)_{Zar}$ is an open immersion then c_f is an isomorphism.*

Proof. Given a sheaf $\mathcal{F}$ on $Sh((Sch/S)_{Zar})$ we set $\mathcal{F}_T = i_p^{-1}\mathcal{F}$ where $p : T \to S$ is the structure morphism. Note that $\mathcal{F}_T(U) = \mathcal{F}(U'/S)$ for any open $U \subset T$, and $U' \to T$ an open immersion in $(Sch/T)_{Zar}$ with image U, see Lemmas 30.3.11 and 30.3.12. Hence given $f : T' \to T$ over S and $U, U' \to T$ we get a canonical map $\mathcal{F}_T(U) = \mathcal{F}(U'/S) \to \mathcal{F}(U' \times_T T'/S) = \mathcal{F}_{T'}(f^{-1}(U))$ where the middle is the restriction map of $\mathcal{F}$ with respect to the morphism $U' \times_T T' \to U'$ over S. The collection of these maps are compatible with restrictions, and hence define an f-map c_f from $\mathcal{F}_T$ to $\mathcal{F}_{T'}$, see Sheaves, Definition 6.21.7

and the discussion surrounding it. It is clear that $c_{f\circ g}$ is the composition of c_f and c_g, since composition of restriction maps of $\mathcal{F}$ gives restriction maps.

Conversely, given a system $(\mathcal{F}_T, c_f)$ as in the lemma we may define a presheaf $\mathcal{F}$ on $Sh((Sch/S)_{Zar})$ by simply setting $\mathcal{F}(T/S) = \mathcal{F}_T(T)$. As restriction mapping, given $f : T' \to T$ we set for $s \in \mathcal{F}(T)$ the pull back $f^*(s)$ equal to $c_f(s)$ (where we think of c_f as an f-map again). The condition on the c_f garantees that pullbacks satisfy the required functoriality property. We omit the verification that this is a sheaf. It is clear that the constructions so defined are mutually inverse. □

30.4. The étale topology

Let S be a scheme. We would like to define the étale-topology on the category of schemes over S. According to our general principle we first introduce the notion of an étale covering.

Definition 30.4.1. Let T be a scheme. An *étale covering of T* is a family of morphisms $\{f_i : T_i \to T\}_{i\in I}$ of schemes such that each f_i is étale and such that $T = \bigcup f_i(T_i)$.

Lemma 30.4.2. *Any Zariski covering is an étale covering.*

Proof. This is clear from the definitions and the fact that an open immersion is an étale morphism, see Morphisms, Lemma 24.35.9. □

Next, we show that this notion satisfies the conditions of Sites, Definition 9.6.2.

Lemma 30.4.3. *Let T be a scheme.*

(1) *If $T' \to T$ is an isomorphism then $\{T' \to T\}$ is an étale covering of T.*
(2) *If $\{T_i \to T\}_{i\in I}$ is an étale covering and for each i we have an étale covering $\{T_{ij} \to T_i\}_{j\in J_i}$, then $\{T_{ij} \to T\}_{i\in I, j\in J_i}$ is an étale covering.*
(3) *If $\{T_i \to T\}_{i\in I}$ is an étale covering and $T' \to T$ is a morphism of schemes then $\{T' \times_T T_i \to T'\}_{i\in I}$ is an étale covering.*

Proof. Omitted. □

Lemma 30.4.4. *Let T be an affine scheme. Let $\{T_i \to T\}_{i\in I}$ be an étale covering of T. Then there exists an étale covering $\{U_j \to T\}_{j=1,\ldots,m}$ which is a refinement of $\{T_i \to T\}_{i\in I}$ such that each U_j is an affine scheme. Moreover, we may choose each U_j to be open affine in one of the T_i.*

Proof. Omitted. □

Thus we define the corresponding standard coverings of affines as follows.

Definition 30.4.5. Let T be an affine scheme. A *standard étale covering* of T is a family $\{f_j : U_j \to T\}_{j=1,\ldots,m}$ with each U_j is affine and étale over T and $T = \bigcup f_j(U_j)$.

In the definition above we do **not** assume the morphisms f_j are standard étale. The reason is that if we did then the standard étale coverings would not define a site on Aff/S, for example because of Algebra, Lemma 7.132.14 part (4). On the other hand, an étale morphism of affines is automatically standard smooth, see Algebra, Lemma 7.132.2. Hence a standard étale covering is a standard smooth covering and a standard syntomic covering.

Definition 30.4.6. A *big étale site* is any site $Sch_{étale}$ as in Sites, Definition 9.6.2 constructed as follows:

(1) Choose any set of schemes S_0, and any set of étale coverings Cov_0 among these schemes.

(2) As underlying category take any category Sch_α constructed as in Sets, Lemma 3.9.2 starting with the set S_0.
(3) Choose any set of coverings as in Sets, Lemma 3.11.1 starting with the category Sch_α and the class of étale coverings, and the set Cov_0 chosen above.

See the remarks following Definition 30.3.5 for motivation and explanation regarding the definition of big sites.

Before we continue with the introduction of the big étale site of a scheme S, let us point out that the topology on a big étale site $Sch_{étale}$ is in some sense induced from the étale topology on the category of all schemes.

Lemma 30.4.7. *Let $Sch_{étale}$ be a big étale site as in Definition 30.4.6. Let $T \in Ob(Sch_{étale})$. Let $\{T_i \to T\}_{i\in I}$ be an arbitrary étale covering of T.*

(1) *There exists a covering $\{U_j \to T\}_{j\in J}$ of T in the site $Sch_{étale}$ which refines $\{T_i \to T\}_{i\in I}$.*
(2) *If $\{T_i \to T\}_{i\in I}$ is a standard étale covering, then it is tautologically equivalent to a covering in $Sch_{étale}$.*
(3) *If $\{T_i \to T\}_{i\in I}$ is a Zariski covering, then it is tautologically equivalent to a covering in $Sch_{étale}$.*

Proof. For each i choose an affine open covering $T_i = \bigcup_{j\in J_i} T_{ij}$ such that each T_{ij} maps into an affine open subscheme of T. By Lemma 30.4.3 the refinement $\{T_{ij} \to T\}_{i\in I, j\in J_i}$ is an étale covering of T as well. Hence we may assume each T_i is affine, and maps into an affine open W_i of T. Applying Sets, Lemma 3.9.9 we see that W_i is isomorphic to an object of Sch_{Zar}. But then T_i as a finite type scheme over W_i is isomorphic to an object V_i of Sch_{Zar} by a second application of Sets, Lemma 3.9.9. The covering $\{V_i \to T\}_{i\in I}$ refines $\{T_i \to T\}_{i\in I}$ (because they are isomorphic). Moreover, $\{V_i \to T\}_{i\in I}$ is combinatorially equivalent to a covering $\{U_j \to T\}_{j\in J}$ of T in the site Sch_{Zar} by Sets, Lemma 3.9.9. The covering $\{U_j \to T\}_{j\in J}$ is a refinement as in (1). In the situation of (2), (3) each of the schemes T_i is isomorphic to an object of $Sch_{étale}$ by Sets, Lemma 3.9.9, and another application of Sets, Lemma 3.11.1 gives what we want. □

Definition 30.4.8. Let S be a scheme. Let $Sch_{étale}$ be a big étale site containing S.

(1) The *big étale site of S*, denoted $(Sch/S)_{étale}$, is the site $Sch_{étale}/S$ introduced in Sites, Section 9.21.
(2) The *small étale site of S*, which we denote $S_{étale}$, is the full subcategory of $(Sch/S)_{étale}$ whose objects are those U/S such that $U \to S$ is étale. A covering of $S_{étale}$ is any covering $\{U_i \to U\}$ of $(Sch/S)_{étale}$ with $U \in Ob(S_{étale})$.
(3) The *big affine étale site of S*, denoted $(Aff/S)_{étale}$, is the full subcategory of $(Sch/S)_{étale}$ whose objects are affine U/S. A covering of $(Aff/S)_{étale}$ is any covering $\{U_i \to U\}$ of $(Sch/S)_{étale}$ which is a standard étale covering.

It is not completely clear that the big affine étale site or the small étale site are sites. We check this now.

Lemma 30.4.9. *Let S be a scheme. Let $Sch_{étale}$ be a big étale site containing S. Both $S_{étale}$ and $(Aff/S)_{étale}$ are sites.*

Proof. Let us show that $S_{étale}$ is a site. It is a category with a given set of families of morphisms with fixed target. Thus we have to show properties (1), (2) and (3) of Sites, Definition 9.6.2. Since $(Sch/S)_{étale}$ is a site, it suffices to prove that given any covering

$\{U_i \to U\}$ of $(Sch/S)_{Zar}$ with $U \in Ob(S_{étale})$ we also have $U_i \in Ob(S_{étale})$. This follows from the definitions as the composition of étale morphisms is an étale morphism.

Let us show that $(Aff/S)_{étale}$ is a site. Reasoning as above, it suffices to show that the collection of standard étale coverings of affines satisfies properties (1), (2) and (3) of Sites, Definition 9.6.2. This is clear since for example, given a standard étale covering $\{T_i \to T\}_{i \in I}$ and for each i we have a standard étale covering $\{T_{ij} \to T_i\}_{j \in J_i}$, then $\{T_{ij} \to T\}_{i \in I, j \in J_i}$ is a standard étale covering because $\bigcup_{i \in I} J_i$ is finite and each T_{ij} is affine. □

Lemma 30.4.10. *Let S be a scheme. Let $Sch_{étale}$ be a big étale site containing S. The underlying categories of the sites $Sch_{étale}$, $(Sch/S)_{étale}$, $S_{étale}$, and $(Aff/S)_{étale}$ have fibre products. In each case the obvious functor into the category Sch of all schemes commutes with taking fibre products. The categories $(Sch/S)_{étale}$, and $S_{étale}$ both have a final object, namely S/S.*

Proof. For $Sch_{étale}$ it is true by construction, see Sets, Lemma 3.9.9. Suppose we have $U \to S$, $V \to U$, $W \to U$ morphisms of schemes with $U, V, W \in Ob(Sch_{étale})$. The fibre product $V \times_U W$ in $Sch_{étale}$ is a fibre product in Sch and is the fibre product of V/S with W/S over U/S in the category of all schemes over S, and hence also a fibre product in $(Sch/S)_{étale}$. This proves the result for $(Sch/S)_{étale}$. If $U \to S$, $V \to U$ and $W \to U$ are étale then so is $V \times_U W \to S$ and hence we get the result for $S_{étale}$. If U, V, W are affine, so is $V \times_U W$ and hence the result for $(Aff/S)_{étale}$. □

Next, we check that the big affine site defines the same topos as the big site.

Lemma 30.4.11. *Let S be a scheme. Let $Sch_{étale}$ be a big étale site containing S. The functor $(Aff/S)_{étale} \to (Sch/S)_{étale}$ is special cocontinuous and induces an equivalence of topoi from $Sh((Aff/S)_{étale})$ to $Sh((Sch/S)_{étale})$.*

Proof. The notion of a special cocontinuous functor is introduced in Sites, Definition 9.25.2. Thus we have to verify assumptions (1) -- (5) of Sites, Lemma 9.25.1. Denote the inclusion functor $u : (Aff/S)_{étale} \to (Sch/S)_{étale}$. Being cocontinuous just means that any étale covering of T/S, T affine, can be refined by a standard étale covering of T. This is the content of Lemma 30.4.4. Hence (1) holds. We see u is continuous simply because a standard étale covering is a étale covering. Hence (2) holds. Parts (3) and (4) follow immediately from the fact that u is fully faithful. And finally condition (5) follows from the fact that every scheme has an affine open covering. □

Next, we esthablish some relationships between the topoi associated to these sites.

Lemma 30.4.12. *Let $Sch_{étale}$ be a big étale site. Let $f : T \to S$ be a morphism in $Sch_{étale}$. The functor $T_{étale} \to (Sch/S)_{étale}$ is cocontinuous and induces a morphism of topoi*

$$i_f : Sh(T_{étale}) \longrightarrow Sh((Sch/S)_{étale})$$

For a sheaf $\mathcal{G}$ on $(Sch/S)_{étale}$ we have the formula $(i_f^{-1}\mathcal{G})(U/T) = \mathcal{G}(U/S)$. The functor i_f^{-1} also has a left adjoint $i_{f,!}$ which commutes with fibre products and equalizers.

Proof. Denote the functor $u : T_{étale} \to (Sch/S)_{étale}$. In other words, given an étale morphism $j : U \to T$ corresponding to an object of $T_{étale}$ we set $u(U \to T) = (f \circ j : U \to S)$. This functor commutes with fibre products, see Lemma 30.4.10. Let $a, b : U \to V$ be two morphisms in $T_{étale}$. In this case the equalizer of a and b (in the category of schemes) is

$$V \times_{\Delta_{V/T}, V \times_T V, (a,b)} U \times_T U$$

which is a fibre product of schemes étale over T, hence étale over T. Thus $T_{étale}$ has equalizers and u commutes with them. It is clearly cocontinuous. It is also continuous as u transforms coverings to coverings and commutes with fibre products. Hence the Lemma follows from Sites, Lemmas 9.19.5 and 9.19.6. □

Lemma 30.4.13. *Let S be a scheme. Let $Sch_{étale}$ be a big étale site containing S. The inclusion functor $S_{étale} \to (Sch/S)_{étale}$ satisfies the hypotheses of Sites, Lemma 9.19.8 and hence induces a morphism of sites*

$$\pi_S : (Sch/S)_{étale} \longrightarrow S_{étale}$$

and a morphism of topoi

$$i_S : Sh(S_{étale}) \longrightarrow Sh((Sch/S)_{étale})$$

such that $\pi_S \circ i_S = id$. Moreover, $i_S = i_{id_S}$ with i_{id_S} as in Lemma 30.4.12. In particular the functor $i_S^{-1} = \pi_{S,*}$ is described by the rule $i_S^{-1}(\mathcal{G})(U/S) = \mathcal{G}(U/S)$.

Proof. In this case the functor $u : S_{étale} \to (Sch/S)_{étale}$, in addition to the properties seen in the proof of Lemma 30.4.12 above, also is fully faithful and transforms the final object into the final object. The lemma follows from Sites, Lemma 9.19.8. □

Definition 30.4.14. In the situation of Lemma 30.4.13 the functor $i_S^{-1} = \pi_{S,*}$ is often called the *restriction to the small étale site*, and for a sheaf $\mathcal{F}$ on the big étale site we denote $\mathcal{F}|_{S_{étale}}$ this restriction.

With this notation in place we have for a sheaf $\mathcal{F}$ on the big site and a sheaf $\mathcal{G}$ on the big site that

$$\begin{aligned} Mor_{Sh(S_{étale})}(\mathcal{F}|_{S_{étale}}, \mathcal{G}) &= Mor_{Sh((Sch/S)_{étale})}(\mathcal{F}, i_{S,*}\mathcal{G}) \\ Mor_{Sh(S_{étale})}(\mathcal{G}, \mathcal{F}|_{S_{étale}}) &= Mor_{Sh((Sch/S)_{étale})}(\pi_S^{-1}\mathcal{G}, \mathcal{F}) \end{aligned}$$

Moreover, we have $(i_{S,*}\mathcal{G})|_{S_{étale}} = \mathcal{G}$ and we have $(\pi_S^{-1}\mathcal{G})|_{S_{étale}} = \mathcal{G}$.

Lemma 30.4.15. *Let $Sch_{étale}$ be a big étale site. Let $f : T \to S$ be a morphism in $Sch_{étale}$. The functor*

$$u : (Sch/T)_{étale} \longrightarrow (Sch/S)_{étale}, \quad V/T \longmapsto V/S$$

is cocontinuous, and has a continuous right adjoint

$$v : (Sch/S)_{étale} \longrightarrow (Sch/T)_{étale}, \quad (U \to S) \longmapsto (U \times_S T \to T).$$

They induce the same morphism of topoi

$$f_{big} : Sh((Sch/T)_{étale}) \longrightarrow Sh((Sch/S)_{étale})$$

We have $f_{big}^{-1}(\mathcal{G})(U/T) = \mathcal{G}(U/S)$. We have $f_{big,*}(\mathcal{F})(U/S) = \mathcal{F}(U \times_S T/T)$. Also, f_{big}^{-1} has a left adjoint $f_{big!}$ which commutes with fibre products and equalizers.

Proof. The functor u is cocontinuous, continuous and commutes with fibre products and equalizers (details omitted; compare with the proof of Lemma 30.4.12). Hence Sites, Lemmas 9.19.5 and 9.19.6 apply and we deduce the formula for f_{big}^{-1} and the existence of $f_{big!}$. Moreover, the functor v is a right adjoint because given U/T and V/S we have $Mor_S(u(U), V) = Mor_T(U, V \times_S T)$ as desired. Thus we may apply Sites, Lemmas 9.20.1 and 9.20.2 to get the formula for $f_{big,*}$. □

Lemma 30.4.16. *Let $Sch_{étale}$ be a big étale site. Let $f : T \to S$ be a morphism in $Sch_{étale}$.*

(1) *We have $i_f = f_{big} \circ i_T$ with i_f as in Lemma 30.4.12 and i_T as in Lemma 30.4.13.*

(2) *The functor* $S_{étale} \to T_{étale}$, $(U \to S) \mapsto (U \times_S T \to T)$ *is continuous and induces a morphism of topoi*

$$f_{small} : Sh(T_{étale}) \longrightarrow Sh(S_{étale}).$$

We have $f_{small,*}(\mathcal{F})(U/S) = \mathcal{F}(U \times_S T/T)$.

(3) *We have a commutative diagram of morphisms of sites*

$$\begin{tikzcd} T_{étale} \arrow[d, "f_{small}"'] & (Sch/T)_{étale} \arrow[l, "\pi_T"] \arrow[d, "f_{big}"] \\ S_{étale} & (Sch/S)_{étale} \arrow[l, "\pi_S"'] \end{tikzcd}$$

so that $f_{small} \circ \pi_T = \pi_S \circ f_{big}$ *as morphisms of topoi.*

(4) *We have* $f_{small} = \pi_S \circ f_{big} \circ i_T = \pi_S \circ i_f$.

Proof. The equality $i_f = f_{big} \circ i_T$ follows from the equality $i_f^{-1} = i_T^{-1} \circ f_{big}^{-1}$ which is clear from the descriptions of these functors above. Thus we see (1).

The functor $u : S_{étale} \to T_{étale}$, $u(U \to S) = (U \times_S T \to T)$ transforms coverings into coverings and commutes with fibre products, see Lemma 30.4.3 (3) and 30.4.10. Moreover, both $S_{étale}, T_{étale}$ have final objects, namely S/S and T/T and $u(S/S) = T/T$. Hence by Sites, Proposition 9.14.6 the functor u corresponds to a morphism of sites $T_{étale} \to S_{étale}$. This in turn gives rise to the morphism of topoi, see Sites, Lemma 9.15.3. The description of the pushforward is clear from these references.

Part (3) follows because π_S and π_T are given by the inclusion functors and f_{small} and f_{big} by the base change functors $U \mapsto U \times_S T$.

Statement (4) follows from (3) by precomposing with i_T. □

In the situation of the lemma, using the terminology of Definition 30.4.14 we have: for $\mathcal{F}$ a sheaf on the big étale site of T

$$(f_{big,*}\mathcal{F})|_{S_{étale}} = f_{small,*}(\mathcal{F}|_{T_{étale}}),$$

This equality is clear from the commutativity of the diagram of sites of the lemma, since restriction to the small étale site of T, resp. S is given by $\pi_{T,*}$, resp. $\pi_{S,*}$. A similar formula involving pullbacks and restrictions is false.

Lemma 30.4.17. *Given schemes X, Y, Y in* $Sch_{étale}$ *and morphisms* $f : X \to Y$, $g : Y \to Z$ *we have* $g_{big} \circ f_{big} = (g \circ f)_{big}$ *and* $g_{small} \circ f_{small} = (g \circ f)_{small}$.

Proof. This follows from the simple description of push forward and pull back for the functors on the big sites from Lemma 30.4.15. For the functors on the small sites this follows from the description of the pushforward functors in Lemma 30.4.16. □

We can think about a sheaf on the big étale site of S as a collection of ``usual" sheaves on all schemes over S.

Lemma 30.4.18. *Let S be a scheme contained in a big étale site* $Sch_{étale}$. *A sheaf* $\mathcal{F}$ *on the big étale site* $(Sch/S)_{étale}$ *is given by the following data:*

(1) *for every* $T/S \in Ob((Sch/S)_{étale})$ *a sheaf* $\mathcal{F}_T$ *on* $T_{étale}$,
(2) *for every* $f : T' \to T$ *in* $(Sch/S)_{étale}$ *a map* $c_f : f_{small}^{-1}\mathcal{F}_T \to \mathcal{F}_{T'}$.

These data are subject to the following conditions:

(i) *given any* $f : T' \to T$ *and* $g : T'' \to T'$ *in* $(Sch/S)_{étale}$ *the composition* $g_{small}^{-1}c_f \circ c_g$ *is equal to* $c_{f\circ g}$, *and*
(ii) *if* $f : T' \to T$ *in* $(Sch/S)_{étale}$ *is étale then* c_f *is an isomorphism.*

Proof. Given a sheaf $\mathcal{F}$ on $Sh((Sch/S)_{étale})$ we set $\mathcal{F}_T = i_p^{-1}\mathcal{F}$ where $p : T \to S$ is the structure morphism. Note that $\mathcal{F}_T(U) = \mathcal{F}(U/S)$ for any $U \to T$ in $T_{étale}$ see Lemma 30.4.12. Hence given $f : T' \to T$ over S and $U \to T$ we get a canonical map $\mathcal{F}_T(U) = \mathcal{F}(U/S) \to \mathcal{F}(U \times_T T'/S) = \mathcal{F}_{T'}(U \times_T T')$ where the middle is the restriction map of $\mathcal{F}$ with respect to the morphism $U \times_T T' \to U$ over S. The collection of these maps are compatible with restrictions, and hence define a map $c'_f : \mathcal{F}_T \to f_{small,*}\mathcal{F}_{T'}$ where $u : T_{étale} \to T'_{étale}$ is the base change functor associated to f. By adjunction of $f_{small,*}$ (see Sites, Section 9.13) with f_{small}^{-1} this is the same as a map $c_f : f_{small}^{-1}\mathcal{F}_T \to \mathcal{F}_{T'}$. It is clear that $c'_{f\circ g}$ is the composition of c'_f and $f_{small,*}c'_g$, since composition of restriction maps of $\mathcal{F}$ gives restriction maps, and this gives the desired relationship among c_f, c_g and $c_{f\circ g}$.

Conversely, given a system $(\mathcal{F}_T, c_f)$ as in the lemma we may define a presheaf $\mathcal{F}$ on $Sh((Sch/S)_{étale})$ by simply setting $\mathcal{F}(T/S) = \mathcal{F}_T(T)$. As restriction mapping, given $f : T' \to T$ we set for $s \in \mathcal{F}(T)$ the pull back $f^*(s)$ equal to $c_f(s)$ where we think of c_f as a map $\mathcal{F}_T \to f_{small,*}\mathcal{F}_{T'}$ again. The condition on the c_f garantees that pullbacks satisfy the required functoriality property. We omit the verification that this is a sheaf. It is clear that the constructions so defined are mutually inverse. □

30.5. The smooth topology

In this section we define the smooth topology. This is a bit pointless as it will turn out later (see More on Morphisms, Section 33.26) that this topology defines the same topos as the étale topology. But still it makes sense and it is used occasionally.

Definition 30.5.1. Let T be a scheme. An *smooth covering of* T is a family of morphisms $\{f_i : T_i \to T\}_{i\in I}$ of schemes such that each f_i is smooth and such that $T = \bigcup f_i(T_i)$.

Lemma 30.5.2. *Any étale covering is a smooth covering, and a fortiori, any Zariski covering is a smooth covering.*

Proof. This is clear from the definitions, the fact that an étale morphism is smooth see Morphisms, Definition 24.35.1 and Lemma 30.4.2. □

Next, we show that this notion satisfies the conditions of Sites, Definition 9.6.2.

Lemma 30.5.3. *Let* T *be a scheme.*

(1) *If* $T' \to T$ *is an isomorphism then* $\{T' \to T\}$ *is an smooth covering of* T.
(2) *If* $\{T_i \to T\}_{i\in I}$ *is a smooth covering and for each i we have a smooth covering* $\{T_{ij} \to T_i\}_{j\in J_i}$, *then* $\{T_{ij} \to T\}_{i\in I, j\in J_i}$ *is a smooth covering.*
(3) *If* $\{T_i \to T\}_{i\in I}$ *is a smooth covering and* $T' \to T$ *is a morphism of schemes then* $\{T' \times_T T_i \to T'\}_{i\in I}$ *is a smooth covering.*

Proof. Omitted. □

Lemma 30.5.4. *Let* T *be an affine scheme. Let* $\{T_i \to T\}_{i\in I}$ *be a smooth covering of* T. *Then there exists a smooth covering* $\{U_j \to T\}_{j=1,\ldots,m}$ *which is a refinement of* $\{T_i \to T\}_{i\in I}$ *such that each* U_j *is an affine scheme, and such that each morphism* $U_j \to T$ *is standard smooth, see Morphisms, Definition 24.33.1. Moreover, we may choose each* U_j *to be open affine in one of the* T_i.

Proof. Omitted, but see Algebra, Lemma 7.126.10. □

Thus we define the corresponding standard coverings of affines as follows.

Definition 30.5.5. Let T be an affine scheme. A *standard smooth covering* of T is a family $\{f_j : U_j \to T\}_{j=1,\ldots,m}$ with each U_j is affine, $U_j \to T$ standard smooth and $T = \bigcup f_j(U_j)$.

Definition 30.5.6. A *big smooth site* is any site Sch_{smooth} as in Sites, Definition 9.6.2 constructed as follows:

(1) Choose any set of schemes S_0, and any set of smooth coverings Cov_0 among these schemes.
(2) As underlying category take any category Sch_α constructed as in Sets, Lemma 3.9.2 starting with the set S_0.
(3) Choose any set of coverings as in Sets, Lemma 3.11.1 starting with the category Sch_α and the class of smooth coverings, and the set Cov_0 chosen above.

See the remarks following Definition 30.3.5 for motivation and explanation regarding the definition of big sites.

Before we continue with the introduction of the big smooth site of a scheme S, let us point out that the topology on a big smooth site Sch_{smooth} is in some sense induced from the smooth topology on the category of all schemes.

Lemma 30.5.7. *Let Sch_{smooth} be a big smooth site as in Definition 30.5.6. Let $T \in Ob(Sch_{smooth})$. Let $\{T_i \to T\}_{i\in I}$ be an arbitrary smooth covering of T.*

(1) *There exists a covering $\{U_j \to T\}_{j\in J}$ of T in the site Sch_{smooth} which refines $\{T_i \to T\}_{i\in I}$.*
(2) *If $\{T_i \to T\}_{i\in I}$ is a standard smooth covering, then it is tautologically equivalent to a covering of Sch_{smooth}.*
(3) *If $\{T_i \to T\}_{i\in I}$ is a Zariski covering, then it is tautologically equivalent to a covering of Sch_{smooth}.*

Proof. For each i choose an affine open covering $T_i = \bigcup_{j\in J_i} T_{ij}$ such that each T_{ij} maps into an affine open subscheme of T. By Lemma 30.5.3 the refinement $\{T_{ij} \to T\}_{i\in I, j\in J_i}$ is an smooth covering of T as well. Hence we may assume each T_i is affine, and maps into an affine open W_i of T. Applying Sets, Lemma 3.9.9 we see that W_i is isomorphic to an object of Sch_{Zar}. But then T_i as a finite type scheme over W_i is isomorphic to an object V_i of Sch_{Zar} by a second application of Sets, Lemma 3.9.9. The covering $\{V_i \to T\}_{i\in I}$ refines $\{T_i \to T\}_{i\in I}$ (because they are isomorphic). Moreover, $\{V_i \to T\}_{i\in I}$ is combinatorially equivalent to a covering $\{U_j \to T\}_{j\in J}$ of T in the site Sch_{Zar} by Sets, Lemma 3.9.9. The covering $\{U_j \to T\}_{j\in J}$ is a refinement as in (1). In the situation of (2), (3) each of the schemes T_i is isomorphic to an object of Sch_{smooth} by Sets, Lemma 3.9.9, and another application of Sets, Lemma 3.11.1 gives what we want. □

Definition 30.5.8. Let S be a scheme. Let Sch_{smooth} be a big smooth site containing S.

(1) The *big smooth site of S*, denoted $(Sch/S)_{smooth}$, is the site Sch_{smooth}/S introduced in Sites, Section 9.21.
(2) The *big affine smooth site of S*, denoted $(Aff/S)_{smooth}$, is the full subcategory of $(Sch/S)_{smooth}$ whose objects are affine U/S. A covering of $(Aff/S)_{smooth}$ is any covering $\{U_i \to U\}$ of $(Sch/S)_{smooth}$ which is a standard smooth covering.

Next, we check that the big affine site defines the same topos as the big site.

Lemma 30.5.9. *Let S be a scheme. Let $Sch_{étale}$ be a big smooth site containing S. The functor $(Aff/S)_{smooth} \to (Sch/S)_{smooth}$ is special cocontinuous and induces an equivalence of topoi from $Sh((Aff/S)_{smooth})$ to $Sh((Sch/S)_{smooth})$.*

Proof. The notion of a special cocontinuous functor is introduced in Sites, Definition 9.25.2. Thus we have to verify assumptions (1) -- (5) of Sites, Lemma 9.25.1. Denote the inclusion functor $u : (Aff/S)_{smooth} \to (Sch/S)_{smooth}$. Being cocontinuous just means that any smooth covering of T/S, T affine, can be refined by a standard smooth covering of T. This is the content of Lemma 30.5.4. Hence (1) holds. We see u is continuous simply because a standard smooth covering is a smooth covering. Hence (2) holds. Parts (3) and (4) follow immediately from the fact that u is fully faithful. And finally condition (5) follows from the fact that every scheme has an affine open covering. □

To be continued...

Lemma 30.5.10. *Let Sch_{smooth} be a big smooth site. Let $f : T \to S$ be a morphism in Sch_{smooth}. The functor*

$$u : (Sch/T)_{smooth} \longrightarrow (Sch/S)_{smooth}, \quad V/T \longmapsto V/S$$

is cocontinuous, and has a continuous right adjoint

$$v : (Sch/S)_{smooth} \longrightarrow (Sch/T)_{smooth}, \quad (U \to S) \longmapsto (U \times_S T \to T).$$

They induce the same morphism of topoi

$$f_{big} : Sh((Sch/T)_{smooth}) \longrightarrow Sh((Sch/S)_{smooth})$$

We have $f_{big}^{-1}(\mathcal{G})(U/T) = \mathcal{G}(U/S)$. We have $f_{big,*}(\mathcal{F})(U/S) = \mathcal{F}(U \times_S T/T)$. Also, f_{big}^{-1} has a left adjoint $f_{big!}$ which commutes with fibre products and equalizers.

Proof. The functor u is cocontinuous, continuous, and commutes with fibre products and equalizers. Hence Sites, Lemmas 9.19.5 and 9.19.6 apply and we deduce the formula for f_{big}^{-1} and the existence of $f_{big!}$. Moreover, the functor v is a right adjoint because given U/T and V/S we have $Mor_S(u(U), V) = Mor_T(U, V \times_S T)$ as desired. Thus we may apply Sites, Lemmas 9.20.1 and 9.20.2 to get the formula for $f_{big,*}$. □

30.6. The syntomic topology

In this section we define the syntomic topology. This topology is quite interesting in that it often has the same cohomology groups as the fppf topology but is technically easier to deal with.

Definition 30.6.1. Let T be a scheme. An *syntomic covering of T* is a family of morphisms $\{f_i : T_i \to T\}_{i \in I}$ of schemes such that each f_i is syntomic and such that $T = \bigcup f_i(T_i)$.

Lemma 30.6.2. *Any smooth covering is a syntomic covering, and a fortiori, any étale or Zariski covering is a syntomic covering.*

Proof. This is clear from the definitions and the fact that a smooth morphism is syntomic, see Morphisms, Lemma 24.33.7 and Lemma 30.5.2. □

Next, we show that this notion satisfies the conditions of Sites, Definition 9.6.2.

Lemma 30.6.3. *Let T be a scheme.*

(1) *If $T' \to T$ is an isomorphism then $\{T' \to T\}$ is an syntomic covering of T.*

(2) *If $\{T_i \to T\}_{i\in I}$ is a syntomic covering and for each i we have a syntomic covering $\{T_{ij} \to T_i\}_{j\in J_i}$, then $\{T_{ij} \to T\}_{i\in I, j\in J_i}$ is a syntomic covering.*
(3) *If $\{T_i \to T\}_{i\in I}$ is a syntomic covering and $T' \to T$ is a morphism of schemes then $\{T' \times_T T_i \to T'\}_{i\in I}$ is a syntomic covering.*

Proof. Omitted. □

Lemma 30.6.4. *Let T be an affine scheme. Let $\{T_i \to T\}_{i\in I}$ be a syntomic covering of T. Then there exists a syntomic covering $\{U_j \to T\}_{j=1,\ldots,m}$ which is a refinement of $\{T_i \to T\}_{i\in I}$ such that each U_j is an affine scheme, and such that each morphism $U_j \to T$ is standard syntomic, see Morphisms, Definition 24.30.1. Moreover, we may choose each U_j to be open affine in one of the T_i.*

Proof. Omitted, but see Algebra, Lemma 7.125.16. □

Thus we define the corresponding standard coverings of affines as follows.

Definition 30.6.5. Let T be an affine scheme. A *standard syntomic covering* of T is a family $\{f_j : U_j \to T\}_{j=1,\ldots,m}$ with each U_j is affine, $U_j \to T$ standard syntomic and $T = \bigcup f_j(U_j)$.

Definition 30.6.6. A *big syntomic site* is any site $Sch_{syntomic}$ as in Sites, Definition 9.6.2 constructed as follows:

(1) Choose any set of schemes S_0, and any set of syntomic coverings Cov_0 among these schemes.
(2) As underlying category take any category Sch_α constructed as in Sets, Lemma 3.9.2 starting with the set S_0.
(3) Choose any set of coverings as in Sets, Lemma 3.11.1 starting with the category Sch_α and the class of syntomic coverings, and the set Cov_0 chosen above.

See the remarks following Definition 30.3.5 for motivation and explanation regarding the definition of big sites.

Before we continue with the introduction of the big syntomic site of a scheme S, let us point out that the topology on a big syntomic site $Sch_{syntomic}$ is in some sense induced from the syntomic topology on the category of all schemes.

Lemma 30.6.7. *Let $Sch_{syntomic}$ be a big syntomic site as in Definition 30.6.6. Let $T \in Ob(Sch_{syntomic})$. Let $\{T_i \to T\}_{i\in I}$ be an arbitrary syntomic covering of T.*

(1) *There exists a covering $\{U_j \to T\}_{j\in J}$ of T in the site $Sch_{syntomic}$ which refines $\{T_i \to T\}_{i\in I}$.*
(2) *If $\{T_i \to T\}_{i\in I}$ is a standard syntomic covering, then it is tautologically equivalent to a covering in $Sch_{syntomic}$.*
(3) *If $\{T_i \to T\}_{i\in I}$ is a Zariski covering, then it is tautologically equivalent to a covering in $Sch_{syntomic}$.*

Proof. For each i choose an affine open covering $T_i = \bigcup_{j\in J_i} T_{ij}$ such that each T_{ij} maps into an affine open subscheme of T. By Lemma 30.6.3 the refinement $\{T_{ij} \to T\}_{i\in I, j\in J_i}$ is an syntomic covering of T as well. Hence we may assume each T_i is affine, and maps into an affine open W_i of T. Applying Sets, Lemma 3.9.9 we see that W_i is isomorphic to an object of Sch_{Zar}. But then T_i as a finite type scheme over W_i is isomorphic to an object V_i of Sch_{Zar} by a second application of Sets, Lemma 3.9.9. The covering $\{V_i \to T\}_{i\in I}$ refines $\{T_i \to T\}_{i\in I}$ (because they are isomorphic). Moreover, $\{V_i \to T\}_{i\in I}$ is combinatorially equivalent to a covering $\{U_j \to T\}_{j\in J}$ of T in the site Sch_{Zar} by Sets, Lemma 3.9.9. The covering $\{U_j \to T\}_{j\in J}$ is a covering as in (1). In the situation of (2), (3) each of the schemes T_i is isomorphic to an object of Sch_{Zar} by Sets, Lemma 3.9.9, and another application of Sets, Lemma 3.11.1 gives what we want. □

Definition 30.6.8. Let S be a scheme. Let $Sch_{syntomic}$ be a big syntomic site containing S.

(1) The *big syntomic site of S*, denoted $(Sch/S)_{syntomic}$, is the site $Sch_{syntomic}/S$ introduced in Sites, Section 9.21.
(2) The *big affine syntomic site of S*, denoted $(Aff/S)_{syntomic}$, is the full subcategory of $(Sch/S)_{syntomic}$ whose objects are affine U/S. A covering of $(Aff/S)_{syntomic}$ is any covering $\{U_i \to U\}$ of $(Sch/S)_{syntomic}$ which is a standard syntomic covering.

Next, we check that the big affine site defines the same topos as the big site.

Lemma 30.6.9. *Let S be a scheme. Let $Sch_{syntomic}$ be a big syntomic site containing S. The functor $(Aff/S)_{syntomic} \to (Sch/S)_{syntomic}$ is special cocontinuous and induces an equivalence of topoi from $Sh((Aff/S)_{syntomic})$ to $Sh((Sch/S)_{syntomic})$.*

Proof. The notion of a special cocontinuous functor is introduced in Sites, Definition 9.25.2. Thus we have to verify assumptions (1) -- (5) of Sites, Lemma 9.25.1. Denote the inclusion functor $u : (Aff/S)_{syntomic} \to (Sch/S)_{syntomic}$. Being cocontinuous just means that any syntomic covering of T/S, T affine, can be refined by a standard syntomic covering of T. This is the content of Lemma 30.6.4. Hence (1) holds. We see u is continuous simply because a standard syntomic covering is a syntomic covering. Hence (2) holds. Parts (3) and (4) follow immediately from the fact that u is fully faithful. And finally condition (5) follows from the fact that every scheme has an affine open covering. □

To be continued...

Lemma 30.6.10. *Let $Sch_{syntomic}$ be a big syntomic site. Let $f : T \to S$ be a morphism in $Sch_{syntomic}$. The functor*

$$u : (Sch/T)_{syntomic} \longrightarrow (Sch/S)_{syntomic}, \quad V/T \longmapsto V/S$$

is cocontinuous, and has a continuous right adjoint

$$v : (Sch/S)_{syntomic} \longrightarrow (Sch/T)_{syntomic}, \quad (U \to S) \longmapsto (U \times_S T \to T).$$

They induce the same morphism of topoi

$$f_{big} : Sh((Sch/T)_{syntomic}) \longrightarrow Sh((Sch/S)_{syntomic})$$

We have $f_{big}^{-1}(\mathcal{G})(U/T) = \mathcal{G}(U/S)$. We have $f_{big,*}(\mathcal{F})(U/S) = \mathcal{F}(U \times_S T/T)$. Also, f_{big}^{-1} has a left adjoint $f_{big!}$ which commutes with fibre products and equalizers.

Proof. The functor u is cocontinuous, continuous, and commutes with fibre products and equalizers. Hence Sites, Lemmas 9.19.5 and 9.19.6 apply and we deduce the formula for f_{big}^{-1} and the existence of $f_{big!}$. Moreover, the functor v is a right adjoint because given U/T and V/S we have $Mor_S(u(U), V) = Mor_T(U, V \times_S T)$ as desired. Thus we may apply Sites, Lemmas 9.20.1 and 9.20.2 to get the formula for $f_{big,*}$. □

30.7. The fppf topology

Let S be a scheme. We would like to define the fppf-topology[2] on the category of schemes over S. According to our general principle we first introduce the notion of an fppf-covering.

[2] The letters fppf stand for ``fidèlement plat de présentation finie''.

Definition 30.7.1. Let T be a scheme. An *fppf covering of T* is a family of morphisms $\{f_i : T_i \to T\}_{i\in I}$ of schemes such that each f_i is flat, locally of finite presentation and such that $T = \bigcup f_i(T_i)$.

Lemma 30.7.2. *Any syntomic covering is an fppf covering, and a fortiori, any smooth, étale, or Zariski covering is an fppf covering.*

Proof. This is clear from the definitions, the fact that a synomtic morphism is flat and locally of finite presentation, see Morphisms, Lemmas 24.30.6 and 24.30.7, and Lemma 30.6.2. ☐

Next, we show that this notion satisfies the conditions of Sites, Definition 9.6.2.

Lemma 30.7.3. *Let T be a scheme.*

1. *If $T' \to T$ is an isomorphism then $\{T' \to T\}$ is an fppf covering of T.*
2. *If $\{T_i \to T\}_{i\in I}$ is an fppf covering and for each i we have an fppf covering $\{T_{ij} \to T_i\}_{j\in J_i}$, then $\{T_{ij} \to T\}_{i\in I, j\in J_i}$ is an fppf covering.*
3. *If $\{T_i \to T\}_{i\in I}$ is an fppf covering and $T' \to T$ is a morphism of schemes then $\{T' \times_T T_i \to T'\}_{i\in I}$ is an fppf covering.*

Proof. The first assertion is clear. The second follows as the composition of flat morphisms is flat (see Morphisms, Lemma 24.24.5) and the composition of morphisms of finite presentation is of finite presentation (see Morphisms, Lemma 24.20.3). The third follows as the base change of a flat morphism is flat (see Morphisms, Lemma 24.24.7) and the base change of a morphism of finite presentation is of finite presentation (see Morphisms, Lemma 24.20.4). Moreover, the base change of a surjective family of morphisms is surjective (proof omitted). ☐

Lemma 30.7.4. *Let T be an affine scheme. Let $\{T_i \to T\}_{i\in I}$ be an fppf covering of T. Then there exists an fppf covering $\{U_j \to T\}_{j=1,\ldots,m}$ which is a refinement of $\{T_i \to T\}_{i\in I}$ such that each U_j is an affine scheme. Moreover, we may choose each U_j to be open affine in one of the T_i.*

Proof. This follows directly from the definitions using that a morphism which is flat and locally of finite presentation is open, see Morphisms, Lemma 24.24.9. ☐

Thus we define the corresponding standard coverings of affines as follows.

Definition 30.7.5. Let T be an affine scheme. A *standard fppf covering* of T is a family $\{f_j : U_j \to T\}_{j=1,\ldots,m}$ with each U_j is affine, flat and of finite presentation over T and $T = \bigcup f_j(U_j)$.

Definition 30.7.6. A *big fppf site* is any site Sch_{fppf} as in Sites, Definition 9.6.2 constructed as follows:

1. Choose any set of schemes S_0, and any set of fppf coverings Cov_0 among these schemes.
2. As underlying category take any category Sch_α constructed as in Sets, Lemma 3.9.2 starting with the set S_0.
3. Choose any set of coverings as in Sets, Lemma 3.11.1 starting with the category Sch_α and the class of fppf coverings, and the set Cov_0 chosen above.

See the remarks following Definition 30.3.5 for motivation and explanation regarding the definition of big sites.

Before we continue with the introduction of the big fppf site of a scheme S, let us point out that the topology on a big fppf site Sch_{fppf} is in some sense induced from the fppf topology on the category of all schemes.

Lemma 30.7.7. *Let Sch_{fppf} be a big fppf site as in Definition 30.7.6. Let $T \in Ob(Sch_{fppf})$. Let $\{T_i \to T\}_{i\in I}$ be an arbitrary fppf covering of T.*

(1) *There exists a covering $\{U_j \to T\}_{j\in J}$ of T in the site Sch_{fppf} which refines $\{T_i \to T\}_{i\in I}$.*
(2) *If $\{T_i \to T\}_{i\in I}$ is a standard fppf covering, then it is tautologically equivalent to a covering of Sch_{fppf}.*
(3) *If $\{T_i \to T\}_{i\in I}$ is a Zariski covering, then it is tautologically equivalent to a covering of Sch_{fppf}.*

Proof. For each i choose an affine open covering $T_i = \bigcup_{j\in J_i} T_{ij}$ such that each T_{ij} maps into an affine open subscheme of T. By Lemma 30.7.3 the refinement $\{T_{ij} \to T\}_{i\in I, j\in J_i}$ is an fppf covering of T as well. Hence we may assume each T_i is affine, and maps into an affine open W_i of T. Applying Sets, Lemma 3.9.9 we see that W_i is isomorphic to an object of Sch_{Zar}. But then T_i as a finite type scheme over W_i is isomorphic to an object V_i of Sch_{Zar} by a second application of Sets, Lemma 3.9.9. The covering $\{V_i \to T\}_{i\in I}$ refines $\{T_i \to T\}_{i\in I}$ (because they are isomorphic). Moreover, $\{V_i \to T\}_{i\in I}$ is combinatorially equivalent to a covering $\{U_j \to T\}_{j\in J}$ of T in the site Sch_{Zar} by Sets, Lemma 3.9.9. The covering $\{U_j \to T\}_{j\in J}$ is a refinement as in (1). In the situation of (2), (3) each of the schemes T_i is isomorphic to an object of Sch_{fppf} by Sets, Lemma 3.9.9, and another application of Sets, Lemma 3.11.1 gives what we want. □

Definition 30.7.8. Let S be a scheme. Let Sch_{fppf} be a big fppf site containing S.

(1) The *big fppf site of S*, denoted $(Sch/S)_{fppf}$, is the site Sch_{fppf}/S introduced in Sites, Section 9.21.
(2) The *big affine fppf site of S*, denoted $(Aff/S)_{fppf}$, is the full subcategory of $(Sch/S)_{fppf}$ whose objects are affine U/S. A covering of $(Aff/S)_{fppf}$ is any covering $\{U_i \to U\}$ of $(Sch/S)_{fppf}$ which is a standard fppf covering.

It is not completely clear that the big affine fppf site is a site. We check this now.

Lemma 30.7.9. *Let S be a scheme. Let Sch_{fppf} be a big fppf site containing S. Then $(Aff/S)_{fppf}$ is a site.*

Proof. Let us show that $(Aff/S)_{fppf}$ is a site. Reasoning as in the proof of Lemma 30.4.9 it suffices to show that the collection of standard fppf coverings of affines satisfies properties (1), (2) and (3) of Sites, Definition 9.6.2. This is clear since for example, given a standard fppf covering $\{T_i \to T\}_{i\in I}$ and for each i we have a standard fppf covering $\{T_{ij} \to T_i\}_{j\in J_i}$, then $\{T_{ij} \to T\}_{i\in I, j\in J_i}$ is a standard fppf covering because $\bigcup_{i\in I} J_i$ is finite and each T_{ij} is affine. □

Lemma 30.7.10. *Let S be a scheme. Let Sch_{fppf} be a big fppf site containing S. The underlying categories of the sites Sch_{fppf}, $(Sch/S)_{fppf}$, and $(Aff/S)_{fppf}$ have fibre products. In each case the obvious functor into the category Sch of all schemes commutes with taking fibre products. The category $(Sch/S)_{fppf}$ has a final object, namely S/S.*

Proof. For Sch_{fppf} it is true by construction, see Sets, Lemma 3.9.9. Suppose we have $U \to S$, $V \to U$, $W \to U$ morphisms of schemes with $U, V, W \in Ob(Sch_{fppf})$. The fibre product $V \times_U W$ in Sch_{fppf} is a fibre product in Sch and is the fibre product of V/S with

W/S over U/S in the category of all schemes over S, and hence also a fibre product in $(Sch/S)_{fppf}$. This proves the result for $(Sch/S)_{fppf}$. If U, V, W are affine, so is $V \times_U W$ and hence the result for $(Aff/S)_{fppf}$. □

Next, we check that the big affine site defines the same topos as the big site.

Lemma 30.7.11. *Let S be a scheme. Let Sch_{fppf} be a big fppf site containing S. The functor $(Aff/S)_{fppf} \to (Sch/S)_{fppf}$ is cocontinuous and induces an equivalence of topoi from $Sh((Aff/S)_{fppf})$ to $Sh((Sch/S)_{fppf})$.*

Proof. The notion of a special cocontinuous functor is introduced in Sites, Definition 9.25.2. Thus we have to verify assumptions (1) -- (5) of Sites, Lemma 9.25.1. Denote the inclusion functor $u : (Aff/S)_{fppf} \to (Sch/S)_{fppf}$. Being cocontinuous just means that any fppf covering of T/S, T affine, can be refined by a standard fppf covering of T. This is the content of Lemma 30.7.4. Hence (1) holds. We see u is continuous simply because a standard fppf covering is a fppf covering. Hence (2) holds. Parts (3) and (4) follow immediately from the fact that u is fully faithful. And finally condition (5) follows from the fact that every scheme has an affine open covering. □

Next, we esthablish some relationships between the topoi associated to these sites.

Lemma 30.7.12. *Let Sch_{fppf} be a big fppf site. Let $f : T \to S$ be a morphism in Sch_{fppf}. The functor*

$$u : (Sch/T)_{fppf} \longrightarrow (Sch/S)_{fppf}, \quad V/T \longmapsto V/S$$

is cocontinuous, and has a continuous right adjoint

$$v : (Sch/S)_{fppf} \longrightarrow (Sch/T)_{fppf}, \quad (U \to S) \longmapsto (U \times_S T \to T).$$

They induce the same morphism of topoi

$$f_{big} : Sh((Sch/T)_{fppf}) \longrightarrow Sh((Sch/S)_{fppf})$$

We have $f_{big}^{-1}(\mathcal{G})(U/T) = \mathcal{G}(U/S)$. We have $f_{big,*}(\mathcal{F})(U/S) = \mathcal{F}(U \times_S T/T)$. Also, f_{big}^{-1} has a left adjoint $f_{big!}$ which commutes with fibre products and equalizers.

Proof. The functor u is cocontinuous, continuous, and commutes with fibre products and equalizers. Hence Sites, Lemmas 9.19.5 and 9.19.6 apply and we deduce the formula for f_{big}^{-1} and the existence of $f_{big!}$. Moreover, the functor v is a right adjoint because given U/T and V/S we have $Mor_S(u(U), V) = Mor_T(U, V \times_S T)$ as desired. Thus we may apply Sites, Lemmas 9.20.1 and 9.20.2 to get the formula for $f_{big,*}$. □

Lemma 30.7.13. *Given schemes X, Y, Y in $(Sch/S)_{fppf}$ and morphisms $f : X \to Y$, $g : Y \to Z$ we have $g_{big} \circ f_{big} = (g \circ f)_{big}$.*

Proof. This follows from the simple description of push forward and pull back for the functors on the big sites from Lemma 30.7.12. □

30.8. The fpqc topology

Definition 30.8.1. Let T be a scheme. An *fpqc covering of T* is a family of morphisms $\{f_i : T_i \to T\}_{i \in I}$ of schemes such that each f_i is flat and such that for every affine open $U \subset T$ there exists $n \geq 0$, a map $a : \{1, \ldots, n\} \to I$ and affine opens $V_j \subset T_{a(j)}$, $j = 1, \ldots, n$ with $\bigcup_{j=1}^n f_{a(j)}(V_j) = U$.

To be sure this condition implies that $T = \bigcup f_i(T_i)$. It is slightly harder to recognize an fpqc covering, hence we provide some lemmas to do so.

Lemma 30.8.2. *Let T be a scheme. Let $\{f_i : T_i \to T\}_{i \in I}$ be a family of morphisms of schemes with target T. The following are equivalent*

(1) *$\{f_i : T_i \to T\}_{i \in I}$ is an fpqc covering,*
(2) *each f_i is flat and for every affine open $U \subset T$ there exist $i_1, \ldots, i_n \in I$ and quasi-compact opens $U_j \subset T_{i_j}$ such that $U = \bigcup_{j=1,\ldots,n} f_{i_j}(U_j)$,*
(3) *each f_i is flat and there exists an affine open covering $T = \bigcup_{\alpha \in A} U_\alpha$ and for each $\alpha \in A$ there exist $i_{\alpha,1}, \ldots, i_{\alpha,n(\alpha)} \in I$ and quasi-compact opens $U_{\alpha,j} \subset T_{i_{\alpha,j}}$ such that $U = \bigcup_{j=1,\ldots,n(\alpha)} f_{i_{\alpha,j}}(U_{\alpha,j})$, and*
(4) *each f_i is flat, and for every $t \in T$ there exist $i_1, \ldots, i_n \in I$ and quasi-compact opens $U_j \subset T_{i_j}$ such that $\bigcup_{j=1,\ldots,n} f_{i_j}(U_j)$ is a (not necessarily open) neighbourhood of t in T.*

Proof. Omitted. □

Lemma 30.8.3. *Let T be a scheme. Let $\{f_i : T_i \to T\}_{i \in I}$ be a family of morphisms of schemes with target T. The following are equivalent*

(1) *$\{f_i : T_i \to T\}_{i \in I}$ is an fpqc covering, and*
(2) *setting $T' = \coprod_{i \in I} T_i$, and $f = \coprod_{i \in I} f_i$ the family $\{f : T' \to T\}$ is an fpqc covering.*

Proof. Omitted. □

Lemma 30.8.4. *Let T be a scheme. Let $\{f_i : T_i \to T\}_{i \in I}$ be a family of morphisms of schemes with target T. Assume that*

(1) *each f_i is flat, and*
(2) *the family $\{f_i : T_i \to T\}_{i \in I}$ can be refined by a fpqc covering of T.*

Then $\{f_i : T_i \to T\}_{i \in I}$ is a fpqc covering of T.

Proof. Omitted. □

Lemma 30.8.5. *Let T be a scheme. Let $\{f_i : T_i \to T\}_{i \in I}$ be a family of morphisms of schemes with target T. Assume that*

(1) *each f_i is flat, and*
(2) *there exists an fpqc covering $\{g_j : S_j \to T\}_{j \in J}$ such that each $\{S_j \times_T T_i \to S_j\}_{i \in I}$ is an fpqc covering.*

Then $\{f_i : T_i \to T\}_{i \in I}$ is a fpqc covering of T.

Proof. Omitted. Hint: Follows from Lemma 30.8.4. □

Lemma 30.8.6. *Any fppf covering is an fpqc covering, and a fortiori, any syntomic, smooth, étale or Zariski covering is an fpqc covering.*

Proof. We will show that an fppf covering is an fpqc covering, and then the rest follows from Lemma 30.7.2. Let $\{f_i : U_i \to U\}_{i \in I}$ be an fppf covering. By definition this means that the f_i are flat which checks the first condition of Definition 30.8.1. To check the second, let $V \subset U$ be an affine open subset. Write $f_i^{-1}(V) = \bigcup_{j \in J_i} V_{ij}$ for some affine opens $V_{ij} \subset U_i$. Since each f_i is open (Morphisms, Lemma 24.24.9), we see that $V = \bigcup_{i \in I} \bigcup_{j \in J_i} f_i(V_{ij})$ is an open covering of V. Since V is quasi-compact, this covering has a finite refinement. This finishes the proof. □

The fpqc[3] topology cannot be treated in the same way as the fppf topology[4]. Namely, suppose that R is a nonzero ring. For any faithfully flat ring map $R \to R'$ the morphism $Spec(R') \to Spec(R)$ is an fpqc-covering. We claim that there does not exist a set A of fpqc-coverings of $Spec(R)$ such that every fpqc-covering can be refined by an element of A. For example, if $R = k$ is a field, then for any set I we can consider the purely transcendental field extension $k \subset k(\{t_i\}_{i \in I})$. We leave it to the reader to show that there does not exist a set of morphisms of schemes $\{S_j \to Spec(k)\}_{j \in J}$ such that every morphism $Spec(k(\{t_i\}_{i \in I}))$ is dominated by one of the schemes S_j.

A mildly interesting option is to consider only those faithfully flat ring extensions $R \to R'$ where the cardinality of R' is suitably bounded. (And if you consider all schemes in a fixed universe as in SGA4 then you are bounding the cardinality by a strongly inaccessible cardinal.) However, it is not so clear what happens if you change the cardinal to a bigger one.

For these reasons we do not introduce fpqc sites and we will not consider cohomology with respect to the fpqc-topology.

On the other hand, given a contravariant functor $F : Sch^{opp} \to Sets$ it does make sense to ask whether F satisfies the sheaf property for the fpqc topology, see below. Moreover, we can wonder about descent of object in the fpqc topology, etc. Simply put, for certain results the correct generality is to work with fpqc coverings.

Lemma 30.8.7. *Let T be a scheme.*

(1) *If $T' \to T$ is an isomorphism then $\{T' \to T\}$ is an fpqc covering of T.*
(2) *If $\{T_i \to T\}_{i \in I}$ is an fpqc covering and for each i we have an fpqc covering $\{T_{ij} \to T_i\}_{j \in J_i}$, then $\{T_{ij} \to T\}_{i \in I, j \in J_i}$ is an fpqc covering.*
(3) *If $\{T_i \to T\}_{i \in I}$ is an fpqc covering and $T' \to T$ is a morphism of schemes then $\{T' \times_T T_i \to T'\}_{i \in I}$ is an fpqc covering.*

Proof. Omitted. □

Lemma 30.8.8. *Let T be an affine scheme. Let $\{T_i \to T\}_{i \in I}$ be an fpqc covering of T. Then there exists an fpqc covering $\{U_j \to T\}_{j=1,\ldots,n}$ which is a refinement of $\{T_i \to T\}_{i \in I}$ such that each U_j is an affine scheme. Moreover, we may choose each U_j to be open affine in one of the T_i.*

Proof. This follows directly from the definition. □

Definition 30.8.9. Let T be an affine scheme. A *standard fpqc covering* of T is a family $\{f_j : U_j \to T\}_{j=1,\ldots,n}$ with each U_j is affine, flat over T and $T = \bigcup f_j(U_j)$.

Since we do not introduce the affine site we have to show directly that the collection of all standard fpqc coverings satisfies the axioms.

Lemma 30.8.10. *Let T be an affine scheme.*

(1) *If $T' \to T$ is an isomorphism then $\{T' \to T\}$ is a standard fpqc covering of T.*
(2) *If $\{T_i \to T\}_{i \in I}$ is a standard fpqc covering and for each i we have a standard fpqc covering $\{T_{ij} \to T_i\}_{j \in J_i}$, then $\{T_{ij} \to T\}_{i \in I, j \in J_i}$ is a standard fpqc covering.*
(3) *If $\{T_i \to T\}_{i \in I}$ is a standard fpqc covering and $T' \to T$ is a morphism of affine schemes then $\{T' \times_T T_i \to T'\}_{i \in I}$ is a standard fpqc covering.*

[3]The letters fpqc stand for ``fidèlement plat quasi-compacte''.

[4]A more precise statement would be that the analogue of Lemma 30.7.7 for the fpqc topology does not hold.

Proof. Omitted. □

Lemma 30.8.11. *Let T be a scheme. Let $\{f_i : T_i \to T\}_{i\in I}$ be a family of morphisms of schemes with target T. Assume that*

1. *each f_i is flat, and*
2. *every affine scheme Z and morphism $h : Z \to T$ there exists a standard fpqc covering $\{Z_j \to Z\}_{j=1,\ldots,n}$ which refines the family $\{T_i \times_T Z \to Z\}_{i\in I}$.*

Then $\{f_i : T_i \to T\}_{i\in I}$ is a fpqc covering of T.

Proof. Omitted. Hint: Follows from Lemmas 30.8.4 and 30.8.5. □

Definition 30.8.12. Let F be a contravariant functor on the category of schemes with values in sets.

1. Let $\{U_i \to T\}_{i\in I}$ be a family of morphisms of schemes with fixed target. We say that F *satisfies the sheaf property for the given family* if for any collection of elements $\xi_i \in F(U_i)$ such that $\xi_i|_{U_i\times_T U_j} = \xi_j|_{U_i\times_T U_j}$ there exists a unique element $\xi \in F(T)$ such that $\xi_i = \xi|_{U_i}$ in $F(U_i)$.
2. We say that F *satisfies the sheaf property for the fpqc topology* if it satisfies the sheaf property for any fpqc covering.

We try to avoid using the terminology ``F is a sheaf'' in this situation since we are not defining a category of fpqc sheaves as we explained above.

Lemma 30.8.13. *Let F be a contravariant functor on the category of schemes with values in sets. Then F satisfies the sheaf property for the fpqc topology if and only if it satisfies*

1. *the sheaf property for every Zariski covering, and*
2. *the sheaf property for any standard fpqc covering.*

Moreover, in the presence of (1) property (2) is equivalent to property

(2') *the sheaf property for $\{V \to U\}$ with V, U affine and $V \to U$ faithfully flat.*

Proof. Omitted. □

30.9. Change of topologies

Let $f : X \to Y$ be a morphism of schemes over a base change S. In this case we have the following morphisms of sites (with suitable choices of sites as in Remark 30.9.1 below):

1. $(Sch/X)_{fppf} \longrightarrow (Sch/Y)_{fppf}$,
2. $(Sch/X)_{fppf} \longrightarrow (Sch/Y)_{syntomic}$,
3. $(Sch/X)_{fppf} \longrightarrow (Sch/Y)_{smooth}$,
4. $(Sch/X)_{fppf} \longrightarrow (Sch/Y)_{étale}$,
5. $(Sch/X)_{fppf} \longrightarrow (Sch/Y)_{Zar}$,
6. $(Sch/X)_{syntomic} \longrightarrow (Sch/Y)_{syntomic}$,
7. $(Sch/X)_{syntomic} \longrightarrow (Sch/Y)_{smooth}$,
8. $(Sch/X)_{syntomic} \longrightarrow (Sch/Y)_{étale}$,
9. $(Sch/X)_{syntomic} \longrightarrow (Sch/Y)_{Zar}$,
10. $(Sch/X)_{smooth} \longrightarrow (Sch/Y)_{smooth}$,
11. $(Sch/X)_{smooth} \longrightarrow (Sch/Y)_{étale}$,
12. $(Sch/X)_{smooth} \longrightarrow (Sch/Y)_{Zar}$,
13. $(Sch/X)_{étale} \longrightarrow (Sch/Y)_{étale}$,
14. $(Sch/X)_{étale} \longrightarrow (Sch/Y)_{Zar}$,
15. $(Sch/X)_{Zar} \longrightarrow (Sch/Y)_{Zar}$,

(16) $(Sch/X)_{fppf} \longrightarrow Y_{\acute{e}tale}$,
(17) $(Sch/X)_{syntomic} \longrightarrow Y_{\acute{e}tale}$,
(18) $(Sch/X)_{smooth} \longrightarrow Y_{\acute{e}tale}$,
(19) $(Sch/X)_{\acute{e}tale} \longrightarrow Y_{\acute{e}tale}$,
(20) $(Sch/X)_{fppf} \longrightarrow Y_{Zar}$,
(21) $(Sch/X)_{syntomic} \longrightarrow Y_{Zar}$,
(22) $(Sch/X)_{smooth} \longrightarrow Y_{Zar}$,
(23) $(Sch/X)_{\acute{e}tale} \longrightarrow Y_{Zar}$,
(24) $(Sch/X)_{Zariski} \longrightarrow Y_{Zar}$,
(25) $X_{\acute{e}tale} \longrightarrow Y_{\acute{e}tale}$,
(26) $X_{\acute{e}tale} \longrightarrow Y_{Zar}$,
(27) $X_{Zar} \longrightarrow Y_{Zar}$,

In each case the underlying continuous functor $Sch/Y \to Sch/X$, or $Y_\tau \to Sch/X$ is the functor $Y'/Y \mapsto X \times_Y Y'/Y$. Namely, in the sections above we have seen the morphisms $f_{big} : (Sch/X)_\tau \to (Sch/Y)_\tau$ and $f_{small} : X_\tau \to Y_\tau$ for τ as above. We also have seen the morphisms of sites $\pi_Y : (Sch/Y)_\tau \to Y_\tau$ for $\tau \in \{\acute{e}tale, Zariski\}$. On the other hand, it is clear that the identity functor $(Sch/X)_\tau \to (Sch/X)_{\tau'}$ defines a morphism of sites when τ is a stronger topology than τ'. Hence composing these gives the list of possible morphisms above.

Because of the simple description of the underlying functor it is clear that given morphisms of schemes $X \to Y \to Z$ the composition of two of the morphisms of sites above, e.g.,

$$(Sch/X)_{\tau_0} \longrightarrow (Sch/Y)_{\tau_1} \longrightarrow (Sch/Z)_{\tau_2}$$

is the corresponding morphism of sites associated to the morphism of schemes $X \to Z$.

Remark 30.9.1. Take any category Sch_α constructed as in Sets, Lemma 3.9.2 starting with the set of schemes $\{X, Y, S\}$. Choose any set of coverings Cov_{fppf} on Sch_α as in Sets, Lemma 3.11.1 starting with the category Sch_α and the class of fppf coverings. Let Sch_{fppf} denote the big fppf site so obtained. Next, for $\tau \in \{Zariski, \acute{e}tale, smooth, syntomic\}$ let Sch_τ have the same underlying category as Sch_{fppf} with coverings $\text{Cov}_\tau \subset \text{Cov}_{fppf}$ simply the subset of τ-coverings. It is straightforward to check that this gives rise to a big site Sch_τ.

30.10. Change of big sites

In this section we explain what happens on changing the big Zariski/fppf/étale sites.

Let $\tau, \tau' \in \{Zariski, \acute{e}tale, smooth, syntomic, fppf\}$. Given two big sites Sch_τ and $Sch'_{\tau'}$ we say that *Sch_τ is contained in $Sch'_{\tau'}$* if $Ob(Sch_\tau) \subset Ob(Sch'_{\tau'})$ and $\text{Cov}(Sch_\tau) \subset \text{Cov}(Sch'_{\tau'})$. In this case τ is stronger than τ', for example, no fppf site can be contained in an étale site.

Lemma 30.10.1. *Any set of big Zariski sites is contained in a common big Zariski site. The same is true, mutatis mutandis, for big fppf and big étale sites.*

Proof. This is true because the union of a set of sets is a set, and the constructions in the chapter on sets. □

Lemma 30.10.2. *Let $\tau \in \{Zariski, \acute{e}tale, smooth, syntomic, fppf\}$. Suppose given big sites Sch_τ and Sch'_τ. Assume that Sch_τ is contained in Sch'_τ. The inclusion functor $Sch_\tau \to Sch'_\tau$ satisfies the assumptions of Sites, Lemma 9.19.8. There are morphisms of topoi*

$$\begin{aligned} g : Sh(Sch_\tau) &\longrightarrow Sh(Sch'_\tau) \\ f : Sh(Sch'_\tau) &\longrightarrow Sh(Sch_\tau) \end{aligned}$$

such that $f \circ g \cong id$. For any object S of Sch_τ the inclusion functor $(Sch/S)_\tau \to (Sch'/S)_\tau$ satisfies the assumptions of Sites, Lemma 9.19.8 also. Hence similarly we obtain morphisms

$$\begin{aligned} g : Sh((Sch/S)_\tau) &\longrightarrow Sh((Sch'/S)_\tau) \\ f : Sh((Sch'/S)_\tau) &\longrightarrow Sh((Sch/S)_\tau) \end{aligned}$$

with $f \circ g \cong id$.

Proof. Assumptions (b), (c), and (e) of Sites, Lemma 9.19.8 are immediate for the functors $Sch_\tau \to Sch'_\tau$ and $(Sch/S)_\tau \to (Sch'/S)_\tau$. Property (a) holds by Lemma 30.3.6, 30.4.7, 30.5.7, 30.6.7, or 30.7.7. Property (d) holds because fibre products in the categories Sch_τ, Sch'_τ exist and are compatible with fibre products in the category of schemes. $\square$

Discussion: The functor $g^{-1} = f_*$ is simply the restriction functor which associates to a sheaf $\mathcal{G}$ on Sch'_τ the restriction $\mathcal{G}|_{Sch_\tau}$. Hence this lemma simply says that given any sheaf of sets $\mathcal{F}$ on Sch_τ there exists a canonical sheaf $\mathcal{F}'$ on Sch'_τ such that $\mathcal{F}|_{Sch'_\tau} = \mathcal{F}'$. In fact the sheaf $\mathcal{F}'$ has the following description: it is the sheafification of the presheaf

$$Sch'_\tau \longrightarrow Sets, \quad V \longmapsto colim_{V \to U} \mathcal{F}(U)$$

where U is an object of Sch_τ. This is true because $\mathcal{F}' = f^{-1}\mathcal{F} = (u_p\mathcal{F})^\#$ according to Sites, Lemmas 9.19.5 and 9.19.8.

CHAPTER 31

Descent

31.1. Introduction

In the chapter on topologies on schemes (see Topologies, Section 30.1) we introduced Zariski, étale, fppf, smooth, syntomic and fpqc coverings of schemes. In this chapter we discuss what kind of structures over schemes can be descended through such coverings. See for example [**Gro95a**], [**Gro95b**], [**Gro95e**], [**Gro95f**], [**Gro95c**], and [**Gro95d**]. This is also meant to introduce the notions of descent, descent data, effective descent data, in the less formal setting of descent questions for quasi-coherent sheaves, schemes, etc. The formal notion, that of a stack over a site, is discussed in the chapter on stacks (see Stacks, Section 50.1).

31.2. Descent data for quasi-coherent sheaves

In this chapter we will use the convention where the projection maps $\mathrm{pr}_i : X \times \ldots \times X \to X$ are labeled starting with $i = 0$. Hence we have $\mathrm{pr}_0, \mathrm{pr}_1 : X \times X \to X$, $\mathrm{pr}_0, \mathrm{pr}_1, \mathrm{pr}_2 : X \times X \times X \to X$, etc.

Definition 31.2.1. Let S be a scheme. Let $\{f_i : S_i \to S\}_{i \in I}$ be a family of morphisms with target S.

(1) A *descent datum* $(\mathcal{F}_i, \varphi_{ij})$ *for quasi-coherent sheaves* with respect to the given family is given by a quasi-coherent sheaf $\mathcal{F}_i$ on S_i for each $i \in I$, an isomorphism of quasi-coherent $\mathcal{O}_{S_i \times_S S_j}$-modules $\varphi_{ij} : \mathrm{pr}_0^*\mathcal{F}_i \to \mathrm{pr}_1^*\mathcal{F}_j$ for each pair $(i, j) \in I^2$ such that for every triple of indices $(i, j, k) \in I^3$ the diagram
$$\begin{tikzcd} \mathrm{pr}_0^*\mathcal{F}_i \arrow[rr, "\mathrm{pr}_{02}^*\varphi_{ik}"'] \arrow[dr, "\mathrm{pr}_{01}^*\varphi_{ij}"'] & & \mathrm{pr}_2^*\mathcal{F}_k \\ & \mathrm{pr}_1^*\mathcal{F}_j \arrow[ur, "\mathrm{pr}_{12}^*\varphi_{jk}"'] & \end{tikzcd}$$
of $\mathcal{O}_{S_i \times_S S_j \times_S S_k}$-modules commutes. This is called the *cocycle condition*.

(2) A *morphism* $\psi : (\mathcal{F}_i, \varphi_{ij}) \to (\mathcal{F}'_i, \varphi'_{ij})$ *of descent data* is given by a family $\psi = (\psi_i)_{i \in I}$ of morphisms of $\mathcal{O}_{S_i}$-modules $\psi_i : \mathcal{F}_i \to \mathcal{F}'_i$ such that all the diagrams
$$\begin{tikzcd} \mathrm{pr}_0^*\mathcal{F}_i \arrow[r, "\varphi_{ij}"'] \arrow[d, "\mathrm{pr}_0^*\psi_i"'] & \mathrm{pr}_1^*\mathcal{F}_j \arrow[d, "\mathrm{pr}_1^*\psi_j"] \\ \mathrm{pr}_0^*\mathcal{F}'_i \arrow[r, "\varphi'_{ij}"] & \mathrm{pr}_1^*\mathcal{F}'_j \end{tikzcd}$$
commute.

A good example to keep in mind is the following. Suppose that $S = \bigcup S_i$ is an open covering. In that case we have seen descent data for sheaves of sets in Sheaves, Section 6.33 where we called them ``glueing data for sheaves of sets with respect to the given covering''. Moreover, we proved that the category of glueing data is equivalent to the category of sheaves on S. We will show the analogue in the setting above when $\{S_i \to S\}_{i\in I}$ is an fpqc covering.

In the extreme case where the covering $\{S \to S\}$ is given by id_S a descent datum is necessarily of the form $(\mathcal{F}, \mathrm{id}_{\mathcal{F}})$. The cocycle condition garantees that the identity on $\mathcal{F}$ is the only permitted map in this case. The following lemma shows in particular that to every quasi-coherent sheaf of $\mathcal{O}_S$-modules there is associated a unique descent datum with respect to any given family.

Lemma 31.2.2. *Let $\mathcal{U} = \{U_i \to U\}_{i\in I}$ and $\mathcal{V} = \{V_j \to V\}_{j\in J}$ be families of morphisms of schemes with fixed target. Let $(g, \alpha : I \to J, (g_i)) : \mathcal{U} \to \mathcal{V}$ be a morphism of families of maps with fixed target, see Sites, Definition 9.8.1. Let $(\mathcal{F}_j, \varphi_{jj'})$ be a descent datum for quasi-coherent sheaves with respect to the family $\{V_j \to V\}_{j\in J}$. Then*

(1) *The system*
$$\left(g_i^*\mathcal{F}_{\alpha(i)}, (g_i \times g_{i'})^*\varphi_{\alpha(i)\alpha(i')}\right)$$
is a descent datum with respect to the family $\{U_i \to U\}_{i\in I}$.
(2) *This construction is functorial in the descent datum $(\mathcal{F}_j, \varphi_{jj'})$.*
(3) *Given a second morphism $(g', \alpha' : I \to J, (g_i'))$ of families of maps with fixed target with $g = g'$ there exists a functorial isomorphism of descent data*
$$(g_i^*\mathcal{F}_{\alpha(i)}, (g_i \times g_{i'})^*\varphi_{\alpha(i)\alpha(i')}) \cong ((g_i')^*\mathcal{F}_{\alpha'(i)}, (g_i' \times g_{i'}')^*\varphi_{\alpha'(i)\alpha'(i')}).$$

Proof. Omitted. Hint: The maps $g_i^*\mathcal{F}_{\alpha(i)} \to (g_i')^*\mathcal{F}_{\alpha'(i)}$ which give the ismorphism of descent data in part (3) are the pullbacks of the maps $\varphi_{\alpha(i)\alpha'(i)}$ by the morphisms $(g_i, g_i') : U_i \to V_{\alpha(i)} \times_V V_{\alpha'(i)}$. $\square$

Any family $\mathcal{U} = \{S_i \to S\}_{i\in I}$ is a refinement of the trivial covering $\{S \to S\}$ in a unique way. For a quasi-coherent sheaf $\mathcal{F}$ on S we denote simply $(\mathcal{F}|_{S_i}, can)$ the descent datum with respect to $\mathcal{U}$ obtained by the procedure above.

Definition 31.2.3. Let S be a scheme. Let $\{S_i \to S\}_{i\in I}$ be a family of morphisms with target S.

(1) Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_S$-module. We call the unique descent on $\mathcal{F}$ datum with respect to the covering $\{S \to S\}$ the *trivial descent datum*.
(2) The pullback of the trival descent datum to $\{S_i \to S\}$ is called the *canonical descent datum*. Notation: $(\mathcal{F}|_{S_i}, can)$.
(3) A descent datum $(\mathcal{F}_i, \varphi_{ij})$ for quasi-coherent sheaves with respect to the given covering is said to be *effective* if there exists a quasi-coherent sheaf $\mathcal{F}$ on S such that $(\mathcal{F}_i, \varphi_{ij})$ is isomorphic to $(\mathcal{F}|_{S_i}, can)$.

Lemma 31.2.4. *Let S be a scheme. Let $S = \bigcup U_i$ be an open covering. Any descent datum on quasi-coherent sheaves for the family $\mathcal{U} = \{U_i \to S\}$ is effective. Moreover, the functor from the category of quasi-coherent $\mathcal{O}_S$-modules to the category of descent data with respect to $\mathcal{U}$ is fully faithful.*

Proof. This follows immediately from Sheaves, Section 6.33 and the fact that being quasi-coherent is a local property, see Modules, Definition 15.10.1. $\square$

To prove more we first need to study the case of modules over rings.

31.3. Descent for modules

Let $R \to A$ be a ring map. By Simplicial, Example 14.5.5 this gives rise to a cosimplicial R-algebra

$$A \rightleftarrows A \otimes_R A \rightleftarrows A \otimes_R A \otimes_R A$$

Let us denote this $(A/R)_\bullet$ so that $(A/R)_n$ is the $(n+1)$-fold tensor product of A over R. Given a map $\varphi : [n] \to [m]$ the R-algebra map $(A/R)_\bullet(\varphi)$ is the map

$$a_0 \otimes \ldots \otimes a_n \longmapsto \prod\nolimits_{\varphi(i)=0} a_i \otimes \prod\nolimits_{\varphi(i)=1} a_i \otimes \ldots \otimes \prod\nolimits_{\varphi(i)=m} a_i$$

where we use the convention that the empty product is 1. Thus the first few maps, notation as in Simplicial, Section 14.5, are

$$\begin{array}{lcccc}
\delta^1_0 & : & a_0 & \mapsto & 1 \otimes a_0 \\
\delta^1_1 & : & a_0 & \mapsto & a_0 \otimes 1 \\
\sigma^0_0 & : & a_0 \otimes a_1 & \mapsto & a_0 a_1 \\
\delta^2_0 & : & a_0 \otimes a_1 & \mapsto & 1 \otimes a_0 \otimes a_1 \\
\delta^2_1 & : & a_0 \otimes a_1 & \mapsto & a_0 \otimes 1 \otimes a_1 \\
\delta^2_2 & : & a_0 \otimes a_1 & \mapsto & a_0 \otimes a_1 \otimes 1 \\
\sigma^1_0 & : & a_0 \otimes a_1 \otimes a_2 & \mapsto & a_0 a_1 \otimes a_2 \\
\sigma^1_1 & : & a_0 \otimes a_1 \otimes a_2 & \mapsto & a_0 \otimes a_1 a_2
\end{array}$$

and so on.

An R-module M gives rise to a cosimplicial $(A/R)_\bullet$-module $(A/R)_\bullet \otimes_R M$. In other words $M_n = (A/R)_n \otimes_R M$ and using the R-algebra maps $(A/R)_n \to (A/R)_m$ to define the corresponding maps on $M \otimes_R (A/R)_\bullet$.

The analogue to a descent datum for quasi-coherent sheaves in the setting of modules is the following.

Definition 31.3.1. Let $R \to A$ be a ring map.

(1) A *descent datum* (N, φ) *for modules with respect to* $R \to A$ is given by an A-module N and a isomorphism of $A \otimes_R A$-modules

$$\varphi : N \otimes_R A \to A \otimes_R N$$

such that the *cocycle condition* holds: the diagram of $A \otimes_R A \otimes_R A$-module maps

$$\begin{tikzcd}
N \otimes_R A \otimes_R A \arrow[rr, "\varphi_{02}"'] \arrow[dr, "\varphi_{01}"'] & & A \otimes_R A \otimes_R N \\
& A \otimes_R N \otimes_R A \arrow[ur, "\varphi_{12}"'] &
\end{tikzcd}$$

commutes (see below for notation).

(2) A *morphism* $(N, \varphi) \to (N', \varphi')$ *of descent data* is a morphism of A-modules $\psi : N \to N'$ such that the diagram

$$\begin{tikzcd}
N \otimes_R A \arrow[r, "\varphi"'] \arrow[d, "\psi \otimes \mathrm{id}_A"'] & A \otimes_R N \arrow[d, "\mathrm{id}_A \otimes \psi"] \\
N' \otimes_R A \arrow[r, "\varphi'"] & A \otimes_R N'
\end{tikzcd}$$

is commutative.

In the definition we use the notation that $\varphi_{01} = \varphi \otimes \mathrm{id}_A$, $\varphi_{12} = \mathrm{id}_A \otimes \varphi$, and $\varphi_{02}(n \otimes 1 \otimes 1) = \sum a_i \otimes 1 \otimes n_i$ if $\varphi(n) = \sum a_i \otimes n_i$. All three are $A \otimes_R A \otimes_R A$-module homomorphisms. Equivalently we have

$$\varphi_{ij} = \varphi \otimes_{(A/R)_1,\ (A/R)_\bullet(\tau^2_{ij})} (A/R)_2$$

where $\tau^2_{ij} : [1] \to [2]$ is the map $0 \mapsto i$, $1 \mapsto j$. Namely, $(A/R)_\bullet(\tau^2_{02})(a_0 \otimes a_1) = a_0 \otimes 1 \otimes a_1$, and similarly for the others[1].

We need some more notation to be able to state the next lemma. Let (N, φ) be a descent datum with respect to a ring map $R \to A$. For $n \geq 0$ and $i \in [n]$ we set

$$N_{n,i} = A \otimes_R \ldots \otimes_R A \otimes_R N \otimes_R A \otimes_R \ldots \otimes_R A$$

with the factor N in the ith spot. It is an $(A/R)_n$-module. If we introduce the maps $\tau^n_i : [0] \to [n]$, $0 \mapsto i$ then we see that

$$N_{n,i} = N \otimes_{(A/R)_0,\ (A/R)_\bullet(\tau^n_i)} (A/R)_n$$

For $0 \leq i \leq j \leq n$ we let $\tau^n_{ij} : [1] \to [n]$ be the map such that 0 maps to i and 1 to j. Similarly to the above the homomorphism φ induces isomorphisms

$$\varphi^n_{ij} = \varphi \otimes_{(A/R)_1,\ (A/R)_\bullet(\tau^n_{ij})} (A/R)_n : N_{n,i} \longrightarrow N_{n,j}$$

of $(A/R)_n$-modules when $i < j$. If $i = j$ we set $\varphi^n_{ij} = \mathrm{id}$. Since these are all isomorphisms they allow us to move the factor N to any spot we like. And the cocycle condition exactly means that it does not matter how we do this (e.g., as a composition of two of these or at once). Finally, for any $\beta : [n] \to [m]$ we define the morphism

$$N_{\beta,i} : N_{n,i} \to N_{m,\beta(i)}$$

as the unique $(A/R)_\bullet(\beta)$-semi linear map such that

$$N_{\beta,i}(1 \otimes \ldots \otimes n \otimes \ldots \otimes 1) = 1 \otimes \ldots \otimes n \otimes \ldots \otimes 1$$

for all $n \in N$. This hints at the following lemma.

Lemma 31.3.2. *Let $R \to A$ be a ring map. Given a descent datum (N, φ) we can associate to it a cosimplicial $(A/R)_\bullet$-module $N_\bullet$[2] by the rules $N_n = N_{n,n}$ and given $\beta : [n] \to [m]$ setting we define*

$$N_\bullet(\beta) = (\varphi^m_{\beta(n)m}) \circ N_{\beta,n} : N_{n,n} \longrightarrow N_{m,m}.$$

This procedure is functorial in the descent datum.

Proof. Here are the first few maps where $\varphi(n \otimes 1) = \sum \alpha_i \otimes x_i$

$$\begin{array}{ccccccc}
\delta^1_0 & : & N & \to & A \otimes N & n & \mapsto & 1 \otimes n \\
\delta^1_1 & : & N & \to & A \otimes N & n & \mapsto & \sum \alpha_i \otimes x_i \\
\sigma^0_0 & : & A \otimes N & \to & N & a_0 \otimes n & \mapsto & a_0 n \\
\delta^2_0 & : & A \otimes N & \to & A \otimes A \otimes N & a_0 \otimes n & \mapsto & 1 \otimes a_0 \otimes n \\
\delta^2_1 & : & A \otimes N & \to & A \otimes A \otimes N & a_0 \otimes n & \mapsto & a_0 \otimes 1 \otimes n \\
\delta^2_2 & : & A \otimes N & \to & A \otimes A \otimes N & a_0 \otimes n & \mapsto & \sum a_0 \otimes \alpha_i \otimes x_i \\
\sigma^1_0 & : & A \otimes A \otimes N & \to & A \otimes N & a_0 \otimes a_1 \otimes n & \mapsto & a_0 a_1 \otimes n \\
\sigma^1_1 & : & A \otimes A \otimes N & \to & A \otimes N & a_0 \otimes a_1 \otimes n & \mapsto & a_0 \otimes a_1 n
\end{array}$$

[1]Note that $\tau^2_{ij} = \delta^2_k$, if $\{i, j, k\} = [2] = \{0, 1, 2\}$, see Simplicial, Definition 14.2.1.

[2]We should really write $(N, \varphi)_\bullet$.

with notation as in Simplicial, Section 14.5. We first verify the two properties $\sigma_0^0 \circ \delta_0^1 = \text{id}$ and $\sigma_0^0 \circ \delta_1^1 = \text{id}$. The first one, $\sigma_0^0 \circ \delta_0^1 = \text{id}$, is clear from the explicit description of the morphisms above. To prove the second relation we have to use the cocycle condition (because it does not holds for an arbitrary isomorphism $\varphi : N \otimes_R A \to A \otimes_R N$). Write $p = \sigma_0^0 \circ \delta_1^1 : N \to N$. By the description of the maps above we deduce that p is also equal to

$$p = \varphi \otimes \text{id} : N = (N \otimes_R A) \otimes_{(A \otimes_R A)} A \longrightarrow (A \otimes_R N) \otimes_{(A \otimes_R A)} A = N$$

Since φ is an isomorphism we see that p is an isomorphism. Write $\varphi(n \otimes 1) = \sum \alpha_i \otimes x_i$ for certain $\alpha_i \in A$ and $x_i \in N$. Then $p(n) = \sum \alpha_i x_i$. Next, write $\varphi(x_i \otimes 1) = \sum \alpha_{ij} \otimes y_j$ for certain $\alpha_{ij} \in A$ and $y_j \in N$. Then the cocycle condition says that

$$\sum \alpha_i \otimes \alpha_{ij} \otimes y_j = \sum \alpha_i \otimes 1 \otimes x_i.$$

This means that $p(n) = \sum \alpha_i x_i = \sum \alpha_i \alpha_{ij} y_j = \sum \alpha_i p(x_i) = p(p(n))$. Thus p is a projector, and since it is an isomorphism it is the identity.

To prove fully that $N_\bullet$ is a cosimplicial module we have to check all 5 types of relations of Simplicial, Remark 14.5.3. The relations on composing σ's are obvious. The relations on composing δ's come down to the cocycle condition for φ. In exactly the same way as above one checks the relations $\sigma_j \circ \delta_j = \sigma_j \circ \delta_{j+1} = \text{id}$. Finally, the other relations on compositions of δ's and σ's hold for any φ whatsoever. □

Note that to an R-module M we can associate a canonical descent datum, namely $(M \otimes_R A, can)$ where $can : (M \otimes_R A) \otimes_R A \to A \otimes_R (M \otimes_R A)$ is the obvious map: $(m \otimes a) \otimes a' \mapsto a \otimes (m \otimes a')$.

Lemma 31.3.3. *Let $R \to A$ be a ring map. Let M be an R-module. The cosimplicial $(A/R)_\bullet$-module associated to the canonical descent datum is isomorphic to the cosimplicial module $(A/R)_\bullet \otimes_R M$.*

Proof. Omitted. □

Definition 31.3.4. Let $R \to A$ be a ring map. We say a descent datum (N, φ) is *effective* if there exists an R-module M and an isomorphism of descent data from $(M \otimes_R A, can)$ to (N, φ).

Let $R \to A$ be a ring map. Let (N, φ) be a descent datum. We may take the cochain complex $s(N_\bullet)$ associated with $N_\bullet$ (see Simplicial, Section 14.23). It has the following shape:

$$N \to A \otimes_R N \to A \otimes_R A \otimes_R N \to \ldots$$

We can describe the maps. The first map is the map

$$n \longmapsto 1 \otimes n - \varphi(n \otimes 1).$$

The second map on pure tensors has the values

$$a \otimes n \longmapsto 1 \otimes a \otimes n - a \otimes 1 \otimes n + a \otimes \varphi(n \otimes 1).$$

It is clear how the pattern continues.

In the special case where $N = A \otimes_R M$ we see that for any $m \in M$ the element $1 \otimes m$ is in the kernel of the first map of the cochain complex associated to the cosimplicial module $(A/R)_\bullet \otimes_R M$. Hence we get an extended cochain complex

$$0 \to M \to A \otimes_R M \to A \otimes_R A \otimes_R M \to \ldots \tag{31.3.4.1}$$

Here we think of the 0 as being in degree -2, the module M in degree -1, the module $A \otimes_R M$ in degree 0, etc. Note that this complex has the shape

$$0 \to R \to A \to A \otimes_R A \to A \otimes_R A \otimes_R A \to \ldots$$

when $M = R$.

Lemma 31.3.5. *Suppose that $R \to A$ has a section. Then for any R-module M the extended cochain complex (31.3.4.1) is exact.*

Proof. By Simplicial, Lemma 14.26.4 the map $R \to (A/R)_\bullet$ is a homotopy equivalence of cosimplicial R-algebras (here R denotes the constant cosimplicial R-algebra). Hence $M \to (A/R)_\bullet \otimes_R M$ is a homotopy equivalence in the category of cosimplicial R-modules, because $\otimes_R M$ is a functor from the category of R-algebras to the category of R-modules, see Simplicial, Lemma 14.26.3. This implies that the induced map of associated complexes is a homotopy equivalence, see Simplicial, Lemma 14.26.5. Since the complex associated to the constant cosimplicial R-module M is the complex

$$M \xrightarrow{0} M \xrightarrow{1} M \xrightarrow{0} M \xrightarrow{1} M \ldots$$

we win (since the extended version simply puts an extra M at the beginning). $\square$

Lemma 31.3.6. *Suppose that $R \to A$ is faithfully flat, see Algebra, Definition 7.35.1. Then for any R-module M the extended cochain complex (31.3.4.1) is exact.*

Proof. Suppose we can show there exists a faithfully flat ring map $R \to R'$ such that the result holds for the ring map $R' \to A' = R' \otimes_R A$. Then the result follows for $R \to A$. Namely, for any R-module M the cosimplicial module $(M \otimes_R R') \otimes_{R'} (A'/R')_\bullet$ is just the cosimplicial module $R' \otimes_R (M \otimes_R (A/R)_\bullet)$. Hence the vanishing of cohomology of the complex associated to $(M \otimes_R R') \otimes_{R'} (A'/R')_\bullet$ implies the vanishing of the cohomology of the complex associated to $M \otimes_R (A/R)_\bullet$ by faithful flatness of $R \to R'$. Similarly for the vanishing of cohomology groups in degrees -1 and 0 of the extended complex (proof omitted).

But we have such a faithfull flat extension. Namely $R' = A$ works because the ring map $R' = A \to A' = A \otimes_A A$ has a section $a \otimes a' \mapsto aa'$ and Lemma 31.3.5 applies. $\square$

Here is how the complex relates to the question of effectivity.

Lemma 31.3.7. *Let $R \to A$ be a faithfully flat ring map. Let (N, φ) be a descent datum. Then (N, φ) is effective if and only if the canonical map*

$$A \otimes_R H^0(s(N_\bullet)) \longrightarrow N$$

is an isomorphism.

Proof. If (N, φ) is effective, then we may write $N = A \otimes_R M$ with $\varphi = can$. It follows that $H^0(s(N_\bullet)) = M$ by Lemmas 31.3.3 and 31.3.6. Conversely, suppose the map of the lemma is an isomorphism. In this case set $M = H^0(s(N_\bullet))$. This is an R-submodule of N, namely $M = \{n \in N \mid 1 \otimes n = \varphi(n \otimes 1)\}$. The only thing to check is that via the isomorphism $A \otimes_R M \to N$ the canonical descent data agrees with φ. We omit the verification. $\square$

Lemma 31.3.8. *Let $R \to A$ be a ring map, and let $R \to R'$ be faithfully flat. Set $A' = R' \otimes_R A$. If all descent data for $R' \to A'$ are effective, then so are all descent data for $R \to A$.*

Proof. Let (N, φ) be a descent datum for $R \to A$. Set $N' = R' \otimes_R N = A' \otimes_A N$, and denote $\varphi' = \mathrm{id}_{R'} \otimes \varphi$ the base change of the descend datum φ. Then (N', φ') is a descent datum for $R' \to A'$ and $H^0(s(N'_\bullet)) = R' \otimes_R H^0(s(N_\bullet))$. Moreover, the map $A' \otimes_{R'} H^0(s(N'_\bullet)) \to N'$ is identified with the base change of the A-module map $A \otimes_R H^0(s(N)) \to N$ via the faithfully flat map $A \to A'$. Hence we conclude by Lemma 31.3.7. $\square$

Here is the main result of this section. Its proof may seem a little clumsy; for a more highbrow approach see Remark 31.3.11 below.

Proposition 31.3.9. *Let $R \to A$ be a faithfully flat ring map. Then*

(1) *any descent datum on modules with respect to $R \to A$ is effective,*
(2) *the functor $M \mapsto (A \otimes_R M, can)$ from R-modules to the category of descent data is an equivalence, and*
(3) *the inverse functor is given by $(N, \varphi) \mapsto H^0(s(N_\bullet))$.*

Proof. We only prove (1) and omit the proofs of (2) and (3). As $R \to A$ is faithfully flat, there exists a faithfully flat base change $R \to R'$ such that $R' \to A' = R' \otimes_R A$ has a section (namely take $R' = A$ as in the proof of Lemma 31.3.6). Hence, using Lemma 31.3.8 we may assume that $R \to A$ as a section, say $\sigma : A \to R$. Let (N, φ) be a descent datum relative to $R \to A$. Set

$$M = H^0(s(N_\bullet)) = \{n \in N \mid 1 \otimes n = \varphi(n \otimes 1)\} \subset N$$

By Lemma 31.3.7 it suffices to show that $A \otimes_R M \to N$ is an isomorphism.

Take an element $n \in N$. Write $\varphi(n \otimes 1) = \sum a_i \otimes x_i$ for certain $a_i \in A$ and $x_i \in N$. By Lemma 31.3.2 we have $n = \sum a_i x_i$ in N (because $\sigma^0_0 \circ \delta^1_0 = \mathrm{id}$ in any cosimplicial object). Next, write $\varphi(x_i \otimes 1) = \sum a_{ij} \otimes y_j$ for certain $a_{ij} \in A$ and $y_j \in N$. The cocycle condition means that

$$\sum a_i \otimes a_{ij} \otimes y_j = \sum a_i \otimes 1 \otimes x_i$$

in $A \otimes_R A \otimes_R N$. We conclude two things from this. First, by applying σ to the first A we conclude that $\sum \sigma(a_i)\varphi(x_i \otimes 1) = \sum \sigma(a_i) \otimes x_i$ which means that $\sum \sigma(a_i)x_i \in M$. Next, by applying σ to the middle A and multiplying out we conclude that $\sum_i a_i(\sum_j \sigma(a_{ij})y_j) = \sum a_i x_i = n$. Hence by the first conclusion we see that $A \otimes_R M \to N$ is surjective. Finally, suppose that $m_i \in M$ and $\sum a_i m_i = 0$. Then we see by applying φ to $\sum a_i m_i \otimes 1$ that $\sum a_i \otimes m_i = 0$. In other words $A \otimes_R M \to N$ is injective and we win. $\square$

Remark 31.3.10. Let R be a ring. Let $f_1, \ldots, f_n \in R$ generate the unit ideal. The ring $A = \prod_i R_{f_i}$ is a faithfully flat R-algebra. We remark that the cosimplicial ring $(A/R)_\bullet$ has the following ring in degree n:

$$\prod\nolimits_{i_0, \ldots, i_n} R_{f_{i_0} \ldots f_{i_n}}$$

Hence the results above recover Algebra, Lemmas 7.20.1, 7.20.2 and 7.21.4. But the results above actually say more because of exactness in higher degrees. Namely, it implies that Cech cohomology of quasi-coherent sheaves on affines is trivial, see (insert future reference here).

Remark 31.3.11. Let R be a ring. Let $A_\bullet$ be a cosimplicial R-algebra. In this setting a descent datum corresponds to an cosimplicial $A_\bullet$-module $M_\bullet$ with the property that for every $n, m \geq 0$ and every $\varphi : [n] \to [m]$ the map $M(\varphi) : M_n \to M_m$ induces an isomorphism

$$M_n \otimes_{A_n, A(\varphi)} A_m \longrightarrow M_m.$$

Let us call such a cosimplicial module a *cartesian module*. In this setting, the proof of Proposition 31.3.9 can be split in the following steps

(1) If $R \to R'$ is faithfully flat, $R \to A$ any ring map, then descent data for A/R are effective if descent data for $(R' \otimes_R A)/R'$ are effective.
(2) Let A be an R-algebra. Descent data for A/R correspond to cartesian $(A/R)_\bullet$-modules.
(3) If $R \to A$ has a section then $(A/R)_\bullet$ is homotopy equivalent to R, the constant cosimplicial R-algebra with value R.
(4) If $A_\bullet \to B_\bullet$ is a homotopy equivalence of cosimplicial R-algebras then the functor $M_\bullet \mapsto M_\bullet \otimes_{A_\bullet} B_\bullet$ induces an equivalence of categories between cartesian $A_\bullet$-modules and cartesian $B_\bullet$-modules.

For (1) see Lemma 31.3.8. Part (2) uses Lemma 31.3.2. Part (3) we have seen in the proof of Lemma 31.3.5 (it relies on Simplicial, Lemma 14.26.4). Moreover, part (4) is a triviality if you think about it right!

31.4. Fpqc descent of quasi-coherent sheaves

The main application of flat descent for modules is the corresponding descent statement for quasi-coherent sheaves with respect to fpqc-coverings.

Lemma 31.4.1. *Let S be an affine scheme. Let $\mathcal{U} = \{f_i : U_i \to S\}_{i=1,\ldots,n}$ be a standard fpqc covering of S, see Topologies, Definition 30.8.1. Any descent datum on quasi-coherent sheaves for $\mathcal{U} = \{U_i \to S\}$ is effective. Moreover, the functor from the category of quasi-coherent $\mathcal{O}_S$-modules to the category of descent data with respect to $\mathcal{U}$ is fully faithful.*

Proof. This is a restatement of Proposition 31.3.9 in terms of schemes. First, note that a descent datum ξ for quasi-coherent sheaves with respect to $\mathcal{U}$ is exactly the same as a descent datum ξ' for quasi-coherent sheaves with respect to the covering $\mathcal{U}' = \{\coprod_{i=1,\ldots,n} U_i \to S\}$. Moreover, effectivity for ξ is the same as effectivity for ξ'. Hence we may assume $n = 1$, i.e., $\mathcal{U} = \{U \to S\}$ where U and S are affine. In this case descent data correspond to descent data on modules with respect to the ring map

$$\Gamma(S, \mathcal{O}) \longrightarrow \Gamma(U, \mathcal{O}).$$

Since $U \to S$ is surjective and flat, we see that this ring map is faithfully flat. In other words, Proposition 31.3.9 applies and we win. $\square$

Proposition 31.4.2. *Let S be a scheme. Let $\mathcal{U} = \{\varphi_i : U_i \to S\}$ be an fpqc covering, see Topologies, Definition 30.8.1. Any descent datum on quasi-coherent sheaves for $\mathcal{U} = \{U_i \to S\}$ is effective. Moreover, the functor from the category of quasi-coherent $\mathcal{O}_S$-modules to the category of descent data with respect to $\mathcal{U}$ is fully faithful.*

Proof. Let $S = \bigcup_{j \in J} V_j$ be an affine open covering. For $j, j' \in J$ we denote $V_{jj'} = V_j \cap V_{j'}$ the intersection (which need not be affine). For $V \subset S$ open we denote $\mathcal{U}_V = \{V \times_S U_i \to V\}_{i \in I}$ which is a fpqc-covering (Topologies, Lemma 30.8.7). By definition of an fpqc covering, we can find for each $j \in J$ a finite set K_j, a map $\underline{i} : K_j \to I$, affine opens $U_{\underline{i}(k),k} \subset U_{\underline{i}(k)}$, $k \in K_j$ such that $\mathcal{V}_j = \{U_{\underline{i}(k),k} \to V_j\}_{k \in K_j}$ is a standard fpqc covering of V_j. And of course, $\mathcal{V}_j$ is a refinement of $\mathcal{U}_{V_j}$. Picture

$$\begin{tikzcd}
\mathcal{V}_j \arrow[r] \arrow[d, squiggly] & \mathcal{U}_{V_j} \arrow[r] \arrow[d, squiggly] & \mathcal{U} \arrow[d, squiggly] \\
V_j \arrow[r, equal] & V_j \arrow[r] & S
\end{tikzcd}$$

where the top horizontal arrows are morphisms of families of morphisms with fixed target (see Sites, Definition 9.8.1).

To prove the proposition you show successively the faithfulness, fullyness, and essential surjectivity of the functor from quasi-coherent sheaves to descent data.

Faithfulness. Let $\mathcal{F}$, $\mathcal{G}$ be quasi-coherent sheaves on S and let $a, b : \mathcal{F} \to \mathcal{G}$ be homomorphisms of $\mathcal{O}_S$-modules. Suppose $\varphi_i^*(a) = \varphi^*(b)$ for all i. Pick $s \in S$. Then $s = \varphi_i(u)$ for some $i \in I$ and $u \in U_i$. Since $\mathcal{O}_{S,s} \to \mathcal{O}_{U_i,u}$ is flat, hence faithfully flat (Algebra, Lemma 7.35.16) we see that $a_s = b_s : \mathcal{F}_s \to \mathcal{G}_s$. Hence $a = b$.

Fully faithfulness. Let $\mathcal{F}$, $\mathcal{G}$ be quasi-coherent sheaves on S and let $a_i : \varphi_i^*\mathcal{F} \to \varphi_i^*\mathcal{G}$ be homomorphisms of $\mathcal{O}_{U_i}$-modules such that $\mathrm{pr}_0^* a_i = \mathrm{pr}_1^* a_j$ on $U_i \times_U U_j$. We can pull back these morphisms to get morphisms

$$a_k : \mathcal{F}|_{U_{\underline{i}(k),k}} \longrightarrow \mathcal{G}|_{U_{\underline{i}(k),k}}$$

$k \in K_j$ with notation as above. Moreover, Lemma 31.2.2 assures us that these define a morphism between (canonical) descent data on $\mathcal{V}_j$. Hence, by Lemma 31.4.1, we get correspondingly unique morphisms $a_j : \mathcal{F}|_{V_j} \to \mathcal{G}|_{V_j}$. To see that $a_j|_{V_{jj'}} = a_{j'}|_{V_{jj'}}$ we use that both a_j and $a_{j'}$ agree with the pullback of the morphism $(a_i)_{i\in I}$ of (canonical) descent data to any covering refining both $\mathcal{V}_{j,V_{jj'}}$ and $\mathcal{V}_{j',V_{jj'}}$, and using the faithfullness already shown. For example the covering $\mathcal{V}_{jj'} = \{V_k \times_S V_{k'} \to V_{jj'}\}_{k\in K_j, k'\in K_{j'}}$ will do.

Essential surjectivity. Let $\xi = (\mathcal{F}_i, \varphi_{ii'})$ be a descent datum for quasi-coherent sheaves relative to the covering $\mathcal{U}$. Pull back this descent datum to get descent data ξ_j for quasi-coherent sheaves relative to the coverings $\mathcal{V}_j$ of V_j. By Lemma 31.4.1 once again there exist quasi-coherent sheaves $\mathcal{F}_j$ on V_j whose associated canonical descent datum is isomorphic to ξ_j. By fully faithfulness (proved above) we see there are isomorphisms

$$\phi_{jj'} : \mathcal{F}_j|_{V_{jj'}} \longrightarrow \mathcal{F}_{j'}|_{V_{jj'}}$$

corresponding to the isomorphism of descent data between the pull back of ξ_j and $\xi_{j'}$ to $\mathcal{V}_{jj'}$. To see that these maps $\phi_{jj'}$ satisfy the cocycle condition we use faithfullness (proved above) over the triple intersections $V_{jj'j''}$. Hence, by Lemma 31.2.4 we see that the sheaves $\mathcal{F}_j$ glue to a quasi-coherent sheaf $\mathcal{F}$ as desired. We still have to verify that the canonical descent datum relative to $\mathcal{U}$ associated to $\mathcal{F}$ is isomorphic to the descent datum we started out with. This verification is omitted. □

31.5. Descent of finiteness properties of modules

In this section we prove that one can check quasi-coherent module has a certain finiteness conditions by checking on the members of a covering.

Lemma 31.5.1. *Let X be a scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Let $\{f_i : X_i \to X\}_{i\in I}$ be an fpqc covering such that each $f_i^*\mathcal{F}$ is a finite type $\mathcal{O}_{X_i}$-module. Then $\mathcal{F}$ is a finite type $\mathcal{O}_X$-module.*

Proof. Omitted. For the affine case, see Algebra, Lemma 7.77.2. □

Lemma 31.5.2. *Let X be a scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Let $\{f_i : X_i \to X\}_{i\in I}$ be an fpqc covering such that each $f_i^*\mathcal{F}$ is an $\mathcal{O}_{X_i}$-module of finite presentation. Then $\mathcal{F}$ is an $\mathcal{O}_X$-module of finite presentation.*

Proof. Omitted. For the affine case, see Algebra, Lemma 7.77.2. □

Lemma 31.5.3. *Let X be a scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Let $\{f_i : X_i \to X\}_{i\in I}$ be an fpqc covering such that each $f_i^*\mathcal{F}$ is a flat $\mathcal{O}_{X_i}$-module. Then $\mathcal{F}$ is a flat $\mathcal{O}_X$-module.*

Proof. Omitted. For the affine case, see Algebra, Lemma 7.77.2. $\square$

Lemma 31.5.4. *Let X be a scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Let $\{f_i : X_i \to X\}_{i\in I}$ be an fpqc covering such that each $f_i^*\mathcal{F}$ is a finite locally free $\mathcal{O}_{X_i}$-module. Then $\mathcal{F}$ is a finite locally free $\mathcal{O}_X$-module.*

Proof. This follows from the fact that a quasi-coherent sheaf is finite locally free if and only if it is of finite presentation and flat, see Algebra, Lemma 7.72.2. Namely, if each $f_i^*\mathcal{F}$ is flat and of finite presentation, then so is $\mathcal{F}$ by Lemmas 31.5.3 and 31.5.2. $\square$

The definition of a locally projective quasi-coherent sheaf can be found in Properties, Section 23.19.

Lemma 31.5.5. *Let X be a scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Let $\{f_i : X_i \to X\}_{i\in I}$ be an fpqc covering such that each $f_i^*\mathcal{F}$ is a locally projective $\mathcal{O}_{X_i}$-module. Then $\mathcal{F}$ is a locally projective $\mathcal{O}_X$-module.*

Proof. Omitted. For Zariski coverings this is Properties, Lemma 23.19.2. For the affine case this is Algebra, Theorem 7.89.5. $\square$

Remark 31.5.6. Being locally free is a property of quasi-coherent modules which does not descend in the fpqc topology. Namely, suppose that R is a ring and that M is a projective R-module which is a countable direct sum $M = \bigoplus L_n$ of rank 1 locally free modules, but not locally free, see Examples, Lemma 64.15.5. Then M becomes free on making the faithfully flat base change

$$R \longrightarrow \bigoplus\nolimits_{m\geq 1} \bigoplus\nolimits_{(i_1,\ldots,i_m)\in \mathbf{Z}^{\oplus m}} L_1^{\otimes i_1} \otimes_R \ldots \otimes_R L_m^{\otimes i_m}$$

But we don't know what happens for fppf coverings. In other words, we don't know the answer to the following question: Suppose $A \to B$ is a faithfully flat ring map of finite presentation. Let M be an A-module such that $M \otimes_A B$ is free. Is M a locally free A-module? It turns out that if A is Noetherian, then the answer is yes. This follows from the results of [**Bas63**]. But in general we don't know the answer. If you know the answer, or have a reference, please email stacks.project@gmail.com.

We also add here two results which are related to the results above, but are of a slightly different nature.

Lemma 31.5.7. *Let $f : X \to Y$ be a morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Assume f is a finite morphism. Then $\mathcal{F}$ is an $\mathcal{O}_X$-module of finite type if and only if $f_*\mathcal{F}$ is an $\mathcal{O}_Y$-module of finite type.*

Proof. As f is finite it is affine. This reduces us to the case where f is the morphism $Spec(B) \to Spec(A)$ given by a finite ring map $A \to B$. Moreover, then $\mathcal{F} = \widetilde{M}$ is the sheaf of modules associated to the B-module M. Note that M is finite as a B-module if and only if M is finite as an A-module, see Algebra, Lemma 7.7.2. Combined with Properties, Lemma 23.16.1 this proves the lemma. $\square$

Lemma 31.5.8. *Let $f : X \to Y$ be a morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Assume f is finite and of finite presentation. Then $\mathcal{F}$ is an $\mathcal{O}_X$-module of finite presentation if and only if $f_*\mathcal{F}$ is an $\mathcal{O}_Y$-module of finite presentation.*

Proof. As f is finite it is affine. This reduces us to the case where f is the morphism $Spec(B) \to Spec(A)$ given by a finite and finitely presented ring map $A \to B$. Moreover, then $\mathcal{F} = \widetilde{M}$ is the sheaf of modules associated to the B-module M. Note that M is finitely presented as a B-module if and only if M is finitely presented as an A-module, see Algebra, Lemma 7.7.4. Combined with Properties, Lemma 23.16.2 this proves the lemma. $\square$

31.6. Quasi-coherent sheaves and topologies

Let S be a scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_S$-module. Consider the functor

$$(Sch/S)^{opp} \longrightarrow Ab, \quad (f : T \to S) \longmapsto \Gamma(T, f^*\mathcal{F}). \tag{31.6.0.1}$$

Lemma 31.6.1. *Let S be a scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_S$-module. Let $\tau \in \{Zariski, fpqc, fppf, \acute{e}tale, smooth, syntomic\}$. The functor defined in (31.6.0.1) satisfies the sheaf condition with respect to any τ-covering $\{T_i \to T\}_{i \in I}$ of any scheme T over S.*

Proof. For $\tau \in \{Zariski, fppf, \acute{e}tale, smooth, syntomic\}$ a τ-covering is also a fpqc-covering, see the results in Topologies, Lemmas 30.4.2, 30.5.2, 30.6.2, 30.7.2, and 30.8.6. Hence it suffices to prove the theorem for a fpqc covering. Assume that $\{f_i : T_i \to T\}_{i \in I}$ is an fpqc covering where $f : T \to S$ is given. Suppose that we have a family of sections $s_i \in \Gamma(T_i, f_i^* f^* \mathcal{F})$ such that $s_i|_{T_i \times_T T_j} = s_j|_{T_i \times_T T_j}$. We have to find the correspond section $s \in \Gamma(T, f^*\mathcal{F})$. We can reinterpret the s_i as a family of maps $\varphi_i : f_i^*\mathcal{O}_T = \mathcal{O}_{T_i} \to f_i^* f^* \mathcal{F}$ compatible with the canonical descent data associated to the quasi-coherent sheaves $\mathcal{O}_T$ and $f^*\mathcal{F}$ on T. Hence by Proposition 31.4.2 we see that we may (uniquely) descend these to a map $\mathcal{O}_T \to f^*\mathcal{F}$ which gives us our section s. $\square$

We may in particular make the following definition.

Definition 31.6.2. Let $\tau \in \{Zariski, fppf, \acute{e}tale, smooth, syntomic\}$. Let S be a scheme. Let Sch_τ be a big site containing S. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_S$-module.

1. The *structure sheaf of the big site* $(Sch/S)_\tau$ is the sheaf of rings $T/S \mapsto \Gamma(T, \mathcal{O}_T)$ which is denoted $\mathcal{O}$ or $\mathcal{O}_S$.
2. If $\tau = \acute{e}tale$ the structure sheaf of the small site $S_{\acute{e}tale}$ is the sheaf of rings $T/S \mapsto \Gamma(T, \mathcal{O}_T)$ which is denoted $\mathcal{O}$ or $\mathcal{O}_S$.
3. The *sheaf of $\mathcal{O}$-modules associated to $\mathcal{F}$* on the big site $(Sch/S)_\tau$ is the sheaf of $\mathcal{O}$-modules $(f : T \to S) \mapsto \Gamma(T, f^*\mathcal{F})$ which is denoted $\mathcal{F}^a$ (and often simply $\mathcal{F}$).
4. Let $\tau = \acute{e}tale$ (resp. $\tau = Zariski$). The *sheaf of $\mathcal{O}$-modules associated to $\mathcal{F}$* on the small site $S_{\acute{e}tale}$ (resp. S_{Zar}) is the sheaf of $\mathcal{O}$-modules $(f : T \to S) \mapsto \Gamma(T, f^*\mathcal{F})$ which is denoted $\mathcal{F}^a$ (and often simply $\mathcal{F}$).

Note how we use the same notation $\mathcal{F}^a$ in each case. No confusion can really arise from this as by definition the rule that defines the sheaf $\mathcal{F}^a$ is independent of the site we choose to look at.

Remark 31.6.3. In Topologies, Lemma 30.3.11 we have seen that the small Zariski site of a scheme S is equivalent to S as a topological space in the sense that the category of sheaves are naturally equivalent. Now that S_{Zar} is also endowed with a structure sheaf $\mathcal{O}$ we see that sheaves of modules on the ringed site $(S_{Zar}, \mathcal{O})$ agree with sheaves of modules on the ringed space $(S, \mathcal{O}_S)$.

Remark 31.6.4. Let $f : T \to S$ be a morphism of schemes. Each of the morphisms of sites f_{sites} listed in Topologies, Section 30.9 becomes a morphism of ringed sites. Namely, each of these morphisms of sites $f_{sites} : (Sch/T)_\tau \to (Sch/S)_{\tau'}$, or $f_{sites} : (Sch/S)_\tau \to S_{\tau'}$ is given by the continuous functor $S'/S \mapsto T \times_S S'/S$. Hence, given S'/S we let

$$f_{sites}^\sharp : \mathcal{O}(S'/S) \longrightarrow f_{sites,*}\mathcal{O}(S'/S) = \mathcal{O}(S \times_S S'/T)$$

be the usual map $\text{pr}_{S'}^\sharp : \mathcal{O}(S') \to \mathcal{O}(T \times_S S')$. Similarly, the morphism $i_f : Sh(T_\tau) \to Sh((Sch/S)_\tau)$ for $\tau \in \{Zar, étale\}$, see Topologies, Lemmas 30.3.12 and 30.4.12, becomes a morphism of ringed topoi because $i_f^{-1}\mathcal{O} = \mathcal{O}$. Here are some special cases:

(1) The morphism of big sites $f_{big} : (Sch/X)_{fppf} \to (Sch/Y)_{fppf}$, becomes a morphism of ringed sites
$$(f_{big}, f_{big}^\sharp) : ((Sch/X)_{fppf}, \mathcal{O}_X) \longrightarrow ((Sch/Y)_{fppf}, \mathcal{O}_Y)$$
as in Modules on Sites, Definition 16.6.1. Similarly for the big syntomic, smooth, étale and Zariski sites.

(2) The morphism of small sites $f_{small} : X_{étale} \to Y_{étale}$, becomes a morphism of ringed sites
$$(f_{small}, f_{small}^\sharp) : (X_{étale}, \mathcal{O}_X) \longrightarrow (Y_{étale}, \mathcal{O}_Y)$$
as in Modules on Sites, Definition 16.6.1. Similarly for the small Zariski site.

Let S be a scheme. It is clear that given an $\mathcal{O}$-module on (say) $(Sch/S)_{Zar}$ the pullback to (say) $(Sch/S)_{fppf}$ is just the fppf-sheafification. To see what happens when comparing big and small sites we have the following.

Lemma 31.6.5. *Let S be a scheme. Denote*

$$\begin{array}{rcll} id_{\tau,Zar} & : & (Sch/S)_\tau \to S_{Zar}, & \tau \in \{Zar, étale, smooth, syntomic, fppf\} \\ id_{\tau,étale} & : & (Sch/S)_\tau \to S_{étale}, & \tau \in \{étale, smooth, syntomic, fppf\} \\ id_{small,étale,Zar} & : & S_{étale}, \to S_{Zar}, & \end{array}$$

the morphisms of ringed sites of Remark 31.6.4.

(1) *Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_S$-modules which we view a sheaf of $\mathcal{O}$-modules on S_{Zar}. Then $(id_{\tau,Zar})^*\mathcal{F}$ is the τ-sheafification of the Zariski sheaf*
$$(f : T \to S) \longmapsto \Gamma(T, f^*\mathcal{F})$$
on $(Sch/S)_\tau$.

(2) *Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_S$-modules which we view a sheaf of $\mathcal{O}$-modules on S_{Zar}. Then $(id_{small,étale,Zar})^*\mathcal{F}$ is the étale sheafification of the Zariski sheaf*
$$(f : T \to S) \longmapsto \Gamma(T, f^*\mathcal{F})$$
on $S_{étale}$.

(3) *Let $\mathcal{F}$ be a sheaf of $\mathcal{O}$-modules on $S_{étale}$. Then $(id_{\tau,étale})^*\mathcal{F}$ is the τ-sheafification of the étale sheaf*
$$(f : T \to S) \longmapsto \Gamma(T, f_{small}^*\mathcal{F})$$
where $f_{small} : T_{étale} \to S_{étale}$ is the morphism of ringed small étale sites of Remark 31.6.4.

Proof. Proof of (1). We first note that the result is true when $\tau = Zar$ because in that case we have the morphism of topoi $i_f : Sh(T_{Zar}) \to Sh(Sch/S)_{Zar})$ such that $\text{id}_{\tau,Zar} \circ i_f = f_{small}$ as morphisms $T_{Zar} \to S_{Zar}$, see Topologies, Lemmas 30.3.12 and 30.3.16. Since pullback is transitive (see Modules on Sites, Lemma 16.13.3) we see that $i_f^*(\text{id}_{\tau,Zar})^*\mathcal{F} =$

$f_{small}^*\mathcal{F}$ as desired. Hence, by the remark preceding this lemma we see that $(\mathrm{id}_{\tau,Zar})^*\mathcal{F}$ is the τ-sheafification of the presheaf $T \mapsto \Gamma(T, f^*\mathcal{F})$.

The proof of (3) is exactly the same as the proof of (1), except that it uses Topologies, Lemmas 30.4.12 and 30.4.16. We omit the proof of (2). $\square$

Remark 31.6.6. Remark 31.6.4 and Lemma 31.6.5 have the following applications:

(1) Let S be a scheme. The construction $\mathcal{F} \mapsto \mathcal{F}^a$ is the pullback under the morphism of ringed sites $\mathrm{id}_{\tau,Zar} : ((Sch/S)_\tau, \mathcal{O}) \to (S_{Zar}, \mathcal{O})$ or the morphism $(S_{\acute{e}tale}, \mathcal{O}) \to (S_{Zar}, \mathcal{O})$.

(2) Let $f : X \to Y$ be a morphism of schemes. For any of the morphisms f_{sites} of ringed sites of Remark 31.6.4 we have

$$(f^*\mathcal{F})^a = f_{sites}^*\mathcal{F}^a.$$

This follows from (1) and the fact that pullbacks are compatible with compositions of morphisms of ringed sites, see Modules on Sites, Lemma 16.13.3.

Lemma 31.6.7. *Let S be a scheme. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_S$-module. Let $\tau \in \{Zariski, fppf, \acute{e}tale, smooth, syntomic\}$.*

(1) *The sheaf $\mathcal{F}^a$ is a quasi-coherent $\mathcal{O}$-module on $(Sch/S)_\tau$, as defined in Modules on Sites, Definition 16.23.1.*

(2) *If $\tau = \acute{e}tale$ (resp. $\tau = Zariski$), then the sheaf $\mathcal{F}^a$ is a quasi-coherent $\mathcal{O}$-module on $S_{\acute{e}tale}$ (resp. S_{Zar}) as defined in Modules on Sites, Definition 16.23.1.*

Proof. Let $\{S_i \to S\}$ be a Zariski covering such that we have exact sequences

$$\bigoplus\nolimits_{k\in K_i} \mathcal{O}_{S_i} \longrightarrow \bigoplus\nolimits_{j\in J_i} \mathcal{O}_{S_i} \longrightarrow \mathcal{F} \longrightarrow 0$$

for some index sets K_i and J_i. This is possible by the definition of a quasi-coherent sheaf on a ringed space (See Modules, Definition 15.10.1).

Proof of (1). Let $\tau \in \{Zariski, fppf, \acute{e}tale, smooth, syntomic\}$. It is clear that $\mathcal{F}^a|_{(Sch/S_i)_\tau}$ also sits in an exact sequence

$$\bigoplus\nolimits_{k\in K_i} \mathcal{O}|_{(Sch/S_i)_\tau} \longrightarrow \bigoplus\nolimits_{j\in J_i} \mathcal{O}|_{(Sch/S_i)_\tau} \longrightarrow \mathcal{F}^a|_{(Sch/S_i)_\tau} \longrightarrow 0$$

Hence $\mathcal{F}^a$ is quasi-coherent by Modules on Sites, Lemma 16.23.3.

Proof of (2). Let $\tau = \acute{e}tale$. It is clear that $\mathcal{F}^a|_{(S_i)_{\acute{e}tale}}$ also sits in an exact sequence

$$\bigoplus\nolimits_{k\in K_i} \mathcal{O}|_{(S_i)_{\acute{e}tale}} \longrightarrow \bigoplus\nolimits_{j\in J_i} \mathcal{O}|_{(S_i)_{\acute{e}tale}} \longrightarrow \mathcal{F}^a|_{(S_i)_{\acute{e}tale}} \longrightarrow 0$$

Hence $\mathcal{F}^a$ is quasi-coherent by Modules on Sites, Lemma 16.23.3. The case $\tau = Zariski$ is similar (actually, it is really tautological since the corresponding ringed topoi agree). $\square$

Lemma 31.6.8. *Let S be a scheme. Let*

(a) *$\tau \in \{Zariski, fppf, \acute{e}tale, smooth, syntomic\}$ and $\mathcal{C} = (Sch/S)_\tau$, or*

(b) *let $\tau = \acute{e}tale$ and $\mathcal{C} = S_{\acute{e}tale}$, or*

(c) *let $\tau = Zariski$ and $\mathcal{C} = S_{Zar}$.*

Let $\mathcal{F}$ be an abelian sheaf on $\mathcal{C}$. Let $U \in Ob(\mathcal{C})$ be affine. Let $\{U_i \to U\}_{i=1,\ldots,n}$ be a standard affine τ-covering in $\mathcal{C}$. Then

(1) *$\mathcal{V} = \{\coprod_{i=1,\ldots,n} U_i \to U\}$ is a τ-covering of U,*

(2) *$\mathcal{U}$ is a refinement of $\mathcal{V}$, and*

(3) *the induced map on Cech complexes (Cohomology on Sites, Equation (19.9.2.1))*
$$\check{\mathcal{C}}^\bullet(\mathcal{V}, \mathcal{F}) \longrightarrow \check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{F})$$
is an isomorphism of complexes.

Proof. This follows because
$$(\coprod\nolimits_{i_0=1,\ldots,n} U_{i_0}) \times_U \ldots \times_U (\coprod\nolimits_{i_p=1,\ldots,n} U_{i_p}) = \coprod\nolimits_{i_0,\ldots,i_p \in \{1,\ldots,n\}} U_{i_0} \times_U \ldots \times_U U_{i_p}$$
and the fact that $\mathcal{F}(\coprod_a V_a) = \prod_a \mathcal{F}(V_a)$ since disjoint unions are τ-coverings. $\square$

Lemma 31.6.9. *Let S be a scheme. Let $\mathcal{F}$ be a quasi-coherent sheaf on S. Let τ, $\mathcal{C}$, U, $\mathcal{U}$ be as in Lemma 31.6.8. Then there is an isomorphism of complexes*
$$\check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{F}^a) \cong s((A/R)_\bullet \otimes_R M)$$
(see Section 31.3) where $R = \Gamma(U, \mathcal{O}_U)$, $M = \Gamma(U, \mathcal{F}^a)$ and $R \to A$ is a faithfully flat ring map. In particular
$$\check{H}^p(\mathcal{U}, \mathcal{F}^a) = 0$$
for all $p \geq 1$.

Proof. By Lemma 31.6.8 we see that $\check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{F}^a)$ is isomorphic to $\check{\mathcal{C}}^\bullet(\mathcal{V}, \mathcal{F}^a)$ where $\mathcal{V} = \{V \to U\}$ with $V = \coprod_{i=1,\ldots n} U_i$ affine also. Set $A = \Gamma(V, \mathcal{O}_V)$. Since $\{V \to U\}$ is a τ-covering we see that $R \to A$ is faithfully flat. On the other hand, by definition of $\mathcal{F}^a$ we have that the degree p term $\check{\mathcal{C}}^p(\mathcal{V}, \mathcal{F}^a)$ is
$$\Gamma(V \times_U \ldots \times_U V, \mathcal{F}^a) = \Gamma(Spec(A \otimes_R \ldots \otimes_R A), \mathcal{F}^a) = A \otimes_R \ldots \otimes_R A \otimes_R M$$
We omit the verification that the maps of the chech complex agree with the maps in the complex $s((A/R)_\bullet \otimes_R M)$. The vanishing of cohomology is Lemma 31.3.6. $\square$

Proposition 31.6.10. *Let S be a scheme. Let $\mathcal{F}$ be a quasi-coherent sheaf on S. Let $\tau \in \{Zariski, fppf, étale, smooth, syntomic\}$.*

(1) *There is a canonical isomorphism*
$$H^q(S, \mathcal{F}) = H^q((Sch/S)_\tau, \mathcal{F}^a).$$
(2) *There are canonical isomorphisms*
$$H^q(S, \mathcal{F}) = H^q(S_{Zar}, \mathcal{F}^a) = H^q(S_{étale}, \mathcal{F}^a).$$

Proof. The result for $q = 0$ is clear from the definition of $\mathcal{F}^a$. Let $\mathcal{C} = (Sch/S)_\tau$, or $\mathcal{C} = S_{étale}$, or $\mathcal{C} = S_{Zar}$.

We are going to apply Cohomology on Sites, Lemma 19.11.8 with $\mathcal{F} = \mathcal{F}^a$, $\mathcal{B} \subset Ob(\mathcal{C})$ the set of affine schemes in $\mathcal{C}$, and $\text{Cov} \subset \text{Cov}_\mathcal{C}$ the set of standard affine τ-coverings. Assumption (3) of the lemma is satisfied by Lemma 31.6.9. Hence we conclude that $H^p(U, \mathcal{F}^a) = 0$ for every affine object U of $\mathcal{C}$.

Next, let $U \in Ob(\mathcal{C})$ be any separated object. Denote $f : U \to S$ the structure morphism. Let $U = \bigcup U_i$ be an affine open covering. We may also think of this as a τ-covering $\mathcal{U} = \{U_i \to U\}$ of U in $\mathcal{C}$. Note that $U_{i_0} \times_U \ldots \times_U U_{i_p} = U_{i_0} \cap \ldots \cap U_{i_p}$ is affine as we assumed U separated. By Cohomology on Sites, Lemma 19.11.6 and the result above we see that
$$H^p(U, \mathcal{F}^a) = \check{H}^p(\mathcal{U}, \mathcal{F}^a) = H^p(U, f^*\mathcal{F})$$
the last equality by Coherent, Lemma 25.2.4. In particular, if S is separated we can take $U = S$ and $f = \text{id}_S$ and the proposition is proved. We suggest the reader skip the rest of the proof (or rewrite it to give a clearer exposition).

Choose an injective resolution $\mathcal{F} \to \mathcal{I}^\bullet$ on S. Choose an injective resolution $\mathcal{F}^a \to \mathcal{J}^\bullet$ on $\mathcal{C}$. Denote $\mathcal{J}^n|_S$ the restriction of $\mathcal{J}^n$ to opens of S; this is a sheaf on the topological space S as open coverings are τ-coverings. We get a complex

$$0 \to \mathcal{F} \to \mathcal{J}^0|_S \to \mathcal{J}^1|_S \to \ldots$$

which is exact since its sections over any affine open $U \subset S$ is exact (by the vanshing of $H^p(U, \mathcal{F}^a)$, $p > 0$ seen above). Hence by Derived Categories, Lemma 11.17.6 there exists map of complexes $\mathcal{J}^\bullet|_S \to \mathcal{I}^\bullet$ which in particular induces a map

$$R\Gamma(\mathcal{C}, \mathcal{F}^a) = \Gamma(S, \mathcal{J}^\bullet) \longrightarrow \Gamma(S, \mathcal{I}^\bullet) = R\Gamma(S, \mathcal{F}).$$

Taking cohomology gives the map $H^n(\mathcal{C}, \mathcal{F}^a) \to H^n(S, \mathcal{F})$ which we have to prove is an isomorphism. Let $\mathcal{U} : S = \bigcup U_i$ be an affine open covering which we may think of as a τ-covering also. By the above we get a map of double complexes

$$\check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{J}) = \check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{J}|_S) \longrightarrow \check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{I}).$$

This map induces a map of spectral sequences

$${}^\tau E_2^{p,q} = \check{H}^p(\mathcal{U}, \underline{H}^q(\mathcal{F}^a)) \longrightarrow E_2^{p,q} = \check{H}^p(\mathcal{U}, \underline{H}^q(\mathcal{F}))$$

The first spectral sequence converges to $H^{p+q}(\mathcal{C}, \mathcal{F})$ and the second to $H^{p+q}(S, \mathcal{F})$. On the other hand, we have seen that the induced maps ${}^\tau E_2^{p,q} \to E_2^{p,q}$ are bijections (as all the intersections are separated being opens in affines). Whence also the maps $H^n(\mathcal{C}, \mathcal{F}^a) \to H^n(S, \mathcal{F})$ are isomorphisms, and we win. □

Proposition 31.6.11. *Let S be a scheme. Let $\tau \in \{Zariski, fppf, étale, smooth, syntomic\}$.*

(1) *The functor $\mathcal{F} \mapsto \mathcal{F}^a$ defines an equivalence of categories*

$$QCoh(\mathcal{O}_S) \longrightarrow QCoh((Sch/S)_\tau, \mathcal{O})$$

between the category of quasi-coherent sheaves on S and the category of quasi-coherent $\mathcal{O}$-modules on the big τ site of S.

(2) *Let $\tau = étale$, or $\tau = Zariski$. The functor $\mathcal{F} \mapsto \mathcal{F}^a$ defines an equivalence of categories*

$$QCoh(\mathcal{O}_S) \longrightarrow QCoh(S_\tau, \mathcal{O})$$

between the category of quasi-coherent sheaves on S and the category of quasi-coherent $\mathcal{O}$-modules on the small τ site of S.

Proof. We have seen in Lemma 31.6.7 that the functor is well defined. It is straightforward to show that the functor is fully faithful (we omit the verification). To finish the proof we will show that a quasi-cohernet $\mathcal{O}$-module on $(Sch/S)_\tau$ gives rise to a descent datum for quasi-coherent sheaves relative to a τ-covering of S. Having produced this descent datum we will appeal to Proposition 31.4.2 to get the corresponding quasi-coherent sheaf on S.

Let $\mathcal{G}$ be a quasi-coherent $\mathcal{O}$-modules on the big τ site of S. By Modules on Sites, Definition 16.23.1 there exists a τ-covering $\{S_i \to S\}_{i \in I}$ of S such that each of the restrictions $\mathcal{G}|_{(Sch/S_i)_\tau}$ has a global presentation

$$\bigoplus\nolimits_{k \in K_i} \mathcal{O}|_{(Sch/S_i)_\tau} \longrightarrow \bigoplus\nolimits_{j \in J_i} \mathcal{O}|_{(Sch/S_i)_\tau} \longrightarrow \mathcal{G}|_{(Sch/S_i)_\tau} \longrightarrow 0$$

for some index sets J_i and K_i. We claim that this implies that $\mathcal{G}|_{(Sch/S_i)_\tau}$ is $\mathcal{F}_i^a$ for some quasi-coherent sheaf $\mathcal{F}_i$ on S_i. Namely, this is clear for the direct sums $\bigoplus_{k \in K_i} \mathcal{O}|_{(Sch/S_i)_\tau}$ and $\bigoplus_{j \in J_i} \mathcal{O}|_{(Sch/S_i)_\tau}$. Hence we see that $\mathcal{G}|_{(Sch/S_i)_\tau}$ is a cokernel of a map $\varphi : \mathcal{K}_i^a \to \mathcal{L}_i^a$ for some quasi-coherent sheaves $\mathcal{K}_i$, $\mathcal{L}_i$ on S_i. By the fully faithfulness of $(\ )^a$ we see that

$\varphi = \phi^a$ for some map of quasi-coherent sheaves $\phi : \mathcal{K}_i \to \mathcal{L}_i$ on S_i. Then it is clear that $\mathcal{G}|_{(Sch/S_i)_\tau} \cong \text{Coker}(\phi)^a$ as claimed.

Since $\mathcal{G}$ lives on all of the category $(Sch/S_i)_\tau$ we see that

$$(\text{pr}_0^*\mathcal{F}_i)^a \cong \mathcal{G}|_{(Sch/(S_i \times_S S_j))_\tau} \cong (\text{pr}_1^*\mathcal{F})^a$$

as $\mathcal{O}$-modules on $(Sch/(S_i \times_S S_j))_\tau$. Hence, using fully faithfulness again we get canonical isomorphisms

$$\phi_{ij} : \text{pr}_0^*\mathcal{F}_i \longrightarrow \text{pr}_1^*\mathcal{F}_j$$

of quasi-coherent modules over $S_i \times_S S_j$. We omit the verification that these satisfy the cocycle condition. Since they do we see by effectivity of descent for quasi-coherent sheaves and the covering $\{S_i \to S\}$ (Proposition 31.4.2) that there exists a quasi-coherent sheaf $\mathcal{F}$ on S with $\mathcal{F}|_{S_i} \cong \mathcal{F}_i$ compatible with the given descent data. In other words we are given $\mathcal{O}$-module isomorphisms

$$\phi_i : \mathcal{F}^a|_{(Sch/S_i)_\tau} \longrightarrow \mathcal{G}|_{(Sch/S_i)_\tau}$$

which agree over $S_i \times_S S_j$. Hence, since $\mathcal{H}om_\mathcal{O}(\mathcal{F}^a, \mathcal{G})$ is a sheaf (Modules on Sites, Lemma 16.25.1), we conclude that there is a morphism of $\mathcal{O}$-modules $\mathcal{F}^a \to \mathcal{G}$ recovering the isomorphisms ϕ_i above. Hence this is an isomorphism and we win.

The case of the sites $S_{étale}$ and S_{Zar} is proved in the exact same manner. □

Lemma 31.6.12. *Let S be a scheme. Let $\tau \in \{Zariski, fppf, étale, smooth, syntomic\}$. Let $\mathcal{P}$ be one of the properties of modules[3] defined in Modules on Sites, Definitions 16.17.1, 16.23.1, and 16.26.1. The equivalences of categories*

$$QCoh(\mathcal{O}_S) \longrightarrow QCoh((Sch/S)_\tau, \mathcal{O}) \quad \textit{and} \quad QCoh(\mathcal{O}_S) \longrightarrow QCoh(S_\tau, \mathcal{O})$$

defined by the rule $\mathcal{F} \mapsto \mathcal{F}^a$ seen in Proposition 31.6.11 have the property

$$\mathcal{F} \textit{ has } \mathcal{P} \Leftrightarrow \mathcal{F}^a \textit{ has } \mathcal{P} \textit{ as an } \mathcal{O}\textit{-module}$$

except (possibly) when $\mathcal{P}$ is ``locally free'' or ``coherent''. If $\mathcal{P}$ =``coherent'' the equivalence holds for $QCoh(\mathcal{O}_S) \to QCoh(S_\tau, \mathcal{O})$ when S is locally Noetherian and τ is Zariski or étale.

Proof. This is immediate for the global properties, i.e., those defined in Modules on Sites, Definition 16.17.1. For the local properties we can use Modules on Sites, Lemma 16.23.3 to translate ``$\mathcal{F}^a$ has $\mathcal{P}$'' into a property on the members of a covering of X. Hence the result follows from Lemmas 31.5.1, 31.5.2, 31.5.3, and 31.5.4. Being coherent for a quasi-coherent module is the same as being of finite type over a locally Noetherian scheme (see Coherent, Lemma 25.11.1) hence this reduces to the case of finite type modules (details omitted). □

Lemma 31.6.13. *Let S be a scheme. Let $\tau \in \{Zariski, fppf, étale, smooth, syntomic\}$. The functors*

$$QCoh(\mathcal{O}_S) \longrightarrow Mod((Sch/S)_\tau, \mathcal{O}) \quad \textit{and} \quad QCoh(\mathcal{O}_S) \longrightarrow Mod(S_\tau, \mathcal{O})$$

defined by the rule $\mathcal{F} \mapsto \mathcal{F}^a$ seen in Proposition 31.6.11 are

(1) *fully faithful,*
(2) *compatible with direct sums,*

[3]The list is: free, finite free, generated by global sections, generated by finitely many global sections, having a global presentation, having a global finite presentation, locally free, finite locally free, locally generated by sections, finite type, of finite presentation, coherent, or flat.

(3) *compatible with colimits,*
(4) *right exact,*
(5) *exact as a functor* $QCoh(\mathcal{O}_S) \to Mod(S_\tau, \mathcal{O})$*,*
(6) **not** *exact as a functor* $QCoh(\mathcal{O}_S) \to Mod((Sch/S)_\tau, \mathcal{O})$ *in general,*
(7) *given two quasi-coherent* $\mathcal{O}_S$*-modules* $\mathcal{F}, \mathcal{G}$ *we have* $(\mathcal{F} \otimes_{\mathcal{O}_S} \mathcal{G})^a = \mathcal{F}^a \otimes_{\mathcal{O}} \mathcal{G}^a$*,*
(8) *given two quasi-coherent* $\mathcal{O}_S$*-modules* $\mathcal{F}, \mathcal{G}$ *such that* $\mathcal{F}$ *is of finite presentation we have* $(\mathcal{H}om_{\mathcal{O}_S}(\mathcal{F}, \mathcal{G}))^a = \mathcal{H}om_{\mathcal{O}}(\mathcal{F}^a, \mathcal{G}^a)$*, and*
(9) *given a short exact sequence* $0 \to \mathcal{F}_1^a \to \mathcal{E} \to \mathcal{F}_2^a \to 0$ *of* $\mathcal{O}$*-modules then* $\mathcal{E}$ *is quasi-coherent*[4]*, i.e.,* $\mathcal{E}$ *is in the essential image of the functor.*

Proof. Part (1) we saw in Proposition 31.6.11.

We have seen in Schemes, Section 21.24 that a colimit of quasi-coherent sheaves on a scheme is a quasi-coherent sheaf. Moreover, in Remark 31.6.6 we saw that $\mathcal{F} \mapsto \mathcal{F}^a$ is the pullback functor for a morphism of ringed sites, hence commutes with all colimits, see Modules on Sites, Lemma 16.14.3. Thus (3) and its special case (3) hold.

This also shows that the functor is right exact (i.e., commutes with finite colimits), hence (4).

The functor $QCoh(\mathcal{O}_S) \to QCoh(S_{étale}, \mathcal{O})$, $\mathcal{F} \mapsto \mathcal{F}^a$ is left exact because an étale morphism is flat, see Morphisms, Lemma 24.35.12. This proves (5).

To see (6), suppose that $S = Spec(\mathbf{Z})$. Then $2 : \mathcal{O}_S \to \mathcal{O}_S$ is injective but the associated map of $\mathcal{O}$-modules on $(Sch/S)_\tau$ isn't injective because $2 : \mathbf{F}_2 \to \mathbf{F}_2$ isn't injective and $Spec(\mathbf{F}_2)$ is an object of $(Sch/S)_\tau$.

We omit the proofs of (7) and (8).

Let $0 \to \mathcal{F}_1^a \to \mathcal{E} \to \mathcal{F}_2^a \to 0$ be a short exact sequence of $\mathcal{O}$-modules with $\mathcal{F}_1$ and $\mathcal{F}_2$ quasi-coherent on S. Consider the restriction

$$0 \to \mathcal{F}_1 \to \mathcal{E}|_{S_{Zar}} \to \mathcal{F}_2$$

to S_{Zar}. By Proposition 31.6.10 we see that on any affine $U \subset S$ we have $H^1(U, \mathcal{F}_1^a) = H^1(U, \mathcal{F}_1) = 0$. Hence the sequence above is also exact on the right. By Schemes, Section 21.24 we conclude that $\mathcal{F} = \mathcal{E}|_{S_{Zar}}$ is quasi-coherent. Thus we obtain a commutative diagram

$$\begin{tikzcd}
 & \mathcal{F}_1^a \arrow[r] \arrow[d] & \mathcal{F}^a \arrow[r] \arrow[d] & \mathcal{F}_2^a \arrow[r] \arrow[d] & 0 \\
0 \arrow[r] & \mathcal{F}_1^a \arrow[r] & \mathcal{E} \arrow[r] & \mathcal{F}_2^a \arrow[r] & 0
\end{tikzcd}$$

To finish the proof it suffices to show that the top row is also right exact. To do this, denote once more $U = Spec(A) \subset S$ an affine open of S. We have seen above that $0 \to \mathcal{F}_1(U) \to \mathcal{E}(U) \to \mathcal{F}_2(U) \to 0$ is exact. For any affine scheme V/U, $V = Spec(B)$ the map $\mathcal{F}_1^a(V) \to \mathcal{E}(V)$ is injective. We have $\mathcal{F}_1^a(V) = \mathcal{F}_1(U) \otimes_A B$ by definition. The injection $\mathcal{F}_1^a(V) \to \mathcal{E}(V)$ factors as

$$\mathcal{F}_1(U) \otimes_A B \to \mathcal{E}(U) \otimes_A B \to \mathcal{E}(U)$$

[4]Warning: This is misleading. See part (6).

Considering A-algebras B of the form $B = A \oplus M$ we see that $\mathcal{F}_1(U) \to \mathcal{E}(U)$ is universally injective (see Algebra, Definition 7.76.1). Since $\mathcal{E}(U) = \mathcal{F}(U)$ we conclude that $\mathcal{F}_1 \to \mathcal{F}$ remains injective after any base change, or equivalently that $\mathcal{F}_1^a \to \mathcal{F}^a$ is injective. $\square$

Proposition 31.6.14. *Let $f : T \to S$ be a morphism of schemes.*

(1) *The equivalences of categories of Proposition 31.6.11 are compatible with pullback. More precisely, we have $f^*(\mathcal{G}^a) = (f^*\mathcal{G})^a$ for any quasi-coherent sheaf $\mathcal{G}$ on S.*
(2) *The equivalences of categories of Proposition 31.6.11 part (1) are* **not** *compatible with pushforward in general.*
(3) *If f is quasi-compact and quasi-separated, and $\tau \in \{Zariski, étale\}$ then f_* and $f_{small,*}$ preserve quasi-coherent sheaves and the diagram*

$$\begin{tikzcd} QCoh(\mathcal{O}_T) \arrow[r, "f_*"'] \arrow[d, "\mathcal{F} \mapsto \mathcal{F}^a"'] & QCoh(\mathcal{O}_S) \arrow[d, "\mathcal{G} \mapsto \mathcal{G}^a"] \\ QCoh(T_\tau, \mathcal{O}) \arrow[r, "f_{small,*}"] & QCoh(S_\tau, \mathcal{O}) \end{tikzcd}$$

is commutative, i.e., $f_{small,*}(\mathcal{F}^a) = (f_*\mathcal{F})^a$.

Proof. Part (1) follows from the discussion in Remark 31.6.6. Part (2) is just a warning, and can be explained in the following way: First the statement cannot be made precise since f_* does not transform quasi-coherent sheaves into quasi-coherent sheaves in general. Even if this is the case for f (and any base change of f), then the compatibility over the big sites would mean that formation of $f_*\mathcal{F}$ commutes with any base change, which does not hold in general. An explicit example is the quasi-compact open immersion $j : X = \mathbf{A}^2_k \setminus \{0\} \to \mathbf{A}^2_k = Y$ where k is a field. We have $j_*\mathcal{O}_X = \mathcal{O}_Y$ but after base change to $Spec(k)$ by the 0 map we see that the pushfoward is zero.

Let us prove (3) in case $\tau = étale$. Note that f, and any base change of f, transforms quasi-coherent sheaves into quasi-coherent sheaves, see Schemes, Lemma 21.24.1. The equality $f_{small,*}(\mathcal{F}^a) = (f_*\mathcal{F})^a$ means that for any étale morphism $g : U \to S$ we have $\Gamma(U, g^*f_*\mathcal{F}) = \Gamma(U \times_S T, (g')^*\mathcal{F})$ where $g' : U \times_S T \to T$ is the projection. This is true by Coherent, Lemma 25.6.2. $\square$

Lemma 31.6.15. *Let $f : T \to S$ be a quasi-compact and quasi-separated morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent sheaf on T. For either the étale or Zariski topology, there are canonical isomorphisms $R^if_{small,*}(\mathcal{F}^a) = (R^if_*\mathcal{F})^a$.*

Proof. We prove this for the étale topology; we omit the proof in the case of the Zariski topology. By Coherent, Lemma 25.5.3 the sheaves $R^if_*\mathcal{F}$ are quasi-coherent so that the assertion makes sense. The sheaf $R^if_{small,*}\mathcal{F}^a$ is the sheaf associated to the presheaf

$$U \longmapsto H^i(U \times_S T, \mathcal{F}^a)$$

where $g : U \to S$ is an object of $S_{étale}$, see Cohomology on Sites, Lemma 19.8.4. By our conventions the right hand side is the étale cohomology of the restriction of $\mathcal{F}^a$ to the localization $T_{étale}/U \times_S T$ which equals $(U \times_S T)_{étale}$. By Proposition 31.6.10 this is presheaf the same as the presheaf

$$U \longmapsto H^i(U \times_S T, (g')^*\mathcal{F}),$$

where $g' : U \times_S T \to T$ is the projection. If U is affine then this is the same as $H^0(U, R^if'_*(g')^*\mathcal{F})$, see Coherent, Lemma 25.5.4. By Coherent, Lemma 25.6.2 this is equal to $H^0(U, g^*R^if_*\mathcal{F})$

which is the value of $(R^i f_*\mathcal{F})^a$ on U. Thus the values of the sheaves of modules $R^i f_{small,*}(\mathcal{F}^a)$ and $(R^i f_*\mathcal{F})^a$ on every affine object of $S_{\acute{e}tale}$ are canonically isomorphic which implies they are canonically isomorphic. $\square$

The results in this section say there is virtually no difference between quasi-coherent sheaves on S and quasi-coherent sheaves on any of the sites associated to S in the chapter on topologies. Hence one often sees statements on quasi-coherent sheaves formulated in either language, without restatements in the other.

31.7. Parasitic modules

Parasitic modules are those which are zero when restricted to schemes flat over the base scheme. Here is the formal definition.

Definition 31.7.1. Let S be a scheme. Let $\tau \in \{Zar, \acute{e}tale, smooth, syntomic, fppf\}$. Let $\mathcal{F}$ be a presheaf of $\mathcal{O}$-modules on $(Sch/S)_\tau$.

1. $\mathcal{F}$ is called *parasitic*[5] if for every flat morphism $U \to S$ we have $\mathcal{F}(U) = 0$.
2. $\mathcal{F}$ is called *parasitic for the τ-topology* if for every τ-covering $\{U_i \to S\}_{i\in I}$ we have $\mathcal{F}(U_i) = 0$ for all i.

If $\tau = fppf$ this means that $\mathcal{F}|_{U_{Zar}} = 0$ whenever $U \to S$ is flat and locally of finite presentation; similar for the other cases.

Lemma 31.7.2. *Let S be a scheme. Let $\tau \in \{Zar, \acute{e}tale, smooth, syntomic, fppf\}$. Let $\mathcal{G}$ be a presheaf of $\mathcal{O}$-modules on $(Sch/S)_\tau$.*

1. *If $\mathcal{G}$ is parasitic for the τ-topology, then $H^p_\tau(U, \mathcal{G}) = 0$ for every U open in S, resp. étale over S, resp. smooth over S, resp. syntomic over S, resp. flat and locally of finite presentation over S.*
2. *If $\mathcal{G}$ is parasitic then $H^p_\tau(U, \mathcal{G}) = 0$ for every U flat over S.*

Proof. Proof in case $\tau = fppf$; the other cases are proved in the exact same way. The assumption means that $\mathcal{G}(U) = 0$ for any $U \to S$ flat and locally of finite presentation. Apply Cohomology on Sites, Lemma 19.11.8 to the subset $\mathcal{B} \subset Ob((Sch/S)_{fppf})$ consisting of $U \to S$ flat and locally of finite presentation and the collection Cov of all fppf coverings of elements of $\mathcal{B}$. $\square$

Lemma 31.7.3. *Let $f : T \to S$ be a morphism of schemes. For any parasitic $\mathcal{O}$-module on $(Sch/T)_\tau$ the pushforward $f_*\mathcal{F}$ and the higher direct images $R^i f_*\mathcal{F}$ are parasitic $\mathcal{O}$-modules on $(Sch/S)_\tau$.*

Proof. Recall that $R^i f_*\mathcal{F}$ is the sheaf associated to the presheaf

$$U \mapsto H^i((Sch/U \times_S T)_\tau, \mathcal{F})$$

see Cohomology on Sites, Lemma 19.8.4. If $U \to S$ is flat, then $U \times_S T \to T$ is flat as a base change. Hence the displayed group is zero by Lemma 31.7.2. If $\{U_i \to U\}$ is a τ-covering then $U_i \times_S T \to T$ is also flat. Hence it is clear that the sheafification of the displayed presheaf is zero on schemes U flat over S. $\square$

Lemma 31.7.4. *Let S be a scheme. Let $\tau \in \{Zar, \acute{e}tale\}$. Let $\mathcal{G}$ be a sheaf of $\mathcal{O}$-modules on $(Sch/S)_{fppf}$ such that*

1. *$\mathcal{G}|_{S_\tau}$ is quasi-coherent, and*

[5] This may be nonstandard notation.

(2) *for every flat, locally finitely presented morphism $g : U \to S$ the canonical map $g_{\tau,small}^*(\mathcal{G}|_{S_\tau}) \to \mathcal{G}|_{U_\tau}$ is an isomorphism.*

Then $H^p(U, \mathcal{G}) = H^p(U, \mathcal{G}|_{U_\tau})$ for every U flat and locally of finite presentation over S.

Proof. Let $\mathcal{F}$ be the pullback of $\mathcal{G}|_{S_\tau}$ to the big fppf site $(Sch/S)_{fppf}$. Note that $\mathcal{F}$ is quasi-coherent. There is a canonical comparison map $\varphi : \mathcal{F} \to \mathcal{G}$ which by assumptions (1) and (2) induces an isomorphism $\mathcal{F}|_{U_\tau} \to \mathcal{G}|_{U_\tau}$ for all $g : U \to S$ flat and locally of finite presentation. Hence in the short exact sequences

$$0 \to \mathrm{Ker}(\varphi) \to \mathcal{F} \to \mathrm{Im}(\varphi) \to 0$$

and

$$0 \to \mathrm{Im}(\varphi) \to \mathcal{G} \to \mathrm{Coker}(\varphi) \to 0$$

the sheaves $\mathrm{Ker}(\varphi)$ and $\mathrm{Coker}(\varphi)$ are parasitic for the fppf topology. By Lemma 31.7.2 we conclude that $H^p(U, \mathcal{F}) \to H^p(U, \mathcal{G})$ is an isomorphism for $g : U \to S$ flat and locally of finite presentation. Since the result holds for $\mathcal{F}$ by Proposition 31.6.10 we win. □

31.8. Derived category of quasi-coherent modules

Let S be a scheme. Often the phrase ``the derived category of quasi-coherent modules on S'' refers to the category $D_{QCoh}(\mathcal{O}_S)$ and not the derived category $D(QCoh(\mathcal{O}_S))$. It turns out that $D_{QCoh}(\mathcal{O}_S)$ is often easier to work with.

In this section we show that $D_{QCoh}(\mathcal{O}_S)$ can be defined in terms of the small étale site of S. Namely, denote $\mathcal{O}_{small}$ the structure sheaf on $S_{étale}$. Recall that $QCoh(\mathcal{O}_S)$ is also a Serre subcategory of $Mod(\mathcal{O}_{étale})$, see Lemma 31.6.13. Hence we can let $D_{QCoh}(\mathcal{O}_{étale})$ be the trangulated subcategory of $D(\mathcal{O}_{étale})$ whose objects are the complexes with quasi-coherent cohomology sheaves, see Derived Categories, Section 11.12.

Lemma 31.8.1. *Let S be a scheme. There is a canonical equivalence $D_{QCoh}(\mathcal{O}_S) = D_{QCoh}(\mathcal{O}_{étale})$.*

Proof. Consider the morphism of ringed sites $\epsilon : S_{étale} \to S_{Zar}$, see Remark 31.6.4. This is the morphism $\mathrm{id}_{small,étale,Zar}$ of Lemma 31.6.5. Since every etale morphism $T \to S$ is flat (Morphisms, Lemma 24.35.12) the description of $\epsilon^* = \mathrm{id}_{small,étale,Zar}^*$ in Lemma 31.6.5 shows that ϵ^* is an exact functor. Hence it induces $\epsilon^* : D(\mathcal{O}_S) \to D(\mathcal{O}_{small})$. By the material in Section 31.6 given a quasi-coherent sheaf $\mathcal{F}$ on S the sheaf $\mathcal{F}^a = \epsilon^*\mathcal{F}$ is the corresonding quasi-coherent module on $S_{étale}$. Thus ϵ^* induces

$$\epsilon^* : D_{QCoh}(\mathcal{O}_S) \to D_{QCoh}(\mathcal{O}_{small})$$

We are going to construct a quasi-inverse functor.

Let $\mathcal{F}^\bullet$ be an object of $D_{QCoh}(\mathcal{O}_{small})$ and denote $\mathcal{H}^i = H^i(\mathcal{F}^\bullet)$ its ith cohomology sheaf. Let $\mathcal{B}$ be the set of affine objects of $S_{étale}$. Then $H^p(U, \mathcal{H}^i) = 0$ for all $p > 0$, all $i \in \mathbf{Z}$, and all $U \in \mathcal{B}$, see Proposition 31.6.10 and Coherent, Lemma 25.2.2. According to Cohomology on Sites, Section 19.20 this implies there exists a quasi-isomorphism $\mathcal{F}^\bullet \to \mathcal{I}^\bullet$ where $\mathcal{I}^\bullet$ is a K-injective complex, $\mathcal{I}^\bullet = lim\, \mathcal{I}_n^\bullet$, each $\mathcal{I}_n^\bullet$ is a bounded below complex of injectives, the maps in the system $\ldots \to \mathcal{I}_2^\bullet \to \mathcal{I}_1^\bullet$ are termwise split surjections, and each $\mathcal{I}_n^\bullet$ is quasi-isomorphic to $\tau_{\geq -n}\mathcal{F}^\bullet$. In particular, we conclude that $R\epsilon_*$ is defined at each object of $D_{QCoh}(\mathcal{O}_{small})$, see Derived Categories, Lemma 11.28.4, with values $R\epsilon_*\mathcal{F}^\bullet = \epsilon_*\mathcal{I}^\bullet$. This defines an exact functor of triangulated categories

$$R\epsilon_* : D_{QCoh}(\mathcal{O}_{small}) \longrightarrow D(\mathcal{O}_S)$$

see Derived Categories, Proposition 11.14.8. Let V be an affine object of $S_{étale}$. In the proof of Cohomology on Sites, Lemma 19.20.1 we have seen that $H^m(\mathcal{I}^\bullet(V))$ is the limit of the cohomology groups $H^m(\mathcal{I}_n^\bullet(V))$. For $n > -m$ these groups are equal to $\mathcal{H}^m(V)$ by the vanishing of higer cohomology and the spectral sequence of Derived Categories, Lemma 11.20.3. If we apply this to all $V = U \subset S$ affine open, then we conclude that the mth cohomology sheaf of $\epsilon_*\mathcal{I}^\bullet$ is $\epsilon_*\mathcal{H}^m$. This implies that $R\epsilon_*\mathcal{F}^\bullet = \epsilon_*\mathcal{I}^\bullet$ is an object of $D_{QCoh}(\mathcal{O}_S)$ and we get our functor

$$R\epsilon_* : D_{QCoh}(\mathcal{O}_{small}) \longrightarrow D_{QCoh}(\mathcal{O}_S)$$

in the other direction! Since also for arbitrary V we have $\mathcal{H}^m(V) = (\epsilon^*\epsilon_*\mathcal{H}^m)(V)$ as $\mathcal{H}^m$ is quasi-coherent, we conclude the canonical map of complexes

$$\epsilon^*\epsilon_*\mathcal{I}^\bullet \longrightarrow \mathcal{I}^\bullet$$

is a quasi-isomorphism. This implies that the composition

$$D_{QCoh}(\mathcal{O}_{small}) \longrightarrow D_{QCoh}(\mathcal{O}_S) \longrightarrow D_{QCoh}(\mathcal{O}_{small})$$

is isomorphic to the identity functor. Finally, we claim that

$$D_{QCoh}(\mathcal{O}_S) \longrightarrow D_{QCoh}(\mathcal{O}_{small}) \longrightarrow D_{QCoh}(\mathcal{O}_S)$$

is isomorphic to the identity as well. Namely, for $\mathcal{G}^\bullet$ an object of $D_{QCoh}(\mathcal{O}_S)$ we choose a map $\epsilon^*\mathcal{G}^\bullet \to \mathcal{I}^\bullet$ into a K-injective complex as above and consider the map

$$\mathcal{G}^\bullet \to \epsilon_*\epsilon^*\mathcal{G}^\bullet \to \epsilon_*\mathcal{I}^\bullet$$

This is a quasi-isomorphism as we've just seen above that the cohomology sheaves of $\epsilon_*\epsilon_*\mathcal{I}^\bullet$ are exactly the quasi-coherent cohomology sheaves of the complex $\mathcal{G}^\bullet$ we started out with. □

31.9. Fpqc coverings are universal effective epimorphisms

We apply the material above to prove an interesting result, namely Lemma 31.9.3. By Sites, Section 9.12 this lemma implies that the representable presheaves on any of the sites $(Sch/S)_\tau$ are sheaves for $\tau \in \{Zarski, fppf, étale, smooth, syntomic\}$. First we prove a helper lemma.

Lemma 31.9.1. *For a scheme X denote $|X|$ the underlying set. Let $f : X \to S$ be a morphism of schemes. Then*

$$|X \times_S X| \to |X| \times_{|S|} |X|$$

is surjective.

Proof. Follows immediately from the description of points on the fibre product in Schemes, Lemma 21.17.5. □

Lemma 31.9.2. *Let $\{f_i : T_i \to T\}_{i \in I}$ be a fpqc covering. Suppose that for each i we have an open subset $W_i \subset T_i$ such that for all $i, j \in I$ we have $pr_0^{-1}(W_i) = pr_1^{-1}(W_j)$ as open subsets of $T_i \times_T T_j$. Then there exists a unique open subset $W \subset T$ such that $W_i = f_i^{-1}(W)$ for each i.*

Proof. Apply Lemma 31.9.1 to the map $\coprod_{i \in I} T_i \to T$. It implies there exists a subset $W \subset T$ such that $W_i = f_i^{-1}(W)$ for each i, namely $W = \bigcup f_i(W_i)$. To see that W is open we may work Zariski locally on T. Hence we may assume that T is affine. Using the definition of a fpqc covering, this reduces us to the case where $\{f_i : T_i \to T\}$ is a standard fpqc covering. In this case we may apply Morphisms, Lemma 24.24.10 to the morphism $\coprod T_i \to T$ to conclude that W is open. □

Lemma 31.9.3. *Let $\{T_i \to T\}$ be an fpqc covering, see Topologies, Definition 30.8.1. Then $\{T_i \to T\}$ is a universal effective epimorphism in the category of schemes, see Sites, Definition 9.12.1. In other words, every representable functor on the category of schemes satisfies the sheaf condition for the fpqc topology, see Topologies, Definition 30.8.12.*

Proof. Let S be a scheme. We have to show the following: Given morphisms $\varphi_i : T_i \to S$ such that $\varphi_i|_{T_i \times_T T_j} = \varphi_j|_{T_i \times_T T_j}$ there exists a unique morphism $T \to S$ which restricts to φ_i on each T_i. In other words, we have to show that the functor $h_S = Mor_{Sch}(-, S)$ satisfies the sheaf property for the fpqc topology.

Thus Topologies, Lemma 30.8.13 reduces us to the case of a Zariski covering and a covering $\{Spec(A) \to Spec(R)\}$ with $R \to A$ faithfully flat. The case of a Zariski covering follows from Schemes, Lemma 21.14.1.

Suppose that $R \to A$ is a faithfully flat ring map. Denote $\pi : Spec(A) \to Spec(R)$ the corresponding morphism of schemes. It is surjective and flat. Let $f : Spec(A) \to S$ be a morphism such that $f \circ \mathrm{pr}_1 = f \circ \mathrm{pr}_2$ as maps $Spec(A \otimes_R A) \to S$. By Lemma 31.9.1 we see that as a map on the underlying sets f is of the form $f = g \circ \pi$ for some (set theoretic) map $g : Spec(R) \to S$. By Morphisms, Lemma 24.24.10 and the fact that f is continuous we see that g is continuous.

Pick $x \in Spec(R)$. Choose $U \subset S$ affine open containing $g(x)$. Say $U = Spec(B)$. By the above we may choose an $r \in R$ such that $x \in D(r) \subset g^{-1}(U)$. The restriction of f to $\pi^{-1}(D(r))$ into U corresponds to a ring map $B \to A_r$. The two induced ring maps $B \to A_r \otimes_{R_r} A_r = (A \otimes_R A)_r$ are equal by assumption on f. Note that $R_r \to A_r$ is faithfully flat. By Lemma 31.3.6 the equalizer of the two arrows $A_r \to A_r \otimes_{R_r} A_r$ is R_r. We conclude that $B \to A_r$ factors uniquely through a map $B \to R_r$. This map in turn gives a morphism of schemes $D(r) \to U \to S$, see Schemes, Lemma 21.6.4.

What have we proved sofar? We have shown that for any prime $\mathfrak{p} \subset R$, there exists a standard affine open $D(r) \subset Spec(R)$ such that the morphism $f|_{\pi^{-1}(D(r))} : \pi^{-1}(D(r)) \to S$ factors uniquely though some morphism of schemes $D(r) \to S$. We omit the verification that these morphisms glue to the desired morphism $Spec(R) \to S$. □

31.10. Descent of finiteness properties of morphisms

Another application of flat descent for modules is the following amusing and useful result. There is an algebraic version and a scheme theoretic version. (The ``Noetherian'' reader should consult Lemma 31.10.2 instead of the next lemma.)

Lemma 31.10.1. *Let $R \to A \to B$ be ring maps. Assume $R \to B$ is of finite presentation and $A \to B$ faithfully flat and of finite presentation. Then $R \to A$ is of finite presentation.*

Proof. Consider the algebra $C = B \otimes_A B$ together with the pair of maps $p, q : B \to C$ given by $p(b) = b \otimes 1$ and $q(b) = 1 \otimes b$. Of course the two compositions $A \to B \to C$ are the same. Note that as $p : B \to C$ is flat and of finite presentation (base change of $A \to B$), the ring map $R \to C$ is of finite presentation (as the composite of $R \to B \to C$).

We are going to use the criterion Algebra, Lemma 7.118.2 to show that $R \to A$ is of finite presentation. Let S be any R-algebra, and suppose that $S = colim_{\lambda \in \Lambda} S_\lambda$ is written as a directed colimit of R-algebras. Let $A \to S$ be an R-algebra homomorphism. We have to show that $A \to S$ factors through one of the S_λ. Consider the rings $B' = S \otimes_A B$ and $C' = S \otimes_A C = B' \otimes_S B'$. As B is faithfully flat of finite presentation over A, also B' is faithfully flat of finite presentation over S. By Algebra, Lemma 7.120.5 part (2) applied to the pair $(S \to B', B')$ and the system (S_λ) there exists a $\lambda_0 \in \Lambda$ and a flat, finitely presented S_{λ_0}-algebra B_{λ_0} such that $B' = S \otimes_{S_{\lambda_0}} B_{\lambda_0}$. For $\lambda \geq \lambda_0$ set $B_\lambda = S_\lambda \otimes_{S_{\lambda_0}} B_{\lambda_0}$ and $C_\lambda = B_\lambda \otimes_{S_\lambda} B_\lambda$.

We interupt the flow of the argument to show that $S_\lambda \to B_\lambda$ is faithfully flat for λ large enough. (This should really be a separate lemma somewhere else, maybe in the chapter on limits.) Since $Spec(B_{\lambda_0}) \to Spec(S_{\lambda_0})$ is flat and of finite presentation it is open (see Morphisms, Lemma 24.24.9). Let $I \subset S_{\lambda_0}$ be an ideal such that $V(I) \subset Spec(S_{\lambda_0})$ is the complement of the image. Note that formation of the image commutes with base change. Hence, since $Spec(B') \to Spec(S)$ is surjective, and $B' = B_{\lambda_0} \otimes_{S_{\lambda_0}} S$ we see that $IS = S$. Thus for some $\lambda \geq \lambda_0$ we have $IS_\lambda = S_\lambda$. For this and all greater λ the morphism $Spec(B_\lambda) \to Spec(S_\lambda)$ is surjective.

By analogy with the notation in the first paragraph of the proof denote $p_\lambda, q_\lambda : B_\lambda \to C_\lambda$ the two canonical maps. Then $B' = colim_{\lambda \geq \lambda_0} B_\lambda$ and $C' = colim_{\lambda \geq \lambda_0} C_\lambda$. Since B and C are finitely presented over R there exist (by Algebra, Lemma 7.118.2 applied several times) a $\lambda \geq \lambda_0$ and an R-algebra maps $B \to B_\lambda$, $C \to C_\lambda$ such that the diagram

$$\begin{tikzcd} C \arrow[r] & C_\lambda \\ B \arrow[u, shift left, "q"'] \arrow[u, shift right, "p"] \arrow[r] & B_\lambda \arrow[u, shift left, "q_\lambda"'] \arrow[u, shift right, "p_\lambda"] \end{tikzcd}$$

is commutative. OK, and this means that $A \to B \to B_\lambda$ maps into the equalizer of p_λ and q_λ. By By Lemma 31.3.6 we see that S_λ is the equalizer of p_λ and q_λ. Thus we get the desired ring map $A \to S_\lambda$ and we win. $\square$

Here is an easier version of this dealing with the property of being of finite type.

Lemma 31.10.2. *Let $R \to A \to B$ be ring maps. Assume $R \to B$ is of finite type and $A \to B$ faithfully flat and of finite presentation. Then $R \to A$ is of finite type.*

Proof. By Algebra, Lemma 7.120.6 there exists a commtutative diagram

$$\begin{tikzcd} R \arrow[r] \arrow[d, equal] & A_0 \arrow[r] \arrow[d] & B_0 \arrow[d] \\ R \arrow[r] & A \arrow[r] & B \end{tikzcd}$$

with $R \to A_0$ of finite presentation, $A_0 \to B_0$ faithfully flat of finite presentation and $B = A \otimes_{A_0} B_0$. Since $R \to B$ is of finite type by assumption, we may add some elements to A_0 and assume that the map $B_0 \to B$ is surjective! In this case, since $A_0 \to B_0$ is faithfully flat, we see that as

$$(A_0 \to A) \otimes_{A_0} B_0 \cong (B_0 \to B)$$

is surjective, also $A_0 \to A$ is surjective. Hence we win. $\square$

Lemma 31.10.3. *Let*

$$\begin{tikzcd} X \arrow[rr, "f"] \arrow[dr, "p"'] & & Y \arrow[dl, "q"] \\ & S & \end{tikzcd}$$

be a commutative diagram of morphisms of schemes. Assume that f is surjective, flat and locally of finite presentation and assume that p is locally of finite presentation (resp. locally of finite type). Then q is locally of finite presentation (resp. locally of finite type).

Proof. The problem is local on S and Y. Hence we may assume that S and Y are affine. Since f is flat and locally of finite presentation, we see that f is open (Morphisms, Lemma 24.24.9). Hence, since Y is quasi-compact, there exist finitely many affine opens $X_i \subset X$ such that $Y = \bigcup f(X_i)$. Clearly we may replace X by $\coprod X_i$, and hence we may assume X is affine as well. In this case the lemma is equivalent to Lemma 31.10.1 (resp. Lemma 31.10.2) above. $\square$

We use this to improve some of the results on morphisms obtained earlier.

Lemma 31.10.4. *Let*

$$\begin{tikzcd} X \arrow[rr, "f"] \arrow[dr, "p"'] & & Y \arrow[dl, "q"] \\ & S & \end{tikzcd}$$

be a commutative diagram of morphisms of schemes. Assume that

(1) *f is surjective, and syntomic (resp. smooth, resp. étale),*
(2) *p is syntomic (resp. smooth, resp. étale).*

Then q is syntomic (resp. smooth, resp. étale).

Proof. Combine Morphisms, Lemmas 24.30.16, 24.33.19, and 24.35.19 with Lemma 31.10.3 above. $\square$

Actually we can strengthen this result as follows.

Lemma 31.10.5. *Let*

$$\begin{tikzcd} X \arrow[rr, "f"] \arrow[dr, "p"'] & & Y \arrow[dl, "q"] \\ & S & \end{tikzcd}$$

be a commutative diagram of morphisms of schemes. Assume that

(1) *f is surjective, flat, and locally of finite presentation,*
(2) *p is smooth (resp. étale).*

Then q is smooth (resp. étale).

Proof. Assume (1) and that p is smooth. By Lemma 31.10.3 we see that q is locally of finite presentation. By Morphisms, Lemma 24.24.11 we see that q is flat. Hence now it suffices to show that the fibres of q are smooth, see Morphisms, Lemma 24.33.3. Apply Varieties, Lemma 28.15.8 to the flat surjective morphisms $X_s \to Y_s$ for $s \in S$ to conclude. We omit the proof of the étale case. $\square$

Remark 31.10.6. With the assumptions (1) and p smooth in Lemma 31.10.5 it is not automatically the case that $X \to Y$ is smooth. A counter example is $S = Spec(k)$, $X = Spec(k[s])$, $Y = Spec(k[t])$ and f given by $t \mapsto s^2$. But see also Remark 31.10.7 for some information on the structure of f.

Remark 31.10.7. Let

$$\begin{tikzcd} X \arrow[rr, "f"] \arrow[dr, "p"'] & & Y \arrow[dl, "q"] \\ & S & \end{tikzcd}$$

be a commutative diagram of morphisms of schemes. Assume that

(1) f is surjective, flat, and locally of finite presentation,
(2) p is syntomic.

Then *both q and f* are syntomic. This follows from the following result of Avramov: If $\varphi : A \to B$ is a local homomorphism of local Noetherian rings, and φ is flat and B is a complete intersection, then both A and $B/\mathfrak{m}_A B$ are complete intersections. See [**Avr75**]. If we need this result we will add its proof to the stacks project.

The following type of lemma is occasionally useful.

Lemma 31.10.8. *Let $X \to Y \to Z$ be morphism of schemes. Let P be one of the following properties of morphisms of schemes: flat, locally finite type, locally finite presentation. Assume that $X \to Z$ has P and that $\{X \to Y\}$ can be refined by an fppf covering of Y. Then $Y \to Z$ is P.*

Proof. Let $Spec(C) \subset Z$ be an affine open and let $Spec(B) \subset Y$ be an affine open which maps into $Spec(C)$. The assumption on $X \to Y$ implies we can find a standard affine fppf covering $\{Spec(B_j) \to Spec(B)\}$ and lifts $x_j : Spec(B_j) \to X$. Since $Spec(B_j)$ is quasi-compact we can find finitely many affine opens $Spec(A_i) \subset X$ lying over $Spec(B)$ such that the image of each x_j is contained in the union $\bigcup Spec(A_i)$. Hence after replacing each $Spec(B_j)$ by a standard affine Zariski coverings of itself we may assume we have a standard affine fppf covering $\{Spec(B_i) \to Spec(B)\}$ such that each $Spec(B_i) \to Y$ factors through an affine open $Spec(A_i) \subset X$ lying over $Spec(B)$. In other words, we have ring maps $C \to B \to A_i \to B_i$ for each i. Note that we can also consider

$$C \to B \to A = \prod A_i \to B' = \prod B_i$$

and that the ring map $B \to \prod B_i$ is faithfully flat and of finite presentation.

The case $P = flat$. In this case we know that $C \to A$ is flat and we have to prove that $C \to B$ is flat. Suppose that $N \to N' \to N''$ is an exact sequence of C-modules. We want to show that $N \otimes_C B \to N' \otimes_C B \to N'' \otimes_C B$ is exact. Let H be its cohomology and let H' be the cohomology of $N \otimes_C B' \to N' \otimes_C B' \to N'' \otimes_C B'$. As $B \to B'$ is flat we know that $H' = H \otimes_B B'$. On the other hand $N \otimes_C A \to N' \otimes_C A \to N'' \otimes_C A$ is exact hence has zero cohomology. Hence the map $H \to H'$ is zero (as it factors through the zero module). Thus $H' = 0$. As $B \to B'$ is faithfully flat we conclude that $H = 0$ as desired.

The case $P = locally\ finite\ type$. In this case we know that $C \to A$ is of finite type and we have to prove that $C \to B$ is of finite type. Because $B \to B'$ is of finite presentation (hence of finite type) we see that $A \to B'$ is of finite type, see Algebra, Lemma 7.6.2. Therefore $C \to B'$ is of finite type and we conclude by Lemma 31.10.2.

The case $P = locally\ finite\ presentation$. In this case we know that $C \to A$ is of finite presentation and we have to prove that $C \to B$ is of finite presentation. Because $B \to B'$ is of finite presentation and $B \to A$ of finite type we see that $A \to B'$ is of finite presentation, see Algebra, Lemma 7.6.2. Therefore $C \to B'$ is of finite presentation and we conclude by Lemma 31.10.1. □

31.11. Local properties of schemes

It often happens one can prove the members of a covering of a scheme have a certain property. In many cases this implies the scheme has the property too. For example, if S is a scheme, and $f : S' \to S$ is a surjective flat morphism such that S' is a reduced scheme, then S is reduced. You can prove this by looking at local rings and using Algebra, Lemma 7.146.2. We say that the property of being reduced *descends through flat surjective morphisms*. Some results of this type are collected in Algebra, Section 7.146.

On the other hand, there are examples of surjective flat morphisms $f : S' \to S$ with S reduced and S' not, for example the morphism $Spec(k[x]/(x^2)) \to Spec(k)$. Hence the property of being reduced does not *ascend along flat morphisms*. Having infinite residue fields is a property which does ascend along flat morphisms (but does not descend along surjective flat morphisms of course). Some results of this type are collected in Algebra, Section 7.145.

Finally, we say that a property is *local for the flat topology* if it ascends along flat morphisms and descends along flat surjective morphisms. A somewhat silly example is the property of having residue fields of a given characteristic. To be more precise, and to tie this in with the various topologies on schemes, we make the following formal definition.

Definition 31.11.1. Let $\mathcal{P}$ be a property of schemes. Let $\tau \in \{fpqc, fppf, syntomic, smooth, étale, Zariski\}$. We say $\mathcal{P}$ is *local in the τ-topology* if for any τ-covering $\{S_i \to S\}_{i \in I}$ (see Topologies, Section 30.2) we have

$$S \text{ has } \mathcal{P} \Leftrightarrow \text{each } S_i \text{ has } \mathcal{P}.$$

To be sure, since isomorphisms are always coverings we see (or require) that property $\mathcal{P}$ holds for S if and only if it holds for any scheme S' isomorphic to S. In fact, if $\tau = fpqc$, $fppf, syntomic, smooth, étale$, or $Zariski$, then if S has $\mathcal{P}$ and $S' \to S$ is flat, flat and locally of finite presentation, syntomic, smooth, étale, or an open immersion, then S' has $\mathcal{P}$. This is true because we can always extend $\{S' \to S\}$ to a τ-covering.

We have the following implications: $\mathcal{P}$ is local in the fpqc topology $\Rightarrow$ $\mathcal{P}$ is local in the fppf topology $\Rightarrow$ $\mathcal{P}$ is local in the syntomic topology $\Rightarrow$ $\mathcal{P}$ is local in the smooth topology $\Rightarrow$ $\mathcal{P}$ is local in the étale topology $\Rightarrow$ $\mathcal{P}$ is local in the Zariski topology. This follows from Topologies, Lemmas 30.4.2, 30.5.2, 30.6.2, 30.7.2, and 30.8.6.

Lemma 31.11.2. *Let $\mathcal{P}$ be a property of schemes. Let $\tau \in \{fpqc, fppf, étale, smooth, syntomic\}$. Assume that*

(1) *the property is local in the Zariski topology,*
(2) *for any morphism of affine schemes $S' \to S$ which is flat, flat of finite presentation, étale, smooth or syntomic depending on whether τ is fpqc, fppf, étale, smooth, or syntomic, property $\mathcal{P}$ holds for S' if property $\mathcal{P}$ holds for S, and*
(3) *for any surjective morphism of affine schemes $S' \to S$ which is flat, flat of finite presentation, étale, smooth or syntomic depending on whether τ is fpqc, fppf, étale, smooth, or syntomic, property $\mathcal{P}$ holds for S if property $\mathcal{P}$ holds for S'.*

Then $\mathcal{P}$ is τ local on the base.

Proof. This follows almost immediately from the definition of a τ-covering, see Topologies, Definition 30.8.1 30.7.1 30.4.1 30.5.1, or 30.6.1 and Topologies, Lemma 30.8.8, 30.7.4, 30.4.4, 30.5.4, or 30.6.4. Details omitted. $\square$

Remark 31.11.3. In Lemma 31.11.2 above if $\tau = smooth$ then in condition (3) we may assume that the morphism is a (surjective) standard smooth morphism. Similarly, when $\tau = syntomic$ or $\tau = \acute{e}tale$.

31.12. Properties of schemes local in the fppf topology

In this section we find some properties of schemes which are local on the base in the fppf topology.

Lemma 31.12.1. *The property $\mathcal{P}(S) =$``S is locally Noetherian" is local in the fppf topology.*

Proof. We will use Lemma 31.11.2. First we note that ``being locally Noetherian" is local in the Zariski topology. This is clear from the definition, see Properties, Definition 23.5.1. Next, we show that if $S' \to S$ is a flat, finitely presented morphism of affines and S is locally Noetherian, then S' is locally Noetherian. This is Morphisms, Lemma 24.14.6. Finally, we have to show that if $S' \to S$ is a surjective flat, finitely presented morphism of affines and S' is locally Noetherian, then S is locally Noetherian. This follows from Algebra, Lemma 7.146.1. Thus (1), (2) and (3) of Lemma 31.11.2 hold and we win. $\square$

Lemma 31.12.2. *The property $\mathcal{P}(S) =$``S is Jacobson" is local in the fppf topology.*

Proof. We will use Lemma 31.11.2. First we note that ``being Jacobson" is local in the Zariski topology. This is Properties, Lemma 23.6.3. Next, we show that if $S' \to S$ is a flat, finitely presented morphism of affines and S is Jacobson, then S' is Jacobson. This is Morphisms, Lemma 24.15.9. Finally, we have to show that if $f : S' \to S$ is a surjective flat, finitely presented morphism of affines and S' is Jacobson, then S is Jacobson. Say $S = Spec(A)$ and $S' = Spec(B)$ and $S' \to S$ given by $A \to B$. Then $A \to B$ is finitely presented and faithfully flat. Moreover, the ring B is Jacobson, see Properties, Lemma 23.6.3.

By Algebra, Lemma 7.121.9 there exists a diagram

$$\begin{tikzcd} B \arrow[rr] & & B' \\ & A \arrow[ul] \arrow[ur] & \end{tikzcd}$$

with $A \to B'$ finitely presented, faithfully flat and quasi-finite. In particular, $B \to B'$ is finite type, and we see from Algebra, Proposition 7.31.18 that B' is Jacobson. Hence we may assume that $A \to B$ is quasi-finite as well as faithfully flat and of finite presentation.

Assume A is not Jacobson to get a contradiction. According to Algebra, Lemma 7.31.5 there exists a nonmaximal prime $\mathfrak{p} \subset A$ and an element $f \in A$, $f \notin \mathfrak{p}$ such that $V(\mathfrak{p}) \cap D(f) = \{\mathfrak{p}\}$.

This leads to a contradiction as follows. First let $\mathfrak{p} \subset \mathfrak{m}$ be a maximal ideal of A. Pick a prime $\mathfrak{m}' \subset B$ lying over $\mathfrak{m}$ (exists because $A \to B$ is faithfully flat, see Algebra, Lemma 7.35.15). As $A \to B$ is flat, by going down see Algebra, Lemma 7.35.17, we can find a prime $\mathfrak{q} \subset \mathfrak{m}'$ lying over $\mathfrak{p}$. In particular we see that $\mathfrak{q}$ is not maximal. Hence according to

Algebra, Lemma 7.31.5 again the set $V(\mathfrak{q}) \cap D(f)$ is infinite (here we finally use that B is Jacobson). All points of $V(\mathfrak{q}) \cap D(f)$ map to $V(\mathfrak{p}) \cap D(f) = \{\mathfrak{p}\}$. Hence the fibre over $\mathfrak{p}$ is infinite. This contradicts the fact that $A \to B$ is quasi-finite (see Algebra, Lemma 7.113.4 or more explicitly Morphisms, Lemma 24.19.10). Thus the lemma is proved. □

31.13. Properties of schemes local in the syntomic topology

In this section we find some properties of schemes which are local on the base in the syntomic topology.

Lemma 31.13.1. *The property $\mathcal{P}(S) =$``S is locally Noetherian and (S_k)'' is local in the syntomic topology.*

Proof. We will check (1), (2) and (3) of Lemma 31.11.2. As a syntomic morphism is flat of finite presentation (Morphisms, Lemmas 24.30.7 and 24.30.6) we have already checked this for ``being locally Noetherian'' in the proof of Lemma 31.12.1. We will use this without further mention in the proof. First we note that $\mathcal{P}$ is local in the Zariski topology. This is clear from the definition, see Coherent, Definition 25.13.1. Next, we show that if $S' \to S$ is a syntomic morphism of affines and S has $\mathcal{P}$, then S' has $\mathcal{P}$. This is Algebra, Lemma 7.145.4 (use Morphisms, Lemma 24.30.2 and Algebra, Definition 7.125.1 and Lemma 7.124.3). Finally, we show that if $S' \to S$ is a surjective syntomic morphism of affines and S' has $\mathcal{P}$, then S has $\mathcal{P}$. This is Algebra, Lemma 7.146.5. Thus (1), (2) and (3) of Lemma 31.11.2 hold and we win. □

Lemma 31.13.2. *The property $\mathcal{P}(S) =$``S is Cohen-Macaulay'' is local in the syntomic topology.*

Proof. This is clear from Lemma 31.13.1 above since a scheme is Cohen-Macaulay if and only if it is locally Noetherian and (S_k) for all $k \geq 0$, see Properties, Lemma 23.12.2. □

31.14. Properties of schemes local in the smooth topology

In this section we find some properties of schemes which are local on the base in the smooth topology.

Lemma 31.14.1. *The property $\mathcal{P}(S) =$``S is reduced'' is local in the smooth topology.*

Proof. We will use Lemma 31.11.2. First we note that ``being reduced'' is local in the Zariski topology. This is clear from the definition, see Schemes, Definition 21.12.1. Next, we show that if $S' \to S$ is a smooth morphism of affines and S is reduced, then S' is reduced. This is Algebra, Lemma 7.145.6. Finally, we show that if $S' \to S$ is a surjective smooth morphism of affines and S' is reduced, then S is reduced. This is Algebra, Lemma 7.146.2. Thus (1), (2) and (3) of Lemma 31.11.2 hold and we win. □

Lemma 31.14.2. *The property $\mathcal{P}(S) =$``S is normal'' is local in the smooth topology.*

Proof. We will use Lemma 31.11.2. First we show ``being normal'' is local in the Zariski topology. This is clear from the definition, see Properties, Definition 23.7.1. Next, we show that if $S' \to S$ is a smooth morphism of affines and S is normal, then S' is normal. This is Algebra, Lemma 7.145.7. Finally, we show that if $S' \to S$ is a surjective smooth morphism of affines and S' is normal, then S is normal. This is Algebra, Lemma 7.146.3. Thus (1), (2) and (3) of Lemma 31.11.2 hold and we win. □

Lemma 31.14.3. *The property $\mathcal{P}(S) =$``S is locally Noetherian and (R_k)'' is local in the smooth topology.*

Proof. We will check (1), (2) and (3) of Lemma 31.11.2. As a smooth morphism is flat of finite presentation (Morphisms, Lemmas 24.33.9 and 24.33.8) we have already checked this for ``being locally Noetherian'' in the proof of Lemma 31.12.1. We will use this without further mention in the proof. First we note that $\mathcal{P}$ is local in the Zariski topology. This is clear from the definition, see Properties, Definition 23.12.1. Next, we show that if $S' \to S$ is a smooth morphism of affines and S has $\mathcal{P}$, then S' has $\mathcal{P}$. This is Algebra, Lemmas 7.145.5 (use Morphisms, Lemma 24.33.2, Algebra, Lemmas 7.126.4 and 7.129.3). Finally, we show that if $S' \to S$ is a surjective smooth morphism of affines and S' has $\mathcal{P}$, then S has $\mathcal{P}$. This is Algebra, Lemma 7.146.5. Thus (1), (2) and (3) of Lemma 31.11.2 hold and we win. $\square$

Lemma 31.14.4. *The property $\mathcal{P}(S) =$``S is regular'' is local in the smooth topology.*

Proof. This is clear from Lemma 31.14.3 above since a locally Noetherian scheme is regular if and only if it is locally Noetherian and (R_k) for all $k \geq 0$. $\square$

Lemma 31.14.5. *The property $\mathcal{P}(S) =$``S is Nagata'' is local in the smooth topology.*

Proof. We will check (1), (2) and (3) of Lemma 31.11.2. First we note that being Nagata is local in the Zariski topology. This is Properties, Lemma 23.13.6. Next, we show that if $S' \to S$ is a smooth morphism of affines and S is Nagata, then S' is Nagata. This is Morphisms, Lemma 24.17.1. Finally, we show that if $S' \to S$ is a surjective smooth morphism of affines and S' is Nagata, then S is Nagata. This is Algebra, Lemma 7.146.7. Thus (1), (2) and (3) of Lemma 31.11.2 hold and we win. $\square$

31.15. Variants on descending properties

Sometimes one can descend properties, which are not local. We put results of this kind in this section.

Lemma 31.15.1. *If $f : X \to Y$ is a flat and surjective morphism of schemes and X is reduced, then Y is reduced.*

Proof. The result follows by looking at local rings (Schemes, Definition 21.12.1) and Algebra, Lemma 7.146.2. $\square$

Lemma 31.15.2. *Let $f : X \to Y$ be a morphism of algebraic spaces. If f is locally of finite presentation, flat, and surjective and X is regular, then Y is regular.*

Proof. This lemma reduces to the following algebra statement: If $A \to B$ is a faithfully flat, finitely presentated ring homomorphism with B Noetherian and regular, then A is Noetherian and regular. We see that A is Noetherian by Algebra, Lemma 7.146.1 and regular by Algebra, Lemma 7.102.8. $\square$

31.16. Germs of schemes

Definition 31.16.1. Germs of schemes.

1. A pair (X, x) consisting of a scheme X and a point $x \in X$ is called the *germ of X at x*.
2. A *morphism of germs* $f : (X, x) \to (S, s)$ is an equivalence class of morphisms of schemes $f : U \to S$ with $f(x) = s$ where $U \subset X$ is an open neighbourhood of x. Two such f, f' are said to be equivalent if and only if f and f' agree in some open neighbourhood of x.

(3) We define the *composition of morphisms of germs* by composing representatives (this is well defined).

Before we continue we need one more definition.

Definition 31.16.2. Let $f : (X, x) \to (S, s)$ be a morphism of germs. We say f is *étale* (resp. *smooth*) if there exists a representative $f : U \to S$ of f which is an étale morphism (resp. a smooth morphism) of schemes.

31.17. Local properties of germs

Definition 31.17.1. Let $\mathcal{P}$ be a property of germs of schemes. We say that $\mathcal{P}$ is *étale local* (resp. *smooth local*) if for any étale (resp. smooth) morphism of germs $(U', u') \to (U, u)$ we have $\mathcal{P}(U, u) \Leftrightarrow \mathcal{P}(U', u')$.

Let (X, x) be a germ of a scheme. The dimension of X at x is the minimum of the dimensions of open neighbourhoods of x in X, and any small enough open neighbourhood has this dimension. Hence this is an invariant of the isomorphism class of the germ. We denote this simply $\dim_x(X)$. The following lemma tells us that the assertion $\dim_x(X) = d$ is an étale local property of germs.

Lemma 31.17.2. *Let $f : U \to V$ be an étale morphism of schemes. Let $u \in U$ and $v = f(u)$. Then* $\dim_u(U) = \dim_v(V)$.

Proof. In the statement $\dim_u(U)$ is the dimension of U at u as defined in Topology, Definition 5.7.1 as the minimum of the Krull dimensions of open neighbourhoods of u in U. Similarly for $\dim_v(V)$.

Let us show that $\dim_v(V) \geq \dim_u(U)$. Let V' be an open neighbourhood of v in V. Then there exists an open neighbourhood U' of u in U contained in $f^{-1}(V')$ such that $\dim_u(U) = \dim(U')$. Suppose that $Z_0 \subset Z_1 \subset \ldots \subset Z_n$ is a chain of irreducible closed subschemes of U'. If $\xi_i \in Z_i$ is the generic point then we have specializations $\xi_n \rightsquigarrow \xi_{n-1} \rightsquigarrow \ldots \rightsquigarrow \xi_0$. This gives specializations $f(\xi_n) \rightsquigarrow f(\xi_{n-1}) \rightsquigarrow \ldots \rightsquigarrow f(\xi_0)$ in V'. Note that $f(\xi_j) \neq f(\xi_i)$ if $i \neq j$ as the fibres of f are discrete (see Morphisms, Lemma 24.35.7). Hence we see that $\dim(V') \geq n$. The inequality $\dim_v(V) \geq \dim_u(U)$ follows formally.

Let us show that $\dim_u(U) \geq \dim_v(V)$. Let U' be an open neighbourhood of u in U. Note that $V' = f(U')$ is an open neighbourhood of v by Morphisms, Lemma 24.24.9. Hence $\dim(V') \geq \dim_v(V)$. Pick a chain $Z_0 \subset Z_1 \subset \ldots \subset Z_n$ of irreducible closed subschemes of V'. Let $\xi_i \in Z_i$ be the generic point, so we have specializations $\xi_n \rightsquigarrow \xi_{n-1} \rightsquigarrow \ldots \rightsquigarrow \xi_0$. Since $\xi_0 \in f(U')$ we can find a point $\eta_0 \in U'$ with $f(\eta_0) = \xi_0$. Consider the map of local rings

$$\mathcal{O}_{V', \xi_0} \longrightarrow \mathcal{O}_{U', \eta_0}$$

which is a flat local ring map by Morphisms, Lemma 24.35.12. Note that the points ξ_i correspond to primes of the ring on the left by Schemes, Lemma 21.13.2. Hence by going down (see Algebra, Section 7.36) for the displayed ring map we can find a sequence of specializations $\eta_n \rightsquigarrow \eta_{n-1} \rightsquigarrow \ldots \rightsquigarrow \eta_0$ in U' mapping to the sequence $\xi_n \rightsquigarrow \xi_{n-1} \rightsquigarrow \ldots \rightsquigarrow \xi_0$ under f. This implies that $\dim_u(U) \geq \dim_v(V)$. $\square$

Let (X, x) be a germ of a scheme. The isomorphism class of the local ring $\mathcal{O}_{X,x}$ is an invariant of the germ. The following lemma says that the property $\dim(\mathcal{O}_{X,x}) = d$ is an étale local property of germs.

Lemma 31.17.3. *Let $f : U \to V$ be an étale morphism of schemes. Let $u \in U$ and $v = f(u)$. Then* $\dim(\mathcal{O}_{U,u}) = \dim(\mathcal{O}_{V,v})$.

Proof. The algebraic statement we are asked to prove is the following: If $A \to B$ is an étale ring map and $\mathfrak{q}$ is a prime of B lying over $\mathfrak{p} \subset A$, then $\dim(A_{\mathfrak{p}}) = \dim(B_{\mathfrak{q}})$.

Namely, because $A_{\mathfrak{p}} \to B_{\mathfrak{q}}$ is flat we have going down, and hence the inequality $\dim(A_{\mathfrak{p}}) \leq \dim(B_{\mathfrak{q}})$. On the other hand, suppose that $\mathfrak{q}_0 \subset \mathfrak{q}_1 \subset \ldots \subset \mathfrak{q}_n$ is a chain of primes in $B_{\mathfrak{q}}$. Then the corresponding sequence of primes $\mathfrak{p}_0 \subset \mathfrak{p}_1 \subset \ldots \subset \mathfrak{p}_n$ (with $\mathfrak{p}_i = \mathfrak{q}_i \cap A_{\mathfrak{p}}$) is chain also (i.e., no equalities in the sequence) as there are no specializations among the points in a fibre of and étale morphism, see Morphisms, Lemma 24.35.7. This means that $\dim(A_{\mathfrak{p}}) \geq \dim(B_{\mathfrak{q}})$ as desired. $\square$

31.18. Properties of morphisms local on the target

Suppose that $f : X \to Y$ is a morphism of schemes. Let $g : Y' \to Y$ be a morphism of schemes. Let $f' : X' \to Y'$ be the base change of f by g:

$$\begin{tikzcd} X' \arrow[r, "g'"] \arrow[d, "f'"'] & X \arrow[d, "f"] \\ Y' \arrow[r, "g"] & Y \end{tikzcd}$$

Let $\mathcal{P}$ be a property of morphisms of schemes. Then we can wonder if (a) $\mathcal{P}(f) \Rightarrow \mathcal{P}(f')$, and also whether the converse (b) $\mathcal{P}(f') \Rightarrow \mathcal{P}(f)$ is true. If (a) holds whenever g is flat, then we say $\mathcal{P}$ is preserved under flat base change. If (b) holds whenever g is surjective and flat, then we say $\mathcal{P}$ descends through flat surjective base changes. If $\mathcal{P}$ is preserved under flat base changes and descends through flat surjective base changes, then we say $\mathcal{P}$ is flat local on the target. Compare with the discussion in Section 31.11. This turns out to be a very important notion which we formalize in the following definition.

Definition 31.18.1. Let $\mathcal{P}$ be a property of morphisms of schemes over a base. Let $\tau \in \{fpqc, fppf, syntomic, smooth, étale, Zariski\}$. We say $\mathcal{P}$ is *τ local on the base*, or *τ local on the target*, or *local on the base for the τ-topology* if for any τ-covering $\{Y_i \to Y\}_{i \in I}$ (see Topologies, Section 30.2) and any morphism of schemes $f : X \to Y$ over S we have

$$f \text{ has } \mathcal{P} \Leftrightarrow \text{each } Y_i \times_Y X \to Y_i \text{ has } \mathcal{P}.$$

To be sure, since isomorphisms are always coverings we see (or require) that property $\mathcal{P}$ holds for $X \to Y$ if and only if it holds for any arrow $X' \to Y'$ isomorphic to $X \to Y$. If a property is τ-local on the target then it is preserved by base changes by morphisms which occur in τ-coverings. Here is a formal statement.

Lemma 31.18.2. *Let $\tau \in \{fpqc, fppf, syntomic, smooth, étale, Zariski\}$. Let $\mathcal{P}$ be a property of morphisms which is τ local on the target. Let $f : X \to Y$ have property $\mathcal{P}$. For any morphism $Y' \to Y$ which is flat, resp. flat and locally of finite presentation, resp. syntomic, resp. étale, resp. an open immersion, the base change $f' : Y' \times_Y X \to Y'$ of f has property $\mathcal{P}$.*

Proof. This is true because we can fit $Y' \to Y$ into a family of morphisms which forms a τ-covering. $\square$

A simple often used consequence of the above is that if $f : X \to Y$ has property $\mathcal{P}$ which is τ-local on the target and $f(X) \subset V$ for some open subscheme $V \subset Y$, then also the induced morphism $X \to V$ has $\mathcal{P}$. Proof: The base change f by $V \to Y$ gives $X \to V$.

Lemma 31.18.3. *Let $\tau \in \{fppf, syntomic, smooth, étale\}$. Let $\mathcal{P}$ be a property of morphisms which is τ local on the target. For any morphism of schemes $f : X \to Y$ there exists a largest open $W(f) \subset Y$ such that the restriction $X_{W(f)} \to W(f)$ has $\mathcal{P}$. Moreover,*

(1) *if $g : Y' \to Y$ is flat and locally of finite presentation, syntomic, smooth, or étale and the base change $f' : X_{Y'} \to Y'$ has $\mathcal{P}$, then $g(Y') \subset W(f)$,*
(2) *if $g : Y' \to Y$ is flat and locally of finite presentation, syntomic, smooth, or étale, then $W(f') = g^{-1}(W(f))$, and*
(3) *if $\{g_i : Y_i \to Y\}$ is a τ-covering, then $g_i^{-1}(W(f)) = W(f_i)$, where f_i is the base change of f by $Y_i \to Y$.*

Proof. Consider the union W of the images $g(Y') \subset Y$ of morphisms $g : Y' \to Y$ with the properties:

(1) g is flat and locally of finite presentation, syntomic, smooth, or étale, and
(2) the base change $Y' \times_{g,Y} X \to Y'$ has property $\mathcal{P}$.

Since such a morphism g is open (see Morphisms, Lemma 24.24.9) we see that $W \subset Y$ is an open subset of Y. Since $\mathcal{P}$ is local in the τ topology the restriction $X_W \to W$ has property $\mathcal{P}$ because we are given a covering $\{Y' \to W\}$ of W such that the pullbacks have $\mathcal{P}$. This proves the existence and proves that $W(f)$ has property (1). To see property (2) note that $W(f') \supset g^{-1}(W(f))$ because $\mathcal{P}$ is stable under base change by flat and locally of finite presentation, syntomic, smooth, or étale morphisms, see Lemma 31.18.2. On the other hand, if $Y'' \subset Y'$ is an open such that $X_{Y''} \to Y''$ has property $\mathcal{P}$, then $Y'' \to Y$ factors through W by construction, i.e., $Y'' \subset g^{-1}(W(f))$. This proves (2). Assertion (3) follows from (2) because each morphism $Y_i \to Y$ is flat and locally of finite presentation, syntomic, smooth, or étale by our definition of a τ-covering. $\square$

Lemma 31.18.4. *Let $\mathcal{P}$ be a property of morphisms of schemes over a base. Let $\tau \in \{fpqc, fppf, étale, smooth, syntomic\}$. Assume that*

(1) *the property is preserved under flat, flat of finite presentation, étale, smooth or syntomic base change depending on whether τ is fpqc, fppf, étale, smooth, or syntomic (compare with Schemes, Definition 21.18.3),*
(2) *the property is Zariski local on the base.*
(3) *for any surjective morphism of affine schemes $S' \to S$ which is flat, flat of finite presentation, étale, smooth or syntomic depending on whether τ is fpqc, fppf, étale, smooth, or syntomic, and any morphism of schemes $f : X \to S$ property $\mathcal{P}$ holds for f if property $\mathcal{P}$ holds for the base change $f' : X' = S' \times_S X \to S'$.*

Then $\mathcal{P}$ is τ local on the base.

Proof. This follows almost immediately from the definition of a τ-covering, see Topologies, Definition 30.8.1 30.7.1 30.4.1 30.5.1, or 30.6.1 and Topologies, Lemma 30.8.8, 30.7.4, 30.4.4, 30.5.4, or 30.6.4. Details omitted. $\square$

Remark 31.18.5. (This is a repeat of Remark 31.11.3 above.) In Lemma 31.18.4 above if $\tau = smooth$ then in condition (3) we may assume that the morphism is a (surjective) standard smooth morphism. Similarly, when $\tau = syntomic$ or $\tau = étale$.

31.19. Properties of morphisms local in the fpqc topology on the target

In this section we find a large number of properties of morphisms of schemes which are local on the base in the fpqc topology.

Lemma 31.19.1. *The property $\mathcal{P}(f) =$``f is quasi-compact'' is fpqc local on the base.*

Proof. A base change of a quasi-compact morphism is quasi-compact, see Schemes, Lemma 21.19.3. Being quasi-compact is Zariski local on the base, see Schemes, Lemma 21.19.2. Finally, let $S' \to S$ be a flat surjective morphism of affine schemes, and let $f : X \to S$ be a morphism. Assume that the base change $f' : X' \to S'$ is quasi-compact. Then X' is quasi-compact, and $X' \to X$ is surjective. Hence X is quasi-compact. This implies that f is quasi-compact. Therefore Lemma 31.18.4 applies and we win. $\square$

Lemma 31.19.2. *The property $\mathcal{P}(f) =$``f is quasi-separated'' is fpqc local on the base.*

Proof. Any base change of a quasi-separated morphism is quasi-separated, see Schemes, Lemma 21.21.13. Being quasi-separated is Zariski local on the base (from the definition or by Schemes, Lemma 21.21.7). Finally, let $S' \to S$ be a flat surjective morphism of affine schemes, and let $f : X \to S$ be a morphism. Assume that the base change $f' : X' \to S'$ is quasi-separated. This means that $\Delta' : X' \to X' \times_{S'} X'$ is quasi-compact. Note that Δ' is the base change of $\Delta : X \to X \times_S X$ via $S' \to S$. By Lemma 31.19.1 this implies Δ is quasi-compact, and hence f is quasi-separated. Therefore Lemma 31.18.4 applies and we win. $\square$

Lemma 31.19.3. *The property $\mathcal{P}(f) =$``f is universally closed'' is fpqc local on the base.*

Proof. A base change of a universally closed morphism is universally closed by definition. Being universally closed is Zariski local on the base (from the definition or by Morphisms, Lemma 24.40.2). Finally, let $S' \to S$ be a flat surjective morphism of affine schemes, and let $f : X \to S$ be a morphism. Assume that the base change $f' : X' \to S'$ is universally closed. Let $T \to S$ be any morphism. Consider the diagram

$$\begin{tikzcd} X' \arrow[d] & S' \times_S T \times_S X \arrow[l] \arrow[r] \arrow[d] & T \times_S X \arrow[d] \\ S' & S' \times_S T \arrow[l] \arrow[r] & T \end{tikzcd}$$

in which both squares are cartesian. Thus the assumption implies that the middle vertical arrow is closed. The right horizontal arrows are flat, quasi-compact and surjective (as base changes of $S' \to S$). Hence a subset of T is closed if and only if its inverse image in $S' \times_S T$ is closed, see Morphisms, Lemma 24.24.10. An easy diagram chase shows that the right vertical arrow is closed too, and we conclude $X \to S$ is universally closed. Therefore Lemma 31.18.4 applies and we win. $\square$

Lemma 31.19.4. *The property $\mathcal{P}(f) =$``f is universally open'' is fpqc local on the base.*

Proof. The proof is the same as the proof of Lemma 31.19.3. $\square$

Lemma 31.19.5. *The property $\mathcal{P}(f) =$``f is separated'' is fpqc local on the base.*

Proof. A base change of a separated morphism is separated, see Schemes, Lemma 21.21.13. Being separated is Zariski local on the base (from the definition or by Schemes, Lemma 21.21.8). Finally, let $S' \to S$ be a flat surjective morphism of affine schemes, and let $f : X \to S$ be a morphism. Assume that the base change $f' : X' \to S'$ is separated. This means that $\Delta' : X' \to X' \times_{S'} X'$ is a closed immersion, hence universally closed. Note that Δ' is the base change of $\Delta : X \to X \times_S X$ via $S' \to S$. By Lemma 31.19.3 this implies Δ is universally closed. Since it is an immersion (Schemes, Lemma 21.21.2) we conclude Δ is a closed immersion. Hence f is separated. Therefore Lemma 31.18.4 applies and we win. $\square$

Lemma 31.19.6. *The property $\mathcal{P}(f)=$"f is surjective" is fpqc local on the base.*

Proof. This is clear. □

Lemma 31.19.7. *The property $\mathcal{P}(f)=$"f is universally injective" is fpqc local on the base.*

Proof. A base change of a universally injective morphism is universally injective (this is formal). Being universally injective is Zariski local on the base; this is clear from the definition. Finally, let $S' \to S$ be a flat surjective morphism of affine schemes, and let $f : X \to S$ be a morphism. Assume that the base change $f' : X' \to S'$ is universally injective. Let K be a field, and let $a, b : Spec(K) \to X$ be two morphisms such that $f \circ a = f \circ b$. As $S' \to S$ is surjective and by the discussion in Schemes, Section 21.13 there exists a field extension $K \subset K'$ and a morphism $Spec(K') \to S'$ such that the following solid diagram commutes

$$\begin{tikzcd}
Spec(K') \arrow[dr, dashed, "{a', b'}"'] \arrow[drr] \arrow[dd] & & \\
& X' \arrow[r] \arrow[d] & S' \arrow[d] \\
Spec(K) \arrow[r, "{a,b}"] & X \arrow[r] & S
\end{tikzcd}$$

As the square is cartesian we get the two dotted arrows a', b' making the diagram commute. Since $X' \to S'$ is universally injective we get $a' = b'$, by Morphisms, Lemma 24.10.2. Clearly this forces $a = b$ (by the discussion in Schemes, Section 21.13). Therefore Lemma 31.18.4 applies and we win.

An alternative proof would be to use the characterization of a universally injective morphism as one whose diagonal is surjective, see Morphisms, Lemma 24.10.2. The lemma then follows from the fact that the property of being surjective is fpqc local on the base, see Lemma 31.19.6. (Hint: use that the base change of the diagonal is the diagonal of the base change.) □

Lemma 31.19.8. *The property $\mathcal{P}(f)=$"f is locally of finite type" is fpqc local on the base.*

Proof. Being locally of finite type is preserved under base change, see Morphisms, Lemma 24.14.4. Being locally of finite type is Zariski local on the base, see Morphisms, Lemma 24.14.2. Finally, let $S' \to S$ be a flat surjective morphism of affine schemes, and let $f : X \to S$ be a morphism. Assume that the base change $f' : X' \to S'$ is locally of finite type. Let $U \subset X$ be an affine open. Then $U' = S' \times_S U$ is affine and of finite type over S'. Write $S = Spec(R)$, $S' = Spec(R')$, $U = Spec(A)$, and $U' = Spec(A')$. We know that $R \to R'$ is faithfully flat, $A' = R' \otimes_R A$ and $R' \to A'$ is of finite type. We have to show that $R \to A$ is of finite type. This is the result of Algebra, Lemma 7.117.1. It follows that f is locally of finite type. Therefore Lemma 31.18.4 applies and we win. □

Lemma 31.19.9. *The property $\mathcal{P}(f)=$"f is locally of finite presentation" is fpqc local on the base.*

Proof. Being locally of finite presentation is preserved under base change, see Morphisms, Lemma 24.20.4. Being locally of finite type is Zariski local on the base, see Morphisms, Lemma 24.20.2. Finally, let $S' \to S$ be a flat surjective morphism of affine schemes, and let $f : X \to S$ be a morphism. Assume that the base change $f' : X' \to S'$ is locally of finite presentation. Let $U \subset X$ be an affine open. Then $U' = S' \times_S U$ is affine and of finite type over S'. Write $S = Spec(R)$, $S' = Spec(R')$, $U = Spec(A)$, and $U' = Spec(A')$. We know that $R \to R'$ is faithfully flat, $A' = R' \otimes_R A$ and $R' \to A'$ is of finite presentation. We have to show that $R \to A$ is of finite presentation. This is the result of Algebra, Lemma 7.117.2. It follows that f is locally of finite presentation. Therefore Lemma 31.18.4 applies and we win. □

Lemma 31.19.10. *The property $\mathcal{P}(f) =$``f is of finite type'' is fpqc local on the base.*

Proof. Combine Lemmas 31.19.1 and 31.19.8. □

Lemma 31.19.11. *The property $\mathcal{P}(f) =$``f is of finite presentation'' is fpqc local on the base.*

Proof. Combine Lemmas 31.19.1, 31.19.2 and 31.19.9. □

Lemma 31.19.12. *The property $\mathcal{P}(f) =$``f is proper'' is fpqc local on the base.*

Proof. The lemma follows by combining Lemmas 31.19.3, 31.19.5 and 31.19.10. □

Lemma 31.19.13. *The property $\mathcal{P}(f) =$``f is flat'' is fpqc local on the base.*

Proof. Being flat is preserved under arbitrary base change, see Morphisms, Lemma 24.24.7. Being flat is Zariski local on the base by definition. Finally, let $S' \to S$ be a flat surjective morphism of affine schemes, and let $f : X \to S$ be a morphism. Assume that the base change $f' : X' \to S'$ is flat. Let $U \subset X$ be an affine open. Then $U' = S' \times_S U$ is affine and of finite type over S'. Write $S = Spec(R)$, $S' = Spec(R')$, $U = Spec(A)$, and $U' = Spec(A')$. We know that $R \to R'$ is faithfully flat, $A' = R' \otimes_R A$ and $R' \to A'$ is flat. Goal: Show that $R \to A$ is flat. This follows immediately from Algebra, Lemma 7.35.7. Hence f is flat. Therefore Lemma 31.18.4 applies and we win. □

Lemma 31.19.14. *The property $\mathcal{P}(f) =$``f is an open immersion'' is fpqc local on the base.*

Proof. The property of being an open immersion is stable under base change, see Schemes, Lemma 21.18.2. The property of being an open immersion is Zariski local on the base (this is obvious). Finally, let $S' \to S$ be a flat surjective morphism of affine schemes, and let $f : X \to S$ be a morphism. Assume that the base change $f' : X' \to S'$ is an open immersion. Then f' is universally open, and universally injective. Hence we conclude that f is universally open by Lemma 31.19.4, and universally injective by Lemma 31.19.7. In particular $f(X) \subset S$ is open, and we may replace S by $f(S)$ and assume that f is surjective. This implies that f' is an isomorphism and we have to show that f is an isomorphism also. Since f is universally injective we see that f is bijective. Hence f is a homeomorphism. Let $x \in X$ and choose $U \subset X$ an affine open neighbourhood of x. Since $f(U) \subset S$ is open, and S is affine we may choose a standard open $D(g) \subset f(U)$ containing $f(x)$ where $g \in \Gamma(S, \mathcal{O}_S)$. It is clear that $U \cap f^{-1}(D(g))$ is still affine and still an open neighbourhood of x. Replace U by $U \cap f^{-1}(D(g))$ and write $V = D(g) \subset S$ and V' the inverse image of V in S'. Note that V' is a standard open of S' as well and in particular that V' is affine. Since f' is an isomorphism we have $V' \times_V U \to V'$ is an isomorphism. In terms of rings this means that

$$\mathcal{O}(V') \longrightarrow \mathcal{O}(V') \otimes_{\mathcal{O}(V)} \mathcal{O}(U)$$

is an isomorphism. Since $\mathcal{O}(V) \to \mathcal{O}(V')$ is faithfully flat this implies that $\mathcal{O}(V) \to \mathcal{O}(U)$ is an isomorphism. Hence $U \cong V$ and we see that f is an isomorphism. Therefore Lemma 31.18.4 applies and we win. □

Lemma 31.19.15. *The property $\mathcal{P}(f) =$``f is an isomorphism" is fpqc local on the base.*

Proof. Combine Lemmas 31.19.6 and 31.19.14. □

Lemma 31.19.16. *The property $\mathcal{P}(f) =$``f is affine" is fpqc local on the base.*

Proof. A base change of an affine morphism is affine, see Morphisms, Lemma 24.11.8. Being affine is Zariski local on the base, see Morphisms, Lemma 24.11.3. Finally, let $g : S' \to S$ be a flat surjective morphism of affine schemes, and let $f : X \to S$ be a morphism. Assume that the base change $f' : X' \to S'$ is affine. In other words, X' is affine, say $X' = Spec(A')$. Also write $S = Spec(R)$ and $S' = Spec(R')$. We have to show that X is affine.

By Lemmas 31.19.1 and 31.19.5 we see that $X \to S$ is separated and quasi-compact. Thus $f_*\mathcal{O}_X$ is a quasi-coherent sheaf of $\mathcal{O}_S$-algebras, see Schemes, Lemma 21.24.1. Hence $f_*\mathcal{O}_X = \widetilde{A}$ for some R-algebra A. In fact $A = \Gamma(X, \mathcal{O}_X)$ of course. Also, by flat base change (see for example Coherent, Lemma 25.6.2) we have $g^*f_*\mathcal{O}_X = f'_*\mathcal{O}_{X'}$. In other words, we have $A' = R' \otimes_R A$. Consider the canonical morphism

$$X \longrightarrow Spec(A)$$

over S from Schemes, Lemma 21.6.4. By the above the base change of this morphism to S' is an isomorphism. Hence it is an isomorphism by Lemma 31.19.15. Therefore Lemma 31.18.4 applies and we win. □

Lemma 31.19.17. *The property $\mathcal{P}(f) =$``f is a closed immersion" is fpqc local on the base.*

Proof. Let $f : X \to Y$ be a morphism of schemes. Let $\{Y_i \to Y\}$ be an fpqc covering. Assume that each $f_i : Y_i \times_Y X \to Y_i$ is a closed immersion. This implies that each f_i is affine, see Morphisms, Lemma 24.11.9. By Lemma 31.19.16 we conclude that f is affine. It remains to show that $\mathcal{O}_Y \to f_*\mathcal{O}_X$ is surjective. For every $y \in Y$ there exists an i and a point $y_i \in Y_i$ mapping to y. By Coherent, Lemma 25.6.2 the sheaf $f_{i,*}(\mathcal{O}_{Y_i \times_Y X})$ is the pullback of $f_*\mathcal{O}_X$. By assumption it is a quotient of $\mathcal{O}_{Y_i}$. Hence we see that

$$\left(\mathcal{O}_{Y,y} \longrightarrow (f_*\mathcal{O}_X)_y\right) \otimes_{\mathcal{O}_{Y,y}} \mathcal{O}_{Y_i,y_i}$$

is surjective. Since $\mathcal{O}_{Y_i,y_i}$ is faithfully flat over $\mathcal{O}_{Y,y}$ this implies the surjectivity of $\mathcal{O}_{Y,y} \longrightarrow (f_*\mathcal{O}_X)_y$ as desired. □

Lemma 31.19.18. *The property $\mathcal{P}(f) =$``f is quasi-affine" is fpqc local on the base.*

Proof. Let $f : X \to Y$ be a morphism of schemes. Let $\{g_i : Y_i \to Y\}$ be an fpqc covering. Assume that each $f_i : Y_i \times_Y X \to Y_i$ is quasi-affine. This implies that each f_i is quasi-compact and separated. By Lemmas 31.19.1 and 31.19.5 this implies that f is quasi-compact and separated. Consider the sheaf of $\mathcal{O}_Y$-algebras $\mathcal{A} = f_*\mathcal{O}_X$. By Schemes, Lemma 21.24.1 it is a quasi-coherent $\mathcal{O}_Y$-algebra. Consider the canonical morphism

$$j : X \longrightarrow \underline{Spec}_Y(\mathcal{A})$$

see Constructions, Lemma 22.4.7. By flat base change (see for example Coherent, Lemma 25.6.2) we have $g_i^*f_*\mathcal{O}_X = f_{i,*}\mathcal{O}_{X'}$ where $g_i : Y_i \to Y$ are the given flat maps. Hence the base change j_i of j by g_i is the canonical morphism of Constructions, Lemma 22.4.7 for the morphism f_i. By assumption and Morphisms, Lemma 24.12.3 all of these morphisms j_i are quasi-compact open immersions. Hence, by Lemmas 31.19.1 and 31.19.14 we see that j is a quasi-compact open immersion. Hence by Morphisms, Lemma 24.12.3 again we conclude that f is quasi-affine. □

Lemma 31.19.19. *The property $\mathcal{P}(f) =$``f is a quasi-compact immersion" is fpqc local on the base.*

Proof. Let $f : X \to Y$ be a morphism of schemes. Let $\{Y_i \to Y\}$ be an fpqc covering. Write $X_i = Y_i \times_Y X$ and $f_i : X_i \to Y_i$ the base change of f. Also denote $q_i : Y_i \to Y$ the given flat morphisms. Assume each f_i is a quasi-compact immersion. By Schemes, Lemma 21.23.7 each f_i is separated. By Lemmas 31.19.1 and 31.19.5 this implies that f is quasi-compact and separated. Let $X \to Z \to Y$ be the factorization of f through its scheme theoretic image. By Morphisms, Lemma 24.4.3 the closed subscheme $Z \subset Y$ is cut out by the quasi-coherent sheaf of ideals $\mathcal{I} = \mathrm{Ker}(\mathcal{O}_Y \to f_*\mathcal{O}_X)$ as f is quasi-compact. By flat base change (see for example Coherent, Lemma 25.6.2; here we use f is separated) we see $f_{i,*}\mathcal{O}_{X_i}$ is the pullback $q_i^*f_*\mathcal{O}_X$. Hence $Y_i \times_Y Z$ is cut out by the quasi-coherent sheaf of ideals $q_i^*\mathcal{I} = \mathrm{Ker}(\mathcal{O}_{Y_i} \to f_{i,*}\mathcal{O}_{X_i})$. By Morphisms, Lemma 24.5.7 the morphisms $X_i \to Y_i \times_Y Z$ are open immersions. Hence by Lemma 31.19.14 we see that $X \to Z$ is an open immersion and hence f is a immersion as desired (we already saw it was quasi-compact). $\square$

Lemma 31.19.20. *The property $\mathcal{P}(f) =$``f is integral" is fpqc local on the base.*

Proof. An integral morphism is the same thing as an affine, universally closed morphism. See Morphisms, Lemma 24.42.7. Hence the lemma follows on combining Lemmas 31.19.3 and 31.19.16. $\square$

Lemma 31.19.21. *The property $\mathcal{P}(f) =$``f is finite" is fpqc local on the base.*

Proof. An finite morphism is the same thing as an integral, morphism which is locally of finite type. See Morphisms, Lemma 24.42.4. Hence the lemma follows on combining Lemmas 31.19.8 and 31.19.20. $\square$

Lemma 31.19.22. *The properties $\mathcal{P}(f) =$``$f$ is locally quasi-finite" and $\mathcal{P}(f) =$``f is quasi-finite" are fpqc local on the base.*

Proof. Let $f : X \to S$ be a morphism of schemes, and let $\{S_i \to S\}$ be an fpqc covering such that each base change $f_i : X_i \to S_i$ is locally quasi-finite. We have already seen (Lemma 31.19.8) that ``locally of finite type" is fpqc local on the base, and hence we see that $f$ is locally of finite type. Then it follows from Morphisms, Lemma 24.19.13 that $f$ is locally quasi-finite. The quasi-finite case follows as we have already seen that ``quasi-compact" is fpqc local on the base (Lemma 31.19.1). $\square$

Lemma 31.19.23. *The property $\mathcal{P}(f) =$``f is locally of finite type of relative dimension d" is fpqc local on the base.*

Proof. This follows immediately from the fact that being locally of finite type is fpqc local on the base and Morphisms, Lemma 24.27.3. $\square$

Lemma 31.19.24. *The property $\mathcal{P}(f) =$``f is syntomic" is fpqc local on the base.*

Proof. A morphism is syntomic if and only if it is locally of finite presentation, flat, and has locally complete intersections as fibres. We have seen already that being flat and locally of finite presentation are fpqc local on the base (Lemmas 31.19.13, and 31.19.9). Hence the result follows for syntomic from Morphisms, Lemma 24.30.12. $\square$

Lemma 31.19.25. *The property $\mathcal{P}(f) =$``f is smooth" is fpqc local on the base.*

Proof. A morphism is smooth if and only if it is locally of finite presentation, flat, and has smooth fibres. We have seen already that being flat and locally of finite presentation are fpqc local on the base (Lemmas 31.19.13, and 31.19.9). Hence the result follows for smooth from Morphisms, Lemma 24.33.15. □

Lemma 31.19.26. *The property $\mathcal{P}(f) =$``$f$ is unramified'' is fpqc local on the base. The property $\mathcal{P}(f) =$``f is G-unramified'' is fpqc local on the base.*

Proof. A morphism is unramified (resp. G-unramified) if and only if it is locally of finite type (resp. finite presentation) and its diagonal morphism is an open immersion (see Morphisms, Lemma 24.34.13). We have seen already that being locally of finite type (resp. locally of finite presentation) and an open immersion is fpqc local on the base (Lemmas 31.19.9, 31.19.8, and 31.19.14). Hence the result follows formally. □

Lemma 31.19.27. *The property $\mathcal{P}(f) =$``f is étale'' is fpqc local on the base.*

Proof. A morphism is étale if and only if it flat and G-unramified. See Morphisms, Lemma 24.35.16. We have seen already that being flat and G-unramified are fpqc local on the base (Lemmas 31.19.13, and 31.19.26). Hence the result follows. □

Lemma 31.19.28. *The property $\mathcal{P}(f) =$``$f$ is finite locally free'' is fpqc local on the base. Let $d \geq 0$. The property $\mathcal{P}(f) =$``f is finite locally free of degree d'' is fpqc local on the base.*

Proof. Being finite locally free is equivalent to being finite, flat and locally of finite presentation (Morphisms, Lemma 24.44.2). Hence this follows from Lemmas 31.19.21, 31.19.13, and 31.19.9. If $f : Z \to U$ is finite locally free, and $\{U_i \to U\}$ is a surjective family of morphisms such that each pullback $Z \times_U U_i \to U_i$ has degree d, then $Z \to U$ has degree d, for example because we can read off the degree in a point $u \in U$ from the fibre $(f_*\mathcal{O}_Z)_u \otimes_{\mathcal{O}_{U,u}} \kappa(u)$. □

Lemma 31.19.29. *The property $\mathcal{P}(f) =$``f is a monomorphism'' is fpqc local on the base.*

Proof. Let $f : X \to S$ be a morphism of schemes. Let $\{S_i \to S\}$ be an fpqc covering, and assume each of the base changes $f_i : X_i \to S_i$ of f is a monomorphism. Let $a, b : T \to X$ be two morphisms such that $f \circ a = f \circ b$. We have to show that $a = b$. Since f_i is a monomorphism we see that $a_i = b_i$, where $a_i, b_i : S_i \times_S T \to X_i$ are the base changes. In particular the compositions $S_i \times_S T \to T \to X$ are equal. Since $\coprod S_i \times_S T \to T$ is an epimorphism (see e.g. Lemma 31.9.3) we conclude $a = b$. □

Lemma 31.19.30. *The properties*

$\mathcal{P}(f) =$``f is a Koszul-regular immersion'',
$\mathcal{P}(f) =$``f is an H_1-regular immersion'', and
$\mathcal{P}(f) =$``f is a quasi-regular immersion''

are fpqc local on the base.

Proof. We will use the criterion of Lemma 31.18.4 to prove this. By Divisors, Definition 26.13.1 being a Koszul-regular (resp. H_1-regular, quasi-regular) immersion is Zariski local on the base. By Divisors, Lemma 26.13.4 being a Koszul-regular (resp. H_1-regular, quasi-regular) immersion is preserved under flat base change. The final hypothesis (3) of Lemma 31.18.4 translates into the following algebra statement: Let $A \to B$ be a faithfully flat ring map. Let $I \subset A$ be an ideal. If IB is locally on $Spec(B)$ generated by a Koszul-regular (resp. H_1-regular, quasi-regular) sequence in B, then $I \subset A$ is locally on $Spec(A)$ generated by a Koszul-regular (resp. H_1-regular, quasi-regular) sequence in A. This is More on Algebra, Lemma 12.23.3. □

31.20. Properties of morphisms local in the fppf topology on the target

In this section we find some properties of morphisms of schemes for which we could not (yet) show they are local on the base in the fpqc topology which, however, are local on the base in the fppf topology.

Lemma 31.20.1. *The property $\mathcal{P}(f) =$``f is an immersion'' is fppf local on the base.*

Proof. The property of being an immersion is stable under base change, see Schemes, Lemma 21.18.2. The property of being an immersion is Zariski local on the base. Finally, let $\pi : S' \to S$ be a surjective morphism of affine schemes, which is flat and locally of finite presentation. Note that $\pi : S' \to S$ is open by Morphisms, Lemma 24.24.9. Let $f : X \to S$ be a morphism. Assume that the base change $f' : X' \to S'$ is an immersion. In particular we see that $f'(X') = \pi^{-1}(f(X))$ is locally closed. Hence by Topology, Lemma 5.15.2 we see that $f(X) \subset S$ is locally closed. Let $Z \subset S$ be the closed subset $Z = \overline{f(X)} \setminus f(X)$. By Topology, Lemma 5.15.2 again we see that $f'(X')$ is closed in $S' \setminus Z'$. Hence we may apply Lemma 31.19.17 to the fpqc covering $\{S' \setminus Z' \to S \setminus Z\}$ and conclude that $f : X \to S \setminus Z$ is a closed immersion. In other words, f is an immersion. Therefore Lemma 31.18.4 applies and we win. □

31.21. Application of fpqc descent of properties of morphisms

The following lemma may seem a bit frivolous but turns out is a useful tool in studying étale and unramified morphisms.

Lemma 31.21.1. *Let $f : X \to Y$ be a flat, quasi-compact, surjective monomorphism. Then f is an isomorphism.*

Proof. As f is a flat, quasi-compact, surjective morphism we see $\{X \to Y\}$ is an fpqc covering of Y. The diagonal $\Delta : X \to X \times_Y X$ is an isomorphism. This implies that the base change of f by f is an isomorphism. Hence we see f is an isomorphism by Lemma 31.19.15. □

We can use this lemma to show the following important result. We will discuss this and related results in more detail in Étale Morphisms, Section 37.14.

Lemma 31.21.2. *A universally injective étale morphism is an open immersion.*

Proof. Let $f : X \to Y$ be an étale morphism which is universally injective. Then f is open (Morphisms, Lemma 24.35.13) hence we can replace Y by $f(X)$ and we may assume that f is surjective. Then f is bijective and open hence a homeomorphism. Hence f is quasi-compact. Thus by Lemma 31.21.1 it suffices to show that f is a monomorphism. As $X \to Y$ is étale the morphism $\Delta_{X/Y} : X \to X \times_Y X$ is an open immersion by Morphisms, Lemma 24.34.13 (and Morphisms, Lemma 24.35.16). As f is universally injective $\Delta_{X/Y}$ is also surjective, see Morphisms, Lemma 24.10.2. Hence $\Delta_{X/Y}$ is an isomorphism, i.e., $X \to Y$ is a monomorphism. □

31.22. Properties of morphisms local on the source

It often happens one can prove a morphism has a certain property after precomposing with some other morphism. In many cases this implies the morphism has the property too. We formalize this in the following definition.

Definition 31.22.1. Let $\mathcal{P}$ be a property of morphisms of schemes. Let $\tau \in \{Zariski, fpqc, fppf, étale, smooth, syntomic\}$. We say $\mathcal{P}$ is *τ local on the source*, or *local on the source for the τ-topology* if for any morphism of schemes $f : X \to Y$ over S, and any τ-covering $\{X_i \to X\}_{i \in I}$ we have

$$f \text{ has } \mathcal{P} \Leftrightarrow \text{each } X_i \to Y \text{ has } \mathcal{P}.$$

To be sure, since isomorphisms are always coverings we see (or require) that property $\mathcal{P}$ holds for $X \to Y$ if and only if it holds for any arrow $X' \to Y'$ isomorphic to $X \to Y$. If a property is τ-local on the source then it is preserved by precomposing with morphisms which occur in τ-coverings. Here is a formal statement.

Lemma 31.22.2. *Let $\tau \in \{fpqc, fppf, syntomic, smooth, étale, Zariski\}$. Let $\mathcal{P}$ be a property of morphisms which is τ local on the source. Let $f : X \to Y$ have property $\mathcal{P}$. For any morphism $a : X' \to X$ which is flat, resp. flat and locally of finite presentation, resp. syntomic, resp. étale, resp. an open immersion, the composition $f \circ a : X' \to Y$ has property $\mathcal{P}$.*

Proof. This is true because we can fit $X' \to X$ into a family of morphisms which forms a τ-covering. □

Lemma 31.22.3. *Let $\mathcal{P}$ be a property of morphisms of schemes. Let $\tau \in \{fpqc, fppf, étale, smooth, syntomic\}$. Assume that*

(1) *the property is preserved under precomposing with flat, flat locally of finite presentation, étale, smooth or syntomic morphisms depending on whether τ is fpqc, fppf, étale, smooth, or syntomic,*
(2) *the property is Zariski local on the source,*
(3) *the property is Zariski local on the target,*
(4) *for any morphism of affine schemes $X \to Y$, and any surjective morphism of affine schemes $X' \to X$ which is flat, flat of finite presentation, étale, smooth or syntomic depending on whether τ is fpqc, fppf, étale, smooth, or syntomic, property $\mathcal{P}$ holds for f if property $\mathcal{P}$ holds for the composition $f' : X' \to Y$.*

Then $\mathcal{P}$ is τ local on the source.

Proof. This follows almost immediately from the definition of a τ-covering, see Topologies, Definition 30.8.1 30.7.1 30.4.1 30.5.1, or 30.6.1 and Topologies, Lemma 30.8.8, 30.7.4, 30.4.4, 30.5.4, or 30.6.4. Details omitted. (Hint: Use locality on the source and target to reduce the verification of property $\mathcal{P}$ to the case of a morphism between affines. Then apply (1) and (4).) □

Remark 31.22.4. (This is a repeat of Remarks 31.11.3 and 31.18.5 above.) In Lemma 31.22.3 above if $\tau = smooth$ then in condition (4) we may assume that the morphism is a (surjective) standard smooth morphism. Similarly, when $\tau = syntomic$ or $\tau = étale$.

31.23. Properties of morphisms local in the fpqc topology on the source

Here are some properties of morphisms that are fpqc local on the source.

Lemma 31.23.1. *The property $\mathcal{P}(f)$ =``f is flat'' is fpqc local on the source.*

Proof. Since flatness is defined in terms of the maps of local rings (Morphisms, Definition 24.24.1) what has to be shown is the following algebraic fact: Suppose $A \to B \to C$ are local homomorphisms of local rings, and assume $B \to C$ are flat. Then $A \to B$ is flat if and only if $A \to C$ is flat. If $A \to B$ is flat, then $A \to C$ is flat by Algebra, Lemma 7.35.3. Conversely, assume $A \to C$ is flat. Note that $B \to C$ is faithfully flat, see Algebra, Lemma 7.35.16. Hence $A \to B$ is flat by Algebra, Lemma 7.35.9. (Also see Morphisms, Lemma 24.24.11 for a direct proof.) □

Lemma 31.23.2. *Then property $\mathcal{P}(f : X \to Y) =$``for every $x \in X$ the map of local rings $\mathcal{O}_{Y,f(x)} \to \mathcal{O}_{X,x}$ is injective'' is fpqc local on the source.*

Proof. Omitted. This is just a (probably misguided) attempt to be playful. □

31.24. Properties of morphisms local in the fppf topology on the source

Here are some properties of morphisms that are fppf local on the source.

Lemma 31.24.1. *The property $\mathcal{P}(f) =$``f is locally of finite presentation'' is fppf local on the source.*

Proof. Being locally of finite presentation is Zariski local on the source and the target, see Morphisms, Lemma 24.20.2. It is a property which is preserved under composition, see Morphisms, Lemma 24.20.3. This proves (1), (2) and (3) of Lemma 31.22.3. The final condition (4) is Lemma 31.10.1. Hence we win. □

Lemma 31.24.2. *The property $\mathcal{P}(f) =$``f is locally of finite type'' is fppf local on the source.*

Proof. Being locally of finite type is Zariski local on the source and the target, see Morphisms, Lemma 24.14.2. It is a property which is preserved under composition, see Morphisms, Lemma 24.14.3, and a flat morphism locally of finite presentation is locally of finite type, see Morphisms, Lemma 24.20.8. This proves (1), (2) and (3) of Lemma 31.22.3. The final condition (4) is Lemma 31.10.2. Hence we win. □

Lemma 31.24.3. *The property $\mathcal{P}(f) =$``f is open'' is fppf local on the source.*

Proof. Being an open morphism is clearly Zariski local on the source and the target. It is a property which is preserved under composition, see Morphisms, Lemma 24.22.3, and a flat morphism of finite presentation is open, see Morphisms, Lemma 24.24.9 This proves (1), (2) and (3) of Lemma 31.22.3. The final condition (4) follows from Morphisms, Lemma 24.24.10. Hence we win. □

Lemma 31.24.4. *The property $\mathcal{P}(f) =$``f is universally open'' is fppf local on the source.*

Proof. Let $f : X \to Y$ be a morphism of schemes. Let $\{X_i \to X\}_{i \in I}$ be an fppf covering. Denote $f_i : X_i \to X$ the compositions. We have to show that f is universally open if and only if each f_i is universally open. If f is universally open, then also each f_i is universally open since the maps $X_i \to X$ are universally open and compositions of universally open morphisms are universally open (Morphisms, Lemmas 24.24.9 and 24.22.3). Conversely, assume each f_i is universally open. Let $Y' \to Y$ be a morphism of schemes. Denote $X' = Y' \times_Y X$ and $X'_i = Y' \times_Y X_i$. Note that $\{X'_i \to X'\}_{i \in I}$ is an fppf covering also. The morphisms $f'_i : X'_i \to Y'$ are open by assumption. Hence by the Lemma 31.24.3 above we conclude that $f' : X' \to Y'$ is open as desired. □

31.25. Properties of morphisms local in the syntomic toplogy on the source

Here are some properties of morphisms that are syntomic local on the source.

Lemma 31.25.1. *The property $\mathcal{P}(f)$ =``f is syntomic'' is syntomic local on the source.*

Proof. Combine Lemma 31.22.3 with Morphisms, Lemma 24.30.2 (local for Zariski on source and target), Morphisms, Lemma 24.30.3 (pre-composing), and Lemma 31.10.4 (part (4)). □

31.26. Properties of morphisms local in the smooth topology on the source

Here are some properties of morphisms that are smooth local on the source.

Lemma 31.26.1. *The property $\mathcal{P}(f)$ =``f is smooth'' is smooth local on the source.*

Proof. Combine Lemma 31.22.3 with Morphisms, Lemma 24.33.2 (local for Zariski on source and target), Morphisms, Lemma 24.33.4 (pre-composing), and Lemma 31.10.4 (part (4)). □

31.27. Properties of morphisms local in the étale topology on the source

Here are some properties of morphisms that are étale local on the source.

Lemma 31.27.1. *The property $\mathcal{P}(f)$ =``f is étale'' is étale local on the source.*

Proof. Combine Lemma 31.22.3 with Morphisms, Lemma 24.35.2 (local for Zariski on source and target), Morphisms, Lemma 24.35.3 (pre-composing), and Lemma 31.10.4 (part (4)). □

Lemma 31.27.2. *The property $\mathcal{P}(f)$ =``f is locally quasi-finite'' is étale local on the source.*

Proof. We are going to use Lemma 31.22.3. By Morphisms, Lemma 24.19.11 the property of being locally quasi-finite is local for Zariski on source and target. By Morphisms, Lemmas 24.19.12 and 24.35.6 we see the precomposition of a locally quasi-finite morphism by an étale morphism is locally quasi-finite. Finally, suppose that $X \to Y$ is a morphism of affine schemes and that $X' \to X$ is a surjective étale morphism of affine schemes such that $X' \to Y$ is locally quasi-finite. Then $X' \to Y$ is of finite type, and by Lemma 31.10.2 we see that $X \to Y$ is of finite type also. Moreover, by assumption $X' \to Y$ has finite fibres, and hence $X \to Y$ has finite fibres also. We conclude that $X \to Y$ is quasi-finite by Morphisms, Lemma 24.19.10. This proves the last assumption of Lemma 31.22.3 and finishes the proof. □

Lemma 31.27.3. *The property $\mathcal{P}(f)$ =``$f$ is unramified'' is étale local on the source. The property $\mathcal{P}(f)$ =``f is G-unramified'' is étale local on the source.*

Proof. We are going to use Lemma 31.22.3. By Morphisms, Lemma 24.34.3 the property of being unramified (resp. G-unramified) is local for Zariski on source and target. By Morphisms, Lemmas 24.34.4 and 24.35.5 we see the precomposition of an unramified (resp. G-unramified) morphism by an étale morphism is unramified (resp. G-unramified). Finally, suppose that $X \to Y$ is a morphism of affine schemes and that $f : X' \to X$ is a surjective étale morphism of affine schemes such that $X' \to Y$ is unramified (resp. G-unramified). Then $X' \to Y$ is of finite type (resp. finite presentation), and by Lemma 31.10.2 (resp. Lemma 31.10.1) we see that $X \to Y$ is of finite type (resp. finite presentation) also. By Morphisms, Lemma 24.33.16 we have a short exact sequence

$$0 \to f^*\Omega_{X/Y} \to \Omega_{X'/Y} \to \Omega_{X'/X} \to 0.$$

As $X' \to Y$ is unramified we see that the middle term is zero. Hence, as f is faithfully flat we see that $\Omega_{X/Y} = 0$. Hence $X \to Y$ is unramified (resp. G-unramified), see Morphisms, Lemma 24.34.2. This proves the last assumption of Lemma 31.22.3 and finishes the proof. □

31.28. Properties of morphisms étale local on source-and-target

Let $\mathcal{P}$ be a property of morphisms of schemes. There is an intuitive meaning to the phrase ``$\mathcal{P}$ is étale local on the source and target". However, it turns out that this notion is not the same as asking $\mathcal{P}$ to be both étale local on the source and étale local on the target. Before we discuss this further we give two silly examples.

Example 31.28.1. Consider the property $\mathcal{P}$ of morphisms of schemes defined by the rule $\mathcal{P}(X \to Y) =$``Y is locally Noetherian". The reader can verify that this is étale local on the source and étale local on the target (omitted, see Lemma 31.12.1). But it is **not** true that if $f : X \to Y$ has $\mathcal{P}$ and $g : Y \to Z$ is étale, then $g \circ f$ has $\mathcal{P}$. Namely, f could be the identity on Y and g could be an open immersion of a locally Noetherian scheme Y into a non locally Noetherian scheme Z.

The following example is in some sense worse.

Example 31.28.2. Consider the property $\mathcal{P}$ of morphisms of schemes defined by the rule $\mathcal{P}(f : X \to Y) =$``for every $y \in Y$ which is a specialization of some $f(x)$, $x \in X$ the local ring $\mathcal{O}_{Y,y}$ is Noetherian". Let us verify that this is étale local on the source and étale local on the target. We will freely use Schemes, Lemma 21.13.2.

Local on the target: Let $\{g_i : Y_i \to Y\}$ be an étale covering. Let $f_i : X_i \to Y_i$ be the base change of f, and denote $h_i : X_i \to X$ the projection. Assume $\mathcal{P}(f)$. Let $f(x_i) \rightsquigarrow y_i$ be a specialization. Then $f(h_i(x_i)) \rightsquigarrow g_i(y_i)$ so $\mathcal{P}(f)$ implies $\mathcal{O}_{Y,g_i(y_i)}$ is Noetherian. Also $\mathcal{O}_{Y,g_i(y_i)} \to \mathcal{O}_{Y_i,y_i}$ is a localization of an étale ring map. Hence $\mathcal{O}_{Y_i,y_i}$ is Noetherian by Algebra, Lemma 7.28.1. Conversely, assume $\mathcal{P}(f_i)$ for all i. Let $f(x) \rightsquigarrow y$ be a specialization. Choose an i and $y_i \in Y_i$ mapping to y. Since x can be viewed as a point of $Spec(\mathcal{O}_{Y,y}) \times_Y X$ and $\mathcal{O}_{Y,y} \to \mathcal{O}_{Y_i,y_i}$ is faithfully flat, there exists a point $x_i \in Spec(\mathcal{O}_{Y_i,y_i}) \times_Y X$ mapping to x. Then $x_i \in X_i$, and $f_i(x_i)$ specializes to y_i. Thus we see that $\mathcal{O}_{Y_i,y_i}$ is Noetherian by $\mathcal{P}(f_i)$ which implies that $\mathcal{O}_{Y,y}$ is Noetherian by Algebra, Lemma 7.146.1.

Local on the source: Let $\{h_i : X_i \to X\}$ be an étale covering. Let $f_i : X_i \to Y$ be the composition $f \circ h_i$. Assume $\mathcal{P}(f)$. Let $f(x_i) \rightsquigarrow y$ be a specialization. Then $f(h_i(x_i)) \rightsquigarrow y$ so $\mathcal{P}(f)$ implies $\mathcal{O}_{Y,y}$ is Noetherian. Thus $\mathcal{P}(f_i)$ holds. Conversely, assume $\mathcal{P}(f_i)$ for all i. Let $f(x) \rightsquigarrow y$ be a specialization. Choose an i and $x_i \in X_i$ mapping to x. Then y is a specialization of $f_i(x_i) = f(x)$. Hence $\mathcal{P}(f_i)$ implies $\mathcal{O}_{Y,y}$ is Noetherian as desired.

We claim that there exists a commutative diagram

$$\begin{tikzcd} U \arrow[r, "h"] \arrow[d, "a"'] & V \arrow[d, "b"] \\ X \arrow[r, "f"] & Y \end{tikzcd}$$

with surjective étale vertical arrows, such that h has $\mathcal{P}$ and f does not have $\mathcal{P}$. Namely, let

$$Y = Spec\left(\mathbf{C}[x_n; n \in \mathbf{Z}]/(x_n x_m; n \neq m)\right)$$

and let $X \subset Y$ be the open subscheme which is the complement of the point all of whose coordinates $x_n = 0$. Let $U = X$, let $V = X \coprod Y$, let a, b the obvious map, and let $h : U \to V$

be the inclusion of $U = X$ into the first summand of V. The claim above holds because U is locally Noetherian, but Y is not.

What should be the correct notion of a property which is étale local on the source-and-target? We think that, by analogy with Morphisms, Definition 24.13.1 it should be the following.

Definition 31.28.3. Let $\mathcal{P}$ be a property of morphisms of schemes. We say $\mathcal{P}$ is *étale local on source-and-target* if

(1) (stable under precomposing with étale maps) if $f : X \to Y$ is étale and $g : Y \to Z$ has $\mathcal{P}$, then $g \circ f$ has $\mathcal{P}$,
(2) (stable under étale base change) if $f : X \to Y$ has $\mathcal{P}$ and $Y' \to Y$ is étale, then the base change $f' : Y' \times_Y X \to Y'$ has $\mathcal{P}$, and
(3) (locality) given a morphism $f : X \to Y$ the following are equivalent
    (a) f has $\mathcal{P}$,
    (b) for every $x \in X$ there exists a commutative diagram

$$\begin{tikzcd} U \arrow[r, "h"] \arrow[d, "a"'] & V \arrow[d, "b"] \\ X \arrow[r, "f"] & Y \end{tikzcd}$$

    with étale vertical arrows and $u \in U$ with $a(u) = x$ such that h has $\mathcal{P}$.

It turns out this definition excludes the behavior seen in Examples 31.28.1 and 31.28.2. We will compare this to the definition in the paper [**DM69a**] by Deligne and Mumford in Remark 31.28.8. Moreover, a property which is étale local on the source-and-target is étale local on the source and étale local on the target. Finally, the converse is almost true as we will see in Lemma 31.28.5.

Lemma 31.28.4. *Let $\mathcal{P}$ be a property of morphisms of schemes which is étale local on source-and-target. Then*

(1) *$\mathcal{P}$ is étale local on the source,*
(2) *$\mathcal{P}$ is étale local on the target,*
(3) *$\mathcal{P}$ is stable under postcomposing with étale morphisms: if $f : X \to Y$ has $\mathcal{P}$ and $g : Y \to Z$ is étale, then $g \circ f$ has $\mathcal{P}$, and*
(4) *$\mathcal{P}$ has a permanence property: given $f : X \to Y$ and $g : Y \to Z$ étale such that $g \circ f$ has $\mathcal{P}$, then f has $\mathcal{P}$.*

Proof. We write everything out completely.

Proof of (1). Let $f : X \to Y$ be a morphism of schemes. Let $\{X_i \to X\}_{i \in I}$ be an étale covering of X. If each composition $h_i : X_i \to Y$ has $\mathcal{P}$, then for each $x \in X$ we can find an $i \in I$ and a point $x_i \in X_i$ mapping to x. Then $(X_i, x_i) \to (X, x)$ is an étale morphism of germs, and $\mathrm{id}_Y : Y \to Y$ is an étale morphism, and h_i is as in part (3) of Definition 31.28.3. Thus we see that f has $\mathcal{P}$. Conversely, if f has $\mathcal{P}$ then each $X_i \to Y$ has $\mathcal{P}$ by Definition 31.28.3 part (1).

Proof of (2). Let $f : X \to Y$ be a morphism of schemes. Let $\{Y_i \to Y\}_{i \in I}$ be an étale covering of Y. Write $X_i = Y_i \times_Y X$ and $h_i : X_i \to Y_i$ for the base change of f. If each $h_i : X_i \to Y_i$ has $\mathcal{P}$, then for each $x \in X$ we pick an $i \in I$ and a point $x_i \in X_i$ mapping to x. Then $(X_i, x_i) \to (X, x)$ is an étale morphism of germs, $Y_i \to Y$ is étale, and h_i is as in part (3) of Definition 31.28.3. Thus we see that f has $\mathcal{P}$. Conversely, if f has $\mathcal{P}$, then each $X_i \to Y_i$ has $\mathcal{P}$ by Definition 31.28.3 part (2).

Proof of (3). Assume $f : X \to Y$ has $\mathcal{P}$ and $g : Y \to Z$ is étale. For every $x \in X$ we can think of $(X, x) \to (X, x)$ as an étale morphism of germs, $Y \to Z$ is an étale morphism, and $h = f$ is as in part (3) of Definition 31.28.3. Thus we see that $g \circ f$ has $\mathcal{P}$.

Proof of (4). Let $f : X \to Y$ be a morphism and $g : Y \to Z$ étale such that $g \circ f$ has $\mathcal{P}$. Then by Definition 31.28.3 part (2) we see that $\mathrm{pr}_Y : Y \times_Z X \to Y$ has $\mathcal{P}$. But the morphism $(f, 1) : X \to Y \times_Z X$ is étale as a section to the étale projection $\mathrm{pr}_X : Y \times_Z X \to X$, see Morphisms, Lemma 24.35.18. Hence $f = \mathrm{pr}_Y \circ (f, 1)$ has $\mathcal{P}$ by Definition 31.28.3 part (1). □

The following lemma is the analogue of Morphisms, Lemma 24.13.4.

Lemma 31.28.5. *Let $\mathcal{P}$ be a property of morphisms of schemes which is étale local on source-and-target. Let $f : X \to Y$ be a morphism of schemes. The following are equivalent:*

(a) *f has property $\mathcal{P}$,*
(b) *for every $x \in X$ there exists an étale morphism of germs $a : (U, u) \to (X, x)$, an étale morphism $b : V \to Y$, and a morphism $h : U \to V$ such that $f \circ a = b \circ h$ and h has $\mathcal{P}$,*
(c) *for any commutative diagram*

$$\begin{tikzcd} U \arrow[r, "h"] \arrow[d, "a"'] & V \arrow[d, "b"] \\ X \arrow[r, "f"] & Y \end{tikzcd}$$

with a, b étale the morphism h has $\mathcal{P}$,
(d) *for some diagram as in (c) with $a : U \to X$ surjective h has $\mathcal{P}$,*
(e) *there exists an étale covering $\{Y_i \to Y\}_{i \in I}$ such that each base change $Y_i \times_Y X \to Y_i$ has $\mathcal{P}$,*
(f) *there exists an étale covering $\{X_i \to X\}_{i \in I}$ such that each composition $X_i \to Y$ has $\mathcal{P}$,*
(g) *there exists an étale covering $\{Y_i \to Y\}_{i \in I}$ and for each $i \in I$ an étale covering $\{X_{ij} \to Y_i \times_Y X\}_{j \in J_i}$ such that each morphism $X_{ij} \to Y_i$ has $\mathcal{P}$.*

Proof. The equivalence of (a) and (b) is part of Definition 31.28.3. The equivalence of (a) and (e) is Lemma 31.28.4 part (2). The equivalence of (a) and (f) is Lemma 31.28.4 part (1). As (a) is now equivalent to (e) and (f) it follows that (a) equivalent to (g).

It is clear that (c) implies (a). If (a) holds, then for any diagram as in (c) the morphism $f \circ a$ has $\mathcal{P}$ by Definition 31.28.3 part (1), whereupon h has $\mathcal{P}$ by Lemma 31.28.4 part (4). Thus (a) and (c) are equivalent. It is clear that (c) implies (d). To see that (d) implies (a) assume we have a diagram as in (c) with $a : U \to X$ surjective and h having $\mathcal{P}$. Then $b \circ h$ has $\mathcal{P}$ by Lemma 31.28.4 part (3). Since $\{a : U \to X\}$ is an étale covering we conclude that f has $\mathcal{P}$ by Lemma 31.28.4 part (1). □

It seems that the result of the following lemma is not a formality, i.e., it actually uses something about the geometry of étale morphisms.

Lemma 31.28.6. *Let $\mathcal{P}$ be a property of morphisms of schemes. Assume*

(1) *$\mathcal{P}$ is étale local on the source,*
(2) *$\mathcal{P}$ is étale local on the target, and*

(3) *$\mathcal{P}$ is stable under postcomposing with open immersions: if $f : X \to Y$ has $\mathcal{P}$ and $Y \subset Z$ is an open subscheme then $X \to Z$ has $\mathcal{P}$.*

Then $\mathcal{P}$ is étale local on the source-and-target.

Proof. Let $\mathcal{P}$ be a property of morphisms of schemes which satisfies conditions (1), (2) and (3) of the lemma. By Lemma 31.22.2 we see that $\mathcal{P}$ is stable under precomposing with étale morphisms. By Lemma 31.18.2 we see that $\mathcal{P}$ is stable under étale base change. Hence it suffices to prove part (3) of Definition 31.28.3 holds.

More precisely, suppose that $f : X \to Y$ is a morphism of schemes which satisfies Definition 31.28.3 part (3)(b). In other words, for every $x \in X$ there exists an étale morphism $a_x : U_x \to X$, a point $u_x \in U_x$ mapping to x, an étale morphism $b_x : V_x \to Y$, and a morphism $h_x : U_x \to V_x$ such that $f \circ a_x = b_x \circ h_x$ and h_x has $\mathcal{P}$. The proof of the lemma is complete once we show that f has $\mathcal{P}$. Set $U = \coprod U_x$, $a = \coprod a_x$, $V = \coprod V_x$, $b = \coprod b_x$, and $h = \coprod h_x$. We obtain a commutative diagram

$$\begin{tikzcd} U \arrow[r, "h"] \arrow[d, "a"'] & V \arrow[d, "b"] \\ X \arrow[r, "f"] & Y \end{tikzcd}$$

with a, b étale, a surjective. Note that h has $\mathcal{P}$ as each h_x does and $\mathcal{P}$ is étale local on the target. Because a is surjective and $\mathcal{P}$ is étale local on the source, it suffices to prove that $b \circ h$ has $\mathcal{P}$. This reduces the lemma to proving that $\mathcal{P}$ is stable under postcomposing with an étale morphism.

During the rest of the proof we let $f : X \to Y$ be a morphism with property $\mathcal{P}$ and $g : Y \to Z$ is an étale morphism. Consider the following statements:

(∅) With no additional assumptions $g \circ f$ has property $\mathcal{P}$.
(A) Whenever Z is affine $g \circ f$ has property $\mathcal{P}$.
(AA) Whenever X and Z are affine $g \circ f$ has property $\mathcal{P}$.
(AAA) Whenever X, Y, and Z are affine $g \circ f$ has property $\mathcal{P}$.

Once we have proved (∅) the proof of the lemma will be complete.

Claim 1: (AAA) ⇒ (AA). Namely, let $f : X \to Y$, $g : Y \to Z$ be as above with X, Z affine. As X is affine hence quasi-compact we can find finitely many affine open $Y_i \subset Y$, $i = 1, \ldots, n$ such that $X = \bigcup_{i=1,\ldots,n} f^{-1}(Y_i)$. Set $X_i = f^{-1}(Y_i)$. By Lemma 31.18.2 each of the morphisms $X_i \to Y_i$ has $\mathcal{P}$. Hence $\coprod_{i=1,\ldots,n} X_i \to \coprod_{i=1,\ldots,n} Y_i$ has $\mathcal{P}$ as $\mathcal{P}$ is étale local on the target. By (AAA) applied to $\coprod_{i=1,\ldots,n} X_i \to \coprod_{i=1,\ldots,n} Y_i$ and the étale morphism $\coprod_{i=1,\ldots,n} Y_i \to Z$ we see that $\coprod_{i=1,\ldots,n} X_i \to Z$ has $\mathcal{P}$. Now $\{\coprod_{i=1,\ldots,n} X_i \to X\}$ is an étale covering, hence as $\mathcal{P}$ is étale local on the source we conclude that $X \to Z$ has $\mathcal{P}$ as desired.

Claim 2: (AAA) ⇒ (A). Namely, let $f : X \to Y$, $g : Y \to Z$ be as above with Z affine. Choose an affine open covering $X = \bigcup X_i$. As $\mathcal{P}$ is étale local on the source we see that each $f|_{X_i} : X_i \to Y$ has $\mathcal{P}$. By (AA), which follows from (AAA) according to Claim 1, we see that $X_i \to Z$ has $\mathcal{P}$ for each i. Since $\{X_i \to X\}$ is an étale covering and $\mathcal{P}$ is étale local on the source we conclude that $X \to Z$ has $\mathcal{P}$.

Claim 3: (AAA) ⇒ (∅). Namely, let $f : X \to Y$, $g : Y \to Z$ be as above. Choose an affine open covering $Z = \bigcup Z_i$. Set $Y_i = g^{-1}(Z_i)$ and $X_i = f^{-1}(Y_i)$. By Lemma 31.18.2 each of the morphisms $X_i \to Y_i$ has $\mathcal{P}$. By (A), which follows from (AAA) according to Claim 2, we see that $X_i \to Z_i$ has $\mathcal{P}$ for each i. Since $\mathcal{P}$ is local on the target and $X_i = (g \circ f)^{-1}(Z_i)$ we conclude that $X \to Z$ has $\mathcal{P}$.

Thus to prove the lemma it suffices to prove (AAA). Let $f : X \to Y$ and $g : Y \to Z$ be as above X, Y, Z affine. Note that an étale morphism of affines has universally bounded fibres, see Morphisms, Lemma 24.35.6 and Lemma 24.48.8. Hence we can do induction on the integer n bounding the degree of the fibres of $Y \to Z$. See Morphisms, Lemma 24.48.7 for a description of this integer in the case of an étale morphism. If $n = 1$, then $Y \to Z$ is an open immersion, see Lemma 31.21.2, and the result follows from assumption (3) of the lemma. Assume $n > 1$.

Consider the following commutative diagram

$$\begin{tikzcd} X \times_Z Y \arrow[r, "f_Y"'] \arrow[d] & Y \times_Z Y \arrow[r, "\mathrm{pr}"'] \arrow[d] & Y \arrow[d] \\ X \arrow[r, "f"] & Y \arrow[r, "g"] & Z \end{tikzcd}$$

Note that we have a decomposition into open and closed subschemes $Y \times_Z Y = \Delta_{Y/Z}(Y) \amalg Y'$, see Morphisms, Lemma 24.34.13. As a base change the degrees of the fibres of the second projection $\mathrm{pr} : Y \times_Z Y \to Y$ are bounded by n, see Morphisms, Lemma 24.48.4. On the other hand, $\mathrm{pr}|_{\Delta(Y)} : \Delta(Y) \to Y$ is an isomorphism and every fibre has exactly one point. Thus, on applying Morphisms, Lemma 24.48.7 we conclude the degrees of the fibres of the restriction $\mathrm{pr}|_{Y'} : Y' \to Y$ are bounded by $n - 1$. Set $X' = f_Y^{-1}(Y')$. Picture

$$\begin{tikzcd} X \amalg X' \arrow[r, "f \amalg f'"'] \arrow[d, equal] & \Delta(Y) \amalg Y' \arrow[r] \arrow[d, equal] & Y \arrow[d, equal] \\ X \times_Z Y \arrow[r, "f_Y"] & Y \times_Z Y \arrow[r, "\mathrm{pr}"] & Y \end{tikzcd}$$

As $\mathcal{P}$ is étale local on the target and hence stable under étale base change (see Lemma 31.18.2) we see that f_Y has $\mathcal{P}$. Hence, as $\mathcal{P}$ is étale local on the source, $f' = f_Y|_{X'}$ has $\mathcal{P}$. By induction hypothesis we see that $X' \to Y$ has $\mathcal{P}$. As $\mathcal{P}$ is local on the source, and $\{X \to X \times_Z Y, X' \to X \times_Y Z\}$ is an étale covering, we conclude that $\mathrm{pr} \circ f_Y$ has $\mathcal{P}$. Note that $g \circ f$ can be viewed as a morphism $g \circ f : X \to g(Y)$. As $\mathrm{pr} \circ f_Y$ is the pullback of $g \circ f : X \to g(Y)$ via the étale covering $\{Y \to g(Y)\}$, and as $\mathcal{P}$ is étale local on the target, we conclude that $g \circ f : X \to g(Y)$ has property $\mathcal{P}$. Finally, applying assumption (3) of the lemma once more we conclude that $g \circ f : X \to Z$ has property $\mathcal{P}$. $\square$

Remark 31.28.7. Using Lemma 31.28.6 and the work done in the earlier sections of this chapter it is easy to make a list of types of morphisms which are étale local on the source-and-target. In each case we list the lemma which implies the property is étale local on the source and the lemma which implies the property is étale local on the target. In each case the third assumption of Lemma 31.28.6 is trivial to check, and we omit it. Here is the list:

1. flat, see Lemmas 31.23.1 and 31.19.13,
2. locally of finite presentation, see Lemmas 31.24.1 and 31.19.9,
3. locally finite type, see Lemmas 31.24.2 and 31.19.8,
4. universally open, see Lemmas 31.24.4 and 31.19.4,
5. syntomic, see Lemmas 31.25.1 and 31.19.24,
6. smooth, see Lemmas 31.26.1 and 31.19.25,
7. étale, see Lemmas 31.27.1 and 31.19.27,
8. locally quasi-finite, see Lemmas 31.27.2 and 31.19.22,

(9) unramified, see Lemmas 31.27.3 and 31.19.26,
(10) G-unramified, see Lemmas 31.27.3 and 31.19.26, and
(11) add more here as needed.

Remark 31.28.8. At this point we have three possible definitions of what it means for a property $\mathcal{P}$ of morphisms to be ``étale local on the source and target'':

(ST) $\mathcal{P}$ is étale local on the source and $\mathcal{P}$ is étale local on the target,
(DM) (the definition in the paper [**DM69a**, Page 100] by Deligne and Mumford) for every diagram

$$\begin{tikzcd} U \arrow[r, "h"] \arrow[d, "a"] & V \arrow[d, "b"] \\ X \arrow[r, "f"] & Y \end{tikzcd}$$

with surjective étale vertical arrows we have $\mathcal{P}(h) \Leftrightarrow \mathcal{P}(f)$, and
(SP) $\mathcal{P}$ is étale local on the source-and-target.

In this section we have seen that (SP) $\Rightarrow$ (DM) $\Rightarrow$ (ST). The Examples 31.28.1 and 31.28.2 show that neither implication can be reversed. Finally, Lemma 31.28.6 shows that the difference disappears when looking at properties of morphisms which are stable under postcomposing with open immersions, which in practive will always be the case.

31.29. Properties of morphisms of germs local on source-and-target

In this section we discuss the analogue of the material in Section 31.28 for morphisms of germs of schemes.

Definition 31.29.1. Let $\mathcal{Q}$ be a property of morphisms of germs of schemes. We say $\mathcal{Q}$ is *étale local on the source-and-target* if for any commutative diagram

$$\begin{tikzcd} (U', u') \arrow[r, "h'"] \arrow[d, "a"] & (V', v') \arrow[d, "b"] \\ (U, u) \arrow[r, "h"] & (V, v) \end{tikzcd}$$

with étale vertical arrows we have $\mathcal{Q}(h) \Leftrightarrow \mathcal{Q}(h')$.

Lemma 31.29.2. *Let $\mathcal{P}$ be a property of morphisms of schemes which is étale local on the source-and-target. Consider the property $\mathcal{Q}$ of morphisms of germs defined by the rule*

$$\mathcal{Q}((X, x) \to (S, s)) \Leftrightarrow \textit{there exists a representative } U \to S \textit{ which has } \mathcal{P}$$

Then $\mathcal{Q}$ is étale local on the source-and-target as in Definition 31.29.1.

Proof. We first remark that as $\mathcal{P}$ is étale local on the source, see Lemma 31.28.4, if $(X, x) \to (S, s)$ has $\mathcal{P}$, then there are arbitrarily small neighbourhoods U of x in X such that a representative $U \to S$ of $(X, x) \to (S, s)$ has $\mathcal{P}$. We will use this without further mention. Let

$$\begin{tikzcd} (U', u') \arrow[r, "h'"] \arrow[d, "a"] & (V', v') \arrow[d, "b"] \\ (U, u) \arrow[r, "h"] & (V, v) \end{tikzcd}$$

be as in Definition 31.29.1. We will use a rather pedantic notation in order to distinguish between morphisms of germs and their representatives in this proof.

If $\mathcal{A}(h)$ holds, then $\mathcal{P}$ holds for a representative $h_1 : U_1 \to V$ of h. Let $a_1 : U_1' \to U$ be a representative of a which is étale with $a_1(U_1') \subset U_1$. As $\mathcal{P}$ is stable under precomposing with étale morphisms we see that $h_1 \circ a_1 : U_1' \to V$ has $\mathcal{P}$. Moreover, $h_1 \circ a_1 : U_1' \to V$ is a representative of $b \circ h'$ by the commutativity of the diagram. Choose a representative $b_1 : V_1' \to V$ of b. Choose a representative $h_1' : U_2' \to V'$ with $h_1'(U_1') \subset V_1'$, $U_2' \subset U_1'$, and $(h_1 \circ a_1)|_{U_2'} = b_1 \circ h_1'$. Then we see that $b_1 \circ h_1'$ has $\mathcal{P}$. Hence h' has $\mathcal{P}$ by Lemma 31.28.4 part (4).

Conversely, suppose $\mathcal{A}(h')$ holds. Choose a representative $b_1 : V_1' \to V$ of b. Choose a representative $h_1' : U_1' \to V'$ with $\mathcal{P}$ and with $h_1'(U_1') \subset V_1'$. Then $b_1 \circ h_1'$ has $\mathcal{P}$ by Lemma 31.28.4 part (3). Moreover, $b_1 \circ h_1' : U_1' \to V$ is a representative of $h \circ a$ by the commutativity of the diagram. Choose a representative $h_1 : U_1 \to V$ of h. Choose a representative $a_1 : U_2' \to U$ with $a_1(U_2') \subset U_1$, $U_2' \subset U_1'$, and $h_1 \circ a_1 = (b_1 \circ h_1')|_{U_2'}$. The we see that $h_1 \circ a_1$ has $\mathcal{P}$. As $\mathcal{P}$ is étale local on the source we conclude that $h_1|_{a_1(U_2')}$ has $\mathcal{P}$ and we win. □

Lemma 31.29.3. *Let $\mathcal{P}$ be a property of morphisms of schemes which is étale local on source-and-target. Let Q be the associated property of morphisms of germs, see Lemma 31.29.2. Let $f : X \to Y$ be a morphism of schemes. The following are equivalent:*

(1) *f has property $\mathcal{P}$, and*
(2) *for every $x \in X$ the morphism of germs $(X, x) \to (Y, f(x))$ has property $\mathcal{Q}$.*

Proof. The implication (1) ⇒ (2) is direct from the definitions. The implication (2) ⇒ (1) also follows from part (3) of Definition 31.28.3. □

A morphism of germs $(X, x) \to (S, s)$ determines a well defined map of local rings. Hence the following lemma makes sense.

Lemma 31.29.4. *The property of morphisms of germs*

$$\mathcal{A}((X, x) \to (S, s)) = \mathcal{O}_{S,s} \to \mathcal{O}_{X,x} \text{ is flat}$$

is étale local on the source-and-target.

Proof. Given a diagram as in Definition 31.29.1 we obtain the following diagram of local homomorphisms of local rings

$$\begin{tikzcd} \mathcal{O}_{U',u'} & \mathcal{O}_{V',v'} \arrow[l] \\ \mathcal{O}_{U,u} \arrow[u] & \mathcal{O}_{V,v} \arrow[l] \arrow[u] \end{tikzcd}$$

Note that the vertical arrows are localizations of étale ring maps, in particular they are essentially of finite presentation, flat, and unramified (see Algebra, Section 7.132). In particular the vertical maps are faithfully flat, see Algebra, Lemma 7.35.16. Now, if the upper horizontal arrow is flat, then the lower horizontal arrow is flat by an application of Algebra, Lemma 7.35.9 with $R = \mathcal{O}_{V,v}$, $S = \mathcal{O}_{U,u}$ and $M = \mathcal{O}_{U',u'}$. If the lower horizontal arrow is flat, then the ring map

$$\mathcal{O}_{V',v'} \otimes_{\mathcal{O}_{V,v}} \mathcal{O}_{U,u} \longleftarrow \mathcal{O}_{V',v'}$$

is flat by Algebra, Lemma 7.35.6. And the ring map

$$\mathcal{O}_{U',u'} \longleftarrow \mathcal{O}_{V',v'} \otimes_{\mathcal{O}_{V,v}} \mathcal{O}_{U,u}$$

is a localization of a map between étale ring extensions of $\mathcal{O}_{U,u}$, hence flat by Algebra, Lemma 7.132.8. □

Lemma 31.29.5. *Consider a commutative diagram of morphisms of schemes*

$$\begin{tikzcd} U' \arrow[r] \arrow[d] & V' \arrow[d] \\ U \arrow[r] & V \end{tikzcd}$$

with étale vertical arrows and a point $v' \in U'$ mapping to $v \in U$. Then the morphism of fibres $U'_{v'} \to U_v$ is étale.

Proof. Note that $U'_v \to U_v$ is étale as a base change of the étale morphism $U' \to U$. The scheme U'_v is a scheme over V'_v. By Morphisms, Lemma 24.35.7 the scheme V'_v is a disjoint union of spectra of finite separable field extensions of $\kappa(v)$. One of these is $v' = Spec(\kappa(v'))$. Hence $U'_{v'}$ is an open and closed subscheme of U'_v and it follows that $U'_{v'} \to U'_v \to U_v$ is étale (as a composition of an open immersion and an étale morphism, see Morphisms, Section 24.35). □

Given a morphism of germs of schemes $(X, x) \to (S, s)$ we can define the *fibre* as the isomorphism class of germs (U_s, x) where $U \to S$ is any representative. We will often abuse notation and just write (X_s, x).

Lemma 31.29.6. *Let $d \in \{0, 1, 2, \ldots, \infty\}$. The property of morphisms of germs*

$$\mathcal{P}_d((X, x) \to (S, s)) = \textit{the local ring } \mathcal{O}_{X_s,x} \textit{ of the fibre has dimension } d$$

is étale local on the source-and-target.

Proof. Given a diagram as in Definition 31.29.1 we obtain an étale morphism of fibres $U'_{v'} \to U_v$ mapping u' to u, see Lemma 31.29.5. Hence the result follows from Lemma 31.17.3. □

Lemma 31.29.7. *Let $r \in \{0, 1, 2, \ldots, \infty\}$. The property of morphisms of germs*

$$\mathcal{P}_r((X, x) \to (S, s)) \Leftrightarrow trdeg_{\kappa(s)}\kappa(x) = r$$

is étale local on the source-and-target.

Proof. Given a diagram as in Definition 31.29.1 we obtain the following diagram of local homomorphisms of local rings

$$\begin{tikzcd} \mathcal{O}_{U',u'} & \mathcal{O}_{V',v'} \arrow[l] \\ \mathcal{O}_{U,u} \arrow[u] & \mathcal{O}_{V,v} \arrow[l] \arrow[u] \end{tikzcd}$$

Note that the vertical arrows are localizations of étale ring maps, in particular they are unramified (see Algebra, Section 7.132). Hence $\kappa(u) \subset \kappa(u')$ and $\kappa(v) \subset \kappa(v')$ are finite separable field extensions. Thus we have $\text{trdeg}_{\kappa(v)}\kappa(u) = \text{trdeg}_{\kappa(v')}\kappa(u)$ which proves the lemma. □

Let (X, x) be a germ of a scheme. The dimension of X at x is the minimum of the dimensions of open neighbourhoods of x in X, and any small enough open neighbourhood has this dimension. Hence this is an invariant of the isomorphism class of the germ. We denote this simply $\dim_x(X)$.

Lemma 31.29.8. *Let $d \in \{0, 1, 2, \ldots, \infty\}$. The property of morphisms of germs*

$$\mathcal{P}_d((X, x) \to (S, s)) \Leftrightarrow \dim_x(X_s) = d$$

is étale local on the source-and-target.

Proof. Given a diagram as in Definition 31.29.1 we obtain an étale morphism of fibres $U'_{v'} \to U_v$ mapping u' to u, see Lemma 31.29.5. Hence now the equality $\dim_u(U_v) = \dim_{u'}(U'_{v'})$ follows from Lemma 31.17.2. □

31.30. Descent data for schemes over schemes

Most of the arguments in this section are formal relying only on the definition of a descent datum. In Section 31.36 we will examine the relationship with simplicial schemes which will somewhat clarify the situation. Hopefully the reader will be convinced by the end of Section 31.36 that the language of descent is awkward and the setting of simplicial schemes is natural for the questions being considered here.

Definition 31.30.1. Let $f : X \to S$ be a morphism of schemes.

(1) Let $V \to X$ be a scheme over X. A *descent datum for $V/X/S$* is an isomorphism $\varphi : V \times_S X \to X \times_S V$ of schemes over $X \times_S X$ satisfying the *cocycle condition* that the diagram

$$\begin{tikzcd} V \times_S X \times_S X \arrow[rr, "\varphi_{02}"] \arrow[dr, "\varphi_{01}"'] & & X \times_S X \times_S V \\ & X \times_S V \times_S X \arrow[ur, "\varphi_{12}"'] & \end{tikzcd}$$

commutes (with obvious notation).

(2) We also say that the pair $(V/X, \varphi)$ is a *descent datum relative to $X \to S$.*

(3) A *morphism $f : (V/X, \varphi) \to (V'/X, \varphi')$ of descent data relative to $X \to S$* is a morphism $f : V \to V'$ of schemes over X such that the diagram

$$\begin{tikzcd} V \times_S X \arrow[r, "\varphi"'] \arrow[d, "f \times \mathrm{id}_X"'] & X \times_S V \arrow[d, "\mathrm{id}_X \times f"] \\ V' \times_S X \arrow[r, "\varphi'"] & X \times_S V' \end{tikzcd}$$

commutes.

There are all kinds of ``miraculous'' identities which arise out of the definition above. For example the pullback of φ via the diagonal morphism $\Delta : X \to X \times_S X$ can be seen as a morphism $\Delta^*\varphi : V \to V$. This because $X \times_{\Delta, X \times_S X} (V \times_S X) = V$ and also $X \times_{\Delta, X \times_S X} (X \times_S V) = V$. In fact, $\Delta^*\varphi$ is equal to the identity. This is a good exercise if you are unfamiliar with this material.

Remark 31.30.2. Let $X \to S$ be a morphism of schemes. Let $(V/X, \varphi)$ be a descent datum relative to $X \to S$. We may think of the isomorphism φ as an isomorphism

$$(X \times_S X) \times_{\mathrm{pr}_0, X} V \longrightarrow (X \times_S X) \times_{\mathrm{pr}_1, X} V$$

of schemes over $X \times_S X$. So loosely speaking one may think of φ as a map $\varphi : \mathrm{pr}_0^*V \to \mathrm{pr}_1^*V$[6]. The cocycle condition then says that $\mathrm{pr}_{02}^*\varphi = \mathrm{pr}_{12}^*\varphi \circ \mathrm{pr}_{01}^*\varphi$. In this way it is very similar to the case of a descent datum on quasi-coherent sheaves.

Here is the definition in case you have a family of morphisms with fixed target.

Definition 31.30.3. Let S be a scheme. Let $\{X_i \to S\}_{i\in I}$ be a family of morphisms with target S.

(1) A *descent datum* (V_i, φ_{ij}) *relative to the family* $\{X_i \to S\}$ is given by a scheme V_i over X_i for each $i \in I$, an isomorphism $\varphi_{ij} : V_i \times_S X_j \to X_i \times_S V_j$ of schemes over $X_i \times_S X_j$ for each pair $(i, j) \in I^2$ such that for every triple of indices $(i, j, k) \in I^3$ the diagram

$$\begin{tikzcd} V_i \times_S X_j \times_S X_k \arrow[rr, "\mathrm{pr}_{02}^*\varphi_{ik}"] \arrow[dr, "\mathrm{pr}_{01}^*\varphi_{ij}"'] & & X_i \times_S X_j \times_S V_k \\ & X_i \times_S V_j \times_S X_k \arrow[ur, "\mathrm{pr}_{12}^*\varphi_{jk}"'] & \end{tikzcd}$$

of schemes over $X_i \times_S X_j \times_S X_k$ commutes (with obvious notation).

(2) A *morphism* $\psi : (V_i, \varphi_{ij}) \to (V_i', \varphi_{ij}')$ *of descent data* is given by a family $\psi = (\psi_i)_{i\in I}$ of morphisms of X_i-schemes $\psi_i : V_i \to V_i'$ such that all the diagrams

$$\begin{tikzcd} V_i \times_S X_j \arrow[r, "\varphi_{ij}"'] \arrow[d, "\psi_i\times\mathrm{id}"'] & X_i \times_S V_j \arrow[d, "\mathrm{id}\times\psi_j"] \\ V_i' \times_S X_j \arrow[r, "\varphi_{ij}'"] & X_i \times_S V_j' \end{tikzcd}$$

commute.

This is the notion that comes up naturally for example when the question arises whether the fibred category of relative curves is a stack in the fpqc topology (it isn't -- at least not if you stick to schemes).

Remark 31.30.4. Let S be a scheme. Let $\{X_i \to S\}_{i\in I}$ be a family of morphisms with target S. Let (V_i, φ_{ij}) be a descent datum relative to $\{X_i \to S\}$. We may think of the isomorphisms φ_{ij} as isomorphisms

$$(X_i \times_S X_j) \times_{\mathrm{pr}_0, X_i} V_i \longrightarrow (X_i \times_S X_j) \times_{\mathrm{pr}_1, X_j} V_j$$

of schemes over $X_i \times_S X_j$. So loosely speaking one may think of φ_{ij} as an isomorphism $\mathrm{pr}_0^*V_i \to \mathrm{pr}_1^*V_j$ over $X_i \times_S X_j$. The cocycle condition then says that $\mathrm{pr}_{02}^*\varphi_{ik} = \mathrm{pr}_{12}^*\varphi_{jk} \circ \mathrm{pr}_{01}^*\varphi_{ij}$. In this way it is very similar to the case of a descent datum on quasi-coherent sheaves.

The reason we will usually work with the version of a family consisting of a single morphism is the following lemma.

[6] Unfortunately, we have chosen the ``wrong'' direction for our arrow here. In Definitions 31.30.1 and 31.30.3 we should have the opposite direction to what was done in Definition 31.2.1 by the general principle that ``functions'' and ``spaces'' are dual.

Lemma 31.30.5. *Let S be a scheme. Let $\{X_i \to S\}_{i\in I}$ be a family of morphisms with target S. Set $X = \coprod_{i\in I} X_i$, and consider it as an S-scheme. There is a canonical equivalence of categories*

$$\begin{matrix}\text{category of descent data} \\ \text{relative to the family } \{X_i \to S\}_{i\in I}\end{matrix} \longrightarrow \begin{matrix}\text{category of descent data} \\ \text{relative to } X/S\end{matrix}$$

which maps (V_i, φ_{ij}) to (V, φ) with $V = \coprod_{i\in I} V_i$ and $\varphi = \coprod \varphi_{ij}$.

Proof. Observe that $X \times_S X = \coprod_{ij} X_i \times_S X_j$ and similarly for higher fibre products. Giving a morphism $V \to X$ is exactly the same as giving a family $V_i \to X_i$. And giving a descent datum φ is exactly the same as giving a family φ_{ij}. $\square$

Lemma 31.30.6. *(Pullback of descent data for schemes over schemes.)*

(1) *Let*

$$\begin{tikzcd} X' \arrow[r, "f"] \arrow[d, "a'"'] & X \arrow[d, "a"] \\ S' \arrow[r, "h"] & S \end{tikzcd}$$

be a commutative diagram of morphisms of schemes. The construction

$$(V \to X, \varphi) \longmapsto f^*(V \to X, \varphi) = (V' \to X', \varphi')$$

where $V' = X' \times_X V$ and where φ' is defined as the composition

$$\begin{tikzcd} V' \times_{S'} X' \arrow[r, equal] & (X' \times_X V) \times_{S'} X' \arrow[r, equal] & (X' \times_{S'} X') \times_{X \times_S X} (V \times_S X) \arrow[d, "id \times \varphi"] \\ X' \times_{S'} V' \arrow[r, equal] & X' \times_{S'} (X' \times_X V) \arrow[r, equal] & (X' \times_S X') \times_{X \times_S X} (X \times_S V) \end{tikzcd}$$

defines a functor from the category of descent data relative to $X \to S$ to the category of descent data relative to $X' \to S$.

(2) *Given two morphisms $f_i : X' \to X$, $i = 0, 1$ making the diagram commute the functors f_0^* and f_1^* are canonically isomorphic.*

Proof. We omit the proof of (1), but we remark that the morphism φ' is the morphism $(f' \times f')^*\varphi$ in the notation introduced in Remark 31.30.2. For (2) we indicate which morphism $f_0^*V \to f_1^*V$ gives the functorial isomorphism. Namely, since f_0 and f_1 both fit into the commutative diagram we see there is a unique morphism $r : X' \to X \times_S X$ with $f_i = \text{pr}_i \circ r$. Then we take

$$\begin{aligned} f_0^*V &= X' \times_{f_0, X} V \\ &= X' \times_{\text{pr}_0 \circ r, X} V \\ &= X' \times_{r, X \times_S X} (X \times_S X) \times_{\text{pr}_0 X} V \\ &\xrightarrow{\varphi} X' \times_{r, X \times_S X} (X \times_S X) \times_{\text{pr}_1 X} V \\ &= X' \times_{\text{pr}_1 \circ r, X} V \\ &= X' \times_{f_1, X} V \\ &= f_1^*V \end{aligned}$$

We omit the verification that this works. $\square$

Definition 31.30.7. With $S, S', X, X', f, a, a', h$ as in Lemma 31.30.6 the functor

$$(V, \varphi) \longmapsto f^*(V, \varphi)$$

constructed in that lemma is called the *pullback functor* on descent data.

Lemma 31.30.8. *(Pullback of descent data for schemes over families.) Let $\mathcal{U} = \{U_i \to S'\}_{i \in I}$ and $\mathcal{V} = \{V_j \to S\}_{j \in J}$ be families of morphisms with fixed target. Let $\alpha : I \to J$, $h : S' \to S$ and $g_i : U_i \to V_{\alpha(i)}$ be a morphism of families of maps with fixed target, see Sites, Definition 9.8.1.*

1. *Let $(Y_j, \varphi_{jj'})$ be a descent datum relative to the family $\{V_j \to S'\}$. The system*
$$\left(g_i^* Y_{\alpha(i)}, (g_i \times g_{i'})^* \varphi_{\alpha(i)\alpha(i')}\right)$$
(with notation as in Remark 31.30.4) is a descent datum relative to $\mathcal{V}$.
2. *This construction defines a functor between descent data relative to $\mathcal{U}$ and descent data relative to $\mathcal{V}$.*
3. *Given a second $\alpha' : I \to J$, $h' : S' \to S$ and $g'_i : U_i \to V_{\alpha'(i)}$ morphism of families of maps with fixed target, then if $h = h'$ the two resulting functors between descent data are canonically isomorphic.*
4. *These functors agree, via Lemma 31.30.5, with the pullback functors constructed in Lemma 31.30.6.*

Proof. This follows from Lemma 31.30.6 via the correspondence of Lemma 31.30.5. □

Definition 31.30.9. With $\mathcal{U} = \{U_i \to S'\}_{i \in I}$, $\mathcal{V} = \{V_j \to S\}_{j \in J}$, $\alpha : I \to J$, $h : S' \to S$, and $g_i : U_i \to V_{\alpha(i)}$ as in Lemma 31.30.8 the functor

$$(Y_j, \varphi_{jj'}) \longmapsto (g_i^* Y_{\alpha(i)}, (g_i \times g_{i'})^* \varphi_{\alpha(i)\alpha(i')})$$

constructed in that lemma is called the *pullback functor* on descent data.

If $\mathcal{U}$ and $\mathcal{V}$ have the same target S, and if $\mathcal{U}$ refines $\mathcal{V}$ (see Sites, Definition 9.8.1) but no explicit pair (α, g_i) is given, then we can still talk about the pullback functor since we have seen in Lemma 31.30.8 that the choice of the pair does not matter (up to a canonical isomorphism).

Definition 31.30.10. Let S be a scheme. Let $f : X \to S$ be a morphism of schemes.

1. Given a scheme U over S we have the *trivial descent datum* of U relative to $\mathrm{id} : S \to S$, namely the identity morphism on U.
2. By Lemma 31.30.6 we get a *canonical descent datum* on $X \times_S U$ relative to $X \to S$ by pulling back the trivial descent datum via f. We often denote $(X \times_S U, can)$ this descent datum.
3. Let $f : X \to S$ be a morphism of schemes. A descent datum (V, φ) relative to X/S is called *effective* if (V, φ) is isomorphic to the canonical descent datum $(X \times_S U, can)$ for some scheme U over S.

Thus being effective means there exists a scheme U over S and an isomorphism $\psi : V \to X \times_S U$ of X-schemes such that φ is equal to the composition

$$V \times_S X \xrightarrow{\psi \times \mathrm{id}_X} X \times_S U \times_S X = X \times_S X \times_S U \xrightarrow{\mathrm{id}_X \times \psi^{-1}} X \times_S V$$

Definition 31.30.11. Let S be a scheme. Let $\{X_i \to S\}$ be a family of morphisms with target S.

(1) Given a scheme U over S we have a *canonical descent datum* on the family of schemes $X_i \times_S U$ by pulling back the trivial descent datum for U relative to $\{\mathrm{id} : S \to S\}$. We denote this descent datum $(X_i \times_S U, can)$.
(2) A descent datum (V_i, φ_{ij}) relative to $\{X_i \to S\}$ is called *effective* if there exists a scheme U over S such that (V_i, φ_{ij}) is isomorphic to $(X_i \times_S U, can)$.

31.31. Fully faithfulness of the pullback functors

It turns out that the pullback functor between descent data for fpqc-coverings is fully faithful. In other words, morphisms of schemes satisfy fpqc descent. The goal of this section is to prove this. The reader is encouraged instead to prove this him/herself. The key is to use Lemma 31.9.3.

Lemma 31.31.1. *A surjective and flat morphism is an epimorphism in the category of schemes.*

Proof. Suppose we have $h : X' \to X$ surjective and flat and $a, b : X \to Y$ morphisms such that $a \circ h = b \circ h$. As h is surjective we see that a and b agree on underlying topological spaces. Pick $x' \in X'$ and set $x = h(x')$ and $y = a(x) = b(x)$. Consider the local ring maps

$$a^\sharp_x, b^\sharp_x : \mathcal{O}_{Y,y} \to \mathcal{O}_{X,x}$$

These become equal when composed with the flat local homomorphism $h^\sharp_{x'} : \mathcal{O}_{X,x} \to \mathcal{O}_{X',x'}$. Since a flat local homomorphism is faithfully flat (Algebra, Lemma 7.35.16) we conclude that $h^\sharp_{x'}$ is injective. Hence $a^\sharp_x = b^\sharp_x$ which implies $a = b$ as desired. □

Lemma 31.31.2. *Let $h : S' \to S$ be a surjective, flat morphism of schemes. The base change functor*

$$Sch/S \longrightarrow Sch/S', \quad X \longmapsto S' \times_S X$$

is faithful.

Proof. Let X_1, X_2 be schemes over S. Let $\alpha, \beta : X_2 \to X_1$ be morphisms over S. If α, β base change to the same morphism then we get a commutative diagram as follows

$$\begin{tikzcd}
X_2 \arrow[d, "\alpha"] & S' \times_S X_2 \arrow[l] \arrow[r] \arrow[d] & X_2 \arrow[d, "\beta"] \\
X_1 & S' \times_S X_1 \arrow[l] \arrow[r] & X_1
\end{tikzcd}$$

Hence it suffices to show that $S' \times_S X_2 \to X_2$ is an epimorphism. As the base change of a surjective and flat morphism it is surjective and flat (see Morphisms, Lemmas 24.9.4 and 24.24.7). Hence the lemma follows from Lemma 31.31.1. □

Lemma 31.31.3. *In the situation of Lemma 31.30.6 assume that $f : X' \to X$ is surjective and flat. Then the pullback functor is faithful.*

Proof. Let (V_i, φ_i), $i = 1, 2$ be descend data for $X \to S$. Let $\alpha, \beta : V_1 \to V_2$ be morphisms of descent data. Suppose that $f^*\alpha = f^*\beta$. Our task is to show that $\alpha = \beta$. Note that α, β are morphisms of schemes over X, and that $f^*\alpha$, $f^*\beta$ are simply the base changes of α, β to morphisms over X'. Hence the lemma follows from Lemma 31.31.2. □

Here is the key lemma of this section.

Lemma 31.31.4. *In the situation of Lemma 31.30.6 assume*

(1) *$\{f : X' \to X\}$ is an fpqc covering (for example if f is surjective, flat, and quasi-compact), and*
(2) *$f \times f : X' \times_{S'} X' \to X \times_S X$ is surjective and flat*[7].

Then the pullback functor is fully faithful.

Proof. Assumption (1) implies that f is surjective and flat. Hence the pullback functor is faithful by Lemma 31.31.3. Let (V, φ) and (W, ψ) be two descent data relative to $X \to S$. Set $(V', \varphi') = f^*(V, \varphi)$ and $(W', \psi') = f^*(W, \psi)$. Let $\alpha' : V' \to W'$ be a morphism of descent data for X' over S'. We have to show there exists a morphism $\alpha : V \to W$ of descent data for X over S whose pullback is α'.

Recall that V' is the base change of V by f and that φ' is the base change of φ by $f \times f$ (see Remark 31.30.2). By assumption the diagram

$$\begin{tikzcd} V' \times_{S'} X' \arrow[r, "\varphi'"'] \arrow[d, "\alpha' \times \mathrm{id}"'] & X' \times_{S'} V' \arrow[d, "\mathrm{id} \times \alpha'"] \\ W' \times_{S'} X' \arrow[r, "\psi'"] & X' \times_{S'} W' \end{tikzcd}$$

commutes. We claim the two compositions

$$V' \times_V V' \xrightarrow{\mathrm{pr}_i} V' \xrightarrow{\alpha'} W' \longrightarrow W, \quad i = 0, 1$$

are the same. The reader is advised to prove this themselves rather than read the rest of this paragraph. (Please email if you find a nice clean argument.) Let v_0, v_1 be points of V' which map to the same point $v \in V$. Let $x_i \in X'$ be the image of v_i, and let x be the point of X which is the image of v in X. In other words, $v_i = (x_i, v)$ in $V' = X' \times_X V$. Write $\varphi(v, x) = (x, v')$ for some point v' of V. This is possible because φ is a morphism over $X \times_S X$. Denote $v_i' = (x_i, v')$ which is a point of V'. Then a calculation (using the definition of φ') shows that $\varphi'(v_i, x_j) = (x_i, v_j')$. Denote $w_i = \alpha'(v_i)$ and $w_i' = \alpha'(v_i')$. Now we may write $w_i = (x_i, u_i)$ for some point u_i of W, and $w_i' = (x_i, u_i')$ for some point u_i' of W. The claim is equivalent to the assertion: $u_0 = u_1$. A formal calculation using the definition of ψ' (see Lemma 31.30.6) shows that the commutativity of the diagram displayed above says that

$$((x_i, x_j), \psi(u_i, x)) = ((x_i, x_j), (x, u_j'))$$

as points of $(X' \times_{S'} X') \times_{X \times_S X} (X \times_S W)$ for all $i, j \in \{0, 1\}$. This shows that $\psi(u_0, x) = \psi(u_1, x)$ and hence $u_0 = u_1$ by taking ψ^{-1}. This proves the claim because the argument above was formal and we can take scheme points (in other words, we may take $(v_0, v_1) = \mathrm{id}_{V' \times_V V'}$).

At this point we can use Lemma 31.9.3. Namely, $\{V' \to V\}$ is a fpqc covering as the base change of the morphism $f : X' \to X$. Hence, by Lemma 31.9.3 the morphism $\alpha' : V' \to W' \to W$ factors through a unique morphism $\alpha : V \to W$ whose base change is necessarily α'. Finally, we see the diagram

$$\begin{tikzcd} V \times_S X \arrow[r, "\varphi"'] \arrow[d, "\alpha \times \mathrm{id}"'] & X \times_S V \arrow[d, "\mathrm{id} \times \alpha"] \\ W \times_S X \arrow[r, "\psi"] & X \times_S W \end{tikzcd}$$

[7] This follows from (1) if $S = S'$.

commutes because its base change to $X' \times_{S'} X'$ commutes and the morphism $X' \times_{S'} X' \to X \times_S X$ is surjective and flat (use Lemma 31.31.2). Hence α is a morphism of descent data $(V, \varphi) \to (W, \psi)$ as desired. □

The following two lemmas have been obsoleted by the improved exposition of the previous material. But they are stilll true!

Lemma 31.31.5. *Let $X \to S$ be a morphism of schemes. Let $f : X \to X$ be a selfmap of X over S. In this case pullback by f is isomorphic to the identity functor on the category of descent data relative to $X \to S$.*

Proof. This is clear from Lemma 31.30.6 since it tells us that $f^* \cong \mathrm{id}^*$. □

Lemma 31.31.6. *Let $f : X' \to X$ be a morphism of schemes over a base scheme S. Assume there exists a morphism $g : X \to X'$ over S, for example if f has a section. Then the pullback functor of Lemma 31.30.6 defines an equivalence of categories between the category of descent data relative to X/S and X'/S.*

Proof. Let $g : X \to X'$ be a morphism over S. Lemma 31.31.5 above shows that the functors $f^* \circ g^* = (g \circ f)^*$ and $g^* \circ f^* = (f \circ g)^*$ are isomorphic to the respective identity functors as desired. □

Lemma 31.31.7. *Let $f : X \to X'$ be a morphism of schemes over a base scheme S. Assume $X \to S$ is surjective and flat. Then the pullback functor of of Lemma 31.30.6 is a faithful functor from the category of descent data relative to X'/S to the category of descent data relative to X/S.*

Proof. We may factor $X \to X'$ as $X \to X \times_S X' \to X'$. The first morphism has a section, hence induces an equivalence of categories of descent data by Lemma 31.31.6. The second morphism is surjective and flat, hence induces a faithful functor by Lemma 31.31.3. □

Lemma 31.31.8. *Let $f : X \to X'$ be a morphism of schemes over a base scheme S. Assume $\{X \to S\}$ is an fpqc covering (for example if f is surjective, flat and quasi-compact). Then the pullback functor of of Lemma 31.30.6 is a fully faithful functor from the category of descent data relative to X'/S to the category of descent data relative to X/S.*

Proof. We may factor $X \to X'$ as $X \to X \times_S X' \to X'$. The first morphism has a section, hence induces an equivalence of categories of descent data by Lemma 31.31.6. The second morphism is an fpqc covering hence induces a fully faithful functor by Lemma 31.31.4. □

Lemma 31.31.9. *Let S be a scheme. Let $\mathcal{U} = \{U_i \to S\}_{i \in I}$, and $\mathcal{V} = \{V_j \to S\}_{j \in J}$, be families of morphisms with target S. Let $\alpha : I \to J$, $id : S \to S$ and $g_i : U_i \to V_{\alpha(i)}$ be a morphism of families of maps with fixed target, see Sites, Definition 9.8.1. Assume that for each $j \in J$ the family $\{g_i : U_i \to V_j\}_{\alpha(i)=j}$ is an fpqc covering of V_j. Then the pullback functor*

$$\textit{descent data relative to } \mathcal{V} \longrightarrow \textit{descent data relative to } \mathcal{U}$$

of Lemma 31.30.8 is fully faithful.

Proof. Consider the morphism of schemes

$$g : X = \coprod\nolimits_{i \in I} U_i \longrightarrow Y = \coprod\nolimits_{j \in J} V_j$$

over S which on the ith component maps into the $\alpha(i)$th component via the morphism $g_{\alpha(i)}$. We claim that $\{g : X \to Y\}$ is an fpqc covering of schemes. Namely, by Topologies, Lemma 30.8.3 for each j the morphism $\{\coprod_{\alpha(i)=j} U_i \to V_j\}$ is an fpqc covering. Thus for every affine open $V \subset V_j$ (which we may think of as an affine open of Y) we can find finitely many affine opens $W_1, \ldots, W_n \subset \coprod_{\alpha(i)=j} U_i$ (which we may think of as affine opens of X) such that $V = \bigcup_{i=1,\ldots,n} g(W_i)$. This provides enough affine opens of Y which can be covered by finitely many affine opens of X so that Topologies, Lemma 30.8.2 part (3) applies, and the claim follows. Let us write $DD(X/S)$, resp. $DD(\mathcal{U})$ for the category of descent data with respect to X/S, resp. $\mathcal{U}$, and similarly for Y/S and $\mathcal{V}$. Consider the diagram

$$\begin{tikzcd} DD(Y/S) \arrow[r] & DD(X/S) \\ DD(\mathcal{V}) \arrow[r] \arrow[u, "\text{Lemma 31.30.5}"] & DD(\mathcal{U}) \arrow[u, "\text{Lemma 31.30.5}"'] \end{tikzcd}$$

This diagram is commutative, see the proof of Lemma 31.30.8. The vertical arrows are equivalences. Hence the lemma follows from Lemma 31.31.4 which shows the top horizontal arrow of the diagram is fully faithful. $\square$

The next lemma shows that, in order to check effectiveness, we may always Zariski refine the given family of morphisms with target S.

Lemma 31.31.10. *Let S be a scheme. Let $\mathcal{U} = \{U_i \to S\}_{i \in I}$, and $\mathcal{V} = \{V_j \to S\}_{j \in J}$, be families of morphisms with target S. Let $\alpha : I \to J$, $id : S \to S$ and $g_i : U_i \to V_{\alpha(i)}$ be a morphism of families of maps with fixed target, see Sites, Definition 9.8.1. Assume that for each $j \in J$ the family $\{g_i : U_i \to V_j\}_{\alpha(i)=j}$ is a Zariski covering (see Topologies, Definition 30.3.1) of V_j. Then the pullback functor*

$$\textit{descent data relative to } \mathcal{V} \longrightarrow \textit{descent data relative to } \mathcal{U}$$

of Lemma 31.30.8 is an equivalence of categories. In particular, the category of schemes over S is equivalent to the category of descent data relative to any Zariski covering of S.

Proof. The functor is faithful and fully faithful by Lemma 31.31.9. Let us indicate how to prove that it is essentially surjective. Let $(X_i, \varphi_{ii'})$ be a descend datum relative to $\mathcal{U}$. Fix $j \in J$ and set $I_j = \{i \in I \mid \alpha(i) = j\}$. For $i, i' \in I_j$ note that there is a canonical morphism

$$c_{ii'} : U_i \times_{g_i, V_j, g_{i'}} U_{i'} \to U_i \times_S U_{i'}.$$

Hence we can pullback $\varphi_{ii'}$ by this morphism and set $\psi_{ii'} = c_{ii'}^* \varphi_{ii'}$ for $i, i' \in I_j$. In this way we obtain a descent datum $(X_i, \psi_{ii'})$ relative to the Zariski covering $\{g_i : U_i \to V_i\}_{i \in I_j}$. Note that $\psi_{ii'}$ is an isomorphism from the open $X_{i, U_i \times_{V_j} U_{i'}}$ of X_i to the corresponding open of $X_{i'}$. It follows from Schemes, Section 21.14 that we may glue $(X_i, \psi_{ii'})$ into a scheme Y_j over V_j. Moreover, the morphisms $\varphi_{ii'}$ for $i \in I_j$ and $i' \in I_{j'}$ glue to a morphism $\varphi_{jj'} : Y_j \times_S V_{j'} \to V_j \times_S Y_{j'}$ satisfying the cocycle condition (details omitted). Hence we obtain the desired descent datum $(Y_j, \varphi_{jj'})$ relative to $\mathcal{V}$. $\square$

Lemma 31.31.11. *Let S be a scheme. Let $\mathcal{U} = \{U_i \to S\}_{i \in I}$, and $\mathcal{V} = \{V_j \to S\}_{j \in J}$, be fpqc-coverings of S. If $\mathcal{U}$ is a refinement of $\mathcal{V}$, then the pullback functor*

$$\textit{descent data relative to } \mathcal{V} \longrightarrow \textit{descent data relative to } \mathcal{U}$$

is fully faithfull. In particular, the category of schemes over S is identified with a full subcategory of the category of descent data relative to any fpqc-covering of S.

Proof. Consider the fpqc-covering $\mathcal{W} = \{U_i \times_S V_j \to S\}_{(i,j)\in I\times J}$ of S. It is a refinement of both $\mathcal{U}$ and $\mathcal{V}$. Hence we have a 2-commutative diagram of functors and categories

$$\begin{tikzcd} DD(\mathcal{V}) \arrow[rr] \arrow[dr] & & DD(\mathcal{U}) \arrow[dl] \\ & DD(\mathcal{W}) & \end{tikzcd}$$

Notation as in the proof of Lemma 31.31.9 and commutativity by Lemma 31.30.8 part (3). Hence clearly it suffices to prove the functors $DD(\mathcal{V}) \to DD(\mathcal{W})$ and $DD(\mathcal{U}) \to DD(\mathcal{W})$ are fully faithful. This follows from Lemma 31.31.9 as desired. □

Remark 31.31.12. Lemma 31.31.11 says that morphisms of schemes satisfy fpqc descent. In other words, given a scheme S and schemes X, Y over S the functor

$$(Sch/S)^{opp} \longrightarrow Sets, \quad T \longmapsto Mor_T(X_T, Y_T)$$

satisfies the sheaf condition for the fpqc topology. The simplest case of this is the following. Suppose that $T \to S$ is a surjective flat morphism of affines. Let $\psi_0 : X_T \to Y_T$ be a morphism of schemes over T which is compatible with the canonical descent data. Then there exists a unique morphism $\psi : X \to Y$ whose base change to T is ψ_0. In fact this special case follows in a straightforward manner from Lemma 31.31.4. And, in turn, that lemma is a formal consequence of the following two facts: (a) the base change functor by a faihfully flat morphism is faithful, see Lemma 31.31.2 and (b) a scheme satisfies the sheaf condition for the fpqc topology, see Lemma 31.9.3.

31.32. Descending types of morphisms

In the following we study the question as to whether descent data for schemes relative to a fpqc-covering are effective. The first remark to make is that this is not always the case. We will see this (insert future reference here).

On the other hand, if the schemes we are trying to descend are particularly simple, then it is sometime the case that for whole classes of schemes descent data are effective. We will introduce terminology here that describes this phenomenon abstractly, even though it may lead to confusion if not used correctly later on.

Definition 31.32.1. Let $\mathcal{P}$ be a property of morphisms of schemes over a base. Let $\tau \in \{Zariski, fpqc, fppf, étale, smooth, syntomic\}$. We say *morphisms of type $\mathcal{P}$ satisfy descent for τ-coverings* if for any τ-covering $\mathcal{U} : \{U_i \to S\}_{i\in I}$ (see Topologies, Section 30.2), any descent datum (X_i, φ_{ij}) relative to $\mathcal{U}$ such that each morphism $X_i \to U_i$ has property $\mathcal{P}$ is effective.

Note that in each of the cases we have already seen that the functor from schemes over S to descent data over $\mathcal{U}$ is fully faithful (Lemma 31.31.11 combined with the results in Topologies that any τ-covering is also a fpqc-covering). We have also seen that descent data are always effective with respect to Zariski coverings (Lemma 31.31.10). It may be prudent to only study the notion just introduced when $\mathcal{P}$ is either stable under any base change or at least local on the base in the τ-topology (see Definition 31.18.1) in order to avoid erroneous arguments (relying on $\mathcal{P}$ when descending halfway).

Here is the obligatory lemma reducing this question to the case of a covering given by a single morphism of affines.

Lemma 31.32.2. *Let $\mathcal{P}$ be a property of morphisms of schemes over a base. Let $\tau \in \{fpqc, fppf, étale, smooth, syntomic\}$. Suppose that*

(1) *$\mathcal{P}$ is stable under any base change (see Schemes, Definition 21.18.3), and*
(2) *for any surjective morphism of affines $X \to S$ which is flat, flat of finite presentation, étale, smooth or syntomic depending on whether τ is fpqc, fppf, étale, smooth, or syntomic, any descent datum (V, φ) relative to X over S such that $\mathcal{P}$ holds for $V \to X$ is effective.*

Then morphisms of type $\mathcal{P}$ satisfy descent for τ-coverings.

Proof. Let S be a scheme. Let $\mathcal{U} = \{\varphi_i : U_i \to S\}_{i\in I}$ be a τ-covering of S. Let $(X_i, \varphi_{ii'})$ be a descent datum relative to $\mathcal{U}$ and assume that each morphism $X_i \to U_i$ has property $\mathcal{P}$. We have to show there exists a scheme $X \to S$ such that $(X_i, \varphi_{ii'}) \cong (U_i \times_S X, can)$.

Before we start the proof proper we remark that for any family of morphisms $\mathcal{V} : \{V_j \to S\}$ and any morphism of families $\mathcal{V} \to \mathcal{U}$, if we pullback the descent datum $(X_i, \varphi_{ii'})$ to a descent datum $(Y_j, \varphi_{jj'})$ over $\mathcal{V}$, then each of the morphisms $Y_j \to V_j$ has property $\mathcal{P}$ also. This is true because we assumed that $\mathcal{P}$ is stable under any base change and the definition of pullback (see Definition 31.30.9). We will use this without further mention.

First, let us prove the lemma when S is affine. By Topologies, Lemma 30.8.8, 30.7.4, 30.4.4, 30.5.4, or 30.6.4 there exists a standard τ-covering $\mathcal{V} : \{V_j \to S\}_{j=1,\ldots,m}$ which refines $\mathcal{U}$. The pullback functor $DD(\mathcal{U}) \to DD(\mathcal{V})$ between categories of descent data is fully faithful by Lemma 31.31.11. Hence it suffices to prove that the descend datum over the standard τ-covering $\mathcal{V}$ is effective. By Lemma 31.30.5 this reduces to the covering $\{\coprod_{j=1,\ldots,m} V_j \to S\}$ for which we have assumed the result in property (2) of the lemma. Hence the lemma holds when S is affine.

Assume S is general. Let $V \subset S$ be an affine open. By the properties of site the family $\mathcal{U}_V = \{V \times_S U_i \to V\}_{i\in I}$ is a τ-covering of V. Denote $(X_i, \varphi_{ii'})_V$ the restriction (or pullback) of the given descent datum to $\mathcal{U}_V$. Hence by what we just saw we obtain a scheme X_V over V whose canonical descent datum with respect to $\mathcal{U}_V$ is isomorphic to $(X_i, \varphi_{ii'})_V$. Suppose that $V' \subset V$ is an affine open of V. Then both $X_{V'}$ and $V' \times_V X_V$ have canonical descent data isomorphic to $(X_i, \varphi_{ii'})_{V'}$. Hence, by Lemma 31.31.11 again we obtain a canonical morphism $\rho^V_{V'} : X_{V'} \to X_V$ over S which identifies $X_{V'}$ with the inverse image of V' in X_V. We omit the verification that given affine opens $V'' \subset V' \subset V$ of S we have $\rho^V_{V''} = \rho^V_{V'} \circ \rho^{V'}_{V''}$.

By Constructions, Lemma 22.2.1 the data $(X_V, \rho^V_{V'})$ glue to a scheme $X \to S$. Moreover, we are given isomorphisms $V \times_S X \to X_V$ which recover the maps $\rho^V_{V'}$. Unwinding the construction of the schemes X_V we obtain isomorphisms

$$V \times_S U_i \times_S X \longrightarrow V \times_S X_i$$

compatible with the maps $\varphi_{ii'}$ and compatible with restricting to smaller affine opens in X. This implies that the canonical descent datum on $U_i \times_S X$ is isomorphic to the given descent datum and we win. $\square$

31.33. Descending affine morphisms

In this section we show that ``affine morphisms satisfy descent for fpqc-coverings''. Here is the formal statement.

Lemma 31.33.1. *Let S be a scheme. Let $\{X_i \to S\}_{i\in I}$ be an fpqc covering, see Topologies, Definition 30.8.1. Let $(V_i/X_i, \varphi_{ij})$ be a descent datum relative to $\{X_i \to S\}$. If each morphism $V_i \to X_i$ is affine, then the descent datum is effective.*

Proof. Being affine is a property of morphisms of schemes which is preserved under any base change, see Morphisms, Lemma 24.11.8. Hence Lemma 31.32.2 applies and it suffices to prove the statement of the lemma in case the fpqc-covering is given by a single $\{X \to S\}$ flat surjective morphism of affines. Say $X = Spec(A)$ and $S = Spec(R)$ so that $R \to A$ is a faithfully flat ring map. Let (V, φ) be a descent datum relative to X over S and assume that $V \to X$ is affine. Then $V \to X$ being affine implies that $V = Spec(B)$ for some A-algebra B (see Morphisms, Definition 24.11.1). The isomorphism φ corresponds to an isomorphism of rings

$$\varphi^\sharp : B \otimes_R A \longleftarrow A \otimes_R B$$

as $A \otimes_R A$-algebras. The cocycle condition on φ says that

$$\begin{tikzcd} B \otimes_R A \otimes_R A & & A \otimes_R A \otimes_R B \arrow[ll] \arrow[dl] \\ & A \otimes_R B \otimes_R A \arrow[ul] & \end{tikzcd}$$

is commutative. Inverting these arrows we see that we have a descent datum for modules with respect to $R \to A$ as in Definition 31.3.1. Hence we may apply Proposition 31.3.9 to obtain an R-module $C = \mathrm{Ker}(B \to A \otimes_R B)$ and an isomorphism $A \otimes_R C \cong B$ respecting descent data. Given any pair $c, c' \in C$ the produc cc' in B lies in C since the map φ is an algebra homomorphism. Hence C is an R-algebra whose base change to A is isomorphic to B compatibly with descent data. Applying $Spec$ we obtain a scheme U over S such that $(V, \varphi) \cong (X \times_S U, can)$ as desired. $\square$

Lemma 31.33.2. *Let S be a scheme. Let $\{X_i \to S\}_{i\in I}$ be an fpqc covering, see Topologies, Definition 30.8.1. Let $(V_i/X_i, \varphi_{ij})$ be a descent datum relative to $\{X_i \to S\}$. If each morphism $V_i \to X_i$ is a closed immersion, then the descent datum is effective.*

Proof. This is true because a closed immersion is an affine morphism (Morphisms, Lemma 24.11.9), and hence Lemma 31.33.1 applies. $\square$

31.34. Descending quasi-affine morphisms

In this section we show that ``quasi-affine morphisms satisfy descent for fpqc-coverings". Here is the formal statement.

Lemma 31.34.1. *Let S be a scheme. Let $\{X_i \to S\}_{i\in I}$ be an fpqc covering, see Topologies, Definition 30.8.1. Let $(V_i/X_i, \varphi_{ij})$ be a descent datum relative to $\{X_i \to S\}$. If each morphism $V_i \to X_i$ is quasi-affine, then the descent datum is effective.*

Proof. Being quasi-affine is a property of morphisms of schemes which is preserved under any base change, see Morphisms, Lemma 24.12.5. Hence Lemma 31.32.2 applies and it suffices to prove the statement of the lemma in case the fpqc-covering is given by a single $\{X \to S\}$ flat surjective morphism of affines. Say $X = Spec(A)$ and $S = Spec(R)$ so that $R \to A$ is a faithfully flat ring map. Let (V, φ) be a descent datum relative to X over S and assume that $\pi : V \to X$ is quasi-affine.

According to Morphisms, Lemma 24.12.3 this means that

$$V \longrightarrow \underline{Spec}_X(\pi_* \mathcal{O}_V) = W$$

is a quasi-compact open immersion of schemes over X. The projections $\mathrm{pr}_i : X \times_S X \to X$ are flat and hence we have

$$\mathrm{pr}_0^*\pi_*\mathcal{O}_V = (\pi \times \mathrm{id}_X)_*\mathcal{O}_{V\times_S X}, \quad \mathrm{pr}_1^*\pi_*\mathcal{O}_V = (\mathrm{id}_X \times \pi)_*\mathcal{O}_{X\times_S V}$$

by flat base change (Coherent, Lemma 25.6.2). Thus the isomorphism $\varphi : V\times_S X \to X\times_S V$ (which is an isomorphism over $X \times_S X$) induces an isomorphism of quasi-coherent sheaves of algebras

$$\varphi^\sharp : \mathrm{pr}_0^*\pi_*\mathcal{O}_V \longrightarrow \mathrm{pr}_1^*\pi_*\mathcal{O}_V$$

on $X \times_S X$. The cocycle condition for φ implies the cocyle condition for $\varphi^\sharp$. Another way to say this is that it produces a descent datum φ' on the affine scheme W relative to X over S, which moreover has the property that the morphism $V \to W$ is a morphism of descent data. Hence by Lemma 31.33.1 (or by effectivity of descent for quasi-coherent algebras) we obtain a scheme $U' \to S$ with an isomorphism $(W, \varphi') \cong (X \times_S U', can)$ of descent data. We note in passing that U' is affine by Lemma 31.19.16.

And now we can think of V as a (quasi-compact) open $V \subset X \times_S U'$ with the property that it is stable under the descent datum

$$can : X \times_S U' \times_S X \to X \times_S X \times_S U', (x_0, u', x_1) \mapsto (x_0, x_1, u').$$

In other words $(x_0, u') \in V \Rightarrow (x_1, u') \in V$ for any x_0, x_1, u' mapping to the same point of S. Because $X \to S$ is surjective we immediately find that V is the inverse image of a subset $U \subset U'$ under the morphism $X \times_S U' \to U'$. Because $X \to S$ is quasi-compact, flat and surjective also $X \times_S U' \to U'$ is quasi-compact flat and surjective. Hence by Morphisms, Lemma 24.24.10 this subset $U \subset U'$ is open and we win. □

31.35. Descent data in terms of sheaves

Here is another way to think about descent data in case of a covering on a site.

Lemma 31.35.1. *Let $\tau \in \{Zariski, fppf, étale, smooth, syntomic$[8]$\}$. Let Sch_τ be a big τ-site. Let $S \in Ob(Sch_\tau)$. Let $\{S_i \to S\}_{i\in I}$ be a covering in the site $(Sch/S)_\tau$. There is an equivalence of categories*

$$\left\{\begin{matrix}\textit{descent data } (X_i, \varphi_{ii'}) \textit{ such that} \\ \textit{each } X_i \in Ob((Sch/S)_\tau)\end{matrix}\right\} \leftrightarrow \left\{\begin{matrix}\textit{sheaves } F \textit{ on } (Sch/S)_\tau \textit{ such that} \\ \textit{each } h_{S_i} \times F \textit{ is representable}\end{matrix}\right\}.$$

Moreover,

(1) *the objects representing $h_{S_i} \times F$ on the right hand side correspond to the schemes X_i on the left hand side, and*
(2) *the sheaf F is representable if and only if the corresponding descent datum $(X_i, \varphi_{ii'})$ is effective.*

Proof. We have seen in Section 31.9 that representable presheaves are sheaves on the site $(Sch/S)_\tau$. Moreover, the Yonea lemma (Categories, Lemma 4.3.5) garantees that maps between representable sheaves correspond one to one with maps between the representing objects. We will use these remarks without further mention during the proof.

Let us construct the functor from right to left. Let F be a sheaf on $(Sch/S)_\tau$ such that each $h_{S_i} \times F$ is representable. In this case let X_i be a representing object in $(Sch/S)_\tau$. It comes

[8] The fact that fpqc is missing is not a typo. See discussion in Topologies, Section 30.8.

equipped with a morphism $X_i \to S_i$. Then both $X_i \times_S S_{i'}$ and $S_i \times_S X_{i'}$ represent the sheaf $h_{S_i} \times F \times h_{S_{i'}}$ and hence we obtain an isomorphism

$$\varphi_{ii'} : X_i \times_S S_{i'} \to S_i \times_S X_{i'}$$

It is straightforward to see that the maps $\varphi_{ii'}$ are morphisms over $S_i \times_S S_{i'}$ and satsify the cocycle condition. The functor from right to left is given by this construction $F \mapsto (X_i, \varphi_{ii'})$.

Let us construct a functor from left to right. For each i denote F_i the sheaf h_{X_i}. The isomorphisms $\varphi_{ii'}$ give isomorphisms

$$\varphi_{ii'} : F_i \times h_{S_{i'}} \longrightarrow h_{S_i} \times F_{i'}$$

over $h_{S_i} \times h_{S_{i'}}$. Set F equal to the coequalizer in the following diagram

$$\coprod\nolimits_{i,i'} F_i \times h_{S_{i'}} \underset{\mathrm{pr}_1 \circ \varphi_{ii'}}{\overset{\mathrm{pr}_0}{\rightrightarrows}} \coprod\nolimits_i F_i \longrightarrow F$$

The cocylce condition garantees that $h_{S_i} \times F$ is isomorphic to F_i and hence representable. The functor from left to right is given by this construction $(X_i, \varphi_{ii'}) \mapsto F$.

We omit the verification that these constructions are mutually quasi-inverse functors. The final statements (1) and (2) follow from the constructions. $\square$

Remark 31.35.2. In the statement of Lemma 31.35.1 the condition that $h_{S_i} \times F$ is representable is equivalent to the condition that the restriction of F to $(Sch/S_i)_\tau$ is representable.

31.36. Descent in terms of simplicial schemes

A *simplicial scheme* is a simplicial object in the category of schemes, see Simplicial, Definition 14.3.1. In this chapter we will use a subscript $\bullet$ to denote simplicial objects. Recall that a simplicial scheme looks like

$$\begin{tikzcd} X_2 \arrow[r, shift left=3] \arrow[r, leftarrow, shift left=1] \arrow[r, shift right=1] \arrow[r, leftarrow, shift right=3] \arrow[r, shift right=5] & X_1 \arrow[r, shift left=2] \arrow[r, leftarrow] \arrow[r, shift right=2] & X_0 \end{tikzcd}$$

Here there are two morphisms $d^1_0, d^1_1 : X_1 \to X_0$ and a single morphism $s^0_0 : X_0 \to X_1$, etc. It is important to remember that $d^n_i : X_n \to X_{n-1}$ should be thought of as a ``projection forgetting the ith coordinate''.

Definition 31.36.1. Let $a : V_\bullet \to X_\bullet$ be a morphism of simplicial schemes. We say a is *cartesian*, or that $V_\bullet$ *is cartesian over* $X_\bullet$, if for every morphism $\varphi : [n] \to [m]$ of Δ the corresponding diagram

$$\begin{tikzcd} V_m \arrow[r, "a"] \arrow[d, "V_\bullet(\varphi)"'] & X_m \arrow[d, "X_\bullet(\varphi)"] \\ V_n \arrow[r, "a"] & X_n \end{tikzcd}$$

is a fibre square in the category of schemes.

Definition 31.36.2. Let $f : X \to S$ be a morphism of schemes. The *simplicial scheme associated to* f, denoted $(X/S)_\bullet$, is the functor $\Delta^{opp} \to Sch$, $[n] \mapsto X \times_S \ldots \times_S X$ described in Simplicial, Example 14.3.5.

Thus $(X/S)_n$ is the $(n+1)$-fold fibre product of X over S. The morphism $d^1_0 : X \times_S X \to X$ is the map $(x_0, x_1) \mapsto x_1$ and the morphism d^1_1 is the other projection. The morphism s^0_0 is the diagonal morphism $X \to X \times_S X$.

Lemma 31.36.3. *Let $f : X \to S$ be a morphism of schemes. Let $\pi : V_\bullet \to (X/S)_\bullet$ be a cartesian morphism. Set $V = V_0$ considered as a scheme over X. The morphisms $d^1_0, d^1_1 : V_1 \to V_0$ and the morphism $\pi_1 : V_1 \to X \times_S X$ induce isomorphisms*

$$V \times_S X \xleftarrow{(d^1_1, pr_1 \circ \pi_1)} V_1 \xrightarrow{(pr_0 \circ \pi_1, d^1_0)} X \times_S V.$$

Denote $\varphi : V \times_S X \to X \times_S V$ the resulting isomorphism. Then the pair (V, φ) is a descent datum relative to $X \to S$.

Proof. The statement that the displayed morphisms are isomorphisms is exactly the cartesian property for the maps $\delta^1_0, \delta^1_1 : [0] \to [1]$. The fact that the diagram of Definition 31.30.1 (1) commutes follows from the fact that each of the induced morphisms $V_2 \to V \times_{X, \mathrm{pr}_i} (X \times_S X \times_S X)$ associated to $[0] \to [2]$, $0 \mapsto i$ is an isomorphism. Details omitted. □

Lemma 31.36.4. *Let $f : X \to S$ be a morphism of schemes. The construction*

$$\begin{matrix} \textit{category of cartesian} \\ \textit{schemes over } (X/S)_\bullet \end{matrix} \longrightarrow \begin{matrix} \textit{category of descent data} \\ \textit{relative to } X/S \end{matrix}$$

of Lemma 31.36.3 is an equivalence of categories.

Proof. Here you have to show that given a descent datum (V, φ) you can canonically construct a cartesian morphism of simplicial schemes $V_\bullet \to (X/S)_\bullet$ so that if you apply the construction of Lemma 31.36.3 then you get back (V, φ). This we did carefully in Section 31.3 for the case of descent data for modules over rings and their associated cosimplicial rings, see especially Lemma 31.3.2. We can easily translate this to the current context. Namely, set

$$V_n = X \times_S \ldots \times_S X \times_S V.$$

Given a point $(x_0, \ldots, x_{n-1}, v)$ of V_n we use the convention that $x_n = \pi(v)$. Using this convention, given a morphism $\beta : [m] \to [n]$ the associated morphism

$$V_\bullet(\beta) : V_n \longrightarrow V_m$$

maps $(x_0, \ldots, x_{n-1}, v)$ to $(x_{\beta(0)}, \ldots, x_{\beta(m-1)}, v')$ where $\varphi^{-1}(x_{\beta(m)}, v) = (v', x_n)$. (It is a fact that $v' = v$ if $n = \beta(m)$; see discussion following Definition 31.30.1.) We omit the verification that this defines a simplicial scheme which is cartesian over $(X/S)_\bullet$. □

We may reinterpret the pullback of Lemma 31.30.6 as follows. Suppose given a commutative diagram of morphisms of schemes

$$\begin{tikzcd} X' \arrow[r, "f"'] \arrow[d] & X \arrow[d] \\ S' \arrow[r] & S. \end{tikzcd}$$

This gives rise to a morphism of simplicial schemes

$$f_\bullet : (X'/S')_\bullet \longrightarrow (X/S)_\bullet.$$

It is a pleasant exercise to check that given any morphism of simplical schemes $f_\bullet : Y_\bullet \to X_\bullet$ and a cartesian simplicial scheme $V_\bullet \to X_\bullet$ the fibre product

$$f^*_\bullet V_\bullet = Y_\bullet \times_{X_\bullet} V_\bullet$$

is a cartesian simplicial scheme over $Y_\bullet$. We omit the verification that this applied to the morphism $(X'/S')_\bullet \to (X/S)_\bullet$ corresponds via Lemma 31.36.4 with the pullback defined in terms of descent data.

CHAPTER 32

Adequate Modules

32.1. Introduction

For any scheme X the category $QCoh(\mathcal{O}_X)$ of quasi-coherent modules is abelian and a weak Serre subcategory of the abelian category of all $\mathcal{O}_X$-modules. The same thing works for the category of quasi-coherent modules on an algebraic space X viewed as a subcategory of the category of all $\mathcal{O}_X$-modules on the small étale site of X. Moreover, for a quasi-compact and quasi-separated morphism $f : X \to Y$ the pushforward f_* and higher direct images preserve quasi-coherency.

Next, let X be a scheme and let $\mathcal{O}$ be the structure sheaf on one of the big sites of X, say, the big fppf site. The category of quasi-coherent $\mathcal{O}$-modules is abelian (in fact it is equivalent to the category of usual quasi-coherent $\mathcal{O}_X$-modules on the scheme X we mentioned above) but its imbedding into $Mod(\mathcal{O})$ is not exact. An example is the map of quasi-coherent modules

$$\mathcal{O}_{\mathbf{A}^1_k} \longrightarrow \mathcal{O}_{\mathbf{A}^1_k}$$

on $\mathbf{A}^1_k = Spec(k[x])$ given by multiplication by x. In the abelian category of quasi-coherent sheaves this map is injective, whereas in the abelian category of all $\mathcal{O}$-modules on the big site of $\mathbf{A}^1_k$ this map has a nontrivial kernel as we see by evaluating on sections over $Spec(k[x]/(x)) = Spec(k)$. Moreover, for a quasi-compact and quasi-separated morphism $f : X \to Y$ the functor $f_{big,*}$ does not preserve quasi-coherency.

In this chapter we introduce a larger category of modules, closely related to quasi-coherent modules, which ``fixes'' the two problems mentioned above.

32.2. Conventions

In this chapter we fix $\tau \in \{Zar, étale, smooth, syntomic, fppf\}$ and we fix a big τ-site Sch_τ as in Topologies, Section 30.2. All schemes will be objects of Sch_τ. In particular, given a scheme S we obtain sites $(Aff/S)_\tau \subset (Sch/S)_\tau$. The structure sheaf $\mathcal{O}$ on these sites is defined by the rule $\mathcal{O}(T) = \Gamma(T, \mathcal{O}_T)$.

All rings A will be such that $Spec(A)$ is (isomorphic to) an object of Sch_τ. Given a ring A we denote Alg_A the category of A-algebras whose objects are the A-algebras B of the form $B = \Gamma(U, \mathcal{O}_U)$ where S is an affine object of Sch_τ. Thus given an affine scheme $S = Spec(A)$ the functor

$$(Aff/S)_\tau \longrightarrow Alg_A, \quad U \longmapsto \mathcal{O}(U)$$

is an equivalence.

32.3. Adequate functors

In this section we discuss a topic closely related to direct images of quasi-coherent sheaves. Most of this material was taken from the paper [**Jaf97**].

Definition 32.3.1. Let A be a ring. A *module-valued functor* is a functor $F : Alg_A \to Ab$ such that

(1) for every object B of Alg_A the group $F(B)$ is endowed with the structure of a B-module, and
(2) for any morphism $B \to B'$ of Alg_A the map $F(B) \to F(B')$ is B-linear.

A *morphism of module-valued functors* is a transformation of functors $\varphi : F \to G$ such that $F(B) \to G(B)$ is B-linear for all $B \in Ob(Alg_A)$.

Let $S = Spec(A)$ be an affine scheme. The category of module-valued functors on Alg_A is equivalent to the category $PMod((Aff/S)_\tau, \mathcal{O})$ of presheaves of $\mathcal{O}$-modules. The equivalence is given by the rule which assigns to the module-valued functor F the presheaf $\mathcal{F}$ defined by the rule $\mathcal{F}(U) = F(\mathcal{O}(U))$. This is clear from the equivalence $(Aff/S)_\tau \to Alg_A$, $U \mapsto \mathcal{O}(U)$ given in Section 32.2. The quasi-inverse sets $F(B) = \mathcal{F}(Spec(B))$.

An important special case of a module-valued functor comes about as follows. Let M be an A-module. Then we will denote $\underline{M}$ the module-valued functor $B \mapsto M \otimes_A B$ (with obvious B-module structure). Note that if $M \to N$ is a map of A-modules then there is an associated morphism $\underline{M} \to \underline{N}$ of module-valued functors. Conversely, any morphism of module-valued functors $\underline{M} \to \underline{N}$ comes from an A-module map $M \to N$ as the reader can see by evaluating on $B = A$. In other words Mod_A is a full subcategory of the category of module-valued functors on Alg_A.

Given and A-module map $\varphi : M \to N$ then $\text{Coker}(\underline{M} \to \underline{N}) = \underline{Q}$ where $Q = \text{Coker}(M \to N)$ because $\otimes$ is right exact. But this isn't the case for the kernel in general: for example an injective map of A-modules need not be injective after base change. Thus the following definition makes sense.

Definition 32.3.2. Let A be a ring. A module-valued functor F on Alg_A is called

(1) *adequate* if there exists a map of A-modules $M \to N$ such that F is isomorphic to $\text{Ker}(\underline{M} \to \underline{N})$.
(2) *linearly adequate* if F is isomorphic to the kernel of a map $\underline{A^{\oplus n}} \to \underline{A^{\oplus m}}$.

Note that F is adequate if and only if there exists an exact sequence $0 \to F \to \underline{M} \to \underline{N}$ and F is linearly adequate if and only if there exists an exact sequence $0 \to F \to \underline{A^{\oplus n}} \to \underline{A^{\oplus m}}$.

Let A be a ring. In this section we will show the category of adequate functors on Alg_A is abelian (Lemmas 32.3.10 and 32.3.11) and has a set of generators (Lemma 32.3.6). We will also see that it is a weak Serre subcategory of the category of all module-valued functors on Alg_A (Lemma 32.3.16) and that it has arbitrary colimits (Lemma 32.3.12).

Lemma 32.3.3. *Let A be a ring. Let F be an adequate functor on Alg_A. If $B = colim\, B_i$ is a filtered colimit of A-algebras, then $F(B) = colim\, F(B_i)$.*

Proof. This holds because for any A-module M we have $M \otimes_A B = colim\, M \otimes_A B_i$ (see Algebra, Lemma 7.11.8) and because filtered colimits commute with exact sequences, see Algebra, Lemma 7.8.9. □

Remark 32.3.4. Consider the category $Alg_{fp,A}$ whose objects are A-algebras B of the form $B = A[x_1, \ldots, x_n]/(f_1, \ldots, f_m)$ and whose morphisms are A-algebra maps. Every A-algebra B is a filtered colimit of finitely presented A-algebra, i.e., a filtered colimit of objects of $Alg_{fp,A}$. By Lemma 32.3.3 we conclude every adequate functor F is determined by its restriction to $Alg_{fp,A}$. For some questions we can therefore restrict to functors on

$Alg_{fp,A}$. For example, the category of adequate functors does not depend on the choice of the big τ-site chosen in Section 32.2.

Lemma 32.3.5. *Let A be a ring. Let F be an adequate functor on Alg_A. If $B \to B'$ is flat, then $F(B) \otimes_B B' \to F(B')$ is an isomorphism.*

Proof. Choose an exact sequence $0 \to F \to \underline{M} \to \underline{N}$. This gives the diagram

$$\begin{tikzcd} 0 \arrow[r] & F(B) \otimes_B B' \arrow[r] \arrow[d] & (M \otimes_A B) \otimes_B B' \arrow[r] \arrow[d] & (N \otimes_A B) \otimes_B B' \arrow[d] \\ 0 \arrow[r] & F(B') \arrow[r] & M \otimes_A B' \arrow[r] & N \otimes_A B' \end{tikzcd}$$

where the rows are exact (the top one because $B \to B'$ is flat). Since the right two vertical arrows are isomorphisms, so is the left one. □

Lemma 32.3.6. *Let A be a ring. Let F be an adequate functor on Alg_A. Then there exists a surjection $L \to F$ with L a direct sum of linearly adequate functors.*

Proof. Choose an exact sequence $0 \to F \to \underline{M} \to \underline{N}$ where $\underline{M} \to \underline{N}$ is given by $\varphi : M \to N$. By Lemma 32.3.3 it suffices to construct $L \to F$ such that $L(B) \to F(B)$ is surjective for every finitely presented A-algebra B. Hence it suffices to construct, given a finitely presented A-algebra B and an element $\xi \in F(B)$ a map $L \to F$ with L linearly adequate such that ξ is in the image of $L(B) \to F(B)$. (Because there is a set worth of such pairs (B, ξ) up to isomorphism.)

To do this write $\sum_{i=1,\ldots,n} m_i \otimes b_i$ the image of ξ in $\underline{M}(B) = M \otimes_A B$. We know that $\sum \varphi(m_i) \otimes b_i = 0$ in $N \otimes_A B$. As N is a filtered colimit of finitely presented A-modules, we can find a finitely presented A-module N', a commutative diagram of A-modules

$$\begin{tikzcd} A^{\oplus n} \arrow[r] \arrow[d, "m_1, \ldots, m_n"'] & N' \arrow[d] \\ M \arrow[r] & N \end{tikzcd}$$

such that $(b_1, \ldots, b_n)$ maps to zero in $N' \otimes_A B$. Choose a presentation $A^{\oplus l} \to A^{\oplus k} \to N' \to 0$. Choose a lift $A^{\oplus n} \to A^{\oplus k}$ of the map $A^{\oplus n} \to N'$ of the diagram. Then we see that there exist $(c_1, \ldots, c_l) \in B^{\oplus l}$ such that $(b_1, \ldots, b_n, c_1, \ldots, c_l)$ maps to zero in $B^{\oplus k}$ under the map $B^{\oplus n} \oplus B^{\oplus l} \to B^{\oplus k}$. Consider the commutative diagram

$$\begin{tikzcd} A^{\oplus n} \oplus A^{\oplus l} \arrow[r] \arrow[d] & A^{\oplus k} \arrow[d] \\ M \arrow[r] & N \end{tikzcd}$$

where the left vertical arrow is zero on the summand $A^{\oplus l}$. Then we see that L equal to the kernel of $\underline{A^{\oplus n+l}} \to \underline{A^{\oplus k}}$ works because the element $(b_1, \ldots, b_n, c_1, \ldots, c_l) \in L(B)$ maps to ξ. □

Consider a graded A-algebra $B = \bigoplus_{d \geq 0} B_d$. Then there are two A-algebra maps $p, a : B \to B[t, t^{-1}]$, namely $p : b \mapsto b$ and $a : b \mapsto t^{\deg(b)} b$ where b is homogeneous. If F is a module-valued functor on Alg_A, then we define

$$F(B)^{(k)} = \{\xi \in F(B) \mid t^k F(p)(\xi) = F(a)(\xi)\}. \quad (32.3.6.1)$$

For functors which behave well with respect to flat ring extensions this gives a direct sum decompostion. This amounts to the fact that representations of $\mathbf{G}_m$ are completely reducible.

Lemma 32.3.7. *Let A be a ring. Let F be a module-valued functor on Alg_A. Assume that for $B \to B'$ flat the map $F(B) \otimes_B B' \to F(B')$ is an isomorphism. Let B be a graded A-algebra. Then*

1. *$F(B) = \bigoplus_{k \in \mathbf{Z}} F(B)^{(k)}$, and*
2. *the map $B \to B_0 \to B$ induces map $F(B) \to F(B)$ whose image is contained in $F(B)^{(0)}$.*

Proof. Let $x \in F(B)$. The map $p : B \to B[t, t^{-1}]$ is free hence we know that

$$F(B[t, t^{-1}]) = \bigoplus\nolimits_{k \in \mathbf{Z}} F(p)(F(B)) \cdot t^k = \bigoplus\nolimits_{k \in \mathbf{Z}} F(B) \cdot t^k$$

as indicated we drop the $F(p)$ in the rest of the proof. Write $F(a)(x) = \sum t^k x_k$ for some $x_k \in F(B)$. Denote $\epsilon : B[t, t^{-1}] \to B$ the B-algebra map $t \mapsto 1$. Note that the compositions $\epsilon \circ p, \epsilon \circ a : B \to B[t, t^{-1}] \to B$ are the identity. Hence we see that

$$x = F(\epsilon)(F(a)(x)) = F(\epsilon)(\sum t^k x_k) = \sum x_k.$$

On the other hand, we claim that $x_k \in F(B)^{(k)}$. Namely, consider the commutative diagram

$$\begin{tikzcd} B \arrow[r, "a"'] \arrow[d, "a'"'] & B[t, t^{-1}] \arrow[d, "f"] \\ B[s, s^{-1}] \arrow[r, "g"] & B[t, s, t^{-1}, s^{-1}] \end{tikzcd}$$

where $a'(b) = s^{\deg(b)} b$, $f(b) = b$, $f(t) = st$ and $g(b) = t^{\deg(b)} b$ and $g(s) = s$. Then

$$F(g)(F(a'))(x) = F(g)(\sum s^k x_k) = \sum s^k F(a)(x_k)$$

and going the other way we see

$$F(f)(F(a))(x) = F(f)(\sum t^k x_k) = \sum (st)^k x_k.$$

Since $B \to B[s, t, s^{-1}, t^{-1}]$ is free we see that $F(B[t, s, t^{-1}, s^{-1}]) = \bigoplus_{k,l \in \mathbf{Z}} F(B) \cdot t^k s^l$ and comparing coefficients in the expressions above we find $F(a)(x_k) = t^k x_k$ as desired.

Finally, the image of $F(B_0) \to F(B)$ is contained in $F(B)^{(0)}$ because $B_0 \to B \xrightarrow{a} B[t, t^{-1}]$ is equal to $B_0 \to B \xrightarrow{p} B[t, t^{-1}]$. $\square$

As a particular case of Lemma 32.3.7 note that

$$\underline{M}(B)^{(k)} = M \otimes_A B_k$$

where B_k is the degree k part of the graded A-algebra B.

Lemma 32.3.8. *Let A be a ring. Given a solid diagram*

$$\begin{tikzcd} 0 \arrow[r] & L \arrow[r] \arrow[d, "\varphi"'] & \underline{A^{\oplus n}} \arrow[r] \arrow[dl, dotted] & \underline{A^{\oplus m}} \\ & \underline{M} & & \end{tikzcd}$$

of module-valued functors on Alg_A with exact row there exists a dotted arrow making the diagram commute.

Proof. Suppose that the map $A^{\oplus n} \to A^{\oplus m}$ is given by the $m \times n$-matrix (a_{ij}). Consider the ring $B = A[x_1, \ldots, x_n]/(\sum a_{ij}x_j)$. The element $(x_1, \ldots, x_n) \in \underline{A}^{\oplus n}(B)$ maps to zero in $\underline{A}^{\oplus m}(B)$ hence is the image of a unique element $\xi \in L(B)$. Note that ξ has the following universal property: for any A-algebra C and any $\xi' \in L(C)$ there exists an A-algebra map $B \to C$ such that ξ maps to ξ' via the map $L(B) \to L(C)$.

Note that B is a graded A-algebra, hence we can use Lemmas 32.3.7 and 32.3.5 to decompose the values of our functors on B into graded pieces. Note that $\xi \in L(B)^{(1)}$ as $(x_1, \ldots, x_n)$ is an element of degree one in $\underline{A}^{\oplus n}(B)$. Hence we see that $\varphi(\xi) \in \underline{M}(B)^{(1)} = M \otimes_A B_1$. Since B_1 is generated by $x_1, \ldots, x_n$ as an A-module we can write $\varphi(\xi) = \sum m_i \otimes x_i$. Consider the map $A^{\oplus n} \to M$ which maps the ith basis vector to m_i. By construction the associated map $\underline{A}^{\oplus n} \to \underline{M}$ maps the element ξ to $\varphi(\xi)$. It follows from the universal property mentioned above that the diagram commutes. $\square$

Lemma 32.3.9. *Let A be a ring. Let $\varphi : F \to \underline{M}$ be a map of module-valued functors on Alg_A with F adequate. Then Coker(φ) is adequate.*

Proof. By Lemma 32.3.6 we may assume that $F = \bigoplus L_i$ is a direct sum of linearly adequate functors. Choose exact sequences $0 \to L_i \to \underline{A}^{\oplus n_i} \to \underline{A}^{\oplus m_i}$. For each i choose a map $A^{\oplus n_i} \to M$ as in Lemma 32.3.8. Consider the diagram

$$\begin{tikzcd}
0 \arrow[r] & \bigoplus L_i \arrow[r] \arrow[d] & \bigoplus \underline{A}^{\oplus n_i} \arrow[r] \arrow[dl] & \bigoplus \underline{A}^{\oplus m_i} \\
& \underline{M} & &
\end{tikzcd}$$

Consider the A-modules

$$Q = \text{Coker}(\bigoplus A^{\oplus n_i} \to M \oplus \bigoplus A^{\oplus m_i}) \quad \text{and} \quad P = \text{Coker}(\bigoplus A^{\oplus n_i} \to \bigoplus A^{\oplus m_i}).$$

Then we see that Coker(φ) is isomorphic to the kernel of $\underline{Q} \to \underline{P}$. $\square$

Lemma 32.3.10. *Let A be a ring. Let $\varphi : F \to G$ be a map of adequate functors on Alg_A. Then Coker(φ) is adequate.*

Proof. Choose an injection $G \to \underline{M}$. Then we have an injection $G/F \to \underline{M}/F$. By Lemma 32.3.9 we see that $\underline{M}/F$ is adequate, hence we can find an injection $\underline{M}/F \to \underline{N}$. Composing we obtain an injection $G/F \to \underline{N}$. By Lemma 32.3.9 the cokernel of the induced map $G \to \underline{N}$ is adequate hence we can find an injection $\underline{N}/G \to \underline{K}$. Then $0 \to G/F \to \underline{N} \to \underline{K}$ is exact and we win. $\square$

Lemma 32.3.11. *Let A be a ring. Let $\varphi : F \to G$ be a map of adequate functors on Alg_A. Then Ker(φ) is adequate.*

Proof. Choose an injection $F \to \underline{M}$ and an injection $G \to \underline{N}$. Denote $F \to \underline{M \oplus N}$ the diagonal map so that

$$\begin{tikzcd}
F \arrow[r] \arrow[d] & G \arrow[d] \\
\underline{M \oplus N} \arrow[r] & \underline{N}
\end{tikzcd}$$

commutes. By Lemma 32.3.10 we can find a module map $M \oplus N \to K$ such that F is the kernel of $\underline{M \oplus N} \to \underline{K}$. Then Ker$(\varphi)$ is the kernel of $\underline{M \oplus N} \to \underline{K \oplus N}$. $\square$

Lemma 32.3.12. *Let A be a ring. An arbitrary direct sum of adequate functors on Alg_A is adequate. A colimit of adequate functors is adequate.*

Proof. The statement on direct sums is immediate. A general colimit can be written as a kernel of a map between direct sums, see Categories, Lemma 4.13.11. Hence this follows from Lemma 32.3.11. □

Lemma 32.3.13. *Let A be a ring. Let F, G be module-valued functors on Alg_A. Let $\varphi : F \to G$ be a transformation of functors. Assume*

(1) *φ is additive,*
(2) *for every A-algebra B and $\xi \in F(B)$ and unit $u \in B^*$ we have $\varphi(u\xi) = u\varphi(\xi)$ in $G(B)$, and*
(3) *for any flat ring map $B \to B'$ we have $G(B) \otimes_B B' = G(B')$.*

Then φ is a morphism of module-valued functors.

Proof. Let B be an A-algebra, $\xi \in F(B)$, and $b \in B$. We have to show that $\varphi(b\xi) = b\varphi(\xi)$. Consider the ring map

$$B \to B' = B[x, y, x^{-1}, y^{-1}]/(x + y - b).$$

This ring map is faithfully flat, hence $G(B) \subset G(B')$. On the other hand

$$\varphi(b\xi) = \varphi((x + y)\xi) = \varphi(x\xi) + \varphi(y\xi) = x\varphi(\xi) + y\varphi(\xi) = (x + y)\varphi(\xi) = b\varphi(\xi)$$

because x, y are units in B'. Hence we win. □

Lemma 32.3.14. *Let A be a ring. Let $0 \to \underline{M} \to G \to L \to 0$ be a short exact sequence of module-valued functors on Alg_A with L linearly adequate. Then G is adequate.*

Proof. We first point out that for any flat A-algebra map $B \to B'$ the map $G(B) \otimes_B B' \to G(B')$ is an isomorphism. Namely, this holds for $\underline{M}$ and L, see Lemma 32.3.5 and hence follows for G by the five lemma. In particular, by Lemma 32.3.7 we see that $G(B) = \bigoplus_{k \in \mathbf{Z}} G(B)^{(k)}$ for any graded A-algebra B.

Choose an exact sequence $0 \to L \to \underline{A^{\oplus n}} \to \underline{A^{\oplus m}}$. Suppose that the map $A^{\oplus n} \to A^{\oplus m}$ is given by the $m \times n$-matrix (a_{ij}). Consider the graded A-algebra $B = A[x_1, \ldots, x_n]/(\sum a_{ij}x_j)$. The element $(x_1, \ldots, x_n) \in \underline{A^{\oplus n}}(B)$ maps to zero in $\underline{A^{\oplus m}}(B)$ hence is the image of a unique element $\xi \in L(B)$. Observe that $\xi \in L(B)^{(1)}$. The map

$$Hom_A(B, C) \longrightarrow L(C), \quad f \longmapsto L(f)(\xi)$$

defines an isomorphism of functors. The reason is that f is determined by the images $c_i = f(x_i) \in C$ which have to satisfy the relations $\sum a_{ij}c_j = 0$. And $L(C)$ is the set of n-tuples $(c_1, \ldots, c_n)$ satisfying the relations $\sum a_{ij}c_j = 0$.

Since the value of each of the functors $\underline{M}$, G, L on B is a direct sum of its weight spaces (by the lemma mentioned above) exactness of $0 \to \underline{M} \to G \to L \to 0$ implies the sequence $0 \to \underline{M}(B)^{(1)} \to G(B)^{(1)} \to L(B)^{(1)} \to 0$ is exact. Thus we may choose an element $\theta \in G(B)^{(1)}$ mapping to ξ.

Consider the graded A-algebra

$$C = A[x_1, \ldots, x_n, y_1, \ldots, y_n]/(\sum a_{ij}x_j, \sum a_{ij}y_j)$$

There are three graded A-algebra homomorphisms $p_1, p_2, m : B \to C$ defined by the rules

$$p_1(x_i) = x_i, \quad p_1(x_i) = y_i, \quad m(x_i) = x_i + y_i.$$

We will show that the element

$$\tau = G(m)(\theta) - G(p_1)(\theta) - G(p_2)(\theta) \in G(C)$$

is zero. First, τ maps to zero in $L(C)$ by a direct calculation. Hence τ is an element of $\underline{M}(C)$. Moreover, since m, p_1, p_2 are graded algebra maps we see that $\tau \in G(C)^{(1)}$ and since $\underline{M} \subset G$ we conclude

$$\tau \in \underline{M}(C)^{(1)} = M \otimes_A C_1.$$

We may write uniquely $\tau = \underline{M}(p_1)(\tau_1) + \underline{M}(p_2)(\tau_2)$ with $\tau_i \in M \otimes_A B_1 = \underline{M}(B)^{(1)}$ because $C_1 = p_1(B_1) \oplus p_2(B_1)$. Consider the ring map $q_1 : C \to B$ defined by $x_i \mapsto x_i$ and $y_i \mapsto 0$. Then $\underline{M}(q_1)(\tau) = \underline{M}(q_1)(\underline{M}(p_1)(\tau_1) + \underline{M}(p_2)(\tau_2)) = \tau_1$. On the other hand, because $q_1 \circ m = q_1 \circ p_1$ we see that $G(q_1)(\tau) = -G(q_1 \circ p_2)(\tau)$. Since $q_1 \circ p_2$ factors as $B \to A \to B$ we see that $G(q_1 \circ p_2)(\tau)$ is in $G(B)^{(0)}$, see Lemma 32.3.7. Hence $\tau_1 = 0$ because it is in $G(B)^{(0)} \cap \underline{M}(B)^{(1)} \subset G(B)^{(0)} \cap G(B)^{(1)} = 0$. Similarly $\tau_2 = 0$, whence $\tau = 0$.

Since $\theta \in G(B)$ we obtain a transformation of functors

$$\psi : L(-) = Hom_A(B, -) \longrightarrow G(-)$$

by mapping $f : B \to C$ to $G(f)(\theta)$. Since θ is a lift of ξ the map ψ is a right inverse of $G \to L$. In terms of ψ the statements proved above have the following meaning: $\tau = 0$ means that ψ is additive and $\theta \in G(B)^{(1)}$ implies that for any A-algebra D we have $\psi(ul) = u\psi(l)$ in $G(D)$ for $l \in L(D)$ and $u \in D^*$ a unit. This implies that ψ is a morphism of module-valued functors, see Lemma 32.3.13. Clearly this implies that $G \cong \underline{M} \oplus L$ and we win. □

Remark 32.3.15. Let A be a ring. The proof of Lemma 32.3.14 shows that any extension $0 \to \underline{M} \to E \to L \to 0$ of module-valued functors on Alg_A with L linearly adequate splits. It uses only the following properties of the module-valued functor $F = \underline{M}$:

(1) $F(B) \otimes_B B' \to F(B')$ is an isomorphism for a flat ring map $B \to B'$, and
(2) $F(C)^{(1)} = F(p_1)(F(B)^{(1)}) \oplus F(p_2)(F(B)^{(1)})$ where $B = A[x_1, \ldots, x_n]/(\sum a_{ij}x_j)$ and $C = A[x_1, \ldots, x_n, y_1, \ldots, y_n]/(\sum a_{ij}x_j, \sum a_{ij}y_j)$.

These two properties hold for any adequate functor F; details omitted. Hence we see that L is a projective object of the abelian category of adequate functors.

Lemma 32.3.16. *Let A be a ring. Let $0 \to F \to G \to H \to 0$ be a short exact sequence of module-valued functors on Alg_A. If F and H are adequate, so is G.*

Proof. Choose an exact sequence $0 \to F \to \underline{M} \to \underline{N}$. If we can show that $(\underline{M} \oplus G)/F$ is adequate, then G is the kernel of the map of adequate functors $(\underline{M} \oplus G)/F \to \underline{N}$, hence adequate by Lemma 32.3.11. Thus we may assume $F = \underline{M}$.

We can choose a surjection $L \to H$ where L is a direct sum of linearly adequate functors, see Lemma 32.3.6. If we can show that the pullback $G \times_H L$ is adequate, then G is the cokernel of the map $\mathrm{Ker}(L \to H) \to G \times_H L$ hence adequate by Lemma 32.3.10. Thus we may assume that $H = \bigoplus L_i$ is a direct sum of linearly adequate functors. By Lemma 32.3.14 each of the pullbacks $G \times_H L_i$ is adequate. By Lemma 32.3.12 we see that $\bigoplus G \times_H L_i$ is adequate. Then G is the cokernel of

$$\bigoplus\nolimits_{i \neq i'} F \longrightarrow \bigoplus G \times_H L_i$$

where ξ in the summand (i, i') maps to $(0, \ldots, 0, \xi, 0, \ldots, 0, -\xi, 0, \ldots, 0)$ with nonzero entries in the summands i and i'. Thus G is adequate by Lemma 32.3.10. □

Lemma 32.3.17. *Let $A \to A'$ be a ring map. If F is an adequate functor on Alg_A, then its restriction F' to $Alg_{A'}$ is adequate too.*

Proof. Choose an exact sequence $0 \to F \to \underline{M} \to \underline{N}$. Then $F'(B') = F(B') = \text{Ker}(M \otimes_A B' \to N \otimes_A B')$. Since $M \otimes_A B' = M \otimes_A A' \otimes_{A'} B'$ and similarly for N we see that F' is the kernel of $\underline{M \otimes_A A'} \to \underline{N \otimes_A A'}$. $\square$

Lemma 32.3.18. *Let $A \to A'$ be a ring map. If F' is an adequate functor on $Alg_{A'}$, then the module-valued functor $F : B \mapsto F'(A' \otimes_A B)$ on Alg_A is adequate too.*

Proof. Choose an exact sequence $0 \to F' \to \underline{M'} \to \underline{N'}$. Then

$$\begin{aligned} F(B) &= F'(A' \otimes_A B) \\ &= \text{Ker}(M' \otimes_{A'} (A' \otimes_A B) \to N' \otimes_{A'} (A' \otimes_A B)) \\ &= \text{Ker}(M' \otimes_A B \to N' \otimes_A B) \end{aligned}$$

Thus F is the kernel of $\underline{M} \to \underline{N}$ where $M = M'$ and $N = N'$ viewed as A-modules. $\square$

Lemma 32.3.19. *Let $A = A_1 \times \ldots \times A_n$ be a product of rings. An adequate functor over A is the same thing as a sequence $F_1, \ldots, F_n$ of adequate functors F_i over A_i.*

Proof. This is true because an A-algebra B is canonically a product $B_1 \times \ldots \times B_n$ and the same thing holds for A-modules. Setting $F(B) = \coprod F_i(B_i)$ gives the correspondence. Details omitted. $\square$

Lemma 32.3.20. *Let $A \to A'$ be a ring map and let F be a module-valued functor on Alg_A such that*

(1) *the restriction F' of F to the category of A'-algebras is adequate, and*
(2) *for any A-algebra B the sequence*

$$0 \to F(B) \to F(B \otimes_A A') \to F(B \otimes_A A' \otimes_A A')$$

is exact.

Then F is adequate.

Proof. The functors $B \to F(B \otimes_A A')$ and $B \mapsto F(B \otimes_A A' \otimes_A A')$ are adequate, see Lemmas 32.3.18 and 32.3.17. Hence F as a kernel of a map of adequate functors is adequate, see Lemma 32.3.11. $\square$

32.4. Higher exts of adequate functors

Let A be a ring. In Lemma 32.3.16 we have seen that any extension of adequate functors in the category of module-valued functors on Alg_A is adequate. In this section we show that the same remains true for higher ext groups.

Lemma 32.4.1. *Let A be a ring. For every module-valued functor F on Alg_A there exists a morphism $Q(F) \to F$ of module-valued functors on Alg_A such that (1) $Q(F)$ is adequate and (2) for every adequate functor G the map $Hom(G, Q(F)) \to Hom(G, F)$ is a bijection.*

Proof. Choose a set $\{L_i\}_{i \in I}$ of linearly adequate functors such that every linearly adequate functor is isomorphic to one of the L_i. This is possible. Suppose that we can find $Q(F) \to F$ with (1) and (2)' or every $i \in I$ the map $Hom(L_i, Q(F)) \to Hom(L_i, F)$ is a bijection. Then (2) holds. Namely, combining Lemmas 32.3.6 and 32.3.11 we see that every adequate functor G sits in an exact sequence

$$K \to L \to G \to 0$$

with K and L direct sums of linearly adequate functors. Hence (2)' implies that $Hom(L, Q(F)) \to Hom(L, F)$ and $Hom(K, Q(F)) \to Hom(K, F)$ are bijections, whence the same thing for G.

Consider the category $\mathcal{J}$ whose objects are pairs (i, φ) where $i \in I$ and $\varphi : L_i \to F$ is a morphism. A morphism $(i, \varphi) \to (i', \varphi')$ is a map $\psi : L_i \to L_{i'}$ such that $\varphi' \circ \psi = \varphi$. Set

$$Q(F) = colim_{(i,\varphi)\in Ob(\mathcal{J})} L_i$$

There is a natural map $Q(F) \to F$, by Lemma 32.3.12 it is adequate, and by construction it has property (2)'. $\square$

Lemma 32.4.2. *Let A be a ring. Denote $\mathcal{P}$ the category of module-valued functors on Alg_A and $\mathcal{A}$ the category of adequate functors on Alg_A. Denote $i : \mathcal{A} \to \mathcal{P}$ the inclusion functor. Denote $Q : \mathcal{P} \to \mathcal{A}$ the construction of Lemma 32.4.1. Then*

(1) *i is fully faithful, exact, and its image is a weak Serre subcategory,*
(2) *$\mathcal{P}$ has enough injectives,*
(3) *the functor Q is a right adjoint to i hence left exact,*
(4) *Q transforms injectives into injectives,*
(5) *$\mathcal{A}$ has enough injectives.*

Proof. This lemma just collects some facts we have already seen sofar. Part (1) is clear from the definitions, the characterization of weak Serre subcategories (see Homology, Lemma 10.7.3), and Lemmas 32.3.10, 32.3.11, and 32.3.16. Recall that $\mathcal{P}$ is equivalent to the category $PMod((Aff/Spec(A))_\tau, \mathcal{O})$. Hence (2) by Injectives, Proposition 17.12.5. Part (3) follows from Lemma 32.4.1 and Categories, Lemma 4.22.2. Parts (4) and (5) follow from Homology, Lemmas 10.22.1 and 10.22.3. $\square$

Let A be a ring. As in Formal Deformation Theory, Section 51.10 given an A-algebra B and an B-module N we set $B[N]$ equal to the R-algebra with underlying B-module $B \oplus N$ with multiplication given by $(b, m)(b', m') = (bb', bm' + b'm)$. Note that this construction is functorial in the pair (B, N) where morphism $(B, N) \to (B', N')$ is given by an A-algebra map $B \to B'$ and an B-module map $N \to N'$. In some sense the functor TF of pairs defined in the following lemma is the tangent space of F. Below we will only consider pairs (B, N) such that $B[N]$ is an object of Alg_A.

Lemma 32.4.3. *Let A be a ring. Let F be a module valued functor. For every $B \in Ob(Alg_A)$ and B-module N there is a canonical decomposition*

$$F(B[N]) = F(B) \oplus TF(B, N)$$

characterized by the following properties

(1) *$TF(B, N) = Ker(F(B[N]) \to F(B))$,*
(2) *there is a B-module structure $TF(B, N)$ compatible with $B[N]$-module structure on $F(B[N])$,*
(3) *TF is a functor from the category of pairs (B, N),*
(4) *there are canonical maps $N \otimes_B F(B) \to TF(B, N)$ inducing a transformation between functors defined on the category of pairs (B, N),*
(5) *$TF(B, 0) = 0$ and the map $TF(B, N) \to TF(B, N')$ is zero when $N \to N'$ is the zero map.*

Proof. Since $B \to B[N] \to B$ is the identity we see that $F(B) \to F(B[N])$ is a direct summand whose complement is $TF(N, B)$ as defined in (1). This construction is functorial in the pair (B, N) simply because given a morphism of pairs $(B, N) \to (B', N')$ we obtain a commutative diagram

$$\begin{tikzcd} B' \arrow[r] & B'[N'] \arrow[r] & B' \\ B \arrow[r] \arrow[u] & B[N] \arrow[r] \arrow[u] & B \arrow[u] \end{tikzcd}$$

in Alg_A. The B-module structure comes from the $B[N]$-module structure and the ring map $B \to B[N]$. The map in (4) is the composition

$$N \otimes_B F(B) \longrightarrow B[N] \otimes_{B[N]} F(B[N]) \longrightarrow F(B[N])$$

whose image is contained in $TF(B, N)$. (The first arrow uses the inclusions $N \to B[N]$ and $F(B) \to F(B[N])$ and the second arrow is the multiplication map.) If $N = 0$, then $B = B[N]$ hence $TF(B, 0) = 0$. If $N \to N'$ is zero then it factors as $N \to 0 \to N'$ hence the induced map is zero since $TF(B, 0) = 0$. $\square$

Let A be a ring. Let M be an A-module. Then the module-valued functor $\underline{M}$ has tangent space $T\underline{M}$ given by the rule $T\underline{M}(B, N) = N \otimes_A M$. In particular, for B given, the functor $N \mapsto T\underline{M}(B, N)$ is additive and right exact. It turns out this also holds for injective module-valued functors.

Lemma 32.4.4. *Let A be a ring. Let I be an injective object of the category of module-valued functors. Then for any $B \in Ob(Alg_A)$ and short exact sequence $0 \to N_1 \to N \to N_2 \to 0$ of B-modules the sequence*

$$TI(B, N_1) \to TI(B, N) \to TI(B, N_2) \to 0$$

is exact.

Proof. We will use the results of Lemma 32.4.3 without further mention. Denote $h : Alg_A \to Sets$ the functor given by $h(C) = Mor_A(B[N], C)$. Similarly for h_1 and h_2. The map $B[N] \to B[N_2]$ corresponding to the surjection $N \to N_2$ is surjective. It corresponds to a map $h_2 \to h$ such that $h_2(C) \to h(C)$ is injective for all A-algebras C. On the other hand, there are two maps $p, q : h \to h_1$, corresponding to the zero map $N_1 \to N$ and the injection $N_1 \to N$. Note that

$$\begin{tikzcd} h_2 \arrow[r] & h \arrow[r, shift left] \arrow[r, shift right] & h_1 \end{tikzcd}$$

is an equalizer diagram. Denote $\mathcal{O}_h$ the module-valued functor $C \mapsto \bigoplus_{h(C)} C$. Similarly for $\mathcal{O}_{h_1}$ and $\mathcal{O}_{h_2}$. Note that

$$Hom_{\mathcal{P}}(\mathcal{O}_h, F) = F(B[N])$$

where $\mathcal{P}$ is the category of of module-valued functors on Alg_A. We claim there is an equalizer diagram

$$\begin{tikzcd} \mathcal{O}_{h_2} \arrow[r] & \mathcal{O}_h \arrow[r, shift left] \arrow[r, shift right] & \mathcal{O}_{h_1} \end{tikzcd}$$

in $\mathcal{P}$. Namely, suppose that $C \in Ob(Alg_A)$ and $\xi = \sum_{i=1,\ldots,n} c_i \cdot f_i$ where $c_i \in C$ and $f_i : B[N] \to C$ is an element of $\mathcal{O}_h(C)$. If $p(\xi) = q(\xi)$, then we see that

$$\sum c_i \cdot f_i \circ z = \sum c_i \cdot f_i \circ y$$

where $z, y : B[N_1] \to B[N]$ are the maps $z : (b, m_1) \mapsto (b, 0)$ and $y : (b, m_1) \mapsto (b, m_1)$. This means that for every i there exists a j such that $f_j \circ z = f_i \circ y$. Clearly, this implies that $f_i(N_1) = 0$, i.e., f_i factors through a unique map $\overline{f}_i : B[N_2] \to C$. Hence ξ is the image of $\bar{\xi} = \sum c_i \cdot \bar{f}_i$. Since I is injective, it transforms this equalizer diagram into a coequalizer diagram

$$I(B[N_1]) \rightrightarrows I(B[N]) \longrightarrow I(B[N_2])$$

This diagram is compatible with the direct sum decompositions $I(B[N]) = I(B) \oplus TI(B, N)$ and $I(B[N_i]) = I(B) \oplus TI(B, N_i)$. The zero map $N \to N_1$ induces the zero map $TI(B, N) \to TI(B, N_1)$. Thus we see that the coequalizer property above means we have an exact sequence $TI(B, N_1) \to TI(B, N) \to TI(B, N_2) \to 0$ as desired. $\square$

Lemma 32.4.5. *Let A be a ring. Let F be a module-valued functor such that for any $B \in Ob(Alg_A)$ the functor $TF(B, -)$ on B-modules transforms a short exact sequence of B-modules into a right exact sequence. Then*

1. *$TF(B, N_1 \oplus N_2) = TF(B, N_1) \oplus TF(B, N_2)$,*
2. *there is a second functorial B-module structure on $TF(B, N)$ defined by setting $x \cdot b = TF(B, b \cdot 1_N)(x)$ for $x \in TF(B, N)$ and $b \in B$,*
3. *the canonical map $N \otimes_B F(B) \to TF(B, N)$ of Lemma 32.4.3 is B-linear also with respect to the second B-module structure,*
4. *given a finitely presented B-module N there is a canonical isomorphism $TF(B, B) \otimes_B N \to TF(B, N)$ where the tensor product uses the second B-module structure on $TF(B, B)$.*

Proof. We will use the results of Lemma 32.4.3 without further mention. The maps $N_1 \to N_1 \oplus N_2$ and $N_2 \to N_1 \oplus N_2$ give a map $TF(B, N_1) \oplus TF(B, N_2) \to TF(B, N_1 \oplus N_2)$ which is injective since the maps $N_1 \oplus N_2 \to N_1$ and $N_1 \oplus N_2 \to N_2$ induce an inverse. Since TF is right exact we see that $TF(B, N_1) \to TF(B, N_1 \oplus N_2) \to TF(B, N_2) \to 0$ is exact. Hence $TF(B, N_1) \oplus TF(B, N_2) \to TF(B, N_1 \oplus N_2)$ is an isomorphism. This proves (1).

To see (2) the only thing we need to show is that $x \cdot (b_1 + b_2) = x \cdot b_1 + x \cdot b_2$. (Associativity and additivity are clear.) To see this consider

$$N \xrightarrow{(b_1, b_2)} N \oplus N \xrightarrow{+} N$$

and apply $TF(B, -)$.

Part (3) follows immediately from the fact that $N \otimes_B F(B) \to TF(B, N)$ is functorial in the pair (B, N).

Suppose N is a finitely presented B-module. Choose a presentation $B^{\oplus m} \to B^{\oplus n} \to N \to 0$. This gives an exact sequence

$$TF(B, B^{\oplus m}) \to TF(B, B^{\oplus n}) \to TF(B, N) \to 0$$

by right exactness of $TF(B, -)$. By part (1) we can write $TF(B, B^{\oplus m}) = TF(B, B)^{\oplus m}$ and $TF(B, B^{\oplus n}) = TF(B, B)^{\oplus n}$. Next, suppose that $B^{\oplus m} \to B^{\oplus n}$ is given by the matrix $T = (b_{ij})$. Then the induced map $TF(B, B)^{\oplus m} \to TF(B, B)^{\oplus n}$ is given by the matrix with entries $TF(B, b_{ij} \cdot 1_B)$. This combined with right exactness of $\otimes$ proves (4). $\square$

Example 32.4.6. Let F be a module-valued functor as in Lemma 32.4.5. It is not always the case that the two module structures on $TF(B, N)$ agree. Here is an example. Suppose $A = \mathbf{F}_p$ where p is a prime. Set $F(B) = B$ but with B-module structure given by $b \cdot x = b^p x$. Then $TF(B, N) = N$ with B-module structure given by $b \cdot x = b^p x$ for $x \in N$. However, the second B-module structure is given by $x \cdot b = bx$. Note that in this case the canonical map $N \otimes_B F(B) \to TF(B, N)$ is zero as raising an element $n \in B[N]$ to the pth power is zero.

In the following lemma we will frequently use the observation that if $0 \to F \to G \to H \to 0$ is an exact sequence of module-valued functors on Alg_A, then for any pair (B, N) the sequence $0 \to TF(B, N) \to TG(B, N) \to TH(B, N) \to 0$ is exact. This follows from the fact that $0 \to F(B[N]) \to G(B[N]) \to H(B[N]) \to 0$ is exact.

Lemma 32.4.7. *Let A be a ring. For F a module-valued functor on Alg_A say $(*)$ holds if for all $B \in Ob(Alg_A)$ the functor $TF(B, -)$ on B-modules tranforms a short exact sequence of B-modules into a right exact sequence. Let $0 \to F \to G \to H \to 0$ be a short exact sequence of module-valued functors on Alg_A.*

1. *If $(*)$ holds for F, G then $(*)$ holds for H.*
2. *If $(*)$ holds for F, H then $(*)$ holds for G.*
3. *If $H' \to H$ is morphism of module-valued functors on Alg_A and $(*)$ holds for F, G, H, and H', then $(*)$ holds for $G \times_H H'$.*

Proof. Let B be given. Let $0 \to N_1 \to N_2 \to N_3 \to 0$ be a short exact sequence of B-modules. Part (1) follows from a diagram chase in the diagram

$$\begin{tikzcd}
0 \arrow[r] & TF(B, N_1) \arrow[r] \arrow[d] & TG(B, N_1) \arrow[r] \arrow[d] & TH(B, N_1) \arrow[r] \arrow[d] & 0 \\
0 \arrow[r] & TF(B, N_2) \arrow[r] \arrow[d] & TG(B, N_2) \arrow[r] \arrow[d] & TH(B, N_2) \arrow[r] \arrow[d] & 0 \\
0 \arrow[r] & TF(B, N_3) \arrow[r] \arrow[d] & TG(B, N_3) \arrow[r] \arrow[d] & TH(B, N_3) \arrow[r] & 0 \\
 & 0 & 0 & &
\end{tikzcd}$$

with exact horizontal rows and exact columns involving TF and TG. To prove part (2) we do a diagram chase in the diagram

$$\begin{tikzcd}
0 \arrow[r] & TF(B, N_1) \arrow[r] \arrow[d] & TG(B, N_1) \arrow[r] \arrow[d] & TH(B, N_1) \arrow[r] \arrow[d] & 0 \\
0 \arrow[r] & TF(B, N_2) \arrow[r] \arrow[d] & TG(B, N_2) \arrow[r] \arrow[d] & TH(B, N_2) \arrow[r] \arrow[d] & 0 \\
0 \arrow[r] & TF(B, N_3) \arrow[r] \arrow[d] & TG(B, N_3) \arrow[r] & TH(B, N_3) \arrow[r] \arrow[d] & 0 \\
 & 0 & & 0 &
\end{tikzcd}$$

with exact horizontal rows and exact columns involving TF and TH. Part (3) follows from part (2) as $G \times_H H'$ sits in the exact sequence $0 \to F \to G \times_H H' \to H' \to 0$. □

Most of the work in this section was done in order to prove the following key vanishing result.

Lemma 32.4.8. *Let A be a ring. Let M, P be A-modules with P of finite presentation. Then $Ext^i_{\mathcal{P}}(\underline{P}, \underline{M}) = 0$ for $i > 0$ where $\mathcal{P}$ is the category of module-valued functors on Alg_A.*

Proof. Choose an injective resolution $\underline{M} \to I^\bullet$ in $\mathcal{P}$, see Lemma 32.4.2. By Derived Categories, Lemma 11.26.2 any element of $\mathrm{Ext}^i_{\mathcal{P}}(\underline{P}, \underline{M})$ comes from a morphsm $\varphi : \underline{P} \to I^i$ with $d^i \circ \varphi = 0$. We will prove that the Yoneda extension

$$E : 0 \to \underline{M} \to I^0 \to \ldots \to I^{i-1} \times_{\mathrm{Ker}(d^i)} \underline{P} \to \underline{P} \to 0$$

of $\underline{P}$ by $\underline{M}$ associated to φ is trivial, which will prove the lemma by Derived Categories, Lemma 11.26.5.

For F a module-valued functor on Alg_A say $(*)$ holds if for all $B \in Ob(Alg_A)$ the functor $TF(B, -)$ on B-modules tranforms a short exact sequence of B-modules into a right exact sequence. Recall that the module-valued functors $\underline{M}, I^n, \underline{P}$ each have property $(*)$, see Lemma 32.4.4 and the remarks preceding it. By splitting $0 \to \underline{M} \to I^\bullet$ into short exact sequences we find that each of the functors $\mathrm{Im}(d^{n-1}) = \mathrm{Ker}(d^n) \subset I^n$ has property $(*)$ by Lemma 32.4.7 and also that $I^{i-1} \times_{\mathrm{Ker}(d^i)} \underline{P}$ has property $(*)$.

Thus we may assume the Yoneda extension is given as

$$E : 0 \to \underline{M} \to F_{i-1} \to \ldots \to F_0 \to \underline{P} \to 0$$

where each of the module-valued functors F_j has property $(*)$. Set $G_j(B) = TF_j(B, B)$ viewed as a B-module via the *second* B-module structure defined in Lemma 32.4.5. Since TF_j is a functor on pairs we see that G_j is a module-valued functor on Alg_A. Moreover, since E is an exact sequence the sequence $G_{j+1} \to G_j \to G_{j-1}$ is exact (see remark preceding Lemma 32.4.7). Observe that $T\underline{M}(B, B) = M \otimes_A B = \underline{M}(B)$ and that the two B-module structures agree on this. Thus we obtain a Yoneda extension

$$E' : 0 \to \underline{M} \to G_{i-1} \to \ldots \to G_0 \to \underline{P} \to 0$$

Moreover, the canonical maps

$$F_j(B) = B \otimes_B F_j(B) \longrightarrow TF_j(B, B) = G_j(B)$$

of Lemma 32.4.3 (4) are B-linear by Lemma 32.4.5 (3) and functorial in B. Hence a map

$$\begin{tikzcd} 0 \arrow[r] & \underline{M} \arrow[r] \arrow[d, "1"] & F_{i-1} \arrow[r] \arrow[d] & \ldots \arrow[r] & F_0 \arrow[r] \arrow[d] & \underline{P} \arrow[r] \arrow[d, "1"] & 0 \\ 0 \arrow[r] & \underline{M} \arrow[r] & G_{i-1} \arrow[r] & \ldots \arrow[r] & G_0 \arrow[r] & \underline{P} \arrow[r] & 0 \end{tikzcd}$$

of Yoneda extensions. In particular we see that E and E' have the same class in $\mathrm{Ext}^i_{\mathcal{P}}(\underline{P}, \underline{M})$ by the lemma on Yoneda Exts mentioned above. Finally, let N be a A-module of finite presentation. Then we see that

$$0 \to T\underline{M}(A, N) \to TF_{i-1}(A, N) \to \ldots \to TF_0(A, N) \to T\underline{P}(A, N) \to 0$$

is exact. By Lemma 32.4.5 (4) with $B = A$ this translates into the exactness of the sequence of A-modules

$$0 \to M \otimes_A N \to G_{i-1}(A) \otimes_A N \to \ldots \to G_0(A) \otimes_A N \to P \otimes_A N \to 0$$

Hence the sequence of A-modules $0 \to M \to G_{i-1}(A) \to \ldots \to G_0(A) \to P \to 0$ is universally exact, in the sense that it remains exact on tensoring with any finitely presented A-module N. Let $K = \mathrm{Ker}(G_0(A) \to P)$ so that we have exact sequences

$$0 \to K \to G_0(A) \to P \to 0 \quad \text{and} \quad G_2(A) \to G_1(A) \to K \to 0$$

Tensoring the second sequence with N we obtain that $K \otimes_A N = \mathrm{Coker}(G_2(A) \otimes_A N \to G_1(A) \otimes_A N)$. Exactness of $G_2(A) \otimes_A N \to G_1(A) \otimes_A N \to G_0(A) \otimes_A N$ then implies that $K \otimes_A N \to G_0(A) \otimes_A N$ is injective. By Algebra, Theorem 7.76.3 this means that the A-module extension $0 \to K \to G_0(A) \to P \to 0$ is exact, and because P is assumed of finite presentation this means the sequence is split, see Algebra, Lemma 7.76.4. Any splitting $P \to G_0(A)$ defines a map $\underline{P} \to G_0$ which splits the surjection $G_0 \to \underline{P}$. Thus the Yoneda extension E' is equivalent to the trivial Yoneda extension and we win. $\square$

Lemma 32.4.9. *Let A be a ring. Let M be an A-module. Let L be a linearly adequate functor on Alg_A. Then $Ext^i_{\mathcal{P}}(L, \underline{M}) = 0$ for $i > 0$ where $\mathcal{P}$ is the category of module-valued functors on Alg_A.*

Proof. Since L is linearly adequate there exists an exact sequence

$$0 \to L \to \underline{A^{\oplus m}} \to \underline{A^{\oplus n}} \to \underline{P} \to 0$$

Here $P = \text{Coker}(A^{\oplus m} \to A^{\oplus n})$ is the cokernel of the map of finite free A-modules which is given by the definition of linearly adequate functors. By Lemma 32.4.8 we have the vanishing of $\text{Ext}^i_{\mathcal{P}}(\underline{P}, \underline{M})$ and $\text{Ext}^i_{\mathcal{P}}(\underline{A}, \underline{M})$ for $i > 0$. Let $K = \text{Ker}(\underline{A^{\oplus n}} \to \underline{P})$. By the long exact sequence of Ext groups associated to the exact sequence $0 \to K \to \underline{A^{\oplus n}} \to \underline{P} \to 0$ we conclude that $\text{Ext}^i_{\mathcal{P}}(K, \underline{M}) = 0$ for $i > 0$. Repeating with the sequence $0 \to L \to \underline{A^{\oplus m}} \to K \to 0$ we win. $\square$

Lemma 32.4.10. *With notation as in Lemma 32.4.2 we have $R^pQ(F) = 0$ for all $p > 0$ and any adequate functor F.*

Proof. Choose an exact sequence $0 \to F \to \underline{M^0} \to \underline{M^1}$. Set $M^2 = \text{Coker}(M^0 \to M^1)$ so that $0 \to F \to \underline{M^0} \to \underline{M^1} \to \underline{M^2} \to 0$ is a resolution. By Derived Categories, Lemma 11.20.3 we obtain a spectral sequence

$$R^pQ(\underline{M^q}) \Rightarrow R^{p+q}Q(F)$$

Since $Q(\underline{M^q}) = \underline{M^q}$ it suffices to prove $R^pQ(\underline{M}) = 0$, $p > 0$ for any A-module M.

Choose an injective resolution $\underline{M} \to I^\bullet$ in the category $\mathcal{P}$. Suppose that $R^iQ(\underline{M})$ is nonzero. Then $\text{Ker}(Q(I^i) \to Q(I^{i+1}))$ is strictly bigger than the image of $Q(I^{i-1}) \to Q(I^i)$. Hence by Lemma 32.3.6 there exists a linearly adequate functor L and a map $\varphi : L \to Q(I^i)$ mapping into the kernel of $Q(I^i) \to Q(I^{i+1})$ which does not factor through the image of $Q(I^{i-1}) \to Q(I^i)$. Because Q is a left adjoint to the inclusion functor the map φ corresponds to a map $\varphi' : L \to I^i$ with the same properties. Thus φ' gives a nonzero element of $\text{Ext}^i_{\mathcal{P}}(L, \underline{M})$ contradicting Lemma 32.4.9. $\square$

32.5. Adequate modules

In Descent, Section 31.6 we have seen that quasi-coherent modules on a scheme S are the same as quasi-coherent modules on any of the big sites $(Sch/S)_\tau$ associated to S. We have seen that there are two issues with this identification:

1. $QCoh(\mathcal{O}_S) \to Mod((Sch/S)_\tau, \mathcal{O})$, $\mathcal{F} \mapsto \mathcal{F}^a$ is not exact in general, and
2. given a quasi-compact and quasi-separated morphism $f : X \to S$ the functor f_* does not preserve quasi-coherent sheaves on the big sites in general.

Part (1) means that we cannot define a triangulated subcategory of $D(\mathcal{O})$ consisting of complexes whose cohomology sheaves are quasi-coherent. Part (2) means that $Rf_*\mathcal{F}$ isn't a complex with quasi-coherent cohomology sheaves even when $\mathcal{F}$ is quasi-coherent and f is quasi-compact and quasi-separated. Moreover, the examples given in the proofs of Descent, Lemma 31.6.13 and Descent, Proposition 31.6.14 are not of a pathological nature.

In this section we discuss a slightly larger category of $\mathcal{O}$-modules on $(Sch/S)_\tau$ with contains the quasi-coherent modules, is abelian, and is preserved under f_* when f is quasi-compact and quasi-separated. To do this, suppose that S is a scheme. Let $\mathcal{F}$ be a presheaf of $\mathcal{O}$-modules on $(Sch/S)_\tau$. For any affine object $U = Spec(A)$ of $(Sch/S)_\tau$ we can restrict $\mathcal{F}$ to $(Aff/U)_\tau$ to get a presheaf of $\mathcal{O}$-modules on this site. The corresponding module-valued functor, see Section 32.3, will be denoted

$$F = F_{\mathcal{F},A} : Alg_A \longrightarrow Ab, \quad B \longmapsto \mathcal{F}(Spec(B))$$

The assignment $\mathcal{F} \mapsto F_{\mathcal{F},A}$ is an exact functor of abelian categories.

Definition 32.5.1. A sheaf of $\mathcal{O}$-modules $\mathcal{F}$ on $(Sch/S)_\tau$ is *adequate* if there exists a τ-covering $\{Spec(A_i) \to S\}_{i\in I}$ such that $F_{\mathcal{F},A_i}$ is adequate for all $i \in I$.

We will see below that the category of adequate $\mathcal{O}$-modules is independent of the chosen topology τ.

Lemma 32.5.2. *Let S be a scheme. Let $\mathcal{F}$ be an adequate $\mathcal{O}$-module on $(Sch/S)_\tau$. For any affine scheme $Spec(A)$ over S the functor $F_{\mathcal{F},A}$ is adequate.*

Proof. Let $\{Spec(A_i) \to S\}_{i\in I}$ be a τ-covering such that $F_{\mathcal{F},A_i}$ is adequate for all $i \in I$. We can find a standard affine τ-covering $\{Spec(A'_j) \to Spec(A)\}_{j=1,\ldots,m}$ such that $Spec(A'_j) \to Spec(A) \to S$ factors through $Spec(A_{i(j)})$ for some $i(j) \in I$. Then we see that $F_{\mathcal{F},A'_j}$ is the restriction of $F_{\mathcal{F},A_{i(j)}}$ to the category of A'_j-algebras. Hence $F_{\mathcal{F},A'_j}$ is adequate by Lemma 32.3.17. By Lemma 32.3.19 the sequence $F_{\mathcal{F},A'_j}$ corresponds to an adequate ``product'' functor F' over $A' = A'_1 \times \ldots \times A'_m$. As $\mathcal{F}$ is a sheaf (for the Zariski topology) this product functor F' is equal to $F_{\mathcal{F},A'}$, i.e., is the restriction of F to A'-algebras. Finally, $\{Spec(A') \to Spec(A)\}$ is a τ-covering. It follows from Lemma 32.3.20 that $F_{\mathcal{F},A}$ is adequate. □

Lemma 32.5.3. *Let $S = Spec(A)$ be an affine scheme. The category of adequate $\mathcal{O}$-modules on $(Sch/S)_\tau$ is equivalent to the category of adequate module-valued functors on Alg_A.*

Proof. Given an adequate module $\mathcal{F}$ the functor $F_{\mathcal{F},A}$ is adequate by Lemma 32.5.2. Given an adequate functor F we choose an exact sequence $0 \to F \to \underline{M} \to \underline{N}$ and we consider the $\mathcal{O}$-module $\mathcal{F} = \text{Ker}(M^a \to N^a)$ where M^a denotes the quasi-coherent $\mathcal{O}$-module on $(Sch/S)_\tau$ associated to the quasi-coherent sheaf $\widetilde{M}$ on S. Note that $F = F_{\mathcal{F},A}$, in particular the module $\mathcal{F}$ is adequate by definition. We omit the proof that the constructions define mutually inverse equivalences of categories. □

Lemma 32.5.4. *Let $f : T \to S$ be a morphism of schemes. The pullback $f^*\mathcal{F}$ of an adequate $\mathcal{O}$-module $\mathcal{F}$ on $(Sch/S)_\tau$ is an adequate $\mathcal{O}$-module on $(Sch/T)_\tau$.*

Proof. The pullback map $f^* : Mod((Sch/S)_\tau, \mathcal{O}) \to Mod((Sch/T)_\tau, \mathcal{O})$ is given by restriction, i.e., $f^*\mathcal{F}(V) = \mathcal{F}(V)$ for any scheme V over T. Hence this lemma follows immediately from Lemma 32.5.2 and the definition. □

Here is a characterization of the category of adequate $\mathcal{O}$-modules. To understand the significance, consider a map $\mathcal{G} \to \mathcal{H}$ of quasi-coherent $\mathcal{O}_S$-modules on a scheme S. The cokernel of the associated map $\mathcal{G}^a \to \mathcal{H}^a$ of $\mathcal{O}$-modules is quasi-coherent because it is equal to $(\mathcal{H}/\mathcal{G})^a$. But the kernel of $\mathcal{G}^a \to \mathcal{H}^a$ in general isn't quasi-coherent. However, it is adequate.

Lemma 32.5.5. *Let S be a scheme. Let $\mathcal{F}$ be an $\mathcal{O}$-module on $(Sch/S)_\tau$. The following are equivalent*

(1) *$\mathcal{F}$ is adequate,*
(2) *there exists an affine open covering $S = \bigcup S_i$ and maps of quasi-coherent $\mathcal{O}_{S_i}$-modules $\mathcal{G}_i \to \mathcal{H}_i$ such that $\mathcal{F}|_{(Sch/S_i)_\tau}$ is the kernel of $\mathcal{G}_i^a \to \mathcal{H}_i^a$*
(3) *there exists a τ-covering $\{S_i \to S\}_{i \in I}$ and maps of $\mathcal{O}_{S_i}$-quasi-coherent modules $\mathcal{G}_i \to \mathcal{H}_i$ such that $\mathcal{F}|_{(Sch/S_i)_\tau}$ is the kernel of $\mathcal{G}_i^a \to \mathcal{H}_i^a$,*
(4) *there exists a τ-covering $\{f_i : S_i \to S\}_{i \in I}$ such that each $f_i^*\mathcal{F}$ is adequate,*
(5) *for any affine scheme U over S the restriction $\mathcal{F}|_{(Sch/U)_\tau}$ is the kernel of a map $\mathcal{G}^a \to \mathcal{H}^a$ of quasi-coherent $\mathcal{O}_U$-modules.*

Proof. Let $U = Spec(A)$ be an affine scheme over S. Set $F = F_{\mathcal{F},A}$. By definition, the functor F is adequate if and only if there exists a map of A-modules $M \to N$ such that $F = \text{Ker}(\underline{M} \to \underline{N})$. Combining with Lemmas 32.5.2 and 32.5.3 we see that (1) and (5) are equivalent.

It is clear that (5) implies (2) and (2) implies (3). If (3) holds then we can refine the covering $\{S_i \to S\}$ such that each $S_i = Spec(A_i)$ is affine. Then we see, by the prelimiary remarks of the proof, that $F_{\mathcal{F},A_i}$ is adequate. Thus $\mathcal{F}$ is adequate by definition. Hence (3) implies (1).

Finally, (4) is equivalent to (1) using Lemma 32.5.4 for one direction and that a composition of τ-coverings is a τ-covering for the other. □

Just like is true for quasi-coherent sheaves the category of adequate modules is independent of the topology.

Lemma 32.5.6. *Let $\mathcal{F}$ be an adequate $\mathcal{O}$-module on $(Sch/S)_\tau$. For any surjective flat morphism $Spec(B) \to Spec(A)$ of affines over S the extended Čech complex*

$$0 \to \mathcal{F}(Spec(A)) \to \mathcal{F}(Spec(B)) \to \mathcal{F}(Spec(B \otimes_A B)) \to \ldots$$

is exact. In particular $\mathcal{F}$ satisfies the sheaf condition for fpqc coverings, and is a sheaf of $\mathcal{O}$-modules on $(Sch/S)_{fppf}$.

Proof. With $A \to B$ as in the lemma let $F = F_{\mathcal{F},A}$. This functor is adequate by Lemma 32.5.2. By Lemma 32.3.5 since $A \to B$, $A \to B \otimes_A B$, etc are flat we see that $F(B) = F(A) \otimes_A B$, $F(B \otimes_A B) = F(A) \otimes_A B \otimes_A B$, etc. Exactness follows from Descent, Lemma 31.3.6.

Thus $\mathcal{F}$ satisfies the sheaf condition for τ-coverings (in particular Zariski coverings) and any faithfully flat covering of an affine by an affine. Arguing as in the proofs of Descent, Lemma 31.4.1 and Descent, Proposition 31.4.2 we conclude that $\mathcal{F}$ satisfies the sheaf condition for all fpqc coverings (made out of objects of $(Sch/S)_\tau$). Details omitted. □

Lemma 32.5.6 shows in particular that for any pair of topologies τ, τ' the collection of adequate modules for the τ-topology and the τ'-topology are identical (as presheaves of modules on the underlying category Sch/S).

Definition 32.5.7. Let S be a scheme. The category of adequate $\mathcal{O}$-modules on $(Sch/S)_\tau$ is denoted $Adeq(\mathcal{O})$ or $Adeq((Sch/S)_\tau, \mathcal{O})$. If we want to think just about the abelian category of adequate modules without choosing a topology we simply write $Adeq(S)$.

Lemma 32.5.8. *Let S be a scheme. Let $\mathcal{F}$ be an adequate $\mathcal{O}$-module on $(Sch/S)_\tau$.*
(1) *The restriction $\mathcal{F}|_{S_{Zar}}$ is a quasi-coherent $\mathcal{O}_S$-module on the scheme S.*
(2) *The restriction $\mathcal{F}|_{S_{étale}}$ is the quasi-coherent module associated to $\mathcal{F}|_{S_{Zar}}$.*
(3) *For any affine scheme U over S we have $H^q(U, \mathcal{F}) = 0$ for all $q > 0$.*

(4) *There is a canonical isomorphism*
$$H^q(S, \mathcal{F}|_{S_{Zar}}) = H^q((Sch/S)_\tau, \mathcal{F}).$$

Proof. By Lemma 32.3.5 and Lemma 32.5.2 we see that for any flat morphism of affines $U \to V$ over S we have $\mathcal{F}(U) = \mathcal{F}(V) \otimes_{\mathcal{O}(V)} \mathcal{O}(U)$. This works in particular if $U \subset V \subset S$ are affine opens of S, hence $\mathcal{F}|_{S_{Zar}}$ is quasi-coherent. Thus (1) holds.

Let $S' \to S$ be an étale morphism of schemes. Then for $U \subset S'$ affine open mapping into an affine open $V \subset S$ we see that $\mathcal{F}(U) = \mathcal{F}(V) \otimes_{\mathcal{O}(V)} \mathcal{O}(U)$ because $U \to V$ is étale, hence flat. Therefore $\mathcal{F}|_{S'_{Zar}}$ is the pullback of $\mathcal{F}|_{S_{Zar}}$. This proves (2).

We are going to apply Cohomology on Sites, Lemma 19.11.8 to the site $(Sch/S)_\tau$ with $\mathcal{B}$ the set of affine schemes over S and Cov the set of standard affine τ-coverings. Assumption (3) of the lemma is satisfied by Descent, Lemma 31.6.8 and Lemma 32.5.6 for the case of a covering by a single affine. Hence we conclude that $H^p(U, \mathcal{F}) = 0$ for every affine scheme U over S. This proves (3). In exactly the same way as in the proof of Descent, Proposition 31.6.10 this implies the equality of cohomologies (4). □

Remark 32.5.9. Let S be a scheme. We have functors $u : QCoh(\mathcal{O}_S) \to Adeq(\mathcal{O})$ and $v : Adeq(\mathcal{O}) \to QCoh(\mathcal{O}_S)$. Namely, the functor $u : \mathcal{F} \mapsto \mathcal{F}^a$ comes from taking the associated $\mathcal{O}$-module which is adequate by Lemma 32.5.5. Conversely, the functor v comes from restriction $v : \mathcal{G} \mapsto \mathcal{G}|_{S_{Zar}}$, see Lemma 32.5.8. Since $\mathcal{F}^a$ can be described as the pullback of $\mathcal{F}$ under a morphism of ringed topoi $((Sch/S)_\tau, \mathcal{O}) \to (S_{Zar}, \mathcal{O}_S)$, see Descent, Remark 31.6.6 and since restriction is the pushforward we see that u and v are adjoint as follows
$$\mathcal{H}om_{\mathcal{O}_S}(\mathcal{F}, v\mathcal{G}) = \mathcal{H}om_{\mathcal{O}}(u\mathcal{F}, \mathcal{G})$$
where $\mathcal{O}$ denotes the structure sheaf on the big site. It is immediate from the description that the adjunction mapping $\mathcal{F} \to vu\mathcal{F}$ is an isomorphism for all quasi-coherent sheaves.

Lemma 32.5.10. *Let S be a scheme. Let $\mathcal{F}$ be a presheaf of $\mathcal{O}$-modules on $(Sch/S)_\tau$. If for every affine scheme $Spec(A)$ over S the functor $F_{\mathcal{F},A}$ is adequate, then the sheafification of $\mathcal{F}$ is an adequate $\mathcal{O}$-module.*

Proof. Let $U = Spec(A)$ be an affine scheme over S. Set $F = F_{\mathcal{F},A}$. The sheafification $\mathcal{F}^\# = (\mathcal{F}^+)^+$, see Sites, Section 9.10. By construction
$$(\mathcal{F})^+(U) = colim_{\mathcal{U}}\, \check{H}^0(\mathcal{U}, \mathcal{F})$$
where the colimit is over coverings in the site $(Sch/S)_\tau$. Since U is affine it suffices to take the limit over standard affine τ-coverings $\mathcal{U} = \{U_i \to U\}_{i\in I} = \{Spec(A_i) \to Spec(A)\}_{i\in I}$ of U. Since each $A \to A_i$ and $A \to A_i \otimes_A A_j$ is flat we see that
$$\check{H}^0(\mathcal{U}, \mathcal{F}) = \mathrm{Ker}(\prod F(A) \otimes_A A_i \to \prod F(A) \otimes_A A_i \otimes_A A_j)$$
by Lemma 32.3.5. Since $A \to \prod A_i$ is faithfully flat we see that this always is canonically isomorphic to $F(A)$ by Descent, Lemma 31.3.6. Thus the presheaf $(\mathcal{F})^+$ has the same value as $\mathcal{F}$ on all affine schemes over S. Repeating the argument once more we deduce the same thing for $\mathcal{F}^\# = ((\mathcal{F})^+)^+$. Thus $F_{\mathcal{F},A} = F_{\mathcal{F}^\#,A}$ and we conclude that $\mathcal{F}^\#$ is adequate. □

Lemma 32.5.11. *Let S be a scheme.*

(1) *The category $Adeq(\mathcal{O})$ is abelian.*
(2) *The functor $Adeq(\mathcal{O}) \to Mod((Sch/S)_\tau, \mathcal{O})$ is exact.*

(3) *If* $0 \to \mathcal{F}_1 \to \mathcal{F}_2 \to \mathcal{F}_3 \to 0$ *is a short exact sequence of* $\mathcal{O}$*-modules and* $\mathcal{F}_1$ *and* $\mathcal{F}_3$ *are adequate, then* $\mathcal{F}_2$ *is adequate.*
(4) *The category* $Adeq(\mathcal{O})$ *has colimits and* $Adeq(\mathcal{O}) \to Mod((Sch/S)_\tau, \mathcal{O})$ *commutes with them.*

Proof. Let $\varphi : \mathcal{F} \to \mathcal{G}$ be a map of adequate $\mathcal{O}$-modules. To prove (1) and (2) it suffices to show that $\mathcal{K} = \text{Ker}(\varphi)$ and $\mathcal{Q} = \text{Coker}(\varphi)$ computed in $Mod((Sch/S)_\tau, \mathcal{O})$ are adequate. Let $U = Spec(A)$ be an affine scheme over S. Let $F = F_{\mathcal{F},A}$ and $G = F_{\mathcal{G},A}$. By Lemmas 32.3.11 and 32.3.10 the kernel K and cokernel Q of the induced map $F \to G$ are adequate functors. Because the kernel is computed on the level of presheaves, we see that $K = F_{\mathcal{K},A}$ and we conclude $\mathcal{K}$ is adequate. To prove the result for the cokernel, denote $\mathcal{Q}'$ the presheaf cokernel of φ. Then $Q = F_{\mathcal{Q}',A}$ and $\mathcal{Q} = (\mathcal{Q}')^\#$. Hence $\mathcal{Q}$ is adequate by Lemma 32.5.10.

Let $0 \to \mathcal{F}_1 \to \mathcal{F}_2 \to \mathcal{F}_3 \to 0$ is a short exact sequence of $\mathcal{O}$-modules and $\mathcal{F}_1$ and $\mathcal{F}_3$ are adequate. Let $U = Spec(A)$ be an affine scheme over S. Let $F_i = F_{\mathcal{F}_i,A}$. The sequence of functors

$$0 \to F_1 \to F_2 \to F_3 \to 0$$

is exact, because for $V = Spec(B)$ affine over U we have $H^1(V, \mathcal{F}_1) = 0$ by Lemma 32.5.8. Since F_1 and F_3 are adequate functors by Lemma 32.5.2 we see that F_2 is adequate by Lemma 32.3.16. Thus $\mathcal{F}_2$ is adequate.

Let $\mathcal{I} \to Adeq(\mathcal{O})$, $i \mapsto \mathcal{F}_i$ be a diagram. Denote $\mathcal{F} = colim_i\, \mathcal{F}_i$ the colimit computed in $Mod((Sch/S)_\tau, \mathcal{O})$. To prove (4) it suffices to show that $\mathcal{F}$ is adequate. Let $\mathcal{F}' = colim_i\, \mathcal{F}_i$ be the colimit computed in presheaves of $\mathcal{O}$-modules. Then $\mathcal{F} = (\mathcal{F}')^\#$. Let $U = Spec(A)$ be an affine scheme over S. Let $F_i = F_{\mathcal{F}_i,A}$. By Lemma 32.3.12 the functor $colim_i\, F_i = F_{\mathcal{F}',A}$ is adequate. Lemma 32.5.10 shows that $\mathcal{F}$ is adequate. $\square$

The following lemma tells us that the total direct image $Rf_*\mathcal{F}$ of an adequate module under a quasi-compact and quasi-separated morphism is a complex whose cohomology sheaves are adequate.

Lemma 32.5.12. *Let* $f : T \to S$ *be a quasi-compact and quasi-separated morphism of schemes. For any adequate* $\mathcal{O}_T$*-module on* $(Sch/T)_\tau$ *the pushforward* $f_*\mathcal{F}$ *and the higher direct images* $R^if_*\mathcal{F}$ *are adequate* $\mathcal{O}_S$*-modules on* $(Sch/S)_\tau$*.*

Proof. First we explain how to compute the higher direct images. Choose an injective resolution $\mathcal{F} \to \mathcal{I}^\bullet$. Then $R^if_*\mathcal{F}$ is the ith cohomology sheaf of the complex $f_*\mathcal{I}^\bullet$. Hence $R^if_*\mathcal{F}$ is the sheaf associated to the presheaf which associates to an object U/S of $(Sch/S)_\tau$ the module

$$\begin{aligned}
\frac{\text{Ker}(f_*\mathcal{I}^i(U) \to f_*\mathcal{I}^{i+1}(U))}{\text{Im}(f_*\mathcal{I}^{i-1}(U) \to f_*\mathcal{I}^i(U))} &= \frac{\text{Ker}(\mathcal{I}^i(U \times_S T) \to \mathcal{I}^{i+1}(U \times_S T))}{\text{Im}(\mathcal{I}^{i-1}(U \times_S T) \to \mathcal{I}^i(U \times_S T))} \\
&= H^i(U \times_S T, \mathcal{F}) \\
&= H^i((Sch/U \times_S T)_\tau, \mathcal{F}|_{(Sch/U \times_S T)_\tau}) \\
&= H^i(U \times_S T, \mathcal{F}|_{(U \times_S T)_{Zar}})
\end{aligned}$$

The first equality by Topologies, Lemma 30.7.12 (and its analogues for other topologies), the second equality by definition of cohomology of $\mathcal{F}$ over an object of $(Sch/T)_\tau$, the third equality by Cohomology on Sites, Lemma 19.8.1, and the last equality by Lemma 32.5.8. Thus by Lemma 32.5.10 it suffices to prove the claim stated in the following paragraph.

Let A be a ring. Let T be a scheme quasi-compact and quasi-separated over A. Let $\mathcal{F}$ be an adequate $\mathcal{O}_T$-module on $(Sch/T)_\tau$. For an A-algebra B set $T_B = T \times_{Spec(A)} Spec(B)$ and denote $\mathcal{F}_B = \mathcal{F}|_{(T_B)_{Zar}}$ the restriction of $\mathcal{F}$ to the small Zariski site of T_B. (Recall that this is a ``usual'' quasi-coherent sheaf on the scheme T_B, see Lemma 32.5.8.) Claim: The functor

$$B \longmapsto H^q(T_B, \mathcal{F}_B)$$

is adequate. We will prove the lemma by the usual procedure of cutting T into pieces.

Case I: T is affine. In this case the schemes T_B are all affine and $H^q(T_B, \mathcal{F}_B) = 0$ for all $q \geq 1$. The functor $B \mapsto H^0(T_B, \mathcal{F}_B)$ is adequate by Lemma 32.3.18.

Case II: T is separated. Let n be the minimal number of affines needed to cover T. We argue by induction on n. The base case is Case I. Choose an affine open covering $T = V_1 \cup \ldots \cup V_n$. Set $V = V_1 \cup \ldots \cup V_{n-1}$ and $U = V_n$. Observe that

$$U \cap V = (V_1 \cap V_n) \cup \ldots \cup (V_{n-1} \cap V_n)$$

is also a union of $n-1$ affine opens as T is separated, see Schemes, Lemma 21.21.8. Note that for each B the base changes U_B, V_B and $(U \cap V)_B = U_B \cap V_B$ behave in the same way. Hence we see that for each B we have a long exact sequence

$$0 \to H^0(T_B, \mathcal{F}_B) \to H^0(U_B, \mathcal{F}_B) \oplus H^0(V_B, \mathcal{F}_B) \to H^0((U \cap V)_B, \mathcal{F}_B) \to H^1(T_B, \mathcal{F}_B) \to \ldots$$

functorial in B, see Cohomology, Lemma 18.8.2. By induction hypothesis the functors $B \mapsto H^q(U_B, \mathcal{F}_B)$, $B \mapsto H^q(V_B, \mathcal{F}_B)$, and $B \mapsto H^q((U \cap V)_B, \mathcal{F}_B)$ are adequate. Using Lemmas 32.3.11 and 32.3.10 we see that our functor $B \mapsto H^q(T_B, \mathcal{F}_B)$ sits in the middle of a short exact sequence whose outer terms are adequate. Thus the claim follows from Lemma 32.3.16.

Case III: General quasi-compact and quasi-separated case. The proof is again by induction on the number n of affines needed to cover T. The base case $n = 1$ is Case I. Choose an affine open covering $T = V_1 \cup \ldots \cup V_n$. Set $V = V_1 \cup \ldots \cup V_{n-1}$ and $U = V_n$. Note that since T is quasi-separated $U \cap V$ is a quasi-compact open of an affine scheme, hence Case II applies to it. The rest of the argument proceeds in exactly the same manner as in the paragraph above and is omitted. □

32.6. Parasitic adequate modules

In this section we start comparing adequate modules and quasi-coherent modules on a scheme S. Recall that there are functors $u : QCoh(\mathcal{O}_S) \to Adeq(\mathcal{O})$ and $v : Adeq(\mathcal{O}) \to QCoh(\mathcal{O}_S)$ satisfying the adjunction

$$\mathcal{H}om_{QCoh(\mathcal{O}_S)}(\mathcal{F}, v\mathcal{G}) = \mathcal{H}om_{Adeq(\mathcal{O})}(u\mathcal{F}, \mathcal{G})$$

and such that $\mathcal{F} \to vu\mathcal{F}$ is an isomorphism for every quasi-coherent sheaf $\mathcal{F}$, see Remark 32.5.9. Hence u is a fully faithfull embedding and we can identify $QCoh(\mathcal{O}_S)$ with a full subcategory of $Adeq(\mathcal{O})$. The functor v is exact but u is not left exact in general. The kernel of v is the subcategory of parasitic adequate modules.

In Descent, Definition 31.7.1 we give the definition of a parasitic module. For adequate modules the notion does not depend on the chosen topology.

Lemma 32.6.1. *Let S be a scheme. Let $\mathcal{F}$ be an adequate $\mathcal{O}$-module on $(Sch/S)_\tau$. The following are equivalent:*

(1) $v\mathcal{F} = 0$,
(2) *$\mathcal{F}$ is parasitic,*

(3) *$\mathcal{F}$ is parasitic for the τ-topology,*
(4) *$\mathcal{F}(U) = 0$ for all $U \subset S$ open, and*
(5) *there exists an affine open covering $S = \bigcup U_i$ such that $\mathcal{F}(U_i) = 0$ for all i.*

Proof. The implications (2) ⇒ (3) ⇒ (4) ⇒ (5) are immediate from the definitions. Assume (5). Suppose that $S = \bigcup U_i$ is an affine open covering such that $\mathcal{F}(U_i) = 0$ for all i. Let $V \to S$ be a flat morphism. There exists an affine open covering $V = \bigcup V_j$ such that each V_j maps into some U_i. As the morphism $V_j \to S$ is flat, also $V_j \to U_i$ is flat. Hence the corresponding ring map $A_i = \mathcal{O}(U_i) \to \mathcal{O}(V_j) = B_j$ is flat. Thus by Lemma 32.5.2 and Lemma 32.3.5 we see that $\mathcal{F}(U_i) \otimes_{A_i} B_j \to \mathcal{F}(V_j)$ is an isomorphism. Hence $\mathcal{F}(V_j) = 0$. Since $\mathcal{F}$ is a sheaf for the Zariski topology we conclude that $\mathcal{F}(V) = 0$. In this way we see that (5) implies (2).

This proves the equivalence of (2), (3), (4), and (5). As (1) is equivalent to (3) (see Remark 32.5.9) we conclude that all five conditions are equivalent. □

Let S be a scheme. The subcategory of parasitic adequate modules is a Serre subcategory of *Adeq*$(\mathcal{O})$. The quotient is the category of quasi-coherent modules.

Lemma 32.6.2. *Let S be a scheme. The subcategory $\mathcal{C} \subset Adeq(\mathcal{O})$ of parasitic adequate modules is a Serre subcategory. Moreover, the functor v induces an equivalence of categories*

$$Adeq(\mathcal{O})/\mathcal{C} = QCoh(\mathcal{O}_S).$$

Proof. The category $\mathcal{C}$ is the kernel of the exact functor $v : Adeq(\mathcal{O}) \to QCoh(\mathcal{O}_S)$, see Lemma 32.6.1. Hence it is a Serre subcategory by Homology, Lemma 10.7.4. By Homology, Lemma 10.7.6 we obtain an induced exact functor $\overline{v} : Adeq(\mathcal{O})/\mathcal{C} \to QCoh(\mathcal{O}_S)$. Because u is a right inverse to v we see right away that $\overline{v}$ is essentially surjective. We see that $\overline{v}$ is faithful by Homology, Lemma 10.7.7. Because u is a right inverse to v we finally conclude that $\overline{v}$ is fully faithful. □

Lemma 32.6.3. *Let $f : T \to S$ be a quasi-compact and quasi-separated morphism of schemes. For any parasitic adequate $\mathcal{O}_T$-module on $(Sch/T)_\tau$ the pushforward $f_*\mathcal{F}$ and the higher direct images $R^i f_*\mathcal{F}$ are parasitic adequate $\mathcal{O}_S$-modules on $(Sch/S)_\tau$.*

Proof. We have already seen in Lemma 32.5.12 that these higher direct images are adequate. Hence it suffices to show that $(R^i f_*\mathcal{F})(U_i) = 0$ for any τ-covering $\{U_i \to S\}$ open. And $R^i f_*\mathcal{F}$ is parasitic by Descent, Lemma 31.7.3. □

32.7. Derived categories of adequate modules, I

Let S be a scheme. We continue the discussion started in Section 32.6. The exact functor v induces a functor

$$D(Adeq(\mathcal{O})) \longrightarrow D(QCoh(\mathcal{O}_S))$$

and similarly for bounded versions.

Lemma 32.7.1. *Let S be a scheme. Let $\mathcal{C} \subset Adeq(\mathcal{O})$ denote the full subcategory consisting of parasitic adequate modules. Then*

$$D(Adeq(\mathcal{O}))/D_{\mathcal{C}}(Adeq(\mathcal{O})) = D(QCoh(\mathcal{O}_S))$$

and similarly for the bounded versions.

Proof. Follows immediately from Derived Categories, Lemma 11.12.3. □

Next, we look for a description the other way around by looking at the functors

$$K^+(QCoh(\mathcal{O}_S)) \longrightarrow K^+(Adeq(\mathcal{O})) \longrightarrow D^+(Adeq(\mathcal{O})) \longrightarrow D^+(QCoh(\mathcal{O}_S)).$$

In some cases the derived category of adequate modules is a localization of the homotopy category of complexes of quasi-coherent modules at universal quasi-isomorphisms. Let S be a scheme. A map of complexes $\varphi : \mathcal{F}^\bullet \to \mathcal{G}^\bullet$ of quasi-coherent $\mathcal{O}_S$-modules is said to be a *universal quasi-isomorphism* if for every morphism of schemes $f : T \to S$ the pullback $f^*\varphi$ is a quasi-isomorphism.

Lemma 32.7.2. *Let $U = Spec(A)$ be an affine scheme. The bounded below derived category $D^+(Adeq(\mathcal{O}))$ is the localization of $K^+(QCoh(\mathcal{O}_U))$ at the multiplicative subset of universal quasi-isomorphisms.*

Proof. If $\varphi : \mathcal{F}^\bullet \to \mathcal{G}^\bullet$ is a morphism of complexes of quasi-coherent $\mathcal{O}_U$-modules, then $u\varphi : u\mathcal{F}^\bullet \to u\mathcal{G}^\bullet$ is a quasi-isomorphism if and only if φ is a universal quasi-isomorphism. Hence the collection S of universal quasi-isomorphisms is a saturated multiplicative system compatible with the triangulated structure by Derived Categories, Lemma 11.5.3. Hence $S^{-1}K^+(QCoh(\mathcal{O}_U))$ exists and is a triangulated category, see Derived Categories, Proposition 11.5.5. We obtain a canonical functor $can : S^{-1}K^+(QCoh(\mathcal{O}_U)) \to D^+(Adeq(\mathcal{O}))$ by Derived Categories, Lemma 11.5.6.

Note that, almost by definition, every adequate module on U has an embedding into a quasi-coherent sheaf, see Lemma 32.5.5. Hence by Derived Categories, Lemma 11.15.4 given $\mathcal{F}^\bullet \in Ob(K^+(Adeq(\mathcal{O})))$ there exists a quasi-isomorphism $\mathcal{F}^\bullet \to u\mathcal{G}^\bullet$ where $\mathcal{G}^\bullet \in Ob(K^+(QCoh(\mathcal{O}_U)))$. This proves that can is essentially surjective.

Similarly, suppose that $\mathcal{F}^\bullet$ and $\mathcal{G}^\bullet$ are bounded below complexes of quasi-coherent $\mathcal{O}_U$-modules. A morphism in $D^+(Adeq(\mathcal{O}))$ between these consists of a pair $f : u\mathcal{F}^\bullet \to \mathcal{H}^\bullet$ and $s : u\mathcal{G}^\bullet \to \mathcal{H}^\bullet$ where s is a quasi-isomorphism. Pick a quasi-isomorphism $s' : \mathcal{H}^\bullet \to u\mathcal{E}^\bullet$. Then we see that $s' \circ f : \mathcal{F} \to \mathcal{E}^\bullet$ and the universal quasi-isomorphism $s' \circ s : \mathcal{G}^\bullet \to \mathcal{E}^\bullet$ give a morphism in $S^{-1}K^+(QCoh(\mathcal{O}_U))$ mapping to the given morphism. This proves the "fully" part of full faithfulness. Faithfulness is proved similarly. ☐

Lemma 32.7.3. *Let $U = Spec(A)$ be an affine scheme. The inclusion functor*

$$Adeq(\mathcal{O}) \to Mod((Sch/U)_\tau, \mathcal{O})$$

has a right adjoint A[1]*. Moreover, the adjunction mapping $A(\mathcal{F}) \to \mathcal{F}$ is an isomorphism for every adequate module $\mathcal{F}$.*

Proof. By Topologies, Lemma 30.7.11 (and similarly for the other topologies) we may work with $\mathcal{O}$-modules on $(Aff/U)_\tau$. Denote $\mathcal{P}$ the category of module-valued functors on Alg_A and $\mathcal{A}$ the category of adequate functors on Alg_A. Denote $i : \mathcal{A} \to \mathcal{P}$ the inclusion functor. Denote $Q : \mathcal{P} \to \mathcal{A}$ the construction of Lemma 32.4.1. We have the commutative diagram

(32.7.3.1)
$$\begin{tikzcd} Adeq(\mathcal{O}) \arrow[r, "k"'] \arrow[d, equal] & Mod((Aff/U)_\tau, \mathcal{O}) \arrow[r, "j"'] & PMod((Aff/U)_\tau, \mathcal{O}) \arrow[d, equal] \\ \mathcal{A} \arrow[rr, "i"] & & \mathcal{P} \end{tikzcd}$$

The left vertical equality is Lemma 32.5.3 and the right vertical equality was explained in Section 32.3. Define $A(\mathcal{F}) = Q(j(\mathcal{F}))$. Since j is fully faithful it follows immediately that

[1] This is the ``adequator''.

A is a right adjoint of the inclusion functor k. Also, since k is fully faithful too, the final assertion follows formally. □

The functor A is a right adjoint hence left exact. Since the inclusion functor is exact, see Lemma 32.5.11 we conclude that A transforms injectives into injectives, and that the category $Adeq(\mathcal{O})$ has enough injectives, see Homology, Lemma 10.22.3 and Injectives, Theorem 17.12.4. This also follows from the equivalence in (32.7.3.1) and Lemma 32.4.2.

Lemma 32.7.4. *Let $U = Spec(A)$ be an affine scheme. For any object $\mathcal{F}$ of $Adeq(\mathcal{O})$ we have $R^pA(\mathcal{F}) = 0$ for all $p > 0$ where A is as in Lemma 32.7.3.*

Proof. With notation as in the proof of Lemma 32.7.3 choose an injective resolution $k(\mathcal{F}) \to \mathcal{I}^\bullet$ in the category of $\mathcal{O}$-modules on $(Aff/U)_\tau$. By Cohomology on Sites, Lemmas 19.12.2 and Lemma 32.5.8 the complex $j(\mathcal{I}^\bullet)$ is exact. On the other hand, each $j(\mathcal{I}^n)$ is an injective object of the category of presheaves of modules by Cohomology on Sites, Lemma 19.12.1. It follows that $R^pA(\mathcal{F}) = R^pQ(j(k(\mathcal{F})))$. Hence the result now follows from Lemma 32.4.10. □

Let S be a scheme. By the discussion in Section 32.5 the embedding $Adeq(\mathcal{O}) \subset Mod((Sch/S)_\tau, \mathcal{O})$ exhibits $Adeq(\mathcal{O})$ as a weak Serre subcategory of the category of all $\mathcal{O}$-modules. Denote

$$D_{Adeq}(\mathcal{O}) \subset D(\mathcal{O}) = D(Mod((Sch/S)_\tau, \mathcal{O}))$$

the triangulated subcategory of complexes whose cohomology sheaves are adequate, see Derived Categories, Section 11.12. We obtain a canonical functor

$$D(Adeq(\mathcal{O})) \longrightarrow D_{Adeq}(\mathcal{O})$$

see Derived Categories, Equation (11.12.1.1).

Lemma 32.7.5. *If $U = Spec(A)$ is an affine scheme, then the bounded below version*

$$D^+(Adeq(\mathcal{O})) \longrightarrow D^+_{Adeq}(\mathcal{O}) \tag{32.7.5.1}$$

of the functor above is an equivalence.

Proof. Let $A : Mod(\mathcal{O}) \to Adeq(\mathcal{O})$ be the right adjoint to the inclusion functor constructed in Lemma 32.7.3. Since A is left exact and since $Mod(\mathcal{O})$ has enough injectives, A has a right derived functor $RA : D^+_{Adeq}(\mathcal{O}) \to D^+(Adeq(\mathcal{O}))$. We claim that RA is a quasi-inverse to (32.7.5.1). To see this the key fact is that if $\mathcal{F}$ is an adequate module, then the adjunction map $\mathcal{F} \to RA(\mathcal{F})$ is a quasi-isomorphism by Lemma 32.7.4.

Namely, to prove the lemma in full it suffices to show:

(1) Given $\mathcal{F}^\bullet \in K^+(Adeq(\mathcal{O}))$ the canonical map $\mathcal{F}^\bullet \to RA(\mathcal{F}^\bullet)$ is a quasi-isomorphism, and
(2) given $\mathcal{G}^\bullet \in K^+(Mod(\mathcal{O}))$ the canonical map $RA(\mathcal{G}^\bullet) \to \mathcal{G}^\bullet$ is a quasi-isomorphism.

Both (1) and (2) follow from the key fact via a spectral sequence argument using one of the spectral sequences of Derived Categories, Lemma 11.20.3. Some details omitted. □

Lemma 32.7.6. *Let $U = Spec(A)$ be an affine scheme. Let $\mathcal{F}$ and $\mathcal{G}$ be adequate $\mathcal{O}$-modules. For any $i \geq 0$ the natural map*

$$Ext^i_{Adeq(\mathcal{O})}(\mathcal{F}, \mathcal{G}) \longrightarrow Ext^i_{Mod(\mathcal{O})}(\mathcal{F}, \mathcal{G})$$

is an isomorphism.

Proof. By definition these ext groups are computed as hom sets in the derived category. Hence this follows immediately from Lemma 32.7.5. □

32.8. Pure extensions

We want to characterize extensions of quasi-coherent sheaves on the big site of an affine schemes in terms of algebra. To do this we introduce the following notion.

Definition 32.8.1. Let A be a ring.

(1) An A-module P is said to be *pure projective* if for every universally exact sequence $0 \to K \to M \to N \to 0$ of A-module the sequence $0 \to Hom_A(P, K) \to Hom_A(P, M) \to Hom_A(P, N) \to 0$ is exact.
(2) An A-module I is said to be *pure injective* if for every universally exact sequence $0 \to K \to M \to N \to 0$ of A-module the sequence $0 \to Hom_A(N, I) \to Hom_A(M, I) \to Hom_A(K, I) \to 0$ is exact.

Let's characterize pure projectives.

Lemma 32.8.2. *Let A be a ring.*

(1) *A module is pure projective if and only if it is a direct summand of a direct sum of finitely presented A-modules.*
(2) *For any module M there exists a universally exact sequence $0 \to N \to P \to M \to 0$ with P pure projective.*

Proof. First note that a finitely presented A-module is pure projective by Algebra, Theorem 7.76.3. Hence a direct summand of a direct sum of finitely presented A-modules is indeed pure projective. Let M be any A-module. Write $M = colim_{i \in I} P_i$ as a filtered colimit of finitely presented A-modules. Consider the sequence

$$0 \to N \to \bigoplus P_i \to M \to 0.$$

For any finitely presented A-module P the map $Hom_A(P, \bigoplus P_i) \to Hom_A(P, M)$ is surjective, as any map $P \to M$ factors through some P_i. Hence by Algebra, Theorem 7.76.3 this sequence is universally exact. This proves (2). If now M is pure projective, then the sequence is split and we see that M is a direct summand of $\bigoplus P_i$. $\square$

Let's characterize pure injectives.

Lemma 32.8.3. *Let A be a ring. For any A-module M set $M^\wedge = Hom_{\mathbf{Z}}(M, \mathbf{Q}/\mathbf{Z})$.*

(1) *For any A-module M the A-module $M^\wedge$ is pure injective.*
(2) *An A-module I is pure injective if and only if the map $I \to (I^\wedge)^\wedge$ splits.*
(3) *For any module M there exists a universally exact sequence $0 \to M \to I \to N \to 0$ with I pure injective.*

Proof. We will use the properties of the functor $M \mapsto M^\wedge$ found in Injectives, Section 17.3 without further mention. Part (1) holds because $Hom_A(N, M^\wedge) = Hom_{\mathbf{Z}}(N \otimes_A M, \mathbf{Q}/\mathbf{Z})$ and because $\mathbf{Q}/\mathbf{Z}$ is injective in the category of abelian groups. Hence if $I \to (I^\wedge)^\wedge$ is split, then I is pure injective. We claim that for any A-module M the evaluation map $ev : M \to (M^\wedge)^\wedge$ is universally injective. To see this note that $ev^\wedge : ((M^\wedge)^\wedge)^\wedge \to M^\wedge$ has a right inverse, namely $ev' : M^\wedge \to ((M^\wedge)^\wedge)^\wedge$. Then for any A-module N applying the exact faithful functor $^\wedge$ to the map $N \otimes_A M \to N \otimes_A (M^\wedge)^\wedge$ gives

$$Hom_A(N, ((M^\wedge)^\wedge)^\wedge) = \left(N \otimes_A (M^\wedge)^\wedge\right)^\wedge \to \left(N \otimes_A M\right)^\wedge = Hom_A(N, M^\wedge)$$

which is surjective by the existence of the right inverse. The claim follows. The claim implies (3) and the necessity of the condition in (2). $\square$

Before we continue we make the following observation which we will use frequently in the rest of this section.

Lemma 32.8.4. *Let A be a ring.*

1. *Let $L \to M \to N$ be a universally exact sequence of A-modules. Let $K = Im(M \to N)$. Then $K \to N$ is universally injective.*
2. *Any universally exact complex can be split into universally exact short exact sequences.*

Proof. Proof of (1). For any A-module T the sequence $L \otimes_A T \to M \otimes_A T \to K \otimes_A T \to 0$ is exact by right exactness of $\otimes$. By assumption the sequence $L \otimes_A T \to M \otimes_A T \to N \otimes_A T$ is exact. Combined this shows that $K \otimes_A T \to N \otimes_A T$ is injective.

Part (2) means the following: Suppose that $M^\bullet$ is a universally exact complex of A-modules. Set $K^i = \text{Ker}(d^i) \subset M^i$. Then the short exact sequences $0 \to K^i \to M^i \to K^{i+1} \to 0$ are universally exact. This follows immediately from part (1). □

Definition 32.8.5. Let A be a ring. Let M be an A-module.

1. A *pure projective resolution* $P_\bullet \to M$ is a universally exact sequence
$$\ldots \to P_1 \to P_0 \to M \to 0$$
with each P_i pure projective.
2. A *pure injective resolution* $M \to I^\bullet$ is a universally exact sequence
$$0 \to M \to I^0 \to I^1 \to \ldots$$
with each I^i pure injective.

These resolutions satisfy the usual uniqueness properties among the class of all universally exact left or right resolutions.

Lemma 32.8.6. *Let A be a ring.*

1. *Any A-module has a pure projective resolution.*

Let $M \to N$ be a map of A-modules. Let $P_\bullet \to M$ be a pure projective resolution and let $N_\bullet \to N$ be a universally exact resolution.

2. *There exists a map of complexes $P_\bullet \to N_\bullet$ inducing the given map*
$$M = Coker(P_1 \to P_0) \to Coker(N_1 \to N_0) = N$$
3. *two maps $\alpha, \beta : P_\bullet \to N_\bullet$ inducing the same map $M \to N$ are homotopic.*

Proof. Part (1) follows immediately from Lemma 32.8.2. Before we prove (2) and (3) note that by Lemma 32.8.4 we can split the universally exact complex $N_\bullet \to N \to 0$ into universally exact short exact sequences $0 \to K_0 \to N_0 \to N \to 0$ and $0 \to K_i \to N_i \to K_{i-1} \to 0$.

Proof of (2). Because P_0 is pure projective we can find a map $P_0 \to N_0$ lifting the map $P_0 \to M \to N$. We obtain an induced map $P_1 \to F_0 \to N_0$ wich ends up in K_0. Since P_1 is pure projective we may lift this to a map $P_1 \to N_1$. This in turn induces a map $P_2 \to P_1 \to N_1$ which maps to zero into N_0, i.e., into K_1. Hence we may lift to get a map $P_2 \to N_2$. Repeat.

Proof of (3). To show that α, β are homotopic it suffices to show the difference $\gamma = \alpha - \beta$ is homotopic to zero. Note that the image of $\gamma_0 : P_0 \to N_0$ is contained in K_0. Hence we may lift γ_0 to a map $h_0 : P_0 \to N_1$. Consider the map $\gamma_1' = \gamma_1 - h_0 \circ d_{P,1} : P_1 \to N_1$. By our choice of h_0 we see that the image of γ_1' is contained in K_1. Since P_1 is pure projective may lift γ_1' to a map $h_1 : P_1 \to N_2$. At this point we have $\gamma_1 = h_0 \circ d_{F,1} + d_{N,2} \circ h_1$. Repeat. □

Lemma 32.8.7. *Let A be a ring.*

(1) *Any A-module has a pure injective resolution.*

Let $M \to N$ be a map of A-modules. Let $M \to M^\bullet$ be a universally exact resolution and let $N \to I^\bullet$ be a pure injective resolution.

(2) *There exists a map of complexes $M^\bullet \to I^\bullet$ inducing the given map*
$$M = Ker(M^0 \to M^1) \to Ker(I^0 \to I^1) = N$$

(3) *two maps $\alpha, \beta : M^\bullet \to I^\bullet$ inducing the same map $M \to N$ are homotopic.*

Proof. This lemma is dual to Lemma 32.8.6. The proof is identical, except one has to reverse all the arrows. □

Using the material above we can define pure extension groups as follows. Let A be a ring and let M, N be A-modules. Choose a pure injective resolution $N \to I^\bullet$. By Lemma 32.8.7 the complex
$$Hom_A(M, I^\bullet)$$
is well defined up to homotopy. Hence its ith cohomology module is a well defined invariant of M and N.

Definition 32.8.8. Let A be a ring and let M, N be A-modules. The ith *pure extension module* $\text{Pext}^i_A(M, N)$ is the ith cohomology module of the complex $Hom_A(M, I^\bullet)$ where $I^\bullet$ is a pure injective resolution of N.

Warning: It is not true that an exact sequence of A-modules gives rise to a long exact sequence of pure extensions groups. (You need a universally exact sequence for this.) We collect some facts which are obvious from the material above.

Lemma 32.8.9. *Let A be a ring.*

(1) *$Pext^i_A(M, N) = 0$ for $i > 0$ whenever N is pure injective,*
(2) *$Pext^i_A(M, N) = 0$ for $i > 0$ whenever M is pure projective, in particular if M is an A-module of finite presentation,*
(3) *$Pext^i_A(M, N)$ is also the ith cohomology module of the complex $Hom_A(P_\bullet, N)$ where $P_\bullet$ is a pure projective resolution of M.*

Proof. To see (3) consider the double complex
$$A^{\bullet,\bullet} = Hom_A(P_\bullet, I^\bullet)$$
Each of its rows is exact except in degree 0 where its cohomology is $Hom_A(M, I^q)$. Each of its columns is exact except in degree 0 where its cohomology is $Hom_A(P_p, N)$. Hence the two spectral sequences associated to this complex in Homology, Section 10.19 degenerate, giving the equality. □

32.9. Higher exts of quasi-coherent sheaves on the big site

It turns out that the module-valued functor $\underline{I}$ associated to a pure injective module I gives rise to an injective object in the category of adequate functors on Alg_A. Warning: It is not true that a pure projective module gives rise to a projective object in the category of adequate functors. We do have plenty of projective objects, namely, the linearly adequate functors.

Lemma 32.9.1. *Let A be a ring. Let $\mathcal{A}$ be the category of adequate functors on Alg_A. The injective objects of $\mathcal{A}$ are exactly the functors $\underline{I}$ where I is a pure injective A-module.*

Proof. Let I be an injective object of $\mathcal{A}$. Choose an embedding $I \to \underline{M}$ for some A-module M. As I is injective we see that $\underline{M} = I \oplus F$ for some module-valued functor F. Then $M = I(A) \oplus F(A)$ and it follows that $I = \underline{I(A)}$. Thus we see that any injective object is of the form $\underline{I}$ for some A-module I. It is clear that the module I has to be pure injective since any universally exact sequence $0 \to M \to N \to L \to 0$ gives rise to an exact sequence $0 \to \underline{M} \to \underline{N} \to \underline{L} \to 0$ of $\mathcal{A}$.

Finally, suppose that I is a pure injective A-module. Choose an embedding $\underline{I} \to J$ into an injective object of $\mathcal{A}$ (see Lemma 32.4.2). We have seen above that $J = \underline{I'}$ for some A-module I' which is pure injective. As $\underline{I} \to \underline{I'}$ is injective the map $I \to I'$ is universally injective. By assumption on I it splits. Hence $\underline{I}$ is a summand of $J = \underline{I'}$ whence an injective object of the category $\mathcal{A}$. ☐

Let $U = Spec(A)$ be an affine scheme. Let M be an A-module. We will use the notation M^a to denote the quasi-coherent sheaf of $\mathcal{O}$-modules on $(Sch/U)_\tau$ associated to the quasi-coherent sheaf $\widetilde{M}$ on U. Now we have all the notation in place to formulate the following lemma.

Lemma 32.9.2. *Let $U = Spec(A)$ be an affine scheme. Let M, N be A-modules. For all i we have a canonical isomorphism*

$$Ext^i_{Mod(\mathcal{O})}(M^a, N^a) = Pext^i_A(M, N)$$

functorial in M and N.

Proof. Let us construct a canonical arrow from right to left. Namely, if $N \to I^\bullet$ is a pure injective resolution, then $M^a \to (I^\bullet)^a$ is an exact complex of (adequate) $\mathcal{O}$-modules. Hence any element of $\mathrm{Pext}^i_A(M, N)$ gives rise to a map $N^a \to M^a[i]$ in $D(\mathcal{O})$, i.e., an element of the group on the left.

To prove this map is an isomorphism, note that we may replace $\mathrm{Ext}^i_{Mod(\mathcal{O})}(M^a, N^a)$ by $\mathrm{Ext}^i_{Adeq(\mathcal{O})}(M^a, N^a)$, see Lemma 32.7.6. Let $\mathcal{A}$ be the category of adequate functors on Alg_A. We have seen that $\mathcal{A}$ is equivalent to $Adeq(\mathcal{O})$, see Lemma 32.5.3; see also the proof of Lemma 32.7.3. Hence now it suffices to prove that

$$\mathrm{Ext}^i_{\mathcal{A}}(\underline{M}, \underline{N}) = \mathrm{Pext}^i_A(M, N)$$

However, this is clear from Lemma 32.9.1 as a pure injective resolution $N \to I^\bullet$ exactly corresponds to an injective resolution of $\underline{N}$ in $\mathcal{A}$. ☐

32.10. Derived categories of adequate modules, II

Let S be a scheme. Denote $\mathcal{O}_S$ the structure sheaf of S and $\mathcal{O}$ the structure sheaf of the big site $(Sch/S)_\tau$. In Descent, Remark 31.6.4 we constructed a morphism of ringed sites

$$f : ((Sch/S)_\tau, \mathcal{O}) \longrightarrow (S_{Zar}, \mathcal{O}_S). \tag{32.10.0.1}$$

In the previous sections have seen that the functor $f_* : Mod(\mathcal{O}) \to Mod(\mathcal{O}_S)$ transforms adequate sheaves into quasi-coherent sheaves, and induces an exact functor $v : Adeq(\mathcal{O}) \to QCoh(\mathcal{O}_S)$, and in fact that $f_* = v$ induces an equivalence $Adeq(\mathcal{O})/\mathcal{C} \to QCoh(\mathcal{O}_S)$ where $\mathcal{C}$ is the subcategory of parasitic adequate modules. Moreover, the functor f^* transforms quasi-coherent modules into adequate modules, and induces a functor $u : QCoh(\mathcal{O}_S) \to Adeq(\mathcal{O})$ which is a left adjoint to v.

There is a very similar relationship between $D_{Adeq}(\mathcal{O})$ and $D_{QCoh}(S)$. First we explain why the category $D_{Adeq}(\mathcal{O})$ is independent of the chosen topology.

Remark 32.10.1. Let S be a scheme. Let $\tau, \tau' \in \{Zar, étale, smooth, syntomic, fppf\}$. Denote $\mathcal{O}_\tau$, resp. $\mathcal{O}_{\tau'}$ the structure sheaf $\mathcal{O}$ viewed as a sheaf on $(Sch/S)_\tau$, resp. $(Sch/S)_{\tau'}$. Then $D_{Adeq}(\mathcal{O}_\tau)$ and $D_{Adeq}(\mathcal{O}_{\tau'})$ are canonically isomorphic. This follows from Cohomology on Sites, Lemma 19.20.2. Namely, assume τ is stronger than the topology τ', let $\mathcal{C} = (Sch/S)_{fppf}$, and let $\mathcal{B}$ the collection of affine schemes over S. Assumptions (1) and (2) we've seen above. Assumption (3) is clear and assumption (4) follows from Lemma 32.5.8.

Remark 32.10.2. Let S be a scheme. The morphism f see (32.10.0.1) induces adjoint functors $Rf_* : D_{Adeq}(\mathcal{O}) \to D_{QCoh}(S)$ and $Lf^* : D_{QCoh}(S) \to D_{Adeq}(\mathcal{O})$. Moreover $Rf_* Lf^* \cong \text{id}_{D_{QCoh}(S)}$.

We sketch the proof. By Remark 32.10.1 we may assume the topology τ is the Zariski topology. We will use the existence of the unbounded total derived functors Lf^* and Rf_* on $\mathcal{O}$-modules and their adjointness, see Cohomology on Sites, Lemma 19.19.1. In this case f_* is just the restriction to the subcategory S_{Zar} of $(Sch/S)_{Zar}$. Hence it is clear that $Rf_* = f_*$ induces $Rf_* : D_{Adeq}(\mathcal{O}) \to D_{QCoh}(S)$. Suppose that $\mathcal{G}^\bullet$ is an object of $D_{QCoh}(S)$. We may choose a system $\mathcal{K}_1^\bullet \to \mathcal{K}_2^\bullet \to \ldots$ of bounded above complexes of flat $\mathcal{O}_S$-modules whose transition maps are termwise split injectives and a diagram

$$\begin{tikzcd} \mathcal{K}_1^\bullet \arrow[r] \arrow[d] & \mathcal{K}_2^\bullet \arrow[r] \arrow[d] & \ldots \\ \tau_{\leq 1}\mathcal{G}^\bullet \arrow[r] & \tau_{\leq 2}\mathcal{G}^\bullet \arrow[r] & \ldots \end{tikzcd}$$

with the properties (1), (2), (3) listed in Derived Categories, Lemma 11.27.1 where $\mathcal{P}$is the collection of flat $\mathcal{O}_S$-modules. Then $Lf^*\mathcal{G}^\bullet$ is computed by $colim\, f^*\mathcal{K}_n^\bullet$, see Cohomology on Sites, Lemmas 19.18.1 and 19.18.3 (note that our sites have enough points by Étale Cohomology, Lemma 38.30.1). We have to see that $H^i(Lf^*\mathcal{G}^\bullet) = colim\, H^i(f^*\mathcal{K}_n^\bullet)$ is adequate for each i. By Lemma 32.5.11 we conclude that it suffices to show that each $H^i(f^*\mathcal{K}_n^\bullet)$ is adequate.

The adequacy of $H^i(f^*\mathcal{K}_n^\bullet)$ is local on S, hence we may assume that $S = Spec(A)$ is affine. Because S is affine $D_{QCoh}(S) = D(QCoh(\mathcal{O}_S))$, see the discussion in Coherent, Section 25.4. Hence there exists a quasi-isomorphism $\mathcal{F}^\bullet \to \mathcal{K}_n^\bullet$ where $\mathcal{F}^\bullet$ is a bounded above complex of flat quasi-coherent modules. Then $f^*\mathcal{F}^\bullet \to f^*\mathcal{K}_n^\bullet$ is a quasi-isomorphism, and the cohomology sheaves of $f^*\mathcal{F}^\bullet$ are adequate.

The final assertion $Rf_* Lf^* \cong \text{id}_{D_{QCoh}(S)}$ follows from the explicit description of the functors above. (In plain english: if $\mathcal{F}$ is quasi-coherent and $p > 0$, then $L_pf^*\mathcal{F}$ is a parasitic adequate module.)

Remark 32.10.3. Remark 32.10.2 above implies we have an equivalence of derived categories

$$D_{Adeq}(\mathcal{O})/D_{\mathcal{C}}(\mathcal{O}) \longrightarrow D_{QCoh}(S)$$

where $\mathcal{C}$ is the category of parasitic adequate modules. Namely, it is clear that $D_{\mathcal{C}}(\mathcal{O})$ is the kernel of Rf_*, hence a functor as indicated. For any object X of $D_{Adeq}(\mathcal{O})$ the map

$Lf^*Rf_*X \to X$ maps to a quasi-isomorphism in $D_{QCoh}(S)$, hence $Lf^*Rf_*X \to X$ is an isomorphism in $D_{Adeq}(\mathcal{O})/D_{\mathcal{C}}(\mathcal{O})$. Finally, for X, Y objects of $D_{Adeq}(\mathcal{O})$ the map

$$Rf_* : Hom_{D_{Adeq}(\mathcal{O})/D_{\mathcal{C}}(\mathcal{O})}(X, Y) \to Hom_{D_{QCoh}(S)}(Rf_*X, Rf_*Y)$$

is bijective as Lf^* gives an inverse (by the remarks above).

CHAPTER 33

More on Morphisms

33.1. Introduction

In this chapter we continue our study of properties of morphisms of schemes. A fundamental reference is [**DG67**].

33.2. Thickenings

The following terminology may not be completely standard, but it is convenient.

Definition 33.2.1. Thickenings.

(1) We say a scheme X' is a *thickening* of a scheme X if X is a closed subscheme of X' and the underlying topological spaces are equal.
(2) We say a scheme X' is a *first order thickening* of a scheme X if X is a closed subscheme of X' and the quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_{X'}$ defining X has square zero.
(3) Given two thickenings $X \subset X'$ and $Y \subset Y'$ a *morphism of thickenings* is a morphism $f' : X' \to Y'$ such that $f(X) \subset Y$, i.e., such that $f'|_X$ factors through the closed subscheme Y. In this situation we set $f = f'|_X : X \to Y$ and we say that $(f, f') : (X \subset X') \to (Y \subset Y')$ is a morphism of thickenings.
(4) Let S be a scheme. We similarly define *thickenings over S*, and *morphisms of thickenings over S*. This means that the schemes X, X', Y, Y' above are schemes over S, and that the morphisms $X \to X'$, $Y \to Y'$ and $f' : X' \to Y'$ are morphisms over S.

Finite order thickenings. Let $i_X : X \to X'$ be a thickening. Any local section of the kernel $\mathcal{I} = \text{Ker}(i_X^\sharp)$ is locally nilpotent. Let us say that $X \subset X'$ is a *finite order thickening* if the ideal sheaf $\mathcal{I}$ is ``globally'' nilpotent, i.e., if there exists an $n \geq 0$ such that $\mathcal{I}^{n+1} = 0$. Technically the class of finite order thickenings $X \subset X'$ is much easier to handle than the general case. Namely, in this case we have a filtration

$$0 \subset \mathcal{I}^n \subset \mathcal{I}^{n-1} \subset \ldots \subset \mathcal{I} \subset \mathcal{O}_{X'}$$

and we see that X' is filtered by closed subspaces

$$X = X_0 \subset X_1 \subset \ldots \subset X_{n-1} \subset X_{n+1} = X'$$

such that each pair $X_i \subset X_{i+1}$ is a first order thickening over B. Using simple induction arguments many results proved for first order thickenings can be rephrased as results on finite order thickenings.
First order thickening are described as follows (see Morphisms, Lemma 24.32.3).

Lemma 33.2.2. *Let X be a scheme over a base S. Consider a short exact sequence*

$$0 \to \mathcal{I} \to \mathcal{A} \to \mathcal{O}_X \to 0$$

of sheaves on X where $\mathcal{A}$ is a sheaf of $f^{-1}\mathcal{O}_S$-algebras, $\mathcal{A} \to \mathcal{O}_X$ is a surjection of sheaves of $f^{-1}\mathcal{O}_S$-algebras, and $\mathcal{I}$ is its kernel. If

(1) *$\mathcal{I}$ is an ideal of square zero in $\mathcal{A}$, and*
(2) *$\mathcal{I}$ is quasi-coherent as an $\mathcal{O}_X$-module*

then $X' = (X, \mathcal{A})$ is a scheme and $X \to X'$ is a first order thickening over S. Moreover, any first order thickening over S is of this form.

Proof. It is clear that X' is a locally ringed space. Let $U = Spec(B)$ be an affine open of X. Set $A = \Gamma(U, \mathcal{A})$. Note that since $H^1(U, \mathcal{I}) = 0$ (see Coherent, Lemma 25.2.2) the map $A \to B$ is surjective. By assumption the kernel $I = \mathcal{I}(U)$ is an ideal of square zero in the ring A. By Schemes, Lemma 21.6.4 there is a canonical morphism of locally ringed spaces

$$(U, \mathcal{A}|_U) \longrightarrow Spec(A)$$

coming from the map $B \to \Gamma(U, \mathcal{A})$. Since this morphism fits into the commutative diagram

$$\begin{tikzcd}
(U, \mathcal{O}_X|_U) \arrow[r] \arrow[d] & Spec(B) \arrow[d] \\
(U, \mathcal{A}|_U) \arrow[r] & Spec(A)
\end{tikzcd}$$

we see that it is a homeomorphism on underlying topological spaces. Thus to see that it is an isomorphism, it suffices to check it induces an isomorphism on the local rings. For $u \in U$ corresponding to the prime $\mathfrak{p} \subset A$ we obtain a commutative diagram of short exact sequences

$$\begin{tikzcd}
0 \arrow[r] & I_{\mathfrak{p}} \arrow[r] \arrow[d] & A_{\mathfrak{p}} \arrow[r] \arrow[d] & B_{\mathfrak{p}} \arrow[r] \arrow[d] & 0 \\
0 \arrow[r] & \mathcal{I}_u \arrow[r] & \mathcal{A}_u \arrow[r] & \mathcal{O}_{X,u} \arrow[r] & 0.
\end{tikzcd}$$

The left and right vertical arrows are isomorphisms because $\mathcal{I}$ and $\mathcal{O}_X$ are quasi-coherent sheaves. Hence also the middle map is an isomorphism. Hence every point of $X' = (X, \mathcal{A})$ has an affine neighbourhood and X' is a scheme as desired. □

Lemma 33.2.3. *Any thickening of an affine scheme is affine.*

Proof. This is a special case of Limits, Proposition 27.7.2. □

33.3. First order infinitesimal neighbourhood

A natural construction of first order thickenings is the following. Suppose that $i : Z \to X$ be an immersion of schemes. Choose an open subscheme $U \subset X$ such that i identifies Z with a closed subscheme $Z \subset U$. Let $\mathcal{I} \subset \mathcal{O}_U$ be the quasi-coherent sheaf of ideals defining Z in U. Then we can consider the closed subscheme $Z' \subset U$ defined by the quasi-coherent sheaf of ideals $\mathcal{I}^2$.

Definition 33.3.1. Let $i : Z \to X$ be an immersion of schemes. The *first order infinitesimal neighbourhood* of Z in X is the first order thickening $Z \subset Z'$ over X described above.

This thickening has the following universal property (which will assuage any fears that the construction above depends on the choice of the open U).

Lemma 33.3.2. *Let $i : Z \to X$ be an immersion of schemes. The first order infinitesimal neighbourhood Z' of Z in X has the following universal property: Given any commutative diagram*

$$\begin{tikzcd} Z \arrow[d, "i"'] & T \arrow[l, "a"'] \arrow[d] \\ X & T' \arrow[l, "b"] \end{tikzcd}$$

where $T \subset T'$ is a first order thickening over X, there exists a unique morphism $(a', a) : (T \subset T') \to (Z \subset Z')$ of thickenings over X.

Proof. Let $U \subset X$ be the open used in the construction of Z', i.e., an open such that Z is identified with a closed subscheme of U cut out by the quasi-coherent sheaf of ideals $\mathcal{I}$. Since $|T| = |T'|$ we see that $b(T') \subset U$. Hence we can think of b as a morphism into U. Let $\mathcal{J} \subset \mathcal{O}_{T'}$ be the ideal cutting out T. Since $b(T) \subset Z$ by the diagram above we see that $b^\sharp(b^{-1}\mathcal{I}) \subset \mathcal{J}$. As T' is a first order thickening of T we see that $\mathcal{J}^2 = 0$ hence $b^\sharp(b^{-1}(\mathcal{I}^2)) = 0$. By Schemes, Lemma 21.4.6 this implies that b factors through Z'. Denote $a' : T' \to Z'$ this factorization and everything is clear. $\square$

Lemma 33.3.3. *Let $i : Z \to X$ be an immersion of schemes. Let $Z \subset Z'$ be the first order infinitesimal neighbourhood of Z in X. Then the diagram*

$$\begin{tikzcd} Z \arrow[r] \arrow[d] & Z' \arrow[d] \\ Z \arrow[r] & X \end{tikzcd}$$

induces a map of conormal sheaves $\mathcal{C}_{Z/X} \to \mathcal{C}_{Z/Z'}$ by Morphisms, Lemma 24.31.3. This map is an isomorphism.

Proof. This is clear from the construction of Z' above. $\square$

33.4. Formally unramified morphisms

Recall that a ring map $R \to A$ is called *formally unramified* (see Algebra, Definition 7.135.1) if for every commutative solid diagram

$$\begin{tikzcd} A \arrow[r] \arrow[rd, dashed] & B/I \\ R \arrow[u] \arrow[r] & B \arrow[u] \end{tikzcd}$$

where $I \subset B$ is an ideal of square zero, at most one dotted arrow exists which makes the diagram commute. This motivates the following analogue for morphisms of schemes.

Definition 33.4.1. Let $f : X \to S$ be a morphism of schemes. We say f is *formally unramified* if given any solid commutative diagram

$$\begin{tikzcd} X \arrow[d, "f"'] & T \arrow[l] \arrow[d, "i"] \\ S & T' \arrow[l] \arrow[lu, dashed] \end{tikzcd}$$

where $T \subset T'$ is a first order thickening of affine schemes over S there exists at most one dotted arrow making the diagram commute.

We first prove some formal lemmas, i.e., lemmas which can be proved by drawing the corresponding diagrams.

Lemma 33.4.2. *If $f : X \to S$ is a formally unramified morphism, then given any solid commutative diagram*

$$\begin{tikzcd} X \arrow[d, "f"'] & T \arrow[l] \arrow[d, "i"] \\ S & T' \arrow[l] \arrow[ul, dashed] \end{tikzcd}$$

where $T \subset T'$ is a first order thickening of schemes over S there exists at most one dotted arrow making the diagram commute. In other words, in Definition 33.4.1 the condition that T be affine may be dropped.

Proof. This is true because a morphism is determined by its restrictions to affine opens. □

Lemma 33.4.3. *A composition of formally unramified morphisms is formally unramified.*

Proof. This is formal. □

Lemma 33.4.4. *A base change of a formally unramified morphism is formally unramified.*

Proof. This is formal. □

Lemma 33.4.5. *Let $f : X \to S$ be a morphism of schemes. Let $U \subset X$ and $V \subset S$ be open such that $f(U) \subset V$. If f is formally unramified, so is $f|_U : U \to V$.*

Proof. Consider a solid diagram

$$\begin{tikzcd} U \arrow[d, "f|_U"'] & T \arrow[l, "a"'] \arrow[d, "i"] \\ V & T' \arrow[l] \arrow[ul, dashed] \end{tikzcd}$$

as in Definition 33.4.1. If f is formally ramified, then there exists at most one S-morphism $a' : T' \to X$ such that $a'|_T = a$. Hence clearly there exists at most one such morphism into U. □

Lemma 33.4.6. *Let $f : X \to S$ be a morphism of schemes. Assume X and S are affine. Then f is formally unramified if and only if $\mathcal{O}_S(S) \to \mathcal{O}_X(X)$ is a formally unramified ring map.*

Proof. This is immediate from the definitions (Definition 33.4.1 and Algebra, Definition 7.135.1) by the equivalence of categories of rings and affine schemes, see Schemes, Lemma 21.6.5. □

Here is a characterization in terms of the sheaf of differentials.

Lemma 33.4.7. *Let $f : X \to S$ be a morphism of schemes. Then f is formally unramified if and only if $\Omega_{X/S} = 0$.*

Proof. We give two proofs.

First proof. It suffices to show that $\Omega_{X/S}$ is zero on the members of an affine open covering of X. Choose an affine open $U \subset X$ with $f(U) \subset V$ where $V \subset S$ is an affine open of S. By Lemma 33.4.5 the restriction $f_U : U \to V$ is formally unramified. By Morphisms, Lemma 24.32.7 we see that $\Omega_{X/S}|_U$ is the quasi-coherent sheaf associated to the $\mathcal{O}_X(U)$-module

$\Omega_{\mathcal{O}_X(U)/\mathcal{O}_S(V)}$. By Lemma 33.4.6 we see that $\mathcal{O}_S(V) \to \mathcal{O}_X(U)$ is a formally unramified ring map. Hence by Algebra, Lemma 7.135.2 we conclude that $\Omega_{X/S}|_U = 0$ as desired.

Second proof. We recall some of the arguments of Morphisms, Section 24.32. Let $U \subset X \times_S X$ be an open such that $\Delta : X \to X \times_S X$ induces a closed immersion into U. Let $\mathcal{J} \subset \mathcal{O}_U$ be the ideal sheaf of this closed immersion. Let $X' \subset U$ be the closed subscheme defined by the quasi-coherent sheaf of ideals $\mathcal{J}^2$. Consider the two morphisms $p_1, p_2 : X' \to X$ induced by the two projections $X \times_S X \to X$. Note that p_1 and p_2 agree when composed with $\Delta : X \to X'$ and that $X \to X'$ is a closed immersion defined by a an ideal whose square is zero. Moreover there is a short exact sequence

$$0 \to \mathcal{J}/\mathcal{J}^2 \to \mathcal{O}_{X'} \to \mathcal{O}_X \to 0$$

and $\Omega_{X/S} = \mathcal{J}/\mathcal{J}^2$. Moreover, $\mathcal{J}/\mathcal{J}^2$ is generated by the local sections $p_1^\sharp(f) - p_2^\sharp(f)$ for f a local section of $\mathcal{O}_X$.

Suppose that $f : X \to S$ is formally unramified. By assumption this means that $p_1 = p_2$ when restricted to any affine open $T' \subset X'$. Hence $p_1 = p_2$. By what was said above we conclude that $\Omega_{X/S} = \mathcal{J}/\mathcal{J}^2 = 0$.

Conversely, suppose that $\Omega_{X/S} = 0$. Then $X' = X$. Take any pair of morphisms $f'_1, f'_2 : T' \to X$ fitting as dotted arrows in the diagram of Definition 33.4.1. This gives a morphism $(f'_1, f'_2) : T' \to X \times_S X$. Since $f'_1|_T = f'_2|_T$ and $|T| = |T'|$ we see that the image of T' under (f'_1, f'_2) is contained in the open U chosen above. Since $(f'_1, f'_2)(T) \subset \Delta(X)$ and since T is defined by an ideal of square zero in T' we see that (f'_1, f'_2) factors through X'. As $X' = X$ we conclude $f'_1 = f'_2$ as desired. $\square$

Lemma 33.4.8. *Let $f : X \to S$ be a morphism of schemes. The following are equivalent:*

(1) *The morphism f is unramified (resp. G-unramified), and*
(2) *the morphism f is locally of finite type (resp. locally of finite presentation) and formally unramified.*

Proof. Use Lemma 33.4.7 and Morphisms, Lemma 24.34.2. $\square$

33.5. Universal first order thickenings

Let $h : Z \to X$ be a morphism of schemes. A *universal first order thickening* of Z over X is a first order thickening $Z \subset Z'$ over X such that given any first order thickening $T \subset T'$ over X and a solid commutative diagram

$$\begin{tikzcd} & Z \arrow[dl] & & T \arrow[ll, "a"'] \arrow[dr] & \\ Z' \arrow[drr] & & & & T' \arrow[llll, dotted, "a'"'] \arrow[dll, "b"] \\ & & X & & \end{tikzcd}$$

there exists a unique dotted arrow making the diagram commute. Note that in this situation $(a, a') : (T \subset T') \to (Z \subset Z')$ is a morphism of thickenings over X. Thus if a universal first order thickening exists, then it is unique up to unique isomorphism. In general a universal first order thickening does not exist, but if h is formally unramified then it does.

Lemma 33.5.1. *Let $h : Z \to X$ be a formally unramified morphism of schemes. There exists a universal first order thickening $Z \subset Z'$ of Z over X.*

Proof. During this proof we will say $Z \subset Z'$ is a universal first order thickening of Z over X if it satisfies the condition of the lemma. We will construct the universal first order thickening $Z \subset Z'$ over X by glueing, starting with the affine case which is Algebra, Lemma 7.136.1. We begin with some general remarks.

If a universal first order thickening of Z over X exists, then it is unique up to unique isomorphism. Moreover, suppose that $V \subset Z$ and $U \subset X$ are open subschemes such that $h(V) \subset U$. Let $Z \subset Z'$ be a universal first order thickening of Z over X. Let $V' \subset Z'$ be the open subscheme such that $V = Z \cap V'$. Then we claim that $V \subset V'$ is the universal first order thickening of V over U. Namely, suppose given any diagram

$$\begin{tikzcd} V \arrow[d, "h"'] & T \arrow[l, "a"'] \arrow[d] \\ U & T' \arrow[l, "b"'] \end{tikzcd}$$

where $T \subset T'$ is a first order thickening over U. By the universal property of Z' we obtain $(a, a') : (T \subset T') \to (Z \subset Z')$. But since we have equality $|T| = |T'|$ of underlying topological spaces we see that $a'(T') \subset V'$. Hence we may think of (a, a') as a morphism of thickenings $(a, a') : (T \subset T') \to (V \subset V')$ over U. Uniqueness is clear also. In a completely similar manner one proves that if $h(Z) \subset U$ and $Z \subset Z'$ is a universal first order thickening over U, then $Z \subset Z'$ is a universal first order thickening over X.

Before we glue affine pieces let us show that the lemma holds if Z and X are affine. Say $X = Spec(R)$ and $Z = Spec(S)$. By Algebra, Lemma 7.136.1 there exists a first order thickening $Z \subset Z'$ over X which has the universal property of the lemma for diagrams

$$\begin{tikzcd} Z \arrow[d, "h"'] & T \arrow[l, "a"'] \arrow[d] \\ X & T' \arrow[l, "b"'] \end{tikzcd}$$

where T, T' are affine. Given a general diagram we can choose an affine open covering $T' = \bigcup T'_i$ and we obtain morphisms $a'_i : T'_i \to Z'$ over X such that $a'_i|_{T_i} = a|_{T_i}$. By uniqueness we see that a'_i and a'_j agree on any affine open of $T'_i \cap T'_j$. Hence the morphisms a'_i glue to a global morphism $a' : T' \to Z'$ over X as desired. Thus the lemma holds if X and Z are affine.

Choose an affine open covering $Z = \bigcup Z_i$ such that each Z_i maps into an affine open U_i of X. By Lemma 33.4.5 the morphisms $Z_i \to U_i$ are formally unramified. Hence by the affine case we obtain universal first order thickenings $Z_i \subset Z'_i$ over U_i. By the general remarks above $Z_i \subset Z'_i$ is also a universal first order thickening of Z_i over X. Let $Z'_{i,j} \subset Z'_i$ be the open subscheme such that $Z_i \cap Z_j = Z'_{i,j} \cap Z_i$. By the general remarks we see that both $Z'_{i,j}$ and $Z'_{j,i}$ are universal first order thickenings of $Z_i \cap Z_j$ over X. Thus, by the first of our general remarks, we see that there is a canonical isomorphism $\varphi_{ij} : Z'_{i,j} \to Z'_{j,i}$ inducing the identity on $Z_i \cap Z_j$. We claim that these morphisms satisfy the cocycle condition of Schemes, Section 21.14. (Verification omitted. Hint: Use that $Z'_{i,j} \cap Z'_{i,k}$ is the universal first order thickening of $Z_i \cap Z_j \cap Z_k$ which determines it up to unique isomorphism by what was said above.) Hence we can use the results of Schemes, Section 21.14 to get a first order thickengin $Z \subset Z'$ over X which the property that the open subscheme $Z'_i \subset Z'$ with $Z_i = Z'_i \cap Z$ is a universal first order thickening of Z_i over X.

It turns out that this implies formally that Z' is a universal first order thickening of Z over X. Namely, we have the universal property for any diagram

$$\begin{tikzcd} Z \arrow[d, "h"'] & T \arrow[l, "a"'] \arrow[d] \\ X & T' \arrow[l, "b"] \end{tikzcd}$$

where $a(T)$ is contained in some Z_i. Given a general diagram we can choose an open covering $T' = \bigcup T'_i$ such that $a(T_i) \subset Z_i$. We obtain morphisms $a'_i : T'_i \to Z'$ over X such that $a'_i|_{T_i} = a|_{T_i}$. We see that a'_i and a'_j necassarily agree on $T'_i \cap T'_j$ since both $a'_i|_{T'_i \cap T'_j}$ and $a'_j|_{T'_i \cap T'_j}$ are solutions of the problem of mapping into the universal first oder thickening $Z'_i \cap Z'_j$ of $Z_i \cap Z_j$ over X. Hence the morphisms a'_i glue to a global morphism $a' : T' \to Z'$ over X as desired. This finishes the proof. □

Definition 33.5.2. Let $h : Z \to X$ be a formally unramified morphism of schemes.

(1) The *universal first order thickening* of Z over X is the thickening $Z \subset Z'$ constructed in Lemma 33.5.1.
(2) The *conormal sheaf of Z over X* is the conormal sheaf of Z in its universal first order thickening Z' over X.

We often denote the conormal sheaf $\mathcal{C}_{Z/X}$ in this situation.

Thus we see that there is a short exact sequence of sheaves

$$0 \to \mathcal{C}_{Z/X} \to \mathcal{O}_{Z'} \to \mathcal{O}_Z \to 0$$

on Z. The following lemma proves that there is no conflict between this definition and the definition in case $Z \to X$ is an immersion.

Lemma 33.5.3. *Let $i : Z \to X$ be an immersion of schemes. Then*

(1) *i is formally unramified,*
(2) *the universal first order thickening of Z over X is the first order infinitesimal neighbourhood of Z in X of Definition 33.3.1, and*
(3) *the conormal sheaf of i in the sense of Morphisms, Definition 24.31.1 agrees with the conormal sheaf of i in the sense of Definition 33.5.2.*

Proof. By Morphisms, Lemmas 24.34.7 and 24.34.8 an immersion is unramified, hence formally unramified by Lemma 33.4.8. The other assertions follow by combining Lemmas 33.3.2 and 33.3.3 and the definitions. □

Lemma 33.5.4. *Let $Z \to X$ be a formally unramified morphism of schemes. Then the universal first order thickening Z' is formally unramified over X.*

Proof. There are two proofs. The first is to show that $\Omega_{Z'/X} = 0$ by working affine locally and applying Algebra, Lemma 7.136.5. Then Lemma 33.4.7 implies what we want. The second is a direct argument as follows.

Let $T \subset T'$ be a first order thickening. Let

$$\begin{tikzcd} Z' \arrow[d] & T \arrow[l, "c"'] \arrow[d] \\ X & T' \arrow[l] \arrow[ul, "{a,b}"] \end{tikzcd}$$

be a commutative diagram. Consider two morphisms $a, b : T' \to Z'$ fitting into the diagram. Set $T_0 = c^{-1}(Z) \subset T$ and $T'_a = a^{-1}(Z)$ (scheme theoretically). Since Z' is a first order thickening of Z, we see that T' is a first order thickening of T'_a. Moreover, since $c = a|_T$ we see that $T_0 = T \cap T'_a$ (scheme theoretically). As T' is a first order thickening of T it follows that T'_a is a first order thickening of T_0. Now $a|_{T'_a}$ and $b|_{T'_a}$ are morphisms of T'_a into Z' over X which agree on T_0 as morphisms into Z. Hence by the universal property of Z' we conclude that $a|_{T'_a} = b|_{T'_a}$. Thus a and b are morphism from the first order thickening T' of T'_a whose restrictions to T'_a agree as morphisms into Z. Thus using the universal property of Z' once more we conclude that $a = b$. In other words, the defining property of a formally unramified morphism holds for $Z' \to X$ as desired. □

Lemma 33.5.5. *Consider a commutative diagram of schemes*

$$\begin{tikzcd} Z \arrow[r, "h"'] \arrow[d, "f"'] & X \arrow[d, "g"] \\ W \arrow[r, "h'"] & Y \end{tikzcd}$$

with h and h' formally unramified. Let $Z \subset Z'$ be the universal first order thickening of Z over X. Let $W \subset W'$ be the universal first order thickening of W over Y. There exists a canonical morphism $(f, f') : (Z, Z') \to (W, W')$ of thickenings over Y which fits into the following commutative diagram

$$\begin{tikzcd} & & Z' \arrow[dl] \arrow[d, "f'"] \\ Z \arrow[urr] \arrow[r] \arrow[d, "f"'] & X \arrow[d] & W' \arrow[dl] \\ W \arrow[urr] \arrow[r] & Y & \end{tikzcd}$$

In particular the morphism (f, f') of thickenings induces a morphism of conormal sheaves $f^*\mathcal{C}_{W/Y} \to \mathcal{C}_{Z/X}$.

Proof. The first assertion is clear from the universal property of W'. The induced map on conormal sheaves is the map of Morphisms, Lemma 24.31.3 applied to $(Z \subset Z') \to (W \subset W')$. □

Lemma 33.5.6. *Let*

$$\begin{tikzcd} Z \arrow[r, "h"'] \arrow[d, "f"'] & X \arrow[d, "g"] \\ W \arrow[r, "h'"] & Y \end{tikzcd}$$

be a fibre product diagram in the category of schemes with h' formally unramified. Then h is formally unramified and if $W \subset W'$ is the universal first order thickening of W over Y, then $Z = X \times_Y W \subset X \times_Y W'$ is the universal first order thickening of Z over X. In particular the canonical map $f^*\mathcal{C}_{W/Y} \to \mathcal{C}_{Z/X}$ of Lemma 33.5.5 is surjective.

Proof. The morphism h is formally unramified by Lemma 33.4.4. It is clear that $X \times_Y W'$ is a first order thickening. It is straightforward to check that it has the universal property because W' has the universal property (by mapping properties of fibre products). See

Morphisms, Lemma 24.31.4 for why this implies that the map of conormal sheaves is surjective. ☐

Lemma 33.5.7. *Let*

$$\begin{tikzcd} Z \arrow[r, "h"] \arrow[d, "f"'] & X \arrow[d, "g"] \\ W \arrow[r, "h'"] & Y \end{tikzcd}$$

be a fibre product diagram in the category of schemes with h' formally unramified and g flat. In this case the corresponding map $Z' \to W'$ of universal first order thickenings is flat, and $f^*\mathcal{C}_{W/Y} \to \mathcal{C}_{Z/X}$ is an isomorphism.

Proof. Flatness is preserved under base change, see Morphisms, Lemma 24.24.7. Hence the first statement follows from the description of W' in Lemma 33.5.6. It is clear that $X \times_Y W'$ is a first order thickening. It is straightforward to check that it has the universal property because W' has the universal property (by mapping properties of fibre products). See Morphisms, Lemma 24.31.4 for why this implies that the map of conormal sheaves is an isomorphism. ☐

Lemma 33.5.8. *Taking the universal first order thickenings commutes with taking opens. More precisely, let $h : Z \to X$ be a formally unramified morphism of schemes. Let $V \subset Z$, $U \subset X$ be opens such that $h(V) \subset U$. Let Z' be the universal first order thickening of Z over X. Then $h|_V : V \to U$ is formally unramified and the universal first order thickening of V over U is the open subscheme $V' \subset Z'$ such that $V = Z \cap V'$. In particular, $\mathcal{C}_{Z/X}|_V = \mathcal{C}_{V/U}$.*

Proof. The first statement is Lemma 33.4.5. The compatibility of universal thickenings can be deduced from the proof of Lemma 33.5.1, or from Algebra, Lemma 7.136.4 or deduced from Lemma 33.5.7. ☐

Lemma 33.5.9. *Let $h : Z \to X$ be a formally unramified morphism of schemes over S. Let $Z \subset Z'$ be the universal first order thickening of Z over X with structure morphism $h' : Z' \to X$. The canonical map*

$$c_{h'} : (h')^*\Omega_{X/S} \longrightarrow \Omega_{Z'/S}$$

induces an isomorphism $h^*\Omega_{X/S} \to \Omega_{Z'/S} \otimes \mathcal{O}_Z$.

Proof. The map $c_{h'}$ is the map defined in Morphisms, Lemma 24.32.9. If $i : Z \to Z'$ is the given closed immersion, then $i^*c_{h'}$ is a map $h^*\Omega_{X/S} \to \Omega_{Z'/S} \otimes \mathcal{O}_Z$. Checking that it is an isomorphism reduces to the affine case by localization, see Lemma 33.5.8 and Morphisms, Lemma 24.32.6. In this case the result is Algebra, Lemma 7.136.5. ☐

Lemma 33.5.10. *Let $h : Z \to X$ be a formally unramified morphism of schemes over S. There is a canonical exact sequence*

$$\mathcal{C}_{Z/X} \to h^*\Omega_{X/S} \to \Omega_{Z/S} \to 0.$$

The first arrow is induced by $d_{Z'/S}$ where Z' is the universal first order neighbourhood of Z over X.

Proof. We know that there is a canonical exact sequence

$$\mathcal{C}_{Z/Z'} \to \Omega_{Z'/S} \otimes \mathcal{O}_Z \to \Omega_{Z/S} \to 0.$$

see Morphisms, Lemma 24.32.17. Hence the result follows on applying Lemma 33.5.9. ☐

Lemma 33.5.11. *Let*

$$\begin{tikzcd} Z \arrow[r, "i"] \arrow[dr, "j"'] & X \arrow[d] \\ & Y \end{tikzcd}$$

be a commutative diagram of schemes where i and j are formally unramified. Then there is a canonical exact sequence

$$\mathcal{C}_{Z/Y} \to \mathcal{C}_{Z/X} \to i^*\Omega_{X/Y} \to 0$$

where the first arrow comes from Lemma 33.5.5 and the second from Lemma 33.5.10.

Proof. Denote $Z \to Z'$ the universal first order thickening of Z over X. Denote $Z \to Z''$ the universal first order thickening of Z over Y. By Lemma 33.5.10 here is a canonical morpism $Z' \to Z''$ so that we have a commutative diagram

$$\begin{tikzcd} Z \arrow[r, "i'"] \arrow[dr, "j'"'] & Z' \arrow[r] \arrow[d] & X \arrow[d] \\ & Z'' \arrow[r] & Y \end{tikzcd}$$

Apply Morphisms, Lemma 24.32.20 to the left triangle to get an exact sequence

$$\mathcal{C}_{Z/Z''} \to \mathcal{C}_{Z/Z'} \to (i')^*\Omega_{Z'/Z''} \to 0$$

As Z'' is formally unramified over Y (see Lemma 33.5.4) we have $\Omega_{Z'/Z''} = \Omega_{Z/Y}$ (by combining Lemma 33.4.7 and Morphisms, Lemma 24.32.11). Then we have $(i')^*\Omega_{Z'/Y} = i^*\Omega_{X/Y}$ by Lemma 33.5.9. $\square$

Lemma 33.5.12. *Let $Z \to Y \to X$ be formally unramified morphisms of schemes.*

(1) *If $Z \subset Z'$ is the universal first order thickening of Z over X and $Y \subset Y'$ is the universal first order thickening of Y over X, then there is a morphism $Z' \to Y'$ and $Y \times_{Y'} Z'$ is the universal first order thickening of Z over Y.*
(2) *There is a canonical exact sequence*

$$i^*\mathcal{C}_{Y/X} \to \mathcal{C}_{Z/X} \to \mathcal{C}_{Z/Y} \to 0$$

where the maps come from Lemma 33.5.5 and $i : Z \to Y$ is the first morphism.

Proof. The map $h : Z' \to Y'$ in (1) comes from Lemma 33.5.5. The assertion that $Y \times_{Y'} Z'$ is the universal first order thickening of Z over Y is clear from the universal properties of Z' and Y'. By Morphisms, Lemma 24.31.5 we have an exact sequence

$$(i')^*\mathcal{C}_{Y\times_{Y'} Z'/Z'} \to \mathcal{C}_{Z/Z'} \to \mathcal{C}_{Z/Y\times_{Y'} Z'} \to 0$$

where $i' : Z \to Y \times_{Y'} Z'$ is the given morphism. By Morphisms, Lemma 24.31.4 there exists a surjection $h^*\mathcal{C}_{Y/Y'} \to \mathcal{C}_{Y\times_{Y'} Z'/Z'}$. Combined with the equalities $\mathcal{C}_{Y/Y'} = \mathcal{C}_{Y/X}$, $\mathcal{C}_{Z/Z'} = \mathcal{C}_{Z/X}$, and $\mathcal{C}_{Z/Y\times_{Y'} Z'} = \mathcal{C}_{Z/Y}$ this proves the lemma. $\square$

33.6. Formally étale morphisms

Recall that a ring map $R \to A$ is called *formally étale* (see Algebra, Definition 7.137.1) if for every commutative solid diagram

$$\begin{tikzcd} A \arrow[r] \arrow[rd, dashed] & B/I \\ R \arrow[u] \arrow[r] & B \arrow[u] \end{tikzcd}$$

where $I \subset B$ is an ideal of square zero, there exists exactly one dotted arrow which makes the diagram commute. This motivates the following analogue for morphisms of schemes.

Definition 33.6.1. Let $f : X \to S$ be a morphism of schemes. We say f is *formally étale* if given any solid commutative diagram

$$\begin{tikzcd} X \arrow[d, "f"'] & T \arrow[l] \arrow[d, "i"] \\ S & T' \arrow[l] \arrow[lu, dashed] \end{tikzcd}$$

where $T \subset T'$ is a first order thickening of affine schemes over S there exists exactly one dotted arrow making the diagram commute.

It is clear that a formally étale morphism is formally unramified. Hence if $f : X \to S$ is formally étale, then $\Omega_{X/S}$ is zero, see Lemma 33.4.7.

Lemma 33.6.2. *If $f : X \to S$ is a formally étale morphism, then given any solid commutative diagram*

$$\begin{tikzcd} X \arrow[d, "f"'] & T \arrow[l] \arrow[d, "i"] \\ S & T' \arrow[l] \arrow[lu, dashed] \end{tikzcd}$$

where $T \subset T'$ is a first order thickening of schemes over S there exists exactly one dotted arrow making the diagram commute. In other words, in Definition 33.6.1 the condition that T be affine may be dropped.

Proof. Let $T' = \bigcup T'_i$ be an affine open covering, and let $T_i = T \cap T'_i$. Then we get morphisms $a'_i : T'_i \to X$ fitting into the diagram. By uniqueness we see that a'_i and a'_j agree on any affine open subscheme of $T'_i \cap T'_j$. Hence a'_i and a'_j agree on $T'_i \cap T'_j$. Thus we see that the morphisms a'_i glue to a global morphism $a' : T' \to X$. The uniqueness of a' we have seen in Lemma 33.4.2. □

Lemma 33.6.3. *A composition of formally étale morphisms is formally étale.*

Proof. This is formal. □

Lemma 33.6.4. *A base change of a formally étale morphism is formally étale.*

Proof. This is formal. □

Lemma 33.6.5. *Let $f : X \to S$ be a morphism of schemes. Let $U \subset X$ and $V \subset S$ be open subschemes such that $f(U) \subset V$. If f is formally étale, so is $f|_U : U \to V$.*

Proof. Consider a solid diagram

$$\begin{tikzcd} U \arrow[d, "f|_U"'] & T \arrow[l, "a"'] \arrow[d, "i"] \\ V & T' \arrow[l] \arrow[ul, dashed] \end{tikzcd}$$

as in Definition 33.6.1. If f is formally ramified, then there exists exactly one S-morphism $a' : T' \to X$ such that $a'|_T = a$. Since $|T'| = |T|$ we conclude that $a'(T') \subset U$ which gives our unique morphism from T' into U. $\square$

Lemma 33.6.6. *Let $f : X \to S$ be a morphism of schemes. The following are equivalent:*

(1) *f is formally étale,*
(2) *f is formally unramified and the universal first order thickening of X over S is equal to X,*
(3) *f is formally unramified and $\mathcal{C}_{X/S} = 0$, and*
(4) *$\Omega_{X/S} = 0$ and $\mathcal{C}_{X/S} = 0$.*

Proof. Actually, the last assertion only make sense because $\Omega_{X/S} = 0$ implies that $\mathcal{C}_{X/S}$ is defined via Lemma 33.4.7 and Definition 33.5.2. This also makes it clear that (3) and (4) are equivalent.

Either of the assumptions (1), (2), and (3) imply that f is formally unramified. Hence we may assume f is formally unramified. The equivalence of (1), (2), and (3) follow from the universal property of the universal first order thickening X' of X over S and the fact that $X = X' \Leftrightarrow \mathcal{C}_{X/S} = 0$ since after all by definition $\mathcal{C}_{X/S} = \mathcal{C}_{X/X'}$ is the ideal sheaf of X in X'. $\square$

Lemma 33.6.7. *An unramified flat morphism is formally étale.*

Proof. Say $X \to S$ is unramified and flat. Then $\Delta : X \to X \times_S X$ is an open immersion, see Morphisms, Lemma 24.34.13. We have to show that $\mathcal{C}_{X/S}$ is zero. Consider the two projections $p, q : X \times_S X \to X$. As f is formally unramified (see Lemma 33.4.8), q is formally unramified (see Lemma 33.4.4). As f is flat, p is flat, see Morphisms, Lemma 24.24.7. Hence $p^*\mathcal{C}_{X/S} = \mathcal{C}_q$ by Lemma 33.5.7 where $\mathcal{C}_q$ denotes the conormal sheaf of the formally unramified morphism $q : X \times_S X \to X$. But $\Delta(X) \subset X \times_S X$ is an open subscheme which maps isomorphically to X via q. Hence by Lemma 33.5.8 we see that $\mathcal{C}_q|_{\Delta(X)} = \mathcal{C}_{X/X} = 0$. In other words, the pullback of $\mathcal{C}_{X/S}$ to X via the identity morphism is zero, i.e., $\mathcal{C}_{X/S} = 0$. $\square$

Lemma 33.6.8. *Let $f : X \to S$ be a morphism of schemes. Assume X and S are affine. Then f is formally étale if and only if $\mathcal{O}_S(S) \to \mathcal{O}_X(X)$ is a formally étale ring map.*

Proof. This is immediate from the definitions (Definition 33.6.1 and Algebra, Definition 7.137.1) by the equivalence of categories of rings and affine schemes, see Schemes, Lemma 21.6.5. $\square$

Lemma 33.6.9. *Let $f : X \to S$ be a morphism of schemes. The following are equivalent:*

(1) *The morphism f is étale, and*
(2) *the morphism f is locally of finite presentation and formally étale.*

Proof. Assume f is étale. An étale morphism is locally of finite presentation, flat and unramified, see Morphisms, Section 24.35. Hence f is locally of finite presentation and formally étale, see Lemma 33.6.7.

Conversely, suppose that f is locally of finite presentation and formally étale. Being étale is local in the Zariski topology on X and S, see Morphisms, Lemma 24.35.2. By Lemma 33.6.5 we can cover X by affine opens U which map into affine opens V such that $U \to V$ is formally étale (and of finite presentation, see Morphisms, Lemma 24.20.2). By Lemma 33.6.8 we see that the ring maps $\mathcal{O}(V) \to \mathcal{O}(U)$ are formally étale (and of finite presentation). We win by Algebra, Lemma 7.137.2. (We will give another proof of this implication when we discuss formally smooth morphisms.) □

33.7. Infinitesimal deformations of maps

In this section we explain how a derivation can be used to infinitesimally move a map. Throughout this section we use that a sheaf on a thickening X' of X can be seen as a sheaf on X.

Lemma 33.7.1. *Let S be a scheme. Let $X \subset X'$ and $Y \subset Y'$ be two first order thickenings over S. Let $(a, a'), (b, b') : (X \subset X') \to (Y \subset Y')$ be two morphisms of thickenings over S. Assume that*

(1) *$a = b$, and*
(2) *the two maps $a^*\mathcal{C}_{Y/Y'} \to \mathcal{C}_{X/X'}$ (Morphisms, Lemma 24.31.3) are equal.*

Then the map $(a')^\sharp - (b')^\sharp$ factors as

$$\mathcal{O}_{Y'} \to \mathcal{O}_Y \xrightarrow{D} a_*\mathcal{C}_{X/X'} \to a_*\mathcal{O}_{X'}$$

where D is an $\mathcal{O}_S$-derivation.

Proof. Instead of working on Y we work on X. The advantage is that the pullback functor a^{-1} is exact. Using (1) and (2) we obtain a commutive diagram with exact rows

$$\begin{tikzcd} 0 \arrow[r] & \mathcal{C}_{X/X'} \arrow[r] & \mathcal{O}_{X'} \arrow[r] & \mathcal{O}_X \arrow[r] & 0 \\ 0 \arrow[r] & a^{-1}\mathcal{C}_{Y/Y'} \arrow[r] \arrow[u] & a^{-1}\mathcal{O}_{Y'} \arrow[r] \arrow[u, shift left, "(a')^\sharp"'] \arrow[u, shift right, "(b')^\sharp"] & a^{-1}\mathcal{O}_Y \arrow[r] \arrow[u] & 0 \end{tikzcd}$$

Now it is a general fact that in such a situation the difference of the $\mathcal{O}_S$-algebra maps $(a')^\sharp$ and $(b')^\sharp$ is an $\mathcal{O}_S$-derivation from $a^{-1}\mathcal{O}_Y$ to $\mathcal{C}_{X/X'}$. By adjointness of the functors a^{-1} and a_* this is the same thing as an $\mathcal{O}_S$-derivation from $\mathcal{O}_Y$ into $a_*\mathcal{C}_{X/X'}$. Some details omitted. □

Note that in the situation of the lemma above we may write D as

$$D = \mathrm{d}_{Y/S} \circ \theta \tag{33.7.1.1}$$

where θ is an $\mathcal{O}_Y$-linear map $\theta : \Omega_{Y/S} \to a_*\mathcal{C}_{X/X'}$. Of course, then by adjunction again we may view θ as an $\mathcal{O}_X$-linear map $\theta : a^*\Omega_{Y/S} \to \mathcal{C}_{X/X'}$.

Lemma 33.7.2. *Let S be a scheme. Let $(a, a') : (X \subset X') \to (Y \subset Y')$ be a morphism of first order thickenings over S. Let*

$$\theta : a^*\Omega_{Y/S} \to \mathcal{C}_{X/X'}$$

be an $\mathcal{O}_X$-linear map. Then there exists a unique morphism of pairs $(b, b') : (X \subset X') \to (Y \subset Y')$ such that (1) and (2) of Lemma 33.7.1 hold and the derivation D and θ are related by Equation (33.7.1.1).

Proof. We simply set $b = a$ and we define $(b')^\sharp$ to be the map

$$(a')^\sharp + D : a^{-1}\mathcal{O}_{Y'} \to \mathcal{O}_{X'}$$

where D is as in Equation (33.7.1.1). We omit the verification that $(b')^\sharp$ is a map of sheaves of $\mathcal{O}_S$-algebras and that (1) and (2) of Lemma 33.7.1 hold. Equation (33.7.1.1) holds by construction. $\square$

Lemma 33.7.3. *Let S be a scheme. Let $X \subset X'$ and $Y \subset Y'$ be first order thickenings over S. Assume given a morphism $a : X \to Y$ and a map $A : a^*\mathcal{C}_{Y/Y'} \to \mathcal{C}_{X/X'}$ of $\mathcal{O}_X$-modules. For an open subscheme $U' \subset X'$ consider morphisms $a' : U' \to Y'$ such that*

1. *a' is a morphism over S,*
2. *$a'|_U = a|_U$, and*
3. *the induced map $a^*\mathcal{C}_{Y/Y'}|_U \to \mathcal{C}_{X/X'}|_U$ is the restriction of A to U.*

Here $U = X \cap U'$. Then the rule

$$U' \mapsto \{a' : U' \to Y' \text{ such that (1), (2), (3) hold.}\} \quad (33.7.3.1)$$

defines a sheaf of sets on X'.

Proof. Denote $\mathcal{F}$ the rule of the lemma. The restriction mapping $\mathcal{F}(U') \to \mathcal{F}(V')$ for $V' \subset U' \subset X'$ of $\mathcal{F}$ is really the restriction map $a' \mapsto a'|_{V'}$. With this definition in place it is clear that $\mathcal{F}$ is a sheaf since morphisms are defined locally. $\square$

In the following lemma we identify sheaves on X and any thickening of X.

Lemma 33.7.4. *Same notation and assumptions as in Lemma 33.7.3. There is an action of the sheaf*

$$\mathcal{H}om_{\mathcal{O}_X}(a^*\Omega_{Y/S}, \mathcal{C}_{X/X'})$$

on the sheaf (33.7.3.1). Moreover, the action is simply transitive for any open $U' \subset X'$ over which the sheaf (33.7.3.1) has a section.

Proof. This is a combination of Lemmas 33.7.1, 33.7.2, and 33.7.3. $\square$

Remark 33.7.5. A special case of Lemmas 33.7.1, 33.7.2, 33.7.3, and 33.7.4 is where $Y = Y'$. In this case the map A is always zero. The sheaf of Lemma 33.7.3 is just given by the rule

$$U' \mapsto \{a' : U' \to Y \text{ over } S \text{ with } a'|_U = a|_U\}$$

and we act on this by the sheaf $\mathcal{H}om_{\mathcal{O}_X}(a^*\Omega_{Y/S}, \mathcal{C}_{X/X'})$. The action of a local section θ on a' is sometimes indicated by $\theta \cdot a'$. Note that this means nothing else than the fact that $(a')^\sharp$ and $(\theta \cdot a')^\sharp$ differ by a derivation D which is related to θ by Equation (33.7.1.1).

Lemma 33.7.6. *Let S be a scheme. Let $X \subset X'$ be a first order thickening over S. Let Y be a scheme over S. Let $a', b' : X' \to Y$ be two morphisms over S with $a = a'|_X = b'|_X$. This gives rise to a commutative diagram*

$$\begin{tikzcd} X \arrow[r] \arrow[d, "a"'] & X' \arrow[d, "{(b',a')}"] \\ Y \arrow[r, "\Delta_{Y/S}"] & Y \times_S Y \end{tikzcd}$$

Since the horizontal arrows are immersions with conormal sheaves $\mathcal{C}_{X/X'}$ and $\Omega_{Y/S}$, by Morphisms, Lemma 24.31.3, we obtain a map $\theta : a^*\Omega_{Y/S} \to \mathcal{C}_{X/X'}$. Then this θ and the derivation D of Lemma 33.7.1 are related by Equation (33.7.1.1).

Proof. Omitted. Hint: The equality may be checked on affine opens where it comes from the following computation. If f is a local section of $\mathcal{O}_Y$, then $1 \otimes f - f \otimes 1$ is a local section of $\mathcal{C}_{Y/(Y \times_S Y)}$ corresponding to $\mathrm{d}_{Y/S}(f)$. It is mapped to the local section $(a')^\sharp(f) - (b')^\sharp(f) = D(f)$ of $\mathcal{C}_{X/X'}$. In other words, $\theta(\mathrm{d}_{Y/S}(f)) = D(f)$. $\square$

For later purposes we need a result that roughly states that the construction of Lemma 33.7.2 is compatible with étale localization.

Lemma 33.7.7. *Let*

$$\begin{tikzcd} X_1 \arrow[d] & X_2 \arrow[l, "f"'] \arrow[d] \\ S_1 & S_2 \arrow[l] \end{tikzcd}$$

be a commutative diagram of schemes with $X_2 \to X_1$ and $S_2 \to S_1$ étale. Then the map $c_f : f^*\Omega_{X_1/S_1} \to \Omega_{X_2/S_2}$ of Morphisms, Lemma 24.32.9 is an isomorphism.

Proof. We recall that an étale morphism $U \to V$ is a smooth morphism with $\Omega_{U/V} = 0$. Using this we see that Morphisms, Lemma 24.32.11 implies $\Omega_{X_2/S_2} = \Omega_{X_2/S_1}$ and Morphisms, Lemma 24.33.16 implies that the map $f^*\Omega_{X_1/S_1} \to \Omega_{X_2/S_1}$ (for the morphism f seen as a morphism over S_1) is an isomorphism. Hence the lemma follows. $\square$

Lemma 33.7.8. *Consider a commutative diagram of schemes*

$$\begin{tikzcd} T_2 \arrow[r] \arrow[d, "h"'] & T_2' \arrow[rr, "a_2'"'] \arrow[d, "h'"] & & X_2 \arrow[dl, "f"] \arrow[dd] \\ T_1 \arrow[r] & T_1' \arrow[r, "a_1'"'] & X_1 \arrow[d] & \\ & & S_1 & S_2 \arrow[l] \end{tikzcd}$$

and assume that

(1) *$i_1 : T_1 \to T_1'$ is a first order thickening,*
(2) *$i_2 : T_2 \to T_2'$ is a first order thickening, and*
(3) *$X_2 \to X_1$ and $S_2 \to S_1$ are étale.*

Write $a_i = a_i' \circ i_k$ for $k = 1, 2$. For any $\mathcal{O}_{T_1}$-linear map $\theta_1 : a_1^*\Omega_{X_1/S_1} \to \mathcal{C}_{T_1/T_1'}$ let θ_2 be the composition

$$a_2^*\Omega_{X_2/S_2} = h^*a_1^*\Omega_{X_1/S_1} \xrightarrow{h^*\theta_1} h^*\mathcal{C}_{T_1/T_1'} \longrightarrow \mathcal{C}_{T_2/T_2'}$$

(equality sign is explained in the proof). Then the diagram

$$\begin{tikzcd} T_2' \arrow[r, "\theta_2 \cdot a_2'"'] \arrow[d] & X_2 \arrow[d] \\ T_1' \arrow[r, "\theta_1 \cdot a_1'"] & X_1 \end{tikzcd}$$

commutes where the actions $\theta_2 \cdot a_2'$ and $\theta_1 \cdot a_1'$ are as in Remark 33.7.5.

Proof. The equality sign comes from the identification $f^*\Omega_{X_1/S_1} = \Omega_{X_2/S_2}$ of Lemma 33.7.7. Namely, using this we have $a_2^*\Omega_{X_2/S_2} = a_2^* f^*\Omega_{X_1/S_1} = h^* a_1^*\Omega_{X_1/S_1}$ because $f \circ a_2 = a_1 \circ h$. Having said this, the commutativity of the diagram may be checked on affine opens. Hence we may assume the schemes in the initial big diagram are affine. Thus we obtain a commutative diagram of rings

$$\begin{tikzcd} B_2/I_2 & B_2 \arrow[l] & & A_2 \arrow[ll, "a_2'"'] \\ B_1/I_1 \arrow[u] & B_1 \arrow[l] \arrow[u, "h'"] & A_1 \arrow[l, "a_1'"'] \arrow[ur, "f"'] & \\ & & R_1 \arrow[u] \arrow[r] & R_2 \arrow[uu] \end{tikzcd}$$

with $I_1^2 = 0$ and $I_2^2 = 0$ and moreover with the property that $A_2 \otimes_{A_1} \Omega_{A_1/R_1} \to \Omega_{A_2/R_2}$ is an isomorphism. Then $\theta_1 : B_1/I_1 \otimes_{A_1} \Omega_{A_1/R_1} \to I_1$ is B_1-linear. This gives an R_1-derivation $D_1 = \theta_1 \circ \mathrm{d}_{A_1/R_1} : A_1 \to I_1$. In a similar way we see that $\theta_2 : B_2/I_2 \otimes_{A_2} \Omega_{A_2/R_2} \to I_2$ gives rise to a R_2-derivation $D_2 = \theta_2 \circ \mathrm{d}_{A_2/R_2} : A_2 \to I_2$. The construction of θ_2 implies the following compatibility between θ_1 and θ_2: for every $x \in A_1$ we have

$$h'(D_1(x)) = D_2(f(x))$$

as elements of I_2. Now by the construction of the action in Lemma 33.7.2 and Remark 33.7.5 we know that $\theta_1 \cdot a_1'$ corresponds to the ring map $a_1' + D_1 : A_1 \to B_1$ and $\theta_2 \cdot a_2'$ corresponds to the ring map $a_2' + D_2 : A_2 \to B_2$. By the displayed equality above we obtain that $h' \circ (a_1' + D_1) = (a_2' + D_2) \circ f$ as desired. □

Remark 33.7.9. Lemma 33.7.8 can be improved in the following way. Suppose that we have a commutative diagram of schemes as in Lemma 33.7.8 but we do not assume that $X_2 \to X_1$ and $S_2 \to S_1$ are étale. Next, suppose we have $\theta_1 : a_1^*\Omega_{X_1/S_1} \to \mathcal{I}_1$ and $\theta_2 : a_2^*\Omega_{X_2/S_2} \to \mathcal{I}_2$ such that for a local section t of $\mathcal{O}_{X_1}$ we have $(h')^*\theta_1(a_1^*(\mathrm{d}_{X_1/S_1}(t))) = \theta_2(a_2^*(\mathrm{d}_{X_2/S_2}(f^*t)))$, i.e., such that

$$\begin{tikzcd} f_*\mathcal{O}_{X_2} \arrow[r, "f_*D_2"'] & f_*a_{2,*}\mathcal{C}_{T_2/T_2'} \\ \mathcal{O}_{X_1} \arrow[u, "f^\sharp"] \arrow[r, "D_1"] & a_{1,*}\mathcal{C}_{T_1/T_1'} \arrow[u, "\text{induced by } (h')^\sharp"'] \end{tikzcd}$$

is commutative where D_i corresponds to θ_i as in Equation (33.7.1.1). Then we have the conclusion of Lemma 33.7.8. The importance of the condition that both $X_2 \to X_1$ and $S_2 \to S_1$ are étale is that it allows us to construct a θ_2 from θ_1.

33.8. Infinitesimal deformations of schemes

The following simple lemma is often a convenient tool to check whether an infinitesimal deformation of a map is flat.

Lemma 33.8.1. *Let $(f, f') : (X \subset X') \to (S \subset S')$ be a morphism of first order thickenings. Assume that f is flat. Then the following are equivalent*

(1) *f' is flat and $X = S \times_{S'} X'$, and*
(2) *the canonical map $f^*\mathcal{C}_{S/S'} \to \mathcal{C}_{X/X'}$ is an isomorphism.*

Proof. As the problem is local on X' we may assume that X, X', S, S' are affine schemes. Say $S' = Spec(A')$, $X' = Spec(B')$, $S = Spec(A)$, $X = Spec(B)$ with $A = A'/I$ and $B = B'/J$ for some square zero ideals. Then we obtain the following commutative diagram

$$\begin{tikzcd} 0 \arrow[r] & J \arrow[r] & B' \arrow[r] & B \arrow[r] & 0 \\ 0 \arrow[r] & I \arrow[r] \arrow[u] & A' \arrow[r] \arrow[u] & A \arrow[r] \arrow[u] & 0 \end{tikzcd}$$

with exact rows. The canonical map of the lemma is the map

$$I \otimes_A B = I \otimes_{A'} B' \longrightarrow J.$$

The assumption that f is flat signifies that $A \to B$ is flat.

Assume (1). Then $A' \to B'$ is flat and $J = IB'$. Flatness implies $\mathrm{Tor}_1^{A'}(B', A) = 0$ (see Algebra, Lemma 7.69.7). This means $I \otimes_{A'} B' \to B'$ is injective (see Algebra, Remark 7.69.8). Hence we see that $I \otimes_A B \to J$ is an isomorphism.

Assume (2). Then it follows that $J = IB'$, so that $X = S \times_{S'} X'$. Moreover, we get $\mathrm{Tor}_1^{A'}(B', A'/I) = 0$ by reversing the implications in the previous paragraph. Hence B' is flat over A' by Algebra, Lemma 7.91.8. ☐

The following lemma is the ``nilpotent'' version of the ``critère de platitude par fibres'', see Section 33.12.

Lemma 33.8.2. *Consider a commutative diagram*

$$\begin{tikzcd} (X \subset X') \arrow[rr, "{(f,f')}"'] \arrow[dr] & & (Y \subset Y') \arrow[dl] \\ & (S \subset S') & \end{tikzcd}$$

of thickenings. Assume

(1) *X' is flat over S',*
(2) *f is flat,*
(3) *$S \subset S'$ is a finite order thickening, and*
(4) *$X = S \times_{S'} X'$ and $Y = S \times_{S'} Y'$.*

Then f' is flat and Y' is flat over S' at all points in the image of f'.

Proof. Immediate consequence of Algebra, Lemma 7.93.8. ☐

Many properties of morphisms of schemes are preserved under flat deformations.

Lemma 33.8.3. *Consider a commutative diagram*

$$\begin{tikzcd} (X \subset X') \arrow[rr, "{(f,f')}"'] \arrow[dr] & & (Y \subset Y') \arrow[dl] \\ & (S \subset S') & \end{tikzcd}$$

of thickenings. Assume $S \subset S'$ is a finite order thickening, X' and Y' flat over S' and $X = S \times_{S'} X'$ and $Y = S \times_{S'} Y'$. Then

(1) *f is flat if and only if f' is flat,*
(2) *f is an isomorphism if and only if f' is an isomorphism,*

(3) *f is an open immersion if and only if f' is an open immersion,*
(4) *f is quasi-compact if and only if f' is quasi-compact,*
(5) *f is universally closed if and only if f' is universally closed,*
(6) *f is (quasi-)separated if and only if f' is (quasi-)separated,*
(7) *f is a monomorphism if and only if f' is a monomorphism,*
(8) *f is surjective if and only if f' is surjective,*
(9) *f is universally injective if and only if f' is universally injective,*
(10) *f is affine if and only if f' is affine,*
(11) *f is locally of finite type if and only if f' is locally of finite type,*
(12) *f is quasi-finite if and only if f' is quasi-finite,*
(13) *f is locally of finite presentation if and only if f' is locally of finite presentation,*
(14) *f is locally of finite type of relative dimension d if and only if f' is locally of finite type of relative dimension d,*
(15) *f is universally open if and only if f' is universally open,*
(16) *f is syntomic if and only if f' is syntomic,*
(17) *f is smooth if and only if f' is smooth,*
(18) *f is unramified if and only if f' is unramified,*
(19) *f is étale if and only if f' is étale,*
(20) *f is proper if and only if f' is proper,*
(21) *f is integral if and only if f' is integral,*
(22) *f is finite if and only if f' is finite,*
(23) *f is finite locally free (of rank d) if and only if f' is finite locally free (of rank d), and*
(24) *add more here.*

Proof. The assumptions on X and Y mean that f is the base change of f' by $X \to X'$. The properties $\mathcal{P}$ listed in (1) -- (23) above are all stable under base change, hence if f' has property $\mathcal{P}$, then so does f. See Schemes, Lemmas 21.18.2, 21.19.3, 21.21.13, and 21.23.5 and Morphisms, Lemmas 24.9.4, 24.10.4, 24.11.8, 24.14.4, 24.19.13, 24.20.4, 24.28.2, 24.30.4, 24.33.5, 24.34.5, 24.35.4, 24.40.5, 24.42.6, and 24.44.4.

The interesting direction in each case is therefore to assume that f has the property and deduce that f' has it too. By induction on the order of the thickening we may assume that $S \subset S'$ is a first order thickening, see discussion immediately following Definition 33.2.1. We make a couple of general remarks which we will use without further mention in the arguments below. (I) Let $W' \subset S'$ be an affine open and let $U' \subset X'$ and $V' \subset S'$ be affine opens lying over W' with $f'(U') \subset V'$. Let $W' = Spec(R')$ and denote $I \subset R'$ be the ideal defining the closed subscheme $W' \cap S$. Say $U' = Spec(B')$ and $V' = Spec(A')$. Then we get a commutative diagram

$$\begin{tikzcd} 0 \arrow[r] & IB' \arrow[r] & B' \arrow[r] & B \arrow[r] & 0 \\ 0 \arrow[r] & IA' \arrow[r] \arrow[u] & A' \arrow[r] \arrow[u] & A \arrow[r] \arrow[u] & 0 \end{tikzcd}$$

with exact rows. Moreover, $IA' \cong I \otimes_R A$ and $IB' \cong I \otimes_R B$, see proof of Lemma 33.8.1. (II) The morphisms $X \to X'$ and $Y \to Y'$ are universal homeomorphisms. Hence the topology of the maps f and f' (after any base change) is identical. (III) If f is flat, then f' is flat, see Lemma 33.8.2.

Ad (1). This is general remark (III).

Ad (2). Assume f is an isomorphism. Choose an affine open $V' \subset Y'$ and set $U' = (f')^{-1}(V')$. Then $V = Y \cap V'$ is affine which implies that $V \cong f^{-1}(V) = U = Y \times_{Y'} U'$ is affine. By Lemma 33.2.3 we see that U' is affine. Hence $IB' \cong I \otimes_R B \cong I \otimes_R A \cong IA'$ and $A \cong B$. By the exactness of the rows in the diagram above we see that $A' \cong B'$, i.e., $U' \cong V'$. Thus f' is an isomorphism.

Ad (3). Assume f is an open immersion. Then f is an isomorphism of X with an open subscheme $V \subset Y$. Let $V' \subset Y'$ be the open subscheme whose underlying topological space is V. Then f' is a map from X' to V' which is an isomorphism by (2). Hence f' is an open immersion.

Ad (4). Immediate from remark (II).

Ad (5). Immediate from remark (II).

Ad (6). Note that $X \times_Y X = Y \times_{Y'} (X' \times_{Y'} X')$ so that $X' \times_{Y'} X'$ is a thickening of $X \times_Y X$. Hence the topology of the maps $\Delta_{X/Y}$ and $\Delta_{X'/Y'}$ matches and we win.

Ad (7). Assume f is a monomorphism. Consider the diagonal morphism $\Delta_{X'/Y'} : X' \to X' \times_{Y'} X'$. Because f is a monomorphism and because $X' \times_{Y'} X'$ is a thickening of $X \times_Y X$ we see that $\Delta_{X'/Y'}$ is surjective. Hence Lemma 33.8.2 implies that $X' \times_{Y'} X'$ is flat over S'. Then (2) shows that $\Delta_{X'/Y'}$ is an isomorphism.

Ad (8). This is clear.

Ad (9). Immediate from remark (II).

Ad (10). Assume f is affine. Choose an affine open $V' \subset Y'$ and set $U' = (f')^{-1}(V')$. Then $V = Y \cap V'$ is affine which implies that $U = Y \times_{Y'} U'$ is affine. By Lemma 33.2.3 we see that U' is affine. Hence f' is affine.

Ad (11). Via remark (I) comes down to proving $A' \to B'$ is of finite type if $A \to B$ is of finite type. Suppose that $x_1, \ldots, x_n \in B'$ are elements whose images in B generate B as an A-algebra. Then $A'[x_1, \ldots, x_n] \to B$ is surjective as both $A'[x_1, \ldots, x_n] \to B$ is surjective and $I \otimes_R A[x_1, \ldots, x_n] \to I \otimes_R B$ is surjective.

Ad (12). Follows from (11) and that quasi-finiteness of a morphism of finite type can be checked on fibres, see Morphisms, Lemma 24.19.6.

Ad (13). Via remark (I) comes down to proving $A' \to B'$ is of finite presentation if $A \to B$ is of finite presentation. We may assume that $B' = A'[x_1, \ldots, x_n]/K'$ for some ideal K' by (11). We get a short exact sequence

$$0 \to K' \to A'[x_1, \ldots, x_n] \to B' \to 0$$

As B' is flat over R' we see that $K' \otimes_{R'} R$ is the kernel of the surjection $A[x_1, \ldots, x_n] \to B$. By assumption on $A \to B$ there exist finitely many $f'_1, \ldots, f'_m \in K'$ whose images in $A[x_1, \ldots, x_n]$ generate this kernel. Since I is nilpotent we see that $f'_1, \ldots, f'_m$ generate K' by Nakayama's lemma, see Algebra, Lemma 7.14.5.

Ad (14). Follows from (11) and general remark (II).

Ad (15). Immediate from general remark (II).

Ad (16). Assume f is syntomic. By (13) f' is locally of finite presentation, by general remark (III) f' is flat and the fibres of f' are the fibres of f. Hence f' is syntomic by Morphisms, Lemma 24.30.11.

Ad (17). Assume f is smooth. By (13) f' is locally of finite presentation, by general remark (III) f' is flat, and the fibres of f' are the fibres of f. Hence f' is smooth by Morphisms, Lemma 24.33.3.

Ad (18). Assume f unramified. By (11) f' is locally of finite type and the fibres of f' are the fibres of f. Hence f' is unramified by Morphisms, Lemma 24.34.12.

Ad (19). Assume f étale. By (13) f' is locally of finite presentation, by general remark (III) f' is flat, and the fibres of f' are the fibres of f. Hence f' is étale by Morphisms, Lemma 24.35.8.

Ad 20). This follows from a combination of (6), (11), (4), and (5).

Ad (21). Combine (5) and (10) with Morphisms, Lemma 24.42.7.

Ad (22). Combine (21), and (11) with Morphisms, Lemma 24.42.4.

Ad (23). Assume f finite locally free. By (22) we see that f' is finite, by general remark (III) f' is flat, and by (13) f' is locally of finite presentation. Hence f' is finite locally free by Morphisms, Lemma 24.44.2. □

33.9. Formally smooth morphisms

Michael Artin's position on differential criteria of smoothness (e.g., Morphisms, Lemma 24.33.14) is that they are basically useless (in practice). In this section we introduce the notion of a formally smooth morphism $X \to S$. Such a morphism is characterized by the property that T-valued points of X lift to inifinitesimal thickenings of T provided T is affine. The main result is that a morphism which is formally smooth and locally of finite presentation is smooth, see Lemma 33.9.7. It turns out that this criterion is often easier to use than the differential criteria mentioned above.

Recall that a ring map $R \to A$ is called *formally smooth* (see Algebra, Definition 7.127.1) if for every commutative solid diagram

$$\begin{tikzcd} A \arrow[r] \arrow[dr, dashed] & B/I \\ R \arrow[u] \arrow[r] & B \arrow[u] \end{tikzcd}$$

where $I \subset B$ is an ideal of square zero, a dotted arrow exists which makes the diagram commute. This motivates the following analogue for morphisms of schemes.

Definition 33.9.1. Let $f : X \to S$ be a morphism of schemes. We say f is *formally smooth* if given any solid commutative diagram

$$\begin{tikzcd} X \arrow[d, "f"'] & T \arrow[l] \arrow[d, "i"] \\ S & T' \arrow[l] \arrow[ul, dashed] \end{tikzcd}$$

where $T \subset T'$ is a first order thickening of affine schemes over S there exists a dotted arrow making the diagram commute.

In the cases of formally unramified and formally étale morphisms the condition that T' be affine could be dropped, see Lemmas 33.4.2 and 33.6.2. This is no longer true in the case of formally smooth morphisms. In fact, a slightly more natural condition would be that we should be able to fill in the dotted arrow Zariski locally on T'. In fact, analyzing the proof of Lemma 33.9.7 shows that this would be equivalent to the definition as it currently stands.

Lemma 33.9.2. *A composition of formally smooth morphisms is formally smooth.*

Proof. Omitted. □

Lemma 33.9.3. *A base change of a formally smooth morphism is formally smooth.*

Proof. Omitted, but see Algebra, Lemma 7.127.2 for the algebraic version. □

Lemma 33.9.4. *Let $f : X \to S$ be a morphism of schemes. Then f is formally étale if and only if f is formally smooth and formally unramified.*

Proof. Omitted. □

Lemma 33.9.5. *Let $f : X \to S$ be a morphism of schemes. Let $U \subset X$ and $V \subset S$ be open subschemes such that $f(U) \subset V$. If f is formally smooth, so is $f|_U : U \to V$.*

Proof. Consider a solid diagram

$$\begin{tikzcd} U \arrow[d, "f|_U"'] & T \arrow[l, "a"'] \arrow[d, "i"] \\ V & T' \arrow[l] \arrow[lu, dashed] \end{tikzcd}$$

as in Definition 33.9.1. If f is formally smooth, then there exists an S-morphism $a' : T' \to X$ such that $a'|_T = a$. Since the underlying sets of T and T' are the same we see that a' is a morphism into U (see Schemes, Section 21.3). And it clearly is a V-morphism as well. Hence the dotted arrow above as desired. □

Lemma 33.9.6. *Let $f : X \to S$ be a morphism of schemes. Assume X and S are affine. Then f is formally smooth if and only if $\mathcal{O}_S(S) \to \mathcal{O}_X(X)$ is a formally smooth ring map.*

Proof. This is immediate from the definitions (Definition 33.9.1 and Algebra, Definition 7.127.1) by the equivalence of categories of rings and affine schemes, see Schemes, Lemma 21.6.5. □

The following lemma is the main result of this section. It is a victory of the functorial point of view in that it implies (combined with Limits, Proposition 27.4.1) that we can recognize whether a morphism $f : X \to S$ is smooth in terms of ``simple" properties of the functor $h_X : Sch/S \to Sets$.

Lemma 33.9.7. *(Infinitesimal lifting criterion) Let $f : X \to S$ be a morphism of schemes. The following are equivalent:*

(1) *The morphism f is smooth, and*
(2) *the morphism f is locally of finite presentation and formally smooth.*

Proof. Assume $f : X \to S$ is locally of finite presentation and formally smooth. Consider a pair of affine opens $Spec(A) = U \subset X$ and $Spec(R) = V \subset S$ such that $f(U) \subset V$. By Lemma 33.9.5 we see that $U \to V$ is formally smooth. By Lemma 33.9.6 we see that $R \to A$ is formally smooth. By Morphisms, Lemma 24.20.2 we see that $R \to A$ is of finite presentation. By Algebra, Proposition 7.127.13 we see that $R \to A$ is smooth. Hence by the definition of a smooth morphism we see that $X \to S$ is smooth.

Conversely, assume that $f : X \to S$ is smooth. Consider a solid commutative diagram

$$\begin{tikzcd} X \arrow[d, "f"'] & T \arrow[l, "a"'] \arrow[d, "i"] \\ S & T' \arrow[l] \arrow[ul, dashed] \end{tikzcd}$$

as in Definition 33.9.1. We will show the dotted arrow exists thereby proving that f is formally smooth.

Let $\mathcal{F}$ be the sheaf of sets on T' of Lemma 33.7.3, see also Remark 33.7.5. Let

$$\mathcal{H} = \mathcal{H}om_{\mathcal{O}_T}(a^*\Omega_{X/S}, \mathcal{C}_{T/T'})$$

be the sheaf of $\mathcal{O}_T$-modules on T introduced in Lemma 33.7.4. Our goal is simply to show that $\mathcal{F}(T) \neq \emptyset$. In other words we are trying to show that $\mathcal{F}$ is a trivial $\mathcal{H}$-torsor on T (see Cohomology, Section 18.5). There are two steps: (I) To show that $\mathcal{F}$ is a torsor we have to show that $\mathcal{F}_t \neq \emptyset$ for all $t \in T$ (see Cohomology, Definition 18.5.1). (II) To show that $\mathcal{F}$ is the trivial torsor it suffices to show that $H^1(T, \mathcal{H}) = 0$ (see Cohomology, Lemma 18.5.3 -- we may use either cohomology of $\mathcal{H}$ as an abelian sheaf or as an $\mathcal{O}_T$-module, see Cohomology, Lemma 18.12.3).

First we prove (I). To see this, for every $t \in T$ we can choose an affine open $U \subset T$ neighbourhood of t such that $a(U)$ is contained in an affine open $Spec(A) = W \subset X$ which maps to an affine open $Spec(R) = V \subset S$. By Morphisms, Lemma 24.33.2 the ring map $R \to A$ is smooth. Hence by Algebra, Proposition 7.127.13 the ring map $R \to A$ is formally smooth. Lemma 33.9.6 in turn implies that $W \to V$ is formally smooth. Hence we can lift $a|_U : U \to W$ to a V-morphism $a' : U' \to W \subset X$ showing that $\mathcal{F}(U) \neq \emptyset$.

Finally we prove (II). By Morphisms, Lemma 24.32.15 we see that $\Omega_{X/S}$ is of finite presentation (it is even finite locally free by Morphisms, Lemma 24.33.12). Hence $a^*\Omega_{X/S}$ is of finite presentation (see Modules, Lemma 15.11.4). Hence the sheaf $\mathcal{H} = \mathcal{H}om_{\mathcal{O}_T}(a^*\Omega_{X/S}, \mathcal{C}_{T/T'})$ is quasi-coherent by the discussion in Schemes, Section 21.24. Thus by Coherent, Lemma 25.2.2 we have $H^1(T, \mathcal{H}) = 0$ as desired. □

Locally projective quasi-coherent modules are defined in Properties, Section 23.19.

Lemma 33.9.8. *Let $f : X \to Y$ be a formally smooth morphism of schemes. Then $\Omega_{X/Y}$ is locally projective on X.*

Proof. Choose $U \subset X$ and $V \subset Y$ affine open such that $f(U) \subset V$. By Lemma 33.9.5 $f|_U : U \to V$ is formally smooth. Hence $\Gamma(V, \mathcal{O}_V) \to \Gamma(U, \mathcal{O}_U)$ is a formally smooth ring map, see Lemma 33.9.6. Hence by Algebra, Lemma 7.127.7 the $\Gamma(U, \mathcal{O}_U)$-module $\Omega_{\Gamma(U,\mathcal{O}_U)/\Gamma(V,\mathcal{O}_V)}$ is projective. Hence $\Omega_{U/V}$ is locally projective, see Properties, Section 23.19. □

Lemma 33.9.9. *Let $f : X \to Y$, $g : Y \to S$ be morphisms of schemes. Assume f is formally smooth. Then*

$$0 \to f^*\Omega_{Y/S} \to \Omega_{X/S} \to \Omega_{X/Y} \to 0$$

(see Morphisms, Lemma 24.32.11) is short exact.

Proof. The algebraic version of this lemma is the following: Given ring maps $A \to B \to C$ with $B \to C$ formally smooth, then the sequence

$$0 \to C \otimes_B \Omega_{B/A} \to \Omega_{C/A} \to \Omega_{C/B} \to 0$$

of Algebra, Lemma 7.122.7 is exact. This is Algebra, Lemma 7.127.9. □

Lemma 33.9.10. *Let $h : Z \to X$ be a formally unramified morphism of schemes over S. Assume that Z is formally smooth over S. Then the canonical exact sequence*

$$0 \to \mathcal{C}_{Z/X} \to i^*\Omega_{X/S} \to \Omega_{Z/S} \to 0$$

of Lemma 33.5.10 is short exact.

Proof. Let $Z \to Z'$ be the universal first order thickening of Z over X. From the proof of Lemma 33.5.10 we see that our sequence is identified with the sequence

$$\mathcal{C}_{Z/Z'} \to \Omega_{Z'/S} \otimes \mathcal{O}_Z \to \Omega_{Z/S} \to 0.$$

Since $Z \to S$ is formally smooth we can locally on Z' find a left inverse $Z' \to Z$ over S to the inclusion map $Z \to Z'$. Thus the sequence is locally split, see Morphisms, Lemma 24.32.18. □

Lemma 33.9.11. *Let*

$$\begin{tikzcd} Z \arrow[r, "i"] \arrow[dr, "j"'] & X \arrow[d, "f"] \\ & Y \end{tikzcd}$$

be a commutative diagram of schemes where i and j are formally unramified and f is formally smooth. Then the canonical exact sequence

$$0 \to \mathcal{C}_{Z/Y} \to \mathcal{C}_{Z/X} \to i^*\Omega_{X/Y} \to 0$$

of Lemma 33.5.11 is exact and locally split.

Proof. Denote $Z \to Z'$ the universal first order thickening of Z over X. Denote $Z \to Z''$ the universal first order thickening of Z over Y. By Lemma 33.5.10 here is a canonical morpism $Z' \to Z''$ so that we have a commutative diagram

$$\begin{tikzcd} Z \arrow[r, "i'"] \arrow[dr, "j'"'] & Z' \arrow[r, "a"] \arrow[d, "k"] & X \arrow[d, "f"] \\ & Z'' \arrow[r, "b"] & Y \end{tikzcd}$$

In the proof of Lemma 33.5.11 we identified the sequence above with the sequence

$$\mathcal{C}_{Z/Z''} \to \mathcal{C}_{Z/Z'} \to (i')^*\Omega_{Z'/Z''} \to 0$$

Let $U'' \subset Z''$ be an affine open. Denote $U \subset Z$ and $U' \subset Z'$ the corresponding affine open subschemes. As f is formally smooth there exists a morphism $h : U'' \to X$ which agrees with i on U and such that $f \circ h$ equals $b|_{U''}$. Since Z' is the universal first order thickening we obtain a unique morphism $g : U'' \to Z'$ such that $g = a \circ h$. The universal property of Z'' implies that $k \circ g$ is the inclusion map $U'' \to Z''$. Hence g is a left inverse to k. Picture

$$\begin{tikzcd} U \arrow[r] \arrow[d] & Z' \arrow[d, "k"] \\ U'' \arrow[r] \arrow[ur, "g"] & Z'' \end{tikzcd}$$

Thus g induces a map $\mathcal{C}_{Z/Z'}|_U \to \mathcal{C}_{Z/Z''}|_U$ which is a left inverse to the map $\mathcal{C}_{Z/Z''} \to \mathcal{C}_{Z/Z'}$ over U. □

33.10. Smoothness over a Noetherian base

It turns out that if the base is Noetherian then we can get away with less in the formulation of formal smoothness. In some sense the following lemmas are the beggining of deformation theory.

Lemma 33.10.1. *Let $f : X \to S$ be a morphism of schemes. Let $x \in X$. Assume that S is locally Noetherian and f locally of finite type. The following are equivalent:*

1. *f is smooth at x,*
2. *for every solid commutative diagram*

$$\begin{tikzcd} X \arrow[d, "f"'] & Spec(B) \arrow[l, "\alpha"'] \arrow[d, "i"] \\ S & Spec(B') \arrow[l, "\beta"] \arrow[ul, dashed] \end{tikzcd}$$

   where $B' \to B$ is a surjection of local rings with $Ker(B' \to B)$ of square zero, and α mapping the closed point of $Spec(B)$ to x there exists a dotted arrow making the diagram commute,
3. *same as in (2) but with $B' \to B$ ranging over small extensions (see Algebra, Definition 7.130.1), and*
4. *same as in (2) but with $B' \to B$ ranging over small extensions such that α induces an isomorphism $\kappa(x) \to \kappa(\mathfrak{m})$ where $\mathfrak{m} \subset B$ is the maximal ideal.*

Proof. Choose an affine neighbourhood $V \subset S$ of $f(x)$ and choose an affine neighbourhood $U \subset X$ of x such that $f(U) \subset V$. For any ``test" diagram as in (2) the morphism α will map $Spec(B)$ into U and the morphism β will map $Spec(B')$ into V (see Schemes, Section 21.13). Hence the lemma reduces to the morphism $f|_U : U \to V$ of affines. (Indeed, V is Noetherian and $f|_U$ is of finite type, see Properties, Lemma 23.5.2 and Morphisms, Lemma 24.14.2.) In this affine case the lemma is identical to Algebra, Lemma 7.130.2. □

Sometimes it is useful to know that one only needs to check the lifting criterion for small extensions ``centered" at points of finite type (see Morphisms, Section 24.15).

Lemma 33.10.2. *Let $f : X \to S$ be a morphism of schemes. Let $x \in X$. Assume that S is locally Noetherian and f locally of finite type. The following are equivalent:*

1. *f is smooth,*
2. *for every solid commutative diagram*

$$\begin{tikzcd} X \arrow[d, "f"'] & Spec(B) \arrow[l, "\alpha"'] \arrow[d, "i"] \\ S & Spec(B') \arrow[l, "\beta"] \arrow[ul, dashed] \end{tikzcd}$$

   where $B' \to B$ is a small extension of Artinian local rings and β of finite type (!) there exists a dotted arrow making the diagram commute.

Proof. If f is smooth, then the infinitesimal lifting criterion (Lemma 33.9.7) says f is formally smooth and (2) holds.

Assume (2). The set of points $x \in X$ where f is not smooth forms a closed subset T of X. By the discussion in Morphisms, Section 24.15, if $T \neq \emptyset$ there exists a point $x \in T \subset X$ such that the morphism

$$Spec(\kappa(x)) \to X \to S$$

is of finite type (namely, pick any point x of T which is closed in an affine open of X). By Morphisms, Lemma 24.15.2 given any local Artinian ring B' with residue field $\kappa(x)$ then any morphism $\beta : Spec(B') \to S$ is of finite type. Thus we see that all the diagrams used in Lemma 33.10.1 (4) correspond to diagrams as in the current lemma (2). Whence $X \to S$ is smooth a x a contradiction. ☐

33.11. Openness of the flat locus

This result takes some work to prove, and (perhaps) deserves its own section. Here it is.

Theorem 33.11.1. *Let S be a scheme. Let $f : X \to S$ be a morphism which is locally of finite presentation. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module which is locally of finite presentation. Then*

$$U = \{x \in X \mid \mathcal{F} \text{ is flat over } S \text{ at } x\}$$

is open in X.

Proof. We may test for openness locally on X hence we may assume that f is a morphism of affine schemes. In this case the theorem is exactly Algebra, Theorem 7.120.4. ☐

Lemma 33.11.2. *Let S be a scheme. Let*

$$\begin{tikzcd} X' \arrow[r, "g'"] \arrow[d, "f'"'] & X \arrow[d, "f"] \\ S' \arrow[r, "g"] & S \end{tikzcd}$$

be a cartesian diagram of schemes. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Let $x' \in X'$ with images $x = g'(x')$ and $s' = g'(x')$.

(1) *If $\mathcal{F}$ is flat over S at x, then $(g')^*\mathcal{F}$ is flat over S' at x'.*
(2) *If g is flat at s' and $(g')^*\mathcal{F}$ is flat over S' at x', then $\mathcal{F}$ is flat over S at x.*

In particular, if g is flat, f is locally of finite presentation, and $\mathcal{F}$ is locally of finite presentation, then formation of the open subset of Theorem 33.11.1 commutes with base change.

Proof. Consider the commutative diagram of local rings

$$\begin{tikzcd} \mathcal{O}_{X',x'} & \mathcal{O}_{X,x} \arrow[l] \\ \mathcal{O}_{S',s'} \arrow[u] & \mathcal{O}_{S,s} \arrow[l] \arrow[u] \end{tikzcd}$$

Note that $\mathcal{O}_{X',x'}$ is a localization of $\mathcal{O}_{X,x} \otimes_{\mathcal{O}_{S,s}} \mathcal{O}_{S',s'}$, and that $((g')^*\mathcal{F})_{x'}$ is equal to $\mathcal{F}_x \otimes_{\mathcal{O}_{X,x}} \mathcal{O}_{X',x'}$. Hence the lemma follows from Algebra, Lemma 7.92.1. ☐

33.12. Critère de platitude par fibres

Consider a commutative diagram of schemes (left hand diagram)

$$\begin{tikzcd} X \arrow[rr, "f"] \arrow[dr] & & Y \arrow[dl] \\ & S & \end{tikzcd} \qquad \begin{tikzcd} X_s \arrow[rr, "f_s"] \arrow[dr] & & Y_s \arrow[dl] \\ & Spec(\kappa(s)) & \end{tikzcd}$$

and a quasi-coherent $\mathcal{O}_X$-module $\mathcal{F}$. Given a point $x \in X$ lying over $s \in S$ with image $y = f(x)$ we consider the question: Is $\mathcal{F}$ flat over Y at x? If $\mathcal{F}$ is flat over S at x, then the theorem states this question is intimately related to the question of whether the restriction of $\mathcal{F}$ to the fibre

$$\mathcal{F}_s = (X_s \to X)^*\mathcal{F}$$

is flat over Y_s at x. Below you will find a ``Noetherian" version, a ``finitely presented" version, and earlier we treated a ``nilpotent" version, see Lemma 33.8.2.

Theorem 33.12.1. *Let S be a scheme. Let $f : X \to Y$ be a morphism of schemes over S. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Let $x \in X$. Set $y = f(x)$ and $s \in S$ the image of x in S. Assume S, X, Y locally Noetherian, $\mathcal{F}$ coherent, and $\mathcal{F}_x \neq 0$. Then the following are equivalent:*

(1) *$\mathcal{F}$ is flat over S at x, and $\mathcal{F}_s$ is flat over Y_s at x, and*
(2) *Y is flat over S at y and $\mathcal{F}$ is flat over Y at x.*

Proof. Consider the ring maps

$$\mathcal{O}_{S,s} \longrightarrow \mathcal{O}_{Y,y} \longrightarrow \mathcal{O}_{X,x}$$

and the module $\mathcal{F}_x$. The stalk of $\mathcal{F}_s$ at x is the module $\mathcal{F}_x/\mathfrak{m}_s\mathcal{F}_x$ and the local ring of Y_s at y is $\mathcal{O}_{Y,y}/\mathfrak{m}_s\mathcal{O}_{Y,y}$. Thus the implication (1) $\Rightarrow$ (2) is Algebra, Lemma 7.91.14. If (2) holds, then the first ring map is faithfully flat and $\mathcal{F}_x$ is flat over $\mathcal{O}_{Y,y}$ so by Algebra, Lemma 7.35.3 we see that $\mathcal{F}_x$ is flat over $\mathcal{O}_{S,s}$. Moreover, $\mathcal{F}_x/\mathfrak{m}_s\mathcal{F}_x$ is the base change of the flat module $\mathcal{F}_x$ by $\mathcal{O}_{Y,y} \to \mathcal{O}_{Y,y}/\mathfrak{m}_s\mathcal{O}_{Y,y}$, hence flat by Algebra, Lemma 7.35.6. $\square$

Here is the non-Noetherian version.

Theorem 33.12.2. *Let S be a scheme. Let $f : X \to Y$ be a morphism of schemes over S. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Assume*

(1) *X is locally of finite presentation over S,*
(2) *$\mathcal{F}$ an $\mathcal{O}_X$-module of finite presentation, and*
(3) *Y is locally of finite type over S.*

Let $x \in X$. Set $y = f(x)$ and let $s \in S$ be the image of x in S. If $\mathcal{F}_x \neq 0$, then the following are equivalent:

(1) *$\mathcal{F}$ is flat over S at x, and $\mathcal{F}_s$ is flat over Y_s at x, and*
(2) *Y is flat over S at y and $\mathcal{F}$ is flat over Y at x.*

Moreover, the set of points x where (1) and (2) hold is open in Supp($\mathcal{F}$).

Proof. Consider the ring maps

$$\mathcal{O}_{S,s} \longrightarrow \mathcal{O}_{Y,y} \longrightarrow \mathcal{O}_{X,x}$$

and the module $\mathcal{F}_x$. The stalk of $\mathcal{F}_s$ at x is the module $\mathcal{F}_x/\mathfrak{m}_s\mathcal{F}_x$ and the local ring of Y_s at y is $\mathcal{O}_{Y,y}/\mathfrak{m}_s\mathcal{O}_{Y,y}$. Thus the implication (1) $\Rightarrow$ (2) is Algebra, Lemma 7.119.9. If (2) holds, then the first ring map is faithfully flat and $\mathcal{F}_x$ is flat over $\mathcal{O}_{Y,y}$ so by Algebra, Lemma 7.35.3 we see that $\mathcal{F}_x$ is flat over $\mathcal{O}_{S,s}$. Moreover, $\mathcal{F}_x/\mathfrak{m}_s\mathcal{F}_x$ is the base change of the flat module $\mathcal{F}_x$ by $\mathcal{O}_{Y,y} \to \mathcal{O}_{Y,y}/\mathfrak{m}_s\mathcal{O}_{Y,y}$, hence flat by Algebra, Lemma 7.35.6.

By Morphisms, Lemma 24.20.11 the morphism f is locally of finite presentation. Consider the set

$$U = \{x \in X \mid \mathcal{F} \text{ flat at } x \text{ over both } Y \text{ and } S\}. \tag{33.12.2.1}$$

This set is open in X by Theorem 33.11.1. Note that if $x \in U$, then $\mathcal{F}_s$ is flat at x over Y_s as a base change of a flat module under the morphism $Y_s \to Y$, see Morphisms, Lemma 24.24.6. Hence at every point of $U \cap \text{Supp}(\mathcal{F})$ condition (1) is satisfied. On the other hand, it is clear that if $x \in \text{Supp}(\mathcal{F})$ satisfies (1) and (2), then $x \in U$. Thus the open set we are looking for is $U \cap \text{Supp}(\mathcal{F})$. $\square$

These theorems are often used in the following simplified forms. We give only the global statements -- of course there are also pointwise versions.

Lemma 33.12.3. *Let S be a scheme. Let $f : X \to Y$ be a morphism of schemes over S. Assume*

1. *S, X, Y are locally Noetherian,*
2. *X is flat over S,*
3. *for every $s \in S$ the morphism $f_s : X_s \to Y_s$ is flat.*

Then f is flat. If f is also surjective, then Y is flat over S.

Proof. This is a special case of Theorem 33.12.1. $\square$

Lemma 33.12.4. *Let S be a scheme. Let $f : X \to Y$ be a morphism of schemes over S. Assume*

1. *X is locally of finite presentation over S,*
2. *X is flat over S,*
3. *for every $s \in S$ the morphism $f_s : X_s \to Y_s$ is flat, and*
4. *Y is locally of finite type over S.*

Then f is flat. If f is also surjective, then Y is flat over S.

Proof. This is a special case of Theorem 33.12.2. $\square$

Lemma 33.12.5. *Let S be a scheme. Let $f : X \to Y$ be a morphism of schemes over S. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Assume*

1. *X is locally of finite presentation over S,*
2. *$\mathcal{F}$ an $\mathcal{O}_X$-module of finite presentation,*
3. *$\mathcal{F}$ is flat over S, and*
4. *Y is locally of finite type over S.*

Then the set

$$U = \{x \in X \mid \mathcal{F} \textit{ flat at } x \textit{ over } Y\}.$$

is open in X and its formation commutes with arbitrary base change: If $S' \to S$ is a morphism of schemes, and U' is the set of points of $X' = X \times_S S'$ where $\mathcal{F}' = \mathcal{F} \times_S S'$ is flat over $Y' = Y \times_S S'$, then $U' = U \times_S S'$.

Proof. By Morphisms, Lemma 24.20.11 the morphism f is locally of finite presentation. Hence U is open by Theorem 33.11.1. Because we have assumed that $\mathcal{F}$ is flat over S we see that Theorem 33.12.2 implies

$$U = \{x \in X \mid \mathcal{F}_s \text{ flat at } x \text{ over } Y_s\}.$$

where s always denotes the image of x in S. (This description also works trivially when $\mathcal{F}_x = 0$.) Moreover, the assumptions of the lemma remain in force for the morphism $f' : X' \to Y'$ and the sheaf $\mathcal{F}'$. Hence U' has a similar description. In other words, it suffices to prove that given $s' \in S'$ mapping to $s \in S$ we have

$$\{x' \in X'_{s'} \mid \mathcal{F}'_{s'} \text{ flat at } x' \text{ over } Y'_{s'}\}$$

is the inverse image of the corresponding locus in X_s. This is true by Lemma 33.11.2 because in the cartesian diagram

$$\begin{tikzcd} X'_{s'} \arrow[r] \arrow[d] & X_s \arrow[d] \\ Y'_{s'} \arrow[r] & Y_s \end{tikzcd}$$

the horizontal morphisms are flat as they are base changes by the flat morphism $Spec(\kappa(s')) \to Spec(\kappa(s))$. □

Lemma 33.12.6. *Let S be a scheme. Let $f : X \to Y$ be a morphism of schemes over S. Assume*

(1) *X is locally of finite presentation over S,*
(2) *X is flat over S, and*
(3) *Y is locally of finite type over S.*

Then the set

$$U = \{x \in X \mid X \text{ flat at } x \text{ over } Y\}.$$

is open in X and its formation commutes with arbitrary base change.

Proof. This is a special case of Lemma 33.12.5. □

33.13. Normal morphisms

In the article [**DM69a**] of Deligne and Mumford the notion of a normal morphism is mentioned. This is just one in a series of types[1] of morphisms that can all be defined similarly. Over time we will add these in their own sections as needed.

Definition 33.13.1. Let $f : X \to Y$ be a morphism of schemes. Assume that all the fibres X_y are locally Noetherian schemes.

(1) Let $x \in X$, and $y = f(x)$. We say that f is *normal at x* if f is flat at x, and the scheme X_y is geometrically normal at x over $\kappa(y)$ (see Varieties, Definition 28.8.1).
(2) We say f is a *normal morphism* if f is normal at every point of X.

So the condition that the morphism $X \to Y$ is normal is stronger than just requiring all the fibres to be normal locally Noetherian schemes.

Lemma 33.13.2. *Let $f : X \to Y$ be a morphism of schemes. Assume all fibres of f are locally Noetherian. The following are equivalent*

(1) *f is normal, and*
(2) *f is flat and its fibres are geometrically normal schemes.*

Proof. This follows directly from the definitions. □

Lemma 33.13.3. *A smooth morphism is normal.*

[1] The other types are coprof $\leq k$, Cohen-Macaulay, (S_k), regular, (R_k), and reduced. See [**DG67**, IV Definition 6.8.1.].

Proof. Let $f : X \to Y$ be a smooth morphism. As f is locally of finite presentation, see Morphisms, Lemma 24.33.8 the fibres X_y are locally of finite type over a field, hence locally Noetherian. Moreover, f is flat, see Morphisms, Lemma 24.33.9. Finally, the fibres X_y are smooth over a field (by Morphisms, Lemma 24.33.5) and hence geometrically normal by Varieties, Lemma 28.15.4. Thus f is normal by Lemma 33.13.2. $\square$

We want to show that this notion is local on the source and target for the smooth topology. First we deal with the property of having locally Noetherian fibres.

Lemma 33.13.4. *The property $\mathcal{P}(f)$ =``the fibres of f are locally Noetherian'' is local in the fppf topology on the source and the target.*

Proof. Let $f : X \to Y$ be a morphism of schemes. Let $\{\varphi_i : Y_i \to Y\}_{i \in I}$ be an fppf covering of Y. Denote $f_i : X_i \to Y_i$ the base change of f by φ_i. Let $i \in I$ and let $y_i \in Y_i$ be a point. Set $y = \varphi_i(y_i)$. Note that

$$X_{i,y_i} = Spec(\kappa(y_i)) \times_{Spec(\kappa(y))} X_y.$$

Moreover, as φ_i is of finite presentation the field extension $\kappa(y) \subset \kappa(y_i)$ is finitely generated. Hence in this situation we have that X_y is locally Noetherian if and only if X_{i,y_i} is locally Noetherian, see Varieties, Lemma 28.9.1. This fact implies locality on the target.

Let $\{X_i \to X\}$ be an fppf covering of X. Let $y \in Y$. In this case $\{X_{i,y} \to X_y\}$ is an fppf covering of the fibre. Hence the locality on the source follows from Descent, Lemma 31.12.1. $\square$

Lemma 33.13.5. *The property $\mathcal{P}(f)$ =``the fibres of f are locally Noetherian and f is normal'' is local in the fppf topology on the target and local in the smooth topology on the source.*

Proof. We have $\mathcal{P}(f) = \mathcal{P}_1(f) \wedge \mathcal{P}_2(f) \wedge \mathcal{P}_3(f)$ where $\mathcal{P}_1(f)$ =``the fibres of $f$ are locally Noetherian'', $\mathcal{P}_2(f)$ =``f is flat'', and $\mathcal{P}_3(f)$ =``the fibres of f are geometrically normal''. We have already seen that $\mathcal{P}_1$ and $\mathcal{P}_2$ are local in the fppf topology on the source and the target, see Lemma 33.13.4, and Descent, Lemmas 31.19.13 and 31.23.1. Thus we have to deal with $\mathcal{P}_3$.

Let $f : X \to Y$ be a morphism of schemes. Let $\{\varphi_i : Y_i \to Y\}_{i \in I}$ be an fpqc covering of Y. Denote $f_i : X_i \to Y_i$ the base change of f by φ_i. Let $i \in I$ and let $y_i \in Y_i$ be a point. Set $y = \varphi_i(y_i)$. Note that

$$X_{i,y_i} = Spec(\kappa(y_i)) \times_{Spec(\kappa(y))} X_y.$$

Hence in this situation we have that X_y is geometrically normal if and only if X_{i,y_i} is geometrically normal, see Varieties, Lemma 28.8.4. This fact implies $\mathcal{P}_3$ is fpqc local on the target.

Let $\{X_i \to X\}$ be a smooth covering of X. Let $y \in Y$. In this case $\{X_{i,y} \to X_y\}$ is a smooth covering of the fibre. Hence the locality of $\mathcal{P}_3$ for the smooth topology on the source follows from Descent, Lemma 31.14.2. Combining the above the lemma follows. $\square$

33.14. Regular morphisms

Compare with Section 33.13. The algebraic version of this notion is discussed in More on Algebra, Section 12.31.

Definition 33.14.1. Let $f : X \to Y$ be a morphism of schemes. Assume that all the fibres X_y are locally Noetherian schemes.

(1) Let $x \in X$, and $y = f(x)$. We say that f is *regular at* x if f is flat at x, and the scheme X_y is geometrically regular at x over $\kappa(y)$ (see Varieties, Definition 28.10.1).
(2) We say f is a *regular morphism* if f is regular at every point of X.

The condition that the morphism $X \to Y$ is regular is stronger than just requiring all the fibres to be regular locally Noetherian schemes.

Lemma 33.14.2. *Let $f : X \to Y$ be a morphism of schemes. Assume all fibres of f are locally Noetherian. The following are equivalent*

(1) *f is regular,*
(2) *f is flat and its fibres are geometrically regular schemes,*
(3) *for every pair of affine opens $U \subset X$, $V \subset Y$ with $f(U) \subset V$ the ring map $\mathcal{O}(V) \to \mathcal{O}(U)$ is regular,*
(4) *there exists an open covering $Y = \bigcup_{j \in J} V_j$ and open coverings $f^{-1}(V_j) = \bigcup_{i \in I_j} U_i$ such that each of the morphisms $U_i \to V_j$ is regular, and*
(5) *there exists an affine open covering $Y = \bigcup_{j \in J} V_j$ and affine open coverings $f^{-1}(V_j) = \bigcup_{i \in I_j} U_i$ such that the ring maps $\mathcal{O}(V_j) \to \mathcal{O}(U_i)$ are regular.*

Proof. The equivalence of (1) and (2) is immediate from the definitions. Let $x \in X$ with $y = f(x)$. By definition f is flat at x if and only if $\mathcal{O}_{Y,y} \to \mathcal{O}_{X,x}$ is a flat ring map, and X_y is geometrically regular at x over $\kappa(y)$ if and only if $\mathcal{O}_{X_y,x} = \mathcal{O}_{X,x}/\mathfrak{m}_y\mathcal{O}_{X,x}$ is a geometrically regular algebra over $\kappa(y)$. Hence Whether or not f is regular at x depends only on the local homomorphism of local rings $\mathcal{O}_{Y,y} \to \mathcal{O}_{X,x}$. Thus the equivalence of (1) and (4) is clear.

Recall (More on Algebra, Definition 12.31.1) that a ring map $A \to B$ is regular if and only if it is flat and the fibre rings $B \otimes_A \kappa(\mathfrak{p})$ are Noetherian and geometrically regular for all primes $\mathfrak{p} \subset A$. By Varieties, Lemma 28.10.3 this is equivalent to $Spec(B \otimes_A \kappa(\mathfrak{p}))$ being a geometrically regular scheme over $\kappa(\mathfrak{p})$. Thus we see that (2) implies (3). It is clear that (3) implies (5). Finally, assume (5). This implies that f is flat (see Morphisms, Lemma 24.24.3). Moreover, if $y \in Y$, then $y \in V_j$ for some j and we see that $X_y = \bigcup_{i \in I_j} U_{i,y}$ with each $U_{i,y}$ geometrically regular over $\kappa(y)$ by Varieties, Lemma 28.10.3. Another application of Varieties, Lemma 28.10.3 shows that X_y is geometrically regular. Hence (2) holds and the proof of the lemma is finished. □

Lemma 33.14.3. *A smooth morphism is regular.*

Proof. Let $f : X \to Y$ be a smooth morphism. As f is locally of finite presentation, see Morphisms, Lemma 24.33.8 the fibres X_y are locally of finite type over a field, hence locally Noetherian. Moreover, f is flat, see Morphisms, Lemma 24.33.9. Finally, the fibres X_y are smooth over a field (by Morphisms, Lemma 24.33.5) and hence geometrically regular by Varieties, Lemma 28.15.4. Thus f is regular by Lemma 33.14.2. □

Lemma 33.14.4. *The property $\mathcal{P}(f)$ =``the fibres of f are locally Noetherian and f is regular'' is local in the fppf topology on the target and local in the smooth topology on the source.*

Proof. We have $\mathcal{P}(f) = \mathcal{P}_1(f) \wedge \mathcal{P}_2(f) \wedge \mathcal{P}_3(f)$ where $\mathcal{P}_1(f)$ =``the fibres of $f$ are locally Noetherian'', $\mathcal{P}_2(f)$ =``f is flat'', and $\mathcal{P}_3(f)$ =``the fibres of f are geometrically regular''. We have already seen that $\mathcal{P}_1$ and $\mathcal{P}_2$ are local in the fppf topology on the source and the target, see Lemma 33.13.4, and Descent, Lemmas 31.19.13 and 31.23.1. Thus we have to deal with $\mathcal{P}_3$.

Let $f : X \to Y$ be a morphism of schemes. Let $\{\varphi_i : Y_i \to Y\}_{i\in I}$ be an fpqc covering of Y. Denote $f_i : X_i \to Y_i$ the base change of f by φ_i. Let $i \in I$ and let $y_i \in Y_i$ be a point. Set $y = \varphi_i(y_i)$. Note that

$$X_{i,y_i} = Spec(\kappa(y_i)) \times_{Spec(\kappa(y))} X_y.$$

Hence in this situation we have that X_y is geometrically regular if and only if X_{i,y_i} is geometrically regular, see Varieties, Lemma 28.10.4. This fact implies $\mathcal{P}_3$ is fpqc local on the target.

Let $\{X_i \to X\}$ be a smooth covering of X. Let $y \in Y$. In this case $\{X_{i,y} \to X_y\}$ is a smooth covering of the fibre. Hence the locality of $\mathcal{P}_3$ for the smooth topology on the source follows from Descent, Lemma 31.14.4. Combining the above the lemma follows. □

33.15. Cohen-Macaulay morphisms

Compare with Section 33.13. Note that, as pointed out in Algebra, Section 7.149 and Varieties, Section 28.11 ``geometrically Cohen-Macaulay'' is the same as plain Cohen-Macaulay.

Definition 33.15.1. Let $f : X \to Y$ be a morphism of schemes. Assume that all the fibres X_y are locally Noetherian schemes.

(1) Let $x \in X$, and $y = f(x)$. We say that f is *Cohen-Macaulay at x* if f is flat at x, and the local ring of the scheme X_y at x is Cohen-Macaulay.
(2) We say f is a *Cohen-Macaulay morphism* if f is Cohen-Macaulay at every point of X.

Here is a translation.

Lemma 33.15.2. *Let $f : X \to Y$ be a morphism of schemes. Assume all fibres of f are locally Noetherian. The following are equivalent*

(1) *f is Cohen-Macaulay, and*
(2) *f is flat and its fibres are Cohen-Macaulay schemes.*

Proof. This follows directly from the definitions. □

Lemma 33.15.3. *Let $f : X \to Y$ be a morphism of schemes. Assume that all the fibres X_y are locally Noetherian schemes. Let $Y' \to Y$ be locally of finite type. Let $f' : X' = X_{Y'} \to Y$ be the base change of f. Let $x' \in X'$ be a point with image $x \in X$.*

(1) *If f is Cohen-Macaulay at x, then the base change $f' : X' \to Y'$ is Cohen-Macaulay at x'.*
(2) *If $Y' \to Y$ is flat at $f'(x')$ and f' is Cohen-Macaulay at x', then f is Cohen-Macaulay at x.*

Proof. Note that the assumption on $Y' \to Y$ means that for $y' \in Y'$ mapping to $y \in Y$ the field extension $\kappa(y) \subset \kappa(y')$ is finitely generated. Hence also all the fibres $X'_{y'} = (X_y)_{\kappa(y')}$ are locally Noetherian, see Varieties, Lemma 28.9.1. Thus the lemma makes sense. Set $y' = f'(x')$ and $y = f(x)$. Hence we get the following commutative diagram of local rings

$$\begin{tikzcd} \mathcal{O}_{X',x'} & \mathcal{O}_{X,x} \arrow[l] \\ \mathcal{O}_{Y',y'} \arrow[u] & \mathcal{O}_{Y,y} \arrow[l] \arrow[u] \end{tikzcd}$$

where the upper left corner is a localization of the tensor product of the upper right and lower left corners over the lower right corner.

Assume f is Cohen-Macaulay at x. The flatness of $\mathcal{O}_{Y,y} \to \mathcal{O}_{X,x}$ implies the flatness of $\mathcal{O}_{Y',y'} \to \mathcal{O}_{X',x'}$, see Algebra, Lemma 7.92.1. The fact that $\mathcal{O}_{X,x}/\mathfrak{m}_y\mathcal{O}_{X,x}$ is Cohen-Macaulay implies that $\mathcal{O}_{X',x'}/\mathfrak{m}_{y'}\mathcal{O}_{X',x'}$, see Varieties, Lemma 28.11.1. Hence we see that f' is Cohen-Macaulay at x'.

Assume $Y' \to Y$ is flat at y' and f' is Cohen-Macaulay at x'. The flatness of $\mathcal{O}_{Y',y'} \to \mathcal{O}_{X',x'}$ and $\mathcal{O}_{Y,y} \to \mathcal{O}_{Y',y'}$ implies the flatness of $\mathcal{O}_{Y,y} \to \mathcal{O}_{X,x}$, see Algebra, Lemma 7.92.1. The fact that $\mathcal{O}_{X',x'}/\mathfrak{m}_{y'}\mathcal{O}_{X',x'}$ is Cohen-Macaulay implies that $\mathcal{O}_{X,x}/\mathfrak{m}_y\mathcal{O}_{X,x}$, see Varieties, Lemma 28.11.1. Hence we see that f is Cohen-Macaulay at x. □

Lemma 33.15.4. *Let $f : X \to S$ be a flat morphism of finite presentation. Let*

$$W = \{x \in X \mid f \text{ is Cohen-Macaulay at } x\}$$

Then

(1) *we have*

$$W = \{x \in X \mid \mathcal{O}_{X_{f(x)},x} \text{ is Cohen-Macaulay}\},$$

(2) *W is open in X,*
(3) *W dense in every fibre of $X \to S$,*
(4) *the formation of W commutes with arbitrary base change of f: For any morphism $g : S' \to S$, consider the base change $f' : X' \to S'$ of f and the projection $g' : X' \to X$. Then the corresponding set W' for the morphism f' is equal to $W' = (g')^{-1}(W)$.*

Proof. As f is flat with locally Noetherian fibres the equality in (1) holds by definition. Parts (2) and (3) follow from Algebra, Lemma 7.121.5. Part (4) follows either from Algebra, Lemma 7.121.7 or Varieties, Lemma 28.11.1. □

Lemma 33.15.5. *Let $f : X \to S$ be a flat morphism of finite presentation. For $d \geq 0$ there exist opens $U_d \subset X$ with the following properties*

(1) *$W = \bigcup_{d\geq 0} U_d$ is dense in every fibre of f, and*
(2) *$U_d \to S$ is of relative dimension d (see Morphisms, Definition 24.28.1).*

Proof. This follows by combining Lemma 33.15.4 with Morphisms, Lemma 24.28.4. □

Lemma 33.15.6. *Let $f : X \to S$ be a flat morphism of finite presentation. Suppose $x' \rightsquigarrow x$ is a specialization of points of X with image $s' \rightsquigarrow s$ in S. If x is a generic point of an irreducible component of X_s then $\dim_{x'}(X_{s'}) = \dim_x(X_s)$.*

Proof. The point x is contained in U_d for some d, where U_d as in Lemma 33.15.5. □

Lemma 33.15.7. *The property $\mathcal{P}(f) =$``the fibres of f are locally Noetherian and f is Cohen-Macaulay" is local in the fppf topology on the target and local in the syntomic topology on the source.*

Proof. We have $\mathcal{P}(f) = \mathcal{P}_1(f) \wedge \mathcal{P}_2(f)$ where $\mathcal{P}_1(f) =$``$f$ is flat", and $\mathcal{P}_2(f) =$``the fibres of f are locally Noetherian and Cohen-Macaulay". We know that $\mathcal{P}_1$ is local in the fppf topology on the source and the target, see Descent, Lemmas 31.19.13 and 31.23.1. Thus we have to deal with $\mathcal{P}_2$.

Let $f : X \to Y$ be a morphism of schemes. Let $\{\varphi_i : Y_i \to Y\}_{i\in I}$ be an fppf covering of Y. Denote $f_i : X_i \to Y_i$ the base change of f by φ_i. Let $i \in I$ and let $y_i \in Y_i$ be a point. Set $y = \varphi_i(y_i)$. Note that

$$X_{i,y_i} = Spec(\kappa(y_i)) \times_{Spec(\kappa(y))} X_y.$$

and that $\kappa(y) \subset \kappa(y_i)$ is a finitely generated field extension. Hence if X_y is locally Noetherian, then X_{i,y_i} is locally Noetherian, see Varieties, Lemma 28.9.1. And if in addition X_y is Cohen-Macaulay, then X_{i,y_i} is Cohen-Macaulay, see Varieties, Lemma 28.11.1. Thus $\mathcal{P}_2$ is fppf local on the target.

Let $\{X_i \to X\}$ be a syntomic covering of X. Let $y \in Y$. In this case $\{X_{i,y} \to X_y\}$ is a syntomic covering of the fibre. Hence the locality of $\mathcal{P}_2$ for the syntomic topology on the source follows from Descent, Lemma 31.13.2. Combining the above the lemma follows. $\square$

33.16. Slicing Cohen-Macaulay morphisms

The results in this section eventually lead to the assertion that the fppf topology is the same as the ``finitely presented, flat, quasi-finite" topology. The following lemma is very closely related to Divisors, Lemma 26.10.7.

Lemma 33.16.1. *Let $f : X \to S$ be a morphism of schemes. Let $x \in X$ be a point with image $s \in S$. Let $h \in \mathfrak{m}_x \subset \mathcal{O}_{X,x}$. Assume*

(1) *f is locally of finite presentation,*
(2) *f is flat at x, and*
(3) *the image $\overline{h}$ of h in $\mathcal{O}_{X_s,x} = \mathcal{O}_{X,x}/\mathfrak{m}_s\mathcal{O}_{X,x}$ is a nonzero divisor.*

Then there exists an affine open neighbourhood $U \subset X$ of x such that h comes from $h \in \Gamma(U, \mathcal{O}_U)$ and such that $D = V(h)$ is an effective Cartier divisor in U with $x \in D$ and $D \to S$ flat and locally of finite presentation.

Proof. We are going to prove this by reducing to the Noetherian case. By openness of flatness (see Theorem 33.11.1) we may assume, after replacing X by an open neighbourhood of x, that $X \to S$ is flat. We may also assume that X and S are affine. After possible shrinking X a bit we may assume that there exists an $h \in \Gamma(X, \mathcal{O}_X)$ which maps to our given h.

We may write $S = Spec(A)$ and we may write $A = colim_i A_i$ as a directed colimit of finite type $\mathbf{Z}$ algebras. Then by Algebra, Lemma 7.120.5 or Limits, Lemmas 27.6.1, 27.6.2, and 27.6.1 we can find a cartesian diagram

$$\begin{tikzcd} X \arrow[r] \arrow[d, "f"'] & X_0 \arrow[d, "f_0"] \\ S \arrow[r] & S_0 \end{tikzcd}$$

with f_0 flat and of finite presentation, X_0 affine, and S_0 affine and Noetherian. Let $x_0 \in X_0$, resp. $s_0 \in S_0$ be the image of x, resp. s. We may also assume there exists an element $h_0 \in \Gamma(X_0, \mathcal{O}_{X_0})$ which restricts to h on X. (If you used the algebra reference above then this is clear; if you used the references to the chapter on limits then this follows from Limits, Lemma 27.6.1 by thinking of h as a morphism $X \to \mathbf{A}^1_S$.) Note that $\mathcal{O}_{X_s,x}$ is a localization of $\mathcal{O}_{(X_0)_{s_0},x_0} \otimes_{\kappa(s_0)} \kappa(s)$, so that $\mathcal{O}_{(X_0)_{s_0},x_0} \to \mathcal{O}_{X_s,x}$ is a flat local ring map, in particular faithfully flat. Hence the image $\overline{h}_0 \in \mathcal{O}_{(X_0)_{s_0},x_0}$ is contained in $\mathfrak{m}_{(X_0)_{s_0},x_0}$ and is a nonzero divisor. We claim that after replacing X_0 by a principal open neighbourhood of x_0 the element h_0 is a nonzero divisor in $B_0 = \Gamma(X_0, \mathcal{O}_{X_0})$ such that B_0/h_0B_0 is flat over $A_0 = \Gamma(S_0, \mathcal{O}_{S_0})$. If so then

$$0 \to B_0 \xrightarrow{h_0} B_0 \to B_0/h_0B_0 \to 0$$

is a short exact sequence of flat A_0-modules. Hence this remains exact on tensoring with A (by Algebra, Lemma 7.35.11) and the lemma follows.

It remains to prove the claim above. The corresponding algebra statement is the following (we drop the subscript $_0$ here): Let $A \to B$ be a flat, finite type ring map of Noetherian rings. Let $\mathfrak{q} \subset B$ be a prime lying over $\mathfrak{p} \subset A$. Assume $h \in \mathfrak{q}$ maps to a nonzero divisor in $B_\mathfrak{q}/\mathfrak{p}B_\mathfrak{q}$. Goal: show that after possible replacing B by B_g for some $g \in B$, $g \not\in \mathfrak{q}$ the element h becomes a nonzero divisor and B/hB becomes flat over A. By Algebra, Lemma 7.91.2 we see that h is a nonzero divisor in $B_\mathfrak{q}$ and that $B_\mathfrak{q}/hB_\mathfrak{q}$ is flat over A. By openess of flatness, see Algebra, Theorem 7.120.4 or Theorem 33.11.1 we see that B/hB is flat over A after replacing B by B_g for some $g \in B$, $g \not\in \mathfrak{q}$. Finally, let $I = \{b \in B \mid hb = 0\}$ be the annihilator of h. Then $IB_\mathfrak{q} = 0$ as h is a nonzero divisor in $B_\mathfrak{q}$. Also I is finitely generated as B is Noetherian. Hence there exists a $g \in B$, $g \not\in \mathfrak{q}$ such that $IB_g = 0$. After replacing B by B_g we see that h is a nonzero divisor. □

Lemma 33.16.2. *Let $f : X \to S$ be a morphism of schemes. Let $x \in X$ be a point with image $s \in S$. Let $h_1, \ldots, h_r \in \mathcal{O}_{X,x}$. Assume*

(1) *f is locally of finite presentation,*
(2) *f is flat at x, and*
(3) *the images of $h_1, \ldots, h_r$ in $\mathcal{O}_{X_s,x} = \mathcal{O}_{X,x}/\mathfrak{m}_s\mathcal{O}_{X,x}$ form a regular sequence.*

Then there exists an affine open neighbourhood $U \subset X$ of x such that $h_1, \ldots, h_r$ come from $h_1, \ldots, h_r \in \Gamma(U, \mathcal{O}_U)$ and such that $Z = V(h_1, \ldots, h_r) \to U$ is a regular immersion with $x \in Z$ and $Z \to S$ flat and locally of finite presentation. Moreover, the base change $Z_{S'} \to U_{S'}$ is a regular immersion for any scheme S' over S.

Proof. (Our conventions on regular sequences imply that $h_i \in \mathfrak{m}_x$ for each i.) The case $r = 1$ follows from Lemma 33.16.1 combined with Divisors, Lemma 26.10.1 to see that $V(h_1)$ remains an effective Cartier divisor after base change. The case $r > 1$ follows from a straightforward induction on r (applying the result for $r = 1$ exactly r times; details omitted).

Another way to prove the lemma is using the material from Divisors, Section 26.14. Namely, first by openness of flatness (see Theorem 33.11.1) we may assume, after replacing X by an open neighbourhood of x, that $X \to S$ is flat. We may also assume that X and S are affine. After possible shrinking X a bit we may assume that we have $h_1, \ldots, h_r \in \Gamma(X, \mathcal{O}_X)$. Set $Z = V(h_1, \ldots, h_r)$. Note that X_s is a Noetherian scheme (because it is an algebraic $\kappa(s)$-scheme, see Varieties, Section 28.13) and that the topology on X_s is induced from the topology on X (see Schemes, Lemma 21.18.5). Hence after shrinking X a bit more we may assume that $Z_s \subset X_s$ is a regular immersion cut out by the r elements $h_i|_{X_s}$, see Divisors, Lemma 26.12.8 and its proof. It is also clear that $r = \dim_x(X_s) - \dim_x(Z_s)$ because

$$\begin{aligned} \dim_x(X_s) &= \dim(\mathcal{O}_{X_s,x}) + \text{trdeg}_{\kappa(s)}(\kappa(x)), \\ \dim_x(Z_s) &= \dim(\mathcal{O}_{Z_s,x}) + \text{trdeg}_{\kappa(s)}(\kappa(x)), \\ \dim(\mathcal{O}_{X_s,x}) &= \dim(\mathcal{O}_{Z_s,x}) + r \end{aligned}$$

the first two equalities by Algebra, Lemma 7.107.3 and the second by r times applying Algebra, Lemma 7.57.11. Hence Divisors, Lemma 26.14.6 part (3) applies to show that (after Zariski shrinking X) the morphism $Z \to X$ is a regular immersion to which Divisors, Lemma 26.14.4 applies (which gives the flatness and the statement on base change). □

Lemma 33.16.3. *Let $f : X \to S$ be a morphism of schemes. Let $x \in X$ be a point with image $s \in S$. Assume*

(1) *f is locally of finite presentation,*
(2) *f is flat at x, and*
(3) *$\mathcal{O}_{X_s,x}$ has depth ≥ 1.*

Then there exists an affine open neighbourhood $U \subset X$ of x and an effective Cartier divisor $D \subset U$ containing x such that $D \to S$ is flat and of finite presentation.

Proof. Pick any $h \in \mathfrak{m}_x \subset \mathcal{O}_{X,x}$ which maps to a nonzero divisor in $\mathcal{O}_{X_s,x}$ and apply Lemma 33.16.1. □

Lemma 33.16.4. *Let $f : X \to S$ be a morphism of schemes. Let $x \in X$ be a point with image $s \in S$. Assume*

(1) *f is locally of finite presentation,*
(2) *f is Cohen-Macaulay at x, and*
(3) *x is a closed point of X_s.*

Then there exists a regular immersion $Z \to X$ containing x such that

(a) *$Z \to S$ is flat and locally of finite presentation,*
(b) *$Z \to S$ is locally quasi-finite, and*
(c) *$Z_s = \{x\}$ set theoretically.*

Proof. We may and do replace S by an affine open neighbourhoof of s. We will prove the lemma for affine S by induction on $d = \dim_x(X_s)$.

The case $d = 0$. In this case we show that we may take Z to be an open neighbourhood of x. (Note that an open immersion is a regular immersion.) Namely, if $d = 0$, then $X \to S$ is quasi-finite at x, see Morphisms, Lemma 24.28.5. Hence there exists an affine open neighbourhood $U \subset X$ such that $U \to S$ is quasi-finite, see Morphisms, Lemma 24.47.2. Thus after replacing X by U we see that the fibre X_s is a finite discrete set. Hence after replacing X by a further affine open neigbourhood of X we see that that $f^{-1}(\{s\}) = \{x\}$ (because the topology on X_s is induced from the topology on X, see Schemes, Lemma 21.18.5). This proves the lemma in this case.

Next, assume $d > 0$. Note that because x is a closed point of its fibre the extension $\kappa(s) \subset \kappa(x)$ is finite (by the Hilbert Nullstellensatz, see Morphisms, Lemma 24.19.3). Thus we see

$$\mathrm{depth}(\mathcal{O}_{X_s,x}) = \dim(\mathcal{O}_{X_s,x}) = d > 0$$

the first equality as $\mathcal{O}_{X_s,x}$ is Cohen-Macaulay and the second by Morphisms, Lemma 24.27.1. Thus we may apply Lemma 33.16.3 to find a diagram

$$\begin{tikzcd} D \arrow[r] \arrow[rrd] & U \arrow[r] \arrow[rd] & X \arrow[d] \\ & & S \end{tikzcd}$$

with $x \in D$. Note that $\mathcal{O}_{D_s,x} = \mathcal{O}_{X_s,x}/(\overline{h})$ for some nonzero divisor $\overline{h}$, see Divisors, Lemma 26.10.1. Hence $\mathcal{O}_{D_s,x}$ is Cohen-Macaulay of dimension one less than the dimension of

$\mathcal{O}_{X_s,x}$, see Algebra, Lemma 7.96.2 for example. Thus the morphism $D \to S$ is flat, locally of finite presentation, and Cohen-Macaulay at x with $\dim_x(D_s) = \dim_x(X_s) - 1 = d - 1$. By induction hypothesis we can find a regular immersion $Z \to D$ having properties (a), (b), (c). As $Z \to D \to U$ are both regular immersions, we see that also $Z \to U$ is a regular immersion by Divisors, Lemma 26.13.7. This finishes the proof. □

Lemma 33.16.5. *Let $f : X \to S$ be a flat morphism of schemes which is locally of finite presentation Let $s \in S$ be a point in the image of f. Then there exists a commutative diagram*

$$\begin{tikzcd} S' \arrow[rr] \arrow[dr, "g"'] & & X \arrow[dl, "f"] \\ & S & \end{tikzcd}$$

where $g : S' \to S$ is flat, locally of finite presentation, locally quasi-finite, and $s \in g(S')$.

Proof. The fibre X_s is not empty by assumption. Hence there exists a closed point $x \in X_s$ where f is Cohen-Macaulay, see Lemma 33.15.4. Apply Lemma 33.16.4 and set $S' = S$. □

The following lemma shows that sheaves for the fppf topology are the same thing as sheaves for the ``quasi-finite, flat, finite presentation" toplogy.

Lemma 33.16.6. *Let S be a scheme. Let $\mathcal{U} = \{S_i \to S\}_{i \in I}$ be an fppf covering of S, see Topologies, Definition 30.5.1. Then there exists an fppf covering $\mathcal{V} = \{T_j \to S\}_{j \in J}$ which refines (see Sites, Definition 9.8.1) $\mathcal{U}$ such that each $T_j \to S$ is locally quasi-finite.*

Proof. For every $s \in S$ there exists an $i \in I$ such that s is in the image of $S_i \to S$. By Lemma 33.16.5 we can find a morphism $g_s : T_s \to S$ such that $s \in g_s(T)_s$ which is flat, locally of finite presentation and locally quasi finite and such that g_s factors through $S_i \to S$. Hence $\{T_s \to S\}$ is the desired covering of S that refines $\mathcal{U}$. □

33.17. Generic fibres

Some results on the relationship between generic fibres and nearby fibres.

Lemma 33.17.1. *Let $f : X \to Y$ be a finite type morphism of schemes. Assume Y irreducible with generic point η. If $X_\eta = \emptyset$ then there exists a nonempty open $V \subset Y$ such that $X_V = V \times_Y X = \emptyset$.*

Proof. Follows immediately from the more general Morphisms, Lemma 24.6.4. □

Lemma 33.17.2. *Let $f : X \to Y$ be a finite type morphism of schemes. Assume Y irreducible with generic point η. If $X_\eta \neq \emptyset$ then there exists a nonempty open $V \subset Y$ such that $X_V = V \times_Y X \to V$ is surjective.*

Proof. This follows, upon taking affine opens, from Algebra, Lemma 7.27.2. (Of course it also follows from generic flatness.) □

Lemma 33.17.3. *Let $f : X \to Y$ be a finite type morphism of schemes. Assume Y irreducible with generic point η. If $Z \subset X$ is a closed subset with Z_η nowhere dense in X_η, then there exists a nonempty open $V \subset Y$ such that Z_y is nowhere dense in X_y for all $y \in V$.*

Proof. Let $Y' \subset Y$ be the reduction of Y. Set $X' = Y' \times_Y X$ and $Z' = Y' \times_Y Z$. As $Y' \to Y$ is a universal homeomorphism by Morphisms, Lemma 24.43.4 we see that it suffices to prove the lemma for $Z' \subset X' \to Y'$. Thus we may assume that Y is integral, see Properties, Lemma 23.3.4. By Morphisms, Proposition 24.26.1 there exists a nonempty affine open $V \subset Y$ such that $X_V \to V$ and $Z_V \to Z$ are flat and of finite presentation. We claim that V works. Pick $y \in V$. If Z_y has a nonempty interior, then Z_y contains a generic point ξ of an irreducible component of X_y. Note that $\eta \rightsquigarrow f(\xi)$. Since $Z_V \to V$ is flat we can choose a specialization $\xi' \rightsquigarrow \xi$, $\xi' \in Z$ with $f(\xi') = \eta$, see Morphisms, Lemma 24.24.8. By Lemma 33.15.6 we see that

$$\dim_{\xi'}(Z_\eta) = \dim_\xi(Z_y) = \dim_\xi(X_y) = \dim_{\xi'}(X_\eta).$$

Hence some irreducible component of Z_η passing through ξ' has dimension $\dim_{\xi'}(X_\eta)$ which contradicts the assumption that Z_η is nowhere dense in X_η and we win. $\square$

Lemma 33.17.4. *Let $f : X \to Y$ be a finite type morphism of schemes. Assume Y irreducible with generic point η. Let $U \subset X$ be an open subscheme such that U_η is scheme theoretically dense in X_η. Then there exists a nonempty open $V \subset Y$ such that U_y is scheme theoretically dense in X_y for all $y \in V$.*

Proof. Let $Y' \subset Y$ be the reduction of Y. Let $X' = Y' \times_Y X$ and $U' = Y' \times_Y U$. As $Y' \to Y$ induces a bijection on points, and as $U' \to U$ and $X' \to X$ induce isomorphisms of scheme theoretic fibres, we may replace Y by Y' and X by X'. Thus we may assume that Y is integral, see Properties, Lemma 23.3.4. We may also replace Y by a nonempty affine open. In other words we may assume that $Y = Spec(A)$ where A is a domain with fraction field K.

As f is of finite type we see that X is quasi-compact. Write $X = X_1 \cup \ldots \cup X_n$ for some affine opens X_i. By Morphisms, Definition 24.5.1 we see that $U_i = X_i \cap U$ is an open subscheme of X_i such that $U_{i,\eta}$ is scheme theoretically dense in $X_{i,\eta}$. Thus it suffices to prove the result for the pairs (X_i, U_i), in other words we may assume that X is affine.

Write $X = Spec(B)$. Note that B_K is Noetherian as it is a finite type K-algebra. Hence U_η is quasi-compact. Thus we can find finitely many $g_1, \ldots, g_m \in B$ such that $D(g_j) \subset U$ and such that $U_\eta = D(g_1)_\eta \cup \ldots \cup D(g_m)_\eta$. The fact that U_η is scheme theoretically dense in X_η means that $B_K \to \bigoplus_j (B_K)_{g_j}$ is injective, see Morphisms, Example 24.5.4. By Algebra, Lemma 7.20.4 this is equivalent to the injectivity of $B_K \to \bigoplus_{j=1,\ldots,m} B_K$, $b \mapsto (g_1 b, \ldots, g_m b)$. Let M be the cokernel of this map over A, i.e., such that we have an exact sequence

$$0 \to I \to B \xrightarrow{(g_1,\ldots,g_m)} \bigoplus\nolimits_{j=1,\ldots,m} B \to M \to 0$$

After replacing A by A_h for some nonzero h we may assume that B is a flat, finitely presented A-algebra, and that M is flat over A, see Algebra, Lemma 7.109.3. The flatness of B over A implies that B is torsion free as an A-module, see More on Algebra, Lemma 12.17.3. Hence $B \subset B_K$. By assumption $I_K = 0$ which implies that $I = 0$ (as $I \subset B \subset B_K$ is a subset of I_K). Hence now we have a short exact sequence

$$0 \to B \xrightarrow{(g_1,\ldots,g_m)} \bigoplus\nolimits_{j=1,\ldots,m} B \to M \to 0$$

with M flat over A. Hence for every homomorphism $A \to \kappa$ where κ is a field, we obtain a short exact sequence

$$0 \to B \otimes_A \kappa \xrightarrow{(g_1\otimes 1,\ldots,g_m\otimes 1)} \bigoplus\nolimits_{j=1,\ldots,m} B \otimes_A \kappa \to M \otimes_A \kappa \to 0$$

see Algebra, Lemma 7.35.11. Reversing the arguments above this means that $\bigcup D(g_j \otimes 1)$ is scheme theoretically dense in $Spec(B \otimes_A \kappa)$. As $\bigcup D(g_j \otimes 1) = \bigcup D(g_j)_\kappa \subset U_\kappa$ we obtain that U_κ is scheme theoretically dense in X_κ which is what we wanted to prove. $\square$

Suppose given a morphism of schemes $f : X \to Y$ and a point $y \in Y$. Recally that the fibre X_y is homeomorphic to the subset $f^{-1}(\{y\})$ of X with induced topology, see Schemes, Lemma 21.18.5. Suppose given a closed subset $T(y) \subset X_y$. Let T be the closure of $T(y)$ in X. Endow T with the induced reduced scheme structure. Then T is a closed subscheme of X with the property that $T_y = T(y)$ set-theoretically. In fact T is the smallest closed subscheme of X with this property. Thus it is ``harmless" to denote a closed subset of X_y by T_y if we so desire. In the following lemma we apply this to the generic fibre of f.

Lemma 33.17.5. *Let $f : X \to Y$ be a finite type morphism of schemes. Assume Y irreducible with generic point η. Let $X_\eta = Z_{1,\eta} \cup \ldots \cup Z_{n,\eta}$ be a covering of the generic fibre by closed subsets of X_η. Let Z_i be the closure of $Z_{i,\eta}$ in X (see discussion above). Then there exists a nonempty open $V \subset Y$ such that $X_y = Z_{1,y} \cup \ldots \cup Z_{n,y}$ for all $y \in V$.*

Proof. If Y is Noetherian then $U = X \setminus (Z_1 \cup \ldots \cup Z_n)$ is of finite type over Y and we can directly apply Lemma 33.17.1 to get that $U_V = \emptyset$ for a nonempty open $V \subset Y$. In general we argue as follows. As the question is topological we may replace Y by its reduction. Thus Y is integral, see Properties, Lemma 23.3.4. After shrinking Y we may assume that $X \to Y$ is flat, see Morphisms, Proposition 24.26.1. In this case every point x in X_y is a specialization of a point $x' \in X_\eta$ by Morphisms, Lemma 24.24.8. As the Z_i are closed in X and cover the generic fibre this implies that $X_y = \bigcup Z_{i,y}$ for $y \in Y$ as desired. $\square$

The following lemma says that generic fibres of morphisms whose source is reduced are reduced.

Lemma 33.17.6. *Let $f : X \to Y$ be a morphism of schemes. Let $\eta \in Y$ be a generic point of an irreducible component of Y. Then $(X_\eta)_{red} = (X_{red})_\eta$.*

Proof. Choose an affine neighbourhood $Spec(A) \subset Y$ of η. Choose an affine open $Spec(B) \subset X$ mapping into $Spec(A)$ via the morphism f. Let $\mathfrak p \subset A$ be the minimal prime corresponding to η. Let B_{red} be the quotient of B by $\sqrt{(0)}$. The algebraic content of the lemma is that $B_{red} \otimes_A \kappa(\mathfrak p)$ is reduced. To prove this, suppose that $x \in B_{red} \otimes_A \kappa(\mathfrak p)$ is nilpotent. Say $x^n = 0$ for some $n > 0$. Pick an $f \in A$, $f \not\in \mathfrak p$ such that fx is the image of $y \in B_{red}$. Then $gy^n \in \mathfrak p B_{red}$ for some $g \in A$, $g \not\in \mathfrak p$. By Algebra, Lemma 7.23.3 we see that $\mathfrak p A_{\mathfrak p}$ is locally nilpotent. By Algebra, Lemma 7.14.1 we see that $\mathfrak p (B_{red})_{\mathfrak p}$ is locally nilpotent. Hence we conclude that gy^n is nilpotent in $(B_{red})_{\mathfrak p}$. Thus there exists a $h \in A$, $h \not\in \mathfrak p$ and an $m > 0$ such that $h(gy^n)^m = 0$ in B_{red}. This implies that hgy is nilpotent in B_{red}, i.e., that $hgy = 0$. Of course this means that $x = 0$ as desired. $\square$

Lemma 33.17.7. *Let $f : X \to Y$ be a morphism of schemes. Assume that Y is irreducible and f is of finite type. There exists a diagram*

$$\begin{tikzcd} X' \arrow[r, "g'"] \arrow[d, "f'"'] & X_V \arrow[r] \arrow[d] & X \arrow[d, "f"] \\ Y' \arrow[r, "g"] & V \arrow[r] & Y \end{tikzcd}$$

where

(1) *V is a nonempty open of Y,*

(2) $X_V = V \times_Y X$,
(3) $g : Y' \to V$ *is a finite universal homeomorphism,*
(4) $X' = (Y' \times_Y X)_{red} = (Y' \times_V X_V)_{red}$,
(5) g' *is a finite universal homeomorphism,*
(6) Y' *is an integral affine scheme,*
(7) f' *is flat and of finite presentation, and*
(8) *the generic fibre of* f' *is geometrically reduced.*

Proof. Let $V = Spec(A)$ be a nonempty affine open of Y. By assumption the radical of A is a prime ideal $\mathfrak{p}$. Let $K = f.f(A/\mathfrak{p})$ be the fraction field. Let p be the characteristic of K if positive and 1 if the characteristic is zero. By Varieties, Lemma 28.4.11 there exists a finite purely inseparable field extension $K \subset K'$ such that $X_{K'}$ is geometrically reduced over K'. Choose elements $x_1, \ldots, x_n \in K'$ which generate K' over K and such that some p-power of x_i is in $A/\mathfrak{p}$. Let $A' \subset K'$ be the finite A-subalgebra of K' generated by $x_1, \ldots, x_n$. Note that A' is a domain with fraction field K'. By Algebra, Lemma 7.43.2 we see that $A \to A'$ is a universal homeomorphism. Set $Y' = Spec(A')$. Set $X' = (Y' \times_Y X)_{red}$. The generic fibre of $X' \to Y'$ is $(X_K)_{red}$ by Lemma 33.17.6 which is geometrically reduced by construction. Note that $X' \to X_V$ is a finite universal homeomorphism as the composition of the reduction morphism $X' \to Y' \times_Y X$ (see Morphisms, Lemma 24.43.4) and the base change of g. At this point all of the properties of the lemma hold except for possibly (7). This can be achieved by shrinking Y' and hence V, see Morphisms, Proposition 24.26.1. □

Lemma 33.17.8. *Let $f : X \to Y$ be a morphism of schemes. Assume that Y is irreducible and f is of finite type. There exists a diagram*

$$\begin{tikzcd} X' \arrow[r, "g'"] \arrow[d, "f'"'] & X_V \arrow[r] \arrow[d] & X \arrow[d, "f"] \\ Y' \arrow[r, "g"] & V \arrow[r] & Y \end{tikzcd}$$

where

(1) V *is a nonempty open of* Y,
(2) $X_V = V \times_Y X$,
(3) $g : Y' \to V$ *is surjective finite étale,*
(4) $X' = Y' \times_Y X = Y' \times_V X_V$,
(5) g' *is surjective finite étale,*
(6) Y' *is an irreducible affine scheme, and*
(7) *all irreducible components of the generic fibre of* f' *are geometrically irreducible.*

Proof. Let $V = Spec(A)$ be a nonempty affine open of Y. By assumption the radical of A is a prime ideal $\mathfrak{p}$. Let $K = f.f(A/\mathfrak{p})$ be the fraction field. By Varieties, Lemma 28.6.14 there exists a finite separable field extension $K \subset K'$ such that all irreducible components of $X_{K'}$ are geometrically irreducible over K'. Choose an element $\alpha \in K'$ which generates K' over K, see Algebra, Lemma 7.38.5. Let $P(T) \in K[T]$ be the minimal polynomial for α over K. After replacing α by $f\alpha$ for some $f \in A$, $f \not\in \mathfrak{p}$ we may assume that there exists a monic polynomial $T^d + a_1T^{d-1} + \ldots + a_d \in A[T]$ which maps to $P(T) \in K[T]$ under the map $A[T] \to K[T]$. Set $A' = A[T]/(P)$. Then $A \to A'$ is a finite free ring map such that there exists a unique prime $\mathfrak{q}$ lying over $\mathfrak{p}$, such that $K = \kappa(\mathfrak{p}) \subset \kappa(\mathfrak{q}) = K'$ is finite separable, and such that $\mathfrak{p}A'_{\mathfrak{q}}$ is the maximal ideal of $A'_{\mathfrak{q}}$. Hence $g : Y' = Spec(A') \to V = Spec(A)$ is étale at $\mathfrak{q}$, see Algebra, Lemma 7.132.7. This means that there exists an open $W \subset Spec(A')$ such that $g|_W : W \to Spec(A)$ is étale. Since g is finite and since $\mathfrak{q}$ is the only point lying over $\mathfrak{p}$ we see that $Z = g(Y' \setminus W)$ is a closed subset of V not containing $\mathfrak{p}$. Hence after replacing V by a principal affine open of V which does not meet Z we obtain that g is finite étale. $\square$

Lemma 33.17.9. *Let S be an integral scheme with generic point η. Let $f : X \to S$ and $g : Y \to S$ be morphisms of schemes such that*

(1) *f, g are locally of finite type,*
(2) *X_η, Y_η are integral with generic points x, y, and*
(3) *$\kappa(x) \cong \kappa(y)$ as $\kappa(\eta)$-extensions.*

Then there exist open subschemes $x \in U \subset X$, $y \in V \subset Y$ and an S-isomorphism $U \to V$ which induces the given isomorphism of residue fields.

Proof. The question is local around the points η, x, y. Hence we may replace S, X, Y by affine neighbourhoods of η, x, y and hence reduce to the case that S, X, Y are affine. Say $S = Spec(R)$ and $X = Spec(A)$, $Y = Spec(B)$. By Algebra, Lemma 7.109.3 we may also assume that A and B are flat and of finite presentation over R. Denote $K = f.f.(R)$. The rings A, B are torsion free as R-modules because A, B are flat over R, see More on Algebra, Lemma 12.17.3. Since $A \otimes_R K$ and $B \otimes_R K$ are domains by assumption it follows that A and B are domains. Set $L = f.f.(A)$ and $M = f.f.(B)$. Let $\varphi : L \to M$ be the given isomorphism of K-extensions.

Choose elements $x_1, \ldots, x_n \in A$ which generate A as an R-algebra, and choose elements $y_1, \ldots, y_m \in B$ which generate B as an R-algebra. Write $\varphi(x_i) = b_i/b$ for some $b, b_i \in B$. In other words, b is a common denominatior for the elements $\varphi(x_i) \in M = f.f.(B)$. Similarly, write $\varphi^{-1}(y_j) = a_j/a$ for some $a, a_j \in A$. Note that $\varphi(a) \in B_b$ because a can be written as a polynomial in the x_i. Similarly we have $\varphi^{-1}(b) \in A_a$. Thus φ gives an isomorphism

$$A_a \longrightarrow B_b$$

of R-algebras and the lemma is proven. $\square$

33.18. Relative assassins

Lemma 33.18.1. *Let $f : X \to S$ be a morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Let $\xi \in Ass_{X/S}(\mathcal{F})$ and set $Z = \overline{\{\xi\}} \subset X$. If f is locally of finite type and $\mathcal{F}$ is a finite type $\mathcal{O}_X$-module, then there exists a nonempty open $V \subset Z$ such that for every $s \in f(V)$ the generic points of V_s are elements of $Ass_{X/S}(\mathcal{F})$.*

Proof. We may replace S by an affine open neighbourhood of $f(\xi)$ and X by an affine open neighbourhood of ξ. Hence we may assume $S = Spec(A)$, $X = Spec(B)$ and that f is given by the finite type ring map $A \to B$, see Morphisms, Lemma 24.14.2. Moreover, we may write $\mathcal{F} = \widetilde{M}$ for some finite B-module M, see Properties, Lemma 23.16.1. Let $\mathfrak{q} \subset B$ be the prime corresponding to ξ and let $\mathfrak{p} \subset A$ be the corresponding prime of A. By assumption $\mathfrak{q} \in \text{Ass}_B(M \otimes_A \kappa(\mathfrak{p}))$, see Algebra, Remark 7.62.6 and Divisors, Lemma 26.2.2. With this notation $Z = V(\mathfrak{q}) \subset Spec(B)$. In particular $f(Z) \subset V(\mathfrak{p})$. Hence clearly it suffices to prove the lemma after replacing A, B, and M by $A/\mathfrak{p}A$, $B/\mathfrak{p}B$, and $M/\mathfrak{p}M$. In other words we may assume that A is a domain with fraction field K and $\mathfrak{q} \subset B$ is an associated prime of $M \otimes_A K$.

At this point we can use generic flatness. Namely, by Algebra, Lemma 7.109.3 there exists a nonzero $g \in A$ such that M_g is flat as an A_g-module. After replacing A by A_g we may assume that M is flat as an A-module.

In this case, by Algebra, Lemma 7.62.4 we see that $\mathfrak{q}$ is also an associated prime of M. Hence we obtain an injective B-module map $B/\mathfrak{q} \to M$. Let Q be the cokernel so that we obtain a short exact sequence

$$0 \to B/\mathfrak{q} \to M \to Q \to 0$$

of finite B-modules. After applying generic flatness Algebra, Lemma 7.109.3 once more, this time to the B-module Q, we may assume that Q is a flat A-module. In particular we may assume the short exact sequence above is universally injective, see Algebra, Lemma 7.35.11. In this situation $(B/\mathfrak{q}) \otimes_A \kappa(\mathfrak{p}') \subset M \otimes_A \kappa(\mathfrak{p}')$ for any prime $\mathfrak{p}'$ of A. The lemma follows as a minimal prime $\mathfrak{q}'$ of the support of $(B/\mathfrak{q}) \otimes_A \kappa(\mathfrak{p}')$ is an associated prime of $(B/\mathfrak{q}) \otimes_A \kappa(\mathfrak{p}')$ by Divisors, Lemma 26.2.8. □

Lemma 33.18.2. *Let $f : X \to Y$ be a morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Let $U \subset X$ be an open subscheme. Assume*

1. *f is of finite type,*
2. *$\mathcal{F}$ is of finite type,*
3. *Y is irreducible with generic point η, and*
4. *$Ass_{X_\eta}(\mathcal{F}_\eta)$ is not contained in U_η.*

Then there exists a nonempty open subscheme $V \subset Y$ such that for all $y \in V$ the set $Ass_{X_y}(\mathcal{F}_y)$ is not contained in U_y.

Proof. Let $\xi \in \text{Ass}_{X_\eta}(\mathcal{F}_\eta)$ be a point which is not contained in U_η. Set $Z = \overline{\{\xi\}}$. By assumption $U \cap Z$ is not dense in the irreducible scheme Z_η. Hence by Lemma 33.17.3 after replacing Y by a nonempty open we may assume that $U_y \cap Z_y$ is nowhere dense in Z_y. On the other hand, by Lemma 33.18.1 there exists a nonempty open $V \subset Z$ such that every generic point of V_y is an associated point of $\mathcal{F}_y$. By Lemma 33.17.2 the set $f(V)$ contains a nonempty open subset of Y and we win. □

Lemma 33.18.3. *Let $f : X \to Y$ be a morphism of schemes. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Let $U \subset X$ be an open subscheme. Assume*

1. *f is of finite type,*
2. *$\mathcal{F}$ is of finite type,*
3. *Y is irreducible with generic point η, and*
4. *$Ass_{X_\eta}(\mathcal{F}_\eta) \subset U_\eta$.*

Then there exists a nonempty open subscheme $V \subset Y$ such that for all $y \in V$ we have $Ass_{X_y}(\mathcal{F}_y) \subset U_y$.

Proof. (This proof is the same as the proof of Lemma 33.17.4. We urge the reader to read that proof first.) Since the statement is about fibres it is clear that we may replace Y by its reduction. Hence we may assume that Y is integral, see Properties, Lemma 23.3.4. We may also assume that $Y = Spec(A)$ is affine. Then A is a domain with fraction field K.

As f is of finite type we see that X is quasi-compact. Write $X = X_1 \cup \ldots \cup X_n$ for some affine opens X_i and set $\mathcal{F}_i = \mathcal{F}|_{X_i}$. By assumption the generic fibre of $U_i = X_i \cap U$ contains $\text{Ass}_{X_{i,\eta}}(\mathcal{F}_{i,\eta})$. Thus it suffices to prove the result for the triples $(X_i, \mathcal{F}_i, U_i)$, in other words we may assume that X is affine.

Write $X = Spec(B)$. Let N be a finite B-module such that $\mathcal{F} = \widetilde{N}$. Note that B_K is Noetherian as it is a finite type K-algebra. Hence U_η is quasi-compact. Thus we can find finitely many $g_1, \ldots, g_m \in B$ such that $D(g_j) \subset U$ and such that $U_\eta = D(g_1)_\eta \cup \ldots \cup D(g_m)_\eta$.

Since $\text{Ass}_{X_\eta}(\mathcal{F}_\eta) \subset U_\eta$ we see that $N_K \to \bigoplus_j (N_K)_{g_j}$ is injective. By Algebra, Lemma 7.20.4 this is equivalent to the injectivity of $N_K \to \bigoplus_{j=1,\ldots,m} N_K$, $n \mapsto (g_1 n, \ldots, g_m n)$. Let I and M be the kernel and cokernel of this map over A, i.e., such that we have an exact sequence

$$0 \to I \to N \xrightarrow{(g_1,\ldots,g_m)} \bigoplus\nolimits_{j=1,\ldots,m} N \to M \to 0$$

After replacing A by A_h for some nonzero h we may assume that B is a flat, finitely presented A-algebra and that both M and N are flat over A, see Algebra, Lemma 7.109.3. The flatness of N over A implies that N is torsion free as an A-module, see More on Algebra, Lemma 12.17.3. Hence $N \subset N_K$. By construction $I_K = 0$ which implies that $I = 0$ (as $I \subset N \subset N_K$ is a subset of I_K). Hence now we have a short exact sequence

$$0 \to N \xrightarrow{(g_1,\ldots,g_m)} \bigoplus\nolimits_{j=1,\ldots,m} N \to M \to 0$$

with M flat over A. Hence for every homomorphism $A \to \kappa$ where κ is a field, we obtain a short exact sequence

$$0 \to N \otimes_A \kappa \xrightarrow{(g_1\otimes 1,\ldots,g_m\otimes 1)} \bigoplus\nolimits_{j=1,\ldots,m} N \otimes_A \kappa \to M \otimes_A \kappa \to 0$$

see Algebra, Lemma 7.35.11. Reversing the arguments above this means that $\bigcup D(g_j \otimes 1)$ contains $\text{Ass}_{B\otimes_A\kappa}(N \otimes_A \kappa)$. As $\bigcup D(g_j \otimes 1) = \bigcup D(g_j)_\kappa \subset U_\kappa$ we obtain that U_κ contains $\text{Ass}_{X\otimes\kappa}(\mathcal{F} \otimes \kappa)$ which is what we wanted to prove. $\square$

Lemma 33.18.4. *Let $f : X \to S$ be a morphism which is locally of finite type. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module of finite type. Let $U \subset X$ be an open subscheme. Let $g : S' \to S$ be a morphism of schemes, let $f' : X' = X_{S'} \to S'$ be the base change of f, let $g' : X' \to X$ be the projection, set $\mathcal{F}' = (g')^*\mathcal{F}$, and set $U' = (g')^{-1}(U)$. Finally, let $s' \in S'$ with image $s = g(s')$. In this case*

$$Ass_{X_s}(\mathcal{F}_s) \subset U_s \Leftrightarrow Ass_{X'_{s'}}(\mathcal{F}'_{s'}) \subset U'_{s'}.$$

Proof. This follows immediately from Divisors, Lemma 26.7.2. See also Divisors, Remark 26.7.3. $\square$

Lemma 33.18.5. *Let $f : X \to Y$ be a morphism of finite presentation. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module of finite presentation. Let $U \subset X$ be an open subscheme such that $U \to Y$ is quasi-compact. Then the set*

$$E = \{y \in Y \mid Ass_{X_y}(\mathcal{F}_y) \subset U_y\}$$

is locally constructible in Y.

Proof. Let $y \in Y$. We have to show that there exists an open neighbourhood V of y in Y such that $E \cap V$ is constructible in V. Thus we may assume that Y is affine. Write $Y = Spec(A)$ and $A = colim\, A_i$ as a directed limit of finite type $\mathbf{Z}$-algebras. By Limits, Lemma 27.6.1 we can find an i and a morphism $f_i : X_i \to Spec(A_i)$ of finite presentation whose base change to Y recovers f. After possibly increasing i we may assume there exists a quasi-coherent $\mathcal{O}_{X_i}$-module $\mathcal{F}_i$ of finite presentation whose pullback to X is isomorphic to $\mathcal{F}$, see Limits, Lemma 27.6.8. After possibly increasing i one more time we may assume there exists an open subscheme $U_i \subset X_i$ whose inverse image in X is U, see Limits, Lemma 27.3.5. By Lemma 33.18.4 it suffices to prove the lemma for f_i. Thus we reduce to the case where Y is the spectrum of a Noetherian ring.

We will use the criterion of Topology, Lemma 5.11.3 to prove that E is constructible in case Y is a Noetherian scheme. To see this let $Z \subset Y$ be an irreducible closed subscheme. We have to show that $E \cap Z$ either contains a nonempty open subset or is not dense in Z. This follows from Lemmas 33.18.2 and 33.18.3 applied to the base change $(X, \mathcal{F}, U) \times_Y Z$ over Z. ☐

33.19. Reduced fibres

Lemma 33.19.1. *Let $f : X \to Y$ be a morphism of schemes. Assume Y irreducible with generic point η and f of finite type. If X_η is nonreduced, then there exists a nonempty open $V \subset Y$ such that for all $y \in V$ the fibre X_y is nonreduced.*

Proof. Let $Y' \subset Y$ be the reduction of Y. Let $X' \to Y'$ be the base change of f. Note that $Y' \to Y$ induces a bijection on points and that $X' \to X$ identifies fibres. Hence we may assume that Y' is reduced, i.e., integral, see Properties, Lemma 23.3.4. We may also replace Y by an affine open. Hence we may assume that $Y = Spec(A)$ with A a domain. Denote $K = f.f.(A)$ the fraction field of A. Pick an affine open $Spec(B) = U \subset X$ and a section $h_\eta \in \Gamma(U_\eta, \mathcal{O}_{U_\eta}) = B_K$ which is nonzero and nilpotent. After shrinking Y we may assume that h comes from $h \in \Gamma(U, \mathcal{O}_U) = B$. After shrinking Y a bit more we may assume that h is nilpotent. Let $I = \{b \in B \mid hb = 0\}$ be the annihilator of h. Then $C = B/I$ is a finite type A-algebra whose generic fiber $(B/I)_K$ is nonzero (as $h_\eta \neq 0$). We apply generic flatness to $A \to C$ and $A \to B/hB$, see Algebra, Lemma 7.109.3, and we obtain a $g \in A$, $g \neq 0$ such that C_g is free as an A_g-module and $(B/hB)_g$ is flat as an A_g-module. Replace Y by $D(g) \subset Y$. Now we have the short exact sequence

$$0 \to C \to B \to B/hB \to 0.$$

with B/hB flat over A and with C nonzero free as an A-module. It follows that for any homomorphism $A \to \kappa$ to a field the ring $C \otimes_A \kappa$ is nonzero and the sequence

$$0 \to C \otimes_A \kappa \to B \otimes_A \kappa \to B/hB \otimes_A \kappa \to 0$$

is exact, see Algebra, Lemma 7.35.11. Note that $B/hB \otimes_A \kappa = (B \otimes_A \kappa)/h(B \otimes_A \kappa)$ by right exactness of tensor product. Thus we conclude that multiplication by h is not zero on $B \otimes_A \kappa$. This clearly means that for any point $y \in Y$ the element h restricts to a nonzero element of U_y, whence X_y is nonreduced. ☐

Lemma 33.19.2. *Let $f : X \to Y$ be a morphism of schemes. Let $g : Y' \to Y$ be any morphism, and denote $f' : X' \to Y'$ the base change of f. Then*

$$\{y' \in Y' \mid X'_{y'} \textit{ is geometrically reduced}\}$$
$$= g^{-1}(\{y \in Y \mid X_y \textit{ is geometrically reduced}\}).$$

Proof. This comes down to the statement that for $y' \in Y'$ with image $y \in Y$ the fibre $X'_{y'} = X_y \times_y y'$ is geometrically reduced over $\kappa(y')$ if and only if X_y is geometrically reduced over $\kappa(y)$. This follows from Varieties, Lemma 28.4.6. ☐

Lemma 33.19.3. *Let $f : X \to Y$ be a morphism of schemes. Assume Y irreducible with generic point η and f of finite type. If X_η is not geometrically reduced, then there exists a nonempty open $V \subset Y$ such that for all $y \in V$ the fibre X_y is not geometrically reduced.*

Proof. Apply Lemma 33.17.7 to get

$$\begin{tikzcd} X' \arrow[r, "g'"] \arrow[d, "f'"'] & X_V \arrow[r] \arrow[d] & X \arrow[d, "f"] \\ Y' \arrow[r, "g"] & V \arrow[r] & Y \end{tikzcd}$$

with all the properties mentioned in that lemma. Let η' be the generic point of Y'. Consider the morphism $X' \to X_{Y'}$ (which is the reduction morphism) and the resulting morphism of generic fibres $X'_{\eta'} \to X_{\eta'}$. Since $X'_{\eta'}$ is geometrically reduced, and X_η is not this cannot be an isomorphism, see Varieties, Lemma 28.4.6. Hence $X_{\eta'}$ is nonreduced. Hence by Lemma 33.19.1 the fibres of $X_{Y'} \to Y'$ are nonreduced at all points $y' \in V'$ of a nonempty open $V' \subset Y'$. Since $g : Y' \to V$ is a homeomorphism Lemma 33.19.2 proves that $g(V')$ is the open we are looking for. $\square$

Lemma 33.19.4. *Let $f : X \to Y$ be a morphism of schemes. Assume*

(1) *Y is irreducible with generic point η,*
(2) *X_η is geometrically reduced, and*
(3) *f is of finite type.*

Then there exists a nonempty open subscheme $V \subset Y$ such that $X_V \to V$ has geometrically reduced fibres.

Proof. Let $Y' \subset Y$ be the reduction of Y. Let $X' \to Y'$ be the base change of f. Note that $Y' \to Y$ induces a bijection on points and that $X' \to X$ identifies fibres. Hence we may assume that Y' is reduced, i.e., integral, see Properties, Lemma 23.3.4. We may also replace Y by an affine open. Hence we may assume that $Y = Spec(A)$ with A a domain. Denote $K = f.f.(A)$ the fraction field of A. After shrinking Y a bit we may also assume that $X \to Y$ is flat and of finite presentation, see Morphisms, Proposition 24.26.1.

As X_η is geometrically reduced there exists an open dense subset $V \subset X_\eta$ such that $V \to Spec(K)$ is smooth, see Varieties, Lemma 28.15.7. Let $U \subset X$ be the set of points where f is smooth. By Morphisms, Lemma 24.33.15 we see that $V \subset U_\eta$. Thus the generic fibre of U is dense in the generic fibre of X. Since X_η is reduced, it follows that U_η is scheme theoretically dense in X_η, see Morphisms, Lemma 24.5.8. We note that as $U \to Y$ is smooth all the fibres of $U \to Y$ are geometrically reduced. Thus it suffices to show that, after shrinking Y, for all $y \in Y$ the scheme U_y is scheme theoretically dense in X_y, see Morphisms, Lemma 24.5.9. This follows from Lemma 33.17.4. $\square$

Lemma 33.19.5. *Let $f : X \to Y$ be a morphism of finite presentation. Then the set*

$$E = \{y \in Y \mid X_y \text{ is geometrically reduced}\}$$

is locally constructible in Y.

Proof. Let $y \in Y$. We have to show that there exists an open neighbourhood V of y in Y such that $E \cap V$ is constructible in V. Thus we may assume that Y is affine. Write $Y = Spec(A)$ and $A = colim\, A_i$ as a directed limit of finite type $\mathbf{Z}$-algebras. By Limits, Lemma 27.6.1 we can find an i and a morphism $f_i : X_i \to Spec(A_i)$ of finite presentation whose base change to Y recovers f. By Lemma 33.19.2 it suffices to prove the lemma for f_i. Thus we reduce to the case where Y is the spectrum of a Noetherian ring.

We will use the criterion of Topology, Lemma 5.11.3 to prove that E is constructible in case Y is a Noetherian scheme. To see this let $Z \subset Y$ be an irreducible closed subscheme.

We have to show that $E \cap Z$ either contains a nonempty open subset or is not dense in Z. If X_ξ is geometrically reduced, then Lemma 33.19.4 (applied to the morphism $X_Z \to Z$) implies that all fibres X_y are geometrically reduced for a nonempty open $V \subset Z$. If X_ξ is not geometrically reduced, then Lemma 33.19.3 (applied to the morphism $X_Z \to Z$) implies that all fibres X_y are geometrically reduced for a nonempty open $V \subset Z$. Thus we win. □

33.20. Irreducible components of fibres

Lemma 33.20.1. *Let $f : X \to Y$ be a morphism of schemes. Assume Y irreducible with generic point η and f of finite type. If X_η has n irreducible components, then there exists a nonempty open $V \subset Y$ such that for all $y \in V$ the fibre X_y has at least n irreducible components.*

Proof. As the question is purely topological we may replace X and Y by their reductions. In particular this implies that Y is integral, see Properties, Lemma 23.3.4. Let $X_\eta = X_{1,\eta} \cup \ldots \cup X_{n,\eta}$ be the decomposition of X_η into irreducible components. Let $X_i \subset X$ be the reduced closed subscheme whose generic fibre is $X_{i,\eta}$. Note that $Z_{i,j} = X_i \cap X_j$ is a closed subset of X_i whose generic fibre $Z_{i,j,\eta}$ is nowhere dense in $X_{i,\eta}$. Hence after shrinking Y we may assume that $Z_{i,j,y}$ is nowhere dense in $X_{i,y}$ for every $y \in Y$, see Lemma 33.17.3. After shrinking Y some more we may assume that $X_y = \bigcup X_{i,y}$ for $y \in Y$, see Lemma 33.17.5. Moreover, after shrinking Y we may assume that each $X_i \to Y$ is flat and of finite presentation, see Morphisms, Proposition 24.26.1. The morphisms $X_i \to Y$ are open, see Morphisms, Lemma 24.24.9. Thus there exists an open neighbourhood V of η which is contained in $f(X_i)$ for each i. For each $y \in V$ the schemes $X_{i,y}$ are nonempty closed subsets of X_y, we have $X_y = \bigcup X_{i,y}$ and the intersections $Z_{i,j,y} = X_{i,y} \cap X_{j,y}$ are not dense in $X_{i,y}$. Clearly this implies that X_y has at least n irreducible components. □

Lemma 33.20.2. *Let $f : X \to Y$ be a morphism of schemes. Let $g : Y' \to Y$ be any morphism, and denote $f' : X' \to Y'$ the base change of f. Then*

$$\begin{aligned} & \{y' \in Y' \mid X'_{y'} \text{ is geometrically irreducible}\} \\ = {} & g^{-1}(\{y \in Y \mid X_y \text{ is geometrically irreducible}\}). \end{aligned}$$

Proof. This comes down to the statement that for $y' \in Y'$ with image $y \in Y$ the fibre $X'_{y'} = X_y \times_y y'$ is geometrically irreducible over $\kappa(y')$ if and only if X_y is geometrically irreducible over $\kappa(y)$. This follows from Varieties, Lemma 28.6.2. □

Lemma 33.20.3. *Let $f : X \to Y$ be a morphism of schemes. Let*

$$n_{X/Y} : Y \to \{0, 1, 2, 3, \ldots, \infty\}$$

be the function which associates to $y \in Y$ the number of irreducible components of $(X_y)_K$ where K is a separably closed extension of $\kappa(y)$. This is well defined and if $g : Y' \to Y$ is a morphism then

$$n_{X'/Y'} = n_{X/Y} \circ g$$

where $X' \to Y'$ is the base change of f.

Proof. Suppose that $y' \in Y'$ has image $y \in Y$. Suppose $K \supset \kappa(y)$ and $K' \supset \kappa(y')$ are separably closed extensions. Then we may choose a commutative diagram

$$\begin{tikzcd} K \arrow[r] & K'' & K' \arrow[l] \\ \kappa(y) \arrow[u] \arrow[rr] & & \kappa(y') \arrow[u] \end{tikzcd}$$

of fields. The result follows as the morphisms of schemes

$$(X'_{y'})_{K'} \longleftarrow (X'_{y'})_{K''} = (X_y)_{K''} \longrightarrow (X_y)_K$$

induce bijections between irreducible components, see Varieties, Lemma 28.6.7. □

Lemma 33.20.4. *Let A be a domain with fraction field K. Let $P \in A[x_1, \ldots, x_n]$. Denote $\overline{K}$ the algebraic closure of K. Assume P is irreducible in $\overline{K}[x_1, \ldots, x_n]$. Then there exists a $f \in A$ such that $P^\varphi \in \kappa[x_1, \ldots, x_n]$ is irreducible for all homomorphisms $\varphi : A_f \to \kappa$ into fields.*

Proof. There exists an automorphism Ψ of $A[x_1, \ldots, x_n]$ over A such that $\Psi(P) = ax_n^d +$ lower order terms in x_n with $a \neq 0$, see Algebra, Lemma 7.106.2. We may replace P by $\Psi(P)$ and we may replace A by A_a. Thus we may assume that P is monic in x_n of degree $d > 0$. For $i = 1, \ldots, n-1$ let d_i be the degree of P in x_i. Note that this implies that P^φ is monic of degree d in x_n and has degree $\leq d_i$ in x_i for every homomorphism $\varphi : A \to \kappa$ where κ is a field. Thus if P^φ is reducible, then we can write

$$P^\varphi = Q_1 Q_2$$

with Q_1, Q_2 monic of degree $e_1, e_2 \geq 0$ in x_n with $e_1 + e_2 = d$ and having degree $\leq d_i$ in x_i for $i = 1, \ldots, n-1$. In other words we can write

$$Q_j = x_n^{e_j} + \sum\nolimits_{0 \leq l < e_j} \left(\sum\nolimits_{L \in \mathcal{L}} a_{j,l,L} x^L \right) x_n^l \quad (33.20.4.1)$$

where the sum is over the set $\mathcal{L}$ of multi-indices L of the form $L = (l_1, \ldots, l_{n-1})$ with $0 \leq l_i \leq d_i$. For any $e_1, e_2 \geq 0$ with $e_1 + e_2 = d$ we consider the A-algebra

$$B_{e_1,e_2} = A[\{a_{1,l,L}\}_{0 \leq l < e_1, L \in \mathcal{L}}, \{a_{2,l,L}\}_{0 \leq l < e_2, L \in \mathcal{L}}]/(\text{relations})$$

where the (relations) is the ideal generated by the coefficients of the polynomial

$$P - Q_1 Q_2 \in A[\{a_{1,l,L}\}_{0 \leq l < e_1, L \in \mathcal{L}}, \{a_{2,l,L}\}_{0 \leq l < e_2, L \in \mathcal{L}}][x_1, \ldots, x_n]$$

with Q_1 and Q_2 defined as in (33.20.4.1). OK, and the assumption that P is irreducible over $\overline{K}$ implies that there does not exist any A-algebra homomorphism $B_{e_1,e_2} \to \overline{K}$. By the Hilbert Nullstellensatz, see Algebra, Theorem 7.30.1 this means that $B_{e_1,e_2} \otimes_A K = 0$. As B_{e_1,e_2} is a finitely generated A-algebra this signifies that we can find an $f_{e_1,e_2} \in A$ such that $(B_{e_1,e_2})_{f_{e_1,e_2}} = 0$. By construction this means that if $\varphi : A_{f_{e_1,e_2}} \to \kappa$ is a homomorphism to a field, then P^φ does not have a factorization $P^\varphi = Q_1 Q_2$ with Q_1 of degree e_1 in x_n and Q_2 of degree e_2 in x_n. Thus taking $f = \prod_{e1,e_2 \geq 0, e_1+e_2=d} f_{e_1,e_2}$ we win. □

Lemma 33.20.5. *Let $f : X \to Y$ be a morphism of schemes. Assume*

1. *Y is irreducible with generic point η,*
2. *X_η is geometrically irreducible, and*
3. *f is of finite type.*

Then there exists a nonempty open subscheme $V \subset Y$ such that $X_V \to V$ has geometrically irreducible fibres.

First proof of Lemma 33.20.5. We give two proofs of the lemma. These are essentially equivalent; the second is more self contained but a bit longer. Choose a diagram

$$\begin{tikzcd} X' \arrow[r, "g'"] \arrow[d, "f'"'] & X_V \arrow[r] \arrow[d] & X \arrow[d, "f"] \\ Y' \arrow[r, "g"] & V \arrow[r] & Y \end{tikzcd}$$

as in Lemma 33.17.7. Note that the generic fibre of f' is the reduction of the geometric fibre of f (see Lemma 33.17.6) and hence is geometrically irreducible. Suppose that the lemma holds for the morphism f'. Then after shrinking V all the fibres of f' are geometrically irreducible. As $X' = (Y' \times_V X_V)_{red}$ this implies that all the fibres of $Y' \times_V X_V$ are geometrically irreducible. Hence by Lemma 33.20.2 all the fibres of $X_V \to V$ are geometrically irreducible and we win. In this way we see that we may assume that the generic fibre is geometrically reduced as well as geometrically irreducible and we may assume $Y = Spec(A)$ with A a domain.

Let $x \in X_\eta$ be the generic point. As X_η is geometrically irreducible and reduced we see that $L = \kappa(x)$ is a finitely generated extension of $K = \kappa(\eta) = f.f.(A)$ which is geometrically reduced and geometrically irreducible, see Varieties, Lemmas 28.4.2 and 28.6.6. In particular the field extension $K \subset L$ is separable, see Algebra, Lemma 7.41.1. Hence we can find $x_1, \ldots, x_{r+1} \in L$ which generate L over K and such that $x_1, \ldots, x_r$ is a transcendence basis for L over K, see Algebra, Lemma 7.39.3. Let $P \in K(x_1, \ldots, x_r)[T]$ be the minimal polynomial for x_{r+1}. Clearing denominators we may assume that P has coefficients in $A[x_1, \ldots, x_r]$. Note that as L is geometrically reduced and geometrically irreducible over K, the polynomial P is irreducible in $\overline{K}[x_1, \ldots, x_r, T]$ where $\overline{K}$ is the algebraic closure of K. Denote

$$B' = A[x_1, \ldots, x_{r+1}]/(P(x_{r+1}))$$

and set $X' = Spec(B')$. By construction the fraction field of B' is isomorphic to $L = \kappa(x)$ as K-extensions. Hence there exists an open $U \subset X$, and open $U' \subset X'$ and a Y-isomorphism $U \to U'$, see Lemma 33.17.9. Here is a diagram:

$$\begin{tikzcd} X \arrow[dr] & U \arrow[l] \arrow[r, equal] \arrow[d] & U' \arrow[r] \arrow[d] & X' \arrow[r, equal] \arrow[dl] & Spec(B') \\ & Y \arrow[r, equal] & Y & & \end{tikzcd}$$

Note that $U_\eta \subset X_\eta$ and $U'_\eta \subset X'_\eta$ are dense opens. Thus after shrinking Y by applying Lemma 33.17.3 we obtain that U_y is dense in X_y and U'_y is dense in X'_y for all $y \in Y$. Thus it suffices to prove the lemma for $X' \to Y$ which is the content of Lemma 33.20.4. $\square$

Second proof of Lemma 33.20.5. Let $Y' \subset Y$ be the reduction of Y. Let $X' \to X$ be the reduction of X. Note that $X' \to X \to Y$ factors through Y', see Schemes, Lemma 21.12.6. As $Y' \to Y$ and $X' \to X$ are universal homeomorphisms by Morphisms, Lemma 24.43.4 we see that it suffices to prove the lemma for $X' \to Y'$. Thus we may assume that X and Y are reduced. In particular Y is integral, see Properties, Lemma 23.3.4. Thus by Morphisms, Proposition 24.26.1 there exists a nonempty affine open $V \subset Y$ such that $X_V \to V$ is flat and of finite presentation. After replacing Y by V we may assume, in addition to (1), (2), (3) that Y is integral affine, X is reduced, and f is flat and of finite presentation. In particular f is universally open, see Morphisms, Lemma 24.24.9.

Pick a nonempty affine open $U \subset X$. Then $U \to Y$ is flat and of finite presentation with geometrically irreducible generic fibre. The complement $X_\eta \setminus U_\eta$ is nowhere dense. Thus after shrinking Y we may assume $U_y \subset X_y$ is open dense for all $y \in Y$, see Lemma 33.17.3. Thus we may replace X by U and we reduce to the case where Y is integral affine and X is reduced affine, flat and of finite presentation over Y with geometrically irreducible generic fibre X_η.

Write $X = Spec(B)$ and $Y = Spec(A)$. Then A is a domain, B is reduced, $A \to B$ is flat of finite presentation, and B_K is geometrically irreducible over $K = f.f.(A)$. In particular we see that B_K is a domain. Let $L = f.f.(B_K)$ be its fraction field. Note that L is a finitely generated field extension of K as B is an A-algebra of finite presentation. Let $K \subset K'$ be a finite purely inseparable extension such that $(L \otimes_K K')_{red}$ is a separably generated field extension, see Algebra, Lemma 7.42.3. Choose $x_1, \ldots, x_n \in K'$ which generate the field extension K' over K, and such that $x_i^{q_i} \in A$ for some prime power q_i (proof existence x_i omitted). Let A' be the A-subalgebra of K' generated by $x_1, \ldots, x_n$. Then A' is a finite A-subalgebra $A' \subset K'$ whose fraction field is K'. Note that $Spec(A') \to Spec(A)$ is a universal homeomorphism, see Algebra, Lemma 7.43.2. Hence it suffices to prove the result after base changing to $Spec(A')$. We are going to replace A by A' and B by $(B \otimes_A A')_{red}$ to arrive at the situation where L is a separably generated field extension of K. Of course it may happen that $(B \otimes_A A')_{red}$ is no longer flat, or of finite presentation over A', but this can be remedied by replacing A' by A'_f for a suitable $f \in A'$, see Algebra, Lemma 7.109.3.

At this point we know that A is a domain, B is reduced, $A \to B$ is flat and of finite presentation, B_K is a domain, and $L = f.f.(B_K)$ is a separably generated field extension of $K = f.f.(A)$. By Algebra, Lemma 7.39.3 we may write $L = K(x_1, \ldots, x_{r+1})$ where $x_1, \ldots, x_r$ are algebraically independent over K, and x_{r+1} is separable over $K(x_1, \ldots, x_r)$. After clearing denominators we may assume that the minimal polynomial $P \in K(x_1, \ldots, x_r)[T]$ of x_{r+1} over $K(x_1, \ldots, x_r)$ has coefficients in $A[x_1, \ldots, x_r]$. Note that since L/K is separable and since L is geometrically irreducible over K, the polynomial P is irreducible over the algebraic closure $\overline{K}$ of K. Denote

$$B' = A[x_1, \ldots, x_{r+1}]/(P(x_{r+1})).$$

By construction the fraction fields of B and B' are isomorphic as K-extensions. Hence there exists an isomorphism of A-algebras $B_h \cong B'_{h'}$ for suitable $h \in B$ and $h' \in B'$, see Lemma 33.17.9. In other words X and $X' = Spec(B')$ have a common affine open U. Here is a diagram:

$$\begin{tikzcd}
X = Spec(B) \arrow[dr] & U \arrow[l] \arrow[r] \arrow[d] & Spec(B') = X' \arrow[dl] \\
 & Y = Spec(A) &
\end{tikzcd}$$

After shrinking Y once more (by applying Lemma 33.17.3 to $Z = X \setminus U$ in X and $Z' = X' \setminus U$ in X') we see that U_y is dense in X_y and U_y is dense in X'_y for all $y \in Y$. Thus it suffices to prove the lemma for $X' \to Y$ which is the content of Lemma 33.20.4. □

Lemma 33.20.6. *Let $f : X \to Y$ be a morphism of schemes. Let $n_{X/Y}$ be the function on Y counting the numbers of geometrically irreducible components of fibres of f introduced in*

Lemma 33.20.3. Assume f of finite type. Let $y \in Y$ be a point. Then there exists a nonempty open $V \subset \overline{\{y\}}$ such that $n_{X/Y}|_V$ is constant.

Proof. Let Z be the reduced induced scheme structure on $\overline{\{y\}}$. Let $f_Z : X_Z \to Z$ be the base change of f. Clearly it suffices to prove the lemma for f_Z and the generic point of Z. Hence we may assume that Y is an integral scheme, see Properties, Lemma 23.3.4. Our goal in this case is to produce a nonempty open $V \subset Y$ such that $n_{X/Y}|_V$ is constant.

We apply Lemma 33.17.8 to $f : X \to Y$ and we get $g : Y' \to V \subset Y$. As $g : Y' \to V$ is surjective finite étale, in particular open (see Morphisms, Lemma 24.35.13), it suffices to prove that there exists an open $V' \subset Y'$ such that $n_{X'/Y'}|_{V'}$ is constant, see Lemma 33.20.3. Thus we see that we may assume that all irreducible components of the generic fibre X_η are geometrically irreducible over $\kappa(\eta)$.

At this point suppose that $X_\eta = X_{1,\eta} \bigcup \ldots \bigcup X_{n,\eta}$ is the decomposition of the generic fibre into (geometrically) irreducible components. In particular $n_{X/Y}(\eta) = n$. Let X_i be the closure of $X_{i,\eta}$ in X. After shrinking Y we may assume that $X = \bigcup X_i$, see Lemma 33.17.5. After shrinking Y some more we see that each fibre of f has at least n irreducible components, see Lemma 33.20.1. Hence $n_{X/Y}(y) \geq n$ for all $y \in Y$. After shrinking Y some more we obtain that $X_{i,y}$ is geometrically irreducible for each i and all $y \in Y$, see Lemma 33.20.5. Since $X_y = \bigcup X_{i,y}$ this shows that $n_{X/Y}(y) \leq n$ and finishes the proof. □

Lemma 33.20.7. *Let $f : X \to Y$ be a morphism of schemes. Let $n_{X/Y}$ be the function on Y counting the numbers of geometrically irreducible components of fibres of f introduced in Lemma 33.20.3. Assume f of finite presentation. Then the level sets*

$$E_n = \{y \in Y \mid n_{X/Y}(y) = n\}$$

of $n_{X/Y}$ are locally constructible in Y.

Proof. Fix n. Let $y \in Y$. We have to show that there exists an open neighbourhood V of y in Y such that $E_n \cap V$ is constructible in V. Thus we may assume that Y is affine. Write $Y = Spec(A)$ and $A = colim\, A_i$ as a directed limit of finite type $\mathbf{Z}$-algebras. By Limits, Lemma 27.6.1 we can find an i and a morphism $f_i : X_i \to Spec(A_i)$ of finite presentation whose base change to Y recovers f. By Lemma 33.20.3 it suffices to prove the lemma for f_i. Thus we reduce to the case where Y is the spectrum of a Noetherian ring.

We will use the criterion of Topology, Lemma 5.11.3 to prove that E_n is constructible in case Y is a Noetherian scheme. To see this let $Z \subset Y$ be an irreducible closed subscheme. We have to show that $E_n \cap Z$ either contains a nonempty open subset or is not dense in Z. Let $\xi \in Z$ be the generic point. Then Lemma 33.20.6 shows that $n_{X/Y}$ is constant in a neighbourhood of ξ in Z. This clearly implies what we want. □

33.21. Connected components of fibres

Lemma 33.21.1. *Let $f : X \to Y$ be a morphism of schemes. Assume Y irreducible with generic point η and f of finite type. If X_η has n connected components, then there exists a nonempty open $V \subset Y$ such that for all $y \in V$ the fibre X_y has at least n connected components.*

Proof. As the question is purely topological we may replace X and Y by their reductions. In particular this implies that Y is integral, see Properties, Lemma 23.3.4. Let $X_\eta = X_{1,\eta} \cup \ldots \cup X_{n,\eta}$ be the decomposition of X_η into connected components. Let $X_i \subset X$ be the reduced closed subscheme whose generic fibre is $X_{i,\eta}$. Note that $Z_{i,j} = X_i \cap X_j$ is a closed subset of

X whose generic fibre $Z_{i,j,\eta}$ is empty. Hence after shrinking Y we may assume that $Z_{i,j} = \emptyset$, see Lemma 33.17.1. After shrinking Y some more we may assume that $X_y = \bigcup X_{i,y}$ for $y \in Y$, see Lemma 33.17.5. Moreover, after shrinking Y we may assume that each $X_i \to Y$ is flat and of finite presentation, see Morphisms, Proposition 24.26.1. The morphisms $X_i \to Y$ are open, see Morphisms, Lemma 24.24.9. Thus there exists an open neighbourhood V of η which is contained in $f(X_i)$ for each i. For each $y \in V$ the schemes $X_{i,y}$ are nonempty closed subsets of X_y, we have $X_y = \bigcup X_{i,y}$ and the intersections $Z_{i,j,y} = X_{i,y} \cap X_{j,y}$ are empty! Clearly this implies that X_y has at least n connected components. □

Lemma 33.21.2. *Let $f : X \to Y$ be a morphism of schemes. Let $g : Y' \to Y$ be any morphism, and denote $f' : X' \to Y'$ the base change of f. Then*

$$\begin{aligned} &\{y' \in Y' \mid X'_{y'} \text{ is geometrically connected}\} \\ &= g^{-1}(\{y \in Y \mid X_y \text{ is geometrically connected}\}). \end{aligned}$$

Proof. This comes down to the statement that for $y' \in Y'$ with image $y \in Y$ the fibre $X'_{y'} = X_y \times_y y'$ is geometrically connected over $\kappa(y')$ if and only if X_y is geometrically connected over $\kappa(y)$. This follows from Varieties, Lemma 28.5.3. □

Lemma 33.21.3. *Let $f : X \to Y$ be a morphism of schemes. Let*

$$n_{X/Y} : Y \to \{0, 1, 2, 3, \ldots, \infty\}$$

be the function which associates to $y \in Y$ the number of connected components of $(X_y)_K$ where K is a separably closed extension of $\kappa(y)$. This is well defined and if $g : Y' \to Y$ is a morphism then

$$n_{X'/Y'} = n_{X/Y} \circ g$$

where $X' \to Y'$ is the base change of f.

Proof. Suppose that $y' \in Y'$ has image $y \in Y$. Suppose $K \supset \kappa(y)$ and $K' \supset \kappa(y')$ are separably closed extensions. Then we may choose a commutative diagram

$$\begin{tikzcd} K \arrow[r] & K'' & K' \arrow[l] \\ \kappa(y) \arrow[u] \arrow[rr] & & \kappa(y') \arrow[u] \end{tikzcd}$$

of fields. The result follows as the morphisms of schemes

$$(X'_{y'})_{K'} \longleftarrow (X'_{y'})_{K''} = (X_y)_{K''} \longrightarrow (X_y)_K$$

induce bijections between connected components, see Varieties, Lemma 28.5.6. □

Lemma 33.21.4. *Let $f : X \to Y$ be a morphism of schemes. Assume*

(1) *Y is irreducible with generic point η,*
(2) *X_η is nonempty and geometrically connected, and*
(3) *f is of finite type.*

Then there exists a nonempty open subscheme $V \subset Y$ such that $X_V \to V$ has nonempty geometrically connected fibres.

Proof. Choose a diagram

$$\begin{tikzcd} X' \arrow[r, "g'"'] \arrow[d, "f'"'] & X_V \arrow[r] \arrow[d] & X \arrow[d, "f"] \\ Y' \arrow[r, "g"] & V \arrow[r] & Y \end{tikzcd}$$

as in Lemma 33.17.8. Note that the generic fibre of f' is nonempty and geometrically connected (for example by Lemma 33.21.3). Suppose that the lemma holds for the morphism f'. This means that there exists a nonempty open $W \subset Y'$ such that every fibre of $X' \to Y'$ over W is nonempty and geometrically connected. Then, as g is an open morphism by Morphisms, Lemma 24.35.13 all the fibres of f at point of the nonempty open $V = g(W)$ are nonempty and geometrically connected, see Lemma 33.21.3. In this way we see that we may assume that the irreducible components of the generic fibre X_η are geometrically irreducible.

Let Y' be the reduction of Y, and set $X' = Y' \times_Y X$. Then it suffices to prove the lemma for the morphism $X' \to Y'$ (for example by Lemma 33.21.3 once again). Since the generic fibre of $X' \to Y'$ is the same as the generic fibre of $X \to Y$ we see that we may assume that Y is irreducible and reduced (i.e., integral, see Properties, Lemma 23.3.4) and that the irreducible components of the generic fibre X_η are geometrically irreducible.

At this point suppose that $X_\eta = X_{1,\eta} \bigcup \ldots \bigcup X_{n,\eta}$ is the decomposition of the generic fibre into (geometrically) irreducible components. Let X_i be the closure of $X_{i,\eta}$ in X. After shrinking Y we may assume that $X = \bigcup X_i$, see Lemma 33.17.5. Let $Z_{i,j} = X_i \cap X_j$. Let

$$\{1, \ldots, n\} \times \{1, \ldots, n\} = I \coprod J$$

where $(i, j) \in I$ if $Z_{i,j,\eta} = \emptyset$ and $(i, j) \in J$ if $Z_{i,j,\eta} \neq \emptyset$. After shrinking Y we may assume that $Z_{i,j} = \emptyset$ for all $(i, j) \in I$, see Lemma 33.17.1. After shrinking Y we obtain that $X_{i,y}$ is geometrically irreducible for each i and all $y \in Y$, see Lemma 33.20.5. After shrinking Y some more we achieve the situation where each $Z_{i,j} \to Y$ is flat and of finite presentation for all $(i, j) \in J$, see Morphisms, Proposition 24.26.1. This means that $f(Z_{i,j}) \subset Y$ is open, see Morphisms, Lemma 24.24.9. We claim that

$$V = \bigcap\nolimits_{(i,j)\in J} f(Z_{i,j})$$

works, i.e., that X_y is geometrically connected for each $y \in V$. Namely, the fact that X_η is connected implies that the equivalence relation generated by the pairs in J has only one equivalence class. Now if $y \in V$ and $K \supset \kappa(y)$ is a separably closed extension, then the irreducible components of $(X_y)_K$ are the fibres $(X_{i,y})_K$. Moreover, we see by construction and $y \in V$ that $(X_{i,y})_K$ meets $(X_{j,y})_K$ if and only $(i, j) \in J$. Hence the remark on equivalence classes shows that $(X_y)_K$ is connected and we win. $\square$

Lemma 33.21.5. *Let $f : X \to Y$ be a morphism of schemes. Let $n_{X/Y}$ be the function on Y counting the numbers of geometrically connected components of fibres of f introduced in Lemma 33.21.3. Assume f of finite type. Let $y \in Y$ be a point. Then there exists a nonempty open $V \subset \overline{\{y\}}$ such that $n_{X/Y}|_V$ is constant.*

Proof. Let Z be the reduced induced scheme structure on $\overline{\{y\}}$. Let $f_Z : X_Z \to Z$ be the base change of f. Clearly it suffices to prove the lemma for f_Z and the generic point of Z. Hence we may assume that Y is an integral scheme, see Properties, Lemma 23.3.4. Our goal in this case is to produce a nonempty open $V \subset Y$ such that $n_{X/Y}|_V$ is constant.

We apply Lemma 33.17.8 to $f : X \to Y$ and we get $g : Y' \to V \subset Y$. As $g : Y' \to V$ is surjective finite étale, in particular open (see Morphisms, Lemma 24.35.13), it suffices to prove that there exists an open $V' \subset Y'$ such that $n_{X'/Y'}|_{V'}$ is constant, see Lemma 33.20.3. Thus we see that we may assume that all irreducible components of the generic fibre X_η are geometrically irreducible over $\kappa(\eta)$. By Varieties, Lemma 28.6.15 this implies that also the connected components of X_η are geometrically connected.

At this point suppose that $X_\eta = X_{1,\eta} \bigcup \ldots \bigcup X_{n,\eta}$ is the decomposition of the generic fibre into (geometrically) connected components. In particular $n_{X/Y}(\eta) = n$. Let X_i be the closure of $X_{i,\eta}$ in X. After shrinking Y we may assume that $X = \bigcup X_i$, see Lemma 33.17.5. After shrinking Y some more we see that each fibre of f has at least n connected components, see Lemma 33.21.1. Hence $n_{X/Y}(y) \geq n$ for all $y \in Y$. After shrinking Y some more we obtain that $X_{i,y}$ is geometrically connected for each i and all $y \in Y$, see Lemma 33.21.4. Since $X_y = \bigcup X_{i,y}$ this shows that $n_{X/Y}(y) \leq n$ and finishes the proof. □

Lemma 33.21.6. *Let $f : X \to Y$ be a morphism of schemes. Let $n_{X/Y}$ be the function on Y counting the numbers of geometrically connected components of fibres of f introduced in Lemma 33.21.3. Assume f of finite presentation. Then the level sets*

$$E_n = \{y \in Y \mid n_{X/Y}(y) = n\}$$

of $n_{X/Y}$ are locally constructible in Y.

Proof. Fix n. Let $y \in Y$. We have to show that there exists an open neighbourhood V of y in Y such that $E_n \cap V$ is constructible in V. Thus we may assume that Y is affine. Write $Y = Spec(A)$ and $A = colim\, A_i$ as a directed limit of finite type $\mathbf{Z}$-algebras. By Limits, Lemma 27.6.1 we can find an i and a morphism $f_i : X_i \to Spec(A_i)$ of finite presentation whose base change to Y recovers f. By Lemma 33.21.3 it suffices to prove the lemma for f_i. Thus we reduce to the case where Y is the spectrum of a Noetherian ring.

We will use the criterion of Topology, Lemma 5.11.3 to prove that E_n is constructible in case Y is a Noetherian scheme. To see this let $Z \subset Y$ be an irreducible closed subscheme. We have to show that $E_n \cap Z$ either contains a nonempty open subset or is not dense in Z. Let $\xi \in Z$ be the generic point. Then Lemma 33.21.5 shows that $n_{X/Y}$ is constant in a neighbourhood of ξ in Z. This clearly implies what we want. □

Lemma 33.21.7. *Let $f : X \to S$ be a morphism of schemes. Assume that*

1. *S is the spectrum of a discrete valuation ring,*
2. *f is flat,*
3. *X is connected,*
4. *the closed fibre X_s is reduced.*

Then the generic fibre X_η is connected.

Proof. Write $Y = Spec(R)$ and let $\pi \in R$ be a uniformizer. To get a contradiction assume that X_η is disconnected. This means there exists a nontrivial idempotent $e \in \Gamma(X_\eta, \mathcal{O}_{X_\eta})$. Let $U = Spec(A)$ be any affine open in X. Note that π is a nonzero divisor on A as A is flat over R, see More on Algebra, Lemma 12.17.3 for example. Then $e|_{U_\eta}$ corresponds to an element $e \in A[1/\pi]$. Let $z \in A$ be an element such that $e = z/\pi^n$ with $n \geq 0$ minimal. Note that $z^2 = \pi^n z$. This means that $z \bmod \pi A$ is nilpotent if $n > 0$. By assumption $A/\pi A$ is reduced, and hence minimality of n implies $n = 0$. Thus we conclude that $e \in A$! In other words $e \in \Gamma(X, \mathcal{O}_X)$. As X is connected it follows that e is a trivial idempotent which is a contradiction. □

33.22. Connected components meeting a section

The results in this section are in particular applicable to a group scheme $G \to S$ and its neutral section $e : S \to G$.

Situation 33.22.1. Here $f : X \to Y$ be a morphism of schemes, and $s : Y \to X$ is a section of f. For every $y \in Y$ we denote X^0_y the connected component of X_y containing $s(y)$. Finally, we set $X^0 = \bigcup_{y \in Y} X^0_y$.

Lemma 33.22.2. *Let $f : X \to Y$, $s : Y \to X$ be as in Situation 33.22.1. If $g : Y' \to Y$ is any morphism, consider the base change diagram*

$$\begin{tikzcd} X' \arrow[r, "g'"] \arrow[d, "f'"] & X \arrow[d, "f"'] \\ Y' \arrow[r, "g"] \arrow[u, bend left, "s'"] & Y \arrow[u, bend right, "s"'] \end{tikzcd}$$

so that we obtain $(X')^0 \subset X'$. Then $(X')^0 = (g')^{-1}(X^0)$.

Proof. Let $y' \in Y'$ with image $y \in Y$. We may think of X^0_y as a closed subscheme of X_y, see for example Morphisms, Definition 24.25.2. As $s(y) \in X^0_y$ we conclude from Varieties, Lemma 28.5.14 that X^0_y is a geometrically connected scheme over $\kappa(y)$. Hence $X^0_y \times_y y' \to X'_{y'}$ is a connected closed subscheme which contains $s'(y')$. Thus $X^0_y \times_y y' \subset (X'_{y'})^0$. The other inclusion $X^0_y \times_y y' \supset (X'_{y'})^0$ is clear as the image of $(X'_{y'})^0$ in X_y is a connected subset of X_y which contains $s(y)$. □

Lemma 33.22.3. *Let $f : X \to Y$, $s : Y \to X$ be as in Situation 33.22.1. Assume f of finite type. Let $y \in Y$ be a point. Then there exists a nonempty open $V \subset \overline{\{y\}}$ such that the inverse image of X^0 in the base change X_V is open and closed in X_V.*

Proof. Let $Z \subset Y$ be the induced reduced closed subscheme structure on $\overline{\{y\}}$. Let $f_Z : X_Z \to Z$ and $s_Z : Z \to X_Z$ be the base changes of f and s. By Lemma 33.22.2 we have $(X_Z)^0 = (X^0)_Z$. Hence it suffices to prove the lemma for the morphism $X_Z \to Z$ and the point $x \in X_Z$ which maps to the generic point of Z. In other words we have reduced the problem to the case where Y is an integral scheme (see Properties, Lemma 23.3.4) with generic point η. Our goal is to show that after shrinking Y the subset X^0 becomes an open and closed subset of X.

Note that the scheme X_η is of finite type over a field, hence Noetherian. Thus its connected components are open as well as closed. Hence we may write $X_\eta = X^0_\eta \coprod T_\eta$ for some open and closed subset T_η of X_η. Next, let $T \subset X$ be the closure of T_η and let $X^{00} \subset X$ be the closure of X^0_η. Note that T_η, resp. X^0_η is the generic fibre of T, resp. X^{00}, see discussion preceding Lemma 33.17.5. Moreover, that lemma implies that after shrinking Y we may assume that $X = X^{00} \cup T$ (set theoretically). Note that $(T \cap X^{00})_\eta = T_\eta \cap X^0_\eta = \emptyset$. Hence after shrinking Y we may assume that $T \cap X^{00} = \emptyset$, see Lemma 33.17.1. In particular X^{00} is open in X. Note that X^0_η is connected and has a rational point, namely $s(\eta)$, hence it is geometrically connected, see Varieties, Lemma 28.5.14. Thus after shrinking Y we may assume that all fibres of $X^{00} \to Y$ are geometrically connected, see Lemma 33.21.4. At this point it follows that the fibres X^{00}_y are open, closed, and connected subsets of X_y containing $\sigma(y)$. It follows that $X^0 = X^{00}$ and we win. □

Lemma 33.22.4. *Let $f : X \to Y$, $s : Y \to X$ be as in Situation 33.22.1. If f is of finite presentation then X^0 is locally constructible in X.*

Proof. Let $x \in X$. We have to show that there exists an open neighbourhood U of x such that $X^0 \cap U$ is constructible in U. This reduces us to the case where Y is affine. Write $Y = Spec(A)$ and $A = colim\, A_i$ as a directed limit of finite type $\mathbf{Z}$-algebras. By Limits, Lemma 27.6.1 we can find an i and a morphism $f_i : X_i \to Spec(A_i)$ of finite presentation, endowed with a section $s_i : Spec(A_i) \to X_i$ whose base change to Y recovers f and the section s. By Lemma 33.22.2 it suffices to prove the lemma for f_i, s_i. Thus we reduce to the case where Y is the spectrum of a Noetherian ring.

Assume Y is a Noetherian affine scheme. Since f is of finite presentation, i.e., of finite type, we see that X is a Noetherian scheme too, see Morphisms, Lemma 24.14.6. In order to prove the lemma in this case it suffices to show that for every irreducible closed subset $Z \subset X$ the intersection $Z \cap X^0$ either contains a nonempty open of Z or is not dense in Z, see Topology, Lemma 5.11.3. Let $x \in Z$ be the generic point, and let $y = f(x)$. By Lemma 33.22.3 there exists a nonempty open subset $V \subset \overline{\{y\}}$ such that $X^0 \cap X_V$ is open and closed in X_V. Since $f(Z) \subset \overline{\{y\}}$ and $f(x) = y \in V$ we see that $W = f^{-1}(V) \cap Z$ is a nonempty open subset of Z. It follows that $X^0 \cap W$ is open and closed in W. Since W is irreducible we see that $X^0 \cap W$ is either empty or equal to W. This proves the lemma. ☐

Lemma 33.22.5. *Let $f : X \to Y$, $s : Y \to X$ be as in Situation 33.22.1. Let $y \in Y$ be a point. Assume*

(1) *f is of finite presentation and flat, and*
(2) *the fibre X_y is geometrically reduced.*

Then X^0 is a neighbourhood of X^0_y in X.

Proof. We may replace Y with an affine open neighbourhood of y. Write $Y = Spec(A)$ and $A = colim\, A_i$ as a directed limit of finite type $\mathbf{Z}$-algebras. By Limits, Lemma 27.6.1 we can find an i and a morphism $f_i : X_i \to Spec(A_i)$ of finite presentation, endowed with a section $s_i : Spec(A_i) \to X_i$ whose base change to Y recovers f and the section s. After possibly increasing i we may also assume that f_i is flat, see Limits, Lemma 27.6.3. Let y_i be the image of y in Y_i. Note that $X_y = (X_{i,y_i}) \times_{y_i} y$. Hence X_{i,y_i} is geometrically reduced, see Varieties, Lemma 28.4.6. By Lemma 33.22.2 it suffices to prove the lemma for the system $f_i, s_i, y_i \in Y_i$. Thus we reduce to the case where Y is the spectrum of a Noetherian ring.

Assume Y is the spectrum of a Noetherian ring. Since f is of finite presentation, i.e., of finite type, we see that X is a Noetherian scheme too, see Morphisms, Lemma 24.14.6. Let $x \in X^0$ be a point lying over y. By Topology, Lemma 5.11.4 it suffices to prove that for any irreducible closed $Z \subset X$ passing through x the intersection $X^0 \cap Z$ is dense in Z. In particular it suffices to prove that the generic point $x' \in Z$ is in X^0. By Properties, Lemma 23.5.9 we can find a discrete valuation ring R and a morphism $Spec(R) \to X$ which maps the special point to x and the generic point to x'. We are going to think of $Spec(R)$ as a scheme over Y via the composition $Spec(R) \to X \to Y$. By Lemma 33.22.2 we have that $(X_R)^0$ is the inverse image of X^0. By construction we have a second section $t : Spec(R) \to X_R$ (besides the base change s_R of s) of the structure morphism $X_R \to Spec(R)$ such that $t(\eta_R)$ is a point of X_R which maps to x' and $t(0_R)$ is a point of X_R which maps to x. Note that $t(0_R)$ is in $(X_R)^0$ and that $t(\eta_R) \rightsquigarrow t(0_R)$. Thus it suffices to prove that this implies that

$t(\eta_R) \in (X_R)^0$. Hence it suffices to prove the lemma in the case where Y is the spectrum of a discrete valuation ring and y its closed point.

Assume Y is the spectrum of a discrete valuation ring and y is its closed point. Our goal is to prove that X^0 is a neighbourhood of X^0_y. Note that X^0_y is open and closed in X_y as X_y has finitely many irreducible components. Hence the complement $C = X_y \setminus X^0_y$ is closed in X. Thus $U = X \setminus C$ is an open neighbourhood of X^0_y and $U^0 = X^0$. Hence it suffices to prove the result for the morphism $U \to Y$. In other words, we may assume that X_y is connected. Suppose that X is disconnected, say $X = X_1 \amalg \ldots \amalg X_n$ is a decomposition into connected components. Then $s(Y)$ is completely contained in one of the X_i. Say $s(Y) \subset X_1$. Then $X^0 \subset X_1$. Hence we may replace X by X_1 and assume that X is connected. At this point Lemma 33.21.7 implies that X_η is connected, i.e., $X^0 = X$ and we win. □

Lemma 33.22.6. *Let $f : X \to Y$, $s : Y \to X$ be as in Situation 33.22.1. Assume*

(1) *f is of finite presentation and flat, and*
(2) *all fibres of f are geometrically reduced.*

Then X^0 is open in X.

Proof. This is an immediate consequence of Lemma 33.22.5. □

33.23. Dimension of fibres

Lemma 33.23.1. *Let $f : X \to Y$ be a morphism of schemes. Assume Y irreducible with generic point η and f of finite type. If X_η has dimension n, then there exists a nonempty open $V \subset Y$ such that for all $y \in V$ the fibre X_y has dimension n.*

Proof. Let $Z = \{x \in X \mid \dim_x(X_{f(x)}) > n\}$. By Morphisms, Lemma 24.27.4 this is a closed subset of X. By assumption $Z_\eta = \emptyset$. Hence by Lemma 33.17.1 we may shrink Y and assume that $Z = \emptyset$. Let $Z' = \{x \in X \mid \dim_x(X_{f(x)}) > n - 1\} = \{x \in X \mid \dim_x(X_{f(x)}) = n\}$. As before this is a closed subset of X. By assumption we have $Z'_\eta \neq \emptyset$. Hence after shrinking Y we may assume that $Z' \to Y$ is surjective, see Lemma 33.17.2. Hence we win. □

Lemma 33.23.2. *Let $f : X \to Y$ be a morphism of finite type. Let*

$$n_{X/Y} : Y \to \{0, 1, 2, 3, \ldots, \infty\}$$

be the function which associates to $y \in Y$ the dimension of X_y. If $g : Y' \to Y$ is a morphism then

$$n_{X'/Y'} = n_{X/Y} \circ g$$

where $X' \to Y'$ is the base change of f.

Proof. This follows from Morphisms, Lemma 24.27.3. □

Lemma 33.23.3. *Let $f : X \to Y$ be a morphism of schemes. Let $n_{X/Y}$ be the function on Y giving the dimension of fibres of f introduced in Lemma 33.23.2. Assume f of finite presentation. Then the level sets*

$$E_n = \{y \in Y \mid n_{X/Y}(y) = n\}$$

of $n_{X/Y}$ are locally constructible in Y.

Proof. Fix n. Let $y \in Y$. We have to show that there exists an open neighbourhood V of y in Y such that $E_n \cap V$ is constructible in V. Thus we may assume that Y is affine. Write $Y = Spec(A)$ and $A = colim\, A_i$ as a directed limit of finite type $\mathbf{Z}$-algebras. By Limits, Lemma 27.6.1 we can find an i and a morphism $f_i : X_i \to Spec(A_i)$ of finite presentation whose base change to Y recovers f. By Lemma 33.23.2 it suffices to prove the lemma for f_i. Thus we reduce to the case where Y is the spectrum of a Noetherian ring.

We will use the criterion of Topology, Lemma 5.11.3 to prove that E_n is constructible in case Y is a Noetherian scheme. To see this let $Z \subset Y$ be an irreducible closed subscheme. We have to show that $E_n \cap Z$ either contains a nonempty open subset or is not dense in Z. Let $\xi \in Z$ be the generic point. Then Lemma 33.23.1 shows that $n_{X/Y}$ is constant in a neighbourhood of ξ in Z. This implies what we want. □

33.24. Limit arguments

Some lemmas involving limits of schemes, and Noetherian approximation. We stick mostly to the affine case. Some of these lemmas are special cases of lemmas in the chapter on limits.

Lemma 33.24.1. *Let $f : X \to S$ be a morphism of affine schemes, which is of finite presentation. Then there exists a cartesian diagram*

$$\begin{tikzcd} X_0 \arrow[d, "f_0"'] & X \arrow[l, "g"'] \arrow[d, "f"] \\ S_0 & S \arrow[l] \end{tikzcd}$$

such that

(1) *X_0, S_0 are affine schemes,*
(2) *S_0 of finite type over $\mathbf{Z}$,*
(3) *f_0 is finite of finite type.*

Proof. Write $S = Spec(A)$ and $X = Spec(B)$. As f is of finite presentation we see that B is of finite presentation as an A-algebra, see Morphisms, Lemma 24.20.2. Thus the lemma follows from Algebra, Lemma 7.118.15. □

Lemma 33.24.2. *Let $f : X \to S$ be a morphism of affine schemes, which is of finite presentation. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module of finite presentation. Then there exists a diagram as in Lemma 33.24.1 such that there exists a coherent $\mathcal{O}_{X_0}$-module $\mathcal{F}_0$ with $g^*\mathcal{F}_0 = \mathcal{F}$.*

Proof. Write $S = Spec(A)$, $X = Spec(B)$, and $\mathcal{F} = \widetilde{M}$. As f is of finite presentation we see that B is of finite presentation as an A-algebra, see Morphisms, Lemma 24.20.2. As $\mathcal{F}$ is of finite presentation over $\mathcal{O}_X$ we see that M is of finite presentation as a B-module, see Properties, Lemma 23.16.2. Thus the lemma follows from Algebra, Lemma 7.118.15. □

Lemma 33.24.3. *Let $f : X \to S$ be a morphism of affine schemes, which is of finite presentation. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module of finite presentation and flat over S. Then we may choose a diagram as in Lemma 33.24.2 and sheaf $\mathcal{F}_0$ such that in addition $\mathcal{F}_0$ is flat over S_0.*

Proof. Write $S = Spec(A)$, $X = Spec(B)$, and $\mathcal{F} = \widetilde{M}$. As f is of finite presentation we see that B is of finite presentation as an A-algebra, see Morphisms, Lemma 24.20.2. As $\mathcal{F}$ is of finite presentation over $\mathcal{O}_X$ we see that M is of finite presentation as a B-module, see

Properties, Lemma 23.16.2. As $\mathcal{F}$ is flat over S we see that M is flat over A, see Morphisms, Lemma 24.24.2. Thus the lemma follows from Algebra, Lemma 7.120.5. □

Lemma 33.24.4. *Let $f : X \to S$ be a morphism of affine schemes, which is of finite presentation and flat. Then there exists a diagram as in Lemma 33.24.1 such that in addition f_0 is flat.*

Proof. This is a special case of Lemma 33.24.3. □

Lemma 33.24.5. *Let $f : X \to S$ be a morphism of affine schemes, which is smooth. Then there exists a diagram as in Lemma 33.24.1 such that in addition f_0 is smooth.*

Proof. Write $S = Spec(A)$, $X = Spec(B)$, and as f is smooth we see that B is smooth as an A-algebra, see Morphisms, Lemma 24.33.2. Hence the lemma follows from Algebra, Lemma 7.127.14. □

Lemma 33.24.6. *Let $f : X \to S$ be a morphism of affine schemes, which is of finite presentation with geometrically reduced fibres. Then there exists a diagram as in Lemma 33.24.1 such that in addition f_0 has geometrically reduced fibres.*

Proof. Apply Lemma 33.24.1 to get a cartesian diagram

$$\begin{tikzcd} X_0 \arrow[d, "f_0"'] & X \arrow[l, "g"'] \arrow[d, "f"] \\ S_0 & S \arrow[l, "h"'] \end{tikzcd}$$

of affine schemes with $X_0 \to S_0$ a finite type morphism of schemes of finite type over $\mathbf{Z}$. By Lemma 33.19.5 the set $E \subset S_0$ of points where the fibre of f_0 is geometrically reduced is a constructible subset. By Lemma 33.19.2 we have $h(S) \subset E$. Write $S_0 = Spec(A_0)$ and $S = Spec(A)$. Write $A = colim_i A_i$ as a direct colimit of finite type A_0-algebras. By Limits, Lemma 27.3.4 we see that $Spec(A_i) \to S_0$ has image contained in E for some i. After replacing S_0 by $Spec(A_i)$ and X_0 by $X_0 \times_{S_0} Spec(A_i)$ we see that all fibres of f_0 are geometrically reduced. □

Lemma 33.24.7. *Let $f : X \to S$ be a morphism of affine schemes, which is of finite presentation with geometrically irreducible fibres. Then there exists a diagram as in Lemma 33.24.1 such that in addition f_0 has geometrically irreducible fibres.*

Proof. Apply Lemma 33.24.1 to get a cartesian diagram

$$\begin{tikzcd} X_0 \arrow[d, "f_0"'] & X \arrow[l, "g"'] \arrow[d, "f"] \\ S_0 & S \arrow[l, "h"'] \end{tikzcd}$$

of affine schemes with $X_0 \to S_0$ a finite type morphism of schemes of finite type over $\mathbf{Z}$. By Lemma 33.20.7 the set $E \subset S_0$ of points where the fibre of f_0 is geometrically irreducible is a constructible subset. By Lemma 33.20.2 we have $h(S) \subset E$. Write $S_0 = Spec(A_0)$ and $S = Spec(A)$. Write $A = colim_i A_i$ as a direct colimit of finite type A_0-algebras. By Limits, Lemma 27.3.4 we see that $Spec(A_i) \to S_0$ has image contained in E for some i. After replacing S_0 by $Spec(A_i)$ and X_0 by $X_0 \times_{S_0} Spec(A_i)$ we see that all fibres of f_0 are geometrically irreducible. □

Lemma 33.24.8. *Let $f : X \to S$ be a morphism of affine schemes, which is of finite presentation with geometrically connected fibres. Then there exists a diagram as in Lemma 33.24.1 such that in addition f_0 has geometrically connected fibres.*

Proof. Apply Lemma 33.24.1 to get a cartesian diagram

$$\begin{tikzcd} X_0 \arrow[d, "f_0"'] & X \arrow[l, "g"'] \arrow[d, "f"] \\ S_0 & S \arrow[l, "h"'] \end{tikzcd}$$

of affine schemes with $X_0 \to S_0$ a finite type morphism of schemes of finite type over $\mathbf{Z}$. By Lemma 33.21.6 the set $E \subset S_0$ of points where the fibre of f_0 is geometrically connected is a constructible subset. By Lemma 33.21.2 we have $h(S) \subset E$. Write $S_0 = Spec(A_0)$ and $S = Spec(A)$. Write $A = colim_i A_i$ as a direct colimit of finite type A_0-algebras. By Limits, Lemma 27.3.4 we see that $Spec(A_i) \to S_0$ has image contained in E for some i. After replacing S_0 by $Spec(A_i)$ and X_0 by $X_0 \times_{S_0} Spec(A_i)$ we see that all fibres of f_0 are geometrically connected. $\square$

Lemma 33.24.9. *Let $d \geq 0$ be an integer. Let $f : X \to S$ be a morphism of affine schemes, which is of finite presentation all of whose fibres have dimension d. Then there exists a diagram as in Lemma 33.24.1 such that in addition all fibres of f_0 have dimension d.*

Proof. Apply Lemma 33.24.1 to get a cartesian diagram

$$\begin{tikzcd} X_0 \arrow[d, "f_0"'] & X \arrow[l, "g"'] \arrow[d, "f"] \\ S_0 & S \arrow[l, "h"'] \end{tikzcd}$$

of affine schemes with $X_0 \to S_0$ a finite type morphism of schemes of finite type over $\mathbf{Z}$. By Lemma 33.23.3 the set $E \subset S_0$ of points where the fibre of f_0 has dimension d is a constructible subset. By Lemma 33.23.2 we have $h(S) \subset E$. Write $S_0 = Spec(A_0)$ and $S = Spec(A)$. Write $A = colim_i A_i$ as a direct colimit of finite type A_0-algebras. By Limits, Lemma 27.3.4 we see that $Spec(A_i) \to S_0$ has image contained in E for some i. After replacing S_0 by $Spec(A_i)$ and X_0 by $X_0 \times_{S_0} Spec(A_i)$ we see that all fibres of f_0 have dimension d. $\square$

Lemma 33.24.10. *Let $f : X \to S$ be a morphism of affine schemes, which is standard syntomic (see Morphisms, Definition 24.30.1). Then there exists a diagram as in Lemma 33.24.1 such that in addition f_0 is standard syntomic.*

Proof. This lemma is an improvement of the awkward Algebra, Lemma 7.125.12. Write $X = Spec(B)$ and $S = Spec(A)$. By assumption we may write $B = A[x_1, \ldots, x_n]/(f_1, \ldots, f_c)$ such that every nonzero fibre ring of $A \to B$ has dimension $n - c$. Let $A_0 \subset A$ be a finite type $\mathbf{Z}$-subalgebra such that the coefficients of the polynomials f_j are contained in A_0. Set $B_0 = A_0[x_1, \ldots, x_n]/(f_1, \ldots, f_c)$. Let

$$E = \{\mathfrak{p}_0 \subset A_0 \mid \dim(B_0 \otimes_{A_0} \kappa(\mathfrak{p}_0) = n - c\}$$

By Lemma 33.23.3 the set E is constructible. By assumption and Lemma 33.23.2 the morphism $Spec(A) \to Spec(A_0)$ has image contained in E. Write $A = colim_i A_i$ as a direct colimit of finite type A_0-algebras. By Limits, Lemma 27.3.4 we see that $Spec(A_i) \to$

$Spec(A_0)$ has image contained in E for some i. After replacing A_0 by A_i and B_0 by $B_0 \otimes_{A_0} A_i$ we see that all nonempty fibre rings of $A_0 \to B_0$ have dimension $n - c$. Hence $A_0 \to B_0$ is a relative global complete intersection. □

Lemma 33.24.11. *(Noetherian approximation and combining properties.) Let P, Q be properties of morphisms of schemes which are stable under base change. Let $f : X \to S$ be a morphism of finite presentation of affine schemes. Assume we can find cartesian diagrams*

$$\begin{tikzcd} X_1 \arrow[d, "f_1"'] & X \arrow[l] \arrow[d, "f"] \\ S_1 & S \arrow[l] \end{tikzcd} \quad \text{and} \quad \begin{tikzcd} X_2 \arrow[d, "f_2"'] & X \arrow[l] \arrow[d, "f"] \\ S_2 & S \arrow[l] \end{tikzcd}$$

of affine schemes, with S_1, S_2 of finite type over $\mathbf{Z}$ and f_1, f_2 of finite type such that f_1 has property P and f_2 has property Q. Then we can find a cartesian diagram

$$\begin{tikzcd} X_0 \arrow[d, "f_0"'] & X \arrow[l] \arrow[d, "f"] \\ S_0 & S \arrow[l] \end{tikzcd}$$

of affine schemes with S_0 of finite type over $\mathbf{Z}$ and f_0 of finite type such that f_0 has both property P and property Q.

Proof. The given pair of diagrams correspond to cocartesian diagrams of rings

$$\begin{tikzcd} B_1 \arrow[r] & B \\ A_1 \arrow[u] \arrow[r] & A \arrow[u] \end{tikzcd} \quad \text{and} \quad \begin{tikzcd} B_2 \arrow[r] & B \\ A_2 \arrow[u] \arrow[r] & A \arrow[u] \end{tikzcd}$$

Let $A_0 \subset A$ be a finite type $\mathbf{Z}$-subalgebra of A containing the image of both $A_1 \to A$ and $A_2 \to A$. Such a subalgebra exists because by assumption both A_1 and A_2 are of finite type over $\mathbf{Z}$. Note that the rings $B_{0,1} = B_1 \otimes_{A_1} A_0$ and $B_{0,2} = B_2 \otimes_{A_2} A_0$ are finite type A_0-algebras with the property that $B_{0,1} \otimes_{A_0} A \cong B \cong B_{0,2} \otimes_{A_0} A$ as A-algebras. As A is the directed colimit of its finite type A_0-subalgebras, by Limits, Lemma 27.6.1 we may assume after enlarging A_0 that there exists an isomorphism $B_{0,1} \cong B_{0,2}$ as A_0-algebras. Since properties P and Q are assumed stable under base change we conclude that setting $S_0 = Spec(A_0)$ and

$$X_0 = X_1 \times_{S_1} S_0 = Spec(B_{0,1}) \cong Spec(B_{0,2}) = X_2 \times_{S_2} S_0$$

works. □

33.25. Étale neighbourhoods

It turns out that some properties of morphisms are easier to study after doing an étale base change. It is convenient to introduce the following terminology.

Definition 33.25.1. Let S be a scheme. Let $s \in S$ be a point.

(1) An *étale neighbourhood of* (S, s) is a pair (U, u) together with an étale morphism of schemes $\varphi : U \to S$ such that $\varphi(u) = s$.
(2) A *morphism of étale neighbourhoods* $f : (V, v) \to (U, u)$ of (S, s) is simply a morphism of S-schemes $f : V \to U$ such that $f(v) = u$.

(3) An *elementary étale neighbourhood* is an étale neighbourhood $\varphi : (U, u) \to (S, s)$ such that $\kappa(s) = \kappa(u)$.

If $f : (V, v) \to (U, u)$ is a morphism of étale neighbourhoods, then f is automatically étale, see Morphisms, Lemma 24.35.18. Hence it turns (V, v) into an étale neighbourhood of (U, u). Of course, since the composition of étale morphisms is étale (Morphisms, Lemma 24.35.3) we see that conversely any étale neighbourhood (V, v) of (U, u) is an étale neighbourhood of (S, s) as well. We also remark that if $U \subset S$ is an open neighbourood of s, then $(U, s) \to (S, s)$ is an étale neighbourhood. This follows from the fact that an open immersion is étale (Morphisms, Lemma 24.35.9). We will use these remarks without further mention throughout this section.

Note that $\kappa(s) \subset \kappa(u)$ is a finite separable extension if $(U, u) \to (S, s)$ is an étale neighbourhood, see Morphisms, Lemma 24.35.15.

Lemma 33.25.2. *Let S be a scheme. Let $s \in S$. Let $\kappa(s) \subset k$ be a finite separable field extension. Then there exists an étale neighbourhood $(U, u) \to (S, s)$ such that the field extension $\kappa(s) \subset \kappa(u)$ is isomorphic to $\kappa(s) \subset k$.*

Proof. We may assume S is affine. In this case the lemma follows from Algebra, Lemma 7.132.15. □

Lemma 33.25.3. *Let S be a scheme, and let s be a geometric point of S. The category of étale neighborhoods has the following properties:*

(1) *Let $(U_i, u_i)_{i=1,2}$ be two étale neighborhoods of s in S. Then there exists a third étale neighborhood (U, u) and morphisms $(U, u) \to (U_i, u_i)$, $i = 1, 2$.*
(2) *Let $h_1, h_2 : (U, u) \to (U', u')$ be two morphisms between étale neighborhoods of s. Assume h_1, h_2 induce the same map $\kappa(u') \to \kappa(u)$ of residue fields. Then there exist an étale neighborhood (U'', u'') and a morphism $h : (U'', u'') \to (U, u)$ which equalizes h_1 and h_2, i.e., such that $h_1 \circ h = h_2 \circ h$.*

Proof. For part (1), consider the fibre product $U = U_1 \times_S U_2$. It is étale over both U_1 and U_2 because étale morphisms are preserved under base change, see Morphisms, Lemma 24.35.4. There is a point of U mapping to both u_1 and u_2 for example by the description of points of a fibre product in Schemes, Lemma 21.17.5. For part (2), define U'' as the fibre product

$$\begin{tikzcd} U'' \arrow[r] \arrow[d] & U \arrow[d, "{(h_1,h_2)}"] \\ U' \arrow[r, "\Delta"] & U' \times_S U'. \end{tikzcd}$$

Since h_1 and h_2 induce the same map of residue fields $\kappa(u') \to \kappa(u)$ there exists a point $u'' \in U''$ lying over u' with $\kappa(u'') = \kappa(u')$. In particular $U'' \neq \emptyset$. Moreover, since U' is étale over S, so is the fibre product $U' \times_S U'$ (see Morphisms, Lemmas 24.35.4 and 24.35.3). Hence the vertical arrow (h_1, h_2) is étale by Morphisms, Lemma 24.35.18. Therefore U'' is étale over U' by base change, and hence also étale over S (because compositions of étale morphisms are étale). Thus (U'', u'') is a solution to the problem. □

Lemma 33.25.4. *Let S be a scheme, and let s be a geometric point of S. The category of elementary étale neighborhoods of (S, s) is cofiltered (see Categories, Definition 4.18.1).*

Proof. This is immediate from the definitions and Lemma 33.25.3. □

Lemma 33.25.5. *Let S be a scheme. Let $s \in S$. Then we have*

$$\mathcal{O}^h_{S,s} = colim_{(U,u)} \mathcal{O}(U)$$

where the colimit is over the filtered category which is opposite to the category of elementary étale neighbourhoods (U, u) of (S, s).

Proof. Let $Spec(A) \subset S$ be an affine neighbourhood of s. Let $\mathfrak{p} \subset A$ be the prime ideal corresponding to s. With these choices we have canonical isomorphisms $\mathcal{O}_{S,s} = A_{\mathfrak{p}}$ and $\kappa(s) = \kappa(\mathfrak{p})$. A cofinal system of elementary étale neighbourhoods is given by those elementary étale neighbourhoods (U, u) such that U is affine and $U \to S$ factors through $Spec(A)$. In other words, we see that the right hand side is equal to $colim_{(B,\mathfrak{q})} B$ where the colimit is over étale A-algebras B endowed with a prime $\mathfrak{q}$ lying over $\mathfrak{p}$ with $\kappa(\mathfrak{p}) = \kappa(\mathfrak{q})$. Thus the lemma follows from Algebra, Lemma 7.139.23. $\square$

33.26. Slicing smooth morphisms

In this section we explain a result that roughly states that smooth coverings of a scheme S can be refined by étale coverings. The technique to prove this relies on a slicing argument.

Lemma 33.26.1. *Let $f : X \to S$ be a morphism of schemes. Let $x \in X$ be a point with image $s \in S$. Let $h \in \mathfrak{m}_x \subset \mathcal{O}_{X,x}$. Assume*

(1) *f is smooth at x, and*
(2) *the image $d\overline{h}$ of dh in*

$$\Omega_{X_s/s,x} \otimes_{\mathcal{O}_{X_s,x}} \kappa(x) = \Omega_{X/S,x} \otimes_{\mathcal{O}_{X,x}} \kappa(x)$$

is nonzero.

Then there exists an affine open neighbourhood $U \subset X$ of x such that h comes from $h \in \Gamma(U, \mathcal{O}_U)$ and such that $D = V(h)$ is an effective Cartier divisor in U with $x \in D$ and $D \to S$ smooth.

Proof. AS f is smooth at x we may assume, after replacing X by an open neighbourhood of x that f is smooth. In particular we see that f is flat and locally of finite presentation. By Lemma 33.16.1 we already know there exists an open neighbourhood $U \subset X$ of x such that h comes from $h \in \Gamma(U, \mathcal{O}_U)$ and such that $D = V(h)$ is an effective Cartier divisor in U with $x \in D$ and $D \to S$ flat and of finite presentation. By Morphisms, Lemma 24.32.17 we have a short exact sequence

$$\mathcal{C}_{D/U} \to i^*\Omega_{U/S} \to \Omega_{D/S} \to 0$$

where $i : D \to U$ is the closed immersion and $\mathcal{C}_{D/U}$ is the conormal sheaf of D in U. As D is an effective Cartier divisor cut out by $h \in \Gamma(U, \mathcal{O}_U)$ we see that $\mathcal{C}_{D/U} = h \cdot \mathcal{O}_S$. Since $U \to S$ is smooth the sheaf $\Omega_{U/S}$ is finite locally free, hence its pullback $i^*\Omega_{U/S}$ is finite locally free also. The first arrow of the sequence maps the free generator h to the section $dh|_D$ of $i^*\Omega_{U/S}$ which has nonzero value in the fibre $\Omega_{U/S,x} \otimes \kappa(x)$ by assumption. By right exactness of $\otimes \kappa(x)$ we conclude that

$$\dim_{\kappa(x)} \left(\Omega_{D/S,x} \otimes \kappa(x)\right) = \dim_{\kappa(x)} \left(\Omega_{U/S,x} \otimes \kappa(x)\right) - 1.$$

By Morphisms, Lemma 24.33.14 we see that $\Omega_{U/S,x} \otimes \kappa(x)$ can be generated by at most $\dim_x(U_s)$ elements. By the displayed formula we see that $\Omega_{D/S,x} \otimes \kappa(x)$ can be generated by at most $\dim_x(U_s) - 1$ elements. Note that $\dim_x(D_s) = \dim_x(U_s) - 1$ for example because $\dim(\mathcal{O}_{D_s,x}) = \dim(\mathcal{O}_{U_s,x}) - 1$ by Algebra, Lemma 7.57.11 (also $D_s \subset U_s$ is effective Cartier, see Divisors, Lemma 26.10.1) and then using Morphisms, Lemma 24.27.1. Thus we conclude that $\Omega_{D/S,x} \otimes \kappa(x)$ can be generated by at most $\dim_x(D_s)$ elements and we conclude that $D \to S$ is smooth at x by Morphisms, Lemma 24.33.14 again. After shrinking U we get that $D \to S$ is smooth and we win. □

Lemma 33.26.2. *Let $f : X \to S$ be a morphism of schemes. Let $x \in X$ be a point with image $s \in S$. Assume*

(1) *f is smooth at x, and*
(2) *the map*
$$\Omega_{X_s/s,x} \otimes_{\mathcal{O}_{X_s,x}} \kappa(x) \longrightarrow \Omega_{\kappa(x)/\kappa(s)}$$
has a nonzero kernel.

Then there exists an affine open neighbourhood $U \subset X$ of x and an effective Cartier divisor $D \subset U$ containing x such that $D \to S$ is smooth.

Proof. Write $k = \kappa(s)$ and $R = \mathcal{O}_{X_s,x}$. Denote $\mathfrak{m}$ the maximal ideal of R and $\kappa = R/\mathfrak{m}$ so that $\kappa = \kappa(x)$. As formation of modules of differentials commutes with localization (see Algebra, Lemma 7.122.8) we have $\Omega_{X_s/s,x} = \Omega_{R/k}$. By Algebra, Lemma 7.122.9 there is an exact sequence
$$\mathfrak{m}/\mathfrak{m}^2 \xrightarrow{\text{d}} \Omega_{R/k} \otimes_R \kappa \to \Omega_{\kappa/k} \to 0.$$
Hence if (2) holds, there exists an element $\overline{h} \in \mathfrak{m}$ such that $\text{d}\overline{h}$ is nonzero. Choose a lift $h \in \mathcal{O}_{X,x}$ of $\overline{h}$ and apply Lemma 33.26.1. □

Remark 33.26.3. The second condition in Lemma 33.26.2 is necessary even if x is a closed point of a positive dimensional fibre. An example is the following: Let k be a field of characteristic $p > 0$ which is imperfect. Let $a \in k$ be an element which is not a pth power. Let $\mathfrak{m} = (x, y^p - a) \subset k[x, y]$. This corresponds to a closed point w of $X = \mathbf{A}^2_k$. Set $S = \mathbf{A}^1_k$ and let $f : X \to S$ be the morphism corresponding to $k[x] \to k[x, y]$. Then there does not exist any commutative diagram

$$\begin{tikzcd} S' \arrow[rr, "h"] \arrow[dr, "g"'] & & X \arrow[dl, "f"] \\ & S & \end{tikzcd}$$

with g étale and w in the image of h. This is clear as the residue field extension $\kappa(f(w)) \subset \kappa(w)$ is purely inseparable, but for any $s' \in S'$ with $g(s') = f(w)$ the extension $\kappa(f(w)) \subset \kappa(s')$ would be separable.

If you assume the residue field extension is separble then the phenomenon of Remark 33.26.3 does not happen. Here is the precise result.

Lemma 33.26.4. *Let $f : X \to S$ be a morphism of schemes. Let $x \in X$ be a point with image $s \in S$. Assume*

(1) *f is smooth at x,*
(2) *the residue field extension $\kappa(s) \subset \kappa(x)$ is separable, and*
(3) *x is not a generic point of X_s.*

Then there exists an affine open neighbourhood $U \subset X$ of x and an effective Cartier divisor $D \subset U$ containing x such that $D \to S$ is smooth.

Proof. Write $k = \kappa(s)$ and $R = \mathcal{O}_{X_s,x}$. Denote $\mathfrak{m}$ the maximal ideal of R and $\kappa = R/\mathfrak{m}$ so that $\kappa = \kappa(x)$. As formation of modules of differentials commutes with localization (see Algebra, Lemma 7.122.8) we have $\Omega_{X_s/s,x} = \Omega_{R/k}$. By assumption (2) and Algebra, Lemma 7.129.4 the map

$$\mathrm{d} : \mathfrak{m}/\mathfrak{m}^2 \longrightarrow \Omega_{R/k} \otimes_R \kappa(\mathfrak{m})$$

is injective. Assumption (3) implies that $\mathfrak{m}/\mathfrak{m}^2 \neq 0$. Thus there exists an element $\overline{h} \in \mathfrak{m}$ such that $\mathrm{d}\overline{h}$ is nonzero. Choose a lift $h \in \mathcal{O}_{X,x}$ of $\overline{h}$ and apply Lemma 33.26.1. □

The subscheme Z constructed in the following lemma is really a complete intersection in an affine open neighbourhood of x. If we ever need this we will explicitly formulate a separate lemma stating this fact.

Lemma 33.26.5. *Let $f : X \to S$ be a morphism of schemes. Let $x \in X$ be a point with image $s \in S$. Assume*

1. *f is smooth at x, and*
2. *x is a closed point of X_s and $\kappa(s) \subset \kappa(x)$ is separable.*

Then there exists an immersion $Z \to X$ containing x such that

1. *$Z \to S$ is étale, and*
2. *$Z_s = \{x\}$ set theoretically.*

Proof. We may and do replace S by an affine open neighbourhoof of s. We may and do replace X by an affine open neighbourhood of x such that $X \to S$ is smooth. We will prove the lemma for smooth morphisms of affines by induction on $d = \dim_x(X_s)$.

The case $d = 0$. In this case we show that we may take Z to be an open neighbourhood of x. Namely, if $d = 0$, then $X \to S$ is quasi-finite at x, see Morphisms, Lemma 24.28.5. Hence there exists an affine open neighbourhood $U \subset X$ such that $U \to S$ is quasi-finite, see Morphisms, Lemma 24.47.2. Thus after replacing X by U we see that X is quasi-finite and smooth over S, hence smooth of relative dimension 0 over S, hence étale over S. Moreover, the fibre X_s is a finite discrete set. Hence after replacing X by a further affine open neigbourhood of X we see that that $f^{-1}(\{s\}) = \{x\}$ (because the topology on X_s is induced from the topology on X, see Schemes, Lemma 21.18.5). This proves the lemma in this case.

Next, assume $d > 0$. Note that because x is a closed point of its fibre the extension $\kappa(s) \subset \kappa(x)$ is finite (by the Hilbert Nullstellensatz, see Morphisms, Lemma 24.19.3). Thus we see $\Omega_{\kappa(x)/\kappa(s)} = 0$ as this holds for algebraic separable field extensions. Thus we may apply Lemma 33.26.2 to find a diagram

$$\begin{tikzcd} D \arrow[r] \arrow[drr] & U \arrow[r] \arrow[dr] & X \arrow[d] \\ & & S \end{tikzcd}$$

with $x \in D$. Note that $\dim_x(D_s) = \dim_x(X_s) - 1$ for example because $\dim(\mathcal{O}_{D_s,x}) = \dim(\mathcal{O}_{X_s,x}) - 1$ by Algebra, Lemma 7.57.11 (also $D_s \subset X_s$ is effective Cartier, see Divisors, Lemma 26.10.1) and then using Morphisms, Lemma 24.27.1. Thus the morphism $D \to S$ is smooth with $\dim_x(D_s) = \dim_x(X_s) - 1 = d - 1$. By induction hypothesis we can find an immersion $Z \to D$ as desired, which finishes the proof. □

Lemma 33.26.6. *Let $f : X \to S$ be a smooth morphism of schemes. Let $s \in S$ be a point in the image of f. Then there exists an étale neighbourhood $(S', s') \to (S, s)$ and a S-morphism $S' \to X$.*

First proof of Lemma 33.26.6. By assumption $X_s \neq \emptyset$. By Varieties, Lemma 28.15.6 there exists a closed point $x \in X_s$ such that $\kappa(x)$ is a finite separable field extension of $\kappa(s)$. Hence by Lemma 33.26.5 there exists an immersion $Z \to X$ such that $Z \to S$ is étale and such that $x \in Z$. Take $(S', s') = (Z, x)$. $\square$

Second proof of Lemma 33.26.6. Pick an point $x \in X$ with $f(x) = s$. Choose a diagram

$$\begin{tikzcd} X \arrow[d] & U \arrow[l] \arrow[r, "\pi"] \arrow[d] & \mathbf{A}^d_V \arrow[dl] \\ Y & V \arrow[l] & \end{tikzcd}$$

with π étale, $x \in U$ and $V = Spec(R)$ affine, see Morphisms, Lemma 24.35.20. In particular $s \in V$. The morphism $\pi : U \to \mathbf{A}^d_V$ is open, see Morphisms, Lemma 24.35.13. Thus $W = \pi(V) \cap \mathbf{A}^d_s$ is a nonempty open subset of $\mathbf{A}^d_s$. Let $w \in W$ be a point with $\kappa(s) \subset \kappa(w)$ finite separable, see Varieties, Lemma 28.15.5. By Algebra, Lemma 7.105.1 there exist d elements $\overline{f}_1, \ldots, \overline{f}_d \in \kappa(s)[x_1, \ldots, x_d]$ which generate the maximal ideal corresponding to w in $\kappa(s)[x_1, \ldots, x_n]$. After replacing R by a principal localization we may assume there are $f_1, \ldots, f_d \in R[x_1, \ldots, x_d]$ which map to $\overline{f}_1, \ldots, \overline{f}_d \in \kappa(s)[x_1, \ldots, x_d]$. Consider the R-algebra

$$R' = R[x_1, \ldots, x_d]/(f_1, \ldots, f_d)$$

and set $S' = Spec(R')$. By construction we have a closed immersion $j : S' \to \mathbf{A}^d_V$ over V. By construction the fibre of $S' \to V$ over s is a single point s' whose residue field is finite separable over $\kappa(s)$. Let $\mathfrak{q}' \subset R'$ be the corresponding prime. By Algebra, Lemma 7.125.11 we see that $(R')_g$ is a relative global complete intersection over R for some $g \in R'$, $g \not\in \mathfrak{q}$. Thus $S' \to V$ is flat and of finite presentation in a neighbourhood of s', see Algebra, Lemma 7.125.14. By construction the scheme theoretic fibre of $S' \to V$ over s is $Spec(\kappa(s'))$. Hence it follows from Morphisms, Lemma 24.35.15 that $S' \to S$ is étale at s'. Set

$$S'' = U \times_{\pi, \mathbf{A}^d_V, j} S'.$$

By construction there exists a point $s'' \in S''$ which maps to s' via the projection $p : S'' \to S'$. Note that p is étale as the base change of the étale morphism π, see Morphisms, Lemma 24.35.4. Choose a small affine neighbourhood $S''' \subset S''$ of s'' which maps into the nonempty open neighbourhood of $s' \in S'$ where the morphism $S' \to S$ is étale. Then the étale neighbourhood $(S''', s'') \to (S, s)$ is a solution to the problem posed by the lemma. $\square$

The following lemma shows that sheaves for the smooth topology are the same thing as sheaves for the étale topology.

Lemma 33.26.7. *Let S be a scheme. Let $\mathcal{U} = \{S_i \to S\}_{i \in I}$ be a smooth covering of S, see Topologies, Definition 30.5.1. Then there exists an étale covering $\mathcal{V} = \{T_j \to S\}_{j \in J}$ (see Topologies, Definition 30.4.1) which refines (see Sites, Definition 9.8.1) $\mathcal{U}$.*

Proof. For every $s \in S$ there exists an $i \in I$ such that s is in the image of $S_i \to S$. By Lemma 33.26.6 we can find an étale morphism $g_s : T_s \to S$ such that $s \in g_s(T)_s$ and such that g_s factors through $S_i \to S$. Hence $\{T_s \to S\}$ is an étale covering of S that refines $\mathcal{U}$. $\square$

33.27. Finite free locally dominates étale

In this section we explain a result that roughly states that étale coverings of a scheme S can be refined by Zariski coverings of finite locally free covers of S.

Lemma 33.27.1. *Let S be a scheme. Let $s \in S$. Let $f : (U, u) \to (S, s)$ be an étale neighbourhood. There exists an affine open neighbourhood $s \in V \subset S$ and a surjective, finite locally free morphism $\pi : T \to V$ such that for every $t \in \pi^{-1}(s)$ there exists an open neighbourhood $t \in W_t \subset T$ and a commutative diagram*

$$\begin{tikzcd} T \arrow[d, "\pi"] & W_t \arrow[l] \arrow[rr, "h_t"] \arrow[rd] & & U \arrow[ld] \\ V \arrow[rr] & & S & \end{tikzcd}$$

with $h_t(t) = u$.

Proof. The problem is local on S hence we may replace S by any open neighbourhood of s. We may also replace U by an open neighbourhood of u. Hence, by Morphisms, Lemma 24.35.14 we may assume that $U \to S$ is a standard étale morphism of affine schemes. In this case the lemma (with $V = S$) follows from Algebra, Lemma 7.132.17. □

Lemma 33.27.2. *Let $f : U \to S$ be a surjective étale morphism of affine schemes. There exists a surjective, finite locally free morphism $\pi : T \to S$ and a finite open covering $T = T_1 \cup \ldots \cup T_n$ such that each $T_i \to S$ factors through $U \to S$. Diagram:*

$$\begin{tikzcd} & \coprod T_i \arrow[ld] \arrow[rd] & \\ T \arrow[rd, "\pi"] & & U \arrow[ld, "f"'] \\ & S & \end{tikzcd}$$

where the south-west arrow is a Zariski-covering.

Proof. This is a restatement of Algebra, Lemma 7.132.18. □

Remark 33.27.3. In terms of topologies the lemmas above mean the following. Let S be any scheme. Let $\{f_i : U_i \to S\}$ be an étale covering of S. There exists a Zariski open covering $S = \bigcup V_j$, for each j a finite locally free, surjective morphism $W_j \to V_j$, and for each j a Zariski open covering $\{W_{j,k} \to W_j\}$ such that the family $\{W_{j,k} \to S\}$ refines the given étale covering $\{f_i : U_i \to S\}$. What does this mean in practice? Well, for example, suppose we have a descend problem which we know how to solve for Zariski coverings and for fppf coverings of the form $\{\pi : T \to S\}$ with π finite locally free and surjective. Then this descend problem has an affirmative answer for étale coverings as well. This trick was used by Gabber in his proof that $\mathrm{Br}(X) = \mathrm{Br}'(X)$ for an affine scheme X, see [**Hoo82**].

33.28. Étale localization of quasi-finite morphisms

Now we come to a series of lemmas around the theme ``quasi-finite morphisms become finite after étale localization''. The general idea is the following. Suppose given a morphism of schemes $f : X \to S$ and a point $s \in S$. Let $\varphi : (U, u) \to (S, s)$ be an étale neighbourhood of s in S. Consider the fibre product $X_U = U \times_S X$ and the basic diagram

(33.28.0.1)
$$\begin{tikzcd} V \arrow[r] \arrow[dr] & X_U \arrow[r] \arrow[d] & X \arrow[d, "f"] \\ & U \arrow[r, "\varphi"] & S \end{tikzcd}$$

where $V \subset X_U$ is open. Is there some standard model for the morphism $f_U : X_U \to U$, or for the morphism $V \to U$ for suitable opens V? Of course the answer is no in general. But for quasi-finite morphisms we can say something.

Lemma 33.28.1. *Let $f : X \to S$ be a morphism of schemes. Let $x \in X$. Set $s = f(x)$. Assume that*

(1) *f is locally of finite type, and*
(2) *$x \in X_s$ is isolated*[2].

Then there exist

(a) *an elementary étale neighbourhood $(U, u) \to (S, s)$,*
(b) *an open subscheme $V \subset X_U$ (see 33.28.0.1)*

such that

(i) *$V \to U$ is a finite morphism,*
(ii) *there is a unique point v of V mapping to u in U, and*
(iii) *the point v maps to x under the morphism $X_U \to X$, inducing $\kappa(x) = \kappa(v)$.*

Moreover, for any elementary étale neighbourhood $(U', u') \to (U, u)$ setting $V' = U' \times_U V \subset X_{U'}$ the triple (U', u', V') satisfies the properties (i), (ii), and (iii) as well.

Proof. Let $Y \subset X$, $W \subset S$ be affine opens such that $f(Y) \subset W$ and such that $x \in Y$. Note that x is also an isolated point of the fibre of the morphism $f|_Y : Y \to W$. If we can prove the theorem for $f|_Y : Y \to W$, then the theorem follows for f. Hence we reduce to the case where f is a morphism of affine schemes. This case is Algebra, Lemma 7.132.21. □

In the preceding and following lemma we do not assume that the morphism f is separated. This means that the opens V, V_i created in them are not necessarily closed in X_U. Moreover, if we choose the neighbourhood U to be affine, then each V_i is affine, but the intersections $V_i \cap V_j$ need not be affine (in the nonseparated case).

Lemma 33.28.2. *Let $f : X \to S$ be a morphism of schemes. Let $x_1, \ldots, x_n \in X$ be points having the same image s in S. Assume that*

(1) *f is locally of finite type, and*
(2) *$x_i \in X_s$ is isolated for $i = 1, \ldots, n$.*

Then there exist

(a) *an elementary étale neighbourhood $(U, u) \to (S, s)$,*
(b) *for each i an open subscheme $V_i \subset X_U$,*

such that for each i we have

(i) *$V_i \to U$ is a finite morphism,*
(ii) *there is a unique point v_i of V_i mapping to u in U, and*
(iii) *the point v_i maps to x_i in X and $\kappa(x_i) = \kappa(v_i)$.*

[2] In the presence of (1) this means that f is quasi-finite at x, see Morphisms, Lemma 24.19.6.

Proof. We will use induction on n. Namely, suppose $(U, u) \to (S, s)$ and $V_i \subset X_U$, $i = 1, \ldots, n-1$ work for $x_1, \ldots, x_{n-1}$. Since $\kappa(s) = \kappa(u)$ the fibre $(X_U)_u = X_s$. Hence there exists a unique point $x'_n \in X_u \subset X_U$ corresponding to $x_n \in X_s$. Also x'_n is isolated in X_u. Hence by Lemma 33.28.1 there exists an elementary étale neighbourhood $(U', u') \to (U, u)$ and an open $V_n \subset X_{U'}$ which works for x'_n and hence for x_n. By the final assertion of Lemma 33.28.1 the open subschemes $V'_i = U' \times_U V_i$ for $i = 1, \ldots, n-1$ still work with respect to $x_1, \ldots, x_{n-1}$. Hence we win. □

If we allow a nontrivial field extension $\kappa(s) \subset \kappa(u)$, i.e., general étale neighbourhoods, then we can split the points as follows.

Lemma 33.28.3. *Let $f : X \to S$ be a morphism of schemes. Let $x_1, \ldots, x_n \in X$ be points having the same image s in S. Assume that*

(1) *f is locally of finite type, and*
(2) *$x_i \in X_s$ is isolated for $i = 1, \ldots, n$.*

Then there exist

(a) *an étale neighbourhood $(U, u) \to (S, s)$,*
(b) *for each i an integer m_i and open subschemes $V_{i,j} \subset X_U$, $j = 1, \ldots, m_i$*

such that we have

(i) *each $V_{i,j} \to U$ is a finite morphism,*
(ii) *there is a unique point $v_{i,j}$ of $V_{i,j}$ mapping to u in U with $\kappa(u) \subset \kappa(v_{i,j})$ finite purely inseparable,*
(iv) *if $v_{i,j} = v_{i',j'}$, then $i = i'$ and $j = j'$, and*
(iii) *the points $v_{i,j}$ map to x_i in X and no other points of $(X_U)_u$ map to x_i.*

Proof. This proof is a variant of the proof of Algebra, Lemma 7.132.23 in the language of schemes. By Morphisms, Lemma 24.19.6 the morphism f is quasi-finite at each of the points x_i. Hence $\kappa(s) \subset \kappa(x_i)$ is finite for each i (Morphisms, Lemma 24.19.5). For each i, let $\kappa(s) \subset L_i \subset \kappa(x_i)$ be the subfield such that $L_i/\kappa(s)$ is separable, and $\kappa(x_i)/L_i$ is purely inseparable. Choose a finite Galois extension $\kappa(s) \subset L$ such that there exist $\kappa(s)$-embeddings $L_i \to L$ for $i = 1, \ldots, n$. Choose an étale neighbourhood $(U, u) \to (S, s)$ such that $L \cong \kappa(u)$ as $\kappa(s)$-extensions (Lemma 33.25.2).

Let $y_{i,j}$, $j = 1, \ldots, m_i$ be the points of X_U lying over $x_i \in X$ and $u \in U$. By Schemes, Lemma 21.17.5 these points $y_{i,j}$ correspond exactly to the primes in the rings $\kappa(u) \otimes_{\kappa(s)} \kappa(x_i)$. This also explains why there are finitely many; in fact $m_i = [L_i : \kappa(s)]$ but we do not need this. By our choice of L (and elementary field theory) we see that $\kappa(u) \subset \kappa(y_{i,j})$ is finite purely inseparable for each pair i, j. Also, by Morphisms, Lemma 24.19.13 for example, the morphism $X_U \to U$ is quasi-finite at the points $y_{i,j}$ for all i, j.

Apply Lemma 33.28.2 to the morphism $X_U \to U$, the point $u \in U$ and the points $y_{i,j} \in (X_U)_u$. This gives an étale neighbourhood $(U', u') \to (U, u)$ with $\kappa(u) = \kappa(u')$ and opens $V_{i,j} \subset X_{U'}$ with the properties (i), (ii), and (iii) of that lemma. We claim that the étale neighbourhood $(U', u') \to (S, s)$ and the opens $V_{i,j} \subset X_{U'}$ are a solution to the problem posed by the lemma. We omit the verifications. □

Lemma 33.28.4. *Let $f : X \to S$ be a morphism of schemes. Let $s \in S$. Let $x_1, \ldots, x_n \in X_s$. Assume that*

(1) *f is locally of finite type,*
(2) *f is separated, and*
(3) *$x_1, \ldots, x_n$ are pairwise distinct isolated points of X_s.*

Then there exists an elementary étale neighbourhood $(U, u) \to (S, s)$ and a decomposition

$$U \times_S X = W \coprod V_1 \coprod \ldots \coprod V_n$$

into open and closed subschemes such that the morphisms $V_i \to U$ are finite, the fibres of $V_i \to U$ over u are singletons $\{v_i\}$, each v_i maps to x_i with $\kappa(x_i) = \kappa(v_i)$, and the fibre of $W \to U$ over u contains no points mapping to any of the x_i.

Proof. Choose $(U, u) \to (S, s)$ and $V_i \subset X_U$ as in Lemma 33.28.2. Since $X_U \to U$ is separated (Schemes, Lemma 21.21.13) and $V_i \to U$ is finite hence proper (Morphisms, Lemma 24.42.10) we see that $V_i \subset X_U$ is closed by Morphisms, Lemma 24.40.7. Hence $V_i \cap V_j$ is a closed subset of V_i which does not contain v_i. Hence the image of $V_i \cap V_j$ in U is a closed set (because $V_i \to U$ proper) not containing u. After shrinking U we may therefore assume that $V_i \cap V_j = \emptyset$ for all i, j. This gives the decomposition as in the lemma. $\square$

Here is the variant where we reduce to purely inseparable field extensions.

Lemma 33.28.5. *Let $f : X \to S$ be a morphism of schemes. Let $s \in S$. Let $x_1, \ldots, x_n \in X_s$. Assume that*

1. *f is locally of finite type,*
2. *f is separated, and*
3. *$x_1, \ldots, x_n$ are pairwise distinct isolated points of X_s.*

Then there exists an étale neighbourhood $(U, u) \to (S, s)$ and a decomposition

$$U \times_S X = W \coprod \coprod\nolimits_{i=1,\ldots,n} \coprod\nolimits_{j=1,\ldots,m_i} V_{i,j}$$

into open and closed subschemes such that the morphisms $V_{i,j} \to U$ are finite, the fibres of $V_{i,j} \to U$ over u are singletons $\{v_{i,j}\}$, each $v_{i,j}$ maps to x_i, $\kappa(u) \subset \kappa(v_{i,j})$ is purely inseparable, and the fibre of $W \to U$ over u contains no points mapping to any of the x_i.

Proof. This is proved in exactly the same way as the proof of Lemma 33.28.4 except that it uses Lemma 33.28.3 instead of Lemma 33.28.2. $\square$

The following version may be a little easier to parse.

Lemma 33.28.6. *Let $f : X \to S$ be a morphism of schemes. Let $s \in S$. Assume that*

1. *f is locally of finite type,*
2. *f is separated, and*
3. *X_s has at most finitely many isolated points.*

Then there exists an elementary étale neighbourhood $(U, u) \to (S, s)$ and a decomposition

$$U \times_S X = W \coprod V$$

into open and closed subschemes such that the morphisms $V \to U$ is finite, and the fibre W_u of the morphism $W \to U$ contains no isolated points. In particular, if $f^{-1}(s)$ is a finite set, then $W_u = \emptyset$.

Proof. This is clear from Lemma 33.28.4 by choosing $x_1, \ldots, x_n$ the complete set of isolated points of X_s and setting $V = \bigcup V_i$. $\square$

33.29. Application to the structure of quasi-finite morphisms

We can use the existence of good étale neighbourhoods to prove some fundamental facts about quasi-finite morphisms.

Lemma 33.29.1. *(Normalization commutes with smooth base change.) Let*

$$\begin{tikzcd} Y_U \arrow[r] \arrow[d] & Y \arrow[d, "f"] \\ U \arrow[r, "\varphi"] & X \end{tikzcd}$$

be a fibre square in the category of schemes. Assume f is quasi-compact and quasi-separated, and $\varphi : U \to X$ is a smooth morphism. Let $Y \to X' \to X$ be the normalization of X in Y. Let $Y_U \to (X_U)' \to U$ be the normalization of U in Y_U. Then $(X_U)' \cong U \times_X X'$.

Proof. Denote $f_U : Y_U \to U$ the base change of f. By definition we have $X' = \underline{Spec}_X(\mathscr{A})$ and $(X_U)' = \underline{Spec}_U(\mathscr{A}')$, where $\mathscr{A} \subset f_*\mathcal{O}_Y$ is the integral closure of $\mathcal{O}_X$ and $\mathscr{A}' \subset (f_U)_*\mathcal{O}_{Y_U}$ is the integral closure of $\mathcal{O}_U$. By Coherent, Lemma 25.6.2 we know that $(f_U)_*\mathcal{O}_{Y_U}$ is the same as $\varphi^*(f_*\mathcal{O}_Y)$. Let $Spec(C) \subset U$, $Spec(R) \subset X$ be affine opens with $\varphi(Spec(C)) \subset Spec(R)$. Hence $R \to C$ is a smooth ring map, see Morphisms, Lemma 24.33.2. Write

$$f_*\mathcal{O}_Y|_{Spec(R)} = \widetilde{B} \quad \text{and} \quad (f_U)_*\mathcal{O}_{Y_U}|_{Spec(C)} = \widetilde{B'}.$$

By the above we have $B' = C \otimes_R B$. Let $A \subset B$ be the integral closure of R in B and let $A' \subset B'$ be the integral closure of C in B'. Then we have

$$\mathscr{A}|_{Spec(R)} = \widetilde{A} \quad \text{and} \quad \mathscr{A}'|_{Spec(C)} = \widetilde{A'},$$

see Morphisms, Lemma 24.46.1. Hence the lemma is reduced to proving that $C \otimes_R A \cong A'$. This is the content of Algebra, Lemma 7.134.4. $\square$

Lemma 33.29.2. *Let $f : X \to S$ be a morphism of schemes. Assume f is of finite type and separated. Let S' be the normalization of S in X, see Morphisms, Definition 24.46.3. Picture:*

$$\begin{tikzcd} X \arrow[rr, "f'"] \arrow[dr, "f"'] & & S' \arrow[dl, "\nu"] \\ & S & \end{tikzcd}$$

Then there exists an open subscheme $U' \subset S'$ such that

1. *$(f')^{-1}(U') \to U'$ is an isomorphism, and*
2. *$(f')^{-1}(U') \subset X$ is the set of points at which f is quasi-finite.*

Proof. By Morphisms, Lemma 24.47.2 the subset $U \subset X$ of points where f is quasi-finite is open, and $U \to S$ is locally quasi-finite. Let $x \in U$. We want to show that

(a) there exists an open neighbourhood $V'' \subset S'$ of $f'(x)$ such that the morphism $f'|_{(f')^{-1}(V'')} : (f')^{-1}(V'') \to V''$ is an isomorphism.

This will prove the lemma since it will imply that $U' = f(U)$ is open, $f^{-1}(U') = U$ and that $f'|_U : U \to U'$ is an isomorphism.

Let $s = f(x)$. Choose an elementary étale neighbourhood $(T, t) \to (S, s)$ and a decomposition

$$X_T = V \coprod W$$

into open and closed subschemes where $V \to T$ is finite, and such that V has a unique point $v \in V$ in the fibre over t which maps to x, and the fibre of $W \to T$ over t contains no point mapping to x. We can do this according to Lemma 33.28.4. Denote $f_T : X_T \to T$ (resp. f'_T) the base change of f (resp. f'). According to Lemma 33.29.1 the factorization

$$X_T \xrightarrow{f'_T} T \times_S S' \longrightarrow T$$

is the normalization of T in X_T. On the other hand, since X_T is a disjoint union of two schemes over T, we see that the normalization of T in X_T is the morphism

$$X_T = V \coprod W \longrightarrow V' \coprod W' \longrightarrow T$$

where V' is the normalization of T in V and W' is the normalization of T in W (Morphisms, Lemma 24.46.7). However, since $V \to T$ is finite we see that $V \to V'$ is an isomorphism (Morphisms, Lemmas 24.42.4 and 24.46.8). Also, $(f'_T)^{-1}(V') = V$. In other words, we have shown the following

(α) there exists an open neighbourhood $V' \subset X'_T$ of $f'_T(v)$ such that the restriction $(f'_T)^{-1}(V') \to V'$ is an isomorphism.

We will show that property (α) implies property (a) above. Since $T \to S$ is étale we see that $X'_T \to X'$ is étale (Morphisms, Lemma 24.35.4). Hence also $V' \to X'$ is étale, in particular open (Morphisms, Lemmas 24.24.9, 24.35.11 and 24.35.12). Denote $V'' \subset X'$ the image. Note that

$$(f'_T)^{-1}(V') = V' \times_{X'} X = V' \times_{V''} (f')^{-1}(V'')$$

Hence the restriction $f'|_{(f')^{-1}(V'')} : (f')^{-1}(V'') \to V''$ is a morphism whose base change to V' is an isomorphism. Since $\{V' \to V''\}$ is an étale covering, we see that $f'|_{(f')^{-1}(V'')} : (f')^{-1}(V'') \to V''$ is an isomorphism also, by Descent, Lemma 31.19.15. This proves (a) and we are done. $\square$

Lemma 33.29.3. *Let $f : X \to S$ be a morphism of schemes. Assume f is quasi-finite and separated. Let S' be the normalization of S in X, see Morphisms, Definition 24.46.3. Picture:*

$$\begin{tikzcd} X \arrow[rr, "f'"] \arrow[dr, "f"'] & & S' \arrow[dl, "\nu"] \\ & S & \end{tikzcd}$$

Then f' is a quasi-compact open immersion and ν is integral. In particular f is quasi-affine.

Proof. This follows from Lemma 33.29.2. Namely, by that lemma there exists an open suscheme $U' \subset S'$ such that $(f')^{-1}(U') = X$ (!) and $X \to U'$ is an isomorphism! In other words, f' is an open immersion. Note that f' is quasi-compact as f is quasi-compact and $\nu : S' \to S$ is separated (Schemes, Lemma 21.21.15). It follows that f is quasi-affine by Morphisms, Lemma 24.12.3. $\square$

Lemma 33.29.4. *Let $f : X \to S$ be a morphism of schemes. Assume f is quasi-finite and separated and assume that S is quasi-compact and quasi-separated. Then there exists a factorization*

$$\begin{tikzcd} X \arrow[rr, "j"] \arrow[dr, "f"'] & & T \arrow[dl, "\pi"] \\ & S & \end{tikzcd}$$

where j is a quasi-compact open immersion and π is finite.

Proof. Let $X \to S' \to S$ be as in the conclusion of Lemma 33.29.3. By Properties, Lemma 23.20.10 we can write $\nu_*\mathcal{O}_{S'} = colim_\lambda \mathcal{A}_\lambda$ as a directed colimit of quasi-coherent $\mathcal{O}_X$-sub algebras $\mathcal{A}_\lambda$ of finite type. Set $T_\lambda = \underline{Spec}_S(\mathcal{A}_\lambda)$. Since $\mathcal{A}_\lambda$ is a quasi-coherent $\mathcal{O}_X$-algebra of finite type contained in the integral $\mathcal{O}_X$-algebra $\nu_*\mathcal{O}_{S'}$, we see that in fact $\mathcal{A}_\lambda$ is finite as an $\mathcal{O}_X$-module, see Algebra, Lemma 7.32.5. Hence $\pi_\lambda : T_\lambda \to S$ is a finite morphism for each λ. Note that the transition morphisms $T_\lambda \to T_\lambda$ are affine and that $S' = lim_\lambda T_\lambda$.

As S is quasi-compact we may choose a finite affine open covering $S = \bigcup_{i=1,\ldots,n} V_i$. As f' is quasi-compact, we can for each i choose a finite number of elements $h_{ij} \in \Gamma(\nu^{-1}(V_i), \mathcal{O}_{S'})$ such that

$$f'(X) \cap \nu^{-1}(V_i) = \bigcup D(h_{ij}).$$

Let $X_{ij} \subset X$ denote the affine open subscheme mapping isomorphically to $D(h_{ij})$. Since $X \to S$ is of finite type we see that

$$\Gamma(V_i, \mathcal{O}_S) \to \Gamma(X_{ij}, \mathcal{O}_X) = \Gamma(D(h_{ij}), \mathcal{O}_{S'}) = \Gamma(\nu^{-1}(V_i), \mathcal{O}_{S'})_{h_{ij}}$$

is a finite type ring map, see Morphisms, Lemma 24.14.2. Choose finitely many $a_{ijk} \in \Gamma(\nu^{-1}(V_i), \mathcal{O}_{S'})$ which together with h_{ij}^{-1} generate $\Gamma(X_{ij}, \mathcal{O}_X)$ as an $\Gamma(V_i, \mathcal{O}_S)$-algebra. Now, pick λ so large that there exist

$$A_{ijk}, H_{ij} \in \Gamma(\pi_\lambda^{-1}(V_i), \mathcal{O}_{T_\lambda})$$

mapping to the elements a_{ijk}, h_{ij} chosen above. Let $U_\lambda \subset T_\lambda$ be the union of the standard affine opens $D(H_{ij})$ determined by the H_{ij} inside $\pi_\lambda^{-1}(V_i)$. By construction the morphism $X \to T_\lambda$ factors through U_λ. By construction the morphism $X \to T_\lambda$ is a closed immersion, because the ring maps on the affine opens $X_{ij} \to D(H_{ij})$ are surjective by construction. Hence $X \to T_\lambda$ is a locally closed immersion. (In fact this morphism will be an open immersion for sufficiently large λ but we don't need this.) By Morphisms, Lemma 24.2.8 we can factor this as $X \to T \to T_\lambda$ where the first arrow is an open immersion and the second a closed immersion. Thus we win. □

Lemma 33.29.5. *Let $f : X \to S$ be a morphism of schemes. The following are equivalent:*

(1) *f is finite,*
(2) *f is proper with finite fibres.*
(3) *f is universally closed, separated, locally of finite type and has finite fibres.*

Proof. We have (1) implies (2) by Morphisms, Lemmas 24.42.10, 24.19.10, and 24.42.9. By definition (2) implies (3).

Assume (3). Pick $s \in S$. By Morphisms, Lemma 24.19.7 we see that all the finitely many points of X_s are isolated in X_s. Choose an elementary étale neighbourhood $(U, u) \to (S, s)$ and decomposition $X_U = V \coprod W$ as in Lemma 33.28.6. Note that $W_u = \emptyset$ because all points of X_s are isolated. Since f is universally closed we see that the image of W in U is a closed set not containing u. After shrinking U we may assume that $W = \emptyset$. In other words we see that $X_U = V$ is finite over U. Since $s \in S$ was arbitrary this means there exists a family $\{U_i \to S\}$ of étale morphisms whose images cover S such that the base changes $X_{U_i} \to U_i$ are finite. Note that $\{U_i \to S\}$ is an étale covering, see Topologies, Definition 30.4.1. Hence it is an fpqc covering, see Topologies, Lemma 30.8.6. Hence we conclude f is finite by Descent, Lemma 31.19.21. □

As a consequence we have the following two useful results.

Lemma 33.29.6. *Let $f : X \to S$ be a morphism of schemes. Let $s \in S$. Assume that f is proper and $f^{-1}(\{s\})$ is a finite set. Then there exists an open neighbourhood $V \subset S$ of s such that $f|_{f^{-1}(V)} : f^{-1}(V) \to V$ is finite.*

Proof. The morphism f is quasi-finite at all the points of $f^{-1}(\{s\})$ by Morphisms, Lemma 24.19.7. By Morphisms, Lemma 24.47.2 the set of points at which f is quasi-finite is an open $U \subset X$. Let $Z = X \setminus U$. Then $s \notin f(Z)$. Since f is proper the set $f(Z) \subset S$ is closed. Choose any open neighbourhood $V \subset S$ of s with $Z \cap V = \emptyset$. Then $f^{-1}(V) \to V$ is locally quasi-finite and proper. Hence it is quasi-finite (Morphisms, Lemma 24.19.9), hence has finite fibres (Morphisms, Lemma 24.19.10), hence is finite by Lemma 33.29.5. □

Lemma 33.29.7. *Let $f : Y \to X$ be a quasi-finite morphism. There exists a dense open $U \subset X$ such that $f|_{f^{-1}(U)} : f^{-1}(U) \to U$ is finite.*

Proof. If $U', U'' \subset X$ are opens such that the restrictions $f|_{f^{-1}(U')} : f^{-1}(U') \to U'$ and $f|_{f^{-1}(U'')} : f^{-1}(U'') \to U''$ are finite, then for $U = U' \cup U''$ the restriction $f|_{f^{-1}(U)} : f^{-1}(U) \to U$ is finite, see Morphisms, Lemma 24.42.3. Thus the problem is local on X and we may assume that X is affine.

Assume X is affine. Write $Y = \bigcup_{j=1,\ldots,m} V_j$ with V_j affine. This is possible since f is quasi-finite and hence in particular quasi-compact. Each $V_j \to X$ is quasi-finite and separated. Let $\eta \in X$ be a generic point of an irreducible component of X. We see from Morphisms, Lemmas 24.19.10 and 24.45.1 that there exists an open neighbourhood $\eta \in U_\eta$ such that $f^{-1}(U_\eta) \cap V_j \to U_\eta$ is finite. We may choose U_η such that it works for each $j = 1, \ldots, m$. Note that the collection of generic points of X is dense in X. Thus we see there exists a dense open $W = \bigcup_\eta U_\eta$ such that each $f^{-1}(W) \cap V_j \to W$ is finite. It suffices to show that there exists a dense open $U \subset W$ such that $f|_{f^{-1}(U)} : f^{-1}(U) \to U$ is finite. Thus we may replace X by an affine open subscheme of W and assume that each $V_j \to X$ is finite.

Assume X is affine, $Y = \bigcup_{j=1,\ldots,m} V_j$ with V_j affine, and the restrictions $f|_{V_j} : V_j \to X$ are finite. Set

$$\Delta_{ij} = \left(\overline{V_i \cap V_j} \setminus V_i \cap V_j\right) \cap V_j.$$

This is a nowhere dense closed subset of V_j because it is the boundary of the open subset $V_i \cap V_j$ in V_j. By Morphisms, Lemma 24.44.7 the image $f(\Delta_{ij})$ is a nowhere dense closed subset of X. By Topology, Lemma 5.17.2 the union $T = \bigcup f(\Delta_{ij})$ is a nowhere dense closed subset of X. Thus $U = X \setminus T$ is a dense open subset of X. We claim that $f|_{f^{-1}(U)} : f^{-1}(U) \to U$ is finite. To see this let $U' \subset U$ be an affine open. Set $Y' = f^{-1}(U') = U' \times_X Y$, $V'_j = Y' \cap V_j = U' \times_X V_j$. Consider the restriction

$$f' = f|_{Y'} : Y' \longrightarrow U'$$

of f. This morphism now has the property that $Y' = \bigcup_{j=1,\ldots,m} V'_j$ is an affine open covering, each $V'_j \to U'$ is finite, and $V'_i \cap V'_j$ is (open and) closed both in V'_i and V'_j. Hence $V'_i \cap V'_j$ is affine, and the map

$$\mathcal{O}(V'_i) \otimes_{\mathbf{Z}} \mathcal{O}(V'_j) \longrightarrow \mathcal{O}(V'_i \cap V'_j)$$

is surjective. This implies that Y' is separated, see Schemes, Lemma 21.21.8. Finally, consider the commutative diagram

$$\begin{tikzcd} \coprod_{j=1,\ldots,m} V'_j \arrow[rr] \arrow[dr] & & Y' \arrow[dl] \\ & U' & \end{tikzcd}$$

The south-east arrow is finite, hence proper, the horizontal arrow is surjective, and the south-west arrow is separated. Hence by Morphisms, Lemma 24.40.8 we conclude that $Y' \to U'$ is proper. Since it is also quasi-finite, we see that it is finite by Lemma 33.29.5, and we win. □

33.30. Application to morphisms with connected fibres

In this section we prove some lemmas that produce morphisms all of whose fibres are geometrically connected or geometrically integral. This will be useful in our study of the local structure of morphisms of finite type later.

Lemma 33.30.1. *Consider a diagram of morphisms of schemes*

$$\begin{tikzcd} Z \arrow[r, "\sigma"'] \arrow[dr] & X \arrow[d] \\ & Y \end{tikzcd}$$

an a point $y \in Y$. Assume

(1) *$X \to Y$ is of finite presentation and flat,*
(2) *$Z \to Y$ is finite locally free,*
(3) *$Z_y \neq \emptyset$,*
(4) *all fibres of $X \to Y$ are geometrically reduced, and*
(5) *X_y is geometrically connected over $\kappa(y)$.*

Then there exists an open $X^0 \subset X$ such that $X^0_y = X_y$ and such that all fibres of $X^0 \to Y$ are geometrically connected.

Proof. In this proof we will use that flat, finite presentation, finite locally free are properties that are preserved under base change and composition. We will also use that a finite locally free morphism is both open and closed. You can find these facts as Morphisms, Lemmas 24.24.7, 24.20.4, 24.44.4, 24.24.5, 24.20.3, 24.44.3, 24.24.9, and 24.42.10.

Note that $X_Z \to Z$ is flat morphism of finite presentation which has a section s coming from σ. Let X^0_Z denote the subset of X_Z defined in Situation 33.22.1. By Lemma 33.22.6 it is an open subset of X_Z.

The pullback $X_{Z\times_Y Z}$ of X to $Z \times_Y Z$ comes equipped with two sections s_0, s_1, namely the base changes of s by $\mathrm{pr}_0, \mathrm{pr}_1 : Z \times_Y Z \to Z$. The construction of Situation 33.22.1 gives two subsets $(X_{Z\times_Y Z})^0_{s_0}$ and $(X_{Z\times_Y Z})^0_{s_1}$. By Lemma 33.22.2 these are the inverse images of X^0_Z under the morphisms $1_X \times \mathrm{pr}_0, 1_X \times \mathrm{pr}_1 : X_{Z\times_Y Z} \to X_Z$. In particular these subsets are open.

Let $(Z \times_Y Z)_y = \{z_1, \ldots, z_n\}$. As X_y is geometrically connected, we see that the fibres of $(X_{Z\times_Y Z})^0_{s_0}$ and $(X_{Z\times_Y Z})^0_{s_1}$ over each z_i agree (being equal to the whole fibre). Another way to say this is that

$$s_0(z_i) \in (X_{Z\times_Y Z})^0_{s_1} \quad \text{and} \quad s_1(z_i) \in (X_{Z\times_Y Z})^0_{s_0}.$$

Since the sets $(X_{Z\times_Y Z})^0_{s_0}$ and $(X_{Z\times_Y Z})^0_{s_1}$ are open in $X_{Z\times_Y Z}$ there exists an open neighbourhood $W \subset Z \times_Y Z$ of $(Z \times_Y Z)_y$ such that

$$s_0(W) \subset (X_{Z\times_Y Z})^0_{s_1} \quad \text{and} \quad s_1(W) \subset (X_{Z\times_Y Z})^0_{s_0}.$$

Then it follows directly from the construction in Situation 33.22.1 that

$$p^{-1}(W) \cap (X_{Z\times_Y Z})^0_{s_0} = p^{-1}(W) \cap (X_{Z\times_Y Z})^0_{s_1}$$

where $p : X_{Z\times_Y Z} \to Z \times_W Z$ is the projection. Because $Z \times_Y Z \to Y$ is finite locally free, hence open and closed, there exists an open neighbourhood $V \subset Y$ of y such that $q^{-1}(V) \subset W$, where $q : Z \times_Y Z \to Y$ is the structure morphism. To prove the lemma we may replace Y by V (because an empty topological space is connected). After we do this we see that $X^0_Z \subset Y_Z$ is an open such that

$$(1_X \times \text{pr}_0)^{-1}(X^0_Z) = (1_X \times \text{pr}_1)^{-1}(X^0_Z).$$

This means that the image $X^0 \subset X$ of X^0_Z is an open such that $(X_Z \to X)^{-1}(X^0) = X^0_Z$, see Descent, Lemma 31.9.2. At this point it is clear that X^0 is the desired open subscheme. □

Lemma 33.30.2. *Let $h : Y \to S$ be a morphism of schemes. Let $s \in S$ be a point. Let $T \subset Y_s$ be an open subscheme. Assume*

(1) *h is flat and of finite presentation,*
(2) *all fibres of h are geometrically reduced, and*
(3) *T is geometrically connected over $\kappa(s)$.*

Then we can find an elementary étale neighbourhood $(S', s') \to (S, s)$ and an open $V \subset Y_{S'}$ such that

(a) *all fibres of $V \to S'$ are geometrically connected,*
(b) *$V_{s'} = T \times_s s'$.*

Proof. The problem is clearly local on S, hence we may replace S by an affine open neighbourhood of s. The topology on Y_s is induced from the topology on X, see Schemes, Lemma 21.18.5. Hence we can find a quasi-compact open $V \subset Y$ such that $V_s = T$. The restriction of h to V is quasi-compact (as S affine and V quasi-compact), quasi-separated, locally of finite presentation, and flat hence flat of finite presentation. Thus after replacing Y by V we may assume, in addition to (1) and (2) that $Y_s = T$ and S affine.

Pick a point $y \in Y_s$ such that h is Cohen-Macaulay at y, see Lemma 33.15.4. By Lemma 33.16.4 there exists a diagram

$$\begin{tikzcd} Z \arrow[r] \arrow[dr] & Y \arrow[d] \\ & S \end{tikzcd}$$

such that $Z \to S$ is flat, locally of finite presentation, locally quasi-finite with $Z_s = \{z\}$. Apply Lemma 33.28.1 to find an elementary neighbourhood $(S', s') \to (S, s)$ and an open $Z' \subset Z_{S'} = S' \times_S Z$ with $Z' \to S'$ finite with a unique point $z' \in Z'$ lying over s. Note that $Z' \to S'$ is also locally of finite presentation and flat (as an open of the base change of $Z \to S$), hence $Z' \to S'$ is finite locally free, see Morphisms, Lemma 24.44.2. Note that $Y_{S'} \to S'$ is flat and of finite presentation with geometrically reduced fibres as a base change of h. Also $Y_{s'} = Y_s$ is geometrically connected. To finish the proof apply Lemma 33.30.1 to $Z' \to Y_{S'}$ over S'. $\square$

Lemma 33.30.3. *Let $h : Y \to S$ be a morphism of schemes. Let $s \in S$ be a point. Let $T \subset Y_s$ be an open subscheme. Assume*

(1) *h is of finite presentation,*
(2) *h is normal, and*
(3) *T is geometrically irreducible over $\kappa(s)$.*

Then we can find an elementary étale neighbourhood $(S', s') \to (S, s)$ and an open $V \subset Y_{S'}$ such that

(a) *all fibres of $V \to S'$ are geometrically integral,*
(b) *$V_{s'} = T \times_s s'$.*

Proof. Apply Lemma 33.30.2 to find an elementary étale neighbourhood $(S', s') \to (S, s)$ and an open $V \subset Y_{S'}$ such that all fibres of $V \to S'$ are geometrically integral and $V_{s'} = T \times_s s'$. Note that $V \to S'$ is open, see Morphisms, Lemma 24.24.9 Hence after replacing S' by the image of $V \to S'$ we see that all fibres of $V \to S'$ are nonempty. As V is an open of the base change of h all fibres of $V \to S'$ are geometrically normal, see Lemma 33.13.2. In particular, they are geometrically reduced. To finish the proof we have to show they are geometrically irreducible. But, if $t \in S'$ then V_t is of finite type over $\kappa(t)$ and hence $V_t \times_{\kappa(t)} \overline{\kappa(t)}$ is of finite type over $\overline{\kappa(t)}$ hence Noetherian. By choice of $S' \to S$ the scheme $V_t \times_{\kappa(t)} \overline{\kappa(t)}$ is connected. Hence $V_t \times_{\kappa(t)} \overline{\kappa(t)}$ is irreducible by Properties, Lemma 23.7.6 and we win. $\square$

33.31. Application to the structure of finite type morphisms

The result in this section can be found in [**GR71**]. Loosely stated it says that a finite type morphism is étale locally on the source and target the composition of a finite morphism by a smooth morphism with geometrically connected fibres of relative dimension equal to the fibre dimension of the original morphism.

Lemma 33.31.1. *Let $f : X \to S$ be a morphism. Let $x \in X$ and set $s = f(x)$. Assume that f is locally of finite type and that $n = \dim_x(X_s)$. Then there exists a commutative diagram*

$$\begin{tikzcd} X \arrow[dd] & X' \arrow[l, "g"'] \arrow[d, "\pi"] \\ & Y \arrow[d, "h"] \\ S \arrow[r, equal] & S \end{tikzcd} \qquad \begin{tikzcd} x \arrow[dd, mapsto] & x' \arrow[l, mapsto] \arrow[d, mapsto] \\ & y \arrow[d, mapsto] \\ s \arrow[r, equal] & s \end{tikzcd}$$

and a point $x' \in X'$ with $g(x') = x$ such that with $y = \pi(x')$ we have

(1) *$h : Y \to S$ is smooth of relative dimension n,*
(2) *$g : (X', x') \to (X, x)$ is an elementary étale neighbourhood,*
(3) *π is finite, and $\pi^{-1}(\{y\}) = \{x'\}$, and*
(4) *$\kappa(y)$ is a purely transcendental extension of $\kappa(s)$.*

Moreover, if f is locally of finite presentation then π is of finite presentation.

Proof. The problem is local on X and S, hence we may assume that X and S are affine. By Algebra, Lemma 7.116.3 after replacing X by a standard open neighbourhood of x in X we may assume there is a factorization

$$X \xrightarrow{\pi} \mathbf{A}^n_S \longrightarrow S$$

such that π is quasi-finite and such that $\kappa(\pi(x))$ is purely transcendental over $\kappa(s)$. By Lemma 33.28.1 there exists an elementary étale neighbourhood

$$(Y, y) \to (\mathbf{A}^n_S, \pi(x))$$

and an open $X' \subset X \times_{\mathbf{A}^n_S} Y$ which contains a unique point x' lying over y such that $X' \to Y$ is finite. This proves (1) -- (4) hold. For the final assertion, use Morphisms, Lemma 24.20.11. $\square$

Lemma 33.31.2. *Let $f : X \to S$ be a morphism. Let $x \in X$ and set $s = f(x)$. Assume that f is locally of finite type and that $n = \dim_x(X_s)$. Then there exists a commutative diagram*

$$\begin{tikzcd} X \arrow[dd] & X' \arrow[l, "g"'] \arrow[d, "\pi"] \\ & Y' \arrow[d, "h"] \\ S & S' \arrow[l, "e"'] \end{tikzcd} \qquad \begin{tikzcd} x \arrow[dd, mapsto] & x' \arrow[l, mapsto] \arrow[d, mapsto] \\ & y' \arrow[d, mapsto] \\ s & s' \arrow[l, mapsto] \end{tikzcd}$$

and a point $x' \in X'$ with $g(x') = x$ such that with $y' = \pi(x')$, $s' = h(y')$ we have

(1) *$h : Y' \to S'$ is smooth of relative dimension n,*
(2) *all fibres of $Y' \to S'$ are geometrically integral,*
(3) *$g : (X', x') \to (X, x)$ is an elementary étale neighbourhood,*
(4) *π is finite, and $\pi^{-1}(\{y'\}) = \{x'\}$,*
(5) *$\kappa(y')$ is a purely transcendental extension of $\kappa(s')$, and*
(6) *$e : (S', s') \to (S, s)$ is an elementary étale neighbourhood.*

Moreover, if f is locally of finite presentation, then π is of finite presentation.

Proof. The question is local on S, hence we may replace S by an affine open neighbourhood of s. Next, we apply Lemma 33.31.1 to get a commutative diagram

$$\begin{tikzcd} X \arrow[dd] & X' \arrow[l, "g"'] \arrow[d, "\pi"] \\ & Y \arrow[d, "h"] \\ S \arrow[r, equal] & S \end{tikzcd} \qquad \begin{tikzcd} x \arrow[dd, mapsto] & x' \arrow[l, mapsto] \arrow[d, mapsto] \\ & y \arrow[d, mapsto] \\ s \arrow[r, equal] & s \end{tikzcd}$$

where h is smooth of relative dimension n and $\kappa(y)$ is a purely transcendental extension of $\kappa(s)$. Since the question is local on X also, we may replace Y by an affine neighbourhood of y (and X' by the inverse image of this under π). As S is affine this guarantees that $Y \to S$ is quasi-compact, separated and smooth, in particular of finite presentation. Let T be the connected component of Y_s containing y. As Y_s is Noetherian we see that T is open. We also see that T is geometrically connected over $\kappa(s)$ by Varieties, Lemma 28.5.14. Since T is also smooth over $\kappa(s)$ it is geometrically normal, see Varieties, Lemma 28.15.4. We conclude that T is geometrically irreducible over $\kappa(s)$ (as a connected Noetherian normal scheme is irreducible, see Properties, Lemma 23.7.6). Finally, note that the smooth morphism h is normal by Lemma 33.13.3. At this point we have verified all assumption of Lemma 33.30.3 hold for the morphism $h : Y \to S$ and open $T \subset Y_s$. As a result of applying Lemma 33.30.3 we obtain $e : S' \to S$, $s' \in S'$, Y' as in the commutative diagram

$$\begin{tikzcd} X \arrow[dd] & X' \arrow[l, "g"'] \arrow[d, "\pi"] & X' \times_Y Y' \arrow[l] \arrow[d] \\ & Y \arrow[d, "h"] & Y' \arrow[l] \arrow[d] \\ S \arrow[r, equal] & S & S' \arrow[l, "e"'] \end{tikzcd} \qquad \begin{tikzcd} x \arrow[dd, maps to] & x' \arrow[l, maps to] \arrow[d, maps to] & (x', s') \arrow[l, maps to] \arrow[d, maps to] \\ & y \arrow[d, maps to] & (y, s') \arrow[l, maps to] \arrow[d, maps to] \\ s \arrow[r, equal] & s & s' \arrow[l, maps to] \end{tikzcd}$$

where $e : (S', s') \to (S, s)$ is an elementary étale neighbourhood, and where $Y' \subset Y_{S'}$ is an open neighbourhood all of whose fibres over S' are geometrically irreducible, such that $Y'_{s'} = T$ via the identification $Y_s = Y_{S',s'}$. Let $(y, s') \in Y'$ be the point corresponding to $y \in T$; this is also the unique point of $Y \times_S S'$ lying over y with residue field equal to $\kappa(y)$ which maps to s' in S'. Similarly, let $(x', s') \in X' \times_Y Y' \subset X' \times_S S'$ be the unique point over x' with residue field equal to $\kappa(x')$ lying over s'. Then the outer part of this diagram is a solution to the problem posed in the lemma. Some minor details omitted. $\square$

Lemma 33.31.3. *Assumption and notation as in Lemma 33.31.2. In addition to properties (1) -- (6) we may also arrange it so that*

(7) *S', Y', X' are affine.*

Proof. Note that if Y' is affine, then X' is affine as π is finite. Choose an affine open neighbourhood $U' \subset S'$ of s'. Choose an affine open neighbourhood $V' \subset h^{-1}(U')$ of y'. Let $W' = h(V')$. This is an open neighbourhood of s' in S', see Morphisms, Lemma 24.33.10, contained in U'. Choose an affine open neighbourhood $U'' \subset W'$ of s'. Then $h^{-1}(U'') \cap V'$ is affine because it is equal to $U'' \times_{U'} V'$. By construction $h^{-1}(U'') \cap V' \to U''$ is a surjective smooth morphism whose fibres are (nonempty) open subschemes of geometrically integral fibres of $Y' \to S'$, and hence geometrically integral. Thus we may replace S' by U'' and Y' by $h^{-1}(U'') \cap V'$. $\square$

The significance of the property $\pi^{-1}(\{y'\}) = \{x'\}$ is partially explained by the following lemma.

Lemma 33.31.4. *Let $\pi : X \to Y$ be a finite morphism. Let $x \in X$ with $y = \pi(x)$ such that $\pi^{-1}(\{y\}) = \{x\}$. Then*

(1) *For every neighbourhood $U \subset X$ of x in X, there exists a neighbourhood $V \subset Y$ of y such that $\pi^{-1}(V) \subset U$.*
(2) *The ring map $\mathcal{O}_{Y,y} \to \mathcal{O}_{X,x}$ is finite.*
(3) *If π is of finite presentation, then $\mathcal{O}_{Y,y} \to \mathcal{O}_{X,x}$ is of finite presentation.*
(4) *For any quasi-coherent $\mathcal{O}_X$-module $\mathcal{F}$ we have $\mathcal{F}_x = \pi_*\mathcal{F}_y$ as $\mathcal{O}_{Y,y}$-modules.*

Proof. The first assertion is purely topological; use that π is a continuous and closed map such that $\pi^{-1}(\{y\}) = \{x\}$. To prove the second and third parts we may assume $X = Spec(B)$ and $Y = Spec(A)$. Then $A \to B$ is a finite ring map and y corresponds to a prime $\mathfrak{p}$ of A such that there exists a unique prime $\mathfrak{q}$ of B lying over $\mathfrak{p}$. Then $B_\mathfrak{q} = B_\mathfrak{p}$, see Algebra, Lemma 7.36.11. In other words, the map $A_\mathfrak{p} \to B_\mathfrak{q}$ is equal to the map $A_\mathfrak{p} \to B_\mathfrak{p}$ you get from localizing $A \to B$ at $\mathfrak{p}$. Thus (2) and (3) follow from simple properties of localization (some details omitted). For the final statement, suppose that $\mathcal{F} = \widetilde{M}$ for some B-module M. Then $\mathcal{F} = M_{\mathfrak{q}}$ and $\pi_*\mathcal{F}_y = M_{\mathfrak{p}}$. By the above these localizations agree. Alternatively you can use part (1) and the definition of stalks to see that $\mathcal{F}_x = \pi_*\mathcal{F}_y$ directly. $\square$

33.32. Application to the fppf topology

We can use the above étale localization techniques to prove the following result describing the fppf topology as being equal to the topology ``generated by'' Zariski coverings and by coverings of the form $\{f : T \to S\}$ where f is surjective finite locally free.

Lemma 33.32.1. *Let S be a scheme. Let $\{S_i \to S\}_{i \in I}$ be an fppf covering. Then there exist*

(1) *a Zariski open covering $S = \bigcup U_j$,*
(2) *surjective finite locally free morphisms $W_j \to U_j$,*
(3) *Zariski open coverings $W_j = \bigcup_k W_{j,k}$,*
(4) *surjective finite locally free morphisms $T_{j,k} \to W_{j,k}$*

such that the fppf covering $\{T_{j,k} \to S\}$ refines the given covering $\{S_i \to S\}$.

Proof. We may assume that each $S_i \to S$ is locally quasi-finite, see Lemma 33.16.6.

Fix a point $s \in S$. Pick an $i \in I$ and a point $s_i \in S_i$ mapping to s. Choose an elementary étale neighbourhood $(S', s) \to (S, s)$ such that there exists an open

$$S_i \times_S S' \supset V$$

which contains a unique point $v \in V$ mapping to $s \in S'$ and such that $V \to S'$ is finite, see Lemma 33.28.1. Then $V \to S'$ is finite locally free, because it is finite and because $S_i \times_S S' \to S'$ is flat and locally of finite presentation as a base change of the morphism $S_i \to S$, see Morphisms, Lemmas 24.20.4, 24.24.7, and 24.44.2. Hence $V \to S'$ is open, and after shrinking S' we may assume that $V \to S'$ is surjective finite locally free. Since we can do this for every point of S we conclude that $\{S_i \to S\}$ can be refined by a covering of the form $\{V_a \to S\}_{a \in A}$ where each $V_a \to S$ factors as $V_a \to S'_a \to S$ with $S'_a \to S$ étale and $V_a \to S'_a$ surjective finite locally free.

By Remark 33.27.3 there exists a Zariski open covering $S = \bigcup U_j$, for each j a finite locally free, surjective morphism $W_j \to U_j$, and for each j a Zariski open covering $\{W_{j,k} \to W_j\}$ such that the family $\{W_{j,k} \to S\}$ refines the étale covering $\{S'_a \to S\}$, i.e., for each pair j, k there exists an $a(j,k)$ and a factorization $W_{j,K} \to S'_a \to S$ of the morphism $W_{j,K} \to S$. Set $T_{j,k} = W_{j,k} \times_{S'_a} V_a$ and everything is clear. $\square$

33.33. Closed points in fibres

Some of the material in this section is taken from the preprint [**OP10**].

Lemma 33.33.1. *Let $f : X \to S$ be a morphism of schemes. Let $Z \subset X$ be a closed subscheme. Let $s \in S$. Assume*

(1) *S is irreducible with generic point η,*
(2) *X is irreducible,*
(3) *f is dominant,*
(4) *f is locally of finite type,*
(5) *$\dim(X_s) \leq \dim(X_\eta)$,*
(6) *Z is locally principal in X, and*

(7) $Z_\eta = \emptyset$.

Then the fibre Z_s is (set theoretically) a union of irreducible components of X_s.

Proof. Let X_{red} denote the reduction of X. Then $Z \cap X_{red}$ is a locally principal closed subscheme of X_{red}, see Divisors, Lemma 26.9.7. Hence we may assume that X is reduced. In other words X is integral, see Properties, Lemma 23.3.4. In this case the morphism $X \to S$ factors through S_{red}, see Schemes, Lemma 21.12.6. Thus we may replace S by S_{red} and assume that S is integral too.

The assertion that f is dominant signifies that the generic point of X is mapped to η, see Morphisms, Lemma 24.6.5. Moreover, the scheme X_η is an integral scheme which is locally of finite type over the field $\kappa(\eta)$. Hence $d = \dim(X_\eta) \geq 0$ is equal to $\dim_\xi(X_\eta)$ for every point ξ of X_η, see Algebra, Lemmas 7.105.4 and 7.105.5. In view of Morphisms, Lemma 24.27.4 and condition (5) we conclude that $\dim_x(X_s) = d$ for every $x \in X_s$.

In the Noetherian case the assertion can be proved as follows. If the lemma does not holds there exists $x \in Z_s$ which is a generic point of an irreducible component of Z_s but not a generic point of any irreducible component of X_s. Then we see that $\dim_x(Z_s) \leq d - 1$, because $\dim_x(X_s) = d$ and in a neighbourhood of x in X_s the closed subscheme Z_s does not contain any of the irreducible components of X_s. Hence after replacing X by an open neighbourhood of x we may assume that $\dim_z(Z_{f(z)}) \leq d-1$ for all $z \in Z$, see Morphisms, Lemma 24.27.4. Let $\xi' \in Z$ be a generic point of an irreducible component of Z and set $s' = f(\xi)$. As $Z \neq X$ is locally principal we see that $\dim(\mathcal{O}_{X,\xi}) = 1$, see Algebra, Lemma 7.57.10 (this is where we use X is Noetherian). Let $\xi \in X$ be the generic point of X and let ξ_1 be a generic point of any irreducible component of $X_{s'}$ which contains ξ'. Then we see that we have the specializations

$$\xi \rightsquigarrow \xi_1 \rightsquigarrow \xi'.$$

As $\dim(\mathcal{O}_{X,\xi}) = 1$ one of the two specializations has to be an equality. By assumption $s' \neq \eta$, hence the first specialization is not an equality. Hence $\xi' = \xi_1$ is a generic point of an irreducible component of $X_{s'}$. Applying Morphisms, Lemma 24.27.4 one more time this implies $\dim_{\xi'}(Z_{s'}) = \dim_{\xi'}(X_{s'}) \geq \dim(X_\eta) = d$ which gives the desired contradiction.

In the general case we reduce to the Noetherian case as follows. If the lemma is false then there exists a point $x \in X$ lying over s such that x is a generic point of an irreducible component of Z_s, but not a generic point of any of the irreducible components of X_s. Let $U \subset S$ be an affine neighbourhood of s and let $V \subset X$ be an affine neighbourhood of x with $f(V) \subset U$. Write $U = Spec(A)$ and $V = Spec(B)$ so that $f|_V$ is given by a ring map $A \to B$. Let $\mathfrak{q} \subset B$, resp. $\mathfrak{p} \subset A$ be the prime corresponding to x, resp. s. After possibly shrinking V we may assume $Z \cap V$ is cut out by some element $g \in B$. Denote $K = f.f.(A)$. What we know at this point is the following:

(1) $A \subset B$ is a finitely generated extension of domains,
(2) the element $g \otimes 1$ is invertible in $B \otimes_A K$,
(3) $d = \dim(B \otimes_A K) = \dim(B \otimes_A \kappa(\mathfrak{p}))$,
(4) $g \otimes 1$ is not a unit of $B \otimes_A \kappa(\mathfrak{p})$, and
(5) $g \otimes 1$ is not in any of the minimal primes of $B \otimes_A \kappa(\mathfrak{p})$.

We are seeking a contradiction.

Pick elements $x_1, \ldots, x_n \in B$ which generate B over A. For a finitely generated $\mathbf{Z}$-algebra $A_0 \subset A$ let $B_0 \subset B$ be the A_0-subalgebra generated by $x_1, \ldots, x_n$, denote $K_0 = f.f.(A_0)$, and set $\mathfrak{p}_0 = A_0 \cap \mathfrak{p}$. We claim that when A_0 is large enough then (1) -- (5) also hold for the system $(A_0 \subset B_0, g, \mathfrak{p}_0)$.

We prove each of the conditions in turn. Part (1) holds by construction. For part (2) write $(g \otimes 1)h = 1$ for some $h \otimes 1/a \in B \otimes_A K$. Write $g = \sum a_I x^I$, $h = \sum a'_I x^I$ (multi-index notation) for some coefficients $a_I, a'_I \in A$. As soon as A_0 contains a and the a_I, a'_I then (2) holds because $B_0 \otimes_{A_0} K_0 \subset B \otimes_A K$ (as localizations of the injective map $B_0 \to B$). To achieve (3) consider the exact sequence

$$0 \to I \to A[X_1, \ldots, X_n] \to B \to 0$$

which defines I where the second map sends X_i to x_i. Since $\otimes$ is right exact we see that $I \otimes_A K$, respectively $I \otimes_A \kappa(\mathfrak{p})$ is the kernel of the surjection $K[X_1, \ldots, X_n] \to B \otimes_A K$, respectively $\kappa(\mathfrak{p})[X_1, \ldots, X_n] \to B \otimes_A \kappa(\mathfrak{p})$. As a polynomial ring over a field is Noetherian there exist finitely many elements $h_j \in I$, $j = 1, \ldots, m$ which generate $I \otimes_A K$ and $I \otimes_A \kappa(\mathfrak{p})$. Write $h_j = \sum a_{j,I} X^I$. As soon as A_0 contains all $a_{j,I}$ we get to the situation where

$$B_0 \otimes_{A_0} K_0 \otimes_{K_0} K = B \otimes_A K \quad \text{and} \quad B_0 \otimes_{A_0} \kappa(\mathfrak{p}_0) \otimes_{\kappa(\mathfrak{p}_0)} \kappa(\mathfrak{p}) = B \otimes_A \kappa(\mathfrak{p}).$$

By either Morphisms, Lemma 24.27.3 or Algebra, Lemma 7.107.5 we see that the dimension equalities of (3) are satisfied. Part (4) is immediate. As $B_0 \otimes_{A_0} \kappa(\mathfrak{p}_0) \subset B \otimes_A \kappa(\mathfrak{p})$ each minimal prime of $B_0 \otimes_{A_0} \kappa(\mathfrak{p}_0)$ lies under a minimal prime of $B \otimes_A \kappa(\mathfrak{p})$ by Algebra, Lemma 7.27.6. This implies that (5) holds. In this way we reduce the problem to the Noetherian case which we have dealt with above. □

Here is an algebraic application of the lemma above. The fourth assumption of the lemma holds if $A \to B$ is flat, see Lemma 33.33.3.

Lemma 33.33.2. *Let $A \to B$ be a local homomorphism of local rings, and $g \in \mathfrak{m}_B$. Assume*

1. *A and B are domains and $A \subset B$,*
2. *B is essentially of finite type over A,*
3. *g is not contained in any minimal prime over $\mathfrak{m}_A B$, and*
4. $\dim(B/\mathfrak{m}_A B) + trdeg_{\kappa(\mathfrak{m}_A)}(\kappa(\mathfrak{m}_B)) = trdeg_A(B)$.

Then $A \subset B/gB$, i.e., the generic point of $Spec(A)$ is in the image of the morphism $Spec(B/gB) \to Spec(A)$.

Proof. Note that the two assertions are equivalent by Algebra, Lemma 7.27.6. To start the proof let C be an A-algebra of finite type and $\mathfrak{q}$ a prime of C such that $B = C_\mathfrak{q}$. Of course we may assume that C is a domain and that $g \in C$. After replacing C by a localization we see that $\dim(C/\mathfrak{m}_A C) = \dim(B/\mathfrak{m}_A B) + \text{trdeg}_{\kappa(\mathfrak{m}_A)}(\kappa(\mathfrak{m}_B))$, see Morphisms, Lemma 24.27.1. Setting $K = f.f.(A)$ we see by the same reference that $\dim(C \otimes_A K) = \text{trdeg}_A(B)$. Hence assumption (4) means that the generic and closed fibres of the morphism $Spec(C) \to Spec(A)$ have the same dimension.

Suppose that the lemma is false. Then $(B/gB) \otimes_A K = 0$. This means that $g \otimes 1$ is invertible in $B \otimes_A K = C_\mathfrak{q} \otimes_A K$. As $C_\mathfrak{q}$ is a limit of principal localizations we conclude that $g \otimes 1$ is invertible in $C_h \otimes_A K$ for some $h \in C$, $h \not\in \mathfrak{q}$. Thus after replacing C by C_h we may assume that $(C/gC) \otimes_A K = 0$. We do one more replacement of C to make sure that the minimal primes of $C/\mathfrak{m}_A C$ correspond one-to-one with the minimal primes of $B/\mathfrak{m}_A B$. At this point we apply Lemma 33.33.1 to $X = Spec(C) \to Spec(A) = S$ and the locally closed subscheme $Z = Spec(C/gC)$. Since $Z_K = \emptyset$ we see that $Z \otimes \kappa(\mathfrak{m}_A)$ has to contain an irreducible component of $X \otimes \kappa(\mathfrak{m}_A) = Spec(C/\mathfrak{m}_A C)$. But this contradicts the assumption that g is not contained in any prime minimal over $\mathfrak{m}_A B$. The lemma follows. $\square$

Lemma 33.33.3. *Let $A \to B$ be a local homomorphism of local rings. Assume*

(1) *A and B are domains and $A \subset B$,*
(2) *B is essentially of finite type over A, and*
(3) *B is flat over A.*

Then we have

$$\dim(B/\mathfrak{m}_A B) + trdeg_{\kappa(\mathfrak{m}_A)}(\kappa(\mathfrak{m}_B)) = trdeg_A(B).$$

Proof. Let C be an A-algebra of finite type and $\mathfrak{q}$ a prime of C such that $B = C_\mathfrak{q}$. We may assume C is a domain. We have $\dim_\mathfrak{q}(C/\mathfrak{m}_A C) = \dim(B/\mathfrak{m}_A B) + \text{trdeg}_{\kappa(\mathfrak{m}_A)}(\kappa(\mathfrak{m}_B))$, see Morphisms, Lemma 24.27.1. Setting $K = f.f.(A)$ we see by the same reference that $\dim(C \otimes_A K) = \text{trdeg}_A(B)$. Thus we are really trying to prove that $\dim_\mathfrak{q}(C/\mathfrak{m}_A C) = \dim(C \otimes_A K)$. Choose a valuation ring A' in K dominating A, see Algebra, Lemma 7.46.2. Set $C' = C \otimes_A A'$. Choose a prime $\mathfrak{q}'$ of C' lying over $\mathfrak{q}$; such a prime exists because

$$C'/\mathfrak{m}_{A'}C' = C/\mathfrak{m}_A C \otimes_{\kappa(\mathfrak{m}_A)} \kappa(\mathfrak{m}_{A'})$$

which proves that $C/\mathfrak{m}_A C \to C'/\mathfrak{m}_{A'}C'$ is faithfully flat. This also proves that $\dim_\mathfrak{q}(C/\mathfrak{m}_A C) = \dim_{\mathfrak{q}'}(C'/\mathfrak{m}_{A'}C')$, see Algebra, Lemma 7.107.6. Note that $B' = C'_{\mathfrak{q}'}$ is a localization of $B \otimes_A A'$. Hence B' is flat over A'. The generic fibre $B' \otimes_{A'} K$ is a localization of $B \otimes_A K$. Hence B' is a domain. If we prove the lemma for $A' \subset B'$, then we get the equality $\dim_{\mathfrak{q}'}(C'/\mathfrak{m}_{A'}C') = \dim(C' \otimes_{A'} K)$ which implies the desired equality $\dim_\mathfrak{q}(C/\mathfrak{m}_A C) = \dim(C \otimes_A K)$ by what was said above. This reduces the lemma to the case where A is a valuation ring.

Let $A \subset B$ be as in the lemma with A a valuation ring. As before write $B = C_\mathfrak{q}$ for some domain C of finite type over A. By Algebra, Lemma 7.116.9 we obtain $\dim(C/\mathfrak{m}_A C) = \dim(C \otimes_A K)$ and we win. $\square$

Lemma 33.33.4. *Let $f : X \to S$ be a morphism of schemes. Let $x \rightsquigarrow x'$ be a specialization of points in X. Set $s = f(x)$ and $s' = f(x')$. Assume*

(1) *x' is a closed point of $X_{s'}$, and*
(2) *f is locally of finite type.*

Then the set

$$\{x_1 \in X \text{ such that } f(x_1) = s \text{ and } x_1 \text{ is closed in } X_s \text{ and } x \rightsquigarrow x_1 \rightsquigarrow x'\}$$

is dense in the closure of x in X_s.

Proof. We apply Schemes, Lemma 21.20.4 to the specialization $x \rightsquigarrow x'$. This produces a morphism $\varphi : Spec(B) \to X$ where B is a valuation ring such that φ maps the generic point to x and the closed point to x'. We may also assume that $\kappa(x) = f.f.(B)$. Let $A = B \cap \kappa(s)$. Note that this is a valuation ring (see Algebra, Lemma 7.46.5) which dominates the image of $\mathcal{O}_{S,s'} \to \kappa(s)$. Consider the commutative diagram

$$\begin{tikzcd} Spec(B) \arrow[r] \arrow[rd] & X_A \arrow[r] \arrow[d] & X \arrow[d] \\ & Spec(A) \arrow[r] & S \end{tikzcd}$$

The generic (resp. closed) point of B maps to a point x_A (resp. x'_A) of X_A lying over the generic (resp. closed) point of $Spec(A)$. Note that x'_A is a closed point of the special fibre of X_A by Morphisms, Lemma 24.19.4. Note that the generic fibre of $X_A \to Spec(A)$ is isomorphic to X_s. Thus we have reduced the lemma to the case where S is the spectrum of a valuation ring, $s = \eta \in S$ is the generic point, and $s' \in S$ is the closed point.

We will prove the lemma by induction on $\dim_x(X_\eta)$. If $\dim_x(X_\eta) = 0$, then there are no other points of X_η specializing to x and x is closed in its fibre, see Morphisms, Lemma 24.19.6, and the result holds. Assume $\dim_x(X_\eta) > 0$.

Let $X' \subset X$ be the reduced induced scheme structure on the irreducible closed subscheme $\overline{\{x\}}$ of X, see Schemes, Definition 21.12.5. To prove the lemma we may replace X by X' as this only decreases $\dim_x(X_\eta)$. Hence we may also assume that X is an integral scheme and that x is its generic point. In addition, we may replace X by an affine neighbourhood of x'. Thus we have $X = Spec(B)$ where $A \subset B$ is a finite type extension of domains. Note that in this case $\dim_x(X_\eta) = \dim(X_\eta) = \dim(X_{s'})$, and that in fact $X_{s'}$ is equidimensional, see Algebra, Lemma 7.116.9.

Let $W \subset X_\eta$ be a proper closed subset (this is the subset we want to ``avoid"). As X_s is of finite type over a field we see that W has finitely many irreducible components $W = W_1 \cup \ldots \cup W_n$. Let $\mathfrak{q}_j \subset B$, $j = 1, \ldots, r$ be the corresponding prime ideals. Let $\mathfrak{q} \subset B$ be the maximal ideal corresponding to the point x'. Let $\mathfrak{p}_1, \ldots, \mathfrak{p}_s \subset B$ be the minimal primes lying over $\mathfrak{m}_A B$. There are finitely many as these correspond to the irreducible components of the Noetherian scheme $X_{s'}$. Moreover, each of these irreducible components has dimension > 0 (see above) hence we see that $\mathfrak{p}_i \neq \mathfrak{q}$ for all i. Now, pick an element $g \in \mathfrak{q}$ such that $g \notin \mathfrak{q}_j$ for all j and $g \notin \mathfrak{p}_i$ for all i, see Algebra, Lemma 7.14.3. Denote $Z \subset X$ the locally principal closed subscheme defined by h. Let $Z_\eta = Z_{1,\eta} \cup \ldots \cup Z_{n,\eta}$, $n \geq 0$ be the decomposition of the generic fibre of Z into irreducible components (finitely many as the generic fibre is Noetherian). Denote $Z_i \subset X$ the closure of $Z_{i,\eta}$. After replacing X by a smaller affine neighbourhood we may assume that $x \in Z_i$ for each $i = 1, \ldots, n$. By construction $Z \cap X_{s'}$ does not contain any irreducible component of $X_{s'}$. Hence by Lemma 33.33.1 we conclude that $Z_\eta \neq \emptyset$! In other words $n \geq 1$. Letting $x_1 \in Z_1$ be the generic point we see that $x_1 \rightsquigarrow x'$ and $f(x_1) = \eta$. Also, by construction $Z_{1,\eta} \cap W_j \subset W_j$ is a proper closed subset. Hence every irreducible component of $Z_{1,\eta} \cap W_j$ has codimension ≥ 2 in X_η whereas $\text{codim}(Z_{1,\eta}, X_\eta) = 1$ by Algebra, Lemma 7.57.10. Thus $W \cap Z_{1,\eta}$ is a proper closed subset. At this point we see that the induction hypothesis applies to $Z_1 \to S$ and the specialization $x_1 \rightsquigarrow x'$. This produces a closed point x_2 of $Z_{1,\eta}$ not contained in W which specializes to x'. Thus we obtain $x \rightsquigarrow x_2 \rightsquigarrow x'$, the point x_2 is closed in X_η, and $x_2 \notin W$ as desired. □

Remark 33.33.5. The proof of Lemma 33.33.4 actually shows that there exists a sequence of specializations

$$x \rightsquigarrow x_1 \rightsquigarrow x_2 \rightsquigarrow \ldots \rightsquigarrow x_d \rightsquigarrow x'$$

where all x_i are in the fibre X_s, each specialization is immediate, and x_d is a closed point of X_s. The integer $d = \text{trdeg}_{\kappa(s)}(\kappa(x)) = \dim(\overline{\{x\}})$ where the closure is taken in X_s. Moreover, the points x_i can be chosen to avoid any closed subset of X_s which does not contain the point x.

Examples, Section 64.20 shows that the following lemma is false if A is not assumed Noetherian.

Lemma 33.33.6. *Let $\varphi : A \to B$ be a local ring map of local rings. Let $V \subset Spec(B)$ be an open subscheme which contains at least one prime not lying over $\mathfrak{m}_A$. Assume A is Noetherian, φ essentially of finite type, and $A/\mathfrak{m}_A \subset B/\mathfrak{m}_B$ is finite. Then there exists a $\mathfrak{q} \in V$, $\mathfrak{m}_A \neq \mathfrak{q} \cap A$ such that $A \to B/\mathfrak{q}$ is the localization of a quasi-finite ring map.*

Proof. Since A is Noetherian and $A \to B$ is essentially of finite type, we know that B is Noetherian too. By Properties, Lemma 23.6.4 the topological space $Spec(B) \setminus \{\mathfrak{m}_B\}$ is Jacobson. Hence we can choose a closed point $\mathfrak{q}$ which is contained in the nonempty open

$$V \setminus \{\mathfrak{q} \subset B \mid \mathfrak{m}_A = \mathfrak{q} \cap A\}.$$

(Nonempty by assumption, open because $\{\mathfrak{m}_A\}$ is a closed subset of $Spec(A)$.) Then $Spec(B/\mathfrak{q})$ has two points, namely $\mathfrak{m}_B$ and $\mathfrak{q}$ and $\mathfrak{q}$ does not lie over $\mathfrak{m}_A$. Write $B/\mathfrak{q} = C_\mathfrak{m}$ for some finite type A-algebra C and prime ideal $\mathfrak{m}$. Then $A \to C$ is quasi-finite at $\mathfrak{m}$ by Algebra, Lemma 7.113.2 (2). Hence by Algebra, Lemma 7.114.14 we see that after replacing C by a principal localization the ring map $A \to C$ is quasi-finite. □

Lemma 33.33.7. *Let $f : X \to S$ be a morphism of schemes. Let $x \in X$ with image $s \in S$. Let $U \subset X$ be an open subscheme. Assume f locally of finite type, S locally Noetherian, x a closed point of X_s, and assume there exists a point $x' \in U$ with $x' \rightsquigarrow x$ and $f(x') \neq s$. Then there exists a closed subscheme $Z \subset X$ such that (a) $x \in Z$, (b) $f|_Z : Z \to S$ is quasi-finite at x, and (c) there exists a $z \in Z$, $z \in U$, $z \rightsquigarrow x$ and $f(z) \neq s$.*

Proof. This is a reformulation of Lemma 33.33.6. Namely, set $A = \mathcal{O}_{S,s}$ and $B = \mathcal{O}_{X,x}$. Denote $V \subset Spec(B)$ the inverse image of U. The ring map $f^\sharp : A \to B$ is essentially of finite type. By assumption there exists at least one point of V which does not map to the closed point of $Spec(A)$. Hence all the assumptions of Lemma 33.33.6 hold and we obtain a prime $\mathfrak{q} \subset B$ which does not lie over $\mathfrak{m}_A$ and such that $A \to B/\mathfrak{q}$ is the localization of a quasi-finite ring map. Let $z \in X$ be the image of the point $\mathfrak{q}$ under the canonical morphism $Spec(B) \to X$. Set $Z = \overline{\{z\}}$ with the induced reduced scheme structure. As $z \rightsquigarrow x$ we see that $x \in Z$ and $\mathcal{O}_{Z,x} = B/\mathfrak{q}$. By construction $Z \to S$ is quasi-finite at x. □

Remark 33.33.8. We can use Lemma 33.33.6 or its variant Lemma 33.33.7 to give an alternative proof of Lemma 33.33.4 in case S is locally Noetherian. Here is a rough sketch. Namely, first replace S by the spectrum of the local ring at s'. Then we may use induction on $\dim(S)$. The case $\dim(S) = 0$ is trivial because then $s' = s$. Replace X by the reduced induced scheme structure on $\overline{\{x\}}$. Apply Lemma 33.33.7 to $X \to S$ and $x' \mapsto s'$ and any nonempty open $U \subset X$ containing x. This gives us a closed subscheme $x' \in Z \subset X$ a point $z \in Z$ such that $Z \to S$ is quasi-finite at x' and such that $f(z) \neq s'$. Then z is a closed point of $X_{f(z)}$, and $z \rightsquigarrow x'$. As $f(z) \neq s'$ we see $\dim(\mathcal{O}_{S,f(z)}) < \dim(S)$. Since x is the generic point of X we see $x \rightsquigarrow z$, hence $s = f(x) \rightsquigarrow f(z)$. Apply the induction hypothesis to $s \rightsquigarrow f(z)$ and $z \mapsto f(z)$ to win.

Lemma 33.33.9. *Suppose that $f : X \to S$ is locally of finite type, S locally Noetherian, $x \in X$ a closed point of its fibre X_s, and $U \subset X$ an open subscheme such that $U \cap X_s = \emptyset$ and $x \in \overline{U}$, then the conclusions of Lemma 33.33.7 hold.*

Proof. Namely, we can reduce this to the cited lemma as follows: First we replace X and S by affine neighbourhoods of x and s. Then X is Noetherian, in particular U is quasi-compact (see Morphisms, Lemma 24.14.6 and Topology, Lemmas 5.6.2 and 5.9.9). Hence there exists a specialization $x' \rightsquigarrow x$ with $x' \in U$ (see Morphisms, Lemma 24.4.5). Note that $f(x') \neq s$. Thus we see all hypotheses of the lemma are satisfied and we win. □

33.34. Stein factorization

Stein factorization is the statement that a proper morphism $f : X \to S$ with $f_*\mathcal{O}_X = \mathcal{O}_S$ has connected fibres.

Lemma 33.34.1. *Let S be a scheme. Let $f : X \to S$ be a universally closed, quasi-compact and quasi-separated morphism. There exists a factorization*

$$\begin{tikzcd} X \arrow[rr, "f'"] \arrow[rd, "f"'] & & S' \arrow[ld, "\pi"] \\ & S & \end{tikzcd}$$

with the following properties:

(1) *the morphism f' is universally closed, quasi-compact, quasi-separated and surjective,*
(2) *the morphism $\pi : S' \to S$ is integral,*
(3) *we have $f'_*\mathcal{O}_X = \mathcal{O}_{S'}$,*
(4) *we have $S' = \underline{Spec}_S(f_*\mathcal{O}_X)$, and*
(5) *S' is the normalization of S in X, see Morphisms, Definition 24.46.3.*

Proof. We just define S' as the normalization of S in X, so (5) and (2) hold automatically. By Morphisms, Lemma 24.46.9 we see that (4) holds. The morphism f' is universally closed by Morphisms, Lemma 24.40.7. It is quasi-compact by Schemes, Lemma 21.21.15 and quasi-separated by Schemes, Lemma 21.21.14.

To show the remaining statements we may assume the base scheme S is affine, say $S = Spec(R)$. Then $S' = Spec(A)$ with $A = \Gamma(X, \mathcal{O}_X)$ an integral R-algebra. Thus it is clear that $f'_*\mathcal{O}_X$ is $\mathcal{O}_{S'}$ (because $f'_*\mathcal{O}_X$ is quasi-coherent, by Schemes, Lemma 21.24.1, and hence equal to $\widetilde{A}$). This proves (3).

Let us show that f' is surjective. As f' is universally closed (see above) the image of f' is a closed subset $V(I) \subset S' = Spec(A)$. Pick $h \in I$. Then $h|_X = f^\sharp(h)$ is a global section of the structure sheaf of X which vanishes at every point. As X is quasi-compact this means that $h|_X$ is a nilpotent section, i.e., $h^n|X = 0$ for some $n > 0$. But $A = \Gamma(X, \mathcal{O}_X)$, hence $h^n = 0$. In other words I is contained in the radical ideal of A and we conclude that $V(I) = S'$ as desired. $\square$

Lemma 33.34.2. *Let $f : X \to S$ be a morphism of schemes. Let $s \in S$. Then X_s is geometrically connected, if and only if for every étale neighbourhood $(U, u) \to (S, s)$ the base change $X_U \to U$ as connected fibre X_u.*

Proof. If X_s is geometrically connected, then any base change of it is connected. On the other hand, suppose that X_s is not geometrically connected. Then by Varieties, Lemma 28.5.11 we see that $X_s \times_{Spec(\kappa(s))} Spec(k)$ is disconnected for some finite separable field extension $\kappa(s) \subset k$. By Lemma 33.25.2 there exists an affine étale neighbourhood $(U, u) \to (S, s)$ such that $\kappa(s) \subset \kappa(u)$ is identified with $\kappa(s) \subset k$. In this case X_u is disconnected. $\square$

Theorem 33.34.3. *(Stein factorization -- Noetherian case) Let S be a locally Noetherian scheme. Let $f : X \to S$ be a proper morphism. There exists a factorization*

$$\begin{tikzcd} X \arrow[rr, "f'"] \arrow[dr, "f"'] & & S' \arrow[dl, "\pi"] \\ & S & \end{tikzcd}$$

with the following properties:

(1) *the morphism f' is proper, surjective with geometrically connected fibres,*
(2) *the morphism $\pi : S' \to S$ is finite,*
(3) *we have $f'_*\mathcal{O}_X = \mathcal{O}_{S'}$,*
(4) *we have $S' = \underline{Spec}_S(f_*\mathcal{O}_X)$, and*
(5) *S' is the normalization of S in X, see Morphisms, Definition 24.46.3.*

Proof. Let $f = \pi \circ f'$ be the factorization of Lemma 33.34.1. Note that besides the conclusions of Lemma 33.34.1 we also have that f' is separated (Schemes, Lemma 21.21.14) and finite type (Morphisms, Lemma 24.14.8). Hence f' is proper. By Coherent, Lemma 25.18.2 we see that $f_*\mathcal{O}_X$ is a coherent $\mathcal{O}_S$-module. Hence we see that π is finite, i.e., (2) holds.

This proves all but the most interesting assertion, namely that all the fibres of f' are geometrically connected. It is clear from the discussion above that we may replace S by S', and we may therefore assume that S is Noetherian, affine, $f : X \to S$ is proper, and $f_*\mathcal{O}_X = \mathcal{O}_S$. Let $s \in S$ be a point of S. We have to show that X_s is geometrically connected. By Lemma 33.34.2 we see that it suffices to show X_u is connected for every étale neighbourhood $(U, u) \to (S, s)$. We may assume U is affine. Thus U is Noetherian (Morphisms, Lemma 24.14.6), the base change $f_U : X_U \to U$ is proper (Morphisms, Lemma 24.40.5), and that also $(f_U)_*\mathcal{O}_{X_U} = \mathcal{O}_U$ (Coherent, Lemma 25.6.2). Hence after replacing $(f : X \to S, s)$ by the base change $(f_U : X_U \to U, u)$ it suffices to prove that the fibre X_s is connected.

At this point we apply the theorem on formal functions, more precisely Coherent, Lemma 25.19.6. It tells us that

$$\mathcal{O}^\wedge_{S,s} = lim_n\, H^0(X_n, \mathcal{O}_{X_n})$$

where X_n is the nth infinitesimal neighbourhood of X_s. Since the underlying topological space of X_n is equal to that of X_s we see that if $X_s = T_1 \coprod T_2$ is a disjoint union of nonempty open and closed subschemes, then similarly $X_n = T_{1,n} \coprod T_{2,n}$ for all n. And this in turn means $H^0(X_n, \mathcal{O}_{X_n})$ contains a nontrivial idempotent $e_{1,n}$, namely the function which is identically 1 on $T_{1,n}$ and identically 0 on $T_{2,n}$. It is clear that $e_{1,n+1}$ restricts to $e_{1,n}$ on X_n. Hence $e_1 = lim\, e_{1,n}$ is a nontrivial idempotent of the limit. This contradicts the fact that $\mathcal{O}^\wedge_{S,s}$ is a local ring. Thus the assumption was wrong, i.e., X_s is connected, and we win. $\square$

Lemma 33.34.4. *Let $(R, \mathfrak{m}, \kappa)$ be a local ring. Let $X \subset \mathbf{P}^n_R$ be a closed subscheme. Assume that $R = \Gamma(X, \mathcal{O}_X)$. Then the special fibre X_k is geometrically connected.*

Proof. Let $R \to R'$ be a flat local ring map so that the residue field of R' is algebraically closed, see Algebra, Lemma 7.142.1. By Coherent, Lemma 25.6.2 we have $\Gamma(X_{R'}, \mathcal{O}_{X_{R'}}) = R'$. Hence we may assume that the residue field of R is algebraically closed. This reduces us to just proving that X_k is connected. (We could also have used Lemma 33.34.2 for this.)

Suppose, to get a contradiction, that $X_k = T_1 \coprod T_2$ for some closed and open subschemes $T_i \subset X_k$. By Constructions, Lemma 22.13.6 we can write

$$X = \mathrm{Proj}(R[T_0, \ldots, T_n]/I)$$

for some graded ideal $I \subset R[T_0, \ldots, T_n]$. We may write $R = colim_\alpha R_\alpha$ as a directed colimit of Noetherian local rings R_α, see Algebra, Lemma 7.118.7. Let k_α be the residue field of R_α. Let $I_\alpha = R_\alpha[T_0, \ldots, T_n] \cap I$ (or more precisely the inverse image). Then $I = colim_\alpha I_\alpha$. Let $X_\alpha = \mathrm{Proj}(R_\alpha[T_0, \ldots, T_n]/I_\alpha)$. Warning: because I may not be finitely generated it may be that the natural morphism

$$X \longrightarrow X_\alpha \times_{Spec(R_\alpha)} Spec(R)$$

is never an isomorphism! The image $\overline{I} \subset k[T_0, \ldots, T_n]$ of I is finitely generated as $k[T_0, \ldots, T_n]$ is a Noetherian ring. Hence for all large enough α the image $\overline{I}_\alpha \subset k_\alpha[T_0, \ldots, T_n]$ of I_α is such that $\overline{I}_\alpha k[T_0, \ldots, T_n] = \overline{I}$. Let $J_1, J_2 \subset k[T_0, \ldots, T_n]$ be graded ideals such that $T_i = \mathrm{Proj}(k[T_0, \ldots, T_n]/J_i)$, see Constructions, Lemma 22.13.6 again. Since $R = colim_\alpha R_\alpha$, also $k = colim_\alpha k_\alpha$. Thus for all large enough α there exist ideals $J_{\alpha,1}, J_{\alpha,2} \subset k_\alpha[T_0, \ldots, T_n]$ such that $J_{\alpha,i} k[T_0, \ldots, T_n] = J_i$. Combining these observations, we see that there exists an α such that

(1) the morphism $X_\alpha \to Spec(R_\alpha)$ has the property that

$$X_\alpha \times_{Spec(R_\alpha)} Spec(k) = (X_\alpha)_{k_\alpha} \times_{Spec(k_\alpha)} Spec(k) = X_k,$$

and

(2) there exists a decomposition $(X_\alpha)_{k_\alpha} = T_{\alpha,1} \coprod T_{\alpha,2}$ such that $(T_{\alpha,i})_k = T_i$.

By the Noetherian case (Theorem 33.34.3) this means there exists a factorization

$$X_\alpha \longrightarrow Spec(R') \longrightarrow Spec(R_\alpha)$$

with $R_\alpha \to R'$ finite and $X_\alpha \to Spec(R')$ having geometrically connected fibres. Let $t_i \in T_i$ be a point, let $t_{\alpha,i} \in T_{\alpha,i}$ be the image points, and let $\mathfrak{m}_i \subset R'$ be the corresponding maximal ideals. Then $\mathfrak{m}_1 \neq \mathfrak{m}_2$ by the connectedness of the fibres. This implies that $X \to Spec(R)$ factors as

$$X \longrightarrow Spec(R \otimes_{R_\alpha} R') \longrightarrow Spec(R)$$

Because t_1 and t_2 map to distinct points in $Spec(R')$ we see that t_1 and t_2 must also map to distinct points in $Spec(R \otimes_{R_\alpha} R')$. Hence there exists an element $f \in R \otimes_{R_\alpha} R'$ such that $f|_X$ is zero in t_1 and not in t_2 (or vice versa). This clearly contradicts the assumption that $R = \Gamma(X, \mathcal{O}_X)$ and we win. □

Theorem 33.34.5. *(Stein factorization -- general case) Let S be a scheme. Let $f : X \to S$ be a proper morphism. There exists a factorization*

$$\begin{tikzcd} X \arrow[rr, "f'"] \arrow[dr, "f"'] & & S' \arrow[dl, "\pi"] \\ & S & \end{tikzcd}$$

with the following properties:

(1) *the morphism f' is proper, surjective with geometrically connected fibres,*
(2) *the morphism $\pi : S' \to S$ is integral,*
(3) *we have $f'_*\mathcal{O}_X = \mathcal{O}_{S'}$,*
(4) *we have $S' = \underline{Spec}_S(f_*\mathcal{O}_X)$, and*
(5) *S' is the normalization of S in X, see Morphisms, Definition 24.46.3.*

Proof. We may apply Lemma 33.34.1 to get the morphism $f' : X \to S'$. Note that besides the conclusions of Lemma 33.34.1 we also have that f' is separated (Schemes, Lemma 21.21.14) and finite type (Morphisms, Lemma 24.14.8). Hence f' is proper. At this point we have proved all of the statements except for the statement that f' has geometrically connected fibres.

To prove this we may assume that $S = Spec(R)$ is affine. Use Limits, Lemma 27.8.1 to choose a diagram

$$\begin{tikzcd} X \arrow[dr, "f"'] & X' \arrow[l, "\pi"'] \arrow[r] \arrow[d] & \mathbf{P}^n_R \arrow[dl] \\ & S = Spec(R) & \end{tikzcd}$$

where $X' \to \mathbf{P}^n_S$ is an immersion, and $\pi : X' \to X$ is proper and surjective. Thus $X' \to S$ is proper, hence $X' \to \mathbf{P}^n_R$ is a closed immersion. (See Morphisms, Lemmas 24.40.4 and 24.40.7 and Schemes, Lemma 21.10.4). Set $A = \Gamma(X, \mathcal{O}_X)$, and $A' = \Gamma(X', \mathcal{O}_{X'})$. Then $S' = Spec(A)$. Consider the diagram

(33.34.5.1)
$$\begin{tikzcd} X \arrow[d, "f'"'] & X' \arrow[l, "\pi"'] \arrow[r] \arrow[d, "g"'] & \mathbf{P}^n_{A'} \arrow[dl] \\ Spec(A) & Spec(A') \arrow[l] & \end{tikzcd}$$

Here π is surjective and proper, the vertical arrows are proper and surjective, the right horizontal arrow is a closed immersion, and $Spec(A') \to Spec(A)$ is integral (see arguments above). Let $\mathfrak{p} \subset A$ be a prime, corresponding to a point $p \in Spec(A)$. Let X_p be the fibre. We have to show that X_p is geometrically connected. By Lemma 33.34.2 it suffices to show that for every étale ring map $A \to B$ and a prime $\mathfrak{q}$ of B lying over $\mathfrak{p}$ the fibre of X_B over $\mathfrak{q}$ is connected. As an étale ring map is flat, we see from Coherent, Lemma 25.6.2 that we have

$$\Gamma(X_B, \mathcal{O}_{X_B}) = B,$$

and similarly

$$\Gamma(X' \times_{Spec(A)} Spec(B), \mathcal{O}) = \Gamma(X' \times_{Spec(A')} Spec(B \otimes_A A'), \mathcal{O}) = B \otimes_A A'.$$

This means that everything we said above about the diagram (33.34.5.1) also holds for that diagram base changed to B (some verifications omitted). Hence we may replace A by B and we reduce to proving that X_p is connected.

Consider the scheme $X'_p = \pi^{-1}(f')^{-1}(p)$. It is proper over $\kappa(p)$, hence Noetherian, and hence has finitely many connected components. The morphism g is surjective, hence any point p' of $Spec(A')$ lying over p is the image of a point of X'_p. On the other hand, there are no specializations among the points of $Spec(A')$ lying over p, see Morphisms, Lemma 24.42.8. Hence the map

$$X'_p \longrightarrow \{p' \in Spec(A') \mid p' \text{ lies over } p\}$$

is surjective and constant on connected components. Thus we see there are finitely many points $p'_1, \ldots, p'_n \in Spec(A')$ of $Spec(A')$ lying over p. Let $\mathfrak{p}'_1, \ldots, \mathfrak{p}'_n$ be the corresponding primes of A', i.e., those lying over $\mathfrak{p}$. Let $A'' \subset A'$ be a finitely generated A-subalgebra such that the primes $A'' \cap \mathfrak{p}'_i$ are pairwise distinct. Such an $A'' \subset A'$ exists; argument omitted. As $A \subset A'$ is integral, this implies that A'' is finite over A, see Algebra, Lemma 7.32.5. Note that that $\mathfrak{p}'_1 \cap A'', \ldots, \mathfrak{p}'_n \cap A''$ are the only primes of A'' lying over $\mathfrak{p}$ as

$Spec(A') \to Spec(A'')$ is surjective, see Algebra, Lemma 7.32.15. By Algebra, Lemma 7.132.22 there exists an étale ring map $A \to B$ and a prime $\mathfrak{q}$ lying over $\mathfrak{p}$ such that $\kappa(\mathfrak{p}) = \kappa(\mathfrak{q})$ and $B \otimes_A A'' = B''_1 \times \ldots \times B''_n$ decomposes into algebras B''_i finite over B each with a single prime lying over $\mathfrak{q}$. Hence also $B \otimes_A A' = B'_1 \times \ldots \times B'_n$ decomposes into algebras B'_i integral over B each with a single prime lying over $\mathfrak{q}$ (namely by taking $B'_i = B''_i \otimes_{A''} A'$). After base changing the sitatuation to B as above, we see that we may assume $Spec(A') = V_1 \coprod \ldots \coprod V_n$ each with a single point $p'_i \in V_i$ lying over p.

Let $X'_i \subset X'$ be the inverse image of V_i. Note that

$$X'_p = \coprod X'_{i,p} = \coprod X'_{p'_i}.$$

Since $\Gamma(X', \mathcal{O}_{X'}) = A'$, and since X' is a closed subscheme of $\mathbf{P}^n_{A'}$ we may apply Lemma 33.34.4 to we see that $g : X' \to Spec(A')$ has geometrically connected fibres. Hence each $X'_{i,p} = X'_{p'_i}$ is connected! Hence, if $T \subset X_p$ is open and closed, then $\pi^{-1}(T) \subset X'_p$ is a disjoint union $\pi^{-1}(T) = \coprod_{i \in I} X'_{i,p}$ for some subset $I \subset \{1, \ldots, n\}$. Let $J = I^c \subset \{1, \ldots, n\}$ be the complement. Set

$$X_I = \bigcup\nolimits_{i \in I} \pi(X'_i), \quad \text{and} \quad X_J = \bigcup\nolimits_{j \in J} \pi(X'_j).$$

These are closed subsets whose union is X and which do not meet in the special fibre X_p. Since $f' : X \to Spec(A)$ is proper hence closed we see that $f'(X_I \cap X_J)$ is a closed subset of $Spec(A)$ which does not meet p. Hence after replacing A by A_g for some $g \in A$, $g \not\in \mathfrak{p}$ (i.e., doing a base change with $B = A_g$ as above) we see that $X_I \cap X_J = \emptyset$. Thus we conclude that X_I and X_J are open and closed in X, and

$$\Gamma(X, \mathcal{O}_X) = \Gamma(X_I, \mathcal{O}_{X_I}) \times \Gamma(X_J, \mathcal{O}_{X_J}).$$

If I and J are both nonempty then we see that $\Gamma(X, \mathcal{O}_X)$ contains an idempotent which cannot be the image of an idempotent in A! This contradicts the assumption that $A = \Gamma(X, \mathcal{O}_X)$, hence either $I = \emptyset$ or $J = \emptyset$. In other words, either $T = X_p$ or $T = \emptyset$, i.e., X_p is connected as desired. ☐

33.35. Descending separated locally quasi-finite morphisms

In this section we show that ``separated locally quasi-finite morphisms satisfy descent for fppf-coverings''. See Descent, Definition 31.32.1 for terminology. This is in the marvellous (for many reasons) paper by Raynaud and Gruson hidden in the proof of [**GR71**, Lemma 5.7.1]. It can also be found in [**Mur95**], and [**ABD⁺66**, Exposé X, Lemma 5.4] under the additional hypothesis that the morphism is locally of finite presentation. Here is the formal statement.

Lemma 33.35.1. *Let S be a scheme. Let $\{X_i \to S\}_{i \in I}$ be an fppf covering, see Topologies, Definition 30.7.1. Let $(V_i/X_i, \varphi_{ij})$ be a descent datum relative to $\{X_i \to S\}$. If each morphism $V_i \to X_i$ is separated and locally quasi-finite, then the descent datum is effective.*

Proof. Being separated and being locally quasi-finite are properties of morphisms of schemes which are preserved under any base change, see Schemes, Lemma 21.21.13 and Morphisms, Lemma 24.19.13. Hence Descent, Lemma 31.32.2 applies and it suffices to prove the statement of the lemma in case the fppf-covering is given by a single $\{X \to S\}$ flat surjective morphism of finite presentation of affines. Say $X = Spec(A)$ and $S = Spec(R)$ so that $R \to A$ is a faithfully flat ring map. Let (V, φ) be a descent datum relative to X over S and assume that $\pi : V \to X$ is separated and locally quasi-finite.

Let $W^1 \subset V$ be any affine open. Consider $W = \mathrm{pr}_1(\varphi(W^1 \times_S X)) \subset V$. Here is a picture

$$
\begin{tikzcd}
W^1 \times_S X \arrow[rrrrr] \arrow[dr] \arrow[ddd] & & & & & \varphi(W^1 \times_S X) \arrow[dl] \arrow[ddd] \\
& V \times_S X \arrow[rrr, "\varphi"] \arrow[dr] \arrow[dd] & & & X \times_S V \arrow[dl] \arrow[dd] & \\
& & X \times_S X \arrow[r, "1"] \arrow[d, "\mathrm{pr}_0"'] & X \times_S X \arrow[d, "\mathrm{pr}_1"] & & \\
W^1 \arrow[r] & V \arrow[r] & X & X & V \arrow[l] & W \arrow[l]
\end{tikzcd}
$$

Ok, and now since $X \to S$ is flat and of finite presentation it is universally open (Morphisms, Lemma 24.24.9). Hence we conclude that W is open. Moreover, it is also clearly the case that W is quasi-compact, and $W^1 \subset W$. Moreover, we note that $\varphi(W \times_S X) = X \times_S W$ by the cocycle condition for φ. Hence we obtain a new descent datum (W, φ') by restricting φ to $W \times_S X$. Note that the morphism $W \to X$ is quasi-compact, separated and locally quasi-finite. This implies that it is separated and quasi-finite by definition. Hence it is quasi-affine by Lemma 33.29.3. Thus by Descent, Lemma 31.34.1 we see that the descent datum (W, φ') is effective.

In other words, we find that there exists an open covering $V = \bigcup W_i$ by quasi-compact opens W_i which are stable for the descent morphism φ. Moreover, for each such quasi-compact open $W \subset V$ the corresponding descent data (W, φ') is effective. It is an exercise to show this means the original descent datum is effective by glueing the schemes obtained from descending the opens W_i (details omitted). □

33.36. Pseudo-coherent morphisms

Avoid reading this section at all cost. If you need some of this material, first take a look at the corresponding algebra sections, see More on Algebra, Sections 12.40, 12.45, and 12.46. For now the only thing you need to know is that a ring map $A \to B$ is pseudo-coherent if and only if $B = A[x_1, \ldots, x_n]/I$ and B as an $A[x_1, \ldots, x_n]$-module has a resolution by finite free $A[x_1, \ldots, x_n]$-modules.

Lemma 33.36.1. *Let $f : X \to S$ be a morphism of schemes which is locally of finite type. The following are equivalent*

1. *there exist an affine open covering $S = \bigcup V_j$ and for each j an affine open covering $f^{-1}(V_j) = \bigcup U_{ji}$ such that $\mathcal{O}_S(V_j) \to \mathcal{O}_X(U_{ij})$ is a pseudo-coherent ring map, and*
2. *for every pair of affine opens $U \subset X$, $V \subset S$ such that $f(U) \subset V$ the ring map $\mathcal{O}_S(V) \to \mathcal{O}_X(U)$ is pseudo-coherent.*

Proof. To see this it suffices to check conditions (1)(a), (b), (c) of Morphisms, Definition 24.13.1 for the property of being a pseudo-coherent ring map. These properties follow (using localization is flat) from More on Algebra, Lemmas 12.45.12, 12.45.11, and 12.45.16. □

Definition 33.36.2. A morphism of schemes $f : X \to S$ is called *pseudo-coherent* if the equivalent conditions of Lemma 33.36.1 are satisfied. In this case we also say that X is pseudo-coherent over S.

Beware that a base change of a pseudo-coherent morphism is not pseudo-coherent in general.

Lemma 33.36.3. *A flat base change of a pseudo-coherent morphism is pseudo-coherent.*

Proof. This translates into the following algebra result: Let $A \to B$ be a pseudo-coherent ring map. Let $A \to A'$ be flat. Then $A' \to B \otimes_A A'$ is pseudo-coherent. This follows from the more general More on Algebra, Lemma 12.45.12. $\square$

Lemma 33.36.4. *A composition of pseudo-coherent morphisms of schemes is pseudo-coherent.*

Proof. This translates into the following algebra result: If $A \to B \to C$ are composable pseudo-coherent ring maps then $A \to C$ is pseudo-coherent. This follows from either More on Algebra, Lemma 12.45.13 or More on Algebra, Lemma 12.45.15. $\square$

Lemma 33.36.5. *A pseudo-coherent morphism is locally of finite presentation.*

Proof. Immediate from the definitions. $\square$

Lemma 33.36.6. *A flat morphism which is locally of finite presentation is pseudo-coherent.*

Proof. This follows from the fact that a flat ring map of finite presentation is pseudo-coherent (and even perfect), see More on Algebra, Lemma 12.46.4. $\square$

Lemma 33.36.7. *Let $f : X \to Y$ be a morphism of schemes pseudo-coherent over a base scheme S. Then f is pseudo-coherent.*

Proof. This translates into the following algebra result: If $R \to A \to B$ are composable ring maps and $R \to A$, $R \to B$ pseudo-coherent, then $R \to B$ is pseudo-coherent. This follows from More on Algebra, Lemma 12.45.15. $\square$

Lemma 33.36.8. *Let $f : X \to S$ be a morphism of schemes. If S is locally Noetherian, then f is pseudo-coherent if and only if f is locally of finite type.*

Proof. This translates into the following algebra result: If $R \to A$ is a finite type ring map with R Noetherian, then $R \to A$ is pseudo-coherent if and only if $R \to A$ is of finite type. To see this, note that a pseudo-coherent ring map is of finite type by definition. Conversely, if $R \to A$ is of finite type, then we can write $A = R[x_1, \ldots, x_n]/I$ and it follows from More on Algebra, Lemma 12.40.16 that A is pseudo-coherent as an $R[x_1, \ldots, x_n]$-module, i.e., $R \to A$ is a pseudo-coherent ring map. $\square$

Lemma 33.36.9. *The property $\mathcal{P}(f) =$``f is pseudo-coherent'' is fpqc local on the base.*

Proof. We will use the criterion of Descent, Lemma 31.18.4 to prove this. By Definition 33.36.2 being pseudo-coherent is Zariski local on the base. By Lemma 33.36.3 being pseudo-coherent is preserved under flat base change. The final hypothesis (3) of Descent, Lemma 31.18.4 translates into the following algebra statement: Let $A \to B$ be a faithfully flat ring map. Let $C = A[x_1, \ldots, x_n]/I$ be an A-algebra. If $C \otimes_A B$ is pseudo-coherent as an $B[x_1, \ldots, x_n]$-module, then C is pseudo-coherent as a $A[x_1, \ldots, x_n]$-module. This is More on Algebra, Lemma 12.40.15. $\square$

Lemma 33.36.10. *Let $A \to B$ be a flat ring map of finite presentation. Let $I \subset B$ be an ideal. Then $A \to B/I$ is pseudo-coherent if and only if I is pseudo-coherent as a B-module.*

Proof. Choose a presentation $B = A[x_1, \ldots, x_n]/J$. Note that B is pseudo-coherent as an $A[x_1, \ldots, x_n]$-module because $A \to B$ is a pseudo-coherent ring map by Lemma 33.36.6. Note that $A \to B/I$ is pseudo-coherent if and only if B/I is pseudo-coherent as an $A[x_1, \ldots, x_n]$-module. By More on Algebra, Lemma 12.40.11 we see this is equivalent to the condition that B/I is pseudo-coherent as an B-module. This proves the lemma as the short exact sequence $0 \to I \to B \to B/I \to 0$ shows that I is pseudo-coherent if and only if B/I is (see More on Algebra, Lemma 12.40.6). $\square$

The following lemma will be obsoleted by the stronger Lemma 33.36.12.

Lemma 33.36.11. *The property $\mathcal{P}(f)$ =``f is pseudo-coherent'' is syntomic local on the source.*

Proof. We will use the criterion of Descent, Lemma 31.22.3 to prove this. It follows from Lemmas 33.36.6 and 33.36.4 that being pseudo-coherent is preserved under precomposing with flat morphisms locally of finite presentation, in particular under precomposing with syntomic morphisms (see Morphisms, Lemmas 24.30.7 and 24.30.6). It is clear from Definition 33.36.2 that being pseudo-coherent is Zariski local on the source and target. Hence, according to the aforementioned Descent, Lemma 31.22.3 it suffices to prove the following: Suppose $X' \to X \to Y$ are morphisms of affine schemes with $X' \to X$ syntomic and $X' \to Y$ pseudo-coherent. Then $X \to Y$ is pseudo-coherent. To see this, note that in any case $X \to Y$ is of finite presentation by Descent, Lemma 31.10.1. Choose a closed immersion $X \to \mathbf{A}^n_Y$. By Algebra, Lemma 7.125.19 we can find an affine open covering $X' = \bigcup_{i=1,\ldots,n} X'_i$ and syntomic morphisms $W_i \to \mathbf{A}^n_Y$ lifting the morphisms $X'_i \to X$, i.e., such that there are fibre product diagrams

$$\begin{tikzcd} X'_i \arrow[r] \arrow[d] & W_i \arrow[d] \\ X \arrow[r] & \mathbf{A}^n_Y \end{tikzcd}$$

After replacing X' by $\coprod X'_i$ and setting $W = \coprod W_i$ we obtain a fibre product diagram

$$\begin{tikzcd} X' \arrow[r] \arrow[d] & W \arrow[d, "h"] \\ X \arrow[r] & \mathbf{A}^n_Y \end{tikzcd}$$

with $W \to \mathbf{A}^n_Y$ flat and of finite presentation and $X' \to Y$ still pseudo-coherent. Since $W \to \mathbf{A}^n_Y$ is open (see Morphisms, Lemma 24.24.9) and $X' \to X$ is surjective we can find $f \in \Gamma(\mathbf{A}^n_Y, \mathcal{O})$ such that $X \subset D(f) \subset \mathrm{Im}(h)$. Write $Y = Spec(R)$, $X = Spec(A)$, $X' = Spec(A')$ and $W = Spec(B)$, $A = R[x_1, \ldots, x_n]/I$ and $A' = B/IB$. Then $R \to A'$ is pseudo-coherent. Picture

$$\begin{tikzcd} A' = B/IB & B \arrow[l] \\ A = R[x_1, \ldots, x_n]/I \arrow[u] & R[x_1, \ldots, x_n] \arrow[l] \arrow[u] \end{tikzcd}$$

By Lemma 33.36.10 we see that IB is pseudo-coherent as a B-module. The ring map $R[x_1, \ldots, x_n]_f \to B_f$ is faithfully flat by our choice of f above. This implies that $I_f \subset$

$R[x_1, \ldots, x_n]_f$ is pseudo-coherent, see More on Algebra, Lemma 12.40.15. Applying Lemma 33.36.10 one more time we see that $R \to A$ is pseudo-coherent. $\square$

Lemma 33.36.12. *The property $\mathcal{P}(f) =$ "f is pseudo-coherent" is fppf local on the source.*

Proof. Let $f : X \to S$ be a morphism of schemes. Let $\{g_i : X_i \to X\}$ be an fppf covering such that each composition $f \circ g_i$ is pseudo-coherent. According to Lemma 33.32.1 there exist

(1) a Zariski open covering $X = \bigcup U_j$,
(2) surjective finite locally free morphisms $W_j \to U_j$,
(3) Zariski open coverings $W_j = \bigcup_k W_{j,k}$,
(4) surjective finite locally free morphisms $T_{j,k} \to W_{j,k}$

such that the fppf covering $\{h_{j,k} : T_{j,k} \to X\}$ refines the given covering $\{X_i \to X\}$. Denote $\psi_{j,k} : T_{j,k} \to X_{\alpha(j,k)}$ the morphisms that witness the fact that $\{T_{j,k} \to X\}$ refines the given covering $\{X_i \to X\}$. Note that $T_{j,k} \to X$ is a flat, locally finitely presented morphism, so both X_i and $T_{j,k}$ are pseudo-coherent over X by Lemma 33.36.6. Hence $\psi_{j,k} : T_{j,k} \to X_i$ is pseudo-coherent, see Lemma 33.36.7. Hence $T_{j,k} \to S$ is pseudo coherent as the composition of $\psi_{j,k}$ and $f \circ g_{\alpha(j,k)}$, see Lemma 33.36.4. Thus we see we have reduced the lemma to the case of a Zariski open covering (which is OK) and the case of a covering given by a single surjective finite locally free morphism which we deal with in the following paragraph.

Assume that $X' \to X \to S$ is a sequence of morphisms of schemes with $X' \to X$ surjective finite locally free and $X' \to Y$ pseudo-coherent. Our goal is to show that $X \to S$ is pseudo-coherent. Note that by Descent, Lemma 31.10.3 the morphism $X \to S$ is locally of finite presentation. It is clear that the problem reduces to the case that X', X and S are affine and $X' \to X$ is free of some rank $r > 0$. The corresponding algebra problem is the following: Suppose $R \to A \to A'$ are ring maps such that $R \to A'$ is pseudo-coherent, $R \to A$ is of finite presentation, and $A' \cong A^{\oplus r}$ as an A-module. Goal: Show $R \to A$ is pseudo-coherent. The assumption that $R \to A'$ is pseudo-coherent means that A' as an A'-module is pseudo-coherent relative to R. By More on Algebra, Lemma 12.45.5 this implies that A' as an A-module is pseudo-coherent relative to R. Since $A' \cong A^{\oplus r}$ as an A-module we see that A as an A-module is pseudo-coherent relative to R, see More on Algebra, Lemma 12.45.8. This by definition means that $R \to A$ is pseudo-coherent and we win. $\square$

33.37. Perfect morphisms

In order to understand the material in this section you have to understand the material of the section on pseudo-coherent morphisms just a little bit. For now the only thing you need to know is that a ring map $A \to B$ is perfect if and only if it is pseudo-coherent and B has finite tor dimension as an A-module.

Lemma 33.37.1. *Let $f : X \to S$ be a morphism of schemes which is locally of finite type. The following are equivalent*

(1) *there exist an affine open covering $S = \bigcup V_j$ and for each j an affine open covering $f^{-1}(V_j) = \bigcup U_{ji}$ such that $\mathcal{O}_S(V_j) \to \mathcal{O}_X(U_{ij})$ is a perfect ring map, and*
(2) *for every pair of affine opens $U \subset X$, $V \subset S$ such that $f(U) \subset V$ the ring map $\mathcal{O}_S(V) \to \mathcal{O}_X(U)$ is perfect.*

Proof. Assume (1) and let U, V be as in (2). It follows from Lemma 33.36.1 that $\mathcal{O}_S(V) \to \mathcal{O}_X(U)$ is pseudo-coherent. Hence it suffices to prove that the property of a ring map being "of finite tor dimension" satisfies conditions (1)(a), (b), (c) of Morphisms, Definition 24.13.1. These properties follow from More on Algebra, Lemmas 12.41.9, 12.41.12, and 12.41.13. Some details omitted. □

Definition 33.37.2. A morphism of schemes $f : X \to S$ is called *perfect* if the equivalent conditions of Lemma 33.36.1 are satisfied. In this case we also say that X is perfect over S.

Note that a perfect morphism is in particular pseudo-coherent, hence locally of finite presentation. Beware that a base change of a perfect morphism is not perfect in general.

Lemma 33.37.3. *A flat base change of a perfect morphism is perfect.*

Proof. This translates into the following algebra result: Let $A \to B$ be a perfect ring map. Let $A \to A'$ be flat. Then $A' \to B \otimes_A A'$ is perfect. This result for pseudo-coherent ring maps we have seen in Lemma 33.36.3. The corresponding fact for finite tor dimension follows from More on Algebra, Lemma 12.41.12. □

Lemma 33.37.4. *A composition of perfect morphisms of schemes is perfect.*

Proof. This translates into the following algebra result: If $A \to B \to C$ are composable perfect ring maps then $A \to C$ is perfect. We have seen this is the case for pseudo-coherent in Lemma 33.36.4 and its proof. By assumption there exist integers n, m such that B has tor dimension $\leq n$ over A and C has tor dimension $\leq m$ over B. Then for any A-module M we have

$$M \otimes_A^{\mathbf{L}} C = (M \otimes_A^{\mathbf{L}} B) \otimes_B^{\mathbf{L}} C$$

and the spectral sequence of More on Algebra, Example 12.6.4 shows that $\text{Tor}_p^A(M, C) = 0$ for $p > n + m$ as desired. □

Lemma 33.37.5. *Let $f : X \to S$ be a morphism of schemes. The following are equivalent*

(1) *f is flat and perfect, and*
(2) *f is flat and locally of finite presentation.*

Proof. The implication (2) $\Rightarrow$ (1) is More on Algebra, Lemma 12.46.4. The converse follows from the fact that a pseudo-coherent morphism is locally of finite presentation, see Lemma 33.36.5. □

Lemma 33.37.6. *Let $f : X \to S$ be a morphism of schemes. Assume S is regular and f is locally of finite type. Then f is perfect.*

Proof. See More on Algebra, Lemma 12.46.5. □

Lemma 33.37.7. *A regular immersion of schemes is perfect. A Koszul-regular immersion of schemes is perfect.*

Proof. Since a regular immersion is a Koszul-regular immersion, see Divisors, Lemma 26.13.2, it suffices to prove the second statement. This translates into the following algebraic statement: Suppose that $I \subset A$ is an ideal generated by a Koszul-regular sequence $f_1, \ldots, f_r$ of A. Then $A \to A/I$ is a perfect ring map. Since $A \to A/I$ is surjective this is a presentation of A/I by a polynomial algebra over A. Hence it suffices to see that A/I is pseudo-coherent as an A-module and has finite tor dimension. By definition of a Koszul sequence the Koszul complex $K(A, f_1, \ldots, f_r)$ is a finite free resolution of A/I. Hence A/I is a perfect complex of A-modules and we win. □

Lemma 33.37.8. *Let*

$$\begin{tikzcd} X \arrow[rr, "f"] \arrow[dr] & & Y \arrow[dl] \\ & S & \end{tikzcd}$$

be a commutative diagram of morphisms of schemes. Assume $Y \to S$ smooth and $X \to S$ perfect. Then $f : X \to Y$ is perfect.

Proof. We can factor f as the composition

$$X \longrightarrow X \times_S Y \longrightarrow Y$$

where the first morphism is the map $i = (1, f)$ and the second morphism is the projection. Since $Y \to S$ is flat, see Morphisms, Lemma 24.33.9, we see that $X \times_S Y \to Y$ is perfect by Lemma 33.37.3. As $Y \to S$ is smooth, also $X \times_S Y \to X$ is smooth, see Morphisms, Lemma 24.33.5. Hence i is a section of a smooth morphism, therefore i is a regular immersion, see Divisors, Lemma 26.14.7. This implies that i is perfect, see Lemma 33.37.7. We conclude that f is perfect because the composition of perfect morphisms is perfect, see Lemma 33.37.4. □

Remark 33.37.9. It is not true that a morphism between schemes X, Y perfect over a base S is perfect. An example is $S = Spec(k)$, $X = Spec(k)$, $Y = Spec(k[x]/(x^2)$ and $X \to Y$ the unique S-morphism.

Lemma 33.37.10. *The property $\mathcal{P}(f) =$``f is perfect'' is fpqc local on the base.*

Proof. We will use the criterion of Descent, Lemma 31.18.4 to prove this. By Definition 33.37.2 being perfect is Zariski local on the base. By Lemma 33.37.3 being perfect is preserved under flat base change. The final hypothesis (3) of Descent, Lemma 31.18.4 translates into the following algebra statement: Let $A \to B$ be a faithfully flat ring map. Let $C = A[x_1, \ldots, x_n]/I$ be an A-algebra. If $C \otimes_A B$ is perfect as an $B[x_1, \ldots, x_n]$-module, then C is perfect as a $A[x_1, \ldots, x_n]$-module. This is More on Algebra, Lemma 12.42.12. □

Lemma 33.37.11. *Let $f : X \to S$ be a pseudo-coherent morphism of schemes. Then f is perfect if and only if for every $x \in X$ the ring $\mathcal{O}_{X,x}$ has finite tor dimension as an $\mathcal{O}_{S,f(x)}$-module.*

Proof. This translates into the following algebra problem. Suppose that $A \to B$ is a pseudo-coherent ring map. Write $B = A[x_1, \ldots, x_n]/I$. Then the following are equivalent

(1) $B_\mathfrak{q}$ has finite tor dimension over $A_\mathfrak{p}$ for all $\mathfrak{q}$ (with $\mathfrak{p} = A \cap \mathfrak{q}$), and
(2) B is perfect as an $A[x_1, \ldots, x_n]$-module.

The implication (2) ⇒ (1) is clear. For the converse, consider a prime $\mathfrak{q}$ of B lying over $\mathfrak{p}$ as in (1). Let $\mathfrak{q}'$ be the prime of $A[x_1, \ldots, x_n]$ corresponding to $\mathfrak{q}$. By More on Algebra, Lemma 12.42.17 applied to $A_\mathfrak{p} \to A[x_1, \ldots, x_n]_{\mathfrak{q}'}$ we see that $B_\mathfrak{q}$ is a perfect $A[x_1, \ldots, x_n]_{\mathfrak{q}'}$-module. Hence B is a perfect $A[x_1, \ldots, x_n]$-module by More on Algebra, Lemma 12.42.16. Some details omitted. □

Lemma 33.37.12. *The property $\mathcal{P}(f) =$``f is perfect'' is fppf local on the source.*

Proof. Let $\{g_i : X_i \to X\}_{i \in I}$ be an fppf covering of schemes and let $f : X \to S$ be a morphism such that each $f \circ g_i$ is perfect. By Lemma 33.36.12 we conclude that f is pseudo-coherent. Hence by Lemma 33.37.11 it suffices to check that $\mathcal{O}_{X,x}$ is an $\mathcal{O}_{S,f(x)}$-module of finite tor dimension for all $x \in X$. Pick $i \in I$ and and $x_i \in X_i$ mapping to x. Then we see that $\mathcal{O}_{X_i,x_i}$ has finite tor dimension over $\mathcal{O}_{S,f(x)}$ and that $\mathcal{O}_{X,x} \to \mathcal{O}_{X_i,x_i}$ is faithfully flat. The desired conclusion follows from More on Algebra, Lemma 12.41.14. □

33.38. Local complete intersection morphisms

In Divisors, Section 26.13 we have defined 4 different types of regular immersions: regular, Koszul-regular, H_1-regular, and quasi-regular. In this section we consider morphisms $f : X \to S$ which locally on X factors as

$$\begin{tikzcd} X \arrow[rr, "i"] \arrow[dr] & & \mathbf{A}^n_S \arrow[dl] \\ & S & \end{tikzcd}$$

where i is a $*$-regular immersion for $* \in \{\emptyset, Koszul, H_1, quasi\}$. However, we don't know how to prove that this condition is independent of the factorization if $* = \emptyset$, i.e., when we require i to be a regular immersion. On the other hand, we want a local complete intersection morphism to be perfect, which is only going to be true if $* = Koszul$ or $* = \emptyset$. Hence we will define a *local complete intersection morphism* or *Koszul morphism* to be a morphism of schemes $f : X \to S$ that locally on X has a factorization as above with i a Koszul-regular immersion. To see that this works we first prove this is independent of the chosen factorizations.

Lemma 33.38.1. *Let S be a scheme. Let U, P, P' be schemes over S. Let $u \in U$. Let $i : U \to P$, $i' : U \to P'$ be immersions over S. Assume P and P' smooth over S. Then the following are equivalent*

(1) *i is a Koszul-regular immersion in a neighbourhood of x, and*
(2) *i' is a Koszul-regular immersion in a neighbourhood of x.*

Proof. Assume i is a Koszul-regular immersion in a neighbourhood of x. Consider the morphism $j = (i, i') : U \to P \times_S P' = P''$. Since $P'' = P \times_S P' \to P$ is smooth, it follows from Divisors, Lemma 26.14.8 that j is a Koszul-regular immersion, whereupon it follows from Divisors, Lemma 26.14.11 that i' is a Koszul-regular immersion. □

Before we state the definition, let us make the following simple remark. Let $f : X \to S$ be a morphism of schemes which is locally of finite type. Let $x \in X$. Then there exist an open neighbourhood $U \subset X$ and a factorization of $f|_U$ as the composition of an immersion $i : U \to \mathbf{A}^n_S$ followed by the projection $\mathbf{A}^n_S \to S$ which is smooth. Picture

$$\begin{tikzcd} X \arrow[dr] & U \arrow[l] \arrow[r, "i"] \arrow[d] & \mathbf{A}^n_S = P \arrow[dl, "\pi"] \\ & S & \end{tikzcd}$$

In fact you can do this with any affine open neighbourhood U of x in X, see Morphisms, Lemma 24.38.2.

Definition 33.38.2. Let $f : X \to S$ be a morphism of schemes.

(1) Let $x \in X$. We say that f is *Koszul at x* if f is of finite type at x and there exists an open neighbourhood and a factorization of $f|_U$ as $\pi \circ i$ where $i : U \to P$ is a Koszul-regular immersion and $\pi : P \to S$ is smooth.

(2) We say f is a *Koszul morphism*, or that f is a *local complete intersection morphism* if f is Koszul at every point.

We have seen above that the choice of the factorization $f|_U = \pi \circ i$ is irrelevant, i.e., given a factorization of $f|_U$ as an immersion i followed by a smooth morphism π, whether or not i is Koszul regular in a neighbourhood of x is an intrinsic property of f at x. Let us record this here explicitly as a lemma so that we can refer to it

Lemma 33.38.3. *Let $f : X \to S$ be a local complete intersection morphism. Let P be a scheme smooth over S. Let $U \subset X$ be an open subscheme and $i : U \to P$ an immersion of schemes over S. Then i is a Koszul-regular immersion.*

Proof. This is the defining property of a local complete intersection morphism. See discussion above. □

It seems like a good idea to collect here some properties in common with all Koszul morphisms.

Lemma 33.38.4. *Let $f : X \to S$ be a local complete intersection morphism. Then*

(1) *f is locally of finite presentation,*
(2) *f is pseudo-coherent, and*
(3) *f is perfect.*

Proof. Since a perfect morphism is pseudo-coherent (because a perfect ring map is pseudo-coherent) and a pseudo-coherent morphism is locally of finite presentation (because a pseudo-coherent ring map is of finite presentation) it suffices to prove the last statement. Being perfect is a local property, hence we may assume that f factors as $\pi \circ i$ where π is smooth and i is a Koszul-regular immersion. A Koszul-regular immersion is perfect, see Lemma 33.37.7. A smooth morphism is perfect as it is flat and locally of finite presentation, see Lemma 33.37.5. Finally a composition of perfect morphisms is perfect, see Lemma 33.37.4. □

Lemma 33.38.5. *Let $f : X = Spec(B) \to S = Spec(A)$ be a morphism of affine schemes. Then f is a local complete intersection morphism if and only if $A \to B$ is a local complete intersection homomorphism, see More on Algebra, Definition 12.24.2.*

Proof. Follows immediately from the definitions. □

Beware that a base change of a Koszul morphism is not Koszul in general.

Lemma 33.38.6. *A flat base change of a local complete intersection morphism is a local complete intersection morphism.*

Proof. Omitted. Hint: This is true because a base change of a smooth morphism is smooth and a flat base change of a Koszul-regular immersion is a Koszul-regular immersion, see Divisors, Lemma 26.13.3. □

Lemma 33.38.7. *A composition of local complete intersection morphisms is a local complete intersection morphism.*

Proof. Let $g : Y \to S$ and $f : X \to Y$ be local complete intersection morphisms. Let $x \in X$ and set $y = f(x)$. Choose an open neighbourhood $V \subset Y$ of y and a factorization $g|_V = \pi \circ i$ for some Koszul-regular immersion $i : V \to P$ and smooth morphism $\pi : P \to S$. Next choose an open neighbourhood U of $x \in X$ and a factorization $f|_U = \pi' \circ i'$ for some Koszul-regular immersion $i' : U \to P'$ and smooth morphism $\pi' : P' \to Y$. In fact, we may assume that $P' = \mathbf{A}^n_V$, see discussion preceding and following Definition 33.38.2. Picture:

$$\begin{tikzcd}
X \arrow[d] & U \arrow[l] \arrow[r, "i'"'] & P' = \mathbf{A}^n_V \arrow[d] & \\
Y \arrow[d] & & V \arrow[ll] \arrow[r, "i"'] & P \arrow[d] \\
S & & & S \arrow[lll]
\end{tikzcd}$$

Set $P'' = \mathbf{A}^n_P$. Then $U \to P' \to P''$ is a Koszul-regular immersion as a composition of Koszul-regular immersions, namely i' and the flat base change of i via $P'' \to P$, see Divisors, Lemma 26.13.3 and Divisors, Lemma 26.13.7. Also $P'' \to P \to S$ is smooth as a composition of smooth morphisms, see Morphisms, Lemma 24.33.4. Hence we conclude that $X \to S$ is Koszul at x as desired. □

Lemma 33.38.8. *Let $f : X \to S$ be a morphism of schemes. The following are equivalent*

(1) *f is flat and a local complete intersection morphism, and*
(2) *f is syntomic.*

Proof. Assume (2). By Morphisms, Lemma 24.30.10 for every point x of X there exist affine open neighbourhoods U of x and V of $f(x)$ such that $f|_U : U \to V$ is standard syntomic. This means that $U = Spec(R[x_1, \ldots, x_n]/(f_1, \ldots, f_c)) \to V = Spec(R)$ where $R[x_1, \ldots, x_n]/(f_1, \ldots, f_c)$ is a relative global complete intersection over R. By Algebra, Lemma 7.125.13 the sequence $f_1, \ldots, f_c$ is a regular sequence in each local ring $R[x_1, \ldots, x_n]_\mathfrak{q}$ for every prime $\mathfrak{q} \supset (f_1, \ldots, f_c)$. Consider the Koszul complex $K_\bullet = K_\bullet(R[x_1, \ldots, x_n], f_1, \ldots, f_c)$ with homology groups $H_i = H_i(K_\bullet)$. By More on Algebra, Lemma 12.22.2 we see that $(H_i)_\mathfrak{q} = 0$, $i > 0$ for every $\mathfrak{q}$ as above. On the other hand, by More on Algebra, Lemma 12.21.6 we see that H_i is annihilated by $(f_1, \ldots, f_c)$. Hence we see that $H_i = 0$, $i > 0$ and $f_1, \ldots, f_c$ is a Koszul-regular sequence. This proves that $U \to V$ factors as a Koszul-regular immersion $U \to \mathbf{A}^n_V$ followed by a smooth morphism as desired.

Assume (1). Then f is a flat and locally of finite presentation (Lemma 33.38.4). Hence, according to Morphisms, Lemma 24.30.10 it suffices to show that the local rings $\mathcal{O}_{X_s,x}$ are local complete intersection rings. Choose, locally on X, a factorization $f = \pi \circ i$ for some Koszul-regular immersion $i : X \to P$ and smooth morphism $\pi : P \to S$. Note that $X \to P$ is a relative quasi-regular immersion over S, see Divisors, Definition 26.14.2. Hence according to Divisors, Lemma 26.14.4 we see that $X \to P$ is a regular immersion and the same remains true after any base change. Thus each fibre is a regular immersion, whence all the local rings of all the fibres of X are local complete intersections. □

Lemma 33.38.9. *A regular immersion of schemes is a local complete intersection morphism. A Koszul-regular immersion of schemes is a local complete intersection morphism.*

Proof. Since a regular immersion is a Koszul-regular immersion, see Divisors, Lemma 26.13.2, it suffices to prove the second statement. The second statement follows immediately from the definition. □

Lemma 33.38.10. *Let*

$$\begin{tikzcd} X \arrow[rr, "f"] \arrow[dr] & & Y \arrow[dl] \\ & S & \end{tikzcd}$$

be a commutative diagram of morphisms of schemes. Assume $Y \to S$ smooth and $X \to S$ is a local complete intersection morphism. Then $f : X \to Y$ is a local complete intersection morphism.

Proof. Immediate from the definitions. □

Lemma 33.38.11. *The property $\mathcal{P}(f)$ =``f is a local complete intersection morphism'' is fpqc local on the base.*

Proof. Let $f : X \to S$ be a morphism of schemes. Let $\{S_i \to S\}$ be an fpqc covering of S. Assume that each base change $f_i : X_i \to S_i$ of f is a local complete intersection morphism. Note that this implies in particular that f is locally of finite type, see Lemma 33.38.4 and Descent, Lemma 31.19.8. Let $x \in X$. Choose an open neighbourhood U of x and an immersion $j : U \to \mathbf{A}^n_S$ over S (see discussion preceding Definition 33.38.2). We have to show that j is a Koszul-regular immersion. Since f_i is a local complete intersection morphism, we see that the base change $j_i : U \times_S S_i \to \mathbf{A}^n_{S_i}$ is a Koszul-regular immersion, see Lemma 33.38.3. Because $\{\mathbf{A}^n_{S_i} \to \mathbf{A}^n_S\}$ is a fpqc covering we see from Descent, Lemma 31.19.30 that j is a Koszul-regular immersion as desired. □

Lemma 33.38.12. *The property $\mathcal{P}(f)$ =``f is a local complete intersection morphism'' is syntomic local on the source.*

Proof. We will use the criterion of Descent, Lemma 31.22.3 to prove this. It follows from Lemmas 33.38.8 and 33.38.7 that being a local complete intersection morphism is preserved under precomposing with syntomic morphisms. It is clear from Definition 33.38.2 that being a local complete intersection morphism is Zariski local on the source and target. Hence, according to the aforementioned Descent, Lemma 31.22.3 it suffices to prove the following: Suppose $X' \to X \to Y$ are morphisms of affine schemes with $X' \to X$ syntomic and $X' \to Y$ a local complete intersection morphism. Then $X \to Y$ is a local complete intersection morphism. To see this, note that in any case $X \to Y$ is of finite presentation by Descent, Lemma 31.10.1. Choose a closed immersion $X \to \mathbf{A}^n_Y$. By Algebra, Lemma 7.125.19 we can find an affine open covering $X' = \bigcup_{i=1,\ldots,n} X'_i$ and syntomic morphisms $W_i \to \mathbf{A}^n_Y$ lifting the morphisms $X'_i \to X$, i.e., such that there are fibre product diagrams

$$\begin{tikzcd} X'_i \arrow[r] \arrow[d] & W_i \arrow[d] \\ X \arrow[r] & \mathbf{A}^n_Y \end{tikzcd}$$

After replacing X' by $\coprod X'_i$ and setting $W = \coprod W_i$ we obtain a fibre product diagram of affine schemes

$$\begin{tikzcd} X' \arrow[r] \arrow[d] & W \arrow[d, "h"] \\ X \arrow[r] & \mathbf{A}^n_Y \end{tikzcd}$$

with $h : W \to \mathbf{A}^n_Y$ syntomic and $X' \to Y$ still a local complete intersection morphism. Since $W \to \mathbf{A}^n_Y$ is open (see Morphisms, Lemma 24.24.9) and $X' \to X$ is surjective we see that X is contained in the image of $W \to \mathbf{A}^n_Y$. Choose a closed immersion $W \to \mathbf{A}^{n+m}_Y$ over $\mathbf{A}^n_Y$. Now the diagram looks like

$$\begin{tikzcd} X' \arrow[r] \arrow[d] & W \arrow[r] \arrow[d, "h"] & \mathbf{A}^{n+m}_Y \arrow[dl] \\ X \arrow[r] & \mathbf{A}^n_Y & \end{tikzcd}$$

Because h is syntomic and hence a local complete intersection morphism (see above) the morphism $W \to \mathbf{A}^{n+m}_Y$ is a Koszul-regular immersion. Because $X' \to Y$ is a local complete intersection morphism the morphism $X' \to \mathbf{A}^{n+m}_Y$ is a Koszul-regular immersion. We conclude from Divisors, Lemma 26.13.8 that $X' \to W$ is a Koszul-regular immersion. Hence, since being a Koszul-regular immersion is fpqc local on the target (see Descent, Lemma 31.19.30) we conclude that $X \to \mathbf{A}^n_Y$ is a Koszul-regular immersion which is what we had to show. □

Lemma 33.38.13. *Let S be a scheme. Let $f : X \to Y$ be a morphism of schemes over S. Assume both X and Y are flat and locally of finite presentation over S. Then the set*

$$\{x \in X \mid f \text{ Koszul at } x\}.$$

is open in X and its formation commutes with arbitrary base change $S' \to S$.

Proof. The set is open by definition (see Definition 33.38.2). Let $S' \to S$ be a morphism of schemes. Set $X' = S' \times_S X$, $Y' = S' \times_S Y$, and denote $f' : X' \to Y'$ the base change of f. Let $x' \in X'$ be a point such that f' is Koszul at x'. Denote $s' \in S'$, $x \in X$, $y' \in Y'$, $y \in Y$, $s \in S$ the image of x'. Note that f is locally of finite presentation, see Morphisms, Lemma 24.20.11. Hence we may choose an affine neighbourhood $U \subset X$ of x and an immersion $i : U \to \mathbf{A}^n_Y$. Denote $U' = S' \times_S U$ and $i' : U' \to \mathbf{A}^n_{Y'}$ the base change of i. The assumption that f' is Koszul at x' implies that i' is a Koszul-regular immersion in a neighbourhood of x', see Lemma 33.38.3. The scheme X' is flat and locally of finite presentation over S' as a base change of X (see Morphisms, Lemmas 24.24.7 and 24.20.4). Hence i' is a relative H_1-regular immersion over S' in a neighbourhood of x' (see Divisors, Definition 26.14.2). Thus the base change $i'_{s'} : U'_{s'} \to \mathbf{A}^n_{Y'_{s'}}$ is a H_1-regular immersion in an open neighbourhood of x', see Divisors, Lemma 26.14.1 and the discussion following Divisors, Definition 26.14.2. Since $s' = Spec(\kappa(s')) \to Spec(\kappa(s)) = s$ is a surjective flat universally open morphism (see Morphisms, Lemma 24.22.4) we conclude that the base change $i_s : U_s \to \mathbf{A}^n_{Y_s}$ is an H_1-regular immersion in a neighbourhood of x, see Descent, Lemma 31.19.30. Finally, note that $\mathbf{A}^n_Y$ is flat and locally of finite presentation over S, hence Divisors, Lemma 26.14.6 implies that i is a (Koszul-)regular immersion in a neighbourhood of x as desired. □

Lemma 33.38.14. *Let $f : X \to Y$ be a local complete intersection morphism of schemes. Then f is unramified if and only if f is formally unramified and in this case the conormal sheaf $\mathcal{C}_{X/Y}$ is finite locally free on X.*

Proof. The first assertion follows immediately from Lemma 33.4.8 and the fact that a local complete intersection morphism is locally of finite type. To compute the conormal sheaf of f we choose, locally on X, a factorization of f as $f = p \circ i$ where $i : X \to V$ is a

Koszul-regular immersion and $V \to Y$ is smooth. By Lemma 33.9.11 we see that $\mathcal{C}_{X/Y}$ is a locally direct summand of $\mathcal{C}_{X/V}$ which is finite locally free as i is a Koszul-regular (hence quasi-regular) immersion, see Divisors, Lemma 26.13.5. $\square$

Lemma 33.38.15. *Let $Z \to Y \to X$ be formally unramified morphisms of schemes. Assume that $Z \to Y$ is a local complete intersection morphism. The exact sequence*

$$0 \to i^*\mathcal{C}_{Y/X} \to \mathcal{C}_{Z/X} \to \mathcal{C}_{Z/Y} \to 0$$

of Lemma 33.5.12 is short exact.

Proof. The question is local on Z hence we may assume there exists a factorization $Z \to \mathbf{A}^n_Y \to Y$ of the morphism $Z \to Y$. Then we get a commutative diagram

$$\begin{tikzcd} Z \arrow[r, "i'"'] \arrow[d, equal] & \mathbf{A}^n_Y \arrow[r] \arrow[d] & \mathbf{A}^n_X \arrow[d] \\ Z \arrow[r, "i"] & Y \arrow[r] & X \end{tikzcd}$$

As $Z \to Y$ is a local complete intersection morphism, we see that $Z \to \mathbf{A}^n_Y$ is a Koszul-regular immersion. Hence by Divisors, Lemma 26.13.6 the sequence

$$0 \to (i')^*\mathcal{C}_{\mathbf{A}^n_Y/\mathbf{A}^n_X} \to \mathcal{C}_{Z/\mathbf{A}^n_X} \to \mathcal{C}_{Z/\mathbf{A}^n_Y} \to 0$$

is exact and locally split. Note that $i^*\mathcal{C}_{Y/X} = (i')^*\mathcal{C}_{\mathbf{A}^n_Y/\mathbf{A}^n_X}$ by Lemma 33.5.7 and note that the diagram

$$\begin{tikzcd} (i')^*\mathcal{C}_{\mathbf{A}^n_Y/\mathbf{A}^n_X} \arrow[r] & \mathcal{C}_{Z/\mathbf{A}^n_X} \\ i^*\mathcal{C}_{Y/X} \arrow[r] \arrow[u, "\cong"] & \mathcal{C}_{Z/X} \arrow[u] \end{tikzcd}$$

is commutative. Hence the lower horizontal arrow is a locally split injection. This proves the lemma. $\square$

33.39. Exact sequences of differentials and conormal sheaves

In this section we collect some results on exact sequences of conormal sheaves and sheaves of differentials. In some sense these are all realizations of the triangle of cotangent complexes associated to a pair of composable morphisms of schemes.

In the sequences below each of the maps are as constructed in either Morphisms, Lemma 24.32.9 or Lemma 33.5.5. Let $g : Z \to Y$ and $f : Y \to X$ be morphisms of schemes.

(1) There is a canonical exact sequence

$$g^*\Omega_{Y/X} \to \Omega_{Z/X} \to \Omega_{Z/Y} \to 0,$$

see Morphisms, Lemma 24.32.11. If $g : Z \to Y$ is formally smooth, then this sequence is a short exact sequence, see Lemma 33.9.9.

(2) If g is formally unramified, then there is a canonical exact sequence

$$\mathcal{C}_{Z/Y} \to g^*\Omega_{Y/X} \to \Omega_{Z/X} \to 0,$$

see Lemma 33.5.10. If $f \circ g : Z \to X$ is formally smooth, then this sequence is a short exact sequence, see Lemma 33.9.10.

(3) If g and $f \circ g$ are formally unramified, then there is a canonical exact sequence
$$\mathcal{C}_{Z/X} \to \mathcal{C}_{Z/Y} \to g^*\Omega_{Y/X} \to 0,$$
see Lemma 33.5.11. If $f : Y \to X$ is formally smooth, then this sequence is a short exact sequence, see Lemma 33.9.11.

(4) If g and f are formally unramified, then there is a canonical exact sequence
$$g^*\mathcal{C}_{Y/X} \to \mathcal{C}_{Z/X} \to \mathcal{C}_{Z/Y} \to 0.$$
see Lemma 33.5.12. If $g : Z \to Y$ is a local complete intersection morphism, then this sequence is a short exact sequence, see Lemma 33.38.15.

CHAPTER 34

More on flatness

34.1. Introduction

In this chapter, we discuss some advanced results on flat modules and flat morphisms of schemes. Most of these results can be found in the paper [**GR71**] by Raynaud and Gruson.

Before reading this chapter we advise the reader to take a look at the following results (this list also serves as a pointer to previous results):

(1) General discussion on flat modules in Algebra, Section 7.35.
(2) The relationship between Tor-groups and flatness, see Algebra, Section 7.69.
(3) The sections on flatness criteria, namely, Algebra, Section 7.91 (Noetherian case), Algebra, Section 7.93 (Artinian case), Algebra, Section 7.119 (non-Noetherian case), and finally More on Morphisms, Section 33.12.
(4) Generic flatness, see Algebra, Section 7.109 and Morphisms, Section 24.26.
(5) Openness of the flat locus, see Algebra, Section 7.120 and More on Morphisms, Section 33.11.
(6) Flattening stratification, see More on Algebra, Section 12.11.
(7) Additional algebraic results in More on Algebra, Sections 12.16, 12.17, 12.18, and 12.19.

34.2. A remark on finite type versus finite presentation

Let $R \to A$ be a finite type ring map. Let M be an A-module. In More on Algebra, Section 12.44 we defined what it means for M to be finitely presented relative to R. We also proved this notion has good localization properties and glues. Hence we can define the corresponding global notion as follows.

Definition 34.2.1. Let $f : X \to S$ be locally of finite type. Let $\mathcal{F}$ be a finite type quasi-coherent $\mathcal{O}_X$-module. Then we say *$\mathcal{F}$ is locally finitely presented relative to S* if there exists an affine open covering $S = \bigcup V_i$ and $f^{-1}(V_i) = \bigcup_j U_{ij}$ such that $\mathcal{F}(U_{ij})$ is a $\mathcal{O}_X(U_{ij})$-module of finite presentation relative to $\mathcal{O}_S(V_i)$.

In this way we can make sense of when a sheaf of modules on X is locally of finite presentation over S even if X is not locally of finite presentation over S. And of course, $X \to S$ is locally of finite presentation if and only if $\mathcal{O}_X$ is locally of finite presentation relative to S.

34.3. Lemmas on étale localization

In this section we list some lemmas on étale localization which will be useful later in this chapter. Please skip this section on a first reading.

Lemma 34.3.1. *Let $i : Z \to X$ be a closed immersion of affine schemes. Let $Z' \to Z$ be an étale morphism with Z' affine. Then there exists an étale morphism $X' \to X$ with X' affine such that $Z' \cong Z \times_X X'$ as schemes over Z.*

Proof. See Algebra, Lemma 7.132.10. □

Lemma 34.3.2. *Let*

$$\begin{tikzcd} X & X' \arrow[l] \arrow[d] \\ S \arrow[from=u] & S' \arrow[l] \end{tikzcd}$$

be a commutative diagram of schemes with $X' \to X$ and $S' \to S$ étale. Let $s' \in S'$ be a point. Then

$$X' \times_{S'} Spec(\mathcal{O}_{S',s'}) \longrightarrow X \times_S Spec(\mathcal{O}_{S',s'})$$

is étale.

Proof. This is true because $X' \to X_{S'}$ is étale as a morphism of schemes étale over X, see Morphisms, Lemma 24.35.18 and the base change of an étale morphism is étale, see Morphisms, Lemma 24.35.4. □

Lemma 34.3.3. *Let $X \to T \to S$ be morphisms of schemes with $T \to S$ étale. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Let $x \in X$ be a point. Then*

$$\mathcal{F} \text{ flat over } S \text{ at } x \Leftrightarrow \mathcal{F} \text{ flat over } T \text{ at } x$$

In particular $\mathcal{F}$ is flat over S if and only if $\mathcal{F}$ is flat over T.

Proof. As an étale morphism is a flat morphism (see Morphisms, Lemma 24.35.12) the implication "$\Leftarrow$" follows from Algebra, Lemma 7.35.3. For the converse assume that $\mathcal{F}$ is flat at x over S. Denote $\tilde{x} \in X \times_S T$ the point lying over x in X and over the image of x in T in T. Then $(X \times_S T \to X)^*\mathcal{F}$ is flat at $\tilde{x}$ over T via $\text{pr}_2 : X \times_S T \to T$, see Morphisms, Lemma 24.24.6. The diagonal $\Delta_{T/S} : T \to T \times_S T$ is an open immersion; combine Morphisms, Lemmas 24.34.13 and 24.35.5. So X is identified with open subscheme of $X \times_S T$, the restriction of pr_2 to this open is the given morphism $X \to T$, the point $\tilde{x}$ corresponds to the point x in this open, and $(X \times_S T \to X)^*\mathcal{F}$ restricted to this open is $\mathcal{F}$. Whence we see that $\mathcal{F}$ is flat at x over T. □

Lemma 34.3.4. *Let $T \to S$ be an étale morphism. Let $t \in T$ with image $s \in S$. Let M be a $\mathcal{O}_{T,t}$-module. Then*

$$M \text{ flat over } \mathcal{O}_{S,s} \Leftrightarrow M \text{ flat over } \mathcal{O}_{T,t}.$$

Proof. We may replace S by an affine neighbourhood of s and after that T by an affine neighbourhood of t. Set $\mathcal{F} = (Spec(\mathcal{O}_{T,t}) \to T)_*\widetilde{M}$. This is a quasi-coherent sheaf (see Schemes, Lemma 21.24.1 or argue directly) on T whose stalk at t is M (details omitted). Apply Lemma 34.3.3. □

Lemma 34.3.5. *Let S be a scheme and $s \in S$ a point. Denote $\mathcal{O}_{S,s}^h$ (resp. $\mathcal{O}_{S,s}^{sh}$) the henselization (resp. strict henselization), see Algebra, Definition 7.139.14. Let M^{sh} be a $\mathcal{O}_{S,s}^{sh}$-module. The following are equivalent*

1. *M^{sh} is flat over $\mathcal{O}_{S,s}$,*
2. *M^{sh} is flat over $\mathcal{O}_{S,s}^h$, and*
3. *M^{sh} is flat over $\mathcal{O}_{S,s}^{sh}$.*

If $M^{sh} = M^h \otimes_{\mathcal{O}^h_{S,s}} \mathcal{O}^{sh}_{S,s}$ this is also equivalent to

(4) *M^h is flat over $\mathcal{O}_{S,s}$, and*
(5) *M^h is flat over $\mathcal{O}^h_{S,s}$.*

If $M^h = M \otimes_{\mathcal{O}_{S,s}} \mathcal{O}^h_{S,s}$ this is also equivalent to

(6) *M is flat over $\mathcal{O}_{S,s}$.*
