Stacks Project

Version 3988929, compiled on Apr 30, 2012.

The following people have contributed to this work: Dan Abramovich, Jarod Alper, Dima Arinkin, Bhargav Bhatt, Mark Behrens, David Brown, Kestutis Cesnavicius, Nava Chitrik, Fraser Chiu, Johan Commelin, Brian Conrad, Rankeya Datta, Aise Johan de Jong, Matt DeLand, Daniel Disegni, Joel Dodge, Alexander Palen Ellis, Andrew Fanoe, Maxim Fedorchuck, Cameron Franc, Lennart Galinat, Martin Gallauer, Luis Garcia, Alberto Gioia, Xue Hang, Florian Heiderich, Jeremiah Heller, Kristen Hendricks, Fraser Hiu, Yuhao Huang, Christian Kappen, Timo Keller, Keenan Kidwell, Andrew Kiluk, Lars Kindler, Emmanuel Kowalski, Daniel Krashen, Min Lee, Tobi Lehman, Max Lieblich, Hsing Liu, Zachary Maddock, Sonja Mapes, Akhil Mathew, Yusuf Mustopa, Josh Nichols-Barrer, Thomas Nyberg, Catherine O'Neil, Martin Olsson, Brian Osserman, Thanos Papaioannou, Peter Percival, Alex Perry, Bjorn Poonen, Thibaut Pugin, You Qi, Matthieu Romagny, Joe Ross, Julius Ross, David Rydh, Beren Sanders, Rene Schoof, Jaakko Seppala, Chung-chieh Shan, Jason Starr, Abolfazl Tarizadeh, John Tate, Titus Teodorescu, Michael Thaddeus, Ravi Vakil, Theo van den Bogaart, Kevin Ventullo, Hendrik Verhoek, Jonathan Wang, Ian Whitehead, Amnon Yekutieli, Fan Zhou.

Contents

Chapter 1. Introduction 41
1.1. Overview 41
1.2. Attribution 41
1.3. Other chapters 42

Chapter 2. Conventions 43
2.1. Comments 43
2.2. Set theory 43
2.3. Categories 43
2.4. Algebra 43
2.5. Notation 43
2.6. Other chapters 43

Chapter 3. Set Theory 45
3.1. Introduction 45
3.2. Everything is a set 45
3.3. Classes 45
3.4. Ordinals 46
3.5. The hierarchy of sets 46
3.6. Cardinality 46
3.7. Cofinality 46
3.8. Reflection principle 47
3.9. Constructing categories of schemes 48
3.10. Sets with group action 52
3.11. Coverings of a site 52
3.12. Abelian categories and injectives 54
3.13. Other chapters 54

Chapter 4. Categories 57
4.1. Introduction 57
4.2. Definitions 57
4.3. Opposite Categories and the Yoneda Lemma 61
4.4. Products of pairs 62
4.5. Coproducts of pairs 62
4.6. Fibre products 63
4.7. Examples of fibre products 64
4.8. Fibre products and representability 64
4.9. Push outs 65
4.10. Equalizers 66
4.11. Coequalizers 66

4.12. Initial and final objects 66
4.13. Limits and colimits 67
4.14. Limits and colimits in the category of sets 69
4.15. Connected limits 70
4.16. Finite limits and colimits 71
4.17. Filtered colimits 73
4.18. Cofiltered limits 75
4.19. Limits and colimits over partially ordered sets 76
4.20. Essentially constant systems 78
4.21. Exact functors 80
4.22. Adjoint functors 80
4.23. Monomorphisms and Epimorphisms 81
4.24. Localization in categories 81
4.25. Formal properties 91
4.26. 2-categories 93
4.27. (2, 1)-categories 95
4.28. 2-fibre products 95
4.29. Categories over categories 102
4.30. Fibred categories 103
4.31. Inertia 108
4.32. Categories fibred in groupoids 109
4.33. Presheaves of categories 115
4.34. Presheaves of groupoids 117
4.35. Categories fibred in sets 118
4.36. Categories fibred in setoids 120
4.37. Representable categories fibred in groupoids 122
4.38. Representable 1-morphisms 123
4.39. Other chapters 125

Chapter 5. Topology 127
5.1. Introduction 127
5.2. Basic notions 127
5.3. Bases 127
5.4. Connected components 128
5.5. Irreducible components 129
5.6. Noetherian topological spaces 130
5.7. Krull dimension 132
5.8. Codimension and catenary spaces 132
5.9. Quasi-compact spaces and maps 133
5.10. Constructible sets 135
5.11. Constructible sets and Noetherian spaces 136
5.12. Characterizing proper maps 138
5.13. Jacobson spaces 140
5.14. Specialization 142
5.15. Submersive maps 144
5.16. Dimension functions 145
5.17. Nowhere dense sets 146
5.18. Miscellany 147
5.19. Other chapters 147

Chapter 6. Sheaves on Spaces 149
6.1. Introduction 149
6.2. Basic notions 149
6.3. Presheaves 149
6.4. Abelian presheaves 150
6.5. Presheaves of algebraic structures 151
6.6. Presheaves of modules 152
6.7. Sheaves 153
6.8. Abelian sheaves 154
6.9. Sheaves of algebraic structures 155
6.10. Sheaves of modules 156
6.11. Stalks 156
6.12. Stalks of abelian presheaves 158
6.13. Stalks of presheaves of algebraic structures 158
6.14. Stalks of presheaves of modules 159
6.15. Algebraic structures 159
6.16. Exactness and points 160
6.17. Sheafification 162
6.18. Sheafification of abelian presheaves 163
6.19. Sheafification of presheaves of algebraic structures 164
6.20. Sheafification of presheaves of modules 165
6.21. Continuous maps and sheaves 166
6.22. Continuous maps and abelian sheaves 169
6.23. Continuous maps and sheaves of algebraic structures 171
6.24. Continuous maps and sheaves of modules 172
6.25. Ringed spaces 175
6.26. Morphisms of ringed spaces and modules 176
6.27. Skyscraper sheaves and stalks 177
6.28. Limits and colimits of presheaves 178
6.29. Limits and colimits of sheaves 178
6.30. Bases and sheaves 180
6.31. Open immersions and (pre)sheaves 186
6.32. Closed immersions and (pre)sheaves 191
6.33. Glueing sheaves 192
6.34. Other chapters 194

Chapter 7. Commutative Algebra 197
7.1. Introduction 197
7.2. Conventions 197
7.3. Basic notions 197
7.4. Snake lemma 199
7.5. Finite modules and finitely presented modules 199
7.6. Ring maps of finite type and of finite presentation 201
7.7. Finite ring maps 202
7.8. Colimits 203
7.9. Localization 206
7.10. Internal Hom 211
7.11. Tensor products 212
7.12. Tensor algebra 217

7.13. Base change 218
7.14. Miscellany 219
7.15. Cayley-Hamilton 221
7.16. The spectrum of a ring 222
7.17. Local rings 226
7.18. Open and closed subsets of spectra 227
7.19. Connected components of spectra 229
7.20. Glueing functions 229
7.21. More glueing results 232
7.22. Total rings of fractions 235
7.23. Irreducible components of spectra 235
7.24. Examples of spectra of rings 237
7.25. A meta-observation about prime ideals 240
7.26. Images of ring maps of finite presentation 242
7.27. More on images 245
7.28. Noetherian rings 247
7.29. Curiosity 248
7.30. Hilbert Nullstellensatz 249
7.31. Jacobson rings 250
7.32. Finite and integral ring extensions 257
7.33. Normal rings 261
7.34. Going down for integral over normal 264
7.35. Flat modules and flat ring maps 266
7.36. Going up and going down 271
7.37. Transcendence 274
7.38. Algebraic elements of field extensions 274
7.39. Separable extensions 276
7.40. Geometrically reduced algebras 277
7.41. Separable extensions, continued 279
7.42. Perfect fields 281
7.43. Geometrically irreducible algebras 282
7.44. Geometrically connected algebras 285
7.45. Geometrically integral algebras 287
7.46. Valuation rings 287
7.47. More Noetherian rings 290
7.48. Length 292
7.49. Artinian rings 295
7.50. Homomorphisms essentially of finite type 296
7.51. K-groups 297
7.52. Graded rings 299
7.53. Proj of a graded ring 300
7.54. Blow up algebras 304
7.55. Noetherian graded rings 305
7.56. Noetherian local rings 307
7.57. Dimension 309
7.58. Applications of dimension theory 312
7.59. Support and dimension of modules 313
7.60. Associated primes 315

7.61. Symbolic powers 317
7.62. Relative assassin 318
7.63. Weakly associated primes 320
7.64. Embedded primes 324
7.65. Regular sequences and depth 325
7.66. Quasi-regular sequences 327
7.67. Ext groups and depth 329
7.68. An application of Ext groups 333
7.69. Tor groups and flatness 334
7.70. Functorialities for Tor 338
7.71. Projective modules 339
7.72. Finite projective modules 340
7.73. Open loci defined by module maps 343
7.74. Faithfully flat descent for projectivity of modules 344
7.75. Characterizing flatness 344
7.76. Universally injective module maps 346
7.77. Descent for finite projective modules 351
7.78. Transfinite dévissage of modules 352
7.79. Projective modules over a local ring 355
7.80. Mittag-Leffler systems 356
7.81. Inverse systems 357
7.82. Mittag-Leffler modules 357
7.83. Interchanging direct products with tensor 362
7.84. Coherent rings 366
7.85. Examples and non-examples of Mittag-Leffler modules 367
7.86. Countably generated Mittag-Leffler modules 369
7.87. Characterizing projective modules 371
7.88. Ascending properties of modules 372
7.89. Descending properties of modules 373
7.90. Completion 374
7.91. Criteria for flatness 380
7.92. Base change and flatness 385
7.93. Flatness criteria over Artinian rings 386
7.94. What makes a complex exact? 389
7.95. Cohen-Macaulay modules 391
7.96. Cohen-Macaulay rings 393
7.97. Catenary rings 394
7.98. Regular local rings 395
7.99. Epimorphisms of rings 396
7.100. Pure ideals 399
7.101. Rings of finite global dimension 402
7.102. Regular rings and global dimension 404
7.103. Homomorphisms and dimension 407
7.104. The dimension formula 408
7.105. Dimension of finite type algebras over fields 409
7.106. Noether normalization 411
7.107. Dimension of finite type algebras over fields, reprise 413
7.108. Dimension of graded algebras over a field 415

7.109. Generic flatness 415
7.110. Around Krull-Akizuki 420
7.111. Factorization 424
7.112. Orders of vanishing 425
7.113. Quasi-finite maps 428
7.114. Zariski's Main Theorem 431
7.115. Applications of Zariski's Main Theorem 436
7.116. Dimension of fibres 437
7.117. Algebras and modules of finite presentation 439
7.118. Colimits and maps of finite presentation 441
7.119. More flatness criteria 447
7.120. Openness of the flat locus 452
7.121. Openness of Cohen-Macaulay loci 456
7.122. Differentials 460
7.123. The naive cotangent complex 464
7.124. Local complete intersections 469
7.125. Syntomic morphisms 475
7.126. Smooth ring maps 483
7.127. Formally smooth maps 489
7.128. Smoothness and differentials 494
7.129. Smooth algebras over fields 495
7.130. Smooth ring maps in the Noetherian case 500
7.131. Overview of results on smooth ring maps 502
7.132. Étale ring maps 503
7.133. Local homomorphisms 515
7.134. Integral closure and smooth base change 515
7.135. Formally unramified maps 517
7.136. Conormal modules and universal thickenings 517
7.137. Formally étale maps 520
7.138. Unramified ring maps 521
7.139. Henselian local rings 527
7.140. Serre's criterion for normality 540
7.141. Formal smoothness of fields 542
7.142. Constructing flat ring maps 546
7.143. The Cohen structure theorem 547
7.144. Nagata and Japanese rings 550
7.145. Ascending properties 559
7.146. Descending properties 561
7.147. Geometrically normal algebras 564
7.148. Geometrically regular algebras 565
7.149. Geometrically Cohen-Macaulay algebras 566
7.150. Other chapters 566

Chapter 8. Brauer groups 569
8.1. Introduction 569
8.2. Noncommutative algebras 569
8.3. Wedderburn's theorem 569
8.4. Lemmas on algebras 570
8.5. The Brauer group of a field 572

8.6. Skolem-Noether 573
8.7. The centralizer theorem 573
8.8. Splitting fields 574
8.9. Other chapters 576

Chapter 9. Sites and Sheaves 579
9.1. Introduction 579
9.2. Presheaves 579
9.3. Injective and surjective maps of presheaves 580
9.4. Limits and colimits of presheaves 580
9.5. Functoriality of categories of presheaves 581
9.6. Sites 583
9.7. Sheaves 584
9.8. Families of morphisms with fixed target 586
9.9. The example of G-sets 589
9.10. Sheafification 591
9.11. Injective and surjective maps of sheaves 595
9.12. Representable sheaves 596
9.13. Continuous functors 597
9.14. Morphisms of sites 598
9.15. Topoi 600
9.16. G-sets and morphisms 602
9.17. More functoriality of presheaves 602
9.18. Cocontinuous functors 603
9.19. Cocontinuous functors and morphisms of topoi 605
9.20. Cocontinuous functors which have a right adjoint 608
9.21. Localization 609
9.22. Glueing sheaves 612
9.23. More localization 613
9.24. Localization and morphisms 614
9.25. Morphisms of topoi 618
9.26. Localization of topoi 623
9.27. Localization and morphisms of topoi 625
9.28. Points 627
9.29. Constructing points 631
9.30. Points and and morphisms of topoi 633
9.31. Localization and points 634
9.32. 2-morphisms of topoi 636
9.33. Morphisms between points 637
9.34. Sites with enough points 637
9.35. Criterion for existence of points 639
9.36. Exactness properties of pushforward 641
9.37. Almost cocontinuous functors 645
9.38. Sheaves of algebraic structures 647
9.39. Pullback maps 649
9.40. Topologies 651
9.41. The topology defined by a site 653
9.42. Sheafification in a topology 655
9.43. Topologies and sheaves 657

9.44. Topologies and continuous functors 658
9.45. Points and topologies 659
9.46. Other chapters 659

Chapter 10. Homological Algebra 661
10.1. Introduction 661
10.2. Basic notions 661
10.3. Abelian categories 661
10.4. Extensions 666
10.5. Additive functors 668
10.6. Localization 670
10.7. Serre subcategories 672
10.8. K-groups 674
10.9. Cohomological delta-functors 676
10.10. Complexes 678
10.11. Truncation of complexes 682
10.12. Homotopy and the shift functor 684
10.13. Filtrations 687
10.14. Spectral sequences 692
10.15. Spectral sequences: exact couples 693
10.16. Spectral sequences: differential objects 694
10.17. Spectral sequences: filtered differential objects 695
10.18. Spectral sequences: filtered complexes 697
10.19. Spectral sequences: double complexes 699
10.20. Injectives 702
10.21. Projectives 703
10.22. Injectives and adjoint functors 704
10.23. Inverse systems 705
10.24. Exactness of products 708
10.25. Differential graded algebras 708
10.26. Other chapters 709

Chapter 11. Derived Categories 711
11.1. Introduction 711
11.2. Triangulated categories 711
11.3. The definition of a triangulated category 711
11.4. Elementary results on triangulated categories 714
11.5. Localization of triangulated categories 721
11.6. Quotients of triangulated categories 726
11.7. The homotopy category 731
11.8. Cones and termwise split sequences 731
11.9. Distinguished triangles in the homotopy category 737
11.10. Derived categories 739
11.11. The canonical delta-functor 742
11.12. Triangulated subcategories of the derived category 743
11.13. Filtered derived categories 745
11.14. Derived functors in general 748
11.15. Derived functors on derived categories 754
11.16. Higher derived functors 758

11.17. Injective resolutions 760
11.18. Projective resolutions 765
11.19. Right derived functors and injective resolutions 767
11.20. Cartan-Eilenberg resolutions 768
11.21. Composition of right derived functors 770
11.22. Resolution functors 771
11.23. Functorial injective embeddings and resolution functors 773
11.24. Right derived functors via resolution functors 774
11.25. Filtered derived category and injective resolutions 775
11.26. Ext groups 782
11.27. Unbounded complexes 785
11.28. K-injective complexes 787
11.29. Bounded cohomological dimension 789
11.30. Other chapters 791

Chapter 12. More on Algebra 793
12.1. Introduction 793
12.2. Computing Tor 793
12.3. Derived tensor product 793
12.4. Derived change of rings 796
12.5. Tor independence 797
12.6. Spectral sequences for Tor 797
12.7. Products and Tor 798
12.8. Formal glueing of module categories 800
12.9. Lifting 808
12.10. Auto-associated rings 813
12.11. Flattening stratification 815
12.12. Flattening over an Artinian ring 815
12.13. Flattening over a closed subset of the base 816
12.14. Flattening over a closed subsets of source and base 817
12.15. Flattening over a Noetherian complete local ring 819
12.16. Descent flatness along integral maps 820
12.17. Torsion and flatness 822
12.18. Flatness and finiteness conditions 822
12.19. Blowing up and flatness 826
12.20. Completion and flatnes 827
12.21. The Koszul complex 828
12.22. Koszul regular sequences 831
12.23. Regular ideals 837
12.24. Local complete intersection maps 838
12.25. Cartier's equality and geometric regularity 840
12.26. Geometric regularity 841
12.27. Topological rings and modules 843
12.28. Formally smooth maps of topological rings 845
12.29. Some results on power series rings 850
12.30. Geometric regularity and formal smoothness 851
12.31. Regular ring maps 856
12.32. Ascending properties along regular ring maps 857
12.33. Permanence of properties under completion 857

12.34. Field extensions, revisited 858
12.35. The singular locus 860
12.36. Regularity and derivations 862
12.37. Formal smoothness and regularity 864
12.38. G-rings 865
12.39. Excellent rings 870
12.40. Pseudo-coherent modules 871
12.41. Tor dimension 877
12.42. Perfect complexes 880
12.43. Characterizing perfect complexes 884
12.44. Relatively finitely presented modules 887
12.45. Relatively pseudo-coherent modules 890
12.46. Pseudo-coherent and perfect ring maps 895
12.47. Other chapters 896

Chapter 13. Smoothing Ring Maps 899
13.1. Introduction 899
13.2. Colimits 900
13.3. Singular ideals 900
13.4. Presentations of algebras 902
13.5. The lifting problem 908
13.6. The lifting lemma 910
13.7. The desingularization lemma 913
13.8. Warmup: reduction to a base field 915
13.9. Local tricks 916
13.10. Separable residue fields 918
13.11. Inseparable residue fields 920
13.12. The main theorem 925
13.13. Other chapters 926

Chapter 14. Simplicial Methods 927
14.1. Introduction 927
14.2. The category of finite ordered sets 927
14.3. Simplicial objects 929
14.4. Simplicial objects as presheaves 930
14.5. Cosimplicial objects 931
14.6. Products of simplicial objects 932
14.7. Fibre products of simplicial objects 932
14.8. Push outs of simplicial objects 933
14.9. Products of cosimplicial objects 933
14.10. Fibre products of cosimplicial objects 934
14.11. Simplicial sets 934
14.12. Products with simplicial sets 935
14.13. Hom from simplicial sets into cosimplicial objects 937
14.14. Internal Hom 937
14.15. Hom from simplicial sets into simplicial objects 938
14.16. Splitting simplicial objects 942
14.17. Skelet and coskelet functors 946
14.18. Augmentations 951

14.19. Left adjoints to the skeleton functors 952
14.20. Simplicial objects in abelian categories 956
14.21. Simplicial objects and chain complexes 960
14.22. Dold-Kan 963
14.23. Dold-Kan for cosimplicial objects 965
14.24. Homotopies 966
14.25. Homotopies in abelian categories 969
14.26. Homotopies and cosimplicial objects 970
14.27. More homotopies in abelian categories 971
14.28. A homotopy equivalence 975
14.29. Other chapters 977

Chapter 15. Sheaves of Modules 979
15.1. Introduction 979
15.2. Pathology 979
15.3. The abelian category of sheaves of modules 979
15.4. Sections of sheaves of modules 981
15.5. Supports of modules and sections 982
15.6. Closed immersions and abelian sheaves 983
15.7. A canonical exact sequence 984
15.8. Modules locally generated by sections 984
15.9. Modules of finite type 985
15.10. Quasi-coherent modules 987
15.11. Modules of finite presentation 990
15.12. Coherent modules 991
15.13. Closed immersions of ringed spaces 993
15.14. Locally free sheaves 994
15.15. Tensor product 995
15.16. Flat modules 997
15.17. Flat morphisms of ringed spaces 998
15.18. Symmetric and exterior powers 999
15.19. Internal Hom 1000
15.20. Koszul complexes 1002
15.21. Invertible sheaves 1002
15.22. Localizing sheaves of rings 1004
15.23. Other chapters 1005

Chapter 16. Modules on Sites 1007
16.1. Introduction 1007
16.2. Abelian presheaves 1007
16.3. Abelian sheaves 1008
16.4. Free abelian presheaves 1009
16.5. Free abelian sheaves 1010
16.6. Ringed sites 1010
16.7. Ringed topoi 1011
16.8. 2-morphisms of ringed topoi 1012
16.9. Presheaves of modules 1012
16.10. Sheaves of modules 1013
16.11. Sheafification of presheaves of modules 1014

16.12. Morphisms of topoi and sheaves of modules 1015
16.13. Morphisms of ringed topoi and modules 1016
16.14. The abelian category of sheaves of modules 1017
16.15. Exactness of pushforward 1019
16.16. Exactness of lower shriek 1020
16.17. Global types of modules 1021
16.18. Intrinsic properties of modules 1022
16.19. Localization of ringed sites 1023
16.20. Localization of morphisms of ringed sites 1025
16.21. Localization of ringed topoi 1027
16.22. Localization of morphisms of ringed topoi 1028
16.23. Local types of modules 1030
16.24. Tensor product 1033
16.25. Internal Hom 1034
16.26. Flat modules 1036
16.27. Flat morphisms 1039
16.28. Invertible modules 1039
16.29. Modules of differentials 1040
16.30. Stalks of modules 1043
16.31. Skyscraper sheaves 1045
16.32. Localization and points 1046
16.33. Pullbacks of flat modules 1046
16.34. Locally ringed topoi 1047
16.35. Lower shriek for modules 1052
16.36. Other chapters 1053

Chapter 17. Injectives 1055
17.1. Introduction 1055
17.2. Abelian groups 1055
17.3. Modules 1056
17.4. Projective resolutions 1057
17.5. Modules over noncommutative rings 1057
17.6. Baer's argument for modules 1057
17.7. G-modules 1061
17.8. Abelian sheaves on a space 1061
17.9. Sheaves of modules on a ringed space 1062
17.10. Abelian presheaves on a category 1062
17.11. Abelian Sheaves on a site 1063
17.12. Modules on a ringed site 1065
17.13. Embedding abelian categories 1066
17.14. Grothendieck's AB conditions 1068
17.15. Injectives in Grothendieck categories 1069
17.16. K-injectives in Grothendieck categories 1071
17.17. Additional remarks on Grothendieck abelian categories 1074
17.18. Other chapters 1076

Chapter 18. Cohomology of Sheaves 1079
18.1. Introduction 1079
18.2. Topics 1079

18.3. Cohomology of sheaves 1079
18.4. Derived functors 1080
18.5. First cohomology and torsors 1081
18.6. Locality of cohomology 1082
18.7. Projection formula 1084
18.8. Mayer-Vietoris 1084
18.9. The Čech complex and Čech cohomology 1086
18.10. Cech cohomology as a functor on presheaves 1086
18.11. Cech cohomology and cohomology 1090
18.12. The Leray spectral sequence 1093
18.13. Functoriality of cohomology 1095
18.14. The base change map 1097
18.15. Cohomology and colimits 1098
18.16. Vanishing on Noetherian topological spaces 1100
18.17. The alternating Čech complex 1102
18.18. Locally finite coverings and the Čech complex 1105
18.19. Čech cohomology of complexes 1106
18.20. Flat resolutions 1113
18.21. Derived pullback 1116
18.22. Cohomology of unbounded complexes 1117
18.23. Producing K-injective resolutions 1118
18.24. Other chapters 1119

Chapter 19. Cohomology on Sites 1121
19.1. Introduction 1121
19.2. Topics 1121
19.3. Cohomology of sheaves 1121
19.4. Derived functors 1122
19.5. First cohomology and torsors 1123
19.6. First cohomology and extensions 1124
19.7. First cohomology and invertible sheaves 1125
19.8. Locality of cohomology 1126
19.9. The Cech complex and Cech cohomology 1128
19.10. Cech cohomology as a functor on presheaves 1128
19.11. Cech cohomology and cohomology 1132
19.12. Cohomology of modules 1135
19.13. Limp sheaves 1137
19.14. The Leray spectral sequence 1138
19.15. The base change map 1140
19.16. Cohomology and colimits 1141
19.17. Flat resolutions 1143
19.18. Derived pullback 1145
19.19. Cohomology of unbounded complexes 1146
19.20. Producing K-injective resolutions 1148
19.21. Spectral sequences for Ext 1150
19.22. Derived lower shriek 1150
19.23. Other chapters 1152

Chapter 20. Hypercoverings 1155

20.1. Introduction 1155
20.2. Hypercoverings 1155
20.3. Acyclicity 1158
20.4. Covering hypercoverings 1160
20.5. Adding simplices 1162
20.6. Homotopies 1163
20.7. Cech cohomology associated to hypercoverings 1165
20.8. Cohomology and hypercoverings 1167
20.9. Hypercoverings of spaces 1169
20.10. Other chapters 1172

Chapter 21. Schemes 1173
21.1. Introduction 1173
21.2. Locally ringed spaces 1173
21.3. Open immersions of locally ringed spaces 1174
21.4. Closed immersions of locally ringed spaces 1175
21.5. Affine schemes 1177
21.6. The category of affine schemes 1179
21.7. Quasi-Coherent sheaves on affines 1182
21.8. Closed subspaces of affine schemes 1185
21.9. Schemes 1186
21.10. Immersions of schemes 1187
21.11. Zariski topology of schemes 1188
21.12. Reduced schemes 1189
21.13. Points of schemes 1191
21.14. Glueing schemes 1193
21.15. A representability criterion 1195
21.16. Existence of fibre products of schemes 1197
21.17. Fibre products of schemes 1199
21.18. Base change in algebraic geometry 1201
21.19. Quasi-compact morphisms 1203
21.20. Valuative criterion for universal closedness 1204
21.21. Separation axioms 1207
21.22. Valuative criterion of separatedness 1211
21.23. Monomorphisms 1211
21.24. Functoriality for quasi-coherent modules 1212
21.25. Other chapters 1214

Chapter 22. Constructions of Schemes 1217
22.1. Introduction 1217
22.2. Relative glueing 1217
22.3. Relative spectrum via glueing 1219
22.4. Relative spectrum as a functor 1220
22.5. Affine n-space 1223
22.6. Vector bundles 1223
22.7. Cones 1224
22.8. Proj of a graded ring 1225
22.9. Quasi-coherent sheaves on Proj 1230
22.10. Invertible sheaves on Proj 1231

22.11. Functoriality of Proj 1234
22.12. Morphisms into Proj 1236
22.13. Projective space 1240
22.14. Invertible sheaves and morphisms into Proj 1243
22.15. Relative Proj via glueing 1244
22.16. Relative Proj as a functor 1246
22.17. Quasi-coherent sheaves on relative Proj 1251
22.18. Invertible sheaves and morphisms into relative Proj 1252
22.19. Twisting by invertible sheaves and relative Proj 1253
22.20. Projective bundles 1254
22.21. Blowing up 1256
22.22. Other chapters 1256

Chapter 23. Properties of Schemes 1259
23.1. Introduction 1259
23.2. Constructible sets 1259
23.3. Integral, irreducible, and reduced schemes 1259
23.4. Types of schemes defined by properties of rings 1261
23.5. Noetherian schemes 1262
23.6. Jacobson schemes 1264
23.7. Normal schemes 1265
23.8. Cohen-Macaulay schemes 1266
23.9. Regular schemes 1267
23.10. Dimension 1268
23.11. Catenary schemes 1268
23.12. Serre's conditions 1269
23.13. Japanese and Nagata schemes 1270
23.14. The singular locus 1272
23.15. Quasi-affine schemes 1272
23.16. Characterizing modules of finite type and finite presentation 1273
23.17. Flat modules 1274
23.18. Locally free modules 1274
23.19. Locally projective modules 1275
23.20. Extending quasi-coherent sheaves 1275
23.21. Gabber's result 1280
23.22. Sections of quasi-coherent sheaves 1282
23.23. Ample invertible sheaves 1285
23.24. Affine and quasi-affine schemes 1289
23.25. Quasi-coherent sheaves and ample invertible sheaves 1290
23.26. Finding suitable affine opens 1291
23.27. Other chapters 1292

Chapter 24. Morphisms of Schemes 1295
24.1. Introduction 1295
24.2. Closed immersions 1295
24.3. Closed immersions and quasi-coherent sheaves 1297
24.4. Scheme theoretic image 1299
24.5. Scheme theoretic closure and density 1300
24.6. Dominant morphisms 1302

24.7. Birational morphisms 1303
24.8. Rational maps 1304
24.9. Surjective morphisms 1305
24.10. Radicial and universally injective morphisms 1306
24.11. Affine morphisms 1308
24.12. Quasi-affine morphisms 1310
24.13. Types of morphisms defined by properties of ring maps 1312
24.14. Morphisms of finite type 1314
24.15. Points of finite type and Jacobson schemes 1316
24.16. Universally catenary schemes 1318
24.17. Nagata schemes, reprise 1319
24.18. The singular locus, reprise 1320
24.19. Quasi-finite morphisms 1321
24.20. Morphisms of finite presentation 1325
24.21. Constructible sets 1327
24.22. Open morphisms 1328
24.23. Submersive morphisms 1329
24.24. Flat morphisms 1329
24.25. Flat closed immersions 1331
24.26. Generic flatness 1333
24.27. Morphisms and dimensions of fibres 1334
24.28. Morphisms of given relative dimension 1336
24.29. The dimension formula 1337
24.30. Syntomic morphisms 1339
24.31. Conormal sheaf of an immersion 1343
24.32. Sheaf of differentials of a morphism 1345
24.33. Smooth morphisms 1351
24.34. Unramified morphisms 1356
24.35. Étale morphisms 1360
24.36. Relatively ample sheaves 1364
24.37. Very ample sheaves 1366
24.38. Ample and very ample sheaves relative to finite type morphisms 1368
24.39. Quasi-projective morphisms 1372
24.40. Proper morphisms 1372
24.41. Projective morphisms 1374
24.42. Integral and finite morphisms 1377
24.43. Universal homeomorphisms 1379
24.44. Finite locally free morphisms 1380
24.45. Generically finite morphisms 1382
24.46. Normalization 1384
24.47. Zariski's Main Theorem (algebraic version) 1390
24.48. Universally bounded fibres 1392
24.49. Other chapters 1395

Chapter 25. Coherent Cohomology 1397
25.1. Introduction 1397
25.2. Cech cohomology of quasi-coherent sheaves 1397
25.3. Vanishing of cohomology 1399
25.4. Derived category of quasi-coherent modules 1400

25.5. Quasi-coherence of higher direct images 1401
25.6. Cohomology and base change, I 1403
25.7. Cohomology and base change, II 1405
25.8. Ample invertible sheaves and cohomology 1407
25.9. Cohomology of projective space 1409
25.10. Supports of modules 1414
25.11. Coherent sheaves on locally Noetherian schemes 1416
25.12. Coherent sheaves on Noetherian schemes 1418
25.13. Depth 1419
25.14. Devissage of coherent sheaves 1420
25.15. Finite morphisms and affines 1426
25.16. Coherent sheaves and projective morphisms 1427
25.17. Chow's Lemma 1430
25.18. Higher direct images of coherent sheaves 1432
25.19. The theorem on formal functions 1433
25.20. Applications of the theorem on formal functions 1438
25.21. Other chapters 1439

Chapter 26. Divisors 1441
26.1. Introduction 1441
26.2. Associated points 1441
26.3. Morphisms and associated points 1443
26.4. Embedded points 1443
26.5. Weakly associated points 1444
26.6. Morphisms and weakly associated points 1445
26.7. Relative assassin 1446
26.8. Relative weak assassin 1447
26.9. Effective Cartier divisors 1447
26.10. Relative effective Cartier divisors 1451
26.11. The normal cone of an immersion 1454
26.12. Regular ideal sheaves 1456
26.13. Regular immersions 1459
26.14. Relative regular immersions 1462
26.15. Meromorphic functions and sections 1468
26.16. Other chapters 1473

Chapter 27. Limits of Schemes 1475
27.1. Introduction 1475
27.2. Directed limits of schemes with affine transition maps 1475
27.3. Absolute Noetherian Approximation 1477
27.4. Limits and morphisms of finite presentation 1482
27.5. Finite type closed in finite presentation 1484
27.6. Descending relative objects 1487
27.7. Characterizing affine schemes 1492
27.8. Variants of Chow's Lemma 1493
27.9. Applications of Chow's lemma 1495
27.10. Universally closed morphisms 1499
27.11. Limits and dimensions of fibres 1501
27.12. Other chapters 1502

Chapter 28. Varieties 1505
28.1. Introduction 1505
28.2. Notation 1505
28.3. Varieties 1505
28.4. Geometrically reduced schemes 1506
28.5. Geometrically connected schemes 1509
28.6. Geometrically irreducible schemes 1514
28.7. Geometrically integral schemes 1518
28.8. Geometrically normal schemes 1518
28.9. Change of fields and locally Noetherian schemes 1520
28.10. Geometrically regular schemes 1520
28.11. Change of fields and the Cohen-Macaulay property 1523
28.12. Change of fields and the Jacobson property 1523
28.13. Algebraic schemes 1524
28.14. Closures of products 1524
28.15. Schemes smooth over fields 1525
28.16. Types of varieties 1527
28.17. Groups of invertible functions 1528
28.18. Uniqueness of base field 1530
28.19. Other chapters 1532

Chapter 29. Chow Homology and Chern Classes 1535
29.1. Introduction 1535
29.2. Determinants of finite length modules 1535
29.3. Periodic complexes 1541
29.4. Symbols 1549
29.5. Lengths and determinants 1554
29.6. Application to tame symbol 1560
29.7. Setup 1560
29.8. Cycles 1561
29.9. Cycle associated to a closed subscheme 1562
29.10. Cycle associated to a coherent sheaf 1563
29.11. Preparation for proper pushforward 1564
29.12. Proper pushforward 1564
29.13. Preparation for flat pullback 1566
29.14. Flat pullback 1567
29.15. Push and pull 1569
29.16. Preparation for principal divisors 1569
29.17. Principal divisors 1570
29.18. Two fun results on principal divisors 1573
29.19. Rational equivalence 1574
29.20. Properties of rational equivalence 1575
29.21. Different characterizations of rational equivalence 1578
29.22. Rational equivalence and K-groups 1580
29.23. Preparation for the divisor associated to an invertible sheaf 1583
29.24. The divisor associated to an invertible sheaf 1584
29.25. Intersecting with Cartier divisors 1585
29.26. Cartier divisors and K-groups 1589
29.27. Blowing up lemmas 1591

29.28. Intersecting with effective Cartier divisors 1597
29.29. Commutativity 1602
29.30. Gysin homomorphisms 1603
29.31. Relative effective Cartier divisors 1606
29.32. Affine bundles 1606
29.33. Projective space bundle formula 1607
29.34. The Chern classes of a vector bundle 1610
29.35. Intersecting with chern classes 1610
29.36. Polynomial relations among chern classes 1613
29.37. Additivity of chern classes 1615
29.38. The splitting principle 1617
29.39. Chern classes and tensor product 1617
29.40. Todd classes 1618
29.41. Grothendieck-Riemann-Roch 1618
29.42. Other chapters 1618

Chapter 30. Topologies on Schemes 1621
30.1. Introduction 1621
30.2. The general procedure 1621
30.3. The Zariski topology 1621
30.4. The étale topology 1627
30.5. The smooth topology 1632
30.6. The syntomic topology 1634
30.7. The fppf topology 1636
30.8. The fpqc topology 1639
30.9. Change of topologies 1642
30.10. Change of big sites 1643
30.11. Other chapters 1644

Chapter 31. Descent 1647
31.1. Introduction 1647
31.2. Descent data for quasi-coherent sheaves 1647
31.3. Descent for modules 1649
31.4. Fpqc descent of quasi-coherent sheaves 1654
31.5. Descent of finiteness properties of modules 1655
31.6. Quasi-coherent sheaves and topologies 1657
31.7. Parasitic modules 1665
31.8. Derived category of quasi-coherent modules 1666
31.9. Fpqc coverings are universal effective epimorphisms 1667
31.10. Descent of finiteness properties of morphisms 1668
31.11. Local properties of schemes 1672
31.12. Properties of schemes local in the fppf topology 1673
31.13. Properties of schemes local in the syntomic topology 1674
31.14. Properties of schemes local in the smooth topology 1674
31.15. Variants on descending properties 1675
31.16. Germs of schemes 1675
31.17. Local properties of germs 1676
31.18. Properties of morphisms local on the target 1677
31.19. Properties of morphisms local in the fpqc topology on the target 1678

31.20. Properties of morphisms local in the fppf topology on the target 1685
31.21. Application of fpqc descent of properties of morphisms 1685
31.22. Properties of morphisms local on the source 1686
31.23. Properties of morphisms local in the fpqc topology on the source 1686
31.24. Properties of morphisms local in the fppf topology on the source 1687
31.25. Properties of morphisms local in the syntomic toplogy on the source 1688
31.26. Properties of morphisms local in the smooth topology on the source 1688
31.27. Properties of morphisms local in the étale topology on the source 1688
31.28. Properties of morphisms étale local on source-and-target 1689
31.29. Properties of morphisms of germs local on source-and-target 1694
31.30. Descent data for schemes over schemes 1697
31.31. Fully faithfulness of the pullback functors 1701
31.32. Descending types of morphisms 1705
31.33. Descending affine morphisms 1706
31.34. Descending quasi-affine morphisms 1707
31.35. Descent data in terms of sheaves 1708
31.36. Descent in terms of simplicial schemes 1709
31.37. Other chapters 1711

Chapter 32. Adequate Modules 1713
32.1. Introduction 1713
32.2. Conventions 1713
32.3. Adequate functors 1713
32.4. Higher exts of adequate functors 1720
32.5. Adequate modules 1726
32.6. Parasitic adequate modules 1731
32.7. Derived categories of adequate modules, I 1732
32.8. Pure extensions 1735
32.9. Higher exts of quasi-coherent sheaves on the big site 1737
32.10. Derived categories of adequate modules, II 1738
32.11. Other chapters 1740

Chapter 33. More on Morphisms 1741
33.1. Introduction 1741
33.2. Thickenings 1741
33.3. First order infinitesimal neighbourhood 1742
33.4. Formally unramified morphisms 1743
33.5. Universal first order thickenings 1745
33.6. Formally étale morphisms 1751
33.7. Infinitesimal deformations of maps 1753
33.8. Infinitesimal deformations of schemes 1756
33.9. Formally smooth morphisms 1760
33.10. Smoothness over a Noetherian base 1764
33.11. Openness of the flat locus 1765
33.12. Critère de platitude par fibres 1765
33.13. Normal morphisms 1768
33.14. Regular morphisms 1769
33.15. Cohen-Macaulay morphisms 1771
33.16. Slicing Cohen-Macaulay morphisms 1773

33.17. Generic fibres 1776
33.18. Relative assassins 1780
33.19. Reduced fibres 1783
33.20. Irreducible components of fibres 1785
33.21. Connected components of fibres 1789
33.22. Connected components meeting a section 1793
33.23. Dimension of fibres 1795
33.24. Limit arguments 1796
33.25. Étale neighbourhoods 1799
33.26. Slicing smooth morphisms 1801
33.27. Finite free locally dominates étale 1805
33.28. Étale localization of quasi-finite morphisms 1805
33.29. Application to the structure of quasi-finite morphisms 1809
33.30. Application to morphisms with connected fibres 1813
33.31. Application to the structure of finite type morphisms 1815
33.32. Application to the fppf topology 1818
33.33. Closed points in fibres 1818
33.34. Stein factorization 1824
33.35. Descending separated locally quasi-finite morphisms 1828
33.36. Pseudo-coherent morphisms 1829
33.37. Perfect morphisms 1832
33.38. Local complete intersection morphisms 1835
33.39. Exact sequences of differentials and conormal sheaves 1840
33.40. Other chapters 1841

Chapter 34. More on flatness 1843
34.1. Introduction 1843
34.2. A remark on finite type versus finite presentation 1843
34.3. Lemmas on étale localization 1843
34.4. The local structure of a finite type module 1846
34.5. One step dévissage 1849
34.6. Complete dévissage 1853
34.7. Translation into algebra 1858
34.8. Localization and universally injective maps 1859
34.9. Completion and Mittag-Leffler modules 1861
34.10. Projective modules 1863
34.11. Flat finite type modules, Part I 1865
34.12. Flat finitely presented modules 1871
34.13. Flat finite type modules, Part II 1877
34.14. Examples of relatively pure modules 1880
34.15. Impurities 1882
34.16. Relatively pure modules 1885
34.17. Examples of relatively pure sheaves 1887
34.18. A criterion for purity 1888
34.19. How purity is used 1892
34.20. Flattening functors 1895
34.21. Flattening stratifications 1899
34.22. Flattening stratification over an Artinian ring 1901
34.23. Flattening a map 1901

34.24. Flattening in the local case 1903
34.25. Flat finite type modules, Part III 1905
34.26. Universal flattening 1906
34.27. Other chapters 1910

Chapter 35. Groupoid Schemes 1913
35.1. Introduction 1913
35.2. Notation 1913
35.3. Equivalence relations 1913
35.4. Group schemes 1914
35.5. Examples of group schemes 1916
35.6. Properties of group schemes 1917
35.7. Properties of group schemes over a field 1918
35.8. Actions of group schemes 1921
35.9. Principal homogeneous spaces 1922
35.10. Equivariant quasi-coherent sheaves 1923
35.11. Groupoids 1924
35.12. Quasi-coherent sheaves on groupoids 1926
35.13. Groupoids and group schemes 1929
35.14. The stabilizer group scheme 1929
35.15. Restricting groupoids 1930
35.16. Invariant subschemes 1931
35.17. Quotient sheaves 1932
35.18. Separation conditions 1935
35.19. Finite flat groupoids, affine case 1935
35.20. Finite flat groupoids 1941
35.21. Descent data give equivalence relations 1941
35.22. An example case 1942
35.23. Other chapters 1943

Chapter 36. More on Groupoid Schemes 1945
36.1. Introduction 1945
36.2. Notation 1945
36.3. Useful diagrams 1945
36.4. Sheaf of differentials 1946
36.5. Properties of groupoids 1946
36.6. Comparing fibres 1949
36.7. Cohen-Macaulay presentations 1950
36.8. Restricting groupoids 1951
36.9. Properties of groupoids on fields 1953
36.10. Morphisms of groupoids on fields 1958
36.11. Slicing groupoids 1962
36.12. Étale localization of groupoids 1965
36.13. Other chapters 1967

Chapter 37. Étale Morphisms of Schemes 1969
37.1. Introduction 1969
37.2. Conventions 1969
37.3. Unramified morphisms 1969

37.4. Three other characterizations of unramified morphisms 1971
37.5. The functorial characterization of unramified morphisms 1972
37.6. Topological properties of unramified morphisms 1973
37.7. Universally injective, unramified morphisms 1974
37.8. Examples of unramified morphisms 1976
37.9. Flat morphisms 1976
37.10. Topological properties of flat morphisms 1978
37.11. Étale morphisms 1978
37.12. The structure theorem 1980
37.13. Étale and smooth morphisms 1981
37.14. Topological properties of étale morphisms 1982
37.15. Topological invariance of the étale topology 1982
37.16. The functorial characterization 1984
37.17. Étale local structure of unramified morphisms 1984
37.18. Étale local structure of étale morphisms 1985
37.19. Permanence properties 1986
37.20. Other chapters 1987

Chapter 38. Étale Cohomology 1989
38.1. Introduction 1989
38.2. Which sections to skip on a first reading? 1989
38.3. Prologue 1989
38.4. The étale topology 1990
38.5. Feats of the étale topology 1991
38.6. A computation 1991
38.7. Nontorsion coefficients 1992
38.8. Sheaf theory 1993
38.9. Presheaves 1993
38.10. Sites 1993
38.11. Sheaves 1994
38.12. The example of G-sets 1995
38.13. Sheafification 1996
38.14. Cohomology 1997
38.15. The fpqc topology 1997
38.16. Faithfully flat descent 2000
38.17. Quasi-coherent sheaves 2001
38.18. Cech cohomology 2003
38.19. The Cech-to-cohomology spectral sequence 2005
38.20. Big and small sites of schemes 2006
38.21. The étale topos 2008
38.22. Cohomology of quasi-coherent sheaves 2008
38.23. Examples of sheaves 2010
38.24. Picard groups 2011
38.25. The étale site 2011
38.26. Étale morphisms 2012
38.27. Étale coverings 2013
38.28. Kummer theory 2014
38.29. Neighborhoods, stalks and points 2018
38.30. Points in other topologies 2023

38.31. Supports of abelian sheaves 2024
38.32. Henselian rings 2026
38.33. Stalks of the structure sheaf 2029
38.34. Functoriality of small étale topos 2030
38.35. Direct images 2031
38.36. Inverse image 2032
38.37. Functoriality of big topoi 2034
38.38. Functoriality and sheaves of modules 2034
38.39. Comparing big and small topoi 2035
38.40. Recovering morphisms 2036
38.41. Push and pull 2042
38.42. Property (A) 2042
38.43. Property (B) 2044
38.44. Property (C) 2045
38.45. Topological invariance of the small étale site 2047
38.46. Closed immersions and pushforward 2048
38.47. Integral universally injective morphisms 2050
38.48. Big sites and pushforward 2050
38.49. Exactness of big lower shriek 2052
38.50. Étale cohomology 2053
38.51. Colimits 2053
38.52. Stalks of higher direct images 2055
38.53. The Leray spectral sequence 2055
38.54. Vanishing of finite higher direct images 2056
38.55. Schemes étale over a point 2057
38.56. Galois action on stalks 2057
38.57. Cohomology of a point 2060
38.58. Cohomology of curves 2061
38.59. Brauer groups 2061
38.60. Higher vanishing for the multiplicative group 2064
38.61. Picards groups of curves 2066
38.62. Constructible sheaves 2068
38.63. Extension by zero 2069
38.64. Higher vanishing for torsion sheaves 2071
38.65. The trace formula 2074
38.66. Frobenii 2074
38.67. Traces 2077
38.68. Why derived categories? 2078
38.69. Derived categories 2079
38.70. Filtered derived category 2080
38.71. Filtered derived functors 2080
38.72. Application of filtered complexes 2081
38.73. Perfectness 2082
38.74. Filtrations and perfect complexes 2083
38.75. Characterizing perfect objects 2083
38.76. Lefschetz numbers 2085
38.77. Preliminaries and sorites 2088
38.78. Proof of the trace formula 2091

38.79. Applications 2093
38.80. On l-adic sheaves 2094
38.81. L-functions 2095
38.82. Cohomological interpretation 2095
38.83. List of things which we should add above 2098
38.84. Examples of L-functions 2099
38.85. Constant sheaves 2099
38.86. The Legendre family 2100
38.87. Exponential sums 2102
38.88. Trace formula in terms of fundamental groups 2103
38.89. Fundamental groups 2103
38.90. Profinite groups, cohomology and homology 2105
38.91. Cohomology of curves, revisited 2106
38.92. Abstract trace formula 2108
38.93. Automorphic forms and sheaves 2109
38.94. Counting points 2112
38.95. Precise form of Chebotarov 2112
38.96. How many primes decompose completely? 2113
38.97. How many points are there really? 2114
38.98. Other chapters 2115

Chapter 39. Crystalline Cohomology 2117
39.1. Introduction 2117
39.2. Divided powers 2117
39.3. Divided power rings 2121
39.4. Extending divided powers 2123
39.5. Divided power polynomial algebras 2125
39.6. Divided power envelope 2126
39.7. Some explicit divided power thickenings 2130
39.8. Compatibility 2132
39.9. Affine crystalline site 2132
39.10. Module of differentials 2135
39.11. Divided power schemes 2141
39.12. The big crystalline site 2142
39.13. The crystalline site 2145
39.14. Sheaves on the crystalline site 2147
39.15. Crystals in modules 2148
39.16. Sheaf of differentials 2149
39.17. Two universal thickenings 2151
39.18. The de Rham complex 2153
39.19. Connections 2153
39.20. Cosimplicial algebra 2154
39.21. Notes on Rlim 2156
39.22. Crystals in quasi-coherent modules 2158
39.23. General remarks on cohomology 2163
39.24. Cosimplicial preparations 2164
39.25. Divided power Poincaré lemma 2166
39.26. Cohomology in the affine case 2167
39.27. Two counter examples 2170

39.28. Applications 2172
39.29. Some further results 2173
39.30. Pulling back along α_p-covers 2179
39.31. Frobenius action on crystalline cohomology 2184
39.32. Other chapters 2186

Chapter 40. Algebraic Spaces 2187
40.1. Introduction 2187
40.2. General remarks 2187
40.3. Representable morphisms of presheaves 2188
40.4. Lists of useful properties of morphisms of schemes 2189
40.5. Properties of representable morphisms of presheaves 2191
40.6. Algebraic spaces 2193
40.7. Fibre products of algebraic spaces 2194
40.8. Glueing algebraic spaces 2195
40.9. Presentations of algebraic spaces 2196
40.10. Algebraic spaces and equivalence relations 2197
40.11. Algebraic spaces, retrofitted 2201
40.12. Immersions and Zariski coverings of algebraic spaces 2203
40.13. Separation conditions on algebraic spaces 2204
40.14. Examples of algebraic spaces 2205
40.15. Change of big site 2209
40.16. Change of base scheme 2210
40.17. Other chapters 2212

Chapter 41. Properties of Algebraic Spaces 2215
41.1. Introduction 2215
41.2. Conventions 2215
41.3. Separation axioms 2215
41.4. Points of algebraic spaces 2216
41.5. Quasi-compact spaces 2220
41.6. Special coverings 2220
41.7. Properties of Spaces defined by properties of schemes 2222
41.8. Dimension at a point 2223
41.9. Reduced spaces 2224
41.10. The schematic locus 2225
41.11. Points on quasi-separated spaces 2227
41.12. Noetherian spaces 2228
41.13. Étale morphisms of algebraic spaces 2229
41.14. Spaces and fpqc coverings 2231
41.15. The étale site of an algebraic space 2233
41.16. Points of the small étale site 2240
41.17. Supports of abelian sheaves 2245
41.18. The structure sheaf of an algebraic space 2246
41.19. Stalks of the structure sheaf 2247
41.20. Dimension of local rings 2247
41.21. Local irreducibility 2248
41.22. Regular algebraic spaces 2249
41.23. Sheaves of modules on algebraic spaces 2250

41.24. Étale localization 2251
41.25. Recovering morphisms 2252
41.26. Quasi-coherent sheaves on algebraic spaces 2257
41.27. Properties of modules 2260
41.28. Locally projective modules 2260
41.29. Quasi-coherent sheaves and presentations 2261
41.30. Morphisms towards schemes 2262
41.31. Quotients by free actions 2263
41.32. Other chapters 2264

Chapter 42. Morphisms of Algebraic Spaces 2265
42.1. Introduction 2265
42.2. Conventions 2265
42.3. Properties of representable morphisms 2265
42.4. Immersions 2266
42.5. Separation axioms 2267
42.6. Surjective morphisms 2272
42.7. Open morphisms 2273
42.8. Submersive morphisms 2275
42.9. Quasi-compact morphisms 2275
42.10. Universally closed morphisms 2278
42.11. Valuative criteria 2281
42.12. Valuative criterion for universal closedness 2285
42.13. Valuative criterion of separatedness 2286
42.14. Monomorphisms 2287
42.15. Pushforward of quasi-coherent sheaves 2289
42.16. Closed immersions 2290
42.17. Closed immersions and quasi-coherent sheaves 2292
42.18. Universally injective morphisms 2294
42.19. Affine morphisms 2296
42.20. Quasi-affine morphisms 2297
42.21. Types of morphisms étale local on source-and-target 2298
42.22. Morphisms of finite type 2300
42.23. Points and geometric points 2302
42.24. Points of finite type 2305
42.25. Quasi-finite morphisms 2307
42.26. Morphisms of finite presentation 2309
42.27. Flat morphisms 2312
42.28. Flat modules 2314
42.29. Generic flatness 2316
42.30. Relative dimension 2318
42.31. Morphisms and dimensions of fibres 2319
42.32. Syntomic morphisms 2321
42.33. Smooth morphisms 2322
42.34. Unramified morphisms 2324
42.35. Étale morphisms 2327
42.36. Proper morphisms 2329
42.37. Integral and finite morphisms 2330
42.38. Finite locally free morphisms 2331

42.39. Separated, locally quasi-finite morphisms 2333
42.40. Applications 2335
42.41. Universal homeomorphisms 2336
42.42. Other chapters 2337

Chapter 43. Decent Algebraic Spaces 2339
43.1. Introduction 2339
43.2. Conventions 2339
43.3. Universally bounded fibres 2339
43.4. Finiteness conditions and points 2341
43.5. Conditions on algebraic spaces 2346
43.6. Reasonable and decent algebraic spaces 2348
43.7. Points and specializations 2351
43.8. Schematic locus 2353
43.9. Points on very reasonable spaces 2353
43.10. Reduced singleton spaces 2354
43.11. Decent spaces 2357
43.12. Valuative criterion 2358
43.13. Relative conditions 2359
43.14. Monomorphisms 2363
43.15. Other chapters 2363

Chapter 44. Topologies on Algebraic Spaces 2365
44.1. Introduction 2365
44.2. The general procedure 2365
44.3. Fpqc topology 2366
44.4. Fppf topology 2367
44.5. Syntomic topology 2368
44.6. Smooth topology 2368
44.7. Étale topology 2368
44.8. Zariski topology 2369
44.9. Other chapters 2369

Chapter 45. Descent and Algebraic Spaces 2371
45.1. Introduction 2371
45.2. Conventions 2371
45.3. Descent data for quasi-coherent sheaves 2371
45.4. Fpqc descent of quasi-coherent sheaves 2373
45.5. Descent of finiteness properties of modules 2373
45.6. Fpqc coverings 2375
45.7. Descent of finiteness properties of morphisms 2376
45.8. Descending properties of spaces 2376
45.9. Descending properties of morphisms 2377
45.10. Descending properties of morphisms in the fpqc topology 2378
45.11. Descending properties of morphisms in the fppf topology 2386
45.12. Properties of morphisms local on the source 2387
45.13. Properties of morphisms local in the fpqc topology on the source 2388
45.14. Properties of morphisms local in the fppf topology on the source 2388
45.15. Properties of morphisms local in the syntomic toplogy on the source 2388

45.16. Properties of morphisms local in the smooth topology on the source 2388
45.17. Properties of morphisms local in the étale topology on the source 2389
45.18. Properties of morphisms smooth local on source-and-target 2389
45.19. Other chapters 2392

Chapter 46. More on Morphisms of Spaces 2393
46.1. Introduction 2393
46.2. Conventions 2393
46.3. Radicial morphisms 2393
46.4. Morphisms of finite presentation 2395
46.5. Conormal sheaf of an immersion 2399
46.6. Sheaf of differentials of a morphism 2402
46.7. Topological invariance of an étale site 2406
46.8. Thickenings 2407
46.9. First order infinitesimal neighbourhood 2411
46.10. Formally smooth, étale, unramified transformations 2412
46.11. Formally unramified morphisms 2415
46.12. Universal first order thickenings 2417
46.13. Formally étale morphisms 2423
46.14. Infinitesimal deformations of maps 2425
46.15. Infinitesimal deformations of algebraic spaces 2426
46.16. Formally smooth morphisms 2427
46.17. Openness of the flat locus 2432
46.18. Critère de platitude par fibres 2433
46.19. Slicing Cohen-Macaulay morphisms 2436
46.20. The structure of quasi-finite morphisms 2437
46.21. Regular immersions 2438
46.22. Pseudo-coherent morphisms 2439
46.23. Perfect morphisms 2440
46.24. Local complete intersection morphisms 2441
46.25. Exact sequences of differentials and conormal sheaves 2443
46.26. Other chapters 2444

Chapter 47. Quot and Hilbert Spaces 2447
47.1. Introduction 2447
47.2. Conventions 2447
47.3. When is a morphism an isomorphism? 2447
47.4. Other chapters 2452

Chapter 48. Algebraic Spaces over Fields 2453
48.1. Introduction 2453
48.2. Conventions 2453
48.3. Geometric components 2453
48.4. Schematic locus 2454
48.5. Spaces smooth over fields 2455
48.6. Other chapters 2455

Chapter 49. Cohomology of Algebraic Spaces 2457
49.1. Introduction 2457
49.2. Conventions 2457

49.3. Derived category of quasi-coherent modules 2457
49.4. Higher direct images 2457
49.5. Colimits and cohomology 2459
49.6. The alternating Čech complex 2459
49.7. Higher vanishing for quasi-coherent sheaves 2464
49.8. Vanishing for higher direct images 2465
49.9. Cohomology and base change, I 2466
49.10. Other chapters 2467

Chapter 50. Stacks 2469
50.1. Introduction 2469
50.2. Presheaves of morphisms associated to fibred categories 2469
50.3. Descent data in fibred categories 2471
50.4. Stacks 2473
50.5. Stacks in groupoids 2476
50.6. Stacks in setoids 2477
50.7. The inertia stack 2479
50.8. Stackification of fibred categories 2480
50.9. Stackification of categories fibred in groupoids 2484
50.10. Inherited topologies 2485
50.11. Gerbes 2486
50.12. Functoriality for stacks 2489
50.13. Stacks and localization 2497
50.14. Other chapters 2498

Chapter 51. Formal Deformation Theory 2499
51.1. Introduction 2499
51.2. Notation and Conventions 2500
51.3. The category $\mathcal{C}_\Lambda$ 2501
51.4. The category $\widehat{\mathcal{C}}_\Lambda$ 2506
51.5. Categories cofibered in groupoids 2509
51.6. Prorepresentable functors and predeformation categories 2511
51.7. Formal objects and completion categories 2512
51.8. Smooth morphisms 2516
51.9. Schlessinger's conditions 2521
51.10. Tangent spaces of functors 2526
51.11. Tangent spaces of predeformation categories 2529
51.12. Versal formal objects 2531
51.13. Minimal versal formal objects 2535
51.14. Miniversal formal objects and tangent spaces 2538
51.15. Rim-Schlessinger conditions and deformation categories 2541
51.16. Lifts of objects 2545
51.17. Schlessinger's theorem on prorepresentable functors 2547
51.18. Infinitesimal automorphisms 2548
51.19. Groupoids in functors on an arbitrary category 2551
51.20. Groupoids in functors on $\mathcal{C}_\Lambda$ 2552
51.21. Smooth groupoids in functors on $\mathcal{C}_\Lambda$ 2553
51.22. Deformation categories as quotients of groupoids in functors 2554
51.23. Presentations of categories cofibered in groupoids 2556

51.24. Presentations of deformation categories 2556
51.25. Remarks regarding minimality 2558
51.26. The Deformation Category of a Point of an Algebraic Stack 2560
51.27. Examples 2561
51.28. Other chapters 2561

Chapter 52. Groupoids in Algebraic Spaces 2563
52.1. Introduction 2563
52.2. Conventions 2563
52.3. Notation 2563
52.4. Equivalence relations 2564
52.5. Group algebraic spaces 2565
52.6. Properties of group algebraic spaces 2565
52.7. Examples of group algebraic spaces 2566
52.8. Actions of group algebraic spaces 2567
52.9. Principal homogeneous spaces 2568
52.10. Equivariant quasi-coherent sheaves 2569
52.11. Groupoids in algebraic spaces 2569
52.12. Quasi-coherent sheaves on groupoids 2571
52.13. Crystals in quasi-coherent sheaves 2572
52.14. Groupoids and group spaces 2575
52.15. The stabilizer group algebraic space 2575
52.16. Restricting groupoids 2576
52.17. Invariant subspaces 2577
52.18. Quotient sheaves 2578
52.19. Quotient stacks 2580
52.20. Functoriality of quotient stacks 2582
52.21. The 2-cartesian square of a quotient stack 2583
52.22. The 2-coequalizer property of a quotient stack 2584
52.23. Explicit description of quotient stacks 2586
52.24. Restriction and quotient stacks 2587
52.25. Inertia and quotient stacks 2590
52.26. Gerbes and quotient stacks 2591
52.27. Quotient stacks and change of big site 2591
52.28. Separation conditions 2593
52.29. Other chapters 2594

Chapter 53. More on Groupoids in Spaces 2595
53.1. Introduction 2595
53.2. Notation 2595
53.3. Useful diagrams 2595
53.4. Properties of groupoids 2596
53.5. Comparing fibres 2597
53.6. Restricting groupoids 2597
53.7. Properties of groups over fields and groupoids on fields 2598
53.8. The finite part of a morphism 2601
53.9. Finite collections of arrows 2608
53.10. The finite part of a groupoid 2608
53.11. Étale localization of groupoid schemes 2610

53.12. Other chapters 2613

Chapter 54. Bootstrap 2615
54.1. Introduction 2615
54.2. Conventions 2615
54.3. Morphisms representable by algebraic spaces 2615
54.4. Properties of maps of presheaves representable by algebraic spaces 2617
54.5. Bootstrapping the diagonal 2618
54.6. Bootstrap 2620
54.7. Finding opens 2621
54.8. Slicing equivalence relations 2622
54.9. Quotient by a subgroupoid 2624
54.10. Final bootstrap 2625
54.11. Applications 2628
54.12. Algebraic spaces in the étale topology 2631
54.13. Other chapters 2631

Chapter 55. Examples of Stacks 2633
55.1. Introduction 2633
55.2. Notation 2633
55.3. Examples of stacks 2633
55.4. Quasi-coherent sheaves 2633
55.5. The stack of finitely generated quasi-coherent sheaves 2634
55.6. Algebraic spaces 2635
55.7. The stack of finite type algebraic spaces 2637
55.8. Examples of stacks in groupoids 2638
55.9. The stack associated to a sheaf 2638
55.10. The stack in groupoids of finitely generated quasi-coherent sheaves 2639
55.11. The stack in groupoids of finite type algebraic spaces 2639
55.12. Quotient stacks 2639
55.13. Classifying torsors 2639
55.14. Quotients by group actions 2643
55.15. The Picard stack 2646
55.16. Examples of inertia stacks 2647
55.17. Finite Hilbert stacks 2648
55.18. Other chapters 2649

Chapter 56. Quotients of Groupoids 2651
56.1. Introduction 2651
56.2. Conventions and notation 2651
56.3. Invariant morphisms 2651
56.4. Categorical quotients 2652
56.5. Quotients as orbit spaces 2653
56.6. Coarse quotients 2662
56.7. Topological properties 2662
56.8. Invariant functions 2663
56.9. Good quotients 2663
56.10. Geometric quotients 2663
56.11. Other chapters 2664

Chapter 57. Algebraic Stacks 2665
57.1. Introduction 2665
57.2. Conventions 2665
57.3. Notation 2665
57.4. Representable categories fibred in groupoids 2666
57.5. The 2-Yoneda lemma 2666
57.6. Representable morphisms of categories fibred in groupoids 2666
57.7. Split categories fibred in groupoids 2668
57.8. Categories fibred in groupoids representable by algebraic spaces 2668
57.9. Morphisms representable by algebraic spaces 2669
57.10. Properties of morphisms representable by algebraic spaces 2672
57.11. Stacks in groupoids 2675
57.12. Algebraic stacks 2675
57.13. Algebraic stacks and algebraic spaces 2677
57.14. 2-Fibre products of algebraic stacks 2678
57.15. Algebraic stacks, overhauled 2680
57.16. From an algebraic stack to a presentation 2682
57.17. The algebraic stack associated to a smooth groupoid 2685
57.18. Change of big site 2686
57.19. Change of base scheme 2687
57.20. Other chapters 2688

Chapter 58. Sheaves on Algebraic Stacks 2691
58.1. Introduction 2691
58.2. Conventions 2691
58.3. Presheaves 2691
58.4. Sheaves 2694
58.5. Computing pushforward 2696
58.6. The structure sheaf 2698
58.7. Sheaves of modules 2698
58.8. Representable categories 2699
58.9. Restriction 2700
58.10. Restriction to algebraic spaces 2702
58.11. Quasi-coherent modules 2705
58.12. Stackification and sheaves 2707
58.13. Quasi-coherent sheaves and presentations 2708
58.14. Quasi-coherent sheaves on algebraic stacks 2710
58.15. Cohomology 2712
58.16. Injective sheaves 2712
58.17. The Čech complex 2715
58.18. The relative Čech complex 2716
58.19. Cohomology on algebraic stacks 2722
58.20. Higher direct images and algebraic stacks 2723
58.21. Comparison 2724
58.22. Change of topology 2725
58.23. Other chapters 2728

Chapter 59. Criteria for Representability 2731
59.1. Introduction 2731

59.2. Conventions 2731
59.3. What we already know 2731
59.4. Morphisms of stacks in groupoids 2732
59.5. Limit preserving on objects 2733
59.6. Formally smooth on objects 2735
59.7. Surjective on objects 2737
59.8. Algebraic morphisms 2738
59.9. Spaces of sections 2739
59.10. Relative morphisms 2740
59.11. Restriction of scalars 2744
59.12. Finite Hilbert stacks 2746
59.13. The finite Hilbert stack of a point 2749
59.14. Finite Hilbert stacks of spaces 2752
59.15. LCI locus in the Hilbert stack 2753
59.16. Bootstrapping algebraic stacks 2756
59.17. Applications 2757
59.18. When is a quotient stack algebraic? 2758
59.19. Algebraic stacks in the étale topology 2760
59.20. Other chapters 2761

Chapter 60. Properties of Algebraic Stacks 2763
60.1. Introduction 2763
60.2. Conventions and abuse of language 2763
60.3. Properties of morphisms representable by algebraic spaces 2764
60.4. Points of algebraic stacks 2769
60.5. Surjective morphisms 2773
60.6. Quasi-compact algebraic stacks 2773
60.7. Properties of algebraic stacks defined by properties of schemes 2774
60.8. Monomorphisms of algebraic stacks 2776
60.9. Immersions of algebraic stacks 2777
60.10. Reduced algebraic stacks 2783
60.11. Residual gerbes 2784
60.12. Other chapters 2788

Chapter 61. Morphisms of Algebraic Stacks 2791
61.1. Introduction 2791
61.2. Conventions and abuse of language 2791
61.3. Properties of diagonals 2791
61.4. Separation axioms 2794
61.5. Inertia stacks 2799
61.6. Higher diagonals 2801
61.7. Quasi-compact morphisms 2803
61.8. Noetherian algebraic stacks 2804
61.9. Open morphisms 2804
61.10. Submersive morphisms 2805
61.11. Universally closed morphisms 2806
61.12. Types of morphisms smooth local on source-and-target 2806
61.13. Morphisms of finite type 2809
61.14. Points of finite type 2811

61.15. Special presentations of algebraic stacks 2813
61.16. Quasi-finite morphisms 2819
61.17. Flat morphisms 2822
61.18. Morphisms of finite presentation 2823
61.19. Gerbes 2825
61.20. Stratification by gerbes 2830
61.21. Existence of residual gerbes 2832
61.22. Smooth morphisms 2833
61.23. Other chapters 2833

Chapter 62. Cohomology of Algebraic Stacks 2835
62.1. Introduction 2835
62.2. Conventions and abuse of language 2835
62.3. Notation 2835
62.4. Pullback of quasi-coherent modules 2836
62.5. The key lemma 2836
62.6. Locally quasi-coherent modules 2838
62.7. Flat comparison maps 2839
62.8. Parasitic modules 2843
62.9. Quasi-coherent modules, I 2845
62.10. Pushforward of quasi-coherent modules 2847
62.11. The lisse-étale and the flat-fppf sites 2850
62.12. Quasi-coherent modules, II 2856
62.13. Derived categories of quasi-coherent modules 2860
62.14. Derived pushforward of quasi-coherent modules 2863
62.15. Derived pullback of quasi-coherent modules 2864
62.16. Other chapters 2865

Chapter 63. Introducing Algebraic Stacks 2867
63.1. Why read this? 2867
63.2. Preliminary 2867
63.3. The moduli stack of elliptic curves 2867
63.4. Fibre products 2869
63.5. The definition 2870
63.6. A smooth cover 2871
63.7. Properties of algebraic stacks 2872
63.8. Other chapters 2873

Chapter 64. Examples 2875
64.1. Introduction 2875
64.2. Noncomplete completion 2875
64.3. Noncomplete quotient 2876
64.4. Completion is not exact 2877
64.5. The category of complete modules is not abelian 2877
64.6. Regular sequences and base change 2878
64.7. A Noetherian ring of infinite dimension 2879
64.8. Local rings with nonreduced completion 2880
64.9. A non catenary Noetherian local ring 2881
64.10. Non-quasi-affine variety with quasi-affine normalization 2882

64.11. A locally closed subscheme which is not open in closed 2883
64.12. Pushforward of quasi-coherent modules 2883
64.13. A nonfinite module with finite free rank 1 stalks 2884
64.14. A finite flat module which is not projective 2884
64.15. A projective module which is not locally free 2885
64.16. Zero dimensional local ring with nonzero flat ideal 2887
64.17. An epimorphism of zero-dimensional rings which is not surjective 2887
64.18. Finite type, not finitely presented, flat at prime 2888
64.19. Finite type, flat and not of finite presentation 2889
64.20. Topology of a finite type ring map 2890
64.21. Pure not universally pure 2890
64.22. A formally smooth non-flat ring map 2891
64.23. A formally étale non-flat ring map 2892
64.24. A formally étale ring map with nontrivial cotangent complex 2892
64.25. Ideals generated by sets of idempotents and localization 2893
64.26. Non flasque quasi-coherent sheaf associated to injective module 2894
64.27. A non-separated flat group scheme 2894
64.28. A non-flat group scheme with flat identity component 2895
64.29. A non-separated group algebraic space over a field 2895
64.30. Specializations between points in fibre étale morphism 2895
64.31. A torsor which is not an fppf torsor 2896
64.32. Stack with quasi-compact flat covering which is not algebraic 2897
64.33. A non-algebraic classifying stack 2898
64.34. Sheaf with quasi-compact flat covering which is not algebraic 2899
64.35. Sheaves and specializations 2899
64.36. Sheaves and constructible functions 2901
64.37. The lisse-étale site is not functorial 2902
64.38. Derived pushforward of quasi-coherent modules 2902
64.39. A big abelian category 2903
64.40. Other chapters 2904

Chapter 65. Exercises 2907
65.1. Algebra 2907
65.2. Colimits 2908
65.3. Additive and abelian categories 2909
65.4. Flat ring maps 2909
65.5. The Spectrum of a ring 2910
65.6. Localization 2912
65.7. Nakayama's Lemma 2913
65.8. Length 2913
65.9. Singularities 2913
65.10. Hilbert Nullstellensatz 2914
65.11. Dimension 2915
65.12. Catenary rings 2915
65.13. Fraction fields 2915
65.14. Transcendence degree 2915
65.15. Finite locally free modules 2915
65.16. Glueing 2916
65.17. Going up and going down 2917

65.18. Fitting ideals 2917
65.19. Hilbert functions 2918
65.20. Proj of a ring 2919
65.21. Cohen-Macaulay rings of dimension 1 2920
65.22. Infinitely many primes 2922
65.23. Filtered derived category 2923
65.24. Regular functions 2925
65.25. Sheaves 2925
65.26. Schemes 2927
65.27. Morphisms 2928
65.28. Tangent Spaces 2929
65.29. Quasi-coherent Sheaves 2931
65.30. Proj and projective schemes 2932
65.31. Morphisms from surfaces to curves 2933
65.32. Invertible sheaves 2934
65.33. Čech Cohomology 2935
65.34. Divisors 2936
65.35. Differentials 2938
65.36. Schemes, Final Exam, Fall 2007 2939
65.37. Schemes, Final Exam, Spring 2009 2940

CHAPTER 1

Introduction

1.1. Overview

Besides the book by Laumon and Moret-Bailly, see [**LMB00a**], and the work (in progress) by Fulton et al, we think there is a place for an open source textbook on algebraic stacks and the algebraic geometry that is needed to define them. The Stacks Project attempts to do this by building the foundations starting with commutative algebra and proceeding via the theory of schemes and algebraic spaces to a comprehensive foundation for the theory of algebraic stacks.

We expect this material to be read online as a key feature are the hyperlinks giving quick access to internal references spread over many different pages. If you use an embedded pdf or dvi viewer in your browser, the cross file links should work.

This project is a collaborative effort and we encourage you to help out. Please email any typos or errors you find while reading or any suggestions, additional material, or examples you have to stacks.project@gmail.com. You can download a tarball containing all source files, extract, run make, and use a dvi or pdf viewer locally. Please feel free to edit the LaTeX files and email your improvements.

1.2. Attribution

The scope of this work is such that it is a daunting task to attribute correctly and succinctly all of those mathematicians whose work has led to the development of the theory we try to explain here. We hope eventually to generate enough community interest to find contributors willing to write sections with historical remarks for each and every chapter.

Those who contributed to this work are listed on the title page of the book version of this work and online. Here we would like to name a selection of major contributions:

(1) Jarod Alper wrote Guide to Literature.
(2) Bhargav Bhatt wrote the initial version of Étale Morphisms of Schemes.
(3) Bhargav Bhatt wrote the initial version of More on Algebra, Section 12.8.
(4) Algebra, Section 7.25 and Injectives, Section 17.6 are from The CRing Project, courtesy of Akhil Mathew.
(5) Alex Perry wrote the material on projective modules, Mittag-Leffler modules, including the proof of Algebra, Theorem 7.89.5.
(6) Alex Perry wrote Formal Deformation Theory.
(7) Thibaut Pugin, Zachary Maddock and Min Lee took course notes which formed the basis for Étale Cohomology.
(8) David Rydh has contributed many helpful comments, pointed out several mistakes, helped out in an essential way with the material on residual gerbes, and was the originator for the material in More on Groupoids in Spaces, Sections 53.8 and 53.11.

1.3. Other chapters

(1) Introduction
(2) Conventions
(3) Set Theory
(4) Categories
(5) Topology
(6) Sheaves on Spaces
(7) Commutative Algebra
(8) Brauer Groups
(9) Sites and Sheaves
(10) Homological Algebra
(11) Derived Categories
(12) More on Algebra
(13) Smoothing Ring Maps
(14) Simplicial Methods
(15) Sheaves of Modules
(16) Modules on Sites
(17) Injectives
(18) Cohomology of Sheaves
(19) Cohomology on Sites
(20) Hypercoverings
(21) Schemes
(22) Constructions of Schemes
(23) Properties of Schemes
(24) Morphisms of Schemes
(25) Coherent Cohomology
(26) Divisors

CHAPTER 2

Conventions

2.1. Comments

The philosophy behind the conventions used in writing these documents is to choose those conventions that work.

2.2. Set theory

We use Zermelo-Fraenkel set theory with the axiom of choice. See [**Kun83**]. We do not use universes (different from SGA4). We do not stress set-theoretic issues, but we make sure everything is correct (of course) and so we do not ignore them either.

2.3. Categories

A category $\mathcal{C}$ consists of a set of objects and, for each pair of objects, a set of morphisms between them. In other words, it is what is called a ``small'' category in other texts. We will use ``big'' categories (categories whose objects form a proper class) as well, but only those that are listed in Categories, Remark 4.2.2.

2.4. Algebra

In these notes a ring is a commutative ring with a 1. Hence the category of rings has an initial object $\mathbf{Z}$ and a final object $\{0\}$ (this is the unique ring where $1 = 0$). Modules are assumed unitary. See [**Eis95**].

2.5. Notation

The natural integers are elements of $\mathbf{N} = \{1, 2, 3, \ldots\}$. The integers are elements of $\mathbf{Z} = \{\ldots, -2, -1, 0, 1, 2, \ldots\}$. The field of rational numbers is denoted $\mathbf{Q}$. The field of real numbers is denoted $\mathbf{R}$. The field of complex numbers is denoted $\mathbf{C}$.

CHAPTER 3

Set Theory

3.1. Introduction

We need some set theory every now and then. We use Zermelo-Fraenkel set theory with the axiom of choice (ZFC) as described in [**Kun83**] and [**Jec02**].

3.2. Everything is a set

Most mathematicians think of set theory as providing the basic foundations for mathematics. So how does this really work? For example, how do we translate the sentence ``X is a scheme'' into set theory? Well, we just unravel the definitions: A scheme is a locally ringed space such that every point has an open neighbourhood which is an affine scheme. A locally ringed space is a ringed space such that every stalk of the structure sheaf is a local ring. A ringed space is a pair $(X, \mathcal{O}_X)$ consisting of a topological space X and a sheaf of rings $\mathcal{O}_X$ on it. A topological space is a pair (X, τ) consisting of a set X and a set of subsets $\tau \subset \mathcal{P}(X)$ satisfying the axioms of a topology. And so on and so forth.

So how, given a set S would we recognize whether it is a scheme? The first thing we look for is whether the set S is an ordered pair. This is defined (see [**Jec02**], page 7) as saying that S has the form $(a, b) := \{\{a\}, \{a, b\}\}$ for some sets a, b. If this is the case, then we would take a look to see whether a is an ordered pair (c, d). If so we would check whether $d \subset \mathcal{P}(c)$, and if so whether d forms the collection of sets for a topology on the set c. And so on and so forth.

So even though it would take a considerable amount of work to write a complete formula $\phi_{scheme}(x)$ with one free variable x in set theory that expresses the notion ``x is a scheme'', it is possible to do so. The same thing should be true for any mathematical object.

3.3. Classes

Informally we use the notion of a *class*. Given a formula $\phi(x, p_1, \ldots, p_n)$, we call

$$C = \{x : \phi(x, p_1, \ldots, p_n)\}$$

a *class*. A class is easier to manipulate than the formula that defines it, but it is not strictly speaking a mathematical object. For example, if R is a ring, then we may consider the class of all R-modules (since after all we may translate the sentence ``M is an R-module'' into a formula in set theory, which then defines a class). A *proper class* is a class which is not a set.

In this way we may consider the category of R-modules, which is a ``big'' category---in other words, it has a proper class of objects. Similarly, we may consider the ``big'' category of schemes, the ``big'' category of rings, etc.

3.4. Ordinals

A set T is *transitive* if $x \in T$ implies $x \subset T$. A set α is an *ordinal* if it is transitive and well-ordered by $\in$. In this case, we define $\alpha + 1 = \alpha \cup \{\alpha\}$, which is another ordinal called the *successor* of α. An ordinal α is called a *successor ordinal* if there exists an ordinal β such that $\alpha = \beta + 1$. The smallest ordinal is $\emptyset$ which is also denoted 0. If α is not 0, and not a successor ordinal, then α is called a *limit ordinal* and we have

$$\alpha = \bigcup\nolimits_{\gamma \in \alpha} \gamma.$$

The first limit ordinal is ω and it is also the first infinite ordinal. The collection of all ordinals is a proper class. It is well-ordered by $\in$ in the following sense: any nonempty set (or even class) of ordinals has a least element. Given a set A of ordinals, we define the *supremum* of A to be $\sup_{\alpha \in A} \alpha = \bigcup_{\alpha \in A} \alpha$. It is the least ordinal bigger or equal to all $\alpha \in A$. Given any well ordered set $(S, \geq)$, there is a unique ordinal α such that $(S, \geq) \cong (\alpha, \in)$; this is called the *order type* of the well ordered set.

3.5. The hierarchy of sets

We define, by transfinite induction, $V_0 = \emptyset$, $V_{\alpha+1} = P(V_\alpha)$ (power set), and for a limit ordinal α,

$$V_\alpha = \bigcup\nolimits_{\beta < \alpha} V_\beta.$$

Note that each V_α is a transitive set.

Lemma 3.5.1. *(See* [**Jec02**]*, Lemma 6.3.) Every set is an element of V_α for some ordinal α.*

In [**Kun83**, Chapter III] it is explained that this lemma is equivalent to the axiom of foundation. The *rank* of a set S is the least ordinal α such that $S \in V_\alpha$.

3.6. Cardinality

The *cardinality* of a set A is the least ordinal α such that there exists a bijection between A and α. We sometimes use the notation $\alpha = |A|$ to indicate this. We say an ordinal α is a *cardinal* if and only if it occurs as the cardinality of some set A---in other words, if $\alpha = |A|$. We use the greek letters κ, λ for cardinals. The first infinite cardinal is ω, and in this context it is denoted $\aleph_0$. A set is *countable* if its cardinality is $\leq \aleph_0$. If α is an ordinal, then we denote α^+ the least cardinal $> \alpha$. You can use this to define $\aleph_1 = \aleph_0^+$, $\aleph_2 = \aleph_1^+$, etc, and in fact you can define $\aleph_\alpha$ for any ordinal α by transfinite induction.

The *addition* of cardinals κ, λ is denoted $\kappa \oplus \lambda$; it is the cardinality of $\kappa \amalg \lambda$. The *multiplication* of cardinals κ, λ is denoted $\kappa \otimes \lambda$; it is the cardinality of $\kappa \times \lambda$. It is uninteresting since if κ and λ are infinite cardinals, then $\kappa \otimes \lambda = \max(\kappa, \lambda)$. The *exponentiation* of cardinals κ, λ is denoted κ^λ; it is the cardinality of the set of (set) maps from λ to κ. Given any set K of cardinals, the *supremum* of K is $\sup_{\kappa \in K} \kappa = \bigcup_{\kappa \in K} \kappa$, which is also a cardinal.

3.7. Cofinality

A *cofinal subset* S of a partially ordered set T is a subset $S \subset T$ such that $\forall t \in T \exists s \in S (t \leq s)$. Note that a subset of a well-ordered set is a well-ordered set (with induced ordering). Given an ordinal α, the *cofinality* $\mathrm{cf}(\alpha)$ of α is the least ordinal β which occurs as the order type of some cofinal subset of α. The cofinality of an ordinal is always a cardinal (this is clear from the definition). Hence alternatively we can define the cofinality of α as the least cardinality of a cofinal subset of α.

Lemma 3.7.1. *Suppose that $T_\beta = colim_{\alpha<\beta} T_\alpha$ is a colimit of sets indexed by ordinals less than a given ordinal β. Suppose that $\varphi : S \to T$ is a map of sets. Then φ lifts to a map into T_α for some $\alpha < \beta$ provided that β is not a limit of ordinals indexed by S, in other words, if β is an ordinal with $cf(\beta) > |S|$.*

Proof. For each element $s \in S$ pick a $\alpha_s < \beta$ and an element $t_s \in T_{\alpha_s}$ which maps to $\varphi(s)$ in T. By assumption $\alpha = \sup_{s\in S} \alpha_s$ is strictly smaller than β. Hence the map $\varphi_\alpha : S \to T_\alpha$ which assigns to s the image of t_s in T_α is a solution. □

The following is essentially Grothendieck's argument for the existence of ordinals with arbitrarily large cofinality which he used to prove the existence of enough injectives in certain abelian categories, see [**Gro57**].

Proposition 3.7.2. *Let κ be a cardinal. Then there exists an ordinal whose cofinality is bigger than κ.*

Proof. If κ is finite, then $\omega = \mathrm{cf}(\omega)$ works. Let us thus assume that κ is infinite. Consider the smallest ordinal α whose cardinality is strictly greater than κ. We claim that $\mathrm{cf}(\alpha) > \kappa$. Note that α is a limit ordinal, since if $\alpha = \beta + 1$, then $|\alpha| = |\beta|$ (because α and β are infinite) and this contradicts the minimality of α. (Of course α is also a cardinal, but we do not need this.) To get a contradiction suppose $S \subset \alpha$ is a cofinal subset with $|S| \leq \kappa$. For $\beta \in S$, i.e., $\beta < \alpha$, we have $|\beta| \leq \kappa$ by minimality of α. As α is a limit ordinal and S cofinal in α we obtain $\alpha = \bigcup_{\beta\in S} \beta$. Hence $|\alpha| \leq |S| \otimes \kappa \leq \kappa \otimes \kappa \leq \kappa$ which is a contradiction with our choice of α. □

3.8. Reflection principle

Some of this material is in the chapter of [**Kun83**] called ``Easy consistency proofs".

Let $\phi(x_1, \dots, x_n)$ be a formula of set theory. Let us use the convention that this notation implies that all the free variables in ϕ occur among $x_1, \dots, x_n$. Let M be a set. The formula $\phi^M(x_1, \dots, x_n)$ is the formula obtained from $\phi(x_1, \dots, x_n)$ by replacing all the $\forall x$ and $\exists x$ by $\forall x \in M$ and $\exists x \in M$, respectively. So the formula $\phi(x_1, x_2) = \exists x(x \in x_1 \wedge x \in x_2)$ is turned into $\phi^M(x_1, x_2) = \exists x \in M(x \in x_1 \wedge x \in x_2)$. The formula ϕ^M is called the *relativization of ϕ to M*.

Theorem 3.8.1. *See* [**Jec02**, Theorem 12.14] *or* [**Kun83**, Theorem 7.4]. *Suppose given $\phi_1(x_1, \dots, x_n), \dots, \phi_m(x_1, \dots, x_n)$ a* **finite** *collection of formulas of set theory. Let M_0 be a set. There exists a set M such that $M_0 \subset M$ and $\forall x_1, \dots, x_n \in M$, we have*

$$\forall i = 1, \dots, m,\ \phi_i^M(x_1, \dots, x_n) \Leftrightarrow \forall i = 1, \dots, m,\ \phi_i(x_1, \dots, x_n).$$

In fact we may take $M = V_\alpha$ for some limit ordinal α.

We view this theorem as saying the following: Given any $x_1, \dots, x_n \in M$ the formulas hold with the bound variables ranging through all sets if and only if they hold for the bound variables ranging through elements of V_α. This theorem is a meta-theorem because it deals with the formulas of set theory directly. It actually says that given the finite list of formulas $\phi_1, \dots, \phi_m$ with at most free variables $x_1, \dots, x_n$ the sentence

$$\forall M_0\ \exists M,\ M_0 \subset M\ \forall x_1, \dots, x_n \in M$$
$$\phi_1(x_1, \dots, x_n) \wedge \dots \wedge \phi_m(x_1, \dots, x_n) \leftrightarrow \phi_1^M(x_1, \dots, x_n) \wedge \dots \wedge \phi_m^M(x_1, \dots, x_n)$$

is provable in ZFC. In other words, whenever we actually write down a finite list of formulas ϕ_i, we get a theorem.

It is somewhat hard to use this theorem in ``ordinary mathematics" since the meaning of the formulas $\phi_i^M(x_1, \ldots, x_n)$ is not so clear! Instead, we will use the idea of the proof of the reflection principle to prove the existence results we need directly.

3.9. Constructing categories of schemes

We will discuss how to apply this to produce, given an initial set of schemes, a ``small" category of schemes closed under a list of natural operations. Before we do so, we introduce the size of a scheme. Given a scheme S we define

$$\text{size}(S) = \max(\aleph_0, \kappa_1, \kappa_2),$$

where we define the cardinal numbers κ_1 and κ_2 as follows:

(1) We let κ_1 be the cardinality of the set of affine opens of S.
(2) We let κ_2 be the supremum of all the cardinalities of all $\Gamma(U, \mathcal{O}_S)$ for all $U \subset S$ affine open.

Lemma 3.9.1. *For every cardinal κ, there exists a set A such that every element of A is a scheme and such that for every scheme S with $Size(S) \leq \kappa$, there is an element $X \in A$ such that $X \cong S$ (isomorphism of schemes).*

Proof. Omitted. Hint: think about how any scheme is isomorphic to a scheme obtained by glueing affines. □

We denote *Bound* the function which to each cardinal κ associates

$$Bound(\kappa) = \max\{\kappa^{\aleph_0}, \kappa^+\}. \tag{3.9.1.1}$$

We could make this function grow much more rapidly, e.g., we could set $Bound(\kappa) = \kappa^\kappa$, and the result below would still hold. For any ordinal α, we denote Sch_α the full subcategory of category of schemes whose objects are elements of V_α. Here is the result we are going to prove.

Lemma 3.9.2. *With notations size, Bound and Sch_α as above. Let S_0 be a set of schemes. There exists a limit ordinal α with the following properties:*

(1) *We have $S_0 \subset V_\alpha$; in other words, $S_0 \subset Ob(Sch_\alpha)$.*
(2) *For any $S \in Ob(Sch_\alpha)$ and any scheme T with $size(T) \leq Bound(size(S))$, there exists a scheme $S' \in Ob(Sch_\alpha)$ such that $T \cong S'$.*
(3) *For any countable diagram[1] category $\mathcal{J}$ and any functor $F : \mathcal{J} \to Sch_\alpha$, the limit $lim_\mathcal{J} F$ exists in Sch_α if and only if it exists in Sch and moreover, in this case, the natural morphism between them is an isomorphism.*
(4) *For any countable diagram category $\mathcal{J}$ and any functor $F : \mathcal{J} \to Sch_\alpha$, the colimit $colim_\mathcal{J} F$ exists in Sch_α if and only if it exists in Sch and moreover, in this case, the natural morphism between them is an isomorphism.*

Proof. We define, by transfinite induction, a function f which associates to every ordinal an ordinal as follows. Let $f(0) = 0$. Given $f(\alpha)$, we define $f(\alpha + 1)$ to be the least ordinal β such that the following hold:

(1) We have $\alpha + 1 \leq \beta$ and $f(\alpha) \leq \beta$.
(2) For any $S \in Ob(Sch_{f(\alpha)})$ and any scheme T with size$(T) \leq Bound(\text{size}(S))$, there exists a scheme $S' \in Ob(Sch_\beta)$ such that $T \cong S'$.

[1] Both the set of objects and the morphism sets are countable. In fact you can prove the lemma with $\aleph_0$ replaced by any cardinal whatsoever in (3) and (4).

(3) For any countable diagram category $\mathcal{I}$ and any functor $F : \mathcal{I} \to Sch_{f(\alpha)}$, if the limit $lim_{\mathcal{I}} F$ or the colimit $colim_{\mathcal{I}} F$ exists in Sch, then it is isomorphic to a scheme in Sch_β.

To see β exists, we argue as follows. Since $Ob(Sch_{f(\alpha)})$ is a set, we see that $\kappa = \sup_{S \in Ob(Sch_{f(\alpha)})} Bound(\text{size}(S))$ exists and is a cardinal. Let A be a set of schemes obtained starting with κ as in Lemma 3.9.1. There is a set $CountCat$ of countable categories such that any countable category is isomorphic to an element of $CountCat$. Hence in (3) above we may assume that $\mathcal{I}$ is an element in $CountCat$. This means that the pairs $(\mathcal{I}, F)$ in (3) range over a set. Thus, there exists a set B whose elements are schemes such that for every $(\mathcal{I}, F)$ as in (3), if the limit or colimit exists, then it is isomorphic to an element in B. Hence, if we pick any β such that $A \cup B \subset V_\beta$ and $\beta > \max\{\alpha + 1, f(\alpha)\}$, then (1)--(3) hold. Since every nonempty collection of ordinals has a least element, we see that $f(\alpha + 1)$ is well defined. Finally, if α is a limit ordinal, then we set $f(\alpha) = \sup_{\alpha' < \alpha} f(\alpha')$.

Pick β_0 such that $S_0 \subset V_{\beta_0}$. By construction $f(\beta) \geq \beta$ and we see that also $S_0 \subset V_{f(\beta_0)}$. Moreover, as f is nondecreasing, we see $S_0 \subset V_{f(\beta)}$ is true for any $\beta \geq \beta_0$. Next, choose any ordinal $\beta_1 > \beta_0$ with cofinality $\text{cf}(\beta_1) > \omega = \aleph_0$. This is possible since the cofinality of ordinals gets arbitrarily large, see Proposition 3.7.2. We claim that $\alpha = f(\beta_1)$ is a solution to the problem posed in the lemma.

The first property of the lemma holds by our choice of $\beta_1 > \beta_0$ above.

Since β_1 is a limit ordinal (as its cofinality is infinite), we get $f(\beta_1) = \sup_{\beta < \beta_1} f(\beta)$. Hence $\{f(\beta) \mid \beta < \beta_1\} \subset f(\beta_1)$ is a cofinal subset. Hence we see that

$$V_\alpha = V_{f(\beta_1)} = \bigcup\nolimits_{\beta < \beta_1} V_{f(\beta)}.$$

Now, let $S \in Ob(Sch_\alpha)$. We define $\beta(S)$ to be the least ordinal β such that $S \in Ob(Sch_{f(\beta)})$. By the above we see that always $\beta(S) < \beta_1$. Since $Ob(Sch_{f(\beta+1)}) \subset Ob(Sch_\alpha)$, we see by construction of f above that the second property of the lemma is satisfied.

Suppose that $\{S_1, S_2, \ldots\} \subset Ob(Sch_\alpha)$ is a countable collection. Consider the function $\omega \to \beta_1$, $n \mapsto \beta(S_n)$. Since the cofinality of β_1 is $> \omega$, the image of this function cannot be a cofinal subset. Hence there exists a $\beta < \beta_1$ such that $\{S_1, S_2, \ldots\} \subset Ob(Sch_{f(\beta)})$. It follows that any functor $F : \mathcal{I} \to Sch_\alpha$ factors through one of the subcategories $Sch_{f(\beta)}$. Thus, if there exists a scheme X that is the colimit or limit of the diagram F, then, by construction of f, we see X is isomorphic to an object of $Sch_{f(\beta+1)}$ which is a subcategory of Sch_α. This proves the last two assertions of the lemma. $\square$

Remark 3.9.3. The lemma above can also be proved using the reflection principle. However, one has to be careful. Namely, suppose the sentence $\phi_{scheme}(X)$ expresses the property ``X is a scheme'', then what does the formula $\phi_{scheme}^{V_\alpha}(X)$ mean? It is true that the reflection principle says we can find α such that for all $X \in V_\alpha$ we have $\phi_{scheme}(X) \leftrightarrow \phi_{scheme}^{V_\alpha}(X)$ but this is entirely useless. It is only by combining two such statements that something interesting happens. For example suppose $\phi_{red}(X, Y)$ expresses the property ``X, Y are schemes, and Y is the reduction of X'' (see Schemes, Definition 21.12.5). Suppose we apply the reflection principle to the pair of formulas $\phi_1(X, Y) = \phi_{red}(X, Y)$, $\phi_2(X) = \exists Y, \phi_1(X, Y)$. Then it is easy to see that any α produced by the reflection principle has the property that given $X \in Ob(Sch_\alpha)$ the reduction of X is also an object of Sch_α (left as an exercise).

Lemma 3.9.4. *Let S be an affine scheme. Let $R = \Gamma(S, \mathcal{O}_S)$. Then the size of S is equal to* $\max\{\aleph_0, |R|\}$.

Proof. There are at most $\max\{|R|, \aleph_0\}$ affine opens of $Spec(R)$. This is clear since any affine open $U \subset Spec(R)$ is a finite union of principal opens $D(f_1) \cup \ldots \cup D(f_n)$ and hence the number of affine opens is at most $\sup_n |R|^n = \max\{|R|, \aleph_0\}$, see [**Kun83**, Ch. I, 10.13]. On the other hand, we see that $\Gamma(U, \mathcal{O}) \subset R_{f_1} \times \ldots \times R_{f_n}$ and hence $|\Gamma(U, \mathcal{O})| \leq \max\{\aleph_0, |R_{f_1}|, \ldots, |R_{f_n}|\}$. Thus it suffices to prove that $|R_f| \leq \max\{\aleph_0, |R|\}$ which is omitted. $\square$

Lemma 3.9.5. *Let S be a scheme. Let $S = \bigcup_{i \in I} S_i$ be an open covering. Then $size(S) \leq \max\{|I|, \sup_i\{size(S_i)\}\}$.*

Proof. Let $U \subset S$ be any affine open. Since U is quasi-compact there exist finitely many elements $i_1, \ldots, i_n \in I$ and affine opens $U_i \subset U \cap S_i$ such that $U = U_1 \cup U_2 \cup \ldots \cup U_n$. Thus

$$|\Gamma(U, \mathcal{O}_U)| \leq |\Gamma(U_1, \mathcal{O})| \otimes \ldots \otimes |\Gamma(U_n, \mathcal{O})| \leq \sup_i\{\text{size}(S_i)\}$$

Moreover, it shows that the set of affine opens of S has cardinality less than or equal to the cardinality of the set

$$\coprod_{n \in \omega} \coprod_{i_1, \ldots, i_n \in I} \{\text{affine opens of } S_{i_1}\} \times \ldots \times \{\text{affine opens of } S_{i_n}\}.$$

Each of the sets inside the disjoint union has cardinality at most $\sup_i\{\text{size}(S_i)\}$. The index set has cardinality at most $\max\{|I|, \aleph_0\}$, see [**Kun83**, Ch. I, 10.13]. Hence by [**Jec02**, Lemma 5.8] the cardinality of the coproduct is at most $\max\{\aleph_0, |I|\} \otimes \sup_i\{\text{size}(S_i)\}$. The lemma follows. $\square$

Lemma 3.9.6. *Let $f : X \to S$, $g : Y \to S$ be morphisms of schemes. Then we have $size(X \times_S Y) \leq \max\{size(X), size(Y)\}$.*

Proof. Let $S = \bigcup_{k \in K} S_k$ be an affine open covering. Let $X = \bigcup_{i \in I} U_i$, $Y = \bigcup_{j \in J} V_j$ be affine open coverings with I, J of cardinality $\leq \text{size}(X), \text{size}(Y)$. For each $i \in I$ there exists a finite set K_i of $k \in K$ such that $f(U_i) \subset \bigcup_{k \in K_i} S_k$. For each $j \in J$ there exists a finite set K_j of $k \in K$ such that $g(V_j) \subset \bigcup_{k \in K_j} S_k$. Hence $f(X), g(Y)$ are contained in $S' = \bigcup_{k \in K'} S_k$ with $K' = \bigcup_{i \in I} K_i \cup \bigcup_{j \in J} K_j$. Note that the cardinality of K' is at most $\max\{\aleph_0, |I|, |J|\}$. Applying Lemma 3.9.5 we see that it suffices to prove that $\text{size}(f^{-1}(S_k) \times_{S_k} g^{-1}(S_k)) \leq \max\{\text{size}(X), \text{size}(Y)\}$ for $k \in K'$. In other words, we may assume that S is affine.

Assume S affine. Let $X = \bigcup_{i \in I} U_i$, $Y = \bigcup_{j \in J} V_j$ be affine open coverings with I, J of cardinality $\leq \text{size}(X), \text{size}(Y)$. Again by Lemma 3.9.5 it suffices to prove the lemma for the products $U_i \times_S V_j$. By Lemma 3.9.4 we see that it suffices to show that

$$|A \otimes_C B| \leq \max\{\aleph_0, |A|, |B|\}.$$

We omit the proof of this inequality. $\square$

Lemma 3.9.7. *Let S be a scheme. Let $f : X \to S$ be locally of finite type with X quasi-compact. Then $size(X) \leq size(S)$.*

Proof. We can find a finite affine open covering $X = \bigcup_{i=1,\ldots n} U_i$ such that each U_i maps into an affine open S_i of S. Thus by Lemma 3.9.5 we reduce to the case where both S and X are affine. In this case by Lemma 3.9.4 we see that it suffices to show

$$|A[x_1, \ldots, x_n]| \leq \max\{\aleph_0, |A|\}.$$

We omit the proof of this inequality. $\square$

In Algebra, Lemma 7.99.13 we will show that if $A \to B$ is an epimorphism of rings, then $|B| \leq |A|$. The analogue for schemes is the following lemma.

Lemma 3.9.8. *If $X \to Y$ is monomorphism of schemes, then $size(X) \leq size(Y)$.*

Proof. Let $Y = \bigcup_{j \in J} V_j$ be an affine open covering of Y with $|J| \leq \text{size}(Y)$. By Lemma 3.9.5 it suffices to bound the size of the inverse image of V_j in X. Hence we reduce to the case that Y is affine. As $X \to Y$ is a monomorphism the map $X \to Y$ is injective on underlying sets of points. For each $x \in X$ choose an affine open neighbourhood $U_x \subset X$. Then $U_x \to Y$ is a monomorphism too, and $X = \bigcup_{x \in X} U_x$ is an affine open covering whose index set has cardinality at most size(Y). Hence applying Lemma 3.9.5 again we see that we reduce to the case that both X and Y are affine. In this case the result follows from Lemma 3.9.4 and the lemma mentioned just above the statement of the lemma whose proof you are reading now. □

Lemma 3.9.9. *Let α be an ordinal as in Lemma 3.9.2 above. The category Sch_α satisfies the following properties:*

(1) *If $X, Y, S \in Ob(Sch_\alpha)$, then for any morphisms $f : X \to S$, $g : Y \to S$ the fibre product $X \times_S Y$ in Sch_α exists and is a fibre product in the category of schemes.*
(2) *Given any at most countable collection $S_1, S_2, \ldots$ of elements of $Ob(Sch_\alpha)$, the coproduct $\coprod_i S_i$ exists in $Ob(Sch_\alpha)$ and is a coproduct in the category of schemes.*
(3) *For any $S \in Ob(Sch_\alpha)$ and any open immersion $U \to S$, there exists a $V \in Ob(Sch_\alpha)$ with $V \cong U$.*
(4) *For any $S \in Ob(Sch_\alpha)$ and any closed immersion $T \to S$, there exists a $S' \in Ob(Sch_\alpha)$ with $S' \cong T$.*
(5) *For any $S \in Ob(Sch_\alpha)$ and any finite type morphism $T \to S$, there exists a $S' \in Ob(Sch_\alpha)$ with $S' \cong T$.*
(6) *Suppose S is a scheme which has an open covering $S = \bigcup_{i \in I} S_i$ such that there exists a $T \in Ob(Sch_\alpha)$ with (a) $size(S_i) \leq size(T)^{\aleph_0}$ for all $i \in I$, and (b) $|I| \leq size(T)^{\aleph_0}$. Then S is isomorphic to an object of Sch_α.*
(7) *For any $S \in Ob(Sch_\alpha)$ and any morphism $f : T \to S$ locally of finite type such that T can be covered by at most $size(S)^{\aleph_0}$ open affines, there exists a $S' \in Ob(Sch_\alpha)$ with $S' \cong T$. For example this holds if T can be covered by at most $|\mathbf{R}| = 2^{\aleph_0} = \aleph_0^{\aleph_0}$ open affines.*
(8) *For any $S \in Ob(Sch_\alpha)$ and any monomorphism $T \to S$, there exists a $S' \in Ob(Sch_\alpha)$ with $S' \cong T$.*
(9) *Suppose that $T \in Ob(Sch_\alpha)$ is affine. Write $R = \Gamma(T, \mathcal{O}_T)$. Then any of the following schemes is isomorphic to a scheme in Sch_α:*
    (a) *For any ideal $I \subset R$ with completion $R^* = lim_n R/I^n$, the scheme $Spec(R^*)$.*
    (b) *For any finite type R-algebra R', the scheme $Spec(R')$.*
    (c) *For any localization $S^{-1}R$, the scheme $Spec(S^{-1}R)$.*
    (d) *For any prime $\mathfrak{p} \subset R$, the scheme $Spec(\overline{\kappa(\mathfrak{p})})$.*
    (e) *For any subring $R' \subset R$, the scheme $Spec(R')$.*
    (f) *Any scheme of finite type over a ring of cardinality at most $|R|^{\aleph_0}$.*
    (g) *And so on.*

Proof. Statements (1) and (2) follow directly from the definitions. Statement (3) follows as the size of an open subscheme U of S is clearly smaller than or equal to the size of S. Statement (4) follows from (5). Statement (5) follows from (7). Statement (6) follows as the size of S is $\leq \max\{|I|, \sup_i \text{size}(S_i)\} \leq \text{size}(T)^{\aleph_0}$ by Lemma 3.9.5. Statement (7) follows from (6). Namely, for any affine open $V \subset T$ we have size$(V) \leq$ size(S) by Lemma 3.9.7. Thus, we see that (6) applies in the situation of (7). Part (8) follows from Lemma 3.9.8.

Statement (9) is translated, via Lemma 3.9.4, into an upper bound on the cardinality of the rings R^*, $S^{-1}R$, $\overline{\kappa(\mathfrak{p})}$, R', etc. Perhaps the most interesting one is the ring R^*. As a set, it is the image of a surjective map $R^{\mathbf{N}} \to R^*$. Since $|R^{\mathbf{N}}| = |R|^{\aleph_0}$, we see that it works by our choice of $Bound(\kappa) = \kappa^{\aleph_0}$. Phew! (The cardinality of the algebraic closure of a field is the same as the cardinality of the field, or it is $\aleph_0$.) $\square$

Remark 3.9.10. Let R be a ring. Suppose we consider the ring $\prod_{\mathfrak{p} \in Spec(R)} \kappa(\mathfrak{p})$. The cardinality of this ring is bounded by $|R|^{|R|}$, but is not bounded by $|R|^{\aleph_0}$ in general (for example if $R = \mathbf{C}[x]$). Thus the ``And so on" of Lemma 3.9.9 above should be taken with a grain of salt. Of course, if it ever becomes necessary to consider these rings in arguments pertaining to fppf/étale cohomology, then we can change the function *Bound* above into the function $\kappa \mapsto \kappa^\kappa$.

3.10. Sets with group action

Let G be a group. We denote *G-Sets* the ``big" category of G-sets. For any ordinal α, we denote *G-Sets*$_\alpha$ the full subcategory of *G-Sets* whose objects are in V_α. As a notion for size of a G-set we take size$(S) = \max\{\aleph_0, |G|, |S|\}$ (where $|G|$ and $|S|$ are the cardinality of the underlying sets). As above we use the function $Bound(\kappa) = \kappa^{\aleph_0}$.

Lemma 3.10.1. *With notations G, G-Sets$_\alpha$, size, and Bound as above. Let S_0 be a set of G-sets. There exists a limit ordinal α with the following properties:*

1. *We have $S_0 \cup \{{}_GG\} \subset Ob(G\text{-}Sets_\alpha)$.*
2. *For any $S \in Ob(G\text{-}Sets_\alpha)$ and any G-set T with size$(T) \leq Bound($size$(S))$, there exists a $S' \in Ob(G\text{-}Sets_\alpha)$ that is isomorphic to T.*
3. *For any countable diagram category $\mathcal{I}$ and any functor $F : \mathcal{I} \to G\text{-}Sets_\alpha$, the limit $lim_{\mathcal{I}} F$ and colimit $colim_{\mathcal{I}} F$ exist in G-Sets$_\alpha$ and are the same as in G-Sets.*

Proof. Omitted. Similar to but easier than the proof of Lemma 3.9.2 above. $\square$

Lemma 3.10.2. *Let α be an ordinal as in Lemma 3.10.1 above. The category G-Sets$_\alpha$ satisfies the following properties:*

1. *The G-set ${}_GG$ is an object of G-Sets$_\alpha$.*
2. *(Co)Products, fibre products, and pushouts exist in G-Sets$_\alpha$ and are the same as their counterparts in G-Sets.*
3. *Given an object U of G-Sets$_\alpha$, any G-stable subset $O \subset U$ is isomorphic to an object of G-Sets$_\alpha$.*

Proof. Omitted. $\square$

3.11. Coverings of a site

Suppose that $\mathcal{C}$ is a category (as in Categories, Definition 4.2.1) and that Cov$(\mathcal{C})$ is a proper class of coverings satisfying properties (1), (2), and (3) of Sites, Definition 9.6.2. We list them here:

1. If $V \to U$ is an isomorphism, then $\{V \to U\} \in$ Cov$(\mathcal{C})$.
2. If $\{U_i \to U\}_{i \in I} \in$ Cov$(\mathcal{C})$ and for each i we have $\{V_{ij} \to U_i\}_{j \in J_i} \in$ Cov$(\mathcal{C})$, then $\{V_{ij} \to U\}_{i \in I, j \in J_i} \in$ Cov$(\mathcal{C})$.

(3) If $\{U_i \to U\}_{i\in I} \in \text{Cov}(\mathcal{C})$ and $V \to U$ is a morphism of $\mathcal{C}$, then $U_i \times_U V$ exists for all i and $\{U_i \times_U V \to V\}_{i\in I} \in \text{Cov}(\mathcal{C})$.

For an ordinal α, we set $\text{Cov}(\mathcal{C})_\alpha = \text{Cov}(\mathcal{C}) \cap V_\alpha$. Given an ordinal α and a cardinal κ, we set $\text{Cov}(\mathcal{C})_{\kappa,\alpha}$ equal to the set of elements $\mathcal{U} = \{\varphi_i : U_i \to U\}_{i\in I} \in \text{Cov}(\mathcal{C})_\alpha$ such that $|I| \leq \kappa$.

We recall the following notion, see Sites, Definition 9.8.2. Two families of morphisms, $\{\varphi_i : U_i \to U\}_{i\in I}$ and $\{\psi_j : W_j \to U\}_{j\in J}$, with the same target of $\mathcal{C}$ are called *combinatorially equivalent* if there exist maps $\alpha : I \to J$ and $\beta : J \to I$ such that $\varphi_i = \psi_{\alpha(i)}$ and $\psi_j = \varphi_{\beta(j)}$. This defines an equivalence relation on families of morphisms having a fixed target.

Lemma 3.11.1. *With notations as above. Let $Cov_0 \subset Cov(\mathcal{C})$ be a set contained in $Cov(\mathcal{C})$. There exist a cardinal κ and a limit ordinal α with the following properties:*

(1) *We have $Cov_0 \subset Cov(\mathcal{C})_{\kappa,\alpha}$.*
(2) *The set of coverings $Cov(\mathcal{C})_{\kappa,\alpha}$ satisfies (1), (2), and (3) of Sites, Definition 9.6.2 (see above). In other words $(\mathcal{C}, Cov(\mathcal{C})_{\kappa,\alpha})$ is a site.*
(3) *Every covering in $Cov(\mathcal{C})$ is combinatorially equivalent to a covering in $Cov(\mathcal{C})_{\kappa,\alpha}$.*

Proof. To prove this, we first consider the set $\mathcal{S}$ of all sets of morphisms of $\mathcal{C}$ with fixed target. In other words, an element of $\mathcal{S}$ is a subset T of $\text{Arrows}(\mathcal{C})$ such that all elements of T have the same target. Given a family $\mathcal{U} = \{\varphi_i : U_i \to U\}_{i\in I}$ of morphisms with fixed target, we define $Supp(\mathcal{U}) = \{\varphi \in \text{Arrows}(\mathcal{C}) \mid \exists i \in I, \varphi = \varphi_i\}$. Note that two families $\mathcal{U} = \{\varphi_i : U_i \to U\}_{i\in I}$ and $\mathcal{V} = \{V_j \to V\}_{j\in J}$ are combinatorially equivalent if and only if $Supp(\mathcal{U}) = Supp(\mathcal{V})$. Next, we define $\mathcal{S}_\tau \subset \mathcal{S}$ to be the subset $\mathcal{S}_\tau = \{T \in \mathcal{S} \mid \exists\, \mathcal{U} \in \text{Cov}(\mathcal{C})\; T = Supp(\mathcal{U})\}$. For every element $T \in \mathcal{S}_\tau$, set $\beta(T)$ to equal the least ordinal β such that there exists a $\mathcal{U} \in \text{Cov}(\mathcal{C})_\beta$ such that $T = \text{Supp}(\mathcal{U})$. Finally, set $\beta_0 = \sup_{T\in S_\tau} \beta(T)$. At this point it follows that every $\mathcal{U} \in \text{Cov}(\mathcal{C})$ is combinatorially equivalent to some element of $\text{Cov}(\mathcal{C})_{\beta_0}$.

Let κ be the maximum of $\aleph_0$, the cardinality $|\text{Arrows}(\mathcal{C})|$,

$$\sup_{\{U_i\to U\}_{i\in I}\in\text{Cov}(\mathcal{C})_{\beta_0}} |I|, \quad \text{and} \quad \sup_{\{U_i\to U\}_{i\in I}\in\text{Cov}_0} |I|.$$

Since κ is an infinite cardinal, we have $\kappa \otimes \kappa = \kappa$. Note that obviously $\text{Cov}(\mathcal{C})_{\beta_0} = \text{Cov}(\mathcal{C})_{\kappa,\beta_0}$.

We define, by transfinite induction, a function f which associates to every ordinal an ordinal as follows. Let $f(0) = 0$. Given $f(\alpha)$, we define $f(\alpha + 1)$ to be the least ordinal β such that the following hold:

(1) We have $\alpha + 1 \leq \beta$ and $f(\alpha) \leq \beta$.
(2) If $\{U_i \to U\}_{i\in I} \in \text{Cov}(\mathcal{C})_{\kappa,f(\alpha)}$ and for each i we have $\{W_{ij} \to U_i\}_{j\in J_i} \in \text{Cov}(\mathcal{C})_{\kappa,f(\alpha)}$, then $\{W_{ij} \to U\}_{i\in I, j\in J_i} \in \text{Cov}(\mathcal{C})_{\kappa,\beta}$.
(3) If $\{U_i \to U\}_{i\in I} \in \text{Cov}(\mathcal{C})_{\kappa,\alpha}$ and $W \to U$ is a morphism of $\mathcal{C}$, then $\{U_i \times_U W \to W\}_{i\in I} \in \text{Cov}(\mathcal{C})_{\kappa,\beta}$.

To see β exists we note that clearly the collection of all coverings $\{W_{ij} \to U\}$ and $\{U_i \times_U W \to W\}$ that occur in (2) and (3) form a set. Hence there is some ordinal β such that V_β contains all of these coverings. Moreover, the index set of the covering $\{W_{ij} \to U\}$ has cardinality $\sum_{i\in I} |J_i| \leq \kappa \otimes \kappa = \kappa$, and hence these coverings are contained in $\text{Cov}(\mathcal{C})_{\kappa,\beta}$. Since every nonempty collection of ordinals has a least element we see that $f(\alpha+1)$ is well defined. Finally, if α is a limit ordinal, then we set $f(\alpha) = \sup_{\alpha'<\alpha} f(\alpha')$.

Pick an ordinal β_1 such that Arrows($\mathcal{C}$) $\subset V_{\beta_1}$, $\text{Cov}_0 \subset V_{\beta_0}$, and $\beta_1 \geq \beta_0$. By construction $f(\beta_1) \geq \beta_1$ and we see that the same properties hold for $V_{f(\beta_1)}$. Moreover, as f is nondecreasing this remains true for any $\beta \geq \beta_1$. Next, choose any ordinal $\beta_2 > \beta_1$ with cofinality $\text{cf}(\beta_2) > \kappa$. This is possible since the cofinality of ordinals gets arbitrarily large, see Proposition 3.7.2. We claim that the pair κ, $\alpha = f(\beta_2)$ is a solution to the problem posed in the lemma.

The first and third property of the lemma holds by our choices of κ, $\beta_2 > \beta_1 > \beta_0$ above.

Since β_2 is a limit ordinal (as its cofinality is infinite) we get $f(\beta_2) = \sup_{\beta<\beta_2} f(\beta)$. Hence $\{f(\beta) \mid \beta < \beta_2\} \subset f(\beta_2)$ is a confinal subset. Hence we see that

$$V_\alpha = V_{f(\beta_2)} = \bigcup\nolimits_{\beta<\beta_2} V_{f(\beta)}.$$

Now, let $\mathcal{U} \in \text{Cov}_{\kappa,\alpha}$. We define $\beta(\mathcal{U})$ to be the least ordinal β such that $\mathcal{U} \in \text{Cov}_{\kappa,f(\beta)}$. By the above we see that always $\beta(\mathcal{U}) < \beta_2$.

We have to show properties (1), (2), and (3) defining a site hold for the pair $(\mathcal{C}, \text{Cov}_{\kappa,\alpha})$. The first holds because by our choice of β_2 all arrows of $\mathcal{C}$ are contained in $V_{f(\beta_2)}$. For the third, we use that given a covering $\mathcal{U} = \{U_i \to U\}_{i\in I} \in \text{Cov}(\mathcal{C})_{\kappa,\alpha}$ we have $\beta(\mathcal{U}) < \beta_2$ and hence any base change of $\mathcal{U}$ is by construction of f contained in $\text{Cov}(\mathcal{C})_{\kappa,f(\beta+1)}$ and hence in $\text{Cov}(\mathcal{C})_{\kappa,\alpha}$.

Finally, for the second condition, suppose that $\{U_i \to U\}_{i\in I} \in \text{Cov}(\mathcal{C})_{\kappa,f(\alpha)}$ and for each i we have $\mathcal{W}_i = \{W_{ij} \to U_i\}_{j\in J_i} \in \text{Cov}(\mathcal{C})_{\kappa,f(\alpha)}$. Consider the function $I \to \beta_2$, $i \mapsto \beta(\mathcal{W}_i)$. Since the cofinality of β_2 is $> \kappa \geq |I|$ the image of this function cannot be a cofinal subset. Hence there exists a $\beta < \beta_1$ such that $\mathcal{W}_i \in \text{Cov}_{\kappa,f(\beta)}$ for all $i \in I$. It follows that the covering $\{W_{ij} \to U\}_{i\in I, j\in J_i}$ is an element of $\text{Cov}(\mathcal{C})_{\kappa,f(\beta+1)} \subset \text{Cov}(\mathcal{C})_{\kappa,\alpha}$ as desired. □

Remark 3.11.2. It is likely the case that, for some limit ordinal α, the set of coverings $\text{Cov}(\mathcal{C})_\alpha$ satisfies the conditions of the lemma. This is after all what an application of the reflection principle would appear to give (modulo caveats as described at the end of Section 3.8 and in Remark 3.9.3).

3.12. Abelian categories and injectives

The following lemma applies to the category of modules over a sheaf of rings on a site.

Lemma 3.12.1. *Suppose given a big category $\mathcal{A}$ (see Categories, Remark 4.2.2). Assume $\mathcal{A}$ is abelian and has enough injectives. See Homology, Definitions 10.3.12 and 10.20.4. Then for any given set of objects $\{A_s\}_{s\in S}$ of $\mathcal{A}$, there is an abelian subcategory $\mathcal{A}' \subset \mathcal{A}$ with the following properties:*

1. *$Ob(\mathcal{A}')$ is a set,*
2. *$Ob(\mathcal{A}')$ contains A_s for each $s \in S$,*
3. *$\mathcal{A}'$ has enough injectives, and*
4. *an object of $\mathcal{A}'$ is injective if and only if it is an injective object of $\mathcal{A}$.*

Proof. Omitted. □

CHAPTER 4

Categories

4.1. Introduction

Categories were first introduced in [**EL45**]. The category of categories (which is a proper class) is a 2-category. Similarly, the category of stacks forms a 2-category. If you already know about categories, but not about 2-categories you should read Section 4.25 as an introduction to the formal definitions later on.

4.2. Definitions

We recall the definitions, partly to fix notation.

Definition 4.2.1. A *category* $\mathcal{C}$ consists of the following data:

(1) A set of objects $Ob(\mathcal{C})$.
(2) For each pair $x, y \in Ob(\mathcal{C})$ a set of morphisms $Mor_{\mathcal{C}}(x, y)$.
(3) For each triple $x, y, z \in Ob(\mathcal{C})$ a composition map $Mor_{\mathcal{C}}(y, z) \times Mor_{\mathcal{C}}(x, y) \to Mor_{\mathcal{C}}(x, z)$, denoted $(\phi, \psi) \mapsto \phi \circ \psi$.

These data are to satisfy the following rules:

(1) For every element $x \in Ob(\mathcal{C})$ there exists a morphism $\text{id}_x \in Mor_{\mathcal{C}}(x, x)$ such that $\text{id}_x \circ \phi = \phi$ and $\psi \circ \text{id}_x = \psi$ whenever these compositions make sense.
(2) Composition is associative, i.e., $(\phi \circ \psi) \circ \chi = \phi \circ (\psi \circ \chi)$ whenever these compositions make sense.

It is customary to require all the morphism sets $Mor_{\mathcal{C}}(x, y)$ to be disjoint. In this way a morphism $\phi : x \to y$ has a unique *source* x and a unique *target* y. This is not strictly necessary, although care has to be taken in formulating condition (2) above if it is not the case. It is convenient and we will often assume this is the case. In this case we say that ϕ and ψ are *composable* if the source of ϕ is equal to the target of ψ, in which case $\phi \circ \psi$ is defined. An equivalent definition would be to define a category as a quintuple $(\text{Ob}, \text{Arrows}, s, t, \circ)$ consisting of a set of objects, a set of morphisms (arrows), source, target and composition subject to a long list of axioms. We will occasionally use this point of view.

Remark 4.2.2. Big categories. In some texts a category is allowed to have a proper class of objects. We will allow this as well in these notes but only in the following list of cases (to be updated as we go along). In particular, when we say: ``Let $\mathcal{C}$ be a category'' then it is understood that $Ob(\mathcal{C})$ is a set.

(1) The category *Sets* of sets.
(2) The category *Ab* of abelian groups.
(3) The category *Groups* of groups.
(4) Given a group G the category G-*Sets* of sets with a left G-action.
(5) Given a ring R the category Mod_R of R-modules.
(6) Given a field k the category of vector spaces over k.

(7) The category of rings.
(8) The category of schemes.
(9) The category *Top* of topological spaces.
(10) Given a topological space X the category $PSh(X)$ of presheaves of sets over X.
(11) Given a topological space X the category $Sh(X)$ of sheaves of sets over X.
(12) Given a topological space X the category $PAb(X)$ of presheaves of abelian groups over X.
(13) Given a topological space X the category $Ab(X)$ of sheaves of abelian groups over X.
(14) Given a small category $\mathcal{C}$ the category of functors from $\mathcal{C}$ to *Sets*.
(15) Given a category $\mathcal{C}$ the category of presheaves of sets over $\mathcal{C}$.
(16) Given a site $\mathcal{C}$ the category of sheaves of sets over $\mathcal{C}$.

One of the reason to enumerate these here is to try and avoid working with something like the ``collection" of ``big" categories which would be like working with the collection of all classes which I think definitively is a meta-mathematical object.

Remark 4.2.3. It follows directly from the definition any two identity morphisms of and object x of $\mathcal{A}$ are the same. Thus we may and will speak of *the* identity morphism id_x of x.

Definition 4.2.4. A morphism $\phi : x \to y$ is an *isomorphism* of the category $\mathcal{C}$ if there exists a morphism $\psi : y \to x$ such that $\phi \circ \psi = \text{id}_y$ and $\psi \circ \phi = \text{id}_x$.

An isomorphism ϕ is also sometimes called an *invertible* morphism, and the morphism ψ of the definition is called the *inverse* and denoted ϕ^{-1}. It is unique if it exists. Note that given an object x of a category $\mathcal{A}$ the set of invertible elements $\text{Aut}_{\mathcal{A}}(x)$ of $Mor_{\mathcal{A}}(x, x)$ forms a group under composition. This group is called the *automorphism* group of x in $\mathcal{A}$.

Definition 4.2.5. A *groupoid* is a category where every morphism is an isomorphism.

Example 4.2.6. A group G gives rise to a groupoid with a single object x and morphisms $Mor(x, x) = G$, with the composition rule given by the group law in G. Every groupoid with a single object is of this form.

Example 4.2.7. A set C gives rise to a groupoid $\mathcal{C}$ defined as follows: As objects we take $Ob(\mathcal{C}) := C$ and for morphisms we take $Mor(x, y)$ empty if $x \neq y$ and equal to $\{\text{id}_x\}$ if $x = y$.

Definition 4.2.8. A *functor* $F : \mathcal{A} \to \mathcal{B}$ between two categories $\mathcal{A}, \mathcal{B}$ is given by the following data:

(1) A map $F : Ob(\mathcal{A}) \to Ob(\mathcal{B})$.
(2) For every $x, y \in Ob(\mathcal{A})$ a map $F : Mor_{\mathcal{A}}(x, y) \to Mor_{\mathcal{B}}(F(x), F(y))$, denoted $\phi \mapsto F(\phi)$.

These data should be compatible with composition and identity morphisms in the following manner: $F(\phi \circ \psi) = F(\phi) \circ F(\psi)$ for a composable pair (ϕ, ψ) of morphisms of $\mathcal{A}$ and $F(\text{id}_x) = \text{id}_{F(x)}$.

Note that every category $\mathcal{A}$ has an *identity* functor $\text{id}_{\mathcal{A}}$. In addition, given a functor $G : \mathcal{B} \to \mathcal{C}$ and a functor $F : \mathcal{A} \to \mathcal{B}$ there is a *composition* functor $G \circ F : \mathcal{A} \to \mathcal{C}$ defined in an obvious manner.

Definition 4.2.9. Let $F : \mathcal{A} \to \mathcal{B}$ be a functor.

(1) We say F is *faithful* if for any objects x, y of $Ob(\mathcal{A})$ the map
$$F : Mor_{\mathcal{A}}(x, y) \to Mor_{\mathcal{B}}(F(x), F(y))$$
is injective.
(2) If these maps are all bijective then F is called *fully faithful*.
(3) The functor F is called *essentially surjective* if for any object $y \in Ob(\mathcal{B})$ there exists an object $x \in Ob(\mathcal{A})$ such that $F(x)$ is isomorphic to y in $\mathcal{B}$.

Definition 4.2.10. A *subcategory* of a category $\mathcal{B}$ is a category $\mathcal{A}$ whose objects and arrows form subsets of the objects and arrows of $\mathcal{A}$ and such that source, target and composition in $\mathcal{A}$ agree with those of $\mathcal{B}$. We say $\mathcal{A}$ is a *full subcategory* of $\mathcal{B}$ if $Mor_{\mathcal{A}}(x, y) = Mor_{\mathcal{B}}(x, y)$ for all $x, y \in Ob(\mathcal{A})$. We say $\mathcal{A}$ is a *strictly full* subcategory of $\mathcal{B}$ if it is a full subcategory and given $x \in Ob(\mathcal{A})$ any object of $\mathcal{B}$ which is isomorphic to x is also in $\mathcal{A}$.

If $\mathcal{A} \subset \mathcal{B}$ is a subcategory then the identity map is a functor from $\mathcal{A}$ to $\mathcal{B}$. Furthermore a subcategory $\mathcal{A} \subset \mathcal{B}$ is full if and only if the inclusion functor is fully faithful. Note that given a category $\mathcal{B}$ the set of full subcategories of $\mathcal{B}$ is the same as the set of subsets of $Ob(\mathcal{B})$.

Remark 4.2.11. Suppose that $\mathcal{A}$ is a category. A functor F from $\mathcal{A}$ to *Sets* is a mathematical object (i.e., it is a set not a class or a formula of set theory, see Sets, Section 3.2) even though the category of sets is ``big''. Namely, the range of F on objects will be a set $F(Ob(\mathcal{A}))$ and then we may think of F as a functor between $\mathcal{A}$ and the full subcategory of the category of sets whose objects are elements of $F(Ob(\mathcal{A}))$.

Example 4.2.12. A homomorphism $p : G \to H$ of groups gives rise to a functor between the associated groupoids in Example 4.2.6. It is faithful (resp. fully faithful) if and only if p is injective (resp. an isomorphism).

Example 4.2.13. Given a category $\mathcal{C}$ and an object $X \in Ob(\mathcal{C})$ we define the *category of objects over* X, denoted $\mathcal{C}/X$ as follows. The objects of $\mathcal{C}/X$ are morphisms $Y \to X$ for some $Y \in Ob(\mathcal{C})$. Morphisms between objects $Y \to X$ and $Y' \to X$ are morphisms $Y \to Y'$ in $\mathcal{C}$ that make the obvious diagram commute. Note that there is a functor $p_X : \mathcal{C}/X \to \mathcal{C}$ which simply forgets the morphism. Moreover given a morphism $f : X' \to X$ in $\mathcal{C}$ there is an induced functor $F : \mathcal{C}/X' \to \mathcal{C}/X$ obtained by composition with f, and $p_X \circ F = p_{X'}$.

Example 4.2.14. Given a category $\mathcal{C}$ and an object $X \in Ob(\mathcal{C})$ we define the *category of objects under* X, denoted $X/\mathcal{C}$ as follows. The objects of $X/\mathcal{C}$ are morphisms $X \to Y$ for some $Y \in Ob(\mathcal{C})$. Morphisms between objects $X \to Y$ and $X \to Y'$ are morphisms $Y \to Y'$ in $\mathcal{C}$ that make the obvious diagram commute. Note that there is a functor $p_X : X/\mathcal{C} \to \mathcal{C}$ which simply forgets the morphism. Moreover given a morphism $f : X' \to X$ in $\mathcal{C}$ there is an induced functor $F : X/\mathcal{C} \to X'/\mathcal{C}$ obtained by composition with f, and $p_{X'} \circ F = p_X$.

Definition 4.2.15. Let $F, G : \mathcal{A} \to \mathcal{B}$ be functors. A *natural transformation*, or a *morphism of functors* $t : F \to G$, is a collection $\{t_x\}_{x \in Ob(\mathcal{A})}$ such that

(1) $t_x : F(x) \to G(x)$ is a morphism in the category $\mathcal{B}$, and
(2) for every morphism $\phi : x \to y$ of $\mathcal{A}$ the following diagram is commutative

$$\begin{tikzcd} F(x) \arrow[r, "t_x"] \arrow[d, "F(\phi)"'] & G(x) \arrow[d, "G(\phi)"] \\ F(y) \arrow[r, "t_y"] & G(y) \end{tikzcd}$$

Sometimes we use the diagram

$$\begin{tikzcd} \mathscr{A} \arrow[r, bend left, "F"] \arrow[r, bend right, "G"'] \arrow[r, phantom, "\Downarrow t"] & \mathscr{B} \end{tikzcd}$$

to indicate that t is a morphism from F to G.

Note that every functor F comes with the *identity* transformation $\mathrm{id}_F : F \to F$. In addition, given a morphism of functors $t : F \to G$ and a morphism of functors $s : E \to F$ then the *composition* $t \circ s$ is defined by the rule

$$(t \circ s)_x = t_x \circ s_x : E(x) \to G(x)$$

for $x \in Ob(\mathscr{A})$. It is easy to verify that this is indeed a morphism of functors from E to G. In this way, given categories $\mathscr{A}$ and $\mathscr{B}$ we obtain a new category, namely the category of functors between $\mathscr{A}$ and $\mathscr{B}$.

Remark 4.2.16. This is one instance where the same thing does not hold if $\mathscr{A}$ is a ``big'' category. For example consider functors *Sets* $\to$ *Sets*. As we have currently defined it such a functor is a class and not a set. In other words, it is given by a formula in set theory (with some variables equal to specified sets)! It is not a good idea to try to consider all possible formulae of set theory as part of the definition of a mathematical object. The same problem presents itself when considering sheaves on the category of schemes for example. We will come back to this point later.

Definition 4.2.17. An *equivalence of categories* $F : \mathscr{A} \to \mathscr{B}$ is a functor such that there exists a functor $G : \mathscr{B} \to \mathscr{A}$ such that the compositions $F \circ G$ and $G \circ F$ are isomorphic to the identity functors $\mathrm{id}_{\mathscr{B}}$, respectively $\mathrm{id}_{\mathscr{A}}$. In this case we say that G is a *quasi-inverse* to F.

Lemma 4.2.18. *Let $F : \mathscr{A} \to \mathscr{B}$ be a fully faithful functor. Suppose for every $X \in Ob(\mathscr{B})$ given an object $j(X)$ of $\mathscr{A}$ and an isomorphism $i_X : X \to F(j(X))$. Then there is a unique functor $j : \mathscr{B} \to \mathscr{A}$ such that j extends the rule on objects, and the isomorphisms i_X define an isomorphism of functors $id_{\mathscr{B}} \to F \circ j$. Moreover, j and F are quasi-inverse equivalences of categories.*

Proof. This lemma proves itself. $\square$

Lemma 4.2.19. *A functor is an equivalence of categories if and only if it is both fully faithful and essentially surjective.*

Proof. Let $F : \mathscr{A} \to \mathscr{B}$ be essentially surjective and fully faithful. As by convention all categories are small and as F is essentially surjective we can, using the axiom of choice, choose for every $X \in Ob(\mathscr{B})$ an object $j(X)$ of $\mathscr{A}$ and an isomorphism $i_X : X \to F(j(X))$. Then we apply Lemma 4.2.18 using that F is fully faithful. $\square$

Definition 4.2.20. Let $\mathscr{A}$, $\mathscr{B}$ be categories. We define the *product category* to be the category $\mathscr{A} \times \mathscr{B}$ to be the category with objects $Ob(\mathscr{A} \times \mathscr{B}) = Ob(\mathscr{A}) \times Ob(\mathscr{B})$ and

$$Mor_{\mathscr{A} \times \mathscr{B}}((x, y), (x', y')) := Mor_{\mathscr{A}}(x, x') \times Mor_{\mathscr{B}}(y, y').$$

Composition is defined componentwise.

4.3. Opposite Categories and the Yoneda Lemma

Definition 4.3.1. Given a category $\mathcal{C}$ the *opposite category* $\mathcal{C}^{opp}$ is the category with the same objects as $\mathcal{C}$ but all morphisms reversed.

In other words $Mor_{\mathcal{C}^{opp}}(x, y) = Mor_{\mathcal{C}}(y, x)$. Composition in $\mathcal{C}^{opp}$ is the same as in $\mathcal{C}$ except backwards: if $\phi : y \to z$ and $\psi : x \to y$ in $\mathcal{C}^{opp}$ then $\phi \circ^{opp} \psi := \psi \circ \phi$.

Definition 4.3.2. Let $\mathcal{C}$, $\mathcal{S}$ be categories. A *contravariant* functor F from $\mathcal{C}$ to $\mathcal{S}$ is a functor $\mathcal{C}^{opp} \to \mathcal{S}$.

Concretely, a contravariant functor F is given by a map $F : Ob(\mathcal{C}) \to Ob(\mathcal{S})$ and for every morphism $\psi : x \to y$ in $\mathcal{C}$ a morphism $F(\psi) : F(y) \to F(x)$. These should satisfy the property that, given another morphism $\phi : y \to z$, we have $F(\phi \circ \psi) = F(\psi) \circ F(\phi)$ as morphisms $F(z) \to F(x)$. (Note the reverse of order.)

Definition 4.3.3. Let $\mathcal{C}$ be a category.

(1) A *presheaf of sets on* $\mathcal{C}$ or simply a *presheaf* is a contravariant functor F from $\mathcal{C}$ to *Sets*.
(2) The category of presheaves is denoted $PSh(\mathcal{C})$.

Of course the category of presheaves is a proper class.

Example 4.3.4. Functor of points. For any $U \in Ob(\mathcal{C})$ there is a contravariant functor

$$\begin{array}{rccc} h_U & : & \mathcal{C} & \longrightarrow & Sets \\ & & X & \longmapsto & Mor_{\mathcal{C}}(X, U) \end{array}$$

which takes an object X to the set $Mor_{\mathcal{C}}(X, U)$. In other words h_U is a presheaf. Given a morphism $f : X \to Y$ the corresponding map $h_U(f) : Mor_{\mathcal{C}}(Y, U) \to Mor_{\mathcal{C}}(X, U)$ takes ϕ to $\phi \circ f$. We will always denote this presheaf $h_U : \mathcal{C}^{opp} \to Sets$. It is called the *representable presheaf* associated to U If $\mathcal{C}$ is the category of schemes this functor is sometimes referred to as the *functor of points* of U.

Note that given a morphism $\phi : U \to V$ in $\mathcal{C}$ we get a corresponding natural transformation of functors $h(\phi) : h_U \to h_V$ defined simply by composing with the morphism $U \to V$. It is trivial to see that this turns composition of morphisms in $\mathcal{C}$ into composition of transformations of functors. In other words we get a functor

$$h : \mathcal{C} \longrightarrow \mathrm{Fun}(\mathcal{C}^{opp}, Sets) = PSh(\mathcal{C})$$

Note that the target is a ``big'' category, see Remark 4.2.2. On the other hand, h is an actual mathematical object (i.e. a set), compare Remark 4.2.11.

Lemma 4.3.5. *Yoneda lemma. Let $U, V \in Ob(\mathcal{C})$. Given any morphism of functors $s : h_U \to h_V$ there is a unique morphism $\phi : U \to V$ such that $h(\phi) = s$. In other words the functor h is fully faithful. More generally, given any contravariant functor F and any object U of $\mathcal{C}$ we have a natural bijection*

$$Mor_{PSh(\mathcal{C})}(h_U, F) \longrightarrow F(U), \quad s \longmapsto s_U(id_U).$$

Proof. Just take $\phi = s_U(\mathrm{id}_U) \in Mor_{\mathcal{C}}(U, V)$. □

Definition 4.3.6. A contravariant functor $F : \mathcal{C} \to Sets$ is said to be *representable* if it is isomorphic to the functor of points h_U for some object U of $\mathcal{C}$.

Choose an object U of $\mathcal{C}$ and an isomorphism $s : h_U \to F$. The Yoneda lemma guarantees that the pair (U, s) is unique up to unique isomorphism. The object U is called an object *representing* F.

4.4. Products of pairs

Definition 4.4.1. Let $x, y \in Ob(\mathscr{C})$, A *product* of x and y is an object $x \times y \in Ob(\mathscr{C})$ together with morphisms $p \in Mor_{\mathscr{C}}(x \times y, x)$ and $q \in Mor_{\mathscr{C}}(x \times y, y)$ such that the following universal property holds: for any $w \in Ob(\mathscr{C})$ and morphisms $\alpha \in Mor_{\mathscr{C}}(w, x)$ and $\beta \in Mor_{\mathscr{C}}(w, y)$ there is a unique $\gamma \in Mor_{\mathscr{C}}(w, x \times y)$ making the diagram

$$\begin{tikzcd}
w \arrow[dr, dashed, "\gamma"] \arrow[drr, "\beta"] \arrow[ddr, "\alpha"'] & & \\
& x \times y \arrow[r, "q"'] \arrow[d, "p"] & z \\
& x &
\end{tikzcd}$$

commute.

If a product exists it is unique up to unique isomorphism. This follows from the Yoneda lemma as the definition requires $x \times y$ to be an object of $\mathscr{C}$ such that

$$h_{x \times y}(w) = h_x(w) \times h_y(w)$$

functorially in w. In other words the product $x \times y$ is an object representing the functor $w \mapsto h_x(w) \times h_y(w)$.

Definition 4.4.2. We say the category $\mathscr{C}$ *has products of pairs of objects* if a product $x \times y$ exists for any $x, y \in Ob(\mathscr{C})$.

We use this terminology to distinguish this notion from the notion of ``having products'' or ``having finite products'' which usually means something else (in particular it always implies there exists a final object).

4.5. Coproducts of pairs

Definition 4.5.1. Let $x, y \in Ob(\mathscr{C})$, A *coproduct*, or *amalgamated sum* of x and y is an object $x \amalg y \in Ob(\mathscr{C})$ together with morphisms $i \in Mor_{\mathscr{C}}(x, x \amalg y)$ and $j \in Mor_{\mathscr{C}}(y, x \amalg y)$ such that the following universal property holds: for any $w \in Ob(\mathscr{C})$ and morphisms $\alpha \in Mor_{\mathscr{C}}(x, w)$ and $\beta \in Mor_{\mathscr{C}}(y, w)$ there is a unique $\gamma \in Mor_{\mathscr{C}}(x \amalg y, w)$ making the diagram

$$\begin{tikzcd}
& y \arrow[d, "j"] \arrow[ddr, "\beta"] & \\
x \arrow[r, "i"] \arrow[drr, "\alpha"'] & x \amalg y \arrow[dr, dashed, "\gamma"] & \\
& & w
\end{tikzcd}$$

commute.

If a coproduct exists it is unique up to unique isomorphism. This follows from the Yoneda lemma (applied to the opposite category) as the definition requires $x \amalg y$ to be an object of $\mathscr{C}$ such that

$$Mor_{\mathscr{C}}(x \amalg y, w) = Mor_{\mathscr{C}}(x, w) \times Mor_{\mathscr{C}}(y, w)$$

functorially in w.

Definition 4.5.2. We say the category $\mathscr{C}$ *has coproducts of pairs of objects* if a coproduct $x \amalg y$ exists for any $x, y \in Ob(\mathscr{C})$.

We use this terminology to distinguish this notion from the notion of ``having coproducts'' or ``having finite coproducts'' which usually means something else (in particular it always implies there exists an initial object in $\mathcal{C}$).

4.6. Fibre products

Definition 4.6.1. Let $x, y, z \in Ob(\mathcal{C})$, $f \in Mor_{\mathcal{C}}(x, y)$ and $g \in Mor_{\mathcal{C}}(z, y)$. A *fibre product* of f and g is an object $x \times_y z \in Ob(\mathcal{C})$ together with morphisms $p \in Mor_{\mathcal{C}}(x \times_y z, x)$ and $q \in Mor_{\mathcal{C}}(x \times_y z, z)$ making the diagram

$$\begin{tikzcd} x \times_y z \arrow[r, "q"] \arrow[d, "p"'] & z \arrow[d, "g"] \\ x \arrow[r, "f"] & y \end{tikzcd}$$

commute, and such that the following universal property holds: for any $w \in Ob(\mathcal{C})$ and morphisms $\alpha \in Mor_{\mathcal{C}}(w, x)$ and $\beta \in Mor_{\mathcal{C}}(w, z)$ with $f \circ \alpha = g \circ \beta$ there is a unique $\gamma \in Mor_{\mathcal{C}}(w, x \times_z y)$ making the diagram

$$\begin{tikzcd} w \arrow[dr, dashed, "\gamma"] \arrow[drr, "\beta"] \arrow[ddr, "\alpha"'] & & \\ & x \times_y z \arrow[r, "q"'] \arrow[d, "p"'] & z \arrow[d, "g"] \\ & x \arrow[r, "f"] & z \end{tikzcd}$$

commute.

If a fibre product exists it is unique up to unique isomorphism. This follows from the Yoneda lemma as the definition requires $x \times_y z$ to be an object of $\mathcal{C}$ such that

$$h_{x \times_y z}(w) = h_x(w) \times_{h_y(w)} h_z(w)$$

functorially in w. In other words the fibre product $x \times_y z$ is an object representing the functor $w \mapsto h_x(w) \times_{h_y(w)} h_z(w)$.

Definition 4.6.2. We say the category $\mathcal{C}$ *has fibre products* if the fibre product exists for any $f \in Mor_{\mathcal{C}}(x, z)$ and $g \in Mor_{\mathcal{C}}(y, z)$.

Definition 4.6.3. A morphism $f : x \to y$ of a category $\mathcal{C}$ is said to be *representable*, if and only if for every morphism $z \to y$ in $\mathcal{C}$ the fibre product $z \times_y x$ exists.

Lemma 4.6.4. *Let $\mathcal{C}$ be a category. Let $f : x \to y$, and $g : y \to z$ be representable. Then $g \circ f : x \to z$ is representable.*

Proof. Omitted. □

Lemma 4.6.5. *Let $\mathcal{C}$ be a category. Let $f : x \to y$ be representable. Let $y' \to y$ be a morphism of $\mathcal{C}$. Then the morphism $x' := x \times_y y' \to y'$ is representable also.*

Proof. Let $z \to y'$ be a morphism. The fibre product $x' \times_{y'} z$ is supposed to represent the functor

$$\begin{aligned} w \quad \mapsto \quad & h_{x'}(w) \times_{h_{y'}(w)} h_z(w) \\ = \quad & (h_x(w) \times_{h_y(w)} h_{y'}(w)) \times_{h_{y'}(w)} h_z(w) \\ = \quad & h_n(w) \times_{h_y(w)} h_z(w) \end{aligned}$$

which is representable by assumption. □

4.7. Examples of fibre products

In this section we list examples of fibre products and we describe them.

As a really trivial first example we observe that the category of sets has fibred products and hence every morphism is representable. Namely, if $f : X \to Y$ and $g : Z \to Y$ are maps of sets then we define $X \times_Y Z$ as the subset of $X \times Z$ consisting of pairs (x, z) such that $f(x) = g(z)$. The morphisms $p : X \times_Y Z \to X$ and $q : X \times_U Z \to Z$ are the projection maps $(x, z) \mapsto x$, and $(x, z) \mapsto z$. Finally, if $\alpha : W \to X$ and $\beta : W \to Z$ are morphisms such that $f \circ \alpha = g \circ \beta$ then the map $W \to X \times Y$, $w \mapsto (\alpha(w), \beta(w))$ obviously ends up in $X \times_Y Z$ as desired.

In many categories whose objects are sets endowed with certain types of algebraic structures the fibre product of the underlying sets also provides the fibre product in the category. For example, suppose that X, Y and Z above are groups and that f, g are homomorphisms of groups. Then the set-theoretic fibre product $X \times_Y Z$ inherits the structure of a group, simply by defining the product of two pairs by the formula $(x, z) \cdot (x', z') = (xx', zz')$. Here we list those categories for which a similar reasoning works.

(1) The category *Groups* of groups.
(2) The category *G-Sets* of sets endowed with a left G-action for some fixed group G.
(3) The category of rings.
(4) The category of R-modules given a ring R.

4.8. Fibre products and representability

In this section we work out fibre products in the category of contravariant functors from a category to the category of sets. This will later be superceded during the discussion of sites, presheaves, sheaves. Of some interest is the notion of a ``representable morphism'' between such functors.

Lemma 4.8.1. *Let $\mathcal{C}$ be a category. Let $F, G, H : \mathcal{C}^{opp} \to Sets$ be functors. Let $a : F \to G$ and $b : H \to G$ be transformations of functors. Then the fibre product $F \times_{a,G,b} H$ in the category $FUN(\mathcal{C}^{opp}, Sets)$ exists and is given by the formula*

$$(F \times_{a,G,b} H)(X) = F(X) \times_{a_X, G(X), b_X} H(X)$$

for any object X of $\mathcal{C}$.

Proof. Omitted. □

As a special case suppose we have a morphism $a : F \to G$, an object $U \in Ob(\mathcal{C})$ and an element $\xi \in G(U)$. According to the Yoneda Lemma 4.3.5 this gives a transformation $\xi : h_U \to G$. The fibre product in this case is described by the rule

$$(h_U \times_{\xi,G,a} F)(X) = \{(f, \xi') \mid f : X \to U,\ \xi' \in F(X),\ G(f)(\xi) = a_X(\xi')\}$$

If F, G are also representable, then this is the functor representing the fibre product, if it exists, see Section 4.6. The analogy with Definition 4.6.3 prompts us to define a notion of representable transformations.

Definition 4.8.2. Let $\mathcal{C}$ be a category. Let $F, G : \mathcal{C}^{opp} \to Sets$ be functors. We say a morphism $a : F \to G$ is *representable*, or that *F is relatively representable over G*, if for every $U \in Ob(\mathcal{C})$ and any $\xi \in G(U)$ the functor $h_U \times_G F$ is representable.

Lemma 4.8.3. *Let $\mathcal{C}$ be a category. Let $a : F \to G$ be a morphism of contravariant functors from $\mathcal{C}$ to Sets. If a is representable, and G is a representable functor, then F is representable.*

Proof. Omitted. □

Lemma 4.8.4. *Let $\mathcal{C}$ be a category. Let $F : \mathcal{C}^{opp} \to Sets$ be a functor. Assume $\mathcal{C}$ has products of pairs of objects and fibre products. The following are equivalent:*

(1) *The diagonal $F \to F \times F$ is representable.*
(2) *For every U in $\mathcal{C}$, and any $\xi \in F(U)$ the map $\xi : h_U \to F$ is representable.*

Proof. Suppose the diagonal is representable, and let U, ξ be given. Consider any $V \in Ob(\mathcal{C})$ and any $\xi' \in F(V)$. Note that $h_U \times h_V = h_{U\times V}$ is representable. Hence the fibre product of the maps $(\xi, \xi') : h_U \times h_V \to F \times F$ and $F \to F \times F$ is representable by assumption. This means there exists $W \in Ob(\mathcal{C})$, morphisms $W \to U$, $W \to V$ and $h_W \to F$ such that

$$\begin{tikzcd} h_W \arrow[r] \arrow[d] & F \arrow[d] \\ h_U \times h_V \arrow[r] & F \times F \end{tikzcd}$$

is cartesian. We leave it to the reader to see that this implies that $h_W = h_U \times_F h_V$ as desired.

Assume (2) holds. Consider any $V \in Ob(\mathcal{C})$ and any $(\xi, \xi') \in (F \times F)(V)$. We have to show that $h_V \times_{F\times F} F$ is representable. What we know is that $h_V \times_{\xi, F, \xi'} h_V$ is representable, say by W in $\mathcal{C}$ with corresponding morphisms $a, a' : W \to V$ (such that $\xi \circ a = \xi' \circ a'$). Consider $W' = W \times_{(a,a'), V\times V} V$. It is formal to show that W' represents $h_V \times_{F\times F} F$ because

$$h_{W'} = h_W \times_{h_V \times h_V} h_V = (h_V \times_{\xi, F, \xi'} h_V) \times_{h_V\times h_V} h_V = F \times_{F\times F} h_V.$$

□

4.9. Push outs

The dual notion to fibre products is that of push outs.

Definition 4.9.1. Let $x, y, z \in Ob(\mathcal{C})$, $f \in Mor_{\mathcal{C}}(y, x)$ and $g \in Mor_{\mathcal{C}}(y, z)$. A *push out* of f and g is an object $x \amalg_y z \in Ob(\mathcal{C})$ together with morphisms $p \in Mor_{\mathcal{C}}(x, x \amalg_y z)$ and $q \in Mor_{\mathcal{C}}(z, x \amalg_y z)$ making the diagram

$$\begin{tikzcd} y \arrow[r, "g"] \arrow[d, "f"'] & z \arrow[d, "q"] \\ x \arrow[r, "p"] & x \amalg_y z \end{tikzcd}$$

commute, and such that the following universal property holds: For any $w \in Ob(\mathcal{C})$ and morphisms $\alpha \in Mor_{\mathcal{C}}(x, w)$ and $\beta \in Mor_{\mathcal{C}}(z, w)$ with $\alpha \circ f = \beta \circ g$ there is a unique

$\gamma \in Mor_{\mathcal{C}}(x \amalg_z y, w)$ making the diagram

$$\begin{tikzcd}
y \arrow[r, "g"] \arrow[d, "f"'] & z \arrow[d, "q"] \arrow[ddr, "\beta"] & \\
x \arrow[r, "p"] \arrow[drr, "\alpha"'] & x \amalg_y z \arrow[dr, dashed, "\gamma"] & \\
& & w
\end{tikzcd}$$

commute.

It is possible and straightforward to prove the uniqueness of the triple $(x \amalg_y z, p, q)$ up to unique isomorphism (if it exists) by direct arguments. Another possibility is to think of the coproduct as the product in the opposite category, thereby getting this uniqueness for free from the discussion in Section 4.6.

4.10. Equalizers

Definition 4.10.1. Suppose that X, Y are objects of a category $\mathcal{C}$ and that $a, b : X \to Y$ are morphisms. We say a morphism $e : Z \to X$ is an *equalizer* for the pair (a, b) if $a \circ e = b \circ e$ and if (Z, e) satisfies the following universal property: For every morphism $t : W \to X$ in $\mathcal{C}$ such that $a \circ t = b \circ t$ there exists a unique morphism $s : W \to Z$ such that $t = e \circ s$.

As in the case of the fibre product above, equalizers when they exist are unique up to unique isomorphism. There is a straightforward generalization of this definition to the case where we have more than 2 morphisms.

4.11. Coequalizers

Definition 4.11.1. Suppose that X, Y are objects of a category $\mathcal{C}$ and that $a, b : X \to Y$ are morphisms. We say a morphism $c : Y \to Z$ is a *coequalizer* for the pair (a, b) if $c \circ a = c \circ b$ and if (Z, c) satisfies the following universal property: For every morphism $t : Y \to W$ in $\mathcal{C}$ such that $t \circ a = t \circ b$ there exists a unique morphism $s : Z \to W$ such that $t = s \circ c$.

As in the case of the push outs above, coequalizers when they exist are unique up to unique isomorphism, and this follows from the uniqueness of equalizers upon considering the opposite category. There is a straightforward generalization of this definition to the case where we have more than 2 morphisms.

4.12. Initial and final objects

Definition 4.12.1. Let $\mathcal{C}$ be a category.

(1) An object x of the category $\mathcal{C}$ is called an *initial* object if for every object y of $\mathcal{C}$ there is exactly one morphism $x \to y$.
(2) An object x of the category $\mathcal{C}$ is called a *final* object if for every object y of $\mathcal{C}$ there is exactly one morphism $y \to x$.

In the category of sets the empty set $\emptyset$ is an initial object, and in fact the only initial object. Also, any *singleton*, i.e., a set with one element, is a final object (so it is not unique).

4.13. Limits and colimits

Let $\mathcal{C}$ be a category. A *diagram* in $\mathcal{C}$ is simply a functor $M : \mathcal{I} \to \mathcal{C}$. We say that $\mathcal{I}$ is the *index category* or that M is an $\mathcal{I}$-diagram. We will use the notation M_i to denote the image of the object i of $\mathcal{I}$. Hence for $\phi : i \to i'$ a morphism in $\mathcal{I}$ we have $M(\phi) : M_i \to M_{i'}$.

Definition 4.13.1. A *limit* of the $\mathcal{I}$-diagram M in the category $\mathcal{C}$ is given by an object $lim_I\, M$ in $\mathcal{C}$ together with morphisms $p_i : lim_I\, M \to M_i$ such that

(1) for $\phi : i \to i'$ a morphism in $\mathcal{I}$ we have $p_{i'} = M(\phi) \circ p_i$, and
(2) for any object W in $\mathcal{C}$ and any family of morphisms $q_i : W \to M_i$ such that for all $\phi : i \to i'$ in $\mathcal{I}$ we have $q_{i'} = M(\phi) \circ q_i$ there exists a unique morphism $q : W \to lim_I\, M$ such that $q_i = p_i \circ q$ for every object i of $\mathcal{I}$.

Limits $(lim_I\, M, (p_i)_{i\in Ob(\mathcal{I})})$ are (if they exist) unique up to unique isomorphism by the uniqueness requirement in the definition. Products of pairs, fibred products, and equalizers are examples of limits. The limit over the empty diagram is a final object of $\mathcal{C}$. In the category of sets all limits exist. The dual notion is that of colimits.

Definition 4.13.2. A *colimit* of the $\mathcal{I}$-diagram M in the category $\mathcal{C}$ is given by an object $colim_I\, M$ in $\mathcal{C}$ together with morphisms $s_i : M_i \to colim_I\, M$ such that

(1) for $\phi : i \to i'$ a morphism in $\mathcal{I}$ we have $s_i = s_{i'} \circ M(\phi)$, and
(2) for any object W in $\mathcal{C}$ and any family of morphisms $t_i : M_i \to W$ such that for all $\phi : i \to i'$ in $\mathcal{I}$ we have $t_i = t_{i'} \circ M(\phi)$ there exists a unique morphism $t : colim_I\, M \to W$ such that $t_i = t \circ s_i$ for every object i of $\mathcal{I}$.

Colimits $(colim_I\, M, (s_i)_{i\in Ob(\mathcal{I})})$ are (if they exist) unique up to unique isomorphism by the uniqueness requirement in the definition. Coproducts of pairs, push outs, and coequalizers are examples of colimits. The colimit over an empty diagram is an initial object of $\mathcal{C}$. In the category of sets all colimits exist.

Remark 4.13.3. The index category of a (co)limit will never allowed to have a proper class of objects. In this project it means that it cannot be one of the categories listed in Remark 4.2.2

Remark 4.13.4. We often write $lim_i\, M_i$, $colim_i\, M_i$, $lim_{i\in\mathcal{I}}\, M_i$, or $colim_{i\in\mathcal{I}}\, M_i$ instead of the versions indexed by $\mathcal{I}$. Using this notation, and using the description of limits and colimits of sets in Section 4.14 below, we can say the following. Let $M : \mathcal{I} \to \mathcal{C}$ be a diagram.

(1) The object $lim_i\, M_i$ if it exists satisfies the following property
$$Mor_{\mathcal{C}}(W, lim_i\, M_i) = lim_i\, Mor_{\mathcal{C}}(W, M_i)$$
where the limit on the right takes place in the category of sets.
(2) The object $colim_i\, M_i$ if it exists satisfies the following property
$$Mor_{\mathcal{C}}(colim_i\, M_i, W) = lim_{i\in\mathcal{I}^{opp}}\, Mor_{\mathcal{C}}(M_i, W)$$
where on the right we have the limit over the opposite category with value in the category of sets.

By the Yoneda lemma (and its dual) this formula completely determines the limit, respectively the colimit.

As an application of the notions of limits and colimits we define products and coproducts.

Definition 4.13.5. Suppose that I is a set, and suppose given for every $i \in I$ an object M_i of the category $\mathcal{C}$. A *product* $\prod_{i \in I} M_i$ is by definition $lim_{\mathcal{I}} M$ (if it exists) where $\mathcal{I}$ is the category having only identities as morphisms and having the elements of I as objects.

An important special case is where $I = \emptyset$ in which case the product is a final object of the category. The morphisms $p_i : \prod M_i \to M_i$ are called the *projection morphisms*.

Definition 4.13.6. Suppose that I is a set, and suppose given for every $i \in I$ an object M_i of the category $\mathcal{C}$. A *coproduct* $\coprod_{i \in I} M_i$ is by definition $colim_{\mathcal{I}} M$ (if it exists) where $\mathcal{I}$ is the category having only identities as morphisms and having the elements of I as objects.

An important special case is where $I = \emptyset$ in which case the product is an initial object of the category. Note that the coproduct comes equipped with morphisms $M_i \to \coprod M_i$. These are sometimes called the *coprojections*.

Lemma 4.13.7. *Suppose that $M : \mathcal{I} \to \mathcal{C}$, and $N : \mathcal{J} \to \mathcal{C}$ are diagrams whose colimits exist. Suppose $H : \mathcal{I} \to \mathcal{J}$ is a functor, and suppose $t : M \to N \circ H$ is a transformation of functors. Then there is a unique morphism*

$$\theta : colim_{\mathcal{I}} M \longrightarrow colim_{\mathcal{J}} N$$

such that all the diagrams

$$\begin{tikzcd} M_i \arrow[r] \arrow[d, "t_{H(i)}"'] & colim_{\mathcal{I}} M \arrow[d, "\theta"] \\ N_{H(i)} \arrow[r] & colim_{\mathcal{J}} N \end{tikzcd}$$

commute.

Proof. Omitted. □

Lemma 4.13.8. *Suppose that $M : \mathcal{I} \to \mathcal{C}$, and $N : \mathcal{J} \to \mathcal{C}$ are diagrams whose limits exist. Suppose $H : \mathcal{I} \to \mathcal{J}$ is a functor, and suppose $t : N \circ H \to M$ is a transformation of functors. Then there is a unique morphism*

$$\theta : lim_{\mathcal{J}} N \longrightarrow lim_{\mathcal{I}} M$$

such that all the diagrams

$$\begin{tikzcd} lim_{\mathcal{J}} N \arrow[r] \arrow[d, "\theta"] & N_{H(i)} \arrow[d, "t_{H(i)}"'] \\ lim_{\mathcal{I}} M \arrow[r] & M_i \end{tikzcd}$$

commute.

Proof. Omitted. □

Lemma 4.13.9. *Let $\mathcal{I}$, $\mathcal{J}$ be index categories. Let $M : \mathcal{I} \times \mathcal{J} \to \mathcal{C}$ be a functor. We have*

$$colim_i \, colim_j \, M_{i,j} = colim_{i,j} \, M_{i,j} = colim_j \, colim_i \, M_{i,j}$$

provided all the indicated colimits exist. Similar for limits.

Proof. Omitted. □

Lemma 4.13.10. *Let $M : \mathcal{I} \to \mathcal{C}$ be a diagram. Write $I = Ob(\mathcal{I})$ and $A = Arrow(\mathcal{I})$. Denote $s, t : A \to I$ the source and target maps. Suppose that $\prod_{i \in I} M_i$ and $\prod_{a \in A} M_{t(a)}$ exist. Suppose that the equalizer of*

$$\prod\nolimits_{i \in I} M_i \underset{\psi}{\overset{\phi}{\rightrightarrows}} \prod\nolimits_{a \in A} M_{t(a)}$$

exists, where the morphisms are determined by their components as follows: $p_a \circ \psi = a \circ p_{s(a)}$ and $p_a \circ \phi = p_{t(a)}$. Then this equalizer is the limit of the diagram.

Proof. Omitted. ☐

Lemma 4.13.11. *Let $M : \mathcal{I} \to \mathcal{C}$ be a diagram. Write $I = Ob(\mathcal{I})$ and $A = Arrow(\mathcal{I})$. Denote $s, t : A \to I$ the source and target maps. Suppose that $\coprod_{i \in I} M_i$ and $\coprod_{a \in A} M_{s(a)}$ exist. Suppose that the coequalizer of*

$$\coprod\nolimits_{a \in A} M_{s(a)} \underset{\psi}{\overset{\phi}{\rightrightarrows}} \coprod\nolimits_{i \in I} M_i$$

exists, where the morphisms are determined by their components as follows: The component $M_{s(a)}$ maps via ψ to the component $M_{t(a)}$ via the morphism a. The component $M_{s(a)}$ maps via ϕ to the component $M_{s(a)}$ by the identity morphism. Then this coequalizer is the colimit of the diagram.

Proof. Omitted. ☐

4.14. Limits and colimits in the category of sets

Not only do limits and colimits exist in *Sets* but they are also easy to describe. Namely, let $M : \mathcal{I} \to Sets$, $i \mapsto M_i$ be a diagram of sets. Denote $I = Ob(\mathcal{I})$. The limit is described as

$$lim_{\mathcal{I}} M = \{(m_i)_{i \in I} \in \prod\nolimits_{i \in I} M_i \mid \forall \phi : i \to i' \text{ in } \mathcal{I}, M(\phi)(m_i) = m_{i'}\}.$$

So we think of an element of the limit as a compatible system of elements of all the sets M_i.

On the other hand, the colimit is

$$colim_{\mathcal{I}} M = (\coprod\nolimits_{i \in I} M_i)/\sim$$

where the equivalence relation $\sim$ is the equivalence relation generated by setting $m_i \sim m_{i'}$ if $m_i \in M_i$, $m_{i'} \in M_{i'}$ and $M(\phi)(m_i) = m_{i'}$ for some $\phi : i \to i'$. In other words, $m_i \in M_i$ and $m_{i'} \in M_{i'}$ are equivalent if there is a chain of morphisms in $\mathcal{I}$

$$\begin{tikzcd}
& i_1 \arrow[dl] \arrow[dr] & & i_3 \arrow[dl] & & i_{2n-1} \arrow[dr] & \\
i = i_0 & & i_2 & & \ldots & & i_{2n} = i'
\end{tikzcd}$$

and elements $m_{i_j} \in M_{i_j}$ mapping to each other under the maps $M_{i_{2k-1}} \to M_{i_{2k-2}}$ and $M_{i_{2k-1}} \to M_{i_{2k}}$ induced from the maps in $\mathcal{I}$ above.

This is not a very pleasant type of object to work with. But if the diagram is filtered then it is much easier to describe. We will explain this in Section 4.17.

4.15. Connected limits

A (co)limit is called connected if its index category is connected.

Definition 4.15.1. We say that a category $\mathcal{I}$ is *connected* if the equivalence relation generated by $x \sim y \Leftrightarrow Mor_{\mathcal{I}}(x, y) \neq \emptyset$ has at most one equivalence class.

The following in some vague sense characterizes connected nonempty limits.

Lemma 4.15.2. *Let $\mathcal{C}$ be a category. Let X be an object of $\mathcal{C}$. Let $M : \mathcal{I} \to \mathcal{C}/X$ be a diagram in the category of objects over X. If the index category $\mathcal{I}$ is nonempty and connected and the limit of M exists in $\mathcal{C}/X$, then the limit of the composition $\mathcal{I} \to \mathcal{C}/X \to \mathcal{C}$ exists and is the same.*

Proof. Let $M \to X$ be an object representing the limit in $\mathcal{C}/X$. Consider the functor

$$W \longmapsto lim_i\ Mor_{\mathcal{C}}(W, M_i).$$

Let (φ_i) be an element of the set on the right. Since each M_i comes equipped with a morphism $s_i : M_i \to X$ we get morphisms $f_i = s_i \circ \varphi_i : W \to X$. But as $\mathcal{I}$ is connected we see that all f_i are equal. Since $\mathcal{I}$ is nonempty there is at least one f_i. Hence this common value $W \to X$ defines the structure of an object of W in $\mathcal{C}/X$ and (φ_i) defines is an element of $lim_i\ Mor_{\mathcal{C}/X}(W, M_i)$. Thus we obtain a unique morphism $\phi : W \to M$ such that φ_i is the composition of ϕ with $M \to M_i$ as desired. □

Lemma 4.15.3. *Let $\mathcal{C}$ be a category. Let X be an object of $\mathcal{C}$. Let $M : \mathcal{I} \to X/\mathcal{C}$ be a diagram in the category of objects under X. If the index category $\mathcal{I}$ is nonempty and connected and the colimit of M exists in $X/\mathcal{C}$, then the colimit of the composition $\mathcal{I} \to X/\mathcal{C} \to \mathcal{C}$ exists and is the same.*

Proof. Omitted. Hint: This lemma is dual to Lemma 4.15.2. □

Lemma 4.15.4. *Let $\mathcal{I}$ be a category. Let $\mathcal{I}'$ be a subcategory of $\mathcal{I}$, see Definition 4.2.10. Assume that*

(1) *for every $x \in Ob(\mathcal{I})$ there exists a $x' \in Ob(\mathcal{I}')$ and a morphism $x' \to x$ in $\mathcal{I}$,*
(2) *for any $x \in Ob(\mathcal{I})$, $x', x'' \in Ob(\mathcal{I}')$ and morphisms $x' \to x$, $x'' \to x$ in $\mathcal{I}$ there exists $n \geq 0$ and a commutative diagram*

$$\begin{tikzcd}
x' \arrow[r] \arrow[drrr] & x_1 \arrow[drr] & x_2 \arrow[l] \arrow[r] \arrow[dr] & \ldots \arrow[r] & x_{2n-1} \arrow[dl] & x_{2n} \arrow[l] \arrow[r] \arrow[dll] & x'' \arrow[dlll] \\
 & & & x & & &
\end{tikzcd}$$

where all the horizontal morphisms are in $\mathcal{I}'$, and the vertical arrows in $\mathcal{I}$.

Then for every diagram $M : \mathcal{I} \to \mathcal{C}$ the limit $lim_{\mathcal{I}} M$ exists if and only if $lim_{\mathcal{I}'} M$ exists and if so these limits agree.

Proof. Omitted. □

Lemma 4.15.5. *Let $F : \mathcal{I} \to \mathcal{I}'$ be a functor. Assume*

(1) *the fibre categories (see Definition 4.29.2) of $\mathcal{I}$ over $\mathcal{I}'$ are all nonempty and connected, and*
(2) *for every morphism $\alpha' : x' \to y'$ in $\mathcal{I}'$ there exist a morphism $\alpha : x \to y$ in $\mathcal{I}$ such that $F(\alpha) = \alpha'$.*

Then for every diagram $M : \mathcal{I}' \to \mathcal{C}$ the colimit $colim_{\mathcal{I}} M \circ F$ exists if and only if $colim_{\mathcal{I}'} M$ exists and if so these colimits agree.

Proof. It suffices to show that for any object T of $\mathcal{C}$ we have

$$lim_{\mathcal{I}} Mor_{\mathcal{C}}(M_{F(i)}, T) = lim_{\mathcal{I}'} Mor_{\mathcal{C}}(M_{i'}, T)$$

If $(g_{i'})_{i' \in Ob(\mathcal{I}')}$ is an element of the right hand side, then setting $f_i = g_{F(i)}$ we obtain an element $(f_i)_{i \in Ob(\mathcal{I})}$ of the left hand side. Conversely, let $(f_i)_{i \in Ob(\mathcal{I})}$ be an element of the left hand side. Note that on each (nonempty connected) fibre category $\mathcal{I}_{i'}$ the functor $M \circ F$ is constant with value $M_{i'}$. Hence the morphisms f_i for $i \in Ob(\mathcal{I})$ with $F(i) = i'$ are all the same and determine a well defined morphism $g_{i'} : M_{i'} \to T$. By assumption (2) the collection $(g_{i'})_{i' \in Ob(\mathcal{I}')}$ defines an element of the right hand side. □

4.16. Finite limits and colimits

A *finite* (co)limit is a (co)limit whose diagram category is finite, i.e., the diagram category has finitely many objects and finitely many morphisms. A (co)limit is called *nonempty* if the index category is nonempty. A (co)limit is called *connected* if the index category is connected, see Definition 4.15.1. It turns out that there are ``enough'' finite diagram categories.

Lemma 4.16.1. *Let $\mathcal{I}$ be a category with*

1. *$Ob(\mathcal{I})$ is finite, and*
2. *there exist finitely many morphisms $f_1, \ldots, f_m \in Arrows(\mathcal{I})$ such that every morphism of $\mathcal{I}$ is a composition $f_{j_1} \circ f_{j_2} \circ \ldots \circ f_{j_k}$.*

Then there exists a functor $F : \mathcal{J} \to \mathcal{I}$ such that

- (a) *$\mathcal{J}$ is a finite category, and*
- (b) *for any diagram $M : \mathcal{I} \to \mathcal{C}$ the (co)limit of M over $\mathcal{I}$ exists if and only if the (co)limit of $M \circ F$ over $\mathcal{J}$ exists and in this case the (co)limits are canonically isomorphic.*

Moreover, $\mathcal{J}$ is connected (resp. nonempty) if and only if $\mathcal{I}$ is so.

Proof. Say $Ob(\mathcal{I}) = \{x_1, \ldots, x_n\}$. Denote $s, t : \{1, \ldots, m\} \to \{1, \ldots, n\}$ the functions such that $f_j : x_{s(j)} \to x_{t(j)}$. We set $Ob(\mathcal{J}) = \{y_1, \ldots, y_n, z_1, \ldots, z_n\}$ Besides the identity morphisms we introduce morphisms $g_j : y_{s(j)} \to z_{t(j)}$, $j = 1, \ldots, m$ and morphisms $h_i : y_i \to z_i$, $i = 1, \ldots, n$. Since all of the nonidentity morphisms in $\mathcal{J}$ go from an x to a y there are no compositions to define and no associativity to check. Set $F(y_i) = F(z_i) = x_i$. Set $F(g_j) = f_j$ and $F(h_i) = \text{id}_{x_i}$. It is clear that F is a functor. It is clear that $\mathcal{J}$ is finite. It is clear that $\mathcal{J}$ is connected, resp. nonempty if and only if $\mathcal{I}$ is so.

Let $M : \mathcal{I} \to \mathcal{C}$ be a diagram. Consider an object W of $\mathcal{C}$ and morphisms $q_i : W \to M(x_i)$ as in Definition 4.13.1. Then by taking $q_i : W \to M(F(y_i)) = M(F(z_i)) = M(x_i)$ we obtain a family of maps as in Definition 4.13.1 for the diagram $M \circ F$. Conversely, suppose we are given maps $qy_i : W \to M(F(y_i))$ and $qz_i : W \to M(F(z_i))$ as in Definition 4.13.1 for the diagram $M \circ F$. Since

$$M(F(h_i)) = \text{id} : M(F(y_i)) = M(x_i) \longrightarrow M(x_i) = M(F(z_i))$$

we conclude that $qy_i = qz_i$ for all i. Set q_i equal to this common value. The compatibility of $q_{s(j)} = qy_{s(j)}$ and $q_{t(j)} = qz_{t(j)}$ with the morphism $M(f_j)$ guarantees that the family q_i is compatible with all morphisms in $\mathcal{I}$ as by assumption every such morphism is a composition of the morphisms f_j. Thus we have found a canonical bijection

$$lim_{B\in Ob(\mathcal{J})} Mor_{\mathcal{C}}(W, M(F(B))) = lim_{A\in Ob(\mathcal{I})} Mor_{\mathcal{C}}(W, M(A))$$

which implies the statement on limits in the lemma. The statement on colimits is proved in the same way (proof omitted). □

Lemma 4.16.2. *Let $\mathcal{C}$ be a category. The following are equivalent:*

(1) *Nonempty connected finite limits exist in $\mathcal{C}$.*
(2) *Equalizers and fibre products exist in $\mathcal{C}$.*

Proof. Since equalizers and fibre products are finite nonempty connected limits we see that (2) implies (1). For the converse, let $\mathcal{I}$ be a finite nonempty connected diagram category. Let $F : \mathcal{J} \to \mathcal{I}$ be the functor of diagram categories constructed in the proof of Lemma 4.16.1. Then we see that we may replace $\mathcal{I}$ by $\mathcal{J}$. The result is that we may assume that $Ob(\mathcal{I}) = \{x_1, \ldots, x_n\} \amalg \{y_1, \ldots, y_m\}$ with $n, m \geq 1$ such that all nonidentity morphisms in $\mathcal{I}$ are morphisms $f : x_i \to y_j$ for some i and j.

Suppose that $n > 1$. Since $\mathcal{I}$ is connected there exist indices i_1, i_2 and j_0 and morphisms $a : x_{i_1} \to y_{j_0}$ and $b : x_{i_2} \to y_{j_0}$. Consider the category

$$\mathcal{I}' = \{x\} \amalg \{x_1, \ldots, \hat{x}_{i_1}, \ldots, \hat{x}_{i_2}, \ldots x_n\} \amalg \{y_1, \ldots, y_m\}$$

with

$$Mor_{\mathcal{I}'}(x, y_j) = Mor_{\mathcal{I}}(x_{i_1}, y_j) \amalg Mor_{\mathcal{I}}(x_{i_2}, y_j)$$

and all other morphism sets the same as in $\mathcal{I}$. For any functor $M : \mathcal{I} \to \mathcal{C}$ we can construct a functor $M' : \mathcal{I}' \to \mathcal{C}$ by setting

$$M'(x) = M(x_{i_1}) \times_{M(a), M(y_j), M(b)} M(x_{i_2})$$

and for a morphism $f' : x \to y_j$ corresponding to, say, $f : x_{i_1} \to y_j$ we set $M'(f) = M(f) \circ \mathrm{pr}_1$. Then the functor M has a limit if and only if the functor M' has a limit (proof omitted). Hence by induction we reduce to the case $n = 1$.

If $n = 1$, then the limit of any $M : \mathcal{I} \to \mathcal{C}$ is the successive equalizer of pairs of maps $x_1 \to y_j$ hence exists by assumption. □

Lemma 4.16.3. *Let $\mathcal{C}$ be a category. The following are equivalent:*

(1) *Nonempty finite limits exist in $\mathcal{C}$.*
(2) *Products of pairs and equalizers exist in $\mathcal{C}$.*
(3) *Products of pairs and fibre products exist in $\mathcal{C}$.*

Proof. Since products of pairs, fibre products, and equalizers are limits with nonempty index categories we see that (1) implies both (2) and (3). Assume (2). Then finite nonempty products and equalizers exist. Hence by Lemma 4.13.10 we see that finite nonempty limits exist, i.e., (1) holds. Assume (3). If $a, b : A \to B$ are morphisms of $\mathcal{C}$, then the equalizer of a, b is

$$(A \times_{a,B,b} A) \times_{(pr_1, pr_2), A\times A, \Delta} A.$$

Thus (3) implies (2), and the lemma is proved. □

Lemma 4.16.4. *Let $\mathcal{C}$ be a category. The following are equivalent:*

(1) *Finite limits exist in $\mathcal{C}$.*
(2) *Finite products and equalizers exist.*
(3) *The category has a final object and fibred products exist.*

Proof. Since products of pairs, fibre products, equalizers, and final objects are limits over finite index categories we see that (1) implies both (2) and (3). By Lemma 4.13.10 above we see that (2) implies (1). Assume (3). Note that the product $A \times A$ is the fibre product over the final object. If $a, b : A \to B$ are morphisms of $\mathcal{C}$, then the equalizer of a, b is

$$(A \times_{a,B,b} A) \times_{(pr_1,pr_2),A\times A,\Delta} A.$$

Thus (3) implies (2) and the lemma is proved. □

Lemma 4.16.5. *Let $\mathcal{C}$ be a category. The following are equivalent:*

(1) *Nonempty connected finite colimits exist in $\mathcal{C}$.*
(2) *Coequalizers and push outs exist in $\mathcal{C}$.*

Proof. Omitted. Hint: This is dual to Lemma 4.16.2. □

Lemma 4.16.6. *Let $\mathcal{C}$ be a category. The following are equivalent:*

(1) *Nonempty finite colimits exist in $\mathcal{C}$.*
(2) *Coproducts of pairs and coequalizers exist in $\mathcal{C}$.*
(3) *Coproducts of pairs and push outs exist in $\mathcal{C}$.*

Proof. Omitted. Hint: This is the dual of Lemma 4.16.3. □

Lemma 4.16.7. *Let $\mathcal{C}$ be a category. The following are equivalent:*

(1) *finite colimits exist in $\mathcal{C}$,*
(2) *finite coproducts and coequalizers exist in $\mathcal{C}$, and*
(3) *$\mathcal{C}$ has an initial object and pushouts exist.*

Proof. Omitted. Hint: This is dual to Lemma 4.16.4. □

4.17. Filtered colimits

Colimits are easier to compute or describe when they are over a filtered diagram. Here is the definition.

Definition 4.17.1. We say that a diagram $M : \mathcal{I} \to \mathcal{C}$ is *directed*, or *filtered* if the following conditions hold:

(1) the category $\mathcal{I}$ has at least one object,
(2) for every pair of objects x, y of $\mathcal{I}$ there exists an object z and morphisms $x \to z$, $y \to z$, and
(3) for every pair of objects x, y of $\mathcal{I}$ and every pair of morphisms $a, b : x \to y$ of $\mathcal{I}$ there exists a morphism $c : y \to z$ of $\mathcal{I}$ such that $M(c \circ a) = M(c \circ b)$ as morphisms in $\mathcal{C}$.

We say that an index category $\mathcal{I}$ is *directed*, or *filtered* if $\text{id} : \mathcal{I} \to \mathcal{I}$ is filtered (in other words you erase the M in part (3) above.)

We observe that any diagram with filtered index category is filtered, and this is how filtered colimits usually come about. In fact, if $M : \mathcal{I} \to \mathcal{C}$ is a filtered diagram, then we can factor M as $\mathcal{I} \to \mathcal{I}' \to \mathcal{C}$ where $\mathcal{I}'$ is a filtered index category[1] such that $colim_{\mathcal{I}} M$ exists if and only if $colim_{\mathcal{I}'} M'$ exists in which case the colimits are canonically isomorphic.

[1]Namely, let $\mathcal{I}'$ have the same objects as $\mathcal{I}$ but where $Mor_{\mathcal{I}'}(x, y)$ is the quotient of $Mor_{\mathcal{I}}(x, y)$ by the equivalence relation which identifies $a, b : x \to y$ if $M(a) = M(b)$.

Suppose that $M : \mathcal{I} \to \mathit{Sets}$ is a filtered diagram. In this case we may describe the equivalence relation in the formula

$$colim_{\mathcal{I}} M = (\coprod\nolimits_{i\in I} M_i)/\sim$$

simply as follows

$$m_i \sim m_{i'} \Leftrightarrow \exists i'', \phi : i \to i'', \phi' : i' \to i'', M(\phi)(m_i) = M(\phi')(m_{i'}).$$

In other words, two elements are equal in the colimit if and only if the ``eventually become equal''.

Lemma 4.17.2. *Let $\mathcal{I}$ and $\mathcal{J}$ be index categories. Assume that $\mathcal{I}$ is filtered and $\mathcal{J}$ is finite. Let $M : \mathcal{J}\times\mathcal{I} \to Sets$, $(i, j) \mapsto M_{i,j}$ be a diagram of diagrams of sets. In this case*

$$colim_i\, lim_j\, M_{i,j} = lim_j\, colim_i\, M_{i,j}.$$

In particular, colimits over $\mathcal{I}$ commute with finite products, fibre products, and equalizers of sets.

Proof. Omitted. □

Instead of giving the easy proof of the lemma we give a counter example to the case where $\mathcal{J}$ is infinite. Namely, let $\mathcal{I}$ consist of $\mathbf{N} = \{1, 2, 3, \ldots\}$ with a unique morphism $i \to i'$ whenever $i \leq i'$. Let $\mathcal{J}$ consist of the discrete category $\mathbf{N} = \{1, 2, 3, \ldots\}$ (only morphisms are identities). Let $M_{i,j} = \{1, 2, \ldots , i\}$ with obvious inclusion maps $M_{i,j} \to M_{i',j}$ when $i \leq i'$. In this case $colim_i\, M_{i,j} = \mathbf{N}$ and hence

$$lim_j\, colim_i\, M_{i,j} = \prod\nolimits_j \mathbf{N} = \mathbf{N}^{\mathbf{N}}$$

On the other hand $lim_j\, M_{i,j} = \prod_j M_{i,j}$ and hence

$$colim_i\, lim_j\, M_{i,j} = \bigcup\nolimits_i \{1, 2, \ldots , i\}^{\mathbf{N}}$$

which is smaller than the other limit.

Lemma 4.17.3. *Let $\mathcal{I}$ be an index category, i.e., a category. Assume*

1. *for every pair of morphisms $a : w \to x$ and $b : w \to y$ in $\mathcal{I}$ there exists an object z and morphisms $c : x \to z$ and $d : y \to z$ such that $c \circ a = d \circ b$, and*
2. *for every pair of morphisms $a, b : x \to y$ there exists a morphism $c : y \to z$ such that $c \circ a = c \circ b$.*

Then $\mathcal{I}$ is a (possibly empty) union of disjoint filtered index categories $\mathcal{I}_j$.

Proof. If $\mathcal{I}$ is the empty category, then the lemma is true. Otherwise, we define a relation on objects of $\mathcal{I}$ by saying that $x \sim y$ if there exists a z and morphisms $x \to z$ and $y \to z$. This is an equivalence relation by the first assumption of the lemma. Hence $Ob(\mathcal{I})$ is a disjoint union of equivalence classes. Let $\mathcal{I}_j$ be the full subcategories corresponding to these equivalence classes. The rest is clear from the definitions. □

Lemma 4.17.4. *Let $\mathcal{I}$ be an index category satisfying the hypotheses of Lemma 4.17.3 above. Then colimits over $\mathcal{I}$ commute with fibre products and equalizers in sets (and more generally with connected finite nonempty limits).*

Proof. By Lemma 4.17.3 we may write $\mathcal{I} = \coprod \mathcal{I}_j$ with each $\mathcal{I}_j$ filtered. By Lemma 4.17.2 we see that colimits of $\mathcal{I}_j$ commute with equalizers and fibred products. Thus it suffices to show that equalizers and fibre products commute with coproducts in the category of sets (including empty coproducts). In other words, given a set J and sets A_j, B_j, C_j and set maps $A_j \to B_j$, $C_j \to B_j$ for $j \in J$ we have to show that

$$(\coprod\nolimits_{j\in J} A_j) \times_{(\coprod_{j\in J} B_j)} (\coprod\nolimits_{j\in J} C_j) = \coprod\nolimits_{j\in J} A_j \times_{B_j} C_j$$

and given $a_j, a'_j : A_j \to B_j$ that

$$\text{Equalizer}(\coprod\nolimits_{j\in J} a_j, \coprod\nolimits_{j\in J} a'_j) = \coprod\nolimits_{j\in J} \text{Equalizer}(a_j, a'_j)$$

This is true even if $J = \emptyset$. Details omitted. □

Definition 4.17.5. Let $\mathcal{I}, \mathcal{J}$ be filtered index categories. Let $H : \mathcal{I} \to \mathcal{J}$ be a functor. We say *$\mathcal{I}$ is cofinal in $\mathcal{J}$* if

(1) for all $y \in Ob(\mathcal{J})$ there exists a $x \in Ob(\mathcal{I})$ and a morphism $y \to H(x)$, and
(2) for all $x_1, x_2 \in Ob(\mathcal{I})$ and any $\varphi : H(x_1) \to H(x_2)$ there exists $x_{12} \in Ob(\mathcal{I})$ and morphisms $x_1 \to x_{12}$, $x_2 \to x_{12}$ such that

$$\begin{tikzcd} & H(x_{12}) & \\ H(x_1) \arrow[ur] \arrow[rr, "\varphi"] & & H(x_2) \arrow[ul] \end{tikzcd}$$

commutes.

Lemma 4.17.6. *Let $\mathcal{I}, \mathcal{J}$ be filtered index categories. Let $H : \mathcal{I} \to \mathcal{J}$ be a functor. Assume $\mathcal{I}$ is cofinal in $\mathcal{J}$. Then for every diagram $M : \mathcal{J} \to \mathcal{C}$ we have a canonical isomorphism*

$$colim_{\mathcal{I}} M \circ H = colim_{\mathcal{J}} M$$

if either side exists.

Proof. Omitted. □

4.18. Cofiltered limits

Limits are easier to compute or describe when they are over a cofiltered diagram. Here is the definition.

Definition 4.18.1. We say that a diagram $M : \mathcal{I} \to \mathcal{C}$ is *codirected* or *cofiltered* if the following conditions hold:

(1) the category $\mathcal{I}$ has at least one object,
(2) for every pair of objects x, y of $\mathcal{I}$ there exists an object z and morphisms $z \to x$, $z \to y$, and
(3) for every pair of objects x, y of $\mathcal{I}$ and every pair of morphisms $a, b : x \to y$ of $\mathcal{I}$ there exists a morphism $c : w \to x$ of $\mathcal{I}$ such that $M(a \circ c) = M(b \circ c)$ as morphisms in $\mathcal{C}$.

We say that an index category $\mathcal{I}$ is *codirected*, or *cofiltered* if id $: \mathcal{I} \to \mathcal{I}$ is cofiltered (in other words you erase the M in part (3) above.)

We observe that any diagram with cofiltered index category is cofiltered, and this is how this situation usually occurs.

Here is an example of why cofiltered limits of sets are ``easier'' than general ones: If $M : \mathcal{I} \to Sets$ is a cofiltered diagram, and all the M_i are finite nonempty, then $lim_i M_i$ is nonempty. The same does not hold for a general limit of finite nonempty sets.

4.19. Limits and colimits over partially ordered sets

A special case of diagrams is given by systems over partially ordered sets.

Definition 4.19.1. Let $(I, \geq)$ be a partially ordered set. Let $\mathcal{C}$ be a category.

(1) A *system over I in $\mathcal{C}$*, sometimes called a *inductive system over I in $\mathcal{C}$* is given by objects M_i of $\mathcal{C}$ and for every $i \leq i'$ a morphism $f_{ii'} : M_i \to M_{i'}$ such that $f_{ii} = \text{id}$ and such that $f_{ii''} = f_{i'i''} \circ f_{ii'}$ whenever $i \leq i' \leq i''$.
(2) An *inverse system over I in $\mathcal{C}$*, sometimes called a *projective system over I in $\mathcal{C}$* is given by objects M_i of $\mathcal{C}$ and for every $i \geq i'$ a morphism $f_{ii'} : M_i \to M_{i'}$ such that $f_{ii} = \text{id}$ and such that $f_{ii''} = f_{i'i''} \circ f_{ii'}$ whenever $i \geq i' \geq i''$. (Note reversal of inequalities.)

We will say $(M_i, f_{ii'})$ is a (inverse) system over I to denote this. The maps $f_{ii'}$ are sometimes called the *transition maps*.

In other words a system over I is just a diagram $M : \mathcal{I} \to \mathcal{C}$ where $\mathcal{I}$ is the category with objects I and a unique arrow $i \to i'$ if and only $i \leq i'$. And an inverse system is a diagram $M : \mathcal{I}^{opp} \to \mathcal{C}$. From this point of view we could take (co)limits of any (inverse) system over I. However, it is customary to take *only colimits of systems over I* and *only limits of inverse systems over I*. More precisely: Given a system $(M_i, f_{ii'})$ over I the colimit of the system $(M_i, f_{ii'})$ is defined as

$$colim_{i \in I} M_i = colim_{\mathcal{I}} M,$$

i.e., as the colimit of the corresponding diagram. Given a inverse system $(M_i, f_{ii'})$ over I the limit of the inverse system $(M_i, f_{ii'})$ is defined as

$$lim_{i \in I} M_i = lim_{\mathcal{I}^{opp}} M,$$

i.e., as the limit of the corresponding diagram.

Definition 4.19.2. With notation as above. We say the system (resp. inverse system) $(M_i, f_{ii'})$ is a *directed system* (resp. *directed inverse system*) if the partially ordered set I is *directed*: I is nonempty and for all $i_1, i_2 \in I$ there exists $i \in I$ such that $i_1 \leq i$ and $i_2 \leq i$.

In this case the colimit is sometimes (unfortunately) called the ``direct limit''. We will not use this last terminology. It turns out that diagrams over a filtered category are no more general than directed systems in the following sense.

Lemma 4.19.3. *Let $\mathcal{I}$ be a filtered index category. There exists a directed partially ordered set $(I, \geq)$ and a system $(x_i, \varphi_{ii'})$ over I in $\mathcal{I}$ with the following properties:*

(1) *For every category $\mathcal{C}$ and every diagram $M : \mathcal{I} \to \mathcal{C}$ with values in $\mathcal{C}$, denote $(M(x_i), M(\varphi_{ii'}))$ the corresponding system over I. If $colim_{i \in I} M(x_i)$ exists then so does $colim_{\mathcal{I}} M$ and the transformation*
$$\theta : colim_{i \in I} M(x_i) \longrightarrow colim_{\mathcal{I}} M$$
of Lemma 4.13.7 is an isomorphism.
(2) *For every category $\mathcal{C}$ and every diagram $M : \mathcal{I}^{opp} \to \mathcal{C}$ in $\mathcal{C}$, denote $(M(x_i), M(\varphi_{ii'}))$ the corresponding inverse system over I. If $lim_{i \in I} M(x_i)$ exists then so does $lim_{\mathcal{I}} M$ and the transformation*
$$\theta : lim_{\mathcal{I}^{opp}} M \longrightarrow lim_{i \in I} M(x_i)$$
of Lemma 4.13.8 is an isomorphism.

Proof. Consider quadruples $(S, A, x, \{f_s\}_{s\in S})$ with the following properties

1. S is a finite set of objects of $\mathcal{I}$,
2. A is a finite set of arrows of $\mathcal{I}$ such that each $a \in A$ is an arrow $a : s(a) \to t(a)$ with $s(a), t(a) \in S$,
3. x is an object of $\mathcal{I}$, and
4. $f_s : s \to x$ is a morphism of $\mathcal{I}$ such that for all $a \in A$ we have $f_{t(a)} \circ a = f_{s(a)}$.

Given such a quadruple $i = (S, A, x, \{f_s\}_{s\in S})$ we denote $S_i = S$, $A_i = A$, $x_i = x$, and $f_{s,i} = f_s$ for $s \in S_i$. We also set $\tilde{S}_i = S_i \cup \{x_i\}$ and $\tilde{A}_i = A_i \cup \{f_{s,i}, s \in S_i\}$. Let I be the set of all such quadruples. We define a relation on I by the rule

$$i \leq i' \Leftrightarrow \tilde{S}_i \subset S_{i'} \text{ and } \tilde{A}_i \subset A_{i'}$$

It is obviously a partial ordering on I. Note that if $i \leq i'$, then there is a given morphism $\varphi_{ii'} : x_i \to x_{i'}$ namely $f_{x_i,i'}$ because $x_i \in S_{i'}$. Hence we have a system over I in $\mathcal{I}$ by taking $(x_i, \varphi_{ii'})$. We claim that this system satisfies all the conditions of the lemma.

First we show that I is a directed partially ordered set. Note that I is nonempty since $(\{x\}, \emptyset, x, \{\text{id}_x\})$ is a quadruple where x is any object of $\mathcal{I}$, and $\mathcal{I}$ is not empty according to Definition 4.17.1. Suppose that $i, i' \in I$. Consider the set of objects $S = S_i \cup S_{i'} \cup \{x_i, x_{i'}\}$ of $\mathcal{I}$. This is a finite set. According to Definition 4.17.1 and a simple induction argument there exists an object x' of $\mathcal{I}$ such that for each $s \in S$ there is a morphism $f'_s : s \to x'$. Consider the set of arrows $A = A_i \cup A_{i'} \cup \{f_{s,i}, s \in S_i\} \cup \{f_{s,i'}, s \in S_{i'}\}$. This is a finite set of arrows whose source and target are elements of S. According to Definition 4.17.1 and a simple induction argument there exists a morphism $f : x' \to x$ such that for all $a \in A$ we have

$$f \circ f'_{t(a)} \circ a = f \circ f'_{s(a)}$$

as morphisms into x. Hence we see that $(S, A, x, \{f \circ f'_s\}_{s\in S})$ is a quadruple which is $\geq i$ and $\geq i'$ in the partial ordering defined above. This proves I is directed.

Next, we prove the statement about colimits. Let $\mathcal{C}$ be a category. Let $M : \mathcal{I} \to \mathcal{C}$ be a functor. Denote $(M(x_i), M(\varphi_{ii'}))$ the corresponding system over I. Below we will write $M_i = M(x_i)$ for clarity. Assume $K = colim_{i\in I} M(x_i)$ exists. We will verify that K is also the colimit of the diagram M. Recall that for every object x of $\mathcal{I}$ the quadruple $i_x = (\{x\}, \emptyset, x, \{\text{id}_x\})$ is an element of I. By definition of a colimit there is a morphism

$$M(x) = M_{i_x} \longrightarrow K$$

Let $\varphi : x \to x'$ be a morphism of $\mathcal{I}$. The quadruples i_x, $i_{x'}$ and

$$i_\varphi = (\{x, x'\}, \{\text{id}_x, \text{id}_{x'}, \varphi\}, x', \{\varphi, \text{id}_{x'}\})$$

are elements of I. Moreover, $i_x \leq i_\varphi$ and $i_{x'} \leq i_\varphi$. Thus the diagram

$$\begin{tikzcd}
M(x) = M_{i_x} \arrow[r] \arrow[dr] & M(x') = M_{i_\varphi} \arrow[d] & M(x') = M_{i_{x'}} \arrow[l] \arrow[dl] \\
& K &
\end{tikzcd}$$

is commutative in $\mathcal{C}$. Since the left pointing horizontal arrow is the identity morphism on $M(x')$ by our definition of $\varphi_{i_{x'}i_\varphi}$ we see that the morphisms $M(x) \to K$ so defined satisfy condition (1) of Definition 4.13.2.

Finally we have to verify condition (2) of Definition 4.13.2. Suppose that W is an object of $\mathcal{C}$ and suppose that we are given morphisms $w_x : M(x) \to W$ such that for all morphisms a of $\mathcal{J}$ we have $w_{s(a)} = w_{t(a)} \circ a$. In this case, set $w_i = w_{x_i}$ for a quadruple $i = (S_i, A_i, x_i, \{f_{s,i}\}_{s \in S_i})$. Note that the condition on the maps w_x in particular guarantees that $w_{i'} = w_i \circ M(\varphi_{ii'})$ if $i \leq i'$ in I. Because K is the colimit of the system $(M(x_i), M(\varphi_{ii'})$ we obtain a unique morphism $K \to W$ compatible with the maps w_i and the given morphisms $M_i \to K$. This proves the statement about colimits of the lemma.

We omit the proof of the statement about limits. (Hint: You can change it into a statement about colimits by considering the opposite category of $\mathcal{C}$.) $\square$

4.20. Essentially constant systems

Let $M : \mathcal{J} \to \mathcal{C}$ be a diagram in a category $\mathcal{C}$. Assume the index category $\mathcal{J}$ is filtered. In this case there are three successively stronger notions which pick out an object X of $\mathcal{C}$. The first is just

$$X = colim_{i \in \mathcal{J}} M_i.$$

Then X comes equipped with projection morphisms $M_i \to X$. A stronger condition would be to require that X is the colimit and that there exists an $i \in \mathcal{J}$ and a morphism $X \to M_i$ such that the composition $X \to M_i \to X$ is id_X. A stronger condition is the following.

Definition 4.20.1. Let $M : \mathcal{J} \to \mathcal{C}$ be a diagram in a category $\mathcal{C}$.

(1) Assume the index category $\mathcal{J}$ is filtered. We say M *is essentially constant* with *value* X if $X = colim_i M_i$ and there exists an $i \in \mathcal{J}$ and a morphism $X \to M_i$ such that
   (a) $X \to M_i \to X$ is id_X, and
   (b) for all j there exist k and morphisms $i \to k$ and $j \to k$ such that the morphism $M_j \to M_k$ equals the composition $M_j \to X \to M_i \to M_k$.

(2) Assume the index category $\mathcal{J}$ is cofiltered. We say M is *essentially constant* with *value* X if $X = lim_i M_i$ and there exists an $i \in \mathcal{J}$ and a morphism $M_i \to X$ such that
   (a) $X \to M_i \to X$ is id_X, and
   (b) for all j there exist k and morphisms $k \to i$ and $k \to j$ such that the morphism $M_k \to M_j$ equals the composition $M_k \to M_i \to X \to M_j$.

Which of the two versions is meant will be clear from context. If there is any confusion we will distinguish between these by saying that the first version means M is essentially constant as an *ind-object*, and in the second case we will say it is essentially constant as an *pro-object*. This terminology is further explained in Remarks 4.20.3 and 4.20.4. In fact we will often use the terminology ``essentially constant system" which formally speaking is only defined for systems over directed partially ordered sets.

Definition 4.20.2. Let $\mathcal{C}$ be a category. A directed system $(M_i, f_{ii'})$ is an *essentially constant system* if M viewed as a functor $I \to \mathcal{C}$ defines an essentially constant diagram. A directed inverse system $(M_i, f_{ii'})$ is an *essentially constant inverse system* if M viewed as a functor $I^{opp} \to \mathcal{C}$ defines an essentially constant inverse diagram.

If $(M_i, f_{ii'})$ is an essentially constant system and the morphisms $f_{ii'}$ are monomorphisms, then for all $i \leq i'$ sufficiently large the morphisms $f_{ii'}$ are isomorphisms. In general this need not be the case however. An example is the system

$$\mathbf{Z}^2 \to \mathbf{Z}^2 \to \mathbf{Z}^2 \to \ldots$$

with maps given by $(a, b) \mapsto (a + b, 0)$. This system is essentially constant with value $\mathbf{Z}$. A non-example is to let $M = \bigoplus_{n\geq 0} \mathbf{Z}$ and to let $S : M \to M$ be the shift operator $(a_0, a_1, \ldots) \mapsto (a_1, a_2, \ldots)$. In this case the system $M \to M \to M \to \ldots$ with transition maps S has colimit 0, and a map $0 \to M$ but the system is not essentially constant.

Remark 4.20.3. Let $\mathcal{C}$ be a category. There exists a big category Ind-$\mathcal{C}$ of *ind-objects of* $\mathcal{C}$. Namely, if $F : \mathcal{I} \to \mathcal{C}$ and $G : \mathcal{J} \to \mathcal{C}$ are filtered diagrams in $\mathcal{C}$, then we can define

$$Mor_{\text{Ind-}\mathcal{C}}(F, G) = lim_i\, colim_j\, Mor_{\mathcal{C}}(F(i), G(j)).$$

There is a canonical functor $\mathcal{C} \to$ Ind-$\mathcal{C}$ which maps X to the *constant system* on X. This is a fully faithful embedding. In this language one sees that a diagram F is essentially constant if and only F is isomorphic to a constant system. If we ever need this material, then we will formulate this into a lemma and prove it here.

Remark 4.20.4. Let $\mathcal{C}$ be a category. There exists a big category Pro-$\mathcal{C}$ of *pro-objects* of $\mathcal{C}$. Namely, if $F : \mathcal{I} \to \mathcal{C}$ and $G : \mathcal{J} \to \mathcal{C}$ are cofiltered diagrams in $\mathcal{C}$, then we can define

$$Mor_{\text{Pro-}\mathcal{C}}(F, G) = lim_j\, colim_i\, Mor_{\mathcal{C}}(F(i), G(j)).$$

There is a canonical functor $\mathcal{C} \to$ Pro-$\mathcal{C}$ which maps X to the *constant system* on X. This is a fully faithful embedding. In this language one sees that a diagram F is essentially constant if and only F is isomorphic to a constant system. If we ever need this material, then we will formulate this into a lemma and prove it here.

Lemma 4.20.5. *Let $\mathcal{C}$ be a category. Let $M : \mathcal{I} \to \mathcal{C}$ be a diagram with filtered (resp. cofiltered) index category $\mathcal{I}$. Let $F : \mathcal{C} \to \mathcal{D}$ be a functor. If M is essentially constant as an ind-object (resp. pro-object), then so is $F \circ M : \mathcal{I} \to \mathcal{D}$.*

Proof. If X is a value for M, then it follows immediately from the definition that $F(X)$ is a value for $F \circ M$. ☐

Lemma 4.20.6. *Let $\mathcal{C}$ be a category. Let $M : \mathcal{I} \to \mathcal{C}$ be a diagram with filtered index category $\mathcal{I}$. The following are equivalent*

(1) *M is an essentially constant ind-object, and*
(2) *$X = colim_i\, M_i$ exists and for any W in $\mathcal{C}$ the map*

$$colim_i\, Mor_{\mathcal{C}}(W, M_i) \longrightarrow Mor_{\mathcal{C}}(W, X)$$

is bijective.

Proof. Assume (2) holds. Then $\text{id}_X \in Mor_{\mathcal{C}}(X, X)$ comes from a morphism $X \to M_i$ for some i, i.e., $X \to M_i \to X$ is the identity. Then both maps

$$Mor_{\mathcal{C}}(W, X) \longrightarrow colim_i\, Mor_{\mathcal{C}}(W, M_i) \longrightarrow Mor_{\mathcal{C}}(W, X)$$

are bijective for all W where the first one is induced by the morphism $X \to M_i$ we found above, and the composition is the identity. This means that the composition

$$colim_i\, Mor_{\mathcal{C}}(W, M_i) \longrightarrow Mor_{\mathcal{C}}(W, X) \longrightarrow colim_i\, Mor_{\mathcal{C}}(W, M_i)$$

is the identity too. Setting $W = M_j$ and starting with id_{M_j} in the colimit, we see that $M_j \to X \to M_i \to M_k$ is equal to $M_j \to M_k$ for some k large enough. This proves (1) holds. The proof of (1) $\Rightarrow$ (2) is omitted. ☐

Lemma 4.20.7. *Let $\mathcal{C}$ be a category. Let $M : \mathcal{I} \to \mathcal{C}$ be a diagram with cofiltered index category $\mathcal{I}$. The following are equivalent*

(1) *M is an essentially constant pro-object, and*

(2) *$X = lim_i\, M_i$ exists and for any W in $\mathcal{C}$ the map*
$$colim_i\, Mor_{\mathcal{C}}(M_i, W) \longrightarrow Mor_{\mathcal{C}}(X, W)$$
is bijective.

Proof. Assume (2) holds. Then $\text{id}_X \in Mor_{\mathcal{C}}(X, X)$ comes from a morphism $M_i \to X$ for some i, i.e., $X \to M_i \to X$ is the identity. Then both maps
$$Mor_{\mathcal{C}}(X, W) \longrightarrow colim_i\, Mor_{\mathcal{C}}(M_i, W) \longrightarrow Mor_{\mathcal{C}}(X, W)$$
are bijective for all W where the first one is induced by the morphism $M_i \to X$ we found above, and the composition is the identity. This means that the composition
$$colim_i\, Mor_{\mathcal{C}}(M_i, W) \longrightarrow Mor_{\mathcal{C}}(X, W) \longrightarrow colim_i\, Mor_{\mathcal{C}}(M_i, W)$$
is the identity too. Setting $W = M_j$ and starting with id_{M_j} in the colimit, we see that $M_k \to M_i \to X \to M_j$ is equal to $M_k \to M_j$ for some k large enough. This proves (1) holds. The proof of (1) ⇒ (2) is omitted. □

4.21. Exact functors

Definition 4.21.1. Let $F : \mathcal{A} \to \mathcal{B}$ be a functor.

(1) Suppose all finite limits exist in $\mathcal{A}$. We say F is *left exact* if it commutes with all finite limits.
(2) Suppose all finite colimits exist in $\mathcal{A}$. We say F is *right exact* if it commutes with all finite colimits.
(3) We say F is *exact* if it is both left and right exact.

Lemma 4.21.2. *Let $F : \mathcal{A} \to \mathcal{B}$ be a functor. Suppose all finite limits exist in $\mathcal{A}$, see Lemma 4.16.4. The following are equivalent:*

(1) *F is left exact,*
(2) *F commutes with finite products and equalizers, and*
(3) *F transforms a final object of $\mathcal{A}$ into a final object of $\mathcal{B}$, and commutes with fibre products.*

Proof. Lemma 4.13.10 shows that (2) implies (1). Suppose (3) holds. The fibre product over the final object is the product. If $a, b : A \to B$ are morphisms of $\mathcal{A}$, then the equalizer of a, b is
$$(A \times_{a,B,b} A) \times_{(pr_1, pr_2), A\times A, \Delta} A.$$
Thus (3) implies (2). Finally (1) implies (3) because the empty limit is a final object, and fibre products are limits. □

4.22. Adjoint functors

Definition 4.22.1. Let $\mathcal{C}$, $\mathcal{D}$ be categories. Let $u : \mathcal{C} \to \mathcal{D}$ and $v : \mathcal{D} \to \mathcal{C}$ be functors. We say that u is a *left adjoint* of v, or that v is a *right adjoint* to u if there are bijections
$$Mor_{\mathcal{D}}(u(X), Y) \longrightarrow Mor_{\mathcal{C}}(X, v(Y))$$
functorial in $X \in Ob(\mathcal{C})$, and $Y \in Ob(\mathcal{D})$.

In other words, this means that there is an isomorphism of functors $\mathcal{C}^{opp} \times \mathcal{D} \to Sets$ from $Mor_{\mathcal{D}}(u(-), -)$ to $Mor_{\mathcal{C}}(-, v(-))$.

Lemma 4.22.2. *Let u be a left adjoint to v as in Definition 4.22.1.*

(1) *Suppose that* $M : \mathcal{I} \to \mathcal{C}$ *is a diagram, and suppose that* $colim_{\mathcal{I}} M$ *exists in* $\mathcal{C}$. *Then* $u(colim_{\mathcal{I}} M) = colim_{\mathcal{I}} u \circ M$. *In other words, u commutes with (representable) colimits.*
(2) *Suppose that* $M : \mathcal{I} \to \mathcal{D}$ *is a diagram, and suppose that* $lim_{\mathcal{I}} M$ *exists in* $\mathcal{D}$. *Then* $v(lim_{\mathcal{I}} M) = lim_{\mathcal{I}} v \circ M$. *In other words v commutes with representable limits.*

Proof. A morphism from a colimit into an object is the same as a compatible system of morphisms from the constituents of the limit into the object, see Remark 4.13.4. So

$$\begin{aligned} Mor_{\mathcal{D}}(u(colim_{i \in \mathcal{I}} M_i), Y) &= Mor_{\mathcal{C}}(colim_{i \in \mathcal{I}} M_i, v(Y)) \\ &= lim_{i \in \mathcal{I}^{opp}} Mor_{\mathcal{C}}(M_i, v(Y)) \\ &= lim_{i \in \mathcal{I}^{opp}} Mor_{\mathcal{D}}(u(M_i), Y) \end{aligned}$$

proves that $u(colim_{i \in \mathcal{I}} M_i)$ is the colimit we are looking for. A similar argument works for the other statement. ☐

Lemma 4.22.3. *Let u be a left adjoint of v as in Definition 4.22.1.*
(1) *If* $\mathcal{C}$ *has finite colimits, then u is right exact.*
(2) *If* $\mathcal{D}$ *has finite limits, then v is left exact.*

Proof. Obvious from the definitions and Lemma 4.22.2. ☐

4.23. Monomorphisms and Epimorphisms

Definition 4.23.1. Let $\mathcal{C}$ be a category, and let $f : X \to Y$ be a morphism of $\mathcal{C}$.
(1) We say that f is a *monomorphism* if for every object W and every pair of morphisms $a, b : W \to X$ such that $f \circ a = f \circ b$ we have $a = b$.
(2) We say that f is an *epimorphism* if for every object W and every pair of morphisms $a, b : Y \to W$ such that $a \circ f = b \circ f$ we have $a = b$.

Example 4.23.2. In the category of sets the monomorphisms correspond to injective maps and the epimorphisms correspond to surjective maps.

4.24. Localization in categories

The basic idea of this section is given a category $\mathcal{C}$ and a set of arrows to construct a functor $F : \mathcal{C} \to S^{-1}\mathcal{C}$ such that all elements of S become invertible in $S^{-1}\mathcal{C}$ and such that F is universal among all functors with this property. References for this section are [**GZ67**, Chapter I, Section 2] and [**Ver96**, Chapter II, Section 2].

Definition 4.24.1. Let $\mathcal{C}$ be a category. A set of arrows S of $\mathcal{C}$ is called a *left multiplicative system* if it has the following properties:

LMS1 The identity of every object of $\mathcal{C}$ is in S and the composition of two composable elements of S is in S.
LMS2 Every solid diagram

$$\begin{tikzcd} X \arrow[r, "g"'] \arrow[d, "t"'] & Y \arrow[d, dotted, "s"] \\ Z \arrow[r, dotted, "f"] & W \end{tikzcd}$$

with $t \in S$ can be completed to a commutative dotted square with $s \in S$.
LMS3 For every pair of morphisms $f, g : X \to Y$ and $t \in S$ with target X such that $f \circ t = g \circ t$ there exists a $s \in S$ with source Y such that $s \circ f = s \circ g$.

A set of arrows S of $\mathcal{C}$ is called a *right multiplicative system* if it has the following properties:

RMS1 The identity of every object of $\mathcal{C}$ is in S and the composition of two composable elements of S is in S.

RMS2 Every solid diagram

$$\begin{tikzcd} X \arrow[r, dotted, "g"] \arrow[d, dotted, "t"'] & Y \arrow[d, "s"] \\ Z \arrow[r, "f"] & W \end{tikzcd}$$

with $s \in S$ can be completed to a commutative dotted square with $t \in S$.

RMS3 For every pair of morphisms $f, g : X \to Y$ and $s \in S$ with source Y such that $s \circ f = s \circ g$ there exists a $t \in S$ with target X such that $f \circ t = g \circ t$.

A set of arrows S of $\mathcal{C}$ is called a *multiplicative system* if it is both a left multiplicative system and a right multiplicative system. In other words, this means that MS1, MS2, MS3 hold, where MS1 = LMS1 = RMS1, MS2 = LMS2 + RMS2, and MS3 = LMS3 + RMS3.

These conditions are useful to construct the categories $S^{-1}\mathcal{C}$ as follows.

Left calculus of fractions. Let $\mathcal{C}$ be a category and let S be a left multiplicative system. We define a new category $S^{-1}\mathcal{C}$ as follows (we verify this works in the proof of Lemma 4.24.2):

(1) We set $Ob(S^{-1}\mathcal{C}) = Ob(\mathcal{C})$.
(2) Morphisms $X \to Y$ of $S^{-1}\mathcal{C}$ are given by pairs $(f : X \to Y', s : Y \to Y')$ with $s \in S$ up to equivalence. (Think of this as $s^{-1}f : X \to Y$.)
(3) Two pairs $(f_1 : X \to Y_1, s_1 : Y \to Y_1)$ and $(f_2 : X \to Y_2, s_2 : Y \to Y_2)$ are said to be equivalent if there exists a third pair $(f_3 : X \to Y_3, s_3 : Y \to Y_3)$ and morphisms $u : Y_1 \to Y_3$ and $v : Y_2 \to Y_3$ of $\mathcal{C}$ fitting into the commutative diagram

$$\begin{tikzcd} & Y_1 \arrow[d, "u"] & \\ X \arrow[ur, "f_1"] \arrow[r, "f_3"] \arrow[dr, "f_2"'] & Y_3 & Y \arrow[ul, "s_1"'] \arrow[l, "s_3"'] \arrow[dl, "s_2"] \\ & Y_2 \arrow[u, "v"'] & \end{tikzcd}$$

(4) The composition of the equivalence classes of the pairs $(f : X \to Y', s : Y \to Y')$ and $(g : Y \to Z', t : Z \to Z')$ is defined as the equivalence class of a pair $(h \circ f : X \to Z'', u \circ t : Z \to Z'')$ where h and $u \in S$ are chosen to fit into a commutative diagram

$$\begin{tikzcd} Y \arrow[r, "g"] \arrow[d, "s"'] & Z' \arrow[d, "u"] \\ Y' \arrow[r, "h"] & Z'' \end{tikzcd}$$

which exists by assumption.

Lemma 4.24.2. *Let $\mathcal{C}$ be a category and let S be a left multiplicative system.*

(1) *The relation on pairs defined above is an equivalence relation.*
(2) *The composition rule given above is well defined on equivalence classes.*
(3) *Composition is associative and hence $S^{-1}\mathcal{C}$ is a category.*

Proof. Proof of (1). Let us say two pairs $p_1 = (f_1 : X \to Y_1, s_1 : Y \to Y_1)$ and $p_2 = (f_2 : X \to Y_2, s_2 : Y \to Y_2)$ are elementary equivalent if there exists a morphism $a : Y_1 \to Y_2$ of $\mathcal{C}$ such that $a \circ f_1 = f_2$ and $a \circ s_1 = s_2$. Diagram:

$$\begin{tikzcd} X \arrow[r, "f_1"'] \arrow[d, equal] & Y_1 \arrow[d, "a"] & Y \arrow[l, "s_1"'] \arrow[d, equal] \\ X \arrow[r, "f_2"] & Y_2 & Y \arrow[l, "s_2"] \end{tikzcd}$$

Let us denote this property by saying $p_1 E p_2$. Note that pEp and $aEb, bEc \Rightarrow aEc$. Part (1) claims that the relation $p \sim p' \Leftrightarrow \exists q : pEq \wedge p'Eq$ is an equivalence relation. A simple formal argument, using the properties of E above shows that it suffices to prove $p_2 E p_1, p_2 E p_3 \Rightarrow p_1 \sim p_2$. Thus suppose that we are given a commutative diagram

$$\begin{tikzcd} & Y_1 & \\ X \arrow[ur, "f_1"] \arrow[r, "f_3"] \arrow[dr, "f_2"'] & Y_3 \arrow[u, "a_{31}"] \arrow[d, "a_{32}"] & Y \arrow[ul, "s_1"'] \arrow[l, "s_3"'] \arrow[dl, "s_2"] \\ & Y_2 & \end{tikzcd}$$

with $s_i \in S$. First we apply LMS2 to get a commutative diagram

$$\begin{tikzcd} Y \arrow[r, "s_3"'] \arrow[d, "s_1"'] & Y_3 \arrow[d, dotted, "s_{34}"] \\ Y_1 \arrow[r, dotted, "a_{14}"] & Y_4 \end{tikzcd}$$

with $s_{34} \in S$. Then we have $s_{34} \circ s_2 = a_{14} \circ a_{31} \circ s_2$. Hence by LMS3 there exists a morphism $s_{44} : Y_4 \to Y_4'$, $s_{44} \in S$ such that $s_{44} \circ s_{34} = s_{44} \circ a_{14} \circ a_{31}$. Hence after replacing Y_4 by Y_4', a_{14} by $s_{44} \circ a_{14}$, and s_{24} by $s_{44} \circ s_{24}$ we may assume that $s_{34} = a_{14} \circ a_{31}$. Next, we apply LMS2 to get a commutative diagram

$$\begin{tikzcd} Y_3 \arrow[r, "s_{34}"'] \arrow[d, "a_{32}"'] & Y_4 \arrow[d, dotted, "s_{45}"] \\ Y_2 \arrow[r, dotted, "a_{25}"] & Y_5 \end{tikzcd}$$

with $s_{45} \in S$. Thus we obtain a pair $p_5 = (s_{45} \circ s_{34} \circ f_3 : X \to Y_5, s_{45} \circ s_{34} \circ s_3 : Y \to Y_5)$ and the morphisms $s_{45} \circ a_{14} : Y_1 \to Y_5$ and $a_{25} : Y_2 \to Y_5$ show that indeed $p_1 E p_5$ and $p_2 E p_5$ as desired.

Proof of (2). Let $p = (f : X \to Y', s : Y \to Y')$ and $q = (g : Y \to Z', t : Z \to Z')$ be pairs as in the definition of composition above. To compose we have to choose a diagram

$$\begin{tikzcd} Y \arrow[r, "g"] \arrow[d, "s"'] & Z' \arrow[d, "u_2"] \\ Y' \arrow[r, "h_2"] & Z_2 \end{tikzcd}$$

We first show that the equivalence class of the pair $r_2 = (h_2 \circ f : X \to Z_2, u_2 \circ t : Z \to Z_2)$ is independent of the choice of (Z_2, h_2, u_2). Namely, suppose that (Z_3, h_3, u_3) is another choice with corresponding composition $r_3 = (h_3 \circ f : X \to Z_3, u_3 \circ t : Z \to Z_3)$. Then by LMS2 we can choose a diagram

$$\begin{tikzcd} Z' \arrow[r, "u_3"'] \arrow[d, "u_2"'] & Z_3 \arrow[d, "u_{34}"] \\ Z_2 \arrow[r, "h_{24}"] & Z_4 \end{tikzcd}$$

with $u_{34} \in S$. Hence we obtain a pair $r_4 = (h_{24} \circ h_2 \circ f : X \to Z_4, u_{34} \circ u_3 \circ t : Z \to Z_4)$ and the morphisms $h_{24} : Z_2 \to Z_4$ and $u_{34} : Z_3 \to Z_4$ show that we have $r_2 E r_4$ and $r_3 E r_4$ as desired. Thus it now makes sense to define $p \circ q$ as the equivalence class of all possible pairs r obtained as above.

To finish the proof of (2) we have to show that given pairs p_1, p_2, q such that $p_1 E p_2$ then $p_1 \circ q = p_2 \circ q$ and $q \circ p_1 = q \circ p_2$ whenever the compositions make sense. To do this, write $p_1 = (f_1 : X \to Y_1, s_1 : Y \to Y_1)$ and $p_2 = (f_2 : X \to Y_2, s_2 : Y \to Y_2)$ and let $a : Y_1 \to Y_2$ be a morphism of $\mathcal{C}$ such that $f_2 = a \circ f_1$ and $s_2 = a \circ s_1$. First assume that $q = (g : Y \to Z', t : Z \to Z')$. In this case choose a commutative diagram as the one on the left

$$\begin{tikzcd} Y \arrow[r, "g"] \arrow[d, "s_2"'] & Z' \arrow[d, "u"] \\ Y_2 \arrow[r, "h"] & Z'' \end{tikzcd} \quad \Rightarrow \quad \begin{tikzcd} Y \arrow[r, "g"] \arrow[d, "s_1"'] & Z' \arrow[d, "u"] \\ Y_1 \arrow[r, "h \circ a"] & Z'' \end{tikzcd}$$

which implies the diagram on the right is commutative as well. Using these diagrams we see that both compositions are the equivalence class of $(h \circ a \circ f_1 : X \to Z'', u \circ t : Z \to Z'')$. Thus $p_1 \circ q = p_2 \circ q$. The proof of the other case, in which we have to show $q \circ p_1 = q \circ p_2$, is omitted.

Proof of (3). We have to prove associativity of composition. Consider a solid diagram

$$\begin{tikzcd} & & & Z \arrow[d] \\ & & Y \arrow[r] \arrow[d] & Z' \arrow[d, dotted] \\ & X \arrow[r] \arrow[d] & Y' \arrow[r, dotted] \arrow[d, dotted] & Z'' \arrow[d, dotted] \\ W \arrow[r] & W' \arrow[r, dotted] & Y'' \arrow[r, dotted] & Z''' \end{tikzcd}$$

which gives rise to three composable pairs. Using LMS2 we can choose the dotted arrows making the squares commutative and such that the vertical arrows are in S. Then it is clear that the composition of the three pairs is the equivalence class of the pair $(W \to Z''', Z \to Z''')$ gotten by composing the horizontal arrows on the bottom row and the vertical arrows on the right column. $\square$

We can ``write any finite collection of morphisms with the same target as fractions with common denominator".

Lemma 4.24.3. *Let $\mathcal{C}$ be a category and let S be a left multiplicative system of morphisms of $\mathcal{C}$. Given any finite collection $g_i : X_i \to Y$ of morphisms of $S^{-1}\mathcal{C}$ we can find an element $s : Y \to Y'$ of S and $f_i : X_i \to Y'$ such that g_i is the equivalence class of the pair $(f_i : X_i \to Y', s : Y \to Y')$.*

Proof. For each i choose a representative $(X_i \to Y_i, s_i : Y \to Y_i)$. The lemma follows if we can find a morphism $s : Y \to Y'$ in S such that for each i there is a morphism $a_i : Y_i \to Y'$ with $a_i \circ s_i = s$. If we have two indices $i = 1, 2$, then we can do this by completing the square

$$\begin{tikzcd} Y \arrow[r, "s_2"'] \arrow[d, "s_1"'] & Y_2 \arrow[d, "t_2"] \\ Y_1 \arrow[r, "a_1"] & Y' \end{tikzcd}$$

with $t_2 \in S$ as is possible by Definition 4.24.1. Then $s = t_2 \circ s_1 \in S$ works. If we have $n > 2$ morphisms, then we use the above trick to reduce to the case of $n - 1$ morphisms, and we win by induction. $\square$

There is an easy characterization of equality of morphisms if they have the same denominator.

Lemma 4.24.4. *Let $\mathcal{C}$ be a category and let S be a left multiplicative system of morphisms of $\mathcal{C}$. Let $A, B : X \to Y$ be morphisms of $S^{-1}\mathcal{C}$ which are the equivalence classes of $(f : X \to Y', s : Y \to Y')$ and $(g : X \to Y', s : Y \to Y')$. Then $A = B$ if and only if there exists a morphism $a : Y' \to Y''$ with $a \circ s \in S$ and such that $a \circ f = a \circ g$.*

Proof. The equality of A and B means that there exists a commutative diagram

$$\begin{tikzcd} & Y' \arrow[d, "u"] & \\ X \arrow[ur, "f"] \arrow[r, "h"] \arrow[dr, "g"'] & Z & Y \arrow[ul, "s"'] \arrow[l, "t"'] \arrow[dl, "s"] \\ & Y' \arrow[u, "v"'] & \end{tikzcd}$$

with $t \in S$. In particular $u \circ s = v \circ s$. Hence by LMS3 there exists a $s' : Z \to Y''$ in S such that $s' \circ u = s' \circ v$. Setting a equal to this common value does the job. $\square$

Remark 4.24.5. Let $\mathcal{C}$ be a category. Let S be a left multiplicative system. Given an object Y of $\mathcal{C}$ we denote Y/S the category whose objects are $s : Y \to Y'$ with $s \in S$ and whose morphisms are commutative diagrams

$$\begin{tikzcd} & Y \arrow[dl, "s"'] \arrow[dr, "t"] & \\ Y' \arrow[rr, "a"] & & Y'' \end{tikzcd}$$

where $a : Y' \to Y''$ is arbitrary. We claim that the category Y/S is filtered (see Definition 4.17.1). Namely, LMS1 implies that $\mathrm{id}_Y : Y \to Y$ is in Y/S hence Y/S is nonempty. LMS2 implies that given $s_1 : Y \to Y_1$ and $s_2 : Y \to Y_2$ we can find a diagram

$$\begin{tikzcd} Y \arrow[r, "s_2"'] \arrow[d, "s_1"'] & Y_2 \arrow[d, "t"] \\ Y_1 \arrow[r, "a"] & Y_3 \end{tikzcd}$$

with $t \in S$. Hence $s_1 : Y \to Y_1$ and $s_2 : Y \to Y_2$ both map to $t \circ s_2 : Y \to Y_3$ in Y/S. Finally, given two morphisms a, b from $s_1 : Y \to Y_1$ to $s_2 : Y \to Y_2$ in S/Y we see that $a \circ s_1 = b \circ s_1$ hence by LMS3 there exists a $t : Y_2 \to Y_3$ such that $t \circ a = t \circ b$. Now the combined results of Lemmas 4.24.3 and 4.24.4 tell us that

$$Mor_{S^{-1}\mathcal{C}}(X, Y) = colim_{(s : Y \to Y') \in Y/S} Mor_{\mathcal{C}}(X, Y') \tag{4.24.5.1}$$

This formula expressing morphisms in $S^{-1}\mathcal{C}$ as a filtered colimit of morphisms in $\mathcal{C}$ is occasionally useful.

Lemma 4.24.6. *Let $\mathcal{C}$ be a category and let S be a left multiplicative system of morphisms of $\mathcal{C}$.*

1. *The rules $X \mapsto X$ and $(f : X \to Y) \mapsto (f : X \to Y, id_Y : Y \to Y)$ define a functor $Q : \mathcal{C} \to S^{-1}\mathcal{C}$.*
2. *For any $s \in S$ the morphism $Q(s)$ is an isomorphism in $S^{-1}\mathcal{C}$.*
3. *If $G : \mathcal{C} \to \mathcal{D}$ is any functor such that $G(s)$ is invertible for every $s \in S$, then there exists a unique functor $H : S^{-1}\mathcal{C} \to \mathcal{D}$ such that $H \circ Q = G$.*

Proof. Parts (1) and (2) are clear. To see (3) just set $H(X) = G(X)$ and set $H((f : X \to Y', s : Y \to Y')) = H(s)^{-1} \circ H(f)$. Details omitted. ☐

Lemma 4.24.7. *Let $\mathcal{C}$ be a category and let S be a left multiplicative system of morphisms of $\mathcal{C}$. The localization functor $Q : \mathcal{C} \to S^{-1}\mathcal{C}$ commutes with finite colimits.*

Proof. This is clear from (4.24.5.1), Remark 4.13.4, and Lemma 4.17.2. ☐

Lemma 4.24.8. *Let $\mathcal{C}$ be a category. Let S be a left multiplicative system. If $f : X \to Y$, $f' : X' \to Y'$ are two morphisms of $\mathcal{C}$ and if*

$$\begin{tikzcd} Q(X) \arrow[r, "a"'] \arrow[d, "Q(f)"'] & Q(X') \arrow[d, "Q(f')"] \\ Q(Y) \arrow[r, "b"] & Q(Y') \end{tikzcd}$$

is a commutative diagram in $S^{-1}\mathcal{C}$, then there exists a morphism $f'' : X'' \to Y''$ in $\mathcal{C}$ and a commutative diagram

$$\begin{tikzcd} X \arrow[r, "g"'] \arrow[d, "f"'] & X'' \arrow[d, "f''"] & X' \arrow[l, "s"'] \arrow[d, "f'"] \\ Y \arrow[r, "h"] & Y'' & Y' \arrow[l, "t"] \end{tikzcd}$$

in $\mathcal{C}$ with $s, t \in S$ and $a = s^{-1}g$, $b = t^{-1}h$.

Proof. We choose maps and objects in the following way: First write $a = s^{-1}g$ for some $s : X' \to X''$ in S and $h : X \to X''$. By LMS2 we can find $t : Y' \to Y''$ in S and

$f'' : X'' \to Y''$ such that

$$\begin{tikzcd} X \arrow[r, "g"'] \arrow[d, "f"'] & X'' \arrow[d, "f''"] & X' \arrow[l, "s"'] \arrow[d, "f'"] \\ Y & Y'' & Y' \arrow[l, "t"'] \end{tikzcd}$$

commutes. Now in this diagram we are going to repeatedly change our choice of

$$X'' \xrightarrow{f''} Y'' \xleftarrow{t} Y'$$

by postcomposing both t and f'' by a morphism $d : Y'' \to Y'''$ with the property that $d \circ t \in S$. According to Remark 4.24.5 we may after such a replacement assume that there exists a morphism $h : Y \to Y''$ such that $b = t^{-1}h$. At this point we have everything as in the lemma except that we don't know that the left square of the diagram commutes. However, we do know that $Q(f''g) = Q(hf)$ in $S^{-1}\mathcal{D}$ because the right square commutes, the outer square commutes in $S^{-1}\mathcal{D}$ by assumption, and because $Q(s), Q(t)$ are isomorphisms. Hence using Lemma 4.24.4 we can find a morphism $d : X''' \to X''$ in S (!) such that $df''g = dhf$. Hence we make one more replacement of the kind described above and we win. $\square$

Right calculus of fractions. Let $\mathcal{C}$ be a category and let S be a right multiplicative system. We define a new category $S^{-1}\mathcal{C}$ as follows (we verify this works in the proof of Lemma 4.24.9):

(1) We set $Ob(S^{-1}\mathcal{C}) = Ob(\mathcal{C})$.
(2) Morphisms $X \to Y$ of $S^{-1}\mathcal{C}$ are given by pairs $(f : X' \to Y, s : X' \to X)$ with $s \in S$ up to equivalence. (Think of this as $fs^{-1} : X \to Y$.)
(3) Two pairs $(f_1 : X_1 \to Y, s_1 : X_1 \to X)$ and $(f_2 : X_2 \to Y, s_2 : X_2 \to X)$ are said to be equivalent if there exists a third pair $(f_3 : X_3 \to Y, s_3 : X_3 \to X)$ and morphisms $u : X_3 \to X_1$ and $v : X_3 \to X_2$ of $\mathcal{C}$ fitting into the commutative diagram

$$\begin{tikzcd} & X_1 \arrow[dl, "s_1"'] \arrow[dr, "f_1"] & \\ X & X_3 \arrow[l, "s_3"'] \arrow[r, "f_3"] \arrow[u, "u"'] \arrow[d, "v"] & Y \\ & X_2 \arrow[ul, "s_2"] \arrow[ur, "f_2"'] & \end{tikzcd}$$

(4) The composition of the equivalence classes of the pairs $(f : X' \to Y, s : X' \to X)$ and $(g : Y' \to Z, t : Y' \to Y)$ is defined as the equivalence class of a pair $(g \circ h : X'' \to Z, s \circ u : X'' \to X)$ where h and $u \in S$ are chosen to fit into a commutative diagram

$$\begin{tikzcd} X'' \arrow[r, "h"] \arrow[d, "u"'] & Y' \arrow[d, "t"] \\ X' \arrow[r, "f"] & Y \end{tikzcd}$$

which exists by assumption.

Lemma 4.24.9. *Let $\mathcal{C}$ be a category and let S be a right multiplicative system.*

(1) *The relation on pairs defined above is an equivalence relation.*
(2) *The composition rule given above is well defined on equivalence classes.*

(3) *Composition is associative and hence $S^{-1}\mathcal{C}$ is a category.*

Proof. This lemma is dual to Lemma 4.24.2. It follows formally from that lemma by replacing $\mathcal{C}$ by its opposite category in which S is a left multiplicative system. $\square$

We can ``write any finite collection of morphisms with the same source as fractions with common denominator".

Lemma 4.24.10. *Let $\mathcal{C}$ be a category and let S be a right multiplicative system of morphisms of $\mathcal{C}$. Given any finite collection $g_i : X \to Y_i$ of morphisms of $S^{-1}\mathcal{C}$ we can find an element $s : X' \to X$ of S and $f_i : X' \to Y_i$ such that g_i is the equivalence class of the pair $(f_i : X' \to Y_i, s : X' \to X)$.*

Proof. This lemma is the dual of Lemma 4.24.3 and follows formally from that lemma by replacing all categories in sight by their opposites. $\square$

There is an easy characterization of equality of morphisms if they have the same denominator.

Lemma 4.24.11. *Let $\mathcal{C}$ be a category and let S be a right multiplicative system of morphisms of $\mathcal{C}$. Let $A, B : X \to Y$ be morphisms of $S^{-1}\mathcal{C}$ which are the equivalence classes of $(f : X' \to Y, s : X' \to X)$ and $(g : X' \to Y, s : X' \to X)$. Then $A = B$ if and only if there exists a morphism $a : X'' \to X'$ with $s \circ a \in S$ and such that $f \circ a = g \circ a$.*

Proof. This is dual to Lemma 4.24.4. $\square$

Remark 4.24.12. Let $\mathcal{C}$ be a category. Let S be a right multiplicative system. Given an object X of $\mathcal{C}$ we denote S/X the category whose objects are $s : X' \to X$ with $s \in S$ and whose morphisms are commutative diagrams

$$\begin{tikzcd} X' \arrow[rr, "a"'] \arrow[dr, "s"'] & & X'' \arrow[dl, "t"] \\ & X & \end{tikzcd}$$

where $a : X' \to X''$ is arbitrary. The category S/X is cofiltered (see Definition 4.18.1). (This is dual to the corresponding statement in Remark 4.24.5.) Now the combined results of Lemmas 4.24.10 and 4.24.11 tell us that

$$Mor_{S^{-1}\mathcal{C}}(X, Y) = colim_{(s : X' \to X) \in (S/X)^{opp}} Mor_{\mathcal{C}}(X', Y) \tag{4.24.12.1}$$

This formula expressing morphisms in $S^{-1}\mathcal{C}$ as a filtered colimit of morphisms in $\mathcal{C}$ is occasionally useful.

Lemma 4.24.13. *Let $\mathcal{C}$ be a category and let S be a right multiplicative system of morphisms of $\mathcal{C}$.*

(1) *The rules $X \mapsto X$ and $(f : X \to Y) \mapsto (f : X \to Y, id_X : X \to X)$ define a functor $Q : \mathcal{C} \to S^{-1}\mathcal{C}$.*
(2) *For any $s \in S$ the morphism $Q(s)$ is an isomorphism in $S^{-1}\mathcal{C}$.*
(3) *If $G : \mathcal{C} \to \mathcal{D}$ is any functor such that $G(s)$ is invertible for every $s \in S$, then there exists a unique functor $H : S^{-1}\mathcal{C} \to \mathcal{D}$ such that $H \circ Q = G$.*

Proof. This lemma is the dual of Lemma 4.24.6 and follows formally from that lemma by replacing all categories in sight by their opposites. $\square$

Lemma 4.24.14. *Let $\mathcal{C}$ be a category and let S be a right multiplicative system of morphisms of $\mathcal{C}$. The localization functor $Q : \mathcal{C} \to S^{-1}\mathcal{C}$ commutes with finite limits.*

Proof. This is clear from (4.24.12.1), Remark 4.13.4, and Lemma 4.17.2. $\square$

Lemma 4.24.15. *Let $\mathcal{C}$ be a category. Let S be a right multiplicative system. If $f : X \to Y$, $f' : X' \to Y'$ are two morphisms of $\mathcal{C}$ and if*

$$\begin{tikzcd} Q(X) \arrow[r, "a"'] \arrow[d, "Q(f)"'] & Q(X') \arrow[d, "Q(f')"] \\ Q(Y) \arrow[r, "b"] & Q(Y') \end{tikzcd}$$

is a commutative diagram in $S^{-1}\mathcal{C}$, then there exists a morphism $f'' : X'' \to Y''$ in $\mathcal{C}$ and a commutative diagram

$$\begin{tikzcd} X \arrow[d, "f"'] & X'' \arrow[l, "s"'] \arrow[r, "g"'] \arrow[d, "f''"] & X' \arrow[d, "f'"] \\ Y & Y'' \arrow[l, "t"] \arrow[r, "h"] & Y' \end{tikzcd}$$

in $\mathcal{C}$ with $s, t \in S$ and $a = gs^{-1}$, $b = ht^{-1}$.

Proof. This lemma is dual to Lemma 4.24.8 but we can also prove it directly as follows. We choose maps and objects in the following way: First write $b = ht^{-1}$ for some $t : Y'' \to Y$ in S and $h : Y'' \to Y'$. By RMS2 we can find $s : X'' \to X$ in S and $f'' : X'' \to Y''$ such that

$$\begin{tikzcd} X \arrow[d, "f"'] & X'' \arrow[l, "s"'] \arrow[d, "f''"] & X' \arrow[d, "f'"] \\ Y & Y'' \arrow[l, "t"] \arrow[r, "h"] & Y' \end{tikzcd}$$

commutes. Now in this diagram we are going to repeatedly change our choice of

$$X \xleftarrow{s} X'' \xrightarrow{f''} Y''$$

by precomposing both s and f'' by a morphism $d : X''' \to X''$ with the property that $s \circ d \in S$. According to Remark 4.24.12 we may after such a replacement assume that there exists a morphism $g : X'' \to X'$ such that $a = gs^{-1}$. At this point we have everything as in the lemma except that we don't know that the right square of the diagram commutes. However, we do know that $Q(f'g) = Q(hf'')$ in $S^{-1}\mathcal{D}$ because the left square commutes, the outer square commutes in $S^{-1}\mathcal{D}$ by assumption, and because $Q(s), Q(t)$ are isomorphisms. Hence using Lemma 4.24.11 we can find a morphism $d : X''' \to X''$ in S (!) such that $f'gd = hf''d$. Hence we make one more replacement of the kind described above and we win. $\square$

Multiplicative systems and two sided calculus of fractions. If S is a multiplicative system then left and right calculus of fractions given canonically isomorphic categories.

Lemma 4.24.16. *Let $\mathcal{C}$ be a category and let S be a multiplicative system. The category of left fractions and the category of right fractions $S^{-1}\mathcal{C}$ are canonically isomorphic.*

Proof. Denote $\mathcal{C}_{left}$, $\mathcal{C}_{right}$ the two categories of fractions. By the universal properties of Lemmas 4.24.6 and 4.24.13 we obtain functors $\mathcal{C}_{left} \to \mathcal{C}_{right}$ and $\mathcal{C}_{right} \to \mathcal{C}_{left}$. By the uniqueness of these functors they are each others inverse. $\square$

Definition 4.24.17. Let $\mathcal{C}$ be a category and let S be a multiplicative system. We say S is *saturated* if, in addition to MS1, MS2, MS3 we also have

MS4 Given three composable morphisms f, g, h, if $fg, gh \in S$, then $g \in S$.

Note that a saturated multiplicative system contains all isomorphisms. Moreover, if f, g, h are composable morphisms in a category and fg, gh are isomorphisms, then g is an isomorphism (because then g has both a left and a right inverse, hence is invertible).

Lemma 4.24.18. *Let $\mathcal{C}$ be a category and let S be a multiplicative system. Denote $Q : \mathcal{S} \to S^{-1}\mathcal{C}$ the localization functor. The set*

$$\hat{S} = \{f \in Arrows(\mathcal{C}) \mid Q(f) \text{ is an isomorphism}\}$$

is equal to

$$S' = \{f \in Arrows(\mathcal{C}) \mid \text{there exist } g, h \text{ such that } gf, fh \in S\}$$

and is the smallest saturated multiplicative system containing S. In particular, if S is saturated, then $\hat{S} = S$.

Proof. It is clear that $S \subset S' \subset \hat{S}$ because elements of S' map to morphisms in $S^{-1}\mathcal{C}$ which have both left and right inverses. Note that S' satisfies MS4, and that $\hat{S}$ satisfies MS1. Next, we prove that $S' = \hat{S}$.

Let $f \in \hat{S}$. Let $s^{-1}g = ht^{-1}$ be the inverse morphism in $S^{-1}\mathcal{C}$. (We may use both left fractions and right fractions to describe morphisms in $S^{-1}\mathcal{C}$, see Lemma 4.24.16.) The relation $\mathrm{id}_X = s^{-1}gf$ in $S^{-1}\mathcal{C}$ means there exists a commutative diagram

$$\begin{tikzcd}
& X' \arrow[d, "u"] & \\
X \arrow[ur, "gf"] \arrow[r, "f'"] \arrow[dr, "\mathrm{id}_X"'] & X'' & X \arrow[ul, "s"'] \arrow[l, "s'"'] \arrow[dl, "\mathrm{id}_X"] \\
& X \arrow[u, "v"] &
\end{tikzcd}$$

for some morphisms f', u, v and $s' \in S$. Hence $ugf = s' \in S$. Similarly, using that $\mathrm{id}_Y = fht^{-1}$ one proves that $fhw \in S$ for some w. We conclude that $f \in S'$. Thus $S' = \hat{S}$. Provided we prove that $S' = \hat{S}$ is a multiplicative system it is now clear that this implies that $S' = \hat{S}$ is the smallest saturated system containing S.

Our remarks above take care of MS1 and MS4, so to finish the proof of the lemma we have to show that LMS2, RMS2, LMS3, RMS3 hold for $\hat{S}$. Let us check that LMS2 holds for $\hat{S}$. Suppose we have a solid diagram

$$\begin{tikzcd}
X \arrow[r, "g"'] \arrow[d, "t"'] & Y \arrow[d, dotted, "s"] \\
Z \arrow[r, dotted, "f"] & W
\end{tikzcd}$$

with $t \in \hat{S}$. Pick a morphism $a : Z \to Z'$ such that $at \in S$. Then we can use LMS2 for S to find a commutative diagram

$$\begin{tikzcd}
X \arrow[r, "g"'] \arrow[d, "t"'] & Y \arrow[dd, "s"] \\
Z \arrow[d, "a"'] & \\
Z' \arrow[r, "f'"] & W
\end{tikzcd}$$

and setting $f = f' \circ a$ we win. The proof of RMS2 is dual to this. Finally, suppose given a pair of morphisms $f, g : X \to Y$ and $t \in \hat{S}$ with target X such that $ft = gt$. Then we pick a morphism b such that $tb \in S$. Then $ftb = gtb$ which implies by LMS3 for S that there exists an $s \in S$ with source Y such that $sf = sg$ as desired. The proof of RMS3 is dual to this. $\square$

4.25. Formal properties

In this section we discuss some formal properties of the 2-category of categories. This will lead us to the definition of a (strict) 2-category later.

Let us denote $Ob(Cat)$ the class of all categories. For every pair of categories $\mathcal{A}, \mathcal{B} \in Ob(Cat)$ we have the ``small'' category of functors $\text{Fun}(\mathcal{A}, \mathcal{B})$. Composition of transformation of functors such as

$$\begin{tikzcd}
\mathcal{A} \arrow[r, bend left=50, "F''"] \arrow[r, "F'" description] \arrow[r, bend right=50, "F"'] \arrow[r, phantom, shift left=3, "\Downarrow t'"] \arrow[r, phantom, shift right=3, "\Downarrow t"] & \mathcal{B}
\end{tikzcd}
\text{ composes to }
\begin{tikzcd}
\mathcal{A} \arrow[r, bend left, "F''"] \arrow[r, bend right, "F"'] \arrow[r, phantom, "\Downarrow t\circ t'"] & \mathcal{B}
\end{tikzcd}$$

is called *vertical* composition. We will use the usual symbol $\circ$ for this. Next, we will define *horizontal* composition. In order to do this we explain a bit more of the structure at hand.

Namely for every triple of categories $\mathcal{A}$, $\mathcal{B}$, and $\mathcal{C}$ there is a composition law

$$\circ : Ob(\text{Fun}(\mathcal{B}, \mathcal{C})) \times Ob(\text{Fun}(\mathcal{A}, \mathcal{B})) \longrightarrow Ob(\text{Fun}(\mathcal{A}, \mathcal{C}))$$

coming from composition of functors. This composition law is associative, and identity functors act as units. In other words -- forgetting about transformations of functors -- we see that Cat forms a category. How does this structure interact with the morphisms between functors?

Well, given $t : F \to F'$ a transformation of functors $F, F' : \mathcal{A} \to \mathcal{B}$ and a functor $G : \mathcal{B} \to \mathcal{C}$ we can define a transformation of functors $G \circ F \to G \circ F'$. We will denote this transformation ${}_Gt$. It is given by the formula $({}_Gt)_x = G(t_x) : G(F(x)) \to G(F'(x))$ for all $x \in \mathcal{A}$. In this way composition with G becomes a functor

$$\text{Fun}(\mathcal{A}, \mathcal{B}) \longrightarrow \text{Fun}(\mathcal{A}, \mathcal{C}).$$

To see this you just have to check that ${}_G(\text{id}_F) = \text{id}_{G \circ F}$ and that ${}_G(t_1 \circ t_2) = {}_Gt_1 \circ {}_Gt_2$. Of course we also have that ${}_{\text{id}_\mathcal{A}}t = t$.

Similarly, given $s : G \to G'$ a transformation of functors $G, G' : \mathcal{B} \to \mathcal{C}$ and $F : \mathcal{A} \to \mathcal{B}$ a functor we can define s_F to be the transformation of functors $G \circ F \to G' \circ F$ given by

$(s_F)_x = s_{F(x)} : G(F(x)) \to G'(F(x))$ for all $x \in \mathcal{A}$. In this way composition with F becomes a functor

$$\mathrm{Fun}(\mathcal{B}, \mathcal{C}) \longrightarrow \mathrm{Fun}(\mathcal{A}, \mathcal{C}).$$

To see this you just have to check that $(\mathrm{id}_G)_F = \mathrm{id}_{G \circ F}$ and that $(s_1 \circ s_2)_F = s_{1,F} \circ s_{2,F}$. Of course we also have that $s_{\mathrm{id}_{\mathcal{B}}} = s$.

These constructions satisfy the additional properties

$${}_{G_1}({}_{G_2}t) = {}_{G_1 \circ G_2}t, \ (s_{F_1})_{F_2} = s_{F_1 \circ F_2}, \text{ and } {}_H(s_F) = ({}_H s)_F$$

whenever these make sense. Finally, given functors $F, F' : \mathcal{A} \to \mathcal{B}$, and $G, G' : \mathcal{B} \to \mathcal{C}$ and transformations $t : F \to F'$, and $s : G \to G'$ the following diagram is commutative

$$\begin{tikzcd}
G \circ F \arrow[r, "{}_G t"] \arrow[d, "s_F"'] & G \circ F' \arrow[d, "s_{F'}"] \\
G' \circ F \arrow[r, "{}_{G'} t"'] & G' \circ F'
\end{tikzcd}$$

in other words ${}_{G'}t \circ s_F = s_{F'} \circ {}_G t$. To prove this we just consider what happens on any object $x \in Ob(\mathcal{A})$:

$$\begin{tikzcd}
G(F(x)) \arrow[r, "G(t_x)"] \arrow[d, "s_{F(x)}"'] & G(F'(x)) \arrow[d, "s_{F'(x)}"] \\
G'(F(x)) \arrow[r, "G'(t_x)"'] & G'(F'(x))
\end{tikzcd}$$

which is commutative because s is a transformation of functors. This compatibility relation allows us to define horizontal composition.

Definition 4.25.1. Given a diagram as in the left hand side of:

$$\begin{tikzcd}
\mathcal{A} \arrow[r, bend left, "F"] \arrow[r, bend right, "F'"'] \arrow[r, phantom, "\Downarrow t"] & \mathcal{B} \arrow[r, bend left, "G"] \arrow[r, bend right, "G'"'] \arrow[r, phantom, "\Downarrow s"] & \mathcal{C}
\end{tikzcd} \text{ gives } \begin{tikzcd}
\mathcal{A} \arrow[r, bend left, "G \circ F"] \arrow[r, bend right, "G' \circ F'"'] \arrow[r, phantom, "\Downarrow s \star t"] & \mathcal{C}
\end{tikzcd}$$

we define the *horizontal* composition $s \star t$ to be the transformation of functors ${}_{G'}t \circ s_F = s_{F'} \circ {}_G t$.

Now we see that we may recover our previously constructed transformations ${}_G t$ and s_F as ${}_G t = \mathrm{id}_G \star t$ and $s_F = s \star \mathrm{id}_F$. Furthermore, all of the rules we found above are consequences of the properties stated in the lemma that follows.

Lemma 4.25.2. *The horizontal and vertical compositions have the following properties*

(1) $\circ$ *and* $\star$ *are associative,*
(2) *the identity transformations* id_F *are units for* $\circ$*,*
(3) *the identity transformations of the identity functors* $\mathrm{id}_{\mathrm{id}_{\mathcal{A}}}$ *are units for* $\star$ *and* $\circ$*, and*

(4) *given a diagram*

$$\begin{tikzcd}[column sep=huge]
\mathscr{A} \arrow[r, bend left=50, "F"] \arrow[r, "F'"'] \arrow[r, bend right=50, "F''"'] \arrow[r, phantom, shift left=3, "\Downarrow t"] \arrow[r, phantom, shift right=3, "\Downarrow t'"] & \mathscr{B} \arrow[r, bend left=50, "G"] \arrow[r, "G'"'] \arrow[r, bend right=50, "G''"'] \arrow[r, phantom, shift left=3, "\Downarrow s"] \arrow[r, phantom, shift right=3, "\Downarrow s'"] & \mathscr{C}
\end{tikzcd}$$

we have $(s' \circ s) \star (t' \circ t) = (s' \star t') \circ (s \star t)$.

Proof. The last statement turns using our previous notation into the following equation

$$s'_{F''} \circ {}_{G'}t' \circ s_{F'} \circ {}_{G}t = (s' \circ s)_{F''} \circ {}_{G}(t' \circ t).$$

According to our result above applied to the middle composition we may rewrite the left hand side as $s'_{F''} \circ s_{F''} \circ {}_{G}t' \circ {}_{G}t$ which is easily shown to be equal to the right hand side. □

Another way of formulating condition (4) of the lemma is that composition of functors and horizontal composition of transformation of functors gives rise to a functor

$$(\circ, \star) : \mathrm{Fun}(\mathscr{B}, \mathscr{C}) \times \mathrm{Fun}(\mathscr{A}, \mathscr{B}) \longrightarrow \mathrm{Fun}(\mathscr{A}, \mathscr{C})$$

whose source is the product category, see Definition 4.2.20.

4.26. 2-categories

We will give a definition of (strict) 2-categories as they appear in the setting of stacks. Before you read this take a look at Section 4.25 and Example 4.27.2. Basically, you take this example and you write out all the rules satisfied by the objects, 1-morphisms and 2-morphisms in that example.

Definition 4.26.1. A (strict) 2-*category* $\mathscr{C}$ consists of the following data

(1) A set of objects $Ob(\mathscr{C})$.
(2) For each pair $x, y \in Ob(\mathscr{C})$ a category $Mor_{\mathscr{C}}(x, y)$. The objects of $Mor_{\mathscr{C}}(x, y)$ will be called 1-*morphisms* and denoted $F : x \to y$. The morphisms between these 1-morphisms will be called 2-*morphisms* and denoted $t : F' \to F$. The composition of 2-morphisms in $Mor_{\mathscr{C}}(x, y)$ will be called *vertical* composition and will be denoted $t \circ t'$ for $t : F' \to F$ and $t' : F'' \to F'$.
(3) For each triple $x, y, z \in Ob(\mathscr{C})$ a functor

$$(\circ, \star) : Mor_{\mathscr{C}}(y, z) \times Mor_{\mathscr{C}}(x, y) \longrightarrow Mor_{\mathscr{C}}(x, z).$$

The image of the pair of 1-morphisms (F, G) on the left hand side will be called the *composition* of F and G, and denoted $F \circ G$. The image of the pair of 2-morphisms (t, s) will be called the *horizontal* composition and denoted $t \star s$.

These data are to satisfy the following rules:

(1) The set of objects together with the set of 1-morphisms endowed with composition of 1-morphisms forms a category.
(2) Horizontal composition of 2-morphisms is associative.
(3) The identity 2-morphism $\mathrm{id}_{\mathrm{id}_x}$ of the identity 1-morphism id_x is a unit for horizontal composition.

This is obviously not a very pleasant type of object to work with. On the other hand, there are lots of examples where it is quite clear how you work with it. The only example we have so far is that of the 2-category whose objects are a given collection of categories, 1-morphisms are functors between these categories, and 2-morphisms are natural transformations of functors, see Section 4.25. As far as this text is concerned all 2-categories will be sub 2-categories of this example. Here is what it means to be a sub 2-category.

Definition 4.26.2. Let $\mathscr{C}$ be a 2-category. A *sub 2-category* $\mathscr{C}'$ of $\mathscr{C}$, is given by a subset $Ob(\mathscr{C}')$ of $Ob(\mathscr{C})$ and sub categories $Mor_{\mathscr{C}'}(x, y)$ of the categories $Mor_{\mathscr{C}}(x, y)$ for all $x, y \in Ob(\mathscr{C}')$ such that these, together with the operations $\circ$ (composition 1-morphisms), $\circ$ (vertical composition 2-morphisms), and $\star$ (horizontal composition) form a 2-category.

Remark 4.26.3. Big 2-categories. In many texts a 2-category is allowed to have a class of objects (but hopefully a ``class of classes'' is not allowed). We will allow these ``big'' 2-categories as well, but only in the following list of cases (to be updated as we go along):

(1) The 2-category of categories *Cat*.
(2) The $(2, 1)$-category of categories *Cat*.
(3) The 2-category of groupoids *Groupoids*.
(4) The $(2, 1)$-category of groupoids *Groupoids*.
(5) The 2-category of fibred categories over a fixed category.
(6) The $(2, 1)$-category of fibred categories over a fixed category.

Note that in each case the class of objects of the 2-category $\mathscr{C}$ is a proper class, but for all objects $x, y \in Ob(C)$ the category $Mor_{\mathscr{C}}(x, y)$ is ``small'' (according to our conventions).

The notion of equivalence of categories that we defined in Section 4.2 extends to the more general setting of 2-categories as follows.

Definition 4.26.4. Two objects x, y of a 2-category are *equivalent* if there exist 1-morphisms $F : x \to y$ and $G : y \to x$ such that $F \circ G$ is 2-isomorphic to id_y and $G \circ F$ is 2-isomorphic to id_x.

Sometimes we need to say what it means to have a functor from a category into a 2-category.

Definition 4.26.5. Let $\mathscr{A}$ be a category and let $\mathscr{C}$ be a 2-category.

(1) A *functor* from an ordinary category into a 2-category will ignore the 2-morphisms unless mentioned otherwise. In other words, it will be a ``usual'' functor into the category formed out of 2-category by forgetting all the 2-morphisms.
(2) A *weak functor*, or a *pseudo functor* φ from $\mathscr{A}$ into the 2-category $\mathscr{C}$ is given by the following data
   (a) a map $\varphi : Ob(\mathscr{A}) \to Ob(\mathscr{C})$,
   (b) for every pair $x, y \in Ob(\mathscr{A})$, and every morphism $f : x \to y$ a 1-morphism $\varphi(f) : \varphi(x) \to \varphi(y)$,
   (c) for every $x \in Ob(A)$ a 2-morphism $\alpha_x : \mathrm{id}_{\varphi(x)} \to \varphi(\mathrm{id}_x)$, and
   (d) for every pair of composable morphisms $f : x \to y$, $g : y \to z$ of $\mathscr{A}$ a 2-morphism $\alpha_{g,f} : \varphi(g \circ f) \to \varphi(g) \circ \varphi(f)$.

   These data are subject to the following conditions:
   (a) the 2-morphisms α_x and $\alpha_{g,f}$ are all isomorphisms,
   (b) for any morphism $f : x \to y$ in $\mathscr{A}$ we have $\alpha_{\mathrm{id}_y, f} = \alpha_y \star \mathrm{id}_{\varphi(f)}$:

$$\begin{tikzcd} \varphi(x) \arrow[r, bend left, "\varphi(f)"] \arrow[r, bend right, "\varphi(f)"'] \arrow[r, phantom, "\Downarrow \mathrm{id}_{\varphi(f)}"] & \varphi(y) \arrow[r, bend left, "\mathrm{id}_y"] \arrow[r, bend right, "\varphi(\mathrm{id}_y)"'] \arrow[r, phantom, "\Downarrow \alpha_y"] & \varphi(y) \end{tikzcd} = \begin{tikzcd} \varphi(x) \arrow[r, bend left, "\varphi(f)"] \arrow[r, bend right, "\varphi(\mathrm{id}_y) \circ \varphi(f)"'] \arrow[r, phantom, "\Downarrow \alpha_{f, \mathrm{id}_y}"] & \varphi(y) \end{tikzcd}$$

(c) for any morphism $f : x \to y$ in $\mathcal{A}$ we have $\alpha_{f,\mathrm{id}_x} = \mathrm{id}_{\varphi(f)} \star \alpha_x$,
(d) for any triple of composable morphisms $f : w \to x$, $g : x \to y$, and $h : y \to z$ of $\mathcal{A}$ we have

$$(\mathrm{id}_{\varphi(h)} \star \alpha_{g,f}) \circ \alpha_{h,g\circ f} = (\alpha_{h,g} \star \mathrm{id}_{\varphi(f)}) \circ \alpha_{h\circ g,f}$$

in other words the following diagram with objects 1-morphisms and arrows 2-morphisms commutes

$$\begin{tikzcd} \varphi(h \circ g \circ f) \arrow[rr, "\alpha_{h\circ g,f}"'] \arrow[d, "\alpha_{h,g\circ f}"'] & & \varphi(h \circ g) \circ \varphi(f) \arrow[d, "\alpha_{h,g}\star \mathrm{id}_{\varphi(f)}"] \\ \varphi(h) \circ \varphi(g \circ f) \arrow[rr, "\mathrm{id}_{\varphi(h)}\star\alpha_{g,f}"] & & \varphi(h) \circ \varphi(g) \circ \varphi(f) \end{tikzcd}$$

Again this is not a very workable notion, but it does sometimes come up. There is a theorem that says that any pseudo-functor is isomorphic to a functor. Finally, there are the notions of *functor between* 2*-categories*, and *pseudo functor between* 2*-categories*. This last notion leads us into 3-category territory. We would like to avoid having to define this at almost any cost!

4.27. (2, 1)-categories

Some 2-categories have the property that all 2-morphisms are isomorphisms. These will play an important role in the following, and they are easier to work with.

Definition 4.27.1. A (strict) (2, 1)-*category* is a 2-category in which all 2-morphisms are isomorphisms.

Example 4.27.2. The 2-category *Cat*, see Remark 4.26.3, can be turned into a (2, 1)-category by only allowing isomorphisms of functors as 2-morphisms.

In fact, more generally any 2-category $\mathcal{C}$ produces a (2, 1)-category by considering the sub 2-category $\mathcal{C}'$ with the same objects and 1-morphisms but whose 2-morphisms are the invertible 2-morphisms of $\mathcal{C}$. In this situation we will say ``*let* $\mathcal{C}'$ *be the* (2, 1)*-category associated to* $\mathcal{C}$" or similar. For example, the (2, 1)-category of groupoids means the 2-category whose objects are groupoids, whose 1-morphisms are functors and whose 2-morphisms are isomorphisms of functors. Except that this is a bad example as a transformation between functors between groupoids is automatically an isomorphism!

Remark 4.27.3. Thus there are variants of the construction of Example 4.27.2 above where we look at the 2-category of groupoids, or categories fibred in groupoids over a fixed category, or stacks. And so on.

4.28. 2-fibre products

In this section we introduce 2-fibre products. Suppose that $\mathcal{C}$ is a 2-category. We say that a diagram

$$\begin{tikzcd} w \arrow[r] \arrow[d] & y \arrow[d] \\ x \arrow[r] & z \end{tikzcd}$$

2-commutes if the two 1-morphisms $w \to y \to z$ and $w \to x \to z$ are 2-isomorphic. In a 2-category it is more natural to ask for 2-commutativity of diagrams than for actually commuting diagrams. (Indeed, some may say that we should not work with strict 2-categories at all, and in a ``weak" 2-category the notion of a commutative diagram of 1-morphisms does not even make sense.) Correspondingly the notion of a fibre product has to be adjusted.

Let $\mathcal{C}$ be a 2-category. Let $x, y, z \in Ob(\mathcal{C})$ and $f \in Mor_{\mathcal{C}}(x, z)$ and $g \in Mor_{\mathcal{C}}(y, z)$. In order to define the 2-fibre product of f and g we are going to look at 2-commutative diagrams

$$\begin{tikzcd} w \arrow[r, "a"'] \arrow[d, "b"'] & x \arrow[d, "f"] \\ y \arrow[r, "g"] & z. \end{tikzcd}$$

Now in the case of categories, the fibre product is a final object in the category of such diagrams. Correspondingly a 2-fibre product is a final object in a 2-category (see definition below). The *2-category of 2-commutative diagrams* is the 2-category defined as follows:

(1) Objects are quadruples (w, a, b, ϕ) as above where ϕ is an invertible 2-morphism $\phi : f \circ a \to g \circ b$,
(2) 1-morphisms from (w', a', b', ϕ') to (w, a, b, ϕ) are given by $(k : w' \to w, \alpha : a' \to a \circ k, \beta : b' \to b \circ k)$ such that

$$\begin{tikzcd} f \circ a' \arrow[rr, "\mathrm{id}_f \star \alpha"'] \arrow[d, "\phi'"'] & & f \circ a \circ k \arrow[d, "\phi \star \mathrm{id}_k"] \\ f \circ b' \arrow[rr, "\mathrm{id}_f \star \beta"] & & f \circ b \circ k \end{tikzcd}$$

is commutative,
(3) given a second 1-morphism $(k', \alpha', \beta') : (w'', a'', b'', \phi'') \to (w', \alpha', \beta', \phi')$ the composition of 1-morphisms is given by the rule

$$(k, \alpha, \beta) \circ (k', \alpha', \beta') = (k \circ k', (\alpha \star \mathrm{id}_{k'}) \circ \alpha', (\beta \star \mathrm{id}_{k'}) \circ \beta'),$$

(4) a 2-morphism between 1-morphisms (k_i, α_i, β_i), $i = 1, 2$ with the same is given by a 2-morphism $\delta : k_1 \to k_2$ such that

$$\begin{tikzcd} a' \arrow[r, "\alpha_1"'] \arrow[dr, "\alpha_2"'] & a \circ k_1 \arrow[d, "\mathrm{id}_a \star \delta"] \\ & a \circ k_2 \end{tikzcd} \qquad \begin{tikzcd} b \circ k_1 \arrow[d, "\mathrm{id}_b \star \delta"'] & b' \arrow[l, "\beta_1"] \arrow[dl, "\beta_2"] \\ b \circ k_2 & \end{tikzcd}$$

commute,
(5) vertical composition of 2-morphisms is given by vertical composition of the morphisms δ in $\mathcal{C}$, and
(6) horizontal composition of the diagram

$$\begin{tikzcd}[column sep=huge] (w'', a'', b'', \phi'') \arrow[r, bend left, "{(k'_1, \alpha'_1, \beta'_1)}"] \arrow[r, bend right, "{(k'_2, \alpha'_2, \beta'_2)}"'] \arrow[r, phantom, "\Downarrow \delta'"] & (w', a', b', \phi') \arrow[r, bend left, "{(k_1, \alpha_1, \beta_1)}"] \arrow[r, bend right, "{(k_2, \alpha_2, \beta_2)}"'] \arrow[r, phantom, "\Downarrow \delta"] & (w, a, b, \phi) \end{tikzcd}$$

is given by the diagram

$$\begin{tikzcd}[column sep=huge] (w'', a'', b'', \phi'') \arrow[r, bend left, "{(k_1 \circ k'_1, (\alpha_1 \star \mathrm{id}_{k'_1}) \circ \alpha'_1, (\beta_1 \star \mathrm{id}_{k'_1}) \circ \beta'_1)}"] \arrow[r, bend right, "{(k_2 \circ k'_2, (\alpha_2 \star \mathrm{id}_{k'_2}) \circ \alpha'_2, (\beta_2 \star \mathrm{id}_{k'_2}) \circ \beta'_2)}"'] \arrow[r, phantom, "\Downarrow \delta \star \delta'"] & (w, a, b, \phi) \end{tikzcd}$$

Note that if $\mathcal{C}$ is actually a $(2, 1)$-category, the morphisms α and β in (2) above are automatically also isomorphisms[2]. In addition the 2-category of 2-commutative diagrams is also a $(2, 1)$-category if $\mathcal{C}$ is a $(2, 1)$-category.

Definition 4.28.1. A *final object* of a $(2, 1)$-category $\mathcal{C}$ is an object x such that

(1) for every $y \in Ob(\mathcal{C})$ there is a morphism $y \to x$, and
(2) every two morphisms $y \to x$ are isomorphic by a unique 2-morphism.

Likely, in the more general case of 2-categories there are different flavours of final objects. We do not want to get into this and hence we only define 2-fibre products in the $(2, 1)$-case.

Definition 4.28.2. Let $\mathcal{C}$ be a $(2, 1)$-category. Let $x, y, z \in Ob(\mathcal{C})$ and $f \in Mor_{\mathcal{C}}(x, z)$ and $g \in Mor_{\mathcal{C}}(y, z)$. A *2-fibre product of f and g* is a final object in the category of 2-commutative diagrams described above. If a 2-fibre product exists we will denote it $x \times_z y \in Ob(\mathcal{C})$, and denote the required morphisms $p \in Mor_{\mathcal{C}}(x \times_z y, x)$ and $q \in Mor_{\mathcal{C}}(x \times_z y, y)$ making the diagram

$$\begin{tikzcd} x \times_y z \arrow[r, "p"] \arrow[d, "q"'] & x \arrow[d, "f"] \\ y \arrow[r, "g"] & z \end{tikzcd}$$

2-commute and we will denote the given invertible 2-morphism exhibiting this by $\psi : f \circ p \to g \circ q$.

Thus the following universal property holds: for any $w \in Ob(\mathcal{C})$ and morphisms $a \in Mor_{\mathcal{C}}(w, x)$ and $b \in Mor_{\mathcal{C}}(w, y)$ with a given 2-isomorphism $\phi : f \circ a \to g \circ b$ there is a $\gamma \in Mor_{\mathcal{C}}(w, x \times_z y)$ making the diagram

$$\begin{tikzcd} w \arrow[rrd, "a"] \arrow[rd, dashed, "\gamma"] \arrow[rdd, "b"'] & & \\ & x \times_y z \arrow[r, "p"'] \arrow[d, "q"'] & x \arrow[d, "f"] \\ & y \arrow[r, "g"] & z \end{tikzcd}$$

2-commute such that for suitable choices of $a \to p \circ \gamma$ and $b \to q \circ \gamma$ the diagram

$$\begin{tikzcd} f \circ a \arrow[r] \arrow[d, "\phi"'] & f \circ p \circ \gamma \arrow[d, "\psi \star \mathrm{id}_\gamma"] \\ g \circ b \arrow[r] & g \circ q \circ \gamma \end{tikzcd}$$

commutes. Moreover γ is unique up to isomorphism. Of course the exact properties are finer than this. All of the cases of 2-fibre products that we will need later on come from the following example of 2-fibre products in the 2-category of categories.

Example 4.28.3. Let $\mathcal{A}$, $\mathcal{B}$, and $\mathcal{C}$ be categories. Let $F : \mathcal{A} \to \mathcal{C}$ and $G : \mathcal{B} \to \mathcal{C}$ be functors. We define a category $\mathcal{A} \times_{\mathcal{C}} \mathcal{B}$ as follows:

[2] In fact it seems in the 2-category case that one could define another 2-category of 2-commutative diagrams where the direction of the arrows α, β is reversed, or even where the direction of only one of them is reversed. This is why we restrict to $(2, 1)$-categories later on.

(1) an object of $\mathscr{A} \times_{\mathscr{C}} \mathscr{B}$ is a triple (A, B, f), where $A \in Ob(\mathscr{A})$, $B \in Ob(\mathscr{B})$, and $f : F(A) \to G(B)$ is an isomorphism in $\mathscr{C}$,
(2) a morphism $(A, B, f) \to (A', B', f')$ is given by a pair (a, b), where $a : A \to A'$ is a morphism in $\mathscr{A}$, and $b : B \to B'$ is a morphism in $\mathscr{B}$ such that the diagram

$$\begin{tikzcd} F(A) \arrow[r, "f"] \arrow[d, "F(a)"] & G(B) \arrow[d, "G(b)"] \\ F(A') \arrow[r, "f'"] & G(B') \end{tikzcd}$$

is commutative.

Moreover, we define functors $p : \mathscr{A} \times_{\mathscr{C}} \mathscr{B} \to \mathscr{A}$ and $q : \mathscr{A} \times_{\mathscr{C}} \mathscr{B} \to \mathscr{B}$ by setting

$$p(A, B, f) = A, \quad q(A, B, f) = B,$$

in other words, these are the forgetful functors. We define a transformation of functors $\psi : F \circ p \to G \circ q$. On the object $\xi = (A, B, f)$ it is given by $\psi_\xi = f : F(p(\xi)) = F(A) \to G(B) = G(q(\xi))$.

Lemma 4.28.4. *In the* $(2,1)$*-category of categories* 2*-fibre products exist and are given by the construction of Example 4.28.3.*

Proof. Let us check the universal property: let $\mathscr{W}$ be a category, let $a : \mathscr{W} \to \mathscr{A}$ and $b : \mathscr{W} \to \mathscr{B}$ be functors, and let $t : F \circ a \to G \circ b$ be an isomorphism of functors.

Consider the functor $\gamma : \mathscr{W} \to \mathscr{A} \times_{\mathscr{C}} \mathscr{B}$ given by $W \mapsto (a(W), b(W), t_W)$. (Check this is a functor omitted.) Moreover, consider $\alpha : a \to p \circ \gamma$ and $\beta : b \to q \circ \gamma$ obtained from the identities $p \circ \gamma = a$ and $q \circ \gamma = b$. Then it is clear that (γ, α, β) is a morphism from (W, a, b, t) to $(\mathscr{A} \times_{\mathscr{C}} \mathscr{B}, p, q, \psi)$.

Let $(k, \alpha', \beta') : (W, a, b, t) \to (\mathscr{A} \times_{\mathscr{C}} \mathscr{B}, p, q, \psi)$ be a second such morphism. For an object W of $\mathscr{W}$ let us write $k(W) = (a_k(W), b_k(W), t_{k,W})$. Hence $p(k(W)) = a_k(W)$ and so on. The map α' corresponds to functorial maps $\alpha' : a(W) \to a_k(W)$. Since we are working in the $(2,1)$-category of categories, in fact each of the maps $a(W) \to a_k(W)$ is an isomorphism. We can use these (and their counterparts $b(W) \to b_k(W)$) to get isomorphisms

$$\delta_W : \gamma(W) = (a(W), b(W), t_W) \longrightarrow (a_k(W), b_k(W), t_{k,W}) = k(W).$$

It is straightforward to show that δ defines a 2-isomorphism between γ and k in the 2-category of 2-commutative diagrams as desired. $\square$

Remark 4.28.5. Let $\mathscr{A}$, $\mathscr{B}$, and $\mathscr{C}$ be categories. Let $F : \mathscr{A} \to \mathscr{C}$ and $G : \mathscr{B} \to \mathscr{C}$ be functors. Another, slightly more symmetrical, construction of a 2-fibre product $\mathscr{A} \times_{\mathscr{C}} \mathscr{B}$ is as follows. An object is a quintuple (A, B, C, a, b) where A, B, C are objects of $\mathscr{A}, \mathscr{B}, \mathscr{C}$ and where $a : F(A) \to C$ and $b : G(B) \to C$ are isomorphisms. A morphism $(A, B, C, a, b) \to (A', B', C', a', b')$ is given by a triple of morphisms $A \to A', B \to B', C \to C'$ compatible with the morphisms a, b, a', b'. We can prove directly that this leads to a 2-fibre product. However, it is easier to observe that the functor $(A, B, C, a, b) \mapsto (A, B, b^{-1} \circ a)$ gives an equivalence from the category of quintuples to the category constructed in Example 4.28.3.

Lemma 4.28.6. *Let*

$$\begin{tikzcd} & \mathcal{Y} \arrow[d, "I"'] \arrow[dr, "K"] & \\ \mathcal{X} \arrow[r, "H"] \arrow[dr, "L"'] & \mathcal{Z} \arrow[dr, "M"] & \mathcal{B} \arrow[d, "G"] \\ & \mathcal{A} \arrow[r, "F"] & \mathcal{C} \end{tikzcd}$$

be a 2*-commutative diagram of categories. A choice of isomorphisms* $\alpha : G \circ K \to M \circ I$ *and* $\beta : M \circ H \to F \circ L$ *determines a morphism*

$$\mathcal{X} \times_{\mathcal{Z}} \mathcal{Y} \longrightarrow \mathcal{A} \times_{\mathcal{C}} \mathcal{B}$$

of 2*-fibre products associated to this situation.*

Proof. Just use the functor

$$(X, Y, \phi) \longmapsto (L(X), K(Y), \alpha_Y^{-1} \circ M(\phi) \circ \beta_X^{-1})$$

on objects and

$$(a, b) \longmapsto (L(a), K(b))$$

on morphisms. □

Lemma 4.28.7. *Assumptions as in Lemma 4.28.6.*

1. *If K and L are faithful then the morphism* $\mathcal{Y} \times_{\mathcal{Z}} \mathcal{X} \to \mathcal{B} \times_{\mathcal{C}} \mathcal{A}$ *is faithful.*
2. *If K and L are fully faithful and M is faithful then the morphism* $\mathcal{Y} \times_{\mathcal{Z}} \mathcal{X} \to \mathcal{B} \times_{\mathcal{C}} \mathcal{A}$ *is fully faithful.*
3. *If K and L are equivalences and M is fully faithful then the morphism* $\mathcal{Y} \times_{\mathcal{Z}} \mathcal{X} \to \mathcal{B} \times_{\mathcal{C}} \mathcal{A}$ *is an equivalence.*

Proof. Let (X, Y, ϕ) and (X', Y', ϕ') be objects of $\mathcal{X} \times_{\mathcal{Z}} \mathcal{Y}$. Set $Z = H(X)$ and identify it with $I(Y)$ via ϕ. Also, identify $M(Z)$ with $F(L(X))$ via α_X and identify $M(Z)$ with $G(K(Y))$ via β_Y. Similarly for $Z' = H(X')$ and $M(Z')$. The map on morphisms is the map

$$\begin{tikzcd} Mor_{\mathcal{X}}(X, X') \times_{Mor_{\mathcal{Z}}(Z, Z')} Mor_{\mathcal{Y}}(Y, Y') \arrow[d] \\ Mor_{\mathcal{A}}(L(X), L(X')) \times_{Mor_{\mathcal{C}}(M(Z), M(Z'))} Mor_{\mathcal{B}}(K(Y), K(Y')) \end{tikzcd}$$

Hence parts (1) and (2) follow. Moreover, if K and L are equivalences and M is fully faithful, then any object (A, B, ϕ) is in the essential image for the following reasons: Pick X, Y such that $L(X) \cong A$ and $K(Y) \cong B$. Then the fully faithfulness of M guarantees that we can find an isomorphism $H(X) \cong I(Y)$. Some details omitted. □

Lemma 4.28.8. *Let*

$$\begin{tikzcd} \mathcal{A} \arrow[dr] & & \mathcal{C} \arrow[dl] \arrow[dr] & & \mathcal{E} \arrow[dl] \\ & \mathcal{B} & & \mathcal{D} & \end{tikzcd}$$

be a diagram of categories and functors. Then there is a canonical isomorphism

$$(\mathcal{A} \times_{\mathcal{B}} \mathcal{C}) \times_{\mathcal{D}} \mathcal{E} \cong \mathcal{A} \times_{\mathcal{B}} (\mathcal{C} \times_{\mathcal{D}} \mathcal{E})$$

of categories.

Proof. Just use the functor

$$((A, C, \phi), E, \psi) \longmapsto (A, (C, E, \psi), \phi)$$

if you know what I mean. $\square$

Henceforth we do not write the parentheses when dealing with fibred products of more than 2 categories.

Lemma 4.28.9. *Let*

$$\begin{tikzcd} \mathcal{A} \arrow[dr] & & \mathcal{C} \arrow[dl] \arrow[dr] & & \mathcal{E} \arrow[dl] \\ & \mathcal{B} \arrow[dr, "F"'] & & \mathcal{D} \arrow[dl, "G"] & \\ & & \mathcal{F} & & \end{tikzcd}$$

be a commutative diagram of categories and functors. Then there is a canonical functor

$$pr_{02} : \mathcal{A} \times_{\mathcal{B}} \mathcal{C} \times_{\mathcal{D}} \mathcal{E} \longrightarrow \mathcal{A} \times_{\mathcal{F}} \mathcal{E}$$

of categories.

Proof. If we write $\mathcal{A} \times_{\mathcal{B}} \mathcal{C} \times_{\mathcal{D}} \mathcal{E}$ as $(\mathcal{A} \times_{\mathcal{B}} \mathcal{C}) \times_{\mathcal{D}} \mathcal{E}$ then we can just use the functor

$$((A, C, \phi), E, \psi) \longmapsto (A, E, G(\psi) \circ F(\phi))$$

if you know what I mean. $\square$

Lemma 4.28.10. *Let*

$$\mathcal{A} \to \mathcal{B} \leftarrow \mathcal{C} \leftarrow \mathcal{D}$$

be a diagram of categories and functors. Then there is a canonical isomorphism

$$\mathcal{A} \times_{\mathcal{B}} \mathcal{C} \times_{\mathcal{C}} \mathcal{D} \cong \mathcal{A} \times_{\mathcal{C}} \mathcal{D}$$

of categories.

Proof. Omitted. $\square$

We claim that this means you can work with these 2-fibre products just like with ordinary fibre products. Here are some further lemmas that actually come up later.

Lemma 4.28.11. *Let*

$$\begin{tikzcd} \mathcal{C}_3 \arrow[r] \arrow[d] & \mathcal{S} \arrow[d, "\Delta"] \\ \mathcal{C}_1 \times \mathcal{C}_2 \arrow[r, "G_1 \times G_2"] & \mathcal{S} \times \mathcal{S} \end{tikzcd}$$

be a 2-fibre product of categories. Then there is a canonical isomorphism $\mathcal{C}_3 \cong \mathcal{C}_1 \times_{G_1, \mathcal{S}, G_2} \mathcal{C}_2$.

Proof. We may assume that $\mathcal{C}_3$ is the category $(\mathcal{C}_1 \times \mathcal{C}_2) \times_{\mathcal{S}\times\mathcal{S}} \mathcal{S}$ constructed in Example 4.28.3. Hence an object is a triple $((X_1, X_2), S, \phi)$ where $\phi = (\phi_1, \phi_2) : (G_1(X_1), G_2(X_2)) \to (S, S)$ is an isomorphism. Thus we can associate to this the triple $(X_1, X_2, \phi_2 \circ \phi_1^{-1})$. Conversely, if (X_1, X_2, ψ) is an object of $\mathcal{C}_1 \times_{G_1,\mathcal{S},G_2} \mathcal{C}_2$, then we can associate to this the triple $((X_1, X_2), G_1(X_1), (\mathrm{id}_{G_1(X_1)}, \psi))$. We claim these constructions given mutually inverse functors. We omit describing how to deal with morphisms and show they are mutually inverse. ☐

Lemma 4.28.12. *Let*

$$\begin{tikzcd} \mathcal{C}' \arrow[r] \arrow[d] & \mathcal{S} \arrow[d, "\Delta"] \\ \mathcal{C} \arrow[r, "G_1\times G_2"] & \mathcal{S}\times\mathcal{S} \end{tikzcd}$$

be a 2*-fibre product of categories. Then there is a canonical isomorphism*

$$\mathcal{C}' \cong (\mathcal{C} \times_{G_1,\mathcal{S},G_2} \mathcal{C}) \times_{(p,q),\mathcal{C}\times\mathcal{C},\Delta} \mathcal{C}.$$

Proof. An object of the right hand side is given by $((C_1, C_2, \phi), C_3, \psi)$ where $\phi : G_1(C_1) \to G_2(C_2)$ is an isomorphism and $\psi = (\psi_1, \psi_2) : (C_1, C_2) \to (C_3, C_3)$ is an isomorphism. Hence we can associate to this the triple $(C_3, G_1(C_1), (G_1(\psi_1^{-1}), \varphi^{-1} \circ G_2(\psi_2^{-1})))$ which is an object of $\mathcal{C}'$. Details omitted. ☐

Lemma 4.28.13. *Let $\mathcal{A} \to \mathcal{C}$, $\mathcal{B} \to \mathcal{C}$ and $\mathcal{C} \to \mathcal{D}$ be functors between categories. Then the diagram*

$$\begin{tikzcd} \mathcal{A} \times_{\mathcal{C}} \mathcal{B} \arrow[r] \arrow[d] & \mathcal{A} \times_{\mathcal{D}} \mathcal{B} \arrow[d] \\ \mathcal{C} \arrow[r, "\Delta_{\mathcal{C}/\mathcal{D}}"] & \mathcal{C} \times_{\mathcal{D}} \mathcal{C} \end{tikzcd}$$

is a 2*-fibre product diagram.*

Proof. Omitted. ☐

Lemma 4.28.14. *Let*

$$\begin{tikzcd} \mathcal{U} \arrow[r] \arrow[d] & \mathcal{V} \arrow[d] \\ \mathcal{X} \arrow[r] & \mathcal{Y} \end{tikzcd}$$

be a 2*-fibre product. Then the diagram*

$$\begin{tikzcd} \mathcal{U} \arrow[r] \arrow[d] & \mathcal{U} \times_{\mathcal{V}} \mathcal{U} \arrow[d] \\ \mathcal{X} \arrow[r] & \mathcal{X} \times_{\mathcal{Y}} \mathcal{X} \end{tikzcd}$$

is 2*-cartesian.*

Proof. This is a purely 2-category theoretic statement, valid in any $(2,1)$-category with 2-fibre products. Explicitly, it follows from the following chain of equivalences:

$$\begin{aligned}\mathcal{X} \times_{(\mathcal{X} \times_{\mathcal{Y}} \mathcal{X})} (\mathcal{U} \times_{\mathcal{V}} \mathcal{U}) &= \mathcal{X} \times_{(\mathcal{X} \times_{\mathcal{Y}} \mathcal{X})} ((\mathcal{X} \times_{\mathcal{Y}} \mathcal{V}) \times_{\mathcal{V}} (\mathcal{X} \times_{\mathcal{Y}} \mathcal{V})) \\ &= \mathcal{X} \times_{(\mathcal{X} \times_{\mathcal{Y}} \mathcal{X})} (\mathcal{X} \times_{\mathcal{Y}} \mathcal{X} \times_{\mathcal{Y}} \mathcal{V}) \\ &= \mathcal{X} \times_{\mathcal{Y}} \mathcal{V} = \mathcal{U}\end{aligned}$$

see Lemmas 4.28.8 and 4.28.10. □

4.29. Categories over categories

In this section we have a functor $p : \mathcal{S} \to \mathcal{C}$. We think of $\mathcal{S}$ as being on top and of $\mathcal{C}$ as being at the bottom. To make sure that everybody knows what we are talking about we define the 2-category of categories over $\mathcal{C}$.

Definition 4.29.1. Let $\mathcal{C}$ be a category. The *2-category of categories over $\mathcal{C}$* is the sub 2-category of *Cat* defined as follows:

(1) Its objects will be functors $p : \mathcal{S} \to \mathcal{C}$.
(2) Its 1-morphisms $(\mathcal{S}, p) \to (\mathcal{S}', p')$ will be functors $G : \mathcal{S} \to \mathcal{S}'$ such that $p' \circ G = p$.
(3) Its 2-morphisms $t : G \to H$ for $G, H : (\mathcal{S}, p) \to (\mathcal{S}', p')$ will be morphisms of functors such that $p'(t_x) = \mathrm{id}_{p(x)}$ for all $x \in Ob(\mathcal{S})$.

In this situation we will denote

$$Mor_{Cat/\mathcal{C}}(\mathcal{S}, \mathcal{S}')$$

the category of 1-morphisms between $(\mathcal{S}, p)$ and $(\mathcal{S}', p')$

Since we have defined this as a sub 2-category of *Cat* we do not have to check any of the axioms. Rather we just have to check things such as ``vertical composition of 2-morphisms over $\mathcal{C}$ gives another 2-morphism over $\mathcal{C}$". This is clear.

Analogously to the fibre of a map of spaces, we have the notion of a fibre category, and some notions of lifting associated to this situation.

Definition 4.29.2. Let $\mathcal{C}$ be a category. Let $p : \mathcal{S} \to \mathcal{C}$ be a category over $\mathcal{C}$.

(1) The *fibre category* over an object $U \in Ob(\mathcal{C})$ is the category $\mathcal{S}_U$ with objects

$$Ob(\mathcal{S}_U) = \{x \in Ob(\mathcal{S}) : p(x) = U\}$$

and morphisms

$$Mor_{\mathcal{S}_U}(x, y) = \{\phi \in Mor_{\mathcal{S}}(x, y) : p(\phi) = \mathrm{id}_U\}.$$

(2) A *lift* of an object $U \in Ob(\mathcal{C})$ is an object $x \in Ob(\mathcal{S})$ such that $p(x) = U$, i.e., $x \in Ob(\mathcal{S}_U)$. We will also sometime say that *x lies over U*.
(3) Similarly, a *lift* of a morphism $f : V \to U$ in $\mathcal{C}$ is a morphism $\phi : y \to x$ in $\mathcal{S}$ such that $p(\phi) = f$. We sometimes say that *ϕ lies over f*.

There are some observations we could make here. For example if $F : (\mathcal{S}, p) \to (\mathcal{S}', p')$ is a 1-morphism of categories over $\mathcal{C}$, then F induces functors of fibre categories $F : \mathcal{S}_U \to \mathcal{S}'_U$. Similarly for 2-morphisms.

Here is the obligatory lemma describing the 2-fibre product in the $(2,1)$-category of categories over $\mathcal{C}$.

Lemma 4.29.3. *Let $\mathcal{C}$ be a category. The $(2,1)$-category of categories over $\mathcal{C}$ has 2-fibre products. Suppose that $f : \mathcal{X} \to \mathcal{S}$ and $g : \mathcal{Y} \to \mathcal{S}$ are morphisms of categories over $\mathcal{C}$. An explicit 2-fibre product $\mathcal{X} \times_{\mathcal{S}} \mathcal{Y}$ is given by the following description*

(1) *an object of $\mathcal{X} \times_{\mathcal{S}} \mathcal{Y}$ is a quadruple (U, x, y, f), where $U \in Ob(\mathcal{C})$, $x \in Ob(\mathcal{X}_U)$, $y \in Ob(\mathcal{Y}_U)$, and $f : F(x) \to G(y)$ is an isomorphism in $\mathcal{S}_U$,*
(2) *a morphism $(U, x, y, f) \to (U', x', y', f')$ is given by a pair (a, b), where $a : x \to x'$ is a morphism in $\mathcal{X}$, and $b : y \to y'$ is a morphism in $\mathcal{Y}$ such that*
   (a) *a and b induced the same morphism $U \to U'$, and*
   (b) *the diagram*

$$\begin{tikzcd} F(x) \arrow[r, "f"] \arrow[d, "F(a)"] & G(y) \arrow[d, "G(b)"] \\ F(x') \arrow[r, "f'"] & G(y') \end{tikzcd}$$

   is commutative.

The functors $p : \mathcal{X} \times_{\mathcal{S}} \mathcal{Y} \to \mathcal{X}$ and $q : \mathcal{X} \times_{\mathcal{S}} \mathcal{Y} \to \mathcal{Y}$ are the forgetful functors in this case. The transformation $\psi : F \circ p \to G \circ q$ is given on the object $\xi = (U, x, y, f)$ by $\psi_\xi = f : F(p(\xi)) = F(x) \to G(y) = G(q(\xi))$.

Proof. Let us check the universal property: let $p_{\mathcal{W}} : \mathcal{W} \to \mathcal{C}$ be a category over $\mathcal{C}$, let $X : \mathcal{W} \to \mathcal{X}$ and $Y : \mathcal{W} \to \mathcal{Y}$ be functors over $\mathcal{C}$, and let $t : F \circ X \to G \circ Y$ be an isomorphism of functors over $\mathcal{C}$. The desired functor $\gamma : \mathcal{W} \to \mathcal{A} \times_{\mathcal{C}} \mathcal{B}$ is given by $W \mapsto (p_{\mathcal{W}}(W), X(W), Y(W), t_W)$. Details omitted; compare with Lemma 4.28.4. $\square$

Lemma 4.29.4. *Let $\mathcal{C}$ be a category. Let $f : \mathcal{X} \to \mathcal{S}$ and $g : \mathcal{Y} \to \mathcal{S}$ be morphisms of categories over $\mathcal{C}$. For any object U of $\mathcal{C}$ we have the following identity of fibre categories*

$$\left(\mathcal{X} \times_{\mathcal{S}} \mathcal{Y}\right)_U = \mathcal{X}_U \times_{\mathcal{S}_U} \mathcal{Y}_U$$

Proof. Omitted. $\square$

4.30. Fibred categories

A very brief discussion of fibred categories is warranted.

Let $p : \mathcal{S} \to \mathcal{C}$ be a category over $\mathcal{C}$. Given an object $x \in \mathcal{S}$ with $p(x) = U$, and given a morphism $f : V \to U$, we can try to take some kind of ``fibre product $V \times_U x$'' (or a *base change* of $x$ via $V \to U$). Namely, a morphism from an object $z \in \mathcal{S}$ into ``$V \times_U x$'' should be given by a pair (φ, g), where $\varphi : z \to x$, $g : p(z) \to V$ such that $p(\varphi) = f \circ g$. Pictorially:

$$\begin{tikzcd} z \arrow[r, dash] \arrow[d, squiggly, "p"] & ? \arrow[r] \arrow[d, squiggly, "p"] & x \arrow[d, squiggly, "p"] \\ p(Z) \arrow[r] & V \arrow[r, "f"] & U \end{tikzcd}$$

If such a morphism $V \times_U x \to x$ exists then it is called a strongly cartesian morphism.

Definition 4.30.1. Let $\mathcal{C}$ be a category. Let $p : \mathcal{S} \to \mathcal{C}$ be a category over $\mathcal{C}$. A *strongly cartesian morphism*, or more precisely a *strongly $\mathcal{C}$-cartesian morphism* is a morphism $\varphi : y \to x$ of $\mathcal{S}$ such that for every $z \in Ob(\mathcal{S})$ the map

$$Mor_{\mathcal{S}}(z, y) \longrightarrow Mor_{\mathcal{S}}(z, x) \times_{Mor_{\mathcal{C}}(p(z), p(x))} Mor_{\mathcal{C}}(p(z), p(y)),$$

given by $\psi \longmapsto (\varphi \circ \psi, p(\psi))$ is bijective.

Note that by the Yoneda Lemma 4.3.5, given $x \in Ob(\mathcal{S})$ lying over $U \in Ob(\mathcal{C})$ and the morphism $f : V \to U$ of $\mathcal{C}$, if there is a strongly cartesian morphism $\varphi : y \to x$ with $p(\varphi) = f$, then (y, φ) is unique up to unique isomorphism. This is clear from the definition above, as the functor

$$z \longmapsto Mor_{\mathcal{S}}(z, x) \times_{Mor_{\mathcal{C}}(p(z),U)} Mor_{\mathcal{C}}(p(z), V)$$

only depends on the data $(x, U, f : V \to U)$. Hence we will sometimes use $V \times_U x \to x$ or $f^*x \to x$ to denote a strongly cartesian morphism which is a lift of f.

Lemma 4.30.2. *Let $\mathcal{C}$ be a category. Let $p : \mathcal{S} \to \mathcal{C}$ be a category over $\mathcal{C}$.*

(1) *The composition of two strongly cartesian morphisms is strongly cartesian.*
(2) *Any isomorphism of $\mathcal{S}$ is strongly cartesian.*
(3) *Any strongly cartesian morphism φ such that $p(\varphi)$ is an isomorphism, is an isomorphism.*

Proof. Proof of (1). Let $\varphi : y \to x$ and $\psi : z \to y$ be strongly cartesian. Let t be an arbitrary object of $\mathcal{S}$. Then we have

$$\begin{aligned}
& Mor_{\mathcal{S}}(t, z) \\
&= Mor_{\mathcal{S}}(t, y) \times_{Mor_{\mathcal{C}}(p(t),p(y))} Mor_{\mathcal{C}}(p(t), p(z)) \\
&= Mor_{\mathcal{S}}(t, x) \times_{Mor_{\mathcal{C}}(p(t),p(x))} Mor_{\mathcal{C}}(p(t), p(y)) \times_{Mor_{\mathcal{C}}(p(t),p(y))} Mor_{\mathcal{C}}(p(t), p(z)) \\
&= Mor_{\mathcal{S}}(t, x) \times_{Mor_{\mathcal{C}}(p(t),p(x))} Mor_{\mathcal{C}}(p(t), p(z))
\end{aligned}$$

hence $x \to z$ is strongly cartesian.

Proof of (2). Let $y \to x$ be an isomorphism. Then $p(y) \to p(x)$ is an isomorphism too. Hence $Mor_{\mathcal{C}}(p(z), p(y)) \to Mor_{\mathcal{C}}(p(z), p(x))$ is a bijection. Hence $Mor_{\mathcal{S}}(z, x) \times_{Mor_{\mathcal{C}}(p(z),p(x))} Mor_{\mathcal{C}}(p(z), p(y))$ is just bijective to $Mor_{\mathcal{S}}(z, x)$. Hence the displayed map of Definition 4.30.1 is a bijection as $y \to x$ is an isomorphism, and we conclude that $x \to y$ is strongly cartesian.

Proof of (3). Assume $\varphi : y \to x$ is strongly cartesian with $p(\varphi) : p(y) \to p(x)$ an isomorphism. Applying the definition with $z = x$ shows that $(\mathrm{id}_x, p(\varphi)^{-1})$ comes from a unique morphism $\chi : x \to y$. We omit the verification that χ is the inverse of φ. □

Lemma 4.30.3. *Let $\mathcal{C}$ be a category. Let $p : \mathcal{S} \to \mathcal{C}$ be a category over $\mathcal{C}$. Let $x \to y$ and $z \to y$ be morphisms of $\mathcal{S}$. Assume*

(1) *$x \to y$ is strongly cartesian,*
(2) *$p(x) \times_{p(y)} p(z)$ exists, and*
(3) *there exists a strongly cartesian morphism $a : w \to z$ in $\mathcal{S}$ with $p(w) = p(x) \times_{p(y)} p(z)$ and $p(a) = pr_2 : p(x) \times_{p(y)} p(z) \to p(z)$.*

Then the fibre product $x \times_y z$ exists and is isomorphic to w.

Proof. Since $x \to y$ is strongly cartesian there exists a unique morphism $b : w \to x$ such that $p(b) = \mathrm{pr}_1$. To see that w is the fibre product we compute

$$
\begin{aligned}
& Mor_{\mathcal{S}}(t, w) \\
&= Mor_{\mathcal{S}}(t, z) \times_{Mor_{\mathcal{C}}(p(t), p(z))} Mor_{\mathcal{C}}(p(t), p(w)) \\
&= Mor_{\mathcal{S}}(t, z) \times_{Mor_{\mathcal{C}}(p(t), p(z))} (Mor_{\mathcal{C}}(p(t), p(x)) \times_{Mor_{\mathcal{C}}(p(t), p(y))} Mor_{\mathcal{C}}(p(t), p(z))) \\
&= Mor_{\mathcal{S}}(t, z) \times_{Mor_{\mathcal{C}}(p(t), p(y))} Mor_{\mathcal{C}}(p(t), p(x)) \\
&= Mor_{\mathcal{S}}(t, z) \times_{Mor_{\mathcal{S}}(t, y)} Mor_{\mathcal{S}}(t, y) \times_{Mor_{\mathcal{C}}(p(t), p(y))} Mor_{\mathcal{C}}(p(t), p(x)) \\
&= Mor_{\mathcal{S}}(t, z) \times_{Mor_{\mathcal{S}}(t, y)} Mor_{\mathcal{S}}(t, x)
\end{aligned}
$$

as desired. The first equality holds because $a : w \to z$ is strongly cartesian and the last equality holds because $x \to y$ is strongly cartesian. $\square$

Definition 4.30.4. Let $\mathcal{C}$ be a category. Let $p : \mathcal{S} \to \mathcal{C}$ be a category over $\mathcal{C}$. We say $\mathcal{S}$ is a *fibred category over* $\mathcal{C}$ if given any $x \in Ob(\mathcal{S})$ lying over $U \in Ob(\mathcal{C})$ and any morphism $f : V \to U$ of $\mathcal{C}$, there exists a strongly cartesian morphism $f^*x \to x$ lying over f.

Assume $p : \mathcal{S} \to \mathcal{C}$ is a fibred category. For every $f : V \to U$ and $x \in Ob(\mathcal{S}_U)$ as in the definition we may choose a strongly cartesian morphism $f^*x \to x$ lying over f. By the axiom of choice we may choose $f^*x \to x$ for all $f : V \to U = p(x)$ simultaneously. We claim that for every morphism $\phi : x \to x'$ in $\mathcal{S}_U$ and $f : V \to U$ there is a unique morphism $f^*\phi : f^*x \to f^*x'$ in $\mathcal{S}_V$ such that

$$
\begin{tikzcd}
f^*x \arrow[r, "f^*\phi"'] \arrow[d] & f^*x' \arrow[d] \\
x \arrow[r, "\phi"] & x'
\end{tikzcd}
$$

commutes. Namely, the arrow exists and is unique because $f^*x' \to x'$ is strongly cartesian. The uniqueness of this arrow guarantees that f^* (now also defined on morphisms) is a functor $f^* : \mathcal{S}_U \to \mathcal{S}_V$.

Definition 4.30.5. Assume $p : \mathcal{S} \to \mathcal{C}$ is a fibred category.

(1) A *choice of pullbacks*[3] for $p : \mathcal{S} \to \mathcal{C}$ is given by a choice of a strongly cartesian morphism $f^*x \to x$ lying over f for any morphism $f : V \to U$ of $\mathcal{C}$ and any $x \in Ob(\mathcal{S}_U)$.
(2) Given a choice of pullbacks, for any morphism $f : V \to U$ of $\mathcal{C}$ the functor $f^* : \mathcal{S}_U \to \mathcal{S}_V$ described above is called a *pullback functor* (associated to the choices $f^*x \to x$ made above).

Of course we may always assume our choice of pullbacks has the property that $\mathrm{id}_U^*x = x$, although in practice this is a useless property without imposing further assumptions on the pullbacks.

Lemma 4.30.6. *Assume $p : \mathcal{S} \to \mathcal{C}$ is a fibred category. Assume given a choice of pullbacks for $p : \mathcal{S} \to \mathcal{C}$.*

[3]This is probably nonstandard terminology. In some texts this is called a ``cleavage'' but it conjures up the wrong image. Maybe a ``cleaving'' would be a better word. A related notion is that of a ``splitting'', but in many texts a ``splitting'' means a choice of pullbacks such that $g^* f^* = (f \circ g)^*$ for any composable pair of morphisms. Compare also with Definition 4.33.2.

(1) *For any pair of composable morphisms $f : V \to U$, $g : W \to V$ there is a unique isomorphism*
$$\alpha_{g,f} : (f \circ g)^* \longrightarrow g^* \circ f^*$$
as functors $\mathcal{S}_U \to \mathcal{S}_W$ such that for every $y \in Ob(\mathcal{S}_U)$ the following diagram commutes
$$\begin{tikzcd} g^* f^* y \arrow[r] & f^* y \arrow[d] \\ (f \circ g)^* y \arrow[r] \arrow[u, "(\alpha_{g,f})_y"] & y \end{tikzcd}$$
(2) *If $f = id_U$, then there is a canonical isomorphism $\alpha_U : id \to (id_U)^*$ as functors $\mathcal{S}_U \to \mathcal{S}_U$.*
(3) *The quadruple $(U \mapsto \mathcal{S}_U, f \mapsto f^*, \alpha_{g,f}, \alpha_U)$ defines a pseudo functor from $\mathcal{C}^{opp}$ to the $(2,1)$-category of categories, see Definition 4.26.5.*

Proof. In fact, it is clear that the commutative diagram of part (1) uniquely determines the morphism $(\alpha_{g,f})_y$ in the fibre category $\mathcal{S}_W$. It is an isomorphism since both the morphism $(f \circ g)^* y \to y$ and the morphism and the composition $g^* f^* y \to f^* y \to Y$ are strongly cartesian morphisms lifting $f \circ g$ (see discussion following Definition 4.30.1 and Lemma 4.30.2). In the same way, since $\mathrm{id}_x : x \to x$ is clearly strongly cartesian over id_U (with $U = p(x)$) we see that there exists an isomorphism $(\alpha_U)_x : x \to (\mathrm{id}_U)^* x$. (Of course we could have assumed beforehand that $f^* x = x$ whenever f is an identity morphism, but it is better for the sake of generality not to assume this.) We omit the verification that $\alpha_{g,f}$ and α_U so obtained are transformations of functors. We also omit the verification of (3). □

Lemma 4.30.7. *Let $\mathcal{C}$ be a site. Let $\mathcal{S}_1$, $\mathcal{S}_2$ be categories over $\mathcal{C}$. Suppose that $\mathcal{S}_1$ and $\mathcal{S}_2$ are equivalent as categories over $\mathcal{C}$. Then $\mathcal{S}_1$ is fibred over $\mathcal{C}$ if and only if $\mathcal{S}_2$ is fibred over $\mathcal{C}$.*

Proof. Let $F : \mathcal{S}_1 \to \mathcal{S}_2$, $G : \mathcal{S}_2 \to \mathcal{S}_1$ be functors over $\mathcal{C}$, and let $i : F \circ G \to \mathrm{id}_{\mathcal{S}_2}$, $j : G \circ F \to \mathrm{id}_{\mathcal{S}_1}$ be isomorphisms of functors over $\mathcal{C}$. We claim that in this case f maps strongly cartesian morphisms to strongly cartesian morphisms. Namely, suppose that $\varphi : y \to x$ is strongly cartesian in $\mathcal{S}_1$. Set $f : V \to U$ equal to $p_1(\varphi)$. Suppose that $z' \in Ob(\mathcal{S}_2)$, with $W = p_2(z')$, and we are given $g : W \to V$ and $\psi' : z' \to F(x)$ such that $p(\psi') = f \circ g$. Then
$$\psi = j \circ G(\psi') : G(z') \to G(F(x)) \to x$$
is a morphism in $\mathcal{S}_1$ with $p(\psi) = f \circ g$. Hence by assumption there exists a unique morphism $\xi : G(z') \to y$ lying over g such that $\psi = \varphi \circ \xi$. This in turn gives a morphism
$$\xi' = F(\xi) \circ i^{-1} : z' \to F(G(z')) \to F(y)$$
lying over g with $\psi' = F(\varphi) \circ \xi'$. We omit the verification that ξ' is unique. □

The conclusion from Lemma 4.30.7 is that equivalences map strongly cartesian morphisms to strongly cartesian morphisms. But this may not be the case for an arbitrary functor between fibred categories over $\mathcal{C}$. Hence we define the 2-category of fibred categories as follows.

Definition 4.30.8. Let $\mathcal{C}$ be a category. The 2-*category of fibred categories over $\mathcal{C}$* is the sub 2-category of the 2-category of categories over $\mathcal{C}$ (see Definition 4.29.1) defined as follows:

(1) Its objects will be fibred categories $p : \mathcal{S} \to \mathcal{C}$.

(2) Its 1-morphisms $(\mathcal{S}, p) \to (\mathcal{S}', p')$ will be functors $G : \mathcal{S} \to \mathcal{S}'$ such that $p' \circ G = p$ and such that G maps strongly cartesian morphisms to strongly cartesian morphisms.
(3) Its 2-morphisms $t : G \to H$ for $G, H : (\mathcal{S}, p) \to (\mathcal{S}', p')$ will be morphisms of functors such that $p'(t_x) = \mathrm{id}_{p(x)}$ for all $x \in Ob(\mathcal{S})$.

In this situation we will denote

$$Mor_{Fib/\mathcal{C}}(\mathcal{S}, \mathcal{S}')$$

the category of 1-morphisms between $(\mathcal{S}, p)$ and $(\mathcal{S}', p')$

Note the condition on 1-morphisms. Note also that this is a true 2-category and not a $(2,1)$-category. Hence when taking 2-fibre products we first pass to the associated $(2,1)$-category.

Lemma 4.30.9. *Let $\mathcal{C}$ be a category. The $(2,1)$-category of fibred categories over $\mathcal{C}$ has 2-fibre products, and they are described as in Lemma 4.29.3.*

Proof. Basically what one has to show here is that given $f : \mathcal{X} \to \mathcal{S}$ and $g : \mathcal{Y} \to \mathcal{S}$ morphisms of fibred categories over $\mathcal{C}$, then the category $\mathcal{X} \times_{\mathcal{S}} \mathcal{Y}$ described in Lemma 4.29.3 is fibred. Let us show that $\mathcal{X} \times_{\mathcal{S}} \mathcal{Y}$ has plenty of strongly cartesian morphisms. Namely, suppose we have (U, x, y, ϕ) an object of $\mathcal{X} \times_{\mathcal{S}} \mathcal{Y}$. And suppose $f : V \to U$ is a morphism in $\mathcal{C}$. Choose strongly cartesian morphisms $a : f^*x \to x$ in $\mathcal{X}$ lying over f and $b : f^*y \to y$ in $\mathcal{Y}$ lying over f. By assumption $F(a)$ and $G(b)$ are strongly cartesian. Since $\phi : F(x) \to G(y)$ is an isomorphism, by the uniqueness of strongly cartesian morphisms we find a unique isomorphism $f^*\phi : F(f^*x) \to G(f^*y)$ such that $G(b) \circ f^*\phi = \phi \circ G(a)$. In other words $(G(a), G(b)) : (V, f^*x, f^*y, f^*\phi) \to (U, x, y, \phi)$ is a morphism in $\mathcal{X} \times_{\mathcal{S}} \mathcal{Y}$. We omit the verification that this is a strongly cartesian morphism (and that these are in fact the only strongly cartesian morphisms). $\square$

Lemma 4.30.10. *Let $\mathcal{C}$ be a category. Let $U \in Ob(\mathcal{C})$. If $p : \mathcal{S} \to \mathcal{C}$ is a fibred category and p factors through $p' : \mathcal{S} \to \mathcal{C}/U$ then $p' : \mathcal{S} \to \mathcal{C}/U$ is a fibred category.*

Proof. Suppose that $\varphi : x' \to x$ is strongly cartesian with respect to p. We claim that φ is strongly cartesian with respect to p' also. Set $g = p'(\varphi)$, so that $g : V'/U \to V/U$ for some morphisms $f : V \to U$ and $f' : V' \to U$. Let $z \in Ob(\mathcal{S})$. Set $p'(z) = (W \to U)$. To show that φ is strongly cartesian for p' we have to show

$$Mor_{\mathcal{S}}(z, x') \longrightarrow Mor_{\mathcal{S}}(z, x) \times_{Mor_{\mathcal{C}/U}(W/U, V/U)} Mor_{\mathcal{C}/U}(W/U, V'/U),$$

given by $\psi' \longmapsto (\varphi \circ \psi', p'(\psi'))$ is bijective. Suppose given an element (ψ, h) of the right hand side, then in particular $g \circ h = p(\psi)$, and by the condition that φ is strongly cartesian we get a unique morphism $\psi' : z \to x'$ with $\psi = \varphi \circ \psi'$ and $p(\psi') = h$. OK, and now $p'(\psi') : W/U \to V/U$ is a morphism whose corresponding map $W \to V$ is h, hence equal to h as a morphism in $\mathcal{C}/U$. Thus ψ' is a unique morphism $z \to x'$ which maps to the given pair (ψ, h). This proves the claim.

Finally, suppose given $g : V'/U \to V/U$ and x with $p'(x) = V/U$. Since $p : \mathcal{S} \to \mathcal{C}$ is a fibred category we see there exists a strongly cartesian morphism $\varphi : x' \to x$ with $p(\varphi) = g$. By the same argument as above it follows that $p'(\varphi) = g : V'/U \to V/U$. And as seen above the morphism φ is strongly cartesian. Thus the conditions of Definition 4.30.4 are satisfied and we win. $\square$

Lemma 4.30.11. *Let $p : \mathcal{S} \to \mathcal{C}$ be a fibred category. Let $x \to y$ and $z \to y$ be morphisms of $\mathcal{S}$ with $x \to y$ strongly cartesian. If $p(x) \times_{p(y)} p(z)$ exists, then $x \times_y z$ exists, $p(x \times_y z) = p(x) \times_{p(y)} p(z)$, and $x \times_y z \to z$ is strongly cartesian.*

Proof. Pick a strongly cartesian morphism $\text{pr}_2^*z \to z$ lying over $\text{pr}_2 : p(x) \times_{p(y)} p(z) \to p(z)$. Then $\text{pr}_2^*z = x \times_y z$ by Lemma 4.30.3. $\square$

4.31. Inertia

Given a fibred categories $p : \mathcal{S} \to \mathcal{C}$ and $p' : \mathcal{S}' \to \mathcal{C}$ over a category $\mathcal{C}$ and a 1-morphism $F : \mathcal{S} \to \mathcal{S}'$ we have the diagonal morphism

$$\Delta = \Delta_{\mathcal{S}/\mathcal{S}'} : \mathcal{S} \longrightarrow \mathcal{S} \times_{\mathcal{S}'} \mathcal{S}$$

in the $(2,1)$-category of fibred categories over $\mathcal{C}$.

Lemma 4.31.1. *Let $\mathcal{C}$ be a category. Let $p : \mathcal{S} \to \mathcal{C}$ and $p' : \mathcal{S}' \to \mathcal{C}$ be fibred categories. Let $F : \mathcal{S} \to \mathcal{S}'$ be a 1-morphism of fibred categories over $\mathcal{C}$. Consider the category $\mathcal{I}_{\mathcal{S}/\mathcal{S}'}$ over $\mathcal{C}$ whose*

(1) *objects are pairs (x, α) where $x \in Ob(\mathcal{S})$ and $\alpha : x \to x$ is an automorphism with $F(\alpha) = id$,*
(2) *morphisms $(x, \alpha) \to (y, \beta)$ are given by morphisms $\phi : x \to y$ such that*

$$\begin{tikzcd} x \arrow[r, "\phi"] \arrow[d, "\alpha"'] & y \arrow[d, "\beta"] \\ x \arrow[r, "\phi"] & y \end{tikzcd}$$

commutes, and
(3) *the functor $\mathcal{I}_{\mathcal{S}/\mathcal{S}'} \to \mathcal{C}$ is given by $(x, \alpha) \mapsto p(x)$.*

Then

(1) *there is an equivalence*

$$\mathcal{I}_{\mathcal{S}/\mathcal{S}'} \longrightarrow \mathcal{S} \times_{\Delta, (\mathcal{S} \times_{\mathcal{S}'} \mathcal{S}), \Delta} \mathcal{S}$$

in the $(2,1)$-category of categories over $\mathcal{C}$, and
(2) *$\mathcal{I}_{\mathcal{S}/\mathcal{S}'}$ is a fibred category over $\mathcal{C}$.*

Proof. Note that (2) follows from (1) by Lemma 4.30.9. Thus it suffices to prove (1). We will use without further mention the construction of the 2-fibre product from Lemma 4.30.9. In particular an object of $\mathcal{S} \times_{\Delta, (\mathcal{S} \times_{\mathcal{S}'} \mathcal{S}), \Delta} \mathcal{S}$ is a triple $(x, y, (\iota, \kappa))$ where x and y are objects of $\mathcal{S}$, and $(\iota, \kappa) : (x, x, \text{id}_{F(x)}) \to (y, y, \text{id}_{F(y)})$ is an isomorphism in $\mathcal{S} \times_{\mathcal{S}'} \mathcal{S}$. This just means that $\iota, \kappa : x \to y$ are isomorphisms and that $F(\iota) = F(\kappa)$. Consider the functor

$$I_{\mathcal{S}/\mathcal{S}'} \longrightarrow \mathcal{S} \times_{\Delta, (\mathcal{S} \times_{\mathcal{S}'} \mathcal{S}), \Delta} \mathcal{S}$$

which to an object (x, α) of the left hand side assigns the object $(x, x, (\alpha, \text{id}_x))$ of the right hand side and to a morphism ϕ of the left hand side assigns the morphism (ϕ, ϕ) of the right hand side. We claim that a quasi-inverse to that morphism is given by the functor

$$\mathcal{S} \times_{\Delta, (\mathcal{S} \times_{\mathcal{S}'} \mathcal{S}), \Delta} \mathcal{S} \longrightarrow I_{\mathcal{S}/\mathcal{S}'}$$

which to an object $(x, y, (\iota, \kappa))$ of the left hand side assigns the object $(x, \kappa^{-1} \circ \iota)$ of the right hand side and to a morphism $(\phi, \phi') : (x, y, (\iota, \kappa)) \to (z, w, (\lambda, \mu))$ of the left hand side assigns the morphism ϕ. Indeed, the endo-functor of $I_{\mathcal{S}/\mathcal{S}'}$ induced by composing the two functors above is the identity on the nose, and the endo-functor induced on $\mathcal{S} \times_{\Delta, (\mathcal{S} \times_{\mathcal{S}'} \mathcal{S}), \Delta} \mathcal{S}$ is isomorphic to the identity via the natural isomorphism

$$(\iota^{-1} \circ \kappa, \kappa \circ \iota^{-1} \circ \kappa) : (x, x, (\kappa^{-1} \circ \iota, \text{id}_x)) \longrightarrow (x, y, (\iota, \kappa)).$$

Some details omitted. $\square$

Definition 4.31.2. Let $\mathcal{C}$ be a category.

(1) Let $F : \mathcal{S} \to \mathcal{S}'$ be a 1-morphism of fibred categories over $\mathcal{C}$. The *relative inertia of $\mathcal{S}$ over $\mathcal{S}'$* is the fibred category $\mathcal{I}_{\mathcal{S}/\mathcal{S}'} \to \mathcal{C}$ of Lemma 4.31.1.
(2) By the *inertia fibred category $\mathcal{I}_{\mathcal{S}}$ of $\mathcal{S}$* we mean $\mathcal{I}_{\mathcal{S}} = \mathcal{I}_{\mathcal{S}/\mathcal{C}}$.

Note that there are canonical 1-morphisms

$$\mathcal{I}_{\mathcal{S}/\mathcal{S}'} \longrightarrow \mathcal{S} \quad \text{and} \quad \mathcal{I}_{\mathcal{S}} \longrightarrow \mathcal{S} \tag{4.31.2.1}$$

of fibred categories over $\mathcal{C}$. In terms of the description of Lemma 4.31.1 these simply map the object (x, α) to the object x and the morphism $\phi : (x, \alpha) \to (y, \beta)$ to the morphism $\phi : x \to y$. There is also a *neutral section*

$$e : \mathcal{S} \to \mathcal{I}_{\mathcal{S}/\mathcal{S}'} \quad \text{and} \quad e : \mathcal{S} \to \mathcal{I}_{\mathcal{S}} \tag{4.31.2.2}$$

defined by the rules $x \mapsto (x, \mathrm{id}_x)$ and $(\phi : x \to y) \mapsto \phi$. This is a right inverse to (4.31.2.1). Given a 2-commutative square

$$\begin{tikzcd} \mathcal{S}_1 \arrow[r, "G"'] \arrow[d, "F_1"'] & \mathcal{S}_2 \arrow[d, "F_2"] \\ \mathcal{S}'_1 \arrow[r, "G'"] & \mathcal{S}'_2 \end{tikzcd}$$

there is a *functoriality map*

$$\mathcal{I}_{\mathcal{S}_1/\mathcal{S}'_1} \longrightarrow \mathcal{I}_{\mathcal{S}_2/\mathcal{S}'_2} \quad \text{and} \quad \mathcal{I}_{\mathcal{S}_1} \longrightarrow \mathcal{I}_{\mathcal{S}_2} \tag{4.31.2.3}$$

defined by the rules $(x, \alpha) \mapsto (G(x), G(\alpha))$ and $\phi \mapsto G(\phi)$. In particular there is always a comparison map

$$\mathcal{I}_{\mathcal{S}/\mathcal{S}'} \longrightarrow \mathcal{I}_{\mathcal{S}} \tag{4.31.2.4}$$

and all the maps above are compatible with this.

Lemma 4.31.3. *Let $F : \mathcal{S} \to \mathcal{S}'$ be a 1-morphism of categories fibred over a category $\mathcal{C}$. Then the diagram*

$$\begin{tikzcd} \mathcal{I}_{\mathcal{S}/\mathcal{S}'} \arrow[r, "(4.31.2.4)"'] \arrow[d, "F \circ (4.31.2.1)"'] & \mathcal{I}_{\mathcal{S}} \arrow[d, "(4.31.2.3)"] \\ \mathcal{S}' \arrow[r, "e"] & \mathcal{I}_{\mathcal{S}'} \end{tikzcd}$$

is a 2-fibre product.

Proof. Omitted. $\square$

4.32. Categories fibred in groupoids

In this section we explain how to think about categories in groupoids and we see how they are basically the same as functors with values in the (2, 1)-category of groupoids.

Definition 4.32.1. We say that $\mathcal{S}$ is *fibred in groupoids* over $\mathcal{C}$ if the following two conditions hold:

(1) For every morphism $f : V \to U$ in $\mathcal{C}$ and every lift x of U there is a lift $\phi : y \to x$ of f with target x.
(2) For every pair of morphisms $\phi : y \to x$ and $\psi : z \to x$ and any morphism $f : p(z) \to p(y)$ such that $p(\phi) \circ f = p(\psi)$ there exists a unique lift $\chi : z \to y$ of f such that $\phi \circ \chi = \psi$.

Condition (2) phrased differently says that applying the functor p gives a bijection between the sets of dotted arrows in the following commutative diagram below:

$$
\begin{tikzcd}
y \arrow[r] & x \\
z \arrow[u, dashed] \arrow[ur]
\end{tikzcd}
\qquad
\begin{tikzcd}
p(y) \arrow[r] & p(x) \\
p(z) \arrow[u, dashed] \arrow[ur]
\end{tikzcd}
$$

Another way to think about the second condition is the following. Suppose that $g : W \to V$ and $f : V \to U$ are morphisms in $\mathcal{C}$. Let $x \in Ob(\mathcal{S}_U)$. By the first condition we can lift f to $\phi : y \to x$ and then we can lift g to $\psi : z \to y$. Instead of doing this two step process we can directly lift $g \circ f$ to $\gamma : z' \to x$. This gives the solid arrows in the diagram

(4.32.1.1)
$$
\begin{tikzcd}
z' \arrow[d, dashed, shift left] \arrow[rrd, "\gamma"] & & \\
z \arrow[u, dashed, shift left] \arrow[r, "\psi"] \arrow[d, squiggly, "p"] & y \arrow[r, "\phi"] \arrow[d, squiggly, "p"] & x \arrow[d, squiggly, "p"] \\
W \arrow[r, "g"] & V \arrow[r, "f"] & U
\end{tikzcd}
$$

where the squiggly arrows represent not morphisms but the functor p. Applying the second condition to the arrows $\phi \circ \psi$, γ and id_W we conclude that there is a unique morphism $\chi : z \to z'$ in $\mathcal{S}_W$ such that $\gamma \circ \chi = \phi \circ \psi$. Similarly there is a unique morphism $z' \to z$. The uniqueness implies that the morphisms $z' \to z$ and $z \to z'$ are mutually inverse, in other words isomorphisms.

It should be clear from this discussion that a category fibred in groupoids is very closely related to a fibred category. Here is the result.

Lemma 4.32.2. *Let $p : \mathcal{S} \to \mathcal{C}$ be a functor. The following are equivalent*

(1) *$p : \mathcal{S} \to \mathcal{C}$ is a category fibred in groupoids, and*
(2) *all fibre categories are groupoids and $\mathcal{S}$ is a fibred category over $\mathcal{C}$.*

Moreover, in this case every morphism of $\mathcal{S}$ is strongly cartesian. In addition, given $f^*x \to x$ lying over f for all $f : V \to U = p(x)$ the data $(U \mapsto \mathcal{S}_U, f \mapsto f^*, \alpha_{f,g}, \alpha_U)$ constructed in Lemma 4.30.6 defines a pseudo functor from $\mathcal{C}^{opp}$ in to the $(2,1)$-category of groupoids.

Proof. Assume $p : \mathcal{S} \to \mathcal{C}$ is fibred in groupoids. To show all fibre categories $\mathcal{S}_U$ for $U \in Ob(\mathcal{C})$ are groupoids, we must exhibit for every $f : y \to x$ in $\mathcal{S}_U$ an inverse morphism. The diagram on the left (in $\mathcal{S}_U$) is mapped by p to the diagram on the right:

$$
\begin{tikzcd}
y \arrow[r, "f"] & x \\
x \arrow[u, dashed] \arrow[ur, "id_x"']
\end{tikzcd}
\qquad
\begin{tikzcd}
U \arrow[r, "id_U"] & U \\
U \arrow[u, dashed] \arrow[ur, "id_U"']
\end{tikzcd}
$$

Since only id_U makes the diagram on the right commute, there is a unique $g : x \to y$ making the diagram on the left commute, so $fg = id_x$. By a similar argument there is a unique $h : y \to x$ so that $gh = id_y$. Then $fgh = f : y \to x$. We have $fg = id_x$, so $h = f$. Condition (2) of Definition 4.32.1 says exactly that every morphism of $\mathcal{S}$ is strongly cartesian. Hence condition (1) of Definition 4.32.1 implies that $\mathcal{S}$ is a fibred category over $\mathcal{C}$.

Conversely, assume all fibre categories are groupoids and $\mathcal{S}$ is a fibred category over $\mathcal{C}$. We have to check conditions (1) and (2) of Definition 4.32.1. The first condition follows trivially. Let $\phi : y \to x$, $\psi : z \to x$ and $f : p(z) \to p(y)$ such that $p(\phi) \circ f = p(\psi)$ be as in condition (2) of Definition 4.32.1. Write $U = p(x)$, $V = p(y)$, $W = p(z)$, $p(\phi) = g : V \to U$, $p(\psi) = h : W \to U$. Choose a strongly cartesian $g^*x \to x$ lying over g. Then we get a morphism $i : y \to g^*x$ in $\mathcal{S}_V$, which is therefore an isomorphism. We also get a morphism $j : z \to g^*x$ corresponding to the pair (ψ, f) as $g^*x \to x$ is strongly cartesian. Then one checks that $\chi = i^{-1} \circ j$ is a solution.

We have seen in the proof of (1) $\Rightarrow$ (2) that every morphism of $\mathcal{S}$ is strongly cartesian. The final statement follows directly from Lemma 4.30.6. □

Lemma 4.32.3. *Let $\mathcal{C}$ be a category. Let $p : \mathcal{S} \to \mathcal{C}$ be a fibred category. Let $\mathcal{S}'$ be the subcategory of $\mathcal{S}$ defined as follows*

(1) *$Ob(\mathcal{S}') = Ob(\mathcal{S})$, and*
(2) *for $x, y \in Ob(\mathcal{S}')$ the set of morphisms between x and y in $\mathcal{S}'$ is the set of of strongly cartesian morphisms between x and y in $\mathcal{S}$.*

Let $p' : \mathcal{S}' \to \mathcal{C}$ be the restriction of p to $\mathcal{S}'$. Then $p' : \mathcal{S}' \to \mathcal{C}$ is fibred in groupoids.

Proof. Note that the construction makes sense since by Lemma 4.30.2 the identity morphism of any object of $\mathcal{S}$ is strongly cartesian, and the composition of strongly cartesian morphisms is strongly cartesian. The first lifting property of Definition 4.32.1 follows from the condition that in a fibred category given any morphism $f : V \to U$ and x lying over U there exists a strongly cartesian morphism $\varphi : y \to x$ lying over f. Let us check the second lifting property of Definition 4.32.1 for the category $p' : \mathcal{S}' \to \mathcal{C}$ over $\mathcal{C}$. To do this we argue as in the discussion following Definition 4.32.1. Thus in Diagram 4.32.1.1 the morphisms ϕ, ψ and γ are strongly cartesian morphisms of $\mathcal{S}$. Hence γ and $\phi \circ \psi$ are strongly cartesian morphisms of $\mathcal{S}$ lying over the same arrow of $\mathcal{C}$ and having the same target in $\mathcal{S}$. By the discussion following Definition 4.30.1 this means these two arrows are isomorphic as desired (here we use also that any isomorphism in $\mathcal{S}$ is strongly cartesian, by Lemma 4.30.2 again). □

Example 4.32.4. A homomorphism of groups $p : G \to H$ gives rise to a functor $p : \mathcal{S} \to \mathcal{C}$ as in Example 4.2.12. This functor $p : \mathcal{S} \to \mathcal{C}$ is fibred in groupoids if and only if p is surjective. The fibre category $\mathcal{S}_U$ over the (unique) object $U \in Ob(\mathcal{C})$ is the category associated to the kernel of p as in Example 4.2.6.

Given $p : \mathcal{S} \to \mathcal{C}$, we can ask: if the fibre category $\mathcal{S}_U$ is a groupoid for all $U \in Ob(\mathcal{C})$, must $\mathcal{S}$ be fibred in groupoids over $\mathcal{C}$? We can see the answer is no as follows. Start with a category fibred in groupoids $p : \mathcal{S} \to \mathcal{C}$. Altering the morphisms in $\mathcal{S}$ which do not map to the identity morphism on some object does not alter the categories $\mathcal{S}_U$. Hence we can violate the existence and uniqueness conditions on lifts. One example is the functor from Example 4.32.4 when $G \to H$ is not surjective. Here is another example.

Example 4.32.5. Let $Ob(\mathcal{C}) = \{A, B, T\}$ and $Mor_{\mathcal{C}}(A, B) = \{f\}$, $Mor_{\mathcal{C}}(B, T) = \{g\}$, $Mor_{\mathcal{C}}(A, T) = \{h\} = \{gf\}$, plus the identity morphism for each object. See the diagram below for a picture of this category. Now let $Ob(\mathcal{S}) = \{A', B', T'\}$ and $Mor_{\mathcal{S}}(A', B') = \emptyset$, $Mor_{\mathcal{S}}(B', T') = \{g'\}$, $Mor_{\mathcal{S}}(A', T') = \{h'\}$, plus the identity morphisms. The functor $p : \mathcal{S} \to \mathcal{C}$ is obvious. Then for every $U \in Ob(\mathcal{C})$, $\mathcal{S}_U$ is the category with one object and the identity morphism on that object, so a groupoid, but the morphism $f : A \to B$ cannot be lifted. Similarly, if we declare $Mor_{\mathcal{S}}(A', B') = \{f'_1, f'_2\}$ and $Mor_{\mathcal{S}}(A', T') = \{h'\} =$

$\{g'f_1'\} = \{g'f_2'\}$, then the fibre categories are the same and $f : A \to B$ in the diagram below has two lifts.

$$\begin{tikzcd} B' \arrow[r, "g'"] & T' \\ A' \arrow[u, dashed, "??"] \arrow[ur, "h'"'] \end{tikzcd} \quad \text{above} \quad \begin{tikzcd} B \arrow[r, "g"] & T \\ A \arrow[u, "f"] \arrow[ur, "gf=h"'] \end{tikzcd}$$

Later we would like to make assertions such as ``any category fibred in groupoids over $\mathcal{C}$ is equivalent to a split one", or ``any category fibred in groupoids whose fibre categories are setlike is equivalent to a category fibred in sets". The notion of equivalence depends on the 2-category we are working with.

Definition 4.32.6. Let $\mathcal{C}$ be a category. The *2-category of categories fibred in groupoids over $\mathcal{C}$* is the sub 2-category of the 2-category of fibred categories over $\mathcal{C}$ (see Definition 4.30.8) defined as follows:

(1) Its objects will be categories $p : \mathcal{S} \to \mathcal{C}$ fibred in groupoids.
(2) Its 1-morphisms $(\mathcal{S}, p) \to (\mathcal{S}', p')$ will be functors $G : \mathcal{S} \to \mathcal{S}'$ such that $p' \circ G = p$ (since every morphism is strongly cartesian G automatically preserves them).
(3) Its 2-morphisms $t : G \to H$ for $G, H : (\mathcal{S}, p) \to (\mathcal{S}', p')$ will be morphisms of functors such that $p'(t_x) = \mathrm{id}_{p(x)}$ for all $x \in Ob(\mathcal{S})$.

Note that every 2-morphism is automatically an isomorphism! Hence this is actually a $(2, 1)$-category and not just a 2-category. Here is the obligatory lemma on 2-fibre products.

Lemma 4.32.7. *Let $\mathcal{C}$ be a category. The 2-category of categories fibred in groupoids over $\mathcal{C}$ has 2-fibre products, and they are described as in Lemma 4.29.3.*

Proof. By Lemma 4.30.9 the fibre product as described in Lemma 4.29.3 is a fibred category. Hence it suffices to prove that the fibre categories are groupoids, see Lemma 4.32.2. By Lemma 4.29.4 it is enough to show that the 2-fibre product of groupoids is a groupoid, which is clear (from the construction in Lemma 4.28.4 for example). $\square$

Lemma 4.32.8. *Let $p : \mathcal{S} \to \mathcal{C}$ and $p' : \mathcal{S}' \to \mathcal{C}$ be categories fibred in groupoids, and suppose that $G : \mathcal{S} \to \mathcal{S}'$ is a functor over $\mathcal{C}$.*

(1) *Then G is faithful (resp. fully faithful, resp. an equivalence) if and only if for each $U \in Ob(\mathcal{C})$ the induced functor $G_U : \mathcal{S}_U \to \mathcal{S}'_U$ is faithful (resp. fully faithful, resp. an equivalence).*
(2) *If G is an equivalence, then G is an equivalence in the 2-category of categories fibred in groupoids over $\mathcal{C}$.*

Proof. Let x, y be objects of $\mathcal{S}$ lying over the same object U. Consider the commutative diagram

$$\begin{tikzcd} Mor_{\mathcal{S}}(x, y) \arrow[rr, "G"'] \arrow[dr, "p"'] & & Mor_{\mathcal{S}'}(G(x), G(y)) \arrow[dl, "p'"] \\ & Mor_{\mathcal{C}}(U, U) & \end{tikzcd}$$

From this diagram it is clear that if G is faithful (resp. fully faithful) then so is each G_U.

Suppose G is an equivalence. For every object x' of $\mathcal{S}'$ there exists an object x of $\mathcal{S}$ such that $G(x)$ is isomorphic to x'. Suppose that x' lies over U' and x lies over U. Then there is an isomorphism $f : U' \to U$ in $\mathcal{C}$, namely, p' applied to the isomorphism $x' \to G(X)$. By the axioms of a category fibred in groupoids there exists an arrow $f^*x \to x$ of $\mathcal{S}$ lying over f. Hence there exists an isomorphism $\alpha : x' \to G(f^*x)$ such that $p'(\alpha) = \mathrm{id}_{U'}$ (this time by the axioms for $\mathcal{S}'$). All in all we conclude that for every object x' of $\mathcal{S}'$ we can choose a pair $(o_{x'}, \alpha_{x'})$ consisting of an object $o_{x'}$ of $\mathcal{S}$ and an isomorphism $\alpha_{x'} : x' \to G(o_{x'})$ with $p(\alpha_{x'}) = \mathrm{id}_{p'(x')}$. From this point on we proceed as usual (see proof of Lemma 4.2.19) to produce an inverse functor $F : \mathcal{S}' \to \mathcal{S}$, by taking $x' \mapsto o_{x'}$ and $\varphi' : x' \to y'$ to the unique arrow $\varphi_{\varphi'} : o_{x'} \to o_{y'}$ with $\alpha_{x'}^{-1} \circ G(\varphi_{\varphi'}) \circ \alpha_{y'} = \varphi'$. With these choices F is a functor over $\mathcal{C}$. We omit the verification that $G \circ F$ and $F \circ G$ are 2-isomorphic (in the 2-category of categories fibred in groupoids over $\mathcal{C}$).

Suppose that G_U is faithful (resp. fully faithful) for all $U \in Ob(\mathcal{C})$. To show that G is faithful (resp. fully faithful) we have to show for any objects $x, y \in Ob(\mathcal{S})$ that G induces an injection (resp. bijection) between $Mor_{\mathcal{S}}(x, y)$ and $Mor_{\mathcal{S}'}(G(x), G(y))$. Set $U = p(x)$ and $V = p(y)$. It suffices to prove that G induces an injection (resp. bijection) between morphism $x \to y$ lying over f to morphisms $G(x) \to G(y)$ lying over f for any morphism $f : U \to V$. Now fix $f : U \to V$. Denote $f^*y \to y$ a pullback. Then also $G(f^*y) \to G(y)$ is a pullback. The set of morphisms from x to y lying over f is bijective to the set of morphisms between x and f^*y lying over id_U. (By the second axiom of a category fibred in groupoids.) Similarly the set of morphisms from $G(x)$ to $G(y)$ lying over f is bijective to the set of morphisms between $G(x)$ and $G(f^*y)$ lying over id_U. Hence the fact that G_U is faithful (resp. fully faithful) gives the desired result.

Finally suppose for all G_U is an equivalence for all U, so it is fully faithful and essentially surjective. We have seen this implies G is fully faithful, and thus to prove it is an equivalence we have to prove that it is essentially surjective. This is clear, for if $z' \in Ob(\mathcal{S}')$ then $z' \in Ob(\mathcal{S}'_U)$ where $U = p'(z')$. Since G_U is essentially surjective we know that z' is isomorphic, in $\mathcal{S}'_U$, to an object of the form $G_U(z)$ for some $z \in Ob(\mathcal{S}_U)$. But morphisms in $\mathcal{S}'_U$ are morphisms in $\mathcal{S}'$ and hence z' is isomorphic to $G(z)$ in $\mathcal{S}'$. □

Lemma 4.32.9. *Let $\mathcal{C}$ be a category. Let $p : \mathcal{S} \to \mathcal{C}$ and $p' : \mathcal{S}' \to \mathcal{C}$ be categories fibred in groupoids. Let $G : \mathcal{S} \to \mathcal{S}'$ be a functor over $\mathcal{C}$. Then G is fully faithful if and only if the diagonal*

$$\Delta_G : \mathcal{S} \longrightarrow \mathcal{S} \times_{G, \mathcal{S}', G} \mathcal{S}$$

is an equivalence.

Proof. By Lemma 4.32.8 it suffices to look at fibre categories over an object U of $\mathcal{C}$. An object of the right hand side is a triple (x, x', α) where $\alpha : G(x) \to G(x')$ is a morphism in $\mathcal{S}'_U$. The functor Δ_G maps the object x of $\mathcal{S}_U$ to the triple $(x, x, \mathrm{id}_{G(x)})$. Note that (x, x', α) is in the essential image of Δ_G if and only if $\alpha = G(\beta)$ for some morphism $\beta : x \to x'$ in $\mathcal{S}_U$ (details omitted). Hence in order for Δ_G to be an equivalence, every α has to be the image of a morphism $\beta : x \to x'$, and also every two distinct morphisms $\beta, \beta' : x \to x'$ have to given distinct morphisms $G(\beta), G(\beta')$. This proves one direction of the lemma. We omit the proof of the other direction. □

Lemma 4.32.10. *Let $\mathcal{C}$ be a category. Let $\mathcal{S}_i$, $i = 1, 2, 3, 4$ be categories fibred in groupoids over $\mathcal{C}$. Suppose that $\varphi : \mathcal{S}_1 \to \mathcal{S}_2$ and $\psi : \mathcal{S}_3 \to \mathcal{S}_4$ are equivalences over $\mathcal{C}$. Then*

$$Mor_{Cat/\mathcal{C}}(\mathcal{S}_2, \mathcal{S}_3) \longrightarrow Mor_{Cat/\mathcal{C}}(\mathcal{S}_1, \mathcal{S}_4), \quad \alpha \longmapsto \psi \circ \alpha \circ \varphi$$

is an equivalence of categories.

Proof. This is a generality and holds in any 2-category. □

Lemma 4.32.11. *Let $\mathcal{C}$ be a category. If $p : \mathcal{S} \to \mathcal{C}$ is fibred in groupoids, then so is the inertia fibred category $\mathcal{I}_\mathcal{S} \to \mathcal{C}$.*

Proof. Clear from the construction in Lemma 4.31.1 or by using (from the same lemma) that $I_\mathcal{S} \to \mathcal{S} \times_{\Delta, \mathcal{S} \times_\mathcal{C} \mathcal{S}, \Delta} \mathcal{S}$ is an equivalence and appealing to Lemma 4.32.7. $\square$

Lemma 4.32.12. *Let $\mathcal{C}$ be a category. Let $U \in Ob(\mathcal{C})$. If $p : \mathcal{S} \to \mathcal{C}$ is a category fibred in groupoids and p factors through $p' : \mathcal{S} \to \mathcal{C}/U$ then $p' : \mathcal{S} \to \mathcal{C}/U$ is fibred in groupoids.*

Proof. We have already seen in Lemma 4.30.10 that p' is a fibred category. Hence it suffices to prove the fibre categories are groupoids, see Lemma 4.32.2. For $V \in Ob(\mathcal{C})$ we have

$$\mathcal{S}_V = \coprod\nolimits_{f : V \to U} \mathcal{S}_{(f : V \to U)}$$

where the left hand side is the fibre category of p and the right hand side is the disjoint union of the fibre categories of p'. Hence the result. $\square$

Lemma 4.32.13. *Let $p : \mathcal{S} \to \mathcal{C}$ be a category fibred in groupoids. Let $x \to y$ and $z \to y$ be morphisms of $\mathcal{S}$. If $p(x) \times_{p(y)} p(z)$ exists, then $x \times_y z$ exists and $p(x \times_y z) = p(x) \times_{p(y)} p(z)$.*

Proof. Follows from Lemma 4.30.11. $\square$

Lemma 4.32.14. *Let $\mathcal{C}$ be a category. Let $F : \mathcal{X} \to \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $\mathcal{C}$. There exists a factorization $\mathcal{X} \to \mathcal{X}' \to \mathcal{Y}$ by 1-morphisms of categories fibred in groupoids over $\mathcal{C}$ such that $\mathcal{X} \to \mathcal{X}'$ is an equivalence over $\mathcal{C}$ and such that $\mathcal{X}'$ is a category fibred in groupoids over $\mathcal{Y}$.*

Proof. Denote $p : \mathcal{X} \to \mathcal{C}$ and $q : \mathcal{Y} \to \mathcal{C}$ the structure functors. We construct $\mathcal{X}'$ explicitly as follows. An object of $\mathcal{X}'$ is a quadruple (U, x, y, f) where $x \in Ob(\mathcal{X}_U)$, $y \in Ob(\mathcal{Y}_U)$ and $f : F(x) \to y$ is an isomorphism in $\mathcal{Y}_U$. A morphism $(a, b) : (U, x, y, f) \to (U', x', y', f')$ is given by $a : x \to x'$ and $b : y \to y'$ with $p(a) = q(b)$ and such that $f' \circ F(a) = b \circ f$. In other words $\mathcal{X}' = \mathcal{X} \times_{F, \mathcal{Y}, \mathrm{id}} \mathcal{Y}$ with the construction of the 2-fibre product from Lemma 4.29.3. By Lemma 4.32.7 we see that $\mathcal{X}'$ is a category fibred in groupoids over $\mathcal{C}$ and that $\mathcal{X}' \to \mathcal{Y}$ is a morphism of categories over $\mathcal{C}$. As functor $\mathcal{X} \to \mathcal{X}'$ we take $x \mapsto (p(x), x, F(x), \mathrm{id}_{F(x)})$ on objects and $(a : x \to x') \mapsto (a, F(a))$ on morphisms. It is clear that the composition $\mathcal{X} \to \mathcal{X}' \to \mathcal{Y}$ equals F. We omit the verification that $\mathcal{X} \to \mathcal{X}'$ is an equivalence of fibred categories over $\mathcal{C}$.

Finally, we have to show that $\mathcal{X}' \to \mathcal{Y}$ is a category fibred in groupoids. Let $b : y' \to y$ be a morphism in $\mathcal{Y}$ and let (U, x, y, f) be an object of $\mathcal{X}'$ lying over y. Because $\mathcal{X}$ is fibred in groupoids over $\mathcal{C}$ we can find a morphism $a : x' \to x$ lying over $U' = q(y') \to q(y) = U$. Since $\mathcal{Y}$ is fibred in groupoids over $\mathcal{C}$ and since both $F(x') \to F(x)$ and $y' \to y$ lie over the same morphism $U' \to U$ we can find $f' : F(x') \to y'$ lying over $\mathrm{id}_{U'}$ such that $f \circ F(a) = b \circ f'$. Hence we obtain $(a, b) : (U', x', y', f') \to (U, x, y, f)$. This verifies the first condition (1) of Definition 4.32.1. To see (2) let $(a, b) : (U', x', y', f') \to (U, x, y, f)$ and $(a', b') : (U'', x'', y'', f'') \to (U, x, y, f)$ be morphisms of $\mathcal{X}'$ and let $b'' : y' \to y''$ be a morphism of $\mathcal{Y}$ such that $b' \circ b'' = b$. We have to show that there exists a unique morphism $a'' : x' \to x''$ such that $f'' \circ F(a'') = b'' \circ f'$ and such that $(a', b') \circ (a'', b'') = (a, b)$. Because $\mathcal{X}$ is fibred in groupoids we know there exists a unique morphism $a'' : x' \to x''$ such that $a' \circ a'' = a$ and $p(a'') = q(b'')$. Because $\mathcal{Y}$ is fibred in groupoids we see that $F(a'')$ is the unique morphism $F(x') \to F(x'')$ such that $F(a') \circ F(a'') = F(a)$ and $q(F(a'')) = q(b'')$. The relation $f'' \circ F(a'') = b'' \circ f'$ follows from this and the given relations $f \circ F(a) = b \circ f'$ and $f \circ F(a') = b' \circ f''$. $\square$

Lemma 4.32.15. *Let $\mathcal{C}$ be a category. Let $F : \mathcal{X} \to \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $\mathcal{C}$. Assume we have a 2-commutative diagram*

$$\begin{tikzcd} \mathcal{X}' \arrow[dr, "f"'] & \mathcal{X} \arrow[l, "a"'] \arrow[r, "b"] \arrow[d, "F"] & \mathcal{X}'' \arrow[dl, "g"] \\ & \mathcal{Y} & \end{tikzcd}$$

where a and b are equivalences of categories over $\mathcal{C}$ and f and g are categories fibred in groupoids. Then there exists an equivalence $h : \mathcal{X}'' \to \mathcal{X}'$ of categories over $\mathcal{Y}$ such that $h \circ b$ is 2-isomorphic to a as 1-morphisms of categories over $\mathcal{C}$. If the diagram above actually commutes, then we can arrange it so that $h \circ b$ is 2-isomorphic to a as 1-morphisms of categories over $\mathcal{Y}$.

Proof. We will show that both $\mathcal{X}'$ and $\mathcal{X}''$ over $\mathcal{Y}$ are equivalent to the category fibred in groupoids $\mathcal{X} \times_{F,\mathcal{Y},\mathrm{id}} \mathcal{Y}$ over $\mathcal{Y}$, see proof of Lemma 4.32.14. Choose a quasi-inverse $b^{-1} : \mathcal{X}'' \to \mathcal{X}$ in the 2-category of categories over $\mathcal{C}$. Since the right triangle of the diagram is 2-commutative we see that

$$\begin{tikzcd} \mathcal{X} \arrow[d, "F"'] & \mathcal{X}'' \arrow[l, "b^{-1}"'] \arrow[d, "g"] \\ \mathcal{Y} & \mathcal{Y} \arrow[l] \end{tikzcd}$$

is 2-commutative. Hence we obtain a 1-morphism $c : \mathcal{X}'' \to \mathcal{X} \times_{F,\mathcal{Y},\mathrm{id}} \mathcal{Y}$ by the universal property of the 2-fibre product. Moreover c is a morphism of categories over $\mathcal{Y}$ (!) and an equivalence (by the assumption that b is an equivalence, see Lemma 4.28.7). Hence c is an equivalence in the 2-category of categories fibred in groupoids over $\mathcal{Y}$ by Lemma 4.32.8.

We still have to construct a 2-isomorphism between $c \circ b$ and the functor $d : \mathcal{X} \to \mathcal{X} \times_{F,\mathcal{Y},\mathrm{id}} \mathcal{Y}$, $x \mapsto (p(x), x, F(x), \mathrm{id}_{F(x)})$ constructed in the proof of Lemma 4.32.14. Let $\alpha : F \to g \circ b$ and $\beta : b^{-1} \circ b \to \mathrm{id}$ be 2-isomorphisms between 1-morphisms of categories over $\mathcal{C}$. Note that $c \circ b$ is given by the rule

$$x \mapsto (p(x), b^{-1}(b(x)), g(b(x)), \alpha_x \circ F(\beta_x))$$

on objects. Then we see that

$$(\beta_x, \alpha_x) : (p(x), x, F(x), \mathrm{id}_{F(x)}) \longrightarrow (p(x), b^{-1}(b(x)), g(b(x)), \alpha_x \circ F(\beta_x))$$

is a functorial isomorphism which gives our 2-morphism $d \to b \circ c$. Finally, if the diagram commutes then α_x is the identity for all x and we see that this 2-morphism is a 2-morphism in the 2-category of categories over $\mathcal{Y}$. $\square$

4.33. Presheaves of categories

In this section we compare the notion of fibred categories with the closely related notion of a ``presheaf of categories''. The basic construction is explained in the following example.

Example 4.33.1. Let $\mathcal{C}$ be a category. Suppose that $F : \mathcal{C}^{opp} \to \textit{Cat}$ is a functor to the 2-category of categories, see Definition 4.26.5. For $f : V \to U$ in $\mathcal{C}$ we will suggestively write $F(f) = f^*$ for the functor from $F(U)$ to $F(V)$. From this we can construct a fibred category $\mathcal{S}_F$ over $\mathcal{C}$ as follows. Define

$$Ob(\mathcal{S}_F) = \{(U, x) \mid U \in Ob(\mathcal{C}), x \in Ob(F(U))\}.$$

For $(U, x), (V, y) \in Ob(\mathcal{S}_F)$ we define

$$\begin{aligned} Mor_{\mathcal{S}_F}((V, y), (U, x)) &= \{(f, \phi) \mid f \in Mor_{\mathcal{C}}(V, U), \phi \in Mor_{F(V)}(y, f^*x)\} \\ &= \coprod\nolimits_{f \in Mor_{\mathcal{C}}(V,U)} Mor_{F(V)}(y, f^*x) \end{aligned}$$

In order to define composition we use that $g^* \circ f^* = (f \circ g)^*$ for a pair of composable morphisms of $\mathcal{C}$ (by definition of a functor into a 2-category). Namely, we define the composition of $\psi : z \to g^*y$ and $\phi : y \to f^*x$ to be $g^*(\phi) \circ \psi$. The functor $p_F : \mathcal{S}_F \to \mathcal{C}$ is given by the rule $(U, x) \mapsto U$. Let us check that this is indeed a fibred category. Given $f : V \to U$ in $\mathcal{C}$ and (U, x) a lift of U, then we claim $(f, id_{f^*x}) : (V, f^*x) \to (U, x)$ is a strongly cartesian lift of f. We have to show a h in the diagram on the left determines (h, ν) on the right:

$$\begin{tikzcd} V \arrow[r, "f"] & U \\ W \arrow[u, dashed, "h"] \arrow[ur, "g"'] & \end{tikzcd} \qquad \begin{tikzcd} (V, f^*x) \arrow[r, "{(f,\mathrm{id}_{f^*x})}"] & (U, x) \\ (W, z) \arrow[u, dashed, "{(h,\nu)}"] \arrow[ur, "{(g,\psi)}"'] & \end{tikzcd}$$

Just take $\nu = \psi$ which works because $f \circ h = g$ and hence $g^*x = h^*f^*x$. Moreover, this is the only lift making the diagram (on the right) commute.

Definition 4.33.2. Let $\mathcal{C}$ be a category. Suppose that $F : \mathcal{C}^{opp} \to Cat$ is a functor to the 2-category of categories. We will write $p_F : \mathcal{S}_F \to \mathcal{C}$ for the fibred category constructed in Example 4.33.1. A *split fibred category* is a fibred category isomorphic (!) over $\mathcal{C}$ to one of these categories $\mathcal{S}_F$.

Lemma 4.33.3. *Let $\mathcal{C}$ be a category. Let $\mathcal{S}$ be a fibred category over $\mathcal{C}$. Then $\mathcal{S}$ is split if and only if for some choice of pullbacks (see Definition 4.30.5) the pullback functors $(f \circ g)^*$ and $g^* \circ f^*$ are equal.*

Proof. This is immediate from the definitions. □

Lemma 4.33.4. *Let $p : \mathcal{S} \to \mathcal{C}$ be a fibred category. There exists a functor $F : \mathcal{C} \to Cat$ such that $\mathcal{S}$ is equivalent to $\mathcal{S}_F$ in the 2-category of fibred categories over $\mathcal{C}$. In other words, every fibred category is equivalent to a split one.*

Proof. Let us make a choice of pullbacks (see Definition 4.30.5). By Lemma 4.30.6 we get pullback functors f^* for every morphism f of $\mathcal{C}$.

We construct a new category $\mathcal{S}'$ as follows. The objects of $\mathcal{S}'$ are pairs (x, f) consisting of a morphism $f : V \to U$ of $\mathcal{C}$ and an object x of $\mathcal{S}$ over U, i.e., $x \in Ob(\mathcal{S}_U)$. The functor $p' : \mathcal{S}' \to \mathcal{C}$ will map the pair (x, f) to the source of the morphism f, in other words $p'(x, f : V \to U) = V$. A morphism $\varphi : (x_1, f_1 : V_1 \to U_1) \to (x_2, f_2 : V_2 \to U_2)$ is given by a pair (φ, g) consisting of a morphism $g : V_1 \to V_2$ and a morphism $\varphi : f_1^*x_1 \to f_2^*x_2$ with $p(\varphi) = g$. It is no problem to define the composition law: $(\varphi, g) \circ (\psi, h) = (\varphi \circ \psi, g \circ h)$ for any pair of composable morphisms. There is a natural functor $\mathcal{S} \to \mathcal{S}'$ which simply maps x over U to the pair (x, id_x).

At this point we need to check that p' makes $\mathcal{S}'$ into a fibred category over $\mathcal{C}$, and we need to check that $\mathcal{S} \to \mathcal{S}'$ is an equivalence of categories over $\mathcal{C}$ which maps strongly cartesian morphisms to strongly cartesian morphisms. We omit the verifications.

Finally, we can define pullback functors on $\mathcal{S}'$ by setting $g^*(x, f) = (x, f \circ g)$ on objects if $g : V' \to V$ and $f : V \to U$. On morphisms $(\varphi, \mathrm{id}_V) : (x_1, f_1) \to (x_2, f_2)$ between morphisms in $\mathcal{S}'_V$ we set $g^*(\varphi, \text{id}_V) = (g^*\varphi, \text{id}_{V'})$ where we use the unique identifications $g^* f_i^* x_i = (f_i \circ g)^* x_i$ from Lemma 4.30.6 to think of $g^*\varphi$ as a morphism from $(f_1 \circ g)^* x_1$ to $(f_2 \circ g)^* x_2$. Clearly, these pullback functors g^* have the property that $g_1^* \circ g_2^* = (g_2 \circ g_1)^*$, in other words $\mathcal{S}'$ is split as desired. □

4.34. Presheaves of groupoids

In this section we compare the notion of categories fibred in groupoids with the closely related notion of a ``presheaf of groupoids''. The basic construction is explained in the following example.

Example 4.34.1. This example is the analogue of Example 4.33.1, for ``presheaves of groupoids'' instead of ``presheaves of categories''. The output will be a category fibred in groupoids instead of a fibred category. Suppose that $F : \mathcal{C}^{opp} \to \text{Groupoids}$ is a functor to the category of groupoids, see Definition 4.26.5. For $f : V \to U$ in $\mathcal{C}$ we will suggestively write $F(f) = f^*$ for the functor from $F(U)$ to $F(V)$. We construct a category $\mathcal{S}_F$ fibred in groupoids over $\mathcal{C}$ as follows. Define

$$Ob(\mathcal{S}_F) = \{(U, x) \mid U \in Ob(\mathcal{C}), x \in Ob(F(U))\}.$$

For $(U, x), (V, y) \in Ob(\mathcal{S}_F)$ we define

$$\begin{aligned} Mor_{\mathcal{S}_F}((V, y), (U, x)) &= \{(f, \phi) \mid f \in Mor_{\mathcal{C}}(V, U), \phi \in Mor_{F(V)}(y, f^* x)\} \\ &= \coprod\nolimits_{f \in Mor_{\mathcal{C}}(V,U)} Mor_{F(V)}(y, f^* x) \end{aligned}$$

In order to define composition we use that $g^* \circ f^* = (f \circ g)^*$ for a pair of composable morphisms of $\mathcal{C}$ (by definition of a functor into a 2-category). Namely, we define the composition of $\psi : z \to g^* y$ and $\phi : y \to f^* x$ to be $g^*(\phi) \circ \psi$. The functor $p_F : \mathcal{S}_F \to \mathcal{C}$ is given by the rule $(U, x) \mapsto U$. The condition that $F(U)$ is a groupoid for every U guarantees that $\mathcal{S}_F$ is fibred in groupoids over $\mathcal{C}$, as we have already seen in Example 4.33.1 that $\mathcal{S}_F$ is a fibred category, see Lemma 4.32.2. But we can also prove conditions (1), (2) of Definition 4.32.1 directly as follows: (1) Lifts of morphisms exist since given $f : V \to U$ in $\mathcal{C}$ and (U, x) an object of $\mathcal{S}_F$ over U, then $(f, id_{f^* x}) : (V, f^* x) \to (U, x)$ is a lift of f. (2) Suppose given solid diagrams as follows

$$\begin{tikzcd} V \arrow[r, "f"] & U \\ W \arrow[u, dashed, "h"] \arrow[ru, "g"'] & \end{tikzcd} \qquad \begin{tikzcd} (V, y) \arrow[r, "{(f,\phi)}"] & (U, x) \\ (W, z) \arrow[u, dashed, "{(h,\nu)}"] \arrow[ru, "{(g,\psi)}"'] & \end{tikzcd}$$

Then for the dotted arrows we have $\nu = (h^* \phi)^{-1} \circ \psi$ so given h there exists a ν which is unique by uniqueness of inverses.

Definition 4.34.2. Let $\mathcal{C}$ be a category. Suppose that $F : \mathcal{C}^{opp} \to \textit{Groupoids}$ is a functor to the 2-category of groupoids. We will write $p_F : \mathcal{S}_F \to \mathcal{C}$ for the category fibred in groupoids constructed in Example 4.34.1. A *split category fibred in groupoids* is a category fibred in groupoids isomorphic (!) over $\mathcal{C}$ to one of these categories $\mathcal{S}_F$.

Lemma 4.34.3. *Let $p : \mathcal{S} \to \mathcal{C}$ be a category fibred in groupoids. There exists a functor $F : \mathcal{C} \to \textit{Groupoids}$ such that $\mathcal{S}$ is equivalent to $\mathcal{S}_F$ over $\mathcal{C}$. In other words, every category fibred in groupoids is equivalent to a split one.*

Proof. Make a choice of pullbacks (see Definition 4.30.5). By Lemmas 4.30.6 and 4.32.2 we get pullback functors f^* for every morphism f of $\mathcal{C}$.

We construct a new category $\mathcal{S}'$ as follows. The objects of $\mathcal{S}'$ are pairs (x, f) consisting of a morphism $f : V \to U$ of $\mathcal{C}$ and an object x of $\mathcal{S}$ over U, i.e., $x \in Ob(\mathcal{S}_U)$. The functor $p' : \mathcal{S}' \to \mathcal{C}$ will map the pair (x, f) to the source of the morphism f, in other words $p'(x, f : V \to U) = V$. A morphism $\varphi : (x_1, f_1 : V_1 \to U_1) \to (x_2, f_2 : V_2 \to U_2)$ is given by a pair (φ, g) consisting of a morphism $g : V_1 \to V_2$ and a morphism $\varphi : f_1^* x_1 \to f_2^* x_2$ with $p(\varphi) = g$. It is no problem to define the composition law: $(\varphi, g) \circ (\psi, h) = (\varphi \circ \psi, g \circ h)$ for any pair of composable morphisms. There is a natural functor $\mathcal{S} \to \mathcal{S}'$ which simply maps x over U to the pair (x, id_x).

At this point we need to check that p' makes $\mathcal{S}'$ into a category fibred in groupoids over $\mathcal{C}$, and we need to check that $\mathcal{S} \to \mathcal{S}'$ is an equivalence of categories over $\mathcal{C}$. We omit the verifications.

Finally, we can define pullback functors on $\mathcal{S}'$ by setting $g^*(x, f) = (x, f \circ g)$ on objects if $g : V' \to V$ and $f : V \to U$. On morphisms $(\varphi, \mathrm{id}_V) : (x_1, f_1) \to (x_2, f_2)$ between morphisms in $\mathcal{S}'_V$ we set $g^*(\varphi, \mathrm{id}_V) = (g^*\varphi, \mathrm{id}_{V'})$ where we use the unique identifications $g^* f_i^* x_i = (f_i \circ g)^* x_i$ from Lemma 4.32.2 to think of $g^*\varphi$ as a morphism from $(f_1 \circ g)^* x_1$ to $(f_2 \circ g)^* x_2$. Clearly, these pullback functors g^* have the property that $g_1^* \circ g_2^* = (g_2 \circ g_1)^*$, in other words $\mathcal{S}'$ is split as desired. $\square$

We will see an alternative proof of this lemma in Section 4.38.

4.35. Categories fibred in sets

Definition 4.35.1. A category is called *discrete* if the only morphisms are the identity morphisms.

A discrete category has only one interesting piece of information: its set of objects. Thus we sometime confuse discrete categories with sets.

Definition 4.35.2. Let $\mathcal{C}$ be a category. A *category fibred in sets*, or a *category fibred in discrete categories* is a category fibred in groupoids all of whose fibre categories are discrete.

We want to clarify the relationship between categories fibred in sets and presheaves (see Definition 4.3.3). To do this it makes sense to first make the following definition.

Definition 4.35.3. Let $\mathcal{C}$ be a category. The 2-*category of categories fibred in sets over* $\mathcal{C}$ is the sub 2-category of the category of categories fibred in groupoids over $\mathcal{C}$ (see Definition 4.32.6) defined as follows:

(1) Its objects will be categories $p : \mathcal{S} \to \mathcal{C}$ fibred in sets.
(2) Its 1-morphisms $(\mathcal{S}, p) \to (\mathcal{S}', p')$ will be functors $G : \mathcal{S} \to \mathcal{S}'$ such that $p' \circ G = p$ (since every morphism is strongly cartesian G automatically preserves them).
(3) Its 2-morphisms $t : G \to H$ for $G, H : (\mathcal{S}, p) \to (\mathcal{S}', p')$ will be morphisms of functors such that $p'(t_x) = \mathrm{id}_{p(x)}$ for all $x \in Ob(\mathcal{S})$.

Note that every 2-morphism is automatically an isomorphism. Hence this 2-category is actually a $(2, 1)$-category. Here is the obligatory lemma on the existence of 2-fibre products.

Lemma 4.35.4. *Let $\mathcal{C}$ be a category. The 2-category of categories fibred in sets over $\mathcal{C}$ has 2-fibre products. More precisely, the 2-fibre product described in Lemma 4.29.3 returns a category fibred in sets if one starts out with such.*

Proof. Omitted. □

Example 4.35.5. This example is the analogue of Examples 4.33.1 and 4.34.1 for presheaves instead of ``presheaves of categories". The output will be a category fibred in sets instead of a fibred category. Suppose that $F : \mathcal{C}^{opp} \to Sets$ is a presheaf. For $f : V \to U$ in $\mathcal{C}$ we will suggestively write $F(f) = f^* : F(U) \to F(V)$. We construct a category $\mathcal{S}_F$ fibred in sets over $\mathcal{C}$ as follows. Define

$$Ob(\mathcal{S}_F) = \{(U, x) \mid U \in Ob(\mathcal{C}), x \in Ob(F(U))\}.$$

For $(U, x), (V, y) \in Ob(\mathcal{S}_F)$ we define

$$Mor_{\mathcal{S}_F}((V, y), (U, x)) = \{f \in Mor_{\mathcal{C}}(V, U) \mid f^*x = y\}$$

Composition is inherited from composition in $\mathcal{C}$ which works as $g^* \circ f^* = (f \circ g)^*$ for a pair of composable morphisms of $\mathcal{C}$. The functor $p_F : \mathcal{S}_F \to \mathcal{C}$ is given by the rule $(U, x) \mapsto U$. As every fibre category $\mathcal{S}_{F,U}$ is discrete with underlying set $F(U)$ and we have already see in Example 4.34.1 that $\mathcal{S}_F$ is a category fibred in groupoids, we conclude that $\mathcal{S}_F$ is fibred in sets.

Lemma 4.35.6. *Let $\mathcal{C}$ be a category. The only 2-morphisms between categories fibred in sets are identities. In other words, the 2-category of categories fibred in sets is a category. Moreover, there is an equivalence of categories*

$$\left\{ \begin{array}{c} \text{the category of presheaves} \\ \text{of sets over } \mathcal{C} \end{array} \right\} \leftrightarrow \left\{ \begin{array}{c} \text{the category of categories} \\ \text{fi}\mathcal{C} \end{array} \right\}$$

The functor from left to right is the construction $F \to \mathcal{S}_F$ discussed in Example 4.35.5. The functor from right to left assigns to $p : \mathcal{S} \to \mathcal{C}$ the presheaf of objects $U \mapsto Ob(\mathcal{S}_U)$.

Proof. The first assertion is clear, as the only morphisms in the fibre categories are identities.

Suppose that $p : \mathcal{S} \to \mathcal{C}$ is fibred in sets. Let $f : V \to U$ be a morphism in $\mathcal{C}$ and let $x \in Ob(\mathcal{S}_U)$. Then there is exactly one choice for the object f^*x. Thus we see that $(f \circ g)^*x = g^*(f^*x)$ for f, g as in Lemma 4.32.2. It follows that we may think of the assignments $U \mapsto Ob(\mathcal{S}_U)$ and $f \mapsto f^*$ as a presheaf on $\mathcal{C}$. □

Here is an important example of a category fibred in sets.

Example 4.35.7. Let $\mathcal{C}$ be a category. Let $X \in Ob(\mathcal{C})$. Consider the representable presheaf $h_X = Mor_{\mathcal{C}}(-, X)$ (see Example 4.3.4). On the other hand, consider the category $p : \mathcal{C}/X \to \mathcal{C}$ from Example 4.2.13. The fibre category $(\mathcal{C}/X)_U$ has as objects morphisms $h : U \to X$, and only identities as morphisms. Hence we see that under the correspondence of Lemma 4.35.6 we have

$$h_X \longleftrightarrow \mathcal{C}/X.$$

In other words, the category $\mathcal{C}/X$ is canonically equivalent to the category $\mathcal{S}_{h_X}$ associated to h_X in Example 4.35.5.

For this reason it is tempting to define a ``representable" object in the 2-category of categories fibred in groupoids to be a category fibred in sets whose associated presheaf is representable. However, this is would not be a good definition for use since we prefer to have a notion which is invariant under equivalences. To make this precise we study exactly which categories fibred in groupoids are equivalent to categories fibred in sets.

4.36. Categories fibred in setoids

Definition 4.36.1. Let us call a category a *setoid*[4] if it is a groupoid where every object has exactly one automorphism: the identity.

If C is a set with an equivalence relation $\sim$, then we can make a setoid $\mathcal{C}$ as follows: $Ob(\mathcal{C}) = C$ and $Mor_{\mathcal{C}}(x, y) = \emptyset$ unless $x \sim y$ in which case we set $Mor_{\mathcal{C}}(x, y) = \{1\}$. Transitivity of $\sim$ means that we can compose morphisms. Conversely any setoid category defines an equivalence relation on its objects (isomorphism) such that you recover the category (up to unique isomorphism -- not equivalence) from the procedure just described.

Discrete categories are setoids. For any setoid $\mathcal{C}$ there is a canonical procedure to make a discrete category equivalent to it, namely one replaces $Ob(\mathcal{C})$ by the set of isomorphism classes (and adds identity morphisms). In terms of sets endowed with an equivalence relation this corresponds to taking the quotient by the equivalence relation.

Definition 4.36.2. Let $\mathcal{C}$ be a category. A *category fibred in setoids* is a category fibred in groupoids all of whose fibre categories are setoids.

Below we will clarify the relationship between categories fibred in setoids and categories fibred in sets.

Definition 4.36.3. Let $\mathcal{C}$ be a category. The 2-*category of categories fibred in setoids over* $\mathcal{C}$ is the sub 2-category of the category of categories fibred in groupoids over $\mathcal{C}$ (see Definition 4.32.6) defined as follows:

(1) Its objects will be categories $p : \mathcal{S} \to \mathcal{C}$ fibred in setoids.
(2) Its 1-morphisms $(\mathcal{S}, p) \to (\mathcal{S}', p')$ will be functors $G : \mathcal{S} \to \mathcal{S}'$ such that $p' \circ G = p$ (since every morphism is strongly cartesian G automatically preserves them).
(3) Its 2-morphisms $t : G \to H$ for $G, H : (\mathcal{S}, p) \to (\mathcal{S}', p')$ will be morphisms of functors such that $p'(t_x) = \mathrm{id}_{p(x)}$ for all $x \in Ob(\mathcal{S})$.

Note that every 2-morphism is automatically an isomorphism. Hence this 2-category is actually a $(2, 1)$-category.
Here is the obligatory lemma on the existence of 2-fibre products.

Lemma 4.36.4. *Let $\mathcal{C}$ be a category. The 2-category of categories fibred in setoids over $\mathcal{C}$ has 2-fibre products. More precisely, the 2-fibre product described in Lemma 4.29.3 returns a category fibred in setoids if one starts out with such.*

Proof. Omitted. $\square$

Lemma 4.36.5. *Let $\mathcal{C}$ be a category. Let $\mathcal{S}$ be a category over $\mathcal{C}$.*

(1) *If $\mathcal{S} \to \mathcal{S}'$ is an equivalence over $\mathcal{C}$ with $\mathcal{S}'$ fibred in sets over $\mathcal{C}$, then*
    (a) *$\mathcal{S}$ is fibred in setoids over $\mathcal{C}$, and*
    (b) *for each $U \in Ob(\mathcal{C})$ the map $Ob(\mathcal{S}_U) \to Ob(\mathcal{S}'_U)$ identifies the target as the set of isomorphism classes of the source.*
(2) *If $p : \mathcal{S} \to \mathcal{C}$ is a category fibred in setoids, then there exists a category fibred in sets $p' : \mathcal{S}' \to \mathcal{C}$ and an equivalence $can : \mathcal{S} \to \mathcal{S}'$ over $\mathcal{C}$.*

Proof. Let us prove (2). An object of the category $\mathcal{S}'$ will be a pair (U, ξ), where $U \in Ob(\mathcal{C})$ and ξ is an isomorphism class of objects of $\mathcal{S}_U$. A morphism $(U, \xi) \to (V, \psi)$ is given by a morphism $x \to y$, where $x \in \xi$ and $y \in \psi$. Here we identify two morphisms $x \to y$ and

[4] A set on steroids!?

$x' \to y'$ if they induce the same morphism $U \to V$, and if for some choices of isomorphisms $x \to x'$ in $\mathcal{S}_U$ and $y \to y'$ in $\mathcal{S}_V$ the compositions $x \to x' \to y'$ and $x \to y \to y'$ agree. By construction there are surjective maps on objects and morphisms from $\mathcal{S} \to \mathcal{S}'$. We define composition of morphisms in $\mathcal{S}'$ to be the unique law that turns $\mathcal{S} \to \mathcal{S}'$ into a functor. Some details omitted. $\square$

Thus categories fibred in setoids are exactly the categories fibred in groupoids which are equivalent to categories fibred in sets. Moreover, an equivalence of categories fibred in sets is an isomorphism by Lemma 4.35.6.

Lemma 4.36.6. *Let $\mathcal{C}$ be a category. The construction of Lemma 4.36.5 part (2) gives a functor*

$$F : \left\{ \begin{matrix} \textit{the 2-category of categories} \\ \textit{fi}\mathcal{C} \end{matrix} \right\} \longrightarrow \left\{ \begin{matrix} \textit{the category of categories} \\ \textit{fi}\mathcal{C} \end{matrix} \right\}$$

(see Definition 4.26.5). This functor is an equivalence in the following sense:

1. *for any two 1-morphisms $f, g : \mathcal{S}_1 \to \mathcal{S}_2$ with $F(f) = F(g)$ there exists a unique 2-isomorphism $f \to g$,*
2. *for any morphism $h : F(\mathcal{S}_1) \to F(\mathcal{S}_2)$ there exists a 1-morphism $f : \mathcal{S}_1 \to \mathcal{S}_2$ with $F(f) = h$, and*
3. *any category fibred in sets $\mathcal{S}$ is equal to $F(\mathcal{S})$.*

In particular, defining $F_i \in PSh(\mathcal{C})$ by the rule $F_i(U) = Ob(\mathcal{S}_{i,U})/\cong$, we have

$$Mor_{Cat/\mathcal{C}}(\mathcal{S}_1, \mathcal{S}_2)\Big/\text{2-isomorphism} = Mor_{PSh(\mathcal{C})}(F_1, F_2)$$

More precisely, given any map $\phi : F_1 \to F_2$ there exists a 1*-morphism $f : \mathcal{S}_1 \to \mathcal{S}_2$ which induces ϕ on isomorphism classes of objects and which is unique up to unique* 2*-isomorphism.*

Proof. By Lemma 4.35.6 the target of F is a category hence the assertion makes sense. The construction of Lemma 4.36.5 part (2) assigns to $\mathcal{S}$ the category fibred in sets whose value over U is the set of isomorphism classes in $\mathcal{S}_U$. Hence it is clear that it defines a functor as indicated. Let $f, g : \mathcal{S}_1 \to \mathcal{S}_2$ with $F(f) = F(g)$ be as in (1). For each object U of $\mathcal{C}$ and each object x of $\mathcal{S}_{1,U}$ we see that $f(x) \cong g(x)$ by assumption. As $\mathcal{S}_2$ is fibred in setoids there exists a unique isomorphism $t_x : f(x) \to g(x)$ in $\mathcal{S}_{2,U}$. Clearly the rule $x \mapsto t_x$ gives the desired 2-isomorphism $f \to g$. We omit the proofs of (2) and (3). To see the final assertion use Lemma 4.35.6 to see that the right hand side is equal to $Mor_{Cat(\mathcal{C})}(F(\mathcal{S}_1), F(\mathcal{S}_2))$ and apply (1) and (2) above. $\square$

Here is another characterization of categories fibred in setoids among all categories fibred in groupoids.

Lemma 4.36.7. *Let $\mathcal{C}$ be a category. Let $p : \mathcal{S} \to \mathcal{C}$ be a category fibred in groupoids. The following are equivalent:*

1. *$p : \mathcal{S} \to \mathcal{C}$ be a category fibred in setoids, and*
2. *the canonical* 1*-morphism $\mathcal{I}_\mathcal{S} \to \mathcal{S}$, see (4.31.2.1), is an equivalence (of categories over $\mathcal{C}$).*

Proof. Assume (2). The category $\mathcal{I}_\mathcal{S}$ has objects (x, α) where $x \in \mathcal{S}$, say with $p(x) = U$, and $\alpha : x \to x$ is a morphism in $\mathcal{S}_U$. Hence if $\mathcal{I}_\mathcal{S} \to \mathcal{S}$ is an equivalence over $\mathcal{C}$ then every pair of objects (x, α), (x, α') are isomorphic in the fibre category of $\mathcal{I}_\mathcal{S}$ over U. Looking at the definition of morphisms in $\mathcal{I}_\mathcal{S}$ we conclude that α, α' are conjugate in the group of automorphisms of x. Hence taking $\alpha' = \mathrm{id}_x$ we conclude that every automorphism of x is equal to the identity. Since $\mathcal{S} \to \mathcal{C}$ is fibred in groupoids this implies that $\mathcal{S} \to \mathcal{C}$ is fibred in setoids. We omit the proof of (1) $\Rightarrow$ (2). $\square$

Lemma 4.36.8. *Let $\mathcal{C}$ be a category. The construction of Lemma 4.36.6 which associates to a category fibred in setoids a presheaf is compatible with products, in the sense that the presheaf associated to a 2-fibre product $\mathcal{X} \times_{\mathcal{Y}} \mathcal{Z}$ is the fibre product of the presheaves associated to $\mathcal{X}, \mathcal{Y}, \mathcal{Z}$.*

Proof. Let $U \in Ob(\mathcal{C})$. The lemma just says that

$$Ob((\mathcal{X} \times_{\mathcal{Y}} \mathcal{Z})_U)/\cong \quad \text{equals} \quad Ob(\mathcal{X}_U)/\cong \times_{Ob(\mathcal{Y}_U)/\cong} Ob(\mathcal{Z}_U)/\cong$$

the proof of which we omit. (But note that this would not be true in general if the category $\mathcal{Y}_U$ is not a setoid.) $\square$

4.37. Representable categories fibred in groupoids

Here is our definition of a representable category fibred in groupoids. As promised this is invariant under equivalences.

Definition 4.37.1. Let $\mathcal{C}$ be a category. A category fibred in groupoids $p : \mathcal{S} \to \mathcal{C}$ is called *representable* if there exists an object X of $\mathcal{C}$ and an equivalence $j : \mathcal{S} \to \mathcal{C}/X$ (in the 2-category of groupoids over $\mathcal{C}$).

The usual abuse of notation is to say that X *represents* $\mathcal{S}$ and not mention the equivalence j. We spell out what this entails.

Lemma 4.37.2. *Let $\mathcal{C}$ be a category. Let $p : \mathcal{S} \to \mathcal{C}$ be a category fibred in groupoids.*

(1) *$\mathcal{S}$ is representable if and only if the following conditions are satisfied:*
   (a) *$\mathcal{S}$ is fibred in setoids, and*
   (b) *the presheaf $U \mapsto Ob(\mathcal{S}_U)/\cong$ is representable.*
(2) *If $\mathcal{S}$ is representable the pair (X, j), where j is the equivalence $j : \mathcal{S} \to \mathcal{C}/X$ is uniquely determined up to isomorphism.*

Proof. The first assertion follows immediately from Lemma 4.36.5. For the second, suppose that $j' : \mathcal{S} \to \mathcal{C}/X'$ is a second such pair. Choose a 1-morphism $t' : \mathcal{C}/X' \to \mathcal{S}$ such that $j' \circ t' \cong \mathrm{id}_{\mathcal{C}/X'}$ and $t' \circ j' \cong \mathrm{id}_{\mathcal{S}}$. Then $j \circ t' : \mathcal{C}/X' \to \mathcal{C}/X$ is an equivalence. Hence it is an isomorphism, see Lemma 4.35.6. Hence by the Yoneda Lemma 4.3.5 (via Example 4.35.7 for example) it is given by an isomorphism $X' \to X$. $\square$

Lemma 4.37.3. *Let $\mathcal{C}$ be a category. Let $\mathcal{X}$, $\mathcal{Y}$ be categories fibred in groupoids over $\mathcal{C}$. Assume that $\mathcal{X}$, $\mathcal{Y}$ are representable by objects X, Y of $\mathcal{C}$. Then*

$$Mor_{Cat/\mathcal{C}}(\mathcal{X}, \mathcal{Y}) \Big/ \textit{2-isomorphism} = Mor_{\mathcal{C}}(X, Y)$$

More precisely, given $\phi : X \to Y$ there exists a 1-morphism $f : \mathcal{X} \to \mathcal{Y}$ which induces ϕ on isomorphism classes of objects and which is unique up to unique 2-isomorphism.

Proof. By Example 4.35.7 we have $\mathcal{C}/X = \mathcal{S}_{h_X}$ and $\mathcal{C}/Y = \mathcal{S}_{h_Y}$. By Lemma 4.36.6 we have

$$Mor_{Cat/\mathcal{C}}(\mathcal{X}, \mathcal{Y}) \Big/ \text{2-isomorphism} = Mor_{PSh(\mathcal{C})}(h_X, h_Y)$$

By the Yoneda Lemma 4.3.5 we have $Mor_{PSh(\mathcal{C})}(h_X, h_Y) = Mor_{\mathcal{C}}(X, Y)$. $\square$

4.38. Representable 1-morphisms

Let $\mathcal{C}$ be a category. In this section we explain what it means for a 1-morphism between categories fibred in groupoids over $\mathcal{C}$ to be representable. Note that the 2-category of categories fibred in groupoids over $\mathcal{C}$ is a ``full'' sub 2-category of the 2-category of categories over $\mathcal{C}$ (see Definition 4.32.6). Hence if $\mathcal{S}$, $\mathcal{S}'$ are fibred in groupoids over $\mathcal{C}$ then

$$Mor_{Cat/\mathcal{C}}(\mathcal{S}, \mathcal{S}')$$

denotes the category of 1-morphisms in this 2-category (see Definition 4.29.1). These are all groupoids, see remarks following Definition 4.32.6. Here is the 2-category analogue of the Yoneda lemma.

Lemma 4.38.1. *(2-Yoneda lemma) Let $\mathcal{S} \to \mathcal{C}$ be fibred in groupoids. Let $U \in Ob(\mathcal{C})$. The functor*

$$Mor_{Cat/\mathcal{C}}(\mathcal{C}/U, \mathcal{S}) \longrightarrow \mathcal{S}_U$$

given by $G \mapsto G(id_U)$ is an equivalence.

Proof. Make a choice of pullbacks for $\mathcal{S}$ (see Definition 4.30.5). We define a functor

$$\mathcal{S}_U \longrightarrow Mor_{Cat/\mathcal{C}}(\mathcal{C}/U, \mathcal{S})$$

as follows. Given $x \in Ob(\mathcal{S}_U)$ the associated functor is

(1) on objects: $(f : V \to U) \mapsto f^*x$, and
(2) on morphisms: the arrow $(g : V'/U \to V/U)$ maps to the composition

$$(f \circ g)^*x \xrightarrow{(\alpha_{g,f})_x} g^*f^*x \to f^*x$$

where $\alpha_{g,f}$ is as in Lemma 4.32.2.

We omit the verification that this is an inverse to the functor of the lemma. □

Remark 4.38.2. We can use the 2-Yoneda lemma to give an alternative proof of Lemmas 4.34.3. Let $p : \mathcal{S} \to \mathcal{C}$ be a category fibred in groupoids. We define a contravariant functor F from $\mathcal{C}$ to the category of groupoids as follows: for $U \in Ob(\mathcal{C})$ let

$$F(U) = Mor_{Cat/\mathcal{C}}(\mathcal{C}/U, \mathcal{S}).$$

If $f : U \to V$ the induced functor $\mathcal{C}/U \to \mathcal{C}/V$ induces the morphism $F(f) : F(V) \to F(U)$. Clearly F is a functor. Let $\mathcal{S}'$ be the associated category fibred in groupoids from Example 4.34.1. There is an obvious functor $G : \mathcal{S}' \to \mathcal{S}$ over $\mathcal{C}$ given by taking the pair (U, x), where $U \in Ob(\mathcal{C})$ and $x \in F(U)$, to $x(\mathrm{id}_U) \in \mathcal{S}$. Now Lemma 4.38.1 implies that for each U,

$$G_U : \mathcal{S}'_U = F(U) = Mor_{Cat/\mathcal{C}}(\mathcal{C}/U, \mathcal{S}) \to \mathcal{S}_U$$

is an equivalence, and thus G equivalence between $\mathcal{S}$ and $\mathcal{S}'$ by Lemma 4.32.8.

Let $\mathcal{C}$ be a category. Let $\mathcal{X}$, $\mathcal{Y}$ be categories fibred in groupoids over $\mathcal{C}$. Let $U \in Ob(\mathcal{C})$. Let $F : \mathcal{X} \to \mathcal{Y}$ and $G : \mathcal{C}/U \to \mathcal{Y}$ be 1-morphisms of categories fibred in groupoids over $\mathcal{C}$. We want to describe the 2-fibre product

$$\begin{tikzcd}
(\mathcal{C}/U) \times_{\mathcal{Y}} \mathcal{X} \arrow[r] \arrow[d] & \mathcal{X} \arrow[d, "F"] \\
\mathcal{C}/U \arrow[r, "G"] & \mathcal{Y}
\end{tikzcd}$$

Let $y = G(\mathrm{id}_U) \in \mathcal{Y}_U$. Make a choice of pullbacks for $\mathcal{Y}$ (see Definition 4.30.5). Then G is isomorphic to the functor $(f : V \to U) \mapsto f^*y$, see Lemma 4.38.1 and its proof. We may think of an object of $(\mathcal{C}/U) \times_{\mathcal{Y}} \mathcal{X}$ as a quadruple $(V, f : V \to U, x, \phi)$, see Lemma 4.29.3. Using the description of G above we may think of ϕ as an isomorphism $\phi : f^*y \to F(x)$ in $\mathcal{Y}_V$.

Lemma 4.38.3. *In the situation above the fibre category of $(\mathcal{C}/U) \times_{\mathcal{Y}} \mathcal{X}$ over an object $f : V \to U$ of $\mathcal{C}/U$ is the category described as follows:*

1. *objects are pairs (x, ϕ), where $x \in Ob(\mathcal{X}_V)$, and $\phi : f^*y \to F(x)$ is a morphism in $\mathcal{Y}_V$,*
2. *the set of morphisms between (x, ϕ) and (x', ϕ') is the set of morphisms $\psi : x \to x'$ in $\mathcal{X}_V$ such that $F(\psi) = \phi' \circ \phi^{-1}$.*

Proof. See discussion above. □

Lemma 4.38.4. *Let $\mathcal{C}$ be a category. Let $\mathcal{X}$, $\mathcal{Y}$ be categories fibred in groupoids over $\mathcal{C}$. Let $F : \mathcal{X} \to \mathcal{Y}$ be a 1-morphism. Let $G : \mathcal{C}/U \to \mathcal{Y}$ be a 1-morphism. Then*

$$(\mathcal{C}/U) \times_{\mathcal{Y}} \mathcal{X} \longrightarrow \mathcal{C}/U$$

is a category fibred in groupoids.

Proof. We have already seen in Lemma 4.32.7 that the composition

$$(\mathcal{C}/U) \times_{\mathcal{Y}} \mathcal{X} \longrightarrow \mathcal{C}/U \longrightarrow \mathcal{C}$$

is a category fibred in groupoids. Then the lemma follows from Lemma 4.32.12. □

Definition 4.38.5. Let $\mathcal{C}$ be a category. Let $\mathcal{X}$, $\mathcal{Y}$ be categories fibred in groupoids over $\mathcal{C}$. Let $F : \mathcal{X} \to \mathcal{Y}$ be a 1-morphism. We say F is *representable*, or that $\mathcal{X}$ *is relatively representable over* $\mathcal{Y}$, if for every $U \in Ob(\mathcal{C})$ and any $G : \mathcal{C}/U \to \mathcal{X}$ the category fibred in groupoids

$$(\mathcal{C}/U) \times_{\mathcal{Y}} \mathcal{X} \longrightarrow \mathcal{C}/U$$

is representable over $\mathcal{C}/U$.

Lemma 4.38.6. *Let $\mathcal{C}$ be a category. Let $\mathcal{X}$, $\mathcal{Y}$ be categories fibred in groupoids over $\mathcal{C}$. Let $F : \mathcal{X} \to \mathcal{Y}$ be a 1-morphism. If F is representable then every one of the functors*

$$F_U : \mathcal{X}_U \longrightarrow \mathcal{Y}_U$$

between fibre categories is faithful.

Proof. Clear from the description of fibre categories in Lemma 4.38.3 and the characterization of representable fibred categories in Lemma 4.37.2. □

Lemma 4.38.7. *Let $\mathcal{C}$ be a category. Let $\mathcal{X}$, $\mathcal{Y}$ be categories fibred in groupoids over $\mathcal{C}$. Let $F : \mathcal{X} \to \mathcal{Y}$ be a 1-morphism. Make a choice of pullbacks for $\mathcal{Y}$. Assume*

1. *each functor $F_U : \mathcal{X}_U \longrightarrow \mathcal{Y}_U$ between fibre categories is faithful, and*
2. *for each U and each $y \in \mathcal{Y}_U$ the presheaf*

$$(f : V \to U) \longmapsto \{(x, \phi) \mid x \in \mathcal{X}_V, \phi : f^*y \to F(x)\}/\cong$$

is a representable presheaf on $\mathcal{C}/U$.

Then F is representable.

Proof. Clear from the description of fibre categories in Lemma 4.38.3 and the characterization of representable fibred categories in Lemma 4.37.2. □

Before we state the next lemma we point out that the 2-category of categories fibred in groupoids is a $(2,1)$-category, and hence we know what it means to say that it has a final object (see Definition 4.28.1). And it has a final object namely $\mathrm{id} : \mathcal{C} \to \mathcal{C}$. Thus we define 2-*products* of categories fibred in groupoids over $\mathcal{C}$ as the 2-fibred products

$$\mathcal{X} \times \mathcal{Y} := \mathcal{X} \times_{\mathcal{C}} \mathcal{Y}.$$

With this definition in place the following lemma makes sense.

Lemma 4.38.8. *Let $\mathcal{C}$ be a category. Let $\mathcal{S} \to \mathcal{C}$ be a category fibred in groupoids. Assume $\mathcal{C}$ has products of pairs of objects and fibre products. The following are equivalent:*

(1) *The diagonal $\mathcal{S} \to \mathcal{S} \times \mathcal{S}$ is representable.*
(2) *For every U in $\mathcal{C}$, any $G : \mathcal{C}/U \to \mathcal{S}$ is representable.*

Proof. Suppose the diagonal is representable, and let U, G be given. Consider any $V \in Ob(\mathcal{C})$ and any $G' : \mathcal{C}/V \to \mathcal{S}$. Note that $\mathcal{C}/U \times \mathcal{C}/V = \mathcal{C}/U \times V$ is representable. Hence the fibre product

$$\begin{tikzcd} (\mathcal{C}/U \times V) \times_{(\mathcal{S}\times\mathcal{S})} \mathcal{S} \arrow[r] \arrow[d] & \mathcal{S} \arrow[d] \\ \mathcal{C}/U \times V \arrow[r, "{(G,G')}"] & \mathcal{S} \times \mathcal{S} \end{tikzcd}$$

is representable by assumption. This means there exists $W \to U \times V$ in $\mathcal{C}$, such that

$$\begin{tikzcd} \mathcal{C}/W \arrow[r] \arrow[d] & \mathcal{S} \arrow[d] \\ \mathcal{C}/U \times \mathcal{C}/V \arrow[r] & \mathcal{S} \times \mathcal{S} \end{tikzcd}$$

is cartesian. This implies that $\mathcal{C}/W \cong \mathcal{C}/U \times_{\mathcal{S}} \mathcal{C}/V$ (see Lemma 4.28.11) as desired.

Assume (2) holds. Consider any $V \in Ob(\mathcal{C})$ and any $(G, G') : \mathcal{C}/V \to \mathcal{S} \times \mathcal{S}$. We have to show that $\mathcal{C}/V \times_{\mathcal{S}\times\mathcal{S}} \mathcal{S}$ is representable. What we know is that $\mathcal{C}/V \times_{G,\mathcal{S},G'} \mathcal{C}/V$ is representable, say by $a : W \to V$ in $\mathcal{C}/V$. The equivalence

$$\mathcal{C}/W \to \mathcal{C}/V \times_{G,\mathcal{S},G'} \mathcal{C}/V$$

followed by the second projection to $\mathcal{C}/V$ gives a second morphism $a' : W \to V$. Consider $W' = W \times_{(a,a'),V\times V} V$. There exists an equivalence

$$\mathcal{C}/W' \cong \mathcal{C}/V \times_{\mathcal{S}\times\mathcal{S}} \mathcal{S}$$

namely

$$\begin{aligned} \mathcal{C}/W' &\cong \mathcal{C}/W \times_{(\mathcal{C}/V \times \mathcal{C}/V)} \mathcal{C}/V \\ &\cong \left(\mathcal{C}/V \times_{(G,\mathcal{S},G')} \mathcal{C}/V\right) \times_{(\mathcal{C}/V \times \mathcal{C}/V)} \mathcal{C}/V \\ &\cong \mathcal{C}/V \times_{(\mathcal{S}\times\mathcal{S})} \mathcal{S} \end{aligned}$$

(for the last isomorphism see Lemma 4.28.12) which proves the lemma. □

CHAPTER 5

Topology

5.1. Introduction

Basic topology will be explained in this document. A reference is [**Eng77**].

5.2. Basic notions

The following notions are considered basic and will not be defined, and or proved. This does not mean they are all necessarily easy or well known.

(1) X is a *topological space*,
(2) $x \in X$ is a *point*,
(3) $x \in X$ is a *closed point*,
(4) $f : X_1 \to X_2$ is *continuous*,
(5) a *neighbourhood of* $x \in X$ is any subset $E \subset X$ which contains an open subset that contains x,
(6) $\mathcal{U} : U = \bigcup_{i \in I} U_i$ is an *open covering of* U (note: we allow any U_i to be empty and we even allow, in case U is empty, the empty set for I),
(7) the open covering $\mathcal{V}$ is a *refinement* of the open covering $\mathcal{U}$ (if $\mathcal{V} : V = \bigcup_{j \in J} V_j$ and $\mathcal{U} : U = \bigcup_{i \in I} U_i$ this means each V_j is completely contained in one of the U_i),
(8) $\{E_i\}_{i \in I}$ *is a fundamental system of neighbourhoods of* x *in* X,
(9) a topological space X is called *Hausdorff* or *separated* if and only if for every distinct pair of points $x, y \in X$ there exist disjoint opens $U, V \subset X$ such that $x \in U$, $y \in V$,
(10) the *product* of two topological spaces,
(11) the *fibre product* $X \times_Y Z$ of a pair of continuous maps $f : X \to Y$ and $g : Z \to Y$,
(12) etc.

5.3. Bases

Definition 5.3.1. Let X be a topological space. A collection of subsets $\mathcal{B}$ of X is called a *base for the topology on* X or a *basis for the topology on* X if the following conditions hold:

(1) Every element $B \in \mathcal{B}$ is open in X.
(2) For every open $U \subset X$ and every $x \in U$, there exists an element $B \in \mathcal{B}$ such that $x \in B \subset U$.

Lemma 5.3.2. *Let X be a topological space. Let $\mathcal{B}$ be a basis for the topology on X. Let $\mathcal{U} : U = \bigcup_i U_i$ be an open covering of $U \subset X$. There exists an open covering $U = \bigcup V_j$ which is a refinement of $\mathcal{U}$ such that each V_j is an element of the basis $\mathcal{B}$.*

Proof. Omitted. □

5.4. Connected components

Definition 5.4.1. Let X be a topological space.

(1) We say X is *connected* if whenever $X = T_1 \coprod T_2$ with $T_i \subset X$ open and closed, then either $T_1 = \emptyset$ or $T_2 = \emptyset$.
(2) We say $T \subset X$ is a *connected component* of X if T is a maximal connected subset of X.

The empty space is connected.

Lemma 5.4.2. *Let $f : X \to Y$ be a continuous map of topological spaces. If $E \subset X$ is a connected subset, then $f(E) \subset Y$ is connected as well.*

Proof. Omitted. □

Lemma 5.4.3. *Let X be a topological space. If $T \subset X$ is connected, then so is its closure. Each point of X is contained in a connected component. Connected components are always closed, but not necessarily open.*

Proof. Let $\overline{T}$ be the closure of the connected subset T. Suppose $\overline{T} = T_1 \coprod T_2$ with $T_i \subset \overline{T}$ open and closed. Then $T = (T \cap T_1) \coprod (T \cap T_2)$. Hence T equals one of the two, say $T = T_1 \cap T$. Thus clearly $\overline{T} \subset T_1$ as desired.

Pick a point $x \in X$. Consider the set A of connected subsets $x \in T_\alpha \subset X$. Note that A is nonempty since $\{x\} \in A$. There is a partial ordering on A coming from inclusion: $\alpha \leq \alpha' \Leftrightarrow T_\alpha \subset T_{\alpha'}$. Choose a maximal totally ordered subset $A' \subset A$, and let $T = \bigcup_{\alpha \in A'} T_\alpha$. We claim that T is connected. Namely, suppose that $T = T_1 \coprod T_2$ is a disjoint union of two open and closed subsets of T. For each $\alpha \in A'$ we have either $T_\alpha \subset T_1$ or $T_\alpha \subset T_2$, by connectedness of T_α. Suppose that for some $\alpha_0 \in A'$ we have $T_{\alpha_0} \not\subset T_1$ (say, if not we're done anyway). Then, since A' is totally ordered we see immediately that $T_\alpha \subset T_2$ for all $\alpha \in A'$. Hence $T = T_2$.

To get an example where connected components are not open, just take an infinite product $\prod_{n \in \mathbf{N}} \{0, 1\}$ with the product topology. This is a totally disconnected space so connected components are singletons, which are not open. □

Lemma 5.4.4. *Let $f : X \to Y$ be a continuous map of topological spaces. Assume that*

(1) *all fibres of f are nonempty and connected, and*
(2) *a set $T \subset Y$ is closed if and only if $f^{-1}(T)$ is closed.*

Then f induces a bijection between the sets of connected components of X and Y.

Proof. Let $T \subset Y$ be a connected component. Note that T is closed, see Lemma 5.4.3. The lemma follows if we show that $p^{-1}(T)$ is connected because any connected subset of X maps into a connected component of Y by Lemma 5.4.2. Suppose that $p^{-1}(T) = Z_1 \coprod Z_2$ with Z_1, Z_2 closed. For any $t \in T$ we see that $p^{-1}(\{t\}) = Z_1 \cap p^{-1}(\{t\}) \coprod Z_2 \cap p^{-1}(\{t\})$. By (1) we see $p^{-1}(\{t\})$ is connected we conclude that either $p^{-1}(\{t\}) \subset Z_1$ or $p^{-1}(\{t\}) \subset Z_2$. In other words $T = T_1 \coprod T_2$ with $p^{-1}(T_i) = Z_i$. By (2) we conclude that T_i is closed in Y. Hence either $T_1 = \emptyset$ or $T_2 = \emptyset$ as desired. □

Lemma 5.4.5. *Let $f : X \to Y$ be a continuous map of topological spaces. Assume that (a) f is open, (b) all fibres of f are nonempty and connected. Then f induces a bijection between the sets of connected components of X and Y.*

Proof. This is a special case of Lemma 5.4.4. □

Definition 5.4.6. A topological space is *totally disconnected* if the connected components are all singletons.

A discrete space is totally disconnected. A totally disconnected space need not be discrete, for example $\mathbf{Q} \subset \mathbf{R}$ is totally disconnected but not discrete.

Definition 5.4.7. A topological space X is called *locally connected* if every point $x \in X$ has a fundamental system of connected neighbourhoods.

Lemma 5.4.8. *Let X be a topological space. If X is locally connected, then*

(1) *any open subset of X is locally connected, and*
(2) *the connected components of X are open.*

So also the connected components of open subsets of X are open. In particular, every point has a fundamental system of open connected neighbourhoods.

Proof. Omitted. □

5.5. Irreducible components

Definition 5.5.1. Let X be a topological space.

(1) We say X is *irreducible*, if X is not empty, and whenever $X = Z_1 \cup Z_2$ with Z_i closed, we have $X = Z_1$ or $X = Z_2$.
(2) We say $Z \subset X$ is an *irreducible component* of X if Z is a maximal irreducible subset of X.

An irreducible space is obviously connected.

Lemma 5.5.2. *Let $f : X \to Y$ be a continuous map of topological spaces. If $E \subset X$ is an irreducible subset, then $f(E) \subset Y$ is irreducible as well.*

Proof. Omitted. □

Lemma 5.5.3. *Let X be a topological space. If $T \subset X$ is irreducible so is its closure in X. Any irreducible component of X is closed. Every point of X is contained in some irreducible component of X.*

Proof. Let $\overline{T}$ be the closure of the irreducible subset T. If $\overline{T} = Z_1 \cup Z_2$ with $Z_i \subset \overline{T}$ closed, then $T = (T \cap Z_1) \cup (T \cap Z_2)$ and hence T equals one of the two, say $T = Z_1 \cap T$. Thus clearly $\overline{T} \subset Z_1$ as desired.

Pick a point $x \in X$. Consider the set A of irreducible subsets $x \in T_\alpha \subset X$. Note that A is nonempty since $\{x\} \in A$. There is a partial ording on A coming from inclusion: $\alpha \leq \alpha' \Leftrightarrow T_\alpha \subset T_{\alpha'}$. Choose a maximal totally ordered subset $A' \subset A$, and let $T = \bigcup_{\alpha \in A'} T_\alpha$. We claim that T is irreducible. Namely, suppose that $T = Z_1 \cup Z_2$ is a union of two closed subsets of T. For each $\alpha \in A'$ we have either $T_\alpha \subset Z_1$ or $T_\alpha \subset Z_2$, by irreducibility of T_α. Suppose that for some $\alpha_0 \in A'$ we have $T_{\alpha_0} \not\subset Z_1$ (say, if not we're done anyway). Then, since A' is totally ordered we see immediately that $T_\alpha \subset Z_2$ for all $\alpha \in A'$. Hence $T = Z_2$. □

A singleton is irreducible. Thus if $x \in X$ is a point then the closure $\overline{\{x\}}$ is an irreducible closed subset of X.

Definition 5.5.4. Let X be a topological space.

(1) Let $Z \subset X$ be an irreducible closed subset. A *generic point* of Z is a point $\xi \in Z$ such that $Z = \overline{\{\xi\}}$.

(2) The space X is called *Kolmogorov*, if for every $x, x' \in X$, $x \neq x'$ there exists a closed subset of X which contains exactly one of the two points.
(3) The space X is called *sober* if every irreducible closed subset has a unique generic point.

A space X is Kolmogorov if for $x_1, x_2 \in X$ we have $x_1 = x_2$ if and only if $\overline{\{x_1\}} = \overline{\{x_2\}}$. Hence we see that a sober topological space is Kolmogorov.

Lemma 5.5.5. *Let X be a topological space. If X has an open covering $X = \bigcup X_i$ with X_i sober (resp. Kolmogorov), then X is sober (resp. Kolmogorov).*

Proof. Omitted. □

Example 5.5.6. Recall that a topological space X is Hausdorff iff for every distinct pair of points $x, y \in X$ there exist disjoint opens $U, V \subset X$ such that $x \in U$, $y \in V$. In this case X is irreducible if and only if X is a singleton. Similarly, any subset of X is irreducible if and only if it is a singleton. Hence a Hausdorff space is sober.

Lemma 5.5.7. *Let $f : X \to Y$ be a continuous map of topological spaces. Assume that (a) Y is irreducible, (b) f is open, and (c) there exists a dense collection of points $y \in Y$ such that $f^{-1}(y)$ is irreducible. Then X is irreducible.*

Proof. Suppose $Y = Z_1 \cup Z_2$ with Z_i closed. Consider the open sets $U_1 = Z_1 \setminus Z_2 = Y \setminus Z_2$ and $U_2 = Z_2 \setminus Z_1 = Y \setminus Z_2$. To get a contradiction assume that U_1 and U_2 are both nonempty. By (b) we see that $f(U_i)$ is open. By (a) we have X irreducible and hence $f(U_1) \cap f(U_2) \neq \emptyset$. By (c) there is a point y which corresponds to a point of this intersection such that the fibre $X_y = f^{-1}(y)$ is irreducible. Then $X_y \cap U_1$ and $X_y \cap U_2$ are nonempty disjoint open subsets of X_y which is a contradiction. □

Lemma 5.5.8. *Let $f : X \to Y$ be a continuous map of topological spaces. Assume that (a) f is open, and (b) for every $y \in Y$ the fibre $f^{-1}(y)$ is irreducible. Then f induces a bijection between irreducible components.*

Proof. We point out that assumption (b) implies that f is surjective (see Definition 5.5.1). Let $T \subset Y$ be an irreducible component. Note that T is closed, see Lemma 5.5.3. The lemma follows if we show that $p^{-1}(T)$ is irreducible because any irreducible subset of X maps into an irreducible component of Y by Lemma 5.5.2. Note that $p^{-1}(T) \to T$ satisfies the assumptions of Lemma 5.5.7. Hence we win. □

5.6. Noetherian topological spaces

Definition 5.6.1. A topological space is called *Noetherian* if the descending chain condition holds for closed subsets of X. A topological space is called *locally Noetherian* if every point has a neighbourhood which is Noetherian.

Lemma 5.6.2. *Let X be a Noetherian topological space.*
(1) *Any subset of X with the induced topology is Noetherian.*
(2) *The space X has finitely many irreducible components.*
(3) *Each irreducible component of X contains a nonempty open of X.*

Proof. Let $T \subset X$ be a subset of X. Let $T_1 \supset T_2 \supset \ldots$ be a descending chain of closed subsets of T. Write $T_i = T \cap Z_i$ with $Z_i \subset X$ closed. Consider the descending chain of closed subsets $Z_1 \supset Z_1 \cap Z_2 \supset Z_1 \cap Z_2 \cap Z_3 \ldots$ This stabilizes by assumption and hence the original sequence of T_i stabilizes. Thus T is Noetherian.

Let A be the set of closed subsets of X which do not have finitely many irreducible components. Assume that A is not empty to arrive at a contradiction. The set A is partially ordered by inclusion: $\alpha \leq \alpha' \Leftrightarrow Z_\alpha \subset Z_{\alpha'}$. By the descending chain condition we may find a smallest element of A, say Z. As Z is not a finite union of irreducible components, it is not irreducible. Hence we can write $Z = Z' \cup Z''$ and both are strictly smaller closed subsets. By construction $Z' = \bigcup Z'_i$ and $Z'' = \bigcup Z''_j$ are finite unions of their irreducible components. Hence $Z = \bigcup Z'_i \cup \bigcup Z''_j$ is a finite union of irreducible closed subsets. After removing redundant members of this expression, this will be the decomposition of Z into its irreducible components, a contradiction.

Let $Z \subset X$ be an irreducible component of X. Let $Z_1, \ldots, Z_n$ be the other irreducible components of X. Consider $U = Z \setminus (Z_1 \cup \ldots \cup Z_n)$. This is not empty since otherwise the irreducible space Z would be contained in one of the other Z_i. Because $X = Z \cup Z_1 \cup \ldots Z_n$ (see Lemma 5.5.3), also $U = X \setminus (Z_1 \cup \ldots \cup Z_n)$ and hence open in X. Thus Z contains a nonempty open of X. □

Lemma 5.6.3. *Let $f : X \to Y$ be a continuous map of topological spaces.*

(1) *If X is Noetherian, then $f(X)$ is Noetherian.*
(2) *If X is locally Noetherian and f open, then $f(X)$ is locally Noetherian.*

Proof. In case (1), suppose that $Z_1 \supset Z_2 \supset Z_2 \supset \ldots$ is a descending chain of closed subsets of $f(X)$ (as usual with the induced topology as a subset of Y). Then $f^{-1}(Z_1) \supset f^{-1}(Z_2) \supset f^{-1}(Z_3) \supset \ldots$ is a descending chain of closed subsets of X. Hence this chain stabilizes. Since $f(f^{-1}(Z_i)) = Z_i$ we conclude that $Z_1 \supset Z_2 \supset Z_2 \supset \ldots$ stabilizes also. In case (2), let $y \in f(X)$. Choose $x \in X$ with $f(x) = y$. By assumption there exists a neighbourhood $E \subset X$ of x which is Noetherian. Then $f(E) \subset f(X)$ is a neighbourhood which is Noetherian by part (1). □

Lemma 5.6.4. *Let X be a topological space. Let $X_i \subset X$, $i = 1, \ldots, n$ be a finite collection of subsets. If each X_i is Noetherian (with the induced topology), then $\bigcup_{i=1,\ldots,n} X_i$ is Noetherian (with the induced topology).*

Proof. Omitted. □

Example 5.6.5. Any Noetherian topological space has a closed point (combine Lemmas 5.9.6 and 5.9.9). Let $X = \{1, 2, 3, \ldots\}$. Define a topology on X with opens $\emptyset$, $\{1, 2, \ldots, n\}$, $n \geq 1$ and X. Thus X is a locally Noetherian topological space, without any closed points. This space cannot be the underlying topological space of a locally Noetherian scheme, see Properties, Lemma 23.5.8.

Lemma 5.6.6. *Let X be a locally Noetherian topological space. Then X is locally connected.*

Proof. Let $x \in X$. Let E be a neighbourhood of x. We have to find a connected neighbourhood of x contained in E. By assumption there exists a neighbourhood E' of x which is Noetherian. Then $E \cap E'$ is Noetherian, see Lemma 5.6.2. Let $E \cap E' = Y_1 \cup \ldots \cup Y_n$ be the decomposition into irreducible components, see Lemma 5.6.2. Let $E'' = \bigcup_{x \in Y_i} Y_i$. This is a connected subset of $E \cap E'$ containing x. It contains the open $E \cap E' \setminus (\bigcup_{x \notin Y_i} Y_i)$ of $E \cap E'$ and hence it is a neighbourhood of x in X. This proves the lemma. □

5.7. Krull dimension

Definition 5.7.1. Let X be a topological space.

(1) A *chain of irreducible closed subsets* of X is a sequence $Z_0 \subset Z_1 \subset \ldots \subset Z_n \subset X$ with Z_i closed irreducible and $Z_i \neq Z_{i+1}$ for $i = 0, \ldots, n-1$.
(2) The *length* of a chain $Z_0 \subset Z_1 \subset \ldots \subset Z_n \subset X$ of irreducible closed subsets of X is the integer n.
(3) The *dimension* or more precisely the *Krull dimension* $\dim(X)$ of X is the element of $\{\infty, 0, 1, 2, 3, \ldots\}$ defined by the formula:

$$\dim(X) = \sup\{\text{lengths of chains of irreducible closed subsets}\}$$

(4) Let $x \in X$. The *Krull dimension of X at x* is defined as

$$\dim_x(X) = \min\{\dim(U), x \in U \subset X \text{ open}\}$$

the minimum of $\dim(U)$ where U runs over the open neighbourhoods of x in X.

Note that if $U' \subset U \subset X$ are open then $\dim(U') \leq \dim(U)$. Hence if $\dim_x(X) = d$ then x has a fundamental system of open neighbourhoods U with $\dim(U) = \dim_x(X)$.

Example 5.7.2. The Krull dimension of the usual Euclidean space $\mathbf{R}^n$ is 0.

Example 5.7.3. Let $X = \{s, \eta\}$ with open sets given by $\{\emptyset, \{\eta\}, \{s, \eta\}\}$. In this case a maximal chain of irreducible closed subsets is $\{s\} \subset \{s, \eta\}$. Hence $\dim(X) = 1$. It is easy to generalize this example to get a $(n+1)$-element topological space of Krull dimension n.

Definition 5.7.4. Let X be a topological space. We say that X is *equidimensional* if every irreducible component of X has the same dimension.

5.8. Codimension and catenary spaces

Definition 5.8.1. Let X be a topological space. We say X is *catenary* if for every pair of irreducible closed subsets $T \subset T'$ there exist a maximal chain of irreducible closed subsets

$$T = T_0 \subset T_1 \subset \ldots \subset T_e = T'$$

and every such chain has the same length.

Lemma 5.8.2. *Let X be a topological space. The following are equivalent:*

(1) *X is catenary,*
(2) *X has an open covering by catenary spaces.*

Moreover, in this case any locally closed subspace of X is catenary.

Proof. Suppose that X is catenary and that $U \subset X$ is an open subset. The rule $T \mapsto \overline{T}$ defines a bijective inclusion preserving map between the closed irreducible subsets of U and the closed irreducible subsets of X which meet U. Using this the lemma easily follows. Details omitted. □

Definition 5.8.3. Let X be a topological space. Let $Y \subset X$ be an irreducible closed subset. The *codimension* of Y in X is the supremum of the lengths e of chains

$$Y = Y_0 \subset Y_1 \subset \ldots \subset Y_e \subset X$$

of irreducible closed subsets in X starting with Y. We will denote this $\text{codim}(Y, X)$.

Lemma 5.8.4. *Let X be a topological space. Let $Y \subset X$ be an irreducible closed subset. Let $U \subset X$ be an open subset such that $Y \cap U$ is nonempty. Then*

$$\mathit{codim}(Y, X) = \mathit{codim}(Y \cap U, U)$$

Proof. Follows from the observation made in the proof of Lemma 5.8.2. □

Example 5.8.5. Let $X = [0, 1]$ be the unit interval with the following topology: The sets $[0, 1]$, $(1 - 1/n, 1]$ for $n \in \mathbf{N}$, and $\emptyset$ are open. So the closed sets are $\emptyset$, $\{0\}$, $[0, 1 - 1/n]$ for $n > 1$ and $[0, 1]$. This is clearly a Noetherian topological space. But the irreducible closed subset $Y = \{0\}$ has infinite codimension $\text{codim}(Y, X) = \infty$. To see this we just remark that all the closed sets $[0, 1 - 1/n]$ are irreducible.

Lemma 5.8.6. *Let X be a topological space. The following are equivalent:*

(1) *X is catenary, and*
(2) *for pair of irreducible closed subsets $Y \subset Y'$ we have $codim(Y, Y') < \infty$ and for every triple $Y \subset Y' \subset Y''$ of irreducible closed subsets we have*

$$codim(Y, Y'') = codim(Y, Y') + codim(Y', Y'').$$

Proof. Omitted. □

5.9. Quasi-compact spaces and maps

The phrase ``compact" will be reserved for Hausdorff topological spaces. And many spaces occuring in algebraic geometry are not Hausdorff.

Definition 5.9.1. Quasi-compactness.

(1) We say that a topological space X is *quasi-compact* if every open covering of X has a finite refinement.
(2) We say that a continuous map $f : X \to Y$ is *quasi-compact* if the inverse image $f^{-1}(V)$ of every quasi-compact open $V \subset Y$ is quasi-compact.
(3) We say a subset $Z \subset X$ is *retrocompact* if the inclusion map $Z \to X$ is quasi-compact.

In many texts on topology a space is called *compact* if it is quasi-compact and Hausdorff; and in other texts the Hausdorff condition is omitted. To avoid confusion in algebraic geometry we use the term quasi-compact. Note that the notion of quasi-compactness of a map is very different from the notion of a ``proper map" in topology, since there one requires the inverse image of any (quasi-)compact subset of the target to be (quasi-)compact, whereas in the definition above we only consider quasi-compact *open* sets.

Lemma 5.9.2. *A composition of quasi-compact maps is quasi-compact.*

Proof. Omitted. □

Lemma 5.9.3. *A closed subset of a quasi-compact topological space is quasi-compact.*

Proof. Omitted. □

The following is really a reformulation of the quasi-compact property.

Lemma 5.9.4. *Let X be a quasi-compact topological space. If $\{Z_\alpha\}_{\alpha \in A}$ is a collection of closed subsets such that the intersection of each finite subcollection is nonempty, then $\bigcap_{\alpha \in A} Z_\alpha$ is nonempty.*

Proof. Omitted. □

Lemma 5.9.5. *Let $f : X \to Y$ be a continuous map of topological spaces.*

(1) *If X is quasi-compact, then $f(X)$ is quasi-compact.*
(2) *If f is quasi-compact, then $f(X)$ is retrocompact.*

Proof. If $f(X) = \bigcup V_i$ is an open covering, then $X = \bigcup f^{-1}(V_i)$ is an open covering. Hence if X is quasi-compact then $X = f^{-1}(V_{i_1}) \cup \ldots \cup f^{-1}(V_{i_n})$ for some $i_1, \ldots, i_n \in I$ and hence $f(X) = V_{i_1} \cup \ldots \cup V_{i_n}$. This proves (1). Assume f is quasi-compact, and let $V \subset Y$ be quasi-compact open. Then $f^{-1}(V)$ is quasi-compact, hence by (1) we see that $f(f^{-1}(V)) = f(X) \cap V$ is quasi-compact. Hence $f(X)$ is retrocompact. □

Lemma 5.9.6. *Let X be a topological space. Assume that*

(1) *X is nonempty,*
(2) *X is quasi-compact, and*
(3) *X is Kolmogorov.*

Then X has a closed point.

Proof. Consider the set

$$\mathcal{T} = \{Z \subset X \mid Z = \overline{\{x\}} \text{ for some } x \in X\}$$

of all closures of singletons in X. It is nonempty since X is nonempty. Make $\mathcal{T}$ into a partially ordered set using the relation of inclusion. Suppose Z_α, $\alpha \in A$ is a totally ordered subset of $\mathcal{T}$. By Lemma 5.9.4 we see that $\bigcap_{\alpha \in A} Z_\alpha \neq \emptyset$. Hence there exists some $x \in \bigcap_{\alpha \in A} Z_\alpha$ and we see that $Z = \overline{\{x\}} \in \mathcal{T}$ is a lower bound for the family. By Zorn's lemma there exists a minimal element $Z \in \mathcal{T}$. As X is Kolmogorov we conclude that $Z = \{x\}$ for some x and $x \in X$ is a closed point. □

Lemma 5.9.7. *Let X be a topological space. Assume*

(1) *X is quasi-compact,*
(2) *X has a basis for the topology consisting of quasi-compact opens, and*
(3) *the intersection of two quasi-compact opens is quasi-compact.*

For any $x \in X$ the connected component of X containing x is the intersection of all open and closed subsets of X containing x.

Proof. Let T be the connected component containing x. Let $S = \bigcap_{\alpha \in A} Z_\alpha$ be the intersection of all open and closed subsets Z_α of X containing x. Note that S is closed in X. Note that any finite intersection of Z_α's is a Z_α. Because T is connected and $x \in T$ we have $T \subset S$. It suffices to show that S is connected. If not, then there exists a disjoint union decomposition $S = B \coprod C$ with B and C open and closed in S. In particular, B and C are closed in X, and so quasi-compact by Lemma 5.9.3 and assumption (1). By assumption (2) there exist quasi-compact opens $U, V \subset X$ with $B = S \cap U$ and $C = S \cap V$ (details omitted). Then $U \cap V \cap S = \emptyset$. Hence $\bigcap_\alpha U \cap V \cap Z_\alpha = \emptyset$. By assumption (3) the intersection $U \cap V$ is quasi-compact. By Lemma 5.9.4 for some $\alpha \in A$ we have $U \cap V \cap Z_\alpha = \emptyset$. Hence $Z_\alpha = U \cap Z_\alpha \coprod V \cap Z_\alpha$ is a decomposition into two open pieces, hence $U \cap Z_\alpha$ and $V \cap Z_\alpha$ are open and closed in X. Thus, if $x \in B$ say, then we see that $S \subset U \cap Z_\alpha$ and we conclude that $C = \emptyset$. □

Lemma 5.9.8. *Let X be a topological space. Assume*

(1) *X is quasi-compact,*
(2) *X has a basis for the topology consisting of quasi-compact opens, and*
(3) *the intersection of two quasi-compact opens is quasi-compact.*

For a subset $T \subset X$ the following are equivalent:

(a) *T is an intersection of open and closed subsets of X, and*
(b) *T is closed in X and is a union of connected components of X.*

Proof. It is clear that (a) implies (b). Assume (b). Let $x \in X$, $x \not\in T$. Let $x \in C \subset X$ be the connected component of X containing x. By Lemma 5.9.7 we see that $C = \bigcap V_\alpha$ is the intersection of all open and closed subsets V_α of X which contain C. In particular, any pairwise intersection $V_\alpha \cap V_\beta$ occurs as a V_α. As T is a union of connected components of X we see that $C \cap T = \emptyset$. Hence $T \cap \bigcap V_\alpha = \emptyset$. Since T is quasi-compact as a closed subset of a quasi-compact space (see Lemma 5.9.3) we deduce that $T \cap V_\alpha = \emptyset$ for some α, see Lemma 5.9.4. For this α we see that $U_\alpha = X \setminus V_\alpha$ is an open and closed subset of X which contains T and not x. The lemma follows. □

Lemma 5.9.9. *Let X be a Noetherian topological space.*

(1) *The space X is quasi-compact.*
(2) *Any subset of X is retrocompact.*

Proof. Suppose $X = \bigcup U_i$ is an open covering of X indexed by the set I which does not have a refinement by a finite open covering. Choose $i_1, i_2, \ldots$ elements of I inductively in the following way: If $X \neq U_{i_1} \cup \ldots \cup U_{i_n}$ then choose i_{n+1} such that $U_{i_{n+1}}$ is not contained in $U_{i_1} \cup \ldots \cup U_{i_n}$. Thus we see that $X \supset (X \setminus U_{i_1}) \supset (X \setminus U_{i_1} \cup U_{i_2}) \supset \ldots$ is a strictly decreasing infinite sequence of closed subsets. This contradicts the fact that X is Noetherian. This proves the first assertion. The second assertion is now clear since every subset of X is Noetherian by Lemma 5.6.2. □

Lemma 5.9.10. *A quasi-compact locally Noetherian space is Noetherian.*

Proof. The conditions imply immediately that X has a finite covering by Noetherian subsets, and hence is Noetherian by Lemma 5.6.4. □

5.10. Constructible sets

Definition 5.10.1. Let X be a topological space. Let $E \subset X$ be a subset of X.

(1) We say E is *constructible*[1] in X if E is a finite union of subsets of the form $U \cap V^c$ where $U, V \subset X$ are open and retrocompact in X.
(2) We say E is *locally constructible* in X if there exists an open covering $X = \bigcup V_i$ such that each $E \cap V_i$ is construcible in V_i.

Lemma 5.10.2. *The collection of constructible sets is closed under finite intersections, finite unions and complements.*

Proof. Note that if U_1, U_2 are open and retrocompact in X then so is $U_1 \cup U_2$ because the union of two quasi-compact subsets of X is quasi-compact. It is also true that $U_1 \cap U_2$ is retrocompact. Namely, suppose $U \subset X$ is quasi-compact open, then $U_2 \cap U$ is quasi-compact because U_2 is retrocompact in X, and then we conclude $U_1 \cap (U_2 \cap U)$ is quasi-compact because U_1 is retrocompact in X. From this it is formal to show that the complement of a constructible set is constructible, that finite unions of constructibles are constructible, and that finite intersections of constructibles are constructible. □

Lemma 5.10.3. *Let $f : X \to Y$ be a continuous map of topological spaces. If the inverse image of every retrocompact open subset of Y is retrocompact in X, then inverse images of constructible sets are constructible.*

Proof. This is true because $f^{-1}(U \cap V^c) = f^{-1}(U) \cap f^{-1}(V)^c$, combined with the definition of constructible sets. □

[1] In the second edition of EGA I [**GD71**] this was called a ``globally constructible'' set and a the terminology ``constructible'' was used for what we call a locally constructible set.

Lemma 5.10.4. *Let $U \subset X$ be open. For a constructible set $E \subset X$ the intersection $E \cap U$ is constructible in U.*

Proof. Suppose that $V \subset X$ is retrocompact open in X. It suffices to show that $V \cap U$ is retrocompact in U by Lemma 5.10.3. To show this let $W \subset U$ be open and quasi-compact. Then W is open and quasi-compact in X. Hence $V \cap W = V \cap U \cap W$ is quasi-compact as V is retrocompact in X. $\square$

Lemma 5.10.5. *Let X be a topological space. Let $E \subset X$ be a subset. Let $X = V_1 \cup \ldots \cup V_m$ be a finite covering by retrocompact opens. Then E is constructible in X if and only if $E \cap V_j$ is constructible in V_j for each $j = 1, \ldots, m$.*

Proof. If E is constructible in X, then by Lemma 5.10.4 we see that $E \cap V_j$ is construcible in V_j for all j. Conversely, suppose that $E \cap V_j$ is constructible in V_j for each $j = 1, \ldots, m$. Then E is a finite union of sets of the form $E' = U' \cap (V_j \setminus V')$ where U', V' are open and retrocompact subsets of V_j. Note that U' and V' are also open and retrocompact in X (as a composition of quasi-compact maps is quasi-compact, see Lemma 5.9.2). Since $E' = U' \cap (V')^c$ where the complement is in X we win. $\square$

Lemma 5.10.6. *Let X be a topological space. Suppose that $Z \subset X$ is irreducible. Let $E \subset X$ be a finite union of locally closed subsets (e.g. E is constructible). The following are equivalent*

(1) *The intersection $E \cap Z$ contains an open dense subset of Z.*
(2) *The intersection $E \cap Z$ is dense in Z.*

If Z has a generic point ξ, then this is also equivalent to

(3) *We have $\xi \in E$.*

Proof. Write $E = \bigcup U_i \cap Z_i$ as the finite union of intersections of open sets U_i and closed sets Z_i. Suppose that $E \cap Z$ is dense in Z. Note that the closure of $E \cap Z$ is the union of the closures of the intersections $U_i \cap Z_i \cap Z$. Hence we see that $U_i \cap Z_i \cap Z$ is dense in Z for some $i = i_0$. As Z is closed we have either $Z \cap Z_i = Z$ or $Z \cap Z_i$ is not dense, hence we conclude $Z \subset Z_{i_0}$. Then $U_{i_0} \cap Z_{i_0} \cap Z = U_{i_0} \cap Z$ is an open not empty subset of Z. Because Z is irreducible, it is open dense. The converse is obvious.

Suppose that $\xi \in Z$ is a generic point. Of course if (1) $\Leftrightarrow$ (2) holds, then $\xi \in E$. Conversely, if $\xi \in E$, then $\xi \in U_i \cap Z_i$ for some $i = i_0$. Clearly this implies $Z \subset Z_{i_0}$ and hence $U_{i_0} \cap Z_{i_0} \cap Z = U_{i_0} \cap Z$ is an open not empty subset of Z. We conclude as before. $\square$

5.11. Constructible sets and Noetherian spaces

Lemma 5.11.1. *Let X be a Noetherian topological space. Constructible sets in X are finite unions of locally closed subsets of X.*

Proof. This follows immediately from Lemma 5.9.9. $\square$

Lemma 5.11.2. *Let $f : X \to Y$ be a continuous map of Noetherian topological spaces. If $E \subset Y$ is constructible in Y, then $f^{-1}(E)$ is constructible in X.*

Proof. Follows immediately from Lemma 5.11.1 and the definition of a continuous map. $\square$

Lemma 5.11.3. *Let X be a Noetherian topological space. Let $E \subset X$ be a subset. The following are equivalent*

(1) *E is constructible in X, and*

(2) *for every irreducible closed $Z \subset X$ the intersection $E \cap Z$ either contains a nonempty open of Z or is not dense in Z.*

Proof. Assume E is constructible and $Z \subset X$ irreducible closed. Then $E \cap Z$ is constructible in Z by Lemma 5.11.2. Hence $E \cap Z$ is a finite union of nonempty locally closed subsets T_i of Z. Clearly if none of the T_i is open in Z, then $E \cap Z$ is not dense in Z. In this way we see that (1) implies (2).

Conversely, assume (2) holds. Consider the set $\mathcal{S}$ of closed subsets Y of X such that $E \cap Y$ is not constructible in Y. If $\mathcal{S} \neq \emptyset$, then it has a smallest element Y as X is Noetherian. Let $Y = Y_1 \cup \ldots \cup Y_r$ be the decomposition of Y into its irreducible components, see Lemma 5.6.2. If $r > 1$, then each $Y_i \cap E$ is constructible in Y_i and hence a finite union of locally closed subsets of Y_i. Thus $E \cap Y$ is a finite union of locally closed subsets of Y too and we conclude that $E \cap Y$ is constructible in Y by Lemma 5.11.1. This is a contradication and so $r = 1$. If $r = 1$, then Y is irreducible, and by assumption (2) we see that $E \cap Y$ either (a) contains an open V of Y or (b) is not dense in Y. In case (a) we see, by minimality of Y, that $E \cap (Y \setminus V)$ is a finite union of locally closed subsets of $Y \setminus V$. Thus $E \cap Y$ is a finite union of locally closed subsets of Y and is constructible by Lemma 5.11.1. This is a contradication and so we must be in case (b). In case (b) we see that $E \cap Y = E \cap Y'$ for some proper closed subset $Y' \subset Y$. By minimality of Y we see that $E \cap Y'$ is a finite union of locally closed subsets of Y' and we see that $E \cap Y' = E \cap Y$ is a finite union of locally closed subsets of Y and is constructible by Lemma 5.11.1. This contradication finishes the proof of the lemma. $\square$

Lemma 5.11.4. *Let X be a Noetherian topological space. Let $x \in X$. Let $E \subset X$ be constructible in X. The following are equivalent*

(1) *E is a neighbourhood of x, and*
(2) *for every irreducible closed subset Y of X which contains x the intersection $E \cap Y$ is dense in Y.*

Proof. It is clear that (1) implies (2). Assume (2). Consider the set $\mathcal{S}$ of closed subsets Y of X containing x such that $E \cap Y$ is not a neighbourhood of x in Y. If $\mathcal{S} \neq \emptyset$, then it has a smallest element Y as X is Noetherian. Let $Y = Y_1 \cup \ldots \cup Y_r$ be the decomposition of Y into its irreducible components, see Lemma 5.6.2. If $r > 1$, then each $Y_i \cap E$ is a neighbourhood of x in Y_i by minimality of Y. Thus $E \cap Y$ is a neighbourhood of x in Y. This is a contradication and so $r = 1$. If $r = 1$, then Y is irreducible, and by assumption (2) we see that $E \cap Y$ is dense in Y. Thus $E \cap Y$ contains an open V of Y, see Lemma 5.11.3. If $x \in V$ then $E \cap Y$ is a neighbourhood of x in Y which is a contradiction. If $x \notin V$, then $Y' = Y \setminus V$ is a proper closed subset of Y containing x. By minimality of Y we see that $E \cap Y'$ contains an open neighbourhood $V' \subset Y'$ of x in Y'. But then $V' \cup V$ is an open neighbourhood of x in Y contained in E, a contradiction. This contradication finishes the proof of the lemma. $\square$

Lemma 5.11.5. *Let X be a Noetherian topological space. Let $E \subset X$ be a subset. The following are equivalent*

(1) *E is open in X, and*
(2) *for every irreducible closed subset Y of X the intersection $E \cap Y$ is either empty or contains a nonempty open of Y.*

Proof. This follows formally from Lemmas 5.11.3 and 5.11.4. $\square$

5.12. Characterizing proper maps

We include a section discussing the notion of a proper map in usual topology. It turns out that in topology, the notion of being proper is the same as the notion of being universally closed, in the sense that any base change is a closed morphism (not just taking products with spaces). The reason for doing this is that in algebraic geometry we use this notion of universal closedness as the basis for our definition of properness.

Lemma 5.12.1. *(Tube lemma.) Let X and Y be topological spaces. Let $A \subset X$ and $B \subset Y$ be quasi-compact subsets. Let $A \times B \subset W \subset X \times Y$ with W open in $X \times Y$. Then there exists opens $A \subset U \subset X$ and $B \subset V \subset Y$ such that $U \times V \subset W$.*

Proof. For every $a \in A$ and $b \in B$ there exist opens $U_{(a,b)}$ of X and $V_{(a,b)}$ of Y such that $(a, b) \in U_{(a,b)} \times V_{(a,b)} \subset W$. Fix b and we see there exist a finite number $a_1, \ldots, a_n$ such that $A \subset U_{(a_1,b)} \cup \ldots \cup U_{(a_n,b)}$. Hence $A \times \{b\} \subset (U_{(a_1,b)} \cup \ldots \cup U_{(a_n,b)}) \times (V_{(a_1,b)} \cup \ldots \cup V_{(a_n,b)}) \subset W$. Thus for every $b \in B$ there exists opens $U_b \subset X$ and $V_b \subset Y$ such that $A \times \{b\} \subset U_b \times V_b \subset W$. As above there exist a finite number $b_1, \ldots, b_m$ such that $B \subset V_{b_1} \cup \ldots \cup V_{b_m}$. Then we win because $A \times B \subset (U_{b_1} \cap \ldots \cap U_{b_m}) \times (V_{b_1} \cup \ldots \cup V_{b_m})$. $\square$

The notation in the following definition may be slightly different from what you are used to.

Definition 5.12.2. Let $f : X \to Y$ be a continuous map between topological spaces.

(1) We say that the map f is *closed* iff the image of every closed subset is closed.
(2) We say that the map f is *proper*[2] iff the map $Z \times X \to Z \times Y$ is closed for any topological space Z.
(3) We say that the map f is *quasi-proper* iff the inverse image $f^{-1}(V)$ of every quasi-compact $V \subset Y$ is quasi-compact.
(4) We say that f is *universally closed* iff the map $f' : Z \times_Y X \to Z$ is closed for any map $g : Z \to Y$.

The following lemma is useful later.

Lemma 5.12.3. *A topological space X is quasi-compact if and only if the projection map $Z \times X \to Z$ is closed for any topological space Z.*

Proof. (See also remark below.) If X is not quasi-compact, there exists an open covering $X = \bigcup_{i \in I} U_i$ such that no finite number of U_i cover X. Let Z be the subset of the power set $\mathcal{P}(I)$ of I consisting of I and all nonempty finite subsets of I. Define a topology on Z with as a basis for the topology the following sets:

(1) All subsets of $Z \setminus \{I\}$.
(2) The empty set.
(3) For every finite subset K of I the set $U_K := \{J \subset I \mid J \in Z,\ K \subset J\}$).

It is left to the reader to verify this is the basis for a topology. Consider the subset of $Z \times X$ defined by the formula

$$M = \{(J, x) \mid J \in Z,\ x \in \bigcap\nolimits_{i \in J} U_i^c)\}$$

If $(J, x) \notin M$, then $x \in U_i$ for some $i \in J$. Hence $U_{\{i\}} \times U_i \subset Z \times X$ is an open subset containing (J, x) and not intersecting M. Hence M is closed. The projection of M to Z is $Z - \{I\}$ which is not closed. Hence $Z \times X \to Z$ is not closed.

[2] This is the terminology used in [**Bou71**]. Usually this is what is called ``universally closed'' in the literature. Thus our notion of proper does not involve any separation conditions.

Assume X is quasi-compact. Let Z be a topological space. Let $M \subset Z \times X$ be closed. Let $z \in Z$ be a point which is not in $\mathrm{pr}_1(M)$. By the Tube Lemma 5.12.1 there exists an open $U \subset Z$ such that $U \times X$ is contained in the complement of M. Hence $\mathrm{pr}_1(M)$ is closed. □

Remark 5.12.4. Lemma 5.12.3 is a combination of [**Bou71**, I, p. 75, Lemme 1] and [**Bou71**, I, p. 76, Corrolaire 1].

Theorem 5.12.5. *Let $f : X \to Y$ be a continuous map between topological spaces. The following condition is equivalent.*

(1) *The map f is quasi-proper and closed.*
(2) *The map f is proper.*
(3) *The map f is universally closed.*
(4) *The map f is closed and $f^{-1}(y)$ is quasi-compact for any $y \in Y$.*

Proof. (See also the remark below.) If the map f satisfies (1), it automatically satisfies (4) because any single point is quasi-compact.

Assume map f satisfies (4). We will prove it is universally closed, i.e., (3) holds. Let $g : Z \to Y$ be a continuous map of topological spaces and consider the diagram

$$\begin{tikzcd} Z \times_Y X \arrow[r, "g'"'] \arrow[d, "f'"'] & X \arrow[d, "f"] \\ Z \arrow[r, "g"] & Y \end{tikzcd}$$

During the proof we will use that $Z \times_Y X \to Z \times X$ is a homeomorphism onto its image, i.e., that we may identify $Z \times_Y X$ with the corresponding subset of $Z \times X$ with the induced topology. The image of $f' : X \times_Y Z \to Z$ is $\mathrm{Im}(f') = \{z : g(z) \in f(X)\}$. Because $f(X)$ is closed, we see that $\mathrm{Im}(f')$ is a closed subspace of Z. Consider a closed subset $P \subset X \times_Y Z$. Let $z \in Z$, $z \not\in f'(P)$. If $z \not\in \mathrm{Im}(f')$, then $Z \setminus \mathrm{Im}(f')$ is an open neighbourhood which avoids $f'(P)$. If z is in $\mathrm{Im}(f')$ then $(f')^{-1}\{z\} = \{z\} \times f^{-1}\{g(z)\}$ and $f^{-1}\{g(z)\}$ is quasi-compact by assumption. Because P is a closed subset of $Z \times_Y X$, we have a closed P' of $Z \times X$ such that $P = P' \cap Z \times_Y X$. Since $(f')^{-1}\{z\}$ is a subset of $P^c = P'^c \cup (Z \times_Y X)^c$, we see that $(f')^{-1}\{z\}$ is disjoint from $(Z \times_Y X)^c$. Hence $(f')^{-1}\{z\}$ is contained in P'^c. We may apply the Tube Lemma 5.12.1 to $(f')^{-1}\{z\} = \{z\} \times f^{-1}\{g(z)\} \subset (P')^c \subset Z \times X$. This gives $U \times V$ containing $(f')^{-1}\{z\}$ where U and V are open sets in X and Z respectively and $U \times V$ has empty intersection with P'. Hence z is contained in V and V has empty intersection with the image of P. As a result, the map f is universally closed.

The implication (3) $\Rightarrow$ (2) is trivial. Namely, given any topological space Z consider the projection morphism $g : Z \times Y \to Y$. Then it is easy to see that f' is the map $Z \times X \to Z \times Y$, in other words that $(Z \times Y) \times_Y X = Z \times X$. (This identification is a purely categorical property having nothing to do with topological spaces per se.)

Assume f satisfies (2). We will prove it satisfies (1). Note that f is closed as f can be identified with the map $\{pt\} \times X \to \{pt\} \times Y$ which is assumed closed. Choose any quasi-compact subset $K \subset Y$. Let Z be any topological space. Because $Z \times X \to Z \times Y$ is closed we see the map $Z \times f^{-1}(K) \to Z \times K$ is closed (if T is closed in $Z \times f^{-1}(K)$, write $T = Z \times f^{-1}(K) \cap T'$ for some closed $T' \subset Z \times X$). Because K is quasi-compact, $K \times Z \to Z$ is closed by Lemma 5.12.3. Hence the composition $Z \times f^{-1}(K) \to Z \times K \to Z$ is closed and therefore $f^{-1}(K)$ must be quasi-compact by Lemma 5.12.3 again. □

Remark 5.12.6. Here are some references to the literature. In [**Bou71**, I, p. 75, Theorem 1] you can find: (2) ⇔ (4). In [**Bou71**, I, p. 77, Proposition 6] you can find: (2) ⇒ (1). Of course, trivially we have (1) ⇒ (4). Thus (1), (2) and (4) are equivalent. Fan Zhou claimed and proved that (3) and (4) are equivalent; let me know if you find a reference in the literature.

5.13. Jacobson spaces

Definition 5.13.1. Let X be a topological space. Let X_0 be the set of closed points of X. We say that X is *Jacobson* if every closed subset $Z \subset X$ is the closure of $Z \cap X_0$.

Let X be a Jacobson space and let X_0 be the set of closed points of X with the induced topology. Clearly, the definition implies that the morphism $X_0 \to X$ induces a bijection between the closed subsets of X_0 and the closed subsets of X. Thus many properties of X are inherted by X_0. For example, the Krull dimensions of X and X_0 are the same.

Lemma 5.13.2. *Let X be a topological space. Let X_0 be the set of closed points of X. Suppose that for every irreducible closed subset $Z \subset X$ the intersection $X_0 \cap Z$ is dense in Z. Then X is Jacobson.*

Proof. Let $Z \subset X$ be closed. According to Lemma 5.5.3 we have $Z = \bigcup Z_i$ with Z_i irreducible and closed. Thus is $X_0 \cap Z_i$ is dense in each Z_i, then $X_0 \cap Z$ is dense in Z. □

Lemma 5.13.3. *Let X be a sober, Noetherian topological space. If X is not Jacobson, then there exists a non-closed point $\xi \in X$ such that $\{\xi\}$ is locally closed.*

Proof. Assume X is sober, Noetherian and not Jacobson. By Lemma 5.13.2 there exists an irreducible closed subset $Z \subset X$ which is not the closure of its closed points. Since X is Noetherian we may assume Z is minimal with this property. Let $\xi \in Z$ be the unique generic point (here we use X is sober). Note that the closed points are dense in $\overline{\{z\}}$ for any $z \in Z$, $z \neq \xi$ by minimality of Z. Hence the closure of the set of closed points of Z is a closed subset containing all $z \in Z$, $z \neq \xi$. Hence $\{\xi\}$ is locally closed as desired. □

Lemma 5.13.4. *Let X be a topological space. Let $X = \bigcup U_i$ be an open covering. Then X is Jacobson if and only if each U_i is Jacobson. Moreover, in this case $X_0 = \bigcup U_{i,0}$.*

Proof. Let X be a topological space. Let X_0 be the set of closed points of X. Let $U_{i,0}$ be the set of closed points of U_i. Then $X_0 \cap U_i \subset U_{i,0}$ but equality may not hold in general.

First, assume that each U_i is Jacobson. We claim that in this case $X_0 \cap U_i = U_{i,0}$. Namely, suppose that $x \in U_{i,0}$, i.e., x is closed in U_i. Let $\overline{\{x\}}$ be the closure in X. Consider $\overline{\{x\}} \cap U_j$. If $x \notin U_j$, then $\overline{\{x\}} \cap U_j = \emptyset$. If $x \in U_j$, then $U_i \cap U_j \subset U_j$ is an open subset of U_j containing x. Let $T' = U_j \setminus U_i \cap U_j$ and $T = \{x\} \coprod T'$. Then T, T' are closed subsets of U_j and T contains x. As U_j is Jacobson we see that the closed points of U_j are dense in T. Because $T = \{x\} \coprod T'$ this can only be the case if x is closed in U_j. Hence $\overline{\{x\}} \cap U_j = \{x\}$. We conlude that $\overline{\{x\}} = \{x\}$ as desired.

Let $Z \subset X$ be a closed subset (still assuming each U_i is Jacobson). Since now we know that $X_0 \cap Z \cap U_i = U_{i,0} \cap Z$ are dense in $Z \cap U_i$ it follows immediately that $X_0 \cap Z$ is dense in Z.

Conversely, assume that X is Jacobson. Let $Z \subset U_i$ be closed. Then $X_0 \cap \overline{Z}$ is dense in $\overline{Z}$. Hence also $X_0 \cap Z$ is dense in Z, because $\overline{Z} \setminus Z$ is closed. As $X_0 \cap U_i \subset U_{i,0}$ we see that $U_{i,0} \cap Z$ is dense in Z. Thus U_i is Jacobson as desired. □

Lemma 5.13.5. *Let X be Jacobson. The following types of subsets $T \subset X$ are Jacobson:*

1. *Open subspaces.*
2. *Closed subspaces.*
3. *Locally closed subspaces.*
4. *Finite unions of locally closed subspaces.*
5. *Constructible sets.*
6. *Any subset $T \subset X$ which locally on X is a finite union of locally closed subsets.*

In each of these cases closed points of T are closed in X.

Proof. Let X_0 be the set of closed points of X. For any subset $T \subset X$ we let $(*)$ denote the property:

$(*)$ For every closed subset $Z \subset T$ the set $Z \cap X_0$ is dense in Z.

Note that always $X_0 \cap T \subset T_0$. Hence property $(*)$ implies that T is Jacobson. In addition it clearly implies that every closed point of T is closed in X.

Let $U \subset X$ be an open subset. Suppose $Z \subset U$ is closed. Then $X_0 \cap \overline{Z}$ is dense in $\overline{Z}$. Hence $X_0 \cap Z$ is dense in Z, because $\overline{Z} \setminus Z$ is closed. Thus $(*)$ holds.

Let $Z \subset X$ be a closed subset. Since closed subsets of Z are the same as closed subsets of X contained in Z property $(*)$ is immediate.

Let $T \subset X$ be locally closed. Write $T = U \cap Z$ for some open $U \cap X$ and some closed $Z \subset X$. Note that closed subsets of T are the same thing as closed subsets of U which happen to be contained in Z. Hence $(*)$ holds for T because we proved it for U above.

Suppose $T_i \subset X$, $i = 1, \ldots, n$ are locally closed subsets. Let $T = T_1 \cup \ldots \cup T_n$. Suppose $Z \subset T$ is closed. Then $Z_i = Z \cap T_i$ is closed in T_i. By $(*)$ for T_i we see that $Z_i \cap X_0$ is dense in Z_i. Clearly this implies that $X_0 \cap Z$ is dense in Z, and property $(*)$ holds for T.

The case of constructible subsets is subsumed in the case of finite unions of locally closed subsets, see Definition 5.10.1.

The condition of the last assertion means that there exists an open covering $X = \bigcup U_i$ such that each $T \cap U_i$ is a finite union of locally closed subsets of U_i. We conclude that T is Jacobson by Lemma 5.13.4 and the case of a finite union of locally closed subsets dealt with above. It is formal to deduce $(*)$ for T from $(*)$ for all the inclusions $T \cap U_i \subset U_i$ and the assertions $X_0 = \bigcup U_{i,0}$ and $T_0 = \bigcup (T \cap U_i)_0$ from Lemma 5.13.4. □

Lemma 5.13.6. *A finite Kolmogorov Jacobson space is discrete.*

Proof. By induction on the number of points. The lemma holds if the space is empty. If X is a non-empty finite Kolmogorov space, choose a closed point $x \in X$, see Lemma 5.9.6. Then $U = X \setminus \{x\}$ is a finite Jacobson space, see Lemma 5.13.5. By induction U is a finite discrete space, hence all its points are closed. By Lemma 5.13.5 all the points of U are also closed in X and we win. □

Lemma 5.13.7. *Suppose X is a Jacobson topological space. Let X_0 be the set of closed points of X. There is a bijective, inclusion preserving correspondence*

$$\{\text{constructible subsets of } X\} \leftrightarrow \{\text{constructible subsets of } X_0\}$$

given by $E \mapsto E \cap X_0$. This correspondence preserves the subset of retrocompact open subsets, as well as complements of these.

Proof. Obvious from Lemma 5.13.5 above. □

Lemma 5.13.8. *Suppose X is a Jacobson topological space. Let X_0 be the set of closed points of X. There is a bijective, inclusion preserving correspondence*

$$\{fiX\} \leftrightarrow \{fiX_0\}$$

given by $E \mapsto E \cap X_0$. This correspondence preserves the subsets of locally closed, of open and of closed subsets.

Proof. Obvious from Lemma 5.13.5 above. □

5.14. Specialization

Definition 5.14.1. Let X be a toplogical space.

(1) If $x, x' \in X$ then we say x is a *specialization* of x', or x' is a *generalization* of x if $x \in \overline{\{x'\}}$. Notation: $x' \rightsquigarrow x$.
(2) A subset $T \subset X$ is *stable under specialization* if for all $x' \in T$ and every specialization $x' \rightsquigarrow x$ we have $x \in T$.
(3) A subset $T \subset X$ is *stable under generalization* if for all $x \in T$ and every generalization x' of x we have $x' \in T$.

Lemma 5.14.2. *Let X be a toplogical space.*

(1) *Any closed subset of X is stable under specialization.*
(2) *Any open subset of X is stable under generalization.*
(3) *A subset $T \subset X$ is stable under specialization if and only if the complement T^c is stable under generalization.*

Proof. Omitted. □

Definition 5.14.3. Let $f : X \to Y$ be a continuous map of topological spaces.

(1) We say that *specializations lift along f* or that f is *specializing* if given $y' \rightsquigarrow y$ in Y and any $x' \in X$ with $f(x') = y'$ there exists a specialization $x' \rightsquigarrow x$ of x' in X such that $f(x) = y$.
(2) We say that *generalizations lift along f* or that f is *generalizing* if given $y' \rightsquigarrow y$ in Y and any $x \in X$ with $f(x) = y$ there exists a generalization $x' \rightsquigarrow x$ of x in X such that $f(x') = y'$.

Lemma 5.14.4. *Suppose $f : X \to Y$ and $g : Y \to Z$ are continuous maps of topological spaces. If specializations lift along both f and g then specializations lift along $g \circ f$. Similarly for ``generalizations lift along''.*

Proof. Omitted. □

Lemma 5.14.5. *Let $f : X \to Y$ be a continuous map of topological spaces.*

(1) *If specializations lift along f, and if $T \subset X$ is stable under specialization, then $f(T) \subset Y$ is stable under specialization.*
(2) *If generalizations lift along f, and if $T \subset X$ is stable under generalization, then $f(T) \subset Y$ is stable under generalization.*

Proof. Omitted. □

Lemma 5.14.6. *Let $f : X \to Y$ be a continuous map of topological spaces.*

(1) *If f is closed then specializations lift along f.*
(2) *If f is open, X is a Noetherian topological space, each irreducible closed subset of X has a generic point, and Y is Kolmogorov then generalizations lift along f.*

Proof. Assume f is closed. Let $y' \rightsquigarrow y$ in Y and any $x' \in X$ with $f(x') = y'$ be given. Consider the closed subset $T = \overline{\{x'\}}$ of X. Then $f(T) \subset Y$ is a closed subset, and $y' \in f(T)$. Hence also $y \in f(T)$. Hence $y = f(x)$ with $x \in T$, i.e., $x' \rightsquigarrow x$.

Assume f is open, X Noetherian, every irreducible closed subset of X has a generic point, and Y is Kolmogorov. Let $y' \rightsquigarrow y$ in Y and any $x \in X$ with $f(x) = y$ be given. Consider $T = f^{-1}(\{y'\}) \subset X$. Take an open neighbourhood $x \in U \subset X$ of x. Then $f(U) \subset Y$ is open and $y \in f(U)$. Hence also $y' \in f(U)$. In other words, $T \cap U \neq \emptyset$. This proves that $x \in \overline{T}$. Since X is Noetherian, T is Noetherian (Lemma 5.6.2). Hence it has a decomposition $T = T_1 \cup \ldots \cup T_n$ into irreducible components. Then correspondingly $\overline{T} = \overline{T_1} \cup \ldots \cup \overline{T_n}$. By the above $x \in \overline{T_i}$ for some i. By assumption there exists a generic point $x' \in \overline{T_i}$, and we see that $x' \rightsquigarrow x$. As $x' \in \overline{T}$ we see that $f(x') \in \overline{\{y'\}}$. Note that $f(\overline{T_i}) = f(\overline{\{x'\}}) \subset \overline{\{f(x')\}}$. If $f(x') \neq y'$, then since Y is Kolmogorov $f(x')$ is not a generic point of the irreducible closed subset $\overline{\{y'\}}$ and the inclusion $\overline{\{f(x')\}} \subset \overline{\{y'\}}$ is strict, i.e., $y' \notin f(\overline{T_i})$. This contradicts the fact that $f(T_i) = \{y'\}$. Hence $f(x') = y'$ and we win. $\square$

Lemma 5.14.7. *Suppose that $s, t : R \to U$ and $\pi : U \to X$ are continuous maps of topological spaces such that*

1. *π is open,*
2. *U is sober,*
3. *s, t have finite fibres,*
4. *generalizations lift along s, t,*
5. *$(t, s)(R) \subset U \times U$ is an equivalence relation on U and X is the quotient of U by this equivalence relation (as a set).*

Then X is Kolmogorov.

Proof. Properties (3) and (5) imply that a point x corresponds to an finite equivalence class $\{u_1, \ldots, u_n\} \subset U$ of the equivalence relation. Suppose that $x' \in X$ is a second point corresponding to the equivalence class $\{u'_1, \ldots, u'_m\} \subset U$. Suppose that $u_i \rightsquigarrow u'_j$ for some i, j. Then for any $r' \in R$ with $s(r') = u'_j$ by (4) we can find $r \rightsquigarrow r'$ with $s(r) = u_i$. Hence $t(t) \rightsquigarrow t(r')$. Since $\{u'_1, \ldots, u'_m\} = t(s^{-1}(\{u'_j\}))$ we conclude that every element of $\{u'_1, \ldots, u'_m\}$ is the specialization of an element of $\{u_1, \ldots, u_n\}$. Thus $\overline{\{u_1\}} \cup \ldots \cup \overline{\{u_n\}}$ is a union of equivalence classes, hence of the form $\pi^{-1}(Z)$ for some subset $Z \subset X$. By (1) we see that Z is closed in X and in fact $Z = \overline{\{x\}}$ because $\pi(\overline{\{u_i\}}) \subset \overline{\{x\}}$ for each i. In other words, $x \rightsquigarrow x'$ if and only if some lift of x in U specializes to some lift of x' in U, if and only if every lift of x' in U is a specialization of some lift of x in U.

Suppose that both $x \rightsquigarrow x'$ and $x' \rightsquigarrow x$. Say x corresponds to $\{u_1, \ldots, u_n\}$ and x' corresponds to $\{u'_1, \ldots, u'_m\}$ as above. Then, by the resuls of the preceding paragraph, we can find a sequence

$$\ldots \rightsquigarrow u'_{j_3} \rightsquigarrow u_{i_3} \rightsquigarrow u'_{j_2} \rightsquigarrow u_{i_2} \rightsquigarrow u'_{j_1} \rightsquigarrow u_{i_1}$$

which must repeat, hence by (2) we conclude that $\{u_1, \ldots, u_n\} = \{u'_1, \ldots, u'_m\}$, i.e., $x = x'$. Thus X is Kolmogorov. $\square$

Lemma 5.14.8. *Let $f : X \to Y$ be a morphism of topological spaces. Suppose that Y is a sober topological space, and f is surjective. If either specializations or generalizations lift along f, then* $\dim(X) \geq \dim(Y)$.

Proof. Assume specializations lift along f. Let $Z_0 \subset Z_1 \subset \ldots Z_e \subset Y$ be a chain of irreducible closed subsets of X. Let $\xi_e \in X$ be a point mapping to the generic point of

Z_e. By assumption there exists a specialization $\xi_e \rightsquigarrow \xi_{e-1}$ in X such that ξ_{e-1} maps to the generic point of Z_{e-1}. Continuing in this manner we find a sequence of specializations

$$\xi_e \rightsquigarrow \xi_{e-1} \rightsquigarrow \ldots \rightsquigarrow \xi_0$$

with ξ_i mapping to the generic point of Z_i. This clearly implies the sequence of irreducible closed subsets

$$\overline{\{\xi_0\}} \subset \overline{\{\xi_1\}} \subset \ldots \overline{\{\xi_e\}}$$

is a chain of length e in X. The case when generalizations lift along f is similar. □

Lemma 5.14.9. *Let X be a Noetherian sober topological space. Let $E \subset X$ be a subset of X.*

1. *If E is constructible and stable under specialization, then E is closed.*
2. *If E is constructible and stable under generalization, then E is open.*

Proof. Let E be constructible and stable under generalization. Let $Y \subset X$ be an irreducible closed subset with generic point $\xi \in Y$. If $E \cap Y$ is nonempty, then it contains ξ (by stability under generalization) and hence is dense in Y, hence it contains a nonempty open of Y, see Lemma 5.11.3. Thus E is open by Lemma 5.11.5. This proves (2). To prove (1) apply (2) to the complement of E in X. □

5.15. Submersive maps

Definition 5.15.1. Let $f : X \to Y$ be a continuous map of topological spaces. We say f is *submersive*[3] if f is surjective and for any $T \subset Y$ we have T is open or closed if and only if $f^{-1}(T)$ is so.

Another way to express the second condition is that Y has the quotient topology relative to the map $X \to Y$. Here is an example where this holds.

Lemma 5.15.2. *Let $f : X \to Y$ be surjective, open, continuous map of topological spaces. Let $T \subset Y$ be a subset. Then*

1. $f^{-1}(\overline{T}) = \overline{f^{-1}(T)}$,
2. *$T \subset Y$ is closed if and only $f^{-1}(T)$ is closed,*
3. *$T \subset Y$ is open if and only $f^{-1}(T)$ is open, and*
4. *$T \subset Y$ is locally closed if and only $f^{-1}(T)$ is locally closed.*

In particular we see that f is submersive.

Proof. It is clear that $\overline{f^{-1}(T)} \subset f^{-1}(\overline{T})$. If $x \in X$, and $x \not\in \overline{f^{-1}(T)}$, then there exists an open neighbourhood $x \in U \subset X$ with $U \cap f^{-1}(T) = \emptyset$. Since f is open we see that $f(U)$ is an open neighbourhood of $f(x)$ not meeting T. Hence $x \not\in f^{-1}(\overline{T})$. This proves (1). Part (2) is an easy consequences of this. Part (3) is obvious from the fact that f is open. For (4), if $f^{-1}(T)$ is locally closed, then $f^{-1}(T) \subset \overline{f^{-1}(T)} = f^{-1}(\overline{T})$ is open, and hence by (3) applied to the map $f^{-1}(\overline{T}) \to \overline{T}$ we see that T is open in $\overline{T}$, i.e., T is locally closed. □

[3]This is very different from the notion of a submersion between differential manifolds!

5.16. Dimension functions

It scarcely makes sense to consider dimension functions unless the space considered is sober (Definition 5.5.4). Thus the definition below can be improved by considering the sober topological space associated to X. Since the underlying topological space of a scheme is sober we do not bother with this improvement.

Definition 5.16.1. Let X be a topological space.

(1) Let $x, y \in X$, $x \neq y$. Suppose $x \rightsquigarrow y$, that is y is a specialization of x. We say y is an *immediate specialization* of x if there is no $z \in X \setminus \{x, y\}$ with $x \rightsquigarrow z$ and $z \rightsquigarrow y$.

(2) A map $\delta : X \to \mathbf{Z}$ is called a *dimension function*[4] if
   (a) whenever $x \rightsquigarrow y$ and $x \neq y$ we have $\delta(x) > \delta(y)$, and
   (b) for every immediate specialization $x \rightsquigarrow y$ in X we have $\delta(x) = \delta(y) + 1$.

It is clear that if δ is a dimension function, then so is $\delta + t$ for any $t \in \mathbf{Z}$. Here is a fun lemma.

Lemma 5.16.2. *Let X be a topological space. If X is sober and has a dimension function, then X is catenary. Moreover, for any $x \rightsquigarrow y$ we have*

$$\delta(x) - \delta(y) = \mathit{codim}\left(\overline{\{y\}}, \overline{\{x\}}\right).$$

Proof. Suppose $Y \subset Y' \subset X$ are irreducible closed subsets. Let $\xi \in Y$, $\xi' \in Y'$ be their generic points. Then we see immediately from the definitions that $\text{codim}(Y, Y') \leq \delta(\xi) - \delta(\xi') < \infty$. In fact the first inequality is an equality. Namely, suppose

$$Y = Y_0 \subset Y_1 \subset \ldots \subset Y_e = Y'$$

is any maximal chain of irreducible closed subsets. Let $\xi_i \in Y_i$ denote the generic point. Then we see that $\xi_i \rightsquigarrow \xi_{i+1}$ is an immediate specialization. Hence we see that $e = \delta(\xi) - \delta(\xi')$ as desired. This also proves the last statement of the lemma. $\square$

Lemma 5.16.3. *Let X be a topological space. Let δ, δ' be two dimension functions on X. If X is locally Noetherian and sober then $\delta - \delta'$ is locally constant on X.*

Proof. Let $x \in X$ be a point. We will show that $\delta - \delta'$ is constant in a neighbourhood of x. We may replace X by an open neighbourhood of x in X which is Noetherian. Hence we may assume X is Noetherian and sober. Let $Z_1, \ldots, Z_r$ be the irreducible components of X passing through x. (There are finitely many as X is Noetherian, see Lemma 5.6.2.) Let $\xi_i \in Z_i$ be the generic point. Note $Z_1 \cup \ldots \cup Z_r$ is a neighbourhood of x in X (not necessarily closed). We claim that $\delta - \delta'$ is constant on $Z_1 \cup \ldots \cup Z_r$. Namely, if $y \in Z_i$, then

$$\delta(x) - \delta(y) = \delta(x) - \delta(\xi_i) + \delta(\xi_i) - \delta(y) = -\text{codim}(\overline{\{x\}}, Z_i) + \text{codim}(\overline{\{y\}}, Z_i)$$

by Lemma 5.16.2. Similarly for δ'. Whence the result. $\square$

Lemma 5.16.4. *Let X be locally Noetherian, sober and catenary. Then any point has an open neighbourhood $U \subset X$ which has a dimension function.*

[4]This is likely nonstandard notation. This notion is usually introduced only for (locally) Noetherian schemes, in which case condition (a) is implied by (b).

Proof. We will use repeatedly that an open subspace of a catenary space is catenary, see Lemma 5.8.2 and that a Noetherian topological space has finitely many irreducible components, see Lemma 5.6.2. In the proof of Lemma 5.16.3 we saw how to construct such a function. Namely, we first replace X by a Noetherian open neighbourhood of x. Next, we let $Z_1, \ldots, Z_r \subset X$ be the irreducible components of X. Let

$$Z_i \cap Z_j = \bigcup Z_{ijk}$$

be the decomposition into irreducible components. We replace X by

$$X \setminus \left(\bigcup\nolimits_{x \notin Z_i} Z_i \cup \bigcup\nolimits_{x \notin Z_{ijk}} Z_{ijk}\right)$$

so that we may assume $x \in Z_i$ for all i and $x \in Z_{ijk}$ for all i, j, k. For $y \in X$ choose any i such that $y \in Z_i$ and set

$$\delta(y) = -\text{codim}(\overline{\{x\}}, Z_i) + \text{codim}(\overline{\{y\}}, Z_i).$$

We claim this is a dimension function. First we show that it is well defined, i.e., independent of the choice of i. Namely, suppose that $y \in Z_{ijk}$ for some i, j, k. Then we have (using Lemma 5.8.6)

$$\begin{aligned}
\delta(y) &= -\text{codim}(\overline{\{x\}}, Z_i) + \text{codim}(\overline{\{y\}}, Z_i) \\
&= -\text{codim}(\overline{\{x\}}, Z_{ijk}) - \text{codim}(Z_{ijk}, Z_i) + \text{codim}(\overline{\{y\}}, Z_{ijk}) + \text{codim}(Z_{ijk}, Z_i) \\
&= -\text{codim}(\overline{\{x\}}, Z_{ijk}) + \text{codim}(\overline{\{y\}}, Z_{ijk})
\end{aligned}$$

which is symmetric in i and j. We omit the proof that it is a dimension function. □

Remark 5.16.5. Combining Lemmas 5.16.3 and 5.16.4 we see that on a catenary, locally Noetherian, sober topological space the obstruction to having a dimension function is an element of $H^1(X, \mathbf{Z})$.

5.17. Nowhere dense sets

Definition 5.17.1. Let X be a topological space.

(1) Given a subset $T \subset X$ the *interior* of T is the largest open subset of X contained in T.
(2) A subset $T \subset X$ is called *nowhere dense* if the closure of T has empty interior.

Lemma 5.17.2. *Let X be a topological space. The union of a finite number of nowhere dense sets is a nowhere dense set.*

Proof. Omitted. □

Lemma 5.17.3. *Let X be a topological space. Let $U \subset X$ be an open. Let $T \subset U$ be a subset. If T is nowhere dense in U, then T is nowhere dense in X.*

Proof. Assume T is nowhere dense in U. Suppose that $x \in X$ is an interior point of the closure $\overline{T}$ of T in X. Say $x \in V \subset \overline{T}$ with $V \subset X$ open in X. Note that $\overline{T} \cap U$ is the closure of T in U. Hence the interior of $\overline{T} \cap U$ being empty implies $V \cap U = \emptyset$. Thus x cannot be in the closure of U, a fortiori cannot be in the closure of T, a contradiction. □

Lemma 5.17.4. *Let X be a topological space. Let $X = \bigcup U_i$ be an open covering. Let $T \subset X$ be a subset. If $T \cap U_i$ is nowhere dense in U_i for all i, then T is nowhere dense in X.*

Proof. Omitted. (Hint: closure commutes with intersecting with opens.) □

Lemma 5.17.5. *Let $f : X \to Y$ be a continuous map of topological spaces. Let $T \subset X$ be a subset. If f identifies X with a closed subset of Y and T is nowhere dense in X, then also $f(T)$ is nowhere dense in Y.*

Proof. Omitted. □

Lemma 5.17.6. *Let $f : X \to Y$ be a continuous map of topological spaces. Let $T \subset Y$ be a subset. If f is open and T is a closed nowhere dense subset of Y, then also $f^{-1}(T)$ is a closed nowhere dense subset of X. If f is surjective and open, then T is closed nowhere dense if and only if $f^{-1}(T)$ is closed nowhere dense.*

Proof. Omitted. (Hint: In the first case the interior of $f^{-1}(T)$ maps into the interior of T, and in the second case the interior of $f^{-1}(T)$ maps onto the interior of T.) □

5.18. Miscellany

Recall that a neighbourhood of a point need not be open.

Definition 5.18.1. A topological space X is called *locally quasi-compact*[5] if every point has a fundamental system of quasi-compact neighbourhoods.

The following lemma applies to the underlying topological space associated to a quasi-separated scheme.

Lemma 5.18.2. *Let X be a topological space which*

(1) *has a basis of the topology consisting of quasi-compact opens, and*
(2) *has the property that the intersection of any two quasi-compact opens is quasi-compact.*

Then

(1) *any quasi-compact open $U \subset X$ has a cofinal system of open coverings $\mathcal{U} : U = \bigcup_{j \in J} U_j$ with J finite and all $U_j \cap U_{j'}$ quasi-compact for all $j, j' \in J$*
(2) *add more here.*

Proof. Omitted. □

Definition 5.18.3. Let X be a topological space. We say $x \in X$ is an *isolated point* of X if $\{x\}$ is open in X.

CHAPTER 6

Sheaves on Spaces

6.1. Introduction

Basic properties of sheaves on topological spaces will be explained in this document. A reference is [**God73**].

This will be superceded by the discussion of sheaves over sites later in the documents. But perhaps it makes sense to briefly define some of the notions here.

6.2. Basic notions

The following notions are considered basic and will not be defined, and or proved. This does not mean they are all necessarily easy or well known.

(1) Let X be a topological space. The phrase: ``Let $U = \bigcup_{i \in I} U_i$ be an open covering" means the following: I is a set, and for each $i \in I$ we are given an open subset $U_i \subset X$. Furthermore U is the union of the U_i. It is allowed to have $I = \emptyset$ in which case there are no U_i and $U = \emptyset$. It is also allowed, in case $I \neq \emptyset$ to have any or all of the U_i be empty.
(2) etc, etc.

6.3. Presheaves

Definition 6.3.1. Let X be a topological space.

(1) A *presheaf $\mathcal{F}$ of sets on X* is a rule which assigns to each open $U \subset X$ a set $\mathcal{F}(U)$ and to each inclusion $V \subset U$ a map $\rho^U_V : \mathcal{F}(U) \to \mathcal{F}(V)$ such that $\rho^U_U = \text{id}_{\mathcal{F}(U)}$ and whenever $W \subset V \subset U$ we have $\rho^U_W = \rho^V_W \circ \rho^U_V$.
(2) A *morphism $\varphi : \mathcal{F} \to \mathcal{G}$ of presheaves of sets on X* is a rule which assigns to each open $U \subset X$ a map of sets $\varphi : \mathcal{F}(U) \to \mathcal{G}(U)$ compatible with restriction maps, i.e., whenever $V \subset U \subset X$ are open the diagram

$$\begin{tikzcd} \mathcal{F}(U) \arrow[r, "\varphi"] \arrow[d, "\rho^U_V"] & \mathcal{G}(U) \arrow[d, "\rho^U_V"] \\ \mathcal{F}(V) \arrow[r, "\varphi"] & \mathcal{G}(V) \end{tikzcd}$$

commutes.
(3) The category of presheaves of sets on X will be denoted $PSh(X)$.

The elements of the set $\mathcal{F}(U)$ are called the *sections* of $\mathcal{F}$ over U. For every $V \subset U$ the map $\rho^U_V : \mathcal{F}(U) \to \mathcal{F}(V)$ is called the *restricton map*. We will use the notation $s|_V := \rho^U_V(s)$ if $s \in \mathcal{F}(U)$. This notation is consistent with the notion of restriction of functions from topology because if $W \subset V \subset U$ and s is a section of $\mathcal{F}$ over U then $s|_W = (s|_V)|_W$ by the property of the restriction maps expressed in the definition above.

Another notation that is often used is to indicate sections over an open U by the symbol $\Gamma(U, -)$ or by $H^0(U, -)$. In other words, the following equalities are tautological

$$\Gamma(U, \mathcal{F}) = \mathcal{F}(U) = H^0(U, \mathcal{F}).$$

In this chapter we will not use this notation, but in others we will.

Definition 6.3.2. Let X be a topological space. Let A be a set. The *constant presheaf with value* A is the presheaf that assigns the set A to every open $U \subset X$, and such that all restriction mappings are id_A.

6.4. Abelian presheaves

In this section we briefly point out some features of the category of presheaves that allow one to define presheaves of abelian groups.

Example 6.4.1. Let X be a topological space X. Consider a rule $\mathcal{F}$ that associates to every open subset a singleton set. Since every set has a unique map into a singleton set, there exist unique restriction maps ρ^U_V. The resulting structure is a presheaf of sets. It is a final object in the category of presheaves of sets, by the property of singleton sets mentioned above. Hence it is also unique up to unique isomorphism. We will sometimes write $*$ for this presheaf.

Lemma 6.4.2. *Let X be a topological space. The category of presheaves of sets on X has products (see Categories, Definition 4.13.5). Moreover, the set of sections of the product $\mathcal{F} \times \mathcal{G}$ over an open U is the product of the sets of sections of $\mathcal{F}$ and $\mathcal{G}$ over U.*

Proof. Namely, suppose $\mathcal{F}$ and $\mathcal{G}$ are presheaves of sets on the topological space X. Consider the rule $U \mapsto \mathcal{F}(U) \times \mathcal{G}(U)$, denoted $\mathcal{F} \times \mathcal{G}$. If $V \subset U \subset X$ are open then define the restriction mapping

$$(\mathcal{F} \times \mathcal{G})(U) \longrightarrow (\mathcal{F} \times \mathcal{G})(V)$$

by mapping $(s, t) \mapsto (s|_V, t|_V)$. Then it is immediately clear that $\mathcal{F} \times \mathcal{G}$ is a presheaf. Also, there are projection maps $p : \mathcal{F} \times \mathcal{G} \to \mathcal{F}$ and $q : \mathcal{F} \times \mathcal{G} \to \mathcal{G}$. We leave it to the reader to show that for any third presheaf $\mathcal{H}$ we have $Mor(\mathcal{H}, \mathcal{F}\times\mathcal{G}) = Mor(\mathcal{H}, \mathcal{F})\times Mor(\mathcal{H}, \mathcal{G})$. $\square$

Recall that if $(A, + : A\times A \to A, - : A \to A, 0 \in A)$ is an abelian group, then the zero and the negation maps are uniquely determined by the addition law. In other words, it makes sense to say ``let $(A, +)$ be an abelian group''.

Lemma 6.4.3. *Let X be a topological space. Let $\mathcal{F}$ be a presheaf of sets. Consider the following types of structure on $\mathcal{F}$:*

1. *For every open U the structure of an abelian group on $\mathcal{F}(U)$ such that all restriction maps are abelian group homomorphisms.*
2. *A map of presheaves $+ : \mathcal{F} \times \mathcal{F} \to \mathcal{F}$, a map of presheaves $- : \mathcal{F} \to \mathcal{F}$ and a map $0 : * \to \mathcal{F}$ (see Example 6.4.1) satisfying all the axioms of $+, -, 0$ in a usual abelian group.*
3. *A map of presheaves $+ : \mathcal{F} \times \mathcal{F} \to \mathcal{F}$, a map of presheaves $- : \mathcal{F} \to \mathcal{F}$ and a map $0 : * \to \mathcal{F}$ such that for each open $U \subset X$ the quadruple $(\mathcal{F}(U), +, -, 0)$ is an abelian group,*
4. *A map of presheaves $+ : \mathcal{F} \times \mathcal{F} \to \mathcal{F}$ such that for every open $U \subset X$ the map $+ : \mathcal{F}(U) \times \mathcal{F}(U) \to \mathcal{F}(U)$ defines the structure of an abelian group.*

There are natural bijections between the collections of types of data (1) - (4) above.

Proof. Omitted. $\square$

The lemma says that to give an abelian group object $\mathcal{F}$ in the category of presheaves is the same as giving a presheaf of sets $\mathcal{F}$ such that all the sets $\mathcal{F}(U)$ are endowed with the structure of an abelian group and such that all the restriction mappings are group homomorphisms. For most algebra structures we will take this approach to (pre)sheaves of such objects, i.e., we will define a (pre)sheaf of such objects to be a (pre)sheaf $\mathcal{F}$ of sets all of whose sets of sections $\mathcal{F}(U)$ are endowed with this structure compatibly with the restriction mappings.

Definition 6.4.4. Let X be a topological space.

(1) A *presheaf of abelian groups on X* or an *abelian presheaf over X* is a presheaf of sets $\mathcal{F}$ such that for each open $U \subset X$ the set $\mathcal{F}(U)$ is endowed with the structure of an abelian group, and such that all restriction maps ρ^U_V are homomorphisms of abelian groups, see Lemma 6.4.3 above.
(2) A *morphism of abelian presheaves over X* $\varphi : \mathcal{F} \to \mathcal{G}$ is a morphism of presheaves of sets which induces a homomorphism of abelian groups $\mathcal{F}(U) \to \mathcal{G}(U)$ for every open $U \subset X$.
(3) The category of presheaves of abelian groups on X is denoted $PAb(X)$.

Example 6.4.5. Let X be a topological space. For each $x \in X$ suppose given an abelian group M_x. For $U \subset X$ open we set

$$\mathcal{F}(U) = \bigoplus\nolimits_{x \in U} M_x.$$

We denote a typical element in this abelian group by $\sum_{i=1}^n m_{x_i}$, where $x_i \in U$ and $m_{x_i} \in M_{x_i}$. (Of course we may always choose our representation such that $x_1, \ldots, x_n$ are pairwise distinct.) We define for $V \subset U \subset X$ open a restriction mapping $\mathcal{F}(U) \to \mathcal{F}(V)$ by mapping an element $s = \sum_{i=1}^n m_{x_i}$ to the element $s|_V = \sum_{x_i \in V} m_{x_i}$. We leave it to the reader to verify that this is a presheaf of abelian groups.

6.5. Presheaves of algebraic structures

Let us clarify the definition of presheaves of algebraic structures. Suppose that $\mathcal{C}$ is a category and that $F : \mathcal{C} \to Sets$ is a faithful functor. Typically F is a ``forgetful" functor. For an object $M \in Ob(\mathcal{C})$ we often call $F(M)$ the *underlying set* of the object M. If $M \to M'$ is a morphism in $\mathcal{C}$ we call $F(M) \to F(M')$ the *underlying map of sets*. In fact, we will often not distinguish between an object and its underlying set, and similarly for morphisms. So we will say a map of sets $F(M) \to F(M')$ is a *morphism of algebraic structures*, if it is equal to $F(f)$ for some morphism $f : M \to M'$ in $\mathcal{C}$.

In analogy with Definition 6.4.4 above a ``presheaf of objects of $\mathcal{C}$" could be defined by the following data:

(1) a presheaf of sets $\mathcal{F}$, and
(2) for every open $U \subset X$ a choice of an object $A(U) \in Ob(\mathcal{C})$

subject to the following conditions (using the phraseology above)

(1) for every open $U \subset X$ the set $\mathcal{F}(U)$ is the underlying set of $A(U)$, and
(2) for every $V \subset U \subset X$ open the map of sets $\rho^U_V : \mathcal{F}(U) \to \mathcal{F}(V)$ is a morphism of algebraic structures.

In other words, for every $V \subset U$ open in X the restriction mappings ρ^U_V is the image $F(\alpha^U_V)$ for some unique morphism $\alpha^U_V : A(U) \to A(V)$ in the category $\mathcal{C}$. The uniqueness is forced by the condition that F is faithful; it also implies that $\alpha^U_W = \alpha^V_W \circ \alpha^U_V$ whenever $W \subset V \subset U$ are open in X. The system $(A(-), \alpha^U_V)$ is what we will define as a presheaf with values in

$\mathcal{C}$ on X, compare Sites, Definition 9.2.2. We recover our presheaf of sets $(\mathcal{F}, \rho^U_V)$ via the rules $\mathcal{F}(U) = F(A(U))$ and $\rho^U_V = F(\alpha^U_V)$.

Definition 6.5.1. Let X be a topological space. Let $\mathcal{C}$ be a category.

(1) A *presheaf $\mathcal{F}$ on X with values in $\mathcal{C}$* is given by a rule which assigns to every open $U \subset X$ an object $\mathcal{F}(U)$ of $\mathcal{C}$ and to each inclusion $V \subset U$ a morphism $\rho^U_V : \mathcal{F}(U) \to \mathcal{F}(V)$ in $\mathcal{C}$ such that whenever $W \subset V \subset U$ we have $\rho^U_W = \rho^V_W \circ \rho^U_V$.
(2) A *morphism $\varphi : \mathcal{F} \to \mathcal{G}$ of presheaves with value in $\mathcal{C}$* is given by a morphism $\varphi : \mathcal{F}(U) \to \mathcal{G}(U)$ in $\mathcal{C}$ compatible with restriction morphisms.

Definition 6.5.2. Let X be a topological space. Let $\mathcal{C}$ be a category. Let $F : \mathcal{C} \to \textit{Sets}$ be a faithful functor. Let $\mathcal{F}$ be a presheaf on X with values in $\mathcal{C}$. The presheaf of sets $U \mapsto F(\mathcal{F}(U))$ is called the *underlying presheaf of sets of $\mathcal{F}$*.

It is customary to use the same letter $\mathcal{F}$ to denote the underlying presheaf of sets, and this makes sense according to our discussion preceding Definition 6.5.1. In particular, the phrase ``let $s \in \mathcal{F}(U)$'' or ``let s be a section of $\mathcal{F}$ over U'' signifies that $s \in F(\mathcal{F}(U))$.

This notation and these definitions apply in particular to: *Presheaves of (not necessarily abelian) groups, rings, modules over a fixed ring, vector spaces over a fixed field,* etc and *morphisms between these*.

6.6. Presheaves of modules

Suppose that $\mathcal{O}$ is a presheaf of rings on X. We would like to define the notion of a presheaf of $\mathcal{O}$-modules over X. In analogy with Definition 6.4.4 we are tempted to define this as a sheaf of sets $\mathcal{F}$ such that for every open $U \subset X$ the set $\mathcal{F}(U)$ is endowed with the structure of an $\mathcal{O}(U)$-module compatible with restriction mappings (of $\mathcal{F}$ and $\mathcal{O}$). However, it is customary (and equivalent) to define it as in the following definition.

Definition 6.6.1. Let X be a topological space, and let $\mathcal{O}$ be a presheaf of rings on X.

(1) A *presheaf of $\mathcal{O}$-modules* is given by an abelian presheaf $\mathcal{F}$ together with a map of presheaves of sets
$$\mathcal{O} \times \mathcal{F} \longrightarrow \mathcal{F}$$
such that for every open $U \subset X$ the map $\mathcal{O}(U) \times \mathcal{F}(U) \to \mathcal{F}(U)$ defines the structure of an $\mathcal{O}(U)$-module structure on the abelian group $\mathcal{F}(U)$.
(2) A *morphism $\varphi : \mathcal{F} \to \mathcal{G}$ of presheaves of $\mathcal{O}$-modules* is a morphism of abelian presheaves $\varphi : \mathcal{F} \to \mathcal{G}$ such that the diagram
$$\begin{tikzcd} \mathcal{O} \times \mathcal{F} \arrow[r] \arrow[d, "\mathrm{id}\times\varphi"'] & \mathcal{F} \arrow[d, "\varphi"] \\ \mathcal{O} \times \mathcal{G} \arrow[r] & \mathcal{G} \end{tikzcd}$$
commutes.
(3) The set of $\mathcal{O}$-module morphisms as above is denoted $\textit{Hom}_{\mathcal{O}}(\mathcal{F}, \mathcal{G})$.
(4) The category of presheaves of $\mathcal{O}$-modules is denoted $\textit{PMod}(\mathcal{O})$.

Suppose that $\mathcal{O}_1 \to \mathcal{O}_2$ is a morphism of presheaves of rings on X. In this case, if $\mathcal{F}$ is a presheaf of $\mathcal{O}_2$-modules then we can think of $\mathcal{F}$ as a presheaf of $\mathcal{O}_1$-modules by using the composition
$$\mathcal{O}_1 \times \mathcal{F} \to \mathcal{O}_2 \times \mathcal{F} \to \mathcal{F}.$$

We sometimes denote this by $\mathcal{F}_{\mathcal{O}_1}$ to indicate the restriction of rings. We call this the *restriction of* $\mathcal{F}$. We obtain the restriction functor

$$PMod(\mathcal{O}_2) \longrightarrow PMod(\mathcal{O}_1)$$

On the other hand, given a presheaf of $\mathcal{O}_1$-modules $\mathcal{G}$ we can construct a presheaf of $\mathcal{O}_2$-modules $\mathcal{O}_2 \otimes_{p,\mathcal{O}_1} \mathcal{G}$ by the rule

$$\left(\mathcal{O}_2 \otimes_{p,\mathcal{O}_1} \mathcal{G}\right)(U) = \mathcal{O}_2(U) \otimes_{\mathcal{O}_1(U)} \mathcal{G}(U)$$

The index p stands for ``presheaf'' and not ``point''. This presheaf is called the tensor product presheaf. We obtain the *change of rings* functor

$$PMod(\mathcal{O}_1) \longrightarrow PMod(\mathcal{O}_2)$$

Lemma 6.6.2. *With X, $\mathcal{O}_1$, $\mathcal{O}_2$, $\mathcal{F}$ and $\mathcal{G}$ as above there exists a canonical bijection*

$$Hom_{\mathcal{O}_1}(\mathcal{G}, \mathcal{F}_{\mathcal{O}_1}) = Hom_{\mathcal{O}_2}(\mathcal{O}_2 \otimes_{p,\mathcal{O}_1} \mathcal{G}, \mathcal{F})$$

In other words, the restriction and change of rings functors are adjoint to each other.

Proof. This follows from the fact that for a ring map $A \to B$ the restriction functor and the change of ring functor are adjoint to each other. $\square$

6.7. Sheaves

In this section we explain the sheaf condition.

Definition 6.7.1. Let X be a topological space.

(1) A *sheaf $\mathcal{F}$ of sets on X* is a presheaf of sets which satsifies the following additional property: Given any open covering $U = \bigcup_{i \in I} U_i$ and any collection of sections $s_i \in \mathcal{F}(U_i)$, $i \in I$ such that $\forall i, j \in I$

$$s_i|_{U_i \cap U_j} = s_j|_{U_i \cap U_j}$$

there exists a unique section $s \in \mathcal{F}(U)$ such that $s_i = s|_{U_i}$ for all $i \in I$.

(2) A *morphism of sheaves of sets* is simply a morphism of presheaves of sets.

(3) The category of sheaves of sets on X is denoted $Sh(X)$.

Remark 6.7.2. There is always a bit of confusion as to whether it is necessary to say something about the set of sections of a sheaf over the empty set $\emptyset \subset X$. It is necessary, and we already did if you read the definition right. Namely, note that the empty set is covered by the empty open covering, and hence the ``collection of section s_i'' from the definition above actually form an element of the empty product which is the final object of the category the sheaf has values in. In other words, if you read the definition right you automatically deduce that $\mathcal{F}(\emptyset) =$ *a final object*, which in the case of a sheaf of sets is a singleton. If you do not like this argument, then you can just require that $\mathcal{F}(\emptyset) = \{*\}$.

In particular, this condition will then ensure that if $U, V \subset X$ are open and *disjoint* then

$$\mathcal{F}(U \cup V) = \mathcal{F}(U) \times \mathcal{F}(V).$$

(Because the fibre product over a final object is a product.)

Example 6.7.3. Let X, Y be topological spaces. Consider the rule $\mathcal{F}$ wich associates to the open $U \subset X$ the set

$$\mathcal{F}(U) = \{f : U \to Y \mid f \text{ is continuous}\}$$

with the obvious restriction mappings. We claim that $\mathcal{F}$ is a sheaf. To see this suppose that $U = \bigcup_{i \in I} U_i$ is an open covering, and $f_i \in \mathcal{F}(U_i)$, $i \in I$ with $f_i|_{U_i \cap U_j} = f_j|_{U_i \cap U_j}$ for all $i, j \in I$. In this case define $f : U \to Y$ by setting $f(u)$ equal to the value of $f_i(u)$ for any $i \in I$ such that $u \in U_i$. This is well defined by assumption. Moreover, $f : U \to Y$ is a map such that its restriction to U_i agrees with the continuous map U_i. Hence clearly f is continuous!

We can use the result of the example to define constant sheaves. Namely, suppose that A is a set. Endow A with the discrete topology. Let $U \subset X$ be an open subset. Then we have

$$\{f : U \to A \mid f \text{ continuous}\} = \{f : U \to A \mid f \text{ locally constant}\}.$$

Thus the rule which assigns to an open all locally constant maps into A is a sheaf.

Definition 6.7.4. Let X be a topological space. Let A be a set. The *constant sheaf with value A* denoted $\underline{A}$, or $\underline{A}_X$ is the sheaf that assigns to an open $U \subset X$ the set of all locally constant maps $U \to A$ with restriction mappings given by restrictions of functions.

Example 6.7.5. Let X be a topological space. Let $(A_x)_{x \in X}$ be a family of sets A_x indexed by points $x \in X$. We are going to construct a sheaf of sets Π from this data. For $U \subset X$ open set

$$\Pi(U) = \prod\nolimits_{x \in U} A_x.$$

For $V \subset U \subset X$ open define a restriction mapping by the following rule: An element $s = (a_x)_{x \in U} \in \Pi(U)$ restricts to $s|_V = (a_x)_{x \in V}$. It is obvious that this defines a presheaf of sets. We claim this is a sheaf. Namely, let $U = \bigcup U_i$ be an open covering. Suppose that $s_i \in \Pi(U_i)$ are such that s_i and s_j agree over $U_i \cap U_j$. Write $s_i = (a_{i,x})_{x \in U_i}$. The compatibility condition implies that $a_{i,x} = a_{j,x}$ in the set A_x whenever $x \in U_i \cap U_j$. Hence there exists a unique element $s = (a_x)_{x \in U}$ in $\Pi(U) = \prod_{x \in U} A_x$ with the property that $a_x = a_{i,x}$ whenever $x \in U_i$ for some i. Of course this element s has the property that $s|_{U_i} = s_i$ for all i.

Example 6.7.6. Let X be a topological space. Suppose for each $x \in X$ we are given an abelian group M_x. Consider the presheaf $\mathcal{F} : U \mapsto \bigoplus_{x \in U} M_x$ defined in Example 6.4.5. This is not a sheaf in general. For example, if X is an infinite set with the discrete topology, then the sheaf condition would imply that $\mathcal{F}(X) = \prod_{x \in X} \mathcal{F}(\{x\})$ but by definition we have $\mathcal{F}(X) = \bigoplus_{x \in X} M_x = \bigoplus_{x \in X} \mathcal{F}(\{x\})$. And an infinite direct sum is in general different from an infinite direct product.

However, if X is a topological space such that every open of X is quasi-compact, then $\mathcal{F}$ *is* a sheaf. This is left as an exercise to the reader.

6.8. Abelian sheaves

Definition 6.8.1. Let X be a topological space.

(1) An *abelian sheaf on X* or *sheaf of abelian groups on X* is an abelian presheaf on X such that the underlying presheaf of sets is a sheaf.
(2) The category of sheaves of abelian groups is denoted $Ab(X)$.

Let X be a topological space. In the case of an abelian presheaf $\mathcal{F}$ the sheaf condition with regards to an open covering $U = \bigcup U_i$ is often expressed by saying that the complex of abelian groups

$$0 \to \mathcal{F}(U) \to \prod\nolimits_i \mathcal{F}(U_i) \to \prod\nolimits_{(i_0,i_1)} \mathcal{F}(U_{i_0} \cap U_{i_1})$$

is exact. The first map is the usual one, whereas the second maps the element $(s_i)_{i\in I}$ to the element

$$(s_{i_0}|_{U_{i_0}\cap U_{i_1}} - s_{i_1}|_{U_{i_0}\cap U_{i_1}})_{(i_0,i_1)} \in \prod\nolimits_{(i_0,i_1)} \mathcal{F}(U_{i_0} \cap U_{i_1})$$

6.9. Sheaves of algebraic structures

Let us clarify the definition of sheaves of certain types of structures. First, let us reformulate the sheaf condition. Namely, suppose that $\mathcal{F}$ is a presheaf of sets on the topological space X. The sheaf condition can be reformulated as follows. Let $U = \bigcup_{i\in I} U_i$ be an open covering. Consider the diagram

$$\mathcal{F}(U) \longrightarrow \prod\nolimits_{i\in I} \mathcal{F}(U_i) \rightrightarrows \prod\nolimits_{(i_0,i_1)\in I\times I} \mathcal{F}(U_{i_0} \cap U_{i_1})$$

Here the left map is defined by the rule $s \mapsto \prod_{i\in I} s|_{U_i}$. The two maps on the right are the maps

$$\prod\nolimits_i s_i \mapsto \prod\nolimits_{(i_0,i_1)} s_{i_0}|_{U_{i_0}\cap U_{i_1}} \text{ resp. } \prod\nolimits_i s_i \mapsto \prod\nolimits_{(i_0,i_1)} s_{i_1}|_{U_{i_0}\cap U_{i_1}}.$$

The sheaf condition exactly says that the left arrow is the equalizer of the right two. This generalizes immediately to the case of presheaves with values in a category as long as the category has products.

Definition 6.9.1. Let X be a topological space. Let $\mathcal{C}$ be a category with products. A presheaf $\mathcal{F}$ with values in $\mathcal{C}$ on X is a *sheaf* if for every open covering the diagram

$$\mathcal{F}(U) \longrightarrow \prod\nolimits_{i\in I} \mathcal{F}(U_i) \rightrightarrows \prod\nolimits_{(i_0,i_1)\in I\times I} \mathcal{F}(U_{i_0} \cap U_{i_1})$$

is an equalizer diagram in the category $\mathcal{C}$.

Suppose that $\mathcal{C}$ is a category and that $F : \mathcal{C} \to Sets$ is a faithful functor. A good example to keep in mind is the case where $\mathcal{C}$ is the category of abelian groups and F is the forgetful functor. Consider a presheaf $\mathcal{F}$ with values in $\mathcal{C}$ on X. We would like to reformulate the condition above in terms of the underlying presheaf of sets (Definition 6.5.2). Note that the underlying presheaf of sets is a sheaf of sets if and only if all the diagrams

$$F(\mathcal{F}(U)) \longrightarrow \prod\nolimits_{i\in I} F(\mathcal{F}(U_i)) \rightrightarrows \prod\nolimits_{(i_0,i_1)\in I\times I} F(\mathcal{F}(U_{i_0} \cap U_{i_1}))$$

of sets -- after applying the forgetful functor F -- are equalizer diagrams! Thus we would like $\mathcal{C}$ to have products and equalizers and we would like F to commute with them. This is equivalent to the condition that $\mathcal{C}$ has limits and that F commutes with them, see Categories, Lemma 4.13.10. But this is not yet good enough (see Example 6.9.4); we also need F to *reflect isomorphisms*. This property means that given a morphism $f : A \to A'$ in $\mathcal{C}$, then f is an isomorphism if (and only if) $F(f)$ is a bijection.

Lemma 6.9.2. *Suppose the category $\mathcal{C}$ and the functor $F : \mathcal{C} \to Sets$ have the following properties:*

(1) *F is faithful,*
(2) *$\mathcal{C}$ has limits and F commutes with them, and*
(3) *the functor F reflects isomorphisms.*

Let X be a topological space. Let $\mathcal{F}$ be a presheaf with values in $\mathcal{C}$. Then $\mathcal{F}$ is a sheaf if and only if the underlying presheaf of sets is a sheaf.

Proof. Assume that $\mathcal{F}$ is a sheaf. Then $\mathcal{F}(U)$ is the equalizer of the diagram above and by assumption we see $F(\mathcal{F}(U))$ is the equalizer of the corresponding diagram of sets. Hence $F(\mathcal{F})$ is a sheaf of sets.

Assume that $F(\mathcal{F})$ is a sheaf. Let $E \in Ob(\mathcal{C})$ be the equalizer of the two parrallel arrows in Definition 6.9.1. We get a canonical morphism $\mathcal{F}(U) \to E$, simply because $\mathcal{F}$ is a presheaf. By assumption, the induced map $F(\mathcal{F}(U)) \to F(E)$ is an isomorphism, because $F(E)$ is the equalizer of the corresponding diagram of sets. Hence we see $\mathcal{F}(U) \to E$ is an isomorphism by condition (3) of the lemma. $\square$

The lemma in particular applies to *sheaves of groups, rings, algebras over a fixed ring, modules over a fixed ring, vector spaces over a fixed field,* etc. In other words, these are presheaves of groups, rings, modules over a fixed ring, vector spaces over a fixed field, etc such that the underlying presheaf of sets is a sheaf.

Example 6.9.3. Let X be a topological space. For each open $U \subset X$ consider the $\mathbf{R}$-algebra $\mathcal{C}^0(U) = \{ f : U \to \mathbf{R} \mid f \text{ is continuous}\}$. There are obvious restriction mappings that turn this into a presheaf of $\mathbf{R}$-algebras over X. By Example 6.7.3 it is a sheaf of sets. Hence by the Lemma 6.9.2 it is a sheaf of $\mathbf{R}$-algebras over X.

Example 6.9.4. Consider the category of topological spaces *Top*. There is a natural faithful functor $Top \to Sets$ which commutes with products and equalizers. But it does not reflect isomorphisms. And, in fact it turns out that the analogue of Lemma 6.9.2 is wrong. Namely, suppose $X = \mathbf{N}$ with the discrete topology. Let A_i, for $i \in \mathbf{N}$ be a discrete topological space. For any subset $U \subset \mathbf{N}$ define $\mathcal{F}(U) = \prod_{i \in U} A_i$ with the discrete topology. Then this is a presheaf of topological spaces whose underlying presheaf of sets is a sheaf, see Example 6.7.5. However, if each A_i has at least two elements, then this is not a sheaf of topological spaces according to Definition 6.9.1. The reader may check that putting the *product topology* on each $\mathcal{F}(U) = \prod_{i \in U} A_i$ does lead to a sheaf of topological spaces over X.

6.10. Sheaves of modules

Definition 6.10.1. Let X be a topological space. Let $\mathcal{O}$ be a sheaf of rings on X.

1. A *sheaf of $\mathcal{O}$-modules* is a presheaf of $\mathcal{O}$-modules $\mathcal{F}$, see Definition 6.6.1, such that the underlying presheaf of abelian groups $\mathcal{F}$ is a sheaf.
2. A *morphism of sheaves of $\mathcal{O}$-modules* is a morphism of presheaves of $\mathcal{O}$-modules.
3. Given sheaves of $\mathcal{O}$-modules $\mathcal{F}$ and $\mathcal{G}$ we denote $Hom_{\mathcal{O}}(\mathcal{F}, \mathcal{G})$ the set of morphism of sheaves of $\mathcal{O}$-modules.
4. The category of sheaves of $\mathcal{O}$-modules is denoted $Mod(\mathcal{O})$.

This definition kind of makes sense even if $\mathcal{O}$ is just a presheaf of rings, allthough we do not know any examples where this is useful, and we will avoid using the terminology ``sheaves of $\mathcal{O}$-modules" in case $\mathcal{O}$ is not a sheaf of rings.

6.11. Stalks

Let X be a topological space. Let $x \in X$ be a point. Let $\mathcal{F}$ be a presheaf of sets on X. The *stalk of $\mathcal{F}$ at x* is the set

$$\mathcal{F}_x = colim_{x \in U} \mathcal{F}(U)$$

where the colimit is over the set of open neighbourhoods U of x in X. The set of open neighbourhoods is (partially) ordered by (reverse) inclusion: We say $U \geq U' \Leftrightarrow U \subset U'$. The transition maps in the system are given by the restriction maps of $\mathcal{F}$. See Categories, Section 4.19 for notation and terminology regarding (co)limits over systems. Note that the colimit is a directed colimit. Thus it is easy to describe $\mathcal{F}_x$. Namely,

$$\mathcal{F}_x = \{(U, s) \mid x \in U, s \in \mathcal{F}(U)\}/\sim$$

with equivalence relation given by $(U, s) \sim (U', s')$ if and only if $s|_{U \cap U'} = s'|_{U \cap U'}$. By abuse of notation we will often denote (U, s), s_x, or even s the corresponding element in $\mathcal{F}_x$. Also we will say $s = s'$ in $\mathcal{F}_x$ for two local sections of $\mathcal{F}$ defined in an open neighbourhod of x to denote that they have the same image in $\mathcal{F}_x$.

An obvious consequence of this definition is that for any open $U \subset X$ there is a canonical map

$$\mathcal{F}(U) \longrightarrow \prod\nolimits_{x \in U} \mathcal{F}_x$$

defined by $s \mapsto \prod_{x \in U}(U, s)$. Think about it!

Lemma 6.11.1. *Let $\mathcal{F}$ be a sheaf of sets on the topological space X. For every open $U \subset X$ the map*

$$\mathcal{F}(U) \longrightarrow \prod\nolimits_{x \in U} \mathcal{F}_x$$

is injective.

Proof. Suppose that $s, s' \in \mathcal{F}(U)$ map to the same element in every stalk $\mathcal{F}_x$ for all $x \in U$. This means that for every $x \in U$, there exists an open $V^x \subset U$, $x \in V^x$ such that $s|_{V^x} = s'|_{V^x}$. But then $U = \bigcup_{x \in U} V^x$ is an open covering. Thus by the uniqueness in the sheaf condition we see that $s = s'$. □

Definition 6.11.2. Let X be a topological space. A presheaf of sets $\mathcal{F}$ on X is *separated* if for every open $U \subset X$ the map $\mathcal{F}(U) \to \prod_{x \in U} \mathcal{F}_x$ is injective.

Another observation is that the construction of the stalk $\mathcal{F}_x$ is functorial in the presheaf $\mathcal{F}$. In other words, it gives a functor

$$PSh(X) \longrightarrow Sets, \ \mathcal{F} \longmapsto \mathcal{F}_x.$$

This functor is called the *stalk functor*. Namely, if $\varphi : \mathcal{F} \to \mathcal{G}$ is a morphism of presheaves, then we define $\varphi_x : \mathcal{F}_x \to \mathcal{G}_x$ by the rule $(U, s) \mapsto (U, \varphi(s))$. To see that this works we have to check that if $(U, s) = (U', s')$ in $\mathcal{F}_x$ then also $(U, \varphi(s)) = (U', \varphi(s'))$ in $\mathcal{G}_x$. This is clear since φ is compatible with the restriction mappings.

Example 6.11.3. Let X be a topological space. Let A be a set. Denote temporarily A_p the constant presheaf with value A (p for presheaf -- not for point). There is a canonical map of presheaves $A_p \to \underline{A}$ into the constant sheaf with value A. For evey point we have canonical bijections $A = (A_p)_x = \underline{A}_x$, where the second map is induced by functoriality from the map $A_p \to \underline{A}$.

Example 6.11.4. Suppose $X = \mathbf{R}^n$ with the Euclidean topology. Consider the presheaf of $\mathcal{C}^\infty$ functions on X, denoted $\mathcal{C}^\infty_{\mathbf{R}^n}$. In other words, $\mathcal{C}^\infty_{\mathbf{R}^n}(U)$ is the set of $\mathcal{C}^\infty$-functions $f : U \to \mathbf{R}$. As in Example 6.7.3 it is easy to show that this is a sheaf. In fact it is a sheaf of $\mathbf{R}$-vector spaces.

Next, let $x \in X = \mathbf{R}^n$ be a point. How do we think of an element in the stalk $\mathcal{C}^\infty_{\mathbf{R}^n,x}$? Such an element is given by a $\mathcal{C}^\infty$-function f whose domain contains x. And a pair of such functions f, g determine the same element of the stalk if they agree in a neighbourhood of x. In other words, an element if $\mathcal{C}^\infty_{\mathbf{R}^n,x}$ is the same thing as what is sometimes called a *germ of a $\mathcal{C}^\infty$-function at x.*

Example 6.11.5. Let X be a topological space. Let A_x be a set for each $x \in X$. Consider the sheaf $\mathcal{F} : U \mapsto \prod_{x \in U} A_x$ of Example 6.7.5. We would just like to point out here that the stalk $\mathcal{F}_x$ of $\mathcal{F}$ at x is in general *not* equal to the set A_x. Of course there is a map $\mathcal{F}_x \to A_x$, but that is in general the best you can say. For example, if each neighbourhood of x has infinitely many points, and each $A_{x'}$ has exactly two elements, then $\mathcal{F}_x$ has infinitely many elements. (Left to the reader.) On the other hand, if every neighbourhood of x contains a point y such that $A_y = \emptyset$, then $\mathcal{F}_x = \emptyset$.

6.12. Stalks of abelian presheaves

We first deal with the case of abelian groups as a model for the general case.

Lemma 6.12.1. *Let X be a topological space. Let $\mathcal{F}$ be a presheaf of abelian groups on X. There exists a unique structure of an abelian group on $\mathcal{F}_x$ such that for every $U \subset X$ open, $x \in U$ the map $\mathcal{F}(U) \to \mathcal{F}_x$ is a group homomorphism. Moreover,*

$$\mathcal{F}_x = colim_{x \in U} \mathcal{F}(U)$$

holds in the category of abelian groups.

Proof. We define addition of a pair of elements (U, s) and (V, t) as the pair $(U \cap V, s|_{U \cap V} + t|_{U \cap V})$. The rest is easy to check. □

What is crucial in the proof above is that the partially ordered set of open neighbourhoods is a directed system (compare Categories, Definition 4.19.2). Namely, the coproduct of two abelian groups A, B is the direct sum $A \oplus B$, whereas the coproduct in the category of sets is the disjoint union $A \coprod B$, showing that colimits in the category of abelian groups do not agree with colimits in the category of sets in general.

6.13. Stalks of presheaves of algebraic structures

The proof of Lemma 6.12.1 will work for any type of algebraic structure such that directed colimits commute with the forgetful functor.

Lemma 6.13.1. *Let $\mathcal{C}$ be a category. Let $F : \mathcal{C} \to Sets$ be a functor. Assume that*

1. *F is faithful, and*
2. *directed colimits exist in $\mathcal{C}$ and F commutes with them.*

Let X be a topological space. Let $x \in X$. Let $\mathcal{F}$ be a presheaf with values in $\mathcal{C}$. Then

$$\mathcal{F}_x = colim_{x \in U} \mathcal{F}(U)$$

exists in $\mathcal{C}$. Its underlying set is equal to the stalk of the underlying presheaf of sets of $\mathcal{F}$. Furthermore, the construction $\mathcal{F} \mapsto \mathcal{F}_x$ is a functor from the category of presheaves with values in $\mathcal{C}$ to $\mathcal{C}$.

Proof. Omitted. □

By the very definition, all the morphisms $\mathcal{F}(U) \to \mathcal{F}_x$ are morphisms in the category $\mathcal{C}$ which (after applying the forgetful functor F) turn into the corresponding maps for the underlying sheaf of sets. As usual we will not distinguish between the morphism in $\mathcal{C}$ and the underlying map of sets, which is permitted since F is faithful.

This lemma applies in particular to: *Presheaves of (not necessarily abelian) groups, rings, modules over a fixed ring, vector spaces over a fixed field.*

6.14. Stalks of presheaves of modules

Lemma 6.14.1. *Let X be a topological space. Let $\mathcal{O}$ be a presheaf of rings on X Let $\mathcal{F}$ be a presheaf $\mathcal{O}$-modules. Let $x \in X$. The canonical map $\mathcal{O}_x \times \mathcal{F}_x \to \mathcal{F}_x$ coming from the multiplication map $\mathcal{O} \times \mathcal{F} \to \mathcal{F}$ defines a $\mathcal{O}_x$-module structure on the abelian group $\mathcal{F}_x$.*

Proof. Omitted. □

Lemma 6.14.2. *Let X be a topological space. Let $\mathcal{O} \to \mathcal{O}'$ be a morphism of presheaves of rings on X Let $\mathcal{F}$ be a presheaf $\mathcal{O}$-modules. Let $x \in X$. We have*

$$\mathcal{F}_x \otimes_{\mathcal{O}_x} \mathcal{O}'_x = (\mathcal{F} \otimes_{p,\mathcal{O}} \mathcal{O}')_x$$

as $\mathcal{O}'_x$-modules.

Proof. Omitted. □

6.15. Algebraic structures

In this section we mildly formalize the notions we have encountered in the sections above.

Definition 6.15.1. A *type of algebraic structure* is given by a category $\mathcal{C}$ and a functor $F : \mathcal{C} \to \textit{Sets}$ with the following properties

(1) F is faithful,
(2) $\mathcal{C}$ has limits and F commutes with limits,
(3) $\mathcal{C}$ has filtered colimits and F commutes with them, and
(4) F reflects isomorphisms.

We make this definition to point out the properties we will use in a number of arguments below. But we will not actually study this notion in any great detail, since we are prohibited from studying ``big'' categories by convention, except for those listed in Categories, Remark 4.2.2. Among those the following have the required properties.

Lemma 6.15.2. *The following categories, endowed with the obvious forgetful functor, define types of algebraic structures:*

(1) *The category of pointed sets.*
(2) *The category of abelian groups.*
(3) *The category of groups.*
(4) *The category of monoids.*
(5) *The category of rings.*
(6) *The category of R-modules for a fixed ring R.*
(7) *The category of Lie algebras over a fixed field.*

Proof. Omitted. □

From now on we will think of a (pre)sheaf of algebraic structures and their stalks, in terms of the underlying (pre)sheaf of sets. This is allowable by Lemmas 6.9.2 and 6.13.1.

In the rest of this section we point out some results on algebraic structures that will be useful in the future.

Lemma 6.15.3. *Let $(\mathcal{C}, F)$ be a type of algebraic structure.*

(1) *$\mathcal{C}$ has a final object 0 and $F(0) = \{*\}$.*

(2) *$\mathcal{C}$ has products and $F(\prod A_i) = \prod F(A_i)$.*
(3) *$\mathcal{C}$ has fibre products and $F(A \times_B C) = F(A) \times_{F(B)} F(C)$.*
(4) *$\mathcal{C}$ has equalizers, and if $E \to A$ is the equalizer of $a, b : A \to B$, then $F(E) \to F(A)$ is the equalizer of $F(a), F(b) : F(A) \to F(B)$.*
(5) *$A \to B$ is a monomorphism if and only if $F(A) \to F(B)$ is injective.*
(6) *if $F(a) : F(A) \to F(B)$ is surjective, then a is an epimorphism.*
(7) *given $A_1 \to A_2 \to A_3 \to \ldots$, then $colim\, A_i$ exists and $F(colim\, A_i) = colim\, F(A_i)$, and more generally for any filtered colimit.*

Proof. Omitted. The only interesting statement is (5) which follows because $A \to B$ is a monomorphism if and only if $A \to A \times_B A$ is an isomorphism, and then applying the fact that F reflects isomorphisms. □

Lemma 6.15.4. *Let $(\mathcal{C}, F)$ be a type of algebraic structure. Suppose that $A, B, C \in Ob(\mathcal{C})$. Let $f : A \to B$ and $g : C \to B$ be morphisms of $\mathcal{C}$. If $F(g)$ is injective, and $Im(F(f)) \subset Im(F(g))$, then f factors as $f = g \circ t$ for some morphism $t : A \to C$.*

Proof. Consider $A \times_B C$. The assumptions imply that $F(A \times_B C) = F(A) \times_{F(B)} F(C) = F(A)$. Hence $A = A \times_B C$ because F reflects isomorphisms. The result follows. □

Example 6.15.5. The lemma will be applied often to the following situation. Suppose that we have a diagram

$$\begin{tikzcd} A \arrow[r] & B \arrow[d] \\ C \arrow[r] & D \end{tikzcd}$$

in $\mathcal{C}$. Suppose $C \to D$ is injective on underlying sets, and suppose that the composition $A \to B \to D$ has image on underlying sets in the image of $C \to D$. Then we get a commutative diagram

$$\begin{tikzcd} A \arrow[r] \arrow[d] & B \arrow[d] \\ C \arrow[r] & D \end{tikzcd}$$

in $\mathcal{C}$.

Example 6.15.6. Let $F : \mathcal{C} \to Sets$ be a type of algebraic structures. Let X be a topological space. Suppose that for every $x \in X$ we are given an object $A_x \in \text{ob}(\mathcal{C})$. Consider the presheaf Π with values in $\mathcal{C}$ on X defined by the rule $\Pi(U) = \prod_{x \in U} A_x$ (with obvious restriction mappings). Note that the associated presheaf of sets $U \mapsto F(\Pi(U)) = \prod_{x \in U} F(A_x)$ is a sheaf by Example 6.7.5. Hence Π is a sheaf of algebraic structures of type $(\mathcal{C}, F)$. This gives many examples of sheaves of abelian groups, groups, rings, etc.

6.16. Exactness and points

In any category we have the notion of epimorphism, monomorphism, isomorphism, etc.

Lemma 6.16.1. *Let X be a topological space. Let $\varphi : \mathcal{F} \to \mathcal{G}$ be a morphism of sheaves of sets on X.*

(1) *The map φ is a monomorphism in the category of sheaves if and only if for all $x \in X$ the map $\varphi_x : \mathcal{F}_x \to \mathcal{G}_x$ is injective.*
(2) *The map φ is an epimorphism in the category of sheaves if and only if for all $x \in X$ the map $\varphi_x : \mathcal{F}_x \to \mathcal{G}_x$ is surjective.*

(3) *The map φ is a isomorphism in the category of sheaves if and only if for all $x \in X$ the map $\varphi_x : \mathcal{F}_x \to \mathcal{G}_x$ is bijective.*

Proof. Omitted. □

It follows that in the category of sheaves of sets the notions epimorphism and monomorphism can be described as follows.

Definition 6.16.2. Let X be a topological space.

(1) A presheaf $\mathcal{F}$ is called a *subpresheaf* of a presheaf $\mathcal{G}$ if $\mathcal{F}(U) \subset \mathcal{G}(U)$ for all open $U \subset X$ such that the restriction maps of $\mathcal{G}$ induce the restriction maps of $\mathcal{F}$. If $\mathcal{F}$ and $\mathcal{G}$ are sheaves, then $\mathcal{F}$ is called a *subsheaf* of $\mathcal{G}$. We sometimes indicate this by the notation $\mathcal{F} \subset \mathcal{G}$.
(2) A morphism of presheaves of sets $\varphi : \mathcal{F} \to \mathcal{G}$ on X is called *injective* if and only if $\mathcal{F}(U) \to \mathcal{G}(U)$ is injective for all U open in X.
(3) A morphism of presheaves of sets $\varphi : \mathcal{F} \to \mathcal{G}$ on X is called *surjective* if and only if $\mathcal{F}(U) \to \mathcal{G}(U)$ is surjective for all U open in X.
(4) A morphism of sheaves of sets $\varphi : \mathcal{F} \to \mathcal{G}$ on X is called *injective* if and only if $\mathcal{F}(U) \to \mathcal{G}(U)$ is injective for all U open in X.
(5) A morphism of sheaves of sets $\varphi : \mathcal{F} \to \mathcal{G}$ on X is called *surjective* if and only if for every open U of X and every section s of $\mathcal{F}(U)$ there exists an open covering $U = \bigcup U_i$ such that $s|_{U_i}$ is in the image of $\mathcal{F}(U_i) \to \mathcal{G}(U)$ for all i.

Lemma 6.16.3. *Let X be a topological space.*

(1) *Epimorphisms (resp. monomorphisms) in the category of presheaves are exactly the surjective (resp. injective) maps of presheaves.*
(2) *Epimorphisms (resp. monomorphisms) in the category of sheaves are exactly the surjective (resp. injective) maps of sheaves, and are exactly those maps with are surjective (resp. injective) on all the stalks.*
(3) *The sheafification of a surjective (resp. injective) morphism of presheaves of sets is surjective (resp. injective).*

Proof. Omitted. □

Lemma 6.16.4. *let X be a topological space. Let $(\mathcal{C}, F)$ be a type of algebraic structure. Suppose that $\mathcal{F}$, $\mathcal{G}$ are sheaves on X with values in $\mathcal{C}$. Let $\varphi : \mathcal{F} \to \mathcal{G}$ be a map of the underlying sheaves of sets. If for all points $x \in X$ the map $\mathcal{F}_x \to \mathcal{G}_x$ is a morphism of algebraic structures, then φ is a morphism of sheaves of algebraic structures.*

Proof. Let U be an open subset of X. Consider the diagram of (underlying) sets

$$\begin{tikzcd}
\mathcal{F}(U) \arrow[r] \arrow[d] & \prod_{x \in U} \mathcal{F}_x \arrow[d] \\
\mathcal{G}(U) \arrow[r] & \prod_{x \in U} \mathcal{G}_x
\end{tikzcd}$$

By assumption, and previous results, all but the left vertical arrow are morphisms of algebraic structures. In addition the bottom horizontal arrow is injective, see Lemma 6.11.1. Hence we conclude by Lemma 6.15.4, see also Example 6.15.5 □

Short exact sequences of abelian sheaves, etc will be discussed in the chapter on sheaves of modules. See Modules, Section 15.3.

6.17. Sheafification

In this section we explain how to get the sheafification of a presheaf on a topological space. We will use stalks to describe the sheafification in this case. This is different from the general procedure described in Sites, Section 9.10, and perhaps somewhat easier to understand.

The basic construction is the following. Let $\mathcal{F}$ be a presheaf of sets $\mathcal{F}$ on a topological space X. For every open $U \subset X$ we define

$$\mathcal{F}^\#(U) = \{(s_u) \in \prod\nolimits_{u \in U} \mathcal{F}_u \text{ such that } (*)\}$$

where $(*)$ is the property:

$(*)$ For every $u \in U$, there exists an open neighbourhood $u \in V \subset U$, and a section $\sigma \in \mathcal{F}(V)$ such that for all $v \in V$ we have $s_v = (V, \sigma)$ in $\mathcal{F}_v$.

Note that $(*)$ is a condition for each $u \in U$, and that given $u \in U$ the truth of this condition depends only on the values s_v for v in any open neighbourhood of u. Thus it is clear that, if $V \subset U \subset X$ are open, the projection maps

$$\prod\nolimits_{u \in U} \mathcal{F}_u \longrightarrow \prod\nolimits_{v \in V} \mathcal{F}_v$$

maps elements of $\mathcal{F}^\#(U)$ into $\mathcal{F}^\#(V)$. In other words, we get the structure of a presheaf of sets on $\mathcal{F}^\#$.

Furthermore, the map $\mathcal{F}(U) \to \prod_{u \in U} \mathcal{F}_u$ described in Section 6.11 clearly has image in $\mathcal{F}^\#(U)$. In addition, if $V \subset U \subset X$ are open then we have the following commutative diagram

$$\begin{tikzcd}
\mathcal{F}(U) \arrow[r] \arrow[d] & \mathcal{F}^\#(U) \arrow[r] \arrow[d] & \prod_{u \in U} \mathcal{F}_u \arrow[d] \\
\mathcal{F}(V) \arrow[r] & \mathcal{F}^\#(V) \arrow[r] & \prod_{v \in V} \mathcal{F}_v
\end{tikzcd}$$

where the vertical maps are induced from the restriction mappings. Thus we see that there is a canonical morphism of presheaves $\mathcal{F} \to \mathcal{F}^\#$.

In Example 6.7.5 we saw that the rule $\Pi(\mathcal{F}) : U \mapsto \prod_{u \in U} \mathcal{F}_u$ is a sheaf, with obvious restriction mappings. And by construction $\mathcal{F}^\#$ is a subpresheaf of this. In other words, we have morphisms of presheaves

$$\mathcal{F} \to \mathcal{F}^\# \to \Pi(\mathcal{F}).$$

In addition the rule that associates to $\mathcal{F}$ the sequence above is clearly functorial in the presheaf $\mathcal{F}$. This notation will be used in the proofs of the lemmas below.

Lemma 6.17.1. *The presheaf $\mathcal{F}^\#$ is a sheaf.*

Proof. It is probably better for the reader to find their own explanation of this than to read the proof here. In fact the lemma is true for the same reason as why the presheaf of continuous function is a sheaf, see Example 6.7.3 (and this analogy can be made precise using the ``espace étalé").

Anyway, let $U = \bigcup U_i$ be an open covering. Suppose that $s_i = (s_{i,u})_{u \in U_i} \in \mathcal{F}^\#(U_i)$ such that s_i and s_j agree over $U_i \cap U_j$. Because $\Pi(\mathcal{F})$ is a sheaf, we find an element $s = (s_u)_{u \in U}$ in $\prod_{u \in U} \mathcal{F}_u$ restricting to s_i on U_i. We have to check property $(*)$. Pick $u \in U$. Then $u \in U_i$ for some i. Hence by $(*)$ for s_i, there exists a V open, $u \in V \subset U_i$ and a $\sigma \in \mathcal{F}(V)$ such that $s_{i,v} = (V, \sigma)$ in $\mathcal{F}_v$ for all $v \in V$. Since $s_{i,v} = s_v$ we get $(*)$ for s. $\square$

Lemma 6.17.2. *Let X be a topological space. Let $\mathcal{F}$ be a presheaf of sets on X. Let $x \in X$. Then $\mathcal{F}_x = \mathcal{F}^\#_x$.*

Proof. The map $\mathcal{F}_x \to \mathcal{F}^\#_x$ is injective, since already the map $\mathcal{F}_x \to \Pi(\mathcal{F})_x$ is injective. Namely, there is a canonical map $\Pi(\mathcal{F})_x \to \mathcal{F}_x$ which is a left inverse to the map $\mathcal{F}_x \to \Pi(\mathcal{F})_x$, see Example 6.11.5. To show that it is surjective, suppose that $\overline{s} \in \mathcal{F}^\#_x$. We can find an open neighbourhood U of x such that $\overline{s}$ is the equivalence class of (U, s) with $s \in \mathcal{F}^\#(U)$. By definition, this means there exists an open neighbourhood $V \subset U$ of x and a section $\sigma \in \mathcal{F}(V)$ such that $s|_V$ is the image of σ in $\Pi(\mathcal{F})(V)$. Clearly the class of (V, σ) defines an element of $\mathcal{F}_x$ mapping to $\overline{s}$. $\square$

Lemma 6.17.3. *Let $\mathcal{F}$ be a presheaf of sets on X. Any map $\mathcal{F} \to \mathcal{G}$ into a sheaf of sets factors uniquely as $\mathcal{F} \to \mathcal{F}^\# \to \mathcal{G}$.*

Proof. Clearly, there is a commutative diagram

$$\begin{tikzcd} \mathcal{F} \arrow[r] \arrow[d] & \mathcal{F}^\# \arrow[r] \arrow[d] & \Pi(\mathcal{F}) \arrow[d] \\ \mathcal{G} \arrow[r] & \mathcal{G}^\# \arrow[r] & \Pi(\mathcal{G}) \end{tikzcd}$$

So it suffices to prove that $\mathcal{G} = \mathcal{G}^\#$. To see this it suffices to prove, for every point $x \in X$ the map $\mathcal{G}_x \to \mathcal{G}^\#_x$ is bijective, by Lemma 6.16.1. And this is Lemma 6.17.2 above. $\square$

This lemma really says that there is an adjoint pair of functors: $i : Sh(X) \to PSh(X)$ (inclusion) and $\# : PSh(X) \to Sh(X)$ (sheafification). The formula is that

$$Mor_{PSh(X)}(\mathcal{F}, i(\mathcal{G})) = Mor_{Sh(X)}(\mathcal{F}^\#, \mathcal{G})$$

which says that sheafification is a left adjoint of the inclusion functor. See Categories, Section 4.22.

Example 6.17.4. See Example 6.11.3 for notation. The map $A_p \to \underline{A}$ induces a map $A_p^\# \to \underline{A}$. It is easy to see that this is an isomorphism. In words: The sheafification of the constant presheaf with value A is the constant sheaf with value A.

Lemma 6.17.5. *Let X be a topological space. A presheaf $\mathcal{F}$ is separated (see Definition 6.11.2) if and only if the canonical map $\mathcal{F} \to \mathcal{F}^\#$ is injective.*

Proof. This is clear from the construction of $\mathcal{F}^\#$ in this section. $\square$

6.18. Sheafification of abelian presheaves

The following strange looking lemma is likely unnecessary, but very convenient to deal with sheafification of presheaves of algebraic structures.

Lemma 6.18.1. *Let X be a topological space. Let $\mathcal{F}$ be a presheaf of sets on X. Let $U \subset X$ be open. There is a canonical fibre product diagram*

$$\begin{tikzcd} \mathcal{F}^\#(U) \arrow[r] \arrow[d] & \Pi(\mathcal{F})(U) \arrow[d] \\ \prod_{x \in U} \mathcal{F}_x \arrow[r] & \prod_{x \in U} \Pi(\mathcal{F})_x \end{tikzcd}$$

where the maps are the following:

(1) *The left vertical map has components* $\mathcal{F}^\#(U) \to \mathcal{F}^\#_x = \mathcal{F}_x$ *where the equality is Lemma 6.17.2.*
(2) *The top horizontal map comes from the map of presheaves* $\mathcal{F} \to \Pi(\mathcal{F})$ *described in Section 6.17.*
(3) *The right vertical map has obvious component maps* $\Pi(\mathcal{F})(U) \to \Pi(\mathcal{F})_x$.
(4) *The bottom horizontal map has components* $\mathcal{F}_x \to \Pi(\mathcal{F})_x$ *which come from the map of presheaves* $\mathcal{F} \to \Pi(\mathcal{F})$ *described in Section 6.17.*

Proof. It is clear that the diagram commutes. We have to show it is a fibre product diagram. The bottom horizontal arrow is injective since all the maps $\mathcal{F}_x \to \Pi(\mathcal{F})_x$ are injective (see beginning proof of Lemma 6.17.2). A section $s \in \Pi(\mathcal{F})(U)$ is in $\mathcal{F}^\#$ if and only if $(*)$ holds. But $(*)$ says that around every point the section s comes from a section of $\mathcal{F}$. By definition of the stalk functors, this is equivalent to saying that the value of s in every stalk $\Pi(\mathcal{F})_x$ comes from an element of the stalk $\mathcal{F}_x$. Hence the lemma. □

Lemma 6.18.2. *Let X be a topological space. Let $\mathcal{F}$ be an abelian presheaf on X. Then there exists a unique structure of abelian sheaf on $\mathcal{F}^\#$ such that $\mathcal{F} \to \mathcal{F}^\#$ is a morphism of abelian presheaves. Moreover, the following adjointness property holds*

$$Mor_{PAb(X)}(\mathcal{F}, i(\mathcal{G})) = Mor_{Ab(X)}(\mathcal{F}^\#, \mathcal{G}).$$

Proof. Recall the sheaf of sets $\Pi(\mathcal{F})$ defined in Section 6.17. All the stalks $\mathcal{F}_x$ are abelian groups, see Lemma 6.12.1. Hence $\Pi(\mathcal{F})$ is a sheaf of abelian groups by Example 6.15.6. Also, it is clear that the map $\mathcal{F} \to \Pi(\mathcal{F})$ is a morphism of abelian presheaves. If we show that condition $(*)$ of Section 6.17 defines a subgroup of $\Pi(\mathcal{F})(U)$ for all open subsets $U \subset X$, then $\mathcal{F}^\#$ canonically inherits the structure of abelian sheaf. This is quite easy to do by hand, and we leave it to the reader to find a good simple argument. The argument we use here, which generalizes to presheaves of algebraic structures is the following: Lemma 6.18.1 show that $\mathcal{F}^\#(U)$ is the fibre product of a diagram of abelian groups. Thus $\mathcal{F}^\#$ is an abelian subgroup as desired.

Note that at this point $\mathcal{F}^\#_x$ is an abelian group by Lemma 6.12.1 and that $\mathcal{F}_x \to \mathcal{F}^\#_x$ is a bijection (Lemma 6.17.2) and a homomorphism of abelian groups. Hence $\mathcal{F}_x \to \mathcal{F}^\#_x$ is an isomorphism of abelian groups. This will be used below without further mention.

To prove the adjointness property we use the adjointness property of sheafification of presheaves of sets. For example if $\psi : \mathcal{F} \to i(\mathcal{G})$ is morphism of presheaves then we obtain a morphism of sheaves $\psi' : \mathcal{F}^\# \to \mathcal{G}$. What we have to do is to check that this is a morphism of abelian sheaves. We may do this for example by noting that it is true on stalks, by Lemma 6.17.2, and then using Lemma 6.16.4 above. □

6.19. Sheafification of presheaves of algebraic structures

Lemma 6.19.1. *Let X be a topological space. Let $(\mathcal{C}, F)$ be a type of algebraic structure. Let $\mathcal{F}$ be a presheaf with values in $\mathcal{C}$ on X. Then there exists a sheaf $\mathcal{F}^\#$ with values in $\mathcal{C}$ and a morphism $\mathcal{F} \to \mathcal{F}^\#$ of presheaves with values in $\mathcal{C}$ with the following properties:*

(1) *The map $\mathcal{F} \to \mathcal{F}^\#$ identifies the underlying sheaf of sets of $\mathcal{F}^\#$ with the sheafification of the underlying presheaf of sets of $\mathcal{F}$.*
(2) *For any morphism $\mathcal{F} \to \mathcal{G}$, where $\mathcal{G}$ is a sheaf with values in $\mathcal{C}$ there exists a unique factorization $\mathcal{F} \to \mathcal{F}^\# \to \mathcal{G}$.*

Proof. The proof is the same as the proof of Lemma 6.18.2, with repeated application of Lemma 6.15.4 (see also Example 6.15.5). The main idea however, is to define $\mathcal{F}^\#(U)$ as the fibre product in $\mathcal{C}$ of the diagram

$$\begin{tikzcd} & \Pi(\mathcal{F})(U) \arrow[d] \\ \prod_{x\in U}\mathcal{F}_x \arrow[r] & \prod_{x\in U}\Pi(\mathcal{F})_x \end{tikzcd}$$

compare Lemma 6.18.1. □

6.20. Sheafification of presheaves of modules

Lemma 6.20.1. *Let X be a topological space. Let $\mathcal{O}$ be a presheaf of rings on X Let $\mathcal{F}$ be a presheaf $\mathcal{O}$-modules. Let $\mathcal{O}^\#$ be the sheafification of $\mathcal{O}$. Let $\mathcal{F}^\#$ be the sheafification of $\mathcal{F}$ as a presheaf of abelian groups. There exists a map of sheaves of sets*

$$\mathcal{O}^\# \times \mathcal{F}^\# \longrightarrow \mathcal{F}^\#$$

which makes the diagram

$$\begin{tikzcd} \mathcal{O}\times\mathcal{F} \arrow[r] \arrow[d] & \mathcal{F} \arrow[d] \\ \mathcal{O}^\#\times\mathcal{F}^\# \arrow[r] & \mathcal{F}^\# \end{tikzcd}$$

commute and which makes $\mathcal{F}^\#$ into a sheaf of $\mathcal{O}^\#$-modules. In addition, if $\mathcal{G}$ is a sheaf of $\mathcal{O}^\#$-modules, then any morphism of presheaves of $\mathcal{O}$-modules $\mathcal{F} \to \mathcal{G}$ (into the restriction of $\mathcal{G}$ to a $\mathcal{O}$-module) factors uniquely as $\mathcal{F} \to \mathcal{F}^\# \to \mathcal{G}$ where $\mathcal{F}^\# \to \mathcal{G}$ is a morphism of $\mathcal{O}^\#$-modules.

Proof. Omitted. □

This actually means that the functor $i : Mod(\mathcal{O}^\#) \to PMod(\mathcal{O})$ (combining restriction and including sheaves into presheaves) and the sheafification functor of the lemma $^\# :$ $PMod(\mathcal{O}) \to Mod(\mathcal{O}^\#)$ are adjoint. In a formula

$$Mor_{PMod(\mathcal{O})}(\mathcal{F}, i\mathcal{G}) = Mor_{Mod(\mathcal{O}^\#)}(\mathcal{F}^\#, \mathcal{G})$$

Let X be a topological space. Let $\mathcal{O}_1 \to \mathcal{O}_2$ be a morphism of sheaves of rings on X. In Section 6.6 we defined a restriction functor and a change of rings functor on presheaves of modules associated to this situation.

If $\mathcal{F}$ is a sheaf of $\mathcal{O}_2$-modules then the restriction $\mathcal{F}_{\mathcal{O}_1}$ of $\mathcal{F}$ is clearly a sheaf of $\mathcal{O}_1$-modules. We obtain the restriction functor

$$Mod(\mathcal{O}_2) \longrightarrow Mod(\mathcal{O}_1)$$

On the other hand, given a sheaf of $\mathcal{O}_1$-modules $\mathcal{G}$ the presheaf of $\mathcal{O}_2$-modules $\mathcal{O}_2 \otimes_{p,\mathcal{O}_1} \mathcal{G}$ is in general not a sheaf. Hence we define the *tensor product sheaf* $\mathcal{O}_2 \otimes_{\mathcal{O}_1} \mathcal{G}$ by the formula

$$\mathcal{O}_2 \otimes_{\mathcal{O}_1} \mathcal{G} = (\mathcal{O}_2 \otimes_{p,\mathcal{O}_1} \mathcal{G})^\#$$

as the sheafification of our construction for presheaves. We obtain the *change of rings* functor

$$Mod(\mathcal{O}_1) \longrightarrow Mod(\mathcal{O}_2)$$

Lemma 6.20.2. *With X, $\mathcal{O}_1$, $\mathcal{O}_2$, $\mathcal{F}$ and $\mathcal{G}$ as above there exists a canonical bijection*

$$Hom_{\mathcal{O}_1}(\mathcal{G}, \mathcal{F}_{\mathcal{O}_1}) = Hom_{\mathcal{O}_2}(\mathcal{O}_2 \otimes_{\mathcal{O}_1} \mathcal{G}, \mathcal{F})$$

In other words, the restriction and change of rings functors are adjoint to each other.

Proof. This follows from Lemma 6.6.2 and the fact that $Hom_{\mathcal{O}_2}(\mathcal{O}_2 \otimes_{\mathcal{O}_1} \mathcal{G}, \mathcal{F}) = Hom_{\mathcal{O}_2}(\mathcal{O}_2 \otimes_{p,\mathcal{O}_1} \mathcal{G}, \mathcal{F})$ because $\mathcal{F}$ is a sheaf. $\square$

Lemma 6.20.3. *Let X be a topological space. Let $\mathcal{O} \to \mathcal{O}'$ be a morphism of sheaves of rings on X Let $\mathcal{F}$ be a sheaf $\mathcal{O}$-modules. Let $x \in X$. We have*

$$\mathcal{F}_x \otimes_{\mathcal{O}_x} \mathcal{O}'_x = (\mathcal{F} \otimes_{\mathcal{O}} \mathcal{O}')_x$$

as $\mathcal{O}'_x$-modules.

Proof. Follows directly from Lemma 6.14.2 and the fact that taking stalks commutes with sheafification. $\square$

6.21. Continuous maps and sheaves

Let $f : X \to Y$ be a continuous map of topological spaces. We will define the push forward and pull back functors for presheaves and sheaves.

Let $\mathcal{F}$ be a presheaf of sets on X. We define the *pushforward* of $\mathcal{F}$ by the rule

$$f_*\mathcal{F}(V) = \mathcal{F}(f^{-1}(V))$$

for any open $V \subset Y$. Given $V_1 \subset V_2 \subset Y$ open the restriction map is given by the commutativity of the diagram

$$\begin{tikzcd}
f_*\mathcal{F}(V_2) \arrow[r, equal] \arrow[d] & \mathcal{F}(f^{-1}(V_2)) \arrow[d, "\text{restriction for } \mathcal{F}"] \\
f_*\mathcal{F}(V_1) \arrow[r, equal] & \mathcal{F}(f^{-1}(V_1))
\end{tikzcd}$$

It is clear that this defines a presheaf of sets. The construction is clearly functorial in the presheaf $\mathcal{F}$ and hence we obtain a functor

$$f_* : PSh(X) \longrightarrow PSh(Y).$$

Lemma 6.21.1. *Let $f : X \to Y$ be a continuous map. Let $\mathcal{F}$ be a sheaf of sets on X. Then $f_*\mathcal{F}$ is a sheaf on Y.*

Proof. This immediately follows from the fact that if $V = \bigcup V_j$ is an open covering in Y, then $f^{-1}(V) = \bigcup f^{-1}(V_j)$ is an open covering in X. $\square$

As a consequence we obtain a functor

$$f_* : Sh(X) \longrightarrow Sh(Y).$$

This is compatible with composition in the following strong sense.

Lemma 6.21.2. *Let $f : X \to Y$ and $g : Y \to Z$ be continuous maps of topological spaces. The functors $(g \circ f)_*$ and $g_* \circ f_*$ are equal (on both presheaves and sheaves of sets).*

Proof. This is because $(g \circ f)_*\mathcal{F}(W) = \mathcal{F}((g \circ f)^{-1}W)$ and $(g_* \circ f_*)\mathcal{F}(W) = \mathcal{F}(f^{-1}g^{-1}W)$ and $(g \circ f)^{-1}W = f^{-1}g^{-1}W$. $\square$

Let $\mathcal{G}$ be a presheaf of sets on Y. The *pullback presheaf* $f_p\mathcal{G}$ of a given presheaf $\mathcal{G}$ is defined as the left adjoint of the pushforward f_* on presheaves. In other words it should be a presheaf $f_p\mathcal{G}$ on X such that

$$Mor_{PSh(X)}(f_p\mathcal{G}, \mathcal{F}) = Mor_{PSh(Y)}(\mathcal{G}, f_*\mathcal{F}).$$

By the Yoneda lemma this determines the pullback uniquely. It turns out that it actually exists.

Lemma 6.21.3. *Let $f : X \to Y$ be a continuous map. There exists a functor $f_p : PSh(Y) \to PSh(X)$ which is right adjoint to f_*. For a presheaf $\mathcal{G}$ it is determined by the rule*

$$f_p\mathcal{G}(U) = colim_{f(U)\subset V}\mathcal{G}(V)$$

where the colimit is over the collection of open neighbourhoods V of $f(U)$ in Y. The colimits are over directed partially ordered sets. (The restriction mappings of $f_p\mathcal{G}$ are explained in the proof.)

Proof. The colimit is over the partially ordered set consisting of open subset $V \subset Y$ which contain $f(U)$ with ordering by reverse inclusion. This is a directed partially ordered set, since if V, V' are in it then so is $V \cap V'$. Furthermore, if $U_1 \subset U_2$, then every open neighbourhood of $f(U_2)$ is an open neighbourhood of $f(U_1)$. Hence the system defining $f_p\mathcal{G}(U_2)$ is a subsystem of the one defining $f_p\mathcal{G}(U_1)$ and we obtain a restiction map (for example by applying the generalities in Categories, Lemma 4.13.7).

Note that the construction of the colimit is clearly functorial in $\mathcal{G}$, and similarly for the restriction mappings. Hence we have defined f_p as a functor.

A small useful remark is that there exists a canonical map $\mathcal{G}(U) \to f_p\mathcal{G}(f^{-1}(U))$, because the system of open neighbourhoods of $f(f^{-1}(U))$ contains the element U. This is compatible with restriction mappings. In other words, there is a canonical map $i_{\mathcal{G}} : \mathcal{G} \to f_*f_p\mathcal{G}$.

Let $\mathcal{F}$ be a presheaf of sets on X. Suppose that $\psi : f_p\mathcal{G} \to \mathcal{F}$ is a map of presheaves of sets. The corresponding map $\mathcal{G} \to f_*\mathcal{F}$ is the map $f_*\psi \circ i_{\mathcal{G}} : \mathcal{G} \to f_*f_p\mathcal{G} \to f_*\mathcal{F}$.

Another small useful remark is that there exists a canonical map $c_{\mathcal{F}} : f_pf_*\mathcal{F} \to \mathcal{F}$. Namely, let $U \subset X$ open. For every open neighbourhood $V \supset f(U)$ in Y there exists a map $f_*\mathcal{F}(V) = \mathcal{F}(f^{-1}(V)) \to \mathcal{F}(U)$, namely the restriction map on $\mathcal{F}$. And this is certainly compatible wrt restriction mappings between values of $\mathcal{F}$ on f^{-1} of varying opens containing $f(U)$. Thus we obtain a canonical map $f_pf_*\mathcal{F}(U) \to \mathcal{F}(U)$. Another trivial verification show that these maps are compatible with restrictions and define a map $c_{\mathcal{F}}$ of presheaves of sets.

Suppose that $\varphi : \mathcal{G} \to f_*\mathcal{F}$ is a map of presheaves of sets. Consider $f_p\varphi : f_p\mathcal{G} \to f_pf_*\mathcal{F}$. Postcomposing with $c_{\mathcal{F}}$ gives the desired map $c_{\mathcal{F}}\circ f_p\varphi : f_p\mathcal{G} \to \mathcal{F}$. We omit the verification that this construction is inverse to the construction in the other direction given above. $\square$

Lemma 6.21.4. *Let $f : X \to Y$ be a continuous map. Let $x \in X$. Let $\mathcal{G}$ be a presheaf of sets on Y. There is a canonical bijection of stalks $(f_p\mathcal{G})_x = \mathcal{G}_{f(x)}$.*

Proof. This you can see as follows

$$\begin{aligned}
(f_p\mathcal{G})_x &= colim_{x\in U} f_p\mathcal{G}(U) \\
&= colim_{x\in U} colim_{f(U)\subset V}\mathcal{G}(V) \\
&= colim_{f(x)\in V}\mathcal{G}(V) \\
&= \mathcal{G}_{f(x)}
\end{aligned}$$

Here we have used Categories, Lemma 4.13.9, and the fact that any V open in Y containing $f(x)$ occurs in the third description above. Details omitted. $\square$

Let $\mathcal{G}$ be a sheaf of sets on Y. The *pullback sheaf* $f^{-1}\mathcal{G}$ is defined by the formula

$$f^{-1}\mathcal{G} = (f_p\mathcal{G})^\#.$$

Sheafification is a left adjoint to the inclusion of sheaves in presheaves, and f_p is a left adjoint to f_* on presheaves. As a formal consequence we obtain that f^{-1} is a left adjoint of pushforward on sheaves. In other words,

$$Mor_{Sh(X)}(f^{-1}\mathcal{G}, \mathcal{F}) = Mor_{Sh(Y)}(\mathcal{G}, f_*\mathcal{F}).$$

The formal argument is given in the setting of abelian sheaves in the next section.

Lemma 6.21.5. *Let $x \in X$. Let $\mathcal{G}$ be a sheaf of sets on Y. There is a canonical bijection of stalks $(f^{-1}\mathcal{G})_x = \mathcal{G}_{f(x)}$.*

Proof. This is a combination of Lemmas 6.17.2 and 6.21.4. $\square$

Lemma 6.21.6. *Let $f : X \to Y$ and $g : Y \to Z$ be continuous maps of topological spaces. The functors $(g \circ f)^{-1}$ and $f^{-1} \circ g^{-1}$ are canonically isomorphic. Similarly $(g \circ f)_p \cong f_p \circ g_p$ on presheaves.*

Proof. To see this use that adjoint functors are unique up to unique isomorphism, and Lemma 6.21.2. $\square$

Definition 6.21.7. Let $f : X \to Y$ be a continuous map. Let $\mathcal{F}$ be a sheaf of sets on X and let $\mathcal{G}$ be a sheaf of sets on Y. An *f-map* $\xi : \mathcal{G} \to \mathcal{F}$ is a collection of maps $\xi_V : \mathcal{G}(V) \to \mathcal{F}(f^{-1}(V))$ indexed by open subsets $V \subset Y$ such that

$$\begin{tikzcd}
\mathcal{G}(V) \arrow[r, "\xi_V"'] \arrow[d, "\text{restriction of } \mathcal{G}"'] & \mathcal{F}(f^{-1}V) \arrow[d, "\text{restriction of } \mathcal{F}"] \\
\mathcal{G}(V') \arrow[r, "\xi_{V'}"] & \mathcal{F}(f^{-1}V')
\end{tikzcd}$$

commutes for all $V' \subset V \subset Y$ open.

Lemma 6.21.8. *Let $f : X \to Y$ be a continuous map. Let $\mathcal{F}$ be a sheaf of sets on X and let $\mathcal{G}$ be a sheaf of sets on Y. There are canonical bijections between the following three sets:*

(1) *The set of maps $\mathcal{G} \to f_*\mathcal{F}$.*
(2) *The set of maps $f^{-1}\mathcal{G} \to \mathcal{F}$.*
(3) *The set of f-maps $\xi : \mathcal{G} \to \mathcal{F}$.*

Proof. We leave the easy verification to the reader. $\square$

It is sometimes convenient to think about f-maps instead of maps between sheaves either on X or on Y. We define composition of f-maps as follows.

Definition 6.21.9. Suppose that $f : X \to Y$ and $g : Y \to Z$ are continuous maps of topological spaces. Suppose that $\mathcal{F}$ is a sheaf on X, $\mathcal{G}$ is a sheaf on Y, and $\mathcal{H}$ is a sheaf on

Z. Let $\varphi : \mathcal{G} \to \mathcal{F}$ be an f-map. Let $\psi : \mathcal{H} \to \mathcal{G}$ be an g-map. The *composition of φ and ψ* is the $(g \circ f)$-map $\varphi \circ \psi$ defined by the commutativity of the diagrams

$$\begin{tikzcd} \mathcal{H}(W) \arrow[rr, "(\varphi\circ\psi)_W"'] \arrow[dr, "\psi_W"'] & & \mathcal{F}(f^{-1}g^{-1}W) \\ & \mathcal{G}(g^{-1}W) \arrow[ur, "\varphi_{g^{-1}W}"'] & \end{tikzcd}$$

We leave it to the reader to verify that this works. Another way to think about this is to think of $\varphi \circ \psi$ as the composition

$$\mathcal{H} \xrightarrow{\psi} g_*\mathcal{G} \xrightarrow{g_*\varphi} g_*f_*\mathcal{F} = (g \circ f)_*\mathcal{F}$$

Now, doesn't it seem that thinking about f-maps is somehow easier?

Finally, given a continuous map $f : X \to Y$, and an f-map $\varphi : \mathcal{G} \to \mathcal{F}$ there is a natural map on stalks

$$\varphi_x : \mathcal{G}_{f(x)} \longrightarrow \mathcal{F}_x$$

for all $x \in X$. The image of a representative (V, s) of an element in $\mathcal{G}_{f(x)}$ is mapped to the element in $\mathcal{F}_x$ with representative $(f^{-1}V, \varphi_V(s))$. We leave it to the reader to see that this is well defined. Another way to state it is that it is the unique map such that all diagrams

$$\begin{tikzcd} \mathcal{F}(f^{-1}V) \arrow[r] & \mathcal{F}_x \\ \mathcal{G}(V) \arrow[r] \arrow[u, "\varphi_V"] & \mathcal{G}_{f(x)} \arrow[u, "\varphi_x"'] \end{tikzcd}$$

(for $x \in V \subset Y$ open) commute.

Lemma 6.21.10. *Suppose that $f : X \to Y$ and $g : Y \to Z$ are continuous maps of topological spaces. Suppose that $\mathcal{F}$ is a sheaf on X, $\mathcal{G}$ is a sheaf on Y, and $\mathcal{H}$ is a sheaf on Z. Let $\varphi : \mathcal{G} \to \mathcal{F}$ be an f-map. Let $\psi : \mathcal{H} \to \mathcal{G}$ be an g-map. Let $x \in X$ be a point. The map on stalks $(\varphi \circ \psi)_x : \mathcal{H}_{g(f(x))} \to \mathcal{F}_x$ is the composition*

$$\mathcal{H}_{g(f(x))} \xrightarrow{\psi_{f(x)}} \mathcal{G}_{f(x)} \xrightarrow{\varphi_x} \mathcal{F}_x$$

Proof. Immediate from Definition 6.21.9 and the definition of the map on stalks above. $\square$

6.22. Continuous maps and abelian sheaves

Let $f : X \to Y$ be a continuous map. We claim there are functors

$$\begin{aligned} f_* : PAb(X) &\longrightarrow PAb(Y) \\ f_* : Ab(X) &\longrightarrow Ab(Y) \\ f_p : PAb(Y) &\longrightarrow PAb(X) \\ f^{-1} : Ab(Y) &\longrightarrow Ab(X) \end{aligned}$$

with similar properties to their counterparts in Section 6.21. To see this we argue in the following way.

Each of the functors will be constructed in the same way as the corresponding functor in Section 6.21. This works because all the colimits in that section are directed colimits (but we will work through it below).

First off, given an abelian presheaf $\mathcal{F}$ on X and an abelian presheaf $\mathcal{G}$ on Y we define

$$\begin{aligned} f_*\mathcal{F}(V) &= \mathcal{F}(f^{-1}(V)) \\ f_p\mathcal{G}(U) &= colim_{f(U)\subset V}\mathcal{G}(V) \end{aligned}$$

as abelian groups. The restriction mappings are the same as the restriction mappings for presheaves of sets (and they are all homomorphisms of abelian groups).

The assignments $\mathcal{F} \mapsto f_*\mathcal{F}$ and $\mathcal{G} \to f_p\mathcal{G}$ are functors on the categories of presheaves of abelian groups. This is clear, as (for example) a map of abelian presheaves $\mathcal{G}_1 \to \mathcal{G}_2$ gives rise to a map of directed systems $\{\mathcal{G}_1(V)\}_{f(U)\subset V} \to \{\mathcal{G}_2(V)\}_{f(U)\subset V}$ all of whose maps are homomorphisms and hence gives rise to a homomorphism of abelian groups $f_p\mathcal{G}_1(U) \to f_p\mathcal{G}_2(U)$.

The functors f_* and f_p are adjoint on the category of presheaves of abelian groups, i.e., we have

$$Mor_{PAb(X)}(f_p\mathcal{G}, \mathcal{F}) = Mor_{PAb(Y)}(\mathcal{G}, f_*\mathcal{F}).$$

To prove this, note that the map $i_\mathcal{G} : \mathcal{G} \to f_*f_p\mathcal{G}$ from the proof of Lemma 6.21.3 is a map of abelian presheaves. Hence if $\psi : f_p\mathcal{G} \to \mathcal{F}$ is a map of abelian presheaves, then the corresponding map $\mathcal{G} \to f_*\mathcal{F}$ is the map $f_*\psi \circ i_\mathcal{G} : \mathcal{G} \to f_*f_p\mathcal{G} \to f_*\mathcal{F}$ is also a map of abelian presheaves. For the other direction we point out that the map $c_\mathcal{F} : f_pf_*\mathcal{F} \to \mathcal{F}$ from the proof of Lemma 6.21.3 is a map of abelian presheaves as well (since it is made out of restriction mappings of $\mathcal{F}$ which are all homomorphisms). Hence given a map of abelian presheaves $\varphi : \mathcal{G} \to f_*\mathcal{F}$ the map $c_\mathcal{F} \circ f_p\varphi : f_p\mathcal{G} \to \mathcal{F}$ is a map of abelian presheaves as well. Since these constructions $\psi \mapsto f_*\psi$ and $\varphi \mapsto c_\mathcal{F} \circ f_p\varphi$ are inverse to each other as constructions on maps of presheaves of sets we see they are also inverse to each other on maps of abelian presheaves.

If $\mathcal{F}$ is an abelian sheaf on Y, then $f_*\mathcal{F}$ is an abelian sheaf on X. This is true because of the definition of an abelian sheaf and because this is true for sheaves of sets, see Lemma 6.21.1. This defines the functor f_* on the category of abelian sheaves.

We define $f^{-1}\mathcal{G} = (f_p\mathcal{G})^\#$ as before. Adjointness of f_* and f^{-1} follows formally as in the case of presheaves of sets. Here is the argument:

$$\begin{aligned} Mor_{Ab(X)}(f^{-1}\mathcal{G}, \mathcal{F}) &= Mor_{PAb(X)}(f_p\mathcal{G}, \mathcal{F}) \\ &= Mor_{PAb(Y)}(\mathcal{G}, f_*\mathcal{F}) \\ &= Mor_{Ab(Y)}(\mathcal{G}, f_*\mathcal{F}) \end{aligned}$$

Lemma 6.22.1. *Let $f : X \to Y$ be a continuous map.*

(1) *Let $\mathcal{G}$ be an abelian presheaf on Y. Let $x \in X$. The bijection $\mathcal{G}_{f(x)} \to (f_p\mathcal{G})_x$ of Lemma 6.21.4 is an isomorphism of abelian groups.*
(2) *Let $\mathcal{G}$ be an abelian sheaf on Y. Let $x \in X$. The bijection $\mathcal{G}_{f(x)} \to (f^{-1}\mathcal{G})_x$ of Lemma 6.21.5 is an isomorphism of abelian groups.*

Proof. Omitted. □

Given a continuous map $f : X \to Y$ and sheaves of abelian groups $\mathcal{F}$ on X, $\mathcal{G}$ on Y, the notion of an *f-map $\mathcal{G} \to \mathcal{F}$ of sheaves of abelian groups* makes sense. We can just define it exactly as in Definition 6.21.7 (replacing maps of sets with homomorphisms of abelian groups) or we can simply say that it is the same as a map of abelian sheaves $\mathcal{G} \to f_*\mathcal{F}$. We will use this notion freely in the following. The group of f-maps between $\mathcal{G}$ and $\mathcal{F}$ will be in canonical bijection with the groups $Mor_{Ab(X)}(f^{-1}\mathcal{G}, \mathcal{F})$ and $Mor_{Ab(Y)}(\mathcal{G}, f_*\mathcal{F})$.

Composition of f-maps is defined in exactly the same manner as in the case of f-maps of sheaves of sets. In addition, given an f-map $\mathscr{G} \to \mathscr{F}$ as above, the induced maps on stalks

$$\varphi_x : \mathscr{G}_{f(x)} \longrightarrow \mathscr{F}_x$$

are abelian group homomorphisms.

6.23. Continuous maps and sheaves of algebraic structures

Let $(\mathscr{C}, F)$ be a type of algebraic structure. For a topological space X let us introduce the notation:

(1) $PSh(X, \mathscr{C})$ will be the category of presheaves with values in $\mathscr{C}$.
(2) $Sh(X, \mathscr{C})$ will be the category of sheaves with values in $\mathscr{C}$.

Let $f : X \to Y$ be a continuous map of topological spaces. The same arguments as in the previous section show there are functors

$$\begin{aligned} f_* : PSh(X, \mathscr{C}) &\longrightarrow PSh(Y, \mathscr{C}) \\ f_* : Sh(X, \mathscr{C}) &\longrightarrow Sh(Y, \mathscr{C}) \\ f_p : PSh(Y, \mathscr{C}) &\longrightarrow PSh(X, \mathscr{C}) \\ f^{-1} : Sh(Y, \mathscr{C}) &\longrightarrow Sh(X, \mathscr{C}) \end{aligned}$$

constructed in the same manner and with the same properties as the functors constructed for abelian (pre)sheaves. In particular there are commutative diagrams

$$\begin{tikzcd} PSh(X, \mathscr{C}) \arrow[r, "f_*"] \arrow[d, "F"] & PSh(Y, \mathscr{C}) \arrow[d, "F"] \\ PSh(X) \arrow[r, "f_*"] & PSh(Y) \end{tikzcd} \qquad \begin{tikzcd} Sh(X, \mathscr{C}) \arrow[r, "f_*"] \arrow[d, "F"] & Sh(Y, \mathscr{C}) \arrow[d, "F"] \\ Sh(X) \arrow[r, "f_*"] & Sh(Y) \end{tikzcd}$$

$$\begin{tikzcd} PSh(Y, \mathscr{C}) \arrow[r, "f_p"] \arrow[d, "F"] & PSh(X, \mathscr{C}) \arrow[d, "F"] \\ PSh(Y) \arrow[r, "f_p"] & PSh(X) \end{tikzcd} \qquad \begin{tikzcd} Sh(Y, \mathscr{C}) \arrow[r, "f^{-1}"] \arrow[d, "F"] & Sh(X, \mathscr{C}) \arrow[d, "F"] \\ Sh(Y) \arrow[r, "f^{-1}"] & Sh(X) \end{tikzcd}$$

The main formulas to keep in mind are the following

$$\begin{aligned} f_*\mathscr{F}(V) &= \mathscr{F}(f^{-1}(V)) \\ f_p\mathscr{G}(U) &= colim_{f(U) \subset V} \mathscr{G}(V) \\ f^{-1}\mathscr{G} &= (f_p\mathscr{G})^\# \\ (f_p\mathscr{G})_x &= \mathscr{G}_{f(x)} \\ (f^{-1}\mathscr{G})_x &= \mathscr{G}_{f(x)} \end{aligned}$$

Each of these formulas has the property that they hold in the category $\mathscr{C}$ and that upon taking underlying sets we get the corresponding formula for presheaves of sets. In addition we have the adjointness properties

$$\begin{aligned} Mor_{PSh(X,\mathscr{C})}(f_p\mathscr{G}, \mathscr{F}) &= Mor_{PSh(Y,\mathscr{C})}(\mathscr{G}, f_*\mathscr{F}) \\ Mor_{Sh(X,\mathscr{C})}(f^{-1}\mathscr{G}, \mathscr{F}) &= Mor_{Sh(Y,\mathscr{C})}(\mathscr{G}, f_*\mathscr{F}). \end{aligned}$$

To prove these, the main step is to construct the maps

$$i_{\mathcal{G}} : \mathcal{G} \longrightarrow f_* f_p \mathcal{G}$$

and

$$c_{\mathcal{F}} : f_p f_* \mathcal{F} \longrightarrow \mathcal{F}$$

which occur in the proof of Lemma 6.21.3 as morphisms of presheaves with values in $\mathcal{C}$. This may be safely left to the reader since the constructions are exactly the same as in the case of presheaves of sets.

Given a continuous map $f : X \to Y$ and sheaves of algebraic structures $\mathcal{F}$ on X, $\mathcal{G}$ on Y, the notion of an *f-map $\mathcal{G} \to \mathcal{F}$ of sheaves of algebraic structures* makes sense. We can just define it exactly as in Definition 6.21.7 (replacing maps of sets with morphisms in $\mathcal{C}$) or we can simply say that it is the same as a map of sheaves of algebraic structures $\mathcal{G} \to f_*\mathcal{F}$. We will use this notion freely in the following. The set of f-maps between $\mathcal{G}$ and $\mathcal{F}$ will be in canonical bijection with the sets $Mor_{Sh(X,\mathcal{C})}(f^{-1}\mathcal{G}, \mathcal{F})$ and $Mor_{Sh(Y,\mathcal{C})}(\mathcal{G}, f_*\mathcal{F})$.

Composition of f-maps is defined in exactly the same manner as in the case of f-maps of sheaves of sets. In addition, given an f-map $\mathcal{G} \to \mathcal{F}$ as above, the induced maps on stalks

$$\varphi_x : \mathcal{G}_{f(x)} \longrightarrow \mathcal{F}_x$$

are homomorphisms of algebraic structures.

Lemma 6.23.1. *Let $f : X \to Y$ be a continuous map of topological spaces. Suppose given sheaves of algebraic structures $\mathcal{F}$ on X, $\mathcal{G}$ on Y. Let $\varphi : \mathcal{G} \to \mathcal{F}$ be an f-map of underlying sheaves of sets. If for every $V \subset Y$ open the map of sets $\varphi_V : \mathcal{G}(V) \to \mathcal{F}(f^{-1}V)$ is the effect of a morphism in $\mathcal{C}$ on underlying sets, then φ comes from a unique f-morphism between sheaves of algebraic structures.*

Proof. Omitted. □

6.24. Continuous maps and sheaves of modules

The case of sheaves of modules is more complicated. The reason is that the natural setting for defining the pullback and pushforward functors, is the setting of ringed spaces, which we will define below. First we state a few obvious lemmas.

Lemma 6.24.1. *Let $f : X \to Y$ be a continuous map of topological spaces. Let $\mathcal{O}$ be a presheaf of rings on X. Let $\mathcal{F}$ be a presheaf of $\mathcal{O}$-modules. There is a natural map of underlying presheaves of sets*

$$f_*\mathcal{O} \times f_*\mathcal{F} \longrightarrow f_*\mathcal{F}$$

which turns $f_*\mathcal{F}$ into a presheaf of $f_*\mathcal{O}$-modules. This construction is functorial in $\mathcal{F}$.

Proof. Let $V \subset Y$ is open. We define the map of the lemma to be the map

$$f_*\mathcal{O}(V) \times f_*\mathcal{F}(V) = \mathcal{O}(f^{-1}V) \times \mathcal{F}(f^{-1}V) \to \mathcal{F}(f^{-1}V) = f_*\mathcal{F}(V).$$

Here the arrow in the middle is the multiplication map on X. We leave it to the reader to see this is compatible with restriction mappings and defines a structure of $f_*\mathcal{O}$-module on $f_*\mathcal{F}$. □

Lemma 6.24.2. *Let $f : X \to Y$ be a continuous map of topological spaces. Let $\mathcal{O}$ be a presheaf of rings on Y. Let $\mathcal{G}$ be a presheaf of $\mathcal{O}$-modules. There is a natural map of underlying presheaves of sets*

$$f_p\mathcal{O} \times f_p\mathcal{G} \longrightarrow f_p\mathcal{G}$$

which turns $f_p\mathcal{G}$ into a presheaf of $f_p\mathcal{O}$-modules. This construction is functorial in $\mathcal{G}$.

Proof. Let $U \subset X$ is open. We define the map of the lemma to be the map

$$\begin{aligned} f_p\mathcal{O}(U) \times f_p\mathcal{G}(U) &= colim_{f(U)\subset V}\mathcal{O}(V) \times colim_{f(U)\subset V}\mathcal{G}(V) \\ &= colim_{f(U)\subset V}(\mathcal{O}(V) \times \mathcal{G}(V)) \\ &\to colim_{f(U)\subset V}\mathcal{G}(V) \\ &= f_p\mathcal{G}(U). \end{aligned}$$

Here the arrow in the middle is the multiplication map on Y. The second equality holds because directed colimits commute with finite limits, see Categories, Lemma 4.17.2. We leave it to the reader to see this is compatible with restriction mappings and defines a structure of $f_p\mathcal{O}$-module on $f_p\mathcal{G}$. □

Let $f : X \to Y$ be a continuous map. Let $\mathcal{O}_X$ be a presheaf of rings on X and let $\mathcal{O}_Y$ be a presheaf of rings on Y. So at the moment we have defined functors

$$\begin{aligned} f_* : PMod(\mathcal{O}_X) &\longrightarrow PMod(f_*\mathcal{O}_X) \\ f_p : PMod(\mathcal{O}_Y) &\longrightarrow PMod(f_p\mathcal{O}_Y) \end{aligned}$$

These satisfy some compatibilities as follows.

Lemma 6.24.3. *Let $f : X \to Y$ be a continuous map of topological spaces. Let $\mathcal{O}$ be a presheaf of rings on Y. Let $\mathcal{G}$ be a presheaf of $\mathcal{O}$-modules. Let $\mathcal{F}$ be a presheaf of $f_p\mathcal{O}$-modules. Then*

$$Mor_{PMod(f_p\mathcal{O})}(f_p\mathcal{G}, \mathcal{F}) = Mor_{PMod(\mathcal{O})}(\mathcal{G}, f_*\mathcal{F}).$$

Here we use Lemmas 6.24.2 and 6.24.1, and we think of $f_*\mathcal{F}$ as an $\mathcal{O}$-module via the map $i_{\mathcal{O}} : \mathcal{O} \to f_*f_p\mathcal{O}$ (defined first in the proof of Lemma 6.21.3).

Proof. Note that we have

$$Mor_{PAb(X)}(f_p\mathcal{G}, \mathcal{F}) = Mor_{PAb(Y)}(\mathcal{G}, f_*\mathcal{F}).$$

according to Section 6.22. So what we have to prove is that under this correspondence, the subsets of module maps correspond. In addition, the correspondence is determined by the rule

$$\left(\psi : f_p\mathcal{G} \to \mathcal{F}\right) \longmapsto \left(f_*\psi \circ i_{\mathcal{G}} : \mathcal{G} \to f_*f_p\mathcal{G} \to f_*\mathcal{F}\right)$$

Hence, using the functoriality of the pushforward we see that it suffices to prove that the map $i_{\mathcal{G}} : \mathcal{G} \to f_*f_p\mathcal{G}$ is compatible with module structure, which we leave to the reader. □

Lemma 6.24.4. *Let $f : X \to Y$ be a continuous map of topological spaces. Let $\mathcal{O}$ be a presheaf of rings on X. Let $\mathcal{F}$ be a presheaf of $\mathcal{O}$-modules. Let $\mathcal{G}$ be a presheaf of $f_*\mathcal{O}$-modules. Then*

$$Mor_{PMod(\mathcal{O})}(\mathcal{O} \otimes_{p,f_pf_*\mathcal{O}} f_p\mathcal{G}, \mathcal{F}) = Mor_{PMod(f_*\mathcal{O})}(\mathcal{G}, f_*\mathcal{F}).$$

Here we use Lemmas 6.24.2 and 6.24.1, and we use the map $c_{\mathcal{O}} : f_pf_*\mathcal{O} \to \mathcal{O}$ in the definition of the tensor product.

Proof. This follows from the equalities

$$\begin{aligned} Mor_{PMod(\mathcal{O})}(\mathcal{O} \otimes_{p,f_pf_*\mathcal{O}} f_p\mathcal{G}, \mathcal{F}) &= Mor_{PMod(f_pf_*\mathcal{O})}(f_p\mathcal{G}, \mathcal{F}_{f_pf_*\mathcal{O}}) \\ &= Mor_{PMod(f_*\mathcal{O})}(\mathcal{G}, f_*\mathcal{F}). \end{aligned}$$

which is a combination of Lemmas 6.6.2 and 6.24.3. □

Lemma 6.24.5. *Let $f : X \to Y$ be a continuous map of topological spaces. Let $\mathcal{O}$ be a sheaf of rings on X. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}$-modules. The pushforward $f_*\mathcal{F}$, as defined in Lemma 6.24.1 is a sheaf of $f_*\mathcal{O}$-modules.*

Proof. Obvious from the definition and Lemma 6.21.1. $\square$

Lemma 6.24.6. *Let $f : X \to Y$ be a continuous map of topological spaces. Let $\mathcal{O}$ be a sheaf of rings on Y. Let $\mathcal{G}$ be a sheaf of $\mathcal{O}$-modules. There is a natural map of underlying presheaves of sets*

$$f^{-1}\mathcal{O} \times f^{-1}\mathcal{G} \longrightarrow f^{-1}\mathcal{G}$$

which turns $f^{-1}\mathcal{G}$ into a sheaf of $f^{-1}\mathcal{O}$-modules.

Proof. Recall that f^{-1} is defined as the composition of the functor f_p and sheafification. Thus the lemma is a combination of Lemma 6.24.2 and Lemma 6.20.1. $\square$

Let $f : X \to Y$ be a continuous map. Let $\mathcal{O}_X$ be a sheaf of rings on X and let $\mathcal{O}_Y$ be a sheaf of rings on Y. So now we have defined functors

$$\begin{array}{rcl} f_* : Mod(\mathcal{O}_X) & \longrightarrow & Mod(f_*\mathcal{O}_X) \\ f^{-1} : Mod(\mathcal{O}_Y) & \longrightarrow & Mod(f^{-1}\mathcal{O}_Y) \end{array}$$

These satisfy some compatibilities as follows.

Lemma 6.24.7. *Let $f : X \to Y$ be a continuous map of topological spaces. Let $\mathcal{O}$ be a sheaf of rings on Y. Let $\mathcal{G}$ be a sheaf of $\mathcal{O}$-modules. Let $\mathcal{F}$ be a sheaf of $f^{-1}\mathcal{O}$-modules. Then*

$$Mor_{Mod(f^{-1}\mathcal{O})}(f^{-1}\mathcal{G}, \mathcal{F}) = Mor_{Mod(\mathcal{O})}(\mathcal{G}, f_*\mathcal{F}).$$

Here we use Lemmas 6.24.6 and 6.24.5, and we think of $f_*\mathcal{F}$ as an $\mathcal{O}$-module by restriction via $\mathcal{O} \to f_*f^{-1}\mathcal{O}$.

Proof. Argue by the equalities

$$\begin{array}{rcl} Mor_{Mod(f^{-1}\mathcal{O})}(f^{-1}\mathcal{G}, \mathcal{F}) & = & Mor_{Mod(f_p\mathcal{O})}(f_p\mathcal{G}, \mathcal{F}) \\ & = & Mor_{Mod(\mathcal{O})}(\mathcal{G}, f_*\mathcal{F}). \end{array}$$

where the second is Lemmas 6.24.3 and the first is by Lemma 6.20.1. $\square$

Lemma 6.24.8. *Let $f : X \to Y$ be a continuous map of topological spaces. Let $\mathcal{O}$ be a sheaf of rings on X. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}$-modules. Let $\mathcal{G}$ be a sheaf of $f_*\mathcal{O}$-modules. Then*

$$Mor_{Mod(\mathcal{O})}(\mathcal{O} \otimes_{f^{-1}f_*\mathcal{O}} f^{-1}\mathcal{G}, \mathcal{F}) = Mor_{Mod(f_*\mathcal{O})}(\mathcal{G}, f_*\mathcal{F}).$$

Here we use Lemmas 6.24.6 and 6.24.5, and we use the canonical map $f^{-1}f_*\mathcal{O} \to \mathcal{O}$ in the definition of the tensor product.

Proof. This follows from the equalities

$$\begin{array}{rcl} Mor_{Mod(\mathcal{O})}(\mathcal{O} \otimes_{f^{-1}f_*\mathcal{O}} f^{-1}\mathcal{G}, \mathcal{F}) & = & Mor_{Mod(f^{-1}f_*\mathcal{O})}(f^{-1}\mathcal{G}, \mathcal{F}_{f^{-1}f_*\mathcal{O}}) \\ & = & Mor_{Mod(f_*\mathcal{O})}(\mathcal{G}, f_*\mathcal{F}). \end{array}$$

which are a combination of Lemma 6.20.2 and 6.24.7. $\square$

Let $f : X \to Y$ be a continuous map. Let $\mathcal{O}_X$ be a (pre)sheaf of rings on X and let $\mathcal{O}_Y$ be a (pre)sheaf of rings on Y. So at the moment we have defined functors

$$\begin{array}{rcl} f_* : PMod(\mathcal{O}_X) & \longrightarrow & PMod(f_*\mathcal{O}_X) \\ f_* : Mod(\mathcal{O}_X) & \longrightarrow & Mod(f_*\mathcal{O}_X) \\ f_p : PMod(\mathcal{O}_Y) & \longrightarrow & PMod(f_p\mathcal{O}_Y) \\ f^{-1} : Mod(\mathcal{O}_Y) & \longrightarrow & Mod(f^{-1}\mathcal{O}_Y) \end{array}$$

Clearly, usually the pair of functors (f_*, f^{-1}) on sheaves of modules are not adjoint, because their target categories do not match. Namely, as we saw above, it works only if by some miracle the sheaves of rings $\mathcal{O}_X, \mathcal{O}_Y$ satisfy the relations $\mathcal{O}_X = f^{-1}\mathcal{O}_Y$ and $\mathcal{O}_Y = f_*\mathcal{O}_X$. This is almost never true in practice. We interrupt the discussion to define the correct notion of morphism for which a suitable adjoint pair of functors on sheaves of modules exists.

6.25. Ringed spaces

Let X be a topological space and let $\mathcal{O}_X$ be a sheaf of rings on X. We are supposed to think of the sheaf of rings $\mathcal{O}_X$ as a sheaf of functions on X. And if $f : X \to Y$ is a ``suitable'' map, then by composition a function on Y turns into a function on X. Thus there should be a natural f-map from $\mathcal{O}_Y$ to $\mathcal{O}_X$ See Definition 6.21.7, and the remarks in previous sections for terminology. For a precise example, see Example 6.25.2 below. Here is the relevant abstract definition.

Definition 6.25.1. A *ringed space* is a pair $(X, \mathcal{O}_X)$ consisting of a topological space X and a sheaf of rings $\mathcal{O}_X$ on X. A *morphism of ringed spaces* $(X, \mathcal{O}_X) \to (Y, \mathcal{O}_Y)$ is a pair consisting of a continuous map $f : X \to Y$ and an f-map of sheaves of rings $f^\sharp : \mathcal{O}_Y \to \mathcal{O}_X$.

Example 6.25.2. Let $f : X \to Y$ be a continuous map of topological spaces. Consider the sheaves of continuous real valued functions $\mathcal{C}^0_X$ on X and $\mathcal{C}^0_Y$ on Y, see Example 6.9.3. We claim that there is a natural f-map $f^\sharp : \mathcal{C}^0_Y \to \mathcal{C}^0_X$ associated to f. Namely, we simply define it by the rule

$$\begin{array}{ccc} \mathcal{C}^0_Y(V) & \longrightarrow & \mathcal{C}^0_X(f^{-1}V) \\ h & \longmapsto & h \circ f \end{array}$$

Stricly speaking we should write $f^\sharp(h) = h \circ f|_{f^{-1}(V)}$. It is clear that this is a family of maps as in Definition 6.21.7 and compatible with the $\mathbf{R}$-algebra structures. Hence it is an f-map of sheaves of $\mathbf{R}$-algebras, see Lemma 6.23.1.

Of course there are lots of other situations where there is a canonical morphism of ringed spaces associated to a geometrical type of morphism. For example, if M, N are $\mathcal{C}^\infty$-manifolds and $f : M \to N$ is a infinitely differentiable map, then f induces a canonical morphism of ringed spaces $(M, \mathcal{C}^\infty_M) \to (N, \mathcal{C}^\infty_N)$. The construction (which is identical to the above) is left to the reader.

It may not be completely obvious how to compose morphisms of ringed spaces hence we spell it out here.

Definition 6.25.3. Let $(f, f^\sharp) : (X, \mathcal{O}_X) \to (Y, \mathcal{O}_Y)$ and $(g, g^\sharp) : (Y, \mathcal{O}_Y) \to (Z, \mathcal{O}_Z)$ be morphisms of ringed spaces. Then we define the *composition of morphisms of ringed spaces* by the rule

$$(g, g^\sharp) \circ (f, f^\sharp) = (g \circ f, f^\sharp \circ g^\sharp).$$

Here we use composition of f-maps defined in Definition 6.21.9.

6.26. Morphisms of ringed spaces and modules

We have now introduced enough notation so that we are able to define the pullback and pushforward of modules along a morphism of ringed spaces.

Definition 6.26.1. Let $(f, f^\sharp) : (X, \mathcal{O}_X) \to (Y, \mathcal{O}_Y)$ be a morphism of ringed spaces.

(1) Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_X$-modules. We define the *pushforward* of $\mathcal{F}$ as the sheaf of $\mathcal{O}_Y$-modules which as a sheaf of abelian groups equals $f_*\mathcal{F}$ and with module structure given by the restriction via $f^\sharp : \mathcal{O}_Y \to f_*\mathcal{O}_X$ of the module structure given in Lemma 6.24.5.

(2) Let $\mathcal{G}$ be a sheaf of $\mathcal{O}_Y$-modules. We define the *pullback* $f^*\mathcal{G}$ to be the sheaf of $\mathcal{O}_X$-modules defined by the formula
$$f^*\mathcal{F} = \mathcal{O}_X \otimes_{f^{-1}\mathcal{O}_Y} f^{-1}\mathcal{F}$$
where the ring map $f^{-1}\mathcal{O}_Y \to \mathcal{O}_X$ is the map corresponding to $f^\sharp$, and where the module structure is given by Lemma 6.24.6.

Thus we have defined functors
$$\begin{aligned} f_* : Mod(\mathcal{O}_X) &\longrightarrow Mod(\mathcal{O}_Y) \\ f^* : Mod(\mathcal{O}_Y) &\longrightarrow Mod(\mathcal{O}_X) \end{aligned}$$
The final result on these functors is that they are indeed adjoint as expected.

Lemma 6.26.2. *Let $(f, f^\sharp) : (X, \mathcal{O}_X) \to (Y, \mathcal{O}_Y)$ be a morphism of ringed spaces. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_X$-modules. Let $\mathcal{G}$ be a sheaf of $\mathcal{O}_Y$-modules. There is a canonical bijection*
$$Hom_{\mathcal{O}_X}(f^*\mathcal{G}, \mathcal{F}) = Hom_{\mathcal{O}_Y}(\mathcal{G}, f_*\mathcal{F}).$$
In other words: the functor f^* is the left adjoint to f_*.

Proof. This follows from the work we did before:
$$\begin{aligned} Hom_{\mathcal{O}_X}(f^*\mathcal{G}, \mathcal{F}) &= Mor_{Mod(\mathcal{O}_X)}(\mathcal{O}_X \otimes_{f^{-1}\mathcal{O}_Y} f^{-1}\mathcal{G}, \mathcal{F}) \\ &= Mor_{Mod(f^{-1}\mathcal{O}_Y)}(f^{-1}\mathcal{G}, \mathcal{F}_{f^{-1}\mathcal{O}_Y}) \\ &= Hom_{\mathcal{O}_Y}(\mathcal{G}, f_*\mathcal{F}). \end{aligned}$$
Here we use Lemmas 6.20.2 and 6.24.7. $\square$

Lemma 6.26.3. *Let $f : X \to Y$ and $g : Y \to Z$ be morphisms of ringed spaces. The functors $(g \circ f)_*$ and $g_* \circ f_*$ are equal. There is a canonical isomorphism of functors $(g \circ f)^* \cong f^* \circ g^*$.*

Proof. The result on pushforwards is a consequence of Lemma 6.21.2 and our definitions. The result on pullbacks follows from this by the same argument as in the proof of Lemma 6.21.6. $\square$

Given a morphism of ringed spaces $(f, f^\sharp) : (X, \mathcal{O}_X) \to (Y, \mathcal{O}_Y)$, and a sheaf of $\mathcal{O}_X$-modules $\mathcal{F}$, a sheaf of $\mathcal{O}_Y$-modules $\mathcal{G}$ on Y, the notion of an *f-map $\varphi : \mathcal{G} \to \mathcal{F}$ of sheaves of modules* makes sense. We can just define it as an f-map $\varphi : \mathcal{G} \to \mathcal{F}$ of abelian sheaves such that for all open $V \subset Y$ the map
$$\mathcal{G}(V) \longrightarrow \mathcal{F}(f^{-1}V)$$
is an $\mathcal{O}_Y(V)$-module map. Here we think of $\mathcal{F}(f^{-1}V)$ as an $\mathcal{O}_Y(V)$-module via the map $f^\sharp_V : \mathcal{O}_Y(V) \to \mathcal{O}_X(f^{-1}V)$. The set of f-maps between $\mathcal{G}$ and $\mathcal{F}$ will be in canonical bijection with the sets $Mor_{Mod(\mathcal{O}_X)}(f^*\mathcal{G}, \mathcal{F})$ and $Mor_{Mod(\mathcal{O}_Y)}(\mathcal{G}, f_*\mathcal{F})$. See above.

Composition of f-maps is defined in exactly the same manner as in the case of f-maps of sheaves of sets. In addition, given an f-map $\mathcal{G} \to \mathcal{F}$ as above, and $x \in X$ the induced map on stalks

$$\varphi_x : \mathcal{G}_{f(x)} \longrightarrow \mathcal{F}_x$$

is an $\mathcal{O}_{Y,f(x)}$-module map where the $\mathcal{O}_{Y,f(x)}$-module structure on $\mathcal{F}_x$ comes from the $\mathcal{O}_{X,x}$-module structure via the map $f_x^\sharp : \mathcal{O}_{Y,f(x)} \to \mathcal{O}_{X,x}$. Here is a related lemma.

Lemma 6.26.4. *Let $(f, f^\sharp) : (X, \mathcal{O}_X) \to (Y, \mathcal{O}_Y)$ be a morphism of ringed spaces. Let $\mathcal{G}$ be a sheaf of $\mathcal{O}_Y$-modules. Let $x \in X$. Then*

$$f^*\mathcal{G}_x = \mathcal{F}_{f(x)} \otimes_{\mathcal{O}_{Y,f(x)}, f_x^\sharp} \mathcal{O}_{X,x}$$

as $\mathcal{O}_{X,x}$-modules.

Proof. This follows from Lemma 6.20.3 and the identification of the stalks of pullback sheaves at x with the corresponding stalks at $f(x)$. See the formulae in Section 6.23 for example. $\square$

6.27. Skyscraper sheaves and stalks

Definition 6.27.1. Let X be a topological space.

(1) Let $x \in X$ be a point. Denote $i_x : \{x\} \to X$ the inclusion map. Let A be a set and think of A as a sheaf on the one point space $\{x\}$. We call $i_{x,*}A$ the *skyscraper sheaf at x with value A*.
(2) If in (1) above A is an abelian group then we think of $i_{x,*}A$ as a sheaf of abelian groups on X.
(3) If in (1) above A is an algebraic structure then we think of $i_{x,*}A$ as a sheaf of algeberaic structures.
(4) If $(X, \mathcal{O}_X)$ is a ringed space, then we think of $i_x : \{x\} \to X$ as a morphism of ringed spaces $(\{x\}, \mathcal{O}_{X,x}) \to (X, \mathcal{O}_X)$ and if A is a $\mathcal{O}_{X,x}$-module, then we think of $i_{x,*}A$ as a sheaf of $\mathcal{O}_X$-modules.
(5) We say a sheaf of sets $\mathcal{F}$ is a *skyscraper sheaf* if there exists an point x of X and a set A such that $\mathcal{F} \cong i_{x,*}A$.
(6) We say a sheaf of abelian groups $\mathcal{F}$ is a *skyscraper sheaf* if there exists an point x of X and an abelian group A such that $\mathcal{F} \cong i_{x,*}A$ as sheaves of abelian groups.
(7) We say a sheaf of algebraic structures $\mathcal{F}$ is a *skyscraper sheaf* if there exists an point x of X and an algebraic structure A such that $\mathcal{F} \cong i_{x,*}A$ as sheaves of algebraic structures.
(8) If $(X, \mathcal{O}_X)$ is a ringed space and $\mathcal{F}$ is a sheaf of $\mathcal{O}_X$-modules, then we say $\mathcal{F}$ is a *skyscraper sheaf* if there exists a point $x \in X$ and a $\mathcal{O}_{X,x}$-module A such that $\mathcal{F} \cong i_{x,*}A$ as sheaves of $\mathcal{O}_X$-modules.

Lemma 6.27.2. *Let X be a topological space, $x \in X$ a point, and A a set. For any point $x' \in X$ the stalk of the skyscraper sheaf at x with value A at x' is*

$$(i_{x,*}A)_{x'} = \begin{cases} A & \text{if} \quad x' \in \overline{\{x\}} \\ \{*\} & \text{if} \quad x' \notin \overline{\{x\}} \end{cases}$$

A similar description holds for the case of abelian groups, algebraic structures and sheaves of modules.

Proof. Omitted. $\square$

Lemma 6.27.3. *Let X be a topological space, and let $x \in X$ a point. The functors $\mathcal{F} \mapsto \mathcal{F}_x$ and $A \mapsto i_{x,*}A$ are adjoint. In a formula*

$$Mor_{Sets}(\mathcal{F}_x, A) = Mor_{Sh(X)}(\mathcal{F}, i_{x,*}A).$$

A similar satement holds for the case of abelian groups, algebraic structures. In the case of sheaves of modules we have

$$Hom_{\mathcal{O}_{X,x}}(\mathcal{F}_x, A) = Hom_{\mathcal{O}_X}(\mathcal{F}, i_{x,*}A).$$

Proof. Omitted. Hint: The stalk functor can be seen as the pullback functor for the morphism $i_x : \{x\} \to X$. Then the adjointness follows from adjointness of i_x^{-1} and $i_{x,*}$ (resp. i_x^* and $i_{x,*}$ in the case of sheaves of modules. □

6.28. Limits and colimits of presheaves

Let X be a topological space. Let $\mathcal{I} \to PSh(X)$, $i \mapsto \mathcal{F}_i$ be a diagram.

(1) Both $lim_i\, \mathcal{F}_i$ and $colim_i\, \mathcal{F}_i$ exist.
(2) For any open $U \subset X$ we have

$$(lim_i\, \mathcal{F}_i)(U) = lim_i\, \mathcal{F}_i(U)$$

and

$$(colim_i\, \mathcal{F}_i)(U) = colim_i\, \mathcal{F}_i(U).$$

(3) Let $x \in X$ be a point. In general the stalk of $lim_i\, \mathcal{F}_i$ at x is not equal to the limit of the stalks. But if the diagram category is finite then it is the case. In other words, the stalk functor is left exact (see Categories, Definition 4.21.1).
(4) Let $x \in X$. We always have

$$(colim_i\, \mathcal{F}_i)_x = colim_i\, \mathcal{F}_{i,x}.$$

The proofs are all easy.

6.29. Limits and colimits of sheaves

Let X be a topological space. Let $\mathcal{I} \to Sh(X)$, $i \mapsto \mathcal{F}_i$ be a diagram.

(1) Both $lim_i\, \mathcal{F}_i$ and $colim_i\, \mathcal{F}_i$ exist.
(2) The inclusion functor $i : Sh(X) \to PSh(X)$ commutes with limits. In other words, we may compute the limit in the category of sheaves as the limit in the category of presheaves. In particular, for any open $U \subset X$ we have

$$(lim_i\, \mathcal{F}_i)(U) = lim_i\, \mathcal{F}_i(U).$$

(3) The inclusion functor $i : Sh(X) \to PSh(X)$ does not commute with colimits in general (not even with finite colimits -- think surjections). The colimit is computed as the sheafification of the colimit in the category of presheaves:

$$colim_i\, \mathcal{F}_i = \left(U \mapsto colim_i\, \mathcal{F}_i(U)\right)^{\#}.$$

(4) Let $x \in X$ be a point. In general the stalk of $lim_i\, \mathcal{F}_i$ at x is not equal to the limit of the stalks. But if the diagram category is finite then it is the case. In other words, the stalk functor is left exact.
(5) Let $x \in X$. We always have

$$(colim_i\, \mathcal{F}_i)_x = colim_i\, \mathcal{F}_{i,x}.$$

(6) The sheafification functor $^{\#} : PSh(X) \to Sh(X)$ commutes with all colimits, and with finite limits. But it does not commute with all limits.

The proofs are all easy. Here is an example of what is true for directed colimits of sheaves.

Lemma 6.29.1. *Let X be a topological space. Let I be a directed partially ordered set. Let $(\mathcal{F}_i, \varphi_{ii'})$ be a system of sheaves of sets over I, see Categories, Section 4.19. Let $U \subset X$ be an open subset. Consider the canonical map*

$$\Psi : colim_i\, \mathcal{F}_i(U) \longrightarrow \left(colim_i\, \mathcal{F}_i\right)(U)$$

1. *If all the transition maps are injective then Ψ is injective for any open U.*
2. *If U is quasi-compact, then Ψ is injective.*
3. *If U is quasi-compact and all the transition maps are injective then Ψ is an isomorphism.*
4. *If U has a cofinal system of open coverings $\mathcal{U} : U = \bigcup_{j \in J} U_j$ with J finite and $U_j \cap U_{j'}$ quasi-compact for all $j, j' \in J$, then Ψ is bijective.*

Proof. Assume all the transition maps are injective. In this case the presheaf $\mathcal{F}' : V \mapsto colim_i\, \mathcal{F}_i(V)$ is separated (see Definition 6.11.2). By the discussion above we have $(\mathcal{F}')^\# = colim_i\, \mathcal{F}_i$. By Lemma 6.17.5 we see that $\mathcal{F}' \to (\mathcal{F}')^\#$ is injective. This proves (1).

Assume U is quasi-compact. Suppose that $s \in \mathcal{F}_i(U)$ and $s' \in \mathcal{F}_{i'}(U)$ give rise to elements on the left hand side which have the same image under Ψ. Since U is quasi-compact this means there exists a finite open covering $U = \bigcup_{j=1,\ldots,m} U_j$ and for each j an index $i_j \in I$, $i_j \geq i$, $i_j \geq i'$ such that $\varphi_{ii_j}(s) = \varphi_{i'i_j}(s')$. Let $i'' \in I$ be $\geq$ than all of the i_j. We conclude that $\varphi_{ii''}(s)$ and $\varphi_{i'i''}(s)$ agree on the opens U_j for all j and hence that $\varphi_{ii''}(s) = \varphi_{i'i''}(s)$. This proves (2).

Assume U is quasi-compact and all transition maps injective. Let s be an element of the target of Ψ. Since U is quasi-compact there exists a finite open covering $U = \bigcup_{j=1,\ldots,m} U_j$, for each j an index $i_j \in I$ and $s_j \in \mathcal{F}_{i_j}(U_j)$ such that $s|_{U_j}$ comes from s_j for all j. Pick $i \in I$ which is $\geq$ than all of the i_j. By (1) the sections $\varphi_{i_ji}(s_j)$ agree over the overlaps $U_j \cap U_{j'}$. Hence they glue to a section $s' \in \mathcal{F}_i(U)$ which maps to s under Ψ. This proves (3).

Assume the hypothesis of (4). Let s be an element of the target of Ψ. By assumption there exists a finite open covering $U = \bigcup_{j=1,\ldots,m} U_j$, with $U_j \cap U_{j'}$ quasi-compact for all $j, j' \in J$ and for each j an index $i_j \in I$ and $s_j \in \mathcal{F}_{i_j}(U_j)$ such that $s|_{U_j}$ is the image of s_j for all j. Since $U_j \cap U_{j'}$ is quasi-compact we can apply (2) and we see that there exists an $i_{jj'} \in I$, $i_{jj'} \geq i_j$, $i_{jj'} \geq i_{j'}$ such that $\varphi_{i_ji_{jj'}}(s_j)$ and $\varphi_{i_{j'}i_{jj'}}(s_{j'})$ agree over $U_j \cap U_{j'}$. Choose an index $i \in I$ wich is bigger or equal than all the $i_{jj'}$. Then we see that the sections $\varphi_{i_ji}(s_j)$ of $\mathcal{F}_i$ glue to a section of $\mathcal{F}_i$ over U. This section is mapped to the element s as desired. $\square$

Example 6.29.2. Let $X = \{s_1, s_2, \xi_1, \xi_2, \xi_3, \ldots\}$ as a set. Declare a subset $U \subset X$ to be open if $s_1 \in U$ or $s_2 \in U$ implies U contains all of the ξ_i. Let $U_n = \{\xi_n, \xi_{n+1}, \ldots\}$, and let $j_n : U_n \to X$ be the inclusion map. Set $\mathcal{F}_n = j_{n,*}\underline{\mathbf{Z}}$. There are transition maps $\mathcal{F}_n \to \mathcal{F}_{n+1}$. Let $\mathcal{F} = colim\, \mathcal{F}_n$. Note that $\mathcal{F}_{n,\xi_m} = 0$ if $m < n$ because $\{\xi_m\}$ is an open subset of X which misses U_n. Hence we see that $\mathcal{F}_{\xi_n} = 0$ for all n. On the other hand the stalk $\mathcal{F}_{s_i}$, $i = 1, 2$ is the colimit

$$M = colim_n \prod\nolimits_{m \geq n} \mathbf{Z}$$

which is not zero. We conclude that the sheaf $\mathcal{F}$ is the direct sum of the skyscraper sheaves with value M at the closed points s_1 and s_2. Hence $\Gamma(X, \mathcal{F}) = M \oplus M$. On the other hand, the reader can verify that $colim_n\, \Gamma(X, \mathcal{F}_n) = M$. Hence some condition is necessary in part (4) of Lemma 6.29.1 above.

6.30. Bases and sheaves

Sometimes there exists a basis for the topology consisting of opens that are easier to work with than general opens. For convenience we give here some definitions and simple lemmas in order to facilitate working with (pre)sheaves in such a situation.

Definition 6.30.1. Let X be a topological space. Let $\mathcal{B}$ be a basis for the topology on X.

(1) A *presheaf $\mathcal{F}$ of sets on $\mathcal{B}$* is a rule which assigns to each $U \in \mathcal{B}$ a set $\mathcal{F}(U)$ and to each inclusion $V \subset U$ of elements of $\mathcal{B}$ a map $\rho^U_V : \mathcal{F}(U) \to \mathcal{F}(V)$ such that whenever $W \subset V \subset U$ in $\mathcal{B}$ we have $\rho^U_W = \rho^V_W \circ \rho^U_V$.
(2) A *morphism $\varphi : \mathcal{F} \to \mathcal{G}$ of presheaves of sets on $\mathcal{B}$* is a rule which assigns to each element $U \in \mathcal{B}$ a map of sets $\varphi : \mathcal{F}(U) \to \mathcal{G}(U)$ compatible with restriction maps.

As in the case of usual presheaves we use the terminology of sections, restrictions of sections, etc. In particular, we may define the *stalk* of $\mathcal{F}$ at a point $x \in X$ by the colimit

$$\mathcal{F}_x = colim_{U \in \mathcal{B}, x \in U} \mathcal{F}(U).$$

As in the case of the stalk of a presheaf on X this limit is directed. The reason is that the collection of $U \in \mathcal{B}$, $x \in U$ is a fundamental system of open neighbourhoods of x.

It is easy to make examples to show that the notion of a presheaf on X is very different from the notion of a presheaf on a basis for the topology on X. This does not happen in the case of sheaves. A much more useful notion therefore, is the following.

Definition 6.30.2. Let X be a topological space. Let $\mathcal{B}$ be a basis for the topology on X.

(1) A *sheaf $\mathcal{F}$ of sets on $\mathcal{B}$* is a presheaf of sets on $\mathcal{B}$ which satisfies the following additional property: Given any $U \in \mathcal{B}$, and any covering $U = \bigcup_{i \in I} U_i$ with $U_i \in \mathcal{B}$, and any coverings $U_i \cap U_j = \bigcup_{k \in I_{ij}} U_{ijk}$ with $U_{ijk} \in \mathcal{B}$ the sheaf condition holds:
   (∗∗) For any collection of sections $s_i \in \mathcal{F}(U_i)$, $i \in I$ such that $\forall i, j \in I, \forall k \in I_{ij}$
   $$s_i|_{U_{ijk}} = s_j|_{U_{ijk}}$$
   there exists a unique section $s \in \mathcal{F}(U)$ such that $s_i = s|_{U_i}$ for all $i \in I$.
(2) A *morphism of sheaves of sets on $\mathcal{B}$* is simply a morphism of presheaves of sets.

First we explain that it suffices to check the sheaf condition (∗∗) on a cofinal system of coverings. In the situation of the definition, suppose $U \in \mathcal{B}$. Let us temporarily denote $\text{Cov}_{\mathcal{B}}(U)$ the set of all coverings of U by elements of $\mathcal{B}$. Note that $\text{Cov}_{\mathcal{B}}(U)$ is partially ordered by refinement. A subset $C \subset \text{Cov}_{\mathcal{B}}(U)$ is a cofinal system, if for every $\mathcal{U} \in \text{Cov}_{\mathcal{B}}(U)$ there exists a covering $\mathcal{V} \in C$ which refines $\mathcal{U}$.

Lemma 6.30.3. *With notation as above. For each $U \in \mathcal{B}$, let $C(U) \subset Cov_{\mathcal{B}}(U)$ be a cofinal system. For each $U \in \mathcal{B}$, and each $\mathcal{U} : U = \bigcup U_i$ in $C(U)$, let coverings $\mathcal{U}_{ij} : U_i \cap U_j = \bigcup U_{ijk}$, $U_{ijk} \in \mathcal{B}$ be given. Let $\mathcal{F}$ be a presheaf of sets on $\mathcal{B}$. The following are equivalent*

(1) *The presheaf $\mathcal{F}$ is a sheaf on $\mathcal{B}$.*
(2) *For every $U \in \mathcal{B}$ and every covering $\mathcal{U} : U = \bigcup U_i$ in $C(U)$ the sheaf condition (∗∗) holds (for the given coverings $\mathcal{U}_{ij}$).*

Proof. We have to show that (2) implies (1). Suppose that $U \in \mathcal{B}$, and that $\mathcal{U} : U = \bigcup_{i \in I} U_i$ is an arbitrary covering by elements of $\mathcal{B}$. Because the system $C(U)$ is cofinal we can find an element $\mathcal{V} : U = \bigcup_{j \in J} V_j$ in $C(U)$ which refines $\mathcal{U}$. This means there exists a map $\alpha : J \to I$ such that $V_j \subset U_{\alpha(i)}$.

Note that if $s, s' \in \mathcal{F}(U)$ are sections such that $s|_{U_i} = s'|_{U_i}$, then

$$s|_{V_j} = (s|_{U_{\alpha(j)}})|_{V_j} = (s'|_{U_{\alpha(j)}})|_{V_j} = s'|_{V_j}$$

for all j. Hence by the uniqueness in $(**)$ for the covering $\mathcal{V}$ we conclude that $s = s'$. Thus we have proved the uniqueness part of $(**)$ for our arbitrary covering $\mathcal{U}$.

Suppose furthermore that $U_i \cap U_{i'} = \bigcup_{k \in I_{ii'}} U_{ii'k}$ are arbitrary coverings by $U_{ii'k} \in \mathcal{B}$. Let us try to prove the existence part of $(**)$ for the system $(\mathcal{U}, \mathcal{U}_{ij})$. Thus let $s_i \in \mathcal{F}(U_i)$ and suppose we have

$$s_i|_{U_{ijk}} = s_{i'}|_{U_{ii'k}}$$

for all i, i', k. Set $t_j = s_{\alpha(i)}|_{V_j}$, where $\mathcal{V}$ and α are as above.

There is one small kink in the argument here. Namely, let $\mathcal{V}_{jj'} : V_j \cap V_{j'} = \bigcup_{l \in J_{jj'}} V_{jj'l}$ be the covering given to us by the statement of the lemma. It is not a priori clear that

$$t_j|_{V_{jj'l}} = t_{j'}|_{V_{jj'l}}$$

for all j, j', l. To see this, note that we do have

$$t_j|_W = t_{j'}|_W \text{ for all } W \in \mathcal{B}, W \subset V_{jj'l} \cap U_{\alpha(j)\alpha(j')k}$$

for all $k \in I_{\alpha(j)\alpha(j')}$, by our assumption on the family of elements s_i. And since $V_j \cap V_{j'} \subset U_{\alpha(j)} \cap U_{\alpha(j')}$ we see that $t_j|_{V_{jj'l}}$ and $t_{j'}|_{V_{jj'l}}$ agree on the members of a covering of $V_{jj'l}$ by elements of $\mathcal{B}$. Hence by the uniqueness part proved above we finally deduce the desired equality of $t_j|_{V_{jj'l}}$ and $t_{j'}|_{V_{jj'l}}$. Then we get the existence of an element $t \in \mathcal{F}(U)$ by property $(**)$ for $(\mathcal{V}, \mathcal{V}_{jj'})$.

Again there is a small snag. We know that t restricts to t_j on V_j but we do not yet know that t restricts to s_i on U_i. To conclude this note that the sets $U_i \cap V_j$, $j \in J$ cover U_i. Hence also the sets $U_{i\alpha(j)k} \cap V_j$, $j \in J$, $k \in I_{i\alpha(j)}$ cover U_i. We leave it to the reader to see that t and s_i restrict to the same section of $\mathcal{F}$ on any $W \in \mathcal{B}$ which is contained in one of the open sets $U_{i\alpha(j)k} \cap V_j$, $j \in J$, $k \in I_{i\alpha(j)}$. Hence by the uniqueness part seen above we win. □

Lemma 6.30.4. *Let X be a topological space. Let $\mathcal{B}$ be a basis for the topology on X. Assume that for every pair $U, U' \in \mathcal{B}$ we have $U \cap U' \in \mathcal{B}$. For each $U \in \mathcal{B}$, let $C(U) \subset Cov_{\mathcal{B}}(U)$ be a cofinal system. Let $\mathcal{F}$ be a presheaf of sets on $\mathcal{B}$. The following are equivalent*

1. *The presheaf $\mathcal{F}$ is a sheaf on $\mathcal{B}$.*
2. *For every $U \in \mathcal{B}$ and every covering $\mathcal{U} : U = \bigcup U_i$ in $C(U)$ and for every family of sections $s_i \in \mathcal{F}(U_i)$ such that $s_i|_{U_i \cap U_j} = s_j|_{U_i \cap U_j}$ there exists a unique section $s \in \mathcal{F}(U)$ which restricts to s_i on U_i.*

Proof. This is a reformulation of Lemma 6.30.3 above in the special case where the coverings $\mathcal{U}_{ij}$ each consist of a single element. But also this case is much easier and is an easy exercise to do directly. □

Lemma 6.30.5. *Let X be a topological space. Let $\mathcal{B}$ be a basis for the topology on X. Let $U \in \mathcal{B}$. Let $\mathcal{F}$ be a sheaf of sets on $\mathcal{B}$. The map*

$$\mathcal{F}(U) \to \prod_{x \in U} \mathcal{F}_x$$

identifies $\mathcal{F}(U)$ with the elements $(s_x)_{x \in U}$ with the property

($*$) *For any $x \in U$ there exists a $V \in \mathcal{B}$, $x \in V$ and a section $\sigma \in \mathcal{F}(V)$ such that for all $y \in V$ we have $s_y = (V, \sigma)$ in $\mathcal{F}_y$.*

Proof. First note that the map $\mathcal{F}(U) \to \prod_{x \in U} \mathcal{F}_x$ is injective by the uniqueness in the sheaf condition of Definition 6.30.2. Let (s_x) be any element on the right hand side which satisfies ($*$). Clearly this means we can find a covering $U = \bigcup U_i$, $U_i \in \mathcal{B}$ such that $(s_x)_{x \in U_i}$ comes from certain $\sigma_i \in \mathcal{F}(U_i)$. For every $y \in U_i \cap U_j$ the sections σ_i and σ_j agree in the stalk $\mathcal{F}_y$. Hence there exists an element $V_{ijy} \in \mathcal{B}$, $y \in V_{ijy}$ such that $\sigma_i|_{V_{ijy}} = \sigma_j|_{V_{ijy}}$. Thus the sheaf condition ($**$) of Definition 6.30.2 applies to the system of σ_i and we obtain a section $s \in \mathcal{F}(U)$ with the desired property. $\square$

Let X be a topological space. Let $\mathcal{B}$ be a basis for the topology on X. There is a natural restriction functor from the category of sheaves of sets on X to the category of sheaves of sets on $\mathcal{B}$. It turns out that this is an equivalence of categories. In down to earth terms this means the following.

Lemma 6.30.6. *Let X be a topological space. Let $\mathcal{B}$ be a basis for the topology on X. Let $\mathcal{F}$ be a sheaf of sets on $\mathcal{B}$. There exists a unique sheaf of sets $\mathcal{F}^{ext}$ on X such that $\mathcal{F}^{ext}(U) = \mathcal{F}(U)$ for all $U \in \mathcal{B}$ compatibly with the restriction mappings.*

Proof. We first construct a presheaf $\mathcal{F}^{ext}$ with the desired property. Namely, for an arbitrary open $U \subset X$ we define $\mathcal{F}^{ext}(U)$ as the set of elements $(s_x)_{x \in U}$ such that ($*$) of Lemma 6.30.5 holds. It is clear that there are restriction mappings that turn $\mathcal{F}^{ext}$ into a presheaf of sets. Also, by Lemma 6.30.5 we see that $\mathcal{F}(U) = \mathcal{F}^{ext}(U)$ whenever U is an element of the basis $\mathcal{B}$. To see $\mathcal{F}^{ext}$ is a sheaf one may argue as in the proof of Lemma 6.17.1. $\square$

Note that we have

$$\mathcal{F}_x = \mathcal{F}^{ext}_x$$

in the situation of the lemma. This is so because the collection of elements of $\mathcal{B}$ containing x forms a fundamental system of open neighbourhoods of x.

Lemma 6.30.7. *Let X be a topological space. Let $\mathcal{B}$ be a basis for the topology on X. Denote $Sh(\mathcal{B})$ the category of sheaves on $\mathcal{B}$. There is an equivalence of categories*

$$Sh(X) \longrightarrow Sh(\mathcal{B})$$

which assigns to a sheaf on X its restriction to the members of $\mathcal{B}$.

Proof. The inverse functor in given in Lemma 6.30.6 above. Checking the obvious functorialities is left to the reader. $\square$

This ends the discussion of sheaves of sets on a basis $\mathcal{B}$. Let $(\mathcal{C}, F)$ be a type of algebraic structure. At the end of this section we would like to point out that the constructions above work for sheaves with values in $\mathcal{C}$. Let us briefly define the relevant notions.

Definition 6.30.8. Let X be a topological space. Let $\mathcal{B}$ be a basis for the topology on X. Let $(\mathcal{C}, F)$ be a type of algebraic structure.

(1) A *presheaf $\mathcal{F}$ with values in $\mathcal{C}$ on $\mathcal{B}$* is a rule which assigns to each $U \in \mathcal{B}$ an object $\mathcal{F}(U)$ of $\mathcal{C}$ and to each inclusion $V \subset U$ of elements of $\mathcal{B}$ a morphism $\rho^U_V : \mathcal{F}(U) \to \mathcal{F}(V)$ in $\mathcal{C}$ such that whenever $W \subset V \subset U$ in $\mathcal{B}$ we have $\rho^U_W = \rho^V_W \circ \rho^U_V$.
(2) A *morphism $\varphi : \mathcal{F} \to \mathcal{G}$ of presheaves with values in $\mathcal{C}$ on $\mathcal{B}$* is a rule which assigns to each element $U \in \mathcal{B}$ a morphism of algebraic structures $\varphi : \mathcal{F}(U) \to \mathcal{G}(U)$ compatible with restriction maps.

(3) Given a presheaf $\mathcal{F}$ with values in $\mathcal{C}$ on $\mathcal{B}$ we say that $U \mapsto F(\mathcal{F}(U))$ is the underlying presheaf of sets.
(4) A *sheaf $\mathcal{F}$ with values in $\mathcal{C}$ on $\mathcal{B}$* is a presheaf with values in $\mathcal{C}$ on $\mathcal{B}$ whose underlying presheaf of sets is a sheaf.

At this point we can define the *stalk* at $x \in X$ of a presheaf with values in $\mathcal{C}$ on $\mathcal{B}$ as the directed colimit

$$\mathcal{F}_x = colim_{U \in \mathcal{B}, x \in U} \mathcal{F}(U).$$

It exists as an object of $\mathcal{C}$ because of our assumptions on $\mathcal{C}$. Also, we see that the underlying set of $\mathcal{F}_x$ is the stalk of the underlying presheaf of sets on $\mathcal{B}$.

Note that Lemmas 6.30.3, 6.30.4 and 6.30.5 refer to the sheaf property which we have defined in terms of the associated presheaf of sets. Hence they generalize without change to the notion of a presheaf with values in $\mathcal{C}$. The analogue of Lemma 6.30.6 need some care. Here it is.

Lemma 6.30.9. *Let X be a topological space. Let $(\mathcal{C}, F)$ be a type of algebraic structure. Let $\mathcal{B}$ be a basis for the topology on X. Let $\mathcal{F}$ be a sheaf with values in $\mathcal{C}$ on $\mathcal{B}$. There exists a unique sheaf $\mathcal{F}^{ext}$ with values in $\mathcal{C}$ on X such that $\mathcal{F}^{ext}(U) = \mathcal{F}(U)$ for all $U \in \mathcal{B}$ compatibly with the restriction mappings.*

Proof. By the conditions imposed on the pair $(\mathcal{C}, F)$ it suffices to come up with a presheaf $\mathcal{F}^{ext}$ which does the correct thing on the level of underlying presheaves of sets. Thus our first task is to construct a suitable object $\mathcal{F}^{ext}(U)$ for all open $U \subset X$. We could do this by imitating Lemma 6.18.1 in the setting of presheaves on $\mathcal{B}$. However, a slightly different method (but basically equivalent) is the following: Define it as the directed colimit

$$\mathcal{F}^{ext}(U) := colim_{\mathcal{U}} FIB(\mathcal{U})$$

over all coverings $\mathcal{U} : U = \bigcup_{i \in I} U_i$ by $U_i \in \mathcal{B}$ of the fibre product

$$\begin{tikzcd} FIB(\mathcal{U}) \arrow[r] \arrow[d] & \prod_{x \in U} \mathcal{F}_x \arrow[d] \\ \prod_{i \in I} \mathcal{F}(U_i) \arrow[r] & \prod_{i \in I} \prod_{x \in U_i} \mathcal{F}_x \end{tikzcd}$$

By the usual arguments, see Lemma 6.15.4 and Example 6.15.5 it suffices to show that this construction on underlying sets is the same as the definition using $(**)$ above. Details left to the reader. $\square$

Note that we have

$$\mathcal{F}_x = \mathcal{F}^{ext}_x$$

as objects in $\mathcal{C}$ in the situation of the lemma. This is so because the collection of elements of $\mathcal{B}$ containing x forms a fundamental system of open neighbourhoods of x.

Lemma 6.30.10. *Let X be a topological space. Let $\mathcal{B}$ be a basis for the topology on X. Let $(\mathcal{C}, F)$ be a type of algebraic structure. Denote $Sh(\mathcal{B}, \mathcal{C})$ the category of sheaves with values in $\mathcal{C}$ on $\mathcal{B}$. There is an equivalence of categories*

$$Sh(X, \mathcal{C}) \longrightarrow Sh(\mathcal{B}, \mathcal{C})$$

which assigns to a sheaf on X its restriction to the members of $\mathcal{B}$.

Proof. The inverse functor in given in Lemma 6.30.9 above. Checking the obvious functorialities is left to the reader. $\square$

Finally we come to the case of (pre)sheaves of modules on a basis. We will use the easy fact that the category of presheaves of sets on a basis has products and that they are described by taking products of values on elements of the bases.

Definition 6.30.11. Let X be a topological space. Let $\mathcal{B}$ be a basis for the topology on X. Let $\mathcal{O}$ be a presheaf of rings on $\mathcal{B}$.

(1) A *presheaf of $\mathcal{O}$-modules $\mathcal{F}$ on $\mathcal{B}$* is a presheaf of abelian groups on $\mathcal{B}$ together with a morphism of presheaves of sets $\mathcal{O} \times \mathcal{F} \to \mathcal{F}$ such that for all $U \in \mathcal{B}$ the map $\mathcal{O}(U) \times \mathcal{F}(U) \to \mathcal{F}(U)$ turns the group $\mathcal{F}(U)$ into an $\mathcal{O}(U)$-module.
(2) A *morphism $\varphi : \mathcal{F} \to \mathcal{G}$ of presheaves of $\mathcal{O}$-modules on $\mathcal{B}$* is a morphism of abelian presheaves on $\mathcal{B}$ which induces an $\mathcal{O}(U)$-module homomorphism $\mathcal{F}(U) \to \mathcal{G}(U)$ for every $U \in \mathcal{B}$.
(3) Suppose that $\mathcal{O}$ is a sheaf of rings on $\mathcal{B}$. A *sheaf $\mathcal{F}$ of $\mathcal{O}$-modules on $\mathcal{B}$* is a presheaf of $\mathcal{O}$-modules on $\mathcal{B}$ whose underlying presheaf of abelain groups is a sheaf.

We can define the *stalk* at $x \in X$ of a presheaf of $\mathcal{O}$-modules on $\mathcal{B}$ as the directed colimit

$$\mathcal{F}_x = colim_{U \in \mathcal{B}, x \in U} \mathcal{F}(U).$$

It is a $\mathcal{O}_x$-module.

Note that Lemmas 6.30.3, 6.30.4 and 6.30.5 refer to the sheaf property which we have defined in terms of the associated presheaf of sets. Hence they generalize without change to the notion of a presheaf of $\mathcal{O}$-modules. The analogue of Lemma 6.30.6 is as follows.

Lemma 6.30.12. *Let X be a topological space. Let $\mathcal{O}$ be a sheaf of rings on $\mathcal{B}$. Let $\mathcal{B}$ be a basis for the topology on X. Let $\mathcal{F}$ be a sheaf with values in $\mathcal{C}$ on $\mathcal{B}$. Let $\mathcal{O}^{ext}$ be the sheaf of rings on X extending $\mathcal{O}$ and let $\mathcal{F}^{ext}$ be the abelian sheaf on X extending $\mathcal{F}$, see Lemma 6.30.9. There exists a canonical map*

$$\mathcal{O}^{ext} \times \mathcal{F}^{ext} \longrightarrow \mathcal{F}^{ext}$$

which agrees with the given map over elements of $\mathcal{B}$ and which endows $\mathcal{F}^{ext}$ with the structure of an $\mathcal{O}^{ext}$-module.

Proof. It suffices to construct the multiplication map on the level of presheaves of sets. Perhaps the easiest way to see this is to prove directly that if $(f_x)_{x \in U}$, $f_x \in \mathcal{O}_x$ and $(m_x)_{x \in U}$, $m_x \in \mathcal{F}_x$ satisfy $(*)$, then the element $(f_x m_x)_{x \in U}$ also satisfies $(*)$. Then we get the desired result, because in the proof of Lemma 6.30.6 we construct the extension in terms of families of elements of stalks satisfying $(*)$. □

Note that we have

$$\mathcal{F}_x = \mathcal{F}^{ext}_x$$

as $\mathcal{O}_x$-modules in the situation of the lemma. This is so because the collection of elements of $\mathcal{B}$ containing x forms a fundamental system of open neighbourhoods of x, or simply because it is true on the underlying sets.

Lemma 6.30.13. *Let X be a topological space. Let $\mathcal{B}$ be a basis for the topology on X. Let $\mathcal{O}$ be a sheaf of rings on X. Denote $Mod(\mathcal{O}|_{\mathcal{B}})$ the category of sheaves of $\mathcal{O}|_{\mathcal{B}}$-modules on $\mathcal{B}$. There is an equivalence of categories*

$$Mod(\mathcal{O}) \longrightarrow Mod(\mathcal{O}|_{\mathcal{B}})$$

which assigns to a sheaf of $\mathcal{O}$-modules on X its restriction to the members of $\mathcal{B}$.

Proof. The inverse functor in given in Lemma 6.30.12 above. Checking the obvious functorialities is left to the reader. □

Finally, we address the question of the relationship of this with continuous maps. This is now very easy thanks to the work above. First we do the case where there is a basis on the target given.

Lemma 6.30.14. *Let $f : X \to Y$ be a continuous map of topological spaces. Let $(\mathcal{C}, F)$ be a type of algebraic structures. Let $\mathcal{F}$ be a sheaf with values in $\mathcal{C}$ on X. Let $\mathcal{G}$ be a sheaf with values in $\mathcal{C}$ on Y. Let $\mathcal{B}$ be a basis for the topology on Y. Suppose given for every $V \in \mathcal{B}$ a morphism*

$$\varphi_V : \mathcal{G}(V) \longrightarrow \mathcal{F}(f^{-1}V)$$

of $\mathcal{C}$ compatible with restriction mappings. Then there is a unique f-map (see Definition 6.21.7 and discussion of f-maps in Section 6.23) $\varphi : \mathcal{G} \to \mathcal{F}$ recovering φ_V for $V \in \mathcal{B}$.

Proof. This is trivial because the collection of maps amounts to a morphism between the restrictions of $\mathcal{G}$ and $f_*\mathcal{F}$ to $\mathcal{B}$. By Lemma 6.30.10 this is the same as giving a morphism from $\mathcal{G}$ to $f_*\mathcal{F}$, which by Lemma 6.21.8 is the same as an f-map. See also Lemma 6.23.1 and the discussion preceding it for how to deal with the case of sheaves of algebraic structures. □

Here is the analogue for ringed spaces.

Lemma 6.30.15. *Let $(f, f^\sharp) : (X, \mathcal{O}_X) \to (Y, \mathcal{O}_Y)$ be a morphism of ringed spaces. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_X$-modules. Let $\mathcal{G}$ be a sheaf of $\mathcal{O}_Y$-modules. Let $\mathcal{B}$ be a basis for the topology on Y. Suppose given for every $V \in \mathcal{B}$ a $\mathcal{O}_Y(V)$-module map*

$$\varphi_V : \mathcal{G}(V) \longrightarrow \mathcal{F}(f^{-1}V)$$

(where $\mathcal{F}(f^{-1}V)$ has a module structure using $f^\sharp_V : \mathcal{O}_Y(V) \to \mathcal{O}_X(f^{-1}V)$) compatible with restriction mappings. Then there is a unique f-map (see discussion of f-maps in Section 6.26) $\varphi : \mathcal{G} \to \mathcal{F}$ recovering φ_V for $V \in \mathcal{B}$.

Proof. Same as the proof of the corresponding lemma for sheaves of algebraic structures above. □

Lemma 6.30.16. *Let $f : X \to Y$ be a continuous map of topological spaces. Let $(\mathcal{C}, F)$ be a type of algebraic structures. Let $\mathcal{F}$ be a sheaf with values in $\mathcal{C}$ on X. Let $\mathcal{G}$ be a sheaf with values in $\mathcal{C}$ on Y. Let $\mathcal{B}_Y$ be a basis for the topology on Y. Let $\mathcal{B}_X$ be a basis for the topology on X. Suppose given for every $V \in \mathcal{B}_Y$, and $U \in \mathcal{B}_X$ such that $f(U) \subset V$ a morphism*

$$\varphi_V^U : \mathcal{G}(V) \longrightarrow \mathcal{F}(U)$$

of $\mathcal{C}$ compatible with restriction mappings. Then there is a unique f-map (see Definition 6.21.7 and the discussion of f-maps in Section 6.23) $\varphi : \mathcal{G} \to \mathcal{F}$ recovering φ_V^U as the composition

$$\mathcal{G}(V) \xrightarrow{\varphi_V} \mathcal{F}(f^{-1}(V)) \xrightarrow{restr.} \mathcal{F}(U)$$

for every pair (U, V) as above.

Proof. Let us first proves this for sheaves of sets. Fix $V \subset Y$ open. Pick $s \in \mathcal{G}(V)$. We are going to construct an element $\varphi_V(s) \in \mathcal{F}(f^{-1}V)$. We can define a value $\varphi(s)_x$ in the stalk $\mathcal{F}_x$ for every $x \in f^{-1}V$ by picking a $U \in \mathcal{B}_X$ with $x \in U \subset f^{-1}V$ and setting $\varphi(s)_x$ equal to the equivalence class of $(U, \varphi_V^U(s))$ in the stalk. Clearly, the family $(\varphi(s)_x)_{x \in f^{-1}V}$ satisfies condition $(*)$ because the maps φ_V^U for varying U are compatible with restrictions in the sheaf $\mathcal{F}$. Thus, by the proof of Lemma 6.30.6 we see that $(\varphi(s)_x)_{x \in f^{-1}V}$ corresponds to a unique element $\varphi_V(s)$ of $\mathcal{F}(f^{-1}V)$. Thus we have defined a set map $\varphi_V : \mathcal{G}(V) \to \mathcal{F}(f^{-1}V)$. The compatibility between φ_V and φ_V^U follows from Lemma 6.30.5.

We leave it to the reader to show that the construction of φ_V is compatible with restriction mappings as we vary $v \in \mathcal{B}_Y$. Thus we may apply Lemma 6.30.14 above to ``glue" them to the desired f-map.

Finally, we note that the map of sheaves of sets so constructed satisfies the property that the map on stalks

$$\mathcal{G}_{f(x)} \longrightarrow \mathcal{F}_x$$

is the colimit of the system of maps φ_V^U as $V \in \mathcal{B}_Y$ varies over those elements that contain $f(x)$ and $U \in \mathcal{B}_X$ varies over those elements that contain x. In particular, if $\mathcal{G}$ and $\mathcal{F}$ are the underlying sheaves of sets of sheaves of algebraic structures, then we see that the maps on stalks is a morphism of algebraic structures. Hence we conclude that the associated map of sheaves of underlying sets $f^{-1}\mathcal{G} \to \mathcal{F}$ satisfies the assumptions of Lemma 6.23.1. We conclude that $f^{-1}\mathcal{G} \to \mathcal{F}$ is a morphism of sheaves with values in $\mathcal{C}$. And by adjointness this means that φ is an f-map of sheaves of algebraic structures. □

Lemma 6.30.17. *Let $(f, f^\sharp) : (X, \mathcal{O}_X) \to (Y, \mathcal{O}_Y)$ be a morphism of ringed spaces. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_X$-modules. Let $\mathcal{G}$ be a sheaf of $\mathcal{O}_Y$-modules. Let $\mathcal{B}_Y$ be a basis for the topology on Y. Let $\mathcal{B}_X$ be a basis for the topology on X. Suppose given for every $V \in \mathcal{B}_Y$, and $U \in \mathcal{B}_X$ such that $f(U) \subset V$ a $\mathcal{O}_Y(V)$-module map*

$$\varphi_V^U : \mathcal{G}(V) \longrightarrow \mathcal{F}(U)$$

compatible with restriction mappings. Here the $\mathcal{O}_Y(V)$-module structure on $\mathcal{F}(U)$ comes from the $\mathcal{O}_X(U)$-module structure via the map $f_V^\sharp : \mathcal{O}_Y(V) \to \mathcal{O}_X(f^{-1}V) \to \mathcal{O}_X(U)$. Then there is a unique f-map of sheaves of modules (see Definition 6.21.7 and the discussion of f-maps in Section 6.26) $\varphi : \mathcal{G} \to \mathcal{F}$ recovering φ_V^U as the composition

$$\mathcal{G}(V) \xrightarrow{\varphi_V} \mathcal{F}(f^{-1}(V)) \xrightarrow{restrc.} \mathcal{F}(U)$$

for every pair (U, V) as above.

Proof. Similar to the above and omitted. □

6.31. Open immersions and (pre)sheaves

Let X be a topological space. Let $j : U \to X$ be the inclusion of an open subset U into X. In Section 6.21 we have defined functors j_* and j^{-1} such that j_* is right adjoint to j^{-1}. It turns out that for an open immersion there is a left adjoint for j^{-1}, which we will denote $j_!$. First we point out that j^{-1} has a particularly simple description in the case of an open immersion.

Lemma 6.31.1. *Let X be a topological space. Let $j : U \to X$ be the inclusion of an open subset U into X.*

1. *Let $\mathcal{G}$ be a presheaf of sets on X. The presheaf $j_p\mathcal{G}$ (see Section 6.21) is given by the rule $V \mapsto \mathcal{G}(V)$ for $V \subset U$ open.*
2. *Let $\mathcal{G}$ be a sheaf of sets on X. The sheaf $j^{-1}\mathcal{G}$ is given by the rule $V \mapsto \mathcal{G}(V)$ for $V \subset U$ open.*

(3) *For any point $u \in U$ and any sheaf $\mathcal{G}$ on X we have a canonical identification of stalks*

$$j^{-1}\mathcal{G}_u = (\mathcal{G}|_U)_u = \mathcal{G}_u.$$

(4) *On the category of presheaves of U we have $j_p j_* = id$.*

(5) *On the category of sheaves of U we have $j^{-1} j_* = id$.*

The same description holds for (pre)sheaves of abelian groups, (pre)sheaves of algebraic structures, and (pre)sheaves of modules.

Proof. The colimit in the definition of $j_p\mathcal{G}(V)$ is over collection of all $W \subset X$ open such that $V \subset W$ ordered by reverse inclusion. Hence this has a largest element, namely V. This proves (1). And (2) follows because the assignment $V \mapsto \mathcal{G}(V)$ for $V \subset U$ open is clearly a sheaf if $\mathcal{G}$ is a sheaf. Assertion (3) follows from (2) since the collection of open neighbourhoods of u which are contained in U is cofinal in the collection of all open neighbourhoods of u in X. Parts (4) and (5) follow by computing $j^{-1}j_*\mathcal{F}(V) = j_*\mathcal{F}(V) = \mathcal{F}(V)$.

The exact same arguments work for (pre)sheaves of abelian groups and (pre)sheaves of algebraic structures. □

Definition 6.31.2. Let X be a topological space. Let $j : U \to X$ be the inclusion of an open subset.

(1) Let $\mathcal{G}$ be a presheaf of sets, abelian groups or algebraic structures on X. The presheaf $j_p\mathcal{G}$ described in Lemma 6.31.1 is called the *restriction of $\mathcal{G}$ to U* and denoted $\mathcal{G}|_U$.

(2) Let $\mathcal{G}$ be a sheaf of sets on X, abelian groups or algebraic structures on X. The sheaf $j^{-1}\mathcal{G}$ is called the *restriction of $\mathcal{G}$ to U* and denoted $\mathcal{G}|_U$.

(3) If $(X, \mathcal{O})$ is a ringed space, then the pair $(U, \mathcal{O}|_U)$ is called the *open subspace of $(X, \mathcal{O})$ associated to U*.

(4) If $\mathcal{G}$ is a presheaf of $\mathcal{O}$-modules then $\mathcal{G}|_U$ together with the multiplication map $\mathcal{O}|_U \times \mathcal{G}|_U \to \mathcal{G}|_U$ (see Lemma 6.24.6) is called the *restriction of $\mathcal{G}$ to U*.

We leave a definition of the restriction of presheaves of modules to the reader. Ok, so in this section we will discuss a left adjoint to the restriction functor. Here is the definition in the case of (pre)sheaves of sets.

Definition 6.31.3. Let X be a topological space. Let $j : U \to X$ be the inclusion of an open subset.

(1) Let $\mathcal{F}$ be a presheaf of sets on U. We define the *extension of $\mathcal{F}$ by the empty set $j_{p!}\mathcal{F}$* to be the presheaf of sets on X defined by the rule

$$j_{p!}\mathcal{F}(V) = \begin{cases} \emptyset & \text{if} \quad V \not\subset U \\ \mathcal{F}(V) & \text{if} \quad V \subset U \end{cases}$$

with obvious restriction mappings.

(2) Let $\mathcal{F}$ be a sheaf of sets on U. We define the *extension of $\mathcal{F}$ by the empty set $j_!\mathcal{F}$* to be the sheafification of the presheaf $j_{p!}\mathcal{F}$.

Lemma 6.31.4. *Let X be a topological space. Let $j : U \to X$ be the inclusion of an open subset.*

(1) *The functor $j_{p!}$ is a left adjoint to the restriction functor j_p (see Lemma 6.31.1).*

(2) *The functor $j_!$ is a left adjoint to restriction, in a formula*

$$Mor_{Sh(X)}(j_!\mathcal{F}, \mathcal{G}) = Mor_{Sh(U)}(\mathcal{F}, j^{-1}\mathcal{G}) = Mor_{Sh(U)}(\mathcal{F}, \mathcal{G}|_U)$$

bifunctorially in $\mathcal{F}$ and $\mathcal{G}$.

(3) *Let $\mathcal{F}$ be a sheaf of sets on U. The stalks of the sheaf $j_!\mathcal{F}$ are described as follows*

$$j_!\mathcal{F}_x = \begin{cases} \emptyset & if \quad x \notin U \\ \mathcal{F}_x & if \quad x \in U \end{cases}$$

(4) *On the category of presheaves of U we have $j_p j_{p!} = id$.*

(5) *On the category of sheaves of U we have $j^{-1}j_! = id$.*

Proof. To map $j_{p!}\mathcal{F}$ into $\mathcal{G}$ it is enough to map $\mathcal{F}(V) \to \mathcal{G}(V)$ whenever $V \subset U$ compatibly with restriction mappings. And by Lemma 6.31.1 the same description holds for maps $\mathcal{F} \to \mathcal{G}|_U$. The adjointness of $j_!$ and restriction follows from this and the properties of sheafification. The identification of stalks is obvious from the definition of the extension by the empty set and the definition of a stalk. Statements (4) and (5) follow by computing the value of the sheaf on any open of U. □

Note that if $\mathcal{F}$ is a sheaf of abelian groups on U, then in general $j_!\mathcal{F}$ as defined above, is not a sheaf of abelian groups, for example because some of its stalks are empty (hence not abelian groups for sure). Thus we need to modify the definition of $j_!$ depending on the type of sheafs we consider. The reason for choosing the empty set in the definition of the extension by the empty set, is that it is the initial object in the category of sets. Thus in the case of abelian groups we use 0 (and more generally for sheaves with values in any abelian category).

Definition 6.31.5. Let X be a topological space. Let $j : U \to X$ be the inclusion of an open subset.

(1) Let $\mathcal{F}$ be an abelian presheaf on U. We define the *extension $j_{p!}\mathcal{F}$ of $\mathcal{F}$ by* 0 to be the abelian presheaf on X defined by the rule

$$j_{p!}\mathcal{F}(V) = \begin{cases} 0 & \text{if} \quad V \not\subset U \\ \mathcal{F}(V) & \text{if} \quad V \subset U \end{cases}$$

with obvious restriction mappings.

(2) Let $\mathcal{F}$ be an abelian sheaf on U. We define the *extension $j_!\mathcal{F}$ of $\mathcal{F}$ by* 0 to be the sheafification of the abelian presheaf $j_{p!}\mathcal{F}$.

(3) Let $\mathcal{C}$ be a category having an initial object e. Let $\mathcal{F}$ be a presheaf on U with values in $\mathcal{C}$. We define the *extension $j_{p!}\mathcal{F}$ of $\mathcal{F}$ by e* to be the presheaf on X with values in $\mathcal{C}$ defined by the rule

$$j_{p!}\mathcal{F}(V) = \begin{cases} e & \text{if} \quad V \not\subset U \\ \mathcal{F}(V) & \text{if} \quad V \subset U \end{cases}$$

with obvious restriction mappings.

(4) Let $(\mathcal{C}, F)$ be a type of algebraic structure such that $\mathcal{C}$ has an initial object e. Let $\mathcal{F}$ be a sheaf of algebraic structures on U (of the give type). We define the *extension $j_!\mathcal{F}$ of $\mathcal{F}$ by e* to be the sheafification of the presheaf $j_{p!}\mathcal{F}$ defined above.

(5) Let $\mathcal{O}$ be a presheaf of rings on X. Let $\mathcal{F}$ be a presheaf of $\mathcal{O}|_U$-modules. In this case we define the *extension by* 0 to be the presheaf of $\mathcal{O}$-modules which is equal to $j_{p!}\mathcal{F}$ as an abelian presheaf endowed with the multiplication map $\mathcal{O} \times j_{p!}\mathcal{F} \to j_{p!}\mathcal{F}$.

(6) Let $\mathcal{O}$ be a sheaf of rings on X. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}|_U$-modules. In this case we define the *extension by* 0 to be the $\mathcal{O}$-module which is equal to $j_!\mathcal{F}$ as an abelian sheaf endowed with the multiplication map $\mathcal{O} \times j_!\mathcal{F} \to j_!\mathcal{F}$.

It is true that one can define $j_!$ in the setting of sheaves of algebraic structures (see below). However, it depends on the type of algebraic structures involved what the resulting object is. For example, if $\mathcal{O}$ is a sheaf of rings on U, then $j_{!,rings}\mathcal{O} \neq j_{!,abelian}\mathcal{O}$ since the initial object in the category of rings is $\mathbf{Z}$ and the initial object in the category of abelian groups is 0. In particular the functor $j_!$ *does not commute with taking underlying sheaves of sets*, in contrast to what we have seen sofar! We separate out the case of (pre)sheaves of abelian groups, (pre)sheaves of algebraic structures and (pre)sheaves of modules as usual.

Lemma 6.31.6. *Let X be a topological space. Let $j : U \to X$ be the inclusion of an open subset. Consider the functors of restriction and extension by* 0 *for abelian (pre)sheaves.*

(1) *The functor $j_{p!}$ is a left adjoint to the restriction functor j_p (see Lemma 6.31.1).*
(2) *The functor $j_!$ is a left adjoint to restriction, in a formula*

$$Mor_{Ab(X)}(j_!\mathcal{F}, \mathcal{G}) = Mor_{Ab(U)}(\mathcal{F}, j^{-1}\mathcal{G}) = Mor_{Ab(U)}(\mathcal{F}, \mathcal{G}|_U)$$

bifunctorially in $\mathcal{F}$ and $\mathcal{G}$.
(3) *Let $\mathcal{F}$ be an abelian sheaf on U. The stalks of the sheaf $j_!\mathcal{F}$ are described as follows*

$$j_!\mathcal{F}_x = \begin{cases} 0 & \text{if} \quad x \notin U \\ \mathcal{F}_x & \text{if} \quad x \in U \end{cases}$$

(4) *On the category of abelian presheaves of U we have $j_p j_{p!} = id$.*
(5) *On the category of abelian sheaves of U we have $j^{-1} j_! = id$.*

Proof. Omitted. □

Lemma 6.31.7. *Let X be a topological space. Let $j : U \to X$ be the inclusion of an open subset. Let $(\mathcal{C}, F)$ be a type of algebraic structure such that $\mathcal{C}$ has an initial object e. Consider the functors of restriction and extension by e for (pre)sheaves of algebraic structure defined above.*

(1) *The functor $j_{p!}$ is a left adjoint to the restriction functor j_p (see Lemma 6.31.1).*
(2) *The functor $j_!$ is a left adjoint to restriction, in a formula*

$$Mor_{Sh(X,\mathcal{C})}(j_!\mathcal{F}, \mathcal{G}) = Mor_{Sh(U,\mathcal{C})}(\mathcal{F}, j^{-1}\mathcal{G}) = Mor_{Sh(U,\mathcal{C})}(\mathcal{F}, \mathcal{G}|_U)$$

bifunctorially in $\mathcal{F}$ and $\mathcal{G}$.
(3) *Let $\mathcal{F}$ be a sheaf on U. The stalks of the sheaf $j_!\mathcal{F}$ are described as follows*

$$j_!\mathcal{F}_x = \begin{cases} e & \text{if} \quad x \notin U \\ \mathcal{F}_x & \text{if} \quad x \in U \end{cases}$$

(4) *On the category of presheaves of algebraic structures on U we have $j_p j_{p!} = id$.*
(5) *On the category of sheaves of algebraic structures on U we have $j^{-1} j_! = id$.*

Proof. Omitted. □

Lemma 6.31.8. *Let $(X, \mathcal{O})$ be a ringed space. Let $j : (U, \mathcal{O}|_U) \to (X, \mathcal{O})$ be an open subspace. Consider the functors of restriction and extension by* 0 *for (pre)sheaves of modules defined above.*

(1) *The functor $j_{p!}$ is a left adjoint to restriction, in a formula*

$$Mor_{PMod(\mathcal{O})}(j_{p!}\mathcal{F}, \mathcal{G}) = Mor_{PMod(\mathcal{O}|_U)}(\mathcal{F}, \mathcal{G}|_U)$$

bifunctorially in $\mathcal{F}$ and $\mathcal{G}$.

(2) *The functor $j_!$ is a left adjoint to restriction, in a formula*

$$Mor_{Mod(\mathcal{O})}(j_!\mathcal{F}, \mathcal{G}) = Mor_{Mod(\mathcal{O}|_U)}(\mathcal{F}, \mathcal{G}|_U)$$

bifunctorially in $\mathcal{F}$ and $\mathcal{G}$.

(3) *Let $\mathcal{F}$ be a sheaf of $\mathcal{O}$-modules on U. The stalks of the sheaf $j_!\mathcal{F}$ are described as follows*

$$j_!\mathcal{F}_x = \begin{cases} 0 & \text{if} \quad x \notin U \\ \mathcal{F}_x & \text{if} \quad x \in U \end{cases}$$

(4) *On the category of sheaves of $\mathcal{O}|_U$-modules on U we have $j^{-1}j_! = id$.*

Proof. Omitted. $\square$

Note that by the lemmas above, both the functors j_* and $j_!$ are fully faithful embeddings of the category of sheaves on U into the category of sheaves on X. It is only true for the functor $j_!$ that one can easily describe the essential image of this functor.

Lemma 6.31.9. *Let X be a topological space. Let $j : U \to X$ be the inclusion of an open subset. The functor*

$$j_! : Sh(U) \longrightarrow Sh(X)$$

is fully faithful. Its essential image consists exactly of those sheaves $\mathcal{G}$ such that $\mathcal{G}_x = \emptyset$ for all $x \in X \setminus U$.

Proof. Fully faithfullness follows formally from $j^{-1}j_! = \text{id}$. We have seen that any sheaf in the image of the functor has the property on the stalks mentioned in the lemma. Conversely, suppose that $\mathcal{G}$ has the indicated property. Then it is easy to check that

$$j_!j^{-1}\mathcal{G} \to \mathcal{G}$$

is an isomorphism on all stalks and hence an isomorphism. $\square$

Lemma 6.31.10. *Let X be a topological space. Let $j : U \to X$ be the inclusion of an open subset. The functor*

$$j_! : Ab(U) \longrightarrow Ab(X)$$

is fully faithful. Its essential image consists exactly of those sheaves $\mathcal{G}$ such that $\mathcal{G}_x = 0$ for all $x \in X \setminus U$.

Proof. Omitted. $\square$

Lemma 6.31.11. *Let X be a topological space. Let $j : U \to X$ be the inclusion of an open subset. Let $(\mathcal{C}, F)$ be a type of algebraic structure such that $\mathcal{C}$ has an initial object e. The functor*

$$j_! : Sh(U, \mathcal{C}) \longrightarrow Sh(X, \mathcal{C})$$

is fully faithful. Its essential image consists exactly of those sheaves $\mathcal{G}$ such that $\mathcal{G}_x = e$ for all $x \in X \setminus U$.

Proof. Omitted. $\square$

Lemma 6.31.12. *Let $(X, \mathcal{O})$ be a ringed space. Let $j : (U, \mathcal{O}|_U) \to (X, \mathcal{O})$ be an open subspace. The functor*

$$j_! : Mod(\mathcal{O}|_U) \longrightarrow Mod(\mathcal{O})$$

is fully faithful. Its essential image consists exactly of those sheaves $\mathcal{G}$ such that $\mathcal{G}_x = 0$ for all $x \in X \setminus U$.

Proof. Omitted. □

Remark 6.31.13. Let $j : U \to X$ be an open immersion of topological spaces as above. Let $x \in X$, $x \notin U$. Let $\mathcal{F}$ be a sheaf of sets on U. Then $\mathcal{F}_x = \emptyset$ by Lemma 6.31.4. Hence $j_!$ does not transform a final object of $Sh(U)$ into a final object of $Sh(X)$ unless $U = X$. According to our conventions in Categories, Section 4.21 this means that the functor $j_!$ is not left exact as a functor between the categories of sheaves of sets. It will be shown later that $j_!$ on abelian sheaves is exact, see Modules, Lemma 15.3.5.

6.32. Closed immersions and (pre)sheaves

Let X be a topological space. Let $i : Z \to X$ be the inclusion of a closed subset Z into X. In Section 6.21 we have defined functors i_* and i^{-1} such that i_* is right adjoint to i^{-1}.

Lemma 6.32.1. *Let X be a topological space. Let $i : Z \to X$ be the inclusion of a closed subset Z into X. Let $\mathcal{F}$ be a sheaf of sets on Z. The stalks of $i_*\mathcal{F}$ are described as follows*

$$i_*\mathcal{F}_x = \begin{cases} \{*\} & \text{if} \quad x \notin Z \\ \mathcal{F}_x & \text{if} \quad x \in Z \end{cases}$$

where $\{*\}$ denotes a singleton set. Moreover, $i^{-1}i_* = id$ on the category of sheaves of sets on Z. Moreover, the same holds for abelian sheaves on Z, resp. sheaves of algebraic structures on Z where $\{*\}$ has to be replaced by 0, resp. a final object of the category of algebraic structures.

Proof. If $x \notin Z$, then there exist arbitrarily small open neighbourhoods U of x which do not meet Z. Because $\mathcal{F}$ is a sheaf we have $\mathcal{F}(i^{-1}(U)) = \{*\}$ for any such U, see Remark 6.7.2. This proves the first case. The second case comes from the fact that for $z \in Z$ any open neighbourhood of z is of the form $Z \cap U$ for some open U of X. For the statement that $i^{-1}i_* = \text{id}$ consider the canonical map $i^{-1}i_*\mathcal{F} \to \mathcal{F}$. This is an isomorphism on stalks (see above) and hence an isomorphism.

For sheaves of abelian groups, and sheaves of algebraic structures you argue in the same manner. □

Lemma 6.32.2. *Let X be a topological space. Let $i : Z \to X$ be the inclusion of a closed subset. The functor*

$$i_* : Sh(Z) \longrightarrow Sh(X)$$

is fully faithful. Its essential image consists exactly of those sheaves $\mathcal{G}$ such that $\mathcal{G}_x = \{*\}$ for all $x \in X \setminus Z$.

Proof. Fully faithfullness follows formally from $i^{-1}i_* = \text{id}$. We have seen that any sheaf in the image of the functor has the property on the stalks mentioned in the lemma. Conversely, suppose that $\mathcal{G}$ has the indicated property. Then it is easy to check that

$$\mathcal{G} \to i_*i^{-1}\mathcal{G}$$

is an isomorphism on all stalks and hence an isomorphism. □

Lemma 6.32.3. *Let X be a topological space. Let $i : Z \to X$ be the inclusion of a closed subset. The functor*
$$i_* : Ab(Z) \longrightarrow Ab(X)$$
is fully faithful. Its essential image consists exactly of those sheaves $\mathcal{G}$ such that $\mathcal{G}_x = 0$ for all $x \in X \setminus Z$.

Proof. Omitted. $\square$

Lemma 6.32.4. *Let X be a topological space. Let $i : Z \to X$ be the inclusion of a closed subset. Let $(\mathcal{C}, F)$ be a type of algebraic structure with final object 0. The functor*
$$i_* : Sh(Z, \mathcal{C}) \longrightarrow Sh(X, \mathcal{C})$$
is fully faithful. Its essential image consists exactly of those sheaves $\mathcal{G}$ such that $\mathcal{G}_x = 0$ for all $x \in X \setminus Z$.

Proof. Omitted. $\square$

Remark 6.32.5. Let $i : Z \to X$ be a closed immersion of topological spaces as above. Let $x \in X$, $x \notin Z$. Let $\mathcal{F}$ be a sheaf of sets on Z. Then $(i_*\mathcal{F})_x = \{*\}$ by Lemma 6.32.1. Hence if $\mathcal{F} = * \amalg *$, where $*$ is the singleton sheaf, then $i_*\mathcal{F}_x = \{*\} \neq i_*(*)_x \amalg i_*(*)_x$ because the latter is a two point set. According to our conventions in Categories, Section 4.21 this means that the functor i_* is not right exact as a functor between the categories of sheaves of sets. In particular, it cannot have a right adjoint, see Categories, Lemma 4.22.3.

On the other hand, we will see later (see Modules, Lemma 15.6.3) that i_* on abelian sheaves is exact, and does have a right adjoint, namely the functor that associates to an abelian sheaf on X the sheaf of sections supported in Z.

Remark 6.32.6. We have not discussed the relationship between closed immersions and ringed spaces. This is because the notion of a closed immersion of ringed spaces is best discussed in the setting of quasi-coherent sheaves, see Modules, Section 15.13.

6.33. Glueing sheaves

In this section we glue sheaves defined on the members of a covering of X. We first deal with maps.

Lemma 6.33.1. *Let X be a topological space. Let $X = \bigcup U_i$ be an open covering. Let $\mathcal{F}$, $\mathcal{G}$ be sheaves of sets on X. Given a collection*
$$\varphi_i : \mathcal{F}|_{U_i} \longrightarrow \mathcal{G}|_{U_i}$$
of maps of sheaves such that for all $i, j \in I$ the maps φ_i, φ_j restrict to the same map $\mathcal{F}|_{U_i \cap U_j} \to \mathcal{G}|_{U_i \cap U_j}$ then there exists a unique map of sheaves
$$\varphi : \mathcal{F} \longrightarrow \mathcal{G}$$
whose restriction to each U_i agrees with φ_i.

Proof. Omitted. $\square$

The previous lemma implies that given two sheaves $\mathcal{F}$, $\mathcal{G}$ on the topological space X the rule
$$U \longmapsto Mor_{Sh(U)}(\mathcal{F}|_U, \mathcal{G}|_U)$$
defines a sheaf. This is a kind of *internal hom sheaf*. It is seldom used in the setting of sheaves of sets, and more usually in the setting of sheaves of modules, see Modules, Section 15.19.

Let X be a topological space. Let $X = \bigcup_{i \in I} U_i$ be an open covering. For each $i \in I$ let $\mathcal{F}_i$ be a sheaf of sets on U_i. For each pair $i, j \in I$, let

$$\varphi_{ij} : \mathcal{F}_i|_{U_i \cap U_j} \longrightarrow \mathcal{F}_j|_{U_i \cap U_j}$$

be an isomorphism of sheaves of sets. Assume in addition that for every triple of indices $i, j, k \in I$ the following diagram is commutative

$$\begin{tikzcd} \mathcal{F}_i|_{U_i \cap U_j \cap U_k} \arrow[rr, "\varphi_{ik}"] \arrow[dr, "\varphi_{ij}"'] & & \mathcal{F}_k|_{U_i \cap U_j \cap U_k} \\ & \mathcal{F}_j|_{U_i \cap U_j \cap U_k} \arrow[ur, "\varphi_{jk}"'] & \end{tikzcd}$$

We will call such a collection of data $(\mathcal{F}_i, \varphi_{ij})$ a *glueing data for sheaves of sets with respect to the covering* $X = \bigcup U_i$.

Lemma 6.33.2. *Let X be a topological space. Let $X = \bigcup_{i \in I} U_i$ be an open covering. Given any glueing data $(\mathcal{F}_i, \varphi_{ij})$ for sheaves of sets with respect to the covering $X = \bigcup U_i$ there exists a sheaf of sets $\mathcal{F}$ on X together with isomorphisms*

$$\varphi_i : \mathcal{F}|_{U_i} \to \mathcal{F}_i$$

such that the diagrams

$$\begin{tikzcd} \mathcal{F}|_{U_i \cap U_j} \arrow[r, "\varphi_i"'] \arrow[d, "id"'] & \mathcal{F}_i|_{U_i \cap U_j} \arrow[d, "\varphi_{ij}"] \\ \mathcal{F}|_{U_i \cap U_j} \arrow[r, "\varphi_j"] & \mathcal{F}_j|_{U_i \cap U_j} \end{tikzcd}$$

are commutative.

Proof. Actually we can write a formula for the set of sections of $\mathcal{F}$ over an open $W \subset X$. Namely, we define

$$\mathcal{F}(W) = \{(s_i)_{i \in I} \mid s_i \in \mathcal{F}_i(W \cap U_i), \varphi_{ij}(s_i|_{W \cap U_i \cap U_j}) = s_j|_{W \cap U_i \cap U_j}\}.$$

Restriction mappings for $W' \subset W$ are defined by the restricting each of the s_i to $W' \cap U_i$. The sheaf condition for $\mathcal{F}$ follows immediately from the sheaf condition for each of the $\mathcal{F}_i$.

We still have to prove that $\mathcal{F}|_{U_i}$ maps isomorphically to $\mathcal{F}_i$. Let $W \subset U_i$. In this case the condition in the definition of $\mathcal{F}(W)$ implies that $s_j = \varphi_{ij}(s_i|_{W \cap U_j})$. And the commutativity of the diagrams in the definition of a glueing data assures that we may start with *any* section $s \in \mathcal{F}_i(W)$ and obtain a compatible collection by setting $s_i = s$ and $s_j = \varphi_{ij}(s_i|_{W \cap U_j})$. Thus the lemma follows. $\square$

Lemma 6.33.3. *Let X be a topological space. Let $X = \bigcup U_i$ be an open covering. Let $(\mathcal{F}_i, \varphi_{ij})$ be a glueing data of sheaves of abelian groups, resp. sheaves of algebraic structures, resp. sheaves of $\mathcal{O}$-modules for some sheaf of rings $\mathcal{O}$ on X. Then the construction in the proof of Lemma 6.33.2 above leads to a sheaf of abelian groups, resp. sheaf of algebraic structures, resp. sheaf of $\mathcal{O}$-modules.*

Proof. This is true because in the construction the set of sections $\mathcal{F}(W)$ over an open W is given as the equalizer of the maps

$$\prod_{i \in I} \mathcal{F}_i(W \cap U_i) \rightrightarrows \prod_{i,j \in I} \mathcal{F}_i(W \cap U_i \cap U_j)$$

And in each of the cases envisioned this equalizer gives an object in the relevant category whose underlying set is the object considered in the cited lemma. □

Lemma 6.33.4. *Let X be a topological space. Let $X = \bigcup_{i \in I} U_i$ be an open covering. The functor which associates to a sheaf of sets $\mathcal{F}$ the following collection of glueing data*

$$(\mathcal{F}|_{U_i}, (\mathcal{F}|_{U_i})|_{U_i \cap U_j} \to (\mathcal{F}|_{U_j})|_{U_i \cap U_j})$$

with respect to the covering $X = \bigcup U_i$ defines an equivalence of categories between $Sh(X)$ and the category of glueing data. A similar statement holds for abelian sheaves, resp. sheaves of algebraic structures, resp. sheaves of $\mathcal{O}$-modules.

Proof. The functor is fully faithful by Lemma 6.33.1 and essentially surjective (via an explicitly given quasi-inverse functor) by Lemma 6.33.2. □

This lemma means that if the sheaf $\mathcal{F}$ was constructed from the glueing data $(\mathcal{F}_i, \varphi_{ij})$ and if $\mathcal{G}$ is a sheaf on X, then a morphism $f : \mathcal{F} \to \mathcal{G}$ is given by a collection of morphisms of sheaves

$$f_i : \mathcal{F}_i \longrightarrow \mathcal{G}|_{U_i}$$

compatible with the glueing maps φ_{ij}. Similarly, to give a morphism of sheaves $g : \mathcal{G} \to \mathcal{F}$ is the same as giving a collection of morphisms of sheaves

$$g_i : \mathcal{G}|_{U_i} \longrightarrow \mathcal{F}_i$$

compatible with the glueing maps φ_{ij}.

CHAPTER 7

Commutative Algebra

7.1. Introduction

Basic commutative algebra will be explained in this document. A reference is [**Mat70**].

7.2. Conventions

A ring is commutative with 1. The zero ring is a ring. In fact it is the only ring that does not have a prime ideal. The Kronecker symbol δ_{ij} will be used. If $R \to S$ is a ring map and $\mathfrak q$ a prime of S, then we use the notation "$\mathfrak p = R \cap \mathfrak q$" to indicate the prime which is the inverse image of $\mathfrak q$ under $R \to S$ even if R is not a subring of S and even if $R \to S$ is not injective.

7.3. Basic notions

The following notions are considered basic and will not be defined, and or proved. This does not mean they are all necessarily easy or well known.

(1) R is a *ring*,
(2) $x \in R$ is *nilpotent*,
(3) $x \in R$ is a *zero-divisor*,
(4) $x \in R$ is a *unit*,
(5) $e \in R$ is an *idempotent*,
(6) an idempotent $e \in R$ is called *trivial* if $e = 1$ or $e = 0$,
(7) $\varphi : R_1 \to R_2$ is a *ring homomorphism*,
(8) $\varphi : R_1 \to R_2$ is *of finite presentation*, or R_2 *is a finitely presented* R_1*-algebra*, see Definition 7.6.1,
(9) $\varphi : R_1 \to R_2$ is *of finite type*, or R_2 *is a finitely type* R_1*-algebra*, see Definition 7.6.1,
(10) $\varphi : R_1 \to R_2$ is *finite*, or R_2 *is a finite* R_1*-algebra*,
(11) R is a *(integral) domain*,
(12) R is *reduced*,
(13) R is *Noetherian*,
(14) R is a *principal ideal domain* or a *PID*,
(15) R is a *Euclidean domain*,
(16) R is a *unique factorization domain* or a *UFD*,
(17) R is a *discrete valuation ring* or a *dvr*,
(18) K is a *field*,
(19) $K \subset L$ is a *field extension*,
(20) $K \subset L$ is an *algebraic field extension*,
(21) $\{t_i\}_{i \in I}$ is a *transcendence basis* for L over K,
(22) the *transcendence degree* $\text{trdeg}(L/K)$ of L over K,
(23) the field k is *algebraically closed*,

(24) if $K \subset L$ is algebraic, and $K \to k$ a field map, then there exists a map $L \to k$ extending the map on K,
(25) $I \subset R$ is an *ideal*,
(26) $I \subset R$ is *radical*,
(27) if I is an ideal then we have its *radical* $\sqrt{I}$,
(28) $I \subset R$ is *nilpotent* means that $I^n = 0$ for some $n \in \mathbf{N}$,
(29) $I \subset R$ is *locally nilpotent* means that every element of I is nilpotent,
(30) $\mathfrak{p} \subset R$ is a *prime ideal*,
(31) if $\mathfrak{p} \subset R$ is prime and if $I, J \subset R$ are ideal, and if $IJ \subset \mathfrak{p}$, then $I \subset \mathfrak{p}$ or $J \subset \mathfrak{p}$.
(32) $\mathfrak{m} \subset R$ is a *maximal ideal*,
(33) any nonzero ring has a maximal ideal,
(34) the *Jacobson radical* of R is $\text{rad}(R) = \bigcap_{\mathfrak{m} \subset R} \mathfrak{m}$ the intersection of all the maximal ideals of R,
(35) the ideal (T) *generated* by a subset $T \subset R$,
(36) the *quotient ring* R/I,
(37) an ideal I in the ring R is prime if and only if R/I is a domain,
(38) an ideal I in the ring R is maximal if and only if the ring R/I is a field,
(39) if $\varphi : R_1 \to R_2$ is a ring homomorphism, and if $I \subset R_2$ is an ideal, then $\varphi^{-1}(I)$ is an ideal of R_1,
(40) if $\varphi : R_1 \to R_2$ is a ring homomorphism, and if $I \subset R_1$ is an ideal, then $\varphi(I) \cdot R_2$ (sometimes denoted $I \cdot R_2$, or IR_2) is the ideal of R_2 generated by $\varphi(I)$,
(41) if $\varphi : R_1 \to R_2$ is a ring homomorphism, and if $\mathfrak{p} \subset R_2$ is a prime ideal, then $\varphi^{-1}(\mathfrak{p})$ is a prime ideal of R_1,
(42) M is an *R-module*,
(43) for $m \in M$ the *annihilator* $I = \{f \in R \mid fm = 0\}$ of m in R,
(44) $N \subset M$ is an *R-submodule*,
(45) M is an *Noetherian R-module*,
(46) M is a *finite R-module*,
(47) M is a *finitely generated R-module*,
(48) M is a *finitely presented R-module*,
(49) M is a *free R-module*,
(50) if $0 \to K \to L \to M \to 0$ is a short exact sequence of R-modules and K, M are free, then L is free,
(51) if $N \subset M \subset L$ are R-modules, then $L/M = (L/N)/(M/N)$,
(52) S is a *multiplicative subset of* R,
(53) the *localization* $R \to S^{-1}R$ of R,
(54) if R is a ring and S is a multiplicative subset of R then $S^{-1}R$ is the zero ring if and only if S contains 0,
(55) if R is a ring and if the multiplicative subset S consists completely of nonzero divisors, then $R \to S^{-1}R$ is injective,
(56) if $\varphi : R_1 \to R_2$ is a ring homomorphism, and S is a multiplicative subsets of R_1, then $\varphi(S)$ is a multiplicative subset of R_2,
(57) if S, S' are multiplicative subsets of R, and if SS' denotes the set of products $SS' = \{r \in R \mid \exists s \in S, \exists s' \in S', r = ss'\}$ then SS' is a multiplicative subset of R,
(58) if S, S' are multiplicative subsets of R, and if $\overline{S}$ denotes the image of S in $(S')^{-1}R$, then $(SS')^{-1}R = \overline{S}^{-1}((S')^{-1}R)$,
(59) the *localization* $S^{-1}M$ of the R-module M,

(60) the functor $M \mapsto S^{-1}M$ preserves injective maps, surjective maps, and exactness,
(61) if S, S' are multiplicative subsets of R, and if M is an R-module, then $(SS')^{-1}M = S^{-1}((S')^{-1}M)$,
(62) if R is a ring, I and ideal of R and S a multiplicative subset of R, then $S^{-1}I$ is an ideal of $S^{-1}R$, and we have $S^{-1}R/S^{-1}I = \overline{S}^{-1}(R/I)$, where $\overline{S}$ is the image of S in R/I,
(63) if R is a ring, and S a multiplicative subset of R, then any ideal I' of $S^{-1}R$ is of the form $S^{-1}I$, where one can take I to be the inverse image of I' in R,
(64) if R is a ring, M an R-module, and S a multiplicative subset of R, then any submodule N' of $S^{-1}M$ is of the form $S^{-1}N$ for some submodule $N \subset M$, where one can take N to be the inverse image of N' in M,
(65) if $S = \{1, f, f^2, \ldots\}$ then $R_f = S^{-1}R$, and $M_f = S^{-1}M$,
(66) if $S = R \setminus \mathfrak{p} = \{x \in R \mid x \notin \mathfrak{p}\}$ for some prime ideal $\mathfrak{p}$, then it is customary to denote $R_\mathfrak{p} = S^{-1}R$ and $M_\mathfrak{p} = S^{-1}M$,
(67) a *local ring* is a ring with exactly one maximal ideal,
(68) a *semi-local ring* is a ring with finitely many maximal ideals,
(69) if $\mathfrak{p}$ is a prime in R, then $R_\mathfrak{p}$ is a local ring with maximal ideal $\mathfrak{p}R_\mathfrak{p}$,
(70) the *residue field*, denoted $\kappa(\mathfrak{p})$, of the prime $\mathfrak{p}$ in the ring R is the quotient $R_\mathfrak{p}/\mathfrak{p}R_\mathfrak{p} = (R \setminus \mathfrak{p})^{-1}R/\mathfrak{p}$,
(71) given R and M_1, M_2 the *tensor product* $M_1 \otimes_R M_2$,
(72) etc.

7.4. Snake lemma

The snake lemma and its variants are discussed in the setting of abelian categories in Homology, Section 10.3.

Lemma 7.4.1. *Suppose given a commutative diagram*

$$\begin{tikzcd} & X \arrow[r] \arrow[d, "\alpha"] & Y \arrow[r] \arrow[d, "\beta"] & Z \arrow[r] \arrow[d, "\gamma"] & 0 \\ 0 \arrow[r] & U \arrow[r] & V \arrow[r] & W & \end{tikzcd}$$

of abelian groups with exact rows, then there is a canonical exact sequence

$$Ker(\alpha) \to Ker(\beta) \to Ker(\gamma) \to Coker(\alpha) \to Coker(\beta) \to Coker(\gamma)$$

Moreover, if $X \to Y$ is injective, then the first map is injective, and if $V \to W$ is surjective, then the last map is surjective.

Proof. The map $\partial : \mathrm{Ker}(\gamma) \to \mathrm{Coker}(\alpha)$ is defined as follows. Take $z \in \mathrm{Ker}(\gamma)$. Choose $y \in Y$ mapping to z. Then $\beta(y) \in V$ maps to zero in W. Hence $\beta(y)$ is the image of some $u \in U$. Set $\partial z = \overline{u}$ the class of u in the cokernel of α. Proof of exactness is omitted. □

7.5. Finite modules and finitely presented modules

Just some basic notation and lemmas.

Definition 7.5.1. Let R be a ring. Let M be an R-module

(1) We say M is a *finite R-module*, or a *finitely generated R-module* if there exist $n \in \mathbf{N}$ and $x_1, \ldots, x_n \in M$ such that every element of M is a R-linear combination of the x_i. Equivalently, this means there exists a surjection $R^{\oplus n} \to M$ for some $n \in \mathbf{N}$.
(2) We say M is a *finitely presented R-module* or an *R-module of finite presentation* if there exist integers $n, m \in \mathbf{N}$ and an exact sequence

$$R^{\oplus m} \longrightarrow R^{\oplus n} \longrightarrow M \longrightarrow 0$$

Informally this means that M is finitely generated and that the module of relations among these generators is finitely generated as well. A choice of an exact sequence as in the definition is called a *presentation* of M.

Lemma 7.5.2. *Let R be a ring. Let $\alpha : R^{\oplus n} \to M$ and $\beta : N \to M$ be module maps. If $Im(\alpha) \subset Im(\beta)$, then there exists an R-module map $\gamma : R^{\oplus n} \to N$ such that $\alpha = \beta \circ \gamma$.*

Proof. Let $e_i = (0, \ldots, 0, 1, 0, \ldots, 0)$ be the ith basis vector of $R^{\oplus n}$. Let $x_i \in N$ be an element with $\alpha(e_i) = \beta(x_i)$ which exists by assumption. Set $\gamma(a_1, \ldots, a_n) = \sum a_i x_i$. By construction $\alpha = \beta \circ \gamma$. □

Lemma 7.5.3. *Let M be an R-module of finite presentation. For any surjection $\alpha : R^{\oplus n} \to M$ the kernel of α is a finitely generated R-module.*

Proof. Choose a presentation

$$R^{\oplus l} \to R^{\oplus m} \to M \to 0$$

Let $K = \text{Ker}(\alpha)$. By Lemma 7.5.2 there exists a map $R^{\oplus m} \to R^{\oplus n}$ such that the solid diagram

$$\begin{tikzcd} & R^{\oplus l} \arrow[r] \arrow[d, dotted] & R^{\oplus m} \arrow[r] \arrow[d] & M \arrow[r] \arrow[d, "id"] & 0 \\ 0 \arrow[r] & K \arrow[r] & R^{\oplus n} \arrow[r, "\alpha"] & M \arrow[r] & 0 \end{tikzcd}$$

commutes. This produces the dotted arrow. By the snake lemma (Lemma 7.4.1) we see that we get an isomorphism

$$\text{Coker}(R^{\oplus l} \to K) \cong \text{Coker}(R^{\oplus m} \to R^{\oplus n})$$

In particular we conclude that $\text{Coker}(R^{\oplus l} \to K)$ is a finite R-module. Hence there are finitely many elements of K which together with the images of the basis vectors of $R^{\oplus l}$ generate K, i.e., K is finitely generated. □

Lemma 7.5.4. *Let R be a ring. Let*

$$0 \to M_1 \to M_2 \to M_3 \to 0$$

be a short exact sequence of R-modules.

(1) *If M_1 and M_3 are finite R-modules, then M_2 is a finite R-module.*
(2) *If M_1 and M_3 are finitely presented R-modules, then M_2 is a finitely presented R-module.*
(3) *If M_2 is a finite R-module, then M_3 is a finite R-module.*
(4) *If M_2 is a finitely presented R-module and M_1 is a finite R-module, then M_3 is a finitely presented R-module.*
(5) *If M_3 is a finitely presented R-module and M_2 is a finite R-module, then M_1 is a finite R-module.*

Proof. We prove part (5). Assume M_3 is finitely presented and M_2 finite. Let $\alpha : R^{\oplus n} \to M_2$ be a surjection. Then we can find $k_1, \dots, k_m \in R^{\oplus n}$ which generate the kernel of the composition $R^{\oplus n} \to M_2 \to M_3$. Then $\alpha(k_1), \dots, \alpha(k_m)$ generate M_1 as a submodule of M_2. The proofs of the other parts are omitted. □

Lemma 7.5.5. *Let R be a ring, and let M be a finite R-module. There exists a filtration by R-submodules*

$$0 = M_0 \subset M_1 \subset \dots \subset M_n = M$$

such that each quotient M_i/M_{i-1} is isomorphic to R/I_i for some ideal I_i of R.

Proof. By induction on the number of generators of M. Let $x_1, \dots, x_r \in M$ be a minimal number of generators. Let $M' = Rx_1 \subset M$. Then M/M' has $r - 1$ generators and the induction hypothesis applies. And clearly $M' \cong R/I_1$ with $I_1 = \{f \in R \mid fx_1 = 0\}$. □

Lemma 7.5.6. *Let $R \to S$ be a ring map. Let M be an S-module. If M is finite as an R-module, then M is finite as an S-module.*

Proof. In fact, any R-generating set of M is also an S-generating set of M, since the R-module structure is induced by the image of R in S. □

7.6. Ring maps of finite type and of finite presentation

Definition 7.6.1. Let $R \to S$ be a ring map.

(1) We say $R \to S$ is of *finite type*, or that *S is a finite type R-algebra* if there exists an $n \in \mathbf{N}$ and an surjection of R-algebras $R[x_1, \dots, x_n] \to S$.
(2) We say $R \to S$ is of *finite presentation* if there exist integers $n, m \in \mathbf{N}$ and polynomials $f_1, \dots, f_m \in R[x_1, \dots, x_n]$ and an isomorphism of R-algebras $R[x_1, \dots, x_n]/(f_1, \dots, f_m) \cong S$.

Informally this means that S is finitely generated as an R-algebra and that the ideal of relations among the generators is finitely generated. A choice of a surjection $R[x_1, \dots, x_n] \to S$ as in the definition is sometimes called a *presentation* of S.

Lemma 7.6.2. *The notions finite type and finite presentation have the following permanence properties.*

(1) *A composition of ring maps of finite type is of finite type.*
(2) *A composition of ring maps of finite presentation is of finite presentation.*
(3) *Given $R \to S' \to S$ with $R \to S$ of finite type, then $S' \to S$ is of finite type.*
(4) *Given $R \to S' \to S$, with $R \to S$ of finite presentation, and $R \to S'$ of finite type, then $S' \to S$ is of finite presentation.*

Proof. We only prove the last assertion. Write $S = R[x_1, \dots, x_n]/(f_1, \dots, f_m)$ and $S' = R[y_1, \dots, y_a]/I$. Say that the class $\bar{y}_i$ of y_i maps to h_i mod $(f_1, \dots, f_m)$ in S. Then it is clear that $S' = S[x_1, \dots, x_n]/(f_1, \dots, f_m, h_1 - \bar{y}_1, \dots, h_m - \bar{y}_m)$. □

Lemma 7.6.3. *Let $R \to S$ be a ring map of finite presentation. For any surjection $\alpha : R[x_1, \dots, x_n] \to S$ the kernel of α is a finitely generated ideal in $R[x_1, \dots, x_n]$.*

Proof. Write $S = R[y_1, \dots, y_m]/(f_1, \dots, f_k)$. Choose $g_i \in R[y_1, \dots, y_m]$ which are lifts of $\alpha(x_i)$. Then we see that $S = R[x_i, y_j]/(f_j, x_i - g_i)$. Choose $h_j \in R[x_1, \dots, x_n]$ such that $\alpha(h_j)$ corresponds to y_j mod $(f_1, \dots, f_k)$. Consider the map $\psi : R[x_i, y_j] \to R[x_i]$, $x_i \mapsto x_i$, $y_j \mapsto h_j$. Then the kernel of α is the image of $(f_j, x_i - g_i)$ under ψ and we win. □

Lemma 7.6.4. *Let $R \to S$ be a ring map. Let M be an S-module. Assume $R \to S$ is of finite type and M is finitely presented as an R-module. Then M is finitely presented as an S-module.*

Proof. This is similar to the proof of part (4) of Lemma 7.6.2. We may assume $S = R[x_1, \ldots, x_n]/J$. Choose $y_1, \ldots, y_m \in M$ which generate M as an R-module and choose relations $\sum a_{ij} y_j = 0$, $i = 1, \ldots, t$ which generate the kernel of $R^{\oplus n} \to M$. For any $i = 1, \ldots, n$ and $j = 1, \ldots, m$ write

$$x_i y_j = \sum a_{ijk} y_k$$

for some $a_{ijk} \in R$. Consider the S-module N generated by $y_1, \ldots, y_m$ subject to the relations $\sum a_{ij} y_j = 0$, $i = 1, \ldots, t$ and $x_i y_j = \sum a_{ijk} y_k$, $i = 1, \ldots, n$ and $j = 1, \ldots, m$. Then N has a presentation

$$S^{\oplus nm+t} \longrightarrow S^{\oplus m} \longrightarrow M \longrightarrow 0$$

By construction there is a surjective map $\varphi : N \to M$. To finish the proof we show φ is injective. Suppose $z = \sum b_j y_j \in N$ for some $b_j \in S$. We may think of b_j as a polynomial in $x_1, \ldots, x_n$ with coefficients in R. By applying the relations of the form $x_i y_j = \sum a_{ijk} y_k$ we can inductively lower the degree of the polynomials. Hence we see that $z = \sum c_j y_j$ for some $c_j \in R$. Hence if $\varphi(z) = 0$ then the vector $(c_1, \ldots, c_m)$ is an R-linear combination of the vectors $(a_{i1}, \ldots, a_{im})$ and we conclude that $z = 0$ as desired. □

7.7. Finite ring maps

Definition 7.7.1. Let $\varphi : R \to S$ be a ring map. We say $\varphi : R \to S$ is *finite* if if S is finite as an R-module.

Lemma 7.7.2. *Let $R \to S$ be a finite ring map. Let M be an S-module. Then M is finite as an R-module if and only if M is finite as an S-module.*

Proof. One of the implications follows from Lemma 7.5.6. To see the other assume that M is finite as an S-module. Pick $x_1, \ldots, x_n \in S$ which generate S as an R-module. Pick $y_1, \ldots, y_m \in M$ which generate M as an S-module. Then $x_i y_j$ generate M as an R-module. □

Lemma 7.7.3. *Suppose that $R \to S$ and $S \to T$ are finite ring maps. Then $R \to T$ is finite.*

Proof. If t_i generate T as an S-module and s_j generate S as an R-module, then $t_i s_j$ generate T as an R-module. (Also follows from Lemma 7.7.2.) □

Lemma 7.7.4. *Let $R \to S$ be a finite and finitely presented ring map. Let M be an S-module. Then M is finitely presented as an R-module if and only if M is finitely presented as an S-module.*

Proof. One of the implications follows from Lemma 7.6.4. To see the other assume that M is finitely presented as an S-module. Pick a presentation

$$S^{\oplus m} \longrightarrow S^{\oplus n} \longrightarrow M \longrightarrow 0$$

As S is finite as an R-module, the kernel of $S^{\oplus n} \to M$ is a finite R-module. Thus from Lemma 7.5.4 we see that it suffices to prove that S is finitely presented as an R-module.

Pick $x_1, \ldots, x_n \in S$ which generate S as an R-module. Write $x_i x_j = \sum a_{ijk} x_k$ for some $a_{ijk} \in R$. Let $J = \mathrm{Ker}(R[X_1, \ldots, X_n] \to S)$ where $R[X_1, \ldots, X_n] \to S$ is the R-algebra map determined by $X_i \mapsto x_i$. Let $g_{ij} = X_i X_j - \sum a_{ijk} X_k$ which is an element of J. Let $I = (g_{ij})$ so that $I \subset J$. By Lemma 7.6.3 there exist finitely many $g_1, \ldots, g_N \in J$ such that

$J = (g_1, \ldots, g_N)$. For every index $l \in \{1, \ldots, N\}$ we can write $g_l = h_l \bmod I$ for some $h_l \in J$ which has degree ≤ 1 in $X_1, \ldots, X_n$. (Details omitted; hint: use the g_{ij} get rid of the monomial of highest degree in g_l and use induction.) Write $h_l = a_{l0} + \sum a_{li} X_i$ for some $a_{li} \in R$. Then S has the following presentation

$$R^{\oplus N} \longrightarrow R^{\oplus n+1} \longrightarrow M \longrightarrow 0$$

as an R-module where the first arrow maps the lth basis vector to $(a_{l0}, a_{l1}, \ldots, a_{ln})$ and the second arrow maps $(a_0, a_1, \ldots, a_n)$ to $a_0 + \sum a_i x_i$. □

7.8. Colimits

Some of the material in this section overlaps with the general discussion on colimits in Categories, Sections 4.13 -- 4.19.

Definition 7.8.1. A *partially ordered set* is a set I together with a relation $\leq$ which is associative (if $i \leq j$ and $j \leq k$ then $i \leq k$) and reflexive ($i \leq i$ for all $i \in I$). A *directed set* $(I, \leq)$ is a partially ordered set $(I, \leq)$ such that I is not empty and such that $\forall i, j \in I$, there exists $k \in I$ with $i \leq k, j \leq k$.

It is customary to drop the $\leq$ from the notation when talking about a partially ordered set. This is the same as the notion defined in Categories, Section 4.19.

Definition 7.8.2. Let $(I, \leq)$ be a partially ordered set. A *system (M_i, μ_{ij}) of R-modules over I* consists of a family of R-modules $\{M_i\}_{i \in I}$ indexed by I and a family of R-module maps $\{\mu_{ij} : M_i \to M_j\}_{i \leq j}$ such that for all $i \leq j \leq k$

(7.8.2.1) $$\mu_{ii} = id_{M_i}$$

(7.8.2.2) $$\mu_{ik} = \mu_{jk} \circ \mu_{ij}$$

We say (M_i, μ_{ij}) is a *directed system* if I is a directed set.

This is the same as the notion defined in Categories, Definition 4.19.1 and Section 4.19. We refer to Categories, Definition 4.13.2 for the definition of a colimit of a diagram/system in any category.

Lemma 7.8.3. *Let (M_i, μ_{ij}) be a system of R-modules over the partially ordered set I. The colimit of the system (M_i, μ_{ij}) is the quotient R-module $(\bigoplus_{i \in I} M_i)/Q$ where Q is the R-submodule generated by all elements*

$$\iota_i(x_i) - \iota_j(\mu_{ij}(x_i))$$

where $\iota_i : M_i \to \bigoplus_{i \in I} M_i$ is the natural inclusion. We denote the colimit $M = colim_i M_i$. We denote $\pi : \bigoplus_{i \in I} M_i \to M$ the projection map and $\phi_i = \pi \circ \iota_i : M_i \to M$.

Proof. This lemma is a special case of Categories, Lemma 4.13.11 but we will also prove it directly in this case. Namely, note that $\phi_i = \phi_j \circ \mu_{ij}$ in the above construction. To show the pair (M, ϕ_i) is the colimit we have to show it satisfies the universal property: for any other such pair (Y, ψ_i) with $\psi_i : M_i \to Y$, $\psi_i = \psi_j \circ \mu_{ij}$, there is a unique R-module homomorphism $g : M \to Y$ such that the following diagram commutes:

$$\begin{tikzcd} M_i \arrow[rr, "\mu_{ij}"] \arrow[dr, "\phi_i"] \arrow[ddr, "\psi_i"'] & & M_j \arrow[dl, "\phi_j"'] \arrow[ddl, "\psi_j"] \\ & M \arrow[d, "g"] & \\ & Y & \end{tikzcd}$$

And this is clear because we can define g by taking the map ψ_i on the summand M_i in the direct sum $\bigoplus M_i$. ☐

Lemma 7.8.4. *Let (M_i, μ_{ij}) be a system of R-modules over the partially ordered set I. Assume that I is directed. The colimit of the system (M_i, μ_{ij}) is canonically isomorphic to the module M defined as follows:*

(1) *as a set let*
$$M = \left(\coprod\nolimits_{i \in I} M_i\right) / \sim$$
where for $m \in M_i$ and $m' \in M_{i'}$ we have
$$m \sim m' \Leftrightarrow \mu_{ij}(m) = \mu_{i'j}(m') \text{ for some } j \geq i, i'$$
(2) *as an abelian group for $m \in M_i$ and $m' \in M_{i'}$ we define the sum of the classes of m and m' in M to be the class of $\mu_{ij}(m) + \mu_{i'j}(m')$ where $j \in I$ is any index with $i \leq j$ and $i' \leq j$, and*
(3) *as an R-module define for $m \in M_i$ and $x \in R$ the product of x and the class of m in M to be the class of xm in M.*

The canonical maps $\phi_i : M_i \to M$ are induced by the canonical maps $M_i \to \coprod_{i \in I} M_i$.

Proof. Omitted. Compare with Categories, Section 4.17. ☐

Lemma 7.8.5. *Let (M_i, μ_{ij}) be a directed system. Let $M = colim\, M_i$ with $\mu_i : M_i \to M$, then $\mu_i(x_i) = 0$ for $x_i \in M_i$ if and only if there exists $j \geq i$ such that $\mu_{ij}(x_i) = 0$.*

Proof. This is clear from the description of the directed colimit in Lemma 7.8.4. ☐

Example 7.8.6. Consider the partially ordered set $I = \{a, b, c\}$ with $a \prec b$ and $a \prec c$ and no other strict inequalities. A system $(M_a, M_b, M_c, \mu_{ab}, \mu_{ac})$ over I consists of three R-modules M_a, M_b, M_c and two R-module homomorphisms $\mu_{ab} : M_a \to M_b$ and $\mu_{ac} : M_a \to M_c$. The colimit of the system is just

$$M := colim_{i \in I} M_i = \mathrm{Coker}(M_a \to M_b \oplus M_c)$$

where the map is $\mu_{ab} \oplus -\mu_{ac}$. Thus the kernel of the canonical map $M_a \to M$ is $\mathrm{Ker}(\mu_{ab}) + \mathrm{Ker}(\mu_{ac})$. And the kernel of the canonical map $M_b \to M$ is the image of $\mathrm{Ker}(\mu_{ac})$ under the map μ_{ab}. Hence clearly the result of Lemma 7.8.5 is false for general systems.

Definition 7.8.7. Let (M_i, μ_{ij}), (N_i, ν_{ij}) be systems of R-modules over the same partially ordered set I. A *homomorphism of systems* Φ from (M_i, μ_{ij}) to (N_i, ν_{ij}) is by definition a family of R-module homomorphisms $\phi_i : M_i \to N_i$ such that $\phi_j \circ \mu_{ij} = \nu_{ij} \circ \phi_i$ for all $i \leq j$.

This is the same notion as a transformation of functors between the associated diagrams $M : I \to \text{Mod}_R$ and $N : I \to \text{Mod}_R$, in the language of categories. The following lemma is a special case of Categories, Lemma 4.13.7.

Lemma 7.8.8. *Let (M_i, μ_{ij}), (N_i, ν_{ij}) be systems of R-modules over the same partially ordered set. A morphism of systems $\Phi = (\phi_i)$ from (M_i, μ_{ij}) to (N_i, ν_{ij}) induces a unique homomorphism*

$$colim\, \phi_i : colim\, M_i \longrightarrow colim\, N_i$$

such that

$$\begin{tikzcd} M_i \arrow[r] \arrow[d, "\phi_i"'] & colim\, M_i \arrow[d, "colim\, \phi_i"] \\ N_i \arrow[r] & colim\, N_i \end{tikzcd}$$

commutes for all $i \in I$.

Proof. Write $M = colim\, M_i$ and $N = colim\, N_i$ and $\phi = colim\, \phi_i$ (as yet to be constructed). We will use the explicit description of M and N in Lemma 7.8.3 without further mention. The condition of the lemma is equivalent to the condition that

$$\begin{tikzcd} \bigoplus_{i \in I} M_i \arrow[r] \arrow[d, "\bigoplus \phi_i"'] & M \arrow[d, "\phi"] \\ \bigoplus_{i \in I} N_i \arrow[r] & N \end{tikzcd}$$

commutes. Hence it is clear that if ϕ exists, then it is unique. To see that ϕ exists, it suffices to show that the kernel of the upper horizontal arrow is mapped by $\bigoplus \phi_i$ to the kernel of the lower horizontal arrow. To see this, let $j \leq k$ and $x_j \in M_j$. Then

$$(\bigoplus \phi_i)(x_j - \mu_{jk}(x_j)) = \phi_j(x_j) - \phi_k(\mu_{jk}(x_j)) = \phi_j(x_j) - \nu_{jk}(\phi_i(x_j))$$

which is in the kernel of the lower horizontal arrow as required. $\square$

Lemma 7.8.9. *Let I be a directed partially ordered set. Let (L_i, λ_{ij}), (M_i, μ_{ij}), and (N_i, ν_{ij}) be systems of R-modules over I. Let $\varphi_i : L_i \to M_i$ and $\psi_i : M_i \to N_i$ be morphisms of systems over I. Assume that for all $i \in I$ the sequence of R-modules*

$$L_i \xrightarrow{\varphi_i} M_i \xrightarrow{\psi_i} N_i$$

is a complex with homology H_i. Then the R-modules H_i form a system over I, the sequence of R-modules

$$colim_i\, L_i \xrightarrow{\varphi} colim_i\, M_i \xrightarrow{\psi} colim_i\, N_i$$

is a complex as well, and denoting H its homology we have

$$H = colim_i\, H_i.$$

Proof. We are going to repeatedly use the description of colimits over I as in Lemma 7.8.4 without further mention. Let $h \in H$. Since $H = \ker(\varphi)/\text{Im}(\psi)$ we see that h is the class mod $\text{Im}(\psi)$ of an element $[m]$ in $\text{Ker}(\psi) \subset colim_i\, M_i$. Choose an i such that $[m]$ comes from an element $m \in M_i$. Choose a $j \geq i$ such that $\nu_{ij}(\psi_i(m)) = 0$ which is possible since $[m] \in \text{Ker}(\psi)$. After replacing i by j and m by $\mu_{ij}(m)$ we see that we may assume $m \in \text{Ker}(\psi_i)$. This shows that the map $colim_i\, H_i \to H$ is surjective.

Suppose that $h_i \in H_i$ has image zero on H. Since $H_i = \mathrm{Ker}(\psi_i)/\mathrm{Im}(\varphi_i)$ we may represent h_i by an element $m \in \mathrm{Ker}(\psi_i) \subset M_i$. The assumption on the vanishing of h_i in H means that the class of m in $colim_i\, M_i$ lies in the image of φ. Hence there exists an $j \geq i$ and a $l \in L_j$ such that $\varphi_j(l) = \mu_{ij}(m)$. Clearly this shows that the image of h_i in H_j is zero. This proves the injectivity of $colim_i\, H_i \to H$. □

Example 7.8.10. Taking colimits is not exact in general. Consider the partially ordered set $I = \{a, b, c\}$ with $a \prec b$ and $a \prec c$ and no other strict inequalities, as in Example 7.8.6. Consider the map of systems $(0, \mathbf{Z}, \mathbf{Z}, 0, 0) \to (\mathbf{Z}, \mathbf{Z}, \mathbf{Z}, 1, 1)$. From the description of the colimit in Example 7.8.6 we see that the associated map of colimits is not injective, even though the map of systems is injective on each object. Hence the result of Lemma 7.8.9 is false for general systems.

Lemma 7.8.11. *Let $\mathcal{I}$ be an index category satisfying the assumptions of Categories, Lemma 4.17.3. Then taking colimits of diagrams of abelian groups over $\mathcal{I}$ is exact (i.e., the analogue of Lemma 7.8.9 holds in this situation).*

Proof. By Categories, Lemma 4.17.3 we may write $\mathcal{I} = \coprod_{j \in J} \mathcal{I}_j$ with each $\mathcal{I}_j$ a filtered category, and J possibly empty. By Categories, Lemma 4.19.3 taking colimits over the index categories $\mathcal{I}_j$ is the same as taking the colimit over some directed partially ordered set. Hence Lemma 7.8.9 applies to these colimits. This reduces the problem to showing that coproducts in the category of R-modules over the set J are exact. In other words, exact sequences $L_j \to M_j \to N_j$ of R modules we have to show that

$$\bigoplus\nolimits_{j \in J} L_j \longrightarrow \bigoplus\nolimits_{j \in J} M_j \longrightarrow \bigoplus\nolimits_{j \in J} N_j$$

is exact. This can be verified by hand, and holds even if J is empty. □

For purposes of reference, we define what it means to have a relation between elements of a module.

Definition 7.8.12. Let R be a ring. Let M be an R-module. Let $n \geq 0$ and $x_i \in M$ for $i = 1, \ldots, n$. A *relation* between $x_1, \ldots, x_n$ in M is a sequence of elements $f_1, \ldots, f_n \in R$ such that $\sum_{i=1,\ldots,n} f_i x_i = 0$.

Lemma 7.8.13. *Let R be a ring and let M be an R-module. Then M is the colimit of a directed system (M_i, μ_{ij}) of R-modules with all M_i finitely presented R-modules.*

Proof. Consider any finite subset $S \subset M$ and any finite collection of relations E among the elements of S. So each $s \in S$ corresponds to $x_s \in M$ and each $e \in E$ consists of a vector of elements $f_{e,s} \in R$ such that $\sum f_{e,s} x_s = 0$. Let $M_{S,E}$ be the cokernel of the map

$$R^{\#E} \longrightarrow R^{\#S}, \quad (g_e)_{e \in E} \longmapsto (\sum g_e f_{e,s})_{s \in S}.$$

There are canonical maps $M_{S,E} \to M$. If $S \subset S'$ and if the elements of E correspond, via this map, to relations in E', then there is an obvious map $M_{S,E} \to M_{S',E'}$ commuting with the maps to M. Let I be the set of pairs (S, E) with ordering by inclusion as above. It is clear that the colimit of this directed system is M. □

7.9. Localization

Definition 7.9.1. Let R be a ring, S a subset of R. We say S is a *multiplicative subset of R* is $1 \in S$ and S is closed under multiplication, i.e., $s, s' \in S \Rightarrow ss' \in S$.

Given a ring A and a multiplicative subset S, we define a relation on $A \times S$ as follows:

$$(x, s) \sim (y, t) \iff \exists u \in S, \text{ such that } (xt - ys)u = 0$$

It is easily checked that this is an equivalence relation. Let x/s (or $\frac{x}{s}$) be the equivalence class of (x, s) and $S^{-1}A$ be the set of all equivalence classes. Define addition and multiplication in $S^{-1}A$ as follows:

$$x/s + y/t = (xt + ys)/st \tag{7.9.1.1}$$

$$x/s \cdot y/t = xy/st \tag{7.9.1.2}$$

One can check that $S^{-1}A$ becomes a ring under these operations.

Definition 7.9.2. This ring is called the *localization of A with respect to S*.

We have a natural ring map from A to its localization $S^{-1}A$,

$$A \longrightarrow S^{-1}A, \quad x \longmapsto x/1$$

which is sometimes called the *localization map*. In general the localization map is not injective, unless S contains no zero divisors. For, if $x/1 = 0$, then there is a $u \in S$ such that $xu = 0$ in A and hence $x = 0$ since there are no zero divisors in S. The localization of a ring has the following universal property.

Proposition 7.9.3. *Let $f : A \to B$ be a ring map that sends every element in S to a unit of B. Then there is a unique homomorphism $g : S^{-1}A \to B$ such that the following diagram commutes.*

$$\begin{tikzcd} A \arrow[rr, "f"] \arrow[dr] & & B \\ & S^{-1}A \arrow[ur, "g"'] & \end{tikzcd}$$

Proof. Existence. We define a map g as follows. For $x/s \in S^{-1}A$, let $g(x/s) = f(x)f(s)^{-1} \in B$. It is easily checked from the definition that this is a well-defined ring map. And it is also clear that this makes the diagram commutative.

Uniqueness. We now show that if $g' : S^{-1}A \to B$ satisfies $g'(x/1) = f(x)$, then $g = g'$. Hence $f(s) = g'(s/1)$ for $s \in S$ by the commutativity of the diagram. But then $g'(1/s)f(s) = 1$ in B, which implies that $g'(1/s) = f(s)^{-1}$ and hence $g'(x/s) = g'(x/1)g'(1/s) = f(x)f(s)^{-1} = g(x/s)$. □

Lemma 7.9.4. *The localization $S^{-1}A$ is the zero ring if and only if $0 \in S$.*

Proof. If $0 \in S$, any pair $(a, s) \sim (0, 1)$ by definition. If $0 \notin S$, then clearly $1/1 \neq 0/1$ in $S^{-1}A$. □

Lemma 7.9.5. *Let R be a ring. Let $S \subset R$ be a multiplicative subset. The category of $S^{-1}R$-modules is equivalent to the category of R-modules N with the property that every $s \in S$ acts as an automorphism on N.*

Proof. The functor which defines the equivalence associates to an $S^{-1}R$-module M the same module but now viewed as an R-module via the localization map $R \to S^{-1}R$. Conversely, if N is an R-module, such that every $s \in S$ acts via an automorphism s_N, then we can think of N as an $S^{-1}R$-module by letting x/s act via $x_N \circ s_N^{-1}$. We omit the verification that these two functors are quasi-inverse to each other. □

The notion of localization of a ring can be generalized to the localization of a module. Let A be a ring, S a multiplicative subset of A and M an A-module. We define a relation on $M \times S$ as follows

$$(m, s) \sim (n, t) \iff \exists u \in S, \text{ such that } (mt - ns)u = 0$$

This is clearly an equivalence relation. Denote by m/s (or $\frac{m}{s}$) be the equivalence class of (m, s) and $S^{-1}M$ be the set of all equivalence classes. Define the addition and scalar multiplication as follows

$$m/s + n/t = (mt + ns)/st \tag{7.9.5.1}$$

$$m/s \cdot n/t = mn/st \tag{7.9.5.2}$$

It is clear that this makes $S^{-1}M$ an $S^{-1}A$ module.

Definition 7.9.6. The $S^{-1}A$-module $S^{-1}M$ is called the *localization* of M at S.

Note that there is an A-module map $M \to S^{-1}M$, $m \mapsto m/1$ which is sometimes called the *localization map*. It satisfies the following universal property.

Lemma 7.9.7. *Let R be a ring. Let $S \subset R$ a multiplicative subset. Let M, N be R-modules. Assume all the elements of S act as automorphisms on N. Then the canonical map*

$$Hom_R(S^{-1}M, N) \longrightarrow Hom_R(M, N)$$

induced by the localisation map, is an isomorphism.

Proof. It is clear that the map is well-defined and R-linear. Injectivity: Let $\alpha \in Hom_R(S^{-1}M, N)$ and take an arbitrary element $m/s \in S^{-1}M$. Then, since $s \cdot \alpha(m/s) = \alpha(m/1)$, we have $\alpha(m/s) = s^{-1}(\alpha(m/1))$, so α is completely determined by what it does on the image of M in $S^{-1}M$. Surjectivity: Let $\beta : M \to N$ be a given R-linear map. We need to show that it can be "extended" to $S^{-1}M$. Define a map of sets

$$M \times S \to N, \quad (m, s) \mapsto s^{-1}(m)$$

Clearly, this map respects the equivalence relation from above, so it descends to a well-defined map $\alpha : S^{-1}M \to N$. It remains to show that this map is R-linear, so take $r, r' \in R$ as well as $s, s' \in S$ and $m, m' \in M$. Then

$$\begin{aligned} \alpha(r \cdot m/s + r' \cdot m'/s') &= \alpha((r \cdot s' \cdot m + r' \cdot s \cdot m')/(ss')) \\ &= (ss')^{-1}(\beta(r \cdot s' \cdot m + r' \cdot s \cdot m') \\ &= (ss')^{-1}(r \cdot s'\beta(m) + r' \cdot s\beta(m') \\ &= r\alpha(m/s) + r'\alpha(m'/s') \end{aligned}$$

and we win. □

Example 7.9.8. Let A be a ring and let M be an A-module. Here are some important examples of localizations.

(1) Given $\mathfrak{p}$ a prime ideal of A consider $S = A \setminus \mathfrak{p}$. It is immediately checked that S is a multiplicative set. In this case we denote $A_{\mathfrak{p}}$ and $M_{\mathfrak{p}}$ the localization of A and M with respect to S respectively. These are called the *localization of A, resp. M at $\mathfrak{p}$*.
(2) Let $f \in A$. Consider $S = \{1, f, f^2, \cdots\}$. This is clearly a multiplicative subset of A. In this case we denote A_f (resp. M_f) the localization $S^{-1}A$ (resp. $S^{-1}M$). This is called the *localization of A, resp. M with respect to f*. Note that $A_f = 0$ if and only if f is nilpotent in A.

(3) Let $S = \{f \in A \mid f \text{ is not a zerodivisor in } A\}$. This is a multiplicative subset of A. In this case the ring $Q(A) = S^{-1}A$ is called either the *total quotient ring*, or the *total ring of fractions* of A.

Lemma 7.9.9. *Let R be a ring. Let $S \subset R$ be a multiplicative subset. Let M be an R-module. Then*

$$S^{-1}M = colim_{f \in S} M_f$$

where the partial ordering on S is given by $f \geq f' \Leftrightarrow f = f'f''$ for some $f' \in R$ in which case the map $M_{f'} \to M_f$ is given by $m/(f')^e \mapsto m(f'')^e/f^e$.

Proof. Omitted. Hint: Use the universal property of Lemma 7.9.7. □

In the following paragraph, let A denote a ring, and M, N denote modules over A.

If S and S' are multiplicative sets of A, then it is clear that

$$SS' = \{ss' : s \in S, \ s' \in S'\}$$

is also a multiplicative set of A. Then the following holds.

Proposition 7.9.10. *Let $\overline{S}$ be the image of S in $S'^{-1}A$, then $(SS')^{-1}A$ is isomorphic to $\overline{S}^{-1}(S'^{-1}A)$.*

Proof. The map sending $x \in A$ to $x/1 \in (SS'^{-1})A$ induces a map sending $x/s \in S'^{-1}A$ to $x/s \in (SS'^{-1})A$, by universal property. The image of the elements in $\overline{S}$ are invertible in $(SS'^{-1})A$. By the universal property we get a map $f : \overline{S}^{-1}(S'^{-1}A) \to (SS'^{-1})A$ which maps $(x/t')/(s/s')$ to $(x/t') \cdot (s/s')^{-1}$.

On the other hand, the map from A to $\overline{S}^{-1}(S'^{-1}A)$ sending $x \in A$ to $(x/1)/(1/1)$ also induces a map $g : (SS'^{-1})A \to \overline{S}^{-1}(S'^{-1}A)$ which sends x/ss' to $(x/s')/(s/1)$, by the universal property again. It is immediately checked that f and g are inverse to each other, hence they are both isomorphisms. □

For the module M we have

Proposition 7.9.11. *View $S'^{-1}M$ as an A-module, then $S^{-1}(S'^{-1}M)$ is isomorphic to $(SS')^{-1}M$.*

Proof. Note that given a A-module M, we have not proved any universal property for $S^{-1}M$. Hence we cannot reason as in the preceding proof; we have to construct the isomorphism explicitly.

We define the maps as follows

$$f : S^{-1}(S'^{-1}M) \longrightarrow (SS')^{-1}M, \quad \frac{x/s'}{s} \mapsto x/ss'$$
$$g : (SS')^{-1}M \longrightarrow S^{-1}(S'^{-1}M), \quad x/t \mapsto \frac{x/s'}{s} \text{ for some } s \in S, s' \in S', \text{ and } t = ss'$$

We have to check that these homomorphisms are well-defined, that is, independent the choice of the fraction. This is easily checked and it is also straightforward to show that they are inverse to each other. □

If $u : M \to N$ is an A homomorphism, then the localization indeed induces a well-defined $S^{-1}A$ homomorphism $S^{-1}u : S^{-1}M \to S^{-1}N$ which sends x/s to $u(x)/s$. It is immediately checked that this construction is functorial, so that S^{-1} is actually a functor from the category of A-modules to the category of $S^{-1}A$-modules. Moreover this functor is exact, as we show in the following proposition.

Proposition 7.9.12. *Let $L \xrightarrow{u} M \xrightarrow{v} N$ is an exact sequence of R modules. Then $S^{-1}L \to S^{-1}M \to S^{-1}N$ is also exact.*

Proof. First it is clear that $S^{-1}L \to S^{-1}M \to S^{-1}N$ is a complex since localization is a functor. Next suppose that x/s maps to zero in $S^{-1}N$ for some $x/s \in S^{-1}M$. Then by definition there is a $t \in S$ such that $v(xt) = v(x)t = 0$ in M, which means $xt \in \mathrm{Ker}(v)$. By the exactness of $L \to M \to N$ we have $xt = u(y)$ for some y in L. Then x/s is the image of y/st. This proves the exactness. $\square$

Lemma 7.9.13. *Localization respects quotients, i.e. if N is a submodule of M, then $S^{-1}(M/N) \simeq (S^{-1}M)/(S^{-1}N)$.*

Proof. From the exact sequence

$$0 \longrightarrow N \longrightarrow M \longrightarrow M/N \longrightarrow 0$$

we have

$$0 \longrightarrow S^{-1}N \longrightarrow S^{-1}M \longrightarrow S^{-1}(M/N) \longrightarrow 0$$

The corollary then follows. $\square$

If, in the preceding Corollary, we take $N = I$ and $M = A$ for an ideal I of A, we see that $S^{-1}A/S^{-1}I \simeq S^{-1}(A/I)$ as A-modules. The next proposition shows that they are isomorphic as rings.

Proposition 7.9.14. *Let I be an ideal of A, S a multiplicative set of A. Then $S^{-1}I$ is an ideal of $S^{-1}A$ and $\overline{S}^{-1}(A/I)$ is isomorphic to $S^{-1}A/S^{-1}I$, where $\overline{S}$ is the image of S in A/I.*

Proof. The fact that $S^{-1}I$ is an ideal is clear since I itself is an ideal. Define

$$f : S^{-1}A \longrightarrow \overline{S}^{-1}(A/I), \quad x/s \mapsto \overline{x}/\overline{s}$$

where $\overline{x}$ and $\overline{s}$ are the images of x and s in A/I. We shall keep similar notations in this proof. This map is well-defined by the universal property of $S^{-1}A$, and $S^{-1}I$ is contained in the kernel of it, therefore it induces a map

$$\overline{f} : S^{-1}A/S^{-1}I \longrightarrow \overline{S}^{-1}(A/I), \quad \overline{x/s} \mapsto \overline{x}/\overline{s}$$

On the other hand, the map $A \to S^{-1}A/S^{-1}I$ sending x to $\overline{x/1}$ induces a map $A/I \to S^{-1}A/S^{-1}I$ sending $\overline{x}$ to $\overline{x/1}$. The image of $\overline{S}$ is invertible in $S^{-1}A/S^{-1}I$, thus induces a map

$$g : \overline{S}^{-1}(A/I) \longrightarrow S^{-1}A/S^{-1}I, \quad \frac{\overline{x}}{\overline{s}} \mapsto \overline{x/s}$$

by the universal property. It is then clear that $\overline{f}$ and g are inverse to each other, hence are both isomorphisms. $\square$

We now consider how submodules behave in localization.

Lemma 7.9.15. *Any submodule N' of $S^{-1}M$ is of the form $S^{-1}N$ for some $N \subset M$. Indeed one can take N to be the inverse image of N' in M.*

Proof. Let N be the inverse image of N' in M. Then one can see that $S^{-1}N \supset N'$. To show they are equal, take x/s in $S^{-1}N$, where $s \in S$ and $x \in N$. This yields that $x/1 \in N'$. Since N' is an $S^{-1}R$-submodule we have $x/s = x/1 \cdot 1/s \in N'$. This finishes the proof. $\square$

Taking $M = A$ and $N = I$ an ideal of A, we have the following corollary, which can be viewed as a converse of the first part of Proposition 7.9.14.

Lemma 7.9.16. *Each ideal I' of $S^{-1}A$ takes the form $S^{-1}I$, where one can take I to be the inverse image of I' in A.*

The next lemma concerns the spectrum and localization. FIXME: This should be moved later in the manuscript.

Lemma 7.9.17. *Let S be a multiplicative set of A. Then the map*

$$f : Spec(S^{-1}A) \longrightarrow Spec(A)$$

induced by the canonical ring map $A \to S^{-1}A$ is a homeomorphism onto its image and $Im(f) = \{\mathfrak{p} \in Spec(R) : \mathfrak{p} \cap S = \emptyset\}$.

Proof. Denote the localization map by $\varphi : A \to S^{-1}A$. We first show that $\mathrm{Im}(f) = \{\mathfrak{p} \in Spec(R) : \mathfrak{p} \cap S = \emptyset\}$. For any ideal $\mathfrak{q}$ of $S^{-1}A$, $\varphi^{-1}(\mathfrak{q}) \cap S = 0$. Otherwise if $x \neq 0 \in \varphi^{-1}(\mathfrak{q}) \cap S$, then $x/1 \in \mathfrak{q}$. But $x \in S$, hence $x/1$ is invertible in $S^{-1}A$ which is impossible since $\mathfrak{q}$ is a prime ideal. For any prime ideal $\mathfrak{p}$ in A which does not meet S, $S^{-1}\mathfrak{p}$ is an ideal in $S^{-1}A$. Moreover it is a prime ideal. This is because $S^{-1}A/S^{-1}\mathfrak{p}$ is isomorphic to $\overline{S}^{-1}(A/\mathfrak{p})$ and the localization of an integral domain is again an integral domain.

We still have to show that this map is open, i.e. we have to show that the image of a standard open set is again open. For any $x/s \in S^{-1}A$, we claim that the image of $D(x/s)$ is $D(x) \cap \mathrm{Im}(f)$. First if $x/s \notin S^{-1}\mathfrak{p}$ for some prime ideal $\mathfrak{p}$ of A, then $x \notin \mathfrak{p}$. Conversely, if $x \notin \mathfrak{p}$ and $\mathfrak{p}$ does not meet S, then $x/s \notin S^{-1}\mathfrak{p}$. This is due to that fact that $\mathfrak{p} \cap S = \emptyset$.

Thus f is indeed an homeomorphism onto its image. □

7.10. Internal Hom

If R is a ring, and M, N are R-modules, then

$$Hom_R(M, N) = \{\varphi : M \to N\}$$

is the set of R-linear maps from M to N. This set comes with the structure of an abelian group by setting $(\varphi + \psi)(m) = \varphi(m) + \psi(m)$, as usual. In fact, $Hom_R(M, N)$ is also an R-module via the rule $(x\varphi)(m) = x\varphi(m) = \varphi(xm)$.

Given maps $a : M \to M'$ and $b : N \to N'$ of R-modules, we can pre-compose and post-compose homomorphisms by a and b. This leads to the following commutative diagram

$$\begin{tikzcd}
Hom_R(M', N) \arrow[r, "b\circ-"'] \arrow[d, "-\circ a"'] & Hom_R(M', N') \arrow[d, "-\circ a"] \\
Hom_R(M, N') \arrow[r, "b\circ-"] & Hom_R(M, N)
\end{tikzcd}$$

In fact, the maps in this diagram are R-module maps. Thus Hom_R defines an additive functor

$$\mathrm{Mod}_R^{opp} \times \mathrm{Mod}_R \longrightarrow \mathrm{Mod}_R, \quad (M, N) \longmapsto Hom_R(M, N)$$

Lemma 7.10.1. *Exactness and Hom_R. Let R be a ring.*

(1) *Let $M_1 \to M_2 \to M_3 \to 0$ be a complex of R-modules. Then $M_1 \to M_2 \to M_3 \to 0$ is exact if and only if $0 \to Hom_R(M_3, N) \to Hom_R(M_2, N) \to Hom_R(M_1, N)$ is exact for all R-modules N.*

(2) *Let $0 \to M_1 \to M_2 \to M_3$ be a complex of R-modules. Then $0 \to M_1 \to M_2 \to M_3$ is exact if and only if $0 \to Hom_R(N, M_1) \to Hom_R(N, M_2) \to Hom_R(N, M_1)$ is exact for all R-modules N.*

Proof. Omitted. $\square$

Lemma 7.10.2. *Let R be a ring. Let M be a finitely presented R-module. Let N be an R-module. Let $f \in R$. Then $Hom_R(M, N)_f \cong Hom_{R_f}(M_f, N_f)$.*

Proof. Choose a presentation

$$\bigoplus_{j=1,\ldots,m} R \longrightarrow \bigoplus_{i=1,\ldots,n} R \to M \to 0.$$

By Lemma 7.10.1 this gives an exact sequence

$$0 \to \mathscr{H}om_R(M, N) \to \bigoplus_{i=1,\ldots,n} N \longrightarrow \bigoplus_{j=1,\ldots,m} N.$$

Inverting f we get an exact sequence

$$0 \to (\mathscr{H}om_R(M, N))_f \to \bigoplus_{i=1,\ldots,n} N_f \longrightarrow \bigoplus_{j=1,\ldots,m} N_f$$

and the result follows since M_f sits in an exact sequence

$$\bigoplus_{j=1,\ldots,m} R_f \longrightarrow \bigoplus_{i=1,\ldots,n} R_f \to M_f \to 0$$

which induces (by Lemma 7.10.1) the exact sequence

$$0 \to Hom_{R_f}(M_f, N_f) \to \bigoplus_{i=1,\ldots,n} N_f \longrightarrow \bigoplus_{j=1,\ldots,m} N_f$$

which is the same as the one above. $\square$

7.11. Tensor products

Definition 7.11.1. Let R be a ring, M, N, P be three R-modules. A mapping $f : M \times N \to P$ (where $M \times N$ is viewed only as Cartesian product of two R-modules) is said to be *R-bilinear* if for each $x \in M$ the mapping $y \mapsto f(x, y)$ of N into P is R-linear, and for each $y \in N$ the mapping $x \mapsto f(x, y)$ is also R-linear.

Lemma 7.11.2. *Let M, N be R-modules. Then there exists a pair (T, g) where T is an R-module, and $g : M \times N \to T$ an R-bilinear mapping, with the following universal property: For any R-module P and any R-bilinear mapping $f : M \times N \to P$, there exists a unique R-linear mapping $\tilde{f} : T \to P$ such that $f = \tilde{f} \circ g$. In other words, the following diagram commutes:*

$$\begin{tikzcd}
M \times N \arrow[rr, "f"] \arrow[dr] & & P \\
& T \arrow[ur, "f'"'] &
\end{tikzcd}$$

Moreover, if (T, g) and (T', g') are two pairs with this property, then there exists a unique isomorphism $j : T \to T'$ such that $j \circ g = g'$.

The R-module T which satisfies the above universal property is called the *tensor product* of R-modules M and N, denoted as $M \otimes_R N$.

We first prove the existence of such R-module T. Let M, N be R-modules. Let T be the quotient module P/Q, where P is the free R-module $R^{M\times N}$ and Q is the R-module generated by all elements of the following types: $(x \in M, y \in N)$

$$(x + x', y) - (x, y) - (x', y) \tag{7.11.2.1}$$

$$(x, y + y') - (x, y) - (x, y') \tag{7.11.2.2}$$

$$(ax, y) - a \cdot (x, y) \tag{7.11.2.3}$$

$$(x, ay) - a \cdot (x, y) \tag{7.11.2.4}$$

Let $\pi : M\times N \to T$ denote the natural map. This map is R-bilinear, as implied by the above relations when we check the bilinearity conditions. Denote the image $\pi(x, y) = x \otimes y$, then these elements generate T. Now let $f : M \times N \to P$ be an R-bilinear map, then we can define $f' : T \to P$ by extending the mapping $f'(x \otimes y) = f(x, y)$. Clearly $f = f' \circ \pi$. Moreover, f' is uniquely determined by the value on the generating sets $\{x \otimes y : x \in M, y \in N\}$. Suppose there is another pair (T', g') satisfying the same properties. Then there is a unique $j : T \to T'$ and also $j' : T' \to T$ such that $g' = j \circ g$, $g = j' \circ g'$. But then both the maps $(j \circ j') \circ g$ and g satisfies the universal properties, so by uniqueness they are equal, and hence $j' \circ j$ is identity on T. Similarly $(j' \circ j) \circ g' = g'$ and $j \circ j'$ is identity on T'. So j is an isomorphism.

Lemma 7.11.3. *Let M, N, P be R-modules, then the bilinear maps*

$$(x, y) \mapsto y \otimes x \tag{7.11.3.1}$$

$$(x + y, z) \mapsto x \otimes z + y \otimes z \tag{7.11.3.2}$$

$$(r, x) \mapsto rx \tag{7.11.3.3}$$

induce unique isomorphisms

$$M \otimes_R N \to N \otimes_R M, \tag{7.11.3.4}$$

$$(M \oplus N) \otimes_R P \to (M \otimes_R P) \oplus (N \otimes_R P), \tag{7.11.3.5}$$

$$R \otimes_R M \to M \tag{7.11.3.6}$$

Proof. Omitted. □

We may generalize the tensor product of two R-modules to finitely many R-modules, and set up a correspondence between the multi-tensor product with multilinear mappings. Using almost the same construction one can prove that:

Lemma 7.11.4. *Let $M_1, \dots, M_r$ be R-modules. Then there exists a pair (T, g) consisting of an R-module T and an R-multilinear mapping: $g : M_1 \times \dots \times M_r \to T$ with the universal property: For any R-multilinear mapping $f : M_1 \times \dots \times M_r \to P$ there exists a unique R-homomorphism $f' : T \to P$ such that $f' \circ g = f$.*
Such a module T is unique up to isomorphism, i.e. if (T, g) and (T', g') are two such pairs, then there exists a unique isomorphism $j : T' \to T$ with $j \circ g = g'$. We denote $T = M_1 \otimes_R \dots \otimes_R M_r$.

Proof. Omitted. □

Lemma 7.11.5. *The homomorphisms*

$$(M \otimes_R N) \otimes_R P \to M \otimes_R N \otimes_R P \to M \otimes_R (N \otimes_R P) \tag{7.11.5.1}$$

such that $f((x \otimes y) \otimes z) = x \otimes y \otimes z$ and $g(x \otimes y \otimes z) = x \otimes (y \otimes z)$, $x \in M, y \in N, z \in P$ are well-defined and are isomorphisms.

Proof. We shall prove f is well-defined and is an isomorphism, and this proof carries analogously to g. Fix any $z \in P$, then the mapping $(x, y) \mapsto x \otimes y \otimes z$, $x \in M, y \in N$, is R-bilinear in x and y, and hence induces homomorphism $f_z : M \otimes N \to M \otimes N \otimes P$ $f_z(x \otimes y) = x \otimes y \otimes z$. Then consider $(M \otimes N) \times P \to M \otimes N \otimes P$ given by $(w, z) \mapsto f_z(w)$. The map is R-bilinear and thus induces $f : (M \otimes_R N) \otimes_R P \to M \otimes_R N \otimes_R P$ and $f((x \otimes y) \otimes z) = x \otimes y \otimes z$. To construct the inverse, we note that the map $\pi : M \times N \times P \to (M \otimes N) \otimes P$ is R-trilinear. Therefore, it induces an R-linear map $h : M \otimes N \otimes P \to (M \otimes N) \otimes P$ which agrees with the universal property. Here we see that $h(x \otimes y \otimes z) = (x \otimes y) \otimes z$. From the explicit expression of f and h, $f \circ h$ and $h \circ f$ are identity maps of $M \otimes N \otimes P$ and $(M \otimes N) \otimes P$ respectively, hence f is our desired isomorphism. $\square$

Doing induction we see that this extends to multi-tensor products. Combined with Lemma 7.11.3 we see that the tensor product operation on the category of R-modules is associative, commutative and distributive.

Definition 7.11.6. An abelian group N is called an (A, B)-*bimodule* if it is both an A-module and a B-module, and the actions $A \to End(M)$ and $B \to End(M)$ are compatible in the sense that $(ax)b = a(xb)$ for all $a \in A, b \in B, x \in N$. Usually we denote it as ${}_AN_B$.

Lemma 7.11.7. *For A-module M, B-module P and (A, B)-bimodule N, the modules $(M \otimes_A N) \otimes_B P$ and $M \otimes_A (N \otimes_B P)$ can both be given (A, B)-bimodule structure, and moreover*

$$(M \otimes_A N) \otimes_B P \cong M \otimes_A (N \otimes_B P). \tag{7.11.7.1}$$

Proof. A priori $M \otimes_A N$ is an A-module, but we can give it a B-module structure by letting

$$(x \otimes y)b = x \otimes yb, \quad x \in M, y \in N, b \in B$$

Thus $M \otimes_A N$ becomes an (A, B)-bimodule. Similarly for $N \otimes_B P$, and thus for $(M \otimes_A N) \otimes_B P$ and $M \otimes_A (N \otimes_B P)$. Therefore by the above lemma, these two modules are isomorphic as both as A-module and B-module via the same mapping. $\square$

Lemma 7.11.8 (Tensor products commute with colimits)**.** *Let (M_i, μ_{ij}) be a system over the partially ordered set I. Let N be an R-module. Then*

$$colim(M_i \otimes N) \cong (colim\, M_i) \otimes N. \tag{7.11.8.1}$$

Moreover, the isomorphism is induced by the homomorphisms $\mu_i \otimes 1 : M_i \otimes N \to M \otimes N$ where $M = colim_i\, M_i$ with natural maps $\mu_i : M_i \to M$.

Proof. Let $P = colim(M_i \otimes N)$, $M = colim\, M_i$. Then for all $i \leq j$, the following diagram commutes:

$$\begin{tikzcd}
M_i \otimes N \arrow[r, "\mu_i \otimes 1"'] \arrow[d, "\mu_{ij} \otimes 1"'] & M \otimes N \arrow[d, "\mathrm{id}"] \\
M_j \otimes N \arrow[r, "\mu_j \otimes 1"] & M \otimes N
\end{tikzcd}$$

By Lemma 7.8.8, these maps induce a unique homomorphism $\psi : P \to M \otimes N$, with $\lambda_i : M_i \otimes N \to P$ given by $\lambda_i = \pi \circ (\iota_i \otimes 1)$.

To construct the inverse map, for each $i \in I$, there is the canonical R-bilinear mapping $g_i : M_i \times N \to M_i \otimes N$. This induces a unique mapping $\widehat{\phi} : M \times N \to P$ such that

$\widehat{\phi}\circ(\mu_i\times 1) = \lambda_i\circ g_i$. It is R-bilinear. Thus it induces an R-linear mapping $\phi : M\otimes N \to P$. From the commutative diagram below:

$$\begin{tikzcd}
M_i \times N \arrow[r, "g_i"] \arrow[d, "\mu_i\times \mathrm{id}"] & M_i \otimes N \arrow[r, "\mathrm{id}"'] \arrow[d, "\lambda_i"'] & M_i \otimes N \arrow[d, "\mu_i\otimes \mathrm{id}"'] \arrow[dr, "\lambda_i"] & \\
M \times N \arrow[r, "\widehat{\phi}"] & P \arrow[r, "\psi"] & M \otimes N \arrow[r, "\phi"] & P
\end{tikzcd}$$

we see that $\psi \circ \widehat{\phi} = g$, the canonical R-bilinear mapping $g : M \times N \to M \otimes N$. So $\psi \circ \phi$ is identity on $M \otimes N$. From the right-hand square and triangle, $\phi \circ \psi$ is also identity on P. $\square$

Exactness Properties. We first make a basic observation relating tensor products and the functor Hom:

Lemma 7.11.9. *For any three R-modules M, N, P,*

(7.11.9.1) $$Hom_R(M \otimes_R N, P) \cong Hom_R(M, Hom_R(N, P))$$

Proof. An R-linear map $\hat{f} \in Hom_R(M \otimes_R N, P)$ corresponds to an R-bilinear map $f : M \times N \to P$. For each $x \in M$ the mapping $y \mapsto f(x, y)$ is R-linear by the universal property. Thus f corresponds to a map $\phi_f : M \to Hom_R(N, P)$. This map is R-linear since

$$\phi_f(ax + y)(z) = f(ax + y, z) = af(x, z) + f(y, z) = (a\phi_f(x) + \phi_f(y))(z),$$

$\forall y \in N$ and $\forall a \in R, x, z \in M$. Conversely, any $f \in Hom_R(M, Hom_R(N, P))$ defines an R-bilinear map $M \times N \to P$, namely $(x, y) \mapsto f(x)(y)$. So this is a natural one-to-one correspondence between the two modules. $\square$

Lemma 7.11.10. *Let*

(7.11.10.1) $$M_1 \xrightarrow{f} M_2 \xrightarrow{g} M_3 \to 0$$

be an exact sequence of R-modules and homomorphisms, and let N be any R-module. Then the sequence

(7.11.10.2) $$M_1 \otimes N \xrightarrow{f\otimes 1} M_2 \otimes N \xrightarrow{g\otimes 1} M_3 \otimes N \to 0$$

is exact. In other words, the functor $-\otimes_R N$ is right exact, in the sense that tensoring each term in the original right exact sequence preserves the exactness.

Proof. We apply the functor $Hom(-, Hom(N, P))$ to the first exact sequence. We obtain

$$0 \to Hom(M_3, Hom(N, P)) \to Hom(M_2, Hom(N, P)) \to Hom(M_1, Hom(N, P))$$

By Lemma 7.11.9, we have

$$0 \to Hom(M_3 \otimes N, P) \to Hom(M_2 \otimes N, P) \to Hom(M_1 \otimes N, P)$$

Using the pullback property again, we arrive at the desired exact sequence. $\square$

Remark 7.11.11. However, tensor product does NOT preserve exact sequences in general. In other words, if $M_1 \to M_2 \to M_3$ is exact, then it is not necessarily true that $M_1 \otimes N \to M_2 \otimes N \to M_3 \otimes N$ is exact for arbitrary R-module N.

Example 7.11.12. Consider the injective map $2 : \mathbf{Z} \to \mathbf{Z}$ viewed as a map of $\mathbf{Z}$-modules. Let $N = \mathbf{Z}/2$. Then the induced map $\mathbf{Z} \otimes \mathbf{Z}/2 \to \mathbf{Z} \otimes \mathbf{Z}/2$ is NOT injective. This is because for $x \otimes y \in \mathbf{Z} \otimes \mathbf{Z}/2$,

$$(2 \otimes 1)(x \otimes y) = 2x \otimes y = x \otimes 2y = x \otimes 0 = 0$$

Therefore the induced map is the zero map while $\mathbf{Z} \otimes N \neq 0$.

Remark 7.11.13. For R-modules N, if the functor $- \otimes_R N$ is exact, i.e. tensoring with N preserves all exact sequences, then N is said to be *flat* R-module. We will discuss this later.

Lemma 7.11.14. *Let R be a ring. Let M and N be R-modules.*

(1) *If N and M are finite, then so is $M \otimes_R N$.*
(2) *If N and M are finitely presented, then so is $M \otimes_R N$.*

Proof. Suppose M is finite. Then choose a presentation $0 \to K \to R^{\otimes n} \to M \to 0$. This gives an exact sequence $K \otimes_R N \to N^{\oplus n} \to M \otimes_R N \to 0$ by Lemma 7.11.10 above. We conclude that if N is finite too then $M \otimes_R N$ is a quotient of a finite module, hence finite, see Lemma 7.5.4. Similarly, if both N and M are finitely presented, then we see that K is finite and that $M \otimes_R N$ is a quotient of the finitely presented module $N^{\oplus n}$ by a finite module, namely $K \otimes_R N$, and hence finitely presented, see Lemma 7.5.4. $\square$

Lemma 7.11.15. *Let M be an R-module. Then the $S^{-1}R$ modules $S^{-1}M$ and $S^{-1}R \otimes_R M$ are canonically isomorphic, and the unique isomorphism $f : S^{-1}R \otimes_R M \to S^{-1}M$ is given by*

$$f((a/s) \otimes m) = am/s, \forall a \in R, m \in M, s \in S \tag{7.11.15.1}$$

Proof. Obviously, the map $f' : S^{-1}R \times M \to S^{-1}M$ given by $f((am, s)) = am/s$ is bilinear, and thus by the universal property, this map induces a unique $S^{-1}R$-module homomorphism $f : S^{-1}R \otimes_R M \to S^{-1}M$ given as in the above lemma. Actually every element in $S^{-1}M$ is of the form m/s, $m \in M, s \in S$ and every element in $S^{-1}R \otimes_R M$ is of the form $1/s \otimes m$. To see the latter fact, write an element in $S^{-1}R \otimes_R M$ as

$$\sum_k \frac{a_k}{s_k} \otimes m_k = \sum_k \frac{a_k t_k}{s} \otimes m_k = \frac{1}{s} \otimes \sum_k a_k t_k m_k = \frac{1}{s} \otimes m$$

Where $m = \sum_k a_k t_k m_k$. Then it is obvious that f is surjective, and if $f(\frac{1}{s} \otimes m) = m/s = 0$ then there exists $t' \in S$ with $tm = 0$ in M. Then we have

$$\frac{1}{s} \otimes m = \frac{1}{st} \otimes tm = \frac{1}{st} \otimes 0 = 0$$

Therefore f is injective. $\square$

Lemma 7.11.16. *Let M, N be R-modules, then there is a canonical $S^{-1}R$-module isomorphism $f : S^{-1}M \otimes_{S^{-1}R} S^{-1}N \to S^{-1}(M \otimes_R N)$, given by*

$$f((m/s) \otimes (n/t) = (m \otimes n)/st$$

Proof. We may use Lemma 7.11.7 and Lemma 7.11.15 repeatedly to see that these two $S^{-1}R$-modules are isomorphic, noting that $S^{-1}R$ is an $(R, S^{-1}R)$-bimodule:

$$S^{-1}(M \otimes_R N) \cong S^{-1}R \otimes_R (M \otimes_R N) \tag{7.11.16.1}$$

$$\cong S^{-1}M \otimes_R N \tag{7.11.16.2}$$

$$\cong (S^{-1}M \otimes_{S^{-1}R} S^{-1}R) \otimes_R N \tag{7.11.16.3}$$

$$\cong S^{-1}M \otimes_{S^{-1}R} (S^{-1}R \otimes_R N) \tag{7.11.16.4}$$

$$\cong S^{-1}M \otimes_{S^{-1}R} S^{-1}N \tag{7.11.16.5}$$

This isomorphism is easily seen to be the one stated in the lemma. □

Let $\varphi : R \to S$ be a ring map. Given a S-module N we obtain an R-module N_R by the rule $r \cdot n = \varphi(r)n$. This is sometimes called the *restriction* of N to R.

Lemma 7.11.17. *Let $R \to S$ be a ring map. The functors $Mod_S \to Mod_R$, $N \mapsto N_R$ (restriction) and $Mod_R \to Mod_S$, $M \mapsto M \otimes_R S$ (base change) are adjoint functors. In a formula*

$$Hom_R(M, N_R) = Hom_S(M \otimes_R S, N)$$

Proof. If $\alpha : M \to N_R$ is an R-module map, then we define $\alpha' : M \otimes_R S \to N$ by the rule $\alpha'(m \otimes s) = s\alpha(m)$. If $\beta : M \otimes_R S \to N$ is an S-module map, we define $\beta' : M \to N_R$ by the rule $\beta'(m) = \beta(m \otimes 1)$. We omit the verification that these constructions are mutually inverse. □

7.12. Tensor algebra

Let R be a ring. Let M be an R-module. We define the *tensor algebra of M over R* to be the noncommutative R-algebra

$$\mathrm{T}(M) = \mathrm{T}_R(M) = \bigoplus_{n \geq 0} \mathrm{T}^n(M)$$

with $\mathrm{T}^0(M) = R$, $\mathrm{T}^1(M) = M$, $\mathrm{T}^2(M) = M \otimes_R M$, $\mathrm{T}^3(M) = M \otimes_R M \otimes_R M$, and so on. Multiplication is defined by the rule that on pure tensors we have

$$(x_1 \otimes x_2 \otimes \ldots \otimes x_n) \cdot (y_1 \otimes y_2 \otimes \ldots \otimes y_m) = x_1 \otimes x_2 \otimes \ldots \otimes x_n \otimes y_1 \otimes y_2 \otimes \ldots \otimes y_m$$

and we extend this by linearity.

We define the *exterior algebra $\wedge(M)$ of M over R* to be the quotient of $\mathrm{T}(M)$ by the two sided ideal generated by the elements $x \otimes x \in \mathrm{T}^2(M)$. The image of a pure tensor $x_1 \otimes \ldots \otimes x_n$ in $\wedge^n(M)$ is denoted $x_1 \wedge \ldots \wedge x_n$. These elements generate $\wedge^n(M)$, they are R-linear in each x_i and they are zero when two of the x_i are equal (i.e., alternating). The multiplication on $\wedge(M)$ is graded commutative, i.e., $x \wedge y = -y \wedge x$.

An example of this is when $M = Rx_1 \oplus \ldots \oplus Rx_n$ is a finite free module. In this case $\wedge(M)$ is free over R with basis the elements

$$x_{i_1} \wedge \ldots \wedge x_{i_r}$$

with $0 \leq r \leq n$ and $1 \leq i_1 < i_2 < \ldots < i_r \leq n$.

We define the *symmetric algebra $Sym(M)$ of M over R* to be the quotient of $\mathrm{T}(M)$ by the two sided ideal generated by the elements $x \otimes y - y \otimes x \in \mathrm{T}^2(M)$. The image of a pure tensor $x_1 \otimes \ldots \otimes x_n$ in $\mathrm{Sym}^n(M)$ is denoted just $x_1 \ldots x_n$. These elements generate $\mathrm{Sym}^n(M)$, these are R-linear in each x_i and $x_1 \ldots x_n = x'_1 \ldots x'_n$ if the sequence of elements $x_1, \ldots, x_n$ is a permutation of the sequence $x'_1, \ldots, x'_n$. Thus we see that $\text{Sym}(M)$ is commutative.

An example of this is when $M = Rx_1 \oplus \ldots \oplus Rx_n$ is a finite free module. In this case $\text{Sym}(M) = R[x_1, \ldots, x_n]$ is a polynomial algebra.

Lemma 7.12.1. *Let R be a ring. Let M be an R-module. If M is a free R-module, so is each symmetric and exterior power.*

Proof. Omitted, but see above for the finite free case. □

Lemma 7.12.2. *Let R be a ring. Let $M_2 \to M_1 \to M \to 0$ be an exact sequence of R-modules. There are exact sequences*

$$M_2 \otimes_R Sym^{n-1}(M_1) \to Sym^n(M_1) \to Sym^n(M) \to 0$$

and similarly

$$M_2 \otimes_R \wedge^{n-1}(M_1) \to \wedge^n(M_1) \to \wedge^n(M) \to 0$$

Proof. Omitted. □

Lemma 7.12.3. *Let R be a ring. Let M be an R-module. Let x_i, $i \in I$ be a given system of generators of M as an R-module. Let $n \geq 2$. There exists a canonical exact sequence*

$$\bigoplus_{1 \leq j_1 < j_2 \leq n} \bigoplus_{i_1, i_2 \in I} T^{n-2}(M) \oplus \bigoplus_{1 \leq j_1 < j_2 \leq n} \bigoplus_{i \in I} T^{n-2}(M) \to T^n(M) \to \wedge^n(M) \to 0$$

where the pure tensor $m_1 \otimes \ldots \otimes m_{n-2}$ in the first summand maps to

$$m_1 \otimes \ldots \otimes x_{i_1} \otimes \ldots \otimes x_{i_2} \otimes \ldots \otimes m_{n-2} + m_1 \otimes \ldots \otimes x_{i_2} \otimes \ldots \otimes x_{i_1} \otimes \ldots \otimes m_{n-2}$$

and $m_1 \otimes \ldots \otimes m_{n-2}$ in the second summand maps to

$$m_1 \otimes \ldots \otimes x_i \otimes \ldots \otimes x_i \otimes \ldots \otimes m_{n-2}$$

There is also a canonical exact sequence

$$\bigoplus_{1 \leq j_1 < j_2 \leq n} \bigoplus_{i_1, i_2 \in I} T^{n-2}(M) \to T^n(M) \to Sym^n(M) \to 0$$

where the pure tensor $m_1 \otimes \ldots \otimes m_{n-2}$ maps to

$$m_1 \otimes \ldots \otimes x_{i_1} \otimes \ldots \otimes x_{i_2} \otimes \ldots \otimes m_{n-2} - m_1 \otimes \ldots \otimes x_{i_2} \otimes \ldots \otimes x_{i_1} \otimes \ldots \otimes m_{n-2}$$

Proof. Omitted. □

Lemma 7.12.4. *Let R be a ring. Let M_i be a directed system of R-modules. Then $colim_i\, T(M) = T(colim_i\, M_i)$ and similarly for the symmetric and exterior algebras.*

Proof. Omitted. □

7.13. Base change

We formally introduce base change in algebra as follows.

Definition 7.13.1. Let $\varphi : R \to S$ be a ring map. Let M be an S-module. Let $R \to R'$ be any ring map. The *base change* of φ by $R \to R'$ is the ring map $R' \to S \otimes_R R'$. In this situation we often write $S' = S \otimes_R R'$. The *base change* of the S-module M is the S'-module $M \otimes_R R'$.

If $S = R[x_i]/(f_j)$ for some collection of variables x_i, $i \in I$ and some collection of polynomials $f_j \in R[x_i]$, $j \in J$, then $S \otimes_R R' = R'[x_i]/(f'_j)$, where $f'_j \in R'[x_i]$ is the image of f_j under the map $R[x_i] \to R'[x_i]$ induced by $R \to R'$. This simple remark is the key to understanding base change.

Lemma 7.13.2. *Let $R \to S$ be a ring map. Let M be an S-module. Let $R \to R'$ be a ring map and let $S' = S \otimes_R R'$ and $M' = M \otimes_R R'$ be the base changes.*

1. *If M is a finite S-module, then the base change M' is a finite S'-module.*
2. *If M is an S-module finite presentation, then the base change M' is an S'-module of finite presentation.*
3. *If $R \to S$ is of finite type, then the base change $R' \to S'$ is of finite type.*
4. *If $R \to S$ is of finite presentation, then the base change $R' \to S'$ is of finite presentation.*

Proof. Proof of (1). Take a surjective, R-linear map $R^{\oplus n} \to M \to 0$. By Lemma 7.11.3 and 7.11.10 the result after tensoring with R' is a surjection $R'^{\oplus n} \to M' \to 0$, so M' is a finitely generated R'-module. Proof of (2). Take a presentation $R^{\oplus m} \to R^{\oplus n} \to M \to 0$. By Lemma 7.11.3 and 7.11.10 the result after tensoring with R' gives a finite presentation $R'^{\oplus m} \to R'^{\oplus n} \to M' \to 0$, of the R'-module M'. Proof of (3). This follows by the remark preceding the lemma as we can take I to be finite by assumption. Proof of (4). This follows by the remark preceding the lemma as we can take I and J to be finte by assumption. □

7.14. Miscellany

The proofs in this section should not refer to any results except those from the section on basic notions, Section 7.3.

Lemma 7.14.1. *Let $R \to R'$ be a ring map and let $I \subset R$ be a locally nilpotent ideal. Then IR' is a locally nilpotent ideal of R'.*

Proof. This follows from the fact that if $x, y \in R'$ are nilpotent, then $x + y$ is nilpotent too. Namely, if $x^n = 0$ and $y^m = 0$, then $(x + y)^{n+m-1} = 0$. □

Lemma 7.14.2. *Let R be a ring, I and J two ideals and $\mathfrak{p}$ a prime ideal containing the product IJ. Then $\mathfrak{p}$ contains I or J.*

Proof. Asumme the contrary and take $x \in I \setminus \mathfrak{p}$ and $y \in I \setminus \mathfrak{p}$. Their product is an element of $IJ \subseteq \mathfrak{p}$, which contradicts the assumption that $\mathfrak{p}$ was prime. □

Lemma 7.14.3 (Prime avoidance)**.** *Let R be a ring. Let $I_i \subset R$, $i = 1, \ldots, r$, and $J \subset R$ be ideals. Assume*

1. *$J \not\subset I_i$ for $i = 1, \ldots, r$, and*
2. *all but two of I_i are prime ideals.*

Then there exists an $x \in J$, $x \notin I_i$ for all i.

Proof. The result is true for $r = 1$. If $r = 2$, then let $x, y \in J$ with $x \notin I_1$ and $y \notin I_2$. We are done unless $x \in I_2$ and $y \in I_1$. Then the element $x + y$ cannot be in I_1 (since that would mean $x + y - y \in I_1$) and it also cannot be in I_2.

For $r \geq 3$, assume the result holds for $r - 1$. After renumbering we may assume that I_r is prime. We may also assume there are no inclusions among the I_i. Pick $x \in J$, $x \notin I_i$ for all $i = 1, \ldots, r - 1$. If $x \notin I_r$ we are done. So assume $x \in I_r$. If $JI_1 \ldots I_{r-1} \subset I_r$ then $J \subset I_r$ (by Lemma 7.14.2) a contradiction. Pick $y \in JI_1 \ldots I_{r-1}$, $y \notin I_r$. Then $x + y$ works. □

Lemma 7.14.4. *(Chinese remainder.) Let R be a ring.*

(1) *If $I_1, \ldots, I_r$ are ideals such that $I_a + I_b = R$ when $a \neq b$, then $I_1 \cap \ldots \cap I_r = I_1 I_2 \ldots I_r$ and $R/(I_1 I_2 \ldots I_r) \cong R/I_1 \times \ldots \times R/I_r$.*
(2) *If $\mathfrak{m}_1, \ldots, \mathfrak{m}_r$ are pairwise distinct maximal ideals then $\mathfrak{m}_a + \mathfrak{m}_b = R$ for $a \neq b$ and the above applies.*

Proof. Let us first prove $I_1 \cap \ldots \cap I_r = I_1 \ldots I_r$ as this will also imply the injectivity of the induced ring homomorphism $R/(I_1 \ldots I_r) \to R/I_1 \times \ldots \times R/I_r$. The inclusion $I_1 \cap \ldots \cap I_r \supseteq I_1 \ldots I_r$ is always fulfilled since ideals are closed under multiplication with arbitrary ring elements. To prove the other inclusion, we claim that the ideals

$$I_1 \ldots \hat{I}_i \ldots I_r, \quad i = 1, \ldots, r$$

generate the ring R. We prove this by induction on r. It holds when $r = 2$. If $r > 2$, then we see that R is the sum of the ideals $I_1 \ldots \hat{I}_i \ldots I_{r-1}$, $i = 1, \ldots, r-1$. Hence I_r is the sum of the ideals $I_1 \ldots \hat{I}_i \ldots I_r$, $i = 1, \ldots, r-1$. Applying the same argument with the reverse ordering on the ideals we see that I_1 is the sum of the ideals $I_1 \ldots \hat{I}_i \ldots I_r$, $i = 2, \ldots, r$. Since $R = I_1 + I_r$ by assumption we see that R is the sum of the ideals displayed above. Therefore we can find elements $a_i \in I_1 \ldots \hat{I}_i \ldots I_r$ such that their sum is one. Multiplying this equation by an element of $I_1 \cap \ldots \cap I_r$ gives the other inclusion. It remains to show that the canonical map $R/(I_1 \ldots I_r) \to R/I_1 \times \ldots \times R/I_r$ is surjective. For this, consider its action on the equation $1 = \sum_{i=1}^r a_i$ we derived above. On the one hand, a ring morphism sends 1 to 1 and on the other hand, the image of any a_i is zero in R/I_j for $j \neq i$. Therefore, the image of a_i in R/I_i is the identity. So given any element $(\bar{b_1}, \ldots, \bar{b_r}) \in R/I_1 \times \ldots \times R/I_r$, the element $\sum_{i=1}^r a_i \cdot b_i$ is an inverse image in R.

To see (2), by the very definition of being distinct maximal ideals, we have $\mathfrak{m}_a + \mathfrak{m}_b = R$ for $a \neq b$ and so the above applies. □

Lemma 7.14.5. *(Nakayama's lemma.) Let R be a ring, let M be an R-module, and let $I \subset R$ be an ideal.*

(1) *If M is finite, and $IM = M$, then there exists a $f = 1 + i \in 1 + I$ such that $fM = 0$.*
(2) *If M is finite, $IM = M$, and $I \subset rad(R)$ then $M = 0$.*
(3) *If $IM = M$, I is nilpotent, then $M = 0$.*

Proof. Proof of (1). Write $M = \sum Rx_j$, $j = 1, \ldots, r$. Write $x_j = \sum i_{jj'} x_{j'}$ with $i_{jj'} \in I$. In other words $\sum (\delta_{jj'} - i_{jj'}) x_{j'} = 0$. Hence the determinant f of the $r \times r$ matrix $(\delta_{jj'} - i_{jj'})$ is a solution. The other parts are easy. □

Lemma 7.14.6. *Let R be a ring. Let $n \geq m$. Let $A = (a_{ij})$ be an $n \times m$ matrix with coefficients in R. Let $I \subset R$ be the ideal generated by the $m \times m$ minors of A.*

(1) *For any $f \in I$ there exists a $m \times n$ matrix B such that $BA = f 1_{m \times m}$.*
(2) *If $f \in R$ and $BA = f 1_{m \times m}$ for some $m \times m$ matrix B, then $f^m \in I$.*

Proof. For $I \subset \{1, \ldots, n\}$ with $|I| = m$ denote E_I the $m \times n$ matrix of the projection

$$R^{\oplus n} = \bigoplus\nolimits_{i \in \{1, \ldots, n\}} R \longrightarrow \bigoplus\nolimits_{i \in I} R$$

and set $A_I = E_I A$, i.e., A_I is the $m \times m$ matrix whose rows are the rows of A with indices in I. Let B_I be the adjugate (transpose of cofactor) matrix to A_I, i.e., such that $A_I B_I = B_I A_I = \det(A_I)$. If $f \in I$ then we can write $f = \sum c_I \det(A_I)$ for some $c_I \in R$. Set $B = \sum c_I B_I E_I$ to see that (1) holds.

If $f 1_{m\times m} = BA$ then by the Cauchy-Binet formula we have $f^m = \sum b_I \det(A_I)$ where b_I is the determinant of the $m \times m$ matrix whose columns are the columns of B with indices in I. $\square$

7.15. Cayley-Hamilton

Lemma 7.15.1. *Let R be a ring. Let $A = (a_{ij})$ be an $n \times n$ matrix with coefficients in R. Let $P(x) \in R[x]$ be the characteristic polynomial of A (defined as $\det(xid_{n\times n} - A)$). Then $P(A) = 0$ in $Mat(n \times n, R)$.*

Proof. We reduce the question to the well-known Cayley-Hamilton theorem from linear algebra in several steps:

1. If $\phi : S \to R$ is a ring morphism and b_{ij} are inverse images of the a_{ij} under this map, then it suffices to show the statement for S and (b_{ij}) since ϕ is a ring morphism.
2. If $\psi : R \hookrightarrow S$ is an injective ring morphism, it clearly suffices to show the result for S and the a_{ij} considered as elements of S.
3. Thus we may first reduce to the case $R = \mathbb{Z}[X_{ij}]$, $a_{ij} = X_{ij}$ of a polynomial ring and then further to the case $R = \mathbb{Q}(X_{ij})$ where we may finally apply Cayley-Hamilton.

$\square$

Lemma 7.15.2. *Let R be a ring. Let M be a finite R-module. Let $\varphi : M \to M$ be an endomorphism. Then there exists a monic polynomial $P \in R[T]$ such that $P(\varphi) = 0$ as an endomorphism of M.*

Proof. Choose a surjective R-module map $R^{\oplus n} \to M$, given by $(a_1, \ldots, a_n) \mapsto \sum a_i x_i$ for some generators $x_i \in M$. Choose $(a_{i1}, \ldots, a_{in}) \in R^{\oplus n}$ such that $\varphi(x_i) = \sum a_{ij} x_j$. In other words the diagram

$$\begin{tikzcd} R^{\oplus n} \arrow[r] \arrow[d, "A"'] & M \arrow[d, "\varphi"] \\ R^{\oplus n} \arrow[r] & M \end{tikzcd}$$

is commutative where $A = (a_{ij})$. By Lemma 7.15.1 there exists a monic polynomial P such that $P(A) = 0$. Then it follows that $P(\varphi) = 0$. $\square$

Lemma 7.15.3. *Let R be a ring. Let $I \subset R$ be an ideal. Let M be a finite R-module. Let $\varphi : M \to M$ be an endomorphism such that $\varphi(M) \subset IM$. Then there exists a monic polynomial $P = t^n + a_1 t^{n-1} + \ldots + a_n \in R[T]$ such that $a_j \in I^j$ and $P(\varphi) = 0$ as an endomorphism of M.*

Proof. Choose a surjective R-module map $R^{\oplus n} \to M$, given by $(a_1, \ldots, a_n) \mapsto \sum a_i x_i$ for some generators $x_i \in M$. Choose $(a_{i1}, \ldots, a_{in}) \in I^{\oplus n}$ such that $\varphi(x_i) = \sum a_{ij} x_j$. In other words the diagram

$$\begin{tikzcd} R^{\oplus n} \arrow[r] \arrow[d, "A"'] & M \arrow[d, "\varphi"] \\ I^{\oplus n} \arrow[r] & M \end{tikzcd}$$

is commutative where $A = (a_{ij})$. By Lemma 7.15.1 the polynomial $P(t) = \det(t\mathrm{id}_{n\times n} - A)$ has all the desired properties. $\square$

As a fun example application we prove the following surprising lemma.

Lemma 7.15.4. *Let R be a ring. Let M be a finite R-module. Let $\varphi : M \to M$ be a surjective R-module map. Then φ is an isomorphism.*

First proof. Write $R' = R[x]$ and think of M as a finite R'-module with x acting via φ. Set $I = (x) \subset R'$. By our assumption that φ is surjective we have $IM = M$. Hence we may apply Lemma 7.15.3 to M as an R' module, the ideal I and the endomorphism id_M. We conclude that $(1 + a_1 + \ldots + a_n)\mathrm{id}_M = 0$ with $a_j \in I$. Write $a_j = b_j(x)x$ for some $b_j(x) \in R[x]$. Translating back into φ we see that $\mathrm{id}_M = -(\sum_{j=1,\ldots,n} b_j(\varphi)\varphi$ and hence φ is invertible. □

Second proof. We perform induction on the number of generators of M over R. If M is generated by one element, then $M \cong R/I$ for some ideal $I \subset R$. In this case we may replace R by R/I so that $M = R$. In this case $\varphi : R \to R$ is given by multiplication on M by an element $r \in R$. The surjectivity of φ forces r invertible, since φ must hit 1, which implies that φ is invertible.

Now assume that we have proven the lemma in the case of modules generated by $n - 1$ elements, and are examining a module M generated by n elements. Let A mean the ring $R[t]$, and regard the module M as an A-module by letting t act via φ; since M is finite over R, it is finite over $R[t]$ as well, and since we're trying to prove φ injective, a set-theoretic property, we might as well prove the endomorphism $t : M \to M$ over A injective. We have reduced our problem to the case our endomorphism is multiplication by an element of the ground ring. Let $M' \subset M$ denote the sub-A-module generated by the first $n - 1$ of the generators of M, and consider the diagram

$$\begin{tikzcd}
0 \arrow[r] & M' \arrow[r] \arrow[d, "\varphi|_{M'}"] & M \arrow[r] \arrow[d, "\varphi"] & M/M' \arrow[r] \arrow[d, "\varphi \bmod M'"] & 0 \\
0 \arrow[r] & M' \arrow[r] & M \arrow[r] & M/M' \arrow[r] & 0,
\end{tikzcd}$$

where the restriction of φ to M' and the map induced by φ on the quotient M/M' are well-defined since φ is multiplication by an element in the base, and M' and M/M' are A-modules in their own right. By the case $n = 1$ the the map $M/M' \to M/M'$ is an isomorphism. A diagram chase implies that $\varphi|_{M'}$ is surjective hence by induction $\varphi|_{M'}$ is an isomorphism. This forces the middle column to be an isomorphism by the snake lemma. □

7.16. The spectrum of a ring

We arbitrarily decide that the spectrum of a ring as a topological space is part of the algebra chapter, whereas an affine scheme is part of the chapter on schemes.

Definition 7.16.1. Let R be a ring.

(1) The *spectrum* of R is the set of prime ideals of R. It is usually denoted $Spec(R)$.
(2) Given a subset $T \subset R$ we let $V(T) \subset Spec(R)$ be the set of primes containing T, i.e., $V(T) = \{\mathfrak{p} \in Spec(R) \mid \forall f \in T, f \in \mathfrak{p}\}$.
(3) Given an element $f \in R$ we let $D(f) \subset Spec(R)$ be the set of primes not containing f.

Lemma 7.16.2. *Let R be a ring.*

(1) *The spectrum of a ring R is empty if and only if R is the zero ring.*

(2) *Every nonzero ring has a maximal ideal.*
(3) *Every nonzero ring has a minimal prime ideal.*
(4) *Given an ideal $I \subset R$ and a prime ideal $I \subset \mathfrak{p}$ there exists a prime $I \subset \mathfrak{q} \subset \mathfrak{p}$ such that $\mathfrak{q}$ is minimal over I.*
(5) *If $T \subset R$, and if (T) is the ideal generated by T in R, then $V((T)) = V(T)$.*
(6) *If I is an ideal and $\sqrt{I}$ is its radical, see basic notion (27), then $V(I) = V(\sqrt{I})$.*
(7) *Given an ideal I of R we have $\sqrt{I} = \bigcap_{I \subset \mathfrak{p}} \mathfrak{p}$.*
(8) *If I is an ideal then $V(I) = \emptyset$ if and only if I is the unit ideal.*
(9) *If I, J are ideals of R then $V(I) \cup V(J) = V(I \cap J)$.*
(10) *If $(I_a)_{a\in A}$ is a set of ideals of R then $\cap_{a\in A} V(I_a) = V(\cup_{a\in A} I_a)$.*
(11) *If $f \in R$, then $D(f) \coprod V(f) = Spec(R)$.*
(12) *If $f \in R$ then $D(f) = \emptyset$ if and only if f is nilpotent.*
(13) *If $f = uf'$ for some unit $u \in R$, then $D(f) = D(f')$.*
(14) *If $I \subset R$ is an ideal, and $\mathfrak{p}$ is a prime of R with $\mathfrak{p} \notin V(I)$, then there exists an $f \in R$ such that $\mathfrak{p} \in D(f)$, and $D(f) \cap V(I) = \emptyset$.*
(15) *If $f, g \in R$, then $D(fg) = D(f) \cap D(g)$.*
(16) *If $f_i \in R$ for $i \in I$, then $\bigcup_{i\in I} D(f_i)$ is the complement of $V(\{f_i\}_{i\in I})$ in $Spec(R)$.*
(17) *If $f \in R$ and $D(f) = Spec(R)$, then f is a unit.*

Proof.

(1) This is a direct consequence of (2) and (3).
(2) Let $\mathfrak{A}$ be the set of all proper ideals of R. This set is ordered by inclusion and is non-empty, since $(0) \in \mathfrak{A}$ is a proper ideal. Let A be a totally ordered subset of R. $\bigcup_{I\in A} I$ is in fact an ideal. Since $1 \notin I$ for all $I \in A$, the union does not contain 1 and thus is proper. Hence $\bigcup_{I\in A} I$ is in $\mathfrak{A}$ and is an upper bound for the set A. Thus by Zorn's lemma $\mathfrak{A}$ has a maximal element, which is the sought-after maximal ideal.
(3) Since R is nonzero, it contains a maximal ideal which is a prime ideal. Thus the set $\mathfrak{A}$ of all prime ideals of R is nonempty. $\mathfrak{A}$ is ordered by reverse-inclusion. Let A be a totally ordered subset of $\mathfrak{A}$. It's pretty clear that $J = \bigcap_{I\in A} I$ is in fact an ideal. Not so clear, however, is that it is prime. Let $xy \in J$. Then $xy \in I$ for all $I \in A$. Now let $B = \{I \in A | y \in I\}$. Let $K = \bigcap_{I\in B} I$. Since A is totally ordered, either $K = J$ (and we're done, since then $y \in J$) or $K \supset J$ and for all $I \in A$ such that I is properly contained in K, we have $y \notin I$. But that means that for all those $I, x \in I$, since they are prime. Hence $x \in J$. In either case, J is prime as desired. Hence by Zorn's lemma we get a maximal element which in this case is a minimal prime ideal.
(4) This is the same exact argument as (3) except you only consider prime ideals contained in $\mathfrak{p}$ and containing I.
(5) (T) is the smallest ideal containing T. Hence if $T \subset I$, some ideal, then $(T) \subset I$ as well. Hence if $I \in V(T)$, then $I \in V((T))$ as well. The other inclusion is obvious.
(6) Since $I \subset \sqrt{I}$, $V(\sqrt{I}) \subset V(I)$. Now let $\mathfrak{p} \in V(I)$. Let $x \in \sqrt{I}$. Then $x^n \in I$ for some n. Hence $x^n \in \mathfrak{p}$. But since $\mathfrak{p}$ is prime, a boring induction argument gets you that $x \in \mathfrak{p}$. Hence $\sqrt{I} \subset \mathfrak{p}$ and $\mathfrak{p} \in V(\sqrt{I})$.
(7) Let $f \in R \setminus \sqrt{I}$. Then $f^n \notin I$ for all n. Hence $S = \{1, f, f^2, \dots\}$ is a multiplicative subset, not containing 0. Take a prime ideal $\bar{\mathfrak{p}} \subset S^{-1}R$ containing $S^{-1}I$. Then the pull-back $\mathfrak{p}$ in R of $\bar{\mathfrak{p}}$ is a prime ideal containing I that does not intersect S. This shows that $\bigcap_{I\subset\mathfrak{p}} \mathfrak{p} \subset \sqrt{I}$. Now if $a \in \sqrt{I}$, then $a^n \in I$ for

some n. Hence if $I \subset \mathfrak{p}$, then $a^n \in \mathfrak{p}$. But since $\mathfrak{p}$ is prime, we have $a \in \mathfrak{p}$. Thus the equality is shown.

(8) I is not the unit ideal iff I is contained in some maximal ideal (to see this, apply (2) to the ring R/I) which is therefore prime.

(9) If $\mathfrak{p} \in V(I) \cup V(J)$, then $I \subset \mathfrak{p}$ or $J \subset \mathfrak{p}$ which means that $I \cap J \subset \mathfrak{p}$. Now if $I \cap J \subset \mathfrak{p}$, then $IJ \subset \mathfrak{p}$ and hence either I of J is in $\mathfrak{p}$, since $\mathfrak{p}$ is prime.

(10) $\mathfrak{p} \in \bigcap_{a\in A} V(I_a) \Leftrightarrow I_a \subset \mathfrak{p}, \forall a \in A \Leftrightarrow \mathfrak{p} \in V(\cup_{a\in A} I_a)$

(11) If $\mathfrak{p}$ is a prime ideal and $f \in R$, then either $f \in \mathfrak{p}$ or $f \notin \mathfrak{p}$ (strictly) which is what the disjoint union says.

(12) If $a \in R$ is nilpotent, then $a^n = 0$ for some n. Hence $a^n \in \mathfrak{p}$ for any prime ideal. Thus $a \in \mathfrak{p}$ as can be shown by induction and $D(f) = \emptyset$. Now, as shown in (7), if $a \in R$ is not nilpotent, then there is a prime ideal that does not contain it.

(13) $f \in \mathfrak{p} \Leftrightarrow uf \in \mathfrak{p}$, since u is invertible.

(14) If $\mathfrak{p} \notin V(I)$, then $\exists f \in I \setminus \mathfrak{p}$. Then $f \notin \mathfrak{p}$ so $\mathfrak{p} \in D(f)$. Also if $\mathfrak{q} \in D(f)$, then $f \notin \mathfrak{q}$ and thus I is not contained in $\mathfrak{q}$. Thus $D(f) \cap V(I) = \emptyset$.

(15) If $fg \in \mathfrak{p}$, then $f \in \mathfrak{p}$ or $g \in \mathfrak{p}$. Hence if $f \notin \mathfrak{p}$ and $g \notin \mathfrak{p}$, then $fg \notin \mathfrak{p}$. Since $\mathfrak{p}$ is an ideal, if $fg \notin \mathfrak{p}$, then $f \notin \mathfrak{p}$ and $g \notin \mathfrak{p}$.

(16) $\mathfrak{p} \in \bigcup_{i\in I} D(f_i) \Leftrightarrow \exists i \in I, f_i \notin \mathfrak{p} \Leftrightarrow \mathfrak{p} \in Spec(R) \setminus V(\{f_i\}_{i\in I})$

(17) If $D(f) = Spec(R)$, then $V(f) = \emptyset$ and hence $fR = R$, so f is a unit.

□

The lemma implies that the subsets $V(T)$ from Definition 7.16.1 form the closed subsets of a topology on $Spec(R)$. And it also shows that the sets $D(f)$ are open and form a basis for this topology.

Definition 7.16.3. Let R be a ring. The topology on $Spec(R)$ whose closed sets are the sets $V(T)$ is called the *Zariski* topology. The open subsets $D(f)$ are called the *standard opens* of $Spec(R)$.

It should be clear from context whether we consider $Spec(R)$ just as a set or as a topological space.

Lemma 7.16.4. *Suppose that $\varphi : R \to R'$ is a ring homomorphism. The induced map*

$$Spec(\varphi) : Spec(R') \longrightarrow Spec(R), \quad \mathfrak{p}' \longmapsto \varphi^{-1}(\mathfrak{p}')$$

is continuous for the Zariski topologies. In fact, for any element $f \in R$ we have $Spec(\varphi)^{-1}(D(f)) = D(\varphi(f))$.

Proof. It is basic notion (41) that $\mathfrak{p} := \varphi^{-1}(\mathfrak{p}')$ is indeed a prime ideal of R. The last assertion of the lemma follows directly from the definitions, and implies the first. □

If $\varphi' : R' \to R''$ is a second ring homomorphism then the composition

$$Spec(R') \longrightarrow Spec(R') \longrightarrow Spec(R'')$$

equals $Spec(\varphi' \circ \varphi)$. In other words, $Spec$ is a contravariant functor from the category of rings to the category of topological spaces.

Lemma 7.16.5. *Let R be a ring. Let $S \subset R$ be a multiplicative subset. The map $R \to S^{-1}R$ induces via the functoriality of Spec a homeomorphism*

$$Spec(S^{-1}R) \longrightarrow \{\mathfrak{p} \in Spec(R) \mid S \cap \mathfrak{p} = \emptyset\}$$

where the topology on the right hand side is that induced from the Zariski topology on $Spec(R)$. The inverse map is given by $\mathfrak{p} \mapsto S^{-1}\mathfrak{p}$.

Proof. Denote the right hand side of the arrow of the lemma by D. Choose a prime $\mathfrak{p}' \subset S^{-1}R$ and let $\mathfrak{p}$ the inverse image of $\mathfrak{p}'$ in R. Since $\mathfrak{p}'$ does not contain 1 we see that $\mathfrak{p}$ does not contain any element of S. Hence $\mathfrak{p} \in D$ and we see that the image is contained in D. Let $\mathfrak{p} \in D$. By assumption the image $\overline{S}$ does not contain 0. By basic notion (54) $\overline{S}^{-1}(R/\mathfrak{p})$ is not the zero ring. By basic notion (62) we see $S^{-1}R/S^{-1}\mathfrak{p} = \overline{S}^{-1}(R/\mathfrak{p})$ is a domain, and hence $S^{-1}\mathfrak{p}$ is a prime. The equality of rings also shows that the inverse image of $S^{-1}\mathfrak{p}$ in R is equal to $\mathfrak{p}$, because $R/\mathfrak{p} \to \overline{S}^{-1}(R/\mathfrak{p})$ is injective by basic notion (55). This proves that the map $Spec(S^{-1}R) \to Spec(R)$ is bijective onto D with inverse as given. It is continuous by Lemma 7.16.4. Finally, let $D(g) \subset Spec(S^{-1}R)$ be a standard open. Write $g = h/s$ for some $h \in R$ and $s \in S$. Since g and $h/1$ differ by a unit we have $D(g) = D(h/1)$ in $Spec(S^{-1}R)$. Hence by Lemma 7.16.4 and the bijectivity above the image of $D(g) = D(h/1)$ is $D \cap D(h)$. This proves the map is open as well. □

Lemma 7.16.6. *Let R be a ring. Let $f \in R$. The map $R \to R_f$ induces via the functoriality of Spec a homeomorphism*

$$Spec(R_f) \longrightarrow D(f) \subset Spec(R).$$

The inverse is given by $\mathfrak{p} \mapsto \mathfrak{p} \cdot R_f$.

Proof. This is a special case of Lemma 7.16.5 above. □

It is not the case that every ``affine open'' of a spectrum is a standard open. See Example 7.24.4.

Lemma 7.16.7. *Let R be a ring. Let $I \subset R$ be an ideal. The map $R \to R/I$ induces via the functoriality of Spec a homeorphism*

$$Spec(R/I) \longrightarrow V(I) \subset Spec(R).$$

The inverse is given by $\mathfrak{p} \mapsto \mathfrak{p}/I$.

Proof. It is immediate that the image is contained in $V(I)$. On the other hand, if $\mathfrak{p} \in V(I)$ then $\mathfrak{p} \supset I$ and we may consider the ideal $\mathfrak{p}/I \subset R/I$. Using basic notion (51) we see that $(R/I)/(\mathfrak{p}/I) = R/\mathfrak{p}$ is a domain and hence $\mathfrak{p}/I$ is a prime ideal. From this it is immediately clear that the image of $D(f+I)$ is $D(f) \cap V(I)$, and hence the map is a homeomorphism. □

Remark 7.16.8. A fundamental commutative diagram associated to $\varphi : R \to S$, $\mathfrak{q} \subset S$ and $\mathfrak{p} = \varphi^{-1}(\mathfrak{q})$ is the following

$$\begin{tikzcd}
\kappa(\mathfrak{q}) = S_\mathfrak{q}/\mathfrak{q}S_\mathfrak{q} & S_\mathfrak{q} \arrow[l] & S \arrow[l] \arrow[r] & S/\mathfrak{q} \arrow[r] & \kappa(\mathfrak{q}) = \text{f.f.}(S/\mathfrak{q}) \\
\kappa(\mathfrak{p}) \otimes_R S = S_\mathfrak{p}/\mathfrak{p}S_\mathfrak{p} \arrow[u] & S_\mathfrak{p} \arrow[l] \arrow[u] & S \arrow[l] \arrow[r] \arrow[u] & S/\mathfrak{p}S \arrow[r] \arrow[u] & (R \setminus \mathfrak{p})^{-1}S/\mathfrak{p}S \arrow[u] \\
\kappa(\mathfrak{p}) = R_\mathfrak{p}/\mathfrak{p}R_\mathfrak{p} \arrow[u] & R_\mathfrak{p} \arrow[l] \arrow[u] & R \arrow[l] \arrow[r] \arrow[u] & R/\mathfrak{p} \arrow[r] \arrow[u] & \kappa(\mathfrak{p}) = \text{f.f.}(R/\mathfrak{p}) \arrow[u]
\end{tikzcd}$$

In this diagram the arrows on the outer left and outer right columns are identical. The horizontal maps induce on the associated spectrums always a homeomorphism onto the image. The lower two rows of the diagram make sense without assuming $\mathfrak{q}$ exists. The lower squares induce fibre squares of topological spaces. This diagram shows that $\mathfrak{p}$ is in the image of the map on Spec if and only if $S \otimes_R \kappa(\mathfrak{p})$ is not the zero ring.

Lemma 7.16.9. *Let $\varphi : R \to S$ be a ring map. Let $\mathfrak{p}$ be a prime of R. The following are equivalent*

1. $\mathfrak{p}$ *is in the image of* $Spec(S) \to Spec(R)$,
2. $S \otimes_R \kappa(\mathfrak{p}) \neq 0$,
3. $S_\mathfrak{p}/\mathfrak{p}S_\mathfrak{p} \neq 0$,
4. $(S/\mathfrak{p}S)_\mathfrak{p} \neq 0$, *and*
5. $\mathfrak{p} = \varphi^{-1}(\mathfrak{p}S)$.

Proof. We have already seen the equivalence of the first two in Remark 7.16.8. The others are just reformulations of this. □

Lemma 7.16.10. *Let R be a ring. The space $Spec(R)$ is quasicompact.*

Proof. It suffices to prove that any covering of $Spec(R)$ by standard opens can be refined by a finite covering. Thus suppose that $Spec(R) = \cup D(f_i)$ for a set of elements $\{f_i\}_{i\in I}$ of R. This means that $\cap V(f_i) = \emptyset$. According to Lemma 7.16.2 this means that $V(\{f_i\}) = \emptyset$. According to the same lemma this means that the ideal generated by the f_i is the unit ideal of R. This means that we can write 1 as a *finite* sum: $1 = \sum_{i\in J} r_i f_i$ with $J \subset I$ finite. And then it follows that $Spec(R) = \cup_{i\in J} D(f_i)$. □

Lemma 7.16.11. *Let R be a ring. The topology on $X = Spec(R)$ has the following properties:*

1. *X is quasi-compact,*
2. *X has a basis for the topology consisting of quasi-compact opens, and*
3. *the intersection of any two quasi-compact opens is quasi-compact.*

Proof. The spectrum of a ring is quasi-compact, see Lemma 7.16.10. It has a basis for the topology consisting of the standard opens $D(f) = Spec(R_f)$ (Lemma 7.16.6) which are quasi-compact by the first remark. The intersection of two standard opens is quasi-compact as $D(f) \cap D(g) = D(fg)$. Given any two quasi-compact opens $U, V \subset X$ we may write $U = D(f_1) \cup \ldots \cup D(f_n)$ and $V = D(g_1) \cup \ldots \cup D(g_m)$. Then $U \cap V = \bigcup D(f_i g_j)$ which is quasi-compact. □

7.17. Local rings

Local rings are the bread and butter of algebraic geometry.

Definition 7.17.1. A *local ring* is a ring with exactly one maximal ideal. The maximal ideal is often denoted $\mathfrak{m}_R$ in this case. We often say ``let $(R, \mathfrak{m}, \kappa)$ be a local ring'' to indicate that R is local, $\mathfrak{m}$ is its unique maximal ideal and $\kappa = R/\mathfrak{m}$ is its residue field. A *local homomorphism of local rings* is a ring map $\varphi : R \to S$ such that R and S are local rings and such that $\varphi(\mathfrak{m}_R) \subset \mathfrak{m}_S$. If it is given that R and S are local rings, then the phrase ``*local ring map* $\varphi : R \to S$'' means that φ is a local homomorphism of local rings.

A field is a local ring. Any ring map between fields is a local homomorphism of local rings.

Lemma 7.17.2. *Let R be a ring. The following are equivalent:*

1. *R is a local ring,*
2. *$Spec(R)$ has exactly one closed point,*
3. *R has a maximal ideal $\mathfrak{m}$ and every element of $R \setminus \mathfrak{m}$ is a unit, and*
4. *R is not the zero ring and every $x \in R$ is either invertible or $1 - x$ is invertible.*

Proof. Let R be a ring, and $\mathfrak{m}$ a maximal ideal. If $x \in R \setminus \mathfrak{m}$, and x is not a unit then there is a maximal ideal $\mathfrak{m}'$ containing x. Hence R has at least two maximal ideals. Conversely, if $\mathfrak{m}'$ is another maximal ideal, then choose $x \in \mathfrak{m}'$, $x \notin \mathfrak{m}$. Clearly x is not a unit. This proves the equivalence of (1) and (3). The equivalence (1) and (2) is tautological. If R is local then (4) holds since x is either in $\mathfrak{m}$ or not. If (4) holds, and $\mathfrak{m}$, $\mathfrak{m}'$ are distinct maximal ideals then we may choose $x \in R$ such that $x \bmod \mathfrak{m}' = 0$ and $x \bmod \mathfrak{m} = 1$ by the Chinese remainder theorem (Lemma 7.14.4). This element x is not invertible and neither is $1 - x$ which is a contradiction. Thus (4) and (1) are equivalent. ☐

The localization $R_{\mathfrak{p}}$ of a ring R at a prime $\mathfrak{p}$ is a local ring with maximal ideal $\mathfrak{p}R_{\mathfrak{p}}$. Namely, the quotient $R_{\mathfrak{p}}/\mathfrak{p}R_{\mathfrak{p}}$ is the fraction field of the domain $R/\mathfrak{p}$ and every element of $R_{\mathfrak{p}}$ which is not contained in $\mathfrak{p}R_{\mathfrak{p}}$ is invertible.

Lemma 7.17.3. *Let $\varphi : R \to S$ be a ring map. Assume R and S are local rings. The following are equivalent:*

1. *φ is a local ring map,*
2. *$\varphi(\mathfrak{m}_R) \subset \mathfrak{m}_S$, and*
3. *$\varphi^{-1}(\mathfrak{m}_S) = \mathfrak{m}_R$.*

Proof. Conditions (1) and (2) are equivalent by definition. If (3) holds then (2) holds. Conversely, if (2) holds, then $\varphi^{-1}(\mathfrak{m}_S)$ is a prime ideal containg the maximal ideal $\mathfrak{m}_R$, hence $\varphi^{-1}(\mathfrak{m}_S) = \mathfrak{m}_R$. ☐

Let $\varphi : R \to S$ be a ring map. Let $\mathfrak{q} \subset S$ be a prime and set $\mathfrak{p} = \varphi^{-1}(\mathfrak{q})$. Then the induced ring map $R_{\mathfrak{p}} \to S_{\mathfrak{q}}$ is a local ring map.

7.18. Open and closed subsets of spectra

It turns out that open and closed subsets of a spectrum correspond to idempotents of the ring.

Lemma 7.18.1. *Let R be a ring. Let $e \in R$ be an idempotent. In this case*
$$Spec(R) = D(e) \coprod D(1-e).$$

Proof. Note that an idempotent e of a domain is either 1 or 0. Hence we see that
$$\begin{aligned} D(e) &= \{\mathfrak{p} \in Spec(R) \mid e \notin \mathfrak{p}\} \\ &= \{\mathfrak{p} \in Spec(R) \mid e \neq 0 \text{ in } \kappa(\mathfrak{p})\} \\ &= \{\mathfrak{p} \in Spec(R) \mid e = 1 \text{ in } \kappa(\mathfrak{p})\} \end{aligned}$$
Similarly we have
$$\begin{aligned} D(1-e) &= \{\mathfrak{p} \in Spec(R) \mid 1 - e \notin \mathfrak{p}\} \\ &= \{\mathfrak{p} \in Spec(R) \mid e \neq 1 \text{ in } \kappa(\mathfrak{p})\} \\ &= \{\mathfrak{p} \in Spec(R) \mid e = 0 \text{ in } \kappa(\mathfrak{p})\} \end{aligned}$$
Since the image of e in any residue field is either 1 or 0 we deduce that $D(e)$ and $D(1-e)$ cover all of $Spec(R)$. ☐

Lemma 7.18.2. *Let R_1 and R_2 be rings. Let $R = R_1 \times R_2$. The maps $R \to R_1$, $(x, y) \mapsto x$ and $R \to R_2$, $(x, y) \mapsto y$ induce continuous maps $Spec(R_1) \to Spec(R)$ and $Spec(R_2) \to Spec(R)$. The induced map*
$$Spec(R_1) \coprod Spec(R_2) \longrightarrow Spec(R)$$

is a homeomorphism. In other words, the spectrum of $R = R_1 \times R_2$ is the disjoint union of the spectrum of R_1 and the spectrum of R_2.

Proof. Write $1 = e_1 + e_2$ with $e_1 = (1, 0)$ and $e_2 = (0, 1)$. Note that e_1 and $e_2 = 1 - e_1$ are idempotents. We leave it to the reader to show that $R_1 = R_{e_1}$ is the localization of R at e_1. Similarly for e_2. Thus the statement of the lemma follows from Lemma 7.18.1 combined with Lemma 7.16.6. □

We reprove the following lemma later after introducing a glueing lemma for functions. See Section 7.20.

Lemma 7.18.3. *Let R be a ring. For each $U \subset Spec(R)$ which is open and closed there exists a unique idempotent $e \in R$ such that $U = D(e)$. This induces a 1-1 correspondence between open and closed subsets $U \subset Spec(R)$ and idempotents $e \in R$.*

First proof of Lemma 7.18.3. Let $U \subset Spec(R)$ be open and closed. Since U is closed it is quasi-compact by Lemma 7.16.10, and similarly for its complement. Write $U = \bigcup_{i=1}^n D(f_i)$ as a finite union of standard opens. Similarly, write $Spec(R) \setminus U = \bigcup_{j=1}^m D(g_j)$ as a finite union of standard opens. Since $\emptyset = D(f_i) \cap D(g_j) = D(f_i g_j)$ we see that $f_i g_j$ is nilpotent by Lemma 7.16.2. Let $I = (f_1, \ldots, f_n) \subset R$ and let $J = (g_1, \ldots, g_m) \subset R$. Note that $V(J)$ equals U, that $V(I)$ equals the complement of U, so $Spec(R) = V(I) \coprod V(J)$. By the remark on nilpotency above, we see that $(IJ)^N = (0)$ for some sufficiently large integer N. Since $\bigcup D(f_i) \cup \bigcup D(g_j) = Spec(R)$ we see that $I + J = R$, see Lemma 7.16.2. By raising this equation to the $2N$th power we conclude that $I^N + J^N = R$. Write $1 = x + y$ with $x \in I^N$ and $y \in J^N$. Then $1 = (x+y)^2 = x^2 + y^2$ because $I^N J^N = (0)$. Then $z = x - x^2 \in I^N \cap J^N$. Thus $zx = 0$ and $z^2 = 0$. Hence $(x - z) - (x - z)^2 = x - x^2 - z = 0$. In other words, $e = x - z$ is an idempotent contained in $I^N \subset I$, and the idempotent $e' = 1 - e = y + z$ is contained in $J^N \subset J$. This shows that the idempotent e maps to 1 in every residue field $\kappa(\mathfrak{p})$ for $\mathfrak{p} \in V(J)$ and that e maps to 0 in $\kappa(\mathfrak{p})$ for every $\mathfrak{p} \in V(I)$.

To see uniqueness suppose that e_1, e_2 are distinct idempotents in R. We have to show there exists a prime $\mathfrak{p}$ such that $e_1 \in \mathfrak{p}$ and $e_2 \notin \mathfrak{p}$, or conversely. Write $e_i' = 1 - e_i$. If $e_1 \neq e_2$, then $0 \neq e_1 - e_2 = e_1(e_2 + e_2') - (e_1 + e_1')e_2 = e_1 e_2' - e_1' e_2$. Hence either the idempotent $e_1 e_2' \neq 0$ or $e_1' e_2 \neq 0$. An idempotent is not nilpotent, and hence we find a prime $\mathfrak{p}$ such that either $e_1 e_2' \notin \mathfrak{p}$ or $e_1' e_2 \notin \mathfrak{p}$, by Lemma 7.16.2. It is easy to see this gives the desired prime. □

Lemma 7.18.4. *Let R be a ring. Then $Spec(R)$ is connected if and only if R has no non-trivial idempotents.*

Proof. Obvious from Lemma 7.18.3 above. □

Lemma 7.18.5. *Let R be a ring. Let I be a finitely generated ideal. Assume that $I = I^2$. Then $V(I)$ is open and closed in $Spec(R)$, and $R/I \cong R_e$ for some idempotent $e \in R$.*

Proof. By Nakayama's Lemma 7.14.5 there exists an element $f = 1 + i$, $i \in I$ in R such that $fI = 0$. It follows that $V(I) = D(f)$ by a simple argument. Also, $0 = fi = i + i^2$, and hence $f^2 = 1 + i + i + i^2 = 1 + i = f$, so f is an idempotent. Consider the canonical map $R \to R_f$. It is surjective since $x/f^n = x/f = xf/f^2 = xf/f = x/1$ in R_f. Any element of I is in the kernel since $fI = 0$. If $x \mapsto 0$ in R_f, then $f^n x = 0$ for some $n > 0$ and hence $(1 + i)x = 0$ hence $x \in I$. □

7.19. Connected components of spectra

Connected components of spectra are not as easy to understand as one may think at first. This is because we are used to the topology of locally connected spaces, but the spectrum of a ring is in general not locally connected.

Lemma 7.19.1. *Let R be a ring. Let $T \subset Spec(R)$ be a subset of the spetrum. The following are equivalent*

1. *T is closed and is a union of connected components of $Spec(R)$,*
2. *T is an intersection of open and closed subsets of $Spec(R)$, and*
3. *$T = V(I)$ where $I \subset R$ is an ideal generated by idempotents.*

Moreover, the ideal in (3) if it exists is unique.

Proof. By Lemma 7.16.11 and Topology, Lemma 5.9.8 we see that (1) and (2) are equivalent. Assume (2) and write $T = \bigcap U_\alpha$ with $U_\alpha \subset Spec(R)$ open and closed. Then $U_\alpha = D(e_\alpha)$ for some idempotent $e_\alpha \in A$ by Lemma 7.18.3. Then setting $I = (1 - e_\alpha)$ we see that $T = V(I)$, i.e., (3) holds. Finally, assume (3). Write $T = V(I)$ and $I = (e_\alpha)$ for some collection of idempotents e_α. Then it is clear that $T = \bigcap V(e_\alpha) = \bigcap D(1 - e_\alpha)$.

Suppose that I is an ideal generated by idempotents. Let $e \in R$ be an idempotent such that $V(I) \subset V(e)$. Then by Lemma 7.16.2 we see that $e^n \in I$ for some $n \geq 1$. As e is an idempotent this means that $e \in I$. Hence we see that I is generated by exactly those idempotents e such that $T \subset V(e)$. In other words, the ideal I is completely determined by the closed subset T which proves uniqueness. ☐

Lemma 7.19.2. *Let R be a ring. A connected component of $Spec(R)$ is of the form $V(I)$, where I is an ideal generated by idempotents such that every idempotent of R either maps to 0 or 1 in R/I.*

Proof. Let $\mathfrak{p}$ be a prime of R. By Lemma 7.16.11 we have see that the hypotheses of Topology, Lemma 5.9.7 are satisfied for the topological space $Spec(R)$. Hence the connected component of $\mathfrak{p}$ in $Spec(R)$ is the intersection of open and closed subsets of $Spec(R)$ containing $\mathfrak{p}$. Hence it equals $V(I)$ where I is generated by the idempotents $e \in R$ such that e maps to 0 in $\kappa(\mathfrak{p})$, see Lemma 7.18.3. Any idempotent e which is not in this collection clearly maps to 1 in R/I. ☐

7.20. Glueing functions

In this section we show that given an open covering

$$Spec(R) = \bigcup\nolimits_{i=1}^{n} D(f_i)$$

by standard opens, and given an element $h_i \in R_{f_i}$ for each i such that $h_i = h_j$ as elements of $R_{f_i f_j}$ then there exists a unique $h \in R$ such that the image of h in R_{f_i} is h_i. This result can be interpreted in two ways:

1. The rule $D(f) \mapsto R_f$ is a sheaf of rings on the standard opens, see Sheaves, Section 6.30.
2. If we think of elements of R_f as the ``algebraic'' or ``regular'' functions on $D(f)$, then these glue as would continuous, resp. differentiable functions on a topological, resp. differentiable manifold.

At the end of this section we use this result to reprove the lemma describing open and closed subsets in terms of idempotents.

Lemma 7.20.1. *Let R be a ring, and let $f_1, f_2, \dots f_n \in R$ generate the unit ideal in R. Then the following sequence is exact:*

$$0 \longrightarrow R \longrightarrow \bigoplus\nolimits_i R_{f_i} \longrightarrow \bigoplus\nolimits_{i,j} R_{f_i f_j}$$

where the maps $\alpha : R \longrightarrow \bigoplus_i R_{f_i}$ and $\beta : \bigoplus_i R_{f_i} \longrightarrow \bigoplus_{i,j} R_{f_i f_j}$ are defined as

$$\alpha(x) = \left(\frac{x}{1}, \dots, \frac{x}{1}\right) \text{ and } \beta\left(\frac{x_1}{f_1}, \dots, \frac{x_n}{f_n}\right) = \left(\frac{x_i}{f_i} - \frac{x_j}{f_j} \text{ in } R_{f_i f_j}\right).$$

Proof. We first show that α is injective, and then that the image of α equals the kernel of β. Assume there exists $x \in R$ such that $\alpha(x) = (0, \dots, 0)$. Then $\frac{x}{1} = 0$ in R_{f_i} for all i. This means, for all i, there exists a number n_i such that

$$f_i^{n_i} x = 0$$

Since the f_i generate R, we can pick a_i so

$$1 = \sum\nolimits_{i=1}^n a_i f_i$$

Then for all $M \geq \sum n_i$, we have

$$1^M = \left(\sum a_i f_i\right)^M,$$

where each term has a factor of at least $f_i^{n_i}$ for some i. Therefore,

$$x = 1x = 1^M x = \left(\sum a_i f_i\right)^M x = 0.$$

Thus, if $\alpha(x) = 0$, $x = 0$ and α is injective. We check that the image of α equals the kernel of β. First, note that for $x \in R$,

$$\beta(\alpha(x)) = \beta\left(\frac{x}{1}, \dots, \frac{x}{1}\right) = \left(\frac{x}{1} - \frac{x}{1} \text{ in } R_{f_i f_j}\right) = 0.$$

Therefore, the image of α is in the kernel of β, and it remains only to verify that if

$$\beta\left(\frac{x_1}{f_1}, \dots, \frac{x_n}{f_n}\right) = 0,$$

then there exists $x \in R$ so that for all i,

$$\frac{x}{1} = \frac{x_i}{f_i}$$

Assume we have $x_1, \dots, x_n$ such that

$$\beta\left(\frac{x_1}{f_1}, \dots, \frac{x_n}{f_n}\right) = 0.$$

Then, for all pairs i, j, there exists an n_{ij} such that

$$f_i^{n_{ij}} f_j^{n_{ij}} (f_j x_i - f_i x_j) = 0$$

Choosing N so $N \geq n_{ij}$ for all i, j, we see that

$$f_i^N f_j^N (f_j x_i - f_i x_j) = 0$$

Define elements $\widetilde{x_i}$ and $\widetilde{f_i}$ as follows:

$$\widetilde{f_i} = f_i^{N+1}, \qquad \widetilde{x_i} = f_i^N x_i.$$

Notice that

$$\frac{\widetilde{x}_i}{\widetilde{f}_i} = \frac{x_i}{f_i}.$$

Also, we can use this to rewrite the above equation to get the following equality, for all i, j,

$$\widetilde{f}_j \widetilde{x}_i = \widetilde{f}_i \widetilde{x}_j.$$

Since $f_1, \ldots, f_n$ generate R, we clearly have that $\widetilde{f}_1, \ldots, \widetilde{f}_n$ also generate R. Therefore, there exist $a_1, \ldots, a_n$ in R so that

$$1 = \sum\nolimits_{i=1}^n a_i \widetilde{f}_i$$

Therefore, we finally conclude that for all i,

$$\frac{x_i}{f_i} = \frac{\widetilde{x}_i}{\widetilde{f}_i} = \sum\nolimits_{j=1}^n \frac{a_j \widetilde{f}_j \widetilde{x}_i}{\widetilde{f}_i} = \sum\nolimits_{j=1}^n \frac{a_j \widetilde{f}_i \widetilde{x}_j}{\widetilde{f}_i} = \frac{\sum_{j=1}^n a_j \widetilde{x}_j}{1}.$$

Thus, we have

$$\alpha\left(\sum\nolimits_{j=1}^n a_j \widetilde{x}_j\right) = \left(\frac{x_1}{f_1}, \ldots, \frac{x_n}{f_n}\right),$$

as required. There the sequence is exact. □

Lemma 7.20.2. *Let R be a ring. Let $f_1, \ldots, f_n$ be elements of R generating the unit ideal. Let M be an R-module. The sequence*

$$0 \to M \xrightarrow{\alpha} \bigoplus\nolimits_{i=1}^n M_{f_i} \xrightarrow{\beta} \bigoplus\nolimits_{i,j=1}^n M_{f_i f_j}$$

is exact, where $\alpha(m) = (m/1, \ldots, m/1)$ and $\beta(m_1/f_1^{e_1}, \ldots, m_n/f_n^{e_n}) = (m_i/f_i^{e_i} - m_j/f_j^{e_j})_{(i,j)}$.

Proof. The same as the proof of Lemma 7.20.1. □

Second proof of Lemma 7.18.3. Having assured ourselves (Lemma 7.20.1) that for generators $f_1, \ldots, f_n$ for the unit ideal of a ring R the sequence

$$0 \to R \to \bigoplus\nolimits_{i=1}^n R_{f_i} \to \bigoplus\nolimits_{i,j} R_{f_i f_j}$$

is exact, we now provide an alternate proof of the surjectivity of the map from idempotents e of R to open and closed subsets of $Spec(R)$ presented in Lemma 7.18.3. Let $U \subset Spec(R)$ be open and closed, and W be its complement. We can write U and V as unions of standard opens such that $U = \bigcup_{i=1}^n D(f_i)$ and $W = \bigcup_{j=1}^m D(g_j)$. Since $Spec(R) = \bigcup D(f_i) \cup \bigcup D(g_j)$, we observe that the collection $\{f_i; g_j\}$ must generate the unit ideal in R by Lemma 7.16.2. So the following sequence is exact.

(7.20.2.1)

$$0 \to R \xrightarrow{\alpha} \bigoplus\nolimits_{i=1}^n R_{f_i} \oplus \bigoplus\nolimits_{j=1}^m R_{g_j} \to \bigoplus\nolimits_{i_1,i_2} R_{f_{i_1} f_{i_2}} \oplus \bigoplus\nolimits_{i,j} R_{f_i g_j} \oplus \bigoplus\nolimits_{j_1,j_2} R_{g_{j_1} g_{j_2}}$$

However, notice that for any pair i, j, $D(f_i) \cap D(g_j) = \emptyset$ since $D(f_i) \subset U$ and $D(g_j) \subset W$). From part (15) of Lemma 7.16.2 we recall that $D(f_i g_j) = D(f_i) \cap D(g_j) = \emptyset$. Therefore by Lemma 7.16.5 $Spec(R_{f_i g_j}) = D(f_i g_j) = \emptyset$, implying that $R_{f_i g_j}$ is the zero ring for each pair i, j by part (3) of Lemma 7.16.2. Consider the element $(1, \ldots, 1, 0, \ldots, 0) \in \bigoplus_{i=1}^n R_{f_i} \oplus \bigoplus_{j=1}^m R_{g_j}$ whose coordinates are 1 in each R_{f_i} and 0 in each R_{g_j}. This is sent to 0 under the map

$$\beta : \bigoplus\nolimits_{i=1}^n R_{f_i} \oplus \bigoplus\nolimits_{j=1}^m R_{g_j} \to \bigoplus\nolimits_{i_1,i_2} R_{f_{i_1} f_{i_2}} \oplus \bigoplus\nolimits_{j_1,j_2} R_{g_{j_1} g_{j_2}}$$

so by the exactness of the sequence (7.20.2.1), there must be some element of R whose image under α is $(1, \ldots, 1, 0, \ldots, 0)$. Call it e. We see that $\alpha(e^2) = \alpha(e)^2 = (1, \ldots, 1, 0, \ldots, 0) = \alpha(e)$. Since α is injective, $e = e^2$ in R and e is an idempotent of R. We claim that $U = D(e)$. Notice that for arbitrary j, the map $R \to R_{g_j}$ maps e to 0. Therefore there must be some positive integer k_j such that $g_j^{k_j}(e - 0) = 0$ in R. Multiplying by e as necessary, we see that $(g_j e)^{k_j} = 0$, so $g_j e$ is nilpotent in R. By Lemma 7.16.2 $D(g_j) \cap D(e) = D(g_j e) = \emptyset$. So since $V = \bigcup D(g_j)$, $D(e) \cap V = \emptyset$ and $D(e) \subset U$. Furthermore, for arbitrary i, the map $R \to R_{f_i}$ maps e to 1, so there must be some l_i such that $f_i^{l_i}(e - 1) = 0$ in R. Hence $f_i^{l_i} e = f_i^{l_i}$. Suppose $\mathfrak{p} \in Spec(R)$ contains e, then $\mathfrak{p}$ contains $f_i^{l_i} e = f_i^{l_i}$, and since $\mathfrak{p}$ is prime, $f_i \in \mathfrak{p}$. So $V(e) \subset V(f_i)$, implying that $D(f_i) \subset D(e)$. Therefore $U = \bigcup D(f_i) \subset D(e)$, and $U = D(e)$. Therefore any open and closed subset of $Spec(R)$ is the standard open of an idempotent as desired. $\square$

The following we have already seen above, but we state it explicitly here for convenience.

Lemma 7.20.3. *Let R be a ring. If $Spec(R) = U \amalg V$ with both U and V open then $R \cong R_1 \times R_2$ with $U \cong Spec(R_1)$ and $V \cong Spec(R_2)$ via the maps in Lemma 7.18.2. Moreover, both R_1 and R_2 are localizations as well as quotients of the ring R.*

Proof. By Lemma 7.18.3 we have $U = D(e)$ and $V = D(1 - e)$ for some idempotent e. By Lemma 7.20.1 we see that $R \cong R_e \times R_{1-e}$ (since clearly $R_{e(1-e)} = 0$ so the glueing condition is trivial; of course it is trivial to prove the product decomposition directly in this case). The lemma follows. $\square$

Lemma 7.20.4. *Let R be a ring. Let $f_1, \ldots, f_n \in R$. Let M be an R-module. Then $M \to \bigoplus M_{f_i}$ is injective if and only if*

$$M \longrightarrow \bigoplus\nolimits_{i=1,\ldots,n} M, \quad m \longmapsto (f_1 m, \ldots, f_n m)$$

is injective.

Proof. The map $M \to \bigoplus M_{f_i}$ is injective if and only if for all $m \in M$ and $e_1, \ldots, e_n \geq 1$ such that $f_i^{e_i} m = 0$, $i = 1, \ldots, n$ we have $m = 0$. This clearly implies the displayed map is injective. Conversely, suppose the displayed map is injective and $m \in M$ and $e_1, \ldots, e_n \geq 1$ are such that $f_i^{e_i} m = 0$, $i = 1, \ldots, n$. If $e_i = 1$ for all i, then we immediately conclude that $m = 0$ from the injectivity of the displayed map. Next, we prove this holds for any such data by induction on $e = \sum e_i$. The base case is $e = n$, and we have just dealt with this. If some $e_i > 1$, then set $m' = f_i m$. By induction we see that $m' = 0$. Hence we see that $f_i m = 0$, i.e., we may take $e_i = 1$ which decreases e and we win. $\square$

7.21. More glueing results

In this section we put a number of standard results of the form: if something is true for all members of a standard open covering then it is true. In fact, it often suffices to check things on the level of local rings as in the following lemma.

Lemma 7.21.1. *Let R be a ring.*

1. *For an element x of an R-module M the following are equivalent*
   (a) *$x = 0$,*
   (b) *x maps to zero in $M_{\mathfrak{p}}$ for all $\mathfrak{p} \in Spec(R)$,*
   (c) *x maps to zero in $M_{\mathfrak{m}}$ for all maximal ideals $\mathfrak{m}$ of R.*

In other words, the map $M \to \prod_{\mathfrak{m}} M_{\mathfrak{m}}$ is injective.

(2) *Given an R-module M the following are equivalent*
   (a) *M is zero,*
   (b) *$M_{\mathfrak{p}}$ is zero for all $\mathfrak{p} \in Spec(R)$,*
   (c) *$M_{\mathfrak{m}}$ is zero for all maximal ideals $\mathfrak{m}$ of R.*

(3) *Given a complex $M_1 \to M_2 \to M_3$ of R-modules the following are equivalent*
   (a) *$M_1 \to M_2 \to M_3$ is exact,*
   (b) *for every prime $\mathfrak{p}$ of R the localization $M_{1,\mathfrak{p}} \to M_{2,\mathfrak{p}} \to M_{3,\mathfrak{p}}$ is exact,*
   (c) *for every maximal ideal $\mathfrak{m}$ of R the localization $M_{1,\mathfrak{m}} \to M_{2,\mathfrak{m}} \to M_{3,\mathfrak{m}}$ is exact.*

(4) *Given a map $f : M \to M'$ of R-modules the following are equivalent*
   (a) *f is injective,*
   (b) *$f_{\mathfrak{p}} : M_{\mathfrak{p}} \to M'_{\mathfrak{p}}$ is injective for all primes $\mathfrak{p}$ of R,*
   (c) *$f_{\mathfrak{m}} : M_{\mathfrak{m}} \to M'_{\mathfrak{m}}$ is injective for all maximal ideals $\mathfrak{m}$ of R.*

(5) *Given a map $f : M \to M'$ of R-modules the following are equivalent*
   (a) *f is surjective,*
   (b) *$f_{\mathfrak{p}} : M_{\mathfrak{p}} \to M'_{\mathfrak{p}}$ is surjective for all primes $\mathfrak{p}$ of R,*
   (c) *$f_{\mathfrak{m}} : M_{\mathfrak{m}} \to M'_{\mathfrak{m}}$ is surjective for all maximal ideals $\mathfrak{m}$ of R.*

(6) *Given a map $f : M \to M'$ of R-modules the following are equivalent*
   (a) *f is bijective,*
   (b) *$f_{\mathfrak{p}} : M_{\mathfrak{p}} \to M'_{\mathfrak{p}}$ is bijective for all primes $\mathfrak{p}$ of R,*
   (c) *$f_{\mathfrak{m}} : M_{\mathfrak{m}} \to M'_{\mathfrak{m}}$ is bijective for all maximal ideals $\mathfrak{m}$ of R.*

Proof. Let $x \in M$ as in (1). Let $I = \{f \in R \mid fx = 0\}$. It is easy to see that I is an ideal (it is the annihilator of x). Condition (1)(c) means that for all maximal ideals $\mathfrak{m}$ there exists an $f \in R \setminus \mathfrak{m}$ such that $fx = 0$. In other words, $V(I)$ does not contain a closed point. By Lemma 7.16.2 we see I is the unit ideal. Hence x is zero, i.e., (1)(a) holds. This proves (1).

Part (2) follows by applying (1) to all elements of M simultaneously.

Proof of (3). Let H be the homology of the sequence, i.e., $H = \text{Ker}(M_2 \to M_3)/\text{Im}(M_1 \to M_2)$. By Proposition 7.9.12 we have that $H_{\mathfrak{p}}$ is the homology of the sequence $M_{1,\mathfrak{p}} \to M_{2,\mathfrak{p}} \to M_{3,\mathfrak{p}}$. Hence (3) is a consequence of (2).

Parts (4) and (5) are special cases of (3). Part (6) follows formally on combining (4) and (5). ☐

Lemma 7.21.2. *Let R be a ring. Let M be an R-module. Let S be an R-algebra. Suppose that $f_1, \ldots, f_n$ is a finite list of elements of R such that $\bigcup D(f_i) = Spec(R)$ in other words $(f_1, \ldots, f_n) = R$.*

(1) *If each $M_{f_i} = 0$ then $M = 0$.*
(2) *If each M_{f_i} is a finite R_{f_i}-module, then M is a finite R-module.*
(3) *If each M_{f_i} is a finitely presented R_{f_i}-module, then M is a finitely presented R-module.*
(4) *Let $M \to N$ be a map of R-modules. If $M_{f_i} \to N_{f_i}$ is an isomorphism for each i then $M \to N$ is an isomorphism.*
(5) *Let $0 \to M'' \to M \to M' \to 0$ be a complex of R-module. If $0 \to M''_{f_i} \to M_{f_i} \to M'_{f_i} \to 0$ is exact for each i, then $0 \to M'' \to M \to M' \to 0$ is exact.*
(6) *If each R_{f_i} is Noetherian, then R is Noetherian.*
(7) *If each S_{f_i} is a finite type R-algebra, so is S.*

(8) *If each S_{f_i} is of finite presentation over R, so is S.*

Proof. We prove each of the parts in turn.

(1) By Proposition 7.9.10 this implies $M_{\mathfrak{p}} = 0$ for all $\mathfrak{p} \in Spec(R)$, so we conclude by Lemma 7.21.1.
(2) For each i take a finite generating set X_i of M_{f_i}. Without loss of generality, we may assume that the elements of X_i are in the image of the localisation map $M \to M_{f_i}$, so we take a finite set Y_i of preimages of the elements of X_i in M. Let Y be the union of these sets. This is still a finite set. Consider the obvious R-linear map $R^Y \to M$ sending the basis element e_y to y. By assumption this map is surjective after localizing at an arbitrary prime ideal $\mathfrak{p}$ of R, so it surjective by Lemma 7.21.1 and M is finitely generated.
(3) By (2) we have a short exact sequence

$$0 \to K \to R^n \to M \to 0$$

Since finite presentation does not depend on the chosen presentation (Lemma 7.5.3) and localisation is an exact functor K_{f_i} is finitely generated for all $1 \leq i \leq n$. By 2. this implies that K is a finitely generated R-module and therefore M is finitely presented.
(4) By Proposition 7.9.10 the assumption implies that the induced morphism on localisations at all prime ideals is an isomorphism, so we conclude by Lemma 7.21.1.
(5) By Proposition 7.9.10 the assumption implies that the induced sequence of localisations at all prime ideals is short exact, so we conclude by Lemma 7.21.1.
(6) We will show that every ideal of R has a finite generating set: For this, let $I \subseteq R$ be an arbitrary ideal. By Proposition 7.9.12 each $I_{f_i} \subseteq R_{f_i}$ is an ideal. These are all finitely generated by assumption, so we conclude by (2).
(7) For each i take a finite generating set X_i of S_{f_i}. Without loss of generality, we may assume that the elements of X_i are in the image of the localisation map $S \to S_{f_i}$, so we take a finite set Y_i of preimages of the elements of X_i in S. Let Y be the union of these sets. This is still a finite set. Consider the algebra homomorphism $R[X_y]_{y \in Y} \to S$ induced by Y. Since it is an algebra homomorphism, the image T is an R-submodule of the R-module S, so we can consider the quotient module S/T. By assumption, this is zero if we localise at the f_i, so it is zero by item 1. and therefore S is an R-algebra of finite type.
(8) By the previous item, there exists a surjective R-algebra homomorphism $R[X_1, ..., X_n] \to S$. Let K be the kernel of this map. This is an ideal in $R[X_1, ..X_n]$, finitely generated in each localisation at f_i. Since the f_i generate the unit ideal in R, they also generate the unit ideal in $R[X_1, ..., X_n]$, so an application of (2) finishes the proof.

□

Lemma 7.21.3. *Let $R \to S$ be a ring map. Suppose that $g_1, \ldots, g_m$ is a finite list of elements of S such that $\bigcup D(g_j) = Spec(S)$ in other words $(g_1, \ldots, g_m) = S$.*

(1) *If each S_{g_i} is of finite type over R, then S is of finite type over R.*
(2) *If each S_{g_i} is of finite presentation over R, then S is of finite presentation over R.*

Proof. Omitted. □

The following lemma is better stated and proved in the more general context of flat descent. However, it makes sense to state it here since it fits well with the above.

Lemma 7.21.4. *Let R be a ring. Let $f_1, \ldots, f_n \in R$ be elements which generate the unit ideal in R. Suppose we are given the following data:*

(1) *For each i an R_{f_i}-module M_i.*
(2) *For each pair i, j an $R_{f_i f_j}$-module isomorphism $\psi_{ij} : (M_i)_{f_j} \to (M_j)_{f_i}$.*

which satisfy the ``cocycle condition'' that all the diagrams

$$\begin{tikzcd} (M_i)_{f_j f_k} \arrow[rr, "\psi_{ik}"] \arrow[dr, "\psi_{ij}"'] & & (M_k)_{f_i f_j} \\ & (M_j)_{f_i f_k} \arrow[ur, "\psi_{jk}"'] & \end{tikzcd}$$

commute (for all triples i, j, k). Given this data define

$$M = Ker\left(\bigoplus\nolimits_{1 \leq i \leq n} M_i \longrightarrow \bigoplus\nolimits_{1 \leq i, j \leq n} (M_i)_{f_i}\right)$$

where $(m_1, \ldots, m_n)$ maps to the element whose (i, j)th entry is $m_i/1 - \psi_{ji}(m_j/1)$. Then the natural map $M \to M_i$ identifies M_i with M_{f_i}. Moreover $\psi_{ij}(m/1) = m/1$ for all $m \in M$ (with obvious notation).

Proof. Omitted. $\square$

7.22. Total rings of fractions

We can apply the glueing results above to prove something about total rings of fractions $Q(R)$. Namely, Lemma 7.22.2 below.

Lemma 7.22.1. *Let R be a ring. Let $S \subset R$ be a multiplicative subset consisting of nonzero divisors. Then $Q(R) \cong Q(S^{-1}R)$. In particular $Q(R) \cong Q(Q(R))$.*

Proof. If $x \in S^{-1}R$ is a nonzero divisor, and $x = r/f$ for some $r \in R$, $f \in S$, then r is a nonzero divisor in R. Whence the lemma. $\square$

Lemma 7.22.2. *Let R be a ring. Assume that R has finitely many minimal primes $\mathfrak{q}_1, \ldots, \mathfrak{q}_t$, and that $\mathfrak{q}_1 \cup \ldots \cup \mathfrak{q}_t$ is the set of zero divisors of R. Then the total ring of fractions $Q(R)$ (Example 7.9.8) is equal to $R_{\mathfrak{q}_1} \times \ldots \times R_{\mathfrak{q}_t}$.*

Proof. There are natural maps $Q(R) \to R_{\mathfrak{q}_i}$ since any nonzero divisor is contained in $R \setminus \mathfrak{q}_i$. Hence a natural map $Q(R) \to R_{\mathfrak{q}_1} \times \ldots \times R_{\mathfrak{q}_t}$. For any nonminimal prime $\mathfrak{p} \subset R$ we see that $\mathfrak{p} \not\subset \mathfrak{q}_1 \cup \ldots \cup \mathfrak{q}_t$ by Lemma 7.14.3. Hence $Spec(Q(R)) = \{\mathfrak{q}_1, \ldots, \mathfrak{q}_t\}$ (as subsets of $Spec(R)$, see Lemma 7.16.5). Therefore $Spec(Q(R))$ is a finite discrete set and it follows that $Q(R) = A_1 \times \ldots \times A_t$ with $Spec(A_i) = \{q_i\}$, see Lemma 7.20.3. Moreover A_i is a local ring, which is a localization of R. Hence $A_i \cong R_{\mathfrak{q}_i}$. $\square$

7.23. Irreducible components of spectra

We show that irreducible components of the spectrum of a ring correspond to the minimal primes in the ring.

Lemma 7.23.1. *Let R be a ring.*

(1) *For a prime $\mathfrak{p} \subset R$ the closure of $\{\mathfrak{p}\}$ in the Zariski topology is $V(\mathfrak{p})$. In a formula $\overline{\{\mathfrak{p}\}} = V(\mathfrak{p})$.*

(2) *The irreducible closed subsets of* $Spec(R)$ *are exactly the subsets* $V(\mathfrak{p})$*, with* $\mathfrak{p} \subset R$ *a prime.*
(3) *The irreducible components (see Topology, Definition 5.5.1) of* $Spec(R)$ *are exactly the subsets* $V(\mathfrak{p})$*, with* $\mathfrak{p} \subset R$ *a minimal prime.*

Proof. Note that if $\mathfrak{p} \in V(I)$, then $I \subset \mathfrak{p}$. Hence, clearly $\overline{\{\mathfrak{p}\}} = V(\mathfrak{p})$. In particular $V(\mathfrak{p})$ is the closure of a singleton and hence irreducible. The second assertion implies the third. To show the second, let $V(I) \subset Spec(R)$ with I a radical ideal. If I is not prime, then choose $a, b \in R$, $a, b \notin I$ with $ab \in I$. In this case $V(I, a) \cup V(I, b) = V(I)$, but neither $V(I, b) = V(I)$ nor $V(I, a) = V(I)$, by Lemma 7.16.2. Hence $V(I)$ is not irreducible. □

In other words, this lemma shows that every irreducible closed subset of $Spec(R)$ is of the form $V(\mathfrak{p})$ for some prime $\mathfrak{p}$. Since $V(\mathfrak{p}) = \overline{\{\mathfrak{p}\}}$ we see that each irreducible closed subset has a unique generic point, see Topology, Definition 5.5.4. In particular, $Spec(R)$ is a sober topological space.

Lemma 7.23.2. *Let* R *be a ring. Let* $\mathfrak{p} \subset R$ *be a prime.*
(1) *the set of irreducible closed subsets of* $Spec(R)$ *passing through* $\mathfrak{p}$ *is in one-to-one correspondence with primes* $\mathfrak{q} \subset R_{\mathfrak{p}}$.
(2) *The set of irreducible components of* $Spec(R)$ *passing through* $\mathfrak{p}$ *is in one-to-one correspondence with minimal primes* $\mathfrak{q} \subset R_{\mathfrak{p}}$.

Proof. Omitted. □

Lemma 7.23.3. *Let* $\mathfrak{p}$ *be a minimal prime of a ring* R*. Every element of the maximal ideal of* $R_{\mathfrak{p}}$ *is nilpotent. If* R *is reduced then* $R_{\mathfrak{p}}$ *is a field.*

Proof. If some element x of $\mathfrak{p}R_{\mathfrak{p}}$ is not nilpotent, then $D(x) \neq \emptyset$, see Lemma 7.16.2. This contradicts the minimality of $\mathfrak{p}$. If R is reduced, then $\mathfrak{p}R_{\mathfrak{p}} = 0$ and hence it is a field. □

Lemma 7.23.4. *Let* R *be a ring. Let* $\mathfrak{p}$ *be a minimal prime of* R*. Let* $W \subset Spec(R)$ *be a quasi-compact open not containing the point* $\mathfrak{p}$*. Then there exists an* $f \in R$*,* $f \notin \mathfrak{p}$ *such that* $D(f) \cap W = \emptyset$*.*

Proof. Since W is quasi-compact we may write it as a finite union of standard affine opens $D(g_i)$, $i = 1, \ldots, n$. Since $\mathfrak{p} \notin W$ we have $g_i \in \mathfrak{p}$ for all i. By Lemma 7.23.3 above each g_i is nilpotent in $R_{\mathfrak{p}}$. Hence we can find an $f \in R$, $f \notin \mathfrak{p}$ such that for all i we have $fg_i^{n_i} = 0$ for some $n_i > 0$. Then $D(f)$ works. □

Lemma 7.23.5. *Let* R *be a ring. The following are equivalent*
(1) *there are no nontrivial inclusions between its prime ideals,*
(2) *every prime ideal is minimal,*
(3) *every prime ideal is a maximal ideal,*
(4) *every quasi-compact open of* $Spec(R)$ *is also closed, and*
(5) $Spec(R)$ *is totally disconnected.*

Proof. It is clear that (1), (2), and (3) are equivalent. The implication (2) $\Rightarrow$ (4) follows from Lemma 7.23.4. Assume (4) holds. Let $\mathfrak{p}, \mathfrak{p}'$ be distinct primes of R. Then we can choose an $f \in \mathfrak{p}'$, $f \notin \mathfrak{p}$. Then $\mathfrak{p}' \notin D(f)$ and $\mathfrak{p} \in D(f)$. By (4) the open $D(f)$ is also closed. Hence $\mathfrak{p}$ and $\mathfrak{p}'$ cannot be in the same connected component of $Spec(R)$ and we see (5) holds. Finally, if (5) holds then there cannot be any specializations between points of $Spec(R)$ and we see that (1) holds. □

Lemma 7.23.6. *Let R be a reduced ring. Then R is a subring of a product of fields. In fact, $R \subset \prod_{\mathfrak{p}\ minimal} R_{\mathfrak{p}}$ is such an embedding.*

Proof. This is clear from Lemma 7.23.3 above and the fact that $\bigcap_{\mathfrak{p}} \mathfrak{p} = (0)$ in a reduced ring, see Lemma 7.16.2. $\square$

7.24. Examples of spectra of rings

In this section we put some examples of spectra.

Example 7.24.1. In this example we describe $X = Spec(\mathbf{Z}[x]/(x^2 - 4))$. Let $\mathfrak{p}$ be an arbitrary prime in X. Let $\phi : \mathbf{Z} \to \mathbf{Z}[x]/(x^2 - 4)$ be the natural ring map. Then, $\phi^{-1}(\mathfrak{p})$ is a prime in $\mathbf{Z}$. If $\phi^{-1}(\mathfrak{p}) = (2)$, then since $\mathfrak{p}$ contains 2, it corresponds to a prime ideal in $\mathbf{Z}[x]/(x^2 - 4, 2) \cong (\mathbf{Z}/2\mathbf{Z})[x]/(x^2)$ via the map $\mathbf{Z}[x]/(x^2 - 4) \to \mathbf{Z}[x]/(x^2 - 4, 2)$. Any prime in $(\mathbf{Z}/2\mathbf{Z})[x]/(x^2)$ corresponds to a prime in $(\mathbf{Z}/2\mathbf{Z})[x]$ containing (x^2). Such primes will then contain x. Since $(\mathbf{Z}/2\mathbf{Z}) \cong (\mathbf{Z}/2\mathbf{Z})[x]/(x)$ is a field, (x) is a maximal ideal. Since any prime contains (x) and (x) is maximal, the ring contains only one prime (x). Thus, in this case, $\mathfrak{p} = (2, x)$. Now, if $\phi^{-1}(\mathfrak{p}) = (q)$ for $q > 2$, then since $\mathfrak{p}$ contains q, it corresponds to a prime ideal in $\mathbf{Z}[x]/(x^2 - 4, q) \cong (\mathbf{Z}/q\mathbf{Z})[x]/(x^2 - 4)$ via the map $\mathbf{Z}[x]/(x^2 - 4) \to \mathbf{Z}[x]/(x^2 - 4, q)$. Any prime in $(\mathbf{Z}/q\mathbf{Z})[x]/(x^2 - 4)$ corresponds to a prime in $(\mathbf{Z}/q\mathbf{Z})[x]$ containing $(x^2 - 4) = (x - 2)(x + 2)$. Hence, these primes must contain either $x - 2$ or $x + 2$. Since $(\mathbf{Z}/q\mathbf{Z})[x]$ is a PID, all nonzero primes are maximal, and so there are precisely 2 primes in $(\mathbf{Z}/q\mathbf{Z})[x]$ containing $(x-2)(x+2)$, namely $(x-2)$ and $(x+2)$. In conclusion, there exist two primes $(q, x - 2)$ and $(q, x + 2)$ since $2 \neq -2 \in \mathbf{Z}/(q)$. Finally, we treat the case where $\phi^{-1}(\mathfrak{p}) = (0)$. Notice that $\mathfrak{p}$ corresponds to a prime ideal in $\mathbf{Z}[x]$ that contains $(x^2-4) = (x-2)(x+2)$. Hence, $\mathfrak{p}$ contains either $(x-2)$ or $(x+2)$. Hence, $\mathfrak{p}$ corresponds to a prime in $\mathbf{Z}[x]/(x-2)$ or one in $\mathbf{Z}[x]/(x+2)$ that intersects $\mathbf{Z}$ only at 0, by assumption. Since $\mathbf{Z}[x]/(x - 2) \cong \mathbf{Z}$ and $\mathbf{Z}[x]/(x - 2) \cong \mathbf{Z}$, this means that $\mathfrak{p}$ must correspond to 0 in one of these rings. Thus, $\mathfrak{p} = (x - 2)$ or $\mathfrak{p} = (x + 2)$ in the original ring.

Example 7.24.2. In this example we describe $X = Spec(\mathbf{Z}[x])$. Fix $\mathfrak{p} \in X$. Let $\phi : \mathbf{Z} \to \mathbf{Z}[x]$ and notice that $\phi^{-1}(\mathfrak{p}) \in Spec(\mathbf{Z})$. If $\phi^{-1}(\mathfrak{p}) = (q)$ for q a prime number $q > 0$, then it $\mathfrak{p}$ corresponds to a prime in $(\mathbf{Z}/(q))[x]$, which must be generated by a polynomial that is irreducible in $(\mathbf{Z}/(q))[x]$. If we choose a representative of this polynomial with minimal degree, then it will also be irreducible in $\mathbf{Z}[x]$. Hence, in this case $\mathfrak{p} = (q, f_q)$ where f_q is an irreducible polynomial in $\mathbf{Z}[x]$ that is irreducible when viewed in $(\mathbf{Z}/(q)[x])$. Now, assume that $\phi^{-1}(\mathfrak{p}) = (0)$. In this case, $\mathfrak{p}$ must be generated by nonconstant polynomials which, since $\mathfrak{p}$ is prime, may be assumed to be irreducible in $\mathbf{Z}[x]$. By Gauss' lemma, these polynomials are also irreducible in $\mathbf{Q}[x]$. Since $\mathbf{Q}[x]$ is a Euclidean domain, if there are at least two distinct irreducibles f, g generating $\mathfrak{p}$, then $1 = af + bg$ for $a, b \in \mathbf{Q}[x]$. Multiplying through by a common denominator, we see that $m = \bar{a}f + \bar{b}g$ for $\bar{a}, \bar{b} \in \mathbf{Z}[x]$ and nonzero $m \in \mathbf{Z}$. This is a contradiction. Hence, $\mathfrak{p}$ is generated by one irreducible polynomial in $\mathbf{Z}[x]$.

Example 7.24.3. In this example we describe $X = Spec(k[x, y])$ when k is an arbitrary field. Clearly (0) is prime, and any principal ideal generated by an irreducible polynomial will also be a prime since $k[x, y]$ is a unique factorization domain. Now assume $\mathfrak{p}$ is an element of X that is not principal. Since $k[x, y]$ is a Noetherian UFD, the prime ideal $\mathfrak{p}$ can be generated by a finite number of irreducible polynomials $(f_1, \ldots, f_n)$. Now, I claim that if f, g are irreducible polynomials in $k[x, y]$ that are not associates, then $(f, g) \cap k[x] \neq 0$. To do this, it is enough to show that f and g are relatively prime when viewed in $k(x)[y]$.

In this case, $k(x)[y]$ is a Euclidean domain, so by applying the Euclidean algorithm and clearing denominators, we obtain $p = af + bg$ for $p, a, b \in k[x]$. Thus, assume this is not the case, that is, that some nonunit $h \in k(x)[y]$ divides both f and g. Then, by Gauss's lemma, for some $a, b \in k(x)$ we have $ah|f$ and $bh|g$ for $ah, bh \in k[x]$ since $\mathrm{Frac}(k[x]) = k(x)$. By irreducibility, $ah = f$ and $bh = g$ (since $h \notin k(x)$). So, back in $k(x)[y]$, f, g are associates, as $\frac{a}{b}g = f$. Since $k(x) = \mathrm{Frac}(k[x])$, we can write $g = \frac{r}{s}f$ for elements $r, s \in k[x]$ sharing no common factors. This implies that $sg = rf$ in $k[x, y]$ and so s must divide f since $k[x, y]$ is a UFD. Hence, $s = 1$ or $s = f$. If $s = f$, then $r = g$, implying $f, g \in k[x]$ and thus must be units in $k(x)$ and relatively prime in $k(x)[y]$, contradicting our hypothesis. If $s = 1$, then $g = rf$, another contradiction. Thus, we must have f, g relatively prime in $k(x)[y]$, a Euclidean domain. Thus, we have reduced to the case $\mathfrak{p}$ contains some irreducible polynomial $p \in k[x] \subseteq k[x, y]$. By the above, $\mathfrak{p}$ corresponds to a prime in the ring $k[x, y]/(p) = k(\alpha)[y]$, where α is an element algebraic over k with minimum polynomial p. This is a PID, and so any prime ideal corresonds to (0) or an irreducible polynomial in $k(\alpha)[y]$. Thus, $\mathfrak{p}$ is of the form (p) or (p, f) where f is a polynomial in $k[x, y]$ that is irreducible in the quotient $k[x, y]/(p)$.

Example 7.24.4. Consider the ring

$$R = \{f \in \mathbf{Q}[z] \text{ with } f(0) = f(1)\}.$$

Consider the map

$$\varphi : \mathbf{Q}[A, B] \to R$$

defined by $\varphi(A) = z^2 - z$ and $\varphi(B) = z^3 - z^2$. It is easily checked that $(A^3 - B^2 + AB) \subseteq \ker(\varphi)$ and that $A^3 - B^2 + AB$ is irreducible. Assume that φ is surjective; then since R is an integral domain (it is a subring of an integral domain), $\ker(\phi)$ must be a prime ideal of $\mathbf{Q}[A, B]$. The prime ideals which contain $(A^3 - B^2 + AB)$ are $(A^3 - B^2 + AB)$ itself and any maximal ideal (f, g) with $f, g \in \mathbf{Q}[A, B]$ such that f is irreducible mod g. But R is not a field, so the kernel must be $(A^3 - B^2 + AB)$; hence φ gives an isomorphism $R \to \mathbf{Q}[A, B]/(A^3 - B^2 + AB)$.

To see that φ is surjective, we must express any $f \in R$ as a $\mathbf{Q}$-coefficient polynomial in $A(z) = z^2 - z$ and $B(z) = z^3 - z^2$. Note the relation $zA(z) = B(z)$. Let $a = f(0) = f(1)$. Then $z(z-1)$ must divide $f(z) - a$, so we can write $f(z) = z(z-1)g(z) + a = A(z)g(z) + a$. If $\deg(g) < 2$, then $h(z) = c_1 z + c_0$ and $f(z) = A(z)(c_1 z + c_0) + a = c_1 B(z) + c_0 A(z) + a$, so we are done. If $\deg(g) \geq 2$, then by the polynomial division algorithm, we can write $g(z) = A(z)h(z) + b_1 z + b_0$ ($\deg(h) \leq \deg(g) - 2$), so $f(z) = A(z)^2 h(z) + b_1 B(z) + b_0 A(z)$. Applying division to $h(z)$ and iterating, we obtain an expression for $f(z)$ as a polynomial in $A(z)$ and $B(z)$; hence φ is surjective.

Now let $a \in \mathbf{Q}$, $a \neq 0, \frac{1}{2}, 1$ and consider

$$R_a = \{f \in \mathbf{Q}[z, \frac{1}{z-a}] \text{ with } f(0) = f(1)\}.$$

This is a finitely generated $\mathbf{Q}$-algebra as well: it is easy to check that the functions $z^2 - z$, $z^3 - z$, and $\frac{a^2-a}{z-a} + z$ generate R_a as an $\mathbf{Q}$-algebra. We have the following inclusions:

$$R \subset R_a \subset \mathbf{Q}[z, \frac{1}{z-a}], \qquad R \subset \mathbf{Q}[z] \subset \mathbf{Q}[z, \frac{1}{z-a}].$$

Recall (Lemma 7.16.5) that for a ring T and a multiplicative subset $S \subset T$, the ring map $T \to S^{-1}T$ induces a map on spectra $Spec(S^{-1}T) \to Spec(T)$ which is a homeomorphism onto the subset

$$\{\mathfrak{p} \in Spec(T) \mid S \cap \mathfrak{p} = \varnothing\} \subseteq Spec(T).$$

When $S = \{1, f, f^2, \dots\}$ for some $f \in T$, this is the open set $D(f) \subset T$. We now verify a corresponding property for the ring map $R \to R_a$: we will show that the map $\theta : Spec(R_a) \to Spec(R)$ induced by inclusion $R \subset R_a$ is a homeomorphism onto an open subset of $Spec(R)$ by verifying that θ is an injective local homeomorphism. We do so with respect to an open cover of $Spec(R_a)$ by two distinguished opens, as we now describe. For any $r \in \mathbf{Q}$, let $\mathrm{ev}_r : R \to \mathbf{Q}$ be the homomorphism given by evaluation at r. Note that for $r = 0$ and $r = 1 - a$, this can be extended to a homomorphism $\mathrm{ev}'_r : R_a \to \mathbf{Q}$ (the latter because $\frac{1}{z-a}$ is well-defined at $z = 1 - a$, since $a \neq \frac{1}{2}$). However, ev_a does not extend to R_a. Write $\mathfrak{m}_r = \ker(\mathrm{ev}_r)$; it is easy to check that

$$\mathfrak{m}_0 = (z^2 - z, z^3 - z),$$

$$\mathfrak{m}_a = ((z - 1 + a)(z - a), (z^2 - 1 + a)(z - a)), \text{ and}$$

$$\mathfrak{m}_{1-a} = ((z - 1 + a)(z - a), (z - 1 + a)(z^2 - a)).$$

(To do so, note that the right-hand sides are clearly contained in the left-hand sides. Then check that the right-hand sides are maximal ideals by writing the generators in terms of A and B, and viewing R as $\mathbf{Q}[A, B]/(A^3 - B^2 + AB)$.) Note that $\mathfrak{m}_a$ is not in the image of θ: we have $(z^2 - 1 + a)(z - a) - (z - 1 + a)(z - a) = (z^2 - z)(z - a)$ is in $\mathfrak{m}_a$, so $z^2 - z = \frac{(z^2-z)(z-a)}{z-a}$ is in $\mathfrak{m}_a R_a$. Hence no ideal I of R_a can satisfy $I \cap R = \mathfrak{m}_\mathrm{a}$, as such an I would have to contain $z^2 - z$, which is in R but not in $\mathfrak{m}_a$. The distinguished open set $D((z - 1 + a)(z - a)) \subset Spec(R)$ is equal to the complement of the closed set $\{\mathfrak{m}_a, \mathfrak{m}_{1-a}\}$. Then check that $R_{(z-1+a)(z-a)} = (R_a)_{(z-1+a)(z-a)}$; calling this localized ring R', then, it follows that the map $R \to R'$ factors as $R \to R_a \to R'$. By Lemma 7.16.5, then, these maps express $Spec(R') \subseteq Spec(R_a)$ and $Spec(R') \subseteq Spec(R)$ as open subsets; hence $\theta : Spec(R_a) \to Spec(R)$, when restricted to $D((z - 1 + a)(z - a))$, is a homeomorphism onto an open subset. Similarly, θ restricted to $D((z^2 + z + 2a - 2)(z - a)) \subseteq Spec(R_a)$ is a homeomorphism onto the open subset $D((z^2+z+2a-2)(z-a)) \subseteq Spec(R)$. Depending on whether $z^2 + z + 2a - 2$ is irreducible or not over $\mathbf{Q}$, this former distinguished open set has complement equal to one or two closed points along with the closed point $\mathfrak{m}_a$. Furthermore, the ideal in R_a generated by the elements $(z^2+z+2a-a)(z-a)$ and $(z-1+a)(z-a)$ is all of R_a, so these two distinguished open sets cover $Spec(R_a)$. Hence in order to show that θ is a homeomorphism onto $Spec(R) - \{\mathfrak{m}_a\}$, it suffices to show that these one or two points can never equal $\mathfrak{m}_{1-a}$. And this is indeed the case, since $1 - a$ is a root of $z^2 + z + 2a - 2$ if and only of $a = 0$ or $a = 1$, both of which do not occur.

Despite this homeomorphism which mimics the behavior of a localization at an element of R, while $\mathbf{Q}[z, \frac{1}{z-a}]$ is the localization of $\mathbf{Q}[z]$ at the maximal ideal $(z - a)$, the ring R_a is *not* a localization of R: Any localization $S^{-1}R$ results in more units than the original ring R. The units of R are $\mathbf{Q}^\times$, the units of $\mathbf{Q}$. If $\frac{f}{(z-a)^k}$ is a unit in R_a ($f \in R$ and $k \geq 0$ an integer), then we have

$$\frac{f}{(z-a)^k} \cdot \frac{g}{(z-a)^\ell} = 1$$

for some $g \in R$ and some integer $\ell \geq 0$. Since R is an integral domain, this is equivalent to

$$fg = (z - a)^{k+\ell}.$$

But $(z-a)^{k+\ell}$ is only an element of R if $k=\ell=0$; hence f,g are units in R as well. Hence R_a has no more units than R does, and thus cannot be a localization of R.

We used the fact that $a \neq 0,1$ to ensure that $\frac{1}{z-a}$ makes sense at $z=0,1$. We used the fact that $a \neq 1/2$ in a few places: (1) In order to be able to talk about the kernel of ev_{1-a} on R_a, which ensures that $\mathfrak{m}_{1-a}$ is a point of R_a (i.e., that R_a is missing just one point of R). (2) At the end in order to conclude that $(z-a)^{k+\ell}$ can only be in R for $k=\ell=0$; indeed, if $a=1/2$, then this is in R as long as $k+\ell$ is even. Hence there would indeed be more units in R_a than in R, and R_a could possibly be a localization of R.

7.25. A meta-observation about prime ideals

This section is taken from the CRing project. Let R be a ring and let $S \subset R$ be a multiplicative subset. A consequence of Lemma 7.16.5 is that an ideal $I \subset R$ maximal with respect to the property of not intersecting S is prime. The reason is that $I = R \cap \mathfrak{m}$ for some maximal ideal $\mathfrak{m}$ of the ring $S^{-1}R$. It turns out that for many properties of ideals, the maximal ones are prime. A general method of seeing this was developed in [**LR08**]. In this section, we digress to explain this phenomenon.

Let R be a ring. If I is an ideal of R and $a \in R$, we define

$$(I : a) = \{x \in R \mid xa \in I\}.$$

More generally, if $J \subset R$ is an ideal, we define

$$(I : J) = \{x \in R \mid xJ \subset I\}.$$

Lemma 7.25.1. *Let R be a ring. For a principal ideal $J \subset R$, and for any ideal $I \subset J$ we have $I = J(I : J)$.*

Proof. Say $J = (a)$. Then $(I : J) = (I : a)$. Since $I \subset J$ we see that any $y \in I$ is of the form $y = xa$ for some $x \in (I : a)$. Hence $I \subset J(I : J)$. Conversely, if $x \in (I : a)$, then $xJ = (xa) \subset I$, which proves the other inclusion. $\square$

Let $\mathcal{F}$ be a collection of ideals of R. We are interested in conditions that will guarantee that the maximal elements in the complement of $\mathcal{F}$ are prime.

Definition 7.25.2. Let R be a ring. Let $\mathcal{F}$ be a set of ideals of R. We say $\mathcal{F}$ is an *Oka family* if $R \in \mathcal{F}$ and whenever $I \subset R$ is an ideal and $(I : a), (I, a) \in \mathcal{F}$ for some $a \in R$, then $I \in \mathcal{F}$.

Let us give some examples of Oka families. The first example is the basic example discussed in the introduction to this section.

Example 7.25.3. Let R be a ring and let S be a multiplicative subset of R. We claim that $\mathcal{F} = \{I \subset R \mid I \cap S \neq \emptyset\}$ is an Oka family. Namely, suppose that $(I : a), (I, a) \in \mathcal{F}$ for some $a \in R$. Then pick $s \in (I, a) \cap S$ and $s' \in (I : a) \cap S$. Then $ss' \in I \cap S$ and hence $I \in \mathcal{F}$. Thus $\mathcal{F}$ is an Oka family.

Example 7.25.4. Let R be a ring, $I \subset R$ an ideal, and $a \in R$. If $(I : a)$ is generated by $a_1, \ldots, a_n$ and (I, a) is generated by $a, b_1, \ldots, b_m$ with $b_1, \ldots, b_m \in I$, then I is generated by $aa_1, \ldots, aa_n, b_1, \ldots, b_m$. To see this, note that if $x \in I$, then $x \in (I, a)$ is a linear combination of $a, b_1, \ldots, b_m$, but the coefficient of a must lie in $(I : a)$. As a result, we deduce that the family of finitely generated ideals is an Oka family.

Example 7.25.5. Let us show that the family of principal ideals of a ring R is an Oka family. Indeed, suppose $I \subset R$ is an ideal, $a \in R$, and (I, a) and $(I : a)$ are principal. Note that $(I : a) = (I : (I, a))$. Setting $J = (I, a)$, we find that J is principal and $(I : J)$ is too. By Lemma 7.25.1 we have $I = J(I : J)$. Thus we find in our situation that since $J = (I, a)$ and $(I : J)$ are principal, I is principal.

Example 7.25.6. Let R be a ring. Let κ be an infinite cardinal. The family of ideals which can be generated by at most κ elements is an Oka family. The argument is analogous to the argument in Example 7.25.4 and is omitted.

Proposition 7.25.7. *If $\mathcal{F}$ is an Oka family of ideals, then any maximal element of the complement of $\mathcal{F}$ is prime.*

Proof. Suppose $I \notin \mathcal{F}$ is maximal with respect to not being in $\mathcal{F}$ but I is not prime. Note that $I \neq R$ because $R \in \mathcal{F}$. Since I is not prime we can find $a, b \in R - I$ with $ab \in I$. it follows that $(I, a) \neq I$ and $(I : a)$ contains $b \notin I$ so also $(I : a) \neq I$. Thus $(I : a), (I, a)$ both strictly contain I, so they must belong to $\mathcal{F}$. By the Oka condition, we have $I \in \mathcal{F}$, a contradiction. ☐

At this point we are able to turn most of the examples above into a lemma about prime ideals in a ring.

Lemma 7.25.8. *Let R be a ring. Let S be a multiplicative subset of R. An ideal $I \subset R$ which is maximal with respect to the property that $I \cap S = \emptyset$ is prime.*

Proof. This is the example discussed in the introduction to this section. For an alternative proof, combine Example 7.25.3 with Proposition 7.25.7. ☐

Lemma 7.25.9. *Let R be a ring.*

(1) *An ideal $I \subset R$ maximal with respect to not being finitely generated is prime.*
(2) *If every prime ideal of R is finitely generated, then every ideal of R is finitely generated*[1].

Proof. The first assertion is an immediate consequence of Example 7.25.4 and Proposition 7.25.7. For the second, suppose that there exists an ideal $I \subset R$ which is not finitely generated. The union of a totally ordered chain $\{I_\alpha\}$ of ideals that are not finitely generated is not finitely generated; indeed, if $I = \bigcup I_\alpha$ were generated by $a_1, \ldots, a_n$, then all the generators would belong to some I_α and would consequently generate it. By Zorn's lemma, there is an ideal maximal with respect to being not finitely generated. By the first part this ideal is prime. ☐

Lemma 7.25.10. *Let R be a ring.*

(1) *An ideal $I \subset R$ maximal with respect to not being principal is prime.*
(2) *If every prime ideal of R is principal, then every ideal of R is principal.*

Proof. This first part follows from Example 7.25.5 and Proposition 7.25.7. For the second, suppose that there exists an ideal $I \subset R$ which is not principal. The union of a totally ordered chain $\{I_\alpha\}$ of ideals that not principal is not principal; indeed, if $I = \bigcup I_\alpha$ were generated by a, then a would belong to some I_α and a would generate it. By Zorn's lemma, there is an ideal maximal with respect to not being principal. This ideal is necessarily prime by the first part. ☐

[1]Later we will say that R is Noetherian.

Lemma 7.25.11. *Let R be a ring.*

(1) *An ideal maximal among the ideals which do not contain a zero divisor is prime.*
(2) *If every nonzero prime ideal in R contains a non-zerodivisor, then R is a domain.*

Proof. Consider the set S of nonzerodivisors. It is a multiplicative subset of R. Hence any ideal maximal with respect to not intersecting S is prime, see Lemma 7.25.8. Thus, if every nonzero prime ideal contains a nonzero divisor, then (0) is prime, i.e., R is a domain. □

Remark 7.25.12. Let R be a ring. Let κ be an infinite cardinal. By applying Example 7.25.6 and Proposition 7.25.7 we see that any ideal maximal with respect to the property of not being generated by κ elements is prime. This result is not so useful because there exists a ring for which every prime ideal of R can be generated by $\aleph_0$ elements, but some ideal cannot. Namely, let k be a field, let T be a set whose cardinality is greater than $\aleph_0$ and let

$$R = k[\{x_n\}_{n\geq 1}, \{z_{t,n}\}_{t\in T, n\geq 0}]/(x_n^2, z_{t,n}^2, x_n z_{t,n} - z_{t,n-1})$$

This is a local ring with unique prime ideal $\mathfrak{m} = (x_n)$. But the ideal $(z_{t,n})$ cannot be generated by countably many elements.

7.26. Images of ring maps of finite presentation

In this section we prove some results on the topology of maps $Spec(S) \to Spec(R)$ induced by ring maps $R \to S$, mainly Chevalley's Theorem. In order to do this we will use the notions of constructible sets, quasi-compact sets, retrocompact sets, and so on which are defined in Topology, Section 5.9.

Lemma 7.26.1. *Let $U \subset Spec(R)$ be open. The following are equivalent:*

(1) *U is retrocompact in $Spec(R)$,*
(2) *U is quasi-compact, and*
(3) *U is a finite union of standard opens.*

Proof. The implication (2)⇒(3) is immediate from the fact that standard opens form a basis for the topology. Each standard open is homeomorphic to the spectrum of a ring and hence quasi-compact, by Lemmas 7.16.10 and 7.16.6. Hence a finite union of standard opens is quasi-compact as well. To finish it suffices to show that a finite union $\bigcup_{i=1\ldots n} D(f_i)$ is retrocompact in $Spec(R)$. In order to do this it suffices to show that $(\bigcup_{i=1\ldots n} D(f_i)) \cap (\bigcup_{j=1\ldots m} D(g_j))$ is quasi-compact, which is clear because it equals $\bigcup_{i,j} D(f_i g_j)$. □

Lemma 7.26.2. *Let $\varphi : R \to S$ be a ring map. The induced continuous map $f : Spec(S) \to Spec(R)$ is quasi-compact. For any constructible set $E \subset Spec(R)$ the inverse image $f^{-1}(E)$ is constructible in $Spec(S)$.*

Proof. We first show that the inverse image of any quasi-compact open $U \subset Spec(R)$ is quasi-compact. By Lemma 7.26.1 we may write U as a finite open of standard opens. Thus by Lemma 7.16.4 we see that $f^{-1}(U)$ is a finite union of standard opens. Hence $f^{-1}(U)$ is quasi-compact by Lemma 7.26.1 again. The second assertion now follows from Topology, Lemma 5.10.3. □

Lemma 7.26.3. *Let R be a ring and let $T \subset Spec(R)$ be constructible. Then there exists a ring map $R \to S$ of finite presentation such that T is the image of $Spec(S)$ in $Spec(R)$.*

Proof. Let $T \subset Spec(R)$ be constructible. The spectrum of a finite product of rings is the disjoint union of the spectra, see Lemma 7.18.2. Hence if $T = T_1 \cup T_2$ and the result holds for T_1 and T_2, then the result holds for T. In particular we may assume that $T =$

$U \cap V^c$, where $U, V \subset Spec(R)$ are retrocompact open. By Lemma 7.26.1 we may write $T = (\bigcup D(f_i)) \cap (\bigcup D(g_j))^c = \bigcup \big(D(f_i) \cap V(g_1, \ldots, g_m)\big)$. In fact we may assume that $T = D(f) \cap V(g_1, \ldots, g_m)$ (by the argument on unions above). In this case T is the image of the map $R \to (R/(g_1, \ldots, g_m))_f$, see Lemmas 7.16.6 and 7.16.7. □

Lemma 7.26.4. *Let R be a ring. Let f be an element of R. Let $S = R_f$. Then the image of a constructible subset of $Spec(S)$ is constructible in $Spec(R)$.*

Proof. We repeatedly use Lemma 7.26.1 without mention. Let U, V be quasi-compact open in $Spec(S)$. We will show that the image of $U \cap V^c$ is constructible. Under the identification $Spec(S) = D(f)$ of Lemma 7.16.6 the sets U, V correspond to quasi-compact opens U', V' of $Spec(R)$. Hence it suffices to show that $U' \cap (V')^c$ is constructible in $Spec(R)$ which is clear. □

Lemma 7.26.5. *Let R be a ring. Let I be a finitely generated ideal of R. Let $S = R/I$. Then the image of a constructible of $Spec(S)$ is constructible in $Spec(R)$.*

Proof. If $I = (f_1, \ldots, f_m)$, then we see that $V(I)$ is the complement of $\bigcup D(f_i)$, see Lemma 7.16.2. Hence it is constructible, by Lemma 7.26.1. Denote the map $R \to S$ by $f \mapsto \overline{f}$. We have to show that if $\overline{U}, \overline{V}$ are retrocompact opens of $Spec(S)$, then the image of $\overline{U} \cap \overline{V}^c$ in $Spec(R)$ is constructible. By Lemma 7.26.1 we may write $\overline{U} = \bigcup D(\overline{g_i})$. Setting $U = \bigcup D(g_i)$ we see $\overline{U}$ has image $U \cap V(I)$ which is constructible in $Spec(R)$. Similarly the image of $\overline{V}$ equals $V \cap V(I)$ for some retrocompact open V of $Spec(R)$. Hence the image of $\overline{U} \cap \overline{V}^c$ equals $U \cap V(I) \cap V^c$ as desired. □

Lemma 7.26.6. *Let R be a ring. The map $Spec(R[x]) \to Spec(R)$ is open, and the image of any standard open is a quasi-compact open.*

Proof. It suffices to show that the image of a standard open $D(f)$, $f \in R[x]$ is quasi-compact open. The image of $D(f)$ is the image of $Spec(R[x]_f) \to Spec(R)$. Let $\mathfrak{p} \subset R$ be a prime ideal. Let $\overline{f}$ be the image of f in $\kappa(\mathfrak{p})[x]$. Recall, see Lemma 7.16.9, that $\mathfrak{p}$ is in the image if and only if $R[x]_f \otimes_R \kappa(\mathfrak{p}) = \kappa(\mathfrak{p})[x]_{\overline{f}}$ is not the zero ring. This is exactly the condition that f does not map to zero in $\kappa(\mathfrak{p})[x]$, in other words, that some coefficient of f is not in $\mathfrak{p}$. Hence we see: if $f = a_d x^d + \ldots a_0$, then the image of $D(f)$ is $D(a_d) \cup \ldots \cup D(a_0)$. □

We prove a property of characteristic polynomials which will be used below.

Lemma 7.26.7. *Let $R \to A$ be a ring homomorphism. Assume $A \cong R^{\oplus n}$ as an R-module. Let $f \in A$. The multiplication map $m_f : A \to A$ is R-linear and hence has a characteristic polynomial $P(T) = T^n + r_{n-1}T^{n-1} + \cdots + r_0 \in R[T]$. For any prime $\mathfrak{p} \in Spec(R)$, f acts nilpotently on $A \otimes_R \kappa(\mathfrak{p})$ if and only if $\mathfrak{p} \in V(r_0, \ldots, r_{n-1})$.*

Proof. This follows quite easily once we prove that the characteristic polynomial $\bar{P}(T) \in \kappa(\mathfrak{p})[T]$ of the multiplication map $m_{\bar{f}} : A \otimes_R \kappa(\mathfrak{p}) \to A \otimes_R \kappa(\mathfrak{p})$ which multiplies elements of $A \otimes_R \kappa(\mathfrak{p})$ by $\bar{f}$, the image of f viewed in $\kappa(\mathfrak{p})$, is just the image of $P(T)$ in $\kappa(\mathfrak{p})[T]$. Let (a_{ij}) be the matrix of the map m_f with entries in R, using a basis $e_1, \ldots, e_n$ of A as an R-module. Then, $A \otimes_R \kappa(\mathfrak{p}) \cong (R \otimes_R \kappa(\mathfrak{p}))^{\oplus n} = \kappa(\mathfrak{p})^n$, which is an n-dimensional vector space over $\kappa(\mathfrak{p})$ with basis $e_1 \otimes 1, \ldots, e_n \otimes 1$. The image $\bar{f} = f \otimes 1$, and so the multiplication map $m_{\bar{f}}$ has matrix $(a_{ij} \otimes 1)$. Thus, the characteristic polynomial is precisely the image of $P(T)$.

From linear algebra, we know that a linear transformation acts nilpotently on an n-dimensional vector space if and only if the characteristic polynomial is T^n (since the characteristic polynomial divides some power of the minimal polynomial). Hence, f acts nilpotently on $A \otimes_R \kappa(\mathfrak{p})$ if and only if $\bar{P}(T) = T^n$. This occurs if and only if $r_i \in \mathfrak{p}$ for all $0 \leq i \leq n-1$, that is when $\mathfrak{p} \in V(r_0, \ldots, r_{n-1})$. □

Lemma 7.26.8. *Let R be a ring. Let $f, g \in R[x]$ be polynomials. Assume the leading coefficient of g is a unit of R. There exists elements $r_i \in R$, $i = 1 \ldots, n$ such that the image of $D(f) \cap V(g)$ in $Spec(R)$ is $\bigcup_{i=1,\ldots,n} D(r_i)$.*

Proof. Write $g = ux^d + a_{d-1}x^{d-1} + \ldots a_0$, where d is the degree of g, and hence $u \in R^*$. Consider the ring $A = R[x]/(g)$. It is, as an R-module, finite free with basis the images of $1, x, \ldots, x^{d-1}$. Consider multiplication by (the image of) f on A. This is an R-module map. Hence we can let $P(T) \in R[T]$ be the characteristic polynomial of this map. Write $P(T) = T^d + r_{d-1}T^{d-1} + \ldots r_0$. We claim that $r_0, \ldots, r_{d-1}$ have the desired property. We will use below the property of characteristic polynomials that

$$\mathfrak{p} \in V(r_0, \ldots, r_{d-1}) \Leftrightarrow \text{multiplication by } f \text{ is nilpotent on } A \otimes_R \kappa(\mathfrak{p}).$$

This was proved in Lemma 7.26.7 above.

Suppose $\mathfrak{q} \in D(f) \cap V(g)$, and let $\mathfrak{p} = \mathfrak{q} \cap R$. Then there is a nonzero map $A \otimes_R \kappa(\mathfrak{p}) \to \kappa(\mathfrak{q})$ which is compatible with multiplication by f. And f acts as a unit on $\kappa(\mathfrak{q})$. Thus we conclude $\mathfrak{p} \notin V(r_0, \ldots, r_{d-1})$.

On the other hand, suppose that $r_i \notin \mathfrak{p}$ for some prime $\mathfrak{p}$ of R and some $0 \leq i \leq d-1$. Then multiplication by f is not nilpotent on the algebra $A \otimes_R \kappa(\mathfrak{p})$. Hence there exists a maximal ideal $\overline{\mathfrak{q}} \subset A \otimes_R \kappa(\mathfrak{p})$ not containing the image of f. The inverse image of $\overline{\mathfrak{q}}$ in $R[x]$ is an element of $D(f) \cap V(g)$ mapping to $\mathfrak{p}$. □

Theorem 7.26.9. *Chevalley's Theorem. Suppose that $R \to S$ is of finite presentation. The image of a constructible subset of $Spec(S)$ in $Spec(R)$ is constructible.*

Proof. Write $S = R[x_1, \ldots, x_n]/(f_1, \ldots, f_m)$. We may factor $R \to S$ as $R \to R[x_1] \to R[x_1, x_2] \to \ldots \to R[x_1, \ldots, x_{n-1}] \to S$. Hence we may assume that $S = R[x]/(f_1, \ldots, f_m)$. In this case we factor the map as $R \to R[x] \to S$, and by Lemma 7.26.5 we reduce to the case $S = R[x]$. By Lemma 7.26.1 suffices to show that if $T = (\bigcup_{i=1\ldots n} D(f_i)) \cap V(g_1, \ldots, g_m)$ for $f_i, g_j \in R[x]$ then the image in $Spec(R)$ is constructible. Since finite unions of constructible sets are constructible, it suffices to deal with the case $n = 1$, i.e., when $T = D(f) \cap V(g_1, \ldots, g_m)$.

Note that if $c \in R$, then we have

$$Spec(R) = V(c) \coprod D(c) = Spec(R/(c)) \coprod Spec(R_c)),$$

and correspondingly $Spec(R[x]) = V(c) \coprod D(c) = Spec(R/(c)[x]) \coprod Spec(R_c[x]))$. The intersection of $T = D(f) \cap V(g_1, \ldots, g_m)$ with each part still has the same shape, with f, g_i replaced by their images in $R/(c)[x]$, respectively $R_c[x]$. Note that the image of T in $Spec(R)$ is the union of the image of $T \cap V(c)$ and $T \cap D(c)$. Using Lemmas 7.26.4 and 7.26.5 it suffices to prove the images of both parts are constructible in $Spec(R/(c))$, respectively $Spec(R_c)$.

Let us assume we have $T = D(f) \cap V(g_1, \ldots, g_m)$ as above, with $\deg(g_1) \leq \deg(g_2) \leq \ldots \leq \deg(g_m)$. We are going to use descending induction on m, and on the degrees of the g_i. Let $d = \deg(g_1)$, i.e., $g_1 = cx^{d_1} + l.o.t$ with $c \in R$ not zero. Cutting R up into the pieces $R/(c)$ and R_c we either lower the degree of g_1 (and this is covered by induction) or we reduce to the case where c is invertible. If c is invertible, and $m > 1$, then write $g_2 = c'x^{d_2} + l.o.t.$ In this case consider $g_2' = g_2 - (c'/c)x^{d_2-d_1}g_1$. Since the ideals $(g_1, g_2, \ldots, g_m)$ and $(g_1, g_2', g_3, \ldots, g_m)$ are equal we see that $T = D(f) \cap V(g_1, g_2', g_3 \ldots, g_m)$. But here the degree of g_2' is strictly less than the degree of g_2 and hence this case is covered by induction.

The bases case for the induction above are the cases (a) $T = D(f) \cap V(g)$ where the leading coefficient of g is invertible, and (b) $T = D(f)$. These two cases are dealt with in Lemmas 7.26.8 and 7.26.6. □

7.27. More on images

In this section we collect a few additional lemmas concerning the image on *Spec* for ring maps. See also Section 7.36 for example.

Lemma 7.27.1. *Let $R \subset S$ be an inclusion of domains. Assume that $R \to S$ is of finite type. There exists a nonzero $f \in R$, and a nonzero $g \in S$ such that $R_f \to S_{fg}$ is of finite presentation.*

Proof. By induction on the number of generators of S over R.

Suppose that S is generated by a single element over R. Then $S = R[x]/\mathfrak{q}$ for some prime ideal $\mathfrak{q} \subset R[x]$. If $\mathfrak{q} = (0)$ there is nothing to prove. If $\mathfrak{q} \neq (0)$, then let $g \in \mathfrak{q}$ be an element with minimal degree in x. Since $K[x] = f.f.(R)[x]$ is a PID we see that g is irreducible over K and that $f.f.(S) = K[x]/(g)$. Write $g = a_d x^d + \ldots + a_0$ with $a_i \in R$ and $a_d \neq 0$. After inverting a_d in R we may assume that g is monic. Hence we see that $R \to R[x]/(g) \to S$ with the last map surjective. But $R[x]/(g) = R \oplus Rx \oplus \ldots \oplus Rx^{d-1}$ maps injectively into $f.f.(S) = K[x]/(g) = K \oplus Kx \oplus \ldots \oplus Kx^{d-1}$. Thus $S \cong R[x]/(g)$ is finitely presented.

Suppose that S is generated by $n > 1$ elements over R. Say $x_1, \ldots, x_n \in S$ generate S. Denote $S' \subset S$ the subring generated by $x_1, \ldots, x_{n-1}$. By induction hypothesis we see that there exist $f \in R$ and $g \in S'$ nonzero such that $R_f \to S'_{fg}$ is of finite presentation. Next we apply the induction hypothesis to $S'_{fg} \to S_{fg}$ to see that there exist $f' \in S'_{fg}$ and $g' \in S_{fg}$ such that $S'_{fgf'} \to S_{fgf'g'}$ is of finite presentation. We leave it to the reader to conclude. □

Lemma 7.27.2. *Let $R \to S$ be a finite type ring map. Denote $X = Spec(R)$ and $Y = Spec(S)$. Write $f : Y \to X$ the induced map of spectra. Let $E \subset Y = Spec(S)$ be a constructible set. If a point $\xi \in X$ is in $f(E)$, then $\overline{\{\xi\}} \cap f(E)$ contains an open dense subset of $\overline{\{\xi\}}$.*

Proof. Let $\xi \in X$ be a point of $f(E)$. Choose a point $\eta \in E$ mapping to ξ. Let $\mathfrak{p} \subset R$ be the prime corresponding to ξ and let $\mathfrak{q} \subset S$ be the prime corresponding to η. Consider the diagram

$$\begin{tikzcd}
\eta \arrow[r] \arrow[d, mapsto] & E \cap Y' \arrow[r] \arrow[d] & Y' = Spec(S/\mathfrak{q}) \arrow[r] \arrow[d] & Y \arrow[d] \\
\xi \arrow[r] & f(E) \cap X' \arrow[r] & X' = Spec(R/\mathfrak{p}) \arrow[r] & X
\end{tikzcd}$$

By Lemma 7.26.2 the set $E \cap Y'$ is constructible in Y'. It follows that we may replace X by X' and Y by Y'. Hence we may assume that $R \subset S$ is an inclusion of domains, ξ is the generic point of X, and η is the generic point of Y. By Lemma 7.27.1 combined with Chevalley's theorem (Theorem 7.26.9) we see that there exist dense opens $U \subset X$, $V \subset Y$

such that $f(V) \subset U$ and such that $f : V \to U$ maps constructible sets to constructible sets. Note that $E \cap V$ is constructible in V, see Topology, Lemma 5.10.4. Hence $f(E \cap V)$ is constructible in U and contains ξ. By Topology, Lemma 5.10.6 we see that $f(E \cap V)$ contains a dense open $U' \subset U$. $\square$

At the end of this section we present a few more results on images of maps on Spectra that have nothing to do with constructible sets.

Lemma 7.27.3. *Let $\varphi : R \to S$ be a ring map. The following are equivalent:*

1. *The map $Spec(S) \to Spec(R)$ is surjective.*
2. *For any radical ideal $I \subset R$ the inverse image of IS in R is equal to I.*
3. *For every prime $\mathfrak p$ of R the inverse image of $\mathfrak pS$ in R is $\mathfrak p$.*

In this case the same is true after any base change: Given a ring map $R \to R'$ the ring map $R' \to R' \otimes_R S$ has the equivalent properties (1), (2), (3) also.

Proof. The implication (2) $\Rightarrow$ (3) is immediate. If $I \subset R$ is a radical ideal, then Lemma 7.16.2 guarantees that $I = \bigcap_{I \subset \mathfrak p} \mathfrak p$. Hence (3) $\Rightarrow$ (2). By Lemma 7.16.9 we have $\mathfrak p = \varphi^{-1}(\mathfrak pS)$ if and only if $\mathfrak p$ is in the image. Hence (1) $\Leftrightarrow$ (3). Thus (1), (2), and (3) are equivalent.

Assume (1) holds. Let $R \to R'$ be a ring map. Let $\mathfrak p' \subset R'$ be a prime ideal lying over the prime $\mathfrak p$ of R. To see that $\mathfrak p'$ is in the image of $Spec(R' \otimes_R S) \to Spec(R')$ we have to show that $(R' \otimes_R S) \otimes_{R'} \kappa(\mathfrak p')$ is not zero, see Lemma 7.16.9. But we have

$$(R' \otimes_R S) \otimes_{R'} \kappa(\mathfrak p') = S \otimes_R \kappa(\mathfrak p) \otimes_{\kappa(\mathfrak p)} \kappa(\mathfrak p')$$

which is not zero as $S \otimes_R \kappa(\mathfrak p)$ is not zero by assumption and $\kappa(\mathfrak p) \to \kappa(\mathfrak p')$ is an extension of fields. $\square$

Lemma 7.27.4. *Let R be a domain. Let $\varphi : R \to S$ be a ring map. The following are equivalent:*

1. *The ring map $R \to S$ is injective.*
2. *The image $Spec(S) \to Spec(R)$ contains a dense set of points.*
3. *There exists a prime ideal $\mathfrak q \subset S$ whose inverse image in R is (0).*

Proof. Let K be the field of fractions of the domain R. Assume that $R \to S$ is injective. Since localization is exact we see that $K \to S \otimes_R K$ is injective. Hence there is a prime mapping to (0) by Lemma 7.16.9.

Note that (0) is dense in $Spec(R)$, so that the last condition implies the second.

Suppose the second condition holds. Let $f \in R$, $f \neq 0$. As R is a domain we see that $V(f)$ is a proper closed subset of R. By assumption there exists a prime $\mathfrak q$ of S such that $\varphi(f) \notin \mathfrak q$. Hence $\varphi(f) \neq 0$. Hence $R \to S$ is injective. $\square$

Lemma 7.27.5. *Let $R \subset S$ be an injective ring map. Then $Spec(S) \to Spec(R)$ hits all the minimal primes of $Spec(R)$.*

Proof. Let $\mathfrak p \subset R$ be a minimal prime. In this case $R_{\mathfrak p}$ has a unique prime ideal. Hence it suffices to show that $S_{\mathfrak p}$ is not zero. And this follows from the fact that localization is exact, see Proposition 7.9.12. $\square$

Lemma 7.27.6. *Let $R \to S$ be a ring map. The following are equivalent:*

1. *The kernel of $R \to S$ consists of nilpotent elements.*
2. *The minimal primes of R are in the image of $Spec(S) \to Spec(R)$.*

(3) *The image of $Spec(S) \to Spec(R)$ is dense in $Spec(R)$.*

Proof. Let $I = \text{Ker}(R \to S)$. Note that $\sqrt{(0)} = \bigcap_{\mathfrak q \subset S} \mathfrak q$, see Lemma 7.16.2. Hence $\sqrt{I} = \bigcap_{\mathfrak q \subset S} R \cap \mathfrak q$. Thus $V(I) = V(\sqrt{I})$ is the closure of the image of $Spec(S) \to Spec(R)$. This shows that (1) is equivalent to (3). It is clear that (2) implies (3). Finally, assume (1). We may replace R by R/I and S by S/IS without affecting the topology of the spectra and the map. Hence the implication (1) $\Rightarrow$ (2) follows from Lemma 7.27.5 above. $\square$

7.28. Noetherian rings

A ring R is *Noetherian* if any ideal of R is finitely generated. This is clearly equivalent to the ascending chain condition for ideals of R. By Lemma 7.25.9 it suffices to check that every prime ideal of R is finitely generated.

Lemma 7.28.1. *Any finitely generated ring over a Noetherian ring is Noetherian. Any localization of a Noetherian ring is Noetherian.*

Proof. The statement on localizations follows from the fact that any ideal $J \subset S^{-1}R$ is of the form $I \cdot S^{-1}R$. Any quotient R/I of a Noetherian ring R is Noetherian because any ideal $\overline{J} \subset R/I$ is of the form J/I for some ideal $I \subset J \subset R$. Thus it suffices to show that if R is Noetherian so is $R[X]$. Suppose $J_1 \subset J_2 \subset \ldots$ is an ascending chain of ideals in $R[X]$. Consider the ideals $I_{i,d}$ defined as the ideal of elements of R which occur as leading coefficients of degree d polynomials in J_i. Clearly $I_{i,d} \subset I_{i',d'}$ whenever $i \leq i'$ and $d \leq d'$. By the ascending chain condition in R there are at most finitely many distinct ideals among all of the $I_{i,d}$. (Hint: Any infinite set of elements of $\mathbf{N} \times \mathbf{N}$ contains an increasing infinite sequence.) Take i_0 so large that $I_{i,d} = I_{i_0,d}$ for all $i \geq i_0$ and all d. Suppose $f \in J_i$ for some $i \geq i_0$. By induction on the degree $d = \deg(f)$ we show that $f \in J_{i_0}$. Namely, there exists a $g \in J_{i_0}$ whose degree is d and which has the same leading coefficient as f. By induction $f - g \in J_{i_0}$ and we win. $\square$

Lemma 7.28.2. *If R is a Noetherian ring, then so is the formal power series ring $R[[x_1, \ldots, x_n]]$.*

Proof. Since $R[[x_1, \ldots, x_{n+1}]] \cong R[[x_1, \ldots, x_n]][[x_{n+1}]]$ it suffices to prove the statement that $R[[x]]$ is Noetherian if R is Noetherian. Let $I \subset R[[x]]$ be a ideal. We have to show that I is a finitely generated ideal. For each integer d denote $I_d = \{a \in R \mid ax^d + \text{h.o.t.} \in I\}$. Then we see that $I_0 \subset I_1 \subset \ldots$ stabilizes as R is Noetherian. Choose d_0 such that $I_{d_0} = I_{d_0+1} = \ldots$. For each $d \leq d_0$ choose elements $f_{d,j} \in I \cap (x^d)$, $j = 1, \ldots, n_d$ such that if we write $f_{d,j} = a_{d,j}x^d + \text{h.o.t}$ then $I_d = (a_{d,j})$. Denote $I' = (\{f_{d,j}\}_{d=0,\ldots,d_0, j=1,\ldots,n_d})$. Then it is clear that $I' \subset I$. Pick $f \in I$. First we may choose $c_{d,i} \in R$ such that

$$f - \sum c_{d,i} f_{d,i} \in (x^{d_0+1}) \cap I.$$

Next, we can choose $c_{i,1} \in R$, $i = 1, \ldots, n_{d_0}$ such that

$$f - \sum c_{d,i} f_{d,i} - \sum c_{i,1} x f_{d_0,i} \in (x^{d_0+2}) \cap I.$$

Next, we can choose $c_{i,2} \in R$, $i = 1, \ldots, n_{d_0}$ such that

$$f - \sum c_{d,i} f_{d,i} - \sum c_{i,1} x f_{d_0,i} - \sum c_{i,2} x^2 f_{d_0,i} \in (x^{d_0+3}) \cap I.$$

And so on. In the end we see that

$$f = \sum c_{d,i} f_{d,i} + \sum\nolimits_i (\sum\nolimits_e c_{i,e} x^e) f_{d_0,i}$$

is contained in I' as desired. $\square$

The following lemma, although easy, is useful because finite type $\mathbf{Z}$-algebras come up quite often in a technique called ``absolute Noetherian reduction''.

Lemma 7.28.3. *Any finite type algebra over a field is Noetherian. Any finite type algebra over $\mathbf{Z}$ is Noetherian.*

Proof. This is immediate from the above and the fact that $\mathbf{Z}$ is a Noetherian ring because it is a principal ideal domain. ☐

Lemma 7.28.4. *Let R be a Noetherian ring.*

(1) *Any finite R-module is of finite presentation.*
(2) *Any finite type R-algebra is of finite presentation over R.*

Proof. Let M be a finite R-module. By Lemma 7.5.5 we can find a finite filtration of M whose succesive quotients are of the form R/I. Since any ideal is finitely generated, each of the quotients R/I is finitely presented. Hence M is finitely presented by Lemma 7.5.4. This proves (1). To see (2) note that any ideal of $R[x_1, \ldots, x_n]$ is finitely generated by Lemma 7.28.1 above. ☐

Lemma 7.28.5. *If R is a Noetherian ring then $Spec(R)$ is a Noetherian topological space, see Topology, Definition 5.6.1.*

Proof. This is because any closed subset of $Spec(R)$ is uniquely of the form $V(I)$ with I a radical ideal, see Lemma 7.16.2. And this correspondence is inclusion reversing. Thus the result follows from the definitions. ☐

Lemma 7.28.6. *If R is a Noetherian ring then $Spec(R)$ has finitely many irreducible components. In other words R has finitely many minimal primes.*

Proof. By Lemma 7.28.5 and Topology, Lemma 5.6.2 we see there are finitely many irreducible components. By Lemma 7.23.1 these correspond to minimal primes of R. ☐

Lemma 7.28.7. *Let k be a field and let R be a Noetherian k-algebra. If $k \subset K$ is a finitely generated field extension the $K \otimes_k R$ is Noetherian.*

Proof. Write $K = S^{-1}B$ where B is a finite type k-algebra, and $S \subset B$ is a multiplicative subset. Then we have $K \otimes_k R = S^{-1}(B \otimes_k R)$. Hence $K \otimes_k R$ is a localization of the finite type R-algebra $B \otimes_k R$ which is Noetherian by Lemma 7.28.1. ☐

Here is fun lemma that is sometimes useful.

Lemma 7.28.8. *Any surjective endomorphism of a Noetherian ring is an isomorphism.*

Proof. If $f : R \to R$ were such an endomorphism but not injective, then

$$\mathrm{Ker}(f) \subset \mathrm{Ker}(f \circ f) \subset \mathrm{Ker}(f \circ f \circ f) \subset \ldots$$

would be a strictly increasing chain of ideals. ☐

7.29. Curiosity

Lemma 7.20.3 explains what happens if $V(I)$ is open for some ideal $I \subset R$. But what if $Spec(S^{-1}R)$ is closed in $Spec(R)$? The next two lemmas give a partial answer. For more information see Section 7.100.

Lemma 7.29.1. *Let R be a ring. Let $S \subset R$ be a multiplicative subset. Assume the image of the map $Spec(S^{-1}R) \to Spec(R)$ is closed. Then $S^{-1}R \cong R/I$ for some ideal $I \subset R$.*

Proof. Let $I = \text{Ker}(R \to S^{-1}R)$ so that $V(I)$ contains the image. Say the image is the closed subset $V(I') \subset Spec(R)$ for some ideal $I' \subset R$. So $V(I') \subset V(I)$. For $f \in I'$ we see that $f/1 \in S^{-1}R$ is contained in every prime ideal. Hence f^n maps to zero in $S^{-1}R$ for some $n \geq 1$ (Lemma 7.16.2). Hence $V(I') = V(I)$. Then this implies every $g \in S$ is invertible mod I. Hence we get ring maps $R/I \to S^{-1}R$ and $S^{-1}R \to R/I$. The first map is injective by choice of I. The second is the map $S^{-1}R \to S^{-1}(R/I) = R/I$ which has kernel $S^{-1}I$ because localization is exact. Since $S^{-1}I = 0$ we see also the second map is injective. Hence $S^{-1}R \cong R/I$. ☐

Lemma 7.29.2. *Let R be a ring. Let $S \subset R$ be a multiplicative subset. Assume the image of the map $Spec(S^{-1}R) \to Spec(R)$ is closed. If R is Noetherian, or $Spec(R)$ is a Noetherian topological space, or S is finitely generated as a monoid, then $R \cong S^{-1}R \times R'$ for some ring R'.*

Proof. By Lemma 7.29.1 we have $S^{-1}R \cong R/I$ for some ideal $I \subset R$. By Lemma 7.20.3 it suffices to show that $V(I)$ is open. If R is Noetherian then $Spec(R)$ is a Noetherian topological space, see Lemma 7.28.5. If $Spec(R)$ is a Noetherian topological space, then the complement $Spec(R) \setminus V(I)$ is quasi-compact, see Topology, Lemma 5.9.9. Hence there exist finitely many $f_1, \ldots, f_n \in I$ such that $V(I) = V(f_1, \ldots, f_n)$. Since each f_i maps to zero in $S^{-1}R$ there exists a $g \in S$ such that $gf_i = 0$ for $i = 1, \ldots, n$. Hence $D(g) = V(I)$ as desired. In case S is finitely generated as a monoid, say S is generated by $g_1, \ldots, g_m$, then $S^{-1}R \cong R_{g_1 \ldots g_m}$ and we conclude that $V(I) = D(g_1 \ldots g_m)$. ☐

7.30. Hilbert Nullstellensatz

Theorem 7.30.1. *(Hilbert Nullstellensatz) Let k be a field.*

(1) *For any maximal ideal $\mathfrak{m} \subset k[x_1, \ldots, x_n]$ the field extension $k \subset \kappa(\mathfrak{m})$ is finite.*
(2) *Any radical ideal $I \subset k[x_1, \ldots, x_n]$ is the intersection of maximal ideals containing it.*

The same is true in any finite type k-algebra.

Proof. It is enough to prove part (1) of the theorem for the case of a polynomial algebra $k[x_1, \ldots, x_n]$, because any finitely generated k-algebra is a quotient of such a polynomial algebra. We prove this by induction on n. The case $n = 0$ is clear. Suppose that $\mathfrak{m}$ is a maximal ideal in $k[x_1, \ldots, x_n]$. Let $\mathfrak{p} \subset k[x_n]$ be the intersection of $\mathfrak{m}$ with $k[x_n]$.

If $\mathfrak{p} \neq (0)$, then $\mathfrak{p}$ is maximal and generated by an irreducible monic polynomial P (because of the Euclidean algorithm in $k[x_n]$). Then $k' = k[x_n]/\mathfrak{p}$ is a finite field extension of k and contained in $\kappa(\mathfrak{m})$. In this case we get a surjection

$$k'[x_1, \ldots, x_{n-1}] \to k'[x_1, \ldots, x_n] = k' \otimes_k k[x_1, \ldots, x_n] \longrightarrow \kappa(\mathfrak{m})$$

and hence we see that $\kappa(\mathfrak{m})$ is a finite extension of k' by induction hypothesis. Thus $\kappa(\mathfrak{m})$ is finite over k as well.

If $\mathfrak{p} = (0)$ we consider the ring extension $k[x_n] \subset k[x_1, \ldots, x_n]/\mathfrak{m}$. This is a finitely generated ring extension, hence of finite presentation by Lemmas 7.28.3 and 7.28.4. Thus the image of $Spec(k[x_1, \ldots, x_n]/\mathfrak{m})$ in $Spec(k[x_n])$ is constructible by Theorem 7.26.9. Since the image contains (0) we conclude that it contains a standard open $D(f)$ for some $f \in k[x_n]$ nonzero. Since clearly $D(f)$ is infinite we get a contradiction with the assumption that $k[x_1, \ldots, x_n]/\mathfrak{m}$ is a field (and hence has a spectrum consisting of one point).

To prove part (2) let $I \subset R$ be radical, with R of finite type over k. Let $f \in R$, $f \notin I$. Pick a maximal ideal $\mathfrak{m}'$ in the nonzero ring $R_f/IR_f = (R/I)_f$. Let $\mathfrak{m} \subset R$ be the inverse image of $\mathfrak{m}'$ in R. We see that $I \subset \mathfrak{m}$ and $f \notin \mathfrak{m}$. If we show that $\mathfrak{m}$ is a maximal ideal of R, then we are done. We clearly have

$$k \subset R/\mathfrak{m} \subset \kappa(\mathfrak{m}').$$

By part (1) the field extension $k \subset \kappa(\mathfrak{m}')$ is finite. By elementary field theory we conclude that $R/\mathfrak{m}$ is a field. □

Lemma 7.30.2. *Let R be a ring. Let K be a field. If $R \subset K$ and K is of finite type over R, then there exists a $f \in R$ such that R_f is a field, and $R_f \subset K$ is a finite field extension.*

Proof. By Lemma 7.27.2 there exist a nonempty open $U \subset Spec(R)$ contained in the image $\{(0)\}$ of $Spec(K) \to Spec(R)$. Choose $f \in R$, $f \neq 0$ such that $D(f) \subset U$, i.e., $D(f) = \{(0)\}$. Then R_f is a domain whose spectrum has exactly one point and R_f is a field. Then K is a finitely generated algebra over the field R_f and hence a finite field extension of R_f by the Hilbert Nullstellensatz above. □

7.31. Jacobson rings

Let R be a ring. The closed points of $Spec(R)$ are the maximal ideals of R. Often rings which occur naturally in algebraic geometry have lots of maximal ideals. For example finite type algebras over a field or over $\mathbf{Z}$. We will show that these are examples of Jacobson rings.

Definition 7.31.1. Let R be a ring. We say that R is a *Jacobson ring* if every radical ideal I is the intersection of the maximal ideals containing it.

Lemma 7.31.2. *Any algebra of finite type over a field is Jacobson.*

Proof. This follows from Theorem 7.30.1 and Definition 7.31.1. □

Lemma 7.31.3. *Let R be a ring. If every prime ideal of R is the intersection of the maximal ideals containing it, then R is Jacobson.*

Proof. This is immediately clear from the fact that every radical ideal $I \subset R$ is the intersection of the primes containing it. See Lemma 7.16.2. □

Lemma 7.31.4. *A ring R is Jacobson if and only if $Spec(R)$ is Jacobson, see Topology, Definition 5.13.1.*

Proof. Suppose R is Jacobson. Let $Z \subset Spec(R)$ be a closed subset. We have to show that the set of closed points in Z is dense in Z. Let $U \subset Spec(R)$ be an open such that $U \cap Z$ is nonempty. We have to show $Z \cap U$ contains a closed point of $Spec(R)$. We may assume $U = D(f)$ as standard opens form a basis for the topology on $Spec(R)$. According to Lemma 7.16.2 we may assume that $Z = V(I)$, where I is a radical ideal. We see also that $f \notin I$. By assumption, there exists a maximal ideal $\mathfrak{m} \subset R$ such that $I \subset \mathfrak{m}$ but $f \notin \mathfrak{m}$. Hence $\mathfrak{m} \in D(f) \cap V(I) = U \cap Z$ as desired.

Conversely, suppose that $Spec(R)$ is Jacobson. Let $I \subset R$ be a radical ideal. Let $J = \cap_{I \subset \mathfrak{m}} \mathfrak{m}$ be the intersection of the maximal ideals containing I. Clearly J is radical, $V(J) \subset V(I)$, and $V(J)$ is the smallest closed subset of $V(I)$ containing all the closed points of $V(I)$. By assumption we see that $V(J) = V(I)$. But Lemma 7.16.2 shows there is a bijection between Zariski closed sets and radical ideals, hence $I = J$ as desired. □

Lemma 7.31.5. *Let R be a ring. If R is not Jacobson there exist a prime $\mathfrak{p} \subset R$, an element $f \in R$ such that the following hold*

(1) $\mathfrak{p}$ *is not a maximal ideal,*
(2) $f \notin \mathfrak{p}$,
(3) $V(\mathfrak{p}) \cap D(f) = \{\mathfrak{p}\}$, *and*
(4) $(R/\mathfrak{p})_f$ *is a field.*

On the other hand, if R is Jacobson, then for any pair $(\mathfrak{p}, f)$ such that (1) and (2) hold the set $V(\mathfrak{p}) \cap D(f)$ is infinite.

Proof. Assume R is not Jacobson. By Lemma 7.31.4 this means there exists an closed subset $T \subset Spec(R)$ whose set $T_0 \subset T$ of closed points is not dense in T. Choose an $f \in R$ such that $T_0 \subset V(f)$ but $T \not\subset V(f)$. Note that $T \cap D(f)$ is homeomorphic to $Spec((R/I)_f)$ if $T = V(I)$, see Lemmas 7.16.7 and 7.16.6. As any ring has a maximal ideal (Lemma 7.16.2) we can choose a closed point t of space $T \cap D(f)$. Then t corresponds to a prime ideal $\mathfrak{p} \subset R$ which is not maximal (as $t \notin T_0$). Thus (1) holds. By construction $f \notin \mathfrak{p}$, hence (2). As t is a closed point of $T \cap D(f)$ we see that $V(\mathfrak{p}) \cap D(f) = \{\mathfrak{p}\}$, i.e., (3) holds. Hence we conclude that $(R/\mathfrak{p})_f$ is a domain whose spectrum has one point, hence (4) holds (for example combine Lemmas 7.17.2 and 7.23.3).

Conversely, suppose that R is Jacobson and $(\mathfrak{p}, f)$ satisfy (1) and (2). If $V(\mathfrak{p}) \cap V(f) = \{\mathfrak{p}, \mathfrak{q}_1, \ldots, \mathfrak{q}_t\}$ then $\mathfrak{p} \neq \mathfrak{q}_i$ implies there exists an element $g \in R$ such that $g \notin \mathfrak{p}$ but $g \in \mathfrak{q}_i$ for all i. Hence $V(\mathfrak{p}) \cap D(fg) = \{\mathfrak{p}\}$ which is impossible since each locally closed subset of $Spec(R)$ contains at least one closed point as $Spec(R)$ is a Jacobson topological space. □

Lemma 7.31.6. *The ring $\mathbf{Z}$ is a Jacobson ring. More generally, let R be a ring such that*

(1) *R is a domain,*
(2) *R is Noetherian,*
(3) *any nonzero prime ideal is a maximal ideal, and*
(4) *R has infinitely many maximal ideals.*

Then R is a Jacobson ring.

Proof. Let R satisfy (1), (2), (3) and (4). The statement means that $(0) = \bigcap_{\mathfrak{m} \subset R} \mathfrak{m}$. Since R has infinitely many maximal ideals it suffices to show that any nonzero $x \in R$ is contained in at most finitely many maximal ideals, in other words that $V(x)$ is finite. By Lemma 7.16.7 we see that $V(x)$ is homeomorphic to $Spec(R/xR)$. By assumption (3) every prime of R/xR is minimal and hence corresponds to an irreducible component of $Spec(R)$ (Lemma 7.23.1). As R/xR is Noetherian, the topological space $Spec(R/xR)$ is Noetherian (Lemma 7.28.5) and has finitely many irreducible components (Topology, Lemma 5.6.2). Thus $V(x)$ is finite as desired. □

Example 7.31.7. Let A be an infinite set. For each $\alpha \in A$, let k_α be a field. We claim that $R = \prod_{\alpha \in A} k_\alpha$ is Jacobson. First, note that any element $f \in R$ has the form $f = ue$, with $u \in R$ a unit and $e \in R$ an idempotent (left to the reader). Hence $D(f) = D(e)$, and $R_f = R_e = R/(1-e)$ is a quotient of R. Actually, any ring with this property is Jacobson. Namely, say $\mathfrak{p} \subset R$ is a prime ideal and $f \in R$, $f \notin \mathfrak{p}$. We have to find a maximal ideal $\mathfrak{m}$ of R such that $\mathfrak{p} \subset \mathfrak{m}$ and $f \notin \mathfrak{m}$. Because R_f is a quotient of R we see that any maximal ideal of R_f corresponds to a maximal ideal of R not containing f. Hence the result follows by choosing a maximal ideal of R_f containing $\mathfrak{p}R_f$.

Example 7.31.8. A domain R with finitely many maximal ideals $\mathfrak{m}_i$, $i = 1, \ldots, n$ is not a Jacobson ring, except when it is a field. Namely, in this case (0) is not the intersection of the maximal ideals $(0) \neq \mathfrak{m}_1 \cap \mathfrak{m}_2 \cap \ldots \cap \mathfrak{m}_n \supset \mathfrak{m}_1 \cdot \mathfrak{m}_2 \cdot \ldots \cdot \mathfrak{m}_n \neq 0$. In particular a discrete valuation ring, or any local ring with at least two prime ideals is not a Jacobson ring.

Lemma 7.31.9. *Let $R \to S$ be a ring map. Let $\mathfrak{m} \subset R$ be a maximal ideal. Let $\mathfrak{q} \subset S$ be a prime ideal lying over $\mathfrak{m}$ such that $\kappa(\mathfrak{m}) \subset \kappa(\mathfrak{q})$ is an algebraic field extension. Then $\mathfrak{q}$ is a maximal ideal of S.*

Proof. Consider the diagram

$$\begin{tikzcd} S \arrow[r] & S/\mathfrak{q} \arrow[r] & \kappa(\mathfrak{q}) \\ R \arrow[r] \arrow[u] & R/\mathfrak{m} \arrow[u] & \end{tikzcd}$$

We see that $\kappa(\mathfrak{m}) \subset S/\mathfrak{q} \subset \kappa(\mathfrak{q})$. Because the field extension $\kappa(\mathfrak{m}) \subset \kappa(\mathfrak{q})$ is algebraic, any ring between $\kappa(\mathfrak{m})$ and $\kappa(\mathfrak{q})$ is a field (by elementary field theory). Thus $S/\mathfrak{q}$ is a field, and a posteriori equal to $\kappa(\mathfrak{q})$. $\square$

Lemma 7.31.10. *Suppose that k is a field and suppose that V is a nonzero vector space over k. Asssume the dimension of V (which is a cardinal number) is smaller than the cardinality of k. Then for any linear operator $T : V \to V$ there exists some monic polynomial $P(t) \in k[t]$ such that $P(T)$ is not invertible.*

Proof. If not then V inherits the structure of a vector space over the field $k(t)$. But the dimension of $k(t)$ over k is at least the cardinality of k for example due to the fact that the elements $\frac{1}{t-\lambda}$ are k-linearly independent. $\square$

Here is another version of Hilbert's Nullstellensatz.

Theorem 7.31.11. *Let k be a field. Let S be a k-algebra generated over k by the elements $\{x_i\}_{i\in I}$. Assume the cardinality of I is smaller than the cardinality of k. Then*

(1) *for all maximal ideals $\mathfrak{m} \subset S$ the field extension $k \subset \kappa(\mathfrak{m})$ is algebraic, and*
(2) *S is a Jacobson ring.*

Proof. If I is finite then the result follows from the Hilbert Nullstellensatz, Theorem 7.30.1. In the rest of the proof we assume I is infinite. It suffices to prove the result for $\mathfrak{m} \subset k[\{x_i\}_{i\in I}]$ maximal in the polynomial ring on variables x_i, since S is a quotient of this. As I is infinite the set of monomials $x_{i_1}^{e_1} \ldots x_{i_r}^{e_r}$, $i_1, \ldots, i_r \in I$ and $e_1, \ldots, e_r \geq 0$ has cardinality at most equal to the cardinality of I. Because the cardinality of $I \times \ldots \times I$ is the cardinality of I, and also the cardinality of $\bigcup_{n\geq 0} I^n$ has the same cardinality. (If I is finite, then this is not true and in that case this proof only works if k is uncountable.)

To arrive at a contradiction pick $T \in \kappa(\mathfrak{m})$ transcendental over k. Note that the k-linear map $T : \kappa(\mathfrak{m}) \to \kappa(\mathfrak{m})$ given by multiplication by T has the property that $P(T)$ is invertible for all monic polynomials $P(t) \in k[t]$. Also, $\kappa(\mathfrak{m})$ has dimension at most the cardinality of I over k since it is a quotient of the vector space $k[\{x_i\}_{i\in I}]$ over k (whose dimension is $\#I$ as we saw above). This is impossible by Lemma 7.31.10.

To show that S is Jacobson we argue as follows. If not then there exists a prime $\mathfrak{q} \subset S$ and an element $f \in S$, $f \not\in \mathfrak{q}$ such that $\mathfrak{q}$ is not maximal and $(S/\mathfrak{q})_f$ is a field, see Lemma 7.31.5. But note that $(S/\mathfrak{q})_f$ is generated by at most $\#I + 1$ elements. Hence the field extension $k \subset (R/\mathfrak{q})_f$ is algebraic (by the first part of the proof). This implies that $\kappa(\mathfrak{q})$ is an algebraic extension of k hence $\mathfrak{q}$ is maximal by Lemma 7.31.9. This contradiction finishes the proof. $\square$

Lemma 7.31.12. *Let k be a field. Let S be a k-algebra. For any field extension $k \subset K$ whose cardinality is larger than the cardinality of S we have*

(1) *for every maximal ideal* $\mathfrak{m}$ *of* S_K *the field* $\kappa(\mathfrak{m})$ *is algebraic over* K*, and*
(2) S_K *is a Jacobson ring.*

Proof. Choose $k \subset K$ such that the cardinality of K is greater than the cardinality of S. Since the elements of S generate the K-algebra S_K we see that Theorem 7.31.11 applies. $\square$

Example 7.31.13. The trick in the proof of Theorem 7.31.11 really does not work if k is a countable field and I is countable too. Let k be a countable field. Let x be a variable, and let $k(x)$ be the field of rational functions in x. Consider the polynomial algebra $R = k[x, \{x_f\}_{f\in k[x]-\{0\}}]$. Let $I = (\{fx_f - 1\}_{f\in k[x]-\{0\}})$. Note that I is a proper ideal in R. Choose a maximal ideal $I \subset \mathfrak{m}$. Then $k \subset R/\mathfrak{m}$ is isomorphic to $k(x)$, and is not algebraic over k.

Lemma 7.31.14. *Let* R *be a Jacobson ring. Let* $f \in R$*. The ring* R_f *is Jacobson and maximal ideals of* R_f *correspond to maximal ideals of* R*.*

Proof. By Topology, Lemma 5.13.5 we see that $D(f) = Spec(R_f)$ is Jacobson and that closed points of $D(f)$ correspond to closed points in $Spec(R)$ which happen to lie in $D(f)$. Thus we win by Lemma 7.31.4. $\square$

Example 7.31.15. Here is a simple example that shows Lemma 7.31.14 to be false if R is not Jacobson. Consider the ring $R = \mathbf{Z}_{(2)}$, i.e., the localization of $\mathbf{Z}$ at the prime (2). The localization of R at the element 2 is isomorphic to $\mathbf{Q}$, in a formula: $R_2 \cong \mathbf{Q}$. Clearly the map $R \to R_2$ maps the closed point of $Spec(\mathbf{Q})$ to the generic point of $Spec(R)$.

Example 7.31.16. Here is a simple example that shows Lemma 7.31.14 is false if R is Jacobson but we localize at infinitely many elements. Namely, let $R = \mathbf{Z}$ and consider the localization $(R \setminus \{0\})^{-1}R \cong \mathbf{Q}$ of R at the set of all nonzero elements. Clearly the map $\mathbf{Z} \to \mathbf{Q}$ maps the closed point of $Spec(\mathbf{Q})$ to the generic point of $Spec(\mathbf{Z})$.

Lemma 7.31.17. *Let* R *be a Jacobson ring. Let* $I \subset R$ *be an ideal. The ring* R/I *is Jacobson and maximal ideals of* R/I *correspond to maximal ideals of* R*.*

Proof. The proof is the same as the proof of Lemma 7.31.14. $\square$

Proposition 7.31.18. *Let* R *be a Jacobson ring. Let* $R \to S$ *be a ring map of finite type. Then*

(1) *The ring* S *is Jacobson.*
(2) *The map* $Spec(S) \to Spec(R)$ *transforms closed points to closed points.*
(3) *For* $\mathfrak{m}' \subset S$ *maximal lying over* $\mathfrak{m} \subset R$ *the field extension* $\kappa(\mathfrak{m}) \subset \kappa(\mathfrak{m}')$ *is finite.*

Proof. Let $A \to B \to C$ be finite type ring maps. Suppose $Spec(C) \to Spec(B)$ and $Spec(B) \to Spec(A)$ map closed points to closed points, and induce finite residue field extensions on residue fields at closed points. Then so does $Spec(C) \to Spec(A)$. Thus it is clear that if we factor $R \to S$ as $R \to S' \to S$ for some finite type R-algebra S', then it suffices to prove the lemma for $R \to S'$ and then $S' \to S$. Writing $S = R[x_1, \ldots, x_n]/I$ we see that it suffices to prove the lemma in the cases $S = R[x]$ and $S = R/I$. The case $S = R/I$ is Lemma 7.31.17.

The case $S = R[x]$. Take an irreducible closed subset $Z \subset Spec(R[x])$. In other words $Z = V(\mathfrak{q})$ for some prime $\mathfrak{q} \subset R[x]$. Set $\mathfrak{p} = \mathfrak{q} \cap R$. Let $U \subset Spec(R[x])$ be open such that $U \cap Z \neq \emptyset$. We have to find a closed point in $U \cap Z$. In fact, we will find

($*$) a closed point y of $U \cap Z$ which maps to a closed point x of $Spec(R)$ such that additionally $\kappa(x) \subset \kappa(y)$ is finite.

To do this we may assume $U = D(f)$ for some $f \in R[x]$. In this case $U \cap V(\mathfrak{q}) \neq \emptyset$ means $f \notin \mathfrak{q}$. Consider the diagram

$$\begin{tikzcd} R[x] \arrow[r] & R/\mathfrak{p}[x] \\ R \arrow[r] \arrow[u] & R/\mathfrak{p} \arrow[u] \end{tikzcd}$$

It suffices to solve the problem on the right hand side of this diagram. Thus we see we may assume R is Jacobson, a domain and $\mathfrak{p} = (0)$.

In case $\mathfrak{q} = (0)$, write $f = a_d x^d + \ldots + a_0$. We see that not all a_i are zero. Take any maximal ideal $\mathfrak{m}$ of R such that $a_i \notin \mathfrak{m}$ for some i (here we use R is Jacobson). Next, choose a maximal ideal $\overline{\mathfrak{m}}' \subset (R/\mathfrak{m})[x]$ not containing the image of f (possible because $\kappa(\mathfrak{m})[x]$ is Jacobson). Then the inverse image $\mathfrak{m}' \subset R[x]$ defines a closed point of $U \cap Z$ and maps to $\mathfrak{m}$. Also, by construction $\kappa(\mathfrak{m}) \subset \kappa(\mathfrak{m}')$ is finite. Thus we have shown ($*$) in this case.

In case $\mathfrak{q} \neq (0)$, let K be the fraction field of R. Write $\mathfrak{q}K[x] = (g)$ for some irreducible $g \in K[x]$. Clearing denominators, we may assume that $g \in R[x]$, and hence in $\mathfrak{q}$. Write $g = b_e x^e + \ldots + b_0$, $b_i \in R$ with $b_e \neq 0$. The maps $R \to R_{b_e}$ and $R[x] \to R[x]_{b_e}$ satisfies the conclusion of the lemma, by Lemma 7.31.14 and moreover induce isomorphisms on residue fields. Hence, in order to prove ($*$), we may replace R by R_{b_e} and assume that g is monic. In this case we see that $R[x]/\mathfrak{q}$ is a quotient of the finite free R-module $R[x]/(g) = R \oplus Rx \oplus \ldots \oplus Rx^{e-1}$. But on the other hand we have $R[x]/(g) \subset K[x]/(g) = K[x]/\mathfrak{q}K[x]$. Hence $\mathfrak{q} = (g)$, and $Z = V(\mathfrak{q}) = V(g)$. At this point, by Lemma 7.26.8 the image of $D(f) \cap V(g)$ in $Spec(R)$ is $D(r_1) \cup \ldots \cup D(r_d)$ for some $r_i \in R$ (of course it is nonempty). Take any maximal ideal $\mathfrak{m} \subset R$ in this image (possible because R is Jacobson) and take any prime $\mathfrak{m}' \subset R[x]$ corresponding to a point of $D(f) \cap V(g)$ lying over $\mathfrak{m}$. Note that the residue field extension $\kappa(\mathfrak{m}) \subset \kappa(\mathfrak{m}')$ is finite (because $g \in \mathfrak{m}'$). By Lemma 7.31.9 we see that $\mathfrak{m}'$ is a closed point. This proves ($*$) in this case.

At this point we are done. Namely, ($*$) implies that $Spec(R[x])$ is Jacobson (via Lemma 7.31.4). Also, if Z is a singleton closed set, then ($*$) implies that $Z = \{\mathfrak{m}'\}$ with $\mathfrak{m}'$ lying over a maximal ideal $\mathfrak{m} \subset R$ such that $\kappa(\mathfrak{m}) \subset \kappa(\mathfrak{m}')$ is finite. □

Lemma 7.31.19. *Any finite type algebra over* $\mathbf{Z}$ *is Jacobson.*

Proof. Combine Lemma 7.31.6 and Proposition 7.31.18. □

Lemma 7.31.20. *Let $R \to S$ be a finite type ring map of Jacobson rings. Denote $X = Spec(R)$ and $Y = Spec(S)$. Write $f : Y \to X$ the induced map of spectra. Let $E \subset Y = Spec(S)$ be a constructible set. Denote with a subscript $_0$ the set of closed points of a topological space.*

(1) *We have $f(E)_0 = f(E_0) = X_0 \cap f(E)$.*
(2) *A point $\xi \in X$ is in $f(E)$ if and only if $\overline{\{\xi\}} \cap f(E_0)$ is dense in $\overline{\{\xi\}}$.*

Proof. We have a commutative diagram of continuous maps

$$\begin{tikzcd} E \arrow[r] \arrow[d] & Y \arrow[d] \\ f(E) \arrow[r] & X \end{tikzcd}$$

Suppose $x \in f(E)$ is closed in $f(E)$. Then $f^{-1}(\{x\}) \cap E$ is closed in E. Hence $f^{-1}(\{x\}) \cap E$ is constructible, nonempty in Y. By Topology, Lemma 5.13.5, the intersection $Y_0 \cap f^{-1}(\{x\}) \cap E$ is not empty. Thus there exists $y \in Y_0$ mapping to x. Since clearly $y \in E_0$ we see that $x \in f(E_0)$. This proves that $f(E)_0 \subset f(E_0)$. Proposition 7.31.18 implies that $f(E_0) \subset X_0 \cap f(E)$. The inclusion $X_0 \cap f(E) \subset f(E)_0$ is trivial. This proves the first assertion.

Suppose that $\xi \in f(E)$. According to Lemma 7.27.2 the set $f(E) \cap \overline{\{\xi\}}$ contains a dense open subset of $\overline{\{\xi\}}$. Since X is Jacobson we conclude that $f(E) \cap \overline{\{\xi\}}$ contains a dense set of closed points, see Topology, Lemma 5.13.5. We conclude by part (1) of the lemma.

On the other hand, suppose that $\overline{\{\xi\}} \cap f(E_0)$ is dense in $\overline{\{\xi\}}$. By Lemma 7.26.3 there exists a ring map $S \to S'$ of finite presentation such that E is the image of $Y' := Spec(S') \to Y$. Then E_0 is the image of Y'_0 by the first part of the lemma applied to the ring map $S \to S'$. Thus we may assume that $E = Y$ by replacing S by S'. Suppose ξ corresponds to $\mathfrak{p} \subset R$. Consider the diagram

$$\begin{tikzcd} S \arrow[r] & S/\mathfrak{p}S \\ R \arrow[r] \arrow[u] & R/\mathfrak{p} \arrow[u] \end{tikzcd}$$

This diagram and the density of $f(Y_0) \cap V(\mathfrak{p})$ in $V(\mathfrak{p})$ shows that the morphism $R/\mathfrak{p} \to S/\mathfrak{p}S$ satisfies condition (2) of Lemma 7.27.4. Hence we conclude there exists a prime $\overline{\mathfrak{q}} \subset S/\mathfrak{p}S$ mapping to (0). In other words the inverse image $\mathfrak{q}$ of $\overline{\mathfrak{q}}$ in S maps to $\mathfrak{p}$ as desired. □

The conclusion of the lemma above is that we can read off the image of f from the set of closed points of the image. This is a little nicer in case the map is of finite presentation because then we know that images of constructibles are constructible. Before we state it we introduce some notation. Denote Constr(X) the set of constructible Let $R \to S$ be a ring map. Denote $X = Spec(R)$ and $Y = Spec(S)$. Write $f : Y \to X$ the induced map of spectra. Denote with a subscript $_0$ the set of closed points of a topological space.

Lemma 7.31.21. *With notation as above. Assume that R is a Noetherian Jacobson ring. Further assume $R \to S$ is of finite type. There is a commutative diagram*

$$\begin{tikzcd} Constr(Y) \arrow[r, "E \mapsto E_0"] \arrow[d, "E \mapsto f(E)"] & Constr(Y_0) \arrow[d, "E \mapsto f(E)"] \\ Constr(X) \arrow[r, "E \mapsto E_0"] & Constr(X_0) \end{tikzcd}$$

where the horizontal arrows are the bijections from Topology, Lemma 5.13.7.

Proof. Since $R \to S$ is of finite type, it is of finite presentation, see Lemma 7.28.4. Thus the image of a constructible set in X is constructible in Y by Chevalley's theorem (Theorem 7.26.9). Combined with Lemma 7.31.20 above the lemma follows. □

To illustrate the use of Jacobson rings, we give the following two examples.

Example 7.31.22. Let k be a field. The space $Spec(k[x, y]/(xy))$ has two irreducible components: namely the x-axis and the y-axis. As a generalization, let

$$R = k[x_{11}, x_{12}, x_{21}, x_{22}, y_{11}, y_{12}, y_{21}, y_{22}]/\mathfrak{a},$$

where $\mathfrak{a}$ is the ideal in $k[x_{11}, x_{12}, x_{21}, x_{22}, y_{11}, y_{12}, y_{21}, y_{22}]$ generated by the entries of the 2×2 product matrix

$$\begin{pmatrix} x_{11} & x_{12} \\ x_{21} & x_{22} \end{pmatrix} \begin{pmatrix} y_{11} & y_{12} \\ y_{21} & y_{22} \end{pmatrix},$$

we shall also describe $Spec(R)$

To prove the statement about $Spec(k[x, y]/(xy))$ we argue as follows. If $\mathfrak{p} \subset k[x, y]$ is any ideal containing xy, then either x or y would be contained in $\mathfrak{p}$. Hence the minimal such prime ideals are just (x) and (y). In case k is algebraically closed, the max-Spec of these components can then be visualized as the point sets of y and x axis.

For the generalization, note that we may identify the closed points of the spectrum of $k[x_{11}, x_{12}, x_{21}, x_{22}, y_{11}, y_{12}, y_{21}, y_{22}])$ with the space of matrices

$$\left\{ (X, Y) \in Mat(2, k) \times Mat(2, k) \mid X = \begin{pmatrix} x_{11} & x_{12} \\ x_{21} & x_{22} \end{pmatrix}, Y = \begin{pmatrix} y_{11} & y_{12} \\ y_{21} & y_{22} \end{pmatrix} \right\}$$

at least if k is algebraically closed. Now define a group action of $GL(2, k) \times GL(2, k) \times GL(2, k)$ on the space of matrices $\{(X, Y)\}$ by

$$(g_1, g_2, g_3) \times (X, Y) \mapsto ((g_1 X g_2^{-1}, g_2 Y g_3^{-1})).$$

Here, also observe that the algebraic set

$$GL(2, k) \times GL(2, k) \times GL(2, k) \subseteq Mat(2, k) \times Mat(2, k) \times Mat(2, k)$$

is irreducible since it is the max spectrum of the domain

$$k[x_{11}, x_{12}, \ldots, z_{21}, z_{22}, (x_{11}x_{22} - x_{12}x_{21})^{-1}, (y_{11}y_{22} - y_{12}y_{21})^{-1}, (z_{11}z_{22} - z_{12}z_{21})^{-1}].$$

Since the image of irreducible an algebraic set is still irreducible, it suffices to classify the orbits of the set $\{(X, Y) \in Mat(2, k) \times Mat(2, k) | XY = 0\}$ and take their closures. From standard linear algebra, we are reduced to the following three cases:

(1) $\exists (g_1, g_2)$ such that $g_1 X g_2^{-1} = I_{2\times 2}$. Then Y is necessarily 0, which as an algebraic set is invariant under the group action. It follows that this orbit is contained in the irreducible algebraic set defined by the prime ideal $(y_{11}, y_{12}, y_{21}, y_{22})$. Taking the closure, we see that $(y_{11}, y_{12}, y_{21}, y_{22})$ is actually a component.

(2) $\exists (g_1, g_2)$ such that

$$g_1 X g_2^{-1} = \begin{pmatrix} 1 & 0 \\ 0 & 0 \end{pmatrix}.$$

This case occurs if and only if X is a rank 1 matrix, and furthermore, Y is killed by such an X if and only if

$$x_{11}y_{11} + x_{12}y_{21} = 0; \quad x_{11}y_{12} + x_{12}y_{22} = 0;$$

$$x_{21}y_{11} + x_{22}y_{21} = 0; \quad x_{21}y_{12} + x_{22}y_{22} = 0.$$

Fix a rank 1 X, such non zero Y's satisfying the above equations form an irreducible algebraic set for the following reason($Y = 0$ is contained the the previous case): $0 = g_1 X g_2^{-1} g_2 Y$ implies that

$$g_2 Y = \begin{pmatrix} 0 & 0 \\ y'_{21} & y'_{22} \end{pmatrix}.$$

With a further $GL(2,k)$-action on the right by g_3, $g_2 Y$ can be brought into

$$g_2 Y g_3^{-1} = \begin{pmatrix} 0 & 0 \\ 0 & 1 \end{pmatrix},$$

and thus such Y's form an irreducible algebraic set isomorphic to the image of $GL(2,k)$ under this action. Finally, notice that the ``rank 1" condition for X's forms an open dense subset of the irreducible algebraic set $\det X = x_{11}x_{22} - x_{12}x_{21} = 0$. It now follows that all the five equations define an irreducible component $(x_{11}y_{11}+x_{12}y_{21}, x_{11}y_{12}+x_{12}y_{22}, x_{21}y_{11}+x_{22}y_{21}, x_{21}y_{12}+x_{22}y_{22}, x_{11}x_{22}-x_{12}x_{21})$, in open subset of the space of pairs of nonzero matrices. It can be shown that the pair of equations $\det X = 0$, $\det Y = 0$ cuts $Spec(R)$ in an irreducible component with the above locus an open dense subset.

(3) $\exists (g_1, g_2)$ such that $g_1 X g_2^{-1} = 0$, or equivalently, $X = 0$. Then Y can be arbitrary and this component is thus defined by $(x_{11}, x_{12}, x_{21}, x_{22})$.

Example 7.31.23. For another example, consider $R = k[\{t_{ij}\}_{i,j=1}^n]/\mathfrak{a}$, where $\mathfrak{a}$ is the ideal generated by the entries of the product matrix $T^2 - T$, $T = (t_{ij})$. From linear algebra, we know that under the $GL(n,k)$-action defined by $g, T \mapsto gTg^{-1}$, T is classified by the its rank and each T is conjugate to some $\mathrm{diag}(1, \ldots, 1, 0, \ldots, 0)$, which has r 1's and $n - r$ 0's. Thus each orbit of such a $\mathrm{diag}(1, \ldots, 1, 0, \ldots, 0)$ under the group action forms an irreducible component and every idempotent matrix is contained in one such orbit. Next we will show that any two different orbits are necessarily disjoint. For this purpose we only need to cook up polynomial functions that take different values on different orbits. In characteristic 0 cases, such a function can be taken to be $f(t_{ij}) = trace(T) = \sum_{i=1}^n t_{ii}$. In positive characteristic cases, things are slightly more tricky since we might have $trace(T) = 0$ even if $T \neq 0$. For instance, $char = 3$

$$trace \begin{pmatrix} 1 & & \\ & 1 & \\ & & 1 \end{pmatrix} = 3 = 0$$

Anyway, these components can be separated using other functions. For instance, in the characteristic 3 case, $tr(\wedge^3 T)$ takes value 1 on the components corresponding to $diag(1,1,1)$ and 0 on other components.

7.32. Finite and integral ring extensions

Trivial lemmas concerning finite and integral ring maps. We recall the definition.

Definition 7.32.1. Let $\varphi : R \to S$ be a ring map.

(1) An element $s \in S$ is *integral over R* if there exists a monic polynomial $P(x) \in R[x]$ such that $P^\varphi(s) = 0$, where $P^\varphi(x) \in S[x]$ is the image of P under $\varphi : R[x] \to S[x]$.
(2) The ring map φ is *integral* if every $s \in S$ is integral over R.

Lemma 7.32.2. *Let $\varphi : R \to S$ be a ring map. Let $y \in S$. If there exists a finite R-submodule M of S such that $1 \in M$ and $yM \subset M$, then y is integral over R.*

Proof. Let $x_1 = 1 \in M$ and $x_i \in M$, $i = 2, \ldots, n$ be a finite set of elements generating M as an R-module. Write $yx_i = \sum \varphi(a_{ij})x_j$ for some $a_{ij} \in R$. Let $P(T) \in R[T]$ be the characteristic polynomial of the $n \times n$ matrix $A = (a_{ij})$. By Lemma 7.15.1 we see $P(A) = 0$. By construction the map $\pi : R^n \to M$, $(a_1, \ldots, a_n) \mapsto \sum \varphi(a_i)x_i$ commutes with $A : R^n \to R^n$ and multiplication by y. In a formula $\pi(Av) = y\pi(v)$. Thus $P(y) = P(y) \cdot 1 = P(y) \cdot x_1 = P(y) \cdot \pi((1, 0, \ldots, 0)) = \pi(P(A)(1, 0, \ldots, 0)) = 0$. □

Lemma 7.32.3. *A finite ring extension is integral.*

Proof. Let $R \to S$ be finite. Let $y \in S$. Apply Lemma 7.32.2 to $M = S$ to see that y is integral over R. □

Lemma 7.32.4. *Let $\varphi : R \to S$ be a ring map. Let $s_1, \ldots, s_n$ be a finite set of elements of S. In this case s_i is integral over R for all $i = 1, \ldots, n$ if and only if there exists an R-subalgebra $S' \subset S$ finite over R containing all of the s_i.*

Proof. If each s_i is integral, then the subalgebra generated by $\varphi(R)$ and the s_i is finite over R. Namely, if s_i satisfies a monic equation of degree d_i over R, then this subalgebra is generated as an R-module by the elements $s_1^{e_1} \ldots s_n^{e_n}$ with $0 \leq e_i \leq d_i - 1$. Conversely, suppose given a finite R-subalgebra S' containing all the s_i. Then all of the s_i are integral by Lemma 7.32.3. □

Lemma 7.32.5. *Let $R \to S$ be a ring map. The following are equivalent*

(1) *$R \to S$ is finite,*
(2) *$R \to S$ is integral and of finite type, and*
(3) *there exist $x_1, \ldots, x_n \in S$ which generate S as an algebra over R such that each x_i is integral over R.*

Proof. Clear from Lemma 7.32.4. □

Lemma 7.32.6. *Suppose that $R \to S$ and $S \to T$ are integral ring maps. Then $R \to T$ is integral.*

Proof. Let $t \in T$. Let $P(x) \in S[x]$ be a monic polynomial such that $P(t) = 0$. Apply Lemma 7.32.4 to the finite set of coefficients of P. Hence t is integral over some subalgebra $S' \subset S$ finite over R. Apply Lemma 7.32.4 again to find a subalgebra $T' \subset T$ finite over S' and containing t. Lemma 7.7.3 applied to $R \to S' \to T'$ shows that T' is finite over R. The integrality of t over R now follows from Lemma 7.32.3. □

Lemma 7.32.7. *Let $R \to S$ be a ring homomorphism. The set*

$$S' = \{s \in S \mid s \text{ is integral over } R\}$$

is an R-subalgebra of S.

Proof. This is clear from Lemmas 7.32.4 and 7.32.3. □

Definition 7.32.8. Let $R \to S$ be a ring map. The ring $S' \subset S$ of elements integral over R, see Lemma 7.32.7, is called the *integral closure* of R in S. If $R \subset S$ we say that R is *integrally closed* in S if $R = S'$.

In particular, we see that $R \to S$ is integral if and only if the integral closure of R in S is all of S.

Lemma 7.32.9. *Integral closure commutes with localization: If $A \to B$ is a ring map, and $S \subset A$ is a multiplicative subset, then the integral closure of $S^{-1}A$ in $S^{-1}B$ is $S^{-1}B'$, where $B' \subset B$ is the integral closure of A in B.*

Proof. Since localization is exact we see that $S^{-1}B' \subset S^{-1}B$. Suppose $x \in B'$ and $f \in S$. Then $x^d + \sum_{i=1,\ldots,d} a_i x^{d-i} = 0$ in B for some $a_i \in A$. Hence also

$$(x/f)^d + \sum\nolimits_{i=1,\ldots,d} a_i/f^i (x/f)^{d-i} = 0$$

in $S^{-1}B$. In this way we see that $S^{-1}B'$ is contained in the integral closure of $S^{-1}A$ in $S^{-1}B$. Conversely, suppose that $x/f \in S^{-1}B$ is integral over $S^{-1}A$. Then we have

$$(x/f)^d + \sum\nolimits_{i=1,\ldots,d} (a_i/f_i)(x/f)^{d-i} = 0$$

in $S^{-1}B$ for some $a_i \in A$ and $f_i \in S$. This means that

$$(f' f_1 \ldots f_d x)^d + \sum\nolimits_{i=1,\ldots,d} f^i (f')^i f_1^i \ldots f_i^{i-1} \ldots f_d^i a_i (f' f_1 \ldots f_d x)^{d-i} = 0$$

for a suitable $f' \in S$. Hence $f' f_1 \ldots f_d x \in B'$ and thus $x/f \in S^{-1}B'$ as desired. $\square$

Lemma 7.32.10. *Let $\varphi : R \to S$ be a ring map. Let $x \in S$. The following are equivalent:*

(1) *x is integral over R, and*
(2) *for every $\mathfrak{p} \in R$ the element $x \in S_{\mathfrak{p}}$ is integral over $R_{\mathfrak{p}}$.*

Proof. It is clear that (1) implies (2). Assume (1). Consider the R-algebra $S' \subset S$ generated by $\varphi(R)$ and x. Let $\mathfrak{p}$ be a prime ideal of R. Then we know that $x^d + \sum_{i=1,\ldots,d} \varphi(a_i) x^{d-i} = 0$ in $S_{\mathfrak{p}}$ for some $a_i \in R_{\mathfrak{p}}$. Hence we see, by looking at which denominators occur, that for some $f \in R$, $f \not\in \mathfrak{p}$ we have $a_i \in R_f$ and $x^d + \sum_{i=1,\ldots,d} \varphi(a_i) x^{d-i} = 0$ in S_f. This implies that S'_f is finite over R_f. Since $\mathfrak{p}$ was arbitrary and $Spec(R)$ is quasi-compact (Lemma 7.16.10) we can find finitely many elements $f_1, \ldots, f_n \in R$ which generate the unit ideal of R such that S'_{f_i} is finite over R. Hence we conclude from Lemma 7.21.2 that S' is finite over R. Hence x is integral over R by Lemma 7.32.4. $\square$

Lemma 7.32.11. *Let $R \to S$ and $R \to R'$ be ring maps. Set $S' = R' \otimes_R S$.*

(1) *If $R \to S$ is integral so is $R' \to S'$.*
(2) *If $R \to S$ is finite so is $R' \to S'$.*

Proof. We prove (1). Let $s_i \in S$ be generators for S over R. Each of these satisfies a monic polynomial equation P_i over R. Hence the elements $1 \otimes s_i \in S'$ generate S' over R' and satisfy the corresponding polynomial P_i' over R'. Since these elements generate S' over R' we see that S' is integral over R'. Proof of (2) omitted. $\square$

Lemma 7.32.12. *Let $R \to S$ be a ring map. Let $f_1, \ldots, f_n \in R$ generate the unit ideal.*

(1) *If each $R_{f_i} \to S_{f_i}$ is integral, so is $R \to S$.*
(2) *If each $R_{f_i} \to S_{f_i}$ is finite, so is $R \to S$.*

Proof. Proof of (1). Let $s \in S$. Consider the ideal $I \subset R[x]$ of polynomials P such that $P(s) = 0$. Let $J \subset R$ denote the ideal (!) of leading coefficients of elements of I. By assumption and clearing denominators we see that $f_i^{n_i} \in J$ for all i and certain $n_i \geq 0$. Hence J contains 1 and we see s is integral over R. Proof of (2) omitted. $\square$

Lemma 7.32.13. *Let $A \to B \to C$ be ring maps.*

(1) *If $A \to C$ is integral so is $B \to C$.*

(2) *If $A \to C$ is finite so is $B \to C$.*

Proof. Omitted. ☐

Lemma 7.32.14. *Let $A \to B \to C$ be ring maps. Let B' be the integral closure of A in B, let C' be the integral closure of B' in C. Then C' is the integral closure of A in C.*

Proof. Omitted. ☐

Lemma 7.32.15. *Suppose that $R \to S$ is an integral ring extension with $R \subset S$. Then $\varphi : Spec(S) \to Spec(R)$ is surjective.*

Proof. Let $\mathfrak{p} \subset R$ be a prime ideal. We have to show $\mathfrak{p}S_{\mathfrak{p}} \neq S_{\mathfrak{p}}$, see Lemma 7.16.9. The localization $R_{\mathfrak{p}} \to S_{\mathfrak{p}}$ is injective (as localization is exact) and integral by Lemma 7.32.9 or 7.32.11. Hence we may replace R, S by $R_{\mathfrak{p}}$, $S_{\mathfrak{p}}$ and we may assume R is local with maximal ideal $\mathfrak{m}$ and it suffices to show that $\mathfrak{m}S \neq S$. Suppose $1 = \sum f_i s_i$ with $f_i \in \mathfrak{m}$ and $s_i \in S$ in order to get a contradiction. Let $R \subset S' \subset S$ be such that $R \to S'$ is finite and $s_i \in S'$, see Lemma 7.32.4. The equation $1 = \sum f_i s_i$ implies that the finite R-module S' satisfies $S' = \mathfrak{m}S'$. Hence by Nakayama's Lemma 7.14.5 we see $S' = 0$. Contradiction. ☐

Lemma 7.32.16. *Let R be a ring. Let K be a field. If $R \subset K$ and K is integral over R, then R is a field and K is an algebraic extension. If $R \subset K$ and K is finite over R, then R is a field and K is a finite algebraic extension.*

Proof. Assume that $R \subset K$ is integral. By Lemma 7.32.15 above we see that $Spec(R)$ has 1 point. Since clearly R is a domain we see that $R = R_{(0)}$ is a field. The other assertions are immediate from this. ☐

Lemma 7.32.17. *Let k be a field. Let S be a k-algebra over k.*

(1) *If S is a domain and finite dimensional over k, then S is a field.*
(2) *If S is integral over k and a domain, then S is a field.*
(3) *If S is integral over k then every prime of S is a maximal ideal (see Lemma 7.23.5 for more consequences).*

Proof. The statement on primes follows from the statement ``integral + domain $\Rightarrow$ field''. Let S integral over k and assume S is a domain, Take $s \in S$. By Lemma 7.32.4 we may find a finite dimensional k-subalgebra $k \subset S' \subset S$. containing s. Hence S is a field if we can prove the first statement. Assume S finite dimensional over k and a domain. Pick $s \in S$. Since S is a domain the multiplication map $s : S \to S$ is surjective by dimension reasons. Hence there exists an element $s_1 \in S$ such that $ss_1 = 1$. So S is a field. ☐

Lemma 7.32.18. *Suppose $R \to S$ is integral. Let $\mathfrak{q}, \mathfrak{q}' \in Spec(S)$ be distinct primes having the same image in $Spec(R)$. Then neither $\mathfrak{q} \subset \mathfrak{q}'$ nor $\mathfrak{q}' \subset \mathfrak{q}$.*

Proof. Let $\mathfrak{p} \subset R$ be the image. By Remark 7.16.8 the primes $\mathfrak{q}, \mathfrak{q}'$ correspond to ideals in $S \otimes_R \kappa(\mathfrak{p})$. Thus the lemma follows from Lemma 7.32.17. ☐

Lemma 7.32.19. *Suppose $R \to S$ is finite. Then the fibres of $Spec(S) \to Spec(R)$ are finite.*

Proof. By the discussion in Remark 7.16.8 the fibres are the spectra of the rings $S \otimes_R \kappa(\mathfrak{p})$. As $R \to S$ is finite, these fibre rings are finite over $\kappa(\mathfrak{p})$ hence Noetherian by Lemma 7.28.1. By Lemma 7.32.18 every prime of $S \otimes_R \kappa(\mathfrak{p})$ is a minimal prime. Hence by Lemma 7.28.6 there are at most finitely many. ☐

Lemma 7.32.20. *Let $R \to S$ be a ring map such that S is integral over R. Let $\mathfrak{p} \subset \mathfrak{p}' \subset R$ be primes. Let $\mathfrak{q}$ be a prime of S mapping to $\mathfrak{p}$. Then there exists a prime $\mathfrak{q}'$ with $\mathfrak{q} \subset \mathfrak{q}'$ mapping to $\mathfrak{p}'$.*

Proof. We may replace R by $R/\mathfrak{p}$ and S by $S/\mathfrak{q}$. This reduces us to the situation of having an integral extension of domains $R \subset S$ and a prime $\mathfrak{p}' \subset R$. By Lemma 7.32.15 we win. □

The property expressed in the lemma above is called the ``going up property" for the ring map $R \to S$, see Definition 7.36.1.

Lemma 7.32.21. *Let R be a ring. Let $x, y \in R$ be nonzero divisors. Let $R[x/y] \subset R_{xy}$ be the R-subalgebra generated by x/y, and similarly for the subalgebras $R[y/x]$ and $R[x/y, y/x]$. If R is integrally closed in R_x or R_y, then the sequence*

$$0 \to R \xrightarrow{(-1,1)} R[x/y] \oplus R[y/x] \xrightarrow{(1,1)} R[x/y, y/x] \to 0$$

is a short exact sequence of R-modules.

Proof. Since $x/y \cdot y/x = 1$ it is clear that the map $R[x/y] \oplus R[y/x] \to R[x/y, y/x]$ is surjective. Let $\alpha \in R[x/y] \cap R[y/x]$. To show exactness in the middle we have to prove that $\alpha \in R$. By assumption we may write

$$\alpha = a_0 + a_1 x/y + \ldots + a_n (x/y)^n = b_0 + b_1 y/x + \ldots + b_m (y/x)^m$$

for some $n, m \geq 0$ and $a_i, b_j \in R$. Pick some $N > \max(n, m)$. Consider the finite R-submodule M of R_{xy} generated by the elements

$$(x/y)^N, (x/y)^{N-1}, \ldots, x/y, 1, y/x, \ldots, (y/x)^{N-1}, (y/x)^N$$

We claim that $\alpha M \subset M$. Namely, it is clear that $(x/y)^i (b_0 + b_1 y/x + \ldots + b_m (y/x)^m) \in M$ for $0 \leq i \leq N$ and that $(y/x)^i (a_0 + a_1 x/y + \ldots + a_n (x/y)^n) \in M$ for $0 \leq i \leq N$. Hence α is integral over R by Lemma 7.32.2. Note that $\alpha \in R_x$, so if R is integrally closed in R_x then $\alpha \in R$ as desired. □

7.33. Normal rings

We first introduce the notion of a normal domain, and then we introduce the (very general) notion of a normal ring.

Definition 7.33.1. A domain R is called *normal* if it is integrally closed in its field of fractions.

Lemma 7.33.2. *Let $R \to S$ be a ring map. If S is a normal domain, then the integral closure of R in S is a normal domain.*

Proof. Omitted. □

The following notion is occasionally useful when studying normality.

Definition 7.33.3. Let R be a domain.

(1) An element g of the fraction field of R is called *almost integral over R* if there exists an element $r \in R$, $r \neq 0$ such that $rg^n \in R$ for all $n \geq 0$.
(2) The domain R is called *completely normal* if every almost integral element of the fraction field of R is contained in R.

The following lemma shows that a Noetherian domain is normal if and only if it is completely normal.

Lemma 7.33.4. *Let R be a domain with fraction field K. If $u, v \in K$ are almost integral over R, then so are $u + v$ and uv. Any element $g \in K$ which is integral over R is almost integral over R. If R is Noetherian then the converse holds as well.*

Proof. If $ru^n \in R$ for all $n \geq 0$ and $v^n r' \in R$ for all $n \geq 0$, then $(uv)^n rr'$ and $(u+v)^n rr'$ are in R for all $n \geq 0$. Hence the first assertion. Suppose $g \in K$ is integral over R. In this case there exists an $d > 0$ such that the ring $R[g]$ is generated by $1, g, \ldots, g^d$ as an R-module. Let $r \in R$ be a common denominator of the elements $1, g, \ldots, g^d \in K$. It is follows that $rR[g] \subset R$, and hence g is almost integral over R.

Suppose R is Noetherian and $g \in K$ is almost integral over R. Let $r \in R$, $r \neq 0$ be as in the definition. Then $R[g] \subset \frac{1}{r}R$ as an R-module. Since R is Noetherian this implies that $R[g]$ is finite over R. Hence g is integral over R, see Lemma 7.32.3. $\square$

Lemma 7.33.5. *Any localization of a normal domain is normal.*

Proof. Let R be a normal domain, and let $S \subset R$ be a multiplicative subset. Suppose g is an element of the fraction field of R which is integral over $S^{-1}R$. Let $P = x^d + \sum_{j<d} a_j x^j$ be a polynomial with $a_i \in S^{-1}R$ such that $P(g) = 0$. Choose $s \in S$ such that $sa_i \in R$ for all i. Then sg satisfies the monic polynomial $x^d + \sum_{j<d} s^{d-j} a_j x^j$ which has coefficients $s^{d-j} a_j$ in R. Hence $sg \in R$ because R is normal. Hence $g \in S^{-1}R$. $\square$

Lemma 7.33.6. *A principal ideal domain is normal.*

Proof. Let R be a principal ideal domain. Let $g = a/b$ be an element of the fraction field of R integral over R. Because R is a principal ideal domain we may divide out a common factor of a and b and assume $(a, b) = R$. In this case, any equation $(a/b)^n + r_{n-1}(a/b)^{n-1} + \ldots + r_0 = 0$ with $r_i \in R$ would imply $a^n \in (b)$. This contradicts $(a, b) = R$ unless b is a unit in R. $\square$

Lemma 7.33.7. *Let R be a domain with fraction field K. Suppose $f = \sum \alpha_i x^i$ is an element of $K[x]$.*

(1) *If f is integral over $R[x]$ then all α_i are integral over $R[x]$, and*
(2) *If f is almost integral over $R[x]$ then all α_i are almost integral over $R[x]$.*

Proof. We first prove the second statement. Write $f = \alpha_d x^d + \ldots + \alpha_r x^r$ with $\alpha_r \neq 0$. By assumption there exists $h = b_d x^d + \ldots + b_s x^s \in R[x]$, $b_s \neq 0$ such that $f^n h \in R[x]$ for all $n \geq 0$. This implies that $b_s \alpha_r^n \in R$ for all $n \geq 0$. Hence α_r is almost integral over R. Since the set of almost integral elements form a subring we deduce that $f - \alpha_r x^r = \alpha_d x^d + \ldots + \alpha_{r-1} x^{r-1}$ is almost integral over $R[x]$. By induction on $d - r$ we win.

In order to prove the first statement we will use absolute Noetherian reduction. Namely, write $\alpha_i = a_i/b_i$ and let $P(t) = t^d + \sum_{j<d} f_j t^j$ be a polynomial with coefficients $f_j \in R[x]$ such that $P(g) = 0$. Let $f_j = \sum f_{ji} x^i$. Consider the subring $R_0 \subset R$ generated by the finite list of elements a_i, b_i, f_{ji} of R. It is a domain; let K_0 be its field of fractions. Since R_0 is a finite type $\mathbf{Z}$-algebra it is Noetherian, see Lemma 7.28.3. It is still the case that $g \in K_0[x]$ is integral over $R_0[x]$, because all the identities in R among the elements a_i, b_i, f_{ji} also hold in R_0. By Lemma 7.33.4 the element g is almost integral over $R_0[x]$. By the first part of the lemma, the elements α_i are almost integral over R_0. And since R_0 is Noetherian, the are integral over R_0, see Lemma 7.33.4. Of course, then they are integral over R. $\square$

Lemma 7.33.8. *Let R be a normal domain. Then $R[x]$ is a normal domain.*

Proof. The result is true if R is a field K because $K[x]$ is a euclidean domain and hence a principal ideal domain and hence normal by Lemma 7.33.6. Let g be an element of the fraction field of $R[x]$ which is integral over $R[x]$. Because g is integral over $K[x]$ where K is the fraction field of R we may write $g = \alpha_d x^d + \alpha_{d-1}x^{d-1} + \ldots + \alpha_0$ with $\alpha_i \in K$. By Lemma 7.33.7 the elements α_i are integral over R and hence are in R. $\square$

Lemma 7.33.9. *Let R be a domain. The following are equivalent:*

(1) *The domain R is a normal domain,*
(2) *for every prime $\mathfrak p \subset R$ the local ring $R_{\mathfrak p}$ is a normal domain, and*
(3) *for every maximal ideal $\mathfrak m$ the ring $R_{\mathfrak m}$ is a normal domain.*

Proof. This follows easily from the fact that for any domain R we have

$$R = \bigcap\nolimits_{\mathfrak m} R_{\mathfrak m}$$

inside the fraction field of R. Namely, if g is an element of the right hand side then the ideal $I = \{x \in R \mid xg \in R\}$ is not contained in any maximal ideal $\mathfrak m$, whence $I = R$. $\square$

Lemma 7.33.9 shows that the following definition is compatible with Definition 7.33.1. (It is the definition from EGA -- see [**DG67**, IV, 5.13.5 and 0, 4.1.4].)

Definition 7.33.10. A ring R is called *normal* if for every prime $\mathfrak p \subset R$ the localization $R_{\mathfrak p}$ is a normal domain (see Definition 7.33.1).

Note that a normal ring is a reduced ring, as R is a subring of the product of its localizations at all primes (see for example Lemma 7.21.1).

Lemma 7.33.11. *A normal ring is integrally closed in its total ring of fractions.*

Proof. Let R be a normal ring. Let $x \in Q(R)$ be an element of the total ring of fractions of R integral over R. Set $I = \{f \in R, fx \in R\}$. Let $\mathfrak p \subset R$ be a prime. As $R \subset R_{\mathfrak p}$ is flat we see that $R_{\mathfrak p} \subset Q(R) \otimes R_{\mathfrak p}$. As $R_{\mathfrak p}$ is a normal domain we see that $x \otimes 1$ is an element of $R_{\mathfrak p}$. Hence we can find $a, f \in R$, $f \not\in \mathfrak p$ such that $x \otimes 1 = a \otimes 1/f$. This means that $fx - a$ maps to zero in $Q(R) \otimes_R R_{\mathfrak p} = Q(R)_{\mathfrak p}$, which in turn means that there exists an $f' \in R$, $f' \not\in \mathfrak p$ such that $f'fx = f'a$ in R. In other words, $ff' \in I$. Thus I is an ideal which isn't contained in any of the prime ideals of R, i.e., $I = R$ and $x \in R$. $\square$

Lemma 7.33.12. *A localization of a normal ring is a normal ring.*

Proof. Omitted. $\square$

Lemma 7.33.13. *Let R be a normal ring. Then $R[x]$ is a normal ring.*

Proof. Let $\mathfrak q$ be a prime of $R[x]$. Set $\mathfrak p = R \cap \mathfrak q$. Then we see that $R_{\mathfrak p}[x]$ is a normal domain by Lemma 7.33.8. Hence $(R[x])_{\mathfrak q}$ is a normal domain by Lemma 7.33.5. $\square$

Lemma 7.33.14. *Let R be a ring. Assume R is reduced and has finitely many minimal primes. Then the following are equivalent:*

(1) *R is a normal ring,*
(2) *R is integrally closed in its total ring of fractions, and*
(3) *R is a finite product of normal domains.*

Proof. Let $\mathfrak q_1, \ldots, \mathfrak q_t$ be the minimal primes of R. By Lemma 7.22.2 we have $Q(R) = R_{\mathfrak q_1} \times \ldots \times R_{\mathfrak q_t}$, and by Lemma 7.23.3 each factor is a field. Denote $e_i = (0, \ldots, 0, 1, 0, \ldots, 0)$ the ith idempotent of $Q(R)$.

If R is integrally closed in $Q(R)$, then it contains in particular the idempotents e_i, and we see that R is a product of t domains (see Sections 7.19 and 7.20). Hence it is clear that R is a finite product of normal domains.

If R is normal, then it is clear that $e_i \in R_{\mathfrak p}$ for every prime ideal $\mathfrak p$ of R. Hence we see that R contains the elements e_i (see proof of Lemma 7.33.9). We conclude that R is a product of t domains as before. Each of these t domains is normal by Lemma 7.33.9 and the assumption that R is a normal ring. Hence it follows that R is a finite product of normal domains.

We omit the verification that (3) implies (1) and (2). □

Lemma 7.33.15. *Let $(R_i, \varphi_{ii'})$ be a directed system (Categories, Definition 7.8.2) of rings. If each R_i is a normal ring so is $R = colim_i R_i$.*

Proof. Let $\mathfrak p \subset R$ be a prime ideal. Set $\mathfrak p_i = R_i \cap \mathfrak p$ (usual abuse of notation). Then we see that $R_{\mathfrak p} = colim_i (R_i)_{\mathfrak p_i}$. Since each $(R_i)_{\mathfrak p_i}$ is a normal domain we reduce to proving the statement of the lemma for normal domains. If $a, b \in R$ and a/b satisfies a monic polynomial $P(T) \in R[T]$, then we can find a (sufficiently large) $i \in I$ such that a, b, P all come from objects a_i, b_i, P_i over R_i. Since R_i is normal we see $a_i/b_i \in R_i$ and hence also $a/b \in R$. □

7.34. Going down for integral over normal

We first play around a little bit with the notion of elements integral over an ideal, and then we prove the theorem referred to in the section title.

Definition 7.34.1. Let $\varphi : R \to S$ be a ring map. Let $I \subset R$ be an ideal. We say an element $g \in S$ is *integral over I* if there exists a monic polynomial $P = x^d + \sum_{j<d} a_j x^j$ with coefficients $a_j \in I^{d-j}$ such that $P^\varphi(g) = 0$ in S.

This is mostly used when $\varphi = \text{id}_R : R \to R$. In this case the set I' of elements integral over I is called the *integral closure of I*. We will see that I' is an ideal of R (and of course $I \subset I'$).

Lemma 7.34.2. *Let $\varphi : R \to S$ be a ring map. Let $I \subset R$ be an ideal. Let $A = \sum I^n t^n \subset R[t]$ be the subring of the polynomial ring generated by $R \oplus It \subset R[t]$. An element $s \in S$ is integral over I if and only if the element $st \in S[t]$ is integral over A.*

Proof. Suppose st is integral over A. Let $P = x^d + \sum_{j<d} a_j x^j$ be a monic polynomial with coefficients in A such that $P^\varphi(st) = 0$. Let $a'_j \in A$ be the degree $d - j$ part of a_i, in other words $a'_j = a''_j t^{d-j}$ with $a''_j \in I^{d-j}$. For degree reasons we still have $(st)^d + \sum_{j<d} \varphi(a''_j) t^{d-j} (st)^j = 0$. Hence we see that s is integral over I.

Suppose that s is integral over I. Say $P = x^d + \sum_{j<d} a_j x^j$ with $a_j \in I^{d-j}$. The we immediately find a polynomial $Q = x^d + \sum_{j<d} (a_j t^{d-j}) x^j$ with coefficients in A which proves that st is integral over A. □

Lemma 7.34.3. *Let $\varphi : R \to S$ be a ring map. Let $I \subset R$ be an ideal. The set of elements of S which are integral over I form a R-submodule of S. Furthermore, if $s \in S$ is integral over R, and s' is integral over I, then ss' is integral over I.*

Proof. Closure under addition is clear from the characterization of Lemma 7.34.2. Any element $s \in S$ which is integral over R corresponds to the degree 0 element s of $S[x]$ which is integral over A (because $R \subset A$). Hence we see that multiplication by s on $S[x]$ preserves the property of being integral over A, by Lemma 7.32.7. □

Lemma 7.34.4. *Suppose $\varphi : R \to S$ is integral. Suppose $I \subset R$ is an ideal. Then every element of IS is integral over I.*

Proof. Immediate from Lemma 7.34.3. □

Lemma 7.34.5. *Let R be a domain with field of fractions K. Let $n, m \in \mathbf{N}$ and $a_0, \ldots, a_{n-1}, b_0, \ldots, b_{m-1} \in R$. If the polynomial $x^n + a_{n-1}x^{n-1} + \ldots + a_0$ divides the polynomial $x^m + b_{m-1}x^{m-1} + \ldots + b_0$ in $K[x]$ then*

(1) *$a_0, \ldots, a_{n-1}$ are integral over the subring of R generated by $b_0, \ldots, b_{m-1}$, and*
(2) *each a_i lies in $\sqrt{(b_0, \ldots, b_m)}$.*

Proof. Let $K \supset R$ be the fraction field of R. Let $L \supset K$ be a field extension such that we can write $x^m + b_{m-1}x^{m-1} + \ldots + b_0 = \prod_{i=1}^m (x - \beta_i)$ with $\beta_i \in L$. Each β_i is integral over the subring generated by $b_0, \ldots, b_{m-1}$. Since each a_i is a homogeneous polynomial in $\beta_1, \ldots, \beta_m$ we deduce the same for the a_i.

Choose $c_0, \ldots, c_{m-n-1} \in K$ such that

$$x^m + b_{m-1}x^{m-1} + \ldots + b_0 = \\ (x^n + a_{n-1}x^{n-1} + \ldots + a_0)(x^{m-n} + c_{m-n-1}x^{m-n-1} + \ldots + c_0).$$

By the first part we see that the elements c_i are integral over R. Let R' be the sub R-algebra of K generated by $c_0, \ldots, c_{m-n-1}$. By Lemmas 7.32.15 and 7.27.3 we see that $R \cap \sqrt{(b_0, \ldots, b_m)R'} = \sqrt{(b_0, \ldots, b_m)}$. Thus we may replace R by R' and assume $c_i \in R$. Dividing out the radical $\sqrt{(b_0, \ldots, b_m)}$ we get a reduced ring $\overline{R}$. We have to show that the images $\overline{a_i} \in \overline{R}$ are zero. And in $\overline{R}[x]$ we have the relation

$$x^m = x^m + \overline{b_{m-1}}x^{m-1} + \ldots + \overline{b_0} = \\ (x^n + \overline{a_{n-1}}x^{n-1} + \ldots + \overline{a_0})(x^{m-n} + \overline{c_{m-n-1}}x^{m-n-1} + \ldots + \overline{c_0}).$$

It is easy to see that this implies $\overline{a_i} = 0$ for all i. For example one can see this by localizing at all the minimal primes, see Lemma 7.23.6. □

Lemma 7.34.6. *Let $R \subset S$ be an inclusion of domains. Assume R is normal. Let $g \in S$ be integral over R. Then the minimal polynomial of g has coefficients in R.*

Proof. Let $P = x^m + b_{m-1}x^{m-1} + \ldots + b_0$ be a polynomial with coefficients in R such that $P(g) = 0$. Let $Q = x^n + a_{n-1}x^{n-1} + \ldots + a_0$ be the minimal polynomial for g over the fraction field K of R. Then Q divides P in $K[x]$. By Lemma 7.34.5 we see the a_i are integral over R. Since R is normal this means they are in R. □

Proposition 7.34.7. *Let $R \subset S$ be an inclusion of domains. Assume R is normal and S integral over R. Let $\mathfrak{p} \subset \mathfrak{p}' \subset R$ be primes. Let $\mathfrak{q}'$ be a prime of S with $\mathfrak{p}' = R \cap \mathfrak{q}'$. Then there exists a prime $\mathfrak{q}$ with $\mathfrak{q} \subset \mathfrak{q}'$ such that $\mathfrak{p} = R \cap \mathfrak{q}$. In other words: the going down property holds for $R \to S$, see Definition 7.36.1.*

Proof. Let $\mathfrak{p}$, $\mathfrak{p}'$ and $\mathfrak{q}'$ be as in the statement. We have to show there is a prime $\mathfrak{q}$, $\mathfrak{q} \subset \mathfrak{q}'$ such that $R \cap \mathfrak{q} = \mathfrak{p}$. This is the same as finding a prime of $S_{\mathfrak{q}'}$ mapping to $\mathfrak{p}$. According to Lemma 7.16.9 we have to show that $\mathfrak{p}S_{\mathfrak{q}'} \cap R = \mathfrak{p}$. Pick $z \in \mathfrak{p}S_{\mathfrak{q}'} \cap R$. We may write $z = y/g$ with $y \in \mathfrak{p}S$ and $g \in S$, $g \not\in \mathfrak{q}'$. Written differently we have $zg = y$.

By Lemma 7.34.4 there exists a monic polynomial $P = x^m + b_{m-1}x^{m-1} + \ldots + b_0$ with $b_i \in \mathfrak{p}$ such that $P(y) = 0$.

By Lemma 7.34.6 the minimal polynomial of g over K has coefficients in R. Write it as $Q = x^n + a_{n-1}x^{n-1} + \ldots + a_0$. Note that not all a_i, $i = n-1, \ldots, 0$ are in $\mathfrak p$ since that would imply $g^n = \sum_{j<n} a_j g^j \in \mathfrak p S \subset \mathfrak p' S \subset \mathfrak q'$ which is a contradiction.

Since $y = zg$ we see immediately from the above that $Q' = x^n + za_{n-1}x^{n-1} + \ldots + z^n a_0$ is the minimal polynomial for y. Hence Q' divides P and by Lemma 7.34.5 we see that $z^j a_{n-j} \in \sqrt{(b_0, \ldots, b_{m-1})} \subset \mathfrak p$, $j = 1, \ldots, n$. Because not all a_i, $i = n-1, \ldots, 0$ are in $\mathfrak p$ we conclude $z \in \mathfrak p$ as desired. □

7.35. Flat modules and flat ring maps

One often used result is that if $M = colim_{i \in \mathcal{I}} M_i$ is a colimit of R-modules and if N is another then

$$M \otimes N = colim_{i \in \mathcal{I}} M_i \otimes_R N,$$

see Lemma 7.11.8. This property is usually expressed by saying that $\otimes$ *commutes with colimits*. Another often used result is that if $0 \to N_1 \to N_2 \to N_3 \to 0$ is an exact sequence and if M is any R-module, then

$$M \otimes_R N_1 \to M \otimes_R N_2 \to M \otimes_R N_3 \to 0$$

is still exact, see Lemma 7.11.10. Both of these properties tell us that the functor $N \mapsto M \otimes_R N$ *is right exact*. See Categories, Section 4.21 and Homology, Section 10.5. An R-module M is flat if this functor is also left exact. Here is the precise definition.

Definition 7.35.1. Let R be a ring.

(1) An R-module M is called *flat* if whenever $N_1 \to N_2 \to N_3$ is an exact sequence of R-modules the sequence $M \otimes_R N_1 \to M \otimes_R N_1 \to M \otimes_R N_1$ is exact as well.
(2) An R-module M is called *faithfully flat* if the complex of R-modules $N_1 \to N_2 \to N_3$ is exact if and only if the sequence $M \otimes_R N_1 \to M \otimes_R N_1 \to M \otimes_R N_1$ is exact.
(3) A ring map $R \to S$ is called *flat* if S is flat as an R-module.
(4) A ring map $R \to S$ is called *faithfully flat* if S is faithfully flat as an R-module.

Lemma 7.35.2. *Let R be a ring. Let $\{M_i, \varphi_{ii'}\}$ be a directed system of flat R-modules. Then $colim_i M_i$ is a flat R-module.*

Proof. This follows as $\otimes$ commutes with colimits and because directed colimits are exact, see Lemma 7.8.9. □

Lemma 7.35.3. *A composition of (faithfully) flat ring maps is (faithfully) flat. If $R \to R'$ is flat, and M' is a flat R'-module, then M' is a flat R-module.*

Proof. Omitted. □

Lemma 7.35.4. *Let M be an R-module. The following are equivalent:*

(1) *M is flat over R.*
(2) *for every injection of R-modules $N \subset N'$ the map $N \otimes_R M \to N' \otimes_R M$ is injective.*
(3) *for every ideal $I \subset R$ the map $I \otimes_R M \to R \otimes_R M = M$ is injective.*
(4) *for every finitely generated ideal $I \subset R$ the map $I \otimes_R M \to R \otimes_R M = M$ is injective.*

Proof. The implications (1) implies (2) implies (3) implies (4) are all trivial. Thus we prove (4) implies (1). Suppose that $N_1 \to N_2 \to N_3$ is exact. Let $K_2 = \text{Ker}(N_2 \to N_3)$. It is clear that the surjection $N_1 \to K$ induces a surjection $N_1 \otimes_R M \to K_2 \otimes_R M$. Hence it suffices to show $K_2 \otimes_R M \to N_2 \otimes_R M$ is injective.

Let $x \in \text{Ker}(K_2 \otimes_R M \to N_2 \otimes_R M)$. We have to show that x is zero. Write $x = \sum_{i=1,\ldots,r} k_i \otimes m_i$. By Lemma 7.8.13 we can find a finitely generated module N, a map $N \to N_2$, and elements $n_i \in N$, $i = 1, \ldots, r$ such that (a) n_i maps to k_i, (b) the element $y = \sum_i n_i \otimes m_i$ maps to zero in $N \otimes_R M$. Let $K \subset N$ be the submodule generated by the n_i. It suffices to show that y is zero as an element of $K' \otimes_R M$.

We do this by induction on the minimal number of generators of N. If this number is > 1 then we can find a short exact sequence $0 \to N' \to N \to N'' \to 0$ such that N' and N'' are finitely generated with a smaller number of generators. By induction the element y maps to zero in $K'' \otimes_R M$ with K'' the image of K in N''. And by the right exactness of $\otimes$ we see that y comes from some element of $K' \otimes_R M$ where K' is the intersection of K with N'. Again by induction we see that $y' = 0$.

The base case of the induction above is when N is generated by 1 element. In other words $N = R/I$, and then $y = \sum g_i \otimes m_i$, Let $J = (g_1, \ldots, g_r) \subset R$. By right exactness, we see that $R/I \otimes_R M = M/IM$. Our assumption is that y is zero in $R/I \otimes_R M = M/IM$ in other words $\sum g_i m_i \in IM$, in other words $\sum g_i m_i = \sum h_j m'_j$ for suitable $h_j \in I$. We may replace I by the finitely generated ideal (h_j) without modifying the assumptions. In this case we have $K = J + I/I$

$$K \otimes_R M = (J + I) \otimes_R M/I \otimes_R M = (J + I)M/IM$$

the first equality by right exactness and the second by assumption on M. Thus y is zero in $K \otimes_R M$ as desired. □

Lemma 7.35.5. *Let $\{R_i, \varphi_{ii'}\}$ be a system of rings of the directed partially ordered set I. Let $R = colim_i R_i$. Let M be an R-module such that M is flat as an R_i-module for all i. Then M is flat as an R-module.*

Proof. Let $\mathfrak{a} \subset R$ be a finitely generated ideal. By Lemma 7.35.4 it suffices to show that $\mathfrak{a} \otimes_R M \to M$ is injective. We can find an $i \in I$ and a finitely generated ideal $\mathfrak{a}' \subset R_i$ such that $\mathfrak{a} = \mathfrak{a}'R$. Then $\mathfrak{a} = colim_{i' \geq i} \mathfrak{a}'R_{i'}$. Hence the map $\mathfrak{a} \otimes_R M \to M$ is the colimit of the maps

$$\mathfrak{a}'R_{i'} \otimes_{R_{i'}} M \longrightarrow M$$

which are all injective by assumption. Since $\otimes$ commutes with colimits and since colimits over I are exact by Lemma 7.8.9 we win. □

Lemma 7.35.6. *Suppose that M is flat over R, and that $R \to R'$ is a ring map. Then $M \otimes_R R'$ is flat over R'.*

Proof. For any R'-module N we have a canonical isomorphism $N \otimes_{R'} (R' \otimes_R M) = N \otimes_R M$. Hence the exactness of $- \otimes_{R'} (R' \otimes_R M)$ follows from the exactness of $- \otimes_R M$. □

Lemma 7.35.7. *Let $R \to R'$ be a faithfully flat ring map. Let M be a module over R, and set $M' = R' \otimes_R M$. Then M is flat over R if and only if M' is flat over R'.*

Proof. By Lemma 7.35.6 we see that if M is flat then M' is flat. For the converse, suppose that M' is flat. Let $N_1 \to N_2 \to N_3$ be an exact sequence of R-modules. We want to show that $N_1 \otimes_R M \to N_2 \otimes_R M \to N_3 \otimes_R M$ is exact. We know that $N_1 \otimes_R R' \to$

$N_2 \otimes_R R' \to N_3 \otimes_R R'$ is exact, because $R \to R'$ is flat. Flatness of M' implies that $N_1 \otimes_R R' \otimes_{R'} M' \to N_2 \otimes_R R' \otimes_{R'} M' \to N_3 \otimes_R R' \otimes_{R'} M'$ is exact. We may write this as $N_1 \otimes_R M \otimes_R R' \to N_2 \otimes_R M \otimes_R R' \to N_3 \otimes_R M \otimes_R R'$. Finally, faithfull flatness implies that $N_1 \otimes_R M \to N_2 \otimes_R M \to N_3 \otimes_R M$ is exact. $\square$

Lemma 7.35.8. *Let R be a ring. Let $S \to S'$ be a faithfully flat map of R-algebras. Let M be a module over S, and set $M' = S' \otimes_S M$. Then M is flat over R if and only if M' is flat over R.*

Proof. Let $N \to N'$ be an injection of R-modules. By the faithful flatness of $S \to S'$ we have

$$\mathrm{Ker}(N \otimes_R M \to N' \otimes_R M) \otimes_S S' = \mathrm{Ker}(N \otimes_R M' \to N' \otimes_R M')$$

Hence the equivalence of the lemma follows from the second characterization of flatness in Lemma 7.35.4. $\square$

Lemma 7.35.9. *Let $R \to S$ be a ring map. Let M be an S-module. If M is flat as an R-module and faithfully flat as an S-module, then $R \to S$ is flat.*

Proof. Let $N_1 \to N_2 \to N_3$ be an exact sequence of R-modules. By assumption $N_1 \otimes_R M \to N_2 \otimes_R M \to N_3 \otimes_R M$ is exact. We may write this as

$$N_1 \otimes_R S \otimes_S M \to N_2 \otimes_R S \otimes_S M \to N_3 \otimes_R S \otimes_S M.$$

By faithful flatness of M over S we conclude that $N_1 \otimes_R S \to N_2 \otimes_R S \to N_3 \otimes_R S$ is exact. Hence $R \to S$ is flat. $\square$

Let R be a ring. Let M be an R-module. Let $\sum f_i x_i = 0$ be a relation in M. We say the relation $\sum f_i x_i$ is *trivial* if there exist an integer $m \geq 0$, elements $y_j \in M$, $j = 1, \ldots, m$, and elements $a_{ij} \in R$, $i = 1, \ldots, n$, $j = 1, \ldots, m$ such that

$$x_i = \sum\nolimits_j a_{ij} y_j, \forall i, \quad \text{and} \quad 0 = \sum\nolimits_i f_i a_{ij}, \forall j.$$

Lemma 7.35.10. *(Equational criterion of flatness.) A module M over R is flat if and only if every relation in M is trivial.*

Proof. Assume M is flat and let $\sum f_i x_i$ be a relation. Let $I = (f_1, \ldots, f_n)$, and let $K = \ker(R^n \to I)$. So we have the short exact sequence $0 \to K \to R^n \to I \to 0$. Then $\sum f_i \otimes x_i$ is an element of $I \otimes_R M$ which maps to zero in $R \otimes_R M = M$. By flatness $\sum f_i \otimes x_i$ is zero in $I \otimes_R M$. Thus there exists an element of $K \otimes_R M$ mapping to $\sum e_i \otimes m_i \in R^n \otimes_R M$. Write this element as $\sum k_j \otimes y_j$ and then write the image of k_j in R^n as $\sum a_{ij} e_i$ to get the result.

Assume every relation is trivial, let I be a finitely generated ideal, and let $x = \sum f_i \otimes x_i$ be an element of $I \otimes_R M$ mapping to zero in $R \otimes_R M = M$. This just means exactly that $\sum h_i x_i$ is a relation in M. And the fact that it is trivial implies easily that x is zero, because

$$x = \sum f_i \otimes x_i = \sum f_i \otimes (\sum a_{ij} y_j) = \sum (\sum f_i a_{ij}) \otimes y_j = 0$$

$\square$

Lemma 7.35.11. *Suppose that R is a ring, $0 \to M'' \to M' \to M \to 0$ a short exact sequence, and N an R-module. If M is flat then $N \otimes_R M'' \to N \otimes_R M'$ is injective, i.e., the sequence*

$$0 \to N \otimes_R M'' \to N \otimes_R M' \to N \otimes_R M \to 0$$

is a short exact sequence.

Proof. Let $R^{(I)} \to N$ be a surjection from a free module onto N with kernel K. The result follows by a simple diagram chase from the following diagram

$$\begin{array}{ccccccccc}
 & & 0 & & 0 & & 0 & & \\
 & & \uparrow & & \uparrow & & \uparrow & & \\
 & & M'' \otimes_R N & \to & M' \otimes_R N & \to & M \otimes_R N & \to & 0 \\
 & & \uparrow & & \uparrow & & \uparrow & & \\
0 & \to & (M'')^{(I)} & \to & (M')^{(I)} & \to & M^{(I)} & \to & 0 \\
 & & \uparrow & & \uparrow & & \uparrow & & \\
 & & M'' \otimes_R N & \to & M' \otimes_R N & \to & M \otimes_R N & \to & 0 \\
 & & & & & & \uparrow & & \\
 & & & & & & 0 & &
\end{array}$$

with exact rows and columns. The middle row is exact because tensoring with the free module $R^{(I)}$ is exact. $\square$

Lemma 7.35.12. *Suppose that $0 \to M' \to M \to M'' \to 0$ is a short exact sequence of R-modules. If M' and M'' are flat so is M. If M and M'' are flat so is M'.*

Proof. We will use the criterion that a module N is R flat if for every ideal the map $N \otimes_R I \to N$ is injective, see Lemma 7.35.4. Consider an ideal $I \subset R$. Consider the diagram

$$\begin{array}{ccccccccc}
0 & \to & M' & \to & M & \to & M'' & \to & 0 \\
 & & \uparrow & & \uparrow & & \uparrow & & \\
 & & M' \otimes_R I & \to & M \otimes_R I & \to & M'' \otimes_R I & \to & 0
\end{array}$$

with exact rows. This immediately proves the first assertion. The second follows because if M'' is flat then the lower left horizontal arrow is injective by Lemma 7.35.11. $\square$

Lemma 7.35.13. *Let R be a ring. Let M be an R-module. The following are equivalent*

(1) *M is faithfully flat, and*
(2) *M is flat and for all R-module homomorpisms $\alpha : N \to N'$ we have $\alpha = 0$ if and only if $\alpha \otimes id_M = 0$.*

Proof. If M is faithfully flat, then $0 \to \text{Ker}(\alpha) \to N \to 0$ is exact if and only if the same holds after tensoring with M. This proves (1) implies (2). For the other, assume (2). Let $N_1 \to N_2 \to N_3$ be a complex, and assume the complex $N_1 \otimes_R M \to N_2 \otimes_R M \to N_3 \otimes_R M$ is exact. Take $x \in \text{Ker}(N_2 \to N_3)$, and consider the map $\alpha : R \to N_2/\text{Im}(N_1)$, $r \mapsto rx + \text{Im}(N_1)$. By the exactness of the complex $- \otimes_R M$ we see that $\alpha \otimes \text{id}_M$ is zero. By assumption we get that α is zero. Hence x is in the image of $N_1 \to N_2$. $\square$

Lemma 7.35.14. *Let M be a flat R-module. The following are equivalent:*

(1) *M is faithfully flat,*
(2) *for all $\mathfrak{p} \in Spec(R)$ the tensor product $M \otimes_R \kappa(\mathfrak{p})$ is nonzero, and*
(3) *for all maximal ideals $\mathfrak{m}$ of R the tensor product $M \otimes_R \kappa(\mathfrak{m}) = M/\mathfrak{m}M$ is nonzero.*

Proof. Assume M faithfully flat. Since $R \to \kappa(\mathfrak{p})$ is not zero we deduce that $M \to M \otimes_R \kappa(\mathfrak{p})$ is not zero, see Lemma 7.35.13.

Conversely assume that M is flat and that $M/\mathfrak{m}M$ is never zero. Suppose that $N_1 \to N_2 \to N_3$ is a complex and suppose that $N_1 \otimes_R M \to N_2 \otimes_R M \to N_3 \otimes_R M$ is exact. Let H be the cohomology of the complex, so $H = \text{Ker}(N_2 \to N_3)/\text{Im}(N_1 \to N_2)$. By flatness we see that $H \otimes_R M = 0$. Take $x \in H$ and let $I = \{f \in R \mid fx = 0\}$ be its annihilator.

Since $R/I \subset H$ we get $M/IM \subset H \otimes_R M = 0$ by flatness of M. If $I \neq R$ we may choose a maximal ideal $I \subset \mathfrak{m} \subset R$. This immediately gives a contradiction. □

Lemma 7.35.15. *Let $R \to S$ be a flat ring map. The following are equivalent:*

(1) *$R \to S$ is faithfully flat,*
(2) *the induced map on Spec is surjective, and*
(3) *any closed point $x \in Spec(R)$ is in the image of the map $Spec(S) \to Spec(R)$.*

Proof. This follows quickly from Lemma 7.35.14, because we saw in Remark 7.16.8 that $\mathfrak{p}$ is in the image if and only if the ring $S \otimes_R \kappa(\mathfrak{p})$ is nonzero. □

Lemma 7.35.16. *A flat local ring homomorphism of local rings is faithfully flat.*

Proof. Immediate from Lemma 7.35.15. □

Lemma 7.35.17. *Let $R \to S$ be flat. Let $\mathfrak{p} \subset \mathfrak{p}'$ be primes of R. Let $\mathfrak{q}' \subset S$ be a prime of S mapping to $\mathfrak{p}'$. Then there exists a prime $\mathfrak{q} \subset \mathfrak{q}'$ mapping to $\mathfrak{p}$.*

Proof. Namely, consider the flat local ring map $R_{\mathfrak{p}'} \to S_{\mathfrak{q}'}$. By Lemma 7.35.16 above this is faithfully flat. By Lemma 7.35.15 there is a prime mapping to $\mathfrak{p}R_{\mathfrak{p}'}$. The inverse image of this prime in S does the job. □

The property of $R \to S$ described in the lemma is called the ``going down property''. See Definition 7.36.1.

Lemma 7.35.18. *If $R \to S$ is a faithfully flat ring map then for every R-module M the map $M \to S \otimes_R M$, $x \mapsto 1 \otimes x$ is injective.*

Proof. This is true because the base change $S \otimes_R M \to S \otimes_R S \otimes_R M$ by the faithfully flat ring map $R \to S$ is injective: It has a section, namely $s \otimes s' \otimes m \mapsto ss' \otimes m$. □

We finish with some remarks on flatness and localization.

Lemma 7.35.19. *Let R be a ring. Let $S \subset R$ be a multiplicative subset.*

(1) *The localization $S^{-1}R$ is a flat R-algebra.*
(2) *If M is a $S^{-1}R$-module, then M is a flat R-module if and only if M is a flat $S^{-1}R$-module.*
(3) *Suppose M is an R-module. Then M is a flat R-module if and only if $M_{\mathfrak{p}}$ is a flat $R_{\mathfrak{p}}$-module for all primes $\mathfrak{p}$ of R.*
(4) *Suppose M is an R-module. Then M is a flat R-module if and only if $M_{\mathfrak{m}}$ is a flat $R_{\mathfrak{m}}$-module for all maximal ideals $\mathfrak{m}$ of R.*
(5) *Suppose $R \to A$ is a ring map, M is an A-module, and $g_1, \ldots, g_m \in A$ are elements generating the unit ideal of A. Then M is flat over R if and only if each localization M_{g_i} is flat over R.*
(6) *Suppose $R \to A$ is a ring map, and M is an A-module. Then M is a flat R-module if and only if the localization $M_{\mathfrak{q}}$ is a flat $R_{\mathfrak{p}}$-module (with $\mathfrak{p}$ the prime of R lying under $\mathfrak{q}$) for all primes $\mathfrak{q}$ of A.*
(7) *Suppose $R \to A$ is a ring map, and M is an A-module. Then M is a flat R-module if and only if the localization $M_{\mathfrak{m}}$ is a flat $R_{\mathfrak{p}}$-module (with $\mathfrak{p} = R \cap \mathfrak{m}$) for all maximal ideals $\mathfrak{m}$ of A.*

Proof. Let us prove the last statement of the lemma. In the proof we will use repeatedly that localization is exact and commutes with tensor product, see Sections 7.9 and 7.11.

Suppose $R \to A$ is a ring map, and M is an A-module. Assume that $M_\mathfrak{m}$ is a flat $R_\mathfrak{p}$-module for all maximal ideals $\mathfrak{m}$ of A (with $\mathfrak{p} = R \cap \mathfrak{m}$). Let $I \subset R$ be an ideal. We have to show the map $I \otimes_R M \to M$ is injective. We can think of this as a map of A-modules. By assumption the localization $(I \otimes_R M)_\mathfrak{m} \to M_\mathfrak{m}$ is injective because $(I \otimes_R M)_\mathfrak{m} = I_\mathfrak{p} \otimes_{R_\mathfrak{p}} M_\mathfrak{m}$. Hence the kernel of $I \otimes_R M \to M$ is zero by Lemma 7.21.1. Hence M is flat over R.

Conversely, assume M is flat over R. Pick a prime $\mathfrak{q}$ of A lying over the prime $\mathfrak{p}$ of R. Suppose that $I \subset R_\mathfrak{p}$ is an ideal. We have to show that $I \otimes_{R_\mathfrak{p}} M_\mathfrak{q} \to M_\mathfrak{q}$ is injective. We can write $I = J_\mathfrak{p}$ for some ideal $J \subset R$. Then the map $I \otimes_{R_\mathfrak{p}} M_\mathfrak{q} \to M_\mathfrak{q}$ is just the localization (at $\mathfrak{q}$) of the map $J \otimes_R M \to M$ which is injective. Since localization is exact we see that $M_\mathfrak{q}$ is a flat $R_\mathfrak{p}$-module.

This proves (7) and (6). The other statements follow in a straightforward way from the last statement (proofs omitted). □

7.36. Going up and going down

Suppose $\mathfrak{p}, \mathfrak{p}'$ are primes of the ring R. Let $X = Spec(R)$ with the Zariski topology. Denote $x \in X$ the point corresponding to $\mathfrak{p}$ and $x' \in X$ the point corresponding to $\mathfrak{p}'$. Then we have:

$$x' \rightsquigarrow x \Leftrightarrow \mathfrak{p}' \subset \mathfrak{p}.$$

In words: x is a specialization of x' if and only if $\mathfrak{p}' \subset \mathfrak{p}$. See Topology, Section 5.14 for terminology and notation.

Definition 7.36.1. Let $\varphi : R \to S$ be a ring map.

(1) We say a $\varphi : R \to S$ satisfies *going up* if given primes $\mathfrak{p} \subset \mathfrak{p}'$ in R and a prime $\mathfrak{q}$ in S lying over $\mathfrak{p}$ there exists a prime $\mathfrak{q}'$ of S such that (a) $\mathfrak{q} \subset \mathfrak{q}'$, and (b) $\mathfrak{q}'$ lies over $\mathfrak{p}'$.
(2) We say a $\varphi : R \to S$ satisfies *going down* if given primes $\mathfrak{p} \subset \mathfrak{p}'$ in R and a prime $\mathfrak{q}'$ in S lying over $\mathfrak{p}'$ there exists a prime $\mathfrak{q}$ of S such that (a) $\mathfrak{q} \subset \mathfrak{q}'$, and (b) $\mathfrak{q}$ lies over $\mathfrak{p}$.

Sofar we have see the following cases of this:

(1) An integral ring map satisfies going up, see Lemma 7.32.20.
(2) As a special case finite ring maps satisfy going up.
(3) As a special case quotient maps $R \to R/I$ satisfy going up.
(4) A flat ring map satisfies going down, see Lemma 7.35.17
(5) As a special case any localization satisfies going down.
(6) An extension $R \subset S$ of domains, with R normal and S integral over R satisfies going down, see Proposition 7.34.7.

Here is another case where going down holds.

Lemma 7.36.2. *Let $R \to S$ be a ring map. If the induced map $\varphi : Spec(S) \to Spec(R)$ is open, then $R \to S$ satisfies going down.*

Proof. Suppose that $\mathfrak{p} \subset \mathfrak{p}' \subset R$ and $\mathfrak{q}' \subset S$ lies over $\mathfrak{p}'$. As φ is open, for every $g \in S$, $g \notin \mathfrak{q}'$ we see that $\mathfrak{p}$ is in the image of $D(g) \subset Spec(S)$. In other words $S_g \otimes_R \kappa(\mathfrak{p})$ is not zero. Since $S_{\mathfrak{q}'}$ is the directed colimit of these S_g this implies that $S_{\mathfrak{q}'} \otimes_R \kappa(\mathfrak{p})$ is not zero, see Lemmas 7.9.9 and 7.11.8. Hence $\mathfrak{p}$ is in the image of $Spec(S_{\mathfrak{q}'}) \to Spec(R)$ as desired. □

Lemma 7.36.3. *Let $R \to S$ be a ring map.*

(1) *$R \to S$ satisfies going down if and only if generalizations lift along the map $Spec(S) \to Spec(R)$, see Topology, Definition 5.14.3.*
(2) *$R \to S$ satisfies going up if and only if specializations lift along the map $Spec(S) \to Spec(R)$, see Topology, Definition 5.14.3.*

Proof. Omitted. □

Lemma 7.36.4. *Suppose $R \to S$ and $S \to T$ are ring maps satisfying going down. Then so does $R \to T$. Similarly for going up.*

Proof. According to Lemma 7.36.3 this follows from Topology, Lemma 5.14.4 □

Lemma 7.36.5. *Let $R \to S$ be a ring map. Let $T \subset Spec(R)$ be the image of $Spec(S)$. If T is stable under specialization, then T is closed.*

Proof. We give two proofs.

First proof. Let $\mathfrak{p} \subset R$ be a prime ideal such that the corresponding point of $Spec(R)$ is in the closure of T. This means that for ever $f \in R$, $f \notin \mathfrak{p}$ we have $D(f) \cap T \neq \emptyset$. Note that $D(f) \cap T$ is the image of $Spec(S_f)$ in $Spec(R)$. Hence we conclude that $S_f \neq 0$. In other words, $1 \neq 0$ in the ring S_f. Since $S_{\mathfrak{p}}$ is the directed limit of the rings S_f we conclude that $1 \neq 0$ in $S_{\mathfrak{p}}$. In other words, $S_{\mathfrak{p}} \neq 0$ and considering the image of $Spec(S_{\mathfrak{p}}) \to Spec(S) \to Spec(R)$ we see there exists a $\mathfrak{p}' \in T$ with $\mathfrak{p}' \subset \mathfrak{p}$. As we assumed T closed under specialization we conclude $\mathfrak{p}$ is a point of T as desired.

Second proof. Let $I = \mathrm{Ker}(R \to S)$. We may replace R by R/I. In this case the ring map $R \to S$ is injective. By Lemma 7.27.5 all the minimal primes of R are contained in the image T. Hence if T is stable under specialization then it contains all primes. □

Lemma 7.36.6. *Let $R \to S$ be a ring map. The following are equivalent:*

(1) *Going up holds for $R \to S$, and*
(2) *the map $Spec(S) \to Spec(R)$ is closed.*

Proof. It is a general fact that specializations lift along a closed map of topological spaces, see Topology, Lemma 5.14.6. Hence the second condition implies the first.

Assume that going up holds for $R \to S$. Let $V(I) \subset Spec(S)$ be a closed set. We want to show that the image of $V(I)$ in $Spec(R)$ is closed. The ring map $S \to S/I$ obviously satisfies going up. Hence $R \to S \to S/I$ satisfies going up, by Lemma 7.36.4. Replacing S by S/I it suffices to show the image T of $Spec(S)$ in $Spec(R)$ is closed. By Topology, Lemmas 5.14.2 and 5.14.5 this image is stable under specialization. Thus the result follows from Lemma 7.36.5. □

Lemma 7.36.7. *Let R be a ring. Let $E \subset Spec(R)$ be a constructible subset.*

(1) *If E is stable under specialization, then E is closed.*
(2) *If E is stable under generalization, then E is open.*

Proof. The first assertion follows from Lemma 7.36.5 combined with Lemma 7.26.3. The second follows because the complement of a constructible set is constructible (see Topology, Lemma 5.10.2), the first part of the lemma and Topology, Lemma 5.14.2. □

Proposition 7.36.8. *Let $R \to S$ be flat and of finite presentation. Then $Spec(R) \to Spec(S)$ is open. More generally this holds for any ring map $R \to S$ of finite presentation which satisfies going down.*

Proof. Assume that $R \to S$ has finite presentation and satisfies going down. It suffices to prove that the image of a standard open $D(f)$ is open. Since $S \to S_f$ satsifies going down as well, we see that $R \to S_f$ satisfies going down. Thus after replacing S by S_f we see it suffices to prove the image is open. By Chevalley's theorem (Theorem 7.26.9) the image is a constructible set E. And E is stable under generalization because $R \to S$ satisfies going down, see Topology, Lemmas 5.14.2 and 5.14.5. Hence E is open by Lemma 7.36.7. $\square$

Lemma 7.36.9. *Let k be a field, and let R, S be k-algebras. Let $S' \subset S$ be a sub k-algebra, and let $f \in S' \otimes_k R$. In the commutative diagram*

$$\begin{tikzcd} Spec((S \otimes_k R)_f) \arrow[rr] \arrow[dr] & & Spec((S' \otimes_k R)_f) \arrow[dl] \\ & Spec(R) & \end{tikzcd}$$

the images of the diagonal arrows are the same.

Proof. Let $\mathfrak p \subset R$ be in the image of the south-west arrow. This means (Lemma 7.16.9) that

$$(S' \otimes_k R)_f \otimes_R \kappa(\mathfrak p) = (S' \otimes_k \kappa(\mathfrak p))_f$$

is not the zero ring, i.e., $S' \otimes_k \kappa(\mathfrak p)$ is not the zero ring and the image of f in it is not nilpotent. The ring map $S' \otimes_k \kappa(\mathfrak p) \to S \otimes_k \kappa(\mathfrak p)$ is injective. Hence also $S \otimes_k \kappa(\mathfrak p)$ is not the zero ring and the image of f in it is not nilpotent. Hence $(S \otimes_k R)_f \otimes_R \kappa(\mathfrak p)$ is not the zero ring. Thus (Lemma 7.16.9) we see that $\mathfrak p$ is in the image of the south-east arrow as desired. $\square$

Lemma 7.36.10. *Let k be a field. Let R and S be k-algebras. The map $Spec(S \otimes_k R) \to Spec(R)$ is open.*

Proof. Let $f \in R \otimes_k S$. It suffices to prove that the image of the standard open $D(f)$ is open. Let $S' \subset S$ be a finite type k-subalgebra such that $f \in S' \otimes_k R$. The map $R \to S' \otimes_k R$ is flat and of finite presentation, hence the image U of $Spec((S' \otimes_k R)_f) \to Spec(R)$ is open by Proposition 7.36.8. By Lemma 7.36.9 this is also the image of $D(f)$ and we win. $\square$

Here is a tricky lemma that is sometimes useful.

Lemma 7.36.11. *Let $R \to S$ be a ring map. Let $\mathfrak p \subset R$ be a prime. Assume that*

1. *there exists a unique prime $\mathfrak q \subset S$ lying over $\mathfrak p$, and*
2. *either*
   - (a) *going up holds for $R \to S$, or*
   - (b) *going down holds for $R \to S$ and there is at most one prime of S above every prime of R.*

Then $S_{\mathfrak p} = S_{\mathfrak q}$.

Proof. Consider any prime $\mathfrak q' \subset S$ which corresponds to a point of $Spec(S_{\mathfrak p})$. This means that $\mathfrak p' = R \cap \mathfrak q'$ is contained in $\mathfrak p$. Here is a picture

$$\begin{tikzcd} \mathfrak q' \arrow[r, dash] \arrow[d, dash] & ? \arrow[r, dash] \arrow[d, dash] & S \arrow[d, dash] \\ \mathfrak p' \arrow[r, dash] & \mathfrak p \arrow[r, dash] & R \end{tikzcd}$$

Assume (1) and (2)(a). By going up there exists a prime $\mathfrak{q}'' \subset S$ with $\mathfrak{q}' \subset \mathfrak{q}''$ and $\mathfrak{q}''$ lying over $\mathfrak{p}$. By the uniqueness of $\mathfrak{q}$ we conclude that $\mathfrak{q}'' = \mathfrak{q}$. In other words $\mathfrak{q}'$ defines a point of $Spec(S_{\mathfrak{q}})$.

Assume (1) and (2)(b). By going down there exists a prime $\mathfrak{q}'' \subset \mathfrak{q}$ lying over $\mathfrak{p}'$. By the uniqueness of primes lying over $\mathfrak{p}'$ we see that $\mathfrak{q}' = \mathfrak{q}''$. In other words $\mathfrak{q}'$ defines a point of $Spec(S_{\mathfrak{q}})$.

In both cases we conclude that the map $Spec(S_{\mathfrak{q}}) \to Spec(S_{\mathfrak{p}})$ is bijective. Clearly this means all the elements of $S - \mathfrak{q}$ are all invertible in $S_{\mathfrak{p}}$, in other words $S_{\mathfrak{p}} = S_{\mathfrak{q}}$. □

7.37. Transcendence

We recall the standard definitions.

Definition 7.37.1. Let $k \subset K$ be a field extension.

(1) A collection of elements $\{x_i\}_{i \in I}$ of K is called *algebraically independent* over k if the map

$$k[X_i; i \in I] \longrightarrow K$$

which maps X_i to x_i is injective.

(2) The field of fractions of a polynomial ring $k[x_i; i \in I]$ is denoted $k(x_i; i \in I)$.

(3) A *purely transcendental extension* of k is any field extension $k \subset K$ isomorphic to the field of fractions of a polynomial ring over k.

(4) A *transcendence basis* of K/k is a collection of elements $\{x_i\}_{i \in I}$ which are algebraically independent over k and such that the extension $k(x_i; i \in I) \subset K$ is algebraic.

Lemma 7.37.2. *Let $k \subset K$ be a field extension. A transcendence basis of K over k exists. Any two transcendence bases have the same cardinality.*

Proof. Omitted. Good exercise. □

Definition 7.37.3. Let $k \subset K$ be a field extension. The *transcendence degree* of K over k is the cardinality of a transcendence basis of K over k. It is denoted $\text{trdeg}_k(K)$.

Lemma 7.37.4. *Let $k \subset K \subset L$ be field extensions. Then*

$$trdeg_k(L) = trdeg_K(L) + trdeg_k(K).$$

Proof. Omitted. □

7.38. Algebraic elements of field extensions

Let $k \subset K$ be a field extension. Let $\alpha \in K$. Then we have the following possibilities:

(1) The element α is transcendental over k.

(2) The element α is algebraic over k. Denote $P(T) \in k[T]$ its *minimal polynomial*. This is a monic polynomial $P(T) = T^d + a_1 T^{d-1} + \ldots + a_d$ with coefficients in k. It is irreducible and $P(\alpha) = 0$. These properties uniquely determine P, and the integer d is called the *degree of α over k*. There are two subcases:

  (a) The polynomial dP/dT is not identically zero. This is equivalent to the condition that $P(T) = \prod_{i=1,\ldots,d}(T - \alpha_i)$ for pairwise distinct elements $\alpha_1, \ldots, \alpha_d$ in the algebraic closure of k. In this case we say that α is *separable* over k.

(b) The dP/dT is identically zero. In this case the characteristic p of k is > 0, and P is actually a polynomial in T^p. Clearly there exists a largest power $q = p^e$ such that P is a polynomial in T^q. Then the element α^q is separable over k.

Definition 7.38.1. Algebraic field extensions.

(1) A field extension $k \subset K$ is called *algebraic* if every element of K is algebraic over k.
(2) An algebraic extension $k \subset k'$ is called *separable* if every $\alpha \in k'$ is separable over k.
(3) An algebraic extension $k \subset k'$ is called *purely inseparable* if the characteristic of k is $p > 0$ and for every element $\alpha \in k'$ there exists a power q of p such that $\alpha^q \in k$.
(4) An algebraic extension $k \subset k'$ is called *normal* if for every $\alpha \in k'$ the minimal polynomial $P(T) \in k[T]$ of α over k splits completely into linear factors over k'.
(5) An algebraic extension $k \subset k'$ is called *Galois* if it is separable and normal.

Here are some well-known lemmas on field extensions.

Lemma 7.38.2. *Let $k \subset k'$ be an algebraic field extension. There exists a unique subfield $k \subset (k')_{sep} \subset k'$ such that $k \subset (k')_{sep}$ is separable, and $(k')_{sep} \subset k'$ is purely inseparable.*

Proof. The Lemma only makes sense if the characteristic of k is $p > 0$. Given an α in k' let q_α be the smallest power of p such that α^{q_α} is separable over k (see discussion at the beginning of this section). Then let $(k')_{sep}$ be the subfield of k' generated by these elements. Details omitted. □

Definition 7.38.3. Let $k \subset k'$ be a finite field extension. Let $k \subset (k')_{sep} \subset k'$ be the subfield found in Lemma 7.38.2.

(1) The integer $[(k')_{sep} : k]$ is called the *separable degree* of the extension.
(2) The integer $[k' : (k')_{sep}]$ is called the *inseparable degree*, or the *degree of inseparability* of the extension.

Lemma 7.38.4. *Let $k \subset k'$ be a normal algebraic field extension. There exists a unique subfields $k \subset (k')_{sep} \subset k'$ and $k \subset (k')_{insep} \subset k'$ such that*

(1) *$k \subset (k')_{sep}$ is separable, and $(k')_{sep} \subset k'$ is purely inseparable,*
(2) *$k \subset (k')_{insep}$ is purely inseparable, and $(k')_{sep} \subset k'$ is separable,*
(3) *$k' = (k')_{sep} \otimes_k (k')_{insep}$.*

Proof. We found the subfield $(k')_{sep}$ in Lemma 7.38.2. The subfield $(k')_{insep} = (k')^{\mathrm{Aut}(k'/k)}$. Details omitted. □

Lemma 7.38.5. *Let $k \subset k'$ be a finite separable field extension. Then there exists an $\alpha \in k'$ such that $k' = k(\alpha)$.*

Proof. Omitted. □

Definition 7.38.6. Let $k \subset K$ be a field extension.

(1) The *algebraic closure of k in K* is the subfield k' of K consisting of elements of K which are algebraic over k.
(2) We say k is *algebraically closed in K* if every element of K which is algebraic over k is contained in k.

Lemma 7.38.7. *Let $k \subset K$ be a finitely generated field extension. The algebraic closure of k in K is finite over k.*

Proof. Let $x_1, \ldots, x_r \in K$ be a transcendence basis for K over k. Then $n = [K : k(x_1, \ldots, x_r)] < \infty$. Suppose that $k \subset k' \subset K$ with k'/k finite. In this case $[k'(x_1, \ldots, x_r) : k(x_1, \ldots, x_r)] = [k' : k] < \infty$. Hence

$$[k' : k] = [k'(x_1, \ldots, x_r) : k(x_1, \ldots, x_r)] < [K : k(x_1, \ldots, x_r)] = n.$$

In other words, the degrees of finite subextensions are bounded and the lemma follows. □

Lemma 7.38.8. *Let K be a field of characteristic $p > 0$. Let $K \subset L$ be a separable algebraic extension. Let $\alpha \in L$. If the coefficients of the minimal polynomial of α over K are pth powers in K then α is a pth power in L.*

Proof. We may assume that $K \subset L$ is finite Galois. Let $P(T) = T^d + \sum_{i=1}^d a_i T^{d-i}$ be the minimal polynomial and assume $a_i = b_i^p$. The polynomial $Q(T) = T^d + \sum_{i=1}^d b_i T^{d-i}$ is a separable irreducible polynomial as well. Let $L \subset L'$ be the field extension obtained by adjoining a single root β of Q to L. This is a separable extension on the one hand, and a purely inseparable extension on the other hand, since clearly β^p is equal to a conjugate of α. Hence $L = L'$ which means a conjugate of α is a pth power. Hence α is a pth power. □

7.39. Separable extensions

In this section we talk about separability for nonalgebraic field extensions. This is closely related to the concept of geometrically reduced algebras, see Definition 7.40.1.

Definition 7.39.1. Let $k \subset K$ be a field extension.

(1) We say K is *separably generated over k* if there exists a transcendence basis $\{x_i; i \in I\}$ of K/k such that the extension $k(x_i; i \in I) \subset K$ is a separable algebraic extension.
(2) We say K is *separable over k* if for every subextension $k \subset K' \subset K$ with K' finitely generated over k, the extension $k \subset K'$ is separably generated.

With this awkward definition it is not clear that a separably generated field extension is itself separable. It will turn out that this is the case, see Lemma 7.41.2.

Lemma 7.39.2. *Let $k \subset K$ be a separable field extension. For any subextension $k \subset K' \subset K$ the field extension $k \subset K'$ is separable.*

Proof. This is direct from the definition. □

Lemma 7.39.3. *Let $k \subset K$ be a separably generated, and finitely generated field extension. Set $r = trdeg_k(K)$. Then there exist elements $x_1, \ldots, x_{r+1}$ of K such that*

(1) *$x_1, \ldots, x_r$ is a transcendence basis of K over k,*
(2) *$K = k(x_1, \ldots, x_{r+1})$, and*
(3) *x_{r+1} is separable over $k(x_1, \ldots, x_r)$.*

Proof. Combine the definition with Lemma 7.38.5. □

Lemma 7.39.4. *Let $k \subset K$ be a finitely generated field extension. There exists a diagram*

$$\begin{array}{ccc} K & \longrightarrow & K' \\ \uparrow & & \uparrow \\ k & \longrightarrow & k' \end{array}$$

where $k \subset k'$, $K \subset K'$ are finite purely inseparable field extensions such that $k' \subset K'$ is a separably generated field extension.

Proof. This lemma is only interesting when the characteristic of k is $p > 0$. Choose $x_1, \ldots, x_r$ a transcendence basis of K over k. As K is finitely generated over k the extension $k(x_1, \ldots, x_r) \subset K$ is finite. Let $k(x_1, \ldots, x_r) \subset K_{sep} \subset K$ be the subextension found in Lemma 7.38.2. If $K = K_{sep}$ then we are done. We will use induction on $d = [K : K_{sep}]$.

Assume that $d > 1$. Choose a $\beta \in K$ with $\alpha = \beta^p \in K_{sep}$ and $\beta \notin K_{sep}$. Let $P = T^d + a_1 T^{d-1} + \ldots + a_d$ be the minimal polynomial of α over $k(x_1, \ldots, x_r)$. Let $k \subset k'$ be a finite purely inseparable extension obtained by adjoining pth roots such that each a_i is a pth power in $k'(x_1^{1/p}, \ldots, x_r^{1/p})$. Such an extension exists; details omitted. Let L be a field fitting into the diagram

$$\begin{tikzcd} K \arrow[r] & L \\ k(x_1, \ldots, x_r) \arrow[u] \arrow[r] & k'(x_1^{1/p}, \ldots, x_r^{1/p}) \arrow[u] \end{tikzcd}$$

and such that L is the compositum of K and $k'(x_1^{1/p}, \ldots, x_r^{1/p})$. Let

$$k'(x_1^{1/p}, \ldots, x_r^{1/p}) \subset L_{sep} \subset L$$

be the subextesion found in Lemma 7.38.2. Then it is clear that L_{sep} is the compositum of K_{sep} and $k'(x_1^{1/p}, \ldots, x_r^{1/p})$. The element $\alpha \in L_{sep}$ has a minimal polynomial P all of whose coefficients are pth powers in $k'(x_1^{1/p}, \ldots, x_r^{1/p})$. By Lemma 7.38.8 we see that $\alpha = (\alpha')^p$ for some $\alpha' \in L_{sep}$. Clearly, this means that β maps to $\alpha' \in L_{sep}$. In other words, we get the tower of fields

$$\begin{tikzcd} K \arrow[r] & L \\ K_{sep}(\beta) \arrow[u] \arrow[r] & L_{sep} \arrow[u] \\ K_{sep} \arrow[u] \arrow[r] & L_{sep} \arrow[u, equal] \\ k(x_1, \ldots, x_r) \arrow[u] \arrow[r] & k'(x_1^{1/p}, \ldots, x_r^{1/p}) \arrow[u] \\ k \arrow[u] \arrow[r] & k' \arrow[u] \end{tikzcd}$$

Thus this construction leads to a new situation with $[L : L_{sep}] < [K : K_{sep}]$. By induction we can find $k' \subset k''$ and $L \subset L'$ as in the lemma for the extension $k' \subset L$. Then the extensions $k \subset k''$ and $K \subset L''$ work for the extension $k \subset K$. This proves the lemma. $\square$

7.40. Geometrically reduced algebras

The main result on geometrically reduced algebras is Lemma 7.41.3. We suggest the reader skip to the lemma after reading the definition.

Definition 7.40.1. Let k be a field. Let S be a k-algebra. We say S is *geometrically reduced over k* if for every field extension $k \subset K$ the K-algebra $K \otimes_k S$ is reduced.

Let k be a field and let S be a reduced k algebra. To check that S is geometrically reduced it will suffice to check that $\overline{k} \otimes_k S$ is reduced (where $\overline{k}$ denotes the algebraic closure of k). In fact it is enough to check this for finite purely inseparable field extensions $k \subset k'$. See Lemma 7.41.3.

Lemma 7.40.2. *Elementary properties of geometrically reducedness. Let k be a field. Let S be a k-algebra.*

(1) *If S is geometrically reduced over k so is every k-subalgebra.*
(2) *If all finitely generated k-subalgebras of S are geometrically reduced, then S is geometrically reduced.*
(3) *A directed colimit of geometrically reduced k-algebras is geometrically reduced.*
(4) *If S is geometrically reduced over k, then any localization of S is geometrically reduced over k.*

Proof. Omitted. The second and third property follow from the fact that tensor product commutes with colimits. □

Lemma 7.40.3. *Let k be a field. If R is geometrically reduced over k, and $S \subset R$ is a multiplicative subset, then the localization $S^{-1}R$ is geometrically reduced over k. If R is geometrically reduced over k, then $R[x]$ is geometrically reduced over k.*

Proof. Omitted. Hints: A localization of a reduced ring is reduced, and localization commutes with tensor products. □

In the proofs of the following lemmas we will repeatedly use the following observation: Suppose that $R' \subset R$ and $S' \subset S$ are inclusions of k-algebras. Then the map $R' \otimes_k S' \to R \otimes_k S$ is injective.

Lemma 7.40.4. *Let k be a field. Let R, S be k-algebras.*

(1) *If $R \otimes_k S$ is nonreduced, then there exist finitely generated subalgebras $R' \subset R$, $S' \subset S$ such that $R' \otimes_k S'$ is not reduced.*
(2) *If $R \otimes_k S$ contains a nonzero zero divisor, then there exist finitely generated subalgebras $R' \subset R$, $S' \subset S$ such that $R' \otimes_k S'$ contains a nonzero zero divisor.*
(3) *If $R \otimes_k S$ contains a nontrivial idempotent, then there exist finitely generated subalgebras $R' \subset R$, $S' \subset S$ such that $R' \otimes_k S'$ contains a nontrivial idempotent.*

Proof. Suppose $z \in R \otimes_k S$ is nilpotent. We may write $z = \sum_{i=1,\ldots,n} x_i \otimes y_i$. Thus we may take R' the k-subalgebra generated by the x_i and S' the k-subalgebra generated by the y_i. The second and third statements are proved in the same way. □

Lemma 7.40.5. *Let k be a field. Let S be a geometrically reduced k-algebra. Let R be any reduced k-algebra. Then $R \otimes_k S$ is reduced.*

Proof. By Lemma 7.40.4 we may assume that R is of finite type over k. Then R, as a reduced Noetherian ring, embeds into a finite product of fields (see Lemmas 7.22.2, 7.28.6, and 7.23.3). Hence we may assume R is a finite product of fields. In this case the reducedness follows from the definition. □

Lemma 7.40.6. *Let k be a field. Let S be a reduced k-algebra. Let $k \subset K$ be either a separable field extension, or a separably generated field extension. Then $K \otimes_k S$ is reduced.*

Proof. Assume $k \subset K$ is separable. By Lemma 7.40.4 we may assume that S is of finite type over k and K is finitely generated over k. Then S embeds into a finite product of fields, namely its total ring of fractions (see Lemmas 7.23.3 and 7.22.2). Hence we may actually assume that S is a domain. We choose $x_1, \ldots, x_{r+1} \in K$ as in Lemma 7.39.3. Let $P \in k(x_1, \ldots, x_r)[T]$ be the minimal polynomial of x_{r+1}. It is a separable polynomial. It is easy to see that $k[x_1, \ldots, x_r] \otimes_k S = S[x_1, \ldots, x_r]$ is a domain. This implies $k(x_1, \ldots, x_r) \otimes_k S$ is a domain as it is a localization of $S[x_1, \ldots, x_r]$. The ring extension $k(x_1, \ldots, x_r) \otimes_k S \subset K \otimes_k S$ is generated by a single element x_{r+1} with a single equation, namely P. Hence $K \otimes_k S$ embeds into $f.f.(k(x_1, \ldots, x_n) \otimes_k S)[T]/(P)$. Since P is separable this is a finite product of fields and we win.

At this point we do not yet know that a separably generated field extension is separable, so we have to prove the lemma in this case also. To do this suppose that $\{x_i\}_{i \in I}$ is a separating transcendence basis for K over k. For any finite set of elements $\lambda_j \in K$ there exists a finite subset $T \subset I$ such that $k(\{x_i\}_{i \in T}) \subset k(\{x_i\}_{i \in T} \cup \{\lambda_j\})$ is finite separable. Hence we see that K is a directed colimit of finitely generated and separably generated extensions of k. Thus the argument of the preceding paragraph applies to this case as well. ☐

Lemma 7.40.7. *Let k be a field and let S be a k-algebra. Assume that S is reduced and that $S_{\mathfrak p}$ is geometrically reduced for every minimal prime $\mathfrak p$ of S. Then S is geometrically reduced.*

Proof. Since S is reduced the map $S \to \prod_{\mathfrak p \text{ minimal}} S_{\mathfrak p}$ is injective, see Lemma 7.23.6. If $k \subset K$ is a field extension, then the maps

$$S \otimes_k K \to (\prod S_{\mathfrak p}) \otimes_k K \to \prod S_{\mathfrak p} \otimes_k K$$

are injective: the first as $k \to K$ is flat and the second by inspection because K is a free k-module. As $S_{\mathfrak p}$ is geometrically reduced the ring on the right is reduced. Thus we see that $S \otimes_k K$ is reduced as a subring of a reduced ring. ☐

7.41. Separable extensions, continued

In this section we continue the discussion started in Section 7.39. Let p be a prime number and let k be a field of characteristic p. In this case we write $k^{1/p}$ for the extension of k gotten by adjoining pth roots of all the elements of k to k. (In other words it is the subfield of an algebraic closure of k generated by the pth roots of elements of k.)

Lemma 7.41.1. *Let k be a field of characteristic $p > 0$. Let $k \subset K$ be a field extension. The following are equivalent:*

(1) *K is separable over k,*
(2) *the ring $K \otimes_k k^{1/p}$ is reduced, and*
(3) *K is geometrically reduced over k.*

Proof. The implication (1) ⇒ (3) follows from Lemma 7.40.6. The implication (3) ⇒ (2) is immediate.

Assume (2). Let $k \subset L \subset K$ be a subextension such that L is a finitely generated field extension of k. We have to show that we can find a separating transcendence basis of L. The assumption implies that $L \otimes_k k^{1/p}$ is reduced. Let $x_1, \ldots, x_r$ be a transcendence basis of L over k such that the degree of inseparability of the finite extension $k(x_1, \ldots, x_r) \subset L$ is minimal. If L is separable over $k(x_1, \ldots, x_r)$ then we win. Assume this is not the case to get a contradiction. Then there exists an element $\alpha \in L$ which is not separable over $k(x_1, \ldots, x_r)$. Let $P(T) \in k(x_1, \ldots, x_r)[T]$ be its minimal polynomial. Because α is not separable actually P is a polynomial in T^p. Clear denominators to get an irreducible polynomial

$$G(X_1, \ldots, X_r, T) \in k[X_1, \ldots, X_r, T]$$

such that $G(x_1, \ldots, x_r, \alpha) = 0$ in L. Note that this means $k[X_1, \ldots, X_r, T]/(G) \subset L$. We claim that dG/dX_i is not identically zero for at least one i. Namely, if this was not the case, then G is actually a polynomial in $X_1^p, \ldots, X_r^p, T^p$ and hence $G^{1/p} \in k^{1/p}[X_1, \ldots, X_r, T]$ would map to a nonzero nilpotent element of $k^{1/p} \otimes_k L$! Thus, after renumbering, we may assume that dG/dX_1 is not zero. Then we see that x_1 is separably algebraic over $k(x_2, \ldots, x_r, \alpha)$, and that $x_2, \ldots, x_r, \alpha$ is a transcendence basis of L over k. This means that the degree of inseparability of the finite extension $k(x_2, \ldots, x_r, \alpha) \subset L$ is less than the degree of inseparability of the finite extension $k(x_1, \ldots, x_r) \subset L$, which is a contradiction. □

Lemma 7.41.2. *A separably generated field extension is separable.*

Proof. Combine Lemma 7.40.6 with Lemma 7.41.1. □

In the following lemma we will use the notion of the perfect closure which is defined in Definition 7.42.5.

Lemma 7.41.3. *Let k be a field. Let S be a k-algebra. The following are equivalent:*

(1) *$k' \otimes_k S$ is reduced for every finite purely inseparable extension k' of k,*
(2) *$k^{1/p} \otimes_k S$ is reduced,*
(3) *$k^{perf} \otimes_k S$ is reduced, where k^{perf} is the perfect closure of k,*
(4) *$\overline{k} \otimes_k S$ is reduced, where $\overline{k}$ is the algebraic closure of k, and*
(5) *S is geometrically reduced over k.*

Proof. Note that any finite purely inseparable extension $k \subset k'$ embeds in k^{perf}. Moreover, $k^{1/p}$ embeds into k^{perf} which embeds into $\overline{k}$. Thus it is clear that (5) ⇒ (4) ⇒ (3) ⇒ (2) and that (3) ⇒ (1).

We prove that (1) ⇒ (5). Assume $k' \otimes_k S$ is reduced for every finite purely inseparable extension k' of k. Let $k \subset K$ be an extension of fields. We have to show that $K \otimes_k S$ is reduced. By Lemma 7.40.4 we reduce to the case where $k \subset K$ is a finitely generated field extension. Choose a diagram

$$\begin{tikzcd} K \arrow[r] & K' \\ k \arrow[u] \arrow[r] & k' \arrow[u] \end{tikzcd}$$

as in Lemma 7.39.4. By assumption $k' \otimes_k S$ is reduced. By Lemma 7.40.6 it follows that $K' \otimes_k S$ is reduced. Hence we conclude that $K \otimes_k S$ is reduced as desired.

Finally we prove that (2) ⇒ (5). Assume $k^{1/p} \otimes_k S$ is reduced. Then S is reduced. Moreover, for each localization $S_{\mathfrak p}$ at a minimal prime $\mathfrak p$, the ring $k^{1/p} \otimes_k S_{\mathfrak p}$ is a localization of $k^{1/p} \otimes_k S$ hence is reduced. But $S_{\mathfrak p}$ is a field by Lemma 7.23.3, hence $S_{\mathfrak p}$ is geometrically reduced by Lemma 7.41.1. It follows from Lemma 7.40.7 that S is geometrically reduced. □

7.42. Perfect fields

Here is the definition.

Definition 7.42.1. Let k be a field. We say k is *perfect* if every field extension of k is separable over k.

Lemma 7.42.2. *A field k is perfect if and only if it is a field of characteristic 0 or a field of characteristic $p > 0$ such that every element has a pth root.*

Proof. The characteristic zero case is clear. Assume the characteristic of k is $p > 0$. If k is perfect, then all the field extensions where we adjoin a pth root of an element of k have to be trivial, hence every element of k has a pth root. Conversely if every element has a pth root, then $k = k^{1/p}$ and every field extension of k is separable by Lemma 7.41.1. $\square$

Lemma 7.42.3. *Let $k \subset K$ be a finitely generated field extension. There exists a diagram*

$$\begin{tikzcd} K \arrow[r] & K' \\ k \arrow[u] \arrow[r] & k' \arrow[u] \end{tikzcd}$$

where $k \subset k'$, $K \subset K'$ are finite purely inseparable field extensions such that $k' \subset K'$ is a separable field extension. In this situation we can assume that $K' = k'K$ is the compositum, and also that $K' = (k' \otimes_k K)_{red}$.

Proof. By Lemma 7.39.4 we can find such a diagram with $k' \subset K'$ separably generated. By Lemma 7.41.2 this implies that K' is separable over k'. The compositum $k'K$ is a subextension of $k' \subset K'$ and hence $k' \subset k'K$ is separable by Lemma 7.39.2. The ring $(k' \otimes_k K)_{red}$ is a domain as for some $n \gg 0$ the map $x \mapsto x^{p^n}$ maps it into K. Hence it is a field by Lemma 7.32.17. Thus $(k' \otimes_k K)_{red} \to K'$ maps it isomorphically onto $k'K$. $\square$

Lemma 7.42.4. *For every field k there exists a purely inseparable extension $k \subset k'$ such that k' is perfect. The field extension $k \subset k'$ is unique up to unique isomorphism.*

Proof. If the characteristic of k is zero, then $k' = k$ is the unique choice. Assume the characteristic of k is $p > 0$. For every $n > 0$ there exists a unique algebraic extension $k \subset k^{1/p^n}$ such that (a) every element $\lambda \in k$ has a p^nth root in k^{1/p^n} and (b) for every element $\mu \in k^{1/p^n}$ we have $\mu^{p^n} \in k$. Namely, consider the ring map $k \to k^{1/p^n} = k$, $x \mapsto x^{p^n}$. This is injective and satisfies (a) and (b). It is clear that $k^{1/p^n} \subset k^{1/p^{n+1}}$ as extensions of k via the map $y \mapsto y^p$. Then we can take $k' = \bigcup k^{1/p^n}$. Some details omitted. $\square$

Definition 7.42.5. Let k be a field. The field extension $k \subset k'$ of Lemma 7.42.4 is called the *perfect closure* of k. Notation $k \subset k^{perf}$.

Note that if $k \subset k'$ is any algebraic purely inseparable extension, then $k' \subset k^{perf}$. Namely, $(k')^{perf}$ is isomorphic to k^{perf} by the uniqueness of Lemma 7.42.4.

Lemma 7.42.6. *Let k be a perfect field. Any reduced k algebra is geometrically reduced over k. Let R, S be k-algebras. Assume both R and S are reduced. Then the k-algebra $R \otimes_k S$ is reduced.*

Proof. The first statement follows from Lemma 7.41.3. For the second statement use the first statement and Lemma 7.40.5. $\square$

7.43. Geometrically irreducible algebras

Let $k \subset k'$ be an algebraic purely inseparable field extension. Then for any k-algebra R the ring map $R \to k' \otimes_k R$ induces a homeomorphism of spectra. The reason for this is the following slightly more general Lemma 7.43.2 below. The second part of this lemma is often applied when $R \subset S$ and there exists a prime number p such that $pR = 0$ and S is generated over R by elements x such that $x^{p^f} \in R$ for some $f = f(x) \geq 0$.

Lemma 7.43.1. *Let $n, m > 0$ be two integers. There exist $a, b \geq 0$ such that setting $N = n^a m^b$ we have $(x + y)^N \in \mathbf{Z}[x^n, nx, y^m, my]$.*

Proof. Let $k = nm$. Then it suffices to prove that we can find a power $N = k^c$ such that $(x + y)^N \in \mathbf{Z}[x^k, kx, y^k, ky]$. Write

$$(x + y)^N = \sum\nolimits_{i,j \geq 0, i+j=N} \binom{N}{i, j} x^i y^j$$

The condition means that

$$k^{r+r'} \mid \binom{N}{i, j}$$

where $i = qk + r$ with $r \in \{0, \ldots, k-1\}$ and $j = q'k + r'$ with $r' \in \{0, \ldots, k-1\}$. Choose $N = k^{k+1}$. Then the fact that $i + j = N$ is divisible by k implies that either $r = r' = 0$ if k divides both i and j, or else $r + r' = k$. The choice of N works: If k divides both i and j then the result is clear. If not then we write because $\binom{N}{i,j} = \frac{N}{i} \cdot \binom{N-1}{i-1}$ and N/i is divisible by k^k because as $r \not= 0$ we see that $\gcd(N, i)$ divides k in this case. □

Lemma 7.43.2. *Let $\varphi : R \to S$ be a ring map. If*

1. *for any $x \in S$ there exists $n > 0$ such that x^n is in the image of φ, and*
2. *for any $x \in Ker(\varphi)$ there exists $n > 0$ such that $x^n = 0$,*

then φ induces a homeomorphism on spectra. If

- (a) *S is generated as an R-algebra by elements x such that there exists an $n > 0$ with $x^n \in \varphi(R)$ and $nx \in \varphi(R)$, and*
- (b) *the kernel of φ is generated by nilpotent elements,*

then (1) and (2) hold, and for any ring map $R \to R'$ the ring map $R' \to R' \otimes_R S$ also satisfies (a), (b), (1), and (2) and in particular induces a homeomorphism on spectra.

Proof. Assume (1) and (2). Let $\mathfrak{q}, \mathfrak{q}'$ be primes of S lying over the same prime ideal $\mathfrak{p}$ of R. Suppose $x \in S$ with $x \in \mathfrak{q}$, $x \not\in \mathfrak{q}'$. Then $x^n \in \mathfrak{q}$ and $x^n \not\in \mathfrak{q}'$ for all $n > 0$. If $x^n = \varphi(y)$ with $y \in R$ for some $n > 0$ then

$$x^n \in \mathfrak{q} \Rightarrow y \in \mathfrak{p} \Rightarrow x^n \in \mathfrak{q}'$$

which is a contradication. Hence there does not exist an x as above and we conclude that $\mathfrak{q} = \mathfrak{q}'$, i.e., the map on spectra is injective. By assumption (2) the kernel $I = \text{Ker}(\varphi)$ is contained in every prime, hence $Spec(R) = Spec(R/I)$ as topological spaces. As the induced map $R/I \to S$ is integral by assumption (1) Lemma 7.32.15 shows that $Spec(S) \to Spec(R/I)$ is surjective. Combining the above we see that $Spec(S) \to Spec(R)$ is bijective. If $x \in S$ is arbitrary, and we pick $y \in R$ such that $\varphi(y) = x^n$ for some $n > 0$, then we see that the open $D(x) \subset Spec(S)$ corresponds to the open $D(y) \subset Spec(R)$ via the bijection above. Hence we see that the map $Spec(S) \to Spec(R)$ is a homeomorphism.

Assume (a) and (b). Note that (b) is equivalent to (2). We claim that for any $x \in S$ there exists an integer $n > 0$ such that $x^n, nx \in \varphi(R)$. By assumption (a) it suffices to show that the set of elements with this property forms a R-sub algebra. Suppose $x, y \in S$ and $n, m > 0$ such that $x^n, y^m, nx, my \in \varphi(R)$. Then $(xy)^{nm}, nmxy \in \varphi(R)$ and we see that xy satisfies the condition. Note that $nm(x + y) \in \varphi(R)$ and that there exists an integer $N = n^a m^b$, $a, b \geq 0$ such that $(x + y)^N \in \varphi(R)$, see Lemma 7.43.1. Thus $x + y$ satisfies the condition and the claim is proved. In particular it follows from the first part of the lemma that $Spec(S) \to Spec(R)$ is a homeomorphism. In particular it is surjective which is a property preserved under any base change, see Lemma 7.27.3. Therefore for any $R \to R'$ the kernel of the ring map $R' \to R' \otimes_R S$ consists of nilpotent elements, see Lemma 7.27.6, in other words (b) holds for $R' \to R' \otimes_R S$. Finally, it is clear that (a) is preserved under base change which finishes the proof. □

Lemma 7.43.3. *Let $R \to S$ be a ring map. Assume*

(a) *$Spec(R)$ is irreducible,*
(b) *$R \to S$ is flat,*
(c) *$R \to S$ is of finite presentation,*
(d) *the fibre rings $S \otimes_R \kappa(\mathfrak{p})$ have irreducible spectra for a dense collection of primes $\mathfrak{p}$ of R.*

Then $Spec(S)$ is irreducible. This is true more generally with (b) + (c) replaced by ``the map $Spec(S) \to Spec(R)$ is open".

Proof. The assumptions (b) and (c) imply that the map on spectra is open, see Proposition 7.36.8. Hence the lemma follows from Topology, Lemma 5.5.7. □

Lemma 7.43.4. *Let k be a separably algebraically closed field. Let R, S be k-algebras. If R, S have a unique minimal prime, so does $R \otimes_k S$.*

Proof. Let $k \subset \overline{k}$ be a perfect closure, see Definition 7.42.5. By assumption $\overline{k}$ is algebraically closed. The ring maps $R \to R \otimes_k \overline{k}$ and $S \to S \otimes_k \overline{k}$ and $R \otimes_k S \to (R \otimes_k S) \otimes_k \overline{k} = (R \otimes_k \overline{k}) \otimes_{\overline{k}} (S \otimes_k \overline{k})$ satisfy the assumptions of Lemma 7.43.2. Hence we may assume k is algebraically closed.

We may replace R and S by their reductions. Hence we may assume that R and S are domains. By Lemma 7.42.6 we see that $R \otimes_k S$ is reduced. Hence its spectrum is reducible if and only if it contains a nonzero zero divisor. By Lemma 7.40.4 we reduce to the case where R and S are domains of finite type over k algebraically closed.

Note that the ring map $R \to R \otimes_k S$ is of finite presentation and flat. Moreover, for every maximal ideal $\mathfrak{m}$ of R we have $(R \otimes_k S) \otimes_R R/\mathfrak{m} \cong S$ because $k \cong R/\mathfrak{m}$ by the Hilbert Nullstellensatz Theorem 7.30.1. Moreover, the set of maximal ideals is dense in the spectrum of R since $Spec(R)$ is Jacobson, see Lemma 7.31.2. Hence we see that Lemma 7.43.3 applies to the ring map $R \to R \otimes_k S$ and we conclude that the spectrum of $R \otimes_k S$ is irreducible as desired. □

Lemma 7.43.5. *Let k be a field. Let R be a k-algebra. The following are equivalent*

(1) *for every field extension $k \subset k'$ the spectrum of $R \otimes_k k'$ is irreducible, and*
(2) *for every finite separable field extension $k \subset k'$ the spectrum of $R \otimes_k k'$ is irreducible.*

Proof. Let $k \subset k^{perf}$ be a perfect closure of k, see Definition 7.42.5. By Lemma 7.43.2 we may replace R by $(R \otimes_k k^{perf})_{reduction}$ and k by k^{perf} (some details omitted). Hence we may assume that R is geometrically reduced over k.

Assume R is geometrically reduced over k. For any extension of fields $k \subset k'$ we see irreducibility of the spectrum of $R \otimes_k k'$ is equivalent to $R \otimes_k k'$ being a domain. Assume (2). Let $k \subset \overline{k}$ be a separable algebraic closure of k. Using Lemma 7.40.4 we see that (2) is equivalent to $R \otimes_k \overline{k}$ being a domain. For any field extension $k \subset k'$, there exists a field extension $\overline{k} \subset \overline{k}'$ with $k' \subset \overline{k}'$. By Lemma 7.43.4 we see that $R \otimes_k \overline{k}'$ is a domain. If $R \otimes_k k'$ is not a domain, then also $R \otimes_k \overline{k}'$ is not a domain, contradiction. □

Definition 7.43.6. Let k be a field. Let S be a k-algebra. We say S is *geometrically irreducible over k* if for every field extension $k \subset k'$ the spectrum of $R \otimes_k k'$ is irreducible[2].

By Lemma 7.43.5 it suffices to check this for finite separable field extensions $k \subset k'$.

Lemma 7.43.7. *Let k be a field. Let R be a k-algebra. If k is separably algebraically closed then R is geometrically irreducible over k if and only if the spectrum of R is irreducible.*

Proof. Immediate from the remark following Definition 7.43.6. □

Lemma 7.43.8. *Let k be a field. Let S be a k-algebra.*

(1) *If S is geometrically irreducible over k so is every k-subalgebra.*
(2) *If all finitely generated k-subalgebras of S are geometrically irreducible, then S is geometrically irreducible.*
(3) *A directed colimit of geometrically irreducible k-algebras is geometrically irreducible.*

Proof. Let $S' \subset S$ be a subalgebra. Then for any extension $k \subset k'$ the ring map $S' \otimes_k k' \to S \otimes_k k'$ is injective also. Hence (1) follows from Lemma 7.27.5 (and the fact that the image of an irreducible space under a continuous map is irreducible). The second and third property follow from the fact that tensor product commutes with colimits. □

Lemma 7.43.9. *Let k be a field. Let S be a geometrically irreducible k-algebra. Let R be any k-algebra. The map*

$$Spec(R \otimes_k S) \longrightarrow Spec(R)$$

induces a bijection on irreducible components.

Proof. Recall that irreducible components correspond to minimal primes (Lemma 7.23.1). As $R \to R \otimes_k S$ is flat we see by going down (Lemma 7.35.17) that any minimal prime of $R \otimes_k S$ lies over a minimal prime of R. Conversely, if $\mathfrak{p} \subset R$ is a (minimal) prime then

$$R \otimes_k S/\mathfrak{p}(R \otimes_k S) = (R/\mathfrak{p}) \otimes_k S \subset f.f.(R/\mathfrak{p}) \otimes_k S$$

by flatness of $R \to R \otimes_k S$. The ring $f.f.(R/\mathfrak{p}) \otimes_k S$ has irreducible spectrum by assumption. It follows that $R \otimes_k S/\mathfrak{p}(R \otimes_k S)$ has a single minimal prime (Lemma 7.27.5). In other words, the inverse image of the irreducible set $V(\mathfrak{p})$ is irreducible. Hence the lemma follows. □

Let us make some remarks on the notion of geometrically irreducible field extensions.

Lemma 7.43.10. *Let $k \subset K$ be a field extension. If k is algebraically closed in K, then K is geometrically irreducible over k.*

[2] An irreducible space is nonempty.

Proof. Let $k \subset k'$ be a finite separable extension, say generated by $\alpha \in k'$ over k (see Lemma 7.38.5). Let $P = T^d + a_1 T^{d-1} + \ldots + a_d \in k[T]$ be the minimal polynomial of α. Then $K \otimes_k k' \cong K[T]/(P)$. The only way the spectrum of $K[T]/(P)$ can be reducible is if P is reducible in $K[T]$. Say $P = P_1 P_2$ is a nontrivial factorization of P into monic polynomials. Let $b_1, \ldots, b_t \in K$ be the coefficients of P_1. Then we see that b_i is algebraic over k by Lemma 7.34.5. Hence the lemma follows. ☐

Lemma 7.43.11. *Let $k \subset K$ be a field extension. Consider the subextension $k \subset k' \subset K$ such that $k \subset k'$ is separable algebraic and $k' \subset K$ maximal with this property. Then K is geometrically irreducible over k'. If K/k is a finitely generated field extension, then $[k' : k] < \infty$.*

Proof. Let $k'' \subset K$ be the algebraic closure of k in K. By Lemma 7.43.10 we see that K is geometrically irreducible over k''. Since $k' \subset k''$ is purely inseparable we see from Lemma 7.43.2 that also the extension $k' \subset K$ is geometrically irreducible (some details omitted). If $k \subset K$ is finitely generated, then k' is finite over k by Lemma 7.38.7. ☐

Lemma 7.43.12. *Let $k \subset K$ be an extension of fields. Let $k \subset \overline{k}$ be a separable algebraic closure. Then $Gal(\overline{k}/k)$ acts transitively on the primes of $\overline{k} \otimes_k K$.*

Proof. Let $k \subset k' \subset K$ be the subextension found in Lemma 7.43.11. Note that as $k \subset \overline{k}$ is integral all the prime ideals of $\overline{k} \otimes_k K$ and $\overline{k} \otimes_k k'$ are maximal, see Lemma 7.32.18. In particular the residue field of any prime ideal of $\overline{k} \otimes_k k'$ is isomorphic to $\overline{k}$. Hence the prime ideals of $\overline{k} \otimes_k k'$ correspond one to one to elements of $Hom_k(k', \overline{k})$ with $\sigma \in Hom_k(k' \overline{k})$ corresponding to the kernel $\mathfrak{p}_\sigma$ of $1 \otimes \sigma : \overline{k} \otimes_k k' \to \overline{k}$. In particular Gal$(\overline{k}/k)$ acts transitively on this set. Finally, since K is geometrically irreducible over k' we see that there is a unique prime of $\overline{k} \otimes_k K$ lying over each $\mathfrak{p}_\sigma$ since the set of these primes is the set of primes in the ring

$$(\overline{k} \otimes_k K) \otimes_{(\overline{k} \otimes_k k'), 1 \otimes \sigma} \kappa(\mathfrak{p}_\sigma) = \overline{k} \otimes_{\overline{k}} (K \otimes_{k'} \overline{k}) = K \otimes_{k', \sigma} \overline{k}$$

Thus the lemma holds. ☐

7.44. Geometrically connected algebras

Lemma 7.44.1. *Let k be a separably algebraically closed field. Let R, S be k-algebras. If $Spec(R)$, and $Spec(S)$ are connected, then so is $Spec(R \otimes_k S)$.*

Proof. Recall that $Spec(R)$ is connected if and only if R has no nontrivial idempotents, see Lemma 7.18.4. Hence, by Lemma 7.40.4 we may assume R and S are of finite type over k. In this case R and S are Noetherian, and have finitely many minimal primes, see Lemma 7.28.6. Thus we may argue by induction on $n + m$ where n, resp. m is the number of irreducible components of $Spec(R)$, resp. $Spec(S)$. Of course the case where either n or m is zero is trivial. If $n = m = 1$, i.e., $Spec(R)$ and $Spec(S)$ both have one irreducible component, then the result holds by Lemma 7.43.4. Suppose that $n > 1$. Let $\mathfrak{p} \subset R$ be a minimal prime corresponding to the irreducible closed subset $T \subset Spec(R)$. Let $I \subset R$ be such that $T' = V(I) \subset Spec(R)$ is the closure of the complement of T. Note that this means that $T' = Spec(R/I)$ (Lemma 7.16.7) has $n - 1$ irreducible components. Then $T \cup T' = Spec(R)$, and $T \cap T' = V(\mathfrak{p} + I) = Spec(R/(\mathfrak{p} + I))$ is not empty as $Spec(R)$ is assumed connected. The inverse image of T in $Spec(R \otimes_k S)$ is $Spec(R/\mathfrak{p} \otimes_k S)$, and the inverse of T' in $Spec(R \otimes_k S)$ is $Spec(R/I \otimes_k S)$. By induction these are both connected.

The inverse image of $T \cap T'$ is $Spec(R/(\mathfrak{p}+I) \otimes_k S)$ which is nonempty. Hence $Spec(R \otimes_k S)$ is connected. $\square$

Lemma 7.44.2. *Let k be a field. Let R be a k-algebra. The following are equivalent*

(1) *for every field extension $k \subset k'$ the spectrum of $R \otimes_k k'$ is connected, and*
(2) *for every finite separable field extension $k \subset k'$ the spectrum of $R \otimes_k k'$ is connected.*

Proof. For any extension of fields $k \subset k'$ the connectivity of the spectrum of $R \otimes_k k'$ is equivalent to $R \otimes_k k'$ having no nontrivial idempotents, see Lemma 7.18.4. Assume (2). Let $k \subset \overline{k}$ be a separable algebraic closure of k. Using Lemma 7.40.4 we see that (2) is equivalent to $R \otimes_k \overline{k}$ having no nontrivial idempotents. For any field extension $k \subset k'$, there exists a field extension $\overline{k} \subset \overline{k}'$ with $k' \subset \overline{k}'$. By Lemma 7.44.1 we see that $R \otimes_k \overline{k}'$ has no nontrivial idempotents. If $R \otimes_k k'$ has a nontrivial idempotent, then also $R \otimes_k \overline{k}'$, contradiction. $\square$

Definition 7.44.3. Let k be a field. Let S be a k-algebra. We say S is *geometrically connected over k* if for every field extension $k \subset k'$ the spectrum of $R \otimes_k k'$ is connected.

By Lemma 7.44.2 it suffices to check this for finite separable field extensions $k \subset k'$.

Lemma 7.44.4. *Let k be a field. Let R be a k-algebra. If k is separably algebraically closed then R is geometrically connected over k if and only if the spectrum of R is connected.*

Proof. Immediate from the remark following Definition 7.44.3. $\square$

Lemma 7.44.5. *Let k be a field. Let S be a k-algebra.*

(1) *If S is geometrically connected over k so is every k-subalgebra.*
(2) *If all finitely generated k-subalgebras of S are geometrically connected, then S is geometrically connected.*
(3) *A directed colimit of geometrically irreducible k-algebras is geometrically connected.*

Proof. This follows from the characterization of connectedness in terms of the nonexistence of nontrivial idempotents. The second and third property follow from the fact that tensor product commutes with colimits. $\square$

The following lemma will be superceded by the more general Varieties, Lemma 28.5.4.

Lemma 7.44.6. *Let k be a field. Let S be a geometrically connected and nonzero k-algebra. Let R be any k-algebra. The map*

$$R \longrightarrow R \otimes_k S$$

induces a bijection on idempotents, and the map

$$Spec(R \otimes_k S) \longrightarrow Spec(R)$$

induces a bijection on connected components.

Proof. The second assertion follows from the first combined with Lemma 7.19.2. By Lemmas 7.44.5 and 7.40.4 we may assume that R and S are of finite type over k. Then we see that also $R \otimes_k S$ is of finite type over k. Note that in this case all the rings are Noetherian and hence their spectra have finitely many connected components (since they have finitely many irreducible components, see Lemma 7.28.6). In particular, all connected components in question are open! Hence via Lemma 7.20.3 we see that the first statement of the lemma in this case is equivalent to the second. Let's prove this. As the algebra S is geometrically connected and nonzero we see that all fibres of $X = Spec(R \otimes_k S) \to Spec(R) = Y$ are connected and nonempty. Also, as $R \to R \otimes_k S$ is flat of finite presentation the map $X \to Y$ is open (Proposition 7.36.8). Topology, Lemma 5.4.5 shows that $X \to Y$ induces bijection on connected components. □

7.45. Geometrically integral algebras

Definition 7.45.1. Let k be a field. Let S be a k-algebra. We say S is *geometrically integral over k* if for every field extension $k \subset k'$ the ring of $R \otimes_k k'$ is a domain.

Any question about geometrically integral algebras can be translated in a question about geometrically reduced and irreducible algebras.

Lemma 7.45.2. *Let k be a field. Let S be a k-algebra. In this case S is geometrically integral over k if and only if S is geometrically irreducible as well as geometrically reduced over k.*

Proof. Omitted. □

7.46. Valuation rings

Here are some definitions.

Definition 7.46.1. Valuation rings.

(1) Let K be a field. Let A, B be local rings contained in K. We say that B *dominates* A if $A \subset B$ and $\mathfrak{m}_A = A \cap \mathfrak{m}_B$.
(2) Let A be a ring. We say A is a *valuation ring* if A is a local domain, not a field, and if A is maximal for the relation of domination among local rings contained in the fraction field of A.
(3) Let A be a valuation ring with fraction field K. If $R \subset K$ is a subring of K, then we say A is *centered* on R if $R \subset A$.

Lemma 7.46.2. *Let K be a field. Let $A \subset K$ be a local subring which is not a field. Then there exists a valuation ring with fraction field K dominating A.*

Proof. During this proof, and during this proof only, the phrase ``local ring'' will mean ``local ring, not a field''. We consider the collection of local subrings of K as a partially ordered set using the relation of domination. Suppose that $\{A_i\}_{i \in I}$ is a totally ordered collection of local subrings of K. Then $B = \bigcup A_i$ is a local subring which dominates all of the A_i. Hence by Zorn's Lemma, it suffices to show that if $A \subset K$ is a local ring whose fraction field is not K, then there exists a local ring $B \subset K$, $B \neq A$ dominating A.

Pick $t \in K$ which is not in the fraction field of A. If t is transcendental over A, then $A[t] \subset K$ and hence $A[t]_{(t,\mathfrak{m})} \subset K$ is a local ring dominating A. Suppose t is algebraic over A. Then for some $a \in A$ the element at is integral over A. In this case the subring $A' \subset K$ generated by A and ta is finite over A. By Lemma 7.32.15 there exists a prime ideal $\mathfrak{m}' \subset A'$ lying over $\mathfrak{m}$. Then $A'_{\mathfrak{m}'}$ clearly dominates A and we win. □

Lemma 7.46.3. *Let A be a valuation ring with maximal ideal $\mathfrak{m}$ and fraction field K. Let $x \in K$. Then either $x \in A$ or $x^{-1} \in A$ or both.*

Proof. Assume that x is not in A. Let A' denote the subring of A generated by A and x. Since A is a valuation ring we see that there is no prime of A' lying over $\mathfrak{m}$. Hence we can write $1 = \sum_{i=0}^{d} t_i x^i$ with $t_i \in \mathfrak{m}$. This implies that $(1 - t_0)(x^{-1})^d - \sum t_i (x^{-1})^{d-i} = 0$. In particular we see that x^{-1} is integral over A. Thus the subring A'' of K generated by A and x^{-1} is finite over A and we see there exists a prime ideal $\mathfrak{m}'' \subset A''$ lying over $\mathfrak{m}$ by Lemma 7.32.15. Since A is a valuation ring we conclude that $A = (A'')_{\mathfrak{m}''}$ and hence $x^{-1} \in A$. □

Lemma 7.46.4. *Let $A \subset K$ be a local domain contained in a field K. Assume that A is not a field, and for every $x \in K$ either $x \in A$ or $x^{-1} \in A$ or both. Then A is a valuation ring.*

Proof. Suppose that A' is a local ring contained in K which dominates A. Let $x \in A'$. We have to show that $x \in A$. If not, then $x^{-1} \in A$, and of course $x^{-1} \in \mathfrak{m}_A$. But then $x^{-1} \in \mathfrak{m}_{A'}$ which contradicts $x \in A'$. □

Lemma 7.46.5. *Let $K \subset L$ be an extension of fields. If $B \subset L$ is a valuation ring, then $A = K \cap B$ is either a field or a valuation ring.*

Proof. Omitted. Hint: Combine Lemmas 7.46.3 and 7.46.4. □

Lemma 7.46.6. *Let A be a valuation ring. Then A is a normal domain.*

Proof. Suppose x is in the field of fractions of A and integral over A, say $x^d + \sum_{i<d} a_i x^i = 0$. By Lemma 7.46.4 either $x \in A$ (and we're done) or $x^{-1} \in A$. In the second case we see that $x = -\sum a_i x^{i-d} \in A$ as well. □

An *totally ordered abelian group* is a pair $(\Gamma, \geq)$ consisting of an abelian group Γ endowed with a total ordering $\geq$ such that $\gamma \geq \gamma' \Rightarrow \gamma + \gamma'' \geq \gamma' + \gamma''$ for all $\gamma, \gamma', \gamma'' \in \Gamma$.

Lemma 7.46.7. *Let A be a valuation ring with field of fractions K. Set $\Gamma = K^*/A^*$ (with group law written additively). For $\gamma, \gamma' \in \Gamma$ define $\gamma \geq \gamma'$ if and only if $\gamma - \gamma'$ is in the image of $A - \{0\} \to \Gamma$. Then $(\Gamma, \geq)$ is a totally ordered abelian group.*

Proof. Omitted, but follows easily from Lemma 7.46.3 above. □

Definition 7.46.8. Let A be a valuation ring.

(1) The totally ordered abelian group $(\Gamma, \geq)$ is called the *value group* of the valuation ring A.
(2) The map $v : A - \{0\} \to \Gamma$ and also $v : K^* \to \Gamma$ is called the *valuation* associated to A.
(3) The valuation ring A is called a *discrete valuation ring* if $\Gamma \cong \mathbf{Z}$.

Note that if $\Gamma \cong \mathbf{Z}$ then there is a unique such isomorphism such that $1 \geq 0$. If the isomorphism is chose in this way, then the ordering becomes the usual ordering of the integers.

Lemma 7.46.9. *Let A be a valuation ring. The valution $v : A - \{0\} \to \Gamma_{\geq 0}$ has the following properties:*

(1) $v(a) = 0 \Leftrightarrow a \in A^*$,
(2) $v(ab) = v(a) + v(b)$,
(3) $v(a + b) \geq min(v(a), v(b))$.

Proof. Omitted. □

Lemma 7.46.10. *Let $(\Gamma, \geq)$ be a totally ordered abelian group. Let K be a field. Let $v : K^* \to \Gamma$ be a homomorphism of abelian groups. Then*

$$A = \{x \in K \mid x = 0 \text{ or } v(x) \geq 0\}$$

is a valuation ring with value group $Im(v) \subset \Gamma$, with maximal ideal

$$\mathfrak{m} = \{x \in K \mid x = 0 \text{ or } v(x) > 0\}$$

and with group of units

$$A^* = \{x \in K^* \mid v(x) = 0\}.$$

Proof. Omitted. □

Let $(\Gamma, \geq)$ be a totally ordered abelian group. An *ideal of* Γ is a subset $I \subset \Gamma$ such that all elements of I are ≥ 0 and $\gamma \in I$, $\gamma' \geq \gamma$ implies $\gamma' \in I$. We say that such an ideal is *prime* if $\gamma + \gamma' \in I, \gamma, \gamma' \geq 0 \Rightarrow \gamma \in I$ or $\gamma' \in I$.

Lemma 7.46.11. *Let A be a valuation ring. Ideals in A correspond $1-1$ with ideals of Γ. This bijection is inclusion preserving, and maps prime ideals to prime ideals.*

Proof. Omitted. □

Lemma 7.46.12. *A valuation ring is Noetherian if and only if it is a discrete valuation ring.*

Proof. Suppose A is a discrete valutation ring with valuation $v : A \setminus \{0\} \to \mathbf{Z}$ normalized so that $\mathrm{Im}(v) \subset \mathbf{Z}_{\geq 0}$. By Lemma 7.46.11 the ideals of A are the subsets $I_n = \{0\} \cup v^{-1}(\mathbf{Z}_{\geq n})$. It is clear that any element $x \in A$ with $v(x) = n$ generates I_n. Hence A is a PID so certainly Noetherian.

Suppose A is a Noetherian valuation ring with value group Γ. By Lemma 7.46.11 we see the ascending chain condition holds for ideals in Γ. In particular, by considering the subsets $\gamma + \Gamma_{\geq 0}$ with $\gamma > 0$ we see there exists a smallest element γ_0 which is bigger than 0. Let $\gamma \in \Gamma$ be an element $\gamma > 0$. Consider the sequence of elements $\gamma, \gamma - \gamma_0, \gamma - 2\gamma_0$, etc. By the ascending chain condition these cannot all be > 0. Let $\gamma - n\gamma_0$ be the last one ≥ 0. By minimality of γ_0 we see that $0 = \gamma - n\gamma_0$. Hence Γ is a cyclic group as desired. □

Lemma 7.46.13. *Let $(R, \mathfrak{m})$ be a local domain with fraction field K. Let $R \subset A \subset K$ be a valuation ring which dominates R. Then*

$$A = colim\, R[\tfrac{I}{a}]$$

is a directed colimit of affine blowups $R \to R[\frac{I}{a}]$ with the following two properties

(1) *$a \in I \subset \mathfrak{m}$,*
(2) *I is finitely generated, and*
(3) *the fibre ring of $R \to R[\frac{I}{a}]$ at $\mathfrak{m}$ is not zero.*

Proof. Consider a finite subset $E \subset A$. Say $E = \{e_1, \ldots, e_n\}$. Choose a nonzero $a \in R$ such that we can write $e_i = f_i/a$ for all $i = 1, \ldots, n$. Set $I = (f_1, \ldots, f_n, a)$. We claim that $R[\frac{I}{a}] \subset A$. This is clear as an element of $R[\frac{I}{a}]$ can be represented as a polynomial in the elements e_i. The lemma follows immediately from this observation. □

7.47. More Noetherian rings

Lemma 7.47.1. *Let R be a Noetherian ring. Any finite R-module is of finite presentation. Any submodule of a finite R-module is finite. The ascending chain condition holds for R-submodules of a finite R-module.*

Proof. We first show that any submodule N of a finite R-module M is finite. We do this by induction on the number of generators of M. If this number is 1, then $N = J/I \subset M = R/I$ for some ideals $I \subset J \subset R$. Thus the definition of Noetherian implies the result. If the number of generators of M is greater than 1, then we can find a short exact sequence $0 \to M' \to M \to M'' \to 0$ where M' and M'' have fewer generators. Note that setting $N' = M' \cap N$ and $N'' = \mathrm{Im}(N \to M'')$ gives a similar short exact sequence for N. Hence the result follows from the induction hypothesis since the number of generators of N is at most the number of generators of N' plus the number of generators of N''.

To show that M is finitely presented just apply the previous result to the kernel of a presentation $R^n \to M$.

It is well known and easy to prove that the ascending chain condition for R-submodules of M is equivalent to the condition that every submodule of M is a finite R-module. We omit the proof. $\square$

Definition 7.47.2. Let R be a ring. Let $I \subset R$ be an ideal. We say I is *locally nilpotent* if for every $x \in I$ there exists an $n \in \mathbf{N}$ such that $x^n = 0$. We say I is *nilpotent* if there exists an $n \in \mathbf{N}$ such that $I^n = 0$.

Lemma 7.47.3. *Let R be a Noetherian ring. Let I, J be ideals of R. Suppose $J \subset \sqrt{I}$. Then $J^n \subset I$ for some n. In particular, in a Noetherian ring the notions of "locally nilpotent ideal" and "nilpotent ideal" coincide.*

Proof. Say $J = (f_1, \ldots, f_s)$. By assumption $f_i^{d_i} \in I$. Take $n = d_1 + d_2 + \ldots + d_s + 1$. $\square$

Lemma 7.47.4. *(Artin-Rees lemma) Suppose that R is Noetherian, $I \subset R$ an ideal. Let $N \subset M$ be finite R-modules. There exists a constant $c > 0$ such that $I^n M \cap N = I^{n-c}(I^c M \cap N)$.*

Proof. Consider the ring $S = R \oplus I \oplus I^2 \oplus \ldots = \bigoplus_{n \geq 0} I^n$. Convention: $I^0 = R$. Multiplication maps $I^n \times I^m$ into I^{n+m} by multiplication in R. Note that if $I = (f_1, \ldots, f_t)$ then S is a quotient of the Noetherian ring $R[X_1, \ldots, X_t]$. The map just sends the monomial $X_1^{e_1} \ldots X_t^{e_t}$ to $f_1^{e_1} \ldots f_t^{e_t}$. Thus S is Noetherian. Similarly, consider the module $M \oplus IM \oplus I^2 M \oplus \ldots = \bigoplus_{n \geq 0} I^n M$. This is a finitely generated S-module. Namely, if $x_1, \ldots, x_r$ generate M over R, then they also generate $\bigoplus_{n \geq 0} I^n M$ over S. Next, consider the submodule $\bigoplus_{n \geq 0} I^n M \cap N$. This is an S-submodule, as is easily verified. By Lemma 7.47.1 it is finitely generated as an S-module, say by $\xi_j \in \bigoplus_{n \geq 0} I^n M \cap N$, $j = 1, \ldots, s$. We may assume by decomposing each ξ_j into its homogeneous pieces that each $\xi_j \in I^{d_j} M \cap N$ for some d_j. Set $c = \max\{d_j\}$. Then for all $n \geq c$ every element in $I^n M \cap N$ is of the form $\sum h_j \xi_j$ with $h_j \in I^{n-d_j}$. The lemma now follows from this and the trivial observation that $I^{n-d_j}(I^{d_j} M \cap N) \subset I^{n-c}(I^c M \cap N)$. $\square$

Lemma 7.47.5. *Suppose that $0 \to K \to M \xrightarrow{f} N$ is an exact sequence of finitely generated modules over a Noetherian ring R. Let $I \subset R$ be an ideal. Then there exists a c such that $f^{-1}(I^n N) = K + I^{n-c} f^{-1}(I^c N)$ for all $n \geq c$.*

Proof. Apply Lemma 7.47.4 to $\text{Im}(f) \subset N$ and note that $f : I^{n-c}M \to I^{n-c}f(M)$ is surjective. $\square$

Lemma 7.47.6. *Let R be a Noetherian local ring. Let $I \subset R$ be a proper ideal. Let M be a finite R-module. Then $\bigcap_{n\geq 0} I^n M = 0$.*

Proof. Let $N = \bigcap_{n\geq 0} I^n M$. Then $N = I^n M \cap N$ for all $n \geq 0$. By the Artin-Rees Lemma 7.47.4 we see that $N = I^n M \cap N \subset IN$ for some suitably large n. By Nakayama's Lemma 7.14.5 we see that $N = 0$. $\square$

Lemma 7.47.7. *Let R be a Noetherian ring. Let $I \subset R$ be an ideal. Let M be a finite R-module. Let $N = \bigcap_n I^n M$. For every prime $\mathfrak{p}$, $I \subset \mathfrak{p}$ there exists a $f \in R$, $f \notin \mathfrak{p}$ such that $N_f = 0$.*

Proof. Let $x_1, \ldots, x_n$ be generators for the module N, see Lemma 7.47.1. For every prime $\mathfrak{p}$, $I \subset \mathfrak{p}$ we see that the image of N in the localization $M_{\mathfrak{p}}$ is zero, by Lemma 7.47.6. Hence we can find $g_i \in R$, $g_i \notin \mathfrak{p}$ such that x_i maps to zero in N_{g_i}. Thus $N_{g_1 g_2 \ldots g_n} = 0$. $\square$

Remark 7.47.8. Lemma 7.47.6 in particular implies that $\bigcap_n I^n = (0)$ when $I \subset R$ is a non-unit ideal in a Noetherian local ring R. More generally, let R be a Noetherian ring and $I \subset R$ an ideal. Suppose that $f \in \bigcap_{n\in\mathbf{N}} I^n$. Then Lemma 7.47.7 says that for every prime ideal $I \subset \mathfrak{p}$ there exists a $g \in R$, $g \notin \mathfrak{p}$ such that f maps to zero in R_g. In algebraic geometry we express this by saying that ``f is zero in an open neighbourhood of the closed set $V(I)$ of $Spec(R)$''.

Lemma 7.47.9. *(Artin-Tate) Let R be a Noetherian ring. Let S be a finitely generated R-algebra. If $T \subset S$ is an R-subalgebra such that S is finitely generated as a T-module, then T is a finite type over R.*

Proof. Choose elements $x_1, \ldots, x_n \in S$ which generate S as an R-algebra. Choose $y_1, \ldots, y_m$ in S which generate S as a T-module. Thus there exist $a_{ij} \in T$ such that $x_i = \sum a_{ij} y_j$. There also exist $b_{ijk} \in T$ such that $y_i y_j = \sum b_{ijk} y_k$. Let $T' \subset T$ be the sub R-algebra generated by a_{ij} and b_{ijk}. This is a finitely generated R-algebra, hence Noetherian. Consider the algebra

$$S' = T'[Y_1, \ldots, Y_m]/(Y_i Y_j - \sum b_{ijk} Y_k).$$

Note that S' is finite over T', namely as a T'-module it is generated by the classes of $1, Y_1, \ldots, Y_m$. Consider the T'-algebra homomorphism $S' \to S$ which maps Y_i to y_i. Because $a_{ij} \in T'$ we see that x_j is in the image of this map. Thus $S' \to S$ is surjective. Therefore S is finite over T' as well. Since T' is Noetherian and we conclude that $T \subset S$ is finite over T' and we win. $\square$

Lemma 7.47.10. *Let R be a ring. Let $\alpha : A \to B$ and $\gamma : C \to B$ be R-algebra maps. Assume*

(1) *$A \to B$ is surjective, and*
(2) *B is finite over C.*

Then the fibre product ring $T = \{(a, c) \mid \alpha(a) = \gamma(c)\}$ is of finite type over R.

Proof. Note that there is a commutative diagram

$$\begin{tikzcd}
0 \arrow[r] & I \arrow[r] & A \arrow[r] & B \arrow[r] & 0 \\
0 \arrow[r] & I \arrow[r] \arrow[u] & T \arrow[r] \arrow[u] & C \arrow[r] \arrow[u] & 0
\end{tikzcd}$$

with exact rows. Choose $y_1, \ldots, y_n$ which are generators for B as a C-module. Choose $x_1, \ldots, x_n \in A$ mapping to y_i. Then it is clear that $1, x_1, \ldots, x_n$ are generators for A as a T-module. By the diagram the map $T \to A \times C$ is injective, and by what we just said the ring $A \times C$ is finite as a T-module (because it is the direct sum of the finite modules A and C). Hence the lemma follows from the Artin-Tate Lemma 7.47.9. □

7.48. Length

Definition 7.48.1. Let R be a ring. For any R-module M we define the *length* of M over R by the formula

$$\text{length}_R(M) = \sup\{n \mid \exists\, 0 = M_0 \subset M_1 \subset \ldots \subset M_n = M,\ M_i \neq M_{i+1}\}.$$

In other words it is the supremum of the lengths of chains of submodules. There is an obvious notion of when a chain of submodules is a refinement of another. This gives a partial ordering on the collection of all chains of submodules, with the smallest chain having the shape $0 = M_0 \subset M_1 = M$ if M is not zero. We note the obvious fact that if the length of M is finite, then every chain can be refined to a maximal chain. But it is not as obvious that all maximal chains have the same length (as we will see later).

Lemma 7.48.2. *Let R be a ring. Let M be an R-module. If $\text{length}_R(M) < \infty$ then M is a finite R-module.*

Proof. Omitted. □

Lemma 7.48.3. *If $0 \to M' \to M \to M'' \to 0$ is a short exact sequence of modules over R then the length of M is the sum of the lengths of M' and M''.*

Proof. Given filtrations of M' and M'' of lengths n', n'' it is easy to make a corresponding filtration of M of length $n' + n''$. Thus we see that $\text{length}_R M \geq \text{length}_R M' + \text{length}_R M''$. Conversely, given a filtration $M_0 \subset M_1 \subset \ldots \subset M_n$ of M consider the induced filtrations $M_i' = M_i \cap M'$ and $M_i'' = \text{Im}(M_i \to M'')$. Let n' (resp. n'') be the number of steps in the filtration $\{M_i'\}$ (resp. $\{M_i''\}$). If $M_i' = M_{i+1}'$ and $M_i'' = M_{i+1}''$ then $M_i = M_{i+1}$. Hence we conclude that $n' + n'' \geq n$. Combined with the earlier result we win. □

Lemma 7.48.4. *Let R be a local ring with maximal ideal $\mathfrak{m}$. Let M be an R-module.*

(1) *If M is a finite and $\mathfrak{m}^n M \neq 0$ for all $n \geq 0$, then $\text{length}_R(M) = \infty$.*
(2) *If M has finite length then $\mathfrak{m}^n M = 0$ for some n.*

Proof. Assume M is finite and $\mathfrak{m}^n M \neq 0$ for all $n \geq 0$. By NAK, Lemma 7.14.5 all the steps in the filtration $0 \subset \mathfrak{m}^n M \subset \mathfrak{m}^{n-1} M \subset \ldots \subset \mathfrak{m} M \subset M$ are distinct. Hence the length is infinite, i.e., (1) holds. Combine (1) and Lemma 7.48.2 to see (2). □

Lemma 7.48.5. *Let $R \to S$ be a ring map. Let M be an S-module. We always have $\text{length}_R(M) \geq \text{length}_S(M)$. If $R \to S$ is surjective then equality holds.*

Proof. A filtration of M by S-submodules gives rise a filtration of M by R-submodules. This proves the inequality. And if $R \to S$ is surjective, then any R-submodule of M is automatically a S-submodule. Hence equality in this case. □

Lemma 7.48.6. *Let R be a ring with maximal ideal $\mathfrak{m}$. Suppose that M is an R-module with $\mathfrak{m} M = 0$. Then the length of M as an R-module agrees with the dimension of M as a $R/\mathfrak{m}$ vector space. The length is finite if and only if M is a finite R-module.*

Proof. The first part is a special case of Lemma 7.48.5. Thus the length is finite if and only if M has a finite basis as a $R/\mathfrak{m}$-vector space if and only if M has a finite set of generators as an R-module. □

Lemma 7.48.7. *Let R be a ring. Let M be an R-module. Let $S \subset R$ be a multiplicative subset. Then $length_R(M) \geq length_{S^{-1}R}(S^{-1}M)$.*

Proof. Any submodule $N' \subset S^{-1}M$ is of the form $S^{-1}N$ for some R-submodule $N \subset M$, by Lemma 7.9.15. The lemma follows. □

Lemma 7.48.8. *Let R be a ring with finitely generated maximal ideal $\mathfrak{m}$. (For example R Noetherian.) Suppose that M is a finite R-module with $\mathfrak{m}^n M = 0$ for some n. Then $length_R(M) < \infty$.*

Proof. Consider the filtration $0 = \mathfrak{m}^n M \subset \mathfrak{m}^{n-1}M \subset \ldots \subset \mathfrak{m}M \subset M$. All of the subquotients are finitely generated R-modules to which Lemma 7.48.6 applies. We conclude by additivity, see Lemma 7.48.3. □

Definition 7.48.9. Let R be a ring. Let M be an R-module. We say M is *simple* if $M \neq 0$ and every submodule of M is either equal to M or to 0.

Lemma 7.48.10. *Let R be a ring. Let M be an R-module. The following are equivalent:*

(1) *M is simple,*
(2) *$length_R(M) = 1$, and*
(3) *$M \cong R/\mathfrak{m}$ for some maximal ideal $\mathfrak{m} \subset R$.*

Proof. Let $\mathfrak{m}$ be a maximal ideal of R. By Lemma 7.48.6 the module $R/\mathfrak{m}$ has length 1. The equivalence of the first two assertions is tautological. Suppose that M is simple. Choose $x \in M$, $x \neq 0$. As M is simple we have $M = R \cdot x$. Let $I \subset R$ be the annihilator of x, i.e., $I = \{f \in R \mid fx = 0\}$. The map $R/I \to M$, $f \bmod I \mapsto fx$ is an isomorphism, hence R/I is a simple R-module. Since $R/I \neq 0$ we see $I \neq R$. Let $I \subset \mathfrak{m}$ be a maximal ideal containing I. If $I \neq \mathfrak{m}$, then $\mathfrak{m}/I \subset R/I$ is a nontrivial submodule contradicting the simplicity of R/I. Hence we see $I = \mathfrak{m}$ as desired. □

Lemma 7.48.11. *Let R be a ring. Let M be a finite length R-module. Let $\ell = length_R(M)$. Choose any maximal chain of submodules*

$$0 = M_0 \subset M_1 \subset M_2 \subset \ldots \subset M_n = M$$

with $M_i \neq M_{i-1}$, $i = 1, \ldots, n$. Then

(1) *$n = \ell$,*
(2) *each M_i/M_{i-1} is simple,*
(3) *each M_i/M_{i-1} is of the form $R/\mathfrak{m}_i$ for some maximal ideal $\mathfrak{m}_i$,*
(4) *given a maximal ideal $\mathfrak{m} \subset R$ we have*

$$\#\{i \mid \mathfrak{m}_i = \mathfrak{m}\} = length_{R_\mathfrak{m}}(M_\mathfrak{m}).$$

Proof. If M_i/M_{i-1} is not simple then we can refine the filtration and the filtration is not maximal. Thus we see that M_i/M_{i-1} is simple. By Lemma 7.48.10 the modules M_i/M_{i-1} have length 1 and are of the form $R/\mathfrak{m}_i$ for some maximal ideals $\mathfrak{m}_i$. By additivity of length, Lemma 7.48.3, we see $n = \ell$. Since localization is exact, we see that

$$0 = (M_0)_\mathfrak{m} \subset (M_1)_\mathfrak{m} \subset (M_2)_\mathfrak{m} \subset \ldots \subset (M_n)_\mathfrak{m} = M_\mathfrak{m}$$

is a filtration of $M_{\mathfrak m}$ with successive quotients $(M_i/M_{i-1})_{\mathfrak m}$. Thus the last statement follows directly from the fact that given maximal ideals $\mathfrak m$, $\mathfrak m'$ of R we have

$$(R/\mathfrak m')_{\mathfrak m} \cong \begin{cases} 0 & \text{if } \mathfrak m \neq \mathfrak m', \\ R_{\mathfrak m}/\mathfrak m R_{\mathfrak m} & \text{if } \mathfrak m = \mathfrak m' \end{cases}$$

This we leave to the reader. □

Lemma 7.48.12. *Let A be a local ring with maximal ideal $\mathfrak m$. Let B be a semi-local ring with maximal ideals $\mathfrak m_i$, $i = 1, \ldots, n$. Suppose that $A \to B$ is a homomorphism such that each $\mathfrak m_i$ lies over $\mathfrak m$ and such that*

$$[\kappa(\mathfrak m_i) : \kappa(\mathfrak m)] < \infty.$$

Let M be a B-module of finite length. Then

$$length_A(M) = \sum\nolimits_{i=1,\ldots,n} [\kappa(\mathfrak m_i) : \kappa(\mathfrak m)] length_{B_{\mathfrak m_i}}(M_{\mathfrak m_i}),$$

in particular $length_A(M) < \infty$.

Proof. Choose a maximal chain

$$0 = M_0 \subset M_1 \subset M_2 \subset \ldots \subset M_n = M$$

by B-submodules as in Lemma 7.48.11. Then each quotient M_i/M_{i-1} is isomorphic to $\kappa(\mathfrak m_{j(i)})$ for some $j(i) \in \{1, \ldots, n\}$. Moreover $\text{length}_A(\kappa(\mathfrak m_i)) = [\kappa(\mathfrak m_i) : \kappa(\mathfrak m)]$ by Lemma 7.48.6. The lemma follows by additivity of lengths (Lemma 7.48.3). □

Lemma 7.48.13. *Let $A \to B$ be a flat local homomorphism of local rings. Then for any A-module M we have*

$$length_A(M) length_B(B/\mathfrak m_A B) = length_B(M \otimes_A B).$$

In particular, if $length_B(B/\mathfrak m_A B) < \infty$ then M has finite length if and only if $M \otimes_A B$ has finite length.

Proof. The ring map $A \to B$ is faithfully flat by Lemma 7.35.16. Hence if $0 = M_0 \subset M_1 \subset \ldots \subset M_n = M$ is a chain of length n in M, then the corresponding chain $0 = M_0 \otimes_A B \subset M_1 \otimes_A B \subset \ldots \subset M_n \otimes_A B = M \otimes_A B$ has length n also. This proves $\text{length}_A(M) = \infty \Rightarrow \text{length}_B(M \otimes_A B) = \infty$. Next, assume $\text{length}_A(M) < \infty$. In this case we see that M has a filtration of length $\ell = \text{length}_A(M)$ whose quotients are $A/\mathfrak m_A$. Arguing as above we see that $M \otimes_A B$ has a filtration of length ℓ whose quotients are isomorphic to $B \otimes_A A/\mathfrak m_A = B/\mathfrak m_A B$. Thus the lemma follows. □

Lemma 7.48.14. *Let $A \to B \to C$ be flat local homomorphisms of local rings. Let M be an A-module of finite length. Then*

$$length_B(B/\mathfrak m_A B) length_C(C/\mathfrak m_B C) = length_C(C/\mathfrak m_A C)$$

Proof. Follows from Lemma 7.48.13 applied to the ring map $B \to C$ and the B-module $M = B/\mathfrak m_A B$ □

7.49. Artinian rings

Artinian rings, and especially local Artinian rings, play an important role in algebraic geometry, for example in deformation theory.

Definition 7.49.1. A ring R is *Artinian* if it satisfies the descending chain condition for ideals.

Lemma 7.49.2. *Suppose R is a finite dimensional algebra over a field. Then R is Artinian.*

Proof. The descending chain condition for ideals obviously holds. $\square$

Lemma 7.49.3. *If R is Artinian then R has only finitely many maximal ideals.*

Proof. Suppose that $\mathfrak{m}_i$, $i = 1, 2, 3, \ldots$ are maximal ideals. Then $\mathfrak{m}_1 \supset \mathfrak{m}_1 \cap \mathfrak{m}_2 \supset \mathfrak{m}_1 \cap \mathfrak{m}_2 \cap \mathfrak{m}_3 \supset \ldots$ is an infinite descending sequence (because by the Chinese remainder theorem all the maps $R \to \bigoplus_{i=1}^n R/\mathfrak{m}_i$ are surjective). $\square$

Lemma 7.49.4. *Let R be Artinian. The radical $rad(R)$ of R is a nilpotent ideal.*

Proof. Denote the radical I. Note that $I \supset I^2 \supset I^3 \supset \ldots$ is a descending sequence. Thus $I^n = I^{n+1}$ for some n. Set $J = \{x \in R \mid xI^n = 0\}$. We have to show $J = R$. If not, choose an ideal $J' \neq J$, $J \subset J'$ minimal (possible by the Artinian property). Then $J' = J + Rx$ for some $x \in R$. By NAK, Lemma 7.14.5, we have $IJ' \subset J$. Hence $xI^{n+1} \subset xI \cdot I^n \subset J \cdot I^n = 0$. Since $I^{n+1} = I^n$ we conclude $x \in J$. Contradiction. $\square$

Lemma 7.49.5. *Let R be a ring. Let $I \subset R$ be a locally nilpotent ideal. Then $R \to R/I$ induces a bijection on idempotents.*

First proof of Lemma 7.49.5. As I is locally nilpotent it is contained in every prime ideal. Hence $Spec(R/I) = V(I) = Spec(R)$. Hence the lemma follows from Lemma 7.18.3. $\square$

Second proof of Lemma 7.49.5. First assume I is nilpotent. Suppose $\overline{e} \in R/I$ is an idempotent. We have to lift $\overline{e}$ to an idempotent of R. Choose a lift $e \in R$ such that $x = e^2 - e \in I^k$ for some $k \geq 1$. Let $e' = e - (2e - 1)x = 3e^2 - 2e^3$, which is another lift of $\overline{e}$. Then

$$(e')^2 - e' = (4e^2 - 4e - 3)(e^2 - e)^2 \in I^{2k}$$

by a simple computation. Hence e' is an idempotent in R/I^{2k}. By succesively improving the approximation as above we reach a stage where $I^k = 0$, and we win.

Next, suppose I is locally nilpotent. Let $\overline{e} \in R/I$ be an idempotent. Let $f \in R$ be any element lifting $\overline{e}$. Denote $R' \subset R$ the $\mathbf{Z}$-subalgebra of R generated by f. Denote $I' = R' \cap I$. Since R' is Noetherian, see Lemma 7.28.3 we see that I' is nilpotent, see Lemma 7.47.3. On the other hand we have $R'/I' \subset R/I$ and hence the image $\overline{f} \in R'/I'$ of f is an idempotent. Thus by the first part of the proof we see that we can find an idempotent $e \in R'$ which is a lift of $\overline{f}$. Then $e \in R$ is also a lift of $\overline{e}$ in R/I. $\square$

Lemma 7.49.6. *Let A be a possibly noncommutative algebra. Let $e \in A$ be an element such that $x = e^2 - e$ is nilpotent. Then there exists an idempotent of the form $e' = e + x(\sum a_{i,j} e^i x^j) \in A$ with $a_{i,j} \in \mathbf{Z}$.*

Proof. Consider the ring $R_n = \mathbf{Z}[e]/((e^2 - e)^n)$. It is clear that if we can prove the result for each R_n then the lemma follows. In R_n consider the ideal $I = (e^2 - e)$ and apply Lemma 7.49.5. $\square$

Lemma 7.49.7. *Any ring with finitely many maximal ideals and locally nilpotent radical is the product of its localizations at its maximal ideals. Also, all primes are maximal.*

Proof. Let R be a ring with finitely many maximal ideals $\mathfrak{m}_1, \ldots, \mathfrak{m}_n$. Let $I = \bigcap_{i=1}^n \mathfrak{m}_i$ be the radical of R. Assume I is locally nilpotent. Let $\mathfrak{p}$ be a prime ideal of R. Since every prime contains every nilpotent element of R we see $\mathfrak{p} \supset \mathfrak{m}_1 \cap \ldots \cap \mathfrak{m}_n$. Since $\mathfrak{m}_1 \cap \ldots \cap \mathfrak{m}_n \supset \mathfrak{m}_1 \ldots \mathfrak{m}_n$ we conclude $\mathfrak{p} \supset \mathfrak{m}_1 \ldots \mathfrak{m}_n$. Hence $\mathfrak{p} \supset \mathfrak{m}_i$ for some i, and so $\mathfrak{p} = \mathfrak{m}_i$. By the Chinese remainder theorem (Lemma 7.14.4) we have $R/I \cong \bigoplus R/\mathfrak{m}_i$ which is a product of fields. Hence by Lemma 7.49.5 there are idempotents e_i, $i = 1, \ldots, n$ with $e_i \bmod \mathfrak{m}_j = \delta_{ij}$. Hence $R = \prod Re_i$, and each Re_i is a ring with exactly one maximal ideal. □

Lemma 7.49.8. *A ring R is Artinian if and only if it has finite length as a module over itself. Any such ring R is both Artinian and Noetherian, any prime ideal of R is a maximal ideal, and R is equal to the (finite) product of its localizations at its maximal ideals.*

Proof. If R has finite length over itself then it satisfies both the ascending chain condition and the descending chain condition for ideals. Hence it is both Noetherian and Artinian. Any Artinian ring is equal to product of its localizations at maximal ideals by Lemmas 7.49.3, 7.49.4, and 7.49.7.

Suppose that R is Artinian. We will show R has finite length over itself. It suffices to exhibit a chain of submodules whose succesive quotients have finite length. By what we said above we may assume that R is local, with maximal ideal $\mathfrak{m}$. By Lemma 7.49.4 we have $\mathfrak{m}^n = 0$ for some n. Consider the sequence $0 = \mathfrak{m}^n \subset \mathfrak{m}^{n-1} \subset \ldots \subset \mathfrak{m} \subset R$. By Lemma 7.48.6 the length of each subquotient $\mathfrak{m}^j/\mathfrak{m}^{j+1}$ is the dimension of this as a vector space over $\kappa(\mathfrak{m})$. This has to be finite since otherwise we would have an infinite descending chain of subvector spaces which would correspond to an infinite descending chain of ideals in R. □

7.50. Homomorphisms essentially of finite type

Some simple remarks on localizations of finite type ring maps.

Definition 7.50.1. Let $R \to S$ be a ring map.

(1) We say that $R \to S$ is *essentially of finite type* if S is the localization of an R-algebra of finite type.
(2) We say that $R \to S$ is *essentially of finite presentation* if S is the localization of an R-algebra of finite presentation.

Lemma 7.50.2. *The class of ring maps which are essentially of finite type is preserved under composition. Similarly for essentially of finite presentation.*

Proof. Omitted. □

Lemma 7.50.3. *Let $R \to S$ be a ring map. Assume S is an Artinian local ring with maximal ideal $\mathfrak{m}$. Then*

(1) *$R \to S$ is finite if and only if $R \to S/\mathfrak{m}$ is finite,*
(2) *$R \to S$ is of finite type if and only if $R \to S/\mathfrak{m}$ is of finite type.*
(3) *$R \to S$ is essentially of finite type if and only if the composition $R \to S/\mathfrak{m}$ is essentially of finite type.*

Proof. If $R \to S$ is finite, then $R \to S/\mathfrak{m}$ is finite by Lemma 7.7.3. Conversely, assume $R \to S/\mathfrak{m}$ is finite. As S has finite length over itself (Lemma 7.49.8) we can choose a filtration

$$0 \subset I_1 \subset \ldots \subset I_n = S$$

by ideals such that $I_i/I_{i-1} \cong S/\mathfrak{m}$ as S-modules. Thus S has a filtration by R-submodules I_i such that each successive quotient is a finite R-module. Thus S is a finite S-module by Lemma 7.5.4.

If $R \to S$ is of finite type, then $R \to S/\mathfrak{m}$ is of finite type by Lemma 7.6.2. Conversely, assume that $R \to S/\mathfrak{m}$ is of finite type. Choose $f_1, \ldots, f_n \in S$ which map to generators of $S/\mathfrak{m}$. Then $A = R[x_1, \ldots, x_n] \to S$, $x_i \mapsto f_i$ is a ring map such that $A \to S/\mathfrak{m}$ is surjective (in particular finite). Hence $A \to S$ is finite by part (1) and we see that $R \to S$ is of finite type by Lemma 7.6.2.

If $R \to S$ is essentially of finite type, then $R \to S/\mathfrak{m}$ is essentially of finite type by Lemma 7.50.2. Conversely, assume that $R \to S/\mathfrak{m}$ is essentially of finite type. Suppose $S/\mathfrak{m}$ is the localization of $R[x_1, \ldots, x_n]/I$. Choose $f_1, \ldots, f_n \in S$ whose congruence classes modulo $\mathfrak{m}$ correspond to the congruence classes of $x_1, \ldots, x_n$ modulo I. Consider the map $R[x_1, \ldots, x_n] \to S$, $x_i \mapsto f_i$ with kernel J. Set $A = R[x_1, \ldots, x_n]/J \subset S$ and $\mathfrak{p} = A \cap \mathfrak{m}$. Note that $A/\mathfrak{p} \subset S/\mathfrak{m}$ is equal to the image of $R[x_1, \ldots, x_n]/I$ in $S/\mathfrak{m}$. Hence $\kappa(\mathfrak{p}) = S/\mathfrak{m}$. Thus $A_{\mathfrak{p}} \to S$ is finite by part (1). We conclude that S is essentially of finite type by Lemma 7.50.2. □

7.51. K-groups

Let R be a ring. We will introduce two abelian groups associated to R. The first of the two is denoted $K'_0(R)$ and has the following properties:

(1) For every finite R-module M there is given an element $[M]$ in $K'_0(R)$,
(2) for every short exact sequence $0 \to M' \to M \to M'' \to 0$ we have the relation $[M] = [M'] + [M'']$,
(3) the group $K'_0(R)$ is generated by the elements $[M]$, and
(4) all relations in $K'_0(R)$ are $\mathbf{Z}$-linear combinations of the relations coming from exact sequences as above.

The actual construction is a bit more annoying since one has to take care that the collection of all finitely generated R-modules is a proper class. However, this problem can be overcome by taking as set of generators of the group $K'_0(R)$ the elements $[R^n/K]$ where n ranges over all integers and K ranges over all submodules $K \subset R^n$. The generators of for the subgroup of relations imposed on these elements will be the relations coming from short exact sequences whose terms are of the form R^n/K. The element $[M]$ is defined by choosing n and K such that $M \cong R^n/K$ and putting $[M] = [R^n/K]$. Details left to the reader.

Lemma 7.51.1. *If R is an Artinian local ring then the length function defines a natural abelian group homomorphism $length_R : K'_0(R) \to \mathbf{Z}$.*

Proof. The length of any finite R-module is finite, because it is the quotient of R^n which has finite length by Lemma 7.49.8. And the length function is additive, see Lemma 7.48.3. □

The second of the two is denoted $K_0(R)$ and has the following properties:

(1) For every finite projective R-module M there is given an element $[M]$ in $K_0(R)$,
(2) for every short exact sequence $0 \to M' \to M \to M'' \to 0$ of finite projective R-modules we have the relation $[M] = [M'] + [M'']$,

(3) the group $K_0(R)$ is generated by the elements $[M]$, and
(4) all relations in $K_0(R)$ are $\mathbf{Z}$-linear combinations of the relations coming from exact sequences as above.

The construction of this group is done as above.

We note that there is an obvious map $K_0(R) \to K_0'(R)$ which is not an isomorphism in general.

Example 7.51.2. Note that if $R = k$ is a field then we clearly have $K_0(k) = K_0'(k) \cong \mathbf{Z}$ with the isomorphism given by the dimension function (which is also the length function).

Example 7.51.3. Let k be a field. Then $K_0(k[x]) = K_0'(k[x]) = \mathbf{Z}$.

Since $R = k[x]$ is a principal ideal domain, any finite projective R-module is free. In a short exact sequence of modules

$$0 \to M' \to M \to M'' \to 0$$

we have $rank(M) = rank(M') + rank(M'')$, which gives $K_0(k[x]) = Z$.

As for K_0', the structure theorem for modules of a PID says that any finitely generated R-module is of the form $M = R^r \times R/(d_1) \times \ldots \times R/(d_k)$. Consider the short exact sequence

$$0 \to (d_i) \to R \to R/(d_i) \to 0$$

Since the ideal (d_i) is isomorphic to R as a module (it is free with generator d_i), in $K_0'(R)$ we have $[(d_i)] = [R]$. Then $[R/(d_i)] = [(d_i)] - [R] = 0$. From this it follows that any torsion part ``disappears" in K_0'. Again the rank of the free part determines that $K_0'(k[x]) = Z$, and the canonical homomorphism from K_0 to K_0' is an isomorphism.

Example 7.51.4. Let k be a field. Let $R = \{f \in k[x] \mid f(0) = f(1)\}$, compare Example 7.24.4. In this case $K_0(R) \cong k^* \oplus \mathbf{Z}$, but $K_0'(R) = \mathbf{Z}$.

Lemma 7.51.5. *Let $R = R_1 \times R_2$. Then $K_0(R) = K_0(R_1) \times K_0(R_2)$ and $K_0'(R) = K_0'(R_1) \times K_0'(R_2)$*

Proof. Omitted. □

Lemma 7.51.6. *Let R be an Artinian local ring. The map $length_R : K_0'(R) \to \mathbf{Z}$ of Lemma 7.51.1 is an isomorphism.*

Proof. Omitted. □

Lemma 7.51.7. *Let R be a local ring. Every finite projective R-module is finite free. The map $rank_R : K_0(R) \to \mathbf{Z}$ defined by $[M] \to rank_R(M)$ is well defined and an isomorphism.*

Proof. Let P be a finite projective R-module. The n generators of P give a surjection $R^n \to P$, and since P is projective it follows that $R^n \cong P \oplus Q$ for some projective module Q.

If $\mathfrak{m} \subset R$ is the maximal ideal, then $P/\mathfrak{m}$ and $Q/\mathfrak{m}$ are $R/\mathfrak{m}$-vector spaces, with $P/\mathfrak{m} \oplus Q/\mathfrak{m} \cong (R/\mathfrak{m})^n$. Say that $\dim P = p$, $\dim Q = q$, so $p + q = n$.

Choose elements $a_1, \ldots, a_p$ in P and $b_1, \ldots, b_q$ in Q lying above bases for $P/\mathfrak{m}$ and $Q/\mathfrak{m}$. The homomorphism $R^n \to P \oplus Q \cong R^n$ given by $(r_1, \ldots, r_n) \mapsto r_1 a_1 + \ldots + r_p a_p + r_{p+1} b_1 + \ldots + r_n b_q$ is a matrix A which is invertible over $R/\mathfrak{m}$. Let B be a matrix over R lying over the inverse of A in $R/\mathfrak{m}$. $AB = I + M$, where M is a matrix whose entries all lie in $\mathfrak{m}$. Thus $\det AB = 1 + x$, for $x \in \mathfrak{m}$, so AB is invertible, so A is invertible.

The homomorphism $R^p \to P$ given by $(r_1, \dots, r_p) \mapsto r_1 a_1 + \dots + r_p a_p$ inherits injectivity and surjectivity from A. Hence, $P \cong R^p$.

Next we show that the rank of a finite projective module over R is well defined: if $P \cong R^\alpha \cong R^\beta$, then $\alpha = \beta$. This is immediate in the vector space case, and so it is true in the general module case as well, by dividing out the maximal ideal on both sides. If $0 \to R^\alpha \to R^\beta \to R^\gamma \to 0$ is exact, the sequence splits, so $R^\beta \cong R^\alpha \oplus R^\gamma$, so $\beta = \alpha + \gamma$.

So far we have seen that the map $\text{rank}_R : K_0(R) \to \mathbf{Z}$ is a well-defined homomorphism. It is surjective because $\text{rank}_R[R] = 1$. It is injective because the element of $K_0(R)$ with rank $\pm\alpha$ is uniquely $\pm[R^\alpha]$. $\square$

Lemma 7.51.8. *Let R be a local Artinian ring. There is a commutative diagram*

$$\begin{tikzcd} K_0(R) \arrow[r] \arrow[d, "rank_R"'] & K'_0(R) \arrow[d, "length_R"] \\ \mathbf{Z} \arrow[r, "length_R(R)"] & \mathbf{Z} \end{tikzcd}$$

where the vertical maps are isomorphisms by Lemmas 7.51.6 and 7.51.7.

Proof. By induction on the rank of M. Suppose $[M] \in K_0(R)$. Then M is a finite projective R-module over a local ring, so M is free; $M \cong R^n$ for some n. The claim is that $\text{rank}(M)\text{length}_R(R) = \text{length}_R(M)$, or equivalently that $n\text{length}_R(R) = \text{length}_R(R^n)$ for all $n \geq 1$. When $n = 1$, this is clearly true. Suppose that $(n-1)\text{length}_R(R) = \text{length}_R(R^{n-1})$. Then since there is a split short exact sequence

$$0 \to R \to R^n \to R^{n-1} \to 0$$

by Lemma 7.48.3 we have

$$\begin{aligned} \text{length}_R(R^n) &= \text{length}_R(R) + \text{length}_R(R^{n-1}) \\ &= \text{length}_R(R) + (n-1)\text{length}_R(R) \\ &= n\text{length}_R(R) \end{aligned}$$

as desired. $\square$

7.52. Graded rings

A *graded ring* will be for us a ring S endowed with a direct sum decomposition $S = \bigoplus_{d \geq 0} S_d$ such that $S_d \cdot S_e \subset S_{d+e}$. Note that we do not allow nonzero elements in negative degrees. The *irrelevant ideal* is the ideal $S_+ = \bigoplus_{d>0} S_d$. A *graded module* will be an S-module M endowed with a direct sum decomposition $M = \bigoplus_{n \in \mathbf{Z}} M_n$ such that $S_d \cdot M_e \subset M_{d+e}$. Note that for modules we do allow nonzero elements in negative degrees. We think of S as a graded S-module by setting $S_{-k} = (0)$ for $k > 0$. An element x (resp. f) of M (resp. S) is called *homogeneous* if $x \in M_d$ (resp. $f \in S_d$) for some d. A *map of graded S-modules* is a map of S-modules $\varphi : M \to M'$ such that $\varphi(M_d) \subset M'_d$. We do not allow maps to shift degrees. Let us denote $\text{GrHom}_0(M, N)$ the S_0-module of homomorphisms of graded modules from M to N.

At this point there are the notions of graded ideal, graded quotient ring, graded submodule, graded quotient module, graded tensor product, etc. We leave it to the reader to find the relevant definitions, and lemmas. For example: A short exact sequence of graded modules is short exact in every degree.

Given a graded ring S, a graded S-module M and $n \in \mathbf{Z}$ we denote $M(n)$ the graded S-module with $M(n)_d = M_{n+d}$. This is called the *twist of M by n*. In particular we get modules $S(n)$, $n \in \mathbf{Z}$ which will play an important role in the study of projective schemes. There are some obvious functorial isomorphisms such as $(M \oplus N)(n) = M(n) \oplus N(n)$, $(M \otimes_S N)(n) = M \otimes_S N(n) = M(n) \otimes_S N$. In addition we can define a graded S-module structure on the S_0-module

$$\mathrm{GrHom}(M, N) = \bigoplus\nolimits_{n \in \mathbf{Z}} \mathrm{GrHom}_n(M, N), \quad \mathrm{GrHom}_n(M, N) = \mathrm{GrHom}_0(M, N(n)).$$

We omit the definition of the multiplication.

Let S be a graded ring. Let $d \geq 1$ be an integer. We set $S^{(d)} = \bigoplus_{n \geq 0} S_{nd}$. We think of $S^{(d)}$ as a graded ring with degree n summand $(S^{(d)})_n = S_{nd}$. Given a graded S-module M we can similarly consider $M^{(d)} = \bigoplus_{n \in \mathbf{Z}} M_{nd}$ which is a graded $S^{(d)}$-module.

Lemma 7.52.1. *Let $R \to S$ be a homomorphism of graded rings. Let $S' \subset S$ be the integral closure of R in S. Then*

$$S' = \bigoplus\nolimits_{d \geq 0} S' \cap S_d,$$

i.e., S' is a graded R-subalgebra of S.

Proof. We have to show the following: If $s = s_n + s_{n+1} + \ldots + s_m \in S'$, then each homogeneous part $s_j \in S'$. We will prove this by induction on $m - n$ over all homomorphisms $R \to S$ of graded rings. First note that it is immediate that s_0 is integral over R_0 (hence over R) as there is a ring map $S \to S_0$ compatible with the ring map $R \to R_0$. Thus, after replacing s by $s - s_0$, we may assume $n > 0$. Consider the extension of graded rings $R[t, t^{-1}] \to S[t, t^{-1}]$ where t has degree 0. There is a commutative diagram

$$\begin{tikzcd}
S[t, t^{-1}] \arrow[r, "s \mapsto t^{\deg(s)} s"'] & S[t, t^{-1}] \\
R[t, t^{-1}] \arrow[u] \arrow[r, "r \mapsto r^{\deg(r)}"] & R[t, t^{-1}] \arrow[u]
\end{tikzcd}$$

where the horizontal maps are ring automorphisms. Hence the integral closure C of $S[t, t^{-1}]$ over $R[t, t^{-1}]$ maps into itself. Thus we see that

$$t^m(s_n + s_{n+1} + \ldots + s_m) - (t^n s_n + t^{n+1} s_{n+1} + \ldots + t^m s_m) \in C$$

which implies by induction hypothesis that each $(t^m - t^i)s_i \in C$ for $i = n, \ldots, m-1$. Note that for any ring A and $m > i \geq n > 0$ we have $A[t, t^{-1}]/(t^m - t^i - 1) \cong A[t]/(t^m - t^i - 1) \supset A$ because $t(t^{m-1} - t^{i-1}) = 1$ in $A[t]/(t^m - t^i - 1)$. Since $t^m - t^i$ maps to 1 we see the image of s_i in the ring $S[t]/(t^m - t^i - 1)$ is integral over $R[t]/(t^m - t^i - 1)$ for $i = n, \ldots, m-1$. Since $R \to R[t]/(t^m - t^i - 1)$ is finite we see that s_i is integral over R by transitivity, see Lemma 7.32.6. Finally, we also conclude that $s_m = s - \sum_{i=n,\ldots,m-1} s_i$ is integral over R. $\square$

7.53. Proj of a graded ring

Let S be a graded ring. A *homogeneous ideal* is simply an ideal $I \subset S$ which is also a graded submodule of S. Equivalently, it is an ideal generated by homogeneous elements. Equivalently, if $f \in I$ and

$$f = f_0 + f_1 + \ldots + f_n$$

is the decomposition of f into homogenous parts in S then $f_i \in I$ for each i. To check that a homogeneous ideal $\mathfrak{p}$ is prime it suffices to check that if $ab \in \mathfrak{p}$ with a, b homogeneous then either $a \in \mathfrak{p}$ or $b \in \mathfrak{p}$.

Definition 7.53.1. Let S be a graded ring. We define Proj(S) to be the set of homogenous, prime ideals $\mathfrak{p}$ of S such that $S_+ \not\subset \mathfrak{p}$. As Proj($S$) is a subset of $Spec(S)$ and we endow it with the induced topology. The topological space Proj(S) is called the *homogeneous spectrum* of the graded ring S.

Note that by construction there is a continuous map

$$\mathrm{Proj}(S) \longrightarrow Spec(S_0)$$

Let $S = \oplus_{d \geq 0} S_d$ be a graded ring. Let $f \in S_d$ and assume that $d \geq 1$. We define $S_{(f)}$ to be the subring of S_f consisting of elements of the form r/f^n with r homogenous and $\deg(r) = nd$. If M is a graded S-module, then we define the $S_{(f)}$-module $M_{(f)}$ as the sub module of M_f consisting of elements of the form x/f^n with x homogeneous of degree nd.

Lemma 7.53.2. *Let S be a $\mathbf{Z}$-graded ring. Let $f \in S_d$, $d > 0$ and assume f is invertible in S. The set $G \subset Spec(S)$ of $\mathbf{Z}$-graded primes of S (with induced topology) maps homeomorphically to $Spec(S_0)$.*

Proof. First we show that the map is a bijection by constructing an inverse. Namely, if $\mathfrak{p}_0$ is a prime of S_0, then $\mathfrak{p}_0 S$ is a $\mathbf{Z}$-graded ideal of S such that $\mathfrak{p}_0 S \cap S_0 = \mathfrak{p}_0$. And if $ab \in \mathfrak{p}_0 S$ with a, b homogenenous, then $a^d b^d / f^{\deg(a)+\deg(b)} \in \mathfrak{p}_0$. Thus either $a^d/f^{\deg(a)} \in \mathfrak{p}_0$ or $b^d/f^{\deg(b)} \in \mathfrak{p}_0$, in other words either $a^d \in \mathfrak{p}_0 S$ or $b^d \in \mathfrak{p}_0 S$. It follows that $\sqrt{\mathfrak{p}_0 S}$ is a $\mathbf{Z}$-graded prime ideal of S whose intersection with S_0 is $\mathfrak{p}_0$.

To show that the map is a homeomorphism we show that the image of $G \cap D(g)$ is open. If $g = \sum g_i$ with $g_i \in S_i$, then by the above $G \cap D(g)$ maps onto the set $\bigcup D(g_i^d/f^i)$ which is open. □

For $f \in S$ homogenenous of degree > 0 we define

$$D_+(f) = \{\mathfrak{p} \in \mathrm{Proj}(S) \mid f \notin \mathfrak{p}\}.$$

Finally, for a homogenous ideal $I \subset S$ we define

$$V_+(I) = \{\mathfrak{p} \in \mathrm{Proj}(S) \mid I \subset \mathfrak{p}\}.$$

We will use more generally the notation $V_+(E)$ for any set E of homogeneous elements $E \subset S$.

Lemma 7.53.3. *(Topology on Proj(S).) Let $S = \oplus_{d \geq 0} S_d$ be a graded ring.*

(1) *The sets $D_+(f)$ are open in Proj(S).*
(2) *We have $D_+(ff') = D_+(f) \cap D_+(f')$.*
(3) *Let $g = g_0 + \ldots + g_m$ be an element of S with $g_i \in S_i$. Then*

$$D(g) \cap Proj(S) = (D(g_0) \cap Proj(S)) \cup \bigcup\nolimits_{i \geq 1} D_+(g_i).$$

(4) *Let $g_0 \in S_0$ be a homogenous element of degree 0. Then*

$$D(g_0) \cap Proj(S) = \bigcup\nolimits_{f \in S_d,\ d \geq 1} D_+(g_0 f).$$

(5) *The open sets $D_+(f)$ form a basis for the topology of Proj(S).*

(6) *Let $f \in S$ be homogeneous of positive degree. The ring S_f has a natural $\mathbf{Z}$-grading. The ring maps $S \to S_f \leftarrow S_{(f)}$ induce homeomorphisms*
$$D_+(f) \leftarrow \{\mathbf{Z}\text{-graded primes of } S_f\} \to Spec(S_{(f)}).$$
(7) *There exists an S such that $Proj(S)$ is not quasi-compact.*
(8) *The sets $V_+(I)$ are closed.*
(9) *Any closed subset $T \subset Proj(S)$ is of the form $V_+(I)$ for some homogeneous ideal $I \subset S$.*
(10) *For any graded ideal $I \subset S$ we have $V_+(I) = \emptyset$ if and only if $S_+ \subset \sqrt{I}$.*

Proof. Since $D_+(f) = \text{Proj}(S) \cap D(f)$, these sets are open. Similarly the sets $V_+(I) = \text{Proj}(S) \cap V(E)$ are closed.

Suppose that $T \subset \text{Proj}(S)$ is closed. Then we can write $T = \text{Proj}(S) \cap V(J)$ for some ideal $J \subset S$. By definition of a homogeneous ideal if $g \in J$, $g = g_0 + \ldots + g_m$ with $g_d \in S_d$ then $g_d \in \mathfrak{p}$ for all $\mathfrak{p} \in T$. Thus, letting $I \subset S$ be the ideal generated by the homogeneous parts of the elements of J we have $T = V_+(I)$.

The formula for $\text{Proj}(S) \cap D(g)$, with $g \in S$ is direct from the definitions. Consider the formula for $\text{Proj}(S) \cap D(g_0)$. The inclusion of the right hand side in the left hand side is obvious. For the other inclusion, suppose $g_0 \not\in \mathfrak{p}$ with $\mathfrak{p} \in \text{Proj}(S)$. If all $g_0 f \in \mathfrak{p}$ for all homogeneous f of positive degree, then we see that $S_+ \subset \mathfrak{p}$ which is a contradiction. This gives the other inclusion.

The collection of opens $D(g) \cap \text{Proj}(S)$ forms a basis for the topology since the standard opens $D(g) \subset Spec(S)$ form a basis for the topology on $Spec(S)$. By the formulas above we can express $D(g) \cap \text{proj}(S)$ as a union of opens $D_+(f)$. Hence the collection of opens $D_+(f)$ forms a basis for the topology also.

First we note that $D_+(f)$ may be identified with a subset (with induced topology) of $D(f) = Spec(S_f)$ via Lemma 7.16.6. Note that the ring S_f has a $\mathbf{Z}$-grading. The homogeneous elements are of the form r/f^n with $r \in S$ homogeneous and have degree $\deg(r/f^n) = \deg(r) - n\deg(f)$. The subset $D_+(f)$ corresponds exactly to those prime ideals $\mathfrak{p} \subset S_f$ which are $\mathbf{Z}$-graded ideals (i.e., generated by homogeneous elements). Hence we have to show that the set of $\mathbf{Z}$-graded prime ideals of S_f maps homeomorphically to $Spec(S_{(f)})$. This follows from Lemma 7.53.2.

Let $S = \mathbf{Z}[X_1, X_2, X_3, \ldots]$ with grading such that each X_i has degree 1. Then it is easy to see that
$$\text{Proj}(S) = \bigcup\nolimits_{i=1}^{\infty} D_+(X_i)$$
does not have a finite refinement.

Let $I \subset S$ be a graded ideal. If $\sqrt{I} \supset S_+$ then $V_+(I) = \emptyset$ since every prime $\mathfrak{p} \in \text{Proj}(S)$ does not contain S_+ by definition. Conversely, suppose that $S_+ \not\subset \sqrt{I}$. Then we can find an element $f \in S_+$ such that f is not nilpotent modulo I. Clearly this means that one of the homogeneous parts of f is not nilpotent modulo I, in other words we may (and do) assume that f is homogeneous. This implies that $IS_f \neq 0$, in other words that $(S/I)_f$ is not zero. Hence $(S/I)_{(f)} \neq 0$ since it is a ring which maps into $(S/I)_f$. Pick a prime $\mathfrak{q} \subset (S/I)_{(f)}$. This corresponds to a graded prime of S/I, not containing the irrelevant ideal $(S/I)_+$. And this in turn corresponds to a graded prime ideal $\mathfrak{p}$ of S, containing I but not containing S_+ as desired. $\square$

Example 7.53.4. Let R be a ring. If $S = R[X]$ with $\deg(X) = 1$, then the natural map $\text{Proj}(S) \to \mathit{Spec}(R)$ is a bijection and in fact a homeomorphism. Namely, suppose $\mathfrak{p} \in \text{Proj}(S)$. Since $S_+ \not\subset \mathfrak{p}$ we see that $X \notin \mathfrak{p}$. Thus if $aX^n \in \mathfrak{p}$ with $a \in R$ and $n > 0$, then $a \in \mathfrak{p}$. It follows that $\mathfrak{p} = \mathfrak{p}_0 S$ with $\mathfrak{p}_0 = \mathfrak{p} \cap R$.

If $\mathfrak{p} \in \text{Proj}(S)$, then we define $S_{(\mathfrak{p})}$ to be the ring whose elements are fractions r/f where $r, f \in S$ are homogeneous elements of the same degree such that $f \notin \mathfrak{p}$. As usual we say $r/f = r'/f'$ if and only if there exists some $f'' \in S$ homogeneous, $f'' \notin \mathfrak{p}$ such that $f''(rf' - r'f) = 0$. Given a graded S-module M we let $M_{(\mathfrak{p})}$ be the $S_{(\mathfrak{p})}$-module whose elements are fractions x/f with $x \in M$ and $f \in S$ homogeneous of the same degree such that $f \notin \mathfrak{p}$. We say $x/f = x'/f'$ if and only if there exists some $f'' \in S$ homogeneous, $f'' \notin \mathfrak{p}$ such that $f''(xf' - x'f) = 0$.

Lemma 7.53.5. *Let S be a graded ring. Let M be a graded S-module. Let $\mathfrak{p}$ be an element of $Proj(S)$. Let $f \in S$ be a homogeneous element of positive degree such that $f \notin \mathfrak{p}$, i.e., $\mathfrak{p} \in D_+(f)$. Let $\mathfrak{p}' \subset S_{(f)}$ be the element of $Spec(S_{(f)})$ corresponding to $\mathfrak{p}$ as in Lemma 7.53.3. Then $S_{(\mathfrak{p})} = (S_{(f)})_{\mathfrak{p}'}$ and compatibly $M_{(\mathfrak{p})} = (M_{(f)})_{\mathfrak{p}'}$.*

Proof. We define a map $\psi : M_{(\mathfrak{p})} \to (M_{(f)})_{\mathfrak{p}'}$. Let $x/g \in M_{(\mathfrak{p})}$. We set $\psi(x/g) = (x^{\deg(f)}/f^{\deg(x)})/(g^{\deg(f)}/f^{\deg(g)})$. This makes sense since $\deg(x) = \deg(g)$, and since $g^{\deg(f)}/f^{\deg(g)} \notin \mathfrak{p}'$. We omit the verification that ψ is well defined, a module map and an isomorphism. □

Here is a graded variant of Lemma 7.14.3.

Lemma 7.53.6. *Suppose S is a graded ring, $\mathfrak{p}_i$, $i = 1, \ldots, r$ homogeneous prime ideals and $I \subset S_+$ a graded ideal. Assume $I \not\subset \mathfrak{p}_i$ for all i. Then there exists a homogeneous element $x \in I$ of positive degree such that $x \notin \mathfrak{p}_i$ for all i.*

Proof. We may assume there are no inclusions among the $\mathfrak{p}_i$. The result is true for $r = 1$. Suppose the result holds for $r - 1$. Pick $x \in I$ homogeneous of positive degree such that $x \notin \mathfrak{p}_i$ for all $i = 1, \ldots, r-1$. If $x \notin \mathfrak{p}_r$ we are done. So assume $x \in \mathfrak{p}_r$. If $I\mathfrak{p}_1 \ldots \mathfrak{p}_{r-1} \subset \mathfrak{p}_r$ then $I \subset \mathfrak{p}_r$ a contradiction. Pick $y \in I\mathfrak{p}_1 \ldots \mathfrak{p}_{r-1}$ homogeneous and $y \notin \mathfrak{p}_r$. Then $x^{\deg(y)} + y^{\deg(x)}$ works. □

Lemma 7.53.7. *Let S be a graded ring. Let $\mathfrak{p} \subset S$ be a prime. Let $\mathfrak{q}$ be the homogeneous ideal of S generated by the homogeneous elements of $\mathfrak{p}$. Then $\mathfrak{q}$ is a prime ideal of S.*

Proof. Suppose $f, g \in S$ are such that $fg \in \mathfrak{q}$. Let f_d (resp. g_e) be the homogeneous part of f (resp. g) of degree d (resp. e). Assume d, e are maxima such that $f_d \neq 0$ and $g_e \neq 0$. By assumption we can write $fg = \sum a_i f_i$ with $f_i \in \mathfrak{p}$ homogeneous. Say $\deg(f_i) = d_i$. Then $f_d g_e = \sum a'_i f_i$ with a'_i to homogeneous par of degree $d+e-d_i$ of a_i (or 0 if $d+e-d_i < 0$). Hence $f_d \in \mathfrak{p}$ or $g_e \in \mathfrak{p}$. Hence $f_d \in \mathfrak{q}$ or $g_e \in \mathfrak{q}$. In the first case replace f by $f - f_d$, in the second case replace g by $g - g_e$. Then still $fg \in \mathfrak{q}$ but the discrete invariant $d + e$ has been decreased. Thus we may continue in this fashion until either f or g is zero. This clearly shows that $fg \in \mathfrak{q}$ implies either $f \in \mathfrak{q}$ or $g \in \mathfrak{q}$ as desired. □

Lemma 7.53.8. *Let S be a graded ring.*

(1) *Any minimal prime of S is a homogeneous ideal of S.*
(2) *Given a homogeneous ideal $I \subset S$ any minimal prime over I is homogeneous.*

Proof. The first assertion holds because the prime $\mathfrak{q}$ constructed in Lemma 7.53.7 satisfies $\mathfrak{q} \subset \mathfrak{p}$. The second because we may consider S/I and apply the first part. □

Lemma 7.53.9. *Let R be a ring. Let R' be a finite type R-algebra, and let M be a finite R'-module. There exists a graded R-algebra S, a graded S-module N and an element $f \in S$ homogeneous of degree 1 such that*

1. *$R' \cong S_{(f)}$ and $M \cong N_{(f)}$ (as modules),*
2. *$S_0 = R$ and S is generated by finitely many elements of degree 1 over R, and*
3. *N is a finite S-module.*

Proof. We may write $R' = R[x_1, \ldots, x_n]/I$ for some ideal I. For an element $g \in R[x_1, \ldots, x_n]$ denote $\tilde{g} \in R[x_0, \ldots, x_n]$ the element homogeneous of minimal degree such that $g = \tilde{g}(1, x_1, \ldots, x_n)$. Let $\tilde{I} \subset R[X_0, \ldots, X_n]$ generated by all elements $\tilde{g}$, $g \in I$. Set $S = R[X_0, \ldots, X_n]/\tilde{I}$ and denote f the image of X_0 in S. By construction we have an isomorphism

$$S_{(f)} \longrightarrow R', \quad X_i/X_0 \longmapsto x_i.$$

To do the same thing with the module M we choose a presentation

$$M = (R')^{\oplus r}/\sum\nolimits_{j \in J} R' k_j$$

with $k_j = (k_{1j}, \ldots, k_{rj})$. Let $d_{ij} = \deg(\tilde{k}_{ij})$. Set $d_j = \max\{d_{ij}\}$. Set $K_{ij} = X_0^{d_j - d_{ij}} \tilde{k}_{ij}$ which is homogeneous of degree d_j. With this notation we set

$$N = \mathrm{Coker}\Big(\bigoplus\nolimits_{j \in J} S(-d_j) \xrightarrow{(K_{ij})} S^{\oplus r} \Big)$$

which works. Some details omitted. □

7.54. Blow up algebras

In this section we make some elementary observations about blowing up.

Definition 7.54.1. Let R be a ring. Let $I \subset R$ be an ideal.

1. The *blowup algebra*, or the *Rees algebra*, associated to the pair (R, I) is the the graded R-algebra
$$\mathrm{Bl}_I(R) = \bigoplus\nolimits_{n \geq 0} I^n = R \oplus I \oplus I^2 \oplus \ldots$$
where the summand I^n is placed in degree n.
2. If $a \in I$ is an element, then the *affine blowup algebra* $R[\frac{I}{a}]$ is the algebra $(\mathrm{Bl}_I(R))_{(a)}$ constructed in Section 7.53.

In other words, an element of $R[\frac{I}{a}]$ is represented by an expression of the form x/a^n with $x \in I^n$. Two representatives x/a^n and y/a^m define the same element if and only if $a^k(a^m x - a^n y) = 0$ for some $k \geq 0$.

Lemma 7.54.2. *If R is a domain then every (affine) blowup algebra of R is a domain.*

Proof. Omitted. □

Lemma 7.54.3. *If R is reduced then every (affine) blowup algebra of R is reduced.*

Proof. Omitted. □

Lemma 7.54.4. *Let R be a ring. Let $I \subset R$ be an ideal. Let $a \in I$. If a is not contained in any minimal prime of R, then $Spec(R[\frac{I}{a}]) \to Spec(R)$ has dense image.*

Proof. If $a^k x = 0$ for $x \in R$, then x is contained in all the minimal primes of R and hence nilpotent, see Lemma 7.16.2. Thus the kernel of $R \to R[\frac{I}{a}]$ consists of nilpotent elements. Hence the result follows from Lemma 7.27.6. □

7.55. Noetherian graded rings

Lemma 7.55.1. *A graded ring S is Noetherian if and only if S_0 is Noetherian and S_+ is finitely generated. Furthermore, a set of homogenous elements $f_i \in S_+$ generates S as an algebra over S_0 if and only if they generate S_+ as an ideal.*

Proof. It is clear that if S is Noetherian then $S_0 = S/S_+$ is Noetherian and S_+ is finitely generated. It is also clear that if f_i generate S over S_0 then they generate S_+ as an ideal. Conversely, suppose that $S_+ = (f_1, \ldots, f_n)$ and S_0 Noetherian. By decomposing the f_i into homogenous pieces we may assume each f_i is homogeneous. Consider the map $\Psi : S_0[X_1, \ldots X_n] \to S$ which maps X_i to f_i. We claim this is surjective. Once we have seent his the result follows from Lemma 7.28.1. Namely, suppose that $f \in S_d$ for some d. By assumption we may write $f = \sum a_i f_i$. We may replace a_i by its piece of degree $\deg(f) - \deg(f_i)$ and still obtain a valid relation. Now each a_i is homogenous of strictly smaller degree than f_i, and hence by induction on the degree we may assume a_i is in the image of Ψ. Of course then f is in the image too. $\square$

Definition 7.55.2. Let A be an abelian group. We say that a function $f : n \mapsto f(n) \in A$ defined for all sufficient large integers n is a *numerical polynomial* if there exists $r \geq 0$, elements $a_0, \ldots, a_r \in A$ such that

$$f(n) = \sum\nolimits_{i=0}^{r} \binom{n}{i} a_i$$

for all $n \gg 0$.

The reason for using the binomial coefficients is the elementary fact that any polynomial $P \in \mathbf{Q}[T]$ all of whose values at integer points are integers, is equal to a sum $P(T) = \sum a_i \binom{T}{i}$ with $a_i \in \mathbf{Z}$. Note that in particular the expressions $\binom{T+1}{i+1}$ are of this form.

Lemma 7.55.3. *If $A \to A'$ is a homomorphism of abelian groups and if $f : n \mapsto f(n) \in A$ is a numerical polynomial, then so is the composition.*

Proof. This is immediate from the definitions. $\square$

Lemma 7.55.4. *Suppose that $f : n \mapsto f(n) \in A$ is defined for all n sufficiently large and suppose that $n \mapsto f(n) - f(n-1)$ is a numerical polynomial. Then f is a numerical polynomial.*

Proof. Let $f(n) - f(n-1) = \sum_{i=0}^{r} \binom{n}{i} a_i$ for all $n \gg 0$. Set $g(n) = f(n) - \sum_{i=0}^{r} \binom{n+1}{i+1} a_i$. Then $g(n) - g(n-1) = 0$ for all $n \gg 0$. Hence g is eventually constant, say equal to a_{-1}. We leave it to the reader to show that $a_{-1} + \sum_{i=0}^{r} \binom{n+1}{i+1} a_i$ has the required shape (see remark above the lemma). $\square$

Lemma 7.55.5. *If M is a finitely generated graded S-module, and if S is finitely generated over S_0, then each M_n is a finite S_0-module.*

Proof. Suppose the generators of M are m_i and the generators of S are f_i. By taking homogeneous components we may assume that the m_i and the f_i are homogeneous and we may assume $f_i \in S_+$. In this case it is clear that each M_n is generated over S_0 by the ``monomials'' $\prod f_i^{e_i} m_j$ whose degree is n. $\square$

Proposition 7.55.6. *Suppose that S is a Noetherian graded ring and M a finite graded S-module. Consider the function*

$$\mathbf{Z} \longrightarrow K'_0(S_0), \quad n \longmapsto [M_n]$$

see Lemma 7.55.5 above. If S_+ is generated by elements of degree 1, then this function is a numerical polynomial.

Proof. We prove this by induction on the minimal number of generators of S_1. If this number is 0, then $M_n = 0$ for all $n \gg 0$ and the result holds. To prove the induction step, let $x \in S_1$ be one of a minimal set of generators, such that the induction hypothesis applies to the graded ring $S/(x)$.

First we show the result holds if x is nilpotent on M. This we do by induction on the minimal integer r such that $x^r M = 0$. If $r = 1$, then M is a module over S/xS and the result holds (by the other induction hypothesis). If $r > 1$, then we can find a short exact sequence $0 \to M' \to M \to M'' \to 0$ such that the integers r', r'' are stricly smaller than r. Thus we know the result for M'' and M'. Hence we get the result for M because of the relation $[M_d] = [M'_d] + [M''_d]$ in $K'_0(R)$.

If x is not nilpotent on M, let $M' \subset M$ be the largest submodule on which x is nilpotent. Consider the exact sequence $0 \to M' \to M \to M/M' \to 0$ we see again it suffices to prove the result for M/M'. In other words we may assume that multiplication by x is injective.

Let $\overline{M} = M/xM$. Note that the map $x : M \to M$ is *not* a map of graded S-modules, since it does not map M_d into M_d. Namely, for each d we have the following short exact sequence

$$0 \to M_d \xrightarrow{x} M_{d+1} \to \overline{M}_{d+1} \to 0$$

This proves that $[M_{d+1}] - [M_d] = [\overline{M}_{d+1}]$. Hence we win by Lemma 7.55.4. $\square$

Remark 7.55.7. If S is still Noetherian but S is not generated in degree 1, then the function associated to a graded S-module is a periodic polynomial (i.e., it is a numerical polynomial on the congruence classes of integers modulo n for some n).

Example 7.55.8. Suppose that $S = k[X_1, \ldots, X_d]$. By Example 7.51.2 we may identify $K_0(k) = K'_0(k) = \mathbf{Z}$. Hence any finitely generated graded $k[X_1, \ldots, X_d]$-module gives rise to a numerical polynomial $n \mapsto \dim_k(M_n)$.

Lemma 7.55.9. *Let k be a field. Suppose that $I \subset k[X_1, \ldots, X_d]$ is a nonzero graded ideal. Let $M = k[X_1, \ldots, X_d]/I$. Then the numerical polynomial $n \mapsto \dim_k(M_n)$ (see Example 7.55.8 above) has degree $< d - 1$ (or is zero if $d = 1$).*

Proof. The numerical polynomial associated to the graded module $k[X_1, \ldots, X_n]$ is $n \mapsto \binom{n-1+d}{d-1}$. For any nonzero homogeneous $f \in I$ of degree e and any degree $n >> e$ we have $I_n \supset f \cdot k[X_1, \ldots, X_d]_{n-e}$ and hence $\dim_k(I_n) \geq \binom{n-e-1+d}{d-1}$. Hence $\dim_k(M_n) \leq \binom{n-1+d}{d-1} - \binom{n-e-1+d}{d-1}$. We win because the last expression has degree $< d - 1$ (or is zero if $d = 1$). $\square$

7.56. Noetherian local rings

In all of this section $(R, \mathfrak{m}, \kappa)$ is a Noetherian local ring. We develop some theory on Hilbert functions of modules in this section. Let M be a finite R-module. We define the *Hilbert function* of M to be the function

$$\varphi_M : n \longmapsto \text{length}_R(\mathfrak{m}^n M/\mathfrak{m}^{n+1}M).$$

Note that we have by Lemma 7.48.3 that

$$\text{length}_R(M/\mathfrak{m}^{n+1}M) = \sum\nolimits_{i=0}^{n} \varphi_M(i).$$

There is a variant of this construction which uses an ideal of definition.

Definition 7.56.1. Let $(R, \mathfrak{m})$ be a local Noetherian ring. An ideal $I \subset R$ such that $\sqrt{I} = \mathfrak{m}$ is called *an ideal of definition of R*.

Let $I \subset R$ be an ideal of definition. Because R is Noetherian this means that $\mathfrak{m}^r \subset I$ for some r, see Lemma 7.47.3. Hence any finite R-module annihilated by a power of I has a finite length, see Lemma 7.48.8. Thus in this case we may put

$$\varphi_{I,M} : n \longmapsto \text{length}_R(I^n M/I^{n+1}M).$$

Again we have that

$$\text{length}_R(M/I^{n+1}M) = \sum\nolimits_{i=0}^{n} \varphi_{I,M}(i).$$

Lemma 7.56.2. *Suppose that $M' \subset M$ are finite R-modules with finite length quotient. Then there exists a constants c_1, c_2 such that for all $n \gg c_2$ we have*

$$c_1 + \sum\nolimits_{i=0}^{n-c_2} \varphi_{I,M'}(i) \leq \sum\nolimits_{i=0}^{n} \varphi_{I,M}(i) \leq c_1 + \sum\nolimits_{i=0}^{n} \varphi_{I,M'}(i)$$

$\varphi_{I,M}(n) \geq \varphi_{I,M'}(n - c_1) - c_2$ *and* $\varphi_{I,M'}(n) \geq \varphi_{I,M}(n) - c_2$.

Proof. Let $c_1 = \text{length}_R(M/M')$. For $n \geq 1$ we have

$$\begin{aligned}
\sum\nolimits_{i=0}^{n} \varphi_{I,M}(i) &= \text{length}_R(M/I^{n+1}M) \\
&= c_1 + \text{length}_R(M'/I^{n+1}M) \\
&\leq c_1 + \text{length}_R(M'/I^{n+1}M') \\
&= c_1 + \sum\nolimits_{i=0}^{n} \varphi_{I,M'}(i)
\end{aligned}$$

On the other hand, let c_2 be such that $I^{c_2}M \subset M'$, so $I^n M \subset I^{n-c_2}M'$. We have

$$\begin{aligned}
\sum\nolimits_{i=0}^{n} \varphi_{I,M}(i) &= \text{length}_R(M/I^{n+1}M) \\
&= c_1 + \text{length}_R(M'/I^{n+1}M) \\
&\geq c_1 + \text{length}_R(M'/I^{n+1-c_2}M') \\
&= c_1 + \sum\nolimits_{i=0}^{n-c_2} \varphi_{I,M'}(i)
\end{aligned}$$

This works as soon as $n \geq c_2$. □

Lemma 7.56.3. *Suppose that $0 \to M' \to M \to M'' \to 0$ is a short exact sequence of finite R-modules. Then there exists a submodule $N \subset M'$ with finite colength and an integer c such that $\varphi_{I,M}(n) = \varphi_{I,M''}(n) + \varphi_{I,N}(n - c)$ for all n large enough.*

Proof. Note that $M/I^nM \to M''/I^nM''$ is surjective with kernel $M'/M' \cap I^nM$. By the Artin-Rees Lemma 7.47.4 there exists a constant c such that $M' \cap I^nM = I^{n-c}(M' \cap I^cM)$. Denote $N = M' \cap I^cM$. Note that $I^cM' \subset N \subset M'$. Hence $\text{length}_R(M'/M' \cap I^nM) = \text{length}_R(M'/N) + \text{length}_R(N/I^{n-c}N)$. Then we obtain the equality

$$\sum_{i=0}^{n-1} \varphi_{I,M}(i) = \sum_{i=0}^{n-1} \varphi_{I,M''}(i) + \sum_{i=0}^{n-c-1} \varphi_{I,N}(i) + \text{length}_R(M'/N)$$

for n large enough. Thus we get $\varphi_{I,M}(n) = \varphi_{I,M''}(n) + \varphi_{I,N}(n-c)$ for n large enough. $\square$

Lemma 7.56.4. *Suppose that I, I' are two ideals of definition for the Noetherian local ring R. Let M be a finite R-module. There exists a constant a such that $\sum_{i=0}^{n} \varphi_{I,M}(i) \leq \sum_{i=0}^{an} \varphi_{I',M}(i)$.*

Proof. There exists an integer a such that $(I')^a \subset I$. Hence we get a surjection $M/(I')^{a(n+1)}M \to M/I^{n+1}M$. Whence the result (with $a+1$). $\square$

Proposition 7.56.5. *For every Noetherian local ring R, any $I \subset R$ such that $\sqrt{I} = \mathfrak{m}$ and every finite R-module M the Hilbert function $\varphi_{I,M}$ is a numerical polynomial.*

Proof. Consider the graded ring $S = R/I \oplus I/I^2 \oplus I^2/I^3 \oplus \ldots = \bigoplus_{d \geq 0} I^d/I^{d+1}$. Consider the graded S-module $N = M/IM \oplus IM/I^2M \oplus \ldots = \bigoplus_{d \geq 0} I^dM/I^{d+1}M$. This pair (S, N) satisfies the hypotheses of Proposition 7.55.6. Hence the result follows from that Proposition, and Lemma 7.51.1. $\square$

Lemma 7.56.6. *Suppose that M is a finite R-module. The degree of the numerical polynomial $\varphi_{I,M}$ is independent of the ideal of definition I.*

Proof. This follows immediately from Lemma 7.56.4. $\square$

Definition 7.56.7. If R is a local Noetherian ring and M a finite R-module. If $\mathfrak{m}^nM = 0$ for some $n \geq 0$ we set $d(M) = 0$. Otherwise we denote $d(M)$ the degree $+1$ of any of the numerical polynomials $\varphi_{I,M}$ above.

Thus $d(M)$ is the degree of the numerical polynomial $n \mapsto \text{length}_R(M/I^nM)$ for any ideal of definition I. We will denote this function

$$\chi_{I,M}(n) = \text{length}_R(M/I^{n+1}M).$$

We will frequently use that $\chi_{I,M}(n) = \sum_{i=0}^{n} \varphi_{I,M}(i)$ without further mention.

Lemma 7.56.8. *Suppose $M \subset M'$ with finite length quotient, but neither finite length. Then $\chi_{I,M} - \chi_{I,M'}$ is a polynomial of degree < degree of either polynomial.*

Proof. Immediate from Lemma 7.56.2 by elementary calculus. $\square$

Lemma 7.56.9. *Suppose that $0 \to M' \to M \to M'' \to 0$ is a short exact sequence of finite R-modules. Then $\max\{\deg(\chi_{I,M'}), \deg(\chi_{I,M''})\} = \deg(\chi_{I,M})$. Suppose the length of M' is not finite. Then $\chi_{I,M} - \chi_{I,M''} - \chi_{I,M'}$ is a numerical polynomial of degree < the degree of $\chi_{I,M'}$.*

Proof. Immediate from Lemma 7.56.3, and 7.56.8 by elementary calculus. $\square$

7.57. Dimension

Definition 7.57.1. The *Krull dimension* of the ring R is the Krull dimension of the topological space $Spec(R)$, see Topology, Definition 5.7.1. In other words it is the supremum of the integers $n \geq 0$ such that there exists a chain of prime ideals of length n:

$$\mathfrak{p}_0 \subset \mathfrak{p}_1 \subset \ldots \subset \mathfrak{p}_n, \quad \mathfrak{p}_i \neq \mathfrak{p}_{i+1}.$$

Definition 7.57.2. The *height* of a prime ideal $\mathfrak{p}$ of a ring R is the dimension of the local ring $R_{\mathfrak{p}}$.

Lemma 7.57.3. *The Krull dimension of R is the supremum of the heights of its (maximal) primes.*

Proof. This is so because we can always add a maximal ideal at the end of a chain of prime ideals. $\square$

Lemma 7.57.4. *A Noetherian ring of dimension* 0 *is Artinian. Conversely, any Artinian ring is Noetherian of dimension zero.*

Proof. By Lemma 7.28.5 the space $Spec(R)$ is Noetherian. By Topology, Lemma 5.6.2 we see that $Spec(R)$ has finitely many irreducible components, say $Spec(R) = Z_1 \cup \ldots Z_r$. According to Lemma 7.23.1, each $Z_i = V(\mathfrak{p}_i)$ with $\mathfrak{p}_i$ a minimal ideal. Since the dimension is 0 these $\mathfrak{p}_i$ are also maximal. Thus $Spec(R)$ is the discrete topological space with elements $\mathfrak{p}_i$. All elements f of the radical $I = \cap \mathfrak{p}_i$ are nilpotent since otherwise R_f would not be the zero ring and we would have another prime. Since I is finitely generated we conclude that I is nilpotent, Lemma 7.47.3. By Lemma 7.49.7 R is the product of its local rings. By Lemma 7.48.8 each of these has finite length over R. Hence we conclude that R is Artinian by Lemma 7.49.8.

If R is Artinian then by Lemma 7.49.8 it is Noetherian. All of its primes are maximal by a combination of Lemmas 7.49.3, 7.49.4 and 7.49.7. $\square$

In the following we will use the invariant $d(-)$ defined in Definition 7.56.7. Here is a warm up lemma.

Lemma 7.57.5. *Let R be a Noetherian local ring. Then* $\dim(R) = 0 \Leftrightarrow d(R) = 0$.

Proof. This is because $d(R) = 0$ if and only if R has finite length as an R-module. See Lemma 7.49.8. $\square$

Proposition 7.57.6. *Let R be a ring. The following are equivalent:*

(1) *R is Artinian,*
(2) *R is Noetherian and* $\dim(R) = 0$,
(3) *R has finite length as a module over itself,*
(4) *R is a finite product of Artinian local rings,*
(5) *R is Noetherian and $Spec(R)$ is a finite discrete topological space,*
(6) *R is a finite product of Noetherian local rings of dimension* 0,
(7) *R is a finite product of Noetherian local rings R_i with $d(R_i) = 0$,*
(8) *R is a finite product of Noetherian local rings R_i whose maximal ideals are nilpotent,*
(9) *R is Noetherian, has finitely many maximal ideals and its radical ideal is nilpotent, and*
(10) *R is Noetherian and there are no strict inclusions among its primes.*

Proof. This is a combination of Lemmas 7.49.7, 7.49.8, 7.57.4, and 7.57.5. ☐

Lemma 7.57.7. *Let R be a local Noetherian ring. The following are equivalent:*

1. $\dim(R) = 1$,
2. $d(R) = 1$,
3. *there exists an* $x \in \mathfrak{m}$, *x not nilpotent such that* $V(x) = \{\mathfrak{m}\}$,
4. *there exists an* $x \in \mathfrak{m}$, *x not nilpotent such that* $\mathfrak{m} = \sqrt{(x)}$, *and*
5. *there exists an ideal of definition generated by* 1 *element, and no ideal of definition is generated by* 0 *elements.*

Proof. First, assume that $\dim(R) = 1$. Let $\mathfrak{p}_i$ be the minimal primes of R. Because the dimension is 1 the only other prime of R is $\mathfrak{m}$. According to Lemma 7.28.6 there are finitely many. Hence we can find $x \in \mathfrak{m}$, $x \not\in \mathfrak{p}_i$, see Lemma 7.14.3. Thus the only prime containing x is $\mathfrak{m}$ and hence (3).

If (3) then $\mathfrak{m} = \sqrt{(x)}$ by Lemma 7.16.2, and hence (4). The converse is clear as well. The equivalence of (4) and (5) follows from directly the definitions.

Assume (5). Let $I = (x)$ be an ideal of definition. Note that I^n/I^{n+1} is a quotient of R/I via multiplication by x^n and hence $\text{length}_R(I^n/I^{n+1})$ is bounded. Thus $d(R) = 0$ or $d(R) = 1$, but $d(R) = 0$ is excluded by the assumption that 0 is not an ideal of definition.

Assume (2). To get a contradiction, assume there exist primes $\mathfrak{p} \subset \mathfrak{q} \subset \mathfrak{m}$, with both inclusions strict. Pick some ideal of definition $I \subset R$. We will repeatedly use Lemma 7.56.9. First of all it implies, via the exact sequence $0 \to \mathfrak{p} \to R \to R/\mathfrak{p} \to 0$, that $d(R/\mathfrak{p}) \leq 1$. But it clearly cannot be zero. Pick $x \in \mathfrak{q}$, $x \not\in \mathfrak{p}$. Consider the short exact sequence

$$0 \to R/\mathfrak{p} \to R/\mathfrak{p} \to R/(xR + \mathfrak{p}) \to 0.$$

This implies that $\chi_{I,R/\mathfrak{p}} - \chi_{I,R/\mathfrak{p}} - \chi_{I,R/(xR+\mathfrak{p})} = -\chi_{I,R/(xR+\mathfrak{p})}$ has degree < 1. In other words, $d(R/(xR + \mathfrak{p}) = 0$, and hence $\dim(R/(xR + \mathfrak{p})) = 0$, by Lemma 7.57.5. But $R/(xR + \mathfrak{p})$ has the distinct primes $\mathfrak{q}/(xR + \mathfrak{p})$ and $\mathfrak{m}/(xR + \mathfrak{p})$ which gives the desired contradiction. ☐

Proposition 7.57.8. *Let R be a local Noetherian ring. The following are equivalent:*

1. $\dim(R) = d$,
2. $d(R) = d$,
3. *there exists an ideal of definition generated by d elements, and no ideal of definition is generated by fewer than d elements.*

Proof. This proof is really just the same as the proof of Lemma 7.57.7. We will prove the proposition by induction on d. By Lemmas 7.57.5 and 7.57.7 we may assume that $d > 1$. Denote the minimal number of generators for an ideal of definition of R by $d'(R)$. We will prove that the inequalities $\dim(R) \geq d'(R) \geq d(R) \geq \dim(R)$, and hence they are all equal.

First, assume that $\dim(R) = d$. Let $\mathfrak{p}_i$ be the minimal primes of R. According to Lemma 7.28.6 there are finitely many. Hence we can find $x \in \mathfrak{m}$, $x \not\in \mathfrak{p}_i$, see Lemma 7.14.3. Note that every maximal chain of primes starts with some $\mathfrak{p}_i$, hence the dimension of R/xR is at most $d-1$. By induction there are $x_2, \ldots, x_d$ which generate an ideal of definition in R/xR. Hence R has an ideal of definition generated by (at most) d elements.

Assume $d'(R) = d$. Let $I = (x_1, \ldots, x_d)$ be an ideal of definition. Note that I^n/I^{n+1} is a quotient of a direct sum of $\binom{d+n-1}{d-1}$ copies R/I via multiplication by all degree n monomials in $x_1, \ldots, x_n$. Hence $\text{length}_R(I^n/I^{n+1})$ is bounded by a polynomial of degree $d-1$. Thus $d(R) \leq d$.

Assume $d(R) = d$. Consider a chain of primes $\mathfrak{p} \subset \mathfrak{q} \subset \mathfrak{q}_2 \subset \ldots \subset \mathfrak{p}_e = \mathfrak{m}$, with all inclusions strict, and $e \geq 2$. Pick some ideal of definition $I \subset R$. We will repeatedly use Lemma 7.56.9. First of all it implies, via the exact sequence $0 \to \mathfrak{p} \to R \to R/\mathfrak{p} \to 0$, that $d(R/\mathfrak{p}) \leq d$. But it clearly cannot be zero. Pick $x \in \mathfrak{q}$, $x \not\in \mathfrak{p}$. Consider the short exact sequence

$$0 \to R/\mathfrak{p} \to R/\mathfrak{p} \to R/(xR + \mathfrak{p}) \to 0.$$

This implies that $\chi_{I,R/\mathfrak{p}} - \chi_{I,R/\mathfrak{p}} - \chi_{I,R/(xR+\mathfrak{p})} = -\chi_{I,R/(xR+\mathfrak{p})}$ has degree $< d$. In other words, $d(R/(xR + \mathfrak{p})) \leq d - 1$, and hence $\dim(R/(xR + \mathfrak{p})) \leq d - 1$, by induction. Now $R/(xR + \mathfrak{p})$ has the chain of prime ideals $\mathfrak{q}/(xR + \mathfrak{p}) \subset \mathfrak{q}_2/(xR + \mathfrak{p}) \subset \ldots \subset \mathfrak{q}_e/(xR + \mathfrak{p})$ which gives $e - 1 \leq d - 1$. Since we started with an arbitrary chain of primes this proves that $\dim(R) \leq d(R)$.

Reading back the reader will see we proved the circular inequalities as desired. □

Let $(R, \mathfrak{m})$ be a Noetherian local ring. From the above it is clear that $\mathfrak{m}$ cannot be generated by fewer than $\dim(R)$ variables. By Nakayama's Lemma 7.14.5 the minimal number of generators of $\mathfrak{m}$ equals $\dim_{\kappa(\mathfrak{m})} \mathfrak{m}/\mathfrak{m}^2$. Hence we have the following fundamental inequality

$$\dim(R) \leq \dim_{\kappa(\mathfrak{m})} \mathfrak{m}/\mathfrak{m}^2.$$

It turns out that the rings where equality holds have a lot of good properties. They are called regular local rings.

Definition 7.57.9. Let $(R, \mathfrak{m})$ be a Noetherian local ring of dimension d.

(1) A *system of parameters of* R is a sequence of elements $x_1, \ldots, x_d \in \mathfrak{m}$ which generates an ideal of definition of R,
(2) if there exist $x_1, \ldots, x_d \in \mathfrak{m}$ such that $\mathfrak{m} = (x_1, \ldots, x_d)$ then we call R a *regular local ring* and $x_1, \ldots, x_d$ a *regular system of parameters*.

The folllowing two lemmas are clear from the proofs of the lemmas and proposition above, but we spell them out so we have convenient references.

Lemma 7.57.10. *Let R be a Noetherian ring.*

(1) *Let $x \in R$, $\mathfrak{p}, \mathfrak{q} \in Spec(R)$. Suppose that $\mathfrak{p} \subset (\mathfrak{p}, x) \subset \mathfrak{q}$ and $\mathfrak{q}$ minimal over $(\mathfrak{p}, x)$. Then there is no prime strictly between $\mathfrak{p}$ and $\mathfrak{q}$.*
(2) *If $x \in R$ and $x \in \mathfrak{p}$ is minimal over (x) then the height of $\mathfrak{p}$ is* 0 *or* 1.

Proof. Consider the situation of the first assertion. The primes containing $\mathfrak{p}$ and contained in $\mathfrak{q}$ correspond to primes of $R_{\mathfrak{q}}/\mathfrak{p}R_{\mathfrak{q}}$, and the primes containing x correspond to the ones containing the image of x. Thus we may assume R is a Noetherian local domain, $\mathfrak{p} = (0)$ and $\mathfrak{q}$ maximal. Now since $\sqrt{(x)}$ is the intersection of the prime ideals containing it, and since $\mathfrak{q}$ is the only prime containing x by minimality, we see that $\sqrt{(x)} = \mathfrak{q}$. Hence Lemma 7.57.7 applies. The second assertion follows from the first. □

Lemma 7.57.11. *Suppose that R is a Noetherian local ring and $x \in \mathfrak{m}$ an element of its maximal ideal. Then* $\dim R \leq \dim R/xR + 1$. *If x is not contained in any of the minimal primes of R then equality holds. (For example if x is a nonzero divisor.)*

Proof. If $x_1, \ldots, x_{\dim R/xR} \in R$ map to elements of R/xR which generate an ideal of definition for R/xR, then $x, x_1, \ldots, x_{\dim R/xR}$ generate an ideal of definition for R. Hence the inequality by Proposition 7.57.8. On the other hand, if x is not contained in any minimal prime of R, then the chains of primes in R/xR all give rise to chains in R which are at least one step away from being maximal. $\square$

Lemma 7.57.12. *Let $(R, \mathfrak{m})$ be a Noetherian local ring. Suppose $x_1, \ldots, x_d \in \mathfrak{m}$ generate an ideal of definition and $d = \dim(R)$. Then $\dim(R/(x_1, \ldots, x_i)) = d - i$ for all $i = 1, \ldots, d$.*

Proof. Clear from the proof of Proposition 7.57.8, or use induction on d and Lemma 7.57.11 above. $\square$

7.58. Applications of dimension theory

We can use the results on dimension to prove certain rings are Jacobson.

Lemma 7.58.1. *Let R be a Noetherian local domain of dimension ≥ 2. A nonempty open subset $U \subset Spec(R)$ is infinite.*

Proof. To get a constradiction, assume that $U \subset Spec(R)$ is finite. In this case $(0) \in U$ and $\{(0)\}$ is an open subset of U (because the complement of $\{(0)\}$ is the union of the closures of the other points). Thus we may assume $U = \{(0)\}$. Let $\mathfrak{m} \subset R$ be the maximal ideal. We can find an $x \in \mathfrak{m}$, $x \neq 0$ such that $V(x) \cup U = Spec(R)$. In other words we see that $D(x) = \{(0)\}$. In particular we see that $\dim(R/xR) = \dim(R) - 1 \geq 1$, see Lemma 7.57.11. Let $\overline{y}_2, \ldots, \overline{y}_{\dim(R)} \in R/xR$ generate an ideal of definition of R/xR, see Proposition 7.57.8. Choose lifts $y_2, \ldots, y_{\dim(R)} \in R$, so that $x, y_2, \ldots, y_{\dim(R)}$ generate an ideal of definition in R. This implies that $\dim(R/(y_2)) = \dim(R) - 1$ and $\dim(R/(y_2, x)) = \dim(R) - 2$, see Lemma 7.57.12. Hence there exists a prime $\mathfrak{p}$ containing y_2 but not x. This constradicts the fact that $D(x) = \{(0)\}$. $\square$

Lemma 7.58.2. *(Noetherian Jacobson rings.)*

(1) *Any Noetherian domain R of dimension 1 with infinitely many primes is Jacobson.*
(2) *Any Noetherian ring such that every prime $\mathfrak{p}$ is either maximal or contained in infinitely many prime ideals is Jacobson.*

Proof. Part (1) is a reformulation of Lemma 7.31.6.

Let R be a Noetherian ring such that every non-maximal prime $\mathfrak{p}$ is contained in infinitely many prime ideals. Assume $Spec(R)$ is not Jacobson to get a contradiction. By Lemmas 7.23.1 and 7.28.5 we see that $Spec(R)$ is a sober, Noetherian topological space. By Topology, Lemma 5.13.3 we see that there exists a non-maximal ideal $\mathfrak{p} \subset R$ such that $\{\mathfrak{p}\}$ is a locally closed subset of $Spec(R)$. In other words, $\mathfrak{p}$ is not maximal and $\{\mathfrak{p}\}$ is an open subset of $V(\mathfrak{p})$. Consider a prime $\mathfrak{q} \subset R$ with $\mathfrak{p} \subset \mathfrak{q}$. Recall that the topology on the spectrum of $(R/\mathfrak{p})_{\mathfrak{q}} = R_{\mathfrak{q}}/\mathfrak{p}R_{\mathfrak{q}}$ is induced from that of $Spec(R)$, see Lemmas 7.16.5 and 7.16.7. Hence we see that $\{(0)\}$ is a locally closed subset of $Spec((R/\mathfrak{p})_{\mathfrak{q}})$. By Lemma 7.58.1 we conclude that $\dim((R/\mathfrak{p})_{\mathfrak{q}}) = 1$. Since this holds for every $\mathfrak{q} \supset \mathfrak{p}$ we conclude that $\dim(R/\mathfrak{p}) = 1$. At this point we use the assumption that $\mathfrak{p}$ is contained in infinitely many primes to see that $Spec(R/\mathfrak{p})$ is infinite. Hence by part (1) of the lemma we see that $V(\mathfrak{p}) \cong Spec(R/\mathfrak{p})$ is the closure of its closed points. This is the desired contradiction since it means that $\{\mathfrak{p}\} \subset V(\mathfrak{p})$ cannot be open. $\square$

7.59. Support and dimension of modules

Lemma 7.59.1. *Let R be a Noetherian ring, and let M be a finite R-module. There exists a filtration by R-submodules*

$$0 = M_0 \subset M_1 \subset \ldots \subset M_n = M$$

such that each quotient M_i/M_{i-1} is isomorphic to $R/\mathfrak{p}_i$ for some prime ideal $\mathfrak{p}_i$ of R.

Proof. By Lemma 7.5.5 it suffices to do the case $M = R/I$ for some ideal I. Consider the set S of ideals J such that the lemma does not hold for the module R/J, and order it by inclusion. To arrive at a contradiction, assume that S is not empty. Because R is Noetherian, S has a maximal element J. By definition of S, the ideal J cannot be prime. Pick $a, b \in R$ such that $ab \in J$, but neither $a \in J$ nor $b \in J$. Consider the filtration $0 \subset aR/(J \cap aR) \subset R/J$. Note that $aR/(J \cap aR)$ is a quotient of $R/(J + bR)$ and the second quotient equals $R/(aR + J)$. Hence by maximality of J, each of these has a filtration as above and hence so does R/J. Contradiction. $\square$

Definition 7.59.2. Let R be a ring and let M be an R-module. The *support of M* is the set

$$\mathrm{Supp}(M) = \{\mathfrak{p} \in Spec(R) \mid M_{\mathfrak{p}} \neq 0\}$$

Lemma 7.59.3. *Let R be a ring. Let M be an R-module. Then*

$$M = (0) \Leftrightarrow Supp(M) = \emptyset.$$

Proof. Actually, Lemma 7.21.1 even shows that $\mathrm{Supp}(M)$ always contains a maximal ideal if M is not zero. $\square$

Lemma 7.59.4. *Let R be a ring and let M be an R-module. If M is finite, then $Supp(M)$ is closed. More precisely, let $I = \{f \in R \mid fM = 0\}$. Then $V(I) = Supp(M)$.*

Proof. We will show that $V(I) = \mathrm{Supp}(M)$.

Suppose $\mathfrak{p} \in \mathrm{Supp}(M)$. Then $M_{\mathfrak{p}} \neq 0$. Hence by Nakayam's Lemma 7.14.5 we have $M \otimes_R \kappa(\mathfrak{p}) \neq 0$. Hence $I \subset \mathfrak{p}$.

Conversely, suppose that $\mathfrak{p} \not\in \mathrm{Supp}(M)$. Then $M_{\mathfrak{p}} = 0$. Let $x_1, \ldots, x_r \in M$ be generators. By Lemma 7.9.9 there exists an $f \in R$, $f \not\in \mathfrak{p}$ such that $x_i/1 = 0$ in M_f. Hence $f^{n_i} x_i = 0$ for some $n_i \geq 1$. Hence $f^n M = 0$ for $n = \max\{n_i\}$ as desired. $\square$

Lemma 7.59.5. *Let R be a ring and let M be an R-module. If M is a finitely presented R-module, then $Supp(M)$ is a closed subset of $Spec(R)$ whose complement is quasi-compact.*

Proof. Choose a presentation

$$R^{\oplus m} \longrightarrow R^{\oplus n} \longrightarrow M \to 0$$

Let $A \in \mathrm{Mat}(n \times m, R)$ be the matrix of the first map. By Nakayama's Lemma 7.14.5 we see that

$$M_{\mathfrak{p}} \neq 0 \Leftrightarrow M \otimes \kappa(\mathfrak{p}) \neq 0 \Leftrightarrow \mathrm{rank}(A \bmod \mathfrak{p}) < n.$$

Hence, if I is the ideal of R generated by the $n \times n$ minors of A, then $\mathrm{Supp}(M) = V(I)$. Since I is finitely generated, say $I = (f_1, \ldots, f_t)$, we see that $Spec(R) \setminus V(I)$ is a finite union of the standard opens $D(f_i)$, hence quasi-compact. $\square$

Lemma 7.59.6. *Let R be a ring and let M be an R-module.*

1. *If M is finite then the support of M/IM is $Supp(M) \cap V(I)$.*
2. *If $N \subset M$, then $Supp(N) \subset Supp(M)$.*

(3) *If Q is a quotient module of M then Supp*$(Q) \subset$ *Supp*(M).
(4) *If* $0 \to N \to M \to Q \to 0$ *is a short exact sequence then Supp*$(M) =$ *Supp*$(Q) \cup$ *Supp*(N).

Proof. The functors $M \mapsto M_{\mathfrak p}$ are exact. This immediately implies all but the first assertion. For the first assertion we need to show that $M_{\mathfrak p}\neq 0$ and $I \subset \mathfrak p$ implies $(M/IM)_{\mathfrak p} = M_{\mathfrak p}/IM_{\mathfrak p}\neq 0$. This follows from Nakayama's Lemma 7.14.5. $\square$

Lemma 7.59.7. *Let R, M, M_i, $\mathfrak p_i$ as in Lemma 7.59.1. All of the primes $\mathfrak p_i$ are in the support of M.*

Proof. Since localization is exact, we see that $(R/\mathfrak p_i)_{\mathfrak p_i}$ is a subquotient of $M_{\mathfrak p_i}$. Hence $M_{\mathfrak p_i}$ is not zero. $\square$

Lemma 7.59.8. *Suppose that R is a Noetherian local ring with maximal ideal $\mathfrak m$. Let M be a finite R-module. Then Supp*$(M) = \{\mathfrak m\}$ *if and only if M has finite length over R.*

Proof. Assume that $\text{Supp}(M) = \{\mathfrak m\}$. It suffices to show that all the primes $\mathfrak p_i$ in the filtration of Lemma 7.59.1 are the maximal ideal. This is clear by Lemma 7.59.7.

Suppose that M has finite length over R. Then $\mathfrak m^n M = 0$ by Lemma 7.48.4. Since some element of $\mathfrak m$ maps to a unit in $R_{\mathfrak p}$ for any prime $\mathfrak p\neq\mathfrak m$ in R we see $M_{\mathfrak p} = 0$. $\square$

Lemma 7.59.9. *Let R be a Noetherian ring. Let $I \subset R$ be an ideal. Let M be a finite R-module. Then $I^n M = 0$ for some $n \geq 0$ if and only if Supp*$(M) \subset V(I)$.

Proof. It is clear that $I^n M = 0$ for some $n \geq 0$ implies $\text{Supp}(M) \subset V(I)$. Suppose that $\text{Supp}(M) \subset V(I)$. Choose a filtration $0 = M_0 \subset M_1 \subset \ldots \subset M_n = M$ as in Lemma 7.59.1. Each of the primes $\mathfrak p_i$ is contained in $V(I)$ by Lemma 7.59.7. Hence $I \subset \mathfrak p_i$ and I annihilates M_i/M_{i-1}. Hence I^n annihilates M. $\square$

Lemma 7.59.10. *Let R, M, M_i, $\mathfrak p_i$ as in Lemma 7.59.1. The minimal elements of the set $\{\mathfrak p_i\}$ are the minimal elements of Supp*(M), *and the number of times a minimal prime $\mathfrak p$ occurs is*

$$\#\{i \mid \mathfrak p_i = \mathfrak p\} = \mathit{length}_{R_{\mathfrak p}} M_{\mathfrak p}.$$

Proof. We have already seen $\{\mathfrak p_i\} \subset \text{Supp}(M)$, in Lemma 7.59.7. Let $\mathfrak p \in \text{Supp}(M)$ be minimal. The support of $M_{\mathfrak p}$ is the set consisting of the maximal ideal $\mathfrak p R_{\mathfrak p}$. Hence by Lemma 7.59.8 the length of $M_{\mathfrak p}$ is finite and > 0. Next we note that $M_{\mathfrak p}$ has a filtration with subquotients $(R/\mathfrak p_i)_{\mathfrak p} = R_{\mathfrak p}/\mathfrak p_i R_{\mathfrak p}$ These are zero if $\mathfrak p_i\not\subset\mathfrak p$ and equal to $\kappa(\mathfrak p)$ if $\mathfrak p_i \subset \mathfrak p$ because by minimality of $\mathfrak p$ we have $\mathfrak p_i = \mathfrak p$ in this case. The result follows since $\kappa(\mathfrak p)$ has length 1. $\square$

Lemma 7.59.11. *Let R be a Noetherian local ring. Let M be a finite R-module. Then* $d(M) = \dim(\mathit{Supp}(M))$.

Proof. Let $M_i, \mathfrak p_i$ be as in Lemma 7.59.1. By Lemma 7.56.9 we obtain the equality $d(M) = \max\{d(R/\mathfrak p_i)\}$. By Proposition 7.57.8 we have $d(R/\mathfrak p_i) = \dim(R/\mathfrak p_i)$. Trivially $\dim(R/\mathfrak p_i) = \dim V(\mathfrak p_i)$. Since all minimal primes of $\text{Supp}(M)$ occur among the $\mathfrak p_i$ we win. $\square$

7.60. Associated primes

Here is the standard definition. For non-Noetherian rings and non-finite modules it may be more appropriate to use the definition in Section 7.63.

Definition 7.60.1. Let R be a ring. Let M be an R-module. A prime $\mathfrak{p}$ of R is *associated* to M if there exists an element $m \in M$ whose annihilator is $\mathfrak{p}$. The set of all such primes is denoted $\text{Ass}_R(M)$ or $\text{Ass}(M)$.

Lemma 7.60.2. *Let R be a ring. Let M be an R-module. Then $Ass(M) \subset Supp(M)$.*

Proof. If $m \in M$ has annihilator $\mathfrak{p}$, then in particular no element of $R \setminus \mathfrak{p}$ annihilates m. Hence m is a nonzero element of $M_{\mathfrak{p}}$, i.e., $\mathfrak{p} \in \text{Supp}(M)$. □

Lemma 7.60.3. *Let R be a ring. Let $0 \to M' \to M \to M'' \to 0$ be a short exact sequence of R-modules. Then $Ass(M') \subset Ass(M)$ and $Ass(M) \subset Ass(M') \cup Ass(M'')$.*

Proof. Omitted. □

Lemma 7.60.4. *Let R be a ring, and M an R-module. Suppose there exists a filtration by R-submodules*

$$0 = M_0 \subset M_1 \subset \ldots \subset M_n = M$$

such that each quotient M_i/M_{i-1} is isomorphic to $R/\mathfrak{p}_i$ for some prime ideal $\mathfrak{p}_i$ of R. Then $Ass(M) \subset \{\mathfrak{p}_1, \ldots, \mathfrak{p}_n\}$.

Proof. By induction on the length n of the filtration $\{M_i\}$. Pick $m \in M$ whose annihilator is a prime $\mathfrak{p}$. If $m \in M_{n-1}$ we are done by induction. If not, then m maps to a nonzero element of $M/M_{n-1} \cong R/\mathfrak{p}_n$. Hence we have $\mathfrak{p} \subset \mathfrak{p}_n$. If equality does not hold, then we can find $f \in \mathfrak{p}_n$, $f \not\in \mathfrak{p}$. In this case the annihilator of fm is still $\mathfrak{p}$ and $fm \in M_{n-1}$. Thus we win by induction. □

Lemma 7.60.5. *Let R be a Noetherian ring. Let M be a finite R-module. Then $Ass(M)$ is finite.*

Proof. Immediate from Lemma 7.60.4 and Lemma 7.59.1. □

Proposition 7.60.6. *Let R be a Noetherian ring. Let M be a finite R-module. The following sets of primes are the same:*

1. *The minimal primes in the support of M.*
2. *The minimal primes in $Ass(M)$.*
3. *For any filtration $0 = M_0 \subset M_1 \subset \ldots \subset M_{n-1} \subset M_n = M$ with $M_i/M_{i-1} \cong R/\mathfrak{p}_i$ the minimal primes of the set $\{\mathfrak{p}_i\}$.*

Proof. Part of this we saw in Lemma 7.59.10. It suffices to prove that if $\mathfrak{p}$ is a minimal element of the set $\{\mathfrak{p}_i\}$ then it is the annihilator of an element of M. Let i be minimal such that $\mathfrak{p} = \mathfrak{p}_i$. Pick $m \in M_i$, $m \not\in M_{i-1}$. The annihilator of m is contained in $\mathfrak{p}_i = \mathfrak{p}$ and contains $\mathfrak{p}_1\mathfrak{p}_2 \ldots \mathfrak{p}_i$. By our choice of i we have $\mathfrak{p}_1\mathfrak{p}_2 \ldots \mathfrak{p}_{i-1} \not\subset \mathfrak{p}_i$. Pick $f \in \mathfrak{p}_1\mathfrak{p}_2 \ldots \mathfrak{p}_{i-1}$, $f \not\in \mathfrak{p}$. Then fm has annihilator $\mathfrak{p}$. □

Lemma 7.60.7. *Let R be a Noetherian ring. Let M be an R-module. Then*

$$M = (0) \Leftrightarrow Ass(M) = \emptyset.$$

Proof. If $M = (0)$, then $\text{Ass}(M) = \emptyset$ by definition. If $M \neq 0$, pick any nonzero finitely generated submodule $M' \subset M$, for example a submodule generated by a single nonzero element. By Lemma 7.59.3 we see that $\text{Supp}(M')$ is nonempty. By Proposition 7.60.6 this implies that $\text{Ass}(M')$ is nonempty. By Lemma 7.60.3 this implies $\text{Ass}(M) \neq \emptyset$. □

Lemma 7.60.8. *Let R be a Noetherian ring. Let M be an R-module. Any $\mathfrak{p} \in Supp(M)$ which is minimal among the elements of $Supp(M)$ is an element of $Ass(M)$.*

Proof. If M is a finite R-module, then this is a consequence of Proposition 7.60.6. In general write $M = \bigcup M_\lambda$ as the union of its finite submodules, and use that $\text{Supp}(M) = \bigcup \text{Supp}(M_\lambda)$ and $\text{Ass}(M) = \bigcup \text{Ass}(M_\lambda)$. □

Lemma 7.60.9. *Let R be a Noetherian ring. Let M be an R-module. The union $\bigcup_{\mathfrak{q} \in Ass(M)} \mathfrak{q}$ is the set of elements of R which are zero divisors on M.*

Proof. Any element in any associated prime clearly is a zero divisor on M. Conversely, suppose $x \in R$ is a zero divisor on M. Consider the submodule $N = \{m \in M \mid xm = 0\}$. Since N is not zero it has an associated prime $\mathfrak{q}$ by Lemma 7.60.7. Then $x \in \mathfrak{q}$ and $\mathfrak{q}$ is an associated prime of M by Lemma 7.60.3. □

Lemma 7.60.10. *Let $\varphi : R \to S$ be a ring map. Let M be an S-module. Then $Spec(\varphi)(Ass_S(M)) \subset Ass_R(M)$.*

Proof. If $\mathfrak{q} \in \text{Ass}_S(M)$, then there exists an m in M such that the annihilator of m in S is $\mathfrak{q}$. Then the annihilator of m in R is $\mathfrak{q} \cap R$. □

Remark 7.60.11. Let $\varphi : R \to S$ be a ring map. Let M be an S-module. Then it is not always the case that $Spec(\varphi)(\text{Ass}_S(M)) \supset \text{Ass}_R(M)$. For example, consider the ring map $R = k \to S = k[x_1, x_2, x_3, \ldots]/(x_i^2)$ and $M = S$. Then $\text{Ass}_R(M)$ is not empty, but $\text{Ass}_S(S)$ is empty.

Lemma 7.60.12. *Let $\varphi : R \to S$ be a ring map. Let M be an S-module. If S is Noetherian, then $Spec(\varphi)(Ass_S(M)) = Ass_R(M)$.*

Proof. We have already seen in Lemma 7.60.10 that $Spec(\varphi)(\text{Ass}_S(M)) \subset \text{Ass}_R(M)$. For the converse, choose a prime $\mathfrak{p} \in \text{Ass}_R(M)$. Let $m \in M$ be an element such that the annihilator of x in R is $\mathfrak{p}$. Let $I = \{g \in S \mid gm = 0\}$ be the annihilator of m in S. Then $R/\mathfrak{p} \subset S/I$ is injective, hence there exists a prime $\mathfrak{q} \subset S$ lying over $\mathfrak{p}$, see Lemma 7.27.5. By Proposition 7.60.6 we see that $\mathfrak{q}$ is an associated prime of S/I, hence an associated prime of M by Lemma 7.60.3 and we win. □

Lemma 7.60.13. *Let R be a ring. Let I be an ideal. Let M be an R/I-module. Via the canonical injection $Spec(R/I) \to Spec(R)$ we have $Ass_{R/I}(M) = Ass_R(M)$.*

Proof. Omitted. □

Lemma 7.60.14. *Let R be a ring. Let M be an R-module. Let $\mathfrak{p} \subset R$ be a prime.*

(1) *If $\mathfrak{p} \in Ass(M)$ then $\mathfrak{p}R_\mathfrak{p} \in Ass(M_\mathfrak{p})$.*
(2) *If $\mathfrak{p}$ is finitely generated then the converse holds as well.*

Proof. If $\mathfrak{p} \in \text{Ass}(M)$ there exists an element $m \in M$ whose annihilator is $\mathfrak{p}$. As localization is exact (Proposition 7.9.12) we see that the annihilator of $m/1$ in $M_\mathfrak{p}$ is $\mathfrak{p}R_\mathfrak{p}$ hence (1) holds. Assume $\mathfrak{p}R_\mathfrak{p} \in \text{Ass}(M_\mathfrak{p})$ and $\mathfrak{p} = (f_1, \ldots, f_n)$. Let m/g be an element of $M_\mathfrak{p}$ whose annihilator is $\mathfrak{p}R_\mathfrak{p}$. This implies that the annihilator of m is contained in $\mathfrak{p}$. As $f_i m/g = 0$ in $M_\mathfrak{p}$ we see there exists a $g_i \in R$, $g_i \notin \mathfrak{p}$ such that $g_i f_i m = 0$ in M. Combined we see the annihilator of $g_1 \ldots g_n m$ is $\mathfrak{p}$. Hence $\mathfrak{p} \in \text{Ass}(M)$. □

Lemma 7.60.15. *Let R be a ring. Let M be an R-module. Let $S \subset R$ be a multiplicative subset. Via the canonical injection $Spec(S^{-1}R) \to Spec(R)$ we have*

1. $Ass_R(S^{-1}M) = Ass_{S^{-1}R}(S^{-1}M)$,
2. $Ass_R(M) \cap Spec(S^{-1}R) \subset Ass_R(S^{-1}M)$, *and*
3. *if R is Noetherian this inclusion is an equality.*

Proof. The first equality follows, since if $m \in S^{-1}M$, then the annihilator of m in R is the intersection of the annihilator of m in $S^{-1}R$ with R. The displayed inclusion and equality in the Noetherian case follows from Lemma 7.60.14 since for $\mathfrak{p} \in R$, $S \cap \mathfrak{p} = \emptyset$ we have $M_{\mathfrak{p}} = (S^{-1}M)_{S^{-1}\mathfrak{p}}$. $\square$

Lemma 7.60.16. *Let R be a ring. Let M be an R-module. Let $S \subset R$ be a multiplicative subset. Assume that every $s \in S$ is a nonzero divisor on M. Then*

$$Ass_R(M) = Ass_R(S^{-1}M).$$

Proof. As $M \subset S^{-1}M$ by assumption we get the inclusion $\text{Ass}(M) = \text{Ass}(S^{-1}M)$ from Lemma 7.60.3. Conversely, suppose that $n/s \in S^{-1}M$ is an element whose annihilator is a prime ideal $\mathfrak{p}$. Then the annihilator of $n \in M$ is also $\mathfrak{p}$. $\square$

Lemma 7.60.17. *Let R be a Noetherian local ring with maximal ideal $\mathfrak{m}$. Let $I \subset \mathfrak{m}$ be an ideal. Let M be a finite R-module. The following are equivalent:*

1. *There exists an $x \in I$ which is not a zero divisor on M.*
2. *We have $I \not\subset \mathfrak{q}$ for all $\mathfrak{q} \in Ass(M)$.*

Proof. If there exists a nonzero divisor x in I, then x clearly cannot be in any associated prime of M. Conversely, suppose $I \not\subset \mathfrak{q}$ for all $\mathfrak{q} \in \text{Ass}(M)$. In this case we can choose $x \in I$, $x \notin \mathfrak{q}$ for all $\mathfrak{q} \in \text{Ass}(M)$ by Lemmas 7.60.5 and 7.14.3. By Lemma 7.60.9 the element x is not a zero divisor on M. $\square$

Lemma 7.60.18. *Let R be a ring. Let M be an R-module. If R is Noetherian the map*

$$M \longrightarrow \prod\nolimits_{\mathfrak{p} \in Ass(M)} M_{\mathfrak{p}}$$

is injective.

Proof. Let $x \in M$ be an element of the kernel of the map. Then if $\mathfrak{p}$ is an associated prime of $Rx \subset M$ we see on the one hand that $\mathfrak{p} \in \text{Ass}(M)$ (Lemma 7.60.3) and on the other hand that $(Rx)_{\mathfrak{p}} \subset M_{\mathfrak{p}}$ is not zero. This contradiction shows that $\text{Ass}(Rx) = \emptyset$. Hence $Rx = 0$ by Lemma 7.60.7. $\square$

7.61. Symbolic powers

We only make the following definition in the case of a Noetherian ring although the formula itself makes sense in general.

Definition 7.61.1. Let R be a Noetherian ring. Let $\mathfrak{p}$ be a prime ideal. Let $n \geq 1$. The nth *symbolic power* of $\mathfrak{p}$ is the ideal $\mathfrak{p}^{(n)} = R \cap \mathfrak{p}^n R_{\mathfrak{p}}$.

Note that $\mathfrak{p}^n \subset \mathfrak{p}^{(n)}$ but equality does not always hold.

Lemma 7.61.2. *Let R be a Noetherian ring. Let $\mathfrak{p}$ be a prime ideal. Let $n > 0$. Then $Ass(R/\mathfrak{p}^{(n)}) = \{\mathfrak{p}\}$.*

Proof. If $\mathfrak{q}$ is an associated prime of $R/\mathfrak{p}^{(n)}$ then clearly $\mathfrak{p} \subset \mathfrak{q}$. On the other hand, any element $x \in R$, $x \notin \mathfrak{p}$ is a nonzero divisor on $R/\mathfrak{p}^{(n)}$. Namely, if $y \in R$ and $xy \in \mathfrak{p}^{(n)} = R \cap \mathfrak{p}^n R_{\mathfrak{p}}$ then $y \in \mathfrak{p}^n R_{\mathfrak{p}}$, hence $y \in \mathfrak{p}^{(n)}$. Hence the lemma follows. $\square$

7.62. Relative assassin

Discussion of relative assassins. Let $R \to S$ be a ring map. Let N be an S-module. In this situation we can introduce the following sets of primes $\mathfrak{q}$ of S:

- A with $\mathfrak{p} = R \cap \mathfrak{q}$ we have that $\mathfrak{q} \in \text{Ass}_S(N \otimes_R \kappa(\mathfrak{p}))$,
- A' with $\mathfrak{p} = R \cap \mathfrak{q}$ we have that $\mathfrak{q}$ is in the image of $\text{Ass}_{S \otimes \kappa(\mathfrak{p})}(N \otimes_R \kappa(\mathfrak{p}))$ under the canonical map $Spec(S \otimes_R \kappa(\mathfrak{p})) \to Spec(S)$,
- A_{fin} with $\mathfrak{p} = R \cap \mathfrak{q}$ we have that $\mathfrak{q} \in \text{Ass}_S(N/\mathfrak{p}N)$,
- A'_{fin} for some prime $\mathfrak{p}' \subset R$ we have $\mathfrak{q} \in \text{Ass}_S(N/\mathfrak{p}'N)$,
- B for some R-module M we have $\mathfrak{q} \in \text{Ass}_S(N \otimes_R M)$, and
- B_{fin} for some finite R-module M we have $\mathfrak{q} \in \text{Ass}_S(N \otimes_R M)$.

Let us determine some of the relations between theses sets.

Lemma 7.62.1. *Let $R \to S$ be a ring map. Let N be an S-module. Let A, A', A_{fin}, B, and B_{fin} be the subsets of $Spec(S)$ introduced above.*

1. *We always have $A = A'$.*
2. *We always have $A_{fin} \subset A$, $B_{fin} \subset B$, $A_{fin} \subset A'_{fin} \subset B_{fin}$ and $A \subset B$.*
3. *If S is Noetherian, then $A = A_{fin}$ and $B = B_{fin}$.*
4. *If N is flat over R, then $A = A_{fin} = A'_{fin}$ and $B = B_{fin}$.*
5. *If R is Noetherian and N is flat over R, then all of the sets are equal, i.e., $A = A' = A_{fin} = A'_{fin} = B = B_{fin}$.*

Proof. Some of the arguments in the proof will be repeated in the proofs of later lemmas which are more precise than this one (because they deal with a given module M or a given prime $\mathfrak{p}$ and not with the collection of all of them).

Proof of (1). Let $\mathfrak{p}$ be a prime of R. Then we have

$$\text{Ass}_S(N \otimes_R \kappa(\mathfrak{p})) = \text{Ass}_{S/\mathfrak{p}S}(N \otimes_R \kappa(\mathfrak{p})) = \text{Ass}_{S \otimes_R \kappa(\mathfrak{p})}(N \otimes_R \kappa(\mathfrak{p}))$$

the first equality by Lemma 7.60.13 and the second by Lemma 7.60.15 part (1). This prove that $A = A'$. The inclusion $A_{fin} \subset A'_{fin}$ is clear.

Proof of (2). Each of the inclusions is immediate from the definitions except perhaps $A_{fin} \subset A$ which follows from Lemma 7.60.15 and the fact that we require $\mathfrak{p} = R \cap \mathfrak{q}$ in the formulation of A_{fin}.

Proof of (3). The equality $A = A_{fin}$ follows from Lemma 7.60.15 part (3) if S is Noetherian. Let $\mathfrak{q} = (g_1, \ldots, g_m)$ be a finitely generated prime ideal of S. Say $z \in N \otimes_R M$ is an element whose annihilator is $\mathfrak{q}$. We may pick a finite submodule $M' \subset M$ such that z is the image of $z' \in N \otimes_R M'$. Then $\text{Ann}_S(z') \subset \mathfrak{q} = \text{Ann}_S(z)$. Since $N \otimes_R -$ commutes with colimits and since M is the directed colimit of finite R-modules we can find $M' \subset M'' \subset M$ such that the image $z'' \in N \otimes_R M''$ is annihilated by $g_1, \ldots, g_m$. Hence $\text{Ann}_S(z'') = \mathfrak{q}$. This proves that $B = B_{fin}$ if S is Noetherian.

Proof of (4). If N is flat, then the functor $N \otimes_R -$ is exact. In particular, if $M' \subset M$, then $N \otimes_R M' \subset N \otimes_R M$. Hence if $z \in N \otimes_R M$ is an element whose annihilator $\mathfrak{q} = \text{Ann}_S(z)$ is a prime, then we can pick any finite R-submodule $M' \subset M$ such that $z \in N \otimes_R M'$ and we see that the annihilator of z as an element of $N \otimes_R M'$ is equal to $\mathfrak{q}$. Hence $B = B_{fin}$. Let $\mathfrak{p}'$ be a prime of R and let $\mathfrak{q}$ be a prime of S which is an associated prime of $N/\mathfrak{p}'N$. This implies that $\mathfrak{p}'S \subset \mathfrak{q}$. As N is flat over R we see that $N/\mathfrak{p}'N$ is flat over the integral domain $R/\mathfrak{p}'$. Hence every nonzero element of $R/\mathfrak{p}'$ is a nonzero divisor on $N/\mathfrak{p}'$. Hence none of these elements can map to an element of $\mathfrak{q}$ and we conclude that $\mathfrak{p}' = R \cap \mathfrak{q}$. Hence

$A_{fin} = A'_{fin}$. Finally, by Lemma 7.60.16 we see that $\text{Ass}_S(N/\mathfrak{p}'N) = \text{Ass}_S(N \otimes_R \kappa(\mathfrak{p}'))$, i.e., $A'_{fin} = A$.

Proof of (5). We only need to prove $A'_{fin} = B_{fin}$ as the other equalities have been proved in (4). To see this let M be a finite R-module. By Lemma 7.59.1 there exists a filtration by R-submodules

$$0 = M_0 \subset M_1 \subset \ldots \subset M_n = M$$

such that each quotient M_i/M_{i-1} is isomorphic to $R/\mathfrak{p}_i$ for some prime ideal $\mathfrak{p}_i$ of R. Since N is flat we obtain a filtration by S-submodules

$$0 = N \otimes_R M_0 \subset N \otimes_R M_1 \subset \ldots \subset N \otimes_R M_n = N \otimes_R M$$

such that each subquotient is isomorphic to $N/\mathfrak{p}_i N$. By Lemma 7.60.3 we conclude that $\text{Ass}_S(N \otimes_R M) \subset \bigcup \text{Ass}_S(N/\mathfrak{p}_i N)$. Hence we see that $B_{fin} \subset A'_{fin}$. Since the other inclusion is part of (2) we win. $\square$

We define the relative assassin of N over S/R to be the set $A = A'$ above. As a motivation we point out that it depends only on the fibre modules $N \otimes_R \kappa(\mathfrak{p})$ over the fibre rings. As in the case of the assassin of a module we warn the reader that this notion makes most sense when the fibre rings $S \otimes_R \kappa(\mathfrak{p})$ are Noetherian, for example if $R \to S$ is of finite type.

Definition 7.62.2. Let $R \to S$ be a ring map. Let N be an S-module. The *relative assassin of N over S/R* is the set

$$\text{Ass}_{S/R}(N) = \{\mathfrak{q} \subset S \mid \mathfrak{q} \in \text{Ass}_S(N \otimes_R \kappa(\mathfrak{p})) \text{ with } \mathfrak{p} = R \cap \mathfrak{q}\}.$$

This is the set named A in Lemma 7.62.1.

The spirit of the next few results is that they are about the relative assassin, even though this may not apparant.

Lemma 7.62.3. *Let $R \to S$ be a ring map. Let M be an R-module, and let N be an S-module. If N is flat as R-module, then*

$$Ass_S(M \otimes_R N) \supset \bigcup\nolimits_{\mathfrak{p} \in Ass_R(M)} Ass_S(N/\mathfrak{p}N)$$

and if R is Noetherian then we have equality.

Proof. If $\mathfrak{p} \in \text{Ass}_R(M)$ then there exists an injection $R/\mathfrak{p} \to M$. As N is flat over R we obtain an injection $R/\mathfrak{p} \otimes_R N \to M \otimes_R M$. Since $R/\mathfrak{p} \otimes_R N = N/\mathfrak{p}N$ we conclude that $\text{Ass}_S(N/\mathfrak{p}N) \subset \text{Ass}_S(M \otimes_R N)$, see Lemma 7.60.3. Hence the right hand side is contained in the left hand side.

Write $M = \bigcup M_\lambda$ as the union of its finitely generated R-submodules. Then also $N \otimes_R M = \bigcup N \otimes_R M_\lambda$ (as N is R-flat). By definition of associated primes we see that $\text{Ass}_S(N \otimes_R M) = \bigcup \text{Ass}_S(N \otimes_R M_\lambda)$ and $\text{Ass}_R(M) = \bigcup \text{Ass}(M_\lambda)$. Hence we may assume M is finitely generated.

Let $\mathfrak{q} \in \text{Ass}_S(M \otimes_R N)$, and assume R is Noetherian and M is a finite R-module. To finish the proof we have to show that $\mathfrak{q}$ is an element of the right hand side. First we observe that $\mathfrak{q}S_\mathfrak{q} \in \text{Ass}_{S_\mathfrak{q}}((M \otimes_R N)_\mathfrak{q})$, see Lemma 7.60.14. Let $\mathfrak{p}$ be the corresponding prime of R. Note that

$$(M \otimes_R N)_\mathfrak{q} = M \otimes_R N_\mathfrak{q} = M_\mathfrak{p} \otimes_{R_\mathfrak{p}} N_\mathfrak{q}$$

If $\mathfrak{p}R_\mathfrak{p} \notin \text{Ass}_{R_\mathfrak{p}}(M_\mathfrak{p})$ then there exists an element $x \in \mathfrak{p}R_\mathfrak{p}$ which is a nonzero divisor in $M_\mathfrak{p}$ (see Lemma 7.60.17). Since $N_\mathfrak{q}$ is flat over $R_\mathfrak{p}$ we see that the image of x in $\mathfrak{q}S_\mathfrak{q}$ is a nonzero divisor on $(M \otimes_R N)_{\mathfrak q}$. This is a contradiction with the assumption that $\mathfrak q S_{\mathfrak q} \in \text{Ass}_S((M \otimes_R N)_{\mathfrak q})$. Hence we conclude that $\mathfrak p$ is one of the associated primes of M.

Continuing the argument we choose a filtration

$$0 = M_0 \subset M_1 \subset \ldots \subset M_n = M$$

such that each quotient M_i/M_{i-1} is isomorphic to $R/\mathfrak p_i$ for some prime ideal $\mathfrak p_i$ of R, see Lemma 7.59.1. (By Lemma 7.60.4 we have $\mathfrak p_i = \mathfrak p$ for at least one i.) This gives a filtration

$$0 = M_0 \otimes_R N \subset M_1 \otimes_R N \subset \ldots \subset M_n \otimes_R N = M \otimes_R N$$

with subquotients isomorphic to $N/\mathfrak p_i N$. If $\mathfrak p_i \neq \mathfrak p$ then $\mathfrak q$ cannot be associated to the module $N/\mathfrak p_i N$ by the result of the preceding paragraph (as $\text{Ass}_R(R/\mathfrak p_i) = \{\mathfrak p_i\}$). Hence we conclude that $\mathfrak q$ is associated to $N/\mathfrak p N$ as desired. □

Lemma 7.62.4. *Let $R \to S$ be a ring map. Let N be an S-module. Assume N is flat as an R-module and R is a domain with fraction field K. Then*

$$Ass_S(N) = Ass_S(N \otimes_R K) = Ass_{S \otimes_R K}(N \otimes_R K)$$

via the canonical inclusion $Spec(S \otimes_R K) \subset Spec(S)$.

Proof. Note that $S \otimes_R K = (R \setminus \{0\})^{-1} S$ and $N \otimes_R K = (R \setminus \{0\})^{-1} N$. For any nonzero $x \in R$ multiplication by x on N is injective as N is flat over R. Hence the lemma follows from Lemma 7.60.16 combined with Lemma 7.60.15 part (1). □

Lemma 7.62.5. *Let $R \to S$ be a ring map. Let M be an R-module, and let N be an S-module. Assume N is flat as R-module. Then*

$$Ass_S(M \otimes_R N) \supset \bigcup\nolimits_{\mathfrak p \in Ass_R(M)} Ass_{S \otimes_R \kappa(\mathfrak p)}(N \otimes_R \kappa(\mathfrak p))$$

where we use Remark 7.16.8 to think of the spectra of fibre rings as subsets of $Spec(S)$. If R is Noetherian then this inclusion is an equality.

Proof. This is equivalent to Lemma 7.62.3 by Lemmas 7.60.13, 7.35.6, and 7.62.4. □

Remark 7.62.6. Let $R \to S$ be a ring map. Let N be an S-module. Let $\mathfrak p$ be a prime of R. Then

$$\text{Ass}_S(N \otimes_R \kappa(\mathfrak p)) = \text{Ass}_{S/\mathfrak p S}(N \otimes_R \kappa(\mathfrak p)) = \text{Ass}_{S \otimes_R \kappa(\mathfrak p)}(N \otimes_R \kappa(\mathfrak p)).$$

The first equality by Lemma 7.60.13 and the second by Lemma 7.60.15 part (1).

7.63. Weakly associated primes

This is a variant on the notion of an associated prime that is useful for non-Noetherian ring and non-finite modules.

Definition 7.63.1. Let R be a ring. Let M be an R-module. A prime $\mathfrak p$ of R is *weakly associated* to M if there exists an element $m \in M$ such that $\mathfrak p$ is minimal among the prime ideals containing the annihilator $\text{Ann}(m) = \{f \in R \mid fm = 0\}$. The set of all such primes is denoted $\text{WeakAss}_R(M)$ or $\text{WeakAss}(M)$.

Thus an associated prime is a weakly associated prime. Here is a characterization in terms of the localization at the prime.

Lemma 7.63.2. *Let R be a ring. Let M be an R-module. Let $\mathfrak p$ be a prime of R. The following are equivalent:*

(1) *$\mathfrak p$ is weakly associated to M,*

(2) $\mathfrak{p}R_\mathfrak{p}$ *is weakly associated to* $M_\mathfrak{p}$, *and*
(3) $M_\mathfrak{p}$ *contains an element whose annihilator has radical equal to* $\mathfrak{p}R_\mathfrak{p}$.

Proof. Assume (1). Then there exists an element $m \in M$ such that $\mathfrak{p}$ is minimal among the primes containing the annihilator $I = \{x \in R \mid xm = 0\}$ of m. As localization is exact, the annihilator of m in $M_\mathfrak{p}$ is $I_\mathfrak{p}$. Hence $\mathfrak{p}R_\mathfrak{p}$ is a minimal prime of $R_\mathfrak{p}$ containing the annihilator $I_\mathfrak{p}$ of m in $M_\mathfrak{p}$. This implies (2) holds, and also (3) as it implies that $\sqrt{I_\mathfrak{p}} = \mathfrak{p}R_\mathfrak{p}$.

Applying the implication (1) ⇒ (3) to $M_\mathfrak{p}$ over $R_\mathfrak{p}$ we see that (2) ⇒ (3).

Finally, assume (3). This means there exists an element $m/f \in M_\mathfrak{p}$ whose annihilator has radical equal to $\mathfrak{p}R_\mathfrak{p}$. Then the annihilator $I = \{x \in R \mid xm = 0\}$ of m in M is such that $\sqrt{I_\mathfrak{p}} = \mathfrak{p}R_\mathfrak{p}$. Clearly this means that $\mathfrak{p}$ contains I and is minimal among the primes containing I, i.e., (1) holds. ☐

Lemma 7.63.3. *Let R be a ring. Let* $0 \to M' \to M \to M'' \to 0$ *be a short exact sequence of R-modules. Then* $WeakAss(M') \subset WeakAss(M)$ *and* $WeakAss(M) \subset WeakAss(M') \cup WeakAss(M'')$.

Proof. We will use the characterization of weakly associated primes of Lemma 7.63.2. Let $\mathfrak{p}$ be a prime of R. As localization is exact we obtain the short exact sequence $0 \to M'_\mathfrak{p} \to M_\mathfrak{p} \to M''_\mathfrak{p} \to 0$. Suppose that $m \in M_\mathfrak{p}$ is an element whose annihilator has radical $\mathfrak{p}R_\mathfrak{p}$. Then either the image $\overline{m}$ of m in $M''_\mathfrak{p}$ is zero and $m \in M'_\mathfrak{p}$, or the annihilator of $\overline{m}$ is $\mathfrak{p}R_\mathfrak{p}$. This proves that WeakAss(M) ⊂ WeakAss(M') ∪ WeakAss(M''). The inclusion WeakAss(M') ⊂ WeakAss(M) is immediate from the definitions. ☐

Lemma 7.63.4. *Let R be a ring. Let M be an R-module. Then*

$$M = (0) \Leftrightarrow WeakAss(M) = \emptyset$$

Proof. If $M = (0)$ then WeakAss(M) = ∅ by definition. Conversely, suppose that $M \neq 0$. Pick a nonzero element $m \in M$. Write $I = \{x \in R \mid xm = 0\}$ the annihilator of m. Then $R/I \subset M$. Hence WeakAss(R/I) ⊂ WeakAss(M) by Lemma 7.63.3. But as $I \neq R$ we have $V(I) = Spec(R/I)$ contains a minimal prime, see Lemmas 7.16.2 and 7.16.7, and we win. ☐

Lemma 7.63.5. *Let R be a ring. Let M be an R-module. Then*

$$Ass(M) \subset WeakAss(M) \subset Supp(M).$$

Proof. The first inclusion is immediate from the definitions. If $\mathfrak{p} \in$ WeakAss(M), then by Lemma 7.63.2 we have $M_\mathfrak{p} \neq 0$, hence $\mathfrak{p} \in$ Supp(M). ☐

Lemma 7.63.6. *Let R be a ring. Let M be an R-module. The union* $\bigcup_{\mathfrak{q} \in WeakAss(M)} \mathfrak{q}$ *is the set elements of R which are zero divisors on M.*

Proof. Suppose $f \in \mathfrak{q} \in$ WeakAss(M). Then there exists an element $m \in M$ such that $\mathfrak{q}$ is minimal over $I = \{x \in R \mid xm = 0\}$. Hence there exists a $g \in R$, $g \notin \mathfrak{p}$ and $n > 0$ such that $f^n gm = 0$. Note that $gm \neq 0$ as $g \notin I$. If we take n minimal as above, then $f(f^{n-1}gm) = 0$ and $f^{n-1}gm \neq 0$, so f is a zero divisor on M. Conversely, suppose $f \in R$ is a zero divisor on M. Consider the submodule $N = \{m \in M \mid fm = 0\}$. Since N is not zero it has a weakly associated prime $\mathfrak{q}$ by Lemma 7.63.4. Clearly $f \in \mathfrak{q}$ and by Lemma 7.63.3 $\mathfrak{q}$ is an associated prime of M. ☐

Lemma 7.63.7. *Let R be a ring. Let M be an R-module. Any* $\mathfrak{p} \in Supp(M)$ *which is minimal among the elements of* $Supp(M)$ *is an element of* $WeakAss(M)$.

Proof. Note that $\text{Supp}(M_{\mathfrak p}) = \{\mathfrak p R_{\mathfrak p}\}$ in $Spec(R_{\mathfrak p})$. In particular $M_{\mathfrak p}$ is nonzero, and hence $\text{WeakAss}(M_{\mathfrak p}) \neq \emptyset$ by Lemma 7.63.4. Since $\text{WeakAss}(M_{\mathfrak p}) \subset \text{Supp}(M_{\mathfrak p})$ by Lemma 7.63.5 we conclude that $\text{WeakAss}(M_{\mathfrak p}) = \{\mathfrak p R_{\mathfrak p}\}$, whence $\mathfrak p \in \text{WeakAss}(M)$ by Lemma 7.63.2. □

Lemma 7.63.8. *Let R be a ring. Let M be an R-module. Let $\mathfrak p$ be a prime ideal of R which is finitely generated. Then*

$$\mathfrak p \in Ass(M) \Leftrightarrow \mathfrak p \in WeakAss(M).$$

In particular, if R is Noetherian, then $Ass(M) = WeakAss(M)$.

Proof. Write $\mathfrak p = (g_1, \ldots, g_n)$ for some $g_i \in R$. It is enough the prove the implication ``$\Leftarrow$" as the other implication holds in general, see Lemma 7.63.5. Assume $\mathfrak p \in \text{WeakAss}(M)$. By Lemma 7.63.2 there exists an element $m \in M_{\mathfrak p}$ such that $I = \{x \in R_{\mathfrak p} \mid xm = 0\}$ has radical $\mathfrak p R_{\mathfrak p}$. Hence for each i there exists a smallest $e_i > 0$ such that $g_i^{e_i} m = 0$ in $M_{\mathfrak p}$. If $e_i > 1$ for some i, then we can replace m by $g_i^{e_i - 1} m \neq 0$ and decrease $\sum e_i$. Hence we may asssume that the annihilator of $m \in M_{\mathfrak p}$ is $(g_1, \ldots, g_n)R_{\mathfrak p} = \mathfrak p R_{\mathfrak p}$. By Lemma 7.60.14 we see that $\mathfrak p \in \text{Ass}(M)$. □

Remark 7.63.9. Let $\varphi : R \to S$ be a ring map. Let M be an S-module. Then it is not always the case that $Spec(\varphi)(\text{WeakAss}_S(M)) \subset \text{WeakAss}_R(M)$ contrary to the case of associated primes (see Lemma 7.60.10). An example is to consider the ring map

$$R = k[x_1, x_2, x_3, \ldots] \to S = k[x_1, x_2, x_3, \ldots, y_1, y_2, y_3, \ldots]/(x_1y_1, x_2y_2, x_3y_3, \ldots)$$

and $M = S$. In this case $\mathfrak q = \sum x_i S$ is a minimal prime of S, hence a weakly associated prime of $M = S$ (see Lemma 7.63.7). But on the other hand, for any nonzero element of S the annihilator in R is finitely generated, and hence does not have radical equal to $R \cap \mathfrak q = (x_1, x_2, x_3, \ldots)$ (details omitted).

Lemma 7.63.10. *Let $\varphi : R \to S$ be a ring map. Let M be an S-module. Then we have $Spec(\varphi)(WeakAss_S(M)) \supset WeakAss_R(M)$.*

Proof. Let $\mathfrak p$ be an element of $\text{WeakAss}_R(M)$. Then there exists an $m \in M_{\mathfrak p}$ whose annihilator $I = \{x \in R_{\mathfrak p} \mid xm = 0\}$ has radical $\mathfrak p R_{\mathfrak p}$. Consider the radical $J = \{x \in S_{\mathfrak p} \mid xm = 0\}$ of m in $S_{\mathfrak p}$. As $IS_{\mathfrak p} \subset J$ we see that any minimal prime $\mathfrak q \subset S_{\mathfrak p}$ over J lies over $\mathfrak p$. Moreover such a $\mathfrak q$ corresponds to a weakly associated prime of M for example by Lemma 7.63.2. □

Remark 7.63.11. Let $\varphi : R \to S$ be a ring map. Let M be an S-module. Denote $f : Spec(S) \to Spec(R)$ the associated map on spectra. Then we have

$$f(\text{Ass}_S(M)) \subset \text{Ass}_R(M) \subset \text{WeakAss}_R(M) \subset f(\text{WeakAss}_S(M))$$

see Lemmas 7.60.10, 7.63.10, and 7.63.5. In general all of the inclusions may be strict, see Remarks 7.60.11 and 7.63.9. If S is Noetherian, then all the inclusions are equalities as the outer two are equal by Lemma 7.63.8.

Lemma 7.63.12. *Let $\varphi : R \to S$ be a ring map. Let M be an S-module. Denote $f : Spec(S) \to Spec(R)$ the associated map on spectra. If φ is a finite ring map, then*

$$WeakAss_R(M) = f(WeakAss_S(M)).$$

Proof. One of the inclusions has already been proved, see Remark 7.63.11. To prove the other assume $\mathfrak q \in \text{WeakAss}_S(M)$ and let $\mathfrak p$ be the corresponding prime of R. Let $m \in M$ be an element such that $\mathfrak q$ is a minimal prime over $J = \{g \in S \mid gm = 0\}$. Thus the radical of

$JS_{\mathfrak q}$ is $\mathfrak q S_{\mathfrak q}$. As $R \to S$ is finite there are finitely many primes $\mathfrak q = \mathfrak q_1, \mathfrak q_2, \ldots, \mathfrak q_l$ over $\mathfrak p$, see Lemma 7.32.19. Pick $x \in \mathfrak q$ with $x \not\in \mathfrak q_i$ for $i > 1$, see Lemma 7.14.3. By the above there exists an element $y \in S$, $y \not\in \mathfrak q$ and an integer $t > 0$ such that $yx^t m = 0$. Thus the element $ym \in M$ is annihilated by x^t, hence ym maps to zero in $M_{\mathfrak q_i}$, $i = 2, \ldots, l$. To be sure, ym does not map to zero in $S_{\mathfrak q}$.

The ring $S_{\mathfrak p}$ is semi-local with maximal ideals $\mathfrak q_i S_{\mathfrak p}$ by going up for finite ring maps, see Lemma 7.32.20. If $f \in \mathfrak p R_{\mathfrak p}$ then some power of f ends up in $JS_{\mathfrak q}$ hence for some $n > 0$ we see that $f^t ym$ maps to zero in $M_{\mathfrak q}$. As ym vanishes at the other maximal ideals of $S_{\mathfrak p}$ we conclude that $f^t ym$ is zero in $M_{\mathfrak p}$, see Lemma 7.21.1. In this way we see that $\mathfrak p$ is a minimal prime over the annihilator of ym in R and we win. □

Lemma 7.63.13. *Let R be a ring. Let I be an ideal. Let M be an R/I-module. Via the canonical injection $Spec(R/I) \to Spec(R)$ we have $WeakAss_{R/I}(M) = WeakAss_R(M)$.*

Proof. Omitted. □

Lemma 7.63.14. *Let R be a ring. Let M be an R-module. Let $S \subset R$ be a multiplicative subset. Via the canonical injection $Spec(S^{-1}R) \to Spec(R)$ we have $WeakAss_R(S^{-1}M) = WeakAss_{S^{-1}R}(S^{-1}M)$ and*

$$WeakAss(M) \cap Spec(S^{-1}R) = WeakAss(S^{-1}M).$$

Proof. Suppose that $m \in S^{-1}M$. Let $I = \{x \in R \mid xm = 0\}$ and $I' = \{x' \in S^{-1}R \mid x'm = 0\}$. Then $I' = S^{-1}I$ and $I \cap S = \emptyset$ unless $I = R$ (verifications omitted). Thus primes in $S^{-1}R$ minimal over I' correspond bijectively to primes in R minimal over I and avoiding S. This proves the equality $\text{WeakAss}_R(S^{-1}M) = \text{WeakAss}_{S^{-1}R}(S^{-1}M)$. The second equality follows from Lemma 7.60.14 since for $\mathfrak p \in R$, $S \cap \mathfrak p = \emptyset$ we have $M_{\mathfrak p} = (S^{-1}M)_{S^{-1}\mathfrak p}$. □

Lemma 7.63.15. *Let R be a ring. Let M be an R-module. Let $S \subset R$ be a multiplicative subset. Assume that every $s \in S$ is a nonzero divisor on M. Then*

$$WeakAss(M) = WeakAss(S^{-1}M).$$

Proof. As $M \subset S^{-1}M$ by assumption we obtain $\text{WeakAss}(M) \subset \text{WeakAss}(S^{-1}M)$ from Lemma 7.63.3. Conversely, suppose that $n/s \in S^{-1}M$ is an element with annihilator I and $\mathfrak p$ a prime which is minimal over I. Then the annihilator of $n \in M$ is I and $\mathfrak p$ is a prime minimal over I. □

Lemma 7.63.16. *Let R be a ring. Let M be an R-module. The map*

$$M \longrightarrow \prod\nolimits_{\mathfrak p \in WeakAss(M)} M_{\mathfrak p}$$

is injective.

Proof. Let $x \in M$ be an element of the kernel of the map. Set $N = Rx \subset M$. If $\mathfrak p$ is a weakly associated prime of N we see on the one hand that $\mathfrak p \in \text{WeakAss}(M)$ (Lemma 7.63.3) and on the other hand that $N_{\mathfrak p} \subset M_{\mathfrak p}$ is not zero. This contradiction shows that $\text{WeakAss}(N) = \emptyset$. Hence $N = 0$, i.e., $x = 0$ by Lemma 7.63.4. □

Lemma 7.63.17. *Let $R \to S$ be a ring map. Let N be an S-module. Assume N is flat as an R-module and R is a domain with fraction field K. Then*

$$WeakAss_S(N) = WeakAss_{S \otimes_R K}(N \otimes_R K)$$

via the canonical inclusion $Spec(S \otimes_R K) \subset Spec(S)$.

Proof. Note that $S \otimes_R K = (R \setminus \{0\})^{-1}S$ and $N \otimes_R K = (R \setminus \{0\})^{-1}N$. For any nonzero $x \in R$ multiplication by x on N is injective as N is flat over R. Hence the lemma follows from Lemma 7.63.15. $\square$

7.64. Embedded primes

Here is the definition.

Definition 7.64.1. Let R be a ring. Let M be an R-module.

(1) The associated primes of M which are not minimal among the associated primes of M are called the *embedded associated primes* of M.
(2) The *embedded primes of* R are the embedded associated primes of R as an R-module.

Here is a way to get rid of these.

Lemma 7.64.2. *Let R be a Noetherian ring. Let M be a finite R-module. Consider the set of R-submodules*

$$\{K \subset M \mid Supp(K) \text{ nowhere dense in } Supp(M)\}.$$

This set has a maximal element K and the quotient $M' = M/K$ has the following properties

(1) *$Supp(M) = Supp(M')$,*
(2) *M' has no embedded associated primes,*
(3) *for any $f \in R$ which is contained in all embedded associated primes of M we have $M_f \cong M'_f$.*

Proof. Let $\mathfrak{q}_1, \ldots, \mathfrak{q}_t$ denote the minimal primes in the support of M. Let $\mathfrak{p}_1, \ldots, \mathfrak{p}_s$ denote the embedded associated primes of M. Then $\text{Ass}(M) = \{\mathfrak{q}_j, \mathfrak{p}_i\}$. There are finitely many of these, see Lemma 7.60.5. Set $I = \prod_{i=1,\ldots,s} \mathfrak{p}_i$. Then $I \not\subset \mathfrak{q}_j$ for any j. Hence by Lemma 7.14.3 we can find an $f \in I$ such that $f \not\in \mathfrak{q}_j$ for all $j = 1, \ldots, t$. Set $M' = \text{Im}(M \to M_f)$. This implies that $M_f \cong M'_f$. Since $M' \subset M_f$ we see that $\text{Ass}(M') \subset \text{Ass}(M_f) = \{\mathfrak{q}_j\}$. Thus M' has no embedded associated primes.

Moreover, the support of $K = \text{Ker}(M \to M')$ is contained in $V(\mathfrak{p}_1) \cup \ldots \cup V(\mathfrak{p}_s)$, because $\text{Ass}(K) \subset \text{Ass}(M)$ (see Lemma 7.60.3) and $\text{Ass}(K)$ contains none of the $\mathfrak{q}_i$ by construction. Clearly, K is in fact the largest submodule of M whose support is contained in $V(\mathfrak{p}_1) \cup \ldots \cup V(\mathfrak{p}_t)$. This implies that K is the maximal element of the set displayed in the lemma. $\square$

Lemma 7.64.3. *Let R be a Noetherian ring. Let M be a finite R-module. For any $f \in R$ we have $(M')_f = (M_f)'$ where $M \to M'$ and $M_f \to (M_f)'$ are the quotients constructed in Lemma 7.64.2.*

Proof. Omitted. $\square$

Lemma 7.64.4. *Let R be a Noetherian ring. Let M be a finite R-module without embedded associated primes. Let $I = \{x \in R \mid xM = 0\}$. Then the ring R/I has no embedded primes.*

Proof. We may replace R by R/I. Hence we may assume every nonzero element of R acts nontrivially on M. By Lemma 7.59.4 this implies that $Spec(R)$ equals the support of M. Suppose that $\mathfrak{p}$ is an embedded prime of R. Let $x \in R$ be an element whose annihilator is $\mathfrak{p}$. Consider the nonzero module $N = xM \subset M$. It is annihilated by $\mathfrak{p}$. Hence any associated prime $\mathfrak{q}$ of N contains $\mathfrak{p}$ and is also an associated prime of M. Then $\mathfrak{q}$ would be an embedded associated prime of M which contradicts the assumption of the lemma. $\square$

7.65. Regular sequences and depth

There is a characterization of depth in terms of Ext-groups that we will discuss in Section 7.67. Here we develop some basic properties of regular sequences and we prove the inequality between depth and dimension.

Definition 7.65.1. Let R be a ring. Let M be an R-module. A sequence of elements $f_1, \ldots, f_r$ of R is called *M-regular* if the following conditions hold:

(1) f_i is a nonzero divisor on $M/(f_1, \ldots, f_{r-1})M$ for each $i = 1, \ldots, r$, and
(2) the module $M/(f_1, \ldots, f_r)M$ is not zero.

If I is an ideal of R and $f_1, \ldots, f_r \in I$ then we call $f_1, \ldots, f_r$ a *M-regular sequence in I*. If $M = R$, we call $f_1, \ldots, f_r$ simply a *regular sequence* (in I).

Please pay attention to the fact that the definition depends on the order of the elements $f_1, \ldots, f_r$. Here are two examples.

Example 7.65.2. Let k be a field. In the ring $k[x, y, z]$ the sequence $x, y(1 - x), z(1 - x)$ is regular but the sequence $y(1 - x), z(1 - x), x$ is not.

Example 7.65.3. Let k be a field. Consider the ring $k[x, y, w_0, w_1, w_2, \ldots]/I$ where I is generated by yw_i, $i = 0, 1, 2, \ldots$ and $w_i - xw_{i+1}$, $i = 0, 1, 2, \ldots$. The sequence x, y is regular, but y is a zero divisor. Moreover you can localize at the maximal ideal (x, y, w_i) and still get an example.

Definition 7.65.4. Let R be a ring, and $I \subset R$ an ideal. Let M be an R-module. The *I-depth* of M is the supremum of the lengths of M-regular sequences in I; we denote it $\text{depth}_I(M)$. If $(R, \mathfrak{m})$ is local we call $\text{depth}_\mathfrak{m}(M)$ simply the *depth* of M.

Example 7.65.2 shows depth does not behave well even if the ring is Noetherian, and Example 7.65.3 shows that it does not behave well if the ring is local but non Noetherian. We will see later depth behaves well if the ring is local Noetherian. The following two lemmas are an indication of this.

Lemma 7.65.5. *Let R be a local Noetherian ring. Let M be a finite R-module. Let $x_1, \ldots, x_c$ be an M-regular sequence. Then any permutation of the x_i is a regular sequence as well.*

Proof. First we do the case $c = 2$. Consider $K \subset M$ the kernel of $x_2 : M \to M$. For any $z \in K$ we know that $z = x_1 z'$ for some $z' \in M$ because x_2 is a nonzero divisor on M/x_1M. Because x_1 is a nonzero divsor on M we see that $x_2 z' = 0$ as well. Hence $x_1 : K \to K$ is surjective. Thus $K = 0$ by Nakayama's Lemma 7.14.5. Next, consider multiplication by x_1 on M/x_2M. If $z \in M$ maps to an element $\overline{z} \in M/x_2M$ in the kernel of this map, then $x_1 z = x_2 y$ for some $y \in M$. But then since x_1, x_2 is a regular sequence we see that $y = x_1 y'$ for some $y' \in M$. Hence $x_1(z - x_2 y') = 0$ and hence $z = x_2 y'$ and hence $\overline{z} = 0$ as desired.

For the general case, observe that any permutation is a composition of transpositions of adjacent indices. Hence it suffices to prove that

$$x_1, \ldots, x_{i-2}, x_i, x_{i-1}, x_{i+1}, \ldots, x_c$$

is an M-regular sequence. This follows from the case we just did applied to the module $M/(x_1, \ldots, x_{i-2})$ and the length 2 regular sequence x_{i-1}, x_i. □

Lemma 7.65.6. *Let R be a Noetherian local ring. Let M be a finite R-module. Then* $\dim(\mathit{Supp}(M)) \geq \mathit{depth}(M)$.

Proof. By Lemma 7.59.11 it suffices to prove that if $f \in \mathfrak{m}$ is a nonzero divisor on M, then $d(M/fM) \leq d(M) - 1$. The existence of f shows that M does not have finite length. Consider the exact sequence

$$0 \to M \xrightarrow{f} M \to M/fM \to 0$$

and apply Lemma 7.56.9. It shows that $d(M/fM) < d(M)$. □

Here are a few more results on depth.

Lemma 7.65.7. *Let R, S be local rings. Let $R \to S$ be a flat local ring homomorphism. Let $x_1, \ldots, x_r$ be a sequence in R. Let M be an R-module. The following are equivalent*

(1) *$x_1, \ldots, x_r$ is an M-regular sequence in R, and*
(2) *the images of $x_1, \ldots, x_r$ in S form a $M \otimes_R S$-regular sequence.*

Proof. This is so because $R \to S$ is faithfully flat by Lemma 7.35.16. □

Lemma 7.65.8. *Let R be a Noetherian ring. Let M be a finite R-module. Let $\mathfrak{p}$ be a prime. Let $x_1, \ldots, x_r$ be a sequence in R whose image in $R_{\mathfrak{p}}$ forms an $M_{\mathfrak{p}}$-regular sequence. Then there exists a $g \in R$, $g \notin \mathfrak{p}$ such that the image of $x_1, \ldots, x_r$ in R_g forms an M_g-regular sequence.*

Proof. Set

$$K_i = \operatorname{Ker}\left(x_i : M/(x_1, \ldots, x_{i-1})M \to M/(x_1, \ldots, x_{i-1})M\right).$$

This is a finite R-module whose localization at $\mathfrak{p}$ is zero by assumption. Hence there exists a $g \in R$, $g \notin \mathfrak{p}$ such that $(K_i)_g = 0$ for all $i = 1, \ldots, r$. This g works. □

Lemma 7.65.9. *Let A be a ring. Let I be an ideal generated by a regular sequence $f_1, \ldots, f_n$ in A. Let $g_1, \ldots, g_m \in A$ be elements whose images $\overline{g}_1, \ldots, \overline{g}_m$ form a regular sequence in A/I. Then $f_1, \ldots, f_n, g_1, \ldots, g_m$ is a regular sequence in A.*

Proof. This follows immediately from the definitions. □

Lemma 7.65.10. *Let R be a ring. Let M be an R-module. Let $f_1, \ldots, f_r \in R$ be M-regula. Then for $e_1, \ldots, e_r > 0$ the sequence $f_1^{e_1}, \ldots, f_r^{e_r}$ is$M$-regular too.*

Proof. We will show that $f_1^e, f_2, \ldots, f_r$ is an M-regular sequence by induction on e. The case $e = 1$ is trivial. Since f_1 is a nonzero divisor we have a short exact sequence

$$0 \to M/f_1M \xrightarrow{f_1^{e-1}} M/f_1^eM \to M/f_1^{e-1}M \to 0$$

By induction the elements $f_2, \ldots, f_r$ are M/f_1M and $M/f_1^{e-1}M$-regular sequences. It follows from the snake lemma that they are also M/f_1^eM-regular sequences. □

Lemma 7.65.11. *Let R be a ring. Let $f_1, \ldots, f_r \in R$ which do not generate the unit ideal. The following are equivalent:*

(1) *any permutation of $f_1, \ldots, f_r$ is a regular sequence,*
(2) *any subsequence of $f_1, \ldots, f_r$ (in the given order) is a regular sequence, and*
(3) *$f_1x_1, \ldots, f_rx_r$ is a regular sequence in the polynomial ring $R[x_1, \ldots, x_r]$.*

Proof. It is clear that (1) implies (2). We prove (2) implies (1) by induction on r. The case $r = 1$ is trivial. The case $r = 2$ says that if $a, b \in R$ are a regular sequence and b is a nonzero divisor, then b, a is a regular sequence. This is clear because the kernel of $a : R/(b) \to R/(b)$ is isomorphic to the kernel of $b : R/(a) \to R/(a)$ if both a and b are nonzero divisors. The case $r > 2$. Assume (2) holds and say we want to prove $f_{\sigma(1)}, \ldots, f_{\sigma(r)}$ is a regular sequence for some permutation σ. We already know that $f_{\sigma(1)}, \ldots, f_{\sigma(r-1)}$ is a regular sequence by induction. Hence it suffices to show that f_s where $s = \sigma(r)$ is a nonzero divisor modulo $f_1, \ldots, \hat{f}_s, \ldots, f_r$. If $s = r$ we are done. If $s < r$, then note that f_s and f_r are both nonzero divisors in the ring $R/(f_1, \ldots, \hat{f}_s, \ldots, f_{r-1})$ (by induction hypothesis again). Since we know f_s, f_r is a regular sequence in that ring we conclude by the case of sequence of length 2 that f_r, f_s is too.

Note that $R[x_1, \ldots, x_r]/(f_1x_1, \ldots, f_ix_i)$ as an R-module is a direct sum of the modules

$$R/I_E \cdot x_1^{e_1} \ldots x_r^{e_r}$$

indexed by multi-indices $E = (e_1, \ldots, e_r)$ where I_E is the ideal generated by $f_j^{e_j}$ for $1 \leq j \leq i$ with $e_j > 0$. Hence $f_{i+1}x_i$ is a nonzero divisor on this if and only if the maps f_{i+1} is a nonzero divisor on R/I_E for all E. Thus it is clear that (3) implies (2) by taking $e_1, \ldots, e_i \in \{0, 1\}$. Conversely, if (2) holds, then any sequence of the form $f_1^{e_1}, \ldots, f_i^{e_i}, f_{i+1}$ (but omitting those powers with zero exponent) is a regular sequence by Lemma 7.65.10, i.e., f_{i+1} is a nonzero divisor on R/I_E. □

7.66. Quasi-regular sequences

There is a notion of regular sequence which is slightly weaker than that of a regular sequence and easier to use. Let R be a ring and let $f_1, \ldots, f_c \in R$. Set $J = (f_1, \ldots, f_c)$. Let M be an R-module. Then there is a canonical map

$$M/JM \otimes_{R/J} R/J[X_1, \ldots, X_c] \longrightarrow \bigoplus\nolimits_{n \geq 0} J^n M/J^{n+1}M \tag{7.66.0.1}$$

of graded $R/J[X_1, \ldots, X_c]$-modules defined by the rule

$$\overline{m} \otimes X_1^{e_1} \ldots X_c^{e_c} \longmapsto f_1^{e_1} \ldots f_c^{e_c} m \bmod J^{e_1+\ldots+e_c+1}M.$$

Note that (7.66.0.1) is always surjective.

Definition 7.66.1. Let R be a ring. Let M be an R-module. A sequence of elements $f_1, \ldots, f_c$ of R is called *M-quasi-regular* if (7.66.0.1) is an isomorphism. If $M = R$, we call $f_1, \ldots, f_c$ simply a *quasi-regular sequence*.

So if $f_1, \ldots, f_c$ is a quasi-regular sequence, then

$$R/J[X_1, \ldots, X_c] = \bigoplus\nolimits_{n \geq 0} J^n/J^{n+1}$$

where $J = (f_1, \ldots, f_c)$. It is clear that being a quasi-regular sequence is independent of the order of $f_1, \ldots, f_c$.

Lemma 7.66.2. *Let R be a ring.*

1. *A regular sequence $f_1, \ldots, f_c$ of R is a quasi-regular sequence.*
2. *Suppose that M is an R-module and that $f_1, \ldots, f_c$ is an M-regular sequence. Then $f_1, \ldots, f_c$ is an M-quasi-regular sequence.*

Proof. Set $J = (f_1, \ldots, f_c)$. We prove the first assertion by induction on c. We have to show that given any relation $\sum_{|I|=n} a_I f^I \in J^{n+1}$ with $a_I \in R$ we actually have $a_I \in J$ for all multi-indices I. Since any element of J^{n+1} is of the form $\sum_{|I|=n} b_I f^I$ with $b_I \in J$ we may assume, after replacing a_I by $a_I - b_I$, the relation reads $\sum_{|I|=n} a_I f^I = 0$. We can rewrite this as

$$\sum\nolimits_{e=0}^{n} \left(\sum\nolimits_{|I'|=n-e} a_{I',e} f^{I'} \right) f_c^e = 0$$

Here and below the ``primed'' multi-indices I' are required to be of the form $I' = (i_1, \ldots, i_{d-1}, 0)$. We will show by descending induction on $l \in \{0, \ldots, n\}$ that if we have a relation

$$\sum\nolimits_{e=0}^{l} \left(\sum\nolimits_{|I'|=n-e} a_{I',e} f^{I'}\right) f_c^e = 0$$

then $a_{I',e} \in J$ for all I', e. Namely, set $J' = (f_1, \ldots, f_{c-1})$. We observe that $\sum_{|I'|=n-l} a_{I',l} f^{I'}$ is mapped into J' by f_c^l and hence (because f_c is not a zero divisor on R/J') it is in J'. By induction hypotheses (for the induction on c), we see that $a_{I',l} \in J'$. This allows us to rewrite the term $(\sum_{|I'|=n-l} a_{I',l} f^{I'}) f_c^l$ in the form $(\sum_{|I'|=n-l+1} f_c b_{I',l-1} f^{I'}) f_c^{l-1}$. This gives a new relation of the form

$$\sum\nolimits_{|I'|=n-l+1} (a_{I',l-1} + f_c b_{I',l-1}) f^{I'}) f_c^{l-1} + \sum\nolimits_{e=0}^{l-2} \left(\sum\nolimits_{|I'|=n-e} a_{I',e} f^{I'}\right) f_c^e = 0$$

Now by the induction hypothesis (on l this time) we see that all $a_{I',l-1} + f_c b_{I',l-1} \in J$ and all $a_{I',e} \in J$ for $e \leq l-2$. This, combined with $a_{I',l} \in J' \subset J$ seen above, finishes the proof of the induction step.

The second assertion means that given any formal expression $F = \sum_{|I|=n} m_I X^I$, $m_I \in M$ with $\sum m_I f^I \in J^{n+1}M$, then all the coefficients m_I are in J. This is proved in exactly the same way as we prove the corresponding result for the first assertion above. $\square$

Lemma 7.66.3. *Let $R \to R'$ be a flat ring map. Let M be an R-module. Suppose that $f_1, \ldots, f_r \in R$ form an M-quasi-regular sequence. Then the images of $f_1, \ldots, f_r$ in R' form a $M \otimes_R R'$-quasi-regular sequence.*

Proof. Set $J = (f_1, \ldots, f_r)$, $J' = JR'$ and $M' = M \otimes_R R'$. Because $R \to S$ is flat the sequences $0 \to J^{n+1}M \to J^n M \to J^n M/J^{n+1}M \to 0$ remain exact on tensoring with S. Hence $(J')^n M'/(J')^{n+1}M' = J^n M/J^{n+1}M \otimes_R R'$. Thus the isomorphism $J^n/J^{n+1} \otimes_R M \to J^n M/J^{n+1}M$ gives rise to the corresponding isomorphism for M'. $\square$

Lemma 7.66.4. *Let R be a Noetherian ring. Let M be a finite R-module. Let $\mathfrak p$ be a prime. Let $x_1, \ldots, x_c$ be a sequence in R whose image in $R_{\mathfrak p}$ forms an $M_{\mathfrak p}$-quasi-regular sequence. Then there exists a $g \in R$, $g \not\in \mathfrak p$ such that the image of $x_1, \ldots, x_c$ in R_g forms an M_g-quasi-regular sequence.*

Proof. Consider the kernel K of the map (7.66.0.1). As $M/JM \otimes_{R/J} R/J[X_1, \ldots, X_c]$ is a finite $R/J[X_1, \ldots, X_c]$-module and as $R/J[X_1, \ldots, X_c]$ is Noetherian, we see that K is also a finite $R/J[X_1, \ldots, X_c]$-module. Pick homogeneous generators $k_1, \ldots, k_t \in K$. By assumption for each $i = 1, \ldots, t$ there exists a $g_i \in R$, $g_i \not\in \mathfrak p$ such that $g_i k_i = 0$. Hence $g = g_1 \ldots g_t$ works. $\square$

Lemma 7.66.5. *Let R be a ring. Let M be an R-module. Let $f_1, \ldots, f_c \in R$ be an M-quasi-regular sequence. For any i the sequence $\overline{f}_{i+1}, \ldots, \overline{f}_c$ of $\overline{R} = R/(f_1, \ldots, f_i)$ is an $\overline{M} = M/(f_1, \ldots, f_i)M$-quasi-regular sequence.*

Proof. It suffices to prove this for $i = 1$. Set $\overline{J} = (\overline{f}_2, \ldots, \overline{f}_c) \subset \overline{R}$. Then

$$\begin{aligned} \overline{J}^n \overline{M}/\overline{J}^{n+1}\overline{M} &= (J^n M + f_1 M)/(J^{n+1}M + f_1 M) \\ &= J^n M/(J^{n+1}M + J^n M \cap f_1 M). \end{aligned}$$

Thus, in order to prove the lemma it suffices to show that $J^{n+1}M + J^n M \cap f_1 M = J^{n+1}M + f_1 J^{n-1}M$ because that will show that $\bigoplus_{n \geq 0} \overline{J}^n \overline{M}/\overline{J}^{n+1}\overline{M}$ is the quotient of $\bigoplus_{n \geq 0} J^n M/J^{n+1} \cong$

$M/JM[X_1, \ldots, X_c]$ by X_1. Actually, we have $J^nM \cap f_1M = f_1J^{n-1}M$. Namely, if $m \notin J^{n-1}M$, then $f_1m \notin J^nM$ because $\bigoplus J^nM/J^{n+1}M$ is the polynomial algebra $M/J[X_1, \ldots, X_c]$ by assumption. □

Lemma 7.66.6. *Let $(R, \mathfrak{m})$ be a local Noetherian ring. Let M be a nonzero finite R-module. Let $f_1, \ldots, f_c \in \mathfrak{m}$ be an M-quasi-regular sequence. Then $f_1, \ldots, f_c$ is an M-regular sequence.*

Proof. Set $J = (f_1, \ldots, f_c)$. Let us show that f_1 is a nonzero divisor on M. Suppose $x \in M$ is not zero. By the Artin-Rees lemma there exists an integer r such that $x \in J^rM$ but $x \notin J^{r+1}M$, see Lemma 7.47.6. Then $f_1x \in J^{r+1}M$ is an element whose class in $J^{r+1}M/J^{r+2}M$ is nonzero by the assumed structure of $\bigoplus J^nM/J^{n+1}M$. Whence $f_1x \neq 0$.

Now we can finish the proof by induction on c using Lemma 7.66.5. □

Remark 7.66.7 (Koszul regular sequences)**.** In the paper [**Kab71**] the author introduces two more regularity conditions for sequences $x_1, \ldots, x_r$ of elements of a ring R. Namely, we say the sequence is *Koszul-regular* if $H_i(K_\bullet(R, x_\bullet)) = 0$ for $i \geq 1$ where $K_\bullet(R, x_\bullet)$ is the Koszul complex. The sequence is called *H_1-regular* if $H_1(K_\bullet(R, x_\bullet)) = 0$. If R is a local ring (possibly nonnoetherian) and the sequence consists of elements of the maximal ideal, then one has the implications regular $\Rightarrow$ Koszul-regular $\Rightarrow$ H_1-regular $\Rightarrow$ quasi-regular. By examples the author shows that these implications cannot be reversed in general. We introduce these notions in more detail in More on Algebra, Section 12.22.

Remark 7.66.8. Let k be a field. Consider the ring

$$A = k[x, y, w, z_0, z_1, z_2, \ldots]/(y^2z_0 - wx, z_0 - yz_1, z_1 - yz_2, \ldots)$$

In this ring x is a nonzero divisor and the image of y in A/xA gives a quasi-regular sequence. But it is not true that x, y is a quasi-regular sequence in A because $(x, y)/(x, y)^2$ isn't free of rank two over $A/(x, y)$ due to the fact that $wx = 0$ in $(x, y)/(x, y)^2$ but w isn't zero in $A/(x, y)$. Hence the analogue of Lemma 7.65.9 does not hold for quasi-regular sequences.

Lemma 7.66.9. *Let R be a ring. Let $J = (f_1, \ldots, f_r)$ be an ideal of R. Let M be an R-module. Set $\overline{R} = R/\bigcap_{n\geq 0} J^n$, $\overline{M} = M/\bigcap_{n\geq 0} J^nM$, and denote $\overline{f}_i$ the image of f_i in $\overline{R}$. Then $f_1, \ldots, f_r$ is M-quasi-regular if and only if $\overline{f}_1, \ldots, \overline{f}_r$ is $\overline{M}$-quasi-regular.*

Proof. This is true because $J^nM/J^{n+1}M \cong \overline{J}^n\overline{M}/\overline{J}^{n+1}\overline{M}$. □

7.67. Ext groups and depth

In this section we do a tiny bit of homological algebra, in order to establish some fundamental properties of depth over Noetherian local rings.

Lemma 7.67.1. *Let R be a ring. Let M be an R-module.*

(1) *The exists an exact complex*
$$\ldots \to F_2 \to F_1 \to F_0 \to M \to 0.$$
with F_i free R-modules.

(2) *If R is Noetherian and M finite R, then we choose the complex such that each F_i is finite free. In other words, we may find an exact complex*
$$\ldots \to R^{n_2} \to R^{n_1} \to R^{n_0} \to M \to 0.$$

Proof. Let us explain only the Noetherian case. As a first step choose a surjection $R^{n_0} \to M$. Then having constructed an exact complex of length e we simply choose a surjection $R^{n_{e+1}} \to \text{Ker}(R^{n_e} \to R^{n_{e-1}})$ which is possible because R is Noetherian. □

Definition 7.67.2. Let R be a ring. Let M be an R-module.

(1) A (left) *resolution* $F_\bullet \to M$ of M is an exact complex
$$\ldots \to F_2 \to F_1 \to F_0 \to M \to 0$$
of R-modules.

(2) A *resolution of M by free R-modules* is a resolution $F_\bullet \to M$ where each F_i is a free R-module.

(3) A *resolution of M by finite free R-modules* is a resolution $F_\bullet \to M$ where each F_i is a finite free R-module.

We often use the notation $F_\bullet$ to denote a complex of R-modules
$$\ldots \to F_i \to F_{i-1} \to \ldots$$
In this case we often use d_i or $d_{F,i}$ to denote the map $F_i \to F_{i-1}$. In this section we are always going to assume that F_0 is the last nonzero term in the complex. The *ith homology group of the complex $F_\bullet$* is the group $H_i = \text{Ker}(d_{F,i})/\text{Im}(d_{F,i+1})$. A *map of complexes* $\alpha : F_\bullet \to G_\bullet$ is given by maps $\alpha_i : F_i \to G_i$ such that $\alpha_{i-1} \circ d_{F,i} = d_{G,i-1} \circ \alpha_i$. Such a map induces a map on homology $H_i(\alpha) : H_i(F_\bullet) \to H_i(G_\bullet)$. If $\alpha, \beta : F_\bullet \to G_\bullet$ are maps of complexes, then a *homotopy* between α and β is given by a collection of maps $h_i : F_i \to G_{i+1}$ such that $\alpha_i - \beta_i = d_{G,i+1} \circ h_i + h_{i-1} \circ d_{F,i}$.

We will use a very similar notation regarding complexes of the form $F^\bullet$ which look like
$$\ldots \to F^i \xrightarrow{d^i} F^{i+1} \to \ldots$$
There are maps of complexes, homotopies, etc. In this case we set $H^i(F^\bullet) = \text{Ker}(d^i)/\text{Im}(d^{i-1})$ and we call it the *ith cohomology group*.

Lemma 7.67.3. *Any two homotopic maps of complexes induce the same maps on (co)homology groups.*

Proof. Omitted. □

Lemma 7.67.4. *Let R be a ring. Let $M \to N$ be a map of R-modules. Let $F_\bullet \to M$ be a resolution by free R-modules and let $N_\bullet \to N$ be an arbitrary resolution. Then*

(1) *there exists a map of complexes $F_\bullet \to N_\bullet$ inducing the given map*
$$M = Coker(F_1 \to F_0) \to Coker(N_1 \to N_0) = N$$

(2) *two maps $\alpha, \beta : F_\bullet \to N_\bullet$ inducing the same map $M \to N$ are homotopic.*

Proof. Proof of (1). Because F_0 is free we can find a map $F_0 \to N_0$ lifting the map $F_0 \to M \to N$. We obtain an induced map $F_1 \to F_0 \to N_0$ wich ends up in the image of $N_1 \to N_0$. Since F_1 is free we may lift this to a map $F_1 \to N_1$. This in turn induces a map $F_2 \to F_1 \to N_1$ which maps to zero into N_0. Since $N_\bullet$ is exact we see that the image of this map is contained in the image of $N_2 \to N_1$. Hence we may lift to get a map $F_2 \to N_2$. Repeat.

Proof of (2). To show that α, β are homotopic it suffices to show the difference $\gamma = \alpha - \beta$ is homotopic to zero. Note that the image of $\gamma_0 : F_0 \to N_0$ is contained in the image of $N_1 \to N_0$. Hence we may lift γ_0 to a map $h_0 : F_0 \to N_1$. Consider the map $\gamma_1' =$

$\gamma_1 - h_0 \circ d_{F,1}$. By our choice of h_0 we see that the image of γ_1' is contained in the kernel of $N_1 \to N_0$. Since $N_\bullet$ is exact we may lift γ_1' to a map $h_1 : F_1 \to N_2$. At this point we have $\gamma_1 = h_0 \circ d_{F,1} + d_{N,2} \circ h_1$. Repeat. □

At this point we are ready to define the groups $\text{Ext}^i_R(M, N)$. Namely, choose a resolution $F_\bullet$ of M by free R-modules, see Lemma 7.67.1. Consider the (cohomological) complex

$$Hom_R(F_\bullet, N) : Hom_R(F_0, N) \to Hom_R(F_1, N) \to Hom_R(F_2, N) \to \dots$$

We define $\text{Ext}^i_R(M, N)$ to be the ith cohomology group of this complex.[3] The following lemma explains in what sense this is well defined.

Lemma 7.67.5. *Let R be a ring. Let M_1, M_2, N be R-modules. Suppose that $F_\bullet$ is a free resolution of the module M_1, and $G_\bullet$ is a free resolution of the module M_2. Let $\varphi : M_1 \to M_2$ be a module map. Let $\alpha : F_\bullet \to G_\bullet$ be a map of complexes inducing φ on $M_1 = Coker(d_{F,1}) \to M_2 = Coker(d_{G,1})$, see Lemma 7.67.4. Then the induced maps*

$$H^i(\alpha) : H^i(Hom_R(F_\bullet, N)) \longrightarrow H^i(Hom_R(G_\bullet, N))$$

are independent of the choice of α. If φ is an isomorphism, so are all the maps $H^i(\alpha)$. If $M_1 = M_2$, $F_\bullet = G_\bullet$, and φ is the identity, so are all the maps $H_i(\alpha)$.

Proof. Another map $\beta : F_\bullet \to G_\bullet$ inducing φ is homotopic to α by Lemma 7.67.4. Hence the maps $Hom_R(F_\bullet, N) \to Hom_R(G_\bullet, N)$ are homotopic. Hence the independence result follows from Lemma 7.67.3.

Suppose that φ is an isomorphism. Let $\psi : M_2 \to M_1$ be an inverse. Choose $\beta : G_\bullet \to F_\bullet$ be a map inducing $\psi : M_2 = \text{Coker}(d_{G,1}) \to M_1 = \text{Coker}(d_{F,1})$, see Lemma 7.67.4. Ok, and now consider the map $H^i(\alpha) \circ H^i(\beta) = H^i(\alpha \circ \beta)$. By the above the map $H^i(\alpha \circ \beta)$ is the *same* as the map $H^i(\text{id}_{G_\bullet}) = \text{id}$. Similarly for the composition $H^i(\beta) \circ H^i(\alpha)$. Hence $H^i(\alpha)$ and $H^i(\beta)$ are inverses of each other. □

Lemma 7.67.6. *Let R be a ring. Let M be an R-module. Let $0 \to N' \to N \to N'' \to 0$ be a short exact sequence. Then we get a long exact sequence*

$$\begin{aligned} 0 \to Hom_R(M, N') \to Hom_R(M, N) \to Hom_R(M, N'') \\ \to Ext^1_R(M, N') \to Ext^1_R(M, N) \to Ext^1_R(M, N'') \to \dots \end{aligned}$$

Proof. Pick a free resolution $F_\bullet \to M$. Since each of the F_i are free we see that we get a short exact sequence of complexes

$$0 \to Hom_R(F_\bullet, N') \to Hom_R(F_\bullet, N) \to Hom_R(F_\bullet, N'') \to 0$$

Thus we get the long exact sequence from the snake lemma applied to this. □

Lemma 7.67.7. *Let R be a ring. Let N be an R-module. Let $0 \to M' \to M \to M'' \to 0$ be a short exact sequence. Then we get a long exact sequence*

$$\begin{aligned} 0 \to Hom_R(M'', N) \to Hom_R(M, N) \to Hom_R(M', N) \\ \to Ext^1_R(M'', N) \to Ext^1_R(M, N) \to Ext^1_R(M', N) \to \dots \end{aligned}$$

Proof. Pick sets of generators $\{m'_{i'}\}_{i' \in I'}$ and $\{m''_{i''}\}_{i'' \in I''}$ of M' and M''. For each $i'' \in I''$ choose a lift $\tilde{m}''_{i''} \in M$ of the element $m''_{i''} \in M''$. Set $F' = \bigoplus_{i' \in I'} R$, $F'' = \bigoplus_{i'' \in I''} R$ and $F = F' \oplus F''$. Mapping the generators of these free modules to the corresponding chosen

[3] At this point it would perhaps be more appropriate to say ``an'' in stead of ``the'' Ext-group.

generators gives surjective R-module maps $F' \to M'$, $F'' \to M''$, and $F \to M$. We obtain a map of short exact sequences

$$\begin{array}{ccccccccc} 0 & \to & M' & \to & M & \to & M'' & \to & 0 \\ & & \uparrow & & \uparrow & & \uparrow & & \\ 0 & \to & F' & \to & F & \to & F'' & \to & 0 \end{array}$$

By the snake lemma we see that the sequence of kernels $0 \to K' \to K \to K'' \to 0$ is short exact sequence of R-modules. Hence we can continue this process indefinitively. In other words we obtain a short exact sequence of resolutions fitting into the diagram

$$\begin{array}{ccccccccc} 0 & \to & M' & \to & M & \to & M'' & \to & 0 \\ & & \uparrow & & \uparrow & & \uparrow & & \\ 0 & \to & F'_\bullet & \to & F_\bullet & \to & F''_\bullet & \to & 0 \end{array}$$

Because each of the sequences $0 \to F'_n \to F_n \to F''_n \to 0$ is split exact (by construction) we obtain a short exact sequence of complexes

$$0 \to Hom_R(F''_\bullet, N) \to Hom_R(F_\bullet, N) \to Hom_R(F'_\bullet, N) \to 0$$

by applying the $Hom_R(-, N)$ functor. Thus we get the long exact sequence from the snake lemma applied to this. $\square$

Lemma 7.67.8. *Let R be a ring. Let M, N be R-modules. Any $x \in R$ such that either $xN = 0$, or $xM = 0$ annihilates each of the modules $Ext^i_R(M, N)$.*

Proof. Pick a free resolution $F_\bullet$ of M. Since $\text{Ext}^i_R(M, N)$ is defined as the cohomology of the complex $Hom_R(F_\bullet, N)$ the lemma is clear when $xN = 0$. If $xM = 0$, then we see that multiplication by x on $F_\bullet$ lifts the zero map on M. Hence by Lemma 7.67.5 we see that it induces the same map on Ext groups as the zero map. $\square$

Lemma 7.67.9. *Let R be a Noetherian local ring with maximal ideal $\mathfrak{m}$. Let M be a finite R-module. Then $depth_R(M)$ is equal to the smallest integer i such that $Ext^i_R(R/\mathfrak{m}, M)$ is nonzero.*

Proof. Let $\delta(M)$ denote the depth of M and let $i = i(M)$ denote the smallest integer such that $\text{Ext}^i_R(R/\mathfrak{m}, M)$ is nonzero. We will see in a moment that $i(M) < \infty$. By Lemma 7.60.17 we have $\delta(M) = 0$ if and only if $i(M) = 0$, because $\mathfrak{m} \in \text{Ass}(M)$ exactly means that $i(M) = 0$. Hence if $\delta(M)$ or $i(M)$ is > 0, then we may choose $x \in \mathfrak{m}$ such that (a) x is a nonzero divisor on M, and (b) $\text{depth}(M/xM) = \delta(M) - 1$. Consider the long exact sequence of Ext-groups associated to the short exact sequence $0 \to M \to M \to M/xM \to 0$ by Lemma 7.67.6:

$$\begin{array}{l} 0 \to Hom_R(\kappa, M) \to Hom_R(\kappa, M) \to Hom_R(\kappa, M/xM) \\ \quad \to \text{Ext}^1_R(\kappa, M) \to \text{Ext}^1_R(\kappa, M) \to \text{Ext}^1_R(\kappa, M/xM) \to \ldots \end{array}$$

Since $x \in \mathfrak{m}$ all the maps $\text{Ext}^i_R(\kappa, M) \to \text{Ext}^i_R(\kappa, M)$ are zero, see Lemma 7.67.8. Thus it is clear that $i(M/xM) = i(M) - 1$. Induction, e.g., on $\dim(\text{Support}(M))$, finishes the proof. $\square$

Lemma 7.67.10. *Let R be a local Noetherian ring. Let $0 \to N' \to N \to N'' \to 0$ be a short exact sequence of finite R-modules.*

1. *$depth(N'') \geq \min\{depth(N), depth(N') - 1\}$*
2. *$depth(N') \geq \min\{depth(N), depth(N'') + 1\}$*

Proof. This is easy using the results above. Hint: Use the characterization of depth using the Ext groups $\mathrm{Ext}^i(\kappa, N)$, see Lemma 7.67.9, and use the long exact cohomology sequence

$$\begin{aligned}0 \to Hom_R(\kappa, N') \to Hom_R(\kappa, N) \to Hom_R(\kappa, N'') \\ \to \mathrm{Ext}^1_R(\kappa, N') \to \mathrm{Ext}^1_R(\kappa, N) \to \mathrm{Ext}^1_R(\kappa, N'') \to \ldots\end{aligned}$$

from Lemma 7.67.6. □

7.68. An application of Ext groups

This section should briefly discuss the relationship between $\mathrm{Ext}^1_R(Q, N)$ and extensions (see Homology, Section 10.4). Omitted.

Lemma 7.68.1. *Let R be a Noetherian local ring with maximal ideal $\mathfrak{m}$. Let $N \to M$ be a homomorphism of finite R-modules. Suppose that there exists arbitrarily large n such that $N/\mathfrak{m}^n N \to M/\mathfrak{m}^n M$ is a split injection. Then $N \to M$ is a split injection.*

Proof. Assume $\varphi : N \to M$ satisfies the assumptions of the lemma. Note that this implies that $\mathrm{Ker}(\varphi) \subset \mathfrak{m}^n N$ for arbitrarily large n. Hence by Lemma 7.47.6 we see that φ is injection. Let $Q = M/N$ so that we have a short exact sequence

$$0 \to N \to M \to Q \to 0.$$

Let

$$F_2 \xrightarrow{d_2} F_1 \xrightarrow{d_1} F_0 \to Q \to 0$$

be a finite free resolution of Q. We can choose a map $\alpha : F_0 \to M$ lifting the map $F_0 \to Q$. This induces a map $\beta : F_1 \to N$ such that $\beta \circ d_2 = 0$. The extension above is split if and only if there exists a map $\gamma : F_0 \to N$ such that $\beta = \gamma \circ d_1$. In other words, the class of β in $\mathrm{Ext}^1_R(Q, N)$ is the obstruction to splitting the short exact sequence above.

Suppose n is a large integer such that $N/\mathfrak{m}^n N \to M/\mathfrak{m}^n M$ is a split injection. This implies

$$0 \to N/\mathfrak{m}^n N \to M/\mathfrak{m}^n M \to Q/\mathfrak{m}^n Q \to 0.$$

is still short exact. Also, the sequence

$$F_1/\mathfrak{m}^n F_1 \xrightarrow{d_1} F_0/\mathfrak{m}^n F_0 \to Q/\mathfrak{m}^n Q \to 0$$

is still exact. Arguing as above we see that the map $\overline{\beta} : F_1/\mathfrak{m}^n F_1 \to N/\mathfrak{m}^n N$ induced by β is equal to $\gamma_n \circ d_1$ for some map $\overline{\gamma_n} : F_0/\mathfrak{m}^n F_0 \to N/\mathfrak{m}^n$. Since F_0 is free we can lift $\overline{\gamma_n}$ to a map $\gamma_n : F_0 \to N$ and then we see that $\beta - \gamma_n \circ d_1$ is a map from F_1 into $\mathfrak{m}^n N$. In other words we conclude that

$$\beta \in \mathrm{Im}\Big(Hom_R(F_0, N) \to Hom_R(F_1, N)\Big) + \mathfrak{m}^n \, Hom_R(F_1, N).$$

for this n.

Since we have this property for arbitrarily large n by assumption we conclude (by Lemma 7.47.4) that β is actually in the image of the map $Hom_R(F_0, N) \to Hom_R(F_1, N)$ as desired. □

7.69. Tor groups and flatness

In this section we use some of the homological algebra developed in the previous section to explain what Tor groups are. Namely, suppose that R is a ring and that M, N are two R-modules. Choose a resolution $F_\bullet$ of M by free R-modules. See Lemma 7.67.1. Consider the homological complex

$$F_\bullet \otimes_R N : \ldots \to F_2 \otimes_R N \to F_1 \otimes_R N \to F_0 \otimes_R N$$

We define $\text{Tor}_i^R(M, N)$ to be the ith homology group of this complex. The following lemma explains in what sense this is well defined.

Lemma 7.69.1. *Let R be a ring. Let M_1, M_2, N be R-modules. Suppose that $F_\bullet$ is a free resolution of the module M_1 and that $G_\bullet$ is a free resolution of the module M_2. Let $\varphi : M_1 \to M_2$ be a module map. Let $\alpha : F_\bullet \to G_\bullet$ be a map of complexes inducing φ on $M_1 = Coker(d_{F,1}) \to M_2 = Coker(d_{G,1})$, see Lemma 7.67.4. Then the induced maps*

$$H_i(\alpha) : H_i(F_\bullet \otimes_R N) \longrightarrow H_i(G_\bullet \otimes_R N)$$

are independent of the choice of α. If φ is an isomorphism, so are all the maps $H_i(\alpha)$. If $M_1 = M_2$, $F_\bullet = G_\bullet$, and φ is the identity, so are all the maps $H_i(\alpha)$.

Proof. The proof of this lemma is identical to the proof of Lemma 7.67.5. □

Not only does this lemma imply that the Tor modules are well defined, but it also provides for the functoriality of the constructions $(M, N) \mapsto \text{Tor}_i^R(M, N)$ in the first variable. Of course the functoriality in the second variable is evident. We leave it to the reader to see that each of the Tor_i^R is in fact a functor

$$\text{Mod}_R \times \text{Mod}_R \to \text{Mod}_R.$$

Here Mod_R denotes the category of R-modules, and for the definition of the product category see Categories, Definition 4.2.20. Namely, given morphisms of R-modules $M_1 \to M_2$ and $N_1 \to N_2$ we get a commutative diagram

$$\begin{tikzcd}
\text{Tor}_i^R(M_1, N_1) \arrow[r] \arrow[d] & \text{Tor}_i^R(M_1, N_2) \arrow[d] \\
\text{Tor}_i^R(M_2, N_1) \arrow[r] & \text{Tor}_i^R(M_2, N_2)
\end{tikzcd}$$

Lemma 7.69.2. *Let R be a ring and let M be an R-module. Suppose that $0 \to N' \to N \to N'' \to 0$ is a short exact sequence of R-modules. There exists a long exact sequence*

$$\begin{array}{c} M \otimes_R N' \to M \otimes_R N \to M \otimes_R N'' \to 0 \\ Tor_1^R(M, N') \to Tor_1^R(M, N) \to Tor_1^R(M, N'') \to \end{array}$$

Proof. The proof of this is the same as the proof of Lemma 7.67.6. □

Consider a homological double complex of R-modules

$$\begin{tikzcd}
\ldots \arrow[r, "d"] & A_{2,0} \arrow[r, "d"] & A_{1,0} \arrow[r, "d"] & A_{0,0} \\
\ldots \arrow[r, "d"] & A_{2,1} \arrow[r, "d"] \arrow[u, "\delta"] & A_{1,1} \arrow[r, "d"] \arrow[u, "\delta"] & A_{0,1} \arrow[u, "\delta"] \\
\ldots \arrow[r, "d"] & A_{2,2} \arrow[r, "d"] \arrow[u, "\delta"] & A_{1,2} \arrow[r, "d"] \arrow[u, "\delta"] & A_{0,2} \arrow[u, "\delta"] \\
& \ldots \arrow[u, "\delta"] & \ldots \arrow[u, "\delta"] & \ldots \arrow[u, "\delta"]
\end{tikzcd}$$

This means that $d_{i,j} : A_{i,j} \to A_{i-1,j}$ and $\delta_{i,j} : A_{i,j} \to A_{i,j-1}$ have the following properties

(1) Any composition of two $d_{i,j}$ is zero. In other words the rows of the double complex are complexes.
(2) Any composition of two $\delta_{i,j}$ is zero. In other words the columns of the double complex are complexes.
(3) For any pair (i, j) we have $\delta_{i-1,j} \circ d_{i,j} = d_{i,j-1} \circ \delta_{i,j}$. In other words, all the squares commute.

The correct thing to do is to associate a spectral sequence to any such double complex. However, for the moment we can get away with doing something slightly easier.

Namely, for the purposes of this section only, given a double complex $(A_{\bullet,\bullet}, d, \delta)$ set $R(A)_j = \mathrm{Coker}(A_{1,j} \to A_{0,j})$ and $U(A)_i = \mathrm{Coker}(A_{i,1} \to A_{i,0})$. (The letters R and U are meant to suggest Right and Up.) We endow $R(A)_\bullet$ with the structure of a complex using the maps δ. Similarly we endow $U(A)_\bullet$ with the structure of a complex using the maps d. In other words we obtain the following huge commutative diagram

$$\begin{tikzcd}
\ldots \arrow[r, "d"] & U(A)_2 \arrow[r, "d"] & U(A)_1 \arrow[r, "d"] & U(A)_0 & \\
\ldots \arrow[r, "d"] & A_{2,0} \arrow[r, "d"] \arrow[u] & A_{1,0} \arrow[r, "d"] \arrow[u] & A_{0,0} \arrow[r] \arrow[u] & R(A)_0 \\
\ldots \arrow[r, "d"] & A_{2,1} \arrow[r, "d"] \arrow[u, "\delta"] & A_{1,1} \arrow[r, "d"] \arrow[u, "\delta"] & A_{0,1} \arrow[r] \arrow[u, "\delta"] & R(A)_1 \arrow[u, "\delta"] \\
\ldots \arrow[r, "d"] & A_{2,2} \arrow[r, "d"] \arrow[u, "\delta"] & A_{1,2} \arrow[r, "d"] \arrow[u, "\delta"] & A_{0,2} \arrow[r] \arrow[u, "\delta"] & R(A)_2 \arrow[u, "\delta"] \\
& \ldots \arrow[u, "\delta"] & \ldots \arrow[u, "\delta"] & \ldots \arrow[u, "\delta"] & \ldots \arrow[u, "\delta"]
\end{tikzcd}$$

(This is no longer a double complex of course.) It is clear what a morphism $\Phi : (A_{\bullet,\bullet}, d, \delta) \to (B_{\bullet,\bullet}, d, \delta)$ of double complexes is, and it is clear that this induces morphisms of complexes $R(\Phi) : R(A)_\bullet \to R(B)_\bullet$ and $U(\Phi) : U(A)_\bullet \to U(B)_\bullet$.

Lemma 7.69.3. *Let $(A_{\bullet,\bullet}, d, \delta)$ be a double complex such that*

(1) *Each row $A_{\bullet,j}$ is a resolution of $R(A)_j$.*

(2) *Each column $A_{i,\bullet}$ is a resolution of $U(A)_i$.*

Then there are canonical isomorphisms

$$H_i(R(A)_\bullet) \cong H_i(U(A)_\bullet).$$

The isomorphisms are functorial with respect to morphisms of double complexes with the properties above.

Proof. We will show that $H_i(R(A)_\bullet))$ and $H_i(U(A)_\bullet)$ are canonically isomorphic to a third group. Namely

$$\mathbf{H}_i(A) := \frac{\{(a_{i,0}, a_{i-1,1}, \ldots, a_{0,i}) \mid d(a_{i,0}) = \delta(a_{i-1,1}), \ldots, d(a_{1,i-1}) = \delta(a_{0,i})\}}{\{d(a_{i+1,0}) - \delta(a_{i,1}), d(a_{i,1}) - \delta(a_{i-1,2}), \ldots, d(a_{1,i}) - \delta(a_{0,i+1})\}}$$

Here we use the notational convention that $a_{i,j}$ denotes an element of $A_{i,j}$. In other words, an element of $\mathbf{H}_i$ is represented by a zig-zag, represented as follows for $i = 2$

$$\begin{tikzcd}
a_{2,0} \arrow[r, mapsto] & d(a_{2,0}) = \delta(a_{1,1}) & \\
& a_{1,1} \arrow[u, mapsto] \arrow[r, mapsto] & d(a_{1,1}) = \delta(a_{0,2}) \\
& & a_{0,2} \arrow[u, mapsto]
\end{tikzcd}$$

Naturally, we divide out by ``trivial'' zig-zags, namely the submodule generated by elements of the form $(0, \ldots, 0, -\delta(a_{t+1,t-i}), d(a_{t+1,t-i}), 0, \ldots, 0)$. Note that there are canonical homomorphisms

$$\mathbf{H}_i(A) \to H_i(R(A)_\bullet), \quad (a_{i,0}, a_{i-1,1}, \ldots, a_{0,i}) \mapsto \text{class of image of } a_{0,i}$$

and

$$\mathbf{H}_i(A) \to H_i(U(A)_\bullet), \quad (a_{i,0}, a_{i-1,1}, \ldots, a_{0,i}) \mapsto \text{class of image of } a_{i,0}$$

First we show that these maps are surjective. Suppose that $\bar{r} \in H_i(R(A)_\bullet)$. Let $r \in R(A)_i$ be a cocycle representing the class of $\bar{r}$. Let $a_{0,i} \in A_{0,i}$ be an element which maps to r. Because $\delta(r) = 0$, we see that $\delta(a_{0,i})$ is in the image of d. Hence there exists an element $a_{1,i-1} \in A_{1,i-1}$ such that $d(a_{1,i-1}) = \delta(a_{0,i})$. This in turn implies that $\delta(a_{1,i-1})$ is in the kernel of d (because $d(\delta(a_{1,i-1})) = \delta(d(a_{1,i-1})) = \delta(\delta(a_{0,i})) = 0$. By exactness of the rows we find an element $a_{2,i-2}$ such that $d(a_{2,i-2}) = \delta(a_{1,i-1})$. And so on until a full zig-zag is found. Of course surjectivity of $\mathbf{H}_i \to H_i(U(A))$ is shown similarly.

To prove injectivity we argue in exactly the same way. Namely, suppose we are given a zig-zag $(a_{i,0}, a_{i-1,1}, \ldots, a_{0,i})$ which maps to zero in $H_i(R(A)_\bullet)$. This means that $a_{0,i}$ maps to an element of $\operatorname{Coker}(A_{i,1} \to A_{i,0})$ which is in the image of $\delta : \operatorname{Coker}(A_{i+1,1} \to A_{i+1,0}) \to \operatorname{Coker}(A_{i,1} \to A_{i,0})$. In other words, $a_{0,i}$ is in the image of $\delta \oplus d : A_{0,i+1} \oplus A_{1,i} \to A_{0,i}$. From the definition of trivial zig-zags we see that we may modify our zig-zag by a trivial one and assume that $a_{0,i} = 0$. This immediately implies that $d(a_{1,i-1}) = 0$. As the rows are exact this implies that $a_{1,i-1}$ is in the image of $d : A_{2,i-1} \to A_{1,i-1}$. Thus we may modify our zig-zag once again by a trivial zig-zag and assume that our zig-zag looks like $(a_{i,0}, a_{i-1,1}, \ldots, a_{2,i-2}, 0, 0)$. Continuing like this we obtain the desired injectivity.

If $\Phi : (A_{\bullet,\bullet}, d, \delta) \to (B_{\bullet,\bullet}, d, \delta)$ is a morphism of double complexes both of which satisfy the conditions of the lemma, then we clearly obtain a commutative diagram

$$\begin{tikzcd} H_i(U(A)_\bullet) \arrow[d] & \mathbf{H}_i(A) \arrow[l] \arrow[r] \arrow[d] & H_i(R(A)_\bullet) \arrow[d] \\ H_i(U(B)_\bullet) & \mathbf{H}_i(B) \arrow[l] \arrow[r] & H_i(R(B)_\bullet) \end{tikzcd}$$

This proves the functoriality. □

Remark 7.69.4. The isomorphism constructed above is the ``correct'' one only up to signs. A good part of homological algebra is concerned with choosing signs for various maps and showing commutativity of diagrams with intervention of suitable signs. For the moment we will simply use the isomorphism as given in the proof above, and worry about signs later.

Lemma 7.69.5. *Let R be a ring. For any $i \geq 0$ the functors $Mod_R \times Mod_R \to Mod_R$, $(M, N) \mapsto Tor_i^R(M, N)$ and $(M, N) \mapsto Tor_i^R(N, M)$ are canonically isomorphic.*

Proof. Let $F_\bullet$ be a free resolution of the module M and let $G_\bullet$ be a free resolution of the module N. Consider the double complex $(A_{i,j}, d, \delta)$ defined as follows:

(1) set $A_{i,j} = F_i \otimes_R G_j$,
(2) set $d_{i,j} : F_i \otimes_R G_j \to F_{i-1} \otimes G_j$ equal to $d_{F,i} \otimes \text{id}$, and
(3) set $\delta_{i,j} : F_i \otimes_R G_j \to F_i \otimes G_{j-1}$ equal to $\text{id} \otimes d_{G,j}$.

This double complex is usually simply denoted $F_\bullet \otimes_R G_\bullet$.

Since each G_j is free, and hence flat we see that each row of the double complex is exact except in homological degree 0. Since each F_i is free and hence flat we see that each column of the double complex is exact except in homological degree 0. Hence the double complex satisfies the conditions of Lemma 7.69.3.

To see what the lemma says we compute $R(A)_\bullet$ and $U(A)_\bullet$. Namely,

$$\begin{aligned} R(A)_i &= \text{Coker}(A_{1,i} \to A_{0,i}) \\ &= \text{Coker}(F_1 \otimes_R G_i \to F_0 \otimes_R G_i) \\ &= \text{Coker}(F_1 \to F_0) \otimes_R G_i \\ &= M \otimes_R G_i \end{aligned}$$

In fact these isomorphisms are compatible with the differentials δ and we see that $R(A)_\bullet = M \otimes_R G_\bullet$ as homological complexes. In exactly the same way we see that $U(A)_\bullet = F_\bullet \otimes_R N$. We get

$$\begin{aligned} \text{Tor}_i^R(M, N) &= H_i(F_\bullet \otimes_R N) \\ &= H_i(U(A)_\bullet) \\ &= H_i(R(A)_\bullet) \\ &= H_i(M \otimes_R G_\bullet) \\ &= H_i(G_\bullet \otimes_R M) \\ &= \text{Tor}_i^R(N, M) \end{aligned}$$

Here the third equality is Lemma 7.69.3, and the fifth equality uses the isomorphism $V \otimes W = W \otimes V$ of the tensor product.

Functoriality. Suppose that we have R-modules M_ν, N_ν, $\nu = 1, 2$. Let $\varphi : M_1 \to M_2$ and $\psi : N_1 \to N_2$ be morphisms of R-modules. Suppose that we have free resolutions $F_{\nu,\bullet}$ for M_ν and free resolutions $G_{\nu,\bullet}$ for N_ν. By Lemma 7.67.4 we may choose maps of complexes $\alpha : F_{1,\bullet} \to F_{2,\bullet}$ and $\beta : G_{1,\bullet} \to G_{2,\bullet}$ compatible with φ and ψ. We claim that the pair (α, β) induces a morphism of double complexes

$$\alpha \otimes \beta : F_{1,\bullet} \otimes_R G_{1,\bullet} \longrightarrow F_{2,\bullet} \otimes_R G_{2,\bullet}$$

This is really a very straightforward check using the rule that $F_{1,i} \otimes_R G_{1,j} \to F_{2,i} \otimes_R G_{2,j}$ is given by $\alpha_i \otimes \beta_j$ where α_i, resp. β_j is the degree i, resp. j component of α, resp. β. The reader also readily verifies that the induced maps $R(F_{1,\bullet} \otimes_R G_{1,\bullet})_\bullet \to R(F_{2,\bullet} \otimes_R G_{2,\bullet})_\bullet$ agrees with the map $M_1 \otimes_R G_{1,\bullet} \to M_2 \otimes_R G_{2,\bullet}$ induced by $\varphi \otimes \beta$. Similarly for the map induced on the $U(-)_\bullet$ complexes. Thus the statement on functoriality follows from the statement on functoriality in Lemma 7.69.3. □

Remark 7.69.6. An interesting case occurs when $M = N$ in the above. In this case we get a canonical map $\text{Tor}_i^R(M, M) \to \text{Tor}_i^R(M, M)$. Note that this map is not the identity, because even when $i = 0$ this map is not the identity! For example, if V is a vector space of dimension n over a field, then the switch map $V \otimes_k V \to V \otimes_k V$ has $(n^2 + n)/2$ eigenvalues $+1$ and $(n^2 - n)/2$ eigenvalues -1. In characteristic 2 it is not even diagonalizable. Note that even changing the sign of the map will not get rid of this.

Lemma 7.69.7. *Let R be a ring. Let M be an R-module. The following are equivalent:*

(1) *The module M is flat over R.*
(2) *For all $i > 0$ the functor $Tor_i^R(M, -)$ is zero.*
(3) *The functor $Tor_1^R(M, -)$ is zero.*
(4) *For all ideals $I \subset R$ we have $Tor_1^R(M, R/I) = 0$.*
(5) *For all finitely generated ideals $I \subset R$ we have $Tor_1^R(M, R/I) = 0$.*

Proof. Suppose M is flat. Let N be an R-module. Let $F_\bullet$ be a free resolution of N. Then $F_\bullet \otimes_R M$ is a resolution of $N \otimes_R M$, by flatness of M. Hence all higher Tor groups vanish.

It now suffices to show that the last condition implies that M is flat. Let $I \subset R$ be an ideal. Consider the short exact sequence $0 \to I \to R \to R/I \to 0$. Apply Lemma 7.69.2. We get an exact sequence

$$\text{Tor}_1^R(M, R/I) \to M \otimes_R I \to M \otimes_R R \to M \otimes_R R/I \to 0$$

Since obviously $M \otimes_R R = M$ we conclude that the last hypothesis implies that $M \otimes_R I \to M$ is injective for every finitely generated ideal I. Thus M is flat by Lemma 7.35.4. □

Remark 7.69.8. The proof of Lemma 7.69.7 actually shows that

$$\text{Tor}_1^R(M, R/I) = \text{Ker}(I \otimes_R M \to M).$$

7.70. Functorialities for Tor

In this section we briefly discuss the functoriality of Tor with respect to change of ring, etc. Here is a list of items to work out.

(1) Given a ring map $R \to R'$, an R-module M and an R'-module N' the R-modules $\text{Tor}_i^R(M, N')$ have a natural R'-module structure.
(2) Given a ring map $R \to R'$ and R-modules M, N there is a natural R-module map $\text{Tor}_i^R(M, N) \to \text{Tor}_i^{R'}(M \otimes_R R', N \otimes_R R')$.

(3) Given a ring map $R \to R'$ an R-module M and an R'-module N' there exists a natural R'-module map $\mathrm{Tor}_i^R(M, N') \to \mathrm{Tor}_i^{R'}(M \otimes_R R', N')$.

Lemma 7.70.1. *Given a flat ring map $R \to R'$ and R-modules M, N the natural R-module map $Tor_i^R(M, N) \otimes_R R' \to Tor_i^{R'}(M \otimes_R R', N \otimes_R R')$ is an isomorphism for all i.*

Proof. Omitted. This is true because a free resolution $F_\bullet$ of M over R stays exact when tensoring with R' over R and hence $(F_\bullet \otimes_R N) \otimes_R R'$ computes the Tor groups over R'. □

7.71. Projective modules

Some lemmas on projective modules.

Definition 7.71.1. Let R be a ring. An R-module P is *projective* if and only if the functor $Hom_R(P, -) : \mathrm{Mod}_R \to \mathrm{Mod}_R$ is an exact functor.

The functor $Hom_R(M, -)$ is left exact for any R-module M, see Lemma 7.10.1. Hence the condition for P to be projective really signifies that given a surjection of R-modules $N \to N'$ the map $Hom_R(P, N) \to Hom_R(P, N')$ is surjective.

Lemma 7.71.2. *Let R be a ring. Let P be an R-module. The following are equivalent*

(1) *P is projective,*
(2) *P is a direct summand of a free R-module, and*
(3) *$Ext^1_R(P, M) = 0$ for every R-module M.*

Proof. Assume P is projective. Choose a surjection $\pi : F \to P$ where F is a free R-module. As P is projective there exists a $i \in Hom_R(P, F)$ such that $i \circ \pi = \mathrm{id}_P$. In other words $F \cong \mathrm{Ker}(\pi) \oplus i(P)$ and we see that P is a direct summand of F.

Conversely, assume that $P \oplus Q = F$ is a free R-module. Note that the free module $F = \bigoplus_{i \in I} R$ is projective as $Hom_R(F, M) = \prod_{i \in I} M$ and the functor $M \mapsto \prod_{i \in I} M$ is exact. Then $Hom_R(F, -) = Hom_R(P, -) \times Hom_R(Q, -)$ as functors, hence both P and Q are projective.

Assume $P \oplus Q = F$ is a free R-module. Then we have a free resolution $F_\bullet$ of the form

$$\ldots F \xrightarrow{a} F \xrightarrow{b} F \to P \to 0$$

where the maps a, b alternate and are equal to the projector onto P and Q. Hence the complex $Hom_R(F_\bullet, M)$ is split exact in degrees ≥ 1, whence we see the vanishing in (3).

Assume $\mathrm{Ext}^1_R(P, M) = 0$ for every R-module M. Pick a free resolution $F_\bullet \to P$. Set $M = \mathrm{Im}(F_1 \to F_0) = \mathrm{Ker}(F_0 \to M)$. Consider the element $\xi \in \mathrm{Ext}^1_R(P, M)$ given by the class of the quotient map $\pi : F_1 \to M$. Since ξ is zero there exists a map $s : F_0 \to M$ such that $\pi = s \circ (F_1 \to F_0)$. Clearly, this means that

$$F_0 = \mathrm{Ker}(s) \oplus \mathrm{Ker}(F_0 \to P) = P \oplus \ker(F_0 \to P)$$

and we win. □

Lemma 7.71.3. *A direct sum of projective modules is projective.*

Proof. This is true by the characterization of projectives as direct summands of free modules in Lemma 7.71.2. □

Lemma 7.71.4. *Let R be a ring. Let $I \subset R$ be a nilpotent ideal. Let $\overline{P}$ be a projective R-module. Then there exists a projective R-module P such that $P/IP \cong \overline{P}$.*

Proof. We can choose a set A and a direct sum decomposition $\bigoplus_{\alpha \in A} R/I = \overline{P} \oplus \overline{K}$ for some R/I-module $\overline{K}$. Write $F = \bigoplus_{\alpha \in A} R$ for the free R-module on A. Choose a lift $p : F \to F$ of the projector $\overline{p}$ associated to the direct summand $\overline{P}$ of $\bigoplus_{\alpha \in A} R/I$. Note that $p^2 - p \in \text{End}_R(F)$ is a nilpotent endomorphism of F (as I is nilpotent and the matrix entries of $p^2 - p$ are in I; more precisely, if $I^n = 0$, then $(p^2 - p)^n = 0$). Hence by Lemma 7.49.6 we can modify our choice of p and assume that p is a projector. Set $P = \text{Im}(p)$. □

Lemma 7.71.5. *Let R be a ring. Let $I \subset R$ be an ideal. Let M be an R-module. Assume*

(1) *I is nilpotent,*
(2) *M/IM is a projective R/I-module,*
(3) *M is a flat R-module.*

Then M is a projective R-module.

Proof. By Lemma 7.71.4 we can find a projective R-module P and an isomorphism $P/IP \to M/IM$. We are going to show that M is isomorphic to P which will finish the proof. Because P is projective we can lift the map $P \to P/IP \to M/IM$ to an R-module map $P \to M$ which is an isomorphism modulo I. By Nakayama's Lemma 7.14.5 the map $P \to M$ is surjective. It remains to show that $P \to M$ is injective. Since $I^n = 0$ for some n, we can use the filtrations

$$0 = I^n M \subset I^{n-1} M \subset \ldots \subset IM \subset M$$

$$0 = I^n P \subset I^{n-1} P \subset \ldots \subset IP \subset P$$

to see that it suffices to show that the induced maps $I^a P/I^{a+1} P \to I^a M/I^{a+1} M$ are injective. Since both P and M are flat R-modules we can identify this with the map

$$I^a/I^{a+1} \otimes_{R/I} P/IP \longrightarrow I^a/I^{a+1} \otimes_{R/I} M/IM$$

induced by $P \to M$. Since we chose $P \to M$ such that the induced map $P/IP \to M/IM$ is an isomorphism, we win. □

7.72. Finite projective modules

Definition 7.72.1. Let R be a ring and M an R-module. We say that M is *locally free* if we can cover $Spec(R)$ by standard opens $D(f_i)$, $i \in I$ such that M_{f_i} is a free R_{f_i}-module for all $i \in I$. We say that M is *finite locally free* if each M_{f_i} is finite free.

Note that a finite locally free R-module is automatically finitely presented by Lemma 7.21.2.

Lemma 7.72.2. *Let R be a ring and let M be an R-module. The following are equivalent*

(1) *M is finitely presented and R-flat,*
(2) *M is finite projective,*
(3) *M is a direct summand of a finite free R-module,*
(4) *M is finitely presented and for all $\mathfrak{p} \in Spec(R)$ the localization $M_{\mathfrak{p}}$ is free,*
(5) *M is finitely presented and for all maximal ideals $\mathfrak{m} \subset R$ the localization $M_{\mathfrak{m}}$ is free,*
(6) *M is finite and locally free,*
(7) *M is finite locally free, and*
(8) *M is finite, for every prime $\mathfrak{p}$ the module $M_{\mathfrak{p}}$ is free, and the function*

$$\rho_M : Spec(R) \to \mathbf{Z}, \quad \mathfrak{p} \longmapsto \dim_{\kappa(\mathfrak{p})} M \otimes_R \kappa(\mathfrak{p})$$

is locally constant in the Zariski topology.

Proof. First suppose M is finite projective, i.e., (2) holds. Take a surjection $R^n \to M$ and let K be the kernel. Since M is projective, $0 \to K \to R^n \to M \to 0$ splits. Hence (2) $\Rightarrow$ (3). The implication (3) $\Rightarrow$ (2) follows from the fact that a direct summand of a projective is projective, see Lemma 7.71.2.

Assume (3), so we can write $K \oplus M \cong R^{\oplus n}$. So K is a direct summand of R^n and thus finitely generated. This shows $M = R^{\oplus n}/K$ is finitely presented. In other words, (3) $\Rightarrow$ (1).

Assume M is finitely presented and flat, i.e., (1) holds. We will prove that (7) holds. Pick any prime $\mathfrak p$ and $x_1, \ldots, x_r \in M$ which map to a basis of $M \otimes_R \kappa(\mathfrak p)$. By Nakayama's Lemma 7.14.5 these elements generate M_g for some $g \in R$, $g \not\in \mathfrak p$. The corresponding surjection $\varphi : R_g^{\oplus r} \to M_g^{\oplus r}$ has the following two properties: (a) $\text{Ker}(\varphi)$ is a finite R_g-module (see Lemma 7.5.3) and (b) $\text{Ker}(\varphi) \otimes \kappa(\mathfrak p) = 0$ by flatness of M_g over R_g (see Lemma 7.35.11). Hence by Nakayama's lemma again there exists a $g' \in R_g$ such that $\text{Ker}(\varphi)_{g'} = 0$. In other words, $M_{gg'}$ is free.

A finite locally free module is a finite module, see Lemma 7.21.2, hence (7) $\Rightarrow$ (6). It is clear that (6) $\Rightarrow$ (7) and that (7) $\Rightarrow$ (8).

A finite locally free module is a finitely presented module, see Lemma 7.21.2, hence (7) $\Rightarrow$ (4). Of course (4) implies (5). Since we may check flatness locally (see Lemma 7.35.19) we conclude that (5) implies (1). At this point we have

$$\begin{tikzcd}
(2) \arrow[r, Leftrightarrow] & (3) \arrow[r, Rightarrow] & (1) \arrow[r, Rightarrow] & (7) \arrow[r, Leftrightarrow] \arrow[d, Rightarrow] \arrow[dr, Rightarrow] & (6) \\
 & & (5) \arrow[u, Rightarrow] & (4) \arrow[l, Rightarrow] & (8)
\end{tikzcd}$$

Suppose that M satisfies (1), (4), (5), (6), and (7). We will prove that (3) holds. It suffices to show that M is projective. We have to show that $Hom_R(M, -)$ is exact. Let $0 \to N'' \to N \to N' \to 0$ be a short exact sequence of R-module. We have to show that $0 \to Hom_R(M, N'') \to Hom_R(M, N) \to Hom_R(M, N') \to 0$ is exact. As M is finite locally free there exist a covering $Spec(R) = \bigcup D(f_i)$ such that M_{f_i} is finite free. By Lemma 7.10.2 we see that

$$0 \to Hom_R(M, N'')_{f_i} \to Hom_R(M, N)_{f_i} \to Hom_R(M, N')_{f_i} \to 0$$

is equal to $0 \to Hom_{R_{f_i}}(M_{f_i}, N''_{f_i}) \to Hom_{R_{f_i}}(M_{f_i}, N_{f_i}) \to Hom_{R_{f_i}}(M_{f_i}, N'_{f_i}) \to 0$ which is exact as M_{f_i} is free and as the localization $0 \to N''_{f_i} \to N_{f_i} \to N'_{f_i} \to 0$ is exact (as localization is exact). Whence we see that $0 \to Hom_R(M, N'') \to Hom_R(M, N) \to Hom_R(M, N') \to 0$ is exact by Lemma 7.21.2.

Finally, assume that (8) holds. Pick a maximal ideal $\mathfrak m \subset R$. Pick $x_1, \ldots, x_r \in M$ which map to a $\kappa(\mathfrak m)$-basis of $M \otimes_R \kappa(\mathfrak m) = M/\mathfrak m M$. In particular $\rho_M(\mathfrak m) = r$. By Nakayama's Lemma 7.14.5 there exists an $f \in R$, $f \not\in \mathfrak m$ such that $x_1, \ldots, x_r$ generate M_f over R_f. By the assumption that ρ_M is locally constant there exists a $g \in R$, $g \not\in \mathfrak m$ such that ρ_M is constant equal to r on $D(g)$. We claim that

$$\Psi : R_{fg}^{\oplus r} \longrightarrow M_{fg}, \quad (a_1, \ldots, a_r) \longmapsto \sum a_i x_i$$

is an isomorphism. This claim will show that M is finite locally free, i.e., that (7) holds. To see the claim it suffices to show that the induced map on localizations $\Psi_{\mathfrak p} : R_{\mathfrak p}^{\oplus r} \to M_{\mathfrak p}$ is an isomorphism for all $\mathfrak p \in D(fg)$, see Lemma 7.21.1. By our choice of f the map

$\Psi_{\mathfrak p}$ is surjective. By assumption (8) we have $M_{\mathfrak p} \cong R_{\mathfrak p}^{\oplus \rho_M(\mathfrak p)}$ and by our choice of g we have $\rho_M(\mathfrak p) = r$. Hence $\Psi_{\mathfrak p}$ determines a surjection $R_{\mathfrak p}^{\oplus r} \to M_{\mathfrak p} \cong R_{\mathfrak p}^{\oplus r}$ whence is an isomorphism by Lemma 7.15.4. (Of course this last fact follows from a simple matrix argument also.) □

Remark 7.72.3. It is not true that a finite R-module which is R-flat is automatically projective. A counter example is where $R = \mathcal{C}^\infty(\mathbf{R})$ is the ring of infinitely differentiable functions on $\mathbf{R}$, and $M = R_{\mathfrak m} = R/I$ where $\mathfrak m = \{f \in R \mid f(0) = 0\}$ and $I = \{f \in R \mid \exists \epsilon, \epsilon > 0 : f(x) = 0\ \forall x, |x| < \epsilon\}$.

Lemma 7.72.4. *(Warning: see Remark 7.72.3 above.) Suppose R is a local ring, and M is a finite flat R-module. Then M is finite free.*

Proof. Follows from the equational criterion of flatness, see Lemma 7.35.10. Namely, suppose that $x_1, \ldots, x_r \in M$ map to a basis of $M/\mathfrak m M$. By Nakayama's Lemma 7.14.5 these elements generate M. We want to show there is no relation among the x_i. Instead, we will show by induction on n that if $x_1, \ldots, x_n \in M$ are linearly independent in the vector space $M/\mathfrak m M$ then they are independent over R.

The base case of the induction is where we have $x \in M$, $x \not\in \mathfrak m M$ and a relation $fx = 0$. By the equational criterion there exist $y_j \in M$ and $a_j \in R$ such that $x = \sum a_j y_j$ and $fa_j = 0$ for all j. Since $x \not\in \mathfrak m M$ we see that at least one a_j is a unit and hence $f = 0$.

Suppose that $\sum f_i x_i$ is a relation among $x_1, \ldots, x_n$. By our choice of x_i we have $f_i \in \mathfrak m$. According to the equational criterion of flatness there exist $a_{ij} \in R$ and $y_j \in M$ such that $x_i = \sum a_{ij} y_j$ and $\sum f_i a_{ij} = 0$. Since $x_n \not\in \mathfrak m M$ we see that $a_{nj} \not\in \mathfrak m$ for at least one j. Since $\sum f_i a_{ij} = 0$ we get $f_n = \sum_{i=1}^{n-1} (-a_{ij}/a_{nj}) f_i$. The relation $\sum f_i x_i = 0$ now can be rewritten as $\sum_{i=1}^{n-1} f_i (x_i + (-a_{ij}/a_{nj}) x_n) = 0$. Note that the elements $x_i + (-a_{ij}/a_{nj}) x_n$ map to $n-1$ linearly independent elements of $M/\mathfrak m M$. By induction assumption we get that all the f_i, $i \leq n-1$ have to be zero, and also $f_n = \sum_{i=1}^{n-1} (-a_{ij}/a_{nj}) f_i$. This proves the induction step. □

Lemma 7.72.5. *Let $R \to S$ be a flat local homomorphism of local rings. Let M be a finite R-module. Then M is finite projective over R if and only if $M \otimes_R S$ is finite projective over S.*

Proof. Suppose that $M \otimes_R S$ is finite projective over S. By Lemma 7.72.2 it is finite free. Pick $x_1, \ldots, x_r \in M$ whose residue classes generate $M/\mathfrak m_R M$. Clearly we see that $x_1 \otimes 1, \ldots, x_r \otimes 1$ are a basis for $M \otimes_R S$. This implies that the map $R^{\oplus r} \to M, (a_i) \mapsto \sum a_i x_i$ becomes an isomorphism after tensoring with S. By faithful flatness of $R \to S$, see Lemma 7.35.16 we see that it is an isomorphism. □

Lemma 7.72.6. *Let R be a semi-local ring. Let M be a finite locally free module. If M has constant rank, then M is free. In particular, if R has connected spectrum, then M is free.*

Proof. Omitted. Hints: First show that $M/\mathfrak m_i M$ has the same dimension d for all maximal ideal $\mathfrak m_1, \ldots, \mathfrak m_n$ of R using the the spectrum is connected. Next, show that there exist elements $x_1, \ldots, x_d \in M$ which form a basis for each $M/\mathfrak m_i M$ by the Chinese remainder theorem. Finally show that $x_1, \ldots, x_d$ is a basis for M. □

Here is a technical lemma that is used in the chapter on groupoids.

Lemma 7.72.7. *Let R be a local ring with maximal ideal $\mathfrak m$ and infinite residue field. Let $R \to S$ be a ring map. Let M be an S-module and let $N \subset M$ be an R-submodule. Assume*

(1) *S is semi-local and $\mathfrak{m}S$ is contained in the radical of S,*
(2) *M is a finite free S-module, and*
(3) *N generates M as an S-module.*

Then N contains an S-basis of M.

Proof. Assume M is free of rank n. Let $I = \mathrm{rad}(S)$. By Nakayama's Lemma 7.14.5 a sequence of elements $m_1, \ldots, m_n$ is a basis for M if and only if $\overline{m}_i \in M/IM$ generate M/IM. Hence we may replace M by M/IM, N by $N/(N \cap IM)$, R by $R/\mathfrak{m}$, and S by S/IS. In this case we see that S is a finite product of fields $S = k_1 \times \ldots \times k_r$ and $M = k_1^{\oplus n} \times \ldots \times k_r^{\oplus n}$. The fact that $N \subset M$ generates M as an S-module means that there exist $x_j \in N$ such that a linear combination $\sum a_j x_j$ with $a_j \in S$ has a nonzero component in each factor $k_i^{\oplus n}$. Because $R = k$ is an infinite field, this means that also some linear combination $y = \sum c_j x_j$ with $c_j \in k$ has a nonzero component in each factor. Hence $y \in N$ generates a free direct summand $Sy \subset M$. By induction on n the result holds for M/Sy and the submodule $\overline{N} = N/(N \cap Sy)$. In other words there exist $\overline{y}_2, \ldots, \overline{y}_n$ in $\overline{N}$ which (freely) generate M/Sy. Then $y, y_2, \ldots, y_n$ (freely) generate M and we win. □

7.73. Open loci defined by module maps

The set of primes where a given module map is surjective, or an isomorphism is sometimes open. In the case of finite projective modules we can look at the rank of the map.

Lemma 7.73.1. *Let R be a ring. Let $\varphi : M \to N$ be a map of R-modules with N a finite R-module. Then we have the equality*

$$\begin{aligned} U &= \{\mathfrak{p} \subset R \mid \varphi_{\mathfrak{p}} : M_{\mathfrak{p}} \to N_{\mathfrak{p}} \text{ is surjective}\} \\ &= \{\mathfrak{p} \subset R \mid \varphi \otimes \kappa(\mathfrak{p}) : M \otimes \kappa(\mathfrak{p}) \to N \otimes \kappa(\mathfrak{p}) \text{ is surjective}\} \end{aligned}$$

and U is an open subset of $Spec(R)$.

Proof. This is a reformulation of Nakayama's lemma, see Lemma 7.14.5. Details omitted. □

Lemma 7.73.2. *Let R be a ring. Let $\varphi : M \to N$ be a map of finitely presented R-modules. Then*

$$U = \{\mathfrak{p} \subset R \mid \varphi_{\mathfrak{p}} : M_{\mathfrak{p}} \to N_{\mathfrak{p}} \text{ is an isomorphism}\}$$

is an open subset of $Spec(R)$.

Proof. Let $\mathfrak{p} \in U$. Pick a presentation $N = R^{\oplus n} / \sum_{j=1,\ldots,m} Rk_j$. Denote e_i the image in N of the ith basis vector of $R^{\oplus n}$. For each $i \in \{1, \ldots, n\}$ choose an element $m_i \in M_{\mathfrak{p}}$ such that $\varphi(m_i) = f_i e_i$ for some $f_i \in R$, $f_i \notin \mathfrak{p}$. This is possible as $\varphi_{\mathfrak{p}}$ is an isomorphism. Set $f = f_1 \ldots f_n$ and let $\psi : R_f^{\oplus n} \to M$ be the map which maps the ith basis vector to m_i/f_i. Note that $\varphi_f \circ \psi$ is the localization at f of the given map $R^{\oplus n} \to N$. As $\varphi_{\mathfrak{p}}$ is an isomorphism we see that $\psi(k_j)$ is an element of M which maps to zero in $M_{\mathfrak{p}}$. Hence we see that there exist $g_j \in R$, $g_j \notin \mathfrak{p}$ such that $g_j \psi(k_j) = 0$. Setting $g = g_1 \ldots g_m$, we see that ψ_g factors through N_{fg} to give a map $N_{fg} \to M_{fg}$. By construction this map is inverse to φ_{fg}. Hence φ_{fg} is an isomorphism, which implies that $D(fg) \subset U$ as desired. □

Lemma 7.73.3. *Let R be a ring. Let $\varphi : P_1 \to P_2$ be a map of finite projective modules. Then*

(1) *The set U of primes $\mathfrak{p} \in Spec(R)$ such that $\varphi \otimes \kappa(\mathfrak{p})$ is injective is open.*

(2) *For any* $f \in R$ *such that* $D(f) \subset U$ *the module* $Coker(\varphi)_f$ *is finite projective over* R_f.
(3) *The set* V *of primes* $\mathfrak{p} \in Spec(R)$ *such that* $\varphi \otimes \kappa(\mathfrak{p})$ *is an isomorphism is open.*
(4) *For any* $f \in R$ *such that* $D(f) \subset V$ *the map* $\varphi : P_{1,f} \to P_{2,f}$ *is an isomorphism of modules over* R_f.

Proof. To prove the sets U and V are open we may work locally on $Spec(R)$. Thus we may replace R by a suitable localization and assume that $P_1 = R^{n_1}$ and $P_2 = R^{n_2}$, see Lemma 7.72.2. In this case injectivity of $\varphi \otimes \kappa(\mathfrak{p})$ is equivalent to some $n_1 \times n_1$ minor f of the matrix of φ being invertible in $\kappa(\mathfrak{p})$. Thus $D(f) \subset U$. Similarly for V, but in that case with the added assumption that $m = n$ (and hence f is just the determinant of the map).

Now suppose $D(f) \subset U$. By Lemma 7.72.2 it suffices to prove that $\text{Coker}(\varphi)$ is finite projective locally on $D(f)$. Thus, as we saw above, we may assume that $P_1 = R^{n_1}$ and $P_2 = R^{n_2}$ and that some minor of the matrix of φ is invertible in R. If the minor in question corresponds to the first n_1 basis vectors of R^{n_2}, then using the last $n_2 - n_1$ basis vectors we get a map $R^{n_2 - n_1} \to R^{n_2} \to \text{Coker}(\varphi)$ which is easily seen to be an isomorphism. If $D(f) \subset V$ the argument is even easier. □

7.74. Faithfully flat descent for projectivity of modules

In the next few sections we prove, following Raynaud and Gruson [**GR71**], that the projectivity of modules descends along faithfully flat ring maps. The idea of the proof is to use dévissage à la Kaplansky [**Kap58**] to reduce to the case of countably generated modules. Given a well-behaved filtration of a module M, dévissage allows us to express M as a direct sum of successive quotients of the filtering submodules (see Section 7.78). Using this technique, we prove that a projective module is a direct sum of countably generated modules (Theorem 7.78.5). To prove descent of projectivity for countably generated modules, we introduce a ``Mittag-Leffler'' condition on modules, prove that a countably generated module is projective if and only if it is flat and Mittag-Leffler (Theorem 7.87.3), and then show that the property of being a flat Mittag-Leffler module descends (Lemma 7.89.1). Finally, given an arbitrary module M whose base change by a faithfully flat ring map is projective, we filter M by submodules whose successive quotients are countably generated projective modules, and then by dévissage conclude M is a direct sum of projectives, hence projective itself (Theorem 7.89.5).

We note that there is an error in the proof of faithfully flat descent of projectivity in [**GR71**]. There, descent of projectivity along faithfully flat ring maps is deduced from descent of projectivity along a more general type of ring map ([**GR71**, Example 3.1.4(1) of Part II]). However, the proof of descent along this more general type of map is incorrect, as explained in [**Gru73**]. Patching this hole in the proof of faithfully flat descent of projectivity comes down to proving that the property of being a flat Mittag-Leffler module descends along faithfully flat ring maps. We do this in Lemma 7.89.1.

7.75. Characterizing flatness

In this section we discuss criteria for flatness. The main result in this section is Lazard's theorem (Theorem 7.75.4 below), which says that a flat module is the colimit of a directed system of free finite modules. We remind the reader of the ``equational criterion for flatness'', see Lemma 7.35.10. It turns out that this can be massaged into a seemingly much stronger property.

Lemma 7.75.1. *Let M be an R-module. The following are equivalent:*

(1) *M is flat.*
(2) *If $f : R^n \to M$ is a module map and $x \in \ker(f)$, then there are module maps $h : R^n \to R^m$ and $g : R^m \to M$ such that $f = g \circ h$ and $x \in \ker(h)$.*
(3) *Suppose $f : R^n \to M$ is a module map, $N \subset \ker(f)$ any submodule, and $h : R^n \to R^m$ a map such that $N \subset \ker(h)$ and f factors through h. Then given any $x \in \ker(f)$ we can find a map $h' : R^n \to R^{m'}$ such that $N + Rx \subset \ker(h')$ and f factors through h'.*
(4) *If $f : R^n \to M$ is a module map and $N \subset \ker(f)$ is a finitely generated submodule, then there are module maps $h : R^n \to R^m$ and $g : R^m \to M$ such that $f = g \circ h$ and $N \subset \ker(h)$.*

Proof. That (1) is equivalent to (2) is just a reformulation of the equational criterion for flatness. To show (2) implies (3), let $g : R^m \to M$ be the map such that f factors as $f = g \circ h$. By (2) find $h'' : R^m \to R^{m'}$ such that h'' kills $h(x)$ and $g : R^m \to M$ factors through h''. Then taking $h' = h'' \circ h$ works. (3) implies (4) by induction on the number of generators of $N \subset \ker(f)$ in (4). Clearly (4) implies (2). □

Lemma 7.75.2. *Let M be an R-module. Then M is flat if and only if the following condition holds: if P is a finitely presented R-module and $f : P \to M$ a module map, then there is a free finite R-module F and module maps $h : P \to F$ and $g : F \to M$ such that $f = g \circ h$.*

Proof. This is just a reformulation of condition (4) from Lemma 7.75.1. □

Lemma 7.75.3. *Let M be an R-module. Then M is flat if and only if the following condition holds: for every finitely presented R-module P, if $N \to M$ is a surjective R-module map, then the induced map $Hom_R(P, N) \to Hom_R(P, M)$ is surjective.*

Proof. First suppose M is flat. We must show that if P is finitely presented, then given a map $f : P \to M$, it factors through the map $N \to M$. By Lemma 7.75.2 the map f factors through a map $F \to M$ where F is free and finite. Since F is free, this map factors through $N \to M$. Thus f factors through $N \to M$.

Conversely, suppose the condition of the lemma holds. Let $f : P \to M$ be a map from a finitely presented module P. Choose a free module N with a surjection $N \to M$ onto M. Then f factors through $N \to M$, and since P is finitely generated, f factors through a free finite submodule of N. Thus M satisfies the condition of Lemma 7.75.2, hence is flat. □

Theorem 7.75.4 (Lazard's theorem)**.** *Let M be an R-module. Then M is flat if and only if it is the colimit of a directed system of free finite R-modules.*

Proof. A colimit of a directed system of flat modules is flat, as taking directed colimits is exact and commutes with tensor product. Hence if M is the colimit of a directed system of free finite modules then M is flat.

For the converse, first recall that any module M can be written as the colimit of a directed system of finitely presented modules, in the following way. Choose a surjection $f : R^I \to M$ for some set I, and let K be the kernel. Let E be the set of ordered pairs (J, N) where J is a finite subset of I and N is a finitely generated submodule of $R^J \cap K$. Then E is made into a directed partially ordered set by defining $(J, N) \leq (J', N')$ if and only if $J \subset J'$ and $N \subset N'$. Define $M_e = R^J/N$ for $e = (J, N)$, and define $f_{ee'} : M_e \to M_{e'}$ to be the natural map for $e \leq e'$. Then $(M_e, f_{ee'})$ is a directed system and the natural maps $f_e : M_e \to M$ induce an isomorphism $colim_{e \in E} M_e \xrightarrow{\cong} M$.

Now suppose M is flat. Let $I = M \times \mathbf{Z}$, write (x_i) for the canonical basis of R^I, and take in the above discussion $f : R^I \to M$ to be the map sending x_i to the projection of i onto M. To prove the theorem it suffices to show that the $e \in E$ such that M_e is free form a cofinal subset of E. So let $e = (J, N) \in E$ be arbitrary. By Lemma 7.75.2 there is a free finite module F and maps $h : R^J/N \to F$ and $g : F \to M$ such that the natural map $f_e : R^J/N \to M$ factors as $R^J/N \xrightarrow{h} F \xrightarrow{g} M$. We are going to realize F as $M_{e'}$ for some $e' \geq e$.

Let $\{b_1, \ldots, b_n\}$ be a finite basis of F. Choose n distinct elements $i_1, \ldots, i_n \in I$ such that $i_\ell \notin J$ for all ℓ, and such that the image of x_{i_ℓ} under $f : R^I \to M$ equals the image of b_ℓ under $g : F \to M$. This is possible by our choice of I. Now let $J' = J \cup \{i_1, \ldots, i_n\}$, and define $R^{J'} \to F$ by $x_i \mapsto h(x_i)$ for $i \in J$ and $x_{i_\ell} \mapsto b_\ell$ for $\ell = 1, \ldots, n$. Let $N' = \ker(R^{J'} \to F)$. Observe:

(1) $R^{J'} \to F$ factors $f : R^I \to M$, hence $N' \subset K = \ker(f)$;
(2) $R^{J'} \to F$ is a surjection onto a free finite module, hence it splits and so N' is finitely generated;
(3) $J \subset J'$ and $N \subset N'$.

By (1) and (2) $e' = (J', N')$ is in E, by (3) $e' \geq e$, and by construction $M_{e'} = R^{J'}/N' \cong F$ is free. □

7.76. Universally injective module maps

Next we discuss universally injective module maps, which are in a sense complementary to flat modules (see Lemma 7.76.5). We follow Lazard's thesis [**Laz67**]; also see [**Lam99**].

Definition 7.76.1. Let $f : M \to N$ be a map of R-modules. Then f is called *universally injective* if for every R-module Q, the map $f \otimes_R \mathrm{id}_Q : M \otimes_R Q \to N \otimes_R Q$ is injective. A sequence $0 \to M_1 \to M_2 \to M_3 \to 0$ of R-modules is called *universally exact* if it is exact and $M_1 \to M_2$ is universally injective.

Example 7.76.2. Examples of universally exact maps.

(1) A split short exact sequence is universally exact since tensoring commutes with taking direct sums.
(2) The colimit of a directed system of universally exact sequences is universally exact. This follows from the fact that taking directed colimits is exact and that tensoring commutes with taking colimits. In particular the colimit of a directed system of split exact sequences is universally exact. We will see below that, conversely, any universally exact sequence arises in this way.

Next we give a list of criteria for a short exact sequence to be universally exact. They are analogues of criteria for flatness given above. Parts (3)-(6) below correspond, respectively, to the criteria for flatness given in Lemmas 7.35.10, 7.75.1, 7.75.3, and Theorem 7.75.4.

Theorem 7.76.3. *Let*

$$0 \to M_1 \xrightarrow{f_1} M_2 \xrightarrow{f_2} M_3 \to 0$$

be an exact sequence of R-modules. The following are equivalent:

(1) *The sequence* $0 \to M_1 \to M_2 \to M_3 \to 0$ *is universally exact.*
(2) *For every finitely presented R-module Q, the sequence*

$$0 \to M_1 \otimes_R Q \to M_2 \otimes_R Q \to M_3 \otimes_R Q \to 0$$

is exact.

(3) *Given elements* $x_i \in M_1$ $(i = 1, \ldots, n)$, $y_j \in M_2$ $(j = 1, \ldots, m)$, *and* $a_{ij} \in R$ $(i = 1, \ldots, n, j = 1, \ldots, m)$ *such that for all i*
$$f_1(x_i) = \sum\nolimits_j a_{ij} y_j,$$
there exists $z_j \in M_1$ $(j = 1, \ldots, m)$ *such that for all i,*
$$x_i = \sum\nolimits_j a_{ij} z_j.$$

(4) *Given a commutative diagram of R-module maps*
$$\begin{tikzcd} R^n \arrow[r] \arrow[d] & R^m \arrow[d] \\ M_1 \arrow[r, "f_1"] & M_2 \end{tikzcd}$$
where m and n are integers, there exists a map $R^m \to M_1$ *making the top triangle commute.*

(5) *For every finitely presented R-module P, the R-module map* $Hom_R(P, M_2) \to Hom_R(P, M_3)$ *is surjective.*

(6) *The sequence* $0 \to M_1 \to M_2 \to M_3 \to 0$ *is the colimit of a directed system of split exact sequences of the form*
$$0 \to M_1 \to M_{2,i} \to M_{3,i} \to 0$$
where the $M_{3,i}$ *are finitely presented.*

Proof. Obviously (1) implies (2).

Next we show (2) implies (3). Let $f_1(x_i) = \sum_j a_{ij} y_j$ be relations as in (3). Let (f_j) be a basis for R^m, (e_i) a basis for R^n, and $R^m \to R^n$ the map given by $f_j \mapsto \sum_i a_{ij} e_i$. Let Q be the cokernel of $R^m \to R^n$. Then tensoring $R^m \to R^n \to Q \to 0$ by the map $f_1 : M_1 \to M_2$, we get a commutative diagram
$$\begin{tikzcd} M_1^{\oplus m} \arrow[r] \arrow[d] & M_1^{\oplus n} \arrow[r] \arrow[d] & M_1 \otimes_R Q \arrow[r] \arrow[d] & 0 \\ M_2^{\oplus m} \arrow[r] & M_2^{\oplus n} \arrow[r] & M_2 \otimes_R Q \arrow[r] & 0 \end{tikzcd}$$
where $M_1^{\oplus m} \to M_1^{\oplus n}$ is given by
$$(z_1, \ldots, z_m) \mapsto (\sum\nolimits_j a_{1j} z_j, \ldots, \sum\nolimits_j a_{nj} z_j),$$
and $M_2^{\oplus m} \to M_2^{\oplus n}$ is given similarly. We want to show $x = (x_1, \ldots, x_n) \in M_1^{\oplus n}$ is in the image of $M_1^{\oplus m} \to M_1^{\oplus n}$. By (2) the map $M_1 \otimes Q \to M_2 \otimes Q$ is injective, hence by exactness of the top row it is enough to show x maps to 0 in $M_2 \otimes Q$, and so by exactness of the bottom row it is enough to show the image of x in $M_2^{\oplus n}$ is in the image of $M_2^{\oplus m} \to M_2^{\oplus n}$. This is true by assumption.

Condition (4) is just a translation of (3) into diagram form.

Next we show (4) implies (5). Let $\varphi : P \to M_3$ be a map from a finitely presented R-module P. We must show that φ lifts to a map $P \to M_2$. Choose a presentation of P,
$$R^n \xrightarrow{g_1} R^m \xrightarrow{g_2} P \to 0.$$

Using freeness of R^n and R^m, we can construct $h_2 : R^m \to M_2$ and then $h_1 : R^n \to M_1$ such that the following diagram commutes

$$\begin{tikzcd}
& R^n \arrow[r, "g_1"] \arrow[d, "h_1"] & R^m \arrow[r, "g_2"] \arrow[d, "h_2"] & P \arrow[r] \arrow[d, "\varphi"] & 0 \\
0 \arrow[r] & M_1 \arrow[r, "f_1"] & M_2 \arrow[r, "f_2"] & M_3 \arrow[r] & 0.
\end{tikzcd}$$

By (4) there is a map $k_1 : R^m \to M_1$ such that $k_1 \circ g_1 = h_1$. Now define $h_2' : R^m \to M_2$ by $h_2' = h_2 - f_1 \circ k_1$. Then

$$h_2' \circ g_1 = h_2 \circ g_1 - f_1 \circ k_1 \circ g_1 = h_2 \circ g_1 - f_1 \circ h_1 = 0.$$

Hence by passing to the quotient h_2' defines a map $\varphi' : P \to M_2$ such that $\varphi' \circ g_2 = h_2'$. In a diagram, we have

$$\begin{tikzcd}
R^m \arrow[r, "g_2"] \arrow[d, "h_2'"'] & P \arrow[d, "\varphi"] \arrow[dl, "\varphi'"'] \\
M_2 \arrow[r, "f_2"] & M_3.
\end{tikzcd}$$

where the top triangle commutes. We claim that φ' is the desired lift, i.e. that $f_2 \circ \varphi' = \varphi$. From the definitions we have

$$f_2 \circ \varphi' \circ g_2 = f_2 \circ h_2' = f_2 \circ h_2 - f_2 \circ f_1 \circ k_1 = f_2 \circ h_2 = \varphi \circ g_2.$$

Since g_2 is surjective, this finishes the proof.

Now we show (5) implies (6). Write M_3 as the colimit of a directed system of finitely presented modules $M_{3,i}$. Let $M_{2,i}$ be the fiber product of $M_{3,i}$ and M_2 over M_3---by definition this is the submodule of $M_2 \times M_{3,i}$ consisting of elements whose two projections onto M_3 are equal. Let $M_{1,i}$ be the kernel of the projection $M_{2,i} \to M_{3,i}$. Then we have a directed system of exact sequences

$$0 \to M_{1,i} \to M_{2,i} \to M_{3,i} \to 0,$$

and for each i a map of exact sequences

$$\begin{tikzcd}
0 \arrow[r] & M_{1,i} \arrow[r] \arrow[d] & M_{2,i} \arrow[r] \arrow[d] & M_{3,i} \arrow[r] \arrow[d] & 0 \\
0 \arrow[r] & M_1 \arrow[r] & M_2 \arrow[r] & M_3 \arrow[r] & 0
\end{tikzcd}$$

compatible with the directed system. From the definition of the fiber product $M_{2,i}$, it follows that the map $M_{1,i} \to M_1$ is an isomorphism. By (5) there is a map $M_{3,i} \to M_2$ lifting $M_{3,i} \to M_3$, and by the universal property of the fiber product this gives rise to a section of $M_{2,i} \to M_{3,i}$. Hence the sequences

$$0 \to M_{1,i} \to M_{2,i} \to M_{3,i} \to 0$$

split. Passing to the colimit, we have a commutative diagram

$$\begin{tikzcd}
0 \arrow[r] & colim\, M_{1,i} \arrow[r] \arrow[d, "\cong"] & colim\, M_{2,i} \arrow[r] \arrow[d] & colim\, M_{3,i} \arrow[r] \arrow[d, "\cong"] & 0 \\
0 \arrow[r] & M_1 \arrow[r] & M_2 \arrow[r] & M_3 \arrow[r] & 0
\end{tikzcd}$$

with exact rows and outer vertical maps isomorphisms. Hence $colim\, M_{2,i} \to M_2$ is also an isomorphism and (6) holds.

Condition (6) implies (1) by Example 7.76.2 (2). □

The previous theorem shows that a universally exact sequence is always a colimit of split short exact sequences. If the cokernel of a universally injective map is finitely presented, then in fact the map itself splits:

Lemma 7.76.4. *Let*

$$0 \to M_1 \to M_2 \to M_3 \to 0$$

be an exact sequence of R-modules. Suppose M_3 is of finite presentation. Then

$$0 \to M_1 \to M_2 \to M_3 \to 0$$

is universally exact if and only if it is split.

Proof. A split sequence is always universally exact. Conversely, if the sequence is universally exact, then by Theorem 7.76.3 (5) applied to $P = M_3$, the map $M_2 \to M_3$ admits a section. □

The following lemma shows how universally injective maps are complementary to flat modules.

Lemma 7.76.5. *Let M be an R-module. Then M is flat if and only if any exact sequence of R-modules*

$$0 \to M_1 \to M_2 \to M \to 0$$

is universally exact.

Proof. This follows from Lemma 7.75.3 and Theorem 7.76.3 (5). □

Example 7.76.6. Non-split and non-flat universally exact sequences.

(1) In spite of Lemma 7.76.4, it is possible to have a short exact sequence of R-modules

$$0 \to M_1 \to M_2 \to M_3 \to 0$$

that is universally exact but non-split. For instance, take $R = \mathbf{Z}$, let $M_1 = \bigoplus_{n=1}^{\infty} \mathbf{Z}$, let $M_2 = \prod_{n=1}^{\infty} \mathbf{Z}$, and let M_3 be the cokernel of the inclusion $M_1 \to M_2$. Then M_1, M_2, M_3 are all flat since they are torsion-free, so by Lemma 7.76.5,

$$0 \to M_1 \to M_2 \to M_3 \to 0$$

is universally exact. However there can be no section $s : M_3 \to M_2$. In fact, if x is the image of $(2, 2^2, 2^3, \ldots) \in M_2$ in M_3, then any module map $s : M_3 \to M_2$ must kill x. This is because $x \in 2^n M_3$ for any $n \geq 1$, hence $s(x)$ is divisible by 2^n for all $n \geq 1$ and so must be 0.

(2) In spite of Lemma 7.76.5, it is possible to have a short exact sequence of R-modules

$$0 \to M_1 \to M_2 \to M_3 \to 0$$

that is universally exact but with M_1, M_2, M_3 all non-flat. In fact if M is any non-flat module, just take the split exact sequence

$$0 \to M \to M \oplus M \to M \to 0.$$

For instance over $R = \mathbf{Z}$, take M to be any torsion module.

(3) Taking the direct sum of an exact sequence as in (1) with one as in (2), we get a short exact sequence of R-modules
$$0 \to M_1 \to M_2 \to M_3 \to 0$$
that is universally exact, non-split, and such that M_1, M_2, M_3 are all non-flat.

We end this section with a simple observation.

Lemma 7.76.7. *Let $0 \to M_1 \to M_2 \to M_3 \to 0$ be a universally exact sequence of R-modules, and suppose M_2 is flat. Then M_1 and M_3 are flat.*

Proof. Let $0 \to N \to N' \to N'' \to 0$ be a short exact sequence of R-modules. Consider the commutative diagram

$$\begin{tikzcd}
M_1 \otimes_R N \arrow[r] \arrow[d] & M_2 \otimes_R N \arrow[r] \arrow[d] & M_3 \otimes_R N \arrow[d] \\
M_1 \otimes_R N' \arrow[r] \arrow[d] & M_2 \otimes_R N' \arrow[r] \arrow[d] & M_3 \otimes_R N' \arrow[d] \\
M_1 \otimes_R N'' \arrow[r] & M_2 \otimes_R N'' \arrow[r] & M_3 \otimes_R N''
\end{tikzcd}$$

(we have dropped the 0's on the boundary). By assumption the rows give short exact sequences and the arrow $M_2 \otimes N \to M_2 \otimes N'$ is injective. Clearly this implies that $M_1 \otimes N \to M_1 \otimes N'$ is injective and we see that M_1 is flat. In particular the left and middle columns give rise to short exact sequences. It follows from a diagram chase that the arrow $M_3 \otimes N \to M_3 \otimes N'$ is injective. Hence M_3 is flat. □

Lemma 7.76.8. *Let R be a ring. Let $M \to M'$ be a universally injective R-module map. Then for any R-module N the map $M \otimes_R N \to M' \otimes_R N$ is universally injective.*

Proof. Omitted. □

Lemma 7.76.9. *Let R be a ring. A composition of universally injective R-module maps is universally injective.*

Proof. Omitted. □

Lemma 7.76.10. *Let R be a ring. Let $M \to M'$ and $M \to M''$ be R-module maps. If $M \to M''$ is universally injective, then $M \to M'$ is universally injective.*

Proof. Omitted. □

Lemma 7.76.11. *Let $R \to S$ be a faithfully flat ring map. Then $R \to S$ is universally injective as a map of R-modules. In particular $R \cap IS = I$ for any ideal $I \subset R$.*

Proof. Let N be an R-module. We have to show that $N \to N \otimes_R S$ is injective. As S is faithfully flat as an R-module, it suffices to prove this after tensoring with S. Hence it suffices to show that $N \otimes_R S \to N \otimes_R S \otimes_R S$, $n \otimes s \mapsto N \otimes 1 \otimes s$ is injective. This is true because there is a section, namely, $n \otimes s \otimes s' \mapsto n \otimes ss'$. □

Lemma 7.76.12. *Let $R \to S$ be a ring map. Let $M \to M'$ be a map of S-modules. The following are equivalent*

(1) *$M \to M'$ is universally injective as a map of R-modules,*

(2) *for each prime* $\mathfrak{q}$ *of* S *the map* $M_\mathfrak{q} \to M'_\mathfrak{q}$ *is universally injective as a map of* R*-modules,*
(3) *for each maximal ideal* $\mathfrak{m}$ *of* S *the map* $M_\mathfrak{m} \to M'_\mathfrak{m}$ *is universally injective as a map of* R*-modules,*
(4) *for each prime* $\mathfrak{q}$ *of* S *the map* $M_\mathfrak{q} \to M'_\mathfrak{q}$ *is universally injective as a map of* $R_\mathfrak{p}$*-modules, where* $\mathfrak{p}$ *is the inverse image of* $\mathfrak{q}$ *in* R*, and*
(5) *for each maximal ideal* $\mathfrak{m}$ *of* S *the map* $M_\mathfrak{m} \to M'_\mathfrak{m}$ *is universally injective as a map of* $R_\mathfrak{p}$*-modules, where* $\mathfrak{p}$ *is the inverse image of* $\mathfrak{m}$ *in* R*.*

Proof. Let N be an R-module. Let $\mathfrak{q}$ be a prime of S lying over the prime $\mathfrak{p}$ of R. Then we have

$$(M \otimes_R N)_\mathfrak{q} = M_\mathfrak{q} \otimes_R N = M_\mathfrak{q} \otimes_{R_\mathfrak{p}} N_\mathfrak{p}.$$

Moreover, the same thing holds for M' and localization is exact. Also, if N is an $R_\mathfrak{p}$-module, then $N_\mathfrak{p} = N$. Using this the equivalences can be proved in a straightforward manner.

For example, suppose that (5) holds. Let $K = \mathrm{Ker}(M \otimes_R N \to M' \otimes_R N)$. By the remarks above we see that $K_\mathfrak{m} = 0$ for each maximal ideal $\mathfrak{m}$ of S. Hence $K = 0$ by Lemma 7.21.1. Thus (1) holds. Conversely, suppose that (1) holds. Take any $\mathfrak{q} \subset S$ lying over $\mathfrak{p} \subset R$. Take any module N over $R_\mathfrak{p}$. Then by assumption $\mathrm{Ker}(M \otimes_R N \to M' \otimes_R N) = 0$. Hence by the formulae above and the fact that $N = N_\mathfrak{p}$ we see that $\mathrm{Ker}(M_\mathfrak{q} \otimes_{R_\mathfrak{p}} N \to M'_\mathfrak{q} \otimes_{R_\mathfrak{p}} N) = 0$. In other words (4) holds. Of course (4) $\Rightarrow$ (5) is immediate. Hence (1), (4) and (5) are all equivalent. We omit the proof of the other equivalences. $\square$

Lemma 7.76.13. *Let* $\varphi : A \to B$ *be a ring map. Let* $S \subset A$ *and* $S' \subset B$ *be multiplicative subsets such that* $\varphi(S) \subset S'$*. Let* $M \to M'$ *be a map of* B*-modules.*

(1) *If* $M \to M'$ *is universally injective as a map of* A*-modules, then* $(S')^{-1}M \to (S')^{-1}M'$ *is universally injective as a map of* A*-modules and as a map of* $S^{-1}A$*-modules.*
(2) *If* M *and* M' *are* $(S')^{-1}B$*-modules, then* $M \to M'$ *is universally injective as a map of* A*-modules if and only if it is universally injective as a map of* $S^{-1}A$*-modules.*

Proof. You can prove this using Lemma 7.76.12 but you can also prove it directly as follows. Assume $M \to M'$ is A-universally injective. Let Q be an A-module. Then $Q \otimes_A M \to Q \otimes_A M'$ is injective. Since localization is exact we see that $(S')^{-1}(Q \otimes_A M) \to (S')^{-1}(Q \otimes_A M')$ is injective. As $(S')^{-1}(Q \otimes_A M) = Q \otimes_A (S')^{-1}M$ and similarly for M' we see that $Q \otimes_A (S')^{-1}M \to Q \otimes_A (S')^{-1}M'$ is injective, hence $(S')^{-1}M \to (S')^{-1}M'$ is universally injective as a map of A-modules. This proves the first part of (1). To see (2) we can use the following two facts: (a) if Q is an $S^{-1}A$-module, then $Q \otimes_A S^{-1}A = Q$, i.e., tensoring with Q over A is the same thing as tensoring with Q over $S^{-1}A$, (b) if M is any A-module on which the elements of S are invertible, then $M \otimes_A Q = M \otimes_{S^{-1}A} S^{-1}Q$. Part (2) follows from this immediately. $\square$

7.77. Descent for finite projective modules

In this section we give an elementary proof of the fact that the property of being a *finite* projective module descends along faithfully flat ring maps. The proof does not apply when we drop the finiteness condition. However, the method is indicative of the one we shall use to prove descent for the property of being a *countably generated* projective module---see the comments at the end of this section.

Lemma 7.77.1. *Let* M *be an* R*-module. Then* M *is finite projective if and only if* M *is finitely presented and flat.*

Proof. This is part of Lemma 7.72.2. However, at this point we can give a more elegant proof of the implication (1) $\Rightarrow$ (2) of that lemma as follows. If M is finitely presented and flat, then take a surjection $R^n \to M$. By Lemma 7.75.3 applied to $P = M$, the map $R^n \to M$ admits a section. So M is a direct summand of a free module and hence projective. $\square$

Here are some properties of modules that descend.

Lemma 7.77.2. *Let $R \to S$ be a faithfully flat ring map. Let M be an R-module. Then*

1. *if the S-module $M \otimes_R S$ is of finite type, then M is of finite type,*
2. *if the S-module $M \otimes_R S$ is of finite presentation, then M is of finite presentation,*
3. *if the S-module $M \otimes_R S$ is flat, then M is flat, and*
4. *add more here as needed.*

Proof. Assume $M \otimes_R S$ is of finite type. Let $y_1, \ldots, y_m$ be generators of $M \otimes_R S$ over S. Write $y_j = \sum x_i \otimes f_i$ for some $x_1, \ldots, x_n \in M$. Then we see that the map $\varphi : R^{\oplus n} \to M$ has the property that $\varphi \otimes \text{id}_S : S^{\oplus n} \to M \otimes_R S$ is surjective. Since $R \to S$ is faithfully flat we see that φ is surjective, and M is finitely generated.

Assume $M \otimes_R S$ is of finite presentation. By (1) we see that M is of finite type. Choose a surjection $R^{\oplus n} \to M$ and denote K the kernel. As $R \to S$ is flat we see that $K \otimes_R S$ is the kernel of the base change $S^{\oplus n} \to M \otimes_R S$. As $M \otimes_R S$ is of finite presentation we conclude that $K \otimes_R S$ is of finite type. Hence by (1) we see that K is of finite type and hence M is of finite presentation.

Part (3) is Lemma 7.35.7. $\square$

Proposition 7.77.3. *Let $R \to S$ be a faithfully flat ring map. Let M be an R-module. If the S-module $M \otimes_R S$ is finite projective, then M is finite projective.*

Proof. Follows from Lemmas 7.77.1 and 7.77.2. $\square$

The next few sections are about removing the finiteness assumption by using dévissage to reduce to the countably generated case. In the countably generated case, the strategy is to find a characterization of countably generated projective modules analogous to Lemma 7.77.1, and then to prove directly that this characterization descends. We do this by introducing the notion of a Mittag-Leffer module and proving that if a module M is countably generated, then it is projective if and only if it is flat and Mittag-Leffler (Theorem 7.87.3). When M is finitely generated, this statement reduces to Lemma 7.77.1 (since, according to Example 7.85.1 (1), a finitely generated module is Mittag-Leffler if and only if it is finitely presented).

7.78. Transfinite dévissage of modules

In this section we introduce a dévissage technique for decomposing a module into a direct sum. The main result is that a projective module is a direct sum of countably generated modules (Theorem 7.78.5 below). We follow [**Kol96**].

Definition 7.78.1. Let M be an R-module. A *direct sum dévissage* of M is a family of submodules $(M_\alpha)_{\alpha \in S}$, indexed by an ordinal S and increasing (with respect to inclusion), such that:

(0) $M_0 = 0$;
(1) $M = \bigcup_\alpha M_\alpha$;
(2) if $\alpha \in S$ is a limit ordinal, then $M_\alpha = \bigcup_{\beta < \alpha} M_\beta$;
(3) if $\alpha + 1 \in S$, then M_α is a direct summand of $M_{\alpha+1}$.

If moreover

(4) $M_{\alpha+1}/M_\alpha$ is countably generated for $\alpha + 1 \in S$,

then $(M_\alpha)_{\alpha \in S}$ is called a *Kaplansky dévissage* of M.

The terminology is justified by the following lemma.

Lemma 7.78.2. *Let M be an R-module. If $(M_\alpha)_{\alpha\in S}$ is a direct sum dévissage of M, then $M \cong \bigoplus_{\alpha+1\in S} M_{\alpha+1}/M_\alpha$.*

Proof. By property (3) of a direct sum dévissage, there is an inclusion $M_{\alpha+1}/M_\alpha \to M$ for each $\alpha \in S$. Consider the map

$$f : \bigoplus_{\alpha+1\in S} M_{\alpha+1}/M_\alpha \to M$$

given by the sum of these inclusions. Transfinite induction on S shows that the image contains M_α for every $\alpha \in S$: for $\alpha = 0$ this is true by (0); if $\alpha + 1$ is a successor ordinal then it is clearly true; and if α is a limit ordinal and it is true for $\beta < \alpha$, then it is true for α by (2). Hence f is surjective by (1).

Transfinite induction on S also shows that for every $\beta \in S$ the restriction

$$f_\beta : \bigoplus_{\alpha+1\leq\beta} M_{\alpha+1}/M_\alpha \longrightarrow M$$

of f is injective: For $\beta = 0$ it is true. If it is true for all $\beta' < \beta$, then let x be in the kernel and write $x = (x_{\alpha+1})_{\alpha+1\leq\beta}$ in terms of its components $x_{\alpha+1} \in M_{\alpha+1}/M_\alpha$. By property (3) both $(x_{\alpha+1})_{\alpha+1<\beta}$ and $x_{\beta+1}$ map to 0. Hence $x_{\beta+1} = 0$ and, by the assumption that the restriction $f_{\beta'}$ is injective for all $\beta' < \beta$, also $x_{\alpha+1} = 0$ for every $\alpha + 1 < \beta$. So $x = 0$ and f_β is injective, which finishes the induction. We conclude that f is injective since f_β is for each $\beta \in S$. □

Lemma 7.78.3. *Let M be an R-module. Then M is a direct sum of countably generated R-modules if and only if it admits a Kaplansky dévissage.*

Proof. The lemma takes care of the ``if'' direction. Conversely, suppose $M = \bigoplus_{i\in I} N_i$ where each N_i is a countably generated R-module. Well-order I so that we can think of it as an ordinal. Then setting $M_i = \bigoplus_{j<i} N_j$ gives a Kaplansky dévissage $(M_i)_{i\in I}$ of M. □

Theorem 7.78.4. *Suppose M is a direct sum of countably generated R-modules. If P is a direct summand of M, then P is also a direct sum of countably generated R-modules.*

Proof. Write $M = P \oplus Q$. We are going to construct a Kaplansky dévissage $(M_\alpha)_{\alpha\in S}$ of M which, in addition to the defining properties (0)-(4), satisfies:

(5) Each M_α is a direct summand of M;

(6) $M_\alpha = P_\alpha \oplus Q_\alpha$, where $P_\alpha = P \cap M_\alpha$ and $Q = Q \cap M_\alpha$.

(Note: if properties (0)-(2) hold, then in fact property (3) is equivalent to property (5).)

To see how this implies the theorem, it is enough to show that $(P_\alpha)_{\alpha\in S}$ forms a Kaplansky dévissage of P. Properties (0), (1), and (2) are clear. By (5) and (6) for (M_α), each P_α is a direct summand of M. Since $P_\alpha \subset P_{\alpha+1}$, this implies P_α is a direct summand of $P_{\alpha+1}$; hence (3) holds for (P_α). For (4), note that

$$M_{\alpha+1}/M_\alpha \cong P_{\alpha+1}/P_\alpha \oplus Q_{\alpha+1}/Q_\alpha,$$

so $P_{\alpha+1}/P_\alpha$ is countably generated because this is true of $M_{\alpha+1}/M_\alpha$.

It remains to construct the M_α. Write $M = \bigoplus_{i\in I} N_i$ where each N_i is a countably generated R-module. Choose a well-ordering of I. By transfinite induction we are going to define an increasing family of submodules M_α of M, one for each ordinal α, such that M_α is a direct sum of some subset of the N_i.

For $\alpha = 0$ let $M_0 = 0$. If α is a limit ordinal and M_β has been defined for all $\beta < \alpha$, then define $M_\alpha = \bigcup_{\beta<\alpha} M_\beta$. Since each M_β for $\beta < \alpha$ is a direct sum of a subset of the N_i, the same will be true of M_α. If $\alpha+1$ is a successor ordinal and M_α has been defined, then define $M_{\alpha+1}$ as follows. If $M_\alpha = M$, then let $M_{\alpha+1} = M$. If not, choose the smallest $j \in I$ such that N_j is not contained in M_α. We will construct an infinite matrix (x_{mn}), $m, n = 1, 2, 3, \ldots$ such that:

(1) N_j is contained in the submodule of M generated by the entries x_{mn};
(2) if we write any entry $x_{k\ell}$ in terms of its P- and Q-components, $x_{k\ell} = y_{k\ell} + z_{k\ell}$, then the matrix (x_{mn}) contains a set of generators for each N_i for which $y_{k\ell}$ or $z_{k\ell}$ has nonzero component.

Then we define $M_{\alpha+1}$ to be the submodule of M generated by M_α and all x_{mn}; by property (2) of the matrix (x_{mn}), $M_{\alpha+1}$ will be a direct sum of some subset of the N_i. To construct the matrix (x_{mn}), let $x_{11}, x_{12}, x_{13}, \ldots$ be a countable set of generators for N_j. Then if $x_{11} = y_{11}+z_{11}$ is the decomposition into P- and Q-components, let $x_{21}, x_{22}, x_{23}, \ldots$ be a countable set of generators for the sum of the N_i for which y_{11} or z_{11} have nonzero component. Repeat this process on x_{12} to get elements $x_{31}, x_{32}, \ldots$, the third row of our matrix. Repeat on x_{21} to get the fourth row, on x_{13} to get the fifth, and so on, going down along successive anti-diagonals as indicated below:

$$\begin{pmatrix}
x_{11} & & x_{12} & & x_{13} & & x_{14} & & \cdots \\
& \swarrow & & \swarrow & & \swarrow & & & \\
x_{21} & & x_{22} & & x_{23} & & \cdots & & \\
& \swarrow & & \swarrow & & & & & \\
x_{31} & & x_{32} & & \cdots & & & & \\
& \swarrow & & & & & & & \\
x_{41} & & \cdots & & & & & & \\
\cdots & & & & & & & &
\end{pmatrix}.$$

Transfinite induction on I (using the fact that we constructed $M_{\alpha+1}$ to contain N_j for the smallest j such that N_j is not contained in M_α) shows that for each $i \in I$, N_i is contained in some M_α. Thus, there is some large enough ordinal S satisfying: for each $i \in I$ there is $\alpha \in S$ such that N_i is contained in M_α. This means $(M_\alpha)_{\alpha\in S}$ satisfies property (1) of a Kaplansky dévissage of M. The family $(M_\alpha)_{\alpha\in S}$ moreover satisfies the other defining properties, and also (5) and (6) above: properties (0), (2), (4), and (6) are clear by construction; property (5) is true because each M_α is by construction a direct sum of some N_i; and (3) is implied by (5) and the fact that $M_\alpha \subset M_{\alpha+1}$. □

As a corollary we get the result for projective modules stated at the beginning of the section.

Theorem 7.78.5. *If P is a projective R-module, then P is a direct sum of countably generated projective R-modules.*

Proof. A module is projective if and only if it is a direct summand of a free module, so this follows from Theorem 7.78.4. □

7.79. Projective modules over a local ring

In this section we prove a very cute result: a projective module M over a local ring is free (Theorem 7.79.4 below). Note that with the additional assumption that M is finite, this result is Lemma 7.72.4. In general we have:

Lemma 7.79.1. *Let R be a ring. Then every projective R-module is free if and only if every countably generated projective R-module is free.*

Proof. Follows immediately from Theorem 7.78.5. □

Here is a criterion for a countably generated module to be free.

Lemma 7.79.2. *Let M be a countably generated R-module. Suppose any direct summand N of M satisfies: any element of N is contained in a free direct summand of N. Then M is free.*

Proof. Let $x_1, x_2, \ldots$ be a countable set of generators for M. By the assumption on M, we can construct by induction free R-modules $F_1, F_2, \ldots$ such that for every positive integer n, $\bigoplus_{i=1}^n F_i$ is a direct summand of M and contains $x_1, \ldots, x_n$. Then $M = \bigoplus_{i=1}^\infty F_i$. □

Lemma 7.79.3. *Let P be a projective module over a local ring R. Then any element of P is contained in a free direct summand of P.*

Proof. Since P is projective it is a direct summand of some free R-module F, say $F = P \oplus Q$. Let $x \in P$ be the element that we wish to show is contained in a free direct summand of P. Let B be a basis of F such that the number of basis elements needed in the expression of x is minimal, say $x = \sum_{i=1}^n a_i e_i$ for some $e_i \in B$ and $a_i \in R$. Then no a_j can be expressed as a linear combination of the other a_i; for if $a_j = \sum_{i \neq j} a_i b_i$ for some $b_i \in R$, then replacing e_i by $e_i + b_i e_j$ for $i \neq j$ and leaving unchanged the other elements of B, we get a new basis for F in terms of which x has a shorter expression.

Let $e_i = y_i + z_i, y_i \in P, z_i \in Q$ be the decomposition of e_i into its P- and Q-components. Write $y_i = \sum_{j=1}^n b_{ij} e_j + t_i$, where t_i is a linear combination of elements in B other than $e_1, \ldots, e_n$. To finish the proof it suffices to show that the matrix (b_{ij}) is invertible. For then the map $F \to F$ sending $e_i \mapsto y_i$ for $i = 1, \ldots, n$ and fixing $B \setminus \{e_1, \ldots, e_n\}$ is an isomorphism, so that $y_1, \ldots, y_n$ together with $B \setminus \{e_1, \ldots, e_n\}$ form a basis for F. Then the submodule N spanned by $y_1, \ldots, y_n$ is a free submodule of P; N is a direct summand of P since $N \subset P$ and both N and P are direct summands of F; and $x \in N$ since $x \in P$ implies $x = \sum_{i=1}^n a_i e_i = \sum_{i=1}^n a_i y_i$.

Now we prove that (b_{ij}) is invertible. Plugging $y_i = \sum_{j=1}^n b_{ij} e_j + t_i$ into $\sum_{i=1}^n a_i e_i = \sum_{i=1}^n a_i y_i$ and equating the coefficients of e_j gives $a_j = \sum_{i=1}^n a_i b_{ij}$. But as noted above, our choice of B guarantees that no a_j can be written as a linear combination of the other a_i. Thus b_{ij} is a non-unit for $i \neq j$, and $1 - b_{ii}$ is a non-unit---so in particular b_{ii} is a unit---for all i. But a matrix over a local ring having units along the diagonal and non-units elsewhere is invertible, as its determinant is a unit. □

Theorem 7.79.4. *If P is a projective module over a local ring R, then P is free.*

Proof. Follows from Lemmas 7.79.1, 7.79.2, and 7.79.3. □

7.80. Mittag-Leffler systems

The purpose of this section is to define Mittag-Leffler systems and why it is a useful property.

In the following, I will be a directed partially ordered set, see Categories, Definition 4.19.2. Let $(A_i, \varphi_{ji} : A_j \to A_i)$ be an inverse system of sets or of modules indexed by I, see Categories, Definition 4.19.2. This is a directed inverse system as we assumed I directed. For each $i \in I$, the images $\varphi_{ji}(A_j) \subset A_i$ for $j \geq i$ form a decreasing family. Let $A'_i = \bigcap_{j \geq i} \varphi_{ji}(A_j)$. Then $\varphi_{ji}(A'_j) \subset A'_i$ for $j \geq i$, hence by restricting we get a directed inverse system $(A'_i, \varphi_{ji}|_{A'_j})$. From the construction of the limit of an inverse system in the category of sets or modules, we have $lim\, A_i = lim\, A'_i$. The Mittag-Leffler condition on (A_i, φ_{ji}) is that A'_i equals $\varphi_{ji}(A_j)$ for some $j \geq i$ (and hence equals $\varphi_{ki}(A_k)$ for all $k \geq j$):

Definition 7.80.1. Let (A_i, φ_{ji}) be a directed inverse system of sets over I. Then we say (A_i, φ_{ji}) is *Mittag-Leffler inverse system* if for each $i \in I$, the decreasing family $\varphi_{ji}(A_j) \subset A_i$ for $j \geq i$ stabilizes. Explicitly, this means that for each $i \in I$, there exists $j \geq i$ such that for $k \geq j$ we have $\varphi_{ki}(A_k) = \varphi_{ji}(A_j)$. If (A_i, φ_{ji}) is a directed inverse system of modules over a ring R, we say that it is Mittag-Leffler if the underlying inverse system of sets is Mittag-Leffler.

Example 7.80.2. If (A_i, φ_{ji}) is a directed inverse system of sets or of modules and the maps φ_{ji} are surjective, then clearly the system is Mittag-Leffler. Conversely, suppose (A_i, φ_{ji}) is Mittag-Leffler. Let $A'_i \subset A_i$ be the stable image of $\varphi_{ji}(A_j)$ for $j \geq i$. Then $\varphi_{ji}|_{A'_j} : A'_j \to A'_i$ is surjective for $j \geq i$ and $lim\, A_i = lim\, A'_i$. Hence the limit of the Mittag-Leffler system (A_i, φ_{ji}) can also be written as the limit of a directed inverse system over I with surjective maps.

Lemma 7.80.3. *Let (A_i, φ_{ji}) be a directed inverse system over I. Suppose I is countable. If (A_i, φ_{ji}) is Mittag-Leffler and the A_i are nonempty, then $lim\, A_i$ is nonempty.*

Proof. Let $i_1, i_2, i_3, \ldots$ be an enumeration of the elements of I. Define inductively a sequence of elements $j_n \in I$ for $n = 1, 2, 3, \ldots$ by the conditions: $j_1 = i_1$, and $j_n \geq i_n$ and $j_n \geq j_m$ for $m < n$. Then the sequence j_n is increasing and forms a cofinal subset of I. Hence we may assume $I = \{1, 2, 3, \ldots\}$. So by Example 7.80.2 we are reduced to showing that the limit of an inverse system of nonempty sets with surjective maps indexed by the positive integers is nonempty. This is obvious. $\square$

The Mittag-Leffler condition will be important for us because of the following exactness property.

Lemma 7.80.4. *Let*

$$0 \to A_i \xrightarrow{f_i} B_i \xrightarrow{g_i} C_i \to 0$$

be an exact sequence of directed inverse systems of abelian groups over I. Suppose I is countable. If (A_i) is Mittag-Leffler, then

$$0 \to lim\, A_i \to lim\, B_i \to lim\, C_i \to 0$$

is exact.

Proof. Taking limits of directed inverse systems is left exact, hence we only need to prove surjectivity of $lim\, B_i \to lim\, C_i$. So let $(c_i) \in lim\, C_i$. For each $i \in I$, let $E_i = g_i^{-1}(c_i)$, which is nonempty since $g_i : B_i \to C_i$ is surjective. The system of maps $\varphi_{ji} : B_j \to B_i$ for (B_i) restrict to maps $E_j \to E_i$ which make (E_i) into an inverse system of nonempty sets. It is enough to show that (E_i) is Mittag-Leffler. For then Lemma 7.80.3 would show $lim\, E_i$ is nonempty, and taking any element of $lim\, E_i$ would give an element of $lim\, B_i$ mapping to (c_i).

By the injection $f_i : A_i \to B_i$ we will regard A_i as a subset of B_i. Since (A_i) is Mittag-Leffler, if $i \in I$ then there exists $j \geq i$ such that $\varphi_{ki}(A_k) = \varphi_{ji}(A_j)$ for $k \geq j$. We claim that also $\varphi_{ki}(E_k) = \varphi_{ji}(E_j)$ for $k \geq j$. Always $\varphi_{ki}(E_k) \subset \varphi_{ji}(E_j)$ for $k \geq j$. For the reverse inclusion let $e_j \in E_j$, and we need to find $x_k \in E_k$ such that $\varphi_{ki}(x_k) = \varphi_{ji}(e_j)$. Let $e'_k \in E_k$ be any element, and set $e'_j = \varphi_{kj}(e'_k)$. Then $g_j(e_j - e'_j) = c_j - c_j = 0$, hence $e_j - e'_j = a_j \in A_j$. Since $\varphi_{ki}(A_k) = \varphi_{ji}(A_j)$, there exists $a_k \in A_k$ such that $\varphi_{ki}(a_k) = \varphi_{ji}(a_j)$. Hence

$$\varphi_{ki}(e'_k + a_k) = \varphi_{ji}(e'_j) + \varphi_{ji}(a_j) = \varphi_{ji}(e_j),$$

so we can take $x_k = e'_k + a_k$. □

7.81. Inverse systems

In many papers (and in this section) the term *inverse system* is used to indicate an inverse system over the partially ordered set $(\mathbf{N}, \geq)$. We briefly discuss such systems in this section. This material will be discussed more broadly in Homology, Section 10.23. Suppose we are given a ring R and a sequence of R-modules

$$M_1 \xleftarrow{\varphi_2} M_2 \xleftarrow{\varphi_3} M_3 \leftarrow \ldots$$

with maps as indicated. By composing succesive maps we obtain maps $\varphi_{ii'} : M_i \to M_{i'}$ whenever $i \geq i'$ such that moreover $\varphi_{ii''} = \varphi_{i'i''} \circ \varphi_{ii'}$ whenever $i \geq i' \geq i''$. Conversely, given the system of maps $\varphi_{ii'}$ we can set $\varphi_i = \varphi_{i(i-1)}$ and recover the maps displayed above. In this case

$$lim\, M_i = \{(x_i) \in \prod M_i \mid \varphi_i(x_i) = x_{i-1},\ i = 2, 3, \ldots\}$$

compare with Categories, Section 4.14. As explained in Homology, Section 10.23 this is actually a limit in the category of R-modules, as defined in Categories, Section 4.13.

Lemma 7.81.1. *Let R be a ring. Let $0 \to K_i \to L_i \to M_i \to 0$ be short exact sequences of R-modules, $i \geq 1$ which fit into maps of short exact sequences*

$$\begin{array}{ccccccccc} 0 & \longrightarrow & K_i & \longrightarrow & L_i & \longrightarrow & M_i & \longrightarrow & 0 \\ & & \uparrow & & \uparrow & & \uparrow & & \\ 0 & \longrightarrow & K_{i+1} & \longrightarrow & L_{i+1} & \longrightarrow & M_{i+1} & \longrightarrow & 0 \end{array}$$

If for every i there exists a $c = c(i) \geq i$ such that $Im(K_c \to K_i) = Im(K_j \to K_i)$ for all $j \geq c$, then the sequence

$$0 \to lim\, K_i \to lim\, L_i \to lim\, M_i \to 0$$

is exact.

Proof. This is a special case of the more general Lemma 7.80.4. □

7.82. Mittag-Leffler modules

A Mittag-Leffler module is (very roughly) a module which can be written as a directed limit whose dual is a Mittag-Leffler system. To be able to give a precise definition we need to do a bit of work.

Definition 7.82.1. Let (M_i, f_{ij}) be a directed system of R-modules. We say that (M_i, f_{ij}) is a *Mittag-Leffler directed system of modules* if each M_i is an R-module of finite presentation and if for every R-module N, the inverse system

$$(Hom_R(M_i, N), Hom_R(f_{ij}, N))$$

is Mittag-Leffler.

We are going to characterize those R-modules that are colimits of Mittag-Leffler directed systems of modules.

Definition 7.82.2. Let $f : M \to N$ and $g : M \to M'$ be maps of R-modules. Then we say g *dominates* f if for any R-module Q, we have $\ker(f \otimes_R \mathrm{id}_Q) \subset \ker(g \otimes_R \mathrm{id}_Q)$.

It is enough to check this condition for finitely presented modules.

Lemma 7.82.3. *Let $f : M \to N$ and $g : M \to M'$ be maps of R-modules. Then g dominates f if and only if for any finitely presented R-module Q, we have* $\ker(f \otimes_R id_Q) \subset \ker(g \otimes_R id_Q)$.

Proof. Suppose $\ker(f \otimes_R \mathrm{id}_Q) \subset \ker(g \otimes_R \mathrm{id}_Q)$ for all finitely presented modules Q. If Q is an arbitrary module, write $Q = colim_{i \in I} Q_i$ as a colimit of a directed system of finitely presented modules Q_i. Then $\ker(f \otimes_R \mathrm{id}_{Q_i}) \subset \ker(g \otimes_R \mathrm{id}_{Q_i})$ for all i. Since taking directed colimits is exact and commutes with tensor product, it follows that $\ker(f \otimes_R \mathrm{id}_Q) \subset \ker(g \otimes_R \mathrm{id}_Q)$. $\square$

The above definition of domination is related to the usual notion of domination of maps as follows.

Lemma 7.82.4. *Let $f : M \to N$ and $g : M \to M'$ be maps of R-modules. Suppose $Coker(f)$ is of finite presentation. Then g dominates f if and only if g factors through f, i.e. there exists a module map $h : N \to M'$ such that $g = h \circ f$.*

Proof. Consider the pushout of f and g,

$$\begin{tikzcd} M \arrow[r, "f"] \arrow[d, "g"'] & N \arrow[d, "g'"] \\ M' \arrow[r, "f'"] & N' \end{tikzcd}$$

where N' is $M' \oplus N$ modulo the submodule consisting of elements $(g(x), -f(x))$ for $x \in M$. We are going to show that the two conditions we wish to prove equivalent are each equivalent to f' being universally injective.

From the definition of N' we have a short exact sequence

$$0 \to \ker(f) \cap \ker(g) \to \ker(f) \to \ker(f') \to 0.$$

Since tensoring commutes with taking pushouts, we have such a short exact sequence

$$0 \to \ker(f \otimes \mathrm{id}_Q) \cap \ker(g \otimes \mathrm{id}_Q) \to \ker(f \otimes \mathrm{id}_Q) \to \ker(f' \otimes \mathrm{id}_Q) \to 0$$

for every R-module Q. So f' is universally injective if and only if $\ker(f \otimes \mathrm{id}_Q) \subset \ker(g \otimes \mathrm{id}_Q)$ for every Q, if and only if g dominates f.

On the other hand, from the definition of the pushout it follows that $\mathrm{Coker}(f') = \mathrm{Coker}(f)$, so $\mathrm{Coker}(f')$ is of finite presentation. Then by Lemma 7.76.4, f' is universally injective if and only if

$$0 \to M' \xrightarrow{f'} N' \to \mathrm{Coker}(f') \to 0$$

splits. This is the case if and only if there is a map $h' : N' \to M'$ such that $h' \circ f' = \mathrm{id}_{M'}$. From the universal property of the pushout, the existence of such an h' is equivalent to g factoring through f. □

Proposition 7.82.5. *Let M be an R-module. Let (M_i, f_{ij}) be a directed system of finitely presented R-modules, indexed by I, such that $M = colim\, M_i$. Let $f_i : M_i \to M$ be the canonical map. The following are equivalent:*

(1) *For every finitely presented R-module P and module map $f : P \to M$, there exists a finitely presented R-module Q and a module map $g : P \to Q$ such that g and f dominate each other, i.e.,* $\ker(f \otimes_R id_N) = \ker(g \otimes_R id_N)$ *for every R-module N.*
(2) *For each $i \in I$, there exists $j \geq i$ such that $f_{ij} : M_i \to M_j$ dominates $f_i : M_i \to M$.*
(3) *For each $i \in I$, there exists $j \geq i$ such that $f_{ij} : M_i \to M_j$ factors through $f_{ik} : M_i \to M_k$ for all $k \geq i$.*
(4) *For every R-module N, the inverse system $(Hom_R(M_i, N), Hom_R(f_{ij}, N))$ is Mittag-Leffler.*
(5) *For $N = \prod_{s\in I} M_s$, the inverse system $(Hom_R(M_i, N), Hom_R(f_{ij}, N))$ is Mittag-Leffler.*

Proof. First we prove the equivalence of (1) and (2). Suppose (1) holds and let $i \in I$. Corresponding to the map $f_i : M_i \to M$, we can choose $g : M_i \to Q$ as in (1). Since M_i and Q are of finite presentation, so is Coker(g). Then by Lemma 7.82.4, $f_i : M_i \to M$ factors through $g : M_i \to Q$, say $f_i = h \circ g$ for some $h : Q \to M$. Then since Q is finitely presented, h factors through $M_j \to M$ for some $j \geq i$, say $h = f_j \circ h'$ for some $h' : Q \to M_j$. In total we have a commutative diagram

$$\begin{tikzcd} & M & \\ M_i \arrow[ur, "f_i"] \arrow[rr, "f_{ij}"] \arrow[dr, "g"'] & & M_j. \arrow[ul, "f_j"'] \\ & Q \arrow[ur, "h'"'] & \end{tikzcd}$$

Thus f_{ij} dominates g. But g dominates f_i, so f_{ij} dominates f_i.

Conversely, suppose (2) holds. Let P be of finite presentation and $f : P \to M$ a module map. Then f factors through $f_i : M_i \to M$ for some $i \in I$, say $f = f_i \circ g'$ for some $g' : P \to M_i$. Choose by (2) a $j \geq i$ such that f_{ij} dominates f_i. We have a commutative diagram

$$\begin{tikzcd} P \arrow[r, "f"] \arrow[d, "g'"'] & M \\ M_i \arrow[ur, "f_i"] \arrow[r, "f_{ij}"'] & M_j . \arrow[u, "f_j"'] \end{tikzcd}$$

From the diagram and the fact that f_{ij} dominates f_i, we find that f and $f_{ij} \circ g'$ dominate each other. Hence taking $g = f_{ij} \circ g' : P \to M_j$ works.

Next we prove (2) is equivalent to (3). Let $i \in I$. It is always true that f_i dominates f_{ik} for $k \geq i$, since f_i factors through f_{ik}. If (2) holds, choose $j \geq i$ such that f_{ij} dominates

f_i. Then since domination is a transitive relation, f_{ij} dominates f_{ik} for $k \geq i$. All M_i are of finite presentation, so $\mathrm{Coker}(f_{ik})$ is of finite presentation for $k \geq i$. By Lemma 7.82.4, f_{ij} factors through f_{ik} for all $k \geq i$. Thus (2) implies (3). On the other hand, if (3) holds then for any R-module N, $f_{ij} \otimes_R \mathrm{id}_N$ factors through $f_{ik} \otimes_R \mathrm{id}_N$ for $k \geq i$. So $\ker(f_{ik} \otimes_R \mathrm{id}_N) \subset \ker(f_{ij} \otimes_R \mathrm{id}_N)$ for $k \geq i$. But $\ker(f_i \otimes_R \mathrm{id}_N : M_i \otimes_R N \to M \otimes_R N)$ is the union of $\ker(f_{ik} \otimes_R \mathrm{id}_N)$ for $k \geq i$. Thus $\ker(f_i \otimes_R \mathrm{id}_N) \subset \ker(f_{ij} \otimes_R \mathrm{id}_N)$ for any R-module N, which by definition means f_{ij} dominates f_i.

It is trivial that (3) implies (4) implies (5). We show (5) implies (3). Let $N = \prod_{s \in I} M_s$. If (5) holds, then given $i \in I$ choose $j \geq i$ such that

$$\mathrm{Im}(Hom(M_j, N) \to Hom(M_i, N)) = \mathrm{Im}(Hom(M_k, N) \to Hom(M_i, N))$$

for all $k \geq j$. Passing the product over $s \in I$ outside of the Hom's and looking at the maps on each component of the product, this says

$$\mathrm{Im}(Hom(M_j, M_s) \to Hom(M_i, M_s)) = \mathrm{Im}(Hom(M_k, M_s) \to Hom(M_i, M_s))$$

for all $k \geq j$ and $s \in I$. Taking $s = j$ we have

$$\mathrm{Im}(Hom(M_j, M_j) \to Hom(M_i, M_j)) = \mathrm{Im}(Hom(M_k, M_j) \to Hom(M_i, M_j))$$

for all $k \geq j$. Since f_{ij} is the image of $\mathrm{id} \in Hom(M_j, M_j)$ under $Hom(M_j, M_j) \to Hom(M_i, M_j)$, this shows that for any $k \geq j$ there is $h \in Hom(M_k, M_j)$ such that $f_{ij} = h \circ f_{ik}$. If $j \geq k$ then we can take $h = f_{kj}$. Hence (3) holds. $\square$

Definition 7.82.6. Let M be an R-module. We say that M is *Mittag-Leffler* if the equivalent conditions of Proposition 7.82.5 hold.

In particular a finitely presented module is Mittag-Leffler.

Remark 7.82.7. Let M be a flat R-module. By Lazard's theorem (Theorem 7.75.4) we can write $M = colim\, M_i$ as the colimit of a directed system (M_i, f_{ij}) where the M_i are free finite R-modules. For M to be Mittag-Leffler, it is enough for the inverse system of duals $(Hom_R(M_i, R), Hom_R(f_{ij}, R))$ to be Mittag-Leffler. This follows from criterion (4) of Proposition 7.82.5 and the fact that for a free finite R-module F, there is a functorial isomorphism $Hom_R(F, R) \otimes_R N \cong Hom_R(F, N)$ for any R-module N.

Lemma 7.82.8. *If R is a ring and M, N are Mittag-Leffler modules over R, then $M \otimes_R N$ is a Mittag-Leffler module.*

Proof. Write $M = colim_{i \in I} M_i$ and $N = colim_{j \in J} N_j$ as directed colimits of finitely presented R-modules. Denote $f_{ii'} : M_i \to M_{i'}$ and $g_{jj'} : N_j \to N_{j'}$ the transition maps. Then $M_i \otimes_R N_j$ is a finitely presented R-module (see Lemma 7.11.14), and $M \otimes_R N = colim_{(i,j) \in I \times J} M_i \otimes_R M_j$. Pick $(i, j) \in I \times J$. By the definition of a Mittag-Leffler module we have Proposition 7.82.5 (3) for both systems. In other words there exist $i' \geq i$ and $j' \geq j$ such that for every choice of $i'' \geq i$ and $j'' \geq j$ there exist maps $a : M_{i''} \to M_{i'}$ and $b : M_{j''} \to M_{j'}$ such that $f_{ii'} = a \circ f_{ii''}$ and $g_{jj'} = b \circ g_{jj''}$. Then it is clear that $a \otimes b : M_{i''} \otimes_R N_{j''} \to M_{i'} \otimes_R N_{j'}$ serves the same purpose for the system $(M_i \otimes_R N_j, f_{ii'} \otimes g_{jj'})$. Thus by the characterization Proposition 7.82.5 (3) we conclude that $M \otimes_R N$ is Mittag-Leffler. $\square$

Lemma 7.82.9. *Let R be a ring and M an R-module. Then M is Mittag-Leffler if and only if for every finite free R-module F and module map $f : F \to M$, there exists a finitely presented R-module Q and a module map $g : F \to Q$ such that g and f dominate each other, i.e.,* $\ker(f \otimes_R id_N) = \ker(g \otimes_R id_N)$ *for every R-module N.*

Proof. Since the condition is clear weaker than condition (1) of Proposition 7.82.5 we see that a Mittag-Leffler module satisfies the condition. Conversely, suppose that M satisfies the condition and that $f : P \to M$ is an R-module map from a finitely presented R-module P into M. Choose a surjection $F \to P$ where F is a finite free R-module. By assumption we can find a map $F \to Q$ where Q is a finitely presented R-module such that $F \to Q$ and $F \to M$ dominate each other. In particular, the kernel of $F \to Q$ contains the kernel of $F \to P$, hence we obtain an R-module map $g : P \to Q$ such that $F \to Q$ is equal to the composition $F \to P \to Q$. Let N be any R-module and consider the commutative diagram

$$\begin{tikzcd} F \otimes_R N \arrow[r] \arrow[d] & Q \otimes_R N \\ P \otimes_R N \arrow[r] \arrow[ur] & M \otimes_R N \end{tikzcd}$$

By assumption the kernels of $F \otimes_R N \to Q \otimes_R N$ and $F \otimes_R N \to M \otimes_R N$ are equal. Hence, as $F \otimes_R N \to P \otimes_R N$ is surjective, also the kernels of $P \otimes_R N \to Q \otimes_R N$ and $P \otimes_R N \to M \otimes_R N$ are equal. □

Lemma 7.82.10. *Let $R \to S$ be a finite and finitely presented ring map. Let M be an S-module. If M is a Mittag-Leffler module over S then M is a Mittag-Leffler module over R.*

Proof. Assume M is a Mittag-Leffler module over S. Write $M = colim\, M_i$ as a directed colimit of finitely presented S-modules M_i. As M is Mittag-Leffler over S there exists for each i an index $j \geq i$ such that for all $k \geq j$ there is a factorization $f_{ij} = h \circ f_{ik}$ (where h depends on i, the choice of j and k). Note that by Lemma 7.7.4 the modules M_i are also finitely presented as R-modules. Moreover, all the maps f_{ij}, f_{ik}, h are maps of R-modules. Thus we see that the system (M_i, f_{ij}) satisfies the same condition when viewed as a system of R-modules. Thus M is Mittag-Leffler as an R-module. □

Lemma 7.82.11. *Let R be a ring. Let $S = R/I$ for some finitely generated ideal I. Let M be an S-module. Then M is a Mittag-Leffler module over R if and only if M is a Mittag-Leffler module over S.*

Proof. One implication follows from Lemma 7.82.10. To prove the other, assume M is Mittag-Leffler as an R-module. Write $M = colim\, M_i$ as a directed colimit of finitely presented S-modules. As I is finitely generated, the ring S is finite and finitely presented as an R-algebra, hence the modules M_i are finitely presented as R-modules, see Lemma 7.7.4. Next, let N be any S-module. Note that for each i we have $Hom_R(M_i, N) = Hom_S(M_i, N)$ as $R \to S$ is surjective. Hence the condition that the inverse system $(Hom_R(M_i, N))_i$ satisfies Mittag-Leffler, implies that the system $(Hom_S(M_i, N))_i$ satisfies Mittag-Leffler. Thus M is Mittag-Leffler over S by definition. □

Remark 7.82.12. Let $R \to S$ be a finite and finitely presented ring map. Let M be an S-module which is Mittag-Leffler as an R-module. Then it is in general not the case that if M is Mittag-Leffler as an S-module. For example suppose that S is the ring of dual numbers over R, i.e., $S = R \oplus R\epsilon$ with $\epsilon^2 = 0$. Then an S-module consists of an R-module M endowed with a square zero R-linear endomorphism $\epsilon : M \to M$. Now suppose that M_0 is an R-module which is not Mittag-Leffler. Choose a presentation $F_1 \xrightarrow{u} F_0 \to M_0 \to 0$ with F_1 and F_0 free R-modules. Set $M = F_1 \oplus F_0$ with

$$\epsilon = \begin{pmatrix} 0 & 0 \\ u & 0 \end{pmatrix} : M \longrightarrow M.$$

Then $M/\epsilon M \cong F_1 \oplus M_0$ is not Mittag-Leffler over $R = S/\epsilon S$, hence not Mittag-Leffler over S (see Lemma 7.82.11). On the other hand, $M/\epsilon M = M \otimes_S S/\epsilon S$ which would be Mittag-Leffler over S if M was, see Lemma 7.82.8.

7.83. Interchanging direct products with tensor

Let M be an R-module and let $(Q_\alpha)_{\alpha \in A}$ be a family of R-modules. Then there is a canonical map $M \otimes_R \left(\prod_{\alpha \in A} Q_\alpha\right) \to \prod_{\alpha \in A}(M \otimes_R Q_\alpha)$ given on pure tensors by $x \otimes (q_\alpha) \mapsto (x \otimes q_\alpha)$. This map is not necessarily injective or surjective, as the following example shows.

Example 7.83.1. Take $R = \mathbf{Z}$, $M = \mathbf{Q}$, and consider the family $Q_n = \mathbf{Z}/n$ for $n \geq 1$. Then $\prod_n (M \otimes Q_n) = 0$. However there is an injection $\mathbf{Q} \to M \otimes (\prod_n Q_n)$ obtained by tensoring the injection $\mathbf{Z} \to \prod_n Q_n$ by M, so $M \otimes (\prod_n Q_n)$ is nonzero. Thus $M \otimes (\prod_n Q_n) \to \prod_n (M \otimes Q_n)$ is not injective.

On the other hand, take again $R = \mathbf{Z}$, $M = \mathbf{Q}$, and let $Q_n = \mathbf{Z}$ for $n \geq 1$. The image of $M \otimes (\prod_n Q_n) \to \prod_n (M \otimes Q_n) = \prod_n M$ consists precisely of sequences of the form $(a_n/m)_{n \geq 1}$ with $a_n \in \mathbf{Z}$ and m some nonzero integer. Hence the map is not surjective.

We determine below the precise conditions needed on M for the map $M \otimes_R \left(\prod_\alpha Q_\alpha\right) \to \prod_\alpha (M \otimes_R Q_\alpha)$ to be surjective, bijective, or injective for all choices of $(Q_\alpha)_{\alpha \in A}$. This is relevant because the modules for which it is injective turn out to be exactly Mittag-Leffler modules (Proposition 7.83.5). In what follows, if M is an R-module and A a set, we write M^A for the product $\prod_{\alpha \in A} M$.

Proposition 7.83.2. *Let M be an R-module. The following are equivalent:*

(1) *M is finitely generated.*
(2) *For every family $(Q_\alpha)_{\alpha \in A}$ of R-modules, the canonical map $M \otimes_R \left(\prod_\alpha Q_\alpha\right) \to \prod_\alpha (M \otimes_R Q_\alpha)$ is surjective.*
(3) *For every R-module Q and every set A, the canonical map $M \otimes_R Q^A \to (M \otimes_R Q)^A$ is surjective.*
(4) *For every set A, the canonical map $M \otimes_R R^A \to M^A$ is surjective.*

Proof. First we prove (1) implies (2). Choose a surjection $R^n \to M$ and consider the commutative diagram

$$\begin{tikzcd} R^n \otimes_R (\prod_\alpha Q_\alpha) \arrow[r, "\cong"] \arrow[d] & \prod_\alpha (R^n \otimes_R Q_\alpha) \arrow[d] \\ M \otimes_R (\prod_\alpha Q_\alpha) \arrow[r] & \prod_\alpha (M \otimes_R Q_\alpha). \end{tikzcd}$$

The top arrow is an isomorphism and the vertical arrows are surjections. We conclude that the bottom arrow is a surjection.

Obviously (2) implies (3) implies (4), so it remains to prove (4) implies (1). In fact for (1) to hold it suffices that the element $d = (x)_{x \in M}$ of M^M is in the image of the map $f : M \otimes_R R^M \to M^M$. In this case $d = \sum_{i=1}^n f(x_i \otimes a_i)$ for some $x_i \in M$ and $a_i \in R^M$. If for $x \in M$ we write $p_x : M^M \to M$ for the projection onto the x-th factor, then

$$x = p_x(d) = \sum_{i=1}^n p_x(f(x_i \otimes a_i)) = \sum_{i=1}^n p_x(a_i) x_i.$$

Thus $x_1, \ldots, x_n$ generate M. $\square$

Proposition 7.83.3. *Let M be an R-module. The following are equivalent:*

(1) *M is finitely presented.*
(2) *For every family $(Q_\alpha)_{\alpha \in A}$ of R-modules, the canonical map $M \otimes_R \left(\prod_\alpha Q_\alpha\right) \to \prod_\alpha (M \otimes_R Q_\alpha)$ is bijective.*
(3) *For every R-module Q and every set A, the canonical map $M \otimes_R Q^A \to (M \otimes_R Q)^A$ is bijective.*
(4) *For every set A, the canonical map $M \otimes_R R^A \to M^A$ is bijective.*

Proof. First we prove (1) implies (2). Choose a presentation $R^m \to R^n \to M$ and consider the commutative diagram

$$\begin{tikzcd} R^m \otimes_R (\prod_\alpha Q_\alpha) \arrow[r] \arrow[d, "\cong"] & R^m \otimes_R (\prod_\alpha Q_\alpha) \arrow[r] \arrow[d, "\cong"] & M \otimes_R (\prod_\alpha Q_\alpha) \arrow[r] \arrow[d] & 0 \\ \prod_\alpha (R^m \otimes_R Q_\alpha) \arrow[r] & \prod_\alpha (R^n \otimes_R Q_\alpha) \arrow[r] & \prod_\alpha (M \otimes_R Q_\alpha) \arrow[r] & 0. \end{tikzcd}$$

The first two vertical arrows are isomorphisms and the rows are exact. This implies that the map $M \otimes_R (\prod_\alpha Q_\alpha) \to \prod_\alpha (M \otimes_R Q_\alpha)$ is surjective and, by a diagram chase, also injective. Hence (2) holds.

Obviously (2) implies (3) implies (4), so it remains to prove (4) implies (1). From Proposition 7.83.2, if (4) holds we already know that M is finitely generated. So we can choose a surjection $F \to M$ where F is free and finite. Let K be the kernel. We must show K is finitely generated. For any set A, we have a commutative diagram

$$\begin{tikzcd} & K \otimes_R R^A \arrow[r] \arrow[d, "f_3"'] & F \otimes_R R^A \arrow[r] \arrow[d, "f_2"', "\cong"] & M \otimes_R R^A \arrow[r] \arrow[d, "f_1"', "\cong"] & 0 \\ 0 \arrow[r] & K^A \arrow[r] & F^A \arrow[r] & M^A \arrow[r] & 0. \end{tikzcd}$$

The map f_1 is an isomorphism by assumption, the map f_2 is a isomorphism since F is free and finite, and the rows are exact. A diagram chase shows that f_3 is surjective, hence by Proposition 7.83.2 we get that K is finitely generated. □

We need the following lemma for the next proposition.

Lemma 7.83.4. *Let M be an R-module, P a finitely presented R-module, and $f : P \to M$ a map. Let Q be an R-module and suppose $x \in \ker(P \otimes Q \to M \otimes Q)$. Then there exists a finitely presented R-module P' and a map $f' : P \to P'$ such that f factors through f' and $x \in \ker(P \otimes Q \to P' \otimes Q)$.*

Proof. Write M as a colimit $M = colim_{i \in I} M_i$ of a directed system of finitely presented modules M_i. Since P is finitely presented, the map $f : P \to M$ factors through $M_j \to M$ for some $j \in I$. Upon tensoring by Q we have a commutative diagram

$$\begin{tikzcd} & M_j \otimes Q \arrow[dr] & \\ P \otimes Q \arrow[ur] \arrow[rr] & & M \otimes Q. \end{tikzcd}$$

The image y of x in $M_j \otimes Q$ is in the kernel of $M_j \otimes Q \to M \otimes Q$. Since $M \otimes Q = colim_{i \in I}(M_i \otimes Q)$, this means y maps to 0 in $M_{j'} \otimes Q$ for some $j' \geq j$. Thus we may take $P' = M_{j'}$ and f' to be the composite $P \to M_j \to M_{j'}$. □

Proposition 7.83.5. *Let M be an R-module. The following are equivalent:*

(1) *M is Mittag-Leffler.*
(2) *For every family $(Q_\alpha)_{\alpha \in A}$ of R-modules, the canonical map $M \otimes_R \left(\prod_\alpha Q_\alpha\right) \to \prod_\alpha (M \otimes_R Q_\alpha)$ is injective.*

Proof. First we prove (1) implies (2). Suppose M is Mittag-Leffler and let x be in the kernel of $M \otimes_R (\prod_\alpha Q_\alpha) \to \prod_\alpha (M \otimes_R Q_\alpha)$. Write M as a colimit $M = colim_{i \in I} M_i$ of a directed system of finitely presented modules M_i. Then $M \otimes_R (\prod_\alpha Q_\alpha)$ is the colimit of $M_i \otimes_R (\prod_\alpha Q_\alpha)$. So x is the image of an element $x_i \in M_i \otimes_R (\prod_\alpha Q_\alpha)$. We must show that x_i maps to 0 in $M_j \otimes_R (\prod_\alpha Q_\alpha)$ for some $j \geq i$. Since M is Mittag-Leffler, we may choose $j \geq i$ such that $M_i \to M_j$ and $M_i \to M$ dominate each other. Then consider the commutative diagram

$$\begin{tikzcd}
M \otimes_R (\prod_\alpha Q_\alpha) \arrow[r] & \prod_\alpha (M \otimes_R Q_\alpha) \\
M_i \otimes_R (\prod_\alpha Q_\alpha) \arrow[r, "\cong"] \arrow[u] \arrow[d] & \prod_\alpha (M_i \otimes_R Q_\alpha) \arrow[u] \arrow[d] \\
M_j \otimes_R (\prod_\alpha Q_\alpha) \arrow[r, "\cong"] & \prod_\alpha (M_j \otimes_R Q_\alpha)
\end{tikzcd}$$

whose bottom two horizontal maps are isomorphisms, according to Proposition 7.83.3. Since x_i maps to 0 in $\prod_\alpha (M \otimes_R Q_\alpha)$, its image in $\prod_\alpha (M_i \otimes_R Q_\alpha)$ is in the kernel of the map $\prod_\alpha (M_i \otimes_R Q_\alpha) \to \prod_\alpha (M \otimes_R Q_\alpha)$. But this kernel equals the kernel of $\prod_\alpha (M_i \otimes_R Q_\alpha) \to \prod_\alpha (M_j \otimes_R Q_\alpha)$ according to the choice of j. Thus x_i maps to 0 in $\prod_\alpha (M_j \otimes_R Q_\alpha)$ and hence to 0 in $M_j \otimes_R (\prod_\alpha Q_\alpha)$.

Now suppose (2) holds. We prove M satisfies formulation (1) of being Mittag-Leffler from Proposition 7.82.5. Let $f : P \to M$ be a map from a finitely presented module P to M. Choose a set B of representatives of the isomorphism classes of finitely presented R-modules. Let A be the set of pairs (Q, x) where $Q \in B$ and $x \in \ker(P \otimes Q \to M \otimes Q)$. For $\alpha = (Q, x) \in A$, we write Q_α for Q and x_α for x. Consider the commutative diagram

$$\begin{tikzcd}
M \otimes_R (\prod_\alpha Q_\alpha) \arrow[r] & \prod_\alpha (M \otimes_R Q_\alpha) \\
P \otimes_R (\prod_\alpha Q_\alpha) \arrow[r, "\cong"] \arrow[u] & \prod_\alpha (P \otimes_R Q_\alpha) \arrow[u]
\end{tikzcd}$$

The top arrow is an injection by assumption, and the bottom arrow is an isomorphism by Proposition 7.83.3. Let $x \in P \otimes_R (\prod_\alpha Q_\alpha)$ be the element corresponding to $(x_\alpha) \in \prod_\alpha (P \otimes_R Q_\alpha)$ under this isomorphism. Then $x \in \ker(P \otimes_R (\prod_\alpha Q_\alpha) \to M \otimes_R (\prod_\alpha Q_\alpha))$ since the top arrow in the diagram is injective. By Lemma 7.83.4, we get a finitely presented module P' and a map $f' : P \to P'$ such that $f : P \to M$ factors through f' and $x \in \ker(P \otimes_R (\prod_\alpha Q_\alpha) \to P' \otimes_R (\prod_\alpha Q_\alpha))$. We have a commutative diagram

$$\begin{tikzcd}
P' \otimes_R (\prod_\alpha Q_\alpha) \arrow[r, "\cong"] & \prod_\alpha (P' \otimes_R Q_\alpha) \\
P \otimes_R (\prod_\alpha Q_\alpha) \arrow[r, "\cong"] \arrow[u] & \prod_\alpha (P \otimes_R Q_\alpha) \arrow[u]
\end{tikzcd}$$

where both the top and bottom arrows are isomorphisms by Proposition 7.83.3. Thus since x is in the kernel of the left vertical map, (x_α) is in the kernel of the right vertical map. This means $x_\alpha \in \ker(P \otimes_R Q_\alpha \to P' \otimes_R Q_\alpha)$ for every $\alpha \in A$. By the definition of A this means $\ker(P \otimes_R Q \to P' \otimes_R Q) \supset \ker(P \otimes_R Q \to M \otimes_R Q)$ for all finitely presented Q and, since $f : P \to M$ factors through $f' : P \to P'$, actually equality holds. By Lemma 7.82.3, f and f' dominate each other. □

Lemma 7.83.6. *Let $0 \to M_1 \to M_2 \to M_3 \to 0$ be a universally exact sequence of R-modules. Then:*

(1) *If M_2 is Mittag-Leffler, then M_1 is Mittag-Leffler.*
(2) *If M_1 and M_3 are Mittag-Leffler, then M_2 is Mittag-Leffler.*

Proof. For any family $(Q_\alpha)_{\alpha \in A}$ of R-modules we have a commutative diagram

$$\begin{tikzcd} 0 \arrow[r] & M_1 \otimes_R (\prod_\alpha Q_\alpha) \arrow[r] \arrow[d] & M_2 \otimes_R (\prod_\alpha Q_\alpha) \arrow[r] \arrow[d] & M_3 \otimes_R (\prod_\alpha Q_\alpha) \arrow[r] \arrow[d] & 0 \\ 0 \arrow[r] & \prod_\alpha (M_1 \otimes Q_\alpha) \arrow[r] & \prod_\alpha (M_2 \otimes Q_\alpha) \arrow[r] & \prod_\alpha (M_3 \otimes Q_\alpha) \arrow[r] & 0 \end{tikzcd}$$

with exact rows. Thus (1) and (2) follow from Proposition 7.83.5. □

Lemma 7.83.7. *If $M = \bigoplus_{i \in I} M_i$ is a direct sum of R-modules, then M is Mittag-Leffler if and only if each M_i is Mittag-Leffler.*

Proof. The ``only if'' direction follows from Lemma 7.83.6 (1) and the fact that a split short exact sequence is universally exact. For the converse, first note that if I is finite then this follows from Lemma 7.83.6 (2). For general I, if all M_i are Mittag-Leffler then we prove the same of M by verifying condition (1) of Proposition 7.82.5. Let $f : P \to M$ be a map from a finitely presented module P. Then f factors as $P \xrightarrow{f'} \bigoplus_{i' \in I'} M_{i'} \hookrightarrow \bigoplus_{i \in I} M_i$ for some finite subset I' of I. By the finite case $\bigoplus_{i' \in I'} M_{i'}$ is Mittag-Leffler and hence there exists a finitely presented module Q and a map $g : P \to Q$ such that g and f' dominate each other. Then also g and f dominate each other. □

Lemma 7.83.8. *Let $R \to S$ be a ring map. Let M be an S-module. If S is Mittag-Leffler as an R-module, and M is flat and Mittag-Leffler as an S-module, then M is Mittag-Leffler as an R-module.*

Proof. We deduce using the characterization of Proposition 7.83.5. Namely, suppose that Q_α is a family of R-modules. Consider the composition

$$\begin{tikzcd} M \otimes_R \prod_\alpha Q_\alpha = M \otimes_S S \otimes_R \prod_\alpha Q_\alpha \arrow[d] \\ M \otimes_S \prod_\alpha (S \otimes_R Q_\alpha) \arrow[d] \\ \prod_\alpha (M \otimes_S \otimes_R Q_\alpha) = \prod_\alpha (M \otimes_R Q_\alpha) \end{tikzcd}$$

The first arrows is injective as M is flat over S and S is Mittag-Leffler over R and the second arrow is injective as M is Mittag-Leffler over S. Hence M is Mittag-Leffler over R. □

7.84. Coherent rings

We use the discussion on interchanging $\prod$ and $\otimes$ to determine for which rings products of flat modules are flat. It turns out that these are the so-called coherent rings. You may be more familiar with the notion of a coherent $\mathcal{O}_X$-module on a ringed space, see Modules, Section 7.84.

Definition 7.84.1. Let R be a ring. Let M be an R-module.

(1) We say M is a *coherent module* if it is finitely generated and every finitely generated submodule of M is finitely presented over R.
(2) We say R is a *coherent ring* if it is coherent as a module over itself.

Thus a ring is coherent if and only if every finitely generated ideal is finitely presented as a module. The category of coherent modules is abelian.

Lemma 7.84.2. *Let R be a ring.*

(1) *A finite type submodule of a coherent module is coherent.*
(2) *Let $\varphi : N \to M$ be a homomorphism from a finite module to a coherent module. Then $\mathrm{Ker}(\varphi)$ is finite.*
(3) *Let $\varphi : N \to M$ be a homomorphism of coherent modules. Then $\mathrm{Ker}(\varphi)$ and $\mathrm{Coker}(\varphi)$ are coherent modules.*
(4) *The category of coherent modules is an abelian subcategory of Mod_R.*
(5) *Given a short exact sequence of R-modules $0 \to M_1 \to M_2 \to M_3 \to 0$ if two out of three are coherent so is the third.*

Proof. The first statement is immediate from the definition. During the rest of the proof we will use the results of Lemma 7.5.4 without further mention.

Let $\varphi : N \to M$ satisfy the assumptions of (2). Suppose that N is generated by $x_1, \ldots, x_n$. By Definition 7.84.1 the kernel K of the induced map $\bigoplus_{i=1}^n R \to M$, $e_i \mapsto \varphi(x_i)$ is of finite type. Hence $\mathrm{Ker}(\varphi)$ which is the image of the composition $K \to \bigoplus_{i=1}^n R \to N$ is of finite type. This proves (2).

Let $\varphi : N \to M$ satisfy the assumptions of (3). By (2) the kernel of φ is of finite type and hence by (1) it is coherent.

With the same hypotheses let us show that $\mathrm{Coker}(\varphi)$ is coherent. Since M is finite so is $\mathrm{Coker}(\varphi)$. Let $\overline{x}_i \in \mathrm{Coker}(\varphi)$. We have to show that the kernel of the associated morphism $\overline{\Psi} : \bigoplus_{i=1}^n R \to \mathrm{Coker}(\varphi)$ is finite. Choose $x_i \in M$ lifting $\overline{x}_i$. Thus $\overline{\Psi}$ lifts to $\Psi : \bigoplus_{i=1}^n R \to M$. Consider the following diagram

$$\begin{tikzcd}
0 \arrow[r] & \mathrm{Ker}(\Psi) \arrow[r] \arrow[d] & \bigoplus_{i=1}^n R \arrow[r] \arrow[d, equal] & R \arrow[r] \arrow[d] & 0 \\
0 \arrow[r] & \mathrm{Ker}(\overline{\Psi}) \arrow[r] & \bigoplus_{i=1}^n R \arrow[r] & \mathrm{Coker}(\varphi) \arrow[r] & 0
\end{tikzcd}$$

By the snake lemma we get a short exact sequence $0 \to \mathrm{Ker}(\Psi) \to \mathrm{Ker}(\overline{\Psi}) \to \mathrm{Im}(\varphi) \to 0$. Hence we see that $\mathrm{Ker}(\overline{\Psi})$ is finite.

Statement (4) follows from (3).

Let $0 \to M_1 \to M_2 \to M_3 \to 0$ be a short exact sequence of R-modules. It suffices to prove that if M_1 and M_3 are coherent so is M_2. By Lemma 7.5.4 we see that M_2 is finite. Let $x_1, \ldots, x_n$ be finitely many elements of M_2. We have to show that the module of relations K between them is finite. Consider the following commutative diagram

$$\begin{tikzcd} 0 \arrow[r] & 0 \arrow[r] \arrow[d] & \bigoplus_{i=1}^n R \arrow[r] \arrow[d] & \bigoplus_{i=1}^n R \arrow[r] \arrow[d] & 0 \\ 0 \arrow[r] & M_1 \arrow[r] & M_2 \arrow[r] & M_3 \arrow[r] & 0 \end{tikzcd}$$

with obvious notation. By the snake lemma we get an exact sequence $0 \to K \to K_3 \to M_1$ where K_3 is the module of relations among the images of the x_i in M_3. Since M_3 is coherent we see that K_3 is a finite module. Since M_1 is coherent we see that the image I of $K_3 \to M_1$ is coherent. Hence K is the kernel of the map $K_3 \to I$ between a finite module and a coherent module and hence finite by (2). $\square$

Lemma 7.84.3. *Let R be a ring. If R is coherent, then a module is coherent if and only if it is finitely presented.*

Proof. It is clear that a coherent module is finitely presented (over any ring). Coversely, if R is coherent, then $R^{\oplus n}$ is coherent and so is the cokernel of any map $R^{\oplus m} \to R^{\oplus n}$, see Lemma 7.84.2. $\square$

Lemma 7.84.4. *A Noetherian ring is a coherent ring.*

Proof. By Lemma 7.28.4 any finite R-module is finitely presented. In particular any ideal of R is finitely presented. $\square$

Proposition 7.84.5. *Let R be a ring. The following are equivalent*

(1) *R is coherent,*
(2) *any product of flat R-modules is flat, and*
(3) *for every set A the module R^A is flat.*

Proof. Assume R coherent, and let Q_α, $\alpha \in A$ be a set of flat R-modules. We have to show that $I \otimes_R \prod_\alpha Q_\alpha \to \prod Q_\alpha$ is injective for every finitely generated ideal I of R, see Lemma 7.35.4. Since R is coherent I is an R-module of finite presentation. Hence $I \otimes_R \prod_\alpha Q_\alpha = \prod I \otimes_R Q_\alpha$ by Proposition 7.83.3. The desired injectivity follows as $I \otimes_R Q_\alpha \to Q_\alpha$ is injective by flatness of Q_α.

The implication (2) $\Rightarrow$ (3) is trivial.

Assume that the R-module R^A is flat for every set A. Let I be a finitely generated ideal in R. Then $I \otimes_R R^A \to R^A$ is injective by assumption. By Proposition 7.83.2 and the finiteness of I the image is equal to I^A. Hence $I \otimes_R R^A = I^A$ for every set A and we conclude that I is finitely presented by Proposition 7.83.3. $\square$

7.85. Examples and non-examples of Mittag-Leffler modules

We end this section with some examples and non-examples of Mittag-Leffler modules.

Example 7.85.1. Mittag-Leffler modules.

(1) Any finitely presented module is Mittag-Leffler. This follows, for instance, from Proposition 7.82.5 (1). In general, it is true that a finitely generated module is Mittag-Leffler if and only it is finitely presented. This follows from Propositions 7.83.2, 7.83.3, and 7.83.5.

(2) A free module is Mittag-Leffler since it satisfies condition (1) of Proposition 7.82.5.
(3) By the previous example together with Lemma 7.83.7, projective modules are Mittag-Leffler.

We also want to add to our list of examples power series rings over a Noetherian ring R. This will be a consequence the following lemma.

Lemma 7.85.2. *Let M be a flat R-module. Suppose the following condition holds: if F is a free finite R-module and $x \in F \otimes_R M$, then there exists a smallest submodule F' of F such that $x \in F' \otimes_R M$. Then M is Mittag-Leffler.*

Proof. By Theorem 7.75.4 we can write M as the colimit $M = colim_{i \in I} M_i$ of a directed system (M_i, f_{ij}) of free finite R-modules. By Remark 7.82.7, it suffices to show that the inverse system $(Hom_R(M_i, R), Hom_R(f_{ij}, R))$ is Mittag-Leffler. In other words, fix $i \in I$ and for $j \geq i$ let Q_j be the image of $Hom_R(M_j, R) \to Hom_R(M_i, R)$; we must show that the Q_j stabilize.

Since M_i is free and finite, we can make the identification $Hom_R(M_i, M_j) = Hom_R(M_i, R) \otimes_R M_j$ for all j. Using the fact that the M_j are free, it follows that for $j \geq i$, Q_j is the smallest submodule of $Hom_R(M_i, R)$ such that $f_{ij} \in Q_j \otimes_R M_j$. Under the identification $Hom_R(M_i, M) = Hom_R(M_i, R) \otimes_R M$, the canonical map $f_i : M_i \to M$ is in $Hom_R(M_i, R) \otimes_R M$. By the assumption on M, there exists a smallest submodule Q of $Hom_R(M_i, R)$ such that $f_i \in Q \otimes_R M$. We are going to show that the Q_j stabilize to Q.

For $j \geq i$ we have a commutative diagram

$$\begin{tikzcd} Q_j \otimes_R M_j \arrow[r] \arrow[d] & Hom_R(M_i, R) \otimes_R M_j \arrow[d] \\ Q_j \otimes_R M \arrow[r] & Hom_R(M_i, R) \otimes_R M. \end{tikzcd}$$

Since $f_{ij} \in Q_j \otimes_R M_j$ maps to $f_i \in Hom_R(M_i, R) \otimes_R M$, it follows that $f_i \in Q_j \otimes_R M$. Hence, by the choice of Q, we have $Q \subset Q_j$ for all $j \geq i$.

Since the Q_j are decreasing and $Q \subset Q_j$ for all $j \geq i$, to show that the Q_j stabilize to Q it suffices to find a $j \geq i$ such that $Q_j \subset Q$. As an element of

$$Hom_R(M_i, R) \otimes_R M = colim_{j \in J}(Hom_R(M_i, R) \otimes_R M_j),$$

f_i is the colimit of f_{ij} for $j \geq i$, and f_i also lies in the submodule

$$colim_{j \in J}(Q \otimes_R M_j) \subset colim_{j \in J}(Hom_R(M_i, R) \otimes_R M_j).$$

It follows that for some $j \geq i$, f_{ij} lies in $Q \otimes_R M_j$. Since Q_j is the smallest submodule of $Hom_R(M_i, R)$ with $f_{ij} \in Q_j \otimes_R M_j$, we conclude $Q_j \subset Q$. □

Lemma 7.85.3. *Let R be a Noetherian ring and A a set. Then $M = R^A$ is a flat and Mittag-Leffler R-module.*

Proof. Combining Lemma 7.84.4 and Proposition 7.84.5 we see that M is flat over R. We show that M satisfies the condition of Lemma 7.85.2. Let F be a free finite R-module. If F'

is any submodule of F then it is finitely presented since R is Noetherian. So by Proposition 7.83.3 we have a commutative diagram

$$\begin{tikzcd} F' \otimes_R M \arrow[r] \arrow[d, "\cong"] & F \otimes_R M \arrow[d, "\cong"] \\ (F')^A \arrow[r] & F^A \end{tikzcd}$$

by which we can identify the map $F' \otimes_R M \to F \otimes_R M$ with $(F')^A \to F^A$. Hence if $x \in F \otimes_R M$ corresponds to $(x_\alpha) \in F^A$, then the submodule of F' of F generated by the x_α is the smallest submodule of F such that $x \in F' \otimes_R M$. $\square$

Lemma 7.85.4. *Let R be a Noetherian ring and n a positive integer. Then the R-module $M = R[[t_1, \ldots, t_n]]$ is flat and Mittag-Leffler.*

Proof. As an R-module, we have $M = R^A$ for a (countable) set A. Hence this lemma is a special case of Lemma 7.85.3. $\square$

Example 7.85.5. Non Mittag-Leffler modules.

(1) By Example 7.83.1 and Proposition 7.83.5, $\mathbf{Q}$ is not a Mittag-Leffler $\mathbf{Z}$-module.
(2) We prove below (Theorem 7.87.3) that for a flat and countably generated module, projectivity is equivalent to being Mittag-Leffler. Thus any flat, countably generated, non-projective module M is an example of a non-Mittag-Leffler module. For such an example, see Remark 7.72.3.
(3) Let k be a field. Let $R = k[[x]]$. The R-module $M = \prod_{n \in \mathbf{N}} R/(x^n)$ is not Mittag-Leffler. Namely, consider the element $\xi = (\xi_1, \xi_2, \xi_3, \ldots)$ defined by $\xi_{2^m} = x^{2^{m-1}}$ and $\xi_n = 0$ else, so
$$\xi = (0, x, 0, x^2, 0, 0, 0, x^4, 0, 0, 0, 0, 0, 0, 0, x^8, \ldots)$$
Then the annihilator of ξ in $M/x^{2^m}M$ is generated $x^{2^{m-1}}$ for $m \gg 0$. But if M was Mittag-Leffler, then there would exist a finite R-module Q and an element $\xi' \in Q$ such that the annihilator of ξ' in Q/x^lQ agrees with the annihilator of ξ in M/x^lM for all $l \geq 1$, see Proposition 7.82.5 (1). Now you can prove there exists an integer $a \geq 0$ such that the annihilator of ξ' in Q/x^lQ is generated by either x^a or x^{l-a} for all $l \gg 0$ (depending on whether $\xi' \in Q$ is torsion or not). The combination of the above would give for all $l = 2^m >> 0$ the equality $a = l/2$ or $l - a = l/2$ which is nonsensical.
(4) The same argument shows that (x)-adic completion of $\bigoplus_{n \in \mathbf{N}} R/(x^n)$ is not Mittag-Leffler over $R = k[[x]]$ (hint: ξ is actually an element of this completion).
(5) Let $R = k[a, b]/(a^2, ab, b^2)$. Let S be the finitely presented R-algebra with presentation $S = R[t]/(at - b)$. Then as an R-module S is countably generated and indecomposable (details omitted). On the other hand, R is Artinian local, hence complete local, hence a henselian local ring, see Lemma 7.139.10. If S was Mittag-Leffler as an R-module, then it would be a direct sum of finite R-modules by Lemma 7.139.26. Thus we conclude that S is not Mittag-Leffler as an R-module.

7.86. Countably generated Mittag-Leffler modules

It turns out that countably generated Mittag-Leffler modules have a particularly simple structure.

Lemma 7.86.1. *Let M be an R-module. Write $M = colim_{i\in I} M_i$ where (M_i, f_{ij}) is a directed system of finitely presented R-modules. If M is Mittag-Leffler and countably generated, then there is a directed countable subset $I' \subset I$ such that $M \cong colim_{i\in I'} M_i$.*

Proof. Let $x_1, x_2, \ldots$ be a countable set of generators for M. For each x_n choose $i \in I$ such that x_n is in the image of the canonical map $f_i : M_i \to M$; let $I'_0 \subset I$ be the set of all these i. Now since M is Mittag-Leffler, for each $i \in I'_0$ we can choose $j \in I$ such that $j \geq i$ and $f_{ij} : M_i \to M_j$ factors through $f_{ik} : M_i \to M_k$ for all $k \geq i$ (condition (3) of Proposition 7.82.5); let I'_1 be the union of I'_0 with all of these j. Since I'_1 is a countable, we can enlarge it to a countable directed set $I'_2 \subset I$. Now we can apply the same procedure to I'_2 as we did to I'_0 to get a new countable set $I'_3 \subset I$. Then we enlarge I'_3 to a countable directed set I'_4. Continuing in this way---adding in a j as in Proposition 7.82.5 (3) for each $i \in I'_\ell$ if ℓ is odd and enlarging I'_ℓ to a directed set if ℓ is even---we get a sequence of subsets $I'_\ell \subset I$ for $\ell \geq 0$. The union $I' = \bigcup I'_\ell$ satisfies:

(1) I' is countable and directed;
(2) each x_n is in the image of $f_i : M_i \to M$ for some $i \in I'$;
(3) if $i \in I'$, then there is $j \in I'$ such that $j \geq i$ and $f_{ij} : M_i \to M_j$ factors through $f_{ik} : M_i \to M_k$ for all $k \in I$ with $k \geq i$. In particular $\ker(f_{ik}) \subset \ker(f_{ij})$ for $k \geq i$.

We claim that the canonical map $colim_{i\in I'} M_i \to colim_{i\in I} M_i = M$ is an isomorphism. By (2) it is surjective. For injectivity, suppose $x \in colim_{i\in I'} M_i$ maps to 0 in $colim_{i\in I} M_i$. Representing x by an element $\tilde{x} \in M_i$ for some $i \in I'$, this means that $f_{ik}(\tilde{x}) = 0$ for some $k \in I, k \geq i$. But then by (3) there is $j \in I', j \geq i$, such that $f_{ij}(\tilde{x}) = 0$. Hence $x = 0$ in $colim_{i\in I'} M_i$. □

Lemma 7.86.1 above implies that a countably generated Mittag-Leffler module M over R is the colimit of a system

$$M_1 \to M_2 \to M_3 \to M_4 \to \ldots$$

with each M_n a finitely presented R-module. To see this argue as in the proof of Lemma 7.80.3 to see that a countable directed partially ordered set has a cofinal subset isomorphic to $(\mathbf{N}, \geq)$. Suppose $R = k[x_1, x_2, x_3, \ldots]$ and $M = R/(x_i)$. Then M is finitely generated but not finitely presented, hence not Mittag-Leffler (see Example 7.85.1 part (1)). But of course you can write $M = colim_n M_n$ by taking $M_n = R/(x_1, \ldots, x_n)$, hence the condition that you can write M as such a limit does not imply that M is Mittag-Leffler.

Lemma 7.86.2. *Let R be a ring. Let M be an R-module. Assume M is Mittag-Leffler and countably generated. For any R-module map $f : P \to M$ with P finitely generated there exists an endomorphism $\alpha : M \to M$ such that*

(1) *$\alpha : M \to M$ factors through a finitely presented R-module, and*
(2) *$\alpha \circ f = f$.*

Proof. Write $M = colim_{i\in I} M_i$ as a directed colimit of finitely presented R-modules with I countable, see Lemma 7.86.1. The transition maps are denoted f_{ij} and we use $f_i : M_i \to M$ to note the canonical maps into M. Set $N = \prod_{s\in I} M_s$. Denote

$$M_i^* = Hom_R(M_i, N) = \prod_{s\in S} Hom_R(M_i, M_s)$$

so that (M_i^*) is an inverse system of R-modules over I. Note that $Hom_R(M, N) = lim\, M_i^*$. As M is Mittag-Leffler, we find for every $i \in I$ an index $k(i) \geq i$ such that

$$E_i := \bigcap\nolimits_{i' \geq i} \mathrm{Im}(M_{i'}^* \to M_i^*) = \mathrm{Im}(M_{k(i)}^* \to M_i^*)$$

Choose $i \in I$ such that $\mathrm{Im}(P \to M) \subset \mathrm{Im}(M_i \to M)$. This is possible as P is finitely generated. Set $k = k(i)$ for this i. Let $x = (0, \ldots, 0, \mathrm{id}_{M_k}, 0, \ldots, 0) \in M_k^*$ and note that this maps to $y = (0, \ldots, 0, f_{ik}, 0, \ldots, 0) \in M_i^*$. By our choice of k we see that $y \in E_i$. By Example 7.80.2 the transition maps $E_{i'} \to E_i$ are surjective for each $i' \geq i$ and $lim\, E_i = lim\, M_i^* = Hom_R(M, N)$. Hence Lemma 7.80.3 guarantees there exists an element $z \in Hom_R(M, N)$ which maps to y in $E_i \subset M_i^*$. Let z_k be the kth component of z. Then $z_k : M \to M_k$ is a homomorphism such that

$$\begin{tikzcd} M \arrow[r, "z_k"'] & M_k \\ M_i \arrow[u, "f_i"] \arrow[ur, "f_{ik}"'] & \end{tikzcd}$$

commutes. Let $\alpha : M \to M$ be the composition $f_k \circ z_k : M \to M_k \to M$. Then α factors through a finitely presented module by construction and $\alpha \circ f_i = f_i$. Since the image of f is contained in the image of f_i this also implies that $\alpha \circ f = f$. □

We will see later (see Lemma 7.139.26) that Lemma 7.86.2 means that a countably generated Mittag-Leffler module over a henselian local ring is a direct sum of finitely presented modules.

7.87. Characterizing projective modules

The goal of this section is to prove that a module is projective if and only if it is flat, Mittag-Leffler, and a direct sum of countably generated modules (Theorem 7.87.3 below).

Lemma 7.87.1. *Let M be an R-module. If M is flat, Mittag-Leffler, and countably generated, then M is projective.*

Proof. By Lazard's theorem (Theorem 7.75.4), we can write $M = colim_{i \in I} M_i$ for a directed system of finite free R-modules (M_i, f_{ij}) indexed by a set I. By Lemma 7.86.1, we may assume I is countable. Now let

$$0 \to N_1 \to N_2 \to N_3 \to 0$$

be an exact sequence of R-modules. We must show that applying $Hom_R(M, -)$ preserves exactness. Since M_i is finite free,

$$0 \to Hom_R(M_i, N_1) \to Hom_R(M_i, N_2) \to Hom_R(M_i, N_3) \to 0$$

is exact for each i. Since M is Mittag-Leffler, $(Hom_R(M_i, N_1))$ is a Mittag-Leffler inverse system. So by Lemma 7.80.4,

$$0 \to lim_{i \in I} Hom_R(M_i, N_1) \to lim_{i \in I} Hom_R(M_i, N_2) \to lim_{i \in I} Hom_R(M_i, N_3) \to 0$$

is exact. But for any R-module N there is a functorial isomorphism $Hom_R(M, N) \cong lim_{i \in I} Hom_R(M_i, N)$, so

$$0 \to Hom_R(M, N_1) \to Hom_R(M, N_2) \to Hom_R(M, N_3) \to 0$$

is exact. □

Remark 7.87.2. Lemma 7.87.1 does not hold without the countable generation assumption. For example, the $\mathbf{Z}$-module $M = \mathbf{Z}[[x]]$ is flat and Mittag-Leffler but not projective. It is Mittag-Leffler by Lemma 7.85.4. Subgroups of free abelian groups are free, hence a projective $\mathbf{Z}$-module is in fact free and so are its submodules. Thus to show M is not projective it suffices to produce a non-free submodule. Fix a prime p and consider the submodule N consisting of power series $f(x) = \sum a_i x^i$ such that for every integer $m \geq 1$, p^m divides a_i for all but finitely many i. Then $\sum a_i p^i x^i$ is in N for all $a_i \in \mathbf{Z}$, so N is uncountable. Thus if N were free it would have uncountable rank and the dimension of N/pN over $\mathbf{Z}/p$ would be uncountable. This is not true as the elements $x^i \in N/pN$ for $i \geq 0$ span N/pN.

Theorem 7.87.3. *Let M be an R-module. Then M is projective if and only it satisfies:*

1. *M is flat,*
2. *M is Mittag-Leffler,*
3. *M is a direct sum of countably generated R-modules.*

Proof. First suppose M is projective. Then M is a direct summand of a free module, so M is flat and Mittag-Leffler since these properties pass to direct summands. By Kaplansky's theorem (Theorem 7.78.5), M satisfies (3).

Conversely, suppose M satisfies (1)-(3). Since being flat and Mittag-Leffler passes to direct summands, M is a direct sum of flat, Mittag-Leffler, countably generated R-modules. Lemma 7.87.1 implies M is a direct sum of projective modules. Hence M is projective. □

Lemma 7.87.4. *Let $f : M \to N$ be universally injective map of R-modules. Suppose M is a direct sum of countably generated R-modules, and suppose N is flat and Mittag-Leffler. Then M is projective.*

Proof. By Lemmas 7.76.7 and 7.83.6, M is flat and Mittag-Leffler, so the conclusion follows from Theorem 7.87.3. □

Lemma 7.87.5. *Let R be a Noetherian ring and let M be a R-module. Suppose M is a direct sum of countably generated R-modules, and suppose there is a universally injective map $M \to R[[t_1, \ldots, t_n]]$ for some n. Then M is projective.*

Proof. Follows from Lemmas 7.87.4 and 7.85.4. □

7.88. Ascending properties of modules

All of the properties of a module in Theorem 7.87.3 ascend along arbitrary ring maps:

Lemma 7.88.1. *Let $R \to S$ be a ring map. Let M be an R-module. Then:*

1. *If M is flat, then the S-module $M \otimes_R S$ is flat.*
2. *If M is Mittag-Leffler, then the S-module $M \otimes_R S$ is Mittag-Leffler.*
3. *If M is a direct sum of countably generated R-modules, then the S-module $M \otimes_R S$ is a direct sum of countably generated S-modules.*
4. *If M is projective, then the S-module $M \otimes_R S$ is projective.*

Proof. All are obvious except (2). For this, use formulation (3) of being Mittag-Leffler from Proposition 7.82.5 and the fact that tensoring commutes with taking colimits. □

7.89. Descending properties of modules

We address the faithfully flat descent of the properties from Theorem 7.87.3 that characterize projectivity. In the presence of flatness, the property of being a Mittag-Leffler module descends:

Lemma 7.89.1. *Let $R \to S$ be a faithfully flat ring map. Let M be an R-module. If the S-module $M \otimes_R S$ is flat and Mittag-Leffler, then M is flat and Mittag-Leffler.*

Proof. By Lemma 7.77.2, flatness descends, so M is flat. Thus by Lazard's theorem (Theorem 7.75.4) we can write $M = colim_{i \in I} M_i$ where (M_i, f_{ij}) is a directed system of free finite R-modules. According to Remark 7.82.7, to prove M is Mittag-Leffler it is enough to show that $(Hom_R(M_i, R))$ is a Mittag-Leffler inverse system.

Since tensoring commutes with colimits, $M \otimes_R S = colim(M_i \otimes_R S)$. Since $M \otimes_R S$ is Mittag-Leffler this means $(Hom_S(M_i \otimes_R S, S))$ is a Mittag-Leffler inverse system. So for every $i \in I$, the family $\text{Im}(Hom_S(M_j \otimes_R S, S) \to Hom_S(M_i \otimes_R S, S))$ for $j \geq i$ stabilizes. Because M_i is free and finite there is a functorial isomorphism $Hom_S(M_i \otimes_R S, S) \cong Hom_R(M_i, R) \otimes_R S$, and because $R \to S$ is faithfully flat, tensoring by S commutes with taking the image of a module map. Thus we find that for every $i \in I$, the family $\text{Im}(Hom_R(M_j, R) \to Hom_R(M_i, R)) \otimes_R S$ for $j \geq i$ stabilizes. But if N is an R-module and $N' \subset N$ a submodule such that $N' \otimes_R S = N \otimes_R S$, then $N' = N$ by faithful flatness of S. We conclude that for every $i \in I$, the family $\text{Im}(Hom_R(M_j, R) \to Hom_R(M_i, R))$ for $j \geq i$ stabilizes. So M is Mittag-Leffler. □

At this point the faithfully flat descent of countably generated projective modules follows easily.

Lemma 7.89.2. *Let $R \to S$ be a faithfully flat ring map. Let M be an R-module. If the S-module $M \otimes_R S$ is countably generated and projective, then M is countably generated and projective.*

Proof. Follows from Lemma 7.89.1, the fact that countable generation descends, and Theorem 7.87.3. □

All that remains is to use dévissage to reduce descent of projectivity in the general case to the countably generated case. First, two simple lemmas.

Lemma 7.89.3. *Let $R \to S$ be a ring map, let M be an R-module, and let Q be a countably generated S-submodule of $M \otimes_R S$. Then there exists a countably generated R-submodule P of M such that $Im(P \otimes_R S \to M \otimes_R S)$ contains Q.*

Proof. Let $y_1, y_2, \ldots$ be generators for Q and write $y_j = \sum_k x_{jk} \otimes s_{jk}$ for some $x_{jk} \in M$ and $s_{jk} \in S$. Then take P be the submodule of M generated by the x_{jk}. □

Lemma 7.89.4. *Let $R \to S$ be a ring map, and let M be an R-module. Suppose $M \otimes_R S = \bigoplus_{i \in I} Q_i$ is a direct sum of countably generated S-modules Q_i. If N is a countably generated submodule of M, then there is a countably generated submodule N' of M such that $N' \supset N$ and $Im(N' \otimes_R S \to M \otimes_R S) = \bigoplus_{i \in I'} Q_i$ for some subset $I' \subset I$.*

Proof. Let $N'_0 = N$. We construct by induction an increasing sequence of countably generated submodules $N'_\ell \subset M$ for $\ell = 0, 1, 2, \ldots$ such that: if I'_ℓ is the set of $i \in I$ such that the projection of $\text{Im}(N'_\ell \otimes_R S \to M \otimes_R S)$ onto Q_i is nonzero, then $\text{Im}(N'_{\ell+1} \otimes_R S \to M \otimes_R S)$ contains Q_i for all $i \in I'_\ell$. To construct $N'_{\ell+1}$ from N'_ℓ, let Q be the sum of (the countably many) Q_i for $i \in I'_\ell$, choose P as in Lemma 7.89.3, and then let $N'_{\ell+1} = N'_\ell + P$. Having constructed the N'_ℓ, just take $N' = \bigcup_\ell N'_\ell$ and $I' = \bigcup_\ell I'_\ell$. □

Theorem 7.89.5. *Let $R \to S$ be a faithfully flat ring map. Let M be an R-module. If the S-module $M \otimes_R S$ is projective, then M is projective.*

Proof. We are going to construct a Kaplansky dévissage of M to show that it is a direct sum of projective modules and hence projective. By Theorem 7.78.5 we can write $M \otimes_R S = \bigoplus_{i\in I} Q_i$ as a direct sum of countably generated S-modules Q_i. Choose a well-ordering on M. By transfinite induction we are going to define an increasing family of submodules M_α of M, one for each ordinal α, such that $M_\alpha \otimes_R S$ is a direct sum of some subset of the Q_i.

For $\alpha = 0$ let $M_0 = 0$. If α is a limit ordinal and M_β has been defined for all $\beta < \alpha$, then define $M_\beta = \bigcup_{\beta<\alpha} M_\beta$. Since each $M_\beta \otimes_R S$ for $\beta < \alpha$ is a direct sum of a subset of the Q_i, the same will be true of $M_\alpha \otimes_R S$. If $\alpha + 1$ is a successor ordinal and M_α has been defined, then define $M_{\alpha+1}$ as follows. If $M_\alpha = M$, then let $M_{\alpha+1} = M$. Otherwise choose the smallest $x \in M$ (with respect to the fixed well-ordering) such that $x \notin M_\alpha$. Since S is flat over R, $(M/M_\alpha)\otimes_R S = M\otimes_R S/M_\alpha \otimes_R S$, so since $M_\alpha \otimes_R S$ is a direct sum of some Q_i, the same is true of $(M/M_\alpha)\otimes_R S$. By Lemma 7.89.4, we can find a countably generated R-submodule P of M/M_α containing the image of x in M/M_α and such that $P\otimes_R S$ (which equals $\mathrm{Im}(P\otimes_R S \to M\otimes_R S)$ since S is flat over R) is a direct sum of some Q_i. Since $M\otimes_R S = \bigoplus_{i\in I} Q_i$ is projective and projectivity passes to direct summands, $P\otimes_R S$ is also projective. Thus by Lemma 7.89.2, P is projective. Finally we define $M_{\alpha+1}$ to be the preimage of P in M, so that $M_{\alpha+1}/M_\alpha = P$ is countably generated and projective. In particular M_α is a direct summand of $M_{\alpha+1}$ since projectivity of $M_{\alpha+1}/M_\alpha$ implies the sequence $0 \to M_\alpha \to M_{\alpha+1} \to M_{\alpha+1}/M_\alpha \to 0$ splits.

Transfinite induction on M (using the fact that we constructed $M_{\alpha+1}$ to contain the smallest $x \in M$ not contained in M_α) shows that each $x \in M$ is contained in some M_α. Thus, there is some large enough ordinal S satisfying: for each $x \in M$ there is $\alpha \in S$ such that $x \in M_\alpha$. This means $(M_\alpha)_{\alpha\in S}$ satisfies property (1) of a Kaplansky dévissage of M. The other properties are clear by construction. We conclude $M = \bigoplus_{\alpha+1\in S} M_{\alpha+1}/M_\alpha$. Since each $M_{\alpha+1}/M_\alpha$ is projective by construction, M is projective. □

7.90. Completion

Suppose that R is a ring and I is an ideal. We define the *completion of R with respect to I* to be the limit

$$R^\wedge = lim_n\, R/I^n.$$

An element of $R^\wedge$ is simply given by a sequence of elements $f_n \in R/I^n$ such that $f_n \equiv f_{n+1} \bmod I^n$ for all n. Similarly, if M is an R-module then we define the *completion of M with respect to I* to be the limit

$$M^\wedge = lim_n\, M/I^nM.$$

An element of $M^\wedge$ is simply given by a sequence of elements $m_n \in M/I^nM$ such that $m_n \equiv m_{n+1} \bmod I^nM$ for all n. From this description it is clear that there are always canonical maps

$$M \longrightarrow M^\wedge, \quad \text{and} \quad M\otimes_R R^\wedge \longrightarrow M^\wedge.$$

Moreover, given a map $\varphi : M \to N$ of modules we get an induced map $\varphi^\wedge : M^\wedge \to N^\wedge$ on completions making the diagram

$$\begin{tikzcd} M \arrow[r] \arrow[d] & N \arrow[d] \\ M^\wedge \arrow[r] & N^\wedge \end{tikzcd}$$

commute. In general completion is not an exact functor, see Examples, Section 64.4. Here are some initial positive results.

Lemma 7.90.1. *Let R be a ring. Let $I \subset R$ be an ideal. Let $\varphi : M \to N$ be a map of R-modules.*

(1) *If $M/IM \to N/IN$ is surjective, then $M^\wedge \to N^\wedge$ is surjective.*
(2) *If $M \to N$ is surjective, then $M^\wedge \to N^\wedge$ is surjective.*
(3) *If $0 \to K \to M \to N \to 0$ is a short exact sequence of R-modules and N is flat, then $0 \to K^\wedge \to M^\wedge \to N^\wedge \to 0$ is a short exact sequence.*
(4) *The map $M \otimes_R R^\wedge \to M^\wedge$ is surjective for any finite R-module M.*

Proof. Assume $M/IM \to N/IN$ is surjective. Then the map $M/I^nM \to N/I^nN$ is surjective for each $n \geq 1$ by Nakayama's lemma (Lemma 7.14.5). Set $K_n = \{x \in M \mid \varphi(x) \in I^nN\}$. Thus we get short exact sequences

$$0 \to K_n/I^nM \to M/I^nM \to N/I^nN \to 0$$

We claim that the canonical map $K_{n+1}/I^{n+1}M \to K_n/I^nM$ is surjective. Namely, if $x \in K_n$ write $\varphi(x) = \sum z_jn_j$ with $z_j \in I^n$, $n_j \in N$. By assumption we can write $n_j = \varphi(m_j) + \sum z_{jk}n_{jk}$ with $m_j \in M$, $z_{jk} \in I$ and $n_{jk} \in N$. Hence

$$\varphi(x - \sum z_jm_j) = \sum z_jz_{jk}n_{jk}.$$

This means that $x' = x - \sum z_jm_j \in K_{n+1}$ maps to x which proves the claim. Now we may apply Lemma 7.81.1 to the inverse system of short exact sequences above to see (1). Part (2) is a special case of (1). If the assumptions of (3) hold, then for each n the sequence

$$0 \to K/I^nK \to M/I^nM \to N/I^nN \to 0$$

is short exact by Lemma 7.35.11. Hence we can directly apply Lemma 7.81.1 to conclude (3) is true. To see (4) choose generators $x_i \in M$, $i = 1, \ldots, n$. Then the map $R^{\oplus n} \to M$, $(a_1, \ldots, a_n) \mapsto \sum a_ix_i$ is surjective. Hence by (2) we see $(R^\wedge)^{\oplus n} \to M^\wedge$, $(a_1, \ldots, a_n) \mapsto \sum a_ix_i$ is surjective. Assertion (4) follows from this. $\square$

Lemma 7.90.2. *Suppose R is Noetherian.*

(1) *If $N \to M$ is an injective map of finite R-modules, then the map on completions $N^\wedge \to M^\wedge$ is injective.*
(2) *If M is a finite R-module, then $M^\wedge = M \otimes_R R^\wedge$.*

Proof. For the first statement, by the Artin-Rees Lemma 7.47.4, we have a constant c such that $I^nM \cap N$ equals $I^{n-c}(I^cM \cap N) \subset I^{n-c}N$. Thus if $(n_i) \in N^\wedge$ maps to zero in $M^\wedge$, then each n_i maps to zero in $N/I^{i-c}N$. And hence $n_{i-c} = 0$. Thus $N^\wedge \to M^\wedge$ is injective.

For the second statement let $0 \to K \to R^t \to M \to 0$ be a presentation of M, corresponding the the generators $x_1, \ldots, x_t$ of M. By Lemma 7.90.1 $(R^t)^\wedge \to M^\wedge$ is surjective, and for any finitely generated R-module the canonical map $M \otimes_R R^\wedge \to M^\wedge$ is surjective. Hence to prove the second statement it suffices to prove the kernel of $(R^t)^\wedge \to M^\wedge$ is exactly $K^\wedge$.

Let $(x_n) \in (R^t)^\wedge$ be in the kernel. Note that each x_n is in the image of the map $K/I^nK \to (R/I^n)^t$. Choose c such that $(I^n)^t \cap K \subset I^{n-c}K$, which is possible by Artin-Rees (Lemma 7.47.4). For each $n \geq 0$ choose $y_n \in K/I^{n+c}K$ mapping to x_{n+c}, and set $z_n = y_n \bmod I^nK$. The elements z_n satisfy $z_{n+1} - z_n \bmod I^nK = y_{n+1} - y_n \bmod I^nK$, and $y_{n+1} - y_n \in I^{n+c}R^t$ by construction. Hence $z_{n+1} = z_n \bmod I^nK$ by the choice of c above. In other words $(z_n) \in K^\wedge$ maps to (x_n) as desired. □

Lemma 7.90.3. *Let R be a Noetherian ring. Let $I \subset R$ be an ideal.*

(1) *The ring map $R \to R^\wedge$ is flat.*
(2) *The functor $M \mapsto M^\wedge$ is exact on the category of finitely generated R-modules.*

Proof. Consider $I \otimes_R R^\wedge \to R \otimes_R R^\wedge = R^\wedge$. According to Lemma 7.90.2 this is identified with $I^\wedge \to R^\wedge$ and $I^\wedge \to R^\wedge$ is injective. Part (1) follows from Lemma 7.35.4. Part (2) follows from part (1) and Lemma 7.90.2 part (2). □

Lemma 7.90.4. *Let R be a Noetherian local ring. Let $\mathfrak{m} \subset R$ be the maximal ideal. Let $I \subset \mathfrak{m}$ be an ideal. The ring map $R \to R^\wedge$ is faithfully flat. In particular the completion with respect to $\mathfrak{m}$, namely $lim_n R/\mathfrak{m}^n$ is faithfully flat.*

Proof. By Lemma 7.90.3 it is flat. The composition $R \to R^\wedge \to R/\mathfrak{m}$ where the last map is the projection map $R^\wedge \to R/I$ combined with $R/I \to R/\mathfrak{m}$ shows that $\mathfrak{m}$ is in the image of $Spec(R^\wedge) \to Spec(R)$. Hence the map is faithfully flat by Lemma 7.35.14. □

Definition 7.90.5. Let R be a ring. Let $I \subset R$ be an ideal. Let M be an R-module. We say M is *I-adically complete* if the map

$$M \longrightarrow M^\wedge = lim_n M/I^nM$$

is an isomorphism[4]. We say R is *I-adically complete* if R is complete as an R-module.

It is not true that the completion of an R-module M with respect to I is I-adically complete. For an example see Examples, Section 64.2. Here is a lemma from an unpublished note of Lenstra and de Smit.

Lemma 7.90.6. *Let R be a ring. Let $I \subset R$ be an ideal. Let M be an R-module. Denote $K_n = Ker(M^\wedge \to M/I^nM)$. Then $M^\wedge$ is I-adically complete if and only if K_n is equal to $I^nM^\wedge$ for all $n \geq 1$.*

Proof. The module $I^nM^\wedge$ is contained in K_n. Thus for each $n \geq 1$ there is a canonical exact sequence

$$0 \to K_n/I^nM^\wedge \to M^\wedge/I^nM^\wedge \to M/I^nM \to 0.$$

As $I^nM^\wedge$ maps onto $I^nM/I^{n+1}M$ we see that $K_{n+1} + I^nM^\wedge = K_n$. Thus the inverse system $\{K_n/I^nM^\wedge\}_{n \geq 1}$ has surjective transition maps. By Lemma 7.81.1 we see that there is a short exact sequence

$$0 \to lim_n K_n/I^nM^\wedge \to (M^\wedge)^\wedge \to M^\wedge \to 0$$

Hence $M^\wedge$ is complete if and only if $K_n/I^nM^\wedge = 0$ for all $n \geq 1$. □

Lemma 7.90.7. *Let R be a ring. Let I be a finitely generated ideal of R. For any R-module M the completion $M^\wedge$ is complete. In particular $R^\wedge$ is complete.*

[4] This includes the condition that $\bigcap I^nM = (0)$.

Proof. Let $K_n = \text{Ker}(M^\wedge \to M/I^nM)$. By Lemma 7.90.6 we have to show that $K_n = I^nM^\wedge$. Write $I = (f_1, \ldots, f_t)$. Let $z \in K_n$. Write $z = (\overline{z}_m)$ with $\overline{z}_m \in M/I^mM$. Choose $z_m \in M$ mapping to $\overline{z}_m$ in M/I^mM. Then $z_{m+1} = z_m \bmod I^m$. Write $z_{n+1} = z_n + \delta_n$, $z_{n+2} = z_{n+1} + \delta_{n+1}$, etc. Then $\delta_m \in I^mM$. Thus the infinite sum

$$z = z_n + \delta_n + \delta_{n+1} + \delta_{n+2} + \ldots$$

converges in $M^\wedge$. For $m \geq n$ we have $\delta_m \in I^mM$ hence we can write

$$\delta_m = \sum\nolimits_{j_1+\ldots+j_t=n} f_1^{j_1} \ldots f_t^{j_t} \alpha_{J,m}$$

with $\alpha_{J,m} \in I^{m-n}M$. Our assumption $z \in K_n$ means $z_n \in I^nM$ hence we can also write

$$z_n = \sum\nolimits_{j_1+\ldots+j_t=n} f_1^{j_1} \ldots f_t^{j_t} \alpha_J$$

with $\alpha_J \in M$. Then we can set

$$z_J = \alpha_J + \alpha_{J,n} + \alpha_{J,n+1} + \alpha_{J,n+2} + \ldots$$

as an element of $M^\wedge$. By construction $z = \sum_J f_1^{j_1} \ldots f_t^{j_t} z_J$. Hence z is an element of $I^nM^\wedge$ as desired. □

Lemma 7.90.8. *Let R be a Noetherian ring. Let I be an ideal of R. Let M be an R-module. Then the completion $M^\wedge$ of M with respect to I is I-adically complete.*

Proof. This is a special case of Lemma 7.90.7 because I is a finitely generated ideal. □

Lemma 7.90.9. *Let R be a ring. Let $I \subset R$ be an ideal. Assume*

(1) *R/I is a Noetherian ring,*
(2) *I is finitely generated.*

Then $R^\wedge$ is a Noetherian ring complete with respect to $IR^\wedge$.

Proof. By Lemma 7.90.7 we see that $R^\wedge$ is I-adically complete. Hence it is also $IR^\wedge$-adically complete. Since $R^\wedge/IR^\wedge = R/I$ is Noetherian we see that after replacing R by $R^\wedge$ we may in addition to assumptions (1) and (2) assume that also R is I-adically complete.

Let $f_1, \ldots, f_t$ be generators of I. Then there is a surjection of rings $R/I[T_1, \ldots, T_t] \to \bigoplus I^n/I^{n+1}$ mapping T_i to the element $\overline{f}_i \in I/I^2$. Hence $\bigoplus I^n/I^{n+1}$ is a Noetherian ring. Let $J \subset R$ be an ideal. Consider the ideal

$$\bigoplus J \cap I^n/J \cap I^{n+1} \subset \bigoplus I^n/I^{n+1}.$$

Let $\overline{g}_1, \ldots, \overline{g}_m$ be generators of this ideal. We may choose $\overline{g}_j$ to be a homogeneous element of degree d_j and we may pick $g_j \in J \cap I^{d_j}$ mapping to $\overline{g}_j \in J \cap I^{d_j}/J \cap I^{d_j+1}$. We claim that $g_1, \ldots, g_m$ generate J.

Let $x \in J \cap I^n$. There exist $a_j \in I^{\max(0,n-d_j)}$ such that $x - \sum a_jg_j \in J \cap I^{n+1}$. The reason is that $J \cap I^n/J \cap I^{n+1}$ is equal to $\sum \overline{g}_jI^{n-d_j}/I^{n-d_j+1}$ by our choice of $g_1, \ldots, g_m$. Hence starting with $x \in J$ we can find a sequence of vectors $(a_{1,n}, \ldots, a_{m,n})_{n \geq 0}$ with $a_{j,n} \in I^{\max(0,n-d_j)}$ such that

$$x = \sum\nolimits_{n=0,\ldots,N} \sum\nolimits_{j=1,\ldots,m} a_{j,n}g_j \bmod I^{N+1}$$

Setting $A_j = \sum_{n \geq 0} a_{j,n}$ we see that $x = \sum A_jg_j$ as R is complete. Hence J is finitely generated and we win. □

Lemma 7.90.10. *Let R be a Noetherian ring. Let I be an ideal of R. The completion $R^\wedge$ of R with respect to I is Noetherian.*

Proof. This is a direct consequence of Lemma 7.90.9. It can also be seen directly as follows. Choose generators $f_1, \ldots, f_n$ of I. Consider the map

$$R[[x_1, \ldots, x_n]] \longrightarrow R^\wedge, \quad x_i \longmapsto f_i.$$

This is a well defined and surjective ring map (details omitted). Since $R[[x_1, \ldots, x_n]]$ is Noetherian (see Lemma 7.28.2) we win. □

Lemma 7.90.11. *Let R be a ring. Let $I \subset R$ be an ideal. Then*

1. *any element of $1 + I$ maps to an invertible element of $R^\wedge$,*
2. *any element of $1 + IR^\wedge$ is invertible in $R^\wedge$, and*
3. *the ideal $IR^\wedge$ is contained in the radical of $R^\wedge$.*

Proof. Let $x \in IR^\wedge$. Let u_n be the image of $1 - x + x^2 - x^3 + \ldots + (-x)^n$ in R/I^{n+1}. Note that (u_n) defines an element u of $R^\wedge$. By construction the element $(1 + x)u_n$ in R/I^n is 1. Hence we see that u is the inverse of $1 + x$ in $R^\wedge$. This proves (2) which implies (1). Let $\mathfrak m \subset R^\wedge$ be a maximal ideal and set $M = R^\wedge/\mathfrak m$. If $IR^\wedge \not\subset \mathfrak m$ then $IM = M$. By Nakayama's Lemma 7.14.5 there exists an $f \in IR^\wedge$ such that $(1 + f)M = 0$. This is a contradiction with (2). □

Lemma 7.90.12. *Let R be a ring. Let I, J be ideals of R. Assume there exist integers $c, d > 0$ such that $I^c \subset J$ and $J^d \subset I$. Then completion with respect to I agrees with completion with respect to J for any R-module. In particular an R-module M is I-adically complete if and only if it is J-adically complete.*

Proof. Consider the system of maps $M/I^nM \to M/J^{\lfloor n/d \rfloor}M$ and the system of maps $M/J^mM \to M/I^{\lfloor m/c \rfloor}M$ to get mutually inverse maps between the completions. □

Lemma 7.90.13. *Let R be a ring. Let I be an ideal of R. Let M be an I-adically complete R-module, and let $K \subset M$ be an R-submodule. The following are equivalent*

1. *$K = \bigcap(K + I^nM)$ and*
2. *M/K is I-adically complete.*

Proof. Set $N = M/K$. By Lemma 7.90.1 the map $M = M^\wedge \to N^\wedge$ is surjective. Hence $N \to N^\wedge$ is surjective. It is easy to see that the kernel of $N \to N^\wedge$ is the module $\bigcap(K + I^nM)/K$. □

Lemma 7.90.14. *Let R be a ring. Let I be an ideal of R. Let M be an R-module. If (a) R is I-adically complete, (b) M is a finite R-module, and (c) $\bigcap I^nM = (0)$, then M is I-adically complete.*

Proof. By Lemma 7.90.1 the map $M = M \otimes_R R = M \otimes_R R^\wedge \to M^\wedge$ is surjective. The kernel of this map is $\bigcap I^nM$ hence zero by assumption. Hence $M \cong M^\wedge$ and M is complete. □

Lemma 7.90.15. *Let R be a ring. Let $I \subset R$ be an ideal. Let M be an R-module. Assume*

1. *R is I-adically complete,*
2. *$\bigcap_{n \geq 1} I^nM = (0)$, and*
3. *M/IM is a finite R/I-module.*

Then M is a finite R-module.

Proof. Let $x_1, \ldots, x_n \in M$ be elements whose images in M/IM generate M/IM as a R/I-module. Denote $M' \subset M$ the R-submodule generated by $x_1, \ldots, x_n$. By Lemma 7.90.1 the map $(M')^\wedge \to M^\wedge$ is surjective. Since $\bigcap I^nM = 0$ we see in particular that

$\bigcap I^n M' = (0)$. Hence by Lemma 7.90.14 we see that M' is complete, and we conclude that $M' \to M^\wedge$ is surjective. Finally, the kernel of $M \to M^\wedge$ is zero since it is equal to $\bigcap I^n M = (0)$. Hence we conclude that $M \cong M' \cong M^\wedge$ is finitely generated. $\square$

Suppose $R \to S$ is a local homomorphism of local rings $(R, \mathfrak{m})$ and $(S, \mathfrak{n})$. Let $S^\wedge$ be the completion of S with respect to $\mathfrak{n}$. In general $S^\wedge$ is not the $\mathfrak{m}$-adic completion of S. If $\mathfrak{n}^t \subset \mathfrak{m}S$ for some $t \geq 1$ then we do have $S^\wedge = lim\, S/\mathfrak{m}^n S$ by Lemma 7.90.12. In some cases this even implies that $S^\wedge$ is finite over $R^\wedge$.

Lemma 7.90.16. *Let $R \to S$ be a local homomorphism of local rings $(R, \mathfrak{m})$ and $(S, \mathfrak{n})$. Let $R^\wedge$, resp. $S^\wedge$ be the completion of R, resp. S with respect to $\mathfrak{m}$, resp. $\mathfrak{n}$. If $\mathfrak{m}$ and $\mathfrak{n}$ are finitely generated and* $\dim_{\kappa(\mathfrak{m})} S/\mathfrak{m}S < \infty$, *then*

(1) *$S^\wedge$ is equal to the $\mathfrak{m}$-adic completion of S, and*
(2) *$S^\wedge$ is a finite $R^\wedge$-module.*

Proof. We have $\mathfrak{m}S \subset \mathfrak{n}$ because $R \to S$ is a local ring map. The assumption $\dim_{\kappa(\mathfrak{m})} S/\mathfrak{m}S < \infty$ implies that $S/\mathfrak{m}S$ is an Artinian ring, see Lemma 7.49.2. Hence has dimension 0, see Lemma 7.57.4, hence $\mathfrak{n} = \sqrt{\mathfrak{m}S}$. This and the fact that $\mathfrak{n}$ is finitely generated implies that $\mathfrak{n}^t \subset \mathfrak{m}S$ for some $t \geq 1$. By Lemma 7.90.12 we see that $S^\wedge$ can be identified with the $\mathfrak{m}$-adic completion of S. As $\mathfrak{m}$ is finitely generated we see from Lemma 7.90.7 that $S^\wedge$ and $R^\wedge$ are $\mathfrak{m}$-adically complete. At this point we may apply Lemma 7.90.15 to $S^\wedge$ as an $R^\wedge$-module to conclude. $\square$

Lemma 7.90.17. *Let R be a Noetherian ring. Let $R \to S$ be a finite ring map. Let $\mathfrak{p} \subset R$ be a prime and let $\mathfrak{q}_1, \ldots, \mathfrak{q}_m$ be the primes of S lying over $\mathfrak{p}$ (Lemma 7.32.19). Then*

$$R_\mathfrak{p}^\wedge \otimes_R S = S_{\mathfrak{q}_1}^\wedge \times \ldots \times S_{\mathfrak{q}_m}^\wedge$$

where the local rings $R_\mathfrak{p}$ and $S_{\mathfrak{q}_i}$ are completed with respect to their maximal ideals.

Proof. We may replace R by the localization $R_\mathfrak{p}$ and S by $S_\mathfrak{p} = S \otimes_R R_\mathfrak{p}$. Hence we may assume that R is a local Noetherian ring and that $\mathfrak{p} = \mathfrak{m}$ is its maximal ideal. The $\mathfrak{q}_i S_{\mathfrak{q}_i}$-adic completion $S_{\mathfrak{q}_i}^\wedge$ is equal to the $\mathfrak{m}$-adic completion by Lemma 7.90.16. For every $n \geq 1$ prime ideals of $S/\mathfrak{m}^n S$ are in 1-to-1 correspondence with the maximal ideals $\mathfrak{q}_1, \ldots, \mathfrak{q}_m$ of S (by going up for S over R, see Lemma 7.32.20). Hence $S/\mathfrak{m}^n S = \prod S_{\mathfrak{q}_i}/\mathfrak{m}^n S_{\mathfrak{q}_i}$ by Lemma 7.49.8 (using for example Proposition 7.57.6 to see that $S/\mathfrak{m}^n S$ is Artinian). Hence the $\mathfrak{m}$-adic completion $S^\wedge$ of S is equal to $\prod S_{\mathfrak{q}_i}^\wedge$. Finally, we have $R^\wedge \otimes_R S = S^\wedge$ by Lemma 7.90.2. $\square$

Lemma 7.90.18. *Let R be a ring. Let $I \subset R$ be an ideal. Let $0 \to K \to P \to M \to 0$ be a short exact sequence of R-modules. If M is flat over R and M/IM is a projective R/I-module, then the sequence of I-adic completions*

$$0 \to K^\wedge \to P^\wedge \to M^\wedge \to 0$$

is a split exact sequence.

Proof. As M is flat, each of the sequences

$$0 \to K/I^n K \to P/I^n P \to M/I^n M \to 0$$

is short exact, see Lemma 7.35.11 and the sequence $0 \to K^\wedge \to P^\wedge \to M^\wedge \to 0$ is a short exact sequence, see Lemma 7.90.1. It suffices to show that we can find spittings $s_n : M/I^n M \to P/I^n P$ such that $s_{n+1} \bmod I^n = s_n$. We will construct these s_n by induction on n. Pick any splitting s_1, which exists as M/IM is a projective R/I-module. Assume given s_n for some $n > 0$. Set $P_{n+1} = \{x \in P \mid x \bmod I^nP \in \mathrm{Im}(s_n)\}$. The map $\pi : P_{n+1}/I^{n+1}P_{n+1} \to M/I^{n+1}M$ is surjective (details omitted). As $M/I^{n+1}M$ is projective as a R/I^{n+1}-module by Lemma 7.71.5 we may choose a section $t : M/I^{n+1}M \to P_{n+1}/I^{n+1}P_{n+1}$ of π. Setting s_{n+1} equal to the composition of t with the canonical map $P_{n+1}/I^{n+1}P_{n+1} \to P/I^{n+1}P$ works. □

7.91. Criteria for flatness

In this section we prove some important technical lemmas in the Noetherian case. We will (partially) generalize these to the non-Noetherian case in Section 7.119.

Lemma 7.91.1. *Suppose that $R \to S$ is a local homomorphism of Noetherian local rings. Denote $\mathfrak{m}$ the maximal ideal of R. Let $u : M \to N$ be a map of finite S-modules. Assume N flat over R. If $\bar{u} : M/\mathfrak{m}M \to N/\mathfrak{m}N$ is injective then u is injective. In this case $N/u(M)$ is flat over R.*

Proof. First we claim that $u_n : M/\mathfrak{m}^nM \to N/\mathfrak{m}^nN$ is injective for all $n \geq 1$. We proceed by induction, the base case given by assumption. By our assumption that N is flat over R we have a short exact sequence $0 \to N \otimes_R \mathfrak{m}^n/\mathfrak{m}^{n+1} \to N/\mathfrak{m}^{n+1}N \to N/\mathfrak{m}^nN \to 0$. Also, $N \otimes_R \mathfrak{m}^n/\mathfrak{m}^{n+1} = N/\mathfrak{m}N \otimes_{R/\mathfrak{m}} \mathfrak{m}^n/\mathfrak{m}^{n+1}$. We have a similar exact sequence $M \otimes_R \mathfrak{m}^n/\mathfrak{m}^{n+1} \to M/\mathfrak{m}^{n+1}M \to M/\mathfrak{m}^nM \to 0$ for M except we do not have the zero on the left. We also have $M \otimes_R \mathfrak{m}^n/\mathfrak{m}^{n+1} = M/\mathfrak{m}M \otimes_{R/\mathfrak{m}} \mathfrak{m}^n/\mathfrak{m}^{n+1}$. Thus the map u_{n+1} is injective as both u_n and the map $\bar{u} \otimes \mathrm{id}_{\mathfrak{m}^n/\mathfrak{m}^{n+1}}$ are.

Note that $lim_n\ M/\mathfrak{m}^nM$ is the completion of the module M with respect to the ideal $I = \mathfrak{m}S$, and similarly for N. Since M and N are finite S-modules we have $M^\wedge = M \otimes S^\wedge$ and similarly for N, see Lemma 7.90.2. We conclude that $u \otimes 1 : M \otimes S^\wedge \to N \otimes S^\wedge$ is injective. Since $S^\wedge$ is faithfully flat over S, see Lemma 7.90.4, we conclude that u is injective, see Lemma 7.35.4.

Finally, we have to prove that $I \otimes_R N/u(M) \to N/u(M)$ is injective for every ideal $I \subset R$. Consider the diagram

$$\begin{array}{ccccccccc}
 & & 0 & & 0 & & 0 & & \\
 & & \uparrow & & \uparrow & & \uparrow & & \\
 & & M/IM & \to & N/IN & \to & N/(IN + u(M)) & \to & 0 \\
 & & \uparrow & & \uparrow & & \uparrow & & \\
0 & \to & M & \to & N & \to & N/u(M) & \to & 0 \\
 & & \uparrow & & \uparrow & & \uparrow & & \\
 & & M \otimes_R I & \to & N \otimes_R I & \to & N/u(M) \otimes_R I & \to & 0
\end{array}$$

The arrow $N \otimes_R I \to N$ is injective. Chasing through the diagram we see that it suffices to prove that M/IM injects into N/IN. Note that M/IM and N/IN are modules over the Noetherian ring S/IS, N/IN is flat over R/I and $u \bmod I : M/IM \to N/IN$ is injective module $\mathfrak{m}$ we may apply the result above to $u \bmod I$, and we win. □

Lemma 7.91.2. *Suppose that $R \to S$ is a flat and local ring homomorphism of Noetherian local rings. Denote $\mathfrak{m}$ the maximal ideal of R. Suppose $f \in S$ is a nonzero divisor in $S/\mathfrak{m}S$. Then S/fS is flat over R, and f is a nonzero divisor in S.*

Proof. Follows directly from Lemma 7.91.1. □

Lemma 7.91.3. *Suppose that $R \to S$ is a flat and local ring homomorphism of Noetherian local rings. Denote $\mathfrak{m}$ the maximal ideal of R. Suppose $f_1, \ldots, f_c$ is a sequence of elements* *of S such that the images $\overline{f}_1, \ldots, \overline{f}_c$ form a regular sequence in $S/\mathfrak{m}S$. Then $f_1, \ldots, f_c$ is a regular sequence in S and each of the quotients $S/(f_1, \ldots, f_i)$ is flat over R.*

Proof. Induction and Lemma 7.91.2 above. □

Lemma 7.91.4. *Let $R \to S$ be a local homomorphism of Noetherian local rings. Let $\mathfrak{m}$ be the maximal ideal of R. Let M be a finite S-modules. Suppose that (a) $M/\mathfrak{m}M$ is a free $S/\mathfrak{m}S$-module, and (b) M is flat over R. Then M is free and S is flat over R.*

Proof. Let $\overline{x}_1, \ldots, \overline{x}_n$ be a basis for the free module $M/\mathfrak{m}M$. Choose $x_1, \ldots, x_n \in M$ with x_i mapping to $\overline{x}_i$. Let $u : S^{\oplus n} \to M$ be the map which maps the ith standard basis vector to x_i. By Lemma 7.91.1 we see that u is injective. On the other hand, by Nakayama's Lemma 7.14.5 the map is surjective. The lemma follows. □

Lemma 7.91.5. *Let $R \to S$ be a local homomorphism of local Noetherian rings. Let $\mathfrak{m}$ be the maximal ideal of R. Let $0 \to F_e \to F_{e-1} \to \ldots \to F_0$ be a finite complex of finite S-modules. Assume that each F_i is R-flat, and that the complex $0 \to F_e/\mathfrak{m}F_e \to F_{e-1}/\mathfrak{m}F_{e-1} \to \ldots \to F_0/\mathfrak{m}F_0$ is exact. Then $0 \to F_e \to F_{e-1} \to \ldots \to F_0$ is exact, and moreover the module Coker$(F_1 \to F_0)$ is R-flat.*

Proof. By induction on e. If $e = 1$, then this is exactly Lemma 7.91.1. If $e > 1$, we see by Lemma 7.91.1 that $F_e \to F_{e-1}$ is injective and that $C = \text{Coker}(F_e \to F_{e-1})$ is a finite S-module flat over R. Hence we can apply the induction hypothesis to the complex $0 \to C \to F_{e-2} \to \ldots \to F_0$. We deduce that $C \to F_{e-2}$ is injective and the exactness of the complex follows, as well as the flatness of the cokernel of $F_1 \to F_0$. □

In the rest of this section we prove two versions of what is called the ``*local criterion of flatness*''. Note also the interesting Lemma 7.119.1 below.

Lemma 7.91.6. *Let R be a local ring with maximal ideal $\mathfrak{m}$ and residue field $\kappa = R/\mathfrak{m}$. Let M be an R-module. If $Tor_1^R(\kappa, M) = 0$, then for every finite length R-module N we have $Tor_1^R(N, M) = 0$.*

Proof. By descending induction on the length of N. If the length of N is 1, then $N \cong \kappa$ and we are done. If the length of N is more than 1, then we can fit N into a short exact sequence $0 \to N' \to N \to N'' \to 0$ where N', N'' are finite length R-modules of smaller length. The vanishing of $\text{Tor}_1^R(N, M)$ follows from the vanishing of $\text{Tor}_1^R(N', M)$ and $\text{Tor}_1^R(N'', M)$ (induction hypothesis) and the long exact sequence of Tor groups, see Lemma 7.69.2. □

Lemma 7.91.7 (Local criterion for flatness)**.** *Let $R \to S$ be a local homomorphism of local Noetherian rings. Let $\mathfrak{m}$ be the maximal ideal of R, and let $\kappa = R/\mathfrak{m}$. Let M be a finite S-module. If $Tor_1^R(\kappa, M) = 0$, then M is flat over R.*

Proof. Let $I \subset R$ be an ideal. By Lemma 7.35.4 it suffices to show that $I \otimes_R M \to M$ is injective. By Remark 7.69.8 we see that this kernel is equal to $\text{Tor}_1^R(M, R/I)$. By Lemma 7.91.6 we see that $J \otimes_R M \to M$ is injective for all ideals of finite colength.

Choose $n >> 0$ and consider the following short exact sequence

$$0 \to I \cap \mathfrak{m}^n \to I \oplus \mathfrak{m}^n \to I + \mathfrak{m}^n \to 0$$

This is a sub sequence of the short exact sequence $0 \to R \to R^{\oplus 2} \to R \to 0$. Thus we get the diagram

$$\begin{tikzcd} (I \cap \mathfrak{m}^n) \otimes_R M \arrow[r] \arrow[d] & I \otimes_R M \oplus \mathfrak{m}^n \otimes_R M \arrow[r] \arrow[d] & (I + \mathfrak{m}^n) \otimes_R M \arrow[d] \\ M \arrow[r] & M \oplus M \arrow[r] & M \end{tikzcd}$$

Note that $I + \mathfrak{m}^n$ and $\mathfrak{m}^n$ are ideals of finite colength. Thus a diagram chase shows that $\mathrm{Ker}((I \cap \mathfrak{m}^n) \otimes_R M \to M) \to \mathrm{Ker}(I \otimes_R M \to M)$ is surjective. We conclude in particular that $K = \mathrm{Ker}(I \otimes_R M \to M)$ is contained in the image of $(I \cap \mathfrak{m}^n) \otimes_R M$ in $I \otimes_R M$. By Artin-Rees, Lemma 7.47.4 we see that K is contained in $\mathfrak{m}^{n-c}(I \otimes_R M)$ for some $c > 0$ and all $n >> 0$. Since $I \otimes_R M$ is a finite S-module (!) and since S is Noetherian, we see that this implies $K = 0$. Namely, the above implies K maps to zero in the $\mathfrak{m}S$-adic completion of $I \otimes_R M$. But the map from S to its $\mathfrak{m}S$-adic completion is faithfully flat by Lemma 7.90.4. Hence $K = 0$, as desired. □

In the following we often encounter the conditions ``M/IM is flat over R/I and $\mathrm{Tor}_1^R(R/I, M) = 0$''. The following lemma gives some consequences of these conditions (it is a generalization of Lemma 7.91.6).

Lemma 7.91.8. *Let R be a ring. Let $I \subset R$ be an ideal. Let M be an R-module. If M/IM is flat over R/I and $Tor_1^R(R/I, M) = 0$ then*

(1) *M/I^nM is flat over R/I^n for all $n \geq 1$, and*
(2) *for any module N which is annihilated by I^m for some $m \geq 0$ we have $Tor_1^R(N, M) = 0$.*

In particular, if I is nilpotent, then M is flat over R.

Proof. Assume M/IM is flat over R/I and $\mathrm{Tor}_1^R(R/I, M) = 0$. Let N be an R/I-module. Choose a short exact sequence

$$0 \to K \to \bigoplus\nolimits_{i \in I} R/I \to N \to 0$$

By the long exact sequence of Tor and the vanishing of $\mathrm{Tor}_1^R(R/I, M)$ we get

$$0 \to \mathrm{Tor}_1^R(N, M) \to K \otimes_R M \to (\bigoplus\nolimits_{i \in I} R/I) \otimes_R M \to N \otimes_R M \to 0$$

But since K, $\bigoplus_{i \in I} R/I$, and N are all annihilated by I we see that

$$\begin{aligned} K \otimes_R M &= K \otimes_{R/I} M/IM, \\ (\bigoplus\nolimits_{i \in I} R/I) \otimes_R M &= (\bigoplus\nolimits_{i \in I} R/I) \otimes_{R/I} M/IM, \\ N \otimes_R M &= N \otimes_{R/I} M/IM. \end{aligned}$$

As M/IM is flat over R/I we conclude that

$$0 \to K \otimes_{R/I} M/IM \to (\bigoplus\nolimits_{i \in I} R/I) \otimes_{R/I} M/IM \to N \otimes_{R/} M/IM \to 0$$

is exact. Combining this with the above we conclude that $\mathrm{Tor}_1^R(N, M) = 0$ for any R-module N annihilated by I.

In particular, if we apply this to the module I/I^2, then we conclude that the sequence

$$0 \to I^2 \otimes_R M \to I \otimes_R M \to I/I^2 \otimes_R M \to 0$$

is short exact. This implies that $I^2 \otimes_R M \to M$ is injective and it implies that $I/I^2 \otimes_{R/I} M/IM = IM/I^2M$.

Let us prove that M/I^2M is flat over R/I^2. Let $I^2 \subset J$ be an ideal. We have to show that $J/I^2 \otimes_{R/I^2} M/I^2M \to M/I^2M$ is injective, see Lemma 7.35.4. As M/IM is flat over R/I we know that the map $(I+J)/I \otimes_{R/I} M/IM \to M/IM$ is injective. The sequence

$$(I \cap J)/I^2 \otimes_{R/I^2} M/I^2M \to J/I^2 \otimes_{R/I^2} M/I^2M \to (I+J)/I \otimes_{R/I} M/IM \to 0$$

is exact, as you get it by tensoring the exact sequence $0 \to (I \cap J) \to J \to (I+J)/I \to 0$ by M/I^2M. Hence suffices to prove the injectivity of the map $(I \cap J)/I^2 \otimes_{R/I} M/IM \to IM/I^2M$. However, the map $(I \cap J)/I^2 \to I/I^2$ is injective and as M/IM is flat over R/I the map $(I \cap J)/I^2 \otimes_{R/I} M/IM \to I/I^2 \otimes_{R/I} M/IM$ is injective. Since we have previously seen that $I/I^2 \otimes_{R/I} M/IM = IM/I^2M$ we obtain the desired injectivity.

Hence we have proven that the assumptions imply: (a) $\text{Tor}_1^R(N, M) = 0$ for all N annihilated by I, (b) $I^2 \otimes_R M \to M$ is injective, and (c) M/I^2M is flat over R/I^2. Thus we can continue by induction to get the same results for I^n for all $n \geq 1$. □

Lemma 7.91.9 (Variant of the local criterion)**.** *Let $R \to S$ be a local homomorphism of Noetherian local rings. Let $I \neq R$ be an ideal in R. Let M be a finite S-module. If $Tor_1^R(M, R/I) = 0$ and M/IM is flat over R/I, then M is flat over R.*

Proof. First proof: By Lemma 7.91.8 we see that $\text{Tor}_1^R(\kappa, M)$ is zero where κ is the residue field of R. Hence we see that M is flat over R by Lemma 7.91.7.

Second proof: Let $\mathfrak{m}$ be the maximal ideal of R. We will show that $\mathfrak{m} \otimes_R M \to M$ is injective, and then apply Lemma 7.91.7. Suppose that $\sum f_i \otimes x_i \in \mathfrak{m} \otimes_R M$ and that $\sum f_i x_i = 0$ in M. By the equational criterion for flatness Lemma 7.35.10 applied to M/IM over R/I we see there exist $\overline{a}_{ij} \in R/I$ and $\overline{y}_j \in M/IM$ such that $x_i \bmod IM = \sum_j \overline{a}_{ij}\overline{y}_j$ and $0 = \sum_i (f_i \bmod I)\overline{a}_{ij}$. Let $a_{ij} \in R$ be a lift of $\overline{a}_{ij}$ and similarly let $y_j \in M$ be a lift of $\overline{y}_j$. Then we see that

$$\begin{aligned} \sum f_i \otimes x_i &= \sum f_i \otimes x_i + \sum f_i a_{ij} \otimes y_j - \sum f_i \otimes a_{ij} y_j \\ &= \sum f_i \otimes (x_i - \sum a_{ij} y_j) + \sum (\sum f_i a_{ij}) \otimes y_j \end{aligned}$$

Since $x_i - \sum a_{ij} y_j \in IM$ and $\sum f_i a_{ij} \in I$ we see that there exists an element in $I \otimes_R M$ which maps to our given element $\sum f_i \otimes x_i$ in $\mathfrak{m} \otimes_R M$. But $I \otimes_R M \to M$ is injective by assumption (see Remark 7.69.8) and we win. □

In particular, in the situation of Lemma 7.91.9, suppose that $I = (x)$ is generated by a single element x which is a nonzero divisor in R. Then $\text{Tor}_1^R(M, R/(x)) = (0)$ if and only if x is a nonzero divisor on M.

Lemma 7.91.10. *Let $R \to S$ be a ring map. Let $I \subset R$ be an ideal. Let M be an S-module. Assume*

(1) *R is a Noetherian ring,*
(2) *S is a Noetherian ring,*
(3) *M is a finite S-module, and*
(4) *for each $n \geq 1$ the module M/I^nM is flat over R/I^n.*

Then for every $\mathfrak{q} \in V(IS)$ the localization $M_{\mathfrak{q}}$ is flat over R. In particular, if S is local and IS is contained in its maximal ideal, then M is flat over R.

Proof. We are going to use Lemma 7.91.9. By assumption M/IM is flat over R/I. Hence it suffices to check that $\text{Tor}_1^R(M, R/I)$ is zero on localization at $\mathfrak{q}$. By Remark 7.69.8 this Tor group is equal to $K = \text{Ker}(I \otimes_R M \to M)$. We know for each $n \geq 1$ that the kernel $\mathrm{Ker}(I/I^n \otimes_{R/I^n} M/I^nM \to M/I^nM)$ is zero. Since there is a module map $I/I^n \otimes_{R/I^n} M/I^nM \to (I \otimes_R M)/I^{n-1}(I \otimes_R M)$ we conclude that $K \subset I^{n-1}(I \otimes_R M)$ for each n. By the Artin-Rees lemma, and more precisely Lemma 7.47.7 we conclude that $K_{\mathfrak q} = 0$, as desired. □

Lemma 7.91.11. *Let $R \to R' \to R''$ be ring maps. Let M be an R-module. Suppose that $M \otimes_R R'$ is flat over R'. Then the natural map $Tor_1^R(M, R') \otimes_{R'} R'' \to Tor_1^R(M, R'')$ is onto.*

Proof. Let $F_\bullet$ be a free resolution of M over R. The complex $F_2 \otimes_R R' \to F_1 \otimes_R R' \to F_0 \otimes_R R'$ computes $\mathrm{Tor}_1^R(M, R')$. The complex $F_2 \otimes_R R'' \to F_1 \otimes_R R'' \to F_0 \otimes_R R''$ computes $\mathrm{Tor}_1^R(M, R'')$. Note that $F_i \otimes_R R' \otimes_{R'} R'' = F_i \otimes_R R''$. Let $K' = \mathrm{Ker}(F_1 \otimes_R R' \to F_0 \otimes_R R')$ and similarly $K'' = \mathrm{Ker}(F_1 \otimes_R R'' \to F_0 \otimes_R R'')$. Thus we have an exact sequence

$$0 \to K' \to F_1 \otimes_R R' \to F_0 \otimes_R R' \to M \otimes_R R' \to 0.$$

By the assumption that $M \otimes_R R'$ is flat over R', the sequence $0 \to K' \otimes_{R'} R'' \to F_1 \otimes_R R'' \to F_0 \otimes_R R'' \to M \otimes_R R'' \to 0$ is still exact. This means that $K'' = K' \otimes_{R'} R''$. Since $\mathrm{Tor}_1^R(M, R')$ is a quotient of K' and $\mathrm{Tor}_1^R(M, R'')$ is a quotient of K'' we win. □

Lemma 7.91.12. *Let $R \to R'$ be a ring map. Let $I \subset R$ be an ideal and $I' = IR'$. Let M be an R-module and set $M' = M \otimes_R R'$. The natural map $Tor_1^R(R'/I', M) \to Tor_1^{R'}(R'/I', M')$ is surjective.*

Proof. Let $F_2 \to F_1 \to F_0 \to M \to 0$ be a free resolution of M over R. Set $F_i' = F_i \otimes_R R'$. The sequence $F_2' \to F_1' \to F_0' \to M' \to 0$ may no longer be exact at F_1'. A free resolution of M' over R' therefore looks like

$$F_2' \oplus F_2'' \to F_1' \to F_0' \to M' \to 0$$

for a suitable free module F_2'' over R'. Next, note that $F_i \otimes_R R'/I' = F_i'/IF_i' = F_i'/I'F_i'$. So the complex $F_2'/I'F_2' \to F_1'/I'F_1' \to F_0'/I'F_0'$ computes $\mathrm{Tor}_1^R(M, R'/I')$. On the other hand $F_i' \otimes_{R'} R'/I' = F_i'/I'F_i'$ and similarly for F_2''. Thus the complex $F_2'/I'F_2' \oplus F_2''/I'F_2'' \to F_1'/I'F_1' \to F_0'/I'F_0'$ computes $\mathrm{Tor}_1^{R'}(M', R'/I')$. Since the vertical map on complexes

$$\begin{tikzcd}
F_2'/I'F_2' \arrow[r] \arrow[d] & F_1'/I'F_1' \arrow[r] \arrow[d] & F_0'/I'F_0' \arrow[d] \\
F_2'/I'F_2' \oplus F_2''/I'F_2'' \arrow[r] & F_1'/I'F_1' \arrow[r] & F_0'/I'F_0'
\end{tikzcd}$$

clearly induces a surjection on cohomology we win. □

Lemma 7.91.13. *Let*

$$\begin{tikzcd}
S \arrow[r] & S' \\
R \arrow[r] \arrow[u] & R' \arrow[u]
\end{tikzcd}$$

be a commutative diagram of local homomorphisms of local Noetherian rings. Let $I \subset R$ be an ideal. Let M be an S-module. Denote $I' = IR'$ and $M' = M \otimes_S S'$. Assume that

(1) *S' is a localization of the tensor product $S \otimes_R R'$,*
(2) *M/IM is flat over R/I,*
(3) *$Tor_1^R(M, R/I) \to Tor_1^{R'}(M', R'/I')$ is zero.*

Then M' is flat over R'.

Proof. Since S' is a localization of $S \otimes_R R'$ we see that M' is a localization of $M \otimes_R R'$. Note that by Lemma 7.35.6 the module $M/IM \otimes_{R/I} R'/I' = M \otimes_R R'/I'(M \otimes_R R')$ is flat over R'/I'. Hence also $M'/I'M'$ is flat over R'/I' as the localization of a flat module is flat. By Lemma 7.91.9 it suffices to show that $\text{Tor}_1^{R'}(M', R'/I')$ is zero. Since M' is a localization of $M \otimes_R R'$, the last assumption implies that it suffices to show that $\text{Tor}_1^R(M, R/I) \otimes_R R' \to \text{Tor}_1^{R'}(M \otimes_R R', R'/I')$ is surjective.

By Lemma 7.91.12 we see that $\text{Tor}_1^R(M, R'/I') \to \text{Tor}_1^{R'}(M \otimes_R R', R'/I')$ is surjective. So now it suffices to show that $\text{Tor}_1^R(M, R/I) \otimes_R R' \to \text{Tor}_1^R(M, R'/I')$ is surjective. This follows from Lemma 7.91.11 by looking at the ring maps $R \to R/I \to R'/I'$ and the module M. □

Please compare the lemma below to Lemma 7.93.8 (the case of a nilpotent ideal) and Lemma 7.119.8 (the case of finitely presented algebras).

Lemma 7.91.14 (Critère de platitude par fibres; Noetherian case)**.** *Let R, S, S' be Noetherian local rings and let $R \to S \to S'$ be local ring homomorphisms. Let $\mathfrak{m} \subset R$ be the maximal ideal. Let M be an S'-module. Assume*

1. *The module M is finite over S'.*
2. *The module M is not zero.*
3. *The module $M/\mathfrak{m}M$ is a flat $S/\mathfrak{m}S$-module.*
4. *The module M is a flat R-module.*

Then S is flat over R and M is a flat S-module.

Proof. Set $I = \mathfrak{m}S \subset S$. Then we see that M/IM is a flat S/I-module because of (3). Since $\mathfrak{m} \otimes_R S' \to I \otimes_S S'$ is surjective we see that also $\mathfrak{m} \otimes_R M \to I \otimes_S M$ is surjective. Consider

$$\mathfrak{m} \otimes_R M \to I \otimes_S M \to M.$$

As M is flat over R the composition is injective and so both arrows are injective. In particular $\text{Tor}_1^S(S/I, M) = 0$ see Remark 7.69.8. By Lemma 7.91.9 we conclude that M is flat over S. Note that since $M/\mathfrak{m}_{S'}M$ is not zero by Nakayama's Lemma 7.14.5 we see that actually M is faithfully flat over S by Lemma 7.35.14 (since it forces $M/\mathfrak{m}_S M \neq 0$).

Consider the exact sequence $0 \to \mathfrak{m} \to R \to \kappa \to 0$. This gives an exact sequence $0 \to \text{Tor}_1^R(\kappa, S) \to \mathfrak{m} \otimes_R S \to I \to 0$. Since M is flat over S this gives an exact sequence $0 \to \text{Tor}_1^R(\kappa, S) \otimes_S M \to \mathfrak{m} \otimes_R M \to I \otimes_S M \to 0$. By the above this implies that $\text{Tor}_1^R(\kappa, S) \otimes_S M = 0$. Since M is faithfully flat over S this implies that $\text{Tor}_1^R(\kappa, S) = 0$ and we conclude that S is flat over R by Lemma 7.91.7. □

7.92. Base change and flatness

Some lemmas which deal with what happens with flatness when doing a base change.

Lemma 7.92.1. *Let*

$$\begin{array}{ccc} S & \longrightarrow & S' \\ \uparrow & & \uparrow \\ R & \longrightarrow & R' \end{array}$$

be a commutative diagram of local homomorphisms of local rings. Assume that S' is a localization of the tensor product $S \otimes_R R'$. Let M be an S-module and set $M' = S' \otimes_S M$.

(1) *If M is flat over R then M' is flat over R'.*
(2) *If M' is flat over R' and $R \to R'$ is flat then M is flat over R.*

In particular we have

(3) *If S is flat over R then S' is flat over R'.*
(4) *If $R' \to S'$ and $R \to R'$ are flat then S is flat over R.*

Proof. Proof of (1). If M is flat over R, then $M \otimes_R R'$ is flat over R' by Lemma 7.35.6. If $W \subset S \otimes_R R'$ is the multiplicative subset such that $W^{-1}(S \otimes_R R') = S'$ then $M' = W^{-1}(M \otimes_R R')$. Hence M' is flat over R' as the localization of a flat module, see Lemma 7.35.19 part (5). This proves (1) and in particular, we see that (3) holds.

Proof of (2). Suppose that M' is flat over R' and $R \to R'$ is flat. By (3) applied to the diagram reflected in the northwest diagonal we see that $S \to S'$ is flat. Thus $S \to S'$ is faithfully flat by Lemma 7.35.16. We are going to use the criterion of Lemma 7.35.4 (3) to show that M is flat. Let $I \subset R$ be an ideal. If $I \otimes_R M \to M$ has a kernel, so does $(I \otimes_R M) \otimes_S S' \to M \otimes_S S' = M'$. Note that $I \otimes_R R' = IR'$ as $R \to R'$ is flat, and that

$$(I \otimes_R M) \otimes_S S' = (I \otimes_R R') \otimes_{R'} (M \otimes_S S') = IR' \otimes_{R'} M'.$$

From flatness of M' over R' we conclude that this maps injectively into M'. This concludes the proof of (2), and hence (4) is true as well. □

7.93. Flatness criteria over Artinian rings

We discuss some flatness criteria for modules over Artinian rings.

Lemma 7.93.1. *Let $(R, \mathfrak{m})$ be a local Artinian ring. Let M be a flat R-module. If A is a set and $x_\alpha \in M$, $\alpha \in A$ is a collection of elements of M, then the following are equivalent:*

(1) *$\{\overline{x}_\alpha\}_{\alpha \in A}$ forms a basis for the vector space $M/\mathfrak{m}M$ over $R/\mathfrak{m}$, and*
(2) *$\{x_\alpha\}_{\alpha \in A}$ forms a basis for M over R.*

Proof. The implication (2) ⇒ (1) is immediate. We will prove the other implication by using induction on n to show that $\{x_\alpha\}_{\alpha \in A}$ forms a basis for $M/\mathfrak{m}^n M$ over $R/\mathfrak{m}^n$. The case $n = 1$ holds by assumption (1). Assume the statement holds for some $n \geq 1$. By Nakayama's Lemma 7.14.5 the elements x_α generate M, in particular $M/\mathfrak{m}^{n+1}M$. The exact sequence $0 \to \mathfrak{m}^n/\mathfrak{m}^{n+1} \to R/\mathfrak{m}^{n+1} \to R/\mathfrak{m}^n \to 0$ gives on tensoring with M the exact sequence

$$0 \to \mathfrak{m}^n M/\mathfrak{m}^{n+1}M \to M/\mathfrak{m}^{n+1}M \to M/\mathfrak{m}^n M \to 0$$

Here we are using that M is flat. Moreover, we have $\mathfrak{m}^n M/\mathfrak{m}^{n+1}M = M/\mathfrak{m}M \otimes_{R/\mathfrak{m}} \mathfrak{m}^n/\mathfrak{m}^{n+1}$ by flatness of M again. Now suppose that $\sum f_\alpha x_\alpha = 0$ in $M/\mathfrak{m}^{n+1}M$. Then by induction hypothesis $f_\alpha \in \mathfrak{m}^n$ for each α. By the short exact sequence above we then conclude that $\sum \overline{f}_\alpha \otimes \overline{x}_\alpha$ is zero in $\mathfrak{m}^n/\mathfrak{m}^{n+1} \otimes_{R/\mathfrak{m}} M/\mathfrak{m}M$. Since $\overline{x}_\alpha$ forms a basis we conclude that each of the congruence classes $\overline{f}_\alpha \in \mathfrak{m}^n/\mathfrak{m}^{n+1}$ is zero and we win. □

Lemma 7.93.2. *Let R be an Artinian local ring. Let M be an R-module. The following are equivalent*

(1) *M is flat over R,*
(2) *M is a free R-module, and*
(3) *M is a projective R-module.*

Proof. Since any projective module is flat (as a direct summand of a free module) and every free module is projective, it suffices to prove that a flat module is free. Let M be a flat module. Let A be a set and let $x_\alpha \in M$, $\alpha \in A$ be elements such that $\overline{x_\alpha} \in M/\mathfrak{m}M$

forms a basis over the residue field of R. By Lemma 7.93.1 the x_α are a basis for M over R and we win. □

Lemma 7.93.3. *Let R be a ring. Let $I \subset R$ be an ideal. Let M be an R-module. Let A be a set and let $x_\alpha \in M$, $\alpha \in A$ be a collection of elements of M. Assume*

1. *I is nilpotent,*
2. *$\{\overline{x}_\alpha\}_{\alpha \in A}$ forms a basis for M/IM over R/I, and*
3. *$Tor_1^R(R/I, M) = 0$.*

Then M is free on $\{x_\alpha\}_{\alpha \in A}$ over R.

Proof. Let R, I, M, $\{x_\alpha\}_{\alpha \in A}$ be as in the lemma and satisfy assumptions (1), (2), and (3). By Nakayama's Lemma 7.14.5 the elements x_α generate M over R. The assumption $\text{Tor}_1^R(R/I, M) = 0$ implies that we have a short exact sequence

$$0 \to I \otimes_R M \to M \to M/IM \to 0.$$

Let $\sum f_\alpha x_\alpha = 0$ be a relation in M. By choice of x_α we see that $f_\alpha \in I$. Hence we conclude that $\sum f_\alpha \otimes x_\alpha = 0$ in $I \otimes_R M$. The map $I \otimes_R M \to I/I^2 \otimes_{R/I} M/IM$ and the fact that $\{x_\alpha\}_{\alpha \in A}$ forms a basis for M/IM implies that $f_\alpha \in I^2$! Hence we conclude that there are no relations among the images of the x_α in M/I^2M. In other words, we see that M/I^2M is free with basis the images of the x_α. Using the map $I \otimes_R M \to I/I^3 \otimes_{R/I^2} M/I^2M$ we then conclude that $f_\alpha \in I^3$! And so on. Since $I^n = 0$ for some n by assumption (1) we win. □

Lemma 7.93.4. *Let $\varphi : R \to R'$ be a ring map. Let $I \subset R$ be an ideal. Let M be an R-module. Assume*

1. *M/IM is flat over R/I, and*
2. *$R' \otimes_R M$ is flat over R'.*

Set $I_2 = \varphi^{-1}(\varphi(I^2)R')$. Then M/I_2M is flat over R/I_2.

Proof. We may replace R, M, and R' by R/I_2, M/I_2M, and $R'/\varphi(I)^2R'$. Then $I^2 = 0$ and φ is injective. By Lemma 7.91.8 and the fact that $I^2 = 0$ it suffices to prove that $\text{Tor}_1^R(R/I, M) = K = \text{Ker}(I \otimes_R M \to M)$ is zero. Set $M' = M \otimes_R R'$ and $I' = IR'$. By assumption the map $I' \otimes_{R'} M' \to M'$ is injective. Hence K maps to zero in

$$I' \otimes_{R'} M' = I' \otimes_R M = I' \otimes_{R/I} M/IM.$$

Then $I \to I'$ is an injective map of R/I-modules. Since M/IM is flat over R/I the map

$$I \otimes_{R/I} M/IM \longrightarrow I' \otimes_{R/I} M/IM$$

is injective. This implies that K is zero in $I \otimes_R M = I \otimes_{R/I} M/IM$ as desired. □

Lemma 7.93.5. *Let $\varphi : R \to R'$ be a ring map. Let $I \subset R$ be an ideal. Let M be an R-module. Assume*

1. *I is nilpotent,*
2. *$R \to R'$ is injective,*
3. *M/IM is flat over R/I, and*
4. *$R' \otimes_R M$ is flat over R'.*

Then M is flat over R.

Proof. Define inductively $I_1 = I$ and $I_{n+1} = \varphi^{-1}(\varphi(I_n)^2R')$ for $n \geq 1$. Note that by Lemma 7.93.4 we find that M/I_nM is flat over R/I_n for each $n \geq 1$. It is clear that $\varphi(I_n) \subset \varphi(I)^{2^n}R'$. Since I is nilpotent we see that $\varphi(I_n) = 0$ for some n. As φ is injective we conclude that $I_n = 0$ for some n and we win. □

Here is the local Artinian version of the local criterion for flatness.

Lemma 7.93.6. *Let R be an Artinian local ring. Let M be an R-module. Let $I \subset R$ be a proper ideal. The following are equivalent*

(1) *M is flat over R, and*
(2) *M/IM is flat over R/I and $Tor_1^R(R/I, M) = 0$.*

Proof. The implication (1) ⇒ (2) follows immediately from the definitions. Assume M/IM is flat over R/I and $\text{Tor}_1^R(R/I, M) = 0$. By Lemma 7.93.2 this implies that M/IM is free over R/I. Pick a set A and elements $x_\alpha \in M$ such that the images in M/IM form a basis. By Lemma 7.93.3 we conclude that M is free and in particular flat. □

It turns out that flatness descends along injective homomorphism whose source is an Artinian ring.

Lemma 7.93.7. *Let $R \to S$ be a ring map. Let M be an R-module. Assume*

(1) *R is Artinian*
(2) *$R \to S$ is injective, and*
(3) *$M \otimes_R S$ is a flat S-module.*

Then M is a flat R-module.

Proof. First proof: Let $I \subset R$ be the radical of R. Then I is nilpotent and M/IM is flat over R/I as R/I is a product of fields, see Section 7.49. Hence M is flat by an application of Lemma 7.93.5.

Second proof: By Lemma 7.49.8 we may write $R = \prod R_i$ as a finite product of local Artinian rings. This induces similar product decompositions for both R and S. Hence we reduce to the case where R is local Artinian (details omitted).

Assume that $R \to S$, M are as in the lemma satisfying (1), (2), and (3) and in addition that R is local with maximal ideal $\mathfrak{m}$. Let A be a set and $x_\alpha \in A$ be elements such that $\overline{x}_\alpha$ forms a basis for $M/\mathfrak{m}M$ over $R/\mathfrak{m}$. By Nakayama's Lemma 7.14.5 we see that the elements x_α generate M as an R-module. Set $N = S \otimes_R M$ and $I = \mathfrak{m}S$. Then $\{1 \otimes x_\alpha\}_{\alpha \in A}$ is a family of elements of N which form a basis for N/IN. Moreover, since N is flat over S we have $\text{Tor}_1^S(S/I, N) = 0$. Thus we conclude from Lemma 7.93.3 that N is free on $\{1 \otimes x_\alpha\}_{\alpha \in A}$. The injectivity of $R \to S$ then guarantees that there cannot be a nontrivial relation among the x_α with coefficients in R. □

Please compare the lemma below to Lemma 7.91.14 (the case of Noetherian local rings) and Lemma 7.119.8 (the case of finitely presented algebras).

Lemma 7.93.8 (Critère de platitude par fibres: Nilpotent case)**.** *Let*

$$\begin{tikzcd} S \arrow[rr] & & S' \\ & R \arrow[ul] \arrow[ur] & \end{tikzcd}$$

be a commutative diagram in the category of rings. Let $I \subset R$ be a nilpotent ideal and M an S'-module. Assume

(1) *The module M/IM is a flat S/IS-module.*
(2) *The module M is a flat R-module.*

Then M is a flat S-module and $S_\mathfrak{q}$ is flat over R for every $\mathfrak{q} \subset S$ such that $M \otimes_S \kappa(\mathfrak{q})$ is nonzero.

Proof. As M is flat over R tensoring with the short exact sequence $0 \to I \to R \to R/I \to 0$ gives a short exact sequence

$$0 \to I \otimes_R M \to M \to M/IM \to 0.$$

Note that $I \otimes_R M \to IS \otimes_S M$ is surjective. Combined with the above this means both maps in

$$I \otimes_R M \to IS \otimes_S M \to M$$

are injective. Hence $\mathrm{Tor}_1^S(IS, M) = 0$ (see Remark 7.69.8) and we conclude that M is a flat S-module by Lemma 7.91.8. To finish we need to show that $S_\mathfrak{q}$ is flat over R for any prime $\mathfrak{q} \subset S$ such that $M \otimes_S \kappa(\mathfrak{q})$ is nonzero. This follows from Lemma 7.35.14 and 7.35.9. □

7.94. What makes a complex exact?

Some of this material can be found in the paper [**BE73**] by Buchsbaum and Eisenbud.

Situation 7.94.1. Here R is a ring, and we have a complex

$$0 \to R^{n_e} \xrightarrow{\varphi_e} R^{n_{e-1}} \xrightarrow{\varphi_{e-1}} \ldots \xrightarrow{\varphi_{i+1}} R^{n_i} \xrightarrow{\varphi_i} R^{n_{i-1}} \xrightarrow{\varphi_{i-1}} \ldots \xrightarrow{\varphi_1} R^{n_0}$$

In other words we require $\varphi_i \circ \varphi_{i+1} = 0$ for $i = 1, \ldots, e-1$.

Lemma 7.94.2. *In Situation 7.94.1. Suppose R is a local ring with maximal ideal $\mathfrak{m}$. Suppose that for some i, $e \le i \le 1$ some matrix coefficient of the map φ_i is invertible. Then the complex $0 \to R^{n_e} \to R^{n_{e-1}} \to \ldots \to R^{n_0}$ is isomorphic to the direct sum of a complex $0 \to R^{n_e} \to \ldots \to R^{n_i - 1} \to R^{n_{i-1}-1} \to \ldots \to R^{n_0}$ and the complex $0 \to 0 \to \ldots \to R \to R \to 0 \to \ldots \to 0$ where the map $R \to R$ is the identity map.*

Proof. The assumption means, after a change of basis of R^{n_i} and $R^{n_{i-1}}$ that the first basis vector of R^{n_i} is mapped via φ_i to the first basis vector of $R^{n_{i-1}}$. Let e_j denote the jth basis vector of R^{n_i} and f_k the kth basis vector of $R^{n_{i-1}}$. Write $\varphi_i(e_j) = \sum a_{jk} f_k$. So $a_{1k} = 0$ unless $k = 1$ and $a_{11} = 1$. Change basis on R^{n_i} again by setting $e'_j = e_j - a_{j1} e_1$ for $j > 1$. After this change of coordinates we have $a_{j1} = 0$ for $j > 1$. Note the image of $R^{n_{i+1}} \to R^{n_i}$ is contained in the subspace spanned by e_j, $j > 1$. Note also that $R^{n_{i-1}} \to R^{n_{i-2}}$ has to annihilate f_1 since it is in the image. These conditions and the shape of the matrix (a_{jk}) for φ_i imply the lemma. □

Let us say that an acyclic complex of the form $\ldots \to 0 \to R \to R \to 0 \to \ldots$ is *trivial*. The lemma above clearly says that any finite complex of finite free modules over a local ring is up to direct sums with trivial complexes the same as a complex all of whose maps have all matrix coefficients in the maximal ideal.

Lemma 7.94.3. *In Situation 7.94.1. Let R be a Artinian local ring. Suppose that $0 \to R^{n_e} \to R^{n_{e-1}} \to \ldots \to R^{n_0}$ is an exact complex. Then the complex is isomorphic to a direct sum of trivial complexes.*

Proof. By induction on the integer $\sum n_i$. Clearly $\mathrm{Ass}(R) = \{\mathfrak{m}\}$. Pick $x \in R$, $x \neq 0$, $\mathfrak{m}x = 0$. Pick a basis vector $e_i \in R^{n_e}$. Since xe_i is not be mapped to zero by exactness of the complex we deduce that some matrix coefficient of the map $R^{n_e} \to R^{n_{e-1}}$ is not in $\mathfrak{m}$. Lemma 7.94.2 then allows us to decrease $\sum n_i$. □

Below we define the rank of a map of finite free modules. This is just one possible definition of rank. It is just the definition that works in this section; there are others that may be more convenient in other settings.

Definition 7.94.4. Let R be a ring. Suppose that $\varphi : R^m \to R^n$ is a map of finite free modules.

(1) The *rank* of φ is the maximal r such that $\wedge^r\varphi : \wedge^r R^m \to \wedge^r R^n$ is nonzero.
(2) We let $I(\varphi) \subset R$ be the ideal generated by the $r \times r$ minors of the matrix of φ, where r is the rank as defined above.

Lemma 7.94.5. *In Situation 7.94.1, suppose the complex is isomorphic to a direct sum of trivial complexes. Then we have*

(1) *the maps φ_i have rank $r_i = n_i - n_{i+1} + \ldots + (-1)^{e-i-1}n_{e-1} + (-1)^{e-i}n_e$,*
(2) *for all i, $1 \leq i \leq e$ we have $rank(\varphi_{i+1}) + rank(\varphi_i) = n_i$,*
(3) *each $I(\varphi_i) = R$.*

Proof. We may assume the complex is the direct sum of trivial complexes. Then for each i we can split the standard basis elements of R^{n_i} into those that map to a basis element of $R^{n_{i-1}}$ and those that are mapped to zero (and these are mapped onto by basis elements of $R^{n_{i+1}}$). Using descending induction starting with $i = e$ it is easy to prove that there are r_{i+1}-basis elements of R^{n_i} which are mapped to zero and r_i which are mapped to basis elements of $R^{n_{i-1}}$. From this the result follows. $\square$

Lemma 7.94.6. *Let R be a local Noetherian ring. Suppose that $\varphi : R^m \to R^n$ is a map of finite free modules. The following are equivalent*

(1) *φ is injective.*
(2) *the rank of φ is m and either $I(\varphi) = R$ or it contains a non zero divisor.*

Proof. If any matrix coefficient of φ is not in $\mathfrak{m}$, then we apply Lemma 7.94.2 to write φ as the sum of $1 : R \to R$ and a map $\varphi' : R^{m-1} \to R^{n-1}$. It is easy to see that the lemma for φ' implies the lemma for φ. Thus we may assume from the outset that all the matrix coefficients of φ are in $\mathfrak{m}$.

Suppose φ is injective. We may assume $m > 0$. Let $\mathfrak{q} \in \text{Ass}(R)$. Let $x \in R$ be an element whose annihilator is $\mathfrak{q}$. Note that φ induces a injective map $xR^m \to xR^n$ which is isomorphic to the map $\varphi_{\mathfrak{q}} : (R/\mathfrak{q})^m \to (R/\mathfrak{q})^n$ induced by φ. Since $R/\mathfrak{q}$ is a domain we deduce immediately by localizing to its fraction field that the rank of $\varphi_{\mathfrak{q}}$ is m and that $I(\varphi_{\mathfrak{q}})$ is not the zero ideal. Hence we conclude by Lemma 7.60.17.

Conversely, assume that the rank of φ is m and that $I(\varphi)$ contains a non zero divisor x. The rank being m implies $n \geq m$. By Lemma 7.14.6 we can find a map $\psi : R^n \to R^m$ such that $\psi \circ \varphi = f\text{id}_{R^m}$. Thus φ is injective. $\square$

Lemma 7.94.7. *In Situation 7.94.1. Suppose R is a local Noetherian ring with maximal ideal $\mathfrak{m}$. Assume $\mathfrak{m} \in Ass(R)$, in other words R has depth 0. Suppose that the complex is exact. In this case the complex is isomorphic to a direct sum of trivial complexes.*

Proof. The proof is the same as in Lemma 7.94.3, except using Lemma 7.94.6 to guarantee that $I(\varphi_e) = R$, and hence some matrix coefficient of φ_e is not in $\mathfrak{m}$. $\square$

Lemma 7.94.8. *In Situation 7.94.1, suppose R is a local Noetherian ring, and suppose that the complex is exact. Let x be an element of the maximal ideal which is a nonzero divisor. The complex $0 \to (R/xR)^{n_e} \to \ldots \to (R/xR)^{n_1}$ is still exact.*

Proof. Follows easily from the snake lemma. $\square$

Lemma 7.94.9. *(Acyclicity lemma.) Let R be a local Noetherian ring. Let $0 \to M_e \to M_{e-1} \to \ldots \to M_0$ be a complex of finite R-modules. Assume depth$(M_i) \geq i$. Let i be the largest index such that the complex is not exact at M_i. If $i > 0$ then Ker$(M_i \to M_{i-1})$/Im$(M_{i+1} \to M_i)$ has depth ≥ 1.*

Proof. Let $H = \mathrm{Ker}(M_i \to M_{i-1})/\mathrm{Im}(M_{i+1} \to M_i)$ be the cohomology group in question. We may break the complex into short exact sequences $0 \to M_e \to M_{e-1} \to K_{e-2} \to 0$, $0 \to K_j \to M_j \to K_{j-1} \to 0$, for $i + 2 \leq j \leq e - 2$, $0 \to K_{i+1} \to M_{i+1} \to B_i \to 0$, $0 \to K_i \to M_i \to M_{i-1}$, and $0 \to B_i \to K_i \to H \to 0$. We proceed up through these complexes to prove the statements about depths, repeatedly using Lemma 7.67.10. First of all, since depth$(M_e) \geq e$, and depth$(M_{e-1}) \geq e-1$ we deduce that depth$(K_{e-2}) \geq e-1$. At this point the sequences $0 \to K_j \to M_j \to K_{j-1} \to 0$ for $i+2 \leq j \leq e-2$ imply similarly that depth$(K_{j-1}) \geq j$ for $i + 2 \leq j \leq e - 2$. The sequence $0 \to K_{i+1} \to M_{i+1} \to B_i \to 0$ then shows that depth$(B_i) \geq i + 1$. The sequence $0 \to K_i \to M_i \to M_{i-1}$ shows that depth$(K_i) \geq 1$ since M_i has depth $\geq i \geq 1$ by assumption. The sequence $0 \to B_i \to K_i \to H \to 0$ then implies the result. □

Proposition 7.94.10. *In Situation 7.94.1, suppose R is a local Noetherian ring. The complex is exact if and only if for all i, $1 \leq i \leq e$ the following two conditions are satisfied:*

(1) *we have rank(φ_{i+1}) + rank$(\varphi_i) = n_i$, and*
(2) *$I(\varphi_i) = R$, or $I(\varphi_i)$ contains a regular sequence of length i.*

Proof. This proof is very similar to the proof of Lemma 7.94.6. As in the proof of Lemma 7.94.6 we may assume that all matrix entries of each φ_i are elements of the maximal ideal. We may also assume that $e \geq 1$.

Assume the complex is exact. Let $q \in \mathrm{Ass}(R)$. (There is at least one such prime.) Note that the ring $R_{\mathfrak q}$ has depth 0. We apply Lemmas 7.94.7 and 7.94.5 to the localized complex over $R_{\mathfrak q}$. all of the ideals $I(\varphi_i)_{\mathfrak q}$, $e \geq i \geq 1$ are equal to $R_{\mathfrak q}$. Thus none of the ideals $I(\varphi_i)$ is contained in $\mathfrak q$. This implies that $I(\varphi_e)I(\varphi_{e-1}) \ldots I(\varphi_1)$ is not contained in any of the associated primes of R. By Lemma 7.14.3 we may choose $x \in I(\varphi_e)I(\varphi_{e-1}) \ldots I(\varphi_1)$, $x \not\in \mathfrak q$ for all $q \in \mathrm{Ass}(R)$. According to Lemma 7.94.8 the complex $0 \to (R/xR)^{n_e} \to \ldots \to (R/xR)^{n_1}$ is exact. By induction on e all the ideals $I(\varphi_i)/xR$ have a regular sequence of length $i - 1$. This proves that $I(\varphi_i)$ contains a regular sequence of length i.

Assume the two conditions on the ranks of φ_i and the ideals $I(\varphi_i)$ is satisfied. Note that $I(\varphi_i) \subset \mathfrak m$ for all i because of what was said in the first paragraph of the proof. Hence the assumption in particular implies that depth$(R) \geq e$. By induction on the dimension of R we may assume the complex is exact when localized at any nonmaximal prime of R. Thus $\mathrm{Ker}(\varphi_i)/\mathrm{Im}(\varphi_{i+1})$ has support $\{\mathfrak m\}$ and hence (if nonzero) depth 0. By Lemma 7.94.9 we see that the complex is exact. □

7.95. Cohen-Macaulay modules

Here we just do a minimal amount of work to show that Cohen-Macaulay modules have good properties. We postpone using Ext groups to esthablish the connection with duality and so on.

Definition 7.95.1. Let R be a Noetherian local ring. Let M be a finite R-module. We say M is *Cohen-Macaulay* if dim(Support(M)) = depth(M).

Let R be a local Noetherian ring. Let M be a Cohen-Macaulay module, and let $f_1, \ldots, f_d$ be an M-regular sequence with $d = \dim(\mathrm{Support}(M))$. We say that $g \in \mathfrak m$ is *good with respect* *to* $(M, f_1, \dots, f_d)$ if for all $i = 0, 1, \dots, d-1$ we have $\dim(\text{Support}(M) \cap V(g, f_1, \dots, f_i)) = d - i - 1$. This is equivalent to the condition that $\dim((\text{Support}(M/(f_1, \dots, f_i)M) \cap V(g) = d - i - 1$ for $i = 0, 1, \dots, d-1$.

Lemma 7.95.2. *Notation and assumptions as above. If g is good with respect to $(M, f_1, \dots, f_d)$, then (a) g is a nonzero-divisor on M, and (b) M/gM is Cohen-Macaulay with maximal regular sequence $f_1, \dots, f_{d-1}$.*

Proof. We prove the lemma by induction on d. If $d = 0$, then M is finite and there is no case to which the lemma applies. If $d = 1$, then we have to show that $g : M \to M$ is injective. The kernel K has support $\{\mathfrak{m}\}$ because by assumption $\dim \text{Supp}(M) \cap V(g) = 0$. Hence K has finite length. Hence $f_1 : K \to K$ injective implies the length of the image is the length of K, and hence $f_1 K = K$, which by Nakayama's Lemma 7.14.5 implies $K = 0$. Also, $\dim \text{Supp}(M/gM) = 0$ and so M/gM is Cohen-Macaulay of depth 0.

For $d > 1$ we essentially argue in the same way. Let $K \subset M$ be the kernel of multiplication by g. As above $f_1 : K \to K$ cannot be surjective if $K \neq 0$ Consider the commutative diagram

$$\begin{array}{ccccccccc} 0 & \to & M & \xrightarrow{f_1} & M & \to & M/f_1M & \to & 0 \\ & & \downarrow g & & \downarrow g & & \downarrow g & & \\ 0 & \to & M & \xrightarrow{f_1} & M & \to & M/f_1M & \to & 0 \end{array}$$

This shows that the kernel K_1 of $g : M/f_1M \to M/f_1M$ cannot be zero if K is not zero. But g is good for $(M/f_1M, f_2, \dots, f_d)$, as is easy seen from the definition. We conclude that $K_1 = 0$, and so $K = 0$. From the snake lemma we see that $0 \to M/gM \to M/gM \to M/(f_1, g)M \to 0$ is exact. By induction, we have that $M/(g, f_1)M$ is Cohen-Macaulay with regular sequence $f_2, \dots, f_{d-1}$. Thus M/gM is Cohen-Macaulay with regular sequence $f_1, \dots, f_{d-1}$. □

Lemma 7.95.3. *Let R be a Noetherian local ring. Let M be a Cohen-Macaulay module over R. Suppose $g \in \mathfrak{m}$ is such that* $\dim(\mathit{Supp}(M) \cap V(g)) = \dim(\mathit{Supp}(M)) - 1$. *Then (a) g is a nonzero divisor on M, and (b) M/gM is Cohen-Macaulay of depth one less.*

Proof. Choose a M-regular sequence $f_1, \dots, f_d$ with $d = \dim(\text{Supp}(M))$. If g is is good with respect to $(M, f_1, \dots, f_d)$ we win by Lemma 7.95.2. In particular the lemma holds if $d = 1$. (The case $d = 0$ does not occur.) Assume $d > 1$. Choose an element $h \in R$ such that (a) h is good with respect to $(M, f_1, \dots, f_d)$, and (b) $\dim(\text{Supp}(M) \cap V(h, g) = d - 2$. To see h exists, let $\{\mathfrak{q}_i\}$ be the (finite) set of minimal primes of the closed sets $\text{Supp}(M)$, $\text{Supp}(M) \cap V(f_1, \dots, f_i)$, $i = 1, \dots, d-1$, and $\text{Supp}(M) \cap V(g)$. None of these $\mathfrak{q}_i$ is equal to $\mathfrak{m}$ and hence we may find $h \in \mathfrak{m}$, $h \not\in \mathfrak{q}_i$ by Lemma 7.14.3. It is clear that h satisfies (a) and (b). At this point we may apply Lemma 7.95.2 to conclude that M/hM is Cohen-Macaulay. By (b) we see that the pair $(M/hM, g)$ satisfies the induction hypothesis. Hence $M/(h, g)M$ is Cohen-Macaulay, and $g : M/hM \to M/hM$ is injective. From this it follows easily that $g : M \to M$ is injective, by a snake lemma argument. This in its turn implies that $h : M/gM \to M/gM$ is injective. Combined with the fact that $M/(g, h)M$ is Cohen-Macaulay this finishes the proof. □

Proposition 7.95.4. *Let R be a Noetherian local ring, with maximal ideal $\mathfrak{m}$. Let M be a Cohen-Macaulay module over R whose support has dimension d. Suppose that $g_1, \dots, g_c$ are elements of $\mathfrak{m}$ such that* $\dim(\mathit{Supp}(M/(g_1, \dots, g_c)M)) = d - c$. *Then $g_1, \dots, g_c$ is an M-regular sequence, and can be extended to a maximal M-regular sequence.*

Proof. Let $Z = \mathrm{Supp}(M) \subset Spec(R)$. By Lemma 7.57.11 in the chain $Z \supset Z \cap V(g_1) \supset \ldots \supset Z \cap V(g_1, \ldots, g_c)$ each step decreases the dimension at most by 1. Hence by assumption each step decreases the dimension by exactly 1 each time. Thus we may succesively apply Lemma 7.95.3 above to the modules $M/(g_1, \ldots, g_i)$ and the element g_{i+1}.

To extend $g_1, \ldots, g_c$ by one element if $c < d$ we simply choose an element $g_{c+1} \in \mathfrak{m}$ which is not in any of the finitely many minimal primes of $Z \cap V(g_1, \ldots, g_c)$, using Lemma 7.14.3. □

7.96. Cohen-Macaulay rings

Definition 7.96.1. A Noetherian local ring R is called *Cohen-Macaulay* if it is Cohen-Macaulay as a module over itself.

Note that this is equivalent to requiring the existence of a R-regular sequence $x_1, \ldots, x_d$ of the maximal ideal such that $R/(x_1, \ldots, x_d)$ has dimension 0. We will usually just say ``regular sequence'' and not ``R-regular sequence''.

Lemma 7.96.2. *Let R be a Noetherian local Cohen-Macaulay ring with maximal ideal $\mathfrak{m}$. Let $x_1, \ldots, x_c \in \mathfrak{m}$ be elements. Then*

$$x_1, \ldots, x_c \textit{ is a regular sequence } \Leftrightarrow \dim(R/(x_1, \ldots, x_c)) = \dim(R) - c$$

If so $x_1, \ldots, x_c$ can be extended to a regular sequence of length $\dim(R)$ *and each quotient $R/(x_1, \ldots, x_i)$ is a Cohen-Macaulay ring of dimension* $\dim(R) - i$.

Proof. This is a reformulation of Proposition 7.95.4 in the case where the module is equal to R. □

Lemma 7.96.3. *Let R be Noetherian local. Suppose R is Cohen-Macaulay of dimension d. Any maximal chain of ideals $\mathfrak{p}_0 \subset \mathfrak{p}_1 \subset \ldots \subset \mathfrak{p}_n$ has length $n = d$.*

Proof. Choose an element $x \in \mathfrak{p}_1$, with x not in any of the minimal primes of R, and in particular $x \not\in \mathfrak{p}_0$. (See Lemma 7.14.3.) Then $\dim(R/xR) < \dim(R)$ and R/xR is Cohen-Macaulay by Proposition 7.95.4. By induction the chain $\mathfrak{p}_1/xR \subset \ldots \subset \mathfrak{p}_n/xR$ has length $d - 1$. □

Lemma 7.96.4. *Suppose R is a Noetherian local Cohen-Macaulay ring of dimension d. For any prime $\mathfrak{p} \subset R$ we have*

$$\dim(R) = \dim(R_{\mathfrak{p}}) + \dim(R/\mathfrak{p}).$$

Proof. This is immediate from the result on maximal sequences above, by looking at maximal sequences which have $\mathfrak{p}$ in them. □

Lemma 7.96.5. *Suppose R is a Cohen-Macaulay local ring. For any prime $\mathfrak{p} \subset R$ the ring $R_{\mathfrak{p}}$ is Cohen-Macaulay as well.*

Proof. Suppose that $\dim(R) = d$ and that $\dim(R/\mathfrak{p}) = d - c$. We may choose $f_1, \ldots, f_c \in \mathfrak{p}$ such that $\dim V(f_1, \ldots, f_i) = d - i$, using Lemma 7.14.3 at each step to avoid minimal primes of $V(f_1, \ldots, f_{i-1})$. Then $\mathfrak{p}$ is minimal over $(f_1, \ldots, f_c)$ and hence the support of $R_{\mathfrak{p}}/(f_1, \ldots, f_c)R_{\mathfrak{p}}$ consists of the maximal ideal of $R_{\mathfrak{p}}$. In other words $R_{\mathfrak{p}}$ has an ideal of definition generated by c elements, and has dimension c by Lemma 7.96.4. □

Definition 7.96.6. A Noetherian ring R is called *Cohen-Macaulay* if all its local rings are Cohen-Macaulay.

Lemma 7.96.7. *Suppose R is a Cohen-Macaulay ring. Any polynomial algebra over R is Cohen-Macaulay.*

Proof. By induction on the number of variables it suffices to prove that $R[x]$ is Cohen-Macaulay if R is. Let $\mathfrak q \subset R[x]$ be a prime, and let $\mathfrak p$ be its image. Let $f_1, \ldots, f_d$ be a regular sequence in the maximal ideal of $R_{\mathfrak p}$ of length $d = \dim(R_{\mathfrak p})$. Note that since $R[x]$ is flat over R the localization $R[x]_{\mathfrak q}$ is flat over $R_{\mathfrak p}$. Hence, by Lemma 7.65.7, the sequence $f_1, \ldots, f_d$ is a regular sequence of length d in $R[x]_{\mathfrak q}$. The quotient $R[x]_{\mathfrak q}/(f_1, \ldots, f_d)$ is a localization of $(R_{\mathfrak p}/(f_1, \ldots, f_d))[x]$ at a prime $\overline{\mathfrak q}$. It is clear that either $\overline{\mathfrak q}$ contains a monic polynomial f in $(R_{\mathfrak p}/(f_1, \ldots, f_d))[x]$, or $\overline{\mathfrak q}$ equals the kernel of $(R_{\mathfrak p}/(f_1, \ldots, f_d))[x] \to \kappa(\mathfrak p)[x]$. In the first case the monic polynomial f is a nonzero divisor in $(R_{\mathfrak p}/(f_1, \ldots, f_d))[x]$ and hence in $R[x]_{\mathfrak q}/(f_1, \ldots, f_d)$, and $x_1, \ldots, x_d, f$ is a regular sequence in $R[x]_{\mathfrak q}$ such that $\dim(R[x]_{\mathfrak q}/(x_1, \ldots, x_d, f)) = 0$. In the second case it is already the case that $\dim R[x]_{\mathfrak q}/(f_1, \ldots, f_d) = 0$. □

Lemma 7.96.8. *Suppose that R is a Noetherian local Cohen-Macaulay ring of dimension d. Suppose that M is a finite R-module, and suppose that $0 \to K \to R^n \to M \to 0$ is an exact sequence of R-modules. Then either depth$(K) >$ depth(M), or depth$(K) =$ depth$(M) = d$.*

Proof. If depth$(M) = 0$ the lemma is clear. Let $x \in \mathfrak m$ be a nonzero divisor on M and on R. Then x is a nonzero divisor on M and on K and it follows by an easy diagram chase that $0 \to K/xK \to (R/xR)^n \to M/xM \to 0$ is exact. Thus the result follows from the result for K/xK over R/xR which has smaller dimension. □

Definition 7.96.9. Let R be a Noetherian local Cohen-Macaulay ring. A finite module M over R is called a *maximal Cohen-Macaulay* module if depth$(M) = \dim(R)$.

Lemma 7.96.10. *Let R be a local Noetherian Cohen-Macaulay ring of dimension d Let M be a finite R module of depth e. There exists an exact complex*

$$0 \to K \to F_{d-e-1} \to \ldots \to F_0 \to M \to 0$$

with each F_i finite free and K maximal Cohen-Macaulay.

Proof. Immediate from the definition and Lemma 7.96.8. □

Lemma 7.96.11. *Let $\varphi : A \to B$ be a map of local rings. Assume that B is Noetherian and Cohen-Macaulay and that $\mathfrak m_B = \sqrt{\varphi(\mathfrak m_A)B}$. Then there exists a sequence of elements $f_1, \ldots, f_{\dim(B)}$ in A such that $\varphi(f_1), \ldots, \varphi(f_{\dim(B)})$ is a regular sequence in B.*

Proof. By induction on $\dim(B)$ it suffices to prove: If $\dim(B) \geq 1$, then we can find an element f of A which maps to a nonzero divisor in B. By Lemma 7.96.2 it suffices to find $f \in A$ whose image in B is not contained in any of the finitely many minimal primes $\mathfrak q_1, \ldots, \mathfrak q_r$ of B. By the assumption that $\mathfrak m_B = \sqrt{\varphi(\mathfrak m_A)B}$ we see that $\mathfrak m_A \not\subset \varphi^{-}(\mathfrak q_i)$. Hence we can find f by Lemma 7.14.3. □

7.97. Catenary rings

Definition 7.97.1. A ring R is said to be *catenary* if for any pair of prime ideals $\mathfrak p \subset \mathfrak q$, all maximal chains of primes $\mathfrak p = \mathfrak p_0 \subset \mathfrak p_1 \subset \ldots \subset \mathfrak p_e = \mathfrak q$ have the same (finite) length.

Lemma 7.97.2. *A ring R is catenary if and only if the topological space Spec(R) is catenary (see Topology, Definition 5.8.1).*

Proof. Immediate from the definition and the characterization of irreducible closed subsets. □

Lemma 7.97.3. *Any localization of a catenary ring is catenary.*

Proof. Omitted. □

Lemma 7.97.4. *Any quotient of a catenary ring is catenary.*

Proof. Omitted. □

In general it is not the case that a finitely generated R-algebra is catenary if R is. Thus we make the following definition.

Definition 7.97.5. A ring R is said to be *universally catenary* if R is Noetherian and every R algebra of finite type is catenary.

By Lemma 7.97.4 this just means that R is Noetherian and that each polynomial algebra $R[x_1, \ldots, x_n]$ is catenary.

Lemma 7.97.6. *A Cohen-Macaulay ring is universally catenary.*

Proof. Since a polynomial algebra over R is Cohen-Macaulay, by Lemma 7.96.7, it suffices to show that a Cohen-Macaulay ring is catenary. Let R be Cohen-Macaulay and $\mathfrak{p} \subset \mathfrak{q}$ primes of R. By definition $R_{\mathfrak{q}}$ and $R_{\mathfrak{p}}$ are Cohen-Macaulay. Take a maximal chain of primes $\mathfrak{p} = \mathfrak{p}_0 \subset \mathfrak{p}_1 \subset \ldots \subset \mathfrak{p}_n = \mathfrak{q}$. Next choose a maximal chain of primes $\mathfrak{q}_0 \subset \mathfrak{q}_1 \subset \ldots \subset \mathfrak{q}_m = \mathfrak{p}$. By Lemma 7.96.3 we have $n + m = \dim(R_{\mathfrak{q}})$. And we have $m = \dim(R_{\mathfrak{p}})$ by the same lemma. Hence $n = \dim(R_{\mathfrak{q}}) - \dim(R_{\mathfrak{p}})$ is independent of choices. □

7.98. Regular local rings

It is not that easy to show that all prime localizations of a regular local ring are regular. In fact, quite a bit of the material developped sofar is geared towards a proof of this fact. See Proposition 7.102.5, and trace back the references.

Lemma 7.98.1. *Let R be a regular local ring with maximal ideal $\mathfrak{m}$. The graded ring $\bigoplus \mathfrak{m}^n/\mathfrak{m}^{n+1}$ is isomorphic to the graded polynomial algebra $\kappa(\mathfrak{m})[X_1, \ldots, X_d]$.*

Proof. Let $x_1, \ldots, x_d$ be a minimal set of generators for the maximal ideal $\mathfrak{m}$. Write $\kappa = \kappa(\mathfrak{m})$. There is a surjection $\kappa[X_1, \ldots, X_d] \to \bigoplus \mathfrak{m}^n/\mathfrak{m}^{n+1}$, which maps the class of x_i in $\mathfrak{m}/\mathfrak{m}^2$ to X_i. Since $d(R) = d$ we know that the numerical polynomial $n \mapsto \dim_\kappa \mathfrak{m}^n/\mathfrak{m}^{n+1}$ has degree d. By Lemma 7.55.9 we conclude that the surjection $\kappa[X_1, \ldots, X_d] \to \bigoplus \mathfrak{m}^n/\mathfrak{m}^{n+1}$ is an isomorphism. □

Lemma 7.98.2. *Any regular local ring is a domain.*

Proof. We will use that $\bigcap \mathfrak{m}^n = 0$ by Lemma 7.47.6. Let $f, g \in R$ such that $fg = 0$. Suppose that $f \in \mathfrak{m}^a$ and $g \in \mathfrak{m}^b$, with a, b maximal. Since $fg = 0 \in \mathfrak{m}^{a+b+1}$ we see from the result of Lemma 7.98.1 that either $f \in \mathfrak{m}^{a+1}$ or $g \in \mathfrak{m}^{b+1}$. Contradiction. □

Lemma 7.98.3. *Let R be a regular local ring and let $x_1, \ldots, x_d$ be a minimal set of generators for the maximal ideal $\mathfrak{m}$. Then $x_1, \ldots, x_d$ is a regular sequence, and each $R/(x_1, \ldots, x_c)$ is a regular local ring of dimension $d - c$. In particular R is Cohen-Macaulay.*

Proof. Note that R/x_1R is a Noetherian local ring of dimension $\geq d - 1$ by Lemma 7.57.11 with $x_2, \ldots, x_d$ generating the maximal ideal. Hence it is a regular local ring by definition. Since R is a domain by Lemma 7.98.2 x_1 is a nonzero divisor. □

Lemma 7.98.4. *Let R be a regular local ring. Let $I \subset R$ be an ideal such that R/I is a regular local ring as well. Then there exists a minimal set of generators $x_1, \ldots, x_d$ for the maximal $\mathfrak{m}$ of R such that $I = (x_1, \ldots, x_c)$ for some $0 \leq c \leq d$.*

Proof. Say $\dim(R) = d$ and $\dim(R/I) = d - c$. Denote $\overline{\mathfrak{m}} = \mathfrak{m}/I$ the maximal ideal of R/I. Let $\kappa = R/\mathfrak{m}$. We have $\dim_\kappa(I/\mathfrak{m}^2) = \dim_\kappa(\mathfrak{m}/\mathfrak{m}^2) - \dim(\overline{\mathfrak{m}}/\overline{\mathfrak{m}}^2) = d - (d - c) = c$ by the definition of a regular local ring. Hence we can choose $x_1, \ldots, x_c \in I$ whose images in $\mathfrak{m}/\mathfrak{m}^2$ are linearly independent, and supplement with $x_{c+1}, \ldots, x_d$ to get a minimal system of generators. □

Lemma 7.98.5. *Let R be a Noetherian local ring. Let $x \in \mathfrak{m}$. Let M be a finite R-module such that x is a nonzero divisor on M and M/xM is free over R/xR. Then M is free over R.*

Proof. Let $m_1, \ldots, m_r$ be elements of M which map to a R/xR-basis of M/xM. By Nakayama's Lemma 7.14.5 $m_1, \ldots, m_r$ generate M. If $\sum a_i m_i = 0$ is a relation, then $a_i \in xR$ for all i. Hence $a_i = b_i x$ for some $b_i \in R$. Hence the kernel K of $R^r \to M$ satisfies $xK = K$ and hence is zero by Nakayama's lemma. □

Lemma 7.98.6. *Let R be a regular local ring. Any maximal Cohen-Macaulay module over R is free.*

Proof. Let M be a maximal Cohen-Macaulay module over R. Let $x \in \mathfrak{m}$ be part of a regular sequence generating $\mathfrak{m}$. Then x is a nonzero divisor on M by Proposition 7.95.4, and M/xM is a maximal Cohen-Macaulay module over R/xR. By induction on $\dim(R)$ we see that M/xM is free. We win by Lemma 7.98.5. □

Lemma 7.98.7. *Suppose R is a Noetherian local ring. Let $x \in \mathfrak{m}$ be a nonzero divisor such that R/xR is a regular local ring. Then R is a regular local ring. More generally, if $x_1, \ldots, x_r$ is a regular sequence in R such that $R/(x_1, \ldots, x_r)$ is a regular local ring, then R is a regular local ring.*

Proof. This is true because x together with the lifts of a system of minimal generators of the maximal ideal of R/xR will give $\dim(R)$ generators of $\mathfrak{m}$. Use Lemma 7.57.11. The last statement follows from the first and induction. □

Lemma 7.98.8. *Let $(R_i, \varphi_{ii'})$ be a directed system of local rings whose transition maps are local ring maps. If each R_i is a regular local ring and $R = colim\, R_i$ is Noetherian, then R is a regular local ring.*

Proof. Let $\mathfrak{m} \subset R$ be the maximal ideal; it is the colimit of the maximal ideal $\mathfrak{m}_i \subset R_i$. We prove the lemma by induction on $d = \dim \mathfrak{m}/\mathfrak{m}^2$. If $d = 0$, then $R = R/\mathfrak{m}$ is a field and R is a regular local ring. If $d > 0$ pick an $x \in \mathfrak{m}$, $x \notin \mathfrak{m}^2$. For some i we can find an $x_i \in \mathfrak{m}_i$ mapping to x. Note that $R/xR = colim_{i' \geq i} R_{i'}/x_i R_{i'}$ is a Noetherian local ring. By Lemma 7.98.3 we see that $R_{i'}/x_i R_{i'}$ is a regular local ring. Hence by induction we see that R/xR is a regular local ring. Since each R_i is a domain (Lemma 7.98.1) we see that R is a domain. Hence x is a nonzero divisor and we conclude that R is a regular local ring by Lemma 7.98.7. □

7.99. Epimorphisms of rings

In any category there is a notion of an *epimorphism*. Some of this material is taken from [**Laz69**] and [**Maz68**].

Lemma 7.99.1. *Let $R \to S$ be a ring map. The following are equivalent*

(1) *$R \to S$ is an epimorphism,*
(2) *the two ring maps $S \to S \otimes_R S$ are equal,*
(3) *either of the ring maps $S \to S \otimes_R S$ is an isomorphism, and*
(4) *the ring map $S \otimes_R S \to S$ is an isomorphism.*

Proof. Omitted. ☐

Lemma 7.99.2. *The composition of two epimorphisms of rings is an epimorphism.*

Proof. Omitted. Hint: This is true in any category. ☐

Lemma 7.99.3. *If $R \to S$ is an epimorphism of rings and $R \to R'$ is any ring map, then $R' \to R' \otimes_R S$ is an epimorphism.*

Proof. Omitted. Hint: True in any category with pushouts. ☐

Lemma 7.99.4. *If $A \to B \to C$ are ring maps and $A \to C$ is an epimorphism, so is $B \to C$.*

Proof. Omitted. Hint: This is true in any category. ☐

This means in particular, that if $R \to S$ is an epimorphism with image $\overline{R} \subset S$, then $\overline{R} \to S$ is an epimorphism. Hence while proving results for epimorphisms we may often assume the map is injective.

Lemma 7.99.5. *Let $R \to S$ be a ring map. The following are equivalent:*

(1) *$R \to S$ is an epimorphism, and*
(2) *$R_{\mathfrak p} \to S_{\mathfrak p}$ is an epimorphism for each prime $\mathfrak p$ of R.*

Proof. Since $S_{\mathfrak p} = R_{\mathfrak p} \otimes_R S$ (see Lemma 7.11.15) we see that (1) implies (2) by Lemma 7.99.3. Conversely, assume that (2) holds. Let $a, b : S \to A$ be two ring maps from S to a ring A equalizing the maop $R \to S$. By assumption we see that for evey prime $\mathfrak p$ of R the induced maps $a_{\mathfrak p}, b_{\mathfrak p} : S_{\mathfrak p} \to A_{\mathfrak p}$ are the same. Hence $a = b$ as $A \subset \prod_{\mathfrak p} A_{\mathfrak p}$, see Lemma 7.21.1. ☐

Lemma 7.99.6. *Let $R \to S$ be a ring map. The following are equivalent*

(1) *$R \to S$ is an epimorphism and finite, and*
(2) *$R \to S$ is surjective.*

Proof. (This lemma seems to have been reproved many times in the literature, and has many different proofs.) It is clear that a surjective ring map is an epimorphism. Suppose that $R \to S$ is a finite ring map such that $S \otimes_R S \to S$ is an isomorphism. Our goal is to show that $R \to S$ is surjective. Assume S/R is not zero. The exact sequence $R \to S \to S/R \to 0$ leads to an exact sequence

$$R \otimes_R S \to S \otimes_R S \to S/R \otimes_R S \to 0.$$

Our assumption implies that the first arrow is an isomorphism, hence we conclude that $S/R \otimes_R S = 0$. Hence also $S/R \otimes_R S/R = 0$. By Lemma 7.5.5 there exists a surjection of R-modules $S/R \to R/I$ for some proper ideal $I \subset R$. Hence there exists a surjection $S/R \otimes_R S/R \to R/I \otimes_R R/I = R/I \neq 0$, contradiction. ☐

Lemma 7.99.7. *A faithfully flat epimorphism is an isomorphism.*

Proof. This is clear from Lemma 7.99.1 part (3) as the map $S \to S \otimes_R S$ is the map $R \to S$ tensored with S. ☐

Lemma 7.99.8. *If $k \to S$ is an epimorphism and k is a field, then $S = k$ or $S = 0$.*

Proof. This is clear from the result of Lemma 7.99.7 (as any nonzero algebra over k is faithfully flat), or by argueing directly that $R \to R \otimes_k R$ cannot be surjective unless $\dim_k(R) \leq 1$. □

Lemma 7.99.9. *Let $R \to S$ be an epimorphism of rings. Then $Spec(S) \to Spec(R)$ is injective.*

Proof. Let $\mathfrak{p}$ be a prime of R. The fibre of the map is the spectrum of the fibre ring $S \otimes_R \kappa(\mathfrak{p})$. By Lemma 7.99.3 the map $\kappa(\mathfrak{p}) \to S \otimes_R \kappa(\mathfrak{p})$ is an epimorphism, and hence by Lemma 7.99.8 there is either one point or no points lying over $\mathfrak{p}$. □

Lemma 7.99.10. *Let R be a ring. Let M, N be R-modules. Let $\{x_i\}_{i \in I}$ be a set of generators of M. Let $\{y_j\}_{j \in J}$ be a set of generators of N. Let $\{m_j\}_{j \in J}$ be a family of elements of M with $m_j = 0$ for all but finitely many j. Then*

$$\sum\nolimits_{j \in J} m_j \otimes y_j = 0 \text{ in } M \otimes_R N$$

is equivalent to the following: There exist $a_{i,j} \in R$ with $a_{i,j} = 0$ for all but finitely many pairs (i, j) such that

$$m_j = \sum\nolimits_{i \in I} a_{i,j} x_i \quad \text{for all } j \in J,$$
$$0 = \sum\nolimits_{j \in J} a_{i,j} y_j \quad \text{for all } i \in I.$$

Proof. The sufficiency is immediate. Suppose that $\sum_{j \in J} m_j \otimes y_j = 0$. Consider the short exact sequence

$$0 \to K \to \bigoplus\nolimits_{j \in J} R \to N \to 0$$

where the jth basis vector of $\bigoplus_{j \in J} R$ maps to y_j. Tensor this with M to get the exact sequence

$$K \otimes_R M \to \bigoplus\nolimits_{j \in J} M \to N \otimes_R M \to 0.$$

The assumption implies that there exist elements $k_i \in K$ such that $\sum k_i \otimes x_i$ maps to the element $(m_j)_{j \in J}$ of the middle. Writing $k_i = (a_{i,j})_{j \in J}$ and we obtain what we want. □

Lemma 7.99.11. *Let $\varphi : R \to S$ be a ring map. Let $g \in S$. The following are equivalent:*

1. *$g \otimes 1 = 1 \otimes g$ in $S \otimes_R S$, and*
2. *there exist $n \geq 0$ and elements $y_i, z_j \in S$ and $x_{i,j} \in R$ for $1 \leq i, j \leq n$ such that*
   (a) *$g = \sum_{i,j \leq n} x_{i,j} y_i z_j$,*
   (b) *for each j we have $\sum x_{i,j} y_i \in \varphi(R)$, and*
   (c) *for each i we have $\sum x_{i,j} z_j \in \varphi(R)$.*

Proof. It is clear that (2) implies (1). Conversely, suppose that $g \otimes 1 = 1 \otimes g$. Choose generators $\{s_i\}_{i \in I}$ of S as an R-module with $0, 1 \in I$ and $s_0 = 1$ and $s_1 = g$. Apply Lemma 7.99.10 to the relation $g \otimes s_0 + (-1) \otimes s_1 = 0$. We see that there exist $a_{i,j} \in R$ such that $g = \sum_i a_{i,0} s_i$, $-1 = \sum_i a_{i,1} s_i$, and for $j \neq 0, 1$ we have $0 = \sum_i a_{i,j} s_i$, and moreover for all i we have $\sum_j a_{i,j} s_j = 0$. Then we have

$$\sum\nolimits_{i,j \neq 0} a_{i,j} s_i s_j = -g + a_{0,0}$$

and for each $j \neq 0$ we have $\sum_{i \neq 0} a_{i,j} s_i \in R$. This proves that $-g + a_{0,0}$ can be written as in (2). It follows that g can be written as in (2). Details omitted. Hint: Show that the set of elements of S which have an expression as in (2) form an R-subalgebra of S. □

Remark 7.99.12. Let $R \to S$ be a ring map. Sometimes the set of elements $g \in S$ such that $g \otimes 1 = 1 \otimes g$ is called the *epicenter* of S. It is an R-algebra. By the construction of Lemma 7.99.11 we get for each g in the epicenter a matrix factorization

$$(g) = YXZ$$

with $X \in \mathrm{Mat}(n \times n, R)$, $Y \in \mathrm{Mat}(1 \times n, S)$, and $Z \in \mathrm{Mat}(n \times 1, S)$. Namely, let $x_{i,j}, y_i, z_j$ be as in part (2) of the lemma. Set $X = (x_{i,j})$, let y be the row vector whose entries are the y_i and let z be the column vector whose entries are the z_j. With this notation conditions (b) and (c) of Lemma 7.99.11 mean exactly that $YX \in \mathrm{Mat}(1 \times n, R)$, $XZ \in \mathrm{Mat}(n \times 1, R)$. It turns out to be very convenient to consider the triple of matrices (X, YX, XZ). Given $n \in \mathbf{N}$ and a triple (P, U, V) we say that (P, U, V) is a *n-triple associated to g* if there exists a matrix factorization as above such that $P = X$, $U = YX$ and $V = XZ$.

Lemma 7.99.13. *Let $R \to S$ be an epimorphism of rings. Then the cardinality of S is at most the cardinality of R. In a formula: $|S| \leq |R|$.*

Proof. The condition that $R \to S$ is an epimorphism means that each $g \in S$ satisfies $g \otimes 1 = 1 \otimes g$, see Lemma 7.99.1. We are going to use the notation introduced in Remark 7.99.12. Suppose that $g, g' \in S$ and suppose that (P, U, V) is an n-triple which is associated to both g and g'. Then we claim that $g = g'$. Namely, write $(P, U, V) = (X, YX, XZ)$ for a matrix factorization $(g) = YXZ$ of g and write $(P, U, V) = (X', Y'X', X'Z')$ for a matrix factorization $(g') = Y'X'Z'$ of g'. Then we see that

$$(g) = YXZ = UZ = Y'X'Z = Y'PZ = Y'XZ = Y'V = Y'X'Z' = (g')$$

and hence $g = g'$. This implies that the cardinality of S is bounded by the number of possible triples, which has cardinality at most $\sup_{n \in \mathbf{N}} |R|^n$. If R is infinite then this is at most $|R|$, see [**Kun83**, Ch. I, 10.13].

If R is a finite ring then the argument above only proves that S is at worst countable. In fact in this case R is Artinian and the map $R \to S$ is surjective. We omit the proof of this case. □

7.100. Pure ideals

The material in this section is discussed in many papers, see for example [**Laz67**], [**Bko70**], and [**DM83**].

Definition 7.100.1. Let R be a ring. We say that $I \subset R$ is *pure* if the quotient ring R/I is flat over R.

Lemma 7.100.2. *Let R be a ring. Let $I \subset R$ be an ideal. The following are equivalent:*

(1) *I is pure,*
(2) *for every ideal $J \subset R$ we have $J \cap I = IJ$,*
(3) *for every finitely generated ideal $J \subset R$ we have $J \cap I = JI$,*
(4) *for every $x \in R$ we have $(x) \cap I = xI$,*
(5) *for every $x \in I$ we have $x = yx$ for some $y \in I$,*
(6) *for every $x_1, \ldots, x_n \in I$ there exists a $y \in I$ such that $x_i = yx_i$ for all $i = 1, \ldots, n$,*
(7) *for every prime $\mathfrak{p}$ of R we have $IR_{\mathfrak{p}} = 0$ or $IR_{\mathfrak{p}} = R_{\mathfrak{p}}$,*
(8) *$Supp(I) = Spec(R) \setminus V(I)$,*
(9) *I is the kernel of the map $R \to (1 + I)^{-1}R$,*
(10) *$R/I \cong S^{-1}R$ as R-algebras for some multiplicative subset S of R, and*
(11) *$R/I \cong (1 + I)^{-1}R$ as R-algebras.*

Proof. For any ideal J of R we have the short exact sequence $0 \to J \to R \to R/J \to 0$. Tensoring with R/I we get an exact sequence $J \otimes_R R/I \to R/I \to R/I + J \to 0$ and $J \otimes_R R/I = R/JI$. Thus the equivalence of (1), (2), and (3) follows from Lemma 7.35.4. Moreover, these imply (4).

The implication (4) $\Rightarrow$ (5) is trivial. Assume (5) and let $x_1, \ldots, x_n \in I$. Choose $y_i \in I$ such that $x_i = y_i x_i$. Let $y \in I$ be the element such that $1 - y = \prod_{i=1,\ldots,n}(1 - y_i)$. Then $x_i = yx_i$ for all $i = 1, \ldots, n$. Hence (6) holds, and it follows that (5) $\Leftrightarrow$ (6).

Assume (5). Let $x \in I$. Then $x = yx$ for some $y \in I$. Hence $x(1 - y) = 0$, which shows that x maps to zero in $(1 + I)^{-1}R$. Of course the kernel of the map $R \to (1 + I)^{-1}R$ is always contained in I. Hence we see that (5) implies (9). Assume (9). Then for any $x \in I$ we see that $x(1 - y) = 0$ for some $y \in I$. In other words, $x = yx$. We conclude that (5) is equivalent to (9).

Assume (5). Let $\mathfrak p$ be a prime of R. If $\mathfrak p \not\in V(I)$, then $IR_{\mathfrak p} = R_{\mathfrak p}$. If $\mathfrak p \in V(I)$, in other words, if $I \subset \mathfrak p$, then $x \in I$ implies $x(1 - y) = 0$ for some $y \in I$, implies x maps to zero in $R_{\mathfrak p}$, i.e., $IR_{\mathfrak p} = 0$. Thus we see that (7) holds.

Assume (7). Then $(R/I)_{\mathfrak p}$ is either 0 or $R_{\mathfrak p}$ for any prime $\mathfrak p$ of R. Hence by Lemma 7.35.19 we see that (1) holds. At this point we see that all of (1) -- (7) and (9) are equivalent.

As $IR_{\mathfrak p} = I_{\mathfrak p}$ we see that (7) implies (8). Finally, if (8) holds, then this means exactly that $I_{\mathfrak p}$ is the zero module if and only if $\mathfrak p \in V(I)$, which is clearly saying that (7) holds. Now (1) -- (9) are equivalent.

Assume (1) -- (9) hold. Then $R/I \subset (1 + I)^{-1}R$ by (9) and the map $R/I \to (1 + I)^{-1}R$ is also surjective by the description of localizations at primes afforded by (7). Hence (11) holds.

The implication (11) $\Rightarrow$ (10) is trivial. And (10) implies that (1) holds because a localization of R is flat over R, see Lemma 7.35.19. $\square$

Lemma 7.100.3. *Let R be a ring. If $I, J \subset R$ are pure ideals, then $V(I) = V(J)$ implies $I = J$.*

Proof. For example, by property (7) of Lemma 7.100.2 we see that $I = \ker(R \to \prod_{\mathfrak p \in V(I)} R_{\mathfrak p})$ can be recovered from the closed subset associated to it. $\square$

Lemma 7.100.4. *Let R be a ring. The rule $I \mapsto V(I)$ determines a bijection*

$$\{I \subset R \textit{ pure}\} \leftrightarrow \{Z \subset \textit{Spec}(R) \textit{ closed and closed under generalizations}\}$$

Proof. Let I be a pure ideal. Then since $R \to R/I$ is flat, by going up generalizations lift along the map $Spec(R/I) \to Spec(R)$. Hence $V(I)$ is closed under generalizations. This shows that the map is well defined. By Lemma 7.100.3 the map is injective. Suppose that $Z \subset Spec(R)$ is closed and closed under generalizations. Let $J \subset R$ be the radical ideal such that $Z = V(J)$. Let $I = \{x \in R : x \in xJ\}$. Note that I is an ideal. We claim that I is pure and that $V(I) = V(J)$. If the claim is true then the map of the lemma is surjective and the lemma holds.

Note that $I \subset J$, so that $V(J) \subset V(I)$. Let $I \subset \mathfrak p$ be a prime. Consider the multiplicative subset $S = (R \setminus \mathfrak p)(1 + J)$. By definition of I and $I \subset \mathfrak p$ we see that $0 \not\in S$. Hence we can find a prime $\mathfrak q$ of R which is disjoint from S, see Lemmas 7.9.4 and 7.16.5. Hence $\mathfrak q \subset \mathfrak p$ and $\mathfrak q \cap (1 + J) = \emptyset$. This implies that $\mathfrak q + J$ is a proper ideal of R. Let $\mathfrak m$ be a maximal ideal containing $\mathfrak q + J$. Then we get $\mathfrak m \in V(J)$ and hence $\mathfrak q \in V(J) = Z$ as Z was assumed to be closed under generalization. This in turn implies $\mathfrak{p} \in V(J)$ as $\mathfrak{q} \subset \mathfrak{p}$. Thus we see that $V(I) = V(J)$.

Finally, since $V(I) = V(J)$ (and J radical) we see that $J = \sqrt{I}$. Pick $x \in I$, so that $x = xy$ for some $y \in J$ by definition. Then $x = xy = xy^2 = \ldots = xy^n$. Since $y^n \in I$ for some $n > 0$ we conclude that property (5) of Lemma 7.100.2 holds and we see that I is indeed pure. ☐

Lemma 7.100.5. *Let R be a ring. Let $I \subset R$ be an ideal. The following are equivalent*

(1) *I is pure and finitely generated,*
(2) *I is generated by an idempotent,*
(3) *I is pure and $V(I)$ is open, and*
(4) *R/I is a projective R-module.*

Proof. If (1) holds, then $I = I \cap I = I^2$ by Lemma 7.100.2. Hence I is generated by an idempotent by Lemma 7.18.5. Thus (1) ⇒ (2). If (2) holds, then $I = (e)$ and $R = (1-e) \bigoplus (e)$ as an R-module hence R/I is flat and I is pure and $V(I) = D(1 - e)$ is open. Thus (2) ⇒ (1) + (3). Finally, assume (3). Then $V(I)$ is open and closed, hence $V(I) = D(1 - e)$ for some idempotent e of R, see Lemma 7.18.3. The ideal $J = (e)$ is a pure ideal such that $V(J) = V(I)$ hence $I = J$ by Lemma 7.100.3. In this way we see that (3) ⇒ (2). By Lemma 7.72.2 we see that (4) is equivalent to the assertion that I is pure and R/I finitely presented. Moreover, R/I is finitely presented if and only if I is finitely generated, see Lemma 7.5.3. Hence (4) is equivalent to (1). ☐

We can use the above to characterize those rings for which every finite flat module is finitely presented.

Lemma 7.100.6. *Let R be a ring. The following are equivalent:*

(1) *every $Z \subset Spec(R)$ which is closed and closed under generalizations is also open, and*
(2) *any finite flat R-module is finite locally free.*

Proof. If any finite flat R-module is finite locally free then the support of R/I where I is a pure ideal is open. Hence the implication (2) ⇒ (1) follows from Lemma 7.100.3.

For the converse assume that R satisfies (1). Let M be a finite flat R-module. The support $Z = \text{Supp}(M)$ of M is closed, see Lemma 7.59.4. On the other hand, if $\mathfrak{p} \subset \mathfrak{p}'$, then by Lemma 7.72.4 the module $M_{\mathfrak{p}'}$ is free, and $M_{\mathfrak{p}} = M_{\mathfrak{p}'} \otimes_{R_{\mathfrak{p}'}} R_{\mathfrak{p}}$ Hence $\mathfrak{p}' \in \text{Supp}(M) \Rightarrow \mathfrak{p} \in \text{Supp}(M)$, in other words, the support is closed under generalization. As R satisfies (1) we see that the support of M is open and closed. Suppose that M is generated by r elements $m_1, \ldots, m_r$. The modules $\wedge^i(M)$, $i = 1, \ldots, r$ are finite flat R-modules also, because $\wedge^i(M)_{\mathfrak{p}} = \wedge^i(M_{\mathfrak{p}})$ is free over $R_{\mathfrak{p}}$. Note that $\text{Supp}(\wedge^{i+1}(M)) \subset \text{Supp}(\wedge^i(M))$. Thus we see that there exists a decomposition

$$Spec(R) = U_0 \coprod U_1 \coprod \ldots \coprod U_r$$

by open and closed subsets such that the support of $\wedge^i(M)$ is $U_r \cup \ldots \cup U_i$ for all $i = 0, \ldots, r$. Let $\mathfrak{p}$ be a prime of R, and say $\mathfrak{p} \in U_i$. Note that $\wedge^i(M) \otimes_R \kappa(\mathfrak{p}) = \wedge^i(M \otimes_R \kappa(\mathfrak{p}))$. Hence, after possibly renumbering $m_1, \ldots, m_r$ we may assume that $m_1, \ldots, m_i$ generate $M \otimes_R \kappa(\mathfrak{p})$. By Nakayama's Lemma 7.14.5 we get a surjection

$$R_f^{\oplus i} \longrightarrow M_f, \quad (a_1, \ldots, a_i) \longmapsto \sum a_i m_i$$

for some $f \in R$, $f \notin \mathfrak{p}$. We may also assume that $D(f) \subset U_i$. This means that $\wedge^i(M_f) = \wedge^i(M)_f$ is a flat R_f module whose support is all of $Spec(R_f)$. By the above it is generated by a single element, namely $m_1 \wedge \ldots \wedge m_i$. Hence $\wedge^i(M)_f \cong R_f/J$ for some pure ideal $J \subset R_f$ with $V(J) = Spec(R_f)$. Clearly this means that $J = (0)$, see Lemma 7.100.3. Thus $m_1 \wedge \ldots \wedge m_i$ is a basis for $\wedge^i(M_f)$ and it follows that the displayed map is injective as well as surjective. This proves that M is finite locally free as desired. □

7.101. Rings of finite global dimension

The following lemma is often used to compare different projective resolutions of a given module.

Lemma 7.101.1. *(Schanuel's lemma.) Let R be a ring. Let M be an R-module. Suppose that $0 \to K \to P_1 \to M \to 0$ and $0 \to L \to P_2 \to M \to 0$ are two short exact sequences, with P_i projective. Then $K \oplus P_2 \cong L \oplus P_1$.*

Proof. Consider the module N defined by the short exaxt sequence $0 \to N \to P_1 \oplus P_2 \to M \to 0$, where the last map is the sum of the two maps $P_i \to M$. It is easy to see that the projection $N \to P_1$ is surjective with kernel L, and that $N \to P_2$ is surjective with kernel K. Since P_i are projective we have $N \cong K \oplus P_2 \cong L \oplus P_1$. □

Definition 7.101.2. Let R be a ring. Let M be an R-module. We say M has *finite projective dimension* if it has a finite length resolution by projective R-modules. The minimal length of such a resolution is called the *projective dimension* of M.

It is clear that the projective dimension of M is 0 if and only if M is a projective module. The following lemma explains to what extend the projective dimension is independent of the choice of a projective resolution.

Lemma 7.101.3. *Let R be a ring. Suppose that M is an R-module of projective dimension d. Suppose that $F_e \to F_{e-1} \to \ldots \to F_0 \to M \to 0$ is exact with F_i projective and $e \geq d-1$. Then the kernel of $F_e \to F_{e-1}$ is projective (or the kernel of $F_0 \to M$ is projective in case $e = 0$).*

Proof. We prove this by induction on d. If $d = 0$, then M is projective. In this case there is a splitting $F_0 = \text{Ker}(F_0 \to M) \oplus M$, and hence $\text{Ker}(F_0 \to M)$ is projective. This finishes the proof if $e = 0$, and if $e > 0$, then replacing M by $\text{Ker}(F_0 \to M)$ we decrease e.

Next assume $d > 0$. Let $0 \to P_d \to P_{d-1} \to \ldots \to P_0 \to M \to 0$ be a minimal length finite resolution with P_i projective. According to Schanuel's Lemma 7.101.1 we have $P_0 \oplus \text{Ker}(F_0 \to M) \cong F_0 \oplus \text{Ker}(P_0 \to M)$. This proves the case $d = 1$, $e = 0$, because then the right hand side is $F_0 \oplus P_1$ which is projective. Hence now we may assume $e > 0$. The module $F_0 \oplus \text{Ker}(P_0 \to M)$ has the finite projective resolution $0 \to P_d \oplus F_0 \to P_{d-1} \oplus F_0 \to \ldots \to P_1 \oplus F_0 \to \text{Ker}(P_0 \to M) \oplus F_0 \to 0$ of length $d-1$. By induction on d we see that the kernel of $F_e \oplus P_0 \to F_{e-1} \oplus P_0$ is projective. This implies the lemma. □

Lemma 7.101.4. *Let R be a ring. Let M be an R-module. Let $n \geq 0$. The following are equivalent*

(1) *M has projective dimension $\leq n$,*
(2) *$Ext^i_R(M, N) = 0$ for all R-modules N and all $i \geq n+1$, and*
(3) *$Ext^{n+1}_R(M, N) = 0$ for all R-modules N.*

Proof. Assume (1). Choose a free resolution $F_\bullet \to M$ of M. Denote $d_e : F_e \to F_{e-1}$. By Lemma 7.101.3 we see that $P_e = \text{Ker}(d_e)$ is projective for $e \geq n - 1$. This implies that $F_e \cong P_e \oplus P_{e-1}$ for $e \geq n$ where d_e maps the summand P_{e-1} isomorphically to P_{e-1} in F_{e-1}. Hence, for any R-module N the complex $Hom_R(F_\bullet, N)$ is split exact in degrees $\geq n + 1$. Whence (2) holds. The implication (2) $\Rightarrow$ (3) is trivial.

Assume (3) holds. If $n = 0$ then M is projective by Lemma 7.71.2 and we see that (1) holds. If $n > 0$ choose a free R-module F and a surjection $F \to M$ with kernel K. By Lemma 7.67.7 and the vanishing of $\text{Ext}^i_R(F, N)$ for all $i > 0$ by part (1) we see that $\text{Ext}^n_R(K, N) = 0$ for all R-modules N. Hence by induction we see that N has projective dimension $\leq n - 1$. Then M has projective dimension $\leq n$ as any finite projective resolution of N gives a projective resolution of length one more for M by adding F to the front. $\square$

Lemma 7.101.5. *Let R be a ring. Let $0 \to M' \to M \to M'' \to 0$ be a short exact sequence of R-modules.*

1. *If M has projective dimension $\leq n$ and M'' has projective dimension $\leq n + 1$, then M' has projective dimension $\leq n$.*
2. *If M' and M'' have projective dimension $\leq n$ then M has projective dimension $\leq n$.*
3. *If M' has projective dimension $\leq n$ and M has projective dimension $\leq n+1$ then M'' has projective dimension $\leq n + 1$.*

Proof. Combine the characterization of projective dimension in Lemma 7.101.4 with the long exact sequence of ext groups in Lemma 7.67.7. $\square$

Definition 7.101.6. Let R be a ring. The ring R is said to have *finite global dimension* if there exists an integer n such that every R-module has a resolution by projective R-modules of length at most n. The minimal such n is then called the *global dimension* of R.

The argument in the proof of the following lemma can be found in the paper [**Aus55**] by Auslander.

Lemma 7.101.7. *Let R be a ring. The following are equivalent*

1. *R has finite global dimension $\leq n$,*
2. *every finite R-module has projective dimension $\leq n$, and*
3. *every cyclic R-module R/I has projective dimension $\leq n$.*

Proof. It is clear that (1) $\Rightarrow$ (3). Assume (3). Since every finite R-module has a finite filtration by cyclic modules, see Lemma 7.5.5 we see that (2) follows by Lemma 7.101.5.

Assume (2). Let M be an arbitrary R-module. Choose a set $E \subset M$ of generators of M. Choose a well ordering on E. For $e \in E$ denote M_e the submodule of M generated by the elements $e' \in E$ with $e' \leq e$. Then $M = \bigcup_{e \in E} M_e$. Note that for each $e \in E$ the quotient

$$M_e / \bigcup\nolimits_{e' < e} M_{e'}$$

is either zero or generated by one element, hence has projective dimension $\leq n$. To finish the proof we claim that any time we have a well ordered set E and a module $M = \bigcup_{e \in E} M_e$ such that the quotients $M_e / \bigcup_{e' < e} M_{e'}$ have projective dimesion $\leq n$, then M has projective dimension $\leq n$.

We may prove this statement by induction on n. If $n = 0$, then we will show, by transfinite induction that M is projective. Namely, for each $e \in E$ we may choose a splitting $M_e =$

$\bigcup_{e'<e} M_{e'} \oplus P_e$ because $P_e = M_e / \bigcup_{e'<e} M_{e'}$ is projective. Hence it follows that $M = \bigoplus_{e \in E} P_e$ and we conclude that M is projective, see Lemma 7.71.3.

If $n > 0$, then for $e \in E$ we denote F_e the free R-module on the set of elements of M_e. Then we have a system of short exact sequences

$$0 \to K_e \to F_e \to M_e \to 0$$

over the well ordered set E. Note that the transition maps $F_{e'} \to F_e$ and $K_{e'} \to K_e$ are injective too. Set $F = \bigcup F_e$ and $K = \bigcup K_e$. Then

$$0 \to K_e / \bigcup\nolimits_{e'<e} K_{e'} \to F_e / \bigcup\nolimits_{e'<e} F_{e'} \to M_e / \bigcup\nolimits_{e'<e} M_{e'} \to 0$$

is a short exact sequence of R-modules too and $F_e / \bigcup_{e'<e} F_{e'}$ is the free R-module on the set of elements in M_e which are not contained in $\bigcup_{e'<e} M_{e'}$. Hence by Lemma 7.101.5 we see that the projective dimension of $K_e / \bigcup_{e'<e} K_{e'}$ is at most $n-1$. By induction we conclude that K has projective dimension at most $n-1$. Whence M has projective dimension at most n and we win. □

Lemma 7.101.8. *Let R be a ring. Let M be an R-module. Let $S \subset R$ be a multiplicative subset.*

1. *If M has projective dimension $\leq n$, then $S^{-1}M$ has projective dimension $\leq n$ over $S^{-1}R$.*
2. *If R has finite global dimension $\leq n$, then $S^{-1}R$ has finite global dimension $\leq n$.*

Proof. Let $0 \to P_n \to P_{n-1} \to \ldots \to P_0 \to M \to 0$ be a projective resolution. As localization is exact, see Proposition 7.9.12, and as each $S^{-1}P_i$ is a projective $S^{-1}R$-module, see Lemma 7.88.1, we see that $0 \to S^{-1}P_n \to \ldots \to S^{-1}P_0 \to S^{-1}M \to 0$ is a projective resolution of $S^{-1}M$. This proves (1). Let M' be an $S^{-1}R$-module. Note that $M' = S^{-1}M'$. Hence we see that (2) follows from (1). □

7.102. Regular rings and global dimension

We can use the material on rings of finite global dimension to give another characterization of regular local rings.

Proposition 7.102.1. *Let R be a regular local ring of dimension d. Every finite R-module M of depth e has a finite free resolution*

$$0 \to F_{d-e} \to \ldots \to F_0 \to M \to 0.$$

In particular a regular local ring has global dimension $\leq d$.

Proof. This is clear in view of Lemma 7.98.6 and Lemma 7.96.10. □

Lemma 7.102.2. *Let R be a Noetherian ring. Then R has finite global dimension if and only if there exists an integer n such that for all maximal ideals $\mathfrak{m}$ of R the ring $R_{\mathfrak{m}}$ has global dimension $\leq n$.*

Proof. We saw, Lemma 7.101.8 that if R has finite global dimension n, then all the localizations $R_{\mathfrak{m}}$ have finite global dimension at most n. Conversely, suppose that all the $R_{\mathfrak{m}}$ have global dimension n. Let M be a finite R-module. Let $0 \to K_n \to F_{n-1} \to \ldots \to F_0 \to M \to 0.$ be a resolution with F_i finite free. Then K_n is a finite R-module. According to Lemma 7.101.3 and the assumption all the modules $K_n \otimes_R R_{\mathfrak{m}}$ are projective. Hence by Lemma 7.72.2 the module K_n is finite projective. □

Lemma 7.102.3. *Suppose that R is a Noetherian local ring with maximal ideal $\mathfrak{m}$ and residue field κ. In this case the projective dimension of κ is $\geq \dim_\kappa \mathfrak{m}/\mathfrak{m}^2$.*

Proof. Let $x_1, \ldots x_n$ be elements of $\mathfrak{m}$ whose images in $\mathfrak{m}/\mathfrak{m}^2$ form a basis. Consider the *Koszul complex* on $x_1, \ldots, x_n$. This is the complex

$$0 \to \wedge^n R^n \to \wedge^{n-1} R^n \to \wedge^{n-2} R^n \to \ldots \to \wedge^i R^n \to \ldots \to R^n \to R$$

with maps given by

$$e_{j_1} \wedge \ldots \wedge e_{j_i} \longmapsto \sum_{a=1}^{i} (-1)^{i+1} x_{j_a} e_{j_1} \wedge \ldots \wedge \hat{e}_{j_a} \wedge \ldots \wedge e_{j_i}$$

It is easy to see that this is a complex $K_\bullet(R, x_\bullet)$. Note that the cokernel of the last map of $K_\bullet(R, x_\bullet)$ is clearly κ.

Now, let $F_\bullet \to \kappa$ by any finite resolution by finite free R-modules. By Lemma 7.94.2 we may assume all the maps in the complex $F_\bullet$ have to property that $\mathrm{Im}(F_i \to F_{i-1}) \subset \mathfrak{m}F_{i-1}$, because removing a trivial summand from the resolution can at worst shorten the resolution. By Lemma 7.67.4 we can find a map of complexes $\alpha : K_\bullet(R, x_\bullet) \to F_\bullet$ inducing the identity on κ. We will prove by induction that the maps $\alpha_i : \wedge^i R^n = K_i(R, x_\bullet) \to F_i$ have the property that $\alpha_i \otimes \kappa : \wedge^i \kappa^n \to F_i \otimes \kappa$ are injective. This will prove the lemma since it clearly shows that $F_n \neq 0$.

The result is clear for $i = 0$ because the composition $R \xrightarrow{\alpha_0} F_0 \to \kappa$ is nonzero. Note that F_0 must have rank 1 since otherwise the map $F_1 \to F_0$ whose cokernel is a single copy of κ cannot have image contained in $\mathfrak{m}F_0$. For α_1 we use that $x_1, \ldots, x_n$ is a minimal set of generators for $\mathfrak{m}$. Namely, we saw above that $F_0 = R$ and $F_1 \to F_0 = R$ has image $\mathfrak{m}$. We have a commutative diagram

$$\begin{array}{ccccccc} R^n & = & K_1(R, x_\bullet) & \to & K_0(R, x_\bullet) & = & R \\ & & \downarrow & & \downarrow & & \downarrow \\ & & F_1 & \to & F_0 & = & R \end{array}$$

where the rightmost vertical arrow is given by multiplication by a unit. Hence we see that the image of the composition $R^n \to F_1 \to F_0 = R$ is also equal to $\mathfrak{m}$. Thus the map $R^n \otimes \kappa \to F_1 \otimes \kappa$ has to be injective since $\dim_\kappa(\mathfrak{m}/\mathfrak{m}^2) = n$.

Suppose the injectivity of $\alpha_j \otimes \kappa$ has been proved for all $j \leq i-1$. Consider the commutative diagram

$$\begin{array}{ccccccc} \wedge^i R^n & = & K_i(R, x_\bullet) & \to & K_{i-1}(R, x_\bullet) & = & \wedge^{i-1} R^n \\ & & \downarrow & & \downarrow & & \\ & & F_i & \to & F_{i-1} & & \end{array}$$

We know that $\wedge^{i-1}\kappa^n \to F_{i-1} \otimes \kappa$ is injective. This proves that $\wedge^{i-1}\kappa^n \otimes_\kappa \mathfrak{m}/\mathfrak{m}^2 \to F_{i-1} \otimes \mathfrak{m}/\mathfrak{m}^2$ is injective. Also, by our choice of the complex, F_i maps into $\mathfrak{m}F_{i-1}$, and similarly for the Koszul complex. Hence we get a commutative diagram

$$\begin{array}{ccc} \wedge^i \kappa^n & \to & \wedge^{i-1}\kappa^n \otimes \mathfrak{m}/\mathfrak{m}^n \\ \downarrow & & \downarrow \\ F_i \otimes \kappa & \to & F_{i-1} \otimes \mathfrak{m}/\mathfrak{m}^2 \end{array}$$

At this point it suffices to verify the map $\wedge^i \kappa^n \to \wedge^{i-1}\kappa^n \otimes \mathfrak{m}/\mathfrak{m}^n$ is injective, which can be done by hand. $\square$

Lemma 7.102.4. *Let R be a Noetherian local ring. Suppose that the residue field κ has finite projective dimension n over R. In this case* $\dim(R) \geq n$.

Proof. Let $F_\bullet$ be a finite resolution of κ by finite free R-modules. By Lemma 7.94.2 we may assume all the maps in the complex $F_\bullet$ have to property that $\mathrm{Im}(F_i \to F_{i-1}) \subset \mathfrak{m}F_{i-1}$, because removing a trivial summand from the resolution can at worst shorten the resolution. Say $F_n \neq 0$ and $F_i = 0$ for $i > n$, so that the projective dimension of κ is n. By Proposition 7.94.10 we see that $\mathrm{depth}(I(\varphi_n)) \geq n$ since $I(\varphi_n)$ cannot equal R by our choice of the complex. Thus by Lemma 7.65.6 also $\dim(R) \geq n$. □

Proposition 7.102.5. *A Noetherian local ring whose residue field has finite projective dimension is a regular local ring. In particular a Noetherian local ring of finite global dimension is a regular local ring.*

Proof. By Lemmas 7.102.3 and 7.102.4 we see that $\dim(R) \geq \dim_\kappa(\mathfrak{m}/\mathfrak{m}^2)$. Thus the result follows immediately from Definition 7.57.9. □

By Propositions 7.102.5 and 7.102.1 we see that a Noetherian local ring is a regular local ring if and only if it has finite global dimension. Furthermore, any localization $R_\mathfrak{p}$ has finite global dimension, see Lemma 7.101.8, and hence is a regular local ring. Thus it now makes sense to make the following definition, because it does not conclict with the earlier definition of a regular local ring.

Definition 7.102.6. A Noetherian ring R is said to be *regular* if all the localizations $R_\mathfrak{p}$ are regular local rings.

Note that this is not the same as asking R to have finite global dimension, even assuming R is Noetherian. This is because there is an example of a regular Noetherian ring which does not have finite global dimension, namely because it does not have finite dimension.

Lemma 7.102.7. *Let R be a Noetherian ring. The following are equivalent:*

(1) *R has finite global dimension n,*
(2) *there exists an integer n such that all the localizations $R_\mathfrak{m}$ at maximal ideals are regular of dimension $\leq n$ with equality for at least one $\mathfrak{m}$, and*
(3) *there exists an integer n such that all the localizations $R_\mathfrak{p}$ at prime ideals are regular of dimension $\leq n$ with equality for at least one $\mathfrak{p}$.*

Proof. This is a reformulation of Lemma 7.102.2 in view of the discussion surrouding Definition 7.102.6. See especially Propositions 7.102.1 and 7.102.5. □

Lemma 7.102.8. *Let $R \to S$ be a local homomorphism of local Noetherian rings. Assume that $R \to S$ is flat and that S is regular. Then R is regular.*

Proof. Let $\mathfrak{m} \subset R$ be the maximal ideal and let $\kappa = R/\mathfrak{m}$ be the residue field. Let $d = \dim S$. Choose any resolution $F_\bullet \to \kappa$ with each F_i a finite free R-module. Set $K_d = \mathrm{Ker}(F_{d-1} \to F_{d-2})$. By flatness of $R \to S$ the complex $0 \to K_d \otimes_R S \to F_{d-1} \otimes_R S \to \ldots \to F_0 \otimes_R S \to \kappa \otimes_R S \to 0$ is still exact. Because the global dimension of S is d, see Proposition 7.102.1, we see that $K_d \otimes_R S$ is a finite free S-module (see also Lemma 7.101.3). By Lemma 7.72.5 we see that K_d is a finite free R-module. Hence κ has finite projective dimension and R is regular by Proposition 7.102.5. □

7.103. Homomorphisms and dimension

This section contains a collection of easy results relating dimensions of rings when there are maps between them.

Lemma 7.103.1. *Suppose $R \to S$ is a ring map satisfying either going up, see Definition 7.36.1, or going down see Definition 7.36.1. Assume in addition that Spec$(S) \to$ Spec(R) is surjective. Then* $\dim(R) \leq \dim(S)$.

Proof. Assume going up. Take any chain $\mathfrak{p}_0 \subset \mathfrak{p}_1 \subset \ldots \subset \mathfrak{p}_e$ of prime ideals in R. By surjectivity we may choose a prime $\mathfrak{q}_0$ mapping to $\mathfrak{p}_0$. By going up we may extend this to a chain of length e of primes $\mathfrak{q}_i$ lying over $\mathfrak{p}_i$. Thus $\dim(S) \geq \dim(R)$. The case of going down is exactly the same. See also Topology, Lemma 5.14.8 for a purely topological version. □

Lemma 7.103.2. *Suppose that $R \to S$ is a ring map with the going up property, see Definition 7.36.1. If $\mathfrak{q} \subset S$ is a maximal ideal. Then the inverse image of $\mathfrak{q}$ in R is a maximal ideal too.*

Proof. Trivial. □

Lemma 7.103.3. *Suppose that $R \to S$ is a ring map such that S is integral over R. Then* $\dim(R) \geq \dim(S)$, *and every closed point of Spec(S) maps to a closed point of Spec(R).*

Proof. Immediate from Lemmas 7.32.18 and 7.103.2 and the definitions. □

Lemma 7.103.4. *Suppose $R \subset S$ and S integral over R. Then* $\dim(R) = \dim(S)$.

Proof. This is a combination of Lemmas 7.32.20, 7.32.15, 7.103.1, and 7.103.3. □

Definition 7.103.5. Suppose that $R \to S$ is a ring map. Let $\mathfrak{q} \subset S$ be a prime lying over the prime $\mathfrak{p}$ of R. The *local ring of the fibre at* $\mathfrak{q}$ is the local ring

$$S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}} = (S/\mathfrak{p}S)_{\mathfrak{q}} = (S \otimes_R \kappa(\mathfrak{p}))_{\mathfrak{q}}$$

Lemma 7.103.6. *Let $R \to S$ be a homomorphism of Noetherian rings. Let $\mathfrak{q} \subset S$ be a prime lying over the prime $\mathfrak{p}$. Then*

$$\dim(S_{\mathfrak{q}}) \leq \dim(R_{\mathfrak{p}}) + \dim(S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}}).$$

Proof. We use the characterization of dimension of Proposition 7.57.8. Let $x_1, \ldots, x_d$ be elements of $\mathfrak{p}$ generating an ideal of definition of $R_{\mathfrak{p}}$ with $d = \dim(R_{\mathfrak{p}})$. Let $y_1, \ldots, y_e$ be elements of $\mathfrak{q}$ generating an ideal of definition of $S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}}$ with $e = \dim(S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}})$. It is clear that $S_{\mathfrak{q}}/(x_1, \ldots, x_d, y_1, \ldots, y_e)$ has a nilpotent maximal ideal. Hence $x_1, \ldots, x_d, y_1, \ldots, y_e$ generate an ideal of definition if $S_{\mathfrak{q}}$. □

Lemma 7.103.7. *Let $R \to S$ be a homomorphism of Noetherian rings. Let $\mathfrak{q} \subset S$ be a prime lying over the prime $\mathfrak{p}$. Assume the going down property holds for $R \to S$ (for example if $R \to S$ is flat, see Lemma 7.35.17). Then*

$$\dim(S_{\mathfrak{q}}) = \dim(R_{\mathfrak{p}}) + \dim(S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}}).$$

Proof. By Lemma 7.103.6 we have an inequality $\dim(S_{\mathfrak{q}}) \leq \dim(R_{\mathfrak{p}}) + \dim(S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}})$. To get equality, choose a chain of primes $\mathfrak{p}S \subset \mathfrak{q}_0 \subset \mathfrak{q}_1 \subset \ldots \subset \mathfrak{q}_d = \mathfrak{q}$ with $d = \dim(S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}})$. On the other hand, choose a chain of primes $\mathfrak{p}_0 \subset \mathfrak{p}_1 \subset \ldots \subset \mathfrak{p}_e = \mathfrak{p}$ with $e = \dim(R_{\mathfrak{p}})$. By the going down theorem we may choose $\mathfrak{q}_{-1} \subset \mathfrak{q}_0$ lying over $\mathfrak{p}_{e-1}$. And then we may choose $\mathfrak{q}_{-2} \subset \mathfrak{q}_{e-1}$ lying over $\mathfrak{p}_{e-2}$. Inductively we keep going until we get a chain $\mathfrak{q}_{-e} \subset \ldots \subset \mathfrak{q}_d$ of length $e + d$. □

Lemma 7.103.8. *Let $R \to S$ be a local homomorphism of local Noetherian rings. Assume*

(1) *R is regular,*
(2) *$S/\mathfrak{m}_R S$ is regular, and*
(3) *$R \to S$ is flat.*

Then S is regular.

Proof. By Lemma 7.103.7 we have $\dim(S) = \dim(R) + \dim(S/\mathfrak{m}_R S)$. Pick generators $x_1, \ldots, x_d \in \mathfrak{m}_R$ with $d = \dim(R)$, and pick $y_1, \ldots, y_e \in \mathfrak{m}_S$ which generate the maximal ideal of $S/\mathfrak{m}_R S$ with $e = \dim(S/\mathfrak{m}_R S)$. Then we see that $x_1, \ldots, x_d, y_1, \ldots, y_e$ are elements which generate the maximal ideal of S and $e + d = \dim(S)$. $\square$

The lemma below will later be used to show that rings of finite type over a field are Cohen-Macaulay if and only if they are quasi-finite flat over a polynomial ring. It is a partial converse to Lemma 7.119.1.

Lemma 7.103.9. *Let $R \to S$ be a local homomorphism of Noetherian local rings. Assume R Cohen-Macaulay. If S is finite flat over R, or if S is flat over R and* $\dim(S) \leq \dim(R)$, *then S is Cohen-Macaulay and* $\dim(R) = \dim(S)$.

Proof. Let $x_1, \ldots, x_d \in \mathfrak{m}_R$ be a regular sequence of length $d = \dim(R)$. By Lemma 7.65.7 this maps to a regular sequence in S. Hence S is Cohen-Macaulay if $\dim(S) \leq d$. This is true if S is finite flat over R by Lemma 7.103.4. And in the second case we assumed it. $\square$

7.104. The dimension formula

Recall the definitions of catenary (Definition 7.97.1) and universally catenary (Definition 7.97.5).

Lemma 7.104.1. *Let $R \to S$ be a ring map. Let $\mathfrak{q}$ be a prime of S lying over the prime $\mathfrak{p}$ of R. Assume that*

(1) *R is Noetherian,*
(2) *$R \to S$ is of finite type,*
(3) *R, S are domains, and*
(4) *$R \subset S$.*

Then we have

$$height(\mathfrak{q}) \leq height(\mathfrak{p}) + trdeg_R(S) - trdeg_{\kappa(\mathfrak{p})}\kappa(\mathfrak{q})$$

with equality if R is universally catenary.

Proof. Suppose that $R \subset S' \subset S$ is a finitely generated R-subalgebra of S. In this case set $\mathfrak{q}' = S' \cap \mathfrak{q}$. The lemma for the ring maps $R \to S'$ and $S' \to S$ implies the lemma for $R \to S$ by additivity of transcendence degree in towers of fields. Hence we can use induction on the number of generators of S over R and reduce to the case where S is generated by one element over R.

Case I: $S = R[x]$ is a polynomial algebra over R. In this case we have $\text{trdeg}_R(S) = 1$. Also $R \to S$ is flat and hence

$$\dim(S_{\mathfrak{q}}) = \dim(R_{\mathfrak{p}}) + \dim(S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}})$$

see Lemma 7.103.7. Let $\mathfrak{r} = \mathfrak{m}S$. Then $\text{trdeg}_{\kappa(\mathfrak{p})}\kappa(\mathfrak{q}) = 1$ is equivalent to $\mathfrak{q} = \mathfrak{r}$, and implies that $\dim(S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}}) = 0$. In the same vein $\text{trdeg}_{\kappa(\mathfrak{p})}\kappa(\mathfrak{q}) = 0$ is equivalent to having a strict inclusion $\mathfrak{q} \subset \mathfrak{r}$, which implies that $\dim(S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}}) = 1$. Thus we are done with case I with equality in every instance.

Case II: $S = R[x]/\mathfrak{n}$ with $\mathfrak{n} \neq 0$. In this case we have $\text{trdeg}_R(S) = 0$. Denote $\mathfrak{q}' \subset R[x]$ the prime corresponding to $\mathfrak{q}$. Thus we have

$$S_{\mathfrak{q}} = (R[x])_{\mathfrak{q}'}/\mathfrak{n}(R[x])_{\mathfrak{q}'}$$

By the previous case we have $\dim((R[x])_{\mathfrak{q}'}) = \dim(R_{\mathfrak{p}}) + 1 - \text{trdeg}_{\kappa(\mathfrak{p})}\kappa(\mathfrak{q})$. Since $\mathfrak{n} \neq 0$ we see that the dimension of $S_{\mathfrak{q}}$ decreases by at least one, see Lemma 7.57.11, which proves the inequality of the lemma. To see the equality in case R is universally catenary note that $\mathfrak{n} \subset R[x]$ is a height one prime as it corresponds to a nonzero prime in $f.f.(R)[x]$. Hence any maximal chain of primes in $R[x]_{\mathfrak{q}'}/\mathfrak{n}$ corresponds to a maximal chain of primes with length 1 greater between $\mathfrak{q}'$ and (0) in $R[x]$. If R is universally catenary these all have the same length equal to the height of $\mathfrak{q}'$. This proves that $\dim(R[x]_{\mathfrak{q}'}/\mathfrak{n}) = \dim(R[x]_{\mathfrak{q}'}) - 1$ as desired. □

The following lemma says that generically finite maps tend to be quasi-finite in codimension 1.

Lemma 7.104.2. *Let $A \to B$ be a ring map. Assume*

(1) *$A \subset B$ is an extension of domains.*
(2) *A is Noetherian,*
(3) *$A \to B$ is of finite type, and*
(4) *the extension $f.f.(A) \subset f.f.(B)$ is finite.*

Let $\mathfrak{p} \subset A$ be a prime such that $\dim(A_{\mathfrak{p}}) = 1$. *Then there are at most finitely many primes of B lying over $\mathfrak{p}$.*

Proof. By the dimension formula (Lemma 7.104.1) for any prime $\mathfrak{q}$ lying over $\mathfrak{p}$ we have

$$\dim(B_{\mathfrak{q}}) \leq \dim(A_{\mathfrak{p}}) - \text{trdeg}_{\kappa(\mathfrak{p})}\kappa(\mathfrak{q}).$$

As the domain $B_{\mathfrak{q}}$ has at least 2 prime ideals we see that $\dim(B_{\mathfrak{q}}) \geq 1$. We conclude that $\dim(B_{\mathfrak{q}}) = 1$ and that the extension $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{q})$ is algebraic. Hence $\mathfrak{q}$ defines a closed point of its fibre $Spec(B \otimes_A \kappa(\mathfrak{p}))$, see Lemma 7.31.9. Since $B \otimes_A \kappa(\mathfrak{p})$ is a Noetherian ring the fibre $Spec(B \otimes_A \kappa(\mathfrak{p}))$ is a Noetherian topological space, see Lemma 7.28.5. A Noetherian topological space consisting of closed points is finite, see for example Topology, Lemma 5.6.2. □

7.105. Dimension of finite type algebras over fields

In this section we compute the dimension of a polynomial ring over a field. We also prove that the dimension of a finite type domain over a field is the dimension of its local rings at maximal ideals. We will esthablish the connection with the transcendence degree over the ground field in Section 7.107.

Lemma 7.105.1. *Let $\mathfrak{m}$ be a maximal ideal in $k[x_1, \ldots, x_n]$. The ideal $\mathfrak{m}$ is generated by n elements. The dimension of $k[x_1, \ldots, x_n]_{\mathfrak{m}}$ is n. Hence $k[x_1, \ldots, x_n]_{\mathfrak{m}}$ is a regular local ring of dimension n.*

Proof. By the Hilbert Nullstellensatz (Theorem 7.30.1) we know the residue field $\kappa = \kappa(\mathfrak{m})$ is a finite extension of k. Denote $\alpha_i \in \kappa$ the image of x_i. Denote $\kappa_i = k(\alpha_1, \ldots, \alpha_i) \subset \kappa$, $i = 1, \ldots, n$ and $\kappa_0 = k$. Note that $\kappa_i = k[\alpha_1, \ldots, \alpha_i]$ by field theory. Define inductively elements $f_i \in \mathfrak{m} \cap k[x_1, \ldots, x_i]$ as follows: Let $P_i(T) \in \kappa_{i-1}[T]$ be the monic minimal polynomial of α_i over κ_{i-1}. Let $Q_i(T) \in k[x_1, \ldots, x_{i-1}][T]$ be a monic lift of $P_i(T)$ (of the same degree). Set $f_i = Q_i(x_i)$. Note that if $d_i = \deg_T(P_i) = \deg_T(Q_i) = \deg_{x_i}(f_i)$ then $d_1 d_2 \ldots d_i = [\kappa_i : k]$ by elementary field theory.

We claim that for all $i = 0, 1, \ldots, n$ there is an isomorphism

$$\psi_i : k[x_1, \ldots, x_i]/(f_1, \ldots, f_i) \cong \kappa_i.$$

By construction the composition $k[x_1, \ldots, x_i] \to k[x_1, \ldots, x_n] \to \kappa$ is surjective onto κ_i and $f_1, \ldots, f_i$ are in the kernel. This gives a surjective homomorphism. We prove ψ_i is injective by induction. It is clear for $i = 0$. Given the statement for i we prove it for $i + 1$. The ring extension $k[x_1, \ldots, x_i]/(f_1, \ldots, f_i) \to k[x_1, \ldots, x_{i+1}]/(f_1, \ldots, f_{i+1})$ is generated by 1 element over a field and one irreducible equation. By elementrary field theory $k[x_1, \ldots, x_{i+1}]/(f_1, \ldots, f_{i+1})$ is a field, and hence ψ_i is injective.

This implies that $\mathfrak{m} = (f_1, \ldots, f_n)$. Moreover, we also conclude that

$$k[x_1, \ldots, x_n]/(f_1, \ldots, f_i) \cong \kappa_i[x_{i+1}, \ldots, x_n].$$

Hence $(f_1, \ldots, f_i)$ is a prime ideal. Thus

$$(0) \subset (f_1) \subset (f_1, f_2) \subset \ldots \subset (f_1, \ldots, f_n) = \mathfrak{m}$$

is a chain of primes of length n. The lemma follows. □

Proposition 7.105.2. *A polynomial algebra in n variables over a field is a regular ring. It has global dimension n. All localizations at maximal ideals are regular local rings of dimension n.*

Proof. By Lemma 7.105.1 all localizations $k[x_1, \ldots, x_n]_{\mathfrak{m}}$ at maximal ideals are regular local rings of dimension n. Hence we conclude by Lemma 7.102.7. □

Lemma 7.105.3. *Let k be a field. Let $\mathfrak{p} \subset \mathfrak{q} \subset k[x_1, \ldots, x_n]$ be a pair of primes. Any maximal chain of primes between $\mathfrak{p}$ and $\mathfrak{q}$ has length height$(\mathfrak{q})$ − height$(\mathfrak{p})$.*

Proof. By Proposition 7.105.2 any local ring of $k[x_1, \ldots, x_n]$ is regular. Hence all local rings are Cohen-Macaulay, see Lemma 7.98.3. The local rings at maximal ideals have dimension n hence every maximal chain of primes in $k[x_1, \ldots, x_n]$ has length n, see Lemma 7.96.3. Hence every maximal chain of primes between (0) and $\mathfrak{p}$ has length height($\mathfrak{p}$), see Lemma 7.96.4 for example. Putting these together leads to the assertion of the lemma. □

Lemma 7.105.4. *Let k be a field. Let S be a finite type k-algebra which is an integral domain. Then* $\dim(S) = \dim(S_{\mathfrak{m}})$ *for any maximal ideal $\mathfrak{m}$ of S. In words: every maximal chain of primes has length equal to the dimension of S.*

Proof. Write $S = k[x_1, \ldots, x_n]/\mathfrak{p}$. By Proposition 7.105.2 and Lemma 7.105.3 above all the maximal chains of primes in S (which necessarily end with a maximal ideal) have length $n - \text{height}(\mathfrak{p})$. Thus this number is the dimension of S and of $S_{\mathfrak{m}}$ for any maximal ideal $\mathfrak{m}$ of S. □

Recall that we defined the dimension $\dim_x(X)$ of a topological space X at a point x in Topology, Definition 5.7.1.

Lemma 7.105.5. *Let k be a field. Let S be a finite type k-algebra. Let $X = Spec(S)$. Let $\mathfrak{p} \subset S$ be a prime ideal and let $x \in X$ be the associated point. The following numbers are equal*

1. $\dim_x(X)$,
2. $\max \dim(Z)$ *where the maximum is over those irreducible components Z of X passing through x, and*
3. $\min \dim(S_{\mathfrak{m}})$ *where the minimum is over maximal ideals $\mathfrak{m}$ with $\mathfrak{p} \subset \mathfrak{m}$.*

Proof. Let $X = \bigcup_{i \in I} Z_i$ be the decomposition of X into its irreducible components. There are finitely many of them (see Lemmas 7.28.3 and 7.28.5). Let $I' = \{i \mid x \in Z_i\}$, and let $T = \bigcup_{x \notin I'} Z_i$. Then $U = X \setminus T$ is an open subset of X containing the point x. The number (2) is $\max_{i \in I'} \dim(Z_i)$. For any open $W \subset U$, with $x \in W$ the irreducible components of W are the irreducible sets $W_i = Z_i \cap W$ for $i \in I'$. Note that each W_i, $i \in I'$ contains a closed point because X is Jacobson, see Section 7.31. By Lemma 7.105.4 we see that $\dim(W_i) = \dim(Z_i)$ for any $i \in I'$. Hence $\dim(W)$ is equal to the number (2). This proves that (1) = (2).

Let $\mathfrak{m} \supset \mathfrak{p}$ be any maximal ideal containing $\mathfrak{p}$. Let $x_0 \in X$ be the corresponding point. First of all, x_0 is contained in all the irreducible components Z_i, $i \in I'$. Let $\mathfrak{q}_i$ denote the minimal primes of S corresponding to the irreducible componenents Z_i. For each i such that $x_0 \in Z_i$ (which is equivalent to $\mathfrak{m} \supset \mathfrak{q}_i$) we have a surjection

$$S_{\mathfrak{m}} \longrightarrow S_{\mathfrak{m}}/\mathfrak{q}_i S_{\mathfrak{m}} = (S/\mathfrak{q}_i)_{\mathfrak{m}}$$

Moreover, the primes $\mathfrak{q}_i S_{\mathfrak{m}}$ so obtained exhaust the minimal primes of the Noetherian local ring $S_{\mathfrak{m}}$, see Lemma 7.23.2. We conclude, using Lemma 7.105.4, that the dimension of $S_{\mathfrak{m}}$ is the maximum of the dimensions of the Z_i passing through x_0. To finish the proof of the lemma it suffices to show that we can choose x_0 such that $x_0 \in Z_i \Rightarrow i \in I'$. Because S is Jacobson (as we saw above) it is enough to show that $V(\mathfrak{p}) \setminus T$ (with T as above) is nonempty. And this is clear since it contains the point x (i.e. $\mathfrak{p}$). $\square$

Lemma 7.105.6. *Let k be a field. Let S be a finite type k-algebra. Let $X = Spec(S)$. Let $\mathfrak{m} \subset S$ be a maximal ideal and let $x \in X$ be the associated closed point. Then* $\dim_x(X) = \dim(S_{\mathfrak{m}})$.

Proof. This is a special case of Lemma 7.105.5 above. $\square$

Lemma 7.105.7. *Let k be a field. Let S be a finite type k algebra. Assume that S is Cohen-Macaulay. Then $Spec(S) = \coprod T_d$ is a finite disjoint union of open and closed subsets T_d with T_d equidimensional (see Topology, Definition 5.7.4) of dimension d. Equivalently, S is a product of rings S_d, $d = 0, \ldots, \dim(S)$ such that every maximal ideal $\mathfrak{m}$ of S_d has height d.*

Proof. The equivalence of the two statements follows from Lemma 7.20.3. Let $\mathfrak{m} \subset S$ be a maximal ideal. Every maximal chain of primes in $S_{\mathfrak{m}}$ has the same length equal to $\dim(S_{\mathfrak{m}})$, see Lemma 7.96.3. Hence, the dimension of the irreducible components passing through the point corresponding to $\mathfrak{m}$ all have dimension equal to $\dim(S_{\mathfrak{m}})$, see Lemma 7.105.4. Since $Spec(S)$ is a Jacobson topological space the intersection of any two irreducible components of it contains a closed point if nonempty, see Lemmas 7.31.2 and 7.31.4. Thus we have shown that any two irreducible components that meet have the same dimension. The lemma follows easily from this, and the fact that $Spec(S)$ has a finite number of irreducible components (see Lemmas 7.28.3 and 7.28.5). $\square$

7.106. Noether normalization

In this section we prove variants of the Noether normalization lemma. The key ingredient we will use is contained in the following two lemmas.

Lemma 7.106.1. *Let $n \in \mathbf{N}$. Let N be a finite nonempty set of multi-indices $\nu = (\nu_1, \ldots, \nu_n)$. Given $e = (e_1, \ldots, e_n)$ we set $e \cdot \nu = \sum e_i \nu_i$. Then for $e_1 \gg e_2 \gg \ldots \gg e_{n-1} \gg e_n$ we have: If $\nu, \nu' \in N$ then*

$$(e \cdot \nu = e \cdot \nu') \Leftrightarrow (\nu = \nu')$$

Proof. Let $A_i = \max_i \nu_i - \min_i \nu_i$. If for each i we have $e_{i-1} > A_i e_i + A_{i+1}e_{i+1} + \ldots + A_n e_n$ then the lemma holds. Details omitted. $\square$

Lemma 7.106.2. *Let R be a ring. Let $g \in R[x_1, \ldots, x_n]$ be an element which is nonconstant, i.e., $g \not\in R$. For $e_1 \gg e_2 \gg \ldots \gg e_{n-1} \gg e_n = 1$ the polynomial*

$$g(x_1 + x_n^{e_1}, x_2 + x_n^{e_2}, \ldots, x_{n-1} + x_n^{e_{n-1}}, x_n) = ax_n^d + \text{lower order terms in } x_n$$

where $d > 0$ and $a \in R$ is one of the nonzero coefficients of g.

Proof. Write $g = \sum_{\nu \in N} a_\nu x^\nu$ with $a_\nu \in R$ not zero. Here N is a finite set of multi-indices as in Lemma 7.106.1 and $x^\nu = x_1^{\nu_1} \ldots x_n^{\nu_n}$. Note that the leading term in

$$(x_1 + x_n^{e_1})^{\nu_1} \ldots (x_{n-1} + x_n^{e_{n-1}})^{\nu_{n-1}} x_n^{\nu_n} \quad \text{is} \quad x_n^{e_1\nu_1 + \ldots + e_{n-1}\nu_{n-1} + \nu_n}.$$

Hence the lemma follows from Lemma 7.106.1 which garantees that there is exactly one nonzero term $a_\nu x^\nu$ of g which gives rise to the leading term of $g(x_1 + x_n^{e_1}, x_2 + x_n^{e_2}, \ldots, x_{n-1} + x_n^{e_{n-1}}, x_n)$, i.e., $a = a_\nu$ for the unique $\nu \in N$ such that $e \cdot \nu$ is maximal. $\square$

Lemma 7.106.3. *Let k be a field. Let $S = k[x_1, \ldots, x_n]/I$ for some ideal I. If $I \neq 0$, then there exist $y_1, \ldots, y_{n-1} \in k[x_1, \ldots, x_n]$ such that S is finite over $k[y_1, \ldots, y_{n-1}]$. Moreover we may choose y_i to be in the $\mathbf{Z}$-subalgebra of $k[x_1, \ldots, x_n]$ generated by $x_1, \ldots, x_n$.*

Proof. Pick $f \in I$, $f \neq 0$. It suffices to show the lemma for $k[x_1, \ldots, x_n]/(f)$ since S is a quotient of that ring. We will take $y_i = x_i - x_n^{e_i}$, $i = 1, \ldots, n-1$ for suitable integers e_i. When does this work? It suffices to show that $\overline{x_n} \in k[x_1, \ldots, x_n]/(f)$ is integral over the ring $k[y_1, \ldots, y_{n-1}]$. The equation for $\overline{x_n}$ over this ring is

$$f(y_1 + x_n^{e_1}, \ldots, y_{n-1} + x_n^{e_{n-1}}, x_n) = 0.$$

Hence we are done if we can show there exists integers e_i such that the leading coefficient w.r.t. x_n of the equation above is a nonzero element of k. This can be achieved for example by choosing $e_1 \gg e_2 \gg \ldots \gg e_{n-1}$, see Lemma 7.106.2. $\square$

Lemma 7.106.4. *Let k be a field. Let $S = k[x_1, \ldots, x_n]/I$ for some ideal I. There exist $r \geq 0$, and $y_1, \ldots, y_r \in k[x_1, \ldots, x_n]$ such that (a) the map $k[y_1, \ldots, y_r] \to S$ is injective, and (b) the map $k[y_1, \ldots, y_r] \to S$ is finite. In this case the integer r is the dimension of S. Moreover we may choose y_i to be in the $\mathbf{Z}$-subalgebra of $k[x_1, \ldots, x_n]$ generated by $x_1, \ldots, x_n$.*

Proof. By induction on n, with $n = 0$ being trivial. If $I = 0$, then take $r = n$ and $y_i = x_i$. If $I \neq 0$, then choose $y_1, \ldots, y_{n-1}$ as in Lemma 7.106.3. Let $S' \subset S$ be the subring generated by the images of the y_i. By induction we can choose r and $z_1, \ldots, z_r \in k[y_1, \ldots, y_{n-1}]$ such that (a), (b) hold for $k[z_1, \ldots, z_r] \to S'$. Since $S' \to S$ is injective and finite we see (a), (b) hold for $k[z_1, \ldots, z_r] \to S$. The last assertion follows from Lemma 7.103.4. $\square$

Lemma 7.106.5. *Let k be a field. Let S be a finite type k algebra and denote $X = Spec(S)$. Let $\mathfrak{q}$ be a prime of S, and let $x \in X$ be the corresponding point. There exists a $g \in S$, $g \not\in \mathfrak{q}$ such that $\dim(S_g) = \dim_x(X) =: d$ and such that there exists a finite injective map $k[y_1, \ldots, y_d] \to S_g$.*

Proof. Note that by definition $\dim_x(X)$ is the minimum of the dimensions of S_g for $g \in S$, $g \not\in \mathfrak{q}$, i.e., the minimum is attained. Thus the lemma follows from Lemma 7.106.4. $\square$

Lemma 7.106.6. *Let k be a field. Let $\mathfrak q \subset k[x_1, \ldots, x_n]$ be a prime ideal. Set $r = trdeg_k\ \kappa(\mathfrak q)$. Then there exists a finite ring map $\varphi : k[y_1, \ldots, y_n] \to k[x_1, \ldots, x_n]$ such that $\varphi^{-1}(\mathfrak q) = (y_{r+1}, \ldots, y_n)$.*

Proof. By induction on n. The case $n = 0$ is clear. Assume $n > 0$. If $r = n$, then $\mathfrak q = (0)$ and the result is clear. Choose a nonzero $f \in \mathfrak q$. Of course f is nonconstant. After applying an automorphism of the form

$$k[x_1, \ldots, x_n] \longrightarrow k[x_1, \ldots, x_n], \quad x_n \mapsto x_n, \quad x_i \mapsto x_i + x_n^{e_i}\ (i < n)$$

we may assume that f is monic in x_n over $k[x_1, \ldots, x_n]$, see Lemma 7.106.2. Hence the ring map

$$k[y_1, \ldots, y_n] \longrightarrow k[x_1, \ldots, x_n], \quad y_n \mapsto f, \quad y_i \mapsto x_i\ (i < n)$$

is finite. Moreover $y_n \in \mathfrak q \cap k[y_1, \ldots, y_n]$ by construction. Thus $\mathfrak q \cap k[y_1, \ldots, y_n] = \mathfrak p k[y_1, \ldots, y_n] + (y_n)$ where $\mathfrak p \subset k[y_1, \ldots, y_{n-1}]$ is a prime ideal. Note that $\kappa(\mathfrak p) \subset \kappa(\mathfrak q)$ is finite, and hence $r = \text{trdeg}_k\ \kappa(\mathfrak p)$. Apply the induction hypothesis to the pair $(k[y_1, \ldots, y_{n-1}], \mathfrak p)$ and we obtain a finite ring map $k[z_1, \ldots, z_{n-1}] \to k[y_1, \ldots, y_{n-1}]$ such that $\mathfrak p \cap k[z_1, \ldots, z_{n-1}] = (z_{r+1}, \ldots, z_{n-1})$. We extend the ring map $k[z_1, \ldots, z_{n-1}] \to k[y_1, \ldots, y_{n-1}]$ to a ring map $k[z_1, \ldots, z_n] \to k[y_1, \ldots, y_n]$ by mapping z_n to y_n. The composition of the ring maps

$$k[z_1, \ldots, z_n] \to k[y_1, \ldots, y_n] \to k[x_1, \ldots, x_n]$$

solves the problem. □

Lemma 7.106.7. *Let $R \to S$ be an injective finite type map of domains. Then there exists an integer d and factorization*

$$R \to R[y_1, \ldots, y_d] \to S' \to S$$

by injective maps such that S' is finite over $R[y_1, \ldots, y_d]$ and such that $S'_f \cong S_f$ for some nonzero $f \in R$.

Proof. Pick $x_1, \ldots, x_n \in S$ which generate S over R. Let $K = f.f.(R)$ and $S_K = S \otimes_R K$. By Lemma 7.106.4 we can find $y_1, \ldots, y_d \in S$ such that $K[y_1, \ldots, y_d] \to S_K$ is a finite injective map. Note that $y_i \in S$ because we may pick the y_j in the $\mathbf{Z}$-algebra generated by $x_1, \ldots, x_n$. As a finite ring map is integral (see Lemma 7.32.3) we can find monic $P_i \in K[y_1, \ldots, y_d][T]$ such that $P_i(x_i) = 0$ in S_K. Let $f \in R$ be a nonzero element such that $fP_i \in R[y_1, \ldots, y_d][T]$ for all i. Set $x_i' = fx_i$ and let $S' \subset S$ be the subalgebra generated by $y_1, \ldots, y_d$ and $x_1', \ldots, x_n'$. Note that x_i' is integral over $R[y_1, \ldots, y_d]$ as we have $Q_i(x_i') = 0$ where $Q_i = f^{-\deg_T(P_i)} P_i(fT)$ which is a monic polynomial in T with coefficients in $R[y_1, \ldots, y_d]$ by our choice of f. Hence $R[y_1, \ldots, y_n] \subset S'$ is finite by Lemma 7.32.5. By construction $S'_f \cong S_f$ and we win. □

7.107. Dimension of finite type algebras over fields, reprise

This section is a continuation of Section 7.105. In this section we esthablish the connection between dimension and transcendence degree over the ground field for finite type domains over a field.

Lemma 7.107.1. *Let k be a field. Let S be a finite type k algebra which is an integral domain. Let $K = f.f.(S)$ be the field of fractions of S. Let $r = trdeg(K/k)$ be the transcendence degree of K over k. Then $\dim(S) = r$. Moreover, the local ring of S at every maximal ideal has dimension r.*

Proof. We may write $S = k[x_1, \ldots, x_n]/\mathfrak{p}$. By Lemma 7.105.3 all local rings of S at maximal ideals have the same dimension. Apply Lemma 7.106.4 above. We get a finite injective ring map

$$k[y_1, \ldots, y_d] \to S$$

with $d = \dim(S)$. Clearly, $k(y_1, \ldots, y_d) \subset K$ is a finite extension and we win. □

Lemma 7.107.2. *Let k be a field. Let S be a finite type k-algebra. Let $\mathfrak{q} \subset \mathfrak{q}' \subset S$ be distinct prime ideals. Then $trdeg_k\ \kappa(\mathfrak{q}') < trdeg_k\ \kappa(\mathfrak{q})$.*

Proof. By Lemma 7.107.1 we have $\dim V(\mathfrak{q}) = \text{trdeg}_k\ \kappa(\mathfrak{q})$ and similarly for $\mathfrak{q}'$. Hence the result follows as the strict inclusion $V(\mathfrak{q}') \subset V(\mathfrak{q})$ implies a strict inequality of dimensions. □

The following lemma generalizes Lemma 7.105.6.

Lemma 7.107.3. *Let k be a field. Let S be a finite type k algebra. Let $X = Spec(S)$. Let $\mathfrak{p} \subset S$ be a prime ideal, and let $x \in X$ be the corresponding point. Then we have*

$$\dim_x(X) = \dim(S_{\mathfrak{p}}) + trdeg_k\ \kappa(\mathfrak{p}).$$

Proof. By Lemma 7.107.1 above we know that $r = \text{trdeg}_k\ \kappa(\mathfrak{p})$ is equal to the dimension of $V(\mathfrak{p})$. Pick any maximal chain of primes $\mathfrak{p} \subset \mathfrak{p}_1 \subset \ldots \subset \mathfrak{p}_r$ starting with $\mathfrak{p}$ in S. This has length r by Lemma 7.105.4. Let $\mathfrak{q}_i$, $i \in I'$ be the minimal primes of S which are contained in $\mathfrak{p}$. These correspond $1-1$ to minimal primes in $S_{\mathfrak{p}}$ via the rule $\mathfrak{q}_i \mapsto \mathfrak{q}_i S_{\mathfrak{p}}$. By Lemma 7.105.5 we know that $\dim_x(X)$ is equal to the maximum of the dimensions of the rings $S/\mathfrak{q}_i$. For each i pick a maximal chain of primes $\mathfrak{q}_i \subset \mathfrak{p}_1 \subset \ldots \subset \mathfrak{p}_{s(i)} = \mathfrak{p}$. Then $\dim(S_{\mathfrak{p}}) = \max_{i \in I'} s(i)$. Now, each chain

$$\mathfrak{q}_i \subset \mathfrak{p}_1 \subset \ldots \subset \mathfrak{p}_{s(i)} = \mathfrak{p} \subset \mathfrak{p}_1 \subset \ldots \subset \mathfrak{p}_r$$

is a maximal chain in $S/\mathfrak{q}_i$, and by what was said before we have $\dim_x(X) = \max_{i \in I'} r + s(i)$. The lemma follows. □

The following lemma says that the codimension of one finite type Spec in another is the difference of heights.

Lemma 7.107.4. *Let k be a field. Let $S' \to S$ be a surjection of finite type k algebras. Let $\mathfrak{p} \subset S$ be a prime ideal, and let $\mathfrak{p}'$ be the corresponding prime ideal of S'. Let $X = Spec(S)$, resp. $X' = Spec(S')$, and let $x \in X$, resp. $x' \in X'$ be the point corrseponding to $\mathfrak{p}$, resp. $\mathfrak{p}'$. Then*

$$\dim_{x'} X' - \dim_x X = height(\mathfrak{p}') - height(\mathfrak{p}).$$

Proof. Immediate from Lemma 7.107.3 above. □

Lemma 7.107.5. *Let k be a field. Let S be a finite type k-algebra. Let $k \subset K$ be a field extension. Then* $\dim(S) = \dim(K \otimes_k S)$.

Proof. By Lemma 7.106.4 there exists a finite injective map $k[y_1, \ldots, y_d] \to S$ with $d = \dim(S)$. Since K is flat over k we also get a finite injective map $K[y_1, \ldots, y_d] \to K \otimes_k S$. The result follows from Lemma 7.103.4. □

Lemma 7.107.6. *Let k be a field. Let S be a finite type k-algebra. Set $X = Spec(S)$. Let $k \subset K$ be a field extension. Set $S_K = K \otimes_k S$, and $X_K = Spec(S_K)$. Let $\mathfrak{q} \subset S$ be a prime corresponding to $x \in X$ and let $\mathfrak{q}_K \subset S_K$ be a prime corresponding to $x_K \in X_K$ lying over $\mathfrak{q}$. Then* $\dim_x X = \dim_{x_K} X_K$.

Proof. Choose a presentation $S = k[x_1, \ldots, x_n]/I$. This gives a presentation $K \otimes_k S = K[x_1, \ldots, x_n]/(K \otimes_k I)$. Let $\mathfrak{q}'_K \subset K[x_1, \ldots, x_n]$, resp. $\mathfrak{q}' \subset k[x_1, \ldots, x_n]$ be the corresponding primes. Consider the following commutative diagram of Noetherian local rings

$$\begin{tikzcd} K[x_1, \ldots, x_n]_{\mathfrak{q}'_K} \arrow[r] & (K \otimes_k S)_{\mathfrak{q}_K} \\ k[x_1, \ldots, x_n]_{\mathfrak{q}'} \arrow[r] \arrow[u] & S_{\mathfrak{q}} \arrow[u] \end{tikzcd}$$

Both vertical arrows are flat because they are localizations of the flat ring maps $S \to S_K$ and $k[x_1, \ldots, x_n] \to K[x_1, \ldots, x_n]$. Moreover, the vertical arrows have the same fibre rings. Hence, we see from Lemma 7.103.7 that $\text{height}(\mathfrak{q}') - \text{height}(\mathfrak{q}) = \text{height}(\mathfrak{q}'_K) - \text{height}(\mathfrak{q}_K)$. Denote $x' \in X' = Spec(k[x_1, \ldots, x_n])$ and $x'_K \in X'_K = Spec(K[x_1, \ldots, x_n])$ the points corresponding to $\mathfrak{q}'$ and $\mathfrak{q}'_K$. By Lemma 7.107.4 and what we showed above we have

$$\begin{aligned} n - \dim_x X &= \dim_{x'} X' - \dim_x X \\ &= \text{height}(\mathfrak{q}') - \text{height}(\mathfrak{q}) \\ &= \text{height}(\mathfrak{q}'_K) - \text{height}(\mathfrak{q}_K) \\ &= \dim_{x'_K} X'_K - \dim_{x_K} X_K \\ &= n - \dim_{x_K} X_K \end{aligned}$$

and the lemma follows. □

7.108. Dimension of graded algebras over a field

Here is a basic result.

Lemma 7.108.1. *Let k be a field. Let S be a finitely generated graded algebra over k. Assume $S_0 = k$. Let $P(T) \in \mathbf{Q}[T]$ be the polynomial such that $\dim(S_d) = P(d)$ for all $d \gg 0$. See Proposition 7.55.6. Then*

1. *The irrelevant ideal S_+ is a maximal ideal $\mathfrak{m}$.*
2. *Any minimal prime of S is a homogeneous ideal and is contained in $S_+ = \mathfrak{m}$.*
3. *We have $\dim(S) = \deg(P)+1 = \dim_x Spec(S)$ (with the convention that $\deg(0) = -1$) where x is the point corresponding to the maximal ideal $S_+ = \mathfrak{m}$.*
4. *The Hilbert function of the local ring $R = S_{\mathfrak{m}}$ is equal to the Hilbert function of S.*

Proof. The first statement is obvious. The second follows from Lemma 7.53.8. The equality $\dim(S) = \dim_x Spec(S)$ follows from the fact that every irreducible component passes through x according to (2). Hence we may compute this dimension as the dimension of the local ring $R = S_{\mathfrak{m}}$ with $\mathfrak{m} = S_+$ by Lemma 7.105.6. Since $\mathfrak{m}^d/\mathfrak{m}^{d+1} \cong \mathfrak{m}^d R/\mathfrak{m}^{d+1} R$ we see that the Hilbert function of the local ring R is equal to the Hilbert function of S, which is (4). We conclude the last equality of (3) by Proposition 7.57.8. □

7.109. Generic flatness

Basically this says that a finite type algebra over a domain becomes flat after inverting a single element of the domain. There are several versions of this result (in increasing order of strength).

Lemma 7.109.1. *Let $R \to S$ be a ring map. Let M be an S-module. Assume*

1. *R is Noetherian,*

(2) *R is a domain,*
(3) *$R \to S$ is of finite type, and*
(4) *M is a finite type S-module.*

Then there exists a nonzero $f \in R$ such that M_f is a free R_f-module.

Proof. Let K be the fraction field of R. Set $S_K = K \otimes_R S$. This is an algebra of finite type over K. We will argue by induction on $d = \dim(S_K)$ (which is finite for example by Noether normalization, see Section 7.106). Fix $d \geq 0$. Assume we know that the lemma holds in all cases where $\dim(S_K) < d$.

Suppose given $R \to S$ and M as in the lemma with $\dim(S_K) = d$. By Lemma 7.59.1 there exists a filtration $0 \subset M_1 \subset M_2 \subset \ldots \subset M_n = M$ so that M_i/M_{i-1} is isomorphic to $S/\mathfrak{q}$ for some prime $\mathfrak{q}$ of S. Note that $\dim((S/\mathfrak{q})_K) \leq \dim(S_K)$. Also, note that an extension of free modules is free (see basic notion 50). Thus we may assume $M = S$ and that S is a domain of finite type over R.

If $R \to S$ has a nontrivial kernel, then take a nonzero $f \in R$ in this kernel. In this case $S_f = 0$ and the lemma holds. (This is really the case $d = -1$ and the start of the induction.) Hence we may assume that $R \to S$ is a finite type extension of Noetherian domains.

Apply Lemma 7.106.7 and replace R by R_f (with f as in the lemma) to get a factorization

$$R \subset R[y_1, \ldots, y_d] \subset S$$

where the second extension is finite. Note that $f.f.(R[y_1, \ldots, y_d]) \subset f.f.(S)$ is a finite extension of fields. Choose $z_1, \ldots, z_r \in S$ which form a basis for $f.f.(S)$ over $f.f.(R[y_1, \ldots, y_d])$. This gives a short exact sequence

$$0 \to R[y_1, \ldots, y_d]^{\oplus r} \xrightarrow{(z_1, \ldots, z_r)} S \to N \to 0$$

By construction N is a finite $R[y_1, \ldots, y_d]$-module whose support does not contain the generic point (0) of $Spec(R[y_1, \ldots, y_d])$. By Lemma 7.59.4 there exists a nonzero $g \in R[y_1, \ldots, y_d]$ such that g annihilates N, so we may view N as a finite module over $S' = R[y_1, \ldots, y_d]/(g)$. Since $\dim(S'_K) < d$ by induction there exists a nonzero $f \in R$ such that N_f is a free R_f-module. Since $(R[y_1, \ldots, y_d])_f \cong R_f[y_1, \ldots, y_d]$ is free also we conclude by the already mentioned fact that an extension of free modules is free. $\square$

Lemma 7.109.2. *Let $R \to S$ be a ring map. Let M be an S-module. Assume*
(1) *R is a domain,*
(2) *$R \to S$ is of finite presentation, and*
(3) *M is an S-module of finite presentation.*

Then there exists a nonzero $f \in R$ such that M_f is a free R_f-module.

Proof. Write $S = R[x_1, \ldots, x_n]/(g_1, \ldots, g_m)$. For $g \in R[x_1, \ldots, x_n]$ denote $\overline{g}$ its image in S. We may write $M = S^{\oplus t}/\sum Sn_i$ for some $n_i \in S^{\oplus t}$. Write $n_i = (\overline{g}_{i1}, \ldots, \overline{g}_{it})$ for some $g_{ij} \in R[x_1, \ldots, x_n]$. Let $R_0 \subset R$ be the subring generated by all the coefficients of all the elements $g_i, g_{ij} \in R[x_1, \ldots, x_n]$. Define $S_0 = R_0[x_1, \ldots, x_n]/(g_1, \ldots, g_m)$. Define $M_0 = S_0^{\oplus t}/\sum S_0 n_i$. Then R_0 is a domain of finite type over $\mathbf{Z}$ and hence Noetherian (see Lemma 7.28.1). Moreover via the injection $R_0 \to R$ we have $S \cong R \otimes_{R_0} S_0$ and $M \cong R \otimes_{R_0} M_0$. Applying Lemma 7.109.1 we obtain a nonzero $f \in R_0$ such that $(M_0)_f$ is a free $(R_0)_f$-module. Hence $M_f = R_f \otimes_{(R_0)_f} (M_0)_f$ is a free R_f-module. $\square$

Lemma 7.109.3. *Let $R \to S$ be a ring map. Let M be an S-module. Assume*
(1) *R is a domain,*

(2) *$R \to S$ is of finite type, and*
(3) *M is a finite type S-module.*

Then there exists a nonzero $f \in R$ such that

(a) *M_f and S_f are free as R_f-modules, and*
(b) *S_f is a finitely presented R_f-algebra and M_f is a finitely presented S_f-module.*

Proof. We first prove the lemma for $S = R[x_1, \ldots, x_n]$, and then we deduce the result in general.

Assume $S = R[x_1, \ldots, x_n]$. Choose elements $m_1, \ldots, m_t$ which generate M. This gives a short exact sequence

$$0 \to N \to S^{\oplus t} \xrightarrow{(m_1,\ldots,m_t)} M \to 0.$$

Denote K the fraction field of R. Denote $S_K = K \otimes_R S = K[x_1, \ldots, x_n]$, and similarly $N_K = K \otimes_R N$, $M_K = K \otimes_R M$. As $R \to K$ is flat the sequence remains flat after tensoring with K. As $S_K = K[x_1, \ldots, x_n]$ is a Noetherian ring (see Lemma 7.28.1) we can find finitely many elements $n'_1, \ldots, n'_s \in N_K$ which generate it. Choose $n_1, \ldots, n_r \in N$ such that $n'_i = \sum a_{ij} n_j$ for some $a_{ij} \in K$. Set

$$M' = S^{\oplus t} / \sum\nolimits_{i=1,\ldots,r} S n_i$$

By construction M' is a finitely presented S-module, and there is a surjection $M' \to M$ which induces an isomorphism $M'_K \cong M_K$. We may apply Lemma 7.109.2 to $R \to S$ and M' and we find an $f \in R$ such that M'_f is a free R_f-module. Thus $M'_f \to M_f$ is a surjection of modules over the domain R_f where the source is a free module and which becomes an isomorphism upon tensoring with K. Thus it is injective as $M'_f \subset M'_K$ as it is free over the domain R_f. Hence $M'_f \to M_f$ is an isomorphism and the result is proved.

For the general case, choose a surjection $R[x_1, \ldots, x_n] \to S$. Think of both S and M as finite modules over $R[x_1, \ldots, x_n]$. By the special case proved above there exists a nonzero $f \in R$ such that both S_f and M_f are free as R_f-modules and finitely presented as $R_f[x_1, \ldots, x_n]$-modules. Clearly this implies that S_f is a finitely presented R_f-algebra and that M_f is a finitely presented S_f-module. □

Let $R \to S$ be a ring map. Let M be an S-module. Consider the following condition on an element $f \in R$:

$$(7.109.3.1) \qquad \begin{cases} S_f & \text{is of finite presentation over } R_f \\ M_f & \text{is of finite presentation as } S_f\text{-module} \\ S_f, M_f & \text{are free as } R_f\text{-modules} \end{cases}$$

We define

$$(7.109.3.2) \qquad U(R \to S, M) = \bigcup\nolimits_{f \in R \text{ with } (7.109.3.1)} D(f)$$

which is an open subset of $Spec(R)$.

Lemma 7.109.4. *Let $R \to S$ be a ring map. Let $0 \to M_1 \to M_2 \to M_3 \to 0$ be a short exact sequence of S-modules. Then*

$$U(R \to S, M_1) \cap U(R \to S, M_3) \subset U(R \to S, M_2).$$

Proof. Let $u \in U(R \to S, M_1) \cap U(R \to S, M_3)$. Choose $f_1, f_3 \in R$ such that $u \in D(f_1)$, $u \in D(f_3)$ and such that (7.109.3.1) holds for f_1 and M_1 and for f_3 and M_3. Then set $f = f_1 f_3$. Then $u \in D(f)$ and (7.109.3.1) holds for f and both M_1 and M_3. An extension of free modules is free, and an extension of finitely presented modules is finitely presented (Lemma 7.5.4). Hence we see that (7.109.3.1) holds for f and M_2. Thus $u \in U(R \to S, M_2)$ and we win. □

Lemma 7.109.5. *Let $R \to S$ be a ring map. Let M be an S-module. Let $f \in R$. Using the identification $Spec(R_f) = D(f)$ we have $U(R_f \to S_f, M_f) = D(f) \cap U(R \to S, M)$.*

Proof. Suppose that $u \in U(R_f \to S_f, M_f)$. Then there exists an element $g \in R_f$ such that $u \in D(g)$ and such that (7.109.3.1) holds for the pair $((R_f)_g \to (S_f)_g, (M_f)_g)$. Write $g = a/f^n$ for some $a \in R$. Set $h = af$. Then $R_h = (R_f)_g$, $S_h = (S_f)_g$, and $M_h = (M_f)_g$. Moreover $u \in D(h)$. Hence $u \in U(R \to S, M)$. Conversely, suppose that $u \in D(f) \cap U(R \to S, M)$. Then there exists an element $g \in R$ such that $u \in D(g)$ and such that (7.109.3.1) holds for the pair $(R_g \to S_g, M_g)$. Then it is clear that (7.109.3.1) also holds for the pair $(R_{fg} \to S_{fg}, M_{fg}) = ((R_f)_g \to (S_f)_g, (M_f)_g)$. Hence $u \in U(R_f \to S_f, M_f)$ and we win. □

Lemma 7.109.6. *Let $R \to S$ be a ring map. Let M be an S-module. Let $U \subset Spec(R)$ be a dense open. Assume there is a covering $U = \bigcup_{i \in I} D(f_i)$ of opens such that $U(R_{f_i} \to S_{f_i}, M_{f_i})$ is dense in $D(f_i)$ for each $i \in I$. Then $U(R \to S, M)$ is dense in $Spec(R)$.*

Proof. In view of Lemma 7.109.5 this is a purely topological statement. Namely, by that lemma we see that $U(R \to S, M) \cap D(f_i)$ is dense in $D(f_i)$ for each $i \in I$. By Topology, Lemma 5.17.4 we see that $U(R \to S, M) \cap U$ is dense in U. Since U is dense in $Spec(R)$ we conclude that $U(R \to S, M)$ is dense in $Spec(R)$. □

Lemma 7.109.7. *Let $R \to S$ be a ring map. Let M be an S-module. Assume*
  (1) *$R \to S$ is of finite type,*
  (2) *M is a finite S-module, and*
  (3) *R is reduced.*

Then there exists a subset $U \subset Spec(R)$ such that
  (1) *U is open and dense in $Spec(R)$,*
  (2) *for every $u \in U$ there exists an $f \in R$ such that $u \in D(f) \subset U$ and such that we have*
    (a) *M_f and S_f are free over R_f,*
    (b) *S_f is a finitely presented R_f-algebra, and*
    (c) *M_f is a finitely presented S_f-module.*

Proof. Note that the lemma is equivalent to the statement that the open $U(R \to S, M)$, see Equation (7.109.3.2), is dense in $Spec(R)$. We first prove the lemma for $S = R[x_1, \ldots, x_n]$, and then we deduce the result in general.

Proof of the case $S = R[x_1, \ldots, x_n]$ and M any finite module over S. Note that in this case $S_f = R_f[x_1, \ldots, x_n]$ is free and of finite presentation over R_f, so we do not have to worry about the conditions regarding S, only those that concern M. We will use induction on n.

There exists a finite filtration

$$0 \subset M_1 \subset M_2 \subset \ldots \subset M_t = M$$

such that $M_i/M_{i-1} \cong S/J_i$ for some ideal $J_i \subset S$, see Lemma 7.5.5. Since a finite intersection of dense opens is dense open, we see from Lemma 7.109.4 that it suffices to prove the lemma for each of the modules R/J_i. Hence we may assume that $M = S/J$ for some ideal J of $S = R[x_1, \ldots, x_n]$.

Let $I \subset R$ be the ideal generated by the coefficients of elements of J. Let $U_1 = Spec(R) \setminus V(I)$ and let

$$U_2 = Spec(R) \setminus \overline{U_1}.$$

Then it is clear that $U = U_1 \cup U_2$ is dense in $Spec(R)$. Let $f \in R$ be an element such that either (a) $D(f) \subset U_1$ or (b) $D(f) \subset U_2$. If for any such f the lemma holds for the pair $(R_f \to R_f[x_1, \ldots, x_n], M_f)$ then by Lemma 7.109.6 we see that $U(R \to S, M)$ is dense in $Spec(R)$. Hence we may assume either (a) $I = R$, or (b) $V(I) = Spec(R)$.

In case (b) we actually have $I = 0$ as R is reduced! Hence $J = 0$ and $M = S$ and the lemma holds in this case.

In case (a) we have to do a little bit more work. Note that every element of I is actually the coefficient of a monomial of an element of J, because the set of coefficients of elements of J forms an ideal (details omitted). Hence we find an element

$$g = \sum\nolimits_{K \in E} a_K x^K \in J$$

where E is a finite set of multi-indices $K = (k_1, \ldots, k_n)$ with at least one coefficient a_{K_0} a unit in R. Actually we can find one which has a coefficient equal to 1 as $1 \in I$ in case (a). Let $m = \#\{K \in E \mid a_K \text{ is not a unit}\}$. Note that $0 \leq m \leq \#E - 1$. We will argue by induction on m.

The case $m = 0$. In this case all the coefficients a_K, $K \in E$ of g are units and $E \neq \emptyset$. If $E = \{K_0\}$ is a singleton and $K_0 = (0, \ldots, 0)$, then g is a unit and $J = S$ so the result holds for sure. (This happens in particular when $n = 0$ and it provides the base case of the induction on n.) If not $E = \{(0, \ldots, 0)\}$, then at least one K is not equal to $(0, \ldots, 0)$, i.e., $g \notin R$. At this point we employ the usual trick of Noether normalization. Namely, we consider

$$G(y_1, \ldots, y_n) = g(y_1 + y_n^{e_1}, y_2 + y_n^{e_2}, \ldots, y_{n-1} + y_n^{e_{n-1}}, y_n)$$

with $0 \ll e_{n-1} \ll e_{n-2} \ll \ldots \ll e_1$. By Lemma 7.106.2 it follows that $G(y_1, \ldots, y_n)$ as a polynomial in y_n looks like

$$a_K y_n^{k_n + \sum_{i=1,\ldots,n-1} e_i k_i} + \text{lower order terms in } y_n$$

As a_K is a unit we conclude that $M = R[x_1, \ldots, x_n]/J$ is finite over $R[y_1, \ldots, y_{n-1}]$. Hence $U(R \to R[x_1, \ldots, x_n], M) = U(R \to R[y_1, \ldots, y_{n-1}], M)$ and we win by induction on n.

The case $m > 0$. Pick a multi-index $K \in E$ such that a_K is not a unit. As before set $U_1 = Spec(R_{a_K}) = Spec(R) \setminus V(a_K)$ and set

$$U_2 = Spec(R) \setminus \overline{U_1}.$$

Then it is clear that $U = U_1 \cup U_2$ is dense in $Spec(R)$. Let $f \in R$ be an element such that either (a) $D(f) \subset U_1$ or (b) $D(f) \subset U_2$. If for any such f the lemma holds for the pair $(R_f \to R_f[x_1, \ldots, x_n], M_f)$ then by Lemma 7.109.6 we see that $U(R \to S, M)$ is dense in $Spec(R)$. Hence we may assume either (a) $a_K R = R$, or (b) $V(a_K) = Spec(R)$. In case (a) the number m drops, as a_K has turned into a unit. In case (b), since R is reduced, we conclude that $a_K = 0$. Hence the set E decreases so the number m drops as well. In both cases we win by induction on m.

At this point we have proven the lemma in case $S = R[x_1, \ldots, x_n]$. Assume that $(R \to S, M)$ is an arbitrary pair satisfying the conditions of the lemma. Choose a surjection $R[x_1, \ldots, x_n] \to S$. Observe that, with the notation introduced in (7.109.3.2), we have

$$U(R \to S, M) = U(R \to R[x_1, \ldots, x_n], S) \cap U(R \to R[x_1, \ldots, x_n], S)$$

Hence as we've just finished proving the right two opens are dense also the open on the left is dense. □

7.110. Around Krull-Akizuki

One application of Krull-Akizuki is to show that there are plenty of discrete valuation rings. More generally in this section we show how to construct discrete valution rings dominating Noetherian local rings.

First we show how to dominate a Noetherian local domain by a 1-dimensional Noetherian local domain by blowing up the maximal ideal.

Lemma 7.110.1. *Let R be a local Noetherian domain with fraction field K. Assume R is not a field. Then there exist $R \subset R' \subset K$ with*

1. *R' local Noetherian of dimension 1,*
2. *$R \to R'$ a local ring map, i.e., R' dominates R, and*
3. *$R \to R'$ essentially of finite type.*

Proof. Choose any valuation ring $A \subset K$ dominating R (which exist by Lemma 7.46.2). Denote v the corresponding valuation. Let $x_1, \ldots, x_r$ be a minimal set of generators of the maximal ideal $\mathfrak{m}$ of R. We may and do assume that $v(x_r) = \min\{v(x_1), \ldots, v(x_r)\}$. Consider the ring

$$S = R[x_1/x_r, x_2/x_r, \ldots, x_{r-1}/x_r] \subset K.$$

Note that $\mathfrak{m}S = x_rS$ is a principal ideal. Note that $S \subset A$ and that $v(x_r) > 0$, hence we see that $x_rS \neq S$. Choose a minimal prime $\mathfrak{q}$ over x_rS. Then height$(\mathfrak{q}) = 1$ by Lemma 7.57.10 and $\mathfrak{q}$ lies over $\mathfrak{m}$. Hence we see that $R' = S_{\mathfrak{q}}$ is a solution. □

The spectrum of the ring R' in the following lemma is really the blow up of $Spec(R)$ in the maximal ideal of R (at least if case R is reduced).

Lemma 7.110.2. *Let R be a local ring with maximal ideal $\mathfrak{m}$. Assume R is Noetherian, dimension 1 and that $\dim(\mathfrak{m}/\mathfrak{m}^2) > 1$. Then there exists a ring map $R \to R'$ such that*

1. *$R \to R'$ is finite,*
2. *$R \to R'$ is not an isomorphism, and*
3. *for every $f \in \mathfrak{m}$ the map $R_f \to R'_f$ is an isomorphism.*

Proof. If $\mathfrak{m}$ is an associated prime of R then we can take $R' = R/I$ with $I = \{x \in R \mid \mathfrak{m}x = 0\}$. Hence we may assume that depth$(R) = 1$. In other words, we may assume R is Cohen-Macaulay.

Denote $\kappa = R/\mathfrak{m}$ the residue field of R. Consider the graded κ-algebra $S = \bigoplus_{d \geq 0} \mathfrak{m}^d/\mathfrak{m}^{d+1}$. This is a Noetherian ring, and hence has finitely many minimal primes $\mathfrak{q}_j$. Since the dimension of R is 1 we know the Hilbert function of R is eventually constant, see Proposition 7.57.8. Hence there exists an integer $d_0 \geq 0$ and an integer $r > 0$ such that $\dim_\kappa(\mathfrak{m}^n/\mathfrak{m}^{n+1}) = r$ for all $d \geq d_0$. By Lemma 7.108.1 we have $\dim(S) = 1$ and each $\mathfrak{q}_i$ is a homogeneous prime ideal. Note that $\dim(S) = 1$ implies none of the $\mathfrak{q}_i$ is equal to S_+. Hence by Lemma 7.53.6 we may choose $f \in S_+$ homogeneous not contained in any $\mathfrak{q}_j$. Then $\dim(S/fS) = 0$. This implies that $\dim_\kappa(S/fS) < \infty$, see for example Lemma 7.106.4. Hence we see that $fS_n = S_{n+\deg(f)}$ for all $n \gg 0$.

Set $d = \deg(f)$. Choose $x \in \mathfrak{m}^d$ which maps to f. Note that since $fS_n = S_{n+d}$ for $n \gg 0$ we have $x\mathfrak{m}^n = \mathfrak{m}^{n+d}$ by Nakayama's Lemma 7.14.5 for $n \gg 0$. Hence $\mathfrak{m} = \sqrt{(x)}$. Since

R is Cohen-Macaulay this implies that x is a nonzero divisor. Choose generators $x_1, \ldots, x_t$ of $\mathfrak{m}^d$ as an ideal of R. Set

$$R' = R[x_1/x, x_2/x, \ldots, x_t/x] \subset R[1/x].$$

Note that since x is a nonzero divisor we have $R \subset R'$. Since $\mathfrak{m} = \sqrt{(x)}$ we see that x is invertible in R_g for any $g \in \mathfrak{m}$, whence (3).

We claim that R' is finite over R. Namely, choose n such that $x\mathfrak{m}^{nd} = \mathfrak{m}^{(n+1)d}$. Then we can write $x_i^{n+1} = xf_i(x_1, \ldots, x_t)$ with $f_i \in R[X_1, \ldots, X_t]$ homogeneous of degree n. Hence we see that

$$(x_i/x)^{n+1} = f_i(x_1/x, \ldots, x_t/x)$$

in R' with the right hand side of degree $\leq n$. Hence any element in R' can be expressed as a sum of $(x_1/x)^{i_1} \ldots (x_t/x)^{i_t}$ with $i_j \leq n$. This proves that R' is finite over R.

Finally we show that $R \neq R'$. We argue by contradiction. Suppose $R' = R$. This means that $x_1/x, \ldots, x_t/x \in R$ for all i. In other words this means that $\mathfrak{m}^d = (x)$. Choose $y_1, \ldots, y_s \in \mathfrak{m}$ a minimal generating set. The assumption of the lemma implies $s \geq 2$. For some $i_1, \ldots, i_s \geq 0$, $\sum i_j = d$ we have $x = uy_1^{i_1} \ldots y_s^{i_s}$ for some unit u in R. We may assume $i_1 > 0$. Then

$$y_1^{i_1-1} y_2^{i_2+1} y_3^{i_3} \ldots y_s^{i_s} \in \mathfrak{m}^d$$

is a multiple of x hence a multiple of $y_1^{i_1} \ldots y_s^{i_s}$. Hence we see that $y_2/y_1 \in R$. This is a contradiction with the minimality of $y_1, \ldots, y_s$. □

Example 7.110.3. Consider the Noetherian local ring

$$R = k[[x, y]]/(y^2)$$

It has dimension 1 and it is Cohen-Macaulay. The result of applying the procedure of Lemma 7.110.2 to R is the extension

$$k[[x, y]]/(y^2) \subset k[[x, z]]/(z^2), \quad y \mapsto xz$$

in other words it is gotten by adjoining y/x to R. The effect of repeating the construction $n > 1$ times is to adjoin the element y/x^n.

Example 7.110.4. Let k be a field of characteristic $p > 0$ such that k has infinite degree over its subfield k^p of pth powers. For example $k = \mathbf{F}_p(t_1, t_2, t_3, \ldots)$. Consider the ring

$$A = \left\{ \sum a_i x^i \in k[[x]] \text{ such that } [k^p(a_0, a_1, a_2, \ldots) : k^p] < \infty \right\}$$

Then A is a discrete valuation ring and its completion is $A^\wedge = k[[x]]$. Note that the field extension $f.f.(A) \subset f.f.(k[[x]])$ is infinite purely inseparable. Choose any $f \in k[[x]]$, $f \notin A$. Let $R = A[f] \subset k[[x]]$. Then R is a Noetherian local domain of dimension 1 whose completion $R^\wedge$ is nonreduced (think!).

Remark 7.110.5. Suppose that R is a 1-dimensional semi-local Noetherian domain. If there is a maximal ideal $\mathfrak{m} \subset R$ such that $R_\mathfrak{m}$ is not regular, then we may apply the procedure of (the proof of) Lemma 7.110.2 to $(R, \mathfrak{m})$ to get a finite ring extension $R \subset R_1$. (Note that $Spec(R_1) \to Spec(R)$ is the blow up of $Spec(R)$ in the ideal $\mathfrak{m}$.) Of course R_1 is a 1-dimensional semi-local Noetherian domain with the same fraction field as R. If R_1 is not a regular semi-liocal ring, then we may repeat the construction to get $R_1 \subset R_2$. Thus we get a sequence

$$R \subset R_1 \subset R_2 \subset R_3 \subset \ldots$$

of finite ring extensions which may stop if R_n is regular for some n. Resolution of singularities would be the claim that eventually R_n is indeed regular. In reality this is not the case. Namely, there exists a characteristic 0 Noetherian local domain A of dimension 1 whose completion is nonreduced, see [**FR70**, Proposition 3.1] or our Examples, Section 64.8. For an example in characteristic $p > 0$ see Example 7.110.4. Since the construction of blowing up commutes with completion it is easy to see the sequence never stabilizes. See [**Ben73**] for a discussion (mostly in positive characteristic). On the other hand, if the completion of R in all of its maximal ideals is reduced, then the procedure stops (insert future reference here).

Lemma 7.110.6. *Let A be a ring. The following are equivalent.*

(1) *The ring A is a discrete valuation ring.*
(2) *The ring A is a valuation ring and Noetherian.*
(3) *The ring A is a regular local ring of dimension* 1.
(4) *The ring A is a Noetherian local domain with maximal ideal $\mathfrak{m}$ generated by a single nonzero element.*
(5) *The ring A is a Noetherian local normal domain of dimension* 1.

In this case if π is a generator of the maximal ideal of A, then every element of A can be uniquely written as $u\pi^n$, where $u \in A$ is a unit.

Proof. The equivalence of (1) and (2) is Lemma 7.46.12. Moreover, in the proof of Lemma 7.46.12 we saw that if A is a dscrete valuation ring, then A is a PID, hence (3). Note that a regular local ring is a domain (see Lemma 7.98.2). Using this the equivalence of (3) and (4) follows from dimension theory, see Section 7.57.

Assume (3) and let π be a generator of the maximal ideal $\mathfrak{m}$. For all $n \geq 0$ we have $\dim_{A/\mathfrak{m}} \mathfrak{m}^n/\mathfrak{m}^{n+1} = 1$ because it is generated by π^n (and it cannot be zero). In particular $\mathfrak{m}^n = (\pi^n)$ and the graded ring $\bigoplus \mathfrak{m}^n/\mathfrak{m}^{n+1}$ is isomorphic to the polynomial ring $A/\mathfrak{m}[T]$. For $x \in A \setminus \{0\}$ define $v(x) = \max\{n \mid x \in \mathfrak{m}^n\}$. In other words $x = u\pi^{v(x)}$ with $u \in A^*$. By the remarks above we have $v(xy) = v(x) + v(y)$ for all $x, y \in A \setminus \{0\}$. We extend this to the field of fractions K of A by setting $v(a/b) = v(a) - v(b)$ (well defined by multiplicativity shown above). Then it is clear that A is the set of elements of K which have valuation ≥ 0. Hence we see that A is a valuation ring by Lemma 7.46.10.

A valuation ring is a normal domain by Lemma 7.46.6. Hence we see that the equivalent conditions (1) -- (3) imply (5). Assume (5). Suppose that $\mathfrak{m}$ cannot be generated by 1 element to get a contradiction. Then Lemma 7.110.2 implies there is a finite ring map $A \to A'$ which is an isomorphism after inverting any nonzero element of $\mathfrak{m}$ but not an isomorphism. In particular $A' \subset f.f.(A)$. Since $A \to A'$ is finite it is integral (see Lemma 7.32.3). Since A is normal we get $A = A'$ a contradiction. $\square$

Lemma 7.110.7. *Let R be a domain with fraction field K. Let M be an R-submodule of $K^{\oplus r}$. Assume R is local Noetherian of dimension* 1. *For any nonzero $x \in R$ we have $length_R(R/xR) < \infty$ and*

$$length_R(M/xM) \leq r \cdot length_R(R/xR).$$

Proof. If x is a unit then the result is true. Hence we may assume $x \in \mathfrak{m}$ the maximal ideal of R. Since x is not zero and R is a domain we have $\dim(R/xR) = 0$, and hence R/xR has finite length. Consider $M \subset K^{\oplus r}$ as in the lemma. We may assume that the elements of M generate $K^{\oplus r}$ as a K-vector space after replacing $K^{\oplus r}$ by a smaller subspace if necessary.

Suppose first that M is a finite R-module. In that case we can clear denominators and assume $M \subset R^{\oplus r}$. Since M generates $K^{\oplus r}$ as a vectors space we see that $R^{\oplus r}/M$ has finite length. In particular there exists an integer $c \geq 0$ such that $x^c R^{\oplus r} \subset M$. Note that $M \supset xM \supset x^2 M \supset \ldots$ is a sequence of modules with succesive quotients each isomorphic to M/xM. Hence we see that

$$n\text{length}_R(M/xM) = \text{length}_R(M/x^n M).$$

The same argument for $M = R^{\oplus r}$ shows that

$$n\text{length}_R(R^{\oplus r}/xR^{\oplus r}) = \text{length}_R(R^{\oplus r}/x^n R^{\oplus r}).$$

By our choice of c above we see that $x^n M$ is sandwiched between $x^n R^{\oplus r}$ and $x^{n+c} R^{\oplus r}$. This easily gives that

$$r(n+c)\text{length}_R(R/xR) \geq n\text{length}_R(M/xM) \geq r(n-c)\text{length}_R(R/xR)$$

Hence in the finite case we actually get the result of the lemma with equality.

Suppose now that M is not finite. Suppose that the length of M/xM is $\geq k$ for some natural number k. Then we can find

$$0 \subset N_0 \subset N_1 \subset N_2 \subset \ldots N_k \subset M/xM$$

with $N_i \neq N_{i+1}$ for $i = 0, \ldots k-1$. Choose an element $m_i \in M$ whose congruence class mod xM falls into N_i but not into N_{i-1} for $i = 1, \ldots, k$. Consider the finite R-module $M' = Rm_1 + \ldots + Rm_k \subset M$. Let $N_i' \subset M'/xM'$ be the inverse image of N_i. It is clear that $N_i' \neq N_{i+1}'$ by our choice of m_i. Hence we see that $\text{length}_R(M'/xM') \geq k$. By the finite case we conclude $k \leq r\text{length}_R(R/xR)$ as desired. □

Here is a first application.

Lemma 7.110.8. *Let $(R, \mathfrak{m}) \to (S, \mathfrak{n})$ be a local homomorphism of local domains with fraction fields $K \subset L$. If R is Noetherian of dimension 1, and $[L : K] < \infty$ then $[\kappa(\mathfrak{n}) : \kappa(\mathfrak{m})] < \infty$.*

Proof. This is clear on applying Lemma 7.110.7 to the submodule $S \subset L \cong K^{\oplus n}$ where $n = [L : K]$. Namely, this shows that for any nonzero $x \in \mathfrak{m}$ the ring S/xS has finite length over R, which shows that $\kappa(\mathfrak{n})$ has finite length over R, which implies that $\dim_{\kappa(\mathfrak{m})} \kappa(\mathfrak{n})$ is finite (Lemma 7.48.6). □

Lemma 7.110.9. *Let R be a domain with fraction field K. Let M be an R-submodule of $K^{\oplus r}$. Assume R is Noetherian of dimension 1. For any nonzero $x \in R$ we have $\text{length}_R(M/xM) < \infty$.*

Proof. Since R has dimension 1 we see that x is contained in finitely many primes $\mathfrak{m}_i$, $i = 1, \ldots, n$, each maximal. Since R is Noetherian we see that R/xR is Artinian, see Proposition 7.57.6. Hence R/xR is a quotient of $\prod R/\mathfrak{m}_i^{e_i}$ for certain e_i because that $\mathfrak{m}_1^{e_1} \ldots \mathfrak{m}_n^{e_n} \subset (x)$ for suitably large e_i as R/xR is Artinian (see Section 7.49). Hence M/xM similarly decomposes as a product $\prod (M/xM)_{\mathfrak{m}_i} = \prod M/(\mathfrak{m}_i^{e_i}, x)M$ of its localizations at the $\mathfrak{m}_i$. By Lemma 7.110.7 applied to $M_{\mathfrak{m}_i}$ over $R_{\mathfrak{m}_i}$ we see each $M_{\mathfrak{m}_i}/xM_{\mathfrak{m}_i} = (M/xM)_{\mathfrak{m}_i}$ has finite length over $R_{\mathfrak{m}_i}$. It easily follows that M/xM has finite length over R. □

Lemma 7.110.10. *(Krull-Akizuki) Let R be a domain with fraction field K. Let $K \subset L$ be a finite extension of fields. Assume R is Noetherian and* $\dim(R) = 1$. *In this case any ring A with $R \subset A \subset L$ is Noetherian.*

Proof. To begin we may assume that L is the fraction field of A by replacing L by the fraction field of A if necessary. Let $I \subset A$ be an ideal. Clearly I generates L as a K-vectors space. Hence we see that $I \cap R \neq (0)$. Pick any nonzero $x \in I \cap R$. Then we get $I/xA \subset A/xA$. By Lemma 7.110.9 the R-module A/xA has finite length as an R-module. Hence I/xA has finite length as an R-module. Hence I is finitely generated as an ideal in A. □

Lemma 7.110.11. *Let R be a Noetherian local domain with fraction field K. Assume that R is not a field. Let $K \subset L$ be a finitely generated field extension. Then there exists discrete valuation ring A with fraction field L which dominates R.*

Proof. If L is not finite over K choose a transcendence basis $x_1, \dots, x_r$ of L over K and replace R by $R[x_1, \dots, x_r]$ localized at the maximal ideal generated by $\mathfrak{m}_R$ and $x_1, \dots, x_r$. Thus we may assume $K \subset L$ finite.

By Lemma 7.110.1 we may assume $\dim(R) = 1$.

Let $A \subset L$ be the integral closure of R in L. By Lemma 7.110.10 this is Noetherian. By Lemma 7.32.15 there is a prime ideal $\mathfrak{q} \subset A$ lying over the maximal ideal of R. By Lemma 7.110.6 the ring $A_{\mathfrak{q}}$ is a discrete valuation ring dominating R as desired. □

7.111. Factorization

Here are some notions and relations between them that are typically taught in a first year course on algebra at the undergraduate level.

Definition 7.111.1. Let R be a domain.

(1) Elements $x, y \in R$ are called *associates* if there exists a unit $u \in R^*$ such that $x = uy$.
(2) An element $x \in R$ is called *irreducible* if it is nonzero, not a unit and whenever $x = yz$, $y, z \in R$, then y is either a unit or an associate of x.
(3) An element $x \in R$ is called *prime* if the ideal generated by x is a prime ideal.

Lemma 7.111.2. *Let R be a domain. Let $x, y \in R$. Then x, y are associates if and only if $(x) = (y)$.*

Proof. Omitted. □

Lemma 7.111.3. *Let R be a domain. Consider the following conditions:*

(1) *The ring R satisfies the ascending chain condition for principal ideals.*
(2) *Every nonzero, nonunit element $a \in R$ has a factorization $a = b_1 \dots b_k$ with each b_i an irreducible element of R.*

Then (1) implies (2).

Proof. Omitted. □

Definition 7.111.4. A *unique factorization domain*, abbreviated *UFD*, is a domain R such that if $x \in R$ is a nonzero, nonunit, then x has a factorization into irreducibles, and if

$$x = a_1 \dots a_m = b_1 \dots b_n$$

are factorizations into irreducibles then $n = m$ and there exists a permutation $\sigma : \{1, \dots, n\} \to \{1, \dots, n\}$ such that a_i and $b_{\sigma(i)}$ are associates.

Lemma 7.111.5. *Let R be a domain. Assume every nonzero, nonunit factors into irreducibles. Then R is a UFD if and only if every irreducible element is prime.*

Proof. Omitted. □

Definition 7.111.6. A *principal ideal domain*, abbreviated *PID*, is a domain R such that every ideal is a principal ideal.

Lemma 7.111.7. *A principal ideal domain is a unique factorization domain.*

Proof. Omitted. □

Definition 7.111.8. A *Dedekind domain* is a domain R such that every nonzero ideal $I \subset R$ can be written

$$I = \mathfrak{p}_1 \ldots \mathfrak{p}_r$$

uniquely up to permutation of the prime ideals $\mathfrak{p}_i$.

Lemma 7.111.9. *Let R be a ring. The following are equivalent*

(1) *R is a Dedeking domain,*
(2) *R is a Noetherian domain, and for every maximal ideal $\mathfrak{m}$ the local ring $R_\mathfrak{m}$ is a discrete valuation ring, and*
(3) *R is a Noetherian, normal domain, and* $\dim(R) \leq 1$.

Proof. Omitted. □

7.112. Orders of vanishing

Lemma 7.112.1. *Let R be a semi-local Noetherian ring of dimension* 1. *If $a, b \in R$ are not zero divisors then*

$$length_R(R/(ab)) = length_R(R/(a)) + length_R(R/(b))$$

and these lengths are finite.

Proof. We saw the finiteness in Lemma 7.110.9. Additivity holds since there is a short exact sequence $0 \to R/(a) \to R/(ab) \to R/(b) \to 0$ where the first map is given by multiplication by b. (Use length is additive, see Lemma 7.48.3.) □

Definition 7.112.2. Suppose that K is a field, and $R \subset K$ is a local[5] Noetherian subring of dimension 1 with fraction field K. In this case we define the *order of vanishing along R*

$$\mathrm{ord}_R : K^* \longrightarrow \mathbf{Z}$$

by the rule

$$\mathrm{ord}_R(x) = \mathrm{length}_R(R/(x))$$

if $x \in R$ and we set $\mathrm{ord}_R(x/y) = \mathrm{ord}_R(x) - \mathrm{ord}_R(y)$ for $x, y \in R$ both nonzero.

We can use the order of vanishing to compare lattices in a vector space. Here is the definition.

Definition 7.112.3. Let R be a Noetherian local domain of dimension 1 with fraction field K. Let V be a finite dimensional K-vector space. A *lattice in V* is a finite R-submodule $M \subset V$ such that $V = K \otimes_R M$.

The condition $V = K \otimes_R M$ signifies that M contains a basis for the vector space K. We remark that in many places in the literature the notion of a lattice may be defined only in case the ring R is a discrete valuation ring. If R is a discrete valuation ring then any lattice is a free R-module, and this may not be the case in general.

Lemma 7.112.4. *Let R be a Noetherian local domain of dimension* 1 *with fraction field K. Let V be a finite dimensional K-vector space.*

[5]We could also define this when R is only semi-local but this is probably never really what you want!

(1) *If M is a lattice in V and $M \subset M' \subset V$ is an R-submodule of V containing M then the following are equivalent*
   (a) *M' is a lattice,*
   (b) *$length_R(M'/M)$ is finite, and*
   (c) *M' is finitely generated.*
(2) *If M is a lattice in V and $M' \subset M$ is an R-submodule of M then M' is a lattice if and only if $length_R(M/M')$ is finite.*
(3) *If M, M' are lattices in V, then so are $M \cap M'$ and $M + M'$.*
(4) *If $M \subset M' \subset M'' \subset V$ are lattices in V then*
$$length_R(M''/M) = length_R(M'/M) + length_R(M''/M').$$
(5) *If M, M', N, N' are lattices in V and $N \subset M \cap M'$, $M + M' \subset N'$, then we have*
$$\begin{aligned} & length_R(M/M \cap M') - length_R(M'/M \cap M') \\ = \quad & length_R(M/N) - length_R(M'/N) \\ = \quad & length_R(M + M'/M') - length_R(M + M'/M) \\ = \quad & length_R(N'/M') - length_R(N'/M) \end{aligned}$$

Proof. Proof of (1). Assume (1)(a). Say $y_1, \ldots, y_m$ generate M'. Then each $y_i = x_i/f_i$ for some $x_i \in M$ and nonzero $f_i \in R$. Hence we see that $f_1 \ldots f_m M' \subset M$. Since R is Noetherian local of dimension 1 we see that $\mathfrak{m}^n \subset (f_1 \ldots f_m)$ for some n (for example combine Lemmas 7.57.11 and Proposition 7.57.6 or combine Lemmas 7.110.7 and 7.48.4). In other words $\mathfrak{m}^n M' \subset M$ for some n Hence length$(M'/M) < \infty$ by Lemma 7.48.8, in other words (1)(b) holds. Assume (1)(b). Then M'/M is a finite R-module (see Lemma 7.48.2). Hence M' is a finite R-module as an extension of finite R-modules. Hence (1)(c). The implication (1)(c) $\Rightarrow$ (1)(a) follows from the remark following Definition 7.112.3.

Proof of (2). Suppose M is a lattice in V and $M' \subset M$ is an R-submodule. We have seen in (1) that if M' is a lattice, then length$_R(M/M') < \infty$. Conversely, assume that length$_R(M/M') < \infty$. Then M' is finitely generated as R is Noetherian and for some n we have $\mathfrak{m}^n M \subset M'$ (Lemma 7.48.4). Hence it follows that M' contains a basis for V, and M' is a lattice.

Proof of (3). Assume M, M' are lattices in V. Since R is Noetherian the submodule $M \cap M'$ of M is finite. As M is a lattice we can find $x_1, \ldots, x_n \in M$ which form a K-basis for V. Because M' is a lattice we can write $x_i = y_i/f_i$ with $y_i \in M'$ and $f_i \in R$. Hence $f_i x_i \in M \cap M'$. Hence $M \cap M'$ is a lattice also. The fact that $M + M'$ is a lattice follows from part (1).

Part (4) follows from additivity of lengths (Lemma 7.48.3) and the exact sequence
$$0 \to M'/M \to M''/M \to M''/M' \to 0$$
Part (5) follows from repeatedly applying part (4). □

Definition 7.112.5. Let R be a Noetherian local domain of dimension 1 with fraction field K. Let V be a finite dimensional K-vector space. Let M, M' be two lattices in V. The *distance between M and M'* is the integer
$$d(M, M') = \text{length}_R(M/M \cap M') - \text{length}_R(M'/M \cap M')$$
of Lemma 7.112.4 part (5).

In particular, if $M' \subset M$, then $d(M, M') = \text{length}_R(M/M')$.

Lemma 7.112.6. *Let R be a Noetherian local domain of dimension 1 with fraction field K. Let V be a finite dimensional K-vector space. This distance function has the property that*

$$d(M, M'') = d(M, M') + d(M', M'')$$

whenever given three lattices M, M', M'' of V. In particular we have $d(M, M') = -d(M', M)$.

Proof. Omitted. □

Lemma 7.112.7. *Let R be a Noetherian local domain of dimension 1 with fraction field K. Let V be a finite dimensional K-vector space. Let $\varphi : V \to V$ be a K-linear isomorphism. For any lattice $M \subset V$ we have*

$$d(M, \varphi(M)) = ord_R(\det(\varphi))$$

Proof. We can see that the integer $d(M, \varphi(M))$ does not depend on the lattice M as follows. Suppose that M' is a second such lattice. Then we see that

$$\begin{aligned} d(M, \varphi(M)) &= d(M, M') + d(M', \varphi(M)) \\ &= d(M, M') + d(\varphi(M'), \varphi(M)) + d(M', \varphi(M')) \end{aligned}$$

Since φ is an isomorphism we see that $d(\varphi(M'), \varphi(M)) = d(M', M) = -d(M, M')$, and hence $d(M, \varphi(M)) = d(M', \varphi(M'))$. Moreover, both sides of the equation (of the lemma) are additive in φ, i.e.,

$$\mathrm{ord}_R(\det(\varphi \circ \psi)) = \mathrm{ord}_R(\det(\varphi)) + \mathrm{ord}_R(\det(\psi))$$

and also

$$\begin{aligned} d(M, \varphi(\psi((M))) &= d(M, \psi(M)) + d(\psi(M), \varphi(\psi(M))) \\ &= d(M, \psi(M)) + d(M, \varphi(M)) \end{aligned}$$

by the independence shown above. Hence it suffices to prove the lemma for generators of $\mathrm{GL}(V)$. Choose an isomorphism $K^{\oplus n} \cong V$. Then $\mathrm{GL}(V) = \mathrm{GL}_n(K)$ is generated by elementary matrices E. The result is clear for E equal to the identity matrix. If $E = E_{ij}(\lambda)$ with $i \neq j$, $\lambda \in K$, $\lambda \neq 0$, for example

$$E_{12}(\lambda) = \begin{pmatrix} 1 & \lambda & \ldots \\ 0 & 1 & \ldots \\ \ldots & \ldots & \ldots \end{pmatrix}$$

then with respect to a different basis we get $E_{12}(1)$. The result is clear for $E = E_{12}(1)$ by taking as lattice $R^{\oplus n} \subset K^{\oplus n}$. Finally, if $E = E_i(a)$, with $a \in K^*$ for example

$$E_1(a) = \begin{pmatrix} a & 0 & \ldots \\ 0 & 1 & \ldots \\ \ldots & \ldots & \ldots \end{pmatrix}$$

then $E_1(a)(R^{\oplus b}) = aR \oplus R^{\oplus n-1}$ and it is clear that $d(R^{\oplus n}, aR \oplus R^{\oplus n-1}) = \mathrm{ord}_R(a)$ as desired. □

Lemma 7.112.8. *Let $A \to B$ be a ring map. Assume*

(1) *A is a Noetherian local domain of dimension 1,*
(2) *$A \subset B$ is a finite extension of domains.*

Let $K = f.f.(A)$ and $L = f.f.(B)$ so that L is a finite field extension of K. Let $y \in L^*$ and $x = Nm_{L/K}(y)$. In this situation B is semi-local. Let $\mathfrak{m}_i$, $i = 1, \ldots, n$ be the maximal ideals of B. Then

$$ord_A(x) = \sum\nolimits_i [\kappa(\mathfrak{m}_i) : \kappa(\mathfrak{m}_A)] ord_{B_{\mathfrak{m}_i}}(y)$$

where ord is defined as in Definition 7.112.2.

Proof. The ring B is semi-local by Lemma 7.104.2. Write $y = b/b'$ for some $b, b' \in B$. By the additivity of ord and multiplicativity of Nm it suffices to prove the lemma for $y = b$ or $y = b'$. In other words we may assume $y \in B$. In this case the left hand side of the formula is

$$\sum [\kappa(\mathfrak{m}_i) : \kappa(\mathfrak{m}_A)] \text{length}_{B_{\mathfrak{m}_i}}((B/yB)_{\mathfrak{m}_i})$$

By Lemma 7.48.12 this is equal to $\text{length}_A(B/yB)$. By Lemma 7.112.7 we have

$$\text{length}_A(B/yB) = d(B, yB) = \text{ord}_A(\det_K(L \xrightarrow{y} L)).$$

Since $x = \text{Nm}_{L/K}(y) = \det_K(L \xrightarrow{y} L)$ by definition the lemma is proved. □

We can extend some of the results above to reduced 1-dimensional Noetherian local rings which are not domains by the following lemma.

Lemma 7.112.9. *Let $(R, \mathfrak{m})$ be a reduced Noetherian local ring of dimension 1 and let $x \in \mathfrak{m}$ be a nonzero divisor. Let $\mathfrak{q}_1, \ldots, \mathfrak{q}_r$ be the minimal primes of R. Then*

$$length_R(R/(x)) = \sum\nolimits_i ord_{R/\mathfrak{q}_i}(x)$$

Proof. Note that $R_i = R/\mathfrak{q}_i$ is a Noetherian 1-dimensional local domain. Denote $K_i = f.f.(R_i)$. If x is a unit in R, then both sides are zero. Hence we may assume $x \in \mathfrak{m}$. Consider the map $\Psi : R \to \prod R_i$. As R is reduced this map is injective, see Lemma 7.16.2. By Lemma 7.22.2 we have $Q(R) = \prod K_i$. Hence the finite R-module $\text{Coker}(\Psi)$ is annihilated by a nonzero divisor $y \in R$, hence has support $\{\mathfrak{m}\}$, is annihilated by some power of x and has finite length over R, see Lemma 7.59.8. Consider the short exact sequence

$$0 \to R \to \prod R_i \to \text{Coker}(\Psi) \to 0$$

Applying multiplication by x^n to this for $n \gg 0$ we obtain from the snake lemma

$$0 \to \text{Coker}(\Psi) \to R/x^nR \to \prod R_i/x^nR_i \to \text{Coker}(\Psi) \to 0$$

Thus we see that

$$\text{length}_R(R/x^nR) = \text{length}_R(\prod R_i/x^nR_i) = \sum \text{length}_R(R_i/x^nR_i)$$

by Lemma 7.48.3. By Lemma 7.48.5 we have $\text{length}_R(R_i/x^nR_i) = \text{length}_{R_i}(R_i/x^nR_i)$. Now the result follows from the additivity of Lemma 7.112.1 and the definition of the order of vanishing along R_i. □

7.113. Quasi-finite maps

Consider a ring map $R \to S$ of finite type. A map $Spec(S) \to Spec(R)$ is quasi-finite at a point if that point is isolated in its fibre. This means that the fibre is zero dimensional at that point. In this section we study the basic properties of this important but technical notion. More advanced material can be found in the next section.

Lemma 7.113.1. *Let k be a field. Let S be a finite type k algebra. Let $\mathfrak{q}$ be a prime of S. The following are equivalent:*

(1) *$\mathfrak{q}$ is an isolated point of $Spec(S)$,*

(2) *$S_{\mathfrak q}$ is finite over k,*
(3) *there exists a $g \in S$, $g \not\in \mathfrak q$ such that $D(g) = \{\mathfrak q\}$,*
(4) $\dim_{\mathfrak q} Spec(S) = 0$,
(5) *$\mathfrak q$ is a closed point of $Spec(S)$ and $\dim(S_{\mathfrak q}) = 0$, and*
(6) *the field extension $k \subset \kappa(\mathfrak q)$ is finite and $\dim(S_{\mathfrak q}) = 0$.*

In this case $S = S_{\mathfrak q} \times S'$ for some finite type k-algebra S'. Also, the element g as in (3) has the property $S_{\mathfrak q} = S_g$.

Proof. Suppose $\mathfrak q$ is an isolated point of $Spec(S)$, i.e., $\{\mathfrak q\}$ is open in $Spec(S)$. Because $Spec(S)$ is a Jacobson space (see Lemmas 7.31.2 and 7.31.4) we see that $\mathfrak q$ is a closed point. Hence $\{\mathfrak q\}$ is open and closed in $Spec(S)$. By Lemmas 7.18.3 and 7.20.3 we may write $S = S_1 \times S_2$ with $\mathfrak q$ corresponding to the only point $Spec(S_1)$. Hence $S_1 = S_{\mathfrak q}$ is a zero dimensional ring of finite type over k. Hence it is finite over k for example by Lemma 7.106.4. We have proved (1) implies (2).

Suppose $S_{\mathfrak q}$ is finite over k. Then $S_{\mathfrak q}$ is Artinian local, see Lemma 7.49.2. So $Spec(S_{\mathfrak q}) = \{\mathfrak q S_{\mathfrak q}\}$ by Lemma 7.49.8. Consider the exact sequence $0 \to K \to S \to S_{\mathfrak q} \to Q \to 0$. It is clear that $K_{\mathfrak q} = Q_{\mathfrak q} = 0$. Also, K is a finite S-module as S is Noetherian and Q is a finite S-modules since $S_{\mathfrak q}$ is finite over k. Hence there exists $g \in S$, $g \not\in \mathfrak q$ such that $K_g = Q_g = 0$. Thus $S_{\mathfrak q} = S_g$ and $D(g) = \{\mathfrak q\}$. We have proved that (2) implies (3).

Suppose $D(g) = \{\mathfrak q\}$. Since $D(g)$ is open by construction of the topology on $Spec(S)$ we see that $\mathfrak q$ is an isolated point of $Spec(S)$. We have proved that (3) implies (1). In other words (1), (2) and (3) are equivalent.

Assume $\dim_{\mathfrak q} Spec(S) = 0$. This means that there is some open neighbourhood of $\mathfrak q$ in $Spec(S)$ which has dimension zero. Then there is an open neighbourhood of the form $D(g)$ which has dimension zero. Since S_g is Noetherian we conclude that S_g is Artinian and $D(g) = Spec(S_g)$ is a finite discrete set, see Proposition 7.57.6. Thus $\mathfrak q$ is an isolated point of $D(g)$ and, by the equivalence of (1) and (2) above applied to $\mathfrak q S_g \subset S_g$, we see that $S_{\mathfrak q} = (S_g)_{\mathfrak q S_g}$ is finite over k. Hence (4) implies (2). It is clear that (1) implies (4). Thus (1) -- (4) are all equivalent.

Lemma 7.105.6 gives the implication (5) $\Rightarrow$ (4). The implication (4) $\Rightarrow$ (6) follows from Lemma 7.107.3. The implication (6) $\Rightarrow$ (5) follows from Lemma 7.31.9. At this point we know (1) -- (6) are equivalent.

The two statements at the end of the lemma we saw during the course of the proof of the equivalence of (1), (2) and (3) above. $\square$

Lemma 7.113.2. *Let $R \to S$ be a ring map of finite type. Let $\mathfrak q \subset S$ be a prime lying over $\mathfrak p \subset R$. Let $F = Spec(S \otimes_R \kappa(\mathfrak p))$ be the fibre of $Spec(S) \to Spec(R)$, see Remark 7.16.8. Denote $\overline{\mathfrak q} \in F$ the point corresponding to $\mathfrak q$. The following are equivalent*

(1) *$\overline{\mathfrak q}$ is an isolated point of F,*
(2) *$S_{\mathfrak q}/\mathfrak p S_{\mathfrak q}$ is finite over $\kappa(\mathfrak p)$,*
(3) *there exists a $g \in S$, $g \not\in \mathfrak q$ such that the only prime of $D(g)$ mapping to $\mathfrak p$ is $\mathfrak q$,*
(4) $\dim_{\overline{\mathfrak q}}(F) = 0$,
(5) *$\overline{\mathfrak q}$ is a closed point of F and $\dim(S_{\mathfrak q}/\mathfrak p S_{\mathfrak q}) = 0$, and*
(6) *the field extension $\kappa(\mathfrak p) \subset \kappa(\mathfrak q)$ is finite and $\dim(S_{\mathfrak q}/\mathfrak p S_{\mathfrak q}) = 0$.*

Proof. Note that $S_{\mathfrak q}/\mathfrak p S_{\mathfrak q} = (S \otimes_R \kappa(\mathfrak p))_{\overline{\mathfrak q}}$. Moreover $S \otimes_R \kappa(\mathfrak p)$ is of finite type over $\kappa(\mathfrak p)$. The conditions correspong exactly to the conditions of Lemma 7.113.1 for the $\kappa(\mathfrak p)$-algebra $S \otimes_R \kappa(\mathfrak p)$ and the prime $\overline{\mathfrak q}$, hence they are equivalent. $\square$

Definition 7.113.3. Let $R \to S$ be a finite type ring map. Let $\mathfrak q \subset S$ be a prime.

(1) If the equivalent conditions of Lemma 7.113.2 are satisfied then we say $R \to S$ is *quasi-finite at* $\mathfrak q$.
(2) We say a ring map $A \to B$ is *quasi-finite* if it is of finite type and quasi-finite at all primes of B.

Lemma 7.113.4. *Let $R \to S$ be a finite type ring map. Then $R \to S$ is quasi-finite if and only if for all primes $\mathfrak p \subset R$ the fibre $S \otimes_R \kappa(\mathfrak p)$ is finite over $\kappa(\mathfrak p)$.*

Proof. If the fibres are finite then the map is clearly quasi-finite. For the converse, note that $S \otimes_R \kappa(\mathfrak p)$ is a $\kappa(\mathfrak p)$-algebra of finite type over k of dimension 0. Hence it is finite over k for example by Lemma 7.106.4. $\square$

Lemma 7.113.5. *Let $R \to S$ be a finite type ring map. Let $\mathfrak q \subset S$ be a prime lying over $\mathfrak p \subset R$. Let $f \in R$, $f \not\in \mathfrak p$ and $g \in S$, $g \not\in \mathfrak q$. Then $R \to S$ is quasi-finite at $\mathfrak q$ if and only if $R_f \to S_{fg}$ is quasi-finite at $\mathfrak q S_{fg}$.*

Proof. The fibre of $\text{Spec}(S_{fg}) \to \text{Spec}(R_f)$ is homeomorphic to an open subset of the fibre of $\text{Spec}(S) \to \text{Spec}(R)$. Hence the lemma follows from part (1) of the equivalent conditions of Lemma 7.113.2. $\square$

Lemma 7.113.6. *Let*

$$\begin{tikzcd} S \arrow[r] & S' \\ R \arrow[u] \arrow[r] & R' \arrow[u] \end{tikzcd} \qquad \begin{tikzcd} \mathfrak q \arrow[r, dash] & \mathfrak q' \\ \mathfrak p \arrow[u, dash] \arrow[r, dash] & \mathfrak p' \arrow[u, dash] \end{tikzcd}$$

be a commutative diagram of rings with primes as indicated. Assume $R \to S$ of finite type, and $S \otimes_R R' \to S'$ surjective. If $R \to S$ is quasi-finite at $\mathfrak q$, then $R' \to S'$ is quasi-finite at $\mathfrak q'$.

Proof. Write $S \otimes_R \kappa(\mathfrak p) = S_1 \times S_2$ with S_1 finite over $\kappa(\mathfrak p)$ and such that $\mathfrak q$ corresponds to a point of S_1 as in Lemma 7.113.1. Because $S \otimes_R R' \to S'$ surjective the canonical map $(S \otimes_R \kappa(\mathfrak p)) \otimes_{\kappa(\mathfrak p)} \kappa(\mathfrak p') \to S' \otimes_{R'} \kappa(\mathfrak p')$ is surjective. Let S_i' be the image of $S_i \otimes_{\kappa(\mathfrak p)} \kappa(\mathfrak p')$ in $S' \otimes_{R'} \kappa(\mathfrak p')$. Then $S' \otimes_{R'} \kappa(\mathfrak p') = S_1' \times S_2'$ and S_1' is finite over $\kappa(\mathfrak p')$. The map $S' \otimes_{R'} \kappa(\mathfrak p') \to \kappa(\mathfrak q')$ factors through S_1' (i.e. it annihilates the factor S_2') because the map $S \otimes_R \kappa(\mathfrak p) \to \kappa(\mathfrak q)$ factors through S_1 (i.e. it annihilates the factor S_2). Thus $\mathfrak q'$ corresponds to a point of $Spec(S_1')$ in the disjoint union decomposition of the fibre: $Spec(S' \otimes_{R'} \kappa(\mathfrak p')) = Spec(S_1') \amalg Spec(S_1')$. (See Lemma 7.18.2.) Since S_1' is finite over a field, it is Artinian ring, and hence $Spec(S_1')$ is a finite discrete set. (See Proposition 7.57.6.) We conclude $\mathfrak q'$ is isolated in its fibre as desired. $\square$

Lemma 7.113.7. *A composition of quasi-finite ring maps is quasi-finite.*

Proof. Suppose $A \to B$ and $B \to C$ are quasi-finite ring maps. By Lemma 7.6.2 we see that $A \to C$ is of finite type. Let $\mathfrak r \subset C$ be a prime of C lying over $\mathfrak q \subset B$ and $\mathfrak p \subset A$. Since $A \to B$ and $B \to C$ are quasi-finite at $\mathfrak q$ and $\mathfrak r$ respectively, then there exist $b \in B$ and $c \in C$ such that $\mathfrak q$ is the only prime of $D(b)$ which maps to $\mathfrak p$ and similarly $\mathfrak r$ is the only prime of

$D(c)$ which maps to $\mathfrak{q}$. If $c' \in C$ is the image of $b \in B$, then $\mathfrak{r}$ is the only prime of $D(cc')$ which maps to $\mathfrak{p}$. Therefore $A \to C$ is quasi-finite at $\mathfrak{r}$. □

Lemma 7.113.8. *Let $R \to S$ be a ring map of finite type. Let $R \to R'$ be any ring map. Set $S' = R' \otimes_R S$.*

(1) *The set $\{\mathfrak{q}' \mid R' \to S' \text{ quasi-finite at } \mathfrak{q}'\}$ is the inverse image of the corresponding set of $Spec(S)$ under the canonical map $Spec(S') \to Spec(S)$.*
(2) *If $Spec(R') \to Spec(R)$ is surjective, then $R \to S$ is quasi-finite if and only if $R' \to S'$ is quasi-finite.*
(3) *Any base change of a quasi-finite ring map is quasi-finite.*

Proof. Let $\mathfrak{p}' \subset R'$ be a prime lying over $\mathfrak{p} \subset R$. Then the fibre ring $S' \otimes_{R'} \kappa(\mathfrak{p}')$ is the base change of the fibre ring $S \otimes_R \kappa(\mathfrak{p})$ by the field extension $\kappa(\mathfrak{p}) \to \kappa(\mathfrak{p}')$. Hence the first assertion follows from the invariance of dimension under field extension (Lemma 7.107.6) and Lemma 7.113.1. The stability of quasi-finite maps under base change follows from this and the stability of finite type property under base change. The second assertion follows since the assumption implies that given a prime $\mathfrak{q} \subset S$ we can find a prime $\mathfrak{q}' \subset S'$ lying over it. □

The following lemma is not quite about quasi-finite ring maps, but it does not seem to fit anywhere else so well.

Lemma 7.113.9. *Let $R \to S$ be a ring map of finite type. Let $\mathfrak{p} \subset R$ be a minimal prime. Assume that there are at most finitely many primes of S lying over $\mathfrak{p}$. Then there exists a $g \in R$, $g \not\in \mathfrak{p}$ such that the ring map $R_g \to S_g$ is finite.*

Proof. Let $x_1, \ldots, x_n$ be generators of S over R. Since $\mathfrak{p}$ is a minimal prime we have that $\mathfrak{p}R_{\mathfrak{p}}$ is a locally nilpotent ideal, see Lemma 7.23.3. Hence $\mathfrak{p}S_{\mathfrak{p}}$ is a locally nilpotent ideal, see Lemma 7.14.1. By assumption the finite type $\kappa(\mathfrak{p})$-algebra $S_{\mathfrak{p}}/\mathfrak{p}S_{\mathfrak{p}}$ has finitely many primes. Hence (for example by Lemma 7.106.4) $\kappa(\mathfrak{p}) \to S_{\mathfrak{p}}/\mathfrak{p}S_{\mathfrak{p}}$ is a finite ring map. Thus we may find monic polynomials $P_i \in R_{\mathfrak{p}}[X]$ such that $P_i(x_i)$ maps to zero in $S_{\mathfrak{p}}/\mathfrak{p}S_{\mathfrak{p}}$. By what we said above there exist $e_i \geq 1$ such that $P(x_i)^{e_i} = 0$ in $S_{\mathfrak{p}}$. Let $g_1 \in R$, $g_1 \not\in \mathfrak{p}$ be an element such that $P_i \in R[1/g_1]$ for all i. Next, let $g_2 \in R$, $g_2 \not\in \mathfrak{p}$ be an element such that $P(x_i) = 0$ in $S_{g_1 g_2}$. Setting $g = g_1 g_2$ we win. □

7.114. Zariski's Main Theorem

In this section our aim is to prove the algebraic version of Zariski's Main theorem. This theorem will be the basis of many further developments in the theory of schemes and morphisms of schemes later in the project.

Let $R \to S$ be a ring map of finite type. Our goal in this section is to show that the set of points of $Spec(S)$ where the map is quasi-finite is *open* (Theorem 7.114.13). In fact, it will turn out that there exists a finite ring map $R \to S'$ such that in some sense the quasi-finite locus of S/R is open in $Spec(S')$ (but we will not prove this in the algebra chapter since we do not develop the language of schemes here -- for the case where $R \to S$ is quasi-finite see Lemma 7.114.15). These statements are somewhat tricky to prove and we do it by a long list of lemmas concering integral and finite extensions of rings. This material may be found in [**Ray70**], and [**Pes66**]. We also found notes by Thierry Coquand helpful.

Lemma 7.114.1. *Let $\varphi : R \to S$ be a ring map. Suppose $t \in S$ satisfies the relation $\varphi(a_0) + \varphi(a_1)t + \ldots + \varphi(a_n)t^n = 0$. Then $\varphi(a_n)t$ is integral over R.*

Proof. Namely, multiply the equation $\varphi(a_0) + \varphi(a_1)t + \ldots + \varphi(a_n)t^n = 0$ with $\varphi(a_n)^{n-1}$ and write it as $\varphi(a_0 a_n^{n-1}) + \varphi(a_1 a_n^{n-2})(\varphi(a_n)t) + \ldots + (\varphi(a_n)t)^n = 0$. $\square$

The following lemma is in some sense the key lemma in this section.

Lemma 7.114.2. *Let R be a ring. Let $\varphi : R[x] \to S$ be a ring map. Let $t \in S$. Assume that (a) t is integral over $R[x]$, and (b) there exists a monic $p \in R[x]$ such that $t\varphi(p) \in Im(\varphi)$. Then there exists a $q \in R[x]$ such that $t - \varphi(q)$ is integral over R.*

Proof. Write $t\varphi(p) = \varphi(r)$ for some $r \in R[x]$. Using euclidean division, write $r = qp + r'$ with $q, r' \in R[x]$ and $\deg(r') < \deg(p)$. We may replace t by $t - \varphi(q)$ which is still integral over $R[x]$, so that we obtain $t\varphi(p) = \varphi(r')$. In the ring S_t we may write this as $\varphi(p) - (1/t)\varphi(r') = 0$. This implies that $\varphi(x)$ gives an element of the localization S_t which is integral over $\varphi(R)[1/t] \subset S_t$. On the other hand, t is integral over the subring $\varphi(R)[\varphi(x)] \subset S$. Combined we conclude that t is integral over the subring $\varphi(R)[1/t] \subset S_t$, see Lemma 7.32.6. In other words there exists an equation of the form $t^d + \sum_{i<d} (\varphi(r_i)/t^{n_i}) t^i = 0$ in S_t with $r_i \in R$. This means that $t^{d+N} + \sum_{i<d} \varphi(r_i) t^{i+N-n_i} = 0$ in S for some N large enough. In other words t is integral over R. $\square$

Lemma 7.114.3. *Let R be a ring and let $\varphi : R[x] \to S$ be a ring map. Let $t \in S$. If t is integral over $R[x]$, then there exists an $\ell \geq 0$ such that for every $a \in R$ the element $\varphi(a)^\ell t$ is integral over $\varphi_a : R[y] \to S$, defined by $y \mapsto \varphi(ax)$ and $r \mapsto \varphi(r)$ for $r \in R$.*

Proof. Say $t^d + \sum_{i<d} \varphi(f_i) t^i = 0$ with $f_i \in R[x]$. Let ℓ be the maximum degree in x of all the f_i. Multiply the equation by $\varphi(a)^\ell$ to get $\varphi(a)^\ell t^d + \sum_{i<d} \varphi(a^\ell f_i) t^i = 0$. Note that each $\varphi(a^\ell f_i)$ is in the image of φ_a. The result follows from Lemma 7.114.1. $\square$

Lemma 7.114.4. *Let R be a ring. Let $\varphi : R[x] \to S$ be a ring map. Let $t \in S$. Assume t is integral over $R[x]$. Let $p \in R[x]$, $p = a_0 + a_1 x + \ldots + a_k x^k$ such that $t\varphi(p) \in Im(\varphi)$. Then there exists a $q \in R[x]$ and $n \geq 0$ such that $\varphi(a_k)^n t - \varphi(q)$ is integral over R.*

Proof. By Lemma 7.114.3 there exists an $\ell \geq 0$ such that the element $\varphi(a_k)^\ell t$ is integral over the map $\varphi' : R[y] \to S$, $\varphi'(y) = \varphi(a_k x)$ and $\varphi'(r) = \varphi(r)$, for $r \in R$. The polynomial $p' = a_k^{k-1} a_0 + a_k^{k-2} a_1 y + \ldots + y^k$ is monic and $t\varphi'(p') = \varphi(a_k^{k-1}) t\varphi(p) \in \mathrm{Im}(\varphi)$. By definition of φ' this implies there exists a $n \geq k-1$ such that $\varphi(a_k^n) t\varphi'(p') \in \mathrm{Im}(\varphi')$. If also $n \geq \ell$, then $\varphi(a_k)^n t$ is still integral over $R[y]$. By Lemma 7.114.2 we see that $\varphi(a_k)^n t - \varphi'(q)$ is integral over R for some $q \in R[y]$. Again by the simple relationship between φ' and φ this implies the lemma. $\square$

Situation 7.114.5. Let R be a ring. Let $\varphi : R[x] \to S$ be finite. Let

$$J = \{g \in S \mid gS \subset \mathrm{Im}(\varphi)\}$$

be the ``conductor ideal" of φ. Assume $\varphi(R) \subset S$ integrally closed in S.

Lemma 7.114.6. *In Situation 7.114.5. Suppose $u \in S$, $a_0, \ldots, a_k \in R$, $u\varphi(a_0 + a_1 x + \ldots + a_k x^k) \in J$. Then there exists an $m \geq 0$ such that $u\varphi(a_k)^m \in J$.*

Proof. Assume that S is generated by $t_1, \ldots, t_n$ as an $R[x]$-module. In this case $J = \{g \in S \mid gt_i \in \mathrm{Im}(\varphi) \text{ for all } i\}$. Note that each element ut_i is integral over $R[x]$, see Lemma 7.32.3. We have $\varphi(a_0 + a_1 x + \ldots + a_k x^k) ut_i \in \mathrm{Im}(\varphi)$. By Lemma 7.114.4, for each i there exists an integer n_i and an element $q_i \in R[x]$ such that $\varphi(a_k^{n_i}) ut_i - \varphi(q_i)$ is integral over R. By assumption this element is in $\varphi(R)$ and hence $\varphi(a_k^{n_i}) ut_i \in \mathrm{Im}(\varphi)$. It follows that $m = \max\{n_1, \ldots, n_n\}$ works. $\square$

Lemma 7.114.7. *In Situation 7.114.5. Suppose $u \in S$, $a_0, \ldots, a_k \in R$, $u\varphi(a_0 + a_1x + \ldots + a_kx^k) \in \sqrt{J}$. Then $u\varphi(a_i) \in \sqrt{J}$ for all i.*

Proof. Under the assumptions of the lemma we have $u^n\varphi(a_0 + a_1x + \ldots + a_kx^k)^n \in J$ for some $n \geq 1$. By Lemma 7.114.6 we deduce $u^n\varphi(a_k^{nm}) \in J$ for some $m \geq 1$. Thus $u\varphi(a_k) \in \sqrt{J}$, and so $u\varphi(a_0 + a_1x + \ldots + a_kx^k) - u\varphi(a_k) = u\varphi(a_0 + a_1x + \ldots + a_{k-1}x^{k-1}) \in \sqrt{J}$. We win by induction on k. $\square$

This lemma suggests the following definition.

Definition 7.114.8. Given an inclusion of rings $R \subset S$ and an element $x \in S$ we say that x is *strongly transcendental over R* if whenever $u(a_0 + a_1x + \ldots + a_kx^k) = 0$ with $u \in S$ and $a_i \in R$, then we have $ua_i = 0$ for all i.

Note that if S is a domain then this is the same as saying that x as an element of the fraction field of S is transcendental over the fraction field of R.

Lemma 7.114.9. *Suppose $R \subset S$ is an inclusion of reduced rings and suppose that $x \in S$ is strongly transcendental over R. Let $\mathfrak{q} \subset S$ be a minimal prime and let $\mathfrak{p} = R \cap \mathfrak{q}$. Then the image of x in $S/\mathfrak{q}$ is strongly transcendental over the subring $R/\mathfrak{p}$.*

Proof. Suppose $u(a_0 + a_1x + \ldots + a_kx^k) \in \mathfrak{q}$. By Lemma 7.23.3 the local ring $S_{\mathfrak{q}}$ is a field, and hence $u(a_0 + a_1x + \ldots + a_kx^k)$ is zero in $S_{\mathfrak{q}}$. Thus $uu'(a_0 + a_1x + \ldots + a_kx^k) = 0$ for some $u' \in S$, $u' \notin \mathfrak{q}$. Since x is strongly transcendental over R we get $uu'a_i = 0$ for all i. This in turn implies that $ua_i \in \mathfrak{q}$. $\square$

Lemma 7.114.10. *Suppose $R \subset S$ is an inclusion of domains and let $x \in S$. Assume x is (strongly) transcendental over R and that S is finite over $R[x]$. Then $R \to S$ is not quasi-finite at any prime of S.*

Proof. As a first case, assume that R is normal, see Definition 7.33.10. By Lemma 7.33.13 we see that $R[x]$ is normal. Take a prime $\mathfrak{q} \subset S$, and set $\mathfrak{p} = R \cap \mathfrak{q}$. Assume that the extension $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{q})$ is finite. This would be the case if $R \to S$ is quasi-finite at $\mathfrak{q}$. Let $\mathfrak{r} = R[x] \cap \mathfrak{q}$. Then since $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{r}) \subset \kappa(\mathfrak{q})$ we see that the extension $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{r})$ is finite too. Thus the inclusion $\mathfrak{r} \supset \mathfrak{p}R[x]$ is strict. By going down for $R[x] \subset S$, see Proposition 7.34.7, we find a prime $\mathfrak{q}' \subset \mathfrak{q}$, lying over the prime $\mathfrak{p}R[x]$. Hence the fibre $Spec(S \otimes_R \kappa(\mathfrak{p}))$ contains a point not equal to $\mathfrak{q}$, namely $\mathfrak{q}'$, whose closure contains $\mathfrak{q}$ and hence $\mathfrak{q}$ is not isolated in its fibre.

If R is not normal, let $R \subset R' \subset K$ be the integral closure R' of R in its field of fractions K. Let $S \subset S' \subset L$ be the subring S' of the field of fractions L of S generated by R' and S. Note that by construction the map $S \otimes_R R' \to S'$ is surjective. This implies that $R'[x] \subset S'$ is finite. Also, the map $S \subset S'$ induces a surjection on $Spec$, see Lemma 7.32.15. We conclude by Lemma 7.113.6 and the normal case we just discussed. $\square$

Lemma 7.114.11. *Suppose $R \subset S$ is an inclusion of reduced rings. Assume $x \in S$ be strongly transcendental over R, and S finite over $R[x]$. Then $R \to S$ is not quasi-finite at any prime of S.*

Proof. Let $\mathfrak{q} \subset S$ be any prime. Choose a minimal prime $\mathfrak{q}' \subset \mathfrak{q}$. According to Lemmas 7.114.9 and 7.114.10 the extension $R/(R \cap \mathfrak{q}') \subset S/\mathfrak{q}'$ is not quasi-finite at the prime corresponding to $\mathfrak{q}$. By Lemma 7.113.6 the extension $R \to S$ is not quasi-finite at $\mathfrak{q}$. $\square$

Lemma 7.114.12. *Let R be a ring. Let $S = R[x]/I$. Let $\mathfrak q \subset S$ be a prime. Assume $R \to S$ is quasi-finite at $\mathfrak q$. Let $S' \subset S$ be the integral closure of R in S. Then there exists an element $g \in S'$, $g \not\in \mathfrak q$ such that $S'_g \cong S_g$.*

Proof. Let $\mathfrak p$ be the image of $\mathfrak q$ in $Spec(R)$. The assumption that $R \to S$ is quasi-finite at $\mathfrak q$ implies there exists an $f \in I$, $f = a_n x^n + \ldots + a_0$ such that some $a_i \not\in \mathfrak p$. In particular there exists a relation $b_m x^m + \ldots + b_0 = 0$ with $b_j \in S'$, $j = 0, \ldots, m$ and $b_j \not\in \mathfrak q \cap S'$ for some j. We prove the lemma by induction on m.

The case $b_m \in \mathfrak q$. In this case we have $b_m x \in S'$ by Lemma 7.114.1. Set $b'_{m-1} = b_m x + b_{m-1}$. Then

$$b'_{m-1} x^{m-1} + b_{m-2} x^{m-2} + \ldots + b_0 = 0$$

Since b'_{m-1} is congruent to b_{m-1} modulo $S' \cap \mathfrak q$ we see that it is still the case that one of $b'_{m-1}, b_{m-2}, \ldots, b_0$ is not in $S' \cap \mathfrak q$. Thus we win by induction on m.

The case $b_m \not\in \mathfrak q$. In this case x is intregral over S'_{b_m}, in fact $b_m x \in S'$ by Lemma 7.114.1. Hence the injective map $S'_{b_m} \to S_{b_m}$ is also surjective, i.e., an isomorphism as desired. $\square$

Theorem 7.114.13. *(Zariski's Main Theorem.) Let R be a ring. Let $R \to S$ be a finite type R-algebra. Let $S' \subset S$ be the integral closure of R in S. Let $\mathfrak q \subset S$ be a prime of S. If $R \to S$ is quasi-finite at $\mathfrak q$ then there exists a $g \in S'$, $g \not\in \mathfrak q$ such that $S'_g \cong S_g$.*

Proof. There exist finitely many elements $x_1, \ldots, x_n \in S$ such that S is finite over the R-sub algebra generated by $x_1, \ldots, x_n$. (For example generators of S over R.) We prove the proposition by induction on the minimal such number n.

The case $n = 0$ is trivial, because in this case $S' = S$, see Lemma 7.32.3.

The case $n = 1$. We may and do replace R by its integral closure in S, in particular this means that $R \subset S$. Consider the map $\varphi : R[x] \to S$, $x \mapsto x_1$. (We will see that φ is not injective below.) By assumption φ is finite. Hence we are in Situation 7.114.5. Let $J \subset S$ be the ``conductor ideal" defined in Situation 7.114.5. Consider the diagram

$$\begin{tikzcd}
R[x] \arrow[r] & S \arrow[r] & S/\sqrt{J} & R/(R \cap \sqrt{J})[x] \arrow[l] \\
& R \arrow[ul] \arrow[u] \arrow[r] & R/(R \cap \sqrt{J}) \arrow[u] \arrow[ur] &
\end{tikzcd}$$

According to Lemma 7.114.7 the image of x in the quotient $S/\sqrt{J}$ is strongly transcendental over $R/(R \cap \sqrt{J})$. Hence by Lemma 7.114.11 the ring map $R/(R \cap \sqrt{J}) \to S/\sqrt{J}$ is not quasi-finite at any prime of $S/\sqrt{J}$. By Lemma 7.113.6 we deduce that $\mathfrak q$ does not lie in $V(J) \subset Spec(S)$. Thus there exists an element $s \in J$, $s \not\in \mathfrak q$. By definition of J we may write $s = \varphi(f)$ for some polynomial $f \in R[x]$. Now let $I = \text{Ker}(R[x] \to S)$. Since $\varphi(f) \in J$ we get $(R[x]/I)_f \cong S_{\varphi(f)}$. Also $s \not\in \mathfrak q$ means that $f \not\in \varphi^{-1}(\mathfrak q)$. Thus $\varphi^{-1}(\mathfrak q)$ is a prime of $R[x]/I$ at which $R \to R[x]/I$ is quasi-finite, see Lemma 7.113.5. Let $C \subset R[x]/I$ be the integral closure of R. By Lemma 7.114.12 there exists an element $h \in C$, $h \not\in \varphi^{-1}(\mathfrak q)$ such that $C_h \cong (R[x]/I)_h$. We conclude that $(R[x]/I)_{fh} = S_{\varphi(fh)}$ is isomorphic to a principal localization $C_{h'}$ of C for some $h' \in C$, $h' \not\in \varphi^{-1}(\mathfrak q)$. Since $\varphi(C) \subset S'$ we get $g = \varphi(h') \in S'$, $g \not\in \mathfrak q$ and moreover the injective map $S'_g \to S_g$ is also surjective because by our choice of h' the map $C_{h'} \to S_g$ is surjective.

The case $n > 1$. Consider the subring $R' \subset S$ which is the integral closure of $R[x_1, \ldots, x_{n-1}]$ in S. By Lemma 7.113.6 the extension S/R' is quasi-finite at $\mathfrak q$. Also, note that S is finite over $R'[x_n]$. By the case $n = 1$ above, there exists a $g' \in R'$, $g' \not\in \mathfrak q$ such that $(R')_{g'} \cong S_{g'}$. At this point we cannot apply induction to $R \to R'$ since R' may not be finite type over R. Since S is finitely generated over R we deduce in particular that $(R')_{g'}$ is finitely generated over R. Say the elements g', and $y_1/(g')^{n_1}, \ldots, y_N/(g')^{n_N}$ with $y_i \in R'$ generate $(R')_{g'}$ over R. Let R'' be the R-sub algebra of R' generated by $x_1, \ldots, x_{n-1}, y_1, \ldots, y_N, g'$. This has the property $(R'')_{g'} \cong S_{g'}$. Surjectivity because of how we chose y_i, injectivity because $R'' \subset R'$, and localization is exact. Note that R'' is finite over $R[x_1, \ldots, x_{n-1}]$ because of our choice of R', see Lemma 7.32.4. Let $\mathfrak q'' = R'' \cap \mathfrak q$. Since $(R'')_{\mathfrak q''} = S_{\mathfrak q}$ we see that $R \to R''$ is quasi-finite at $\mathfrak q''$, see Lemma 7.113.2. We apply our induction hypothesis to $R \to R''$, $\mathfrak q''$ and $x_1, \ldots, x_{n-1} \in R''$ and we find a subring $R''' \subset R''$ which is integral over R and an element $g'' \in R'''$, $g'' \not\in \mathfrak q''$ such that $(R''')_{g''} \cong (R'')_{g''}$. Write the image of g' in $(R'')_{g''}$ as $g'''/(g'')^n$ for some $g''' \in R'''$. Set $g = g''g''' \in R'''$. Then it is clear that $g \not\in \mathfrak q$ and $(R''')_g \cong S_g$. Since by construction we have $R''' \subset S'$ we also have $S'_g \cong S_g$ as desired. □

Lemma 7.114.14. *Let $R \to S$ be a finite type ring map. The set of points $\mathfrak q$ of $Spec(S)$ at which S/R is quasi-finite is open in $Spec(S)$.*

Proof. Let $\mathfrak q \subset S$ be a point at which the ring map is quasi-finite. By Theorem 7.114.13 there exists an integral ring extension $R \to S'$, $S' \subset S$ and an element $g \in S'$, $g \not\in \mathfrak q$ such that $S'_g \cong S_g$. Since S and hence S_g are of finite type over R we may find finitely many elements $y_1, \ldots, y_N$ of S' such that $S''_g \cong S$ where $S'' \subset S'$ is the sub R-algebra generated by $g, y_1, \ldots, y_N$. Since S'' is finite over R (see Lemma 7.32.4) we see that S'' is quasi-finite over R (see Lemma 7.113.4). It is easy to see that this implies that S''_g is quasi-finite over R, for example because the property of being quasi-finite at a prime depends only on the local ring at the prime. Thus we see that S_g is quasi-finite over R. By the same token this implies that $R \to S$ is quasi-finite at every prime of S which lies in $D(g)$. □

Lemma 7.114.15. *Let $R \to S$ be a finite type ring map. Suppose that S is quasi-finite over R. Let $S' \subset S$ be the integral closure of R in S. Then*

(1) *$Spec(S) \to Spec(S')$ is a homeomorphism onto an open subset,*
(2) *if $g \in S'$ and $D(g)$ is contained in the image of the map, then $S'_g \cong S_g$, and*
(3) *there exists a finite R-algebra $S'' \subset S'$ such that (1) and (2) hold for the ring map $S'' \to S$.*

Proof. Because S/R is quasi-finite we may apply Theorem 7.114.13 to each point $\mathfrak q$ of $Spec(S)$. Since $Spec(S)$ is quasi-compact, see Lemma 7.16.10, we may choose a finite number of $g_i \in S'$, $i = 1, \ldots, n$ such that $S'_{g_i} = S_{g_i}$, and such that $g_1, \ldots, g_n$ generate the unit ideal in S (in other words the standard opens of $Spec(S)$ associated to $g_1, \ldots, g_n$ cover all of $Spec(S)$).

Suppose that $D(g) \subset Spec(S')$ is contained in the image. Then $D(g) \subset \bigcup D(g_i)$. In other words, $g_1, \ldots, g_n$ generate the unit ideal of S'_g. Note that $S'_{gg_i} \cong S_{gg_i}$ by our choice of g_i. Hence $S'_g \cong S_g$ by Lemma 7.21.2.

We construct a finite algebra $S'' \subset S'$ as in (3). To do this note that each $S'_{g_i} \cong S_{g_i}$ is a finite type R-algebra. For each i pick some elements $y_{ij} \in S'$ such that each S'_{g_i} is generated as R-algebra by $1/g_i$ and the elements y_{ij}. Then set S'' equal to the sub R-algebra of S' generated by all g_i and all the y_{ij}. Details omitted. □

7.115. Applications of Zariski's Main Theorem

Here is an immediate application characterizing the finite maps of 1-dimensional semi-local rings among the quasi-finite ones as those where equality always holds in the formula of Lemma 7.112.8.

Lemma 7.115.1. *Let $A \subset B$ be an extension of domains. Assume*

1. *A is a local Noetherian ring of dimension 1,*
2. *$A \to B$ is of finite type, and*
3. *the extension $K = f.f.(A) \subset L = f.f.(B)$ is a finite field extension.*

Then B is semi-local. Let $x \in \mathfrak{m}_A$, $x \neq 0$. Let $\mathfrak{m}_i$, $i = 1, \ldots, n$ be the maximal ideals of B. Then

$$[L : K]ord_A(x) \geq \sum\nolimits_i [\kappa(\mathfrak{m}_i) : \kappa(\mathfrak{m}_A)]ord_{B_{\mathfrak{m}_i}}(x)$$

where ord is defined as in Definition 7.112.2. We have equality if and only if $A \to B$ is finite.

Proof. The ring B is semi-local by Lemma 7.104.2. Let B' be the integral closure of A in B. By Lemma 7.114.15 we can find a finite A-subalgebra $C \subset B'$ such that on setting $\mathfrak{n}_i = C \cap \mathfrak{m}_i$ we have $C_{\mathfrak{n}_i} \cong B_{\mathfrak{m}_i}$ and the primes $\mathfrak{n}_1, \ldots, \mathfrak{n}_n$ are pairwise distinct. The ring C is semi-local by Lemma 7.104.2. Let $\mathfrak{p}_j$, $j = 1, \ldots, m$ be the other maximal ideals of C (the ``missing points"). By Lemma 7.112.8 we have

$$\mathrm{ord}_A(x^{[L:K]}) = \sum\nolimits_i [\kappa(\mathfrak{n}_i) : \kappa(\mathfrak{m}_A)]\mathrm{ord}_{C_{\mathfrak{n}_i}}(x) + \sum\nolimits_j [\kappa(\mathfrak{p}_j) : \kappa(\mathfrak{m}_A)]\mathrm{ord}_{C_{\mathfrak{p}_j}}(x)$$

hence the inequality follows. In case of equality we conclude that $m = 0$ (no ``missing points"). Hence $C \subset B$ is an inclusion of semi-local rings inducing a bijection on maximal ideals and an isomorphism on all localizations at maximal ideals. So if $b \in B$, then $I = \{x \in C \mid xb \in C\}$ is an ideal of C which is not contained in any of the maximal ideals of C, and hence $I = C$, hence $b \in C$. Thus $B = C$ and B is finite over A. □

Here is a more standard application of Zariski's main theorem to the structure of local homomorphisms of local rings.

Lemma 7.115.2. *Let $(R, \mathfrak{m}_R) \to (S, \mathfrak{m}_S)$ be a local homomorphism of local rings. Assume*

1. *$R \to S$ is essentially of finite type,*
2. *$\kappa(\mathfrak{m}_R) \subset \kappa(\mathfrak{m}_S)$ is finite, and*
3. *$\dim(S/\mathfrak{m}_R S) = 0$.*

Then S is the localization of a finite R-algebra.

Proof. Let S' be a finite type R-algebra such that $S = S'_{\mathfrak{q}'}$ for some prime $\mathfrak{q}'$ of S'. By Definition 7.113.3 we see that $R \to S'$ is quasi-finite at $\mathfrak{q}'$. After replacing S' by $S'_{g'}$ for some $g' \in S'$, $g' \notin \mathfrak{q}'$ we may assume that $R \to S'$ is quasi-finite, see Lemma 7.114.14. Then by Lemma 7.114.15 there exists a finite R-algebra S'' and elements $g' \in S'$, $g' \notin \mathfrak{q}'$ and $g'' \in S''$ such that $S'_{g'} \cong S''_{g''}$ as R-algebras. This proves the lemma. □

Lemma 7.115.3. *Let $R \to S$ be a ring map, $\mathfrak{q}$ a prime of S lying over $\mathfrak{p}$ in R. If*

1. *R is Noetherian,*
2. *$R \to S$ is of finite type, and*
3. *$R \to S$ is quasi-finite at $\mathfrak{q}$,*

then $R_{\mathfrak{p}}^\wedge \otimes_R S = S_{\mathfrak{q}}^\wedge \times B$ for some $R_{\mathfrak{p}}^\wedge$-algebra B.

Proof. There exists a finite R-algebra $S' \subset S$ and an element $g \in S'$, $g \not\in \mathfrak{q}' = S' \cap \mathfrak{q}$ such that $S'_g = S_g$ and in particular $S'_{\mathfrak{q}'} = S_{\mathfrak{q}}$, see Lemma 7.114.15. We have

$$R_{\mathfrak{p}}^\wedge \otimes_R S' = (S'_{\mathfrak{q}'})^\wedge \times B'$$

by Lemma 7.90.17. Note that we have a commutative diagram

$$\begin{tikzcd}
R_{\mathfrak{p}}^\wedge \otimes_R S \arrow[r] & S_{\mathfrak{q}}^\wedge \\
R_{\mathfrak{p}}^\wedge \otimes_R S' \arrow[r] \arrow[u] & (S'_{\mathfrak{q}'})^\wedge \arrow[u]
\end{tikzcd}$$

where the right vertical is an isomorphism and the lower horizontal arrow is the projection map of the product decomposition above. The lemma follows. □

7.116. Dimension of fibres

We study the behaviour of dimensions of fibres, using Zariski's main theorem. Recall that we defined the dimension $\dim_x(X)$ of a topological space X at a point x in Topology, Definition 5.7.1.

Definition 7.116.1. Suppose that $R \to S$ is of finite type, and let $\mathfrak{q} \subset S$ be a prime lying over a prime $\mathfrak{p}$ of R. We define the *relative dimension of S/R at* $\mathfrak{q}$, denoted $\dim_{\mathfrak{q}}(S/R)$, to be the dimension of $Spec(S \otimes_R \kappa(\mathfrak{p}))$ at the point corresponding to $\mathfrak{q}$. We let $\dim(S/R)$ be the supremum of $\dim_{\mathfrak{q}}(S/R)$ over all $\mathfrak{q}$. This is called the *relative dimension of S/R*.

In particular, $R \to S$ is quasi-finite at $\mathfrak{q}$ if and only if $\dim_{\mathfrak{q}}(S/R) = 0$. The following lemma is more or less a reformulation of Zariski's Main Theorem.

Lemma 7.116.2. *Let $R \to S$ be a finite type ring map. Let $\mathfrak{q} \subset S$ be a prime. Suppose that $\dim_{\mathfrak{q}}(S/R) = n$. There exists a $g \in S$, $g \not\in \mathfrak{q}$ such that S_g is quasi-finite over a polynomial algebra $R[t_1, \ldots, t_n]$.*

Proof. The ring $\overline{S} = S \otimes_R \kappa(\mathfrak{p})$ is of finite type over $\kappa(\mathfrak{p})$. Let $\overline{\mathfrak{q}}$ be the prime of $\overline{S}$ corresponding to $\mathfrak{q}$. By definition of the dimension of a topological space at a point there exists an open $U \subset Spec(\overline{S})$ with $\overline{q} \in U$ and $\dim(U) = n$. Since the topology on $Spec(\overline{S})$ is induced from the topology on $Spec(S)$ (see Remark 7.16.8), we can find a $g \in S$, $g \not\in \mathfrak{q}$ with image $\overline{g} \in \overline{S}$ such that $D(\overline{g}) \subset U$. Thus after replacing S by S_g we see that $\dim(\overline{S}) = n$.

Next, choose generators $x_1, \ldots, x_N$ for S as an R-algebra. By Lemma 7.106.4 there exist elements $y_1, \ldots, y_n$ in the $\mathbf{Z}$-subalgebra of S generated by $x_1, \ldots, x_N$ such that the map $R[t_1, \ldots, t_n] \to S$, $t_i \mapsto y_i$ has the property that $\kappa(\mathfrak{p})[t_1 \ldots, t_n] \to \overline{S}$ is finite. In particular, S is quasi-finite over $R[t_1, \ldots, t_n]$ at $\mathfrak{q}$. Hence, by Lemma 7.114.14 we may replace S by S_g for some $g \in S$, $g \not\in \mathfrak{q}$ such that $R[t_1, \ldots, t_n] \to S$ is quasi-finite. □

Lemma 7.116.3. *Let $R \to S$ be a ring map. Let $\mathfrak{q} \subset S$ be a prime lying over the prime $\mathfrak{p}$ of R. Assume*

(1) *$R \to S$ is of finite type,*
(2) *$\dim_{\mathfrak{q}}(S/R) = n$, and*
(3) *$trdeg_{\kappa(\mathfrak{p})}\kappa(\mathfrak{q}) = r$.*

Then there exist $f \in R$, $f \not\in \mathfrak{p}$, $g \in S$, $g \not\in \mathfrak{q}$ *and a quasi-finite ring map*

$$\varphi : R_f[x_1, \ldots, x_n] \longrightarrow S_g$$

such that $\varphi^{-1}(\mathfrak{q}S_g) = (\mathfrak{p}, x_{r+1}, \ldots, x_n)R_f[x_{r+1}, \ldots, x_n]$

Proof. After replacing S by a principal localization we may assume there exists a quasi-finite ring map $\varphi : R[t_1, \ldots, t_n] \to S$, see Lemma 7.116.2. Set $\mathfrak{q}' = \varphi^{-1}(\mathfrak{q})$. Let $\overline{\mathfrak{q}}' \subset \kappa(\mathfrak{p})[t_1, \ldots, t_n]$ be the prime corresponding to $\mathfrak{q}'$. By Lemma 7.106.6 there exists a finite ring map $\kappa(\mathfrak{p})[x_1, \ldots, x_n] \to \kappa(\mathfrak{p})[t_1, \ldots, t_n]$ such that the inverse image of $\overline{\mathfrak{q}}'$ is $(x_{r+1}, \ldots, x_n)$. Let $\overline{h}_i \in \kappa(\mathfrak{p})[t_1, \ldots, t_n]$ be the image of x_i. We can find an element $f \in R$, $f \not\in \mathfrak{p}$ and $h_i \in R_f[t_1, \ldots, t_n]$ which map to $\overline{h}_i$ in $\kappa(\mathfrak{p})[t_1, \ldots, t_n]$. Then the ring map

$$R_f[x_1, \ldots, x_n] \longrightarrow R_f[t_1, \ldots, t_n]$$

becomes finite after tensoring with $\kappa(\mathfrak{p})$. In particular, $R_f[t_1, \ldots, t_n]$ is quasi-finite over $R_f[x_1, \ldots, x_n]$ at the prime $\mathfrak{q}'R_f[t_1, \ldots, t_n]$. Hence, by Lemma 7.114.14 there exists a $g \in R_f[t_1, \ldots, t_n]$, $g \not\in \mathfrak{q}'R_f[t_1, \ldots, t_n]$ such that $R_f[x_1, \ldots, x_n] \to R_f[t_1, \ldots, t_n, 1/g]$ is quasi-finite. Thus we see that the composition

$$R_f[x_1, \ldots, x_n] \longrightarrow R_f[t_1, \ldots, t_n, 1/g] \longrightarrow S_{\varphi(g)}$$

is quasi-finite and we win. □

Lemma 7.116.4. *Let* $R \to S$ *be a finite type ring map. Let* $\mathfrak{q} \subset S$ *be a prime lying over* $\mathfrak{p} \subset R$*. If* $R \to S$ *is quasi-finite at* $\mathfrak{q}$*, then* $\dim(S_{\mathfrak{q}}) \leq \dim(R_{\mathfrak{p}})$.

Proof. If $R_{\mathfrak{p}}$ is Noetherian (and hence $S_{\mathfrak{q}}$ Noetherian since it is essentially of finite type over $R_{\mathfrak{p}}$) then this follows immediately from Lemma 7.103.6 and the definitions. In the general case we can use Zariski's Main Theorem 7.114.13 to write $S_{\mathfrak{q}} = S'_{\mathfrak{q}'}$ for some ring S' integral over $R_{\mathfrak{p}}$. Thus the result follows from Lemma 7.103.3. □

Lemma 7.116.5. *Let* k *be a field. Let* S *be a finite type* k*-algebra. Suppose there is a quasi-finite* k*-algebra map* $k[t_1, \ldots, t_n] \subset S$*. Then* $\dim(S) \leq n$.

Proof. By Lemma 7.105.1 the dimension of any local ring of $k[t_1, \ldots, t_n]$ is at most n. Thus the result follows from Lemma 7.116.4 above. □

Lemma 7.116.6. *Let* $R \to S$ *be a finite type ring map. Let* $\mathfrak{q} \subset S$ *be a prime. Suppose that* $\dim_{\mathfrak{q}}(S/R) = n$*. There exists an open neighbourhood* V *of* $\mathfrak{q}$ *in* $Spec(S)$ *such that* $\dim_{\mathfrak{q}'}(S/R) \leq n$ *for all* $\mathfrak{q}' \in V$.

Proof. By Lemma 7.116.2 we see that we may assume that S is quasi-finite over a polynomial algebra $R[t_1, \ldots, t_n]$. Considering the fibres, we reduce to Lemma 7.116.5. □

In other words, the lemma says that the set of points where the fibre has dimension $\leq n$ is open in $Spec(S)$. The next lemma says that formation of this open commutes with base change. If the ring map is of finite presentation then this set is quasi-compact open (see below).

Lemma 7.116.7. *Let* $R \to S$ *be a finite type ring map. Let* $R \to R'$ *be any ring map. Set* $S' = R' \otimes_R S$ *and denote* $f : Spec(S') \to Spec(S)$ *the associated map on spectra. Let* $n \geq 0$*. The inverse image* $f^{-1}(\{\mathfrak{q} \in Spec(S) \mid \dim_{\mathfrak{q}}(S/R) \leq n\})$ *is equal to* $\{\mathfrak{q}' \in Spec(S') \mid \dim_{\mathfrak{q}'}(S'/R') \leq n\}$.

Proof. The condition is formulated in terms of dimensions of fibre rings which are of finite type over a field. Combined with Lemma 7.107.6 this yields the lemma. □

Lemma 7.116.8. *Let $R \to S$ be a ring homomorphism of finite presentation. Let $n \geq 0$. The set*
$$V_n = \{\mathfrak{q} \in Spec(S) \mid \dim_{\mathfrak{q}}(S/R) \leq n\}$$
is a quasi-compact open subset of $Spec(S)$.

Proof. It is open by Lemma 7.116.6 above. Let $S = R[x_1, \ldots, x_n]/(f_1, \ldots, f_m)$ be a presentation of S. Let R_0 be the $\mathbf{Z}$-subalgebra of R generated by the coefficients of the polynomials f_i. Let $S_0 = R_0[x_1, \ldots, x_n]/(f_1, \ldots, f_m)$. Then $S = R \otimes_{R_0} S_0$. By Lemma 7.116.7 V_n is the inverse image of an open $V_{0,n}$ under the quasi-compact continuous map $Spec(S) \to Spec(S_0)$. Since S_0 is Noetherian we see that $V_{0,n}$ is quasi-compact. ☐

Lemma 7.116.9. *Let R be a valuation ring with residue field k and field of fractions K. Let S be a domain containing R such that S is of finite type over R. If $S \otimes_R k$ is not the zero ring then*
$$\dim(S \otimes_R k) = \dim(S \otimes_R K)$$
In fact, $Spec(S \otimes_R k)$ is equidimensional.

Proof. It suffices to show that $\dim_{\mathfrak{q}}(S/k)$ is equal to $\dim(S \otimes_R K)$ for every prime $\mathfrak{q}$ of S containing $\mathfrak{m}_R S$. Pick such a prime. By Lemma 7.116.6 the inequality $\dim_{\mathfrak{q}}(S/k) \geq \dim(S \otimes_R K)$ holds. Set $n = \dim_{\mathfrak{q}}(S/k)$. By Lemma 7.116.2 after replacing S by S_g for some $g \in S, g \not\in \mathfrak{q}$ there exists a quasi-finite ring map $R[t_1, \ldots, t_n] \to S$. If $\dim(S \otimes_R K) < n$, then $K[t_1, \ldots, t_n] \to S \otimes_R K$ has a nonzero kernel. Say $f = \sum a_I t_1^{i_1} \ldots t_n^{i_n}$. After dividing f by a nonzero coefficient of f with minimal valuation, we may assume $f \in R[t_1, \ldots, t_n]$ and some a_I does not map to zero in k. Hence the ring map $k[t_1, \ldots, t_n] \to S \otimes_R k$ has a nonzero kernel which implies that $\dim(S \otimes_R k) < n$. Contradiction. ☐

7.117. Algebras and modules of finite presentation

In this section we dicuss some standard results where the key feature is that the assumption involves a finite type or finite presentation assumption.

Lemma 7.117.1. *Let $R \to S$ be a ring map. Let $R \to R'$ be a faithfully flat ring map. Set $S' = R' \otimes_R S$. Then $R \to S$ is of finite type if and only if $R' \to S'$ is of finite type.*

Proof. It is clear that if $R \to S$ is of finite type then $R' \to S'$ is of finite type. Assume that $R' \to S'$ is of finite type. Say $y_1, \ldots, y_m$ generate S' over R'. Write $y_j = \sum_i a_{ij} \otimes x_{ji}$ for some $a_{ij} \in R'$ and $x_{ji} \in S$. Let $A \subset S$ be the R-subalgebra generated by the x_{ij}. By flatness we have $A' := R' \otimes_R A \subset S'$, and by construction $y_j \in A'$. Hence $A' = S'$. By faithful flatness $A = S$. ☐

Lemma 7.117.2. *Let $R \to S$ be a ring map. Let $R \to R'$ be a faithfully flat ring map. Set $S' = R' \otimes_R S$. Then $R \to S$ is of finite presentation if and only if $R' \to S'$ is of finite presentation.*

Proof. It is clear that if $R \to S$ is of finite presentation then $R' \to S'$ is of finite presentation. Assume that $R' \to S'$ is of finite presentation. By Lemma 7.117.1 above we see that $R \to S$ is of finite type. Write $S = R[x_1, \ldots, x_n]/I$. By flatness $S' = R'[x_1, \ldots, x_n]/R' \otimes I$. Say $g_1, \ldots, g_m$ generate $R' \otimes I$ over $R'[x_1, \ldots, x_n]$. Write $g_j = \sum_i a_{ij} \otimes f_{ji}$ for some $a_{ij} \in R'$ and $f_{ji} \in I$. Let $J \subset I$ be the ideal generated by the f_{ij}. By flatness we have $R' \otimes_R J \subset R' \otimes_R I$, and both are ideals over $R'[x_1, \ldots, x_n]$. By construction $g_j \in R' \otimes_R J$. Hence $R' \otimes_R J = R' \otimes_R I$. By faithful flatness $J = I$. ☐

Lemma 7.117.3. *Let R be a ring. Let $I \subset R$ be an ideal. Let $S \subset R$ be a multiplicative subset. Set $R' = S^{-1}(R/I) = S^{-1}R/S^{-1}I$.*

(1) *For any finite R'-module M' there exists a finite R-module M such that $S^{-1}(M/IM) \cong M'$.*
(2) *For any finitely presented R'-module M' there exists a finitely presented R-module M such that $S^{-1}(M/IM) \cong M'$.*

Proof. Proof of (1). Choose a short exact sequence $0 \to K' \to (R')^{\oplus n} \to M' \to 0$. Let $K \subset R^{\oplus n}$ be the inverse image of K' under the map $R^{\oplus n} \to (R')^{\oplus n}$. Then $M = R^{\oplus n}/K$ works.

Proof of (2). Choose a presentation $(R')^{\oplus m} \to (R')^{\oplus n} \to M' \to 0$. Suppose that the first map is given by the matrix $A' = (a'_{ij})$ and the second map is determined by generators $x'_i \in M'$, $i = 1, \ldots, n$. As $R' = S^{-1}(R/I)$ we can choose $s \in S$ and a matrix $A = (a_{ij})$ with coefficients in R such that $a'_{ij} = a_{ij}/s \bmod S^{-1}I$. Let M be the finitely presented R-module with presentation $R^{\oplus m} \to R^{\oplus n} \to M \to 0$ where the first map is given by the matrix A and the second map is determined by generators $x_i \in M$, $i = 1, \ldots, n$. Then the map $M \to M'$, $x_i \mapsto x'_i$ induces an isomorphism $S^{-1}(M/IM) \cong M'$. □

Lemma 7.117.4. *Let R be a ring. Let $S \subset R$ be a multiplicative subset. Let M be an R-module.*

(1) *If $S^{-1}M$ is a finite $S^{-1}R$-module then there exists a finite R-module M' and a map $M' \to M$ which induces an isomorphism $S^{-1}M' \to S^{-1}M$.*
(2) *If $S^{-1}M$ is a finitely presented $S^{-1}R$-module then there exists an R-module M' of finite presentation and a map $M' \to M$ which induces an isomorphism $S^{-1}M' \to S^{-1}M$.*

Proof. Proof of (1). Let $x_1, \ldots, x_n \in M$ be elements which generate $S^{-1}M$ as an $S^{-1}R$-module. Let M' be the R-submodule of M generated by $x_1, \ldots, x_n$.

Proof of (2). Let $x_1, \ldots, x_n \in M$ be elements which generate $S^{-1}M$ as an $S^{-1}R$-module. Let $K = \mathrm{Ker}(R^{\oplus n} \to M)$ where the map is given by the rule $(a_1, \ldots, a_n) \mapsto \sum a_i x_i$. By Lemma 7.5.3 we see that $S^{-1}K$ is a finite $S^{-1}R$-module. By (1) we can find a finite type submodule $K' \subset K$ with $S^{-1}K' = S^{-1}K$. Take $M' = \mathrm{Coker}(K' \to R^{\oplus n})$. □

Lemma 7.117.5. *Let R be a ring. Let $\mathfrak{p} \subset R$ be a prime ideal. Let M be an R-module.*

(1) *If $M_{\mathfrak{p}}$ is a finite $R_{\mathfrak{p}}$-module then there exists a finite R-module M' and a map $M' \to M$ which induces an isomorphism $M'_{\mathfrak{p}} \to M_{\mathfrak{p}}$.*
(2) *If $M_{\mathfrak{p}}$ is a finitely presented $R_{\mathfrak{p}}$-module then there exists an R-module M' of finite presentation and a map $M' \to M$ which induces an isomorphism $M'_{\mathfrak{p}} \to M_{\mathfrak{p}}$.*

Proof. This is a special case of Lemma 7.117.4 □

Lemma 7.117.6. *Let R be a ring. Let $\varphi : S' \to S$ be a homomorphism of R-algebras. Assume*

(1) *S' is of finite type over R,*
(2) *S is of finite presentation over R, and*
(3) *$\mathfrak{q}' \subset S'$ and $\mathfrak{q} \subset S$ are primes such that φ induces an isomorphism $S'_{\mathfrak{q}'} \cong S_{\mathfrak{q}}$.*

Then there exist $g \in S'$, $g \notin \mathfrak{q}'$ and such that φ induces an isomorphism $S'_g \cong S_{\varphi(g)}$.

Proof. By Lemma 7.6.2 the map $S' \to S$ is of finite presentation. Write $S = S'[y_1, \ldots, y_a]/(g_1, \ldots, g_b)$. We may, after replacing S' by S'_g and S by $S_{\varphi(g)}$ for a suitable g, assume that the elements y_j are in the image of φ. This implies that $S' \to S$ is surjective. Say $x_j \in S'$ maps to y_j. After further replacing S' by S'_g and S by $S_{\varphi(g)}$ for a suitable g we may assume the expressions $g_i(x_1, \ldots, x_a)$ are zero in S'. This means that $S' \to S$ is an isomorphism. □

Lemma 7.117.7. *Let R be a ring. Let S, S' be of finite presentation over R. Let $\mathfrak{q} \subset S$ and $\mathfrak{q}' \subset S'$ be primes. If $S_{\mathfrak{q}} \cong S_{\mathfrak{q}'}$ as R-algebras, then there exist $g \in S$, $g \not\in \mathfrak{q}$ and $g' \in S'$, $g' \not\in \mathfrak{q}'$ such that $S_g \cong S'_{g'}$ as R-algebras.*

Proof. Let $\psi : S_{\mathfrak{q}} \to S_{\mathfrak{q}'}$ be the isomorphism of the hypothesis of the lemma. Write $S = R[x_1, \ldots, x_n]/(f_1, \ldots, f_r)$ and $S' = R[y_1, \ldots, y_m]/J$. For each $i = 1, \ldots, n$ choose a fraction h_i/g_i with $h_i, g_i \in R[y_1, \ldots, y_m]$ and $g_i \bmod J$ not in $\mathfrak{q}'$ which represents the image of x_i under ψ. After replacing S' by $S'_{g_1 \ldots g_n}$ and $R[y_1, \ldots, y_m, y_{m+1}]$ (mapping y_{m+1} to $1/(g_1 \ldots g_n)$) we may assume that $\psi(x_i)$ is the image of some $h_i \in R[y_1, \ldots, y_m]$. Consider the elements $f_j(h_1, \ldots, h_n) \in R[y_1, \ldots, y_m]$. Since ψ kills each f_j we see that there exists a $g \in R[y_1, \ldots, y_m]$, $g \bmod J \not\in \mathfrak{q}'$ such that $g f_j(h_1, \ldots, h_n) \in J$ for each $j = 1, \ldots, r$. After replacing S' by S'_g and $R[y_1, \ldots, y_m, y_{m+1}]$ as before we may assume that $f_j(h_1, \ldots, h_n) \in J$. Thus we obtain a ring map $S \to S'$, $x_i \mapsto h_i$ which induces ψ on local rings. We win by Lemma 7.117.6 above. □

7.118. Colimits and maps of finite presentation

In this section we prove some preliminary lemmas which will eventually help us prove result using absolute Noetherian reduction. we begin discussing how we will think about colimits in this section.

Let $(\Lambda, \geq)$ a partially ordered set. A system of rings over Λ is given by a ring R_λ for every $\lambda \in \Lambda$, and a morphism $R_\lambda \to R_\mu$ whenever $\lambda \leq \mu$. These morphisms have to satisfy the rule that $R_\lambda \to R_\mu \to R_\nu$ is equal to the map $R_\lambda \to R_\nu$ for all $\lambda \leq \mu \leq \nu$. See Categories, Section 4.19. We will often assume that $(I, \leq)$ is *directed*, which means that Λ is nonempty and given $\lambda, \mu \in \Lambda$ there exists a $\nu \in \Lambda$ with $\lambda \leq \nu$ and $\mu \leq \nu$. Recall that the colimit $colim_\lambda R_\lambda$ is sometimes called a ``direct limit" in this case (but we will not use this terminology).

Lemma 7.118.1. *Let $R \to A$ be a ring map. There exists a directed system A_λ of R-algebras of finite presentation such that $A = colim_\lambda A_\lambda$. If A is of finite type over R we may arrange it so that all the transition maps are surjective.*

Proof. Compare with the proof of Lemma 7.8.13. Consider any finite subset $S \subset A$, and any finite collection of polynomial relations E among the elements of S. So each $s \in S$ corresponds to $x_s \in A$ and each $e \in E$ consists of a polynomial $f_e \in R[X_s; s \in S]$ such that $f_e(x_s) = 0$. Let $A_{S,E} = R[X_s; s \in S]/(f_e; e \in E)$ which is a finitely presented R-algebra. There are canonical maps $A_{S,E} \to A$. If $S \subset S'$ and if the elements of E correspond, via the map $R[X_s; s \in S] \to R[X_s; s \in S']$, to a subset of E', then there is an obvious map $A_{S,E} \to A_{S',E'}$ commuting with the maps to A. Thus, setting Λ equal the set of pairs (S, E) with ordering by inclusion as above, we get a directed partially ordered set. It is clear that the colimit of this directed system is A.

For the last statement, suppose $A = R[x_1, \ldots, x_n]/I$. In this case, consider the subset $\Lambda' \subset \Lambda$ consisting of those systems (S, E) above with $S = \{x_1, \ldots, x_n\}$. It is easy to see that still $A = colim_{\lambda' \in \Lambda'} A_{\lambda'}$. Moreover, the transition maps are clearly surjective. □

It turns out that we can characterize ring maps of finite presentation as follows. This in some sense says that the algebras of finite presentation are the ``compact'' objects in the category of R-algebras.

Lemma 7.118.2. *Let $\varphi : R \to S$ be a ring map. Then φ is of finite presentation if and only if for every directed system A_λ of R-algebras we have*

$$colim_\lambda\, Hom_R(S, A_\lambda) = Hom_R(S, colim_\lambda\, A_\lambda)$$

Proof. Suppose $S = R[x_1, \ldots, x_n]/(f_1, \ldots, f_m)$. If $\chi : S \to colim\, A_\lambda$ is a map, then each x_i maps to some element in the image of some A_{λ_i}. We may pick $\mu \geq \lambda_i$, $i = 1, \ldots, n$ and assume $\chi(x_i)$ is the image of $y_i \in A_\mu$ for $i = 1, \ldots, n$. Consider $z_j = f_j(y_1, \ldots, y_n) \in A_\mu$. Since χ is a homomorphism the image of z_j in $colim_\lambda\, A_\lambda$ is zero. Hence there exists a $\mu_j \geq \mu$ such that z_j maps to zero in A_{μ_j}. Pick $\nu \geq \mu_j$, $j = 1, \ldots, m$. Then the images of $z_1, \ldots, z_m$ are zero in A_ν. This exactly means that the y_i map to elements $y'_i \in A_\nu$ which satsify the relations $f_j(y'_1, \ldots, y'_n) = 0$. Thus we obtain a ring map $S \to A_\nu$ as desired.

Conversely, suppose the displayed formula holds always. By Lemma 7.118.1 we may write $S = colim_\lambda\, S_\lambda$ with S_λ of finite presentation over R. Then the identity map factors as

$$S \to S_\lambda \to S$$

for some λ. Hence we see that S is finitely generated over R (because S_λ is). Thus we may choose the system such that all transition maps are surjective. In this case a factorization of the identity as above can only exist if $S = S_\lambda$. □

But more is true. Namely, given $R = colim_\lambda\, R_\lambda$ we see that the category of finitely presented R-modules is equivalent to the limit of the category of finitely presented R_λ-modules. Similarly for the categories of finitely presented R-algebras.

Lemma 7.118.3. *Let A be a ring and let M, N be A-modules. Suppose that $R = colim_{i\in I}\, R_i$ is a directed colimit of A-algebras.*

1. *If M is a finite A-module, and $u, u' : M \to N$ are A-module maps such that $u \otimes 1 = u' \otimes 1 : M \otimes_A R \to N \otimes_A R$ then for some i we have $u \otimes 1 = u' \otimes 1 : M \otimes_A R_i \to N \otimes_A R_i$.*
2. *If N is a finite A-module and $u : M \to N$ is an A-module map such that $u \otimes 1 : M \otimes_A R \to N \otimes_A R$ is surjective, then for some i the map $u \otimes 1 : M \otimes_A R_i \to N \otimes_A R_i$ is surjective.*
3. *If N is a finitely presented A-module, and $v : N \otimes_A R \to M \otimes_A R$ is an R-module map, then there exists an i and an R_i-module map $v_i : N \otimes_A R_i \to M \otimes_A R_i$ such that $v = v_i \otimes 1$.*
4. *If M is a finite A-module, N is a finitely presented A-module, and $u : M \to N$ is an R-module map such that $u \otimes 1 : M \otimes_A R \to N \otimes_A R$ is an isomorphism, then for some i the map $u \otimes 1 : M \otimes_A R_i \to N \otimes_A R_i$ is an isomorphism.*

Proof. To prove (1) assume u is as in (1) and let $x_1, \ldots, x_m \in M$ be generators. Since $N \otimes_A R = colim_i\, N \otimes_A R_i$ we may pick an $i \in I$ such that $u(x_j) \otimes 1 = u'(x_j) \otimes 1$ in $M \otimes_A R_i$, $j = 1, \ldots, m$. For such an i we have $u \otimes 1 = u' \otimes 1 : M \otimes_A R_i \to N \otimes_A R_i$.

To prove (2) assume $u \otimes 1$ surjective and let $y_1, \ldots, y_m \in N$ be generators. Since $N \otimes_A R = colim_i\, N \otimes_A R_i$ we may pick an $i \in I$ and $z_j \in M \otimes_A R_i$, $j = 1, \ldots, m$ whose images in $N \otimes_A R$ equal $y_j \otimes 1$. For such an i the map $u \otimes 1 : M \otimes_A R_i \to N \otimes_A R_i$ is surjective.

To prove (3) let $y_1, \ldots, y_m \in N$ be generators. Let $K = \text{Ker}(A^{\oplus m} \to N)$ where the map is given by the rule $(a_1, \ldots, a_m) \mapsto \sum a_j x_j$. Let $k_1, \ldots, k_t$ be generators for K. Say $k_s =$

$(k_{s1}, \ldots, k_{sm})$. Since $M \otimes_A R = colim_i\, M \otimes_A R_i$ we may pick an $i \in I$ and $z_j \in M \otimes_A R_i$, $j = 1, \ldots, m$ whose images in $M \otimes_A R$ equal $v(y_j \otimes 1)$. We want to use the z_j to define the map $v_i : N \otimes_A R_i \to M \otimes_A R_i$. Since $K \otimes_A R_i \to R_i^{\oplus m} \to N \otimes_A R_i \to 0$ is a presentation, it suffices to check that $\xi_s = \sum_j k_{sj} z_j$ is zero in $M \otimes_A R_i$ for each $s = 1, \ldots, t$. This may not be the case, but since the image of ξ_s in $M \otimes_A R$ is zero we see that it will be the case after increasing i a bit.

To prove (4) assume $u \otimes 1$ is an isomorphism, that M is finite, and that N is finitely presented. Let $v : N \otimes_A R \to M \otimes_A R$ be an inverse to $u \otimes 1$. Apply part (3) to get a map $v_i : N \otimes_A R_i \to M \otimes_A R_i$ for some i. Apply part (1) to see that, after increasing i we have $v_i \circ (u \otimes 1) = \mathrm{id}_{M \otimes_R R_i}$ and $(u \otimes 1) \circ v_i = \mathrm{id}_{N \otimes_R R_i}$. □

Lemma 7.118.4. *Suppose that $R = colim_{i \in I} R_i$ is a directed colimit of rings. Then the category of finitely presented R-modules is the colimit of the categories of finitely presented R_λ-modules. More precisely*

1. *Given a finitely presented R-module M there exists a $\lambda \in \Lambda$ and a finitely presented R_λ-module M_λ such that $M \cong M_\lambda \otimes_{R_\lambda} R$.*
2. *Given a $\lambda \in \Lambda$, finitely presented R_λ-modules M_λ, N_λ, and an R-module map $\varphi : M_\lambda \otimes_{R_\lambda} R \to N_\lambda \otimes_{R_\lambda} R$, then there exists a $\mu \geq \lambda$ and an R_μ-module map $\varphi_\mu : M_\lambda \otimes_{R_\lambda} R_\mu \to N_\lambda \otimes_{R_\lambda} R_\mu$ such that $\varphi = \varphi_\mu \otimes 1_R$.*
3. *Given a $\lambda \in \Lambda$, finitely presented R_λ-modules M_λ, N_λ, and R-module maps $\varphi_\lambda, \psi_\lambda : M_\lambda \to N_\lambda$ such that $\varphi \otimes 1_R = \psi \otimes 1_R$, then $\varphi \otimes 1_{R_\mu} = \psi \otimes 1_{R_\mu}$ for some $\mu \geq \lambda$.*

Proof. To prove (1) choose a presentation $R^{\oplus m} \to R^{\oplus n} \to M \to 0$. Suppose that the first map is given by the matrix $A = (a_{ij})$. We can choose a $\lambda \in \Lambda$ and a matrix $A_\lambda = (a_{\lambda, ij})$ with coefficients in R_λ which maps to A in R. Then we simply let M_λ be the R_λ-module with presentation $R_\lambda^{\oplus m} \to R_\lambda^{\oplus n} \to M_\lambda \to 0$ where the first arrow is given by A_λ.

Parts (3) and (4) follow from Lemma 7.118.3. □

Lemma 7.118.5. *Let A be a ring and let B, C be A-algebras. Suppose that $R = colim_{i \in I} R_i$ is a directed colimit of A-algebras.*

1. *If B is a finite type A-algebra, and $u, u' : B \to C$ are A-algebra maps such that $u \otimes 1 = u' \otimes 1 : B \otimes_A R \to C \otimes_A R$ then for some i we have $u \otimes 1 = u' \otimes 1 : B \otimes_A R_i \to C \otimes_A R_i$.*
2. *If C is a finite type A-algebra and $u : B \to C$ is an A-algebra map such that $u \otimes 1 : B \otimes_A R \to C \otimes_A R$ is surjective, then for some i the map $u \otimes 1 : B \otimes_A R_i \to C \otimes_A R_i$ is surjective.*
3. *If C is of finite presentation over A and $v : C \otimes_A R \to B \otimes_A R$ is an R-algebra map, then there exists an i and an R_i-algebra map $v_i : C \otimes_A R_i \to B \otimes_A R)i$ such that $v = v_i \otimes 1$.*
4. *If B is a finite type A-algebra, C is a finitely presented A-algebra, and $u \otimes 1 : B \otimes_A R \to C \otimes_A R$ is an isomorphism, then for some i the map $u \otimes 1 : B \otimes_A R_i \to C \otimes_A R_i$ is an isomorphism.*

Proof. To prove (1) assume u is as in (1) and let $x_1, \ldots, x_m \in B$ be generators. Since $B \otimes_A R = colim_i\, B \otimes_A R_i$ we may pick an $i \in I$ such that $u(x_j) \otimes 1 = u'(x_j) \otimes 1$ in $B \otimes_A R_i$, $j = 1, \ldots, m$. For such an i we have $u \otimes 1 = u' \otimes 1 : B \otimes_A R_i \to C \otimes_A R_i$.

To prove (2) assume $u \otimes 1$ surjective and let $y_1, \ldots, y_m \in C$ be generators. Since $B \otimes_A R = colim_i\, B \otimes_A R_i$ we may pick an $i \in I$ and $z_j \in B \otimes_A R_i$, $j = 1, \ldots, m$ whose images in $C \otimes_A R$ equal $y_j \otimes 1$. For such an i the map $u \otimes 1 : B \otimes_A R_i \to C \otimes_A R_i$ is surjective.

To prove (3) let $c_1, \ldots, c_m \in C$ be generators. Let $K = \mathrm{Ker}(A[x_1, \ldots, x_m] \to N)$ where the map is given by the rule $x_j \mapsto \sum c_j$. Let $f_1, \ldots, f_t$ be generators for K as an ideal in $A[x_1, \ldots, x_m]$. We think of $f_j = f_j(x_1, \ldots, x_m)$ as a polynomial. Since $B \otimes_A R = colim_i\, B \otimes_A R_i$ we may pick an $i \in I$ and $z_j \in B \otimes_A R_i$, $j = 1, \ldots, m$ whose images in $B \otimes_A R$ equal $v(c_j \otimes 1)$. We want to use the z_j to define a map $v_i : C \otimes_A R_i \to B \otimes_A R_i$. Since $K \otimes_A R_i \to R_i[x_1, \ldots, x_m] \to C \otimes_A R_i \to 0$ is a presentation, it suffices to check that $\xi_s = f_j(z_1, \ldots, z_m)$ is zero in $B \otimes_A R_i$ for each $s = 1, \ldots, t$. This may not be the case, but since the image of ξ_s in $B \otimes_A R$ is zero we see that it will be the case after increasing i a bit.

To prove (4) assume $u \otimes 1$ is an isomorphism, that B is a finite type A-algebra, and that C is a finitely presented A-algebra. Let $v : B \otimes_A R \to C \otimes_A R$ be an inverse to $u \otimes 1$. let $v_i : C \otimes_A R_i \to B \otimes_A R_i$ be as in part (3). Apply part (1) to see that, after increasing i we have $v_i \circ (u \otimes 1) = \mathrm{id}_{B \otimes_R R_i}$ and $(u \otimes 1) \circ v_i = \mathrm{id}_{C \otimes_R R_i}$. □

Lemma 7.118.6. *Suppose that $R = colim_{i \in I} R_i$ is a directed colimit of rings. Then the category of finitely presented R-algebras is the colimit of the categories of finitely presented R_λ-algebras. More precisely*

1. *Given a finitely presented R-algebra A there exists a $\lambda \in \Lambda$ and a finitely presented R_λ-algebra A_λ such that $A \cong A_\lambda \otimes_{R_\lambda} R$.*
2. *Given a $\lambda \in \Lambda$, finitely presented R_λ-algebras A_λ, B_λ, and an R-algebra map $\varphi : A_\lambda \otimes_{R_\lambda} R \to B_\lambda \otimes_{R_\lambda} R$, then there exists a $\mu \geq \lambda$ and an R_μ-algebra map $\varphi_\mu : A_\lambda \otimes_{R_\lambda} R_\mu \to B_\lambda \otimes_{R_\lambda} R_\mu$ such that $\varphi = \varphi_\mu \otimes 1_R$.*
3. *Given a $\lambda \in \Lambda$, finitely presented R_λ-algebras A_λ, B_λ, and R-algebra maps $\varphi_\lambda, \psi_\lambda : A_\lambda \to B_\lambda$ such that $\varphi \otimes 1_R = \psi \otimes 1_R$, then $\varphi \otimes 1_{R_\mu} = \psi \otimes 1_{R_\mu}$ for some $\mu \geq \lambda$.*

Proof. To prove (1) choose a presentation $A = R[x_1, \ldots, x_n]/(f_1, \ldots, f_m)$. We can choose a $\lambda \in \Lambda$ and elements $f_{\lambda,j} \in R_\lambda[x_1, \ldots, x_n]$ mapping to $f_j \in R[x_1, \ldots, x_n]$. Then we simply let $A_\lambda = R_\lambda[x_1, \ldots, x_n]/(f_{\lambda,1}, \ldots, f_{\lambda,m})$.

Parts (3) and (4) follow from Lemma 7.118.5. □

Lemma 7.118.7. *Suppose $R \to S$ is a local homomorphism of local rings. There exists a directed set $(\Lambda, \leq)$, and a system of local homomorphisms $R_\lambda \to S_\lambda$ of local rings such that*

1. *The colimit of the system $R_\lambda \to S_\lambda$ is equal to $R \to S$.*
2. *Each R_λ is essentially of finite type over $\mathbf{Z}$.*
3. *Each S_λ is essentially of finite type over R_λ.*

Proof. Denote $\varphi : R \to S$ the ring map. Let $\mathfrak{m} \subset R$ be the maximal ideal of R and let $\mathfrak{n} \subset S$ be the maximal ideal of S. Let

$$\Lambda = \{(A, B) \mid A \subset R, B \subset S, \#A < \infty, \#B < \infty, \varphi(A) \subset B\}.$$

As partial ordering we take the inclusion relation. For each $\lambda = (A, B) \in \Lambda$ we let R'_λ be the sub $\mathbf{Z}$-algebra generated by $a \in A$, and we let S'_λ be the sub $\mathbf{Z}$-algebra generated by

b, $b \in B$. Let R_λ be the localization of R'_λ at the prime ideal $R'_\lambda \cap \mathfrak{m}$ and let S_λ be the localization of S'_λ at the prime ideal $S'_\lambda \cap \mathfrak{n}$. In a picture

$$\begin{tikzcd} B \arrow[r] & S'_\lambda \arrow[r] & S_\lambda \arrow[r] & S \\ A \arrow[r] \arrow[u] & R'_\lambda \arrow[r] \arrow[u] & R_\lambda \arrow[r] \arrow[u] & R \arrow[u] \end{tikzcd}$$

The transition maps are clear. We leave the proofs of the other assertions to the reader. □

Lemma 7.118.8. *Suppose $R \to S$ is a local homomorphism of local rings. Assume that S is essentially of finite type over R. Then there exists a directed set $(\Lambda, \leq)$, and a system of local homomorphisms $R_\lambda \to S_\lambda$ of local rings such that*

1. *The colimit of the system $R_\lambda \to S_\lambda$ is equal to $R \to S$.*
2. *Each R_λ is essentially of finite type over $\mathbf{Z}$.*
3. *Each S_λ is essentially of finite type over R_λ.*
4. *For each $\lambda \leq \mu$ the map $S_\lambda \otimes_{R_\lambda} R_\mu \to S_\mu$ presents S_μ as the localization of a quotient of $S_\lambda \otimes_{R_\lambda} R_\mu$.*

Proof. Denote $\varphi : R \to S$ the ring map. Let $\mathfrak{m} \subset R$ be the maximal ideal of R and let $\mathfrak{n} \subset S$ be the maximal ideal of S. Let $x_1, \ldots, x_n \in S$ be elements such that S is a localization of the sub R-algebra of S generated by $x_1, \ldots, x_n$. In other words, S is a quotient of a localization of the polynomial ring $R[x_1, \ldots, x_n]$.

Let $\Lambda = \{A \subset R \mid \#A < \infty\}$ be the set of finite subsets of R. As partial ordering we take the inclusion relation. For each $\lambda = A \in \Lambda$ we let R'_λ be the sub $\mathbf{Z}$-algebra generated by $a \in A$, and we let S'_λ be the sub $\mathbf{Z}$-algebra generated by $\varphi(a)$, $a \in A$ and the elements $x_1, \ldots, x_n$. Let R_λ be the localization of R'_λ at the prime ideal $R'_\lambda \cap \mathfrak{m}$ and let S_λ be the localization of S'_λ at the prime ideal $S'_\lambda \cap \mathfrak{n}$. In a picture

$$\begin{tikzcd} \varphi(A) \coprod \{x_i\} \arrow[r] & S'_\lambda \arrow[r] & S_\lambda \arrow[r] & S \\ A \arrow[r] \arrow[u] & R'_\lambda \arrow[r] \arrow[u] & R_\lambda \arrow[r] \arrow[u] & R \arrow[u] \end{tikzcd}$$

It is clear that if $A \subset B$ corresponds to $\lambda \leq \mu$ in Λ, then there are canonical maps $R_\lambda \to R_\mu$, and $S_\lambda \to S_\mu$ and we obtain a system over the directed set Λ.

The assertion that $R = colim\, R_\lambda$ is clear because all the maps $R_\lambda \to R$ are injective and any element of R eventually is in the image. The same argument works for $S = colim\, S_\lambda$. Assertions (2), (3) are true by construction. The final assertion holds because clearly the maps $S'_\lambda \otimes_{R'_\lambda} R'_\mu \to S'_\mu$ are surjective. □

Lemma 7.118.9. *Suppose $R \to S$ is a local homomorphism of local rings. Assume that S is essentially of finite presentation over R. Then there exists a directed set $(\Lambda, \leq)$, and a system of local homomorphism $R_\lambda \to S_\lambda$ of local rings such that*

1. *The colimit of the system $R_\lambda \to S_\lambda$ is equal to $R \to S$.*
2. *Each R_λ is essentially of finite type over $\mathbf{Z}$.*
3. *Each S_λ is essentially of finite type over R_λ.*
4. *For each $\lambda \leq \mu$ the map $S_\lambda \otimes_{R_\lambda} R_\mu \to S_\mu$ presents S_μ as the localization of $S_\lambda \otimes_{R_\lambda} R_\mu$ at a prime ideal.*

Proof. By assumption we may choose an isomorphism $\Phi : (R[x_1, \ldots, x_n]/I)_{\mathfrak q} \to S$ where $I \subset R[x_1, \ldots, x_n]$ is a finitely generated ideal, and $\mathfrak q \subset R[x_1, \ldots, x_n]/I$ is a prime. (Note that the pull back of $\mathfrak q$ to R is equal to the maximal ideal $\mathfrak m$ of R.) We also choose generators $f_1, \ldots, f_m \in I$ for the ideal I. Write R in any way as a colimit $R = colim\, R_\lambda$ over a directed set $(\Lambda, \leq)$, with each R_λ local and essentially of finite type over $\mathbf{Z}$. There exists some $\lambda_0 \in \Lambda$ such that f_j is the image of some $f_{j,\lambda_0} \in R_{\lambda_0}[x_1, \ldots, x_n]$. For all $\lambda \geq \lambda_0$ denote $f_{j,\lambda} \in R_\lambda[x_1, \ldots, x_n]$ the image of f_{j,λ_0}. Thus we obtain a system of ring maps

$$R_\lambda[x_1, \ldots, x_n]/(f_{1,\lambda}, \ldots, f_{n,\lambda}) \to R[x_1, \ldots, x_n]/(f_1, \ldots, f_n) \to S$$

Set $\mathfrak q_\lambda$ the inverse image of $\mathfrak q$. Set $S_\lambda = (R_\lambda[x_1, \ldots, x_n]/(f_{1,\lambda}, \ldots, f_{n,\lambda}))_{\mathfrak q_\lambda}$. We leave it to the reader to see that this works. ☐

Remark 7.118.10. Suppose that $R \to S$ is a local homomorphism of local rings, which is essentially of finite presentation. Take any system $(\Lambda, \leq)$, $R_\lambda \to S_\lambda$ with the properties listed in Lemma 7.118.8. What may happen is that this is the ``wrong'' system, namely, it may happen that property (4) of Lemma 7.118.9 is not satisfied. Here is an example. Let k be a field. Consider the ring

$$R = k[[z, y_1, y_2, \ldots]]/(y_i^2 - zy_{i+1}).$$

Set $S = R/zR$. As system take $\Lambda = \mathbf{N}$ and $R_n = k[[z, y_1, \ldots, y_n]]/(\{y_i^2 - zy_{i+1}\}_{i\leq n-1})$ and $S_n = R_n/(z, y_n^2)$. All the maps $S_n \otimes_{R_n} R_{n+1} \to S_{n+1}$ are not localizations (i.e., isomorphisms in this case) since $1 \otimes y_{n+1}^2$ maps to zero. If we take instead $S'_n = R_n/zR_n$ then the maps $S'_n \otimes_{R_n} R_{n+1} \to S'_{n+1}$ are isomorphisms. The moral of this remark is that we do have to be a little careful in choosing the systems.

Lemma 7.118.11. *Suppose $R \to S$ is a local homomorphism of local rings. Assume that S is essentially of finite presentation over R. Let M be a finitely presented S-module. Then there exists a directed set $(\Lambda, \leq)$, and a system of local homomorphisms $R_\lambda \to S_\lambda$ of local rings together with S_λ-modules M_λ, such that*

1. *The colimit of the system $R_\lambda \to S_\lambda$ is equal to $R \to S$. The colimit of the system M_λ is M.*
2. *Each R_λ is essentially of finite type over $\mathbf{Z}$.*
3. *Each S_λ is essentially of finite type over R_λ.*
4. *Each M_λ is finite over S_λ.*
5. *For each $\lambda \leq \mu$ the map $S_\lambda \otimes_{R_\lambda} R_\mu \to S_\mu$ presents S_μ as the localization of $S_\lambda \otimes_{R_\lambda} R_\mu$ at a prime ideal.*
6. *For each $\lambda \leq \mu$ the map $M_\lambda \otimes_{S_\lambda} S_\mu \to M_\mu$ is an isomorphism.*

Proof. As in the proof of Lemma 7.118.9 we may first write $R = colim\, R_\lambda$ as a directed colimit of local $\mathbf{Z}$-algebras which are essentially of finite type. Next, we may assume that for some $\lambda_1 \in \Lambda$ there exist $f_{j,\lambda_1} \in R_{\lambda_1}[x_1, \ldots, x_n]$ such that

$$S = colim_{\lambda \geq \lambda_1} S_\lambda, \text{ with } S_\lambda = (R_\lambda[x_1, \ldots, x_n]/(f_{1,\lambda}, \ldots, f_{m,\lambda}))_{\mathfrak q_\lambda}$$

Choose a presentation

$$S^{\oplus s} \to S^{\oplus t} \to M \to 0$$

of M over S. Let $A \in \mathrm{Mat}(t \times s, S)$ be the matrix of the presentation. For some $\lambda_2 \in \Lambda$, $\lambda_2 \geq \lambda_1$ we can find a matrix $A_{\lambda_2} \in \mathrm{Mat}(t \times s, S_{\lambda_2})$ which maps to A. For all $\lambda \geq \lambda_2$ we let $M_\lambda = \mathrm{Coker}(S_\lambda^{\oplus s} \xrightarrow{A_\lambda} S_\lambda^{\oplus t})$. We leave it to the reader to see that this works. ☐

Lemma 7.118.12. *Suppose $R \to S$ is a ring map. Then there exists a directed set $(\Lambda, \leq)$, and a system of ring maps $R_\lambda \to S_\lambda$ such that*

1. *The colimit of the system $R_\lambda \to S_\lambda$ is equal to $R \to S$.*
2. *Each R_λ is of finite type over $\mathbf{Z}$.*
3. *Each S_λ is of finite type over R_λ.*

Proof. This is the non-local version of Lemma 7.118.7. Proof is similar and left to the reader. □

Lemma 7.118.13. *Suppose $R \to S$ is a ring map. Assume that S is of finite type over R. Then there exists a directed set $(\Lambda, \leq)$, and a system of ring maps $R_\lambda \to S_\lambda$ such that*

1. *The colimit of the system $R_\lambda \to S_\lambda$ is equal to $R \to S$.*
2. *Each R_λ is of finite type over $\mathbf{Z}$.*
3. *Each S_λ is of finite type over R_λ.*
4. *For each $\lambda \leq \mu$ the map $S_\lambda \otimes_{R_\lambda} R_\mu \to S_\mu$ presents S_μ as a quotient of $S_\lambda \otimes_{R_\lambda} R_\mu$.*

Proof. This is the non-local version of Lemma 7.118.8. Proof is similar and left to the reader. □

Lemma 7.118.14. *Suppose $R \to S$ is a ring map. Assume that S is of finite presentation over R. Then there exists a directed set $(\Lambda, \leq)$, and a system of ring maps $R_\lambda \to S_\lambda$ such that*

1. *The colimit of the system $R_\lambda \to S_\lambda$ is equal to $R \to S$.*
2. *Each R_λ is of finite type over $\mathbf{Z}$.*
3. *Each S_λ is of finite type over R_λ.*
4. *For each $\lambda \leq \mu$ the map $S_\lambda \otimes_{R_\lambda} R_\mu \to S_\mu$ is an isomorphism.*

Proof. This is the non-local version of Lemma 7.118.9. Proof is similar and left to the reader. □

Lemma 7.118.15. *Suppose $R \to S$ is a ring map. Assume that S is of finite presentation over R. Let M be a finitely presented S-module. Then there exists a directed set $(\Lambda, \leq)$, and a system of ring maps $R_\lambda \to S_\lambda$ together with S_λ-modules M_λ, such that*

1. *The colimit of the system $R_\lambda \to S_\lambda$ is equal to $R \to S$. The colimit of the system M_λ is M.*
2. *Each R_λ is of finite type over $\mathbf{Z}$.*
3. *Each S_λ is of finite type over R_λ.*
4. *Each M_λ is finite over S_λ.*
5. *For each $\lambda \leq \mu$ the map $S_\lambda \otimes_{R_\lambda} R_\mu \to S_\mu$ is an isomorphism.*
6. *For each $\lambda \leq \mu$ the map $M_\lambda \otimes_{S_\lambda} S_\mu \to S_\mu$ is an isomorphism.*

In particular, for every $\lambda \in \Lambda$ we have

$$M = M_\lambda \otimes_{S_\lambda} S = M_\lambda \otimes_{R_\lambda} R.$$

Proof. This is the non-local version of Lemma 7.118.11. Proof is similar and left to the reader. □

7.119. More flatness criteria

The following lemma is often used in algebraic geometry to show that a finite morphism from a normal surface to a smooth surface is flat. It is a partial converse to Lemma 7.103.9 because a finite local ring map certainly satisfies condition (3).

Lemma 7.119.1. *Let $R \to S$ be a local homomorphism of Noetherian local rings. Assume*

1. *R is regular,*
2. *S Cohen-Macaulay,*
3. *$\mathfrak{m}_S = \sqrt{\mathfrak{m}_R S}$, and*
4. $\dim(R) = \dim(S)$.

Then $R \to S$ is flat.

Proof. By induction on $\dim(R)$. The case $\dim(R) = 0$ is trivial, because then R is a field. Assume $\dim(R) > 0$. By (4) this implies that $\dim(S) > 0$. Let $\mathfrak{q}_1, \ldots, \mathfrak{q}_r$ be the minimal primes of S. Note that $\mathfrak{q}_i \neq \mathfrak{m}_S$, hence $\mathfrak{p}_i = R \cap \mathfrak{q}_i$ is not equal to $\mathfrak{m}_R$ by (3). Pick $x \in \mathfrak{m}$, $x \notin \mathfrak{m}^2$, and $x \notin \mathfrak{p}_i$, see Lemma 7.14.3. Hence we see that x is not contained in any of the minimal primes of S. Hence x is a nonzero divisor on S by (2), see Lemma 7.96.2 and S/xS is Cohen-Macaulay with $\dim(S/xS) = \dim(S) - 1$. By (1) and Lemma 7.98.3 the ring R/xR is regular with $\dim(R/xR) = \dim(R) - 1$. By induction we see that $R/xR \to S/xS$ is flat. Hence we conclude by Lemma 7.91.9 (see also the remarks following it). □

Lemma 7.119.2. *Let $R \to S$ be a homomorphism of Noetherian local rings. Assume that R is a regular local ring and that a regular system of parameters maps to a regular sequence in S. Then $R \to S$ is flat.*

Proof. Suppose that $x_1, \ldots, x_d$ are a system of parameters of R which map to a regular sequence in S. Note that $S/(x_1, \ldots, x_d)S$ is flat over $R/(x_1, \ldots, x_d)$ as the latter is a field. Then x_d is a nonzero divisor in $S/(x_1, \ldots, x_{d-1})S$ hence $S/(x_1, \ldots, x_{d-1})S$ is flat over $R/(x_1, \ldots, x_{d-1})$ by the local criterion of flatness (see Lemma 7.91.9 and remarks following). Then x_{d-1} is a nonzero divisor in $S/(x_1, \ldots, x_{d-2})S$ hence $S/(x_1, \ldots, x_{d-2})S$ is flat over $R/(x_1, \ldots, x_{d-2})$ by the local criterion of flatness (see Lemma 7.91.9 and remarks following). Continue till one reaches the conclusion that S is flat over R. □

The following lemma is the key to proving that results for finitely presented modules over finitely presented rings over a base ring follow from the corresponding results for finite modules in the Noetherian case.

Lemma 7.119.3. *Let $R \to S$, M, Λ, $R_\lambda \to S_\lambda$, M_λ be as in Lemma 7.118.11. Assume that M is flat over R. Then for some $\lambda \in \Lambda$ the module M_λ is flat over R_λ.*

Proof. Pick some $\lambda \in \Lambda$ and consider

$$\mathrm{Tor}_1^{R_\lambda}(M_\lambda, R_\lambda/\mathfrak{m}_\lambda) = \mathrm{Ker}(\mathfrak{m}_\lambda \otimes_{R_\lambda} M_\lambda \to M_\lambda).$$

See Remark 7.69.8. The right hand side shows that this is a finitely generated S_λ-module (because S_λ is Noetherian and the modules in question are finite). Let $\xi_1, \ldots, \xi_n$ be generators. Because M is flat over R we have that $0 = \mathrm{Ker}(\mathfrak{m}_\lambda R \otimes_R M \to M)$. Since $\otimes$ commutes with colimits we see there exists a $\lambda' \geq \lambda$ such that each ξ_i maps to zero in $\mathfrak{m}_\lambda R_{\lambda'} \otimes_{R_{\lambda'}} M_{\lambda'}$. Hence we see that

$$\mathrm{Tor}_1^{R_\lambda}(M_\lambda, R_\lambda/\mathfrak{m}_\lambda) \longrightarrow \mathrm{Tor}_1^{R_{\lambda'}}(M_\lambda, R_{\lambda'}/\mathfrak{m}_\lambda R_{\lambda'})$$

is zero. Note that $M_\lambda \otimes_{R_\lambda} R_\lambda/\mathfrak{m}_\lambda$ is flat over $R_\lambda/\mathfrak{m}_\lambda$ because this last ring is a field. Hence we may apply Lemma 7.91.13 to get that $M_{\lambda'}$ is flat over $R_{\lambda'}$. □

Using the lemma above we can start to reprove the results of Section 7.91 in the non-Noetherian case.

Lemma 7.119.4. *Suppose that $R \to S$ is a local homomorphism of local rings. Denote $\mathfrak{m}$ the maximal ideal of R. Let $u : M \to N$ be a map of S-modules. Assume*

(1) *S is essentially of finite presentation over R,*
(2) *M, N are finitely presented over S,*
(3) *N is flat over R, and*
(4) *$\bar{u} : M/\mathfrak{m}M \to N/\mathfrak{m}N$ is injective.*

Then u is injective, and $N/u(M)$ is flat over R.

Proof. By Lemma 7.118.11 and its proof we can find a system $R_\lambda \to S_\lambda$ of local ring maps together with maps of S_λ-modules $u_\lambda : M_\lambda \to N_\lambda$ satisfying the conclusions (1) -- (6) for both N and M of that lemma and such that the colimit of the maps u_λ is u. By Lemma 7.119.3 we may assume that N_λ is flat over R_λ for all sufficiently large λ. Denote $\mathfrak{m}_\lambda \subset R_\lambda$ the maximal ideal and $\kappa_\lambda = R_\lambda/\mathfrak{m}_\lambda$, resp. $\kappa = R/\mathfrak{m}$ the residue fields.

Consider the map

$$\Psi_\lambda : M_\lambda/\mathfrak{m}_\lambda M_\lambda \otimes_{\kappa_\lambda} \kappa \longrightarrow M/\mathfrak{m}M.$$

Since $S_\lambda/\mathfrak{m}_\lambda S_\lambda$ is essentially of finite type over the field κ_λ we see that the tensor product $S_\lambda/\mathfrak{m}_\lambda S_\lambda \otimes_{\kappa_\lambda} \kappa$ is essentially of finite type over κ. Hence it is a Noetherian ring and we conclude the kernel of Ψ_λ is finitely generated. Since $M/\mathfrak{m}M$ is the colimit of the system $M_\lambda/\mathfrak{m}_\lambda M_\lambda$ and κ is the colimit of the fields κ_λ there exists a $\lambda' > \lambda$ such that the kernel of Ψ_λ is generated by the kernel of

$$\Psi_{\lambda,\lambda'} : M_\lambda/\mathfrak{m}_\lambda M_\lambda \otimes_{\kappa_\lambda} \kappa_{\lambda'} \longrightarrow M_{\lambda'}/\mathfrak{m}_{\lambda'} M_{\lambda'}.$$

By construction there exists a multiplicative subset $W \subset S_\lambda \otimes_{R_\lambda} R_{\lambda'}$ such that $S_{\lambda'} = W^{-1}(S_\lambda \otimes_{R_\lambda} R_{\lambda'})$ and

$$W^{-1}(M_\lambda/\mathfrak{m}_\lambda M_\lambda \otimes_{\kappa_\lambda} \kappa_{\lambda'}) = M_{\lambda'}/\mathfrak{m}_{\lambda'} M_{\lambda'}.$$

Now suppose that x is an element of the kernel of

$$\Psi_{\lambda'} : M_{\lambda'}/\mathfrak{m}_{\lambda'} M_{\lambda'} \otimes_{\kappa_{\lambda'}} \kappa \longrightarrow M/\mathfrak{m}M.$$

Then for some $w \in W$ we have $wx \in M_\lambda/\mathfrak{m}_\lambda M_\lambda \otimes \kappa$. Hence $wx \in \mathrm{Ker}(\Psi_\lambda)$. Hence wx is a linear combination of elements in the kernel of $\Psi_{\lambda,\lambda'}$. Hence $wx = 0$ in $M_{\lambda'}/\mathfrak{m}_{\lambda'} M_{\lambda'} \otimes_{\kappa_{\lambda'}} \kappa$, hence $x = 0$ because w is invertible in $S_{\lambda'}$. We conclude that the kernel of $\Psi_{\lambda'}$ is zero for all sufficiently large λ'!

By the result of the preceding paragraph we may assume that the kernel of Ψ_λ is zero for all λ sufficiently large, which implies that the map $M_\lambda/\mathfrak{m}_\lambda M_\lambda \to M/\mathfrak{m}M$ is injective. Combined with $\bar{u}$ being injective this formally implies that also $\overline{u_\lambda} : M_\lambda/\mathfrak{m}_\lambda M_\lambda \to N_\lambda/\mathfrak{m}_\lambda N_\lambda$ is injective. By Lemma 7.91.1 we conclude that (for all sufficiently large λ) the map u_λ is injective and that $N_\lambda/u_\lambda(M_\lambda)$ is flat over R_λ. The lemma follows. □

Lemma 7.119.5. *Suppose that $R \to S$ is a local ring homomorphism of local rings. Denote $\mathfrak{m}$ the maximal ideal of R. Suppose*

(1) *S is essentially of finite presentation over R,*
(2) *S is flat over R, and*
(3) *$f \in S$ is a nonzero divisor in $S/\mathfrak{m}S$.*

Then S/fS is flat over R, and f is a nonzero divisor in S.

Proof. Follows directly from Lemma 7.119.4. □

Lemma 7.119.6. *Suppose that $R \to S$ is a local ring homomorphism of local rings. Denote $\mathfrak{m}$ the maximal ideal of R. Suppose*

(1) *$R \to S$ is essentially of finite presentation,*

(2) *$R \to S$ is flat, and*
(3) *$f_1, \ldots, f_c$ is a sequence of elements of S such that the images $\overline{f}_1, \ldots, \overline{f}_c$ form a regular sequence in $S/\mathfrak{m}S$.*

Then $f_1, \ldots, f_c$ is a regular sequence in S and each of the quotients $S/(f_1, \ldots, f_i)$ is flat over R.

Proof. Induction and Lemma 7.119.5 above. □

Here is the version of the local criterion of flatness for the case of local ring maps which are locally of finite presentation.

Lemma 7.119.7. *Let $R \to S$ be a local homomorphism of local rings. Let $I \neq R$ be an ideal in R. Let M be an S-module. Assume*

(1) *S is essentially of finite presentation over R,*
(2) *M is of finite presentation over S,*
(3) *$Tor_1^R(M, R/I) = 0$, and*
(4) *M/IM is flat over R/I.*

Then M is flat over R.

Proof. Let Λ, $R_\lambda \to S_\lambda$, M_λ be as in Lemma 7.118.11. Denote $I_\lambda \subset R_\lambda$ the inverse image of I. In this case the system $R/I \to S/IS$, M/IM, $R_\lambda \to S_\lambda/I_\lambda S_\lambda$, and $M_\lambda/I_\lambda M_\lambda$ satisfies the conclusions of Lemma 7.118.11 as well. Hence by Lemma 7.119.3 we may assume (after shrinking the index set Λ) that $M_\lambda/I_\lambda M_\lambda$ is flat for all λ. Pick some λ and consider

$$\mathrm{Tor}_1^{R_\lambda}(M_\lambda, R_\lambda/I_\lambda) = \mathrm{Ker}(I_\lambda \otimes_{R_\lambda} M_\lambda \to M_\lambda).$$

See Remark 7.69.8. The right hand side shows that this is a finitely generated S_λ-module (because S_λ is Noetherian and the modules in question are finite). Let $\xi_1, \ldots, \xi_n$ be generators. Because $\mathrm{Tor}^1_R(M, R/I) = 0$ and since $\otimes$ commutes with colimits we see there exists a $\lambda' \geq \lambda$ such that each ξ_i maps to zero in $\mathrm{Tor}_1^{R_{\lambda'}}(M_{\lambda'}, R_{\lambda'}/I_{\lambda'})$. The composition of the maps

$$\begin{array}{c}
R_{\lambda'} \otimes_{R_\lambda} \mathrm{Tor}_1^{R_\lambda}(M_\lambda, R_\lambda/I_\lambda) \\
\Big\downarrow \text{surjective by Lemma 7.91.11} \\
\mathrm{Tor}_1^{R_\lambda}(M_\lambda, R_{\lambda'}/I_\lambda R_{\lambda'}) \\
\Big\downarrow \text{surjective up to localization by Lemma 7.91.12} \\
\mathrm{Tor}_1^{R_{\lambda'}}(M_{\lambda'}, R_{\lambda'}/I_\lambda R_{\lambda'}) \\
\Big\downarrow \text{surjective by Lemma 7.91.11} \\
\mathrm{Tor}_1^{R_{\lambda'}}(M_{\lambda'}, R_{\lambda'}/I_{\lambda'}).
\end{array}$$

is surjective up to a localization by the reasons indicated. The localization is necessary since $M_{\lambda'}$ is not equal to $M_\lambda \otimes_{R_\lambda} R_{\lambda'}$. Namely, it is equal to $M_\lambda \otimes_{S_\lambda} S_{\lambda'}$ and $S_{\lambda'}$ is the localization of $S_\lambda \otimes_{R_\lambda} R_{\lambda'}$ whence the statement up to a localization (or tensoring with $S_{\lambda'}$). Note that Lemma 7.91.11 applies to the first and third arrows because $M_\lambda/I_\lambda M_\lambda$ is flat over R_λ/I_λ and because $M_{\lambda'}/I_\lambda M_{\lambda'}$ is flat over $R_{\lambda'}/I_\lambda R_{\lambda'}$ as it is a base change of the flat module $M_\lambda/I_\lambda M_\lambda$. The composition maps the generators ξ_i to zero as we explained above. We finally conclude that $\text{Tor}_1^{R_{\lambda'}}(M_{\lambda'}, R_{\lambda'}/I_{\lambda'})$ is zero. This implies that $M_{\lambda'}$ is flat over $R_{\lambda'}$ by Lemma 7.91.9. ☐

Please compare the lemma below to Lemma 7.91.14 (the case of Noetherian local rings) and Lemma 7.93.8 (the case of a nilpotent ideal in the base).

Lemma 7.119.8 (Critère de platitude par fibres)**.** *Let R, S, S' be local rings and let $R \to S \to S'$ be local ring homomorphisms. Let M be an S'-module. Let $\mathfrak{m} \subset R$ be the maximal ideal. Assume*

1. *The ring maps $R \to S$ and $R \to S'$ are essentially of finite presentation.*
2. *The module M is of finite presentation over S'.*
3. *The module M is not zero.*
4. *The module $M/\mathfrak{m}M$ is a flat $S/\mathfrak{m}S$-module.*
5. *The module M is a flat R-module.*

Then S is flat over R and M is a flat S-module.

Proof. As in the proof of Lemma 7.118.9 we may first write $R = colim\, R_\lambda$ as a directed colimit of local $\mathbf{Z}$-algebras which are essentially of finite type. Denote $\mathfrak{p}_\lambda$ the maximal ideal of R. Next, we may assume that for some $\lambda_1 \in \Lambda$ there exist $f_{j,\lambda_1} \in R_{\lambda_1}[x_1, \ldots, x_n]$ such that

$$S = colim_{\lambda \geq \lambda_1} S_\lambda, \text{ with } S_\lambda = (R_\lambda[x_1, \ldots, x_n]/(f_{1,\lambda}, \ldots, f_{u,\lambda}))_{\mathfrak{q}_\lambda}$$

For some $\lambda_2 \in \Lambda$, $\lambda_2 \geq \lambda_1$ there exist $g_{j,\lambda_2} \in R_{\lambda_2}[x_1, \ldots, x_n, y_1, \ldots, y_m]$ with images $\overline{g}_{j,\lambda_2} \in S_{\lambda_2}[y_1, \ldots, y_m]$ such that

$$S' = colim_{\lambda \geq \lambda_2} S'_\lambda, \text{ with } S'_\lambda = (S_\lambda[y_1, \ldots, y_m]/(\overline{g}_{1,\lambda}, \ldots, \overline{g}_{v,\lambda}))_{\overline{\mathfrak{q}}'_\lambda}$$

Note that this also implies that

$$S'_\lambda = (R_\lambda[x_1, \ldots, x_n, y_1, \ldots, y_m]/(g_{1,\lambda}, \ldots, g_{v,\lambda}))_{\mathfrak{q}'_\lambda}$$

Choose a presentation

$$(S')^{\oplus s} \to (S')^{\oplus t} \to M \to 0$$

of M over S'. Let $A \in \text{Mat}(t \times s, S')$ be the matrix of the presentation. For some $\lambda_3 \in \Lambda$, $\lambda_3 \geq \lambda_2$ we can find a matrix $A_{\lambda_3} \in \text{Mat}(t \times s, S_{\lambda_3})$ which maps to A. For all $\lambda \geq \lambda_3$ we let $M_\lambda = \text{Coker}((S'_\lambda)^{\oplus s} \xrightarrow{A_\lambda} (S'_\lambda)^{\oplus t})$.

With these choices, we have for each $\lambda_3 \leq \lambda \leq \mu$ that $S_\lambda \otimes_{R_\lambda} R_\mu \to S_\mu$ is a localization, $S'_\lambda \otimes_{S_\lambda} S_\mu \to S'_\mu$ is a localization, and the map $M_\lambda \otimes_{S'_\lambda} S_\mu \to M_\mu$ is an isomorphism. This also implies that $S'_\lambda \otimes_{R_\lambda} R_\mu \to S'_\mu$ is a localization. Thus, since M is flat over R we see by Lemma 7.119.3 that for all λ big enough the module M_λ is flat over R_λ. Moreover, note that $\mathfrak{m} = colim\, \mathfrak{p}_\lambda$, $S/\mathfrak{m}S = colim\, S_\lambda/\mathfrak{p}_\lambda S_\lambda$, $S'/\mathfrak{m}S' = colim\, S'_\lambda/\mathfrak{p}_\lambda S'_\lambda$, and $M/\mathfrak{m}M = colim\, M_\lambda/\mathfrak{p}_\lambda M_\lambda$. Also, for each $\lambda_3 \leq \lambda \leq \mu$ we see (from the properties listed above) that

$$S'_\lambda/\mathfrak{p}_\lambda S'_\lambda \otimes_{S_\lambda/\mathfrak{p}_\lambda S_\lambda} S_\mu/\mathfrak{p}_\mu S_\mu \longrightarrow S'_\mu/\mathfrak{p}_\mu S'_\mu$$

is a localization, and the map

$$M_\lambda/\mathfrak{p}_\lambda M_\lambda \otimes_{S'_\lambda/\mathfrak{p}_\lambda S'_\lambda} S_\mu/\mathfrak{p}_\mu S'_\mu \longrightarrow M_\mu/\mathfrak{p}_\mu M_\mu$$

is an isomorphism. Hence the system $(S_\lambda/\mathfrak{p}_\lambda S_\lambda \to S'_\lambda/\mathfrak{p}_\lambda S'_\lambda, M_\lambda/\mathfrak{p}_\lambda M_\lambda)$ is a system as in Lemma 7.118.11 as well. We may apply Lemma 7.119.3 again because $M/\mathfrak{m}M$ is assumed flat over $S/\mathfrak{m}S$ and we see that $M_\lambda/\mathfrak{p}_\lambda M_\lambda$ is flat over $S_\lambda/\mathfrak{p}_\lambda S_\lambda$ for all λ big enough. Thus for λ big enough the data $R_\lambda \to S_\lambda \to S'_\lambda, M_\lambda$ satisfies the hypotheses of Lemma 7.91.14.

Pick such a λ. Then $S = S_\lambda \otimes_{R_\lambda} R$ is flat over R, and $M = M_\lambda \otimes_{S_\lambda} S'_\lambda$ is flat over S (since the base change of a flat module is flat). $\square$

The following is an easy consequence of the usual version of the ``critére de platitude par fibres". For more results of this kind see More on Flatness, Section 34.1.

Lemma 7.119.9. *(Critère de platitude par fibres; the case of essentially finite presentation over essentially finite type.) Let R, S, S' be local rings and let $R \to S \to S'$ be local ring homomorphisms. Let M be an S'-module. Let $\mathfrak{m} \subset R$ be the maximal ideal. Assume*

(1) *$R \to S'$ is essentially of finite presentation,*
(2) *$R \to S$ is essentially of finite type,*
(3) *M is of finite presentation over S',*
(4) *M is not zero,*
(5) *$M/\mathfrak{m}M$ is a flat $S/\mathfrak{m}S$-module, and*
(6) *M is a flat R-module.*

Then S is essentially of finite presentation and flat over R and M is a flat S-module.

Proof. As S is essentially of finite presentation over R we can write $S = C_{\overline{\mathfrak{q}}}$ for some finite type R-algebra C. Write $C = R[x_1, \ldots, x_n]/I$. Denote $\mathfrak{q} \subset R[x_1, \ldots, x_n]$ be the prime ideal corresponding to $\overline{\mathfrak{q}}$. Then we see that $S = B/J$ where $B = R[x_1, \ldots, x_n]_{\mathfrak{q}}$ is essentially of finite presentation over R and $J = IB$. We can find $f_1, \ldots, f_k \in J$ such that the images $\overline{f}_i \in B/\mathfrak{m}B$ generate the image $\overline{J}$ of J in the Noetherian ring $B/\mathfrak{m}B$. Hence there exist finitely generated ideals $J' \subset J$ such that $B/J' \to B/J$ induces an isomorphism

$$(B/J') \otimes_R R/\mathfrak{m} \longrightarrow B/J \otimes_R R/\mathfrak{m} = S/\mathfrak{m}S.$$

For any J' as above we see that Lemma 7.119.8 applies to the ring maps

$$R \longrightarrow B/J' \longrightarrow S'$$

and the module M. Hence we conclude that B/J' is flat over R for any choice J' as above. Now, if $J' \subset J' \subset J$ are two finitely generated ideals as above, then we conclude that $B/J' \to B/J''$ is a surjective map between flat R-algebras which are essentially of finite presentation which is an isomorphism modulo $\mathfrak{m}$. Hence Lemma 7.119.4 implies that $B/J' = B/J''$, i.e., $J' = J''$. Clearly this means that J is finitely generated, i.e., S is essentially of finite presentation over R. Thus we may apply Lemma 7.119.8 to $R \to S \to S'$ and we win. $\square$

7.120. Openness of the flat locus

Lemma 7.120.1. *Let k be a field. Let S be a finite type k-algebra. Let $f_1, \ldots, f_i$ be elements of S. Assume that S is Cohen-Macaulay and equidimensional of dimension d, and that* $\dim V(f_1, \ldots, f_i) \leq d - i$. *Then equality holds and $f_1, \ldots, f_i$ forms a regular sequence in $S_\mathfrak{q}$ for every prime $\mathfrak{q}$ of $V(f_1, \ldots, f_i)$.*

Proof. If S is Cohen-Macaulay and equidimensional of dimension d, then we have $\dim(S_\mathfrak{m}) = d$ for all maximal ideals $\mathfrak{m}$ of S, see Lemma 7.105.7. By Proposition 7.95.4 we see that for all maximal ideals $\mathfrak{m} \in V(f_1, \ldots, f_i)$ the sequence is a regular sequence in $S_\mathfrak{m}$ and the local ring $S_\mathfrak{m}/(f_1, \ldots, f_i)$ is Cohen-Macaulay of dimension $d - i$. This actually means that $S/(f_1, \ldots, f_i)$ is Cohen-Macaulay and equidimensional of dimension $d - i$. $\square$

Lemma 7.120.2. *Suppose that $R \to S$ is a ring map which is finite type, flat. Let d be an integer such that all fibres $S \otimes_R \kappa(\mathfrak{p})$ are Cohen-Macaulay and equidimensional of dimension d. Let $f_1, \ldots, f_i$ be elements of S. The set*

$$\{\mathfrak{q} \in V(f_1, \ldots, f_i) \mid f_1, \ldots, f_i \text{ are a regular sequence in } S_\mathfrak{q}/\mathfrak{p}S_\mathfrak{q} \text{ where } \mathfrak{p} = R \cap \mathfrak{q}\}$$

is open in $V(f_1, \ldots, f_i)$.

Proof. Write $\overline{S} = S/(f_1, \ldots, f_i)$. Suppose $\mathfrak{q}$ is an element of the set defined in the lemma, and $\mathfrak{p}$ is the corresponding prime of R. We will use relative dimension as defined in Definition 7.116.1. First, note that $d = \dim_\mathfrak{q}(S/R) = \dim(S_\mathfrak{q}/\mathfrak{p}S_\mathfrak{q}) + \text{trdeg}_{\kappa(\mathfrak{p})}\ \kappa(\mathfrak{q})$ by Lemma 7.107.3. Since $f_1, \ldots, f_i$ form a regular sequence in the Noetherian local ring $S_\mathfrak{q}/\mathfrak{p}S_\mathfrak{q}$ general dimension theory tells us that $\dim(\overline{S}_\mathfrak{q}/\mathfrak{p}\overline{S}_\mathfrak{q}) = \dim(S_\mathfrak{q}/\mathfrak{p}S_\mathfrak{q}) - i$. By the same Lemma 7.107.3 we then conclude that $\dim_\mathfrak{q}(\overline{S}/R) = \dim(\overline{S}_\mathfrak{q}/\mathfrak{p}\overline{S}_\mathfrak{q}) + \text{trdeg}_{\kappa(\mathfrak{p})}\ \kappa(\mathfrak{q}) = d - i$. By Lemma 7.116.6 we have $\dim_{\mathfrak{q}'}(\overline{S}/R) \le d - i$ for all $\mathfrak{q}' \in V(f_1, \ldots, f_i) = Spec(\overline{S})$ in a neighbourhood of $\mathfrak{q}$. Thus after replacing S by S_g for some $g \in S$, $g \notin \mathfrak{q}$ we may assume that the inequality holds for all $\mathfrak{q}'$. The result follows from Lemma 7.120.1. $\square$

Lemma 7.120.3. *Let $R \to S$ is a ring map. Consider a finite homological complex of finite free S-modules:*

$$F_\bullet : 0 \to S^{n_e} \xrightarrow{\varphi_e} S^{n_{e-1}} \xrightarrow{\varphi_{e-1}} \ldots \xrightarrow{\varphi_{i+1}} S^{n_i} \xrightarrow{\varphi_i} S^{n_{i-1}} \xrightarrow{\varphi_{i-1}} \ldots \xrightarrow{\varphi_1} S^{n_0}$$

For every prime $\mathfrak{q}$ of S consider the complex $\overline{F}_{\bullet,\mathfrak{q}} = F_{\bullet,\mathfrak{q}} \otimes_R \kappa(\mathfrak{p})$ where $\mathfrak{p}$ is inverse image of $\mathfrak{q}$ in R. Assume there exists an integer d such that $R \to S$ is finite type, flat with fibres $S \otimes_R \kappa(\mathfrak{p})$ Cohen-Macaulay of dimension d. The set

$$\{\mathfrak{q} \in Spec(S) \mid \overline{F}_{\bullet,\mathfrak{q}} \text{ is exact}\}$$

is open in $Spec(S)$.

Proof. Let $\mathfrak{q}$ be an element of the set defined in the lemma. We are going to use Proposition 7.94.10 to show there exists a $g \in S$, $g \notin \mathfrak{q}$ such that $D(g)$ is contained in the set defined in the lemma. In other words, we are going to show that after replacing S by S_g, the set of the lemma is all of $Spec(S)$. Thus during the proof we will, finitely often, replace S by such a localization. Recall that Proposition 7.94.10 characterizes exactness of complexes in terms of ranks of the maps φ_i and the ideals $I(\varphi_i)$, in case the ring is local. We first address the rank condition. Set $r_i = n_i - n_{i+1} + \ldots + (-1)^{e-i} n_e$. Note that $r_i + r_{i+1} = n_i$ and note that r_i is the expected rank of φ_i (in the exact case).

By Lemma 7.91.5 we see that if $\overline{F}_{\bullet,\mathfrak{q}}$ is exact, then the localization $F_{\bullet,\mathfrak{q}}$ is exact. In particular the complex $F_\bullet$ becomes exact after localizing by an element $g \in S$, $g \notin \mathfrak{q}$. In this case Proposition 7.94.10 applied to all localizations of S at prime ideals implies that all $(r_i + 1) \times (r_i + 1)$-minors of φ_i are zero. Thus we see that the rank of of φ_i is at most r_i.

Let $I_i \subset S$ denote the ideal generated by the $r_i \times r_i$-minors of the matrix of φ_i. By Proposition 7.94.10 the complex $\overline{F}_{\bullet,\mathfrak{q}}$ is exact if and only if for every $1 \le i \le e$ we have either $(I_i)_\mathfrak{q} = S_\mathfrak{q}$ or $(I_i)_\mathfrak{q}$ contains a $S_\mathfrak{q}/\mathfrak{p}S_\mathfrak{q}$-regular sequence of length i. Namely, by our choice of r_i above and by the bound on the ranks of the φ_i this is the only way the conditions of Proposition 7.94.10 can be satisfied.

If $(I_i)_\mathfrak{q} = S_\mathfrak{q}$, then after localizing S at some element $g \notin \mathfrak{q}$ we may assume that $I_i = S$. Clearly, this is an open condition.

If $(I_i)_\mathfrak{q} \neq S_\mathfrak{q}$, then we have a sequence $f_1, \ldots, f_i \in (I_i)_\mathfrak{q}$ which form a regular sequence in $S_\mathfrak{q}/\mathfrak{p}S_\mathfrak{q}$. Note that for any prime $\mathfrak{q}' \subset S$ such that $(f_1, \ldots, f_i) \not\subset \mathfrak{q}'$ we have $(I_i)_{\mathfrak{q}'} = S_{\mathfrak{q}'}$. Thus the result follows from Lemma 7.120.2. □

Theorem 7.120.4. *Let R be a ring. Let $R \to S$ be a ring map of finite presentation. Let M be a finitely presented S-module. The set*

$$\{\mathfrak{q} \in Spec(S) \mid M_\mathfrak{q} \text{ is flat over } R\}$$

is open in $Spec(S)$.

Proof. Let $\mathfrak{q} \in Spec(S)$ be a prime. Let $\mathfrak{p} \subset R$ be the inverse image of $\mathfrak{q}$ in R. Note that $M_\mathfrak{q}$ is flat over R if and only if it is flat over $R_\mathfrak{p}$. Let us assume that $M_\mathfrak{q}$ is flat over R. We claim that there exists a $g \in S$, $g \notin \mathfrak{q}$ such that M_g is flat over R.

We first reduce to the case where R and S are of finite type over $\mathbf{Z}$. Choose a directed partially ordered set Λ and a system $(R_\lambda \to S_\Lambda, M_\lambda)$ as in Lemma 7.118.15. Set $\mathfrak{p}_\lambda$ equal to the inverse image of $\mathfrak{p}$ in R_λ. Set $\mathfrak{q}_\lambda$ equal to the inverse image of $\mathfrak{q}$ in S_λ. Then the system

$$((R_\lambda)_{\mathfrak{p}_\lambda}, (S_\lambda)_{\mathfrak{q}_\lambda}, (M_\lambda)_{\mathfrak{q}_\lambda})$$

is a system as in Lemma 7.118.11. Hence by Lemma 7.119.3 we see that for some λ the module M_λ is flat over R_λ at the prime $\mathfrak{q}_\lambda$. Suppose we can prove our claim for the system $(R_\lambda \to S_\lambda, M_\lambda, \mathfrak{q}_\lambda)$. In other words, suppose that we can find a $g \in S_\lambda$, $g \notin \mathfrak{q}_\lambda$ such that $(M_\lambda)_g$ is flat over R_λ. By Lemma 7.118.15 we have $M = M_\lambda \otimes_{R_\lambda} R$ and hence also $M_g = (M_\lambda)_g \otimes_{R_\lambda} R$. Thus by Lemma 7.35.6 we deduce the claim for the system $(R \to S, M, \mathfrak{q})$.

At this point we may assume that R and S are of finite type over $\mathbf{Z}$. We may write S as a quotient of a polynomial ring $R[x_1, \ldots, x_n]$. Of course, we may replace S by $R[x_1, \ldots, x_n]$ and assume that S is a polynomial ring over R. In particular we see that $R \to S$ is flat and all fibres rings $S \otimes_R \kappa(\mathfrak{p})$ have global dimension n.

Choose a resolution $F_\bullet$ of M over S with each F_i finite free, see Lemma 7.67.1. Let $K_n = \text{Ker}(F_{n-1} \to F_{n-2})$. Note that $(K_n)_\mathfrak{q}$ is flat over R, since each F_i is flat over R and by assumption on M, see Lemma 7.35.12. In addition, the sequence

$$0 \to K_n/\mathfrak{p}K_n \to F_{n-1}/\mathfrak{p}F_{n-1} \to \ldots \to F_0/\mathfrak{p}F_0 \to M/\mathfrak{p}M \to 0$$

is exact upon localizing at $\mathfrak{q}$, because of vanishing of $\text{Tor}_i^{R_\mathfrak{p}}(\kappa(\mathfrak{p}), M_\mathfrak{q})$. Since the global dimension of $S_\mathfrak{q}/\mathfrak{p}S_\mathfrak{q}$ is n we conclude that $K_n/\mathfrak{p}K_n$ localized at $\mathfrak{q}$ is a finite free module over $S_\mathfrak{q}/\mathfrak{p}S_\mathfrak{q}$. By Lemma 7.91.4 $(K_n)_\mathfrak{q}$ is free over $S_\mathfrak{q}$. In particular, there exists a $g \in S$, $g \notin \mathfrak{q}$ such that $(K_n)_g$ is finite free over S_g.

By Lemma 7.120.3 there exists a further localization S_g such that the complex

$$0 \to K_n \to F_{n-1} \to \ldots \to F_0$$

is exact on *all fibres* of $R \to S$. By Lemma 7.91.5 this implies that the cokernel of $F_1 \to F_0$ is flat. This proves the theorem in the Noetherian case. □

Here is a technical application of the openness of flatness. It says that we can approximate flat modules by flat modules which is sometimes useful. Please skip on a first reading.

Lemma 7.120.5. *Let $R \to S$ be a ring map. Let M be an S-module. Assume that*

(1) *$R \to S$ is of finite presentation,*
(2) *M is a finitely presented S-module, and*
(3) *M is flat over R.*

In this case we have the following:

1. *There exists a finite type* $\mathbf{Z}$*-algebra* R_0 *and a finite type ring map* $R_0 \to S_0$ *and a finite* S_0*-module* M_0 *such that* M_0 *is flat over* R_0*, together with a ring maps* $R_0 \to R$ *and* $S_0 \to S$ *and an* S_0*-module map* $M_0 \to M$ *such that* $S \cong R \otimes_{R_0} S_0$ *and* $M = S \otimes_{S_0} M_0$*.*
2. *If* $R = colim_{\lambda \in \Lambda} R_\lambda$ *is written as a directed colimit, then there exists a* λ *and a ring map* $R_\lambda \to S_\lambda$ *of finite presentation, and an* S_λ*-module* M_λ *of finite presentation such that* M_λ *is flat over* R_λ *and such that* $S = R \otimes_{R_\lambda} S_\lambda$ *and* $M = S \otimes_{S_\lambda} M_\lambda$*.*
3. *If*
$$(R \to S, M) = colim_{\lambda \in \Lambda}(R_\lambda \to S_\lambda, M_\lambda)$$
is written as a directed colimit such that for $\mu \geq \lambda$ *the maps* $R_\mu \otimes_{R_\lambda} S_\lambda \to S_\mu$ *and* $S_\mu \otimes_{S_\lambda} M_\lambda \to M_\mu$ *are isomorphisms then for all sufficiently large* λ *the module* M_λ *is flat over* R_λ*.*

Proof. We first write $(R \to S, M)$ as the directed colimit of a system $(R_\lambda \to S_\lambda, M_\lambda)$ as in as in Lemma 7.118.15. Let $\mathfrak{q} \subset S$ be a prime. Let $\mathfrak{p} \subset R$, $\mathfrak{q}_\lambda \subset S_\lambda$, and $\mathfrak{p}_\lambda \subset R_\lambda$ the corresponding primes. As seen in the proof of Theorem 7.120.4

$$((R_\lambda)_{\mathfrak{p}_\lambda}, (S_\lambda)_{\mathfrak{q}_\lambda}, (M_\lambda)_{\mathfrak{q}_\lambda})$$

is a system as in Lemma 7.118.11, and hence by Lemma 7.119.3 we see that for some $\lambda_{\mathfrak{q}} \in \Lambda$ for all $\lambda \geq \lambda_{\mathfrak{q}}$ the module M_λ is flat over R_λ at the prime $\mathfrak{q}_\lambda$.

By Theorem 7.120.4 we get an open subset $U_\lambda \subset Spec(S_\lambda)$ such that M_λ flat over R_λ at all the primes of U_λ. Denote $V_\lambda \subset Spec(S)$ the inverse image of U_λ under the map $Spec(S) \to Spec(S_\lambda)$. The argument above shows that for every $\mathfrak{q} \in Spec(S)$ there exists a $\lambda_{\mathfrak{q}}$ such that $\mathfrak{q} \in V_\lambda$ for all $\lambda \geq \lambda_{\mathfrak{q}}$. Since $Spec(S)$ is quasi-compact we see this implies there exists a single $\lambda_0 \in \Lambda$ such that $V_{\lambda_0} = Spec(S)$.

The complement $Spec(S_{\lambda_0}) \setminus U_{\lambda_0}$ is $V(I)$ for some ideal $I \subset S_{\lambda_0}$. As $V_{\lambda_0} = Spec(S)$ we see that $IS = S$. Choose $f_1, \ldots, f_r \in I$ and $s_1, \ldots, s_n \in S$ such that $\sum f_i s_i = 1$. Since $colim\, S_\lambda = S$, after increasing λ_0 we may assume there exist $s_{i,\lambda_0} \in S_{\lambda_0}$ such that $\sum f_i s_{i,\lambda_0} = 1$. Hence for this λ_0 we have $U_{\lambda_0} = Spec(S_{\lambda_0})$. This proves (1).

It turns out that (2) and (3) follow in a mechanical way from part (1). Namely, let $(R_0 \to S_0, M_0)$ be as in (1) and suppose that $R = colim\, R_\lambda$. Since R_0 is a finite type $\mathbf{Z}$ algebra, there exists a lambda and a map $R_0 \to R_\lambda$ such that $R_0 \to R_\lambda \to R$ is the given map $R_0 \to R$. Then, part (2) follows by taking $S_\lambda = R_\lambda \otimes_{R_0} S_0$ and $M_\lambda = S_\lambda \otimes_{S_0} M_0$.

Finally, we come to the proof of (3). We strongly suggest not reading this proof ever! Assume the directed system $(R_\lambda \to S_\lambda, M_\lambda)$ satisfies the hypotheses of (3) and that $(R_0 \to S_0, M_0)$, $R_0 \to R$ satisfies the conclusion of (1). As above, there exits a λ_0 and a ring map $R_0 \to R_{\lambda_0}$ such that $R_0 \to R_{\lambda_0} \to R$ is the given map $R_0 \to R$. Then for all $\lambda \geq \lambda_0$ we get an induced ring map $R_0 \to R_\lambda$ with the same property. Then, since S_0 is of finite type over $\mathbf{Z}$ too, and as $S = colim\, S_\lambda$ we see that for some $\lambda_1 \geq \lambda_0$ we also get an R_0-algebra map $S_0 \to S_{\lambda_1}$ such that the composition $S_0 \to S_{\lambda_1} \to S$ is the given map $S_0 \to S$. For all $\lambda \geq \lambda_1$ this gives maps

$$\Psi_\lambda : R_\lambda \otimes_{R_0} S_0 \longrightarrow R_\lambda \otimes_{R_{\lambda_1}} S_{\lambda_1} \cong S_\lambda$$

the last isomorphism by assumption. Let us argue that this map is an isomorphism for all λ large enough. First, pick generators $x_1, \ldots, x_n$ of the finitely presented algebra S_{λ_1} over R_{λ_1}. Since $S = R \otimes_{R_0} S_0$ and since $R = colim\, R_\lambda$ hence $S = colim\, R_\lambda \otimes_{R_0} S_0$ there exists a $\lambda_2 \geq \lambda_1$ such that $x_i \in S_{\lambda_2}$ is in the image of Ψ_{λ_2}. Hence for $\lambda \geq \lambda_2$ the map Ψ_{λ_2} is surjective. Write $S_0 = R_0[y_1, \ldots, y_m]/I_0$. Write

$$S_{\lambda_2} = R_{\lambda_2}[y_1, \ldots, y_m]/(g_1, \ldots, g_k).$$

We know that $g_1, \ldots, g_k \in I_0R[y_1, \ldots, y_m]$ as $S = R[y_1, \ldots, y_m]/(g_1, \ldots, g_m)$ and also $S = R[y_1, \ldots, y_m]/I_0R[y_1, \ldots, y_m]$ by all our assumptions. Hence for some $\lambda_3 \geq \lambda_2$ we see that $g_1, \ldots, g_m \in I_0R_{\lambda_3}[y_1, \ldots, y_m]$. Then it is clear that Ψ_λ is an isomorphism for all $\lambda \geq \lambda_3$. Phew!

In the same vein, there exists a λ_4 and an S_0-module map $M_0 \to M_{\lambda_4}$ such that $M_0 \to M_{\lambda_4} \to M$ is the given map $M_0 \to M$. We claim that for all λ large enough the induced maps $S_\lambda \otimes_{S_0} M_0 \to M_\lambda$ are isomorphisms. This is proved in exactly the same way as above and we omit it. Of course this implies (3), because M_0 is flat over R_0. □

Lemma 7.120.6. *Let $R \to A \to B$ be ring maps. Assume $A \to B$ faithfully flat of finite presentation. Then there exists a commutative diagram*

$$\begin{tikzcd} R \arrow[r] \arrow[d, equal] & A_0 \arrow[r] \arrow[d] & B_0 \arrow[d] \\ R \arrow[r] & A \arrow[r] & B \end{tikzcd}$$

with $R \to A_0$ of finite presentation, $A_0 \to B_0$ faithfully flat of finite presentation and $B = A \otimes_{A_0} B_0$.

Proof. We first prove the lemma with R replaced $\mathbf{Z}$. By Lemma 7.120.5 there exists a diagram

$$\begin{tikzcd} A_0 \arrow[r] & A \\ B_0 \arrow[u] \arrow[r] & B \arrow[u] \end{tikzcd}$$

where A_0 is of finite type over $\mathbf{Z}$, B_0 is flat of finite presentation over A_0 such that $B = A \otimes_{A_0} B_0$. As $A_0 \to B_0$ is flat of finite presentation we see that the image of $Spec(B_0) \to Spec(A_0)$ is open, see Proposition 7.36.8. Hence the complement of the image is $V(I_0)$ for some ideal $I_0 \subset A_0$. As $A \to B$ is faithfully flat the map $Spec(B) \to Spec(A)$ is surjective, see Lemma 7.35.15. Now we use that the base change of the image is the image of the base change. Hence $I_0A = A$. Pick a relation $\sum f_ir_i = 1$, with $r_i \in A$, $f_i \in I_0$. Then after enlarging A_0 to contain the elements r_i (and correspondingly enlarging B_0) we see that $A_0 \to B_0$ is surjective on spectra also, i.e., faithfully flat.

Thus the lemma holds in case $R = \mathbf{Z}$. In the general case, take the solution $A_0' \to B_0'$ just obtained and set $A_0 = A_0' \otimes_{\mathbf{Z}} R$, $B_0 = B_0' \otimes_{\mathbf{Z}} R$. □

7.121. Openness of Cohen-Macaulay loci

In this section we characterize the Cohen-Macaulay property of finite type algebras in terms of flatness. We then use this to prove the set of points where such an algebra is Cohen-Macaulay is open.

Lemma 7.121.1. *Let S be a finite type algebra over a field k. Let $\varphi : k[y_1, \ldots, y_d] \to S$ be a finite ring map. As subsets of $Spec(S)$ we have*

$$\{\mathfrak{q} \mid S_\mathfrak{q} \text{ flat over } k[y_1, \ldots, y_d]\} = \{\mathfrak{q} \mid S_\mathfrak{q} \text{ CM and } \dim_\mathfrak{q}(S/k) = d\}$$

For notation see Definition 7.116.1.

Proof. Let $\mathfrak{q} \subset S$ be a prime. Denote $\mathfrak{p} = k[y_1, \ldots, y_d] \cap \mathfrak{q}$. Note that always $\dim(S_\mathfrak{q}) \leq \dim(k[y_1, \ldots, y_d]_\mathfrak{p})$ by Lemma 7.116.4 for example. Moreover, the field extension $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{q})$ is finite and hence $\text{trdeg}_k(\kappa(\mathfrak{p})) = \text{trdeg}_k(\kappa(\mathfrak{q}))$.

Let $\mathfrak{q}$ be an element of the left hand side. Then Lemma 7.103.9 applies and we conclude that $S_\mathfrak{q}$ is Cohen-Macaulay and $\dim(S_\mathfrak{q}) = \dim(k[y_1, \ldots, y_d]_\mathfrak{p})$. Combined with the equality of transcendence degrees above and Lemma 7.107.3 this implies that $\dim_\mathfrak{q}(S/k) = d$. Hence $\mathfrak{q}$ is an element of the right hand side.

Let $\mathfrak{q}$ be an element of the right hand side. By the equality of transcendence degrees above, the assumption that $\dim_\mathfrak{q}(S/k) = d$ and Lemma 7.107.3 we conclude that $\dim(S_\mathfrak{q}) = \dim(k[y_1, \ldots, y_d]_\mathfrak{p})$. Hence Lemma 7.119.1 applies and we see that $\mathfrak{q}$ is an element of the left hand side. □

Lemma 7.121.2. *Let S be a finite type algebra over a field k. The set of primes $\mathfrak{q}$ such that $S_\mathfrak{q}$ is Cohen-Macaulay is open in S.*

This lemma is a special case of Lemma 7.121.4 below, so you can skip straight to the proof of that lemma if you like.

Proof. Let $\mathfrak{q} \subset S$ be a prime such that $S_\mathfrak{q}$ is Cohen-Macaulay. We have to show there exists a $g \in S$, $g \notin \mathfrak{q}$ such that the ring S_g is Cohen-Macaulay. For any $g \in S$, $g \notin \mathfrak{q}$ we may replace S by S_g and $\mathfrak{q}$ by $\mathfrak{q}S_g$. Combining this with Lemmas 7.106.5 and 7.107.3 we may assume that there exists a finite injective ring map $k[y_1, \ldots, y_d] \to S$ with $d = \dim(S_\mathfrak{q}) + \text{trdeg}_k(\kappa(\mathfrak{q}))$. Set $\mathfrak{p} = k[y_1, \ldots, y_d] \cap \mathfrak{q}$. By construction we see that $\mathfrak{q}$ is an element of the right hand side of the displayed equality of Lemma 7.121.1. Hence it is also an element of the left hand side.

By Theorem 7.120.4 we see that for some $g \in S$, $g \notin \mathfrak{q}$ the ring S_g is flat over $k[y_1, \ldots, y_d]$. Hence by the equality of Lemma 7.121.1 again we conclude that all local rings of S_g are Cohen-Macaulay as desired. □

Lemma 7.121.3. *Let k be a field. Let S be a finite type k algebra. The set of Cohen-Macaulay primes forms a dense open $U \subset Spec(S)$.*

Proof. The set is open by Lemma 7.121.2 above. It contains all minimal primes $\mathfrak{q} \subset S$ since the local ring at a minimal prime $S_\mathfrak{q}$ has dimension zero and hence is Cohen-Macaulay. □

Lemma 7.121.4. *Let R be a ring. Let $R \to S$ be of finite presentation and flat. For any $d \geq 0$ the set*

$$\left\{ \begin{matrix} \mathfrak{q} \in Spec(S) \text{ such that setting } \mathfrak{p} = R \cap \mathfrak{q} \text{ the fibre ring} \\ S_\mathfrak{q}/\mathfrak{p}S_\mathfrak{q} \text{ is Cohen-Macaulay and } \dim_\mathfrak{q}(S/R) = d \end{matrix} \right\}$$

is open in $Spec(S)$.

Proof. Let $\mathfrak{q}$ be an element of the set indicated, with $\mathfrak{p}$ the corresponding prime of R. We have to find a $g \in S$, $g \notin \mathfrak{q}$ such that all fibre rings of $R \to S_g$ are Cohen-Macaulay. During the course of the proof we may (finitely many times) replace S by S_g for a $g \in S$, $g \notin \mathfrak{q}$. Thus by Lemma 7.116.2 we may assume there is a quasi-finite ring map $R[t_1, \ldots, t_d] \to S$ with $d = \dim_\mathfrak{q}(S/R)$. Let $\mathfrak{q}' = R[t_1, \ldots, t_d] \cap \mathfrak{q}$. By Lemma 7.121.1 we see that the ring map

$$R[t_1, \ldots, t_d]_{\mathfrak{q}'}/\mathfrak{p}R[t_1, \ldots, t_d]_{\mathfrak{q}'} \longrightarrow S_\mathfrak{q}/\mathfrak{p}S_\mathfrak{q}$$

is flat. Hence by the critère de platitude par fibres Lemma 7.119.8 we see that $R[t_1, \ldots, t_d]_{\mathfrak q'} \to S_{\mathfrak q}$ is flat. Hence by Theorem 7.120.4 we see that for some $g \in S$, $g \not\in \mathfrak q$ the ring map $R[t_1, \ldots, t_d] \to S_g$ is flat. Replacing S by S_g we see that for every prime $\mathfrak r \subset S$, setting $\mathfrak r' = R[t_1, \ldots, t_d] \cap \mathfrak r$ and $\mathfrak p' = R \cap \mathfrak r$ the local ring map $R[t_1, \ldots, t_d]_{\mathfrak r'} \to S_{\mathfrak r}$ is flat. Hence also the base change

$$R[t_1, \ldots, t_d]_{\mathfrak r'}/\mathfrak p' R[t_1, \ldots, t_d]_{\mathfrak r'} \longrightarrow S_{\mathfrak r}/\mathfrak p' S_{\mathfrak r}$$

is flat. Hence by Lemma 7.121.1 applied with $k = \kappa(\mathfrak p')$ we see $\mathfrak r$ is in the set of the lemma as desired. □

Lemma 7.121.5. *Let R be a ring. Let $R \to S$ be flat of finite presentation. The set of primes $\mathfrak q$ such that the fibre ring $S_{\mathfrak q} \otimes_R \kappa(\mathfrak p)$, with $\mathfrak p = R \cap \mathfrak q$ is Cohen-Macaulay is open and dense in every fibre of $Spec(S) \to Spec(R)$.*

Proof. The set, call it W, is open by Lemma 7.121.4 above. It is dense in the fibres because the intersection of W with a fibre is the corresponding set of the fibre to which Lemma 7.121.3 applies. □

Lemma 7.121.6. *Let k be a field. Let S be a finite type k-algebra. Let $k \subset K$ be a field extension, and set $S_K = K \otimes_k S$. Let $\mathfrak q \subset S$ be a prime of S. Let $\mathfrak q_K \subset S_K$ be a prime of S_K lying over $\mathfrak q$. Then $S_{\mathfrak q}$ is Cohen-Macaulay if and only if $(S_K)_{\mathfrak q_K}$ is Cohen-Macaulay.*

Proof. During the course of the proof we may (finitely many times) replace S by S_g for any $g \in S$, $g \not\in \mathfrak q$. Hence using Lemma 7.106.5 we may assume that $\dim(S) = \dim_{\mathfrak q}(S/k) =: d$ and find a finite injective map $k[x_1, \ldots, x_d] \to S$. Note that this also induces a finite injective map $K[x_1, \ldots, x_d] \to S_K$ by base change. By Lemma 7.107.6 we have $\dim_{\mathfrak q_K}(S_K/K) = d$. Set $\mathfrak p = k[x_1, \ldots, x_d] \cap \mathfrak q$ and $\mathfrak p_K = K[x_1, \ldots, x_d] \cap \mathfrak q_K$. Consider the following commutative diagram of Noetherian local rings

$$\begin{tikzcd} S_{\mathfrak q} \arrow[r] & (S_K)_{\mathfrak q_K} \\ k[x_1, \ldots, x_d]_{\mathfrak p} \arrow[u] \arrow[r] & K[x_1, \ldots, x_d]_{\mathfrak p_K} \arrow[u] \end{tikzcd}$$

By Lemma 7.121.1 above we have to show that the left vertical arrow is flat if and only if the right vertical arrow is flat. Because the bottom arrow is flat this equivalence holds by Lemma 7.92.1. □

Lemma 7.121.7. *Let R be a ring. Let $R \to S$ be of finite type. Let $R \to R'$ be any ring map. Set $S' = R' \otimes_R S$. Denote $f : Spec(S') \to Spec(S)$ the map associated to the ring map $S \to S'$. Set W equal to the set of primes $\mathfrak q$ such that the fibre ring $S_{\mathfrak q} \otimes_R \kappa(\mathfrak p)$, $\mathfrak p = R \cap \mathfrak q$ is Cohen-Macaulay, and let W' denote the analogue for S'/R'. Then $W' = f^{-1}(W)$.*

Proof. Trivial from Lemma 7.121.6 and the definitions. □

Lemma 7.121.8. *Let R be a ring. Let $R \to S$ be a ring map which is (a) flat, (b) of finite presentation, (c) has Cohen-Macaulay fibres. Then $S = S_0 \times \ldots \times S_n$ is a product of rings S_d such that each S_d satisfies (a), (b), (c) and has all fibres equidimensional of dimension d.*

Proof. For each integer d denote $W_d \subset Spec(S)$ the set defined in Lemma 7.121.4. Clearly we have $Spec(S) = \coprod W_d$, and each W_d is open by the lemma we just quoted. Hence the result follows from Lemma 7.20.3. □

Lemma 7.121.9. *Let $R \to S$ be a faithfully flat ring map of finite presentation. Then there exists a commutative diagram*

$$\begin{tikzcd} S \arrow[rr] & & S' \\ & R \arrow[ul] \arrow[ur] & \end{tikzcd}$$

where $R \to S'$ is quasi-finite, faithfully flat and of finite presentation.

Proof. As a first step we reduce this lemma to the case where R is of finite type over $\mathbf{Z}$. By Lemma 7.120.6 there exists a diagram

$$\begin{tikzcd} S_0 \arrow[r] & S \\ R_0 \arrow[u] \arrow[r] & R \arrow[u] \end{tikzcd}$$

where R_0 is of finite type over $\mathbf{Z}$, and S_0 is faithfully flat of finite presentation over R_0 such that $S = R \otimes_{R_0} S_0$. If we prove the lemma for the ring map $R_0 \to S_0$, then the lemma follows for $R \to S$ by base change, as the base change of a quasi-finite ring map is quasi-finite, see Lemma 7.113.8. (Of course we also use that base changes of flat maps are flat and base changes of maps of finite presentation are of finite presentation.)

Assume $R \to S$ is a faithfully flat ring map of finite presentation and that R is Noetherian (which we may assume by the preceding paragraph). Let $W \subset Spec(S)$ be the open set of Lemma 7.121.4. As $R \to S$ is faithfully flat the map $Spec(S) \to Spec(R)$ is surjective, see Lemma 7.35.15. By Lemma 7.121.5 the map $W \to Spec(R)$ is also surjective. Hence by replacing S with a product $S_{g_1} \times \ldots \times S_{g_m}$ we may assume $W = Spec(S)$; here we use that $Spec(R)$ is quasi-compact (Lemma 7.16.10), and that the map $Spec(S) \to Spec(R)$ is open (Proposition 7.36.8). Suppose that $\mathfrak{p} \subset R$ is a prime. Choose a prime $\mathfrak{q} \subset S$ lying over $\mathfrak{p}$ which corresponds to a maximal ideal of the fibre ring $S \otimes_R \kappa(\mathfrak{p})$. The Noetherian local ring $\overline{S}_{\mathfrak{q}} = S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}}$ is Cohen-Macaulay, say of dimension d. We may choose $f_1, \ldots, f_d$ in the maximal ideal of $S_{\mathfrak{q}}$ which map to a regular sequence in $\overline{S}_{\mathfrak{q}}$. Choose a common denominator $g \in S$, $g \notin \mathfrak{q}$ of $f_1, \ldots, f_d$, and consider the R-algebra

$$S' = S_g/(f_1, \ldots, f_d).$$

By construction there is a prime ideal $\mathfrak{q}' \subset S'$ lying over $\mathfrak{p}$ and corresponding to $\mathfrak{q}$ (via $S_g \to S'_g$). Also by construction the ring map $R \to S'$ is quasi-finite at $\mathfrak{q}$ as the local ring

$$S'_{\mathfrak{q}'}/\mathfrak{p}S'_{\mathfrak{q}'} = S_{\mathfrak{q}}/(f_1, \ldots, f_d) + \mathfrak{p}S_{\mathfrak{q}} = \overline{S}_{\mathfrak{q}}/(\overline{f}_1, \ldots, \overline{f}_d)$$

has dimension zero, see Lemma 7.113.2. Also by construction $R \to S'$ is of finite presentation. Finally, by Lemma 7.91.3 the local ring map $R_{\mathfrak{p}} \to S'_{\mathfrak{q}'}$ is flat (this is where we use that R is Noetherian). Hence, by openness of flatness (Theorem 7.120.4), and openness of quasi-finiteness (Lemma 7.114.14) we may after replacing g by gg' for a suitable $g' \in S$, $g' \notin \mathfrak{q}$ assume that $R \to S'$ is flat and quasi-finite. The image $Spec(S') \to Spec(R)$ is open and contains $\mathfrak{p}$. In other words we have shown a ring S' as in the statement of the lemma exists (except possibly the faithfulness part) whose image contains any given prime. Using one more time the quasi-compactness of $Spec(R)$ we see that a finite product of such rings does the job. $\square$

7.122. Differentials

Definition 7.122.1. Let $\varphi : R \to S$ be a ring map and let M be an S-module. A *derivation*, or more precisely an *R-derivation* into M is a map $D : S \to M$ which is additive, annihilates elements of $\varphi(R)$, and satisfies the *Leibniz rule*: $D(ab) = aD(b) + D(a)b$.

Note that $D(ra) = rD(a)$ if $r \in R$ and $a \in S$. The set of all R-derivations forms an S-module: Given two R-derivations D, D' the sum $D + D' : S \to M$, $a \mapsto D(a) + D'(a)$ is an R-derivation, and given an R-derivation D and an element $c \in S$ the scalar multiple $cD : S \to M$, $a \mapsto cD(a)$ is an R-derivation. We denote this S-module

$$\mathrm{Der}_R(S, M).$$

Also, if $\alpha : M \to N$ is an S-module map, then the composition $\alpha \circ D$ is an R-derivation into N. In this way the assignment $M \mapsto \mathrm{Der}_R(S, M)$ is a covariant functor.

Consider the following map of free S-modules

$$\bigoplus\nolimits_{(a,b)\in S^2} S[(a,b)] \oplus \bigoplus\nolimits_{(f,g)\in S^2} S[(f,g)] \oplus \bigoplus\nolimits_{r\in R} S[r] \longrightarrow \bigoplus\nolimits_{a\in S} S[a]$$

defined by the rules

$$[(a,b)] \longmapsto [a+b] - [a] - [b], \quad [(f,g)] \longmapsto [fg] - f[g] - g[f], \quad [r] \longmapsto [\varphi(r)]$$

with obvious notation. Let $\Omega_{S/R}$ be the cokernel of this map. There is a map $\mathrm{d} : S \to \Omega_{S/R}$ which maps a to the class $\mathrm{d}a$ of $[a]$ in the cokernel. This is an R-derivation by the relations imposed on $\Omega_{S/R}$, in other words

$$\mathrm{d}(a+b) = \mathrm{d}a + \mathrm{d}b, \quad \mathrm{d}(fg) = f\mathrm{d}g + g\mathrm{d}f, \quad \mathrm{d}r = 0$$

where $a, b, f, g \in S$ and $r \in R$.

Definition 7.122.2. The pair $(\Omega_{S/R}, \mathrm{d})$ is called the *module of Kähler diffentials* or the *module of differentials* of S over R.

Lemma 7.122.3. *The module of differentials of S over R has the following universal property. The map*

$$Hom_S(\Omega_{S/R}, M) \longrightarrow Der_R(S, M), \quad \alpha \longmapsto \alpha \circ d$$

is an isomorphism of functors.

Proof. By definition an R-derivation is a rule which associates to each $a \in S$ an element $D(a) \in M$. Thus D gives rise to a map $[D] : \bigoplus S[a] \to M$. However, the conditions of being an R-derivation exactly mean that $[D]$ annihilates the image of the map in the displayed presentation of $\Omega_{S/R}$ above. □

Lemma 7.122.4. *Let I be a directed partially ordered set. Let $(R_i \to S_i, \varphi_{ii'})$ be a system of ring maps over I, see Categories, Section 4.19. Then we have*

$$\Omega_{S/R} = colim_i \, \Omega_{S_i/R_i}.$$

Proof. This is clear from the presentation of $\Omega_{S/R}$ given above. □

Lemma 7.122.5. *Suppose that $R \to S$ is surjective. Then $\Omega_{S/R} = 0$.*

Proof. You can see this either because all R-derivations clearly have to be zero, or because the map in the presentation of $\Omega_{S/R}$ is surjective. □

Suppose that

$$\begin{tikzcd} S \arrow[r, "\varphi"'] & S' \\ R \arrow[u, "\alpha"] \arrow[r, "\psi"] & R' \arrow[u, "\beta"'] \end{tikzcd} \tag{7.122.5.1}$$

is a commutative diagram of rings. In this case there is a natural map of modules of differentials fitting into the commutative diagram

$$\begin{tikzcd} \Omega_{S/R} \arrow[r] & \Omega_{S'/R'} \\ S \arrow[u, "\mathrm{d}"] \arrow[r] & S' \arrow[u, "\mathrm{d}"'] \end{tikzcd}$$

To construct the map just use the obvious map between the presentations for $\Omega_{S/R}$ and $\Omega_{S'/R'}$. Namely,

$$\begin{tikzcd} \bigoplus S'[(a',b')] \oplus \bigoplus S'[(f',g')] \oplus \bigoplus S'[r'] \arrow[r] & \bigoplus S'[a'] \\ \bigoplus S[(a,b)] \oplus \bigoplus S[(f,g)] \oplus \bigoplus S[r] \arrow[u, "{\begin{array}{c}[(a,b)] \mapsto [(\varphi(a),\varphi(b))] \\ {[(f,g)]} \mapsto [(\varphi(f),\varphi(g))] \\ {[r]} \mapsto [\psi(r)]\end{array}}"] \arrow[r] & \bigoplus S[a] \arrow[u, "{[a]\mapsto[\varphi(a)]}"'] \end{tikzcd}$$

The result is simply that $f\mathrm{d}g \in \Omega_{S/R}$ is mapped to $\varphi(f)\mathrm{d}\varphi(g)$.

Lemma 7.122.6. *In diagram (7.122.5.1), suppose that $S \to S'$ is surjective with kernel $I \subset S$. Then $\Omega_{S/R} \to \Omega_{S'/R'}$ is surjective with kernel generated as an S-module by the elements the elements da, where $a \in S$ is such that $\varphi(a) \in \beta(R')$. (This includes in particular the elements $d(i)$, $i \in I$.)*

Proof. Consider the map of presentations above. Clearly the right vertical map of free modules is surjective. Thus the map is surjective. A diagram chase shows that the following elements generate the kernel as an S-module for sure: $i\mathrm{d}a$, $i \in I$, $a \in S$, and $\mathrm{d}a$, with $a \in S$ such that $\varphi(a) = \beta(r')$ for some $r' \in R'$. Note that $\varphi(i) = \varphi(ia) = 0 = \beta(0)$, and that $\mathrm{d}(ia) = i\mathrm{d}a + a\mathrm{d}i$. Hence $i\mathrm{d}a = \mathrm{d}(ia) - a\mathrm{d}i$ is an S-linear combination of elements of the second kind. □

Lemma 7.122.7. *Let $A \to B \to C$ be ring maps. Then there is a canonical exact sequence*

$$C \otimes_B \Omega_{B/A} \to \Omega_{C/A} \to \Omega_{C/B} \to 0$$

of C-modules.

Proof. We get a diagram (7.122.5.1) by putting $R = A$, $S = C$, $R' = B$, and $S' = C$. By Lemma 7.122.6 the map $\Omega_{C/A} \to \Omega_{C/B}$ is surjective, and the kernel is generated by the elements $\mathrm{d}(c)$, where $c \in C$ is in the image of $B \to C$. The lemma follows. □

Lemma 7.122.8. *Let $\varphi : A \to B$ be a ring map.*

(1) *If $S \subset A$ is a multiplicative subset mapping to invertible elements of B, then $\Omega_{B/A} = \Omega_{B/S^{-1}A}$.*
(2) *If $S \subset B$ is a multiplicative subset then $S^{-1}\Omega_{B/A} = \Omega_{S^{-1}B/A}$.*

Proof. To show the equality of (1) it is enough to show that any A-derivation $D : B \to M$ annihilates the elements $\varphi(s)^{-1}$. This is clear from the Leibniz rule applied to $1 = \varphi(s)\varphi(s)^{-1}$. To show (2) note that there is an obvious map $S^{-1}\Omega_{B/A} \to \Omega_{S^{-1}B/A}$. To show it is an isomorphism it is enough to show that there is a A-derivation d' of $S^{-1}B$ into $S^{-1}\Omega_{B/A}$. To define it we simply set $\mathrm{d}'(b/s) = (1/s)\mathrm{d}b - (1/s^2)b\mathrm{d}s$. Details omitted. □

Lemma 7.122.9. *In diagram (7.122.5.1), suppose that $S \to S'$ is surjective with kernel $I \subset S$, and assume that $R' = R$. Then there is a canonical exact sequence of S'-modules*

$$I/I^2 \longrightarrow \Omega_{S/R} \otimes_S S' \longrightarrow \Omega_{S'/R} \longrightarrow 0$$

The leftmost map is characterized by the rule that $f \in I$ maps to $\mathrm{d}f \otimes 1$.

Proof. The middle term is $\Omega_{S/R} \otimes_S S/I$. For $f \in I$ denote $\overline{f}$ the image of f in I/I^2. To show that the map $\overline{f} \mapsto \mathrm{d}f \otimes 1$ is well defined we just have to check that $\mathrm{d}f_1f_2 \otimes 1 = 0$ if $f_1, f_2 \in I$. And this is clear from the Leibniz rule $\mathrm{d}f_1f_2 \otimes 1 = (f_1\mathrm{d}f_2 + f_2\mathrm{d}f_1) \otimes 1 = \mathrm{d}f_2 \otimes f_1 + \mathrm{d}f_2 \otimes f_1 = 0$. A similar computation show this map is $S' = S/I$-linear.

The map $\Omega_{S/R} \otimes_S S' \to \Omega_{S'/R}$ is the canonical S'-linear map associated to the S-linear map $\Omega_{S/R} \to \Omega_{S'/R}$. It is surjective because $\Omega_{S/R} \to \Omega_{S'/R}$ is surjective by Lemma 7.122.6.

The composite of the two maps is zero because $\mathrm{d}f$ maps to zero in $\Omega_{S'/R}$ for $f \in I$. Note that exactness just says that the kernel of $\Omega_{S/R} \to \Omega_{S'/R}$ is generated as an S-submodule by the submodule $I\Omega_{S/R}$ together with the elements $\mathrm{d}f$, with $f \in I$. We know by Lemma 7.122.6 that this kernel is generated by the elements $\mathrm{d}(a)$ where $\varphi(a) = \beta(r)$ for some $r \in R$. But then $a = \alpha(r) + a - \alpha(r)$, so $\mathrm{d}(a) = \mathrm{d}(a - \alpha(r))$. And $a - \alpha(r) \in I$ since $\varphi(a - \alpha(r)) = \varphi(a) - \varphi(\alpha(r)) = \beta(r) - \beta(r) = 0$. We conclude the elements $\mathrm{d}f$ with $f \in I$ already generate the kernel as an S-module, as desired. □

Lemma 7.122.10. *In diagram (7.122.5.1), suppose that $S \to S'$ is surjective with kernel $I \subset S$, and assume that $R' = R$. Moreover, assume that there exists an R-algebra map $S' \to S$ which is a right inverse to $S' \to S$. Then the exact sequence of S'-modules of Lemma 7.122.9 turns into a short exact sequence*

$$0 \longrightarrow I/I^2 \longrightarrow \Omega_{S/R} \otimes_S S' \longrightarrow \Omega_{S'/R} \longrightarrow 0$$

which is even a split short exact sequence.

Proof. Let $\beta : S' \to S$ be the right inverse to the surjection $\alpha : S \to S'$, so $S = I \oplus \beta(S')$. Clearly we can use $\beta : \Omega_{S'/R} \to \Omega_{S/R}$, to get a right inverse to the map $\Omega_{S/R} \otimes_S S' \to \Omega_{S'/R}$. On the other hand, consider the map

$$D : S \longrightarrow I/I^2, \quad x \longmapsto x - \beta(\alpha(x))$$

It is easy to show that D is an R-derivation (omitted). Moreover $xD(s) = 0$ if $x \in I, s \in S$. Hence, by the universal property D induces a map $\tau : \Omega_{S/R} \otimes_R S' \to I/I^2$. We omit the verification that it is a left inverse to $\mathrm{d} : I/I^2 \to \Omega_{S/R} \otimes_S S'$. Hence we win. □

Lemma 7.122.11. *Let $R \to S$ be a ring map. Let $I \subset S$ be an ideal. Let $n \geq 1$ be an integer. Set $S' = S/I^{n+1}$. The map $\Omega_{S/R} \to \Omega_{S'/R}$ induces an isomorphism*

$$\Omega_{S/R} \otimes_S S/I^n \longrightarrow \Omega_{S'/R} \otimes_{S'} S/I^n.$$

Proof. This follows from Lemma 7.122.9 and the fact that $\mathrm{d}(I^{n+1}) \subset I^n\Omega_{S/R}$ by the Leibniz rule for d. □

Lemma 7.122.12. *Suppose that we have ring maps $R \to R'$ and $R \to S$. Set $S' = S \otimes_R R'$, so that we obtain a diagram (7.122.5.1). Then the canonical map defined above induces an isomorphism $\Omega_{S/R} \otimes_R R' = \Omega_{S'/R'}$.*

Proof. Let $\mathrm{d}' : S' = S \otimes_R R' \to \Omega_{S/R} \otimes_R R'$ denote the map $\mathrm{d}'(\sum a_i \otimes x_i) = \mathrm{d}(a_i) \otimes x_i$. It exists because the map $S \times R' \to \Omega_{S/R} \otimes_R R'$, $(a, x) \mapsto \mathrm{d}a \otimes_R x$ is R-bilinear. This is an R'-derivation, as can be verified by a simple computation. We will show that $(\Omega_{S/R} \otimes_R R', \mathrm{d}')$ satisfies the universal property. Let $D : S' \to M'$ be an R' derivation into an S'-module. The composition $S \to S' \to M'$ is an R-derivation, hence we get an S-linear map $\varphi_D : \Omega_{S/R} \to M'$. We may tensor this with R' and get the map $\varphi'_D : \Omega_{S/R} \otimes_R R' \to M'$, $\varphi'_D(\eta \otimes x) = x\varphi_D(\eta)$. It is clear that $D = \varphi'_D \circ \mathrm{d}'$. □

The multiplication map $S \otimes_R S \to S$ is the R-algebra map which maps $a \otimes b$ to ab in S. It is also an S-algebra map, if we think of $S \otimes_R S$ as an S-algebra via either of the maps $S \to S \otimes_R S$.

Lemma 7.122.13. *Let $R \to S$ be a ring map. Let $J = Ker(S \otimes_R S \to S)$ be the kernel of the multiplication map. There is a canonical isomorphism of S-modules $\Omega_{S/R} \to J/J^2$, $adb \mapsto a \otimes b - ab \otimes 1$.*

Proof. First we show that the rule $a\mathrm{d}b \mapsto a \otimes b - ab \otimes 1$ is well defined. In order to do this we have to show that $\mathrm{d}r$ and $a\mathrm{d}b + b\mathrm{d}a - d(ab)$ map to zero. The first because $r \otimes 1 - 1 \otimes r = 0$ by definition of the tensor product. The second because $a \otimes b - ab \otimes 1 + b \otimes a - ba \otimes 1 = (a \otimes 1 - 1 \otimes a)(1 \otimes b - b \otimes 1)$ is in J^2.

We construct a map in the other direction. We may think of $S \to S \otimes_R S$, $a \mapsto a \otimes 1$ as the base change of $R \to S$. Hence we have $\Omega_{S \otimes_R S/S} = \Omega_{S/R} \otimes_S (S \otimes_R S)$, by Lemma 7.122.12. At this point the sequence of Lemma 7.122.9 gives a map

$$J/J^2 \to \Omega_{S \otimes_R S/S} \otimes_{S \otimes_R S} S = (\Omega_{S/R} \otimes_S (S \otimes_R S)) \otimes_{S \otimes_R S} S = \Omega_{S/R}.$$

We leave it to the reader to see it is the inverse of the map above. □

Lemma 7.122.14. *If $S = R[x_1, \ldots, x_n]$, then $\Omega_{S/R}$ is a finite free S-module with basis $dx_1, \ldots, dx_n$.*

Proof. We first show that $\mathrm{d}x_1, \ldots, \mathrm{d}x_n$ generate $\Omega_{S/R}$ as an S-module. To prove this we show that $\mathrm{d}g$ can be expressed as a sum $\sum g_i \mathrm{d}x_i$ for any $g \in R[x_1, \ldots, x_n]$. We do this by induction on the (total) degree of g. It is clear if the degree of g is 0, because then $\mathrm{d}g = 0$. If the degree of g is > 0, then we may write g as $c + \sum g_i x_i$ with $c \in R$ and $\deg(g_i) < \deg(g)$. By the Leibnize rule we have $\mathrm{d}g = \sum g_i \mathrm{d}x_i + \sum x_i \mathrm{d}g_i$, and hence we win by induction.

Consider the R-derivation $\partial/\partial x_i : R[x_1, \ldots, x_n] \to R[x_1, \ldots, x_n]$. (We leave it to the reader to define this; the defining property being that $\partial/\partial x_i(x_j) = \delta_{ij}$.) By the universal property this corresponds to an S-module map $l_i : \Omega_{S/R} \to R[x_1, \ldots, x_n]$ which maps $\mathrm{d}x_i$ to 1 and $\mathrm{d}x_j$ to 0 for $j \neq i$. Thus it is clear that there are no S-linear relations among the elements $\mathrm{d}x_1, \ldots, \mathrm{d}x_n$. □

Lemma 7.122.15. *Suppose $R \to S$ is of finite presentation. Then $\Omega_{S/R}$ is a finitely presented S-module.*

Proof. Write $S = R[x_1, \ldots, x_n]/(f_1, \ldots, f_m)$. Write $I = (f_1, \ldots, f_m)$. According to Lemma 7.122.9 there is an exact sequence of S-modules

$$I/I^2 \to \Omega_{R[x_1,\ldots,x_n]/R} \otimes_{R[x_1,\ldots,x_n]} S \to \Omega_{S/R} \to 0$$

The result follows from the fact that I/I^2 is a finite S-module (generated by the images of the f_i), and that the middle term is finite free by Lemma 7.122.14. □

Lemma 7.122.16. *Suppose $R \to S$ is of finite type. Then $\Omega_{S/R}$ is finitely generated S-module.*

Proof. This is very similar to, but easier than the proof of Lemma 7.122.15. □

7.123. The naive cotangent complex

Let $R \to S$ be a ring map. Denote $R[S]$ the polynomial ring whose variables are the elements $s \in S$. Let's denote $[s] \in R[S]$ the variable corresponding to $s \in S$. Thus $R[S]$ is a free R-module on the basis elements $[s_1] \ldots [s_n]$ where $s_1, \ldots, s_n$ is an unordered sequence of elements of S. There is a canonical surjection

$$R[S] \longrightarrow S, \quad [s] \longmapsto s \tag{7.123.0.1}$$

whose kernel we denote $I \subset R[S]$. It is a simple observation that I is generated by the elements $[s][s'] - [ss']$ and $r[s] - [rs]$. According to Lemma 7.122.9 there is a canonical map

$$I/I^2 \longrightarrow \Omega_{R[S]/S} \otimes_R S \tag{7.123.0.2}$$

whose cokernel is canonically isomorphic to $\Omega_{S/R}$. Observe that the S-module $\Omega_{R[S]/R} \otimes_R S$ is free on the generators $\text{d}[s]$.

Definition 7.123.1. Let $R \to S$ be a ring map. The *naive cotangent complex $NL_{S/R}$* is the chain complex (7.123.0.2)

$$NL_{S/R} = \left(I/I^2 \longrightarrow \Omega_{R[S]/S} \otimes_R S\right)$$

with I/I^2 placed in (homological) degree 1 and $\Omega_{R[S]/S} \otimes_R S$ placed in degree 0. We will denote $H_1(L_{S/R}) = H_1(NL_{S/R})$[6] the homology in degree 1.

Before we continue let us say a few words about the actual cotangent complex (insert future reference here). Given a ring map $R \to S$ there exists a canonical augmented cosimplicial R-algebra $P_{S/R,\bullet}$ whose terms are polynomial algebras and which comes equipped with a canonical homotopy equivalence

$$P_{S/R,\bullet} \longrightarrow S$$

The cotangent complex $L_{S/R}$ of S over R is defined as the chain complex associated to the cosimplicial module

$$\Omega_{P_{S/R,\bullet}/R} \otimes_{P_{S/R,\bullet}} S$$

The naive cotangent complex as defined above is canonically isomorphic to the truncation $\tau_{\leq 1} L_{S/R}$ (see Homology, Section 10.11). In particular, it is indeed the case that $H_1(NL_{S/R}) = H_1(L_{S/R})$ so our definition is compatible with the one using the cotangent complex. Moreover, $H_0(L_{S/R}) = H_0(NL_{S/R}) = \Omega_{S/R}$ as we've seen above.

Let $R \to S$ be a ring map. A *presentation of S over R* is a surjection $\alpha : P \to S$ of R-algebras where P is a polynomial algebra (on a set of variables). Often, when S is of finite type over R we will indicate this by saying: ``Let $R[x_1, \ldots, x_n] \to S$ be a presentation of $S/R$", or ``Let $0 \to I \to R[x_1, \ldots, x_n] \to S \to 0$ be a presentation of S/R" if we want to indicate that I is the kernel of the presentation. Note that the map $R[S] \to S$ used to define the naive cotangent complex is an example of a presentation.

[6] This module is sometimes denoted $\Gamma_{S/R}$ in the literature.

Note that for every presentation α we obtain a two term chain complex of S-modules

$$NL(\alpha) : I/I^2 \longrightarrow \Omega_{P/R} \otimes_P S.$$

Here the term I/I^2 is placed in degree 1 and the term $\Omega_{P/R} \otimes S$ is placed in degree 0. The class of $f \in I$ in I/I^2 is mapped to $\mathrm{d}f \otimes 1$ in $\Omega_{P/R} \otimes S$. The cokernel of this complex is canonically $\Omega_{S/R}$, see Lemma 7.122.9. We call the complex $NL(\alpha)$ the *naive cotangent complex associated to the presentation $\alpha : P \to S$ of S/R*. Note that if $P = R[S]$ with its canonical surjection onto S, then we recover $NL_{S/R}$. If $P = R[x_1, \ldots, x_n]$ then will sometimes use the notation $I/I^2 \to \bigoplus_{i=1,\ldots,n} S\mathrm{d}x_i$ to denote this complex.

Suppose we are given a commutative diagram

$$\begin{tikzcd} S \arrow[r, "\phi"] & S' \\ R \arrow[u] \arrow[r] & R' \arrow[u] \end{tikzcd} \tag{7.123.1.1}$$

of rings. Let $\alpha : P \to S$ be a presentation of S over R and let $\alpha : P' \to S'$ be a presentation of S' over R'. A *morphism of presentations from $\alpha : P \to S$ to $\alpha' : P' \to S'$* is defined to be an R-algebra map

$$\varphi : P \to P'$$

such that $\phi \circ \alpha = \alpha' \circ \varphi$. Note that in this case $\varphi(I) \subset I'$, where $I = \ker(\alpha)$ and $I' = \ker(\alpha')$. Thus φ induces a map of S-modules $I/I^2 \to I'/(I')^2$ and by functoriality of differentials also an S-module map $\Omega_{P/R} \otimes S \to \Omega_{P'/R'} \otimes S'$. These maps are compatible with the differentials of $NL(\alpha)$ and $NL(\alpha')$ and we obtain a map of naive cotangent complexes

$$NL(\alpha) \longrightarrow NL(\alpha').$$

It is often convenient to consider the induced map $NL(\alpha) \otimes_S S' \to NL(\alpha')$.

In the special case that $P = R[S]$ and $P' = R'[S']$ the map $\phi : S \to S'$ induces a canonical ring map $\varphi : P \to P'$ by the rule $[s] \mapsto [\phi(s)]$. Hence the construction above determines a canonical(!) maps of chain complexes

$$NL_{S/R} \longrightarrow NL_{S'/R'}, \quad \text{and} \quad NL_{S/R} \otimes_S S' \longrightarrow NL_{S'/R'}$$

associated to the diagram (7.123.1.1). Note that this construction is compatible with composition: given a commutative diagram

$$\begin{tikzcd} S \arrow[r, "\phi"] & S' \arrow[r, "\phi'"] & S'' \\ R \arrow[u] \arrow[r] & R' \arrow[u] \arrow[r] & R'' \arrow[u] \end{tikzcd}$$

we see that the composition of

$$NL_{S/R} \longrightarrow NL_{S'/R'} \longrightarrow NL_{S'/R'}$$

is the map $NL_{S/R} \to NL_{S''/R''}$ given by the outer square.

It turns out that $NL(\alpha)$ is homotopy equivalent to $NL_{S/R}$ and that the maps constructed above are well defined up to homotopy (homotopies of maps of complexes are discussed in Homology, Section 10.10 but we also spell out the exact meaning of the statements in the lemma below in its proof).

Lemma 7.123.2. *Suppose given a diagram (7.123.1.1). Let $\alpha : P \to S$ and $\alpha' : P' \to S'$ be presentations.*

(1) *There exist a morphism of presentations from α to α'.*
(2) *Any two morphisms of presentations induce homotopic morphisms of complexes $NL(\alpha) \to NL(\alpha')$.*
(3) *The construction is compatible with compositions of morphisms of presentations (see proof for exact statement).*
(4) *If $R \to R'$ and $S \to S'$ are isomorphisms, then for any map φ of presentations from α to α' the induced map $NL(\alpha) \to NL(\alpha')$ is a homotopy equivalence and a quasi-isomorphism.*

In particular, comparing α to the canonical presentation (7.123.0.1) we conclude there is a quasi-isomorphism $NL(\alpha) \to NL_{S/R}$ well defined up to homotopy and compatible with all functorialities (up to homotopy).

Proof. To construct a morphism φ from α to α', write $P = R[x_a, a \in A]$. Choose for every a an element $f_a \in P'$ such that $\alpha'(f_a) = \phi(\alpha(x_i))$. Let $\varphi : P = R[x_a, a \in A] \to P'$ be the unique R-algebra map such that $\varphi(x_a) = f_a$. This gives the morphism.

Let φ and φ' morphisms of presentations from α to α'. Let $I = \mathrm{Ker}(\alpha)$ and $I' = \mathrm{Ker}(\alpha')$. We have to construct the diagonal map h in the diagram

$$\begin{tikzcd} I/I^2 \arrow[r, "\mathrm{d}"] \arrow[d, shift right, "\varphi_1"'] \arrow[d, shift left, "\varphi_1'"] & \Omega_{P/R} \otimes_P S \arrow[d, shift right, "\varphi_0"'] \arrow[d, shift left, "\varphi_0'"] \arrow[dl, "h"'] \\ J/J^2 \arrow[r, "\mathrm{d}"] & \Omega_{P'/R'} \otimes_{P'} S' \end{tikzcd}$$

where the vertical maps are induced by φ, φ' such that

$$\varphi_1 - \varphi_1' = h \circ d \quad \text{and} \quad \varphi_0 - \varphi_0' = d \circ h$$

Consider the map $D = \varphi - \varphi' : P \to P'$. Since both φ and φ are compatible with α and α' we conclude that $\varphi - \varphi' : P \to I'$. Also $\varphi - \varphi'$ is R-linear and

$$(\varphi - \varphi')(fg) = \varphi(f)(\varphi - \varphi')(g) + (\varphi - \varphi')(f)\varphi'(g)$$

Hence the induced map $D : P \to I'/(I')^2$ is a R-derivation. Thus we obtain a canonical map $h : \Omega_{P/S} \otimes_P S \to I'/(I')^2$ such that $D = h \circ \mathrm{d}$. A calculation (omitted) shows that h is the desired homotopy.

Suppose that we have a commutative diagram

$$\begin{tikzcd} S \arrow[r, "\phi"'] & S' \arrow[r, "\phi'"'] & S'' \\ R \arrow[r] \arrow[u] & R' \arrow[r] \arrow[u] & R'' \arrow[u] \end{tikzcd}$$

with finite type vertical arrows. Suppose that

(1) $\alpha : P \to S$,
(2) $\alpha' : P' \to S'$, and
(3) $\alpha'' : P'' \to S''$

are presentations. Suppose that

(1) $\varphi : P \to P$ is a morphism of presentations from α to α' and
(2) $\varphi' : P' \to P''$ is a morphism of presentations from α' to α''.

Then it is immediate that $\varphi' \circ \varphi : P \to P''$ is a morphism of presentations from α to α'' and that the induced map $NL(\alpha) \to NL(\alpha'')$ of naive cotangent complexes is the composition of the maps $NL(\alpha) \to NL(\alpha')$ and $NL(\alpha) \to NL(\alpha')$ induced by φ and φ'.

In the simple case of complexes with 2 terms a quasi-isomorphism is just a map that induces an isomorphism on both the cokernel and the kernel of the maps between the terms. Note that homotopic maps of 2 term complexes (as explained above) define the same maps on kernel and cokernel. Hence if φ is a map from a presentation α of S over R to itself, then the induced map $NL(\alpha) \to NL(\alpha)$ is a quasi-isomorphism being homotopic to the identity by part (2). To prove (4) in full generality, consider a morphism φ' from α' to α which exists by (1). The compositions $NL(\alpha) \to NL(\alpha') \to NL(\alpha)$ and $NL(\alpha') \to NL(\alpha) \to NL(\alpha')$ are homotopic to the identity maps by (3), hence these maps are homotopy equivalences by definition. It follows formally that both maps $NL(\alpha) \to NL(\alpha')$ and $NL(\alpha') \to NL(\alpha)$ are quasi-isomorphisms. Some details omitted. $\square$

The following lemma is part of the motivation for introducing the naive cotangent complex. The cotangent complex extends this to a genuine long exact cohomology sequence. If $B \to C$ is a local complete intersection, then one can extend the sequence with a zero on the left, see More on Algebra, Lemma 12.24.6.

Lemma 7.123.3 (Jacobi-Zariski sequence)**.** *Let $A \to B \to C$ be ring maps. Choose a presentation $\alpha : A[x_s, s \in S] \to B$ with kernel I. Choose a presentation $\beta : B[y_t, t \in T] \to C$ with kernel J. Let $\gamma : A[x_s, y_t] \to C$ be the induced presentation of C with kernel K. Then we get a canonical commutative diagram*

$$\begin{tikzcd} 0 \arrow[r] & \Omega_{A[x_s]/A} \otimes C \arrow[r] & \Omega_{A[x_s,y_t]/A} \otimes C \arrow[r] & \Omega_{B[y_t]/B} \otimes C \arrow[r] & 0 \\ & I/I^2 \otimes C \arrow[r] \arrow[u] & K/K^2 \arrow[r] \arrow[u] & J/J^2 \arrow[r] \arrow[u] & 0 \end{tikzcd}$$

with exact rows. We get the following exact sequence of homology groups

$$H_1(NL_{B/A} \otimes_B C) \to H_1(L_{C/A}) \to H_1(L_{C/B}) \to C \otimes_B \Omega_{B/A} \to \Omega_{C/A} \to \Omega_{C/B} \to 0$$

of C-modules extending the sequence of Lemma 7.122.7. If $Tor_1^B(\Omega_{B/A}, C) = 0$, then $H_1(NL_{B/A} \otimes_B C) = H_1(L_{B/A}) \otimes_B C$.

Proof. The precise definition of the maps is omitted. The exactness of the top row follows as the $\mathrm{d}x_s$, $\mathrm{d}y_t$ form a basis for the middle module. The map γ factors

$$A[x_s, y_t] \to B[y_t] \to C$$

with surjective first arrow and second arrow equal to β. Thus we see that $K \to J$ is surjective. Moreover, the kernel of the first displayed arrow is $IA[x_s, y_t]$. Hence $I/I^2 \otimes C$ surjects onto the kernel of $J/J^2 \to K/K^2$. Finally, we can use Lemma 7.123.2 to identify the terms as homology groups of the naive cotangent complexes. The final assertion follows as the degree 0 term of the complex $NL_{B/A}$ is a free B-module. $\square$

Lemma 7.123.4. *Let $A \to B$ be a surjective ring map with kernel I. Then $NL_{B/A}$ is homotopy equivalent to the chain complex $(I/I^2 \to 0)$ with I/I^2 in degree 1. In particular $H_1(L_{B/A}) = I/I^2$.*

Proof. Follows from Lemma 7.123.2 and the fact that $A \to B$ is a presentation of B over A. $\square$

Lemma 7.123.5. *Let $A \to B \to C$ be ring maps. Assume $A \to C$ is surjective (so also $B \to C$ is). Denote $I = Ker(A \to C)$ and $J = Ker(B \to C)$. Then the sequence*

$$I/I^2 \to J/J^2 \to \Omega_{B/A} \otimes_B B/J \to 0$$

is exact.

Proof. Follows from Lemma 7.123.3 and the description of the naive cotangent complexes $NL_{C/B}$ and $NL_{C/A}$ in Lemma 7.123.4. □

Lemma 7.123.6 (Flat base change)**.** *Let $R \to S$ be a ring map. Let $\alpha : P \to S$ be a presentation. Let $R \to R'$ be a flat ring map. Let $\alpha' : P' \otimes_R R' \to S' = S \otimes_R R'$ be the induced presentation. Then $NL(\alpha) \otimes_R R' = NL(\alpha) \otimes_S S' = NL(\alpha')$. In particular, the canonical map*

$$NL_{S/R} \otimes_R R' \longrightarrow NL_{S \otimes_R R'/R'}$$

is a homotopy equivalence if $R \to R'$ is flat.

Proof. This is true because $\mathrm{Ker}(\alpha') = R' \otimes_R \mathrm{Ker}(\alpha)$ since $R \to R'$ is flat. □

Lemma 7.123.7. *Let $R_i \to S_i$ be a system of ring maps over the directed partially ordered set I. Set $R = colim\, R_i$ and $S = colim\, S_i$. Then $NL_{S/R} = colim\, NL_{S_i/R_i}$.*

Proof. Recall that $NL_{S/R}$ is the complex $I/I^2 \to \bigoplus_{s \in S} S\mathrm{d}[s]$ where $I \subset R[S]$ is the kernel of the canonical presentation $R[S] \to S$. Now it is clear that $R[S] = colim\, R_i[S_i]$ and similarly that $I = colim\, I_i$ where $I_i = \mathrm{Ker}(R_i[S_i] \to S_i)$. Hence the lemma is clear. □

Lemma 7.123.8. *If $S \subset A$ is a multiplicative subset of A, then $NL_{S^{-1}A/A}$ is homotopy equivalent to the zero complex.*

Proof. Since $A \to S^{-1}A$ is flat we see that $NL_{S^{-1}A/A} \otimes_A S^{-1}A \to NL_{S^{-1}A/S^{-1}A}$ is a homotopy equivalence. Since the source of the arrow is isomorphic to $NL_{S^{-1}A/A}$ and the target of the arrow is zero (by Lemma 7.123.4) we win. □

Lemma 7.123.9. *Let $S \subset A$ is a multiplicative subset of A. Let $S^{-1}A \to B$ be a ring map. Then $NL_{B/A} \to NL_{B/S^{-1}A}$ is an homotopy equivalence.*

Proof. Follows from Lemmas 7.123.3 and 7.123.8. □

Lemma 7.123.10. *Let $A \to B$ be a ring map. Let $S \subset B$ be a multiplicative subset. Then there exists a quasi-isomorphism $NL_{B/A} \otimes_B S^{-1}B \to NL_{S^{-1}B/A}$.*

Proof. Note that $S^{-1}B = colim_{g \in S}\, B_g$ where we think of S as a directed partially ordered set (ordering by divisibility). Hence by Lemma 7.123.7 it suffices to prove $NL_{B/A} \otimes_B B_g \to NL_{B_g/A}$. Suppose $\alpha : P \to B$ is a presentation with kernel I. Then a presentation of B_g over A is

$$\beta : P[x] \longrightarrow B_g$$

mapping x to $1/g$ in B_g. Then kernel J of β is generated by I and the element $fx - 1$. Here $f \in P$ is a polynomial that maps to g in B. In this case

$$J/J^2 \cong (I/I^2)_g \oplus B_g \cdot (fx - 1).$$

Moreover, the term of degree zero of the naive cotangent complex for the presentation of B_g has one more summand, namely $B_g\mathrm{d}x$. Thus we see that there is a short exact sequence of complexes

$$0 \to NL(\alpha) \otimes_B B_g \to NL(\beta) \to (B_g \xrightarrow{g} B_g) \to 0$$

which proves that $NL(\beta)$ is quasi-isomorphic to $NL(\alpha) \otimes_S S_g$. By Lemma 7.123.2 this implies $NL_{B/A} \otimes_B B_g \to NL_{B_g/A}$ is a quasi-isomorphism as desired. $\square$

Lemma 7.123.11. *Let R be a ring. Let $A_1 \to A_0$, and $B_1 \to B_0$ be two two term complexes. Suppose that there exist morphisms of complexes $\varphi : A_\bullet \to B_\bullet$ and $\psi : B_\bullet \to A_\bullet$ such that $\varphi \circ \psi$ and $\psi \circ \varphi$ are homotopic to the identity maps. Then $A_1 \oplus B_0 \cong B_1 \oplus A_0$ as R-modules.*

Proof. Choose a map $h : A_0 \to B_1$ such that

$$\mathrm{id}_{A_1} - \psi_1 \circ \varphi_1 = h \circ d_A \text{ and } \mathrm{id}_{A_0} - \psi_0 \circ \varphi_0 = d_A \circ h.$$

Similarly, choose a map $h' : B_0 \to A_1$ such that

$$\mathrm{id}_{B_1} - \varphi_1 \circ \psi_1 = h \circ d_B \text{ and } \mathrm{id}_{B_0} - \varphi_0 \circ \psi_0 = d_B \circ h.$$

A trivial computation shows that

$$\begin{pmatrix} \mathrm{id}_{A_1} & -h' \circ \psi_1 + h \circ \psi_0 \\ 0 & \mathrm{id}_{B_0} \end{pmatrix} = \begin{pmatrix} \psi_1 & h \\ -d_B & \varphi_0 \end{pmatrix} \begin{pmatrix} \varphi_1 & -h' \\ d_A & \psi_0 \end{pmatrix}$$

This shows that both matrices on the right hand side are invertible and proves the lemma. $\square$

Lemma 7.123.12. *Let $R \to S$ be a ring map of finite type. For any presentations $\alpha : R[x_1, \ldots, x_n] \to S$, and $\beta : R[y_1, \ldots, y_m] \to S$ we have*

$$I/I^2 \oplus S^{\oplus m} \cong J/J^2 \oplus S^{\oplus n}$$

as S-modules where $I = Ker(\alpha)$ and $J = ker(\beta)$.

Proof. See Lemmas 7.123.2 and 7.123.11. $\square$

Lemma 7.123.13. *Let $R \to S$ be a ring map of finite type. Let $g \in S$. For any presentations $\alpha : R[x_1, \ldots, x_n] \to S$, and $\beta : R[y_1, \ldots, y_m] \to S_g$ we have*

$$(I/I^2)_g \oplus S_g^{\oplus m} \cong J/J^2 \oplus S_g^{\oplus n}$$

as S_g-modules where $I = Ker(\alpha)$ and $J = ker(\beta)$.

Proof. By Lemma 7.123.12 above, we see that it suffices to prove this for a single choice of α and β. Thus take β to be the presentation

$$\beta : R[x_1, \ldots, x_n, x_{n+1}] \longrightarrow S_g$$

which maps x_i to $\alpha(x_i)$ and x_{n+1} to $1/g$. Clearly $J = Ik[x_1, \ldots, x_n, x_{n+1}] + (x_{n+1}g - 1)$. Hence $J/J^2 \cong (I/I^2)_g \oplus S_g$ and we win. $\square$

7.124. Local complete intersections

The property of being a local complete intersection is somehow an intrinsic property of a Noetherian local ring. However, for the moment we just define this property for finite type algebras over a field.

Definition 7.124.1. Let k be a field. Let S be a finite type k-algebra.

(1) We say that S is a *global complete intersection over k* if there exists a presentation $S = k[x_1, \ldots, x_n]/(f_1, \ldots, f_c)$ such that $\dim(S) = n - c$.
(2) We say that S is a *local complete intersection over k* if there exists a covering $Spec(S) = \bigcup D(g_i)$ such that each of the rings S_{g_i} is a global complete intersection over k.

We will also use the convention that the zero ring is a global complete intersection over k.

Suppose S is a global complete intersection $S = k[x_1, \ldots, x_n]/(f_1, \ldots, f_c)$ as in the definition. Recall that $\dim(S) = n - c$ means that all irreducible components of $Spec(S)$ have dimension $\leq n - c$. Since all maximal ideals of the polynomial ring have local rings of dimension n we conclude that all irreducible components of $Spec(S)$ have dimension $\geq n - c$. See Section 7.57. In other words, $Spec(S)$ is equidimensional of dimension $n - c$.

Lemma 7.124.2. *Let k be a field. Let S be a finite type k-algebra. Let $g \in S$.*

1. *If S is a global complete intersection so is S_g.*
2. *If S is a local complete intersection so is S_g.*

Proof. The second statement follows immediately from the first. For the first, say that $S = k[x_1, \ldots, x_n]/(f_1, \ldots, f_c)$ with $n - c = \dim(S)$. By the remarks above S is equidimensional of dimension $n - c$, so $\dim(S_g) = n - c$ as well (or it is the zero ring in which case the lemma is true by convention). Let $g' \in k[x_1, \ldots, x_n]$ be an element whose residue class corresponds to g. Then $S_g = k[x_1, \ldots, x_n, x_{n+1}]/(f_1, \ldots, f_c, x_{n+1}g' - 1)$ as desired. $\square$

Lemma 7.124.3. *Let k be a field. Let S be a finite type k-algebra. If S is a local complete intersection, then S is a Cohen-Macaulay ring.*

Proof. Choose a maximal prime $\mathfrak{m}$ of S. We have to show that $S_{\mathfrak{m}}$ is Cohen-Macaulay. By assumption we may assume $S = k[x_1, \ldots, x_n]/(f_1, \ldots, f_c)$ with $\dim(S) = n - c$. Let $\mathfrak{m}' \subset k[x_1, \ldots, x_n]$ be the maximal ideal corresponding to $\mathfrak{m}$. According to Proposition 7.105.2 the local ring $k[x_1, \ldots, x_n]_{\mathfrak{m}'}$ is regular local of dimension n. Hence, by dimension theory (see Section 7.57) the ring $S_{\mathfrak{m}} = k[x_1, \ldots, x_n]_{\mathfrak{m}'}/(f_1, \ldots, f_c)$ has dimension $\geq n - c$. By assumption $\dim(S_{\mathfrak{m}}) \leq n - c$. Thus we get equality. This implies that $f_1, \ldots, f_c$ is a regular sequence in $k[x_1, \ldots, x_n]_{\mathfrak{m}'}$ and that $S_{\mathfrak{m}}$ is Cohen-Macaulay, see Proposition 7.95.4. $\square$

The following is the technical key to the rest of the material in this section. An important feature of this lemma is that we may choose any presentation for the ring S, but that condition (1) does not depend on this choice.

Lemma 7.124.4. *Let k be a field. Let S be a finite type k-algebra. Let $\mathfrak{q}$ be a prime of S. Choose any presentation $S = k[x_1, \ldots, x_n]/I$. Let $\mathfrak{q}'$ be the prime of $k[x_1, \ldots, x_n]$ corresponding to $\mathfrak{q}$. Set $c = height(\mathfrak{q}') - height(\mathfrak{q})$, in other words $\dim_{\mathfrak{q}}(S) = n - c$ (see Lemma 7.107.4). The following are equivalent*

1. *There exists a $g \in S$, $g \notin \mathfrak{q}$ such that S_g is a global complete intersection over k.*
2. *The ideal $I_{\mathfrak{q}'} \subset k[x_1, \ldots, x_n]_{\mathfrak{q}'}$ can be generated by c elements.*
3. *The conormal module $(I/I^2)_{\mathfrak{q}}$ can be generated by c elements over $S_{\mathfrak{q}}$.*
4. *The conormal module $(I/I^2)_{\mathfrak{q}}$ is a free $S_{\mathfrak{q}}$-module of rank c.*
5. *The ideal $I_{\mathfrak{q}'}$ can be generated by a regular sequence in the regular local ring $k[x_1, \ldots, x_n]_{\mathfrak{q}'}$.*

In this case any c elements of $I_{\mathfrak{q}'}$ which generate $I_{\mathfrak{q}'}/\mathfrak{q}'I_{\mathfrak{q}'}$ form a regular sequence in the local ring $k[x_1, \ldots, x_n]_{\mathfrak{q}'}$.

Proof. Set $R = k[x_1, \ldots, x_n]_{\mathfrak{q}'}$. This is a regular local ring of dimension height$(\mathfrak{q}')$. Moreover, $\overline{R} = R/IR = R/I_{\mathfrak{q}'} = S_{\mathfrak{q}}$ is a quotient of dimension height$(\mathfrak{q})$. Let $f_1, \ldots, f_c \in I_{\mathfrak{q}'}$ be elements which generate $(I/I^2)_{\mathfrak{q}}$. By Lemma 7.14.5 we see that $f_1, \ldots, f_c$ generate $I_{\mathfrak{q}'}$. Since the dimensions work out, we conclude by Proposition 7.95.4 that $f_1, \ldots, f_c$ is a regular sequence in R. By Lemma 7.66.2 we see that $(I/I^2)_{\mathfrak{q}}$ is free. These arguments show that (2), (3), (4) are equivalent and that they imply the last statement of the lemma, and therefore they imply (5).

If (5) holds, say $I_{\mathfrak{q}'}$ is generated by a regular sequence of length e, then $\text{height}(\mathfrak{q}) = \dim(S_{\mathfrak{q}}) = \dim(k[x_1, \ldots, x_n]_{\mathfrak{q}'}) - e = \text{height}(\mathfrak{q}') - e$ by dimension theory, see Section 7.57. We conclude that $e = c$. Thus (5) implies (2).

We continue with the notation introduced in the first paragraph. For each f_i we may find $d_i \in k[x_1, \ldots, x_n]$, $d_i \not\in \mathfrak{q}'$ such that $f_i' = d_i f_i \in k[x_1, \ldots, x_n]$. Then it is still true that $I_{\mathfrak{q}'} = (f_1', \ldots, f_c')R$. Hence there exists a $g' \in k[x_1, \ldots, x_n]$, $g' \not\in \mathfrak{q}'$ such that $I_{g'} = (f_1', \ldots, f_c')$. Moreover, pick $g'' \in k[x_1, \ldots, x_n]$, $g'' \not\in \mathfrak{q}'$ such that $\dim(S_{g''}) = \dim_{\mathfrak{q}} Spec(S)$. By Lemma 7.107.4 this dimension is equal to $n - c$. Finally, set g equal to the image of $g'g''$ in S. Then we see that

$$S_g \cong k[x_1, \ldots, x_n, x_{n+1}]/(f_1', \ldots, f_c', x_{n+1}g'g'' - 1)$$

and by our choice of g'' this ring has dimension $n - c$. Therefore it is a global complete intersection. Thus each of (2), (3), and (4) implies (1).

Assume (1). Let $S_g \cong k[y_1, \ldots, y_m]/(f_1, \ldots, f_t)$ be a presentation of S_g as a global complete intersection. Write $J = (f_1, \ldots, f_t)$. Let $\mathfrak{q}'' \subset k[y_1, \ldots, y_m]$ be the prime corresponding to $\mathfrak{q}S_g$. Note that $t = m - \dim(S_g) = \text{height}(\mathfrak{q}) - \text{height}(\mathfrak{q}'')$, see Lemma 7.107.4 for the last equality. As seen in the proof of Lemma 7.124.3 (and also above) the elements $f_1, \ldots, f_t$ form a regular sequence in the local ring $k[y_1, \ldots, y_m]_{\mathfrak{q}''}$. By Lemma 7.66.2 we see that $(J/J^2)_{\mathfrak{q}}$ is free of rank t. By Lemma 7.123.13 we have

$$J/J^2 \oplus S_g^n \cong (I/I^2)_g \oplus S_g^m$$

Thus $(I/I^2)_{\mathfrak{q}}$ is free of rank $t + n - m = m - \dim(S_g) + n - m = n - \dim(S_g) = \text{height}(\mathfrak{q}) - \text{height}(\mathfrak{q}') = c$. Thus we obtain (4). □

The result of Lemma 7.124.4 suggests the following definition.

Definition 7.124.5. Let k be a field. Let S be a local k-algebra essentially of finite type over k. We say S is a *complete intersection (over k)* if there exists a local k-algebra R and elements $f_1, \ldots, f_c \in \mathfrak{m}_R$ such that

(1) R is essentially of finite type over k,
(2) R is a regular local ring,
(3) $f_1, \ldots, f_c$ form a regular sequence in R, and
(4) $S \cong R/(f_1, \ldots, f_c)$ as k-algebras.

By the Cohen structure theorem (see Theorem 7.143.8) any complete Noetherian local ring may be written as the quotient of some regular complete local ring. Hence we may use the definition above to define the notion of a complete intersection ring for any complete Noetherian local ring. We will discuss this later, see (insert future reference here). In the meantime the following lemma shows that such a definition makes sense.

Lemma 7.124.6. *Let $A \to B \to C$ be surjective local ring homomorphisms. Assume A and B are regular local rings. The following are equivalent*

(1) *$Ker(A \to C)$ is generated by a regular sequence,*
(2) *$Ker(A \to C)$ is generated by* $\dim(A) - \dim(C)$ *elements,*
(3) *$Ker(B \to C)$ is generated by a regular sequence, and*
(4) *$Ker(B \to C)$ is generated by* $\dim(B) - \dim(C)$ *elements.*

Proof. A regular local ring is Cohen-Macaulay, see Lemma 7.98.3. Hence the equivalences (1) $\Leftrightarrow$ (2) and (3) $\Leftrightarrow$ (4), see Proposition 7.95.4. By Lemma 7.98.4 the ideal $\mathrm{Ker}(A \to B)$ can be generated by $\dim(A) - \dim(B)$ elements. Hence we see that (4) implies (2).

It remains to show that (1) implies (4). We do this by induction on $\dim(A) - \dim(B)$. The case $\dim(A) - \dim(B) = 0$ is trivial. Assume $\dim(A) > \dim(B)$. Write $I = \mathrm{Ker}(A \to C)$ and $J = \mathrm{Ker}(A \to B)$. Note that $J \subset I$. Our assumption is that the minimal number of generators of I is $\dim(A) - \dim(C)$. Let $\mathfrak{m} \subset A$ be the maximal ideal. Consider the maps

$$J/\mathfrak{m}J \to I/\mathfrak{m}I \to \mathfrak{m}/\mathfrak{m}^2$$

By Lemma 7.98.4 and its proof the composition is injective. Take any element $x \in J$ which is not zero in $J/\mathfrak{m}J$. By the above and Nakayama's lemma x is an element of a minimal set of generators of I. Hence we may replace A by A/xA and I by I/xA which decreases both $\dim(A)$ and the minimal number of generators of I by 1. Thus we win. □

Lemma 7.124.7. *Let k be a field. Let S be a local k-algebra essentially of finite type over k. The following are equivalent:*

1. *S is a complete intersection over k,*
2. *for any surjection $R \to S$ with R a regular local ring essentially of finite presentation over k the ideal $\mathrm{Ker}(R \to S)$ can be generated by a regular sequence,*
3. *for some surjection $R \to S$ with R a regular local ring essentially of finite presentation over k the ideal $\mathrm{Ker}(R \to S)$ can be generated by* $\dim(R) - \dim(S)$ *elements,*
4. *there exists a global complete intersection A over k and a prime $\mathfrak{a}$ of A such that $S \cong A_{\mathfrak{a}}$, and*
5. *there exists a local complete intersection A over k and a prime $\mathfrak{a}$ of A such that $S \cong A_{\mathfrak{a}}$.*

Proof. It is clear that (2) implies (1) and (1) implies (3). It is also clear that (4) implies (5). Let us show that (3) implies (4). Thus we assume there exists a surjection $R \to S$ with R a regular local ring essentially of finite presentation over k such that the ideal $\mathrm{Ker}(R \to S)$ can be generated by $\dim(R) - \dim(S)$ elements. We may write $R = (k[x_1, \ldots, x_n]/J)_{\mathfrak{q}}$ for some $J \subset k[x_1, \ldots, x_n]$ and some prime $\mathfrak{q} \subset k[x_1, \ldots, x_n]$ with $J \subset \mathfrak{q}$. Let $I \subset k[x_1, \ldots, x_n]$ be the kernel of the map $k[x_1, \ldots, x_n] \to S$ so that $S \cong (k[x_1, \ldots, x_n]/I)_{\mathfrak{q}}$. By assumption $(I/J)_{\mathfrak{q}}$ is generated by $\dim(R) - \dim(S)$ elements. We conclude that $I_{\mathfrak{q}}$ can be generated by $\dim(k[x_1, \ldots, x_n]_{\mathfrak{q}}) - \dim(S)$ elements by Lemma 7.124.6. From Lemma 7.124.4 we see that for some $g \in k[x_1, \ldots, x_n]$, $g \notin \mathfrak{q}$ the algebra $(k[x_1, \ldots, x_n]/I)_g$ is a global complete intersection and S is isomorphic to a local ring of it.

To finish the proof of the lemma we have to show that (5) implies (2). Assume (5) and let $\pi : R \to S$ be a surjection with R a regular local k-algebra essentially of finite type over k. By assumption we have $S = A_{\mathfrak{a}}$ for some local complete intersection A over k. Choose a presentation $R = (k[y_1, \ldots, y_m]/J)_{\mathfrak{q}}$ with $J \subset \mathfrak{q} \subset k[y_1, \ldots, y_m]$. We may and do assume that J is the kernel of the map $k[y_1, \ldots, y_m] \to R$. Let $I \subset k[y_1, \ldots, y_m]$ be the kernel of the map $k[y_1, \ldots, y_m] \to S = A_{\mathfrak{a}}$. Then $J \subset I$ and $(I/J)_{\mathfrak{q}}$ is the kernel of the surjection $\pi : R \to S$. So $S = (k[y_1, \ldots, y_m]/I)_{\mathfrak{q}}$.

By Lemma 7.117.7 we see that there exist $g \in A$, $g \notin \mathfrak{a}$ and $g' \in k[y_1, \ldots, y_m]$, $g' \notin \mathfrak{q}$ such that $A_g \cong (k[y_1, \ldots, y_m]/I)_{g'}$. After replacing A by A_g and $k[y_1, \ldots, y_m]$ by $k[y_1, \ldots, y_{m+1}]$ we may assume that $A \cong k[y_1, \ldots, y_m]/I$. Consider the surjective maps of local rings

$$k[y_1, \ldots, y_m]_{\mathfrak{q}} \to R \to S.$$

We have to show that the kernel of $R \to S$ is generated by a regular sequence. By Lemma 7.124.4 we know that $k[y_1, \ldots, y_m]_{\mathfrak q} \to A_{\mathfrak a} = S$ has this property (as A is a local complete intersection over k). We win by Lemma 7.124.6. $\square$

Lemma 7.124.8. *Let k be a field. Let S be a finite type k-algebra. Let $\mathfrak q$ be a prime of S. The following are equivalent:*

1. *The local ring $S_{\mathfrak q}$ is a complete intersection ring (Definition 7.124.5).*
2. *There exists a $g \in S$, $g \not\in \mathfrak q$ such that S_g is a local complete intersection over k.*
3. *There exists a $g \in S$, $g \not\in \mathfrak q$ such that S_g is a global complete intersection over k.*
4. *For any presentation $S = k[x_1, \ldots, x_n]/I$ with $\mathfrak q' \subset k[x_1, \ldots, x_n]$ corresponding to $\mathfrak q$ any of the equivalent conditions (1) -- (5) of Lemma 7.124.4 hold.*

Proof. This is a combination of Lemmas 7.124.4 and 7.124.7 and the definitions. $\square$

Lemma 7.124.9. *Let k be a field. Let S be a finite type k-algebra. The following are equivalent:*

1. *The ring S is a local complete intersection over k.*
2. *All local rings of S are complete intersection rings over k.*
3. *All localizations of S at maximal ideals are complete intersection rings over k.*

Proof. This follows from Lemma 7.124.8, the fact that $Spec(S)$ is quasi-compact and the definitions. $\square$

The following lemma says that being a complete intersection is preserved under change of base field (in a strong sense).

Lemma 7.124.10. *Let $k \subset K$ be a field extension. Let S be a finite type algebra over k. Let $\mathfrak q_K$ be a prime of $S_K = K \otimes_k S$ and let $\mathfrak q$ be the corresponding prime of S. Then $S_{\mathfrak q}$ is a complete intersection over k (Definition 7.124.5) if and only if $(S_K)_{\mathfrak q_K}$ is a complete intersection over K.*

Proof. Choose a presentation $S = k[x_1, \ldots, x_n]/I$. This gives a presentation $S_K = K[x_1, \ldots, x_n]/I_K$ where $I_K = K \otimes_k I$. Let $\mathfrak q'_K \subset K[x_1, \ldots, x_n]$, resp. $\mathfrak q' \subset k[x_1, \ldots, x_n]$ be the corresponding prime. We will show that the equivalent conditions of Lemma 7.124.4 hold for the pair $(S = k[x_1, \ldots, x_n]/I, \mathfrak q)$ if and only if they hold for the pair $(S_K = K[x_1, \ldots, x_n]/I_K, \mathfrak q_K)$. The lemma will follow from this (see Lemma 7.124.8).

By Lemma 7.107.6 we have $\dim_{\mathfrak q} S = \dim_{\mathfrak q_K} S_K$. Hence the integer c occuring in Lemma 7.124.4 is the same for the pair $(S = k[x_1, \ldots, x_n]/I, \mathfrak q)$ as for the pair $(S_K = K[x_1, \ldots, x_n]/I_K, \mathfrak q_K)$. On the other hand we have

$$\begin{aligned} I \otimes_{k[x_1,\ldots,x_n]} \kappa(\mathfrak q') \otimes_{\kappa(\mathfrak q')} \kappa(\mathfrak q'_K) &= I \otimes_{k[x_1,\ldots,x_n]} \kappa(\mathfrak q'_K) \\ &= I \otimes_{k[x_1,\ldots,x_n]} K[x_1, \ldots, x_n] \otimes_{K[x_1,\ldots,x_n]} \kappa(\mathfrak q'_K) \\ &= (K \otimes_k I) \otimes_{K[x_1,\ldots,x_n]} \kappa(\mathfrak q'_K) \\ &= I_K \otimes_{K[x_1,\ldots,x_n]} \kappa(\mathfrak q'_K). \end{aligned}$$

Therefore, $\dim_{\kappa(\mathfrak q')} I \otimes_{k[x_1,\ldots,x_n]} \kappa(\mathfrak q') = \dim_{\kappa(\mathfrak q'_K)} I_K \otimes_{K[x_1,\ldots,x_n]} \kappa(\mathfrak q'_K)$. Thus it follows from Nakayama's Lemma 7.14.5 that the minimal number of generators of $I_{\mathfrak q'}$ is the same as the minimal number of generators of $(I_K)_{\mathfrak q'_K}$. Thus the lemma follows from characterization (2) of Lemma 7.124.4. $\square$

Lemma 7.124.11. *Let $k \to K$ be a field extension. Let S be a finite type k-algebra. Then S is a local complete intersection over k if and only if $S \otimes_k K$ is a local complete intersection over K.*

Proof. This follows from a combination of Lemmas 7.124.9 and 7.124.10. But we also give a different proof here (based on the same principles).

Set $S' = S \otimes_k K$. Let $\alpha : k[x_1, \ldots, x_n] \to S$ be a presentation with kernel I. Let $\alpha' : K[x_1, \ldots, x_n] \to S'$ be the induced presentation with kernel I'.

Suppose that S is a local complete intersection. Pick a prime $\mathfrak{q} \subset S'$. Denote $\mathfrak{q}'$ the corresponding prime of $K[x_1, \ldots, x_n]$, $\mathfrak{p}$ the corresponding prime of S, and $\mathfrak{p}'$ the corresponding prime of $k[x_1, \ldots, x_n]$. Consider the following diagram of Noetherian local rings

$$\begin{tikzcd} S'_{\mathfrak{q}} & K[x_1, \ldots, x_n]_{\mathfrak{q}'} \arrow[l] \\ S_{\mathfrak{p}} \arrow[u] & k[x_1, \ldots, x_n]_{\mathfrak{p}'} \arrow[l] \arrow[u] \end{tikzcd}$$

By Lemma 7.124.4 we know that $S_{\mathfrak{p}}$ is cut out by some regular sequence $f_1, \ldots, f_e$ in $k[x_1, \ldots, x_n]_{\mathfrak{p}'}$. Since the right vertical arrow is flat we see that the images of $f_1, \ldots, f_c$ form a regular sequence in $K[x_1, \ldots, x_n]_{\mathfrak{q}'}$. Because tensoring with K over k is an exact functor we have $S'_{\mathfrak{q}} = K[x_1, \ldots, x_n]_{\mathfrak{q}'}/(f_1, \ldots, f_e)$. Hence by Lemma 7.124.4 again we see that S' is a local complete intersection in a neighbourhood of $\mathfrak{q}$. Since $\mathfrak{q}$ was arbitrary we see that S' is a local complete intersection over K.

Suppose that S' is a local complete intersection. Pick a maximal ideal $\mathfrak{m}$ of S. Let $\mathfrak{m}'$ denote the corresponding maximal ideal of $k[x_1, \ldots, x_n]$. Denote $\kappa = \kappa(\mathfrak{m})$ the residue field. By Remark 7.16.8 the primes of S' lying over $\mathfrak{m}$ correspond to primes in $K \otimes_k \kappa$. By the Hilbert-Nullstellensatz Theorem 7.30.1 we have $[\kappa : k] < \infty$. Hence $K \otimes_k \kappa$ is finite nonzero over K. Hence $K \otimes_k \kappa$ has a finite number > 0 of primes which are all maximal, each of which has a residue field finite over K (see Section 7.49). Hence there are finitely many > 0 prime ideals $\mathfrak{n} \subset S'$ lying over $\mathfrak{m}$, each of which is maximal and has a residue field which is finite over K. Pick one, say $\mathfrak{n} \subset S'$, and let $\mathfrak{n}' \subset K[x_1, \ldots, x_n]$ denote the corresponding prime ideal of $K[x_1, \ldots, x_n]$. Note that since $V(\mathfrak{m}S')$ is finite, we see that $\mathfrak{n}$ is an isolated closed point of it, and we deduce that $\mathfrak{m}S'_{\mathfrak{n}}$ is an ideal of definition of $S'_{\mathfrak{n}}$. This implies that $\dim(S_{\mathfrak{m}}) \geq \dim(S'_{\mathfrak{n}})$, for example by Lemma 7.103.6 or by the characterization of dimension in terms of minimal number of generators of ideal of definition, see Section 7.57. (In reality the dimensions are equal but we do not need this.) Consider the corresponding diagram of Noetherian local rings

$$\begin{tikzcd} S'_{\mathfrak{n}} & K[x_1, \ldots, x_n]_{\mathfrak{n}'} \arrow[l] \\ S_{\mathfrak{m}} \arrow[u] & k[x_1, \ldots, x_n]_{\mathfrak{m}'} \arrow[l] \arrow[u] \end{tikzcd}$$

According to Lemma 7.123.6 we have $NL(\alpha) \otimes_S S' = NL(\alpha')$, in particular $I'/(I')^2 = I/I^2 \otimes_S S'$. Thus $(I/I^2)_{\mathfrak{m}} \otimes_{S_{\mathfrak{m}}} \kappa$ and $(I'/(I')^2)_{\mathfrak{n}} \otimes_{S'_{\mathfrak{n}}} \kappa(\mathfrak{n})$ have the same dimension. Since $(I'/(I')^2)_{\mathfrak{n}}$ is free of rank $n - \dim S'_{\mathfrak{n}}$ we deduce that $(I/I^2)_{\mathfrak{m}}$ can be generated by $n - \dim S'_{\mathfrak{n}} \leq n - \dim S_{\mathfrak{m}}$ elements. By Lemma 7.124.4 we see that S is a local complete intersection in a neighbourhood of $\mathfrak{m}$. Since $\mathfrak{m}$ was any maximal ideal we conclude that S is a local complete intersection. □

We end with a lemma which we will later use to prove that given ring maps $T \to A \to B$ where B is syntomic over T, and B is syntomic over A, then A is syntomic over T.

Lemma 7.124.12. *Let*

$$\begin{tikzcd} B & S \arrow[l] \\ A \arrow[u] & R \arrow[l] \arrow[u] \end{tikzcd}$$

be a commutative square of local rings. Assume

(1) *R and $\overline{S} = S/\mathfrak{m}_R S$ are regular local rings,*
(2) *$A = R/I$ and $B = S/J$ for some ideals I, J,*
(3) *$J \subset S$ and $\overline{J} = J/\mathfrak{m}_R \cap J \subset \overline{S}$ are generated by regular sequences, and*
(4) *$A \to B$ and $R \to S$ are flat.*

Then I is generated by a regular sequence.

Proof. Set $\overline{B} = B/\mathfrak{m}_R B = B/\mathfrak{m}_A B$ so that $\overline{B} = \overline{S}/\overline{J}$. Let $f_1, \ldots, f_{\overline{c}} \in J$ be elements such that $\overline{f}_1, \ldots, \overline{f}_{\overline{c}} \in \overline{J}$ form a regular sequence generating $\overline{J}$. Note that $\overline{c} = \dim(\overline{S}) - \dim(\overline{B})$, see Lemma 7.124.6. By Lemma 7.91.3 the ring $S/(f_1, \ldots, f_{\overline{c}})$ is flat over R. Hence $S/(f_1, \ldots, f_{\overline{c}}) + IS$ is flat over A. The map $S/(f_1, \ldots, f_{\overline{c}}) + IS \to B$ is therefore a surjection of finite S/IS-modules flat over A which is an isomorphism modulo $\mathfrak{m}_A$, and hence an isomorphism by Lemma 7.91.1. In other words, $J = (f_1, \ldots, f_{\overline{c}}) + IS$.

By Lemma 7.124.6 again the ideal J is generated by a regular sequence of $c = \dim(S) - \dim(B)$ elements. Hence $J/\mathfrak{m}_S J$ is a vector space of dimension c. By the description of J above there exist $g_1, \ldots, g_{c-\overline{c}} \in I$ such that J is generated by $f_1, \ldots, f_{\overline{c}}, g_1, \ldots, g_{c-\overline{c}}$ (use Nakayama's Lemma 7.14.5). Consider the ring $A' = R/(g_1, \ldots, g_{c-\overline{c}})$ and the surjection $A' \to A$. We see from the above that $B = S/(f_1, \ldots, f_{\overline{c}}, g_1, \ldots, g_{c-\overline{c}})$ is flat over A' (as $S/(f_1, \ldots, f_{\overline{c}})$ is flat over R). Hence $A' \to B$ is injective (as it is faithfully flat, see Lemma 7.35.16). Since this map factors through A we get $A' = A$. Note that $\dim(B) = \dim(A) + \dim(\overline{B})$, and $\dim(S) = \dim(R) + \dim(\overline{S})$, see Lemma 7.103.7. Hence $c - \overline{c} = \dim(R) - \dim(A)$ by elementary algebra. Thus $I = (g_1, \ldots, g_{c-\overline{c}})$ is generated by a regular sequence according to Lemma 7.124.6. □

7.125. Syntomic morphisms

Definition 7.125.1. A ring map $R \to S$ is called *syntomic*, or we say S is a *flat local complete intersection over* R if it is flat, of finite presentation, and if all of its fibre rings $S \otimes_R \kappa(\mathfrak{p})$ are local complete intersections, see Definition 7.124.1.

Clearly, an algebra over a field is syntomic over the field if and only if it is a local complete intersection. Here is a pleasing feature of this definition.

Lemma 7.125.2. *Let $R \to S$ be a ring map. Let $R \to R'$ be a faithfully flat ring map. Set $S' = R' \otimes_R S$. Then $R \to S$ is syntomic if and only if $R' \to S'$ is syntomic.*

Proof. By Lemma 7.117.2 and Lemma 7.35.7 this holds for the property of being flat and for the property of being of finite presentation. The map $Spec(R') \to Spec(R)$ is surjective, see Lemma 7.35.15. Thus it suffices to show given primes $\mathfrak{p}' \subset R'$ lying over $\mathfrak{p} \subset R$ that $S \otimes_R \kappa(\mathfrak{p})$ is a local complete intersection if and only if $S' \otimes_{R'} \kappa(\mathfrak{p}')$ is a local complete intersection. Note that $S' \otimes_{R'} \kappa(\mathfrak{p}') = S \otimes_R \kappa(\mathfrak{p}) \otimes_{\kappa(\mathfrak{p})} \kappa(\mathfrak{p}')$. Thus Lemma 7.124.11 applies. □

Lemma 7.125.3. *Any base change of a syntomic map is syntomic.*

Proof. This is true for being flat, for being of finite presentation, and for having local complete intersections as fibres by Lemmas 7.35.6, 7.6.2 and 7.124.11. $\square$

Lemma 7.125.4. *Let $R \to S$ be a ring map. Suppose we have $g_1, \ldots g_m \in S$ which generate the unit ideal such that each $R \to S_{g_i}$ is syntomic. Then $R \to S$ is syntomic.*

Proof. This is true for being flat and for being of finite presentation by Lemmas 7.35.19 and 7.21.3. The property of having fibre rings which are local complete intersections is local on S by its very definition, see Definition 7.124.1. $\square$

Definition 7.125.5. Let $R \to S$ be a ring map. We say that $R \to S$ is a *relative global complete intersection* if we are given a presentation $S = R[x_1, \ldots, x_n]/(f_1, \ldots, f_c)$ such that every nonempty fibre has dimension $n - c$.

The following lemma is occasionally useful to find global presentations.

Lemma 7.125.6. *Let S be a finitely presented R-algebra which has a presentation $S = R[x_1, \ldots, x_n]/I$ such that I/I^2 is free over S. Then S has a presentation $S = R[y_1, \ldots, y_m]/(f_1, \ldots, f_c)$ such that $(f_1, \ldots, f_c)/(f_1, \ldots, f_c)^2$ is free with basis given by the classes of $f_1, \ldots, f_c$.*

Proof. Note that I is a finitely generated ideal by Lemma 7.6.3. Let $f_1, \ldots, f_c \in I$ be elements which map to a basis of I/I^2. By Nakayama's lemma (Lemma 7.14.5) there exists a $g \in 1 + I$ such that

$$g \cdot I \subset (f_1, \ldots, f_c)$$

Hence we see that

$$S \cong R[x_1, \ldots, x_n]/(f_1, \ldots, f_c)[1/g] \cong R[x_1, \ldots, x_n, x_{n+1}]/(f_1, \ldots, f_c, gx_{n+1} - 1)$$

as desired. $\square$

Example 7.125.7. Let $n, m \geq 1$ be integers. Consider the ring map

$$\begin{array}{rcl} R = \mathbf{Z}[a_1, \ldots, a_{n+m}] & \longrightarrow & S = \mathbf{Z}[b_1, \ldots, b_n, c_1, \ldots, c_m] \\ a_1 & \longmapsto & b_1 + c_1 \\ a_2 & \longmapsto & b_2 + b_1c_1 + c_2 \\ \ldots & \ldots & \ldots \\ a_{n+m} & \longmapsto & b_nc_m \end{array}$$

In other words, this is the unique ring map of polynomial rings as indicated such that the polynomial factorization

$$x^n + a_1x^{n-1} + \ldots + a_{n+m} = (x^n + b_1x^{n-1} + \ldots + b_n)(x^m + c_1x^{m-1} + \ldots + c_m)$$

holds. Note that S is generated by $n + m$ elements over R (namely, b_i, c_j) and that there are $n + m$ equations (namely $a_k = a_k(b_i, c_j)$). In order to show that S is a relative global complete intersection over R it suffices to prove that all fibres have dimension 0.

To prove this, let $R \to k$ be a ring map into a field k. Say a_i maps to $\alpha_i \in k$. Consider the fibre ring $S_k = k \otimes_R S$. Let $k \to K$ be a field extension. A k-algebra map of $S_k \to K$ is the same thing as finding $\beta_1, \ldots, \beta_n, \gamma_1, \ldots, \gamma_m \in K$ such that

$$x^n + \alpha_1x^{n-1} + \ldots + \alpha_{n+m} = (x^n + \beta_1x^{n-1} + \ldots + \beta_n)(x^m + \gamma_1x^{m-1} + \ldots + \gamma_m).$$

Hence we see there are at most finitely many choices of such $n + m$-tuples in K. This proves that all fibres have finitely many closed points (use Hilbert's Nullstellensatz to see they all correspond to solutions in $\overline{k}$ for example) and hence that $R \to S$ is a relative global complete intersection.

Another way to argue this is to show $\mathbf{Z}[a_1, \ldots, a_{n+m}] \to \mathbf{Z}[b_1, \ldots, b_n, c_1, \ldots, c_m]$ is actually also a *finite* ring map. Namely, by Lemma 7.34.5 each of b_i, c_j is integral over R, and hence $R \to S$ is finite by Lemma 7.32.4.

Example 7.125.8. Consider the ring map

$$\begin{array}{ccc} R = \mathbf{Z}[a_1, \ldots, a_n] & \longrightarrow & S = \mathbf{Z}[\alpha_1, \ldots, \alpha_n] \\ a_1 & \longmapsto & \alpha_1 + \ldots + \alpha_n \\ \ldots & \ldots & \ldots \\ a_n & \longmapsto & \alpha_1 \ldots \alpha_n \end{array}$$

In other words this is the unique ring map of polynomial rings as indicated such that

$$x^n + a_1 x^{n-1} + \ldots + a_n = \prod\nolimits_{i=1}^n (x + \alpha_i)$$

holds in $\mathbf{Z}[\alpha_i, x]$. Another way to say this is that a_i maps to the ith elementary symmetric function in $\alpha_1, \ldots, \alpha_n$. Note that S is generated by n elements over R subject to n equations. Hence to show that S is a global relative complete intersection over R we have to show that the fibre rings $S \otimes_R \kappa(\mathfrak{p})$ have dimension 0. This follows as in Example 7.125.7 above because the ring map $\mathbf{Z}[a_1, \ldots, a_n] \to \mathbf{Z}[\alpha_1, \ldots, \alpha_n]$ is actually *finite* since each $\alpha_i \in S$ satisfies the monic equation $x^n - a_1 x^{n-1} + \ldots + (-1)^n a_n$ over R.

Lemma 7.125.9. *Suppose that A is a ring, and $P(x) = x^n + b_1 x^{n-1} + \ldots + b_n \in A[x]$ is a monic polynomial over A. Then there exists a syntomic, finite locally free, faithfully flat ring extension $A \subset A'$ such that $P(x) = \prod_{i=1,\ldots,n}(x - \beta_i)$ for certain $\beta_i \in A'$.*

Proof. Take $A' = A \otimes_R S$, where R and S are as in Example 7.125.8 above, where $R \to A$ maps a_i to b_i, and let $\beta_i = -1 \otimes \alpha_i$. □

Lemma 7.125.10. *Let $S = R[x_1, \ldots, x_n]/(f_1, \ldots, f_c)$ be a relative global complete intersection over R.*

(1) *For any $R \to R'$ the base change $R' \otimes_R S = R'[x_1, \ldots, x_n]/(f_1, \ldots, f_c)$ is a relative global complete intersection.*
(2) *For any $g \in S$ which is the image of $h \in R[x_1, \ldots, x_n]$ the ring $S_g = R[x_1, \ldots, x_n, x_{n+1}]/(f_1, \ldots, f_c, hx_{n+1} - 1)$ is a relative global complete intersection.*
(3) *If $R \to S$ factors as $R \to R_f \to S$ for some $f \in R$. Then the ring $S = R_f[x_1, \ldots, x_n]/(f_1, \ldots, f_c)$ is a relative global complete intersection over R_f.*

Proof. By Lemma 7.107.5 the fibres of a base change have the same dimension as the fibres of the original map. Moreover $R' \otimes_R R[x_1, \ldots, x_n]/(f_1, \ldots, f_c) = R'[x_1, \ldots, x_n]/(f_1, \ldots, f_c)$. Thus (1) follows. The proof of (2) is that the localization at one element can be described as $S_g \cong S[x_{n+1}]/(gx_{n+1} - 1)$. Assertion (3) follows from (1) since under the assumptions of (3) we have $R_f \otimes_R S \cong S$. □

Lemma 7.125.11. *Let R be a ring. Let $S = R[x_1, \ldots, x_n]/(f_1, \ldots, f_c)$. Let $\mathfrak{q} \subset S$ be a prime lying over $\mathfrak{p} \subset R$. If $\dim_{\mathfrak{q}}(S/R) = n - c$, then there exists a $h \in R[x_1, \ldots, x_n]$ which maps to $g \in S$, $g \notin \mathfrak{q}$ such that*

$$S_g = R[x_1, \ldots, x_n, x_{n+1}]/(f_1, \ldots, f_c, hx_{n+1} - 1)$$

is a relative global complete intersection over R.

Proof. By Lemma 7.116.6 there exists a $g \in S$, $g \notin \mathfrak q$ such that all nonempty fibres of $R \to S_g$ have dimension $\leq n-c$. Let $h \in R[x_1, \ldots, x_n]$ be an element that maps to g. Then $S_g \cong R[x_1, \ldots, x_n, x_{n+1}]/(f_1, \ldots, f_c, f_{c+1})$ with $f_{c+1} = hx_{n+1} - 1$. Thus S_g is a relative global complete intersection. □

The following lemma ``almost'' states that we can do absolute Noetherian approximation for relative complete intersections. It is a bit awkward because we have not yet developed enough theory to deal with the condition on the dimensions of fibres. We will state and prove the correct version of this lemma in More on Morphisms, Lemma 33.24.10.

Lemma 7.125.12. *Let R be a ring. Let S be a relative global complete intersection with presentation $S = R[x_1, \ldots, x_n]/(f_1, \ldots, f_c)$. Let $\mathfrak q \subset S$ be a prime. There exist*

1. *a finite type $\mathbf{Z}$-subalgebra $R_0 \subset R$ such that $f_i \in R_0[x_1, \ldots, x_n]$, and*
2. *an element $h \in R_0[x_1, \ldots, x_n]$*

such that with $f_{c+1} = hx_{n+1} - 1$ we have

1. *h maps to an element g of S which is not in $\mathfrak q$, and*
2. *$R_0[x_1, \ldots, x_n, x_{n+1}]/(f_1, \ldots, f_c, f_{c+1})$ is a relative global complete intersection over R_0.*

In particular S_g is isomorphic to the base change of a relative global complete intersection over R_0.

Proof. Let $R_0 \subset R$ be the $\mathbf{Z}$-algebra of R generated by all the coefficients of the polynomials $f_1, \ldots, f_c$. Let $S_0 = R_0[x_1, \ldots, x_n]/(f_1, \ldots, f_c)$. Clearly, $S = R \otimes_{R_0} S_0$. Suppose our $\mathfrak q \subset S$ lies over the prime $\mathfrak p \subset R$, and let $\mathfrak q_0 \subset S_0$ be the corresponding prime lying over the prime $\mathfrak p_0$ of R_0. Because $\dim(S \otimes_R \kappa(\mathfrak p)) = n - c$ we also have $\dim(S_0 \otimes_{R_0} \kappa(\mathfrak p_0)) = n-c$, see Lemma 7.107.5 for example. By Lemma 7.125.11 we conclude that there exists a $g \in S_0$, $g \notin \mathfrak q_0$ such that $R_0 \to (S_0)_g$ is a relative global complete intersection. Let $h \in R_0[x_1, \ldots, x_n]$ be any element mapping to g. □

Lemma 7.125.13. *Let R be a ring. Let $S = R[x_1, \ldots, x_n]/(f_1, \ldots, f_c)$ be a relative global complete intersection. For every prime $\mathfrak q$ of S, let $\mathfrak q'$ denote the corresponding prime of $R[x_1, \ldots, x_n]$. Then*

1. *$f_1, \ldots, f_c$ is a regular sequence in the local ring $R[x_1, \ldots, x_n]_{\mathfrak q'}$,*
2. *each of the rings $R[x_1, \ldots, x_n]_{\mathfrak q'}/(f_1, \ldots, f_i)$ is flat over R, and*
3. *the S-module $(f_1, \ldots, f_c)/(f_1, \ldots, f_c)^2$ is free with basis given by the elements $f_i \bmod (f_1, \ldots, f_c)^2$.*

Proof. First, by Lemma 7.66.2, the last statement follows from the first.

We first reduce (1) and (2) to the Noetherian case. Namely, assume the lemma holds in the Noetherian case. For every $\mathfrak q$ we may choose R_0, h, $f_{c+1} = hx_{n+1} - 1$ and g as in Lemma 7.125.12. Denote $\mathfrak q'' \subset R[x_1, \ldots, x_{n+1}]$ the unique prime containing $\mathfrak q$ and f_{c+1}, i.e., the one that corresponds to the prime $\mathfrak q S_g$ via the isomorphism $S_g = R[x_1, \ldots, x_n, x_{n+1}]/(f_1, \ldots, f_c, f_{c+1})$. Denote $\mathfrak q_0'' \subset R_0[x_1, \ldots, x_n, x_{n+1}]$ the prime corresponding to q''. Because $S_0 = R_0[x_1, \ldots, x_n, x_{n+1}]/(f_1, \ldots, f_c, f_{c+1})$ is a relative global complete intersection over a Noetherian ring we see that $f_{c+1}, f_1, \ldots, f_c$ is a regular sequence in $R_0[x_1, \ldots, x_{n+1}]_{\mathfrak q_0''}$. Since after all we may reorder the elements at will without destroying the property of being a relative global complete intersection. Similarly each ring $R_0[x_1, \ldots, x_{n+1}]_{\mathfrak q_0''}/(f_{c+1}, f_1, \ldots, f_i)$ is flat over R_0. Thus each short exact sequence

$$0 \to \frac{(P_0)_{\mathfrak q_0''}}{(f_{c+1}, f_1, \ldots, f_{i-1})} \to \frac{(P_0)_{\mathfrak q_0''}}{(f_{c+1}, f_1, \ldots, f_{i-1})} \to \frac{(P_0)_{\mathfrak q_0''}}{(f_{c+1}, f_1, \ldots, f_i)} \to 0$$

and the short exact sequence

$$0 \to (P_0)_{\mathfrak q_0''} \to (P_0)_{\mathfrak q_0''} \to (P_0)_{\mathfrak q_0''}/(f_{c+1}) \to 0$$

with $P_0 = R_0[x_1, \ldots, x_n, x_{n+1}]$ remain exact upon tensoring over R_0 with R, see Lemma 7.35.11. Since $R[x_1, \ldots, x_n, x_{n+1}]_{\mathfrak q''}$ is a localization of $R \otimes_{R_0} P_0$ we conclude that $f_{c+1}, f_1, \ldots, f_c$ form a regular sequence in the local ring $R[x_1, \ldots, x_n, x_{n+1}]_{\mathfrak q''}$. Finally we use the obvious isomorphism $R[x_1, \ldots, x_{n+1}]_{\mathfrak q''}/(f_{c+1}) \cong R[x_1, \ldots, x_n]_{\mathfrak q'}$, to conclude that $f_1, \ldots, f_c$ form a regular sequence in the local ring $R[x_1, \ldots, x_n]_{\mathfrak q'}$. Similarly the quotients

$$R[x_1, \ldots, x_n, x_{n+1}]_{\mathfrak q''}/(f_{c+1}, f_1, \ldots, f_i) \cong R[x_1, \ldots, x_n]_{\mathfrak q'}/(f_1, \ldots, f_i)$$

are flat over R as desired.

It remains to show (1) and (2) in case R is Noetherian. By Lemma 7.124.4 for example we see that $f_1, \ldots, f_c$ form a regular sequence in the local ring $R[x_1, \ldots, x_n]_{\mathfrak q'} \otimes_R \kappa(\mathfrak p)$. Moreover, the local ring $R[x_1, \ldots, x_n]_{\mathfrak q'}$ is flat over $R_{\mathfrak p}$. Since R, and hence $R[x_1, \ldots, x_n]_{\mathfrak q'}$ is Noetherian we may apply Lemma 7.91.3 to conclude. ☐

Lemma 7.125.14. *A relative global complete intersection is syntomic.*

Proof. Let $R \to S$ be a relative global complete intersection. The fibres are global complete intersections, and S is of finite presentation over R. Thus the only thing to prove is that $R \to S$ is flat. This is true by (2) of Lemma 7.125.13 above. ☐

The following technical lemma says that you can lift any sequence of relations from a fibre to the whole space of a ring map which is essentially of finite type, in a suitable sense.

Lemma 7.125.15. *Let $R \to S$ be a ring map. Let $\mathfrak p \subset R$ be a prime. Let $\mathfrak q \subset S$ be a prime lying over $\mathfrak p$. Assume $S_{\mathfrak q}$ is essentially of finite type over $R_{\mathfrak p}$. Assume given*

(1) *an integer $n \geq 0$,*
(2) *a prime $\mathfrak a \subset \kappa(\mathfrak p)[x_1, \ldots, x_n]$,*
(3) *a surjective $\kappa(\mathfrak p)$-homomorphism*

$$\psi : (\kappa(\mathfrak p)[x_1, \ldots, x_n])_{\mathfrak a} \longrightarrow S_{\mathfrak q}/\mathfrak p S_{\mathfrak q},$$

and

(4) *elements $\overline{f}_1, \ldots, \overline{f}_e$ in Ker(ψ).*

Then there exist

(1) *an integer $m \geq 0$,*
(2) *and element $g \in S$, $g \notin \mathfrak q$,*
(3) *a map*

$$\Psi : R[x_1, \ldots, x_n, x_{n+1}, \ldots, x_{n+m}] \longrightarrow S_g,$$

and

(4) *elements $f_1, \ldots, f_e, f_{e+1}, \ldots, f_{e+m}$ of Ker(Ψ)*

such that

(1) *the following diagram commutes*

$$\begin{tikzcd} R[x_1, \ldots, x_{n+m}] \arrow[r, "x_{n+j}\mapsto 0"'] \arrow[d, "\Psi"'] & (\kappa(\mathfrak p)[x_1, \ldots, x_n])_{\mathfrak a} \arrow[d, "\psi"] \\ S_g \arrow[r] & S_{\mathfrak q}/\mathfrak p S_{\mathfrak q} \end{tikzcd},$$

(2) *the element f_i, $i \leq n$ maps to a unit times $\overline{f}_i$ in the local ring*

$$(\kappa(\mathfrak p)[x_1, \ldots, x_{n+m}])_{(\mathfrak a, x_{n+1}, \ldots, x_{n+m})},$$

(3) *the element f_{e+j} maps to a unit times x_{n+j} in the same local ring, and*

(4) *the induced map $R[x_1, \ldots, x_{n+m}]_{\mathfrak b} \to S_{\mathfrak q}$ is surjective, where $\mathfrak b = \Psi^{-1}(\mathfrak q S_g)$.*

Proof. We claim that it suffices to prove the lemma in case R and S are local with maximal ideals $\mathfrak p$ and $\mathfrak q$. Namely, suppose we have constructed

$$\Psi' : R_{\mathfrak p}[x_1, \ldots, x_{n+m}] \longrightarrow S_{\mathfrak q}$$

and $f'_1, \ldots, f'_{e+m} \in R_{\mathfrak p}[x_1, \ldots, x_{n+m}]$ with all the required properties. Then there exists an element $f \in R$, $f \not\in \mathfrak p$ such that each ff'_k comes from an element $f_k \in R[x_1, \ldots, x_{n+m}]$. Moreover, for a suitable $g \in S$, $g \not\in \mathfrak q$ the elements $\Psi'(x_i)$ are the image of elements $y_i \in S_g$. Let Ψ be the R-algebra map defined by the rule $\Psi(x_i) = y_i$. Since $\Psi(f_i)$ is zero in the localization $S_{\mathfrak q}$ we may after possibly replacing g assume that $\Psi(f_i) = 0$. This proves the claim.

Thus we may assume R and S are local with maximal ideals $\mathfrak p$ and $\mathfrak q$. Pick $y_1, \ldots, y_n \in S$ such that $y_i \bmod \mathfrak p S = \psi(x_i)$. Let $y_{n+1}, \ldots, y_{n+m} \in S$ be elements which generate an R-subalgebra of which S is the localization. These exist by the assumption that S is essentially of finite type over R. Since ψ is surjective we may write $y_{n+j} \bmod \mathfrak p S = \psi(h_j)$ for some $h_j \in \kappa(\mathfrak p)[x_1, \ldots, x_n]_{\mathfrak a}$. Write $h_j = g_j/d$, $g_j \in \kappa(\mathfrak p)[x_1, \ldots, x_n]$ for some common denominator $d \in \kappa(\mathfrak p)[x_1, \ldots, x_n]$, $d \not\in \mathfrak a$. Choose lifts $G_j, D \in R[x_1, \ldots, x_n]$ of g_j and d. Set $y'_{n+j} = D(y_1, \ldots, y_n)y_{n+j} - G_j(y_1, \ldots, y_n)$. By construction $y'_{n+j} \in \mathfrak p S$. It is clear that $y_1, \ldots, y_n, y'_n, \ldots, y'_{n+m}$ generate an R-subalgebra of S whose localization is S. We define

$$\Psi : R[x_1, \ldots, x_{n+m}] \to S$$

to be the map that sends x_i to y_i for $i = 1, \ldots, n$ and x_{n+j} to y'_{n+j} for $j = 1, \ldots, m$. Properties (1) and (4) are clear by construction. Moreover the ideal $\mathfrak b$ maps onto the ideal $(\mathfrak a, x_{n+1}, \ldots, x_{n+m})$ in the polynomial ring $\kappa(\mathfrak p)[x_1, \ldots, x_{n+m}]$.

Denote $J = \text{Ker}(\Psi)$. We have a short exact sequence

$$0 \to J_{\mathfrak b} \to R[x_1, \ldots, x_{n+m}]_{\mathfrak b} \to S_{\mathfrak q} \to 0.$$

The surjectivity comes from our choice of $y_1, \ldots, y_n, y'_n, \ldots, y'_{n+m}$ above. This implies that

$$J_{\mathfrak b}/\mathfrak p J_{\mathfrak b} \to \kappa(\mathfrak p)[x_1, \ldots, x_{n+m}]_{(\mathfrak a, x_{n+1}, \ldots, x_{n+m})} \to S_{\mathfrak q}/\mathfrak p S_{\mathfrak q} \to 0$$

is exact. By construction x_i maps to $\psi(x_i)$ and x_{n+j} maps to zero under the last map. Thus it is easy to choose f_i as in (2) and (3) of the lemma. □

Lemma 7.125.16. *Let $R \to S$ be a ring map. Let $\mathfrak q \subset S$ be a prime lying over the prime $\mathfrak p$ of R. The following are equivalent:*

(1) *There exists an element $g \in S$, $g \not\in \mathfrak q$ such that $R \to S_g$ is syntomic.*

(2) *There exists an element $g \in S$, $g \not\in \mathfrak q$ such that S_g is a relative global complete intersection over R.*
(3) *There exists an element $g \in S$, $g \not\in \mathfrak q$, such that $R \to S_g$ is of finite presentation, the local ring map $R_{\mathfrak p} \to S_{\mathfrak q}$ is flat, and the local ring $S_{\mathfrak q}/\mathfrak pS_{\mathfrak q}$ is a complete intersection ring over $\kappa(\mathfrak p)$ (see Definition 7.124.5).*

Proof. The implication (1) ⇒ (3) is clear (see Lemma 7.124.8). The implication (2) ⇒ (1) follows from Lemma 7.125.14. Assume (3). After replacing S by S_g for some $g \in S$, $g \not\in \mathfrak q$ we may assume S is finitely presented over R.

We use this to reduce to the case where R is Noetherian. Namely, write $R \to S$ as a directed colimit of map $R_\lambda \to S_\lambda$ as in Lemma 7.118.14. Denote $\mathfrak q_\lambda \subset S_\lambda$ and $\mathfrak p_\lambda \subset R_\lambda$ the corresponding prime ideals. Note that

$$S_\lambda \otimes_{R_\lambda} \kappa(\mathfrak p_\lambda) \otimes_{\kappa(\mathfrak p_\lambda)} \kappa(\mathfrak p) \cong S \otimes_R \kappa(\mathfrak p).$$

Our assumption implies that $S \otimes_R \kappa(\mathfrak p)$ satisfies any of the conditions (1) - (5) of Lemma 7.124.4 at the prime corresponding to $\mathfrak q$, see Lemma 7.124.8. By Lemma 7.124.10 we see that the same holds for $S_\lambda \otimes_{R_\lambda} \kappa(\mathfrak p_\lambda)$ at the prime corresponding to $\mathfrak q_\lambda$. Moreover, for some sufficiently large λ the local ring map $(R_\lambda)_{\mathfrak p_\lambda} \to (S_\lambda)_{\mathfrak q_\lambda}$ is flat, by Lemma 7.119.3. In other words, all the conditions of (3) hold for $(R_\lambda \to S_\lambda, \mathfrak q_\lambda)$. If we can show that (2) holds for $(R_\lambda \to S_\lambda, \mathfrak q_\lambda)$ then it follows for $(R \to S, \mathfrak q)$. Thus we have reduced to the case where R is Noetherian.

By the last statement of Lemma 7.124.4 we may find a surjective $\kappa(\mathfrak p)$-algebra map $\overline{\psi} : \kappa(\mathfrak p)[x_1, \ldots, x_n]_{\mathfrak a} \to S_{\mathfrak q}/\mathfrak pS_{\mathfrak q}$ whose kernel is generated by a regular sequence $\overline{f}_1, \ldots, \overline{f}_c$ of $\kappa(\mathfrak p)[x_1, \ldots, x_n]_{\mathfrak a}$. We apply Lemma 7.125.15. Thus we find a $g \in S$, $g \not\in \mathfrak q$, a map $\Psi : R[x_1, \ldots, x_{n+m}] \to S_g$ and elements $f_1, \ldots, f_{c+m}$ in the kernel of Ψ which (up to units) give the elements $\overline{f}_1, \ldots, \overline{f}_c, x_{n+1}, \ldots, x_{n+m}$ in the local ring $\kappa(\mathfrak p)[x_1, \ldots, x_{n+m}]_{(\mathfrak a, x_{n+1}, \ldots, x_{n+m})}$. Moreover, the referenced lemma shows the induced map $R[x_1, \ldots, x_{n+m}]_{\mathfrak b} \to S_{\mathfrak q}$ is surjective, where $\mathfrak b \subset R[x_1, \ldots, x_{n+m}]$ is a suitable prime ideal. Consider the induced map

$$\overline{\Psi} : S' := R[x_1, \ldots, x_{n+m}]/(f_1, \ldots, f_{c+m}) \longrightarrow S_g.$$

We now know it has the following properties:

(1) it induces an surjection between the localizations at the primes $\mathfrak q' = \mathfrak b/(f_i)$ and $\mathfrak qS_g$
(2) it induces an isomorphism $S'_{\mathfrak q'}/\mathfrak pS'_{\mathfrak q'} \to S_{\mathfrak q}/\mathfrak pS_{\mathfrak q}$,
(3) the local ring $S_{\mathfrak q}$ is flat over $R_{\mathfrak p}$.

Denoting $J = \text{Ker}(\overline{\Psi})$, we see that $0 \to J_{\mathfrak q'} \to S'_{\mathfrak q'} \to S_{\mathfrak q} \to 0$ is exact. By flatness of $S_{\mathfrak q}$ over $R_{\mathfrak p}$ we see that $0 \to J_{\mathfrak q'}/\mathfrak pJ_{\mathfrak q'} \to S'_{\mathfrak q'}/\mathfrak pS_{\mathfrak q} \to S_{\mathfrak q}/\mathfrak pS_{\mathfrak q} \to 0$ is exact. By the second property above we conclude that $J_{\mathfrak q'}/\mathfrak pJ_{\mathfrak q'} = 0$. Because R and hence S' is Noetherian, we conclude that $J_{\mathfrak q'} = 0$, in other words $S'_{\mathfrak q'} \cong S_{\mathfrak q}$. By Lemma 7.117.6, we conclude there exists a $g' \in S'$, $g' \not\in \mathfrak q'$ such that $S'_{g'} \cong S_{g\overline{\Psi}(g')}$. By Lemma 7.125.11 applied to S' and the prime $\mathfrak q'$ (note that $\dim_{\mathfrak q'}(S'/R) = n + m - (c + m)$ by the explicit description of the sequence f_j) there exists a further element $g'' \in S'$, $g'' \not\in \mathfrak q'$ such that $S'_{g''}$ is a relative global complete intersection over R. By Lemma 7.125.10 we conclude that $S'_{g'g''} \cong S_{g\overline{\Psi}(g'g'')}$ is a relative global complete intersection over R, as desired. □

Lemma 7.125.17. *Let R be a ring. Let $S = R[x_1, \ldots, x_n]/I$ for some finitely generated ideal I. If $g \in S$ is such that S_g is syntomic over R, then $(I/I^2)_g$ is a finite projective S_g-module.*

Proof. By Lemma 7.125.16 there exist finitely many elements $g_1, \ldots, g_m \in S$ which generate the unit ideal in S_g such that each S_{gg_j} is a relative global complete intersection over R. Since it suffices to prove that $(I/I^2)_{gg_j}$ is finite projective, see Lemma 7.72.2, we may asssume that S_g is a relative global complete intersection. In this case the result follows from Lemmas 7.123.13 and 7.125.13. □

Lemma 7.125.18. *Let $R \to S$, $S \to S'$ be ring maps.*

(1) *If $R \to S$ and $S \to S'$ are syntomic, then $R \to S'$ is syntomic.*
(2) *If $R \to S$ and $S \to S'$ are relative global complete intersections so is $R \to S'$.*

Proof. Assume $R \to S$ and $S \to S'$ are syntomic. This implies that $R \to S'$ is flat by Lemma 7.35.3. It also implies that $R \to S'$ is of finite presentation by Lemma 7.6.2. Thus it suffices to show that the fibres of $R \to S'$ are local complete intersections. Choose a prime $\mathfrak{p} \subset R$. We have a factorization

$$\kappa(\mathfrak{p}) \to S \otimes_R \kappa(\mathfrak{p}) \to S' \otimes_R \kappa(\mathfrak{p}).$$

By assumption $S \otimes_R \kappa(\mathfrak{p})$ is a local complete intersection, and by Lemma 7.125.3 we see that $S \otimes_R \kappa(\mathfrak{p})$ is syntomic over $S \otimes_R \kappa(\mathfrak{p})$. After replacing S by $S \otimes_R \kappa(\mathfrak{p})$ and S' by $S' \otimes_R \kappa(\mathfrak{p})$ we may assume that R is a field. Say $R = k$.

Choose a prime $\mathfrak{q}' \subset S'$ lying over the prime $\mathfrak{q}$ of S. Our goal is to find a $g' \in S'$, $g' \not\in \mathfrak{q}'$ such that $S'_{g'}$ is a global complete intersection over k. Choose a $g \in S$, $g \not\in \mathfrak{q}$ such that $S_g = k[x_1, \ldots, x_n]/(f_1, \ldots, f_c)$ is a global complete intersection over k. Since $S_g \to S'_g$ is still syntomic also, and $g \not\in \mathfrak{q}'$ we may replace S by S_g and S' by S'_g and assume that $S = k[x_1, \ldots, x_n]/(f_1, \ldots, f_c)$ is a global complete intersection over k. Next we choose a $g' \in S'$, $g' \not\in \mathfrak{q}'$ such that $S' = S[y_1, \ldots, y_m]/(h_1, \ldots, h_d)$ is a relative global complete intersection over S. Hence we have reduced to part (2) of the lemma.

Suppose that $R \to S$ and $S \to S'$ are relative global complete intersections. Say $S = R[x_1, \ldots, x_n]/(f_1, \ldots, f_c)$ and $S' = S[y_1, \ldots, y_m]/(h_1, \ldots, h_d)$. Then

$$S' \cong R[x_1, \ldots, x_n, y_1, \ldots, y_m]/(f_1, \ldots, f_c, h'_1, \ldots, h'_d)$$

for some lifts $h'_j \in R[x_1, \ldots, x_n, y_1, \ldots, y_m]$ of the h_j. Hence it suffices to bound the dimensions of the fibres. Thus we may yet again assume $R = k$ is a field. In this case we see that we have a ring, namely S, which is of finite type over k and equidimensional of dimension $n - c$, and a finite type ring map $S \to S'$ all of whose nonempty fibre rings are equidimensional of dimension $m - d$. Then, by Lemma 7.103.6 for example applied to localizations at maximal ideals of S', we see that $\dim(S') \leq n - c + m - d$ as desired. □

Lemma 7.125.19. *Let R be a ring and let $I \subset R$ be an ideal. Let $R/I \to \overline{S}$ be a syntomic map. Then there exists elements $\overline{g}_i \in \overline{S}$ which generate the unit ideal of $\overline{S}$ such that each $\overline{S}_{g_i} \cong S_i/IS_i$ for some relative global complete intersection S_i over R.*

Proof. By Lemma 7.125.16 we find a collection of elements $\overline{g}_i \in \overline{S}$ which generate the unit ideal of $\overline{S}$ such that each $\overline{S}_{g_i}$ is a relative global complete intersection over R/I. Hence we may assume that $\overline{S}$ is a relative global complete intersection. Write $\overline{S} = (R/I)[x_1, \ldots, x_n]/(\overline{f}_1, \ldots, \overline{f}_c)$ as in Definition 7.125.5. Choose $f_1, \ldots, f_c \in R[x_1, \ldots, x_n]$ lifting $\overline{f}_1, \ldots, \overline{f}_c$. Set $S =$

$R[x_1, \ldots, x_n]/(f_1, \ldots, f_c)$. Note that $S/IS \cong \overline{S}$. Choose a prime $\overline{\mathfrak q}$ of $\overline{S}$, and let $\mathfrak q \subset S$ be the corresponding prime of S. By Lemma 7.125.11 there exists an element $g \in S$, $g \notin \mathfrak q$ such that S_g is a relative global complete intersection over R. And $\overline{S}_{\overline{g}} \cong S_g/IS_g$. This proves the lemma. □

7.126. Smooth ring maps

Let us motivate the definition of a smooth ring map by an example. Suppose R is a ring and $S = R[x, y]/(f)$ for some nonzero $f \in R[x, y]$. In this case there is an exact sequence

$$S \to S\mathrm{d}x \oplus S\mathrm{d}y \to \Omega_{S/R} \to 0$$

where the first arrow maps 1 to $\frac{\partial f}{\partial x}\mathrm{d}x + \frac{\partial f}{\partial y}\mathrm{d}y$ see Section 7.123. We conclude that $\Omega_{S/R}$ is locally free of rank 1 if the partial derivatives of f generate the unit ideal in S. In this case S is smooth of relative dimension 1 over R. But it can happen that $\Omega_{S/R}$ is locally free of rank 2 namely if both partial derivatives of f are zero. For example if for a prime p we have $p = 0$ in R and $f = x^p + y^p$ then this happens. Here $R \to S$ is a relative global complete intersection of relative dimension 1 which is not smooth. Hence, in order to check that a ring map is smooth it is not sufficient to check whether the module of differentials is free. The correct condition is the following.

Definition 7.126.1. A ring map $R \to S$ is *smooth* if it is of finite presentation and the naive cotangent complex $NL_{S/R}$ is quasi-isomorphic to a finite projective S-module placed in degree 0.

In particular, if $R \to S$ is smooth then the module $\Omega_{S/R}$ is a finite projective S-module. Moreover, by Lemma 7.126.2 the naive cotangent complex of any presentation has the same structure. Thus, for a surjection $\alpha : R[x_1, \ldots, x_n] \to S$ with kernel I the map

$$I/I^2 \longrightarrow \Omega_{R[x_1,\ldots,x_n]/R} \otimes_{R[x_1,\ldots,x_n]} S$$

is a split injection. In other words $\bigoplus_{i=1}^n S\mathrm{d}x_i \cong I/I^2 \oplus \Omega_{S/R}$ as S-modules. This implies that I/I^2 is a finite projective S-module too!

Lemma 7.126.2. *Let $R \to S$ be a ring map of finite presentation. If for some presentation α of S over R the naive cotangent complex $NL(\alpha)$ is quasi-isomorphic to a finite projective S-module placed in degree 0, then this holds for any presentation.*

Proof. Immediate from Lemma 7.123.2. □

Lemma 7.126.3. *Let $R \to S$ be a smooth ring map. Any localization S_g is smooth over R. If $f \in R$ maps to an invertible element of S, then $R_f \to S$ is smooth.*

Proof. By Lemma 7.123.10 we see that the naive cotangent complex for S_g over R is the base change of the naive cotangent complex of S over R. The assumption is that the naive cotangent complex of S/R is $\Omega_{S/R}$ and that this is a finite projective S-module. Hence so is its base change. Thus S_g is smooth over R.

For the last assertion: A presentation of S over R_f is $R_f[x_1, \ldots, x_n]/I_f$. Since $I_f/I_f^2 = (I/I^2)_f = I/I^2$ we see that this presentation has isomorphic naive cotangent complex to the presentation of S over R. The result follows. □

Lemma 7.126.4. *Let $R \to S$ be a smooth ring map. Let $R \to R'$ be any ring map. Then the base change $R' \to S' = R' \otimes_R S$ is smooth.*

Proof. Let $\alpha : R[x_1, \ldots, x_n] \to S$ be a presentation with kernel I. Let $\alpha' : R'[x_1, \ldots, x_n] \to R' \otimes_R S$ be the induced presentation. Let $I' = \mathrm{Ker}(\alpha')$. Since $0 \to I \to R[x_1, \ldots, x_n] \to S \to 0$ is exact, the sequence $R' \otimes_R I \to R'[x_1, \ldots, x_n] \to R' \otimes_r S \to 0$ is exact. Thus $R' \otimes_R I \to I'$ is surjective. By Definition 7.126.1 there is a short exact sequence

$$0 \to I/I^2 \to \Omega_{R[x_1,\ldots,x_n]/R} \otimes_{R[x_1,\ldots,x_n]} S \to \Omega_{S/R} \to 0$$

and the S-module $\Omega_{S/R}$ is finite projective. In particular I/I^2 is a direct summand of $\Omega_{R[x_1,\ldots,x_n]/R} \otimes_{R[x_1,\ldots,x_n]} S$. Consider the commutative diagram

$$\begin{tikzcd}
R' \otimes_R (I/I^2) \arrow[r] \arrow[d] & R' \otimes_R (\Omega_{R[x_1,\ldots,x_n]/R} \otimes_{R[x_1,\ldots,x_n]} S) \arrow[d] \\
I'/(I')^2 \arrow[r] & \Omega_{R'[x_1,\ldots,x_n]/R'} \otimes_{R'[x_1,\ldots,x_n]} (R' \otimes_R S)
\end{tikzcd}$$

Since the right vertical map is an isomorphism we see that the left vertical map is injective and surjective by what was said above. Thus we conclude that $NL(\alpha')$ is quasi-isomorphic to $\Omega_{S'/R'} \cong S' \otimes_S \Omega_{S/R}$. And this is finite projective since it is the base change of a finite projective module. □

Lemma 7.126.5. *Let k be a field. Let S be a smooth k-algebra. Then S is a local complete intersection.*

Proof. By Lemmas 7.126.4 and 7.124.11 it suffices to prove this when k is algebraically closed. Choose a presentation $\alpha : k[x_1, \ldots, x_n] \to S$ with kernel I. Let $\mathfrak{m}$ be a maximal ideal of S, and let $\mathfrak{m}' \subset I$ be the corresponding maximal ideal of $k[x_1, \ldots, x_n]$. We will show that condition (5) of Lemma 7.124.4 holds (with $\mathfrak{m}$ instead of $\mathfrak{q}$). We may write $\mathfrak{m}' = (x_1 - a_1, \ldots, x_n - a_n)$ for some $a_i \in k$, because k is algebraically closed, see Theorem 7.30.1. By our assumption that $k \to S$ is smooth the S-module map $\mathrm{d} : I/I^2 \to \bigoplus_{i=1}^n S\mathrm{d}x_i$ is a split injection. Hence the corresponding map $I/\mathfrak{m}'I \to \bigoplus \kappa(\mathfrak{m}')\mathrm{d}x_i$ is injective. Say $\dim_{\kappa(\mathfrak{m}')}(I/\mathfrak{m}'I) = c$ and pick $f_1, \ldots, f_c \in I$ which map to a $\kappa(\mathfrak{m}')$-basis of $I/\mathfrak{m}'I$. By Nakayama's Lemma 7.14.5 we see that $f_1, \ldots, f_c$ generate $I_{\mathfrak{m}'}$ over $k[x_1, \ldots, x_n]_{\mathfrak{m}'}$. Consider the commutative diagram

$$\begin{tikzcd}
I \arrow[r] \arrow[d] & I/I^2 \arrow[r] \arrow[d] & I/\mathfrak{m}'I \arrow[d] \\
\Omega_{k[x_1,\ldots,x_n]/k} \arrow[r] & \bigoplus S\mathrm{d}x_i \arrow[r, "\mathrm{d}x_i \mapsto x_i - a_i"] & \mathfrak{m}'/(\mathfrak{m}')^2
\end{tikzcd}$$

(proof commutativity omitted). The middle vertical map is the one defining the naive cotangent complex of α. Note that the right lower horizontal arrow induces an isomorphism $\bigoplus \kappa(\mathfrak{m}')\mathrm{d}x_i \to \mathfrak{m}'/(\mathfrak{m}')^2$. Hence our generators $f_1, \ldots, f_c$ of $I_{\mathfrak{m}'}$ map to a collection of elements in $k[x_1, \ldots, x_n]_{\mathfrak{m}'}$ whose classes in $\mathfrak{m}'/(\mathfrak{m}')^2$ are linearly independent over $\kappa(\mathfrak{m}')$. Therefore they form a regular sequence in the ring $k[x_1, \ldots, x_n]_{\mathfrak{m}'}$ by Lemma 7.98.3. This verifies condition (5) of Lemma 7.124.4 hence S_g is a global complete intersection over k for some $g \in S$, $g \notin \mathfrak{m}$. As this works for any maximal ideal of S we conclude that S is a local complete intersection over k. □

Definition 7.126.6. Let R be a ring. A *standard smooth algebra over R* is a an algebra S with a (given) presentation

$$S = R[x_1, \ldots, x_n]/(f_1, \ldots, f_c)$$

such that the polynomial

$$g = \det \begin{pmatrix} \partial f_1/\partial x_1 & \partial f_2/\partial x_1 & \ldots & \partial f_c/\partial x_1 \\ \partial f_1/\partial x_2 & \partial f_2/\partial x_2 & \ldots & \partial f_c/\partial x_2 \\ \ldots & \ldots & \ldots & \ldots \\ \partial f_1/\partial x_c & \partial f_2/\partial x_c & \ldots & \partial f_c/\partial x_c \end{pmatrix}$$

maps to an invertible element in S.

Lemma 7.126.7. *Let $S = R[x_1, \ldots, x_n]/(f_1, \ldots, f_c) = R[x_1, \ldots, x_n]/I$ be a standard smooth algebra. Then*

(1) *the ring map $R \to S$ is smooth,*
(2) *the S-module $\Omega_{S/R}$ is free on $dx_{c+1}, \ldots, dx_n$,*
(3) *the S-module I/I^2 is free on the classes of $f_1, \ldots, f_c$,*
(4) *for any $g \in S$ the ring map $R \to S_g$ is standard smooth,*
(5) *for any ring map $R \to R'$ the base change $R' \to R' \otimes_R S$ is standard smooth,*
(6) *if $f \in R$ maps to an invertible element in S, then $R_f \to S$ is standard smooth, and*
(7) *the ring S is a relative global complete intersection over R.*

Proof. Consider the naive cotangent complex of the given presentation

$$(f_1, \ldots, f_c)/(f_1, \ldots, f_c)^2 \longrightarrow \bigoplus\nolimits_{i=1}^{n} S\mathrm{d}x_i$$

Let us compose this map with the projection onto the first c direct summands of the direct sum. According to the definition of a standard smooth algebra the classes f_i mod $(f_1, \ldots, f_c)^2$ map to a basis of $\bigoplus_{i=1}^{c} S\mathrm{d}x_i$. We conclude that $(f_1, \ldots, f_c)/(f_1, \ldots, f_c)^2$ is free of rank c with a basis given by the elements f_i mod $(f_1, \ldots, f_c)^2$, and that the homology in degree 0, i.e., $\Omega_{S/R}$, of the naive cotangent complex is a free S-module with basis the images of $\mathrm{d}x_{c+j}$, $j = 1, \ldots, n-c$. In particular, this proves $R \to S$ is smooth.

The proofs of (4) and (6) are omitted. But see the example below and the proof of Lemma 7.125.10.

Let $\varphi : R \to R'$ be any ring map. Denote $S' = R'[x_1, \ldots, x_n]/(f_1^{\varphi}, \ldots, f_c^{\varphi})$ where f^{φ} is the polynomial obtained from $f \in R[x_1, \ldots, x_n]$ by applying φ to all the coefficients. Then $S' \cong R' \otimes_R S$. Moreover, the determinant of Definition 7.126.6 for S'/R' is equal to g^{φ}. Its image in S' is therefore the image of g via $R[x_1, \ldots, x_n] \to S \to S'$ and hence invertible. This proves (5).

To prove (7) it suffices to show that $S \otimes_R \kappa(\mathfrak{p})$ has dimension $n-c$. By (5) it suffices to prove that any standard smooth algebra $k[x_1, \ldots, x_n]/(f_1, \ldots, f_c)$ over a field k has dimension $n-c$. We already know that $k[x_1, \ldots, x_n]/(f_1, \ldots, f_c)$ is a local complete intersection by Lemma 7.126.5 above. Hence, since I/I^2 is free of rank c we see that it dimension $n-c$, by Lemma 7.124.4 for example. □

Example 7.126.8. Let R be a ring. Let $f_1, \ldots, f_c \in R[x_1, \ldots, x_n]$. Let

$$h = \det \begin{pmatrix} \partial f_1/\partial x_1 & \partial f_2/\partial x_1 & \ldots & \partial f_c/\partial x_1 \\ \partial f_1/\partial x_2 & \partial f_2/\partial x_2 & \ldots & \partial f_c/\partial x_2 \\ \ldots & \ldots & \ldots & \ldots \\ \partial f_1/\partial x_c & \partial f_2/\partial x_c & \ldots & \partial f_c/\partial x_c \end{pmatrix}.$$

Set $S = R[x_1, \ldots , x_{n+1}]/(f_1, \ldots , f_c, x_{n+1}h - 1)$. This is an example of a standard smooth algebra, except that the presentation is wrong and the variables should be in the following order: $x_1, \ldots , x_c, x_{n+1}, x_{c+1}, \ldots , x_n$.

Lemma 7.126.9. *A composition of standard smooth ring maps is standard smooth.*

Proof. Suppose that $R \to S$ and $S \to S'$ are standard smooth. We choose presentations $S = R[x_1, \ldots , x_n]/(f_1, \ldots , f_c)$ and $S' = S[y_1, \ldots , y_m]/(g_1, \ldots , g_d)$. Choose elements $g'_j \in R[x_1, \ldots , x_n, y_1, \ldots , y_m]$ mapping to the g_j. In this way we see $S' = R[x_1, \ldots , x_n, y_1, \ldots , y_m]/(f_1, \ldots , f_c, g'_1, \ldots , g'_d)$. To show that S' is standard smooth it suffices to verify that the determinant

$$\det \begin{pmatrix} \partial f_1/\partial x_1 & \ldots & \partial f_c/\partial x_1 & \partial g_1/\partial x_1 & \ldots & \partial g_d/\partial x_1 \\ \ldots & \ldots & \ldots & \ldots & \ldots & \ldots \\ \partial f_1/\partial x_c & \ldots & \partial f_c/\partial x_c & \partial g_1/\partial x_c & \ldots & \partial g_d/\partial x_c \\ 0 & \ldots & 0 & \partial g_1/\partial y_1 & \ldots & \partial g_d/\partial y_1 \\ \ldots & \ldots & \ldots & \ldots & \ldots & \ldots \\ 0 & \ldots & 0 & \partial g_1/\partial y_d & \ldots & \partial g_d/\partial y_d \end{pmatrix}$$

is invertible in S'. This is clear since it is the product of the two determinants which were assumed to be invertible by hypothesis. $\square$

Lemma 7.126.10. *Let $R \to S$ be a smooth ring map. There exists an open covering of $Spec(S)$ by standard opens $D(g)$ such that each S_g is standard smooth over R. In particular $R \to S$ is syntomic.*

Proof. Choose a presentation $\alpha : R[x_1, \ldots , x_n] \to S$ with kernel $I = (f_1, \ldots , f_m)$. For every subset $E \subset \{1, \ldots , m\}$ consider the open subset U_E where the classes $f_e, e \in E$ freely generate the finite projective S-module I/I^2, see Lemma 7.73.3. We may cover $Spec(S)$ by standard opens $D(g)$ each completely contained in one of the opens U_E. For such a g we look at the presentation

$$S_g = R[x_1, \ldots , x_n, x_{n+1}]/(f_1, \ldots , f_n, f_{n+1}) = R[x_1, \ldots , x_n, x_{n+1}]/J$$

with $f_{n+1} = gx_{n+1} - 1$. Since $J/J^2 = (I/I^2)_g \oplus S_g \cdot f_{n+1}$ we see that J/J^2 is freely generated by $f_e, e \in E$ and f_{n+1}. This reduces us to the case where S has a presentation $S = R[x_1, \ldots , x_n]/I$ with $I = (f_1, \ldots , f_m)$ and with I/I^2 free on the classes of $f_1, \ldots , f_c$.

Next, we more or less repeat this argument with the basis elements $\mathrm{d}x_1, \ldots , \mathrm{d}x_n$ of $\Omega_{R[x_1,\ldots,x_n]/R} \otimes_R S$. Namely, for any subset $E \subset \{1, \ldots , n\}$ we may consider the open subset U_E of $Spec(S)$, where the differential of $NL(\alpha)$ composed with the projection

$$S^{\oplus c} \cong I/I^2 \longrightarrow \Omega_{R[x_1,\ldots,x_n]/R} \otimes_R S \longrightarrow \bigoplus\nolimits_{e\in E} S\mathrm{d}x_i$$

is an isomorphism. Again we may find a covering of $Spec(S)$ by (finitely many) standard opens $D(g)$ such that each $D(g)$ is completely contained in one of the opens U_E. For a g with $D(g) \subset U_E$ we look at the presentation

$$S_g = R[x_1, \ldots , x_n, x_{n+1}]/(f_1, \ldots , f_n, f_{n+1}) = R[x_1, \ldots , x_n, x_{n+1}]/J$$

with $f_{n+1} = gx_{n+1} - 1$. Ok, and now we have $J/J^2 = (I/I^2)_g \oplus S_g \cdot f_{n+1}$, and $\Omega_{R[x_1,\ldots,x_{n+1}]/R} \otimes_R S_g = \bigoplus_{i=1}^{n+1} S_g \mathrm{d}x_i$, and $\mathrm{d}(f_{n+1}) = g\mathrm{d}x_{n+1} + x_{n+1}\mathrm{d}g$. From this we see that $J/J^2 \to (\bigoplus_{e\in E} S_g \mathrm{d}x_e) \oplus S_g \mathrm{d}x_{n+1}$ is an isomorphism. This reduces us to the case where S has a presentation $S = R[x_1, \ldots , x_n]/I$ with $I = (f_1, \ldots , f_m)$ and with I/I^2 free on the classes of $f_1, \ldots , f_c$, and furthermore the composition

$$I/I^2 \longrightarrow \Omega_{R[x_1,\ldots,x_n]/R} \otimes_R S \longrightarrow \bigoplus\nolimits_{i=1}^{c} S\mathrm{d}x_i$$

is an isomorphism.

At this point we consider the surjective map of R-algebras

$$S' := R[x_1, \ldots, x_n]/(f_1, \ldots, f_c) \longrightarrow S = R[x_1, \ldots, x_n]/(f_1, \ldots, f_m).$$

This is surjective. Let J be the kernel. Note that J is finitely generated (by the images of $f_{c+1}, \ldots, f_m$ in S'). Since $(f_1, \ldots, f_m)/(f_1, \ldots, f_m)^2$ is freely generated by $f_1, \ldots, f_c$ we see that $J/J^2 = 0$. By Lemma 7.18.5 we see that $Spec(S')$ contains $Spec(S)$ as an open and closed subset, and moreover that S is a localization $S = S'_{g'}$ for some element $g' \in S'$. Note that the determinant

$$g = \det \begin{pmatrix} \partial f_1/\partial x_1 & \partial f_2/\partial x_1 & \ldots & \partial f_c/\partial x_1 \\ \partial f_1/\partial x_2 & \partial f_2/\partial x_2 & \ldots & \partial f_c/\partial x_2 \\ \ldots & \ldots & \ldots & \ldots \\ \partial f_1/\partial x_c & \partial f_2/\partial x_c & \ldots & \partial f_c/\partial x_c \end{pmatrix}$$

maps to an invertible element in S (by the conclusion of the previous paragraph). Hence we actually have $S \cong S_{gg'}$. Since S'_g is standard smooth (see Example 7.126.8), we win because a principal localization of a standard smooth algebra is standard smooth, see Lemma 7.126.7. $\square$

Definition 7.126.11. Let $R \to S$ be a ring map. Let $\mathfrak{q}$ be a prime of S. We say $R \to S$ is *smooth at* $\mathfrak{q}$ if there exists a $g \in S$, $g \notin \mathfrak{q}$ such that $R \to S_g$ is smooth.

For ring maps of finite presentation we can characterize this as follows.

Lemma 7.126.12. *Let $R \to S$ be of finite presentation. Let $\mathfrak{q}$ be a prime of S. The following are equivalent*

(1) *$R \to S$ is smooth at $\mathfrak{q}$,*
(2) *$H_1(L_{S/R})_{\mathfrak{q}} = 0$ and $\Omega_{S/R,\mathfrak{q}}$ is a projective $S_{\mathfrak{q}}$-module, and*
(3) *$H_1(L_{S/R})_{\mathfrak{q}} = 0$ and $\Omega_{S/R,\mathfrak{q}}$ is a flat $S_{\mathfrak{q}}$-module.*

Proof. We will use without further mention that formation of the naive cotangent complex commutes with localization, see Section 7.123, especially Lemma 7.123.10. It is clear that (1) implies (2) implies (3). Assume (3) holds. Note that $\Omega_{S/R}$ is a finitely presented S-module, see Lemma 7.122.15. Hence $\Omega_{S/R,\mathfrak{q}}$ is a finite free module by Lemma 7.72.4. Writing $S_{\mathfrak{q}}$ as the colimit of principal localizations we see from Lemma 7.118.4 that we can find a $g \in S$, $g \notin \mathfrak{q}$ such that $(\Omega_{S/R})_g$ is finite free. Choose a presentation $\alpha : R[x_1, \ldots, x_n] \to S$ with kernel I. We may work with $NL(\alpha)$ instead of $NL_{S/R}$, see Lemma 7.123.2. The surjection

$$\Omega_{R[x_1,\ldots,x_n]/R} \otimes_R S \to \Omega_{S/R} \to 0$$

has a right inverse after inverting g because $(\Omega_{S/R})_g$ is projective. Hence the image of $\text{d} : (I/I^2)_g \to \Omega_{R[x_1,\ldots,x_n]/R} \otimes_R S_g$ is a direct summand and this map has a right inverse too. We conclude that $H_1(L_{S/R})_g$ is a quotient of $(I/I^2)_g$. In particular $H_1(L_{S/R})_g$ is a finite S_g-module. Thus the vanishing of $H_1(L_{S/R})_{\mathfrak{q}}$ implies the vanishing of $H_1(L_{S/R})_{gg'}$ for some $g' \in S$, $g' \notin \mathfrak{q}$. Then $R \to S_{gg'}$ is smooth by definition. $\square$

Lemma 7.126.13. *Let $R \to S$ be a ring map. Then $R \to S$ is smooth if and only if $R \to S$ is smooth at every prime $\mathfrak{q}$ of S.*

Proof. The direct implication is trivial. Suppose that $R \to S$ is smooth at every prime $\mathfrak{q}$ of S. Since $Spec(S)$ is quasi-compact, see Lemma 7.16.10, there exists a finite covering $Spec(S) = \bigcup D(g_i)$ such that each S_{g_i} is smooth. By Lemma 7.21.3 this implies that S is of finite presentation over R. According to Lemma 7.123.10 we see that $NL_{S/R} \otimes_S S_{g_i}$ is quasi-isomorphic to a finite projective S_{g_i}-module. By Lemma 7.72.2 this implies that $NL_{S/R}$ is quasi-isomorphic to a finite projective S-module. □

Lemma 7.126.14. *A composition of smooth ring maps is smooth.*

Proof. This follows from a combination of Lemmas 7.126.10, 7.126.9 and 7.126.13. (You can also prove this in many different ways; including easier ones.) □

Lemma 7.126.15. *Let R be a ring. Let $S = R[x_1, \ldots, x_n]/(f_1, \ldots, f_c)$ be a relative global complete intersection. Let $\mathfrak{q} \subset S$ be a prime. Then $R \to S$ is smooth at $\mathfrak{q}$ if and only if there exists a subset $I \subset \{1, \ldots, n\}$ of cardinality c such that the polynomial*

$$g_I = \det(\partial f_j/\partial x_i)_{j=1,\ldots,c,\ i\in I}.$$

does not map to an element of $\mathfrak{q}$.

Proof. By Lemma 7.125.13 we see that the naive cotangent complex associated to the given presentation of S is the complex

$$\bigoplus\nolimits_{j=1}^{c} S \cdot f_j \longrightarrow \bigoplus\nolimits_{i=1}^{n} S \cdot \mathrm{d}x_i, \quad f_j \longmapsto \sum \frac{\partial f_j}{\partial x_i} \mathrm{d}x_i.$$

The maximal minors of the matrix giving the map are exactly the polynomials g_I.

Assume g_I maps to $g \in S$, with $g \notin \mathfrak{q}$. Then the algebra S_g is smooth over R. Namely, its naive cotangent complex is quasi-isomorphic to the complex above localized at g, see Lemma 7.123.10. And by construction it is quasi-isomorphic to a free rank $n - c$ module in degree 0.

Conversely, suppose that all g_I end up in $\mathfrak{q}$. In this case the complex above tensored with $\kappa(\mathfrak{q})$ does not have maximal rank, and hence there is no localization by an element $g \in S$, $g \notin \mathfrak{q}$ where this map becomes a split injection. By Lemma 7.123.10 again there is no such localization which is smooth over R. □

Lemma 7.126.16. *Let $R \to S$ be a ring map. Let $\mathfrak{q} \subset S$ be a prime lying over the prime $\mathfrak{p}$ of R. Assume*

(1) *there exists a $g \in S$, $g \notin \mathfrak{q}$ such that $R \to S_g$ is of finite presentation,*
(2) *the local ring homomorphism $R_{\mathfrak{p}} \to S_{\mathfrak{q}}$ is flat,*
(3) *the fibre $S \otimes_R \kappa(\mathfrak{p})$ is smooth over $\kappa(\mathfrak{p})$ at the prime corresponding to $\mathfrak{q}$.*

Then $R \to S$ is smooth at $\mathfrak{q}$.

Proof. By Lemmas 7.125.16 and 7.126.5 we see that there exists a $g \in S$ such that S_g is a relative global complete intersection. Replacing S by S_g we may assume $S = R[x_1, \ldots, x_n]/(f_1, \ldots, f_c)$ is a relative global complete intersection. For any subset $I \subset \{1, \ldots, n\}$ of cardinality c consider the polynomial $g_I = \det(\partial f_j/\partial x_i)_{j=1,\ldots,c,i\in I}$ of Lemma 7.126.15. Note that the image $\overline{g}_I$ of g_I in the polynomial ring $\kappa(\mathfrak{p})[x_1, \ldots, x_n]$ is the determinant of the partial derivatives of the images $\overline{f}_j$ of the f_j in the ring $\kappa(\mathfrak{p})[x_1, \ldots, x_n]$. Thus the lemma follows by applying Lemma 7.126.15 both to $R \to S$ and to $\kappa(\mathfrak{p}) \to S \otimes_R \kappa(\mathfrak{p})$. □

Note that the sets U, V in the following lemma are open by definition.

Lemma 7.126.17. *Let $R \to S$ be a ring map of finite presentation. Let $R \to R'$ be a flat ring map. Denote $S' = R' \otimes_R S$ the base change. Let $U \subset Spec(S)$ be the set of primes at which $R \to S$ is smooth. Let $V \subset Spec(S')$ the set of primes at which $R' \to S'$ is smooth. Then V is the inverse image of U under the map $f : Spec(S') \to Spec(S)$.*

Proof. By Lemma 7.123.6 we see that $NL_{S/R} \otimes_S S'$ is homotopy equivalent to $NL_{S'/R'}$. This already implies that $f^{-1}(U) \subset V$.

Let $\mathfrak{q}' \subset S'$ be a prime lying over $\mathfrak{q} \subset S$. Assume $\mathfrak{q}' \in V$. We have to show that $\mathfrak{q} \in U$. Since $S \to S'$ is flat, we see that $S_{\mathfrak{q}} \to S'_{\mathfrak{q}'}$ is faithfully flat (Lemma 7.35.16). Thus the vanishing of $H_1(L_{S'/R'})_{\mathfrak{q}'}$ implies the vanishing of $H_1(L_{S/R})_{\mathfrak{q}}$. By Lemma 7.72.5 applied to the $S_{\mathfrak{q}}$-module $(\Omega_{S/R})_{\mathfrak{q}}$ and the map $S_{\mathfrak{q}} \to S'_{\mathfrak{q}'}$ we see that $(\Omega_{S/R})_{\mathfrak{q}}$ is projective. Hence $R \to S$ is smooth at $\mathfrak{q}$ by Lemma 7.126.12. ☐

Lemma 7.126.18. *Let $k \subset K$ be a field extension. Let S be a finite type algebra over k. Let $\mathfrak{q}_K$ be a prime of $S_K = K \otimes_k S$ and let $\mathfrak{q}$ be the corresponding prime of S. Then S is smooth over k at $\mathfrak{q}$ if and only if S_K is smooth at $\mathfrak{q}_K$ over K.*

Proof. This is a special case of Lemma 7.126.17 above. ☐

Lemma 7.126.19. *Let R be a ring and let $I \subset R$ be an ideal. Let $R/I \to \overline{S}$ be a smooth ring map. Then there exists elements $\overline{g}_i \in \overline{S}$ which generate the unit ideal of $\overline{S}$ such that each $\overline{S}_{g_i} \cong S_i/IS_i$ for some (standard) smooth ring S_i over R.*

Proof. By Lemma 7.126.10 we find a collection of elements $\overline{g}_i \in \overline{S}$ which generate the unit ideal of $\overline{S}$ such that each $\overline{S}_{g_i}$ is standard smooth over R/I. Hence we may assume that $\overline{S}$ is standard smooth over R/I. Write $\overline{S} = (R/I)[x_1, \ldots, x_n]/(\overline{f}_1, \ldots, \overline{f}_c)$ as in Definition 7.126.6. Choose $f_1, \ldots, f_c \in R[x_1, \ldots, x_n]$ lifting $\overline{f}_1, \ldots, \overline{f}_c$. Set $S = R[x_1, \ldots, x_n, x_{n+1}]/(f_1, \ldots, f_c, x_{n+1}\Delta - 1)$ where $\Delta = \det(\frac{\partial f_i}{\partial x_j})_{i,j=1,\ldots,c}$ as in Example 7.126.8. This proves the lemma. ☐

7.127. Formally smooth maps

In this section we define formally smooth ring maps. It will turn out that a ring map of finite presentation is formally smooth if and only if it is smooth, see Proposition 7.127.13.

Definition 7.127.1. Let $R \to S$ be a ring map. We say S is *formally smooth over R* if for every commutative solid diagram

$$\begin{tikzcd} S \arrow[r] \arrow[rd, dashed] & A/I \\ R \arrow[u] \arrow[r] & A \arrow[u] \end{tikzcd}$$

where $I \subset A$ is an ideal of square zero, a dotted arrow exists which makes the diagram commute.

Lemma 7.127.2. *Let $R \to S$ be a formally smooth ring map. Let $R \to R'$ be any ring map. Then the base change $S' = R' \otimes_R S$ is formally smooth over R'.*

Proof. Let a solid diagram

$$\begin{tikzcd} S \arrow[r] \arrow[rrd, dashed] & R' \otimes_R S \arrow[r] \arrow[rd, dashed] & A/I \\ R \arrow[u] \arrow[r] & R' \arrow[u] \arrow[r] & A \arrow[u] \end{tikzcd}$$

as in Definition 7.127.1 be given. By assumption the longer dotted arrow exists. By the universal property of tensor product we obtain the shorter dotted arrow. ☐

Lemma 7.127.3. *A composition of formally smooth ring maps is formally smooth.*

Proof. Omitted. (Hint: This is completely formal, and follows from considering a suitable diagram.) ☐

Lemma 7.127.4. *A polynomial ring over R is formally smooth over R.*

Proof. Suppose we have a diagram as in Definition 7.127.1 with $S = R[x_j; j \in J]$. Then there exists a dotted arrow simply by choosing lifts $a_j \in A$ of the elements in A/I to which the elements x_j map to under the top horizontal arrow. ☐

Lemma 7.127.5. *Let $R \to S$ be a ring map. Let $P \to S$ be a surjective R-algebra map from a polynomial ring P onto S. Denote $J \subset P$ the kernel. Then $R \to S$ is formally smooth if and only if there exists an R-algebra map $\sigma : S \to P/J^2$ which is a right inverse to the surjection $P/J^2 \to S$.*

Proof. Assume $R \to S$ is formally smooth. Consider the commutative diagram

$$\begin{tikzcd} S \arrow[r] \arrow[rd, dashed] & P/J \\ R \arrow[u] \arrow[r] & P/J^2 \arrow[u] \end{tikzcd}$$

By assumption the dotted arrow exists. This proves that σ exists.

Conversely, suppose we have a σ as in the lemma. Let a solid diagram

$$\begin{tikzcd} S \arrow[r] \arrow[rd, dashed] & A/I \\ R \arrow[u] \arrow[r] & A \arrow[u] \end{tikzcd}$$

as in Definition 7.127.1 be given. Because P is formally smooth by Lemma 7.127.4, there exists an R-algebra homomorphism $\psi : P \to A$ which lifts the map $P \to S \to A/I$. Clearly $\psi(J) \subset I$ and since $I^2 = 0$ we conclude that $\psi(J^2) = 0$. Hence ψ factors as $\overline{\psi} : P/J^2 \to A$. The desired dotted arrow is the composition $\overline{\psi} \circ \sigma : S \to A$. ☐

Remark 7.127.6. Lemma 7.127.5 above holds more generally whenever P is formally smooth over R.

Lemma 7.127.7. *Let $R \to S$ be a ring map. Let $P \to S$ be a surjective R-algebra map from a polynomial ring P onto S. Denote $J \subset P$ the kernel. Then $R \to S$ is formally smooth if and only if the sequence*

$$0 \to J/J^2 \to \Omega_{P/R} \otimes_R S \to \Omega_{S/R} \to 0$$

of Lemma 7.122.9 is a split exact sequence.

Proof. Assume S is formally smooth over R. By Lemma 7.127.5 this means there exists an R-algebra map $S \to P/J^2$ which is a left inverse to the canonical map $P/J^2 \to S$. This means that

$$P/J^2 \cong S \oplus J/J^2$$

as R-algebras. Note that the middle term of the exact sequence is $\Omega_{P/R} \otimes_P S \cong \Omega_{(P/J^2)/R} \otimes_R S$ by Lemma 7.122.11. A direct computation shows that

$$\Omega_{(S \oplus J/J^2)/R} \otimes_{(S \oplus J/J^2)} S = \Omega_{S/R} \oplus J/J^2$$

as desired.

Assume the exact sequence of the lemma is split exact. Choose a splitting $\sigma : \Omega_{S/R} \to \Omega_{P/R} \otimes_R S$. For each $\lambda \in S$ choose $x_\lambda \in P$ which maps to λ. Next, for each $\lambda \in S$ choose $f_\lambda \in J$ such that

$$\mathrm{d}f_\lambda = \mathrm{d}x_\lambda - \sigma(\mathrm{d}\lambda)$$

in the middle term of the exact sequence. We claim that $s : \lambda \mapsto x_\lambda - f_\lambda \mod J^2$ is an R-algebra homomorphism $s : S \to P/J^2$. To prove this we will repeatedly use that if $h \in J$ and $\mathrm{d}h = 0$ in $\Omega_{P/R} \otimes_R S$, then $h \in J^2$. Let $\lambda, \mu \in S$. Then $\sigma(\mathrm{d}\lambda + \mathrm{d}\mu - \mathrm{d}(\lambda + \mu)) = 0$. This implies

$$\mathrm{d}(x_\lambda + x_\mu - x_{\lambda+\mu} - f_\lambda - f_\mu + f_{\lambda+\mu}) = 0$$

which means that $x_\lambda + x_\mu - x_{\lambda+\mu} - f_\lambda - f_\mu + f_{\lambda+\mu} \in J^2$, which in turn means that $s(\lambda) + s(\mu) = s(\lambda + \mu)$. Similarly, we have $\sigma(\lambda \mathrm{d}\mu + \mu \mathrm{d}\lambda - \mathrm{d}\lambda\mu) = 0$ which implies that

$$\mu(\mathrm{d}x_\lambda - \mathrm{d}f_\lambda) + \lambda(\mathrm{d}x_\mu - \mathrm{d}f_\mu) - \mathrm{d}x_{\lambda\mu} - \mathrm{d}f_{\lambda\mu} = 0$$

in the middle term of the exact sequence. Moreover we have

$$\mathrm{d}(x_\lambda x_\mu) = x_\lambda \mathrm{d}x_\mu + x_\mu \mathrm{d}x_\lambda = \lambda \mathrm{d}x_\mu + \mu \mathrm{d}x_\lambda$$

in the middle term again. Combined these equations mean that $x_\lambda x_\mu - x_{\lambda\mu} - \mu f_\lambda - \lambda f_\mu + f_{\lambda\mu} \in J^2$ which means that $s(\lambda)s(\mu) = s(\lambda\mu)$. If $\lambda \in R$, then $\mathrm{d}\lambda = 0$ and we see that $\mathrm{d}f_\lambda = \mathrm{d}x_\lambda$, hence $\lambda - x_\lambda + f_\lambda \in J^2$ and hence $s(\lambda) = \lambda$ as desired. At this point we can apply Lemma 7.127.5 to conclude that S/R is formally smooth. □

Proposition 7.127.8. *Let $R \to S$ be a ring map. Consider a formally smooth R-algebra P and a surjection $P \to S$ with kernel J. The following are equivalent*

(1) *S is formally smooth over R,*
(2) *for some $P \to S$ as above there exists a section to $P/J^2 \to S$,*
(3) *for all $P \to S$ as above there exists a section to $P/J^2 \to S$,*
(4) *for some $P \to S$ as above the sequence $0 \to J/J^2 \to \Omega_{P/R} \otimes S \to \Omega_{S/R} \to 0$ is split exact,*
(5) *for all $P \to S$ as above the sequence $0 \to J/J^2 \to \Omega_{P/R} \otimes S \to \Omega_{S/R} \to 0$ is split exact, and*
(6) *the naive cotangent complex $NL_{S/R}$ is quasi-isomorphic to a projective S-module placed in degree 0.*

Proof. It is clear that (1) implies (3) implies (2), see first part of the proof of Lemma 7.127.5. It is also true that (3) implies (5) implies (4) and that (2) implies (4), see first part of the proof of Lemma 7.127.7. Finally, Lemma 7.127.7 applied to the canonical surjection $R[S] \to S$ (7.123.0.1) shows that (1) implies (6).

Assume (4) and let's prove (6). Consider the sequence of Lemma 7.123.3 associated to the ring maps $R \to P \to S$. By the implication (1) ⇒ (6) proved above we see that $NL_{P/R} \otimes_R S$ is quasi-isomorphic to $\Omega_{P/R} \otimes_P S$ placed in degree 0. Hence $H_1(NL_{P/R} \otimes_P S) = 0$. Since $P \to S$ is surjective we see that $NL_{S/P}$ is homotopy equivalent to J/J^2 placed in degee 1 (Lemma 7.123.4). Thus we obtain the exact sequence $0 \to H_1(L_{S/R}) \to J/J^2 \to$

$\Omega_{P/R} \otimes_P S \to \Omega_{S/R} \to 0$. By assumption we see that $H_1(L_{S/R}) = 0$ and that $\Omega_{S/R}$ is a projective S-module. Thus (6) follows.

Finally, let's prove that (6) implies (1). The assumption means that the complex $J/J^2 \to \Omega_{P/R} \otimes S$ where $P = R[S]$ and $P \to S$ is the canonical surjection (7.123.0.1). Hence Lemma 7.127.7 shows that S is formally smooth over R. □

Lemma 7.127.9. *Let $A \to B \to C$ be ring maps. Assume $B \to C$ is formally smooth. Then the sequence*

$$0 \to \Omega_{B/A} \otimes_B C \to \Omega_{C/A} \to \Omega_{C/B} \to 0$$

of Lemma 7.122.7 is a split short exact sequence.

Proof. Follows from Proposition 7.127.8 and Lemma 7.123.3. □

Lemma 7.127.10. *Let $A \to B \to C$ be ring maps with $A \to C$ formally smooth and $B \to C$ surjective with kernel $J \subset B$. Then the exact sequence*

$$0 \to J/J^2 \to \Omega_{B/A} \otimes_B C \to \Omega_{C/A} \to 0$$

of Lemma 7.122.9 is split exact.

Proof. Follows from Proposition 7.127.8, Lemma 7.123.3, and Lemma 7.122.9. □

Lemma 7.127.11. *Let $A \to B \to C$ be ring maps. Assume $A \to C$ is surjective (so also $B \to C$ is) and $A \to B$ formally smooth. Denote $I = Ker(A \to C)$ and $J = Ker(B \to C)$. Then the sequence*

$$0 \to I/I^2 \to J/J^2 \to \Omega_{B/A} \otimes_B B/J \to 0$$

of Lemma 7.123.5 is split exact.

Proof. Since $A \to B$ is formally smooth there exists a ring map $\sigma : B \to A/I^2$ whose composition with $A \to B$ equals the quotient map $A \to A/I^2$. Then σ induces a map $J/J^2 \to I/I^2$ which is inverse to the map $I/I^2 \to J/J^2$. □

Lemma 7.127.12. *Let $R \to S$ be a ring map. Let $I \subset R$ be an ideal. Assume*

(1) *$I^2 = 0$,*
(2) *$R \to S$ is flat, and*
(3) *$R/I \to S/IS$ is formally smooth.*

Then $R \to S$ is formally smooth.

Proof. Assume (1), (2) and (3). Let $P = R[\{x_t\}_{t\in T}] \to S$ be a surjection of R-algebras with kernel J. Thus $0 \to J \to P \to S \to 0$ is a short exact sequence of flat R-modules. This implies that $I \otimes_R S = IS$, $I \otimes_R P = IP$ and $I \otimes_R J = IJ$ as well as $J \cap IP = IJ$. We will use throughout the proof that

$$\Omega_{(S/IS)/(R/I)} = \Omega_{S/R} \otimes_S (S/IS) = \Omega_{S/R} \otimes_R R/I = \Omega_{S/R}/I\Omega_{S/R}$$

and similarly for P (see Lemma 7.122.12). By Lemma 7.127.7 the sequence

$$(7.127.12.1) \qquad 0 \to J/(IJ + J^2) \to \Omega_{P/R} \otimes_P S/IS \to \Omega_{S/R} \otimes_S S/IS \to 0$$

is split exact. Of course the middle term is $\bigoplus_{t\in T} S/IS\mathrm{d}x_t$. Choose a splitting $\sigma : \Omega_{P/R} \otimes_P S/IS \to J/(IJ + J^2)$. For each $t \in T$ choose an element $f_t \in J$ which maps to $\sigma(\mathrm{d}x_t)$ in $J/(IJ + J^2)$. This determines a unique S-module map

$$\tilde{\sigma} : \Omega_{P/R} \otimes_R S = \bigoplus S\mathrm{d}x_t \longrightarrow J/J^2$$

with the property that $\tilde{\sigma}(\mathrm{d}x_t) = f_t$. As σ is a section to d the difference

$$\Delta = \mathrm{id}_{J/J^2} - \tilde{\sigma} \circ \mathrm{d}$$

is a self map $J/J^2 \to J/J^2$ whose image is contained in $(IJ + J^2)/J^2$. In particular $\Delta((IJ + J^2)/J^2) = 0$ because $I^2 = 0$. This means that Δ factors as

$$J/J^2 \to J/(IJ + J^2) \xrightarrow{\overline{\Delta}} (IJ + J^2)/J^2 \to J/J^2$$

where $\overline{\Delta}$ is a S/IS-module map. Using again that the sequence (7.127.12.1) is split, we can find a S/IS-module map $\overline{\delta} : \Omega_{P/R} \otimes_P S/IS \to (IJ + J^2)/J^2$ such that $\overline{\delta} \circ d$ is equal to $\overline{\Delta}$. In the same manner as above the map $\overline{\delta}$ determines an S-module map $\delta : \Omega_{P/R} \otimes_P S \to J/J^2$. After replacing $\tilde{\sigma}$ by $\tilde{\sigma} + \delta$ a simple computation shows that $\Delta = 0$. In other words $\tilde{\sigma}$ is a section of $J/J^2 \to \Omega_{P/R} \otimes_P S$. By Lemma 7.127.7 we conclude that $R \to S$ is formally smooth. ☐

Proposition 7.127.13. *Let $R \to S$ be a ring map. The following are equivalent*

1. *$R \to S$ is of finite presentation and formally smooth,*
2. *$R \to S$ is smooth.*

Proof. Follows from Proposition 7.127.8 and Definition 7.126.1. (Note that $\Omega_{S/R}$ is a finitely presented S-module if $R \to S$ is of finite presentation, see Lemma 7.122.15.) ☐

Lemma 7.127.14. *Let $R \to S$ be a smooth ring map. Then there exists a subring $R_0 \subset R$ of finite type over $\mathbf{Z}$ and a smooth ring map $R_0 \to S_0$ such that $S \cong R \otimes_{R_0} S_0$.*

Proof. We are going to use that smooth is equivalent to finite presentation and formally smooth, see Proposition 7.127.13. Write $S = R[x_1, \ldots, x_n]/(f_1, \ldots, f_m)$ and denote $I = (f_1, \ldots, f_m)$. Choose a right inverse $\sigma : S \to R[x_1, \ldots, x_n]/I^2$ to the projection to S as in Lemma 7.127.5. Choose $h_i \in R[x_1, \ldots, x_n]$ such that $\sigma(x_i \bmod I) = h_i \bmod I^2$. The fact that σ is an R-algebra homomorphism $R[x_1, \ldots, x_n]/I \to R[x_1, \ldots, x_n]/I^2$ is equivalent to the condition that

$$f_j(h_1, \ldots, h_n) = \sum\nolimits_{j_1 j_2} a_{j_1 j_2} f_{j_1} f_{j_2}$$

for certain $a_{kl} \in R[x_1, \ldots, x_n]$. Let $R_0 \subset R$ be the subring generated over $\mathbf{Z}$ by all the coefficients of the polynomials f_j, h_i, a_{kl}. Set $S_0 = R_0[x_1, \ldots, x_n]/(f_1, \ldots, f_m)$, with $I_0 = (f_1, \ldots, f_m)$. Let $\sigma_0 : S_0 \to R_0[x_1, \ldots, x_n]/I_0^2$ defined by the rule $x_i \mapsto h_i \bmod I_0^2$; this works since the a_{lk} are defined over R_0 and satisfy the same relations. Thus by Lemma 7.127.5 the ring S_0 is formally smooth over R_0. ☐

Lemma 7.127.15. *Let $R \to S$ be a ring map. Let $R \to R'$ be a faithfully flat ring map. Set $S' = S \otimes_R R'$. Then $R \to S$ is formally smooth if and only if $R' \to S'$ is formally smooth.*

Proof. If $R \to S$ is formally smooth, then $R' \to S'$ is formally smooth by Lemma 7.127.2. To prove the converse, assume $R' \to S'$ is formally smooth. Note that $N \otimes_R R' = N \otimes_S S'$ for any S-module N. In particular $S \to S'$ is faithfully flat also. Choose a polynomial ring $P = R[\{x_i\}_{i \in I}]$ and a surjection of R-algebras $P \to S$ with kernel J. Note that $P' = P \otimes_R R'$ is a polynomial algebra over R'. Since $R \to R'$ is flat the kernel J' of the surjection $P' \to S'$ is $J \otimes_R R'$. Hence the split exact sequence (see Lemma 7.127.7)

$$0 \to J'/(J')^2 \to \Omega_{P'/R'} \otimes_{P'} S' \to \Omega_{S'/R'} \to 0$$

is the base change via $S \to S'$ of the corresponding sequence

$$J/J^2 \to \Omega_{P/R} \otimes_P S \to \Omega_{S/R} \to 0$$

see Lemma 7.122.9. As $S \to S'$ is faithfully flat we conclude two things: (1) this sequence (without $'$) is exact too, and (2) $\Omega_{S/R}$ is a projective S-module. Namely, $\Omega_{S'/R'}$ is projective as a direct sum of the free module $\Omega_{P'/R'} \otimes_{P'} S'$ and $\Omega_{S/R} \otimes_S S' = \Omega_{S'/R'}$ by what we said above. Thus (2) follows by descent of projectivity through faithfully flat ring maps, see Theorem 7.89.5. Hence the sequence $0 \to J/J^2 \to \Omega_{P/R} \otimes_P S \to \Omega_{S/R} \to 0$ is exact also and we win by applying Lemma 7.127.7 once more. $\square$

It turns out that smooth ring maps satisfy the following strong lifting property.

Lemma 7.127.16. *Let $R \to S$ be a smooth ring map. Given a commutative solid diagram*

$$\begin{tikzcd} S \arrow[r] \arrow[rd, dashed] & A/I \\ R \arrow[u] \arrow[r] & A \arrow[u] \end{tikzcd}$$

where $I \subset A$ is a locally nilpotent ideal, a dotted arrow exists which makes the diagram commute.

Proof. By Lemma 7.127.14 we can extend the diagram to a commutative diagram

$$\begin{tikzcd} S_0 \arrow[r] & S \arrow[r] \arrow[rd, dashed] & A/I \\ R_0 \arrow[u] \arrow[r] & R \arrow[u] \arrow[r] & A \arrow[u] \end{tikzcd}$$

with $R_0 \to S_0$ smooth, R_0 of finite type over $\mathbf{Z}$, and $S = S_0 \otimes_{R_0} R$. Let $x_1, \ldots, x_n \in S_0$ be generators of S_0 over R_0. Let $a_1, \ldots, a_n$ be elements of A which map to the same elements in A/I as the elements $x_1, \ldots, x_n$. Denote $A_0 \subset A$ the subring generated by the image of R_0 and the elements $a_1, \ldots, a_n$. Set $I_0 = A_0 \cap I$. Then $A_0/I_0 \subset A/I$ and $S_0 \to A/I$ maps into A_0/I_0. Thus it suffices to find the dotted arrow in the diagram

$$\begin{tikzcd} S_0 \arrow[r] \arrow[rd, dashed] & A_0/I_0 \\ R_0 \arrow[u] \arrow[r] & A_0 \arrow[u] \end{tikzcd}$$

The ring A_0 is of finite type over $\mathbf{Z}$ by construction. Hence A_0 is Noetherian, whence I_0 is nilpotent, see Lemma 7.47.3. Say $I_0^n = 0$. By Proposition 7.127.13 we can successively lift the R_0-algebra map $S_0 \to A_0/I_0$ to $S_0 \to A_0/I_0^2$, $S_0 \to A_0/I_0^3$, ..., and finally $S_0 \to A_0/I_0^n = A_0$. $\square$

7.128. Smoothness and differentials

Some results on differentials and smooth ring maps.

Lemma 7.128.1. *Given ring maps $A \to B \to C$ with $B \to C$ smooth, then the sequence*

$$0 \to C \otimes_B \Omega_{B/A} \to \Omega_{C/A} \to \Omega_{C/B} \to 0$$

of Lemma 7.122.7 is exact.

Proof. This follows from the more general Lemma 7.127.9 because a smooth ring map is formally smooth, see Proposition 7.127.13. But it also follows directly from Lemma 7.123.3 since $H_1(L_{C/B}) = 0$ is part of the definition of smoothness of $B \to C$. $\square$

Lemma 7.128.2. *Let $A \to B \to C$ be ring maps with $A \to C$ smooth and $B \to C$ surjective with kernel $J \subset B$. Then the exact sequence*

$$0 \to J/J^2 \to \Omega_{B/A} \otimes_B C \to \Omega_{C/A} \to 0$$

of Lemma 7.122.9 is split exact.

Proof. This follows from the more general Lemma 7.127.10 because a smooth ring map is formally smooth, see Proposition 7.127.13. □

Lemma 7.128.3. *Let $A \to B \to C$ be ring maps. Assume $A \to C$ is surjective (so also $B \to C$ is) and $A \to B$ smooth. Denote $I = Ker(A \to C)$ and $J = Ker(B \to C)$. Then the sequence*

$$0 \to I/I^2 \to J/J^2 \to \Omega_{B/A} \otimes_B B/J \to 0$$

of Lemma 7.123.5 is exact.

Proof. This follows from the more general Lemma 7.127.11 because a smooth ring map is formally smooth, see Proposition 7.127.13. □

Lemma 7.128.4. *Let $\varphi : R \to S$ be a smooth ring map. Let $\sigma : S \to R$ be a left inverse to φ. Set $I = Ker(\sigma)$. Then*

(1) *I/I^2 is a finite locally free R-module, and*
(2) *if I/I^2 is free, then $S^\wedge \cong R[[t_1, \ldots, t_d]]$ as R-algebras, where $S^\wedge$ is the I-adic completion of S.*

Proof. By Lemma 7.122.10 applied to $R \to S \to R$ we see that $I/I^2 = \Omega_{S/R} \otimes_{S,\sigma} R$. Since by definition of a smooth morphism the module $\Omega_{S/R}$ is finite locally free over S we deduce that (1) holds. If I/I^2 is free, then choose $f_1, \ldots, f_d \in I$ whose images in I/I^2 form an R-basis. Consider the R-algebra map defined by

$$\Psi : R[[x_1, \ldots, x_d]] \longrightarrow S^\wedge, \quad x_i \longmapsto f_i.$$

Denote $P = R[[x_1, \ldots, x_d]]$ and $J = (x_1, \ldots, x_d) \subset P$. We write $\Psi_n : P/J^n \to S/I^n$ for the induced map of quotient rings. Note that $S/I^2 = \varphi(R) \oplus I/I^2$. Thus Ψ_2 is an isomorphism. Denote $\sigma_2 : S/I^2 \to P/J^2$ the inverse of Ψ_2. We will prove by induction on n that for all $n > 2$ there exists an inverse $\sigma_n : S/I^n \to P/J^n$ of Ψ_n. Namely, as S is formally smooth over R (by Proposition 7.127.13) we see that in the solid diagram

$$\begin{tikzcd} S \arrow[r, dotted] \arrow[dr, "\sigma_{n-1}"'] & P/J^n \arrow[d] \\ & P/J^{n-1} \end{tikzcd}$$

of R-algebras we can fill in the dotted arrow by some R-algebra map $\tau : S \to P/J^n$ making the diagram commute. This induces an R-algebra map $\overline{\tau} : S/I^n \to P/J^n$ which is equal to σ_{n-1} modulo J^n. By construction the map Ψ_n is surjective and now $\overline{\tau} \circ \Psi_n$ is an R-algebra endomorphism of P/J^n which maps x_i to $x_i + \delta_{i,n}$ with $\delta_{i,n} \in J^{n-1}/J^n$. It follows that Ψ_n is an isomorphism and hence it has an inverse σ_n. This proves the lemma. □

7.129. Smooth algebras over fields

Warning: The following two lemmas do not hold over nonperfect fields in general.

Lemma 7.129.1. *Let k be an algebraically closed field. Let S be a finite type k-algebra. Let $\mathfrak{m} \subset S$ be a maximal ideal. Then*

$$\dim_{\kappa(\mathfrak{m})} \Omega_{S/k} \otimes_S \kappa(\mathfrak{m}) = \dim_{\kappa(\mathfrak{m})} \mathfrak{m}/\mathfrak{m}^2.$$

Proof. Since k is algebraically closed we have $\kappa(\mathfrak{m}) = k$. We may choose a presentation $0 \to I \to k[x_1, \ldots, x_n] \to S \to 0$ such that all x_i end up in $\mathfrak{m}$. Write $I = (f_1, \ldots, f_m)$. Note that each f_i is contained in $(x_1, \ldots, x_n)$, i.e., each f_i has zero constant term. Hence we may write

$$f_j = \sum a_{ij} x_i + \text{h.o.t.}$$

By Lemma 7.122.9 there is an exact sequence

$$\bigoplus S \cdot f_j \to \bigoplus S \cdot \mathrm{d}x_i \to \Omega_{S/k} \to 0.$$

Tensoring with $\kappa(\mathfrak{m}) = k$ we get an exact sequence

$$\bigoplus k \cdot f_j \to \bigoplus k \cdot \mathrm{d}x_i \to \Omega_{S/k} \otimes \kappa(\mathfrak{m}) \to 0.$$

The matrix of the map is given by the partial derivatives of the f_j evaluated at 0. In other words by the matrix (a_{ij}). Similarly there is a short exact sequence

$$(f_1, \ldots, f_m)/(x_1 f_1, \ldots, x_n f_m) \to (x_1, \ldots, x_n)/(x_1, \ldots, x_n)^2 \to \mathfrak{m}/\mathfrak{m}^2 \to 0.$$

Note that the first map is given by expanding the f_j in terms of the x_i, i.e., by the same matrix (a_{ij}). Hence the two numbers are the same. $\square$

Lemma 7.129.2. *Let k be an algebraically closed field. Let S be a finite type k-algebra. Let $\mathfrak{m} \subset S$ be a maximal ideal. The following are equivalent:*

1. *The ring $S_{\mathfrak{m}}$ is a regular local ring.*
2. *We have* $\dim_{\kappa(\mathfrak{m})} \Omega_{S/k} \otimes_S \kappa(\mathfrak{m}) \leq \dim(S_{\mathfrak{m}})$.
3. *We have* $\dim_{\kappa(\mathfrak{m})} \Omega_{S/k} \otimes_S \kappa(\mathfrak{m}) = \dim(S_{\mathfrak{m}})$.
4. *There exists a $g \in S$, $g \notin \mathfrak{m}$ such that S_g is smooth over k. In other words S/k is smooth at $\mathfrak{m}$.*

Proof. Note that (1), (2) and (3) are equivalent by Lemma 7.129.1 and Definition 7.102.6.

Assume that S is smooth at $\mathfrak{q}$. By Lemma 7.126.10 we see that S_g is standard smooth over k for a suitable $g \in S$, $g \notin \mathfrak{m}$. Hence by Lemma 7.126.7 we see that $\Omega_{S_g/k}$ is free of rank $\dim(S_g)$. Hence by Lemma 7.129.1 we see that $\dim(S_m) = \dim(\mathfrak{m}/\mathfrak{m}^2)$ in other words $S_{\mathfrak{m}}$ is regular.

Conversely, suppose that $S_{\mathfrak{m}}$ is regular. Let $d = \dim(S_{\mathfrak{m}}) = \dim \mathfrak{m}/\mathfrak{m}^2$. Choose a presentation $S = k[x_1, \ldots, x_n]/I$ such that x_i maps to an element of $\mathfrak{m}$ for all i. In other words, $\mathfrak{m}'' = (x_1, \ldots, x_n)$ is the corresponding maximal ideal of $k[x_1, \ldots, x_n]$. Note that we have a short exact sequence

$$I/\mathfrak{m}'' I \to \mathfrak{m}''/(\mathfrak{m}'')^2 \to \mathfrak{m}/(\mathfrak{m})^2 \to 0$$

Pick $c = n - d$ elements $f_1, \ldots, f_d \in I$ such that their images in $\mathfrak{m}''/(\mathfrak{m}'')^2$ span the kernel of the map to $\mathfrak{m}/(\mathfrak{m})^2$. This is clearly possible. Denote $J = (f_1, \ldots, f_c)$. So $J \subset I$.

Denote $S' = k[x_1, \ldots, x_n]/J$ so there is a surjection $S' \to S$. Denote $\mathfrak m' = \mathfrak m'' S'$ the corresponding maximal ideal of S'. Hence we have

$$\begin{tikzcd} k[x_1, \ldots, x_n] \arrow[r] & S' \arrow[r] & S \\ \mathfrak m'' \arrow[r] \arrow[u] & \mathfrak m' \arrow[r] \arrow[u] & \mathfrak m \arrow[u] \end{tikzcd}$$

By our choice of J the exact sequence

$$J/\mathfrak m'' J \to \mathfrak m''/(\mathfrak m'')^2 \to \mathfrak m'/(\mathfrak m')^2 \to 0$$

shows that $\dim(\mathfrak m'/(\mathfrak m')^2) = d$. Since $S'_{\mathfrak m'}$ surjects onto $S_{\mathfrak m}$ we see that $\dim(S_{\mathfrak m'}) \geq d$. Hence by the discussion preceding Definition 7.57.9 we conclude that $S'_{\mathfrak m'}$ is regular of dimension d as well. Because S' was cut out by $c = n - d$ equations we conclude that there exists a $g' \in S'$, $g' \not\in \mathfrak m'$ such that $S'_{g'}$ is a global complete intersection over k, see Lemma 7.124.4. Also the map $S'_{\mathfrak m'} \to S_{\mathfrak m}$ is a surjection of Noetherian local domains of the same dimension and hence an isomorphism. By Lemma 7.117.6 we see that $S'_{g''} \cong S_{g''}$ for some $g'' \in S'$, $g'' \not\in \mathfrak m'$. All in all we conclude that after replacing S by a principal localization we may assume that S is a global complete intersection.

At this point we may write $S = k[x_1, \ldots, x_n]/(f_1, \ldots, f_c)$ with $\dim S = n - c$. Recall that the naive cotangent complex of this algebra is given by

$$\bigoplus S \cdot f_j \to \bigoplus S \cdot \mathrm{d}x_i$$

see Lemma 7.126.15. By this same lemma in order to show that S is smooth at $\mathfrak m$ we have to show that one of the $c \times c$ minors g_I of the matrix ``A'' giving the map above does not vanish at $\mathfrak m$. By Lemma 7.129.1 the matrix A mod $\mathfrak m$ has rank c. Thus we win. ☐

Lemma 7.129.3. *Let k be any field. Let S be a finite type k-algebra. Let $X = Spec(S)$. Let $\mathfrak q \subset S$ be a prime corresponding to $x \in X$. The following are equivalent:*

1. *The k-algebra S is smooth at $\mathfrak q$ over k.*
2. *We have $\dim_{\kappa(\mathfrak q)} \Omega_{S/k} \otimes_S \kappa(\mathfrak q) \leq \dim_x X$.*
3. *We have $\dim_{\kappa(\mathfrak q)} \Omega_{S/k} \otimes_S \kappa(\mathfrak q) = \dim_x X$.*

Moreover, in this case the local ring $S_{\mathfrak q}$ is regular.

Proof. If S is smooth at $\mathfrak q$ over k, then there exists a $g \in S$, $g \not\in \mathfrak q$ such that S_g is standard smooth over k, see Lemma 7.126.10. A standard smooth algebra over k has a module of differentials which is free of rank equal to the dimension, see Lemma 7.126.7. Thus we see that (1) implies (3). To finish the proof of the lemma it suffices to show that (2) implies (1) and that it implies that $S_{\mathfrak q}$ is regular.

Assume (2). By Nakayama's Lemma 7.14.5 we see that $\Omega_{S/k, \mathfrak q}$ can be generated by $\leq \dim_x X$ elements. We may replace S by S_g for some $g \in S$, $g \not\in \mathfrak q$ such that $\Omega_{S/k}$ is generated by at most $\dim_x X$ elements. Let $K \supset k$ be an algebraically closed field extension such that there exists a k-algebra map $\psi : \kappa(\mathfrak q) \to K$. Consider $S_K = K \otimes_k S$. Let $\mathfrak m \subset S_K$ be the maximal ideal corresponding to the surjection

$$S_K = K \otimes_k S \longrightarrow K \otimes_k \kappa(\mathfrak q) \xrightarrow{\mathrm{id}_K \otimes \psi} K.$$

Note that $\mathfrak m \cap S = \mathfrak q$, in other words $\mathfrak m$ lies over $\mathfrak q$. By Lemma 7.107.6 the dimension of $X_K = Spec(S_K)$ at the point corresponding to $\mathfrak m$ is $\dim_x X$. By Lemma 7.105.6 this is equal to $\dim((S_K)_\mathfrak{m})$. By Lemma 7.122.12 the module of differentials of S_K over K is the base change of $\Omega_{S/k}$, hence also generated by at most $\dim_x X = \dim((S_K)_\mathfrak{m})$ elements. By Lemma 7.129.2 we see that S_K is smooth at $\mathfrak{m}$ over K. By Lemma 7.126.17 this implies that S is smooth at $\mathfrak{q}$ over k. This proves (1). Moreover, we know by Lemma 7.129.2 that the local ring $(S_K)_\mathfrak{m}$ is regular. Since $S_\mathfrak{q} \to (S_K)_\mathfrak{m}$ is flat we conclude from Lemma 7.102.8 that $S_\mathfrak{q}$ is regular. □

The following lemma can be significantly generalized (in several different ways).

Lemma 7.129.4. *Let k be a field. Let R be a Noetherian local ring containing k. Assume that the residue field $\kappa = R/\mathfrak{m}$ is a finitely generated separable extension of k. Then the map*
$$d : \mathfrak{m}/\mathfrak{m}^2 \longrightarrow \Omega_{R/k} \otimes_R \kappa(\mathfrak{m})$$
is injective.

Proof. We may replace R by $R/\mathfrak{m}^2$. Hence we may assume that $\mathfrak{m}^2 = 0$. By assumption we may write $\kappa = k(\overline{x}_1, \ldots, \overline{x}_r, \overline{y})$ where $\overline{x}_1, \ldots, \overline{x}_r$ is a transcendence basis of κ over k and $\overline{y}$ is separable algebraic over $k(\overline{x}_1, \ldots, \overline{x}_r)$. Say its minimal equation is $P(\overline{y}) = 0$ with $P(T) = T^d + \sum_{i<d} a_i T^i$, with $a_i \in k(\overline{x}_1, \ldots, \overline{x}_r)$ and $P'(\overline{y}) \neq 0$. Choose any lifts $x_i \in R$ of the elements $\overline{x}_i \in \kappa$. This gives a commutative diagram

$$\begin{tikzcd} R \arrow[r] & \kappa \\ & k(\overline{x}_1, \ldots, \overline{x}_r) \arrow[u] \arrow[ul, "\varphi"] \end{tikzcd}$$

of k-algebras. We want to extend the left upwards arrow φ to a k-algebra map from κ to R. To do this choose any $y \in R$ lifting $\overline{y}$. To see that it defines a k-algebra map defined on $\kappa \cong k(\overline{x}_1, \ldots, \overline{x}_r)[T]/(P)$ all we have to show is that we may choose y such that $P^\varphi(y) = 0$. If not then we compute for $\delta \in \mathfrak{m}$ that
$$P(y + \delta) = P(y) + P'(y)\delta$$
because $\mathfrak{m}^2 = 0$. Since $P'(y)\delta = P'(\overline{y})\delta$ we see that we can adjust our choice as desired. This shows that $R \cong \kappa \oplus \mathfrak{m}$ as k-algebras! From a direct computation of $\Omega_{\kappa \oplus \mathfrak{m}/k}$ the lemma follows. □

Lemma 7.129.5. *Let k be a field. Let S be a finite type k-algebra. Let $\mathfrak{q} \subset S$ be a prime. Assume $\kappa(\mathfrak{q})$ is separable over k. The following are equivalent:*

(1) *The algebra S is smooth at $\mathfrak{q}$ over k.*
(2) *The ring $S_\mathfrak{q}$ is regular.*

Proof. Denote $R = S_\mathfrak{q}$ and denote its maximal by $\mathfrak{m}$ and its residue field κ. By Lemma 7.129.4 and 7.122.9 we see that there is a short exact sequence
$$0 \to \mathfrak{m}/\mathfrak{m}^2 \to \Omega_{R/k} \otimes_R \kappa \to \Omega_{\kappa/k} \to 0$$
Note that $\Omega_{R/k} = \Omega_{S/k,\mathfrak{q}}$, see Lemma 7.122.8. Moreover, since κ is separable over k we have $\dim_\kappa \Omega_{\kappa/k} = \text{trdeg}_k(\kappa)$. Hence we get
$$\dim_\kappa \Omega_{R/k} \otimes_R \kappa = \dim_\kappa \mathfrak{m}/\mathfrak{m}^2 + \text{trdeg}_k(\kappa) \geq \dim R + \text{trdeg}_k(\kappa) = \dim_\mathfrak{q} S$$
(see Lemma 7.107.3 for the last equality) with equality if and only if R is regular. Thus we win by applying Lemma 7.129.3. □

Lemma 7.129.6. *Let $R \to S$ be a $\mathbf{Q}$-algebra map. Let $f \in S$ be such that $\Omega_{S/R} = S\mathrm{d}f \oplus C$ for some S-submodule C. Then*

(1) *f is not nilpotent, and*
(2) *if S is a Noetherian local ring, then f is a nonzero divisor in S.*

Proof. For $a \in S$ write $\mathrm{d}(a) = \theta(a)\mathrm{d}f + c(a)$ for some $\theta(a) \in S$ and $c(a) \in C$. Consider the R-derivation $S \to S$, $a \mapsto \theta(a)$. Note that $\theta(f) = 1$.

If $f^n = 0$ with $n > 1$ minimal, then $0 = \theta(f^n) = nf^{n-1}$ contradicting the minimality of n. We conclude that f is not nilpotent.

Suppose $fa = 0$. If f is a unit then $a = 0$ and we win. Assume f is not a unit. Then $0 = \theta(fa) = f\theta(a) + a$ by the Leibniz rule and hence $a \in (f)$. By induction suppose we have shown $fa = 0 \Rightarrow a \in (f^n)$. Then writing $a = f^n b$ we get $0 = \theta(f^{n+1}b) = (n+1)f^n b + f^{n+1}\theta(b)$. Hence $a = f^n b = -f^{n+1}\theta(b)/(n+1) \in (f^{n+1})$. Since in the Noetherian local ring S we have $\bigcap (f^n) = 0$, see Lemma 7.47.6 we win. $\square$

The following is probably quite useless in applications.

Lemma 7.129.7. *Let k be a field of characteristic 0. Let S be a finite type k-algebra. Let $\mathfrak{q} \subset S$ be a prime. The following are equivalent:*

(1) *The algebra S is smooth at $\mathfrak{q}$ over k.*
(2) *The $S_{\mathfrak{q}}$-module $\Omega_{S/k,\mathfrak{q}}$ is (finite) free.*
(3) *The ring $S_{\mathfrak{q}}$ is regular.*

Proof. In characteristic zero any field extension is separable and hence the equivalence of (1) and (3) follows from Lemma 7.129.5. Also (1) implies (2) by definition of smooth algebras. Assume that $\Omega_{S/k,\mathfrak{q}}$ is free over $S_{\mathfrak{q}}$. We are going to use the notation and observations made in the proof of Lemma 7.129.5. So $R = S_{\mathfrak{q}}$ with maximal ideal $\mathfrak{m}$ and residue field κ. Our goal is to prove R is regular.

If $\mathfrak{m}/\mathfrak{m}^2 = 0$, then $\mathfrak{m} = 0$ and $R \cong \kappa$. Hence R is regular and we win.

If $\mathfrak{m}/\mathfrak{m}^2 \neq 0$, then choose any $f \in \mathfrak{m}$ whose image in $\mathfrak{m}/\mathfrak{m}^2$ is not zero. By Lemma 7.129.4 we see that $\mathrm{d}f$ has nonzero image in $\Omega_{R/k}/\mathfrak{m}\Omega_{R/k}$. By assumption $\Omega_{R/k} = \Omega_{S/k,\mathfrak{q}}$ is finite free and hence by Nakayama's Lemma 7.14.5 we see that $\mathrm{d}f$ generates a direct summand. We apply Lemma 7.129.6 to deduce that f is a nonzero divisor in R. Furthermore, by Lemma 7.122.9 we get an exact sequence

$$(f)/(f^2) \to \Omega_{R/k} \otimes_R R/fR \to \Omega_{(R/fR)/k} \to 0$$

This implies that $\Omega_{(R/fR)/k}$ is finite free as well. Hence by induction we see that R/fR is a regular local ring. Since $f \in \mathfrak{m}$ was a nonzero divisor we conclude that R is regular, see Lemma 7.98.7. $\square$

Example 7.129.8. Lemma 7.129.7 does not hold in characteristic $p > 0$. The standard examples are the ring maps

$$\mathbf{F}_p \longrightarrow \mathbf{F}_p[x]/(x^p)$$

whose module of differentials is free but is clearly not smooth, and the ring map ($p > 2$)

$$\mathbf{F}_p(t) \to \mathbf{F}_p(t)[x, y]/(x^p + y^2 + \alpha)$$

which is not smooth at the prime $\mathfrak{q} = (y, x^p - \alpha)$ but is regular.

Using the material above we can characterize smoothness at the generic point in terms of field extensions.

Lemma 7.129.9. *Let $R \to S$ be an injective finite type ring map with R and S domains. Then $R \to S$ is smooth at $\mathfrak{q} = (0)$ if and only if $f.f.(R) \subset f.f.(S)$ is a separable extension of fields.*

Proof. Assume $R \to S$ is smooth at (0). We may replace S by S_g for some nonzero $g \in S$ and assume that $R \to S$ is smooth. Set $K = f.f.(R)$. Then $K \to S \otimes_R K$ is smooth (Lemma 7.126.4). Moreover, for any field extension $K \subset K'$ the ring map $K' \to S \otimes_R K'$ is smooth as well. Hence $S \otimes_R K'$ is a regular ring by Lemma 7.129.3, in particular reduced. It follows that $S \otimes_R K$ is a geometrically reduced over K. Hence $f.f.(S)$ is geometricaly reduced over K, see Lemma 7.40.3. Hence $f.f.(S)/K$ is separable by Lemma 7.41.1.

Conversely, assume that $f.f.(R) \subset f.f.(S)$ is separable. We may assume $R \to S$ is of finite presentation, see Lemma 7.27.1. It suffices to prove that $K \to S \otimes_R K$ is smooth at (0), see Lemma 7.126.17. This follows from Lemma 7.129.5, the fact that a field is a regular ring, and the assumption that $f.f.(R) \to f.f.(S)$ is separable. $\square$

7.130. Smooth ring maps in the Noetherian case

Definition 7.130.1. Let $\varphi : B' \to B$ be a ring map. We say φ is a *small extension* if B' and B are local Artinian rings, φ is surjective and $I = \mathrm{Ker}(\varphi)$ has length 1 as a B'-module.

Clearly this means that $I^2 = 0$ and that $I = (x)$ for some $x \in B'$ such that $\mathfrak{m}'x = 0$ where $\mathfrak{m}' \subset B'$ is the maximal ideal.

Lemma 7.130.2. *Let $R \to S$ be a ring map. Let $\mathfrak{q}$ be a prime ideal of S lying over $\mathfrak{p} \subset R$. Assume R is Noetherian and $R \to S$ of finite type. The following are equivalent:*

(1) *$R \to S$ is smooth at $\mathfrak{q}$,*
(2) *for every surjection of local R-algebras $(B', \mathfrak{m}') \to (B, \mathfrak{m})$ with Ker$(B' \to B)$ having square zero and every solid commutative diagram*

$$\begin{tikzcd} S \arrow[r] \arrow[dr, dashed] & B \\ R \arrow[u] \arrow[r] & B' \arrow[u] \end{tikzcd}$$

such that $\mathfrak{q} = S \cap \mathfrak{m}$ there exists a dotted arrow making the diagram commute,
(3) *same as in (2) but with $B' \to B$ ranging over small extensions, and*
(4) *same as in (2) but with $B' \to B$ ranging over small extensions such that in addition $S \to R$ induces an isomorphism $\kappa(\mathfrak{q}) \cong \kappa(\mathfrak{m})$.*

Proof. Assume (1). This means there exists a $g \in S$, $g \notin \mathfrak{q}$ such that $R \to S_g$ is smooth. By Proposition 7.127.13 we know that $R \to S_g$ is formally smooth. Note that given any diagram as in (2) the map $S \to B$ factors automatically through $S_{\mathfrak{q}}$ and a fortiori through S_g. The formal smoothness of S_g over R gives us a morphism $S_g \to B'$ fitting into a similar diagram with S_g at the upper left corner. Composing with $S \to S_g$ gives the desired arrow. In other words, we have shown that (1) implies (2).

Clearly (2) implies (3) and (3) implies (4).

Assume (4). We are going to show that (1) holds, thereby finishing the proof of the lemma. Choose a presentation $S = R[x_1, \ldots, x_n]/(f_1, \ldots, f_m)$. This is possible as S is of finite type over R and therefore of finite presentation (see Lemma 7.28.4). Set $I = (f_1, \ldots, f_m)$. Consider the naive cotangent complex

$$\mathrm{d} : I/I^2 \longrightarrow \bigoplus\nolimits_{j=1}^{m} S\mathrm{d}x_j$$

of this presentation (see Section 7.123). It suffices to show that when we localize this complex at $\mathfrak q$ then the map becomes a split injection, see Lemma 7.126.12. Denote $S' = R[x_1, \ldots, x_n]/I^2$. By Lemma 7.122.11 we have

$$S \otimes_{S'} \Omega_{S'/R} = S \otimes_{R[x_1, \ldots, x_n]} \Omega_{R[x_1, \ldots, x_n]/R} = \bigoplus\nolimits_{j=1}^m S\mathrm{d}x_j.$$

Thus the map

$$\mathrm{d} : I/I^2 \longrightarrow S \otimes_{S'} \Omega_{S'/R}$$

is the same as the map in the naive cotangent complex above. In particular the truth of the assertion we are trying to prove depends only on the three rings $R \to S' \to S$. Let $\mathfrak q' \subset R[x_1, \ldots, x_n]$ be the prime ideal corresponding to $\mathfrak q$. Since localization commutes with taking modules of differentials (Lemma 7.122.8) we see that it suffices to show that the map

$$\mathrm{d} : I_{\mathfrak q'}/I^2_{\mathfrak q'} \longrightarrow S_{\mathfrak q} \otimes_{S'_{\mathfrak q'}} \Omega_{S'_{\mathfrak q'}/R} \tag{7.130.2.1}$$

coming from $R \to S'_{\mathfrak q'} \to S_{\mathfrak q}$ is a split injection.

Let $N \in \mathbf{N}$ be an integer. Consider the ring

$$B'_N = S'_{\mathfrak q'}/(\mathfrak q')^N S'_{\mathfrak q'} = (S'/(\mathfrak q')^N S')_{\mathfrak q'}$$

and its quotient $B_N = B'_N/IB'_N$. Note that $B_N \cong S_{\mathfrak q}/\mathfrak q^N S_{\mathfrak q}$. Observe that B'_N is an Artinian local ring since it is the quotient of a local Noetherian ring by a power of its maximal ideal. Consider a filtration of the kernel I_N of $B'_N \to B_N$ by B'_N-submodules

$$0 \subset J_{N,1} \subset J_{N,2} \subset \ldots \subset J_{N,n(N)} = I_N$$

such that each successive quotient $J_{N,i}/J_{N,i-1}$ has length 1. (As B'_N is Artinian such a filtration exists.) This gives a sequence of small extensions

$$B'_N \to B'_N/J_{N,1} \to B'_N/J_{N,2} \to \ldots \to B'_N/J_{N,n(N)} = B'_N/I_N = B_N = S_{\mathfrak q}/\mathfrak q^N S_{\mathfrak q}$$

Applying condition (4) successively to these small extensions starting with the map $S \to B_N$ we see there exists a commutative diagram

$$\begin{tikzcd} S \arrow[r] \arrow[dr] & B_N \\ R \arrow[u] \arrow[r] & B'_N \arrow[u] \end{tikzcd}$$

Clearly the ring map $S \to B'_N$ factors as $S \to S_{\mathfrak q} \to B'_N$ where $S_{\mathfrak q} \to B'_N$ is a local homomorphism of local rings. Moreover, since the maximal ideal of B'_N to the Nth power is zero we conclude that $S_{\mathfrak q} \to B'_N$ factors through $S_{\mathfrak q}/(\mathfrak q)^N S_{\mathfrak q} = B_N$. In other words we have shown that for all $N \in \mathbf{N}$ the surjection of R-algebras $B'_N \to B_N$ has a splitting.

Consider the presentation

$$I_N \to B_N \otimes_{B'_N} \Omega_{B'_N/R} \to \Omega_{B_N/R} \to 0$$

coming from the surjection $B'_N \to B_N$ with kernel I_N (see Lemma 7.122.9). By the above the R-algebra map $B'_N \to B_N$ has a right inverse. Hence by Lemma 7.122.10 we see that the sequence above is split exact! Thus for every N the map

$$I_N \longrightarrow B_N \otimes_{B'_N} \Omega_{B'_N/R}$$

is a split injection. The rest of the proof is gotten by unwinding what this means exactly. Note that

$$I_N = I_{\mathfrak{q}'}/(I_{\mathfrak{q}'}^2 + (\mathfrak{q}')^N \cap I_{\mathfrak{q}'})$$

By Artin-Rees (Lemma 7.47.4) we find a $c \geq 0$ such that

$$S_\mathfrak{q}/\mathfrak{q}^{N-c}S_\mathfrak{q} \otimes_{S_\mathfrak{q}} I_N = S_\mathfrak{q}/\mathfrak{q}^{N-c}S_\mathfrak{q} \otimes_{S_\mathfrak{q}} I_{\mathfrak{q}'}/I_{\mathfrak{q}'}^2$$

for all $N \geq c$ (these tensor product are just a fancy way of dividing by $\mathfrak{q}^{N-c}$). We may of course assume $c \geq 1$. By Lemma 7.122.11 we see that

$$S'_{\mathfrak{q}'}/(\mathfrak{q}')^{N-c}S'_{\mathfrak{q}'} \otimes_{S'_{\mathfrak{q}'}} \Omega_{B'_N/R} = S'_{\mathfrak{q}'}/(\mathfrak{q}')^{N-c}S'_{\mathfrak{q}'} \otimes_{S'_{\mathfrak{q}'}} \Omega_{S'_{\mathfrak{q}'}/R}$$

we can further tensor this by $B_N = S_\mathfrak{q}/\mathfrak{q}^N$ to see that

$$S_\mathfrak{q}/\mathfrak{q}^{N-c}S_\mathfrak{q} \otimes_{S'_{\mathfrak{q}'}} \Omega_{B'_N/R} = S_\mathfrak{q}/\mathfrak{q}^{N-c}S_\mathfrak{q} \otimes_{S'_{\mathfrak{q}'}} \Omega_{S'_{\mathfrak{q}'}/R}.$$

Since a split injection remains a split injection after tensoring with anything we see that

$$S_\mathfrak{q}/\mathfrak{q}^{N-c}S_\mathfrak{q} \otimes_{S_\mathfrak{q}} (7.130.2.1) = S_\mathfrak{q}/\mathfrak{q}^{N-c}S_\mathfrak{q} \otimes_{S_\mathfrak{q}} (I_N \longrightarrow B_N \otimes_{B'_N} \Omega_{B'_N/R})$$

is a split injection for all $N \geq c$. By Lemma 7.68.1 we see that (7.130.2.1) is a split injection. This finishes the proof. □

7.131. Overview of results on smooth ring maps

Here is a list of results on smooth ring maps that we proved in the preceding sections. For more precise statements and definitions please consult the references given.

(1) A ring map $R \to S$ is smooth if it is of finite presentation and the naive cotangent complex of S/R is quasi-isomorphic to a finite projective S-module in degree 0, see Definition 7.126.1.
(2) If S is smooth over R, then $\Omega_{S/R}$ is a finite projective S-module, see discussion following Definition 7.126.1.
(3) The property of being smooth is local on S, see Lemma 7.126.13.
(4) The property of being smooth is stable under base change, see Lemma 7.126.4.
(5) The property of being smooth is stable under composition, see Lemma 7.126.14.
(6) A smooth ring map is syntomic, in particular flat, see Lemma 7.126.10.
(7) A finitely presented, flat ring map with smooth fibre rings is smooth, see Lemma 7.126.16.
(8) A finitely presented ring map $R \to S$ is smooth if and only if it is formally smooth, see Proposition 7.127.13.
(9) If $R \to S$ is a finite type ring map with R Noetherian then to check that $R \to S$ is smooth it suffices to check the lifting property of formal smoothness along small extensions of Artinian local rings, see Lemma 7.130.2.
(10) A smooth ring map $R \to S$ is the base change of a smooth ring map $R_0 \to S_0$ with R_0 of finite type over $\mathbf{Z}$, see Lemma 7.127.14.
(11) Formation of the set of points where a ring map is smooth commutes with flat base change, see Lemma 7.126.17.
(12) If S is of finite type over an algebraically closed field k, and $\mathfrak{m} \subset S$ a maximal ideal, then the following are equivalent
   (a) S is smooth over k in a neighbourhood of $\mathfrak{m}$,
   (b) $S_\mathfrak{m}$ is a regular local ring,
   (c) $\dim(S_\mathfrak{m}) = \dim_{\kappa(m)} \Omega_{S/k} \otimes_S \kappa(\mathfrak{m})$.

see Lemma 7.129.2.

(13) If S is of finite type over a field k, and $\mathfrak{q} \subset S$ a prime ideal, then the following are equivalent
  (a) S is smooth over k in a neighbourhood of $\mathfrak{q}$,
  (b) $\dim_{\mathfrak{q}}(S/k) = \dim_{\kappa(\mathfrak{q})} \Omega_{S/k} \otimes_S \kappa(\mathfrak{q})$.
  see Lemma 7.129.3.

(14) If S is smooth over a field, then all its local rings are regular, see Lemma 7.129.3.

(15) If S is of finite type over a field k, $\mathfrak{q} \subset S$ a prime ideal, the field extension $k \subset \kappa(\mathfrak{q})$ is separable and $S_{\mathfrak{q}}$ is regular, then S is smooth over k at $\mathfrak{q}$, see Lemma 7.129.5.

(16) If S is of finite type over a field k, if k has characteristic 0, if $\mathfrak{q} \subset S$ a prime ideal, and if $\Omega_{S/k,\mathfrak{q}}$ is free, then S is smooth over k at $\mathfrak{q}$, see Lemma 7.129.7.

Some of these results were proved using the notion of a standard smooth ring map, see Definition 7.126.6. This is the analogue of what a relative global complete intersection map is for the case of syntomic morphisms. It is also the easiest way to make examples.

7.132. Étale ring maps

An étale ring map is a smooth ring map whose relative dimension is equal to zero. This is the same as the following slightly more direct definition.

Definition 7.132.1. Let $R \to S$ be a ring map. We say $R \to S$ is *étale* if it is of finite presentation and the naive cotangent complex $NL_{S/R}$ is quasi-isomorphic to zero. Given a prime $\mathfrak{q}$ of S we say that $R \to S$ is *étale at* $\mathfrak{q}$ if there exists a $g \in S$, $g \notin \mathfrak{q}$ such that $R \to S_g$ is étale.

In particular we see that $\Omega_{S/R} = 0$ if S is étale over R. If $R \to S$ is smooth, then $R \to S$ is étale if and only if $\Omega_{S/R} = 0$. From our results on smooth ring maps we automatically get a whole host of results for étale maps. We summarize these in Lemma 7.132.3 below. But before we do so we prove that *any* étale ring map is standard smooth.

Lemma 7.132.2. *Any étale ring map is standard smooth. More precisely, if $R \to S$ is étale, then there exists a presentation $S = R[x_1, \ldots, x_n]/(f_1, \ldots, f_n)$ such that the image of* $\det(\partial f_j/\partial x_i)$ *is invertible in S.*

Proof. Let $R \to S$ be étale. Choose a presentation $S = R[x_1, \ldots, x_n]/I$. As $R \to S$ is étale we know that

$$\mathrm{d} : I/I^2 \longrightarrow \bigoplus\nolimits_{i=1,\ldots,n} S\mathrm{d}x_i$$

is an isomorphism, in particular I/I^2 is a free S-module. Thus by Lemma 7.125.6 we may assume (after possibly changing the presentation), that $I = (f_1, \ldots, f_c)$ such that the classes $f_i \bmod I^2$ form a basis of I/I^2. It follows immediately from the fact that the displayed map above is an isomorphism that $c = n$ and that $\det(\partial f_j/\partial x_i)$ is invertible in S. □

Lemma 7.132.3. *Results on étale ring maps.*

1. *If $R \to R_f$ is étale for any ring R and any $f \in R$.*
2. *Compositions of étale ring maps are étale.*
3. *A base change of an étale ring map is étale.*
4. *The property of being étale is local: Given a ring map $R \to S$ and elements $g_1, \ldots, g_m \in S$ which generate the unit ideal such that $R \to S_{g_j}$ is étale for $j = 1, \ldots, m$ then $R \to S$ is étale.*

(5) *Given $R \to S$ of finite presentation, and a flat ring map $R \to R'$, set $S' = R' \otimes_R S$. The set of primes where $R \to S'$ is étale is the inverse image via $Spec(S') \to Spec(S)$ of the set of primes where $R \to S$ is étale.*
(6) *An étale ring map is syntomic, in particular flat.*
(7) *If S is finite type over a field k, then S is étale over k if and only if $\Omega_{S/k} = 0$.*
(8) *Any étale ring map $R \to S$ is the base change of an étale ring map $R_0 \to S_0$ with R_0 of finite type over $\mathbf{Z}$.*
(9) *Let $A = colim\, A_i$ be a filtered colimit of rings. Let $A \to B$ be an étale ring map. Then there exists an étale ring map $A_i \to B_i$ for some i such that $B \cong A \otimes_{A_i} B_i$.*
(10) *Let A be a ring. Let S be a multiplicative subset of A. Let $S^{-1}A \to B'$ be étale. Then there exists an étale ring map $A \to B$ such that $B' \cong S^{-1}B$.*

Proof. In each case we use the corresponding result for smooth ring maps with a small argument added to show that $\Omega_{S/R}$ is zero.

Proof of (1). The ring map $R \to R_f$ is smooth and $\Omega_{R_f/R} = 0$.

Proof of (2). The composition $A \to C$ of smooth maps $A \to B$ and $B \to C$ is smooth, see Lemma 7.126.14. By Lemma 7.122.7 we see that $\Omega_{C/A}$ is zero as both $\Omega_{C/B}$ and $\Omega_{B/A}$ are zero.

Proof of (3). Let $R \to S$ be étale and $R \to R'$ be arbitrary. Then $R' \to S' = R' \otimes_R S$ is smooth, see Lemma 7.126.4. Since $\Omega_{S'/R'} = S' \otimes_S \Omega_{S/R}$ by Lemma 7.122.12 we conclude that $\Omega_{S'/R'} = 0$. Hence $R' \to S'$ is étale.

Proof of (4). Assume the hypotheses of (4). By Lemma 7.126.13 we see that $R \to S$ is smooth. We are also given that $\Omega_{S_{g_i}/R} = (\Omega_{S/R})_{g_i} = 0$ for all i. Then $\Omega_{S/R} = 0$, see Lemma 7.21.2.

Proof of (5). The result for smooth maps is Lemma 7.126.17. In the proof of that lemma we used that $NL_{S/R} \otimes_S S'$ is homotopy equivalent to $NL_{S'/R'}$. This reduces us to showing that if M is a finitely presented S-module the set of primes $\mathfrak{q}'$ of S' such that $(M \otimes_S S')_{\mathfrak{q}'} = 0$ is the inverse image of the set of primes $\mathfrak{q}$ of S such that $M_{\mathfrak{q}} = 0$. This is true (proof omitted).

Proof of (6). Follows directly from the corresponding result for smooth ring maps (Lemma 7.126.10).

Proof of (7). Follows from Lemma 7.129.3 and the definitions.

Proof of (8). Lemma 7.127.14 gives the result for smooth ring maps. The resulting smooth ring map $R_0 \to S_0$ satisfies the hypotheses of Lemma 7.121.8, and hence we may replace S_0 by the factor of relative dimension 0 over R_0.

Proof of (9). Follows from (8) since $R_0 \to A$ will factor through A_i for some i.

Proof of (10). Follows from (9), (1), and (2) since $S^{-1}A$ is a filtered colimit of principal localizations of A. □

Next we work out in more detail what it means to be étale over a field.

Lemma 7.132.4. *Let k be a field. A ring map $k \to S$ is étale if and only if S is isomorphic as a k-algebra to a finite product of finite separable extensions of k.*

Proof. If $k \to k'$ is a finite separable field extension then we can write $k' = k(\alpha) \cong k[x]/(f)$. Here f is the minimal polynomial of the element α. Since k' is separable over k we have $\gcd(f, f') = 1$. This implies that $\mathrm{d} : k' \cdot f \to k' \cdot \mathrm{d}x$ is an isomorphism. Hence $k \to k'$ is étale.

Conversely, suppose that $k \to S$ is étale. Let $\overline{k}$ be an algebraic closure of k. Then $S \otimes_k \overline{k}$ is étale over $\overline{k}$. Suppose we have the result over $\overline{k}$. Then $S \otimes_k \overline{k}$ is reduced and hence S is reduced. Also, $S \otimes_k \overline{k}$ is finite over $\overline{k}$ and hence S is finite over k. Hence S is a finite product $S = \prod k_i$ of fields, see Lemma 7.49.2 and Proposition 7.57.6. The result over $\overline{k}$ means $S \otimes_k \overline{k}$ is isomorphic to a finite product of copies of $\overline{k}$, which implies that each $k \subset k_i$ is finite separable, see for example Lemmas 7.41.1 and 7.41.3. Thus we have reduced to the case $k = \overline{k}$. In this case Lemma 7.129.2 (combined with $\Omega_{S/k} = 0$) we see that $S_\mathfrak{m} \cong k$ for all maximal ideals $\mathfrak{m} \subset S$. This implies the result because S is the product of the localizations at its maximal ideals by Lemma 7.49.2 and Proposition 7.57.6 again. □

Lemma 7.132.5. *Let $R \to S$ be a ring map. Let $\mathfrak{q} \subset S$ be a prime lying over $\mathfrak{p}$ in R. If S/R is étale at $\mathfrak{q}$ then*

(1) *we have $\mathfrak{p}S_\mathfrak{q} = \mathfrak{q}S_\mathfrak{q}$ is the maximal ideal of the local ring $S_\mathfrak{q}$, and*
(2) *the field extension $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{q})$ is finite separable.*

Proof. First we may replace S by S_g for some $g \in S$, $g \notin \mathfrak{q}$ and assume that $R \to S$ is étale. Then the lemma follows from Lemma 7.132.4 by unwinding the fact that $S \otimes_R \kappa(\mathfrak{p})$ is étale over $\kappa(\mathfrak{p})$. □

Lemma 7.132.6. *An étale ring map is quasi-finite.*

Proof. Let $R \to S$ be an étale ring map. By definition $R \to S$ is of finite type. For any prime $\mathfrak{p} \subset R$ the fibre ring $S \otimes_R \kappa(\mathfrak{p})$ is étale over $\kappa(\mathfrak{p})$ and hence a finite products of fields finite separable over $\kappa(\mathfrak{p})$, in particular finite over $\kappa(\mathfrak{p})$. Thus $R \to S$ is quasi-finite by Lemma 7.113.4. □

Lemma 7.132.7. *Let $R \to S$ be a ring map. Let $\mathfrak{q}$ be a prime of S lying over a prime $\mathfrak{p}$ of R. If*

(1) *$R \to S$ is of finite presentation,*
(2) *$R_\mathfrak{p} \to S_\mathfrak{q}$ is flat*
(3) *$\mathfrak{p}S_\mathfrak{q}$ is the maximal ideal of the local ring $S_\mathfrak{q}$, and*
(4) *the field extension $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{q})$ is finite separable,*

then $R \to S$ is étale at $\mathfrak{q}$.

Proof. Apply Lemma 7.113.2 to find a $g \in S$, $g \notin \mathfrak{q}$ such that $\mathfrak{q}$ is the only prime of S_g lying over $\mathfrak{p}$. We may and do replace S by S_g. Then $S \otimes_R \kappa(\mathfrak{p})$ has a unique prime, hence is a local ring, hence is equal to $S_\mathfrak{q}/\mathfrak{p}S_\mathfrak{q} \cong \kappa(\mathfrak{q})$. By Lemma 7.126.16 there exists a $g \in S$, $g \notin \mathfrak{q}$ such that $R \to S_g$ is smooth. Replace S by S_g again we may assume that $R \to S$ is smooth. By Lemma 7.126.10 we may even assume that $R \to S$ is standard smooth, say $S = R[x_1, \ldots, x_n]/(f_1, \ldots, f_c)$. Since $S \otimes_R \kappa(\mathfrak{p}) = \kappa(\mathfrak{q})$ has dimension 0 we conclude that $n = c$, i.e., if $R \to S$ is étale. □

Here is a completely new phenomenon.

Lemma 7.132.8. *Let $R \to S$ and $R \to S'$ be étale. Then any R-algebra map $S' \to S$ is étale.*

Proof. First of all we note that $S' \to S$ is of finite presentation by Lemma 7.6.2. Let $\mathfrak{q} \subset S$ be a prime ideal lying over the primes $\mathfrak{q}' \subset S'$ and $\mathfrak{p} \subset R$. By Lemma 7.132.5 the ring map $S_\mathfrak{q}/\mathfrak{p}S_\mathfrak{q} \to S'_{\mathfrak{q}'}/\mathfrak{p}S'_{\mathfrak{q}'}$ is a map finite separable extensions of $\kappa(\mathfrak{p})$. In particular it is flat. Hence by Lemma 7.119.8 we see that $S'_{\mathfrak{q}'} \to S_\mathfrak{q}$ is flat. Thus $S' \to S$ is flat. Moreover, the above also shows that $\mathfrak{q}'S_\mathfrak{q}$ is the maximal ideal of $S_\mathfrak{q}$ and that the residue field extension of $S'_{\mathfrak{q}'} \to S_\mathfrak{q}$ is finite separable. Hence from Lemma 7.132.7 above we conclude that $S' \to S$ is étale at $\mathfrak{q}$. Since being étale is local (see Lemma 7.132.3) we win. $\square$

Lemma 7.132.9. *Let $\varphi : R \to S$ be a ring map. If $R \to S$ is surjective, flat and finitely presented then there exist an idempotent $e \in R$ such that $S = R_e$.*

Proof. Since $Spec(S) \to Spec(R)$ is a homeomorphism onto a closed subset (see Lemma 7.16.7) and is open (see Proposition 7.36.8) we see that the image is $D(e)$ for some idempotent $e \in R$ (see Lemma 7.18.3). Thus $R_e \to S$ induces a bijection on spectra. Now this map induces an isomorphism on all local rings for example by Lemmas 7.72.4 and 7.14.5. Then it follows that $R_e \to S$ is also injective, for example see Lemma 7.21.1. $\square$

Lemma 7.132.10. *Let R be a ring and let $I \subset R$ be an ideal. Let $R/I \to \overline{S}$ be an étale ring map. Then there exists an étale ring map $R \to S$ such that $\overline{S} \cong S/IS$ as R/I-algebras.*

Proof. By Lemma 7.132.2 we can write $\overline{S} = (R/I)[x_1, \ldots, x_n]/(\overline{f}_1, \ldots, \overline{f}_n)$ as in Definition 7.126.6 with $\overline{\Delta} = \det(\frac{\partial \overline{f}_i}{\partial x_j})_{i,j=1,\ldots,n}$ invertible in $\overline{S}$. Just take some lifts f_i and set $S = R[x_1, \ldots, x_n, x_{n+1}]/(f_1, \ldots, f_c, x_{n+1}\Delta - 1)$ where $\Delta = \det(\frac{\partial f_i}{\partial x_j})_{i,j=1,\ldots,c}$ as in Example 7.126.8. This proves the lemma. $\square$

Lemma 7.132.11. *Consider a commutative diagram*

$$\begin{tikzcd}
0 \arrow[r] & J \arrow[r] & B' \arrow[r] & B \arrow[r] & 0 \\
0 \arrow[r] & I \arrow[r] \arrow[u] & A' \arrow[r] \arrow[u] & A \arrow[r] \arrow[u] & 0
\end{tikzcd}$$

with exact rows where $B' \to B$ and $A' \to A$ are surjective ring maps whose kernels are ideals of square zero. If $A \to B$ is étale, and $J = I \otimes_A B$, then $A' \to B'$ is étale.

Proof. By Lemma 7.132.10 there exists an étale ring map $A' \to C$ such that $C/IC = B$. Then $A' \to C$ is formally smooth (by Proposition 7.127.13) hence we get an A'-algebra map $\varphi : C \to B'$. Since $A' \to C$ is flat we have $I \otimes_A B = I \otimes_A C/IC = IC$. Hence the assumption that $J = I \otimes_A B$ implies that φ induces an isomorphism $IC \to J$ and an isomorphism $C/IC \to B'/IB'$, whence φ is an isomorphism. $\square$

Example 7.132.12. Let $n, m \geq 1$ be integers. Consider the ring map

$$\begin{array}{rcl}
R = \mathbf{Z}[a_1, \ldots, a_{n+m}] & \longrightarrow & S = \mathbf{Z}[b_1, \ldots, b_n, c_1, \ldots, c_m] \\
a_1 & \longmapsto & b_1 + c_1 \\
a_2 & \longmapsto & b_2 + b_1 c_1 + c_2 \\
\ldots & \ldots & \ldots \\
a_{n+m} & \longmapsto & b_n c_m
\end{array}$$

of Example 7.125.7. Write symbolically

$$S = R[b_1, \ldots, c_m]/(\{a_k(b_i, c_j) - a_k\}_{k=1,\ldots,n+m})$$

where for example $a_1(b_i, c_j) = b_1 + c_1$. The matrix of partial derivatives is

$$\begin{pmatrix} 1 & c_1 & \ldots & c_m & 0 & \ldots & 0 \\ 0 & 1 & c_1 & \ldots & c_m & \ldots & 0 \\ \ldots & \ldots & \ldots & \ldots & \ldots & \ldots & \ldots \\ 0 & \ldots & 0 & 1 & c_1 & \ldots & c_m \\ 1 & b_1 & \ldots & b_n & 0 & \ldots & 0 \\ 0 & 1 & b_1 & \ldots & b_n & \ldots & 0 \\ \ldots & \ldots & \ldots & \ldots & \ldots & \ldots & \ldots \\ 0 & \ldots & 0 & 1 & b_1 & \ldots & b_n \end{pmatrix}$$

The determinant Δ of this matrix is better known as the *resultant* of the polynomials $g = x^n + b_1 x^{n-1} + \ldots + b_n$ and $h = x^m + c_1 x^{m-1} + \ldots + c_m$, and the matrix above is known as the *Sylvester matrix* associated to g, h. In a formula $\Delta = \text{Res}_x(g, h)$. The Sylvester matrix is the tranpose of the matrix of the linear map

$$\begin{array}{ccc} S[x]_{<m} \oplus S[x]_{<n} & \longrightarrow & S[x]_{<n+m} \\ a \oplus b & \longmapsto & ag + bh \end{array}$$

Let $\mathfrak{q} \subset S$ be any prime. By the above the following are equivalent:

(1) $R \to S$ is étale at $\mathfrak{q}$,
(2) $\Delta = \text{Res}_x(g, h) \not\in \mathfrak{q}$,
(3) the images $\overline{g}, \overline{h} \in \kappa(\mathfrak{q})[x]$ of the polynomials g, h are relatively prime in $\kappa(\mathfrak{q})[x]$.

The equivalence of (2) and (3) holds because the image of the Sylvester matrix in $\text{Mat}(n + m, \kappa(\mathfrak{q}))$ has a kernel if and only if the polynomials $\overline{g}, \overline{h}$ have a factor in common. We conclude that the ring map

$$R \longrightarrow S[\frac{1}{\Delta}] = S[\frac{1}{\text{Res}_x(g, h)}]$$

is étale.

Lemma 7.132.2 tells us that it does not really make sense to define a standard étale morphism to be a standard smooth morphism of relative dimension 0. As a model for an étale morphism we take the example given by a finite separable extension $k \subset k'$ of fields. Namely, we can always find an element $\alpha \in k'$ such that $k' = k(\alpha)$ and such that the minimal polynomial $f(x) \in k[x]$ of α has derivative f' which is relatively prime to f.

Definition 7.132.13. Let R be a ring. Let $g, f \in R[x]$. Assume that f is monic and the derivative f' is invertible in the localization $R[x]_g$. In this case the ring map $R \to R[x]_g/(f)$ is said to be *standard étale*.

Lemma 7.132.14. *Let $R \to R[x]_g/(f)$ be standard étale.*

(1) *The ring map $R \to R[x]_g/(f)$ is étale.*
(2) *For any ring map $R \to R'$ the base change $R' \to R'[x]_g/(f)$ of the standard étale ring map $R \to R[x]_g/(f)$ is standard étale.*
(3) *Any principal localization of $R[x]_g/(f)$ is standard étale over R.*
(4) *A composition of standard étale maps is* **not** *standard étale in general.*

Proof. Omitted. Here is an example for (4). The ring map $\mathbf{F}_2 \to \mathbf{F}_{2^2}$ is standard étale. The ring map $\mathbf{F}_{2^2} \to \mathbf{F}_{2^2} \times \mathbf{F}_{2^2} \times \mathbf{F}_{2^2} \times \mathbf{F}_{2^2}$ is standard étale. But the ring map $\mathbf{F}_2 \to \mathbf{F}_{2^2} \times \mathbf{F}_{2^2} \times \mathbf{F}_{2^2} \times \mathbf{F}_{2^2}$ is not standard étale. □

Standard étale morphisms are a convenient way to produce étale maps. Here is an example.

Lemma 7.132.15. *Let R be a ring. Let $\mathfrak{p}$ be a prime of R. Let $\kappa(\mathfrak{p}) \subset L$ be a finite separable field extension. There exists an étale ring map $R \to R'$ together with a prime $\mathfrak{p}'$ lying over $\mathfrak{p}$ such that the field extension $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{p}')$ is isomorphic to $\kappa(\mathfrak{p}) \subset L$.*

Proof. By the theorem of the primitive element we may write $L = \kappa(\mathfrak{p})[\alpha]$. Let $\overline{f} \in \kappa(\mathfrak{p})[x]$ denote the minimal polynomial for α (in particular this is monic). After replacing α by $c\alpha$ for some $c \in R$, $c \not\in \mathfrak{p}$ we may assume all the coefficients of $\overline{f}$ are in the image of $R \to \kappa(\mathfrak{p})$ (verification omitted). Thus we can find a monic polynomial $f \in R[x]$ which maps to $\overline{f}$ in $\kappa(\mathfrak{p})[x]$. Since $\kappa(\mathfrak{p}) \subset L$ is separable, we see that $\gcd(\overline{f}, \overline{f}') = 1$. Hence there is an element $\gamma \in L$ such that $\overline{f}'(\alpha)\gamma = 1$. Thus we get a R-algebra map

$$\begin{array}{rcl} R[x, 1/f']/(f) & \longrightarrow & L \\ x & \longmapsto & \alpha \\ 1/f' & \longmapsto & \gamma \end{array}$$

The left hand side is a standard étale algebra R' over R and the kernel of the ring map gives the desired prime. □

Proposition 7.132.16. *Let $R \to S$ be a ring map. Let $\mathfrak{q} \subset S$ be a prime. If $R \to S$ is étale at $\mathfrak{q}$, then there exists a $g \in S$, $g \not\in \mathfrak{q}$ such that $R \to S_g$ is standard étale.*

Proof. The following proof is a little roundabout and there may be ways to shorten it.

Step 1. By Definition 7.132.1 there exists a $g \in S$, $g \not\in \mathfrak{q}$ such that $R \to S_g$ is étale. Thus we may assume that S is étale over R.

Step 2. By Lemma 7.132.3 there exists an étale ring map $R_0 \to S_0$ with R_0 of finite type over $\mathbf{Z}$, and a ring map $R_0 \to R$ such that $R = R \otimes_{R_0} S_0$. Denote $\mathfrak{q}_0$ the prime of S_0 corresponding to $\mathfrak{q}$. If we show the result for $(R_0 \to S_0, \mathfrak{q}_0)$ then the result follows for $(R \to S, \mathfrak{q})$ by base change. Hence we may assume that R is Noetherian.

Step 3. Note that $R \to S$ is quasi-finite by Lemma 7.132.6. By Lemma 7.114.15 there exists a finite ring map $R \to S'$, an R-algebra map $S' \to S$, an element $g' \in S'$ such that $g' \not\in \mathfrak{q}$ such that $S' \to S$ induces an isomorphism $S'_{g'} \cong S_{g'}$. (Note that of course S' is not étale over R in general.) Thus we may assume that (a) R is Noetherian, (b) $R \to S$ is finite and (c) $R \to S$ is étale at $\mathfrak{q}$ (but no longer necessarily étale at all primes).

Step 4. Let $\mathfrak{p} \subset R$ be the prime corresponding to $\mathfrak{q}$. Consider the fibre ring $S \otimes_R \kappa(\mathfrak{p})$. This is a finite algebra over $\kappa(\mathfrak{p})$. Hence it is Artinian (see Lemma 7.49.2) and so a finite product of local rings

$$S \otimes_R \kappa(\mathfrak{p}) = \prod\nolimits_{i=1}^{n} A_i$$

see Proposition 7.57.6. One of the factors, say A_1, is the local ring $S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}}$ which is isomorphic to $\kappa(\mathfrak{q})$, see Lemma 7.132.5. The other factors correspond to the other primes, say $\mathfrak{q}_2, \ldots, \mathfrak{q}_n$ of S lying over $\mathfrak{p}$.

Step 5. We may choose a nonzero element $\alpha \in \kappa(\mathfrak{q})$ which generates the finite separable field extension $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{q})$ (so even if the field extension is trivial we do not allow $\alpha = 0$). Note that for any $\lambda \in \kappa(\mathfrak{p})^*$ the element $\lambda\alpha$ also generates $\kappa(\mathfrak{q})$ over $\kappa(\mathfrak{p})$. Consider the element

$$\bar{t} = (\alpha, 0, \ldots, 0) \in \prod\nolimits_{i=1}^{n} A_i = S \otimes_R \kappa(\mathfrak{p}).$$

After possibly replacing α by $\lambda\alpha$ as above we may assume that $\bar{t}$ is the image of $t \in S$. Let $I \subset R[x]$ be the kernel of the R-algebra map $R[x] \to S$ which maps x to t. Set $S' = R[x]/I$, so $S' \subset S$. Here is a diagram

$$\begin{tikzcd} R[x] \arrow[r] & S' \arrow[r] & S \\ R \arrow[u] \arrow[ur] \arrow[urr] & & \end{tikzcd}$$

By construction the primes $\mathfrak{q}_j$, $j \geq 2$ of S all lie over the prime $(\mathfrak{p}, x)$ of $R[x]$, whereas the prime $\mathfrak{q}$ lies over a different prime of $R[x]$ because $\alpha \neq 0$.

Step 6. Denote $\mathfrak{q}' \subset S'$ the prime of S' corresponding to $\mathfrak{q}$. By the above $\mathfrak{q}$ is the only prime of S lying over $\mathfrak{q}'$. Thus we see that $S_\mathfrak{q} = S_{\mathfrak{q}'}$, see Lemma 7.36.11 (we have going up for $S' \to S$ by Lemma 7.32.20 since $S' \to S$ is finite as $R \to S$ is finite). It follows that $S'_{\mathfrak{q}'} \to S_\mathfrak{q}$ is finite and injective as the localization of the finite injective ring map $S' \to S$. Consider the maps of local rings

$$R_\mathfrak{p} \to S'_{\mathfrak{q}'} \to S_\mathfrak{q}$$

The second map is finite and injective. We have $S_\mathfrak{q}/\mathfrak{p}S_\mathfrak{q} = \kappa(\mathfrak{q})$, see Lemma 7.132.5. Hence a fortiori $S_\mathfrak{q}/\mathfrak{q}'S_\mathfrak{q} = \kappa(\mathfrak{q})$. Since

$$\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{q}') \subset \kappa(\mathfrak{q})$$

and since α is in the image of $\kappa(\mathfrak{q}')$ in $\kappa(\mathfrak{q})$ we conclude that $\kappa(\mathfrak{q}') = \kappa(\mathfrak{q})$. Hence by Nakayama's Lemma 7.14.5 applied to the $S'_{\mathfrak{q}'}$-module map $S'_{\mathfrak{q}'} \to S_\mathfrak{q}$, the map $S'_{\mathfrak{q}'} \to S_\mathfrak{q}$ is surjective. In other words, $S'_{\mathfrak{q}'} \cong S_\mathfrak{q}$.

Step 7. By Lemma 7.117.6 there exists a $g' \in S'$, $g' \notin \mathfrak{q}'$ such that $S'_{g'} \cong S_{g'}$. As R is Noetherian the ring S' is finite over R as it is an R-submodule of the finite R-module S. Hence after replacing S by S' we may assume that (a) R is Noetherian, (b) S finite over R, (c) S is étale over R at $\mathfrak{q}$, and (d) $S = R[x]/I$.

Step 8. Consider the ring $S \otimes_R \kappa(\mathfrak{p}) = \kappa(\mathfrak{p})[x]/\overline{I}$ where $\overline{I} = I \cdot \kappa(\mathfrak{p})[x]$ is the ideal generated by I in $\kappa(\mathfrak{p})[x]$. As $\kappa(\mathfrak{p})[x]$ is a PID we know that $\overline{I} = (\overline{h})$ for some monic $\overline{h} \in \kappa(\mathfrak{p})$. After replacing $\overline{h}$ by $\lambda \cdot \overline{h}$ for some $\lambda \in \kappa(\mathfrak{p})$ we may assume that $\overline{h}$ is the image of some $h \in R[x]$. (The problem is that we do not know if we may choose h monic.) Also, as in Step 4 we know that $S \otimes_R \kappa(\mathfrak{p}) = A_1 \times \ldots \times A_n$ with $A_1 = \kappa(\mathfrak{q})$ a finite separable extension of $\kappa(\mathfrak{p})$ and $A_2, \ldots, A_n$ local. This implies that

$$\overline{h} = \overline{h}_1 \overline{h}_2^{e_2} \ldots \overline{h}_n^{e_n}$$

for certain pairwise coprime irreducible monic polynomials $\overline{h}_i \in \kappa(\mathfrak{p})[x]$ and certain $e_2, \ldots, e_n \geq 1$. Here the numbering is chosen so that $A_i = \kappa(\mathfrak{p})[x]/(\overline{h}_i^{e_i})$ as $\kappa(\mathfrak{p})[x]$-algebras. Note that $\overline{h}_1$ is the minimal polynomial of $\alpha \in \kappa(\mathfrak{q})$ and hence is a separable polynomial (its derivative is prime to itself).

Step 9. Let $m \in I$ be a monic element; such an element exists because the ring extension $R \to R[x]/I$ is finite hence integral. Denote $\overline{m}$ the image in $\kappa(\mathfrak{p})[x]$. We may factor

$$\overline{m} = \overline{k}\overline{h}_1^{d_1} \overline{h}_2^{d_2} \ldots \overline{h}_n^{d_n}$$

for some $d_1 \geq 1$, $d_j \geq e_j$, $j = 2, \ldots, n$ and $\overline{k} \in \kappa(\mathfrak{p})[x]$ prime to all the $\overline{h}_i$. Set $f = m^l + h$ where $l\deg(m) > \deg(h)$, and $l \geq 2$. Then f is monic as a polynomial over R. Also, the image $\overline{f}$ of f in $\kappa(\mathfrak{p})[x]$ factors as

$$\overline{f} = \overline{h}_1\overline{h}_2^{e_2} \ldots \overline{h}_n^{e_n} + \overline{k}^l\overline{h}_1^{ld_1}\overline{h}_2^{ld_2} \ldots \overline{h}_n^{ld_n} = \overline{h}_1(\overline{h}_2^{e_2} \ldots \overline{h}_n^{e_n} + \overline{k}^l\overline{h}_1^{ld_1-1}\overline{h}_2^{ld_2} \ldots \overline{h}_n^{ld_n}) = \overline{h}_1\overline{w}$$

with $\overline{w}$ a polynomial relatively prime to $\overline{h}_1$. Set $g = f'$ (the derivative with respect to x).

Step 10. The ring map $R[x] \to S = R[x]/I$ has the properties: (1) it maps f to zero, and (2) it maps g to an element of $S \setminus \mathfrak{q}$. The first assertion is clear since f is an element of I. For the second assertion we just have to show that g does not map to zero in $\kappa(\mathfrak{q}) = \kappa(\mathfrak{p})[x]/(\overline{h}_1)$. The image of g in $\kappa(\mathfrak{p})[x]$ is the derivative of $\overline{f}$. Thus (2) is clear because

$$\overline{g} = \frac{\mathrm{d}\overline{f}}{\mathrm{d}x} = \overline{w}\frac{\mathrm{d}\overline{h}_1}{\mathrm{d}x} + \overline{h}_1\frac{\mathrm{d}\overline{w}}{\mathrm{d}x},$$

$\overline{w}$ is prime to $\overline{h}_1$ and $\overline{h}_1$ is separable.

Step 11. We conclude that $\varphi : R[x]/(f) \to S$ is a surjective ring map, $R[x]_g/(f)$ is étale over R (because it is standard étale, see Lemma 7.132.14) and $\varphi(g) \not\in \mathfrak{q}$. Pick an element $g' \in R[x]/(f)$ such that also $\varphi(g') \not\in \mathfrak{q}$ and $S_{\varphi(g')}$ is étale over R (which exists since S is étale over R at $\mathfrak{q}$). Then the ring map $R[x]_{gg'}/(f) \to S_{\varphi(g)}$ is a surjective map of étale algebras over R. Hence it is étale by Lemma 7.132.8. Hence it is a localization by Lemma 7.132.9. Thus a localization of S at an element not in $\mathfrak{q}$ is isomorphic to a localization of a standard étale algebra over R which is what we wanted to show. □

The following two lemmas say that the étale topology is coarser than the topology generated by Zariski coverings and finite flat morphisms. They should be skipped on a first reading.

Lemma 7.132.17. *Let $R \to S$ be a standard étale morphism. There exists a ring map $R \to S'$ with the following properties*

1. *$R \to S'$ is finite, finitely presented, and flat (in other words S' is finite projective as an R-module),*
2. *$Spec(S') \to Spec(R)$ is surjective,*
3. *for every prime $\mathfrak{q} \subset S$, lying over $\mathfrak{p} \subset R$ and every prime $\mathfrak{q}' \subset S'$ lying over $\mathfrak{p}$ there exists a $g' \in S'$, $g' \not\in \mathfrak{q}'$ such that the ring map $R \to S'_{g'}$ factors through a map $\varphi : S \to S'_{g'}$ with $\varphi^{-1}(\mathfrak{q}'S'_{g'}) = \mathfrak{q}$.*

Proof. Let $S = R[x]_g/(f)$ be a presentation of S as in Definition 7.132.13. Write $f = x^n + a_1x^{n-1} + \ldots + a_n$ with $a_i \in R$. By Lemma 7.125.9 there exists a finite locally free and faithfully flat ring map $R \to S'$ such that $f = \prod(x - \alpha_i)$ for certain $\alpha_i \in S'$. Hence $R \to S'$ satisfies conditions (1), (2). Let $\mathfrak{q} \subset R[x]/(f)$ be a prime ideal with $g \not\in \mathfrak{q}$ (i.e., it corresponds to a prime of S). Let $\mathfrak{p} = R \cap \mathfrak{q}$ and let $\mathfrak{q}' \subset S'$ be a prime lying over $\mathfrak{p}$. Note that there are n maps of R-algebras

$$\begin{array}{rccc} \varphi_i : & R[x]/(f) & \longrightarrow & S' \\ & x & \longmapsto & \alpha_i \end{array}$$

To finish the proof we have to show that for some i we have (a) the image of $\varphi_i(g)$ in $\kappa(\mathfrak{q}')$ is not zero, and (b) $\varphi_i^{-1}(\mathfrak{q}') = \mathfrak{q}$. Because then we can just take $g' = \varphi_i(g)$, and $\varphi = \varphi_i$ for that i.

Let $\overline{f}$ denote the image of f in $\kappa(\mathfrak{p})[x]$. Note that as a point of $Spec(\kappa(\mathfrak{p})[x]/(\overline{f}))$ the prime $\mathfrak{q}$ corresponds to an irreducible factor f_1 of $\overline{f}$. Moreover, $g \not\in \mathfrak{q}$ means that f_1 does not divide the image $\overline{g}$ of g in $\kappa(\mathfrak{p})[x]$. Denote $\overline{\alpha}_1, \ldots, \overline{\alpha}_n$ the images of $\alpha_1, \ldots, \alpha_n$ in $\kappa(\mathfrak{q}')$. Note that the polynomial $\overline{f}$ splits completely in $\kappa(\mathfrak{q}')[x]$, namely

$$\overline{f} = \prod\nolimits_i (x - \overline{\alpha}_i)$$

Moreover $\varphi_i(g)$ reduces to $\overline{g}(\overline{\alpha}_i)$. It follows we may pick i such that $f_1(\overline{\alpha}_i) = 0$ and $\overline{g}(\overline{\alpha}_i) \neq 0$. For this i properties (a) and (b) hold. Some details omitted. □

Lemma 7.132.18. *Let $R \to S$ be a ring map. Assume that*

1. *$R \to S$ is étale, and*
2. *$Spec(S) \to Spec(R)$ is surjective.*

Then there exists a ring map $R \to S'$ such that

1. *$R \to S'$ is finite, finitely presented, and flat (in other words it is finite projective as an R-module),*
2. *$Spec(S') \to Spec(R)$ is surjective,*
3. *for every prime $\mathfrak{q}' \subset S'$ there exists a $g' \in S'$, $g' \notin \mathfrak{q}'$ such that the ring map $R \to S'_{g'}$ factors as $R \to S \to S'_{g'}$.*

Proof. By Proposition 7.132.16 and the quasi-compactness of $Spec(S)$ (see Lemma 7.16.10) we can find $g_1, \ldots, g_n \in S$ generating the unit ideal of S such that each $R \to S_{g_i}$ is standard étale. If we prove the lemma for the ring map $R \to \prod_{i=1,\ldots,n} S_{g_i}$ then the lemma follows for the ring map $R \to S$. Hence we may assume that $S = \prod_{i=1,\ldots,n} S_i$ is a finite product of standard étale morphisms.

For each i choose a ring map $R \to S'_i$ as in Lemma 7.132.17 adapted to the standard étale morphism $R \to S_i$. Set $S' = S'_1 \otimes_R \ldots \otimes_R S'_n$; we will use the R-algebra maps $S'_i \to S'$ without further mention below. We claim this works. Properties (1) and (2) are immediate. For property (3) suppose that $\mathfrak{q}' \subset S'$ is a prime. Denote $\mathfrak{p}$ its image in $Spec(R)$. Choose $i \in \{1, \ldots, n\}$ such that $\mathfrak{p}$ is in the image of $Spec(S_i) \to Spec(R)$; this is possible by assumption. Set $\mathfrak{q}'_i \subset S'_i$ the image of $\mathfrak{q}'$ in the spectrum of S'_i. By construction of S'_i there exists a $g'_i \in S'_i$ such that $R \to (S'_i)_{g'_i}$ factors as $R \to S_i \to (S'_i)_{g'_i}$. Hence also $R \to S'_{g'_i}$ factors as

$$R \to S_i \to (S'_i)_{g'_i} \to S'_{g'_i}$$

as desired. □

Lemma 7.132.19. *Let R be a ring. Let $f \in R[x]$ be a monic polynomial. Let $\mathfrak{p}$ be a prime of R. Let f mod $\mathfrak{p} = \overline{g}\overline{h}$ be a factorization of the image of f in $\kappa(\mathfrak{p})[x]$. If $\gcd(\overline{g}, \overline{h}) = 1$, then there exist*

1. *an étale ring map $R \to R'$,*
2. *a prime $\mathfrak{p}' \subset R'$ lying over $\mathfrak{p}$, and*
3. *a factorization $f = gh$ in $R'[x]$*

such that

1. *$\kappa(\mathfrak{p}) = \kappa(\mathfrak{p}')$,*
2. *$\overline{g} = g$ mod $\mathfrak{p}'$, $\overline{h} = h$ mod $\mathfrak{p}'$, and*
3. *the polynomials g, h generate the unit ideal in $R'[x]$.*

Proof. Suppose $\overline{g} = \overline{b}_0 x^n + \overline{b}_1 x^{n-1} + \ldots + \overline{b}_n$, and $\overline{h} = \overline{c}_0 x^m + \overline{c}_1 x^{m-1} + \ldots + \overline{c}_m$ with $\overline{b}_0, \overline{c}_0 \in \kappa(\mathfrak{p})$ nonzero. After localizing R at some element of R not contained in $\mathfrak{p}$ we may assume $\overline{b}_0$ is the image of an invertible element $b_0 \in R$. Replacing $\overline{g}$ by $\overline{g}/b_0$ and $\overline{h}$ by $b_0\overline{h}$ we reduce to the case where $\overline{g}, \overline{h}$ are monic (verification omitted). Say $\overline{g} = x^n + \overline{b}_1 x^{n-1} + \ldots + \overline{b}_n$, and $\overline{h} = x^m + \overline{c}_1 x^{m-1} + \ldots + \overline{c}_m$. Write $f = x^{n+m} + a_1 x^{n-1} + \ldots + a_{n+m}$. Consider the fibre product

$$R' = R \otimes_{\mathbf{Z}[a_1,\ldots,a_{n+m}]} \mathbf{Z}[b_1, \ldots, b_n, c_1, \ldots, c_m]$$

where the map $\mathbf{Z}[a_k] \to \mathbf{Z}[b_i, c_j]$ is as in Examples 7.125.7 and 7.132.12. By construction there is an R-algebra map

$$R' = R \otimes_{\mathbf{Z}[a_1,\ldots,a_{n+m}]} \mathbf{Z}[b_1, \ldots, b_n, c_1, \ldots, c_m] \longrightarrow \kappa(\mathfrak{p})$$

which maps b_i to $\overline{b}_i$ and c_j to $\overline{c}_j$. Denote $\mathfrak{p}' \subset R'$ the kernel of this map. Since by assumption the polynomials $\overline{g}, \overline{h}$ are relatively prime we see that the element $\Delta = \text{Res}_x(g, h) \in \mathbf{Z}[b_i, c_j]$ (see Example 7.132.12) does not map to zero in $\kappa(\mathfrak{p})$ under the displayed map. We conclude that $R \to R'$ is étale at $\mathfrak{p}'$. In fact a solution to the problem posed in the lemma is the ring map $R \to R'[1/\Delta]$ and the prime $\mathfrak{p}' R'[1/\Delta]$. Because $\text{Res}_x(f, g)$ is invertible in this ring the Sylvester matrix is invertible over R' and hence $1 = ag + bh$ for some $a, b \in R'[x]$ see Example 7.132.12. □

The following lemmas say roughly that after an étale extension a quasi-finite ring map becomes finite. To help interpret the results recall that the locus where a finite type ring map is quasi-finite is open (see Lemma 7.114.14) and that formation of this locus commutes with arbitrary base change (see Lemma 7.113.8).

Lemma 7.132.20. *Let $R \to S' \to S$ be ring maps. Let $\mathfrak{p} \subset R$ be a prime. Let $g \in S'$ be an element. Assume*

1. *$R \to S'$ is integral,*
2. *$R \to S$ is finite type,*
3. *$S'_g \cong S_g$, and*
4. *g invertible in $S' \otimes_R \kappa(\mathfrak{p})$.*

Then there exists a $f \in R$, $f \notin \mathfrak{p}$ such that $R_f \to S_f$ is finite.

Proof. By assumption the image T of $V(g) \subset Spec(S')$ under the morphism $Spec(S') \to Spec(R)$ does not contain $\mathfrak{p}$. By Section 7.36 especially, Lemma 7.36.6 we see T is closed. Pick $f \in R$, $f \notin \mathfrak{p}$ such that $T \cap V(f) = \emptyset$. Then we see that g becomes invertible in S'_f. Hence $S'_f \cong S_f$. Thus S_f is both of finite type and integral over R_f, hence finite. □

Lemma 7.132.21. *Let $R \to S$ be a ring map. Let $\mathfrak{q} \subset S$ be a prime lying over the prime $\mathfrak{p} \subset R$. Assume $R \to S$ finite type and quasi-finite at $\mathfrak{q}$. Then there exists*

1. *an étale ring map $R \to R'$,*
2. *a prime $\mathfrak{p}' \subset R'$ lying over $\mathfrak{p}$,*
3. *a product decomposition*

$$R' \otimes_R S = A \times B$$

with the following properties

1. *$\kappa(\mathfrak{p}) = \kappa(\mathfrak{p}')$,*
2. *$R' \to A$ is finite,*
3. *A has exactly one prime $\mathfrak{r}$ lying over $\mathfrak{p}'$, and*
4. *$\mathfrak{r}$ lies over $\mathfrak{q}$.*

Proof. Let $S' \subset S$ be the integral closure of R in S. Let $\mathfrak{q}' = S' \cap \mathfrak{q}$. By Zariski's Main Theorem 7.114.13 there exists a $g \in S'$, $g \notin \mathfrak{q}'$ such that $S'_g \cong S_g$. Consider the fibre rings $F = S \otimes_R \kappa(\mathfrak{p})$ and $F' = S' \otimes_R \kappa(\mathfrak{p})$. Denote $\overline{\mathfrak{q}}'$ the prime of F' corresponding to $\mathfrak{q}'$. Since

F' is integral over $\kappa(\mathfrak{p})$ we see that $\overline{\mathfrak{q}}'$ is a closed point of $Spec(F')$, see Lemma 7.32.17. Note that $\mathfrak{q}$ defines an isolated closed point $\overline{\mathfrak{q}}$ of $Spec(F)$ (see Definition 7.113.3). Since $S'_g \cong S_g$ we have $F'_g \cong F_g$, so $\overline{\mathfrak{q}}$ and $\overline{\mathfrak{q}}'$ have isomorphic open neighbourhoods in $Spec(F)$ and $Spec(F')$. We conclude the set $\{\overline{\mathfrak{q}}'\} \subset Spec(F')$ is open. Combined with closedness shown above we conclude that $\overline{\mathfrak{q}}'$ defines an isolated closed point of $Spec(F')$ as well.

An additional small remark is that under the map $Spec(F) \to Spec(F')$ the point $\overline{\mathfrak{q}}$ is the only point mapping to $\overline{\mathfrak{q}}'$. This follows from the discussion above.

By Lemma 7.20.3 we may write $F' = F'_1 \times F'_2$ with $Spec(F'_1) = \{\overline{\mathfrak{q}}'\}$. Since $F' = S' \otimes_R \kappa(\mathfrak{p})$, there exists an $s' \in S'$ which maps to the element $(r, 0) \in F'_1 \times F'_2 = F'$ for some $r \in R$, $r \not\in \mathfrak{p}$. In fact, what we will use about s' is that it is an element of S', not contained in $\mathfrak{q}'$, and contained in any other prime lying over $\mathfrak{p}$.

Let $f(x) \in R[x]$ be a monic polynomial such that $f(s') = 0$. Denote $\overline{f} \in \kappa(\mathfrak{p})[x]$ the image. We can factor it as $\overline{f} = x^e \overline{h}$ where $\overline{h}(0) \neq 0$. By Lemma 7.132.19 we can find an étale ring extension $R \to R'$, a prime $\mathfrak{p}'$ lying over $\mathfrak{p}$, and a factorization $f = hi$ in $R'[x]$ such that $\kappa(\mathfrak{p}) = \kappa(\mathfrak{p}')$, $x^e = h \bmod \mathfrak{p}'$, $\overline{i} = i \bmod \mathfrak{p}'$, and we can write $ah + bi = 1$ in $R'[x]$ (for suitable a, b).

Consider the elements $h(s'), i(s') \in R' \otimes_R S'$. By construction we have $h(s')i(s') = f(s') = 0$. On the other hand they generate the unit ideal since $a(s')h(s') + b(s')i(s') = 1$. Thus we see that $R' \otimes_R S'$ is the product of the localizations at these elements:

$$R' \otimes_R S' = (R' \otimes_R S')_{h(s')} \times (R' \otimes_R S')_{i(s')} = S'_1 \times S'_2$$

Moreover this product decomposition is compatible with the product decomposition we found for the fibre ring F'; this comes from our choice of s', h which garantee that $\overline{\mathfrak{q}}'$ is the only prime of F' which does not contain the image of $h(s')$ in F'. Here we use that the fibre ring of $R' \otimes_R S'$ over R' at $\mathfrak{p}'$ is the same as F' due to the fact that $\kappa(\mathfrak{p}) = \kappa(\mathfrak{p}')$. It follows that S'_1 has exactly one prime, say $\mathfrak{r}'$, lying over $\mathfrak{p}'$ and that this prime lies over $\mathfrak{q}$. Hence the element $g \in S'$ maps to an element of S'_1 not contained in $\mathfrak{r}'$.

The base change $R' \otimes_R S$ inherits a similar product decomposition

$$R' \otimes_R S = (R' \otimes_R S)_{h(s')} \times (R' \otimes_R S)_{i(s')} = S_1 \times S_2$$

It follows from the above that S_1 has exactly one prime, say $\mathfrak{r}$, lying over $\mathfrak{p}'$ (consider the fibre ring as above), and that this prime lies over $\mathfrak{q}$.

Now we may apply Lemma 7.132.20 to the ring maps $R' \to S'_1 \to S_1$, the prime $\mathfrak{p}'$ and the element g to see that after replacing R' by a principal localization we can assume that S_1 is finite over R' as desired. ☐

Lemma 7.132.22. *Let $R \to S$ be a ring map. Let $\mathfrak{p} \subset R$ be a prime. Assume $R \to S$ finite type. Then there exists*

1. *an étale ring map $R \to R'$,*
2. *a prime $\mathfrak{p}' \subset R'$ lying over $\mathfrak{p}$,*
3. *a product decomposition*

$$R' \otimes_R S = A_1 \times \ldots \times A_n \times B$$

with the following properties

1. *we have $\kappa(\mathfrak{p}) = \kappa(\mathfrak{p}')$,*
2. *each A_i is finite over R',*
3. *each A_i has exactly one prime $\mathfrak{r}_i$ lying over $\mathfrak{p}'$, and*

(4) *$R' \to B$ not quasi-finite at any prime lying over $\mathfrak{p}'$.*

Proof. Denote $F = S \otimes_R \kappa(\mathfrak{p})$ the fibre ring of S/R at the prime $\mathfrak{p}$. As F is of finite type over $\kappa(\mathfrak{p})$ it is Noetherian and hence $Spec(F)$ has finitely many isolated closed points. If there are no isolated closed points, i.e., no primes $\mathfrak{q}$ of S over $\mathfrak{p}$ such that S/R is quasi-finite at $\mathfrak{q}$, then the lemma holds. If there exists at least one such prime $\mathfrak{q}$, then we may apply Lemma 7.132.21 above. This gives a diagram

$$\begin{tikzcd} S \arrow[r] & R' \otimes_R S \arrow[r, equal] & A_1 \times B' \\ R \arrow[u] \arrow[r] & R' \arrow[u] \arrow[ur] & \end{tikzcd}$$

as in said lemma. Since the residue fields at $\mathfrak{p}$ and $\mathfrak{p}'$ are the same, the fibre rings of S/R and $(A \times B)/R'$ are the same. Hence, by induction on the number of isolated closed points of the fibre we may assume that the lemma holds for $R' \to B$ and $\mathfrak{p}'$. Thus we get an étale ring map $R' \to R''$, a prime $\mathfrak{p}'' \subset R''$ and a decomposition

$$R'' \otimes_{R'} B' = A_2 \times \ldots \times A_n \times B$$

We omit the verification that the ring map $R \to R''$, the prime $\mathfrak{p}''$ and the resulting decomposition

$$R'' \otimes_R S = (R'' \otimes_{R'} A_1) \times A_2 \times \ldots \times A_n \times B$$

is a solution to the problem posed in the lemma. □

Lemma 7.132.23. *Let $R \to S$ be a ring map. Let $\mathfrak{p} \subset R$ be a prime. Assume $R \to S$ finite type. Then there exists*

(1) *an étale ring map $R \to R'$,*
(2) *a prime $\mathfrak{p}' \subset R'$ lying over $\mathfrak{p}$,*
(3) *a product decomposition*

$$R' \otimes_R S = A_1 \times \ldots \times A_n \times B$$

with the following properties

(1) *each A_i is finite over R',*
(2) *each A_i has exactly one prime $\mathfrak{r}_i$ lying over $\mathfrak{p}'$,*
(3) *the finite field extensions $\kappa(\mathfrak{p}') \subset \kappa(\mathfrak{r}_i)$ are purely inseparable, and*
(4) *$R' \to B$ not quasi-finite at any prime lying over $\mathfrak{p}'$.*

Proof. The strategy of the proof is to make two étale ring extensions: first we control the residue fields, then we apply Lemma 7.132.22 above.

Denote $F = S \otimes_R \kappa(\mathfrak{p})$ the fibre ring of S/R at the prime $\mathfrak{p}$. As in the proof of Lemma 7.132.22 there are finitely may primes, say $\mathfrak{q}_1, \ldots, \mathfrak{q}_n$ of S lying over R at which the ring map $R \to S$ is quasi-finite. Let $\kappa(\mathfrak{p}) \subset L_i \subset \kappa(\mathfrak{q}_i)$ be the subfield such that $\kappa(\mathfrak{p}) \subset L_i$ is separable, and the field extension $L_i \subset \kappa(\mathfrak{q}_i)$ is purely inseparable. Let $\kappa(\mathfrak{p}) \subset L$ be a finite Galois extension into which L_i embeds for $i = 1, \ldots, n$. By Lemma 7.132.15 we can find an étale ring extension $R \to R'$ together with a prime $\mathfrak{p}'$ lying over $\mathfrak{p}$ such that the field extension $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{p}')$ is isomorphic to $\kappa(\mathfrak{p}) \subset L$. Thus the fibre ring of $R' \otimes_R S$ at $\mathfrak{p}'$ is isomorphic to $F \otimes_{\kappa(\mathfrak{p})} L$. The primes lying over $\mathfrak{q}_i$ correspond to primes of $\kappa(\mathfrak{q}_i) \otimes_{\kappa(\mathfrak{p})} L$ which is a product of fields purely inseparable over L by our choice of L and elementary field theory. These are also the only primes over $\mathfrak{p}'$ at which $R' \to R' \otimes_R S$ is quasi-finite, by Lemma 7.113.8. Hence after replacing R by R', $\mathfrak{p}$ by $\mathfrak{p}'$, and S by $R' \otimes_R S$ we may assume that for all primes $\mathfrak{q}$ lying over $\mathfrak{p}$ for which S/R is quasi-finite the field extensions $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{q})$ are purely inseparable.

Next apply Lemma 7.132.22. The result is what we want since the field extensions do not change under this étale ring extension. □

7.133. Local homomorphisms

Lemma 7.133.1. *Let $(R, \mathfrak{m}_R) \to (S, \mathfrak{m}_S)$ be a local homomorphism of local rings. Assume S is the localization of an étale ring extension of R. Then there exists a finite, finitely presented, faithfully flat ring map $R \to S'$ such that for every maximal ideal $\mathfrak{m}'$ of S' there is a factorization*

$$R \to S \to S'_{\mathfrak{m}'}.$$

of the ring map $R \to S'_{\mathfrak{m}'}$.

Proof. Write $S = T_{\mathfrak{q}}$ for some étale R-algebra T. By Proposition 7.132.16 we may assume T is standard étale. Apply Lemma 7.132.17 to the ring map $R \to T$ to get $R \to S'$. Then in particular for every maximal ideal $\mathfrak{m}'$ of S' we get a factorization $\varphi : T \to S'_{g'}$ for some $g' \not\in \mathfrak{m}'$ such that $\mathfrak{q} = \varphi^{-1}(\mathfrak{m}' S'_{g'})$. Thus φ induces the desired local ring map $S \to S'_{\mathfrak{m}'}$. □

7.134. Integral closure and smooth base change

Lemma 7.134.1. *Let R be a ring. Let $f \in R[x]$ be a monic polynomial. Let $R \to B$ be a ring map. If $h \in B[x]/(f)$ is integral over R, then the element $f'h$ can be written as $f'h = \sum_i b_i x^i$ with $b_i \in B$ integral over R.*

Proof. Say $h^e + r_1 h^{e-1} + \ldots + r_e = 0$ in the ring $B[x]/(f)$ with $r_i \in R$. There exists a finite free ring extension $B \subset B'$ such that $f = (x - \alpha_1) \ldots (x - \alpha_d)$ for some $\alpha_i \in B'$, see Lemma 7.125.9. Note that each α_i is integral over R. We may represent $h = h_0 + h_1 x + \ldots + h_{d-1} x^{d-1}$ with $h_i \in B$. Then it is a universal fact that

$$f'h \equiv \sum\nolimits_{i=1,\ldots,d} h(\alpha_i)(x - \alpha_1) \ldots \widehat{(x - \alpha_i)} \ldots (x - \alpha_d)$$

as elements of $B[x]/(f)$. You prove this by evaluating both sides at the points α_i over the ring $B_{univ} = \mathbf{Z}[\alpha_i, h_j]$ (some details omitted). By our assumption that h satisfies $h^e + r_1 h^{e-1} + \ldots + r_e = 0$ in the ring $B[x]/(f)$ we see that

$$h(\alpha_i)^e + r_1 h(\alpha_i)^{e-1} + \ldots + r_e = 0$$

in B'. Hence $h(\alpha_i)$ is integral over R. Using the formula above we see that $f'h \equiv \sum_{j=0,\ldots,d-1} b'_j x^j$ in $B'[x]/(f)$ with $b'_j \in B'$ integral over R. However, since $f'h \in B[x]/(f)$ and since $1, x, \ldots, x^{d-1}$ is a B'-basis for $B'[x]/(f)$ we see that $b'_j \in B$ as desired. □

Lemma 7.134.2. *Let $R \to S$ be an étale ring map. Let $R \to B$ be any ring map. Let $A \subset B$ be the integral closure of R in B. Let $A' \subset S \otimes_R B$ be the integral closure of S in $S \otimes_R B$. Then the canonical map $S \otimes_R A \to A'$ is an isomorphism.*

Proof. The map $S \otimes_R A \to A'$ is injective because $A \subset B$ and $R \to S$ is flat. We are going to use repeatedly that taking integral closure commutes with localization, see Lemma 7.32.9. Hence we may localize on S, by Lemma 7.21.2 (the criterion for checking whether an S-module map is an isomorphism). Thus we may assume that $S = R[x]_g/(f) = (R[x]/(f))_g$ is standard étale over R, see Proposition 7.132.16. Applying localization one more time we see that A' is $(A'')_g$ where A'' is the integral closure of $R[x]/(f)$ in $B[x]/(f)$. Suppose that $a \in A''$. It suffices to show that a is in $S \otimes_R A$. By Lemma 7.134.1 we see that $f' a = \sum a_i x^i$ with $a_i \in A$. Since f' is invertible in $B[x]_g/(f)$ (by definition of a standard étale ring map) we conclude that $a \in S \otimes_R A$ as desired. □

Example 7.134.3. Let p be a prime number. For every $n > 0$ the ring extension

$$R = \mathbf{Z}[1/p] \subset R' = \mathbf{Z}[1/p][x]/(x^{p^n} - 1)$$

has the following property: For $d < p^n$ there exist elements $\alpha_0, \ldots, \alpha_{d-1} \in R'$ such that

$$\prod\nolimits_{0 \leq i < j < d} (\alpha_i - \alpha_j)$$

is a unit in R'. Namely, take α_i equal to the class of x^i in R'. Then we have

$$T^{p^n} - 1 = \prod\nolimits_{i = 0, \ldots, p^n - 1} (T - \alpha_i)$$

(for example because this is clear over $\mathbf{Q}$) and hence by taking derivatives on both sides

$$p^n \alpha_i^{p^n - 1} = (\alpha_i - \alpha_1) \ldots \widehat{(\alpha_i - \alpha_i)} \ldots (\alpha_i - \alpha_1)$$

and we see this is invertible in R'.

Lemma 7.134.4. *Let $R \to S$ be a smooth ring map. Let $R \to B$ be any ring map. Let $A \subset B$ be the integral closure of R in B. Let $A' \subset S \otimes_R B$ be the integral closure of S in $S \otimes_R B$. Then the canonical map $S \otimes_R A \to A'$ is an isomorphism.*

Proof. Arguing as in the proof of Lemma 7.134.2 we may localize on S. Hence we may assume that $R \to S$ is a standard smooth ring map, see Lemma 7.126.10. By definition of a standard smooth ring map we see that S is étale over a polynomial ring $R[x_1, \ldots, x_n]$. Since we have seen the result in the case of an étale ring extension (Lemma 7.134.2) this reduces us to the case where $S = R[x]$. Thus we have to show

$$f = \sum b_i x^i \text{ integral over } R[x] \Leftrightarrow \text{each } b_i \text{ integral over } R.$$

The implication from right to left holds because the set of elements in $B[x]$ integral over $R[x]$ is a ring (Lemma 7.32.7) and contains x.

Suppose that $f \in B[x]$ is integral over $R[x]$, and assume that $f = \sum_{i<d} b_i x^i$ has degree $< d$. Since integral closure and localization commute, it suffices to show that each b_i is integral over $R[1/2]$ and over $R[1/3]$. Hence, we can find a finite free ring extension $R \subset R'$ such that R' contains $\alpha_1, \ldots, \alpha_d$ with the property that $\prod_{i<j}(\alpha_i - \alpha_j)$ is a unit in R', see Example 7.134.3. In this case we have the universal equality

$$f = \sum_i f(\alpha_i) \frac{(x - \alpha_1) \ldots \widehat{(x - \alpha_i)} \ldots (x - \alpha_d)}{(\alpha_i - \alpha_1) \ldots \widehat{(\alpha_i - \alpha_i)} \ldots (\alpha_i - \alpha_d)}.$$

OK, and the elements $f(\alpha_i)$ are integral over R' since $(R' \otimes_R B)[x] \to R' \otimes_R B$, $h \mapsto h(\alpha_i)$ is a ring map. Hence we see that the coefficients of f in $(R' \otimes_R B)[x]$ are integral over over R'. Since R' is finite over R (hence integral over R) we see that they are integral over R also, as desired. □

7.135. Formally unramified maps

It turns out to be logically more efficient to define the notion of a formally unramified map before introducing the notion of a formally étale one.

Definition 7.135.1. Let $R \to S$ be a ring map. We say S is *formally unramified over R* if for every commutative solid diagram

$$\begin{tikzcd} S \arrow[r] \arrow[rd, dashed] & A/I \\ R \arrow[u] \arrow[r] & A \arrow[u] \end{tikzcd}$$

where $I \subset A$ is an ideal of square zero, there exists at most one dotted arrow making the diagram commute.

Lemma 7.135.2. *Let $R \to S$ be a ring map. The following are equivalent:*

(1) *$R \to S$ is formally unramified,*
(2) *the module of differentials $\Omega_{S/R}$ is zero.*

Proof. Let $J = \mathrm{Ker}(S \otimes_R S \to S)$ be the kernel of the multiplication map. Let $A_{univ} = S \otimes_R S/J^2$. Recall that $I_{univ} = J/J^2$ is isomorphic to $\Omega_{S/R}$, see Lemma 7.122.13. Moreover, the two R-algebra maps $\sigma_1, \sigma_2 : S \to A_{univ}$, $\sigma_1(s) = s \otimes 1 \bmod J^2$, and $\sigma_2(s) = 1 \otimes s \bmod J^2$ differ by the universal derivation $\mathrm{d} : S \to \Omega_{S/R} = I_{univ}$.

Assume $R \to S$ formally unramified. Then we see that $\sigma_1 = \sigma_2$. Hence $\mathrm{d}(s) = 0$ for all $s \in S$. Hence $\Omega_{S/R} = 0$.

Assume that $\Omega_{S/R} = 0$. Let $A, I, R \to A, S \to A/I$ be a solid diagram as in Definition 7.135.1. Let $\tau_1, \tau_2 : S \to A$ be two dotted arrows making the diagram commute. Consider the R-algebra map $A_{univ} \to A$ defined by the rule $s_1 \otimes s_2 \mapsto \tau_1(s_1)\tau_2(s_2)$. We omit the verification that this is well defined. Since $A_{univ} \cong S$ as $I_{univ} = \Omega_{S/R} = 0$ we conclude that $\tau_1 = \tau_2$. □

Lemma 7.135.3. *Let $R \to S$ be a ring map. The following are equivalent:*

(1) *$R \to S$ is formally unramified,*
(2) *$R \to S_{\mathfrak q}$ is formally unramified for all primes $\mathfrak q$ of S, and*
(3) *$R_{\mathfrak p} \to S_{\mathfrak q}$ is formally unramified for all primes $\mathfrak q$ of S with $\mathfrak p = R \cap \mathfrak q$.*

Proof. We have seen in Lemma 7.135.2 that (1) is equivalent to $\Omega_{S/R} = 0$. Similarly, by Lemma 7.122.8 we see that (2) and (3) are equivalent to $(\Omega_{S/R})_{\mathfrak q} = 0$ for all $\mathfrak q$. Hence the equivalence follows from Lemma 7.21.1. □

Lemma 7.135.4. *Let $A \to B$ be a formally unramified ring map.*

(1) *For $S \subset A$ a multiplicative subset, $S^{-1}A \to S^{-1}B$ is formally unramified.*
(2) *For $S \subset B$ a multiplicative subset, $A \to S^{-1}B$ is formally unramified.*

Proof. Follows from Lemma 7.135.3. (You can also deduce it from Lemma 7.135.2 combined with Lemma 7.122.8.) □

7.136. Conormal modules and universal thickenings

It turns out that one can define the first infinitesimal neighbourhood not just for a closed immersion of schemes, but already for any formally unramified morphism. This is based on the following algebraic fact.

Lemma 7.136.1. *Let $R \to S$ be a formally unramified ring map. There exists a surjection of R-algebras $S' \to S$ whose kernel is an ideal of square zero with the following universal property: Given any commutative diagram*

$$\begin{tikzcd} S \arrow[r, "a"'] & A/I \\ R \arrow[u] \arrow[r, "b"] & A \arrow[u] \end{tikzcd}$$

where $I \subset A$ is an ideal of square zero, there is a unique R-algebra map $a' : S' \to A$ such that $S' \to A \to A/I$ is equal to $S' \to S \to A$.

Proof. Choose a set of generators $z_i \in S, i \in I$ for S as an R-algebra. Let $P = R[\{x_i\_i \in I]$ denote the polynomial ring on generators x_i, $i \in I$. Consider the R-algebra map $P \to S$ which maps x_i to z_i. Let $J = \text{Ker}(P \to S)$. Consider the map

$$\mathrm{d} : J/J^2 \longrightarrow \Omega_{P/R} \otimes_P S$$

see Lemma 7.122.9. This is surjective since $\Omega_{S/R} = 0$ by assumption, see Lemma 7.135.2. Note that $\Omega_{P/R}$ is free on $\mathrm{d}x_i$, and hence the module $\Omega_{P/R} \otimes_P S$ is free over S. Thus we may choose a splitting of the surjection above and write

$$J/J^2 = K \oplus \Omega_{P/R} \otimes_P S$$

Let $J^2 \subset J' \subset J$ be the ideal of P such that J'/J^2 is the second summand in the decomposition above. Set $S' = P/J'$. We obtain a short exact sequence

$$0 \to J/J' \to S' \to S \to 0$$

and we see that $J/J' \cong K$ is a square zero ideal in S'. Hence

$$\begin{tikzcd} S \arrow[r, "1"'] & S \\ R \arrow[u] \arrow[r] & S' \arrow[u] \end{tikzcd}$$

is a diagram as above. In fact we claim that this is an initial object in the category of diagrams. Namely, let $(I \subset A, a, b)$ be an arbitrary diagram. We may choose an R-algebra map $\beta : P \to A$ such that

$$\begin{tikzcd} S \arrow[r, "1"'] & S \arrow[r, "a"'] & A/I \\ R \arrow[u] \arrow[r] \arrow[rr, bend right, "b"'] & P \arrow[u] \arrow[r, "\beta"] & A \arrow[u] \end{tikzcd}$$

is commutative. Now it may not be the case that $\beta(J') = 0$, in other words it may not be true that β factors through $S' = P/J'$. But what is clear is that $\beta(J') \subset I$ and since $\beta(J) \subset I$ and $I^2 = 0$ we have $\beta(J^2) = 0$. Thus the ``obstruction" to finding a morphism from $(J/J' \subset S', 1, R \to S')$ to $(I \subset A, a, b)$ is the corresponding S-linear map $\overline{\beta} : J'/J^2 \to I$. The choice in picking β lies in the choice of $\beta(x_i)$. A different choice of β, say β', is gotten by taking $\beta'(x_i) = \beta(x_i) + \delta_i$ with $\delta_i \in I$. In this case, for $g \in J'$, we obtain

$$\beta'(g) = \beta(g) + \sum\nolimits_i \delta_i \frac{\partial g}{\partial x_i}.$$

Since the map $\mathrm{d}|_{J'/J^2} : J'/J^2 \to \Omega_{P/R} \otimes_P S$ given by $g \mapsto \frac{\partial g}{\partial x_i}\mathrm{d}x_i$ is an isomorphism by construction, we see that there is a unique choice of $\delta_i \in I$ such that $\beta'(g) = 0$ for all $g \in J'$.

(Namely, δ_i is $-\overline{\beta}(g)$ where $g \in J'/J^2$ is the unique element with $\frac{\partial g}{\partial x_j} = 1$ if $i = j$ and 0 else.) The uniqueness of the solution implies the uniqueness required in the lemma. □

In the situation of Lemma 7.136.1 the R-algebra map $S' \to S$ is unique up to unique isomorphism.

Definition 7.136.2. Let $R \to S$ be a formally unramified ring map.

(1) The *universal first order thickening* of S over R is the surjection of R-algebras $S' \to S$ of Lemma 7.136.1.
(2) The *conormal module* of $R \to S$ is the kernel I of the universal first order thickening $S' \to S$, seen as a S-module.

We often denote the conormal module $C_{S/R}$ in this situation.

Lemma 7.136.3. *Let $I \subset R$ be an ideal of a ring. The universal first order thickening of R/I over R is the surjection $R/I^2 \to R/I$. The conormal module of R/I over R is $C_{(R/I)/R} = I/I^2$.*

Proof. Omitted. □

Lemma 7.136.4. *Let $A \to B$ be a formally unramified ring map. Let $\varphi : B' \to B$ be the universal first order thickening of B over A.*

(1) *Let $S \subset A$ be a multiplicative subset. Then $S^{-1}B' \to S^{-1}B$ is the universal first order thickening of $S^{-1}B$ over $S^{-1}A$. In particular $S^{-1}C_{B/A} = C_{S^{-1}B/S^{-1}A}$.*
(2) *Let $S \subset B$ be a multiplicative subset. Then $S' = \varphi^{-1}(S)$ is a multiplicative subset in B' and $(S')^{-1}B' \to S^{-1}B$ is the universal first order thickening of $S^{-1}B$ over A. In particular $S^{-1}C_{B/A} = C_{S^{-1}B/A}$.*

Note that the lemma makes sense by Lemma 7.135.4.

Proof. With notation and assumptions as in (1). Let $(S^{-1}B)' \to S^{-1}B$ be the universal first order thickening of $S^{-1}B$ over $S^{-1}A$. Note that $S^{-1}B' \to S^{-1}B$ is a surjection of $S^{-1}A$-algebras whose kernel has square zero. Hence by definition we obtain a map $(S^{-1}B)' \to S^{-1}B'$ compatible with the maps towards $S^{-1}B$. Consider any commutative diagram

$$\begin{tikzcd} B \arrow[r] & S^{-1}B \arrow[r] & D/I \\ A \arrow[r] \arrow[u] & S^{-1}A \arrow[r] \arrow[u] & D \arrow[u] \end{tikzcd}$$

where $I \subset D$ is an ideal of square zero. Since B' is the universal first order thickening of B over A we obtain an A-algebra map $B' \to D$. But it is clear that the image of S in D is mapped to invertible elements of D, and hence we obtain a compatible map $S^{-1}B' \to D$. Applying this to $D = (S^{-1}B)'$ we see that we get a map $S^{-1}B' \to (S^{-1}B)'$. We omit the verification that this map is inverse to the map described above.

With notation and assumptions as in (2). Let $(S^{-1}B)' \to S^{-1}B$ be the universal first order thickening of $S^{-1}B$ over A. Note that $(S')^{-1}B' \to S^{-1}B$ is a surjection of A-algebras whose kernel has square zero. Hence by definition we obtain a map $(S^{-1}B)' \to (S')^{-1}B'$

compatible with the maps towards $S^{-1}B$. Consider any commutative diagram

$$\begin{tikzcd} B \arrow[r] & S^{-1}B \arrow[r] & D/I \\ A \arrow[u] \arrow[r] & A \arrow[u] \arrow[r] & D \arrow[u] \end{tikzcd}$$

where $I \subset D$ is an ideal of square zero. Since B' is the universal first order thickening of B over A we obtain an A-algebra map $B' \to D$. But it is clear that the image of S' in D is mapped to invertible elements of D, and hence we obtain a compatible map $(S')^{-1}B' \to D$. Applying this to $D = (S^{-1}B)'$ we see that we get a map $(S')^{-1}B' \to (S^{-1}B)'$. We omit the verification that this map is inverse to the map described above. $\square$

Lemma 7.136.5. *Let $R \to A \to B$ be ring maps. Assume $A \to B$ formally unramified. Let $B' \to B$ be the universal first order thickening of B over A. Then B' is formally unramified over A, and the canonical map $\Omega_{A/R} \otimes_A B \to \Omega_{B'/R} \otimes_{B'} B$ is an isomorphism.*

Proof. We are going to use the construction of B' from the proof of Lemma 7.136.1 allthough in principle it should be possible to deduce these results formally from the definition. Namely, we choose a presentation $B = P/J$, where $P = A[x_i]$ is a polynomial ring over A. Next, we choose elements $f_i \in J$ such that $\mathrm{d}f_i = \mathrm{d}x_i \otimes 1$ in $\Omega_{P/A} \otimes_P B$. Having made these choices we have $B' = P/J'$ with $J' = (f_i) + J^2$, see proof of Lemma 7.136.1.

Consider the canonical exact sequence

$$J'/(J')^2 \to \Omega_{P/A} \otimes_P B' \to \Omega_{B'/A} \to 0$$

see Lemma 7.122.9. By construction the classes of the $f_i \in J'$ map to elements of the module $\Omega_{P/A} \otimes_P B'$ which generate it modulo J'/J^2 by construction. Since J'/J^2 is a nilpotent ideal, we see that these elements generate the module alltogether (by Nakayama's Lemma 7.14.5). This proves that $\Omega_{B'/A} = 0$ and hence that B' is formally unramified over A, see Lemma 7.135.2.

Since P is a polynomial ring over A we have $\Omega_{P/R} = \Omega_{A/R} \otimes_A P \oplus \bigoplus P\mathrm{d}x_i$. We are going to use this decomposition. Consider the following exact sequence

$$J'/(J')^2 \to \Omega_{P/R} \otimes_P B' \to \Omega_{B'/R} \to 0$$

see Lemma 7.122.9. We may tensor this with B and obtain the exact sequence

$$J'/(J')^2 \otimes_{B'} B \to \Omega_{P/R} \otimes_P B \to \Omega_{B'/R} \otimes_{B'} B \to 0$$

If we remember that $J' = (f_i) + J^2$ then we see that the first arrow annihilates the submodule $J^2/(J')^2$. In terms of the direct sum decomposition $\Omega_{P/R} \otimes_P B = \Omega_{A/R} \otimes_A B \oplus \bigoplus B\mathrm{d}x_i$ given we see that the submodule $(f_i)/(J')^2 \otimes_{B'} B$ maps isomorphically onto the summand $\bigoplus B\mathrm{d}x_i$. Hence what is left of this exact sequence is an isomorphism $\Omega_{A/R} \otimes_A B \to \Omega_{B'/R} \otimes_{B'} B$ as desired. $\square$

7.137. Formally étale maps

Definition 7.137.1. Let $R \to S$ be a ring map. We say S is *formally étale over R* if for every commutative solid diagram

$$\begin{tikzcd} S \arrow[r] \arrow[dr, dashed] & A/I \\ R \arrow[u] \arrow[r] & A \arrow[u] \end{tikzcd}$$

where $I \subset A$ is an ideal of square zero, there exists a unique dotted arrow making the diagram commute.

Clearly a ring map is formally étale if and only if it is booth formally smooth and formally unramified.

Lemma 7.137.2. *Let $R \to S$ be a ring map of finite presentation. The following are equivalent:*

(1) *$R \to S$ is formally étale,*
(2) *$R \to S$ is étale.*

Proof. Assume that $R \to S$ is formally étale. Then $R \to S$ is smooth by Proposition 7.127.13. By Lemma 7.135.2 we have $\Omega_{S/R} = 0$. Hence $R \to S$ is étale by definition.

Assume that $R \to S$ is étale. Then $R \to S$ is formally smooth by Proposition 7.127.13. By Lemma 7.135.2 it is formally unramified. Hence $R \to S$ is formally étale. □

Lemma 7.137.3. *Let R be a ring. Let I be a directed partially ordered set. Let $(S_i, \varphi_{ii'})$ be a system of R-algebras over I. If each $R \to S_i$ is formally étale, then $S = colim_{i\in I} S_i$ is formally étale over R*

Proof. Consider a diagram as in Definition 7.137.1. By assumption we get unique R-algebra maps $S_i \to A$ lifting the compositions $S_i \to S \to A/I$. Hence these are compatible with the transition maps $\varphi_{ii'}$ and define a lift $S \to A$. This proves existence. The uniqueness is clear by restricting to each S_i. □

Lemma 7.137.4. *Let R be a ring. Let $S \subset R$ be any multiplicative subset. Then the ring map $R \to S^{-1}R$ is formally étale.*

Proof. Let $I \subset A$ be an ideal of square zero. What we are saying here is that given a ring map $\varphi : R \to A$ such that $\varphi(f) \mod I$ is invertible for all $f \in S$ we have also that $\varphi(f)$ is invertible in A for all $f \in S$. This is true because A^* is the inverse image of $(A/I)^*$ under the canonical map $A \to A/I$. □

7.138. Unramified ring maps

The definition of a G-unramified ring map is the one from EGA. The definition of an unramified ring map is the one from [**Ray70**].

Definition 7.138.1. Let $R \to S$ be a ring map.

(1) We say $R \to S$ is *unramified* if $R \to S$ is of finite type and $\Omega_{S/R} = 0$.
(2) We say $R \to S$ is *G-unramified* if $R \to S$ is of finite presentation and $\Omega_{S/R} = 0$.
(3) Given a prime $\mathfrak{q}$ of S we say that S is *unramified at* $\mathfrak{q}$ if there exists a $g \in S$, $g \notin \mathfrak{q}$ such that $R \to S_g$ is unramified.
(4) Given a prime $\mathfrak{q}$ of S we say that S is *G-unramified at* $\mathfrak{q}$ if there exists a $g \in S$, $g \notin \mathfrak{q}$ such that $R \to S_g$ is G-unramified.

Of course a G-unramified map is unramified.

Lemma 7.138.2. *Let $R \to S$ be a ring map. The following are equivalent*

(1) *$R \to S$ is formally unramified and of finite type, and*
(2) *$R \to S$ is unramified.*

Moreover, also the following are equivalent

(1) *$R \to S$ is formally unramified and of finite presentation, and*

(2) *$R \to S$ is G-unramified.*

Proof. Follows from Lemma 7.135.2 and the definitions. $\square$

Lemma 7.138.3. *Properties of unramified and G-unramified ring maps.*

1. *The base change of an unramified ring map is unramified. The base change of a G-unramified ring map is G-unramified.*
2. *The composition of unramified ring maps is unramified. The composition of G-unramified ring maps is G-unramified.*
3. *Any principal localization $R \to R_f$ is G-unramified and unramified.*
4. *If $I \subset R$ is an ideal, then $R \to R/I$ is unramified. If $I \subset R$ is a finitely generated ideal, then $R \to R/I$ is G-unramified.*
5. *An étale ring map is G-unramified and unramified.*
6. *If $R \to S$ is of finite type (resp. finite presentation), $\mathfrak{q} \subset S$ is a prime and $(\Omega_{S/R})_{\mathfrak{q}} = 0$, then $R \to S$ is unramified (resp. G-unramified) at $\mathfrak{q}$.*
7. *If $R \to S$ is of finite type (resp. finite presentation), $\mathfrak{q} \subset S$ is a prime and $\Omega_{S/R} \otimes_S \kappa(\mathfrak{q}) = 0$, then $R \to S$ is unramified (resp. G-unramified) at $\mathfrak{q}$.*
8. *If $R \to S$ is of finite type (resp. finite presentation), $\mathfrak{q} \subset S$ is a prime lying over $\mathfrak{p} \subset R$ and $(\Omega_{S \otimes_R \kappa(\mathfrak{p})/\kappa(\mathfrak{p})})_{\mathfrak{q}} = 0$, then $R \to S$ is unramified (resp. G-unramified) at $\mathfrak{q}$.*
9. *If $R \to S$ is of finite type (resp. presentation), $\mathfrak{q} \subset S$ is a prime lying over $\mathfrak{p} \subset R$ and $(\Omega_{S \otimes_R \kappa(\mathfrak{p})/\kappa(\mathfrak{p})}) \otimes_{S \otimes_R \kappa(\mathfrak{p})} \kappa(\mathfrak{q}) = 0$, then $R \to S$ is unramified (resp. G-unramified) at $\mathfrak{q}$.*
10. *If $R \to S$ is a ring map, $g_1, \ldots, g_m \in S$ generate the unit ideal and $R \to S_{g_j}$ is unramified (resp. G-unramified) for $j = 1, \ldots, m$, then $R \to S$ is unramified (resp. G-unramified).*
11. *If $R \to S$ is a ring map which is unramified (resp. G-unramified) at every prime of S, then $R \to S$ is unramified (resp. G-unramified).*
12. *If $R \to S$ is G-unramified, then there exists a finite type $\mathbf{Z}$-algebra R_0 and a G-unramified ring map $R_0 \to S_0$ and a ring map $R_0 \to R$ such that $S = R \otimes_{R_0} S_0$.*
13. *If $R \to S$ is unramified, then there exists a finite type $\mathbf{Z}$-algebra R_0 and an unramified ring map $R_0 \to S_0$ and a ring map $R_0 \to R$ such that S is a quotient of $R \otimes_{R_0} S_0$.*

Proof. We prove each point, in order.

Ad (1). Follows from Lemmas 7.122.12 and 7.13.2.

Ad (2). Follows from Lemmas 7.122.7 and 7.13.2.

Ad (3). Follows by direct computation of $\Omega_{R_f/R}$ which we omit.

Ad (4). We have $\Omega_{(R/I)/R} = 0$, see Lemma 7.122.5, and the ring map $R \to R/I$ is of finite type. If I is a finitely generated ideal then $R \to R/I$ is of finite presentation.

Ad (5). See discussion following Definition 7.132.1.

Ad (6). In this case $\Omega_{S/R}$ is a finite S-module (see Lemma 7.122.16) and hence there exists a $g \in S$, $g \notin \mathfrak{q}$ such that $(\Omega_{S/R})_g = 0$. By Lemma 7.122.8 this means that $\Omega_{S_g/R} = 0$ and hence $R \to S_g$ is unramified as desired.

Ad (7). Use Nakayama's lemma (Lemma 7.14.5) to see that the condition is equivalent to the condition of (6).

Ad (8) & (9). These are equivalent in the same manner that (6) and (7) are equivalent. Moreover $\Omega_{S\otimes_R\kappa(\mathfrak p)/\kappa(\mathfrak p)} = \Omega_{S/R} \otimes_S (S \otimes_R \kappa(\mathfrak p))$ by Lemma 7.122.12. Hence we see that (9) is equivalent to (7) since the $\kappa(\mathfrak q)$ vector spaces in both are canonically isomorphic.

Ad (10). Follows from from Lemmas 7.21.2 and 7.122.8.

Ad (11). Follows from (6) and (7) and the fact that the spectrum of S is quasi-compact.

Ad (12). Write $S = R[x_1, \ldots, x_n]/(g_1, \ldots, g_m)$. As $\Omega_{S/R} = 0$ we can write

$$\mathrm{d}x_i = \sum h_{ij}\mathrm{d}g_j + \sum a_{ijk}g_j\mathrm{d}x_k$$

in $\Omega_{R[x_1,\ldots,x_n]/R}$ for some $h_{ij}, a_{ijk} \in R[x_1, \ldots, x_n]$. Choose a finitely generated $\mathbf{Z}$-subalgebra $R_0 \subset R$ containing all the coefficients of the polynomials g_i, h_{ij}, a_{ijk}. Set $S_0 = R_0[x_1, \ldots, x_n]/(g_1, \ldots, g_m)$. This works.

Ad (13). Write $S = R[x_1, \ldots, x_n]/I$. As $\Omega_{S/R} = 0$ we can write

$$\mathrm{d}x_i = \sum h_{ij}\mathrm{d}g_{ij} + \sum g'_{ik}\mathrm{d}x_k$$

in $\Omega_{R[x_1,\ldots,x_n]/R}$ for some $h_{ij} \in R[x_1, \ldots, x_n]$ and $g_{ij}, g'_{ik} \in I$. Choose a finitely generated $\mathbf{Z}$-subalgebra $R_0 \subset R$ containing all the coefficients of the polynomials g_{ij}, h_{ij}, g'_{ik}. Set $S_0 = R_0[x_1, \ldots, x_n]/(g_{ij}, g'_{ik})$. This works. □

Lemma 7.138.4. *Let $R \to S$ be a ring map. If $R \to S$ is unramified, then there exists an idempotent $e \in S \otimes_R S$ such that $S \otimes_R S \to S$ is isomorphic to $S \otimes_R S \to (S \otimes_R S)_e$.*

Proof. Let $J = \mathrm{Ker}(S \otimes_R S \to S)$. By assumption $J/J^2 = 0$, see Lemma 7.122.13. Since S is of finite type over R we see that J is finitely generated, namely by $x_i \otimes 1 - 1 \otimes x_i$, where x_i generate S over R. We win by Lemma 7.18.5. □

Lemma 7.138.5. *Let $R \to S$ be a ring map. Let $\mathfrak q \subset S$ be a prime lying over $\mathfrak p$ in R. If S/R is unramified at $\mathfrak q$ then*

(1) *we have $\mathfrak pS_{\mathfrak q} = \mathfrak qS_{\mathfrak q}$ is the maximal ideal of the local ring $S_{\mathfrak q}$, and*
(2) *the field extension $\kappa(\mathfrak p) \subset \kappa(\mathfrak q)$ is finite separable.*

Proof. We may first replace S by S_g for some $g \in S$, $g \notin \mathfrak q$ and assume that $R \to S$ is unramified. The base change $S \otimes_R \kappa(\mathfrak p)$ is unramified over $\kappa(\mathfrak p)$ by Lemma 7.138.3. By Lemma 7.129.3 it is smooth hence étale over $\kappa(\mathfrak p)$. Hence we see that $S \otimes_R \kappa(\mathfrak p) = (R \setminus \mathfrak p)^{-1}S/\mathfrak pS$ is a product of finite separable field extensions of $\kappa(\mathfrak p)$ by Lemma 7.132.4. This implies the lemma. □

Lemma 7.138.6. *Let $R \to S$ be a finite type ring map. Let $\mathfrak q$ be a prime of S. If $R \to S$ is unramified at $\mathfrak q$ then $R \to S$ is quasi-finite at $\mathfrak q$. In particular, an unramified ring map is quasi-finite.*

Proof. An unramified ring map is of finite type. Thus it is clear that the second statement follows from the first. To see the first statement apply the characterization of Lemma 7.113.2 part (2) using Lemma 7.138.5. □

Lemma 7.138.7. *Let $R \to S$ be a ring map. Let $\mathfrak q$ be a prime of S lying over a prime $\mathfrak p$ of R. If*

(1) *$R \to S$ is of finite type,*
(2) *$\mathfrak pS_{\mathfrak q}$ is the maximal ideal of the local ring $S_{\mathfrak q}$, and*
(3) *the field extension $\kappa(\mathfrak p) \subset \kappa(\mathfrak q)$ is finite separable,*

then $R \to S$ is unramified at $\mathfrak q$.

Proof. By Lemma 7.138.3 (8) it suffices to show that $\Omega_{S \otimes_R \kappa(\mathfrak{p})/\kappa(\mathfrak{p})}$ is zero when localized at $\mathfrak{q}$. Hence we may replace S by $S \otimes_R \kappa(\mathfrak{p})$ and R by $\kappa(\mathfrak{p})$. In other words, we may assume that $R = k$ is a field and S is a finite type k-algebra. In this case the hypotheses imply that $S_{\mathfrak{q}} \cong \kappa(\mathfrak{q})$ and hence $S = \kappa(\mathfrak{q}) \times S'$ (see Lemma 7.113.1). Hence $(\Omega_{S/k})_{\mathfrak{q}} = \Omega_{\kappa(\mathfrak{q})/k}$ which is zero as desired. □

Proposition 7.138.8. *Let $R \to S$ be a ring map. Let $\mathfrak{q} \subset S$ be a prime. If $R \to S$ is unramified at $\mathfrak{q}$, then there exist*

(1) *a $g \in S$, $g \notin \mathfrak{q}$,*
(2) *a standard étale ring map $R \to S'$, and*
(3) *a surjective R-algebra map $S' \to S_g$.*

Proof. This proof is the ``same'' as the proof of Proposition 7.132.16. The proof is a little roundabout and there may be ways to shorten it.

Step 1. By Definition 7.138.1 there exists a $g \in S$, $g \notin \mathfrak{q}$ such that $R \to S_g$ is unramified. Thus we may assume that S is unramified over R.

Step 2. By Lemma 7.138.3 there exists an unramified ring map $R_0 \to S_0$ with R_0 of finite type over $\mathbf{Z}$, and a ring map $R_0 \to R$ such that S is a quotient of $R \otimes_{R_0} S_0$. Denote $\mathfrak{q}_0$ the prime of S_0 corresponding to $\mathfrak{q}$. If we show the result for $(R_0 \to S_0, \mathfrak{q}_0)$ then the result follows for $(R \to S, \mathfrak{q})$ by base change. Hence we may assume that R is Noetherian.

Step 3. Note that $R \to S$ is quasi-finite by Lemma 7.138.6. By Lemma 7.114.15 there exists a finite ring map $R \to S'$, an R-algebra map $S' \to S$, an element $g' \in S'$ such that $g' \notin \mathfrak{q}$ such that $S' \to S$ induces an isomorphism $S'_{g'} \cong S_{g'}$. (Note that S' may not unramified over R.) Thus we may assume that (a) R is Noetherian, (b) $R \to S$ is finite and (c) $R \to S$ is unramified at $\mathfrak{q}$ (but no longer necessarily unramified at all primes).

Step 4. Let $\mathfrak{p} \subset R$ be the prime corresponding to $\mathfrak{q}$. Consider the fibre ring $S \otimes_R \kappa(\mathfrak{p})$. This is a finite algebra over $\kappa(\mathfrak{p})$. Hence it is Artinian (see Lemma 7.49.2) and so a finite product of local rings

$$S \otimes_R \kappa(\mathfrak{p}) = \prod\nolimits_{i=1}^n A_i$$

see Proposition 7.57.6. One of the factors, say A_1, is the local ring $S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}}$ which is isomorphic to $\kappa(\mathfrak{q})$, see Lemma 7.138.5. The other factors correspond to the other primes, say $\mathfrak{q}_2, \ldots, \mathfrak{q}_n$ of S lying over $\mathfrak{p}$.

Step 5. We may choose a nonzero element $\alpha \in \kappa(\mathfrak{q})$ which generates the finite separable field extension $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{q})$ (so even if the field extension is trivial we do not allow $\alpha = 0$). Note that for any $\lambda \in \kappa(\mathfrak{p})^*$ the element $\lambda\alpha$ also generates $\kappa(\mathfrak{q})$ over $\kappa(\mathfrak{p})$. Consider the element

$$\bar{t} = (\alpha, 0, \ldots, 0) \in \prod\nolimits_{i=1}^n A_i = S \otimes_R \kappa(\mathfrak{p}).$$

After possibly replacing α by $\lambda\alpha$ as above we may assume that $\bar{t}$ is the image of $t \in S$. Let $I \subset R[x]$ be the kernel of the R-algebra map $R[x] \to S$ which maps x to t. Set $S' = R[x]/I$, so $S' \subset S$. Here is a diagram

$$\begin{tikzcd} R[x] \arrow[r] & S' \arrow[r] & S \\ R \arrow[u] \arrow[ur] \arrow[urr] & & \end{tikzcd}$$

By construction the primes $\mathfrak{q}_j$, $j \geq 2$ of S all lie over the prime $(\mathfrak{p}, x)$ of $R[x]$, whereas the prime $\mathfrak{q}$ lies over a different prime of $R[x]$ because $\alpha \neq 0$.

Step 6. Denote $\mathfrak{q}' \subset S'$ the prime of S' corresponding to $\mathfrak{q}$. By the above $\mathfrak{q}$ is the only prime of S lying over $\mathfrak{q}'$. Thus we see that $S_\mathfrak{q} = S_{\mathfrak{q}'}$, see Lemma 7.36.11 (we have going up for $S' \to S$ by Lemma 7.32.20 since $S' \to S$ is finite as $R \to S$ is finite). It follows that $S'_{\mathfrak{q}'} \to S_\mathfrak{q}$ is finite and injective as the localization of the finite injective ring map $S' \to S$. Consider the maps of local rings

$$R_\mathfrak{p} \to S'_{\mathfrak{q}'} \to S_\mathfrak{q}$$

The second map is finite and injective. We have $S_\mathfrak{q}/\mathfrak{p}S_\mathfrak{q} = \kappa(\mathfrak{q})$, see Lemma 7.138.5. Hence a fortiori $S_\mathfrak{q}/\mathfrak{q}'S_\mathfrak{q} = \kappa(\mathfrak{q})$. Since

$$\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{q}') \subset \kappa(\mathfrak{q})$$

and since α is in the image of $\kappa(\mathfrak{q}')$ in $\kappa(\mathfrak{q})$ we conclude that $\kappa(\mathfrak{q}') = \kappa(\mathfrak{q})$. Hence by Nakayama's Lemma 7.14.5 applied to the $S'_{\mathfrak{q}'}$-module map $S'_{\mathfrak{q}'} \to S_\mathfrak{q}$, the map $S'_{\mathfrak{q}'} \to S_\mathfrak{q}$ is surjective. In other words, $S'_{\mathfrak{q}'} \cong S_\mathfrak{q}$.

Step 7. By Lemma 7.117.6 there exists a $g' \in S'$, $g' \notin \mathfrak{q}'$ such that $S'_{g'} \cong S_{g'}$. As R is Noetherian the ring S' is finite over R as it is an R-submodule of the finite R-module S. Hence after replacing S by S' we may assume that (a) R is Noetherian, (b) S finite over R, (c) S is unramified over R at $\mathfrak{q}$, and (d) $S = R[x]/I$.

Step 8. Consider the ring $S \otimes_R \kappa(\mathfrak{p}) = \kappa(\mathfrak{p})[x]/\overline{I}$ where $\overline{I} = I \cdot \kappa(\mathfrak{p})[x]$ is the ideal generated by I in $\kappa(\mathfrak{p})[x]$. As $\kappa(\mathfrak{p})[x]$ is a PID we know that $\overline{I} = (\overline{h})$ for some monic $\overline{h} \in \kappa(\mathfrak{p})$. After replacing $\overline{h}$ by $\lambda \cdot \overline{h}$ for some $\lambda \in \kappa(\mathfrak{p})$ we may assume that $\overline{h}$ is the image of some $h \in R[x]$. (The problem is that we do not know if we may choose h monic.) Also, as in Step 4 we know that $S \otimes_R \kappa(\mathfrak{p}) = A_1 \times \ldots \times A_n$ with $A_1 = \kappa(\mathfrak{q})$ a finite separable extension of $\kappa(\mathfrak{p})$ and $A_2, \ldots, A_n$ local. This implies that

$$\overline{h} = \overline{h}_1 \overline{h}_2^{e_2} \ldots \overline{h}_n^{e_n}$$

for certain pairwise coprime irreducible monic polynomials $\overline{h}_i \in \kappa(\mathfrak{p})[x]$ and certain $e_2, \ldots, e_n \geq 1$. Here the numbering is chosen so that $A_i = \kappa(\mathfrak{p})[x]/(\overline{h}_i^{e_i})$ as $\kappa(\mathfrak{p})[x]$-algebras. Note that $\overline{h}_1$ is the minimal polynomial of $\alpha \in \kappa(\mathfrak{q})$ and hence is a separable polynomial (its derivative is prime to itself).

Step 9. Let $m \in I$ be a monic element; such an element exists because the ring extension $R \to R[x]/I$ is finite hence integral. Denote $\overline{m}$ the image in $\kappa(\mathfrak{p})[x]$. We may factor

$$\overline{m} = \overline{k} \overline{h}_1^{d_1} \overline{h}_2^{d_2} \ldots \overline{h}_n^{d_n}$$

for some $d_1 \geq 1$, $d_j \geq e_j$, $j = 2, \ldots, n$ and $\overline{k} \in \kappa(\mathfrak{p})[x]$ prime to all the $\overline{h}_i$. Set $f = m^l + h$ where $l \deg(m) > \deg(h)$, and $l \geq 2$. Then f is monic as a polynomial over R. Also, the image $\overline{f}$ of f in $\kappa(\mathfrak{p})[x]$ factors as

$$\overline{f} = \overline{h}_1 \overline{h}_2^{e_2} \ldots \overline{h}_n^{e_n} + \overline{k}^l \overline{h}_1^{ld_1} \overline{h}_2^{ld_2} \ldots \overline{h}_n^{ld_n} = \overline{h}_1 (\overline{h}_2^{e_2} \ldots \overline{h}_n^{e_n} + \overline{k}^l \overline{h}_1^{ld_1 - 1} \overline{h}_2^{ld_2} \ldots \overline{h}_n^{ld_n}) = \overline{h}_1 \overline{w}$$

with $\overline{w}$ a polynomial relatively prime to $\overline{h}_1$. Set $g = f'$ (the derivative with respect to x).

Step 10. The ring map $R[x] \to S = R[x]/I$ has the properties: (1) it maps f to zero, and (2) it maps g to an element of $S \setminus \mathfrak{q}$. The first assertion is clear since f is an element of I. For the second assertion we just have to show that g does not map to zero in $\kappa(\mathfrak{q}) = \kappa(\mathfrak{p})[x]/(\overline{h}_1)$. The image of g in $\kappa(\mathfrak{p})[x]$ is the derivative of $\overline{f}$. Thus (2) is clear because

$$\overline{g} = \frac{\mathrm{d}\overline{f}}{\mathrm{d}x} = \overline{w}\frac{\mathrm{d}\overline{h}_1}{\mathrm{d}x} + \overline{h}_1 \frac{\mathrm{d}\overline{w}}{\mathrm{d}x},$$

$\overline{w}$ is prime to $\overline{h}_1$ and $\overline{h}_1$ is separable.

Step 11. We conclude that $\varphi : R[x]/(f) \to S$ is a surjective ring map, $R[x]_g/(f)$ is étale over R (because it is standard étale, see Lemma 7.132.14) and $\varphi(g) \not\in \mathfrak{q}$. Thus the map $(R[x]/(f))_g \to S_{\varphi(g)}$ is the desired surjection. □

Lemma 7.138.9. *Let $R \to S$ be a ring map. Let $\mathfrak{q}$ be a prime of S lying over $\mathfrak{p} \subset R$. Assume that $R \to S$ is of finite type and unramified at $\mathfrak{q}$. Then there exist*

(1) *an étale ring map $R \to R'$,*
(2) *a prime $\mathfrak{p}' \subset R'$ lying over $\mathfrak{p}$.*
(3) *a product decomposition*

$$R' \otimes_R S = A \times B$$

with the following properties

(1) *$R' \to A$ is surjective, and*
(2) *$\mathfrak{p}'A$ is a prime of A lying over $\mathfrak{p}'$ and over $\mathfrak{q}$.*

Proof. We may replace $(R \to S, \mathfrak{p}, \mathfrak{q})$ with any base change $(R' \to R' \otimes_R S, \mathfrak{p}', \mathfrak{q}')$ by a étale ring map $R \to R'$ with a prime $\mathfrak{p}'$ lying over $\mathfrak{p}$, and a choice of $\mathfrak{q}'$ lying over both $\mathfrak{q}$ and $\mathfrak{p}'$. Note also that given $R \to R'$ and $\mathfrak{p}'$ a suitable $\mathfrak{q}'$ can always be found.

The assumption that $R \to S$ is of finite type means that we may apply Lemma 7.132.23. Thus we may assume that $S = A_1 \times \ldots \times A_n \times B$, that each $R \to A_i$ is finite with exactly one prime $\mathfrak{r}_i$ lying over $\mathfrak{p}$ such that $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{r}_i)$ is purely inseparable and that $R \to B$ is not quasi-finite at any prime lying over $\mathfrak{p}$. Then clearly $\mathfrak{q} = \mathfrak{r}_i$ for some i, since an unramified morphism is quasi-finite (see Lemma 7.138.6). Say $\mathfrak{q} = \mathfrak{r}_1$. By Lemma 7.138.5 we see that $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{r}_1)$ is separable hence the trivial field extension, and that $\mathfrak{p}(A_1)_{\mathfrak{r}_1}$ is the maximal ideal. Also, by Lemma 7.36.11 (which applies to $R \to A_1$ because a finite ring map satisfies going up by Lemma 7.32.20) we have $(A_1)_{\mathfrak{r}_1} = (A_1)_{\mathfrak{p}}$. It follows from Nakayama's Lemma 7.14.5 that the map of local rings $R_{\mathfrak{p}} \to (A_1)_{\mathfrak{p}} = (A_1)_{\mathfrak{r}_1}$ is surjective. Since A_1 is finite over R we see that there exists a $f \in R$, $f \not\in \mathfrak{p}$ such that $R_f \to (A_1)_f$ is surjective. After replacing R by R_f we win. □

Lemma 7.138.10. *Let $R \to S$ be a ring map. Let $\mathfrak{p}$ be a prime of R. If $R \to S$ is unramified then there exist*

(1) *an étale ring map $R \to R'$,*
(2) *a prime $\mathfrak{p}' \subset R'$ lying over $\mathfrak{p}$.*
(3) *a product decomposition*

$$R' \otimes_R S = A_1 \times \ldots \times A_n \times B$$

with the following properties

(1) *$R' \to A_i$ is surjective,*
(2) *$\mathfrak{p}'A_i$ is a prime of A_i lying over $\mathfrak{p}'$, and*
(3) *there is no prime of B lying over $\mathfrak{p}'$.*

Proof. We may apply Lemma 7.132.23. Thus, after an étale base change, we may assume that $S = A_1 \times \ldots \times A_n \times B$, that each $R \to A_i$ is finite with exactly one prime $\mathfrak{r}_i$ lying over $\mathfrak{p}$ such that $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{r}_i)$ is purely inseparable, and that $R \to B$ is not quasi-finite at any prime lying over $\mathfrak{p}$. Since $R \to S$ is quasi-finite (see Lemma 7.138.6) we see there is no prime of B lying over $\mathfrak{p}$. By Lemma 7.138.5 we see that $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{r}_i)$ is separable hence the trivial field extension, and that $\mathfrak{p}(A_i)_{\mathfrak{r}_i}$ is the maximal ideal. Also, by Lemma 7.36.11 (which applies to $R \to A_i$ because a finite ring map satisfies going up by Lemma 7.32.20) we have $(A_i)_{\mathfrak{r}_i} = (A_i)_{\mathfrak{p}}$. It follows from Nakayama's Lemma 7.14.5 that the map of local rings $R_{\mathfrak{p}} \to (A_i)_{\mathfrak{p}} = (A_i)_{\mathfrak{r}_i}$ is surjective. Since A_i is finite over R we see that there exists a $f \in R$, $f \notin \mathfrak{p}$ such that $R_f \to (A_i)_f$ is surjective. After replacing R by R_f we win. □

7.139. Henselian local rings

In this section we discuss a bit the notion of a henselian local ring. Let $(R, \mathfrak{m}, \kappa)$ be a local ring. For $a \in R$ we denote $\overline{a}$ the image of a in κ. For a polynomial $f \in R[T]$ we often denote $\overline{f}$ the image of f in $\kappa[T]$. Given a polynomial $f \in R[T]$ we denote f' the derivative of f with respect to T. Note that $\overline{f}' = \overline{f'}$.

Definition 7.139.1. Let $(R, \mathfrak{m}, \kappa)$ be a local ring.

1. We say R is *henselian* if for every monic $f \in R[T]$ and every root $a_0 \in \kappa$ of $\overline{f}$ such that $\overline{f'}(a_0) \neq 0$ there exists an $a \in R$ such that $f(a) = 0$ and $a_0 = \overline{a}$.
2. We say R is *strictly henselian* if R is henselian and its residue field is separably algebraically closed.

Note that the condition $\overline{f'}(a_0) \neq 0$ is equivalent to the condition that a_0 is a simple root of the polynomial $\overline{f}$. In fact, it implies that the lift $a \in R$, if it exists, is unique.

Lemma 7.139.2. *Let $(R, \mathfrak{m}, \kappa)$ be a local ring. Let $f \in R[T]$. Let $a, b \in R$ such that $f(a) = f(b) = 0$, $a = b \bmod \mathfrak{m}$, and $f'(a) \notin \mathfrak{m}$. Then $a = b$.*

Proof. Write $f(x+y) - f(x) = f'(x)y + g(x, y)y^2$ in $R[x, y]$ (this is possible as one sees by expaning $f(x+y)$; details omitted). Then we see that $0 = f(b) - f(a) = f(a+(b-a)) - f(a) = f'(a)(b-a) + c(b-a)^2$ for some $c \in R$. By assumption $f'(a)$ is a unit in R. Hence $(b-a)(1 + f'(a)^{-1}c(b-a)) = 0$. By assumption $b - a \in \mathfrak{m}$, hence $1 + f'(a)^{-1}c(b-a)$ is a unit in R. Hence $b - a = 0$ in R. □

Here is the characterization of henselian local rings.

Lemma 7.139.3. *Let $(R, \mathfrak{m}, \kappa)$ be a local ring. The following are equivalent*

1. *R is henselian,*
2. *for every $f \in R[T]$ and every root $a_0 \in \kappa$ of $\overline{f}$ such that $\overline{f'}(a_0) \neq 0$ there exists an $a \in R$ such that $f(a) = 0$ and $a_0 = \overline{a}$,*
3. *for any monic $f \in R[T]$ and any factorization $\overline{f} = g_0 h_0$ with $\gcd(g_0, h_0) = 1$ there exists a factorization $f = gh$ in $R[T]$ such that $g_0 = \overline{g}$ and $h_0 = \overline{h}$,*
4. *for any monic $f \in R[T]$ and any factorization $\overline{f} = g_0 h_0$ with $\gcd(g_0, h_0) = 1$ there exists a factorization $f = gh$ in $R[T]$ such that $g_0 = \overline{g}$ and $h_0 = \overline{h}$ and moreover $\deg_T(g) = \deg_T(g_0)$,*
5. *for any $f \in R[T]$ and any factorization $\overline{f} = g_0 h_0$ with $\gcd(g_0, h_0) = 1$ there exists a factorization $f = gh$ in $R[T]$ such that $g_0 = \overline{g}$ and $h_0 = \overline{h}$,*

(6) *for any* $f \in R[T]$ *and any factorization* $\overline{f} = g_0 h_0$ *with* $\gcd(g_0, h_0) = 1$ *there exists a factorization* $f = gh$ *in* $R[T]$ *such that* $g_0 = \overline{g}$ *and* $h_0 = \overline{h}$ *and moreover* $\deg_T(g) = \deg_T(g_0)$*,*
(7) *for any étale ring map* $R \to S$ *and prime* $\mathfrak{q}$ *of* S *lying over* $\mathfrak{m}$ *with* $\kappa = \kappa(\mathfrak{q})$ *there exists a section* $\tau : S \to R$ *of* $R \to S$*,*
(8) *for any étale ring map* $R \to S$ *and prime* $\mathfrak{q}$ *of* S *lying over* $\mathfrak{m}$ *with* $\kappa = \kappa(\mathfrak{q})$ *there exists a section* $\tau : S \to R$ *of* $R \to S$ *with* $\mathfrak{q} = \tau^{-1}(\mathfrak{m})$*,*
(9) *any finite* R*-algebra is a product of local rings,*
(10) *any finite* R*-algebra is a finite product of local rings,*
(11) *any finite type* R*-algebra* S *can be written as* $A \times B$ *with* $R \to A$ *finite and* $R \to B$ *not quasi-finite at any prime lying over* $\mathfrak{m}$*,*
(12) *any finite type* R*-algebra* S *can be written as* $A \times B$ *with* $R \to A$ *finite such that each irreducible component of* $\mathrm{Spec}(B \otimes_R \kappa)$ *has dimension* ≥ 1*, and*
(13) *any quasi-finite* R*-algebra* S *can be written as* $S = A \times B$ *with* $R \to A$ *finite such that* $B \otimes_R \kappa = 0$*.*

Proof. Here is a list of the easier implications:

2⇒1 because in (2) we consider all polynomials and in (1) only monic ones,
5⇒3 because in (5) we consider all polynomials and in (3) only monic ones,
6⇒4 because in (6) we consider all polynomials and in (4) only monic ones,
4⇒3 is obvious,
6⇒5 is obvious,
8⇒7 is obvious,
10⇒9 is obvious,
11⇔12 by definition of being quasi-finite at a prime,
11⇒13 by definition of being quasi-finite,

Proof of 1⇒8. Assume (1). Let $R \to S$ be étale, and let $\mathfrak{q} \subset S$ be a prime ideal such that $\kappa(\mathfrak{q}) \cong \kappa$. By Proposition 7.132.16 we can find a $g \in S$, $g \notin \mathfrak{q}$ such that $R \to S_g$ is standard étale. After replacing S by S_g we may assume that $S = R[t]_g/(f)$ is standard étale. Since the prime $\mathfrak{q}$ has residue field κ it corresponds to a root a_0 of $\overline{f}$ which is not a root of $\overline{g}$. By definition of a standard étale algebra this also means that $\overline{f'}(a_0) \neq 0$. Since also f is monic by definition of a standard étale algebra again we may use that R is henselian to conclude that there exists an $a \in R$ with $a_0 = \overline{a}$ such that $f(a) = 0$. This implies that $g(a)$ is a unit of R and we obtain the desired map $\tau : S = R[t]_g/(f) \to R$ by the rule $t \mapsto a$. By construction $\tau^{-1}(\mathfrak{q}) = \mathfrak{m}$. This proves (8) holds.

Proof of 7⇒8. (This is really unimportant and should be skipped.) Assume (7) holds and assume $R \to S$ is étale. Let $\mathfrak{q}_1, \ldots, \mathfrak{q}_r$ be the other primes of S lying over $\mathfrak{m}$. Then we can find a $g \in S$, $g \notin \mathfrak{q}$ and $g \in \mathfrak{q}_i$ for $i = 1, \ldots, r$, see Lemma 7.14.3. Apply (7) to the étale ring map $R \to S_g$ and the prime $\mathfrak{q}S_g$. This gives a section $\tau_g : S_g \to R$ such that the composition $\tau : S \to S_g \to R$ has the property $\tau^{-1}(\mathfrak{q}) = \mathfrak{m}$. Minor details omitted.

Proof of 8⇒11. Assume (8) and let $R \to S$ be a finite type ring map. Apply Lemma 7.132.22. We find an étale ring map $R \to R'$ and a prime $\mathfrak{m}' \subset R'$ lying over $\mathfrak{m}$ with $\kappa = \kappa(\mathfrak{m}')$ such that $R' \otimes_R S = A' \times B'$ with A' finite over R' and B' not quasi-finite over R' at any prime lying over $\mathfrak{m}'$. Apply (8) to get a section $\tau : R' \to R$ with $\mathfrak{m} = \tau^{-1}(\mathfrak{m}')$. Then use that

$$S = (S \otimes_R R') \otimes_{R',\tau} R = (A' \times B') \otimes_{R',\tau} R = (A' \otimes_{R',\tau} R) \times (B' \otimes_{R',\tau} R)$$

which gives a decomposition as in (11).

Proof of 8⇒10. Assume (8) and let $R \to S$ be a finite ring map. Apply Lemma 7.132.22. We find an étale ring map $R \to R'$ and a prime $\mathfrak{m}' \subset R'$ lying over $\mathfrak{m}$ with $\kappa = \kappa(\mathfrak{m}')$ such that $R' \otimes_R S = A'_1 \times \ldots \times A'_n \times B'$ with A'_i finite over R' having exactly one prime over $\mathfrak{m}'$ and B' not quasi-finite over R' at any prime lying over $\mathfrak{m}'$. Apply (8) to get a section $\tau : R' \to R$ with $\mathfrak{m} = \tau^{-1}(\mathfrak{m}')$. Then we obtain

$$\begin{aligned} S &= (S \otimes_R R') \otimes_{R',\tau} R \\ &= (A'_1 \times \ldots \times A'_n \times B') \otimes_{R',\tau} R \\ &= (A'_1 \otimes_{R',\tau} R) \times \ldots \times (A'_1 \otimes_{R',\tau} R) \times (B' \otimes_{R',\tau} R) \\ &= A_1 \times \ldots \times A_n \times B \end{aligned}$$

The factor B is finite over R but $R \to B$ is not quasi-finite at any prime lying over $\mathfrak{m}$. Hence $B = 0$. The factors A_i are finite R-algebras having exactly one prime lying over $\mathfrak{m}$, hence they are local rings. This proves that S is a finite product of local rings.

Proof of 9⇒10. This holds because if S is finite over the local ring R, then it has at most finitely many maximal ideals. Namely, by going up for $R \to S$ the maximal ideals of S all lie over $\mathfrak{m}$, and $S/\mathfrak{m}S$ is Artinian hence has finitely many primes.

Proof of 10⇒1. Assume (10). Let $f \in R[T]$ be a monic polynomial and $a_0 \in \kappa$ a simple root of $\overline{f}$. Then $S = R[T]/(f)$ is a finite R-algebra. Applying (10) we get $S = A_1 \times \ldots \times A_r$ is a finite product of local R-algebras. In particular we see that $S/\mathfrak{m}S = \prod A_i/\mathfrak{m}A_i$ is the decomposition of $\kappa[T]/(\overline{f})$ as a product of local rings. This means that one of the factors, say $A_1/\mathfrak{m}A_1$ is the quotient $\kappa[T]/(\overline{f}) \to \kappa[T]/(T - a_0)$. Since A_1 is a summand of the finite free R-module S it is a finite free R-module itself. As $A_1/\mathfrak{m}A_1$ is a κ-vector space of dimension 1 we see that $A_1 \cong R$ as an R-module. Clearly this means that $R \to A_1$ is an isomorphism. Let $a \in R$ be the image of T under the map $R[T] \to S \to A_1 \to R$. Then $f(a) = 0$ and $\overline{a} = a_0$ as desired.

Proof of 13⇒1. Assume (13). Let $f \in R[T]$ be a monic polynomial and $a_0 \in \kappa$ a simple root of $\overline{f}$. Then $S_1 = R[T]/(f)$ is a finite R-algebra. Let $g \in R[T]$ be any element such that $\overline{g} = \overline{f}/(T - a_0)$. Then $S = (S_1)_g$ is a quasi-finite R-algebra such that $S \otimes_R \kappa \cong \kappa[T]_{\overline{g}}/(\overline{f}) \cong \kappa[T]/(T - a_0) \cong \kappa$. Applying (13) to S we get $S = A \times B$ with A finite over R and $B \otimes_R \kappa = 0$. In particular we see that $\kappa \cong S/\mathfrak{m}S = A/\mathfrak{m}A$. Since A is a summand of the flat R-algebra S we see that it is finite flat, hence free over R. As $A/\mathfrak{m}A$ is a κ-vector space of dimension 1 we see that $A \cong R$ as an R-module. Clearly this means that $R \to A$ is an isomorphism. Let $a \in R$ be the image of T under the map $R[T] \to S \to A \to R$. Then $f(a) = 0$ and $\overline{a} = a_0$ as desired.

Proof of 8⇒2. Assume (8). Let $f \in R[T]$ be any polynomial and let $a_0 \in \kappa$ be a simple root. Then the algebra $S = R[T]_{f'}/(f)$ is étale over R. Let $\mathfrak{q} \subset S$ be the prime generated by $\mathfrak{m}$ and $T - b$ where $b \in R$ is any element such that $\overline{b} = a_0$. Apply (8) to S and $\mathfrak{q}$ to get $\tau : S \to R$. Then the image $\tau(T) = a \in R$ works in (2).

At this point we see that (1), (2), (7), (8), (9), (10), (11), (12), (13) are all equivalent. The weakest assertion of (3), (4), (5) and (6) is (3) and the strongest is (6). Hence we still have to prove that (3) implies (1) and (1) implies (6).

Proof of 3⇒1. Assume (3). Let $f \in R[T]$ be monic and let $a_0 \in \kappa$ be a simple root of $\overline{f}$. This gives a factorization $\overline{f} = (T - a_0)h_0$ with $h_0(a_0) \neq 0$, so $\gcd(T - a_0, h_0) = 1$.

Apply (3) to get a factorization $f = gh$ with $\overline{g} = T - a_0$ and $\overline{h} = h_0$. Set $S = R[T]/(f)$ which is a finite free R-algebra. We will write g, h also for the images of g and h in S. Then $gS + hS = S$ by Nakayama's Lemma 7.14.5 as the equality holds modulo $\mathfrak{m}$. Since $gh = f = 0$ in S this also implies that $gS \cap hS = 0$. Hence by the Chinese Remainder theorem we obtain $S = S/(g) \times S/(h)$. This implies that $A = S/(g)$ is a summand of a finite free R-module, hence finite free. Moreover, the rank of A is 1 as $A/\mathfrak{m}A = \kappa[T]/(T - a_0)$. Thus the map $R \to A$ is an isomorphism. Setting $a \in R$ equal to the image of T under the maps $R[T] \to S \to A \to R$ gives an element of R with $f(a) = 0$ and $\overline{a} = a_0$.

Proof of 1⇒6. Assume (1) or equivalently all of (1), (2), (7), (8), (9), (10), (11), (12), (13). Let $f \in R[T]$ be a polynomial. Suppose that $\overline{f} = g_0 h_0$ is a factorization with $\gcd(g_0, h_0) = 1$. We may and do assume that g_0 is monic. Consider $S = R[T]/(f)$. Because we have the factorization we see that the coefficients of f generate the unit ideal in R. This implies that S has finite fibres over R, hence is quasi-finite over R. It also implies that S is flat over R by Lemma 7.91.2. Combining (13) and (10) we may write $S = A_1 \times \ldots \times A_n \times B$ where each A_i is local and finite over R, and $B \otimes_R \kappa = 0$. After reordering the factors $A_1, \ldots, A_n$ we may assume that

$$\kappa[T]/(g_0) = A_1/\mathfrak{m}A_1 \times \ldots \times A_r/\mathfrak{m}A_r,\ \kappa[T]/(h_0) = A_{r+1}/\mathfrak{m}A_{r+1} \times \ldots \times A_n/\mathfrak{m}A_n$$

as quotients of $\kappa[T]$. The finite flat R-algebra $A = A_1 \times \ldots \times A_r$ is free as an R-module, see Lemma 7.72.4. Its rank is $\deg_T(g_0)$. Let $g \in R[T]$ be the characteristic polynomial of the R-linear operator $T : A \to A$. Then g is a monic polynomial of degree $\deg_T(g) = \deg_T(g_0)$ and moreover $\overline{g} = g_0$. By Cayley-Hamilton (Lemma 7.15.1) we see that $g(T_A) = 0$ where T_A indicates the image of T in A. Hence we obtain a well defined surjective map $R[T]/(g) \to A$ which is an isomorphism by Nakayama's Lemma 7.14.5. The map $R[T] \to A$ factors through $R[T]/(f)$ by construction hence we may write $f = gh$ for some h. This finishes the proof. □

Lemma 7.139.4. *Let $(R, \mathfrak{m}, \kappa)$ be a henselian local ring.*

1. *If $R \subset S$ is a finite ring extension then S is a finite product of henselian local rings.*
2. *If $R \subset S$ is a finite local homomorphism of local rings, then S is a henselian local ring.*
3. *If $R \to S$ is a finite type ring map, and $\mathfrak{q}$ is a prime of S lying over $\mathfrak{m}$ at which $R \to S$ is quasi-finite, then $S_{\mathfrak{q}}$ is henselian.*
4. *If $R \to S$ is quasi-finite then $S_{\mathfrak{q}}$ is henselian for every prime $\mathfrak{q}$ lying over $\mathfrak{m}$.*

Proof. Part (2) implies part (1) since S as in part (1) is a finite product of its localizations at the primes lying over $\mathfrak{m}$. Part (2) follows from Lemma 7.139.3 part (10) since any finite S-algebra is also a finite R-algebra. If $R \to S$ and $\mathfrak{q}$ are as in (3), then $S_{\mathfrak{q}}$ is a local ring of a finite R-algebra by Lemma 7.139.3 part (11). Hence (3) follows from (1). Part (4) follows from part (3). □

Lemma 7.139.5. *A filtered colimit of henselian local rings along local homorphisms is henselian.*

Proof. Categories, Lemma 4.19.3 says that this is really just a question about a colimit of henselian local rings over a directed partially ordered set. Let $(R_i, \varphi_{ii'})$ be such a system with each $\varphi_{ii'}$ local. Then $R = colim_i\, R_i$ is local, and its residue field κ is $colim\, \kappa_i$ (argument omitted). Suppose that $f \in R[T]$ is monic and that $a_0 \in \kappa$ is a simple root of $\overline{f}$. Then for some large enough i there exists an $f_i \in R_i[T]$ mapping to f and an $a_{0,i} \in \kappa_i$ mapping to a_0. Since $\overline{f_i}(a_{0,i}) \in \kappa_i$, resp. $\overline{f_i'}(a_{0,i}) \in \kappa_i$ maps to $0 = \overline{f}(a_0) \in \kappa$, resp. $0 \neq \overline{f'}(a_0) \in \kappa$ we conclude that $a_{0,i}$ is a simple root of $\overline{f_i}$. As R_i is henselian we can find $a_i \in R_i$ such that $f_i(a_i) = 0$ and $a_{0,i} = \overline{a_i}$. Then the image $a \in R$ of a_i is the desired solution. Thus R is henselian. □

Lemma 7.139.6. *Let $(R, \mathfrak{m}, \kappa)$ be a henselian local ring. Any finite type R-algebra S can be written as $S = A_1 \times \ldots \times A_n \times B$ with A_i local and finite over R and $R \to B$ not quasi-finite at any prime of B lying over $\mathfrak{m}$.*

Proof. This is a combination of parts (11) and (10) of Lemma 7.139.3. □

Lemma 7.139.7. *Let $(R, \mathfrak{m}, \kappa)$ be a strictly henselian local ring. Any finite type R-algebra S can be written as $S = A_1 \times \ldots \times A_n \times B$ with A_i local and finite over R and $\kappa \subset \kappa(\mathfrak{m}_{A_i})$ finite purely inseparable and $R \to B$ not quasi-finite at any prime of B lying over $\mathfrak{m}$.*

Proof. First write $S = A_1 \times \ldots \times A_n \times B$ as in Lemma 7.139.6. The field extension $\kappa \subset \kappa(\mathfrak{m}_{A_i})$ is finite and κ is separably algebraically closed, hence it is finite purely inseparable. □

Lemma 7.139.8. *Let $(R, \mathfrak{m}, \kappa)$ be a henselian local ring. The category of finite étale ring extensions $R \to S$ is equivalent to the category of finite étale algebras $\kappa \to \overline{S}$ via the functor $S \mapsto S/\mathfrak{m}S$.*

Proof. Denote $\mathcal{C} \to \mathcal{D}$ the functor of categories of the statement. Suppose that $R \to S$ is finite étale. Then we may write

$$S = A_1 \times \ldots \times A_n$$

with A_i local and finite étale over S, use either Lemma 7.139.6 or Lemma 7.139.3 part (10). In particular $A_i/\mathfrak{m}A_i$ is a finite separable field extension of κ, see Lemma 7.132.5. Thus we see that every object of $\mathcal{C}$ and $\mathcal{D}$ decomposes canonically into irreducible pieces which correspond via the given functor. Next, suppose that S_1, S_2 are finite étale over R such that $\kappa_1 = S_1/\mathfrak{m}S_1$ and $\kappa_2 = S_2/\mathfrak{m}S_2$ are fields (finite separable over κ). Then $S_1 \otimes_R S_2$ is finite étale over R and we may write

$$S_1 \otimes_R S_2 = A_1 \times \ldots \times A_n$$

as before. Then we see that $Hom_R(S_1, S_2)$ is identified with the set of indices $i \in \{1, \ldots, n\}$ such that $S_2 \to A_i$ is an isomorphism. To see this use that given any R-algebra map $\varphi : S_1 \to S_2$ the map $\varphi \times 1 : S_1 \otimes_R S_2 \to S_2$ is surjective, and hence is equal to projection onto one of the factors A_i. But in exectly the same way we see that $Hom_\kappa(\kappa_1, \kappa_2)$ is identified with the set of indices $i \in \{1, \ldots, n\}$ such that $\kappa_2 \to A_i/\mathfrak{m}A_i$ is an isomorphism. By the discussion above these sets of indices match, and we conclude that our functor is fully faithful. Finally, let $\kappa \subset \kappa'$ be a finite separable field extension. By Lemma 7.132.15 there exists an étale ring map $R \to S$ and a prime $\mathfrak{q}$ of S lying over $\mathfrak{m}$ such that $\kappa \subset \kappa(\mathfrak{q})$ is isomorphic to the given extension. By part (1) we may write $S = A_1 \times \ldots \times A_n \times B$. Since $R \to S$ is quasi-finite we see that there exists no prime of B over $\mathfrak{m}$. Hence $S_\mathfrak{q}$ is equal to A_i for some i. Hence $R \to A_i$ is finite étale and produces the given residue field extension. Thus the functor is essentially surjective and we win. □

Lemma 7.139.9. *Let $(R, \mathfrak{m}, \kappa)$ be a strictly henselian local ring. Let $R \to S$ be an unramified ring map. Then*

$$S = A_1 \times \ldots \times A_n \times B$$

with each $R \to A_i$ surjective and no prime of B lying over $\mathfrak{m}$.

Proof. First write $S = A_1 \times \ldots \times A_n \times B$ as in Lemma 7.139.6. Now we see that $R \to A_i$ is finite unramified and A_i local. Hence the maximal ideal of A_i is $\mathfrak{m}A_i$ and its residue field $A_i/\mathfrak{m}A_i$ is a finite separable extension of κ, see Lemma 7.138.5. However, the condition that R is strictly henselian means that κ is separably algebraically closed, so $\kappa = A_i/\mathfrak{m}A_i$. By Nakayama's Lemma 7.14.5 we conclude that $R \to A_i$ is surjective as desired. □

Lemma 7.139.10. *Let $(R, \mathfrak{m}, \kappa)$ be a complete local ring, see Definition 7.143.1. Then R is henselian.*

Proof. Let $f \in R[T]$ be monic. Denote $f_n \in R/\mathfrak{m}^{n+1}[T]$ the image. Denote f'_n the derivative of f_n with respect to T. Let $a_0 \in \kappa$ be a simple root of f_0. We lift this to a solution of f over R inductively as follows: Suppose given $a_n \in R/\mathfrak{m}^{n+1}$ such that $a_n \bmod \mathfrak{m} = a_0$ and $f_n(a_n) = 0$. Pick any element $b \in R/\mathfrak{m}^{n+2}$ such that $a_n = b \bmod \mathfrak{m}^{n+1}$. Then $f_{n+1}(b) \in \mathfrak{m}^{n+1}/\mathfrak{m}^{n+2}$. Set

$$a_{n+1} = b - f_{n+1}(b)/f'_{n+1}(b)$$

(Newton's method). This makes sense as $f'_{n+1}(b) \in R_{n+1}$ is invertible by the condition on a_0. Then we compute $f_{n+1}(a_{n+1}) = f_{n+1}(b) - f_{n+1}(b) = 0$ in $R/\mathfrak{m}^{n+2}$. Since the system of elements $a_n \in R/\mathfrak{m}^{n+1}$ so constructed is compatible we get an element $a \in lim\, R/\mathfrak{m} = R$ (here we use that R is complete). Moreover, $f(a) = 0$ since it maps to zero in each $R/\mathfrak{m}^n$. Finally $\overline{a} = a_0$ and we win. □

Lemma 7.139.11. *Let $(R, \mathfrak{m})$ be a local ring of dimension* 0*. Then R is henselian.*

Proof. Let $R \to S$ be a finite ring map. By Lemma 7.139.3 it suffices to show that S is a product of local rings. By Lemma 7.32.19 S has finitely many primes $\mathfrak{m}_1, \ldots, \mathfrak{m}_r$ which all lie over $\mathfrak{m}$. There are no inclusions among these primes, see Lemma 7.32.18, hence they are all maximal. Every element of $\mathfrak{m}_1 \cap \ldots \cap \mathfrak{m}_r$ is nilpotent by Lemma 7.16.2. It follows S is the product of the localizations of S at the primes $\mathfrak{m}_i$ by Lemma 7.49.7. □

Lemma 7.139.12. *Let $(R, \mathfrak{m}, \kappa)$ be a local ring. There exists a canonical local ring map $R \to R^h$ with the following properties*

(1) *R^h is henselian,*
(2) *R^h is a filtered colimit of étale R-algebras,*
(3) *$\mathfrak{m}R^h$ is the maximal ideal of R^h, and*
(4) *$\kappa = R^h/\mathfrak{m}R^h$.*

Proof. Consider the cateory of pairs $(S, \mathfrak{q})$ where $R \to S$ is an étale ring map, and $\mathfrak{q}$ is a prime of S lying over $\mathfrak{m}$ with $\kappa = \kappa(\mathfrak{q})$. A morphism of pairs $(S, \mathfrak{q}) \to (S', \mathfrak{q}')$ is given by an R-algebra map $\varphi : S \to S'$ such that $\varphi^{-1}(\mathfrak{q}') = \mathfrak{q}$. We set

$$R^h = colim_{(S,\mathfrak{q})}\, S.$$

This clearly implies that R^h is canonical, since no choices were made in this construction. Moreover, property (2) is clear.

Let us show that the category of pairs is filtered, see Categories, Definition 4.17.1. The category contains the pair $(R, \mathfrak{m})$ and hence is not empty, which proves part (1) of Categories, Definition 4.17.1. Note that for any pair $(S, \mathfrak{q})$ the prime ideal $\mathfrak{q}$ is maximal, for example since $\kappa \to S/\mathfrak{q} \subset \kappa(\mathfrak{q})$ are isomorphisms. Suppose that $(S, \mathfrak{q})$ and $(S', \mathfrak{q}')$ are two objects. Set $S'' = S \otimes_R S'$ and $\mathfrak{q}'' = \mathfrak{q}S'' + \mathfrak{q}'S''$. Then $S''/\mathfrak{q}'' = S/\mathfrak{q} \otimes_R S'/\mathfrak{q}' = \kappa$ by what we said above. Moreover, $R \to S''$ is étale by Lemma 7.132.3. This proves part (2) of Categories, Definition 4.17.1. Next, suppose that $\varphi, \psi : (S, \mathfrak{q}) \to (S', \mathfrak{q}')$ are two morphisms of pairs. Consider

$$S'' = (S' \otimes_{\varphi, S, \psi} S') \otimes_{S' \otimes_R S'} S'$$

with prime ideal

$$\mathfrak{q}'' = (\mathfrak{q}' \otimes S' + S' \otimes \mathfrak{q}') \otimes S' + (S' \otimes_{\varphi, S, \psi} S') \otimes \mathfrak{q}'$$

Arguing as above (base change of étale maps is étale, composition of étale maps is étale) we see that S'' is étale over R. Moreover, the canonical map $S' \to S''$ (using the right most factor for example) equalizes φ and ψ. This proves part (3) of Categories, Definition 4.17.1. Hence we conclude that R^h consists of triples $(S, \mathfrak{q}, f)$ with $f \in S$, and two such triples $(S, \mathfrak{q}, f)$, $(S', \mathfrak{q}', f')$ define the same element of R^h if and only if there exists a pair $(S'', \mathfrak{q}'')$ and morphisms of pairs $\varphi : (S, \mathfrak{q}) \to (S'', \mathfrak{q}'')$ and $\varphi' : (S', \mathfrak{q}') \to (S'', \mathfrak{q}'')$ such that $\varphi(f) = \varphi'(f')$.

Suppose that $x \in R^h$. Represent x by a triple $(S, \mathfrak{q}, f)$. Let $\mathfrak{q}_1, \ldots, \mathfrak{q}_r$ be the other primes of S lying over $\mathfrak{m}$. Then we can find a $g \in S$, $g \notin \mathfrak{q}$ and $g \in \mathfrak{q}_i$ for $i = 1, \ldots, r$, see Lemma 7.14.3. Consider the morphism of pairs $(S, \mathfrak{q}) \to (S_g, \mathfrak{q}S_g)$. In this way we see that we may always assume that x is given by a triple $(S, \mathfrak{q}, f)$ where $\mathfrak{q}$ is the only prime of S lying over $\mathfrak{m}$, i.e., $\sqrt{\mathfrak{m}S} = \mathfrak{q}$. But since $R \to S$ is étale, we have $\mathfrak{m}S_\mathfrak{q} = \mathfrak{q}S_\mathfrak{q}$, see Lemma 7.132.5. Hence we actually get that $\mathfrak{m}S = \mathfrak{q}$.

Suppose that $x \notin \mathfrak{m}R^h$. Represent x by a triple $(S, \mathfrak{q}, f)$ with $\mathfrak{m}S = \mathfrak{q}$. Then $f \notin \mathfrak{m}S$, i.e., $f \notin \mathfrak{q}$. Hence $(S, \mathfrak{q}) \to (S_f, \mathfrak{q}S_f)$ is a morphism of pairs such that the image of f becomes invertible. Hence x is invertible with inverse represented by the triple $(S_f, \mathfrak{q}S_f, 1/f)$. We conclude that R^h is a local ring with maximal ideal $\mathfrak{m}R^h$. The residue field is κ since we can define $R^h/\mathfrak{m}R^h \to \kappa$ by mapping a triple $(S, \mathfrak{q}, f)$ to the residue class of f module $\mathfrak{q}$.

We still have to show that R^h is henselian. Namely, suppose that $P \in R^h[T]$ is a monic polynomial and $a_0 \in \kappa$ is a simple root of the reduction $\overline{P} \in \kappa[T]$. Then we can find a pair $(S, \mathfrak{q})$ such that P is the image of a monic polynomial $Q \in S[T]$. Since $S \to R^h$ induces an isomorphism of residue fields we see that $S' = S[T]/(Q)$ has a prime ideal $\mathfrak{q}' = (\mathfrak{q}, T - a_0)$ at which $S \to S'$ is standard étale. Moreover, $\kappa = \kappa(\mathfrak{q}')$. Pick $g \in S'$, $g \notin \mathfrak{q}'$ such that $S'' = S'_g$ is étale over S. Then $(S, \mathfrak{q}) \to (S'', \mathfrak{q}'S'')$ is a morphism of pairs. Now that triple $(S'', \mathfrak{q}'S'', \text{class of } T)$ determines an element $a \in R^h$ with the properties $P(a) = 0$, and $\overline{a} = a_0$ as desired. $\square$

Lemma 7.139.13. *Let $(R, \mathfrak{m}, \kappa)$ be a local ring. Let $\kappa \subset \kappa^{sep}$ be a separable algebraic closure. There exists a canonical commutative diagram*

$$\begin{array}{ccccc} \kappa & \longrightarrow & \kappa & \longrightarrow & \kappa^{sep} \\ \uparrow & & \uparrow & & \uparrow \\ R & \longrightarrow & R^h & \longrightarrow & R^{sh} \end{array}$$

with the following properties

1. *the map $R^h \to R^{sh}$ is local*
2. *R^{sh} is strictly henselian,*
3. *R^{sh} is a filtered colimit of étale R-algebras,*
4. *$\mathfrak{m}R^{sh}$ is the maximal ideal of R^{sh}, and*
5. *$\kappa^{sep} = R^{sh}/\mathfrak{m}R^{sh}$.*

Proof. This can be proved using the method followed in the proof of Lemma 7.139.12. The only difference is that, instead of pairs, one uses triples $(S, \mathfrak{q}, \alpha)$ where $R \to S$ étale, $\mathfrak{q}$ is a prime of S lying over $\mathfrak{m}$, and $\alpha : \kappa(\mathfrak{q}) \to \kappa^{sep}$ is an embedding of extensions of κ.

But we can also deduce the result directly from the result of Lemma 7.139.12. Namely, for any finite separable field sub extension $\kappa \subset \kappa' \subset \kappa^{sep}$ there exists a unique (up to unique isomorphism) finite étale local ring extension $R^h \subset R^h(\kappa')$ whose residue field extension extension reproduces the given extension, see Lemma 7.139.8. Hence we can set

$$R^{sh} = \bigcup\nolimits_{\kappa \subset \kappa' \subset \kappa^{sep}} R^h(\kappa')$$

The arrows in this system, compatible with the arrows on the level of residue fields, exist by Lemma 7.139.8. This will produce a henselian local ring by Lemma 7.139.5 since each of the rings $R^h(\kappa')$ is henselian by Lemma 7.139.4. By construction the residue field extension induced by $R^h \to R^{sh}$ is the field extension $\kappa \subset \kappa^{sep}$. We omit the proof that R^{sh} is a colimit of étale R-algebras. □

Definition 7.139.14. Let $(R, \mathfrak{m}, \kappa)$ be a local ring.

(1) The local ring map $R \to R^h$ constructed in Lemma 7.139.12 is called the *henselization* of R.
(2) Given a separable algebraic closure $\kappa \subset \kappa^{sep}$ the local ring map $R \to R^{sh}$ constructed in Lemma 7.139.13 is called the *strict henselization of R with respect to* $\kappa \subset \kappa^{sep}$.
(3) A local ring map $R \to R^{sh}$ is called a *strict henselization* of R if it is isomorphic to one of the local ring maps constructed in Lemma 7.139.13

Note that $R \to R^h \to R^{sh}$ are flat local ring homomorphisms. The first by the construction of R^h in Lemma 7.139.12 as a directed colimit of étale hence flat R-algebras and the second by the construction of R^{sh} in the proof of Lemma 7.139.13 as a directed colimit of finite étale hence flat R^h-algebras (see Lemma 7.35.2). In the following lemmas we discuss functoriality properties of the (strict) henselizations. This should make it clear exactly how canonical these constructions really are.

Lemma 7.139.15. *Let $R \to S$ be a local map of local rings. Let $S \to S^h$ be the henselization. Let $R \to A$ be an étale ring map and let $\mathfrak{q}$ be a prime of A lying over $\mathfrak{m}_R$ such that $R/\mathfrak{m}_R \cong \kappa(\mathfrak{q})$. Then there exists a unique morphism of rings $f : A \to S^h$ fitting into the commutative diagram*

$$\begin{tikzcd} A \arrow[r, "f"] & S^h \\ R \arrow[u] \arrow[r] & S \arrow[u] \end{tikzcd}$$

such that $f^{-1}(\mathfrak{m}_{S^h}) = \mathfrak{q}$.

Proof. Consider $A \otimes_R S^h$. This is an étale algebra over S^h, see Lemma 7.132.3. Moreover $\mathfrak{q}' = \mathfrak{q} \otimes S^h + A \otimes \mathfrak{m}_{S^h}$ is a maximal ideal lying over $\mathfrak{m}_{S^h}$ with residue field equal to the residue field of S^h. Hence by Lemma 7.139.3 there exists a (unique) splitting $\tau : A \otimes_R S^h \to S^h$ with $\tau^{-1}(\mathfrak{m}_{S^h}) = \mathfrak{q}'$. Set f equal to the composition $A \to A \otimes_R S^h \to S^h$. Minor details omitted. □

Lemma 7.139.16. *Let $R \to S$ be a local map of local rings. Let $R \to R^h$ and $S \to S^h$ be the henselizations. There exists a unique local ring map $R^h \to S^h$ fitting into the* *commutative diagram*

$$\begin{tikzcd} R^h \arrow[r, "f"'] & S^h \\ R \arrow[u] \arrow[r] & S \arrow[u] \end{tikzcd}$$

Proof. Write $R^h = colim\, R_i$ as a filtered colimit of étale R-algebras R_i. Note that $\mathfrak{m}_i = \mathfrak{m}_{R^h} \cap R_i$ is a maximal ideal of R_i with residue field κ. Hence by Lemma 7.139.15 we obtain canonical ring maps $f_i : R_i \to S^h$. Setting $f = colim\, f_i$ we win. $\square$

Lemma 7.139.17. *Let $R \to S$ be a ring map. Let $\mathfrak{q}$ be a prime of S lying over $\mathfrak{p}$ in R. Assume $R \to S$ is quasi-finite at $\mathfrak{q}$. The commutative diagram*

$$\begin{tikzcd} R_{\mathfrak{p}}^h \arrow[r] & S_{\mathfrak{q}}^h \\ R_{\mathfrak{p}} \arrow[u] \arrow[r] & S_{\mathfrak{q}} \arrow[u] \end{tikzcd}$$

of Lemma 7.139.16 identifies $S_{\mathfrak{q}}^h$ with the localization of $R_{\mathfrak{p}}^h \otimes_{R_{\mathfrak{p}}} S_{\mathfrak{q}}$ at the prime generated by $\mathfrak{q}$.

Proof. Note that $R_{\mathfrak{p}}^h \otimes_R S$ is quasi-finite over $R_{\mathfrak{p}}^h$ at the prime ideal corresponding to $\mathfrak{q}$, see Lemma 7.113.6. Hence the localization S' of $R_{\mathfrak{p}}^h \otimes_{R_{\mathfrak{p}}} S_{\mathfrak{q}}$ is henselian, see Lemma 7.139.4. On the other hand, since $R_{\mathfrak{p}}^h$ is a filtered colimit of étale R-algebras, also $R_{\mathfrak{p}}^h \otimes_{R_{\mathfrak{p}}} S_{\mathfrak{q}}$ is a filtered colimit of étale $S_{\mathfrak{q}}$-algebras, and hence S' is a filtered colimit of étale $S_{\mathfrak{q}}$-algebras. Moreover, each of those étale algebras occurs in the limit defining $S_{\mathfrak{q}}^h$. Hence the map $S' \to S_{\mathfrak{q}}^h$ exihibits $S_{\mathfrak{q}}^h$ as a colimit of étale algebras over S' with trivial residue field extensions at the primes lying over $\mathfrak{q}$. Since S' is henselian, this map is an isomorphism. $\square$

Lemma 7.139.18. *Let R be a local ring with henselization R^h. Let $I \subset \mathfrak{m}_R$. Then R^h/IR^h is the henselization of R/I.*

Proof. This is a special case of Lemma 7.139.17. $\square$

Lemma 7.139.19. *Let $\varphi : R \to S$ be a local map of local rings. Let $S/\mathfrak{m}_S \subset \kappa^{sep}$ be a separable algebraic closure. Let $S \to S^{sh}$ be the strict henselization of S with respect to $S/\mathfrak{m}_S \subset \kappa^{sep}$. Let $R \to A$ be an étale ring map and let $\mathfrak{q}$ be a prime of A lying over $\mathfrak{m}_R$. Given any commutative diagram*

$$\begin{tikzcd} \kappa(\mathfrak{q}) \arrow[r, "\phi"'] & \kappa^{sep} \\ R/\mathfrak{m}_R \arrow[u] \arrow[r, "\varphi"] & S/\mathfrak{m}_S \arrow[u] \end{tikzcd}$$

there exists a unique morphism of rings $f : A \to S^{sh}$ fitting into the commutative diagram

$$\begin{tikzcd} A \arrow[r, "f"'] & S^{sh} \\ R \arrow[u] \arrow[r, "\varphi"] & S \arrow[u] \end{tikzcd}$$

such that $f^{-1}(\mathfrak{m}_{S^h}) = \mathfrak{q}$ and the induced map $\kappa(\mathfrak{q}) \to \kappa^{sep}$ is the given one.

Proof. Consider $A \otimes_R S^h$. This is an étale algebra over S^h, see Lemma 7.132.3. Moreover $I = \mathfrak{q} \otimes S^h + A \otimes \mathfrak{m}_{S^h}$ is an ideal lying over $\mathfrak{m}_{S^h}$ and our map ϕ induces a surjection

$$A \otimes_R S^h/I = \kappa(\mathfrak{q}) \otimes_{R/\mathfrak{m}_R} \kappa^{sep} \xrightarrow{\phi\otimes 1} \kappa^{sep}$$

The kernel of this surjection determines a maximal ideal $\mathfrak{q}'$ of $A \otimes_R S^h$. Hence by Lemma 7.139.3 there exists a (unique) splitting $\tau : A \otimes_R S^h \to S^h$ with $\tau^{-1}(\mathfrak{m}_{S^h}) = \mathfrak{q}'$. Set f equal to the composition $A \to A \otimes_R S^h \to S^h$. Minor details omitted. □

Lemma 7.139.20. *Let $R \to S$ be a local map of local rings. Choose separable algebraic closures $R/\mathfrak{m}_R \subset \kappa_1^{sep}$ and $S/\mathfrak{m}_S \subset \kappa_2^{sep}$. Let $R \to R^{sh}$ and $S \to S^{sh}$ be the corresponding strict henselizations. Given any commutative diagram*

$$\begin{tikzcd} \kappa_1^{sep} \arrow[r, "\phi"'] & \kappa_2^{sep} \\ R/\mathfrak{m}_R \arrow[u] \arrow[r, "\varphi"] & S/\mathfrak{m}_S \arrow[u] \end{tikzcd}$$

There exists a unique local ring map $R^{sh} \to S^{sh}$ fitting into the commutative diagram

$$\begin{tikzcd} R^{sh} \arrow[r, "f"'] & S^{sh} \\ R \arrow[u] \arrow[r] & S \arrow[u] \end{tikzcd}$$

and inducing ϕ on the residue fields of R^{sh} and S^{sh}.

Proof. Write $R^{sh} = colim\, R_i$ as a filtered colimit of étale R-algebras R_i. Note that $\mathfrak{m}_i = \mathfrak{m}_{R^h} \cap R_i$ is a maximal ideal of R_i with residue field contained in κ_1^{sep}. Hence by Lemma 7.139.19 we obtain canonical ring maps $f_i : R_i \to S^{sh}$. Setting $f = colim\, f_i$ we win. □

Lemma 7.139.21. *Let $R \to S$ be a ring map. Let $\mathfrak{q}$ be a prime of S lying over $\mathfrak{p}$ in R. Let $\kappa(\mathfrak{q}) \subset \kappa^{sep}$ be a separable algebraic closure. Assume $R \to S$ is quasi-finite at $\mathfrak{q}$. The commutative diagram*

$$\begin{tikzcd} R_{\mathfrak{p}}^{sh} \arrow[r] & S_{\mathfrak{q}}^{sh} \\ R_{\mathfrak{p}} \arrow[u] \arrow[r] & S_{\mathfrak{q}} \arrow[u] \end{tikzcd}$$

of Lemma 7.139.20 identifies $S_{\mathfrak{q}}^{sh}$ with a localization of $R_{\mathfrak{p}}^{sh} \otimes_{R_{\mathfrak{p}}} S_{\mathfrak{q}}$.

Proof. The residue field of $R_{\mathfrak{p}}^{sh}$ is the separable algebraic closure of $\kappa(\mathfrak{p})$ in κ^{sep}. Note that $R_{\mathfrak{p}}^{sh} \otimes_R S$ is quasi-finite over $R_{\mathfrak{p}}^{sh}$ at the prime ideal corresponding to $\mathfrak{q}$, see Lemma 7.113.6. Hence the localization S' of $R_{\mathfrak{p}}^{sh} \otimes_{R_{\mathfrak{p}}} S_{\mathfrak{q}}$ is henselian, see Lemma 7.139.4. Note that the residue field of S' is κ^{sep} since it contains both the separable algebraic closure of $\kappa(\mathfrak{p})$ and $\kappa(\mathfrak{q})$. Since $R_{\mathfrak{p}}^{sh}$ is a filtered colimit of étale R-algebras, also $R_{\mathfrak{p}}^{sh} \otimes_{R_{\mathfrak{p}}} S_{\mathfrak{q}}$ is a filtered colimit of étale $S_{\mathfrak{q}}$-algebras, and hence S' is a filtered colimit of étale $S_{\mathfrak{q}}$-algebras. Moreover, each of those étale algebras occurs in the limit defining $S_{\mathfrak{q}}^{sh}$. Hence the map $S' \to S_{\mathfrak{q}}^{sh}$ exihibits

$S_{\mathfrak q}^{sh}$ as a colimit of étale algebras over S'! Since S' is strictly henselian, this map is an isomorphism. □

Lemma 7.139.22. *Let R be a local ring with strict henselization R^{sh}. Let $I \subset \mathfrak m_R$. Then R^{sh}/IR^{sh} is a strict henselization of R/I.*

Proof. This is a special case of Lemma 7.139.21. □

Here is a slightly different construction of the henselization.

Lemma 7.139.23. *Let R be a ring. Let $\mathfrak p \subset R$ be a prime ideal. Consider the category of pairs $(S, \mathfrak q)$ where $R \to S$ is étale and $\mathfrak q$ is a prime lying over $\mathfrak p$ such that $\kappa(\mathfrak p) = \kappa(\mathfrak q)$. This category is filtered and*

$$(R_{\mathfrak p})^h = colim_{(S,\mathfrak q)}\, S = colim_{(S,\mathfrak q)}\, S_{\mathfrak q}$$

canonically.

Proof. A morphism of pairs $(S, \mathfrak q) \to (S', \mathfrak q')$ is given by an R-algebra map $\varphi : S \to S'$ such that $\varphi^{-1}(\mathfrak q') = \mathfrak q$. Let us show that the category of pairs is filtered, see Categories, Definition 4.17.1. The category contains the pair $(R, \mathfrak p)$ and hence is not empty, which proves part (1) of Categories, Definition 4.17.1. Suppose that $(S, \mathfrak q)$ and $(S', \mathfrak q')$ are two pairs. Note that $\mathfrak q$, resp. $\mathfrak q'$ correspond to primes of the fibre rings $S \otimes \kappa(\mathfrak p)$, resp. $S' \otimes \kappa(\mathfrak p)$ with residue fields $\kappa(\mathfrak p)$, hence they correspond to maximal ideals of $S \otimes \kappa(\mathfrak p)$, resp. $S' \otimes \kappa(\mathfrak p)$. Set $S'' = S \otimes_R S'$. By the above there exists a unique prime $\mathfrak q'' \subset S''$ lying over $\mathfrak q$ and over $\mathfrak q'$ whose residue field is $\kappa(\mathfrak p)$. The ring map $R \to S''$ is étale by Lemma 7.132.3. This proves part (2) of Categories, Definition 4.17.1. Next, suppose that $\varphi, \psi : (S, \mathfrak q) \to (S', \mathfrak q')$ are two morphisms of pairs. Consider

$$S'' = (S' \otimes_{\varphi, S, \psi} S') \otimes_{S' \otimes_R S'} S'$$

Arguing as above (base change of étale maps is étale, composition of étale maps is étale) we see that S'' is étale over R. The fibre ring of S'' over $\mathfrak p$ is

$$F'' = (F' \otimes_{\varphi, F, \psi} F') \otimes_{F' \otimes_{\kappa(\mathfrak p)} F'} F'$$

where F', F are the fibre rings of S' and S. Since φ and ψ are morphisms of pairs the map $F' \to \kappa(\mathfrak p)$ corresponding to $\mathfrak p'$ extends to a map $F'' \to \kappa(\mathfrak p)$ and in turn corresponds to a prime ideal $\mathfrak q'' \subset S''$ whose residue field is $\kappa(\mathfrak p)$. The canonical map $S' \to S''$ (using the right most factor for example) is a morphism of pairs $(S', \mathfrak q') \to (S'', \mathfrak q'')$ which equalizes φ and ψ. This proves part (3) of Categories, Definition 4.17.1. Hence we conclude that the category is filtered.

Recall that in the proof of Lemma 7.139.12 we constructed $(R_{\mathfrak p})^h$ as the corresponding colimit but starting with $R_{\mathfrak p}$ and its maximal ideal $\mathfrak pR_{\mathfrak p}$. Now, given any pair $(S, \mathfrak q)$ for $(R, \mathfrak p)$ we obtain a pair $(S_{\mathfrak p}, \mathfrak qS_{\mathfrak p})$ for $(R_{\mathfrak p}, \mathfrak pR_{\mathfrak p})$. Moreover, in this situation

$$S_{\mathfrak p} = colim_{f \in R, f \not\in \mathfrak p}\, S_f.$$

Hence in order to show the equalities of the lemma, it suffices to show that any pair $(S_{loc}, \mathfrak q_{loc})$ for $(R_{\mathfrak p}, \mathfrak pR_{\mathfrak p})$ is of the form $(S_{\mathfrak p}, \mathfrak qS_{\mathfrak p})$ for some pair $(S, \mathfrak q)$ over $(R, \mathfrak p)$ (some details omitted). This follows from Lemma 7.132.3. □

Lemma 7.139.24. *Let R be a ring. Let $\mathfrak p \subset R$ be a prime ideal. Let $\kappa(\mathfrak p) \subset \kappa^{sep}$ be a separable algebraic closure. Consider the category of triples $(S, \mathfrak q, \phi)$ where $R \to S$ is* *étale, $\mathfrak{q}$ is a prime lying over $\mathfrak{p}$, and $\phi : \kappa(\mathfrak{q}) \to \kappa^{sep}$ is a $\kappa(\mathfrak{p})$-algebra map. This category is filtered and*

$$(R_{\mathfrak{p}})^{sh} = colim_{(S,\mathfrak{q},\phi)} S = colim_{(S,\mathfrak{q},\phi)} S_{\mathfrak{q}}$$

canonically.

Proof. A morphism of triples $(S, \mathfrak{q}, \phi) \to (S', \mathfrak{q}', \phi')$ is given by an R-algebra map $\varphi : S \to S'$ such that $\varphi^{-1}(\mathfrak{q}') = \mathfrak{q}$ and such that $\phi' \circ \varphi = \phi$. Let us show that the category of pairs is filtered, see Categories, Definition 4.17.1. The category contains the triple $(R, \mathfrak{p}, \kappa(\mathfrak{p}) \subset \kappa^{sep})$ and hence is not empty, which proves part (1) of Categories, Definition 4.17.1. Suppose that $(S, \mathfrak{q}, \phi)$ and $(S', \mathfrak{q}', \phi')$ are two triples. Note that $\mathfrak{q}$, resp. $\mathfrak{q}'$ correspond to primes of the fibre rings $S \otimes \kappa(\mathfrak{p})$, resp. $S' \otimes \kappa(\mathfrak{p})$ with residue fields finite separable over $\kappa(\mathfrak{p})$ and ϕ, resp. ϕ' correspond to maps into κ^{sep}. Hence this data corresponds to $\kappa(\mathfrak{p})$-algebra maps

$$\phi : S \otimes_R \kappa(\mathfrak{p}) \longrightarrow \kappa^{sep}, \quad \phi' : S' \otimes_R \kappa(\mathfrak{p}) \longrightarrow \kappa^{sep}.$$

Set $S'' = S \otimes_R S'$. Combining the maps the above we get a unique $\kappa(\mathfrak{p})$-algerba map

$$\phi'' = \phi \otimes \phi' : S'' \otimes_R \kappa(\mathfrak{p}) \longrightarrow \kappa^{sep}$$

whose kernel corresponds to a prime $\mathfrak{q}'' \subset S''$ lying over $\mathfrak{q}$ and over $\mathfrak{q}'$, and whose residue field maps via ϕ'' to the compositum of $\phi(\kappa(\mathfrak{q}))$ and $\phi'(\kappa(\mathfrak{q}'))$ in κ^{sep}. The ring map $R \to S''$ is étale by Lemma 7.132.3. Hence $(S'', \mathfrak{q}'', \phi'')$ is a triple dominating both $(S, \mathfrak{q}, \phi)$ and $(S', \mathfrak{q}', \phi')$. This proves part (2) of Categories, Definition 4.17.1. Next, suppose that $\varphi, \psi : (S, \mathfrak{q}, \phi) \to (S', \mathfrak{q}', \phi')$ are two morphisms of pairs. Consider

$$S'' = (S' \otimes_{\varphi,S,\psi} S') \otimes_{S' \otimes_R S'} S'$$

Arguing as above (base change of étale maps is étale, composition of étale maps is étale) we see that S'' is étale over R. The fibre ring of S'' over $\mathfrak{p}$ is

$$F'' = (F' \otimes_{\varphi,F,\psi} F') \otimes_{F' \otimes_{\kappa(\mathfrak{p})} F'} F'$$

where F', F are the fibre rings of S' and S. Since φ and ψ are morphisms of triples the map $\phi' : F' \to \kappa^{sep}$ extends to a map $\phi'' : F'' \to \kappa^{sep}$ which in turn corresponds to a prime ideal $\mathfrak{q}'' \subset S''$. The canonical map $S' \to S''$ (using the right most factor for example) is a morphism of triples $(S', \mathfrak{q}', \phi') \to (S'', \mathfrak{q}'', \phi'')$ which equalizes φ and ψ. This proves part (3) of Categories, Definition 4.17.1. Hence we conclude that the category is filtered.

We still have to show that the colimit R_{colim} of the system is equal to the strict henselization of $R_{\mathfrak{p}}$ with respect to κ^{sep}. To see this note that the system of triples $(S, \mathfrak{q}, \phi)$ contains as a subsystem the pairs $(S, \mathfrak{q})$ of Lemma 7.139.23. Hence R_{colim} contains $R_{\mathfrak{p}}^h$ by the result of that lemma. Moreover, it is clear that $R_{\mathfrak{p}}^h \subset R_{colim}$ is a directed colimit of étale ring extensions. It follows that R_{colim} is henselian by Lemmas 7.139.4 and 7.139.5. Finally, by Lemma 7.132.15 we see that the residue field of R_{colim} is equal to κ^{sep}. Hence we conclude that R_{colim} is strictly henselian and hence equals the strict henselization of $R_{\mathfrak{p}}$ as desired. Some details omitted. □

Lemma 7.139.25. *Let $\varphi : R \to S$ be a local homomorphism of strictly henselian local rings. Let $P_1, \ldots, P_n \in R[x_1, \ldots, x_n]$ be polynomials such that $R[x_1, \ldots, x_n]/(P_1, \ldots, P_n)$ is étale over R. Then the map*

$$R^n \longrightarrow S^n, \quad (h_1, \ldots, h_n) \longmapsto (\varphi(h_1), \ldots, \varphi(h_n))$$

induces a bijection between

$$\{(r_1, \ldots, r_n) \in R^n \mid P_i(r_1, \ldots, r_n) = 0,\ i = 1, \ldots, n\}$$

and

$$\{(s_1, \ldots, s_n) \in S^n \mid P_i'(s_1, \ldots, s_n) = 0,\ i = 1, \ldots, n\}$$

where $P_i' \in S[x_1, \ldots, x_n]$ *are the images of the* P_i *under* φ.

Proof. The first solution set is canonically isomorphic to the set

$$Hom_R(R[x_1, \ldots, x_n]/(P_1, \ldots, P_n), R).$$

As R is henselian the map $R \to R/\mathfrak{m}_R$ induces a bijection between this set and the set of solutions in the residue field $R/\mathfrak{m}_R$, see Lemma 7.139.3. The same is true for S. Now since $R[x_1, \ldots, x_n]/(P_1, \ldots, P_n)$ is étale over R and $R/\mathfrak{m}_R$ is separably algebraically closed we see that $R/\mathfrak{m}_R[x_1, \ldots, x_n]/(\overline{P_1}, \ldots, \overline{P_n})$ is a finite product of copies of $R/\mathfrak{m}_R$. Hence the tensor product

$$R/\mathfrak{m}_R[x_1, \ldots, x_n]/(\overline{P_1}, \ldots, \overline{P_n}) \otimes_{R/\mathfrak{m}_R} S/\mathfrak{m}_S = S/\mathfrak{m}_S[x_1, \ldots, x_n]/(\overline{P_1'}, \ldots, \overline{P_n'})$$

is also a finite product of copies of $S/\mathfrak{m}_S$ with the same index set. This proves the lemma. □

Lemma 7.139.26. *Let R be a henselian local ring. Any countably generated Mittag-Leffler module over R is a direct sum of finitely presented R-modules.*

Proof. Let M be a countably generated and Mittag-Leffler R-module. We claim that for any element $x \in M$ there exists a direct sum decomposition $M = N \oplus K$ with $x \in N$, the module N finitely presented, and K Mittag-Leffler.

Suppose the claim is true. Choose generators $x_1, x_2, x_3, \ldots$ of M. By the claim we can inductively find direct sum decompositions

$$M = N_1 \oplus N_2 \oplus \ldots \oplus N_n \oplus K_n$$

with N_i finitely presented, $x_1, \ldots, x_n \in N_1 \oplus \ldots \oplus N_n$, and K_n Mittag-Leffler. Repeating ad infinitum we see that $M = \bigoplus N_i$.

We still have to prove the claim. Let $x \in M$. By Lemma 7.86.2 there exists an endomorphism $\alpha : M \to M$ such that α factors through a finitely presented module, and $\alpha(x) = x$. Say α factors as

$$M \xrightarrow{\pi} P \xrightarrow{i} M$$

Set $a = \pi \circ \alpha \circ i : P \to P$, so $i \circ a \circ \pi = \alpha^3$. By Lemma 7.15.2 there exists a monic polynomial $P \in R[T]$ such that $P(a) = 0$. Note that this implies formally that $\alpha^2 P(\alpha) = 0$. Hence we may think of M as a module over $R[T]/(T^2 P)$. Assume that $x \neq 0$. Then $\alpha(x) = x$ implies that $0 = \alpha^2 P(\alpha) x = P(1) x$ hence $P(1) = 0$ in R/I where $I = \{r \in R \mid rx = 0\}$ is the annihilator of x. As $x \neq 0$ we see $I \subset \mathfrak{m}_R$, hence 1 is a root of $\overline{P} = P \bmod \mathfrak{m}_R \in R/\mathfrak{m}_R[T]$. As R is henselian we can find a factorization

$$T^2 P = (T^2 Q_1) Q_2$$

for some $Q_1, Q_2 \in R[T]$ with $Q_2 = (T-1)^e \bmod \mathfrak{m}_R R[T]$ and $Q_1(1) \neq 0 \bmod \mathfrak{m}_R$, see Lemma 7.139.3. Let $N = \mathrm{Im}(\alpha^2 Q_1(\alpha) : M \to M)$ and $K = \mathrm{Im}(Q_2(\alpha) : M \to M)$. As $T^2 Q_1$ and Q_2 generate the unit ideal of $R[T]$ we get a direct sum decomposition $M = N \oplus K$. Moreover, Q_2 acts as zero on N and $T^2 Q_1$ acts as zero on K. Note that N is a quotient of P hence is finitely generated. Also $x \in N$ because $\alpha^2 Q_1(\alpha) x = Q_1(1) x$ and $Q_1(1)$ is a unit in R. By Lemma 7.83.7 the modules N and K are Mittag-Leffler. Finally, the finitely generated module N is finitely presented as a finitely generated Mittag-Leffler module is finitely presented, see Example 7.85.1 part (1). $\square$

7.140. Serre's criterion for normality

We introduce the following properties of Noetherian rings.

Definition 7.140.1. Let R be a Noetherian ring. Let $k \geq 0$ be an integer.

(1) We say R has property (R_k) if for every prime $\mathfrak{p}$ of height $\leq k$ the local ring $R_{\mathfrak{p}}$ is regular. We also say that R is *regular in codimension* $\leq k$.
(2) We say R has property (S_k) if for every prime $\mathfrak{p}$ the local ring $R_{\mathfrak{p}}$ has depth at least $\min\{k, \dim(R_{\mathfrak{p}})\}$.
(3) Let M be a finite R-module. We say M has property (S_k) if for every prime $\mathfrak{p}$ the module $M_{\mathfrak{p}}$ has depth at least $\min\{k, \dim(M_{\mathfrak{p}})\}$.

Any Noetherian ring has property (S_0) (and so does any finite module over it).

Lemma 7.140.2. *Let R be a Noetherian ring. Let M be a finite R-module. The following are equivalent:*

(1) *M has no embedded associated prime, and*
(2) *M has property (S_1).*

Proof. Let $\mathfrak{p}$ be an embedded associated prime of M. Then there exists another associated prime $\mathfrak{q}$ of M such that $\mathfrak{p} \subset \mathfrak{q}$. In particular this implies that $\dim(M_{\mathfrak{p}}) \geq 1$ (since $\mathfrak{q}$ is in the support as well). On the other hand $\mathfrak{p}R_{\mathfrak{p}}$ is associated to $M_{\mathfrak{p}}$ (Lemma 7.60.14) and hence $\text{depth}(M_{\mathfrak{p}}) = 0$ (see Lemma 7.60.17). In other words (S_1) does not hold. Conversely, if (S_1) does not then there exists a prime $\mathfrak{p}$ such that $\dim(M_{\mathfrak{p}}) \geq 1$ and $\text{depth}(M_{\mathfrak{p}}) = 0$. Then we see (arguing backwards using the lemmas cited above) that $\mathfrak{p}$ is an embedded associated prime. $\square$

Lemma 7.140.3. *Let R be a Noetherian ring. The following are equivalent:*

(1) *R is reduced, and*
(2) *R has properties (R_0) and (S_1).*

Proof. Suppose that R is reduced. Then $R_{\mathfrak{p}}$ is a field for every minimal prime $\mathfrak{p}$ of R, according to Lemma 7.23.3. Hence we have (R_0). Let $\mathfrak{p}$ be a prime of height ≥ 1. Then $A = R_{\mathfrak{p}}$ is a reduced local ring of dimension ≥ 1. Hence its maximal ideal $\mathfrak{m}$ is not an associated prime since this would mean there exists a $x \in \mathfrak{m}$ with annihilator $\mathfrak{m}$ so $x^2 = 0$. Hence the depth of $A = R_{\mathfrak{p}}$ is at least one, by Lemma 7.60.9. This shows that (S_1) holds.

Conversely, assume that R satisfies (R_0) and (S_1). If $\mathfrak{p}$ is a minimal prime of R, then $R_{\mathfrak{p}}$ is a field by (R_0), and hence is reduced. If $\mathfrak{p}$ is not minimal, then we see that $R_{\mathfrak{p}}$ has depth ≥ 1 by (S_1) and we conclude there exists an element $t \in \mathfrak{p}R_{\mathfrak{p}}$ such that $R_{\mathfrak{p}} \to R_{\mathfrak{p}}[1/t]$ is injective. This implies that $R_{\mathfrak{p}}$ is a subring of localizations of R at primes of smaller height. Thus by induction on the height we conclude that R is reduced. $\square$

Lemma 7.140.4. *(Serre's criterion for normality) Let R be a Noetherian ring. The following are equivalent:*

(1) *R is a normal ring, and*
(2) *R has properties (R_1) and (S_2).*

Proof. Suppose that R is normal. This means by definition that R is reduced and all localizations $R_{\mathfrak p}$ are normal domains. In particular we see that R has (R_0) and (S_1) by Lemma 7.140.3. Hence it suffices to show that a local Noetherian normal domain R of dimension d has depth $\geq \min(2, d)$ and is regular if $d = 1$. The assertion if $d = 1$ follows from Lemma 7.110.6.

Let R be a local Noetherian normal domain with maximal ideal $\mathfrak m$ and dimension $d \geq 2$. Choose $x \in \mathfrak m$, $x \not\in \mathfrak m^2$. If $\text{depth}(R/xR) \geq 1$ then $\text{depth}(R) \geq 2$ and we win. Assume $\text{depth}(R/xR) = 0$ to get a contradiction. This means that $\mathfrak m/(x)$ is an associated prime of R/xR. In other words, there exists an element $z \in R$ such that $\mathfrak m z \subset (x)$, but $z \not\in (x)$. Consider the element z/x of the fraction field of R. Let $c \in \mathfrak m$ be an arbitrary nonzero element. We claim that $cz^n/x^n \in R$. Namely, $cz^n/x^n = (cz/x)z^{n-1}/x^{n-1}$. By choice of z we have $cz = c'x$ for some $c' \in R$. Note that $c' \in \mathfrak m$ since $x \not\in \mathfrak m^2$. Hence $cz^n/x^n = c'z^{n-1}/x^{n-1}$ which is an element of R by induction on n. In other words, this shows that z/x is almost integral over R, see Definition 7.33.3. By Lemma 7.33.4 we see that z/x is integral over R. As R is normal we see that $z/x \in R$ which is the desired contradiction.

Suppose that R satisfies (R_1) and (S_2). By Lemma 7.140.3 we conclude that R is reduced. Hence it suffices to show that if R is a reduced local Noetherian ring of dimension d satisfying (S_2) and (R_1) then R is a normal domain. If $d = 0$, the result is clear. If $d = 1$, then the result follows from Lemma 7.110.6.

Let R be a reduced local Noetherian ring with maximal ideal $\mathfrak m$ and dimension d which satisfies (R_1) and (S_2). By Lemma 7.33.14 it suffices to show that R is integrally closed in its total ring of fractions. Pick $x = f/g$, with $f, g \in R$ and g a nonzero divisor which satisfies a monic equation

$$(f/g)^n + \sum\nolimits_{i=1}^n a_i (f/g)^{n-i} = 0$$

with $a_i \in R$. Our goal is to show that $f \in (g) = gR$. We will prove this by induction on d. By the remarks in the previous paragraph we know this is the case when $d = 0$, and when $d = 1$, which starts the induction. Assume $d \geq 2$. Consider the short exact sequence

$$0 \to R \to R \to R/(g) \to 0.$$

By Lemma 7.67.10 this implies $\text{depth}(R/(g)) \geq 1$. Hence there exists an element $t \in \mathfrak m$ which is a nonzero divisor on $R/(g)$. Hence if f has a nonzero image in $R/(g)$ then it has a nonzero image in $(R/(g))[1/t] \cong R_t/gR_t$. But by induction on the dimension the image of f is zero in R_t/gR_t (for example by localizing at all the primes of $D(t) \subset Spec(R)$). Hence we win. □

Lemma 7.140.5. *A regular ring is normal.*

Proof. Let R be a regular ring. By Lemma 7.140.4 it suffices to prove that R is (R_1) and (S_2). As a regular local ring is Cohen-Macaulay, see Lemma 7.98.3, it is clear that R is (S_2). Property (R_1) is immediate. □

Lemma 7.140.6. *Let R be a Noetherian normal domain with fraction field K. Then*

(1) *for any nonzero $a \in R$ the quotient R/aR has no embedded primes, and all its associated primes have height* 1

(2) $$R = \bigcap\nolimits_{height(\mathfrak p)=1} R_{\mathfrak p}$$

(3) *For any nonzero $x \in K$ the quotient $R/(R \cap xR)$ has no embedded primes, and all its associates primes have height* 1.

Proof. By Lemma 7.140.4 we see that R has (S_2). Hence for any nonzero element $a \in R$ we see that R/aR has (S_1) (use Lemma 7.67.10 for example) Hence R/aR has no embedded primes (Lemma 7.140.2). We conclude the associated primes of R/aR are exactly the minimal primes $\mathfrak p$ over (a), which have height 1 as a is not zero (Lemma 7.57.10). This proves (1).

Thus, given $b \in R$ we have $b \in aR$ if and only if $b \in aR_{\mathfrak p}$ for every minimal prime $\mathfrak p$ over (a) (see Lemma 7.60.18). These primes all have height 1 as seen above so $b/a \in R$ if and only if $b/a \in R_{\mathfrak p}$ for all height 1 primes. Hence (2) holds.

For (3) write $x = a/b$. Let $\mathfrak p_1, \ldots, \mathfrak p_r$ be the minimal primes over (ab). These all have height 1 by the above. Then we see that $R \cap xR = \bigcap_{i=1,\ldots,r}(R \cap xR_{\mathfrak p_i})$ by part (2) of the lemma. Hence $R/(R \cap xR)$ is a submodule of $\bigoplus R/(R \cap xR_{\mathfrak p_i})$. As $R_{\mathfrak p_i}$ is a discrete valuation ring (by property (R_1) for the Noetherian normal domain R, see Lemma 7.140.4) we have $xR_{\mathfrak p_i} = \mathfrak p_i^{e_i}R_{\mathfrak p_i}$ for some $e_i \in \mathbf Z$. Hence the direct sum is equal to $\bigoplus_{e_i>0} R/\mathfrak p_i^{(e_i)}$, see Definition 7.61.1. By Lemma 7.61.2 the only associated prime of the module $R/\mathfrak p^{(n)}$ is $\mathfrak p$. Hence the set of associate primes of $R/(R \cap xR)$ is a subset of $\{\mathfrak p_i\}$ and there are no inclusion relations among them. This proves (3). □

7.141. Formal smoothness of fields

In this section we show that field extensions are formally smooth if and only if they are separable.

Lemma 7.141.1. *Let K be a field of characteristic $p > 0$. Let $a \in K$. Then $da = 0$ in $\Omega_{K/\mathbf F_p}$ if and only if a is a pth power.*

Proof. By Lemma 7.122.4 we see that there exists a subfield $\mathbf F_p \subset L \subset K$ such that $\mathbf F_p \subset L$ is a finitely generated field extension and such that $\mathrm da$ is zero in $\Omega_{L/\mathbf F_p}$. Hence we may assume that K is a finitely generated field extension of $\mathbf F_p$.

Choose a transcendence basis $x_1, \ldots, x_r \in K$ such that K is finite separable over $\mathbf F_p(x_1, \ldots, x_r)$. We remark that the result holds for the purely transcendental subfield $\mathbf F_p(x_1, \ldots, x_r) \subset K$. Namely,

$$\Omega_{\mathbf F_p(x_1,\ldots,x_r)/\mathbf F_p} = \bigoplus\nolimits_{i=1}^r \mathbf F_p(x_1, \ldots, x_r)\mathrm dx_i$$

and any rational function all of whose partial derivatives are zero is a pth power. Moreover, we also have

$$\Omega_{K/\mathbf F_p} = \bigoplus\nolimits_{i=1}^r K\mathrm dx_i$$

since $\mathbf F_p(x_1, \ldots, x_r) \subset K$ is finite separable (computation omitted). Suppose $a \in K$ is an element such that $\mathrm da = 0$ in the module of differentials. By our choice of x_i we see that the minimal polynomial $P(T) \in k(x_1, \ldots, x_r)[T]$ of a is separable. Write

$$P(T) = T^d + \sum\nolimits_{i=1}^d a_iT^{d-i}$$

and hence

$$0 = \mathrm dP(a) = \sum\nolimits_{i=1}^d a^{d-i}\mathrm da_i$$

in $\Omega_{K/\mathbf F_p}$. By the description of $\Omega_{K/\mathbf F_p}$ above and the fact that P was the minimal polynomial of a, we see that this implies $\mathrm da_i = 0$. Hence $a_i = b_i^p$ for each i. Therefore by Lemma 7.38.8 we see that a is a pth power. □

Lemma 7.141.2. *Let k be a field of characteristic $p > 0$. Let $a_1, \ldots, a_n \in k$ be elements such that $da_1, \ldots, da_n$ are linearly independent in $\Omega_{k/\mathbf{F}_p}$. Then the field extension $k(a_1^{1/p}, \ldots, a_n^{1/p})$ has degree p^n over k.*

Proof. By induction on n. If $n = 1$ the result is Lemma 7.141.1. For the induction step, suppose that $k(a_1^{1/p}, \ldots, a_{n-1}^{1/p})$ has degree p^{n-1} over k. We have to show that a_n does not map to a pth power in $k(a_1^{1/p}, \ldots, a_{n-1}^{1/p})$. If it does then we can write

$$\begin{aligned} a_n &= \left(\sum\nolimits_{I=(i_1,\ldots,i_{n-1}),\ 0\le i_j\le p-1} \lambda_I a_1^{i_1/p} \ldots a_{n-1}^{i_{n-1}/p}\right)^p \\ &= \sum\nolimits_{I=(i_1,\ldots,i_{n-1}),\ 0\le i_j\le p-1} \lambda_I^p a_1^{i_1} \ldots a_{n-1}^{i_{n-1}} \end{aligned}$$

Applying d we see that da_n is linearly dependent on da_i, $i < n$. This is a contradiction. $\square$

Lemma 7.141.3. *Let k be a field of characteristic $p > 0$. The following are equivalent:*

(1) *the field extension K/k is separable (see Definition 7.39.1), and*
(2) *the map $K \otimes_k \Omega_{k/\mathbf{F}_p} \to \Omega_{K/\mathbf{F}_p}$ is injective.*

Proof. Write K as a directed colimit $K = colim_i K_i$ of finitely generated field extensions $k \subset K_i$. By definition K is separable if and only if each K_i is separable over k, and by Lemma 7.122.4 we see that $K \otimes_k \Omega_{k/\mathbf{F}_p} \to \Omega_{K/\mathbf{F}_p}$ is injective if and only if each $K_i \otimes_k \Omega_{k/\mathbf{F}_p} \to \Omega_{K_i/\mathbf{F}_p}$ is injective. Hence we may assume that K/k is a finitely generated field extension.

Assume $k \subset K$ is a finitely generated field extension which is separable. Choose $x_1, \ldots, x_{r+1} \in K$ as in Lemma 7.39.3. In this case there exists an irreducible polynomial $G(X_1, \ldots, X_{r+1}) \in k[X_1, \ldots, X_{r+1}]$ such that $G(x_1, \ldots, x_{r+1}) = 0$ and such that $\partial G/\partial X_{r+1}$ is not identically zero. Moreover K is the field of fractions of the domain. $S = K[X_1, \ldots, X_{r+1}]/(G)$. Write

$$G = \sum a_I X^I, \quad X^I = X_1^{i_1} \ldots X_{r+1}^{i_{r+1}}.$$

Using the presentation of S above we see that

$$\Omega_{S/\mathbf{F}_p} = \frac{S \otimes_k \Omega_k \oplus \bigoplus_{i=1,\ldots,r+1} S\mathrm{d}X_i}{\langle \sum X^I \mathrm{d}a_I + \sum \partial G/\partial X_i \mathrm{d}X_i \rangle}$$

Since $\Omega_{K/\mathbf{F}_p}$ is the localization of the S-module $\Omega_{S/\mathbf{F}_p}$ (see Lemma 7.122.8) we conclude that

$$\Omega_{K/\mathbf{F}_p} = \frac{K \otimes_k \Omega_k \oplus \bigoplus_{i=1,\ldots,r+1} K\mathrm{d}X_i}{\langle \sum X^I \mathrm{d}a_I + \sum \partial G/\partial X_i \mathrm{d}X_i \rangle}$$

Now, since the polynomial $\partial G/\partial X_{r+1}$ is not identically zero we conclude that the map $K \otimes_k \Omega_{k/\mathbf{F}_p} \to \Omega_{S/\mathbf{F}_p}$ is injective as desired.

Assume $k \subset K$ is a finitely generated field extension and that $K \otimes_k \Omega_{k/\mathbf{F}_p} \to \Omega_{K/\mathbf{F}_p}$ is injective. (This part of the proof is the same as the argument proving Lemma 7.41.1.) Let $x_1, \ldots, x_r$ be a transcendence basis of K over k such that the degree of inseparability of the finite extension $k(x_1, \ldots, x_r) \subset K$ is minimal. If K is separable over $k(x_1, \ldots, x_r)$ then we win. Assume this is not the case to get a contradiction. Then there exists an element $\alpha \in K$ which is not separable over $k(x_1, \ldots, x_r)$. Let $P(T) \in k(x_1, \ldots, x_r)[T]$ be its minimal polynomial. Because α is not separable actually P is a polynomial in T^p. Clear denominators to get an irreducible polynomial

$$G(X_1, \ldots, X_r, T) = \sum a_{I,i} X^I T^i \in k[X_1, \ldots, X_r, T]$$

such that $G(x_1, \ldots, x_r, \alpha) = 0$ in L. Note that this means $k[X_1, \ldots, X_r, T]/(G) \subset L$. We may assume that for some pair (I_0, i_0) the coefficient $a_{I_0,i_0} = 1$. We claim that dG/dX_i is not identically zero for at least one i. Namely, if this is not the case, then G is actually a polynomial in $X_1^p, \ldots, X_r^p, T^p$. Then this means that

$$\sum\nolimits_{(I,i)\neq(I_0,i_0)} x^I\alpha^i \mathrm{d}a_{I,i}$$

is zero in $\Omega_{K/\mathbf{F}_p}$. Note that there is no k-linear relation among the elements

$$\{x^I\alpha^i \mid a_{I,i}\neq 0 \text{ and } (I,i)\neq(I_0,i_0)\}$$

of K. Hence the assumption that $K\otimes_k \Omega_{k/\mathbf{F}_p} \to \Omega_{K/\mathbf{F}_p}$ is injective this implies that $\mathrm{d}a_{I,i} = 0$ in $\Omega_{k/\mathbf{F}_p}$ for all (I, i). By Lemma 7.141.1 we see that each $a_{I,i}$ is a pth power, which implies that G is a pth power contradicting the irreducibility of G. Thus, after renumbering, we may assume that dG/dX_1 is not zero. Then we see that x_1 is separably algebraic over $k(x_2, \ldots, x_r, \alpha)$, and that $x_2, \ldots, x_r, \alpha$ is a transcendence basis of L over k. This means that the degree of inseparability of the finite extension $k(x_2, \ldots, x_r, \alpha) \subset L$ is less than the degree of inseparability of the finite extension $k(x_1, \ldots, x_r) \subset L$, which is a contradiction. □

Lemma 7.141.4. *Let $k \subset K$ be an extension of fields. If K is formally smooth over k, then K is a separable extension of k.*

Proof. Assume K is formally smooth over k. By Lemma 7.127.9 we see that $K\otimes_k \Omega_{k/\mathbf{Z}} \to \Omega_{K/\mathbf{Z}}$ is injective. Hence K is separable over k by Lemma 7.141.3 above. □

Lemma 7.141.5. *Let $k \subset K$ be an extension of fields. Then K is formally smooth over k if and only if $H_1(L_{K/k}) = 0$.*

Proof. This follows from Proposition 7.127.8 and the fact that a vector spaces is free (hence projective). □

Lemma 7.141.6. *Let $k \subset K$ be an extension of fields.*

(1) *If K is purely transcendental over k, then K is formally smooth over k.*
(2) *If K is separable algebraic over k, then K is formally smooth over k.*
(3) *If K is separable over k, then K is formally smooth over k.*

Proof. For (1) write $K = k(x_j; j \in J)$. Suppose that A is a k-algebra, and $I \subset A$ is an ideal of square zero. Let $\varphi : K \to A/I$ be a k-algebra map. Let $a_j \in A$ be an element such that $a_j \mod I = \varphi(x_j)$. Then it is easy to see that there is a unique k-algebra map $K \to A$ which maps x_j to a_j and which reduces to φ mod I. Hence $k \subset K$ is formally smooth.

In case (2) we see that $k \subset K$ is a colimit of étale ring extensions. An étale ring map is formally étale (Lemma 7.137.2). Hence this case follows from Lemma 7.137.3 and the trivial observation that a formally étale ring map is formally smooth.

In case (3), write $K = colim\, K_i$ as the filtered colimit of its finitely generated sub k-extensions. By Definition 7.39.1 each K_i is separable algebraic over a purely transcendental extension of k. Hence K_i/k is formally smooth by cases (1) and (2) and Lemma 7.127.3. Thus $H_1(L_{K_i/k}) = 0$ by Lemma 7.141.5. Hence $H_1(L_{K/k}) = 0$ by Lemma 7.123.7. Hence K/k is formally smooth by Lemma 7.141.5 again. □

Lemma 7.141.7. *Let k be a field.*

(1) *If the characteristic of k is zero, then any extension field of k is formally smooth over k.*

(2) *If the characteristic of k is $p > 0$, then $k \subset K$ is formally smooth if and only if it is a separable field extension.*

Proof. Combine Lemmas 7.141.4 and 7.141.6. □

Here we put together all the different characterizations of separable field extensions.

Proposition 7.141.8. *Let $k \subset K$ be a field extension. If the characteristic of k is zero then*

(1) *K is separable over k,*
(2) *K is geometrically reduced over k,*
(3) *K is formally smooth over k,*
(4) *$H_1(L_{K/k}) = 0$, and*
(5) *the map $K \otimes_k \Omega_{k/\mathbf{Z}} \to \Omega_{K/\mathbf{Z}}$ is injective.*

If the characteristic of k is $p > 0$, then the following are equivalent:

(1) *K is separable over k,*
(2) *the ring $K \otimes_k k^{1/p}$ is reduced,*
(3) *K is geometrically reduced over k,*
(4) *the map $K \otimes_k \Omega_{k/\mathbf{F}_p} \to \Omega_{K/\mathbf{F}_p}$ is injective,*
(5) *$H_1(L_{K/k}) = 0$, and*
(6) *K is formally smooth over k.*

Proof. This is a combination of Lemmas 7.41.1, 7.141.7 7.141.4, and 7.141.3. □

Here is yet another characterization of finitely generated separable field extensions.

Lemma 7.141.9. *Let $k \subset K$ be a finitely generated field extension. Then K is separable over k if and only if K is the localization of a smooth k-algebra.*

Proof. Choose a finite type k-algebra R which is a domain whose fraction field is K. Lemma 7.129.9 says that $k \to R$ is smooth at (0) if and only if K/k is separable. This proves the lemma. □

Lemma 7.141.10. *Let $k \subset K$ be a field extension. Then K is a filtered colimit of global complete intersection algebras over k. If K/k is separable, then K is a filtered colimit of smooth algebras over k.*

Proof. Suppose that $E \subset K$ is a finite subset. It suffices to show that there exists a k subalgebra $A \subset K$ which contains E and which is a global complete intersection (resp. smooth) over k. The separable/smooth case follows from Lemma 7.141.9. In general let $L \subset K$ be the subfield generated by E. Pick a transcendence basis $x_1, \ldots, x_d \in L$ over k. The extension $k(x_1, \ldots, x_d) \subset L$ is finite. Say $L = k(x_1, \ldots, x_d)[y_1, \ldots, y_r]$. Pick inductively polynomials $P_i \in k(x_1, \ldots, x_d)[Y_1, \ldots, Y_r]$ such that $P_i = P_i(Y_1, \ldots, Y_i)$ is monic in Y_i over $k(x_1, \ldots, x_d)[Y_1, \ldots, Y_{i-1}]$ and maps to the minimum polynomial of y_i in $k(x_1, \ldots, x_d)[y_1, \ldots, y_{i-1}][Y_i]$. Then it is clear that $P_1, \ldots, P_r$ is a regular sequence in $k(x_1, \ldots, x_r)[Y_1, \ldots, Y_r]$ and that $L = k(x_1, \ldots, x_r)[Y_1, \ldots, Y_r]/(P_1, \ldots, P_r)$. If $h \in k[x_1, \ldots, x_d]$ is a polynomial such that $P_i \in k[x_1, \ldots, x_d, 1/h, Y_1, \ldots, Y_r]$, then we see that $P_1, \ldots, P_r$ is a regular sequence in $k[x_1, \ldots, x_d, 1/h, Y_1, \ldots, Y_r]$ and $A = k[x_1, \ldots, x_d, 1/h, Y_1, \ldots, Y_r]/(P_1, \ldots, P_r)$ is a global complete intersection. After adjusting our choice of h we may assume $E \subset A$ and we win. □

7.142. Constructing flat ring maps

The following lemma is occasionally useful.

Lemma 7.142.1. *Let $(R, \mathfrak m, k)$ be a local ring. Let $k \subset K$ be a field extension. There exists a local ring R', a flat local ring map $R \to R'$ such that $\mathfrak m' = \mathfrak m R'$ and the residue field extension $k = R/\mathfrak m \subset R'/\mathfrak m'$ is isomorphic to $k \subset K$.*

Proof. Suppose that $k \subset k' = k(\alpha)$ is a monogenic extension of fields. Then k' is the residue field of a flat local extension $R \subset R'$ as in the lemma. Namely, if α is transcendental over k, then we let R' be the localization of $R[x]$ at the prime $\mathfrak m R[x]$. If α is algebraic with minimal polynomial $T^d + \sum \overline{\lambda}_i T^{d-i}$, then we let $R' = R[T]/(T^d + \sum \lambda_i T^{d-i})$.

Consider the collection of triples $(k', R \to R', \phi)$, where $k \subset k' \subset K$ is a subfield, $R \to R'$ is a local ring map as in the lemma, and $\phi : R' \to k'$ induces an isomorphism $R'/\mathfrak m R' \cong k'$ of k-extensions. These form a ``big'' category $\mathcal C$ with morphisms $(k_1, R_1, \phi_1) \to (k_2, R_2, \phi_2)$ given by ring maps $\psi : R_1 \to R_2$ such that

$$\begin{tikzcd} R_1 \arrow[r, "\phi_1"'] \arrow[d, "\psi"'] & k_1 \arrow[r] & K \arrow[d, equal] \\ R_2 \arrow[r, "\phi_2"] & k_2 \arrow[r] & K \end{tikzcd}$$

commutes. This implies that $k_1 \subset k_2$.

Suppose that I is a directed partially ordered set, and $((R_i, k_i, \phi_i), \psi_{ii'})$ is a system over I, see Categories, Section 4.19. In this case we can consider

$$R' = colim_{i \in I} R_i$$

This is a local ring with maximal ideal $\mathfrak m R'$, and residue field $k' = \bigcup_{i \in I} k_i$. Moreover, the ring map $R \to R'$ is flat as it is a colimit of flat maps (and tensor products commute with directed colimits). Hence we see that (R', k', ϕ') is an ``upper bound'' for the system.

An almost trivial application of Zorn's Lemma would finish the proof if $\mathcal C$ was a set, but it isn't. (Actually, you can make this work by finding a reasonable bound on the cardinals of the local rings occuring.) To get around this problem we choose a total ordering on K. For $x \in K$ we let $K(x)$ be the subfield of K generated by all elements of K which are $\leq x$. By transfinite induction on $x \in K$ we will produce ring maps $R \subset R(x)$ as in the lemma with residue field extension $k \subset K(x)$. Moreover, by construction we will have that $R(x)$ will contain $R(y)$ for all $y \leq x$. Namely, if x has a predecessor x', then $K(x) = K(x')[x]$ and hence we can let $R(x') \subset R(x)$ be the local ring extension constructed in the first paragraph of the proof. If x does not have a predecessor, then we first set $R'(x) = colim_{x' < x} R(x')$ as in the third paragraph of the proof. The residue field of $R'(x)$ is $K'(x) = \bigcup_{x' < x} K(x')$. Since $K(x) = K'(x)[x]$ we see that we can use the construction of the first paragraph of the proof to produce $R'(x) \subset R(x)$. This finishes the proof of the lemma. $\square$

Lemma 7.142.2. *Let R be a ring. Let $\mathfrak p \subset R$ be a prime and let $\kappa(\mathfrak p) \subset L$ be a finite extension of fields. Then there exists a finite free ring map $R \to S$ such that $\mathfrak q = \mathfrak p S$ is prime and $\kappa(\mathfrak p) \subset \kappa(\mathfrak q)$ is isomorphic to the given extension $\kappa(\mathfrak p) \subset L$.*

Proof. By induction of the degree of $\kappa(\mathfrak p) \subset L$. If the degree is 1, then we take $R = S$. In general, if there exists a sub extension $\kappa(\mathfrak p) \subset L' \subset L$ then we win by induction on the degree (by first constructing $R \subset S'$ corresponding to $L'/\kappa(\mathfrak p)$ and then construction $S' \subset S$ corresponding to L/L'). Thus we may assume that $L \supset \kappa(\mathfrak p)$ is generated by a single element $\alpha \in L$. Let $X^d + \sum_{i<d} a_i X^i$ be the minimal polynomial of α over $\kappa(\mathfrak p)$, so $a_i \in \kappa(\mathfrak p)$. We may write a_i as the image of f_i/g for some $f_i, g \in R$ and $g \not\in \mathfrak p$. After replacing α by $g\alpha$ (and correspondingly replacing a_i by $g^{d-i}a_i$) we may assume that a_i is the image of some $f_i \in R$. Then we simply take $S = R[x]/(x^d + \sum f_i x^i)$. $\square$

7.143. The Cohen structure theorem

Here is a fundamental notion in commutative algebra.

Definition 7.143.1. Let $(R, \mathfrak m)$ be a local ring. We say R is a *complete local ring* if the canonical map

$$R \longrightarrow lim_n R/\mathfrak m^n$$

to the completion of R with respect to $\mathfrak m$ is an isomorphism[7].

Note that an Artinian local ring R is a complete local ring because $\mathfrak m_R^n = 0$ for some $n > 0$. In this section we mostly focus on Noetherian complete local rings.

Lemma 7.143.2. *Let R be a Noetherian complete local ring. Any quotient of R is also a Noetherian complete local ring. Given a finite ring map $R \to S$, then S is a product of Noetherian complete local rings.*

Proof. The ring S is Noetherian by Lemma 7.28.1. As an R-module S is complete by Lemma 7.90.2. Hence S is the product of the completions at its maximal ideals by Lemma 7.90.17. $\square$

Lemma 7.143.3. *Let $(R, \mathfrak m)$ be a complete local ring. If $\mathfrak m$ is a finitely generated ideal then R is Noetherian.*

Proof. See Lemma 7.90.9. $\square$

Definition 7.143.4. Let $(R, \mathfrak m)$ be a complete local ring. A subring $\Lambda \subset R$ is called a *coefficient ring* if the following conditions hold:

1. Λ is a complete local ring with maximal ideal $\Lambda \cap \mathfrak m$,
2. the residue field of Λ maps isomorphically to the residue field of R, and
3. $\Lambda \cap \mathfrak m = p\Lambda$, where p is the characteristic of the residue field of R.

Let us make some remarks on this definition. We split the discussion into the following cases:

1. The local ring R contains a field. This happens if either $\mathbf Q \subset R$, or $pR = 0$ where p is the characteristic of $R/\mathfrak m$. In this case a coefficient ring Λ is a field contained in R which maps isomorphically to $R/\mathfrak m$.
2. The characteristic of $R/\mathfrak m$ is $p > 0$ but no power of p is zero in R. In this case Λ is a complete discrete valuation ring with uniformizer p and residue field $R/\mathfrak m$.
3. The characteristic of $R/\mathfrak m$ is $p > 0$, and for some $n > 1$ we have $p^{n-1} \neq 0$, $p^n = 0$ in R. In this case Λ is an Artinian local ring whose maximal ideal is generated by p and which has residue field $R/\mathfrak m$.

The complete discrete valuation rings with uniformizer p above play a special role and we baptize them as follows.

[7] This includes the condition that $\bigcap \mathfrak m^n = (0)$; in some texts this may be indicated by saying that R is complete and separated. Warning: It can happen that the completion $lim_n R/\mathfrak m^n$ of a local ring is non-complete, see Examples, Lemma 64.2.1. This does not happen when $\mathfrak m$ is finitely generated, see Lemma 7.90.7 in which case the completion is Noetherian, see Lemma 7.90.9.

Definition 7.143.5. A *Cohen ring* is a complete discrete valuation ring with uniformizer p a prime number.

Lemma 7.143.6. *Let p be a prime number. Let k be a field of characteristic p. There exists a Cohen ring Λ with $\Lambda/p\Lambda \cong k$.*

Proof. First note that the p-adic integers $\mathbf{Z}_p$ form a Cohen ring for $\mathbf{F}_p$. Let k be an arbitrary field of characteristic p. Let $\mathbf{Z}_p \to R$ be a flat local ring map such that $\mathfrak{m}_R = pR$ and $R/pR = k$, see Lemma 7.142.1. Then clearly R is a discrete valuation ring. Hence its completion is a Cohen ring for k. $\square$

Lemma 7.143.7. *Let $p > 0$ be a prime. Let Λ be a Cohen ring with residue field of characteristic p. For every $n \geq 1$ the ring map*

$$\mathbf{Z}/p^n\mathbf{Z} \to \Lambda/p^n\Lambda$$

is formally smooth.

Proof. If $n = 1$, this follows from Proposition 7.141.8. For general n we argue by induction on n. Namely, if $\mathbf{Z}/p^n\mathbf{Z} \to \Lambda/p^n\Lambda$ is formally smooth, then we can apply Lemma 7.127.12 to the ring map $\mathbf{Z}/p^{n+1}\mathbf{Z} \to \Lambda/p^{n+1}\Lambda$ and the ideal $I = (p^n) \subset \mathbf{Z}/p^{n+1}\mathbf{Z}$. $\square$

Theorem 7.143.8. *(Cohen structure theorem) Let $(R, \mathfrak{m})$ be a complete local ring.*

(1) *R has a coefficient ring (see Definition 7.143.4),*
(2) *if $\mathfrak{m}$ is a finitely generated ideal, then R is isomorphic to a quotient*

$$\Lambda[[x_1, \ldots, x_n]]/I$$

where Λ is either a field or a Cohen ring.

Proof. Let us prove a coefficient ring exists. First we prove this in case the characteristic of the residue field κ is zero. Namely, in this case we will prove by induction on $n > 0$ that there exists a section

$$\varphi_n : \kappa \longrightarrow R/\mathfrak{m}^n$$

to the canonical map $R/\mathfrak{m}^n \to \kappa = R/\mathfrak{m}$. This is trivial for $n = 1$. If $n > 1$, let φ_{n-1} be given. The field extension $\mathbf{Q} \subset \kappa$ is formally smooth by Proposition 7.141.8. Hence we can find the dotted arrow in the following diagram

$$\begin{tikzcd} R/\mathfrak{m}^{n-1} & R/\mathfrak{m}^n \arrow[l] \\ \kappa \arrow[u, "\varphi_{n-1}"] \arrow[ur, dotted] & \mathbf{Q} \arrow[l] \arrow[u] \end{tikzcd}$$

This proves the induction step. Putting these maps together

$$lim_n\ \varphi_n : \kappa \longrightarrow R = lim_n\ R/\mathfrak{m}^n$$

gives a map whose image is the desired coefficient ring.

Next, we prove the existence of a coefficient ring in the case where the characteristic of the residue field κ is $p > 0$. Namely, choose a Cohen ring Λ with $\kappa = \Lambda/p\Lambda$, see Lemma 7.143.6. In this case we will prove by induction on $n > 0$ that there exists a map

$$\varphi_n : \Lambda/p^n\Lambda \longrightarrow R/\mathfrak{m}^n$$

whose composition with the reduction map $R/\mathfrak{m}^n \to \kappa$ produces the given isomorphism $\Lambda/p\Lambda = \kappa$. This is trivial for $n = 1$. If $n > 1$, let φ_{n-1} be given. The ring map $\mathbf{Z}/p^n\mathbf{Z} \to$

$\Lambda/p^n\Lambda$ is formally smooth by Lemma 7.143.7. Hence we can find the dotted arrow in the following diagram

$$\begin{tikzcd} R/\mathfrak{m}^{n-1} & R/\mathfrak{m}^n \arrow[l] \\ \Lambda/p^n\Lambda \arrow[u, "\varphi_{n-1}"] \arrow[ur, dotted] & \mathbf{Z}/p^n\mathbf{Z} \arrow[l] \arrow[u] \end{tikzcd}$$

This proves the induction step. Putting these maps together

$$lim_n\ \varphi_n : \Lambda = lim_n\ \Lambda/p^n\Lambda \longrightarrow R = lim_n\ R/\mathfrak{m}^n$$

gives a map whose image is the desired coefficient ring.

The final statement of the theorem is now clear. Namely, if $y_1, \ldots, y_n$ are generators of the ideal $\mathfrak{m}$, then we can use the map $\Lambda \to R$ just constructed to get a map

$$\Lambda[[x_1, \ldots, x_n]] \longrightarrow R, \quad x_i \longmapsto y_i.$$

This map is surjective on each $R/\mathfrak{m}^n$ and hence is surjective as R is complete. Some details omitted. $\square$

Remark 7.143.9. If k is a field then the power series ring $k[[X_1, \ldots, X_d]]$ is a Noetherian complete local regular ring of dimension d. If Λ is a Cohen ring then $\Lambda[[X_1, \ldots, X_d]]$ is a complete local Noetherian regular ring of dimension $d + 1$. Hence the Cohen structure theorem implies that any Noetherian complete local ring is a quotient of a regular local ring. In particular we see that a Noetherian complete local ring is universally catenary, see Lemma 7.97.6 and Lemma 7.98.3.

Lemma 7.143.10. *Let $(R, \mathfrak{m})$ be a Noetherian complete local domain. Then there exists a $R_0 \subset R$ with the following properties*

1. *R_0 is a regular complete local ring,*
2. *$R_0 \subset R$ is finite and induces an isomorphism on residue fields,*
3. *R_0 is either isomorphic to $k[[X_1, \ldots, X_d]]$ where k is a field or $\Lambda[[X_1, \ldots, X_d]]$ where Λ is a Cohen ring.*

Proof. Let Λ be a coefficient ring of R. Since R is a domain we see that either Λ is a field or Λ is a Cohen ring.

Case I: $\Lambda = k$ is a field. Let $d = \dim(R)$. Choose $x_1, \ldots, x_d \in \mathfrak{m}$ which generate an ideal of definition $I \subset R$. (See Section 7.57.) By Lemma 7.90.12 we see that R is I-adically complete as well. Consider the map $R_0 = k[[X_1, \ldots, X_d]] \to R$ which maps X_i to x_i. Note that R_0 is complete with respect to the ideal $I_0 = (X_1, \ldots, X_d)$, and that $R/I_0R \cong R/IR$ is finite over $k = R_0/I_0$ (because $\dim(R/I) = 0$, see Section 7.57.) Hence we conclude that $R_0 \to R$ is finite by Lemma 7.90.15. Since $\dim(R) = \dim(R_0)$ this implies that $R_0 \to R$ is injective (see Lemma 7.103.3), and the lemma is proved.

Case II: Λ is a Cohen ring. Let $d+1 = \dim(R)$. Let $p > 0$ be the characteristic of the residue field k. As R is a domain we see that p is a nonzero divisor in R. Hence $\dim(R/pR) = d$, see Lemma 7.57.11. Choose $x_1, \ldots, x_d \in R$ which generate an ideal of definition in R/pR. Then $I = (p, x_1, \ldots, x_d)$ is an ideal of definition of R. By Lemma 7.90.12 we see that R is I-adically complete as well. Consider the map $R_0 = \Lambda[[X_1, \ldots, X_d]] \to R$ which maps X_i to x_i. Note that R_0 is complete with respect to the ideal $I_0 = (p, X_1, \ldots, X_d)$, and that $R/I_0R \cong R/IR$ is finite over $k = R_0/I_0$ (because $\dim(R/I) = 0$, see Section 7.57.) Hence we conclude that $R_0 \to R$ is finite by Lemma 7.90.15. Since $\dim(R) = \dim(R_0)$ this implies that $R_0 \to R$ is injective (see Lemma 7.103.3), and the lemma is proved. $\square$

7.144. Nagata and Japanese rings

In this section we discuss finiteness of integral closure. It turns out that this is closely related to the relationship between a local ring and its completion.

Definition 7.144.1. Let R be a a domain with field of fractions K.

(1) We say R is *N-1* if the integral closure of R in K is a finite R-module.
(2) We say R is *N-2*, or *Japanese* if for any finite extension $K \subset L$ of fields the integral closure of R in L is finite over R.

The main interest in these notions is for Noetherian rings, but here is a non-Noetherian example.

Example 7.144.2. Let k be a field. The domain $R = k[x_1, x_2, x_3, \ldots]$ is Japanese, but not Noetherian. The reason is the following. Suppose that $R \subset L$ and the field L is a finite extension of the fraction field of R. Then there exists an integer n such that L comes from a finite extension $k(x_1, \ldots, x_n) \subset L_0$ by adjoining the (transcendental) elements x_{n+1}, x_{n+2}, etc. Let S_0 be the integral closure of $k[x_1, \ldots, x_n]$ in L_0. By Proposition 7.144.31 below it is true that S_0 is finite over $k[x_1, \ldots, x_n]$. Moreover, the integral closure of R in L is $S = S_0[x_{n+1}, x_{n+2}, \ldots]$ (use Lemma 7.33.8) and hence finite over R. The same argument works for $R = \mathbf{Z}[x_1, x_2, x_3, \ldots]$.

Lemma 7.144.3. *Let R be a domain. If R is N-1 then so is any localization of R. Same for N-2.*

Proof. These statements hold because taking integral closure commutes with localization, see Lemma 7.32.9. □

Lemma 7.144.4. *Let R be a domain. Let $f_1, \ldots, f_n \in R$ generate the unit ideal. If each domain R_{f_i} is N-1 then so is R. Same for N-2.*

Proof. Assume R_{f_i} is N-2 (or N-1). Let L be a finite extension of the fraction field of R (equal to the fraction field in the N-1 case). Let S be the integral closure of R in L. By Lemma 7.32.9 we see that S_{f_i} is the integral closure of R_{f_i} in L. Hence S_{f_i} is finite over R_{f_i} by assumption. Thus S is finite over R by Lemma 7.21.2. □

Lemma 7.144.5. *Let R be a domain. Let $R \subset S$ be a quasi-finite extension of domains (for example finite). Assume R is N-2 and Noetherian. Then S is N-2.*

Proof. Let $K = f.f.(R) \subset L = f.f.(S)$. Note that this is a finite field extension (for example by Lemma 7.113.2 (2) applied to the fibre $S \otimes_R K$, and the definition of a quasi-finite ring map). Let S' be the integral closure of R in S. Then S' is contained in the integral closure of R in L which is finite over R by assumption. As R is Noetherian this implies S' is finite over R. By Lemma 7.114.15 there exist elements $g_1, \ldots, g_n \in S'$ such that $S'_{g_i} \cong S_{g_i}$ and such that $g_1, \ldots, g_n$ generate the unit ideal in S. Hence it suffices to show that S' is N-2 by Lemmas 7.144.3 and 7.144.4. Thus we have reduced to the case where S is finite over R.

Assume $R \subset S$ with hypotheses as in the lemma and moreover that S is finite over R. Let M be a finite field extension of the fraction field of S. Then M is also a finite field extension of $f.f(R)$ and we conclude that the integral closure T of R in M is finite over R. By Lemma 7.32.14 we see that T is also the integral closure of S in M and we win by Lemma 7.32.13. □

Lemma 7.144.6. *Let R be a Noetherian domain. If $R[z, z^{-1}]$ is N-1, then so is R.*

Proof. Let R' be the integral closure of R in its field of fractions K. Let S' be the integral closure of $R[z, z^{-1}]$ in its field of fractions. Clearly $R' \subset S'$. Since $K[z, z^{-1}]$ is a normal domain we see that $S' \subset K[z, z^{-1}]$. Suppose that $f_1, \ldots, f_n \in S'$ generate S' as $R[z, z^{-1}]$-module. Say $f_i = \sum a_{ij} z^j$ (finite sum), with $a_{ij} \in K$. For any $x \in R'$ we can write

$$x = \sum h_i f_i$$

with $h_i \in R[z, z^{-1}]$. Thus we see that R' is contained in the finite R-submodule $\sum R a_{ij} \subset K$. Since R is Noetherian we conclude that R' is a finite R-module. □

Lemma 7.144.7. *Let R be a Noetherian domain, and let $R \subset S$ be a finite extension of domains. If S is N-1, then so is R. If S is N-2, then so is R.*

Proof. Omitted. (Hint: Integral closures of R in extension fields are contained in integral closures of S in extension fields.) □

Lemma 7.144.8. *Let R be a Noetherian normal domain with fraction field K. Let $K \subset L$ be a finite separable field extension. Then the integral closure of R in L is finite over R.*

Proof. Consider the trace pairing

$$L \times L \longrightarrow K, \quad (x, y) \longmapsto \langle x, y \rangle := \mathrm{Tr}_{L/K}(xy).$$

Since L/K is separable this is nondegenerate (exercise in Galois theory). Moreover, if $x \in L$ is integral over R, then $\mathrm{Tr}_{L/K}(x)$ is integral over R also, and since R is normal we see $\mathrm{Tr}_{L/K}(x) \in R$. Pick $x_1, \ldots, x_n \in L$ which are integral over R and which form a K-basis of L. Then the integral closure $S \subset L$ is contained in the R-module

$$M = \{ y \in L \mid \langle x_i, y \rangle \in R,\ i = 1, \ldots, n \}$$

By linear algebra we see that $M \cong R^{\oplus n}$ as an R-module. Hence $S \subset R^{\oplus n}$ is a finitely generated R-module as R is Noetherian. □

Example 7.144.9. Lemma 7.144.8 does not work if the ring is not Noetherian. For example consider the action of $G = \{+1, -1\}$ on $A = \mathbf{C}[x_1, x_2, x_3, \ldots]$ where -1 acts by mapping x_i to $-x_i$. The invariant ring $R = A^G$ is the $\mathbf{C}$-algebra generated by all $x_i x_j$. Hence $R \subset A$ is not finite. But R is a normal domain with fraction field $K = L^G$ the G-invariants in the fraction field L of A. And clearly A is the integral closure of R in L.

Lemma 7.144.10. *A Noetherian domain of characteristic zero is N-1 if and only if it is N-2 (i.e., Japanese).*

Proof. This is clear from Lemma 7.144.8 since every field extension in characteristic zero is separable. □

Lemma 7.144.11. *Let R be a Noetherian domain with fraction field K of characteristic $p > 0$. Then R is Japanese if and only if for every finite purely inseparable extension $K \subset L$ the integral closure of R in L is finite over R.*

Proof. Assume the integral closure of R in every finite purely inseparable field extension of K is finite. Let $K \subset L$ be any finite extension. We have to show the integral closure of R in L is finite over R. Choose a finite normal field extension $K \subset M$ containing L. As R is Noetherian it suffices to show that the integral closure of R in M is finite over R. By Lemma 7.38.4 there exists a subextension $K \subset M_{insep} \subset M$ such that M_{insep}/K is purely inseparable, and M/M_{insep} is separable. By assumption the integral closure R' of R in M_{insep} is finite over R. By Lemma 7.144.8 the integral closure R'' of R' in M is finite over

R'. Then R'' is finite over R by Lemma 7.7.3. Since R'' is also the integral closure of R in M (see Lemma 7.32.14) we win. □

Lemma 7.144.12. *Let R be a Noetherian domain. If R is N-1 then $R[x]$ is N-1. If R is N-2 then $R[x]$ is N-2.*

Proof. Assume R is N-1. Let R' be the integral closure of R which is finite over R. Hence also $R'[x]$ is finite over $R[x]$. The ring $R'[x]$ is normal (see Lemma 7.33.8), hence N-1. This proves the first assertion.

For the second assertion, by Lemma 7.144.7 it suffices to show that $R'[x]$ is N-2. In other words we may and do assume that R is a normal N-2 domain. In characteristic zero we are done by Lemma 7.144.10. In characteristic $p > 0$ we have to show that the integral closure of $R[x]$ is finite in any finite purely inseparable extension of $f.f.(R[x]) = K(x) \subset L$ with $K = f.f.(R)$. Clearly there exists a finite purely inseparable field extension $K \subset L'$ and $q = p^e$ such that $L \subset L'(x^{1/q})$. As $R[x]$ is Noetherian it suffices to show that the integral closure of $R[x]$ in $L'(x^{1/q})$ is finite over $R[x]$. And this integral closure is equal to $R'[x^{1/q}]$ with $R \subset R' \subset L'$ the integral closure of R in L'. Since R is N-2 we see that R' is finite over R and hence $R'[x^{1/q}]$ is finite over $R[x]$. □

Lemma 7.144.13 (Tate)**.** *Let R be a ring. Let $x \in R$. Assume*

(1) *R is a normal Noetherian domain,*
(2) *R/xR is a Japanese domain,*
(3) *$R \cong lim_n R/x^n R$ is complete with respect to x.*

Then R is Japanese.

Proof. We may assume $x \neq 0$ since otherwise the lemma is trivial. Let K be the fraction field of R. If the characteristic of K is zero the lemma follows from (1), see Lemma 7.144.10. Hence we may assume that the characteristic of K is $p > 0$, and we may apply Lemma 7.144.11. Thus given $K \subset L$ be a finite purely inseparable field extension we have to show that the integral closure S of R in L is finite over R.

Let q be a power of p such that $L^q \subset K$. By enlarging L if necessary we may assume there exists an element $y \in L$ such that $y^q = x$. Since $R \to S$ induces a homeomorphism of spectra (see Lemma 7.43.2) there is a unique prime ideal $\mathfrak{q} \subset S$ lying over the prime ideal $\mathfrak{p} = xR$. It is clear that

$$\mathfrak{q} = \{f \in S \mid f^q \in \mathfrak{p}\} = yS$$

since $y^q = x$. Hence $R_{\mathfrak{p}}$ and $S_{\mathfrak{q}}$ are discrete valuation rings, see Lemma 7.110.6. By Lemma 7.110.8 we see that $\kappa(\mathfrak{p}) \subset \kappa(\mathfrak{q})$ is a finite field extension. Hence the integral closure $S' \subset \kappa(\mathfrak{q})$ of R/xR is finite over R/xR by assumption (2). Since $S/yS \subset S'$ this implies that S/yS is finite over R. Note that S/y^nS has a finite filtration whose subquotients are the modules $y^iS/y^{i+1}S \cong S/yS$. Hence we see that each S/y^nS is finite over R. In particular S/xS is finite over R. Also, it is clear that $\bigcap x^nS = (0)$ since an element in the intersection has qth power contained in $\bigcap x^nR = (0)$ (Lemma 7.47.6). Thus we may apply Lemma 7.90.15 to conclude that S is finite over R, and we win. □

Lemma 7.144.14. *Let R be a ring. If R is Noetherian, a domain, and N-2, then so is $R[[x]]$.*

Proof. Apply Lemma 7.144.13 to the element $x \in R[[x]]$. □

Definition 7.144.15. Let R be a ring.

(1) We say R is *universally Japanese* if for any finite type ring map $R \to S$ with S a domain we have that S is Japanese (i.e., N-2).

(2) We say that R is a *Nagata ring* if R is Noetherian and for every prime ideal $\mathfrak{p}$ the ring $R/\mathfrak{p}$ is Japanese.

It is clear that a Noetherian universally Japanese ring is a Nagata ring. It is our goal to show that a Nagata ring is universally Japanese. This is not obvious at all, and requires some work. But first, here is a useful lemma.

Lemma 7.144.16. *Let R be a Nagata ring. Let $R \to S$ be essentially of finite type with S reduced. Then the integral closure of R in S is finite over R.*

Proof. As S is essentially of finite type over R it is Noetherian and has finitely many minimal primes $\mathfrak{q}_1, \ldots, \mathfrak{q}_m$, see Lemma 7.28.6. Since S is reduced we have $S \subset \prod S_{\mathfrak{q}_i}$ and each $S_{\mathfrak{q}_i} = K_i$ is a field, see Lemmas 7.22.2 and 7.23.3. It suffices to show that the integral closure A_i' of R in each K_i is finite over R. This is true because R is Noetherian and $A \subset \prod A_i'$. Let $\mathfrak{p}_i \subset R$ be the prime of R corresponding to $\mathfrak{q}_i$. As S is essentially of finite type over R we see that $K_i = S_{\mathfrak{q}_i} = \kappa(\mathfrak{q}_i)$ is a finitely generated field extension of $\kappa(\mathfrak{p}_i)$. Hence the algebraic closure L_i of $\kappa(\mathfrak{p}_i)$ in $\subset K_i$ is finite over $\kappa(\mathfrak{p}_i)$, see Lemma 7.38.7. It is clear that A_i' is the integral closure of $R/\mathfrak{p}_i$ in L_i, and hence we win by definition of a Nagata ring. ☐

Lemma 7.144.17. *Let R be a ring. To check that R is universally Japanese it suffices to show: If $R \to S$ is of finite type, and S a domain then S is N-1.*

Proof. Namely, assume the condition of the lemma. Let $R \to S$ be a finite type ring map with S a domain. Let $f.f.(S) \subset L$ be a finite extension of its fraction field. Then there exists a finite ring extension $S \subset S' \subset L$ with $f.f.(S') = L$. By assumption S' is N-1, and hence the integral closure S'' of S' in L is finite over S'. Thus S'' is finite over S (Lemma 7.7.3) and S'' is the integral closure of S in L (Lemma 7.32.14). We conclude that R is universally Japanese. ☐

Lemma 7.144.18. *If R is universally Japanese then any algebra essentially of finite type over R is universally Japanese.*

Proof. The case of an algebra of finite type over R is immediate from the definition. The general case follows on applying Lemma 7.144.3. ☐

Lemma 7.144.19. *Let R be a Nagata ring. If $R \to S$ is a quasi-finite ring map (for example finite) then S is a Nagata ring also.*

Proof. First note that S is Noetherian as R is Noetherian and a quasi-finite ring map is of finite type. Let $\mathfrak{q} \subset S$ be a prime ideal, and set $\mathfrak{p} = R \cap \mathfrak{q}$. Then $R/\mathfrak{p} \subset S/\mathfrak{q}$ is quasi-finite and hence we conclude that $S/\mathfrak{q}$ is N-2 by Lemma 7.144.5 as desired. ☐

Lemma 7.144.20. *A localization of a Nagata ring is a Nagata ring.*

Proof. Clear from Lemma 7.144.3. ☐

Lemma 7.144.21. *Let R be a ring. Let $f_1, \ldots, f_n \in R$ generate the unit ideal.*

(1) *If each R_{f_i} is universally Japanese then so is R.*
(2) *If each R_{f_i} is Nagata then so is R.*

Proof. Let $\varphi : R \to S$ be a finite type ring map so that S is a domain. Then $\varphi(f_1), \ldots, \varphi(f_n)$ generate the unit ideal in S. Hence if each $S_{f_i} = S_{\varphi(f_i)}$ is N-1 then so is S, see Lemma 7.144.4. This proves (1).

If each R_{f_i} is Nagata, then each R_{f_i} is Noetherian and hence R is Noetherian, see Lemma 7.21.2. And if $\mathfrak{p} \subset R$ is a prime, then we see each $R_{f_i}/\mathfrak{p}R_{f_i} = (R/\mathfrak{p})_{f_i}$ is Japanese and hence we conclude $R/\mathfrak{p}$ is Japanese by Lemma 7.144.4. This proves (2). □

Lemma 7.144.22. *A Noetherian complete local ring is a Nagata ring.*

Proof. Let R be a complete local Noetherian ring. Let $\mathfrak{p} \subset R$ be a prime. Then $R/\mathfrak{p}$ is also a complete local Noetherian ring, see Lemma 7.143.2. Hence it suffices to show that a Noetherian complete local domain R is N-2. By Lemmas 7.144.5 and 7.143.10 we reduce to the case $R = k[[X_1, \ldots, X_d]]$ where k is a field or $R = \Lambda[[X_1, \ldots, X_d]]$ where Λ is a Cohen ring.

In the case $k[[X_1, \ldots, X_d]]$ we reduce to the statement that a field is N-2 by Lemma 7.144.14. This is clear. In the case $\Lambda[[X_1, \ldots, X_d]]$ we reduce to the statement that a Cohen ring Λ is N-2. Applying Lemma 7.144.13 once more with $x = p \in \Lambda$ we reduce yet again to the case of a field. Thus we win. □

Definition 7.144.23. Let $(R, \mathfrak{m})$ be a Noetherian local ring. We say R is *analytically unramified* if its completion $R^\wedge = lim_n R/\mathfrak{m}^n$ is reduced. A prime ideal $\mathfrak{p} \subset R$ is said to be *analytically unramified* if $R/\mathfrak{p}$ is analytically unramified.

At this point we know the following are true for any Noetherian local ring R: The map $R \to R^\wedge$ is a faithfully flat local ring homomorphism (Lemma 7.90.4). The completion $R^\wedge$ is Noetherian (Lemma 7.90.9) and complete (Lemma 7.90.8). Hence the completion $R^\wedge$ is a Nagata ring (Lemma 7.144.22). Moreover, we have seen in Section 7.143 that $R^\wedge$ is a quotient of a regular local ring (Theorem 7.143.8), and hence universally catenary (Remark 7.143.9).

Lemma 7.144.24. *Let $(R, \mathfrak{m})$ be a Noetherian local ring.*

(1) *If R is analytically unramified, then R is reduced.*
(2) *If R is analytically unramified, then each minimal prime of R is analytically unramified.*
(3) *If R is reduced with minimal primes $\mathfrak{q}_1, \ldots, \mathfrak{q}_t$, and each $\mathfrak{q}_i$ is analytically unramified, then R is analytically unramified.*
(4) *If R is analytically unramified, then the integral closure of R in its total ring of fractions $Q(R)$ is finite over R.*
(5) *If R is a domain and analytically unramified, then R is N-1.*

Proof. In this proof we will use the remarks immediately following Definition 7.144.23. As $R \to R^\wedge$ is a faithfully flat local ring homomorphism it is injective and (1) follows.

Let $\mathfrak{q}$ be a minimal prime of R, and assume R is analytically unramified. Then $\mathfrak{q}$ is an associated prime of R (see Proposition 7.60.6). Hence there exists an $f \in R$ such that $\{x \in R \mid fx = 0\} = \mathfrak{q}$. Note that $(R/\mathfrak{q})^\wedge = R^\wedge/\mathfrak{q}^\wedge$, and that $\{x \in R^\wedge \mid fx = 0\} = \mathfrak{q}^\wedge$, because completion is exact (Lemma 7.90.3). If $x \in R^\wedge$ is such that $x^2 \in \mathfrak{q}^\wedge$, then $fx^2 = 0$ hence $(fx)^2 = 0$ hence $fx = 0$ hence $x \in \mathfrak{q}^\wedge$. Thus $\mathfrak{q}$ is analytically unramified and (2) holds.

Assume R is reduced with minimal primes $\mathfrak{q}_1, \ldots, \mathfrak{q}_t$, and each $\mathfrak{q}_i$ is analytically unramified. Then $R \to R/\mathfrak{q}_1 \times \ldots \times R/\mathfrak{q}_t$ is injective. Since completion is exact (see Lemma 7.90.3) we see that $R^\wedge \subset (R/\mathfrak{q}_1)^\wedge \times \ldots \times (R/\mathfrak{q}_t)^\wedge$. Hence (3) is clear.

Assume R is analytically unramified. Let $\mathfrak{p}_1, \ldots, \mathfrak{p}_s$ be the minimal primes of $R^\wedge$. Then we see that

$$Q(R^\wedge) = R_{\mathfrak{p}_1} \times \ldots \times R_{\mathfrak{p}_s}$$

with each $R_{\mathfrak{p}_i}$ a field as $R^\wedge$ is reduced (see Lemma 7.22.2). Hence the integral closure S of $R^\wedge$ in $Q(R^\wedge)$ is equal to $S = S_1 \times \ldots \times S_s$ with S_i the integral closure of $R/\mathfrak{p}_i$ in its fraction field. In particular S is finite over $R^\wedge$. Denote R' the integral closure of R in $Q(R)$. As $R \to R^\wedge$ is flat we see that $R' \otimes_R R^\wedge \subset Q(R) \otimes_R R^\wedge \subset Q(R^\wedge)$. Moreover $R' \otimes_R R^\wedge$ is integral over $R^\wedge$ (Lemma 7.32.11). Hence $R' \otimes_R R^\wedge \subset S$ is a $R^\wedge$-submodule. As $R^\wedge$ is Noetherian it is a finite $R^\wedge$-module. Thus we may find $f_1, \ldots, f_n \in R'$ such that $R' \otimes_R R^\wedge$ is generated by the elements $f_i \otimes 1$ as a $R^\wedge$-module. By faithful flatness we see that R' is generated by $f_1, \ldots, f_n$ as an R-module. This proves (4).

Part (5) is a special case of part (4). □

Lemma 7.144.25. *Let R be a Noetherian local ring. Let $\mathfrak{p} \subset R$ be a prime. Assume*

1. *$R_\mathfrak{p}$ is a discrete valuation ring, and*
2. *$\mathfrak{p}$ is analytically unramified.*

Then for any associated prime $\mathfrak{q}$ of $R^\wedge/\mathfrak{p}R^\wedge$ the local ring $(R^\wedge)_\mathfrak{q}$ is a discrete valuation ring.

Proof. Assumption (2) says that $R^\wedge/\mathfrak{p}R^\wedge$ is a reduced ring. Hence an associated prime $\mathfrak{q} \subset R^\wedge$ of $R^\wedge/\mathfrak{p}R^\wedge$ is the same thing as a minimal prime over $\mathfrak{p}R^\wedge$. In particular we see that the maximal ideal of $(R^\wedge)_\mathfrak{q}$ is $\mathfrak{p}(R^\wedge)_\mathfrak{q}$. Choose $x \in R$ such that $xR_\mathfrak{p} = \mathfrak{p}R_\mathfrak{p}$. By the above we see that $x \in (R^\wedge)_\mathfrak{q}$ generates the maximal ideal. As $R \to R^\wedge$ is faithfully flat we see that x is a nonzero divisor in $(R^\wedge)_\mathfrak{q}$. Hence we win. □

Lemma 7.144.26. *Let $(R, \mathfrak{m})$ be a Noetherian local domain. Let $x \in \mathfrak{m}$. Assume*

1. *$x \neq 0$,*
2. *R/xR has no embedded primes, and*
3. *for each associated prime $\mathfrak{p} \subset R$ of R/xR we have*
   (a) *the local ring $R_\mathfrak{p}$ is regular, and*
   (b) *$\mathfrak{p}$ is analytically unramified.*

Then R is analytically unramified.

Proof. Let $\mathfrak{p}_1, \ldots, \mathfrak{p}_t$ be the associated primes of the R-module R/xR. Since R/xR has no embedded primes we see that each $\mathfrak{p}_i$ has height 1, and is a minimal prime over (x). For each i, let $\mathfrak{q}_{i1}, \ldots, \mathfrak{q}_{is_i}$ be the associated primes of the $R^\wedge$-module $R^\wedge/\mathfrak{p}_iR^\wedge$. By Lemma 7.144.25. we see that $(R^\wedge)_{\mathfrak{q}_{ij}}$ is regular. By Lemma 7.62.3 we see that

$$\text{Ass}_{R^\wedge}(R^\wedge/xR^\wedge) = \bigcup\nolimits_{\mathfrak{p} \in \text{Ass}_R(R/xR)} \text{Ass}_{R^\wedge}(R^\wedge/\mathfrak{p}R^\wedge) = \{\mathfrak{q}_{ij}\}.$$

Let $y \in R^\wedge$ with $y^2 = 0$. As $(R^\wedge)_{\mathfrak{q}_{ij}}$ is regular, and hence a domain (Lemma 7.98.2) we see that y maps to zero in $(R^\wedge)_{\mathfrak{q}_{ij}}$. Hence y maps to zero in $R^\wedge/xR^\wedge$ by Lemma 7.60.18. Hence $y = xy'$. Since x is a nonzero divisor (as $R \to R^\wedge$ is flat) we see that $(y')^2 = 0$. Hence we conclude that $y \in \bigcap x^nR^\wedge = (0)$ (Lemma 7.47.6). □

Lemma 7.144.27. *Let $(R, \mathfrak{m})$ be a local ring. If R is Noetherian, a domain, and Nagata, then R is analytically unramified.*

Proof. By induction on $\dim(R)$. The case $\dim(R) = 0$ is trivial. Hence we assume $\dim(R) = d$ and that the lemma holds for all Noetherian Nagata domains of dimension $< d$.

Let $R \subset S$ be the integral closure of R in the field of fractions of R. By assumption S is a finite R-module. By Lemma 7.144.19 we see that S is Nagata. By Lemma 7.103.4 we see $\dim(R) = \dim(S)$. Let $\mathfrak{m}_1, \ldots, \mathfrak{m}_t$ be the maximal ideals of S. Each of these lies over the maximal ideal $\mathfrak{m}$ of R. Moreover

$$(\mathfrak{m}_1 \cap \ldots \cap \mathfrak{m}_t)^n \subset \mathfrak{m}S$$

for sufficiently large n as $S/\mathfrak{m}S$ is Artinian. By Lemma 7.90.3 $R^\wedge \to S^\wedge$ is an injective map, and by the Chinese Remainder Lemma 7.14.4 combined with Lemma 7.90.12 we have $S^\wedge = \prod S_i^\wedge$ where $S_i^\wedge$ is the completion of S with respect to the maximal ideal $\mathfrak{m}_i$. Hence it suffices to show that $S_{\mathfrak{m}_i}$ is analytically unramified. In other words, we have reduced to the case where R is a Noetherian normal Nagata domain.

Assume R is a Noetherian, normal, local Nagata domain. Pick a nonzero $x \in \mathfrak{m}$ in the maximal ideal. We are going to apply Lemma 7.144.26. We have to check properties (1), (2), (3)(a) and (3)(b). Property (1) is clear. We have that R/xR has no embedded primes by Lemma 7.140.6. Thus property (2) holds. The same lemma also tells us each associated prime $\mathfrak{p}$ of R/xR has height 1. Hence $R_\mathfrak{p}$ is a 1-dimensional normal domain hence regular (Lemma 7.110.6). Thus (3)(a) holds. Finally (3)(b) holds by induction hypothesis, since $R/\mathfrak{p}$ is Nagata (by Lemma 7.144.19 or directly from the definition). Thus we conclude R is analytically unramified. □

Lemma 7.144.28. *Let R be a Noetherian domain. If there exists an $f \in R$ such that R_f is normal then*

$$U = \{\mathfrak{p} \in Spec(R) \mid R_\mathfrak{p} \text{ is normal}\}$$

is open in $Spec(R)$.

Proof. It is clear that the standard open $D(f)$ is contained in U. By Serre's criterion Lemma 7.140.4 we see that $\mathfrak{p} \notin U$ implies that for some $\mathfrak{q} \subset \mathfrak{p}$ we have either

(1) Case I: $\text{depth}(R_\mathfrak{q}) < 2$ and $\dim(R_\mathfrak{q}) \geq 2$, and
(2) Case II: $R_\mathfrak{q}$ is not regular and $\dim(R_\mathfrak{q}) = 1$.

This in particular also means that $R_\mathfrak{q}$ is not normal, and hence $f \in \mathfrak{q}$. In case I we see that $\text{depth}(R_\mathfrak{q}) = \text{depth}(R_\mathfrak{q}/fR_\mathfrak{q}) + 1$. Hence such a prime $\mathfrak{q}$ is the same thing as an embedded associated prime of R/fR. In case II $\mathfrak{q}$ is an associated prime of R/fR of height 1. Thus there is a finite set E of such primes $\mathfrak{q}$ (see Lemma 7.60.5) and

$$Spec(R) \setminus U = \bigcup\nolimits_{\mathfrak{q} \in E} V(\mathfrak{q})$$

as desired. □

Lemma 7.144.29. *Let R be a Noetherian domain. Assume*

(1) *there exists a nonzero $f \in R$ such that R_f is normal, and*
(2) *for every maximal ideal $\mathfrak{m} \subset R$ the local ring $R_\mathfrak{m}$ is N-1.*

Then R is N-1.

Proof. Set $K = f.f.(R)$. Suppose that $R \subset R' \subset K$ is a finite extension of R contained in K. Note that $R_f = R'_f$ since R_f is already normal. Hence by Lemma 7.144.28 the set of primes $\mathfrak{p}' \in Spec(R')$ with $R'_{\mathfrak{p}'}$ non-normal is closed in $Spec(R')$. Since $Spec(R') \to$

$Spec(R)$ is closed the image of this set is closed in $Spec(R)$. For such a ring R' denote $Z_{R'} \subset Spec(R)$ this image.

Pick a maximal ideal $\mathfrak{m} \subset R$. Let $R_\mathfrak{m} \subset R'_\mathfrak{m}$ be the integral closure of the local ring in K. By assumption this is a finite ring extension. By Lemma 7.32.9 we can find finitely many elements $r_1, \ldots, r_n \in K$ integral over R such that $R'_\mathfrak{m}$ is generated by $r_1, \ldots, r_n$ over $R_\mathfrak{m}$. Let $R' = R[x_1, \ldots, x_n] \subset K$. With this choice it is clear that $\mathfrak{m} \notin Z_{R'}$.

As $Spec(R)$ is quasi-compact, the above shows that we can find a finite collection $R \subset R'_i \subset K$ such that $\bigcap Z_{R'_i} = \emptyset$. Let R' be the subring of K generated by all of these. It is finite over R. Also $Z_{R'} = \emptyset$. Namely, every prime $\mathfrak{p}'$ lies over a prime $\mathfrak{p}'_i$ such that $(R'_i)_{\mathfrak{p}'_i}$ is normal. This implies that $R'_{\mathfrak{p}'} = (R'_i)_{\mathfrak{p}'_i}$ is normal too. Hence R' is normal, in other words R' is the integral closure of R in K. □

The following proposition says in particular that an algebra of finite type over a Nagata ring is a Nagata ring.

Proposition 7.144.30 (Nagata). *Let R be a ring. The following are equivalent:*

(1) *R is a Nagata ring,*
(2) *any finite type R-algebra is Nagata, and*
(3) *R is universally Japanese and Noetherian.*

Proof. It is clear that a Noetherian universally Japanese ring is universally Nagata (i.e., condition (2) holds). Let R be a Nagata ring. We will show that any finitely generated R-algebra S is Nagata. This will prove the proposition.

Step 1. There exists a sequence of ring maps $R = R_0 \to R_1 \to R_2 \to \ldots \to R_n = S$ such that each $R_i \to R_{i+1}$ is generated by a single element. Hence by induction it suffices to prove S is Nagata if $S \cong R[x]/I$.

Step 2. Let $\mathfrak{q} \subset S$ be a prime of S, and let $\mathfrak{p} \subset R$ be the corresponding prime of R. We have to show that $S/\mathfrak{q}$ is N-2. Hence we have reduced to the proving the following: (*) Given a Nagata domain R and a monogenic extension $R \subset S$ of domains then S is N-2.

Step 3. Let R be a Nagata domain and $R \subset S$ a monogenic extension of domains. Let $R \subset R'$ be the integral closure of R in its fraction field. Let S' be the subring of $f.f.(S)$ generated by R' and S. As R' is finite over R (by the Nagata property) also S' is finite over S. Since S is Noetherian it suffices to prove that S' is N-2 (Lemma 7.144.7). Hence we have reduced to proving the following: (**) Given a normal Nagata domain R and a monogenic extension $R \subset S$ of domains then S is N-2.

Step 4: Let R be a normal Nagata domain and let $R \subset S$ be a monogenic extension of domains. Suppose the extension of fraction fields $f.f.(R) \subset f.f.(S)$ is purely transcendental. In this case $S = R[x]$. By Lemma 7.144.12 we see that S is N-2. Hence we have reduced to proving the following: (**) Given a normal Nagata domain R and a monogenic extension $R \subset S$ of domains inducing a finite extension of fraction fields then S is N-2.

Step 5. Let R be a normal Nagata domain and let $R \subset S$ be a monogenic extension of domains inducing a finite extension of fraction fields $K = f.f.(R) \subset f.f.(S) = L$. Choose an element $x \in S$ which generates S as an R-algebra. Let $L \subset M$ be a finite extension of fields. Let R' be the integral closure of R in M. Then the integral closure S' of S in M is equal to the integral closure of $R'[x]$ in M. Also $f.f.(R') = M$, and $R \subset R'$ is finite (by the Nagata property of R). This implies that R' is a Nagata ring (Lemma 7.144.19). To show that S' is finite over S is the same as showing that S' is finite over $R'[x]$. Replace

R by R' and S by S' to reduce to the following statement: (***) Given a normal Nagata domain R with fraction field K, and $x \in K$, the ring $S \subset K$ generated by R and x is N-1.

Step 6. Let R be a normal Nagata domain with fraction field K. Let $x = b/a \in K$. We have to show that the ring $S \subset K$ generated by R and x is N-1. Note that $S_a \cong R_a$ is normal. Hence by Lemma 7.144.29 it suffices to show that $S_{\mathfrak m}$ is N-1 for every maximal ideal $\mathfrak m$ of S.

With assumptions as in the preceding paragraph, pick such a maximal ideal and set $\mathfrak n = R \cap \mathfrak m$. The residue field extension $\kappa(\mathfrak n) \subset \kappa(\mathfrak m)$ is finite (Theorem 7.30.1) and generated by the image of x. Hence there exists a monic polynomial $f(X) = X^d + \sum_{i=1,\ldots,d} a_i X^{d-i}$ with $f(x) \in \mathfrak m$. Let $K \subset K''$ be a finite extension of fields such that $f(X)$ splits completely in $K''[X]$. Let R' be the integral closure of R in K''. Let $S' \subset K'$ be the subring generated by R' and x. As R is Nagata we see R' is finite over R and Nagata (Lemma 7.144.19). Moreover, S' is finite over S. If for every maximal ideal $\mathfrak m'$ of S' the local ring $S'_{\mathfrak m'}$ is N-1, then $S'_{\mathfrak m}$ is N-1 by Lemma 7.144.29, which in turn implies that $S_{\mathfrak m}$ is N-1 by Lemma 7.144.7. After replacing R by R' and S by S', and $\mathfrak m$ by any of the maximal ideals $\mathfrak m'$ lying over $\mathfrak m$ we reach the situation where the polynomial f above split completely: $f(X) = \prod_{i=1,\ldots,d}(X - a_i)$ with $a_i \in R$. Since $f(x) \in \mathfrak m$ we see that $x - a_i \in \mathfrak m$ for some i. Finally, after replacing x by $x - a_i$ we may assume that $x \in \mathfrak m$.

To recapitulate: R is a normal Nagata domain with fraction field K, $x \in K$ and S is the subring of K generated by x and R, finally $\mathfrak m \subset S$ is a maximal ideal with $x \in \mathfrak m$. We have to show $S_{\mathfrak m}$ is N-1.

We will show that Lemma 7.144.26 applies to the local ring $S_{\mathfrak m}$ and the element x. This will imply that $S_{\mathfrak m}$ is analytically unramified, whereupon we see that it is N-1 by Lemma 7.144.24.

We have to check properties (1), (2), (3)(a) and (3)(b). Property (1) is trivial. Let $I = \mathrm{Ker}(R[X] \to S)$ where $X \mapsto x$. We claim that I is generated by all linear forms $aX + b$ such that $ax = b$ in K. Clearly all these linear forms are in I. If $g = a_d X^d + \ldots a_1 X + a_0 \in I$, then we see that $a_d x$ is integral over R (Lemma 7.114.1) and hence $b := a_d x \in R$ as R is normal. Then $g - (a_d X - b)X^{d-1} \in I$ and we win by induction on the degree. As a consequence we see that

$$S/xS = R[X]/(X, I) = R/J$$

where

$$J = \{b \in R \mid ax = b \text{ for some } a \in R\} = xR \cap R$$

By Lemma 7.140.6 we see that $S/xS = R/J$ has no embedded primes as an R-module, hence as an R/J-module, hence as an S/xS-module, hence as an S-module. This proves property (2). Take such an associated prime $\mathfrak q \subset S$ with the property $\mathfrak q \subset \mathfrak m$ (so that it is an associated prime of $S_{\mathfrak m}/xS_{\mathfrak m}$ -- it does not matter for the arguments). Then $\mathfrak q$ is minimal over xS and hence has height 1. By the sequence of equalities above we see that $\mathfrak p = R \cap \mathfrak q$ is an associated prime of R/J, and so has height 1 (see Lemma 7.140.6). Thus $R_{\mathfrak p}$ is a discrete valuation ring and therefore $R_{\mathfrak p} \subset S_{\mathfrak q}$ is an equality. This shows that $S_{\mathfrak q}$ is regular. This proves property (3)(a). Finally, $(S/\mathfrak q)_{\mathfrak m}$ is a localization of $S/\mathfrak q$, which is a quotient of $S/xS = R/J$. Hence $(S/\mathfrak q)_{\mathfrak m}$ is a localization of a quotient of the Nagata ring R, hence Nagata (Lemmas 7.144.19 and 7.144.20) and hence analytically unramified (Lemma 7.144.27). This shows (3)(b) holds and we are done. □

Proposition 7.144.31. *The following types of rings are Nagata and in particular universally Japanese:*

(1) *fields,*
(2) *Noetherian complete local rings,*
(3) $\mathbf{Z}$*,*
(4) *Dedekind domains with fraction field of characteristic zero,*
(5) *finite type ring extensions of any of the above.*

Proof. The Noetherian complete local ring case is Lemma 7.144.22. In the other cases you just check if $R/\mathfrak{p}$ is N-2 for every prime ideal $\mathfrak{p}$ of the ring. This is clear whenever $R/\mathfrak{p}$ is a field, i.e., $\mathfrak{p}$ is maximal. Hence for the Dedeking ring case we only need to check it when $\mathfrak{p} = (0)$. But since we assume the fraction field has characteristic zero Lemma 7.144.10 kicks in. $\square$

7.145. Ascending properties

In this section we start proving some algebraic facts concerning the ``ascent'' of properties of rings.

Lemma 7.145.1. *Suppose that $R \to S$ is a flat and local ring homomorphism of Noetherian local rings. Then*
$$depth_S(S) = depth_R(R) + depth_S(S/\mathfrak{m}_R S).$$

Proof. Denote n the right hand side of the equality of the lemma. First assume that n is zero. Then $\text{depth}(R) = 0$ (resp. $\text{depth}(S/\mathfrak{m}_R S) = 0$) which means there is a $z \in R$ (resp. $\overline{y} \in S/\mathfrak{m}_R S$) whose annihilator is $\mathfrak{m}_R$ (resp. $\mathfrak{m}_S/\mathfrak{m}_R$). Let $y \in S$ be a lift of $\overline{y}$. It follows from the fact that $R \to S$ is flat that the annihilator of z in S is $\mathfrak{m}_R S$, and hence the annihilator of zy is $\mathfrak{m}_S$. Thus $\text{depth}_S(S) = 0$ as well.

Assume $n > 0$. If $\text{depth}(S/\mathfrak{m}_R S) > 0$, then choose an $f \in \mathfrak{m}_S$ which maps to a nonzero divisor in $S/\mathfrak{m}_R S$. According to Lemma 7.91.2 the element $f \in S$ is a nonzero divisor and S/fS is flat over R. Hence by induction on n we have
$$\text{depth}(S/fS) = \text{depth}(R) + \text{depth}(S/(f, \mathfrak{m}_R)).$$
Since f and $\overline{f}$ are nonzero divisors we see that $\text{depth}(S) = \text{depth}(S/fS)+1$ and $\text{depth}(S/\mathfrak{m}_R S) = \text{depth}(S/(f, \mathfrak{m}_R))+1$, see Lemma 7.67.10. Hence we see that the equality holds for $R \to S$ as well.

If $n > 0$, but $\text{depth}(S/\mathfrak{m}_R S) = 0$, then choose $f \in \mathfrak{m}_R$ a nonzero divisor. As $R \to S$ is flat it is also the case that f is a nonzero divisor on S. By induction on n again we have
$$\text{depth}(S/fS) = \text{depth}(R/fR) + \text{depth}(S/\mathfrak{m}_R).$$
By a similar argument as above we conclude that the equality holds for $R \to S$ as well. $\square$

Here is a more general statement involving modules, see [**DG67**, IV, Proposition 6.3.1].

Lemma 7.145.2. *We have*
$$depth_S(M \otimes_R N) = depth_R(M) + depth_{S/\mathfrak{m}_R S}(N/\mathfrak{m}_R N)$$
where $R \to S$ is a local homomorphism of local Noetherian rings, M is a finite R-module, and N is a finite S-module flat over R.

Proof. Omitted, but similar to the proof of Lemma 7.145.1. $\square$

Lemma 7.145.3. *Let $R \to S$ be a local homomorphism of local Noetherian rings. Assume*
(1) *$S/\mathfrak{m}_R S$ is Cohen-Macaulay, and*
(2) *$R \to S$ is flat.*

Then S is Cohen-Macaulay if and only if R is Cohen-Macaulay.

Proof. This follows from the definitions combined with Lemmas 7.145.1 and 7.103.7. □

Lemma 7.145.4. *Let $\varphi : R \to S$ be a ring map. Assume*

1. *R is Noetherian,*
2. *S is Noetherian,*
3. *φ is flat,*
4. *the fibre rings $S \otimes_R \kappa(\mathfrak{p})$ are Cohen-Macaulay, and*
5. *R has property (S_k).*

Then S has property (S_k).

Proof. Let $\mathfrak{q}$ be a prime of S lying over a prime $\mathfrak{p}$ of R. By Lemma 7.145.1 we have

$$\text{depth}(S_\mathfrak{q}) = \text{depth}(S_\mathfrak{q}/\mathfrak{p}S_\mathfrak{q}) + \text{depth}(R_\mathfrak{p}).$$

On the other hand, we have

$$\dim(S_\mathfrak{q}) \leq \dim(R_\mathfrak{p}) + \dim(S_\mathfrak{q}/\mathfrak{p}S_\mathfrak{q}).$$

by Lemma 7.103.6. (Actually equality holds, by Lemma 7.103.7 but strictly speaking we do not need this.) Finally, as the fibre rings of the map are assumed Cohen-Macaulay we see that $\text{depth}(S_\mathfrak{q}/\mathfrak{p}S_\mathfrak{q}) = \dim(S_\mathfrak{q}/\mathfrak{p}S_\mathfrak{q})$. Thus the lemma follows by the following string of inequalities

$$\begin{array}{rcl} \text{depth}(S_\mathfrak{q}) & = & \dim(S_\mathfrak{q}/\mathfrak{p}S_\mathfrak{q}) + \text{depth}(R_\mathfrak{p}) \\ & \geq & \dim(S_\mathfrak{q}/\mathfrak{p}S_\mathfrak{q}) + \min(k, \dim(R_\mathfrak{p})) \\ & = & \min(\dim(S_\mathfrak{q}/\mathfrak{p}S_\mathfrak{q}) + k, \dim(S_\mathfrak{q}/\mathfrak{p}S_\mathfrak{q}) + \dim(R_\mathfrak{p})) \\ & \geq & \min(k, \dim(S_\mathfrak{q})) \end{array}$$

as desired. □

Lemma 7.145.5. *Let $\varphi : R \to S$ be a ring map. Assume*

1. *R is Noetherian,*
2. *S is Noetherian*
3. *φ is flat,*
4. *the fibre rings $S \otimes_R \kappa(\mathfrak{p})$ are regular, and*
5. *R has property (R_k).*

Then S has property (R_k).

Proof. Let $\mathfrak{q}$ be a prime of S lying over a prime $\mathfrak{p}$ of R. Assume that $\dim(S_\mathfrak{q}) \leq k$. Since $\dim(S_\mathfrak{q}) = \dim(R_\mathfrak{p}) + \dim(S_\mathfrak{q}/\mathfrak{p}S_\mathfrak{q})$ by Lemma 7.103.7 we see that $\dim(R_\mathfrak{p}) \leq k$. Hence $R_\mathfrak{p}$ is regular by assumption. It follows that $S_\mathfrak{q}$ is regular by Lemma 7.103.8. □

Lemma 7.145.6. *Let $\varphi : R \to S$ be a ring map. Assume*

1. *φ is smooth,*
2. *R is reduced.*

Then S is reduced.

Proof. First assume R is Noetherian. In this case being reduced is the same as having properties (S_1) and (R_0), see Lemma 7.140.3. Note that S is noetherian, and $R \to S$ is flat with regular fibres (see the list of results on smooth ring maps in Section 7.131). Hence we may apply Lemmas 7.145.4 and 7.145.5 and we see that S is (S_1) and (R_0), in other words reduced by Lemma 7.140.3 again.

In the general case we may find a finitely generated $\mathbf{Z}$-subalgebra $R_0 \subset R$ and a smooth ring map $R_0 \to S_0$ such that $S \cong R \otimes_{R_0} S_0$, see remark (10) in Section 7.131. Now, if $x \in S$ is an element with $x^2 = 0$, then we can enlarge R_0 and assume that x comes from an element $x_0 \in S_0$. After enlarging R_0 once more we may assume that $x_0^2 = 0$ in S_0. However, since $R_0 \subset R$ is reduced we see that S_0 is reduced and hence $x_0 = 0$ as desired. $\square$

Lemma 7.145.7. *Let $\varphi : R \to S$ be a ring map. Assume*

(1) *φ is smooth,*
(2) *R is normal.*

Then S is normal.

Proof. First assume R is Noetherian. In this case being reduced is the same as having properties (S_2) and (R_1), see Lemma 7.140.4. Note that S is noetherian, and $R \to S$ is flat with regular fibres (see the list of results on smooth ring maps in Section 7.131). Hence we may apply Lemmas 7.145.4 and 7.145.5 and we see that S is (S_2) and (R_1), in other words reduced by Lemma 7.140.4 again.

The general case. First note that R is reduced and hence S is reduced by Lemma 7.145.6. Let $\mathfrak{q}$ be a prime of S and let $\mathfrak{p}$ be the corresponding prime of R. Note that $R_{\mathfrak{p}}$ is a normal domain. We have to show that $S_{\mathfrak{q}}$ is a normal domain. To do this we may replace R by $R_{\mathfrak{p}}$ and S by $S_{\mathfrak{p}}$. Hence we may assume that R is a normal domain.

Assume $R \to S$ smooth, and R a normal domain. We may find a finitely generated $\mathbf{Z}$-subalgebra $R_0 \subset R$ and a smooth ring map $R_0 \to S_0$ such that $S \cong R \otimes_{R_0} S_0$, see remark (10) in Section 7.131. As R_0 is a Nagata domain (see Proposition 7.144.31) we see that its integral closure R_0' is finite over R_0. Moreover, as R is a normal domain it is clear that $R_0' \subset R$. Hence we may replace R_0 by R_0' and S_0 by $R_0' \otimes_{R_0} S_0$ and assume that R_0 is a normal Noetherian domain. By the first paragraph of the proof we conclude that S_0 is a normal ring (it need not be a domain of course). In this way we see that $R = \bigcup R_\lambda$ is the union of normal Noetherian domains and correspondingly $S = colim\, R_\lambda \otimes_{R_0} S_0$ is the colimit of normal rings. This implies that S is a normal ring. Some details omitted. $\square$

Lemma 7.145.8. *Let $\varphi : R \to S$ be a ring map. Assume*

(1) *φ is smooth,*
(2) *R is a regular ring.*

Then S is regular.

Proof. This follows from Lemma 7.145.5 applied for all (R_k) using Lemma 7.129.3 to see that the hypotheses are satisfied. $\square$

7.146. Descending properties

In this section we start proving some algebraic facts concerning the ``descent" of properties of rings. It turns out that it is often ``easier" to descend properties than it is to ascend them. In other words, the assumption on the ring map $R \to S$ are often weaker than the assumptions in the corresponding lemma of the preceding section. However, we warn the reader that the results on descent are often useless unless the corresponding ascent can also be shown! Here is a typical result which illustrates this phenomenon.

Lemma 7.146.1. *Let $R \to S$ be a ring map. Assume that*

(1) *$R \to S$ is faithfully flat, and*
(2) *S is Noetherian.*

Then R is Noetherian.

Proof. Let $I_0 \subset I_1 \subset I_2 \subset \ldots$ be a growing sequence of ideals of R. By assumption we have $I_n S = I_{n+1} S = I_{n+2} S = \ldots$ for some n. Since $R \to S$ is flat we have $I_k S = I_k \otimes_R S$. Hence, as $R \to S$ is faithfully flat we see that $I_n S = I_{n+1} S = I_{n+2} S = \ldots$ implies that $I_n = I_{n+1} = I_{n+2} = \ldots$ as desired. $\square$

Lemma 7.146.2. *Let $R \to S$ be a ring map. Assume that*

(1) *$R \to S$ is faithfully flat, and*
(2) *S is reduced.*

Then R is reduced.

Proof. This is clear as $R \to S$ is injective. $\square$

Lemma 7.146.3. *Let $R \to S$ be a ring map. Assume that*

(1) *$R \to S$ is faithfully flat, and*
(2) *S is a normal ring.*

Then R is a normal ring.

Proof. Since S is reduced it follows that R is reduced. Let $\mathfrak{p}$ be a prime of R. We have to show that $R_\mathfrak{p}$ is a normal domain. Since $S_\mathfrak{p}$ is faithfully over $R_\mathfrak{p}$ too we may assume that R is local with maximal ideal $\mathfrak{m}$. Let $\mathfrak{q}$ be a prime of S lying over $\mathfrak{m}$. Then we see that $R \to S_\mathfrak{q}$ is faithfully flat (Lemma 7.35.16). Hence we may assume S is local as well. In particular S is a normal domain. Since $R \to S$ is faithfully flat and S is a normal domain we see that R is a domain. Next, suppose that a/b is integral over R with $a, b \in R$. Then $a/b \in S$ as S is normal. Hence $a \in bS$. This means that $a : R \to R/bR$ becomes the zero map after base change to S. By faithful flatness we see that $a \in bR$, so $a/b \in R$. Hence R is normal. $\square$

Lemma 7.146.4. *Let $R \to S$ be a ring map. Assume that*

(1) *$R \to S$ is faithfully flat, and*
(2) *S is a regular ring.*

Then R is a regular ring.

Proof. We see that R is Noetherian by Lemma 7.146.1. Let $\mathfrak{p} \subset R$ be a prime. Choose a prime $\mathfrak{q} \subset S$ lying over $\mathfrak{p}$. Then Lemma 7.102.8 applies to $R_\mathfrak{p} \to S_\mathfrak{q}$ and we conclude that $R_\mathfrak{p}$ is regular. Since $\mathfrak{p}$ was arbitrary we see R is regular. $\square$

Lemma 7.146.5. *Let $R \to S$ be a ring map. Assume that*

(1) *$R \to S$ is faithfully flat of finite presentation, and*
(2) *S is Noetherian and has property (S_k).*

Then R is Noetherian and has property (S_k).

Proof. We have already seen that (1) and (2) imply that R is Noetherian, see Lemma 7.146.1. Let $\mathfrak{p} \subset R$ be a prime ideal. Choose a prime $\mathfrak{q} \subset S$ lying over $\mathfrak{p}$ which corresponds to a minimal prime of the fibre ring $S \otimes_R \kappa(\mathfrak{p})$. Then $A = R_\mathfrak{p} \to S_\mathfrak{q} = B$ is a flat local ring homomorphism of Noetherian local rings with $\mathfrak{m}_A B$ an ideal of definition of B. Hence $\dim(A) = \dim(B)$ (Lemma 7.103.7) and $\text{depth}(A) = \text{depth}(B)$ (Lemma 7.145.1). Hence since B has (S_k) we see that A has (S_k). $\square$

Lemma 7.146.6. *Let $R \to S$ be a ring map. Assume that*

(1) *$R \to S$ is faithfully flat and of finite presentation, and*

(2) *S is Noetherian and has property (R_k).*

Then R is Noetherian and has property (R_k).

Proof. We have already seen that (1) and (2) imply that R is Noetherian, see Lemma 7.146.1. Let $\mathfrak{p} \subset R$ be a prime ideal and assume $\dim(R_\mathfrak{p}) \leq k$. Choose a prime $\mathfrak{q} \subset S$ lying over $\mathfrak{p}$ which corresponds to a minimal prime of the fibre ring $S \otimes_R \kappa(\mathfrak{p})$. Then $A = R_\mathfrak{p} \to S_\mathfrak{q} = B$ is a flat local ring homomorphism of Noetherian local rings with $\mathfrak{m}_A B$ an ideal of definition of B. Hence $\dim(A) = \dim(B)$ (Lemma 7.103.7). As S has (R_k) we conclude that B is a regular local ring. By Lemma 7.102.8 we conclude that A is regular. □

Lemma 7.146.7. *Let $R \to S$ be a ring map. Assume that*

(1) *$R \to S$ is smooth and surjective on spectra, and*
(2) *S is a Nagata ring.*

Then R is a Nagata ring.

Proof. Recall that a Nagata ring is the same thing as a Noetherian universally Japanese ring (Proposition 7.144.30). We have already seen that R is Noetherian in Lemma 7.146.1. Let $R \to A$ be a finite type ring map into a domain. According to Lemma 7.144.17 it suffices to check that A is N-1. It is clear that $B = A \otimes_R S$ is a finite type S-algebra and hence Nagata (Proposition 7.144.30). Since $A \to B$ is smooth (Lemma 7.126.4) we see that B is reduced (Lemma 7.145.6). Since B is Noetherian it has only a finite number of minimal primes $\mathfrak{q}_1, \ldots, \mathfrak{q}_t$ (see Lemma 7.28.6). As $A \to B$ is flat each of these lies over $(0) \subset A$ (by going down, see Lemma 7.35.17) The total ring of fractions $Q(B)$ is the product of the $L_i = f.f.(B/\mathfrak{q}_i)$ (Lemmas 7.22.2 and 7.23.3). Moreover, the integral closure B' of B in $Q(B)$ is the product of the integral closures B'_i of the $B/\mathfrak{q}_i$ in the factors L_i (compare with Lemma 7.33.14). Since B is universally Japanese the ring extensions $B/\mathfrak{q}_i \subset B'_i$ are finite and we conclude that $B' = \prod B'_i$ is finite over B. Since $A \to B$ is flat we see that any nonzero divisor on A maps to a nonzero divisor on B. The corresponding map

$$Q(A) \otimes_A B = (A \setminus \{0\})^{-1} A \otimes_A B = (A \setminus \{0\})^{-1} B \to Q(B)$$

is injective (we used Lemma 7.11.15). Via this map A' maps into B'. This induces a map

$$A' \otimes_A B \longrightarrow B'$$

which is injective (by the above and the flatness of $A \to B$). Since B' is a finite B-module and B is Noetherian we see that $A' \otimes_A B$ is a finite B-module. Hence there exist finitely many elements $x_i \in A'$ such that the elements $x_i \otimes 1$ generate $A' \otimes_A B$ as a B-module. Finally, by faithful flatness of $A \to B$ we conclude that the x_i also generated A' as an A-module, and we win. □

Remark 7.146.8. The property of being ``universally catenary" does not descend; not even along étale ring maps. In Examples, Section 64.9 there is a construction of a finite ring map $A \to B$ with A local Noetherian and not universally catenary, B semi-local with two maximal ideals $\mathfrak{m}$, $\mathfrak{n}$ with $B_\mathfrak{m}$ and $B_\mathfrak{n}$ regular of dimension 2 and 1 respectively, and the same residue fields as that of A. Moreover, $\mathfrak{m}_A$ generates the maximal ideal in both $B_\mathfrak{m}$ and $B_\mathfrak{n}$ (so $A \to B$ is unramified as well as finite). By Lemma 7.138.10 there exists a local étale ring map $A \to A'$ such that $B \otimes_A A' = B_1 \times B_2$ decomposes with $A' \to B_i$ surjective. This shows that A' has two minimal primes $\mathfrak{q}_i$ with $A'/\mathfrak{q}_i \cong B_i$. Since B_i is regular local (since it is étale over either $B_\mathfrak{m}$ or $B_\mathfrak{n}$) we conclude that A' is universally catenary.

7.147. Geometrically normal algebras

In this section we put some applications of ascent and descent of properties of rings.

Lemma 7.147.1. *Let k be a field. Let A be a k-algebra. The following properties of A are equivalent:*

(1) *$k' \otimes_k A$ is a normal ring for every field extension $k \subset k'$,*
(2) *$k' \otimes_k A$ is a normal ring for every finitely generated field extension $k \subset k'$, and*
(3) *$k' \otimes_k A$ is a normal ring for every finite purely inseparable extension $k \subset k'$.*

where normal ring is as defined in Definition 7.33.10.

Proof. It is clear that (1) $\Rightarrow$ (2) $\Rightarrow$ (3).

Assume (2) and let $k \subset k'$ be any field extension. Then we can write $k' = colim_i\, k_i$ as a directed colimit of finitely generated field extensions. Hence we see that $k' \otimes_k A = colim_i\, k_i \otimes_k A$ is a directed colimit of normal rings. Thus we see that $k' \otimes_k A$ is a normal ring by Lemma 7.33.15. Hence (1) holds.

Assume (3) and let $k \subset K$ be a finitely generated field extension. By Lemma 7.42.3 we can find a diagram

$$\begin{tikzcd} K \arrow[r] & K' \\ k \arrow[u] \arrow[r] & k' \arrow[u] \end{tikzcd}$$

where $k \subset k'$, $K \subset K'$ are finite purely inseparable field extensions such that $k' \subset K'$ is separable. By Lemma 7.141.9 there exists a smooth k'-algebra B such that K' is the fraction field of B. Now we can argue as follows: Step 1: $k' \otimes_k A$ is a normal ring because we assumed (3). Step 2: $B \otimes_{k'} k' \otimes_k A$ is a normal ring as $k' \otimes_k A \to B \otimes_{k'} k' \otimes_k A$ is smooth (Lemma 7.126.4) and ascent of normality along smooth maps (Lemma 7.145.7). Step 3. $K' \otimes_{k'} k' \otimes_k A = K' \otimes_k A$ is a normal ring as it is a localization of a normal ring (Lemma 7.33.12). Step 4. Finally $K \otimes_k A$ is a normal ring by descent of normality along the faithfully flat ring map $K \otimes_k A \to K' \otimes_k A$ (Lemma 7.146.3). This proves the lemma. $\square$

Definition 7.147.2. Let k be a field. A k-algebra R is called *geometrically normal* over k if the equivalent conditions of Lemma 7.147.1 hold.

Lemma 7.147.3. *Let k be a field. A localization of a geometrically normal k-algebra is geometrically normal.*

Proof. This is clear as being a normal ring is checked at the localizations at prime ideals. $\square$

Lemma 7.147.4. *Let k be a field. Let A, B be k-algebras. Assume A is geometrically normal over k and B is a normal ring. Then $A \otimes_k B$ is a normal ring.*

Proof. Let $\mathfrak{r}$ be a prime ideal of $A \otimes_k B$. Denote $\mathfrak{p}$, resp. $\mathfrak{q}$ the corresponding prime of A, resp. B. Then $(A \otimes_k B)_{\mathfrak{r}}$ is a localization of $A_{\mathfrak{p}} \otimes_k B_{\mathfrak{q}}$. Hence it suffices to prove the result for the ring $A_{\mathfrak{p}} \otimes_k B_{\mathfrak{q}}$, see Lemma 7.33.12 and Lemma 7.147.3. Thus we may assume A and B are domains.

Assume that A and B are domains with fractions fields K and L. Note that B is the filtered colimit of its finite type normal k-sub algebras (as k is a Nagata ring, see Proposition 7.144.31, and hence the integral closure of a finite type k-sub algebra is still a finite type

k-sub algebra by Proposition 7.144.30). By Lemma 7.33.15 we reduce to the case that B is of finite type over k.

Assume that A and B are domains with fractions fields K and L and B of finite type over k. In this case the ring $K \otimes_k B$ is of finite type over K, hence Noetherian (Lemma 7.28.1). In particular $K \otimes_k B$ has finitely many minimal primes (Lemma 7.28.6). Since $A \to A \otimes_k B$ is flat, this implies that $A \otimes_k B$ has finitely many minimal primes (by going down for flat ring maps -- Lemma 7.35.17 -- these primes all lie over $(0) \subset A$). Thus it suffices to prove that $A \otimes_k B$ is integrally closed in its total ring of fractions (Lemma 7.33.14).

We claim that $K \otimes_k B$ and $A \otimes_k L$ are both normal rings. If this is true then any element x of $Q(A \otimes_k B)$ which is integral over $A \otimes_k B$ is (by Lemma 7.33.11) contained in $K \otimes_k B \cap A \otimes_k L = A \otimes_k B$ and we're done. Since $A \otimes_K L$ is a normal ring by assumption, it suffices to prove that $K \otimes_k B$ is normal.

As A is geometrically normal over k we see K is geometrically normal over k (Lemma 7.147.3) hence K is geometrically reduced over k. Hence $K = \bigcup K_i$ is the union of finitely generated field extensions of k which are geometrically reduced (Lemma 7.40.2). Each K_i is the localization of a smooth k-algebra (Lemma 7.141.9). So $K_i \otimes_k B$ is the localization of a smooth B-algebra hence normal (Lemma 7.145.7). Thus $K \otimes_k B$ is a normal ring (Lemma 7.33.15) and we win. □

7.148. Geometrically regular algebras

Let k be a field. Let A be a Noetherian k-algebra. Let $k \subset K$ be a finitely generated field extension. Then the ring $K \otimes_k A$ is Noetherian as well, see Lemma 7.28.7. Thus the following lemma makes sense.

Lemma 7.148.1. *Let k be a field. Let A be a k-algebra. Assume A is Noetherian. The following properties of A are equivalent:*

(1) *$k' \otimes_k A$ is a regular ring for every finitely generated field extension $k \subset k'$, and*
(2) *$k' \otimes_k A$ is a regular ring for every finite purely inseparable extension $k \subset k'$.*

where regular ring is as defined in Definition 7.102.6.

Proof. The lemma makes sense by the remarks preceding the lemma. It is clear that (1) $\Rightarrow$ (2).

Assume (2) and let $k \subset K$ be a finitely generated field extension. By Lemma 7.42.3 we can find a diagram

$$\begin{tikzcd} K \arrow[r] & K' \\ k \arrow[u] \arrow[r] & k' \arrow[u] \end{tikzcd}$$

where $k \subset k'$, $K \subset K'$ are finite purely inseparable field extensions such that $k' \subset K'$ is separable. By Lemma 7.141.9 there exists a smooth k'-algebra B such that K' is the fraction field of B. Now we can argue as follows: Step 1: $k' \otimes_k A$ is a regular ring because we assumed (2). Step 2: $B \otimes_{k'} k' \otimes_k A$ is a regular ring as $k' \otimes_k A \to B \otimes_{k'} k' \otimes_k A$ is smooth (Lemma 7.126.4) and ascent of regularity along smooth maps (Lemma 7.145.8). Step 3. $K' \otimes_{k'} k' \otimes_k A = K' \otimes_k A$ is a regular ring as it is a localization of a regular ring (immediate from the definition). Step 4. Finally $K \otimes_k A$ is a regular ring by descent of regularity along the faithfully flat ring map $K \otimes_k A \to K' \otimes_k A$ (Lemma 7.146.4). This proves the lemma. □

Definition 7.148.2. Let k be a field. Let R be a Noetherian k-algebra. The k-algebra R is called *geometrically regular* over k if the equivalent conditions of Lemma 7.148.1 hold.

We will see later (More on Algebra, Proposition 12.26.1) that it suffices to check $R \otimes_k k'$ is regular whenever $k \subset k' \subset k^{1/p}$ (finite).

Lemma 7.148.3. *Let k be a field. Let $A \to B$ be a faithfully flat k-algebra map. If B is geometrically regular over k, so is A.*

Proof. Assume B is geometrically regular over k. Let $k \subset k'$ be a finite, purely inseparable extension. Then $A \otimes_k k' \to B \otimes_k k'$ is faithfully flat as a base change of $A \to B$ (by Lemmas 7.27.3 and 7.35.6) and $B \otimes_k k'$ is regular by our assumption on B over k. Then $A \otimes_k k'$ is regular by Lemma 7.146.4. □

7.149. Geometrically Cohen-Macaulay algebras

This section is a bit of a misnomer, since Cohen-Macaulay algebras are automatically geometrically Cohen-Macaulay. Namely, see Lemma 7.121.6 and Lemma 7.149.2 below.

Lemma 7.149.1. *Let k be a field and let $k \subset K$ and $k \subset L$ be two field extensions such that one of them is a field extension of finite type. Then $K \otimes_k L$ is a Noetherian Cohen-Macaulay ring.*

Proof. The ring $K \otimes_k L$ is Noetherian by Lemma 7.28.7. Say K is a finite extension of the purely transcendental extension $k(t_1, \ldots, t_r)$. Then $k(t_1, \ldots, t_r) \otimes_k L \to K \otimes_k L$ is a finite free ring map. By Lemma 7.103.9 it suffices to show that $k(t_1, \ldots, t_r) \otimes_k L$ is Cohen-Macaulay. This is clear because it is a localization of the polynomial ring $L[t_1, \ldots, t_r]$. (See for example Lemma 7.96.7 for the fact that a polynomial ring is Cohen-Macaulay.) □

Lemma 7.149.2. *Let k be a field. Let S be a Noetherian k-algebra. Let $k \subset K$ be a finitely generated field extension, and set $S_K = K \otimes_k S$. Let $\mathfrak{q} \subset S$ be a prime of S. Let $\mathfrak{q}_K \subset S_K$ be a prime of S_K lying over $\mathfrak{q}$. Then $S_{\mathfrak{q}}$ is Cohen-Macaulay if and only if $(S_K)_{\mathfrak{q}_K}$ is Cohen-Macaulay.*

Proof. By Lemma 7.28.7 the ring S_K is Noetherian. Hence $S_{\mathfrak{q}} \to (S_K)_{\mathfrak{q}_K}$ is a flat local homomorphism of Noetherian local rings. Note that the fibre

$$(S_K)_{\mathfrak{q}_K}/\mathfrak{q}(S_K)_{\mathfrak{q}_K} \cong (\kappa(\mathfrak{q}) \otimes_k K)_{\mathfrak{q}'}$$

is the localization of the Cohen-Macaulay (Lemma 7.149.1) ring $\kappa(\mathfrak{q}) \otimes_k K$ at a suitable prime ideal $\mathfrak{q}'$. Hence the lemma follows from Lemma 7.145.3. □

CHAPTER 8

Brauer groups

8.1. Introduction

A reference are the lectures by Serre in the Seminaire Cartan, see [**Ser55a**]. Serre in turn refers to [**Deu68**] and [**ANT44**]. We changed some of the proofs, in particular we used a fun argument of Rieffel to prove Wedderburn's theorem. Very likely this change is not an improvement and we strongly encourage the reader to read the original exposition by Serre.

8.2. Noncommutative algebras

Let k be a field. In this chapter an *algebra* A over k is a possibly noncommutative ring A together with a ring map $k \to A$ such that k maps into the center of A and such that 1 maps to an identity element of A. An A-*module* is a right A-module such that the identity of A acts as the identity.

Definition 8.2.1. Let A be a k-algebra. We say A is *finite* if $\dim_k(A) < \infty$. In this case we write $[A : k] = \dim_k(A)$.

Definition 8.2.2. A *skew field* is a possibly noncommutative ring with an identity element 1, with $1 \neq 0$, such that in which every nonzero element has a multiplicative inverse.

A skew field is a k-algebra for some k (e.g., for the prime field contained in it). We will use below that any module over a skew field is free because a maximal linearly independent set of vectors forms a basis and exists by Zorn's lemma.

Definition 8.2.3. Let A be a k-algebra. We say an A-module M is *simple* if it is nonzero and the only A-submodules are 0 and M. We say A is *simple* if the only two-sided ideals of A are 0 and A.

Definition 8.2.4. A k-algebra A is *central* if the center of A is the image of $k \to A$.

Definition 8.2.5. Given a k-algebra A we denote A^{op} the k-algebra we get by reversing the order of multiplication in A. This is called the *opposite algebra*.

8.3. Wedderburn's theorem

The following cute argument can be found in a paper of Rieffel, see [**Rie65**]. The proof could not be simpler (quote from Carl Faith's review).

Lemma 8.3.1. *Let A be a possibly noncommutative ring with* 1 *which contains no nontrivial two-sided ideal. Let M be a nonzero right ideal in A, and view M as a right A-module. Then A coincides with the bicommutant of M.*

Proof. Let $A' = \text{End}_A(M)$, and let $A'' = \text{End}_{A'}(M)$ (the bicommutant of M). Let $R : A \to A''$ be the natural homomorphism $R(a)(m) = ma$. Then R is injective, since $R(1) = \text{id}_M$ and A contains no nontrivial two-sided ideal. We claim that $R(M)$ is a right ideal in

A''. Namely, $R(m)a'' = R(ma'')$ for $a'' \in A''$ and m in M, because *left* multiplication of M by any element n of M represents an element of A', and so $(nm)a'' = n(ma'')$, that is, $(R(m)a'')(n) = R(ma'')(n)$ for all n in M. Finally, the product ideal AM is a two-sided ideal, and so $A = AM$. Thus $R(A) = R(A)R(M)$, so that $R(A)$ is a right ideal in A''. But $R(A)$ contains the identity element of A'', and so $R(A) = A''$. □

Lemma 8.3.2. *Let A be a k-algebra. If A is finite, then*

(1) *A has a simple module,*
(2) *any nonzero module contains a simple submodule,*
(3) *a simple module over A has finite dimension over k, and*
(4) *if M is a simple A-module, then $End_A(M)$ is a skew field.*

Proof. Of course (1) follows from (2) since A is a nonzero A-module. For (2), any sub-module of minimal (finite) dimension as a k-vector space will be simple. There exists a finite dimensional one because a cyclic submodule is one. If M is simple, then $mA \subset M$ is a sub-module, hence we see (3). Any nonzero element of $\text{End}_A(M)$ is an isomorphism, hence (4) holds. □

Theorem 8.3.3. *Let A be a simple finite k-algebra. Then A is a matrix algebra over a finite k-algebra K which is a skew field.*

Proof. We may choose a simple submodule $M \subset A$ and then the k-algebra $K = \text{End}_A(M)$ is a skew field, see Lemma 8.3.2. By Lemma 8.3.1 we see that $A = \text{End}_K(M)$. Since K is a skew field and M is finitely generated (since $\dim_k(M) < \infty$) we see that M is finite free as a left K-module. It follows immediately that $A \cong \text{Mat}(n \times n, K^{op})$. □

8.4. Lemmas on algebras

Let A be a k-algebra. Let $B \subset A$ be a subalgebra. The *centralizer of B in A* is the subalgebra

$$C = \{y \in A \mid xy = yx \text{ for all } x \in B\}.$$

It is a k-algebra.

Lemma 8.4.1. *Let A, A' be k-algebras. Let $B \subset A$, $B' \subset A'$ be subalgebras with centralizers C, C'. Then the centralizer of $B \otimes_k B'$ in $A \otimes_k A'$ is $C \otimes_k C'$.*

Proof. Denote $C'' \subset A \otimes_k A'$ the centralizer of $B \otimes_k B'$. It is clear that $C \otimes_k C' \subset C''$. Conversely, every element of C'' commutes with $B \otimes 1$ hence is contained in $C \otimes_k A'$. Similarly $C'' \subset A \otimes_k C'$. Thus $C'' \subset C \otimes_k A' \cap A \otimes_k C' = C \otimes_k C'$. □

Lemma 8.4.2. *Let A be a finite simple k-algebra. Then the center k' of A is a finite field extension of k.*

Proof. Write $A = \text{Mat}(n \times n, K)$ for some skew field K finite over k, see Theorem 8.3.3. By Lemma 8.4.1 the center of A is $k \otimes_k k'$ where $k' \subset K$ is the center of K. Since the center of a skew field is a field, we win. □

Lemma 8.4.3. *Let V be a k vector space. Let K be a central k-algebra which is a skew field. Let $W \subset V \otimes_k K$ be a two-sided K-sub vector space. Then W is generated as a left K-vector space by $W \cap (V \otimes 1)$.*

Proof. Let $V' \subset V$ be the k-sub vector space generated by $v \in V$ such that $v \otimes 1 \in W$. Then $V' \otimes_k K \subset W$ and we have

$$W/V' \otimes_k K \subset V/V' \otimes_k K.$$

If $\overline{v} \in V/V'$ is a nonzero vector such that $\overline{v} \otimes 1$ is contained in $W/V' \otimes_k K$, then we see that $v \otimes 1 \in W$ where $v \in V$ lifts $\overline{v}$. This contradicts our construction of V'. Hence we may replace V by V/V' and W by $W/V' \otimes_k K$ and it suffices to prove that $W \cap (V \otimes 1)$ is nonzero if W is nonzero.

To see this let $w \in W$ be a nonzero element which can be written as $W = \sum_{i=1,\ldots,n} v_i \otimes k_i$ with n minimal. We may right multiply with k_1^{-1} and assume that $k_1 = 1$. If $n = 1$, then we win because $v_1 \otimes 1 \in W$. If $n > 1$, then we see that for any $c \in K$

$$cv - vc = \sum\nolimits_{i=2,\ldots,n} v_i \otimes (ck_i - k_i c) \in W$$

and hence $ck_i - k_i c = 0$ by minimality of n. This implies that k_i is in the center of K which is k by assumption. Hence $v = (v_1 + \sum k_i v_i) \otimes 1$ contradicting the minimality of n. $\square$

Lemma 8.4.4. *Let A be a k-algebra. Let K be a central k-algebra which is a skew field. Then any two-sided ideal $I \subset A \otimes_k K$ is of the form $J \otimes_k K$ for some two-sided ideal $J \subset A$. In particular, if A is simple, then so is $A \otimes_k K$.*

Proof. Set $J = \{a \in A \mid a \otimes 1 \in I\}$. This is a two-sided ideal of A. And $I = J \otimes_k K$ by Lemma 8.4.3. $\square$

Lemma 8.4.5. *Let R be a possibly noncommutative ring. Let $n \geq 1$ be an integer. Let $R_n = Mat(n \times n, R)$.*

(1) *The functors $M \mapsto M^{\oplus n}$ and $N \mapsto Ne_{11}$ define quasi-inverse equivalences of categories $Mod_R \leftrightarrow Mod_{R_n}$.*
(2) *A two-sided ideal of R_n is of the form IR_n for some two-sided ideal I of R.*
(3) *The center of R_n is equal to the center of R.*

Proof. Part (1) proves itself. If $J \subset R_n$ is a two-sided ideal, then $J = \bigoplus e_{ii} J e_{jj}$ and all of the summands $e_{ii} J e_{jj}$ are equal to each other and are a two-sided ideal I of R. This proves (2). Part (3) is clear. $\square$

Lemma 8.4.6. *Let A be a finite simple k-algebra.*

(1) *There exists exactly one simple A-module M up to isomorphism.*
(2) *Any finite A-module is a direct sum of copies of a simple module.*
(3) *Two finite A-modules are isomorphic if and only if they have the same dimension over k.*
(4) *If $A = Mat(n \times n, K)$ with K a finite skew field extension of k, then $M = K^{\oplus n}$ is a simple A-module and $End_A(M) = K^{op}$.*
(5) *If M is a simple A-module, then $L = End_A(M)$ is a skew field finite over k acting on the left on M, we have $A = End_L(M)$, and the centers of A and L agree. Also $[A : k][L : k] = \dim_k(M)^2$.*
(6) *For a finite A-module N the algebra $B = End_A(N)$ is a matrix algebra over the skew field L of (3). Moreover $End_B(N) = A$.*

Proof. By Theorem 8.3.3 we can write $A = \text{Mat}(n \times n, K)$ for some finite skew field extension K of k. By Lemma 8.4.5 the category of modules over A is equivalent to the category of modules over K. Thus (1), (2), and (3) hold because every module over K is free. Part (4) holds because the equivalence transforms the K-module K to $M = K^{\oplus n}$. Using $M = K^{\oplus n}$ in (5) we see that $L = K^{op}$. The statement about the center of $L = K^{op}$ follows from Lemma 8.4.5. The statement about $\text{End}_L(M)$ follows from the explicit form of M. The formula of dimensions is clear. Part (6) follows as N is isomorphic to a direct sum of copies of a simple module. $\square$

Lemma 8.4.7. *Let A, A' be two simple k-algebras one of which is finite and central over k. Then $A \otimes_k A'$ is simple.*

Proof. Suppose that A' is finite and central over k. Write $A' = \text{Mat}(n \times n, K')$, see Theorem 8.3.3. Then the center of K' is k and we conclude that $A \otimes_k K'$ is simple by Lemma 8.4.4. Hence $A \otimes_k A' = \text{Mat}(n \times n, A \otimes_k K')$ is simple by Lemma 8.4.5. □

Lemma 8.4.8. *The tensor product of finite central simple algebras over k is finite, central, and simple.*

Proof. Combine Lemmas 8.4.1 and 8.4.7. □

Lemma 8.4.9. *Let A be a finite central simple algebra over k. Let $k \subset k'$ be a field extension. Then $A' = A \otimes_k k'$ is a finite central simple algebra over k'.*

Proof. Combine Lemmas 8.4.1 and 8.4.7. □

Lemma 8.4.10. *Let A be a finite central simple algebra over k. Then $A \otimes_k A^{op} \cong Mat(n \times n, k)$ where $n = [A : k]$.*

Proof. By Lemma 8.4.8 the algebra $A \otimes_k A^{op}$ is simple. Hence the map

$$A \otimes_k A^{op} \longrightarrow \text{End}_k(A), \quad a \otimes a' \longmapsto (x \mapsto axa')$$

is injective. Since both sides of the arrow have the same dimension we win. □

8.5. The Brauer group of a field

Let k be a field. Consider two finite central simple algebras A and B over k. We say A and B are *similar* if there exist $n, m > 0$ such that $\text{Mat}(n \times n, A) \cong \text{Mat}(m \times m, B)$ as k-algebras.

Lemma 8.5.1. *Similarity.*

(1) *Similarity defines an equivalence relation on the set of isomorphism classes of finite central simple algebras over k.*
(2) *Every similarity class contains a unique (up to isomorphism) finite central skew field extension of k.*
(3) *If $A = Mat(n \times n, K)$ and $B = Mat(m \times m, K')$ for some finite central skew fields K, K' over k then A and B are similar if and only if $K \cong K'$ as k-algebras.*

Proof. Note that by Wedderburn's theorem (Theorem 8.3.3) we can always write a finite central simple algebra as a matrix algebra over a finite central skew field. Hence it suffices to prove the third assertion. To see this it suffices to show that if $A = \text{Mat}(n \times n, K) \cong \text{Mat}(m \times m, K') = B$ then $K \cong K'$. To see this note that for a simple module M of A we have $\text{End}_A(M) = K^{op}$, see Lemma 8.4.6. Hence $A \cong B$ implies $K^{op} \cong (K')^{op}$ and we win. □

Given two finite central simple k-algebras A, B the tensor product $A \otimes_k B$ is another, see Lemma 8.4.8. Moreover if A is similar to A', then $A \otimes_k B$ is similar to $A' \otimes_k B$ because tensor products and taking matrix algebras commute. Hence tensor product defines an operation on equivalence classes of finite central simple algebras which is clearly associative and commutative. Finally, Lemma 8.4.10 shows that $A \otimes_k A^{op}$ is isomorphic to a matrix algebra, i.e., that $A \otimes_k A^{op}$ is in the similarity class of k. Thus we obtain an abelian group.

Definition 8.5.2. Let k be a field. The *Brauer group* of k is the abelian group of similarity classes of finite central simple k-algebras defined above. Notation $\text{Br}(k)$.

For any map of fields $k \to k'$ we obtain a group homomorphism

$$\mathrm{Br}(k) \longrightarrow \mathrm{Br}(k'), \quad A \longmapsto A \otimes_k k'$$

see Lemma 8.4.9. In other words, $\mathrm{Br}(-)$ is a functor from the category of fields to the category of abelian groups. Observe that the Brauer group of a field is zero if and only if every finite central skew field extension $k \subset K$ is trivial.

Lemma 8.5.3. *The Brauer group of an algebraically closed field is zero.*

Proof. Let $k \subset K$ be a finite central skew field extension. For any element $x \in K$ the subring $k[x] \subset K$ is a commutative finite integral k-sub algebra, hence a field, see Algebra, Lemma 7.32.17. Since k is algebraically closed we conclude that $k[x] = k$. Since x was arbitrary we conclude $k = K$. □

Lemma 8.5.4. *Let A be a finite central simple algebra over a field k. Then $[A : k]$ is a square.*

Proof. This is true because $A \otimes_k \overline{k}$ is a matrix algebra over $\overline{k}$ by Lemma 8.5.3. □

8.6. Skolem-Noether

Theorem 8.6.1. *Let A be a finite central simple k-algebra. Let B be a simple k-algebra. Let $f, g : B \to A$ be two k-algebra homomorphisms. Then there exists an invertible element $x \in A$ such that $f(b) = xg(b)x^{-1}$ for all $b \in B$.*

Proof. Choose a simple A-module M. Set $L = \mathrm{End}_A(M)$. Then L is a skew field with center k which acts on the left on M, see Lemmas 8.3.2 and 8.4.6. Then M has two $B \otimes_k L^{op}$-module structures defined by $m \cdot_1 (b \otimes l) = lmf(b)$ and $m \cdot_2 (b \otimes l) = lmg(b)$. Since $B \otimes_k L^{op}$ is a finite simple k-algebra by Lemma 8.4.7 we see that these module structures are isomorphic by Lemma 8.4.6. Hence we find $\varphi : M \to M$ intertwining these operations. In particular φ is in the commutant of L which implies that φ is multiplication by some $x \in A$, see Lemma 8.4.6. Working out the definitions we see that x is a solution to our problem. □

Lemma 8.6.2. *Let A be a finite simple k-algebra. Any automorphism of A is inner. In particular, any automorphism of $Mat(n \times n, k)$ is inner.*

Proof. Note that A is a finite central simple algebra over the center of A which is a finite field extension of k, see Lemma 8.4.2. Hence the Skolem-Noether theorem (Theorem 8.6.1) applies. □

8.7. The centralizer theorem

Theorem 8.7.1. *Let A be a finite central simple algebra over k, and let B be a simple subalgebra of A. Then*

(1) *the centralizer C of B in A is simple,*
(2) *$[A : k] = [B : k][C : k]$, and*
(3) *the centralizer of C in A is B.*

Proof. Throughout this proof we use the results of Lemma 8.4.6 freely. Choose a simple A-module M. Set $L = \mathrm{End}_A(M)$. Then L is a skew field with center k which acts on the left on M and $A = \mathrm{End}_L(M)$. Then M is a right $B \otimes_k L^{op}$-module and $C = \mathrm{End}_{B \otimes_k L^{op}}(M)$. Since the algebra $B \otimes_k L^{op}$ is simple by Lemma 8.4.7 we see that C is simple (by Lemma 8.4.6 again).

Write $B \otimes_k L^{op} = \mathrm{Mat}(m \times m, K)$ for some skew field K finite over k. Then $C = \mathrm{Mat}(n \times n, K^{op})$ if M is isomorphic to a direct sum of n copies of the simple $B \otimes_k L^{op}$-module $K^{\oplus m}$ (the lemma again). Thus we have $\dim_k(M) = nm[K : k]$, $[B : k][L : k] = m^2[K : k]$, $[C : k] = n^2[K : k]$, and $[A : k][L : k] = \dim_k(M)^2$ (by the lemma again). We conclude that (2) holds.

Part (3) follows because of (2) applied to $C \subset A$ shows that $[B : k] = [C' : k]$ where C' is the centralizer of C in A (and the obvious fact that $B \subset C'$). □

Lemma 8.7.2. *Let A be a finite central simple algebra over k, and let B be a simple subalgebra of A. If B is a central k-algebra, then $A = B \otimes_k C$ where C is the (central simple) centralizer of B in A.*

Proof. We have $\dim_k(A) = \dim_k(B \otimes_k C)$ by Theorem 8.7.1. By Lemma 8.4.7 the tensor product is simple. Hence the natural map $B \otimes_k C \to A$ is injective hence an isomorphism. □

Lemma 8.7.3. *Let A be a finite central simple algebra over k. If $K \subset A$ is a subfield, then the following are equivalent*

(1) $[A : k] = [K : k]^2$,
(2) *K is its own centralizer, and*
(3) *K is a maximal commutative subring.*

Proof. Theorem 8.7.1 shows that (1) and (2) are equivalent. It is clear that (3) and (2) are equivalent. □

Lemma 8.7.4. *Let A be a finite central skew field over k. Then every maximal subfield $K \subset A$ satisfies $[A : k] = [K : k]^2$.*

Proof. Special case of Lemma 8.7.3. □

8.8. Splitting fields

Definition 8.8.1. Let A be a finite central simple k-algebra. We say a field extension $k \subset k'$ *splits* A, or k' is a *splitting field* for A if $A \otimes_k k'$ is a matrix algebra over k'.

Another way to say this is that the class of A maps to zero under the map $\mathrm{Br}(k) \to \mathrm{Br}(k')$.

Theorem 8.8.2. *Let A be a finite central simple k-algebra. Let $k \subset k'$ be a finite field extension. The following are equivalent*

(1) *k' splits A, and*
(2) *there exists a finite central simple algebra B similar to A such that $k' \subset B$ and $[B : k] = [k' : k]^2$.*

Proof. Assume (2). It suffices to show that $B \otimes_k k'$ is a matrix algebra. We know that $B \otimes_k B^{op} \cong \mathrm{End}_k(B)$. Since k' is the centralizer of k' in B^{op} by Lemma 8.7.3 we see that $B \otimes_k k'$ is the centralizer of $k \otimes k'$ in $B \otimes_k B^{op} = \mathrm{End}_k(B)$. Of course this centralizer is just $\mathrm{End}_{k'}(B)$ where we view B as a k' vector space via the embedding $k' \to B$. Thus the result.

Assume (1). This means that we have an isomorphism $A \otimes_k k' \cong \mathrm{End}_{k'}(V)$ for some k'-vector space V. Let B be the commutant of A in $\mathrm{End}_k(V)$. Note that k' sits in B. By Lemma 8.7.2 the classes of A and B add up to zero in $\mathrm{Br}(k)$. From the dimension formula in Theorem 8.7.1 we see that

$$[B : k][A : k] = \dim_k(V)^2 = [k' : k]^2 \dim_{k'}(V)^2 = [k' : k]^2[A : k].$$

Hence $[B : k] = [k' : k]^2$. Thus we have proved the result for the opposite to the Brauer class of A. However, k' splits the Brauer class of A if and only if it splits the Brauer class of the opposite algebra, so we win anyway. □

Lemma 8.8.3. *A maximal subfield of a finite central skew field K over k is a splitting field for K.*

Proof. Combine Lemma 8.7.4 with Theorem 8.8.2. □

Lemma 8.8.4. *Consider a finite central skew field K over k. Let $d^2 = [K : k]$. For any finite splitting field k' for K the degree $[k' : k]$ is divisible by d.*

Proof. By Theorem 8.8.2 there exists a finite central simple algebra B in the Brauer class of K such that $[B : k] = [k' : k]^2$. By Lemma 8.5.1 we see that $B = \text{Mat}(n \times n, K)$ for some n. Then $[k' : k]^2 = n^2 d^2$ whence the result. □

Proposition 8.8.5. *Consider a finite central skew field K over k. There exists a maximal subfield $k \subset k' \subset K$ which is separable over k. In particular, every Brauer class has a finite separable spitting field.*

Proof. Since every Brauer class is represented by a finite central skew field over k, we see that the second statement follows from the first by Lemma 8.8.3.

To prove the first statement, suppose that we are given a separable subfield $k' \subset K$. Then the centralizer K' of k' in K has center k', and the problem reduces to finding a maximal subfield of K' separable over k'. Thus it suffices to prove, if $k \neq K$, that we can find an element $x \in K$, $x \notin K$ which is separable over k. This statement is clear in characteristic zero. Hence we may assume that k has characteristic $p > 0$. If the ground field k is finite then, the result is clear as well (because extensions of finite fields are always separable). Thus we may assume that k is an infinite field of positive characteristic.

To get a contradiction assume no element of K is separable over k. By the discussion in Algebra, Section 7.38 this means the minimal polynomial of any $x \in K$ is of the form $T^q - a$ where q is a power of p and $a \in k$. Since it is clear that every element of K has a minimal polynomial of degree $\leq \dim_k(K)$ we conclude that there exists a fixed p-power q such that $x^q \in k$ for all $x \in K$.

Consider the map

$$(-)^q : K \longrightarrow K$$

and write it out in terms of a k-basis $\{a_1, \ldots, a_n\}$ of K with $a_1 = 1$. So

$$(\sum x_i a_i)^q = \sum f_i(x_1, \ldots, x_n) a_i.$$

Since multiplication on A is k-bilinear we see that each f_i is a polynomial in $x_1, \ldots, x_n$ (details omitted). The choice of q above and the fact that k is infinite shows that f_i is identically zero for $i \geq 2$. Hence we see that it remains zero on extending k to its algebraic closure $\overline{k}$. But the algebra $A \otimes_k \overline{k}$ is a matrix algebra, which implies there are some elements whose qth power is not central (e.g., e_{11}). This is the desired contradiction. □

The results above allow us to characterize finite central simple algebras as follows.

Lemma 8.8.6. *Let k be a field. For a k-algebra A the following are equivalent*

(1) *A is finite central simple k-algebra,*
(2) *A is a finite dimensional k-vector space, k is the center of A, and A has no non-trivial two-sided ideal,*

(3) *there exists* $d \geq 1$ *such that* $A \otimes_k \bar{k} \cong Mat(d \times d, \bar{k})$*,*
(4) *there exists* $d \geq 1$ *such that* $A \otimes_k k^{sep} \cong Mat(d \times d, k^{sep})$*,*
(5) *there exist* $d \geq 1$ *and a finite Galois extension* $k \subset k'$ *such that* $A \otimes_{k'} k' \cong Mat(d \times d, k')$*,*
(6) *there exist* $n \geq 1$ *and a finite central skew field* K *over* k *such that* $A \cong Mat(n \times n, K)$*.*

The integer d *is called the degree of* A*.*

Proof. The equivalence of (1) and (2) is a consequence of the definitions, see Section 8.2. Assume (1). By Proposition 8.8.5 there exists a separable splitting field $k \subset k'$ for A. Of course, then a Galois closure of k'/k is a splitting field also. Thus we see that (1) implies (5). It is clear that (5) $\Rightarrow$ (4) $\Rightarrow$ (3). Assume (3). Then $A \otimes_k \overline{k}$ is a finite central simple $\overline{k}$-algebra for example by Lemma 8.4.5. This trivially implies that A is a finite central simple k-algebra. Finally, the equivalence of (1) and (6) is Wedderburn's theorem, see Theorem 8.3.3. □

CHAPTER 9

Sites and Sheaves

9.1. Introduction

The notion of a site was introduced by Grothendieck to be able to study sheaves in the étale topology of schemes. The basic reference for this notion is perhaps [**MA71**]. Our notion of a site differs from that in [**MA71**]; what we call a site is called a category endowed with a pretopology in [**MA71**, Exposé II, Définition 1.3]. The reason we do this is that in algebraic geometry it is often convenient to work with a given class of coverings, for example when defining when a property of schemes is local in a given topology, see Descent, Section 31.11. Our exposition will closely follow [**Art62**]. We will not use universes.

9.2. Presheaves

Let $\mathcal{C}$ be a category. A *presheaf of sets* is a contravariant functor $\mathcal{F}$ from $\mathcal{C}$ to *Sets* (see Categories, Remark 4.2.11). So for every object U of $\mathcal{C}$ we have a set $\mathcal{F}(U)$. The elements of this set are called the *sections* of $\mathcal{F}$ over U. For every morphism $f : V \to U$ the map $\mathcal{F}(f) : \mathcal{F}(U) \to \mathcal{F}(V)$ is called the *restricton map* and is often denoted $f^* : \mathcal{F}(U) \to \mathcal{F}(V)$. Another way of expressing this is to say that $f^*(s)$ is the *pullback* of s via f. Functoriality means that $g^* f^*(s) = (f \circ g)^*(s)$. Sometimes we use the notation $s|_V := f^*(s)$. This notation is consistent with the notion of restriction of functions from topology because if $W \to V \to U$ are morphisms in $\mathcal{C}$ and s is a section of $\mathcal{F}$ over U then $s|_W = (s|_V)|_W$ by the functorial nature of $\mathcal{F}$. Of course we have to be careful since it may very well happen that there is more than one morphism $V \to U$ and it is certainly not going to be the case that the corresponding pull back maps are equal.

Definition 9.2.1. A *presheaf of sets* on $\mathcal{C}$ is a contravariant functor from $\mathcal{C}$ to *Sets*. *Morphisms of presheaves* are transformations of functors. The category of presheaves of sets is denoted $PSh(\mathcal{C})$.

Note that for any object U of $\mathcal{C}$ the functor of points h_U, see Categories, Example 4.3.4 is a presheaf. These are called the *representable presheaves*. These presheaves have the pleasing property that for any presheaf $\mathcal{F}$ we have

$$Mor_{PSh(\mathcal{C})}(h_U, \mathcal{F}) = \mathcal{F}(U).$$

This is similar to the Yoneda lemma (Categories, Lemma 4.3.5) and left as a good exercise to the reader.

Similarly, we can define the notion of a presheaf of abelian groups, rings, etc. More generally we may define a presheaf with values in a category.

Definition 9.2.2. Let $\mathcal{C}$, $\mathcal{A}$ be categories. A *presheaf* $\mathcal{F}$ on $\mathcal{C}$ with values in $\mathcal{A}$ is a contravariant functor from $\mathcal{C}$ to $\mathcal{A}$, i.e., $\mathcal{F} : \mathcal{C}^{o} \to \mathcal{A}$. A *morphism* of presheaves $\mathcal{F} \to \mathcal{G}$ on $\mathcal{C}$ with values in $\mathcal{A}$ is a transformation of functors from $\mathcal{F}$ to $\mathcal{G}$.

These form the objects and morphisms of the category of presheaves on $\mathcal{C}$ with values in $\mathcal{A}$.

Remark 9.2.3. As already pointed out we may consider the category presheaves with values in any of the ``big'' categories listed in Categories, Remark 4.2.2. These will be ``big'' categories as well and they will be listed in the above mentioned remark as we go along.

9.3. Injective and surjective maps of presheaves

Definition 9.3.1. Let $\mathcal{C}$ be a category, and let $\varphi : \mathcal{F} \to \mathcal{G}$ be a map of presheaves of sets.

(1) We say that φ is *injective* if for every object U of $\mathcal{C}$ we have $\alpha : \mathcal{F}(U) \to \mathcal{G}(U)$ is injective.
(2) We say that φ is *surjective* if for every object U of $\mathcal{C}$ we have $\alpha : \mathcal{F}(U) \to \mathcal{G}(U)$ is surjective.

Lemma 9.3.2. *The injective (resp. surjective) maps defined above are exactly the monomorphisms (resp. epimorphisms) of $PSh(\mathcal{C})$. A map is an isomorphism if and only if it is both injective and surjective.*

Proof. Omitted. □

Definition 9.3.3. We say $\mathcal{F}$ is a *subpresheaf* of $\mathcal{G}$ if for every object $U \in Ob(\mathcal{C})$ the set $\mathcal{F}(U)$ is a subset of $\mathcal{G}(U)$, compatibly with the restriction mappings.

In other words, the inclusion maps $\mathcal{F}(U) \to \mathcal{G}(U)$ glue together to give an (injective) morphism of presheaves $\mathcal{F} \to \mathcal{G}$.

Lemma 9.3.4. *Let $\mathcal{C}$ be a category. Suppose that $\varphi : \mathcal{F} \to \mathcal{G}$ is a morphism of presheaves of setson $\mathcal{C}$. There exists a unique subpresheaf $\mathcal{G}' \subset \mathcal{G}$ such that φ factors as $\mathcal{F} \to \mathcal{G}' \to \mathcal{G}$ and such that the first map is surjective.*

Proof. Omitted. □

Definition 9.3.5. Notation as in Lemma 9.3.4. We say that $\mathcal{G}'$ is the *image of φ*.

9.4. Limits and colimits of presheaves

Let $\mathcal{C}$ be a category. Limits and colimits exist in the category $PSh(\mathcal{C})$. In addition, for any $U \in \mathrm{ob}(\mathcal{C})$ the functor

$$PSh(\mathcal{C}) \longrightarrow Sets, \quad \mathcal{F} \longmapsto \mathcal{F}(U)$$

commutes with limits and colimits. Perhaps the easiest way to prove these statement is the following. Given a diagram $\mathcal{F} : \mathcal{I} \to PSh(\mathcal{C})$ define presheaves

$$\mathcal{F}_{lim} : U \longmapsto lim_{i\in\mathcal{I}}\mathcal{F}_i(U) \text{ and } \mathcal{F}_{colim} : U \longmapsto colim_{i\in\mathcal{I}}\mathcal{F}_i(U)$$

There are clearly projection maps $\mathcal{F}_{lim} \to \mathcal{F}_i$ and canonical maps $\mathcal{F}_i \to \mathcal{F}_{colim}$. These maps satisfy the requirements of the maps of a limit (reps. colimit) of Categories, Definition 4.13.1 (resp. Categories, Definition 4.13.2). Finally, if $(\mathcal{G}, q_i : \mathcal{G} \to \mathcal{F}_i)$ is another system (as in the definition of a limit), then we get for every U a system of maps $\mathcal{G}(U) \to \mathcal{F}_i(U)$ with suitable functoriality requirements. And thus a unique map $\mathcal{G}(U) \to \mathcal{F}_{lim}(U)$. It is easy to verify these are compatible as we vary U and arise from the desired map $\mathcal{G} \to \mathcal{F}_{lim}$. A similar argument works in the case of the colimit.

9.5. Functoriality of categories of presheaves

Let $u : \mathcal{C} \to \mathcal{D}$ be a functor between categories. In this case we denote

$$u^p : PSh(\mathcal{D}) \longrightarrow PSh(\mathcal{C})$$

the functor that associates to $\mathcal{G}$ on $\mathcal{D}$ the presheaf $u^p\mathcal{G} = \mathcal{G} \circ u$. Note that by the previous section this functor commutes with all limits.

For $V \in \text{ob}(\mathcal{D})$ let $\mathcal{I}_V^u$ denote the category with

$$(9.5.0.1) \qquad \begin{array}{rcl} Ob(\mathcal{I}_V^u) & = & \{(U, \phi) \mid U \in Ob(\mathcal{C}), \phi : V \to u(U)\} \\ Mor_{\mathcal{I}_V^u}((U, \phi), (U', \phi')) & = & \{f : U \to U' \text{ in } \mathcal{C} \mid u(f) \circ \phi = \phi'\} \end{array}$$

We sometimes drop the subscript ^{u} from the notation and we simply write $\mathcal{I}_V$. We will use these categories to define a left adjoint to the functor u^p. Before we do so we prove a few technical lemmas.

Lemma 9.5.1. *Let $u : \mathcal{C} \to \mathcal{D}$ be a functor between categories. Suppose that $\mathcal{C}$ has fibre products and equalizers, and that u commutes with them. Then the categories $(\mathcal{I}_V)^{opp}$ satisfy the hypotheses of Categories, Lemma 4.17.3.*

Proof. There are two conditions to check.

First, suppose we are given three objects $\phi : V \to u(U)$, $\phi' : V \to u(U')$, and $\phi'' : V \to u(U'')$ and morphisms $a : U' \to U$, $b : U'' \to U$ such that $u(a) \circ \phi = \phi'$ and $u(b) \circ \phi = \phi''$. We have to show there exists another object $\phi''' : V \to u(U''')$ and morphisms $c : U''' \to U'$ and $d : U''' \to U''$ such that $u(c) \circ \phi = \phi'''$, $u(d) \circ \phi = \phi'''$ and $a \circ c = b \circ d$. We take $U''' = U' \times_U U''$ with c and d the projection morphisms. This works as u commutes with fibre products; we omit the verification.

Second, suppose we are given two objects $\phi : V \to u(U)$ and $\phi' : V \to u(U')$ and morphisms $a, b : (U, \phi) \to (U', \phi')$. We have to find a morphism $c : (U'', \phi'') \to (U, \phi)$ which equalizes a and b. Let $c : U'' \to U$ be the equalizer of a and b in the category $\mathcal{C}$. As u commutes with equalizers and since $u(a) \circ \phi = u(b) \circ \phi = \phi'$ we obtain a morphism $\phi'' : V \to u(U'')$. $\square$

Lemma 9.5.2. *Let $u : \mathcal{C} \to \mathcal{D}$ be a functor between categories. Assume*

1. *the category $\mathcal{C}$ has a final object X and $u(X)$ is a final object of $\mathcal{D}$, and*
2. *the category $\mathcal{C}$ has fibre products and u commutes with them.*

Then the index categories $(\mathcal{I}_V^u)^{opp}$ of are filtered (see Categories, Definition 4.17.1).

Proof. The assumptions imply that the assumptions of Lemma 9.5.1 are satisfied (see the discussion in Categories, Section 4.16). By Categories, Lemma 4.17.3 we see that $\mathcal{I}_V$ is a (possibly empty) disjoint union of directed categories. Hence it suffices to show that $\mathcal{I}_V$ is nonempty and connected.

First, we show that $\mathcal{I}_V$ is nonempty. Namely, let X be the final object of $\mathcal{C}$, which exists by assumption. Let $V \to u(X)$ be the morphism coming from the fact that $u(X)$ is final in $\mathcal{D}$ by assumption. This gives an object of $\mathcal{I}_V$.

Second, we show that $\mathcal{I}_V$ is connected. Let $\phi_1 : V \to u(U_1)$ and $\phi_2 : V \to u(U_2)$ be in $Ob(\mathcal{I}_V)$. By assumption $U_1 \times U_2$ exists and $u(U_1 \times U_2) = u(U_1) \times u(U_2)$. Consider the morphism $\phi : V \to u(U_1 \times U_2)$ corresponding to (ϕ_1, ϕ_2) by the universal property of products. Clearly the object $\phi : V \to u(U_1 \times U_2)$ maps to both $\phi_1 : V \to u(U_1)$ and $\phi_2 : V \to u(U_2)$. $\square$

Given $g : V' \to V$ in $\mathcal{D}$ we get a functor $\overline{g} : \mathcal{I}_V \to \mathcal{I}_{V'}$ by setting $\overline{g}(U, \phi) = (U, \phi \circ g)$ on objects. Given a presheaf $\mathcal{F}$ on $\mathcal{C}$ we obtain a functor

$$\mathcal{F}_V : \mathcal{I}_V^{opp} \longrightarrow Sets, \quad (U, \phi) \longmapsto \mathcal{F}(U).$$

In other words, $\mathcal{F}_V$ is a presheaf of sets on $\mathcal{I}_V$. Note that we have $\mathcal{F}_{V'} \circ \overline{g} = \mathcal{F}_V$. We define

$$u_p\mathcal{F}(V) := colim_{\mathcal{I}_V^{opp}} \mathcal{F}_V$$

As a colimit we obtain for each $(U, \phi) \in Ob(\mathcal{I}_V)$ a canonical map $\mathcal{F}(U) \xrightarrow{c(\phi)} u_p\mathcal{F}(V)$. For $g : V' \to V$ as above there is a canonical restriction map $g^* : u_p\mathcal{F}(V) \to u_p\mathcal{F}(V')$ compatible with $\mathcal{F}_{V'} \circ \overline{g} = \mathcal{F}_V$ by Categories, Lemma 4.13.7. It is the unique map so that for all $(U, \phi) \in Ob(\mathcal{I}_V)$ the diagram

$$\begin{tikzcd} \mathcal{F}(U) \arrow[r, "c(\phi)"] \arrow[d, "\mathrm{id}"'] & u_p\mathcal{F}(V) \arrow[d, "g^*"] \\ \mathcal{F}(U) \arrow[r, "c(\phi \circ g)"] & u_p\mathcal{F}(V') \end{tikzcd}$$

commutes. The uniquess of these maps implies that we obtain a presheaf. This presheaf will be denoted $u_p\mathcal{F}$.

Lemma 9.5.3. *There is a canonical map $\mathcal{F}(U) \to u_p\mathcal{F}(u(U))$, which is compatible with restriction maps (on $\mathcal{F}$ and on $u_p\mathcal{F}$).*

Proof. This is just the map $c(\mathrm{id}_{u(U)})$ introduced above. □

Note that any map of presheaves $\mathcal{F} \to \mathcal{F}'$ gives rise to compatible systems of maps between functors $\mathcal{F}_Y \to \mathcal{F}'_Y$, and hence to a map of presheaves $u_p\mathcal{F} \to u_p\mathcal{F}'$. In other words, we have defined a functor

$$u_p : PSh(\mathcal{C}) \longrightarrow PSh(\mathcal{D})$$

Lemma 9.5.4. *The functor u_p is a left adjoint to the functor u^p. In other words the formula*

$$Mor_{PSh(\mathcal{C})}(\mathcal{F}, u^p\mathcal{G}) = Mor_{PSh(\mathcal{D})}(u_p\mathcal{F}, \mathcal{G})$$

holds bifunctorially in $\mathcal{F}$ and $\mathcal{G}$.

Proof. Let $\mathcal{G}$ be a presheaf on $\mathcal{D}$ and let $\mathcal{F}$ be a presheaf on $\mathcal{C}$. We will show that the displayed formula holds by constructing maps either way. We will leave it to the reader to verify they are each others inverse.

Given a map $\alpha : u_p\mathcal{F} \to \mathcal{G}$ we get $u^p\alpha : u^p u_p\mathcal{F} \to u^p\mathcal{G}$. Lemma 9.5.3 says that there is a map $\mathcal{F} \to u^p u_p\mathcal{F}$. The composition of the two gives the desired map. (The good thing about this construction is that it is clearly functorial in everything in sight.)

Conversely, given a map $\beta : \mathcal{F} \to u^p\mathcal{G}$ we get a map $u_p\beta : u_p\mathcal{F} \to u_p u^p\mathcal{G}$. We claim that the functor $u^p\mathcal{G}_Y$ on $\mathcal{I}_Y$ has a canonical map to the constant functor with value $\mathcal{G}(Y)$. Namely, for every object (X, ϕ) of $\mathcal{I}_Y$, the value of $u^p\mathcal{G}_Y$ on this object is $\mathcal{G}(u(X))$ which maps to $\mathcal{G}(Y)$ by $\mathcal{G}(\phi) = \phi^*$. This is a transformation of functors because $\mathcal{G}$ is a functor itself. This leads to a map $u_p u^p\mathcal{G}(Y) \to \mathcal{G}(Y)$. Another trivial verification shows that this is functorial in Y leading to a map of presheaves $u_p u^p\mathcal{G} \to \mathcal{G}$. The composition $u_p\mathcal{F} \to u_p u^p\mathcal{G} \to \mathcal{G}$ is the desired map. □

Remark 9.5.5. Suppose that $\mathcal{A}$ is a category such that any diagram $\mathcal{I}_Y \to \mathcal{A}$ has a colimit in $\mathcal{A}$. In this case it is clear that there are functors u^p and u_p, defined in exactly the same way as above, on the categories of presheaves with values in $\mathcal{A}$. Moreover, the adjointness of the pair u^p and u_p continues to hold in this setting.

Lemma 9.5.6. *Let $u : \mathcal{C} \to \mathcal{D}$ be a functor between categories. For any object U of $\mathcal{C}$ we have $u_p h_U = h_{u(U)}$.*

Proof. By adjointness of u_p and u^p we have

$$Mor_{PSh(\mathcal{D})}(u_p h_U, \mathcal{G}) = Mor_{PSh(\mathcal{C})}(h_U, u^p\mathcal{G}) = u^p\mathcal{G}(U) = \mathcal{G}(u(U))$$

and hence by Yoneda's lemma we see that $u_p h_U = h_{u(U)}$ as presheaves. □

9.6. Sites

Our notion of a site uses the following type of structures.

Definition 9.6.1. Let $\mathcal{C}$ be a category, see Conventions, Section 2.3. A *family of morphisms with fixed target* in $\mathcal{C}$ is given by an object $U \in Ob(\mathcal{C})$, a set I and for each $i \in I$ a morphism $U_i \to U$ of $\mathcal{C}$ with target U. We use the notation $\{U_i \to U\}_{i\in I}$ to indicate this.

It can happen that the set I is empty! This notation is meant to suggest an open covering as in topology.

Definition 9.6.2. A *site*[1] is given by a category $\mathcal{C}$ and a set $\mathrm{Cov}(\mathcal{C})$ of families of morphisms with fixed target $\{U_i \to U\}_{i\in I}$, called *coverings of $\mathcal{C}$*, satisfying the following axioms

(1) If $V \to U$ is an isomorphism then $\{V \to U\} \in \mathrm{Cov}(\mathcal{C})$.
(2) If $\{U_i \to U\}_{i\in I} \in \mathrm{Cov}(\mathcal{C})$ and for each i we have $\{V_{ij} \to U_i\}_{j\in J_i} \in \mathrm{Cov}(\mathcal{C})$, then $\{V_{ij} \to U\}_{i\in I, j\in J_i} \in \mathrm{Cov}(\mathcal{C})$.
(3) If $\{U_i \to U\}_{i\in I} \in \mathrm{Cov}(\mathcal{C})$ and $V \to U$ is a morphism of $\mathcal{C}$ then $U_i \times_U V$ exists for all i and $\{U_i \times_U V \to V\}_{i\in I} \in \mathrm{Cov}(\mathcal{C})$.

Remark 9.6.3. (On set theoretic issues -- skip on a first reading.) The main reason for introducing sites is to study the category of sheaves on a site, because it is the generalization of the category of sheaves on a topological space that has been so important in algebraic geometry. In order to avoid thinking about things like ``classes of classes'' and so on, we will not allow sites to be ``big'' categories, in contrast to what we do for categories and 2-categories.

Suppose that $\mathcal{C}$ is a category and that $\mathrm{Cov}(\mathcal{C})$ is a proper class of coverings satisfying (1), (2) and (3) above. We will not allow this as a site either, mainly because we are going to take limits over coverings. However, there are several natural ways to replace $\mathrm{Cov}(\mathcal{C})$ by a set of coverings or a slightly different structure that give rise to the same category of sheaves. For example:

(1) In Sets, Section 3.11 we show how to pick a suitable set of coverings that gives the same category of sheaves.
(2) Another thing we can do is to take the associated topology (see Definition 9.41.2). The resulting topology on $\mathcal{C}$ has the same category of sheaves. Two topologies have the same categories of sheaves if and only if they are equal, see Theorem 9.43.2. A topology on a category is given by a choice of sieves on objects. The collection of all possible sieves and even all possible topologies on $\mathcal{C}$ is a set.

[1] This notation differs from that of [**MA71**], as explained in the introduction.

(3) We could also slightly modify the notion of a site, see Remark 9.41.4 below, and end up with a canonical set of coverings which is contained in the powerset of the set of arrows of $\mathcal{C}$.

Each of these solutions has some minor drawback. For the first, one has to check that constructions later on do not depend on the choice of the set of coverings. For the second, one has to learn about topologies and redo many of the arguments for sites. For the third, see the last sentence of Remark 9.41.4.

Our approach will be to work with sites as in Definition 9.6.2 above. Given a category $\mathcal{C}$ with a proper class of coverings as above, we will replace this by a set of coverings producing a site using Sets, Lemma 3.11.1. It is shown in Lemma 9.8.6 below that the resulting category of sheaves (the topos) is independent of this choice. We leave it to the reader to use one of the other two strategies to deal with these issues if he/she so desires.

Example 9.6.4. Let X be a topological space. Let $\mathcal{T}_X$ be the category whose objects consist of all the open sets U in X and whose morphisms are just the inclusion maps. That is, there is at most one morphism between any two objects in $\mathcal{T}_X$. Now define $\{U_i \to U\}_{i\in I} \in \text{Cov}(\mathcal{T}_X)$ if and only if $\bigcup U_i = U$. Conditions (1) and (2) above are clear, and (3) is also clear once we realize that in $\mathcal{T}_X$ we have $U\times V = U\cap V$. Note that in particular the empty set has to be an element of $\mathcal{T}_X$ since otherwise this would not work in general. Furthermore, it is equally important, as we will see later, to allow the *empty covering of the empty set as a covering*! We turn $\mathcal{T}_X$ into a site by choosing a suitable set of coverings $\text{Cov}(\mathcal{T}_X)_{\kappa,\alpha}$ as in Sets, Lemma 3.11.1. Presheaves and sheaves (as defined below) on the site $\mathcal{T}_X$ will agree exactly with the usual notion of a presheaves and sheaves on a topological space, as defined in Sheaves, Section 6.1.

Example 9.6.5. Let G be a group. Consider the category G-*Sets* whose objects are sets X with a left G-action, with G-equivariant maps as the morphisms. An important example is ${}_GG$ which is the G-set whose underlying set is G and action given by left multiplication. This category has fiber products, see Categories, Section 4.7. We declare $\{\varphi_i : U_i \to U\}_{i\in I}$ to be a covering if $\bigcup_{i\in I} \varphi_i(U_i) = U$. This gives a class of coverings on G-*Sets* which is easily see to satisfy conditions (1), (2), and (3) of Definition 9.6.2. The result is not a site since both the collection of objects of the underlying category and the collection of coverings form a proper class. We first replace by G-*Sets* by a full subcategory G-*Sets*$_\alpha$ as in Sets, Lemma 3.10.1. After this the site $(G\text{-}Sets_\alpha, \text{Cov}_{\kappa,\alpha'}(G\text{-}Sets_\alpha))$ gotten by suitably restricting the collection of coverings as in Sets, Lemma 3.11.1 will be denoted $\mathcal{T}_G$.

Example 9.6.6. Let $\mathcal{C}$ be a category. There is a canonical way to turn this into a site where $\{\text{id}_U : U \to U\}$ are the coverings. Sheaves on this site are the presheaves on $\mathcal{C}$. This corresponding topology is called the *chaotic* or *indiscrete topology*.

9.7. Sheaves

Let $\mathcal{C}$ be a site. Before we introduce the notion of a sheaf with values in a category we explain what it means for a presheaf of sets to be a sheaf. Let $\mathcal{F}$ be a presheaf of sets on $\mathcal{C}$ and let $\{U_i \to U\}_{i\in I}$ be an element of $\text{Cov}(\mathcal{C})$. By assumption all the fibre products $U_i \times_U U_j$ exist in $\mathcal{C}$. There are two natural maps

$$\prod\nolimits_{i\in I} \mathcal{F}(U_i) \underset{\text{pr}_1^*}{\overset{\text{pr}_0^*}{\rightrightarrows}} \prod\nolimits_{(i_0,i_1)\in I\times I} \mathcal{F}(U_{i_0} \times_U U_{i_1})$$

which we will denote pr_i^*, $i = 0, 1$ as indicated in the displayed equation. Namely, an element of the left hand side corresponds to a family $(s_i)_{i\in I}$, where each s_i is a section of $\mathcal{F}$ over U_i. For each pair $(i_0, i_1) \in I \times I$ we have the projection morphisms

$$\mathrm{pr}^{(i_0,i_1)}_{i_0} : U_{i_0} \times_U U_{i_1} \longrightarrow U_{i_0} \text{ and } \mathrm{pr}^{(i_0,i_1)}_{i_1} : U_{i_0} \times_U U_{i_1} \longrightarrow U_{i_1}.$$

Thus we may pull back either the section s_{i_0} via the first of these maps or the section s_{i_1} via the second. Explicitly the maps we refered to above are

$$\mathrm{pr}_0^* : (s_i)_{i\in I} \longmapsto \left(\mathrm{pr}^{(i_0,i_1),*}_{i_0}(s_{i_0})\right)_{(i_0,i_1)\in I\times I}$$

and

$$\mathrm{pr}_1^* : (s_i)_{i\in I} \longmapsto \left(\mathrm{pr}^{(i_0,i_1),*}_{i_1}(s_{i_1})\right)_{(i_0,i_1)\in I\times I}.$$

Finally consider the natural map

$$\mathcal{F}(U) \longrightarrow \prod\nolimits_{i\in I} \mathcal{F}(U_i), \quad s \longmapsto (s|_{U_i})_{i\in I}$$

where we have used the notation $s|_{U_i}$ to indicate the pullback of s via the map $U_i \to U$. It is clear from the functorial natural of $\mathcal{F}$ and the commutativity of the fibre product diagrams that $\mathrm{pr}_0^*((s|_{U_i})_{i\in I}) = \mathrm{pr}_1^*((s|_{U_i})_{i\in I})$.

Definition 9.7.1. Let $\mathcal{C}$ be a site, and let $\mathcal{F}$ be a presheaf of sets on $\mathcal{C}$. We say $\mathcal{F}$ is a *sheaf* if for every covering $\{U_i \to U\}_{i\in I} \in \mathrm{Cov}(\mathcal{C})$ the diagram

$$\mathcal{F}(U) \longrightarrow \prod\nolimits_{i\in I} \mathcal{F}(U_i) \underset{\mathrm{pr}_1^*}{\overset{\mathrm{pr}_0^*}{\rightrightarrows}} \prod\nolimits_{(i_0,i_1)\in I\times I} \mathcal{F}(U_{i_0} \times_U U_{i_1}) \tag{9.7.1.1}$$

represents the first arrow as the equalizer of pr_0^* and pr_1^*.

Loosely speaking this means that given sections $s_i \in \mathcal{F}(U_i)$ such that

$$s_i|_{U_i\times_U U_j} = s_j|_{U_i\times_U U_j}$$

in $\mathcal{F}(U_i \times_U U_j)$ for all pairs $(i, j) \in I \times I$ then there exists a unique $s \in \mathcal{F}(U)$ such that $s_i = s|_{U_i}$.

Remark 9.7.2. If the covering $\{U_i \to U\}_{i\in I}$ is the empty family (this means that $I = \emptyset$), then the sheaf condition signifies that $\mathcal{F}(U) = \{*\}$ is a singleton set. This is true because in (9.7.1.1) the second and third sets are empty products in the category of sets, which are final objects in the category of sets, hence singletons.

Example 9.7.3. Let X be a topological space. Let $\mathcal{T}_X$ be the site constructed in Example 9.6.4. The notion of a sheaf on $\mathcal{T}_X$ coincides with the notion of a sheaf on X introduced in Sheaves, Definition 6.7.1.

Example 9.7.4. Let X be a topological space. Let us consider the site $\mathcal{T}'_X$ which is the same as the site $\mathcal{T}_X$ of Example 9.6.4 except that we disallow the empty covering of the empty set. In other words, we do allow the covering $\{\emptyset \to \emptyset\}$ but we do not allow the covering whose index set is empty. It is easy to show that this still defines a site. However, we claim that the sheaves on $\mathcal{T}'_X$ are different from the sheaves on $\mathcal{T}_X$. For example, as an extreme case consider the situation where $X = \{p\}$ is a singleton. Then the objects of $\mathcal{T}'_X$ are $\emptyset, X$ and the coverings are $\{\{\emptyset \to \emptyset\}, \{X \to X\}\}$. Clearly, a sheaf on this is given by any choice of a set $\mathcal{F}(\emptyset)$ and any choice of a set $\mathcal{F}(X)$, together with any restricion map $\mathcal{F}(X) \to \mathcal{F}(\emptyset)$. Thus sheaves on $\mathcal{T}'_X$ are the same as usual sheaves on the two point space

$\{\eta, p\}$ with open sets $\{\emptyset, \{\eta\}, \{p, \eta\}\}$. In general sheaves on $\mathcal{T}'_X$ are the same as sheaves on the space $X \amalg \{\eta\}$, with opens given by the empty set and any set of the form $U \cup \{\eta\}$ for $U \subset X$ open.

Definition 9.7.5. The category $Sh(\mathcal{C})$ of sheaves of sets is the full subcategory of the category $PSh(\mathcal{C})$ whose objects are the sheaves of sets.

Let $\mathcal{A}$ be a category. If products indexed by I, and $I \times I$ exist in $\mathcal{A}$ for any I that occurs as an index set for covering families then Definition 9.7.1 above makes sense, and defines a notion of a sheaf on $\mathcal{C}$ with values in $\mathcal{A}$. Note that the diagram in $\mathcal{A}$

$$\mathcal{F}(U) \longrightarrow \prod\nolimits_{i\in I} \mathcal{F}(U_i) \overset{\mathrm{pr}_0^*}{\underset{\mathrm{pr}_1^*}{\rightrightarrows}} \prod\nolimits_{(i_0,i_1)\in I\times I} \mathcal{F}(U_{i_0} \times_U U_{i_1})$$

is an equalizer diagram if and only if for every object X of $\mathcal{A}$ the diagram of sets

$$Mor_{\mathcal{A}}(X, \mathcal{F}(U)) \longrightarrow \prod Mor_{\mathcal{A}}(X, \mathcal{F}(U_i)) \overset{\mathrm{pr}_0^*}{\underset{\mathrm{pr}_1^*}{\rightrightarrows}} \prod Mor_{\mathcal{A}}(X, \mathcal{F}(U_{i_0} \times_U U_{i_1}))$$

is an equalizer diagram.

Suppose $\mathcal{A}$ is arbitrary. Let $\mathcal{F}$ be a presheaf with values in $\mathcal{A}$. Choose any object $X \in Ob(\mathcal{A})$. Then we get a presheaf of sets $\mathcal{F}_X$ defined by the rule

$$\mathcal{F}_X(U) = Mor_{\mathcal{A}}(X, \mathcal{F}(U)).$$

From the above it follows that a good definition is obtained by requiring all the presheaves $\mathcal{F}_X$ to be sheaves of sets.

Definition 9.7.6. Let $\mathcal{C}$ be a site, let $\mathcal{A}$ be a category and let $\mathcal{F}$ be a presheaf on $\mathcal{C}$ with values in $\mathcal{A}$. We say that $\mathcal{F}$ is a *sheaf* if for all objects X of $\mathcal{A}$ the presheaf of sets $\mathcal{F}_X$ (defined above) is a sheaf.

9.8. Families of morphisms with fixed target

This section is meant to introduce some notions regarding families of morphisms with the same target.

Definition 9.8.1. Let $\mathcal{C}$ be a category. Let $\mathcal{U} = \{U_i \to U\}_{i\in I}$ be a family of morphisms of $\mathcal{C}$ with fixed target. Let $\mathcal{V} = \{V_j \to V\}_{j\in J}$ be another.

1. A *morphism of families of maps with fixed target of $\mathcal{C}$ from $\mathcal{U}$ to $\mathcal{V}$*, or simply a *morphism from $\mathcal{U}$ to $\mathcal{V}$* is given by a morphism $U \to V$, a map of sets $\alpha : I \to J$ and for each $i \in I$ a morphism $U_i \to V_{\alpha(i)}$ such that the diagram
$$\begin{tikzcd} U_i \arrow[r] \arrow[d] & V_{\alpha(i)} \arrow[d] \\ U \arrow[r] & V \end{tikzcd}$$
is commutative.
2. In the special case that $U = V$ and $U \to V$ is the identity we call $\mathcal{U}$ a *refinement* of the family $\mathcal{V}$.

A trivial but important remark is that if $\mathcal{U} = \{U_i \to U\}_{i\in I}$ is the *empty family of maps*, i.e., if $I = \emptyset$, then no family $\mathcal{V} = \{V_j \to V\}_{j\in J}$ with $J \neq \emptyset$ can refine $\mathcal{U}$!

Definition 9.8.2. Let $\mathcal{C}$ be a category. Let $\mathcal{U} = \{\varphi_i : U_i \to U\}_{i \in I}$, and $\mathcal{V} = \{\psi_j : V_j \to U\}_{j \in J}$ be two families of morphisms with fixed target.

(1) We say $\mathcal{U}$ and $\mathcal{V}$ are *combinatorially equivalent* if there exist maps $\alpha : I \to J$ and $\beta : J \to I$ such that $\varphi_i = \psi_{\alpha(i)}$ and $\psi_j = \varphi_{\beta(j)}$.
(2) We say $\mathcal{U}$ and $\mathcal{V}$ are *tautologically equivalent* if there exist maps $\alpha : I \to J$ and $\beta : J \to I$ and for all $i \in I$ and $j \in J$ commutative diagrams

$$\begin{tikzcd} U_i \arrow[rr] \arrow[dr] & & V_{\alpha(i)} \arrow[dl] \\ & U & \end{tikzcd} \qquad \begin{tikzcd} V_j \arrow[rr] \arrow[dr] & & U_{\beta(j)} \arrow[dl] \\ & U & \end{tikzcd}$$

with isomorphisms as horizontal arrows.

Lemma 9.8.3. *Let $\mathcal{C}$ be a category. Let $\mathcal{U} = \{\varphi_i : U_i \to U\}_{i \in I}$, and $\mathcal{V} = \{\psi_j : V_j \to U\}_{j \in J}$ be two families of morphisms with the same fixed target.*

(1) *If $\mathcal{U}$ and $\mathcal{V}$ are combinatorially equivalent then they are tautologically equivalent.*
(2) *If $\mathcal{U}$ and $\mathcal{V}$ are tautologically equivalent then $\mathcal{U}$ is a refinement of $\mathcal{V}$ and $\mathcal{V}$ is a refinement of $\mathcal{U}$.*
(3) *The relation ``being combinatorially equivalent'' is an equivalence relation on all families of morphisms with fixed target.*
(4) *The relation ``being tautologically equivalent'' is an equivalence relation on all families of morphisms with fixed target.*
(5) *The relation ``$\mathcal{U}$ refines $\mathcal{V}$ and $\mathcal{V}$ refines $\mathcal{U}$'' is an equivalence relation on all families of morphisms with fixed target.*

Proof. Omitted. $\square$

In the following lemma, given a category $\mathcal{C}$, a presheaf $\mathcal{F}$ on $\mathcal{C}$, a family $\mathcal{U} = \{U_i \to U\}_{i \in I}$ such that all fibre products $U_i \times_U U_{i'}$ exist, we say that *the sheaf condition for $\mathcal{F}$ with respect to $\mathcal{U}$* holds if the diagram (9.7.1.1) is an equalizer diagram.

Lemma 9.8.4. *Let $\mathcal{C}$ be a category. Let $\mathcal{U} = \{\varphi_i : U_i \to U\}_{i \in I}$, and $\mathcal{V} = \{\psi_j : V_j \to U\}_{j \in J}$ be two families of morphisms with the same fixed target. Assume that the fibre products $U_i \times_U U_{i'}$ and $V_j \times_U V_{j'}$ exist. If $\mathcal{U}$ and $\mathcal{V}$ are tautologically equivalent, then for any presheaf $\mathcal{F}$ on $\mathcal{C}$ the sheaf condition for $\mathcal{F}$ with respect to $\mathcal{U}$ is equivalent to the sheaf condition for $\mathcal{F}$ with respect to $\mathcal{V}$.*

Proof. First, note that if $\varphi : A \to B$ is an isomorphism in the category $\mathcal{C}$, then $\varphi^* : \mathcal{F}(B) \to \mathcal{F}(A)$ is an isomorphism. Let $\beta : J \to I$ be a map and let $\psi_j : V_j \to U_{\beta(j)}$ be isomorphisms over U which are assumed to exist by hypothesis. Let us show that the sheaf condition for $\mathcal{V}$ implies the sheaf condition for $\mathcal{U}$. Suppose given sections $s_i \in \mathcal{F}(U_i)$ such that

$$s_i|_{U_i \times_U U_{i'}} = s_{i'}|_{U_i \times_U U_{i'}}$$

in $\mathcal{F}(U_i \times_U U_{i'})$ for all pairs $(i, i') \in I \times I$. Then we can define $s_j = \psi_j^* s_{\beta(j)}$. For any pair $(j, j') \in J \times J'$ the morphism $\psi_j \times_{\mathrm{id}_U} \psi_{j'} : V_j \times_U V_{j'} \to U_{\beta(j)} \times_U U_{\beta(j')}$ is an isomorphism as well. Hence by transport of structure we see that

$$s_j|_{V_j \times_U V_{j'}} = s_{j'}|_{V_j \times_U V_{j'}}$$

as well. The sheaf condition w.r.t. $\mathcal{V}$ implies there exists a unique s such that $s|_{V_j} = s_j$ for all $j \in J$. By the first remark of the proof this implies that $s|_{U_i} = s_i$ for all $i \in \mathrm{Im}(\beta)$ as well.

Suppose that $i \in I$, $i \notin \mathrm{Im}(\beta)$. For such an i we have isomorphisms $U_i \to V_{\alpha(i)} \to U_{\beta(\alpha(i))}$ over U. This gives a morphism $U_i \to U_i \times_U U_{\beta(\alpha(i))}$ which is a section of the projection. Because s_i and $s_{\beta(\alpha(i))}$ restrict to the same element on the fibre product we conclude that $s_{\beta(\alpha(i))}$ pulls back to s_i via $U_i \to U_{\beta(\alpha(i))}$. Thus we see that also $s_i = s|_{U_i}$ as desired. $\square$

Lemma 9.8.5. *Let $\mathcal{C}$ be a category. Let Cov_i, $i = 1, 2$ be two sets of families of morphisms with fixed target which each define the structure of a site on $\mathcal{C}$.*

(1) *If every $\mathcal{U} \in Cov_1$ is tautologically equivalent to some $\mathcal{V} \in Cov_2$, then $Sh(\mathcal{C}, Cov_2) \subset Sh(\mathcal{C}, Cov_1)$. If also, every $\mathcal{U} \in Cov_2$ is tautologically quivalent to some $\mathcal{V} \in Cov_1$ then the category of sheaves are equal.*
(2) *Suppose that for each $\mathcal{U} \in Cov_1$ there exists a $\mathcal{V} \in Cov_2$ such that $\mathcal{V}$ refines $\mathcal{U}$. In this case $Sh(\mathcal{C}, Cov_2) \subset Sh(\mathcal{C}, Cov_1)$. If also for every $\mathcal{U} \in Cov_2$ there exists a $\mathcal{V} \in Cov_1$ such that $\mathcal{V}$ refines $\mathcal{U}$, then the categories of sheaves are equal.*

Proof. Part (1) follows directly from Lemma 9.8.4 and the definitions.

We advise the reader to **skip the proof of (2)** on a first reading. Let $\mathcal{F}$ be a sheaf of sets for the site $(\mathcal{C}, \mathrm{Cov}_2)$. Let $\mathcal{U} \in \mathrm{Cov}_1$, say $\mathcal{U} = \{U_i \to U\}_{i \in I}$. Choose a refinement $\mathcal{V} \in \mathrm{Cov}_2$ of $\mathcal{U}$, say $\mathcal{V} = \{V_j \to U\}_{j \in J}$ and refinement given by $\alpha : J \to I$ and $f_j : V_j \to U_{\alpha(j)}$.

First let $s, s' \in \mathcal{F}(U)$. If for all $i \in I$ we have $s|_{U_i} = s'|_{U_i}$, then we also have $s|_{V_j} = s'|_{V_j}$ for all $j \in J$. This implies that $s = s'$ by the sheaf condition for $\mathcal{F}$ with respect to Cov_2. Hence we see that the unicity in the sheaf condition for $\mathcal{F}$ and the site $(\mathcal{C}, \mathrm{Cov}_1)$ holds.

Next, suppose given $s_i \in \mathcal{F}(U_i)$ such that $s_i|_{U_i \times_U U_{i'}} = s_{i'}|_{U_i \times_U U_{i'}}$ for all $i, i' \in I$. Set $s_j = f_j^*(s_{\alpha(j)}) \in \mathcal{F}(V_j)$. Since the morphisms f_j are morphisms over U we obtain induced morphisms $f_{jj'} : V_j \times_U V_{j'} \to U_{\alpha(i)} \times_U U_{\alpha(i')}$ compatible with the $f_j, f_{j'}$ via the projection maps. It follows that

$$s_j|_{V_j \times_U V_{j'}} = f_{jj'}^*(s_{\alpha(j)}|_{U_{\alpha(j)} \times_U U_{\alpha(j')}}) = f_{jj'}^*(s_{\alpha(j')}|_{U_{\alpha(j)} \times_U U_{\alpha(j')}}) = s_{j'}|_{V_j \times_U V_{j'}}$$

for all $j, j' \in J$. Hence, by the sheaf condition for $\mathcal{F}$ with respect to Cov_2, we get a section $s \in \mathcal{F}(U)$ which restricts to s_j on each V_j. We are done if we show s restricts to s_{i_0} on U_{i_0} for any $i_0 \in I$. For each $i_0 \in I$ the family $\mathcal{U}' = \{U_i \times_U U_{i_0} \to U_{i_0}\}_{i \in I}$ is an element of Cov_1 by the axioms of a site. Also, the family $\mathcal{V}' = \{V_j \times_U U_{i_0} \to U_{i_0}\}_{j \in J}$ is an element of Cov_2. Then $\mathcal{V}'$ refines $\mathcal{U}'$ via $\alpha : J \to I$ and the maps $f'_j = f_j \times \mathrm{id}_{U_{i_0}}$. The element s_{i_0} restricts to $s_i|_{U_i \times_U U_{i_0}}$ on the members of the covering $\mathcal{U}'$ and hence via $(f'_j)^*$ to the elements $s_j|_{V_j \times_U U_{i_0}}$ on the members of the covering $\mathcal{V}'$. By construction of s this is the same as the family of restrictions of $s|_{U_{i_0}}$ to the members of the covering $\mathcal{V}'$. Hence by the sheaf condition for $\mathcal{F}$ with respect to Cov_2 we see that $s|_{U_{i_0}} = s_{i_0}$ as desired. $\square$

Lemma 9.8.6. *Let $\mathcal{C}$ be a category. Let $Cov(\mathcal{C})$ be a proper class of coverings satisfying conditions (1), (2) and (3) of Definition 9.6.2. Let $Cov_1, Cov_2 \subset Cov(\mathcal{C})$ be two subsets of $Cov(\mathcal{C})$ which endow $\mathcal{C}$ with the structure of a site. If every covering $\mathcal{U} \in Cov(\mathcal{C})$ is combinatorially equivalent to a covering in Cov_1 and combinatorially equivalent to a covering in Cov_2, then $Sh(\mathcal{C}, Cov_1) = Sh(\mathcal{C}, Cov_2)$.*

Proof. This is clear from Lemmas 9.8.5 and 9.8.3 above as the hypothesis implies that every covering $\mathcal{U} \in \mathrm{Cov}_1 \subset \mathrm{Cov}(\mathcal{C})$ is combinatorially equivalent to an element of Cov_2, and similarly with the roles of Cov_1 and Cov_2 reversed. $\square$

9.9. The example of G-sets

As an example, consider the site $\mathcal{T}_G$ of Example 9.6.5. We will describe the category of sheaves on $\mathcal{T}_G$. The answer will turn out to be independent of the choices made in defining $\mathcal{T}_G$. In fact, during the proof we will need only the following properties of the site $\mathcal{T}_G$:

(a) $\mathcal{T}_G$ is a full subcategory of G-$Sets$,
(b) $\mathcal{T}_G$ contains the G-set ${}_GG$,
(c) $\mathcal{T}_G$ has fibre products and they are the same as in G-$Sets$,
(d) given $U \in Ob(\mathcal{T}_G)$ and a G-invariant subset $O \subset U$, there exists an object of $\mathcal{T}_G$ isomorphic to O, and
(e) any surjective family of maps $\{U_i \to U\}_{i\in I}$, with $U, U_i \in Ob(\mathcal{T}_G)$ is combinatorially equivalent to a covering of $\mathcal{T}_G$.

These properties hold by Sets, Lemmas 3.10.2 and 3.11.1.

Remark that the map

$$Hom_G({}_GG, {}_GG) \longrightarrow G^{opp}, \varphi \longmapsto \varphi(1)$$

is an isomorphism of groups. The inverse map sends $g \in G$ to the map $R_g : s \mapsto sg$ (i.e. right multiplication). Note that $R_{g_1g_2} = R_{g_2} \circ R_{g_1}$ so the opposite is necessary.

This implies that for every presheaf $\mathcal{F}$ on $\mathcal{T}_G$ the value $\mathcal{F}({}_GG)$ inherets the structure of a G-set as follows: $g \cdot s$ for $g \in G$ and $s \in \mathcal{F}({}_GG)$ defined by $\mathcal{F}(R_g)(s)$. This is a left action because

$$(g_1g_2) \cdot s = \mathcal{F}(R_{g_1g_2})(s) = \mathcal{F}(R_{g_2} \circ R_{g_1})(s) = \mathcal{F}(R_{g_1})(\mathcal{F}(R_{g_2})(s)) = g_1 \cdot (g_2 \cdot s).$$

Here we've used that $\mathcal{F}$ is contravariant. Note that if $\mathcal{F} \to \mathcal{G}$ is a morphism of presheaves of sets on $\mathcal{T}_G$ then we get a map $\mathcal{F}({}_GG) \to \mathcal{G}({}_GG)$ which is compatible with the G-actions we have just defined. All in all we have constructed a functor

$$PSh(\mathcal{T}_G) \longrightarrow G\text{-}Sets, \quad \mathcal{F} \longmapsto \mathcal{F}({}_GG).$$

We leave it to the reader to verify that this construction has the pleasing property that the representable presheaf h_U is mapped to something canonically isomorphic to U. In a formula $h_U({}_GG) = Hom_G({}_GG, U) \cong U$.

Suppose that S is a G-set. We define a presheaf $\mathcal{F}_S$ by the formula[2]

$$\mathcal{F}_S(U) = Mor_{G\text{-}Sets}(U, S).$$

This is clearly a presheaf. On the other hand, suppose that $\{U_i \to U\}_{i\in I}$ is a covering in $\mathcal{T}_G$. This implies that $\coprod_i U_i \to U$ is surjective. Thus it is clear that the map

$$\mathcal{F}_S(U) = Mor_{G\text{-}Sets}(U, S) \longrightarrow \prod \mathcal{F}_S(U_i) = \prod Mor_{G\text{-}Sets}(U_i, S)$$

is injective. And, given a family of G-equivariant maps $s_i : U_i \to S$, such that all the diagrams

$$\begin{tikzcd} U_i \times_U U_j \arrow[r] \arrow[d] & U_j \arrow[d, "s_j"] \\ U_i \arrow[r, "s_i"] & S \end{tikzcd}$$

commute, there is a unique G-equivariant map $s : U \to S$ such that s_i is the composition $U_i \to U \to S$. Namely, we just define $s(u) = s_i(u_i)$ where $i \in I$ is any index such that

[2] It may appear this is the representable presheaf defined by S. This may not be the case because S may not be an object of $\mathcal{T}_G$ which was chosen to be a sufficiently large set of G-sets.

there exists some $u_i \in U_i$ mapping to u under the map $U_i \to U$. The commutativity of the diagrams above implies exactly that this construction is well defined. All in all we have constructed a functor

$$G\text{-}Sets \longrightarrow Sh(\mathcal{T}_G), \quad S \longmapsto \mathcal{F}_S.$$

We now have the following diagram of categories and functors

$$\begin{tikzcd}
PSh(\mathcal{T}_G) \arrow[rr, "\mathcal{F}\mapsto\mathcal{F}({}_GG)"] & & G\text{-}Sets \arrow[dl, "S\mapsto\mathcal{F}_S"] \\
& Sh(\mathcal{T}_G) \arrow[ul] &
\end{tikzcd}$$

It is immediate from the definitions that $\mathcal{F}_S({}_GG) = Mor_G({}_GG, S) = S$, the last equality by evaluation at 1. This almost proves the following.

Proposition 9.9.1. *The functors $\mathcal{F} \mapsto \mathcal{F}({}_GG)$ and $S \mapsto \mathcal{F}_S$ define quasi-inverse equivalences between $Sh(\mathcal{T}_G)$ and G-Sets.*

Proof. We have already seen that composing the functors one way around is isomorphic to the identity functor. In the other direction, for any sheaf $\mathcal{H}$ there is a natural map of sheaves

$$can : \mathcal{H} \longrightarrow \mathcal{F}_{\mathcal{H}({}_GG)}.$$

Namely, for any object U of $\mathcal{T}_G$ we let can_U be the map

$$\begin{array}{ccc}
\mathcal{H}(U) & \longrightarrow & \mathcal{F}_{\mathcal{H}({}_GG)}(U) = Mor_G(U, \mathcal{H}({}_GG)) \\
s & \longmapsto & (u \mapsto \alpha_u^* s).
\end{array}$$

Here $\alpha_u : {}_GG \to U$ is the map $\alpha_u(g) = gu$ and $\alpha_u^* : \mathcal{H}(U) \to \mathcal{H}({}_GG)$ is the pullback map. A trivial but confusing verification shows that this is indeed a map of presheaves. We have to show that can is an isomorphism. We do this by showing can_U is an isomorphism for all $U \in \mathrm{ob}(\mathcal{T}_G)$. We leave the (important but easy) case that $U = {}_GG$ to the reader. A general object U of $\mathcal{T}_G$ is a disjoint union of G-orbits: $U = \coprod_{i\in I} O_i$. The family of maps $\{O_i \to U\}_{i\in I}$ is tautologically equivalent to a covering in $\mathcal{T}_G$ (by the properties of $\mathcal{T}_G$ listed at the beginning of this section). Hence by Lemma 9.8.4 the sheaf $\mathcal{H}$ satisfies the sheaf property with respect to $\{O_i \to U\}_{i\in I}$. The sheaf property for this covering implies $\mathcal{H}(U) = \prod_i \mathcal{H}(O_i)$. Hence it suffices to show that can_U is an isomorphism when U consists of a single G-orbit. Let $u \in U$ and let $H \subset G$ be its stabilizer. Clearly, $Mor_G(U, \mathcal{H}({}_GG)) = \mathcal{H}({}_GG)^H$ equals the subset of H-invariant elements. On the other hand consider the covering $\{{}_GG \to U\}$ given by $g \mapsto gu$ (again it is just combinatorially equivalent to some covering of $\mathcal{T}_G$, and again this doesn't matter). Note that the fibre product $({}_GG) \times_U ({}_GG)$ is equal to $\{(g, gh), g \in G, h \in H\} \cong \coprod_{h\in H} {}_GG$. Hence the sheaf property for this covering reads as

$$\begin{tikzcd}
\mathcal{H}(U) \arrow[r] & \mathcal{H}({}_GG) \arrow[r, shift left, "\mathrm{pr}_0^*"] \arrow[r, shift right, "\mathrm{pr}_1^*"'] & \prod_{h\in H} \mathcal{H}({}_GG).
\end{tikzcd}$$

The two maps pr_i^* into the factor $\mathcal{H}({}_GG)$ differ by multiplication by h. Now the result follows from this and the fact that can is an isomorphism for $U = {}_GG$. $\square$

9.10. Sheafification

In order to define the sheafification we study the zeroth Cech cohomology group of a covering and its functoriality properties.

Let $\mathcal{F}$ be a presheaf of sets on $\mathcal{C}$, and let $\mathcal{U} = \{U_i \to U\}_{i\in I}$ be a covering of $\mathcal{C}$. Let us use the notation $\mathcal{F}(\mathcal{U})$ to indicate the equalizer

$$H^0(\mathcal{U}, \mathcal{F}) = \{(s_i)_{i\in I} \in \prod\nolimits_i \mathcal{F}(U_i) \mid s_i|_{U_i\times_U U_j} = s_j|_{U_i\times_U U_j}\ \forall i,j\in I\}.$$

As we will see later, this is the zeroth Cech cohomology of $\mathcal{F}$ over U with respect to the covering $\mathcal{U}$. A small remark is that we can define $H^0(\mathcal{U}, \mathcal{F})$ as soon as all the morphisms $U_i \to U$ are representable, i.e., $\mathcal{U}$ need not be a covering of the site. There is a canonical map $\mathcal{F}(U) \to H^0(\mathcal{U}, \mathcal{F})$. It is clear that a morphism of coverings $\mathcal{U} \to \mathcal{V}$ induces commutative diagrams

$$\begin{tikzcd}
 & U_i \arrow[rr] & & V_{\alpha(i)} \\
U_i \times_U U_j \arrow[ur] \arrow[r] \arrow[dr] & & V_{\alpha(i)} \times_V V_{\alpha(j)} \arrow[ur] \arrow[dr] & \\
 & U_j \arrow[rr] & & V_{\alpha(j)}
\end{tikzcd}.$$

This in turn produces a map $H^0(\mathcal{V}, \mathcal{F}) \to H^0(\mathcal{U}, \mathcal{F})$, compatible with the map $\mathcal{F}(V) \to \mathcal{F}(U)$.

By construction, a presheaf $\mathcal{F}$ is a sheaf if and only if for every covering $\mathcal{U}$ of $\mathcal{C}$ the natural map $\mathcal{F}(U) \to H^0(\mathcal{U}, \mathcal{F})$ is bijective. We will use this notion to prove the following simple lemma about limits of sheaves.

Lemma 9.10.1. *Let $\mathcal{F} : \mathcal{I} \to Sh(\mathcal{C})$ be a diagram. Then $lim_{\mathcal{I}} \mathcal{F}$ exists and is equal to the limit in the category of presheaves.*

Proof. Let $lim_i \mathcal{F}_i$ be the limit as a presheaf. We will show that this is a sheaf and then it will trivially follow that it is a limit in the category of sheaves. To prove the sheaf property, let $\mathcal{V} = \{V_j \to V\}_{j\in J}$ be a covering. Let $(s_j)_{j\in J}$ be an element of $H^0(\mathcal{V}, lim_i \mathcal{F}_i)$. Using the projection maps we get elements $(s_{j,i})_{j\in J}$ in $H^0(\mathcal{V}, \mathcal{F}_i)$. By the sheaf poperty for $\mathcal{F}_i$ we see that there is a unique $s_i \in \mathcal{F}_i(V)$ such that $s_{j,i} = s_i|_{V_j}$. Let $\phi : i \to i'$ be a morphism of the index category. We would like to show that $\mathcal{F}(\phi) : \mathcal{F}_i \to \mathcal{F}_{i'}$ maps s_i to $s_{i'}$. We know this is true for the sections $s_{i,j}$ and $s_{i',j}$ for all j and hence by the sheaf property for $\mathcal{F}_{i'}$ this is true. At this point we have an element $s = (s_i)_{i\in Ob(\mathcal{I})}$ of $(lim_i \mathcal{F}_i)(V)$. We leave it to the reader to see this element has the required property that $s_j = s|_{V_j}$. □

Example 9.10.2. A particular example is the limit over the empty diagram. This gives the final object in the category of (pre)sheaves. It is the sheaf that associates to each object U of $\mathcal{C}$ a singleton set, with unique restriction mappings. We often denote this sheaf by $*$.

Let $\mathcal{J}_U$ be the category of all coverings of U. In other words, the objects of $\mathcal{J}_U$ are the coverings of U in $\mathcal{C}$, and the morphisms are the refinements. By our conventions on sites this is indeed a category, i.e., the collection of objects and morphisms forms a set. Note that $Ob(\mathcal{J}_U)$ is not empty since $\{\mathrm{id}_U\}$ is an object of it. According to the remarks above the construction $\mathcal{U} \mapsto H^0(\mathcal{U}, \mathcal{F})$ is a contravariant functor on $\mathcal{J}_U$. We define

$$\mathcal{F}^+(U) = colim_{\mathcal{J}_U^{opp}} H^0(\mathcal{U}, \mathcal{F})$$

See Categories, Section 4.13 for a discussion of limits and colimits. We point out that later we will see that $\mathcal{F}^+(U)$ is the zeroth Cech cohomology of $\mathcal{F}$ over U.

Before we say more about the structure of the colimit, we turn the collection of sets $\mathcal{F}^+(U)$, $U \in Ob(\mathcal{C})$ into a presheaf. Namely, let $V \to U$ be a morphism of $\mathcal{C}$. By the axioms of a site there is a functor[3]

$$\mathcal{J}_U \longrightarrow \mathcal{J}_V, \quad \{U_i \to U\} \longmapsto \{U_i \times_U V \to V\}.$$

Note that the projection maps furnish a functorial morphism of coverings $\{U_i \times_U V \to V\} \to \{U_i \to U\}$ and hence, by the construction above, a functorial map of sets $H^0(\{U_i \to U\}, \mathcal{F}) \to H^0(\{U_i \times_U V \to V\}, \mathcal{F})$. In other words, there is a transformation of functors from $H^0(-, \mathcal{F}) : \mathcal{J}_U \to Sets$ to the compostion $\mathcal{J}_U \to \mathcal{J}_V \xrightarrow{H^0(-,\mathcal{F})} Sets$. Hence by generalities of colimits we obtain a canonical map $\mathcal{F}^+(U) \to \mathcal{F}^+(V)$. In terms of the description of the set $\mathcal{F}^+(U)$ above, it just takes the element associated with $s = (s_i) \in H^0(\{U_i \to U\}, \mathcal{F})$ to the element associated with $(s_i|_{V\times_U U_i}) \in H^0(\{U_i \times_U V \to V\}, \mathcal{F})$.

Lemma 9.10.3. *The constructions above define a presheaf $\mathcal{F}^+$ together with a canonical map of presheaves $\mathcal{F} \to \mathcal{F}^+$.*

Proof. All we have to do is to show that given morphisms $W \to V \to U$ the composition $\mathcal{F}^+(U) \to \mathcal{F}^+(V) \to \mathcal{F}^+(W)$ equals the map $\mathcal{F}^+(U) \to \mathcal{F}^+(W)$. This can be shown directly by verifying that, given a covering $\{U_i \to U\}$ and $s = (s_i) \in H^0(\{U_i \to U\}, \mathcal{F})$, we have canonically $W \times_U U_i \cong W \times_V (V \times_U U_i)$, and $s_i|_{W\times_U U_i}$ corresponds to $(s_i|_{V\times_U U_i})|_{W\times_V(V\times_U U_i)}$ via this isomorphism. □

More indirectly, the result of Lemma 9.10.6 shows that we may pullback an element s as above via any morphism from any covering of W to $\{U_i \to U\}$ and we will always end up with the same element in $\mathcal{F}^+(W)$.

Lemma 9.10.4. *The association $\mathcal{F} \mapsto (\mathcal{F} \to \mathcal{F}^+)$ is a functor.*

Proof. Instead of proving this we state exactly what needs to be proven. Let $\mathcal{F} \to \mathcal{G}$ be a map of presehaves. Prove the commutativity of:

$$\begin{tikzcd} \mathcal{F} \arrow[r] \arrow[d] & \mathcal{F}^+ \arrow[d] \\ \mathcal{G} \arrow[r] & \mathcal{G}^+ \end{tikzcd}$$

□

The next two lemmas imply that the colimits above are colimits over a directed partially ordered set.

Lemma 9.10.5. *Given a pair of coverings $\{U_i \to U\}$ and $\{V_j \to U\}$ of a given object U of the site $\mathcal{C}$, there exists a covering which is a common refinement.*

[3]This construction actually involves a choice of the fibre products $U_i \times_U V$ and hence the axiom of choice. The resulting map does not depend on the choices made, see below.

Proof. Since $\mathcal{C}$ is a site we have that for every i the family $\{V_j \times_U U_i \to U_i\}_j$ is a covering. And, then another axiom implies that $\{V_j \times_U U_i \to U\}_{i,j}$ is a covering of U. Clearly this covering refines both given coverings. $\square$

Lemma 9.10.6. *Any two morphisms $f, g : \mathcal{U} \to \mathcal{V}$ of coverings inducing the same morphism $U \to V$ induce the same map $H^0(\mathcal{V}, \mathcal{F}) \to H^0(\mathcal{U}, \mathcal{F})$.*

Proof. Let $\mathcal{U} = \{U_i \to U\}_{i \in I}$ and $\mathcal{V} = \{V_j \to V\}_{j \in J}$. The morphism f consists of a map $U \to V$, a map $\alpha : I \to J$ and maps $f_i : U_i \to V_{\alpha(i)}$. Likewise, g determines a map $\beta : I \to J$ and maps $g_i : U_i \to V_{\beta(i)}$. As f and g induce the same map $U \to V$, the diagram

$$\begin{tikzcd} & V_{\alpha(i)} \arrow[dr] & \\ U_i \arrow[ur, "f_i"] \arrow[dr, "g_i"'] & & V \\ & V_{\beta(i)} \arrow[ur] & \end{tikzcd}$$

is commutative for every $i \in I$. Hence f and g factor through the fibre product

$$\begin{tikzcd} & V_{\alpha(i)} \\ U_i \arrow[ur, "f_i"] \arrow[r, "\varphi"] \arrow[dr, "g_i"'] & V_{\alpha(i)} \times_V V_{\beta(i)} \arrow[u, "\mathrm{pr}_1"'] \arrow[d, "\mathrm{pr}_2"] \\ & V_{\beta(i)}. \end{tikzcd}$$

Now let $s = (s_j)_j \in H^0(\mathcal{V}, \mathcal{F})$. Then for all $i \in I$:

$$(f^* s)_i = f_i^*(s_{\alpha(i)}) = \varphi^* \mathrm{pr}_1^*(s_{\alpha(i)}) = \varphi^* \mathrm{pr}_2^*(s_{\beta(i)}) = g_i^*(s_{\beta(i)}) = (g^* s)_i,$$

where the middle equality is given by the definition of $H^0(\mathcal{V}, \mathcal{F})$. This shows that the maps $H^0(\mathcal{V}, \mathcal{F}) \to H^0(\mathcal{U}, \mathcal{F})$ induced by f and g are equal. $\square$

Remark 9.10.7. In particular this lemma shows that if $\mathcal{U}$ is a refinement of $\mathcal{V}$, and if $\mathcal{V}$ is a refinement of $\mathcal{U}$, then there is a canonical identification $H^0(\mathcal{U}, \mathcal{F}) = H^0(\mathcal{V}, \mathcal{F})$.

From these two lemmas, and the fact that $\mathcal{J}_U$ is nonempty, it follows that the diagram $H^0(-, \mathcal{F}) : \mathcal{J}_U^{opp} \to Sets$ is filtered, see Categories, Definition 4.17.1. Hence, by Categories, Section 4.17 the colimit $\mathcal{F}^+(U)$ may be described in the following straightforward manner. Namely, every element in the set $\mathcal{F}^+(U)$ arises from an element $s \in H^0(\mathcal{U}, \mathcal{F})$ for some covering $\mathcal{U}$ of U. Given a second element $s' \in H^0(\mathcal{U}', \mathcal{F})$ then s and s' determine the same element of the colimit if and only if there exists a covering $\mathcal{V}$ of U and refinements $f : \mathcal{V} \to \mathcal{U}$ and $f' : \mathcal{V} \to \mathcal{U}'$ such that $f^* s = (f')^* s'$ in $H^0(\mathcal{V}, \mathcal{F})$. Since the trivial covering $\{\mathrm{id}_U\}$ is an object of $\mathcal{J}_U$ we get a canonical map $\mathcal{F}(U) \to \mathcal{F}^+(U)$.

Lemma 9.10.8. *The map $\theta : \mathcal{F} \to \mathcal{F}^+$ has the following property: For every object U of $\mathcal{C}$ and every section $s \in \mathcal{F}^+(U)$ there exists a covering $\{U_i \to U\}$ such that $s|_{U_i}$ is in the image of $\theta : \mathcal{F}(U_i) \to \mathcal{F}^+(U_i)$.*

Proof. Namely, let $\{U_i \to U\}$ be a covering such that s arises from the element $(s_i) \in H^0(\{U_i \to U\}, \mathcal{F})$. According to Lemma 9.10.6 we may consider the covering $\{U_i \to U_i\}$ and the (obvious) morphism of coverings $\{U_i \to U_i\} \to \{U_i \to U\}$ to compute the pullback of s to an element of $\mathcal{F}^+(U_i)$. And indeed, using this covering we get exactly $\theta(s_i)$ for the restriction of s to U_i. □

Definition 9.10.9. We say that a presheaf of sets $\mathcal{F}$ on a site $\mathcal{C}$ is *separated* if, for all coverings of $\{U_i \to U\}$, the map $\mathcal{F}(U) \to \prod \mathcal{F}(U_i)$ is injective.

Theorem 9.10.10. *With $\mathcal{F}$ as above*

(1) *The presheaf $\mathcal{F}^+$ is separated.*
(2) *If $\mathcal{F}$ is separated, then $\mathcal{F}^+$ is a sheaf and the map of presheaves $\mathcal{F} \to \mathcal{F}^+$ is injective.*
(3) *If $\mathcal{F}$ is a sheaf, then $\mathcal{F} \to \mathcal{F}^+$ is an isomorphism.*
(4) *The presheaf $\mathcal{F}^{++}$ is always a sheaf.*

Proof. Proof of (1). Suppose that $s, s' \in \mathcal{F}^+(U)$ and suppose that there exists some covering $\{U_i \to U\}$ such that $s|_{U_i} = s'|_{U_i}$ for all i. We now have three coverings of U: the covering $\{U_i \to U\}$ above, a covering $\mathcal{U}$ for s as in Lemma 9.10.8, and a similar covering $\mathcal{U}'$ for s'. By Lemma 9.10.5, we can find a common refinement, say $\{W_j \to U\}$. This means we have $s_j, s'_j \in \mathcal{F}(W_j)$ such that $s|_{W_j} = \theta(s_j)$, similarly for $s'|_{W_j}$, and such that $\theta(s_j) = \theta(s'_j)$. This last equality means that there exists some covering $\{W_{jk} \to W_j\}$ such that $s_j|_{W_{jk}} = s'_j|_{W_{jk}}$. Then since $\{W_{jk} \to U\}$ is a covering we see that s, s' map to the same element of $H^0(\{W_{jk} \to U\}, \mathcal{F})$ as desired.

Proof of (2). It is clear that $\mathcal{F} \to \mathcal{F}^+$ is injective because all the maps $\mathcal{F}(U) \to H^0(\mathcal{U}, \mathcal{F})$ are injective. It is also clear that, if $\mathcal{U} \to \mathcal{U}'$ is a refinement, then $H^0(\mathcal{U}', \mathcal{F}) \to H^0(\mathcal{U}, \mathcal{F})$ is injective. Now, suppose that $\{U_i \to U\}$ is a covering, and let (s_i) be a family of elements of $\mathcal{F}^+(U_i)$ satisfying the sheaf condition $s_i|_{U_i \times_U U_j} = s_j|_{U_i \times_U U_j}$ for all $i, j \in I$. Choose coverings (as in Lemma 9.10.8) $\{U_{ij} \to U_i\}$ such that $s_i|_{U_{ij}}$ is the image of the (unique) element $s_{ij} \in \mathcal{F}(U_{ij})$. The sheaf condition implies that s_{ij} and $s_{i'j'}$ agree over $U_{ij} \times_U U_{i'j'}$ because it maps to $U_i \times_U U_{i'}$ and we have the equality there. Hence $(s_{ij}) \in H^0(\{U_{ij} \to U\}, \mathcal{F})$ gives rise to an element $s \in \mathcal{F}^+(U)$. We leave it to the reader to verify that $s|_{U_i} = s_i$.

Proof of (3). This is immediate from the definitions because the sheaf property says exactly that every map $\mathcal{F} \to H^0(\mathcal{U}, \mathcal{F})$ is bijective (for every covering $\mathcal{U}$ of U).

Statement (4) is now obvious. □

Definition 9.10.11. Let $\mathcal{C}$ be a site and let $\mathcal{F}$ be a presheaf of sets on $\mathcal{C}$. The sheaf $\mathcal{F}^\# := \mathcal{F}^{++}$ together with the canonical map $\mathcal{F} \to \mathcal{F}^\#$ is called the *sheaf associated to $\mathcal{F}$*.

Proposition 9.10.12. *The canonical map $\mathcal{F} \to \mathcal{F}^\#$ has the following universal property: For any map $\mathcal{F} \to \mathcal{G}$, where $\mathcal{G}$ is a sheaf of sets, there is a unique map $\mathcal{F}^\# \to \mathcal{G}$ such that $\mathcal{F} \to \mathcal{F}^\# \to \mathcal{G}$ equals the given map.*

Proof. By Lemma 9.10.4 we get a commutative diagram

$$\begin{tikzcd} \mathcal{F} \arrow[r] \arrow[d] & \mathcal{F}^+ \arrow[r] \arrow[d] & \mathcal{F}^{++} \arrow[d] \\ \mathcal{G} \arrow[r] & \mathcal{G}^+ \arrow[r] & \mathcal{G}^{++} \end{tikzcd}$$

and by Theorem 9.10.10 the lower horizontal maps are isomorphisms. The uniqueness follows from Lemma 9.10.8 which says that every section of $\mathcal{F}^\#$ locally comes from sections of $\mathcal{F}$. □

It is clear from this result that the functor $\mathcal{F} \mapsto (\mathcal{F} \to \mathcal{F}^\#)$ is unique up to unique isomorphism of functors. Actually, let us temporarily denote $i : Sh(\mathcal{C}) \to PSh(\mathcal{C})$ the functor of inclusion. The result above actually says that

$$Mor_{PSh(\mathcal{C})}(\mathcal{F}, i(\mathcal{G})) = Mor_{Sh(\mathcal{C})}(\mathcal{F}^\#, \mathcal{G}).$$

In other words, the functor of sheafification is the left adjoint to the inclusion functor i. We finish this section with a couple of lemmas.

Lemma 9.10.13. *Let $\mathcal{F} : \mathcal{I} \to Sh(\mathcal{C})$ be a diagram. Then $colim_\mathcal{I} \mathcal{F}$ exists and is the sheafification of the colimit in the category of presheaves.*

Proof. Since the sheafification functor is a left adjoint it commutes with all colimits, see Categories, Lemma 4.22.2. Hence, since $PSh(\mathcal{C})$ has colimits, we deduce that $Sh(\mathcal{C})$ has colimits (which are the sheafifications of the colimits in presheaves). □

Lemma 9.10.14. *The functor $PSh(\mathcal{C}) \to Sh(\mathcal{C})$, $\mathcal{F} \mapsto \mathcal{F}^\#$ is exact.*

Proof. Since it is a left adjoint it is right exact, see Categories, Lemma 4.22.3. On the other hand, by Lemmas 9.10.5 and Lemma 9.10.6 the colimits in the construction of $\mathcal{F}^+$ are really over the directed partially ordered set $Ob(\mathcal{J}_U)$ where $\mathcal{U} \geq \mathcal{U}'$ if and only if $\mathcal{U}$ is a refinement of $\mathcal{U}'$. Hence by Categories, Lemma 4.17.2 we see that $\mathcal{F} \to \mathcal{F}^+$ commutes with finite limits (as a functor from presheaves to presheaves). Then we conclude using Lemma 9.10.1. □

Lemma 9.10.15. *Let $\mathcal{C}$ be a site. Let $\mathcal{F}$ be a presheaf of sets on $\mathcal{C}$. Denote $\theta^2 : \mathcal{F} \to \mathcal{F}^\#$ the canonical map of $\mathcal{F}$ into its sheafification. Let U be an object of $\mathcal{C}$. Let $s \in \mathcal{F}^\#(U)$. There exists a covering $\{U_i \to U\}$ and sections $s_i \in \mathcal{F}(U_i)$ such that*

1. *$s|_{U_i} = \theta^2(s_i)$, and*
2. *for every i, j there exists a covering $\{U_{ijk} \to U_i \times_U U_j\}$ of $\mathcal{C}$ such that the pullback of s_i and s_j to each U_{ijk} agree.*

Conversely, given any covering $\{U_i \to U\}$, elements $s_i \in \mathcal{F}(U_i)$ such that (2) holds, then there exists a unique section $s \in \mathcal{F}^\#(U)$ such that (1) holds.

Proof. Omitted. □

9.11. Injective and surjective maps of sheaves

Definition 9.11.1. Let $\mathcal{C}$ be a site, and let $\varphi : \mathcal{F} \to \mathcal{G}$ be a map of sheaves of sets.

1. We say that φ is *injective* if for every object U of $\mathcal{C}$ the map $\varphi : \mathcal{F}(U) \to \mathcal{G}(U)$ is injective.
2. We say that φ is *surjective* if for every object U of $\mathcal{C}$ and every section $s \in \mathcal{F}(U)$ there exists a covering $\{U_i \to U\}$ such that for all i the restriction $s|_{U_i}$ is in the image of $\varphi : \mathcal{F}(U_i) \to \mathcal{G}(U_i)$.

Lemma 9.11.2. *The injective (resp. surjective) maps defined above are exactly the monomorphisms (resp. epimorphisms) of the category $Sh(\mathcal{C})$. A map of sheaves is an isomorphism if and only if it is both injective and surjective.*

Proof. Omitted. □

9.12. Representable sheaves

Let $\mathcal{C}$ be a category. The canonical topology is the finest topology such that all representable presheaves are sheaves (it is formally defined in Definition 9.40.12 but we will not need this). This topology is not always the topology associated to the structure of a site on $\mathcal{C}$. We will give a collection of coverings that generates this topology in case $\mathcal{C}$ has fibered products. First we give the following general definition.

Definition 9.12.1. Let $\mathcal{C}$ be a category. We say that a family $\{U_i \to U\}$ is an *effective epimorphism* if all the morphisms $U_i \to U$ are representable (see Categories, Definition 4.6.3), and for any $X \in Ob(\mathcal{C})$ the sequence

$$Mor_{\mathcal{C}}(U, X) \longrightarrow Mor_{\mathcal{C}}(U_i, X) \rightrightarrows Mor_{\mathcal{C}}(U_i \times_U U_j, X)$$

is an equalizer diagram. We say that a family $\{U_i \to U\}$ is a *universal effective epimorphism* if for any morphism $V \to U$ the base change $\{U_i \times_U V \to V\}$ is an effective epimorphism.

The class of families which are universal effective epimorphisms satisfies the axioms of Definition 9.6.2. If $\mathcal{C}$ has fibre products, then the associated topology is the canonical topology. (In this case, to get a site argue as in Sets, Lemma 3.11.1.)

Conversely, suppose that $\mathcal{C}$ is a site such that all representable presheaves are sheaves. Then clearly, all coverings are universal effective epimorphisms. Thus the following definition is the ``correct'' one in the setting of sites.

Definition 9.12.2. We say that the topology on a site $\mathcal{C}$ is *weaker than the canonical topology*, or that the topology is *subcanonical* if all the coverings of $\mathcal{C}$ are universal effective epimorphisms.

A representable sheaf is a representable presheaf which is also a sheaf. Since it is perhap better to avoid this terminology when the topology is not subcanonical, we only define it formally in that case.

Definition 9.12.3. Suppose that the topology on the site $\mathcal{C}$ is weaker than the canonical topology. The Yoneda embedding h (see Categories, Section 4.3) actually presents $\mathcal{C}$ as a full subcategory of the category of sheaves of $\mathcal{C}$. In this case we sometimes write $\underline{U} = h_U$ or simply U for the *representable sheaf* associated to the object U of $\mathcal{C}$.

Note that we have in the situation of the definition

$$Mor_{Sh(\mathcal{C})}(\underline{U}, \mathcal{F}) = \mathcal{F}(U)$$

for every sheaf $\mathcal{F}$, since after all the same thing was true for presheaves. In general (but only rarely) the presheaves h_U are not sheaves and to get a sheaf you have to sheafifiy them. In this case it will still be true that $Mor_{Sh(\mathcal{C})}(h_U^\#, \mathcal{F}) = \mathcal{F}(U)$ for every sheaf $\mathcal{F}$ by the adjointness property of #.

The next lemma says that, if the topology is weaker than the canonical topology, every sheaf is made up out of representable sheaves in a way.

Lemma 9.12.4. *Let $\mathcal{C}$ be a site. Let $\mathcal{F}$ be a sheaf of sets. There exists a diagram of sheaves of sets*

$$\mathcal{F}_1 \rightrightarrows \mathcal{F}_0 \longrightarrow \mathcal{F}$$

which represents $\mathcal{F}$ as a coequalizer, such that $\mathcal{F}_i$, $i = 0, 1$ are coproducts of sheaves of the form $h_U^\#$.

Proof. First we show there is an epimorphism $\mathcal{F}_0 \to \mathcal{F}$ of the desired type. Namely, just take

$$\mathcal{F}_0 = \coprod\nolimits_{U \in Ob(\mathcal{C}), s \in \mathcal{F}(U)} (h_U)^\# \longrightarrow \mathcal{F}$$

Here the arrow restricted to the component corresponding to (U, s) maps the element $\mathrm{id}_U \in h_U^\#(U)$ to the section $s \in \mathcal{F}(U)$. This is an epimorphism according to Lemma 9.11.2 above. To construct $\mathcal{F}_1$ first set $\mathcal{G} = \mathcal{F}_0 \times_{\mathcal{F}} \mathcal{F}_0$ and then construct an epimorphism $\mathcal{F}_1 \to \mathcal{G}$ as above. □

Lemma 9.12.5. *Let $\mathcal{C}$ be a site. If $\{U_i \to U\}_{i \in I}$ is a covering of the site $\mathcal{C}$, then the morphism of presheaves of sets*

$$\coprod\nolimits_{i \in I} h_{U_i} \to h_U$$

becomes surjective after sheafification.

Proof. By Lemma 9.11.2 above we have to show that $\coprod_{i \in I} h_{U_i}^\# \to h_U^\#$ is an epimorphism. Let $\mathcal{F}$ be a sheaf of sets. A morphism $h_U^\# \to \mathcal{F}$ corresponds to a section $s \in \mathcal{F}(U)$. Hence the injectivity of $Mor(h_U^\#, \mathcal{F}) \to \prod_i Mor(h_{U_i}^\#, \mathcal{F})$ follows directly from the sheaf property of $\mathcal{F}$. □

9.13. Continuous functors

Definition 9.13.1. Let $\mathcal{C}$ and $\mathcal{D}$ be sites. A functor $u : \mathcal{C} \to \mathcal{D}$ is called *continuous* if for every $\{V_i \to V\}_{i \in I} \in \mathrm{Cov}(\mathcal{C})$ we have the following

(1) $\{u(V_i) \to u(V)\}_{i \in I}$ is in $\mathrm{Cov}(\mathcal{D})$, and
(2) for any morphism $T \to V$ in $\mathcal{C}$ the morphism $u(T \times_V V_i) \to u(T) \times_{u(V)} u(V_i)$ is an isomorphism.

Recall that given a functor u as above, and a presheaf of sets $\mathcal{F}$ on $\mathcal{D}$ we have defined $u^p\mathcal{F}$ to be simply the presheaf $\mathcal{F} \circ u$, in other words

$$u^p\mathcal{F}(V) = \mathcal{F}(u(V))$$

for every object V of $\mathcal{C}$.

Lemma 9.13.2. *Let $\mathcal{C}$ and $\mathcal{D}$ be sites. Let $u : \mathcal{C} \to \mathcal{D}$ be a continuous functor. If $\mathcal{F}$ is a sheaf on $\mathcal{D}$ then $u^p\mathcal{F}$ is a sheaf as well.*

Proof. Let $\{V_i \to V\}$ be a covering. By assumption $\{u(V_i) \to u(V)\}$ is a covering in $\mathcal{D}$ and $u(V_i \times_V V_j) = u(V_i) \times_{u(V)} u(V_j)$. Hence the sheaf condition for $u^p\mathcal{F}$ and the covering $\{V_i \to V\}$ is precisely the same as the sheaf condition for $\mathcal{F}$ and the covering $\{u(V_i) \to u(V)\}$. □

In order to avoid confusion we sometimes denote

$$u^s : Sh(\mathcal{D}) \longrightarrow Sh(\mathcal{C})$$

the functor u^p restricted to the subcategory of sheaves of sets.

Lemma 9.13.3. *In the situation of Lemma 9.13.2. The functor $u_s : \mathcal{G} \mapsto (u_p\mathcal{G})^\#$ is a left adjoint to u^s.*

Proof. Follows directly from Lemma 9.5.4 and Proposition 9.10.12. □

Here is a technical lemma.

Lemma 9.13.4. *In the situation of Lemma 9.13.2. For any presheaf $\mathcal{G}$ on $\mathcal{C}$ we have $(u_p\mathcal{G})^\# = (u_p(\mathcal{G}^\#))^\#$.*

Proof. For any sheaf $\mathcal{F}$ on $\mathcal{D}$ we have

$$\begin{aligned} Mor_{Sh(\mathcal{D})}(u_s(\mathcal{G}^\#), \mathcal{F}) &= Mor_{Sh(\mathcal{C})}(\mathcal{G}^\#, u^s\mathcal{F}) \\ &= Mor_{PSh(\mathcal{C})}(\mathcal{G}^\#, u^p\mathcal{F}) \\ &= Mor_{PSh(\mathcal{C})}(\mathcal{G}, u^p\mathcal{F}) \\ &= Mor_{PSh(\mathcal{D})}(u_p\mathcal{G}, \mathcal{F}) \\ &= Mor_{Sh(\mathcal{D})}((u_p\mathcal{G})^\#, \mathcal{F}) \end{aligned}$$

and the result follows from the Yoneda lemma. □

Lemma 9.13.5. *Let $u : \mathcal{C} \to \mathcal{D}$ be a continuous functor between sites. For any object U of $\mathcal{C}$ we have $u_s h_U^\# = h_{u(U)}^\#$.*

Proof. Follows from Lemmas 9.5.6 and 9.13.4. □

Remark 9.13.6. (Skip on first reading.) Let $\mathcal{C}$ and $\mathcal{D}$ be sites. Let us use the definition of tautologically equivalent families of maps, see Definition 9.8.2 to (slightly) weaken the conditions defining continuity. Let $u : \mathcal{C} \to \mathcal{D}$ be a functor. Let us call u *quasi-continuous* if for every $\mathcal{V} = \{V_i \to V\}_{i\in I} \in \text{Cov}(\mathcal{C})$ we have the following

(1') the family of maps $\{u(V_i) \to u(V)\}_{i\in I}$ is tautologically equivalent to an element of $\text{Cov}(\mathcal{D})$, and
(2) for any morphism $T \to V$ in $\mathcal{C}$ the morphism $u(T \times_V V_i) \to u(T) \times_{u(V)} u(V_i)$ is an isomorphism.

We are going to see that Lemmas 9.13.2 and 9.13.3 hold in case u is quasi-continuous as well.

We first remark that the morphisms $u(V_i) \to u(V)$ are representable, since they are isomorphic to representable morphisms (by the first condition). In particular, the family $u(\mathcal{V}) = \{u(V_i) \to u(V)\}_{i\in I}$ gives rise to a zeroth Cech cohomology group $H^0(u(\mathcal{V}), \mathcal{F})$ for any presheaf $\mathcal{F}$ on $\mathcal{D}$. Let $\mathcal{U} = \{U_j \to u(V)\}_{j\in J}$ be an element of $\text{Cov}(\mathcal{D})$ tautologically equivalent to $\{u(V_i) \to u(V)\}_{i\in I}$. Note that $u(\mathcal{V})$ is a refinement of $\mathcal{U}$ and vice versa. Hence by Remark 9.10.7 we see that $H^0(u(\mathcal{V}), \mathcal{F}) = H^0(\mathcal{U}, \mathcal{F})$. In particular, if $\mathcal{F}$ is a sheaf, then $\mathcal{F}(u(V)) = H^0(u(\mathcal{V}), \mathcal{F})$ because of the sheaf property expressed in terms of zeroth Cech cohomology groups. We conclude that $u^p\mathcal{F}$ is a sheaf if $\mathcal{F}$ is a sheaf, since $H^0(\mathcal{V}, u^p\mathcal{F}) = H^0(u(\mathcal{V}), \mathcal{F})$ which we just observed is equal to $\mathcal{F}(u(V)) = u^p\mathcal{F}(V)$. Thus Lemma 9.13.2 holds. Lemma 9.13.3 follows immediately.

9.14. Morphisms of sites

Definition 9.14.1. Let $\mathcal{C}$ and $\mathcal{D}$ be sites. A *morphism of sites* $f : \mathcal{D} \to \mathcal{C}$ is given by a continuous functor $u : \mathcal{C} \to \mathcal{D}$ such that the functor u_s is exact.

Notice how the functor u goes in the direction *opposite* the morphism f. If $f \leftrightarrow u$ is a morphism of sites then we use the notation $f^{-1} = u_s$ and $f_* = u^s$. The functor f^{-1} is called the *pullback functor* and the functor f_* is called the *push forward functor*. As in topology we have the following adjointness property

$$Mor_{Sh(\mathcal{D})}(f^{-1}\mathcal{G}, \mathcal{F}) = Mor_{Sh(\mathcal{C})}(\mathcal{G}, f_*\mathcal{F})$$

The motivation for this definition comes from the following example.

Example 9.14.2. Let $f : X \to Y$ be a continuous map of topological spaces. Recall that we have sites $\mathcal{T}_X$ and $\mathcal{T}_Y$, see Example 9.6.4. Consider the functor $u : \mathcal{T}_Y \to \mathcal{T}_X$, $V \mapsto f^{-1}(V)$. This functor is clearly continuous because inverse images of open coverings are open coverings. (Actually, this depends on how you chose sets of coverings for $\mathcal{T}_X$ and $\mathcal{T}_Y$. But in any case the functor is quasi-continuous, see Remark 9.13.6.) It is easy to verify that the functor u^s equals the usual pushforward functor f_* from topology. Hence, since u_s is an adjoint and since the usual topological pullback functor f^{-1} is an adjoint as well, we get a canonical isomorphism $f^{-1} \cong u_s$. Since f^{-1} is exact we deduce that u_s is exact. Hence u defines a morphism of sites $f : \mathcal{T}_X \to \mathcal{T}_Y$, which we may denote f as well since we've already seen the functors u_s, u^s agree with their usual notions anyway.

Lemma 9.14.3. *Let $\mathcal{C}_i$, $i = 1, 2, 3$ be sites. Let $u : \mathcal{C}_2 \to \mathcal{C}_1$ and $v : \mathcal{C}_3 \to \mathcal{C}_2$ be continuous functors which induce morphisms of sites. Then the functor $u \circ v : \mathcal{C}_3 \to \mathcal{C}_1$ is continuous and defines a morphism of sites $\mathcal{C}_1 \to \mathcal{C}_3$.*

Proof. It is immediate from the definitions that $u \circ v$ is a continuous functor. In addition, we clearly have $(u \circ v)^p = v^p \circ u^p$, and hence $(u \circ v)^s = v^s \circ u^s$. Hence functors $(u \circ v)_s$ and $u_s \circ v_s$ are both left adjoints of $(u \circ v)^s$. Therefore $(u \circ v)_s \cong u_s \circ v_s$ and we conclude that $(u \circ v)_s$ is exact as a composition of exact functors. $\square$

Definition 9.14.4. Let $\mathcal{C}_i$, $i = 1, 2, 3$ be sites. Let $f : \mathcal{C}_1 \to \mathcal{C}_2$ and $g : \mathcal{C}_2 \to \mathcal{C}_3$ be morphisms of sites given by continuous functors $u : \mathcal{C}_2 \to \mathcal{C}_1$ and $v : \mathcal{C}_3 \to \mathcal{C}_2$. The *composition* $g \circ f$ is the morphism of sites corresponding to the functor $u \circ v$.

In this situation we have $(g \circ f)_* = g_* \circ f_*$ and $(g \circ f)^{-1} = f^{-1} \circ g^{-1}$ (see proof of Lemma 9.14.3).

Lemma 9.14.5. *Let $\mathcal{C}$ and $\mathcal{D}$ be sites. Let $u : \mathcal{C} \to \mathcal{D}$ be continuous. Assume all the categories $(\mathcal{I}_V^u)^{opp}$ of Section 9.5 are filtered. Then u defines a morphism of sites $\mathcal{D} \to \mathcal{C}$, in other words u_s is exact.*

Proof. Since u_s is the left adjoint of u^s we see that u_s is right exact, see Categories, Lemma 4.22.3. Hence it suffices to show that u_s is left exact. In other words we have to show that u_s commutes with finite limits. Because the categories $\mathcal{I}_Y^{opp}$ are filtered we see that u_p commutes with finite limits, see Categories, Lemma 4.17.2 (this also uses the description of limits in *PSh*, see Section 9.4). And since sheafification commutes with finite limits as well (Lemma 9.10.14) we conclude because $u_s = \# \circ u_p$. $\square$

Proposition 9.14.6. *Let $\mathcal{C}$ and $\mathcal{D}$ be sites. Let $u : \mathcal{C} \to \mathcal{D}$ be continuous. Assume furthermore the following:*

(1) *the category $\mathcal{C}$ has a final object X and $u(X)$ is a final object of $\mathcal{D}$, and*
(2) *the category $\mathcal{C}$ has fibre products and u commutes with them.*

Then u defines a morphism of sites $\mathcal{D} \to \mathcal{C}$, in other words u_s is exact.

Proof. This follows from Lemmas 9.5.2 and 9.14.5. $\square$

Remark 9.14.7. The conditions of Proposition 9.14.6 above are equivalent to saying that u is left exact, i.e., commutes with finite limits. See Categories, Lemmas 4.16.4 and 4.21.2. It seems more natural to phrase it in terms of final objects and fibre products since this seems to have more geometric meaning in the examples.

Remark 9.14.8. (Skip on first reading.) Let $\mathcal{C}$ and $\mathcal{D}$ be sites. Analogously to Definition 9.14.1 we say that a *quasi-morphism of sites* $f : \mathcal{D} \to \mathcal{C}$ is given by a quasi-continuous functor $u : \mathcal{C} \to \mathcal{D}$ (see Remark 9.13.6) such that u_s is exact. The analogue of Proposition 9.14.6 in this setting is obtained by replacing the word ``continuous" by the word ``quasi-continuous", and replacing the word ``morphism" by ``quasi-morphism". The proof is literally the same.

9.15. Topoi

Here is a definition of a topos which is suitable for our purposes. Namely, a topos is the category of sheaves on a site. In order to specify a topos you just specify the site. The real difference between a topos and a site lies in the definition of morphisms. Namely, it turns out that there are lots of morphisms of topoi which do not come from morphisms of the underlying sites.

Definition 9.15.1. Topoi.

(1) A *topos* is the category $Sh(\mathcal{C})$ of sheaves of sets on a site $\mathcal{C}$.
(2) Let $\mathcal{C}$, $\mathcal{D}$ be sites. A *morphism of topoi* f from $Sh(\mathcal{D})$ to $Sh(\mathcal{C})$ is given by a pair of functors $f_* : Sh(\mathcal{D}) \to Sh(\mathcal{C})$ and $f^{-1} : Sh(\mathcal{C}) \to Sh(\mathcal{D})$ such that
  (a) we have
  $$Mor_{Sh(\mathcal{D})}(f^{-1}\mathcal{G}, \mathcal{F}) = Mor_{Sh(\mathcal{C})}(\mathcal{G}, f_*\mathcal{F})$$
  bifunctorially, and
  (b) the functor f^{-1} commutes with finite limits, i.e., is left exact.
(3) Let $\mathcal{C}$, $\mathcal{D}$, $\mathcal{E}$ be sites. Given morphisms of topoi $f : Sh(\mathcal{D}) \to Sh(\mathcal{C})$ and $g : Sh(\mathcal{E}) \to Sh(\mathcal{D})$ the *composition* $f \circ g$ is the morphism of topoi defined by the functors $(f \circ g)_* = f_* \circ g_*$ and $(f \circ g)^{-1} = g^{-1} \circ f^{-1}$.

Note that, being an adjoint pair, the functor f_* commutes with all limits and that f^{-1} commutes with all colimits, see Categories, Lemma 4.22.2. In particular, f^{-1} is exact.

Suppose that $\alpha : \mathcal{S}_1 \to \mathcal{S}_2$ is an equivalence of (possibly ``big") categories. If $\mathcal{S}_1$, $\mathcal{S}_2$ are topoi, then setting $f_* = \alpha$ and f^{-1} equal to the quasi-inverse of α gives a morphism $f : \mathcal{S}_1 \to \mathcal{S}_2$ of topoi. Moreover this morphism is an equivalence in the 2-category of topoi (see Section 9.32). Thus it makes sense to say ``$\mathcal{S}$ is a topos" if $\mathcal{S}$ is equivalent to the category of sheaves on a site (and not necessarily equal to the the category of sheaves on a site). We will occasionally use this abuse of notation.

Remark 9.15.2. (Set theoretical issues related to morphisms of topoi. Skip on a first reading.) A morphism of topoi as defined above is not a set but a class. In other words it is given by a mathematical formula rather than a mathematical object. Allthough we may contemplate the collection of all morphisms between two given topoi, it is not a good idea to introduce it as a mathematical object. On the other hand, suppose $\mathcal{C}$ and $\mathcal{D}$ are given sites. Consider a functor $\Phi : \mathcal{C} \to Sh(\mathcal{D})$. Such a thing is a set, in other words, it is a mathematical object. We may, in succession, ask the following questions on Φ.

(1) Is it true, given a sheaf $\mathcal{F}$ on $\mathcal{D}$, that the rule $U \mapsto Mor_{Sh(\mathcal{D})}(\Phi(U), \mathcal{F})$ defines a sheaf on $\mathcal{C}$? If so, this defines a functor $\Phi_* : Sh(\mathcal{D}) \to Sh(\mathcal{C})$.
(2) Is it true that Φ_* has a left adjoint? If so, write Φ^{-1} for this left adjoint.
(3) Is it true that Φ^{-1} is exact?

If the last question still has the answer ``yes", then we obtain a morphism of topoi (Φ_*, Φ^{-1}). Moreover, given any morphism of topoi (f_*, f^{-1}) we may set $\Phi(U) = f^{-1}(h_U^\#)$ and obtain a functor Φ as above with $f_* \cong \Phi_*$ and $f^{-1} \cong \Phi^{-1}$ (compatible with adjoint property). The upshot is that by working with the collection of Φ instead of morphisms of topoi, we (a) replaced the notion of a morphism of topoi by a mathematical object, and (b) the collection of Φ forms a class (and not a collection of classes). Of course, more can be said, for example one can work out more precisely the significance of condition (2) above for example; we do this in the case of points of topoi in Section 9.28.

Most geometrically interesting morphisms of topoi come about via Lemma 9.19.1 and the following lemma.

Lemma 9.15.3. *Given a morphism of sites $f : \mathcal{D} \to \mathcal{C}$ corresponding to the functor $u : \mathcal{C} \to \mathcal{D}$ the pair of functors $(f^{-1} = u_s, f_* = u^s)$ is a morphism of topoi.*

Proof. This is obvious from Definition 9.14.1. □

The simplest example of a site is perhaps the site whose category has exactly one object pt and one morphism id_{pt} and whose only covering is the covering $\{\mathrm{id}_{pt}\}$. We will simply write pt for this site. It is clear that the category of sheaves = the category of presheaves = the category of sets. In a formula $Sh(pt) = Sets$.

Remark 9.15.4. There are many sites that give rise to the topos $Sh(pt)$. A useful example is the following. Suppose that S is a set (of sets) which contains at least one nonempty element. Let $\mathcal{S}$ be the category whose objects are elements of S and whose morphisms are arbitrary set maps. Assume that $\mathcal{S}$ has fibre products. For example this will be the case if $S = \mathcal{P}(\text{infinite set})$ is the power set of any infinite set (exercise in set theory). Make $\mathcal{S}$ into a site by declaring surjective families of maps to be coverings (and choose a suitable sufficiently large set of covering families as in Sets, Section 3.11). We claim that $Sh(\mathcal{S})$ is equivalent to the category of sets.

We first prove this in case S contains $e \in S$ which is a singleton. In this case, there is an equivalence of topoi $i : Sh(pt) \to Sh(\mathcal{S})$ given by the functors

$$i^{-1}\mathcal{F} = \mathcal{F}(e), \quad i_*E = (U \mapsto Mor_{Sets}(U, E)) \tag{9.15.4.1}$$

Namely, suppose that $\mathcal{F}$ is a sheaf on $\mathcal{S}$. For any $U \in Ob(\mathcal{S}) = S$ we can find a covering $\{\varphi_u : e \to U\}_{u\in U}$, where φ_u maps the unique element of e to $u \in U$. The sheaf condition implies in this case that $\mathcal{F}(U) = \prod_{u\in U} \mathcal{F}(e)$. In other words $\mathcal{F}(U) = Mor_{Sets}(U, \mathcal{F}(e))$. Moreover, this rule is compatible with restriction mappings. Hence the functor

$$i_* : Sets = Sh(pt) \longrightarrow Sh(\mathcal{S}), \quad E \longmapsto (U \mapsto Mor_{Sets}(U, E))$$

is an equivalence of categories, and its inverse is the functor i^{-1} given above.

If $\mathcal{S}$ does not contain a singleton, then the functor i_* as defined above still makes sense. To show that it is still an equivalence in this case, choose any nonempty $\tilde{e} \in S$ and a map $\varphi : \tilde{e} \to \tilde{e}$ whose image is a singleton. For any sheaf $\mathcal{F}$ set

$$\mathcal{F}(e) := \mathrm{Im}(\mathcal{F}(\varphi) : \mathcal{F}(\tilde{e}) \longrightarrow \mathcal{F}(\tilde{e}))$$

and show that this is a quasi-inverse to i_*. Details omitted.

Remark 9.15.5. (Skip on first reading.) Let $\mathcal{C}$ and $\mathcal{D}$ be sites. A quasi-morphism of sites $f : \mathcal{D} \to \mathcal{C}$ (see Remark 9.14.8) gives rise to a morphis of topoi f from $Sh(\mathcal{D})$ to $Sh(\mathcal{C})$ exactly as in Lemma 9.15.3.

9.16. G-sets and morphisms

Let $\varphi : G \to H$ be a homomorphism of groups. Choose (suitable) sites $\mathcal{T}_G$ and $\mathcal{T}_H$ as in Example 9.6.5 and Section 9.9. Let $u : \mathcal{T}_H \to \mathcal{T}_G$ be the functor which assigns to a H-set U the G-set U_φ which has the same underlying set but G action defined by $g \cdot u = \varphi(g)u$. It is clear that u commutes with finite limits and is continuous[4]. Applying Proposition 9.14.6 and Lemma 9.15.3 we obtain a morphism of topoi

$$f : Sh(\mathcal{T}_G) \longrightarrow Sh(\mathcal{T}_H)$$

associated with φ. Using Proposition 9.9.1 we see that we get a pair of adjoint functors

$$f_* : G\textit{-Sets} \longrightarrow H\textit{-Sets}, \quad f^{-1} : H\textit{-Sets} \longrightarrow G\textit{-Sets}.$$

Let's work out what are these functors in this case.

We first work out a formula for f_*. Recall that given a G-set S the corresponding sheaf $\mathcal{F}_S$ on $\mathcal{T}_G$ is given by the rule $\mathcal{F}_S(U) = Mor_G(U, S)$. And on the other hand, given a sheaf $\mathcal{G}$ on $\mathcal{T}_H$ the corresponding H-set is given by the rule $\mathcal{G}({}_HH)$. Hence we see that

$$f_*S = Mor_{G\textit{-Sets}}(({}_HH)_\varphi, S).$$

If we work this out a little bit more then we get

$$f_*S = \{a : H \to S \mid a(gh) = ga(h)\}$$

with left H-action given by $(h \cdot a)(h') = a(h'h)$ for any element $a \in f_*S$.

Next, we explicitly compute f^{-1}. Note that since the topology on $\mathcal{T}_G$ and $\mathcal{T}_H$ is subcanonical, all representable presheaves are sheaves. Moreover, given an object V of $\mathcal{T}_H$ we see that $f^{-1}h_V$ is equal to $h_{u(V)}$ (see Lemma 9.13.5). Hence we see that $f^{-1}S = S_\varphi$ for representable sheaves. Since every sheaf on $\mathcal{T}_H$ is a coproduct of representable sheaves we conclude that this is true in general. Hence we see that for any H-set T we have

$$f^{-1}T = T_\varphi.$$

The adjunction between f^{-1} and f_* is evidenced by the formula

$$Mor_{G\textit{-Sets}}(T_\varphi, S) = Mor_{H\textit{-Sets}}(T, f_*S)$$

with f_*S as above. This can be proved directly. Moreover, it is then clear that (f^{-1}, f_*) form an adjoint pair and that f^{-1} is exact. So alternatively to the above the morphism of topoi $f : G\textit{-Sets} \to H\textit{-Sets}$ can be defined directly in this manner.

9.17. More functoriality of presheaves

In this section we revisit the material of Section 9.5. Let $u : \mathcal{C} \to \mathcal{D}$ be a functor between categories. Recall that

$$u^p : PSh(\mathcal{D}) \longrightarrow PSh(\mathcal{C})$$

is the functor that associates to $\mathcal{G}$ on $\mathcal{D}$ the presheaf $u^p\mathcal{G} = \mathcal{G} \circ u$. It turns out that this functor not only has a left adjoint (namely u_p) but also a right adjoint.

Namely, for any $V \in Ob(\mathcal{D})$ we define a category ${}_V\mathcal{I} = {}^u_V\mathcal{I}$. Its objects are pairs $(U, \psi : u(U) \to V)$. Note that the arrow is in the opposite direction from the arrow we used in defining the category $\mathcal{I}_V^u$ in Section 9.5. A morphism $(U, \psi) \to (U', \psi')$ is given by a morphism $\alpha : U \to U'$ such that $\psi = \psi' \circ u(\alpha)$. In addition, given any presheaf of

[4]Set theoretical remark: First choose $\mathcal{T}_H$. Then choose $\mathcal{T}_G$ to contain $u(\mathcal{T}_H)$ and such that every covering in $\mathcal{T}_H$ corresponds to a covering in $\mathcal{T}_G$. This is possible by Sets, Lemmas 3.10.1, 3.10.2 and 3.11.1.

sets $\mathcal{F}$ on $\mathcal{C}$ we introduce the functor ${}_V\mathcal{F} : {}_V\mathcal{I}^{opp} \to Sets$, which is defined by the rule ${}_V\mathcal{F}(U, \psi) = \mathcal{F}(U)$. We define

$$ {}_pu(\mathcal{F})(V) := lim_{{}_V\mathcal{I}^{opp}}\, {}_V\mathcal{F} $$

As a limit there are projection maps $c(\psi) : {}_pu(\mathcal{F})(V) \to \mathcal{F}(U)$ for every object (U, ψ) of ${}_V\mathcal{I}$. In fact,

$$ {}_pu(\mathcal{F})(V) = \left\{ \begin{matrix} \text{collections } s_{(U,\psi)} \in \mathcal{F}(U) \\ \forall \beta : (U_1, \psi_1) \to (U_2, \psi_2) \text{ in } {}_V\mathcal{I} \\ \text{we have } \beta^* s_{(U_2,\psi_2)} = s_{(U_1,\psi_1)} \end{matrix} \right\} $$

where the correspondence is given by $s \mapsto s_{(U,\psi)} = c(\psi)(s)$. We leave it to the reader to define the restriction mappings ${}_pu(\mathcal{F})(V) \to {}_pu(\mathcal{F})(V')$ associated to any morphism $V' \to V$ of $\mathcal{D}$. The resulting presheaf will be denoted ${}_pu\mathcal{F}$.

Lemma 9.17.1. *There is a canonical map ${}_pu\mathcal{F}(u(U)) \to \mathcal{F}(U)$, which is compatible with restriction maps.*

Proof. This is just the projection map $c(\mathrm{id}_{u(U)})$ above. $\square$

Note that any map of presheaves $\mathcal{F} \to \mathcal{F}'$ gives rise to compatible systems of maps between functors ${}_V\mathcal{F} \to {}_V\mathcal{F}'$, and hence to a map of presheaves ${}_pu\mathcal{F} \to {}_pu\mathcal{F}'$. In other words, we have defined a functor

$$ {}_pu : PSh(\mathcal{C}) \longrightarrow PSh(\mathcal{D}) $$

Lemma 9.17.2. *The functor ${}_pu$ is a right adjoint to the functor u^p. In other words the formula*

$$ Mor_{PSh(\mathcal{C})}(u^p\mathcal{G}, \mathcal{F}) = Mor_{PSh(\mathcal{D})}(\mathcal{G}, {}_pu\mathcal{F}) $$

holds bifunctorially in $\mathcal{F}$ and $\mathcal{G}$.

Proof. This is proved in exactly the same way as the proof of Lemma 9.5.4. We note that the map $u^p\,{}_pu\mathcal{F} \to \mathcal{F}$ from Lemma 9.17.1 is the map that is used to go from the right to the left.

Alternately, think of a presheaf of sets $\mathcal{F}$ on $\mathcal{C}$ as a presheaf $\mathcal{F}'$ on $\mathcal{C}^{opp}$ with values in $Sets^{opp}$, and similarly on $\mathcal{D}$. Check that $({}_pu\mathcal{F})' = u_p(\mathcal{F}')$, and that $(u^p\mathcal{G})' = u^p(\mathcal{G}')$. By Remark 9.5.5 we have the adjointness of u_p and u^p for presheaves with values in $Sets^{opp}$. The result then follows formally from this. $\square$

9.18. Cocontinuous functors

There is another way to construct morphisms of topoi. This involves using cocontinuous functors defined as follows.

Definition 9.18.1. Let $\mathcal{C}$ and $\mathcal{D}$ be sites. Let $u : \mathcal{C} \to \mathcal{D}$ be a functor. The functor u is called *cocontinuous* if for every $U \in Ob(\mathcal{C})$ and every covering $\{V_j \to u(U)\}_{j\in J}$ of $\mathcal{D}$ there exists a covering $\{U_i \to U\}_{i\in I}$ of $\mathcal{C}$ such that the family of maps $\{u(U_i) \to u(U)\}_{i\in I}$ refines the covering $\{V_j \to u(U)\}_{j\in J}$.

Note that $\{u(U_i) \to u(U)\}_{i\in I}$ is in general *not* a covering of the site $\mathcal{D}$.

Lemma 9.18.2. *Let $\mathcal{C}$ and $\mathcal{D}$ be sites. Let $u : \mathcal{C} \to \mathcal{D}$ be cocontinuous. Let $\mathcal{F}$ be a sheaf on $\mathcal{C}$. Then ${}_pu\mathcal{F}$ is a sheaf on $\mathcal{D}$, which we will denote ${}_su\mathcal{F}$.*

Proof. Let $\{V_j \to V\}_{j\in J}$ be a covering of the site $\mathcal{D}$. We have to show that

$$ {}_pu\mathcal{F}(V) \longrightarrow \prod {}_pu\mathcal{F}(V_j) \rightrightarrows \prod {}_pu\mathcal{F}(V_j \times_V V_{j'}) $$

is an equalizer diagram. Since ${}_pu$ is right adjoint to u^p we have

$$ {}_pu\mathcal{F}(V) = \mathrm{Mor}_{PSh(\mathcal{D})}(h_V, {}_pu\mathcal{F}) = \mathrm{Mor}_{PSh(\mathcal{C})}(u^ph_V, \mathcal{F}) = \mathrm{Mor}_{Sh(\mathcal{C})}((u^ph_V)^\#, \mathcal{F}) $$

Hence it suffices to show that

$$ \coprod u^ph_{V_j\times_V V_{j'}} \rightrightarrows \coprod u^ph_{V_j} \longrightarrow u^ph_V \tag{9.18.2.1} $$

becomes a coequalizer diagram after sheafification. (Recall that a coproduct in the category of sheaves is the sheafification of the coproduct in the category of presheaves, see Lemma 9.10.13.)

We first show that the second arrow of (9.18.2.1) becomes surjective after sheafification. To do this we use Lemma 9.11.2. Thus it suffices to show a section s of u^ph_V over U lifts to a section of $\coprod u^ph_{V_j}$ on the members of a covering of U. Note that s is a morphism $s : u(U) \to V$. Then $\{V_j\times_{V,s}u(U) \to u(U)\}$ is a covering of $\mathcal{D}$. Hence, as u is cocontinuous, there is a covering $\{U_i \to U\}$ such that $\{u(U_i) \to u(U)\}$ refines $\{V_j\times_{V,s}u(U) \to u(U)\}$. This means that each restriction $s|_{U_i} : u(U_i) \to V$ factors through a morphism $s_i : u(U_i) \to V_j$ for some j, i.e., $s|_{U_i}$ is in the image of $u^ph_{V_j}(U_i) \to u^ph_V(U_i)$ as desired.

Let $s, s' \in (\coprod u^ph_{V_j})^\#(U)$ map to the same element of $(u^ph_V)^\#(U)$. To finish the proof of the lemma we show that after replacing U by the members of a covering that s, s' are the image of the same section of $\coprod u^ph_{V_j\times_V V_{j'}}$ by the two maps of (9.18.2.1). We may first replace U by the members of a covering and assume that $s \in u^ph_{V_j}(U)$ and $s' \in u^ph_{V_{j'}}(U)$. A second such replacement guarantees that s and s' have the same image in $u^ph_V(U)$ instead of in the sheafification. Hence $s : u(U) \to V_j$ and $s' : u(U) \to V_{j'}$ are morphisms of $\mathcal{D}$ such that

$$ \begin{tikzcd} u(U) \arrow[r, "s'"'] \arrow[d, "s"'] & V_{j'} \arrow[d] \\ V_j \arrow[r] & V \end{tikzcd} $$

is commutative. Thus we obtain $t = (s, s') : u(U) \to V_j \times_V V_{j'}$, i.e., a section $t \in u^ph_{V_j\times_V V_{j'}}(U)$ which maps to s, s' as desired. □

Lemma 9.18.3. *Let $\mathcal{C}$ and $\mathcal{D}$ be sites. Let $u : \mathcal{C} \to \mathcal{D}$ be cocontinuous. The functor $Sh(\mathcal{D}) \to Sh(\mathcal{C})$, $\mathcal{G} \mapsto (u^p\mathcal{G})^\#$ is a left adjoint to the functor ${}_su$ introduced in Lemma 9.18.2 above. Moreover, it is exact.*

Proof. Let us prove the adjointness property as follows

$$ \begin{aligned} Mor_{Sh(\mathcal{C})}((u^p\mathcal{G})^\#, \mathcal{F}) &= Mor_{PSh(\mathcal{C})}(u^p\mathcal{G}, \mathcal{F}) \\ &= Mor_{PSh(\mathcal{D})}(\mathcal{G}, {}_pu\mathcal{F}) \\ &= Mor_{Sh(\mathcal{D})}(\mathcal{G}, {}_su\mathcal{F}). \end{aligned} $$

Thus it is a left adjoint and hence right exact, see Categories, Lemma 4.22.3. We have seen that sheafification is left exact, see Lemma 9.10.14. Moreover, the inclusion $i : Sh(\mathcal{D}) \to PSh(\mathcal{D})$ is left exact by Lemma 9.10.1. Finally, the functor u^p is left exact because it is a right adjoint (namely to u_p). Thus the functor is the composition $^\# \circ u^p \circ i$ of left exact functors, hence left exact. □

We finish this section with a technical lemma.

Lemma 9.18.4. *In the situation of Lemma 9.18.3. For any presheaf $\mathcal{G}$ on $\mathcal{D}$ we have $(u^p\mathcal{G})^\# = (u^p(\mathcal{G}^\#))^\#$.*

Proof. For any sheaf $\mathcal{F}$ on $\mathcal{C}$ we have

$$\begin{aligned} Mor_{Sh(\mathcal{C})}((u^p(\mathcal{G}^\#))^\#, \mathcal{F}) &= Mor_{Sh(\mathcal{D})}(\mathcal{G}^\#, {}_su\mathcal{F}) \\ &= Mor_{PSh(\mathcal{D})}(\mathcal{G}^\#, {}_pu\mathcal{F}) \\ &= Mor_{PSh(\mathcal{D})}(\mathcal{G}, {}_pu\mathcal{F}) \\ &= Mor_{PSh(\mathcal{C})}(u^p\mathcal{G}, \mathcal{F}) \\ &= Mor_{Sh(\mathcal{C})}((u^p\mathcal{G})^\#, \mathcal{F}) \end{aligned}$$

and the result follows from the Yoneda lemma. □

9.19. Cocontinuous functors and morphisms of topoi

It is clear from the above that a cocontinuous functor u gives a morphism of topoi in the same direction as u. Thus this is in the opposite direction from the morphism of topoi associated (under certain conditions) to a continuous u as in Definition 9.14.1, Proposition 9.14.6, and Lemma 9.15.3.

Lemma 9.19.1. *Let $\mathcal{C}$ and $\mathcal{D}$ be sites. Let $u : \mathcal{C} \to \mathcal{D}$ be cocontinuous. The functors $g_* = {}_su$ and $g^{-1} = (u^p\ )^\#$ define a morphism of topoi g from $Sh(\mathcal{C})$ to $Sh(\mathcal{D})$.*

Proof. This is exactly the content of Lemma 9.18.3. □

Lemma 9.19.2. *Let $u : \mathcal{C} \to \mathcal{D}$, and $v : \mathcal{D} \to \mathcal{E}$ be cocontinuous functors. Then $v \circ u$ is cocontinuous and we have $h = g \circ f$ where $f : Sh(\mathcal{C}) \to Sh(\mathcal{D})$, resp. $g : Sh(\mathcal{D}) \to Sh(\mathcal{E})$, resp. $h : Sh(\mathcal{C}) \to Sh(\mathcal{E})$ is the morphism of topoi associated to u, resp. v, resp. $v \circ u$.*

Proof. Let $U \in Ob(\mathcal{C})$. Let $\{E_i \to v(u(U))\}$ be a covering of U in $\mathcal{E}$. By assumption there exists a covering $\{D_j \to u(U)\}$ in $\mathcal{D}$ such that $\{v(D_j) \to v(u(U))\}$ refines $\{E_i \to v(u(U))\}$. Also by assumption there exists a covering $\{C_l \to U\}$ in $\mathcal{C}$ such that $\{u(C_l) \to u(U)\}$ refines $\{D_j \to u(U)\}$. Then it is true that $\{v(u(C_l)) \to v(u(U))\}$ refines the covering $\{E_i \to v(u(U))\}$. This proves that $v \circ u$ is cocontinuous. To prove the last assertion it suffices to show that ${}_sv \circ {}_su = {}_s(v \circ u)$. It suffices to prove that ${}_pv \circ {}_pu = {}_p(v \circ u)$, see Lemma 9.18.2. Since ${}_pu$, resp. ${}_pv$, resp. ${}_p(v \circ u)$ is right adjoint to u^p, resp. v^p, resp. $(v \circ u)^p$ it suffices to prove that $u^p \circ v^p = (v \circ u)^p$. And this is direct from the definitions. □

Example 9.19.3. Let X be a topological space. Let $j : U \to X$ be the inclusion of an open subspace. Recall that we have sites $\mathcal{T}_X$ and $\mathcal{T}_U$, see Example 9.6.4. Recall that we have the functor $u : \mathcal{T}_X \to \mathcal{T}_U$ associated to j which is continuous and gives rise to a morphism of sites $\mathcal{T}_U \to \mathcal{T}_X$, see Example 9.14.2. This also gives a morphism of topoi (j_*, j^{-1}). Next, consider the functor $v : \mathcal{T}_U \to \mathcal{T}_X$, $V \mapsto v(V) = V$ (just the same open but now thought of as an object of $\mathcal{T}_X$). This functor is cocontinuous. Namely, if $v(V) = \bigcup_{j\in J} W_j$ is an open covering in X, then each W_j must be a subset of U and hence is of the form $v(V_j)$, and trivially $V = \bigcup_{j\in J} V_j$ is an open covering in U. We conclude by Lemma 9.19.1 above that there is a morphism of topoi associated to v

$$Sh(U) \longrightarrow Sh(X)$$

given by ${}_sv$ and $(v^p\ )^\#$. We claim that actually $(v^p\ )^\# = j^{-1}$ and that ${}_sv = j_*$, in other words, that this is the same morphism of topoi as the one given above. Perhaps the easiest way to see this is to realize that for any sheaf $\mathcal{G}$ on X we have $v^p\mathcal{G}(V) = \mathcal{G}(V)$ which according to Sheaves, Lemma 6.31.1 is a description of $j^{-1}\mathcal{G}$ (and hence sheafification is superfluous in this case). The equality of ${}_sv$ and j_* follows by uniqueness of adjoint functors (but may also be computed directly).

Example 9.19.4. This example is a slight generalization of Example 9.19.3. Let $f : X \to Y$ be a continuous map of topological spaces. Assume that f is open. Recall that we have sites $\mathcal{T}_X$ and $\mathcal{T}_Y$, see Example 9.6.4. Recall that we have the functor $u : \mathcal{T}_Y \to \mathcal{T}_X$ associated to f which is continuous and gives rise to a morphism of sites $\mathcal{T}_X \to \mathcal{T}_Y$, see Example 9.14.2. This also gives a morphism of topoi (f_*, f^{-1}). Next, consider the functor $v : \mathcal{T}_X \to \mathcal{T}_Y$, $U \mapsto v(U) = f(U)$. This functor is cocontinuous. Namely, if $f(U) = \bigcup_{j\in J} V_j$ is an open covering in Y, then setting $U_j = f^{-1}(V_j) \cap U$ we get an open covering $U = \bigcup U_j$ such that $f(U) = \bigcup f(U_j)$ is a refinement of $f(U) = \bigcup V_j$. We conclude by Lemma 9.19.1 above that there is a morphism of topoi associated to v

$$Sh(X) \longrightarrow Sh(Y)$$

given by ${}_sv$ and $(v^p)^\#$. We claim that actually $(v^p)^\# = f^{-1}$ and that ${}_sv = f_*$, in other words, that this is the same morphism of topoi as the one given above. For any sheaf $\mathcal{G}$ on Y we have $v^p\mathcal{G}(U) = \mathcal{G}(f(U))$. On the other hand, we may compute $u_p\mathcal{G}(U) = colim_{f(U)\subset V}\mathcal{G}(V) = \mathcal{G}(f(U))$ because clearly $(f(U), U \subset f^{-1}(f(U)))$ is an initial object of the category $\mathcal{I}^u_U$ of Section 9.5. Hence $u_p = v^p$ and we conclude $f^{-1} = u_s = (v^p)^\#$. The equality of ${}_sv$ and f_* follows by uniqueness of adjoint functors (but may also be computed directly).

In the first Example 9.19.3 the functor v is also continuous. But in the second Example 9.19.4 it is generally not continuous because condition (2) of Definition 9.13.1 may fail. Hence the following lemma applies to the first example, but not to the second.

Lemma 9.19.5. *Let $\mathcal{C}$ and $\mathcal{D}$ be sites. Let $u : \mathcal{C} \to \mathcal{D}$ be a functor. Assume that*

(a) *u is cocontinuous, and*
(b) *u is continuous.*

Let $g : Sh(\mathcal{C}) \to Sh(\mathcal{D})$ be the associated morphism of topoi. Then

(1) *sheafification in the formula $g^{-1} = (u^p)^\#$ is unnecessary, in other words $g^{-1}(\mathcal{G})(U) = \mathcal{G}(u(U))$,*
(2) *g^{-1} has a left adjoint $g_! = (u_p)^\#$, and*
(3) *g^{-1} commutes with arbitrary limits and colimits.*

Proof. By Lemma 9.13.2 for any sheaf $\mathcal{G}$ on $\mathcal{D}$ the presheaf $u^p\mathcal{G}$ is a sheaf on $\mathcal{C}$. And then we see the adjointness by the following string of equalities

$$\begin{aligned} Mor_{Sh(\mathcal{C})}(\mathcal{F}, g^{-1}\mathcal{G}) &= Mor_{PSh(\mathcal{C})}(\mathcal{F}, u^p\mathcal{G}) \\ &= Mor_{PSh(\mathcal{D})}(u_p\mathcal{F}, \mathcal{G}) \\ &= Mor_{Sh(\mathcal{D})}(g_!\mathcal{F}, \mathcal{G}) \end{aligned}$$

The statement on limits and colimits follows from the discussion in Categories, Section 4.22. □

In the situation of Lemma 9.19.5 above we see that we have a sequence of adjoint functors

$$g_!,\ g^{-1},\ g_*.$$

The functor $g_!$ is *not* exact in general, because it does not transform a final object of $Sh(\mathcal{C})$ into a final object of $Sh(\mathcal{D})$ in general. See Sheaves, Remark 6.31.13. On the other hand, in the topological setting of Example 9.19.3 the functor $j_!$ is exact on abelian sheaves, see Modules, Lemma 15.3.5. The following lemma gives the generalization to the case of sites.

Lemma 9.19.6. *Let $\mathcal{C}$ and $\mathcal{D}$ be sites. Let $u : \mathcal{C} \to \mathcal{D}$ be a functor. Assume that*

(a) *u is cocontinuous,*
(b) *u is continuous, and*
(c) *fibre products and equalizers exist in $\mathcal{C}$ and u commutes with them.*

In this case the functor $g_!$ above commutes with fibre products and equalizers (and more generally with any finite, nonempty connected limits).

Proof. Assume (a), (b), and (c). We have $g_! = (u_p\ )^\#$. Recall (Lemma 9.10.1) that limits of sheaves are equal to the corresponding limits as presheaves. And sheafification commutes with finite limits (Lemma 9.10.14). Thus it suffices to show that u_p commutes with fibre products and equalizers. To do this it suffices that colimits over the categories $(\mathcal{I}_V^u)^{opp}$ of Section 9.5 commute with fibre products and equalizers. This follows from Lemma 9.5.1 and Categories, Lemma 4.17.4. □

The following lemma deals with a case that is even more like the morphism associated to an open immersion of topological spaces.

Lemma 9.19.7. *Let $\mathcal{C}$ and $\mathcal{D}$ be sites. Let $u : \mathcal{C} \to \mathcal{D}$ be a functor. Assume that*

(a) *u is cocontinuous,*
(b) *u is continuous, and*
(c) *u is fully faithful.*

For $g_!, g^{-1}, g_*$ as above the canonical maps $\mathcal{F} \to g^{-1}g_!\mathcal{F}$ and $g^{-1}g_*\mathcal{F} \to \mathcal{F}$ are isomorphisms for all sheaves $\mathcal{F}$ on $\mathcal{C}$.

Proof. Let X be an object of $\mathcal{C}$. In Lemmas 9.18.2 and 9.19.5 we have seen that sheafification is not necessary for the functors $g^{-1} = (u^p\ )^\#$ and $g_* = ({}_pu\ )^\#$. We may compute $(g^{-1}g_*\mathcal{F})(X) = g_*\mathcal{F}(u(X)) = lim\,\mathcal{F}(Y)$. Here the limit is over the category of pairs $(Y, u(Y) \to u(X))$ where the morphisms $u(Y) \to u(X)$ are not required to be of the form $u(\alpha)$ with α a morphism of $\mathcal{C}$. By assumption (c) we see that they automatically come from morphisms of $\mathcal{C}$ and we deduce that the limit is the value on $(X, u(\mathrm{id}_X))$, i.e., $\mathcal{F}(X)$. This proves that $g^{-1}g_*\mathcal{F} = \mathcal{F}$.

On the other hand, $(g^{-1}g_!\mathcal{F})(X) = g_!\mathcal{F}(u(X)) = (u_p\mathcal{F})^\#(u(X))$, and $u_p\mathcal{F}(u(X)) = colim\,\mathcal{F}(Y)$. Here the colimit is over the category of pairs $(Y, u(X) \to u(Y))$ where the morphisms $u(X) \to u(Y)$ are not required to be of the form $u(\alpha)$ with α a morphism of $\mathcal{C}$. By assumption (c) we see that they automatically come from morphisms of $\mathcal{C}$ and we deduce that the colimit is the value on $(X, u(\mathrm{id}_X))$, i.e., $\mathcal{F}(X)$. Thus for every $X \in Ob(\mathcal{C})$ we have $u_p\mathcal{F}(u(X)) = \mathcal{F}(X)$. Since u is cocontinuous and continuous any covering of $u(X)$ in $\mathcal{D}$ can be refined by a covering (!) $\{u(X_i) \to u(X)\}$ of $\mathcal{D}$ where $\{X_i \to X\}$ is a covering in $\mathcal{C}$. This implies that $(u_p\mathcal{F})^+(u(X)) = \mathcal{F}(X)$ also, since in the colimit defining the value of $(u_p\mathcal{F})^+$ on $u(X)$ we may restrict to the cofinal system of coverings $\{u(X_i) \to u(X)\}$ as above. Hence we see that $(u_p\mathcal{F})^+(u(X)) = \mathcal{F}(X)$ for all objects X of $\mathcal{C}$ as well. Repeating this argument one more time gives the equality $(u_p\mathcal{F})^\#(u(X)) = \mathcal{F}(X)$ for all objects X of $\mathcal{C}$. This produces the desired equality $g^{-1}g_!\mathcal{F} = \mathcal{F}$. □

Finally, here is a case that does not have any corresponding topological example. Namely, this lemma explains what happens when we enlarge a ``partial universe'' of schemes keeping the same topology.

Lemma 9.19.8. *Let $\mathcal{C}$ and $\mathcal{D}$ be sites. Let $u : \mathcal{C} \to \mathcal{D}$ be a functor. Assume that*

(a) *u is cocontinuous,*
(b) *u is continuous,*
(c) *u is fully faithful,*
(d) *fibre products exist in $\mathcal{C}$ and u commutes with them, and*
(e) *there exist final objects $e_{\mathcal{C}} \in Ob(\mathcal{C})$, $e_{\mathcal{D}} \in Ob(\mathcal{D})$ such that $u(e_{\mathcal{C}}) = e_{\mathcal{D}}$.*

Let $g_!, g^{-1}, g_*$ be as above. Then, u defines a morphism of sites $f : \mathcal{D} \to \mathcal{C}$ with $f_* = g^{-1}$, $f^{-1} = g_!$. The composition

$$Sh(\mathcal{C}) \xrightarrow{g} Sh(\mathcal{D}) \xrightarrow{f} Sh(\mathcal{C})$$

is isomorphic to the identity morphism of the topos $Sh(\mathcal{C})$. Moreover, the functor f^{-1} is fully faithful.

Proof. By assumption the functor u satisfies the hypotheses of Proposition 9.14.6. Hence u defines a morphism of sites and hence a morphism of topoi f as in Lemma 9.15.3. The formulas $f_* = g^{-1}$ and $f^{-1} = g_!$ are clear from the lemma cited and Lemma 9.19.5. We have $f_* \circ g_* = g^{-1} \circ g_* \cong \mathrm{id}$, and $g^{-1} \circ f^{-1} = g^{-1} \circ g_! \cong \mathrm{id}$ by Lemma 9.19.7.

We still have to show that f^{-1} is fully faithful. Let $\mathcal{F}, \mathcal{G} \in Ob(Sh(\mathcal{C}))$. We have to show that the map

$$Mor_{Sh(\mathcal{C})}(\mathcal{F}, \mathcal{G}) \longrightarrow Mor_{Sh(\mathcal{D})}(f^{-1}\mathcal{F}, f^{-1}\mathcal{G})$$

is bijective. But the right hand side is equal to

$$\begin{aligned} Mor_{Sh(\mathcal{D})}(f^{-1}\mathcal{F}, f^{-1}\mathcal{G}) &= Mor_{Sh(\mathcal{C})}(f_*f^{-1}\mathcal{F}, \mathcal{G}) \\ &= Mor_{Sh(\mathcal{C})}(g^{-1}f^{-1}\mathcal{F}, \mathcal{G}) \\ &= Mor_{Sh(\mathcal{C})}(\mathcal{F}, \mathcal{G}) \end{aligned}$$

(the first equality by adjunction) which proves what we want. □

Example 9.19.9. Let X be a topological space. Let $i : Z \to X$ be the inclusion of a subset (with induced topology). Consider the functor $u : \mathcal{T}_X \to \mathcal{T}_Z$, $U \mapsto u(U) = Z \cap U$. At first glance it may appear that this functor is cocontinuous as well. After all, since Z has the induced topology, shouldn't any covering of $U \cap Z$ it come from a covering of U in X? Not so! Namely, what if $U \cap Z = \emptyset$? In that case, the empty covering is a covering of $U \cap Z$, and the empty covering can only be refined by the empty covering. Thus we conclude that u cocontinuous $\Rightarrow$ every nonempty open U of X has nonempty intersection with Z. But this is not sufficient. For example, if $X = \mathbf{R}$ the real number line with the usual topology, and $Z = \mathbf{R} \setminus \{0\}$, then there is an open covering of Z, namely $Z = \{x < 0\} \cup \bigcup_n \{1/n < x\}$ which cannot be refined by the restriction of any open covering of X.

9.20. Cocontinuous functors which have a right adjoint

It may happen that a cocontinuous functor u has a right adjoint v. In this case it is often the case that v is continuous, and if so, then it defines a morphism of topoi (which is the same as the one defined by u).

Lemma 9.20.1. *Let $\mathcal{C}$ and $\mathcal{D}$ be sites. Let $u : \mathcal{C} \to \mathcal{D}$, and $v : \mathcal{D} \to \mathcal{C}$ be functors. Assume that u is cocontinuous, and that v is a right adjoint to u. Let $g : Sh(\mathcal{C}) \to Sh(\mathcal{D})$ be the morphism of topoi associated to u, see Lemma 9.19.1. Then $g_*\mathcal{F}$ is equal to the presheaf $v^p\mathcal{F}$, in other words, $(g_*\mathcal{F})(V) = \mathcal{F}(v(V))$.*

Proof. Let V be an object of $\mathcal{D}$. We have $u^p h_V = h_{v(V)}$ because $u^p h_V(U) = Mor_{\mathcal{D}}(u(U), V) = Mor_{\mathcal{C}}(U, v(V))$ by assumption. By Lemma 9.18.4 this implies that $g^{-1}(h_V^\#) = (u^p h_V^\#)^\# = (u^p h_V)^\# = h_{v(V)}^\#$. Hence for any sheaf $\mathcal{F}$ on $\mathcal{C}$ we have

$$\begin{aligned} (g_*\mathcal{F})(V) &= Mor_{Sh(\mathcal{D})}(h_V^\#, g_*\mathcal{F}) \\ &= Mor_{Sh(\mathcal{C})}(g^{-1}(h_V^\#), \mathcal{F}) \\ &= Mor_{Sh(\mathcal{C})}(h_{v(V)}^\#, \mathcal{F}) \\ &= \mathcal{F}(v(V)) \end{aligned}$$

which proves the lemma. □

In the situation of the lemma we see that v^p transforms sheaves into sheaves. Hence we can define $v^s = v^p$ restricted to sheaves. Just as in Lemma 9.13.3 we see that $v_s : \mathcal{G} \mapsto (v_p\mathcal{G})^\#$ is a left adjoint to v^s. On the other hand, we have $v^s = g_*$ and g^{-1} is a left adjoint of g_* as well. We conclude that $g^{-1} = v_s$ is exact.

Lemma 9.20.2. *In the situation of Lemma 9.20.1. We have $g_* = v^s = v^p$ and $g^{-1} = v_s = (v_p)^\#$. If v is continuous then v defines a morphism of sites f from $\mathcal{C}$ to $\mathcal{D}$ whose associated morphism of topoi is equal to the morphism g associated to the cocontinuous functor u.*

Proof. Clear from the discussion above the lemma and Definitions 9.14.1 and Lemma 9.15.3. □

9.21. Localization

Let $\mathcal{C}$ be a site. Let $U \in Ob(\mathcal{C})$. See Categories, Example 4.2.13 for the definition of the category $\mathcal{C}/U$ of objects over U. We turn $\mathcal{C}/U$ into a site by declaring a family of morphisms $\{V_j \to V\}$ of objects over U to be a covering of $\mathcal{C}/U$ if and only if it is a covering in $\mathcal{C}$. Consider the forgetful functor

$$j_U : \mathcal{C}/U \longrightarrow \mathcal{C}.$$

This is clearly cocontinuous and continuous. Hence by the results of the previous sections we obtain a morphism of topoi

$$j_U : Sh(\mathcal{C}/U) \longrightarrow Sh(\mathcal{C})$$

given by j_U^{-1} and j_{U*}, as well as a functor $j_{U!}$.

Definition 9.21.1. Let $\mathcal{C}$ be a site. Let $U \in Ob(\mathcal{C})$.

(1) The site $\mathcal{C}/U$ is called the *localization of the site $\mathcal{C}$ at the object U*.
(2) The morphism of topoi $j_U : Sh(\mathcal{C}/U) \to Sh(\mathcal{C})$ is called the *localization morphism*.
(3) The functor j_{U*} is called the *direct image functor*.
(4) For a sheaf $\mathcal{F}$ on $\mathcal{C}$ the sheaf $j_U^{-1}\mathcal{F}$ is called the *restriction of $\mathcal{F}$ to $\mathcal{C}/U$*.
(5) For a sheaf $\mathcal{G}$ on $\mathcal{C}/U$ the sheaf $j_{U!}\mathcal{G}$ is called the *extension of $\mathcal{G}$ by the empty set*.

The restriction $j_U^{-1}\mathcal{F}$ is the sheaf defined by the rule $j_U^{-1}\mathcal{F}(X/U) = \mathcal{F}(X)$ as expected. The extension by the empty set also has a very easy description in this case; here it is.

Lemma 9.21.2. *Let $\mathcal{C}$ be a site. Let $U \in Ob(\mathcal{C})$. Let $\mathcal{G}$ be a presheaf on $\mathcal{C}/U$. Then $j_{U!}(\mathcal{G}^\#)$ is the sheaf associated to the presheaf*

$$V \longmapsto \coprod\nolimits_{\varphi \in Mor_{\mathcal{C}}(V,U)} \mathcal{G}(V \xrightarrow{\varphi} U)$$

with obvious restriction mappings.

Proof. By Lemma 9.19.5 we have $j_{U!}(\mathcal{G}^\#) = ((j_U)_p\mathcal{G}^\#)^\#$. By Lemma 9.13.4 this is equal to $((j_U)_p\mathcal{G})^\#$. Hence it suffices to prove that $(j_U)_p$ is given by the formula above for any presheaf $\mathcal{G}$ on $\mathcal{C}/U$. OK, and by the definition in Section 9.5 we have

$$(j_U)_p\mathcal{G}(V) = colim_{(W/U, V\to W)}\,\mathcal{G}(W)$$

Now it is clear that the category of pairs $(W/U, V \to W)$ has an object $O_\varphi = (\varphi : V \to U, \mathrm{id} : V \to V)$ for every $\varphi : V \to U$, and moreover for any object there is a unique morphism from one of the O_φ into it. The result follows. $\square$

Lemma 9.21.3. *Let $\mathcal{C}$ be a site. Let $U \in Ob(\mathcal{C})$. Let X/U be an object of $\mathcal{C}/U$. Then we have $j_{U!}(h^\#_{X/U}) = h^\#_X$.*

Proof. Denote $p : X \to U$ the structure morphism of X. By Lemma 9.21.2 we see $j_{U!}(h^\#_{X/U})$ is the sheaf associated to the presheaf

$$V \longmapsto \coprod\nolimits_{\varphi\in Mor_{\mathcal{C}}(V,U)} \{\psi : V \to X \mid p \circ \psi = \varphi\}$$

This is clearly the same thing as $Mor_{\mathcal{C}}(V, X)$. Hence the lemma follows. $\square$

We have $j_{U!}(*) = h^\#_U$ by either of the two lemmas above. Hence for every sheaf $\mathcal{G}$ over $\mathcal{C}/U$ there is a canonical map of sheaves $j_{U!}\mathcal{G} \to h^\#_U$. This characterizes sheaves in the essential image of $j_{U!}$.

Lemma 9.21.4. *Let $\mathcal{C}$ be a site. Let $U \in Ob(\mathcal{C})$. The functor $j_{U!}$ gives an equivalence of categories*

$$Sh(\mathcal{C}/U) \longrightarrow Sh(\mathcal{C})/h^\#_U$$

Proof. We explain how to get a functor from $Sh(\mathcal{C})/h^\#_U$ to $Sh(\mathcal{C}/U)$. Suppose that $\varphi : \mathcal{F} \to h^\#_U$ is given. For any object $a : X \to U$ of $\mathcal{C}/U$ we consider the set $\mathcal{F}_\varphi(X \to U)$ of elements $s \in \mathcal{F}(X)$ which under φ map to the image of $a \in Mor_{\mathcal{C}}(X, U) = h_U(X)$ in $h^\#_U(X)$. It is easy to see that $(X \to U) \mapsto \mathcal{F}_\varphi(X \to U)$ is a sheaf on $\mathcal{C}/U$. The verification that $(\mathcal{F}, \varphi) \mapsto \mathcal{F}_\varphi$ is an inverse to the functor $j_{U!}$ is omitted. $\square$

The lemma says the functor $j_{U!}$ is the composition

$$Sh(\mathcal{C}/U) \to Sh(\mathcal{C})/h^\#_U \to Sh(\mathcal{C})$$

where the first arrow is an equivalence.

Lemma 9.21.5. *Let $\mathcal{C}$ be a site. Let $U \in Ob(\mathcal{C})$. The functor $j_{U!}$ commutes with with fibre products and equalizers (and more generally finite, nonempty, connected limits). In particular, if $\mathcal{F} \subset \mathcal{F}'$ in $Sh(\mathcal{C}/U)$, then $j_{U!}\mathcal{F} \subset j_{U!}\mathcal{F}'$.*

Proof. This follows from the fact that an isomorphism of categories commutes with all limits and the functor $Sh(\mathcal{C})/h^\#_U \to Sh(\mathcal{C})$ commutes with fibre products and equalizers. Alternatively, one can prove this directly using the description of $j_{U!}$ in Lemma 9.21.2 using that sheafification is exact. (Also, in case $\mathcal{C}$ has fibre products and equalizers, the result follows from Lemma 9.19.6.) $\square$

Lemma 9.21.6. *Let $\mathcal{C}$ be a site. Let $U \in Ob(\mathcal{C})$. For any sheaf $\mathcal{F}$ on $\mathcal{C}$ we have $j_{U!}j_U^{-1}\mathcal{F} = \mathcal{F} \times h^\#_U$.*

Proof. This is clear from the description of $j_{U!}$ in Lemma 9.21.2. $\square$

Lemma 9.21.7. *Let $\mathcal{C}$ be a site. Let $f : V \to U$ be a morphism of $\mathcal{C}$. Then there exists a commutative diagram*

$$\begin{tikzcd} \mathcal{C}/V \arrow[rr, "j"] \arrow[dr, "j_V"'] & & \mathcal{C}/U \arrow[dl, "j_U"] \\ & \mathcal{C} & \end{tikzcd}$$

of cocontinuous functors. Here $j : \mathcal{C}/V \to \mathcal{C}/U$, $(a : W \to V) \mapsto (f \circ a : W \to U)$ is identified with the functor $j_{V/U} : (\mathcal{C}/U)/(V/U) \to \mathcal{C}/U$ via the identification $(\mathcal{C}/U)/(V/U) = \mathcal{C}/V$. Moreover we have $j_{V!} = j_{U!} \circ j_!$, $j_V^{-1} = j^{-1} \circ j_U^{-1}$, and $j_{V*} = j_{U*} \circ j_*$.

Proof. The commutativity of the diagram is immediate. The agreement of j with $j_{V/U}$ follows from the definitions. By Lemma 9.19.2 we see that the following diagram of morphisms of topoi

(9.21.7.1)
$$\begin{tikzcd} Sh(\mathcal{C}/V) \arrow[rr, "j"] \arrow[dr, "j_V"'] & & Sh(\mathcal{C}/U) \arrow[dl, "j_U"] \\ & Sh(\mathcal{C}) & \end{tikzcd}$$

is commutative. This proves that $j_V^{-1} = j^{-1} \circ j_U^{-1}$ and $j_{V*} = j_{U*} \circ j_*$. The equality $j_{V!} = j_{U!} \circ j_!$ follows formally from adjointness properties. □

Lemma 9.21.8. *Notation $\mathcal{C}$, $f : V \to U$, j_U, j_V, and j as in Lemma 9.21.7. Via the identifications $Sh(\mathcal{C}/V) = Sh(\mathcal{C})/h_V^\#$ and $Sh(\mathcal{C}/U) = Sh(\mathcal{C})/h_U^\#$ of Lemma 9.21.4 the functor j^{-1} has the following description*

$$j^{-1}(\mathcal{H} \xrightarrow{\varphi} h_U^\#) = (\mathcal{H} \times_{\varphi, h_U^\#, f} h_V^\# \to h_V^\#).$$

Proof. Suppose that $\varphi : \mathcal{H} \to h_U^\#$ is an object of $Sh(\mathcal{C})/h_U^\#$. By the proof of Lemma 9.21.4 this corresponds to the sheaf $\mathcal{H}_\varphi$ on $\mathcal{C}/U$ defined by the rule

$$(a : W \to U) \longmapsto \{s \in \mathcal{H}(W) \mid \varphi(s) = a\}$$

on $\mathcal{C}/U$. The pullback $j^{-1}\mathcal{H}_\varphi$ to $\mathcal{C}/V$ is given by the rule

$$(a : W \to V) \longmapsto \{s \in \mathcal{H}(W) \mid \varphi(s) = f \circ a\}$$

by the description of $j^{-1} = j_{U/V}^{-1}$ as the restriction of $\mathcal{H}_\varphi$ to $\mathcal{C}/V$. On the other hand, applying the rule to the object

$$\mathcal{H}' = \mathcal{H} \times_{\varphi, h_U^\#, f} h_V^\# \xrightarrow{\varphi'} h_V^\#$$

of $Sh(\mathcal{C})/h_V^\#$ we get $\mathcal{H}'_{\varphi'}$ given by

$$\begin{aligned} (a : W \to V) \longmapsto & \{s' \in \mathcal{H}'(W) \mid \varphi'(s') = a\} \\ = & \{(s, a') \in \mathcal{H}(W) \times h_V^\#(W) \mid a' = a \text{ and } \varphi(s) = f \circ a'\} \end{aligned}$$

which is exactly the same rule as the one describing $j^{-1}\mathcal{H}_\varphi$ above. □

Remark 9.21.9. Localization and presheaves. Let $\mathcal{C}$ be a category. Let U be an object of $\mathcal{C}$. Strictly speaking the functors j_U^{-1}, j_{U*} and $j_{U!}$ have not been defined for presheaves. But of course, we can think of a presheaf as a sheaf for the chaotic topology on $\mathcal{C}$ (see Example 9.6.6). Hence we also obtain a functor

$$j_U^{-1} : PSh(\mathcal{C}) \longrightarrow PSh(\mathcal{C}/U)$$

and functors

$$j_{U*}, j_{U!} : PSh(\mathcal{C}/U) \longrightarrow PSh(\mathcal{C})$$

which are right, left adjoint to j_U^{-1}. By Lemma 9.21.2 we see that $j_{U!}\mathcal{G}$ is the presheaf

$$V \longmapsto \coprod\nolimits_{\varphi \in Mor_{\mathcal{C}}(V,U)} \mathcal{G}(V \xrightarrow{\varphi} U)$$

In addition the functor $j_{U!}$ commutes with fibre products and equalizers.

9.22. Glueing sheaves

This section is the analogue of Sheaves, Section 6.33.

Lemma 9.22.1. *Let $\mathcal{C}$ be a site. Let $\{U_i \to U\}$ be a covering of $\mathcal{C}$. Let $\mathcal{F}$, $\mathcal{G}$ be sheaves on $\mathcal{C}$. Given a collection*

$$\varphi_i : \mathcal{F}|_{\mathcal{C}/U_i} \longrightarrow \mathcal{G}|_{\mathcal{C}/U_i}$$

of maps of sheaves such that for all $i, j \in I$ the maps φ_i, φ_j restrict to the same map $\mathcal{F}|_{\mathcal{C}/U_i \times_U U_j} \to \mathcal{G}|_{\mathcal{C}/U_i \times_U U_j}$ then there exists a unique map of sheaves

$$\varphi : \mathcal{F}|_{\mathcal{C}/U} \longrightarrow \mathcal{G}|_{\mathcal{C}/U}$$

whose restriction to each $\mathcal{C}/U_i$ agrees with φ_i.

Proof. Omitted. Note that the restrictions are always those of Lemma 9.21.7. ☐

The previous lemma implies that given two sheaves $\mathcal{F}$, $\mathcal{G}$ on a site $\mathcal{C}$ the rule

$$U \longmapsto Mor_{Sh(\mathcal{C}/U)}(\mathcal{F}|_{\mathcal{C}/U}, \mathcal{G}|_{\mathcal{C}/U})$$

defines a sheaf. This is a kind of *internal hom sheaf*. It is seldom used in the setting of sheaves of sets, and more usually in the setting of sheaves of modules, see Modules on Sites, Section 16.25.

Let $\mathcal{C}$ be a site. Let $\{U_i \to U\}_{i \in I}$ be a covering of $\mathcal{C}$. For each $i \in I$ let $\mathcal{F}_i$ be a sheaf of sets on $\mathcal{C}/U_i$. For each pair $i, j \in I$, let

$$\varphi_{ij} : \mathcal{F}_i|_{\mathcal{C}/U_i \times_U U_j} \longrightarrow \mathcal{F}_j|_{\mathcal{C}/U_i \times_U U_j}$$

be an isomorphism of sheaves of sets. Assume in addition that for every triple of indices $i, j, k \in I$ the following diagram is commutative

$$\begin{tikzcd}
\mathcal{F}_i|_{\mathcal{C}/U_i \times_U U_j \times_U U_k} \arrow[rr, "\varphi_{ik}"] \arrow[dr, "\varphi_{ij}"'] & & \mathcal{F}_k|_{\mathcal{C}/U_i \times_U U_j \times_U U_k} \\
& \mathcal{F}_j|_{\mathcal{C}/U_i \times_U U_j \times_U U_k} \arrow[ur, "\varphi_{jk}"'] &
\end{tikzcd}$$

We will call such a collection of data $(\mathcal{F}_i, \varphi_{ij})$ a *glueing data for sheaves of sets with respect to the covering $\{U_i \to U\}_{i \in I}$*.

Lemma 9.22.2. *Let $\mathcal{C}$ be a site. Let $\{U_i \to U\}_{i \in I}$ be a covering of $\mathcal{C}$. Given any glueing data $(\mathcal{F}_i, \varphi_{ij})$ for sheaves of sets with respect to the covering $\{U_i \to U\}_{i \in I}$ there exists a sheaf of sets $\mathcal{F}$ on $\mathcal{C}/U$ together with isomorphisms*

$$\varphi_i : \mathcal{F}|_{\mathcal{C}/U_i} \to \mathcal{F}_i$$

such that the diagrams

$$\begin{tikzcd}
\mathcal{F}|_{\mathcal{C}/U_i\times_U U_j} \arrow[r, "\varphi_i"'] \arrow[d, "id"'] & \mathcal{F}_i|_{\mathcal{C}/U_i\times_U U_j} \arrow[d, "\varphi_{ij}"] \\
\mathcal{F}|_{\mathcal{C}/U_i\times_U U_j} \arrow[r, "\varphi_j"] & \mathcal{F}_j|_{\mathcal{C}/U_i\times_U U_j}
\end{tikzcd}$$

are commutative.

Proof. Let us describe how to construct the sheaf $\mathcal{F}$ on $\mathcal{C}/U$. Let $a : V \to U$ be an object of $\mathcal{C}/U$. Then

$$\mathcal{F}(V/U) = \{(s_i)_{i\in I} \in \prod_{i\in I} \mathcal{F}_i(U_i \times_U V/U_i) \mid \varphi_{ij}(s_i|_{U_i\times_U U_j\times_U V}) = s_j|_{U_i\times_U U_j\times_U V}\}$$

We omit the construction of the restriction mappings. We omit the verification that this is a sheaf. We omit the construction of the isomorphisms φ_i, and we omit proving the commutativity of the diagrams of the lemma. □

Let $\mathcal{C}$ be a site. Let $\{U_i \to U\}_{i\in I}$ be a covering of $\mathcal{C}$. Let $\mathcal{F}$ be a sheaf on $\mathcal{C}/U$. Associated to $\mathcal{F}$ we have its *canonical glueing data* given by the restrictions $\mathcal{F}|_{\mathcal{C}/U_i}$ and the canonical isomorphisms

$$\left(\mathcal{F}|_{\mathcal{C}/U_i}\right)|_{\mathcal{C}/U_i\times_U U_j} = \left(\mathcal{F}|_{\mathcal{C}/U_j}\right)|_{\mathcal{C}/U_i\times_U U_j}$$

coming from the fact that the composition of the functors $\mathcal{C}/U_i \times_U U_j \to \mathcal{C}/U_i \to \mathcal{C}/U$ and $\mathcal{C}/U_i \times_U U_j \to \mathcal{C}/U_j \to \mathcal{C}/U$ are equal.

Lemma 9.22.3. *Let $\mathcal{C}$ be a site. Let $\{U_i \to U\}_{i\in I}$ be a covering of $\mathcal{C}$. The category $Sh(\mathcal{C}/U)$ is equivalent to the category of glueing data via the functor that associates to $\mathcal{F}$ on $\mathcal{C}/U$ the canonical glueing data.*

Proof. In Lemma 9.22.1 we saw that the functor is fully faithful, and in Lemma 9.22.2 we proved that it is essentially surjective (by explicitly constructing a quasi-inverse functor). □

9.23. More localization

In this section we prove a few lemmas on localization where we impose some additional hypotheses on the site on or the object we are localizing at.

Lemma 9.23.1. *Let $\mathcal{C}$ be a site. Let $U \in Ob(\mathcal{C})$. If the topology on $\mathcal{C}$ is subcanonical, see Definition 9.12.2, and if $\mathcal{G}$ is a sheaf on $\mathcal{C}/U$, then*

$$j_{U!}(\mathcal{G})(V) = \coprod\nolimits_{\varphi\in Mor_{\mathcal{C}}(V,U)} \mathcal{G}(V \xrightarrow{\varphi} U),$$

in other words sheafification is not necessary in Lemma 9.21.2.

Proof. Let $\mathcal{V} = \{V_i \to V\}_{i\in I}$ be a covering of V in the site $\mathcal{C}$. We are going to check the sheaf condition for the presheaf $\mathcal{H}$ of Lemma 9.21.2 directly. Let $(s_i, \varphi_i)_{i\in I} \in \prod_i \mathcal{H}(V_i)$, This means $\varphi_i : V_i \to U$ is a morphism in $\mathcal{C}$, and $s_i \in \mathcal{G}(V_i \xrightarrow{\varphi_i} U)$. The restriction of the pair (s_i, φ_i) to $V_i \times_V V_j$ is the pair $(s_i|_{V_i\times_V V_j/U}, \mathrm{pr}_1 \circ \varphi_i)$, and likewise the restriction of the pair (s_j, φ_j) to $V_i \times_V V_j$ is the pair $(s_j|_{V_i\times_V V_j/U}, \mathrm{pr}_2 \circ \varphi_j)$. Hence, if the family (s_i, φ_i) lies in $\check{H}^0(\mathcal{V}, \mathcal{H})$, then we see that $\mathrm{pr}_1 \circ \varphi_i = \mathrm{pr}_2 \circ \varphi_j$. The condition that the topology on $\mathcal{C}$ is weaker than the canonical topology then implies that there exists a unique morphism $\varphi : V \to U$ such that φ_i is the composition of $V_i \to V$ with φ. At this point the sheaf condition for $\mathcal{G}$ garantees that the sections s_i glue to a unique section $s \in \mathcal{G}(V \xrightarrow{\varphi} U)$. Hence $(s, \varphi) \in \mathcal{H}(V)$ as desired. $\square$

Lemma 9.23.2. *Let $\mathcal{C}$ be a site. Let $U \in Ob(\mathcal{C})$. Assume $\mathcal{C}$ has products of pairs of objects. Then*

1. *the functor j_U has a continuous right adjoint, namely the functor $v(X) = X \times U/U$,*
2. *the functor v defines a morphism of sites $\mathcal{C}/U \to \mathcal{C}$ whose associated morphism of topoi equals $j_U : Sh(\mathcal{C}/U) \to Sh(\mathcal{C})$, and*
3. *we have $j_{U*}\mathcal{F}(X) = \mathcal{F}(X \times U/U)$.*

Proof. The functor v being right adjoint to j_U means that given Y/U and X we have

$$Mor_{\mathcal{C}}(Y, X) = Mor_{\mathcal{C}/U}(Y/U, X \times U/U)$$

which is clear. To check that v is continous let $\{X_i \to X\}$ be a convering of $\mathcal{C}$. By the third axiom of a site (Definition 9.6.2) we see that

$$\{X_i \times_X (X \times U) \to X \times_X (X \times U)\} = \{X_i \times U \to X \times U\}$$

is a covering of $\mathcal{C}$ also. Hence v is continuous. The other statements of the lemma follow from Lemmas 9.20.1 and 9.20.2. $\square$

A fundamental property of an open immersion is that the restriction of the pushforward and the restriction of the extension by the empty set produces back the original sheaf. This is not always true for the functors associated to j_U above. It is true when U is a ``subobject of the final object''.

Lemma 9.23.3. *Let $\mathcal{C}$ be a site. Let $U \in Ob(\mathcal{C})$. Assume that every X in $\mathcal{C}$ has at most one morphism to U. Let $\mathcal{F}$ be a sheaf on $\mathcal{C}/U$. The canonical maps $\mathcal{F} \to j_U^{-1} j_{U!}\mathcal{F}$ and $j_U^{-1} j_{U*}\mathcal{F} \to \mathcal{F}$ are isomorphisms.*

Proof. If $\mathcal{C}$ has fibre products, then this is a special case of Lemma 9.19.7. In general we have the following direct proof.

Let X/U be an object over U. In Lemmas 9.18.2 and 9.19.5 we have seen that sheafification is not necessary for the functors $j_U^{-1} = (u^p\ )^\#$ and $j_{U*} = ({}_pu)^\#$. We may compute $(j_U^{-1} j_{U*}\mathcal{F})(X/U) = j_{U*}\mathcal{F}(X) = lim\, \mathcal{F}(Y/U)$. Here the limit is over the category of pairs $(Y/U, Y \to X)$ where the morphisms $Y \to X$ are not required to be over U. By our assumption however we see that they are automatically morphisms over U and we deduce that the limit is the value on id_X, i.e., $\mathcal{F}(X/U)$. This proves that $j_U^{-1} j_{U*}\mathcal{F} = \mathcal{F}$.

On the other hand, $(j_U^{-1} j_{U!}\mathcal{F})(X/U) = j_{U!}\mathcal{F}(X) = (u_p\mathcal{F})^\#(X)$, and $u_p\mathcal{F}(X) = colim\, \mathcal{F}(Y/U)$. Here the colimit is over the category of pairs $(Y/U, X \to Y)$ where the morphisms $X \to Y$ are not required to be over U. By our assumption however we see that they are automatically morphisms over U and we deduce that the colimit is the value on id_X, i.e., $\mathcal{F}(X/U)$. This shows that the sheafification is not necessary (since any object over X is automatically in a unique way an object over U) and the result follows. $\square$

9.24. Localization and morphisms

The following lemma is important in order to understand relation between localization and morphisms of sites and topoi.

Lemma 9.24.1. *Let $f : \mathcal{C} \to \mathcal{D}$ be a morphism of sites corresponding to the continuous functor $u : \mathcal{D} \to \mathcal{C}$. Let $V \in Ob(\mathcal{D})$ and set $U = u(V)$. Then the functor $u' : \mathcal{D}/V \to \mathcal{C}/U$, $V'/V \mapsto u(V')/U$ determines a morphism of sites $f' : \mathcal{C}/U \to \mathcal{D}/V$. The morphism f' fits into a commutative diagram of topoi*

$$\begin{tikzcd} Sh(\mathcal{C}/U) \arrow[r, "j_U"'] \arrow[d, "f'"'] & Sh(\mathcal{C}) \arrow[d, "f"] \\ Sh(\mathcal{D}/V) \arrow[r, "j_V"] & Sh(\mathcal{D}). \end{tikzcd}$$

Using the identifications $Sh(\mathcal{C}/U) = Sh(\mathcal{C})/h_U^\#$ and $Sh(\mathcal{D}/V) = Sh(\mathcal{D})/h_V^\#$ of Lemma 9.21.4 the functor $(f')^{-1}$ is described by the rule

$$(f')^{-1}(\mathcal{H} \xrightarrow{\varphi} h_V^\#) = (f^{-1}\mathcal{H} \xrightarrow{f^{-1}\varphi} h_U^\#).$$

Finally, we have $f'_* j_U^{-1} = j_V^{-1} f_*$.

Proof. It is clear that u' is continuous, and hence we get functors $f'_* = (u')^s = (u')^p$ (see Sections 9.5 and 9.13) and an adjoint $(f')^{-1} = (u')_s = ((u')_p\ )^\#$. The assertion $f'_* j_U^{-1} = j_V^{-1} f_*$ follows as

$$(j_V^{-1} f_*\mathcal{F})(V'/V) = f_*\mathcal{F}(V') = \mathcal{F}(u(V')) = (j_U^{-1}\mathcal{F})(u(V')/U) = (f'_* j_U^{-1}\mathcal{F})(V'/V)$$

which holds even for presheaves. What isn't clear a priori is that $(f')^{-1}$ is exact, that the diagram commutes, and that the description of $(f')^{-1}$ holds.

Let $\mathcal{H}$ be a sheaf on $\mathcal{D}/V$. Let us compute $j_{U!}(f')^{-1}\mathcal{H}$. We have

$$\begin{aligned} j_{U!}(f')^{-1}\mathcal{H} &= ((j_U)_p(u'_p\mathcal{H})^\#)^\# \\ &= ((j_U)_p u'_p\mathcal{H})^\# \\ &= (u_p(j_V)_p\mathcal{H})^\# \\ &= f^{-1} j_{V!}\mathcal{H} \end{aligned}$$

The first equality by unwinding the definitions. The second equality by Lemma 9.13.4. The third equality because $u \circ j_V = j_U \circ u'$. The fourth equality by Lemma 9.13.4 again. All of the equalities above are isomorphisms of functors, and hence we may interpret this as saying that the following diagram of categories and functors is commutative

$$\begin{tikzcd} Sh(\mathcal{C}/U) \arrow[r, "j_{U!}"'] & Sh(\mathcal{C})/h_U^\# \arrow[r] & Sh(\mathcal{C}) \\ Sh(\mathcal{D}/V) \arrow[r, "j_{V!}"] \arrow[u, "(f')^{-1}"] & Sh(\mathcal{D})/h_V^\# \arrow[r] \arrow[u, "f^{-1}"] & Sh(\mathcal{D}) \arrow[u, "f^{-1}"] \end{tikzcd}$$

The middle arrow makes sense as $f^{-1}h_V^\# = (h_{u(V)})^\# = h_U^\#$, see Lemma 9.13.5. In particular this proves the description of $(f')^{-1}$ given in the statement of the lemma. Since by Lemma 9.21.4 the left horizontal arrows are equivalences and since f^{-1} is exact by assumption we conclude that $(f')^{-1} = u'_s$ is exact. Namely, because it is a left adjoint it is already right exact (Categories, Lemma 4.22.2). Hence we only need to show that it transforms a final object into a final object and commutes with fibre products (Categories, Lemma 4.21.2). Both are clear for the induced functor $f^{-1} : Sh(\mathcal{D})/h_V^\# \to Sh(\mathcal{C})/h_U^\#$. This proves that f' is a morphism of sites.

We still have to verify that $(f')^{-1}j_V^{-1} = j_U^{-1}f^{-1}$. To see this use the formula above and the description in Lemma 9.21.6. Namely, combined these give, for any sheaf $\mathcal{G}$ on $\mathcal{D}$, that

$$j_{U!}(f')^{-1}j_V^{-1}\mathcal{G} = f^{-1}j_{V!}j_V^{-1}\mathcal{G} = f^{-1}(\mathcal{G}\times h_V^\#) = f^{-1}\mathcal{G}\times h_U^\# = j_{U!}j_U^{-1}f^{-1}\mathcal{G}.$$

Since the functor $j_{U!}$ induces an equivalence $Sh(\mathcal{C}/U) \to Sh(\mathcal{C})/h_U^\#$ we conclude. □

The following lemma is a special case of the more general Lemma 9.24.1 above.

Lemma 9.24.2. *Let $\mathcal{C}$, $\mathcal{D}$ be sites. Let $u : \mathcal{D} \to \mathcal{C}$ be a functor. Let $V \in Ob(\mathcal{D})$. Set $U = u(V)$. Assume that*

1. *$\mathcal{C}$ and $\mathcal{D}$ have all finite limits,*
2. *u is continuous, and*
3. *u commutes with finite limits.*

There exists a commutative diagram of morphisms of sites

$$\begin{tikzcd} \mathcal{C}/U \arrow[r, "j_U"'] \arrow[d, "f'"'] & \mathcal{C} \arrow[d, "f"] \\ \mathcal{D}/V \arrow[r, "j_V"] & \mathcal{D} \end{tikzcd}$$

where the right vertical arrow corresponds to u, the left vertical arrow corresponds to the functor $u' : \mathcal{D}/V \to \mathcal{C}/U$, $V'/V \mapsto u(V')/u(V)$ and the horizontal arrows correspond to the functors $\mathcal{C} \to \mathcal{C}/U$, $X \mapsto X \times U$ and $\mathcal{D} \to \mathcal{D}/V$, $Y \mapsto Y \times V$ as in Lemma 9.23.2. Moreover, the associated diagram of morphisms of topoi is equal to the diagram of Lemma 9.24.1. In particular we have $f'_* j_U^{-1} = j_V^{-1} f_*$.

Proof. Note that u satisfies the assumptions of Proposition 9.14.6 and hence induces a morphism of sites $f : \mathcal{C} \to \mathcal{D}$ by that proposition. It is clear that u induces a functor u' as indicated. It is clear that this functor also satisfies the assumptions of Proposition 9.14.6. Hence we get a morphism of sites $f' : \mathcal{C}/U \to \mathcal{D}/V$. The diagram commutes by our definition of composition of morphisms of sites (see Definition 9.14.4) and because

$$u(Y \times V) = u(Y) \times u(V) = u(Y) \times U$$

which shows that the diagram of categories and functors opposite to the diagram of the lemma commutes. □

At this point we can localize a site, we know how to relocalize, and we can localize a morphism of sites at an object of the site downstairs. If we combine these then we get the following kind of diagram.

Lemma 9.24.3. *Let $f : \mathcal{C} \to \mathcal{D}$ be a morphism of sites corresponding to the continuous functor $u : \mathcal{C} \to \mathcal{D}$. Let $V \in Ob(\mathcal{D})$, $U \in Ob(\mathcal{C})$ and $c : U \to u(V)$ a morphism of $\mathcal{C}$. There exists a commutative diagram of topoi*
