Let us prove that (a) and (b) imply that $\mathcal{X}' \to \mathcal{Y}$ is a gerbe. First of all, by Lemma 50.10.4 we see that $\mathcal{X}' \to \mathcal{Y}$ is a stack in groupoids. Next, let y be an object of $\mathcal{Y}$ lying over $U \in Ob(\mathcal{C})$. By (a) we can find a covering $\{U_i \to U\}$ in $\mathcal{C}$ and objects x_i of $\mathcal{X}$ over U_i and isomorphisms $f_i : F(x_i) \to y|_{U_i}$ in $\mathcal{Y}_{U_i}$. Then $(U_i, x_i, y|_{U_i}, f_i)$ are objects of $\mathcal{X}'_{U_i}$, i.e., the second condition of Definition 50.11.1 holds. Finally, let (U, x, y, f) and (U, x', y, f') be objects of $\mathcal{X}'$ lying over the same object $y \in Ob(\mathcal{Y})$. Set $b = (f')^{-1} \circ f$. By condition (b) we can find a convering $\{U_i \to U\}$ and isomorphisms $a_i : x|_{U_i} \to x'|_{U_i}$ in $\mathcal{X}_{U_i}$ with $F(a_i) = b|_{U_i}$. Then

$$(a_i, \text{id}) : (U, x, y, f)|_{U_i} \to (U, x', y, f')|_{U_i}$$

is a morphism in $\mathcal{X}'_{U_i}$ as desired. This proves that (2) implies (1).

To prove that (1) implies (2) one reads the arguments in the preceding paragraph backwards. Details omitted. $\square$

Definition 50.11.4. Let $\mathcal{C}$ be a site. Let $\mathcal{X}$ and $\mathcal{Y}$ be stacks in groupoids over $\mathcal{C}$. Let $F : \mathcal{X} \to \mathcal{Y}$ be a 1-morphism of categories over $\mathcal{C}$. We say $\mathcal{X}$ is a *gerbe over* $\mathcal{Y}$ if the equivalent conditions of Lemma 50.11.3 are satisfied.

This definition does not conflict with Definition 50.11.1 when $\mathcal{Y} = \mathcal{C}$ because in this case we may take $\mathcal{X}' = \mathcal{X}$ in part (1) of Lemma 50.11.3. Note that conditions (2)(a) and (2)(b) of Lemma 50.11.3 are quite close in spirit to conditions (2) and (3) of Definition 50.11.1. Namely, (2)(a) says that the map of presheaves of isomorphism classes of objects becomes a surjection after sheafification. Moreover, (2)(b) says that

$$Isom_{\mathcal{X}}(x, x') \longrightarrow Isom_{\mathcal{Y}}(F(x), F(x'))$$

is a surjection of sheaves on $\mathcal{C}/U$ for any U and $x, x' \in Ob(\mathcal{X}_U)$.

Lemma 50.11.5. *Let $\mathcal{C}$ be a site. Let*

$$\begin{tikzcd} \mathcal{X}' \arrow[r, "G'"'] \arrow[d, "F'"'] & \mathcal{X} \arrow[d, "F"] \\ \mathcal{Y}' \arrow[r, "G"] & \mathcal{Y} \end{tikzcd}$$

be a 2-fibre product of stacks in groupoids over $\mathcal{C}$. If $\mathcal{X}$ is a gerbe over $\mathcal{Y}$, then $\mathcal{X}'$ is a gerbe over $\mathcal{Y}'$.

Proof. By the uniqueness property of a 2-fibre product may assume that $\mathcal{X}' = \mathcal{Y}' \times_{\mathcal{Y}} \mathcal{X}$ as in Categories, Lemma 4.29.3. Let us prove properties (2)(a) and (2)(b) of Lemma 50.11.3 for $\mathcal{Y}' \times_{\mathcal{Y}} \mathcal{X} \to \mathcal{Y}'$.

Let y' be an object of $\mathcal{Y}'$ lying over the object U of $\mathcal{C}$. By assumption there exists a covering $\{U_i \to U\}$ of U and objects $x_i \in \mathcal{X}_{U_i}$ with isomorphisms $\alpha_i : G(y')|_{U_i} \to F(x_i)$. Then $(U_i, y'|_{U_i}, x_i, \alpha_i)$ is an object of $\mathcal{Y}' \times_{\mathcal{Y}} \mathcal{X}$ over U_i whose image in $\mathcal{Y}'$ is $y'|_{U_i}$. Thus (2)(a) holds.

Let $U \in Ob(\mathcal{C})$, let x'_1, x'_2 be objects of $\mathcal{Y}' \times_{\mathcal{Y}} \mathcal{X}$ over U, and let $b' : F'(x'_1) \to F'(x'_2)$ be a morphism in $\mathcal{Y}'_U$. Write $x'_i = (U, y'_i, x_i, \alpha_i)$. Note that $F'(x'_i) = x_i$ and $G'(x'_i) = y'_i$. By assumption there exists a covering $\{U_i \to U\}$ in $\mathcal{C}$ and morphisms $a_i : x_1|_{U_i} \to x_2|_{U_i}$ in $\mathcal{X}_{U_i}$ with $F(a_i) = G(b')|_{U_i}$. Then $(b'|_{U_i}, a_i)$ is a morphism $x'_1|_{U_i} \to x'_2|_{U_i}$ as required in (2)(b). □

Lemma 50.11.6. *Let $\mathcal{C}$ be a site. Let $F : \mathcal{X} \to \mathcal{Y}$ and $G : \mathcal{Y} \to \mathcal{Z}$ be 1-morphisms of stacks in groupoids over $\mathcal{C}$. If $\mathcal{X}$ is a gerbe over $\mathcal{Y}$ and $\mathcal{Y}$ is a gerbe over $\mathcal{Z}$, then $\mathcal{X}$ is a gerbe over $\mathcal{Z}$.*

Proof. Let us prove properties (2)(a) and (2)(b) of Lemma 50.11.3 for $\mathcal{X} \to \mathcal{Z}$.

Let z be an object of $\mathcal{Z}$ lying over the object U of $\mathcal{C}$. By assumption on G there exists a covering $\{U_i \to U\}$ of U and objects $y_i \in \mathcal{Y}_{U_i}$ such that $G(y_i) \cong z|_{U_i}$. By assumption on F there exist coverings $\{U_{ij} \to U_i\}$ and objects $x_{ij} \in \mathcal{X}_{U_{ij}}$ such that $F(x_{ij}) \cong y_i|_{U_{ij}}$. Then $\{U_{ij} \to U\}$ is a covering of $\mathcal{C}$ and $(G \circ F)(x_{ij}) \cong z|_{U_{ij}}$. Thus (2)(a) holds.

Let $U \in Ob(\mathcal{C})$, let x_1, x_2 be objects of $\mathcal{X}$ over U, and let $c : (G \circ F)(x_1) \to (G \circ F)(x_2)$ be a morphism in $\mathcal{Z}_U$. By assumption on G there exists a covering $\{U_i \to U\}$ of U and morphisms $b_i : F(x_1)|_{U_i} \to F(x_2)|_{U_i}$ in $\mathcal{Y}_{U_i}$ such that $G(b_i) = c|_{U_i}$. By assumption on F there exist coverings $\{U_{ij} \to U_i\}$ and morphisms $a_{ij} : x_1|_{U_{ij}} \to x_2|_{U_{ij}}$ in $\mathcal{X}_{U_{ij}}$ such that $F(a_{ij}) = b_i|_{U_{ij}}$. Then $\{U_{ij} \to U\}$ is a covering of $\mathcal{C}$ and $(G \circ F)(a_{ij}) = c|_{U_{ij}}$ as required in (2)(b). □

Lemma 50.11.7. *Let $\mathcal{C}$ be a site. Let*

$$\begin{tikzcd} \mathcal{X}' \arrow[r, "G'"] \arrow[d, "F'"'] & \mathcal{X} \arrow[d, "F"] \\ \mathcal{Y}' \arrow[r, "G"] & \mathcal{Y} \end{tikzcd}$$

be a 2-cartesian diagram of stacks in groupoids over $\mathcal{C}$. If for every $U \in Ob(\mathcal{C})$ and $x \in Ob(\mathcal{Y}_U)$ there exists a covering $\{U_i \to U\}$ such that $x|_{U_i}$ is in the essential image of $G : \mathcal{Y}'_{U_i} \to \mathcal{Y}_{U_i}$ and $\mathcal{X}'$ is a gerbe over $\mathcal{Y}'$, then $\mathcal{X}$ is a gerbe over $\mathcal{Y}$.

Proof. By the uniqueness property of a 2-fibre product may assume that $\mathcal{X}' = \mathcal{Y}' \times_{\mathcal{Y}} \mathcal{X}$ as in Categories, Lemma 4.29.3. Let us prove properties (2)(a) and (2)(b) of Lemma 50.11.3 for $\mathcal{X} \to \mathcal{Y}$.

Let y be an object of $\mathcal{Y}$ lying over the object U of $\mathcal{C}$. By assumption there exists a covering $\{U_i \to U\}$ of U and objects $y'_i \in \mathcal{Y}'_{U_i}$ with $G(y'_i) \cong y|_{U_i}$. By (2)(a) for $\mathcal{X}' \to \mathcal{Y}'$ there exist coverings $\{U_{ij} \to U_i\}$ and objects x'_{ij} of $\mathcal{X}'$ over U_{ij} with $F'(x'_{ij})$ isomorphic to the restriction of y'_i to U_{ij}. Then $\{U_{ij} \to U\}$ is a covering of $\mathcal{C}$ and $G'(x'_{ij})$ are objects of $\mathcal{X}$ over U_{ij} whose images in $\mathcal{Y}$ are isomorphic to the restrictions $y|_{U_{ij}}$. This proves (2)(a) for $\mathcal{X} \to \mathcal{Y}$.

Let $U \in Ob(\mathcal{C})$, let x_1, x_2 be objects of $\mathcal{X}$ over U, and let $b : F(x_1) \to F(x_2)$ be a morphism in $\mathcal{Y}_U$. By assumption we may choose a covering $\{U_i \to U\}$ and objects y'_{1i}, y'_{2i} of $\mathcal{Y}'$ over U_i such that there exist isomorphisms $\alpha_{1i} : G(y'_{1i}) \cong F(x_1)|_{U_i}$ and $\alpha_{2i} : G(y'_{2i}) \cong F(x_2)|_{U_i}$. Then we get objects $x'_{1i} = (U_i, y'_{1i}, x_1|_{U_i}, \alpha_{1i})$ and $x'_{2i} = (U_i, y'_{1i}, x_1|_{U_i}, \alpha_{2i})$ of $\mathcal{X}'$ over U_i. The restriction $b|_{U_i}$ is a morphism $F'(x'_{1i}) \to F'(x'_{2i})$. By (2)(b) for $\mathcal{X}' \to \mathcal{Y}'$ there exist coverings $\{U_{ij} \to U_i\}$ and morphisms $a'_{ij} : x'_{1i}|_{U_{ij}} \to x'_{2i}|_{U_{ij}}$ such that $F'(a'_{ij}) = b|_{U_{ij}}$. Unwinding the definition of morphisms in $\mathcal{Y}' \times_{\mathcal{Y}} \mathcal{X}$ we see that $G'(a'_{ij}) : x_1|_{U_{ij}} \to x_2|_{U_{ij}}$ are the morphism we're looking for, i.e., (2)(b) holds for $\mathcal{X} \to \mathcal{Y}$. $\square$

50.12. Functoriality for stacks

In this section we study what happens if we want to change the base site of a stack. This section can be skipped on a first reading.

Let $u : \mathcal{C} \to \mathcal{D}$ be a functor between categories. Let $p : \mathcal{S} \to \mathcal{D}$ be a category over $\mathcal{D}$. In this situation we denote $u^p\mathcal{S}$ the category over $\mathcal{C}$ defined as follows

1. An object of $u^p\mathcal{S}$ is a pair (U, y) consisting of an object U of $\mathcal{C}$ and an object y of $\mathcal{S}_{u(U)}$.
2. A morphism $(a, \beta) : (U, y) \to (U', y')$ is given by a morphism $a : U \to U'$ of $\mathcal{C}$ and a morphism $\beta : y \to y'$ of $\mathcal{S}$ such that $p(\beta) = u(a)$.

Note that with these definitions the fibre category of $u^p\mathcal{S}$ over U is equal to the fibre category of $\mathcal{S}$ over $u(U)$.

Lemma 50.12.1. *In the situation above, if $\mathcal{S}$ is a fibred category over $\mathcal{D}$ then $u^p\mathcal{S}$ is a fibred category over $\mathcal{C}$.*

Proof. Please take a look at the discussion surrounding Categories, Definitions 4.30.1 and 4.30.4 before reading this proof. Let $(a, \beta) : (U, y) \to (U', y')$ be a morphism of $u^p\mathcal{S}$. We claim that (a, β) is strongly cartesian if and only if β is strongly cartesian. First, assume β

is strongly cartesian. Consider any second morphism $(a_1, \beta_1) : (U_1, y_1) \to (U', y')$ of $u^p\mathcal{S}$. Then

$$
\begin{aligned}
& Mor_{u^p\mathcal{S}}((U_1, y_1), (U, y)) \\
& = Mor_{\mathcal{C}}(U_1, U) \times_{Mor_{\mathcal{D}}(u(U_1), u(U))} Mor_{\mathcal{S}}(y_1, y) \\
& = Mor_{\mathcal{C}}(U_1, U) \times_{Mor_{\mathcal{D}}(u(U_1), u(U))} Mor_{\mathcal{S}}(y_1, y') \times_{Mor_{\mathcal{D}}(u(U_1), u(U'))} Mor_{\mathcal{D}}(u(U_1), u(U)) \\
& = Mor_{\mathcal{S}}(y_1, y') \times_{Mor_{\mathcal{D}}(u(U_1), u(U'))} Mor_{\mathcal{C}}(U_1, U) \\
& = Mor_{u^p\mathcal{S}}((U_1, y_1), (U', y')) \times_{Mor_{\mathcal{C}}(U_1, U')} Mor_{\mathcal{C}}(U_1, U)
\end{aligned}
$$

the second equality as β is strongly cartesian. Hence we see that indeed (a, β) is strongly cartesian. Conversely, suppose that (a, β) is strongly cartesian. Choose a strongly cartesian morphism $\beta' : y'' \to y'$ in $\mathcal{S}$ with $p(\beta') = u(a)$. Then bot $(a, \beta) : (U, y) \to (U, y')$ and $(a, \beta') : (U, y'') \to (U, y)$ are strongly cartesian and lift a. Hence, by the uniqueness of strongly cartesian morphisms (see discussion in Categories, Section 4.30) there exists an isomorphism $\iota : y \to y''$ in $\mathcal{S}_{u(U)}$ such that $\beta = \beta' \circ \iota$, which implies that β is strongly cartesian in $\mathcal{S}$ by Categories, Lemma 4.30.2.

Finally, we have to show that given (U', y') and $U \to U'$ we can find a strongly cartesian morphism $(U, y) \to (U', y')$ in $u^p\mathcal{S}$ lifting the morphism $U \to U'$. This follows from the above as by assumption we can find a strongly cartesian morphism $y \to y'$ lifting the morphism $u(U) \to u(U')$. □

Lemma 50.12.2. *Let $u : \mathcal{C} \to \mathcal{D}$ be a continuous functor of sites. Let $p : \mathcal{S} \to \mathcal{D}$ be a stack over $\mathcal{D}$. Then $u^p\mathcal{S}$ is a stack over $\mathcal{S}$.*

Proof. We have seen in Lemma 50.12.1 that $u^p\mathcal{S}$ is a fibred category over $\mathcal{S}$. Moreover, in the proof of that lemma we have seen that a morphism (a, β) of $u^p\mathcal{S}$ is strongly cartesian if and only β is strongly cartesian in $\mathcal{S}$. Hence, given a morphism $a : U \to U'$ of $\mathcal{C}$, not only do we have the equalities $(u^p\mathcal{S})_U = \mathcal{S}_U$ and $(u^p\mathcal{S})_{U'} = \mathcal{S}_{U'}$, but via these equalities the pullback functors agree; in a formula $a^*(U', y') = (U, u(a)^*y')$.

Having said this, let $\mathcal{U} = \{U_i \to U\}$ be a covering of $\mathcal{C}$. As u is continuous we see that $\mathcal{V} = \{u(U_i) \to u(U)\}$ is a covering of $\mathcal{D}$, and that $u(U_i \times_U U_j) = u(U_i) \times_{u(U)} u(U_j)$ and similarly for the triple fibre products $U_i \times_U U_j \times_U U_k$. As we have the identifications of fibre categories and pullbacks we see that descend data relative to $\mathcal{U}$ are identical to descend data relative to $\mathcal{V}$. Since by assumption we have effective descent in $\mathcal{S}$ we conclude the same holds for $u^p\mathcal{S}$. □

Lemma 50.12.3. *Let $u : \mathcal{C} \to \mathcal{D}$ be a continuous functor of sites. Let $p : \mathcal{S} \to \mathcal{D}$ be a stack in groupoids over $\mathcal{D}$. Then $u^p\mathcal{S}$ is a stack in groupoids over $\mathcal{S}$.*

Proof. This follows immediately from Lemma 50.12.2 and the fact that all fibre categories are groupoids. □

Definition 50.12.4. Let $f : \mathcal{D} \to \mathcal{C}$ be a morphism of sites given by the continuous functor $u : \mathcal{C} \to \mathcal{D}$. Let $\mathcal{S}$ be a fibred category over $\mathcal{D}$. In this setting we write $f_*\mathcal{S}$ for the fibred category $u^p\mathcal{S}$ defined above. We say that $f_*\mathcal{S}$ is the *pushforward of $\mathcal{S}$ along f*.

By the results above we know that $f_*\mathcal{S}$ is a stack (in groupoids) if $\mathcal{S}$ is a stack (in groupoids). It is harder to define the pullback of a stack (and we'll need additional assumptions for our particular construction -- feel free to write up and submit a more general construction). We do this in several steps.

Let $u : \mathcal{C} \to \mathcal{D}$ be a functor between categories. Let $p : \mathcal{S} \to \mathcal{C}$ be a category over $\mathcal{C}$. In this setting we define a category $u_{pp}\mathcal{S}$ as follows:

(1) An object of $u_{pp}\mathcal{S}$ is a triple $(U, \phi : V \to u(U), x)$ where $U \in Ob(\mathcal{C})$, the map $\phi : V \to u(U)$ is a morphism in $\mathcal{D}$, and $x \in Ob(\mathcal{S}_U)$.
(2) A morphism

$$(U_1, \phi_1 : V_1 \to u(U_1), x_1) \longrightarrow (U_2, \phi_2 : V_2 \to u(U_2), x_2)$$

of $u_{pp}\mathcal{S}$ is given by a (a, b, α) where $a : U_1 \to U_2$ is a morphism of $\mathcal{C}$, $b : V_1 \to V_2$ is a morphism of $\mathcal{D}$, and $\alpha : x_1 \to x_2$ is morphism of $\mathcal{S}$, such that $p(\alpha) = a$ and the diagram

$$\begin{tikzcd} V_1 \arrow[r, "b"'] \arrow[d, "\phi_1"'] & V_2 \arrow[d, "\phi_2"] \\ u(U_1) \arrow[r, "u(a)"] & u(U_2) \end{tikzcd}$$

commutes in $\mathcal{D}$.

We think of $u_{pp}\mathcal{S}$ as a category over $\mathcal{D}$ via

$$p_{pp} : u_{pp}\mathcal{S} \longrightarrow \mathcal{D}, \quad (U, \phi : V \to u(U), x) \longmapsto V.$$

The fibre category of $u_{pp}\mathcal{S}$ over an object V of $\mathcal{D}$ does not have a simple description. Moreover, it is in general not the case that $u_{pp}\mathcal{S}$ is a fibred category over $\mathcal{D}$ if $\mathcal{S}$ is a fibred category over $\mathcal{C}$.

Lemma 50.12.5. *In the situation above assume*

(1) $p : \mathcal{S} \to \mathcal{C}$ *is a fibred category,*
(2) $\mathcal{C}$ *has nonempty finite limits, and*
(3) $u : \mathcal{C} \to \mathcal{D}$ *commutes with nonempty finite limits.*

Consider the set $R \subset Arrows(u_{pp}\mathcal{S})$ *of morphisms of the form*

$$(a, id_V, \alpha) : (U', \phi' : V \to u(U'), x') \longrightarrow (U, \phi : V \to u(U), x)$$

with α *strongly cartesian. Then* R *is a right multiplicative system.*

Proof. According to Categories, Definition 4.24.1 we have to check RMS1, RMS2, RMS3. Condition RMS1 holds as a composition of strongly cartesian morphisms is strongly cartesian, see Categories, Lemma 4.30.2.

To check RMS2 suppose we have a morphism

$$(a, b, \alpha) : (U_1, \phi_1 : V_1 \to u(U_1), x_1) \longrightarrow (U, \phi : V \to u(U), x)$$

of $u_{pp}\mathcal{S}$ and a morphism

$$(c, \mathrm{id}_V, \gamma) : (U', \phi' : V \to u(U'), x') \longrightarrow (U, \phi : V \to u(U), x)$$

with γ strongly cartesian from R. In this situation set $U_1' = U_1 \times_U U'$, and denote $a' : U_1' \to U'$ and $c' : U_1' \to U_1$ the projections. As $u(U_1') = u(U_1) \times_{u(U)} u(U')$ we see that $\phi_1' = (\phi_1, \phi') : V_1 \to u(U_1')$ is a morphism in $\mathcal{D}$. Let $\gamma_1 : x_1' \to x_1$ be a strongly cartesian morphism of $\mathcal{S}$ with $p(\gamma_1) = \phi_1'$ (which exists because $\mathcal{S}$ is a fibred category over $\mathcal{C}$). Then as $\gamma : x' \to x$ is strongly cartesian there exists a unique morphism $\alpha' : x_1' \to x'$ with $p(\alpha') = a'$. At this point we see that

$$(a', b, \alpha') : (U_1, \phi_1 : V_1 \to u(U_1'), x_1') \longrightarrow (U, \phi : V \to u(U'), x')$$

is a morphism and that

$$(c', \mathrm{id}_{V_1}, \gamma_1) : (U_1', \phi_1' : V_1 \to u(U_1'), x_1') \longrightarrow (U_1, \phi : V_1 \to u(U_1), x_1)$$

is an element of R which form a solution of the existence problem posed by RMS2.

Finally, suppose that

$$(a, b, \alpha), (a', b', \alpha') : (U_1, \phi_1 : V_1 \to u(U_1), x_1) \longrightarrow (U, \phi : V \to u(U), x)$$

are two morphisms of $u_{pp}\mathcal{S}$ and suppose that

$$(c, \mathrm{id}_V, \gamma) : (U, \phi : V \to u(U), x) \longrightarrow (U', \phi : V \to u(U'), x')$$

is an element of R which equalizes the morphisms (a, b, α) and (a', b', α'). This implies in particular that $b = b'$. Let $d : U_2 \to U_1$ be the equalizer of a, a' which exists (see Categories, Lemma 4.16.3). Moreover, $u(d) : u(U_2) \to u(U_1)$ is the equalizer of $u(a), u(a')$ hence (as $b = b'$) there is a morphism $\phi_2 : V_1 \to u(U_2)$ such that $\phi_1 = u(d) \circ \phi_1$. Let $\delta : x_2 \to x_1$ be a strongly cartesian morphism of $\mathcal{S}$ with $p(\delta) = u(d)$. Now we claim that $\alpha \circ \delta = \alpha' \circ \delta$. This is true because γ is strongly cartesian, $\gamma \circ \alpha \circ \delta = \gamma \circ \alpha' \circ \delta$, and $p(\alpha \circ \delta) = p(\alpha' \circ \delta)$. Hence the arrow

$$(d, \mathrm{id}_{V_1}, \delta) : (U_2, \phi_2 : V_1 \to u(U_2), x_2) \longrightarrow (U_1, \phi_1 : V_1 \to u(U_1), x_1)$$

is an element of R and equalizes (a, b, α) and (a', b', α'). Hence R satisfies RMS3 as well. □

Lemma 50.12.6. *With notation and assumptions as in Lemma 50.12.5. Set $u_p\mathcal{S} = R^{-1}u_{pp}\mathcal{S}$, see Categories, Section 4.24. Then $u_p\mathcal{S}$ is a fibred category over $\mathcal{D}$.*

Proof. We use the description of $u_p\mathcal{S}$ given just above Categories, Lemma 4.24.9. Note that the functor $p_{pp} : u_{pp}\mathcal{S} \to \mathcal{D}$ transforms every element of R to an identity morphism. Hence by Categories, Lemma 4.24.13 we obtain a canonical functor $p_p : u_p\mathcal{S} \to \mathcal{D}$ extending the given functor. This is how we think of $u_p\mathcal{S}$ as a category over $\mathcal{D}$.

First we want to characterize the $\mathcal{D}$-strongly cartesian morphisms in $u_p\mathcal{S}$. A morphism $f : X \to Y$ of $u_p\mathcal{S}$ is the equivalence class of a pair $(f' : X' \to Y, r : X' \to X)$ with $r \in R$. In fact, in $u_p\mathcal{S}$ we have $f = (f', 1) \circ (r, 1)^{-1}$ with obvious notation. Note that an isomorphism is always strongly cartesian, as are compositions of strongly cartesian morphisms, see Categories, Lemma 4.30.2. Hence f is strongly cartesian if and only if $(f', 1)$ is so. Thus the following claim completely characterizes strongly cartesian morphisms. Claim: A morphism

$$(a, b, \alpha) : X_1 = (U_1, \phi_1 : V_1 \to u(U_1), x_1) \longrightarrow (U_2, \phi_2 : V_2 \to u(U_2), x_2) = X_2$$

of $u_{pp}\mathcal{S}$ has image $f = ((a, b, \alpha), 1)$ strongly cartesian in $u_p\mathcal{S}$ if and only if α is a strongly cartesian morphism of $\mathcal{S}$.

Assume α strongly cartesian. Let $X = (U, \phi : V \to u(U), x)$ be another object, and let $f_2 : X \to X_2$ be a morphism of $u_p\mathcal{S}$ such that $p_p(f_2) = b \circ b_1$ for some $b_1 : U \to U_1$. To show that f is strongly cartesian we have to show that there exists a unique morphism $f_1 : X \to X_1$ in $u_p\mathcal{S}$ such that $p_p(f_1) = b_1$ and $f_2 = f \circ f_1$ in $u_p\mathcal{S}$. Write $f_2 = (f_2' : X' \to X_2, r : X' \to X)$. Again we can write $f_2 = (f_2', 1) \circ (r, 1)^{-1}$ in $u_p\mathcal{S}$. Since $(r, 1)$ is an isomorphism whose image in $\mathcal{D}$ is an identity we see that finding a morphism $f_1 : X \to X_1$ with the required properties is the same thing as finding a morphism $f_1' : X' \to X_1$ in $u_p\mathcal{S}$ with $p(f_1') = b_1$

and $f_2' = f \circ f_1'$. Hence we may assume that f_2 is of the form $f_2 = ((a_2, b_2, \alpha_2), 1)$ with $b_2 = b \circ b_1$. Here is a picture

$$\begin{tikzcd} & (U_1, V_1 \to u(U_1), x_1) \arrow[d, "{(a,b,\alpha)}"] \\ (U, V \to u(U), x) \arrow[r, "{(a_2,b_2,\alpha_2)}"] & (U_2, V_2 \to u(U_2), x_2) \end{tikzcd}$$

Now it is clear how to construct the morphism f_1. Namely, set $U' = U \times_{U_2} U_1$ with projections $c : U' \to U$ and $a_1 : U' \to U_1$. Pick a strongly cartesian morphism $\gamma : x' \to x$ lifting the morphism c. Since $b_2 = b \circ b_1$, and since $u(U') = u(U) \times_{u(U_2)} u(U_1)$ we see that $\phi' = (\phi, \phi_1 \circ b_1) : V \to u(U')$. Since α is strongly cartesian, and $a \circ a_1 = a_2 \circ c = p(\alpha_2 \circ \gamma)$ there exists a morphism $\alpha_1 : x' \to x_1$ lifting a_1 such that $\alpha \circ \alpha_1 = \alpha_2 \circ \gamma$. Set $X' = (U', \phi' : V \to u(U'), x')$. Thus we see that

$$f_1 = ((a_1, b_1, \alpha_1) : X' \to X_1, (c, \mathrm{id}_V, \gamma) : X' \to X) : X \longrightarrow X_1$$

works, in fact the diagram

$$\begin{tikzcd} (U', \phi' : V \to u(U'), x') \arrow[r, "{(a_1,b_1,\alpha_1)}"'] \arrow[d, "{(c,\mathrm{id}_V,\gamma)}"'] & (U_1, V_1 \to u(U_1), x_1) \arrow[d, "{(a,b,\alpha)}"] \\ (U, V \to u(U), x) \arrow[r, "{(a_2,b_2,\alpha_2)}"] & (U_2, V_2 \to u(U_2), x_2) \end{tikzcd}$$

is commutative by construction. This proves existence.

Next we prove uniqueness, still in the special case $f = ((a, b, \alpha), 1)$ and $f_2 = ((a_2, b_2, \alpha_2), 1)$. We strongly advise the reader to skip this part. Suppose that $g_1, g_1' : X \to X_1$ are two morphisms of $u_p\mathcal{S}$ such that $p_p(g_1) = p_p(g_1') = b_1$ and $f_2 = f \circ g_1 = f \circ g_1'$. Our goal is to show that $g_1 = g_1'$. By Categories, Lemma 4.24.10 we may represent g_1 and g_1' as the equivalence classes of $(f_1 : X' \to X_1, r : X' \to X)$ and $(f_1' : X' \to X_1, r : X' \to X)$ for some $r \in R$. By Categories, Lemma 4.24.11 we see that $f_2 = f \circ g_1 = f \circ g_1'$ means that there exists a morphism $r' : X'' \to X'$ in $u_{pp}\mathcal{S}$ such that $r' \circ r \in R$ and

$$(a, b, \alpha) \circ f_1 \circ r' = (a, b, \alpha) \circ f_1' \circ r' = (a_2, b_2, \alpha_2) \circ r'$$

in $u_{pp}\mathcal{S}$. Note that now g_1 is represented by $(f_1 \circ r', r \circ r')$ and similarly for g_1'. Hence we may assume that

$$(a, b, \alpha) \circ f_1 = (a, b, \alpha) \circ f_1' = (a_2, b_2, \alpha_2).$$

Write $r = (c, \mathrm{id}_V, \gamma) : (U', \phi' : V \to u(U'), x')$, $f_1 = (a_1, b_1, \alpha_1)$, and $f_1' = (a_1', b_1, \alpha_1')$. Here we have used the condition that $p_p(g_1) = p_p(g_1')$. The equalities above are now equivalent to $a \circ a_1 = a \circ a_1' = a_2 \circ c$ and $\alpha \circ \alpha_1 = \alpha \circ \alpha_1' = \alpha_2 \circ \gamma$. It need not be the case that $a_1 = a_1'$ in this situation. Thus we have to precompose by one more morphism from R. Namely, let $U'' = \mathrm{Eq}(a_1, a_1')$ be the equalizer of a_1 and a_1' which is a subobject of U'. Denote $c' : U'' \to U'$ the canonical monomorphism. Because of the relations among the morphisms above we see that $V \to u(U')$ maps into $u(U'') = u(\mathrm{Eq}(a_1, a_1')) = \mathrm{Eq}(u(a_1), u(a_1'))$. Hence we get a new object $(U'', \phi'' : V \to u(U''), x'')$, where $\gamma' : x'' \to x'$ is a strongly cartesian morphism lifting γ. Then we see that we may precompose f_1 and f_1' with the element $(c', \mathrm{id}_V, \gamma')$ of R. After doing this, i.e., replacing $(U', \phi' : V \to u(U'), x')$ with $(U'', \phi'' : V \to u(U''), x'')$, we get back to the previous situation where in addition we now have that $a_1 = a_1'$. In this case it follows formally from the fact that α is strongly cartesian (!) that $\alpha_1 = \alpha_1'$. This shows that $g_1 = g_1'$ as desired.

We omit the proof of the fact that for any strongly cartesian morphism of $u_p\mathcal{S}$ of the form $((a, b, \alpha), 1)$ the morphism α is strongly cartesian in $\mathcal{S}$. (We do not need the characterization of strongly cartesian morphisms in the rest of the proof, although we do use it later in this section.)

Let $(U, \phi : V \to u(U), x)$ be an object of $u_p\mathcal{S}$. Let $b : V' \to V$ be a morphism of $\mathcal{D}$. Then the morphism

$$(\text{id}_U, b, \text{id}_x) : (U, \phi \circ b : V' \to u(U), x) \longrightarrow (U, \phi : V \to u(U), x)$$

is strongly cartesian by the result of the preceding paragraphs and we win. □

Lemma 50.12.7. *With notation and assumptions as in Lemma 50.12.6. If $\mathcal{S}$ is fibred in groupoids, then $u_p\mathcal{S}$ is fibred in groupoids.*

Proof. By Lemma 50.12.6 we know that $u_p\mathcal{S}$ is a fibred category. Let $f : X \to Y$ be a morphism of $u_p\mathcal{S}$ with $p_p(f) = \text{id}_V$. We are done if we can show that f is invertible, see Categories, Lemma 4.32.2. Write f as the equivalence class of a pair $((a, b, \alpha), r)$ with $r \in R$. Then $p_p(r) = \text{id}_V$, hence $p_{pp}((a, b, \alpha)) = \text{id}_V$. Hence $b = \text{id}_V$. But any morphism of $\mathcal{S}$ is strongly cartesian, see Categories, Lemma 4.32.2 hence we see that $(a, b, \alpha) \in R$ is invertible in $u_p\mathcal{S}$ as desired. □

Lemma 50.12.8. *Let $u : \mathcal{C} \to \mathcal{D}$ be a functor. Let $p : \mathcal{S} \to \mathcal{C}$ and $q : \mathcal{T} \to \mathcal{D}$ be categories over $\mathcal{C}$ and $\mathcal{D}$. Assume that*

(1) *$p : \mathcal{S} \to \mathcal{C}$ is a fibred category,*
(2) *$q : \mathcal{T} \to \mathcal{D}$ is a fibred category,*
(3) *$\mathcal{C}$ has nonempty finite limits, and*
(4) *$u : \mathcal{C} \to \mathcal{D}$ commutes with nonempty finite limits.*

Then we have a canonical equivalence of categories

$$Mor_{Fib/\mathcal{C}}(\mathcal{S}, u^p\mathcal{T}) = Mor_{Fib/\mathcal{D}}(u_p\mathcal{S}, \mathcal{T})$$

of morphism categories.

Proof. In this proof we use the notation x/U to denote an object x of $\mathcal{S}$ which lies over U in $\mathcal{C}$. Similarly y/V denotes an object y of $\mathcal{T}$ which lies over V in $\mathcal{D}$. In the same vein $\alpha/a : x/U \to x'/U'$ denotes the morphism $\alpha : x \to x'$ with image $a : U \to U'$ in $\mathcal{C}$.

Let $G : u_p\mathcal{S} \to \mathcal{T}$ be a 1-morphism of fibred categories over $\mathcal{D}$. Denote $G' : u_{pp}\mathcal{S} \to \mathcal{T}$ the composition of G with the canonical (localization) functor $u_{pp}\mathcal{S} \to u_p\mathcal{S}$. Then consider the functor $H : \mathcal{S} \to u^p\mathcal{T}$ given by

$$H(x/U) = (U, G'(U, \text{id}_{u(U)} : u(U) \to u(U), x))$$

on objects and by

$$H((\alpha, a) : x/U \to x'/U') = G'(a, u(a), \alpha)$$

on morphisms. Since G transforms strongly cartesian morphisms into strongly cartesian morphisms, we see that if α is strongly cartesian, then $H(\alpha)$ is strongly cartesian. Namely, we've seen in the proof of Lemma 50.12.6 that in this case the map $(a, u(a), \alpha)$ becomes strongly cartesian in $u_p\mathcal{S}$. Clearly this construction is functorial in G and we obtain a functor

$$A : Mor_{Fib/\mathcal{D}}(u_p\mathcal{S}, \mathcal{T}) \longrightarrow Mor_{Fib/\mathcal{C}}(\mathcal{S}, u^p\mathcal{T})$$

Conversely, let $H : \mathcal{S} \to u^p\mathcal{T}$ be a 1-morphism of fibred categories. Recall that an object of $u^p\mathcal{T}$ is a pair (U, y) with $y \in Ob(\mathcal{T}_{u(U)})$. We denote $\text{pr} : u^p\mathcal{T} \to \mathcal{T}$ the functor $(U, y) \mapsto y$. In this case we define a functor $G' : u_{pp}\mathcal{S} \to \mathcal{T}$ by the rules

$$G'(U, \phi : V \to u(U), x) = \phi^*\text{pr}(H(x))$$

on objects and we let

$$G'((a, b, \alpha) : (U, \phi : V \to u(U), x) \to (U', \phi' : V' \to u(U'), x')) = \beta$$

be the unique morphism $\beta : \phi^*\text{pr}(H(x)) \to (\phi')^*\text{pr}(H(x'))$ such that $q(\beta) = b$ and the diagram

$$\begin{tikzcd} \phi^*\text{pr}(H(x)) \arrow[r, "\beta"'] \arrow[d] & (\phi')^*\text{pr}(H(x')) \arrow[d] \\ \text{pr}(H(x)) \arrow[r, "\text{pr}(H(a,\alpha))"] & \text{pr}(H(x')) \end{tikzcd}$$

Such a morphism exists and is unique because $\mathcal{T}$ is a fibred category.

We check that $G'(r)$ is an isomorphism if $r \in R$. Namely, if

$$(a, \text{id}_V, \alpha) : (U', \phi' : V \to u(U'), x') \longrightarrow (U, \phi : V \to u(U), x)$$

with α strongly cartesian is an element of the right multiplicative system R of Lemma 50.12.5 then $H(\alpha)$ is strongly cartesian, and $\text{pr}(H(\alpha))$ is strongly cartesian, see proof of Lemma 50.12.1. Hence in this case the morphism β has $q(\beta) = \text{id}_V$ and is strongly cartesian. Hence β is an isomorphism by Categories, Lemma 4.30.2. Thus by Categories, Lemma 4.24.13 we obtain a canonical extension $G : u_p\mathcal{S} \to \mathcal{T}$.

Next, let us prove that G transforms strongly cartesian morphisms into strongly cartesian morphisms. Suppose that $f : X \to Y$ is a strongly cartesian. By the characterization of strongly cartesian morphisms in $u_p\mathcal{S}$ we can write f as $((a, b, \alpha) : X' \to Y, r : X' \to Y)$ where $r \in R$ and α strongly cartesian in $\mathcal{S}$. By the above it suffices to show that $G'(a, b\alpha)$ is strongly cartesian. As before the condition that α is strongly cartesian implies that $\text{pr}(H(a, \alpha)) : \text{pr}(H(x)) \to \text{pr}(H(x'))$ is strongly cartesian in $\mathcal{T}$. Since in the commutative square above now all arrows except possibly β is strongly cartesian it follows that also β is strongly cartesian as desired. Clearly the construction $H \mapsto G$ is functorial in H and we obtain a functor

$$B : Mor_{Fib/\mathcal{C}}(\mathcal{S}, u^p\mathcal{T}) \longrightarrow Mor_{Fib/\mathcal{D}}(u_p\mathcal{S}, \mathcal{T})$$

To finish the proof of the lemma we have to show that the functors A and B are mutually quasi-inverse. We omit the verifications. □

Definition 50.12.9. Let $f : \mathcal{D} \to \mathcal{C}$ be a morphism of sites given by a continuous functor $u : \mathcal{C} \to \mathcal{D}$ satisyfing the hypotheses and conclusions of Sites, Proposition 9.14.6. Let $\mathcal{S}$ be a stack over $\mathcal{C}$. In this setting we write $f^{-1}\mathcal{S}$ for the stackification of the fibred category $u_p\mathcal{S}$ over $\mathcal{D}$ constructed above. We say that $f^{-1}\mathcal{S}$ is the *pullback of $\mathcal{S}$ along f*.

Of course, if $\mathcal{S}$ is a stack in groupoids, then $f^{-1}\mathcal{S}$ is a stack in groupoids by Lemmas 50.9.1 and 50.12.7.

Lemma 50.12.10. *Let $f : \mathcal{D} \to \mathcal{C}$ be a morphism of sites given by a continuous functor $u : \mathcal{C} \to \mathcal{D}$ satisyfing the hypotheses and conclusions of Sites, Proposition 9.14.6. Let $p : \mathcal{S} \to \mathcal{C}$ and $q : \mathcal{T} \to \mathcal{D}$ be stacks. Then we have a canonical equivalence of categories*

$$Mor_{Stacks/\mathcal{C}}(\mathcal{S}, f_*\mathcal{T}) = Mor_{Stacks/\mathcal{D}}(f^{-1}\mathcal{S}, \mathcal{T})$$

of morphism categories.

Proof. For $i = 1, 2$ an i-morphism of stacks is the same thing as a i-morphism of fibred categories, see Definition 50.4.5. By Lemma 50.12.8 we have already

$$Mor_{Fib/\mathcal{C}}(\mathcal{S}, u^p\mathcal{T}) = Mor_{Fib/\mathcal{D}}(u_p\mathcal{S}, \mathcal{T})$$

Hence the result follows from Lemma 50.8.3 as $u^p\mathcal{T} = f_*\mathcal{T}$ and $f^{-1}\mathcal{S}$ is the stackification of $u_p\mathcal{S}$. □

Lemma 50.12.11. *Let $f : \mathcal{D} \to \mathcal{C}$ be a morphism of sites given by a continuous functor $u : \mathcal{C} \to \mathcal{D}$ satisyfing the hypotheses and conclusions of Sites, Proposition 9.14.6. Let $\mathcal{S} \to \mathcal{C}$ be a fibred category, and let $\mathcal{S} \to \mathcal{S}'$ be the stackification of $\mathcal{S}$. Then $f^{-1}\mathcal{S}'$ is the stackification of $u_p\mathcal{S}$.*

Proof. Omitted. Hint: This is the analogue of Sites, Lemma 9.13.4. □

The following lemma tells us that the 2-category of stacks over Sch_{fppf} is a ``full 2-sub category'' of the 2-category of stacks over Sch'_{fppf} provided that Sch'_{fppf} contains Sch_{fppf} (see Topologies, Section 30.10).

Lemma 50.12.12. *Let $\mathcal{C}$ and $\mathcal{D}$ be sites. Let $u : \mathcal{C} \to \mathcal{D}$ be a functor satisfying the assumptions of Sites, Lemma 9.19.8. Let $f : \mathcal{D} \to \mathcal{C}$ be the corresponding morphism of sites. Then*

1. *for every stack $p : \mathcal{S} \to \mathcal{C}$ the canonical functor $\mathcal{S} \to f_*f^{-1}\mathcal{S}$ is an equivalence of stacks,*
2. *given stacks $\mathcal{S}, \mathcal{S}'$ over $\mathcal{C}$ the construction f^{-1} induces an equivalence*
$$Mor_{Stacks/\mathcal{C}}(\mathcal{S}, \mathcal{S}') \longrightarrow Mor_{Stacks/\mathcal{D}}(f^{-1}\mathcal{S}, f^{-1}\mathcal{S}')$$
of morphism categories.

Proof. Note that by Lemma 50.12.10 we have an equivalence of categories

$$Mor_{Stacks/\mathcal{D}}(f^{-1}\mathcal{S}, f^{-1}\mathcal{S}') = Mor_{Stacks/\mathcal{C}}(\mathcal{S}, f_*f^{-1}\mathcal{S}')$$

Hence (2) follows from (1).

To prove (1) we are going to use Lemma 50.4.8. This lemma tells us that we have to show that $can : \mathcal{S} \to f_*f^{-1}\mathcal{S}$ is fully faithful and that all objects of $f_*f^{-1}\mathcal{S}$ are locally in the essential image.

We quickly describe the functor can, see proof of Lemma 50.12.8. To do this we introduce the functor $c'' : \mathcal{S} \to u_{pp}\mathcal{S}$ defined by $c''(x/U) = (U, \text{id} : u(U) \to u(U), x)$, and $c''(\alpha/a) = (a, u(a), \alpha)$. We set $c' : \mathcal{S} \to u_p\mathcal{S}$ equal to the composition of c'' and the canonical functor $u_{pp}\mathcal{S} \to u_p\mathcal{S}$. We set $c : \mathcal{S} \to f^{-1}\mathcal{S}$ equal to the composition of c' and the canonical functor $u_p\mathcal{S} \to f^{-1}\mathcal{S}$. Then $can : \mathcal{S} \to f_*f^{-1}\mathcal{S}$ is the functor which to x/U associates the pair $(U, c(x))$ and to α/a the morphism $(a, c(\alpha))$.

Fully faithfulness. To prove this we are going to use Lemma 50.4.7. Let $U \in Ob(\mathcal{C})$. Let $x, y \in \mathcal{S}_U$. First off, as u is fully faithful, we have

$$Mor_{(f_*f^{-1}\mathcal{S})_U}(can(x), can(y)) = Mor_{(f^{-1}\mathcal{S})_{u(U)}}(c(x), c(y))$$

directly from the definition of f_*. Similarly holds after pull back to any U'/U. Because $f^{-1}\mathcal{S}$ is the stackification of $u_p\mathcal{S}$, and since u is continuous and cocontinuous the presheaf

$$U'/U \longmapsto Mor_{(f^{-1}\mathcal{S})_{u(U')}}(c(x|_{U'}), c(y|_{U'}))$$

is the sheafification of the presheaf

$$U'/U \longmapsto Mor_{(u_p\mathcal{S})_{u(U')}}(c'(x|_{U'}), c'(y|_{U'}))$$

Hence to finish the proof of fully faithfulness it suffices to show that for any U and x, y the map

$$Mor_{\mathcal{S}_U}(x, y) \longrightarrow Mor_{(u_p\mathcal{S})_U}(c'(x), c'(y))$$

is bijective. A morphism $f : x \to y$ in $u_p\mathcal{S}$ over $u(U)$ is given by an equivalence class of diagrams

$$\begin{tikzcd} (U', \phi : u(U) \to u(U'), x') \arrow[r, "(a,b,\alpha)"'] \arrow[d, "(c, \mathrm{id}_{u(U)}, \gamma)"'] & (U, \mathrm{id} : u(U) \to u(U), y) \\ (U, \mathrm{id} : u(U) \to u(U), x) \end{tikzcd}$$

with γ strongly cartesian and $b = \mathrm{id}_{u(U)}$. But since u is fully faithful we can write $\phi = u(c')$ for some morphism $c' : U \to U'$ and then we see that $a \circ c' = \mathrm{id}_U$ and $c \circ c' = \mathrm{id}_{U'}$. Because γ is strongly cartesian we can find a morphism $\gamma' : x \to x'$ lifting c' such that $\gamma \circ \gamma' = \mathrm{id}_x$. By definition of the equivalence classes defining morphisms in $u_p\mathcal{S}$ it follows that the morphism

$$(U, \mathrm{id} : u(U) \to u(U), x) \xrightarrow[(\mathrm{id}, \mathrm{id}, \alpha \circ \gamma')]{} (U, \mathrm{id} : u(U) \to u(U), y)$$

of $u_{pp}\mathcal{S}$ induces the morphism f in $u_p\mathcal{S}$. This proves that the map is surjective. We omit the proof that it is injective.

Finally, we have to show that any object of $f_*f^{-1}\mathcal{S}$ locally comes from an object of $\mathcal{S}$. This is clear from the constructions (details omitted). □

50.13. Stacks and localization

Let $\mathcal{C}$ be a site. Let U be an object of $\mathcal{C}$. We want to understand stacks over $\mathcal{C}/U$ as stacks over $\mathcal{C}$ together with a morphism towards U. The following lemma is the reason why this is easier to do when the presheaf h_U is a sheaf.

Lemma 50.13.1. *Let $\mathcal{C}$ be a site. Let $U \in Ob(\mathcal{C})$. Then $j_U : \mathcal{C}/U \to \mathcal{C}$ is a stack over $\mathcal{C}$ if and only if h_U is a sheaf.*

Proof. Combine Lemma 50.6.3 with Categories, Example 4.35.7. □

Assume that $\mathcal{C}$ is a site, and U is an object of $\mathcal{C}$ whose associated representable presheaf is a sheaf. We denote $j : \mathcal{C}/U \to \mathcal{C}$ the localization functor.

Construction A. Let $p : \mathcal{S} \to \mathcal{C}/U$ be a stack over the site $\mathcal{C}/U$. We define a stack $j_!p : j_!\mathcal{S} \to \mathcal{C}$ as follows:

(1) As a category $j_!\mathcal{S} = \mathcal{S}$, and
(2) the functor $j_!p : j_!\mathcal{S} \to \mathcal{C}$ is just the composition $j \circ p$.

We omit the verification that this is a stack (hint: Use that h_U is a sheaf to glue morphisms to U). There is a canonical functor

$$j_!\mathcal{S} \longrightarrow \mathcal{C}/U$$

namely the functor p which is a 1-morphism of stacks over $\mathcal{C}$.

Construction B. Let $q : \mathcal{T} \to \mathcal{C}$ be a stack over $\mathcal{C}$ which is endowed with a morphism of stacks $p : \mathcal{T} \to \mathcal{C}/U$ over $\mathcal{C}$. In this case it is automically the case that $p : \mathcal{T} \to \mathcal{C}/U$ is a stack over $\mathcal{C}/U$.

Lemma 50.13.2. *Assume that $\mathcal{C}$ is a site, and U is an object of $\mathcal{C}$ whose associated representable presheaf is a sheaf. Constructions A and B above define mutually inverse (!) functors of 2-categories*

$$\left\{\begin{matrix} \text{2-category of} \\ \text{stacks over } \mathcal{C}/U \end{matrix}\right\} \leftrightarrow \left\{\begin{matrix} \text{2-category of pairs } (\mathcal{X}, p) \text{ consisting} \\ \text{of a stack } \mathcal{X} \text{ over } \mathcal{C} \text{ and a morphism} \\ p : \mathcal{X} \to \mathcal{C}/U \text{ of stacks over } \mathcal{C} \end{matrix}\right\}$$

Proof. This is clear. □

CHAPTER 51

Formal Deformation Theory

51.1. Introduction

This chapter develops formal deformation theory in a form applicable later in the stacks project, closely following Rim [**GRR72**, Exposee VI] and Schlessinger [**Sch68**]. We strongly encourage the reader new to this topic to read the paper by Schlessinger first, as it is sufficiently general for most applications, and Schlessinger's results are indeed used in most papers that use this kind of formal deformation theory.

Let Λ be a complete Noetherian local ring with residue field k, and let $\mathcal{C}_\Lambda$ denote the category of Artinian local Λ-algebras with residue field k. Given a functor $F : \mathcal{C}_\Lambda \to Sets$ such that $F(k)$ is a one element set, Schlessinger's paper introduced conditions (H1)-(H4) such that:

(1) F has a ``hull'' if and only if (H1)-(H3) hold.
(2) F is prorepresentable if and only (H1)-(H4) hold.

The purpose of this chapter is to generalize these results in two ways exactly as is done in Rim's paper:

(A) The functor F is replaced by a category $\mathcal{F}$ cofibered in groupoids over $\mathcal{C}_\Lambda$, see Section 51.3.
(B) We let Λ be a Noetherian ring and $\Lambda \to k$ a finite ring map to a field. The category $\mathcal{C}_\Lambda$ is the category of Artinian local Λ-algebras A endowed with a given identification $A/\mathfrak{m}_A = k$.

The analogue of the condition that $F(k)$ is a one element set is that $\mathcal{F}(k)$ is the trivial groupoid. If $\mathcal{F}$ satisfies this condition then we say it is a *predeformation category*, but in general we do not make this assumption. Rim's paper [**GRR72**, Exposee VI] is the original source for the results in this document. We also mention the useful paper [**TV**], which discusses deformation theory with groupoids but in less generality than we do here.

An important role is played by the ``completion'' $\widehat{\mathcal{C}}_\Lambda$ of the category $\mathcal{C}_\Lambda$. An object of $\widehat{\mathcal{C}}_\Lambda$ is a Noetherian complete local Λ-algebra R whose residue field is identified with k, see Section 51.4. On the one hand $\mathcal{C}_\Lambda \subset \widehat{\mathcal{C}}_\Lambda$ is a strictly full subcategory and on the other hand $\widehat{\mathcal{C}}_\Lambda$ is a full subcategory of the category of pro-objects of $\mathcal{C}_\Lambda$. A functor $\mathcal{C}_\Lambda \to Sets$ is *prorepresentable* if it is isomorphic to the restriction of a representable functor $\underline{R} = Mor_{\widehat{\mathcal{C}}_\Lambda}(R, -)$ to $\mathcal{C}_\Lambda$ where $R \in Ob(\widehat{\mathcal{C}}_\Lambda)$.

Categories cofibred in groupoids are dual to categories fibred in groupoids; we introduced them in Section 51.5. A *smooth* morphism of categories cofibred in groupoids over $\mathcal{C}_\Lambda$ is one that satisfies the infinitesimal lifting criterion for objects, see Section 51.8. This is analogous to the definition of a formally smooth ring map, see Algebra, Definition 7.127.1 and is exactly dual to the notion in Criteria for Representability, Section 59.6. This is an important notion as we eventually want to prove that certain kinds of categories cofibred in groupoids have a smooth prorepresentable presentation, much like the characterization of algebraic stacks in Algebraic Stacks, Sections 57.16 and 57.17. A *versal formal object* of a category $\mathcal{F}$ cofibred in groupoids over $\mathcal{C}_\Lambda$ is an object $\xi \in \widehat{\mathcal{F}}(R)$ of the completion such that the associated morphism $\underline{\xi} : \underline{R} \to \mathcal{F}$ is smooth.

In Section 51.9, we define conditions (S1) and (S2) on $\mathcal{F}$ generalizing Schlessinger's (H1) and (H2). The analogue of Schlessinger's (H3)---the condition that $\mathcal{F}$ has finite dimensional tangent space---is not given a name. A key step in the development of the theory is the existence of versal formal objects for predeformation categories satisfying (S1), (S2) and (H3), see Lemma 51.12.4. Schlessinger's notion of a *hull* for a functor $F : \mathcal{C}_\Lambda \to Sets$ is, in our terminology, a versal formal object $\xi \in \widehat{F}(R)$ such that the induced map of tangent spaces $d\underline{\xi} : T\underline{R} \to TF$ is an isomorphism. In the literature a hull is often called a ``miniversal'' object. We do not do so, and here is why. It can happen that a functor has a versal formal object without having a hull. Moreover, we show in Section 51.13 that if a predeformation category has a versal formal object, then it always has a *minimal* one (as defined in Definition 51.13.4) which is unique up to isomorphism, see Lemma 51.13.5. But it can happen that the minimal versal formal object does not induce an isomorphism on tangent spaces! (See Examples 51.14.3 and 51.14.8.)

Keeping in mind the differences pointed out above, Theorem 51.14.5 is the direct generalization of (1) above: it recovers Schlessinger's result in the case that $\mathcal{F}$ is a functor and it characterizes minimal versal formal objects, in the presence of conditions (S1) and (S2), in terms of the map $d\underline{\xi} : T\underline{R} \to TF$ on tangent spaces.

In Section 51.15, we define Rim's condition (RS) on $\mathcal{F}$ generalizing Schlessinger's (H4). A *deformation category* is defined as a predeformation category satisfying (RS). The analogue to prorepresentable functors are the categories cofibred in groupoids over $\mathcal{C}_\Lambda$ which have a *presentation by a smooth prorepresentable groupoid in functors* on $\mathcal{C}_\Lambda$, see Definitions 51.19.1, 51.20.1, and 51.21.1. This notion of a presentation takes into account the groupoid structure of the fibers of $\mathcal{F}$. In Theorem 51.24.5 we prove that $\mathcal{F}$ has a presentation by a smooth prorepresentable groupoid in functors if and only if $\mathcal{F}$ has a finite dimensional tangent space and finite dimensonsal infinitesimal automorphism space. This is the generalization of (2) above: it reduces to Schlessinger's result in the case that $\mathcal{F}$ is a functor. There is a final Section 51.25 where we discuss how to use minimal versal formal objects to produce a (unique up to isomorphism) minimal presentation by a smooth prorepresentable groupoid in functors.

We also find the following conceptual explanation for Schlessinger's conditions. If a predeformation category $\mathcal{F}$ satisfies (RS), then the associated functor of isomorphism classes $\overline{\mathcal{F}} : \mathcal{C}_\Lambda \to Sets$ satisfies (H1) and (H2) (Lemmas 51.15.6 and 51.9.5). Conversely, if a functor $F : \mathcal{C}_\Lambda \to Sets$ arises naturally as the functor of isomorphism classes of a category $\mathcal{F}$ cofibered in groupoids, then it seems to happen in practice that an argument showing F satisfies (H1) and (H2) will also show $\mathcal{F}$ satisfies (RS) (see Section 51.27 for examples). Moreover, if $\mathcal{F}$ satisfies (RS), then condition (H4) for $\overline{\mathcal{F}}$ has a simple interpretation in terms of extending automorphisms of objects of $\mathcal{F}$ (Lemma 51.15.7). These observations suggest that (RS) should be regarded as the fundamental deformation theoretic glueing condition.

51.2. Notation and Conventions

A ring is commutative with 1. The maximal ideal of a local ring A is denoted by $\mathfrak{m}_A$. The set of positive integers is denoted by $\mathbf{N} = \{1, 2, 3, \ldots\}$. If U is an object of a category $\mathcal{C}$, we denote by $\underline{U}$ the functor $Mor_{\mathcal{C}}(U, -) : \mathcal{C} \to Sets$, see Remarks 51.5.2 (12). Warning: this may conflict with the notation in other chapters where sometimes use $\underline{U}$ to denote $h_U(-) = Mor_{\mathcal{C}}(-, U)$.

Throughout this chapter Λ is a Noetherian ring and $\Lambda \to k$ is a finite ring map from Λ to a field. The kernel of this map is denoted $\mathfrak{m}_\Lambda$ and the image $k' \subset k$. It turns out that $\mathfrak{m}_\Lambda$ is a maximal ideal, $k' = \Lambda/\mathfrak{m}_\Lambda$ is a field, and the extension $k' \subset k$ is finite. See discussion surrounding (51.3.3.1).

51.3. The category $\mathcal{C}_\Lambda$

Motivation. An important application of formal deformation theory is to criteria for representability by algebraic spaces. Suppose given a locally Noetherian base change S and a functor $F : (Sch/S)_{fppf}^{opp} \to Sets$. Let k be a finite type field over S, i.e., we are given a finite type morphism $Spec(k) \to S$. One of Artin's criteria is that for any element $x \in F(Spec(k))$ the predeformation functor associated to the triple (S, k, x) should be prorepresentable. By Morphisms, Lemma 24.15.1 the condition that k is of finite type over S means that there exists an affine open $Spec(\Lambda) \subset S$ such that k is a finite Λ-algebra. This motivates why we work throughout this chapter with a base category as follows.

Definition 51.3.1. Let Λ be a Noetherian ring and let $\Lambda \to k$ be a finite ring map where k is a field. We define $\mathcal{C}_\Lambda$ to be the category with

(1) objects are pairs (A, φ) where A is an Artinian local Λ-algebra and where $\varphi : A/\mathfrak{m}_A \to k$ is a Λ-algebra isomorphism, and
(2) morphisms $f : (B, \psi) \to (A, \varphi)$ are local Λ-algebra homomorphisms such that $\varphi \circ (f \bmod \mathfrak{m}) = \psi$.

We say we are in the *classical case* if Λ is a Noetherian complete local ring and k is its residue field.

Note that if $\Lambda \to k$ is surjective and if A is an Artinian local Λ-algebra, then the identification φ, if it exists, is unique. Moreover, in this case any Λ-algebra map $A \to B$ is going to be compatible with the identifications. Hence in this case $\mathcal{C}_\Lambda$ is just the category of local Artinian Λ-algebras whose residue field ``is'' k. By abuse of notation we also denote objects of $\mathcal{C}_\Lambda$ simply A in the general case. Moreover, we will often write $A/\mathfrak{m} = k$, i.e., we will pretend all rings in $\mathcal{C}_\Lambda$ have residue field k (since all ring maps in $\mathcal{C}_\Lambda$ are compatible with the given identifications this should never cause any problems). Throughout the rest of this chapter the base ring Λ and the field k are fixed. The category $\mathcal{C}_\Lambda$ will be the base category for the cofibered categories considered below.

Definition 51.3.2. Let $f : B \to A$ be a ring map in $\mathcal{C}_\Lambda$. We say f is a *small extension* if it is surjective and $\ker(f)$ is a nonzero principal ideal which is annihilated by $\mathfrak{m}_B$.

By the following lemma we can often reduce arguments involving surjective ring maps in $\mathcal{C}_\Lambda$ to the case of small extensions.

Lemma 51.3.3. *Let $f : B \to A$ be a surjective ring map in $\mathcal{C}_\Lambda$. Then f can be factored as a composition of small extensions.*

Proof. Let I be the kernel of f. The maximal ideal $\mathfrak{m}_B$ is nilpotent since B is Artinian, say $\mathfrak{m}_B^n = 0$. Hence we get a factorization

$$B = B/I\mathfrak{m}_B^{n-1} \to B/I\mathfrak{m}_B^{n-2} \to \cdots \to B/I \cong A$$

of f into a composition of surjective maps whose kernels are annihilated by the maximal ideal. Thus it suffices to prove the lemma when f itself is such a map, i.e. when I is annihilated by $\mathfrak{m}_B$. In this case I is a k-vector space, which has finite dimension, see Algebra, Lemma 7.49.8. Take a basis $x_1, \ldots, x_n$ of I as a k-vector space to get a factorization

$$B \to B/(x_1) \to \cdots \to B/(x_1, \ldots, x_n) \cong A$$

of f into a composition of small extensions. □

The next lemma says that we can compute the length of a module over a local Λ-algebra with residue field k in terms of the length over Λ. To explain the notation in the statement, let $k' \subset k$ be the image of our fixed finite ring map $\Lambda \to k$. Note that k/k' is a finite extension of rings. Hence k' is a field and k'/k is a finite extension, see Algebra, Lemma 7.32.16. Moreover, as $\Lambda \to k'$ is surjective we see that its kernel is a maximal ideal $\mathfrak{m}_\Lambda$. Thus

$$[k : k'] = [k : \Lambda/\mathfrak{m}_\Lambda] < \infty \tag{51.3.3.1}$$

and in the classical case we have $k = k'$. The notation $k' = \Lambda/\mathfrak{m}_\Lambda$ will be fixed throughout this chapter.

Lemma 51.3.4. *Let A be a local Λ-algebra with residue field k. Let M be an A-module. Then $[k : k']length_A(M) = length_\Lambda(M)$. In the classical case we have $length_A(M) = length_\Lambda(M)$.*

Proof. If M is a simple A-module then $M \cong k$ as an A-module, see Algebra, Lemma 7.48.10. In this case $\text{length}_A(M) = 1$ and $\text{length}_\Lambda(M) = [k' : k]$, see Algebra, Lemma 7.48.6. If $\text{length}_A(M)$ is finite, then the result follows on choosing a filtration of M by A-submodules with simple quotients using additivity, see Algebra, Lemma 7.48.3. If $\text{length}_A(M)$ is infinite, the result follows from the obvious inequality $\text{length}_A(M) \le \text{length}_\Lambda(M)$. □

Lemma 51.3.5. *Let $A \to B$ be a ring map in $\mathcal{C}_\Lambda$. The following are equivalent*

(1) *f is surjective,*
(2) *$\mathfrak{m}_A/\mathfrak{m}_A^2 \to \mathfrak{m}_B/\mathfrak{m}_B^2$ is surjective, and*
(3) *$\mathfrak{m}_A/(\mathfrak{m}_\Lambda A + \mathfrak{m}_A^2) \to \mathfrak{m}_B/(\mathfrak{m}_\Lambda B + \mathfrak{m}_B^2)$ is surjective.*

Proof. For any ring map $f : A \to B$ in $\mathcal{C}_\Lambda$ we have $f(\mathfrak{m}_A) \subset \mathfrak{m}_B$ for example because $\mathfrak{m}_A$, $\mathfrak{m}_B$ is the set of nilpotent elements of A, B. Suppose f is surjective. Let $y \in \mathfrak{m}_B$. Choose $x \in A$ with $f(x) = y$. Since f induces an isomorphism $A/\mathfrak{m}_A \to B/\mathfrak{m}_B$ we see that $x \in \mathfrak{m}_A$. Hence the induced map $\mathfrak{m}_A/\mathfrak{m}_A^2 \to \mathfrak{m}_B/\mathfrak{m}_B^2$ is surjective. In this way we see that (1) implies (2).

It is clear that (2) implies (3). The map $A \to B$ gives rise to a canonical commutative diagram

$$\begin{tikzcd}
\mathfrak{m}_\Lambda/\mathfrak{m}_\Lambda^2 \otimes_{k'} k \arrow[r] \arrow[d] & \mathfrak{m}_A/\mathfrak{m}_A^2 \arrow[r] \arrow[d] & \mathfrak{m}_A/(\mathfrak{m}_\Lambda A + \mathfrak{m}_A^2) \arrow[r] \arrow[d] & 0 \\
\mathfrak{m}_\Lambda/\mathfrak{m}_\Lambda^2 \otimes_{k'} k \arrow[r] & \mathfrak{m}_B/\mathfrak{m}_B^2 \arrow[r] & \mathfrak{m}_B/(\mathfrak{m}_\Lambda B + \mathfrak{m}_B^2) \arrow[r] & 0
\end{tikzcd}$$

with exact rows. Hence if (3) holds, then so does (2).

Assume (2). To show that $A \to B$ is surjective it suffices by Nakayama's lemma (Algebra, Lemma 7.14.5) to show that $A/\mathfrak{m}_A \to B/\mathfrak{m}_A B$ is surjective. (Note that $\mathfrak{m}_A$ is a nilpotent ideal.) As $k = A/\mathfrak{m}_A = B/\mathfrak{m}_B$ it suffices to show that $\mathfrak{m}_A B \to \mathfrak{m}_B$ is surjective. Applying

Nakayama's lemma once more we see that it suffces to see that $\mathfrak{m}_A B/\mathfrak{m}_A\mathfrak{m}_B \to \mathfrak{m}_B/\mathfrak{m}_B^2$ is surjective which is what we assumed. □

If $A \to B$ is a ring map in $\mathcal{C}_\Lambda$, then the map $\mathfrak{m}_A/(\mathfrak{m}_\Lambda A + \mathfrak{m}_A^2) \to \mathfrak{m}_B/(\mathfrak{m}_\Lambda B + \mathfrak{m}_B^2)$ is the map on relative cotangent spaces. Here is a formal definition.

Definition 51.3.6. Let $R \to S$ be a local homomorphism of local rings. The *relative cotangent space*[1] of R over S is the $S/\mathfrak{m}_S$-vector space $\mathfrak{m}_S/(\mathfrak{m}_R S + \mathfrak{m}_S^2)$.

If $f_1 : A_1 \to A$ and $f_2 : A_2 \to A$ are two ring maps, then the fiber product $A_1 \times_A A_2$ is the subring of $A_1 \times A_2$ consisting of elements whose two projections to A are equal. Throughout this chapter we will be considering conditions involving such a fiber product when f_1 and f_2 are in $\mathcal{C}_\Lambda$. It isn't always the case that the fibre product is an object of $\mathcal{C}_\Lambda$.

Example 51.3.7. Let p be a prime number and let $n \in \mathbf{N}$. Let $\Lambda = \mathbf{F}_p(t_1, t_2, \ldots, t_n)$ and let $k = \mathbf{F}_p(x_1, \ldots, x_n)$ with map $\Lambda \to k$ given by $t_i \mapsto x_i^p$. Let $A = k[\epsilon] = k[x]/(x^2)$. Then A is an object of $\mathcal{C}_\Lambda$. Suppose that $D : k \to k$ is a derivation of k over Λ, for example $D = \partial/\partial x_i$. Then the map

$$f_D : k \longrightarrow k[\epsilon], \quad a \mapsto a + D(a)\epsilon$$

is a morphism of $\mathcal{C}_\Lambda$. Set $A_1 = A_2 = k$ and set $f_1 = f_{\partial/\partial x_1}$ and $f_2(a) = a$. Then $A_1 \times_A A_2 = \{a \in k \mid \partial/\partial x_1(a) = 0\}$ which does not surject onto k. Hence the fibre product isn't an object of $\mathcal{C}_\Lambda$.

It turns out that this problem can only occur if the residue field extension $k' \subset k$ (51.3.3.1) is inseparable and neither f_1 nor f_2 is surjective.

Lemma 51.3.8. *Let $f_1 : A_1 \to A$ and $f_2 : A_2 \to A$ be ring maps in $\mathcal{C}_\Lambda$. Then:*

(1) *If f_1 or f_2 is surjective, then $A_1 \times_A A_2$ is in $\mathcal{C}_\Lambda$.*
(2) *If f_2 is a small extension, then so is $A_1 \times_A A_2 \to A_1$.*
(3) *If the field extension $k' \subset k$ is separable, then $A_1 \times_A A_2$ is in $\mathcal{C}_\Lambda$.*

Proof. The ring $A_1 \times_A A_2$ is a Λ-algebra via the map $\Lambda \to A_1 \times_A A_2$ induced by the maps $\Lambda \to A_1$ and $\Lambda \to A_2$. It is a local ring with unique maximal ideal

$$\mathfrak{m}_{A_1} \times_{\mathfrak{m}_A} \mathfrak{m}_{A_2} = \mathrm{Ker}(A_1 \times_A A_2 \longrightarrow k)$$

A ring is Artinian if and only if it has finite length as a module over itself, see Algebra, Lemma 7.49.8. Since A_1 and A_2 are Artinian, Lemma 51.3.4 implies $\mathrm{length}_\Lambda(A_1)$ and $\mathrm{length}_\Lambda(A_2)$, and hence $\mathrm{length}_\Lambda(A_1 \times A_2)$, are all finite. As $A_1 \times_A A_2 \subset A_1 \times A_2$ is a Λ-submodule, this implies $\mathrm{length}_{A_1\times_A A_2}(A_1 \times_A A_2) \leq \mathrm{length}_\Lambda(A_1 \times_A A_2)$ is finite. So $A_1 \times_A A_2$ is Artinian. Thus the only thing that is keeping $A_1 \times_A A_2$ from being an object of $\mathcal{C}_\Lambda$ is the possibility that its residue field maps to a proper subfield of k via the map $A_1 \times_A A_2 \to A \to A/\mathfrak{m}_A = k$ above.

Proof of (1). If f_2 is surjective, then the projection $A_1 \times_A A_2 \to A_1$ is surjective. Hence the composition $A_1 \times_A A_2 \to A_1 \to A_1/\mathfrak{m}_{A_1} = k$ is surjective and we conclude that $A_1 \times_A A_2$ is an object of $\mathcal{C}_\Lambda$.

Proof of (2). If f_2 is a small extension then $A_2 \to A$ and $A_1 \times_A A_2 \to A_1$ are both surjective with the same kernel. Hence the kernel of $A_1 \times_A A_2 \to A_1$ is a 1-dimensional k-vector space and we see that $A_1 \times_A A_2 \to A_1$ is a small extension.

[1] Caution: We will see later that in our general setting the tangent space of an object $A \in \mathcal{C}_\Lambda$ over Λ should not be defined simply as the k-linear dual of the relative cotangent space. In fact, the correct definition of the relative cotangent space is $\Omega_{S/R} \otimes_S S/\mathfrak{m}_S$.

Proof of (3). Choose $\overline{x} \in k$ such that $k = k'(\overline{x})$ (see Algebra, Lemma 7.38.5). Let $P'(T) \in k'[T]$ be the minimal polynomial of $\overline{x}$ over k'. Since k/k' is separable we see that $\mathrm{d}P/\mathrm{d}T(\overline{x}) \neq 0$. Choose a monic $P \in \Lambda[T]$ which maps to P' under the surjective map $\Lambda[T] \to k'[T]$. Because A, A_1, A_2 are henselian, see Algebra, Lemma 7.139.11, we can find $x, x_1, x_2 \in A, A_1, A_2$ with $P(x) = 0, P(x_1) = 0, P(x_2) = 0$ and such that the image of x, x_1, x_2 in k is $\overline{x}$. Then $(x_1, x_2) \in A_1 \times_A A_2$ because x_1, x_2 map to $x \in A$ by uniqueness, see Algebra, Lemma 7.139.2. Hence the residue field of $A_1 \times_A A_2$ contains a generator of k over k' and we win. □

Next we define essential surjections in $\mathcal{C}_\Lambda$. A necessary and sufficient condition for a surjection in $\mathcal{C}_\Lambda$ to be essential is given in Lemma 51.3.12.

Definition 51.3.9. Let $f : B \to A$ be a ring map in $\mathcal{C}_\Lambda$. We say f is an *essential surjection* if it has the following properties:

(1) f is surjective.
(2) If $g : C \to B$ is a ring map in $\mathcal{C}_\Lambda$ such that $f \circ g$ is surjective, then g is surjective.

Using Lemma 51.3.5, we can characterize essential surjections in $\mathcal{C}_\Lambda$ as follows.

Lemma 51.3.10. *Let $f : B \to A$ be a ring map in $\mathcal{C}_\Lambda$. The following are equivalent*

(1) *f is an essential surjection,*
(2) *the map $B/\mathfrak{m}_B^2 \to A/\mathfrak{m}_A^2$ is an essential surjection, and*
(3) *the map $B/(\mathfrak{m}_\Lambda B + \mathfrak{m}_B^2) \to A/(\mathfrak{m}_\Lambda A + \mathfrak{m}_A^2)$ is an essential surjection.*

Proof. Assume (3). Let $C \to B$ be a ring map in $\mathcal{C}_\Lambda$ such that $C \to A$ is surjective. Then $C \to A/(\mathfrak{m}_\Lambda A + \mathfrak{m}_A^2)$ is surjective too. We conclude that $C \to B/(\mathfrak{m}_\Lambda B + \mathfrak{m}_B^2)$ is surjective by our assumption. Hence $C \to B$ is surjective by applying Lemma 51.3.5 (2 times).

Assume (1). Let $C \to B/(\mathfrak{m}_\Lambda B + \mathfrak{m}_B^2)$ be a morphism of $\mathcal{C}_\Lambda$ such that $C \to A/(\mathfrak{m}_\Lambda A + \mathfrak{m}_A^2)$ is surjective. Set $C' = C \times_{B/(\mathfrak{m}_\Lambda B + \mathfrak{m}_B^2)} B$ which is an object of $\mathcal{C}_\Lambda$ by Lemma 51.3.8. Note that $C' \to A/(\mathfrak{m}_\Lambda A + \mathfrak{m}_A^2)$ is still surjective, hence $C' \to A$ is surjective by Lemma 51.3.5. Thus $C' \to B$ is surjective by our assumption. This implies that $C' \to B/(\mathfrak{m}_\Lambda B + \mathfrak{m}_B^2)$ is surjective, which implies by the construction of C' that $C \to B/(\mathfrak{m}_\Lambda B + \mathfrak{m}_B^2)$ is surjective.

In the first paragraph we proved (3) ⇒ (1) and in the second paragraph we proved (1) ⇒ (3). The equivalence of (2) and (3) is a special case of the equivalence of (1) and (3), hence we are done. □

To analyze essential surjections in $\mathcal{C}_\Lambda$ a bit more we introduce some notation. Suppose that A is an object of $\mathcal{C}_\Lambda$. There is a canonical exact sequence

$$\mathfrak{m}_A/\mathfrak{m}_A^2 \xrightarrow{\mathrm{d}_A} \Omega_{A/\Lambda} \otimes_A k \to \Omega_{k/\Lambda} \to 0 \tag{51.3.10.1}$$

see Algebra, Lemma 7.122.9. Note that $\Omega_{k/\Lambda} = \Omega_{k/k'}$ with k' as in (51.3.3.1). Let $H_1(L_{k/\Lambda})$ be the first homology module of the naive cotangent complex of k over Λ, see Algebra, Definition 7.123.1. Then we can extend (51.3.10.1) to the exact sequence

$$H_1(L_{k/\Lambda}) \to \mathfrak{m}_A/\mathfrak{m}_A^2 \xrightarrow{\mathrm{d}_A} \Omega_{A/\Lambda} \otimes_A k \to \Omega_{k/\Lambda} \to 0, \tag{51.3.10.2}$$

see Algebra, Lemma 7.123.3. If $B \to A$ is a ring map in $\mathcal{C}_\Lambda$ then we obtain a commutative diagram

$$\begin{tikzcd} H_1(L_{k/\Lambda}) \arrow[r] \arrow[d, equal] & \mathfrak{m}_B/\mathfrak{m}_B^2 \arrow[r, "\mathrm{d}_B"'] \arrow[d] & \Omega_{B/\Lambda} \otimes_B k \arrow[r] \arrow[d] & \Omega_{k/\Lambda} \arrow[r] \arrow[d, equal] & 0 \\ H_1(L_{k/\Lambda}) \arrow[r] & \mathfrak{m}_A/\mathfrak{m}_A^2 \arrow[r, "\mathrm{d}_A"] & \Omega_{A/\Lambda} \otimes_A k \arrow[r] & \Omega_{k/\Lambda} \arrow[r] & 0 \end{tikzcd} \tag{51.3.10.3}$$

with exact rows.

Lemma 51.3.11. *There is a canonical map*

$$\mathfrak{m}_\Lambda/\mathfrak{m}_\Lambda^2 \longrightarrow H_1(L_{k/\Lambda}).$$

If $k' \subset k$ is separable (for example if the characteristic of k is zero), then this map induces an isomorphism $\mathfrak{m}_\Lambda/\mathfrak{m}_\Lambda^2 \otimes_{k'} k = H_1(L_{k/\Lambda})$. If $k = k'$ (for example in the classical case), then $\mathfrak{m}_\Lambda/\mathfrak{m}_\Lambda^2 = H_1(L_{k/\Lambda})$. The composition

$$\mathfrak{m}_\Lambda/\mathfrak{m}_\Lambda^2 \longrightarrow H_1(L_{k/\Lambda}) \longrightarrow \mathfrak{m}_A/\mathfrak{m}_A^2$$

comes from the canonical map $\mathfrak{m}_\Lambda \to \mathfrak{m}_A$.

Proof. Note that $H_1(L_{k'/\Lambda}) = \mathfrak{m}_\Lambda/\mathfrak{m}_\Lambda^2$ as $\Lambda \to k'$ is surjective with kernel $\mathfrak{m}_\Lambda$. The map arises from functoriality of the naive cotangent complex. If $k' \subset k$ is separable, then $k' \to k$ is an étale ring map, see Algebra, Lemma 7.132.4. Thus its naive cotangent complex has trivial homology groups, see Algebra, Definition 7.132.1. Then Algebra, Lemma 7.123.3 applied to the ring maps $\Lambda \to k' \to k$ implies that $\mathfrak{m}_\Lambda/\mathfrak{m}_\Lambda^2 \otimes_{k'} k = H_1(L_{k/\Lambda})$. We omit the proof of the final statement. □

Lemma 51.3.12. *Let $f : B \to A$ be a ring map in $\mathcal{C}_\Lambda$. Notation as in (51.3.10.3).*

(1) *The equivalent conditions of Lemma 51.3.10 characterizing when f is surjective are also equivalent to*
   (a) *$Im(d_B) \to Im(d_A)$ is surjective, and*
   (b) *the map $\Omega_{B/\Lambda} \otimes_B k \to \Omega_{A/\Lambda} \otimes_A k$ is surjective.*
(2) *The following are equivalent*
   (a) *f is an essential surjection,*
   (b) *the map $Im(d_B) \to Im(d_A)$ is an isomorphism, and*
   (c) *the map $\Omega_{B/\Lambda} \otimes_B k \to \Omega_{A/\Lambda} \otimes_A k$ is an isomorphism.*
(3) *If k/k' is separable, then f is an essential surjection if and only if the map $\mathfrak{m}_B/(\mathfrak{m}_\Lambda B + \mathfrak{m}_B^2) \to \mathfrak{m}_A/(\mathfrak{m}_\Lambda A + \mathfrak{m}_A^2)$ is an isomorphism.*
(4) *If f is a small extension, then f is not essential if and only if f has a section $s : A \to B$ in $\mathcal{C}_\Lambda$ with $f \circ s = id_A$.*

Proof. Proof of (1). It follows from (51.3.10.3) that (1)(a) and (1)(b) are equivalent. Also, if $A \to B$ is surjective, then (1)(a) and (1)(b) hold. Assume (1)(a). Since the kernel of d_A is the image of $H_1(L_{k/\Lambda})$ which also maps to $\mathfrak{m}_B/\mathfrak{m}_B^2$ we conclude that $\mathfrak{m}_B/\mathfrak{m}_B^2 \to \mathfrak{m}_A/\mathfrak{m}_A^2$ is surjective. Hence $B \to A$ is surjective by Lemma 51.3.5. This finishes the proof of (1).

Proof of (2). The equivalence of (2)(b) and (2)(c) is immediate from (51.3.10.3).

Assume (2)(b). Let $g : C \to B$ be a ring map in $\mathcal{C}_\Lambda$ such that $f \circ g$ is surjective. We conclude that $\mathfrak{m}_C/\mathfrak{m}_C^2 \to \mathfrak{m}_A/\mathfrak{m}_A^2$ is surjective by Lemma 51.3.5. Hence $\mathrm{Im}(\mathrm{d}_C) \to \mathrm{Im}(\mathrm{d}_A)$ is surjective and by the assumption we see that $\mathrm{Im}(\mathrm{d}_C) \to \mathrm{Im}(\mathrm{d}_B)$ is surjective. It follows that $C \to B$ is surjective by (1).

Assume (2)(a). Then f is surjective and we see that $\Omega_{B/\Lambda} \otimes_B k \to \Omega_{A/\Lambda} \otimes_A k$ is surjective. Let K be the kernel. Note that $K = \mathrm{d}_B(\mathrm{Ker}(\mathfrak{m}_B/\mathfrak{m}_B^2 \to \mathfrak{m}_A/\mathfrak{m}_A^2))$ by (51.3.10.3). Choose a splitting

$$\Omega_{B/\Lambda} \otimes_B k = \Omega_{A/\Lambda} \otimes_A k \oplus K$$

of k-vector space. The map $\mathrm{d} : B \to \Omega_{B/\Lambda}$ induces via the projection onto K a map $D : B \to K$. Set $C = \{b \in B \mid D(b) = 0\}$. The Leibniz rule shows that this is a Λ-subalgebra of B. Let $\overline{x} \in k$. Choose $x \in B$ mapping to $\overline{x}$. If $D(x) \neq 0$, then we can find an element $y \in \mathfrak{m}_B$ such that $D(y) = D(x)$. Hence $x - y \in C$ is an element which maps to $\overline{x}$. Thus $C \to k$ is surjective and C is an object of $\mathcal{C}_\Lambda$. Similarly, pick $\omega \in \mathrm{Im}(\mathrm{d}_A)$. We can find $x \in \mathfrak{m}_B$ such that $\mathrm{d}_B(x)$ maps to ω by (1). If $D(x) \neq 0$, then we can find an element $y \in \mathfrak{m}_B$ which maps to zero in $\mathfrak{m}_A/\mathfrak{m}_A^2$ such that $D(y) = D(x)$. Hence $z = x - y$ is an element of $\mathfrak{m}_C$ whose image $\mathrm{d}_C(z) \in \Omega_{C/k} \otimes_C k$ maps to ω. Hence $\mathrm{Im}(\mathrm{d}_C) \to \mathrm{Im}(\mathrm{d}_A)$ is surjective. We conclude that $C \to A$ is surjective by (1). Hence $C \to B$ is surjective by assumption. Hence $D = 0$, i.e., $K = 0$, i.e., (2)(c) holds. This finishes the proof of (2).

Proof of (3). If k'/k is separable, then $H_1(L_{k/\Lambda}) = \mathfrak{m}_\Lambda/\mathfrak{m}_\Lambda^2 \otimes_{k'} k$, see Lemma 51.3.11. Hence $\mathrm{Im}(\mathrm{d}_A) = \mathfrak{m}_A/(\mathfrak{m}_\Lambda A + \mathfrak{m}_A^2)$ and similarly for B. Thus (3) follows from (2).

Proof of (4). A section s of f is not surjective (by definition a small extension has nontrivial kernel), hence f is not essentially surjective. Conversely, assume f is a small surjection but not an essential surjection. Choose a ring map $C \to B$ in $\mathcal{C}_\Lambda$ which is not surjective, such that $C \to A$ is surjective. Let $C' \subset B$ be the image of $C \to B$. Then $C' \neq B$ but C' surjects onto A. Since $f : B \to A$ is a small extension, $\mathrm{length}_C(B) = \mathrm{length}_C(A) + 1$. Thus $\mathrm{length}_C(C') \leq \mathrm{length}_C(A)$ since C' is a proper subring of B. But $C' \to A$ is surjective, so in fact we must have $\mathrm{length}_C(C') = \mathrm{length}_C(A)$ and $C' \to A$ is an isomorphism which gives us our section. $\square$

Example 51.3.13. Let $\Lambda = k[[x]]$ be the power series ring in 1 variable over k. Set $A = k$ and $B = \Lambda/(x^2)$. Then $B \to A$ is an essential surjection by Lemma 51.3.12 because it is a small extension and the map $B \to A$ does not have a right inverse (in the category $\mathcal{C}_\Lambda$). But the map

$$k \cong \mathfrak{m}_B/\mathfrak{m}_B^2 \longrightarrow \mathfrak{m}_A/\mathfrak{m}_A^2 = 0$$

is not an isomorphism. Thus in Lemma 51.3.12 (3) it is necessary to consider the map of relative cotangent spaces $\mathfrak{m}_B/(\mathfrak{m}_\Lambda B + \mathfrak{m}_B^2) \to \mathfrak{m}_A/(\mathfrak{m}_\Lambda A + \mathfrak{m}_A^2)$.

51.4. The category $\widehat{\mathcal{C}}_\Lambda$

The following ``completion'' of the category $\mathcal{C}_\Lambda$ will serve as the base category of the completion of a category cofibered in groupoids over $\mathcal{C}_\Lambda$ (Section 51.7).

Definition 51.4.1. Let Λ be a Noetherian ring and let $\Lambda \to k$ be a finite ring map where k is a field. We define $\widehat{\mathcal{C}}_\Lambda$ to be the category with

(1) objects are pairs (R, φ) where R is a Noetherian complete local Λ-algebra and where $\varphi : R/\mathfrak{m}_R \to k$ is a Λ-algebra isomorphism, and
(2) morphisms $f : (S, \psi) \to (R, \varphi)$ are local Λ-algebra homomorphisms such that $\varphi \circ (f \bmod \mathfrak{m}) = \psi$.

As in the discussion following Definition 51.3.1 we will usually denote an object of $\widehat{\mathcal{C}}_\Lambda$ simply R, with the identification $R/\mathfrak{m}_R = k$ understood. In this section we discuss some basic properties of objects and morphisms of the category $\widehat{\mathcal{C}}_\Lambda$ paralleling our discussion of the category $\mathcal{C}_\Lambda$ in the previous section.

Our first observation is that any object $A \in \mathcal{C}_\Lambda$ is an object of $\widehat{\mathcal{C}}_\Lambda$ as an Artinian local ring is always Noetherian and complete with respect to its maximal ideal (which is after all a nilpotent ideal). Moreover, it is clear from the definitions that $\mathcal{C}_\Lambda \subset \widehat{\mathcal{C}}_\Lambda$ is the strictly full subcategory consisting of all Artinian rings. As it turns out, conversely every object of $\widehat{\mathcal{C}}_\Lambda$ is a limit of objects of $\mathcal{C}_\Lambda$.

Suppose that R is an object of $\widehat{\mathcal{C}}_\Lambda$. Consider the rings $R_n = R/\mathfrak{m}_R^n$ for $n \in \mathbf{N}$. These are Noetherian local rings with a unique nilpotent prime ideal, hence Artinian, see Algebra, Proposition 7.57.6. The ring maps

$$\ldots \to R_{n+1} \to R_n \to \ldots \to R_2 \to R_1 = k$$

are all surjective. Completeness of R by definition means that $R = lim\, R_n$. If $f : R \to S$ is a ring map in $\widehat{\mathcal{C}}_\Lambda$ then we obtain a system of ring maps $f_n : R_n \to S_n$ whose limit is the given map.

Lemma 51.4.2. *Let $f : R \to S$ be a ring map in $\widehat{\mathcal{C}}_\Lambda$. The following are equivalent*

(1) *f is surjective,*
(2) *the map $\mathfrak{m}_R/\mathfrak{m}_R^2 \to \mathfrak{m}_S/\mathfrak{m}_S^2$ is surjective, and*
(3) *the map $\mathfrak{m}_R/(\mathfrak{m}_\Lambda R + \mathfrak{m}_R^2) \to \mathfrak{m}_S/(\mathfrak{m}_\Lambda S + \mathfrak{m}_S^2)$ is surjective.*

Proof. Note that for $n \geq 2$ we have the equality of relative cotangent spaces

$$\mathfrak{m}_R/(\mathfrak{m}_\Lambda R + \mathfrak{m}_R^2) = \mathfrak{m}_{R_n}/(\mathfrak{m}_\Lambda R_n + \mathfrak{m}_{R_n}^2)$$

and similarly for S. Hence by Lemma 51.3.5 we see that $R_n \to S_n$ is surjective for all n. Now let K_n be the kernel of $R_n \to S_n$. Then the sequences

$$0 \to K_n \to R_n \to S_n \to 0$$

form an exact sequence of directed inverse systems. The system (K_n) is Mittag-Leffler since each K_n is Artinian. Hence by Algebra, Lemma 7.80.4 taking limits preserves exactness. So $lim\, R_n \to lim\, S_n$ is surjective, i.e., f is surjective. $\square$

Lemma 51.4.3. *The category $\widehat{\mathcal{C}}_\Lambda$ admits pushouts.*

Proof. Let $R \to S_1$ and $R \to S_2$ be morphisms of $\widehat{\mathcal{C}}_\Lambda$. Consider the ring $C = S_1 \otimes_R S_2$. This ring has a finitely generated maximal ideal $\mathfrak{m} = \mathfrak{m}_{S_1} \otimes S_2 + S_1 \otimes \mathfrak{m}_{S_2}$ with residue field k. Set $C^\wedge$ equal to the completion of C with respect to $\mathfrak{m}$. Then $C^\wedge$ is a Noetherian ring complete with respect to the maximal ideal $\mathfrak{m}^\wedge = \mathfrak{m}C^\wedge$ whose residue field is identified with k, see Algebra, Lemma 7.90.9. Hence $C^\wedge$ is an object of $\widehat{\mathcal{C}}_\Lambda$. Then $S_1 \to C^\wedge$ and $S_2 \to C^\wedge$ turn $C^\wedge$ into a pushout over R in $\widehat{\mathcal{C}}_\Lambda$ (details omitted). $\square$

We will not need the following lemma.

Lemma 51.4.4. *The category $\widehat{\mathcal{C}}_\Lambda$ admits coproducts of pairs of objects.*

Proof. Let R and S be objects of $\widehat{\mathcal{C}}_\Lambda$. Consider the ring $C = R \otimes_\Lambda S$. There is a canonical surjective map $C \to R \otimes_\Lambda S \to k \otimes_\Lambda k \to k$ where the last map is the multiplication map. The kernel of $C \to k$ is a maximal ideal $\mathfrak{m}$. Note that $\mathfrak{m}$ is generated by $\mathfrak{m}_R C$, $\mathfrak{m}_S C$ and finitely many elements of C which map to generators of the kernel of $k \otimes_\Lambda k \to k$. Hence $\mathfrak{m}$ is a finitely generated ideal. Set $C^\wedge$ equal to the completion of C with respect to $\mathfrak{m}$. Then $C^\wedge$ is a Noetherian ring complete with respect to the maximal ideal $\mathfrak{m}^\wedge = \mathfrak{m}C^\wedge$ with residue field k, see Algebra, Lemma 7.90.9. Hence $C^\wedge$ is an object of $\widehat{\mathcal{C}}_\Lambda$. Then $R \to C^\wedge$ and $S \to C^\wedge$ turn $C^\wedge$ into a coproduct in $\widehat{\mathcal{C}}_\Lambda$ (details omitted). $\square$

An empty coproduct in a category is an initial object of the category. In the classical case $\widehat{\mathcal{C}}_\Lambda$ has an initial object, namely Λ itself. More generally, if $k' = k$, then the completion $\Lambda^\wedge$ of Λ with respect to $\mathfrak{m}_\Lambda$ is an initial object. More generally still, if $k' \subset k$ is separable, then $\widehat{\mathcal{C}}_\Lambda$ has an initial object too. Namely, choose a monic polynomial $P \in \Lambda[T]$ such that $k \cong k'[T]/(P')$ where $p' \in k'[T]$ is the image of P. Then $R = \Lambda^\wedge[T]/(P)$ is an initial object, see proof of Lemma 51.3.8.

If R is an initial object as above, then we have $\mathcal{C}_\Lambda = \mathcal{C}_R$ and $\widehat{\mathcal{C}}_\Lambda = \widehat{\mathcal{C}}_R$ which effectively brings the whole discussion in this chapter back to the classical case. But, if $k' \subset k$ is inseparable, then an initial object does not exist.

Lemma 51.4.5. *Let S be an object of $\widehat{\mathcal{C}}_\Lambda$. Then* $\dim_k Der_\Lambda(S, k) < \infty$.

Proof. Let $x_1, \ldots, x_n \in \mathfrak{m}_S$ map to a k-basis for the relative cotangent space $\mathfrak{m}_S/(\mathfrak{m}_\Lambda S + \mathfrak{m}_S^2)$. Choose $y_1, \ldots, y_m \in S$ whose images in k generate k over k'. We claim that $\dim_k \mathrm{Der}_\Lambda(S, k) \leq n + m$. To see this it suffices to prove that if $D(x_i) = 0$ and $D(y_j) = 0$, then $D = 0$. Let $a \in S$. We can find a polynomial $P = \sum \lambda_J y^J$ with $\lambda_J \in \Lambda$ whose image in k is the same as the image of a in k. Then we see that $D(a-P) = D(a) - D(P) = D(a)$ by our assumption that $D(y_j) = 0$ for all j. Thus we may assume $a \in \mathfrak{m}_S$. Write $a = \sum a_i x_i$ with $a_i \in S$. By the Leibniz rule

$$D(a) = \sum x_i D(a_i) + \sum a_i D(x_i) = \sum x_i D(a_i)$$

as we assumed $D(x_i) = 0$. We have $\sum x_i D(a_i) = 0$ as multiplication by x_i is zero on k. $\square$

Lemma 51.4.6. *Let $f : R \to S$ be a morphism of $\widehat{\mathcal{C}}_\Lambda$. If $Der_\Lambda(S, k) \to Der_\Lambda(R, k)$ is injective, then f is surjective.*

Proof. If f is not surjective, then $\mathfrak{m}_S/(\mathfrak{m}_R S + \mathfrak{m}_S^2)$ is nonzero by Lemma 51.4.2. Then also $Q = S/(f(R) + \mathfrak{m}_R S + \mathfrak{m}_S^2)$ is nonzero. Note that Q is a $k = R/\mathfrak{m}_R$-vector space via f. We turn Q into an S-module via $S \to k$. The quotient map $D : S \to Q$ is an R-derivation: if $a_1, a_2 \in S$, we can write $a_1 = f(b_1) + a_1'$ and $a_2 = f(b_2) + a_2'$ for some $b_1, b_2 \in R$ and $a_1', a_2' \in \mathfrak{m}_S$. Then b_i and a_i have the same image in k for $i = 1, 2$ and

$$\begin{aligned} a_1 a_2 &= (f(b_1) + a_1')(f(b_2) + a_2') \\ &= f(b_1)a_2' + f(b_2)a_1' \\ &= f(b_1)(f(b_2) + a_2') + f(b_2)(f(b_1) + a_1') \\ &= f(b_1)a_2 + f(b_2)a_1 \end{aligned}$$

in Q which proves the Leibnize rule. Hence $D : S \to Q$ is a Λ-derivation which is zero on composing with $R \to S$. Since $Q \neq 0$ there also exist derivations $D : S \to k$ which are zero on composing with $R \to S$, i.e., $\mathrm{Der}_\Lambda(S, k) \to \mathrm{Der}_\Lambda(R, k)$ is not injective. $\square$

Lemma 51.4.7. *Let R be an object of $\widehat{\mathcal{C}}_\Lambda$. Let (J_n) be a decreasing sequence of ideals such that $\mathfrak{m}_R^n \subset J_n$. Set $J = \bigcap J_n$. Then the sequence (J_n/J) defines the $\mathfrak{m}_{R/J}$-adic topology on R/J.*

Proof. It is clear that $\mathfrak{m}_{R/J}^n \subset J_n/J$. Thus it suffices to show that for every n there exists an N such that $J_N/J \subset \mathfrak{m}_{R/J}^n$. This is equivalent to $J_N \subset \mathfrak{m}_R^n + J$. For each n the ring $R/\mathfrak{m}_R^n$ is Artinian, hence there exists a N_n such that

$$J_{N_n} + \mathfrak{m}_R^n = J_{N_n+1} + \mathfrak{m}_R^n = \ldots$$

Set $E_n = (J_{N_n} + \mathfrak{m}_R^n)/\mathfrak{m}_R^n$. Set $E = \lim E_n \subset \lim R/\mathfrak{m}_R^n = R$. Note that $E \subset J$ as for any $f \in E$ and any m we have $f \in J_m + \mathfrak{m}_R^n$ for all $n \gg 0$, so $f \in J_m$ by Artin-Rees, see Algebra, Lemma 7.47.6. Since the transition maps $E_n \to E_{n-1}$ are all surjective, we see that J surjects onto E_n. Hence for $N = N_n$ works. ☐

Lemma 51.4.8. *Let $\ldots \to A_3 \to A_2 \to A_1$ be a sequence of surjective ring maps in $\mathcal{C}_\Lambda$. If $\dim_k(\mathfrak{m}_{A_n}/\mathfrak{m}_{A_n}^2)$ is bounded, then $S = \lim A_n$ is an object in $\widehat{\mathcal{C}}_\Lambda$ and the ideals $I_n = Ker(S \to A_n)$ define the $\mathfrak{m}_S$-adic topology on S.*

Proof. We will use freely that the maps $S \to A_n$ are surjective for all n. Note that the maps $\mathfrak{m}_{A_{n+1}}/\mathfrak{m}_{A_{n+1}}^2 \to \mathfrak{m}_{A_n}/\mathfrak{m}_{A_n}^2$ are surjective, see Lemma 51.4.2. Hence for n sufficiently large the dimension $\dim_k(\mathfrak{m}_{A_n}/\mathfrak{m}_{A_n}^2)$ stabilizes to an integer, say r. Thus we can find $x_1, \ldots, x_r \in \mathfrak{m}_S$ whose images in A_n generate $\mathfrak{m}_{A_n}$. Moreover, pick $y_1, \ldots, y_t \in S$ whose images in k generate k over Λ. Then we get a ring map $P = \Lambda[z_1, \ldots, z_{r+t}] \to S$, $z_i \mapsto x_i$ and $z_{r+j} \mapsto y_j$ such that the composition $P \to S \to A_n$ is surjective for all n. Let $\mathfrak{m} \subset P$ be the kernel of $P \to k$. Let $R = P^\wedge$ be the $\mathfrak{m}$-adic completion of P; this is an object of $\widehat{\mathcal{C}}_\Lambda$. Since we still have the compatible system of (surjective) maps $R \to A_n$ we get a map $R \to S$. Set $J_n = \mathrm{Ker}(R \to A_n)$. Set $J = \bigcap J_n$. By Lemma 51.4.7 we see that $R/J = \lim R/J_n = \lim A_n = S$ and that the ideals $J_n/J = I_n$ define the $\mathfrak{m}$-adic topology. (Note that for each n we have $\mathfrak{m}_R^{N_n} \subset J_n$ for some N_n and not necessarily $N_n = n$, so a renumbering of the ideals J_n may be necessary before applying the lemma.) ☐

Lemma 51.4.9. *Let $R', R \in Ob(\widehat{\mathcal{C}}_\Lambda)$. Suppose that $R = R' \oplus I$ for some ideal I of R. Let $x_1, \ldots, x_r \in I$ map to a basis of $I/\mathfrak{m}_R I$. Set $S = R'[[X_1, \ldots, X_r]]$ and consider the R'-algebra map $S \to R$ mapping X_i to x_i. Assume that for every $n \gg 0$ the map $S/\mathfrak{m}_S^n \to R/\mathfrak{m}_R^n$ has a left inverse in $\mathcal{C}_\Lambda$. Then $S \to R$ is an isomorphism.*

Proof. As $R = R' \oplus I$ we have

$$\mathfrak{m}_R/\mathfrak{m}_R^2 = \mathfrak{m}_{R'}/\mathfrak{m}_{R'}^2 \oplus I/\mathfrak{m}_R I$$

and similarly

$$\mathfrak{m}_R/\mathfrak{m}_R^2 = \mathfrak{m}_{R'}/\mathfrak{m}_{R'}^2 \oplus \bigoplus kX_i$$

Hence for $n > 1$ the map $S/\mathfrak{m}_S^n \to R/\mathfrak{m}_R^n$ induces an isomorphism on cotangent spaces. Thus a left inverse $h_n : R/\mathfrak{m}_R^n \to S/\mathfrak{m}_S^n$ is surjective by Lemma 51.4.2. Since h_n is injective as a left inverse it is an isomorphism. Thus the canonical surjections $S/\mathfrak{m}_S^n \to R/\mathfrak{m}_R^n$ are all isomorphisms and we win. ☐

51.5. Categories cofibered in groupoids

In developing the theory we work with categories *cofibered* in groupoids. We assume as known the definition and basic properties of categories *fibered* in groupoids, see Categories, Section 4.32.

Definition 51.5.1. Let $\mathcal{C}$ be a category. A *category cofibered in groupoids over $\mathcal{C}$* is a category $\mathcal{F}$ equipped with a functor $p : \mathcal{F} \to \mathcal{C}$ such that $\mathcal{F}^{opp}$ is a category fibered in groupoids over $\mathcal{C}^{opp}$ via $p^{opp} : \mathcal{F}^{opp} \to \mathcal{C}^{opp}$.

Explicitly, $p : \mathcal{F} \to \mathcal{C}$ is cofibered in groupoids if the following two conditions hold:

(1) For every morphism $f : U \to V$ in $\mathcal{C}$ and every object x lying over U, there is a morphism $x \to y$ of $\mathcal{F}$ lying over f.

(2) For every pair of morphisms $a : x \to y$ and $b : x \to z$ of $\mathcal{F}$ and any morphism $f : p(y) \to p(z)$ such that $p(b) = f \circ p(a)$, there exists a unique morphism $c : y \to z$ of $\mathcal{F}$ lying over f such that $b = c \circ a$.

Remarks 51.5.2. Everything about categories fibered in groupoids translates directly to the cofibered setting. The following remarks are meant to fix notation. Let $\mathcal{C}$ be a category.

(1) We often omit the functor $p : \mathcal{F} \to \mathcal{C}$ from the notation.
(2) The fiber category over an object U in $\mathcal{C}$ is denoted by $\mathcal{F}(U)$. Its objects are those of $\mathcal{F}$ lying over U and its morphisms are those of $\mathcal{F}$ lying over id_U. If x, y are objects of $\mathcal{F}(U)$, we sometimes write $Mor_U(x, y)$ for $Mor_{\mathcal{F}(U)}(x, y)$.
(3) The fibre categories $\mathcal{F}(U)$ are groupoids, see Categories, Lemma 4.32.2. Hence the morphisms in $\mathcal{F}(U)$ are all isomorphisms. We sometimes write $\mathrm{Aut}_U(x)$ for $Mor_{\mathcal{F}(U)}(x, x)$.
(4) Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}$, let $f : U \to V$ be a morphism in $\mathcal{C}$, and let $x \in Ob(\mathcal{F}(U))$. A *pushforward* of x along f is a morphism $x \to y$ of $\mathcal{F}$ lying over f. A pushforward is unique up to unique isomorphism (see the discussion following Categories, Definition 4.30.1). We sometimes write $x \to f_*x$ for ``the'' pushforward of x along f.
(5) A *choice of pushforwards for* $\mathcal{F}$ is the choice of a pushforward of x along f for every pair (x, f) as above. We can make such a choice of pushforwards for $\mathcal{F}$ by the axiom of choice.
(6) Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}$. Given a choice of pushforwards for $\mathcal{F}$, there is an associated pseudo-functor $\mathcal{C} \to$ *Groupoids*. We will never use this construction so we give no details.
(7) A morphism of categories cofibered in groupoids over $\mathcal{C}$ is a functor commuting with the projections to $\mathcal{C}$. If $\mathcal{F}$ and $\mathcal{F}'$ are categories cofibered in groupoids over $\mathcal{C}$, we denote the morphisms from $\mathcal{F}$ to $\mathcal{F}'$ by $Mor_{\mathcal{C}}(\mathcal{F}, \mathcal{F}')$.
(8) Categories cofibered in groupoids form a (2, 1)-category $\mathrm{Cof}(\mathcal{C})$. Its 1-morphisms are the morphisms described in (7). If $p : \mathcal{F} \to C$ and $p' : \mathcal{F}' \to \mathcal{C}$ are categories cofibered in groupoids and $\varphi, \psi : \mathcal{F} \to \mathcal{F}'$ are 1-morphisms, then a 2-morphism $t : \varphi \to \psi$ is a morphism of functors such that $p'(t_x) = \mathrm{id}_{p(x)}$ for all $x \in Ob(\mathcal{F})$.
(9) Let $F : \mathcal{C} \to$ *Groupoids* be a functor. There is a category cofibered in groupoids $\mathcal{F} \to \mathcal{C}$ associated to F as follows. An object of $\mathcal{F}$ is a pair (U, x) where $U \in Ob(\mathcal{C})$ and $x \in Ob(F(U))$. A morphism $(U, x) \to (V, y)$ is a pair (f, a) where $f \in Mor_{\mathcal{C}}(U, V)$ and $a \in Mor_{F(V)}(F(f)(x), y)$. The functor $\mathcal{F} \to \mathcal{C}$ sends (U, x) to U. See Categories, Section 4.34.
(10) Let $\mathcal{F}$ be cofibered in groupoids over $\mathcal{C}$. For $U \in Ob(\mathcal{C})$ set $\overline{F}(U)$ equal to the set of isomorphisms classes of the category $\mathcal{F}(U)$. If $f : U \to V$ is a morphism of $\mathcal{C}$, then we obtain a map of sets $\overline{F}(U) \to \overline{F}(V)$ by mapping the isomorphism class of x to the isomorphism class of a pushforward f_*x of x see (4). Then $\overline{\mathcal{F}} : \mathcal{C} \to$ *Sets* is a functor. Similarly, if $\varphi : \mathcal{F} \to \mathcal{G}$ is a morphism of cofibered categories, we denote by $\overline{\varphi} : \overline{\mathcal{F}} \to \overline{\mathcal{G}}$ the associated morphism of functors.
(11) Let $F : \mathcal{C} \to$ *Sets* be a functor. We can think of a set as a discrete category, i.e., as a groupoid with only identity morphisms. Then the construction (9) associates to F a category cofibered in sets. This defines a fully faithful embedding of the category of functors $\mathcal{C} \to$ *Sets* to the category of categories cofibered in groupoids over $\mathcal{C}$. We identify the category of functors with its image under this

embedding. Hence if $F : \mathcal{C} \to Sets$ is a functor, we denote the associated category cofibered in sets also by F; and if $\varphi : F \to G$ is a morphism of functors, we denote still by φ the corresponding morphism of categories cofibered in sets, and vice-versa. See Categories, Section 4.35.

(12) Let U be an object of $\mathcal{C}$. We write $\underline{U}$ for the functor $Mor_{\mathcal{C}}(U, -) : \mathcal{C} \to Sets$. This defines a fully faithful embedding of $\mathcal{C}^{opp}$ into the category of functors $\mathcal{C} \to Sets$. Hence, if $f : U \to V$ is a morphism, we are justified in denoting still by f the induced morphism $\underline{V} \to \underline{U}$, and vice-versa.

(13) Fiber products of categories cofibered in groupoids: If $\mathcal{F} \to \mathcal{H}$ and $\mathcal{G} \to \mathcal{H}$ are morphisms of categories cofibered in groupoids over $\mathcal{C}_\Lambda$, then a construction of their 2-fiber product is given by the construction for their 2-fiber product as categories over $\mathcal{C}_\Lambda$, as described in Categories, Lemma 4.29.3.

(14) Restricting the base category: Let $p : \mathcal{F} \to \mathcal{C}$ be a category cofibered in groupoids, and let $\mathcal{C}'$ be a full subcategory of $\mathcal{C}$. The restriction $\mathcal{F}|_{\mathcal{C}'}$ is the full subcategory of $\mathcal{F}$ whose objects lie over objects of $\mathcal{C}'$. It is a category cofibered in groupoids via the functor $p|_{\mathcal{C}'} : \mathcal{F}|_{\mathcal{C}'} \to \mathcal{C}'$.

51.6. Prorepresentable functors and predeformation categories

Our basic goal is to understand categories cofibered in groupoids over $\mathcal{C}_\Lambda$ and $\widehat{\mathcal{C}}_\Lambda$. Since $\mathcal{C}_\Lambda$ is a full subcategory of $\widehat{\mathcal{C}}_\Lambda$ we can restrict categories cofibred in groupoids over $\widehat{\mathcal{C}}_\Lambda$ to $\mathcal{C}_\Lambda$, see Remarks 51.5.2 (14). In particular we can do this with functors, in particular with representable functors. The functors on $\mathcal{C}_\Lambda$ one obtains in this way are called prorepresentable functors.

Definition 51.6.1. Let $F : \mathcal{C}_\Lambda \to Sets$ be a functor. We say F is *prorepresentable* if there exists an isomorphism $F \cong \underline{R}|_{\mathcal{C}_\Lambda}$ of functors for some $R \in Ob(\widehat{\mathcal{C}}_\Lambda)$.

Note that if $F : \mathcal{C}_\Lambda \to Sets$ is prorepresentable by $R \in Ob(\widehat{\mathcal{C}}_\Lambda)$, then

$$F(k) = Mor_{\widehat{\mathcal{C}}_\Lambda}(R, k) = \{*\}$$

is a singleton. The categories cofibered in groupoids over $\mathcal{C}_\Lambda$ that are arise in deformation theory will often satisfy an analogous condition.

Definition 51.6.2. A *predeformation category* $\mathcal{F}$ is a category cofibered in groupoids over $\mathcal{C}_\Lambda$ such that $\mathcal{F}(k)$ is equivalent to a category with a single object and a single morphism, i.e., $\mathcal{F}(k)$ contains at least one object and there is a unique morphism between any two objects. A *morphism of predeformation categories* is a morphism of categories cofibered in groupoids over $\mathcal{C}_\Lambda$.

A feature of a predeformation category is the following. Let $x_0 \in Ob(\mathcal{F}(k))$. Then every object of $\mathcal{F}$ comes equipped with a unique morphism to x_0. Namely, if x is an object of $\mathcal{F}$ over A, then we can choose a pushforward $x \to q_*x$ where $q : A \to k$ is the quotient map. There is a unique isomorphism $q_*x \to x_0$ and the composition $x \to q_*x \to x_0$ is the desired morphism.

Remark 51.6.3. We say that a functor $F : \mathcal{C}_\Lambda \to Sets$ is a *predeformation functor* if the associated cofibered set is a predeformation category, i.e. if $F(k)$ is a one element set. Thus if $\mathcal{F}$ is a predeformation category, then $\overline{\mathcal{F}}$ is a predeformation functor.

Remark 51.6.4. Let $p : \mathcal{F} \to \mathcal{C}_\Lambda$ be a category cofibered in groupoids, and let $x \in Ob(\mathcal{F}(k))$. We denote by $\mathcal{F}_x$ the category of objects over x. An object of $\mathcal{F}_x$ is an arrow $y \to x$. A morphism $(y \to x) \to (z \to x)$ in $\mathcal{F}_x$ is a commutative diagram

$$\begin{tikzcd} y \arrow[rr] \arrow[dr] & & z \arrow[dl] \\ & x & \end{tikzcd}$$

There is a forgetful functor $\mathcal{F}_x \to \mathcal{F}$. We define the functor $p_x : \mathcal{F}_x \to \mathcal{C}_\Lambda$ as the composition $\mathcal{F}_x \to \mathcal{F} \xrightarrow{p} \mathcal{C}_\Lambda$. Then $p_x : \mathcal{F}_x \to \mathcal{C}_\Lambda$ is a predeformation category (proof omitted). In this way we can pass from an arbitrary category cofibered in groupoids over $\mathcal{C}_\Lambda$ to a predeformation category at any $x \in Ob(\mathcal{F}(k))$.

51.7. Formal objects and completion categories

In this section we discuss how to go between categories cofibred in groupoids over $\mathcal{C}_\Lambda$ to categories cofibred in groupoids over $\widehat{\mathcal{C}}_\Lambda$ and vice versa.

Definition 51.7.1. Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_\Lambda$. The *category $\widehat{\mathcal{F}}$ of formal objects of $\mathcal{F}$* is the category with the following objects and morphisms.

(1) A *formal object $\xi = (R, \xi_n, f_n)$ of $\mathcal{F}$* consists of an object R of $\widehat{\mathcal{C}}_\Lambda$, and a collection indexed by $n \in \mathbf{N}$ of objects ξ_n of $\mathcal{F}(R/\mathfrak{m}_R^n)$ and morphisms $f_n : \xi_{n+1} \to \xi_n$ lying over the projection $R/\mathfrak{m}_R^{n+1} \to R/\mathfrak{m}_R^n$.
(2) Let $\xi = (R, \xi_n, f_n)$ and $\eta = (S, \eta_n, g_n)$ be formal objects of $\mathcal{F}$. A *morphism $a : \xi \to \eta$ of formal objects* consists of a map $a_0 : R \to S$ in $\widehat{\mathcal{C}}_\Lambda$ and a collection $a_n : \xi_n \to \eta_n$ of morphisms of $\mathcal{F}$ lying over $R/\mathfrak{m}_R^n \to S/\mathfrak{m}_S^n$, such that for every n the diagram

$$\begin{tikzcd} \xi_{n+1} \arrow[r, "f_n"] \arrow[d, "a_{n+1}"'] & \xi_n \arrow[d, "a_n"] \\ \eta_{n+1} \arrow[r, "g_n"] & \eta_n \end{tikzcd}$$

commutes.

The category of formal objects comes with a functor $\hat{p} : \widehat{\mathcal{F}} \to \widehat{\mathcal{C}}_\Lambda$ which sends an object (R, ξ_n, f_n) to R and a morphism $(R, \xi_n, f_n) \to (S, \eta_n, g_n)$ to the map $R \to S$.

Lemma 51.7.2. *Let $p : \mathcal{F} \to \mathcal{C}_\Lambda$ be a category cofibered in groupoids. Then $\hat{p} : \widehat{\mathcal{F}} \to \widehat{\mathcal{C}}_\Lambda$ is a category cofibered in groupoids.*

Proof. Let $R \to S$ be a ring map in $\widehat{\mathcal{C}}_\Lambda$. Let (R, ξ_n, f_n) be an object of $\widehat{\mathcal{F}}$. For each n choose a pushforward $\xi_n \to \eta_n$ of ξ_n along $R/\mathfrak{m}_R^n \to S/\mathfrak{m}_S^n$. For each n there exists a unique morphism $g_n : \eta_{n+1} \to \eta_n$ in $\mathcal{F}$ lying over $S/\mathfrak{m}_S^{n+1} \to S/\mathfrak{m}_S^n$ such that

$$\begin{tikzcd} \xi_{n+1} \arrow[r, "f_n"'] \arrow[d] & \xi_n \arrow[d] \\ \eta_{n+1} \arrow[r, "g_n"] & \eta_n \end{tikzcd}$$

commutes (by the first axiom of a category cofibred in groupoids). Hence we obtain a morphism $(R, \xi_n, f_n) \to (S, \eta_n, g_n)$ lying over $R \to S$, i.e., the first axiom of a category cofibred in groupoids holds for $\widehat{\mathcal{F}}$. To see the second axiom suppose that we have morphisms $a : (R, \xi_n, f_n) \to (S, \eta_n, g_n)$ and $b : (R, \xi_n, f_n) \to (T, \theta_n, h_n)$ in $\widehat{\mathcal{F}}$ and a morphism $c_0 : S \to T$ in $\widehat{\mathcal{C}}_\Lambda$ such that $c_0 \circ a_0 = b_0$. By the second axiom of a category cofibred in groupoids for $\mathcal{F}$ we obtain unique maps $c_n : \eta_n \to \theta_n$ lying over $S/\mathfrak{m}_S^n \to T/\mathfrak{m}_T^n$ such that $c_n \circ a_n = b_n$. Setting $c = (c_n)_{n \geq 0}$ gives the desired morphism $c : (S, \eta_n, g_n) \to (T, \theta_n, h_n)$ in $\widehat{\mathcal{F}}$ (we omit the verification that $h_n \circ c_{n+1} = c_n \circ g_n$). □

Definition 51.7.3. Let $p : \mathcal{F} \to \mathcal{C}_\Lambda$ be a category cofibered in groupoids. The category cofibered in groupoids $\hat{p} : \widehat{\mathcal{F}} \to \widehat{\mathcal{C}}_\Lambda$ is called the *completion of* $\mathcal{F}$.

If $\mathcal{F}$ is a category cofibered in groupoids over $\mathcal{C}_\Lambda$, we have defined $\widehat{\mathcal{F}}(R)$ for $R \in Ob(\widehat{\mathcal{C}}_\Lambda)$ in terms of the filtration of R by powers of its maximal ideal. But suppose $\mathcal{I} = (I_n)$ is a filtration of R by ideals inducing the $\mathfrak{m}_R$-adic topology. We define $\widehat{\mathcal{F}}_\mathcal{I}(R)$ to be the category with the following objects and morphisms:

(1) An object is a collection $(\xi_n, f_n)_{n \in \mathbf{N}}$ of objects ξ_n of $\mathcal{F}(R/I_n)$ and morphisms $f_n : \xi_{n+1} \to \xi_n$ lying over the projections $R/I_{n+1} \to R/I_n$.
(2) A morphism $a : (\xi_n, f_n) \to (\eta_n, g_n)$ consists of a collection $a_n : \xi_n \to \eta_n$ of morphisms in $\mathcal{F}(R/I_n)$, such that for every n the diagram

$$\begin{tikzcd} \xi_{n+1} \arrow[r, "f_n"] \arrow[d, "a_{n+1}"'] & \xi_n \arrow[d, "a_n"] \\ \eta_{n+1} \arrow[r, "g_n"] & \eta_n \end{tikzcd}$$

commutes.

Lemma 51.7.4. *In the situation above, $\widehat{\mathcal{F}}_\mathcal{I}(R)$ is equivalent to the category $\widehat{\mathcal{F}}(R)$.*

Proof. An equivalence $\widehat{\mathcal{F}}_\mathcal{I}(R) \to \widehat{\mathcal{F}}(R)$ can be defined as follows. For each n, let $m(n)$ be the least m that $I_m \subset \mathfrak{m}_R^n$. Given an object (ξ_n, f_n) of $\widehat{\mathcal{F}}_\mathcal{I}(R)$, let η_n be the pushforward of $\xi_{m(n)}$ along $R/I_{m(n)} \to R/\mathfrak{m}_R^n$. Let $g_n : \eta_{n+1} \to \eta_n$ be the unique morphism of $\mathcal{F}$ lying over $R/\mathfrak{m}_R^{n+1} \to R/\mathfrak{m}_R^n$ such that

$$\begin{tikzcd} \xi_{m(n+1)} \arrow[r, "f_{m(n)} \circ \ldots \circ f_{m(n+1)-1}"'] \arrow[d] & \xi_{m(n)} \arrow[d] \\ \eta_{n+1} \arrow[r, "g_n"] & \eta_n \end{tikzcd}$$

commutes (existence and uniqueness is garanteed by the axioms of a cofibred category). The functor $\widehat{\mathcal{F}}_\mathcal{I}(R) \to \widehat{\mathcal{F}}(R)$ sends (ξ_n, f_n) to (R, η_n, g_n). We omit the verification that this is indeed an equivalence of categories. □

Remark 51.7.5. Let $p : \mathcal{F} \to \mathcal{C}_\Lambda$ be a category cofibered in groupoids. Suppose that for each $R \in Ob(\widehat{\mathcal{C}}_\Lambda)$ we are given a filtration $\mathcal{I}_R$ of R by ideals. If $\mathcal{I}_R$ induces the $\mathfrak{m}_R$-adic topology on R for all R, then one can define a category $\widehat{\mathcal{F}}_\mathcal{I}$ by mimicking the definition of $\widehat{\mathcal{F}}$. This category comes equipped with a morphism $\hat{p}_\mathcal{I} : \widehat{\mathcal{F}}_\mathcal{I} \to \widehat{\mathcal{C}}_\Lambda$ making it into a category cofibered in groupoids such that $\widehat{\mathcal{F}}_\mathcal{I}(R)$ is isomorphic to $\widehat{\mathcal{F}}_{\mathcal{I}_R}(R)$ as defined above. The categories cofibered in groupoids $\widehat{\mathcal{F}}_\mathcal{I}$ and $\widehat{\mathcal{F}}$ are equivalent, by using over an object $R \in Ob(\widehat{\mathcal{C}}_\Lambda)$ the equivalence of Lemma 51.7.4.

Remark 51.7.6. Let $F : \mathcal{C}_\Lambda \to Sets$ be a functor. Identifying functors with cofibered sets, the completion of F is the functor $\widehat{F} : \widehat{\mathcal{C}}_\Lambda \to Sets$ given by $\widehat{F}(S) = \lim F(S/\mathfrak{m}_S^n)$. This agrees with the definition in Schlessinger's paper [**Sch68**].

Remark 51.7.7. Let $\mathcal{F}$ be a category cofibred in groupoids over $\mathcal{C}_\Lambda$. We claim that there is a canonical equivalence

$$can : \widehat{\mathcal{F}}|_{\mathcal{C}_\Lambda} \longrightarrow \mathcal{F}.$$

Namely, let $A \in Ob(\mathcal{C}_\Lambda)$ and let (A, ξ_n, f_n) be an object of $\widehat{\mathcal{F}}|_{\mathcal{C}_\Lambda}(A)$. Since A is Artinian there is a minimal $m \in \mathbf{N}$ such that $\mathfrak{m}_A^m = 0$. Then can sends (A, ξ_n, f_n) to ξ_m. This functor is an equivalence of categories cofibered in groupoids by Categories, Lemma 4.32.8 because it is an equivalence on all fibre categories by Lemma 51.7.4 and the fact that the $\mathfrak{m}_A$-adic topology on a local Artinian ring A comes from the zero ideal. We will frequently identify $\mathcal{F}$ with a full subcategory of $\widehat{\mathcal{F}}$ via a quasi-inverse to the functor can.

Remark 51.7.8. Let $\varphi : \mathcal{F} \to \mathcal{G}$ be a morphism of categories cofibered in groupoids over $\mathcal{C}_\Lambda$. Then there is an induced morphism $\widehat{\varphi} : \widehat{\mathcal{F}} \to \widehat{\mathcal{G}}$ of categories cofibered in groupoids over $\widehat{\mathcal{C}}_\Lambda$. It sends an object $\xi = (R, \xi_n, f_n)$ of $\widehat{\mathcal{F}}$ to $(R, \varphi(\xi_n), \varphi(f_n))$, and it sends a morphism $(a_0 : R \to S, a_n : \xi_n \to \eta_n)$ between objects ξ and η of $\widehat{\mathcal{F}}$ to $(a_0 : R \to S, \varphi(a_n) : \varphi(\xi_n) \to \varphi(\eta_n))$. Finally, if $t : \varphi \to \varphi'$ is a 2-morphism between 1-morphisms $\varphi, \varphi' : \mathcal{F} \to \mathcal{G}$ of categories cofibred in groupoids, then we obtain a 2-morphism $\hat{t} : \widehat{\varphi} \to \widehat{\varphi}'$. Namely, for $\xi = (R, \xi_n, f_n)$ as above we set $\hat{t}_\xi = (t_{\varphi(\xi_n)})$. Hence completion defines a functor between 2-categories

$$\widehat{\ } : \text{Cof}(\mathcal{C}_\Lambda) \longrightarrow \text{Cof}(\widehat{\mathcal{C}}_\Lambda)$$

from the 2-category of categories cofibred in groupoids over $\mathcal{C}_\Lambda$ to the 2-category of categories cofibred in groupoids over $\widehat{\mathcal{C}}_\Lambda$.

Remark 51.7.9. We claim the completion functor of Remark 51.7.8 and the restriction functor $|_{\mathcal{C}_\Lambda} : \text{Cof}(\widehat{\mathcal{C}}_\Lambda) \to \text{Cof}(\mathcal{C}_\Lambda)$ of Remarks 51.5.2 (14) are ``2-adjoint'' in the following precise sense. Let $\mathcal{F} \in Ob(\text{Cof}(\mathcal{C}_\Lambda))$ and let $\mathcal{G} \in Ob(\text{Cof}(\widehat{\mathcal{C}}_\Lambda))$. Then there is an equivalence of categories

$$\Phi : Mor_{\mathcal{C}_\Lambda}(\mathcal{G}|_{\mathcal{C}_\Lambda}, \mathcal{F}) \longrightarrow Mor_{\widehat{\mathcal{C}}_\Lambda}(\mathcal{G}, \widehat{\mathcal{F}})$$

To describe this equivalence, we define canonical morphisms $\mathcal{G} \to \widehat{\mathcal{G}|_{\mathcal{C}_\Lambda}}$ and $\widehat{\mathcal{F}}|_{\mathcal{C}_\Lambda} \to \mathcal{F}$ as follows

(1) Let $R \in Ob(\widehat{\mathcal{C}}_\Lambda)$ and let ξ be an object of the fiber category $\mathcal{G}(R)$. Choose a pushforward $\xi \to \xi_n$ of ξ to $R/\mathfrak{m}_R^n$ for each $n \in \mathbf{N}$, and let $f_n : \xi_{n+1} \to \xi_n$ be the induced morphism. Then $\mathcal{G} \to \widehat{\mathcal{G}|_{\mathcal{C}_\Lambda}}$ sends ξ to (R, ξ_n, f_n).
(2) This is the equivalence $can : \widehat{\mathcal{F}}|_{\mathcal{C}_\Lambda} \to \mathcal{F}$ of Remark 51.7.7.

Having said this, the equivalence $\Phi : Mor_{\mathcal{C}_\Lambda}(\mathcal{G}|_{\mathcal{C}_\Lambda}, \mathcal{F}) \to Mor_{\widehat{\mathcal{C}}_\Lambda}(\mathcal{G}, \widehat{\mathcal{F}})$ sends a morphism $\varphi : \mathcal{G}|_{\mathcal{C}_\Lambda} \to \mathcal{F}$ to

$$\mathcal{G} \to \widehat{\mathcal{G}|_{\mathcal{C}_\Lambda}} \xrightarrow{\widehat{\varphi}} \widehat{\mathcal{F}}$$

There is a quasi-inverse $\Psi : Mor_{\widehat{\mathcal{C}}_\Lambda}(\mathcal{G}, \widehat{\mathcal{F}}) \to Mor_{\mathcal{C}_\Lambda}(\mathcal{G}|_{\mathcal{C}_\Lambda}, \mathcal{F})$ to Φ which sends $\psi : \mathcal{G} \to \widehat{\mathcal{F}}$ to

$$\mathcal{G}|_{\mathcal{C}_\Lambda} \xrightarrow{\psi|_{\mathcal{C}_\Lambda}} \widehat{\mathcal{F}}|_{\mathcal{C}_\Lambda} \to \mathcal{F}.$$

We omit the verification that Φ and Ψ are quasi-inverse. We also do not address functoriality of Φ (because it would lead into 3-category territory which we want to avoid at all cost).

Remark 51.7.10. For a category $\mathcal{C}$ we denote by CofSet($\mathcal{C}$) the category of cofibered sets over $\mathcal{C}$. It is a 1-category isomorphic the category of functors $\mathcal{C} \to \textit{Sets}$. See Remarks 51.5.2 (11). The completion and restriction functors restrict to functors$\hat{}$: CofSet($\mathcal{C}_\Lambda$) $\to$ CofSet($\widehat{\mathcal{C}}_\Lambda$) and $|_{\mathcal{C}_\Lambda}$: CofSet($\widehat{\mathcal{C}}_\Lambda$) $\to$ CofSet($\mathcal{C}_\Lambda$) which we denote by the same symbols. As functors on the categories of cofibered sets, completion and restriction are adjoints in the usual 1-categorical sense: the same construction as in Remark 51.7.9 defines a functorial bijection

$$Mor_{\mathcal{C}_\Lambda}(G|_{\mathcal{C}_\Lambda}, F) \longrightarrow Mor_{\widehat{\mathcal{C}}_\Lambda}(G, \widehat{F})$$

for $F \in Ob(\text{CofSet}(\mathcal{C}_\Lambda))$ and $G \in Ob(\text{CofSet}(\widehat{\mathcal{C}}_\Lambda))$. Again the map $\widehat{F}|_{\mathcal{C}_\Lambda} \to F$ is an isomorphism.

Remark 51.7.11. Let $G : \widehat{\mathcal{C}}_\Lambda \to \textit{Sets}$ be a functor that commutes with limits. Then the map $G \to \widehat{G|_{\mathcal{C}_\Lambda}}$ described in Remark 51.7.9 is an isomorphism. Indeed, if S is an object of $\widehat{\mathcal{C}}_\Lambda$, then we have canonical bijections

$$\widehat{G|_{\mathcal{C}_\Lambda}}(S) = lim_n\, G(S/\mathfrak{m}_S^n) = G(lim_n\, S/\mathfrak{m}_S^n) = G(S).$$

In particular, if R is an object of $\widehat{\mathcal{C}}_\Lambda$ then $\underline{R} = \widehat{\underline{R}|_{\mathcal{C}_\Lambda}}$ because the representable functor $\underline{R}$ commutes with limits by definition of limits.

Remark 51.7.12. Let R be an object of $\widehat{\mathcal{C}}_\Lambda$. It defines a functor $\underline{R} : \widehat{\mathcal{C}}_\Lambda \to \textit{Sets}$ as described in Remarks 51.5.2 (12). As usual we identify this functor with the associated cofibered set. If $\mathcal{F}$ is a cofibered category over $\mathcal{C}_\Lambda$, then there is an equivalence of categories

$$Mor_{\mathcal{C}_\Lambda}(\underline{R}|_{\mathcal{C}_\Lambda}, \mathcal{F}) \longrightarrow \widehat{\mathcal{F}}(R). \tag{51.7.12.1}$$

It is given by the composition

$$Mor_{\mathcal{C}_\Lambda}(\underline{R}|_{\mathcal{C}_\Lambda}, \mathcal{F}) \xrightarrow{\Phi} Mor_{\widehat{\mathcal{C}}_\Lambda}(\underline{R}, \widehat{\mathcal{F}}) \xrightarrow{\sim} \widehat{\mathcal{F}}(R)$$

where Φ is as in Remark 51.7.9 and the second equivalence comes from the 2-Yoneda lemma (the cofibered analogue of Categories, Lemma 4.38.1). Explicitly, the equivalence sends a morphism $\varphi : \underline{R}|_{\mathcal{C}_\Lambda} \to \mathcal{F}$ to the formal object $(R, \varphi(R \to R/\mathfrak{m}_R^n), \varphi(f_n))$ in $\widehat{\mathcal{F}}(R)$, where $f_n : R/\mathfrak{m}_R^{n+1} \to R/\mathfrak{m}_R^n$ is the projection.

Assume a choice of pushforwards for $\mathcal{F}$ has been made. Given any $\xi \in Ob(\widehat{\mathcal{F}}(R))$ we construct an explicit $\underline{\xi} : \underline{R}|_{\mathcal{C}_\Lambda} \to \mathcal{F}$ which maps to ξ under (51.7.12.1). Namely, say $\xi = (R, \xi_n, f_n)$. An object α in $\underline{R}|_{\mathcal{C}_\Lambda}$ is the same thing as a morphism $\alpha : R \to A$ of $\widehat{\mathcal{C}}_\Lambda$ with A Artinian. Let $m \in \mathbf{N}$ be minimal such that $\mathfrak{m}_A^m = 0$. Then α factors through a unique $\alpha_m : R/\mathfrak{m}_R^m \to A$ and we can set $\underline{\xi}(\alpha) = \alpha_{m,*}\xi_m$. We omit the description of $\underline{\xi}$ on morphisms and we omit the proof that $\underline{\xi}$ maps to ξ via (51.7.12.1).

Assume a choice of pushforwards for $\widehat{\mathcal{F}}$ has been made. In this case the proof of Categories, Lemma 4.38.1 gives an explicit quasi-inverse

$$\iota : \widehat{\mathcal{F}}(R) \longrightarrow Mor_{\widehat{\mathcal{C}}_\Lambda}(\underline{R}, \widehat{\mathcal{F}})$$

to the 2-Yoneda equivalence which takes ξ to the the morphism $\iota(\xi) : \underline{R} \to \widehat{\mathcal{F}}$ sending $f \in \underline{R}(S) = Mor_{\mathcal{C}_\Lambda}(R, S)$ to $f_*\xi$. A quasi-inverse to (51.7.12.1) is then

$$\widehat{\mathcal{F}}(R) \xrightarrow{\iota} Mor_{\widehat{\mathcal{C}}_\Lambda}(\underline{R}, \widehat{\mathcal{F}}) \xrightarrow{\Psi} Mor_{\mathcal{C}_\Lambda}(\underline{R}|_{\mathcal{C}_\Lambda}, \mathcal{F})$$

where Ψ is as in Remark 51.7.9. Given $\xi \in Ob(\widehat{\mathcal{F}}(R))$ we have $\Psi(\iota(\xi)) \cong \underline{\xi}$ where $\underline{\xi}$ is as in the previous paragraph, because both are mapped to ξ under the equivalence of categories (51.7.12.1). Using $\underline{R} = \widehat{\underline{R}|_{\mathcal{C}_\Lambda}}$ (see Remark 51.7.11) and unwinding the definitions of Φ and Ψ we conclude that $\iota(\xi)$ is isomorphic to the completion of $\underline{\xi}$.

Remark 51.7.13. Let $\mathcal{F}$ be a category cofibred in groupoids over $\mathcal{C}_\Lambda$. Let $\xi = (R, \xi_i, f_n)$ and $\eta = (S, \eta_n, g_n)$ be formal objects of $\mathcal{F}$. Let $a = (a_n) : \xi \to \eta$ be a morphism of formal objects, i.e., a morphism of $\widehat{\mathcal{F}}$. Let $f = \hat{p}(a) = a_0 : R \to S$ be the projection of a in $\widehat{\mathcal{C}}_\Lambda$. Then we obtain a 2-commutative diagram

$$\begin{tikzcd} \underline{R}|_{\mathcal{C}_\Lambda} \arrow[dr, "\underline{\xi}"'] & & \underline{S}|_{\mathcal{C}_\Lambda} \arrow[ll, "f"'] \arrow[dl, "\underline{\eta}"] \\ & \mathcal{F} & \end{tikzcd}$$

where $\underline{\xi}$ and $\underline{\eta}$ are the morphisms constructed in Remark 51.7.12. To see this let $\alpha : S \to A$ be an object of $\underline{S}|_{\mathcal{C}_\Lambda}$ (see loc. cit.). Let $m \in \mathbf{N}$ be minimal such that $\mathfrak{m}_A^m = 0$. We get a commutative diagram

$$\begin{tikzcd} R \arrow[r] \arrow[d, "f"] & R/\mathfrak{m}_R^m \arrow[d, "f_m"'] \arrow[dr, "\beta_m"] & \\ S \arrow[r] & S/\mathfrak{m}_S^m \arrow[r, "\alpha_m"] & A \end{tikzcd}$$

such that the bottom arrows compose to give α. Then $\underline{\eta}(\alpha) = \alpha_{m,*}\eta_m$ and $\underline{\xi}(\alpha \circ f) = \beta_{m,*}\xi_m$. The morphism $a_m : \xi_m \to \eta_m$ lies over f_m hence we obtain a canonical morphism

$$\underline{\xi}(\alpha \circ f) = \beta_{m,*}\xi_m \longrightarrow \underline{\eta}(\alpha) = \alpha_{m,*}\eta_m$$

lying over id_A such that

$$\begin{tikzcd} \xi_m \arrow[r] \arrow[d, "a_m"] & \beta_{m,*}\xi_m \arrow[d] \\ \eta_m \arrow[r] & \alpha_{m,*}\eta_m \end{tikzcd}$$

commutes by the axioms of a category cofibred in groupoids. This defines a transformation of functors $\underline{\xi} \circ f \to \underline{\eta}$ which witnesses the 2-commutativity of the first diagram of this remark.

Remark 51.7.14. According to Remark 51.7.12, giving a formal object ξ of $\mathcal{F}$ is equivalent to giving a prorepresentable functor $U : \mathcal{C}_\Lambda \to Sets$ and a morphism $U \to \mathcal{F}$.

51.8. Smooth morphisms

In this section we discuss smooth morphisms of categories cofibered in groupoids over $\mathcal{C}_\Lambda$.

Definition 51.8.1. Let $\varphi : \mathcal{F} \to \mathcal{G}$ be a morphism of categories cofibered in groupoids over $\mathcal{C}_\Lambda$. We say φ is *smooth* if it satisfies the following condition: Let $B \to A$ be a surjective ring map in $\mathcal{C}_\Lambda$. Let $y \in Ob(\mathcal{G}(B)), x \in Ob(\mathcal{F}(A))$, and $y \to \varphi(x)$ be a morphism lying over $B \to A$. Then there exists $x' \in Ob(\mathcal{F}(B))$, a morphism $x' \to x$ lying over $B \to A$, and a morphism $\varphi(x') \to y$ lying over $\mathrm{id} : B \to B$, such that the diagram

$$\begin{tikzcd} \varphi(x') \arrow[r] \arrow[dr] & y \arrow[d] \\ & \varphi(x) \end{tikzcd}$$

commutes.

Lemma 51.8.2. *Let $\varphi : \mathcal{F} \to \mathcal{G}$ be a morphism of categories cofibered in groupoids over $\mathcal{C}_\Lambda$. Then φ is smooth if the condition in Definition 51.8.1 is assumed to hold only for small extensions $B \to A$.*

Proof. Let $B \to A$ be a surjective ring map in $\mathcal{C}_\Lambda$. Let $y \in Ob(\mathcal{G}(B))$, $x \in Ob(\mathcal{F}(A))$, and $y \to \varphi(x)$ be a morphism lying over $B \to A$. By Lemma 51.3.3 we can factor $B \to A$ into small extensions $B = B_n \to B_{n-1} \to \ldots \to B_0 = A$. We argue by induction on n. If $n = 1$ the result is true by assumption. If $n > 1$, then denote $f : B = B_n \to B_{n-1}$ and denote $g : B_{n-1} \to B_0 = A$. Choose a pushforward $y \to f_*y$ of y along f, so that the morphism $y \to \varphi(x)$ factors as $y \to f_*y \to \varphi(x)$. By the induction hypothesis we can find $x_{n-1} \to x$ lying over $g : B_{n-1} \to A$ and $a : \varphi(x_{n-1}) \to f_*y$ lying over $\mathrm{id} : B_{n-1} \to B_{n-1}$ such that

$$\begin{tikzcd} \varphi(x_{n-1}) \arrow[r, "a"'] \arrow[dr] & f_*y \arrow[d] \\ & \varphi(x) \end{tikzcd}$$

commutes. We can apply the assumption to the composition $y \to \varphi(x_{n-1})$ of $y \to f_*y$ with $a^{-1} : f_*y \to \varphi(x_{n-1})$. We obtain $x_n \to x_{n-1}$ lying over $B_n \to B_{n-1}$ and $\varphi(x_n) \to y$ lying over $\mathrm{id} : B_n \to B_n$ so that the diagram

$$\begin{tikzcd} \varphi(x_n) \arrow[r] \arrow[d] & y \arrow[d] \\ \varphi(x_{n-1}) \arrow[r, "a"] \arrow[dr] & f_*y \arrow[d] \\ & \varphi(x) \end{tikzcd}$$

commutes. Then the composition $x_n \to x_{n-1} \to x$ and $\varphi(x_n) \to y$ are the morphisms required by the definition of smoothness. $\square$

Remark 51.8.3. Let $\varphi : \mathcal{F} \to \mathcal{G}$ be a morphism of categories cofibered in groupoids over $\mathcal{C}_\Lambda$. Let $B \to A$ be a ring map in $\mathcal{C}_\Lambda$. Choices of pushforwards along $B \to A$ for objects in the fiber categories $\mathcal{F}(B)$ and $\mathcal{G}(B)$ determine functors $\mathcal{F}(B) \to \mathcal{F}(A)$ and $\mathcal{G}(B) \to \mathcal{G}(A)$ fitting into a 2-commutative diagram

$$\begin{tikzcd} \mathcal{F}(B) \arrow[r, "\varphi"] \arrow[d] & \mathcal{G}(B) \arrow[d] \\ \mathcal{F}(A) \arrow[r, "\varphi"] & \mathcal{G}(A). \end{tikzcd}$$

Hence there is an induced functor $\mathcal{F}(B) \to \mathcal{F}(A) \times_{\mathcal{G}(A)} \mathcal{G}(B)$. Unwinding the definitions shows that $\varphi : \mathcal{F} \to \mathcal{G}$ is smooth if and only if this induced functor is essentially surjective whenever $B \to A$ is surjective (or equivalently, by Lemma 51.8.2, whenever $B \to A$ is a small extension).

Remark 51.8.4. The characterization of smooth morphisms in Remark 51.8.3 is analogous to Schlessinger's notion of a smooth morphism of functors, cf. [**Sch68**, Definition 2.2.]. In fact, when $\mathcal{F}$ and $\mathcal{G}$ are cofibered in sets then our notion is equivalent to Schlessinger's. Namely, in this case let $F, G : \mathcal{C}_\Lambda \to Sets$ be the corresponding functors, see Remarks 51.5.2 (11). Then $F \to G$ is smooth if and only if for every surjection of rings $B \to A$ in $\mathcal{C}_\Lambda$ the map $F(B) \to F(A) \times_{G(A)} G(B)$ is surjective.

Remark 51.8.5. Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_\Lambda$. Then the morphism $\mathcal{F} \to \overline{\mathcal{F}}$ is smooth.

If $R \to S$ is a ring map $\widehat{\mathcal{C}}_\Lambda$, then there is an induced morphism $\underline{S} \to \underline{R}$ between the functors $\underline{S}, \underline{R} : \widehat{\mathcal{C}}_\Lambda \to Sets$. In this situation, smoothness of the restriction $\underline{S}|_{\mathcal{C}_\Lambda} \to \underline{R}|_{\mathcal{C}_\Lambda}$ is a familiar notion:

Lemma 51.8.6. *Let $R \to S$ be a ring map in $\widehat{\mathcal{C}}_\Lambda$. Then the induced morphism $\underline{S}|_{\mathcal{C}_\Lambda} \to \underline{R}|_{\mathcal{C}_\Lambda}$ is smooth if and only if S is a power series ring over R.*

Proof. Assume S is a power series ring over R. Say $S = R[[x_1, \ldots, x_n]]$. Smoothness of $\underline{S}|_{\mathcal{C}_\Lambda} \to \underline{R}|_{\mathcal{C}_\Lambda}$ means the following (see Remark 51.8.4): Given a surjective ring map $B \to A$ in $\mathcal{C}_\Lambda$, a ring map $R \to B$, a ring map $S \to A$ such that the solid diagram

$$\begin{tikzcd} S \arrow[r] \arrow[dr, dotted] & A \\ R \arrow[u] \arrow[r] & B \arrow[u] \end{tikzcd}$$

is commutative then a dotted arrow exists making the diagram commute. (Note the similarity with Algebra, Definition 7.127.1.) To construct the dotted arrow choose elements $b_i \in B$ whose images in A are equal to the images of x_i in A. Note that $b_i \in \mathfrak{m}_B$ as x_i maps to an element of $\mathfrak{m}_A$. Hence there is a unique R-algebra map $R[[x_1, \ldots, x_n]] \to B$ which maps x_i to b_i and which can serve as our dotted arrow.

Conversely, assume $\underline{S}|_{\mathcal{C}_\Lambda} \to \underline{R}|_{\mathcal{C}_\Lambda}$ is smooth. Let $x_1, \ldots, x_n \in S$ be elements whose images form a basis in the relative cotangent space $\mathfrak{m}_S/(\mathfrak{m}_R S + \mathfrak{m}_S^2)$ of S over R. Set $T = R[[X_1, \ldots, X_n]]$. Note that both

$$S/(\mathfrak{m}_R S + \mathfrak{m}_S^2) \cong R/\mathfrak{m}_R[x_1, \ldots, x_n]/(x_i x_j)$$

and

$$T/(\mathfrak{m}_R T + \mathfrak{m}_T^2) \cong R/\mathfrak{m}_R[X_1, \ldots, X_n]/(X_i X_j).$$

Let $S/(\mathfrak{m}_R S + \mathfrak{m}_S^2) \to T/(\mathfrak{m}_R T + \mathfrak{m}_T^2)$ be the local R-algebra isomorphism given by mapping the class of x_i to the class of X_i. Let $f_1 : S \to T/(\mathfrak{m}_R T + \mathfrak{m}_T^2)$ be the composition $S \to S/(\mathfrak{m}_R S + \mathfrak{m}_S^2) \to T/(\mathfrak{m}_R T + \mathfrak{m}_T^2)$. The assumption that $\underline{S}|_{\mathcal{C}_\Lambda} \to \underline{R}|_{\mathcal{C}_\Lambda}$ is smooth means we can lift f_1 to a map $f_2 : S \to T/\mathfrak{m}_T^2$, then to a map $f_3 : S \to T/\mathfrak{m}_T^3$, and so on, for all $n \geq 1$. Thus we get an induced map $f : S \to T = \lim T/\mathfrak{m}_T^n$ of local R-algebras. By our choice of f_1, the map f induces an isomorphism $\mathfrak{m}_S/(\mathfrak{m}_R S + \mathfrak{m}_S^2) \to \mathfrak{m}_T/(\mathfrak{m}_R T + \mathfrak{m}_T^2)$ of relative cotangent spaces. Hence f is surjective by Lemma 51.4.2 (where we think of f as a map in $\widehat{\mathcal{C}}_R$). Choose preimages $y_i \in S$ of $X_i \in T$ under f. As T is a power series ring over R there exists a local R-algebra homomorphism $s : T \to S$ mapping X_i to y_i. By construction $f \circ s = \mathrm{id}$. Then s is injective. But s induces an isomorphism on relative cotangent spaces since f does, so it is also surjective by Lemma 51.4.2 again. Hence s and f are isomorphisms. □

Smooth morphisms satisfy the following functorial properties.

Lemma 51.8.7. *Let $\varphi : \mathcal{F} \to \mathcal{G}$ and $\psi : \mathcal{G} \to \mathcal{H}$ be morphisms of categories cofibered in groupoids over $\mathcal{C}_\Lambda$.*

1. *If φ and ψ are smooth, then $\psi \circ \varphi$ is smooth.*
2. *If φ is essentially surjective and $\psi \circ \varphi$ is smooth, then ψ is smooth.*
3. *If $\mathcal{G}' \to \mathcal{G}$ is a morphism of categories cofibered in groupoids and φ is smooth, then $\mathcal{F} \times_{\mathcal{G}} \mathcal{G}' \to \mathcal{G}'$ is smooth.*

Proof. Statements (1) and (2) follow immediately from the definitions. Proof of (3) omitted. Hints: use the formulation of smoothness given in Remark 51.8.3 and use that $\mathcal{F} \times_{\mathcal{G}} \mathcal{G}'$ is the 2-fibre product, see Remarks 51.5.2 (13). □

Lemma 51.8.8. *Let $\varphi : \mathcal{F} \to \mathcal{G}$ be a smooth morphism of categories cofibered in groupoids over $\mathcal{C}_\Lambda$. Assume $\varphi : \mathcal{F}(k) \to \mathcal{G}(k)$ is essentially surjective. Then $\varphi : \mathcal{F} \to \mathcal{G}$ and $\widehat{\varphi} : \widehat{\mathcal{F}} \to \widehat{\mathcal{G}}$ are essentially surjective.*

Proof. Let y be an object of $\mathcal{G}$ lying over $A \in Ob(\mathcal{C}_\Lambda)$. Let $y \to y_0$ be a pushforward of y along $A \to k$. By the assumption on essential surjectivity of $\varphi : \mathcal{F}(k) \to \mathcal{G}(k)$ there exist an object x_0 of $\mathcal{F}$ lying over k and an isomorphism $y_0 \to \varphi(x_0)$. Smoothness of φ implies there exists an object x of $\mathcal{F}$ over A whose image $\varphi(x)$ is isomorphic to y. Thus $\varphi : \mathcal{F} \to \mathcal{G}$ is essentially surjective.

Let $\eta = (R, \eta_n, g_n)$ be an object of $\widehat{\mathcal{G}}$. We construct an object ξ of $\widehat{\mathcal{F}}$ with an isomorphism $\eta \to \varphi(\xi)$. By the assumption on essential surjectivity of $\varphi : \mathcal{F}(k) \to \mathcal{G}(k)$, there exists a morphism $\eta_1 \to \varphi(\xi_1)$ in $\mathcal{G}(k)$ for some $\xi_1 \in Ob(\mathcal{F}(k))$. The morphism $\eta_2 \xrightarrow{g_1} \eta_1 \to \varphi(\xi_1)$ lies over the surjective ring map $R/\mathfrak{m}_R^2 \to k$, hence by smoothness of φ there exists $\xi_2 \in Ob(\mathcal{F}(R/\mathfrak{m}_R^2))$, a morphism $f_1 : \xi_2 \to \xi_1$ lying over $R/\mathfrak{m}_R^2 \to k$, and a morphism $\eta_2 \to \varphi(\xi_2)$ such that

$$
\begin{tikzcd}
\varphi(\xi_2) \arrow[r, "\varphi(f_1)"] & \varphi(\xi_1) \\
\eta_2 \arrow[u] \arrow[r, "g_1"] & \eta_1 \arrow[u]
\end{tikzcd}
$$

commutes. Continuing in this way we construct an object $\xi = (R, \xi_n, f_n)$ of $\widehat{\mathcal{F}}$ and a morphism $\eta \to \varphi(\xi) = (R, \varphi(\xi_n), \varphi(f_n))$ in $\widehat{\mathcal{G}}(R)$. □

Remark 51.8.9. Let $p : \mathcal{F} \to \mathcal{C}_\Lambda$ be a category cofibered in groupoids. We can consider $\mathcal{C}_\Lambda$ as the trivial category cofibered in groupoids over $\mathcal{C}_\Lambda$, and then p is a morphism of categories cofibered in groupoids over $\mathcal{C}_\Lambda$. We say $\mathcal{F}$ is *smooth* if its structure morphism p is smooth. This is the ``absolute" notion of smoothness for a category cofibered in groupoids over $\mathcal{C}_\Lambda$.

Example 51.8.10. Let $R \in Ob(\widehat{\mathcal{C}}_\Lambda)$. When is $\underline{R}|_{\mathcal{C}_\Lambda}$ smooth? In the classical case this means that R is a power series ring over Λ, see Lemma 51.8.6. (Strictly speaking this uses that $\underline{\Lambda}|_{\mathcal{C}_\Lambda} = \mathcal{C}_\Lambda$ because Λ is an initial object of $\widehat{\mathcal{C}}_\Lambda$ in the classical case.) In the general case we can construct examples as follows. Pick an integer $n \geq 0$ and a maximal ideal $\mathfrak{m} \subset \Lambda[x_1, \ldots, x_n]$ lying over $\mathfrak{m}_\Lambda$ so that

$$k' = \Lambda/\mathfrak{m}_\Lambda \longrightarrow \Lambda[x_1, \ldots, x_n]/\mathfrak{m}$$

is isomorphic to $k' \to k$. Fix such an identification $k = \Lambda[x_1, \ldots, x_n]/\mathfrak{m}$. Set $R = \Lambda[x_1, \ldots, x_n]^\wedge$ equal to the $\mathfrak{m}$-adic completion of $\Lambda[x_1, \ldots, x_n]$. Then R is an object of $\widehat{\mathcal{C}}_\Lambda$. Namely, it is a complete local Noetherian ring (see Algebra, Lemma 7.90.10) and its residue field is identified with k. We claim that $\underline{R}|_{\mathcal{C}_\Lambda}$ is smooth. To see this we have to show: Given a surjection $B \to A$ in $\mathcal{C}_\Lambda$ and a map $R \to A$ there exists a lift of this map to B. This is clear as we can first lift the composition $\Lambda[x_1, \ldots, x_n] \to R \to A$ to a map $\Lambda[x_1, \ldots, x_n] \to B$ and then observe that this latter map factors through the completion R as B is complete (being Artinian). In fact, it turns out that whenever $\underline{R}|_{\mathcal{C}_\Lambda}$ is smooth, then R is isomorphic to a completion of a smooth algebra over Λ, but we won't use this.

Example 51.8.11. Here is a more explicit example of an R as in Example 51.8.10. Let p be a prime number and let $n \in \mathbf{N}$. Let $\Lambda = \mathbf{F}_p(t_1, t_2, \ldots, t_n)$ and let $k = \mathbf{F}_p(x_1, \ldots, x_n)$ with map $\Lambda \to k$ given by $t_i \mapsto x_i^p$. Then we can take

$$R = \Lambda[x_1, \ldots, x_n]^\wedge_{(x_1^p - t_1, \ldots, x_n^p - t_n)}$$

We cannot do ``better'' in this example, i.e., we cannot approximate $\mathcal{C}_\Lambda$ by a smaller smooth object of $\widehat{\mathcal{C}}_\Lambda$ (one can argue that the dimension of R has to be at least n since the map $\Omega_{R/\Lambda} \otimes_R k \to \Omega_{k/\Lambda}$ is surjective). We will discuss this phenomenon later in more detail.

Remark 51.8.12. Suppose $\mathcal{F}$ is a predeformation category admitting a smooth morphism $\varphi : \mathcal{U} \to \mathcal{F}$ from a predeformation category $\mathcal{U}$. Then by Lemma 51.8.8 φ is essentially surjective, so by Lemma 51.8.7 $p : \mathcal{F} \to \mathcal{C}_\Lambda$ is smooth if and only if the composition $\mathcal{U} \xrightarrow{\varphi} \mathcal{F} \xrightarrow{p} \mathcal{C}_\Lambda$ is smooth, i.e. $\mathcal{F}$ is smooth if and only if $\mathcal{U}$ is smooth.

Later we are interested in producing smooth morphisms from prorepresentable functors to predeformation categories $\mathcal{F}$. By the discussion in Remark 51.7.12 these morphisms correspond to certain formal objects of $\mathcal{F}$ More precisely, these are the so-called versal formal objects of $\mathcal{F}$.

Definition 51.8.13. Let $\mathcal{F}$ be a category cofibered in groupoids. Let ξ be a formal object of $\mathcal{F}$ lying over $R \in Ob(\widehat{\mathcal{C}}_\Lambda)$. We say ξ is *versal* if the corresponding morphism $\underline{\xi} : \underline{R}|_{\mathcal{C}_\Lambda} \to \mathcal{F}$ of Remark 51.7.12 is smooth.

Remark 51.8.14. Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_\Lambda$, and let ξ be a formal object of $\mathcal{F}$. It follows from the definition of smoothness that versality of ξ is equivalent to the following condition: If

$$\begin{tikzcd} & y \arrow[d] \\ \xi \arrow[r] & x \end{tikzcd}$$

is a diagram in $\widehat{\mathcal{F}}$ such that $y \to x$ lies over a surjective map $B \to A$ of Artinian rings (we may assume it is a small extension), then there exists a morphism $\xi \to y$ such that

$$\begin{tikzcd} & y \arrow[d] \\ \xi \arrow[r] \arrow[ur] & x \end{tikzcd}$$

commutes. In particular, the condition that ξ be versal does not depend on the choices of pushforwards made in the construction of $\underline{\xi} : \underline{R}|_{\mathcal{C}_\Lambda} \to \mathcal{F}$ in Remark 51.7.12.

Lemma 51.8.15. *Let $\mathcal{F}$ be a predeformation category. Let ξ be a versal formal object of $\mathcal{F}$. For any formal object η of $\widehat{\mathcal{F}}$, there exists a morphism $\xi \to \eta$.*

Proof. By assumption the morphism $\underline{\xi} : \underline{R}|_{\mathcal{C}_\Lambda} \to \mathcal{F}$ is smooth. Then $\iota(\xi) : \underline{R} \to \widehat{\mathcal{F}}$ is the completion of $\underline{\xi}$, see Remark 51.7.12. By Lemma 51.8.8 there exists an object f of $\underline{R}$ such that $\iota(\xi)(f) = \eta$. Then f is a ring map $f : R \to S$ in $\widehat{\mathcal{C}}_\Lambda$. And $\iota(\xi)(f) = \eta$ means that $f_*\xi \cong \eta$ which means exactly that there is a morphism $\xi \to \eta$ lying over f. $\square$

51.9. Schlessinger's conditions

In the following we often consider fibre products $A_1 \times_A A_2$ of rings in the category $\mathcal{C}_\Lambda$. We have seen in Example 51.3.7 that such a fibre product may not always be an object of $\mathcal{C}_\Lambda$. However, in virtually all cases below one of the two maps $A_i \to A$ is surjective and $A_1 \times_A A_2$ will be an object of $\mathcal{C}_\Lambda$ by Lemma 51.3.8. We will use this result without further mention.

We denote by $k[\epsilon]$ the ring of dual numbers over k. More generally, for a k-vector space V, we denote by $k[V]$ the k-algebra whose underlying vector space is $k \oplus V$ and whose multiplication is given by $(a, v) \cdot (a', v') = (aa', av' + a'v)$. When $V = k$, $k[V]$ is the ring of dual numbers over k. For any finite dimensional k-vector space V the ring $k[V]$ is in $\mathcal{C}_\Lambda$.

Definition 51.9.1. Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_\Lambda$. We define *conditions (S1) and (S2)* on $\mathcal{F}$ as follows:

(S1) Every diagram in $\mathcal{F}$

$$\begin{tikzcd} & x_2 \arrow[d] \\ x_1 \arrow[r] & x \end{tikzcd} \quad \text{lying over} \quad \begin{tikzcd} & A_2 \arrow[d] \\ A_1 \arrow[r] & A \end{tikzcd}$$

in $\mathcal{C}_\Lambda$ with $A_2 \to A$ surjective can be completed to a commutative diagram

$$\begin{tikzcd} y \arrow[r] \arrow[d] & x_2 \arrow[d] \\ x_1 \arrow[r] & x \end{tikzcd} \quad \text{lying over} \quad \begin{tikzcd} A_1 \times_A A_2 \arrow[r] \arrow[d] & A_2 \arrow[d] \\ A_1 \arrow[r] & A. \end{tikzcd}$$

(S2) The condition of (S1) holds for diagrams in $\mathcal{F}$ lying over a diagram in $\mathcal{C}_\Lambda$ of the form

$$\begin{tikzcd} & k[\epsilon] \arrow[d] \\ A \arrow[r] & k. \end{tikzcd}$$

Moreover, if we have two commutative diagrams in $\mathcal{F}$

$$\begin{tikzcd} y \arrow[r, "c"] \arrow[d, "a"'] & x_\epsilon \arrow[d, "e"] \\ x \arrow[r, "d"] & x_0 \end{tikzcd} \quad \text{and} \quad \begin{tikzcd} y' \arrow[r, "c'"] \arrow[d, "a'"'] & x_\epsilon \arrow[d, "e"] \\ x \arrow[r, "d"] & x_0 \end{tikzcd} \quad \text{lying over} \quad \begin{tikzcd} A \times_k k[\epsilon] \arrow[r] \arrow[d] & k[\epsilon] \arrow[d] \\ A \arrow[r] & k \end{tikzcd}$$

then there exists a morphism $b : y \to y'$ in $\mathcal{F}(A \times_k k[\epsilon])$ such that $a = a' \circ b$.

We can partly explain the meaning of conditions (S1) and (S2) in terms of fibre categories. Suppose that $f_1 : A_1 \to A$ and $f_2 : A_2 \to A$ are ring maps in $\mathcal{C}_\Lambda$ with f_2 surjective. Denote $p_i : A_1 \times_A A_2 \to A_i$ the projection maps. Assume a choice of pushforwards for $\mathcal{F}$ has been made. Then the commutative diagram of rings tranlates into a 2-commutative diagram

$$\begin{tikzcd} \mathcal{F}(A_1 \times_A A_2) \arrow[r, "p_{2,*}"'] \arrow[d, "p_{1,*}"'] & \mathcal{F}(A_2) \arrow[d, "f_{2,*}"] \\ \mathcal{F}(A_1) \arrow[r, "f_{1,*}"] & \mathcal{F}(A) \end{tikzcd}$$

of fibre categories whence a functor

$$\mathcal{F}(A_1 \times_A A_2) \to \mathcal{F}(A_1) \times_{\mathcal{F}(A)} \mathcal{F}(A_2) \tag{51.9.1.1}$$

into the 2-fibre product of categories. Condition (S1) requires that this functor be essentially surjective. The first part of condition (S2) requires that this functor be a essentially surjective if f_2 equals the map $k[\epsilon] \to k$. Moreover in this case, the second part of (S2) implies that two objects which become isomorphic in the target are isomorphic in the source (but it is *not* equivalent to this statement). The advantage of stating the conditions as in the definition is that no choices have to be made.

Lemma 51.9.2. *Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_\Lambda$. Then $\mathcal{F}$ satisfies (S1) if the condition of (S1) is assumed to hold only when $A_2 \to A$ is a small extension.*

Proof. Proof omitted. Hints: apply Lemma 51.3.3 and use induction similar to the proof of Lemma 51.8.2. ☐

Remark 51.9.3. When $\mathcal{F}$ is cofibered in sets, conditions (S1) and (S2) are exactly conditions (H1) and (H2) from Schlessinger's paper [**Sch68**]. Namely, for a functor $F : \mathcal{C}_\Lambda \to$ *Sets*, conditions (S1) and (S2) state:

(S1) If $A_1 \to A$ and $A_2 \to A$ are maps in $\mathcal{C}_\Lambda$ with $A_2 \to A$ surjective, then the induced map $F(A_1 \times_A A_2) \to F(A_1) \times_{F(A)} F(A_2)$ is surjective.

(S2) If $A \to k$ is a map in $\mathcal{C}_\Lambda$, then the induced map $F(A \times_k k[\epsilon]) \to F(A) \times_{F(k)} F(k[\epsilon])$ is bijective.

The injectivity of the map $F(A \times_k k[\epsilon]) \to F(A) \times_{F(k)} F(k[\epsilon])$ comes from the second part of condition (S2) and the fact that morphisms are identities.

Lemma 51.9.4. *Let $\mathcal{F}$ be a category cofibred in groupoids over $\mathcal{C}_\Lambda$. If $\mathcal{F}$ satisfies (S2), then the condition of (S2) also holds when $k[\epsilon]$ is replaced by $k[V]$ for any finite dimensional k-vector space V.*

Proof. In the case that $\mathcal{F}$ is cofibred in sets, i.e., corresponds to a functor $F : \mathcal{C}_\Lambda \to$ *Sets* this follows from the description of (S2) for F in Remark 51.9.3 and the fact that $k[V] \cong k[\epsilon] \times_k \ldots \times_k k[\epsilon]$ with $\dim_k V$ factors. The case of functors is what we will use in the rest of this chapter.

We prove the general case by induction on $\dim(V)$. If $\dim(V) = 1$, then $k[V] \cong k[\epsilon]$ and the result holds by assumption. If $\dim(V) > 1$ we write $V = V' \oplus k\epsilon$. Pick a diagram

$$\begin{tikzcd} & x_V \arrow[d] \\ x \arrow[r] & x_0 \end{tikzcd} \quad \text{lying over} \quad \begin{tikzcd} & k[V] \arrow[d] \\ A \arrow[r] & k \end{tikzcd}$$

Choose a morphism $x_V \to x_{V'}$ lying over $k[V] \to k[V']$ and a morphism $x_V \to x_\epsilon$ lying over $k[V] \to k[\epsilon]$. Note that the morphism $x_V \to x_0$ factors as $x_V \to x_{V'} \to x_0$ and as $x_V \to x_\epsilon \to x_0$. By induction hypothesis we can find a diagram

$$\begin{tikzcd} y' \arrow[r] \arrow[d] & x_{V'} \arrow[d] \\ x \arrow[r] & x_0 \end{tikzcd} \quad \text{lying over} \quad \begin{tikzcd} A \times_k k[V'] \arrow[r] \arrow[d] & k[V'] \arrow[d] \\ A \arrow[r] & k \end{tikzcd}$$

This gives us a commutative diagram

$$\begin{tikzcd} & x_\epsilon \arrow[d] \\ y' \arrow[r] & x_0 \end{tikzcd} \quad \text{lying over} \quad \begin{tikzcd} & k[\epsilon] \arrow[d] \\ A \times_k k[V'] \arrow[r] & k \end{tikzcd}$$

Hence by (S2) we get a commutative diagram

$$\begin{tikzcd} y \arrow[r] \arrow[d] & x_\epsilon \arrow[d] \\ y' \arrow[r] & x_0 \end{tikzcd} \quad \text{lying over} \quad \begin{tikzcd} (A \times_k k[V']) \times_k k[\epsilon] \arrow[r] \arrow[d] & k[\epsilon] \arrow[d] \\ A \times_k k[V'] \arrow[r] & k \end{tikzcd}$$

Note that $(A \times_k k[V']) \times_k k[\epsilon] = A \times_k k[V' \oplus k\epsilon] = A \times_k k[V]$. We claim that y fits into the correct commutative diagram. To see this we let $y \to y_V$ be a morphism lying over $A \times_k k[V] \to k[V]$. We can factor the morphisms $y \to y' \to x_{V'}$ and $y \to x_\epsilon$ through the morphism $y \to y_V$ (by the axioms of categories cofibred in groupoids). Hence we see that both y_V and x_V fit into commutative diagrams

$$\begin{tikzcd} y_V \arrow[r] \arrow[d] & x_\epsilon \arrow[d] \\ x_{V'} \arrow[r] & x_0 \end{tikzcd} \quad \text{and} \quad \begin{tikzcd} x_V \arrow[r] \arrow[d] & x_\epsilon \arrow[d] \\ x_{V'} \arrow[r] & x_0 \end{tikzcd}$$

and hence by the second part of (S2) there exists an isomorphism $y_V \to x_V$ compatible with $y_V \to x_{V'}$ and $x_V \to x_{V'}$ and in particular compatible with the maps to x_0. The composition $y \to y_V \to x_V$ then fits into the required commutative diagram

$$\begin{tikzcd} y \arrow[r] \arrow[d] & x_V \arrow[d] \\ x \arrow[r] & x_0 \end{tikzcd} \quad \text{lying over} \quad \begin{tikzcd} A \times_k k[V] \arrow[r] \arrow[d] & k[V] \arrow[d] \\ A \arrow[r] & k \end{tikzcd}$$

In this way we see that the first part of $(S2)$ holds with $k[\epsilon]$ replaced by $k[V]$.

To prove the second part suppose given two commutative diagrams

$$\begin{tikzcd} y \arrow[r] \arrow[d] & x_V \arrow[d] \\ x \arrow[r] & x_0 \end{tikzcd} \quad \text{and} \quad \begin{tikzcd} y' \arrow[r] \arrow[d] & x_V \arrow[d] \\ x \arrow[r] & x_0 \end{tikzcd} \quad \text{lying over} \quad \begin{tikzcd} A \times_k k[V] \arrow[r] \arrow[d] & k[V] \arrow[d] \\ A \arrow[r] & k \end{tikzcd}$$

We will use the morphisms $x_V \to x_{V'} \to x_0$ and $x_V \to x_\epsilon \to x_0$ introduced in the first paragraph of the proof. Choose morphisms $y \to y_{V'}$ and $y' \to y'_{V'}$ lying over $A \times_k k[V] \to A \times_k k[V']$. The axioms of a cofibred category imply we can find commutative diagrams

$$\begin{tikzcd} y_{V'} \arrow[r] \arrow[d] & x_{V'} \arrow[d] \\ x \arrow[r] & x_0 \end{tikzcd} \quad \text{and} \quad \begin{tikzcd} y'_{V'} \arrow[r] \arrow[d] & x_{V'} \arrow[d] \\ x \arrow[r] & x_0 \end{tikzcd} \quad \text{lying over} \quad \begin{tikzcd} A \times_k k[V'] \arrow[r] \arrow[d] & k[V'] \arrow[d] \\ A \arrow[r] & k \end{tikzcd}$$

By induction hypothesis we obtain an isomorphism $b : y_{V'} \to y'_{V'}$ compatible with the morphisms $y_{V'} \to x$ and $y'_{V'} \to x$, in particular compatible with the morphisms to x_0. Then we have commutative diagrams

$$\begin{tikzcd} y \arrow[r] \arrow[d] & x_\epsilon \arrow[d] \\ y'_{V'} \arrow[r] & x_0 \end{tikzcd} \quad \text{and} \quad \begin{tikzcd} y' \arrow[r] \arrow[d] & x_\epsilon \arrow[d] \\ y'_{V'} \arrow[r] & x_0 \end{tikzcd} \quad \text{lying over} \quad \begin{tikzcd} A \times_k k[\epsilon] \arrow[r] \arrow[d] & k[\epsilon] \arrow[d] \\ A \arrow[r] & k \end{tikzcd}$$

where the morphism $y \to y'_{V'}$ is the composition $y \to y_{V'} \xrightarrow{b} y'_{V'}$ and where the morphisms $y \to x_\epsilon$ and $y' \to x_\epsilon$ are the compositions of the maps $y \to x_V$ and $y' \to x_V$ with the morphism $x_V \to x_\epsilon$. Then the second part of (S2) garantees the existence of an isomorphism $y \to y'$ compatible with the maps to $y'_{V'}$, in particular compatible with the maps to x (because b was compatible with the maps to x). ☐

Lemma 51.9.5. *Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_\Lambda$.*

(1) *If $\mathcal{F}$ satisfies (S1), then so does $\overline{\mathcal{F}}$.*
(2) *If $\mathcal{F}$ satisfies (S2), then so does $\overline{\mathcal{F}}$ provided at least one of the following conditions is satisfied*
   (a) *$\mathcal{F}$ is a predeformation category,*
   (b) *the category $\mathcal{F}(k)$ is a set or a setoid, or*
   (c) *for any morphism $x_\epsilon \to x_0$ of $\mathcal{F}$ lying over $k[\epsilon] \to k$ the pushforward map $Aut_{k[\epsilon]}(x_\epsilon) \to Aut_k(x_0)$ is surjective.*

Proof. Assume $\mathcal{F}$ has (S1). Suppose we have ring maps $f_i : A_i \to A$ in $\mathcal{C}_\Lambda$ with f_2 surjective. Let $x_i \in \mathcal{F}(A_i)$ such that the pushforwards $f_{1,*}(x_1)$ and $f_{2,*}(x_2)$ are isomorphic. Then we can denote x an object of $\mathcal{F}$ over A isomorphic to both of these and we obtain a diagram as in (S1). Hence we find an object y of $\mathcal{F}$ over $A_1 \times_A A_2$ whose pushforward to A_1, resp. A_2 is isomorphic to x_1, resp. x_2. In this way we see that (S1) holds for $\overline{\mathcal{F}}$.

Assume $\mathcal{F}$ has (S2). The first part of (S2) for $\overline{\mathcal{F}}$ follows as in the argument above. The second part of (S2) for $\overline{\mathcal{F}}$ signifies that the map

$$\overline{\mathcal{F}}(A \times_k k[\epsilon]) \to \overline{\mathcal{F}}(A) \times_{\overline{\mathcal{F}}(k)} \overline{\mathcal{F}}(k[\epsilon])$$

is injective for any ring A in $\mathcal{C}_\Lambda$. Suppose that $y, y' \in \mathcal{F}(A \times_k k[\epsilon])$. Using the axioms of cofibred categories we can choose commutative diagrams

$$\begin{tikzcd} y \arrow[r, "c"] \arrow[d, "a"] & x_\epsilon \arrow[d, "e"] \\ x \arrow[r, "d"] & x_0 \end{tikzcd} \quad \text{and} \quad \begin{tikzcd} y' \arrow[r, "c'"] \arrow[d, "a'"] & x'_\epsilon \arrow[d, "e'"] \\ x' \arrow[r, "d'"] & x'_0 \end{tikzcd} \quad \text{lying over} \quad \begin{tikzcd} A \times_k k[\epsilon] \arrow[r] \arrow[d] & k[\epsilon] \arrow[d] \\ A \arrow[r] & k \end{tikzcd}$$

Assume that there exist isomorphisms $\alpha : x \to x'$ in $\mathcal{F}(A)$ and $\beta : x_\epsilon \to x'_\epsilon$ in $\mathcal{F}(k[\epsilon])$. This also means there exists an isomorphism $\gamma : x_0 \to x'_0$ compatible with α. To prove (S2) for $\overline{\mathcal{F}}$ we have to show that there exists an isomorphism $y \to y'$ in $\mathcal{F}(A \times_k k[\epsilon])$. By (S2) for $\mathcal{F}$ such a morphism will exist if we can choose the isomorphisms α and β and γ such that

$$\begin{tikzcd}
x \arrow[r] \arrow[d, "\alpha"] & x_0 \arrow[d, "\gamma"] & x_\epsilon \arrow[l, "e"'] \arrow[d, "\beta"] \\
x' \arrow[r] & x'_0 & x'_\epsilon \arrow[l, "e'"]
\end{tikzcd}$$

is commutative (because then we can replace x by x' and x_ϵ by x'_ϵ in the previous displayed diagram). The left hand square commutes by our choice of γ. We can factor $e' \circ \beta$ as $\gamma' \circ e$ for some second map $\gamma' : x_0 \to x'_0$. Now the question is whether we can arrange it so that $\gamma = \gamma'$? This is clear if $\mathcal{F}(k)$ is a set, or a setoid. Moreover, if $\text{Aut}_{k[\epsilon]}(x_\epsilon) \to \text{Aut}_k(x_0)$ is surjective, then we can adjust the choice of β by precomposing with an automorphism of x_ϵ whose image is $\gamma^{-1} \circ \gamma'$ to make things work. $\square$

Lemma 51.9.6. *Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_\Lambda$. Let $x_0 \in Ob(\mathcal{F}(k))$. Let $\mathcal{F}_{x_0}$ be the category cofibred in groupoids over $\mathcal{C}_\Lambda$ constructed in Remark 51.6.4.*

(1) *If $\mathcal{F}$ satisfies (S1), then so does $\mathcal{F}_{x_0}$.*
(2) *If $\mathcal{F}$ satisfies (S2), then so does $\mathcal{F}_{x_0}$.*

Proof. Any diagram as in Definition 51.9.1 in $\mathcal{F}_{x_0}$ gives rise to a diagram in $\mathcal{F}$ and the output of condition (S1) or (S2) for this diagram in $\mathcal{F}$ can be viewed as an output for $\mathcal{F}_{x_0}$ as well. $\square$

Lemma 51.9.7. *Let $p : \mathcal{F} \to \mathcal{C}_\Lambda$ be a category cofibered in groupoids. Consider a diagram of $\mathcal{F}$*

$$\begin{tikzcd}
y \arrow[r] \arrow[d, "a"'] & x_\epsilon \arrow[d, "e"] \\
x \arrow[r, "d"] & x_0
\end{tikzcd} \quad \textit{lying over} \quad \begin{tikzcd}
A \times_k k[\epsilon] \arrow[r] \arrow[d] & k[\epsilon] \arrow[d] \\
A \arrow[r] & k.
\end{tikzcd}$$

in $\mathcal{C}_\Lambda$. Assume $\mathcal{F}$ satisfies (S2). Then there exists a morphism $s : x \to y$ with $a \circ s = id_x$ if and only if there exists a morphism $s_\epsilon : x \to x_\epsilon$ with $e \circ s_\epsilon = d$.

Proof. The ``only if" direction is clear. Conversely, assume there exists a morphism $s_\epsilon : x \to x_\epsilon$ with $e \circ s_\epsilon = d$. Note that $p(s_\epsilon) : A \to k[\epsilon]$ is a ring map compatible with the map $A \to k$. Hence we obtain

$$\sigma = (\text{id}_A, p(s_\epsilon)) : A \to A \times_k k[\epsilon].$$

Choose a pushforward $x \to \sigma_* x$. By construction we can factor s_ϵ as $x \to \sigma_* x \to x_\epsilon$. Moreover, as σ is a section of $A \times_k k[\epsilon] \to A$, we get a morphism $\sigma_* x \to x$ such that $x \to \sigma_* x \to x$ is id_x. Because $e \circ s_\epsilon = d$ we find that the diagram

$$\begin{tikzcd}
\sigma_* x \arrow[r] \arrow[d] & x_\epsilon \arrow[d, "e"] \\
x \arrow[r, "d"] & x_0
\end{tikzcd}$$

is commutative. Hence by (S2) we obtain a morphism $\sigma_*x \to y$ such that $\sigma_*x \to y \to x$ is the given map $\sigma_*x \to x$. The solution to the problem is now to take $a : x \to y$ equal to the composition $x \to \sigma_*x \to y$. $\square$

Lemma 51.9.8. *Consider a commutative diagram in a predeformation category $\mathcal{F}$*

$$\begin{tikzcd} y \arrow[r] \arrow[d] & x_2 \arrow[d, "a_2"] \\ x_1 \arrow[r, "a_1"] & x \end{tikzcd} \quad \textit{lying over} \quad \begin{tikzcd} A_1 \times_A A_2 \arrow[r] \arrow[d] & A_2 \arrow[d, "f_2"] \\ A_1 \arrow[r, "f_1"] & A \end{tikzcd}$$

in $\mathcal{C}_\Lambda$ where $f_2 : A_2 \to A$ is a small extension. Assume there is a map $h : A_1 \to A_2$ such that $f_2 = f_1 \circ h$. Let $I = Ker(f_2)$. Consider the ring map

$$g : A_1 \times_A A_2 \longrightarrow k[I] = k \oplus I, \quad (u, v) \longmapsto \overline{u} \oplus (v - h(u))$$

Choose a pushforward $y \to g_*y$. Assume $\mathcal{F}$ satisfies (S2). If there exists a morphism $x_1 \to g_*y$, then there exists a morphism $b : x_1 \to x_2$ such that $a_1 = a_2 \circ b$.

Proof. Note that $\mathrm{id}_{A_1} \times g : A_1 \times_A A_2 \to A_1 \times_k k[I]$ is an isomorphism and that $k[I] \cong k[\epsilon]$. Hence we have a diagram

$$\begin{tikzcd} y \arrow[r] \arrow[d] & g_*y \arrow[d] \\ x_1 \arrow[r] & x_0 \end{tikzcd} \quad \text{lying over} \quad \begin{tikzcd} A_1 \times_k k[\epsilon] \arrow[r] \arrow[d] & k[\epsilon] \arrow[d] \\ A_1 \arrow[r] & k. \end{tikzcd}$$

where x_0 is an object of $\mathcal{F}$ lying over k (every object of $\mathcal{F}$ has a unique morphism to x_0, see discussion following Definition 51.6.2). If we have a morphism $x_1 \to g_*y$ then Lemma 51.9.7 provides us with a section $s : x_1 \to y$ of the map $y \to x_1$. Composing this with the map $y \to x_2$ we obtain $b : x_1 \to x_2$ which has the property that $a_1 = a_2 \circ b$ because the diagram of the lemma commutes and because s is a section. $\square$

51.10. Tangent spaces of functors

Let R be a ring. We write $\mathrm{Mod}(R)$ for the category of R-modules and $\mathrm{Mod}_{fg}(R)$ for the category of finitely generated R-modules.

Definition 51.10.1. Let $L : \mathrm{Mod}_{fg}(R) \to \mathrm{Mod}(R)$ be a functor. We say that L is *R-linear* if for every $M, N \in Ob(\mathrm{Mod}_{fg}(R))$ the map

$$L : Hom_R(M, N) \longrightarrow Hom_R(L(M), L(N))$$

is a map of R-modules.

Remark 51.10.2. One can define the notion of an R-linearity for any functor between categories enriched over $\mathrm{Mod}(R)$. We made the definition specifically for a functor $L : \mathrm{Mod}_{fg}(R) \to \mathrm{Mod}(R)$ because this is the case that occurs below.

Remark 51.10.3. If $L : \mathrm{Mod}_{fg}(R) \to \mathrm{Mod}(R)$ is an R-linear functor, then L preserves finite products and sends the zero module to the zero module, see Homology, Lemma 10.3.7. On the other hand, if a functor $\mathrm{Mod}_{fg}(R) \to \mathit{Sets}$ preserves finite products and sends the zero module to a one element set, then it has a unique lift to a R-linear functor, see Lemma 51.10.4.

Lemma 51.10.4. *Let $L : Mod_{fg}(R) \to Sets$ be a functor. Suppose $L(0)$ is a one element set and L preserves finite products. Then there exists a unique R-linear functor $\widetilde{L} : Mod_{fg}(R) \to Mod(R)$ such that the diagram*

$$\begin{tikzcd} & Mod(R) \arrow[dr, "forget"] & \\ Mod_{fg}(R) \arrow[ur, "\widetilde{L}"] \arrow[rr, "L"] & & Sets \end{tikzcd}$$

commutes.

Proof. Let M be a finitely generated R-module. We define $\widetilde{L}(M)$ to be the set $L(M)$ with the following R-module structure.

Multiplication: If $r \in R$, multiplication by r on $L(M)$ is defined to be the map $L(M) \to L(M)$ induced by the multiplication map $r\cdot : M \to M$.

Addition: The sum map $M \times M \to M : (m_1, m_2) \mapsto m_1 + m_2$ induces a map $L(M \times M) \to L(M)$. By assumption $L(M \times M)$ is canonically isomorphic to $L(M) \times L(M)$. Addition on $L(M)$ is defined by the map $L(M) \times L(M) \cong L(M \times M) \to L(M)$.

Zero: There is a unique map $0 \to M$. The zero element of $L(M)$ is the image of $L(0) \to L(M)$.

We omit the verification that this defines an R-module $\widetilde{L}(M)$, the unique such that is R-linearly functorial in M. □

Lemma 51.10.5. *Let $L_1, L_2 : Mod_{fg}(R) \to Sets$ be functors that take 0 to a one element set and preserve finite products. Let $t : L_1 \to L_2$ be a morphism of functors. Then t induces a morphism $\tilde{t} : \widetilde{L}_1 \to \widetilde{L}_2$ between the functors guaranteed by Lemma 51.10.4, which is given simply by $\tilde{t}_M = t_M : \widetilde{L}_1(M) \to \widetilde{L}_2(M)$ for each $M \in Ob(Mod_{fg}(R))$. In other words, $t_M : \widetilde{L}_1(M) \to \widetilde{L}_2(M)$ is a map of R-modules.*

Proof. Omitted. □

In the case $R = K$ is a field, a K-linear functor $L : \text{Mod}_{fg}(K) \to \text{Mod}(K)$ is determined by its value $L(K)$.

Lemma 51.10.6. *Let K be a field. Let $L : Mod_{fg}(K) \to Mod(K)$ be a K-linear functor. Then L is isomorphic to the functor $L(K) \otimes_K - : Mod_{fg}(K) \to Mod(K)$.*

Proof. For $V \in Ob(\text{Mod}_{fg}(K))$, the isomorphism $L(K) \otimes_K V \to L(V)$ is given on pure tensors by $x \otimes v \mapsto L(f_v)(x)$, where $f_v : K \to V$ is the K-linear map sending $1 \mapsto v$. When $V = K$, this is the isomorphism $L(K) \otimes_K K \to L(K)$ given by multiplication by K. For general V, it is an isomorphism by the case $V = K$ and the fact that L commutes with finite products (Remark 51.10.3). □

For a ring R and an R-module M, let $R[M]$ be the R-algebra whose underlying R-module is $R \oplus M$ and whose multiplication is given by $(r, m) \cdot (r', m') = (rr', rm' + r'm)$. When $M = R$ this is the ring of dual numbers over R, which we denote by $R[\epsilon]$.

Now let S be a ring and assume R is an S-algebra. Then the assignment $M \mapsto R[M]$ determines a functor $\text{Mod}(R) \to S\text{-Alg}/R$, where $S\text{-Alg}/R$ denotes the category of S-algebras over R. Note that $S\text{-Alg}/R$ admits finite products: if $A_1 \to R$ and $A_2 \to R$ are two objects, then $A_1 \times_R A_2$ is a product.

Lemma 51.10.7. *Let R be an S-algebra. Then the functor $Mod(R) \to S\text{-}Alg/R$ described above preserves finite products.*

Proof. This is merely the statement that if M and N are R-modules, then the map $R[M \times N] \to R[M] \times_R R[N]$ is an isomorphism in S-Alg$/R$. □

Lemma 51.10.8. *Let R be an S-algebra, and let $\mathcal{C}$ be a strictly full subcategory of $S\text{-}Alg/R$ containing $R[M]$ for all $M \in Ob(Mod_{fg}(R))$. Let $F : \mathcal{C} \to Sets$ be a functor. Suppose that $F(R)$ is a one element set and that for any $M, N \in Ob(Mod_{fg}(R))$, the induced map*

$$F(R[M] \times_R R[N]) \to F(R[M]) \times F(R[N])$$

is a bijection. Then $F(R[M])$ has a natural R-module structure for any $M \in Ob(Mod_{fg}(R))$.

Proof. Note that $R \cong R[0]$ and $R[M] \times_R R[N] \cong R[M \times N]$ hence R and $R[M] \times_R R[N]$ are objects of $\mathcal{C}$ by our assumptions on $\mathcal{C}$. Thus the conditions on F make sense. The functor $\text{Mod}(R) \to S\text{-Alg}/R$ of Lemma 51.10.7 restricts to a functor $\text{Mod}_{fg}(R) \to \mathcal{C}$ by the assumption on $\mathcal{C}$. Let L be the composition $\text{Mod}_{fg}(R) \to \mathcal{C} \to Sets$, i.e., $L(M) = F(R[M])$. Then L preserves finite products by Lemma 51.10.7 and the assumption on F. Hence Lemma 51.10.4 shows that $L(M) = F(R[M])$ has a natural R-module structure for any $M \in Ob(\text{Mod}_{fg}(R))$. □

Definition 51.10.9. Let $\mathcal{C}$ be a category as in Lemma 51.10.8. Let $F : \mathcal{C} \to Sets$ be a functor such that $F(R)$ is a one element set. The *tangent space TF of F* is $F(R[\epsilon])$.

When $F : \mathcal{C} \to Sets$ satisfies the hypotheses of Lemma 51.10.8, the tangent space TF has a natural R-module structure.

Example 51.10.10. Since $\mathcal{C}_\Lambda$ contains all $k[V]$ for finite dimensional vector spaces V we see that Definition 51.10.9 applies with $S = \Lambda$, $R = k$, $\mathcal{C} = \mathcal{C}_\Lambda$, and $F : \mathcal{C}_\Lambda \to Sets$ a predeformation functor. The tangent space is $TF = F(k[\epsilon])$.

Example 51.10.11. Let us work out the tangent space of Example 51.10.10 when $F : \mathcal{C}_\Lambda \to Sets$ is a prorepresentable functor, say $F = \underline{S}|_{\mathcal{C}_\Lambda}$ for $S \in Ob(\widehat{\mathcal{C}}_\Lambda)$. Then F commutes with arbitrary limits and thus satisfies the hypotheses of Lemma 51.10.8. We compute

$$TF = F(k[\epsilon]) = Mor_{\mathcal{C}_\Lambda}(S, k[\epsilon]) = \text{Der}_\Lambda(S, k)$$

and more generally for a finite dimensional k-vector space V we have

$$F(k[V]) = Mor_{\mathcal{C}_\Lambda}(S, k[V]) = \text{Der}_\Lambda(S, V).$$

Explicitly, a Λ-algebra map $f : S \to k[V]$ compatible with the augmentations $q : S \to k$ and $k[V] \to k$ corresponds to the derivation D defined by $s \mapsto f(s) - q(s)$. Conversely, a Λ-derivation $D : S \to V$ corresponds to $f : S \to k[V]$ in $\mathcal{C}_\Lambda$ defined by the rule $f(s) = q(s) + D(s)$. Since these identifications are functorial we see that the k-vector spaces structures on TF and $\text{Der}_\Lambda(S, k)$ correspond (see Lemma 51.10.5). It follows that $\dim_k TF$ is finite by Lemma 51.4.5.

Example 51.10.12. The computation of Example 51.10.11 simplifies in the classical case. Namely, in this case the tangent space of the functor $F = \underline{S}|_{\mathcal{C}_\Lambda}$ is simply the relative cotangent space of S over Λ, in a formula $TF = T_{S/\Lambda}$. In fact, this works more generally when the field extension $k' \subset k$ is separable. See Exercises, Exercise 65.28.2.

Lemma 51.10.13. *Let $F, G : \mathcal{C} \to Sets$ be functors satisfying the hypotheses of Lemma 51.10.8. Let $t : F \to G$ be a morphism of functors. For any $M \in Ob(Mod_{fg}(R))$, the map $t_{R[M]} : F(R[M]) \to G(R[M])$ is a map of R-modules, where $F(R[M])$ and $G(R[M])$ are* *given the R-module structure from Lemma 51.10.8. In particular, $t_{R[\epsilon]} : TF \to TG$ is a map of R-modules.*

Proof. Follows from Lemma 51.10.5. □

Example 51.10.14. Suppose that $f : R \to S$ is a ring map in $\widehat{\mathcal{C}}_\Lambda$. Set $F = \underline{R}|_{\mathcal{C}_\Lambda}$ and $G = \underline{S}|_{\mathcal{C}_\Lambda}$. The ring map f induces a transformation of functors $G \to F$. By Lemma 51.10.13 we get a k-linear map $TG \to TF$. This is the map

$$TG = \mathrm{Der}_\Lambda(S, k) \longrightarrow \mathrm{Der}_\Lambda(R, k) = TF$$

as follows from the canonical identifications $F(k[V]) = \mathrm{Der}_\Lambda(R, V)$ and $G(k[V]) = \mathrm{Der}_\Lambda(S, V)$ of Example 51.10.11 and the rule for computing the map on tangent spaces.

Lemma 51.10.15. *Let $F : \mathcal{C} \to Sets$ be a functor satisfying the hypotheses of Lemma 51.10.8. Assume $R = K$ is a field. Then $F(K[V]) \cong TF \otimes_K V$ for any finite dimensional K-vector space V.*

Proof. Follows from Lemma 51.10.6. □

51.11. Tangent spaces of predeformation categories

We will define tangent spaces of predeformation functors using the general Definition 51.10.9. We have spelled this out in Example 51.10.10. It applies to predeformation categories by looking at the associated functor of isomorphism classes.

Definition 51.11.1. Let $\mathcal{F}$ be a predeformation category. The *tangent space $T\mathcal{F}$ of $\mathcal{F}$* is the set $\overline{\mathcal{F}}(k[\epsilon])$ of isomorphism classes of objects in the fiber category $\mathcal{F}(k[\epsilon])$.

Thus $T\mathcal{F}$ is nothing but the tangent space of the associated functor $\overline{\mathcal{F}} : \mathcal{C}_\Lambda \to Sets$. It has a natural vector space structure when $\mathcal{F}$ satisfies (S2), or, in fact, as long as $\overline{\mathcal{F}}$ does.

Lemma 51.11.2. *Let $\mathcal{F}$ be a predeformation category such that $\overline{\mathcal{F}}$ satisfies (S2). Then $T\mathcal{F}$ has a natural k-vector space structure. For any finite dimensional vector space V we have $\overline{\mathcal{F}}(k[V]) = T\mathcal{F} \otimes_k V$ functorially in V.*

Proof. Let us write $F = \overline{\mathcal{F}} : \mathcal{C}_\Lambda \to Sets$. This is a predeformation functor and F satisfies (S2). By Lemma 51.9.4 (and the translation of Remark 51.9.3) we see that

$$F(A \times_k k[V]) \longrightarrow F(A) \times F(k[V])$$

is a bijection for every finite dimensional vector space V and every $A \in Ob(\mathcal{C}_\Lambda)$. In particular, if $A = k[W]$ then we see that $F(k[W] \times_k k[V]) = F(k[W]) \times F(k[V])$. In other words, the hypotheses of Lemma 51.10.8 hold and we see that $TF = T\mathcal{F}$ has a natural k-vector space structure. The final assertion follows from Lemma 51.10.15. □

A morphism of predeformation categories induces a map on tangent spaces.

Definition 51.11.3. Let $\varphi : \mathcal{F} \to \mathcal{G}$ be a morphism predeformation categories. The *differential $d\varphi : T\mathcal{F} \to T\mathcal{G}$ of φ* is the map obtained by evaluating the morphism of functors $\overline{\varphi} : \overline{\mathcal{F}} \to \overline{\mathcal{G}}$ at $A = k[\epsilon]$.

Lemma 51.11.4. *Let $\varphi : \mathcal{F} \to \mathcal{G}$ be a morphism predeformation categories. Assume $\overline{\mathcal{F}}$ and $\overline{\mathcal{G}}$ both satisfy (S2). Then $d\varphi : T\mathcal{F} \to T\mathcal{G}$ is k-linear.*

Proof. In the proof of Lemma 51.11.2 we have seen that $\overline{\mathcal{F}}$ and $\overline{\mathcal{G}}$ satisfy the hypotheses of Lemma 51.10.8. Hence the lemma follows from Lemma 51.10.13. □

Remark 51.11.5. We can globalize the notions of tangent space and differential to arbitrary categories cofibered in groupoids as follows. Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_\Lambda$, and let $x \in Ob(\mathcal{F}(k))$. As in Remark 51.6.4, we get a predeformation category $\mathcal{F}_x$. We define the *tangent space $T_x\mathcal{F}$ of $\mathcal{F}$ at x* to be the tangent space $T\mathcal{F}_x$ of $\mathcal{F}_x$. Similarly, if $\varphi : \mathcal{F} \to \mathcal{G}$ is a morphism of categories cofibered in groupoids over $\mathcal{C}_\Lambda$ and $x \in Ob(\mathcal{F}(k))$, then there is an induced morphism $\varphi_x : \mathcal{F}_x \to \mathcal{G}_{\varphi(x)}$. We define the *differential $d_x\varphi : T_x\mathcal{F} \to T_{\varphi(x)}\mathcal{G}$ of φ at x* to be the map $d\varphi_x : T\mathcal{F}_x \to T\mathcal{G}_{\varphi(x)}$. If both $\mathcal{F}$ and $\mathcal{G}$ satisfy (S2) then all of these tangent spaces have a natural k-vector space structure and all the differentials $d_x\varphi : T_x\mathcal{F} \to T_{\varphi(x)}\mathcal{G}$ are k-linear (use Lemmas 51.9.6 and 51.11.4).

The following observations are uninteresting in the classical case or when $k' \subset k$ is a separable field extension, because then $\mathrm{Der}_\Lambda(k, k)$ and $\mathrm{Der}_\Lambda(V, k)$ are zero. There is a canonical identification

$$Mor_{\mathcal{C}_\Lambda}(k, k[\epsilon]) = \mathrm{Der}_\Lambda(k, k).$$

Namely, for $D \in \mathrm{Der}_\Lambda(k, k)$ let $f_D : k \to k[\epsilon]$ be the map $a \mapsto a + D(a)\epsilon$. More generally, given a finite dimensional vector space V over k we have

$$Mor_{\mathcal{C}_\Lambda}(k, k[V]) = \mathrm{Der}_\Lambda(k, V)$$

and we will use the same notation f_D for the map associated to the derivation D. We also have

$$Mor_{\mathcal{C}_\Lambda}(k[W], k[V]) = Hom_k(V, W) \oplus \mathrm{Der}_\Lambda(k, V)$$

where (φ, D) corresponds to the map $f_{\varphi,D} : a + w \mapsto a + \varphi(w) + D(a)$. We will sometimes write $f_{1,D} : a+v \to a+v+D(a)$ for the automorphism of $k[V]$ determined by the derivation $D : k \to V$. Note that $f_{1,D} \circ f_{1,D'} = f_{1,D+D'}$.

Let $\mathcal{F}$ be a predeformation category over $\mathcal{C}_\Lambda$. Let $x_0 \in Ob(\mathcal{F}(k))$. By the above there is a canonical map

$$\gamma_V : \mathrm{Der}_\Lambda(k, V) \longrightarrow \overline{\mathcal{F}}(k[V])$$

defined by $D \mapsto f_{D,*}(x_0)$. Moreover, there is an action

$$a_V : \mathrm{Der}_\Lambda(k, V) \times \overline{\mathcal{F}}(k[V]) \longrightarrow \overline{\mathcal{F}}(k[V])$$

defined by $(D, x) \mapsto f_{1,D,*}(x)$. These two maps are compatible, i.e., $f_{1,D,*}f_{D',*}x_0 = f_{D+D',*}x_0$ as follows from a computation of the compositions of these maps. Note that the maps γ_V and a_V are independent of the choice of x_0 as there is a unique x_0 up to isomorphism.

Lemma 51.11.6. *Let $\mathcal{F}$ be a predeformation category over $\mathcal{C}_\Lambda$. If $\overline{\mathcal{F}}$ has (S2) then the maps γ_V are k-linear and we have $a_V(D, x) = x + \gamma_V(D)$.*

Proof. In the proof of Lemma 51.11.2 we have seen that the functor $V \mapsto \overline{\mathcal{F}}(k[V])$ transforms 0 to a singleton and products to products. The same is true of the functor $V \mapsto \mathrm{Der}_\Lambda(k, V)$. Hence γ_V is linear by Lemma 51.10.5. Let $D : k \to V$ be a Λ-derivation. Set $D_1 : k \to V^{\oplus 2}$ equal to $a \mapsto (D(a), 0)$. Then

$$\begin{tikzcd} k[V \times V] \arrow[r, "+"] \arrow[d, "f_{1,D_1}"] & k[V] \arrow[d, "f_{1,D}"] \\ k[V \times V] \arrow[r, "+"] & k[V] \end{tikzcd}$$

commutes. Unwinding the definitions and using that $\overline{F}(V \times V) = \overline{F}(V) \times \overline{F}(V)$ this means that $a_D(x_1) + x_2 = a_D(x_1 + x_2)$ for all $x_1, x_2 \in \overline{F}(V)$. Thus it suffices to show that $a_V(D, 0) =$

$0 + \gamma_V(D)$ where $0 \in \overline{F}(V)$ is the zero vector. By definition this is the element $f_{0,*}(x_0)$. Since $f_D = f_{1,D} \circ f_0$ the desired result follows. □

A special case of the constructions above are the map

$$\gamma : \mathrm{Der}_\Lambda(k, k) \longrightarrow T\mathcal{F} \tag{51.11.6.1}$$

and the action

$$a : \mathrm{Der}_\Lambda(k, k) \times T\mathcal{F} \longrightarrow T\mathcal{F} \tag{51.11.6.2}$$

defined for any predeformation category $\mathcal{F}$. Note that if $\varphi : \mathcal{F} \to \mathcal{G}$ is a morphism of predeformation categories, then we get commutative diagrams

$$\begin{tikzcd} \mathrm{Der}_\Lambda(k,k) \arrow[r, "\gamma"'] \arrow[dr, "\gamma"'] & T\mathcal{F} \arrow[d, "d\varphi"'] \\ & T\mathcal{G} \end{tikzcd} \quad \text{and} \quad \begin{tikzcd} \mathrm{Der}_\Lambda(k,k) \times T\mathcal{F} \arrow[r, "a"'] \arrow[d, "1\times d\varphi"'] & T\mathcal{F} \arrow[d, "d\varphi"] \\ \mathrm{Der}_\Lambda(k,k) \times T\mathcal{G} \arrow[r, "a"] & T\mathcal{G} \end{tikzcd}$$

51.12. Versal formal objects

The existence of a versal formal object forces $\mathcal{F}$ to have property (S1).

Lemma 51.12.1. *Let $\mathcal{F}$ be a predeformation category. Assume $\mathcal{F}$ has a versal formal object. Then $\mathcal{F}$ satisfies (S1).*

Proof. Let ξ be a versal formal object of $\mathcal{F}$. Let

$$\begin{tikzcd} & x_2 \arrow[d] \\ x_1 \arrow[r] & x \end{tikzcd}$$

be a diagram in $\mathcal{F}$ such that $x_2 \to x$ lies over a surjective ring map. Since the natural morphism $\widehat{\mathcal{F}}|_{\mathcal{C}_\Lambda} \xrightarrow{\sim} \mathcal{F}$ is an equivalence (see Remark 51.7.7), we can consider this diagram also as a diagram in $\widehat{\mathcal{F}}$. By Lemma 51.8.15 there exists a morphism $\xi \to x_1$, so by Remark 51.8.14 we also get a morphism $\xi \to x_2$ making the diagram

$$\begin{tikzcd} \xi \arrow[r] \arrow[d] & x_2 \arrow[d] \\ x_1 \arrow[r] & x \end{tikzcd}$$

commute. If $x_1 \to x$ and $x_2 \to x$ lie above ring maps $A_1 \to A$ and $A_2 \to A$ then taking the pushforward of ξ to $A_1 \times_A A_2$ gives an object y as required by (S1). □

In the case that our cofibred category satisfies (S1) and (S2) we can characterize the versal formal objects as follows.

Lemma 51.12.2. *Let $\mathcal{F}$ be a predeformation category satisfying (S1) and (S2). Let ξ be a formal object of $\mathcal{F}$ corresponding to $\underline{\xi} : \underline{R}|_{\mathcal{C}_\Lambda} \to \mathcal{F}$, see Remark 51.7.12. Then ξ is versal if and only if the following two conditions hold:*

1. *the map $d\underline{\xi} : T\underline{R}|_{\mathcal{C}_\Lambda} \to T\mathcal{F}$ on tangent spaces is surjective, and*

(2) *given a diagram in* $\widehat{\mathcal{F}}$

$$\begin{tikzcd} & y \arrow[d] \\ \xi \arrow[r] & x \end{tikzcd} \quad \text{lying over} \quad \begin{tikzcd} & B \arrow[d, "f"] \\ R \arrow[r] & A \end{tikzcd}$$

in $\widehat{\mathcal{C}}_\Lambda$ *with* $B \to A$ *a small extension of Artinian rings, then there exists a ring map* $R \to B$ *such that*

$$\begin{tikzcd} & B \arrow[d, "f"] \\ R \arrow[r] \arrow[ur] & A \end{tikzcd}$$

commutes.

Proof. If ξ is versal then (1) holds by Lemma 51.8.8 and (2) holds by Remark 51.8.14. Assume (1) and (2) hold. By Remark 51.8.14 we must show that given a diagram in $\widehat{\mathcal{F}}$ as in (2), there exists $\xi \to y$ such that

$$\begin{tikzcd} & y \arrow[d] \\ \xi \arrow[r] \arrow[ur] & x \end{tikzcd}$$

commutes. Let $b : R \to B$ be the map guaranteed by (2). Denote $y' = b_*\xi$ and choose a factorization $\xi \to y' \to x$ lying over $R \to B \to A$ of the given morphism $\xi \to x$. By (S1) we obtain a commutative diagram

$$\begin{tikzcd} z \arrow[r] \arrow[d] & y \arrow[d] \\ y' \arrow[r] & x \end{tikzcd} \quad \text{lying over} \quad \begin{tikzcd} B \times_A B \arrow[r] \arrow[d] & B \arrow[d, "f"] \\ B \arrow[r, "f"] & A. \end{tikzcd}$$

Set $I = \text{Ker}(k)$. Let $\overline{g} : B \times_A B \to k[I]$ be the ring map $(u, v) \mapsto \overline{u} \oplus (v - u)$, cf. Lemma 51.9.8. By (1) there exists a morphism $\xi \to \overline{g}_* z$ which lies over a ring map $i : R \to k[\epsilon]$. Choose an Artinian quotient $b_1 : R \to B_1$ such that both $b : R \to B$ and $i : R \to k[\epsilon]$ factor through $R \to B_1$, i.e., giving $h : B_1 \to B$ and $i' : B_1 \to k[\epsilon]$. Choose a pushforward $y_1 = b_{1,*}\xi$, a factorization $\xi \to y_1 \to y'$ lying over $R \to B_1 \to B$ of $\xi \to y'$, and a factorization $\xi \to y_1 \to \overline{g}_* z$ lying over $R \to B_1 \to k[\epsilon]$ of $\xi \to \overline{g}_* z$. Applying (S1) once more we obtain

$$\begin{tikzcd} z_1 \arrow[r] \arrow[d] & z \arrow[r] \arrow[d] & y \arrow[d] \\ y_1 \arrow[r] & y' \arrow[r] & x \end{tikzcd} \quad \text{lying over} \quad \begin{tikzcd} B_1 \times_A B \arrow[r] \arrow[d] & B \times_A B \arrow[r] \arrow[d] & B \arrow[d, "f"] \\ B_1 \arrow[r] & B \arrow[r] & A. \end{tikzcd}$$

Note that the map $g : B_1 \times_A B \to k[I]$ of Lemma 51.9.8 (defined using h) is the composition of $B_1 \times_A B \to B \times_A B$ and the map $\overline{g}$ above. By construction there exists a morphism $y_1 \to g_* z_1 \cong \overline{g}_* z$! Hence Lemma 51.9.8 applies (to the outer rectangles in the diagrams above) to give a morphism $y_1 \to y$ and precomposing with $\xi \to y_1$ gives the desired morphism $\xi \to y$. $\square$

If $\mathcal{F}$ has property (S1) then the ``largest quotient where a lift exists'' exists. Here is a precise statement.

Lemma 51.12.3. *Let $\mathcal{F}$ be a category cofibred in groupoids over $\mathcal{C}_\Lambda$ which has (S1). Let $B \to A$ be a surjection in $\mathcal{C}_\Lambda$ with kernel I annihilated by $\mathfrak{m}_B$. Let $x \in \mathcal{F}(A)$. The set of ideals*

$$\mathcal{J} = \{J \subset I \mid \text{there exists an } y \to x \text{ lying over } B/J \to A\}$$

has a smallest element.

Proof. Note that $\mathcal{J}$ is nonempty as $I \in \mathcal{J}$. Also, if $J \in \mathcal{J}$ and $J \subset J' \subset I$ then $J' \in \mathcal{J}$ because we can pushforward the object y to an object y' over B/J'. Let J and K be elements of the displayed set. We claim that $J \cap K \in \mathcal{J}$ which will prove the lemma. Since I is a k-vector space we can find an ideal $J \subset J' \subset I$ such that $J \cap K = J' \cap K$ and such that $J' + K = I$. By the above we may replace J by J' and assume that $J + K = I$. In this case

$$A/(J \cap K) = A/J \times_{A/I} A/K.$$

Hence the existence of an element $z \in \mathcal{F}(A/(J \cap K))$ mapping to x follows, via (S1), from the existence of the elements we have assumed exist over A/J and A/K. □

We will improve on the following result later.

Lemma 51.12.4. *Let $\mathcal{F}$ be a category cofibred in groupoids over $\mathcal{C}_\Lambda$. Assume the following conditions hold:*

(1) *$\mathcal{F}$ is a predeformation category.*
(2) *$\mathcal{F}$ satisfies (S1).*
(3) *$\mathcal{F}$ satisfies (S2).*
(4) *$\dim_k T\mathcal{F}$ is finite.*

Then $\mathcal{F}$ has a versal formal object.

Proof. Assume (1), (2), (3), and (4) hold. Choose an object $R \in Ob(\widehat{\mathcal{C}}_\Lambda)$ such that $\underline{R}|_{\mathcal{C}_\Lambda}$ is smooth, see Example 51.8.10. Let $r = \dim_k T\mathcal{F}$ and put $S = R[[X_1, \ldots, X_r]]$.

We are going to inductively construct for $n \geq 2$ pairs $(J_n, f_{n-1} : \xi_n \to \xi_{n-1})$ where $J_n \subset S$ is an decreasing sequence of ideals and $f_{n-1} : \xi_n \to \xi_{n-1}$ is a morphism of $\mathcal{F}$ lying over the projection $S/J_n \to S/J_{n-1}$.

Step 1. Let $J_1 = \mathfrak{m}_S$. Let ξ_1 be the unique (up to unique isomorphism) object of $\mathcal{F}$ over $k = S/J_1 = S/\mathfrak{m}_S$

Step 2. Let $J_2 = \mathfrak{m}_S^2 + \mathfrak{m}_R S$. Then $S/J_2 = k[V]$ with $V = kX_1 \oplus \ldots \oplus kX_r$. By (S2) for $\overline{\mathcal{F}}$ we get a bijection

$$\overline{\mathcal{F}}(S/J_2) \longrightarrow T\mathcal{F} \otimes_k V,$$

see Lemmas 51.9.5 and 51.11.2. Choose a basis $\theta_1, \ldots, \theta_r$ for $T\mathcal{F}$ and set $\xi_2 = \sum \theta_i \otimes X_i \in Ob(\mathcal{F}(S/J_2))$. The point of this choice is that

$$d\xi_2 : Mor_{\mathcal{C}_\Lambda}(S/J_2, k[\epsilon]) \longrightarrow T\mathcal{F}$$

is surjective. Let $f_1 : \xi_2 \to \xi_1$ be the unique morphism.

Induction step. Assume $(J_n, f_{n-1} : \xi_n \to \xi_{n-1})$ has been constructed for some $n \geq 2$. There is a minimal element J_{n+1} of the set of ideals $J \subset S$ satisfying: (a) $\mathfrak{m}_S J_n \subset J \subset J_n$ and (b) there exists a morphism $\xi_{n+1} \to \xi_n$ lying over $S/J \to S/J_n$, see Lemma 51.12.3. Let $f_n : \xi_{n+1} \to \xi_n$ be any morphism of $\mathcal{F}$ lying over $S/J_{n+1} \to S/J_n$.

Set $J = \bigcap J_n$. Set $\overline{S} = S/J$. Set $\overline{J}_n = J_n/J$. By Lemma 51.4.7 the sequence of ideals $(\overline{J}_n)$ induces the $\mathfrak{m}_{\overline{S}}$-adic topology on $\overline{S}$. Since (ξ_n, f_n) is an object of $\widehat{\mathcal{F}}_{\mathcal{J}}(\overline{S})$, where $\mathcal{J}$ is the filtration $(\overline{J}_n)$ of $\overline{S}$, we see that (ξ_n, f_n) induces an object ξ of $\widehat{\mathcal{F}}(\overline{S})$. see Lemma 51.7.4.

We prove ξ is versal. For versality it suffices to check conditions (1) and (2) of Lemma 51.12.2. Condition (1) follows from our choice of ξ_2 in Step 2 above. Suppose given a diagram in $\widehat{\mathcal{F}}$

$$\begin{tikzcd} & y \arrow[d] \\ \eta \arrow[r] & x \end{tikzcd} \quad \text{lying over} \quad \begin{tikzcd} & B \arrow[d, "f"] \\ \overline{S} \arrow[r] & A \end{tikzcd}$$

in $\widehat{\mathcal{C}}_\Lambda$ with $f : B \to A$ a small extension of Artinian rings. We have to show there is a map $\overline{S} \to B$ fitting into the diagram on the right. Choose n such that $\overline{S} \to A$ factors through $\overline{S} \to S/J_n$. This is possible as the sequence $(\overline{J}_n)$ induces the $\mathfrak{m}_{\overline{S}}$-adic topology as we saw above. The pushforward of ξ along $\overline{S} \to S/J_n$ is ξ_n. We may factor $\xi \to x$ as $\xi \to \xi_n \to x$ hence we get a diagram in $\mathcal{F}$

$$\begin{tikzcd} & y \arrow[d] \\ \xi_n \arrow[r] & x \end{tikzcd} \quad \text{lying over} \quad \begin{tikzcd} & B \arrow[d, "f"] \\ S/J_n \arrow[r] & A. \end{tikzcd}$$

To check condition (2) of Lemma 51.12.2 it suffices to complete the diagram

$$\begin{tikzcd} S/J_{n+1} \arrow[r, dashed] \arrow[d] & B \arrow[d, "f"] \\ S/J_n \arrow[r] & A \end{tikzcd}$$

or equivalently, to complete the diagram

$$\begin{tikzcd} & S/J_n \times_A B \arrow[d, "p_1"] \\ S/J_{n+1} \arrow[r] \arrow[ru, dashed] & S/J_n. \end{tikzcd}$$

If p_1 has a section we are done. If not, by Lemma 51.3.8 (2) p_1 is a small extension, so by Lemma 51.3.12 (4) p_1 is an essential surjection. Recall that $S = R[[X_1, \ldots, X_r]]$ and that we chose R such that $\underline{R}|_{\mathcal{C}_\Lambda}$ is smooth. Hence there exists a map $h : R \to B$ lifting the map $R \to S \to S/J_n \to A$. By the universal property of a power series ring there is an R-algebra map $h : S = R[[X_1, \ldots, X_2]] \to B$ lifting the given map $S \to S/J_n \to A$. This induces a map $g : S \to S/J_n \times_A B$ making the solid square in the diagram

$$\begin{tikzcd} S \arrow[r, "g"'] \arrow[d] & S/J_n \times_A B \arrow[d, "p_1"] \\ S/J_{n+1} \arrow[r] \arrow[ru, dashed] & S/J_n \end{tikzcd}$$

commute. Then g is a surjection since p_1 is an essential surjection. We claim the ideal $K = \mathrm{Ker}(g)$ of S satisfies conditions (a) and (b) of the construction of J_{n+1} in the induction step above. Namely, $K \subset J_n$ is clear and $\mathfrak{m}_S J_n \subset K$ as p_1 is a small extension; this proves (a). By (S1) applied to

$$\begin{tikzcd} & y \arrow[d] \\ \xi_n \arrow[r] & x, \end{tikzcd}$$

there exists a lifting of ξ_n to $S/K \cong S/J_n \times_A B$, so (b) holds. Since J_{n+1} was the minimal ideal with properties (a) and (b) this implies $J_{n+1} \subset K$. Thus the desired map $S/J_{n+1} \to S/K \cong S/J_n \times_A B$ exists. □

51.13. Minimal versal formal objects

We do a little bit of work to try and understand (non)uniqueness of versal formal objects. It turns out that if a predeformation category has a versal formal object, then it has a minimal versal formal object and any two such are isomorphic. Moreover, all versal formal objects are ``more or less'' the same up to replacing the base ring by a power series extension.

Let $\mathcal{F}$ be a category cofibred in groupoids over $\mathcal{C}_\Lambda$. For every object x of $\mathcal{F}$ lying over $A \in Ob(\mathcal{C}_\Lambda)$ consider the category $\mathcal{S}_x$ with objects

$$Ob(\mathcal{S}_x) = \{x' \to x \mid x' \to x \text{ lies over } A' \subset A\}$$

and morphisms are morphisms over x. For every $y \to x$ in $\mathcal{F}$ lying over $f : B \to A$ in $\mathcal{C}_\Lambda$ there is a functor $f_* : \mathcal{S}_y \to \mathcal{S}_x$ defined as follows: Given $y' \to y$ lying over $B' \subset B$ set $A' = f(B')$ and let $y' \to x'$ be over $B' \to f(B')$ be the pushforward of y'. By the axioms of a category cofibred in groupoids we obtain a unique morphism $x' \to x$ lying over $f(B') \to A$ such that

$$\begin{tikzcd} y' \arrow[r] \arrow[d] & x' \arrow[d] \\ y \arrow[r] & x \end{tikzcd}$$

commutes. Then $x' \to x$ is an object of $\mathcal{S}_x$. We say an object $x' \to x$ of $\mathcal{S}_x$ is *minimal* if any morphism $(x'_1 \to x) \to (x' \to x)$ in $\mathcal{S}_x$ is an isomorphism, i.e., x' and x'_1 are defined over the same subring of A. Since A has finite length as a Λ-module we see that minimal objects always exist.

Lemma 51.13.1. *Let $\mathcal{F}$ be a category cofibred in groupoids over $\mathcal{C}_\Lambda$ which has (S1).*

1. *For $y \to x$ in $\mathcal{F}$ a minimal object in $\mathcal{S}_y$ maps to a minimal object of $\mathcal{S}_x$.*
2. *For $y \to x$ in $\mathcal{F}$ lying over a surjection $f : B \to A$ in $\mathcal{C}_\Lambda$ every minimal object of $\mathcal{S}_x$ is the image of a minimal object of $\mathcal{S}_y$.*

Proof. Proof of (1). Say $y \to x$ lies over $f : B \to A$. Let $y' \to y$ lying over $B' \subset B$ be a minimal object of $\mathcal{S}_y$. Let

$$\begin{tikzcd} y' \arrow[r] \arrow[d] & x' \arrow[d] \\ y \arrow[r] & x \end{tikzcd} \quad \text{lying over} \quad \begin{tikzcd} B' \arrow[r] \arrow[d] & f(B') \arrow[d] \\ B \arrow[r] & A \end{tikzcd}$$

be as in the construction of f_* above. Suppose that $(x'' \to x) \to (x' \to x)$ is a morphism of $\mathcal{S}_x$ with $x'' \to x'$ lying over $A'' \subset f(B')$. By (S1) there exists $y'' \to y'$ lying over $B' \times_{f(B')} A'' \to B'$. Since $y' \to y$ is minimal we conclude that $B' \times_{f(B')} A'' \to B'$ is an isomorphism, which implies that $A'' = f(B')$, i.e., $x' \to x$ is minimal.

Proof of (2). Suppose $f : B \to A$ is surjective and $y \to x$ lies over f. Let $x' \to x$ be a minimal object of $\mathcal{S}_x$ lying over $A' \subset A$. By (S1) there exists $y' \to y$ lying over $B' = f^{-1}(A') = B \times_A A' \to B$ whose image in $\mathcal{S}_x$ is $x' \to x$. So $f_*(y' \to y) = x' \to x$. Choose a morphism $(y'' \to y) \to (y' \to y)$ in $\mathcal{S}_y$ with $y'' \to y$ a minimal object (this is possible by the remark on lengths above the lemma). Then $f_*(y'' \to y)$ is an object of $\mathcal{S}_x$ which maps to $x' \to x$ (by functoriality of f_*) hence is isomorphic to $x' \to x$ by minimality of $x' \to x$. $\square$

Lemma 51.13.2. *Let $\mathcal{F}$ be a category cofibred in groupoids over $\mathcal{C}_\Lambda$ which has (S1). Let ξ be a versal formal object of $\mathcal{F}$ lying over R. There exists a morphism $\xi' \to \xi$ lying over $R' \subset R$ with the following minimality properties*

(1) *for every $f : R \to A$ with $A \in Ob(\mathcal{C}_\Lambda)$ the pushforwards*

$$\begin{tikzcd} \xi' \arrow[r] \arrow[d] & x' \arrow[d] & \text{lying over} & R' \arrow[r] \arrow[d] & f(R') \arrow[d] \\ \xi \arrow[r] & x & & R \arrow[r] & A \end{tikzcd}$$

produce a minimal object $x' \to x$ of $\mathcal{S}_x$, and

(2) *for any morphism of formal objects $\xi'' \to \xi'$ the corresponding morphism $R'' \to R'$ is surjective.*

Proof. Write $\xi = (R, \xi_n, f_n)$. Set $R'_1 = k$ and $\xi'_1 = \xi_1$. Suppose that we have constructed minimal objects $\xi'_m \to \xi_m$ of $\mathcal{S}_{\xi_m}$ lying over $R'_m \subset R/\mathfrak{m}_R^m$ for $m \leq n$ and morphisms $f'_m : \xi'_{m+1} \to \xi'_m$ compatible with f_m for $m \leq n-1$. By Lemma 51.13.1 (2) there exists a minimal object $\xi'_{n+1} \to \xi_{n+1}$ lying over $R'_{n+1} \subset R/\mathfrak{m}_R^{n+1}$ whose image is $\xi'_n \to \xi_n$ over $R'_n \subset R/\mathfrak{m}_R^n$. This produces the commutative diagram

$$\begin{tikzcd} \xi'_{n+1} \arrow[r, "f'_n"'] \arrow[d] & \xi'_n \arrow[d] \\ \xi_{n+1} \arrow[r, "f_n"] & \xi_n \end{tikzcd}$$

by construction. Moreover the ring map $R'_{n+1} \to R'_n$ is surjective. Set $R' = lim_n R'_n$. Then $R' \to R$ is injective.

However, it isn't a priori clear that R' is Noetherian. To prove this we use that ξ is versal. Namely, versality implies that there exists a morphism $\xi \to \xi'_n$ in $\widehat{\mathcal{F}}$, see Lemma 51.8.15. The corresponding map $R \to R'_n$ has to be surjective (as $\xi'_n \to \xi_n$ is minimal in $\mathcal{S}_{\xi_n}$). Thus the dimensions of the cotangent spaces are bounded and Lemma 51.4.8 implies R' is Noetherian, i.e., an object of $\widehat{\mathcal{C}}_\Lambda$. By Lemma 51.7.4 (plus the result on filtrations of Lemma 51.4.8) the sequence of elements ξ'_n defines a formal object ξ' over R' and we have a map $\xi' \to \xi$.

By construction (1) holds for $R \to R/\mathfrak{m}_R^n$ for each n. Since each $R \to A$ as in (1) factors through $R \to R/\mathfrak{m}_R^n \to A$ we see that (1) for $x' \to x$ over $f(R) \subset A$ follows from the minimality of $\xi'_n \to \xi_n$ over $R'_n \to R/\mathfrak{m}_R^n$ by Lemma 51.13.1 (1).

If $R'' \to R'$ as in (2) is not surjective, then $R'' \to R' \to R'_n$ would not be surjective for some n and $\xi'_n \to \xi_n$ wouldn't be minimal, a contradiction. This contradiction proves (2). $\square$

Lemma 51.13.3. *Let $\mathcal{F}$ be a category cofibred in groupoids over $\mathcal{C}_\Lambda$ which has (S1). Let ξ be a versal formal object of $\mathcal{F}$ lying over R. Let $\xi' \to \xi$ be a morphism of formal objects lying over $R' \subset R$ as constructed in Lemma 51.13.2. Then*

$$R \cong R'[[x_1, \ldots, x_r]]$$

is a power series ring over R'. Moreover, ξ' is a versal formal object too.

Proof. By Lemma 51.8.15 there exists a morphism $\xi \to \xi'$. By Lemma 51.13.2 the corresponding map $f : R \to R'$ induces a surjection $f|_{R'} : R' \to R'$. This is an isomorphism by Algebra, Lemma 7.28.8. Hence $I = \text{Ker}(f)$ is an ideal of R such that $R = R' \oplus I$. Let $x_1, \ldots, x_n \in I$ be elements which form a basis for $I/\mathfrak{m}_R I$. Consider the map $S = R'[[X_1, \ldots, X_r]] \to R$ mapping X_i to x_i. For every $n \geq 1$ we get a surjection of Artinian R'-algebras $B = S/\mathfrak{m}_S^n \to R/\mathfrak{m}_R^n = A$. Denote $y \in Ob(\mathcal{F}(B)$, resp. $x \in Ob(\mathcal{F}(A))$ the pushforward of ξ' along $R' \to S \to B$, resp. $R' \to S \to A$. Note that x is also the pushforward of ξ along $R \to A$ as ξ is the pushforward of ξ' along $R' \to R$. Thus we have a solid diagram

$$\begin{tikzcd} & y \arrow[d] \\ \xi \arrow[r] \arrow[ur, dotted] & x \end{tikzcd} \quad \text{lying over} \quad \begin{tikzcd} & S/\mathfrak{m}_S^n \arrow[d] \\ R \arrow[r] \arrow[ur, dotted] & R/\mathfrak{m}_R^n \end{tikzcd}$$

Because ξ is versal, using Remark 51.8.14 we obtain the dotted arrows fitting into these diagrams. In particular, the maps $S/\mathfrak{m}_S^n \to R/\mathfrak{m}_R^n$ have sections $h_n : R/\mathfrak{m}_R^n \to S/\mathfrak{m}_S^n$. It follows from Lemma 51.4.9 that $S \to R$ is an isomorphism.

As ξ is a pushforward of ξ' along $R' \to R$ we obtain from Remark 51.7.13 a commutative diagram

$$\begin{tikzcd} \underline{R}|_{\mathcal{C}_\Lambda} \arrow[rr] \arrow[dr, "\underline{\xi}"'] & & \underline{R'}|_{\mathcal{C}_\Lambda} \arrow[dl, "\underline{\xi'}"] \\ & \mathcal{F} & \end{tikzcd}$$

Since $R' \to R$ has a left inverse (namely $R \to R/I = R'$) we see that $\underline{R}|_{\mathcal{C}_\Lambda} \to \underline{R'}|_{\mathcal{C}_\Lambda}$ is essentially surjective. Hence by Lemma 51.8.7 we see that $\underline{\xi'}$ is smooth, i.e., ξ' is a versal formal object. □

Motivated by the preceding lemmas we make the following definition.

Definition 51.13.4. Let $\mathcal{F}$ be a predeformation category. We say a versal formal object ξ of $\mathcal{F}$ is *minimal*[2] if for any morphism of formal objects $\xi' \to \xi$ the underlying map on rings is surjective. Sometimes a minimal versal formal object is called *miniversal*.

The work in this section shows this definition is reasonable. First of all, the existence of a versal formal object implies that $\mathcal{F}$ has (S1). Then the preceding lemmas show there exists a minimal versal formal object. Finally, any two minimal versal formal objects are isomorphic. Here is a summary of our results (with detailed proofs).

Lemma 51.13.5. *Let $\mathcal{F}$ be a predeformation category which has a versal formal object. Then*

[2]This may be nonstandard terminology. Many authors tie this notion in with properties of tangent spaces. We will make the link in Section 51.14.

(1) *$\mathcal{F}$ has a minimal versal formal object,*
(2) *minimal versal objects are unique up to isomorphism, and*
(3) *any versal object is the pushforward of a minimal versal object along a power series ring extension.*

Proof. Suppse $\mathcal{F}$ has a versal formal object ξ over R. Then it satisfies (S1), see Lemma 51.12.1. Let $\xi' \to \xi$ over $R' \subset R$ be any of the morphisms constructed in Lemma 51.13.2. By Lemma 51.13.3 we see that ξ' is versal, hence it is a minimal versal formal object (by construction). This proves (1). Also, $R \cong R'[[x_1, \ldots, x_n]]$ which proves (3).

Suppose that ξ_i/R_i are two minimal versal formal objects. By Lemma 51.8.15 there exist morphisms $\xi_1 \to \xi_2$ and $\xi_2 \to \xi_1$. The corresponding ring maps $f : R_1 \to R_2$ and $g : R_2 \to R_1$ are surjective by minimality. Hence the compositions $g \circ f : R_1 \to R_1$ and $f \circ g : R_2 \to R_2$ are isomorphisms by Algebra, Lemma 7.28.8. Thus f and g are isomorphisms whence the maps $\xi_1 \to \xi_2$ and $\xi_2 \to \xi_1$ are isomorphisms (because $\widehat{\mathcal{F}}$ is cofibred in groupoids by Lemma 51.7.2). This proves (2) and finishes the proof of the lemma. □

51.14. Miniversal formal objects and tangent spaces

The general notion of minimality introduced in Definition 51.13.4 can sometimes be deduced from the behaviour on tangent spaces. Let ξ be a formal object of the predeformation category $\mathcal{F}$ and let $\underline{\xi} : \underline{R}|_{\mathcal{C}_\Lambda} \to \mathcal{F}$ be the corresponding morphism. Then we can consider the following two conditions

(51.14.0.1) $$d\underline{\xi} : \mathrm{Der}_\Lambda(R, k) \to T\mathcal{F} \text{ is bijective}$$

(51.14.0.2) $$d\underline{\xi} : \mathrm{Der}_\Lambda(R, k) \to T\mathcal{F} \text{ is bijective on } \mathrm{Der}_\Lambda(k, k)\text{-orbits.}$$

Here we are using the identification $T\underline{R}|_{\mathcal{C}_\Lambda} = \mathrm{Der}_\Lambda(R, k)$ of Example 51.10.11 and the action (51.11.6.2) of derivations on the tangent spaces. If $k' \subset k$ is separable, then $\mathrm{Der}_\Lambda(k, k) = 0$ and the two conditions are equivalent. It turns out that, in the presence of condition (S2) a versal formal object is minimal if and only if $\underline{\xi}$ satisfies (51.14.0.2). Moreover, if $\underline{\xi}$ satisfies (51.14.0.1), then $\mathcal{F}$ satisfies (S2).

Lemma 51.14.1. *Let $\mathcal{F}$ be a predeformation category. Let ξ be a versal formal object of $\mathcal{F}$ such that (51.14.0.2) holds. Then ξ is a minimal versal formal object. In particular, such ξ are unique up to isomorphism.*

Proof. If ξ is not minimal, then there exists a morphism $\xi' \to \xi$ lying over $R' \to R$ such that $R = R'[[x_1, \ldots, x_n]]$ with $n > 0$, see Lemma 51.13.5. Thus $d\underline{\xi}$ factors as

$$\mathrm{Der}_\Lambda(R, k) \to \mathrm{Der}_\Lambda(R', k) \to T\mathcal{F}$$

and we see that (51.14.0.2) cannot hold because $D : f \mapsto \partial/\partial x_1(f) \bmod \mathfrak{m}_R$ is an element of the kernel of the first arrow which is not in the image of $\mathrm{Der}_\Lambda(k, k) \to \mathrm{Der}_\Lambda(R, k)$. □

Lemma 51.14.2. *Let $\mathcal{F}$ be a predeformation category. Let ξ be a versal formal object of $\mathcal{F}$ such that (51.14.0.1) holds. Then*

(1) *$\mathcal{F}$ satisfies (S1).*
(2) *$\mathcal{F}$ satisfies (S2).*
(3) *$\dim_k T\mathcal{F}$ is finite.*

Proof. Condition (S1) holds by Lemma 51.12.1. The first part of (S2) holds since (S1) holds. Let

$$\begin{tikzcd} y \arrow[r, "c"] \arrow[d, "a"] & x_\epsilon \arrow[d, "e"] \\ x \arrow[r, "d"] & x_0 \end{tikzcd} \quad \text{and} \quad \begin{tikzcd} y' \arrow[r, "c'"] \arrow[d, "a'"] & x_\epsilon \arrow[d, "e"] \\ x \arrow[r, "d"] & x_0 \end{tikzcd} \quad \text{lying over} \quad \begin{tikzcd} A \times_k k[\epsilon] \arrow[r] \arrow[d] & k[\epsilon] \arrow[d] \\ A \arrow[r] & k \end{tikzcd}$$

be diagrams as in the second part of (S2). As above we can find morphisms $b : \xi \to y$ and $b' : \xi \to y'$ such that

$$\begin{tikzcd} \xi \arrow[r, "b'"] \arrow[d, "b"] & y' \arrow[d, "a'"] \\ y \arrow[r, "a"] & x \end{tikzcd}$$

commutes. Let $p : \mathscr{F} \to \mathscr{C}_\Lambda$ denote the structure morphism. Say $\hat{p}(\xi) = R$, i.e., ξ lies over $R \in Ob(\widehat{\mathscr{C}}_\Lambda)$. We see that the pushforward of ξ via $p(c) \circ p(b)$ is x_ϵ and that the pushforward of ξ via $p(c') \circ p(b')$ is x_ϵ. Since ξ satisfies (51.14.0.1), we see that $p(c) \circ p(b) = p(c') \circ p(b')$ as maps $R \to k[\epsilon]$. Hence $p(b) = p(b')$ as maps from $R \to A \times_k k[\epsilon]$. Thus we see that y and y' are isomorphic to the pushforward of ξ along this map and we get a unique morphism $y \to y'$ over $A \times_k k[\epsilon]$ compatible with b and b' as desired.

Finally, by Example 51.10.11 we see $\dim_k T\mathscr{F} = \dim_k T\underline{R}|_{\mathscr{C}_\Lambda}$ is finite. □

Example 51.14.3. There exist predeformation categories which have a versal formal object satisfying (51.14.0.2) but which do not satisfy (S2). A quick example is to take $F = \underline{k[\epsilon]}/G$ where $G \subset \mathrm{Aut}_{\mathscr{C}_\Lambda}(k[\epsilon])$ is a finite nontrivial subgroup. Namely, the map $\underline{k[\epsilon]} \to F$ is smooth, but the tangent space of F does not have a natural k-vector space structure (as it is a quotient of a k-vector space by a finite group).

Lemma 51.14.4. *Let $\mathscr{F}$ be a predeformation category satisfying (S2) which has a versal formal object. Then its minimal versal formal object satisfies (51.14.0.2).*

Proof. Let ξ be a minimal versal formal object for $\mathscr{F}$, see Lemma 51.13.5. Say ξ lies over $R \in Ob(\widehat{\mathscr{C}}_\Lambda)$. In order to parse (51.14.0.2) we point out that $T\mathscr{F}$ has a natural k-vector space structure (see Lemma 51.11.2), that $d\underline{\xi} : \mathrm{Der}_\Lambda(R, k) \to T\mathscr{F}$ is linear (see Lemma 51.11.4), and that the action of $\mathrm{Der}_\Lambda(k, k)$ is given by addition (see Lemma 51.11.6). Consider the diagram

$$\begin{tikzcd} & Hom_k(\mathfrak{m}_R/\mathfrak{m}_R^2, k) & \\ K \arrow[r] & \mathrm{Der}_\Lambda(R, k) \arrow[u] \arrow[r, "d\underline{\xi}"] & T\mathscr{F} \\ & \mathrm{Der}_\Lambda(k, k) \arrow[u] \arrow[ur] & \end{tikzcd}$$

The vector space K is the kernel of $d\underline{\xi}$. Note that the middle column is exact in the middle as it is dual to the sequence (51.3.10.1). If (51.14.0.2) fails, then we can find a nonzero element $D \in K$ which does not map to zero in $Hom_k(\mathfrak{m}_R/\mathfrak{m}_R^2, k)$. This means there exists an $t \in \mathfrak{m}_R$ such that $D(t) = 1$. Set $R' = \{a \in R \mid D(a) = 0\}$. As D is a derivation this is a subring of R. Since $D(t) = 1$ we see that $R' \to k$ is surjective (compare with the proof of Lemma 51.3.12). Note that $\mathfrak{m}_{R'} = \text{Ker}(D : \mathfrak{m}_R \to k)$ is an ideal of R and $\mathfrak{m}_R^2 \subset \mathfrak{m}_{R'}$. Hence

$$\mathfrak{m}_R/\mathfrak{m}_R^2 = \mathfrak{m}_{R'}/\mathfrak{m}_R^2 + k\bar{t}$$

which implies that the map

$$R'/\mathfrak{m}_R^2 \times_k k[\epsilon] \to R/\mathfrak{m}_R^2$$

sending ϵ to $\bar{t}$ is an isomorphism. In particular there is a map $R/\mathfrak{m}_R^2 \to R'/\mathfrak{m}_R^2$.

Let $\xi \to y$ be a morphism lying over $R \to R/\mathfrak{m}_R^2$. Let $y \to x$ be a morphism lying over $R/\mathfrak{m}_R^2 \to R'/\mathfrak{m}_R^2$. Let $y \to x_\epsilon$ be a morphism lying over $R/\mathfrak{m}_R^2 \to k[\epsilon]$. Let x_0 be the unique (up to unique isomorphism) object of $\mathcal{F}$ over k. By the axioms of a category cofibred in groupoids we obtain a commutative diagram

$$\begin{tikzcd} y \arrow[r] \arrow[d] & x_\epsilon \arrow[d] \\ x \arrow[r] & x_0 \end{tikzcd} \quad \text{lying over} \quad \begin{tikzcd} R'/\mathfrak{m}_R^2 \times_k k[\epsilon] \arrow[r] \arrow[d] & k[\epsilon] \arrow[d] \\ R'/\mathfrak{m}_R^2 \arrow[r] & k. \end{tikzcd}$$

Because $D \in K$ we see that x_ϵ is isomorphic to $0 \in \mathcal{F}(k[\epsilon])$, i.e., x_ϵ is the pushforward of x_0 via $k \to k[\epsilon]$, $a \mapsto a$. Hence by Lemma 51.9.7 we see that there exists a morphism $x \to y$. Since $\text{length}_\Lambda(R'/\mathfrak{m}_R^2) < \text{length}_\Lambda(R/\mathfrak{m}_R^2)$ the corresponding ring map $R'/\mathfrak{m}_R^2 \to R/\mathfrak{m}_R^2$ is not surjective. This contradicts the minimality of ξ/R, see part (1) of Lemma 51.13.2. This contradiction shows that such a D cannot exist, hence we win. □

Theorem 51.14.5. *Let $\mathcal{F}$ be a predeformation category. Consider the following conditions*

(1) *$\mathcal{F}$ has a minimal versal formal object satisfying (51.14.0.1),*
(2) *$\mathcal{F}$ has a minimal versal formal object satisfying (51.14.0.2),*
(3) *the following conditions hold:*
    (a) *$\mathcal{F}$ satisfies (S1).*
    (b) *$\mathcal{F}$ satisfies (S2).*
    (c) *$\dim_k T\mathcal{F}$ is finite.*

We always have

$$(1) \Rightarrow (3) \Rightarrow (2).$$

If $k' \subset k$ is separable, then all three are equivalent.

Proof. Lemma 51.14.2 shows that (1) ⇒ (3). Lemmas 51.12.4 and 51.14.4 show that (3) ⇒ (2). If $k' \subset k$ is separable then $\text{Der}_\Lambda(k, k) = 0$ and we see that (51.14.0.1) = (51.14.0.2), i.e., (1) is the same as (2).

An alternative proof of (3) ⇒ (1) in the classical case is to add a few words to the proof of Lemma 51.12.4 to see that one can right away construct a versal object which satisfies (51.14.0.1) in this case. This avoids the use of Lemma 51.12.4 in the classical case. Details omitted. □

Remark 51.14.6. When $\mathcal{F}$ is a predeformation functor, the condition $\dim_k T\mathcal{F} < \infty$ is precisely condition (H3) from Schlessinger's paper. In the classical case (or the case where $k' \subset k$ is separable), Theorem 51.14.5 recovers Schlessinger's theorem on the existence of ``hulls''. In our terminology a *hull* is a versal formal object ξ for a predeformation functor such that $d\xi$ is an isomorphism.

Remark 51.14.7. Let $\mathcal{F}$ be a predeformation category satisfying (S1), (S2), and $\dim_k T\mathcal{F} < \infty$. Then $\overline{\mathcal{F}}$ also satisfies (S1), (S2), and $\dim_k T\overline{\mathcal{F}} < \infty$, see Lemma 51.9.5. Thus, if $k' \subset k$ is separable, then $\overline{\mathcal{F}}$ has a hull (see Remark 51.14.6). In fact, if ξ is a minimal versal object for $\mathcal{F}$ lying over R, then the composition

$$\underline{R}|_{\mathcal{C}_\Lambda} \longrightarrow \mathcal{F} \longrightarrow \overline{\mathcal{F}}$$

is smooth and identifies tangent spaces, i.e., the image $\overline{\xi}$ of ξ in $\overline{\mathcal{F}}$ is a hull. This follows from the fact that $\mathcal{F} \to \overline{\mathcal{F}}$ identifies tangent spaces.

Example 51.14.8. In Example 51.8.10 we constructed objects $R \in \widehat{\mathcal{C}}_\Lambda$ such that $\underline{R}|_{\mathcal{C}_\Lambda}$ is smooth. We can reformulate this as follows. Let $\mathcal{F} = \mathcal{C}_\Lambda$ considered as cofibred in groupoids via the identity functor. In other words, $\mathcal{F}$ is the category cofibred in sets corresponding to the functor $F : A \mapsto \{*\}$ (this is the final object in the category of functors $\mathcal{C}_\Lambda \to \textit{Sets}$). The condition that $\underline{R}|_{\mathcal{C}_\Lambda}$ is smooth means exactly that $\underline{R}|_{\mathcal{C}_\Lambda} \to F$ is smooth, i.e., that $\xi = *$ is a formal versal object of $\mathcal{F}$ over R. Hence $\mathcal{F}$ has a versal formal object. In fact, it is easy to see that $\mathcal{F}$ satisfies condition (3) of Theorem 51.14.5. The theorem implies that (2) holds. This means we can find a minimal versal formal object $* \in \widehat{\mathcal{F}}(S)$ over some $S \in \widehat{\mathcal{C}}_\Lambda$ such that $d* : \mathrm{Der}_\Lambda(S, k) \to 0$ is bijective on $\mathrm{Der}_\Lambda(k, k)$-orbits. Clearly this means that the injection $\mathrm{Der}_\Lambda(k, k) \to \mathrm{Der}_\Lambda(S, k)$ is also surjective. In other words, the exact sequence (51.3.10.2) turns into a pair of isomorphisms

$$H_1(L_{k/\Lambda}) = \mathfrak{m}_S/\mathfrak{m}_S^2 \quad \text{and} \quad \Omega_{S/\Lambda} \otimes_S k = \Omega_{k/\Lambda}.$$

(The first arrow is injective because of the formal smoothness of S over Λ; details omitted.) Of course the existence of such a ring S can be proved directly by judiciously slicing the ring R constructed in Example 51.8.10.

51.15. Rim-Schlessinger conditions and deformation categories

There is a very natural property of categories fibred in groupoids over $\mathcal{C}_\Lambda$ which is easy to check in practice and which implies Schlessinger's properties (S1) and (S2) we have introduced earlier.

Definition 51.15.1. Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_\Lambda$. We say that $\mathcal{F}$ satisfies *condition (RS)* if for every diagram in $\mathcal{F}$

$$\begin{tikzcd} & x_2 \arrow[d] \\ x_1 \arrow[r] & x \end{tikzcd} \quad \text{lying over} \quad \begin{tikzcd} & A_2 \arrow[d] \\ A_1 \arrow[r] & A \end{tikzcd}$$

in $\mathcal{C}_\Lambda$ with $A_2 \to A$ surjective, there exits a fiber product $x_1 \times_x x_2$ in $\mathcal{F}$ such that the diagram

$$\begin{tikzcd} x_1 \times_x x_2 \arrow[r] \arrow[d] & x_2 \arrow[d] \\ x_1 \arrow[r] & x \end{tikzcd} \quad \text{lies over} \quad \begin{tikzcd} A_1 \times_A A_2 \arrow[r] \arrow[d] & A_2 \arrow[d] \\ A_1 \arrow[r] & A. \end{tikzcd}$$

Lemma 51.15.2. *Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_\Lambda$ satisfying (RS). Given a commutative diagram in $\mathcal{F}$*

$$\begin{tikzcd} y \arrow[r] \arrow[d] & x_2 \arrow[d] \\ x_1 \arrow[r] & x \end{tikzcd} \quad \textit{lying over} \quad \begin{tikzcd} A_1 \times_A A_2 \arrow[r] \arrow[d] & A_2 \arrow[d] \\ A_1 \arrow[r] & A. \end{tikzcd}$$

with $A_2 \to A$ surjective, then it is a fiber square.

Proof. Since $\mathcal{F}$ satisfies (RS), there exists a fiber product diagram

$$\begin{tikzcd} x_1 \times_x x_2 \arrow[r] \arrow[d] & x_2 \arrow[d] \\ x_1 \arrow[r] & x \end{tikzcd} \quad \text{lying over} \quad \begin{tikzcd} A_1 \times_A A_2 \arrow[r] \arrow[d] & A_2 \arrow[d] \\ A_1 \arrow[r] & A. \end{tikzcd}$$

The induced map $y \to x_1 \times_x x_2$ lies over $\text{id} : A_1 \times_A A_1 \to A_1 \times_A A_1$, hence it is an isomorphism. □

Lemma 51.15.3. *Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_\Lambda$. Then $\mathcal{F}$ satisfies (RS) if the condition in Definition 51.15.1 is assumed to hold only when $A_2 \to A$ is a small extension.*

Proof. Apply Lemma 51.3.3. The proof is similar to that of Lemma 51.8.2. □

Lemma 51.15.4. *Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_\Lambda$. The following are equivalent*

(1) *$\mathcal{F}$ satisfies (RS),*
(2) *the functor $\mathcal{F}(A_1 \times_A A_2) \to \mathcal{F}(A_1) \times_{\mathcal{F}(A)} \mathcal{F}(A_2)$ see (51.9.1.1) is an equivalence of categories whenever $A_2 \to A$ is surjective, and*
(3) *same as in (2) whenever $A_2 \to A$ is a small extension.*

Proof. Assume (1). By Lemma 51.15.2 we see that every object of $\mathcal{F}(A_1 \times_A A_2)$ is of the form $x_1 \times_x x_2$. Moreover

$$Mor_{A_1 \times_A A_2}(x_1 \times_x x_2, y_1 \times_y y_2) = Mor_{A_1}(x_1, y_1) \times_{Mor_A(x,y)} Mor_{A_2}(x_2, y_2).$$

Hence we see that $\mathcal{F}(A_1 \times_A A_2)$ is a 2-fibre product of $\mathcal{F}(A_1)$ with $\mathcal{F}(A_2)$ over $\mathcal{F}(A)$ by Categories, Remark 4.28.5. In other words, we see that (2) holds.

The implication (2) ⇒ (3) is immediate.

Assume (3). Let $q_1 : A_1 \to A$ and $q_2 : A_2 \to A$ be given with q_2 a small extension. We will use the description of the 2-fibre product $\mathcal{F}(A_1) \times_{\mathcal{F}(A)} \mathcal{F}(A_2)$ from Categories, Remark 4.28.5. Hence let $y \in \mathcal{F}(A_1 \times_A A_2)$ correspond to $(x_1, x_2, x, a_1 : x_1 \to x, a_2 : x_2 \to x)$. Let z be an object of $\mathcal{F}$ lying over C. Then

$$\begin{aligned} Mor_{\mathcal{F}}(z, y) &= \{(f, \alpha) \mid f : C \to A_1 \times_A A_2, \alpha : f_* z \to y\} \\ &= \{(f_1, f_2, \alpha_1, \alpha_2) \mid f_i : C \to A_i,\ \alpha_i : f_{i,*} z \to x_i, \\ &\qquad q_1 \circ f_1 = q_2 \circ f_2,\ q_{1,*}\alpha_1 = q_{2,*}\alpha_2\} \\ &= Mor_{\mathcal{F}}(z, x_1) \times_{Mor_{\mathcal{F}}(z,x)} Mor_{\mathcal{F}}(z, x_2) \end{aligned}$$

whence y is a fibre product of x_1 and x_2 over x. Thus we see that $\mathcal{F}$ satisfies (RS) in case $A_2 \to A$ is a small extension. Hence (RS) holds by Lemma 51.15.3. □

Remark 51.15.5. When $\mathcal{F}$ is cofibered in sets, condition (RS) is exactly condition (H4) from Schlessinger's paper [**Sch68**, Theorem 2.11]. Namely, for a functor $F : \mathcal{C}_\Lambda \to \textit{Sets}$, condition (RS) states: If $A_1 \to A$ and $A_2 \to A$ are maps in $\mathcal{C}_\Lambda$ with $A_2 \to A$ surjective, then the induced map $F(A_1 \times_A A_2) \to F(A_1) \times_{F(A)} F(A_2)$ is bijective.

Lemma 51.15.6. *Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_\Lambda$. The condition (RS) for $\mathcal{F}$ implies both (S1) and (S2) for $\mathcal{F}$.*

Proof. Using the reformulation of Lemma 51.15.4 and the explanation of (S1) following Definition 51.9.1 it is immediate that (RS) implies (S1). This proves the first part of (S2). The second part of (S2) follows because Lemma 51.15.2 tells us that $y = x_1 \times_{d,x_0,e} x_2 = y'$ if y, y' are as in the second part of the definition of (S2) in Definition 51.9.1. (In fact the morphism $y \to y'$ is compatible with both a, a' and c, c'!) $\square$

The following lemma is the analogue of Lemma 51.9.5. Recall that if $\mathcal{F}$ is a category cofibred in groupoids over $\mathcal{C}_\Lambda$ and x is an object of $\mathcal{F}$ lying over A, then we denote $\text{Aut}_A(x) = \mathit{Mor}_A(x, x) = \mathit{Mor}_{\mathcal{F}(A)}(x, x)$. If $x' \to x$ is a morphism of $\mathcal{F}$ lying over $A' \to A$ then there is a well defined map of groups $\text{Aut}_{A'}(x') \to \text{Aut}_A(x)$.

Lemma 51.15.7. *Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_\Lambda$ satisfying (RS). The following conditions are equivalent:*

(1) *$\overline{\mathcal{F}}$ satisfies (RS).*
(2) *Let $f_1 : A_1 \to A$ and $f_2 : A_2 \to A$ be ring maps in $\mathcal{C}_\Lambda$ with f_2 surjective. The induced map of sets of isomorphism classes*
$$\overline{\mathcal{F}(A_1) \times_{\mathcal{F}(A)} \mathcal{F}(A_2)} \to \overline{\mathcal{F}}(A_1) \times_{\overline{\mathcal{F}}(A)} \overline{\mathcal{F}}(A_2)$$
is injective.
(3) *For every morphism $x' \to x$ in $\mathcal{F}$ lying over a surjective ring map $A' \to A$, the map $Aut_{A'}(x') \to Aut_A(x)$ is surjective.*
(4) *For every morphism $x' \to x$ in $\mathcal{F}$ lying over a small extension $A' \to A$, the map $Aut_{A'}(x') \to Aut_A(x)$ is surjective.*

Proof. We prove that (1) is equivalent to (2) and (2) is equivalent to (3). The equivalence of (3) and (4) follows from Lemma 51.3.3.

Let $f_1 : A_1 \to A$ and $f_2 : A_2 \to A$ be ring maps in $\mathcal{C}_\Lambda$ with f_2 surjective. By Remark 51.15.5 we see $\overline{\mathcal{F}}$ satisfies (RS) if and only if the map
$$\overline{\mathcal{F}}(A_1 \times_A A_2) \to \overline{\mathcal{F}}(A_1) \times_{\overline{\mathcal{F}}(A)} \overline{\mathcal{F}}(A_2)$$
is bijective for any such f_1, f_2. This map is at least surjective since that is the condition of (S1) and $\overline{\mathcal{F}}$ satisfies (S1) by Lemmas 51.15.6 and 51.9.5. Moreover, this map factors as
$$\overline{\mathcal{F}}(A_1 \times_A A_2) \longrightarrow \overline{\mathcal{F}(A_1) \times_{\mathcal{F}(A)} \mathcal{F}(A_2)} \longrightarrow \overline{\mathcal{F}}(A_1) \times_{\overline{\mathcal{F}}(A)} \overline{\mathcal{F}}(A_2),$$
where the first map is a bijection since
$$\mathcal{F}(A_1 \times_A A_2) \longrightarrow \mathcal{F}(A_1) \times_{\mathcal{F}(A)} \mathcal{F}(A_2)$$
is an equivalence by (RS) for $\mathcal{F}$. Hence (1) is equivalent to (2).

Assume (2) holds. Let $x' \to x$ be a morphism in $\mathcal{F}$ lying over a surjective ring map $f : A' \to A$. Let $a \in \text{Aut}_A(x)$. The objects
$$(x', x', a : x \to x),\ (x', x', \text{id} : x \to x)$$

of $\mathcal{F}(A') \times_{\mathcal{F}(A)} \mathcal{F}(A')$ have the same image in $\overline{\mathcal{F}}(A') \times_{\overline{\mathcal{F}}(A)} \overline{\mathcal{F}}(A')$. By (2) there exists maps $b_1, b_2 : x' \to x'$ such that

$$\begin{tikzcd} x \arrow[r, "a"] \arrow[d, "f_*b_1"'] & x \arrow[d, "f_*b_2"] \\ x \arrow[r, "\mathrm{id}"] & x \end{tikzcd}$$

commutes. Hence $b_2^{-1} \circ b_1 \in \mathrm{Aut}_{A'}(x')$ has image $a \in \mathrm{Aut}_A(x)$. Hence (3) holds.

Assume (3) holds. Suppose

$$(x_1, x_2, a : (f_1)_*x_1 \to (f_2)_*x_2),\ (x'_1, x'_2, a' : (f_1)_*x'_1 \to (f_2)_*x'_2)$$

are objects of $\mathcal{F}(A_1) \times_{\mathcal{F}(A)} \mathcal{F}(A_2)$ with the same image in $\overline{\mathcal{F}}(A_1) \times_{\overline{\mathcal{F}}(A)} \overline{\mathcal{F}}(A_2)$. Then there are morphisms $b_1 : x_1 \to x'_1$ in $\mathcal{F}(A_1)$ and $b_2 : x_2 \to x'_2$ in $\mathcal{F}(A_2)$. By (3) we can modify b_2 by an automorphism of x_2 over A_2 so that the diagram

$$\begin{tikzcd} (f_1)_*x_1 \arrow[r, "a"] \arrow[d, "(f_1)_*b_1"'] & (f_2)_*x_2 \arrow[d, "(f_2)_*b_2"] \\ (f_1)_*x'_1 \arrow[r, "a'"] & (f_2)_*x'_2. \end{tikzcd}$$

commutes. This proves $(x_1, x_2, a) \cong (x'_1, x'_2, a')$ in $\overline{\mathcal{F}(A_1) \times_{\mathcal{F}(A)} \mathcal{F}(A_2)}$. Hence (2) holds. □

Finally we define the notion of a deformation category.

Definition 51.15.8. A *deformation category* is a predeformation category $\mathcal{F}$ satisfying (RS). A morphism of deformation categories is a morphism of categories over $\mathcal{C}_\Lambda$.

Remark 51.15.9. We say that a functor $F : \mathcal{C}_\Lambda \to Sets$ is a *deformation functor* if the associated cofibered set is a deformation category, i.e. if $F(k)$ is a one element set and F satisfies (RS). If $\mathcal{F}$ is a deformation category, then $\overline{\mathcal{F}}$ is a predeformation functor but not necessarily a deformation functor, as Lemma 51.15.7 shows.

Example 51.15.10. A prorepresentable functor F is a deformation functor. Namely, suppose $R \in Ob(\widehat{\mathcal{C}}_\Lambda)$ and $F(A) = Mor_{\widehat{\mathcal{C}}_\Lambda}(R, A)$. There is a unique morphism $R \to k$, so $F(k)$ is a one element set. Since

$$Hom_\Lambda(R, A_1 \times_A A_2) = Hom_\Lambda(R, A_1) \times_{Hom_\Lambda(R,A)} Hom_\Lambda(R, A_2)$$

the same is true for maps in $\widehat{\mathcal{C}}_\Lambda$ and we see that F has (RS).

The following is one of our typical remarks on passing from a category cofibered in groupoids to the predeformation category at a point over k: it says that this process preserves (RS).

Lemma 51.15.11. *Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_\Lambda$. Let $x_0 \in Ob(\mathcal{F}(k))$. Let $\mathcal{F}_{x_0}$ be the category cofibred in groupoids over $\mathcal{C}_\Lambda$ constructed in Remark 51.6.4. If $\mathcal{F}$ satisfies (RS), then so does $\mathcal{F}_{x_0}$. In particular, $\mathcal{F}_{x_0}$ is a deformation category.*

Proof. Any diagram as in Definition 51.15.1 in $\mathcal{F}_{x_0}$ gives rise to a diagram in $\mathcal{F}$ and the output of (RS) for this diagram in $\mathcal{F}$ can be viewed as an output for $\mathcal{F}_{x_0}$ as well. □

The following lemma is the analogue of the fact that 2-fibre products of algebraic stacks are algebraic stacks.

Lemma 51.15.12. *Let*

$$\begin{tikzcd} \mathcal{H} \times_{\mathcal{F}} \mathcal{G} \arrow[r] \arrow[d] & \mathcal{G} \arrow[d, "g"] \\ \mathcal{H} \arrow[r, "f"] & \mathcal{F} \end{tikzcd}$$

be 2*-fibre product of categories cofibered in groupoids over* $\mathcal{C}_\Lambda$*. If* $\mathcal{F}, \mathcal{G}, \mathcal{H}$ *all satisfy (RS), then* $\mathcal{H} \times_{\mathcal{F}} \mathcal{G}$ *satisfies (RS).*

Proof. If A is an object of $\mathcal{C}_\Lambda$, then an object of the fiber category of $\mathcal{H} \times_{\mathcal{F}} \mathcal{G}$ over A is a triple (u, v, a) where $u \in \mathcal{H}(A)$, $v \in \mathcal{G}(A)$, and $a : f(u) \to g(v)$ is a morphism in $\mathcal{F}(A)$. Consider a diagram in $\mathcal{H} \times_{\mathcal{F}} \mathcal{G}$

$$\begin{tikzcd} & (u_2, v_2, a_2) \arrow[d] & & & A_2 \arrow[d] \\ (u_1, v_1, a_1) \arrow[r] & (u, v, a) & \text{lying over} & A_1 \arrow[r] & A \end{tikzcd}$$

in $\mathcal{C}_\Lambda$ with $A_2 \to A$ surjective. Since $\mathcal{H}$ and $\mathcal{G}$ satisfy (RS), there are fiber products $u_1 \times_u u_2$ and $v_1 \times_v v_2$ lying over $A_1 \times_A A_2$. Since $\mathcal{F}$ satisfies (RS), Lemma 51.15.2 shows

$$\begin{tikzcd} f(u_1 \times_u u_2) \arrow[r] \arrow[d] & f(u_2) \arrow[d] & \text{and} & g(v_1 \times_v v_2) \arrow[r] \arrow[d] & g(v_2) \arrow[d] \\ f(u_1) \arrow[r] & f(u) & & g(v_1) \arrow[r] & g(v) \end{tikzcd}$$

are both fiber squares in $\mathcal{F}$. Thus we can view $a_1 \times_a a_2$ as a morphism from $f(u_1 \times_u u_2)$ to $g(v_1 \times_v v_2)$ over $A_1 \times_A A_2$. It follows that

$$\begin{tikzcd} (u_1 \times_u u_2, v_1 \times_v v_2, a_1 \times_a a_2) \arrow[r] \arrow[d] & (u_2, v_2, a_2) \arrow[d] \\ (u_1, v_1, a_1) \arrow[r] & (u, v, a) \end{tikzcd}$$

is a fiber square in $\mathcal{H} \times_{\mathcal{F}} \mathcal{G}$ as desired. $\square$

51.16. Lifts of objects

The content of this section is that the tangent space has a principal homogeneous action on the set of lifts along a small surjection in the case of a deformation category.

Definition 51.16.1. Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_\Lambda$. Let $f : A' \to A$ be a map in $\mathcal{C}_\Lambda$. Let $x \in \mathcal{F}(A)$. The category $\mathit{Lift}(x, f)$ of lifts of x along f is the category with the following objects and morphisms.

(1) Objects: A *lift of x along f* is a morphism $x' \to x$ lying over f.
(2) Morphisms: A *morphism of lifts* from $a_1 : x'_1 \to x$ to $a_2 : x'_2 \to x$ is a morphism $b : x'_1 \to x'_2$ in $\mathcal{F}(A')$ such that $a_2 = a_1 \circ b$.

The set $\mathrm{Lift}(x, f)$ of lifts of x along f is the set of isomorphism classes of $\mathit{Lift}(x, f)$.

Remark 51.16.2. When the map $f : A' \to A$ is clear from the context, we may write $\mathit{Lift}(x, A')$ and $\mathrm{Lift}(x, A')$ in place of $\mathit{Lift}(x, f)$ and $\mathrm{Lift}(x, f)$.

Remark 51.16.3. Let $\mathcal{F}$ be a category cofibred in groupoids over $\mathcal{C}_\Lambda$. Let $x_0 \in Ob(\mathcal{F}(k))$. Let V be a finite dimesional vector space. Then $\text{Lift}(x_0, k[V])$ is the set of isomorphism classes of $\mathcal{F}_{x_0}(k[V])$ where $\mathcal{F}_{x_0}$ is the predeformation category of objects in $\mathcal{F}$ lying over x_0, see Remark 51.6.4. Hence if $\mathcal{F}$ satisfies (S2), then so does $\mathcal{F}_{x_0}$ (see Lemma 51.9.6) and by Lemma 51.11.2 we see that

$$\text{Lift}(x_0, k[V]) = T\mathcal{F}_{x_0} \otimes_k V$$

as k-vector spaces.

Remark 51.16.4. Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_\Lambda$ satisfying (RS). Let

$$\begin{tikzcd} A_1 \times_A A_2 \arrow[r] \arrow[d] & A_2 \arrow[d] \\ A_1 \arrow[r] & A \end{tikzcd}$$

be a fibre square in $\mathcal{C}_\Lambda$ such that either $A_1 \to A$ or $A_2 \to A$ is surjective. Let $x \in Ob(\mathcal{F}(A))$. Given lifts $x_1 \to x$ and $x_2 \to x$ of x to A_1 and A_2, we get by (RS) a lift $x_1 \times_x x_2 \to x$ of x to $A_1 \times_A A_2$. Conversely, by Lemma 51.15.2 any lift of x to $A_1 \times_A A_2$ is of this form. Hence a bijection

$$\text{Lift}(x, A_1) \times \text{Lift}(x, A_2) \longrightarrow \text{Lift}(x, A_1 \times_A A_2).$$

Similarly, if $x_1 \to x$ is a fixed lifting of x to A_1, then there is a bijection

$$\text{Lift}(x_1, A_1 \times_A A_2) \longrightarrow \text{Lift}(x, A_2).$$

Now let

$$\begin{tikzcd} A_1' \times_A A_2 \arrow[r] \arrow[d] & A_1 \times_A A_2 \arrow[r] \arrow[d] & A_2 \arrow[d] \\ A_1' \arrow[r] & A_1 \arrow[r] & A \end{tikzcd}$$

be a composition of fibre squares in $\mathcal{C}_\Lambda$ with both $A_1' \to A_1$ and $A_1 \to A$ surjective. Let $x_1 \to x$ be a morphism lying over $A_1 \to A$. Then by the above we have bijections

$$\begin{aligned} \text{Lift}(x_1, A_1' \times_A A_2) &= \text{Lift}(x_1, A_1') \times \text{Lift}(x_1, A_1 \times_A A_2) \\ &= \text{Lift}(x_1, A_1') \times \text{Lift}(x, A_2). \end{aligned}$$

Lemma 51.16.5. *Let $\mathcal{F}$ be a deformation category. Let $A' \to A$ be a surjective ring map in $\mathcal{C}_\Lambda$ whose kernel I is annihilated by $\mathfrak{m}_{A'}$. Let $x \in Ob(\mathcal{F}(A))$. If $\text{Lift}(x, A')$ is nonempty, then there is a free and transitive action of $T\mathcal{F} \otimes_k I$ on $\text{Lift}(x, A')$.*

Proof. Consider the ring map $g : A' \times_A A' \to k[I]$ defined by the rule $g(a_1, a_2) = \overline{a_1} \oplus a_2 - a_1$ (compare with Lemma 51.9.8). There is an isomorphism

$$A' \times_A A' \xrightarrow{\sim} A' \times_k k[I]$$

given by $(a_1, a_2) \mapsto (a_1, g(a_1, a_2))$. This isomorphism commutes with the projections to A' on the first factor, and hence with the projections of $A' \times_A A'$ and $A' \times_k k[I]$ to A. Thus there is a bijection

$$\text{Lift}(x, A' \times_A A') \longrightarrow \text{Lift}(x, A' \times_k k[I]) \tag{51.16.5.1}$$

By Remark 51.16.4 there is a bijection

$$\text{Lift}(x, A') \times \text{Lift}(x, A') \longrightarrow \text{Lift}(x, A' \times_A A') \tag{51.16.5.2}$$

There is a commutative diagram

$$\begin{tikzcd} A' \times_k k[I] \arrow[r] \arrow[d] & A \times_k k[I] \arrow[r] \arrow[d] & k[I] \arrow[d] \\ A' \arrow[r] & A \arrow[r] & k. \end{tikzcd}$$

Thus if we choose a pushforward $x \to x_0$ of x along $A \to k$, we obtain by the end of Remark 51.16.4 a bijection

$$\mathrm{Lift}(x, A' \times_k k[I]) \longrightarrow \mathrm{Lift}(x, A') \times \mathrm{Lift}(x_0, k[I]) \tag{51.16.5.3}$$

Composing (51.16.5.2), (51.16.5.1), and (51.16.5.3) we get a bijection

$$\Phi : \mathrm{Lift}(x, A') \times \mathrm{Lift}(x, A') \longrightarrow \mathrm{Lift}(x, A') \times \mathrm{Lift}(x_0, k[I]).$$

This bijection commutes with the projections on the first factors. By Remark 51.16.3 we see that $\mathrm{Lift}(x_0, k[I]) = T\mathcal{F} \otimes_k I$. If pr_2 is the second projection of $\mathrm{Lift}(x, A') \times \mathrm{Lift}(x, A')$, then we get a map

$$a = \mathrm{pr}_2 \circ \Phi^{-1} : \mathrm{Lift}(x, A') \times (T\mathcal{F} \otimes_k I) \longrightarrow \mathrm{Lift}(x, A').$$

Unwinding all the above we see that $a(x' \to x, \theta)$ is the unique lift $x'' \to x$ such that $g_*(x', x'') = \theta$ in $\mathrm{Lift}(x_0, k[I]) = T\mathcal{F} \otimes_k I$. To see this is an action of $T\mathcal{F} \otimes_k I$ on $\mathrm{Lift}(x, A')$ we have to show the following: if x', x'', x''' are lifts of x and $g_*(x', x'') = \theta$, $g_*(x'', x''') = \theta'$, then $g_*(x', x''') = \theta + \theta'$. This follows from the commutative diagram

$$\begin{tikzcd} A' \times_A A' \times_A A' \arrow[r, "(a_1,a_2,a_3)\mapsto(g(a_1,a_2),g(a_2,a_3))"'] \arrow[dr, "(a_1,a_2,a_3)\mapsto g(a_1,a_3)"'] & k[I] \times_k k[I] = k[I \times I] \arrow[d, "+"] \\ & k[I] \end{tikzcd}$$

The action is free and transitive because Φ is bijective. $\square$

Remark 51.16.6. The action of Lemma 51.16.5 is functorial. Let $\varphi : \mathcal{F} \to \mathcal{G}$ be a morphism of deformation categories. Let $A' \to A$ be a surjective ring map whose kernel I is annihilated by $\mathfrak{m}_{A'}$. Let $x \in Ob(\mathcal{F}(A))$. In this situation φ induces the vertical arrows in the following commutative diagram

$$\begin{tikzcd} \mathrm{Lift}(x, A') \times (T\mathcal{F} \otimes_k I) \arrow[r] \arrow[d, "(\varphi, d\varphi \otimes \mathrm{id}_I)"'] & \mathrm{Lift}(x, A') \arrow[d, "\varphi"] \\ \mathrm{Lift}(\varphi(x), A') \times (T\mathcal{G} \otimes_k I) \arrow[r] & \mathrm{Lift}(\varphi(x), A') \end{tikzcd}$$

The commutativity follows as each of the maps (51.16.5.2), (51.16.5.1), and (51.16.5.3) of the proof of Lemma 51.16.5 gives rise to a similar commutative diagram.

51.17. Schlessinger's theorem on prorepresentable functors

We deduce Schlessinger's theorem characterizing prorepresentable functors on $\mathcal{C}_\Lambda$.

Lemma 51.17.1. *Let $F, G : \mathcal{C}_\Lambda \to Sets$ be deformation functors. Let $\varphi : F \to G$ be a smooth morphism which induces an isomorphism $d\varphi : TF \to TG$ of tangent spaces. Then φ is an isomorphism.*

Proof. We prove $F(A) \to G(A)$ is a bijection for all $A \in Ob(\mathcal{C}_\Lambda)$ by induction on $\text{length}_A(A)$. For $A = k$ the statement follows from the assumption that F and G are deformation functors. Suppose that the statement holds for rings of length less than n and let A' be a ring of length n. Choose a small extension $f : A' \to A$. We have a commutative diagram

$$\begin{tikzcd} F(A') \arrow[r] \arrow[d, "F(f)"'] & G(A') \arrow[d, "G(f)"] \\ F(A) \arrow[r, "\sim"] & G(A) \end{tikzcd}$$

where the map $F(A) \to G(A)$ is a bijection. By smoothness of $F \to G$, $F(A') \to G(A')$ is surjective (Lemma 51.8.8). Thus we can check bijectivity by checking it on fibers $F(f)^{-1}(x) \to G(f)^{-1}(\varphi(x))$ for $x \in F(A)$ such that $F(f)^{-1}(x)$ is nonempty. These fibers are precisely $\text{Lift}(x, A')$ and $\text{Lift}(\varphi(x), A')$ and by assumption we have an isomorphism $d\varphi \otimes \text{id} : TF \otimes_k \text{Ker}(f) \to TG \otimes_k \text{Ker}(f)$. Thus, by Lemma 51.16.5 and Remark 51.16.6, for $x \in F(A)$ such that $F(f)^{-1}(x)$ is nonempty the map $F(f)^{-1}(x) \to G(f)^{-1}(\varphi(x))$ is a map of sets commuting with free transitive actions by $TF \otimes_k \text{Ker}(f)$. Hence it is bijective. □

Note that in case $k' \subset k$ is separable condition (c) in the theorem below is empty.

Theorem 51.17.2. *Let $F : \mathcal{C}_\Lambda \to Sets$ be a functor. Then F is prorepresentable if and only if (a) F is a deformation functor, (b) $\dim_k TF$ is finite, and (c) $\gamma : Der_\Lambda(k, k) \to TF$ is injective.*

Proof. Assume F is prorepresentable by $R \in \widehat{\mathcal{C}}_\Lambda$. We see F is a deformation functor by Example 51.15.10. We see $\dim_k TF$ is finite by Example 51.10.11. Finally, $\text{Der}_\Lambda(k, k) \to TF$ is identified with $\text{Der}_\Lambda(k, k) \to \text{Der}_\Lambda(R, k)$ by Example 51.10.14 which is injective because $R \to k$ is surjective.

Conversely, assume (a), (b), and (c) hold. By Lemma 51.15.6 we see that (S1) and (S2) hold. Hence by Theorem 51.14.5 there exists a minimal versal formal object ξ of F such that (51.14.0.2) holds. Say ξ lies over R. The map

$$d\underline{\xi} : \text{Der}_\Lambda(R, k) \to T\mathcal{F}$$

is bijective on $\text{Der}_\Lambda(k, k)$-orbits. Since the action of $\text{Der}_\Lambda(k, k)$ on the left hand side is free by (c) and Lemma 51.11.6 we see that the map is bijective. Thus we see that $\underline{\xi}$ is an isomorphism by Lemma 51.17.1. □

51.18. Infinitesimal automorphisms

Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_\Lambda$. Given a morphism $x' \to x$ in $\mathcal{F}$ lying over $A' \to A$, there is an induced homomorphism

$$\text{Aut}_{A'}(x') \to \text{Aut}_A(x).$$

Lemma 51.15.7 says that the cokernel of this homomorphism determines whether condition (RS) on $\mathcal{F}$ passes to $\overline{\mathcal{F}}$. In this section we study the kernel of this homomorphism. We will see that it also gives a measure of how far $\mathcal{F}$ is from $\overline{\mathcal{F}}$.

Definition 51.18.1. Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_\Lambda$. Let $x' \to x$ be a morphism in $\mathcal{F}$ lying over $A' \to A$. The *group of infinitesimal automorphisms of x' over x* is the kernel of $\text{Aut}_{A'}(x') \to \text{Aut}_A(x)$. Notation $\text{Inf}(x'/x) = \text{Ker}(\text{Aut}_{A'}(x') \to \text{Aut}_A(x))$.

Definition 51.18.2. Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_\Lambda$. Let $x_0 \in Ob(\mathcal{F}(k))$. Assume a choice of pushforward $x_0 \to x_0'$ of x_0 along the map $k \to k[\epsilon]$, $a \mapsto a$ has been made. Then there is a unique map $x_0' \to x_0$ such that $x_0 \to x_0' \to x_0$ is the identity on x_0. The *group of infinitesimal automorphisms of* x_0 is $\mathrm{Inf}_{x_0}(\mathcal{F}) := \mathrm{Inf}(x_0'/x_0)$.

Remark 51.18.3. Up to isomorphism, $\mathrm{Inf}_{x_0}(\mathcal{F})$ does not depend on the choice of pushforward $x_0 \to x_0'$. Moreover, if $y_0 \in \mathcal{F}(k)$ and $x_0 \cong y_0$ in $\mathcal{F}(k)$, then $\mathrm{Inf}_{x_0}(\mathcal{F}) \cong \mathrm{Inf}_{y_0}(\mathcal{F})$.

Remark 51.18.4. When $\mathcal{F}$ is a predeformation category, $\mathrm{Aut}_k(x_0)$ is trivial and hence $\mathrm{Inf}_{x_0}(\mathcal{F}) = \mathrm{Aut}_{k[\epsilon]}(x_0')$.

We will see that $\mathrm{Inf}_{x_0}(\mathcal{F})$ has a natural k-vector space structure when $\mathcal{F}$ satisfies (RS). At the same time, we will see that if $\mathcal{F}$ satisfies (RS), then the infinitesimal automorphisms $\mathrm{Inf}(x'/x)$ of a morphism $x' \to x$ lying over a small extension are governed by $\mathrm{Inf}_{x_0}(\mathcal{F})$, where x_0 is a pushforward of x to $\mathcal{F}(k)$. In order to do this, we introduce the automorphism functor for any object $x \in Ob(\mathcal{F})$ as follows.

Definition 51.18.5. Let $p : \mathcal{F} \to \mathcal{C}$ be a category cofibered in groupoids over an arbitrary base category $\mathcal{C}$. Assume a choice of pushforwards has been made. Let $x \in Ob(\mathcal{F})$ and let $U = p(x)$. Let $U/\mathcal{C}$ denote the category of objects under U. The *automorphism functor of* x is the functor $Aut(x) : U/\mathcal{C} \to Sets$ sending an object $f : U \to V$ to $\mathrm{Aut}_V(f_*x)$ and sending a morphism

$$\begin{tikzcd} V' \arrow[rr] & & V \\ & U \arrow[ul, "f'"] \arrow[ur, "f"'] & \end{tikzcd}$$

to the homomorphism $\mathrm{Aut}_{V'}(f'_*x) \to \mathrm{Aut}_V(f_*x)$ coming from the unique morphism $f'_*x \to f_*x$ lying over $V' \to V$ and compatible with $x \to f'_*x$ and $x \to f_*x$.

We will be concerned with the automorphism functors of objects in a category cofibered in groupoids $\mathcal{F}$ over $\mathcal{C}_\Lambda$. If $A \in Ob(\mathcal{C}_\Lambda)$, then the category $A/\mathcal{C}_\Lambda$ is nothing but the category $\mathcal{C}_A$, i.e. the category defined in Section 51.3 where we take $\Lambda = A$ and $k = A/\mathfrak{m}_A$. Hence the automorphism functor of an object $x \in Ob(\mathcal{F}(A))$ is a functor $Aut(x) : \mathcal{C}_A \to Sets$.

The following lemma could be deduced from Lemma 51.15.12 by thinking about the ``inertia'' of a category cofibred in groupoids, see for example Stacks, Section 50.7 and Categories, Section 4.31. However, it is easier to see it directly.

Lemma 51.18.6. *Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_\Lambda$ satisfying (RS). Let $x \in Ob(\mathcal{F}(A))$. Then $Aut(x) : \mathcal{C}_A \to Sets$ satisfies (RS).*

Proof. It follows that $Aut(x)$ satisfies (RS) from the fully faithfulness of the functor $\mathcal{F}(A_1 \times_A A_2) \to \mathcal{F}(A_1) \times_{\mathcal{F}(A)} \mathcal{F}(A_2)$ in Lemma 51.15.4. □

Lemma 51.18.7. *Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_\Lambda$ satisfying (RS). Let $x \in Ob(\mathcal{F}(A))$. Let x_0 be a pushforward of x to $\mathcal{F}(k)$.*

(1) *$T_{id_{x_0}} Aut(x)$ has a natural k-vector space structure such that addition agrees with composition in $T_{id_{x_0}} Aut(x)$. In particular, composition in $T_{id_{x_0}} Aut(x)$ is commutative.*
(2) *There is a canonical isomorphism $T_{id_{x_0}} Aut(x) \to T_{id_{x_0}} Aut(x_0)$ of k-vector spaces.*

Proof. We apply Remark 51.6.4 to the functor $Aut(x) : \mathcal{C}_A \to Sets$ and the element $\mathrm{id}_{x_0} \in Aut(x)(k)$ to get a predeformation functor $F = Aut(x)_{\mathrm{id}_{x_0}}$. By Lemmas 51.18.6 and 51.15.11 F is a deformation functor. By definition $T_{\mathrm{id}_{x_0}} Aut(x) = TF = F(k[\epsilon])$ which has a natural k-vector space structure specified by Lemma 51.10.8.

Addition is defined as the composition

$$F(k[\epsilon]) \times F(k[\epsilon]) \longrightarrow F(k[\epsilon] \times_k k[\epsilon]) \longrightarrow F(k[\epsilon])$$

where the first map is the inverse of the bijection guaranteed by (RS) and the second is induced by the k-algebra map $k[\epsilon] \times_k k[\epsilon] \to k[\epsilon]$ which maps $(\epsilon, 0)$ and $(0, \epsilon)$ to ϵ. If $A \to B$ is a ring map in $\mathcal{C}_\Lambda$, then $F(A) \to F(B)$ is a homomorphism where $F(A) = Aut(x)_{\mathrm{id}_{x_0}}(A)$ and $F(B) = Aut(x)_{\mathrm{id}_{x_0}}(B)$ are groups under composition. We conclude that $+ : F(k[\epsilon]) \times F(k[\epsilon]) \to F(k[\epsilon])$ is a homomorphism where $F(k[\epsilon])$ is regarded as a group under composition. With $\mathrm{id} \in F(k[\epsilon])$ the unit element we see that $+(v, \mathrm{id}) = +(\mathrm{id}, v) = v$ for any $v \in F(k[\epsilon])$ because (id, v) is the pushforward of v along the ring map $k[\epsilon] \to k[\epsilon] \times_k k[\epsilon]$ with $\epsilon \mapsto (\epsilon, 0)$. In general, given a group G with multiplication $\circ$ and $+ : G \times G \to G$ is a homomorphism such that $+(g, 1) = +(1, g) = g$, where 1 is the identity of G, then $+ = \circ$. This shows addition in the k-vector space structure on $F(k[\epsilon])$ agrees with composition.

Finally, (2) is a matter of unwinding the definitions. Namely $T_{\mathrm{id}_{x_0}} Aut(x)$ is the set of automorphisms α of the pushforward of x along $A \to k \to k[\epsilon]$ which are trivial modulo ϵ. On the other hand $T_{\mathrm{id}_{x_0}} Aut(x_0)$ is the set of automorphisms of the pushforward of x_0 along $k \to k[\epsilon]$ which are trivial modulo ϵ. Since x_0 is the pushforward of x along $A \to k$ the result is clear. □

Remark 51.18.8. We point out some basic relationships between infinitesimal automorphism groups, liftings, and tangent spaces to automorphism functors. Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_\Lambda$. Let $x' \to x$ be a morphism lying over a ring map $A' \to A$. Let x_0 be a pushforward of x to $\mathcal{F}(k)$. Then from the definitions we have an equality

$$\mathrm{Inf}(x'/x) = \mathrm{Lift}(\mathrm{id}_x, A')$$

where the liftings are of id_x as an object of $Aut(x')$. If $x_0 \in Ob(\mathcal{F}(k))$ and x'_0 is the pushforward to $\mathcal{F}(k[\epsilon])$, then applying this to $x'_0 \to x_0$ we get

$$\mathrm{Inf}_{x_0}(\mathcal{F}) = \mathrm{Lift}(\mathrm{id}_{x_0}, k[\epsilon]) = T_{\mathrm{id}_{x_0}} Aut(x_0),$$

the last equality following directly from the definitions.

Lemma 51.18.9. *Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_\Lambda$ satisfying (RS). Let $x_0 \in Ob(\mathcal{F}(k))$. Then $Inf_{x_0}(\mathcal{F})$ is equal as a set to $T_{id_{x_0}} Aut(x_0)$, and so has a natural k-vector space structure such that addition agrees with composition of automorphisms.*

Proof. The equality of sets is as in the end of Remark 51.18.8 and the statement about the vector space structure follows from Lemma 51.18.7. □

Lemma 51.18.10. *Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_\Lambda$ satisfying (RS). Let $x' \to x$ be a morphism lying over a surjective ring map $A' \to A$ with kernel I annihilated by $\mathfrak{m}_{A'}$. Let x_0 be a pushforward of x to $\mathcal{F}(k)$. Then $Inf(x'/x)$ has a free and transitive action by $T_{id_{x_0}} Aut(x') \otimes_k I = Inf_{x_0}(\mathcal{F}) \otimes_k I$.*

Proof. This is just the analogue of Lemma 51.16.5 in the setting of automorphism sheaves. To be precise, we apply Remark 51.6.4 to the functor $Aut(x') : \mathcal{C}_{A'} \to Sets$ and the element

$\mathrm{id}_{x_0} \in Aut(x)(k)$ to get a predeformation functor $F = Aut(x')_{\mathrm{id}_{x_0}}$. By Lemmas 51.18.6 and 51.15.11 F is a deformation functor. Hence Lemma 51.16.5 gives a free and transitive action of $TF \otimes_k I$ on $\mathrm{Lift}(\mathrm{id}_x, A')$, because as $\mathrm{Lift}(\mathrm{id}_x, A')$ is a group it is always nonempty. Note that we have equalities of vector spaces

$$TF = T_{\mathrm{id}_{x_0}} Aut(x') \otimes_k I = \mathrm{Inf}_{x_0}(\mathcal{F}) \otimes_k I$$

by Lemma 51.18.7. The equality $\mathrm{Inf}(x'/x) = \mathrm{Lift}(\mathrm{id}_x, A')$ of Remark 51.18.8 finishes the proof. □

Lemma 51.18.11. *Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_\Lambda$ satisfying (RS). Let $x' \to x$ be a morphism in $\mathcal{F}$ lying over a surjective ring map. Let x_0 be a pushforward of x to $\mathcal{F}(k)$. If $Inf_{x_0}(\mathcal{F}) = 0$ then $Inf(x'/x) = 0$.*

Proof. Follows from Lemmas 51.3.3 and 51.18.10. □

Lemma 51.18.12. *Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_\Lambda$ satisfying (RS). Let $x_0 \in Ob(\mathcal{F}(k))$. Then $Inf_{x_0}(\mathcal{F}) = 0$ if and only if the natural morphism $\mathcal{F}_{x_0} \to \overline{\mathcal{F}_{x_0}}$ of categories cofibered in groupoids is an equivalence.*

Proof. The morphism $\mathcal{F}_{x_0} \to \overline{\mathcal{F}_{x_0}}$ is an equivalence if and only if $\mathcal{F}_{x_0}$ is fibered in setoids, cf. Categories, Section 4.36 (a setoid is by definition a groupoid in which the only automorphism of any object is the identity). We prove that $\mathrm{Inf}_{x_0}(\mathcal{F}) = 0$ if and only if this condition holds for $\mathcal{F}_{x_0}$. Obviously if $\mathcal{F}_{x_0}$ is fibered in setoids then $\mathrm{Inf}_{x_0}(\mathcal{F}) = 0$. Conversely assume $\mathrm{Inf}_{x_0}(\mathcal{F}) = 0$. Let A be an object of $\mathcal{C}_\Lambda$. Then by Lemma 51.18.11, $\mathrm{Inf}(x/x_0) = 0$ for any object $x \to x_0$ of $\mathcal{F}_{x_0}(A)$. Since by definition $\mathrm{Inf}(x/x_0)$ equals the group of automorphisms of $x \to x_0$ in $\mathcal{F}_{x_0}(A)$, this proves $\mathcal{F}_{x_0}(A)$ is a setoid. □

51.19. Groupoids in functors on an arbitrary category

We begin with generalities on groupoids in functors on an arbitrary category. In the next section we will pass to the category $\mathcal{C}_\Lambda$. For clarity we shall sometimes refer to an ordinary groupoid, i.e., a category whose morphisms are all isomorphisms, as a groupoid category.

Definition 51.19.1. Let $\mathcal{C}$ be a category. The *category of groupoids in functors on $\mathcal{C}$* is the category with the following objects and morphisms.

(1) Objects: A *groupoid in functors on $\mathcal{C}$* is a quintuple (U, R, s, t, c) where $U, R : \mathcal{C} \to Sets$ are functors and $s, t : R \to U$ and $c : R \times_{s,U,t} R \to R$ are morphisms with the following property: For any object T of $\mathcal{C}$, the quintuple

$$(U(T), R(T), s, t, c)$$

is a groupoid category.

(2) Morphisms: A *morphism* $(U, R, s, t, c) \to (U', R', s', t', c')$ *of groupoids in functors on $\mathcal{C}$* consists of morphisms $U \to U'$ and $R \to R'$ with the following property: For any object T of $\mathcal{C}$, the induced maps $U(T) \to U'(T)$ and $R(T) \to R'(T)$ define a functor between groupoid categories

$$(U(T), R(T), s, t, c) \to (U'(T), R'(T), s', t', c').$$

Remark 51.19.2. A groupoid in functors on $\mathcal{C}$ amounts to the data of a functor $\mathcal{C} \to Groupoids$, and a morphism of groupoids in functors on $\mathcal{C}$ amounts to a morphism of the corresponding functors $\mathcal{C} \to Groupoids$ (where $Groupoids$ is regarded as a 1-category). However, for our purposes it is more convenient to use the terminology of groupoids in functors. In fact, thinking of a groupoid in functors as the corresponding functor $\mathcal{C} \to$

Groupoids, or equivalently as the category cofibered in groupoids associated to that functor, can lead to confusion (Remark 51.21.2).

Remark 51.19.3. Let (U, R, s, t, c) be a groupoid in functors on a category $\mathcal{C}$. There are unique morphisms $e : U \to R$ and $i : R \to R$ such that for every object T of $\mathcal{C}$, $e : U(T) \to R(T)$ sends $x \in U(T)$ to the identity morphism on x and $i : R(T) \to R(T)$ sends $a \in U(T)$ to the inverse of a in the groupoid category $(U(T), R(T), s, t, c)$. We will sometimes refer to s, t, c, e, and i as ``source'', ``target'', ``composition'', ``identity'', and ``inverse''.

Definition 51.19.4. Let $\mathcal{C}$ be a category. A groupoid in functors on $\mathcal{C}$ is *representable* if it is isomorphic to one of the form $(\underline{U}, \underline{R}, s, t, c)$ where U and R are objects of $\mathcal{C}$ and the pushout $R \amalg_{s,U,t} R$ exists.

Remark 51.19.5. Hence a representable groupoid in functors on $\mathcal{C}$ is given by objects U and R of $\mathcal{C}$ and morphisms $s, t : U \to R$ and $c : R \to R \amalg_{s,U,t} R$ such that $(\underline{U}, \underline{R}, s, t, c)$ satisfies the condition of Definition 51.19.1. The reason for requiring the existence of the pushout $R \coprod_{s,U,t} R$ is so that the composition morphism c is defined at the level of morphisms in $\mathcal{C}$. This requirement will always be satisfied below when we consider representable groupoids in functors on $\widehat{\mathcal{C}}_\Lambda$, since by Lemma 51.4.3 the category $\widehat{\mathcal{C}}_\Lambda$ admits pushouts.

Remark 51.19.6. We will say ``*let* $(\underline{U}, \underline{R}, s, t, c)$ *be a groupoid in functors on* $\mathcal{C}$'' to mean that we have a representable groupoid in functors. Thus this means that U and R are objects of $\mathcal{C}$, there are morphisms $s, t : U \to R$, the pushout $R \amalg_{s,U,t} R$ exists, there is a morphism $c : R \to R \amalg_{s,U,t} R$, and $(\underline{U}, \underline{R}, s, t, c)$ is a groupoid in functors on $\mathcal{C}$.

We introduce notation for restriction of groupoids in functors. This will be relevant below in situations where we restrict from $\widehat{\mathcal{C}}_\Lambda$ to $\mathcal{C}_\Lambda$.

Definition 51.19.7. Let (U, R, s, t, c) be a groupoid in functors on a category $\mathcal{C}$. Let $\mathcal{C}'$ be a subcategory of $\mathcal{C}$. The *restriction* $(U, R, s, t, c)|_{\mathcal{C}'}$ *of* (U, R, s, t, c) *to* $\mathcal{C}'$ is the groupoid in functors on $\mathcal{C}'$ given by $(U|_{\mathcal{C}'}, R|_{\mathcal{C}'}, s|_{\mathcal{C}'}, t|_{\mathcal{C}'}, c|_{\mathcal{C}'})$.

Remark 51.19.8. In the situation of Definition 51.19.7, we often denote $s|_{\mathcal{C}'}, t|_{\mathcal{C}'}, c|_{\mathcal{C}'}$ simply by s, t, c.

Definition 51.19.9. Let (U, R, s, t, c) be a groupoid in functors on a category $\mathcal{C}$.

(1) The assignment $T \mapsto (U(T), R(T), s, t, c)$ determines a functor $\mathcal{C} \to$ *Groupoids*. The *quotient category cofibered in groupoids* $[U/R] \to \mathcal{C}$ is the category cofibered in groupoids over $\mathcal{C}$ associated to this functor (as in Remarks 51.5.2 (9)).
(2) The *quotient morphism* $U \to [U/R]$ is the morphism of categories cofibered in groupoids over $\mathcal{C}$ defined by the rules
  (a) $x \in U(T)$ maps to the object $(T, x) \in Ob([U/R](T))$, and
  (b) $x \in U(T)$ and $f : T \to T'$ give rise to the morphism $(f, \mathrm{id}_{U(f)(x)}) : (T, x) \to (T, U(f)(x))$ lying over $f : T \to T'$.

51.20. Groupoids in functors on $\mathcal{C}_\Lambda$

In this section we discuss groupoids in functors on $\mathcal{C}_\Lambda$. Our eventual goal is to show that prorepresentable groupoids in functors on $\mathcal{C}_\Lambda$ serve as ``presentations'' for well-behaved deformation categories in the same way that smooth groupoids in algebraic spaces serve as presentations for algebraic stacks, cf. Algebraic Stacks, Section 57.16.

Definition 51.20.1. A groupoid in functors on $\mathcal{C}_\Lambda$ is *prorepresentable* if it is isomorphic to $(\underline{R_0}, \underline{R_1}, s, t, c)|_{\mathcal{C}_\Lambda}$ for some representable groupoid in functors $(\underline{R_0}, \underline{R_1}, s, t, c)$ on the category $\widehat{\mathcal{C}}_\Lambda$.

Let (U, R, s, t, c) be a groupoid in functors on $\mathcal{C}_\Lambda$. Taking completions, we get a quintuple $(\widehat{U}, \widehat{R}, \hat{s}, \hat{t}, \hat{c})$. By Remark 51.7.10 completion as a functor on CofSet$(\mathcal{C}_\Lambda)$ is a right adjoint, so it commutes with limits. In particular, there is a canonical isomorphism

$$\widehat{R \times_{s,U,t} R} \longrightarrow \widehat{R} \times_{\hat{s},\widehat{U},\hat{t}} \widehat{R},$$

so $\hat{c}$ can be regarded as a functor $\widehat{R} \times_{\hat{s},\widehat{U},\hat{t}} \widehat{R} \to \widehat{R}$. Then $(\widehat{U}, \widehat{R}, \hat{s}, \hat{t}, \hat{c})$ is a groupoid in functors on $\widehat{\mathcal{C}}_\Lambda$, with identity and inverse morphisms being the completions of those of (U, R, s, t, c).

Definition 51.20.2. Let (U, R, s, t, c) be a groupoid in functors on $\mathcal{C}_\Lambda$. The *completion* $(U, R, s, t, c)^\wedge$ *of* (U, R, s, t, c) is the groupoid in functors $(\widehat{U}, \widehat{R}, \hat{s}, \hat{t}, \hat{c})$ on $\widehat{\mathcal{C}}_\Lambda$ described above.

Remark 51.20.3. Let (U, R, s, t, c) be a groupoid in functors on $\mathcal{C}_\Lambda$. Then there is a canonical isomorphism $(U, R, s, t, c)^\wedge|_{\mathcal{C}_\Lambda} \cong (U, R, s, t, c)$, see Remark 51.7.7. On the other hand, let (U, R, s, t, c) be a groupoid in functors on $\widehat{\mathcal{C}}_\Lambda$ such that $U, R : \widehat{\mathcal{C}}_\Lambda \to$ *Sets* both commute with limits, e.g. if U, R are representable. Then there is a canonical isomorphism $((U, R, s, t, c)|_{\mathcal{C}_\Lambda})^\wedge \cong (U, R, s, t, c)$. This follows from Remark 51.7.11.

Lemma 51.20.4. *Let (U, R, s, t, c) be a groupoid in functors on $\mathcal{C}_\Lambda$.*

(1) *(U, R, s, t, c) is prorepresentable if and only if its completion is representable as a groupoid in functors on $\widehat{\mathcal{C}}_\Lambda$.*
(2) *(U, R, s, t, c) is prorepresentable if and only if U and R are prorepresentable.*

Proof. Part (1) follows from Remark 51.20.3. For (2), the ``only if'' direction is clear from the definition of a prorepresentable groupoid in functors. Conversely, assume U and R are prorepresentable, say $U \cong \underline{R_0}|_{\mathcal{C}_\Lambda}$ and $R \cong \underline{R_1}|_{\mathcal{C}_\Lambda}$ for objects R_0 and R_1 of $\widehat{\mathcal{C}}_\Lambda$. Since $\underline{R_0} \cong \widehat{\underline{R_0}|_{\mathcal{C}_\Lambda}}$ and $\underline{R_1} \cong \widehat{\underline{R_1}|_{\mathcal{C}_\Lambda}}$ by Remark 51.7.11 we see that the completion $(U, R, s, t, c)^\wedge$ is a groupoid in functors of the form $(\underline{R_0}, \underline{R_1}, \hat{s}, \hat{t}, \hat{c})$. By Lemma 51.4.3 the pushout $\underline{R_1} \times_{\hat{s},\underline{R_1},\hat{t}} \underline{R_1}$ exists. Hence $(\underline{R_0}, \underline{R_1}, \hat{s}, \hat{t}, \hat{c})$ is a representable groupoid in functors on $\widehat{\mathcal{C}}_\Lambda$. Finally, the restriction $(\underline{R_0}, \underline{R_1}, s, t, c)|_{\mathcal{C}_\Lambda}$ gives back (U, R, s, t, c) by Remark 51.20.3 hence (U, R, s, t, c) is prorepresentable by definition. □

51.21. Smooth groupoids in functors on $\mathcal{C}_\Lambda$

The notion of smoothness for groupoids in functors on $\mathcal{C}_\Lambda$ is defined as follows.

Definition 51.21.1. Let (U, R, s, t, c) be a groupoid in functors on $\mathcal{C}_\Lambda$. We say (U, R, s, t, c) is *smooth* if $s, t : R \to U$ are smooth.

Remark 51.21.2. We note that this terminology is potentially confusing: if (U, R, s, t, c) is a smooth groupoid in functors, then the quotient $[U/R]$ need not be a smooth category cofibred in groupoids as defined in Remark 51.8.9. However smoothness of (U, R, s, t, c) does imply (in fact is equivalent to) smoothness of the quotient morphism $U \to [U/R]$ as we shall see in Lemma 51.21.4.

Remark 51.21.3. Let $(\underline{R_0}, \underline{R_1}, s, t, c)|_{\mathcal{C}_\Lambda}$ be a prorepresentable groupoid in functors on $\mathcal{C}_\Lambda$. Then $(\underline{R_0}, \underline{R_1}, s, t, c)|_{\mathcal{C}_\Lambda}$ is smooth if and only if R_1 is a power series over R_0 via both s and t. This follows from Lemma 51.8.6.

Lemma 51.21.4. *Let (U, R, s, t, c) be a groupoid in functors on $\mathcal{C}_\Lambda$. The following are equivalent:*

(1) *The groupoid in functors (U, R, s, t, c) is smooth.*
(2) *The morphism $s : R \to U$ is smooth.*
(3) *The morphism $t : R \to U$ is smooth.*
(4) *The quotient morphism $U \to [U/R]$ is smooth.*

Proof. Statement (2) is equivalent to (3) since the inverse $i : R \to R$ of (U, R, s, t, c) is an isomorphism and $t = s \circ i$. By definition (1) is equivalent to (2) and (3) together, hence it is equivalent to either of them individually.

Finally we prove (2) is equivalent to (4). Unwinding the definitions:

(2) Smoothness of $s : R \to U$ amounts to the following condition: If $f : B \to A$ is a surjective ring map in $\mathcal{C}_\Lambda$, $a \in R(A)$, and $y \in U(B)$ such that $s(a) = U(f)(y)$, then there exists $a' \in R(B)$ such that $R(f)(a') = a$ and $s(a') = y$.
(4) Smoothness of $U \to [U/R]$ amounts to the following condition: If $f : B \to A$ is a surjective ring map in $\mathcal{C}_\Lambda$ and $(f, a) : (B, y) \to (A, x)$ is a morphism of $[U/R]$, then there exists $x' \in U(B)$ and $b \in R(B)$ with $s(b) = x'$, $t(b) = y$ such that $c(a, R(f)(b)) = e(x)$. Here $e : U \to R$ denotes the identity and the notation (f, a) is as in Remarks 51.5.2 (9); in particular $a \in R(A)$ with $s(a) = U(f)(y)$ and $t(a) = x$.

If (4) holds and f, a, y as in (2) are given, let $x = t(a)$ so that we have a morphism $(f, a) : (B, y) \to (A, x)$. Then (4) produces x' and b, and $a' = i(b)$ satisfies the requirements of (2). Conversely, assume (2) holds and let $(f, a) : (B, y) \to (A, x)$ as in (4) be given. Then (2) produces $a' \in R(B)$, and $x' = t(a')$ and $b = i(a')$ satisfy the requirements of (4). ☐

51.22. Deformation categories as quotients of groupoids in functors

We discuss conditions on a groupoid in functors on $\mathcal{C}_\Lambda$ which guarantee that the quotient is a deformation category, and we calculate the tangent and infinitesimal automorphism spaces of such a quotient.

Lemma 51.22.1. *Let (U, R, s, t, c) be a smooth groupoid in functors on $\mathcal{C}_\Lambda$. Assume U and R satisfy (RS). Then $[U/R]$ satisfies (RS).*

Proof. Let

$$\begin{tikzcd} & (A_2, x_2) \arrow[d, "(f_2, a_2)"] \\ (A_1, x_1) \arrow[r, "(f_1, a_1)"] & (A, x) \end{tikzcd}$$

be a diagram in $[U/R]$ such that $f_2 : A_2 \to A$ is surjective. The notation is as in Remarks 51.5.2 (9). Hence $f_1 : A_1 \to A$, $f_2 : A_2 \to A$ are maps in $\mathcal{C}_\Lambda$, $x \in U(A)$, $x_1 \in U(A_1)$, $x_2 \in U(A_2)$, and $a_1, a_2 \in R(A)$ with $s(a_1) = U(f_1)(x_1)$, $t(a_1) = x$ and $s(a_2) = U(f_2)(x_2)$, $t(a_2) = x$. We construct a fiber product lying over $A_1 \times_A A_2$ for this diagram in $[U/R]$ as follows.

Let $a = c(i(a_1), a_2)$, where $i : R \to R$ is the inverse morphism. Then $a \in R(A)$, $x_2 \in U(A_2)$ and $s(a) = U(f_2)(x_2)$. Hence an element $(a, x_2) \in R(A) \times_{s,U(A),U(f_2)} U(A_2)$. By smoothness of $s : R \to U$ there is an element $\tilde{a} \in R(A_2)$ with $R(f_2)(\tilde{a}) = a$ and $s(\tilde{a}) = x_2$. In particular $U(f_2)(t(\tilde{a})) = t(a) = U(f_1)(x_1)$. Thus x_1 and $t(\tilde{a})$ define an element

$$(x_1, t(\tilde{a})) \in U(A_1) \times_{U(A)} U(A_2).$$

By the assumption that U satisfies (RS), we have an identification $U(A_1) \times_{U(A)} U(A_2) = U(A_1 \times_A A_2)$. Let us denote $x_1 \times t(\tilde{a}) \in U(A_1 \times_A A_2)$ the element corresponding to $(x_1, t(\tilde{a})) \in U(A_1) \times_{U(A)} U(A_2)$. Let p_1, p_2 be the projections of $A_1 \times_A A_2$. We claim

$$\begin{tikzcd} (A_1 \times_A A_2, x_1 \times t(\tilde{a})) \arrow[r, "(p_2, i(\tilde{a}))"'] \arrow[d, "(p_1, e(x_1))"'] & (A_2, x_2) \arrow[d, "(f_2, a_2)"] \\ (A_1, x_1) \arrow[r, "(f_1, a_1)"] & (A, x) \end{tikzcd}$$

is a fiber square in $[U/R]$. (Note $e : U \to R$ denotes the identity.)

The diagram is commutative because $c(a_2, R(f_2)(i(\tilde{a}))) = c(a_2, i(a)) = a_1$. To check it is a fiber square, let

$$\begin{tikzcd} (B, z) \arrow[r, "(g_2, b_2)"'] \arrow[d, "(g_1, b_1)"'] & (A_2, x_2) \arrow[d, "(f_2, a_2)"] \\ (A_1, x_1) \arrow[r, "(f_1, a_1)"] & (A, x) \end{tikzcd}$$

be a commutative diagram in $[U/R]$. We will show there is a unique morphism $(g, b) : (B, z) \to (A_1 \times_A A_2, x_1 \times t(\tilde{a}))$ compatible with the morphisms to (A_1, x_1) and (A_2, x_2). We must take $g = (g_1, g_2) : B \to A_1 \times_A A_2$. Since by assumption R satisfies (RS), we have an identification $R(A_1 \times_A A_2) = R(A_1) \times_{R(A)} R(A_2)$. Hence we can write $b = (b_1', b_2')$ for some $b_1' \in R(A_1)$, $b_2' \in R(A_2)$ which agree in $R(A)$. Then $((g_1, g_2), (b_1', b_2')) : (B, z) \to (A_1 \times_A A_2, x_1 \times t(\tilde{a}))$ will commute with the projections if and only if $b_1' = b_1$ and $b_2' = c(\tilde{a}, b_2)$ proving unicity and existence. □

Lemma 51.22.2. *Let (U, R, s, t, c) be a smooth groupoid in functors on $\mathcal{C}_\Lambda$. Assume U and R are deformation functors. Then:*

1. *The quotient $[U/R]$ is a deformation category.*
2. *The tangent space of $[U/R]$ is*

$$T[U/R] = Coker(ds - dt : TR \to TU).$$

3. *Let x_0 be the unique object of $[U/R](k)$. The space of infinitesimal automorphisms of $[U/R]$ is*

$$Inf_{x_0}([U/R]) = Ker(ds \oplus dt : TR \to TU \oplus TU).$$

Proof. Since U and R are deformation functors $[U/R]$ is a predeformation category. Since (RS) holds for deformation functors by definition we see that (RS) holds for [U/R] by Lemma 51.22.1. Hence $[U/R]$ is a deformation category. Statements (2) and (3) follow directly from the definitions. □

51.23. Presentations of categories cofibered in groupoids

A presentation is defined as follows.

Definition 51.23.1. Let $\mathcal{F}$ be a category cofibered in groupoids over a category $\mathcal{C}$. Let (U, R, s, t, c) be a groupoid in functors on $\mathcal{C}$. A *presentation of $\mathcal{F}$ by (U, R, s, t, c)* is an equivalence $\varphi : [U/R] \to \mathcal{F}$ of categories cofibered in groupoids over $\mathcal{C}$.

The following two general lemmas will be used to get presentations.

Lemma 51.23.2. *Let $\mathcal{F}$ be category cofibered in groupoids over a category $\mathcal{C}$. Let $U : \mathcal{C} \to Sets$ be a functor. Let $f : U \to \mathcal{F}$ be a morphism of categories cofibered in groupoids over $\mathcal{C}$. Define R, s, t, c as follows:*

1. *$R : \mathcal{C} \to Sets$ is the functor $U \times_{f,\mathcal{F},f} U$.*
2. *$t, s : R \to U$ are the first and second projections, respectively.*
3. *$c : R \times_{s,U,t} R \to R$ is the morphism given by projection onto the first and last factors of $U \times_{f,\mathcal{F},f} U \times_{f,\mathcal{F},f} U$ under the canonical isomorphism $R \times_{s,U,t} R \to U \times_{f,\mathcal{F},f} U \times_{f,\mathcal{F},f} U$.*

Then (U, R, s, t, c) is a groupoid in functors on $\mathcal{C}$.

Proof. Omitted. □

Lemma 51.23.3. *Let $\mathcal{F}$ be category cofibered in groupoids over a category $\mathcal{C}$. Let $U : \mathcal{C} \to Sets$ be a functor. Let $f : U \to \mathcal{F}$ be a morphism of categories cofibered in groupoids over $\mathcal{C}$. Let (U, R, s, t, c) be the groupoid in functors on $\mathcal{C}$ constructed from $f : U \to \mathcal{F}$ in Lemma 51.23.2. Then there is a natural morphism $[f] : [U/R] \to \mathcal{F}$ such that:*

1. *$[f] : [U/R] \to \mathcal{F}$ is fully faithful.*
2. *$[f] : [U/R] \to \mathcal{F}$ is an equivalence if and only if $f : U \to \mathcal{F}$ is essentially surjective.*

Proof. Omitted. □

51.24. Presentations of deformation categories

According to the next lemma, a smooth morphism from a predeformation functor to a predeformation category $\mathcal{F}$ gives rise to a presentation of $\mathcal{F}$ by a smooth groupoid in functors.

Lemma 51.24.1. *Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_\Lambda$. Let $U : \mathcal{C}_\Lambda \to Sets$ be a functor. Let $f : U \to \mathcal{F}$ be a smooth morphism of categories cofibered in groupoids. Then:*

1. *If (U, R, s, t, c) is the groupoid in functors on $\mathcal{C}_\Lambda$ constructed from $f : U \to \mathcal{F}$ in Lemma 51.23.2, then (U, R, s, t, c) is smooth.*
2. *If $f : U(k) \to \mathcal{F}(k)$ is essentially surjective, then the morphism $[f] : [U/R] \to \mathcal{F}$ of Lemma 51.23.3 is an equivalence.*

Proof. From the construction of Lemma 51.23.2 we have a commutative diagram

$$\begin{tikzcd} R = U \times_{f,\mathcal{F},f} U \arrow[r, "s"'] \arrow[d, "t"'] & U \arrow[d, "f"] \\ U \arrow[r, "f"] & \mathcal{F} \end{tikzcd}$$

where t, s are the first and second projections. So t, s are smooth by Lemma 51.8.7. Hence (1) holds.

If the assumption of (2) holds, then by Lemma 51.8.8 the morphism $f : U \to \mathcal{F}$ is essentially surjective. Hence by Lemma 51.23.3 the morphism $[f] : [U/R] \to \mathcal{F}$ is an equivalence. □

Lemma 51.24.2. *Let $\mathcal{F}$ be a deformation category. Let $U, V : \mathcal{C}_\Lambda \to Sets$ be deformation functors. Let $f : U \to \mathcal{F}$ and $g : V \to \mathcal{F}$ be morphisms of categories cofibered in groupoids. Then:*

(1) *$U \times_{f,\mathcal{F},g} V$ is a deformation functor.*
(2) *Let u_0 be the unique element of $U(k)$ and u_0' its pushforward to $U(k[\epsilon])$; define v_0 and v_0' similarly. There is an exact sequence of k-vector spaces*
$$0 \to K \to T(U \times_{f,\mathcal{F},g} V) \to TU \oplus TV$$
where K is the subspace of $T(U \times_{f,\mathcal{F},g} V)$ consisting of elements of the form $(u_0', v_0', a : f(u_0') \to g(v_0'))$, $a \in Hom_{k[\epsilon]}(f(u_0'), g(v_0'))$.

Proof. Part (1) follows from Lemma 51.15.12 and the fact that $(U \times_{f,\mathcal{F},g} V)(k)$ is a singleton as $U(k)$, $V(k)$ are singletons and $\mathcal{F}(k)$ is a setoid with exactly one isomorphism class.

Taking the differentials of the projections of $U \times_{f,\mathcal{F},g} V$ to U and V gives k-linear maps $T(U \times_{f,\mathcal{F},g} V) \to TU$ and $T(U \times_{f,\mathcal{F},g} V) \to TV$ by Lemma 51.11.4. Hence a k-linear map $T(U \times_{f,\mathcal{F},g} V) \to TU \oplus TV$. Explicitly, this map sends an element $(u, v, a : f(u) \to g(v))$ of $T(U \times_{f,\mathcal{F},g} V)$ to (u, v). So the kernel is exactly K (this proves that K is a subspace). Hence (2) holds. □

Lemma 51.24.3. *Let $\mathcal{F}$ be a deformation category. Let $U : \mathcal{C}_\Lambda \to Sets$ be a deformation functor. Let $f : U \to \mathcal{F}$ be a morphism of categories cofibered in groupoids. Let u_0 be the unique element of $U(k)$. Then $U \times_{f,\mathcal{F},f} U$ is a deformation functor with tangent space fitting into an exact sequence of k-vector spaces*
$$0 \to Inf_{f(u_0)}(\mathcal{F}) \to T(U \times_{f,\mathcal{F},g} U) \to TU \oplus TU$$

Proof. Follows from Lemma 51.24.2 and Definition 51.18.2. □

Lemma 51.24.4. *Let $\mathcal{F}$ be a deformation category. Let $U : \mathcal{C}_\Lambda \to Sets$ be a prorepresentable functor. Let $f : U \to \mathcal{F}$ be a morphism of categories cofibered in groupoids. Let (U, R, s, t, c) be the groupoid in functors on $\mathcal{C}_\Lambda$ constructed from $f : U \to \mathcal{F}$ in Lemma 51.23.2. Assume $\dim_k Inf_{x_0}(\mathcal{F})$ is finite for $x_0 \in Ob(\mathcal{F}(k))$. Then (U, R, s, t, c) is prorepresentable.*

Proof. Note that U is a deformation functor by Example 51.15.10. By Lemma 51.24.3 we see that $R = U \times_{f,\mathcal{F},f} U$ is a deformation functor whose tangent space $TR = T(U \times_{f,\mathcal{F},f} U)$ sits in an exact sequence $0 \to \mathrm{Inf}_{x_0}(\mathcal{F}) \to TR \to TU \oplus TU$. Since we have assumed the first space has finite dimension and since TU has finite dimension by Example 51.10.11 we see that $\dim TR < \infty$. The map $\gamma : \mathrm{Der}_\Lambda(k, k) \to TR$ see (51.11.6.1) is injective because its composition with $TR \to TU$ is injective by Theorem 51.17.2 for the prorepresentable functor U. Thus R is prorepresentable by Theorem 51.17.2. It follows from Lemma 51.20.4 that (U, R, s, t, c) is prorepresentable. □

Theorem 51.24.5. *Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_\Lambda$. Then $\mathcal{F}$ admits a presentation by a smooth prorepresentable groupoid in functors on $\mathcal{C}_\Lambda$ if and only if the following conditions hold:*

(1) *$\mathcal{F}$ is a deformation category.*
(2) *$\dim_k T\mathcal{F}$ is finite.*

(3) $\dim_k Inf_{x_0}(\mathcal{F})$ *is finite for some* $x_0 \in Ob(\mathcal{F}(k))$.

Proof. Recall that a prorepresentable functor is a deformation functor, see Example 51.15.10. Thus if $\mathcal{F}$ is equivalent to a smooth prorepresentable groupoid in functors, then conditions (1), (2), and (3) follow from Lemma 51.22.2 (1), (2), and (3).

Conversely, assume conditions (1), (2), and (3) hold. Condition (1) implies that (S1) and (S2) are satisfied, see Lemma 51.15.6. By Lemma 51.12.4 there exists a versal formal object ξ. Setting $U = \underline{R}|_{\mathcal{C}_\Lambda}$ the associated map $\underline{\xi} : U \to \mathcal{F}$ is smooth (this is the definition of a versal formal object). Let (U, R, s, t, c) be the groupoid in functors constructed in Lemma 51.23.2 from the map $\underline{\xi}$. By Lemma 51.24.1 we see that (U, R, s, t, c) is a smooth groupoid in functors and that $[U/R] \to \mathcal{F}$ is an equivalence. By Lemma 51.24.4 we see that (U, R, s, t, c) is prorepresentable. Hence $[U/R] \to \mathcal{F}$ is the desired presentation of $\mathcal{F}$. $\square$

51.25. Remarks regarding minimality

The main theorem of this chapter is Theorem 51.24.5 above. It describes completely those categories cofibred in groupoids over $\mathcal{C}_\Lambda$ which have a presentation by a smooth prorepresentable groupoid in functors. In this section we briefly discuss how the minimality discussed in Sections 51.13 and 51.14 can be used to obtain a ``minimal'' smooth prorepresentable presentation.

Definition 51.25.1. Let (U, R, s, t, c) be a smooth prorepresentable groupoid in functors on $\mathcal{C}_\Lambda$.

(1) We say (U, R, s, t, c) is *normalized* if the groupoid $(U(k[\epsilon]), R(k[\epsilon]), s, t, c)$ is totally disconnected, i.e., there are no morphisms between distinct objects.
(2) We say (U, R, s, t, c) is *minimal* if the $U \to [U/R]$ is given by a minimal versal formal object of $[U/R]$.

The difference between the two notions is related to the difference between conditions (51.14.0.1) and (51.14.0.2) and disappears when $k' \subset k$ is separable. Also a normalized smooth prorepresentable groupoid in functors is minimal as the following lemma shows. Here is a precise statement.

Lemma 51.25.2. *Let* (U, R, s, t, c) *be a smooth prorepresentable groupoid in functors on* $\mathcal{C}_\Lambda$.

(1) (U, R, s, t, c) *is normalized if and only if the morphism* $U \to [U/R]$ *induces an isomorphism on tangent spaces, and*
(2) (U, R, s, t, c) *is minimal if and only if the kernel of* $TU \to T[U/R]$ *is contained in the image of* $Der_\Lambda(k, k) \to TU$.

Proof. Part (1) follows immediately from the definitions. To see part (2) set $\mathcal{F} = [U/R]$. Since $\mathcal{F}$ has a presentation it is a deformation category, see Theorem 51.24.5. In particular it satisfies (RS), (S1), and (S2), see Lemma 51.15.6. Recall that minimal versal formal objects are unique up to isomorphism, see Lemma 51.13.5. By Theorem 51.14.5 a minimal versal object induces a map $\underline{\xi} : \underline{R}|_{\mathcal{C}_\Lambda} \to \mathcal{F}$ satisfying (51.14.0.2). Since $U \cong \underline{R}|_{\mathcal{C}_\Lambda}$ over $\mathcal{F}$ we see that $TU \to T\mathcal{F} = T[U/R]$ satisfies the property as stated in the lemma. $\square$

The quotient of a minimal prorepresentable groupoid in functors on $\mathcal{C}_\Lambda$ does not admit autoequivalences which are not automorphisms. To prove this, we first note the following lemma.

Lemma 51.25.3. *Let $U : \mathcal{C}_\Lambda \to Sets$ be a prorepresentable functor. Let $\varphi : U \to U$ be a morphism such that $d\varphi : TU \to TU$ is an isomorphism. Then φ is an isomorphism.*

Proof. If $U \cong \underline{R}|_{\mathcal{C}_\Lambda}$ for some $R \in Ob(\widehat{\mathcal{C}}_\Lambda)$, then completing φ gives a morphism $\underline{R} \to \underline{R}$. If $f : R \to R$ is the corresponding morphism in $\widehat{\mathcal{C}}_\Lambda$, then f induces an isomorphism $\mathrm{Der}_\Lambda(R, k) \to \mathrm{Der}_\Lambda(R, k)$, see Example 51.10.14. In particular f is a surjection by Lemma 51.4.6. As a surjective endomorphism of a Noetherian ring is an isomorphism (see Algebra, Lemma 7.28.8) we conclude f, hence $\underline{R} \to \underline{R}$, hence $\varphi : U \to U$ is an isomorphism. □

Lemma 51.25.4. *Let (U, R, s, t, c) be a minimal smooth prorepresentable groupoid in functors on $\mathcal{C}_\Lambda$. If $\varphi : [U/R] \to [U/R]$ is an equivalence of categories cofibered in groupoids, then φ is an isomorphism.*

Proof. A morphism $\varphi : [U/R] \to [U/R]$ is the same thing as a morphism $\varphi : (U, R, s, t, c) \to (U, R, s, t, c)$ of groupoids in functors over $\mathcal{C}_\Lambda$ as defined in Definition 51.19.1. Denote $\phi : U \to U$ and $\psi : R \to R$ the corresponding morphisms. Because the diagram

$$\begin{tikzcd} & \mathrm{Der}_\Lambda(k,k) \arrow[dl, "\gamma"'] \arrow[dr, "\gamma"] & \\ TU \arrow[rr, "d\phi"] \arrow[d] & & TU \arrow[d] \\ T[U/R] \arrow[rr, "d\varphi"] & & T[U/R] \end{tikzcd}$$

is commutative, since $d\varphi$ is bijective, and since we have the characterization of minimality in Lemma 51.25.2 we conclude that $d\phi$ is injective (hence bijective by dimension reasons). Thus $\phi : U \to U$ is an isomorphism by Lemma 51.25.3. We can use a similar argument, using the exact sequence

$$0 \to \mathrm{Inf}_{x_0}([U/R]) \to TR \to TU \oplus TU$$

of Lemma 51.24.3 to prove that $\psi : R \to R$ is an isomorphism. But is also a consequence of the fact that $R = U \times_{[U/R]} U$ and that φ and ϕ are isomorphisms. □

Lemma 51.25.5. *Let (U, R, s, t, c) and (U', R', s', t', c') be minimal smooth prorepresentable groupoids in functors on $\mathcal{C}_\Lambda$. If $\varphi : [U/R] \to [U'/R']$ is an equivalence of categories cofibered in groupoids, then φ is an isomorphism.*

Proof. Let $\psi : [U'/R'] \to [U/R]$ be a quasi-inverse to φ. Then $\psi \circ \varphi$ and $\varphi \circ \psi$ are isomorphisms by Lemma 51.25.4, hence φ and ψ are isomorphisms. □

The following lemma summarizes some of the things we have seen earlier in this chapter.

Lemma 51.25.6. *Let $\mathcal{F}$ be a deformation category such that $\dim_k T\mathcal{F} < \infty$ and $\dim_k Inf_{x_0}(\mathcal{F}) < \infty$ for some $x_0 \in Ob(\mathcal{F}(k))$. Then there exists a minimal versal formal object ξ of $\mathcal{F}$. Say ξ lies over $R \in Ob(\widehat{\mathcal{C}}_\Lambda)$. Let $U = \underline{R}|_{\mathcal{C}_\Lambda}$. Let $f = \underline{\xi} : U \to \mathcal{F}$ be the associated morphism. Let (U, R, s, t, c) be the groupoid in functors on $\mathcal{C}_\Lambda$ constructed from $f : U \to \mathcal{F}$ in Lemma 51.23.2. Then (U, R, s, t, c) is a minimal smooth prorepresentable groupoid in functors on $\mathcal{C}_\Lambda$ and there is an equivalence $[U/R] \to \mathcal{F}$.*

Proof. As $\mathcal{F}$ is a deformation category it satisfies (S1) and (S2), see Lemma 51.15.6. By Lemma 51.12.4 there exists a versal formal object. By Lemma 51.13.5 there exists a minimal versal formal object ξ/R as in the statement of the lemma. Setting $U = \underline{R}|_{\mathcal{C}_\Lambda}$ the associated map $\underline{\xi} : U \to \mathcal{F}$ is smooth (this is the definition of a versal formal object). Let (U, R, s, t, c) be the groupoid in functors constructed in Lemma 51.23.2 from the map $\underline{\xi}$. By Lemma 51.24.1 we see that (U, R, s, t, c) is a smooth groupoid in functors and that $[U/R] \to \mathcal{F}$ is an equivalence. By Lemma 51.24.4 we see that (U, R, s, t, c) is prorepresentable. Finally, (U, R, s, t, c) is minimal because $U \to [U/R] = \mathcal{F}$ corresponds to the minimal versal formal object ξ. $\square$

Presentations by minimal prorepresentable groupoids in functors satisfy the following uniqueness property.

Lemma 51.25.7. *Let $\mathcal{F}$ be category cofibered in groupoids over $\mathcal{C}_\Lambda$. Assume there exist presentations of $\mathcal{F}$ by minimal smooth prorepresentable groupoids in functors (U, R, s, t, c) and (U', R', s', t', c'). Then (U, R, s, t, c) and (U', R', s', t', c') are isomorphic.*

Proof. Follows from Lemma 51.25.5 and the observation that a morphism $[U/R] \to [U'/R']$ is the same thing as a morphism of groupoids in functors (by our explicit construction of $[U/R]$ in Definition 51.19.9). $\square$

In summary we have proved the following theorem.

Theorem 51.25.8. *Let $\mathcal{F}$ be a category cofibered in groupoids over $\mathcal{C}_\Lambda$. Consider the following conditions*

1. *$\mathcal{F}$ admits a presentation by a normalized smooth prorepresentable groupoid in functors on $\mathcal{C}_\Lambda$,*
2. *$\mathcal{F}$ admits a presentation by a smooth prorepresentable groupoid in functors on $\mathcal{C}_\Lambda$,*
3. *$\mathcal{F}$ admits a presentation by a minimal smooth prorepresentable groupoid in functors on $\mathcal{C}_\Lambda$, and*
4. *$\mathcal{F}$ satisfies the following conditions*
   (a) *$\mathcal{F}$ is a deformation category.*
   (b) *$\dim_k T\mathcal{F}$ is finite.*
   (c) *$\dim_k Inf_{x_0}(\mathcal{F})$ is finite for some $x_0 \in Ob(\mathcal{F}(k))$.*

Then (2), (3), (4) are equivalent and are implied by (1). If $k' \subset k$ is separable, then (1), (2), (3), (4) are all equivalent. Furthermore, the minimal smooth prorepresentable groupoids in functors which provide a presentation of $\mathcal{F}$ are unique up to isomorphism.

Proof. We see that (1) implies (3) and is equivalent to (3) if $k' \subset k$ is separable from Lemma 51.25.2. It is clear that (3) implies (2). We see that (2) implies (4) by Theorem 51.24.5. We see that (4) implies (3) by Lemma 51.25.6. This proves all the implications. The final uniqueness statement follows from Lemma 51.25.7. $\square$

51.26. The Deformation Category of a Point of an Algebraic Stack

To do: Show that an algebraic stack of finite type over a locally Noetherian base satisfies (RS) at any finite type point (this may have to go in a later chapter). This will provide some motivation for Artin's criteria later. A perhaps more roundabout way of showing this (which does give more information, though) is to show that a groupoid presentation of the stack gives rise to a presentation of the deformation category at any point.

51.27. Examples

List of things that should go here:

(1) Describe the general outline of an example.
(2) Deformations of schemes:
    (a) The Rim-Schlessinger condition.
    (b) Computing the tangent space.
    (c) Computing the infinitesimal deformations.
    (d) The deformation category of an affine hypersurface.
(3) Deformations of representations of abstract groups.
(4) Deformations of representations of topological groups (e.g., profinite ones).
(5) Deformations of sheaves (for example fix X/S, a finite type point s of S, and a quasi-coherent sheaf $\mathcal{F}_s$ over X_s).
(6) Deformations of algebraic spaces (very similar to deformations of schemes; maybe even easier?).
(7) Deformations of maps (eg morphisms between schemes; you can fix both or one of the target and/or source).
(8) Add more here.

CHAPTER 52

Groupoids in Algebraic Spaces

52.1. Introduction

This chapter is devoted to generalities concering groupoids in algebraic spaces. We recommend reading the beautiful paper [**KM97a**] by Keel and Mori.

A lot of what we say here is a repeat of what we said in the chapter on groupoid schemes, see Groupoids, Section 35.1. The discussion of quotient stacks is new here.

52.2. Conventions

The standing assumption is that all schemes are contained in a big fppf site Sch_{fppf}. And all rings A considered have the property that $Spec(A)$ is (isomorphic) to an object of this big site.

Let S be a scheme and let X be an algebraic space over S. In this chapter and the following we will write $X \times_S X$ for the product of X with itself (in the category of algebraic spaces over S), instead of $X \times X$.

We continue our convention to label projection maps starting with index 0, so we have $\text{pr}_0 : X \times_S Y \to X$ and $\text{pr}_1 : X \times_S Y \to Y$.

52.3. Notation

Let S be a scheme; this will be our base scheme and all algebraic spaces will be over S. Let B be an algebraic space over S; this will be our base algebraic space, and often other algebraic spaces, and schemes will be over B. If we say that X is an algebraic space over B, then we mean that X is an algebraic space over S which comes equipped with structure morphism $X \to B$. Moreover, we try to reserve the letter T to denote a ``test" scheme over B. In other words T is a scheme which comes equipped with a structure morphism $T \to B$. In this situation we denote $X(T)$ for the set of T-valued points of X *over* B. In a formula:

$$X(T) = Mor_B(T, X).$$

Similarly, given a second algebraic space Y over B we set

$$X(Y) = Mor_B(Y, X).$$

Suppose we are given algebraic spaces X, Y over B as above and a morphism $f : X \to Y$ over B. For any scheme T over B we get an induced map of sets

$$f : X(T) \longrightarrow Y(T)$$

which is functorial in the scheme T over B. As f is a map of sheaves on $(Sch/S)_{fppf}$ over the sheaf B it is clear that f determines and is determined by this rule. More generally, we use the same notation for maps between fibre products. For example, if X, Y, Z are algebraic spaces over B, and if $m : X \times_B Y \to Z \times_B Z$ is a morphism of algebraic spaces over B, then we think of m as corresponding to a collection of maps between T-valued points

$$X(T) \times Y(T) \longrightarrow Z(T) \times Z(T).$$

And so on and so forth.

Finally, given two maps $f, g : X \to Y$ of algebraic spaces over B, if the induced maps $f, g : X(T) \to Y(T)$ are equal for every scheme T over B, then $f = g$, and hence also $f, g : X(Z) \to Y(Z)$ are equal for every third algebraic space Z over B. Hence, for example, to check the axioms for an group algebraic space G over B, it suffices to check commutativity of diagram on T-valued points where T is a scheme over B as we do in Definition 52.5.1 below.

52.4. Equivalence relations

Please refer to Groupoids, Section 35.3 for notation.

Definition 52.4.1. Let $B \to S$ as in Section 52.3. Let U be an algebraic space over B.

1. A *pre-relation* on U over B is any morphism $j : R \to U \times_B U$ of algebraic spaces over B. In this case we set $t = \text{pr}_0 \circ j$ and $s = \text{pr}_1 \circ j$, so that $j = (t, s)$.
2. A *relation* on U over B is a monomorphism $j : R \to U \times_B U$ of algebraic spaces over B.
3. A *pre-equivalence relation* is a pre-relation $j : R \to U \times_B U$ such that the image of $j : R(T) \to U(T) \times U(T)$ is an equivalence relation for all schemes T over B.
4. We say a morphism $R \to U \times_B U$ of algebraic spaces over B is an *equivalence relation on U over B* if and only if for every T over B the T-valued points of R define an equivalence relation on the set of T-valued points of U.

In other words, an equivalence relation is a pre-equivalence relation such that j is a relation.

Lemma 52.4.2. *Let $B \to S$ as in Section 52.3. Let U be an algebraic space over B. Let $j : R \to U \times_B U$ be a pre-relation. Let $g : U' \to U$ be a morphism of algebraic spaces over B. Finally, set*

$$R' = (U' \times_B U') \times_{U \times_B U} R \xrightarrow{j'} U' \times_B U'$$

Then j' is a pre-relation on U' over B. If j is a relation, then j' is a relation. If j is a pre-equivalence relation, then j' is a pre-equivalence relation. If j is an equivalence relation, then j' is an equivalence relation.

Proof. Omitted. □

Definition 52.4.3. Let $B \to S$ as in Section 52.3. Let U be an algebraic space over B. Let $j : R \to U \times_B U$ be a pre-relation. Let $g : U' \to U$ be a morphism of algebraic spaces over B. The pre-relation $j' : R' \to U' \times_B U'$ is called the *restriction*, or *pullback* of the pre-relation j to U'. In this situation we sometimes write $R' = R|_{U'}$.

Lemma 52.4.4. *Let $B \to S$ as in Section 52.3. Let $j : R \to U \times_B U$ be a pre-relation of algebraic spaces over B. Consider the relation on $|U|$ defined by the rule*

$$x \sim y \Leftrightarrow \exists\, r \in |R| : t(r) = x, s(r) = y.$$

If j is a pre-equivalence relation then this is an equivalence relation.

Proof. Suppose that $x \sim y$ and $y \sim z$. Pick $r \in |R|$ with $t(r) = x$, $s(r) = y$ and pick $r' \in |R|$ with $t(r') = y$, $s(r') = z$. We may pick a field K such that r and r' can be represented by morphisms $r, r' : Spec(K) \to R$ with $s \circ r = t \circ r'$. Denote $x = t \circ r$, $y = s \circ r = t \circ r'$, and $z = s \circ r'$, so $x, y, z : Spec(K) \to U$. By construction $(x, y) \in j(R(K))$ and $(y, z) \in j(R(K))$. Since j is a pre-equivalence relation we see that also $(x, z) \in j(R(K))$. This clearly implies that $x \sim z$.

The proof that $\sim$ is reflexive and symmetric is omitted. □

52.5. Group algebraic spaces

Please refer to Groupoids, Section 35.4 for notation.

Definition 52.5.1. Let $B \to S$ as in Section 52.3.

(1) A *group algebraic space over B* is a pair (G, m), where G is an algebraic space over B and $m : G \times_B G \to G$ is a morphism of algebraic spaces over B with the following property: For every scheme T over B the pair $(G(T), m)$ is a group.
(2) A *morphism $\psi : (G, m) \to (G', m')$ of group algebraic spaces over B* is a morphism $\psi : G \to G'$ of algebraic spaces over B such that for every T/B the induced map $\psi : G(T) \to G'(T)$ is a homomorphism of groups.

Let (G, m) be a group algebraic space over the algebraic space B. By the discussion in Groupoids, Section 35.4 we obtain morphisms of algebraic spaces over B (identity) $e : B \to G$ and (inverse) $i : B \to B$ such that for every T the quadruple $(G(T), m, e, i)$ satisfies the axioms of a group.

Let (G, m), (G', m') be group algebraic spaces over B. Let $f : G \to G'$ be a morphism of algebraic spaces over B. It follows from the definition that f is a morphism of group algebraic spaces over B if and only if the following diagram is commutative:

$$\begin{tikzcd} G \times_B G \arrow[r, "f\times f"'] \arrow[d, "m"'] & G' \times_B G' \arrow[d, "m"] \\ G \arrow[r, "f"] & G' \end{tikzcd}$$

Lemma 52.5.2. *Let $B \to S$ as in Section 52.3. Let (G, m) be a group algebraic space over B. Let $B' \to B$ be a morphism of algebraic spaces. The pullback $(G_{B'}, m_{B'})$ is a group algebraic space over B'.*

Proof. Omitted. □

52.6. Properties of group algebraic spaces

In this section we collect some simple properties of group algebraic spaces which hold over any base.

Lemma 52.6.1. *Let S be a scheme. Let B be an algebraic space over S. Let G be a group algebraic space over B. Then $G \to B$ is separated (resp. quasi-separated, resp. locally separated) if and only if the identity morphism $e : B \to G$ is a closed immersion (resp. quasi-compact, resp. an immersion).*

Proof. We recall that by Morphisms of Spaces, Lemma 42.5.7 we have that e is a closed immersion (resp. quasi-compact, resp. an immersion) if $G \to B$ is separated (resp. quasi-separated, resp. locally separated). For the converse, consider the diagram

$$\begin{tikzcd} G \arrow[r, "\Delta_{G/B}"'] \arrow[d] & G \times_B G \arrow[d, "{(g,g') \mapsto m(i(g),g')}"] \\ B \arrow[r, "e"] & G \end{tikzcd}$$

It is an exercise in the functorial point of view in algebraic geometry to show that this diagram is cartesian. In other words, we see that $\Delta_{G/B}$ is a base change of e. Hence if e is a closed immersion (resp. quasi-compact, resp. an immersion) so is $\Delta_{G/B}$, see Spaces, Lemma 40.12.3 (resp. Morphisms of Spaces, Lemma 42.9.3, resp. Spaces, Lemma 40.12.3). $\square$

52.7. Examples of group algebraic spaces

If $G \to S$ is a group scheme over the base scheme S, then the base change G_B to any algebraic space B over S is an group algebraic space over B by Lemma 52.5.2. We will frequently use this in the examples below.

Example 52.7.1. (Multiplicative group algebraic space.) Let $B \to S$ as in Section 52.3. Consider the functor which associates to any scheme T over B the group $\Gamma(T, \mathcal{O}_T^*)$ of units in the global sections of the structure sheaf. This is representable by the group algebraic space

$$\mathbf{G}_{m,B} = B \times_S \mathbf{G}_{m,S}$$

over B. Here $\mathbf{G}_{m,S}$ is the multiplicative group scheme over S, see Groupoids, Example 35.5.1.

Example 52.7.2. (Roots of unity as a group algebraic space.) Let $B \to S$ as in Section 52.3. Let $n \in \mathbf{N}$. Consider the functor which associates to any scheme T over B the subgroup of $\Gamma(T, \mathcal{O}_T^*)$ consisting of nth roots of unity. This is representable by the group algebraic space

$$\mu_{n,B} = B \times_S \mu_{n,S}$$

over B. Here $\mu_{n,S}$ is the group scheme of nth roots of unity over S, see Groupoids, Example 35.5.2.

Example 52.7.3. (Additive group algebraic space.) Let $B \to S$ as in Section 52.3. Consider the functor which associates to any scheme T over B the group $\Gamma(T, \mathcal{O}_T)$ of global sections of the structure sheaf. This is representable by the group algebraic space

$$\mathbf{G}_{a,B} = B \times_S \mathbf{G}_{a,S}$$

over B. Here $\mathbf{G}_{a,S}$ is the additive group scheme over S, see Groupoids, Example 35.5.3.

Example 52.7.4. (General linear group algebraic space.) Let $B \to S$ as in Section 52.3. Let $n \geq 1$. Consider the functor which associates to any scheme T over B the group

$$\text{GL}_n(\Gamma(T, \mathcal{O}_T))$$

of invertible $n \times n$ matrices over the global sections of the structure sheaf. This is representable by the group algebraic space

$$\text{GL}_{n,B} = B \times_S \text{GL}_{n,S}$$

over B. Here $\mathbf{G}_{m,S}$ is the general linear group scheme over S, see Groupoids, Example 35.5.4.

Example 52.7.5. Let $B \to S$ as in Section 52.3. Let $n \geq 1$. The determinant defines a morphisms of group algebraic spaces

$$\det : \mathrm{GL}_{n,B} \longrightarrow \mathbf{G}_{m,B}$$

over B. It is the base change of the determinant morphism over S from Groupoids, Example 35.5.5.

Example 52.7.6. Let $B \to S$ as in Section 52.3. (Constant group algebraic space.) Let G be an abstract group. Consider the functor which associates to any scheme T over B the group of locally constant maps $T \to G$ (where T has the Zariski topology and G the discrete topology). This is representable by the group algebraic space

$$G_B = B \times_S G_S$$

over B. Here G_S is the constant group scheme introduced in Groupoids, Example 35.5.6.

52.8. Actions of group algebraic spaces

Please refer to Groupoids, Section 35.8 for notation.

Definition 52.8.1. Let $B \to S$ as in Section 52.3. Let (G, m) be a group algebraic space over B. Let X be an algebraic space over B.

(1) An *action of G on the algebraic space X/B* is a morphism $a : G \times_B X \to X$ over B such that for every scheme T over B the map $a : G(T) \times X(T) \to X(T)$ defines the structure of a $G(T)$-set on $X(T)$.
(2) Suppose that X, Y are algebraic spaces over B each endowed with an action of G. An *equivariant* or more precisely a *G-equivariant* morphism $\psi : X \to Y$ is a morphism of algebraic spaces over B such that for every T over B the map $\psi : X(T) \to Y(T)$ is a morphism of $G(T)$-sets.

In situation (1) this means that the diagrams

$$\begin{tikzcd} G \times_B G \times_B X \arrow[r, "1_G \times a"] \arrow[d, "m \times 1_X"'] & G \times_B X \arrow[d, "a"] \\ G \times_B X \arrow[r, "a"] & X \end{tikzcd} \qquad \begin{tikzcd} G \times_B X \arrow[r, "a"] & X \\ X \arrow[u, "e \times 1_X"] \arrow[ur, "1_X"'] & \end{tikzcd} \tag{52.8.1.1}$$

are commutative. In situation (2) this just means that the diagram

$$\begin{tikzcd} G \times_B X \arrow[r, "\mathrm{id} \times f"] \arrow[d, "a"'] & G \times_B Y \arrow[d, "a"] \\ X \arrow[r, "f"] & Y \end{tikzcd}$$

commutes.

Definition 52.8.2. Let $B \to S$, $G \to B$, and $X \to B$ as in Definition 52.8.1. Let $a : G \times_B X \to X$ be an action of G on X/B. We say the action is *free* if for every scheme T over B the action $a : G(T) \times X(T) \to X(T)$ is a free action of the group $G(T)$ on the set $X(T)$.

Lemma 52.8.3. *Situation as in Definition 52.8.2, The action a is free if and only if*

$$G \times_B X \to X \times_B X, \quad (g, x) \mapsto (a(g, x), x)$$

is a monomorphism of algebraic spaces.

Proof. Immediate from the definitions. $\square$

52.9. Principal homogeneous spaces

This section is the analogue of Groupoids, Section 35.9. We suggest reading that section first.

Definition 52.9.1. Let S be a scheme. Let B be an algebraic space over S. Let (G, m) be a group algebraic space over B. Let X be an algebraic space over B, and let $a : G \times_B X \to X$ be an action of G on X.

(1) We say X is a *pseudo G-torsor* or that X is *formally principally homogeneous under G* if the induced morphism $G \times_B X \to X \times_B X$, $(g, x) \mapsto (a(g, x), x)$ is an isomorphism.
(2) A pseudo G-torsor X is called *trivial* if there exists an G-equivariant isomorphism $G \to X$ over B where G acts on G by left multiplication.

It is clear that if $B' \to B$ is a morphism of algebraic spaces then the pullback $X_{B'}$ of a pseudo G-torsor over B is a pseudo $G_{B'}$-torsor over B'.

Lemma 52.9.2. *In the situation of Definition 52.9.1.*

(1) *The algebraic space X is a pseudo G-torsor if and only if for every scheme T over B the set $X(T)$ is either empty or the action of the group $G(T)$ on $X(T)$ is simply transitive.*
(2) *A pseudo G-torsor X is trivial if and only if the morphism $X \to B$ has a section.*

Proof. Omitted. $\square$

Definition 52.9.3. Let S be a scheme. Let B be an algebraic space over S. Let (G, m) be a group algebraic space over B. Let X be a pseudo G-torsor over B.

(1) We say X is a *principal homogeneous space*, or more precisely a *principal homogeneous G-space over B* if there exists a fpqc covering[1] $\{B_i \to B\}_{i \in I}$ such that each $X_{B_i} \to B_i$ has a section (i.e., is a trivial pseudo G_{B_i}-torsor).
(2) Let $\tau \in \{Zariski, étale, smooth, syntomic, fppf\}$. We say X is a *G-torsor in the τ topology*, or a *τ G-torsor*, or simply a *τ torsor* if there exists a τ covering $\{B_i \to B\}_{i \in I}$ such that each $X_{B_i} \to B_i$ has a section.
(3) If X is a G-torsor, then we say that it is *quasi-isotrivial* if it is a torsor for the étale topology.
(4) If X is a G-torsor, then we say that it is *locally trivial* if it is a torsor for the Zariski topology.

We sometimes say ``let X be a G-principal homogeneous space over B" to indicate that X is an algebraic space over B equippend with an action of G which turns it into a principal homogeneous space over B. Next we show that this agrees with the notation introduced earlier when both apply.

Lemma 52.9.4. *Let S be a scheme. Let (G, m) be a group algebraic space over S. Let X be an algebraic space over S, and let $a : G \times_S X \to X$ be an action of G on X. Then X is a G-torsor in the $fppf$-topology in the sense of Definition 52.9.3 if and only if X is a G-torsor on $(Sch/S)_{fppf}$ in the sense of Cohomology on Sites, Definition 19.5.1.*

Proof. Omitted. $\square$

[1] The default type of torsor in Groupoids, Definition 35.9.3 is a pseudo torsor which is trivial on an fpqc covering. Since G, as an algebraic space, can be seen a sheaf of groups there already is a notion of a G-torsor which corresponds to fppf-torsor, see Lemma 52.9.4. Hence we use ``principal homogeneous space" for a pseudo torsor which is fpqc locally trivial, and we try to avoid using the word torsor in this situation.

52.10. Equivariant quasi-coherent sheaves

Please compare with Groupoids, Section 35.10.

Definition 52.10.1. Let $B \to S$ as in Section 52.3. Let (G, m) be a group algebraic space over B, and let $a : G \times_B X \to X$ be an action of G on the algebraic space X over B. An *G-equivariant quasi-coherent $\mathcal{O}_X$-module*, or simply a *equivariant quasi-coherent $\mathcal{O}_X$-module*, is a pair $(\mathcal{F}, \alpha)$, where $\mathcal{F}$ is a quasi-coherent $\mathcal{O}_X$-module, and α is a $\mathcal{O}_{G\times_B X}$-module map

$$\alpha : a^*\mathcal{F} \longrightarrow \mathrm{pr}_1^*\mathcal{F}$$

where $\mathrm{pr}_1 : G \times_B X \to X$ is the projection such that

(1) the diagram

$$\begin{tikzcd} (1_G \times a)^*\mathrm{pr}_2^*\mathcal{F} \arrow[r, "\mathrm{pr}_{12}^*\alpha"'] & \mathrm{pr}_2^*\mathcal{F} \\ (1_G \times a)^*a^*\mathcal{F} \arrow[u, "(1_G\times a)^*\alpha"] \arrow[r, equal] & (m \times 1_X)^*a^*\mathcal{F} \arrow[u, "(m\times 1_X)^*\alpha"'] \end{tikzcd}$$

is a commutative in the category of $\mathcal{O}_{G\times_B G\times_B X}$-modules, and

(2) the pullback

$$(e \times 1_X)^*\alpha : \mathcal{F} \longrightarrow \mathcal{F}$$

is the identity map.

For explanation compare with the relevant diagrams of Equation (52.8.1.1).

Note that the commutativity of the first diagram garantees that $(e \times 1_X)^*\alpha$ is an idempotent operator on $\mathcal{F}$, and hence condition (2) is just the condition that it is an isomorphism.

Lemma 52.10.2. *Let $B \to S$ as in Section 52.3. Let G be a group algebraic space over B. Let $f : X \to Y$ be a G-equivariant morphism between algebraic spaces over B endowed with G-actions. Then pullback f^* given by $(\mathcal{F}, \alpha) \mapsto (f^*\mathcal{F}, (1_G \times f)^*\alpha)$ defines a functor from the category of G-equivariant sheaves on X to the category of quasi-coherent G-equivariant sheaves on Y.*

Proof. Omitted. □

52.11. Groupoids in algebraic spaces

Please refer to Groupoids, Section 35.11 for notation.

Definition 52.11.1. Let $B \to S$ as in Section 52.3.

(1) A *groupoid in algebraic spaces over B* is a quintuple (U, R, s, t, c) where U and R are algebraic spaces over B, and $s, t : R \to U$ and $c : R \times_{s,U,t} R \to R$ are morphisms of algebraic spaces over B with the following property: For any scheme T over B the quintuple

$$(U(T), R(T), s, t, c)$$

is a groupoid category.

(2) A *morphism $f : (U, R, s, t, c) \to (U', R', s', t', c')$ of groupoids in algebraic spaces over B* is given by morphisms of algebraic spaces $f : U \to U'$ and $f : R \to R'$ over B with the following property: For any scheme T over B the maps f define a functor from the groupoid category $(U(T), R(T), s, t, c)$ to the groupoid category $(U'(T), R'(T), s', t', c')$.

Let (U, R, s, t, c) be a groupoid in algebraic spaces over B. Note that there are unique morphisms of algebraic spaces $e : U \to R$ and $i : R \to R$ over B such that for every scheme T over B the induced map $e : U(T) \to R(T)$ is the identity, and $i : R(T) \to R(T)$ is the inverse of the groupoid category. The septuple (U, R, s, t, c, e, i) satisfies commutative diagrams corresponding to each of the axioms (1), (2)(a), (2)(b), (3)(a) and (3)(b) of Groupoids, Section 35.11. Conversely given a septuple with this property the quintuple (U, R, s, t, c) is a groupoid in algebraic spaces over B. Note that i is an isomorphism, and e is a section of both s and t. Moreover, given a groupoid in algebraic spaces over B we denote

$$j = (t, s) : R \longrightarrow U \times_B U$$

which is compatible with our conventions in Section 52.4 above. We sometimes say ``let (U, R, s, t, c, e, i) be a groupoid in algebraic spaces over B'' to stress the existence of identity and inverse.

Lemma 52.11.2. *Let $B \to S$ as in Section 52.3. Given a groupoid in algebraic spaces (U, R, s, t, c) over B the morphism $j : R \to U \times_B U$ is a pre-equivalence relation.*

Proof. Omitted. This is a nice exercise in the definitions. ☐

Lemma 52.11.3. *Let $B \to S$ as in Section 52.3. Given an equivalence relation $j : R \to U$ over B there is a unique way to extend it to a groupoid in algebraic spaces (U, R, s, t, c) over B.*

Proof. Omitted. This is a nice exercise in the definitions. ☐

Lemma 52.11.4. *Let $B \to S$ as in Section 52.3. Let (U, R, s, t, c) be a groupoid in algebraic spaces over B. In the commutative diagram*

$$\begin{tikzcd}
 & U & \\
R \arrow[ur, "t"] \arrow[d, "s"'] & R \times_{s,U,t} R \arrow[l, "pr_0"'] \arrow[r, "c"] \arrow[d, "pr_1"] & R \arrow[ul, "t"'] \arrow[d, "s"] \\
U & R \arrow[l, "t"] \arrow[r, "s"'] & U
\end{tikzcd}$$

the two lower squares are fibre product squares. Moreover, the triangle on top (which is really a square) is also cartesian.

Proof. Omitted. Exercise in the definitions and the functorial point of view in algebraic geometry. ☐

Lemma 52.11.5. *Let $B \to S$ be as in Section 52.3. Let (U, R, s, t, c, e, i) be a groupoid in algebraic spaces over B. The diagram*

(52.11.5.1)
$$\begin{tikzcd}
R \times_{t,U,t} R \arrow[r, shift left, "pr_1"] \arrow[r, shift right, "pr_0"'] \arrow[d, "pr_0 \times c \circ (i,1)"'] & R \arrow[r, "t"] \arrow[d, "id_R"] & U \arrow[d, "id_U"] \\
R \times_{s,U,t} R \arrow[r, shift left, "c"] \arrow[r, shift right, "pr_0"'] \arrow[d, "pr_1"'] & R \arrow[r, "t"] \arrow[d, "s"] & U \\
R \arrow[r, shift left, "s"] \arrow[r, shift right, "t"'] & U &
\end{tikzcd}$$

is commutative. The two top rows are isomorphic via the vertical maps given. The two lower left squares are cartesian.

Proof. The commutativity of the diagram follows from the axioms of a groupoid. Note that, in terms of groupoids, the top left vertical arrow assigns to a pair of morphisms (α, β) with the same target, the pair of morphisms $(\alpha, \alpha^{-1} \circ \beta)$. In any groupoid this defines a bijection between Arrows $\times_{t,\mathrm{Ob},t}$ Arrows and Arrows $\times_{s,\mathrm{Ob},t}$ Arrows. Hence the second assertion of the lemma. The last assertion follows from Lemma 52.11.4. □

52.12. Quasi-coherent sheaves on groupoids

Please compare with Groupoids, Section 35.12.

Definition 52.12.1. Let $B \to S$ as in Section 52.3. Let (U, R, s, t, c) be a groupoid in algebraic spaces over B. A *quasi-coherent module on* (U, R, s, t, c) is a pair $(\mathcal{F}, \alpha)$, where $\mathcal{F}$ is a quasi-coherent $\mathcal{O}_U$-module, and α is a $\mathcal{O}_R$-module map

$$\alpha : t^*\mathcal{F} \longrightarrow s^*\mathcal{F}$$

such that

(1) the diagram

$$\begin{tikzcd}
& \mathrm{pr}_1^*t^*\mathcal{F} \arrow[r, "\mathrm{pr}_1^*\alpha"'] \arrow[ld, equal] & \mathrm{pr}_1^*s^*\mathcal{F} \arrow[rd, equal] & \\
\mathrm{pr}_0^*s^*\mathcal{F} & & & c^*s^*\mathcal{F} \\
& \mathrm{pr}_0^*t^*\mathcal{F} \arrow[lu, "\mathrm{pr}_0^*\alpha"] \arrow[r, equal] & c^*t^*\mathcal{F} \arrow[ru, "c^*\alpha"'] &
\end{tikzcd}$$

is a commutative in the category of $\mathcal{O}_{R\times_{s,U,t}R}$-modules, and

(2) the pullback

$$e^*\alpha : \mathcal{F} \longrightarrow \mathcal{F}$$

is the identity map.

Compare with the commutative diagrams of Lemma 52.11.4.

The commutativity of the first diagram forces the operator $e^*\alpha$ to be idempotent. Hence the second condition can be reformulated as saying that $e^*\alpha$ is an isomorphism. In fact, the condition implies that α is an isomorphism.

Lemma 52.12.2. *Let S be a scheme, let (U, R, s, t, c) be a groupoid scheme over S. If $(\mathcal{F}, \alpha)$ is a quasi-coherent module on (U, R, s, t, c) then α is an isomorphism.*

Proof. Pull back the commutative diagram of Definition 52.12.1 by the morphism $(i, 1) : R \to R \times_{s,U,t} R$. Then we see that $i^*\alpha \circ \alpha = s^*e^*\alpha$. Pulling back by the morphism $(1, i)$ we obtain the relation $\alpha \circ i^*\alpha = t^*e^*\alpha$. By the second assumption these morphisms are the identity. Hence $i^*\alpha$ is an inverse of α. □

Lemma 52.12.3. *Let $B \to S$ as in Section 52.3. Consider a morphism $f : (U, R, s, t, c) \to (U', R', s', t', c')$ of groupoid in algebraic spacess over B. Then pullback f^* given by*

$$(\mathcal{F}, \alpha) \mapsto (f^*\mathcal{F}, f^*\alpha)$$

defines a functor from the category of quasi-coherent sheaves on (U', R', s', t', c') to the category of quasi-coherent sheaves on (U, R, s, t, c).

Proof. Omitted. □

Lemma 52.12.4. *Let $B \to S$ be as in Section 52.3. Let (U, R, s, t, c) be a groupoid in algebraic spaces over B. The category of quasi-coherent modules on (U, R, s, t, c) has colimits.*

Proof. Let $i \mapsto (\mathcal{F}_i, \alpha_i)$ be a diagram over the index category $\mathcal{I}$. We can form the colimit $\mathcal{F} = colim \mathcal{F}_i$ which is a quasi-coherent sheaf on U, see Properties of Spaces, Lemma 41.26.7. Since colimits commute with pullback we see that $s^*\mathcal{F} = colim\, s^*\mathcal{F}_i$ and similarly $t^*\mathcal{F} = colim\, t^*\mathcal{F}_i$. Hence we can set $\alpha = colim\, \alpha_i$. We omit the proof that $(\mathcal{F}, \alpha)$ is the colimit of the diagram in the category of quasi-coherent modules on (U, R, s, t, c). □

Lemma 52.12.5. *Let $B \to S$ as in Section 52.3. Let (U, R, s, t, c) be a groupoid in algebraic spaces over B. If s, t are flat, then the category of quasi-coherent modules on (U, R, s, t, c) is abelian.*

Proof. Let $\varphi : (\mathcal{F}, \alpha) \to (\mathcal{G}, \beta)$ be a homomorphism of quasi-coherent modules on (U, R, s, t, c). Since s is flat we see that

$$0 \to s^*\mathrm{Ker}(\varphi) \to s^*\mathcal{F} \to s^*\mathcal{G} \to s^*\mathrm{Coker}(\varphi) \to 0$$

is exact and similarly for pullback by t. Hence α and β induce isomorphisms $\kappa : t^*\mathrm{Ker}(\varphi) \to s^*\mathrm{Ker}(\varphi)$ and $\lambda : t^*\mathrm{Coker}(\varphi) \to s^*\mathrm{Coker}(\varphi)$ which satisfy the cocycle condition. Then it is straightforward to verify that $(\mathrm{Ker}(\varphi), \kappa)$ and $(\mathrm{Coker}(\varphi), \lambda)$ are a kernel and cokernel in the category of quasi-coherent modules on (U, R, s, t, c). Moreover, the condition $\mathrm{Coim}(\varphi) = \mathrm{Im}(\varphi)$ follows because it holds over U. □

52.13. Crystals in quasi-coherent sheaves

Let (I, Φ, j) be a pair consisting of a set I and a pre-relation $j : \Phi \to I \times I$. Assume given for every $i \in I$ a scheme X_i and for every $\phi \in \Phi$ a morphisms of schemes $f_\phi : X_{i'} \to X_i$ where $j(\phi) = (i, i')$. Set $X = (\{X_i\}_{i \in I}, \{f_\phi\}_{\phi \in \Phi})$. Define a *crystal in quasi-coherent modules on X* as a rule which associates to every $i \in Ob(\mathcal{I})$ a quasi-coherent sheaf $\mathcal{F}_i$ on X_i and for every $\phi \in \Phi$ with $j(\phi) = (i, i')$ an isomorphism

$$\alpha_\phi : f_\phi^*\mathcal{F}_i \longrightarrow \mathcal{F}_{i'}$$

of quasi-coherent sheaves on $X_{i'}$. These crystals in quasi-coherent modules form an additive category $CQC(X)$[2]. This category has colimits (proof is the same as the proof of Lemma 52.12.4). If all the morphisms f_ϕ are flat, then $CQC(X)$ is abelian (proof is the same as the proof of Lemma 52.12.5). Let κ be a cardinal. We say that a crystal in quasi-coherent modules $\mathcal{F}$ on X is *κ-generated* if each $\mathcal{F}_i$ is κ-generated (see Properties, Definition 23.21.1).

Lemma 52.13.1. *In the situation above, if all the morphisms f_ϕ are flat, then there exists a cardinal κ such that every object $(\{\mathcal{F}_i\}_{i \in I}, \{\alpha_\phi\}_{\phi \in \Phi})$ of $CQC(X)$ is the directed colimit of its κ-generated submodules.*

[2]We could single out a set of triples $\phi, \phi', \phi'' \in \Phi$ with $j(\phi) = (i, i')$, $j(\phi') = (i', i'')$, and $j(\phi'') = (i, i'')$ such that $f_{\phi''} = f_\phi \circ f_{\phi'}$ and require that $\alpha_{\phi'} \circ f_{\phi'}^*\alpha_\phi = \alpha_{\phi''}$ for these triples. This would define an additive subcategory. For example the data (I, Φ) could be the set of objects and arrows of an index category and X could be a diagram of schemes over this index category. The result of Lemma 52.13.1 immediately gives the corresponding result in the subcategory.

Proof. In the the lemma and in this proof a *submodule* of $(\{\mathcal{F}_i\}_{i\in I}, \{\alpha_\phi\}_{\phi\in\Phi})$ means the data of a quasi-coherent submodule $\mathcal{G}_i \subset \mathcal{F}_i$ for all i such that $\alpha_\phi(f_\phi^*\mathcal{G}_i) = \mathcal{G}_{i'}$ as subsheaves of $\mathcal{F}_{i'}$ for all $\phi \in \Phi$. This makes sense because since f_ϕ is flat the pullback f_ϕ^* is exact, i.e., preserves subsheaves. The proof will be a variant to the proof of Properties, Lemma 23.21.3. We urge the reader to read that proof first.

We claim that it suffices to prove the lemma in case all the schemes X_i are affine. To see this let

$$J = \coprod\nolimits_{i\in I}\{U \subset X_i \text{ affine open}\}$$

and let

$$\begin{aligned}\Psi = &\coprod\nolimits_{\phi\in\Phi}\{(U,V) \mid U \subset X_i, V \subset X_{i'} \text{ affine open with } f_\phi(U) \subset V\}\\ &\amalg \coprod\nolimits_{i\in I}\{(U,U') \mid U,U' \subset X_i \text{ affine open with } U \subset U'\}\end{aligned}$$

endowed with the obvious map $\Psi \to J \times J$. Then our $(\mathcal{F}, \alpha)$ induces a crystal in quasi-coherent sheaves $(\{\mathcal{H}_j\}_{j\in J}, \{\beta_\psi\}_{\psi\in\Psi})$ on $Y = (J, \Psi)$ by setting $\mathcal{H}_{(i,U)} = \mathcal{F}_i|_U$ for $(i,U) \in J$ and setting β_ψ for $\psi \in \Psi$ equal to the restriction of α_ϕ to U if $\psi = (\phi, U, V)$ and equal to $\text{id} : (\mathcal{F}_i|_{U'})|_U \to \mathcal{F}_i|_U$ when $\psi = (i, U, U')$. Moreover, submodules of $(\{\mathcal{H}_j\}_{j\in J}, \{\beta_\psi\}_{\psi\in\Psi})$ correspond 1-to-1 with submodules of $(\{\mathcal{F}_i\}_{i\in I}, \{\alpha_\phi\}_{\phi\in\Phi})$. We omit the proof (hint: use Sheaves, Section 6.30). Moreover, it is clear that if κ works for Y, then the same κ works for X (by the definition of κ-generated modules). Hence it suffices to proof the lemma for crystals in quasi-coherent sheaves on Y.

Assume that all the schemes X_i are affine. Let κ be an infinite cardinal larger than the cardinality of I or Φ. Let $(\{\mathcal{F}_i\}_{i\in I}, \{\alpha_\phi\}_{\phi\in\Phi})$ be an object of $CQC(X)$. For each i write $X_i = Spec(A_i)$ and $M_i = \Gamma(X_i, \mathcal{F}_i)$. For every $\phi \in \Phi$ with $j(\phi) = (i,i')$ the map α_ϕ translates into an $A_{i'}$-module isomorphism

$$\alpha_\phi : M_i \otimes_{A_i} A_{i'} \longrightarrow M_{i'}$$

Using the axiom of choice choose a rule

$$(\phi, m) \longmapsto S(\phi, m')$$

where the source is the collection of pairs (ϕ, m') such that $\phi \in \Phi$ with $j(\phi) = (i,i')$ and $m' \in M_{i'}$ and where the output is a finite subset $S(\phi, m') \subset M_i$ so that

$$m' = \alpha_\phi\left(\sum\nolimits_{m\in S(\phi,m')} m \otimes a'_m\right)$$

for some $a'_m \in A_{i'}$.

Having made these choices we claim that any section of any $\mathcal{F}_i$ over any X_i is in a κ-generated submodule. To see this suppose that we are given a collection $\mathcal{S} = \{S_i\}_{i\in I}$ of subsets $S_i \subset M_i$ each with cardinality at most κ. Then we define a new collection $\mathcal{S}' = \{S'_i\}_{i\in I}$ with

$$S'_i = S_i \cup \bigcup\nolimits_{(\phi,m'),\ j(\phi)=(i,i'),\ m'\in S_{i'}} S(\phi, m')$$

Note that each S'_i still has cardinality at most κ. Set $\mathcal{S}^{(0)} = \mathcal{S}$, $\mathcal{S}^{(1)} = \mathcal{S}'$ and by induction $\mathcal{S}^{(n+1)} = (\mathcal{S}^{(n)})'$. Then set $S_i^{(\infty)} = \bigcup_{n\geq 0} S_i^{(n)}$ and $\mathcal{S}^{(\infty)} = \{S_i^{(\infty)}\}_{i\in I}$. By construction, for every $\phi \in \Phi$ with $j(\phi) = (i,i')$ and every $m' \in S_{i'}^{(\infty)}$ we can write m' as a finite linear combination of images $\alpha_\phi(m \otimes 1)$ with $m \in S_i^{(\infty)}$. Thus we see that setting N_i equal to the A_i-submodule of M_i generated by $S_i^{(\infty)}$ the corresponding quasi-coherent submodules $\widetilde{N_i} \subset \mathcal{F}_i$ form a κ-generated submodule. This finishes the proof. □

Lemma 52.13.2. *Let $B \to S$ as in Section 52.3. Let (U, R, s, t, c) be a groupoid in algebraic spaces over B. If s, t are flat, then there exists a set T and a family of objects $(\mathcal{F}_t, \alpha_t)_{t\in T}$ of $QCoh(U, R, s, t, c)$ such that every object $(\mathcal{F}, \alpha)$ is the directed colimit of its submodules isomorphic to one of the objects $(\mathcal{F}_t, \alpha_t)$.*

Proof. This lemma is a generalization of Groupoids, Lemma 35.12.7 which deals with the case of a groupoid in schemes. We can't quite use the same argument, so we use the material on ``crystals of quasi-coherent sheaves'' we developed above.

Choose a scheme W and a surjective étale morphism $W \to U$. Choose a scheme V and a surjective étale morphism $V \to W \times_{U,s} R$. Choose a scheme V' and a surjective étale morphism $V' \to R \times_{t,U} W$. Consider the collection of schemes

$$I = \{W, W \times_U W, V, V', V \times_R V'\}$$

and the set of morphisms of schemes

$$\Phi = \{\text{pr}_i : W \times_U W \to W, V \to W, V' \to W, V \times_R V' \to V, V \times_R V' \to V'\}$$

Set $X = (I, \Phi)$. Recall that we have defined a category $CQC(X)$ of crystals of quasi-coherent sheaves on X. There is a functor

$$QCoh(U, R, s, t, c) \longrightarrow CQC(X)$$

which assigns to $(\mathcal{F}, \alpha)$ the sheaf $\mathcal{F}|_W$ on W, the sheaf $\mathcal{F}|_{W\times_U W}$ on $W \times_U W$, the pull back of $\mathcal{F}$ via $V \to W \times_{U,s} R \to W \to U$ on V, the pull back of $\mathcal{F}$ via $V' \to R \times_{t,U} W \to W \to U$ on V', and finally the pull back of $\mathcal{F}$ via $V \times_R V' \to V \to W \times_{U,s} R \to W \to U$ on $V \times_R V'$. As comparison maps $\{\alpha_\phi\}_{\phi\in\Phi}$ we use the obvious ones (coming from associativity of pullbacks) except for the map $\phi = \text{pr}_{V'} : V \times_R V' \to V'$ we use the pullback of $\alpha : t^*\mathcal{F} \to s^*\mathcal{F}$ to $V \times_R V'$. This makes sense because of the following commutative diagram

$$\begin{tikzcd}
& V \times_R V' \arrow[dl] \arrow[dr] & \\
V \arrow[dr] \arrow[dd] & & V' \arrow[dl] \arrow[dd] \\
& R \arrow[dd, shift right, "s"'] \arrow[dd, shift left, "t"] & \\
W \arrow[dr] & & W \arrow[dl] \\
& U &
\end{tikzcd}$$

The functor displayed above isn't an equivalence of categories. However, since $W \to U$ is surjective étale it is faithful[3]. Since all the morphisms in the diagram above are flat we see that it is an exact functor of abelian categories. Moreover, we claim that given $(\mathcal{F}, \alpha)$ with image $(\{\mathcal{F}_i\}_{i\in I}, \{\alpha_\phi\}_{\phi\in\Phi})$ there is a 1-to-1 correspondence between quasi-coherent submodules of $(\mathcal{F}, \alpha)$ and $(\{\mathcal{F}_i\}_{i\in I}, \{\alpha_\phi\}_{\phi\in\Phi})$. Namely, given a submodule of $(\{\mathcal{F}_i\}_{i\in I}, \{\alpha_\phi\}_{\phi\in\Phi})$ compatibility of the submodule over W with the projection maps $W \times_U W \to W$ will guarantee the submodule comes from a quasi-coherent submodule of $\mathcal{F}$ (by

[3]In fact the functor is fully faithful, but we won't need this.

Properties of Spaces, Proposition 41.29.1) and compatibility with $\alpha_{\mathrm{pr}_{V'}}$ will insure this subsheaf is compatible with α (details omitted).

Choose a cardinal κ as in Lemma 52.13.1 for the system $X = (I, \Phi)$. It is clear from Properties, Lemma 23.21.2 that there is a set of isomorphism classes of κ-generated crystals in quasi-coherent sheaves on X. Hence the result is clear. □

52.14. Groupoids and group spaces

Please compare with Groupoids, Section 35.13.

Lemma 52.14.1. *Let $B \to S$ as in Section 52.3. Let (G, m) be a group algebraic space over B with identity e_G and inverse i_G. Let X be an algebraic space over B and let $a : G \times_B X \to X$ be an action of G on X over B. Then we get a groupoid in algebraic spaces (U, R, s, t, c, e, i) over B in the following manner:*

1. *We set $U = X$, and $R = G \times_B X$.*
2. *We set $s : R \to U$ equal to $(g, x) \mapsto x$.*
3. *We set $t : R \to U$ equal to $(g, x) \mapsto a(g, x)$.*
4. *We set $c : R \times_{s,U,t} R \to R$ equal to $((g, x), (g', x')) \mapsto (m(g, g'), x')$.*
5. *We set $e : U \to R$ equal to $x \mapsto (e_G(x), x)$.*
6. *We set $i : R \to R$ equal to $(g, x) \mapsto (i_G(g), a(g, x))$.*

Proof. Omitted. Hint: It is enough to show that this works on the set level. For this use the description above the lemma describing g as an arrow from v to $a(g, v)$. □

Lemma 52.14.2. *Let $B \to S$ as in Section 52.3. Let (G, m) be a group algebraic space over B. Let X be an algebraic space over B and let $a : G \times_B X \to X$ be an action of G on X over B. Let (U, R, s, t, c) be the groupoid in algebraic spaces constructed in Lemma 52.14.1. The rule $(\mathcal{F}, \alpha) \mapsto (\mathcal{F}, \alpha)$ defines an equivalence of categories between G-equivariant $\mathcal{O}_X$-modules and the category of quasi-coherent modules on (U, R, s, t, c).*

Proof. The assertion makes sense because $t = a$ and $s = \mathrm{pr}_1$ as morphisms $R = G \times_B X \to X$, see Definitions 52.10.1 and 52.12.1. Using the translation in Lemma 52.14.1 the commutativity requirements of the two definitions match up exactly. □

52.15. The stabilizer group algebraic space

Please compare with Groupoids, Section 35.14. Given a groupoid in algebraic spaces we get a group algebraic space as follows.

Lemma 52.15.1. *Let $B \to S$ as in Section 52.3. Let (U, R, s, t, c) be a groupoid in algebraic spaces over B. The algebraic space G defined by the cartesian square*

$$\begin{tikzcd} G \arrow[r] \arrow[d] & R \arrow[d, "j=(t,s)"] \\ U \arrow[r, "\Delta"] & U \times_B U \end{tikzcd}$$

is a group algebraic space over U with compostion law m induced by the composition law c.

Proof. This is true because in a groupoid category the set of self maps of any object forms a group. □

Since Δ is a monomorphism we see that $G = j^{-1}(\Delta_{U/B})$ is a subsheaf of R. Thinking of it in this way, the structure morphism $G = j^{-1}(\Delta_{U/B}) \to U$ is induced by either s or t (it is the same), and m is induced by c.

Definition 52.15.2. Let $B \to S$ as in Section 52.3. Let (U, R, s, t, c) be a groupoid in algebraic spaces over B. The group algebraic space $j^{-1}(\Delta_{U/B}) \to U$ is called the *stabilizer of the groupoid in algebraic spaces* (U, R, s, t, c).

In the literature the stabilizer group algebraic space is often denoted S (because the word stabilizer starts with an ``s" presumably); we cannot do this since we have already used S for the base scheme.

Lemma 52.15.3. *Let $B \to S$ as in Section 52.3. Let (U, R, s, t, c) be a groupoid in algebraic spaces over B, and let G/U be its stabilizer. Denote R_t/U the algebraic space R seen as an algebraic space over U via the morphism $t : R \to U$. There is a canonical left action*

$$a : G \times_U R_t \longrightarrow R_t$$

induced by the composition law c.

Proof. In terms of points over T/B we define $a(g, r) = c(g, r)$. $\square$

52.16. Restricting groupoids

Please refer to Groupoids, Section 35.15 for notation.

Lemma 52.16.1. *Let $B \to S$ as in Section 52.3. Let (U, R, s, t, c) be a groupoid in algebraic spaces over B. Let $g : U' \to U$ be a morphism of algebraic spaces. Consider the following diagram*

$$\begin{tikzcd}
R' \arrow[r] \arrow[d] \arrow[rr, bend left, "s'"] \arrow[dd, bend right, "t'"'] & R \times_{s,U} U' \arrow[r] \arrow[d] & U' \arrow[d, "g"] \\
U' \times_{U,t} R \arrow[r] \arrow[d] & R \arrow[r, "s"] \arrow[d, "t"] & U \\
U' \arrow[r, "g"] & U &
\end{tikzcd}$$

where all the squares are fibre product squares. Then there is a canonical composition law $c' : R' \times_{s',U',t'} R' \to R'$ such that (U', R', s', t', c') is a groupoid in algebraic spaces over B and such that $U' \to U$, $R' \to R$ defines a morphism $(U', R', s', t', c') \to (U, R, s, t, c)$ of groupoids in algebraic spaces over B. Moreover, for any scheme T over B the functor of groupoids

$$(U'(T), R'(T), s', t', c') \to (U(T), R(T), s, t, c)$$

is the restriction (see Groupoids, Section 35.15) of $(U(T), R(T), s, t, c)$ via the map $U'(T) \to U(T)$.

Proof. Omitted. $\square$

Definition 52.16.2. Let $B \to S$ as in Section 52.3. Let (U, R, s, t, c) be a groupoid in algebraic spaces over B. Let $g : U' \to U$ be a morphism of algebraic spaces over B. The morphism of groupoids in algebraic spaces $(U', R', s', t', c') \to (U, R, s, t, c)$ constructed in Lemma 52.16.1 is called the *restriction of* (U, R, s, t, c) *to* U'. We sometime use the notation $R' = R|_{U'}$ in this case.

Lemma 52.16.3. *The notions of restricting groupoids and (pre-)equivalence relations defined in Definitions 52.16.2 and 52.4.3 agree via the constructions of Lemmas 52.11.2 and 52.11.3.*

Proof. What we are saying here is that R' of Lemma 52.16.1 is also equal to

$$R' = (U' \times_B U') \times_{U \times_B U} R \longrightarrow U' \times_B U'$$

In fact this might have been a clearer way to state that lemma. □

52.17. Invariant subspaces

In this section we discuss briefly the notion of an invariant subspace.

Definition 52.17.1. Let $B \to S$ as in Section 52.3. Let (U, R, s, t, c) be a groupoid in algebraic spaces over the base B.

(1) We say an open subspace $W \subset U$ is *R-invariant* if $t(s^{-1}(W)) \subset W$.
(2) A locally closed subspace $Z \subset U$ is called *R-invariant* if $t^{-1}(Z) = s^{-1}(Z)$ as locally closed subspaces of R.
(3) A monomorphism of algebraic spaces $T \to U$ is *R-invariant* if $T \times_{U,t} R = R \times_{s,U} T$ as algebraic spaces over R.

For an open subspace $W \subset U$ the R-invariance is also equivalent to requiring that $s^{-1}(W) = t^{-1}(W)$. If $W \subset U$ is R-invariant then the restriction of R to W is just $R_W = s^{-1}(W) = t^{-1}(W)$. Similarly, if $Z \subset U$ is an R-invariant locally closed subspace, then the restriction of R to Z is just $R_Z = s^{-1}(Z) = t^{-1}(Z)$.

Lemma 52.17.2. *Let $B \to S$ as in Section 52.3. Let (U, R, s, t, c) be a groupoid in algebraic spaces over B.*

(1) *If s and t are open, then for every open $W \subset U$ the open $s(t^{-1}(W))$ is R-invariant.*
(2) *If s and t are open and quasi-compact, then U has an open covering consisting of R-invariant quasi-compact open subspaces.*

Proof. Assume s and t open and $W \subset U$ open. Since s is open we see that $W' = s(t^{-1}(W))$ is an open subspace of U. Now it is quite easy to using the functorial point of view that this is an R-invariant open subset of U, but we are going to argue this directly by some diagrams, since we think it is instructive. Note that $t^{-1}(W')$ is the image of the morphism

$$A := t^{-1}(W) \times_{s|_{t^{-1}(W)}, U, t} R \xrightarrow{\text{pr}_1} R$$

and that $s^{-1}(W')$ is the image of the morphism

$$B := R \times_{s, U, s|_{t^{-1}(W)}} t^{-1}(W) \xrightarrow{\text{pr}_0} R.$$

The algebraic spaces A, B on the left of the arrows above are open subspaces of $R \times_{s,U,t} R$ and $R \times_{s,U,s} R$ respectively. By Lemma 52.11.4 the diagram

$$\begin{tikzcd} R \times_{s,U,t} R \arrow[rr, "(\text{pr}_1, c)"'] \arrow[dr, "\text{pr}_1"'] & & R \times_{s,U,s} R \arrow[dl, "\text{pr}_0"] \\ & R & \end{tikzcd}$$

is commutative, and the horizontal arrow is an isomorphism. Moreover, it is clear that $(\text{pr}_1, c)(A) = B$. Hence we conclude $s^{-1}(W') = t^{-1}(W')$, and W' is R-invariant. This proves (1).

Assume now that s, t are both open and quasi-compact. Then, if $W \subset U$ is a quasi-compact open, then also $W' = s(t^{-1}(W))$ is a quasi-compact open, and invariant by the discussion above. Letting W range over images of affines étale over U we see (2). □

52.18. Quotient sheaves

Let S be a scheme, and let B be an algebraic space over S. Let $j : R \to U \times_B U$ be a pre-relation over B. For each scheme S' over S we can take the equivalence relation $\sim_{S'}$ generated by the image of $j(S') : R(S') \to U(S') \times U(S')$. Hence we get a presheaf

$$(52.18.0.1) \qquad \begin{array}{ccc} (Sch/S)_{fppf}^{opp} & \longrightarrow & Sets, \\ S' & \longmapsto & U(S')/\sim_{S'} \end{array}$$

Note that since j is a morphism of algebraic spaces over B and into $U \times_B U$ there is a canonical transformation of presheaves from the presheaf (52.18.0.1) to B.

Definition 52.18.1. Let $B \to S$ and the pre-relation $j : R \to U \times_B U$ be as above. In this setting the *quotient sheaf* U/R associated to j is the sheafification of the presheaf (52.18.0.1) on $(Sch/S)_{fppf}$. If $j : R \to U \times_B U$ comes from the action of a group algebraic space G over B on U as in Lemma 52.14.1 then we denote the quotient sheaf U/G.

This means exactly that the diagram

$$R \rightrightarrows U \longrightarrow U/R$$

is a coequalizer diagram in the category of sheaves of sets on $(Sch/S)_{fppf}$. Again there is a canonical map of sheaves $U/R \to B$ as j is a morphism of algebraic spaces over B into $U \times_B U$.

Remark 52.18.2. A variant of the construction above would have been to sheafify the functor

$$\begin{array}{ccc} (Spaces/B)_{fppf}^{opp} & \longrightarrow & Sets, \\ X & \longmapsto & U(X)/\sim_X \end{array}$$

where now $\sim_X \subset U(X) \times U(X)$ is the equivalence relation generated by the image of $j : R(X) \to U(X) \times U(X)$. Here of course $U(X) = Mor_B(X, U)$ and $R(X) = Mor_B(X, R)$. In fact, the result would have been the same, via the identifications of (insert future reference in Topologies of Spaces here).

Definition 52.18.3. In the situation of Definition 52.18.1. We say that the pre-relation j has a *quotient representable by an algebraic space* if the sheaf U/R is an algebraic space. We say that the pre-relation j has a *representable quotient* if the sheaf U/R is representable by a scheme. We will say a groupoid in algebraic spaces (U, R, s, t, c) over B has a *representable quotient* (resp. *quotient representable by an algebraic space* if the quotient U/R with $j = (t, s)$ is representable (resp. an algebraic space).

If the quotient U/R is representable by M (either a scheme or an algebraic space over S), then it comes equipped with a canonical structure morphism $M \to B$ as we've seen above.

The following lemma characterizes M representing the quotient. It applies for example if $U \to M$ is flat, of finite presentation and surjective, and $R \cong U \times_M U$.

Lemma 52.18.4. *In the situation of Definition 52.18.1. Assume there is an algebraic space M over S, and a morphism $U \to M$ such that*

(1) *the morphism $U \to M$ equalizes s, t,*
(2) *the map $U \to M$ is a surjection of sheaves, and*

(3) *the induced map* $(t, s) : R \to U \times_M U$ *is a surjection of sheaves.*

In this case M *represents the quotient sheaf* U/R.

Proof. Condition (1) says that $U \to M$ factors through U/R. Condition (2) says that $U/R \to M$ is surjective as a map of sheaves. Condition (3) says that $U/R \to M$ is injective as a map of sheaves. Hence the lemma follows. □

The following lemma is wrong if we do not require j to be a pre-equivalence relation (but just a pre-relation say).

Lemma 52.18.5. *Let* S *be a scheme. Let* B *be an algebraic space over* S. *Let* $j : R \to U \times_B U$ *be a pre-equivalence relation over* B. *For a scheme* S' *over* S *and* $a, b \in U(S')$ *the following are equivalent:*

(1) *a and b map to the same element of* $(U/R)(S')$, *and*
(2) *there exists an fppf covering* $\{f_i : S_i \to S'\}$ *of* S' *and morphisms* $r_i : S_i \to R$ *such that* $a \circ f_i = s \circ r_i$ *and* $b \circ f_i = t \circ r_i$.

In other words, in this case the map of sheaves

$$R \longrightarrow U \times_{U/R} U$$

is surjective.

Proof. Omitted. Hint: The reason this works is that the presheaf (52.18.0.1) in this case is really given by $T \mapsto U(T)/j(R(T))$ as $j(R(T)) \subset U(T) \times U(T)$ is an equivalence relation, see Definition 52.4.1. □

Lemma 52.18.6. *Let* S *be a scheme. Let* B *be an algebraic space over* S. *Let* $j : R \to U \times_B U$ *be a pre-relation over* B *and* $g : U' \to U$ *a morphism of algebraic spaces over* B. *Let* $j' : R' \to U' \times_B U'$ *be the restriction of* j *to* U'. *The map of quotient sheaves*

$$U'/R' \longrightarrow U/R$$

is injective. If $U' \to U$ *is surjective as a map of sheaves, for example if* $\{g : U' \to U\}$ *is an fppf covering (see Topologies on Spaces, Definition 44.4.1), then* $U'/R' \to U/R$ *is an isomorphism of sheaves.*

Proof. Suppose $\xi, \xi' \in (U'/R')(S')$ are sections which map to the same section of U/R. Then we can find an fppf covering $\mathcal{S} = \{S_i \to S'\}$ of S' such that $\xi|_{S_i}, \xi'|_{S_i}$ are given by $a_i, a_i' \in U'(S_i)$. By Lemma 52.18.5 and the axioms of a site we may after refining $\mathcal{T}$ assume there exist morphisms $r_i : S_i \to R$ such that $g \circ a_i = s \circ r_i$, $g \circ a_i' = t \circ r_i$. Since by construction $R' = R \times_{U \times_S U} (U' \times_S U')$ we see that $(r_i, (a_i, a_i')) \in R'(S_i)$ and this shows that a_i and a_i' define the same section of U'/R' over S_i. By the sheaf condition this implies $\xi = \xi'$.

If $U' \to U$ is a surjective map of sheaves, then $U'/R' \to U/R$ is surjective also. Finally, if $\{g : U' \to U\}$ is a fppf covering, then the map of sheaves $U' \to U$ is surjective, see Topologies on Spaces, Lemma 44.4.4. □

Lemma 52.18.7. *Let* S *be a scheme. Let* B *be an algebraic space over* S. *Let* (U, R, s, t, c) *be a groupoid in algebraic spaces over* B. *Let* $g : U' \to U$ *a morphism of algebraic spaces over* B. *Let* (U', R', s', t', c') *be the restriction of* (U, R, s, t, c) *to* U'. *The map of quotient sheaves*

$$U'/R' \longrightarrow U/R$$

is injective. If the composition

$$\begin{tikzcd} U' \times_{g,U,t} R \arrow[r, "pr_1"'] \arrow[rr, bend left, "h"] & R \arrow[r, "s"'] & U \end{tikzcd}$$

is a surjection of fppf sheaves then the map is bijective. This holds for example if $\{h : U' \times_{g,U,t} R \to U\}$ *is an* $fppf$*-covering, or if* $U' \to U$ *is a surjection of sheaves, or if* $\{g : U' \to U\}$ *is a covering in the fppf topology.*

Proof. Injectivity follows on combining Lemmas 52.11.2 and 52.18.6. To see surjectivity (see Sites, Section 9.11 for a characterization of surjective maps of sheaves) we argue as follows. Suppose that T is a scheme and $\sigma \in U/R(T)$. There exists a covering $\{T_i \to T\}$ such that $\sigma|_{T_i}$ is the image of some element $f_i \in U(T_i)$. Hence we may assume that σ if the image of $f \in U(T)$. By the assumption that h is a surjection of sheaves, we can find an fppf covering $\{\varphi_i : T_i \to T\}$ and morphisms $f_i : T_i \to U' \times_{g,U,t} R$ such that $f \circ \varphi_i = h \circ f_i$. Denote $f_i' = \mathrm{pr}_0 \circ f_i : T_i \to U'$. Then we see that $f_i' \in U'(T_i)$ maps to $g \circ f_i' \in U(T_i)$ and that $g \circ f_i' \sim_{T_i} h \circ f_i = f \circ \varphi_i$ notation as in (52.18.0.1). Namely, the element of $R(T_i)$ giving the relation is $\mathrm{pr}_1 \circ f_i$. This means that the restriction of σ to T_i is in the image of $U'/R'(T_i) \to U/R(T_i)$ as desired.

If $\{h\}$ is an fppf covering, then it induces a surjection of sheaves, see Topologies on Spaces, Lemma 44.4.4. If $U' \to U$ is surjective, then also h is surjective as s has a section (namely the neutral element e of the groupoid scheme). $\square$

52.19. Quotient stacks

In this section and the next few sections we describe a kind of generalization of Section 52.18 above and Groupoids, Section 35.17. It is different in the following way: We are going to take quotient stacks instead of quotient sheaves.

Let us assume we have a scheme S, and algebraic space B over S and a groupoid in algebraic spaces (U, R, s, t, c) over B. Given these data we consider the functor

(52.19.0.1)
$$\begin{matrix} (Sch/S)_{fppf}^{opp} & \longrightarrow & Groupoids \\ S' & \longmapsto & (U(S'), R(S'), s, t, c) \end{matrix}$$

By Categories, Example 4.34.1 this ``presheaf in groupoids'' corresponds to a category fibred in groupoids over $(Sch/S)_{fppf}$. In this chapter we will denote this

$$[U/_pR] \to (Sch/S)_{fppf}$$

where the subscript $_p$ is there to distinguish from the quotient stack.

Definition 52.19.1. Quotient stacks. Let $B \to S$ be as above.

(1) Let (U, R, s, t, c) be a groupoid in algebraic spaces over B. The *quotient stack*
$$p : [U/R] \longrightarrow (Sch/S)_{fppf}$$
of (U, R, s, t, c) is the stackification (see Stacks, Lemma 50.9.1) of the category fibred in groupoids $[U/_pR]$ over $(Sch/S)_{fppf}$ associated to (52.19.0.1).

(2) Let (G, m) be a group algebraic space over B. Let $a : G \times_B X \to X$ be an action of G on an algebraic space over B. The *quotient stack*
$$p : [X/G] \longrightarrow (Sch/S)_{fppf}$$
is the quotient stack associated to the groupoid in algebraic spaces $(X, G \times_B X, s, t, c)$ over B of Lemma 52.14.1.

Thus $[U/R]$ and $[X/G]$ are stacks in groupoids over $(Sch/S)_{fppf}$. These stacks will be very important later on and hence it makes sense to give a detailed description. Recall that given an algebraic space X over S we use the notation $\mathcal{S}_X \to (Sch/S)_{fppf}$ to denote the stack in sets associated to the sheaf X, see Categories, Lemma 4.35.6 and Stacks, Lemma 50.6.2.

Lemma 52.19.2. *Assume $B \to S$ and (U, R, s, t, c) as in Definition 52.19.1 (1). There are canonical 1-morphisms $\pi : \mathcal{S}_U \to [U/R]$, and $[U/R] \to \mathcal{S}_B$ of stacks in groupoids over $(Sch/S)_{fppf}$. The composition $\mathcal{S}_U \to \mathcal{S}_B$ is the 1-morphism associated to the structure morphism $U \to B$.*

Proof. During this proof let us denote $[U/_pR]$ the category fibred in groupoids associated to the presheaf in groupoids (52.19.0.1). By construction of the stackification there is a 1-morphism $[U/_pR] \to [U/R]$. The 1-morphism $\mathcal{S}_U \to [U/R]$ is simply the composition $\mathcal{S}_U \to [U/_pR] \to [U/R]$, where the first arrow associates to the scheme S'/S and morphism $x : S' \to U$ over S the object $x \in U(S')$ of the fibre category of $[U/_pR]$ over S'.

To construct the 1-morphism $[U/R] \to \mathcal{S}_B$ it is enough to construct the 1-morphism $[U/_pR] \to \mathcal{S}_B$, see Stacks, Lemma 50.9.2. On objects over S'/S we just use the map

$$U(S') \longrightarrow B(S')$$

coming from the structure morphism $U \to B$. And clearly, if $a \in R(S')$ is an ``arrow'' with source $s(a) \in U(S')$ and target $t(a) \in U(S')$, then since s and t are morphisms *over* B these both map to the same element $\overline{a}$ of $B(S')$. Hence we can map an arrow $a \in R(S')$ to the identity morphism of $\overline{a}$. (This is good because the fibre category $(\mathcal{S}_B)_{S'}$ only contains identities.) We omit the verification that this rule is compatible with pullback on these split fibred categories, and hence defines a 1-morphism $[U/_pR] \to \mathcal{S}_B$ as desired.

We omit the verification of the last statement. □

Lemma 52.19.3. *Assumptions and notation as in Lemma 52.19.2. There exists a canonical 2-morphism $\alpha : \pi \circ s \to \pi \circ t$ making the diagram*

$$\begin{tikzcd} \mathcal{S}_R \arrow[r, "s"'] \arrow[d, "t"'] & \mathcal{S}_U \arrow[d, "\pi"] \\ \mathcal{S}_U \arrow[r, "\pi"] & {[U/R]} \end{tikzcd}$$

2-commutative.

Proof. Let S' be a scheme over S. Let $r : S' \to R$ be a morphism over S. Then $r \in R(S')$ is an isomorphism between the objects $s \circ r, t \circ r \in U(S')$. Moreover, this construction is compatible with pullbacks. This gives a canonical 2-morphism $\alpha_p : \pi_p \circ s \to \pi_p \circ t$ where $\pi_p : \mathcal{S}_U \to [U/_pR]$ is as in the proof of Lemma 52.19.2. Thus even the diagram

$$\begin{tikzcd} \mathcal{S}_R \arrow[r, "s"'] \arrow[d, "t"] & \mathcal{S}_U \arrow[d, "\pi_p"] \\ \mathcal{S}_U \arrow[r, "\pi_p"] & {[U/_pR]} \end{tikzcd}$$

is 2-commutative. Thus a fortiori the diagram of the lemma is 2-commutative. □

Remark 52.19.4. In future chapters we will use the ambiguous notation where instead of writing $\mathcal{S}_X$ for the stack in sets associated to X we simply write X. Using this notation the diagram of Lemma 52.19.3 becomes the familiar diagram

$$\begin{tikzcd} R \arrow[r, "s"'] \arrow[d, "t"'] & U \arrow[d, "\pi"] \\ U \arrow[r, "\pi"] & {[U/R]} \end{tikzcd}$$

In the following sections we will show that this diagram has many good properties. In particular we will show that it is a 2-fibre product (Section 52.21) and that it is close to being a 2-coequalizer of s and t (Section 52.22).

52.20. Functoriality of quotient stacks

A morphism of groupoids in algebraic spaces gives an associated morphism of quotient stacks.

Lemma 52.20.1. *Let S be a scheme. Let B be an algebraic space over S. Let $f : (U, R, s, t, c) \to (U', R', s', t', c')$ be a morphism of groupoids in algebraic spacess over B. Then f induces a canonical 1-morphism of quotient stacks*

$$[f] : [U/R] \longrightarrow [U'/R'].$$

Proof. Denote $[U/_pR]$ and $[U'/_pR']$ the categories fibred in groupoids over the base site $(Sch/S)_{fppf}$ associated to the functors (52.19.0.1). It is clear that f defines a 1-morphism $[U/_pR] \to [U'/_pR']$ which we can compose with the stackyfication functor for $[U'/R']$ to get $[U/_pR] \to [U'/R']$. Then, by the universal property of the stackyfication functor $[U/_pR] \to [U/R]$, see Stacks, Lemma 50.9.2 we get $[U/R] \to [U'/R']$. $\square$

Let $B \to S$ and $f : (U, R, s, t, c) \to (U', R', s', t', c')$ be as in Lemma 52.20.1. In this situation, we define a third groupoid in algebraic spaces over B as follows, using the language of T-valued points where T is a (varying) scheme over B:

(1) $U'' = U \times_{f,U',t'} R'$ so that a T-valued point is a pair (u, r') with $f(u) = t'(r')$,
(2) $R'' = R \times_{f\circ s,U',t'} R'$ so that a T-valued point is a pair (r, r') with $f(s(r)) = t'(r')$,
(3) $s'' : R'' \to U''$ is given by $s''(r, r') = (s(r), r')$,
(4) $t'' : R'' \to U''$ is given by $t''(r, r') = (t(r), c'(f(r), r'))$,
(5) $c'' : R'' \times_{s'',U'',t''} R'' \to R''$ is given by $c''((r_1, r_1'), (r_2, r_2')) = (c(r_1, r_2), r_2')$.

The formula for c'' makes sense as $s''(r_1, r_1') = t''(r_2, r_2')$. It is clear that c'' is associative. The identity e'' is given by $e''(u, r) = (e(u), r)$. The inverse of (r, r') is given by $(i(r), c'(f(r), r'))$. Thus we do indeed get a groupoid in algebraic spaces over B.

Clearly the maps $U'' \to U$ and $R'' \to R$ define a morphism $g : (U'', R'', s'', t'', c'') \to (U, R, s, t, c)$ of groupoids in algebraic spaces over B. Moreover, the maps $U'' \to U'$, $(u, r') \mapsto s'(r')$ and $R'' \to U'$, $(r, r') \mapsto s'(r')$ show that in fact $(U'', R'', s'', t'', c'')$ is a groupoid in algebraic spaces over U'.

Lemma 52.20.2. *Notation and assumption as in Lemma 52.20.1. Let $(U'', R'', s'', t'', c'')$ be the groupoid in algebraic spaces over B constructed above. There is a 2-commutative* *square*

$$\begin{tikzcd} {[U''/R'']} \arrow[r, "{[g]}"'] \arrow[d] & {[U/R]} \arrow[d, "{[f]}"] \\ \mathcal{S}_{U'} \arrow[r] & {[U'/R']} \end{tikzcd}$$

which identifies $[U''/R'']$ *with the* 2*-fibre product.*

Proof. The maps $[f]$ and $[g]$ come from an application of Lemma 52.20.1 and the other two maps come from Lemma 52.19.2 (and the fact that $(U'', R'', s'', t'', c'')$ lives over U'). To show the 2-fibre product property, it suffices to prove the lemma for the diagram

$$\begin{tikzcd} {[U''/_pR'']} \arrow[r, "{[g]}"'] \arrow[d] & {[U/_pR]} \arrow[d, "{[f]}"] \\ \mathcal{S}_{U'} \arrow[r] & {[U'/_pR']} \end{tikzcd}$$

of categories fibred in groupoids, see Stacks, Lemma 50.9.3. In other words, it suffices to show that an object of the 2-fibre product $\mathcal{S}_U \times_{[U'/_pR']} [U/_pR]$ over T corresponds to a T-valued point of U'' and similarly for morphisms. And of course this is exactly how we constructed U'' and R'' in the first place.

In detail, an object of $\mathcal{S}_U \times_{[U'/_pR']} [U/_pR]$ over T is a triple (u', u, r') where u' is a T-valued point of U', u is a T-valued point of U, and r' is a morphism from u' to $f(u)$ in $[U'/R']_T$, i.e., r' is a T-valued point of R with $s'(r') = u'$ and $t'(r') = f(u)$. Clearly we can forget about u' without losing information and we see that these objects are in one-to-one correspondence with T-valued points of R''.

Similarly for morphisms: Let (u'_1, u_1, r'_1) and (u'_2, u_2, r'_2) be two objects of the fibre product over T. Then a morphism from (u'_2, u_2, r'_2) to (u'_1, u_1, r'_1) is given by $(1, r)$ where $1 : u'_1 \to u'_2$ means simply $u'_1 = u'_2$ (this is so because $\mathcal{S}_U$ is fibred in sets), and r is a T-valued point of R with $s(r) = u_2$, $t(r) = u_1$ and moreover $c'(f(r), r'_2) = r'_1$. Hence the arrow

$$(1, r) : (u'_2, u_2, r'_2) \to (u'_1, u_1, r'_1)$$

is completely determined by knowing the pair (r, r'_2). Thus the functor of arrows is represented by R'', and moreover the morphisms s'', t'', and c'' clearly correspond to source, target and composition in the 2-fibre product $\mathcal{S}_U \times_{[U'/_pR']} [U/_pR]$. $\square$

52.21. The 2-cartesian square of a quotient stack

In this section we compute the $Isom$-sheaves for a quotient stack and we deduce that the defining diagram of a quotient stack is a 2-fibre product.

Lemma 52.21.1. *Assume $B \to S$, (U, R, s, t, c) and $\pi : \mathcal{S}_U \to [U/R]$ are as in Lemma 52.19.2. Let S' be a scheme over S. Let $x, y \in Ob([U/R]_{S'})$ be objects of the quotient stack over S'. If $x = \pi(x')$ and $y = \pi(y')$ for some morphisms $x', y' : S' \to U$, then*

$$Isom(x, y) = S' \times_{(y',x'), U \times_S U} R$$

as sheaves over S'.

Proof. Let $[U/_pR]$ be the category fibred in groupoids associated to the presheaf in groupoids (52.19.0.1) as in the proof of Lemma 52.19.2. By construction the sheaf $Isom(x, y)$ is the sheaf associated to the presheaf $Isom(x', y')$. On the other hand, by definition of morphisms in $[U/_pR]$ we have

$$Isom(x', y') = S' \times_{(y',x'),U\times_S U} R$$

and the right hand side is an algebraic space, therefore a sheaf. □

Lemma 52.21.2. *Assume $B \to S$, (U, R, s, t, c), and $\pi : \mathcal{S}_U \to [U/R]$ are as in Lemma 52.19.2. The 2-commutative square*

$$\begin{tikzcd} \mathcal{S}_R \arrow[r, "s"'] \arrow[d, "t"'] & \mathcal{S}_U \arrow[d, "\pi"] \\ \mathcal{S}_U \arrow[r, "\pi"] & {[U/R]} \end{tikzcd}$$

of Lemma 52.19.3 is a 2-fibre product of stacks in groupoids of $(Sch/S)_{fppf}$.

Proof. According to Stacks, Lemma 50.5.6 the lemma makes sense. It also tells us that we have to show that the functor

$$\mathcal{S}_R \longrightarrow \mathcal{S}_U \times_{[U/R]} \mathcal{S}_U$$

which maps $r : T \to R$ to $(T, t(r), s(r), \alpha(r))$ is an equivalence, where the right hand side is the 2-fibre product as described in Categories, Lemma 4.29.3. This is, after spelling out the definitions, exactly the content of Lemma 52.21.1. (Alternative proof: Work out the meaning of Lemma 52.20.2 in this situation will give you the result also.) □

Lemma 52.21.3. *Assume $B \to S$ and (U, R, s, t, c) are as in Definition 52.19.1 (1). For any scheme T over S and objects x, y of $[U/R]$ over T the sheaf $Isom(x, y)$ on $(Sch/T)_{fppf}$ has the following property: There exists a fppf covering $\{T_i \to T\}_{i\in I}$ such that $Isom(x, y)|_{(Sch/T_i)_{fppf}}$ is representable by an algebraic space.*

Proof. Follows immediately from Lemma 52.21.1 and the fact that both x and y locally in the fppf topology come from objects of $\mathcal{S}_U$ by construction of the quotient stack. □

52.22. The 2-coequalizer property of a quotient stack

On a groupoid we have the composition, which leads to a cocyle condition for the canonical 2-morphism of the lemma above. To give the precise formulation we will use the notation introduced in Categories, Sections 4.25 and 4.26.

Lemma 52.22.1. *Assumptions and notation as in Lemmas 52.19.2 and 52.19.3. The vertical composition of*

$$\begin{tikzcd}[column sep=huge] \mathcal{S}_{R\times_{s,U,t}R} \arrow[r, bend left=30, "\pi\circ s\circ pr_1=\pi\circ s\circ c"{name=U}] \arrow[r, "\pi\circ t\circ pr_1=\pi\circ s\circ pr_0"'{name=M}] \arrow[r, bend right=30, "\pi\circ t\circ pr_0=\pi\circ t\circ c"'{name=D}] & {[U/R]} \arrow[from=U, to=M, phantom, "\Downarrow\alpha\star id_{pr_1}"] \arrow[from=M, to=D, phantom, "\Downarrow\alpha\star id_{pr_0}"] \end{tikzcd}$$

is the 2-morphism $\alpha \star id_c$. In a formula $\alpha \star id_c = (\alpha \star id_{pr_0}) \circ (\alpha \star id_{pr_1})$.

Proof. We make two remarks:

(1) The formula $\alpha \star \mathrm{id}_c = (\alpha \star \mathrm{id}_{\mathrm{pr}_0}) \circ (\alpha \star \mathrm{id}_{\mathrm{pr}_1})$ only makes sense if you realize the *equalities* $\pi \circ s \circ \mathrm{pr}_1 = \pi \circ s \circ c$, $\pi \circ t \circ \mathrm{pr}_1 = \pi \circ s \circ \mathrm{pr}_0$, and $\pi \circ t \circ \mathrm{pr}_0 = \pi \circ t \circ c$. Namely, the second one implies the vertical composition $\circ$ makes sense, and the other two garantee the two sides of the formula are 2-morphisms with the same source and target.
(2) The reason the lemma holds is that composition in the category fibred in groupoids $[U/_pR]$ associated to the presheaf in groupoids (52.19.0.1) comes from the composition law $c : R \times_{s,U,t} R \to R$.

We omit the proof of the lemma. □

Note that, in the situation of the lemma, we actually have the equalities $s \circ \mathrm{pr}_1 = s \circ c$, $t \circ \mathrm{pr}_1 = s \circ \mathrm{pr}_0$, and $t \circ \mathrm{pr}_0 = t \circ c$ before composing with π. Hence the formula in the lemma below makes sense in exactly the same way that the formula in the lemma above makes sense.

Lemma 52.22.2. *Assumptions and notation as in Lemmas 52.19.2 and 52.19.3. The* 2*-commutative diagram of Lemma 52.19.3 is a* 2*-coequalizer in the following sense: Given*

(1) *a stack in groupoids $\mathcal{X}$ over $(Sch/S)_{fppf}$,*
(2) *a* 1*-morphism $f : \mathcal{S}_U \to \mathcal{X}$, and*
(3) *a* 2*-arrow $\beta : f \circ s \to f \circ t$*

such that

$$\beta \star id_c = (\beta \star id_{pr_0}) \circ (\beta \star id_{pr_1})$$

then there exists a 1*-morphism $[U/R] \to \mathcal{X}$ which makes the diagram*

$$\begin{tikzcd} \mathcal{S}_R \arrow[r, "s"'] \arrow[d, "t"] & \mathcal{S}_U \arrow[d] \arrow[ddr, "f"] & \\ \mathcal{S}_U \arrow[r] \arrow[drr, "f"'] & {[U/R]} \arrow[dr] & \\ & & \mathcal{X} \end{tikzcd}$$

2*-commute.*

Proof. Suppose given $\mathcal{X}$, f and β as in the lemma. By Stacks, Lemma 50.9.2 it suffices to construct a 1-morphism $g : [U/_pR] \to \mathcal{X}$. First we note that the 1-morphism $\mathcal{S}_U \to [U/_pR]$ is bijective on objects. Hence on objects we can set $g(x) = f(x)$ for $x \in Ob(\mathcal{S}_U) = Ob([U/_pR])$. A morphism $\varphi : x \to y$ of $[U/_pR]$ arises from a commutative diagram

$$\begin{tikzcd} S_2 \arrow[r, "x"'] \arrow[dr, "\varphi"'] \arrow[dd, "h"'] & U \\ & R \arrow[u, "s"'] \arrow[d, "t"] \\ S_1 \arrow[r, "y"] & U. \end{tikzcd}$$

Thus we can set $g(\varphi)$ equal to the composition

$$
\begin{tikzcd}
f(x) \arrow[r, equal] \arrow[rrrrrd] & f(s \circ \varphi) \arrow[r, equal] & (f \circ s)(\varphi) \arrow[r, "\beta"] & (f \circ t)(\varphi) \arrow[r, equal] & f(\varphi \circ t) \arrow[r, equal] & f(y \circ h) \arrow[d] \\
 & & & & & f(y).
\end{tikzcd}
$$

The vertical arrow is the result of applying the functor f to the canonical morphism $y \circ h \to y$ in $\mathcal{S}_U$ (namely, the strongly cartesian morphism lifting h with target y). Let us verify that f so defined is compatible with composition, at least on fibre categories. So let S' be a scheme over S, and let $a : S' \to R \times_{s,U,t} R$ be a morphism. In this situation we set $x = s \circ \mathrm{pr}_1 \circ a = s \circ c \circ a$, $y = t \circ \mathrm{pr}_1 \circ a = s \circ \mathrm{pr}_0 \circ a$, and $z = t \circ \mathrm{pr}_0 \circ a = t \circ \mathrm{pr}_0 \circ c$ to get a commutative diagram

$$
\begin{tikzcd}
x \arrow[rr, "c \circ a"] \arrow[rd, "\mathrm{pr}_1 \circ a"'] & & z \\
 & y \arrow[ru, "\mathrm{pr}_0 \circ a"'] &
\end{tikzcd}
$$

in the fibre category $[U/_pR]_{S'}$. Moreover, any commutative triangle in this fibre category has this form. Then we see by our definitions above that f maps this to a commutative diagram if and only if the diagram

$$
\begin{tikzcd}
 & (f \circ s)(c \circ a) \arrow[r, "\beta"] & (f \circ t)(c \circ a) \arrow[rd, equal] & \\
(f \circ s)(\mathrm{pr}_1 \circ a) \arrow[ru, equal] \arrow[rd, "\beta"] & & & (f \circ t)(\mathrm{pr}_0 \circ a) \\
 & (f \circ t)(\mathrm{pr}_1 \circ a) \arrow[r, equal] & (f \circ s)(\mathrm{pr}_0 \circ a) \arrow[ru, "\beta"] &
\end{tikzcd}
$$

is commutative which is exactly the condition expressed by the formula in the lemma. We omit the verification that f maps identities to idenities and is compatible with composition for arbitrary morphisms. □

52.23. Explicit description of quotient stacks

In order to formulate the result we need to introduce some notation. Assume $B \to S$ and (U, R, s, t, c) are as in Definition 52.19.1 (1). Let T be a scheme over S. Let $\mathcal{T} = \{T_i \to T\}_{i \in I}$ be an fppf covering. A $[U/R]$-*descent datum* relative to $\mathcal{T}$ is given by a system (u_i, r_{ij}) where

(1) for each i a morphism $u_i : T_i \to U$, and
(2) for each i, j a morphism $r_{ij} : T_i \times_T T_j \to R$

such that

(a) as morphisms $T_i \times_T T_j \to U$ we have
$$s \circ r_{ij} = u_i \circ \mathrm{pr}_0 \quad \text{and} \quad t \circ r_{ij} = u_j \circ \mathrm{pr}_1,$$
(b) as morphisms $T_i \times_T T_j \times_T T_k \to R$ we have
$$c \circ (r_{jk} \circ \mathrm{pr}_{12}, r_{ij} \circ \mathrm{pr}_{01}) = r_{ik} \circ \mathrm{pr}_{02}.$$

A *morphism* $(u_i, r_{ij}) \to (u'_i, r'_{ij})$ *between two* $[U/R]$-*descent data* over the same covering $\mathcal{T}$ is a collection $(r_i : T_i \to R)$ such that

(α) as morphisms $T_i \to U$ we have

$$u_i = s \circ r_i \quad \text{and} \quad u'_i = t \circ r_i$$

(β) as morphisms $T_i \times_T T_j \to R$ we have

$$c \circ (r'_{ij}, r_i \circ \text{pr}_0) = c \circ (r_j \circ \text{pr}_1, r_{ij}).$$

There is a natural composition law on morphisms of descent data relative to a fixed covering and we obtain a category of descent data. This category is a groupoid. Finally, if $\mathcal{T}' = \{T'_j \to T\}_{j \in J}$ is a second fppf covering which refines $\mathcal{T}$ then there is a notion of pullback of descent data. This is particularly easy to describe explicitly in this case. Namely, if $\alpha : J \to I$ and $\varphi_j : T'_j \to T_{\alpha(i)}$ is the morphism of coverings, then the pullback of the descent datum $(u_i, r_{ii'})$ is simply

$$(u_{\alpha(i)} \circ \varphi_j, r_{\alpha(j)\alpha(j')} \circ \varphi_j \times \varphi_{j'}).$$

Pullback defined in this manner defines a functor from the category of descent data over $\mathcal{T}$ to the category of descend data over $\mathcal{T}'$.

Lemma 52.23.1. *Assume $B \to S$ and (U, R, s, t, c) are as in Definition 52.19.1 (1). Let $\pi : \mathcal{S}_U \to [U/R]$ be as in Lemma 52.19.2. Let T be a scheme over S.*

1. *for every object x of the fibre category $[U/R]_T$ there exists an fppf covering $\{f_i : T_i \to T\}_{i \in I}$ such that $f_i^* x \cong \pi(u_i)$ for some $u_i \in U(T_i)$,*
2. *the composition of the isomorphisms*
$$\pi(u_i \circ pr_0) = pr_0^* \pi(u_i) \cong pr_0^* f_i^* x \cong pr_1^* f_j^* x \cong pr_1^* \pi(u_j) = \pi(u_j \circ pr_1)$$
are of the form $\pi(r_{ij})$ for certain morphisms $r_{ij} : T_i \times_T T_j \to R$,
3. *the system (u_i, r_{ij}) forms a $[U/R]$-descent datum as defined above,*
4. *any $[U/R]$-descent datum (u_i, r_{ij}) arises in this manner,*
5. *if x corresponds to (u_i, r_{ij}) as above, and $y \in Ob([U/R]_T)$ corresponds to (u'_i, r'_{ij}) then there is a canonical bijection*
$$Mor_{[U/R]_T}(x, y) \longleftrightarrow \left\{ \begin{matrix} \textit{morphisms } (u_i, r_{ij}) \to (u'_i, r'_{ij}) \\ \textit{of } [U/R]\textit{-descent data} \end{matrix} \right\}$$
6. *this correspondence is compatible with refinements of fppf coverings.*

Proof. Statement (1) is part of the construction of the stackyfication. Part (2) follows from Lemma 52.21.1. We omit the verification of (3). Part (4) is a translation of the fact that in a stack all descent data are effective. We omit the verifications of (5) and (6). $\square$

52.24. Restriction and quotient stacks

In this section we study what happens to the quotient stack when taking a restriction.

Lemma 52.24.1. *Notation and assumption as in Lemma 52.20.1. The morphism of quotient stacks*

$$[f] : [U/R] \longrightarrow [U'/R']$$

is fully faithful if and only if R is the restriction of R via the morphism $f : U \to U'$.

Proof. Let x, y be objects of $[U/R]$ over a scheme T/S. Let x', y' be the images of x, y in the category $[U'/' R]_T$. The functor $[f]$ is fully faithful if and only if the map of sheaves

$$Isom(x, y) \longrightarrow Isom(x', y')$$

is an isomorphism for every T, x, y. We may test this locally on T (in the fppf topology). Hence, by Lemma 52.23.1 we may assume that x, y come from $a, b \in U(T)$. In that case we see that x', y' correspond to $f \circ a, f \circ b$. By Lemma 52.21.1 the displayed map of sheaves in this case becomes

$$T \times_{(a,b), U \times_B U} R \longrightarrow T \times_{f \circ a, f \circ b, U' \times_B U'} R'.$$

This is an isomorphism if R is the restriction, because in that case $R = (U \times_B U) \times_{U' \times_B U'} R'$, see Lemma 52.16.3 and its proof. Conversely, if the last displayed map is an isomorphism for all T, a, b, then it follows that $R = (U \times_B U) \times_{U' \times_B U'} R'$, i.e., R is the restriction of R'. $\square$

Lemma 52.24.2. *Notation and assumption as in Lemma 52.20.1. The morphism of quotient stacks*

$$[f] : [U/R] \longrightarrow [U'/R']$$

is an equivalence if and only if

(1) *(U, R, s, t, c) is the restriction of (U', R', s', t', c') via $f : U \to U'$, and*
(2) *the map*

$$\begin{tikzcd} U \times_{f, U', t'} R' \arrow[r, "pr_1"'] \arrow[rr, bend left, "h"] & R' \arrow[r, "s'"'] & U' \end{tikzcd}$$

is a surjection of sheaves.

Part (2) holds for example if $\{h : U \times_{f, U', t'} R' \to U'\}$ is an fppf covering, or if $f : U \to U'$ is a surjection of sheaves, or if $\{f : U \to U'\}$ is an fppf covering.

Proof. We already know that part (1) is equivalent to fully faithfulness by Lemma 52.24.1. Hence we may assume that (1) holds and that $[f]$ is fully faithful. Our goal is to show, under these assumptions, that $[f]$ is an equivalence if and only if (2) holds. We may use Stacks, Lemma 50.4.8 which characterizes equivalences.

Assume (2). We will use Stacks, Lemma 50.4.8 to prove $[f]$ is an equivalence. Suppose that T is a scheme and $x' \in Ob([U'/R']_T)$. There exists a covering $\{g_i : T_i \to T\}$ such that $g_i^* x'$ is the image of some element $a_i' \in U'(T_i)$, see Lemma 52.23.1. Hence we may assume that x' is the image of $a' \in U'(T)$. By the assumption that h is a surjection of sheaves, we can find an fppf covering $\{\varphi_i : T_i \to T\}$ and morphisms $b_i : T_i \to U \times_{g, U', t'} R'$ such that $a' \circ \varphi_i = h \circ b_i$. Denote $a_i = \mathrm{pr}_0 \circ b_i : T_i \to U$. Then we see that $a_i \in U(T_i)$ maps to $f \circ a_i \in U'(T_i)$ and that $f \circ a_i \cong_{T_i} h \circ b_i = a' \circ \varphi_i$, where $\cong_{T_i}$ denotes isomorphism in the fibre category $[U'/R']_{T_i}$. Namely, the element of $R'(T_i)$ giving the isomorphism is $\mathrm{pr}_1 \circ b_i$. This means that the restriction of x to T_i is in the essential image of the functor $[U/R]_{T_i} \to [U'/R']_{T_i}$ as desired.

Assume $[f]$ is an equivalence. Let $\xi' \in [U'/R']_{U'}$ denote the object corresponding to the identity morphism of U'. Applying Stacks, Lemma 50.4.8 we see there exists an fppf covering $\mathcal{U}' = \{g_i' : U_i' \to U'\}$ such that $(g_i')^* \xi' \cong [f](\xi_i)$ for some ξ_i in $[U/R]_{U_i'}$. After refining the covering $\mathcal{U}'$ (using Lemma 52.23.1) we may assume ξ_i comes from a morphism $a_i : U_i' \to U$. The fact that $[f](\xi_i) \cong (g_i')^* \xi'$ means that, after possibly refining the covering $\mathcal{U}'$ once more, there exist morphisms $r_i' : U_i' \to R'$ with $t' \circ r_i' = f \circ a_i$ and $s' \circ r_i' = \mathrm{id}_{U'} \circ g_i'$. Picture

$$\begin{tikzcd} U \arrow[d, "f"] & & U_i' \arrow[ll, "a_i"'] \arrow[dl, "r_i'"'] \arrow[d, "g_i'"] \\ U' & R' \arrow[l, "t'"'] \arrow[r, "s'"] & U' \end{tikzcd}$$

Thus $(a_i, r'_i) : U'_i \to U \times_{g,U',t'} R'$ are morphisms such that $h \circ (a_i, r'_i) = g'_i$ and we conclude that $\{h : U \times_{g,U',t'} R' \to U'\}$ can be refined by the fppf covering $\mathcal{U}'$ which means that h induces a surjection of sheaves, see Topologies on Spaces, Lemma 44.4.4.

If $\{h\}$ is an fppf covering, then it induces a surjection of sheaves, see Topologies on Spaces, Lemma 44.4.4. If $U' \to U$ is surjective, then also h is surjective as s has a section (namely the neutral element e of the groupoid in algebraic spaces). $\square$

Lemma 52.24.3. *Notation and assumption as in Lemma 52.20.1. Assume that*

$$\begin{tikzcd} R \arrow[r, "f"'] \arrow[d, "s"'] & R' \arrow[d, "s'"] \\ U \arrow[r, "f"] & U' \end{tikzcd}$$

is cartesian. Then

$$\begin{tikzcd} \mathcal{S}_U \arrow[r] \arrow[d] & {[U/R]} \arrow[d, "{[f]}"] \\ \mathcal{S}_{U'} \arrow[r] & {[U'/R']} \end{tikzcd}$$

is a 2*-fibre product square.*

Proof. Applying the inverse isomorphisms $i : R \to R$ and $i' : R' \to R'$ to the (first) cartesian diagram of the statement of the lemma we see that

$$\begin{tikzcd} R \arrow[r, "f"'] \arrow[d, "t"'] & R' \arrow[d, "t'"] \\ U \arrow[r, "f"] & U' \end{tikzcd}$$

is cartesian as well. By Lemma 52.20.2 we have a 2-fibre square

$$\begin{tikzcd} {[U''/R'']} \arrow[r] \arrow[d] & {[U/R]} \arrow[d] \\ \mathcal{S}_{U'} \arrow[r] & {[U'/R']} \end{tikzcd}$$

where $U'' = U \times_{f,U',t'} R'$ and $R'' = R \times_{f \circ s,U',t'} R'$. By the above we see that $(t, f) : R \to U''$ is an isomorphism, and that

$$R'' = R \times_{f \circ s,U',t'} R' = R \times_{s,U} U \times_{f,U',t'} R' = R \times_{s,U,t} \times R.$$

Explicitly the isomorphism $R \times_{s,U,t} R \to R''$ is given by the rule $(r_0, r_1) \mapsto (r_0, f(r_1))$. Moreover, s'', t'', c'' translate into the maps

$$R \times_{s,U,t} R \to R, \quad s''(r_0, r_1) = r_1, \quad t''(r_0, r_1) = c(r_0, r_1)$$

and

$$\begin{array}{rccc} c'' : & (R \times_{s,U,t} R) \times_{s'',R,t''} (R \times_{s,U,t} R) & \longrightarrow & R \times_{s,U,t} R, \\ & ((r_0, r_1), (r_2, r_3)) & \longmapsto & (c(r_0, r_2), r_3). \end{array}$$

Precomposing with the isomorphism

$$R \times_{s,U,s} R \longrightarrow R \times_{s,U,t} R, \quad (r_0, r_1) \longmapsto (c(r_0, i(r_1)), r_1)$$

we see that t'' and s'' turn into pr_0 and pr_1 and that c'' turns into $\mathrm{pr}_{02} : R \times_{s,U,s} R \times_{s,U,s} R \to R \times_{s,U,s} R$. Hence we see that there is an isomorphism $[U''/R''] \cong [R/R \times_{s,U,s} R]$ where as a groupoid in algebraic spaces $(R, R \times_{s,U,s} R, s'', t'', c'')$ is the restriction of the trivial groupoid $(U, U, \mathrm{id}, \mathrm{id}, \mathrm{id})$ via $s : R \to U$. Since $s : R \to U$ is a surjection of fppf sheaves (as it has a right inverse) the morphism

$$[U''/R''] \cong [R/R \times_{s,U,s} R] \longrightarrow [U/U] = \mathcal{S}_U$$

is an equivalence by Lemma 52.24.2. This proves the lemma. □

52.25. Inertia and quotient stacks

The (relative) inertia stack of a stack in groupoids is defined in Stacks, Section 50.7. The actual construction, in the setting of fibred categories, and some of its properties is in Categories, Section 4.31.

Lemma 52.25.1. *Assume $B \to S$ and (U, R, s, t, c) as in Definition 52.19.1 (1). Let G/U be the stabilizer group algebraic space of the groupoid (U, R, s, t, c, e, i), see Definition 52.15.2. Set $R' = R \times_{s,U} G$ and set*

(1) $s' : R' \to G$, $(r, g) \mapsto g$,
(2) $t' : R' \to G$, $(r, g) \mapsto c(r, c(g, i(r)))$,
(3) $c' : R' \times_{s',G,t'} R' \to R'$, $((r_1, g_1), (r_2, g_2)) \mapsto (c(r_1, r_2), g_1)$.

Then (G, R', s', t', c') is a groupoid in algebraic spaces over B and

$$\mathcal{I}_{[U/R]} = [G/R'].$$

i.e., the associated quotient stack is the inertia stack of $[U/R]$.

Proof. By Stacks, Lemma 50.8.5 it suffices to prove that $\mathcal{I}_{[U/_pR]} = [G/_pR']$. Let T be a scheme over S. Recall that an object of the inertia fibred category of $[U/_pR]$ over T is given by a pair (x, g) where x is an object of $[U/_pR]$ over T and g is an automorphism of x in its fibre category over T. In other words, $x : T \to U$ and $g : T \to R$ such that $x = s \circ g = t \circ g$. This means exactly that $g : T \to G$. A morphism in the inertia fibred category from $(x, g) \to (y, h)$ over T is given by $r : T \to R$ such that $s(r) = x$, $t(r) = y$ and $c(r, g) = c(h, r)$, see the commutative diagram in Categories, Lemma 4.31.1. In a formula

$$h = c(r, c(g, i(r))) = c(c(r, g), i(r)).$$

The notation $s(r)$, etc is a short hand for $s \circ r$, etc. The composition of $r_1 : (x_2, g_2) \to (x_1, g_1)$ and $r_2 : (x_1, g_1) \to (x_2, g_2)$ is $c(r_1, r_2) : (x_1, g_1) \to (x_3, g_3)$.

Note that in the above we could have written g in stead of (x, g) for an object of $\mathcal{I}_{[U/_pR]}$ over T as x is the image of g under the structure morphism $G \to U$. Then the morphisms $g \to h$ in $\mathcal{I}_{[U/_pR]}$ over T correspond exactly to morphisms $r' : T \to R'$ with $s'(r') = g$ and $t'(r') = h$. Moreover, the composition corresponds to the rule explained in (3). Thus the lemma is proved. □

Lemma 52.25.2. *Assume $B \to S$ and (U, R, s, t, c) as in Definition 52.19.1 (1). Let G/U be the stabilizer group algebraic space of the groupoid (U, R, s, t, c, e, i), see Definition 52.15.2. There is a canonical 2-cartesian diagram*

$$\begin{tikzcd} \mathcal{S}_G \arrow[r] \arrow[d] & \mathcal{S}_U \arrow[d] \\ \mathcal{I}_{[U/R]} \arrow[r] & [U/R] \end{tikzcd}$$

of stacks in groupoids of $(Sch/S)_{fppf}$.

Proof. By Lemma 52.24.3 it suffices to prove that the morphism $s' : R' \to G$ of Lemma 52.25.1 isomorphic to the base change of s by the structure morphism $G \to U$. This base change property is clear from the construction of s'. □

52.26. Gerbes and quotient stacks

In this section we relate quotient stacks to the discussion Stacks, Section 50.11 and especially gerbes as defined in Stacks, Definition 50.11.4. The stacks in groupoids occuring in this section are generally speaking not algebraic stacks!

Lemma 52.26.1. *Notation and assumption as in Lemma 52.20.1. The morphism of quotient stacks*

$$[f] : [U/R] \longrightarrow [U'/R']$$

turns $[U/R]$ into a gerbe over $[U'/R']$ if $f : U \to U'$ and $R \to R'|_U$ are surjective maps of fppf sheaves. Here $R'|_U$ is the restriction of R' to U via $f : U \to U'$.

Proof. We will verify that Stacks, Lemma 50.11.3 properties (2) (a) and (2) (b) hold. Property (2)(a) holds because $U \to U'$ is a surjective map of sheaves (use Lemma 52.23.1 to see that objects in $[U'/R']$ locally come from U'). To prove (2)(b) let x, y be objects of $[U/R]$ over a scheme T/S. Let x', y' be the images of x, y in the category $[U'/'R]_T$. Condition (2)(b) requires us to check the map of sheaves

$$Isom(x, y) \longrightarrow Isom(x', y')$$

on $(Sch/T)_{fppf}$ is surjective. To see this we may work fppf locally on T and assume that come from $a, b \in U(T)$. In that case we see that x', y' correspond to $f \circ a, f \circ b$. By Lemma 52.21.1 the displayed map of sheaves in this case becomes

$$T \times_{(a,b),U\times_B U} R \longrightarrow T \times_{f\circ a, f\circ b, U'\times_B U'} R' = T \times_{(a,b),U\times_B U} R'|_U.$$

Hence the assumption that $R \to R'|_U$ is a surjective map of fppf sheaves on $(Sch/S)_{fppf}$ implies the desired surjectivity. □

Lemma 52.26.2. *Let S be a scheme. Let B be an algebraic space over S. Let G be a group algebraic space over B. Endow B with the trivial action of G. The morphism*

$$[B/G] \longrightarrow \mathcal{S}_B$$

(Lemma 52.19.2) turns $[B/G]$ into a gerbe over B.

Proof. Immediate from Lemma 52.26.1 as the morphisms $B \to B$ and $B \times_B G \to B$ are surjective as morphisms of sheaves. □

52.27. Quotient stacks and change of big site

We suggest skipping this section on a first reading. Pullbacks of stacks are defined in Stacks, Section 50.12.

Lemma 52.27.1. *Suppose given big sites Sch_{fppf} and Sch'_{fppf}. Assume that Sch_{fppf} is contained in Sch'_{fppf}, see Topologies, Section 30.10. Let $S \in Ob(Sch_{fppf})$. Let $B, U, R \in Sh((Sch/S)_{fppf})$ be algebraic spaces, and let (U, R, s, t, c) be a groupoid in algebraic spaces over B. Let $f : (Sch'/S)_{fppf} \to (Sch/S)_{fppf}$ the morphism of sites corresponding to the inclusion functor $u : Sch_{fppf} \to Sch'_{fppf}$. Then we have a canonical equivalence*

$$[f^{-1}U/f^{-1}R] \longrightarrow f^{-1}[U/R]$$

of stacks in groupoids over $(Sch'/S)_{fppf}$.

Proof. Note that $f^{-1}B, f^{-1}U, f^{-1}R \in Sh((Sch'/S)_{fppf})$ are algebraic spaces by Spaces, Lemma 40.15.1 and hence $(f^{-1}U, f^{-1}R, f^{-1}s, f^{-1}t, f^{-1}c)$ is a groupoid in algebraic spaces over $f^{-1}B$. Thus the statement makes sense.

The category $u_p[U/_pR]$ is the localization of the category $u_{pp}[U/_pR]$ at right multiplicative system I of morphisms. An object of $u_{pp}[U/_pR]$ is a triple

$$(T', \phi : T' \to T, x)$$

where $T' \in Ob((Sch'/S)_{fppf})$, $T \in Ob((Sch/S)_{fppf})$, ϕ is a morphism of schemes over S, and $x : T \to U$ is a morphism of sheaves on $(Sch/S)_{fppf}$. Note that the morphism of schemes $\phi : T' \to T$ is the same thing as a morphism $\phi : T' \to u(T)$, and since $u(T)$ represents $f^{-1}T$ it is the same thing as a morphism $T' \to f^{-1}T$. Moreover, as f^{-1} on algebraic spaces is fully faithful, see Spaces, Lemma 40.15.2, we may think of x as a morphism $x : f^{-1}T \to f^{-1}U$ as well. From now on we will make such identifications without further mention. A morphism

$$(a, a', \alpha) : (T'_1, \phi_1 : T'_1 \to T_1, x_1) \longrightarrow (T'_2, \phi_2 : T'_2 \to T_2, x_2)$$

of $u_{pp}[U/_pR]$ is a commutative diagram

$$\begin{tikzcd} & & U \\ T'_1 \arrow[r, "\phi_1"'] \arrow[d, "a'"'] & T_1 \arrow[r, "\alpha"'] \arrow[d, "a"'] \arrow[ru, "x_1"] & R \arrow[u, "s"'] \arrow[d, "t"] \\ T'_2 \arrow[r, "\phi_2"] & T_2 \arrow[r, "x_2"] & U \end{tikzcd}$$

and such a morphism is an element of I if and only if $T'_1 = T'_2$ and $a' = \text{id}$. We define a functor

$$u_{pp}[U/_pR] \longrightarrow [f^{-1}U/_pf^{-1}R]$$

by the rules

$$(T', \phi : T' \to T, x) \longmapsto (x \circ \phi : T' \to f^{-1}U)$$

on objects and

$$(a, a', \alpha) \longmapsto (\alpha \circ \phi_1 : T'_1 \to f^{-1}R)$$

on morphisms as above. It is clear that elements of I are transformed into isomorphisms as $(f^{-1}U, f^{-1}R, f^{-1}s, f^{-1}t, f^{-1}c)$ is a groupoid in algebraic spaces over $f^{-1}B$. Hence this functor factors in a canonical way through a functor

$$u_p[U/_pR] \longrightarrow [f^{-1}U/_pf^{-1}R]$$

Applying stackification we obtain a functor of stacks

$$f^{-1}[U/R] \longrightarrow [f^{-1}U/f^{-1}R]$$

over $(Sch'/S)_{fppf}$, as by Stacks, Lemma 50.12.11 the stack $f^{-1}[U/R]$ is the stackification of $u_p[U/_pR]$.

At this point we have a morphism of stacks, and to verify that it is an equivalence it suffices to show that it is fully faithful and that objects are locally in the essential image, see Stacks, Lemmas 50.4.7 and 50.4.8. The statement on objects holds as $f^{-1}R$ admits a surjective étale morphism $f^{-1}W \to f^{-1}R$ for some object W of $(Sch/S)_{fppf}$. To show that the functor is ``full'', it suffices to show that morphisms are locally in the image of the functor which holds as $f^{-1}U$ admits a surjective étale morphism $f^{-1}W \to f^{-1}U$ for some object W of $(Sch/S)_{fppf}$. We omit the proof that the functor is faithful. $\square$

52.28. Separation conditions

This really means conditions on the morphism $j : R \to U \times_B U$ when given a groupoid in algebraic spaces (U, R, s, t, c) over B. As in the previous section we first formulate the corresponding diagram.

Lemma 52.28.1. *Let $B \to S$ be as in Section 52.3. Let (U, R, s, t, c) be a groupoid in algebraic spaces over B. Let $G \to U$ be the stabilizer group algebraic space. The commutative diagram*

$$\begin{tikzcd} R \arrow[r, "f \mapsto (f, s(f))"'] \arrow[d, "\Delta_{R/U\times_B U}"] & R \times_{s,U} U \arrow[r] \arrow[d] & U \arrow[d] \\ R \times_{(U \times_B U)} R \arrow[r, "(f,g) \mapsto (f, f^{-1} \circ g)"] & R \times_{s,U} G \arrow[r] & G \end{tikzcd}$$

the two left horizontal arrows are isomorphisms and the right square is a fibre product square.

Proof. Omitted. Exercise in the definitions and the functorial point of view in algebraic geometry. $\square$

Lemma 52.28.2. *Let $B \to S$ be as in Section 52.3. Let (U, R, s, t, c) be a groupoid in algebraic spaces over B. Let $G \to U$ be the stabilizer group algebraic space.*

(1) *The following are equivalent*
   (a) *$j : R \to U \times_B U$ is separated,*
   (b) *$G \to U$ is separated, and*
   (c) *$e : U \to G$ is a closed immersion.*
(2) *The following are equivalent*
   (a) *$j : R \to U \times_B U$ is locally separated,*
   (b) *$G \to U$ is locally separated, and*
   (c) *$e : U \to G$ is an immersion.*
(3) *The following are equivalent*
   (a) *$j : R \to U \times_B U$ is quasi-separated,*
   (b) *$G \to U$ is quasi-separated, and*
   (c) *$e : U \to G$ is quasi-compact.*

Proof. The group algebraic space $G \to U$ is the base change of $R \to U \times_B U$ by the diagonal morphism $U \to U \times_B U$, see Lemma 52.15.1. Hence if j is separated (resp. locally separated, resp. quasi-separated), then $G \to U$ is separated (resp. locally separated, resp. quasi-separated). See Morphisms of Spaces, Lemma 42.5.4. Thus (a) $\Rightarrow$ (b) in (1), (2), and (3).

Conversely, if $G \to U$ is separated (resp. locally separated, resp. quasi-separated), then the morphism $e : U \to G$, as a section of the structure morphism $G \to U$ is a closed immersion (resp. an immersion, resp. quasi-compact), see Morphisms of Spaces, Lemma 42.5.7. Thus (b) $\Rightarrow$ (c) in (1), (2), and (3).

If e is a closed immersion (resp. an immersion, resp. quasi-compact) then by the result of Lemma 52.28.1 (and Spaces, Lemma 40.12.3, and Morphisms of Spaces, Lemma 42.9.3) we see that $\Delta_{R/U\times_B U}$ is a closed immersion (resp. an immerion, resp. quasi-compact). Thus (c) $\Rightarrow$ (a) in (1), (2), and (3). $\square$

CHAPTER 53

More on Groupoids in Spaces

53.1. Introduction

This chapter is devoted to advanced topics on groupoids in algebraic spaces. Even though the results are stated in terms of groupoids in algebraic spaces, the reader should keep in mind the 2-cartesian diagram

(53.1.0.1)
$$\begin{tikzcd} R \arrow[r] \arrow[d] & U \arrow[d] \\ U \arrow[r] & {[U/R]} \end{tikzcd}$$

where $[U/R]$ is the quotient stack, see Groupoids in Spaces, Remark 52.19.4. Many of the results are motivated by thinking about this diagram. See for example the beautiful paper [**KM97a**] by Keel and Mori.

53.2. Notation

We continue to abide by the conventions and notation introduced in Groupoids in Spaces, Section 52.3.

53.3. Useful diagrams

We briefly restate the results of Groupoids in Spaces, Lemmas 52.11.4 and 52.11.5 for easy reference in this chapter. Let S be a scheme. Let B be an algebraic space over S. Let (U, R, s, t, c) be a groupoid in algebraic spaces over B. In the commutative diagram

(53.3.0.2)
$$\begin{tikzcd} & U & \\ R \arrow[ur, "t"] \arrow[d, "s"'] & R \times_{s,U,t} R \arrow[l, "\mathrm{pr}_0"'] \arrow[r, "c"] \arrow[d, "\mathrm{pr}_1"] & R \arrow[ul, "t"'] \arrow[d, "s"] \\ U & R \arrow[l, "t"'] \arrow[r, "s"] & U \end{tikzcd}$$

the two lower squares are fibre product squares. Moreover, the triangle on top (which is really a square) is also cartesian.

The diagram

$$
\begin{tikzcd}
R \times_{t,U,t} R \arrow[r, shift left, "\mathrm{pr}_1"] \arrow[r, shift right, "\mathrm{pr}_0"'] \arrow[d, "\mathrm{pr}_0 \times c \circ (i,1)"'] & R \arrow[r, "t"] \arrow[d, "\mathrm{id}_R"] & U \arrow[d, "\mathrm{id}_U"] \\
R \times_{s,U,t} R \arrow[r, shift left, "c"] \arrow[r, shift right, "\mathrm{pr}_0"'] \arrow[d, "\mathrm{pr}_1"'] & R \arrow[r, "t"] \arrow[d, "s"] & U \\
R \arrow[r, shift left, "s"] \arrow[r, shift right, "t"'] & U &
\end{tikzcd}
\tag{53.3.0.3}
$$

is commutative. The two top rows are isomorphic via the vertical maps given. The two lower left squares are cartesian.

53.4. Properties of groupoids

This section is the analogue of More on Groupoids, Section 36.5. The reader is strongly encouraged to read that section first.

The following lemma is the analogue of More on Groupoids, Lemma 36.5.4.

Lemma 53.4.1. *Let $B \to S$ be as in Section 53.2. Let (U, R, s, t, c) be a groupoid in algebraic spaces over B. Let $\tau \in \{fppf, étale, smooth, syntomic\}$. Let $\mathcal{P}$ be a property of morphisms of algebraic spaces which is τ-local on the target (Descent on Spaces, Definition 45.9.1). Assume $\{s : R \to U\}$ and $\{t : R \to U\}$ are coverings for the τ-topology. Let $W \subset U$ be the maximal open subspace such that $s^{-1}(W) \to W$ has property $\mathcal{P}$. Then W is R-invariant (Groupoids in Spaces, Definition 52.17.1).*

Proof. The existence and properties of the open $W \subset U$ are described in Descent on Spaces, Lemma 45.9.3. In Diagram (53.3.0.2) let $W_1 \subset R$ be the maximal open subscheme over which the morphism $\mathrm{pr}_1 : R \times_{s,U,t} R \to R$ has property $\mathcal{P}$. It follows from the aforementioned Descent on Spaces, Lemma 45.9.3 and the assumption that $\{s : R \to U\}$ and $\{t : R \to U\}$ are coverings for the τ-topology that $t^{-1}(W) = W_1 = s^{-1}(W)$ as desired. $\square$

Lemma 53.4.2. *Let $B \to S$ be as in Section 53.2. Let (U, R, s, t, c) be a groupoid in algebraic spaces over B. Let $G \to U$ be its stabilizer group algebraic space. Let $\tau \in \{fppf, étale, smooth, syntomic\}$. Let $\mathcal{P}$ be a property of morphisms of algebraic spaces which is τ-local on the target. Assume $\{s : R \to U\}$ and $\{t : R \to U\}$ are coverings for the τ-topology. Let $W \subset U$ be the maximal open subspace such that $G_W \to W$ has property $\mathcal{P}$. Then W is R-invariant (see Groupoids in Spaces, Definition 52.17.1).*

Proof. The existence and properties of the open $W \subset U$ are described in Descent on Spaces, Lemma 45.9.3. The morphism

$$G \times_{U,t} R \longrightarrow R \times_{s,U} G, \quad (g, r) \longmapsto (r, r^{-1} \circ g \circ r)$$

is an isomorphism of algebraic spaces over R (where $\circ$ denotes composition in the groupoid). Hence $s^{-1}(W) = t^{-1}(W)$ by the properties of W proved in the aforementioned Descent on Spaces, Lemma 45.9.3. $\square$

53.5. Comparing fibres

This section is the analogue of More on Groupoids, Section 36.6. The reader is strongly encouraged to read that section first.

Lemma 53.5.1. *Let $B \to S$ be as in Section 53.2. Let (U, R, s, t, c) be a groupoid in algebraic spaces over B. Let K be a field and let $r, r' : Spec(K) \to R$ be morphisms such that $t \circ r = t \circ r' : Spec(K) \to U$. Set $u = s \circ r$, $u' = s \circ r'$ and denote $F_u = Spec(K) \times_{u,U,s} R$ and $F_{u'} = Spec(K) \times_{u',U,s} R$ the fibre products. Then $F_u \cong F_{u'}$ as algebraic spaces over K.*

Proof. We use the properties and the existence of Diagram (53.3.0.2). There exists a morphism $\xi : Spec(K) \to R \times_{s,U,t} R$ with $\mathrm{pr}_0 \circ \xi = r$ and $c \circ \xi = r'$. Let $\tilde{r} = \mathrm{pr}_1 \circ \xi : Spec(K) \to R$. Then looking at the bottom two squares of Diagram (53.3.0.2) we see that both F_u and $F_{u'}$ are identified with the algebraic space $Spec(K) \times_{\tilde{r},R,\mathrm{pr}_1} (R \times_{s,U,t} R)$. □

Actually, in the situation of the lemma the morphisms of pairs $s : (R, r) \to (U, u)$ and $s : (R, r') \to (U, u')$ are locally isomorphic in the τ-topology, provided $\{s : R \to U\}$ is a τ-covering. We will insert a precise statement here if needed.

53.6. Restricting groupoids

In this section we collect a bunch of lemmas on properties of groupoids which are inherited by restrictions. Most of these lemmas can be proved by contemplating the defining diagram

$$\tag{53.6.0.1}
\begin{tikzcd}
R' \arrow[r] \arrow[d] \arrow[rr, bend left, "s'"] \arrow[dd, bend right, "t'"'] & R \times_{s,U} U' \arrow[r] \arrow[d] & U' \arrow[d, "g"] \\
U' \times_{U,t} R \arrow[r] \arrow[d] & R \arrow[r, "s"] \arrow[d, "t"] & U \\
U' \arrow[r, "g"] & U &
\end{tikzcd}$$

of a restriction. See Groupoids in Spaces, Lemma 52.16.1.

Lemma 53.6.1. *Let S be a scheme. Let B be an algebraic space over S. Let (U, R, s, t, c) be a groupoid in algebraic spaces over B. Let $g : U' \to U$ be a morphism of algebraic spaces over B. Let (U', R', s', t', c') be the restriction of (U, R, s, t, c) via g.*

1. *If s, t are locally of finite type and g is locally of finite type, then s', t' are locally of finite type.*
2. *If s, t are locally of finite presentation and g is locally of finite presentation, then s', t' are locally of finite presentation.*
3. *If s, t are flat and g is flat, then s', t' are flat.*
4. *Add more here.*

Proof. The property of being locally of finite type is stable under composition and arbitrary base change, see Morphisms of Spaces, Lemmas 42.22.2 and 42.22.3. Hence (1) is clear from Diagram (53.6.0.1). For the other cases, see Morphisms of Spaces, Lemmas 42.26.2, 42.26.3, 42.27.2, and 42.27.3. □

53.7. Properties of groups over fields and groupoids on fields

The reader is advised to first look at the corresponding sections for groupoid schemes, see Groupoids, Section 35.7 and More on Groupoids, Section 36.9.

Situation 53.7.1. Here S is a scheme, k is a field over S, and (G, m) is a group algebraic spaces over $Spec(k)$.

Situation 53.7.2. Here S is a scheme, B is an algebraic space, and (U, R, s, t, c) is a groupoid in algebraic spaces over B with $U = Spec(k)$ for some field k.

Note that in Situation 53.7.1 we obtain a groupoid in algebraic spaces

$$(Spec(k), G, p, p, m) \tag{53.7.2.1}$$

where $p : G \to Spec(k)$ is the structure morphism of G, see Groupoids in Spaces, Lemma 52.14.1. This is a situation as in Situation 53.7.2. We will use this without further mention in the rest of this section.

Lemma 53.7.3. *In Situation 53.7.2 the composition morphism $c : R \times_{s,U,t} R \to R$ is flat and universally open. In Situation 53.7.1 the group law $m : G \times_k G \to G$ is flat and universally open.*

Proof. The composition is isomorphic to the projection map $\text{pr}_1 : R \times_{t,U,t} R \to R$ by Diagram (53.3.0.3). The projection is flat as a base change of the flat morphism t and open by Morphisms of Spaces, Lemma 42.7.6. The second assertion follows immediately from the first because m matches c in (53.7.2.1). $\square$

Lemma 53.7.4. *In Situation 53.7.2. Let $k \subset k'$ be a field extension, $U' = Spec(k')$ and let (U', R', s', t', c') be the restriction of (U, R, s, t, c) via $U' \to U$. In the defining diagram*

$$\begin{tikzcd}
R' \arrow[r] \arrow[d] \arrow[dr, dotted] \arrow[rr, bend left, "s'"] \arrow[dd, bend right=60, "t'"'] & R \times_{s,U} U' \arrow[r] \arrow[d] & U' \arrow[d] \\
U' \times_{U,t} R \arrow[r] \arrow[d] & R \arrow[r, "s"] \arrow[d, "t"] & U \\
U' \arrow[r] & U &
\end{tikzcd}$$

all the morphisms are surjective, flat, and universally open. The dotted arrow $R' \to R$ is in addition affine.

Proof. The morphism $U' \to U$ equals $Spec(k') \to Spec(k)$, hence is affine, surjective and flat. The morphisms $s, t : R \to U$ and the morphism $U' \to U$ are universally open by Morphisms, Lemma 24.22.4. Since R is not empty and U is the spectrum of a field the morphisms $s, t : R \to U$ are surjective and flat. Then you conclude by using Morphisms of Spaces, Lemmas 42.6.5, 42.6.4, 42.7.4, 42.19.5, 42.19.4, 42.27.3, and 42.27.2. $\square$

Lemma 53.7.5. *In Situation 53.7.2. For any point $r \in |R|$ there exist*

1. *a field extension $k \subset k'$ with k' algebraically closed,*
2. *a point $r' : Spec(k') \to R'$ where (U', R', s', t', c') is the restriction of (U, R, s, t, c) via $Spec(k') \to Spec(k)$*

such that

(1) *the point r' maps to r under the morphism $R' \to R$, and*
(2) *the maps $s' \circ r', t' \circ r' : Spec(k') \to Spec(k')$ are automorphisms.*

Proof. Let's represent r by a morphism $r : Spec(K) \to R$ for some field K. To prove the lemma we have to find an algebraically closed field k' and a commutative diagram

$$\begin{tikzcd} k' & k' \arrow[l, "1"'] & \\ k' \arrow[u, "\tau"] & K \arrow[ul, "\sigma"] & k \arrow[l, "s"] \arrow[ul, "i"'] \\ & k \arrow[ul, "i"] \arrow[u, "t"'] & \end{tikzcd}$$

where $s, t : k \to K$ are the field maps coming from $s \circ r$ and $t \circ r$. In the proof of More on Groupoids, Lemma 36.9.5 it is shown how to construct such a diagram. $\square$

Lemma 53.7.6. *In Situation 53.7.2. If $r : Spec(k) \to R$ is a morphism such that $s \circ r, t \circ r$ are automorphisms of $Spec(k)$, then the map*

$$R \longrightarrow R, \quad x \longmapsto c(r, x)$$

is an automorphism $R \to R$ which maps e to r.

Proof. Proof is identical to the proof of More on Groupoids, Lemma 36.9.6. $\square$

Lemma 53.7.7. *In Situation 53.7.2 the algebraic space R is geometrically unibranch. In Situation 53.7.1 the algebraic space G is geometrically unibranch.*

Proof. Let $r \in |R|$. We have to show that R is geometrically unibranch at r. Combining Lemma 53.7.4 with Descent on Spaces, Lemma 45.8.1 we see that it suffices to prove this in case k is algebraically closed and r comes from a morphism $r : Spec(k) \to R$ such that $s \circ r$ and $t \circ r$ are automorphisms of $Spec(k)$. By Lemma 53.7.6 we reduce to the case that $r = e$ is the identity of R and k is algebraically closed.

Assume $r = e$ and k is algebraically closed. Let $A = \mathcal{O}_{R,e}$ be the étale local ring of R at e and let $C = \mathcal{O}_{R \times_{s,U,t} R,(e,e)}$ be the étale local ring of $R \times_{s,U,t} R$ at (e, e). By Spaces over Fields, Lemma 48.3.1 the minimal prime ideals $\mathfrak{q}$ of C correspond 1-to-1 to pairs of minimal primes $\mathfrak{p}, \mathfrak{p}' \subset A$. On the other hand, the composition law induces a flat ring map

$$\begin{tikzcd} A \arrow[r, "c^\sharp"'] & C & & \mathfrak{q} \\ & A \otimes_{s^\sharp,k,t^\sharp} A \arrow[u] & & \mathfrak{p} \otimes A + A \otimes \mathfrak{p}' \arrow[u, mapsto] \end{tikzcd}$$

Note that $(c^\sharp)^{-1}(\mathfrak{q})$ contains both $\mathfrak{p}$ and $\mathfrak{p}'$ as the diagrams

$$\begin{tikzcd} A \arrow[r, "c^\sharp"'] & C & A \arrow[r, "c^\sharp"'] & C \\ A \otimes_{s^\sharp,k} k \arrow[u] & A \otimes_{s^\sharp,k,t^\sharp} A \arrow[l, "1\otimes e^\sharp"'] \arrow[u] & k \otimes_{k,t^\sharp} A \arrow[u] & A \otimes_{s^\sharp,k,t^\sharp} A \arrow[l, "e^\sharp\otimes 1"'] \arrow[u] \end{tikzcd}$$

commute by (53.3.0.2). Since $c^\sharp$ is flat (as c is a flat morphism by Lemma 53.7.3), we see that $(c^\sharp)^{-1}(\mathfrak{q})$ is a minimal prime of A. Hence $\mathfrak{p} = (c^\sharp)^{-1}(\mathfrak{q}) = \mathfrak{p}'$. $\square$

In the following lemma we use dimension of algebraic spaces (at a point) as defined in Properties of Spaces, Section 41.8. We also use the dimension of the local ring defined in Properties of Spaces, Section 41.20 and transcendence degree of points, see Morphisms of Spaces, Section 42.30.

Lemma 53.7.8. *In Situation 53.7.2 assume s, t are locally of finite type. For all $r \in |R|$*

1. $\dim(R) = \dim_r(R)$,
2. *the transcendence degree of r over $Spec(k)$ via s equals the transcendence degree of r over $Spec(k)$ via t, and*
3. *if the transcendence degree mentioned in (2) is* 0, *then* $\dim(R) = \dim(\mathcal{O}_{R,\overline{r}})$.

Proof. Let $r \in |R|$. Denote $\text{trdeg}(r/_s k)$ the transcendence degree of r over $Spec(k)$ via s. Choose an étale morphism $\varphi : V \to R$ where V is a scheme and $v \in V$ mapping to r. Using the definitions mentioned above the lemma we see that

$$\dim_r(R) = \dim_v(V) = \dim(\mathcal{O}_{V,v}) + \text{trdeg}_{s(k)}(\kappa(v)) = \dim(\mathcal{O}_{R,\overline{r}}) + \text{trdeg}(r/_s k)$$

and similarly for t (the second equality by Morphisms, Lemma 24.27.1). Hence we see that $\text{trdeg}(r/_s k) = \text{trdeg}(r/_t k)$, i.e., (2) holds.

Let $k \subset k'$ be a field extension. Note that the restriction R' of R to $Spec(k')$ (see Lemma 53.7.4) is obtained from R by two base changes by morphisms of fields. Thus Morphisms of Spaces, Lemma 42.31.3 shows the dimension of R at a point is unchanged by this operation. Hence in order to prove (1) we may assume, by Lemma 53.7.5, that r is represented by a morphism $r : Spec(k) \to R$ such that both $s \circ r$ and $t \circ r$ are automorphisms of $Spec(k)$. In this case there exists an automorphism $R \to R$ which maps r to e (Lemma 53.7.6). Hence we see that $\dim_r(R) = \dim_e(R)$ for any r. By definition this means that $\dim_r(R) = \dim(R)$.

Part (3) is a formal consequence of the results obtained in the discussion above. □

Lemma 53.7.9. *In Situation 53.7.1 assume G locally of finite type. For all $g \in |G|$*

1. $\dim(G) = \dim_g(G)$,
2. *if the transcendence degree of g over k is* 0, *then* $\dim(G) = \dim(\mathcal{O}_{G,\overline{g}})$.

Proof. Immediate from Lemma 53.7.8 via (53.7.2.1). □

Lemma 53.7.10. *In Situation 53.7.2 assume s, t are locally of finite type. Let $G = Spec(k) \times_{\Delta, Spec(k) \times_B Spec(k), t \times s} R$ be the stabilizer group algebraic space. Then we have* $\dim(R) = \dim(G)$.

Proof. Since G and R are equidimensional (see Lemmas 53.7.8 and 53.7.9) it suffices to prove that $\dim_e(R) = \dim_e(G)$. Let V be an affine scheme, $v \in V$, and let $\varphi : V \to R$ be an étale morphism of schemes such that $\varphi(v) = e$. Note that V is a Noetherian scheme as $s \circ \varphi$ is locally of finite type as a composition of morphisms locally of finite type and as V is quasi-compact (use Morphisms of Spaces, Lemmas 42.22.2, 42.35.8, and 42.26.5 and Morphisms, Lemma 24.14.6). Hence V is locally connected (see Properties, Lemma 23.5.5 and Topology, Lemma 5.6.6). Thus we may replace V by the connected component containing v (it is still affine as it is an open and closed subscheme of V). Set $T = V_{red}$ equal to the reduction of V. Consider the two morphisms $a, b : T \to Spec(k)$ given by $a = s \circ \varphi|_T$ and $b = t \circ \varphi|_T$. Note that a, b induce the same field map $k \to \kappa(v)$ because $\varphi(v) = e$! Let $k_a \subset \Gamma(T, \mathcal{O}_T)$ be the integral closure of $a^\sharp(k) \subset \Gamma(T, \mathcal{O}_T)$. Similarly, let $k_b \subset \Gamma(T, \mathcal{O}_T)$ be the integral closure of $b^\sharp(k) \subset \Gamma(T, \mathcal{O}_T)$. By Varieties, Proposition 28.18.1 we see that

$k_a = k_b$. Thus we obtain the following commutative diagram

$$\begin{tikzcd} k \arrow[dr, "a"] \arrow[drrr] & & & \\ & k_a = k_b \arrow[r] & \Gamma(T, \mathcal{O}_T) \arrow[r] & \kappa(v) \\ k \arrow[ur, "b"] \arrow[urrr] & & & \end{tikzcd}$$

As discussed above the long arrows are equal. Since $k_a = k_b \to \kappa(v)$ is injective we conclude that the two morphisms a and b agree. Hence $T \to R$ factors through G. It follows that $R_{red} = G_{red}$ in an open neighbourhood of e which certainly implies that $\dim_e(R) = \dim_e(G)$. □

53.8. The finite part of a morphism

Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. For an algebraic space or a scheme T over S consider pairs (a, Z) where

$$(53.8.0.1) \quad \begin{array}{l} a : T \to Y \text{ is a morphism over } S, \\ Z \subset T \times_Y X \text{ is an open subspace such that } \mathrm{pr}_0|_Z : Z \to T \text{ is finite.} \end{array}$$

Suppose $h : T' \to T$ is a morphism of algebraic spaces over S and (a, Z) is a pair over T. Set $a' = a \circ h$ and $Z' = (h \times \mathrm{id}_X)^{-1}(Z) = T' \times_T Z$. Then the pair (a', Z') satisfies (1), (2) over T'. This follows as finite morphisms are preserved under base change, see Morphisms of Spaces, Lemma 42.37.5. Thus we obtain a functor

$$(53.8.0.2) \quad \begin{array}{cccc} (X/Y)_{fin} : & (Sch/S)^{opp} & \longrightarrow & Sets \\ & T & \longmapsto & \{(a, Z) \text{ as above}\} \end{array}$$

For applications we are mainly interested in this functor $(X/Y)_{fin}$ when f is separated and locally of finite type. To get an idea of what this is all about, take a look at Remark 53.8.6.

Lemma 53.8.1. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Then we have*

1. *The presheaf $(X/Y)_{fin}$ satisfies the sheaf condition for the fppf topology.*
2. *If T is an algebraic space over S, then there is a canonical bijection*

$$Mor_{Sh((Sch/S)_{fppf})}(T, (X/Y)_{fin}) = \{(a, Z) \text{ satisfying 53.8.0.1}\}$$

Proof. Let T be an algebraic space over S. Let $\{T_i \to T\}$ be an fppf covering (by algebraic spaces). Let $s_i = (a_i, Z_i)$ be pairs over T_i satisfying 53.8.0.1 such that we have $s_i|_{T_i \times_T T_j} = s_j|_{T_i \times_T T_j}$. First, this implies in particular that a_i and a_j define the same morphism $T_i \times_T T_j \to Y$. By Descent on Spaces, Lemma 45.6.2 we deduce that there exists a unique morphism $a : T \to Y$ such that a_i equals the composition $T_i \to T \to Y$. Second, this implies that $Z_i \subset T_i \times_Y X$ are open subspaces whose inverse images in $(T_i \times_T T_j) \times_Y X$ are equal. Since $\{T_i \times_Y X \to T \times_Y X\}$ is an fppf covering we deduce that there exists a unique open subspace $Z \subset T \times_Y X$ which restricts back to Z_i over T_i, see Descent on Spaces, Lemma 45.6.1. We claim that the projection $Z \to T$ is finite. This follows as being finite is local for the fpqc topology, see Descent on Spaces, Lemma 45.10.21.

Note that the result of the preceding paragraph in particular implies (1).

Let T be an algebraic space over S. In order to prove (2) we will construct mutually inverse maps between the displayed sets. In the following when we say ``pair'' we mean a pair satisfying conditions 53.8.0.1.

Let $v : T \to (X/Y)_{fin}$ be a natural transformation. Choose a scheme U and a surjective étale morphism $p : U \to T$. Then $v(p) \in (X/Y)_{fin}(U)$ corresponds to a pair (a_U, Z_U) over U. Let $R = U \times_T U$ with projections $t, s : R \to U$. As v is a transformation of functors we see that the pullbacks of (a_U, Z_U) by s and t agree. Hence, since $\{U \to T\}$ is an fppf covering, we may apply the result of the first paragraph that deduce that there exists a unique pair (a, Z) over T.

Conversely, let (a, Z) be a pair over T. Let $U \to T$, $R = U \times_T U$, and $t, s : R \to U$ be as above. Then the restriction $(a, Z)|_U$ gives rise to a tranformation of functors $v : h_U \to (X/Y)_{fin}$ by the Yoneda lemma (Categories, Lemma 4.3.5). As the two pullbacks $s^*(a, Z)|_U$ and $t^*(a, Z)|_U$ are equal, we see that v coequalizes the two maps $h_t, h_s : h_R \to h_U$. Since $T = U/R$ is the fppf quotient sheaf by Spaces, Lemma 40.9.1 and since $(X/Y)_{fin}$ is an fppf sheaf by (1) we conclude that v factors through a map $T \to (X/Y)_{fin}$.

We omit the verification that the two constructions above are mutually inverse. ☐

Lemma 53.8.2. *Let S be a scheme. Consider a commutative diagram*

$$\begin{tikzcd} X' \arrow[rr, "j"] \arrow[dr] & & X \arrow[dl] \\ & Y & \end{tikzcd}$$

of algebraic spaces over S. If j is an open immersion, then there is a canonical injective map of sheaves $j : (X'/Y)_{fin} \to (X/Y)_{fin}$.

Proof. If (a, Z) is a pair over T for X'/Y, then $(a, j(Z))$ is a pair over T for X/Y. ☐

Lemma 53.8.3. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S which is locally of finite type. Let $X' \subset X$ be the maximal open subspace over which f is locally quasi-finite, see Morphisms of Spaces, Lemma 42.31.7. Then $(X/Y)_{fin} = (X'/Y)_{fin}$.*

Proof. Lemma 53.8.2 gives us an injective map $(X'/Y)_{fin} \to (X/Y)_{fin}$. Morphisms of Spaces, Lemma 42.31.7 assures us that formation of X' commutes with base change. Hence everything comes down to proving that if $Z \subset X$ is a open subspace such that $f|_Z : Z \to Y$ is finite, then $Z \subset X'$. This is true because a finite morphism is locally quasi-finite, see Morphisms of Spaces, Lemma 42.37.8. ☐

Lemma 53.8.4. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Let T be an algebraic space over S, and let (a, Z) be a pair as in 53.8.0.1. If f is separated, then Z is closed in $T \times_Y X$.*

Proof. A finite morphism of algebraic spaces is universally closed by Morphisms of Spaces, Lemma 42.37.9. Since f is separated so is the morphism $T \times_Y X \to T$, see Morphisms of Spaces, Lemma 42.5.4. Thus the closedness of Z follows from Morphisms of Spaces, Lemma 42.36.5. ☐

Remark 53.8.5. Let $f : X \to Y$ be a separated morphism of algebraic spaces. The sheaf $(X/Y)_{fin}$ comes with a natural map $(X/Y)_{fin} \to Y$ by mapping the pair $(a, Z) \in (X/Y)_{fin}(T)$ to the element $a \in Y(T)$. We can use Lemma 53.8.4 to define operations

$$\star_i : (X/Y)_{fin} \times_Y (X/Y)_{fin} \longrightarrow (X/Y)_{fin}$$

by the rules

$$\begin{aligned} \star_1 &: ((a, Z_1), (a, Z_2)) \longmapsto (a, Z_1 \cup Z_2) \\ \star_2 &: ((a, Z_1), (a, Z_2)) \longmapsto (a, Z_1 \cap Z_2) \\ \star_3 &: ((a, Z_1), (a, Z_2)) \longmapsto (a, Z_1 \setminus Z_2) \\ \star_4 &: ((a, Z_1), (a, Z_2)) \longmapsto (a, Z_2 \setminus Z_1). \end{aligned}$$

The reason this works is that $Z_1 \cap Z_2$ is both open and closed inside Z_1 and Z_2 (which also implies that $Z_1 \cup Z_2$ is the disjoint union of the other three pieces). Thus we can think of $(X/Y)_{fin}$ as an $\mathbf{F}_2$-algebras (without unit) over Y with multiplication given by $ss' = \star_2(s, s')$, and addition given by

$$s + s' = \star_1(\star_3(s, s'), \star_4(s, s'))$$

which boils down to taking the symmetric difference. Note that in this sheaf of algebras $0 = (1_Y, \emptyset)$ and that indeed $s + s = 0$ for any local section s. If $f : X \to Y$ is finite, then this algebra has a unit namely $1 = (1_Y, X)$ and $\star_3(s, s') = s(1 + s')$, and $\star_4(s, s') = (1 + s)s'$.

Remark 53.8.6. Let $f : X \to Y$ be a separated, locally quasi-finite morphism of schemes. In this case the sheaf $(X/Y)_{fin}$ is closely related to the sheaf $f_!\mathbf{F}_2$ (insert future reference here) on $Y_{étale}$. Namely, if $V \to Y$ is étale, and $s \in \Gamma(V, f_!\mathbf{F}_2)$, then $s \in \Gamma(V \times_Y X, \mathbf{F}_2)$ is a section with proper support $Z = \text{Supp}(s)$ over V. Since f is als locally quasi-finite we see that the projection $Z \to V$ is actually finite. Since the support of a section of a constant abelian sheaf is open we see that the pair $(V \to Y, \text{Supp}(s))$ satisfies 53.8.0.1. In fact, $f_!\mathbf{F}_2 \cong (X/Y)_{fin}|_{Y_{étale}}$ in this case which also explains the $\mathbf{F}_2$-algebra structure introduced in Remark 53.8.5.

Lemma 53.8.7. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. The diagonal of $(X/Y)_{fin} \to Y$*

$$(X/Y)_{fin} \longrightarrow (X/Y)_{fin} \times_Y (X/Y)_{fin}$$

is representable (by schemes) and an open immersion and the ``absolute" diagonal

$$(X/Y)_{fin} \longrightarrow (X/Y)_{fin} \times (X/Y)_{fin}$$

is representable (by schemes).

Proof. The second statement follows from the first as the absolute diagonal is the composition of the relative diagonal and a base change of the diagonal of Y (which is representable by schemes), see Spaces, Section 40.3. To prove the first assertion we have to show the following: Given a scheme T and two pairs (a, Z_1) and (a, Z_2) over T with identical first component satisfying 53.8.0.1 there is an open subscheme $V \subset T$ with the following property: For any morphism of schemes $h : T' \to T$ we have

$$h(T') \subset V \Leftrightarrow \left(T' \times_T Z_1 = T' \times_T Z_2 \text{ as subspaces of } T' \times_Y X\right)$$

Let us construct V. Note that $Z_1 \cap Z_2$ is open in Z_1 and in Z_2. Since $\text{pr}_0|_{Z_i} : Z_i \to T$ is finite, hence proper (see Morphisms of Spaces, Lemma 42.37.9) we see that

$$E = \text{pr}_0|_{Z_1}\left(Z_1 \setminus Z_1 \cap Z_2\right) \cup \text{pr}_0|_{Z_2}\left(Z_2 \setminus Z_1 \cap Z_2\right)$$

is closed in T. Now it is clear that $V = T \setminus E$ works. □

Lemma 53.8.8. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Suppose that U is a scheme, $U \to Y$ is an étale morphism and $Z \subset U \times_Y X$ is an open subspace finite over U. Then the induced morphism $U \to (X/Y)_{fin}$ is étale.*

Proof. This is formal from the description of the diagonal in Lemma 53.8.7 but we write it out since it is an important step in the development of the theory. We have to check that for any scheme T over S and a morphism $T \to (X/Y)_{fin}$ the projection map

$$T \times_{(X/Y)_{fin}} U \longrightarrow T$$

is étale. Note that

$$T \times_{(X/Y)_{fin}} U = (X/Y)_{fin} \times_{((X/Y)_{fin} \times_Y (X/Y)_{fin})} (T \times_Y U)$$

Applying the result of Lemma 53.8.7 we see that $T \times_{(X/Y)_{fin}} U$ is represented by an open subscheme of $T \times_Y U$. As the projection $T \times_Y U \to T$ is étale by Morphisms of Spaces, Lemma 42.35.4 we conclude. $\square$

Lemma 53.8.9. *Let S be a scheme. Let*

$$\begin{tikzcd} X' \arrow[r] \arrow[d] & X \arrow[d] \\ Y' \arrow[r] & Y \end{tikzcd}$$

be a fibre product square of algebraic spaces over S. Then

$$\begin{tikzcd} (X'/Y')_{fin} \arrow[r] \arrow[d] & (X/Y)_{fin} \arrow[d] \\ Y' \arrow[r] & Y \end{tikzcd}$$

is a fibre product square of sheaves on $(Sch/S)_{fppf}$.

Proof. It follows immediately from the definitions that the sheaf $(X'/Y')_{fin}$ is equal to the sheaf $Y' \times_Y (X/Y)_{fin}$. $\square$

Lemma 53.8.10. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. If f is separated and locally quasi-finite, then there exists a scheme U étale over Y and a surjective étale morphism $U \to (X/Y)_{fin}$ over Y.*

Proof. Note that the assertion makes sense by the result of Lemma 53.8.7 on the diagonal of $(X/Y)_{fin}$, see Spaces, Lemma 40.5.10. Let V be a scheme and let $V \to Y$ be a surjective étale morphism. By Lemma 53.8.9 the morphism $(V \times_Y X/V)_{fin} \to (X/Y)_{fin}$ is a base change of the map $V \to Y$ and hence is surjective and étale, see Spaces, Lemma 40.5.5. Hence it suffices to prove the lemma for $(V \times_Y X/V)_{fin}$. (Here we implicitly use that the composition of representable, surjective, and étale transformations of functors is again representable, surjective, and étale, see Spaces, Lemmas 40.3.2 and 40.5.4, and Morphisms, Lemmas 24.9.2 and 24.35.3.) Note that the properties of being separated and locally quasi-finite are preserved under base change, see Morphisms of Spaces, Lemmas 42.5.4 and 42.25.3. Hence $V \times_Y X \to V$ is separated and locally quasi-finite as well, and by Morphisms of Spaces, Proposition 42.39.2 we see that $V \times_Y X$ is a scheme as well. Thus we may assume that $f : X \to Y$ is a separated and locally quasi-finite morphism of schemes.

Pick a point $y \in Y$. Pick $x_1, \ldots, x_n \in X$ points lying over y. Pick an étale neighbourhood $a : (U, u) \to (Y, y)$ and a decomposition

$$U \times_S X = W \coprod \coprod_{i=1,\ldots,n} \coprod_{j=1,\ldots,m_j} V_{i,j}$$

as in More on Morphisms, Lemma 33.28.5. Pick any subset

$$I \subset \{(i,j) \mid 1 \leq i \leq n,\ 1 \leq j \leq m_i\}.$$

Given these choices we obtain a pair (a, Z) with $Z = \bigcup_{(i,j)\in I} V_{i,j}$ which satisfies conditions 53.8.0.1. In other words we obtain a morphism $U \to (X/Y)_{fin}$. The construction of this morphism depends on all the things we picked above, so we should really write

$$U(y, n, x_1, \ldots, x_n, a, I) \longrightarrow (X/Y)_{fin}$$

This morphism is étale by Lemma 53.8.8.

Claim: The disjoint union of all of these is surjective onto $(X/Y)_{fin}$. It is clear that if the claim holds, then the lemma is true.

To show surjectivity we have to show the following (see Spaces, Remark 40.5.2): Given a scheme T over S, a point $t \in T$, and a map $T \to (X/Y)_{fin}$ we can find a datum $(y, n, x_1, \ldots, x_n, a, I)$ as above such that t is in the image of the projection map

$$U(y, n, x_1, \ldots, x_n, a, I) \times_{(X/Y)_{fin}} T \longrightarrow T.$$

To prove this we may clearly replace T by $Spec(\overline{\kappa(t)})$ and $T \to (X/Y)_{fin}$ by the composition $Spec(\overline{\kappa(t)}) \to T \to (X/Y)_{fin}$. In other words, we may assume that T is the spectrum of an algebraically closed field.

Let $T = Spec(k)$ be the spectrum of an algebraically closed field k. The morphism $T \to (X/Y)_{fin}$ is given by a pair $(T \to Y, Z)$ satisfying conditions 53.8.0.1. Here is a picture:

$$\begin{tikzcd} & Z \arrow[r] \arrow[d] & X \arrow[d] \\ Spec(k) \arrow[r, equal] & T \arrow[r] & Y \end{tikzcd}$$

Let $y \in Y$ be the image point of $T \to Y$. Since Z is finite over k it has finitely many points. Thus there exist finitely many points $x_1, \ldots, x_n \in X$ such that the image of Z in X is contained in $\{x_1, \ldots, x_n\}$. Choose $a : (U, u) \to (Y, y)$ adapted to y and $x_1, \ldots, x_n$ as above, which gives the diagram

$$\begin{tikzcd} W \amalg \coprod_{i=1,\ldots,n} \coprod_{j=1,\ldots,m_j} V_{i,j} \arrow[r] \arrow[d] & X \arrow[d] \\ U \arrow[r] & Y. \end{tikzcd}$$

Since k is algebraically closed and $\kappa(y) \subset \kappa(u)$ is finite separable we may factor the morphism $T = Spec(k) \to Y$ through the morphism $u = Spec(\kappa(u)) \to Spec(\kappa(y)) = y \subset Y$. With this choice we obtain the commutative diagram:

$$\begin{tikzcd} Z \arrow[r] \arrow[d] & W \amalg \coprod_{i=1,\ldots,n} \coprod_{j=1,\ldots,m_j} V_{i,j} \arrow[r] \arrow[d] & X \arrow[d] \\ Spec(k) \arrow[r] & U \arrow[r] & Y \end{tikzcd}$$

We know that the image of the left upper arrow ends up in $\coprod V_{i,j}$. Recall also that Z is an open subscheme of $Spec(k) \times_Y X$ by definition of $(X/Y)_{fin}$ and that the right hand square is a fibre product square. Thus we see that

$$Z \subset \coprod\nolimits_{i=1,\ldots,n} \coprod\nolimits_{j=1,\ldots,m_j} Spec(k) \times_U V_{i,j}$$

is an open subscheme. By construction (see More on Morphisms, Lemma 33.28.5) each $V_{i,j}$ has a unique point $v_{i,j}$ lying over u with purely inseparable residue field extension $\kappa(u) \subset \kappa(v_{i,j})$. Hence each scheme $Spec(k) \times_U V_{i,j}$ has exactly one point. Thus we see that

$$Z = \coprod\nolimits_{(i,j)\in I} Spec(k) \times_U V_{i,j}$$

for a unique subset $I \subset \{(i,j) \mid 1 \leq i \leq n,\ 1 \leq j \leq m_i\}$. Unwinding the definitions this shows that

$$U(y, n, x_1, \ldots, x_n, a, I) \times_{(X/Y)_{fin}} T$$

with I as found above is nonempty as desired. □

Proposition 53.8.11. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S which is separated and locally of finite type. Then $(X/Y)_{fin}$ is an algebraic space. Moreover, the morphism $(X/Y)_{fin} \to Y$ is étale.*

Proof. By Lemma 53.8.3 we may replace X by the open subscheme which is locally quasi-finite over Y. Hence we may assume that f is separated and locally quasi-finite. We will check the three conditions of Spaces, Definition 40.6.1. Condition (1) follows from Lemma 53.8.1. Condition (2) follows from Lemma 53.8.7. Finally, condition (3) follows from Lemma 53.8.10. Thus $(X/Y)_{fin}$ is an algebraic space. Moreover, that lemma shows that there exists a commutative diagram

$$\begin{tikzcd} U \arrow[rr] \arrow[dr] & & (X/Y)_{fin} \arrow[dl] \\ & Y & \end{tikzcd}$$

with horizontal arrow surjective and étale and south-east arrow étale. By Properties of Spaces, Lemma 41.13.3 this implies that the south-west arrow is étale as well. □

Remark 53.8.12. The condition that f be separated cannot be dropped from Proposition 53.8.11. An example is to take X the affine line with zero doubled, see Schemes, Example 21.14.3, $Y = \mathbf{A}^1_k$ the affine line, and $X \to Y$ the obvious map. Recall that over $0 \in Y$ there are two points 0_1 and 0_2 in X. Thus $(X/Y)_{fin}$ has four points over 0, namely $\emptyset, \{0_1\}, \{0_2\}, \{0_1, 0_2\}$. Of these four points only three can be lifted to an open subscheme of $U \times_Y X$ finite over U for $U \to Y$ étale, namely $\emptyset, \{0_1\}, \{0_2\}$. This shows that $(X/Y)_{fin}$ if representable by an algebraic space is not étale over Y. Similar arguments show that $(X/Y)_{fin}$ is really not an algebraic space. Details omitted.

Remark 53.8.13. Let $Y = \mathbf{A}^1_{\mathbf{R}}$ be the affine line over the real numbers, and let $X = Spec(\mathbf{C})$ mapping to the $\mathbf{R}$-rational point 0 in Y. In this case the morphism $f : X \to Y$ is finite, but it is not the case that $(X/Y)_{fin}$ is a scheme. Namely, one can show that in this case the algebraic space $(X/Y)_{fin}$ is isomorphic to the algebraic space of Spaces, Example 40.14.2 associated to the extension $\mathbf{R} \subset \mathbf{C}$. Thus it is really necessary to leave the category of schemes in order to represent the sheaf $(X/Y)_{fin}$, even when f is a finite morphism.

Lemma 53.8.14. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S which is separated, flat, and locally of finite presentation. In this case*

(1) *$(X/Y)_{fin} \to Y$ is separated, representable, and étale, and*

(2) *if Y is a scheme, then $(X/Y)_{fin}$ is (representable by) a scheme.*

Proof. Since f is in particular separated and locally of finite type (see Morphisms of Spaces, Lemma 42.26.5) we see that $(X/Y)_{fin}$ is an algebraic space by Proposition 53.8.11. To prove that $(X/Y)_{fin} \to Y$ is separated we have to show the following: Given a scheme T and two pairs (a, Z_1) and (a, Z_2) over T with identical first component satisfying 53.8.0.1 there is a closed subscheme $V \subset T$ with the following property: For any morphism of schemes $h : T' \to T$ we have

$$h \text{ factors through } V \Leftrightarrow \left(T' \times_T Z_1 = T' \times_T Z_2 \text{ as subspaces of } T' \times_Y X\right)$$

In the proof of Lemma 53.8.7 we have seen that $V = T' \setminus E$ is an open subscheme of T' with closed complement

$$E = \mathrm{pr}_0|_{Z_1}\left(Z_1 \setminus Z_1 \cap Z_2)\right) \cup \mathrm{pr}_0|_{Z_2}\left(Z_2 \setminus Z_1 \cap Z_2)\right).$$

Thus everything comes down to showing that E is also open. By Lemma 53.8.4 we see that Z_1 and Z_2 are closed in $T' \times_Y X$. Hence $Z_1 \setminus Z_1 \cap Z_2$ is open in Z_1. As f is flat and locally of finite presentation, so is $\mathrm{pr}_0|_{Z_1}$. This is true as Z_1 is an open subspace of the base change $T' \times_Y X$, and Morphisms of Spaces, Lemmas 42.26.3 and Lemmas 42.27.3. Hence $\mathrm{pr}_0|_{Z_1}$ is open, see Morphisms of Spaces, Lemma 42.27.5. Thus $\mathrm{pr}_0|_{Z_1}\left(Z_1 \setminus Z_1 \cap Z_2)\right)$ is open and it follows that E is open as desired.

We have already seen that $(X/Y)_{fin} \to Y$ is étale, see Proposition 53.8.11. Hence now we know it is locally quasi-finite (see Morphisms of Spaces, Lemma 42.35.5) and separated, hence representable by Morphisms of Spaces, Lemma 42.40.1. The final assertion is clear (if you like you can use Morphisms of Spaces, Proposition 42.39.2). □

Variant: Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Let $\sigma : Y \to X$ be a section of f. For an algebraic space or a scheme T over S consider pairs (a, Z) where

$$\begin{array}{l} a : T \to Y \text{ is a morphism over } S, \\ Z \subset T \times_Y X \text{ is an open subspace such that } \mathrm{pr}_0|_Z : Z \to T \text{ is finite, and} \\ (1_T, \sigma \circ a) : T \to T \times_Y X \text{ factors through } Z. \end{array} \tag{53.8.14.1}$$

We will denote $(X/Y, \sigma)_{fin}$ the subfunctor of $(X/Y)_{fin}$ parametrizing these pairs.

Lemma 53.8.15. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Let $\sigma : Y \to X$ be a section of f. Consider the transformation of functors*

$$t : (X/Y, \sigma)_{fin} \longrightarrow (X/Y)_{fin}.$$

defined above. Then

(1) *t is representable by open immersions,*
(2) *if f is separated, then t is representable by open and closed immersions,*
(3) *if $(X/Y)_{fin}$ is an algebraic space, then $(X/Y, \sigma)_{fin}$ is an algebraic space and an open subspace of $(X/Y)_{fin}$, and*
(4) *if $(X/Y)_{fin}$ is a scheme, then $(X/Y, \sigma)_{fin}$ is an open subscheme of it.*

Proof. Omitted. Hint: Given a pair (a, Z) over T as in (53.8.0.1) the inverse image of Z by $(1_T, \sigma \circ a) : T \to T \times_Y X$ is the open subscheme of T we are looking for. □

53.9. Finite collections of arrows

Let $\mathcal{C}$ be a groupoid, see Categories, Definition 4.2.5. As discussed in Groupoids, Section 35.11 this corresponds to a septuple $(\text{Ob}, \text{Arrows}, s, t, c, e, i)$.

Using this data we can make another groupoid $\mathcal{C}_{fin}$ as follows:

(1) An object of $\mathcal{C}_{fin}$ consists of a finite subset $Z \subset \text{Arrows}$ with the following properties:
   (a) $s(Z) = \{u\}$ is a singleton, and
   (b) $e(u) \in Z$.
(2) A morphism of $\mathcal{C}_{fin}$ consists of a pair (Z, z), where Z is an object of $\mathcal{C}_{fin}$ and $z \in Z$.
(3) The source of (Z, z) is Z.
(4) The target of (Z, z) is $t(Z, z) = \{z' \circ z^{-1}; z' \in Z\}$.
(5) Given $(Z_1, z_1), (Z_2, z_2)$ such that $s(Z_1, z_1) = t(Z_2, z_2)$ the composition $(Z_1, z_1) \circ (Z_2, z_2)$ is $(Z_2, z_1 \circ z_2)$.

We omit the verification that this defines a groupoid. Pictorially an object of $\mathcal{C}_{fin}$ can be viewed as a diagram

$$\begin{tikzcd}
 & \bullet \\
\bullet \arrow[loop left, "e"] \arrow[ur] \arrow[r] \arrow[dr] & \bullet \\
 & \bullet
\end{tikzcd}$$

To make a morphism of $\mathcal{C}_{fin}$ you pick one of the arrows and you precompose the other arrows by its inverse. For example if we pick the middle horizontal arrow then the target is the picture

$$\begin{tikzcd}
 & \bullet & \\
\bullet & \bullet \arrow[l] \arrow[u] \arrow[d] \arrow[loop right, "e"] & \\
 & \bullet &
\end{tikzcd}$$

Note that the cardinalities of $s(Z, z)$ and $t(Z, z)$ are equal. So $\mathcal{C}_{fin}$ is really a countable disjoint union of groupoids.

53.10. The finite part of a groupoid

In this section we are going to use the idea explained in Section 53.9 to take the finite part of a groupoid in algebraic spaces.

Let S be a scheme. Let B be an algebraic space over S. Let (U, R, s, t, c, e, i) be a groupoid in algebraic spaces over B. Assumption: The morphisms s, t are separated and locally of finite type. This notation and assumption will we be fixed throughout this section.

Denote R_s the algebraic space R seen as an algebraic space over U via s. Let $U' = (R_s/U, e)_{fin}$. Since s is separated and locally of finite type, by Proposition 53.8.11 and Lemma 53.8.15, we see that U' is an algebraic space endowed with an étale morphism $g : U' \to U$. Moreover, by Lemma 53.8.1 there exists a universal open subspace $Z_{univ} \subset$

$R \times_{s,U,g} U'$ which is finite over U' and such that $(1_{U'}, e \circ g) : U' \to R \times_{s,U,g} U'$ factors through Z_{univ}. Moreover, by Lemma 53.8.4 the open subspace Z_{univ} is also closed in $R \times_{s,U',g} U$. Picture so far:

$$\begin{tikzcd}
Z_{univ} \arrow[d] \arrow[rd] & \\
R \times_{s,U,g} U' \arrow[r] \arrow[d] & U' \arrow[d, "g"] \\
R \arrow[r, "s"] & U
\end{tikzcd}$$

Let T be a scheme over B. We see that a T-valued point of Z_{univ} may be viewed as a triple (u, Z, z) where

(1) $u : T \to U$ is a T-valued point of U,
(2) $Z \subset R \times_{s,U,u} T$ is an open and closed subspace finite over T such that $(e \circ u, 1_T)$ factors through it, and
(3) $z : T \to R$ is a T-valued point of R with $s \circ z = u$ and such that $(z, 1_T)$ factors through Z.

Having said this, it is morally clear from the discussion in Section 53.9 that we can turn (Z_{univ}, U') into a groupoid in algebraic spaces over B. To make sure will define the morphisms s', t', c', e', i' one by one using the functorial point of view. (Please don't read this before reading and understanding the simple construction in Section 53.9.)

The morphism $s' : Z_{univ} \to U'$ corresponds to the rule

$$s' : (u, Z, z) \mapsto (u, Z).$$

The morphism $t' : Z_{univ} \to U'$ is given by the rule

$$t' : (u, Z, z) \mapsto (t \circ z, c(Z, i \circ z)).$$

The entry $c(Z, i \circ z)$ makes sense as the map $c(-, i \circ z) : R \times_{s,U,u} T \to R \times_{s,U,t\circ z} T$ is an isomorphism with inverse $c(-, z)$. The morphism $e' : U' \to Z_{univ}$ is given by the rule

$$e' : (u, Z) \mapsto (u, Z, (e \circ u, 1_T)).$$

Note that this makes sense by the requirement that $(e \circ u, 1_T)$ factors through Z. The morphism $i' : Z_{univ} \to Z_{univ}$ is given by the rule

$$i' : (u, Z, z) \mapsto (t \circ z, c(Z, i \circ z), i \circ z).$$

Finally, composition is defined by the rule

$$c' : ((u_1, Z_1, z_1), (u_2, Z_2, z_2)) \mapsto (u_2, Z_2, z_1 \circ z_2).$$

We omit the verification that the axioms of a groupoid in algebraic spaces hold for $(U', Z_{univ}, s', t', c', e', i')$.

A final piece of information is that there is a canonical morphism of groupoids

$$(U', Z_{univ}, s', t', c', e', i') \longrightarrow (U, R, s, t, c, e, i)$$

Namely, the morphism $U' \to U$ is the morphism $g : U' \to U$ which is defined by the rule $(u, Z) \mapsto u$. The morphism $Z_{univ} \to R$ is defined by the rule $(u, Z, z) \mapsto z$. This finishes the construction. Let us summarize our findings as follows.

Lemma 53.10.1. *Let S be a scheme. Let B be an algebraic space over S. Let (U, R, s, t, c, e, i) be a groupoid in algebraic spaces over B. Assume the morphisms s, t are separated and locally of finite type. There exists a canonical morphism*

$$(U', Z_{univ}, s', t', c', e', i') \longrightarrow (U, R, s, t, c, e, i)$$

of groupoids in algebraic spaces over B where

(1) *$g : U' \to U$ is identified with $(R_s/U, e)_{fin} \to U$, and*
(2) *$Z_{univ} \subset R \times_{s,U,g} U'$ is the universal open (and closed) subspace finite over U' which contains the base change of the unit e.*

Proof. See discussion above. □

53.11. Étale localization of groupoid schemes

In this section we prove results similar to [**KM97a**, Proposition 4.2]. We try to be a bit more general, and we try to avoid using Hilbert schemes by using the finite part of a morphism instead. The goal is to "split" a groupoid in algebraic spaces over a point after étale localization. Here is the definition (very similar to [**KM97a**, Definition 4.1]).

Definition 53.11.1. Let S be a scheme. Let B be an algebraic space over S Let (U, R, s, t, c) be a groupoid in algebraic spaces over B. Let $u \in |U|$ be a point.

(1) We say R is *split over u* if there exists an open subspace $P \subset R$ such that
  (a) $(U, P, s|_P, t|_P, c|_{P \times_{s,U,t} P})$ is a groupoid in algebraic spaces over B,
  (b) $s|_P, t|_P$ are finite, and
  (c) $\{r \in |R| : s(r) = u, t(r) = u\} \subset P$.

  The choice of such a P will be called a *splitting of R over u*.
(2) We say R is *quasi-split over u* if there exists an open subspace $P \subset R$ such that
  (a) $(U, P, s|_P, t|_P, c|_{P \times_{s,U,t} P})$ is a groupoid in algebraic spaces over B,
  (b) $s|_P, t|_P$ are finite, and
  (c) $e(u) \in |P|$[1].

  The choice of such a P will be called a *quasi-splitting of R over u*.

Note the similarity of the conditions on P to the conditions on pairs in (53.8.0.1). In particular, if s, t are separated, then P is also closed in R (see Lemma 53.8.4).

Suppose we start with a groupoid in algebraic spaces (U, R, s, t, c) over B and a point $u \in |U|$. Since the goal is to split the groupoid after étale localization we may as well replace U by an affine scheme (what we mean is that this is harmless for any possible application). Moreover, the additional hypotheses we are going to have to impose will force R to be a scheme at least in a neighbourhood of $\{r \in |R| : s(r) = u, t(r) = u\}$ or $e(u)$. This is why we start with a groupoid scheme as described below. However, our technique of proof leads us outside of the category of schemes, which is why we have formulated a splitting for the case of groupoids in algebraic spaces above. On the other hand, we know of no applications but the case where the morphisms s, t are also flat and of finite presentation, in which case we end up back in the category of schemes.

Situation 53.11.2. (Assumptions for splitting.) Let S be a scheme. Let (U, R, s, t, c) be a groupoid scheme over S. Let $u \in U$ be a point. Assume that

(1) $s, t : R \to U$ are separated,
(2) s, t are locally of finite type,

[1] This condition is implied by (a).

(3) the set $\{r \in R : s(r) = u, t(r) = u\}$ is finite, and
(4) s is quasi-finite at each point of the set in (3).

Note that assumptions (3) and (4) are implied by the assumption that the fibre $s^{-1}(\{u\})$ is finite, see Morphisms, Lemma 24.19.7.

Situation 53.11.3. (Assumptions for quasi-splitting.) Let S be a scheme. Let (U, R, s, t, c) be a groupoid scheme over S. Let $u \in U$ be a point. Assume that

(1) $s, t : R \to U$ are separated,
(2) s, t are locally of finite type, and
(3) s is quasi-finite at $e(u)$.

It turns out that for applications to the existence theorems for algebraic spaces the case of quasi-splittings is sufficient. In fact, it is for us somehow a more natural case to consider, as in the stacks project there are no finiteness conditions on the diagonal of an algebaic space, hence the assumption that $\{r \in R : s(r) = u, t(r) = u\}$ is finite need not hold even for a presentation $X = U/R$ of an algebraic space X.

Lemma 53.11.4. *Assumptions and notation as in Situation 53.11.2. Then there exists an algebraic space U', an étale morphism $U' \to U$, and a point $u' : Spec(\kappa(u)) \to U'$ lying over $u : Spec(\kappa(u)) \to U$ such that the restriction $R' = R|_{U'}$ of R to U' splits over u'.*

Proof. Let $f : (U', Z_{univ}, s', t', c') \to (U, R, s, t, c)$ be as constructed in Lemma 53.10.1. Recall that $R' = R \times_{(U \times_S U)} (U' \times_S U')$. Thus we get a morphism $(f, t', s') : Z_{univ} \to R'$ of groupoids in algebraic spaces

$$(U', Z_{univ}, s', t', c') \to (U', R', s', t', c')$$

(by abuse of notation we indicate the morphisms in the two groupoids by the same symbols). Now, as $Z \subset R \times_{s,U,g} U'$ is open and $R' \to R \times_{s,U,g} U'$ is étale (as a base change of $U' \to U$) we see that $Z_{univ} \to R'$ is an open immersion. By construction the morphisms $s', t' : Z_{univ} \to U'$ are finite. It remains to find the point u' of U'.

We think of u as a morphism $Spec(\kappa(u)) \to U$ as in the statement of the lemma. Set $F_u = R \times_{s,U} Spec(\kappa(u))$. The set $\{r \in R : s(r) = u, t(r) = u\}$ is finite by assumption and $F_u \to Spec(\kappa(u))$ is quasi-finite at each of its elements. Hence we can find a decomposition into open and closed subschemes

$$F_u = Z_u \coprod Rest$$

for some scheme Z_u finite over $\kappa(u)$ whose support is $\{r \in R : s(r) = u, t(r) = u\}$. Note that $e(u) \in Z_u$. Hence by the construction of U' in Section 53.10 (u, Z_u) defines a $Spec(\kappa(u))$-valued point u' of U'.

We still have to show that the set $\{r' \in |R'| : s'(r') = u', t'(r') = u'\}$ is contained in $|Z_{univ}|$. Pick any point r' in this set and represent it by a morphism $r' : Spec(k) \to R'$. Denote $z : Spec(k) \to R$ the composition of r' with the map $R' \to R$. Since $\kappa(u) = \kappa(u')$, and since $s'(r') = u'$, $t(r') = u'$ no information is lost by considering the point z rather than the point r', i.e., we can recover r' from the point z. For example z is an element of the set $\{r \in R : s(r) = u, t(r) = u\}$ by our assumption on r'. The composition $s \circ z : Spec(k) \to U$ factors through u, so we may think of $s \circ z$ as a morphism $Spec(k) \to Spec(\kappa(u))$. Hence we can consider the triple

$$(s \circ z, Z_u \times_{Spec(\kappa(u)), s \circ z} Spec(k), z)$$

where Z_u is as above. This defines a $Spec(k)$-valued point of Z_{univ} above whose image under the map $Z_{univ} \to R'$ is the point r' by the relationship between z and r' mentioned above. This finishes the proof. □

Lemma 53.11.5. *Assumptions and notation as in Situation 53.11.3. Then there exists an algebraic space U', an étale morphism $U' \to U$, and a point $u' : Spec(\kappa(u)) \to U'$ lying over $u : Spec(\kappa(u)) \to U$ such that the restriction $R' = R|_{U'}$ of R to U' is quasi-split over u'.*

Proof. The proof is almost exactly the same as the proof of Lemma 53.11.4. Let $f : (U', Z_{univ}, s', t', c') \to (U, R, s, t, c)$ be as constructed in Lemma 53.10.1. Recall that $R' = R \times_{(U \times_S U)} (U' \times_S U')$. Thus we get a morphism $(f, t', s') : Z_{univ} \to R'$ of groupoids in algebraic spaces

$$(U', Z_{univ}, s', t', c') \to (U', R', s', t', c')$$

(by abuse of notation we indicate the morphisms in the two groupoids by the same symbols). Now, as $Z \subset R \times_{s,U,g} U'$ is open and $R' \to R \times_{s,U,g} U'$ is étale (as a base change of $U' \to U$) we see that $Z_{univ} \to R'$ is an open immersion. By construction the morphisms $s', t' : Z_{univ} \to U'$ are finite. It remains to find the point u' of U'.

We think of u as a morphism $Spec(\kappa(u)) \to U$ as in the statement of the lemma. Set $F_u = R \times_{s,U} Spec(\kappa(u))$. The morphism $F_u \to Spec(\kappa(u))$ is quasi-finite at $e(u)$ by assumption. Hence we can find a decomposition into open and closed subschemes

$$F_u = Z_u \coprod Rest$$

for some scheme Z_u finite over $\kappa(u)$ whose support is $e(u)$. Hence by the construction of U' in Section 53.10 (u, Z_u) defines a $Spec(\kappa(u))$-valued point u' of U'. To finish the proof we have to show that $e'(u') \in Z_{univ}$ which is clear. □

Finally, when we add additional assumptions we obtain schemes.

Lemma 53.11.6. *Assumptions and notation as in Situation 53.11.2. Assume in addition that s, t are flat and locally of finite presentation. Then there exists a scheme U', a separated étale morphism $U' \to U$, and a point $u' \in U'$ lying over u with $\kappa(u) = \kappa(u')$ such that the restriction $R' = R|_{U'}$ of R to U' splits over u'.*

Proof. This follows from the construction of U' in the proof of Lemma 53.11.4 because in this case $U' = (R_s/U, e)_{fin}$ is a scheme separated over U by Lemmas 53.8.14 and 53.8.15. □

Lemma 53.11.7. *Assumptions and notation as in Situation 53.11.3. Assume in addition that s, t are flat and locally of finite presentation. Then there exists a scheme U', a separated étale morphism $U' \to U$, and a point $u' \in U'$ lying over u with $\kappa(u) = \kappa(u')$ such that the restriction $R' = R|_{U'}$ of R to U' is quasi-split over u'.*

Proof. This follows from the construction of U' in the proof of Lemma 53.11.5 because in this case $U' = (R_s/U, e)_{fin}$ is a scheme separated over U by Lemmas 53.8.14 and 53.8.15. □

In fact we can obtain affine schemes by applying an earlier result on finite locally free groupoids.

Lemma 53.11.8. *Assumptions and notation as in Situation 53.11.2. Assume in addition that s, t are flat and locally of finite presentation and that U is affine. Then there exists an affine scheme U', an étale morphism $U' \to U$, and a point $u' \in U'$ lying over u with $\kappa(u) = \kappa(u')$ such that the restriction $R' = R|_{U'}$ of R to U' splits over u'.*

Proof. Let $U' \to U$ and $u' \in U'$ be the étale morphism of schemes we found in Lemma 53.11.6. Let $P \subset R'$ be the splitting of R' over u'. By More on Groupoids, Lemma 36.8.1 the morphisms $s', t' : R' \to U'$ are flat and locally of finite presentation. They are finite by assumption. Hence s', t' are finite locally free, see Morphisms, Lemma 24.44.2. In particular $t(s^{-1}(u'))$ is a finite set of points $\{u'_1, u'_2, \ldots, u'_n\}$ of U'. Choose a quasi-compact open $W \subset U'$ containing each u'_i. As U is affine the morphism $W \to U$ is quasi-compact (see Schemes, Lemma 21.19.2). The morphism $W \to U$ is also locally quasi-finite (see Morphisms, Lemma 24.35.6) and separated. Hence by More on Morphisms, Lemma 33.29.3 (a version of Zariski's Main Theorem) we conclude that W is quasi-affine. By Properties, Lemma 23.26.5 we see that $\{u'_1, \ldots, u'_n\}$ are contained in an affine open of U'. Thus we may apply Groupoids, Lemma 35.20.1 to conclude that there exists an affine P-invariant open $U'' \subset U'$ which contains u'.

To finish the proof denote $R'' = R|_{U''}$ the restriction of R to U''. This is the same as the restriction of R' to U''. As $P \subset R'$ is an open and closed subscheme, so is $P|_{U''} \subset R''$. By construction the open subscheme $U'' \subset U'$ is P-invariant which means that $P|_{U''} = (s'|_P)^{-1}(U'') = (t'|_P)^{-1}(U'')$ (see discussion in Groupoids, Section 35.16) so the restrictions of s'' and t'' to $P|_{U''}$ are still finite. The sub groupoid scheme $P|_{U''}$ is still a splitting of R'' over u''; above we verified (a), (b) and (c) holds as $\{r' \in R' : t'(r') = u', s'(r') = u'\} = \{r'' \in R'' : t''(r'') = u', s''(r'') = u'\}$ trivially. The lemma is proved. □

Lemma 53.11.9. *Assumptions and notation as in Situation 53.11.3. Assume in addition that s, t are flat and locally of finite presentation and that U is affine. Then there exists an affine scheme U', an étale morphism $U' \to U$, and a point $u' \in U'$ lying over u with $\kappa(u) = \kappa(u')$ such that the restriction $R' = R|_{U'}$ of R to U' is quasi-split over u'.*

Proof. The proof of this lemma is literally the same as the proof of Lemma 53.11.8 except that ``splitting'' needs to be replaced by ``quasi-splitting'' (2 times) and that the reference to Lemma 53.11.6. needs to be replaced by a reference to Lemma 53.11.7. □

CHAPTER 54

Bootstrap

54.1. Introduction

In this chapter we use the material from the preceding sections to give criteria under which a presheaf of sets on the category of schemes is an algebraic space. Some of this material comes from the work of Artin, see [**Art69c**], [**Art70a**], [**Art73a**], [**Art71c**], [**Art71a**], [**Art69a**], [**Art69e**], and [**Art74a**]. However, our method will be to use as much as possible arguments similar to those of the paper by Keel and Mori, see [**KM97a**].

54.2. Conventions

The standing assumption is that all schemes are contained in a big fppf site Sch_{fppf}. And all rings A considered have the property that $Spec(A)$ is (isomorphic) to an object of this big site.

Let S be a scheme and let X be an algebraic space over S. In this chapter and the following we will write $X \times_S X$ for the product of X with itself (in the category of algebraic spaces over S), instead of $X \times X$.

54.3. Morphisms representable by algebraic spaces

Here we define the notion of one presheaf being relatively representabe by algebraic spaces over another, and we prove some properties of this notion.

Definition 54.3.1. Let S be a scheme contained in Sch_{fppf}. Let F, G be presheaves on Sch_{fppf}/S. We say a morphism $a : F \to G$ is *representable by algebraic spaces* if for every $U \in Ob((Sch/S)_{fppf})$ and any $\xi : U \to G$ the fiber product $U \times_{\xi, G} F$ is an algebraic space.

Here is a sanity check.

Lemma 54.3.2. *Let S be a scheme. Let $f : X \to Y$ be a morphism of algebraic spaces over S. Then f is representable by algebraic spaces.*

Proof. This is formal. It relies on the fact that the category of algebraic spaces over S has fibre products, see Spaces, Lemma 40.7.3. $\square$

Lemma 54.3.3. *Let S be a scheme. Let*

$$\begin{tikzcd} G' \times_G F \arrow[r] \arrow[d, "a'"] & F \arrow[d, "a"] \\ G' \arrow[r] & G \end{tikzcd}$$

be a fibre square of presheaves on $(Sch/S)_{fppf}$. If a is representable by algebraic spaces so is a'.

Proof. Omitted. Hint: This is formal. $\square$

Lemma 54.3.4. *Let S be a scheme contained in Sch_{fppf}. Let $F, G : (Sch/S)_{fppf}^{opp} \to Sets$. Let $a : F \to G$ be representable by algebraic spaces. If G is a sheaf, then so is F.*

Proof. (Same as the proof of Spaces, Lemma 40.3.5.) Let $\{\varphi_i : T_i \to T\}$ be a covering of the site $(Sch/S)_{fppf}$. Let $s_i \in F(T_i)$ which satisfy the sheaf condition. Then $\sigma_i = a(s_i) \in G(T_i)$ satisfy the sheaf condition also. Hence there exists a unique $\sigma \in G(T)$ such that $\sigma_i = \sigma|_{T_i}$. By assumption $F' = h_T \times_{\sigma, G, a} F$ is a sheaf. Note that $(\varphi_i, s_i) \in F'(T_i)$ satisfy the sheaf condition also, and hence come from some unique $(\mathrm{id}_T, s) \in F'(T)$. Clearly s is the section of F we are looking for. $\square$

Lemma 54.3.5. *Let S be a scheme contained in Sch_{fppf}. Let $F, G : (Sch/S)_{fppf}^{opp} \to Sets$. Let $a : F \to G$ be representable by algebraic spaces. Then $\Delta_{F/G} : F \to F \times_G F$ is representable by algebraic spaces.*

Proof. (Same as the proof of Spaces, Lemma 40.3.6.) Let U be a scheme. Let $\xi = (\xi_1, \xi_2) \in (F \times_G F)(U)$. Set $\xi' = a(\xi_1) = a(\xi_2) \in G(U)$. By assumption there exist an algebraic space V and a morphism $V \to U$ representing the fibre product $U \times_{\xi', G} F$. In particular, the elements ξ_1, ξ_2 give morphisms $f_1, f_2 : U \to V$ over U. Because V represents the fibre product $U \times_{\xi', G} F$ and because $\xi' = a \circ \xi_1 = a \circ \xi_2$ we see that if $g : U' \to U$ is a morphism then

$$g^*\xi_1 = g^*\xi_2 \Leftrightarrow f_1 \circ g = f_2 \circ g.$$

In other words, we see that $U \times_{\xi, F \times_G F} F$ is represented by $V \times_{\Delta, V \times V, (f_1, f_2)} U$ which is an algebraic space. $\square$

The proof of Lemma 54.3.6 below is actually slightly tricky. Namely, we cannot use the argument of the proof of Spaces, Lemma 40.11.1 because we do not yet know that a composition of transformations representable by algebraic spaces is representable by algebraic spaces. In fact, we will use this lemma to prove that statement.

Lemma 54.3.6. *Let S be a scheme contained in Sch_{fppf}. Let $F, G : (Sch/S)_{fppf}^{opp} \to Sets$. Let $a : F \to G$ be representable by algebraic spaces. If G is an algebraic space, then so is F.*

Proof. We have seen in Lemma 54.3.4 that F is a sheaf.

Let U be a scheme and let $U \to G$ be a surjective étale morphism. In this case $U \times_G F$ is an algebraic space. Let W be a scheme and let $W \to U \times_G F$ be a surjective étale morphism.

First we claim that $W \to F$ is representable. To see this let X be a scheme and let $X \to F$ be a morphism. Then

$$W \times_F X = W \times_{U \times_G F} U \times_G F \times_F X = W \times_{U \times_G F} (U \times_G X)$$

Since both $U \times_G F$ and G are algebraic spaces we see that this is a scheme.

Next, we claim that $W \to F$ is surjective and étale (this makes sense now that we know it is representable). This follows from the formula above since both $W \to U \times_G F$ and $U \to G$ are étale and surjective, hence $W \times_{U \times_G F} (U \times_G X) \to U \times_G X$ and $U \times_G X \to X$ are surjective and étale, and the composition of surjective étale morphisms is surjective and étale.

Set $R = W \times_F W$. By the above R is a scheme and the projections $t, s : R \to W$ are étale. It is clear that R is an equivalence relation, and $W \to F$ is a surjection of sheaves. Hence R is an étale equivalence relation and $F = W/R$. Hence F is an algebraic space by Spaces, Theorem 40.10.5. $\square$

Lemma 54.3.7. *Let S be a scheme. Let $a : F \to G$ be a map of presheaves on $(Sch/S)_{fppf}$. Suppose $a : F \to G$ is representable by algebraic spaces. If X is an algebraic space over S, and $X \to G$ is a map of presheaves then $X \times_G F$ is an algebraic space.*

Proof. By Lemma 54.3.3 the transformation $X \times_G F \to X$ is representable by algebraic spaces. Hence it is an algebraic space by Lemma 54.3.6. □

Lemma 54.3.8. *Let S be a scheme. Let*

$$F \xrightarrow{a} G \xrightarrow{b} H$$

be maps of presheaves on $(Sch/S)_{fppf}$. If a and b are representable by algebraic spaces, so is $b \circ a$.

Proof. Let T be a scheme over S, and let $T \to H$ be a morphism. By assumption $T \times_H G$ is an algebraic space. Hence by Lemma 54.3.7 we see that $T \times_H F = (T \times_H G) \times_G F$ is an algebraic space as well. □

Lemma 54.3.9. *Let S be a scheme. Let $F_i, G_i : (Sch/S)_{fppf}^{opp} \to Sets$, $i = 1, 2$. Let $a_i : F_i \to G_i$, $i = 1, 2$ be representable by algebraic spaces. Then*

$$a_1 \times a_2 : F_1 \times F_2 \longrightarrow G_1 \times G_2$$

is a representable by algebraic spaces.

Proof. Write $a_1 \times a_2$ as the composition $F_1 \times F_2 \to G_1 \times F_2 \to G_1 \times G_2$. The first arrow is the base change of a_1 by the map $G_1 \times F_2 \to G_1$, and the second arrow is the base change of a_2 by the map $G_1 \times G_2 \to G_2$. Hence this lemma is a formal consequence of Lemmas 54.3.8 and 54.3.3. □

54.4. Properties of maps of presheaves representable by algebraic spaces

Here is the definition that makes this work.

Definition 54.4.1. Let S be a scheme. Let $a : F \to G$ be a map of presheaves on $(Sch/S)_{fppf}$ which is representable by algebraic spaces. Let $\mathcal{P}$ be a property of morphisms of algebraic spaces which

(1) is preserved under any base change, and
(2) is fppf local on the base, see Descent on Spaces, Definition 45.9.1.

In this case we say that a has *property $\mathcal{P}$* if for every scheme U and $\xi : U \to G$ the resulting morphism of algebraic spaces $U \times_G F \to U$ has property $\mathcal{P}$.

It is important to note that we will only use this definition for properties of morphisms that are stable under base change, and local in the fppf topology on the base. This is not because the definition doesn't make sense otherwise; rather it is because we may want to give a different definition which is better suited to the property we have in mind.

The definition above applies for example to the properties of being ``surjective'', ``flat'', ``étale'', and ``locally of finite presentation''. In other words, a is *surjective* (resp. *étale*, *flat*, *locally of finite presentation*) if for every scheme T and map $\xi : T \to G$ the morphism of algebraic spaces $T \times_{\xi,G} F \to T$ is surjective (resp. étale, flat, locally of finite presentation).

By Lemma 54.3.2 any morphism between algebraic spaces over S is representable by algebraic spaces. And by Morphisms of Spaces, Lemma 42.6.3 (resp. 42.35.2, 42.27.4, 42.26.4) the definition of surjective (resp. étale, flat, locally of finite presentation) above agrees with the already existing definition of morphisms of algebraic spaces.

Some formal lemmas follow.

Lemma 54.4.2. *Let S be a scheme. Let $\mathcal{P}$ be a property as in Definition 54.4.1. Let*

$$\begin{tikzcd} G' \times_G F \arrow[r] \arrow[d, "a'"] & F \arrow[d, "a"] \\ G' \arrow[r] & G \end{tikzcd}$$

be a fibre square of presheaves on $(Sch/S)_{fppf}$. If a is representable by algebraic spaces and has $\mathcal{P}$ so does a'.

Proof. Omitted. Hint: This is formal. □

Lemma 54.4.3. *Let S be a scheme. Let $\mathcal{P}$ be a property as in Definition 54.4.1, and assume $\mathcal{P}$ is stable under composition. Let*

$$F \xrightarrow{a} G \xrightarrow{b} H$$

be maps of presheaves on $(Sch/S)_{fppf}$. If a, b are representable by algebraic spaces and has $\mathcal{P}$ so does $b \circ a$.

Proof. Omitted. Hint: See Lemma 54.3.8 and use stability under composition. □

Lemma 54.4.4. *Let S be a scheme. Let $F_i, G_i : (Sch/S)_{fppf}^{opp} \to Sets$, $i = 1, 2$. Let $a_i : F_i \to G_i$, $i = 1, 2$ be representable by algebraic spaces. Let $\mathcal{P}$ be a property as in Definition 54.4.1 which is stable under composition. If a_1 and a_2 have property $\mathcal{P}$ so does $a_1 \times a_2 : F_1 \times F_2 \longrightarrow G_1 \times G_2$.*

Proof. Note that the lemma makes sense by Lemma 54.3.9. Proof omitted. □

Lemma 54.4.5. *Let S be a scheme. Let $F, G : (Sch/S)_{fppf}^{opp} \to Sets$ be sheaves. Let $a : F \to G$ be representable by algebraic spaces, flat, locally of finite presentation, and surjective. Then $a : F \to G$ is surjective as a map of sheaves.*

Proof. Let T be a scheme over S and let $g : T \to G$ be a T-valued point of G. By assumption $T' = F \times_G T$ is an algebraic space and the morphism $T' \to T$ is a flat, locally of finite presentation, and surjective morphism of algebraic spaces. Let $U \to T'$ be a surjective étale morphism, where U is a scheme. Then by the definition of flat morphisms of algebraic spaces the morphism of schemes $U \to T$ is flat. Similarly for ``locally of finite presentation". The morphism $U \to T$ is surjective also, see Morphisms of Spaces, Lemma 42.6.3. Hence we see that $\{U \to T\}$ is an fppf covering such that $g|_U \in G(U)$ comes from an element of $F(U)$, namely the map $U \to T' \to F$. This proves the map is surjective as a map of sheaves, see Sites, Definition 9.11.1. □

54.5. Bootstrapping the diagonal

Lemma 54.5.1. *Let S be a scheme. If F is a presheaf on $(Sch/S)_{fppf}$. The following are equivalent:*

1. *$\Delta_F : F \to F \times F$ is representable by algebraic spaces,*
2. *for every scheme T any map $T \to F$ is representable by algebraic spaces, and*
3. *for every algebraic space X any map $X \to F$ is representable by algebraic spaces.*

Proof. Assume (1). Let $X \to F$ be as in (3). Let T be a scheme, and let $T \to F$ be a morphism. Then we have

$$T \times_F X = (T \times_S X) \times_{F \times F, \Delta} F$$

which is an algebraic space by Lemma 54.3.7 and (1). Hence $X \to F$ is representable, i.e., (3) holds. The implication (3) $\Rightarrow$ (2) is trivial. Assume (2). Let T be a scheme, and let $(a, b) : T \to F \times F$ be a morphism. Then

$$F \times_{\Delta_F, F \times F} T = T \times_{a, F, b} T$$

which is an algebraic space by assumption. Hence Δ_F is representable by algebraic spaces, i.e., (1) holds. □

In particular if F is a presheaf satisfying the equivalent conditions of the lemma, then for any morphism $X \to F$ where X is an algebraic space it makes sense to say that $X \to F$ is surjective (resp. étale, flat, locally of finite presentation) by using Definition 54.4.1.

Before we actually do the bootstrap we prove a fun lemma.

Lemma 54.5.2. *Let S be a scheme. Let*

$$\begin{tikzcd} E \arrow[r, "a"] \arrow[d, "f"'] & F \arrow[d, "g"] \\ H \arrow[r, "b"] & G \end{tikzcd}$$

be a cartesian diagram of sheaves on $(Sch/S)_{fppf}$, so $E = H \times_G F$. If

(1) *g is representable by algebraic spaces, surjective, flat, and locally of finite presentation, and*
(2) *a is representable by algebraic spaces, separated, and locally quasi-finite*

then b is representable (by schemes) as well as separated and locally quasi-finite.

Proof. Let T be a scheme, and let $T \to G$ be a morphism. We have to show that $T \times_G H$ is an algebraic space, and that the morphism $T \times_G H \to T$ is separated and locally quasi-finite. Thus we may base change the whole diagram to T and assume that G is a scheme. In this case F is an algebraic space. Let U be a scheme, and let $U \to F$ be a surjective étale morphism. Then $U \to F$ is representable, surjective, flat and locally of finite presentation by Morphisms of Spaces, Lemmas 42.35.7 and 42.35.8. By Lemma 54.3.8 $U \to G$ is surjective, flat and locally of finite presentation also. Note that the base change $E \times_F U \to U$ of a is still separated and locally quasi-finite (by Lemma 54.4.2). Hence we may replace the upper part of the diagram of the lemma by $E \times_F U \to U$. In other words, we may assume that $F \to G$ is a surjective, flat morphism of schemes which is locally of finite presentation. In particular, $\{F \to G\}$ is an fppf covering of schemes. By Morphisms of Spaces, Proposition 42.39.2 we conclude that E is a scheme also. By Descent, Lemma 31.35.1 the fact that $E = H \times_G F$ means that we get a descent datum on E relative to the fppf covering $\{F \to G\}$. By More on Morphisms, Lemma 33.35.1 this descent datum is effective. By Descent, Lemma 31.35.1 again this implies that H is a scheme. By Descent, Lemmas 31.19.5 and 31.19.22 it now follows that b is separated and locally quasi-finite. □

Here is the result that the section title refers to.

Lemma 54.5.3. *Let S be a scheme. Let $F : (Sch/S)_{fppf}^{opp} \to Sets$ be a functor. Assume that*

(1) *the presheaf F is a sheaf,*

(2) *there exists an algebraic space X and a map $X \to F$ which is representable by algebraic spaces, surjective, flat and locally of finite presentation.*

Then Δ_F is representable (by schemes).

Proof. Let $U \to X$ be a surjective étale morphism from a scheme towards X. Then $U \to X$ is representable, surjective, flat and locally of finite presentation by Morphisms of Spaces, Lemmas 42.35.7 and 42.35.8. By Lemma 54.4.3 the composition $U \to F$ is representable by algebraic spaces, surjective, flat and locally of finite presentation also. Thus we see that $R = U \times_F U$ is an algebraic space, see Lemma 54.3.7. The morphism of algebraic spaces $R \to U \times_S U$ is a monomorphism, hence separated (as the diagonal of a monomorphism is an isomorphism, see Morphisms of Spaces, Lemma 42.14.2). Since $U \to F$ is locally of finite presentation, both morphisms $R \to U$ are locally of finite presentation, see Lemma 54.4.2. Hence $R \to U \times_S U$ is locally of finite type (use Morphisms of Spaces, Lemmas 42.26.5 and 42.22.6). Altogether this means that $R \to U \times_S U$ is a monomorphism which is locally of finite type, hence a separated and locally quasi-finite morphism, see Morphisms of Spaces, Lemma 42.25.8.

Now we are ready to prove that Δ_F is representable. Let T be a scheme, and let $(a, b) : T \to F \times F$ be a morphism. Set

$$T' = (U \times_S U) \times_{F \times F} T.$$

Note that $U \times_S U \to F \times F$ is representable by algebraic spaces, surjective, flat and locally of finite presentation by Lemma 54.4.4. Hence T' is an algebraic space, and the projection morphism $T' \to T$ is surjective, flat, and locally of finite presentation. Consider $Z = T \times_{F \times F} F$ (this is a sheaf) and

$$Z' = T' \times_{U \times_S U} R = T' \times_T Z.$$

We see that Z' is an algebraic space, and $Z' \to T'$ is separated and locally quasi-finite by the discussion in the first paragraph of the proof which showed that R is an algebraic space and that the morphism $R \to U \times_S U$ has those properties. Hence we may apply Lemma 54.5.2 to the diagram

$$\begin{tikzcd} Z' \arrow[r] \arrow[d] & T' \arrow[d] \\ Z \arrow[r] & T \end{tikzcd}$$

and we conclude. □

54.6. Bootstrap

We warn the reader right away that the result of this section will be superseded by the stronger Theorem 54.10.1. On the other hand, the theorem in this section is quite a bit easier to prove and still provides quite a bit of insight into how things work, especially for those readers mainly interested in Deligne-Mumford stacks.

In Spaces, Section 40.6 we defined an algebraic space as a sheaf in the fppf topology whose diagonal is representable, and such that there exist a surjective étale morphism from a scheme towards it. In this section we show that a sheaf in the fppf topology whose diagonal is representable by algebraic spaces and which has an étale surjective covering by an algebraic space is also an algebraic space. In other words, the category of algebraic spaces is an enlargement of the category of schemes by those fppf sheaves F which have a representable diagonal and an étale covering by a scheme. The result of this section says that doing the same process again starting with the category of algebraic spaces, does not lead to yet another category.

Another motivation for the material in this section is that it will guarantee later that a Deligne-Mumford stack whose inertia stack is trivial is equivalent to an algebraic space, see Algebraic Stacks, Lemma 57.13.2.

Here is the main result of this section (as we mentioned above this will be superseded by the stronger Theorem 54.10.1).

Theorem 54.6.1. *Let S be a scheme. Let $F : (Sch/S)_{fppf}^{opp} \to Sets$ be a functor. Assume that*

(1) *the presheaf F is a sheaf,*
(2) *the diagonal morphism $F \to F \times F$ is representable by algebraic spaces, and*
(3) *there exists an algebraic space X and a map $X \to F$ which is surjective, and étale.*

Then F is an algebraic space.

Proof. We will use the remarks directly below Definition 54.4.1 without further mention. In the situation of the theorem, let $U \to X$ be a surjective étale morphism from a scheme towards X. By Lemma 54.3.8 $U \to F$ is surjective and étale also. Hence the theorem boils down to proving that Δ_F is representable. This follows immediately from Lemma 54.5.3. On the other hand we can circumvent this lemma and show directly F is an algebraic space as in the next paragraph.

Let U be a scheme, and let $U \to F$ be surjective and étale. Set $R = U \times_F U$, which is an algebraic space (see Lemma 54.5.1). The morphism of algebraic spaces $R \to U \times_S U$ is a monomorphism, hence separated (as the diagonal of a monomorphism is an isomorphism). Moreover, since $U \to F$ is étale, we see that $R \to U$ is étale, by Lemma 54.4.2. In particular, we see that $R \to U$ is locally quasi-finite, see Morphisms of Spaces, Lemma 42.35.5. We conclude that also $R \to U \times_S U$ is locally quasi-finite by Morphisms of Spaces, Lemma 42.25.7. Hence Morphisms of Spaces, Proposition 42.39.2 applies and R is a scheme. Hence $F = U/R$ is an algebraic space according to Spaces, Theorem 40.10.5. $\square$

54.7. Finding opens

First we prove a lemma which is a slight improvement and generalization of Spaces, Lemma 40.10.2 to quotient sheaves associated to groupoids.

Lemma 54.7.1. *Let S be a scheme. Let (U, R, s, t, c) be a groupoid scheme over S. Let $g : U' \to U$ be a morphism. Assume*

(1) *the composition*

$$\begin{tikzcd} U' \times_{g,U,t} R \arrow[r, "pr_1"'] \arrow[rr, bend left, "h"] & R \arrow[r, "s"'] & U \end{tikzcd}$$

has an open image $W \subset U$, and
(2) *the resulting map $h : U' \times_{g,U,t} R \to W$ defines a surjection of sheaves in the fppf topology.*

Let $R' = R|_{U'}$ be the restriction of R to U. Then the map of quotient sheaves

$$R'/U' \to R/U$$

in the fppf topology is representable, and is an open immersion.

Proof. Note that W is an R-invariant open subscheme of U. This is true because the set of points of W is the set of points of U which are equivalent in the sense of Groupoids, Lemma 35.3.4 to a point of $g(U') \subset U$ (the lemma applies as $j : R \to U \times_S U$ is a pre-equivalence relation by Groupoids, Lemma 35.11.2). Also $g : U' \to U$ factors through W. Let $R|_W$ be the restriction of R to W. Then it follows that R' is also the restriction of $R|_W$ to U'. Hence we can factor the map of sheaves of the lemma as

$$U'/R' \longrightarrow W/R|_W \longrightarrow U/R$$

By Groupoids, Lemma 35.17.6 we see that the first arrow is an isomorphism of sheaves. Hence it suffices to show the lemma in case g is the immersion of an R-invariant open into U.

Assume $U' \subset U$ is an R-invariant open and g is the inclusion morphism. Set $F = U/R$ and $F' = U'/R'$. By Groupoids, Lemma 35.17.5 or 35.17.6 the map $F' \to F$ is injective. Let $\xi \in F(T)$. We have to show that $T \times_{\xi, F} F'$ is representable by an open subscheme of T. There exists an fppf covering $\{f_i : T_i \to T\}$ such that $\xi|_{T_i}$ is the image via $U \to U/R$ of a morphism $a_i : T_i \to U$. Set $V_i = s_i^{-1}(U')$. We claim that $V_i \times_T T_j = T_i \times_T V_j$ as open subschemes of $T_i \times_T T_j$.

As $a_i \circ \text{pr}_0$ and $a_j \circ \text{pr}_1$ are morphisms $T_i \times_T T_j \to U$ which both map to the section $\xi|_{T_i \times_T T_j} \in F(T_i \times_T T_j)$ we can find an fppf covering $\{f_{ijk} : T_{ijk} \to T_i \times_T T_j\}$ and morphisms $r_{ijk} : T_{ijk} \to R$ such that

$$a_i \circ \text{pr}_0 \circ f_{ijk} = s \circ r_{ijk}, \quad a_j \circ \text{pr}_1 \circ f_{ijk} = t \circ r_{ijk},$$

see Groupoids, Lemma 35.17.4. Since U' is R-invariant we have $s^{-1}(U') = t^{-1}(U')$ and hence $f_{ijk}^{-1}(V_i \times_T T_j) = f_{ijk}^{-1}(T_i \times_T V_j)$. As $\{f_{ijk}\}$ is surjective this implies the claim above. Hence by Descent, Lemma 31.9.2 there exists an open subscheme $V \subset T$ such that $f_i^{-1}(V) = V_i$. We claim that V represents $T \times_{\xi, F} F'$.

As a first step, we will show that $\xi|_V$ lies in $F'(V) \subset F(V)$. Namely, the family of morphisms $\{V_i \to V\}$ is an fppf covering, and by construction we have $\xi|_{V_i} \in F'(V_i)$. Hence by the sheaf property of F' we get $\xi|_V \in F'(V)$. Finally, let $T' \to T$ be a morphism of schemes and that $\xi|_{T'} \in F'(T')$. To finish the proof we have to show that $T' \to T$ factors through V. We can find a fppf covering $\{T'_j \to T'\}_{j \in J}$ and morphisms $b_j : T'_j \to U'$ such that $\xi|_{T'_j}$ is the image via $U' \to U/R$ of b_j. Clearly, it is enough to show that the compositions $T'_j \to T$ factor through V. Hence we may assume that $\xi|_{T'}$ is the image of a morphism $b : T' \to U'$. Now, it is enough to show that $T' \times_T T_i \to T_i$ factors through V_i. Over the scheme $T' \times_T T_i$ the restriction of ξ is the image of two elements of $(U/R)(T' \times_T T_i)$, namely $a_i \circ \text{pr}_1$, and $b \circ \text{pr}_0$, the second of which factors through the R-invariant open U'. Hence by Groupoids, Lemma 35.17.4 there exists a covering $\{h_k : Z_k \to T' \times_T T_i\}$ and morphisms $r_k : Z_k \to R$ such that $a_i \circ \text{pr}_1 \circ h_k = s \circ r_k$ and $b \circ \text{pr}_0 \circ h_k = t \circ r_k$. As U' is an R-invariant open the fact that b has image in U' then implies that each $a_i \circ \text{pr}_1 \circ h_k$ has image in U'. It follows from this that $T' \times_T T_i \to T_i$ has image in V_i by definition of V_i which concludes the proof. □

54.8. Slicing equivalence relations

In this section we explain how to ``improve" a given equivalence relation by slicing. This is not a kind of ``étale slicing" that you may be used to but a much coarser kind of slicing.

Lemma 54.8.1. *Let S be a scheme. Let $j : R \to U \times_S U$ be an equivalence relation on schemes over S. Assume $s, t : R \to U$ are flat and locally of finite presentation. Then there exists an equivalence relation $j' : R' \to U' \times_S U'$ on schemes over S, and an isomorphism*

$$U'/R' \longrightarrow U/R$$

induced by a morphism $U' \to U$ which maps R' into R such that $s', t' : R \to U$ are flat, locally of finite presentation and locally quasi-finite.

Proof. We will prove this lemma in several steps. We will use without further mention that an equivalence relation gives rise to a groupoid scheme and that the restriction of an equivalence relation is an equivalence relation, see Groupoids, Lemmas 35.3.2, 35.11.3, and 35.15.3.

Step 1: We may assume that $s, t : R \to U$ are locally of finite presentation and Cohen-Macaulay morphisms. Namely, as in More on Groupoids, Lemma 36.7.1 let $g : U' \to U$ be the open subscheme such that $t^{-1}(U') \subset R$ is the maximal open over which $s : R \to U$ is Cohen-Macaulay, and denote R' the restriction of R to U'. By the lemma cited above we see that

$$\begin{tikzcd} t^{-1}(U') \arrow[r, equal] & U' \times_{g,U,t} R \arrow[r, "\mathrm{pr}_1"'] \arrow[rr, bend left, "h"] & R \arrow[r, "s"'] & U \end{tikzcd}$$

is surjective. Since h is flat and locally of finite presentation, we see that $\{h\}$ is a fppf covering. Hence by Groupoids, Lemma 35.17.6 we see that $U'/R' \to U/R$ is an isomorphism. By the construction of U' we see that s', t' are Cohen-Macaulay and locally of finite presentation.

Step 2. Assume s, t are Cohen-Macaulay and locally of finite presentation. Let $u \in U$ be a point of finite type. By More on Groupoids, Lemma 36.11.4 there exists an affine scheme U' and a morphism $g : U' \to U$ such that

(1) g is an immersion,
(2) $u \in U'$,
(3) g is locally of finite presentation,
(4) h is flat, locally of finite presentation and locally quasi-finite, and
(5) the morphisms $s', t' : R' \to U'$ are flat, locally of finite presentation and locally quasi-finite.

Here we have used the notation introduced in More on Groupoids, Situation 36.11.1.

Step 3. For each point $u \in U$ which is of finite type choose a $g_u : U'_u \to U$ as in Step 2 and denote R'_u the restriction of R to U'_u. Denote $h_u = s \circ \mathrm{pr}_1 : U'_u \times_{g_u,U,t} R \to U$. Set $U' = \coprod_{u \in U} U'_u$, and $g = \coprod g_u$. Let R' be the restriction of R to U as above. We claim that the pair (U', g) works[1]. Note that

$$\begin{aligned} R' &= \coprod\nolimits_{u_1,u_2 \in U} (U'_{u_1} \times_{g_{u_1},U,t} R) \times_R (R \times_{s,U,g_{u_2}} U'_{u_2}) \\ &= \coprod\nolimits_{u_1,u_2 \in U} (U'_{u_1} \times_{g_{u_1},U,t} R) \times_{h_{u_1},U,g_{u_2}} U'_{u_2} \end{aligned}$$

[1]Here we should check that U' is not too large, i.e., that it is isomorphic to an object of the category Sch_{fppf}, see Section 54.2. This is a purely set theoretical matter; let us use the notion of size of a scheme introduced in Sets, Section 3.9. Note that each U'_u has size at most the size of U and that the cardinality of the index set is at most the cardinality of $|U|$ which is bounded by the size of U. Hence U' is isomorphic to an object of Sch_{fppf} by Sets, Lemma 3.9.9 part (6).

Hence the projection $s' : R' \to U' = \coprod U'_{u_2}$ is flat, locally of finite presentation and locally quasi-finite as a base change of $\coprod h_{u_1}$. Finally, by construction the morphism $h : U' \times_{g,U,t} R \to U$ is equal to $\coprod h_u$ hence its image contains all points of finite type of U. Since each h_u is flat and locally of finite presentation we conclude that h is flat and locally of finite presentation. In particular, the image of h is open (see Morphisms, Lemma 24.24.9) and since the set of points of finite type is dense (see Morphisms, Lemma 24.15.7) we conclude that the image of h is U. This implies that $\{h\}$ is an fppf covering. By Groupoids, Lemma 35.17.6 this means that $U'/R' \to U/R$ is an isomorphism. This finishes the proof of the lemma. □

54.9. Quotient by a subgroupoid

We need one more lemma before we can do our final bootstrap. Let us discuss what is going on in terms of ``plain'' groupoids before embarking on the scheme theoretic version.

Let $\mathcal{C}$ be a groupoid, see Categories, Definition 4.2.5. As discussed in Groupoids, Section 35.11 this corresponds to a quintuple $(\text{Ob}, \text{Arrows}, s, t, c)$. Suppose we are given a subset $P \subset \text{Arrows}$ such that $(\text{Ob}, P, s|_P, t|_P, c|_P)$ is also a groupoid and such that there are no non-trivial automorphisms in P. Then we can construct the quotient groupoid $(\overline{\text{Ob}}, \overline{\text{Arrows}}, \overline{s}, \overline{t}, \overline{c})$ as follows:

(1) $\overline{\text{Ob}} = \text{Ob}/P$ is the set of P-isomorphism classes,
(2) $\overline{\text{Arrows}} = P\backslash\text{Arrows}/P$ is the set of arrows in $\mathcal{C}$ up to pre-composing and post-composing by arrows of P,
(3) the source and target maps $\overline{s}, \overline{t} : P\backslash\text{Arrows}/P \to \text{Ob}/P$ are induced by s, t,
(4) composition is defined by the rule $\overline{c}(\overline{a}, \overline{b}) = \overline{c(a, b)}$ which is well defined.

In fact, it turns out that the original groupoid $(\text{Ob}, \text{Arrows}, s, t, c)$ is canonically isomorphic to the restriction (see discussion in Groupoids, Section 35.15) of the groupoid $(\overline{\text{Ob}}, \overline{\text{Arrows}}, \overline{s}, \overline{t}, \overline{c})$ via the quotient map $g : \text{Ob} \to \overline{\text{Ob}}$. Recall that this means that

$$\text{Arrows} = \text{Ob} \times_{g, \overline{\text{Ob}}, \overline{t}} \overline{\text{Arrows}} \times_{\overline{s}, \overline{\text{Ob}}, g} \text{Ob}$$

which holds as P has no nontrivial automorphisms. We omit the details.

The following lemma holds in much greater generality, but this is the version we use in the proof of the final bootstrap (after which we can more easily prove the more general versions of this lemma).

Lemma 54.9.1. *Let S be a scheme. Let (U, R, s, t, c) be a groupoid scheme over S. Let $P \to R$ be monomorphism of schemes. Assume that*

(1) *$(U, P, s|_P, t|_P, c|_{P \times_{s,U,t} P})$ is a groupoid scheme,*
(2) *$s|_P, t|_P : P \to U$ are finite locally free,*
(3) *$j|_P : P \to U \times_S U$ is a monomorphism.*
(4) *U is affine, and*
(5) *$j : R \to U \times_S U$ is separated and locally quasi-finite,*

Then U/P is representable by an affine scheme $\overline{U}$, the quotient morphism $U \to \overline{U}$ is finite locally free, and $P = U \times_{\overline{U}} U$. Moreover, R is the restriction of a groupoid scheme $(\overline{U}, \overline{R}, \overline{s}, \overline{t}, \overline{c})$ on $\overline{U}$ via the quotient morphism $U \to \overline{U}$.

Proof. Conditions (1), (2), (3), and (4) and Groupoids, Proposition 35.19.8 imply the affine scheme $\overline{U}$ representing U/P exists, the morphism $U \to \overline{U}$ is finite locally free, and $P = U \times_{\overline{U}} U$. The identification $P = U \times_{\overline{U}} U$ is such that $t|_P = \text{pr}_0$ and $s|_P = \text{pr}_1$, and such that composition is equal to $\mathrm{pr}_{02} : U \times_{\overline{U}} U \times_{\overline{U}} U \to U \times_{\overline{U}} U$. A product of finite locally free morphisms is finite locally free (see Spaces, Lemma 40.5.7 and Morphisms, Lemmas 24.44.4 and 24.44.3). To get $\overline{R}$ we are going to descend the scheme R via the finite locally free morphism $U \times_S U \to \overline{U} \times_S \overline{U}$. Namely, note that

$$(U \times_S U) \times_{(\overline{U} \times_S \overline{U})} (U \times_S U) = P \times_S P$$

by the above. Thus giving a descent datum (see Descent, Definition 31.30.1) for $R/U \times_S U/\overline{U} \times_S \overline{U}$ consists of an isomorphism

$$\varphi : R \times_{(U \times_S U), t \times t} (P \times_S P) \longrightarrow (P \times_S P) \times_{s \times s, (U \times_S U)} R$$

over $P \times_S P$ satisfying a cocycle condition. We define φ on T-valued points by the rule

$$\varphi : (r, (p, p')) \longmapsto ((p, p'), p^{-1} \circ r \circ p')$$

where the composition is taken in the groupoid category $(U(T), R(T), s, t, c)$. This makes sense because for $(r, (p, p'))$ to be a T-valued point of the source of φ it needs to be the case that $t(r) = t(p)$ and $s(r) = t(p')$. Note that this map is an isomorphism with inverse given by $((p, p'), r') \mapsto (p \circ r' \circ (p')^{-1}, (p, p'))$. To check the cocycle condition we have to verify that $\varphi_{02} = \varphi_{12} \circ \varphi_{01}$ as maps over

$$(U \times_S U) \times_{(\overline{U} \times_S \overline{U})} (U \times_S U) \times_{(\overline{U} \times_S \overline{U})} (U \times_S U) = (P \times_S P) \times_{s \times s, (U \times_S U), t \times t} (P \times_S P)$$

By explicit calculation we see that

$$\begin{array}{lllc} \varphi_{02} & (r, (p_1, p_1'), (p_2, p_2')) & \mapsto & ((p_1, p_1'), (p_2, p_2'), (p_1 \circ p_2)^{-1} \circ r \circ (p_1' \circ p_2')) \\ \varphi_{01} & (r, (p_1, p_1'), (p_2, p_2')) & \mapsto & ((p_1, p_1'), p_1^{-1} \circ r \circ p_1', (p_2, p_2')) \\ \varphi_{12} & ((p_1, p_1'), r, (p_2, p_2')) & \mapsto & ((p_1, p_1'), (p_2, p_2'), p_2^{-1} \circ r \circ p_2') \end{array}$$

(with obvious notation) which implies what we want. As j is separated and locally quasi-finite by (5) we may apply More on Morphisms, Lemma 33.35.1 to get a scheme $\overline{R} \to \overline{U} \times_S \overline{U}$ and an isomorphism

$$R \to \overline{R} \times_{(\overline{U} \times_S \overline{U})} (U \times_S U)$$

which identifies the descent datum φ with the canonical descent datum on $\overline{R} \times_{(\overline{U} \times_S \overline{U})} (U \times_S U)$, see Descent, Definition 31.30.10.

Since $U \times_S U \to \overline{U} \times_S \overline{U}$ is finite locally free we conclude that $R \to \overline{R}$ is finite locally free as a base change. Hence $R \to \overline{R}$ is surjective as a map of sheaves on $(Sch/S)_{fppf}$. Our choice of φ implies that given T-valued points $r, r' \in R(T)$ these have the same image in $\overline{R}$ if and only if $p^{-1} \circ r \circ p'$ for some $p, p' \in P(T)$. Thus $\overline{R}$ represents the sheaf

$$T \longmapsto \overline{R(T)} = P(T) \backslash R(T) / P(T)$$

with notation as in the discussion preceding the lemma. Hence we can define the groupoid structure on $(\overline{U} = U/P, \overline{R} = P \backslash R/P)$ exactly as in the discussion of the ``plain'' groupoid case. It follows from this that (U, R, s, t, c) is the pullback of this groupoid structure via the morphism $U \to \overline{U}$. This concludes the proof. □

54.10. Final bootstrap

The results in this section go quite a bit beyond the earlier results.

Theorem 54.10.1. *Let S be a scheme. Let $F : (Sch/S)_{fppf}^{opp} \to Sets$ be a functor. Any one of the following conditions implies that F is an algebraic space:*

(1) *$F = U/R$ where (U, R, s, t, c) is a groupoid in algebraic spaces over S such that s, t are flat and locally of finite presentation, and $j = (t, s) : R \to U \times_S U$ is an equivalence relation,*
(2) *$F = U/R$ where (U, R, s, t, c) is a groupoid scheme over S such that s, t are flat and locally of finite presentation, and $j = (t, s) : R \to U \times_S U$ is an equivalence relation,*
(3) *F is a sheaf and there exists an algebraic space U and a morphism $U \to F$ which is which is representable by algebraic spaces, surjective, flat and locally of finite presentation,*
(4) *F is a sheaf and there exists a scheme U and a morphism $U \to F$ which is which is representable (by algebraic spaces or schemes), surjective, flat and locally of finite presentation,*
(5) *F is a sheaf, Δ_F is representable by algebraic spaces, and there exists an algebraic space U and a morphism $U \to F$ which is surjective, flat, and locally of finite presentation, or*
(6) *F is a sheaf, Δ_F is representable, and there exists a scheme U and a morphism $U \to F$ which is surjective, flat, and locally of finite presentation.*

Proof. Trivial observations: (6) is a special case of (5) and (4) is a special case of (3). We first prove that cases (5) and (3) reduce to case (1). Namely, by bootstrapping the diagonal Lemma 54.5.3 we see that (3) implies (5). In case (5) we set $R = U \times_F U$ which is an algebraic space by assumption. Moreover, by assumption both projections $s, t : R \to U$ are surjective, flat and locally of finite presentation. The map $j : R \to U \times_S U$ is clearly an equivalence relation. By Lemma 54.4.5 the map $U \to F$ is a surjection of sheaves. Thus $F = U/R$ which reduces us to case (1).

Next, we show that (1) reduces to (2). Namely, let (U, R, s, t, c) be a groupoid in algebraic spaces over S such that s, t are flat and locally of finite presentation, and $j = (t, s) : R \to U \times_S U$ is an equivalence relation. Choose a scheme U' and a surjective étale morphism $U' \to U$. Let $R' = R|_{U'}$ be the restriction of R to U'. By Groupoids in Spaces, Lemma 52.18.6 we see that $U/R = U'/R'$. Since $s', t' : R' \to U'$ are also flat and locally of finite presentation (see More on Groupoids in Spaces, Lemma 53.6.1) this reduces us to the case where U is a scheme. As j is an equivalence relation we see that j is a monomorphism. As $s : R \to U$ is locally of finite presentation we see that $j : R \to U \times_S U$ is locally of finite type, see Morphisms of Spaces, Lemma 42.22.6. By Morphisms of Spaces, Lemma 42.25.8 we see that j is locally quasi-finite and separated. Hence if U is a scheme, then R is a scheme by Morphisms of Spaces, Proposition 42.39.2. Thus we reduce to proving the theorem in case (2).

Assume $F = U/R$ where (U, R, s, t, c) is a groupoid scheme over S such that s, t are flat and locally of finite presentation, and $j = (t, s) : R \to U \times_S U$ is an equivalence relation. By Lemma 54.8.1 we reduce to that case where s, t are flat, locally of finite presentation, and locally quasi-finite. Let $U = \bigcup_{i \in I} U_i$ be an affine open covering (with index set I of cardinality $\leq$ than the size of U to avoid set theoretic problems later -- most readers can safely ignore this remark). Let $(U_i, R_i, s_i, t_i, c_i)$ be the restriction of R to U_i. It is clear that s_i, t_i are still flat, locally of finite presentation, and locally quasi-finite as R_i is the open subscheme $s^{-1}(U_i) \cap t^{-1}(U_i)$ of R and s_i, t_i are the restrictions of s, t to this open. By Lemma 54.7.1 (or the simpler Spaces, Lemma 40.10.2) the map $U_i/R_i \to U/R$ is representable by open immersions. Hence if we can show that $F_i = U_i/R_i$ is an algebraic space, then $\coprod_{i \in I} F_i$ is an algebraic space by Spaces, Lemma 40.8.3. As $U = \bigcup U_i$ is an open covering it is clear that $\coprod F_i \to F$ is surjective. Thus it follows that U/R is an algebraic space, by Spaces, Lemma 40.8.4. In this way we reduce to the case where U is affine and s, t are flat, locally of finite presentation, and locally quasi-finite and j is an equivalence.

Assume (U, R, s, t, c) is a groupoid scheme over S, with U affine, such that s, t are flat, locally of finite presentation, and locally quasi-finite, and j is an equivalence relation. Choose $u \in U$. We apply More on Groupoids in Spaces, Lemma 53.11.9 to $u \in U, R, s, t, c$. We obtain an affine scheme U', an étale morphism $g : U' \to U$, a point $u' \in U'$ with $\kappa(u) = \kappa(u')$ such that the restriction $R' = R|_{U'}$ is quasi-split over u'. Note that the image $g(U')$ is open as g is étale and contains u'. Hence, repeatedly applying the lemma, we can find finitely many points $u_i \in U$, $i = 1, \ldots, n$, affine schemes U_i', étale morphisms $g_i : U_i' \to U$, points $u_i' \in U_i'$ with $g(u_i') = u_i$ such that (a) each restriction R_i' is quasi-split over some point in U_i' and (b) $U = \bigcup_{i=1,\ldots,n} g_i(U_i')$. Now we rerun the last part of the argument in the preceding paragraph: Using Lemma 54.7.1 (or the simpler Spaces, Lemma 40.10.2) the map $U_i'/R_i' \to U/R$ is representable by open immersions. If we can show that $F_i = U_i'/R_i'$ is an algebraic space, then $\coprod_{i \in I} F_i$ is an algebraic space by Spaces, Lemma 40.8.3. As $\{g_i : U_i' \to U\}$ is an étale covering it is clear that $\coprod F_i \to F$ is surjective. Thus it follows that U/R is an algebraic space, by Spaces, Lemma 40.8.4. In this way we reduce to the case where U is affine and s, t are flat, locally of finite presentation, and locally quasi-finite, j is an equivalence, and R is quasi-split over u for some $u \in U$.

Assume (U, R, s, t, c) is a groupoid scheme over S, with U affine, $u \in U$ such that s, t are flat, locally of finite presentation, and locally quasi-finite and $j = (t, s) : R \to U \times_S U$ is an equivalence relation and R is quasi-split over u. Let $P \subset R$ be a quasi-splitting of R over u. By Lemma 54.9.1 we see that (U, R, s, t, c) is the restriction of a groupoid $(\overline{U}, \overline{R}, \overline{s}, \overline{t}, \overline{c})$ by a surjective finite locally free morphism $U \to \overline{U}$ such that $P = U \times_{\overline{U}} U$. Note that s, t are the base changes of the morphsms $\overline{s}, \overline{t}$ by $U \to \overline{U}$. As $\{U \to \overline{U}\}$ is an fppf covering we conclude $\overline{s}, \overline{t}$ are flat, locally of finite presentation, and locally quasi-finite, see Descent, Lemmas 31.19.13, 31.19.9, and 31.19.22. Consider the commutative diagram

$$
\begin{tikzcd}
U \times_{\overline{U}} U \arrow[r, equal] \arrow[dr] & P \arrow[r] \arrow[d] & R \arrow[d] \\
& \overline{U} \arrow[r, "\overline{e}"] & \overline{R}
\end{tikzcd}
$$

It is a general fact about restrictions that the outer four corners form a cartesian diagram. By the equality we see the inner square is cartesian. Since P is open in R (by definition of a quasi-splitting) we conclude that $\overline{e}$ is an open immersion by Descent, Lemma 31.19.14. An application of Groupoids, Lemma 35.17.5 shows that $U/R = \overline{U}/\overline{R}$. Hence we have reduced to the case where (U, R, s, t, c) is a groupoid scheme over S, with U affine, $u \in U$ such that s, t are flat, locally of finite presentation, and locally quasi-finite and $j = (t, s) : R \to U \times_S U$ is an equivalence relation and $e : U \to R$ is an open immersion!

But of course, if e is an open immersion and s, t are flat and locally of finite presentation then the morphisms t, s are étale. For example you can see this by applying More on Groupoids, Lemma 36.4.1 which shows that $\Omega_{R/U} = 0$ which in turn implies that $s, t : R \to U$ is G-unramified (see Morphisms, Lemma 24.34.2), which in turn implies that s, t are étale (see Morphisms, Lemma 24.35.16). And if s, t are étale then finally U/R is an algebraic space by Spaces, Theorem 40.10.5. $\square$

54.11. Applications

As a first application we obtain the following fundamental fact:

$$\boxed{\text{A sheaf which is fppf locally an algebraic space is an algebraic space.}}$$

This is the content of the following lemma. Note that assumption (2) is equivalent to the condition that $F|_{(Sch/S_i)_{fppf}}$ is an algebraic space, see Spaces, Lemma 40.16.4. Assumption (3) is a set theoretic condition which may be ignored by those not worried about set theoretic questions.

Lemma 54.11.1. *Let S be a scheme. Let $F : (Sch/S)_{fppf}^{opp} \to Sets$ be a functor. Let $\{S_i \to S\}_{i\in I}$ be a covering of $(Sch/S)_{fppf}$. Assume that*

(1) *F is a sheaf,*
(2) *each $F_i = h_{S_i} \times F$ is an algebraic space, and*
(3) *$\coprod_{i\in I} F_i$ is an algebraic space (see Spaces, Lemma 40.8.3).*

Then F is an algebraic space.

Proof. Consider the morphism $\coprod F_i \to F$. This is the base change of $\coprod S_i \to S$ via $F \to S$. Hence it is representable, locally of finite presentation, flat and surjective by our definition of an fppf covering and Lemma 54.4.2. Thus Theorem 54.10.1 applies to show that F is an algebraic space. $\square$

Here is a special case where we do not need to worry about set theoretical issues.

Lemma 54.11.2. *Let S be a scheme. Let $F : (Sch/S)_{fppf}^{opp} \to Sets$ be a functor. Let $\{S_i \to S\}_{i\in I}$ be a covering of $(Sch/S)_{fppf}$. Assume that*

(1) *F is a sheaf,*
(2) *each $F_i = h_{S_i} \times F$ is an algebraic space, and*
(3) *the morphisms $F_i \to S_i$ are of finite type.*

Then F is an algebraic space.

Proof. We will use Lemma 54.11.1 above. To do this we will show that the assumption that F_i is of finite type over S_i to prove that the set theoretic condition in the lemma is satisfied (after perhaps refining the given covering of S a bit). We suggest the reader skip the rest of the proof.

If $S_i' \to S_i$ is a morphism of schemes then

$$h_{S_i'} \times F = h_{S_i'} \times_{h_{S_i}} h_{S_i} \times F = h_{S_i'} \times_{h_{S_i}} F_i$$

is an algebraic space of finite type over S_i', see Spaces, Lemma 40.7.3 and Morphisms of Spaces, Lemma 42.22.3. Thus we may refine the given covering. After doing this we may assume: (a) each S_i is affine, and (b) the cardinality of I is at most the cardinality of the set of points of S. (Since to cover all of S it is enough that each point is in the image of $S_i \to S$ for some i.)

Since each S_i is affine and each F_i of finite type over S_i we conclude that F_i is quasi-compact. Hence by Properties of Spaces, Lemma 41.6.3 we can find an affine $U_i \in Ob((Sch/S)_{fppf})$ and a surjective étale morphism $U_i \to F_i$. The fact that $F_i \to S_i$ is locally of finite type then implies that $U_i \to S_i$ is locally of finite type, and in particular $U_i \to S$ is locally of finite type. By Sets, Lemma 3.9.7 we conclude that $\text{size}(U_i) \leq \text{size}(S)$. Since also $|I| \leq \text{size}(S)$ we conclude that $\coprod_{i\in I} U_i$ is isomorphic to an object of $(Sch/S)_{fppf}$ by Sets, Lemma 3.9.5

and the construction of *Sch*. This implies that $\coprod F_i$ is an algebraic space by Spaces, Lemma 40.8.3 and we win. □

Lemma 54.11.3. *Assume $B \to S$ and (U, R, s, t, c) are as in Groupoids in Spaces, Definition 52.19.1 (1). For any scheme T over S and objects x, y of $[U/R]$ over T the sheaf $Isom(x, y)$ on $(Sch/T)_{fppf}$ is an algebraic space.*

Proof. By Groupoids in Spaces, Lemma 52.21.3 there exists an fppf covering $\{T_i \to T\}_{i\in I}$ such that $Isom(x, y)|_{(Sch/T_i)_{fppf}}$ is an algebraic space for each i. By Spaces, Lemma 40.16.4 this means that each $F_i = h_{S_i} \times Isom(x, y)$ is an algebraic space. Thus to prove the lemma we only have to verify the set theoretic condition that $\coprod F_i$ is an algebraic space of Lemma 54.11.1 above to conclude. To do this we use Spaces, Lemma 40.8.3 which requires showing that I and the F_i are not ``too large". We suggest the reader skip the rest of the proof.

Choose $U' \in Ob(Sch/S)_{fppf}$ and a surjective étale morphism $U' \to U$. Let R' be the restriction of R to U'. Since $[U/R] = [U'/R']$ we may, after replacing U by U', assume that U is a scheme. (This step is here so that the fibre products below are over a scheme.)

Note that if we refine the covering $\{T_i \to T\}$ then it remains true that each F_i is an algebraic space. Hence we may assume that each T_i is affine. Since $T_i \to T$ is locally of finite presentation, this then implies that $\text{size}(T_i) \leq \text{size}(T)$, see Sets, Lemma 3.9.7. We may also assume that the cardinality of the index set I is at most the cardinality of the set of points of T since to get a covering it suffices to check that each point of T is in the image. Hence $|I| \leq \text{size}(T)$. Choose $W \in Ob((Sch/S)_{fppf})$ and a surjective étale morphism $W \to R$. Note that in the proof of Groupoids in Spaces, Lemma 52.21.3 we showed that F_i is representable by $T_i \times_{(y_i,x_i),U\times_B U} R$ for some $x_i, y_i : T_i \to U$. Hence now we see that $V_i = T_i \times_{(y_i,x_i),U\times_B U} W$ is a scheme which comes with an étale surjection $V_i \to F_i$. By Sets, Lemma 3.9.6 we see that

$$\text{size}(V_i) \leq \max\{\text{size}(T_i), \text{size}(W)\} \leq \max\{\text{size}(T), \text{size}(W)\}$$

Hence, by Sets, Lemma 3.9.5 we conclude that

$$\text{size}(\coprod\nolimits_{i\in I} V_i) \leq \max\{|I|, \text{size}(T), \text{size}(W)\}.$$

Hence we conclude by our construction of *Sch* that $\coprod_{i\in I} V_i$ is isomorphic to an object V of $(Sch/S)_{fppf}$. This verifies the hypothesis of Spaces, Lemma 40.8.3 and we win. □

Lemma 54.11.4. *Let S be a scheme. Consider an algebraic space F of the form $F = U/R$ where (U, R, s, t, c) is a groupoid in algebraic spaces over S such that s, t are flat and locally of finite presentation, and $j = (t, s) : R \to U \times_S U$ is an equivalence relation. Then $U \to F$ is surjective, flat, and locally of finite presentation.*

Proof. This is almost but not quite a triviality. Namely, by Groupoids in Spaces, Lemma 52.18.5 and the fact that j is a monomorphism we see that $R = U \times_F U$. Choose a scheme W and a surjective étale morphism $W \to F$. As $U \to F$ is a surjection of sheaves we can find an fppf covering $\{W_i \to W\}$ and maps $W_i \to U$ lifting the morphisms $W_i \to F$. Then we see that

$$W_i \times_F U = W_i \times_U U \times_F U = W_i \times_{U,t} R$$

and the projection $W_i \times_F U \to W_i$ is the base change of $t : R \to U$ hence flat and locally of finite presentation, see Morphisms of Spaces, Lemmas 42.27.3 and 42.26.3. Hence by Descent on Spaces, Lemmas 45.10.11 and 45.10.8 we see that $U \to F$ is flat and locally of finite presentation. It is surjective by Spaces, Remark 40.5.2. □

Lemma 54.11.5. *Let S be a scheme. Let $X \to B$ be a morphism of algebraic spaces over S. Let G be a group algebraic space over B and let $a : G \times_B X \to X$ be an action of G on X/B. If*

(1) *a is a free action, and*
(2) *$G \to B$ is flat and locally of finite presentation,*

then X/G (see Groupoids in Spaces, Definition 52.18.1) is an algebraic space and $X \to X/G$ is surjective, flat, and locally of finite presentation.

Proof. The fact that X/G is an algebraic space is immediate from Theorem 54.10.1 and the definitions. Namely, $X/G = X/R$ where $R = G \times_B X$. The morphisms $s, t : G \times_B X \to X$ are flat and locally of finite presentation (clear for s as a base change of $G \to B$ and by symmetry using the inverse it follows for t) and the morphism $j : G \times_B X \to X \times_B X$ is a monomorphism by Groupoids in Spaces, Lemma 52.8.3 as the action is free. The asssertions about the morphism $X \to X/G$ follow from Lemma 54.11.4. $\square$

Lemma 54.11.6. *Let $\{S_i \to S\}_{i \in I}$ be a covering of $(Sch/S)_{fppf}$. Let G be a group algebraic space over S, and denote $G_i = G_{S_i}$ the base changes. Suppose given*

(1) *for each $i \in I$ an fppf G_i-torsor X_i over S_i, and*
(2) *for each $i, j \in I$ a $G_{S_i \times_S S_j}$-equivariant isomorphism $\varphi_{ij} : X_i \times_S S_j \to S_i \times_S X_j$ satisfying the cocycle condition over every $S_i \times_S S_j \times_S S_j$.*

Then there exists an fppf G-torsor X over S whose base change to S_i is isomorphic to X_i such that we recover the descent datum φ_{ij}.

Proof. We may think of X_i as a sheaf on $(Sch/S_i)_{fppf}$, see Spaces, Section 40.16. By Sites, Section 9.22 the descent datum (X_i, φ_{ij}) is effective in the sense that there exists a unique sheaf X on $(Sch/S)_{fppf}$ which recovers the algebraic spaces X_i after restricting back to $(Sch/S_i)_{fppf}$. Hence we see that $X_i = h_{S_i} \times X$. By Lemma 54.11.1 we see that X is an algebraic space, modulo verifying that $\coprod X_i$ is an algebraic space which we do at the end of the proof. By the equivalence of categories in Sites, Lemma 9.22.3 the action maps $G_i \times_{S_i} X_i \to X_i$ glue to give a map $a : G \times_S X \to X$. Now we have to show that a is an action and that X is a pseudo-torsor, and fppf locally trivial (see Groupoids in Spaces, Definition 52.9.3). These may be checked fppf locally, and hence follow from the corresponding properties of the actions $G_i \times_{S_i} X_i \to X_i$. Hence the lemma is true.

We suggest the reader skip the rest of the proof, which is purely set theoretical. Pick coverings $\{S_{ij} \to S_j\}_{j \in J_i}$ of $(Sch/S)_{fppf}$ which trivialize the G_i torsors X_i (possible by assumption, and Topologies, Lemma 30.7.7 part (1)). Then $\{S_{ij} \to S\}_{i \in I, j \in J_i}$ is a covering of $(Sch/S)_{fppf}$ and hence we may assume that each X_i is the trivial torsor! Of course we may also refine the covering further, hence we may assume that each S_i is affine and that the index set I has cardinality bounded by the cardinality of the set of points of S. Choose $U \in Ob((Sch/S)_{fppf})$ and a surjective étale morphism $U \to G$. Then we see that $U_i = U \times_S S_i$ comes with an étale surjective morphism to $X_i \cong G_i$. By Sets, Lemma 3.9.6 we see $\text{size}(U_i) \leq \max\{\text{size}(U), \text{size}(S_i)\}$. By Sets, Lemma 3.9.7 we have $\text{size}(S_i) \leq \text{size}(S)$. Hence we see that $\text{size}(U_i) \leq \max\{\text{size}(U), \text{size}(S)\}$ for all $i \in I$. Together with the bound on $|I|$ we found above we conclude from Sets, Lemma 3.9.5 that $\text{size}(\coprod U_i) \leq \max\{\text{size}(U), \text{size}(S)\}$. Hence Spaces, Lemma 40.8.3 applies to show that $\coprod X_i$ is an algebraic space which is what we had to prove. $\square$

54.12. Algebraic spaces in the étale topology

Let S be a scheme. Instead of working with sheaves over the big fppf site $(Sch/S)_{fppf}$ we could work with sheaves over the big étale site $(Sch/S)_{étale}$. All of the material in Algebraic Spaces, Sections 40.3 and 40.5 makes sense for sheaves over $(Sch/S)_{étale}$. Thus we get a second notion of algebraic spaces by working in the étale topology. This notion is (a priori) weaker then the notion introduced in Algebraic Spaces, Definition 40.6.1 since a sheaf in the fppf topology is certainly a sheaf in the étale topology. However, the notions are equivalent as is shown by the following lemma.

Lemma 54.12.1. *Denote the common underlying category of Sch_{fppf} and $Sch_{étale}$ by Sch_α (see Topologies, Remark 30.9.1). Let S be an object of Sch_α.*

$$F : (Sch_\alpha/S)^{opp} \longrightarrow Sets$$

be a presheaf with the following properties:

(1) *F is a sheaf for the étale topology,*
(2) *the diagonal $\Delta : F \to F \times F$ is representable, and*
(3) *there exists $U \in Ob(Sch_\alpha/S)$ and $U \to F$ which is surjective and étale.*

Then F is an algebraic space in the sense of Algebraic Spaces, Definition 40.6.1.

Proof. Note that properties (2) and (3) of the lemma and the corresponding properties (2) and (3) of Algebraic Spaces, Definition 40.6.1 are independent of the topology. This is true because these properties involve only the notion of a fibre product of presheaves, maps of presheaves, the notion of a representable transformation of functors, and what it means for such a transformation to be surjective and étale. Thus all we have to prove is that an étale sheaf F with properties (2) and (3) is also an fppf sheaf.

To do this, let $R = U \times_F U$. By (2) the presheaf R is representable by a scheme and by (3) the projections $R \to U$ are étale. Thus $j : R \to U \times_S U$ is an étale equivalence relation. Moreover the map $U \to F$ identifies F as the quotient of U by R for the étale topology (follows exactly as in the proof of Algebraic Spaces, Lemma 40.9.1). Next, let U/R denote the quotient sheaf in the fppf topology which is an algebraic space by Spaces, Theorem 40.10.5. Thus we have morphisms (tranformations of functors)

$$U \to F \to U/R.$$

By the aforementioned Spaces, Theorem 40.10.5 the composition is representable, surjective, and étale. Hence for any scheme T and morphism $T \to U/R$ the fibre product $V = T \times_{U/R} U$ is a scheme surjective and étale over T. In other words, $\{V \to U\}$ is an étale covering. This proves that $U \to U/R$ is surjective as a map of sheaves in the étale topology. It follows that $F \to U/R$ is surjective as a map of sheaves in the étale topology. On the other hand, the map $F \to U/R$ is injective (as a map of presheaves) since $R = U \times_{U/R} U$ again by Spaces, Theorem 40.10.5. It follows that $F \to U/R$ is an isomorphism of étale sheaves, see Sites, Lemma 9.11.2 which concludes the proof. □

CHAPTER 55

Examples of Stacks

55.1. Introduction

This is a discussion of examples of stacks in algebraic geometry. Some of them are algebraic stacks, some are not. We will discuss which are algebraic stacks in a later chapter. This means that in this chapter we mainly worry about the descent conditions. See [**Vis**] for example.

55.2. Notation

In this chapter we fix a suitable big fppf site Sch_{fppf} as in Topologies, Definition 30.7.6. So, if not explicitly stated otherwise all schemes will be objects of Sch_{fppf}. We will always work relative to a base S contained in Sch_{fppf}. And we will then work with the big fppf site $(Sch/S)_{fppf}$, see Topologies, Definition 30.7.8. The absolute case can be recovered by taking $S = Spec(\mathbf{Z})$.

55.3. Examples of stacks

We first give some important examples of stacks over $(Sch/S)_{fppf}$.

55.4. Quasi-coherent sheaves

We define a category $QCoh$ as follows:

(1) An object of $QCoh$ is a pair $(X, \mathcal{F})$, where X/S is an object of $(Sch/S)_{fppf}$, and $\mathcal{F}$ is a quasi-coherent $\mathcal{O}_X$-module, and
(2) a morphism $(f, \varphi) : (Y, \mathcal{G}) \to (X, \mathcal{F})$ is a pair consisting of a morphism $f : Y \to X$ of schemes over S and an f-map (see Sheaves, Section 6.26) $\varphi : \mathcal{F} \to \mathcal{G}$.
(3) The composition of morphisms

$$(Z, \mathcal{H}) \xrightarrow{(g,\psi)} (Y, \mathcal{G}) \xrightarrow{(f,\phi)} (X, \mathcal{F})$$

is $(f \circ g, \psi \circ \phi)$ where $\psi \circ \phi$ is the composition of f-maps.

Thus $QCoh$ is a category and

$$p : QCoh \to (Sch/S)_{fppf}, \quad (X, \mathcal{F}) \mapsto X$$

is a functor. Note that the fibre category of $QCoh$ over a scheme X is just the category $QCoh(X)$ of quasi-coherent $\mathcal{O}_X$-modules. We remark for later use that given $(X, \mathcal{F}), (Y, \mathcal{G}) \in Ob(QCoh)$ we have

$$Mor_{QCoh}((Y, \mathcal{G}), (X, \mathcal{F})) = \coprod\nolimits_{f \in Mor_S(Y,X)} Mor_{QCoh(Y)}(f^*\mathcal{F}, \mathcal{G}) \tag{55.4.0.1}$$

See the discussion on f-maps of modules in Sheaves, Section 6.26.

The category $QCoh$ is not a stack over $(Sch/S)_{fppf}$ because its collection of objects is a proper class. On the other hand we will see that it does satisfy all the axioms of a stack. We will get around the set theoretical issue in Section 55.5.

Lemma 55.4.1. *A morphism $(f, \varphi) : (Y, \mathcal{G}) \to (X, \mathcal{F})$ of $QCoh$ is strongly cartesian if and only if the map φ induces an isomorphism $f^*\mathcal{F} \to \mathcal{G}$.*

Proof. Let $(X, \mathcal{F}) \in Ob(QCoh)$. Let $f : Y \to X$ be a morphism of $(Sch/S)_{fppf}$. Note that there is a canonical f-map $c : \mathcal{F} \to f^*\mathcal{F}$ and hence we get a morphism $(f, c) : (Y, f^*\mathcal{F}) \to (X, \mathcal{F})$. We claim that (f, c) is strongly cartesian. Namely, for any object $(Z, \mathcal{H})$ of $QCoh$ we have

$$\begin{aligned} Mor_{QCoh}((Z, \mathcal{H}), (Y, f^*\mathcal{F})) &= \coprod\nolimits_{g \in Mor_S(Z,Y)} Mor_{QCoh(Z)}(g^*f^*\mathcal{F}, \mathcal{H}) \\ &= \coprod\nolimits_{g \in Mor_S(Z,Y)} Mor_{QCoh(Z)}((f \circ g)^*\mathcal{F}, \mathcal{H}) \\ &= Mor_{QCoh}((Z, \mathcal{H}), (X, \mathcal{F})) \times_{Mor_S(Z,X)} Mor_S(Z, Y) \end{aligned}$$

where we have used Equation (55.4.0.1) twice. This proves that the condition of Categories, Definition 4.30.1 holds for (f, c), and hence our claim is true. Now by Categories, Lemma 4.30.2 we see that isomorphisms are strongly cartesian and compositions of strongly cartesian morphisms are strongly cartesian which proves the ``if" part of the lemma. For the converse, note that given $(X, \mathcal{F})$ and $f : Y \to X$, if there exists a strongly cartesian morphism lifting f with target $(X, \mathcal{F})$ then it has to be isomorphic to (f, c) (see discussion following Categories, Definition 4.30.1). Hence the "only if" part of the lemma holds. □

Lemma 55.4.2. *The functor $p : QCoh \to (Sch/S)_{fppf}$ satisfies conditions (1), (2) and (3) of Stacks, Definition 50.4.1.*

Proof. It is clear from Lemma 55.4.1 that $QCoh$ is a fibred category over $(Sch/S)_{fppf}$. Given covering $\mathcal{U} = \{X_i \to X\}_{i \in I}$ of $(Sch/S)_{fppf}$ the functor

$$QCoh(T) \longrightarrow DD(\mathcal{U})$$

is fully faithful and essentially surjective, see Descent, Proposition 31.4.2. Hence Stacks, Lemma 50.4.2 applies to show that $QCoh$ satisfies all the axioms of a stack. □

55.5. The stack of finitely generated quasi-coherent sheaves

It turns out that we can get a stack of quasi-coherent sheaves if we only consider finite type quasi-coherent modules. Let us denote

$$p_{fg} : QCoh_{fg} \to (Sch/S)_{fppf}$$

the full subcategory of $QCoh$ over $(Sch/S)_{fppf}$ consisting of pairs $(T, \mathcal{F})$ such that $\mathcal{F}$ is a quasi-coherent $\mathcal{O}_T$-module of finite type.

Lemma 55.5.1. *The functor $p_{fg} : QCoh_{fg} \to (Sch/S)_{fppf}$ satisfies conditions (1), (2) and (3) of Stacks, Definition 50.4.1.*

Proof. We will verify assumptions (1), (2), (3) of Stacks, Lemma 50.4.3 to prove this. By Lemma 55.4.1 a morphism $(Y, \mathcal{G}) \to (X, \mathcal{F})$ is strongly cartesian if and only if it induces an isomorphism $f^*\mathcal{F} \to \mathcal{G}$. By Modules, Lemma 15.9.2 the pullback of a finite type $\mathcal{O}_X$-module is of finite type. Hence assumption (1) of Stacks, Lemma 50.4.3 holds. Assumption (2) holds trivially. Finally, to prove assumption (3) we have to show: If $\mathcal{F}$ is a quasi-coherent $\mathcal{O}_X$-module and $\{f_i : X_i \to X\}$ is an fppf covering such that each $f_i^*\mathcal{F}$ is of finite type, then $\mathcal{F}$ is of finite type. Considering the restriction of $\mathcal{F}$ to an affine open of X

this reduces to the following algebra statement: Suppose that $R \to S$ is a finitely presented, faithfully flat ring map and M an R-module. If $M \otimes_R S$ is a finitely generated S-module, then M is a finitely generated R-module. A stronger form of the algebra fact can be found in Algebra, Lemma 7.77.2. □

Lemma 55.5.2. *Let $(X, \mathcal{O}_X)$ be a ringed space.*

1. *The category of finite type $\mathcal{O}_X$-modules has a set of isomorphism classes.*
2. *The category of finite type quasi-coherent $\mathcal{O}_X$-modules has a set of isomorphism classes.*

Proof. Part (2) follows from part (1) as the category in (2) is a full subcategory of the category in (1). Consider any open covering $\mathcal{U} : X = \bigcup_{i \in I} U_i$. Denote $j_i : U_i \to X$ the inclusion maps. Consider any map $r : I \to \mathbf{N}$. If $\mathcal{F}$ is an $\mathcal{O}_X$-module whose restriction to U_i is generated by at most $r(i)$ sections from $\mathcal{F}(U_i)$, then $\mathcal{F}$ is a quotient of the sheaf

$$\mathcal{H}_{\mathcal{U},r} = \bigoplus\nolimits_{i \in I} j_{i,!}\mathcal{O}_{U_i}^{\oplus r(i)}$$

By definition, if $\mathcal{F}$ is of finite type, then there exists some open covering with $\mathcal{U}$ whose index set is $I = X$ such that this condition is true. Hence it suffices to show that there is a set of possible choices for $\mathcal{U}$ (obvious), a set of possible choices for $r : I \to \mathbf{N}$ (obvious), and a set of possible quotient modules of $\mathcal{H}_{\mathcal{U},r}$ for each $\mathcal{U}$ and r. In other words, it suffices to show that given an $\mathcal{O}_X$-module $\mathcal{H}$ there is at most a set of isomorphism classes of quotients. This last assertion becomes obvious by thinking of the kernels of a quotient map $\mathcal{H} \to \mathcal{F}$ as being parametrized by a subset of the power set of $\prod_{U \subset X \text{ open}} \mathcal{H}(U)$. □

Lemma 55.5.3. *There exists a subcategory $QCoh_{fg,small} \subset QCoh_{fg}$ with the following properties:*

1. *the inclusion functor $QCoh_{fg,small} \to QCoh_{fg}$ is fully faithful and essentially surjective, and*
2. *the functor $p_{fg,small} : QCoh_{fg,small} \to (Sch/S)_{fppf}$ turns $QCoh_{fg,small}$ into a stack over $(Sch/S)_{fppf}$.*

Proof. We have seen in Lemmas 55.5.1 and 55.5.2 that $p_{fg} : QCoh_{fg} \to (Sch/S)_{fppf}$ satisfies (1), (2) and (3) of Stacks, Definition 50.4.1 as well as the additional condition (4) of Stacks, Remark 50.4.9. Hence we obtain $QCoh_{fg,small}$ from the discussion in that remark. □

We will often perform the replacement

$$QCoh_{fg} \leadsto QCoh_{fg,small}$$

without further remarking on it, and by abuse of notation we will simply denote $QCoh_{fg}$ this replacement.

Remark 55.5.4. Note that the whole discussion in this section works if we want to consider those quasi-coherent sheaves which are locally generated by at most κ sections, for some infinite cardinal κ, e.g., $\kappa = \aleph_0$.

55.6. Algebraic spaces

We define a category *Spaces* as follows:

1. An object of *Spaces* is a morphism $X \to U$ of algebraic spaces over S, where U is representable by an object of $(Sch/S)_{fppf}$, and

(2) a morphism $(f, g) : (X \to U) \to (Y \to V)$ is a commutative diagram

$$\begin{tikzcd} X \arrow[r, "f"'] \arrow[d] & Y \arrow[d] \\ U \arrow[r, "g"] & V \end{tikzcd}$$

of morphisms of algebraic spaces over S.

Thus *Spaces* is a category and

$$p : Spaces \to (Sch/S)_{fppf}, \quad (X \to U) \mapsto U$$

is a functor. Note that the fibre category of *Spaces* over a scheme U is just the category $Spaces/U$ of algebraic spaces over U (see Topologies on Spaces, Section 44.2). Hence we sometimes think of an object of *Spaces* as a pair X/U consisting of a scheme U and an algebraic space X over U. We remark for later use that given $(X/U), (Y/V) \in Ob(Spaces)$ we have

$$Mor_{Spaces}(X/U, Y/V) = \coprod\nolimits_{g \in Mor_S(U,V)} Mor_{Spaces/U}(X, U \times_{g,V} Y) \tag{55.6.0.1}$$

The category *Spaces* is almost, but not quite a stack over $(Sch/S)_{fppf}$. The problem is a set theoretical issue as we will explain below.

Lemma 55.6.1. *A morphism $(f, g) : X/U \to Y/V$ of Spaces is strongly cartesian if and only if the map f induces an isomorphism $X \to U \times_{g,V} Y$.*

Proof. Let $Y/V \in Ob(Spaces)$. Let $g : U \to V$ be a morphism of $(Sch/S)_{fppf}$. Note that the projection $p : U \times_{g,V} Y \to Y$ gives rise a morphism $(p, g) : U \times_{g,V} Y/U \to Y/V$ of *Spaces*. We claim that (p, g) is strongly cartesian. Namely, for any object Z/W of *Spaces* we have

$$\begin{aligned} Mor_{Spaces}(Z/W, U \times_{g,V} Y/U) &= \coprod\nolimits_{h \in Mor_S(W,U)} Mor_{Spaces/W}(Z, W \times_{h,U} U \times_{g,V} Y) \\ &= \coprod\nolimits_{h \in Mor_S(W,U)} Mor_{Spaces/W}(Z, W \times_{g \circ h,V} Y) \\ &= Mor_{Spaces}(Z/W, Y/V) \times_{Mor_S(W,V)} Mor_S(W, U) \end{aligned}$$

where we have used Equation (55.6.0.1) twice. This proves that the condition of Categories, Definition 4.30.1 holds for (p, g), and hence our claim is true. Now by Categories, Lemma 4.30.2 we see that isomorphisms are strongly cartesian and compositions of strongly cartesian morphisms are strongly cartesian which proves the ``if'' part of the lemma. For the converse, note that given Y/V and $g : U \to V$, if there exists a strongly cartesian morphism lifting g with target Y/V then it has to be isomorphic to (p, g) (see discussion following Categories, Definition 4.30.1). Hence the "only if" part of the lemma holds. □

Lemma 55.6.2. *The functor $p : Spaces \to (Sch/S)_{fppf}$ satisfies conditions (1) and (2) of Stacks, Definition 50.4.1.*

Proof. It is follows from Lemma 55.6.1 that *Spaces* is a fibred category over $(Sch/S)_{fppf}$ which proves (1). Suppose that $\{U_i \to U\}_{i \in I}$ is a covering of $(Sch/S)_{fppf}$. Suppose that X, Y are algebraic spaces over U. Finally, suppose that $\varphi_i : X_{U_i} \to Y_{U_i}$ are morphisms of $Spaces/U_i$ such that φ_i and φ_j restrict to the same morphisms $X_{U_i \times_U U_j} \to Y_{U_i \times_U U_j}$ of algebraic spaces over $U_i \times_U U_j$. To prove (2) we have to show that there exists a unique morphism $\varphi : X \to Y$ over U whose base change to U_i is equal to φ_i. As a morphism from X to Y is the same thing as a map of sheaves this follows directly from Sites, Lemma 9.22.1. □

Remark 55.6.3. Ignoring set theoretical difficulties[1] *Spaces* also satisfies descent for objects and hence is a stack. Namely, we have to show that given

(1) an fppf covering $\{U_i \to U\}_{i \in I}$,
(2) for each $i \in I$ an algebraic space X_i/U_i, and
(3) for each $i, j \in I$ an isomorphism $\varphi_{ij} : X_i \times_U U_j \to U_i \times_U X_j$ of algebraic spaces over $U_i \times_U U_j$ satisfying the cocycle condition over $U_i \times_U U_j \times_U U_k$,

there exists an algebraic space X/U and isomorphisms $X_{U_i} \cong X_i$ over U_i recovering the isomorphisms φ_{ij}. First, note that by Sites, Lemma 9.22.2 there exists a sheaf X on $(Sch/U)_{fppf}$ recovering the X_i and the φ_{ij}. Then by Bootstrap, Lemma 54.11.1 we see that X is an algebraic space (if we ignore the set theoretic condition of that lemma). We will use this argument in the next section to show that if we consider only algebraic spaces of finite type, then we obtain a stack.

55.7. The stack of finite type algebraic spaces

It turns out that we can get a stack of spaces if we only consider spaces of finite type. Let us denote

$$p_{ft} : Spaces_{ft} \to (Sch/S)_{fppf}$$

the full subcategory of *Spaces* over $(Sch/S)_{fppf}$ consisting of pairs X/U such that $X \to U$ is a morphism of finite type.

Lemma 55.7.1. *The functor $p_{ft} : Spaces_{ft} \to (Sch/S)_{fppf}$ satisfies the conditions (1), (2) and (3) of Stacks, Definition 50.4.1.*

Proof. We are going to write this out in ridiculous detail (which may make it hard to see what is going on).

We have seen in Lemma 55.6.1 that a morphism $(f, g) : X/U \to Y/V$ of *Spaces* is strongly cartesian if the induced morphism $f : X \to U \times_V Y$ is an isomorphism. Note that if $Y \to V$ is of finite type then also $U \times_V Y \to U$ is of finite type, see Morphisms of Spaces, Lemma 42.22.3. So if $(f, g) : X/U \to Y/V$ of *Spaces* is strongly cartesian in *Spaces* and Y/V is an object of $Spaces_{ft}$ then automatically also X/U is an object of $Spaces_{ft}$, and of course (f, g) is also strongly cartesian in $Spaces_{ft}$. In this way we conclude that $Spaces_{ft}$ is a fibred category over $(Sch/S)_{fppf}$. This proves (1).

The argument above also shows that the inclusion functor $Spaces_{ft} \to Spaces$ transforms strongly cartesian morphisms into strongly cartesian morphisms. In other words $Spaces_{ft} \to Spaces$ is a 1-morphism of fibred categories over $(Sch/S)_{fppf}$.

Let $U \in Ob((Sch/S)_{fppf})$. Let X, Y be algebraic spaces of finite type over U. By Stacks, Lemma 50.2.3 we obtain a map of presheaves

$$Mor_{Spaces_{ft}}(X, Y) \longrightarrow Mor_{Spaces}(X, Y)$$

which is an isomorphism as $Spaces_{ft}$ is a full subcategory of *Spaces*. Hence the left hand side is a sheaf, because in Lemma 55.6.2 we showed the right hand side is a sheaf. This proves (2).

To prove condition (3) of Stacks, Definition 50.4.1 we have to show the following: Given

(1) a covering $\{U_i \to U\}_{i \in I}$ of $(Sch/S)_{fppf}$,

[1] The difficulty is not that *Spaces* is a proper class, since by our definition of an algebraic space over S there is only a set worth of isomorphism classes of algebraic spaces over S. It is rather that arbitrary disjoint unions of algebraic spaces may end up being too large, hence lie outside of our chosen ``partial universe'' of sets.

(2) for each $i \in I$ an algebraic space X_i of finite type over U_i, and
(3) for each $i, j \in I$ an isomorphism $\varphi_{ij} : X_i \times_U U_j \to U_i \times_U X_j$ of algebraic spaces over $U_i \times_U U_j$ satisfying the cocycle condition over $U_i \times_U U_j \times_U U_k$,

there exists an algebraic space X of finite type over U and isomorphisms $X_{U_i} \cong X_i$ over U_i recovering the isomorphisms φ_{ij}. By Sites, Lemma 9.22.2 there exists a sheaf X on $(Sch/U)_{fppf}$ recovering the X_i and the φ_{ij}. Then by Bootstrap, Lemma 54.11.2 we see that X is an algebraic space. By Descent on Spaces, Lemma 45.10.8 we see that $X \to U$ is of finite type which concludes the proof. □

Lemma 55.7.2. *There exists a subcategory $Spaces_{ft,small} \subset Spaces_{ft}$ with the following properties:*

(1) *the inclusion functor $Spaces_{ft,small} \to Spaces_{ft}$ is fully faithful and essentially surjective, and*
(2) *the functor $p_{ft,small} : Spaces_{ft,small} \to (Sch/S)_{fppf}$ turns $Spaces_{ft,small}$ into a stack over $(Sch/S)_{fppf}$.*

Proof. We have seen in Lemmas 55.7.1 that $p_{fg} : QCoh_{fg} \to (Sch/S)_{fppf}$ satisfies (1), (2) and (3) of Stacks, Definition 50.4.1. The additional condition (4) of Stacks, Remark 50.4.9 holds because every algebraic space X over S is of the form U/R for $U, R \in Ob((Sch/S)_{fppf})$, see Spaces, Lemma 40.9.1. Thus there is only a set worth of isomorphism classes of objects. Hence we obtain $Spaces_{ft,small}$ from the discussion in that remark. □

We will often perform the replacement

$$Spaces_{ft} \leadsto Spaces_{ft,small}$$

without further remarking on it, and by abuse of notation we will simply denote $Spaces_{ft}$ this replacement.

Remark 55.7.3. Note that the whole discussion in this section works if we want to consider those algebraic spaces X/U which are locally of finite type such that the inverse image in X of an affine open of U can be covered by countably many affines. If needed we can also introduce the notion of a morphism of κ-type (meaning some bound on the number of generators of ring extensions and some bound on the cardinality of the affines over a given affine in the base) where κ is a cardinal, and then we can produce a stack

$$Spaces_{\kappa} \longrightarrow (Sch/S)_{fppf}$$

in exactly the same manner as above (provided we make sure that Sch is large enough depending on κ).

55.8. Examples of stacks in groupoids

The examples above are examples of stacks which are not stacks in groupoids. In the rest of this chapter we give algebraic geometric examples of stacks in groupoids.

55.9. The stack associated to a sheaf

Let $F : (Sch/S)_{fppf}^{opp} \to Sets$ be a presheaf. We obtain a category fibred in sets

$$p_F : \mathcal{S}_F \to (Sch/S)_{fppf},$$

see Categories, Example 4.35.5. This is a stack in sets if and only if F is a sheaf, see Stacks, Lemma 50.6.3.

55.10. The stack in groupoids of finitely generated quasi-coherent sheaves

Let $p : QCoh_{fg} \to (Sch/S)_{fppf}$ be the stack introduced in Section 55.5 (using the abuse of notation introduced there). We can turn this into a stack in groupoids $p' : QCoh'_{fg} \to (Sch/S)_{fppf}$ by the procedure of Categories, Lemma 4.32.3, see Stacks, Lemma 50.5.3. In this particular case this simply means $QCoh'_{fg}$ has the same objects as $QCoh_{fg}$ but the morphsms are pairs $(f, g) : (U, \mathcal{F}) \to (U', \mathcal{F}')$ where g is an isomorphism $g : f^*\mathcal{F}' \to \mathcal{F}$.

55.11. The stack in groupoids of finite type algebraic spaces

Let $p : Spaces_{ft} \to (Sch/S)_{fppf}$ be the stack introduced in Section 55.7 (using the abuse of notation introduced there). We can turn this into a stack in groupoids $p' : Spaces'_{ft} \to (Sch/S)_{fppf}$ by the procedure of Categories, Lemma 4.32.3, see Stacks, Lemma 50.5.3. In this particular case this simply means $Spaces'_{ft}$ has the same objects as $Spaces_{ft}$, i.e., finite type morphisms $X \to U$ where X is an algebraic space over S and U is a scheme over S. But the morphsms $(f, g) : X/U \to Y/V$ are now commutative diagrams

$$\begin{tikzcd} X \arrow[r, "f"] \arrow[d] & Y \arrow[d] \\ U \arrow[r, "g"] & V \end{tikzcd}$$

which are cartesian.

55.12. Quotient stacks

Let (U, R, s, t, c) be a groupoid in algebraic spaces over S. In this case the quotient stack

$$[U/R] \longrightarrow (Sch/S)_{fppf}$$

is a stack in groupoids by construction, see Groupoids in Spaces, Definition 52.19.1. It is even the case that the $Isom$-sheaves are representable by algebraic spaces, see Bootstrap, Lemma 54.11.3. These quotient stacks are of fundamental importance to the theory of algebraic stacks.

A special case of the construction above is the quotient stack

$$[X/G] \longrightarrow (Sch/S)_{fppf}$$

associated to a datum $(B, G/B, m, X/B, a)$. Here

(1) B is an algebraic space over S,
(2) (G, m) is a group algebraic space over B,
(3) X is an algebraic space over B, and
(4) $a : G \times_B X \to X$ is an action of G on X over B.

Namely, by Groupoids in Spaces, Definition 52.19.1 the stack in groupoids $[X/G]$ is the quotient stack $[X/G \times_B X]$ given above. It behooves us to spell out what the category $[X/G]$ really looks like. We will do this in Section 55.14.

55.13. Classifying torsors

We want to carefully explain a number of variants of what it could mean to study the stack of torsors for a group algebraic space G or a sheaf of groups $\mathcal{G}$.

55.13.1. Torsors for a sheaf of groups. Let $\mathcal{G}$ be a sheaf of groups on $(Sch/S)_{fppf}$. For $U \in Ob((Sch/S)_{fppf})$ we denote $\mathcal{G}|_U$ the restriction of $\mathcal{G}$ to $(Sch/U)_{fppf}$. We define a category $\mathcal{G}$*-Torsors* as follows:

(1) An object of $\mathcal{G}$*-Torsors* is a pair $(U, \mathcal{F})$ where U is an object of $(Sch/S)_{fppf}$ and $\mathcal{F}$ is a $\mathcal{G}|_U$-torsor, see Cohomology on Sites, Definition 19.5.1.
(2) A morphism $(U, \mathcal{F}) \to (V, \mathcal{H})$ is given by a pair (f, α), where $f : U \to V$ is a morphism of schemes over S, and $\alpha : f^{-1}\mathcal{H} \to \mathcal{F}$ is an isomorphism of $\mathcal{G}|_U$-torsors.

Thus $\mathcal{G}$*-Torsors* is a category and

$$p : \mathcal{G}\text{-}Torsors \longrightarrow (Sch/S)_{fppf}, \quad (U, \mathcal{F}) \longmapsto U$$

is a functor. Note that the fibre category of $\mathcal{G}$*-Torsors* over U is the category of $\mathcal{G}|_U$-torsors which is a groupoid.

Lemma 55.13.2. *Up to a replacement as in Stacks, Remark 50.4.9 the functor*

$$p : \mathcal{G}\text{-}Torsors \longrightarrow (Sch/S)_{fppf}$$

defines a stack in groupoids over $(Sch/S)_{fppf}$.

Proof. The most difficult part of the proof is to show that we have descent for objects. Let $\{U_i \to U\}_{i \in I}$ be a covering of $(Sch/S)_{fppf}$. Suppose that for each i we are given a $\mathcal{G}|_{U_i}$-torsor $\mathcal{F}_i$, and for each $i, j \in I$ an isomorphism $\varphi_{ij} : \mathcal{F}_i|_{U_i \times_U U_j} \to \mathcal{F}_j|_{U_i \times_U U_j}$ of $\mathcal{G}|_{U_i \times_U U_j}$-torsors satisfying a suitable cocycle condition on $U_i \times_U U_j \times_U U_k$. Then by Sites, Section 9.22 we obtain a sheaf $\mathcal{F}$ on $(Sch/U)_{fppf}$ whose restriction to each U_i recovers $\mathcal{F}_i$ as well as recovering the descent data. By the equivalence of categories in Sites, Lemma 9.22.3 the action maps $\mathcal{G}|_{U_i} \times \mathcal{F}_i \to \mathcal{F}_i$ glue to give a map $a : \mathcal{G}|_U \times \mathcal{F} \to \mathcal{F}$. Now we have to show that a is an action and that $\mathcal{F}$ becomes a $\mathcal{G}|_U$-torsor. Both properties may be checked locally, and hence follow from the corresponding properties of the actions $\mathcal{G}|_{U_i} \times \mathcal{F}_i \to \mathcal{F}_i$. This proves that descent for objects holds in $\mathcal{G}$*-Torsors*. Some details omitted. □

55.13.3. Variant on torsors for a sheaf. The construction of Subsection 55.13.1 can be generalized slightly. Namely, let $\mathcal{G} \to \mathcal{B}$ be a map of sheaves on $(Sch/S)_{fppf}$ and let

$$m : \mathcal{G} \times_{\mathcal{B}} \mathcal{G} \longrightarrow \mathcal{G}$$

be a group law on $\mathcal{G}/\mathcal{B}$. In other words, the pair $(\mathcal{G}, m)$ is a group object of the topos $Sh((Sch/S)_{fppf})/\mathcal{B}$. See Sites, Section 9.26 for information regarding localizations of topoi. In this setting we can define a category $\mathcal{G}/\mathcal{B}$*-Torsors* as follows (where we use the Yoneda embedding to think of schemes as sheaves):

(1) An object of $\mathcal{G}/\mathcal{B}$*-Torsors* is a triple $(U, b, \mathcal{F})$ where
    (a) U is an object of $(Sch/S)_{fppf}$,
    (b) $b : U \to \mathcal{B}$ is a section of $\mathcal{B}$ over U, and
    (c) $\mathcal{F}$ is a $U \times_{b,\mathcal{B}} \mathcal{G}$-torsor over U.
(2) A morphism $(U, b, \mathcal{F}) \to (U', b', \mathcal{F}')$ is given by a pair (f, g), where $f : U \to U'$ is a morphism of schemes over S such that $b = b' \circ f$, and $g : f^{-1}\mathcal{F}' \to \mathcal{F}$ is an isomorphism of $U \times_{b,\mathcal{B}} \mathcal{G}$-torsors.

Thus $\mathcal{G}/\mathcal{B}$*-Torsors* is a category and

$$p : \mathcal{G}/\mathcal{B}\text{-}Torsors \longrightarrow (Sch/S)_{fppf}, \quad (U, b, \mathcal{F}) \longmapsto U$$

is a functor. Note that the fibre category of $\mathcal{G}/\mathcal{B}$*-Torsors* over U is the disjoint union over $b : U \to \mathcal{B}$ of the categories of $U \times_{b,\mathcal{B}} \mathcal{G}$-torsors, hence is a groupoid.

In the special case $\mathcal{B} = S$ we recover the category $\mathcal{G}$*-Torsors* introduced in Subsection 55.13.1.

Lemma 55.13.4. *Up to a replacement as in Stacks, Remark 50.4.9 the functor*

$$p : \mathcal{G}/\mathcal{B}\textit{-Torsors} \longrightarrow (Sch/S)_{fppf}$$

defines a stack in groupoids over $(Sch/S)_{fppf}$.

Proof. This proof is a repeat of the proof of Lemma 55.13.2. The reader is encouraged to read that proof first since the notation is less cumbersome. The most difficult part of the proof is to show that we have descent for objects. Let $\{U_i \to U\}_{i \in I}$ be a covering of $(Sch/S)_{fppf}$. Suppose that for each i we are given a pair $(b_i, \mathcal{F}_i)$ consisting of a morphism $b_i : U_i \to \mathcal{B}$ and a $U_i \times_{b_i, \mathcal{B}} \mathcal{G}$-torsor $\mathcal{F}_i$, and for each $i, j \in I$ we have $b_i|_{U_i \times_U U_j} = b_j|_{U_i \times_U U_j}$ and we are given an isomorphism $\varphi_{ij} : \mathcal{F}_i|_{U_i \times_U U_j} \to \mathcal{F}_j|_{U_i \times_U U_j}$ of $(U_i \times_U U_j) \times_{\mathcal{B}} \mathcal{G}$-torsors satisfying a suitable cocycle condition on $U_i \times_U U_j \times_U U_k$. Then by Sites, Section 9.22 we obtain a sheaf $\mathcal{F}$ on $(Sch/U)_{fppf}$ whose restriction to each U_i recovers $\mathcal{F}_i$ as well as recovering the descent data. By the sheaf axiom for $\mathcal{B}$ the morphisms b_i come from a unique morphism $b : U \to \mathcal{B}$. By the equivalence of categories in Sites, Lemma 9.22.3 the action maps $(U_i \times_{b_i, \mathcal{B}} \mathcal{G}) \times_{U_i} \mathcal{F}_i \to \mathcal{F}_i$ glue to give a map $(U \times_{b, \mathcal{B}} \mathcal{G}) \times \mathcal{F} \to \mathcal{F}$. Now we have to show that this is an action and that $\mathcal{F}$ becomes a $U \times_{b, \mathcal{B}} \mathcal{G}$-torsor. Both properties may be checked locally, and hence follow from the corresponding properties of the actions on the $\mathcal{F}_i$. This proves that descent for objects holds in $\mathcal{G}/\mathcal{B}$*-Torsors*. Some details omitted. □

55.13.5. Principal homogeneous spaces. Let B be an algebraic space over S. Let G be a group algebraic space over B. We define a category G*-Principal* as follows:

(1) An object of G*-Principal* is a triple (U, b, X) where
   (a) U is an object of $(Sch/S)_{fppf}$,
   (b) $b : U \to B$ is a morphism over S, and
   (c) X is a principal homogeneous G_U-space over U where $G_U = U \times_{b,B} G$.
   See Groupoids in Spaces, Definition 52.9.3.
(2) A morphism $(U, b, X) \to (U', b', X')$ is given by a pair (f, g), where $f : U \to U'$ is a morphism of schemes over B, and $g : X \to U \times_{f,U'} X'$ is an isomorphism of principal homogeneous G_U-spaces.

Thus G*-Principal* is a category and

$$p : G\textit{-Principal} \longrightarrow (Sch/S)_{fppf}, \quad (U, b, X) \longmapsto U$$

is a functor. Note that the fibre category of G*-Principal* over U is the disjoint union over $b : U \to B$ of the categories of principal homogeneous $U \times_{b,B} G$-spaces, hence is a groupoid.

In the special case $S = B$ the objects are simply pairs (U, X) where U is a scheme over S, and X is a principal homogeneous G_U-space over U. Moreover, morphisms are simply cartesian diagrams

$$\begin{tikzcd} X \arrow[r, "g"] \arrow[d] & X' \arrow[d] \\ U \arrow[r, "f"] & U' \end{tikzcd}$$

where g is G-equivariant.

Remark 55.13.6. We conjecture that up to a replacement as in Stacks, Remark 50.4.9 the functor

$$p : G\text{-}Principal \longrightarrow (Sch/S)_{fppf}$$

defines a stack in groupoids over $(Sch/S)_{fppf}$. This would follow if one could show that given

(1) a covering $\{U_i \to U\}_{i \in I}$ of $(Sch/S)_{fppf}$,
(2) an group algebraic space H over U,
(3) for every i a principal homogeneous H_{U_i}-space X_i over U_i, and
(4) H-equivariant isomorphisms $\varphi_{ij} : X_{i,U_i \times_U U_j} \to X_{j,U_i \times_U U_j}$ satisfying the cocycle condition,

there exists a principal homogeneous H-space X over U which recovers (X_i, φ_{ij}). The technique of the proof of Bootstrap, Lemma 54.11.6 reduces this to a set theoretical question, so the reader who ignores set theoretical questions will ``know" that the result is true. In `http://math.columbia.edu/~dejong/wordpress/?p=591` there is a suggestion as to how to approach this problem.

55.13.7. Variant on principal homogeneous spaces. Let S be a scheme. Let $B = S$. Let G be a group scheme over $B = S$. In this setting we can define a full subcategory $G\text{-}Principal\text{-}Schemes \subset G\text{-}Principal$ whose objects are pairs (U, X) where U is an object of $(Sch/S)_{fppf}$ and $X \to U$ is a principal homogeneous G-space over U which is representable, i.e., a scheme.

It is in general not the case that $G\text{-}Principal\text{-}Schemes$ is a stack in groupoids over $(Sch/S)_{fppf}$. The reason is that in general there really do exist principal homogeneous spaces which are not schemes, hence descent for objects will not be satisfied in general.

55.13.8. Torsors in fppf topology. Let B be an algebraic space over S. Let G be a group algebraic space over B. We define a category $G\text{-}Torsors$ as follows:

(1) An object of $G\text{-}Torsors$ is a triple (U, b, X) where
  (a) U is an object of $(Sch/S)_{fppf}$,
  (b) $b : U \to B$ is a morphism, and
  (c) X is an fppf G_U-torsor over U where $G_U = U \times_{b,B} G$.
  See Groupoids in Spaces, Definition 52.9.3.
(2) A morphism $(U, b, X) \to (U', b', X')$ is given by a pair (f, g), where $f : U \to U'$ is a morphism of schemes over B, and $g : X \to U \times_{f,U'} X'$ is an isomorphism of G_U-torsors.

Thus $G\text{-}Torsors$ is a category and

$$p : G\text{-}Torsors \longrightarrow (Sch/S)_{fppf}, \quad (U, a, X) \longmapsto U$$

is a functor. Note that the fibre category of $G\text{-}Torsors$ over U is the disjoint union over $b : U \to B$ of the categories of fppf $U \times_{b,B} G$-torsors, hence is a groupoid.

In the special case $S = B$ the objects are simply pairs (U, X) where U is a scheme over S, and X is an fppf G_U-torsor over U. Moreover, morphisms are simply cartesian diagrams

$$\begin{tikzcd} X \arrow[r, "g"'] \arrow[d] & X' \arrow[d] \\ U \arrow[r, "f"] & U' \end{tikzcd}$$

where g is G-equivariant.

Lemma 55.13.9. *Up to a replacement as in Stacks, Remark 50.4.9 the functor*

$$p : G\text{-}Torsors \longrightarrow (Sch/S)_{fppf}$$

defines a stack in groupoids over $(Sch/S)_{fppf}$.

Proof. The most difficult part of the proof is to show that we have descent for objects, which is Bootstrap, Lemma 54.11.6. Some details omitted. □

Lemma 55.13.10. *Let B be an algebraic space over S. Let G be a group algebraic space over B. Denote $\mathcal{G}$, resp. $\mathcal{B}$ the algebraic space G, resp. B seen as a sheaf on $(Sch/S)_{fppf}$. The functor*

$$G\text{-}Torsors \longrightarrow \mathcal{G}/\mathcal{B}\text{-}Torsors$$

which associates to a triple (U, b, X) the triple $(U, b, \mathcal{X})$ where $\mathcal{X}$ is X viewed as a sheaf is an equivalence of stacks in groupoids over $(Sch/S)_{fppf}$.

Proof. We will use the result of Stacks, Lemma 50.4.8 to prove this. The functor is fully faithful since the category of algebraic spaces over S is a full subcategory of the category of sheaves on $(Sch/S)_{fppf}$. Moreover, all objects (on both sides) are locally trivial torsors so condition (2) of the lemma referenced above holds. Hence the functor is an equivalence. □

55.13.11. Variant on torsors in fppf topology. Let S be a scheme. Let $B = S$. Let G be a group scheme over $B = S$. In this setting we can define a full subcategory G-*Torsors-Schemes* $\subset$ G-*Torsors* whose objects are pairs (U, X) where U is an object of $(Sch/S)_{fppf}$ and $X \to U$ is an fppf G-torsor over U which is representable, i.e., a scheme.

It is in general not the case that G-*Torsors-Schemes* is a stack in groupoids over $(Sch/S)_{fppf}$. The reason is that in general there really do exist fppf G-torsors which are not schemes, hence descent for objects will not be satisfied in general.

55.14. Quotients by group actions

At this point we have introduced enough notation that we can work out in more detail what the stacks $[X/G]$ of Section 55.12 look like.

Situation 55.14.1. Here

1. (1) S is a scheme contained in Sch_{fppf},
2. (2) B is an algebraic space over S,
3. (3) (G, m) is a group algebraic space over B,
4. (4) $\pi : X \to B$ is an algebraic space over B, and
5. (5) $a : G \times_B X \to X$ is an action of G on X over B.

In this situation we construct a category $[[X/G]]$[2] as follows:

1. (1) An object of $[[X/G]]$ consists of a quadruple $(U, b, P, \varphi : P \to X)$ where
   - (a) U is an object of $(Sch/S)_{fppf}$,
   - (b) $b : U \to B$ is a morphism over S,
   - (c) P is an fppf G_U-torsor over U where $G_U = U \times_{b,B} G$, and

[2] The notation $[[X/G]]$ with double brackets serves to distinguish this category from the stack $[X/G]$ introduced earlier. In Proposition 55.14.4 we show that the two are canonically equivalent. Afterwards we will use the notation $[X/G]$ to indicate either.

(d) $\varphi : P \to X$ is a G-equivariant morphism fitting into the commutative diagram

$$\begin{tikzcd} P \arrow[r, "\varphi"] \arrow[d] & X \arrow[d] \\ U \arrow[r, "b"] & B \end{tikzcd}$$

(2) A morphism of $[[X/G]]$ is a pair $(f, g) : (U, b, P, \varphi) \to (U', b', P', \varphi')$ where $f : U \to U'$ is a morphism of schemes over B and $g : P \to P'$ is a G-equivariant morphism over f which induces an isomorphism $P \cong U \times_{f,U'} P'$, and has the property that $\varphi = \varphi' \circ g$. In other words (f, g) fits into the following commutative diagram

$$\begin{tikzcd} P \arrow[r, "g"] \arrow[d] \arrow[rrd, "\varphi"] & P' \arrow[d] \arrow[rd, "\varphi'"] & \\ U \arrow[r, "f"] \arrow[rrd, "b"'] & U' \arrow[rd, "b'"] & X \arrow[d] \\ & & B \end{tikzcd}$$

Thus $[[X/G]]$ is a category and

$$p : [[X/G]] \longrightarrow (Sch/S)_{fppf}, \quad (U, b, P, \varphi) \longmapsto U$$

is a functor. Note that the fibre category of $[[X/G]]$ over U is the disjoint union over $b \in Mor_S(U, B)$ of $U \times_{b,B} G$-torsors P endowed with a G-equivariant morphism to X. Hence the fibre categories of $[[X/G]]$ are groupoids.

Note that the functor

$$[[X/G]] \longrightarrow G\text{-}Torsors, \quad (U, b, P, \varphi) \longmapsto (U, b, P)$$

is a 1-morphism of categories over $(Sch/S)_{fppf}$.

Lemma 55.14.2. *Up to a replacement as in Stacks, Remark 50.4.9 the functor*

$$p : [[X/G]] \longrightarrow (Sch/S)_{fppf}$$

defines a stack in groupoids over $(Sch/S)_{fppf}$.

Proof. The most difficult part of the proof is to show that we have descent for objects. Suppose that $\{U_i \to U\}_{i\in I}$ is a covering in $(Sch/S)_{fppf}$. Let $\xi_i = (U_i, b_i, P_i, \varphi_i)$ be objects of $[[X/G]]$ over U_i, and let $\varphi_{ij} : \mathrm{pr}_0^*\xi_i \to \mathrm{pr}_1^*\xi_j$ be a descent datum. This in particular implies that we get a descent datum on the triples (U_i, b_i, P_i) for the stack in groupoids G-*Torsors* by applying the functor $[[X/G]] \to G$-*Torsors* above. Hence we may assume that $b_i = b|_{U_i}$ for some morphism $b : U \to B$, and that $P_i = U_i \times_U P$ for some fppf $G_U = U \times_{b,B} G$-torsor P over U. Then finally the morphisms φ_i are compatible with the canonical descent datum on the restrictions $U_i \times_U P$ and hence define a morphism $\varphi : P \to X$. (For example you can use Sites, Lemma 9.22.3 or you can use Descent on Spaces, Lemma 45.6.2 to get φ.) This proves descent for objects. We omit the proof of the other two defining properties of a stack in groupoids. $\square$

Remark 55.14.3. Let S be a scheme. Let G be an abstract group. Let X be an algebraic space over S. Let $G \to \mathrm{Aut}_S(X)$ be a group homomorphism. In this setting we can define $[[X/G]]$ similarly to the above as follows:

(1) An object of $[[X/G]]$ consists of a triple $(U, P, \varphi : P \to X)$ where
   (a) U is an object of $(Sch/S)_{fppf}$,
   (b) P is a sheaf on $(Sch/U)_{fppf}$ which comes with an action of G that turns it into a torsor under the constant sheaf with value G, and
   (c) $\varphi : P \to X$ is a G-equivariant map of sheaves.
(2) A morphism $(f, g) : (U, P, \varphi) \to (U', P', \varphi')$ is given by a morphism of schemes $f : T \to T'$ and a G-equivariant isomorphism $g : P \to f^{-1}P'$ such that $\varphi = \varphi' \circ g$.

In exactly the same manner as above we obtain a functor

$$[[X/G]] \longrightarrow (Sch/S)_{fppf}$$

which turns $[[X/G]]$ into a stack in groupoids over $(Sch/S)_{fppf}$. The constant sheaf $\underline{G}$ is (provided the cardinality of G is not too large) representable by G_S on $(Sch/S)_{fppf}$ and this version of $[[X/G]]$ is equivalent to the stack $[[X/G_S]]$ introduced above.

Proposition 55.14.4. *In Situation 55.14.1 there exists a canonical equivalence*

$$[X/G] \longrightarrow [[X/G]]$$

of stacks in groupoids over $(Sch/S)_{fppf}$.

Proof. We write this out in detail, to make sure that all the definitions work out in exactly the correct manner. Recall that $[X/G]$ is the quotient stack associated to the groupoid in algebraic spaces $(X, G \times_B X, s, t, c)$, see Groupoids in Spaces, Definition 52.19.1. This means that $[X/G]$ is the stackification of the category fibred in groupoids $[X/_pG]$ associated to the functor

$$(Sch/S)_{fppf} \longrightarrow Groupoids, \quad U \longmapsto (X(U), G(U) \times_{B(U)} X(U), s, t, c)$$

where $s(g, x) = x$, $t(g, x) = a(g, x)$, and $c((g, x), (g', x')) = (m(g, g'), x')$. By the construction of Categories, Example 4.34.1 an object of $[X/_pG]$ is a pair (U, x) with $x \in X(U)$ and a morphism $(f, g) : (U, x) \to (U', x')$ of $[X/_pG]$ is given by a morphism of schemes $f : U \to U'$ and an element $g \in G(U)$ such that $a(g, x) = x' \circ f$. Hence we can define a 1-morphism of stacks in groupoids

$$F_p : [X/_pG] \longrightarrow [[X/G]]$$

by the following rules: On objects we set

$$F_p(U, x) = (U, \pi \circ x, G \times_{B, \pi\circ x} U, a \circ (\mathrm{id}_G \times x))$$

This makes sense because the diagram

$$\begin{tikzcd} G \times_{B,\pi\circ x} U \arrow[r, "\mathrm{id}_G \times x"'] \arrow[d] & G \times_{B,\pi} X \arrow[r, "a"'] & X \arrow[d, "\pi"] \\ U \arrow[rr, "\pi\circ x"] & & B \end{tikzcd}$$

commutes, and the two horizontal arrows are G-equivariant if we think of the fibre products as trivial G-torsors over U, resp. X. On morphisms $(f, g) : (U, x) \to (U', x')$ we set $F_p(f, g) = (f, R_g)$ where R_g denotes right translation by g. More precisely, the morphism of $F_p(f, g) : F_p(U, x) \to F_p(U', x')$ is given by the cartesian diagram

$$\begin{tikzcd} G \times_{B,\pi\circ x} U \arrow[r, "R_g"'] \arrow[d] & G \times_{B,\pi\circ x'} U' \arrow[d] \\ U \arrow[r, "f"] & U' \end{tikzcd}$$

where R_g on T-valued points is given by

$$R_g(g', u) = (m(g', g), f(u))$$

To see that this works we have to verify that

$$a \circ (\mathrm{id}_G \times x) = a \circ (\mathrm{id}_G \times x') \circ R_g$$

which is true because the right hand side applied to the T-valued point (g', u) gives

$$\begin{aligned} a((\mathrm{id}_G \times x')(m(g', g), f(u))) &= a(m(g', g), x'(f(u))) \\ &= a(g', a(g, x'(f(u)))) \\ &= a(g', x(u)) \end{aligned}$$

because $a(g, x) = x' \circ f$ as desired.

By the universal property of stackification from Stacks, Lemma 50.9.2 we obtain a canonical extension $F : [X/G] \to [[X/G]]$ of the 1-morphism F_p above. We first prove that F is fully faithful. To do this, since both source and target are stacks in groupoids, it suffices to prove that the $Isom$-sheaves are identified under F. Pick a scheme U and objects ξ, ξ' of $[X/G]$ over U. We want to show that

$$F : Isom_{[X/G]}(\xi, \xi') \longrightarrow Isom_{[[X/G]]}(F(\xi), F(\xi'))$$

is an isomorphism of sheaves. To do this it suffices to work locally on U, and hence we may assume that ξ, ξ' come from objects (U, x), (U, x') of $[X/_pG]$ over U; this follows directly from the construction of the stackification, and it is also worked out in detail in Groupoids in Spaces, Section 52.23. Either by directly using the description of morphisms in $[X/_pG]$ above, or using Groupoids in Spaces, Lemma 52.21.1 we see that in this case

$$Isom_{[X/G]}(\xi, \xi') = U \times_{(x,x'), X\times_S X, (s,t)} (G \times_B X)$$

A T-valued point of this fibre product corresponds to a pair (u, g) with $u \in U(T)$, and $g \in G(T)$ such that $a(g, x \circ u) = x' \circ u$. (Note that this implies $\pi \circ x \circ u = \pi \circ x' \circ u$.) On the other hand, a T-valued point of $Isom_{[[X/G]]}(F(\xi), F(\xi'))$ by definition corresponds to a morphism $u : T \to U$ such that $\pi \circ x \circ u = \pi \circ x' \circ u : T \to B$ and an isomorphism

$$R : G \times_{B,\pi\circ x\circ u} T \longrightarrow G \times_{B,\pi\circ x'\circ u} T$$

of trivial G_T-torsors compatible with the given maps to X. Since the torsors are trivial we see that $R = R_g$ (right multiplication) by some $g \in G(T)$. Compatibility with the maps $a\circ(1_G, x\circ u), a\circ(1_G, x'\circ u) : G\times_B T \to X$ is equivalent to the condition that $a(g, x\circ u) = x'\circ u$. Hence we obtain the desired equality of $Isom$-sheaves.

Now that we know that F is fully faithful we see that Stacks, Lemma 50.4.8 applies. Thus to show that F is an equivalence it suffices to show that objects of $[[X/G]]$ are fppf locally in the essential image of F. This is clear as fppf torsors are locally trivial, and hence we win. □

55.15. The Picard stack

Let S be a scheme. Let $\pi : X \to B$ be a morphism of algebraic spaces over S. We define a category $Pic_{X/B}$ as follows:

(1) An object is a triple $(U, b, \mathcal{L})$, where
  (a) U is an object of $(Sch/S)_{fppf}$,
  (b) $b : U \to B$ is a morphism over S, and
  (c) $\mathcal{L}$ is in invertible sheaf on the base change $X_U = U \times_{b,B} X$.

(2) A morphism $(f, g) : (U, b, \mathscr{L}) \to (U', b', \mathscr{L}')$ is given by a morphism of schemes $f : U \to U'$ over B and an isomorphism $g : f^*\mathscr{L}' \to \mathscr{L}$.

The composition of $(f, g) : (U, b, \mathscr{L}) \to (U', b', \mathscr{L}')$ with $(f', g') : (U', b', \mathscr{L}') \to (U'', b'', \mathscr{L}'')$ is given by $(f \circ f', g \circ f^*(g'))$. Thus we get a category $Pic_{X/B}$ and

$$p : Pic_{X/B} \longrightarrow (Sch/S)_{fppf}, \quad (U, b, \mathscr{L}) \longmapsto U$$

is a functor. Note that the fibre category of $Pic_{X/B}$ over U is the disjoint union over $b \in Mor_S(U, B)$ of the categories of invertible sheaves on $X_U = U \times_{b,B} X$. Hence the fibre categories are groupoids.

Lemma 55.15.1. *Up to a replacement as in Stacks, Remark 50.4.9 the functor*

$$Pic_{X/B} \longrightarrow (Sch/S)_{fppf}$$

defines a stack in groupoids over $(Sch/S)_{fppf}$.

Proof. As usual, the hardest part is to show descent for objects. To see this let $\{U_i \to U\}$ be a covering of $(Sch/S)_{fppf}$. Let $\xi_i = (U_i, b_i, \mathscr{L}_i)$ be an object of $Pic_{X/B}$ lying over U, and let $\varphi_{ij} : \mathrm{pr}_0^*\xi_i \to \mathrm{pr}_1^*\xi_j$ be a descent datum. This implies in particular that the morphisms b_i are the restrictions of a morphism $b : U \to B$. Write $X_U = U \times_{b,B} X$ and $X_i = U_i \times_{b_i,B} X = U_i \times_U U \times_{b,B} X = U_i \times_U X_U$. Observe that $\mathscr{L}_i$ is an invertible $\mathscr{O}_{X_i}$-module. Note that $\{X_i \to X_U\}$ forms an fppf covering as well. Moreover, the descent datum φ_{ij} translates into a descent datum on the invertible sheaves $\mathscr{L}_i$ relative to the fppf covering $\{X_i \to X_U\}$. Hence by Descent on Spaces, Proposition 45.4.1 we obtain a unique invertible sheaf $\mathscr{L}$ on X_U which recovers $\mathscr{L}_i$ and the descent data over X_i. The triple $(U, b, \mathscr{L})$ is therefore the object of $Pic_{X/B}$ over U we were looking for. Details omitted. $\square$

55.16. Examples of inertia stacks

Here are some examples of inertia stacks.

Example 55.16.1. Let S be a scheme. Let G be a commutative group. Let $X \to S$ be a scheme over S. Let $a : G \times X \to X$ be an action of G on X. For $g \in G$ we denote $g : X \to X$ the corresponding automorphism. In this case the inertia stack of $[X/G]$ (see Remark 55.14.3) is given by

$$I_{[X/G]} = \coprod\nolimits_{g \in G} [X^g/G],$$

where, given an element g of G, the symbol X^g denotes the scheme $X^g = \{x \in X \mid g(x) = x\}$. In a formula X^g is really the fibre product

$$X^g = X \times_{(1,1), X \times_S X, (g,1)} X.$$

Indeed, for any S-scheme T, a T-point on the inertia stack of $[X/G]$ consists of a triple $(P/T, \phi, \alpha)$ consisting of a G-torsor $P \to T$ together with a G-equivariant isomorphism $\phi : P \to X$, together with an automorphism α of $P \to T$ over T such that $\phi \circ \alpha = \phi$. Since G is a sheaf of *commutative* groups, α is, locally in the fppf topology over T, given by multiplication by some element g of G. The condition that $\phi \circ \alpha = \phi$ means that ϕ factors through the inclusion of X^g in X, i.e., ϕ is obtained by composing that inclusion with a morphism $P \to X^\gamma$. The above discussion allows us to define a morphism of fibred categories $I_{[X/G]} \to \coprod_{g \in G}[X^g/G]$ given on T-points by the discussion above. We omit showing that this is an equivalence.

Example 55.16.2. Let $X \to S$ be a morphism of schemes. Assume that for any $T \to S$ the base change $f_T : X_T \to T$ has the property that the map $\mathcal{O}_T \to f_{T,*}\mathcal{O}_{X_T}$ is an isomorphism. (This implies that f is *cohomologically flat in dimension* 0 (insert future reference here) but is stronger.) Consider the Picard stack $Pic_{X/S}$, see Section 55.15. The points of its inertia stack over an S-scheme T consist of pairs $(\mathcal{L}, \alpha)$ where $\mathcal{L}$ is a line bundle on X_T and α is an automorphism of that line bundle. I.e., we can think of α as an element of $H^0(X_T, \mathcal{O}_{X_T})^\times = H^0(T, \mathcal{O}_T^*)$ by our condition. Note that $H^0(T, \mathcal{O}_T^*) = \mathbf{G}_{m,S}(T)$, see Groupoids, Example 35.5.1. Hence the inertia stack of $Pic_{X/S}$ is

$$I_{Pic_{X/S}} = \mathbf{G}_{m,S} \times_S Pic_{X/S}.$$

as a stack over $(Sch/S)_{fppf}$.

55.17. Finite Hilbert stacks

We formulate this in somewhat greater generality than is perhaps strictly needed. Fix a 1-morphism

$$F : \mathcal{X} \longrightarrow \mathcal{Y}$$

of stacks in groupoids over $(Sch/S)_{fppf}$. For each integer $d \geq 1$ consider a category $\mathcal{H}_d(\mathcal{X}/\mathcal{Y})$ defined as follows:

(1) An object (U, Z, y, x, α) where U, Z are objects of in $(Sch/S)_{fppf}$ and Z is a finite locally free of degree d over U, where $y \in Ob(\mathcal{Y}_U)$, $x \in Ob(\mathcal{X}_Z)$ and $\alpha : y|_Z \to F(x)$ is an isomorphism[3].

(2) A morphism $(U, Z, y, x, \alpha) \to (U', Z', y', x', \alpha')$ is given by a morphism of schemes $f : U \to U'$, a morphism of schemes $g : Z \to Z'$ which induces an isomorphism $Z \to Z' \times_U U'$, and isomorphisms $b : y \to f^*y'$, $a : x \to g^*x'$ inducing a commutative diagram

$$\begin{tikzcd} y|_Z \arrow[r, "\alpha"'] \arrow[d, "b|_Z"'] & F(x) \arrow[d, "F(a)"] \\ f^*y'|_Z \arrow[r, "\alpha'"] & F(g^*x') \end{tikzcd}$$

It is clear from the definitions that there is a canonical forgetful functor

$$p : \mathcal{H}_d(\mathcal{X}/\mathcal{Y}) \longrightarrow (Sch/S)_{fppf}$$

which assignes to the quintuple (U, Z, y, x, α) the scheme U and to the morphism $(f, g, b, a) : (U, Z, y, x, \alpha) \to (U', Z', y', x', \alpha')$ the morphism $f : U \to U'$.

---

[3] This means the data gives rise, via the 2-Yoneda lemma (Categories, Lemma 4.38.1), to a 2-commutative diagram

$$\begin{tikzcd} (Sch/Z)_{fppf} \arrow[r, "x"'] \arrow[d] & \mathcal{X} \arrow[d, "F"] \\ (Sch/U)_{fppf} \arrow[r, "y"] & \mathcal{Y} \end{tikzcd}$$

of stacks in groupoids over $(Sch/S)_{fppf}$. Alternatively, we may picture α as a 2-morphism

$$\begin{tikzcd} (Sch/Z)_{fppf} \arrow[r, bend left, "y\circ(Z\to U)"] \arrow[r, bend right, "F\circ x"'] \arrow[r, phantom, "\Downarrow\alpha"] & \mathcal{Y}. \end{tikzcd}$$

Lemma 55.17.1. *The category $\mathcal{H}_d(\mathcal{X}/\mathcal{Y})$ endowed with the functor p above defines a stack in groupoids over $(Sch/S)_{fppf}$.*

Proof. As usual, the hardest part is to show descent for objects. To see this let $\{U_i \to U\}$ be a covering of $(Sch/S)_{fppf}$. Let $\xi_i = (U_i, Z_i, y_i, x_i, \alpha_i)$ be an object of $\mathcal{H}_d(\mathcal{X}/\mathcal{Y})$ lying over U_i, and let $\varphi_{ij} : \mathrm{pr}_0^*\xi_i \to \mathrm{pr}_1^*\xi_j$ be a descent datum. First, observe that φ_{ij} induces a descent datum $(Z_i/U_i, \varphi_{ij})$ which is effective by Descent, Lemma 31.33.1 This produces a scheme Z/U which is finite locally free of degree d by Descent, Lemma 31.19.28. From now on we identify Z_i with $Z \times_U U_i$. Next, the objects y_i in the fibre categories $\mathcal{Y}_{U_i}$ descend to an object y in $\mathcal{Y}_U$ because $\mathcal{Y}$ is a stack in groupoids. Similarly the objects x_i in the fibre categories $\mathcal{X}_{Z_i}$ descend to an object x in $\mathcal{X}_Z$ because $\mathcal{X}$ is a stack in groupoids. Finally, the given isomorpisms

$$\alpha_i : (y|_Z)_{Z_i} = y_i|_{Z_i} \longrightarrow F(x_i) = F(x|_{Z_i})$$

glue to a morphism $\alpha : y|_Z \to F(x)$ as the $\mathcal{Y}$ is a stack and hence $Isom_{\mathcal{Y}}(y|_Z, F(x))$ is a sheaf. Details omitted. $\square$

Definition 55.17.2. We will denote $\mathcal{H}_d(\mathcal{X}/\mathcal{Y})$ the *degree d finite Hilbert stack of $\mathcal{X}$ over $\mathcal{Y}$* constructed above. If $\mathcal{Y} = S$ we write $\mathcal{H}_d(\mathcal{X}) = \mathcal{H}_d(\mathcal{X}/\mathcal{Y})$. If $\mathcal{X} = \mathcal{Y} = S$ we denote it $\mathcal{H}_d$.

Note that given $F : \mathcal{X} \to \mathcal{Y}$ as above we have the following natural 1-morphisms of stacks in groupoids over $(Sch/S)_{fppf}$:

(55.17.2.1)
$$\begin{tikzcd} \mathcal{H}_d(\mathcal{X}) \arrow[dr] & \mathcal{H}_d(\mathcal{X}/\mathcal{Y}) \arrow[l] \arrow[r] \arrow[d] & \mathcal{Y} \\ & \mathcal{H}_d & \end{tikzcd}$$

Each of the arrows is given by a "forgetful functor".

Lemma 55.17.3. *The 1-morphism $\mathcal{H}_d(\mathcal{X}/\mathcal{Y}) \to \mathcal{H}_d(\mathcal{X})$ is faithful.*

Proof. To check that $\mathcal{H}_d(\mathcal{X}/\mathcal{Y}) \to \mathcal{H}_d(\mathcal{X})$ is faithful it suffices to prove that it is faithful on fibre categories. Suppose that $\xi = (U, Z, y, x, \alpha)$ and $\xi' = (U, Z', y', x', \alpha')$ are two objects of $\mathcal{H}_d(\mathcal{X}/\mathcal{Y})$ over the scheme U. Let $(g, b, a), (g', b', a') : \xi \to \xi'$ be two morphisms in the fibre category of $\mathcal{H}_d(\mathcal{X}/\mathcal{Y})$ over U. The image of these morphisms in $\mathcal{H}_d(\mathcal{X})$ agree if and only if $g = g'$ and $a = a'$. Then the commutative diagram

$$\begin{tikzcd} y|_Z \arrow[rr, "\alpha"] \arrow[d, "b|_Z,\, b'|_Z"'] & & F(x) \arrow[d, "F(a)=F(a')"] \\ y'|_Z \arrow[r, "\alpha'"] & F(g^*x') = F((g')^*x') \end{tikzcd}$$

implies that $b|_Z = b'|_Z$. Since $Z \to U$ is finite locally free of degree d we see $\{Z \to U\}$ is an fppf covering, hence $b = b'$. $\square$

CHAPTER 56

Quotients of Groupoids

56.1. Introduction

This chapter is devoted to generalities concering groupoids and their quotients (as far as they exist). There is a lot of literature on this subject, see for example [**MFK94**], [**Ses72**], [**Kol97**], [**KM97a**], [**Kol08**] and many more.

56.2. Conventions and notation

In this chapter the conventions and notation are those introduced in Groupoids in Spaces, Sections 52.2 and 52.3.

56.3. Invariant morphisms

Definition 56.3.1. Let S be a scheme, and let B be an algebraic space over S. Let $j = (t, s) : R \to U \times_B U$ be a pre-relation of algebraic spaces over B. We say a morphism $\phi : U \to X$ of algebraic spaces over B is *R-invariant* if the diagram

$$\begin{tikzcd} R \arrow[r, "s"] \arrow[d, "t"'] & U \arrow[d, "\phi"] \\ U \arrow[r, "\phi"] & X \end{tikzcd}$$

is commutative. If $j : R \to U \times_B U$ comes from the action of a group algebraic space G on U over B as in Groupoids in Spaces, Lemma 52.14.1, then we say that ϕ is *G-invariant*.

In other words, a morphism $U \to X$ is R-invariant if it equalizes s and t. We can reformulate this in terms of associated quotient sheaves as follows.

Lemma 56.3.2. *Let S be a scheme, and let B be an algebraic space over S. Let $j = (t, s) : R \to U \times_B U$ be a pre-relation of algebraic spaces over B. A morphism of algebraic spaces $\phi : U \to X$ is R-invariant if and only if it factors as $U \to U/R \to X$.*

Proof. This is clear from the definition of the quotient sheaf in Groupoids in Spaces, Section 52.18. □

Lemma 56.3.3. *Let S be a scheme, and let B be an algebraic space over S. Let $j = (t, s) : R \to U \times_B U$ be a pre-relation of algebraic spaces over B. Let $U \to X$ be an R-invariant morphism of algebraic spaces over B. Let $X' \to X$ be any morphism of algebraic spaces.*

(1) *Setting $U' = X' \times_X U$, $R' = X' \times_X R$ we obtain a pre-relation $j' : R' \to U' \times_B U'$.*
(2) *The pre-relation $j' : R' \to U' \times_B U'$ is the restriction of $j : R \to U \times_B U$ via $U' \to U$, see Groupoids in Spaces, Definition 52.4.3.*
(3) *If j is a relation, then j' is a relation.*
(4) *If j is a pre-equivalence relation, then j' is a pre-equivalence relation.*
(5) *If j is an equivalence relation, then j' is an equivalence relation.*

(6) *If j comes from a groupoid in algebraic spaces (U, R, s, t, c) over B, then j' comes from the restriction of this groupoid to U', see Groupoids in Spaces, Definition 52.16.2.*
(7) *If j comes from the action of a group algebraic space G/B on U as in Groupoids in Spaces, Lemma 52.14.1 then j' comes from the induced action of G on U'.*

Proof. Omitted. Hint: Functorial point of view combined with the picture:

$$\begin{tikzcd}
R' = X' \times_X R \arrow[rr] \arrow[dr] \arrow[dd] & & X' \times_X U = U' \arrow[dr] \arrow[dd] & \\
& R \arrow[rr] \arrow[dd] & & U \arrow[dd] \\
U' = X' \times_X U \arrow[rr] \arrow[dr] & & X' \arrow[dr] & \\
& U \arrow[rr] & & X
\end{tikzcd}$$

□

Definition 56.3.4. In the situation of Lemma 56.3.3 we call $j' : R' \to U' \times_B U'$ the *pullback* of the pre-relation j to X'. We say it is a *flat pullback* if $X' \to X$ is a flat morphism of algebraic spaces.

56.4. Categorical quotients

This is the most basic kind of quotient one can consider.

Definition 56.4.1. Let S be a scheme, and let B be an algebraic space over S. Let $j = (t, s) : R \to U \times_B U$ be pre-relation in algebraic spaces over B.

(1) We say a morphism $\phi : U \to X$ of algebraic spaces over B is a *categorical quotient* if it is R-invariant, and for every R-invariant morphism $\psi : U \to Y$ of algebraic spaces over B there exists a unique morphism $\chi : X \to Y$ such that $\psi = \phi \circ \chi$.
(2) Let $\mathcal{C}$ be a full subcategory of the category of algebraic spaces over B. Assume U, R are objects of $\mathcal{C}$. In this situation we say a morphism $\phi : U \to X$ of algebraic spaces over B is a *categorical quotient in* $\mathcal{C}$ if $X \in Ob(\mathcal{C})$, and ϕ is R-invariant, and for every R-invariant morphism $\psi : U \to Y$ with $Y \in Ob(\mathcal{C})$ there exists a unique morphism $\chi : X \to Y$ such that $\psi = \phi \circ \chi$.
(3) If $B = S$ and $\mathcal{C}$ is the category of schemes over S, then we say $U \to X$ is a *categorical quotient in the category of schemes*, or simply a *categorical quotient in schemes*.

We often single out a category $\mathcal{C}$ of algebraic spaces over B by some separation axiom, see Example 56.4.3 for some standard cases. Note that if $\phi : U \to X$ is a categorical quotient if and only if $U \to X$ is a coequalizer for the morphisms $t, s : R \to U$ in the category. Hence we immediately deduce the following lemma.

Lemma 56.4.2. *Let S be a scheme, and let B be an algebraic space over S. Let $j : R \to U \times_B U$ be a pre-relation in algebraic spaces over B. If a categorical quotient in the category of algebaic spaces over B exists, then it is unique up to unique isomorphism. Similarly for categorical quotients in full subcategories of Spaces/B.*

Proof. See Categories, Section 4.11. □

Example 56.4.3. Let S be a scheme, and let B be an algebraic space over S. Here are some standard examples of categories $\mathcal{C}$ that we often come up when applying Definition 56.4.1:

(1) $\mathcal{C}$ is the category of all algebraic spaces over B,
(2) B is separated and $\mathcal{C}$ is the category of all separated algebraic spaces over B,
(3) B is quasi-separated and $\mathcal{C}$ is the category of all quasi-separated algebraic spaces over B,
(4) B is locally separated and $\mathcal{C}$ is the category of all locally separated algebraic spaces over B,
(5) B is decent and $\mathcal{C}$ is the category of all decent algebraic spaces over B, and
(6) $S = B$ and $\mathcal{C}$ is the category of schemes over S.

In this case, if $\phi : U \to X$ is a categorical quotient then we say $U \to X$ is (1) a *categorical quotient*, (2) a *categorical quotient in separated algebraic spaces*, (3) a *categorical quotient in quasi-separated algebraic spaces*, (4) a *categorical quotient in locally separated algebraic spaces*, (5) a *categorical quotient in decent algebraic spaces*, (6) a *categorical quotient in schemes*.

Definition 56.4.4. Let S be a scheme, and let B be an algebraic space over S. Let $\mathcal{C}$ be a full subcategory of the category of algebraic spaces over B closed under fibre products. Let $j = (t, s) : R \to U \times_B U$ be pre-relation in $\mathcal{C}$, and let $U \to X$ be an R-invariant morphism with $X \in Ob(\mathcal{C})$.

(1) We say $U \to X$ is a *universal categorical quotient* in $\mathcal{C}$ if for every morphism $X' \to X$ in $\mathcal{C}$ the morphism $U' = X' \times_X U \to X'$ is the categorical quotient in $\mathcal{C}$ of the pullback $j' : R' \to U'$ of j.
(2) We say $U \to X$ is a *uniform categorical quotient* in $\mathcal{C}$ if for every flat morphism $X' \to X$ in $\mathcal{C}$ the morphism $U' = X' \times_X U \to X'$ is the categorical quotient in $\mathcal{C}$ of the pullback $j' : R' \to U'$ of j.

Lemma 56.4.5. *In the situation of Definition 56.4.1. If $\phi : U \to X$ is a categorical quotient and U is reduced, then X is reduced. The same holds for categorical quotients in a category of spaces $\mathcal{C}$ listed in Example 56.4.3.*

Proof. Let X_{red} be the reduction of the algebraic space X. Since U is reduced the morphism $\phi : U \to X$ factors through $i : X_{red} \to X$ (insert future reference here). Denote this morphism by $\phi_{red} : U \to X_{red}$. Since $\phi \circ s = \phi \circ t$ we see that also $\phi_{red} \circ s = \phi_{red} \circ t$ (as $i : X_{red} \to X$ is a monomorphism). Hence by the universal property of ϕ there exists a morphism $\chi : X \to X_{red}$ such that $\phi_{red} = \phi \circ \chi$. By uniqueness we see that $i \circ \chi = \mathrm{id}_X$ and $\chi \circ i = \mathrm{id}_{X_{red}}$. Hence i is an isomorphism and X is reduced.

To show that this argument works in a category $\mathcal{C}$ one just needs to show that the reduction of an object of $\mathcal{C}$ is an object of $\mathcal{C}$. We omit the verification that this holds for each of the standard examples. □

56.5. Quotients as orbit spaces

Let $j = (t, s) : R \to U \times_B U$ be a pre-relation. If j is a pre-equivalence relation, then loosely speaking the ``orbits'' of R on U are the subsets $t(s^{-1}(\{u\}))$ of U. However, if j is just a pre-relation, then we need to take the equivalence relation generated by R.

Definition 56.5.1. Let S be a scheme, and let B be an algebraic space over S. Let $j : R \to U \times_B U$ be a pre-relation over B. If $u \in |U|$, then the *orbit*, or more precisely the *R-orbit* of u is

$$O_u = \left\{ u' \in |U| \ : \ \begin{matrix} \exists n \geq 1,\ \exists u_0, \ldots, u_n \in |U| \text{ such that} \\ \text{for all } i \in \{0, \ldots, n-1\} \text{ either} \\ u_i = u_{i+1} \text{ or} \\ \exists r \in |R|,\ s(r) = u_i, t(r) = u_{i+1} \text{ or} \\ \exists r \in |R|,\ t(r) = u_i, s(r) = u_{i+1} \end{matrix} \right\}$$

It is clear that these are the equivalence classes of an equivalence relation, i.e., we have $u' \in O_u$ if and only if $u \in O_{u'}$. The following lemma is a reformulation of Groupoids in Spaces, Lemma 52.4.4.

Lemma 56.5.2. *Let $B \to S$ as in Section 56.2. Let $j : R \to U \times_B U$ be a pre-equivalence relation of algebraic spaces over B. Then*

$$O_u = \{u' \in |U| \text{ such that } \exists r \in |R|,\ s(r) = u,\ t(r) = u'\}.$$

Proof. By the aforemetioned Groupoids in Spaces, Lemma 52.4.4 we see that the orbits O_u as defined in the lemma give a disjoint union decomposition of $|U|$. Thus we see they are equal to the orbits as defined in Definition 56.5.1. □

Lemma 56.5.3. *In the situation of Definition 56.5.1. Let $\phi : U \to X$ be an R-invariant morphism of algebraic spaces over B. Then $|\phi| : |U| \to |X|$ is constant on the orbits.*

Proof. To see this we just have to show that $\phi(u) = \phi(u')$ for all $u, u' \in |U|$ such that there exists an $r \in |R|$ such that $s(r) = u$ and $t(r) = u'$. And this is clear since ϕ equalizes s and t. □

There are several problems with considering the orbits $O_u \subset |U|$ as a tool for singling out properties of quotient maps. One issue is the following. Suppose that $Spec(k) \to B$ is a geometric point of B. Consider the canonical map

$$U(k) \longrightarrow |U|.$$

Then it is usually not the case that the equivalence classes of the equivalence relation generated by $j(R(k)) \subset U(k) \times U(k)$ are the inverse images of the orbits $O_u \subset |U|$. A silly example is to take $S = B = Spec(\mathbf{Z})$, $U = R = Spec(k)$ with $s = t = \text{id}_k$. Then $|U| = |R|$ is a single point but $U(k)/R(k)$ is enormous. A more interesting example is to take $S = B = Spec(\mathbf{Q})$, choose some of number fields $K \subset L$, and set $U = Spec(L)$ and $R = Spec(L \otimes_K L)$ with obvious maps $s, t : R \to U$. In this case $|U|$ still has just one point, but the quotient

$$U(k)/R(k) = Hom(K, k)$$

consists of more than one element. We conclude from both examples that if $U \to X$ is an R-invariant map and if we want it to ``separate orbits'' we get a much stronger and interesting notion by considering the induced maps $U(k) \to X(k)$ and ask that those maps separate orbits.

There is an issue with this too. Namely, suppose that $S = B = Spec(\mathbf{R})$, $U = Spec(\mathbf{C})$, and $R = Spec(\mathbf{C}) \amalg Spec(K)$ for some field extension $\sigma : \mathbf{C} \to K$. Let the maps s, t be given by the identity on the component $Spec(\mathbf{C})$, but by $\sigma, \sigma \circ \tau$ on the second component where τ is complex conjugation. If K is a nontrivial extension of $\mathbf{C}$, then the two points $1, \tau \in U(\mathbf{C})$ are not equivalent under $j(R(\mathbf{C}))$. But after choosing an extension $\mathbf{C} \subset \Omega$ of sufficiently large cardinality (for example larger than the cardinality of K) then the images of $1, \tau \in U(\mathbf{C})$ in $U(\Omega)$ do become equivalent! It seems intuitively clear that this happens either because $s, t : R \to U$ are not locally of finite type or because the cardinality of the field k is not large enough.

Keeping this in mind we make the following definition.

Definition 56.5.4. Let S be a scheme, and let B be an algebraic space over S. Let $j : R \to U \times_B U$ be a pre-relation over B. Let $Spec(k) \to B$ be a geometric point of B.

(1) We say $\overline{u}, \overline{u}' \in U(k)$ are *weakly R-equivalent* if they are in the same equivalence class for the equivalence relation generated by the relation $j(R(k)) \subset U(k) \times U(k)$.
(2) We say $\overline{u}, \overline{u}' \in U(k)$ are *R-equivalent* if for some overfield $k \subset \Omega$ the images in $U(\Omega)$ are weakly R-equivalent.
(3) The *weak orbit*, or more precisely the *weak R-orbit* of $\overline{u} \in U(k)$ is set of all elements of $U(k)$ which are weakly R-equivalent to $\overline{u}$.
(4) The *orbit*, or more precisely the *R-orbit* of $\overline{u} \in U(k)$ is set of all elements of $U(k)$ which are R-equivalent to $\overline{u}$.

It turns out that in good cases orbits and weak orbits agree, see Lemma 56.5.7. The following lemma illustrates the difference in the special case of a pre-equivalence relation.

Lemma 56.5.5. *Let S be a scheme, and let B be an algebraic space over S. Let $Spec(k) \to B$ be a geometric point of B. Let $j : R \to U \times_B U$ be a pre-equivalence relation over B. In this case the weak orbit of $\overline{u} \in U(k)$ is simply*

$$\{\overline{u}' \in U(k) \text{ such that } \exists \overline{r} \in R(k),\ s(\overline{r}) = \overline{u},\ t(\overline{r}) = \overline{u}'\}$$

and the orbit of $\overline{u} \in U(k)$ is

$$\{\overline{u}' \in U(k) : \exists \text{ field extension } k \subset K,\ \exists\, r \in R(K),\ s(r) = \overline{u},\ t(r) = \overline{u}'\}$$

Proof. This is true because by definition of a pre-equivalence relation the image $j(R(k)) \subset U(k) \times U(k)$ is an equivalence relation. $\square$

Let us describe the recipe for turning any pre-relation into a pre-equivalence relation. We will use the morphisms

$$(56.5.5.1) \qquad \begin{array}{lcccccc} j_{diag} & : & U & \longrightarrow & U \times_B U, & u & \longmapsto & (u, u) \\ j_{flip} & : & R & \longrightarrow & U \times_B U, & r & \longmapsto & (s(r), t(r)) \\ j_{comp} & : & R \times_{s,U,t} R & \longrightarrow & U \times_B U, & (r, r') & \longmapsto & (t(r), s(r')) \end{array}$$

We define $j_1 = (t_1, s_1) : R_1 \to U \times_B U$ to be the morphism

$$j \amalg j_{diag} \amalg j_{flip} : R \amalg U \amalg R \longrightarrow U \times_B U$$

with notation as in Equation (56.5.5.1). For $n > 1$ we set

$$j_n = (t_n, s_n) : R_n = R_1 \times_{s_1, U, t_{n-1}} R_{n-1} \longrightarrow U \times_B U$$

where t_n comes from t_1 precomposed with projection onto R_1 and s_n comes from s_{n-1} precomposed with projection onto R_{n-1}. Finally, we denote

$$j_\infty = (t_\infty, s_\infty) : R_\infty = \coprod\nolimits_{n \geq 1} R_n \longrightarrow U \times_B U.$$

Lemma 56.5.6. *Let S be a scheme, and let B be an algebraic space over S. Let $j : R \to U \times_B U$ be a pre-relation over B. Then $j_\infty : R_\infty \to U \times_B U$ is a pre-equivalence relation over B. Moreover*

(1) *$\phi : U \to X$ is R-invariant if and only if it is R_∞-invariant,*

(2) *the canonical map of quotient sheaves $U/R \to U/R_\infty$ (see Groupoids in Spaces, Section 52.18) is an ismorphism,*
(3) *weak R-orbits agree with weak R_∞-orbits,*
(4) *R-orbits agree with R_∞-orbits,*
(5) *if s, t are locally of finite type, then s_∞, t_∞ are locally of finite type,*
(6) *add more here as needed.*

Proof. Omitted. Hint for (5): Any property of s, t which is stable under composition and stable under base change, and Zariski local on the source will be inherited by s_∞, t_∞. $\square$

Lemma 56.5.7. *Let S be a scheme, and let B be an algebraic space over S. Let $j : R \to U \times_B U$ be a pre-relation over B. Let $Spec(k) \to B$ be a geometric point of B.*

(1) *If $s, t : R \to U$ are locally of finite type then weak R-equivalence on $U(k)$ agrees with R-equivalence, and weak R-orbits agree with R-orbits on $U(k)$.*
(2) *If k has sufficiently large cardinality then weak R-equivalence on $U(k)$ agrees with R-equivalence, and weak R-orbits agree with R-orbits on $U(k)$.*

Proof. We first prove (1). Assume s, t locally of finite type. By Lemma 56.5.6 we may assume that R is a pre-equivalence relation. Let k be an algebraically closed field over B. Suppose $\overline{u}, \overline{u}' \in U(k)$ are R-equivalent. Then for some extension field $k \subset \Omega$ there exists a point $\overline{r} \in R(\Omega)$ mapping to $(\overline{u}, \overline{u}') \in (U \times_B U)(\Omega)$, see Lemma 56.5.5. Hence

$$Z = R \times_{j, U \times_B U, (\overline{u}, \overline{u}')} Spec(k)$$

is nonempty. As s is locally of finite type we see that also j is locally of finite type, see Morphisms of Spaces, Lemma 42.22.6. This implies Z is a nonempty algebraic space locally of finite type over the algebraically closed field k (use Morphisms of Spaces, Lemma 42.22.3). Thus Z has a k-valued point, see Morphisms of Spaces, Lemma 42.23.1. Hence we conclude there exists a $\overline{r} \in R(k)$ with $j(\overline{r}) = (\overline{u}, \overline{u}')$, and we conclude that $\overline{u}, \overline{u}'$ are R-equivalent as desired.

The proof of part (2) is the same, except that it uses Morphisms of Spaces, Lemma 42.23.2 instead of Morphisms of Spaces, Lemma 42.23.1. This shows that the assertion holds as soon as $|k| > \lambda(R)$ with $\lambda(R)$ as introduced just above Morphisms of Spaces, Lemma 42.23.1. $\square$

In the following definition we use the terminology ``k is a field over B'' to mean that $Spec(k)$ comes equipped with a morphism $Spec(k) \to B$.

Definition 56.5.8. Let S be a scheme, and let B be an algebraic space over S. Let $j : R \to U \times_B U$ be a pre-relation over B.

(1) We say $\phi : U \to X$ is *set-theoretically R-invariant* if and only if the map $U(k) \to X(k)$ equalizes the two maps $s, t : R(k) \to U(k)$ for every algebraically closed field k over B.
(2) We say $\phi : U \to X$ *separates orbits*, or *separates R-orbits* if it is set-theoretically R-invariant and $\phi(\overline{u}) = \phi(\overline{u}')$ in $X(k)$ implies that $\overline{u}, \overline{u}' \in U(k)$ are in the same orbit for every algebraically closed field k over B.

In Example 56.5.12 we show that being set-theoretically invariant is ``too weak'' a notion in the category of algebraic spaces. A more geometric reformulation of what it means to be set-theoretically invariant or to separate orbits is in Lemma 56.5.17.

Lemma 56.5.9. *In the situation of Definition 56.5.8. A morphism $\phi : U \to X$ is set-theoretically R-invariant if and only if for any algebraically closed field k over B the map $U(k) \to X(k)$ is constant on orbits.*

Proof. This is true because the condition is supposed to hold for all algebraically closed fields over B. □

Lemma 56.5.10. *In the situation of Definition 56.5.8. An invariant morphism is set-theoretically invariant.*

Proof. This is immediate from the definitions. □

Lemma 56.5.11. *In the situation of Definition 56.5.8. Let $\phi : U \to X$ be a morphism of algebraic spaces over B. Assume*

(1) *ϕ is set-theoretically R-invariant,*
(2) *R is reduced, and*
(3) *X is locally separated over B.*

Then ϕ is R-invariant.

Proof. Consider the equalizer

$$Z = R \times_{(\phi,\phi)\circ j, X\times_B X, \Delta_{X/B}} X$$

algebraic space. Then $Z \to R$ is an immersion by assumption (3). By assumption (1) $|Z| \to |R|$ is surjective. This implies that $Z \to R$ is a bijective closed immersion (use Schemes, Lemma 21.10.4) and by assumption (2) we conclude that $Z = R$. □

Example 56.5.12. There exist reduced quasi-separated algebraic spaces X, Y and a pair of morphisms $a, b : Y \to X$ which agree on all k-valued points but are not equal. To get an example take $Y = Spec(k[[x]])$ and

$$X = \mathbf{A}^1_k \Big/ \big(\Delta \amalg \{(x, -x) \mid x \neq 0\}\big)$$

the algebraic space of Spaces, Example 40.14.1. The two morphisms $a, b : Y \to X$ come from the two maps $x \mapsto x$ and $x \mapsto -x$ from Y to $\mathbf{A}^1_k = Spec(k[x])$. On the generic point the two maps are the same because on the open part $x \neq 0$ of the space X the functions x and $-x$ are equal. On the closed point the maps are obviously the same. It is also true that $a \neq b$. This implies that Lemma 56.5.11 does not hold with assumption (3) replaced by the assumption that X be quasi-separated. Namely, consider the diagram

$$\begin{tikzcd} Y \arrow[r, "1"'] \arrow[d, "-1"'] & Y \arrow[d, "a"] \\ Y \arrow[r, "a"] & X \end{tikzcd}$$

then the composition $a \circ (-1) = b$. Hence we can set $R = Y$, $U = Y$, $s = 1$, $t = -1$, $\phi = a$ to get an example of a set-theoretically invariant morphism which is not invariant.

The example above is instructive because the map $Y \to X$ even separates orbits. It shows that in the category of algebraic spaces there are simply too many set-theoretically invariant morphisms lying around. Next, let us define what it means for R to be a set-theoretic equivalence relation, while remembering that we need to allow for field extensions to make this work correctly.

Definition 56.5.13. Let S be a scheme, and let B be an algebraic space over S. Let $j : R \to U \times_B U$ be a pre-relation over B.

(1) We say j is a *set-theoretic pre-equivalence relation* if

$$\overline{u} \sim_R \overline{u}' \Leftrightarrow \begin{matrix} \exists \text{ field extension } k \subset K,\ \exists\, r \in R(K), \\ s(r) = \overline{u},\ t(r) = \overline{u}' \end{matrix}$$

defines an equivalence relation on $U(k)$ for all algebraically closed fields k over B.

(2) We say j is a *set-theoretic equivalence relation* if j is universally injective and a set-theoretic pre-equivalence relation.

Let us reformulate this in more geometric terms.

Lemma 56.5.14. *In the situation of Definition 56.5.13. The following are equivalent:*

(1) *The morphism j is a set-theoretic pre-equivalence relation.*
(2) *The subset $j(|R|) \subset |U \times_B U|$ contains the image of $|j'|$ for any of the morphisms j' as in Equation (56.5.5.1).*
(3) *For every algebraically closed field k over B of sufficiently large cardinality the subset $j(R(k)) \subset U(k) \times U(k)$ is an equivalence relation.*

If s, t are locally of finite type these are also equivalent to

(4) *For every algebraically closed field k over B the subset $j(R(k)) \subset U(k) \times U(k)$ is an equivalence relation.*

Proof. Assume (2). Let k be an algebraically closed field over B. We are going to show that $\sim_R$ is an equivalence relation. Suppose that $\overline{u}_i : Spec(k) \to U$, $i = 1, 2$ are k-valued points of U. Suppose that $(\overline{u}_1, \overline{u}_2)$ is the image of a K-valued point $r \in R(K)$. Consider the solid commutative diagram

$$\begin{tikzcd} Spec(K') \arrow[r, dotted] \arrow[d, dotted] & Spec(k) \arrow[d, "{(\overline{u}_2,\overline{u}_1)}"'] & Spec(K) \arrow[l] \arrow[d] \\ R \arrow[r, "j"] & U \times_B U & R \arrow[l, "j_{flip}"'] \end{tikzcd}$$

We also denote $r \in |R|$ the image of r. By assumption the image of $|j_{flip}|$ is contained in the image of $|j|$, in other words there exists a $r' \in |R|$ such that $|j|(r') = |j_{flip}|(r)$. But note that $(\overline{u}_2, \overline{u}_1)$ is in the equivalence class that defines $|j|(r')$ (by the commutativity of the solid part of the diagram). This means there exists a field extension $k \subset K'$ and a morphism $r' : Spec(K) \to R$ (abusively denoted r' as well) with $j \circ r' = (\overline{u}_2, \overline{u}_1) \circ i$ where $i : Spec(K') \to Spec(K)$ is the obvious map. In other words the dotted part of the diagram commutes. This proves that $\sim_R$ is a symmetric relation on $U(k)$. In the similar way, using that the image of $|j_{diag}|$ is contained in the image of $|j|$ we see that $\sim_R$ is reflexive (details omitted).

To show that $\sim_R$ is transitive assume given $\overline{u}_i : Spec(k) \to U$, $i = 1, 2, 3$ and field extensions $k \subset K_i$ and points $r_i : Spec(K_i) \to R$, $i = 1, 2$ such that $j(r_1) = (\overline{u}_1, \overline{u}_2)$ and $j(r_1) = (\overline{u}_2, \overline{u}_3)$. Then we may choose a commutative diagram of fields

$$\begin{tikzcd} K & K_2 \arrow[l] \\ K_1 \arrow[u] & k \arrow[l] \arrow[u] \end{tikzcd}$$

and we may think of $r_1, r_2 \in R(K)$. We consider the commutative solid diagram

$$\begin{tikzcd} Spec(K') \arrow[r, dotted] \arrow[d, dotted] & Spec(k) \arrow[d, "(\overline{u}_1,\overline{u}_3)"] & Spec(K) \arrow[l] \arrow[d, "(r_1,r_2)"] \\ R \arrow[r, "j"] & U \times_B U & R \times_{s,U,t} R \arrow[l, "j_{comp}"'] \end{tikzcd}$$

By exactly the same reasoning as in the first part of the proof, but this time using that $|j_{comp}|((r_1, r_2))$ is in the image of $|j|$, we conclude that a field K' and dotted arrows exist making the diagram commute. This proves that $\sim_R$ is transitive and concludes the proof that (2) implies (1).

Assume (1) and let k be an algebraically closed field over B whose cardinality is larger than $\lambda(R)$, see Morphisms of Spaces, Lemma 42.23.2. Suppose that $\overline{u} \sim_R \overline{u}'$ with $\overline{u}, \overline{u}' \in U(k)$. By assumption there exists a point in $|R|$ mapping to $(\overline{u}, \overline{u}') \in |U \times_B U|$. Hence by Morphisms of Spaces, Lemma 42.23.2 we conclude there exists an $\overline{r} \in R(k)$ with $j(\overline{r}) = (\overline{u}, \overline{u}')$. In this way we see that (1) implies (3).

Assume (3). Let us show that $\mathrm{Im}(|j_{comp}|) \subset \mathrm{Im}(|j|)$. Pick any point $c \in |R \times_{s,U,t} R|$. We may represent this by a morphism $\overline{c} : Spec(k) \to R \times_{s,U,t} R$, with k over B having sufficiently large cardinality. By assumption we see that $j_{comp}(\overline{c}) \in U(k) \times U(k) = (U \times_B U)(k)$ is also the image $j(\overline{r})$ for some $\overline{r} \in R(k)$. Hence $j_{comp}(c) = j(r)$ in $|U \times_B U|$ as desired (with $r \in |R|$ the equivalence class of $\overline{r}$). The same argument shows also that $\mathrm{Im}(|j_{diag}|) \subset \mathrm{Im}(|j|)$ and $\mathrm{Im}(|j_{flip}|) \subset \mathrm{Im}(|j|)$ (details omitted). In this way we see that (3) implies (2). At this point we have shown that (1), (2) and (3) are all equivalent.

It is clear that (4) implies (3) (without any assumptions on s, t). To finish the proof of the lemma we show that (1) implies (4) if s, t are locally of finite type. Namely, let k be an algebraically closed field over B. Suppose that $\overline{u} \sim_R \overline{u}'$ with $\overline{u}, \overline{u}' \in U(k)$. By assumption the algebraic space $Z = R \times_{j, U \times_B U, (\overline{u}, \overline{u}')} Spec(k)$ is nonempty. On the other hand, since $j = (t, s)$ is locally of finite type the morphism $Z \to Spec(k)$ is locally of finite type as well (use Morphisms of Spaces, Lemmas 42.22.6 and 42.22.3). Hence Z has a k point by Morphisms of Spaces, Lemma 42.23.1 and we conclude that $(\overline{u}, \overline{u}') \in j(R(k))$ as desired. This finishes the proof of the lemma. □

Lemma 56.5.15. *In the situation of Definition 56.5.13. The following are equivalent:*

(1) *The morphism j is a set-theoretic equivalence relation.*
(2) *The morphism j is universally injective and $j(|R|) \subset |U \times_B U|$ contains the image of $|j'|$ for any of the morphisms j' as in Equation (56.5.5.1).*
(3) *For every algebraically closed field k over B of sufficiently large cardinality the map $j : R(k) \to U(k) \times U(k)$ is injective and its image is an equivalence relation.*

If j is decent, or locally separated, or quasi-separated these are also equivalent to

(4) *For every algebraically closed field k over B the map $j : R(k) \to U(k) \times U(k)$ is injective and its image is an equivalence relation.*

Proof. The implications (1) ⇒ (2) and (2) ⇒ (3) follow from Lemma 56.5.14 and the definitions. The same lemma shows that (3) implies j is a set-theoretic pre-equivalence relation. But of course condition (3) also implies that j is universally injective, see Morphisms of Spaces, Lemma 42.18.2, so that j is indeed a set-theoretic equivalence relation. At this point we know that (1), (2), (3) are all equivalent.

Condition (4) implies (3) without any further hypotheses on j. Assume j is decent, or locally separated, or quasi-separated and the equivalent conditions (1), (2), (3) hold. By More on Morphisms of Spaces, Lemma 46.3.4 we see that j is radicial. Let k be any algebraically closed field over B. Let $\overline{u}, \overline{u}' \in U(k)$ with $\overline{u} \sim_R \overline{u}'$. We see that $R \times_{U \times_B U, (\overline{u}, \overline{u}')} Spec(k)$ is nonempty. Hence, as j is radicial, its reduction is the spectrum of a field purely inseparable over k. As $k = \overline{k}$ we see that it is the spectrum of k. Whence a point $\overline{r} \in R(k)$ with $t(\overline{r}) = \overline{u}$ and $s(\overline{r}) = \overline{u}'$ as desired. □

Lemma 56.5.16. *Let S be a scheme, and let B be an algebraic space over S. Let $j : R \to U \times_B U$ be a pre-relation over B.*

(1) *If j is a pre-equivalence relation, then j is a set-theoretic pre-equivalence relation. This holds in particular when j comes from a groupoid in algebraic spaces, or from an action of a group algebraic space on U.*
(2) *If j is an equivalence relation, then j is a set-theoretic equivalence relation.*

Proof. Omitted. □

Lemma 56.5.17. *Let $B \to S$ be as in Section 56.2. Let $j : R \to U \times_B U$ be a pre-relation. Let $\phi : U \to X$ be a morphism of algebraic spaces over B. Consider the diagram*

$$\begin{tikzcd} (U \times_X U) \times_{(U \times_B U)} R \arrow[r, "p"'] \arrow[d, "q"] & R \arrow[d, "j"] \\ U \times_X U \arrow[r, "c"] & U \times_B U \end{tikzcd}$$

Then we have:

(1) *The morphism ϕ is set-theoretically invariant if and only if p is surjective.*
(2) *If j is a set-theoretic pre-equivalence relation then ϕ separates orbits if and only if p and q are surjective.*
(3) *If p and q are surjective, then j is a set-theoretic pre-equivalence relation (and ϕ separates orbits).*
(4) *If ϕ is R-invariant and j is a set-theoretic pre-equivalence relation, then ϕ separates orbits if and only if the induced morphism $R \to U \times_X U$ is surjective.*

Proof. Assume ϕ is set-theoretically invariant. This means that for any algebraically closed field k over B and any $\overline{r} \in R(k)$ we have $\phi(s(\overline{r})) = \phi(t(\overline{r}))$. Hence $((\phi(t(\overline{r})), \phi(s(\overline{r}))), \overline{r})$ defines a point in the fibre product mapping to $\overline{r}$ via p. This shows that p is surjective. Conversely, assume p is surjective. Pick $\overline{r} \in R(k)$. As p is surjective, we can find a field extension $k \subset K$ and a K-valued point $\tilde{r}$ of the fibre product with $p(\tilde{r}) = \overline{r}$. Then $q(\tilde{r}) \in U \times_X U$ maps to $(t(\overline{r}), s(\overline{r}))$ in $U \times_B U$ and we conclude that $\phi(s(\overline{r})) = \phi(t(\overline{r}))$. This proves that ϕ is set-theoretically invariant.

The proofs of (2), (3), and (4) are omitted. Hint: Assume k is an algebraically closed field over B of large cardinality. Consider the associated diagram of sets

$$\begin{tikzcd} (U(k) \times_{X(k)} U(k)) \times_{U(k) \times U(k)} R(k) \arrow[r, "p"'] \arrow[d, "q"] & R(k) \arrow[d, "j"] \\ U(k) \times_{X(k)} U(k) \arrow[r, "c"] & U(k) \times U(k) \end{tikzcd}$$

By the lemmas above the equivalences posed in (2), (3), and (4) become set-theoretic questions related to the diagram we just displayed, using that surjectivity translates into surjectivity on k-valued points by Morphisms of Spaces, Lemma 42.23.2. □

Because we have seen above that the notion of a set-theoretically invariant morphism is a rather weak one in the category of algebraic spaces, we define an orbit space for a pre-relation as follows.

Definition 56.5.18. Let $B \to S$ as in Section 56.2. Let $j : R \to U \times_B U$ be a pre-relation. We say $\phi : U \to X$ is an *orbit space for R* if

(1) ϕ is R-invariant,
(2) ϕ separates R-orbits, and
(3) ϕ is surjective.

The definition of separating R-orbits involves a discussion of points with values in algebraically closed fields. But as we've seen in many cases this just corresponds to the surjectivity of certain canonically associated morphisms of algebraic spaces. We summarize some of the discussion above in the following characterization of orbit spaces.

Lemma 56.5.19. *Let $B \to S$ as in Section 56.2. Let $j : R \to U \times_B U$ be a set-theoretic pre-equivalence relation. A morphism $\phi : U \to X$ is an orbit space for R if and only if*

(1) *$\phi \circ s = \phi \circ t$, i.e., ϕ is invariant,*
(2) *the induced morphism $(t, s) : R \to U \times_X U$ is surjective, and*
(3) *the morphism $\phi : U \to X$ is surjective.*

This characterization applies for example if j is a pre-equivalence relation, or comes from a groupoid in algebraic spaces over B, or comes from the action of a group algebraic space over B on U.

Proof. Follows immediately from Lemma 56.5.17 part (4). □

In the following lemma it is (probably) not good enough to assume just that the morphisms s, t are locally of finite type. The reason is that it may happen that some map $\phi : U \to X$ is an orbit space, yet is not locally of finite type. In that case $U(k) \to X(k)$ may not be surjective for all algebraically closed fields k over B.

Lemma 56.5.20. *Let $B \to S$ as in Section 56.2. Let $j = (t, s) : R \to U \times_B U$ be a pre-relation. Assume R, U are locally of finite type over B. Let $\phi : U \to X$ be an R-invariant morphism of algebraic spaces over B. Then ϕ is an orbit space for R if and only if the natural map*

$$U(k)/\big(\textit{equivalence relation generated by } j(R(k))\big) \longrightarrow X(k)$$

is bijective for all algebraically closed fields k over B.

Proof. Note that since U, R are locally of finite type over B all of the morphisms s, t, j, ϕ are locally of finite type, see Morphisms of Spaces, Lemma 42.22.6. We will also use without further mention Morphisms of Spaces, Lemma 42.23.1. Assume ϕ is an orbit space. Let k be any algebraically closed field over B. Let $\overline{x} \in X(k)$. Consider $U \times_{\phi, X, \overline{x}} Spec(k)$. This is a nonempty algebraic space which is locally of finite type over k. Hence it has a k-valued point. This shows the displayed map of the lemma is surjective. Suppose that $\overline{u}, \overline{u}' \in U(k)$ map to the same element of $X(k)$. By Definition 56.5.8 this means that $\overline{u}, \overline{u}'$ are in the same R-orbit. By Lemma 56.5.7 this means that they are equivalent under the equivalence relation generated by $j(R(k))$. Thus the displayed morphism is injective.

Conversely, assume the displayed map is bijective for all algebraically closed fields k over B. This condition clearly implies that ϕ is surjective. We have already assumed that ϕ is R-invariant. Finally, the injectivity of all the displayed maps implies that ϕ separates orbits. Hence ϕ is an orbit space. □

56.6. Coarse quotients

We only add this here so that we can later say that coarse quotients correspond to coarse moduli spaces (or moduli schemes).

Definition 56.6.1. Let S be a scheme and B an algebraic space over S. Let $j : R \to U \times_B U$ be a pre-relation. A morphism $\phi : U \to X$ of algebraic spaces over B is called a *coarse quotient* if

(1) ϕ is a categorical quotient, and
(2) ϕ is an orbit space.

If $S = B$, U, R are all schemes, then we say a morphism of schemes $\phi : U \to X$ is a *coarse quotient in schemes* if

(1) ϕ is a categorical quotient in schemes, and
(2) ϕ is an orbit space.

In many situations the algebraic spaces R and U are locally of finite type over B and the orbit space condition simply means that

$$U(k)/\big(\text{equivalence relation generated by } j(R(k))\big) \cong X(k)$$

for all algebraically closed fields k. See Lemma 56.5.20. If j is also a (set-theoretic) pre-equivalence relation, then the condition is simply equivalent to $U(k)/j(R(k)) \to X(k)$ being bijective for all algebraically closed fields k.

56.7. Topological properties

Let S be a scheme and B an algebraic space over S. Let $j : R \to U \times_B U$ be a pre-relation. We say a subset $T \subset |U|$ is *R-invariant* if $s^{-1}(T) = t^{-1}(T)$ as subsets of $|R|$. Note that if T is closed, then it may not be the case that the corresponding reduced closed subspace of U is R-invariant (as in Groupoids in Spaces, Definition 52.17.1) because the pullbacks $s^{-1}(T)$, $t^{-1}(T)$ may not be reduced. Here are some conditions that we can consider for an invariant morphism $\phi : U \to X$.

Definition 56.7.1. Let S be a scheme and B an algebraic space over S. Let $j : R \to U \times_B U$ be a pre-relation. Let $\phi : U \to X$ be an R-invariant morphism of algebraic spaces over B.

(56.7.1.1) The morphism ϕ is submersive.
(56.7.1.2) For any R-invariant closed subset $Z \subset |U|$ the image $\phi(Z)$ is closed in $|X|$.
(56.7.1.3) Condition (56.7.1.2) holds and for any pair of R-invariant closed subsets $Z_1, Z_2 \subset |U|$ we have
$$\phi(Z_1 \cap Z_2) = \phi(Z_1) \cap \phi(Z_2)$$
(56.7.1.4) The morphism $(t, s) : R \to U \times_X U$ is universally submersive.

For each of these properties we can also require them to hold after any flat pullback, or after any pullback, see Definition 56.3.4. In this case we say condition (56.7.1.1), (56.7.1.2), (56.7.1.3), or (56.7.1.4) holds *uniformly* or *universally*.

56.8. Invariant functions

In some cases it is convenient to pin down the structure sheaf of a quotient by requiring any invariant function to be a local section of the structure sheaf of the quotient.

Definition 56.8.1. Let S be a scheme and B an algebraic space over S. Let $j : R \to U \times_B U$ be a pre-relation. Let $\phi : U \to X$ be an R-invariant morphism. Denote $\phi' = \phi \circ s = \phi \circ t : R \to X$.

(1) We denote $(\phi_* \mathcal{O}_U)^R$ the $\mathcal{O}_X$-sub-algebra of $\phi_* \mathcal{O}_U$ which is the equalizer of the two maps

$$\phi_* \mathcal{O}_U \underset{\phi_* t^\sharp}{\overset{\phi_* s^\sharp}{\rightrightarrows}} \phi'_* \mathcal{O}_R$$

on $X_{étale}$. We sometimes call this the *sheaf of R-invariant functions on X*.

(2) We say *the functions on X are the R-invariant functions on U* if the natural map $\mathcal{O}_X \to (\phi_* \mathcal{O}_U)^R$ is an isomorphism.

Of course we can require this property holds after any (flat or any) pullback, leading to a (uniform or) universal notion. This condition is often thrown in with other conditions in order to obtain a (more) unique quotient. And of course a good deal of motivation for the whole subject comes from the following special case: $U = Spec(A)$ is an affine scheme over a field $S = B = Spec(k)$ and where $R = G \times U$, with G an affine group scheme over k. In this case you have the option of taking for the quotient:

$$X = Spec(A^G)$$

so that at least the condition of the definition above is satisfied. Even though this is a nice thing you can do it is often not the right quotient; for example if $U = \mathrm{GL}_{n,k}$ and G is the group of upper triangular matrices, then the above gives $X = Spec(k)$, whereas a much better quotient (namely the flag variety) exists.

56.9. Good quotients

Especially when taking quotients by group actions the following definition is useful.

Definition 56.9.1. Let S be a scheme and B an algebraic space over S. Let $j : R \to U \times_B U$ be a pre-relation. A morphism $\phi : U \to X$ of algebraic spaces over B is called a *good quotient* if

(1) ϕ is invariant,
(2) ϕ is affine,
(3) ϕ is surjective,
(4) condition (56.7.1.3) holds universally, and
(5) the functions on X are the R-invariant functions on U.

In [**Ses72**] Seshadri gives almost the same definition, except that instead of (4) he simply requires the condition (56.7.1.3) to hold -- he does not require it to hold universally.

56.10. Geometric quotients

This is Mumford's definition of a geometric quotient (at least the definition from the first edition of GIT; as far as we can tell later editions changed ``universally submersive'' to ``submersive'').

Definition 56.10.1. Let S be a scheme and B an algebraic space over S. Let $j : R \to U \times_B U$ be a pre-relation. A morphism $\phi : U \to X$ of algebraic spaces over B is called a *geometric quotient* if

1. ϕ is an orbit space,
2. condition (56.7.1.1) holds universally, i.e., ϕ is universally submersive, and
3. the functions on X are the R-invariant functions on U.

CHAPTER 57

Algebraic Stacks

57.1. Introduction

This is where we define algebraic stacks and make some very elementary observations. The general philosophy will be to have no separation conditions whatsoever and add those conditions necessary to make lemmas, propositions, theorems true/provable. Thus the notions discussed here differ slightly from those in other places in the literature, e.g., [**LMB00a**].

This chapter is not an introduction to algebraic stacks. For an informal discussion of algebraic stacks, please take a look at Introducing Algebraic Stacks, Section 63.1.

57.2. Conventions

The conventions we use in this chapter are the same as those in the chapter on algebraic spaces. For convenience we repeat them here.

We work in a suitable big fppf site Sch_{fppf} as in Topologies, Definition 30.7.6. So, if not explicitly stated otherwise all schemes will be objects of Sch_{fppf}. We discuss what changes if you change the big fppf site in Section 57.18.

We will always work relative to a base S contained in Sch_{fppf}. And we will then work with the big fppf site $(Sch/S)_{fppf}$, see Topologies, Definition 30.7.8. The absolute case can be recovered by taking $S = Spec(\mathbf{Z})$.

If U, T are schemes over S, then we denote $U(T)$ for the set of T-valued points *over* S. In a formula: $U(T) = Mor_S(T, U)$.

Note that any fpqc covering is a universal effective epimorphism, see Descent, Lemma 31.9.3. Hence the topology on Sch_{fppf} is weaker than the canonical topology and all representable presheaves are sheaves.

57.3. Notation

We use the letters S, T, U, V, X, Y to indicate schemes. We use the letters $\mathcal{X}, \mathcal{Y}, \mathcal{Z}$ to indicate categories (fibred, fibred in groupoids, stacks, ...) over $(Sch/S)_{fppf}$. We use small case letters f, g for functors such as $f : \mathcal{X} \to \mathcal{Y}$ over $(Sch/S)_{fppf}$. We use capital F, G, H for algebraic spaces over S, and more generally for presheaves of sets on $(Sch/S)_{fppf}$. (In future chapters we will revert to using also X, Y, etc for algebraic spaces.)

The reason for these choices is that we want to clearly distinguish between the different types of objects in this chapter, to build the foundations.

57.4. Representable categories fibred in groupoids

Let S be a scheme contained in Sch_{fppf}. The basic object of study in this chapter will be a category fibred in groupoids $p : \mathcal{X} \to (Sch/S)_{fppf}$, see Categories, Definition 4.32.1. We will often simply say ``let $\mathcal{X}$ be a category fibred in groupoids over $(Sch/S)_{fppf}$" to indicate this situation. A 1-morphism $\mathcal{X} \to \mathcal{Y}$ of categories in groupoids over $(Sch/S)_{fppf}$ will be a 1-morphism in the 2-category of categories fibred in groupoids over $(Sch/S)_{fppf}$, see Categories, Definition 4.32.6. It is simply a functor $\mathcal{X} \to \mathcal{Y}$ over $(Sch/S)_{fppf}$. We recall this is really a $(2,1)$-category and that all 2-fibre products exist.

Let $\mathcal{X}$ be a category fibred in groupoids over $(Sch/S)_{fppf}$. Recall that $\mathcal{X}$ is said to be *representable* if there exists a scheme $U \in Ob((Sch/S)_{fppf})$ and an equivalence

$$j : \mathcal{X} \longrightarrow (Sch/U)_{fppf}$$

of categories over $(Sch/S)_{fppf}$, see Categories, Definition 4.37.1. We will sometimes say that $\mathcal{X}$ is *representable by a scheme* to distinguish from the case where $\mathcal{X}$ is representable by an algebraic space (see below).

If $\mathcal{X}, \mathcal{Y}$ are fibred in groupoids and representable by U, V, then we have

$$Mor_{Cat/(Sch/S)_{fppf}}(\mathcal{X}, \mathcal{Y}) \Big/ \text{2-isomorphism} = Mor_{Sch/S}(U, V) \tag{57.4.0.1}$$

see Categories, Lemma 4.37.3. More precisely, any 1-morphism $\mathcal{X} \to \mathcal{Y}$ gives rise to a morphism $U \to V$. Conversely, given a morphism of schemes $U \to V$ over S there exists a 1-morphism $\phi : \mathcal{X} \to \mathcal{Y}$ which gives rise to $U \to V$ and which is unique up to unique 2-isomorphism.

57.5. The 2-Yoneda lemma

Let $U \in Ob((Sch/S)_{fppf})$, and let $\mathcal{X}$ be a category fibred in groupoids over $(Sch/S)_{fppf}$. We will frequently use the 2-Yoneda lemma, see Categories, Lemma 4.38.1. Technically it says that there is an equivalence of categories

$$Mor_{Cat/(Sch/S)_{fppf}}((Sch/U)_{fppf}, \mathcal{X}) \longrightarrow \mathcal{X}_U, \quad f \longmapsto f(U/U).$$

It says that 1-morphisms $(Sch/U)_{fppf} \to \mathcal{X}$ correspond to objects x of the fibre category $\mathcal{X}_U$. Namely, given a 1-morphism $f : (Sch/U)_{fppf} \to \mathcal{X}$ we obtain the object $x = f(U/U) \in Ob(\mathcal{X}_U)$. Conversely, given a choice of pullbacks for $\mathcal{X}$ as in Categories, Definition 4.30.5, and an object x of $\mathcal{X}_U$, we obtain a functor $(Sch/U)_{fppf} \to \mathcal{X}$ defined by the rule

$$(\varphi : V \to U) \longmapsto \varphi^* x$$

on objects. By abuse of notation we use $x : (Sch/U)_{fppf} \to \mathcal{X}$ to indicate this functor. It indeed has the property that $x(U/U) = x$ and moreover, given any other functor f with $f(U/U) = x$ there exists a unique 2-isomorphism $x \to f$. In other words the functor x is well determined by the object x up to unique 2-isomorphism.

We will use this without further mention in the following.

57.6. Representable morphisms of categories fibred in groupoids

Let $\mathcal{X}$, $\mathcal{Y}$ be categories fibred in groupoids over $(Sch/S)_{fppf}$. Let $f : \mathcal{X} \to \mathcal{Y}$ be a *representable 1-morphism*, see Categories, Definition 4.38.5. This means that for every $U \in Ob((Sch/S)_{fppf})$ and any $y \in Ob(\mathcal{Y}_U)$ the 2-fibre product $(Sch/U)_{fppf} \times_{y,\mathcal{Y}} \mathcal{X}$ is representable. Choose a representing object V_y and an equivalence

$$(Sch/V_y)_{fppf} \longrightarrow (Sch/U)_{fppf} \times_{y,\mathcal{Y}} \mathcal{X}.$$

The projection $(Sch/V_y)_{fppf} \to (Sch/U)_{fppf} \times_{\mathcal{Y}} \mathcal{Y} \to (Sch/U)_{fppf}$ comes from a morphism of schemes $f_y : V_y \to U$, see Section 57.4. We represent this by the diagram

(57.6.0.2)
$$\begin{tikzcd} V_y \arrow[r, squiggly] \arrow[d, "f_y"'] & (Sch/V_y)_{fppf} \arrow[r] \arrow[d] & \mathcal{X} \arrow[d, "f"] \\ U \arrow[r, squiggly] & (Sch/U)_{fppf} \arrow[r, "y"] & \mathcal{Y} \end{tikzcd}$$

where the squiggly arrows represent the 2-Yoneda embedding. Here are some lemmas about this notion that work in great generality (namely, they work for categories fibred in groupoids over any base category which has fibre products).

Lemma 57.6.1. *Let S, X, Y be objects of Sch_{fppf}. Let $f : X \to Y$ be a morphism of schemes. Then the 1-morphism induced by f*

$$(Sch/X)_{fppf} \longrightarrow (Sch/Y)_{fppf}$$

is a representable 1-morphism.

Proof. This is formal and relies only on the fact that the category $(Sch/S)_{fppf}$ has fibre products. □

Lemma 57.6.2. *Let S be an object of Sch_{fppf}. Consider a 2-commutative diagram*

$$\begin{tikzcd} \mathcal{X}' \arrow[r] \arrow[d, "f'"'] & \mathcal{X} \arrow[d, "f"] \\ \mathcal{Y}' \arrow[r] & \mathcal{Y} \end{tikzcd}$$

of 1-morphisms of categories fibred in groupoids over $(Sch/S)_{fppf}$. Assume the horizontal arrows are equivalences. Then f is representable if and only if f' is representable.

Proof. Omitted. □

Lemma 57.6.3. *Let S be a scheme contained in Sch_{fppf}. Let $\mathcal{X}, \mathcal{Y}, \mathcal{Z}$ be categories fibred in groupoids over $(Sch/S)_{fppf}$ Let $f : \mathcal{X} \to \mathcal{Y}$, $g : \mathcal{Y} \to \mathcal{Z}$ be representable 1-morphisms. Then*

$$g \circ f : \mathcal{X} \longrightarrow \mathcal{Z}$$

is a representable 1-morphism.

Proof. This is entirely formal and works in any category. □

Lemma 57.6.4. *Let S be a scheme contained in Sch_{fppf}. Let $\mathcal{X}, \mathcal{Y}, \mathcal{Z}$ be categories fibred in groupoids over $(Sch/S)_{fppf}$ Let $f : \mathcal{X} \to \mathcal{Y}$ be a representable 1-morphism. Let $g : \mathcal{Z} \to \mathcal{Y}$ be any 1-morphism. Consider the fibre product diagram*

$$\begin{tikzcd} \mathcal{Z} \times_{g,\mathcal{Y},f} \mathcal{X} \arrow[r, "g'"'] \arrow[d, "f'"'] & \mathcal{X} \arrow[d, "f"] \\ \mathcal{Z} \arrow[r, "g"] & \mathcal{Y} \end{tikzcd}$$

Then the base change f' is a representable 1-morphism.

Proof. This is entirely formal and works in any category. □

Lemma 57.6.5. *Let S be a scheme contained in Sch_{fppf}. Let $\mathcal{X}_i, \mathcal{Y}_i$ be categories fibred in groupoids over $(Sch/S)_{fppf}$, $i = 1, 2$. Let $f_i : \mathcal{X}_i \to \mathcal{Y}_i$, $i = 1, 2$ be representable 1-morphisms. Then*

$$f_1 \times f_2 : \mathcal{X}_1 \times \mathcal{X}_2 \longrightarrow \mathcal{Y}_1 \times \mathcal{Y}_2$$

is a representable 1-morphism.

Proof. Write $f_1 \times f_2$ as the composition $\mathcal{X}_1 \times \mathcal{X}_2 \to \mathcal{Y}_1 \times \mathcal{X}_2 \to \mathcal{Y}_1 \times \mathcal{Y}_2$. The first arrow is the base change of f_1 by the map $\mathcal{Y}_1 \times \mathcal{X}_2 \to \mathcal{Y}_1$, and the second arrow is the base change of f_2 by the map $\mathcal{Y}_1 \times \mathcal{Y}_2 \to \mathcal{Y}_2$. Hence this lemma is a formal consequence of Lemmas 57.6.3 and 57.6.4. □

57.7. Split categories fibred in groupoids

Let S be a scheme contained in Sch_{fppf}. Recall that given a ``presheaf of groupoids"

$$F : (Sch/S)_{fppf}^{opp} \longrightarrow Groupoids$$

we get a category fibred in groupoids $\mathcal{S}_F$ over $(Sch/S)_{fppf}$, see Categories, Example 4.34.1. Any category fibred in groupoids isomorphic (!) to one of these is called a *split category fibred in groupoids*. Any category fibred in groupoids is equivalent to a split one.

If F is a presheaf of sets then $\mathcal{S}_F$ is fibred in sets, see Categories, Definition 4.35.2, and Categories, Example 4.35.5. The rule $F \mapsto \mathcal{S}_F$ is in some sense fully faithful on presheaves, see Categories, Lemma 4.35.6. If F, G are presheaves, then

$$\mathcal{S}_{F \times G} = \mathcal{S}_F \times_{(Sch/S)_{fppf}} \mathcal{S}_G$$

and if $F \to H$ and $G \to H$ are maps of presheaves of sets, then

$$\mathcal{S}_{F \times_H G} = \mathcal{S}_F \times_{\mathcal{S}_H} \mathcal{S}_G$$

where the right hand sides are 2-fibre products. This is immediate from the definitions as the fibre categories of $\mathcal{S}_F, \mathcal{S}_G, \mathcal{S}_H$ have only identity morphisms.

An even more special case is where $F = h_X$ is a representable presheaf. In this case we have $\mathcal{S}_{h_X} = (Sch/X)_{fppf}$, see Categories, Example 4.35.7.

We will use the notation $\mathcal{S}_F$ without further mention in the following.

57.8. Categories fibred in groupoids representable by algebraic spaces

A slightly weaker notion than being representable is the notion of being representable by algebraic spaces which we discuss in this section. This discussion might have been avoided had we worked with some category $Spaces_{fppf}$ of algebraic spaces instead of the category Sch_{fppf}. However, it seems to us natural to consider the category of schemes as the natural collection of ``test objects" over which the fibre categories of an algebraic stack are defined.

In analogy with Categories, Definitions 4.37.1 we make the following definition.

Definition 57.8.1. Let S be a scheme contained in Sch_{fppf}. A category fibred in groupoids $p : \mathcal{X} \to (Sch/S)_{fppf}$ is called *representable by an algebraic space over S* if there exists an algebraic space F over S and an equivalence $j : \mathcal{X} \to \mathcal{S}_F$ of categories over $(Sch/S)_{fppf}$.

We continue our abuse of notation in surpressing the equivalence j whenever we encounter such a situation. It follows formally from the above that if $\mathcal{X}$ is representable (by a scheme), then it is representable by an algebraic space. Here is the analogue of Categories, Lemma 4.37.2.

Lemma 57.8.2. *Let S be a scheme contained in Sch_{fppf}. Let $p : \mathcal{X} \to (Sch/S)_{fppf}$ be a category fibred in groupoids. Then $\mathcal{X}$ is representable by an algebraic space over S if and only if the following conditions are satisfied:*

(1) *$\mathcal{X}$ is fibred in setoids*[1]*, and*
(2) *the presheaf $U \mapsto Ob(\mathcal{X}_U)/\cong$ is an algebraic space.*

Proof. Omitted, but see Categories, Lemma 4.37.2. □

If $\mathcal{X}, \mathcal{Y}$ are fibred in groupoids and representable by algebraic spaces F, G over S, then we have

$$Mor_{Cat/(Sch/S)_{fppf}}(\mathcal{X}, \mathcal{Y})\Big/\text{2-isomorphism} = Mor_{Sch/S}(F, G) \tag{57.8.2.1}$$

see Categories, Lemma 4.36.6. More precisely, any 1-morphism $\mathcal{X} \to \mathcal{Y}$ gives rise to a morphism $F \to G$. Conversely, give a morphism of sheaves $F \to G$ over S there exists a 1-morphism $\phi : \mathcal{X} \to \mathcal{Y}$ which gives rise to $F \to G$ and which is unique up to unique 2-isomorphism.

57.9. Morphisms representable by algebraic spaces

In analogy with Categories, Definition 4.38.5 we make the following definition.

Definition 57.9.1. Let S be a scheme contained in Sch_{fppf}. A 1-morphism $f : \mathcal{X} \to \mathcal{Y}$ of categories fibred in groupoids over $(Sch/S)_{fppf}$ is called *representable by algebraic spaces* if for any $U \in Ob((Sch/S)_{fppf})$ and any $y : (Sch/U)_{fppf} \to \mathcal{Y}$ the category fibred in groupoids

$$(Sch/U)_{fppf} \times_{y,\mathcal{Y}} \mathcal{X}$$

over $(Sch/U)_{fppf}$ is representable by an algebraic space over U.

Choose an algebraic space F_y over U which represents $(Sch/U)_{fppf} \times_{y,\mathcal{Y}} \mathcal{X}$. We may think of F_y as an algebraic stack over S which comes equipped with a canonical morphism $f_y : F_y \to U$ over S, see Spaces, Section 40.16. Here is the diagram

$$\begin{tikzcd} F_y \arrow[d, "f_y"'] & (Sch/U)_{fppf} \times_{y,\mathcal{Y}} \mathcal{X} \arrow[l, squiggly] \arrow[r, "\mathrm{pr}_1"'] \arrow[d, "\mathrm{pr}_0"'] & \mathcal{X} \arrow[d, "f"] \\ U & (Sch/U)_{fppf} \arrow[l, squiggly] \arrow[r, "y"] & \mathcal{Y} \end{tikzcd} \tag{57.9.1.1}$$

where the squiggly arrows represent the construction which associates to a stack fibred in setoids its associated sheaf of isomorphism classes of objects. The right square is 2-commutative, and is a 2-fibre product square.

Here is the analogue of Categories, Lemma 4.38.7.

Lemma 57.9.2. *Let S be a scheme contained in Sch_{fppf}. Let $f : \mathcal{X} \to \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. The following are necessary and sufficient conditions for f to be representable by algebraic spaces:*

(1) *for each scheme U/S the functor $f_U : \mathcal{X}_U \longrightarrow \mathcal{Y}_U$ between fibre categories is faithful, and*

[1] This means that it is fibred in groupoids and objects in the fibre categories have no nontrivial automorphisms, see Categories, Definition 4.35.2.

(2) *for each U and each $y \in Ob(\mathcal{Y}_U)$ the presheaf*
$$(h : V \to U) \longmapsto \{(x, \phi) \mid x \in Ob(\mathcal{X}_V), \phi : h^*y \to f(x)\}/\cong$$
is an algebraic space over U.

Here we have made a choice of pullbacks for $\mathcal{Y}$.

Proof. This follows from the description of fibre categories of the 2-fibre products $(Sch/U)_{fppf} \times_{y,\mathcal{Y}} \mathcal{X}$ in Categories, Lemma 4.38.3 combined with Lemma 57.8.2. □

Here are some lemmas about this notion that work in great generality.

Lemma 57.9.3. *Let S be an object of Sch_{fppf}. Consider a 2-commutative diagram*
$$\begin{tikzcd} \mathcal{X}' \arrow[r] \arrow[d, "f'"'] & \mathcal{X} \arrow[d, "f"] \\ \mathcal{Y}' \arrow[r] & \mathcal{Y} \end{tikzcd}$$
of 1-morphisms of categories fibred in groupoids over $(Sch/S)_{fppf}$. Assume the horizontal arrows are equivalences. Then f is representable by algebraic spaces if and only if f' is representable by algebraic spaces.

Proof. Omitted. □

Lemma 57.9.4. *Let S be an object of Sch_{fppf}. Let $f : \mathcal{X} \to \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over S. If $\mathcal{X}$ and $\mathcal{Y}$ are representable by algebraic spaces over S, then the 1-morphism f is representable by algebraic spaces.*

Proof. Omitted. This relies only on the fact that the category of algebraic spaces over S has fibre products, see Spaces, Lemma 40.7.3. □

Lemma 57.9.5. *Let S be an object of Sch_{fppf}. Let $a : F \to G$ be a map of presheaves of sets on $(Sch/S)_{fppf}$. Denote $a' : \mathcal{S}_F \to \mathcal{S}_G$ the associated map of categories fibred in sets. Then a is representable by algebraic spaces (see Bootstrap, Definition 54.3.1) if and only if a' is representable by algebraic spaces.*

Proof. Omitted. □

Lemma 57.9.6. *Let S be an object of Sch_{fppf}. Let $f : \mathcal{X} \to \mathcal{Y}$ be a 1-morphism of categories fibred in setoids over $(Sch/S)_{fppf}$. Let F, resp. G be the presheaf which to T associates the set of isomorphism classes of objects of $\mathcal{X}_T$, resp. $\mathcal{Y}_T$. Let $a : F \to G$ be the map of presheaves corresponding to f. Then a is representable by algebraic spaces (see Bootstrap, Definition 54.3.1) if and only if f is representable by algebraic spaces.*

Proof. Omitted. Hint: Combine Lemmas 57.9.3 and 57.9.5. □

Lemma 57.9.7. *Let S be a scheme contained in Sch_{fppf}. Let $\mathcal{X}, \mathcal{Y}, \mathcal{Z}$ be categories fibred in groupoids over $(Sch/S)_{fppf}$. Let $f : \mathcal{X} \to \mathcal{Y}$ be a 1-morphism representable by algebraic spaces. Let $g : \mathcal{Z} \to \mathcal{Y}$ be any 1-morphism. Consider the fibre product diagram*
$$\begin{tikzcd} \mathcal{Z} \times_{g,\mathcal{Y},f} \mathcal{X} \arrow[r, "g'"'] \arrow[d, "f'"'] & \mathcal{X} \arrow[d, "f"] \\ \mathcal{Z} \arrow[r, "g"] & \mathcal{Y} \end{tikzcd}$$
Then the base change f' is a 1-morphism representable by algebraic spaces.

Proof. This is formal. □

Lemma 57.9.8. *Let S be a scheme contained in Sch_{fppf}. Let $\mathcal{X}, \mathcal{Y}, \mathcal{Z}$ be categories fibred in groupoids over $(Sch/S)_{fppf}$ Let $f : \mathcal{X} \to \mathcal{Y}$, $g : \mathcal{Z} \to \mathcal{Y}$ be 1-morphisms. Assume*

(1) *f is representable by algebraic spaces, and*
(2) *$\mathcal{Z}$ is representable by an algebraic space over S.*

Then the 2-fibre product $\mathcal{Z} \times_{g,\mathcal{Y},f} \mathcal{X}$ is representable by an algebraic space.

Proof. This is a reformulation of Bootstrap, Lemma 54.3.6. First note that $\mathcal{Z} \times_{g,\mathcal{Y},f} \mathcal{X}$ is fibred in setoids over $(Sch/S)_{fppf}$. Hence it is equivalent to $\mathcal{S}_F$ for some presheaf F on $(Sch/S)_{fppf}$, see Categories, Lemma 4.36.5. Moreover, let G be an algebraic space which represents $\mathcal{Z}$. The 1-morphism $\mathcal{Z} \times_{g,\mathcal{Y},f} \mathcal{X} \to \mathcal{Z}$ is representable by algebraic spaces by Lemma 57.9.7. And $\mathcal{Z} \times_{g,\mathcal{Y},f} \mathcal{X} \to \mathcal{Z}$ corresponds to a morphism $F \to G$ by Categories, Lemma 4.36.6. Then $F \to G$ is representable by algebraic spaces by Lemma 57.9.6. Hence Bootstrap, Lemma 54.3.6 implies that F is an algebraic space as desired. □

Let S, $\mathcal{X}$, $\mathcal{Y}$, $\mathcal{Z}$, f, g be as in Lemma 57.9.8. Let F and G be algebraic spaces over S such that F represents $\mathcal{Z} \times_{g,\mathcal{Y},f} \mathcal{X}$ and G represents $\mathcal{Z}$. The 1-morphism $f' : \mathcal{Z} \times_{g,\mathcal{Y},f} \mathcal{X} \to \mathcal{Z}$ corresponds to a morphism $f' : F \to G$ of algebraic spaces by (57.8.2.1). Thus we have the following diagram

(57.9.8.1)
$$\begin{tikzcd} F \arrow[d, "f'"'] & \mathcal{Z} \times_{g,\mathcal{Y},f} \mathcal{X} \arrow[l, squiggly] \arrow[r] \arrow[d] & \mathcal{X} \arrow[d, "f"] \\ G & \mathcal{Z} \arrow[l, squiggly] \arrow[r, "g"] & \mathcal{Y} \end{tikzcd}$$

where the squiggly arrows represent the construction which associates to a stack fibred in setoids its associated sheaf of isomorphism classes of objects. The middle square is 2-commutative with equivalences as horizontal arrows.

Lemma 57.9.9. *Let S be a scheme contained in Sch_{fppf}. Let $\mathcal{X}, \mathcal{Y}, \mathcal{Z}$ be categories fibred in groupoids over $(Sch/S)_{fppf}$. If $f : \mathcal{X} \to \mathcal{Y}$, $g : \mathcal{Y} \to \mathcal{Z}$ are 1-morphisms representable by algebraic spaces, then*

$$g \circ f : \mathcal{X} \longrightarrow \mathcal{Z}$$

is a 1-morphism representable by algebraic spaces.

Proof. This follows from Lemma 57.9.8. Details omitted. □

Lemma 57.9.10. *Let S be a scheme contained in Sch_{fppf}. Let $\mathcal{X}_i, \mathcal{Y}_i$ be categories fibred in groupoids over $(Sch/S)_{fppf}$, $i = 1, 2$. Let $f_i : \mathcal{X}_i \to \mathcal{Y}_i$, $i = 1, 2$ be 1-morphisms representable by algebraic spaces. Then*

$$f_1 \times f_2 : \mathcal{X}_1 \times \mathcal{X}_2 \longrightarrow \mathcal{Y}_1 \times \mathcal{Y}_2$$

is a 1-morphism representable by algebraic spaces.

Proof. Write $f_1 \times f_2$ as the composition $\mathcal{X}_1 \times \mathcal{X}_2 \to \mathcal{Y}_1 \times \mathcal{X}_2 \to \mathcal{Y}_1 \times \mathcal{Y}_2$. The first arrow is the base change of f_1 by the map $\mathcal{Y}_1 \times \mathcal{X}_2 \to \mathcal{Y}_1$, and the second arrow is the base change of f_2 by the map $\mathcal{Y}_1 \times \mathcal{Y}_2 \to \mathcal{Y}_2$. Hence this lemma is a formal consequence of Lemmas 57.9.9 and 57.9.7. □

57.10. Properties of morphisms representable by algebraic spaces

Here is the definition that makes this work.

Definition 57.10.1. Let S be a scheme contained in Sch_{fppf}. Let $f : \mathcal{X} \to \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. Assume f is representable by algebraic spaces. Let $\mathcal{P}$ be a property of morphisms of algebraic spaces which

(1) is preserved under any base change, and
(2) is fppf local on the base, see Descent on Spaces, Definition 45.9.1.

In this case we say that f has *property* $\mathcal{P}$ if for every $U \in Ob((Sch/S)_{fppf})$ and any $y \in \mathcal{Y}_U$ the resulting morphism of algebraic spaces $f_y : F_y \to U$, see diagram (57.9.1.1), has property $\mathcal{P}$.

It is important to note that we will only use this definition for properties of morphisms that are stable under base change, and local in the fppf topology on the target. This is not because the definition doesn't make sense otherwise; rather it is because we may want to give a different definition which is better suited to the property we have in mind.

Lemma 57.10.2. *Let S be an object of Sch_{fppf}. Let $\mathcal{P}$ be as in Definition 57.10.1. Consider a 2-commutative diagram*

$$\begin{tikzcd} \mathcal{X}' \arrow[r] \arrow[d, "f'"'] & \mathcal{X} \arrow[d, "f"] \\ \mathcal{Y}' \arrow[r] & \mathcal{Y} \end{tikzcd}$$

of 1-morphisms of categories fibred in groupoids over $(Sch/S)_{fppf}$. Assume the horizontal arrows are equivalences and f (or equivalently f') is representably by algebraic spaces. Then f has $\mathcal{P}$ if and only if f' has $\mathcal{P}$.

Proof. Note that this makes sense by Lemma 57.9.3. Proof omitted. □

Here is a sanity check.

Lemma 57.10.3. *Let S be a scheme contained in Sch_{fppf}. Let $a : F \to G$ be a map of presheaves on $(Sch/S)_{fppf}$. Let $\mathcal{P}$ be as in Definition 57.10.1. Assume a is representable by algebraic spaces. Then $a : F \to G$ has property $\mathcal{P}$ (see Bootstrap, Definition 54.4.1) if and only if the corresponding morphism $\mathcal{S}_F \to \mathcal{S}_G$ of categories fibred in groupoids has propery $\mathcal{P}$.*

Proof. Note that the lemma makes sense by Lemma 57.9.5. Proof omitted. □

Lemma 57.10.4. *Let S be an object of Sch_{fppf}. Let $\mathcal{P}$ be as in Definition 57.10.1. Let $f : \mathcal{X} \to \mathcal{Y}$ be a 1-morphism of categories fibred in setoids over $(Sch/S)_{fppf}$. Let F, resp. G be the presheaf which to T associates the set of isomorphism classes of objects of $\mathcal{X}_T$, resp. $\mathcal{Y}_T$. Let $a : F \to G$ be the map of presheaves corresponding to f. Then a has $\mathcal{P}$ if and only if f has $\mathcal{P}$.*

Proof. The lemma makes sense by Lemma 57.9.6. The lemma follows on combining Lemmas 57.10.2 and 57.10.3. □

Lemma 57.10.5. *Let S be a scheme contained in Sch_{fppf}. Let $\mathcal{X}$, $\mathcal{Y}$, $\mathcal{Z}$ be categories fibred in groupoids over $(Sch/S)_{fppf}$. Let $\mathcal{P}$ be a property as in Definition 57.10.1 which is stable under composition. Let $f : \mathcal{X} \to \mathcal{Y}$, $g : \mathcal{Y} \to \mathcal{Z}$ be 1-morphisms which are representable by algebraic spaces. If f and g have property $\mathcal{P}$ so does $g \circ f : \mathcal{X} \to \mathcal{Z}$.*

Proof. Note that the lemma makes sense by Lemma 57.9.9. Proof omitted. $\square$

Lemma 57.10.6. *Let S be a scheme contained in Sch_{fppf}. Let $\mathcal{X}, \mathcal{Y}, \mathcal{Z}$ be categories fibred in groupoids over $(Sch/S)_{fppf}$. Let $\mathcal{P}$ be a property as in Definition 57.10.1. Let $f : \mathcal{X} \to \mathcal{Y}$ be a 1-morphism representable by algebraic spaces. Let $g : \mathcal{Z} \to \mathcal{Y}$ be any 1-morphism. Consider the 2-fibre product diagram*

$$\begin{tikzcd} \mathcal{Z} \times_{g,\mathcal{Y},f} \mathcal{X} \arrow[r, "g'"'] \arrow[d, "f'"'] & \mathcal{X} \arrow[d, "f"] \\ \mathcal{Z} \arrow[r, "g"] & \mathcal{Y} \end{tikzcd}$$

If f has $\mathcal{P}$, then the base change f' has $\mathcal{P}$.

Proof. The lemma makes sense by Lemma 57.9.7. Proof omitted. $\square$

Lemma 57.10.7. *Let S be a scheme contained in Sch_{fppf}. Let $\mathcal{X}, \mathcal{Y}, \mathcal{Z}$ be categories fibred in groupoids over $(Sch/S)_{fppf}$. Let $\mathcal{P}$ be a property as in Definition 57.10.1. Let $f : \mathcal{X} \to \mathcal{Y}$ be a 1-morphism representable by algebraic spaces. Let $g : \mathcal{Z} \to \mathcal{Y}$ be any 1-morphism. Consider the fibre product diagram*

$$\begin{tikzcd} \mathcal{Z} \times_{g,\mathcal{Y},f} \mathcal{X} \arrow[r, "g'"'] \arrow[d, "f'"'] & \mathcal{X} \arrow[d, "f"] \\ \mathcal{Z} \arrow[r, "g"] & \mathcal{Y} \end{tikzcd}$$

Assume that for every scheme U and object x of $\mathcal{Y}_U$, there exists an fppf covering $\{U_i \to U\}$ such that $x|_{U_i}$ is in the essential image of the functor $g : \mathcal{Z}_{U_i} \to \mathcal{Y}_{U_i}$. In this case, if f' has $\mathcal{P}$, then f has $\mathcal{P}$.

Proof. Proof omitted. Hint: Compare with the proof of Spaces, Lemma 40.5.6. $\square$

Lemma 57.10.8. *Let S be a scheme contained in Sch_{fppf}. Let $\mathcal{P}$ be a property as in Definition 57.10.1 which is stable under composition. Let $\mathcal{X}_i, \mathcal{Y}_i$ be categories fibred in groupoids over $(Sch/S)_{fppf}$, $i = 1, 2$. Let $f_i : \mathcal{X}_i \to \mathcal{Y}_i$, $i = 1, 2$ be 1-morphisms representable by algebraic spaces. If f_1 and f_2 have property $\mathcal{P}$ so does $f_1 \times f_2 : \mathcal{X}_1 \times \mathcal{X}_2 \to \mathcal{Y}_1 \times \mathcal{Y}_2$.*

Proof. The lemma makes sense by Lemma 57.9.10. Proof omitted. $\square$

Lemma 57.10.9. *Let S be a scheme contained in Sch_{fppf}. Let $\mathcal{X}$, $\mathcal{Y}$ be categories fibred in groupoids over $(Sch/S)_{fppf}$. Let $f : \mathcal{X} \to \mathcal{Y}$ be a 1-morphism representable by algebraic spaces. Let $\mathcal{P}$, $\mathcal{P}'$ be properties as in Definition 57.10.1. Suppose that for any morphism of algebraic spaces $a : F \to G$ we have $\mathcal{P}(a) \Rightarrow \mathcal{P}'(a)$. If f has property $\mathcal{P}$ then f has property $\mathcal{P}'$.*

Proof. Formal. $\square$

Lemma 57.10.10. *Let S be a scheme contained in Sch_{fppf}. Let $j : \mathcal{X} \to \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. Assume j is representable by algebraic spaces and a monomorphism (see Definition 57.10.1 and Descent on Spaces, Lemma 45.10.28). Then j is fully faithful on fibre categories.*

Proof. We have seen in Lemma 57.9.2 that j is faithful on fibre categories. Consider a scheme U, two objects u, v of $\mathcal{X}_U$, and an isomorphism $t : j(u) \to j(v)$ in $\mathcal{Y}_U$. We have to construct an isomorphism in $\mathcal{X}_U$ between u and v. By the 2-Yoneda lemma (see Section

57.5) we think of u, v as 1-morphisms $u, v : (Sch/U)_{fppf} \to \mathcal{X}$ and we consider the 2-fibre product

$$(Sch/U)_{fppf} \times_{j\circ v, \mathcal{Y}} \mathcal{X}.$$

By assumption this is representable by an algebraic space $F_{j\circ v}$, over U and the morphism $F_{j\circ v} \to U$ is a monomorphism. But since $(1_U, v, 1_{j(v)})$ gives a 1-morphism of $(Sch/U)_{fppf}$ into the displayed 2-fibre product, we see that $F_{j\circ v} = U$ (here we use that if $V \to U$ is a monomorphism of algebraic spaces which has a section, then $V = U$). Therefore the 1-morphism projecting to the first coordinate

$$(Sch/U)_{fppf} \times_{j\circ v, \mathcal{Y}} \mathcal{X} \to (Sch/U)_{fppf}$$

is an equivalence of fibre categories. Since $(1_U, u, t)$ and $(1_U, v, 1_{j(v)})$ give two objects in $((Sch/U)_{fppf} \times_{j\circ v, \mathcal{Y}} \mathcal{X})_U$ which have the same first coordinate, there must be a 2-morphism between them in the 2-fibre product. This is by definition a morphism $\tilde{t} : u \to v$ such that $j(\tilde{t}) = t$. □

Here is a characterization of those categories fibred in groupoids for which the diagonal is representable by algebraic spaces.

Lemma 57.10.11. *Let S be a scheme contained in Sch_{fppf}. Let $\mathcal{X}$ be a category fibred in groupoids over $(Sch/S)_{fppf}$. The following are equivalent:*

(1) *the diagonal $\mathcal{X} \to \mathcal{X} \times \mathcal{X}$ is representable by algebraic spaces,*
(2) *for every scheme U over S, and any $x, y \in Ob(\mathcal{X}_U)$ the sheaf $Isom(x, y)$ is representable by an algebraic space over U,*
(3) *for every scheme U over S, and any $x \in Ob(\mathcal{X}_U)$ the associated 1-morphism $x : (Sch/U)_{fppf} \to \mathcal{X}$ is representable by algebraic spaces,*
(4) *for every pair of schemes T_1, T_2 over S, and any $x_i \in Ob(\mathcal{X}_{T_i})$, $i = 1, 2$ the 2-fibre product $(Sch/T_1)_{fppf} \times_{x_1, \mathcal{X}, x_2} (Sch/T_2)_{fppf}$ is representable by an algebraic space,*
(5) *for every representable category fibred in groupoids $\mathcal{U}$ over $(Sch/S)_{fppf}$ every 1-morphism $\mathcal{U} \to \mathcal{X}$ is representable by algebraic spaces,*
(6) *for every pair $\mathcal{T}_1, \mathcal{T}_2$ of representable categories fibred in groupoids over $(Sch/S)_{fppf}$ and any 1-morphisms $x_i : \mathcal{T}_i \to \mathcal{X}$, $i = 1, 2$ the 2-fibre product $\mathcal{T}_1 \times_{x_1, \mathcal{X}, x_2} \mathcal{T}_2$ is representable by an algebraic space,*
(7) *for every category fibred in groupoids $\mathcal{U}$ over $(Sch/S)_{fppf}$ which is representable by an algebraic space every 1-morphism $\mathcal{U} \to \mathcal{X}$ is representable by algebraic spaces,*
(8) *for every pair $\mathcal{T}_1, \mathcal{T}_2$ of categories fibred in groupoids over $(Sch/S)_{fppf}$ which are representable by algebraic spaces, and any 1-morphisms $x_i : \mathcal{T}_i \to \mathcal{X}$ the 2-fibre product $\mathcal{T}_1 \times_{x_1, \mathcal{X}, x_2} \mathcal{T}_2$ is representable by an algebraic space.*

Proof. The equivalence of (1) and (2) follows from Stacks, Lemma 50.2.5 and the definitions. Let us prove the equivalence of (1) and (3). Write $\mathcal{C} = (Sch/S)_{fppf}$ for the base category. We will use some of the observations of the proof of the similar Categories, Lemma 4.38.8. We will use the symbol $\cong$ to mean ``equivalence of categories fibred in groupoids over $\mathcal{C} = (Sch/S)_{fppf}$". Assume (1). Suppose given U and x as in (3). For any scheme V and $y \in Ob(\mathcal{X}_V)$ we see (compare reference above) that

$$\mathcal{C}/U \times_{x, \mathcal{X}, y} \mathcal{C}/V \cong (\mathcal{C}/U \times_S V) \times_{(x,y), \mathcal{X} \times \mathcal{X}, \Delta} \mathcal{X}$$

which is representable by an algebraic space by assumption. Conversely, assume (3). Consider any scheme U over S and a pair (x, x') of objects of $\mathcal{X}$ over U. We have to show that

$\mathcal{X} \times_{\Delta, \mathcal{X} \times \mathcal{X}, (x, x')} U$ is representable by an algebraic space. This is clear because (compare reference above)

$$\mathcal{X} \times_{\Delta, \mathcal{X} \times \mathcal{X}, (x, x')} \mathcal{C}/U \cong (\mathcal{C}/U \times_{x, \mathcal{X}, x'} \mathcal{C}/U) \times_{\mathcal{C}/U \times_S U, \Delta} \mathcal{C}/U$$

and the right hand side is representable by an algebraic space by assumption and the fact that the category of algebraic spaces over S has fibre products and contains U and S.

The equivalences (3) $\Leftrightarrow$ (4), (5) $\Leftrightarrow$ (6), and (7) $\Leftrightarrow$ (8) are formal. The equivalences (3) $\Leftrightarrow$ (5) and (4) $\Leftrightarrow$ (6) follow from Lemma 57.9.3. Assume (3), and let $\mathcal{U} \to \mathcal{X}$ be as in (7). To prove (7) we have to show that for every scheme V and 1-morphism $y : (Sch/V)_{fppf} \to \mathcal{X}$ the 2-fibre product $(Sch/V)_{fppf} \times_{y, \mathcal{X}} \mathcal{U}$ is representable by an algebraic space. Property (3) tells us that y is representable by algebraic spaces hence Lemma 57.9.8 implies what we want. Finally, (7) directly implies (3). $\square$

In the situation of the lemma, for any 1-morphism $x : (Sch/U)_{fppf} \to \mathcal{X}$ as in the lemma, it makes sense to say that x has property $\mathcal{P}$, for any property as in Definition 57.10.1. In particular this holds for $\mathcal{P}$ = ``surjective'', $\mathcal{P}$ = ``smooth'', and $\mathcal{P}$ = ``étale'', see Descent on Spaces, Lemmas 45.10.5, 45.10.24, and 45.10.26. We will use these three cases in the definitions of algebraic stacks below.

57.11. Stacks in groupoids

Let S be a scheme contained in Sch_{fppf}. Recall that a category $p : \mathcal{X} \to (Sch/S)_{fppf}$ over $(Sch/S)_{fppf}$ is said to be a *stack in groupoids* (see Stacks, Definition 50.5.1) if and only if

1. $p : \mathcal{X} \to \mathcal{C}$ is fibred in groupoids over $(Sch/S)_{fppf}$,
2. for all $U \in Ob((Sch/S)_{fppf})$, for all $x, y \in Ob(\mathcal{X}_U)$ the presheaf $Isom(x, y)$ is a sheaf on the site $(Sch/U)_{fppf}$, and
3. for all coverings $\mathcal{U} = \{U_i \to U\}$ in $(Sch/S)_{fppf}$, all descent data (x_i, ϕ_{ij}) for $\mathcal{U}$ are effective.

For examples see Examples of Stacks, Section 55.8 ff.

57.12. Algebraic stacks

Here is the definition of an algebraic stack. We remark that condition (2) implies we can make sense out of the condition in part (3) that $(Sch/U)_{fppf} \to \mathcal{X}$ is smooth and surjective, see discussion following Lemma 57.10.11.

Definition 57.12.1. Let S be a base scheme contained in Sch_{fppf}. An *algebraic stack over S* is a category

$$p : \mathcal{X} \to (Sch/S)_{fppf}$$

over $(Sch/S)_{fppf}$ with the following properties:

1. The category $\mathcal{X}$ is a stack in groupoids over $(Sch/S)_{fppf}$.
2. The diagonal $\Delta : \mathcal{X} \to \mathcal{X} \times \mathcal{X}$ is representable by algebraic spaces.
3. There exists a scheme $U \in Ob((Sch/S)_{fppf})$ and a 1-morphism $(Sch/U)_{fppf} \to \mathcal{X}$ which is surjective and smooth[2].

[2]In future chapters we will denote this simply $U \to \mathcal{X}$ as is customary in the literature. Another good alterative would be to formulate this condition as the existence of a representable category fibred in groupoids $\mathcal{U}$ and a surjective smooth 1-morphism $\mathcal{U} \to \mathcal{X}$.

There are some differences with other definitions found in the literature.

The first is that we require $\mathcal{X}$ to be a stack in groupoids in the fppf topology, whereas in many references the étale topology is used. It somehow seems to us that the fppf topology is the natural topology to work with. In the end the resulting 2-category of algebraic stacks ends up being the same. This is explained in Criteria for Representability, Section 59.19.

The second is that we only require the diagonal map of $\mathcal{X}$ to be representable by algebraic spaces, whereas in most references some other conditions are imposed. Our point of view is to try to prove a certain number of the results that follow only assuming that the diagonal of $\mathcal{X}$ be representable by algebraic spaces, and simply add an additional hypothesis wherever this is necessary. It has the added benefit that any algebraic space (as defined in Spaces, Definition 40.6.1) gives rise to an algebraic stack.

The third is that in some papers it is required that there exists a scheme U and a surjective and étale morphism $U \to \mathcal{X}$. In the groundbreaking paper [**DM69a**] where algebraic stacks were first introduced Deligne and Mumford used this definition and showed that the moduli stack of stable genus $g > 1$ curves is an algebraic stack which has an étale covering by a scheme. Micheal Artin, see [**Art74b**], realized that many natural results on algebraic stacks generalize to the case where one only assume a smooth covering by a scheme. Hence our choice above. To distinguish the two cases one sees the terms ``Deligne-Mumford stack'' and ``Artin stack'' used in the literature. We will reserve the term ``Artin stack'' for later use (insert future reference here), and continue to use ``algebraic stack'', but we will use ``Deligne-Mumford stack'' to indicate those algebraic stacks which have an étale covering by a scheme.

Definition 57.12.2. Let S be a scheme contained in Sch_{fppf}. Let $\mathcal{X}$ be an algebraic stack over S. We say $\mathcal{X}$ is a *Deligne-Mumford stack* if there exists a scheme U and a surjective étale morphism $(Sch/U)_{fppf} \to \mathcal{X}$.

We will compare our notion of a Deligne-Mumford stack with the notion as defined in the paper by Deligne and Mumford later (see insert future reference here).

The category of algebraic stacks over S forms a 2-category. Here is the precise definition.

Definition 57.12.3. Let S be a scheme contained in Sch_{fppf}. The *2-category of algebraic stacks over S* is the sub 2-category of the 2-category of categories fibred in groupoids over $(Sch/S)_{fppf}$ (see Categories, Definition 4.32.6) defined as follows:

(1) Its objects are those categories fibred in groupoids over $(Sch/S)_{fppf}$ which are algebraic stacks over S.
(2) Its 1-morphisms $f : \mathcal{X} \to \mathcal{Y}$ are any functors of categories over $(Sch/S)_{fppf}$, as in Categories, Definition 4.29.1.
(3) Its 2-morphisms are transformations between functors over $(Sch/S)_{fppf}$, as in Categories, Definition 4.29.1.

In other words this 2-category is the full sub 2-category of $Cat/(Sch/S)_{fppf}$ whose objects are algebraic stacks. Note that every 2-morphism is automatically an isomorphism. Hence this is actually a (2, 1)-category and not just a 2-category.

We will see later (insert future reference here) that this 2-category has 2-fibre products.

Similar to the remark above the 2-category of algebraic stacks over S is a full sub 2-category of the 2-category of categories fibred in groupoids over $(Sch/S)_{fppf}$. It turns out that it is closed under equivalences. Here is the precise statement.

Lemma 57.12.4. *Let S be a scheme contained in Sch_{fppf}. Let $\mathcal{X}$, $\mathcal{Y}$ be categories over $(Sch/S)_{fppf}$. Assume $\mathcal{X}$, $\mathcal{Y}$ are equivalent as categories over $(Sch/S)_{fppf}$. Then $\mathcal{X}$ is an algebraic stack if and only if $\mathcal{Y}$ is an algebraic stack. Similarly, $\mathcal{X}$ is a Deligne-Mumford stack if and only if $\mathcal{Y}$ is a Deligne-Mumford stack.*

Proof. Assume $\mathcal{X}$ is an algebraic stack (resp. a Deligne-Mumford stack). By Stacks, Lemma 50.5.4 this implies that $\mathcal{Y}$ is a stack in groupoids over Sch_{fppf}. Choose an equivalence $f : \mathcal{X} \to \mathcal{Y}$ over Sch_{fppf}. This gives a 2-commutative diagram

$$\begin{tikzcd}
\mathcal{X} \arrow[r, "f"'] \arrow[d, "\Delta_{\mathcal{X}}"'] & \mathcal{Y} \arrow[d, "\Delta_{\mathcal{Y}}"] \\
\mathcal{X} \times \mathcal{X} \arrow[r, "f \times f"] & \mathcal{Y} \times \mathcal{Y}
\end{tikzcd}$$

whose horizontal arrows are equivalences. This implies that $\Delta_{\mathcal{Y}}$ is representable by algebraic spaces according to Lemma 57.9.3. Finally, let U be a scheme over S, and let $x : (Sch/U)_{fppf} \to \mathcal{X}$ be a 1-morphism which is surjective and smooth (resp. étale). Considering the diagram

$$\begin{tikzcd}
(Sch/U)_{fppf} \arrow[r, "\mathrm{id}"'] \arrow[d, "x"'] & (Sch/U)_{fppf} \arrow[d, "f \circ x"] \\
\mathcal{X} \arrow[r, "f"] & \mathcal{Y}
\end{tikzcd}$$

and applying Lemma 57.10.2 we conclude that $x \circ f$ is surjective and smooth (resp. étale) as desired. $\square$

57.13. Algebraic stacks and algebraic spaces

In this section we discuss some simple criteria which imply that an algebraic stack is an algebraic space. The main result is that this happens exactly when objects of fibre categories have no nontrivial automorphisms. This is not a triviality! Before we come to this we first do a sanity check.

Lemma 57.13.1. *Let S be a scheme contained in Sch_{fppf}.*

1. *A category fibred in groupoids $p : \mathcal{X} \to (Sch/S)_{fppf}$ which is representable by an algebraic space is a Deligne-Mumford stack.*
2. *If F is an algebraic space over S, then the associated category fibred in groupoids $p : \mathcal{S}_F \to (Sch/S)_{fppf}$ is a Deligne-Mumford stack.*
3. *If $X \in Ob((Sch/S)_{fppf})$, then $(Sch/X)_{fppf} \to (Sch/S)_{fppf}$ is a Deligne-Mumford stack.*

Proof. It is clear that (2) implies (3). Parts (1) and (2) are equivalent by Lemma 57.12.4. Hence it suffices to prove (2). First, we note that $\mathcal{S}_F$ is stack in sets since F is a sheaf (see Examples of Stacks, Section 55.9). A fortiori it is a stack in groupoids. Second the diagonal morphism $\mathcal{S}_F \to \mathcal{S}_F \times \mathcal{S}_F$ is the same as the morphism $\mathcal{S}_F \to \mathcal{S}_{F \times F}$ which comes from the diagonal of F. Hence this is representable by algebraic spaces according to Lemma 57.9.4. Actually it is even representable (by schemes), as the diagonal of an algebraic space is representable, but we do not need this. Let U be a scheme and let $h_U \to F$ be a surjective étale morphism. We may think of this a surjective étale morphism of algebraic spaces. Hence by Lemma 57.10.3 the corresponding 1-morphism $(Sch/U)_{fppf} \to \mathcal{S}_F$ is surjective and étale. $\square$

The following result says that a Deligne-Mumford stack whose inertia is trivial ``is'' an algebraic space. This lemma will be obsoleted by the stronger Proposition 57.13.3 below which says that this holds more generally for algebraic stacks...

Lemma 57.13.2. *Let S be a scheme contained in Sch_{fppf}. Let $\mathcal{X}$ be an algebraic stack over S. The following are equivalent*

(1) *$\mathcal{X}$ is a Deligne-Mumford stack and is a stack in setoids,*
(2) *$\mathcal{X}$ is a Deligne-Mumford stack such that the canonical 1-morphism $\mathcal{I}_\mathcal{X} \to \mathcal{X}$ is an equivalence, and*
(3) *$\mathcal{X}$ is representable by an algebraic space.*

Proof. The equivalence of (1) and (2) follows from Stacks, Lemma 50.7.2. The implication (3) ⇒ (1) follows from Lemma 57.13.1. Finally, assume (1). By Stacks, Lemma 50.6.3 there exists a sheaf F on $(Sch/S)_{fppf}$ and an equivalence $j : \mathcal{X} \to \mathcal{S}_F$. By Lemma 57.9.5 the fact that $\Delta_\mathcal{X}$ is representable by algebraic spaces, means that $\Delta_F : F \to F \times F$ is representable by algebraic spaces. Let U be a scheme, and let $x : (Sch/U)_{fppf} \to \mathcal{X}$ be a surjective étale morphism. The composition $j \circ x : (Sch/U)_{fppf} \to \mathcal{S}_F$ corresponds to a morphism $h_U \to F$ of sheaves. By Bootstrap, Lemma 54.5.1 this morphism is representable by algebraic spaces. Hence by Lemma 57.10.4 we conclude that $h_U \to F$ is surjective and étale. Finally, we apply Bootstrap, Theorem 54.6.1 to see that F is an algebraic space. □

Proposition 57.13.3. *Let S be a scheme contained in Sch_{fppf}. Let $\mathcal{X}$ be an algebraic stack over S. The following are equivalent*

(1) *$\mathcal{X}$ is a stack in setoids,*
(2) *the canonical 1-morphism $\mathcal{I}_\mathcal{X} \to \mathcal{X}$ is an equivalence, and*
(3) *$\mathcal{X}$ is representable by an algebraic space.*

Proof. The equivalence of (1) and (2) follows from Stacks, Lemma 50.7.2. The implication (3) ⇒ (1) follows from Lemma 57.13.2. Finally, assume (1). By Stacks, Lemma 50.6.3 there exists an equivalence $j : \mathcal{X} \to \mathcal{S}_F$ where F is a sheaf on $(Sch/S)_{fppf}$. By Lemma 57.9.5 the fact that $\Delta_\mathcal{X}$ is representable by algebraic spaces, means that $\Delta_F : F \to F \times F$ is representable by algebraic spaces. Let U be a scheme and let $x : (Sch/U)_{fppf} \to \mathcal{X}$ be a surjective smooth morphism. The composition $j \circ x : (Sch/U)_{fppf} \to \mathcal{S}_F$ corresponds to a morphism $h_U \to F$ of sheaves. By Bootstrap, Lemma 54.5.1 this morphism is representable by algebraic spaces. Hence by Lemma 57.10.4 we conclude that $h_U \to F$ is surjective and smooth. In particular it is surjective, flat and locally of finite presentation (by Lemma 57.10.9 and the fact that a smooth morphism of algebraic spaces is flat and locally of finite presentation, see Morphisms of Spaces, Lemmas 42.33.5 and 42.33.7). Finally, we apply Bootstrap, Theorem 54.10.1 to see that F is an algebraic space. □

57.14. 2-Fibre products of algebraic stacks

The 2-category of algebraic stacks has products and 2-fibre products. The first lemma is really a special case of Lemma 57.14.3 but its proof is slightly easier.

Lemma 57.14.1. *Let S be a scheme contained in Sch_{fppf}. Let $\mathcal{X}$, $\mathcal{Y}$ be algebraic stacks over S. Then $\mathcal{X} \times_{(Sch/S)_{fppf}} \mathcal{Y}$ is an algebraic stack, and is a product in the 2-category of algebraic stacks over S.*

Proof. An object of $\mathcal{X} \times_{(Sch/S)_{fppf}} \mathcal{Y}$ over T is just a pair (x, y) where x is an object of $\mathcal{X}_T$ and y is an object of $\mathcal{Y}_T$. Hence it is immediate from the definitions that $\mathcal{X} \times_{(Sch/S)_{fppf}} \mathcal{Y}$ is a stack in groupoids. If (x, y) and (x', y') are two objects of $\mathcal{X} \times_{(Sch/S)_{fppf}} \mathcal{Y}$ over T, then

$$Isom((x, y), (x', y')) = Isom(x, x') \times Isom(y, y').$$

Hence it follows from the equivalences in Lemma 57.10.11 and the fact that the category of algebraic spaces has products that the diagonal of $\mathcal{X} \times_{(Sch/S)_{fppf}} \mathcal{Y}$ is representable by algebraic spaces. Finally, suppose that $U, V \in Ob((Sch/S)_{fppf})$, and let x, y be surjective smooth morphisms $x : (Sch/U)_{fppf} \to \mathcal{X}$, $y : (Sch/Y)_{fppf} \to \mathcal{Y}$. Note that

$$(Sch/U \times_S V)_{fppf} = (Sch/U)_{fppf} \times_{(Sch/S)_{fppf}} (Sch/V)_{fppf}.$$

The object $(\text{pr}_U^*x, \text{pr}_V^*y)$ of $\mathcal{X} \times_{(Sch/S)_{fppf}} \mathcal{Y}$ over $(Sch/U \times_S V)_{fppf}$ thus defines a 1-morphism

$$(Sch/U \times_S V)_{fppf} \longrightarrow \mathcal{X} \times_{(Sch/S)_{fppf}} \mathcal{Y}$$

which is the composition of base changes of x and y, hence is surjective and smooth, see Lemmas 57.10.6 and 57.10.5. We conclude that $\mathcal{X} \times_{(Sch/S)_{fppf}} \mathcal{Y}$ is indeed an algebraic stack. We omit the verification that it really is a product. □

Lemma 57.14.2. *Let S be a scheme contained in Sch_{fppf}. Let $\mathcal{Z}$ be a stack in groupoids over $(Sch/S)_{fppf}$ whose diagonal is representable by algebraic spaces. Let $\mathcal{X}$, $\mathcal{Y}$ be algebraic stacks over S. Let $f : \mathcal{X} \to \mathcal{Z}$, $g : \mathcal{Y} \to \mathcal{Z}$ be 1-morphisms of stacks in groupoids. Then the 2-fibre product $\mathcal{X} \times_{f,\mathcal{Z},g} \mathcal{Y}$ is an algebraic stack.*

Proof. We have to check conditions (1), (2), and (3) of Definition 57.12.1. The first condition follows from Stacks, Lemma 50.5.6.

The second condition we have to check is that the $Isom$-sheaves are representable by algebraic spaces. To do this, suppose that T is a scheme over S, and u, v are objects of $(\mathcal{X} \times_{f,\mathcal{Z},g} \mathcal{Y})_T$. By our construction of 2-fibre products (which goes all the way back to Categories, Lemma 4.29.3) we may write $u = (x, y, \alpha)$ and $v = (x', y', \alpha')$. Here $\alpha : f(x) \to g(y)$ and similarly for α'. Then it is clear that

$$\begin{tikzcd} Isom(u, v) \arrow[r] \arrow[d] & Isom(y, y') \arrow[d, "\phi \mapsto g(\phi) \circ \alpha"] \\ Isom(x, x') \arrow[r, "\psi \mapsto \alpha' \circ f(\psi)"] & Isom(f(x), g(y')) \end{tikzcd}$$

is a cartesian diagram of sheaves on $(Sch/T)_{fppf}$. Since by assumption the sheaves $Isom(y, y')$, $Isom(x, x')$, $Isom(f(x), g(y'))$ are algebraic spaces (see Lemma 57.10.11) we see that $Isom(u, v)$ is an algebraic space.

Let $U, V \in Ob((Sch/S)_{fppf})$, and let x, y be surjective smooth morphisms $x : (Sch/U)_{fppf} \to \mathcal{X}$, $y : (Sch/Y)_{fppf} \to \mathcal{Y}$. Consider the morphism

$$(Sch/U)_{fppf} \times_{f \circ x, \mathcal{Z}, g \circ y} (Sch/V)_{fppf} \longrightarrow \mathcal{X} \times_{f,\mathcal{Z},g} \mathcal{Y}.$$

As the diagonal of $\mathcal{Z}$ is representable by algebraic spaces the source of this arrow is representable by an algebraic space F, see Lemma 57.10.11. Moreover, the morphism is the composition of base changes of x and y, hence surjective and smooth, see Lemmas 57.10.6 and 57.10.5. Choosing a scheme W and a surjective étale morphism $W \to F$ we see that the composition of the displayed 1-morphism with the corresponding 1-morphism

$$(Sch/W)_{fppf} \longrightarrow (Sch/U)_{fppf} \times_{f \circ x, \mathcal{Z}, g \circ y} (Sch/V)_{fppf}$$

is surjective and smooth which proves the last condition. □

Lemma 57.14.3. *Let S be a scheme contained in Sch_{fppf}. Let $\mathcal{X}, \mathcal{Y}, \mathcal{Z}$ be algebraic stacks over S. Let $f : \mathcal{X} \to \mathcal{Z}$, $g : \mathcal{Y} \to \mathcal{Z}$ be 1-morphisms of algebraic stacks. Then the 2-fibre product $\mathcal{X} \times_{f,\mathcal{Z},g} \mathcal{Y}$ is an algebraic stack. It is also the 2-fibre product in the 2-category of algebraic stacks over $(Sch/S)_{fppf}$.*

Proof. The fact that $\mathcal{X} \times_{f,\mathcal{Z},g} \mathcal{Y}$ is an algebraic stack follows from the stronger Lemma 57.14.2. The fact that $\mathcal{X} \times_{f,\mathcal{Z},g} \mathcal{Y}$ is a 2-fibre product in the 2-category of algebraic stacks over S follows formally from the fact that the 2-category of algebraic stacks over S is a full sub 2-category of the 2-category of stacks in groupoids over $(Sch/S)_{fppf}$. ☐

57.15. Algebraic stacks, overhauled

Some basic results on algebraic stacks.

Lemma 57.15.1. *Let S be a scheme contained in Sch_{fppf}. Let $f : \mathcal{X} \to \mathcal{Y}$ be a 1-morphism of algebraic stacks over S. Let $V \in Ob((Sch/S)_{fppf})$. Let $y : (Sch/V)_{fppf} \to \mathcal{Y}$ be surjective and smooth. Then there exists an object $U \in Ob((Sch/S)_{fppf})$ and a 2-commutative diagram*

$$\begin{tikzcd} (Sch/U)_{fppf} \arrow[r, "a"'] \arrow[d, "x"'] & (Sch/V)_{fppf} \arrow[d, "y"] \\ \mathcal{X} \arrow[r, "f"] & \mathcal{Y} \end{tikzcd}$$

with x surjective and smooth.

Proof. First choose $W \in Ob((Sch/S)_{fppf})$ and a surjective smooth 1-morphism $z : (Sch/W)_{fppf} \to \mathcal{X}$. As $\mathcal{Y}$ is an algebraic stack we may choose an equivalence

$$j : \mathcal{S}_F \longrightarrow (Sch/W)_{fppf} \times_{f \circ z, \mathcal{Y}, y} (Sch/V)_{fppf}$$

where F is an algebraic space. By Lemma 57.10.6 the morphism $\mathcal{S}_F \to (Sch/W)_{fppf}$ is surjective and smooth as a base change of y. Hence by Lemma 57.10.5 we see that $\mathcal{S}_F \to \mathcal{X}$ is surjective and smooth. Choose an object $U \in Ob((Sch/S)_{fppf})$ and a surjective étale morphism $U \to F$. Then applying Lemma 57.10.5 once more we obtain the desired properties. ☐

This lemma is a generalization of Proposition 57.13.3.

Lemma 57.15.2. *Let S be a scheme contained in Sch_{fppf}. Let $f : \mathcal{X} \to \mathcal{Y}$ be a 1-morphism of algebraic stacks over S. The following are equivalent:*

1. *for $U \in Ob((Sch/S)_{fppf})$ the functor $f : \mathcal{X}_U \to \mathcal{Y}_U$ is faithful,*
2. *the functor f is faithful, and*
3. *f is representable by algebraic spaces.*

Proof. Parts (1) and (2) are equivalent by general properties of 1-morphisms of categories fibred in groupoids, see Categories, Lemma 4.32.8. We see that (3) implies (2) by Lemma 57.9.2. Finally, assume (2). Let U be a scheme. Let $y \in Ob(\mathcal{Y}_U)$. We have to prove that

$$\mathcal{W} = (Sch/U)_{fppf} \times_{y,\mathcal{Y}} \mathcal{X}$$

is representable by an algebraic space over U. Since $(Sch/U)_{fppf}$ is an algebraic stack we see from Lemma 57.14.3 that $\mathcal{W}$ is an algebraic stack. On the other hand the explicit description of objects of $\mathcal{W}$ as triples $(V, x, \alpha : y(V) \to f(x))$ and the fact that f is faithful, shows that the fibre categories of $\mathcal{W}$ are setoids. Hence Proposition 57.13.3 garantees that $\mathcal{W}$ is representable by an algebraic space. ☐

Lemma 57.15.3. *Let S be a scheme contained in Sch_{fppf}. Let $u : \mathcal{U} \to \mathcal{X}$ be a 1-morphism of stacks in groupoids over $(Sch/S)_{fppf}$. If*

(1) *$\mathcal{U}$ is representable by an algebraic space, and*
(2) *u is representable by algebraic spaces, surjective and smooth,*

then $\mathcal{X}$ is an algebraic stack over S.

Proof. We have to show that $\Delta : \mathcal{X} \to \mathcal{X} \times \mathcal{X}$ is representable by algebraic spaces, see Definition 57.12.1. Given two schemes T_1, T_2 over S denote $\mathcal{T}_i = (Sch/T_i)_{fppf}$ the associated representable fibre categories. Suppose given 1-morphisms $f_i : \mathcal{T}_i \to \mathcal{X}$. According to Lemma 57.10.11 it suffices to prove that the 2-fibered product $\mathcal{T}_1 \times_{\mathcal{X}} \mathcal{T}_2$ is representable by an algebraic space. By Stacks, Lemma 50.6.8 this is in any case a stack in setoids. Thus $\mathcal{T}_1 \times_{\mathcal{X}} \mathcal{T}_2$ corresponds to some sheaf F on $(Sch/S)_{fppf}$, see Stacks, Lemma 50.6.3. Let U be the algebraic space which represents $\mathcal{U}$. By assumption

$$\mathcal{T}_i' = \mathcal{U} \times_{u,\mathcal{X},f_i} \mathcal{T}_i$$

is representable by an algebraic space T_i' over S. Hence $\mathcal{T}_1' \times_{\mathcal{U}} \mathcal{T}_2'$ is representable by the algebraic space $T_1' \times_U T_2'$. Consider the commutative diagram

$$\begin{tikzcd}
 & \mathcal{T}_1 \times_{\mathcal{X}} \mathcal{T}_2 \arrow[rr] \arrow[dd] & & \mathcal{T}_1 \arrow[dd] \\
\mathcal{T}_1' \times_{\mathcal{U}} \mathcal{T}_2' \arrow[ur] \arrow[rr] \arrow[dd] & & \mathcal{T}_1' \arrow[ur] \arrow[dd] & \\
 & \mathcal{T}_2 \arrow[rr] & & \mathcal{X} \\
\mathcal{T}_2' \arrow[ur] \arrow[rr] & & \mathcal{U} \arrow[ur] &
\end{tikzcd}$$

In this diagram the bottom square, the right square, the back square, and the front square are 2-fibre products. A formal argument then shows that $\mathcal{T}_1' \times_{\mathcal{U}} \mathcal{T}_2' \to \mathcal{T}_1 \times_{\mathcal{X}} \mathcal{T}_2$ is the ``base change'' of $\mathcal{U} \to \mathcal{X}$, more precisely the diagram

$$\begin{tikzcd}
\mathcal{T}_1' \times_{\mathcal{U}} \mathcal{T}_2' \arrow[r] \arrow[d] & \mathcal{U} \arrow[d] \\
\mathcal{T}_1 \times_{\mathcal{X}} \mathcal{T}_2 \arrow[r] & \mathcal{X}
\end{tikzcd}$$

is a 2-fibre square. Hence $T_1' \times_U T_2' \to F$ is representable by algebraic spaces, smooth, and surjective, see Lemmas 57.9.6, 57.9.7, 57.10.4, and 57.10.6. Therefore F is an algebraic space by Bootstrap, Theorem 54.10.1 and we win. □

An application of Lemma 57.15.3 is that something which is an algebraic space over an algebraic stack is an algebraic stack. This is the analogue of Bootstrap, Lemma 54.3.6. Actually, it suffices to assume the morphism $\mathcal{X} \to \mathcal{Y}$ is ``algebraic'', as we will see in Criteria for Representability, Lemma 59.8.2.

Lemma 57.15.4. *Let S be a scheme contained in Sch_{fppf}. Let $\mathcal{X} \to \mathcal{Y}$ be a morphism of stacks in groupoids over $(Sch/S)_{fppf}$. Assume that*

(1) *$\mathcal{X} \to \mathcal{Y}$ is representable by algebraic spaces, and*

(2) *$\mathcal{Y}$ is an algebraic stack over S.*

Then $\mathcal{X}$ is an algebraic stack over S.

Proof. Let $\mathcal{V} \to \mathcal{Y}$ be a surjective smooth 1-morphism from a representable stack in groupoids to $\mathcal{Y}$. This exists by Definition 57.12.1. Then the 2-fibre product $\mathcal{U} = \mathcal{V} \times_{\mathcal{Y}} \mathcal{X}$ is representable by an algebraic space by Lemma 57.9.8. The 1-morphism $\mathcal{U} \to \mathcal{X}$ is representable by algebraic spaces, smooth, and surjective, see Lemmas 57.9.7 and 57.10.6. By Lemma 57.15.3 we conclude that $\mathcal{X}$ is an algebraic stack. $\square$

Lemma 57.15.5. *Let S be a scheme contained in Sch_{fppf}. Let $j : \mathcal{X} \to \mathcal{Y}$ be a 1 morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. Assume j is representable by algebraic spaces and a monomorphism[3]. Then, if $\mathcal{Y}$ is a stack in groupoids (resp. an algebraic stack), so is $\mathcal{X}$.*

Proof. We prove that $\mathcal{X}$ is a stack. The case of algebraic stacks will then follow from Lemma 57.15.4. It suffices to check effectiveness of descent for $\mathcal{X}$. Fix a scheme T and an fppf covering $\{f_i : T_i \to T\}$. Suppose we have objects x_i of the fibre categories $\mathcal{X}_{T_i}$ together with a descent datum. Then since $\mathcal{Y}$ is a stack, there exists an object y in the fibre category $\mathcal{Y}_T$ such that $f_i^*(y) \simeq j(x_i)$ in $\mathcal{Y}_{T_i}$. By hypothesis, the 2-fibered product

$$\mathcal{X} \times_{j,\mathcal{Y},y} (Sch/T)_{fppf}$$

is representable by an algebraic space U such that the induced morphism $U \to T$ is a monomorphism of algebraic spaces. By the universal property of the 2-fibre product and the fact that $f_i^*(y) \cong j(x_i)$, we have that $f_i : T_i \to T$ factors through $U \to T$ for all i. Hence $U \to T$ is a monomorphism of fppf sheaves, but also surjective as $\{f_i : T_i \to T\}$ is a covering. We conclude that $U = T$. Thus y comes from some object x of the fibre category $\mathcal{X}_T$. We have $f_i^* x \cong x_i$ in the fibre category $\mathcal{X}_{T_i}$ as the functor j is fully faithful on fibre categories, see Lemma 57.10.10. $\square$

57.16. From an algebraic stack to a presentation

Given an algebraic stack over S we obtain a groupoid in algebraic spaces over S whose associated quotient stack is the algebraic stack.

Recall that if (U, R, s, t, c) is a groupoid in algebraic spaces over S then $[U/R]$ denotes the quotient stack associated to this datum, see Groupoids in Spaces, Definition 52.19.1. In general $[U/R]$ is **not** an algebraic stack. In particular the stack $[U/R]$ occuring in the following lemma is in general not algebraic.

Lemma 57.16.1. *Let S be a scheme contained in Sch_{fppf}. Let $\mathcal{X}$ be an algebraic stack over S. Let $\mathcal{U}$ be an algebraic stack over S which is representable by an algebraic space. Let $f : \mathcal{U} \to \mathcal{X}$ be a 1-morphism. Then*

(1) *the 2-fibre product $\mathcal{R} = \mathcal{U} \times_{f,\mathcal{X},f} \mathcal{U}$ is representable by an algebraic space,*
(2) *there is a canonical equivalence*

$$\mathcal{U} \times_{f,\mathcal{X},f} \mathcal{U} \times_{f,\mathcal{X},f} \mathcal{U} = \mathcal{R} \times_{pr_1,\mathcal{U},pr_0} \mathcal{R},$$

(3) *the projection pr_{02} induces via (2) a 1-morphism*

$$pr_{02} : \mathcal{R} \times_{pr_1,\mathcal{U},pr_0} \mathcal{R} \longrightarrow \mathcal{R}$$

[3] For example an open immersion.

(4) *let U, R be the algebraic spaces representing $\mathcal{U}, \mathcal{R}$ and $t, s : R \to U$ and $c : R \times_{s,U,t} R \to U$ are the morphisms corresponding to the 1-morphisms $pr_0, pr_1 : \mathcal{R} \to \mathcal{U}$ and $pr_{02} : \mathcal{R} \times_{pr_1,\mathcal{U},pr_0} \mathcal{R} \to \mathcal{R}$ above, then the quintuple (U, R, s, t, c) is a groupoid in algebraic spaces over S,*
(5) *the morphism f induces a canonical 1-morphism $f_{can} : [U/R] \to \mathcal{X}$ of stacks in groupoids over $(Sch/S)_{fppf}$, and*
(6) *the 1-morphism $f_{can} : [U/R] \to \mathcal{X}$ is fully faithful.*

Proof. Proof of (1). By definition $\Delta_{\mathcal{X}}$ is representable by algebraic spaces so Lemma 57.10.11 applies to show that $\mathcal{U} \to \mathcal{X}$ is representable by algebraic spaces. Hence the result follows from Lemma 57.9.8.

Let T be a scheme over S. By construction of the 2-fibre product (see Categories, Lemma 4.29.3) we see that the objects of the fibre category $\mathcal{R}_T$ are triples (a, b, α) where $a, b \in Ob(\mathcal{U}_T)$ and $\alpha : f(a) \to f(b)$ is a morphism in the fibre category $\mathcal{X}_T$.

Proof of (2). The equivalence comes from repeatedly applying Categories, Lemmas 4.28.8 and 4.28.10. Let us identify $\mathcal{U} \times_{\mathcal{X}} \mathcal{U} \times_{\mathcal{X}} \mathcal{U}$ with $(\mathcal{U} \times_{\mathcal{X}} \mathcal{U}) \times_{\mathcal{X}} \mathcal{U}$. If T is a scheme over S, then on fibre categories over T this equivalence maps the object $((a, b, \alpha), c, \beta)$ on the left hand side to the object $((a, b, \alpha), (b, c, \beta))$ of the right hand side.

Proof of (3). The 1-morphism pr_{02} is constructed in the proof of Categories, Lemma 4.28.9. In terms of the description of objects of the fibre category above we see that $((a, b, \alpha), (b, c, \beta))$ maps to $(a, c, \beta \circ \alpha)$.

Unfortunately, this is *not compatible* with our conventions on groupoids where we always have $j = (t, s) : R \to U$, and we ``think" of a T-valued point r of R as a morphism $r : s(r) \to t(r)$. However, this does not affect the proof of (4), since the opposite of a groupoid is a groupoid. But in the proof of (5) it is responsible for the inverses in the displayed formula below.

Proof of (4). Recall that the sheaf U is isomorphic to the sheaf $T \mapsto Ob(\mathcal{U}_T)/\cong$, and similarly for R, see Lemma 57.8.2. It follows from Categories, Lemma 4.36.8 that this description is compatible with 2-fibre products so we get a similar matching of $\mathcal{R} \times_{\text{pr}_1,\mathcal{U},\text{pr}_0} \mathcal{R}$ and $R \times_{s,U,t} R$. The morphisms $t, s : R \to U$ and $c : R \times_{s,U,t} R \to R$ we get from the general equality (57.8.2.1). Explicitly these maps are the transformations of functors that come from letting pr_0, pr_0, pr_{02} act on isomorphism classes of objects of fibre categories. Hence to show that we obtain a groupoid in algebraic spaces it suffices to show that for every scheme T over S the structure

$$(Ob(\mathcal{U}_T)/\cong, Ob(\mathcal{R}_T)/\cong, \text{pr}_1, \text{pr}_0, \text{pr}_{02})$$

is a groupoid which is clear from our description of objects of $\mathcal{R}_T$ above.

Proof of (5). We will eventually apply Groupoids in Spaces, Lemma 52.22.2 to obtain the functor $[U/R] \to \mathcal{X}$. Consider the 1-morphism $f : \mathcal{U} \to \mathcal{X}$. We have a 2-arrow $\tau : f \circ \text{pr}_1 \to f \circ \text{pr}_0$ by definition of $\mathcal{R}$ as the 2-fibre product. Namely, on an object (a, b, α) of $\mathcal{R}$ over T it is the map $\alpha^{-1} : b \to a$. We claim that

$$\tau \circ \text{id}_{\text{pr}_{02}} = (\tau \star \text{id}_{\text{pr}_0}) \circ (\tau \star \text{id}_{\text{pr}_1}).$$

This identity says that given an object $((a, b, \alpha), (b, c, \beta))$ of $\mathcal{R} \times_{\text{pr}_1,\mathcal{U},\text{pr}_0} \mathcal{R}$ over T, then the composition of

$$c \xrightarrow{\beta^{-1}} b \xrightarrow{\alpha^{-1}} a$$

is the same as the arrow $(\beta \circ \alpha)^{-1} : a \to c$. This is clearly true, hence the claim holds. In this way we see that all the assumption of Groupoids in Spaces, Lemma 52.22.2 are satisfied for the structure $(\mathcal{U}, \mathcal{R}, \text{pr}_0, \text{pr}_1, \text{pr}_{02})$ and the 1-morphism f and the 2-morphism τ. Except, to apply the lemma we need to prove this holds for the structure $(\mathcal{S}_U, \mathcal{S}_R, s, t, c)$ with suitable morphisms.

Now there should be some general abstract nonsense argument which transfer these data between the two, but it seems to be quite long. Instead, we use the following trick. Pick a quasi-inverse $j^{-1} : \mathcal{S}_U \to \mathcal{U}$ of the canonical equivalence $j : \mathcal{U} \to \mathcal{S}_U$ which comes from $U(T) = Ob(\mathcal{U}_T)/\cong$. This just means that for every scheme T/S and every object $a \in \mathcal{U}_T$ we have picked out a particular element of its isomorphism class, namely $j^{-1}(j(a))$. Using j^{-1} we may therefore see $\mathcal{S}_U$ as a subcategory of $\mathcal{U}$. Having chosen this subcategory we can consider those objects (a, b, α) of $\mathcal{R}_T$ such that a, b are objects of $(\mathcal{S}_U)_T$, i.e., such that $j^{-1}(j(a)) = a$ and $j^{-1}(j(b)) = b$. Then it is clear that this forms a subcategory of $\mathcal{R}$ which maps isomorphically to $\mathcal{S}_R$ via the canonical equivalence $\mathcal{R} \to \mathcal{S}_R$. Moreover, this is clearly compatible with forming the 2-fibre product $\mathcal{R} \times_{\text{pr}_1, \mathcal{U}, \text{pr}_0} \mathcal{R}$. Hence we see that we may simply restrict f to $\mathcal{S}_U$ and restrict τ to a transformation beween functors $\mathcal{S}_R \to \mathcal{X}$. Hence it is clear that the displayed equality of Groupoids in Spaces, Lemma 52.22.2 holds since it holds even as an equality of transformations of functors $\mathcal{R} \times_{\text{pr}_1, \mathcal{U}, \text{pr}_0} \mathcal{R} \to \mathcal{X}$ before restricting to the subcategory $\mathcal{S}_{R \times_{s,U,t} R}$.

This proves that Groupoids in Spaces, Lemma 52.22.2 applies and we get our desired morphism of stacks $f_{can} : [U/R] \to \mathcal{X}$. We briefly spell out how f_{can} is defined in this special case. On an object a of $\mathcal{S}_U$ over T we have $f_{can}(a) = f(a)$, where we think of $\mathcal{S}_U \subset \mathcal{U}$ by the chosen embedding above. If a, b are objects of $\mathcal{S}_U$ over T, then a morphism $\varphi : a \to b$ in $[U/R]$ is by definition an object of the form $\varphi = (b, a, \alpha)$ of $\mathcal{R}$ over T. (Note switch.) And the rule in the proof of Groupoids in Spaces, Lemma 52.22.2 is that

$$f_{can}(\varphi) = \left(f(a) \xrightarrow{\alpha^{-1}} f(b) \right). \tag{57.16.1.1}$$

Proof of (6). Both $[U/R]$ and $\mathcal{X}$ are stacks. Hence given a scheme T/S and objects a, b of $[U/R]$ over T we obtain a transformation of fppf sheaves

$$Isom(a, b) \longrightarrow Isom(f_{can}(a), f_{can}(b))$$

on $(Sch/T)_{fppf}$. We have to show that this is an isomorphism. We may work fppf locally on T, hence we may assume that a, b come from morphisms $a, b : T \to U$. By the embedding $\mathcal{S}_U \subset \mathcal{U}$ above we may also think of a, b as objects of $\mathcal{U}$ over T. In Groupoids in Spaces, Lemma 52.21.1 we have seen that the left hand sheaf is represented by the algebraic space

$$R \times_{(t,s), U \times_S U, (b,a)} T$$

over T. On the other hand, the right hand side is by Stacks, Lemma 50.2.5 equal to the sheaf associated to the following stack in setoids:

$$\mathcal{X} \times_{\mathcal{X} \times \mathcal{X}, (f \circ b, f \circ a)} T = \mathcal{X} \times_{\mathcal{X} \times \mathcal{X}, (f,f)} (\mathcal{U} \times \mathcal{U}) \times_{\mathcal{U} \times \mathcal{U}, (b,a)} T = \mathcal{R} \times_{(\text{pr}_0, \text{pr}_1), \mathcal{U} \times \mathcal{U}, (b,a)} T$$

which is representable by the fibre product desplayed above. At this point we have shown that the two $Isom$-sheaves are isomorphic. Our 1-morphism $f_{can} : [U/R] \to \mathcal{X}$ induces this isomorphism on $Isom$-sheaves by Equation (57.16.1.1). $\square$

We can use the previous very abstract lemma to produce presentations.

Lemma 57.16.2. *Let S be a scheme contained in Sch_{fppf}. Let $\mathcal{X}$ be an algebraic stack over S. Let U be an algebraic space over S. Let $f : \mathcal{S}_U \to \mathcal{X}$ be a surjective smooth morphism. Let (U, R, s, t, c) be the groupoid in algebraic spaces and $f_{can} : [U/R] \to \mathcal{X}$ be the result of applying Lemma 57.16.1 to U and f. Then*

(1) *the morphisms s, t are smooth, and*
(2) *the 1-morphism $f_{can} : [U/R] \to \mathcal{X}$ is an equivalence.*

Proof. The morphisms s, t are smooth by Lemmas 57.10.2 and 57.10.3. As the 1-morphism f is smooth and surjective it is clear that given any scheme T and any object $a \in Ob(\mathcal{X}_T)$ there exists a smooth and surjective morphism $T' \to T$ such that $a|'_T$ comes from an object of $[U/R]_{T'}$. Since $f_{can} : [U/R] \to \mathcal{X}$ is fully faithful, we deduce that $[U/R] \to \mathcal{X}$ is essentially surjective as descent data on objects are effective on both sides, see Stacks, Lemma 50.4.8. ☐

Remark 57.16.3. If the morphism $f : \mathcal{S}_U \to \mathcal{X}$ of Lemma 57.16.2 is only assumed surjective, flat and locally of finite presentation, then it will still be the case that $f_{can} : [U/R] \to \mathcal{X}$ is an equivalence. In this case the morphisms s, t will be flat and locally of finite presentation, but of course not smooth in general.

Lemma 57.16.2 suggests the following definitions.

Definition 57.16.4. Let S be a scheme. Let B be an algebraic space over S. Let (U, R, s, t, c) be a groupoid in algebraic spaces over B. We say (U, R, s, t, c) is a *smooth groupoid*[4] if $s, t : R \to U$ are smooth morphisms of algebraic spaces.

Definition 57.16.5. Let $\mathcal{X}$ be an algebraic stack over S. A *presentation* of $\mathcal{X}$ is given by a smooth groupoid (U, R, s, t, c) in algebraic spaces over S, and an equivalence $f : [U/R] \to \mathcal{X}$.

We have seen above that every algebraic stack has a presentation. Our next task is to show that every smooth groupoid in algebraic spaces over S gives rise to an algebraic stack.

57.17. The algebraic stack associated to a smooth groupoid

In this section we start with a smooth groupoid in algebraic spaces and we show that the associated quotient stack is an algebraic stack.

Lemma 57.17.1. *Let S be a scheme contained in Sch_{fppf}. Let (U, R, s, t, c) be a groupoid in algebraic spaces over S. Then the diagonal of $[U/R]$ is representable by algebraic spaces.*

Proof. It suffices to show that the $Isom$-sheaves are algebraic spaces, see Lemma 57.10.11. This follows from Bootstrap, Lemma 54.11.3. ☐

Lemma 57.17.2. *Let S be a scheme contained in Sch_{fppf}. Let (U, R, s, t, c) be a smooth groupoid in algebraic spaces over S. Then the morphism $\mathcal{S}_U \to [U/R]$ is smooth and surjective.*

Proof. Let T be a scheme and let $x : (Sch/T)_{fppf} \to [U/R]$ be a 1-morphism. We have to show that the projection

$$\mathcal{S}_U \times_{[U/R]} (Sch/T)_{fppf} \longrightarrow (Sch/T)_{fppf}$$

is surjective and smooth. We already know that the left hand side is representable by an algebraic space F, see Lemmas 57.17.1 and 57.10.11. Hence we have to show the corresponding morphism $F \to T$ of algebraic spaces is surjective and smooth. Since we are

[4]This terminology might be a bit confusing: it does not imply that $[U/R]$ is smooth over anything.

working with properties of morphisms of algebraic spaces which are local on the target in the fppf topology we may check this fppf locally on T. By construction, there exists an fppf covering $\{T_i \to T\}$ of T such that $x|_{(Sch/T_i)_{fppf}}$ comes from a morphism $x_i : T_i \to U$. (Note that $F \times_T T_i$ represents the 2-fibre product $\mathcal{S}_U \times_{[U/R]} (Sch/T_i)_{fppf}$ so everything is compatible with the base change via $T_i \to T$.) Hence we may assume that x comes from $x : T \to U$. In this case we see that

$$\mathcal{S}_U \times_{[U/R]} (Sch/T)_{fppf} = (\mathcal{S}_U \times_{[U/R]} \mathcal{S}_U) \times_{\mathcal{S}_U} (Sch/T)_{fppf} = \mathcal{S}_R \times_{\mathcal{S}_U} (Sch/T)_{fppf}$$

The first equality by Categories, Lemma 4.28.10 and the second equality by Groupoids in Spaces, Lemma 52.21.2. Clearly the last 2-fibre product is represented by the algebraic space $F = R \times_{s,U,x} T$ and the projection $R \times_{s,U,x} T \to T$ is smooth as the base change of the smooth morphism of algebraic spaces $s : R \to U$. It is also surjective as s has a section (namely the identity $e : U \to R$ of the groupoid). This proves the lemma. □

Here is the main result of this section.

Theorem 57.17.3. *Let S be a scheme contained in Sch_{fppf}. Let (U, R, s, t, c) be a smooth groupoid in algebraic spaces over S. Then the quotient stack $[U/R]$ is an algebraic stack over S.*

Proof. We check the three conditions of Definition 57.12.1. By construction we have that $[U/R]$ is a stack in groupoids which is the first condition.

The second condition follows from the stronger Lemma 57.17.1.

Finally, we have to show there exists a scheme W over S and a surjective smooth 1-morphism $(Sch/W)_{fppf} \longrightarrow \mathcal{X}$. First choose $W \in Ob((Sch/S)_{fppf})$ and a surjective étale morphism $W \to U$. Note that this gives a surjective étale morphism $\mathcal{S}_W \to \mathcal{S}_U$ of categories fibred in sets, see Lemma 57.10.3. Of course then $\mathcal{S}_W \to \mathcal{S}_U$ is also surjective and smooth, see Lemma 57.10.9. Hence $\mathcal{S}_W \to \mathcal{S}_U \to [U/R]$ is surjective and smooth by a combination of Lemmas 57.17.2 and 57.10.5. □

57.18. Change of big site

In this section we briefly discuss what happens when we change big sites. The upshot is that we can always enlarge the big site at will, hence we may assume any set of schemes we want to consider is contained in the big fppf site over which we consider our algebraic space. We encourage the reader to skip this section.

Pullbacks of stacks is defined in Stacks, Section 50.12.

Lemma 57.18.1. *Suppose given big sites Sch_{fppf} and Sch'_{fppf}. Assume that Sch_{fppf} is contained in Sch'_{fppf}, see Topologies, Section 30.10. Let S be an object of Sch_{fppf}. Let Let $f : (Sch'/S)_{fppf} \to (Sch/S)_{fppf}$ the morphism of sites corresponding to the inclusion functor $u : (Sch/S)_{fppf} \to (Sch'/S)_{fppf}$. Let $\mathcal{X}$ be a stack in groupoids over $(Sch/S)_{fppf}$.*

1. *if $\mathcal{X}$ is representable by some $X \in Ob((Sch/S)_{fppf})$, then $f^{-1}\mathcal{X}$ is representable too, in fact it is representable by the same scheme X, now viewed as an object of $(Sch'/S)_{fppf}$,*
2. *if $\mathcal{X}$ is representable by $F \in Sh((Sch/S)_{fppf})$ which is an algebraic space, then $f^{-1}\mathcal{X}$ is representable by the algebraic space $f^{-1}F$,*
3. *if $\mathcal{X}$ is an algebraic stack, then $f^{-1}\mathcal{X}$ is an algebraic stack, and*
4. *if $\mathcal{X}$ is a Deligne-Mumford stack, then $f^{-1}\mathcal{X}$ is a Deligne-Mumford stack too.*

Proof. Let us prove (3). By Lemma 57.16.2 we may write $\mathcal{X} = [U/R]$ for some smooth groupoid in algebraic spaces (U, R, s, t, c). By Groupoids in Spaces, Lemma 52.27.1 we see that $f^{-1}[U/R] = [f^{-1}U/f^{-1}R]$. Of course $(f^{-1}U, f^{-1}R, f^{-1}s, f^{-1}t, f^{-1}c)$ is a smooth groupoid in algebraic spaces too. Hence (3) is proved.

Now the other cases (1), (2), (4) each mean that $\mathcal{X}$ has a presentation $[U/R]$ of a particular kind, and hence translate into the same kind of presentation for $f^{-1}\mathcal{X} = [f^{-1}U/f^{-1}R]$. Whence the lemma is proved. □

It is not true (in general) that the restriction of an algebraic space over the bigger site is an algebraic space over the smaller site (simply by reasons of cardinality). Hence we can only ever use a simple lemma of this kind to enlarge the base category and never to shrink it.

Lemma 57.18.2. *Suppose Sch_{fppf} is contained in Sch'_{fppf}. Let S be an object of Sch_{fppf}. Denote Algebraic-Stacks/S the 2-category of algebraic spaces over S defined using Sch_{fppf}. Similarly, denote Algebraic-Stacks$'/S$ the 2-category of algebraic spaces over S defined using Sch'_{fppf}. The rule $\mathcal{X} \mapsto f^{-1}\mathcal{X}$ of Lemma 57.18.1 defines a functor of 2-categories*

$$\textit{Algebraic-Stacks}/S \longrightarrow \textit{Algebraic-Stacks}'/S$$

which defines equivalences of morphism categories

$$Mor_{\textit{Algebraic-Stacks}/S}(\mathcal{X}, \mathcal{Y}) \longrightarrow Mor_{\textit{Algebraic-Stacks}'/S}(f^{-1}\mathcal{X}, f^{-1}\mathcal{Y})$$

for every objects $\mathcal{X}, \mathcal{Y}$ of Algebraic-Stacks/S. An object $\mathcal{X}'$ of Algebraic-Stacks$'/S$ is equivalence to $f^{-1}\mathcal{X}$ for some $\mathcal{X}$ in Algebraic-Stacks/S if and only if it has a presentation $\mathcal{X} = [U'/R']$ with U', R' isomorphic to $f^{-1}U$, $f^{-1}R$ for some $U, R \in Spaces/S$.

Proof. The statement on morphism categories is a consequence of the more general Stacks, Lemma 50.12.12. The characterization of the ``essential image'' follows from the description of f^{-1} in the proof of Lemma 57.18.1. □

57.19. Change of base scheme

In this section we briefly discuss what happens when we change base schemes. The upshot is that given a morphism $S \to S'$ of base schemes, any algebraic stack over S can be viewed as an algebraic stack over S'.

Lemma 57.19.1. *Let Sch_{fppf} be a big fppf site. Let $S \to S'$ be a morphism of this site. The constructions A and B of Stacks, Section 50.13 above give ismorphisms of 2-categories*

$$\left\{ \begin{matrix} \textit{2-category of algebraic} \\ \textit{stacks } \mathcal{X} \textit{ over } S \end{matrix} \right\} \leftrightarrow \left\{ \begin{matrix} \textit{2-category of pairs } (\mathcal{X}', f) \textit{ consisting of an} \\ \textit{algebraic stack } \mathcal{X}' \textit{ over } S' \textit{ and a morphism} \\ f : \mathcal{X}' \to (Sch/S)_{fppf} \textit{ of algebraic stacks over } S' \end{matrix} \right\}$$

Proof. The statement makes sense as the functor $j : (Sch/S)_{fppf} \to (Sch/S')_{fppf}$ is the localization functor assocated to the object S/S' of $(Sch/S')_{fppf}$. By Stacks, Lemma 50.13.2 the only thing to show is that the constructions A and B preserve the subcategories of algebraic stacks. But for example, if $\mathcal{X} = [U/R]$ then we have construction A applied to $\mathcal{X}$ just produces $\mathcal{X}' = \mathcal{X}$. Conversely, if $\mathcal{X}' = [U'/R']$ the the morphism p induces morphisms of algebraic spaces $U' \to S$ and $R' \to S$, and then $\mathcal{X} = [U'/R']$ but now viewed as a stack over S. Hence the lemma is clear. □

Definition 57.19.2. Let Sch_{fppf} be a big fppf site. Let $S \to S'$ be a morphism of this site. If $p : \mathcal{X} \to (Sch/S)_{fppf}$ is an algebraic stack over S, then $\mathcal{X}$ *viewed as an algebraic stack over* S' is the algebraic stack

$$\mathcal{X} \longrightarrow (Sch/S')_{fppf}$$

gotten by applying construction A of Lemma 57.19.1 to $\mathcal{X}$.

Conversely, what if we start with an algebraic stack $\mathcal{X}'$ over S' and we want to get an algebraic stack over S? Well, then we consider the 2-fibre product

$$\mathcal{X}'_S = (Sch/S)_{fppf} \times_{(Sch/S')_{fppf}} \mathcal{X}'$$

which is an algebraic stack over S' according to Lemma 57.14.3. Moreover, it comes equipped with a natural 1-morphism $p : \mathcal{X}'_S \to (Sch/S)_{fppf}$ and hence by Lemma 57.19.1 it corresponds in a canonical way to an algebraic stack over S.

Definition 57.19.3. Let Sch_{fppf} be a big fppf site. Let $S \to S'$ be a morphism of this site. Let $\mathcal{X}'$ be an algebraic stack over S'. The *change of base of* $\mathcal{X}'$ is the algebraic space $\mathcal{X}'_S$ over S described above.

CHAPTER 58

Sheaves on Algebraic Stacks

58.1. Introduction

There is a myriad of ways to think about sheaves on algebraic stacks. In this chapter we discuss one approach, which is particularly well adapted to our foundations for algebraic stacks. Whenever we introduce a type of sheaves we will indicate the precise relationship with similar notions in the literature. The goal of this chapter is to state those results that are either obviously true or straightforward to prove and leave more intricate constructions till later.

In fact, it turns out that to develop a fully fledged theory of constructible étale sheaves and/or an adequate discussion of derived categories of complexes $\mathcal{O}$-modules whose cohomology sheaves are quasi-coherent takes a significant amount of work, see [**Ols07b**]. We will return to these issues later (insert future reference here).

In the literature and in research papers on sheaves on algebraic stacks the lisse-étale site of an algebraic stack often plays a prominent role. However, it is a problematic beast, because it turns out that a morphism of algebraic stacks does not induce a morphism of lisse-étale topoi. We have therefore made the design decision to avoid any mention of the lisse-étale site as long as possible. Arguments that traditionally use the lisse-étale site will be replaced by an argument using a Čech covering in the site $\mathcal{X}_{smooth}$ defined below.

58.2. Conventions

The conventions we use in this chapter are the same as those in the chapter on algebraic stacks, see Algebraic Stacks, Section 57.2. For convenience we repeat them here.

We work in a suitable big fppf site Sch_{fppf} as in Topologies, Definition 30.7.6. So, if not explicitly stated otherwise all schemes will be objects of Sch_{fppf}. We record what changes if you change the big fppf site elsewhere (insert future reference here).

We will always work relative to a base S contained in Sch_{fppf}. And we will then work with the big fppf site $(Sch/S)_{fppf}$, see Topologies, Definition 30.7.8. The absolute case can be recovered by taking $S = Spec(\mathbf{Z})$.

58.3. Presheaves

In this section we define presheaves on categories fibred in groupoids over $(Sch/S)_{fppf}$, but most of the discussion works for categories over any base category. This section also serves to introduce the notation we will use later on.

Definition 58.3.1. Let $p : \mathcal{X} \to (Sch/S)_{fppf}$ be a category fibred in groupoids.

(1) A *presheaf on $\mathcal{X}$* is a presheaf on the underlying category of $\mathcal{X}$.
(2) A *morphism of presheaves on $\mathcal{X}$* is a morphism of presheaves on the underlying category of $\mathcal{X}$.

We denote $PSh(\mathcal{X})$ the category of presheaves on $\mathcal{X}$.

This defines presheaves of sets. Of course we can also talk about presheaves of pointed sets, abelian groups, groups, monoids, rings, modules over a fixed ring, and lie algebras over a fixed field, etc. The category of *abelian presheaves*, i.e., presheaves of abelian groups, is denoted $PAb(\mathcal{X})$.

Let $f : \mathcal{X} \to \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. Recall that this means just that f is a functor over $(Sch/S)_{fppf}$. The material in Sites, Section 9.17 provides us with a pair of adjoint functors[1]

(58.3.1.1) $$f^p : PSh(\mathcal{Y}) \longrightarrow PSh(\mathcal{X}) \quad \text{and} \quad {}_pf : PSh(\mathcal{X}) \longrightarrow PSh(\mathcal{Y}).$$

The adjointness is

$$Mor_{PSh(\mathcal{X})}(f^p\mathcal{G}, \mathcal{F}) = Mor_{PSh(\mathcal{Y})}(\mathcal{G}, {}_pf\mathcal{F})$$

where $\mathcal{F} \in Ob(PSh(\mathcal{X}))$ and $\mathcal{G} \in Ob(PSh(\mathcal{Y}))$. We call $f^p\mathcal{G}$ the *pullback* of $\mathcal{G}$. It follows from the definitions that

$$f^p\mathcal{G}(x) = \mathcal{G}(f(x))$$

for any $x \in Ob(\mathcal{X})$. The presheaf ${}_pf\mathcal{F}$ is called the *pushforward* of $\mathcal{F}$. It is described by the formula

$$({}_pf\mathcal{F})(y) = lim_{f(x)\to y}\, \mathcal{F}(x).$$

The rest of this section should probably be moved to the chapter on sites and in any case should be skipped on a first reading.

Lemma 58.3.2. *Let $f\mathcal{X} \to \mathcal{Y}$ and $g : \mathcal{Y} \to \mathcal{Z}$ be 1-morphisms of categories fibred in groupoids over $(Sch/S)_{fppf}$. Then $(g \circ f)^p = f^p \circ g^p$ and there is a canonical isomorphism ${}_p(g\circ f) \to {}_pg\circ {}_pf$ compatible with with adjointness of $(f^p, {}_pf)$, $(g^p, {}_pg)$, and $((g\circ f)^p, {}_p(g\circ f))$.*

Proof. Let $\mathcal{H}$ be a presheaf on $\mathcal{Z}$. Then $(g \circ f)^p\mathcal{H} = f^p(g^p\mathcal{H})$ is given by the equalities

$$(g \circ f)^p\mathcal{H}(x) = \mathcal{H}((g \circ f)(x)) = \mathcal{H}(g(f(x))) = f^p(g^p\mathcal{H})(x).$$

We omit the verification that this is compatible with restriction maps.

Next, we define the transformation ${}_p(g \circ f) \to {}_pg \circ {}_pf$. Let $\mathcal{F}$ be a presheaf on $\mathcal{X}$. If z is an object of $\mathcal{Z}$ then we get a category $\mathcal{J}$ of quadruples $(x, f(x) \to y, y, g(y) \to z)$ and a category $\mathcal{I}$ of pairs $(x, g(f(x)) \to z)$. There is a canonical functor $\mathcal{J} \to \mathcal{I}$ sending the object $(x, \alpha : f(x) \to y, y, \beta : g(y) \to z)$ to $(x, \beta \circ f(\alpha) : g(f(x)) \to z)$. This gives the arrow in

$$\begin{aligned} ({}_p(g \circ f)\mathcal{F})(z) &= lim_{g(f(x))\to z}\, \mathcal{F}(x) \\ &= lim_{\mathcal{I}}\, \mathcal{F} \\ &\to lim_{\mathcal{J}}\, \mathcal{F} \\ &= lim_{g(y)\to z} \left(lim_{f(x)\to y}\, \mathcal{F}(x) \right) \\ &= ({}_pg \circ {}_pf\mathcal{F})(x) \end{aligned}$$

by Categories, Lemma 4.13.8. We omit the verification that this is compatible with restriction maps. An alternative to this direct construction is to define ${}_p(g \circ f) \cong {}_pg \circ {}_pf$ as the unique map compatible with the adjointness properties. This also has the advantage that one does not need to prove the compatibility.

[1]These functors will be denoted f^{-1} and f_* after Lemma 58.4.4 has been proved.

Compatibility with adjointness of $(f^p, {}_pf)$, $(g^p, {}_pg)$, and $((g \circ f)^p, {}_p(g \circ f))$ means that given presheaves $\mathcal{H}$ and $\mathcal{F}$ as above we have a commutative diagram

$$\begin{tikzcd} Mor_{PSh(\mathcal{X})}(f^pg^p\mathcal{H}, \mathcal{F}) \arrow[r, equal] \arrow[d, equal] & Mor_{PSh(\mathcal{Y})}(g^p\mathcal{H}, {}_pf\mathcal{F}) \arrow[r, equal] & Mor_{PSh(\mathcal{Y})}(\mathcal{H}, {}_pg_pf\mathcal{F}) \\ Mor_{PSh(\mathcal{X})}((g \circ f)^p\mathcal{G}, \mathcal{F}) \arrow[rr, equal] & & Mor_{PSh(\mathcal{Y})}(\mathcal{G}, {}_p(g \circ f)\mathcal{F}) \arrow[u] \end{tikzcd}$$

Proof omitted. $\square$

Lemma 58.3.3. *Let $f, g : \mathcal{X} \to \mathcal{Y}$ be 1-morphisms of categories fibred in groupoids over $(Sch/S)_{fppf}$. Let $t : f \to g$ be a 2-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. Assigned to t there are canonical isomorphisms of functors*

$$t^p : g^p \longrightarrow f^p \quad \text{and} \quad {}_pt : {}_pf \longrightarrow {}_pg$$

which compatible with adjointness of $(f^p, {}_pf)$ and $(g^p, {}_pg)$ and with vertical and horizontal composition of 2-morphisms.

Proof. Let $\mathcal{G}$ be a presheaf on $\mathcal{Y}$. Then $t^p : g^p\mathcal{G} \to f^p\mathcal{G}$ is given by the family of maps

$$g^p\mathcal{G}(x) = \mathcal{G}(g(x)) \xrightarrow{\mathcal{G}(t_x)} \mathcal{G}(f(x)) = f^p\mathcal{G}(x)$$

parametrized by $x \in Ob(\mathcal{X})$. This makes sense as $t_x : f(x) \to g(x)$ and $\mathcal{G}$ is a contravariant functor. We omit the verification that this is compatible with restriction mappings.

To define the transformation ${}_pt$ for $y \in Ob(\mathcal{Y})$ define ${}^f_y\mathcal{I}$, resp. ${}^g_y\mathcal{I}$ to be the category of pairs $(x, \psi : f(x) \to y)$, resp. $(x, \psi : g(x) \to y)$, see Sites, Section 9.17. Note that t defines a functor ${}_yt : {}^g_y\mathcal{I} \to {}^f_y\mathcal{I}$ given by the rule

$$(x, g(x) \to y) \longmapsto (x, f(x) \xrightarrow{t_x} g(x) \to y).$$

Note that for $\mathcal{F}$ a presheaf on $\mathcal{X}$ the composition of ${}_yt$ with $\mathcal{F} : {}^f_y\mathcal{I}^{opp} \to Sets$, $(x, f(x) \to y) \mapsto \mathcal{F}(x)$ is equal to $\mathcal{F} : {}^g_y\mathcal{I}^{opp} \to Sets$. Hence by Categories, Lemma 4.13.8 we get for every $y \in Ob(\mathcal{Y})$ a canonical map

$$({}_pf\mathcal{F})(y) = lim_{{}^f_y\mathcal{I}}\mathcal{F} \longrightarrow lim_{{}^g_y\mathcal{I}}\mathcal{F} = ({}_pg\mathcal{F})(y)$$

We omit the verification that this is compatible with restriction mappings. An alternative to this direct construction is to define ${}_pt$ as the unique map compatible with the adjointness properties of the pairs $(f^p, {}_pf)$ and $(g^p, {}_pg)$ (see below). This also has the advantage that one does not need to prove the compatibility.

Compatibility with adjointness of $(f^p, {}_pf)$ and $(g^p, {}_pg)$ means that given presheaves $\mathcal{G}$ and $\mathcal{F}$ as above we have a commutative diagram

$$\begin{tikzcd} Mor_{PSh(\mathcal{X})}(f^p\mathcal{G}, \mathcal{F}) \arrow[r, equal] \arrow[d, "- \circ t^p"'] & Mor_{PSh(\mathcal{Y})}(\mathcal{G}, {}_pf\mathcal{F}) \arrow[d, "{}_pt \circ -"] \\ Mor_{PSh(\mathcal{X})}(g^p\mathcal{G}, \mathcal{F}) \arrow[r, equal] & Mor_{PSh(\mathcal{Y})}(\mathcal{G}, {}_pg\mathcal{F}) \end{tikzcd}$$

Proof omitted. Hint: Work through the proof of Sites, Lemma 9.17.2 and observe the compatibility from the explicit description of the horizontal and vertical maps in the diagram.

We omit the verification that this is compatible with vertical and horizontal compositions. Hint: The proof of this for t^p is straightforward and one can conclude that this holds for the ${}_pt$ maps using compatibility with adjointness. □

58.4. Sheaves

We first make an observation that is important and trivial (especially for those readers who do not worry about set theoretical issues).

Consider a big fppf site Sch_{fppf} as in Topologies, Definition 30.7.6 and denote its underlying category Sch_α. Besides being the underlying category of a fppf site, the category Sch_α can also can serve as the underlying category for a big Zariski site, a big étale site, a big smooth site, and a big syntomic site, see Topologies, Remark 30.9.1. We denote these sites Sch_{Zar}, $Sch_{\acute{e}tale}$, Sch_{smooth}, and $Sch_{syntomic}$. In this situation, since we have defined the big Zariski site $(Sch/S)_{Zar}$ of S, the big étale site $(Sch/S)_{\acute{e}tale}$ of S, the big smooth site $(Sch/S)_{smooth}$ of S, the big syntomic site $(Sch/S)_{syntomic}$ of S, and the big fppf site $(Sch/S)_{fppf}$ of S as the localizations (see Sites, Section 9.21) Sch_{Zar}/S, $Sch_{\acute{e}tale}/S$, Sch_{smooth}/S, $Sch_{syntomic}/S$, and Sch_{fppf}/S of these (absolute) big sites we see that all of these have the same underlying category, namely Sch_α/S.

It follows that if we have a category $p : \mathcal{X} \to (Sch/S)_{fppf}$ fibred in groupoids, then $\mathcal{X}$ inherits a Zariski, étale, smooth, syntomic, and fppf topology, see Stacks, Definition 50.10.2.

Definition 58.4.1. Let $\mathcal{X}$ be a category fibred in groupoids over $(Sch/S)_{fppf}$.

(1) The *associated Zariski site*, denoted $\mathcal{X}_{Zar}$, is the structure of site on $\mathcal{X}$ inherited from $(Sch/S)_{Zar}$.
(2) The *associated étale site*, denoted $\mathcal{X}_{\acute{e}tale}$, is the structure of site on $\mathcal{X}$ inherited from $(Sch/S)_{\acute{e}tale}$.
(3) The *associated smooth site*, denoted $\mathcal{X}_{smooth}$, is the structure of site on $\mathcal{X}$ inherited from $(Sch/S)_{smooth}$.
(4) The *associated syntomic site*, denoted $\mathcal{X}_{syntomic}$, is the structure of site on $\mathcal{X}$ inherited from $(Sch/S)_{syntomic}$.
(5) The *associated fppf site*, denoted $\mathcal{X}_{fppf}$, is the structure of site on $\mathcal{X}$ inherited from $(Sch/S)_{fppf}$.

This definition makes sense by the discussion above. If $\mathcal{X}$ is an algebraic stack, the literature calls $\mathcal{X}_{fppf}$ (or a site equivalent to it) the *big fppf site* of $\mathcal{X}$ and similarly for the other ones. We may occasionally use this terminology to distinguish this construction from others.

Remark 58.4.2. We only use this notation when the symbol $\mathcal{X}$ refers to a category fibred in groupoids, and not a scheme, an algebraic space, etc. In this way we will avoid confusion with the small étale site of a scheme, or algebraic space which is denoted $X_{\acute{e}tale}$ (in which case we use a roman capital instead of a calligraphic one).

Now that we have these topologies defined we can say what it means to have a sheaf on $\mathcal{X}$, i.e., define the corresponding topoi.

Definition 58.4.3. Let $\mathcal{X}$ be a category fibred in groupoids over $(Sch/S)_{fppf}$. Let $\mathcal{F}$ be a presheaf on $\mathcal{X}$.

(1) We say $\mathcal{F}$ is a *Zariski sheaf*, or a *sheaf for the Zariski topology* if $\mathcal{F}$ is a sheaf on the associated Zariski site $\mathcal{X}_{Zar}$.
(2) We say $\mathcal{F}$ is an *étale sheaf*, or a *sheaf for the étale topology* if $\mathcal{F}$ is a sheaf on the associated étale site $\mathcal{X}_{\acute{e}tale}$.

(3) We say $\mathcal{F}$ is a *smooth sheaf*, or a *sheaf for the smooth topology* if $\mathcal{F}$ is a sheaf on the associated smooth site $\mathcal{X}_{smooth}$.
(4) We say $\mathcal{F}$ is a *syntomic sheaf*, or a *sheaf for the syntomic topology* if $\mathcal{F}$ is a sheaf on the associated syntomic site $\mathcal{X}_{syntomic}$.
(5) We say $\mathcal{F}$ is an *fppf sheaf*, or a *sheaf*, or a *sheaf for the fppf topology* if $\mathcal{F}$ is a sheaf on the associated fppf site $\mathcal{X}_{fppf}$.

A morphism of sheaves is just a morphism of presheaves. We denote these categories of sheaves $Sh(\mathcal{X}_{Zar})$, $Sh(\mathcal{X}_{étale})$, $Sh(\mathcal{X}_{smooth})$, $Sh(\mathcal{X}_{syntomic})$, and $Sh(\mathcal{X}_{fppf})$.

Of course we can also talk about sheaves of pointed sets, abelian groups, groups, monoids, rings, modules over a fixed ring, and lie algebras over a fixed field, etc. The category of *abelian sheaves*, i.e., sheaves of abelian groups, is denoted $Ab(\mathcal{X}_{fppf})$ and similarly for the other topologies. If $\mathcal{X}$ is an algebraic stack, then $Sh(\mathcal{X}_{fppf})$ is equivalent (modulo set theoretical problems) to what in the literature would be termed the *category of sheaves on the big fppf site of $\mathcal{X}$*. Similar for other topologies. We may occasionally use this terminology to distinguish this construction from others.

Since the topologies are listed in increasing order of strength we have the following strictly full inclusions

$$Sh(\mathcal{X}_{fppf}) \subset Sh(\mathcal{X}_{syntomic}) \subset Sh(\mathcal{X}_{smooth}) \subset Sh(\mathcal{X}_{étale}) \subset Sh(\mathcal{X}_{Zar}) \subset PSh(\mathcal{X})$$

We sometimes write $Sh(\mathcal{X}_{fppf}) = Sh(\mathcal{X})$ and $Ab(\mathcal{X}_{fppf}) = Ab(\mathcal{X})$ in accordance with our terminology that a sheaf on $\mathcal{X}$ is an fppf sheaf on $\mathcal{X}$.

With this setup functoriality of these topoi is straightforward, and moreover, is compatible with the inclusion functors above.

Lemma 58.4.4. *Let $f : \mathcal{X} \to \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. Let $\tau \in \{Zar, étale, smooth, syntomic, fppf\}$. The functors ${}_pf$ and f^p of (58.3.1.1) transform τ sheaves into τ sheaves and define a morphism of topoi $f : Sh(\mathcal{X}_\tau) \to Sh(\mathcal{Y}_\tau)$.*

Proof. This follows immediately from Stacks, Lemma 50.10.3. □

In other words, pushforward and pullback of presheaves as defined in Section 58.3 also produces *pushforward* and *pullback* of τ-sheaves. Having said all of the above we see that we can write $f^p = f^{-1}$ and ${}_pf = f_*$ without any possibility of confusion.

Definition 58.4.5. Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. We denote

$$f = (f^{-1}, f_*) : Sh(\mathcal{X}_{fppf}) \longrightarrow Sh(\mathcal{Y}_{fppf})$$

the *associated morphism of fppf topoi* constructed above. Similarly for the associated Zariski, étale, smooth, and syntomic topoi.

As discussed in Sites, Section 9.38 the same formula (on the underlying sheaf of sets) defines pushforward and pullback for sheaves (for one of our topologies) of pointed sets, abelian groups, groups, monoids, rings, modules over a fixed ring, and lie algebras over a fixed field, etc.

58.5. Computing pushforward

Let $f : \mathcal{X} \to \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. Let $\mathcal{F}$ be a presheaf on $\mathcal{X}$. Let $y \in Ob(\mathcal{Y})$. We can compute $f_*\mathcal{F}(y)$ in the following way. Suppose that y lies over the scheme V and using the 2-Yoneda lemma think of y as a 1-morphism. Consider the projection

$$\text{pr} : (Sch/V)_{fppf} \times_{y,\mathcal{Y}} \mathcal{X} \longrightarrow \mathcal{X}$$

Then we have a canonical identification

$$f_*\mathcal{F}(y) = \Gamma\Big((Sch/V)_{fppf} \times_{y,\mathcal{Y}} \mathcal{X},\ \text{pr}^{-1}\mathcal{F}\Big) \tag{58.5.0.1}$$

Namely, objects of the 2-fibre product are triples $(h : U \to V, x, f(x) \to h^*y)$. Dropping the h from the notation we see that this is equivalent to the data of an object x of $\mathcal{X}$ and a morphism $\alpha : f(x) \to y$ of $\mathcal{Y}$. Since $f_*\mathcal{F}(y) = lim_{f(x)\to y}\mathcal{F}(x)$ by definition the equality follows.

As a consequence we have the following ``base change'' result for pushforwards. This result is trivial and hinges on the fact that we are using ``big'' sites.

Lemma 58.5.1. *Let S be a scheme. Let*

$$\begin{tikzcd} \mathcal{Y}' \times_{\mathcal{Y}} \mathcal{X} \arrow[r, "g'"'] \arrow[d, "f'"'] & \mathcal{X} \arrow[d, "f"] \\ \mathcal{Y}' \arrow[r, "g"] & \mathcal{Y} \end{tikzcd}$$

be a 2-cartesian diagram of categories fibred in groupoids over S. Then we have a canonical isomorphism

$$g^{-1}f_*\mathcal{F} \longrightarrow f'_*(g')^{-1}\mathcal{F}$$

functorial in the presheaf $\mathcal{F}$ on $\mathcal{X}$.

Proof. Given an object y' of $\mathcal{Y}'$ over V there is an equivalence

$$(Sch/V)_{fppf} \times_{g(y'),\mathcal{Y}} \mathcal{X} = (Sch/V)_{fppf} \times_{y',\mathcal{Y}'} (\mathcal{Y}' \times_{\mathcal{Y}} \mathcal{X})$$

Hence by (58.5.0.1) a bijection $g^{-1}f_*\mathcal{F}(y') \to f'_*(g')^{-1}\mathcal{F}(y')$. We omit the verification that this is compatible with restriction mappings. $\square$

In the case of a representable morphism of categories fibred in groupoids this formula (58.5.0.1) simplifies. We suggest the reader skip the rest of this section.

Lemma 58.5.2. *Let $f : \mathcal{X} \to \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. The following are equivalent*

1. *f is representable, and*
2. *for every $y \in Ob(\mathcal{Y})$ the functor $\mathcal{X}^{opp} \to Sets$, $x \mapsto Mor_{\mathcal{Y}}(f(x), y)$ is representable.*

Proof. According to the discussion in Algebraic Stacks, Section 57.6 we see that f is representable if and only if for every $y \in Ob(\mathcal{Y})$ lying over U the 2-fibre product $(Sch/U)_{fppf} \times_{y,\mathcal{Y}} \mathcal{X}$ is representable, i.e., of the form $(Sch/V_y)_{fppf}$ for some scheme V_y over U. Objects in this 2-fibre products are triples $(h : V \to U, x, \alpha : f(x) \to h^*y)$ where α lies over id_V. Dropping the h from the notation we see that this is equivalent to the data of an object x of $\mathcal{X}$ and a morphism $f(x) \to y$. Hence the 2-fibre product is representable by V_y and $f(x_y) \to y$ where x_y is an object of $\mathcal{X}$ over V_y if and only if the functor in (2) is representable by x_y with universal object a map $f(x_y) \to y$. $\square$

Let

$$\begin{tikzcd} \mathcal{X} \arrow[rr, "f"] \arrow[dr, "p"'] & & \mathcal{Y} \arrow[dl, "q"] \\ & (Sch/S)_{fppf} & \end{tikzcd}$$

be a 1-morphism of categories fibred in groupoids. Assume f is representable. For every $y \in Ob(\mathcal{Y})$ we choose an object $u(y) \in Ob(\mathcal{X})$ representing the functor $x \mapsto Mor_{\mathcal{Y}}(f(x), y)$ of Lemma 58.5.2 (this is possible by the axiom of choice). The objects come with canonical morphisms $f(u(y)) \to y$ by construction. For every morphism $\beta : y' \to y$ in $\mathcal{Y}$ we obtain a unique morphism $u(\beta) : u(y') \to u(y)$ in $\mathcal{X}$ such that the diagram

$$\begin{tikzcd} f(u(y')) \arrow[r, "f(u(\beta))"] \arrow[d] & f(u(y)) \arrow[d] \\ y' \arrow[r] & y \end{tikzcd}$$

commutes. In other words, $u : \mathcal{Y} \to \mathcal{X}$ is a functor. In fact, we can say a little bit more. Namely, suppose that $V' = q(y')$, $V = q(y)$, $U' = p(u(y'))$ and $U = p(u(y))$. Then

$$\begin{tikzcd} U' \arrow[r, "p(u(\beta))"] \arrow[d] & U \arrow[d] \\ V' \arrow[r, "q(\beta)"] & V \end{tikzcd}$$

is a fibre product square. This is true because $U' \to U$ represents the base change $(Sch/V')_{fppf} \times_{y', \mathcal{Y}} \mathcal{X} \to (Sch/V)_{fppf} \times_{y, \mathcal{Y}} \mathcal{X}$ of $V' \to V$.

Lemma 58.5.3. *Let $f : \mathcal{X} \to \mathcal{Y}$ be a representable 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. Let $\tau \in \{Zar, étale, smooth, syntomic, fppf\}$. Then the functor $u : \mathcal{Y}_\tau \to \mathcal{X}_\tau$ is continuous and defines a morphism of sites $\mathcal{X}_\tau \to \mathcal{Y}_\tau$ which induces the same morphism of topoi $Sh(\mathcal{X}_\tau) \to Sh(\mathcal{Y}_\tau)$ as the morphism f constructed in Lemma 58.4.4. Moreover, $f_*\mathcal{F}(y) = \mathcal{F}(u(y))$ for any presheaf $\mathcal{F}$ on $\mathcal{X}$.*

Proof. Let $\{y_i \to y\}$ be a τ-covering in $\mathcal{Y}$. By definition this simply means that $\{q(y_i) \to q(y)\}$ is a τ-covering of schemes. By the final remark above the lemma we see that $\{p(u(y_i)) \to p(u(y))\}$ is the base change of the τ-covering $\{q(y_i) \to q(y)\}$ by $p(u(y)) \to q(y)$, hence is itself a τ-covering by the axioms of a site. Hence $\{u(y_i) \to u(y)\}$ is a τ-covering of $\mathcal{X}$. This proves that u is continuous.

Let's use the notation u_p, u_s, u^p, u^s of Sites, Sections 9.5 and 9.13. If we can show the final assertion of the lemma, then we see that $f_* = u^p = u^s$ (by continuity of u seen above) and hence by adjointness $f^{-1} = u_s$ which will prove u_s is exact, hence that u determines a morphism of sites, and the equality will be clear as well. To see that $f_*\mathcal{F}(y) = \mathcal{F}(u(y))$ note that by definition

$$f_*\mathcal{F}(y) = ({}_pf\mathcal{F})(y) = lim_{f(x) \to y} \mathcal{F}(x).$$

Since $u(y)$ is a final object in the category the limit is taken over we conclude. $\square$

58.6. The structure sheaf

Let $\tau \in \{Zar, étale, smooth, syntomic, fppf\}$. Let $p : \mathcal{X} \to (Sch/S)_{fppf}$ be a category fibred in groupoids. The 2-category of categories fibred in groupoids over $(Sch/S)_{fppf}$ has a final object, namely, $\text{id} : (Sch/S)_{fppf} \to (Sch/S)_{fppf}$ and p is a 1-morphism from $\mathcal{X}$ to this final object. Hence any presheaf $\mathcal{G}$ on $(Sch/S)_{fppf}$ gives a presheaf $p^{-1}\mathcal{G}$ on $\mathcal{X}$ defined by the rule $p^{-1}\mathcal{G}(x) = \mathcal{G}(p(x))$. Moreover, the discussion in Section 58.4 shows that $p^{-1}\mathcal{G}$ is a τ sheaf whenever $\mathcal{G}$ is a τ-sheaf.

Recall that the site $(Sch/S)_{fppf}$ is a ringed site with structure sheaf $\mathcal{O}$ defined by the rule

$$(Sch/S)^{opp} \longrightarrow Rings, \quad U/S \longmapsto \Gamma(U, \mathcal{O}_U)$$

see Descent, Definition 31.6.2.

Definition 58.6.1. Let $p : \mathcal{X} \to (Sch/S)_{fppf}$ be a category fibred in groupoids. The *structure sheaf of $\mathcal{X}$* is the sheaf of rings $\mathcal{O}_\mathcal{X} = p^{-1}\mathcal{O}$.

For an object x of $\mathcal{X}$ lying over U we have $\mathcal{O}_\mathcal{X}(x) = \mathcal{O}(U) = \Gamma(U, \mathcal{O}_U)$. Needless to say $\mathcal{O}_\mathcal{X}$ is also a Zariski, étale, smooth, and syntomic sheaf, and hence each of the sites $\mathcal{X}_{Zar}$, $\mathcal{X}_{étale}$, $\mathcal{X}_{smooth}$, $\mathcal{X}_{syntomic}$, and $\mathcal{X}_{fppf}$ is a ringed site. This construction is functorial as well.

Lemma 58.6.2. *Let $f : \mathcal{X} \to \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. Let $\tau \in \{Zar, étale, smooth, syntomic, fppf\}$. There is a canonical identification $f^{-1}\mathcal{O}_\mathcal{X} = \mathcal{O}_\mathcal{Y}$ which turns $f : Sh(\mathcal{X}_\tau) \to Sh(\mathcal{Y}_\tau)$ into a morphism of ringed topoi.*

Proof. Denote $p : \mathcal{X} \to (Sch/S)_{fppf}$ and $q : \mathcal{Y} \to (Sch/S)_{fppf}$ the structural functors. Then $q = p \circ f$, hence $q^{-1} = f^{-1} \circ p^{-1}$ by Lemma 58.3.2. The result follows. □

Remark 58.6.3. In the situation of Lemma 58.6.2 the morphism of ringed topoi $f : Sh(\mathcal{X}_\tau) \to Sh(\mathcal{Y}_\tau)$ is flat as is clear from the equality $f^{-1}\mathcal{O}_\mathcal{X} = \mathcal{O}_\mathcal{Y}$. This is a bit counter intuitive, for example because a closed immersion of algebraic stacks is typically not flat (as a morphism of algebraic stacks). However, exactly the same thing happens when taking a closed immersion $i : X \to Y$ of schemes: in this case the associated morphism of big τ-sites $i : (Sch/X)_\tau \to (Sch/Y)_\tau$ also is flat.

58.7. Sheaves of modules

Since we have a structure sheaf we have modules.

Definition 58.7.1. Let $\mathcal{X}$ be a category fibred in groupoids over $(Sch/S)_{fppf}$.

(1) A *presheaf of modules on $\mathcal{X}$* is a presheaf of $\mathcal{O}_\mathcal{X}$-modules. The category of presheaves of modules is denoted $PMod(\mathcal{O}_\mathcal{X})$.
(2) We say a presheaf of modules $\mathcal{F}$ is an *$\mathcal{O}_\mathcal{X}$-module*, or more precisely a *sheaf of $\mathcal{O}_\mathcal{X}$-modules* if $\mathcal{F}$ is an fppf sheaf. The category of $\mathcal{O}_\mathcal{X}$-modules is denoted $Mod(\mathcal{O}_\mathcal{X})$.

These (pre)sheaves of modules occur in the literature as *(pre)sheaves of $\mathcal{O}_\mathcal{X}$-modules on the big fppf site of $\mathcal{X}$*. We will occasionally use this terminology if we want to distinguish these categories from others. We will also encounter presheaves of modules which are sheaves in the Zariski, étale, smooth, or syntomic topologies (without necessarily being sheaves). If need be these will be denoted $Mod(\mathcal{X}_{étale}, \mathcal{O}_\mathcal{X})$ and similarly for the other topologies.

Next, we address functoriality -- first for presheaves of modules. Let

$$\begin{tikzcd} \mathcal{X} \arrow[rr, "f"] \arrow[dr, "p"'] & & \mathcal{Y} \arrow[dl, "q"] \\ & (Sch/S)_{fppf} & \end{tikzcd}$$

be a 1-morphism of categories fibred in groupoids. The functors f^{-1}, f_* on abelian presheaves extend to functors

$$(58.7.1.1) \quad f^{-1} : PMod(\mathcal{O}_\mathcal{Y}) \longrightarrow PMod(\mathcal{O}_\mathcal{X}) \quad \text{and} \quad f_* : PMod(\mathcal{O}_\mathcal{Y}) \longrightarrow PMod(\mathcal{O}_\mathcal{X})$$

This is immediate for f^{-1} because $f^{-1}\mathcal{G}(x) = \mathcal{G}(f(x))$ which is a module over $\mathcal{O}_\mathcal{Y}(f(x)) = \mathcal{O}(q(f(x))) = \mathcal{O}(p(x)) = \mathcal{O}_\mathcal{X}(x)$. Afternatively it follows because $f^{-1}\mathcal{O}_\mathcal{Y} = \mathcal{O}_\mathcal{X}$ and because f^{-1} commutes with limits (on presheaves). Since f_* is a right adjoint it commutes with all limits (on presheaves) in particular products. Hence we can extend f_* to a functor on presheaves of modules as in the proof of Modules on Sites, Lemma 16.12.1. We claim that the functors (58.7.1.1) form an adjoint pair of functors:

$$Mor_{PMod(\mathcal{O}_\mathcal{X})}(f^{-1}\mathcal{G}, \mathcal{F}) = Mor_{PMod(\mathcal{O}_\mathcal{Y})}(\mathcal{G}, f_*\mathcal{F}).$$

As $f^{-1}\mathcal{O}_\mathcal{Y} = \mathcal{O}_\mathcal{X}$ this follows from Modules on Sites, Lemma 16.12.3 by endowing $\mathcal{X}$ and $\mathcal{Y}$ with the chaotic topology.

Next, we discuss functoriality for modules, i.e., for sheaves of modules in the fppf topology. Denote by f also the induced morphism of ringed topoi, see Lemma 58.6.2 (for the fppf toplogies right now). Note that the functors f^{-1} and f_* of (58.7.1.1) preserve the subcategories of sheaves of modules, see Lemma 58.4.4. Hence it follows immediately that

$$(58.7.1.2) \quad f^{-1} : Mod(\mathcal{O}_\mathcal{Y}) \longrightarrow Mod(\mathcal{O}_\mathcal{X}) \quad \text{and} \quad f_* : Mod(\mathcal{O}_\mathcal{Y}) \longrightarrow Mod(\mathcal{O}_\mathcal{X})$$

form an adjoint pair of functors:

$$Mor_{Mod(\mathcal{O}_\mathcal{X})}(f^{-1}\mathcal{G}, \mathcal{F}) = Mor_{Mod(\mathcal{O}_\mathcal{Y})}(\mathcal{G}, f_*\mathcal{F}).$$

By uniqueness of adjoints we conclude that $f^* = f^{-1}$ where f^* is as defined in Modules on Sites, Section 16.13 for the morphism of ringed topoi f above. Of course we could have seen this directly because $f^*(-) = f^{-1}(-) \otimes_{f^{-1}\mathcal{O}_\mathcal{Y}} \mathcal{O}_\mathcal{X}$ and because $f^{-1}\mathcal{O}_\mathcal{Y} = \mathcal{O}_\mathcal{X}$.

Similarly for sheaves of modules in the Zariski, étale, smooth, syntomic topology.

58.8. Representable categories

In this short section we compare our definitions with what happens in case the algebraic stacks in question are representable.

Lemma 58.8.1. *Let S be a scheme. Let $\mathcal{X}$ be a category fibred in groupoids over (Sch/S). Assume $\mathcal{X}$ is representable by a scheme X. For $\tau \in \{Zar, étale, smooth, syntomic, fppf\}$ there is a canonical equivalence*

$$(\mathcal{X}_\tau, \mathcal{O}_\mathcal{X}) = ((Sch/X)_\tau, \mathcal{O}_X)$$

of ringed sites.

Proof. This follows by choosing an equivalence $(Sch/X)_\tau \to \mathcal{X}$ of categories fibred in groupoids over $(Sch/S)_{fppf}$ and using the functoriality of the construction $\mathcal{X} \rightsquigarrow \mathcal{X}_\tau$. $\square$

Lemma 58.8.2. *Let S be a scheme. Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of categories fibred in groupoids over S. Assume $\mathcal{X}$, $\mathcal{Y}$ are representable by schemes X, Y. Let $f : X \to Y$ be the morphism of schemes corresponding to f. For $\tau \in \{Zar, étale, smooth, syntomic, fppf\}$ the morphism of ringed topoi $f : (Sh(\mathcal{X}_\tau), \mathcal{O}_\mathcal{X}) \to (Sh(\mathcal{X}_\tau), \mathcal{O}_\mathcal{X})$ agrees with the morphisms of ringed topoi $f : (Sh((Sch/X)_\tau), \mathcal{O}_X) \to (Sh((Sch/Y)_\tau), \mathcal{O}_Y)$ via the identifications of Lemma 58.8.1.*

Proof. Follows by unwinding the definitions. □

58.9. Restriction

A trivial but useful observation is that the localization of a category fibred in groupoids at an object is equivalent to the big site of the scheme it lies over.

Lemma 58.9.1. *Let $p : \mathcal{X} \to (Sch/S)_{fppf}$ be a category fibred in groupoids. Let $\tau \in \{Zar, étale, smooth, syntomic, fppf\}$. Let $x \in Ob(\mathcal{X})$ lying over $U = p(x)$. The functor p induces an equivalence of sites $\mathcal{X}_\tau/x \to (Sch/U)_\tau$.*

Proof. Note that $(Sch/U)_\tau$ is the localization of the site $(Sch/S)_{fppf}$ at the object U. It follows from Categories, Definition 4.32.1 that the rule $x'/x \mapsto p(x')/p(x)$ defines an equivalence of categories $\mathcal{X}_\tau/x \to (Sch/U)_\tau$. Whereupon it follows from Stacks, Definition 50.10.2 that coverings of x' in $\mathcal{X}_\tau/x$ are in bijective correspondence with coverings of $p(x')$ in $(Sch/U)_\tau$. □

We use the lemma above to talk about the pullback and the restriction of a (pre)sheaf to a scheme.

Definition 58.9.2. Let $p : \mathcal{X} \to (Sch/S)_{fppf}$ be a category fibred in groupoids. Let $x \in Ob(\mathcal{X})$ lying over $U = p(x)$. Let $\mathcal{F}$ be a presheaf on $\mathcal{X}$.

(1) The *pullback $x^{-1}\mathcal{F}$ of $\mathcal{F}$* is the restriction $\mathcal{F}|_{(\mathcal{X}/x)}$ viewed as a presheaf on $(Sch/U)_{fppf}$ via the equivalence $\mathcal{X}/x \to (Sch/U)_{fppf}$ of Lemma 58.9.1.
(2) The *restriction of $\mathcal{F}$ to $U_{étale}$* is $x^{-1}\mathcal{F}|_{U_{étale}}$, abusively written $\mathcal{F}|_{U_{étale}}$.

This notation makes sense because to the object x the 2-Yoneda lemma, see Algebraic Stacks, Section 57.5 associates a 1-morphism $x : (Sch/U)_{fppf} \to \mathcal{X}/x$ which is quasi-inverse to $p : \mathcal{X}/x \to (Sch/U)_{fppf}$. Hence $x^{-1}\mathcal{F}$ truly is the pullback of $\mathcal{F}$ via this 1-morphism. In particular, by the material above, if $\mathcal{F}$ is a sheaf (or a Zariski, étale, smooth, syntomic sheaf), then $x^{-1}\mathcal{F}$ is a sheaf on $(Sch/U)_{fppf}$ (or on $(Sch/U)_{Zar}$, $(Sch/U)_{étale}$, $(Sch/U)_{smooth}$, $(Sch/U)_{syntomic}$).

Let $p : \mathcal{X} \to (Sch/S)_{fppf}$ be a category fibred in groupoids. Let $\varphi : x \to y$ be a morphism of $\mathcal{X}$ lying over the morphism of schemes $a : U \to V$. Recall that a induces a morphism of small étale sites $a_{small} : U_{étale} \to V_{étale}$, see Étale Cohomology, Section 38.34. Let $\mathcal{F}$ be a presheaf on $\mathcal{X}$. Let $\mathcal{F}|_{U_{étale}}$ and $\mathcal{F}|_{V_{étale}}$ be the restrictions of $\mathcal{F}$ via x and y. There is a natural *comparison* map

$$c_\varphi : \mathcal{F}|_{V_{étale}} \longrightarrow a_{small,*}(\mathcal{F}|_{U_{étale}}) \tag{58.9.2.1}$$

of presheaves on $U_{\acute{e}tale}$. Namely, if $V' \to V$ is étale, set $U' = V' \times_V U$ and define c_φ on sections over V' via

$$\begin{tikzcd} a_{small,*}(\mathcal{F}|_{U_{\acute{e}tale}})(V') \arrow[r, equal] & \mathcal{F}|_{U_{\acute{e}tale}}(U') \arrow[r, equal] & \mathcal{F}(x') \\ \mathcal{F}|_{V_{\acute{e}tale}}(V') \arrow[u, "c_\varphi"] \arrow[rr, equal] & & \mathcal{F}(y') \arrow[u, "\mathcal{F}(\varphi')"'] \end{tikzcd}$$

Here $\varphi' : x' \to y'$ is a morphism of $\mathcal{X}$ fitting into a commutative diagram

$$\begin{tikzcd} x' \arrow[r] \arrow[d, "\varphi'"'] & x \arrow[d, "\varphi"] \\ y' \arrow[r] & y \end{tikzcd} \quad \text{lying over} \quad \begin{tikzcd} U' \arrow[r] \arrow[d] & U \arrow[d, "a"] \\ V' \arrow[r] & V \end{tikzcd}$$

The existence and uniqueness of φ' follow from the axioms of a category fibred in groupoids. We omit the verification that c_φ so defined is indeed a map of presheaves (i.e., compatible with restriction mappings) and that it is functorial in $\mathcal{F}$. In case $\mathcal{F}$ is a sheaf for the étale topology we obtain a *comparison* map

$$c_\varphi : a_{small}^{-1}(\mathcal{F}|_{V_{\acute{e}tale}}) \longrightarrow \mathcal{F}|_{U_{\acute{e}tale}} \tag{58.9.2.2}$$

which is also denoted c_φ as indicated (this is the customary abuse of notation in not distinguishing between adjoint maps).

Lemma 58.9.3. *Let $\mathcal{F}$ be an étale sheaf on $\mathcal{X} \to (Sch/S)_{fppf}$.*

(1) *If $\varphi : x \to y$ and $\psi : y \to z$ are morphisms of $\mathcal{X}$ lying over $a : U \to V$ and $b : V \to W$, then the composition*
$$a_{small}^{-1}(b_{small}^{-1}(\mathcal{F}|_{W_{\acute{e}tale}})) \xrightarrow{a_{small}^{-1}c_\psi} a_{small}^{-1}(\mathcal{F}|_{V_{\acute{e}tale}}) \xrightarrow{c_\varphi} \mathcal{F}|_{U_{\acute{e}tale}}$$
is equal to $c_{\psi\circ\varphi}$ via the identification
$$(b \circ a)_{small}^{-1}(\mathcal{F}|_{W_{\acute{e}tale}}) = a_{small}^{-1}(b_{small}^{-1}(\mathcal{F}|_{W_{\acute{e}tale}})).$$
(2) *If $\varphi : x \to y$ lies over an étale morphism of schemes $a : U \to V$, then (58.9.2.2) is an isomorphism.*
(3) *Suppose $f : \mathcal{Y} \to \mathcal{X}$ is a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$ and y is an object of $\mathcal{Y}$ lying over the scheme U with image $x = f(y)$. Then there is a canonical identification $f^{-1}\mathcal{F}|_{U_{\acute{e}tale}} = \mathcal{F}|_{U_{\acute{e}tale}}$.*
(4) *Moreover, given $\psi : y' \to y$ in $\mathcal{Y}$ lying over $a : U' \to U$ the comparison map $c_\psi : a_{small}^{-1}(F^{-1}\mathcal{F}|_{U_{\acute{e}tale}}) \to F^{-1}\mathcal{F}|_{U'_{\acute{e}tale}}$ is equal to the comparison map $c_{f(\psi)} : a_{small}^{-1}\mathcal{F}|_{U_{\acute{e}tale}} \to \mathcal{F}|_{U'_{\acute{e}tale}}$ via the indentifications in (3).*

Proof. The verification of these properties is omitted. ☐

Next, we turn to the restriction of (pre)sheaves of modules.

Lemma 58.9.4. *Let $p : \mathcal{X} \to (Sch/S)_{fppf}$ be a category fibred in groupoids. Let $\tau \in \{Zar, \acute{e}tale, smooth, syntomic, fppf\}$. Let $x \in Ob(\mathcal{X})$ lying over $U = p(x)$. The equivalence of Lemma 58.9.1 extends to an equivalence of ringed sites $(\mathcal{X}_\tau/x, \mathcal{O}_\mathcal{X}|_x) \to ((Sch/U)_\tau, \mathcal{O})$.*

Proof. This is immediate from the construction of the structure sheaves. ☐

Let $\mathcal{X}$ be a category fibred in groupoids over $(Sch/S)_{fppf}$. Let $\mathcal{F}$ be a (pre)sheaf of modules on $\mathcal{X}$ as in Definition 58.7.1. Let x be an object of $\mathcal{X}$ lying over U. Then Lemma 58.9.4 guarantees that the restriction $x^{-1}\mathcal{F}$ is a (pre)sheaf of modules on $(Sch/U)_{fppf}$. We will sometimes write $x^*\mathcal{F} = x^{-1}\mathcal{F}$ in this case. Similarly, if $\mathcal{F}$ is a sheaf for the Zariski, étale, smooth, or syntomic topology, then $x^{-1}\mathcal{F}$ is as well. Moreover, the restriction $\mathcal{F}|_{U_{\acute{e}tale}} = x^{-1}\mathcal{F}|_{U_{\acute{e}tale}}$ to U is a presheaf of $\mathcal{O}_{U_{\acute{e}tale}}$-modules. If $\mathcal{F}$ is a sheaf for the étale topology, then $\mathcal{F}|_{U_{\acute{e}tale}}$ is a sheaf of modules. Moreover, if $\varphi : x \to y$ is a morphism of $\mathcal{X}$ lying over $a : U \to V$ then the comparison map (58.9.2.2) is compatible with $a_{small}^\sharp$ (see Descent, Remark 31.6.4) and induces a *comparison* map

$$c_\varphi : a_{small}^*(\mathcal{F}|_{V_{\acute{e}tale}}) \longrightarrow \mathcal{F}|_{U_{\acute{e}tale}} \tag{58.9.4.1}$$

of $\mathcal{O}_{U_{\acute{e}tale}}$-modules. Note that the properties (1), (2), (3), and (4) of Lemma 58.9.3 hold in the setting of étale sheaves of modules as well. We will use this in the following without further mention.

Lemma 58.9.5. *Let $p : \mathcal{X} \to (Sch/S)_{fppf}$ be a category fibred in groupoids. Let $\tau \in \{Zar, étale, smooth, syntomic, fppf\}$. The site $\mathcal{X}_\tau$ has enough points.*

Proof. By Sites, Lemma 9.34.5 we have to show that there exists a family of objects x of $\mathcal{X}$ such that $\mathcal{X}_\tau/x$ has enough points and such that the sheaves $h_x^\#$ cover the final object of the category of sheaves. By Lemma 58.9.1 and Étale Cohomology, Lemma 38.30.1 we see that $\mathcal{X}_\tau/x$ has enough points for every object x and we win. □

58.10. Restriction to algebraic spaces

In this section we consider sheaves on categories representable by algebraic spaces. The following lemma is the analogue of Topologies, Lemma 30.4.13 for algebraic spaces.

Lemma 58.10.1. *Let S be a scheme. Let $\mathcal{X} \to (Sch/S)_{fppf}$ be a category fibred in groupoids. Assume $\mathcal{X}$ is representably by an algebraic space F. Then there exists a continuous and cocontinuous functor $F_{\acute{e}tale} \to \mathcal{X}_{\acute{e}tale}$ which induces a morphism of ringed sites*

$$\pi_F : (\mathcal{X}_{\acute{e}tale}, \mathcal{O}_\mathcal{X}) \longrightarrow (F_{\acute{e}tale}, \mathcal{O}_F)$$

and a morphism of ringed topoi

$$i_F : (Sh(F_{\acute{e}tale}), \mathcal{O}_F) \longrightarrow (Sh(\mathcal{X}_{\acute{e}tale}), \mathcal{O}_\mathcal{X})$$

such that $\pi_F \circ i_F = id$. Moreover $\pi_{F,*} = i_F^{-1}$.

Proof. Choose an equivalence $j : \mathcal{S}_F \to \mathcal{X}$, see Algebraic Stacks, Sections 57.7 and 57.8. An object of $F_{\acute{e}tale}$ is a scheme U together with an étale morphism $\varphi : U \to F$. Then φ is an object of $\mathcal{S}_F$ over U. Hence $j(\varphi)$ is an object of $\mathcal{X}$ over U. In this way j induces a functor $u : F_{\acute{e}tale} \to \mathcal{X}$. It is clear that u is continuous and cocontinuous for the étale topology on $\mathcal{X}$. Since j is an equivalence, the functor u is fully faithful. Also, fibre products and equalizers exist in $F_{\acute{e}tale}$ and u commutes with them because these are computed on the level of underlying schemes in $F_{\acute{e}tale}$. Thus Sites, Lemmas 9.19.5, 9.19.6, and 9.19.7 apply. In particular u defines a morphism of topoi $i_F : Sh(F_{\acute{e}tale}) \to Sh(\mathcal{X}_{\acute{e}tale})$ and there exists a left adjoint $i_{F,!}$ of i_F^{-1} which commutes with fibre products and equalizers.

We claim that $i_{F,!}$ is exact. If this is true, then we can define π_F by the rules $\pi_F^{-1} = i_{F,!}$ and $\pi_{F,*} = i_F^{-1}$ and everything is clear. To prove the claim, note that we already know that $i_{F,!}$ is right exact and preserves fibre products. Hence it suffices to show that $i_{F,!}* = *$ where

$*$ indicates the final object in the category of sheaves of sets. Let U be a scheme and let $\varphi : U \to F$ be surjective and étale. Set $R = U \times_F U$. Then

$$h_R \rightrightarrows h_U \longrightarrow *$$

is a coequalizer diagram in $Sh(F_{\acute{e}tale})$. Using the right exactness of $i_{F,!}$, using $i_{F,!} = (u_p\ )^\#$, and using Sites, Lemma 9.5.6 we see that

$$h_{u(R)} \rightrightarrows h_{u(U)} \longrightarrow i_{F,!}*$$

is a coequalizer diagram in $Sh(F_{\acute{e}tale})$. Using that j is an equivalence and that $F = U/R$ it follows that the coequalizer in $Sh(\mathcal{X}_{\acute{e}tale})$ of the two maps $h_{u(R)} \to h_{u(U)}$ is $*$. We omit the proof that these morphisms are compatible with structure sheaves. □

Assume $\mathcal{X}$ is an algebraic stack represented by the algebraic space F. Let $j : \mathcal{S}_F \to \mathcal{X}$ be an equivalence and denote $u : F_{\acute{e}tale} \to \mathcal{X}_{\acute{e}tale}$ the functor of the proof of Lemma 58.10.1 above. Given a sheaf $\mathcal{F}$ on $\mathcal{X}_{\acute{e}tale}$ we have

$$\pi_{F,*}\mathcal{F}(U) = i_F^{-1}\mathcal{F}(U) = \mathcal{F}(u(U)).$$

This is why we often think of i_F^{-1} as a *restriction functor* similarly to Definition 58.9.2 and to the restriction of a sheaf on the big étale site of a scheme to the small étale site of a scheme. We often use the notation

$$\mathcal{F}|_{F_{\acute{e}tale}} = i_F^{-1}\mathcal{F} = \pi_{F,*}\mathcal{F} \tag{58.10.1.1}$$

in this situation.

Lemma 58.10.2. *Let S be a scheme. Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. Assume $\mathcal{X}$, $\mathcal{Y}$ are representable by algebraic spaces F, G. Denote $f : F \to G$ the induced morphism of algebraic spaces, and $f_{small} : F_{\acute{e}tale} \to G_{\acute{e}tale}$ the corresponding morphism of ringed topoi. Then*

$$\begin{tikzcd} (Sh(\mathcal{X}_{\acute{e}tale}), \mathcal{O}_\mathcal{X}) \arrow[r, "f"'] \arrow[d, "\pi_F"'] & (Sh(\mathcal{Y}_{\acute{e}tale}), \mathcal{O}_\mathcal{Y}) \arrow[d, "\pi_G"] \\ (Sh(F_{\acute{e}tale}), \mathcal{O}_F) \arrow[r, "f_{small}"] & (Sh(G_{\acute{e}tale}), \mathcal{O}_G) \end{tikzcd}$$

is a commutative diagram of ringed topoi.

Proof. This is similar to Topologies, Lemma 30.4.16 (3) but there is a small snag due to the fact that $F \to G$ may not be representable by schemes. In particular we don't get a commutative diagram of ringed sites, but only a commutative diagram of ringed topoi.

Before we start the proof proper, we choose equivalences $j : \mathcal{S}_F \to \mathcal{X}$ and $j' : \mathcal{S}_G \to \mathcal{Y}$ which induce functors $u : F_{\acute{e}tale} \to \mathcal{X}$ and $u' : G_{\acute{e}tale} \to \mathcal{Y}$ as in the proof of Lemma 58.10.1. Because of the 2-functoriality of sheaves on categories fibred in groupoids over Sch_{fppf} (see discussion in Section 58.3) we may assume that $\mathcal{X} = \mathcal{S}_F$ and $\mathcal{Y} = \mathcal{S}_G$ and that $f : \mathcal{S}_F \to \mathcal{S}_G$ is the functor associated to the morphism $f : F \to G$. Correspondingly we will omit u and u' from the notation, i.e., given an object $U \to F$ of $F_{\acute{e}tale}$ we denote U/F the corresponding object of $\mathcal{X}$. Similarly for G.

Let $\mathcal{G}$ be a sheaf on $\mathcal{X}_{\acute{e}tale}$. To prove (2) we compute $\pi_{G,*}f_*\mathcal{G}$ and $f_{small,*}\pi_{F,*}\mathcal{G}$. To do this let $V \to G$ be an object of $G_{\acute{e}tale}$. Then

$$\pi_{G,*}f_*\mathcal{G}(V) = f_*\mathcal{G}(V/G) = \Gamma\Big((Sch/V)_{fppf} \times_\mathcal{Y} \mathcal{X},\ \mathrm{pr}^{-1}\mathcal{G}\Big)$$

see (58.5.0.1). The fibre product in the formula is

$$(Sch/V)_{fppf} \times_{\mathcal{Y}} \mathcal{X} = (Sch/V)_{fppf} \times_{\mathcal{S}_G} \mathcal{S}_F = \mathcal{S}_{V \times_G F}$$

i.e., it is the split category fibred in groupoids associated to the algebraic space $V \times_G F$. And $\mathrm{pr}^{-1}\mathcal{G}$ is a sheaf on $\mathcal{S}_{V \times_G F}$ for the étale topology.

In particular, if $V \times_G F$ is representable, i.e., if it is a scheme, then $\pi_{G,*} f_* \mathcal{G}(V) = \mathcal{G}(V \times_G F/F)$ and also

$$f_{small,*}\pi_{F,*}\mathcal{G}(V) = \pi_{F,*}\mathcal{G}(V \times_G F) = \mathcal{G}(V \times_G F/F)$$

which proves the desired equality in this special case.

In general, choose a scheme U and a surjective étale morphism $U \to V \times_G F$. Set $R = U \times_{V \times_G F} U$. Then $U/V \times_G F$ and $R/V \times_G F$ are objects of the fibre product category above. Since $\mathrm{pr}^{-1}\mathcal{G}$ is a sheaf for the étale topology on $\mathcal{S}_{V \times_G F}$ the diagram

$$\Gamma\Big((Sch/V)_{fppf} \times_{\mathcal{Y}} \mathcal{X},\ \mathrm{pr}^{-1}\mathcal{G}\Big) \longrightarrow \mathrm{pr}^{-1}\mathcal{G}(U/V \times_G F) \rightrightarrows \mathrm{pr}^{-1}\mathcal{G}(R/V \times_G F)$$

is an equalizer diagram. Note that $\mathrm{pr}^{-1}\mathcal{G}(U/V \times_G F) = \mathcal{G}(U/F)$ and $\mathrm{pr}^{-1}\mathcal{G}(R/V \times_G F) = \mathcal{G}(R/F)$ by the definition of pullbacks. Moreover, by the material in Properties of Spaces, Section 41.15 (especially, Properties of Spaces, Remark 41.15.4 and Lemma 41.15.7) we see that there is an equalizer diagram

$$f_{small,*}\pi_{F,*}\mathcal{G}(V) \longrightarrow \pi_{F,*}\mathcal{G}(U/F) \rightrightarrows \pi_{F,*}\mathcal{G}(R/F)$$

Since we also have $\pi_{F,*}\mathcal{G}(U/F) = \mathcal{G}(U/F)$ and $\pi_{F,*}\mathcal{G}(U/F) = \mathcal{G}(U/F)$ we obtain a canonical identification $f_{small,*}\pi_{F,*}\mathcal{G}(V) = \pi_{G,*}f_*\mathcal{G}(V)$. We omit the proof that this is compatible with restriction mappings and that it is functorial in $\mathcal{G}$. $\square$

Let $f : \mathcal{X} \to \mathcal{Y}$ and $f : F \to G$ be as in the second part of the lemma above. A consequence of the lemma, using (58.10.1.1), is that

(58.10.2.1) $$(f_*\mathcal{F})|_{G_{\acute{e}tale}} = f_{small,*}(\mathcal{F}|_{F_{\acute{e}tale}})$$

for any sheaf $\mathcal{F}$ on $\mathcal{X}_{\acute{e}tale}$. Moreover, if $\mathcal{F}$ is a sheaf of $\mathcal{O}$-modules, then (58.10.2.1) is an isomorphism of $\mathcal{O}_G$-modules on $G_{\acute{e}tale}$.

Finally, suppose that we have a 2-commutative diagram

$$\begin{tikzcd} \mathcal{U} \arrow[r, "a"] \arrow[dr, "f"'] & \mathcal{V} \arrow[d, "g"] \arrow[dl, phantom, "\swarrow\varphi"] \\ & \mathcal{X} \end{tikzcd}$$

of 1-morphisms of categories fibred in groupoids over $(Sch/S)_{fppf}$, that $\mathcal{F}$ is a sheaf on $\mathcal{X}_{\acute{e}tale}$, and that $\mathcal{U}, \mathcal{V}$ are representable by algebraic spaces U, V. Then we obtain a comparison map

(58.10.2.2) $$c_\varphi : a_{small}^{-1}(g^{-1}\mathcal{F}|_{V_{\acute{e}tale}}) \longrightarrow f^{-1}\mathcal{F}|_{U_{\acute{e}tale}}$$

where $a : U \to V$ denotes the morphism of algebraic spaces corresponding to a. This is the analogue of (58.9.2.2). We define c_φ as the adjoint to the map

$$g^{-1}\mathcal{F}|_{V_{\acute{e}tale}} \longrightarrow a_{small,*}(f^{-1}\mathcal{F}|_{U_{\acute{e}tale}}) = (a_*f^{-1}\mathcal{F})|_{V_{\acute{e}tale}}$$

(equality by (58.10.2.1)) which is the restriction to V (58.10.1.1) of the map

$$g^{-1}\mathcal{F} \to a_*a^{-1}g^{-1}\mathcal{F} = a_*f^{-1}\mathcal{F}$$

where the last equality uses the 2-commutativity of the diagram above. In case $\mathcal{F}$ is a sheaf of $\mathcal{O}_\mathcal{X}$-modules c_φ induces a *comparison* map

$$c_\varphi : a_{small}^*(g^*\mathcal{F}|_{V_{étale}}) \longrightarrow f^*\mathcal{F}|_{U_{étale}} \tag{58.10.2.3}$$

of $\mathcal{O}_{U_{étale}}$-modules. Note that the properties (1), (2), (3), and (4) of Lemma 58.9.3 hold in this setting as well.

58.11. Quasi-coherent modules

At this point we can apply the general definition of a quasi-coherent module to the situation discussed in this chapter.

Definition 58.11.1. Let $p : \mathcal{X} \to (Sch/S)_{fppf}$ be a category fibred in groupoids. A *quasi-coherent module on* $\mathcal{X}$, or a *quasi-coherent* $\mathcal{O}_\mathcal{X}$*-module* is a quasi-coherent module on the ringed site $(\mathcal{X}_{fppf}, \mathcal{O}_\mathcal{X})$ as in Modules on Sites, Definition 16.23.1. The category of quasi-coherent sheaves on $\mathcal{X}$ is denoted $QCoh(\mathcal{O}_\mathcal{X})$ or $QCoh(\mathcal{X})$.

If $\mathcal{X}$ is an algebraic stack, then this definition agrees with all definitions in the literature in the sense that $QCoh(\mathcal{X})$ is equivalent (modulo set theoretic issues) to any variant of this category defined in the literature. For example, we will match our definition with the definition in [**Ols07b**, Definition 6.1] in Cohomology on Stacks, Lemma 58.11.5. We will also see alternative constructions of this category later on.

In general (as is the case for morphisms of schemes) the pushforward of quasi-coherent sheaf along a 1-morphism is not quasi-coherent. Pullback does preserve quasi-coherence.

Lemma 58.11.2. *Let $f : \mathcal{X} \to \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. The pullback functor $f^* = f^{-1} : Mod(\mathcal{O}_\mathcal{Y}) \to Mod(\mathcal{O}_\mathcal{X})$ preserves quasi-coherent sheaves.*

Proof. This is a general fact, see Modules on Sites, Lemma 16.23.4. □

It turns out that quasi-coherent sheaves have a very simple characterization in terms of their pullbacks. See also Lemma 58.11.5 for a characterization in terms of restrictions.

Lemma 58.11.3. *Let $p : \mathcal{X} \to (Sch/S)_{fppf}$ be a category fibred in groupoids. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_\mathcal{X}$-modules. Then $\mathcal{F}$ is quasi-coherent if and only if $x^*\mathcal{F}$ is a quasi-coherent sheaf on $(Sch/U)_{fppf}$ for every object x of $\mathcal{X}$ with $U = p(x)$.*

Proof. By Lemma 58.11.2 the condition is necessary. Conversely, since $x^*\mathcal{F}$ is just the restriction to $\mathcal{X}_{fppf}/x$ we see that it is sufficient directly from the definition of a quasi-coherent sheaf (and the fact that the notion of being quasi-coherent is an intrinsic property of sheaves of modules, see Modules on Sites, Section 16.18). □

Although there is a variant for the Zariski topology, it seems that the étale topology is the natural topology to use in the following definition.

Definition 58.11.4. Let $p : \mathcal{X} \to (Sch/S)_{fppf}$ be a category fibred in groupoids. Let $\mathcal{F}$ be a presheaf of $\mathcal{O}_\mathcal{X}$-modules. We say $\mathcal{F}$ is *locally quasi-coherent*[2] if $\mathcal{F}$ is a sheaf for the étale topology and for every object x of $\mathcal{X}$ the restriction $x^*\mathcal{F}|_{U_{étale}}$ is a quasi-coherent sheaf. Here $U = p(x)$.

[2]This is nonstandard notation.

We use $LQCoh(\mathcal{O}_\mathcal{X})$ to indicate the category of locally quasi-coherent modules. We now have the following diagram of categories of modules

$$\begin{tikzcd} QCoh(\mathcal{O}_\mathcal{X}) \arrow[r] \arrow[d] & Mod(\mathcal{O}_\mathcal{X}) \arrow[d] \\ LQCoh(\mathcal{O}_\mathcal{X}) \arrow[r] & Mod(\mathcal{X}_{étale}, \mathcal{O}_\mathcal{X}) \end{tikzcd}$$

where the arrows are strictly full embeddings. It turns out that many results for quasi-coherent sheaves have a counter part for locally quasi-coherent modules. Moreover, from many points of view (as we shall see later) this is a natural category to consider. For example the quasi-coherent sheaves are exactly those locally quasi-coherent modules that are ``cartesian", i.e., satisfy the second condition of the lemma below.

Lemma 58.11.5. *Let $p : \mathcal{X} \to (Sch/S)_{fppf}$ be a category fibred in groupoids. Let $\mathcal{F}$ be a presheaf of $\mathcal{O}_\mathcal{X}$-modules. Then $\mathcal{F}$ is quasi-coherent if and only if the following two conditions hold*

(1) *$\mathcal{F}$ is locally quasi-coherent, and*
(2) *for any morphism $\varphi : x \to y$ of $\mathcal{X}$ lying over $f : U \to V$ the comparison map $c_\varphi : f^*_{small}\mathcal{F}|_{V_{étale}} \to \mathcal{F}|_{U_{étale}}$ of (58.9.4.1) is an isomorphism.*

Proof. Assume $\mathcal{F}$ is quasi-coherent. Then $\mathcal{F}$ is a sheaf for the fppf topology, hence a sheaf for the étale topology. Moreover, any pullback of $\mathcal{F}$ to a ringed topos is quasi-coherent, hence the restrictions $x^*\mathcal{F}|_{U_{étale}}$ are quasi-coherent. This proves $\mathcal{F}$ is locally quasi-coherent. Let y be an object of $\mathcal{X}$ with $V = p(y)$. We have seen that $\mathcal{X}/y = (Sch/V)_{fppf}$. By Descent, Proposition 31.6.11 it follows that $y^*\mathcal{F}$ is the quasi-coherent module associated to a (usual) quasi-coherent module $\mathcal{F}_V$ on the scheme V. Hence certainly the comparison maps (58.9.4.1) are isomorphisms.

Conversely, suppose that $\mathcal{F}$ satisfies (1) and (2). Let y be an object of $\mathcal{X}$ with $V = p(y)$. Denote $\mathcal{F}_V$ the quasi-coherent module on the scheme V corresponding to the restriction $y^*\mathcal{F}|_{V_{étale}}$ which is quasi-coherent by assumption (1), see Descent, Proposition 31.6.11. Condition (2) now signifies that the restrictions $x^*\mathcal{F}|_{U_{étale}}$ for x over y are each isomorphic to the (étale sheaf associated to the) pullback of $\mathcal{F}_V$ via the corresponding morphism of schemes $U \to V$. Hence $y^*\mathcal{F}$ is the sheaf on $(Sch/V)_{fppf}$ associated to $\mathcal{F}_V$. Hence it is quasi-coherent (by Descent, Proposition 31.6.11 again) and we see that $\mathcal{F}$ is quasi-coherent on $\mathcal{X}$ by Lemma 58.11.3. $\square$

Lemma 58.11.6. *Let $f : \mathcal{X} \to \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. The pullback functor $f^* = f^{-1} : Mod(\mathcal{Y}_{étale}, \mathcal{O}_\mathcal{Y}) \to Mod(\mathcal{X}_{étale}, \mathcal{O}_\mathcal{X})$ preserves locally quasi-coherent sheaves.*

Proof. Let $\mathcal{G}$ be locally quasi-coherent on $\mathcal{Y}$. Choose an object x of $\mathcal{X}$ lying over the scheme U. The restriction $x^*f^*\mathcal{G}|_{U_{étale}}$ equals $(f \circ x)^*\mathcal{G}|_{U_{étale}}$ hence is a quasi-coherent sheaf by assumption on $\mathcal{G}$. $\square$

Lemma 58.11.7. *Let $p : \mathcal{X} \to (Sch/S)_{fppf}$ be a category fibred in groupoids.*

(1) *The category $LQCoh(\mathcal{O}_\mathcal{X})$ has colimits and they agree with colimits in the category $Mod(\mathcal{X}_{étale}, \mathcal{O}_\mathcal{X})$.*
(2) *The category $LQCoh(\mathcal{O}_\mathcal{X})$ is abelian with kernels and cokernels computed in $Mod(\mathcal{X}_{étale}, \mathcal{O}_\mathcal{X})$, in other words the inclusion functor is exact.*

(3) *Given a short exact sequence* $0 \to \mathcal{F}_1 \to \mathcal{F}_2 \to \mathcal{F}_3 \to 0$ *of* $Mod(\mathcal{X}_{\acute{e}tale}, \mathcal{O}_\mathcal{X})$ *if two out of three are locally quasi-coherent so is the third.*
(4) *Given* $\mathcal{F}, \mathcal{G}$ *in* $LQCoh(\mathcal{O}_\mathcal{X})$ *the tensor product* $\mathcal{F} \otimes_{\mathcal{O}_\mathcal{X}} \mathcal{G}$ *in* $Mod(\mathcal{X}_{\acute{e}tale}, \mathcal{O}_\mathcal{X})$ *is an object of* $LQCoh(\mathcal{O}_\mathcal{X})$.
(5) *Given* $\mathcal{F}, \mathcal{G}$ *in* $LQCoh(\mathcal{O}_\mathcal{X})$ *with* $\mathcal{F}$ *locally of finite presentation on* $\mathcal{X}_{\acute{e}tale}$ *the sheaf* $\mathcal{H}om_{\mathcal{O}_\mathcal{X}}(\mathcal{F}, \mathcal{G})$ *in* $Mod(\mathcal{X}_{\acute{e}tale}, \mathcal{O}_\mathcal{X})$ *is an object of* $LQCoh(\mathcal{O}_\mathcal{X})$.

Proof. Each of these statements follows from the corresponding statement of Descent, Lemma 31.6.13. For example, suppose that $\mathcal{I} \to LQCoh(\mathcal{O}_\mathcal{X})$, $i \mapsto \mathcal{F}_i$ is a diagram. Consider the object $\mathcal{F} = colim_i \mathcal{F}_i$ of $Mod(\mathcal{X}_{\acute{e}tale}, \mathcal{O}_\mathcal{X})$. For any object x of $\mathcal{X}$ with $U = p(x)$ the pullback functor x^* commutes with all colimits as it is a left adjoint. Hence $x^*\mathcal{F} = colim_i x^*\mathcal{F}_i$. Similarly we have $x^*\mathcal{F}|_{U_{\acute{e}tale}} = colim_i x^*\mathcal{F}_i|_{U_{\acute{e}tale}}$. Now by assumption each $x^*\mathcal{F}_i|_{U_{\acute{e}tale}}$ is quasi-coherent, hence the colimit is quasi-coherent by the aforementioned Descent, Lemma 31.6.13. This proves (1).

It follows from (1) that cokernels exist in $LQCoh(\mathcal{O}_\mathcal{X})$ and agree with the cokernels computed in $Mod(\mathcal{X}_{\acute{e}tale}, \mathcal{O}_\mathcal{X})$. Let $\varphi : \mathcal{F} \to \mathcal{G}$ be a morphism of $LQCoh(\mathcal{O}_\mathcal{X})$ and let $\mathcal{K} = \mathrm{Ker}(\varphi)$ computed in $Mod(\mathcal{X}_{\acute{e}tale}, \mathcal{O}_\mathcal{X})$. If we can show that $\mathcal{K}$ is a locally quasi-coherent module, then the proof of (2) is complete. To see this, note that kernels are computed in the category of presheaves (no sheafification necessary). Hence $\mathcal{K}|_{U_{\acute{e}tale}}$ is the kernel of the map $\mathcal{F}|_{U_{\acute{e}tale}} \to \mathcal{G}|_{U_{\acute{e}tale}}$, i.e., is the kernel of a map of quasi-coherent sheaves on $U_{\acute{e}tale}$ whence quasi-coherent by Descent, Lemma 31.6.13. This proves (2).

Parts (3), (4), and (5) follow in exactly the same way. Details omitted. □

In the generality discussed here we don't know how to prove that the category of quasi-coherent sheaves is abelian. Here is what we can prove without any further work.

Lemma 58.11.8. *Let* $p : \mathcal{X} \to (Sch/S)_{fppf}$ *be a category fibred in groupoids.*

(1) *The category* $QCoh(\mathcal{O}_\mathcal{X})$ *has colimits and they agree with colimits in the category* $Mod(\mathcal{O}_\mathcal{X})$ *as well as with colimits in the category* $LQCoh(\mathcal{O}_\mathcal{X})$.
(2) *Given* $\mathcal{F}, \mathcal{G}$ *in* $QCoh(\mathcal{O}_\mathcal{X})$ *the tensor product* $\mathcal{F} \otimes_{\mathcal{O}_\mathcal{X}} \mathcal{G}$ *in* $Mod(\mathcal{O}_\mathcal{X})$ *is an object of* $QCoh(\mathcal{O}_\mathcal{X})$.
(3) *Given* $\mathcal{F}, \mathcal{G}$ *in* $QCoh(\mathcal{O}_\mathcal{X})$ *with* $\mathcal{F}$ *locally of finite presentation on* $\mathcal{X}_{fppf}$ *the sheaf* $\mathcal{H}om_{\mathcal{O}_\mathcal{X}}(\mathcal{F}, \mathcal{G})$ *in* $Mod(\mathcal{O}_\mathcal{X})$ *is an object of* $QCoh(\mathcal{O}_\mathcal{X})$.

Proof. Let $\mathcal{I} \to QCoh(\mathcal{O}_\mathcal{X})$, $i \mapsto \mathcal{F}_i$ be a diagram. Consider the object $\mathcal{F} = colim_i \mathcal{F}_i$ of $Mod(\mathcal{O}_\mathcal{X})$. For any object x of $\mathcal{X}$ with $U = p(x)$ the pullback functor x^* commutes with all colimits as it is a left adjoint. Hence $x^*\mathcal{F} = colim_i x^*\mathcal{F}_i$ in $Mod((Sch/U)_{fppf}, \mathcal{O})$. We conclude from Descent, Lemma 31.6.13 that $x^*\mathcal{F}$ is quasi-coherent, hence $\mathcal{F}$ is quasi-coherent, see Lemma 58.11.3. Thus we see that $QCoh(\mathcal{O}_\mathcal{X})$ has colimits and they agree with colimits in the category $Mod(\mathcal{O}_\mathcal{X})$. In particular the (fppf) sheaf $\mathcal{F}$ is also the colimit of the diagram in $Mod(\mathcal{X}_{\acute{e}tale}, \mathcal{O}_\mathcal{X})$, hence $\mathcal{F}$ is also the colimit in $LQCoh(\mathcal{O}_\mathcal{X})$. This proves (1).

Parts (2) and (3) are proved in the same way. Details omitted. □

58.12. Stackification and sheaves

It turns out that the category of sheaves on a category fibred in groupoids only ``knows about'' the stackification.

Lemma 58.12.1. *Let* $f : \mathcal{X} \to \mathcal{Y}$ *be a* 1*-morphism of categories fibred in groupoids over* $(Sch/S)_{fppf}$*. If* f *induces an equivalence of stackifications, then the morphism of topoi* $f : Sh(\mathcal{X}_{fppf}) \to Sh(\mathcal{Y}_{fppf})$ *is an equivalence.*

Proof. We may assume $\mathcal{Y}$ is the stackification of $\mathcal{X}$. We claim that $f : \mathcal{X} \to \mathcal{Y}$ is a special cocontinuous functor, see Sites, Definition 9.25.2 which will prove the lemma. By Stacks, Lemma 50.10.3 the functor f is continuous and cocontinuous. By Stacks, Lemma 50.8.1 we see that conditions (3), (4), and (5) of Sites, Lemma 9.25.1 hold. $\square$

Lemma 58.12.2. *Let $f : \mathcal{X} \to \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. If f induces an equivalence of stackifications, then f^* induces equivalences $Mod(\mathcal{O}_\mathcal{X}) \to Mod(\mathcal{O}_\mathcal{Y})$ and $QCoh(\mathcal{O}_\mathcal{X}) \to QCoh(\mathcal{O}_\mathcal{Y})$.*

Proof. We may assume $\mathcal{Y}$ is the stackification of $\mathcal{X}$. The first assertion is clear from Lemma 58.12.1 and $\mathcal{O}_\mathcal{X} = f^{-1}\mathcal{O}_\mathcal{Y}$. Pullback of quasi-coherent sheaves are quasi-coherent, see Lemma 58.11.2. Hence it suffices to show that if $f^*\mathcal{G}$ is quasi-coherent, then $\mathcal{G}$ is. To see this, let y be an object of $\mathcal{Y}$. Translating the condition that $\mathcal{Y}$ is the stackification of $\mathcal{X}$ we see there exists an fppf covering $\{y_i \to y\}$ in $\mathcal{Y}$ such that $y_i \cong f(x_i)$ for some x_i object of $\mathcal{X}$. Say x_i and y_i lie over the scheme U_i. Then $f^*\mathcal{G}$ being quasi-coherent, means that $x_i^*f^*\mathcal{G}$ is quasi-coherent. Since $x_i^*f^*\mathcal{G}$ is isomorphic to $y_i^*\mathcal{G}$ (as sheaves on $(Sch/U_i)_{fppf}$ we see that $y_i^*\mathcal{G}$ is quasi-coherent. It follows from Modules on Sites, Lemma 16.23.3 that the restriction of $\mathcal{G}$ to $\mathcal{Y}/y$ is quasi-coherent. Hence $\mathcal{G}$ is quasi-coherent by Lemma 58.11.3. $\square$

58.13. Quasi-coherent sheaves and presentations

In Groupoids in Spaces, Definition 52.12.1 we have the defined the notion of a quasi-coherent module on an arbitrary groupoid. The following (formal) proposition tells us that we can study quasi-coherent sheaves on quotient stacks in terms of quasi-coherent modules on presentations.

Proposition 58.13.1. *Let (U, R, s, t, c) be a groupoid in algebraic spaces over S. Let $\mathcal{X} = [U/R]$ be the quotient stack. The category of quasi-coherent modules on $\mathcal{X}$ is equivalent to the category of quasi-coherent modules on (U, R, s, t, c).*

Proof. Denote $QCoh(U, R, s, t, c)$ the category of quasi-coherent modules on the groupoid (U, R, s, t, c). We will construct quasi-inverse functors

$$QCoh(\mathcal{O}_\mathcal{X}) \longleftrightarrow QCoh(U, R, s, t, c).$$

According to Lemma 58.12.2 the stackification map $[U/_pR] \to [U/R]$ (see Groupoids in Spaces, Definition 52.19.1) induces an equivalence of categories of quasi-coherent sheaves. Thus it suffices to prove the lemma with $\mathcal{X} = [U/_pR]$.

Recall that an object $x = (T, u)$ of $\mathcal{X} = [U/_pR]$ is given by a scheme T and a morphism $u : T \to U$. A morphism $(T, u) \to (T', u')$ is given by a pair (f, r) where $f : T \to T'$ and $r : T \to R$ with $s \circ r = u$ and $t \circ r = u' \circ f$. Let us call a *special morphism* any morphism of the form $(f, e \circ u' \circ f) : (T, u' \circ f) \to (T', u')$. The category of (T, u) with special morphisms is just the category of schemes over U.

Let $\mathcal{F}$ be a quasi-coherent sheaf on $\mathcal{X}$. Then we obtain for every $x = (T, u)$ a quasi-coherent sheaf $\mathcal{F}_{(T,u)} = x^*\mathcal{F}|_{T_{étale}}$ on T. Moreover, for any morphism $(f, r) : x = (T, u) \to (T', u') = x'$ we obtain a comparison isomorphism

$$c_{(f,r)} : f^*_{small}\mathcal{F}_{(T',u')} \longrightarrow \mathcal{F}_{(T,u)}$$

see Lemma 58.11.5. Moreover, these isomorphisms are compatible with compositions, see Lemma 58.9.3. If U, R are schemes, then we can construct the quasi-coherent sheaf on the groupoid as follows: First the object (U, id) corresponds to a quasi-coherent sheaf $\mathcal{F}_{(U,\mathrm{id})}$ on U. Next, the isomorphism $\alpha : t^*_{small}\mathcal{F}_{(U,\mathrm{id})} \to s^*_{small}\mathcal{F}_{(U,\mathrm{id})}$ comes from

(1) the morphism $(R, \text{id}_R) : (R, s) \to (R, t)$ in the category $[U/_pR]$ which produces an isomorphism $\mathcal{F}_{(R,t)} \to \mathcal{F}_{(R,s)}$,
(2) the special morphism $(R, s) \to (U, \text{id})$ which produces an isomorphism $s_{small}^*\mathcal{F}_{(U,\text{id})} \to \mathcal{F}_{(R,s)}$, and
(3) the special morphism $(R, t) \to (U, \text{id})$ which produces an isomorphism $t_{small}^*\mathcal{F}_{(U,\text{id})} \to \mathcal{F}_{(R,t)}$.

The cocycle condition for α follows from the condition that (U, R, s, t, c) is groupoid, i.e., that composition is associative (details omitted).

To do this in general, i.e., when U and R are algebraic spaces, it suffices to explain how to associate to an algebraic space (W, u) over U a quasi-coherent sheaf $\mathcal{F}_{(W,u)}$ and to construct the comparison maps for morphisms between these. We set $\mathcal{F}_{(W,u)} = x^*\mathcal{F}|_{W_{étale}}$ where x is the 1-morphism $\mathcal{S}_W \to \mathcal{S}_U \to [U/_pR]$ and the comparison maps are explained in (58.10.2.3).

Conversely, suppose that $(\mathcal{G}, \alpha)$ is a quasi-coherent module on (U, R, s, t, c). We are going to define a presheaf of modules $\mathcal{F}$ on $\mathcal{X}$ as follows. Given an object (T, u) of $[U/_pR]$ we set

$$\mathcal{F}(T, u) := \Gamma(T, u_{small}^*\mathcal{G}).$$

Given a morphism $(f, r) : (T, u) \to (T', u')$ we get a map

$$\begin{aligned} \mathcal{F}(T', u') &= \Gamma(T', (u')_{small}^*\mathcal{G}) \\ &\to \Gamma(T, f_{small}^*(u')_{small}^*\mathcal{G}) = \Gamma(T, (u' \circ f)_{small}^*\mathcal{G}) \\ &= \Gamma(T, (t \circ r)_{small}^*\mathcal{G}) = \Gamma(T, r_{small}^*t_{small}^*\mathcal{G}) \\ &\to \Gamma(T, r_{small}^*s_{small}^*\mathcal{G}) = \Gamma(T, (s \circ r)_{small}^*\mathcal{G}) \\ &= \Gamma(T, u_{small}^*\mathcal{G}) \\ &= \mathcal{F}(T, u) \end{aligned}$$

where the first arrow is pullback along f and the second arrow is α. Note that if (T, r) is a special morphism, then this map is just pullback along f as $e_{small}^*\alpha = \text{id}$ by the axioms of a sheaf of quasi-coherent modules on a groupoid. The cocycle condition implies that $\mathcal{F}$ is a presheaf of modules (details omitted). It is immediate from the definition that $\mathcal{F}$ is quasi-coherent when pulled back to $(Sch/T)_{fppf}$ (by the simple description of the restriction maps of $\mathcal{F}$ in case of a special morphism).

We omit the verification that the functors constructed above are quasi-inverse to each other. □

We finish this section with a technical lemma on maps out of quasi-coherent sheaves. It is an analogue of Schemes, Lemma 21.7.1. We will see later (Criteria for Representability, Theorem 59.17.2) that the assumptions on the groupoid imply that $\mathcal{X}$ is an algebraic stack.

Lemma 58.13.2. *Let (U, R, s, t, c) be a groupoid in algebraic spaces over S. Assume s, t are flat and locally of finite presentation. Let $\mathcal{X} = [U/R]$ be the quotient stack. Denote $\pi : \mathcal{S}_U \to \mathcal{X}$ the quotient map. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_\mathcal{X}$-module, and let $\mathcal{H}$ be any object of $Mod(\mathcal{O}_\mathcal{X})$. The map*

$$Hom_{\mathcal{O}_\mathcal{X}}(\mathcal{F}, \mathcal{H}) \longrightarrow Hom_{\mathcal{O}_U}(x^*\mathcal{F}|_{U_{étale}}, x^*\mathcal{H}|_{U_{étale}}), \quad \phi \longmapsto x^*\phi|_{U_{étale}}$$

is injective and its image consists of exactly those $\varphi : x^*\mathcal{F}|_{U_{étale}} \to x^*\mathcal{H}|_{U_{étale}}$ *which give rise to a commutative diagram*

$$\begin{tikzcd} s_{small}^*(x^*\mathcal{F}|_{U_{étale}}) \arrow[r] \arrow[d, "s_{small}^*\varphi"] & (x \circ s)^*\mathcal{F}|_{R_{étale}} = (x \circ t)^*\mathcal{F}|_{R_{étale}} & t_{small}^*(x^*\mathcal{F}|_{U_{étale}}) \arrow[l] \arrow[d, "t_{small}^*\varphi"'] \\ s_{small}^*(x^*\mathcal{H}|_{U_{étale}}) \arrow[r] & (x \circ s)^*\mathcal{H}|_{R_{étale}} = (x \circ t)^*\mathcal{H}|_{R_{étale}} & t_{small}^*(x^*\mathcal{H}|_{U_{étale}}) \arrow[l] \end{tikzcd}$$

of modules on $R_{étale}$ *where the horizontal arrows are the comparison maps (58.10.2.3).*

Proof. According to Lemma 58.12.2 the stackification map $[U/_pR] \to [U/R]$ (see Groupoids in Spaces, Definition 52.19.1) induces an equivalence of categories of quasi-coherent sheaves and of fppf $\mathcal{O}$-modules. Thus it suffices to prove the lemma with $\mathcal{X} = [U/_pR]$. By Proposition 58.13.1 and its proof there exists a quasi-coherent module $(\mathcal{G}, \alpha)$ on (U, R, s, t, c) such that $\mathcal{F}$ is given by the rule $\mathcal{F}(T, u) = \Gamma(T, u^*\mathcal{G})$. In particular $x^*\mathcal{F}|_{U_{étale}} = \mathcal{G}$ and it is clear that the map of the statement of the lemma is injective. Moreover, given a map $\varphi : \mathcal{G} \to x^*\mathcal{H}|_{U_{étale}}$ and given any object $y = (T, u)$ of $[U/_pR]$ we can consider the map

$$\mathcal{F}(y) = \Gamma(T, u^*\mathcal{G}) \xrightarrow{u_{small}^*\varphi} \Gamma(T, u_{small}^* x^*\mathcal{H}|_{U_{étale}}) \to \Gamma(T, y^*\mathcal{H}|_{T_{étale}}) = \mathcal{H}(y)$$

where the second arrow is the comparison map (58.9.4.1) for the sheaf $\mathcal{H}$. This assignment is compatible with the restriction mappings of the sheaves $\mathcal{F}$ and $\mathcal{G}$ for morphisms of $[U/_pR]$ if the cocycle condition of the lemma is satisfied. Proof omitted. Hint: the restriction maps of $\mathcal{F}$ are made explicit in terms of $(\mathcal{G}, \alpha)$ in the proof of Proposition 58.13.1. ☐

58.14. Quasi-coherent sheaves on algebraic stacks

Let $\mathcal{X}$ be an algebraic stack over S. By Algebraic Stacks, Lemma 57.16.2 we can find an equivalence $[U/R] \to \mathcal{X}$ where (U, R, s, t, c) is a smooth groupoid in algebraic spaces. Then

$$QCoh(\mathcal{O}_\mathcal{X}) \cong QCoh(\mathcal{O}_{[U/R]}) \cong QCoh(U, R, s, t, c)$$

where the second equivalence is Proposition 58.13.1. Hence the category of quasi-coherent sheaves on an algebraic stack is equivalent to the category of quasi-coherent modules on a smooth groupoid in algebraic spaces. In particular, by Groupoids in Spaces, Lemma 52.12.5 we see that $QCoh(\mathcal{O}_\mathcal{X})$ is abelian!

There is something slightly disconcerting about our current setup. It is that the fully faithful embedding

$$QCoh(\mathcal{O}_\mathcal{X}) \longrightarrow Mod(\mathcal{O}_\mathcal{X})$$

is in general **not** exact. However, exactly the same thing happens for schemes: for most schemes X the embedding

$$QCoh(\mathcal{O}_X) \cong QCoh((Sch/X)_{fppf}, \mathcal{O}_X) \longrightarrow Mod((Sch/X)_{fppf}, \mathcal{O}_X)$$

isn't exact, see Descent, Lemma 31.6.13. Parenthetically, the example in the proof of Descent, Lemma 31.6.13 shows that in general the strictly full embedding $QCoh(\mathcal{O}_\mathcal{X}) \to LQCoh(\mathcal{O}_\mathcal{X})$ isn't exact either.

We collect all the positive results obtained so far in a single statement.

Lemma 58.14.1. *Let* $\mathcal{X}$ *be an algebraic stack over* S.

(1) *If* $[U/R] \to \mathcal{X}$ *is a presentation of* $\mathcal{X}$ *then there is a canonical equivalence* $QCoh(\mathcal{O}_\mathcal{X}) \cong QCoh(U, R, s, t, c)$.
(2) *The category* $QCoh(\mathcal{O}_\mathcal{X})$ *is abelian.*

(3) *The category* $QCoh(\mathcal{O}_\mathcal{X})$ *has colimits and they agree with colimits in the category* $Mod(\mathcal{O}_\mathcal{X})$.
(4) *Given* $\mathcal{F}, \mathcal{G}$ *in* $QCoh(\mathcal{O}_\mathcal{X})$ *the tensor product* $\mathcal{F} \otimes_{\mathcal{O}_\mathcal{X}} \mathcal{G}$ *in* $Mod(\mathcal{O}_\mathcal{X})$ *is an object of* $QCoh(\mathcal{O}_\mathcal{X})$.
(5) *Given* $\mathcal{F}, \mathcal{G}$ *in* $QCoh(\mathcal{O}_\mathcal{X})$ *with* $\mathcal{F}$ *locally of finite presentation on* $\mathcal{X}_{fppf}$ *the sheaf* $\mathcal{H}om_{\mathcal{O}_\mathcal{X}}(\mathcal{F}, \mathcal{G})$ *in* $Mod(\mathcal{O}_\mathcal{X})$ *is an object of* $QCoh(\mathcal{O}_\mathcal{X})$.

Proof. Properties (3), (4), and (5) were proven in Lemma 58.11.8. Part (1) is Proposition 58.13.1. Part (2) follows from Groupoids in Spaces, Lemma 52.12.5 as discussed above. □

Proposition 58.14.2. *Let* $\mathcal{X}$ *be an algebraic stack over* S. *The inclusion functor* $QCoh(\mathcal{O}_\mathcal{X}) \to Mod(\mathcal{O}_\mathcal{X})$ *has a right adjoint*

$$Q^3 : Mod(\mathcal{O}_\mathcal{X}) \longrightarrow QCoh(\mathcal{O}_\mathcal{X})$$

such that for every quasi-coherent sheaf $\mathcal{F}$ *the adjunction mapping* $Q(\mathcal{F}) \to \mathcal{F}$ *is an isomorphism. Moreover, the category* $QCoh(\mathcal{O}_\mathcal{X})$ *has limits and enough injectives.*

Proof. This proof is a repeat of the proof in the case of schemes, see Properties, Proposition 23.21.4 and the case of algebraic spaces, see Properties of Spaces, Proposition 41.29.2. We urge the reader to read either of those proofs first.

The two assertions about $Q(\mathcal{F}) \to \mathcal{F}$ and limits in $QCoh(\mathcal{O}_\mathcal{X})$ are formal consequences of the existence of Q, the fact that the inclusion is fully faithful, and the fact that $Mod(\mathcal{O}_\mathcal{X})$ has limits (see Modules on Sites, Lemma 16.14.2). The existence of injectives follows from the existence of injectives in $Mod(\mathcal{O}_\mathcal{X})$ (see Injectives, Theorem 17.12.4) and Homology, Lemma 10.22.3. Thus it suffices to construct Q.

Choose a presentation $\mathcal{X} = [U/R]$ so that (U, R, s, t, c) is a smooth groupoid in algebraic spaces and in particular s and t are flat morphisms of algebraic spaces. By Lemma 58.14.1 above we have $QCoh(\mathcal{O}_\mathcal{X}) = QCoh(U, R, s, t, c)$. By Groupoids in Spaces, Lemma 52.13.2 there exists a set T and a family $(\mathcal{F}_t)_{t \in T}$ of quasi-coherent sheaves on $\mathcal{X}$ such that every quasi-coherent sheaf on $\mathcal{X}$ is the directed colimit of its subsheaves which are isomorphic to one of the $\mathcal{F}_t$.

Given an object $\mathcal{G}$ of $QCoh(\mathcal{O}_\mathcal{X})$ we set

$$Q(\mathcal{G}) = colim_{(t,\psi)} \mathcal{F}_t$$

The colimit is over the category of pairs (t, ψ) where $t \in T$ and $\psi : \mathcal{F}_t \to \mathcal{G}$ is a morphism of $\mathcal{O}_\mathcal{X}$-modules. A morphism $(t, \psi) \to (t', \psi')$ is given by a morphism $\beta : \mathcal{F}_t \to \mathcal{F}_{t'}$ such that $\psi' \circ \beta = \psi$. By Lemma 58.14.1 the colimit is quasi-coherent. Note that there is a canonical map $Q(\mathcal{G}) \to \mathcal{G}$ by definition of the colimit. The formula

$$Hom(\mathcal{H}, Q(\mathcal{G})) = Hom(\mathcal{H}, \mathcal{G})$$

holds for $\mathcal{H} = \mathcal{F}_t$ by construction. It follows formally from this and the fact that every $\mathcal{H}$ is a directed colimit of $\mathcal{O}_\mathcal{X}$-modules isomorphic to $\mathcal{F}_t$ that this equality holds for any quasi-coherent module $\mathcal{H}$ on X. This finishes the proof. □

[3] This functor is sometimes called the *coherator*.

58.15. Cohomology

Let S be a scheme and let $\mathcal{X}$ be a category fibred in groupoids over $(Sch/S)_{fppf}$. For any $\tau \in \{Zariski, étale, smooth, syntomic, fppf\}$ the categories $Ab(\mathcal{X}_\tau)$ and $Mod(\mathcal{X}_\tau, \mathcal{O}_\mathcal{X})$ have enough injectives, see Injectives, Theorems 17.11.4 and 17.12.4. Thus we can use the machinery of Cohomology on Sites, Section 19.3 to define the cohomology groups

$$H^p(\mathcal{X}_\tau, \mathcal{F}) = H^p_\tau(\mathcal{X}, \mathcal{F}) \quad \text{and} \quad H^p(x, \mathcal{F}) = H^p_\tau(x, \mathcal{F})$$

for any $x \in Ob(\mathcal{X})$ and any object $\mathcal{F}$ of $Ab(\mathcal{X}_\tau)$ or $Mod(\mathcal{X}_\tau, \mathcal{O}_\mathcal{X})$. Moreover, if $f : \mathcal{X} \to \mathcal{Y}$ is a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$, then we obtain the higher direct images $R^i f_*\mathcal{F}$ in $Ab(\mathcal{Y}_\tau)$ or $Mod(\mathcal{Y}_\tau, \mathcal{O}_\mathcal{Y})$. Of course, as explained in Cohomology on Sites, Section 19.4 there are also derived versions of $H^p(-)$ and $R^i f_*$.

Lemma 58.15.1. *Let S be a scheme. Let $\mathcal{X}$ be a category fibred in groupoids over $(Sch/S)_{fppf}$. Let $\tau \in \{Zariski, étale, smooth, syntomic, fppf\}$. Let $x \in Ob(\mathcal{X})$ be an object lying over the scheme U. Let $\mathcal{F}$ be an object of $Ab(\mathcal{X}_\tau)$ or $Mod(\mathcal{X}_\tau, \mathcal{O}_\mathcal{X})$. Then*

$$H^p_\tau(x, \mathcal{F}) = H^p((Sch/U)_\tau, x^{-1}\mathcal{F})$$

and if $\tau = étale$, then we also have

$$H^p_{étale}(x, \mathcal{F}) = H^p(U_{étale}, \mathcal{F}|_{U_{étale}}).$$

Proof. The first statement follows from Cohomology on Sites, Lemma 19.8.1 and the equivalence of Lemma 58.9.4. The second statement follows from the first combined with Étale Cohomology, Lemma 38.20.5. □

58.16. Injective sheaves

The pushfoward of an injective abelian sheaf or module is injective.

Lemma 58.16.1. *Let $f : \mathcal{X} \to \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. Let $\tau \in \{Zar, étale, smooth, syntomic, fppf\}$.*

(1) *$f_*\mathcal{I}$ is injective in $Ab(\mathcal{Y}_\tau)$ for $\mathcal{I}$ injective in $Ab(\mathcal{X}_\tau)$, and*
(2) *$f_*\mathcal{I}$ is injective in $Mod(\mathcal{Y}_\tau, \mathcal{O}_\mathcal{Y})$ for $\mathcal{I}$ injective in $Mod(\mathcal{X}_\tau, \mathcal{O}_\mathcal{X})$.*

Proof. This follows formally from the fact that f^{-1} is an exact left adjoint of f_*, see Homology, Lemma 10.22.1. □

In the rest of this section we prove that pullback f^{-1} has a left adjoint $f_!$ on abelian sheaves and modules. If f is representable (by schemes or by algebraic spaces), then it will turn out that $f_!$ is exact and f^{-1} will preserve injectives. We first prove a few preliminary lemmas about fibre products and equalizers in categories fibred in groupoids and their behaviour with respect to morphisms.

Lemma 58.16.2. *Let $p : \mathcal{X} \to (Sch/S)_{fppf}$ be a category fibred in groupoids.*

(1) *The category $\mathcal{X}$ has fibre products.*
(2) *If the $Isom$-presheaves of $\mathcal{X}$ are representable by algebraic spaces, then $\mathcal{X}$ has equalizers.*
(3) *If $\mathcal{X}$ is an algebraic stack (or more generally a quotient stack), then $\mathcal{X}$ has equalizers.*

Proof. Part (1) follows Categories, Lemma 4.32.13 as $(Sch/S)_{fppf}$ has fibre products.

Let $a, b : x \to y$ be morphisms of $\mathcal{X}$. Set $U = p(x)$ and $V = p(y)$. The category of schemes has equalizers hence we can let $W \to U$ be the equalizer of $p(a)$ and $p(b)$. Denote $c : z \to x$ a morphism of $\mathcal{X}$ lying over $W \to U$. The equalizer of a and b, if it exists, is the equalizer of $a \circ c$ and $b \circ c$. Thus we may assume that $p(a) = p(b) = f : U \to V$. As $\mathcal{X}$ is fibred in groupoids, there exists a unique automorphism $i : x \to x$ in the fibre category of $\mathcal{X}$ over U such that $a \circ i = b$. Again the equalizer of a and b is the equalizer of id_x and i. Recall that the $Isom_{\mathcal{X}}(x)$ is the presheaf on $(Sch/U)_{fppf}$ which to V/U associates the set of automorphisms of $x|_V$ in the fibre category of $\mathcal{X}$ over V, see Stacks, Definition 50.2.2. If $Isom_{\mathcal{X}}(x)$ is representable by an algebraic space $G \to U$, then we see that id_x and i define morphisms $e, i : U \to G$ over U. Set $V = U \times_{e,G,i} U$, which by Morphisms of Spaces, Lemma 42.5.7 is a scheme. Then it is clear that $x|_V \to x$ is the equalizer of the maps id_x and i in $\mathcal{X}$. This proves (2).

If $\mathcal{X} = [U/R]$ for some groupoid in algebraic spaces (U, R, s, t, c) over S, then the hypothesis of (2) holds by Bootstrap, Lemma 54.11.3. If $\mathcal{X}$ is an algebraic stack, then we can choose a presentation $[U/R] \cong \mathcal{X}$ by Algebraic Stacks, Lemma 57.16.2. □

Lemma 58.16.3. *Let $f : \mathcal{X} \to \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$.*

(1) *The functor f transforms fibre products into fibre products.*
(2) *If f is faithful, then f transforms equalizers into equalizers.*

Proof. By Categories, Lemma 4.32.13 we see that a fibre product in $\mathcal{X}$ is any commutative square lying over a fibre product diagram in $(Sch/S)_{fppf}$. Similarly for $\mathcal{Y}$. Hence (1) is clear.

Let $x \to x'$ be the equalizer of two morphisms $a, b : x' \to x''$ in $\mathcal{X}$. We will show that $f(x) \to f(x')$ is the equalizer of $f(a)$ and $f(b)$. Let $y \to f(x)$ be a morphism of $\mathcal{Y}$ equalizing $f(a)$ and $f(b)$. Say x, x', x'' lie over the schemes U, U', U'' and y lies over V. Denote $h : V \to U'$ the image of $y \to f(x)$ in the category of schemes. The morphism $y \to f(x)$ is isomorphic to $f(h^*x') \to f(x')$ by the axioms of fibred categories. Hence, as f is faithful, we see that $h^*x' \to x'$ equalizes a and b. Thus we obtain a unique morphism $h^*x' \to x$ whose image $y = f(h^*x') \to f(x)$ is the desired morphism in $\mathcal{Y}$. □

Lemma 58.16.4. *Let $f : \mathcal{X} \to \mathcal{Y}$, $g : \mathcal{Z} \to \mathcal{Y}$ be faithful 1-morphisms of categories fibred in groupoids over $(Sch/S)_{fppf}$.*

(1) *the functor $\mathcal{X} \times_{\mathcal{Y}} \mathcal{Z} \to \mathcal{Y}$ is faithful, and*
(2) *if $\mathcal{X}, \mathcal{Z}$ have equalizers, so does $\mathcal{X} \times_{\mathcal{Y}} \mathcal{Z}$.*

Proof. We think of objects in $\mathcal{X} \times_{\mathcal{Y}} \mathcal{Z}$ as quadruples (U, x, z, α) where $\alpha : f(x) \to g(z)$ is an isomorphism over U, see Categories, Lemma 4.29.3. A morphism $(U, x, z, \alpha) \to (U', x', z', \alpha')$ is a pair of morphisms $a : x \to x'$ and $b : z \to z'$ compatible with α and α'. Thus it is clear that if f and g are faithful, so is the functor $\mathcal{X} \times_{\mathcal{Y}} \mathcal{Z} \to \mathcal{Y}$. Now, suppose that $(a, b), (a', b') : (U, x, z, \alpha) \to (U', x', z', \alpha')$ are two morphisms of the 2-fibre product. Then consider the equalizer $x'' \to x$ of a and a' and the equalizer $z'' \to z$ of b and b'. Since f commutes with equalizers (by Lemma 58.16.3) we see that $f(x'') \to f(x)$ is the equalizer of $f(a)$ and $f(a')$. Similarly, $g(z'') \to g(z)$ is the equalizer of $g(b)$ and $g(b')$. Picture

$$\begin{tikzcd} f(x'') \arrow[r] \arrow[d, dotted, "\alpha''"'] & f(x) \arrow[r, shift left, "f(a)"] \arrow[r, shift right, "f(a')"'] \arrow[d, "\alpha"] & f(x') \arrow[d, "\alpha'"] \\ g(z'') \arrow[r] & g(z) \arrow[r, shift left, "g(b)"] \arrow[r, shift right, "g(b')"'] & g(z') \end{tikzcd}$$

It is clear that the dotted arrow exists and is an isomorphism. However, it is not a priori the case that the image of α'' in the category of schemes is the identity of its source. On the other hand, the existence of α'' means that we can assume that x'' and z'' are defined over the same scheme and that the morphisms $x'' \to x$ and $z'' \to z$ have the same image in the category of schemes. Redoing the diagram above we see that the dotted arrow now does project to an identity morphism and we win. Some details omitted. $\square$

As we are working with big sites we have the following somewhat counter intuitive result (which also holds for morphisms of big sites of schemes). Warning: This result isn't true if we drop the hypothesis that f is faithful.

Lemma 58.16.5. *Let $f : \mathcal{X} \to \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. Let $\tau \in \{Zar, étale, smooth, syntomic, fppf\}$. The functor $f^{-1} : Ab(\mathcal{Y}_\tau) \to Ab(\mathcal{X}_\tau)$ has a left adjoint $f_! : Ab(\mathcal{X}_\tau) \to Ab(\mathcal{Y}_\tau)$. If f is faithful and $\mathcal{X}$ has equalizers, then*

(1) *$f_!$ is exact, and*
(2) *$f^{-1}\mathcal{I}$ is injective in $Ab(\mathcal{X}_\tau)$ for $\mathcal{I}$ injective in $Ab(\mathcal{Y}_\tau)$.*

Proof. By Stacks, Lemma 50.10.3 the functor f is continuous and cocontinuous. Hence by Modules on Sites, Lemma 16.16.2 the functor $f^{-1} : Ab(\mathcal{Y}_\tau) \to Ab(\mathcal{X}_\tau)$ has a left adjoint $f_! : Ab(\mathcal{X}_\tau) \to Ab(\mathcal{Y}_\tau)$. To see (1) we apply Modules on Sites, Lemma 16.16.3 and to see that the hypotheses of that lemma are satisfied use Lemmas 58.16.2 and 58.16.3 above. Part (2) follows from this formally, see Homology, Lemma 10.22.1. $\square$

Lemma 58.16.6. *Let $f : \mathcal{X} \to \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. Let $\tau \in \{Zar, étale, smooth, syntomic, fppf\}$. The functor $f^* : Mod(\mathcal{Y}_\tau, \mathcal{O}_\mathcal{Y}) \to Mod(\mathcal{X}_\tau, \mathcal{O}_\mathcal{X})$ has a left adjoint $f_! : Mod(\mathcal{X}_\tau, \mathcal{O}_\mathcal{X}) \to Mod(\mathcal{Y}_\tau, \mathcal{O}_\mathcal{Y})$ which agrees with the functor $f_!$ of Lemma 58.16.5 on underlying abelian sheaves. If f is faithful and $\mathcal{X}$ has equalizers, then*

(1) *$f_!$ is exact, and*
(2) *$f^{-1}\mathcal{I}$ is injective in $Mod(\mathcal{X}_\tau, \mathcal{O}_\mathcal{X})$ for $\mathcal{I}$ injective in $Mod(\mathcal{Y}_\tau, \mathcal{O}_\mathcal{X})$.*

Proof. Recall that f is a continuous and cocontinuous functor of sites and that $f^{-1}\mathcal{O}_\mathcal{Y} = \mathcal{O}_\mathcal{X}$. Hence Modules on Sites, Lemma 16.35.1 implies f^* has a left adjoint $f_!^{Mod}$. Let x be an object of $\mathcal{X}$ lying over the scheme U. Then f induces an equivalence of ringed sites

$$\mathcal{X}/x \longrightarrow \mathcal{Y}/f(x)$$

as both sides are equivalent to $(Sch/U)_\tau$, see Lemma 58.9.4. Modules on Sites, Remark 16.35.2 shows that $f_!$ agrees with the functor on abelian sheaves.

Assume now that $\mathcal{X}$ has equalizers and that f is faithful. Lemma 58.16.5 tells us that $f_!$ is exact. Finally, Homology, Lemma 10.22.1 implies the statement on pullbacks of injective modules. $\square$

58.17. The Čech complex

To compute the cohomology of a sheaf on an algebraic stack we compare it to the cohomology of the sheaf restricted to coverings of the given algebraic stack.

Throughout this section the situation will be as follows. We are given a 1-morphism of categories fibred in groupoids

(58.17.0.1)
$$\begin{tikzcd} \mathcal{U} \arrow[rr, "f"] \arrow[dr, "q"'] & & \mathcal{X} \arrow[dl, "p"] \\ & (Sch/S)_{fppf} & \end{tikzcd}$$

We are going to think about $\mathcal{U}$ as a ``covering'' of $\mathcal{X}$. Hence we want to consider the simplicial object

$$\mathcal{U} \times_{\mathcal{X}} \mathcal{U} \times_{\mathcal{X}} \mathcal{U} \substack{\longrightarrow\\\longrightarrow\\\longrightarrow} \mathcal{U} \times_{\mathcal{X}} \mathcal{U} \substack{\longrightarrow\\\longrightarrow} \mathcal{U}$$

in the category of categories fibred in groupoids over $(Sch/S)_{fppf}$. However, since this is a $(2,1)$-category and not a category, we should say explicitly what we mean. Namely, we let $\mathcal{U}_n$ be the category with objects $(u_0, \ldots, u_n, x, \alpha_0, \ldots, \alpha_n)$ where $\alpha_i : f(u_i) \to x$ is an isomorphism in $\mathcal{X}$. We denote $f_n : \mathcal{U}_n \to \mathcal{X}$ the 1-morphism which assigns to $(u_0, \ldots, u_n, x, \alpha_0, \ldots, \alpha_n)$ the object x. Note that $\mathcal{U}_0 = \mathcal{U}$ and $f_0 = f$. Given a map $\varphi : [m] \to [n]$ we consider the 1-morphism $\mathcal{U}_\varphi : \mathcal{U}_n \longrightarrow \mathcal{U}_n$ given by

$$(u_0, \ldots, u_n, x, \alpha_0, \ldots, \alpha_n) \longmapsto (u_{\varphi(0)}, \ldots, u_{\varphi(n)}, x, \alpha_{\varphi(0)}, \ldots, \alpha_{\varphi(n)})$$

on objects. All of these 1-morphisms compose correctly on the nose (no 2-morphisms required) and all of these 1-morphisms are 1-morphisms over $\mathcal{X}$. We denote $\mathcal{U}_\bullet$ this simplicial object. If $\mathcal{F}$ is a presheaf of sets on $\mathcal{X}$, then we obtain a cosimplicial set

$$\Gamma(\mathcal{U}_0, f_0^{-1}\mathcal{F}) \substack{\longrightarrow\\\longrightarrow} \Gamma(\mathcal{U}_1, f_1^{-1}\mathcal{F}) \substack{\longrightarrow\\\longrightarrow\\\longrightarrow} \Gamma(\mathcal{U}_2, f_2^{-1}\mathcal{F})$$

Here the arrows are the pullback maps along the given morphisms of the simplicial object. If $\mathcal{F}$ is a presheaf of abelian groups, this is a cosimplicial abelian group.

Let $\mathcal{U} \to \mathcal{X}$ be as above and let $\mathcal{F}$ be an abelian presheaf on $\mathcal{X}$. The *Čech complex* associated to the situation is denoted $\check{\mathcal{C}}^\bullet(\mathcal{U} \to \mathcal{X}, \mathcal{F})$. It is the cochain complex associated to the cosimplicial abelian group above, see Simplicial, Section 14.23. It has terms

$$\check{\mathcal{C}}^n(\mathcal{U} \to \mathcal{X}, \mathcal{F}) = \Gamma(\mathcal{U}_n, f_n^{-1}\mathcal{F}).$$

The boundary maps are the maps

$$d^n = \sum\nolimits_{i=0}^{n+1} (-1)^i \delta_i^{n+1} : \Gamma(\mathcal{U}_n, f_n^{-1}\mathcal{F}) \longrightarrow \Gamma(\mathcal{U}_{n+1}, f_{n+1}^{-1}\mathcal{F})$$

where δ_i^{n+1} corresponds to the map $[n] \to [n+1]$ omitting the index i. Note that the map $\Gamma(\mathcal{X}, \mathcal{F}) \to \Gamma(\mathcal{U}_0, f_0^{-1}\mathcal{F}_0)$ is in the kernel of the differential d^0. Hence we define the *extended Čech complex* to be the complex

$$\ldots \to 0 \to \Gamma(\mathcal{X}, \mathcal{F}) \to \Gamma(\mathcal{U}_0, f_0^{-1}\mathcal{F}_0) \to \Gamma(\mathcal{U}_1, f_1^{-1}\mathcal{F}_1) \to \ldots$$

with $\Gamma(\mathcal{X}, \mathcal{F})$ placed in degree -1. The extended Čech complex is acyclic if and only if the canonical map

$$\Gamma(\mathcal{X}, \mathcal{F})[0] \longrightarrow \check{\mathcal{C}}^\bullet(\mathcal{U} \to \mathcal{X}, \mathcal{F})$$

is a quasi-isomorphism of complexes.

Lemma 58.17.1. *Generalities on Čech complexes.*

(1) *If*

$$\begin{tikzcd} \mathcal{V} \arrow[r, "h"] \arrow[d, "g"] & \mathcal{U} \arrow[d, "f"] \\ \mathcal{Y} \arrow[r, "e"] & \mathcal{X} \end{tikzcd}$$

is 2-commutative diagram of categories fibred in groupoids over $(Sch/S)_{fppf}$, then there is a morphism of Čech complexes

$$\check{\mathcal{C}}^\bullet(\mathcal{U} \to \mathcal{X}, \mathcal{F}) \longrightarrow \check{\mathcal{C}}^\bullet(\mathcal{V} \to \mathcal{Y}, e^{-1}\mathcal{F})$$

(2) *if h and e are equivalences, then the map of (1) is an isomorphism,*
(3) *if $f, f' : \mathcal{U} \to \mathcal{X}$ are 2-isomorphic, then the associated Čech complexes are isomorphic,*

Proof. In the situation of (1) let $t : f \circ h \to e \circ g$ be a 2-morphism. The map on complexes is given in degree n by pullback along the 1-morphisms $\mathcal{V}_n \to \mathcal{U}_n$ given by the rule

$$(v_0, \ldots, v_n, y, \beta_0, \ldots, \beta_n) \longmapsto (h(v_0), \ldots, h(v_n), e(y), e(\beta_0) \circ t_{v_0}, \ldots, e(\beta_n) \circ t_{v_n}).$$

For (2), note that pullback on global sections is an isomorphism for any presheaf of sets when the pullback is along an equivalence of categories. Part (3) follows on combining (1) and (2). ☐

Lemma 58.17.2. *If there exists a 1-morphism $s : \mathcal{X} \to \mathcal{U}$ such that $f \circ s$ is 2-isomorphic to $\mathrm{id}_\mathcal{X}$ then the extended Čech complex is homotopic to zero.*

Proof. Set $\mathcal{U}' = \mathcal{U} \times_\mathcal{X} \mathcal{X}$ equal to the fibre product as described in Categories, Lemma 4.29.3. Set $f' : \mathcal{U}' \to \mathcal{X}$ equal to the second projection. Then $\mathcal{U} \to \mathcal{U}'$, $u \mapsto (u, f(x), 1)$ is an equivalence over $\mathcal{X}$, hence we may replace $(\mathcal{U}, f)$ by $(\mathcal{U}', f')$ by Lemma 58.17.1. The advantage of this is that now f' has a section s' such that $f' \circ s' = \mathrm{id}_\mathcal{X}$ on the nose. Namely, if $t : s \circ f \to \mathrm{id}_\mathcal{X}$ is a 2-isomorphism then we can set $s'(x) = (s(x), x, t_x)$. Thus we may assume that $f \circ s = \mathrm{id}_\mathcal{X}$.

In the case that $f \circ s = \mathrm{id}_\mathcal{X}$ the result follows from general principles. We give the homotopy explicitly. Namely, for $n \geq 0$ define $s_n : \mathcal{U}_n \to \mathcal{U}_{n+1}$ to be the 1-morphism defined by the rule on objects

$$(u_0, \ldots, u_n, x, \alpha_0, \ldots, \alpha_n) \longmapsto (u_0, \ldots, u_n, s(x), x, \alpha_0, \ldots, \alpha_n, \mathrm{id}_x).$$

Define

$$h^{n+1} : \Gamma(\mathcal{U}_{n+1}, f_{n+1}^{-1}\mathcal{F}) \longrightarrow \Gamma(\mathcal{U}_n, f_n^{-1}\mathcal{F})$$

as pullback along s_n. We also set $s_{-1} = s$ and $h^0 : \Gamma(\mathcal{U}_0, f_0^{-1}\mathcal{F}) \to \Gamma(\mathcal{X}, \mathcal{F})$ equal to pullback along s_{-1}. Then the family of maps $\{h^n\}_{n \geq 0}$ is a homotopy between 1 and 0 on the extended Čech complex. ☐

58.18. The relative Čech complex

Let $f : \mathcal{U} \to \mathcal{X}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$ as in (58.17.0.1). Consider the associated simplicial object $\mathcal{U}_\bullet$ and the maps $f_n : \mathcal{U}_n \to \mathcal{X}$. Let $\tau \in \{Zar, \acute{e}tale, smooth, syntomic, fppf\}$. Finally, suppose that $\mathcal{F}$ is a sheaf (of sets) on $\mathcal{X}_\tau$. Then

$$f_{0,*}f_0^{-1}\mathcal{F} \rightrightarrows f_{1,*}f_1^{-1}\mathcal{F} \substack{\longrightarrow\\ \longrightarrow\\ \longrightarrow} f_{2,*}f_2^{-1}\mathcal{F}$$

is a cosimplicial sheaf on $\mathcal{X}_\tau$ where we use the pullback maps introduced in Sites, Section 9.39. If $\mathcal{F}$ is an abelian sheaf, then $f_{n,*}f_n^{-1}\mathcal{F}$ form a cosimplicial abelian sheaf on $\mathcal{X}_\tau$. The associated complex (see Simplicial, Section 14.23)

$$\ldots \to 0 \to f_{0,*}f_0^{-1}\mathcal{F} \to f_{1,*}f_1^{-1}\mathcal{F} \to f_{2,*}f_2^{-1}\mathcal{F} \to \ldots$$

is called the *relative Čech complex* associated to the situation. We will denote this complex $\mathcal{K}^\bullet(f, \mathcal{F})$. The *extended relative Čech complex* is the complex

$$\ldots \to 0 \to \mathcal{F} \to f_{0,*}f_0^{-1}\mathcal{F} \to f_{1,*}f_1^{-1}\mathcal{F} \to f_{2,*}f_2^{-1}\mathcal{F} \to \ldots$$

with $\mathcal{F}$ in degree -1. The extended relative Čech complex is acyclic if and only if the map $\mathcal{F}[0] \to \mathcal{K}^\bullet(f, \mathcal{F})$ is a quasi-isomorphism of complexes of sheaves.

Remark 58.18.1. We can define the complex $\mathcal{K}^\bullet(f, \mathcal{F})$ also if $\mathcal{F}$ is a presheaf, only we cannot use the reference to Sites, Section 9.39 to define the pullback maps. To explain the pullback maps, suppose given a commutative diagram

$$\begin{tikzcd} \mathcal{V} \arrow[rr, "h"] \arrow[dr, "g"'] & & \mathcal{U} \arrow[dl, "f"] \\ & \mathcal{X} & \end{tikzcd}$$

of categories fibred in groupoids over $(Sch/S)_{fppf}$ and a presheaf $\mathcal{G}$ on $\mathcal{U}$ we can define the pullback map $f_*\mathcal{G} \to g_*h^{-1}\mathcal{G}$ as the composition

$$f_*\mathcal{G} \longrightarrow f_*h_*h^{-1}\mathcal{G} = g_*h^{-1}\mathcal{G}$$

where the map comes from the adjunction map $\mathcal{G} \to h_*h^{-1}\mathcal{G}$. This works because in our situation the functors h_* and h^{-1} are adjoint in presheaves (and agree with their counter parts on sheaves). See Sections 58.3 and 58.4.

Lemma 58.18.2. *Generalities on relative Čech complexes.*

(1) *If*

$$\begin{tikzcd} \mathcal{V} \arrow[r, "h"] \arrow[d, "g"'] & \mathcal{U} \arrow[d, "f"] \\ \mathcal{Y} \arrow[r, "e"] & \mathcal{X} \end{tikzcd}$$

is 2-commutative diagram of categories fibred in groupoids over $(Sch/S)_{fppf}$, then there is a morphism $e^{-1}\mathcal{K}^\bullet(f, \mathcal{F}) \to \mathcal{K}^\bullet(g, e^{-1}\mathcal{F})$.

(2) *if h and e are equivalences, then the map of (1) is an isomorphism,*

(3) *if $f, f' : \mathcal{U} \to \mathcal{X}$ are 2-isomorphic, then the associated relative Čech complexes are isomorphic,*

Proof. Literally the same as the proof of Lemma 58.17.1 using the pullback maps of Remark 58.18.1. □

Lemma 58.18.3. *If there exists a 1-morphism $s : \mathcal{X} \to \mathcal{U}$ such that $f \circ s$ is 2-isomorphic to $id_\mathcal{X}$ then the extended relative Čech complex is homotopic to zero.*

Proof. Literally the same as the proof of Lemma 58.17.2. □

Remark 58.18.4. Let us ``compute'' the value of the relative Čech complex on an object x of $\mathcal{X}$. Say $p(x) = U$. Consider the 2-fibre product diagram (which serves to introduce the notation $g : \mathcal{V} \to \mathcal{Y}$)

$$\begin{tikzcd} \mathcal{V} \arrow[r, equal] \arrow[d, "g"] & (Sch/U)_{fppf} \times_{x,\mathcal{X}} \mathcal{U} \arrow[r] \arrow[d] & \mathcal{U} \arrow[d, "f"] \\ \mathcal{Y} \arrow[r, equal] & (Sch/U)_{fppf} \arrow[r, "x"] & \mathcal{X} \end{tikzcd}$$

Note that the morphism $\mathcal{V}_n \to \mathcal{U}_n$ of the proof of Lemma 58.17.1 induces an equivalence $\mathcal{V}_n = (Sch/U)_{fppf} \times_{x,\mathcal{X}} \mathcal{U}_n$. Hence we see from (58.5.0.1) that

$$\Gamma(x, \mathcal{K}^\bullet(f, \mathcal{F})) = \check{\mathcal{C}}^\bullet(\mathcal{V} \to \mathcal{Y}, x^{-1}\mathcal{F})$$

In words: The value of the relative Čech complex on an object x of $\mathcal{X}$ is the Čech complex of the base change of f to $\mathcal{X}/x \cong (Sch/U)_{fppf}$. This implies for example that Lemma 58.17.2 implies Lemma 58.18.3 and more generally that results on the (usual) Čech complex imply results for the relative Čech complex.

Lemma 58.18.5. *Let*

$$\begin{tikzcd} \mathcal{V} \arrow[r, "h"] \arrow[d, "g"] & \mathcal{U} \arrow[d, "f"] \\ \mathcal{Y} \arrow[r, "e"] & \mathcal{X} \end{tikzcd}$$

be a 2-fibre product of categories fibred in groupoids over $(Sch/S)_{fppf}$ and let $\mathcal{F}$ be an abelian presheaf on $\mathcal{X}$. Then the map $e^{-1}\mathcal{K}^\bullet(f, \mathcal{F}) \to \mathcal{K}^\bullet(g, e^{-1}\mathcal{F})$ of Lemma 58.18.2 is an isomorphism of complexes of abelian presheaves.

Proof. Let y be an object of $\mathcal{Y}$ lying over the scheme T. Set $x = e(y)$. We are going to show that the map induces an isomorphism on sections over y. Note that

$$\Gamma(y, e^{-1}\mathcal{K}^\bullet(f, \mathcal{F})) = \Gamma(x, \mathcal{K}^\bullet(f, \mathcal{F})) = \check{\mathcal{C}}^\bullet((Sch/T)_{fppf} \times_{x,\mathcal{X}} \mathcal{U} \to (Sch/T)_{fppf}, x^{-1}\mathcal{F})$$

by Remark 58.18.4. On the other hand,

$$\Gamma(y, \mathcal{K}^\bullet(g, e^{-1}\mathcal{F})) = \check{\mathcal{C}}^\bullet((Sch/T)_{fppf} \times_{y,\mathcal{Y}} \mathcal{V} \to (Sch/T)_{fppf}, y^{-1}e^{-1}\mathcal{F})$$

also by Remark 58.18.4. Note that $y^{-1}e^{-1}\mathcal{F} = x^{-1}\mathcal{F}$ and since the diagram is 2-cartesian the 1-morphism

$$(Sch/T)_{fppf} \times_{y,\mathcal{Y}} \mathcal{V} \to (Sch/T)_{fppf} \times_{x,\mathcal{X}} \mathcal{U}$$

is an equivalence. Hence the map on sections over y is an isomorphism by Lemma 58.17.1. $\square$

Exactness can be checked on a ``covering''.

Lemma 58.18.6. *Let $f : \mathcal{U} \to \mathcal{X}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. Let $\tau \in \{Zar, étale, smooth, syntomic, fppf\}$. Let*

$$\mathcal{F} \to \mathcal{G} \to \mathcal{H}$$

be a complex in $Ab(\mathcal{X}_\tau)$. Assume that

(1) *for every object x of $\mathcal{X}$ there exists a covering $\{x_i \to x\}$ in $\mathcal{X}_\tau$ such that each x_i is isomorphic to $f(u_i)$ for some object u_i of $\mathcal{U}$, and*
(2) *$f^{-1}\mathcal{F} \to f^{-1}\mathcal{G} \to f^{-1}\mathcal{H}$ is exact.*

Then the sequence $\mathcal{F} \to \mathcal{G} \to \mathcal{H}$ is exact.

Proof. Let x be an object of $\mathcal{X}$ lying over the scheme T. Consider the sequence $x^{-1}\mathcal{F} \to x^{-1}\mathcal{G} \to x^{-1}\mathcal{H}$ of abelian sheaves on $(Sch/T)_\tau$. It suffices to show this sequence is exact. By assumption there exists a τ-covering $\{T_i \to T\}$ such that $x|_{T_i}$ is isomorphic to $f(u_i)$ for some object u_i of $\mathcal{U}$ over T_i and moreover the sequence $u_i^{-1}f^{-1}\mathcal{F} \to u_i^{-1}f^{-1}\mathcal{G} \to u_i^{-1}f^{-1}\mathcal{H}$ of abelian sheaves on $(Sch/T_i)_\tau$ is exact. Since $u_i^{-1}f^{-1}\mathcal{F} = x^{-1}\mathcal{F}|_{(Sch/T_i)_\tau}$ we conclude that the sequence $x^{-1}\mathcal{F} \to x^{-1}\mathcal{G} \to x^{-1}\mathcal{H}$ become exact after localizing at each of the members of a covering, hence the sequence is exact. $\square$

Proposition 58.18.7. *Let $f : \mathcal{U} \to \mathcal{X}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. Let $\tau \in \{Zar, étale, smooth, syntomic, fppf\}$. If*

1. *$\mathcal{F}$ is an abelian sheaf on $\mathcal{X}_\tau$, and*
2. *for every object x of $\mathcal{X}$ there exists a covering $\{x_i \to x\}$ in $\mathcal{X}_\tau$ such that each x_i is isomorphic to $f(u_i)$ for some object u_i of $\mathcal{U}$,*

then the extended relative Čech complex

$$\ldots \to 0 \to \mathcal{F} \to f_{0,*}f_0^{-1}\mathcal{F} \to f_{1,*}f_1^{-1}\mathcal{F} \to f_{2,*}f_2^{-1}\mathcal{F} \to \ldots$$

is exact in $Ab(\mathcal{X}_\tau)$.

Proof. By Lemma 58.18.6 it suffices to check exactness after pulling back to $\mathcal{U}$. By Lemma 58.18.5 the pullback of the extended relative Čech complex is isomorphic to the extend relative Čech complex for the morphism $\mathcal{U} \times_\mathcal{X} \mathcal{U} \to \mathcal{U}$ and an abelian sheaf on $\mathcal{U}_\tau$. Since there is a section $\Delta_{\mathcal{U}/\mathcal{X}} : \mathcal{U} \to \mathcal{U} \times_\mathcal{X} \mathcal{U}$ exactness follows from Lemma 58.18.3. $\square$

Using this we can construct the Čech-to-cohomology spectral sequence as follows. We first give a technical, precise version. In the next section we give a version that applies only to algebraic stacks.

Lemma 58.18.8. *Let $f : \mathcal{U} \to \mathcal{X}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. Let $\tau \in \{Zar, étale, smooth, syntomic, fppf\}$. Assume*

1. *$\mathcal{F}$ is an abelian sheaf on $\mathcal{X}_\tau$,*
2. *for every object x of $\mathcal{X}$ there exists a covering $\{x_i \to x\}$ in $\mathcal{X}_\tau$ such that each x_i is isomorphic to $f(u_i)$ for some object u_i of $\mathcal{U}$,*
3. *the category $\mathcal{U}$ has equalizers, and*
4. *the functor f is faithful.*

Then there is a first quadrant spectral sequence of abelian groups

$$E_2^{p,q} = H^q((\mathcal{U}_p)_\tau, f_p^{-1}\mathcal{F}) \Rightarrow H^{p+q}(\mathcal{X}_\tau, \mathcal{F})$$

converging to the cohomology of $\mathcal{F}$ in the τ-topology.

Proof. Before we start the proof we make some remarks. By Lemma 58.16.4 (and induction) all of the categories fibred in groupoids $\mathcal{U}_p$ have equalizers and all of the morphisms $f_p : \mathcal{U}_p \to \mathcal{X}$ are faithful. Let $\mathcal{I}$ be an injective object of $Ab(\mathcal{X}_\tau)$. By Lemma 58.16.5 we see $f_p^{-1}\mathcal{I}$ is an injective object of $Ab((\mathcal{U}_p)_\tau)$. Hence $f_{p,*}f_p^{-1}\mathcal{I}$ is an injective object of $Ab(\mathcal{X}_\tau)$ by Lemma 58.16.1. Hence Proposition 58.18.7 shows that the extended relative Čech complex

$$\ldots \to 0 \to \mathcal{I} \to f_{0,*}f_0^{-1}\mathcal{I} \to f_{1,*}f_1^{-1}\mathcal{I} \to f_{2,*}f_2^{-1}\mathcal{I} \to \ldots$$

is an exact complex in $Ab(\mathcal{X}_\tau)$ all of whose terms are injective. Taking global sections of this complex is exact and we see that the Čech complex $\check{\mathcal{C}}^\bullet(\mathcal{U} \to \mathcal{X}, \mathcal{I})$ is quasi-isomorphic to $\Gamma(\mathcal{X}_\tau, \mathcal{I})[0]$.

With these preliminaries out of the way consider the two spectral sequences associated to the double complex (see Homology, Section 10.19)

$$\check{\mathcal{C}}^\bullet(\mathcal{U} \to \mathcal{X}, \mathcal{I}^\bullet)$$

where $\mathcal{F} \to \mathcal{I}^\bullet$ is an injective resolution in $Ab(\mathcal{X}_\tau)$. The discussion above shows that Homology, Lemma 10.19.6 applies which shows that $\Gamma(\mathcal{X}_\tau, \mathcal{I}^\bullet)$ is quasi-isomorphic to the total complex associated to the double complex. By our remarks above the complex $f_p^{-1}\mathcal{I}^\bullet$ is an injective resolution of $f_p^{-1}\mathcal{F}$. Hence the other spectral sequence is as indicated in the lemma. □

To be sure there is a version for modules as well.

Lemma 58.18.9. *Let $f : \mathcal{U} \to \mathcal{X}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$. Let $\tau \in \{Zar, étale, smooth, syntomic, fppf\}$. Assume*

1. *$\mathcal{F}$ is an object of $Mod(\mathcal{X}_\tau, \mathcal{O}_\mathcal{X})$,*
2. *for every object x of $\mathcal{X}$ there exists a covering $\{x_i \to x\}$ in $\mathcal{X}_\tau$ such that each x_i is isomorphic to $f(u_i)$ for some object u_i of $\mathcal{U}$,*
3. *the category $\mathcal{U}$ has equalizers, and*
4. *the functor f is faithful.*

Then there is a first quadrant spectral sequence of $\Gamma(\mathcal{O}_\mathcal{X})$-modules

$$E_2^{p,q} = H^q((\mathcal{U}_p)_\tau, f_p^*\mathcal{F}) \Rightarrow H^{p+q}(\mathcal{X}_\tau, \mathcal{F})$$

converging to the cohomology of $\mathcal{F}$ in the τ-topology.

Proof. The proof of this lemma is identical to the proof of Lemma 58.18.8 except that it uses an injective resolution in $Mod(\mathcal{X}_\tau, \mathcal{O}_\mathcal{X})$ and it uses Lemma 58.16.6 instead of Lemma 58.16.5. □

Here is a lemma that translates a more usual kind of covering in the kinds of coverings we have encountered above.

Lemma 58.18.10. *Let $f : \mathcal{X} \to \mathcal{Y}$ be a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$.*

1. *Assume that f is representable by algebraic spaces, surjective, flat, and locally of finite presentation. Then for any object y of $\mathcal{Y}$ there exists an fppf covering $\{y_i \to y\}$ and objects x_i of $\mathcal{X}$ such that $f(x_i) \cong y_i$ in $\mathcal{Y}$.*
2. *Assume that f is representable by algebraic spaces, surjective, and smooth. Then for any object y of $\mathcal{Y}$ there exists an étale covering $\{y_i \to y\}$ and objects x_i of $\mathcal{X}$ such that $f(x_i) \cong y_i$ in $\mathcal{Y}$.*

Proof. Proof of (1). Suppose that y lies over the scheme V. We may think of y as a morphism $(Sch/V)_{fppf} \to \mathcal{Y}$. By definition the 2-fibre product $\mathcal{X} \times_\mathcal{Y} (Sch/V)_{fppf}$ is representable by an algebraic space W and the morphism $W \to V$ is surjective, flat, and locally of finite presentation. Choose a scheme U and a surjective étale morphism $U \to W$. Then $U \to V$ is also surjective, flat, and locally of finite presentation (see Morphisms of Spaces, Lemmas 42.35.7, 42.35.8, 42.6.4, 42.26.2, and 42.27.2). Hence $\{U \to V\}$ is an fppf covering. Denote x the object of $\mathcal{X}$ over U corresponding to the 1-morphism $(Sch/U)_{fppf} \to \mathcal{X}$. Then $\{f(x) \to y\}$ is the desired fppf covering of $\mathcal{Y}$.

Proof of (1). Suppose that y lies over the scheme V. We may think of y as a morphism $(Sch/V)_{fppf} \to \mathcal{Y}$. By definition the 2-fibre product $\mathcal{X} \times_{\mathcal{Y}} (Sch/V)_{fppf}$ is representable by an algebraic space W and the morphism $W \to V$ is surjective and smooth. Choose a scheme U and a surjective étale morphism $U \to W$. Then $U \to V$ is also surjective and smooth (see Morphisms of Spaces, Lemmas 42.35.6, 42.6.4, and 42.33.2). Hence $\{U \to V\}$ is a smooth covering. By More on Morphisms, Lemma 33.26.7 there exists an étale covering $\{V_i \to V\}$ such that each $V_i \to V$ factors through U. Denote x_i the object of $\mathcal{X}$ over V_i corresponding to the 1-morphism

$$(Sch/V_i)_{fppf} \to (Sch/U)_{fppf} \to \mathcal{X}.$$

Then $\{f(x_i) \to y\}$ is the desired étale covering of $\mathcal{Y}$. □

Lemma 58.18.11. *Let $f : \mathcal{U} \to \mathcal{X}$ and $g : \mathcal{X} \to \mathcal{Y}$ be composable 1-morphisms of categories fibred in groupoids over $(Sch/S)_{fppf}$. Let $\tau \in \{Zar, étale, smooth, syntomic, fppf\}$. Assume*

1. *$\mathcal{F}$ is an abelian sheaf on $\mathcal{X}_\tau$,*
2. *for every object x of $\mathcal{X}$ there exists a covering $\{x_i \to x\}$ in $\mathcal{X}_\tau$ such that each x_i is isomorphic to $f(u_i)$ for some object u_i of $\mathcal{U}$,*
3. *the category $\mathcal{U}$ has equalizers, and*
4. *the functor f is faithful.*

Then there is a first quadrant spectral sequence of abelian sheaves on $\mathcal{Y}_\tau$

$$E_2^{p,q} = R^q(g \circ f_p)_* f_p^{-1}\mathcal{F} \Rightarrow R^{p+q}g_*\mathcal{F}$$

where all higher direct images are computed in the τ-topology.

Proof. Note that the assumptions on $f : \mathcal{U} \to \mathcal{X}$ and $\mathcal{F}$ are indentical to those in Lemma 58.18.8. Hence the preliminary remarks made in the proof of that lemma hold here also. These remarks imply in particular that

$$0 \to g_*\mathcal{I} \to (g \circ f_0)_* f_0^{-1}\mathcal{I} \to (g \circ f_1)_* f_1^{-1}\mathcal{I} \to \ldots$$

is exact if $\mathcal{I}$ is an injective object of $Ab(\mathcal{X}_\tau)$. Having said this, consider the two spectral sequences of Homology, Section 10.19 associated to the double complex $\mathcal{C}^{\bullet,\bullet}$ with terms

$$\mathcal{C}^{p,q} = (g \circ f_p)_*\mathcal{I}^q$$

where $\mathcal{F} \to \mathcal{I}^\bullet$ is an injective resolution in $Ab(\mathcal{X}_\tau)$. The first spectral sequence implies, via Homology, Lemma 10.19.6, that $g_*\mathcal{I}^\bullet$ is quasi-isomorphic to the total complex associated to $\mathcal{C}^{\bullet,\bullet}$. Since $f_p^{-1}\mathcal{I}^\bullet$ is an injective resolution of $f_p^{-1}\mathcal{F}$ (see Lemma 58.16.5) the second spectral sequence has terms $E_2^{p,q} = R^q(g \circ f_p)_* f_p^{-1}\mathcal{F}$ as in the statement of the lemma. □

Lemma 58.18.12. *Let $f : \mathcal{U} \to \mathcal{X}$ and $g : \mathcal{X} \to \mathcal{Y}$ be composable 1-morphisms of categories fibred in groupoids over $(Sch/S)_{fppf}$. Let $\tau \in \{Zar, étale, smooth, syntomic, fppf\}$. Assume*

1. *$\mathcal{F}$ is an object of $Mod(\mathcal{X}_\tau, \mathcal{O}_\mathcal{X})$,*
2. *for every object x of $\mathcal{X}$ there exists a covering $\{x_i \to x\}$ in $\mathcal{X}_\tau$ such that each x_i is isomorphic to $f(u_i)$ for some object u_i of $\mathcal{U}$,*
3. *the category $\mathcal{U}$ has equalizers, and*
4. *the functor f is faithful.*

Then there is a first quadrant spectral sequence in $Mod(\mathcal{Y}_\tau, \mathcal{O}_\mathcal{Y})$

$$E_2^{p,q} = R^q(g \circ f_p)_* f_p^{-1}\mathcal{F} \Rightarrow R^{p+q}g_*\mathcal{F}$$

where all higher direct images are computed in the τ-topology.

Proof. The proof is identical to the proof of Lemma 58.18.11 except that it uses an injective resolution in $Mod(\mathcal{X}_\tau, \mathcal{O}_\mathcal{X})$ and it uses Lemma 58.16.6 instead of Lemma 58.16.5. □

58.19. Cohomology on algebraic stacks

Let $\mathcal{X}$ be an algebraic stack over S. In the sections above we have seen how to define sheaves for the étale, ..., fppf topologies on $\mathcal{X}$. In fact, we have constructed a site $\mathcal{X}_\tau$ for each $\tau \in \{Zar, étale, smooth, syntomic, fppf\}$. There is a notion of an abelian sheaf $\mathcal{F}$ on these sites. In the chapter on cohomology of sites we have explained how to define cohomology. Putting all of this together, let's define the *derived global sections*

$$R\Gamma_{Zar}(\mathcal{X}, \mathcal{F}), R\Gamma_{étale}(\mathcal{X}, \mathcal{F}), \ldots, R\Gamma_{fppf}(\mathcal{X}, \mathcal{F})$$

as $\Gamma(\mathcal{X}_\tau, \mathcal{I}^\bullet)$ where $\mathcal{F} \to \mathcal{I}^\bullet$ is an injective resolution in $Ab(\mathcal{X}_\tau)$. The ith cohomology group is the ith cohomology of the total derived cohomology. We will denote this

$$H^i_{Zar}(\mathcal{X}, \mathcal{F}), H^i_{étale}(\mathcal{X}, \mathcal{F}), \ldots, H^i_{fppf}(\mathcal{X}, \mathcal{F}).$$

It will turn out that $H^i_{étale} = H^i_{smooth}$ because of More on Morphisms, Lemma 33.26.7. If $\mathcal{F}$ is a presheaf of $\mathcal{O}_\mathcal{X}$-modules which is a sheaf in the τ-topology, then we use injective resolutions in $Mod(\mathcal{X}_\tau, \mathcal{O}_\mathcal{X})$ to compute total derived global sections and cohomology groups; of course the end result is quasi-isomorphic resp. isomorphic by the general fact Cohomology on Sites, Lemma 19.12.4.

Sofar our only tool to compute cohomology groups is the result on Čech complexes proved above. We rephrase it here in the language of algebraic stacks for the étale and the fppf topology. Let $f : \mathcal{U} \to \mathcal{X}$ be a 1-morphism of algebraic stacks. Recall that

$$f_p : \mathcal{U}_p = \mathcal{U} \times_\mathcal{X} \ldots \times_\mathcal{X} \mathcal{U} \longrightarrow \mathcal{X}$$

is the structure morphism where there are $(p+1)$-factors. Also, recall that a sheaf on $\mathcal{X}$ is a sheaf for the fppf topology. Note that if $\mathcal{U}$ is an algebraic space, then $f : \mathcal{U} \to \mathcal{X}$ is representable by algebraic spaces, see Algebraic Stacks, Lemma 57.10.11. Thus the proposition applies in particular to a smooth cover of the algebraic stack $\mathcal{X}$ by a scheme.

Proposition 58.19.1. *Let $f : \mathcal{U} \to \mathcal{X}$ be a 1-morphism of algebraic stacks.*

(1) *Let $\mathcal{F}$ be an abelian étale sheaf on $\mathcal{X}$. Assume that f is representable by algebraic spaces, surjective, and smooth. Then there is a spectral sequence*

$$E_2^{p,q} = H^q_{étale}(\mathcal{U}_p, f_p^{-1}\mathcal{F}) \Rightarrow H^{p+q}_{étale}(\mathcal{X}, \mathcal{F})$$

(2) *Let $\mathcal{F}$ be an abelian sheaf on $\mathcal{X}$. Assume that f is representable by algebraic spaces, surjective, flat, and locally of finite presentation. Then there is a spectral sequence*

$$E_2^{p,q} = H^q_{fppf}(\mathcal{U}_p, f_p^{-1}\mathcal{F}) \Rightarrow H^{p+q}_{fppf}(\mathcal{X}, \mathcal{F})$$

Proof. To see this we will check the hypotheses (1) -- (4) of Lemma 58.18.8. The 1-morphism f is faithful by Algebraic Stacks, Lemma 57.15.2. This proves (4). Hypothesis (3) follows from the fact that $\mathcal{U}$ is an algebraic stack, see Lemma 58.16.2. To see (2) apply Lemma 58.18.10. Condition (1) is satisfied by fiat. □

58.20. Higher direct images and algebraic stacks

Let $g : \mathcal{X} \to \mathcal{Y}$ be a 1-morphism of algebraic stacks over S. In the sections above we have constructed a morphism of ringed topoi $g : Sh(\mathcal{X}_\tau) \to Sh(\mathcal{Y}_\tau)$ for each $\tau \in \{Zar, étale, smooth, syntomic, fppf\}$. In the chapter on cohomology of sites we have explained how to define higher direct images. Hence the *derived direct image* $Rg_*\mathcal{F}$ is defined as $g_*\mathcal{I}^\bullet$ where $\mathcal{F} \to \mathcal{I}^\bullet$ is an injective resolution in $Ab(\mathcal{X}_\tau)$. The ith higher direct image $R^ig_*\mathcal{F}$ is the ith cohomology of the derived direct image. Important: it matters which topology τ is used here!

If $\mathcal{F}$ is a presheaf of $\mathcal{O}_\mathcal{X}$-modules which is a sheaf in the τ-topology, then we use injective resolutions in $Mod(\mathcal{X}_\tau, \mathcal{O}_\mathcal{X})$ to compute derived direct image and higher direct images.

Sofar our only tool to compute the higher direct images of g_* is the result on Čech complexes proved above. This requires the choice of a ``covering'' $f : \mathcal{U} \to \mathcal{X}$. If $\mathcal{U}$ is an algebraic space, then $f : \mathcal{U} \to \mathcal{X}$ is representable by algebraic spaces, see Algebraic Stacks, Lemma 57.10.11. Thus the proposition applies in particular to a smooth cover of the algebraic stack $\mathcal{X}$ by a scheme.

Proposition 58.20.1. *Let $f : \mathcal{U} \to \mathcal{X}$ and $g : \mathcal{X} \to \mathcal{Y}$ be composable 1-morphisms of algebraic stacks.*

(1) *Assume that f is representable by algebraic spaces, surjective and smooth.*
   (a) *If $\mathcal{F}$ is in $Ab(\mathcal{X}_{étale})$ then there is a spectral sequence*
$$E_2^{p,q} = R^q(g \circ f_p)_* f_p^{-1}\mathcal{F} \Rightarrow R^{p+q}g_*\mathcal{F}$$
   in $Ab(\mathcal{Y}_{étale})$ with higher direct images computed in the étale topology.
   (b) *If $\mathcal{F}$ is in $Mod(\mathcal{X}_{étale}, \mathcal{O}_\mathcal{X})$ then there is a spectral sequence*
$$E_2^{p,q} = R^q(g \circ f_p)_* f_p^{-1}\mathcal{F} \Rightarrow R^{p+q}g_*\mathcal{F}$$
   in $Mod(\mathcal{Y}_{étale}, \mathcal{O}_\mathcal{Y})$.

(2) *Assume that f is representable by algebraic spaces, surjective, flat, and locally of finite presentation.*
   (a) *If $\mathcal{F}$ is in $Ab(\mathcal{X})$ then there is a spectral sequence*
$$E_2^{p,q} = R^q(g \circ f_p)_* f_p^{-1}\mathcal{F} \Rightarrow R^{p+q}g_*\mathcal{F}$$
   in $Ab(\mathcal{Y})$ with higher direct images computed in the fppf topology.
   (b) *If $\mathcal{F}$ is in $Mod(\mathcal{O}_\mathcal{X})$ then there is a spectral sequence*
$$E_2^{p,q} = R^q(g \circ f_p)_* f_p^{-1}\mathcal{F} \Rightarrow R^{p+q}g_*\mathcal{F}$$
   in $Mod(\mathcal{O}_\mathcal{Y})$.

Proof. To see this we will check the hypotheses (1) -- (4) of Lemma 58.18.11 and Lemma 58.18.12. The 1-morphism f is faithful by Algebraic Stacks, Lemma 57.15.2. This proves (4). Hypothesis (3) follows from the fact that $\mathcal{U}$ is an algebraic stack, see Lemma 58.16.2. To see (2) apply Lemma 58.18.10. Condition (1) is satisfied by fiat in all four cases. □

Here is a description of higher direct images for a morphism of algebraic stacks.

Lemma 58.20.2. *Let S be a scheme. Let $f : \mathcal{X} \to \mathcal{Y}$ be a 1-morphism of algebraic stacks*[4] *over S. Let $\tau \in \{Zariski, étale, smooth, syntomic, fppf\}$. Let $\mathcal{F}$ be an object of $Ab(\mathcal{X}_\tau)$*

[4] This result should hold for any 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$.

or $Mod(\mathcal{X}_\tau, \mathcal{O}_\mathcal{X})$. Then the sheaf $R^if_*\mathcal{F}$ is the sheaf associated to the presheaf

$$y \longmapsto H^i_\tau\Big((Sch/V)_{fppf} \times_{y,\mathcal{Y}} \mathcal{X},\ pr^{-1}\mathcal{F}\Big)$$

Here y is a typical object of $\mathcal{Y}$ lying over the scheme V.

Proof. Choose an injective resolution $\mathcal{F}[0] \to \mathcal{I}^\bullet$. By the formula for pushforward (58.5.0.1) we see that $R^if_*\mathcal{F}$ is the sheaf associated to the presheaf which associates to y the cohomology of the complex

$$\begin{matrix} \Gamma\Big((Sch/V)_{fppf} \times_{y,\mathcal{Y}} \mathcal{X},\ \mathrm{pr}^{-1}\mathcal{I}^{i-1}\Big) \\ \downarrow \\ \Gamma\Big((Sch/V)_{fppf} \times_{y,\mathcal{Y}} \mathcal{X},\ \mathrm{pr}^{-1}\mathcal{I}^{i}\Big) \\ \downarrow \\ \Gamma\Big((Sch/V)_{fppf} \times_{y,\mathcal{Y}} \mathcal{X},\ \mathrm{pr}^{-1}\mathcal{I}^{i+1}\Big) \end{matrix}$$

Since pr^{-1} is exact, it suffices to show that pr^{-1} preserves injectives. This follows from Lemmas 58.16.5 and 58.16.6 as well as the fact that pr is a representable morphism of algebraic stacks (so that pr is faithful by Algebraic Stacks, Lemma 57.15.2 and that $(Sch/V)_{fppf}\times_{y,\mathcal{Y}}\mathcal{X}$ has equalizers by Lemma 58.16.2). □

Here is a trivial base change result.

Lemma 58.20.3. *Let S be a scheme. Let $\tau \in \{Zariski, étale, smooth, syntomic, fppf\}$. Let*

$$\begin{tikzcd} \mathcal{Y}' \times_\mathcal{Y} \mathcal{X} \arrow[r, "g'"'] \arrow[d, "f'"'] & \mathcal{X} \arrow[d, "f"] \\ \mathcal{Y}' \arrow[r, "g"] & \mathcal{Y} \end{tikzcd}$$

be a 2-cartesian diagram of algebraic stacks over S. Then the base change map is an isomorphism

$$g^{-1}Rf_*\mathcal{F} \longrightarrow Rf'_*(g')^{-1}\mathcal{F}$$

functorial for $\mathcal{F}$ in $Ab(\mathcal{X}_\tau)$ or $\mathcal{F}$ in $Mod(\mathcal{X}_\tau, \mathcal{O}_\mathcal{X})$.

Proof. The isomorphism $g^{-1}f_*\mathcal{F} = f'_*(g')^{-1}\mathcal{F}$ is Lemma 58.5.1 (and it holds for arbitrary presheaves). For the derived direct images, there is a base change map because the morphisms g and g' are flat, see Cohomology on Sites, Section 19.15. To see that this map is a quasi-isomorphism we can use that for an object y' of $\mathcal{Y}'$ over a scheme V there is an equivalence

$$(Sch/V)_{fppf} \times_{g(y'),\mathcal{Y}} \mathcal{X} = (Sch/V)_{fppf} \times_{y',\mathcal{Y}'} (\mathcal{Y}' \times_\mathcal{Y} \mathcal{X})$$

We conclude that the induced map $g^{-1}R^if_*\mathcal{F} \to R^if'_*(g')^{-1}\mathcal{F}$ is an isomorphism by Lemma 58.20.2. □

58.21. Comparison

In this section we collect some results on comparing cohomology defined using stacks and using algebraic spaces.

Lemma 58.21.1. *Let S be a scheme. Let $\mathcal{X}$ be an algebraic stack over S representable by the algebraic space F.*

(1) *$\mathcal{I}|_{F_{étale}}$ is injective in $Ab(F_{étale})$ for $\mathcal{I}$ injective in $Ab(\mathcal{X}_{étale})$, and*

(2) $\mathcal{I}|_{F_{\acute{e}tale}}$ *is injective in* $Mod(F_{\acute{e}tale}, \mathcal{O}_F)$ *for* $\mathcal{I}$ *injective in* $Mod(\mathcal{X}_{\acute{e}tale}, \mathcal{O})$.

Proof. This follows formally from the fact that the restriction functor $\pi_{F,*} = i_F^{-1}$ (see Lemma 58.10.1) is an exact left adjoint of $i_{F,*}$, see Homology, Lemma 10.22.1. □

Lemma 58.21.2. *Let S be a scheme. Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks over S. Assume $\mathcal{X}$, $\mathcal{Y}$ are representable by algebraic spaces F, G. Denote $f : F \to G$ the induced morphism of algebraic spaces.*

(1) *For any $\mathcal{F} \in Ab(\mathcal{X}_{\acute{e}tale})$ we have*
$$(Rf_*\mathcal{F})|_{G_{\acute{e}tale}} = Rf_{small,*}(\mathcal{F}|_{F_{\acute{e}tale}})$$
in $D(G_{\acute{e}tale})$.

(2) *For any object $\mathcal{F}$ of $Mod(\mathcal{X}_{\acute{e}tale}, \mathcal{O}_{\mathcal{X}})$ we have*
$$(Rf_*\mathcal{F})|_{G_{\acute{e}tale}} = Rf_{small,*}(\mathcal{F}|_{F_{\acute{e}tale}})$$
in $D(\mathcal{O}_G)$.

Proof. Follows immediately from Lemma 58.21.1 and (58.10.2.1) on choosing an injective resolution of $\mathcal{F}$. □

Lemma 58.21.3. *Let S be a scheme. Consider a 2-fibre product square*

$$\begin{tikzcd} \mathcal{X}' \arrow[r, "g'"] \arrow[d, "f'"'] & \mathcal{X} \arrow[d, "f"] \\ \mathcal{Y}' \arrow[r, "g"] & \mathcal{Y} \end{tikzcd}$$

of algebraic stacks over S. Assume that f is representable by algebraic spaces and that $\mathcal{Y}'$ is representable by an algebraic space G'. Then $\mathcal{X}'$ is representable by an algebraic space F' and denoting $f' : F' \to G'$ the induced morphism of algebraic spaces we have

$$g^{-1}(Rf_*\mathcal{F})|_{G'_{\acute{e}tale}} = Rf'_{small,*}((g')^{-1}\mathcal{F}|_{F'_{\acute{e}tale}})$$

for any $\mathcal{F}$ in $Ab(\mathcal{X}_{\acute{e}tale})$ or in $Mod(\mathcal{X}_{\acute{e}tale}, \mathcal{O}_{\mathcal{X}})$

Proof. Follows formally on combining Lemmas 58.20.3 and 58.21.2. □

58.22. Change of topology

Here is a technical lemma which tells us that the fppf cohomology of a locally quasi-coherent sheaf is equal to its étale cohomology provided the comparison maps are isomorphisms for morphisms of $\mathcal{X}$ lying over flat morphisms.

Lemma 58.22.1. *Let S be a scheme. Let $\mathcal{X}$ be an algebraic stack over S. Let $\mathcal{F}$ be a presheaf of $\mathcal{O}_{\mathcal{X}}$-modules. Assume*

(a) *$\mathcal{F}$ is locally quasi-coherent, and*

(b) *for any morphism $\varphi : x \to y$ of $\mathcal{X}$ which lies over a morphism of schemes $f : U \to V$ which is flat and locally of finite presentation the comparison map $c_\varphi : f^*_{small}\mathcal{F}|_{V_{\acute{e}tale}} \to \mathcal{F}|_{U_{\acute{e}tale}}$ of (58.9.4.1) is an isomorphism.*

Then $\mathcal{F}$ is a sheaf for the fppf topology.

Proof. Let $\{x_i \to x\}$ be an fppf covering of $\mathcal{X}$ lying over the fppf covering $\{f_i : U_i \to U\}$ of schemes over S. By assumption the restriction $\mathcal{G} = \mathcal{F}|_{U_{étale}}$ is quasi-coherent and the comparison maps $f_{i,small}^*\mathcal{G} \to \mathcal{F}|_{U_{i,étale}}$ are isomorphisms. Hence the sheaf condition for $\mathcal{F}$ and the covering $\{x_i \to x\}$ is equivalent to the sheaf condition for $\mathcal{G}^a$ on $(Sch/U)_{fppf}$ and the covering $\{U_i \to U\}$ which holds by Descent, Lemma 31.6.1. □

Lemma 58.22.2. *Let S be a scheme. Let $\mathcal{X}$ be an algebraic stack over S. Let $\mathcal{F}$ be a presheaf $\mathcal{O}_\mathcal{X}$-module such that*

(a) *$\mathcal{F}$ is locally quasi-coherent, and*
(b) *for any morphism $\varphi : x \to y$ of $\mathcal{X}$ which lies over a morphism of schemes $f : U \to V$ which is flat and locally of finite presentation, the comparison map $c_\varphi : f_{small}^*\mathcal{F}|_{V_{étale}} \to \mathcal{F}|_{U_{étale}}$ of (58.9.4.1) is an isomorphism.*

Then $\mathcal{F}$ is an $\mathcal{O}_\mathcal{X}$-module and we have the following

(1) *If $\epsilon : \mathcal{X}_{fppf} \to \mathcal{X}_{étale}$ is the comparison morphism, then $R\epsilon_*\mathcal{F} = \epsilon_*\mathcal{F}$.*
(2) *The cohomology groups $H^p_{fppf}(\mathcal{X}, \mathcal{F})$ are equal to the cohomology groups computed in the étale topology on $\mathcal{X}$. Similarly for the cohomology groups $H^p_{fppf}(x, \mathcal{F})$ and the derived versions $R\Gamma(\mathcal{X}, \mathcal{F})$ and $R\Gamma(x, \mathcal{F})$.*
(3) *If $f : \mathcal{X} \to \mathcal{Y}$ is a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$ then $R^if_*\mathcal{F}$ is equal to the fppf-sheafification of the higher direct image computed in the étale cohomology. Similarly for derived pushforward.*

Proof. The assertion that $\mathcal{F}$ is an $\mathcal{O}_\mathcal{X}$-module follows from Lemma 58.22.1. Note that ϵ is a morphism of sites given by the identity functor on $\mathcal{X}$. The sheaf $R^p\epsilon_*\mathcal{F}$ is therefore the sheaf associated to the presheaf $x \mapsto H^p_{fppf}(x, \mathcal{F})$, see Cohomology on Sites, Lemma 19.8.4. To prove (1) it suffices to show that $H^p_{fppf}(x, \mathcal{F}) = 0$ for $p > 0$ whenever x lies over an affine scheme U. By Lemma 58.15.1 we have $H^p_{fppf}(x, \mathcal{F}) = H^p((Sch/U)_{fppf}, x^{-1}\mathcal{F})$. Combining Descent, Lemma 31.7.4 with Coherent, Lemma 25.2.2 we see that these cohomology groups are zero.

We have seen above that $\epsilon_*\mathcal{F}$ and $\mathcal{F}$ are the sheaves on $\mathcal{X}_{étale}$ and $\mathcal{X}_{fppf}$ corresponding to the same presheaf on $\mathcal{X}$ (and this is true more generally for any sheaf in the fppf topology on $\mathcal{X}$). We often abusively identify $\mathcal{F}$ and $\epsilon_*\mathcal{F}$ and this is the sense in which parts (2) and (3) of the lemma should be understood. Thus part (2) follows formally from (1) and the Leray spectral sequence, see Cohomology on Sites, Lemma 19.14.5.

Finally we prove (3). The sheaf $R^if_*\mathcal{F}$ (resp. $Rf_{étale,*}\mathcal{F}$) is the sheaf associated to the presheaf

$$y \longmapsto H^i_\tau\Big((Sch/V)_{fppf} \times_{y,\mathcal{Y}} \mathcal{X},\ \mathrm{pr}^{-1}\mathcal{F}\Big)$$

where τ is $fppf$ (resp. $étale$), see Lemma 58.20.2. Note that $\mathrm{pr}^{-1}\mathcal{F}$ satisfies properties (a) and (b) also (by Lemmas 58.11.6 and 58.9.3), hence these two presheaves are equal by (2). This immediately implies (3). □

We will use the following lemma to compare étale cohomology of sheaves on algebraic stacks with cohomology on the lisse-étale topos.

Lemma 58.22.3. *Let S be a scheme. Let $\mathcal{X}$ be an algebraic stack over S. Let $\tau = étale$ (resp. $\tau = fppf$). Let $\mathcal{X}' \subset \mathcal{X}$ be a full subcategory with the following properties*

(1) *if $x \to x'$ is a morphism of $\mathcal{X}$ which lies over a smooth (resp. flat and locally finitely presented) morphism of schemes and $x' \in Ob(\mathcal{X}')$, then $x \in Ob(\mathcal{X}')$, and*
(2) *there exists an object $x \in Ob(\mathcal{X}')$ lying over a scheme U such that the associated 1-morphism $x : (Sch/U)_{fppf} \to \mathcal{X}$ is smooth and surjective.*

We get a site $\mathcal{X}'_\tau$ by declaring a covering of $\mathcal{X}'$ to be any family of morphisms $\{x_i \to x\}$ in $\mathcal{X}'$ which is a covering in $\mathcal{X}_\tau$. Then the inclusion functor $\mathcal{X}' \to \mathcal{X}_\tau$ is fully faithful, cocontinuous, and continuous, whence defines a morphism of topoi

$$g : Sh(\mathcal{X}'_\tau) \longrightarrow Sh(\mathcal{X}_\tau)$$

and $H^p(\mathcal{X}'_\tau, g^{-1}\mathcal{F}) = H^p(\mathcal{X}_\tau, \mathcal{F})$ for all $p \geq 0$ and all $\mathcal{F} \in Ab(\mathcal{X}_\tau)$.

Proof. Note that assumption (1) implies that if $\{x_i \to x\}$ is a covering of $\mathcal{X}_\tau$ and $x \in Ob(\mathcal{X}')$, then we have $x_i \in Ob(\mathcal{X}')$. Hence we see that $\mathcal{X}' \to \mathcal{X}$ is continuous and cocontinuous as the coverings of objects of $\mathcal{X}'_\tau$ agree with their coverings seen as objects of $\mathcal{X}_\tau$. We obtain the morphism g and the functor g^{-1} is identified with the restriction functor, see Sites, Lemma 9.19.5.

In particular, if $\{x_i \to x\}$ is a covering in $\mathcal{X}'_\tau$, then for any abelian sheaf $\mathcal{F}$ on $\mathcal{X}$ then

$$\check{H}^p(\{x_i \to x\}, g^{-1}\mathcal{F}) = \check{H}^p(\{x_i \to x\}, \mathcal{F})$$

Thus if $\mathcal{I}$ is an injective abelian sheaf on $\mathcal{X}_\tau$ then we see that the higher Čech cohomology groups are zero (Cohomology on Sites, Lemma 19.11.2). Hence $H^p(x, g^{-1}\mathcal{I}) = 0$ for all objects x of $\mathcal{X}'$ (Cohomology on Sites, Lemma 19.11.8). In other words injective abelian sheaves on $\mathcal{X}_\tau$ are right acyclic for the functor $H^0(x, g^{-1}-)$. It follows that $H^p(x, g^{-1}\mathcal{F}) = H^p(x, \mathcal{F})$ for all $\mathcal{F} \in Ab(\mathcal{X})$ and all $x \in Ob(\mathcal{X}')$.

Choose an object $x \in \mathcal{X}'$ lying over a scheme U as in assumption (2). In particular $\mathcal{X}/x \to \mathcal{X}$ is a morphism of algebraic stacks which representable by algebraic spaces, surjective, and smooth. (Note that $\mathcal{X}/x$ is equivalent to $(Sch/U)_{fppf}$, see Lemma 58.9.1.) The map of sheaves

$$h_x \longrightarrow *$$

in $Sh(\mathcal{X}_\tau)$ is surjective. Namely, for any object x' of $\mathcal{X}$ there exists a τ-covering $\{x'_i \to x'\}$ such that there exist morphisms $x'_i \to x$, see Lemma 58.18.10. Since g is exact, the map of sheaves

$$g^{-1}h_x \longrightarrow * = g^{-1}*$$

in $Sh(\mathcal{X}'_\tau)$ is surjective also. Let $h_{x,n}$ be the $(n+1)$-fold product $h_x \times \ldots \times h_x$. Then we have spectral sequences

$$E_1^{p,q} = H^q(h_{x,p}, \mathcal{F}) \Rightarrow H^{p+q}(\mathcal{X}_\tau, \mathcal{F}) \tag{58.22.3.1}$$

and

$$E_1^{p,q} = H^q(g^{-1}h_{x,p}, g^{-1}\mathcal{F}) \Rightarrow H^{p+q}(\mathcal{X}'_\tau, g^{-1}\mathcal{F}) \tag{58.22.3.2}$$

see Cohomology on Sites, Lemma 19.13.2.

Case I: $\mathcal{X}$ has a final object x which is also an object of $\mathcal{X}'$. This case follows immediately from the discussion in the second paragraph above.

Case II: $\mathcal{X}$ is representable by an algebraic space F. In this case the sheaves $h_{x,n}$ are representable by an object x_n in $\mathcal{X}$. (Namely, if $\mathcal{S}_F = \mathcal{X}$ and $x : U \to F$ is the given object, then $h_{x,n}$ is representable by the object $U \times_F \ldots \times_F U \to F$ of $\mathcal{S}_F$.) It follows that $H^q(h_{x,p}, \mathcal{F}) = H^q(x_p, \mathcal{F})$. The morphisms $x_n \to x$ lie over smooth morphisms of schemes, hence $x_n \in \mathcal{X}'$ for all n. Hence $H^q(g^{-1}h_{x,p}, g^{-1}\mathcal{F}) = H^q(x_p, g^{-1}\mathcal{F})$. Thus in the two spectral sequences (58.22.3.1) and (58.22.3.2) above the $E_1^{p,q}$ terms agree by the discussion in the second paragraph. The lemma follows in Case II as well.

Case III: $\mathcal{X}$ is an algebraic stack. We claim that in this case the cohomology groups $H^q(h_{x,p}, \mathcal{F})$ and $H^q(g^{-1}h_{x,n}, g^{-1}\mathcal{F})$ agree by Case II above. Once we have proved this the result will follow as before.

Namely, consider the category $\mathcal{X}/h_{x,n}$, see Sites, Lemma 9.26.3. Since $h_{x,n}$ is the $(n+1)$-fold product of h_x an object of this category is an $(n+2)$-tuple $(y, s_0, \ldots, s_n)$ where y is an object of $\mathcal{X}$ and each $s_i : y \to x$ is a morphism of $\mathcal{X}$. This is a category over $(Sch/S)_{fppf}$. There is an equivalence

$$\mathcal{X}/h_{x,n} \longrightarrow (Sch/U)_{fppf} \times_{\mathcal{X}} \ldots \times_{\mathcal{X}} (Sch/U)_{fppf} =: \mathcal{U}_n$$

over $(Sch/S)_{fppf}$. Namely, if $x : (Sch/U)_{fppf} \to \mathcal{X}$ also denotes the 1-morphism associated with x and $p : \mathcal{X} \to (Sch/S)_{fppf}$ the structure functor, then we can think of $(y, s_0, \ldots, s_n)$ as $(y, f_0, \ldots, f_n, \alpha_0, \ldots, \alpha_n)$ where y is an object of $\mathcal{X}$, $f_i : p(y) \to p(x)$ is a morphism of schemes, and $\alpha_i : y \to x(f_i)$ an isomorphism. The category of $2n+3$-tuples $(y, f_0, \ldots, f_n, \alpha_0, \ldots, \alpha_n)$ is an incarnation of the $(n+1)$-fold fibred product $\mathcal{U}_n$ of algebraic stacks displayed above, as we discussed in Section 58.17. By Cohomology on Sites, Lemma 19.13.3 we have

$$H^p(\mathcal{U}_n, \mathcal{F}|_{\mathcal{U}_n}) = H^p(\mathcal{X}/h_{x,n}, \mathcal{F}|_{\mathcal{X}/h_{x,n}}) = H^p(h_{x,n}, \mathcal{F}).$$

Finally, we discuss the ``primed'' analogue of this. Namely, $\mathcal{X}'/h_{x,n}$ corresponds, via the equivalence above to the full subcategory $\mathcal{U}_n' \subset \mathcal{U}_n$ consisting of those tuples $(y, f_0, \ldots, f_n, \alpha_0, \ldots, \alpha_n)$ with $y \in \mathcal{X}'$. Hence certainly property (1) of the statement of the lemma holds for the inclusion $\mathcal{U}_n' \subset \mathcal{U}_n$. To see property (2) choose an object $\xi = (y, s_0, \ldots, s_n)$ which lies over a scheme W such that $(Sch/W)_{fppf} \to \mathcal{U}_n$ is smooth and surjective (this is possible as $\mathcal{U}_n$ is an algebraic stack). Then $(Sch/W)_{fppf} \to \mathcal{U}_n \to (Sch/U)_{fppf}$ is smooth as a composition of base changes of the morphism $x : (Sch/U)_{fppf} \to \mathcal{X}$, see Algebraic Stacks, Lemmas 57.10.6 and 57.10.5. Thus axiom (1) for $\mathcal{X}$ implies that y is an object of $\mathcal{X}'$ whence ξ is an object of $\mathcal{U}_n'$. Using again

$$H^p(\mathcal{U}_n', \mathcal{F}|_{\mathcal{U}_n'}) = H^p(\mathcal{X}'/h_{x,n}, \mathcal{F}|_{\mathcal{X}'/h_{x,n}}) = H^p(g^{-1}h_{x,n}, g^{-1}\mathcal{F}).$$

we now can use Case II for $\mathcal{U}_n' \subset \mathcal{U}_n$ to conclude. □

CHAPTER 59

Criteria for Representability

59.1. Introduction

The purpose of this chapter is to find criteria guaranteeing that a a stack in groupoids over the category of schemes with the fppf topology is an algebraic stack. Historically, this often involved proving that certain functors were representable, see Grothendieck's lectures [**Gro95a**], [**Gro95b**], [**Gro95e**], [**Gro95f**], [**Gro95c**], and [**Gro95d**]. This explains the title of this chapter. Another important source of this material comes from the work of Artin, see [**Art69c**], [**Art70a**], [**Art73a**], [**Art71c**], [**Art71a**], [**Art69a**], [**Art69e**], and [**Art74a**].

59.2. Conventions

The conventions we use in this chapter are the same as those in the chapter on algebraic stacks, see Algebraic Stacks, Section 57.2.

59.3. What we already know

The analogue of this chapter for algebraic spaces is the chapter entitled ``Bootstrap'', see Bootstrap, Section 54.1. That chapter already contains some representability results. Moreover, some of the preliminary material treated there we already have worked out in the chapter on algebraic stacks. Here is a list:

(1) We discuss morphisms of presheaves representable by algebraic spaces in Bootstrap, Section 54.3. In Algebraic Stacks, Section 57.9 we discuss the notion of a 1-morphism of categories fibred in groupoids being representable by algebraic spaces.
(2) We discuss properties of morphisms of presheaves representable by algebraic spaces in Bootstrap, Section 54.4. In Algebraic Stacks, Section 57.10 we discuss the notion of a 1-morphism of categories fibred in groupoids being representable by algebraic spaces.
(3) We proved that if F is a sheaf whose diagonal is representable by algebraic spaces and which has an étale covering by an algebraic space, then F is an algebraic space, see Bootstrap, Theorem 54.6.1. (This is a weak version of the result in the next item on the list.)
(4) We proved that if F is a sheaf and if there exists an algebraic space U and a morphism $U \to F$ which is representable by algebraic spaces, surjective, flat, and locally of finite presentation, then F is an algebraic space, see Bootstrap, Theorem 54.10.1.
(5) We have also proved the ``smooth'' analogue of (4) for algebraic stacks: If $\mathcal{X}$ is a stack in groupoids over $(Sch/S)_{fppf}$ and if there exists a stack in groupoids $\mathcal{U}$ over $(Sch/S)_{fppf}$ which is representably by an algebraic space and a 1-morphism $u : \mathcal{U} \to \mathcal{X}$ which is representable by algebraic spaces, surjective, and smooth then $\mathcal{X}$ is an algebraic stack, see Algebraic Stacks, Lemma 57.15.3.

Our first task now is to prove the analogue of (4) for algebraic stacks in general; it is Theorem 59.16.1.

59.4. Morphisms of stacks in groupoids

This section is preliminary and should be skipped on a first reading.

Lemma 59.4.1. *Let $\mathcal{X} \to \mathcal{Y} \to \mathcal{Z}$ be 1-morphisms of categories fibred in groupoids over $(Sch/S)_{fppf}$. If $\mathcal{X} \to \mathcal{Z}$ and $\mathcal{Y} \to \mathcal{Z}$ are representable by algebraic spaces and étale so is $\mathcal{X} \to \mathcal{Y}$.*

Proof. Let $\mathcal{U}$ be a representable category fibred in groupoids over S. Let $f : \mathcal{U} \to \mathcal{Y}$ be a 1-morphism. We have to show that $\mathcal{X} \times_{\mathcal{Y}} \mathcal{U}$ is representable by an algebraic space and étale over $\mathcal{U}$. Consider the composition $h : \mathcal{U} \to \mathcal{Z}$. Then

$$\mathcal{X} \times_{\mathcal{Z}} \mathcal{U} \longrightarrow \mathcal{Y} \times_{\mathcal{Z}} \mathcal{U}$$

is a 1-morphism between categories fibres in groupoids which are both representable by algebraic spaces and both étale over $\mathcal{U}$. Hence by Properties of Spaces, Lemma 41.13.6 this is represented by an étale morphism of algebraic spaces. Finally, we obtain the result we want as the morphism f induces a morphism $\mathcal{U} \to \mathcal{Y} \times_{\mathcal{Z}} \mathcal{U}$ and we have

$$\mathcal{X} \times_{\mathcal{Y}} \mathcal{U} = (\mathcal{X} \times_{\mathcal{Z}} \mathcal{U}) \times_{(\mathcal{Y} \times_{\mathcal{Z}} \mathcal{U})} \mathcal{U}.$$

□

Lemma 59.4.2. *Let $\mathcal{X}, \mathcal{Y}, \mathcal{Z}$ be stacks in groupoids over $(Sch/S)_{fppf}$. Suppose that $\mathcal{X} \to \mathcal{Y}$ and $\mathcal{Z} \to \mathcal{Y}$ are 1-morphisms. If*

1. *$\mathcal{Y}$, $\mathcal{Z}$ are representable by algebraic spaces Y, Z over S,*
2. *the associated morphism of algebraic spaces $Y \to Z$ is surjective, flat and locally of finite presentation, and*
3. *$\mathcal{Y} \times_{\mathcal{Z}} \mathcal{X}$ is a stack in setoids,*

then $\mathcal{X}$ is a stack in setoids.

Proof. This is a special case of Stacks, Lemma 50.6.10. □

The following lemma is the analogue of Algebraic Stacks, Lemma 57.15.3 and will be superseded by the stronger Theorem 59.16.1.

Lemma 59.4.3. *Let S be a scheme. Let $u : \mathcal{U} \to \mathcal{X}$ be a 1-morphism of stacks in groupoids over $(Sch/S)_{fppf}$. If*

1. *$\mathcal{U}$ is representable by an algebraic space, and*
2. *u is representable by algebraic spaces, surjective, flat and locally of finite presentation,*

then $\Delta : \mathcal{X} \to \mathcal{X} \times \mathcal{X}$ representable by algebraic spaces.

Proof. Given two schemes T_1, T_2 over S denote $\mathcal{T}_i = (Sch/T_i)_{fppf}$ the associated representable fibre categories. Suppose given 1-morphisms $f_i : \mathcal{T}_i \to \mathcal{X}$. According to Algebraic Stacks, Lemma 57.10.11 it suffices to prove that the 2-fibered product $\mathcal{T}_1 \times_{\mathcal{X}} \mathcal{T}_2$ is representable by an algebraic space. By Stacks, Lemma 50.6.8 this is in any case a stack in setoids. Thus $\mathcal{T}_1 \times_{\mathcal{X}} \mathcal{T}_2$ corresponds to some sheaf F on $(Sch/S)_{fppf}$, see Stacks, Lemma 50.6.3. Let U be the algebraic space which represents $\mathcal{U}$. By assumption

$$\mathcal{T}_i' = \mathcal{U} \times_{u, \mathcal{X}, f_i} \mathcal{T}_i$$

is representable by an algebraic space T_i' over S. Hence $\mathcal{T}_1' \times_{\mathcal{U}} \mathcal{T}_2'$ is representable by the algebraic space $T_1' \times_U T_2'$. Consider the commutative diagram

$$\begin{tikzcd}
& \mathcal{T}_1 \times_{\mathcal{X}} \mathcal{T}_2 \arrow[rr] \arrow[dd] & & \mathcal{T}_1 \arrow[dd] \\
\mathcal{T}_1' \times_{\mathcal{U}} \mathcal{T}_2' \arrow[ur] \arrow[rr] \arrow[dd] & & \mathcal{T}_1' \arrow[ur] \arrow[dd] & \\
& \mathcal{T}_2 \arrow[rr] & & \mathcal{X} \\
\mathcal{T}_2' \arrow[ur] \arrow[rr] & & \mathcal{U} \arrow[ur] &
\end{tikzcd}$$

In this diagram the bottom square, the right square, the back square, and the front square are 2-fibre products. A formal argument then shows that $\mathcal{T}_1' \times_{\mathcal{U}} \mathcal{T}_2' \to \mathcal{T}_1 \times_{\mathcal{X}} \mathcal{T}_2$ is the ``base change" of $\mathcal{U} \to \mathcal{X}$, more precisely the diagram

$$\begin{tikzcd}
\mathcal{T}_1' \times_{\mathcal{U}} \mathcal{T}_2' \arrow[r] \arrow[d] & \mathcal{U} \arrow[d] \\
\mathcal{T}_1 \times_{\mathcal{X}} \mathcal{T}_2 \arrow[r] & \mathcal{X}
\end{tikzcd}$$

is a 2-fibre square. Hence $T_1' \times_U T_2' \to F$ is representable by algebraic spaces, flat, locally of finite presentation and surjective, see Algebraic Stacks, Lemmas 57.9.6, 57.9.7, 57.10.4, and 57.10.6. Therefore F is an algebraic space by Bootstrap, Theorem 54.10.1 and we win. □

59.5. Limit preserving on objects

Let S be a scheme. Let $p : \mathcal{X} \to \mathcal{Y}$ be a 1-morphism of stacks in groupoids over $(Sch/S)_{fppf}$. We will say that p is *limit preserving on objects* if the following condition holds: Given any data consisting of

(1) an affine scheme $U = lim_{i \in I} U_i$ which is written as the directed limit of affine schemes U_i over S,
(2) an object y_i of $\mathcal{Y}$ over U_i for some i,
(3) an object x of $\mathcal{X}$ over U, and
(4) an isomorphism $\gamma : p(x) \to y_i|_U$,

then there exists an $i' \geq i$, an object $x_{i'}$ of $\mathcal{X}$ over $U_{i'}$, an isomorphism $\beta : x_{i'}|_U \to x$, and an isomorphism $\gamma_{i'} : p(x_{i'}) \to y_i|_{U_{i'}}$ such that

$$\begin{tikzcd}
p(x_{i'}|_U) \arrow[r, "\gamma_{i'}|_U"'] \arrow[d, "p(\beta)"'] & (y_i|_{U_{i'}})|_U \arrow[d, equal] \\
p(x) \arrow[r, "\gamma"] & y_i|_U
\end{tikzcd} \tag{59.5.0.1}$$

commutes. In this situation we say that ``$(i', x_{i'}, \beta, \gamma_{i'})$ is a *solution* to the problem posed by our data (1), (2), (3), (4)". The motivation for this definition comes from More on Morphisms of Spaces, Lemma 46.4.2.

Lemma 59.5.1. *Let $p : \mathcal{X} \to \mathcal{Y}$ and $q : \mathcal{Z} \to \mathcal{Y}$ be 1-morphisms of stacks in groupoids over $(Sch/S)_{fppf}$. If $p : \mathcal{X} \to \mathcal{Y}$ is limit preserving on objects, then so is the base change $p' : \mathcal{X} \times_{\mathcal{Y}} \mathcal{Z} \to \mathcal{Z}$ of p by q.*

Proof. This is formal. Let $U = lim_{i \in I} U_i$ be the directed limit of affine schemes U_i over S, let z_i be an object of $\mathcal{Z}$ over U_i for some i, let w be an object of $\mathcal{X} \times_{\mathcal{Y}} \mathcal{Z}$ over U, and let $\delta : p'(w) \to z_i|_U$ be an isomorphism. We may write $w = (U, x, z, \alpha)$ for some object x of $\mathcal{X}$ over U and object z of $\mathcal{Z}$ over U and isomorphism $\alpha : p(x) \to q(z)$. Note that $p'(w) = z$ hence $\delta : z \to z_i|_U$. Set $y_i = q(z_i)$ and $\gamma = q(\delta) \circ \alpha : p(x) \to y_i|_U$. As p is limit preserving on objects there exists an $i' \geq i$ and an object $x_{i'}$ of $\mathcal{X}$ over $U_{i'}$ as well as isomorphisms $\beta : x_{i'}|_U \to x$ and $\gamma_{i'} : p(x_{i'}) \to y_i|_{U_{i'}}$ such that (59.5.0.1) commutes. Then we consider the object $w_{i'} = (U_{i'}, x_{i'}, z_i|_{U_{i'}}, \gamma_{i'})$ of $\mathcal{X} \times_{\mathcal{Y}} \mathcal{Z}$ over $U_{i'}$ and define isomorphisms

$$w_{i'}|_U = (U, x_{i'}|_U, z_i|_U, \gamma_{i'}|_U) \xrightarrow{(\beta, \delta^{-1})} (U, x, z, \alpha) = w$$

and

$$p'(w_{i'}) = z_i|_{U_{i'}} \xrightarrow{\text{id}} z_i|_{U_{i'}}.$$

These combine to give a solution to the problem. □

Lemma 59.5.2. *Let $p : \mathcal{X} \to \mathcal{Y}$ and $q : \mathcal{Y} \to \mathcal{Z}$ be 1-morphisms of stacks in groupoids over $(Sch/S)_{fppf}$. If p and q are limit preserving on objects, then so is the composition $q \circ p$.*

Proof. This is formal. Let $U = lim_{i \in I} U_i$ be the directed limit of affine schemes U_i over S, let z_i be an object of $\mathcal{Z}$ over U_i for some i, let x be an object of $\mathcal{X}$ over U, and let $\gamma : q(p(x)) \to z_i|_U$ be an isomorphism. As q is limit preserving on objects there exist an $i' \geq i$, an object $y_{i'}$ of $\mathcal{Y}$ over $U_{i'}$, an isomorphism $\beta : y_{i'}|_U \to p(x)$, and an isomorphism $\gamma_{i'} : q(y_{i'}) \to z_i|_{U_{i'}}$ such that (59.5.0.1) is commutative. As p is limit preserving on objects there exist an $i'' \geq i'$, an object $x_{i''}$ of $\mathcal{X}$ over $U_{i''}$, an isomorphism $\beta' : x_{i''}|_U \to x$, and an isomorphism $\gamma'_{i''} : p(x_{i''}) \to y_{i'}|_{U_{i''}}$ such that (59.5.0.1) is commutative. The solution is to take $x_{i''}$ over $U_{i''}$ with isomorphism

$$q(p(x_{i''})) \xrightarrow{q(\gamma'_{i''})} q(y_{i'})|_{U_{i''}} \xrightarrow{\gamma_{i'}|_{U_{i''}}} z_i|_{U_{i''}}$$

and isomorphism $\beta' : x_{i''}|_U \to x$. We omit the verification that (59.5.0.1) is commutative. □

Lemma 59.5.3. *Let $p : \mathcal{X} \to \mathcal{Y}$ be a 1-morphisms of stacks in groupoids over $(Sch/S)_{fppf}$. If p is representable by algebraic spaces, then the following are equivalent:*

(1) *p is limit preserving on objects, and*
(2) *p is locally of finite presentation (see Algebraic Stacks, Definition 57.10.1).*

Proof. Assume (2). Let $U = lim_{i \in I} U_i$ be the directed limit of affine schemes U_i over S, let y_i be an object of $\mathcal{Y}$ over U_i for some i, let x be an object of $\mathcal{X}$ over U, and let $\gamma : p(x) \to y_i|_U$ be an isomorphism. Let X_{y_i} denote an algebraic space over U_i representing the 2-fibre product

$$(Sch/U_i)_{fppf} \times_{y_i, \mathcal{Y}, p} \mathcal{X}.$$

Note that $\xi = (U, U \to U_i, x, \gamma^{-1})$ defines an object of this 2-fibre product over U. Via the 2-Yoneda lemma ξ corresponds to a morphism $f_\xi : U \to X_{y_i}$ over U_i. By More on Morphisms of Spaces, Proposition 46.4.9 there exists an $i' \geq i$ and a morphism $f_{i'} : U_{i'} \to X_{y_i}$ such that f_ξ is the composition of $f_{i'}$ and the projection morphism $U \to U_{i'}$. Also, the 2-Yoneda lemma tells us that $f_{i'}$ corresponds to an object $\xi_{i'} = (U_{i'}, U_{i'} \to U_i, x_{i'}, \alpha)$ of the displayed 2-fibre product over $U_{i'}$ whose restriction to U recovers ξ. In particular we obtain an isomorphism $\gamma : x_{i'}|U \to x$. Note that $\alpha : y_i|_{U_{i'}} \to p(x_{i'})$. Hence we see that taking $x_{i'}$, the isomorphism $\gamma : x_{i'}|U \to x$, and the isomorphism $\beta = \alpha^{-1} : p(x_{i'}) \to y_i|_{U_{i'}}$ is a solution to the problem.

Assume (1). Choose a scheme T and a 1-morphism $y : (Sch/T)_{fppf} \to \mathcal{Y}$. Let X_y be an algebraic space over T representing the 2-fibre product $(Sch/T)_{fppf} \times_{y,\mathcal{Y},p} \mathcal{X}$. We have to show that $X_y \to T$ is locally of finite presentation. To do this we may use More on Morphisms of Spaces, Proposition 46.4.9 in the form described in More on Morphisms of Spaces, Remark 46.4.10. Hence it suffices to show that given an affine scheme $U = lim_{i \in I} U_i$ written as the directed limit of affine schemes over T, then $X_y(U) = colim_i X_y(U_i)$. Pick any $i \in I$ and set $y_i = y|_{U_i}$. Also denote i' an element of I which is bigger than or equal to i. By the 2-Yoneda lemma morphisms $U \to X_y$ over T correspond bijectively to isomorphism classes of pairs (x, α) where x is an object of $\mathcal{X}$ over U and $\alpha : y|_U \to p(x)$ is an isomorphism. Of course giving α is, up to an inverse, the same thing as giving an isomorphism $\gamma : p(x) \to y_i|_U$. Similarly for morphisms $U_{i'} \to X_y$ over T. Hence (1) guarantees that

$$X_y(U) = colim_{i' \geq i} X_y(U_{i'})$$

in this situation and we win. □

Lemma 59.5.4. *Let $p : \mathcal{X} \to \mathcal{Y}$ be a 1-morphism of stacks in groupoids over $(Sch/S)_{fppf}$. Assume p is representable by algebraic spaces and an open immersion. Then p is limit preserving on objects.*

Proof. This follows from Lemma 59.5.3 and (via the general principle Algebraic Stacks, Lemma 57.10.9) from the fact that an open immersion of algebraic spaces is locally of finite presentation, see Morphisms of Spaces, Lemma 42.26.10. □

59.6. Formally smooth on objects

Let S be a scheme. Let $p : \mathcal{X} \to \mathcal{Y}$ be a 1-morphism of stacks in groupoids over $(Sch/S)_{fppf}$. We will say that p is *formally smooth on objects* if the following condition holds: Given any data consisting of

(1) a first order thickening $U \subset U'$ of affine schemes over S,
(2) an object y' of $\mathcal{Y}$ over U',
(3) an object x of $\mathcal{X}$ over U, and
(4) an isomorphism $\gamma : p(x) \to y'|_U$,

then there exists an object x' of $\mathcal{X}$ over U' with an isomorphism $\beta : x'|_U \to x$ and an isomorphism $\gamma' : p(x') \to y'$ such that

(59.6.0.1)
$$\begin{tikzcd} p(x'|_U) \arrow[r, "\gamma'|_U"] \arrow[d, "p(\beta)"] & y'|_U \arrow[d, equal] \\ p(x) \arrow[r, "\gamma"] & y'|_U \end{tikzcd}$$

commutes. In this situation we say that ``(x', β, γ') is a *solution* to the problem posed by our data (1), (2), (3), (4)".

Lemma 59.6.1. *Let $p : \mathcal{X} \to \mathcal{Y}$ and $q : \mathcal{Z} \to \mathcal{Y}$ be 1-morphisms of stacks in groupoids over $(Sch/S)_{fppf}$. If $p : \mathcal{X} \to \mathcal{Y}$ is formally smooth on objects, then so is the base change $p' : \mathcal{X} \times_{\mathcal{Y}} \mathcal{Z} \to \mathcal{Z}$ of p by q.*

Proof. This is formal. Let $U \subset U'$ be a first order thickening of affine schemes over S, let z' be an object of $\mathcal{Z}$ over U', let w be an object of $\mathcal{X} \times_{\mathcal{Y}} \mathcal{Z}$ over U, and let $\delta : p'(w) \to z'|_U$ be an isomorphism. We may write $w = (U, x, z, \alpha)$ for some object x of $\mathcal{X}$ over U and object z of $\mathcal{Z}$ over U and isomorphism $\alpha : p(x) \to q(z)$. Note that $p'(w) = z$ hence $\delta : z \to z|_U$. Set $y' = q(z')$ and $\gamma = q(\delta) \circ \alpha : p(x) \to y'|_U$. As p is formally smooth on objects there exists an object x' of $\mathcal{X}$ over U' as well as isomorphisms $\beta : x'|_U \to x$ and $\gamma' : p(x') \to y'$ such that (59.6.0.1) commutes. Then we consider the object $w = (U', x', z', \gamma')$ of $\mathcal{X} \times_{\mathcal{Y}} \mathcal{Z}$ over U' and define isomorphisms

$$w'|_U = (U, x'|_U, z'|_U, \gamma'|_U) \xrightarrow{(\beta, \delta^{-1})} (U, x, z, \alpha) = w$$

and

$$p'(w') = z' \xrightarrow{\text{id}} z'.$$

These combine to give a solution to the problem. □

Lemma 59.6.2. *Let $p : \mathcal{X} \to \mathcal{Y}$ and $q : \mathcal{Y} \to \mathcal{Z}$ be 1-morphisms of stacks in groupoids over $(Sch/S)_{fppf}$. If p and q are formally smooth on objects, then so is the composition $q \circ p$.*

Proof. This is formal. Let $U \subset U'$ be a first order thickening of affine schemes over S, let z' be an object of $\mathcal{Z}$ over U', let x be an object of $\mathcal{X}$ over U, and let $\gamma : q(p(x)) \to z'|_U$ be an isomorphism. As q is formally smooth on objects there exist an object y' of $\mathcal{Y}$ over U', an isomorphism $\beta : y'|_U \to p(x)$, and an isomorphism $\gamma' : q(y') \to z'$ such that (59.6.0.1) is commutative. As p is formally smooth on objects there exist an object x' of $\mathcal{X}$ over U', an isomorphism $\beta' : x'|_U \to x$, and an isomorphism $\gamma'' : p(x') \to y'$ such that (59.6.0.1) is commutative. The solution is to take x' over U' with isomorphism

$$q(p(x')) \xrightarrow{q(\gamma'')} q(y') \xrightarrow{\gamma'} z'$$

and isomorphism $\beta' : x'|_U \to x$. We omit the verification that (59.6.0.1) is commutative. □

Note that the class of formally smooth morphisms of algebraic spaces is stable under arbitrary base change and local on the target in the fpqc topology, see More on Morphisms of Spaces, Lemma 46.16.3 and 46.16.10. Hence condition (2) in the lemma below makes sense.

Lemma 59.6.3. *Let $p : \mathcal{X} \to \mathcal{Y}$ be a 1-morphisms of stacks in groupoids over $(Sch/S)_{fppf}$. If p is representable by algebraic spaces, then the following are equivalent:*

1. *p is formally smooth on objects, and*
2. *p is formally smooth (see Algebraic Stacks, Definition 57.10.1).*

Proof. Assume (2). Let $U \subset U'$ be a first order thickening of affine schemes over S, let y' be an object of $\mathcal{Y}$ over U', let x be an object of $\mathcal{X}$ over U, and let $\gamma : p(x) \to y'|_U$ be an isomorphism. Let $X_{y'}$ denote an algebraic space over U' representing the 2-fibre product

$$(Sch/U')_{fppf} \times_{y', \mathcal{Y}, p} \mathcal{X}.$$

Note that $\xi = (U, U \to U', x, \gamma^{-1})$ defines an object of this 2-fibre product over U. Via the 2-Yoneda lemma ξ corresponds to a morphism $f_\xi : U \to X_{y'}$ over U'. As $X_{y'} \to U'$ is formally smooth by assumption there exists a morphism $f' : U' \to X_{y'}$ such that f_ξ is the composition of f' and the morphism $U \to U'$. Also, the 2-Yoneda lemma tells us that f' corresponds to an object $\xi' = (U', U' \to U', x', \alpha)$ of the displayed 2-fibre product over U' whose restriction to U recovers ξ. In particular we obtain an isomorphism $\gamma : x'|U \to x$.

Note that $\alpha : y' \to p(x')$. Hence we see that taking x', the isomorphism $\gamma : x'|U \to x$, and the isomorphism $\beta = \alpha^{-1} : p(x') \to y'$ is a solution to the problem.

Assume (1). Choose a scheme T and a 1-morphism $y : (Sch/T)_{fppf} \to \mathcal{Y}$. Let X_y be an algebraic space over T representing the 2-fibre product $(Sch/T)_{fppf} \times_{y,\mathcal{Y},p} \mathcal{X}$. We have to show that $X_y \to T$ is formally smooth. Hence it suffices to show that given a first order thickening $U \subset U'$ of affine schemes over T, then $X_y(U') \to X_y(U')$ is surjective (morphisms in the category of algebraic spaces over T). Set $y' = y|_{U'}$. By the 2-Yoneda lemma morphisms $U \to X_y$ over T correspond bijectively to isomorphism classes of pairs (x, α) where x is an object of $\mathcal{X}$ over U and $\alpha : y|_U \to p(x)$ is an isomorphism. Of course giving α is, up to an inverse, the same thing as giving an isomorphism $\gamma : p(x) \to y'|_U$. Similarly for morphisms $U' \to X_y$ over T. Hence (1) guarantees the surjectivity of $X_y(U') \to X_y(U')$ in this situation and we win. □

59.7. Surjective on objects

Let S be a scheme. Let $p : \mathcal{X} \to \mathcal{Y}$ be a 1-morphism of stacks in groupoids over $(Sch/S)_{fppf}$. We will say that p is *surjective on objects* if the following condition holds: Given any data consisting of

(1) a field k over S, and
(2) an object y of $\mathcal{Y}$ over $Spec(k)$,

then there exists an extension $k \subset K$ of fields over S, an object x of $\mathcal{X}$ over $Spec(K)$ such that $p(x) \cong y|_{Spec(K)}$.

Lemma 59.7.1. *Let $p : \mathcal{X} \to \mathcal{Y}$ and $q : \mathcal{Z} \to \mathcal{Y}$ be 1-morphisms of stacks in groupoids over $(Sch/S)_{fppf}$. If $p : \mathcal{X} \to \mathcal{Y}$ is surjective on objects, then so is the base change $p' : \mathcal{X} \times_{\mathcal{Y}} \mathcal{Z} \to \mathcal{Z}$ of p by q.*

Proof. This is formal. Let z be an object of $\mathcal{Z}$ over a field k. As p is surjective on objects there exists an extension $k \subset K$ and an object x of $\mathcal{X}$ over K and an isomorphism $\alpha : p(x) \to q(z)|_{Spec(K)}$. Then $w = (Spec(K), x, z|_{Spec(K)}, \alpha)$ is an object of $\mathcal{X} \times_{\mathcal{Y}} \mathcal{Z}$ over K with $p'(w) = z|_{Spec(K)}$. □

Lemma 59.7.2. *Let $p : \mathcal{X} \to \mathcal{Y}$ and $q : \mathcal{Y} \to \mathcal{Z}$ be 1-morphisms of stacks in groupoids over $(Sch/S)_{fppf}$. If p and q are surjective on objects, then so is the composition $q \circ p$.*

Proof. This is formal. Let z be an object of $\mathcal{Z}$ over a field k. As q is surjective on objects there exists a field extension $k \subset K$ and an object y of $\mathcal{Y}$ over K such that $q(y) \cong x|_{Spec(K)}$. As p is surjective on objects there exists a field extension $K \subset L$ and an object x of $\mathcal{X}$ over L such that $p(x) \cong y|_{Spec(L)}$. Then the field extension $k \subset L$ and the object x of $\mathcal{X}$ over L satisfy $q(p(x)) \cong z|_{Spec(L)}$ as desired. □

Lemma 59.7.3. *Let $p : \mathcal{X} \to \mathcal{Y}$ be a 1-morphisms of stacks in groupoids over $(Sch/S)_{fppf}$. If p is representable by algebraic spaces, then the following are equivalent:*

(1) *p is surjective on objects, and*
(2) *p is surjective (see Algebraic Stacks, Definition 57.10.1).*

Proof. Assume (2). Let k be a field and let y be an object of $\mathcal{Y}$ over k. Let X_y denote an algebraic space over k representing the 2-fibre product

$$(Sch/\, Spec(k))_{fppf} \times_{y,\mathcal{Y},p} \mathcal{X}.$$

As we've assumed that p is surjective we see that X_y is not empty. Hence we can find a field extension $k \subset K$ and a K-valued point x of X_y. Via the 2-Yoneda lemma this corresponds to an object x of $\mathcal{X}$ over K together with an isomorphism $p(x) \cong y|_{Spec(K)}$ and we see that (1) holds.

Assume (1). Choose a scheme T and a 1-morphism $y : (Sch/T)_{fppf} \to \mathcal{Y}$. Let X_y be an algebraic space over T representing the 2-fibre product $(Sch/T)_{fppf} \times_{y,\mathcal{Y},p} \mathcal{X}$. We have to show that $X_y \to T$ is surjective. By Morphisms of Spaces, Definition 42.6.2 we have to show that $|X_y| \to |T|$ is surjective. This means exactly that given a field k over T and a morphism $t : Spec(k) \to T$ there exists a field extension $k \subset K$ and a morphism $x : Spec(K) \to X_y$ such that

$$\begin{tikzcd} Spec(K) \arrow[r, "x"'] \arrow[d] & X_y \arrow[d] \\ Spec(k) \arrow[r, "t"] & T \end{tikzcd}$$

commutes. By the 2-Yoneda lemma this means exactly that we have to find $k \subset K$ and an object x of $\mathcal{X}$ over K such that $p(x) \cong t^*y|_{Spec(K)}$. Hence (1) guarantees that this is the case and we win. □

59.8. Algebraic morphisms

The following notion is occasionally useful.

Definition 59.8.1. Let S be a scheme. Let $F : \mathcal{X} \to \mathcal{Y}$ be a 1-morphism of stacks in groupoids over $(Sch/S)_{fppf}$. We say that F is *algebraic* if for every scheme T and every object ξ of $\mathcal{Y}$ over T the 2-fibre product

$$(Sch/T)_{fppf} \times_{\xi,\mathcal{Y}} \mathcal{X}$$

is an algebraic stack over S.

With this terminology in place we have the following result that generalizes Algebraic Stacks, Lemma 57.15.4.

Lemma 59.8.2. *Let S be a scheme. Let $F : \mathcal{X} \to \mathcal{Y}$ be a 1-morphism of stacks in groupoids over $(Sch/S)_{fppf}$. If*

(1) *$\mathcal{Y}$ is an algebraic stack, and*
(2) *F is algebraic (see above),*

then $\mathcal{X}$ is an algebraic stack.

Proof. By assumption (1) there exists a scheme T and an object ξ of $\mathcal{Y}$ over T such that the corresponding 1-morphism $\xi : (Sch/T)_{fppf} \to \mathcal{Y}$ is smooth an surjective. Then $\mathcal{U} = (Sch/T)_{fppf} \times_{\xi,\mathcal{Y}} \mathcal{X}$ is is an algebraic stack by assumption (2). Choose a scheme U and a surjective smooth 1-morphism $(Sch/U)_{fppf} \to \mathcal{U}$. The projection $\mathcal{U} \longrightarrow \mathcal{X}$ is, as the base change of the morphism $\xi : (Sch/T)_{fppf} \to \mathcal{Y}$, surjective and smooth, see Algebraic Stacks, Lemma 57.10.6. Then the composition $(Sch/U)_{fppf} \to \mathcal{U} \to \mathcal{X}$ is surjective and smooth as a composition of surjective and smooth morphisms, see Algebraic Stacks, Lemma 57.10.5. Hence $\mathcal{X}$ is an algebraic stack by Algebraic Stacks, Lemma 57.15.3. □

Lemma 59.8.3. *Let S be a scheme. Let $F : \mathcal{X} \to \mathcal{Y}$ be a 1-morphism of stacks in groupoids over $(Sch/S)_{fppf}$. If $\mathcal{X}$ is an algebraic stack and $\Delta : \mathcal{Y} \to \mathcal{Y} \times \mathcal{Y}$ is representable by algebraic spaces, then F is algebraic.*

Proof. Choose a representable stack in groupoids $\mathcal{U}$ and a surjective smooth 1-morphism $\mathcal{U} \to \mathcal{X}$. Let T be a scheme and let ξ be an object of $\mathcal{Y}$ over T. The morphism of 2-fibre products

$$(Sch/T)_{fppf} \times_{\xi,\mathcal{Y}} \mathcal{U} \longrightarrow (Sch/T)_{fppf} \times_{\xi,\mathcal{Y}} \mathcal{X}$$

is representable by algebraic spaces, surjective, and smooth as a base change of $\mathcal{U} \to \mathcal{X}$, see Algebraic Stacks, Lemmas 57.9.7 and 57.10.6. By our condition on the diagonal of $\mathcal{Y}$ we see that the source of this morphism is representable by an algebraic space, see Algebraic Stacks, Lemma 57.10.11. Hence the target is an algebraic stack by Algebraic Stacks, Lemma 57.15.3. $\square$

59.9. Spaces of sections

Given morphisms $W \to Z \to U$ we can consider the functor that associates to a scheme U' over U the set of sections $\sigma : Z_{U'} \to W_{U'}$ of the base change $W_{U'} \to Z_{U'}$ of the morphism $W \to Z$. In this section we prove some preliminary lemmas on this functor.

Lemma 59.9.1. *Let $Z \to U$ be a finite morphism of schemes. Let W be an algebraic space and let $W \to Z$ be a surjective étale morphism. Then there exists a surjective étale morphism $U' \to U$ and a section*

$$\sigma : Z_{U'} \to W_{U'}$$

of the morphism $W_{U'} \to Z_{U'}$.

Proof. We may choose a separated scheme W' and a surjective étale morphism $W' \to W$. Hence after replacing W by W' we may assume that W is a separated scheme. Write $f : W \to Z$ and $\pi : Z \to U$. Note that $f \circ \pi : W \to U$ is separated as W is separated (see Schemes, Lemma 21.21.14). Let $u \in U$ be a point. Clearly it suffices to find an étale neighbourhood (U', u') of (U, u) such that a section σ exists over U'. Let $z_1, \ldots, z_r$ be the points of Z lying above u. For each i choose a point $w_i \in W$ which maps to z_i. We may pick an étale neighbourhood $(U', u') \to (U, u)$ such that the conclusions of More on Morphisms, Lemma 33.28.5 hold for both $Z \to U$ and the points $z_1, \ldots, z_r$ and $W \to U$ and the points $w_1, \ldots, w_r$. Hence, after replacing (U, u) by (U', u') and relabeling, we may assume that all the field extensions $\kappa(u) \subset \kappa(z_i)$ and $\kappa(u) \subset \kappa(w_i)$ are purely inseparable, and moreover that there exist disjoint union decompositions

$$Z = V_1 \amalg \ldots \amalg V_r \amalg A, \quad W = W_1 \amalg \ldots \amalg W_r \amalg B$$

by open and closed subschemes with $z_i \in V_i$, $w_i \in W_i$ and $V_i \to U$, $W_i \to U$ finite. After replacing U by $U \setminus \pi(A)$ we may assume that $A = \emptyset$, i.e., $Z = V_1 \amalg \ldots \amalg V_r$. After replacing W_i by $W_i \cap f^{-1}(V_i)$ and B by $B \cup \bigcup W_i \cap f^{-1}(Z \setminus V_i)$ we may assume that f maps W_i into V_i. Then $f_i = f|_{W_i} : W_i \to V_i$ is a morphism of schemes finite over U, hence finite (see Morphisms, Lemma 24.42.12). It is also étale (by assumption), $f_i^{-1}(\{z_i\}) = w_i$, and induces an isomorphism of residue fields $\kappa(z_i) = \kappa(w_i)$ (because both are purely inseparable extensions of $\kappa(u)$ and $\kappa(z_i) \subset \kappa(w_i)$ is separable as f is étale). Hence by Étale Morphisms, Lemma 37.14.2 we see that f_i is an isomorphism in a neighbourhood V_i' of z_i. Since $\pi : Z \to U$ is closed, after shrinking U, we may assume that $W_i \to V_i$ is an isomorphism. This proves the lemma. $\square$

Lemma 59.9.2. *Let $Z \to U$ be a finite locally free morphism of schemes. Let W be an algebraic space and let $W \to Z$ be an étale morphism. Then the functor*

$$F : (Sch/U)_{fppf}^{opp} \longrightarrow Sets,$$

defined by the rule

$$U' \longmapsto F(U') = \{\sigma : Z_{U'} \to W_{U'} \text{ section of } W_{U'} \to Z_{U'}\}$$

is an algebraic space and the morphism $F \to U$ is étale.

Proof. Assume first that $W \to Z$ is also separated. Let U' be a scheme over U and let $\sigma \in F(U')$. By Morphisms of Spaces, Lemma 42.5.7 the morphism σ is a closed immersion. Moreover, σ is étale by Properties of Spaces, Lemma 41.13.6. Hence σ is also an open immersion, see Morphisms of Spaces, Lemma 42.40.2. In other words, $Z_\sigma = \sigma(Z_{U'}) \subset W_{U'}$ is an open subspace such that the morphism $Z_\sigma \to Z_{U'}$ is an isomorphism. In particular, the morphism $Z_\sigma \to U'$ is finite. Hence we obtain a transformation of functors

$$F \longrightarrow (W/U)_{fin}, \quad \sigma \longmapsto (U' \to U, Z_\sigma)$$

where $(W/U)_{fin}$ is the finite part of the morphism $W \to U$ introduced in More on Groupoids in Spaces, Section 53.8. It is clear that this transformation of functors is injective (since we can recover σ from Z_σ as the inverse of the isomorphism $Z_\sigma \to Z_{U'}$). By More on Groupoids in Spaces, Proposition 53.8.11 we know that $(W/U)_{fin}$ is an algebraic space étale over U. Hence to finish the proof in this case it suffices to show that $F \to (W/U)_{fin}$ is representable and an open immersion. To see this suppose that we are given a morphism of schemes $U' \to U$ and an open subspace $Z' \subset W_{U'}$ such that $Z' \to U'$ is finite. Then it suffices to show that there exists an open subscheme $U'' \subset U'$ such that a morphism $T \to U'$ factors through U'' if and only if $Z' \times_{U'} T$ maps isomorphically to $Z \times_{U'} T$. This follows from Quot, Lemma 47.3.6 (here we use that $Z \to B$ is flat and locally of finite presentation as well as finite). Hence we have proved the lemma in case $W \to Z$ is separated as well as étale.

In the general case we choose a separated scheme W' and a surjective étale morphism $W' \to W$. Note that the morphisms $W' \to W$ and $W \to Z$ are separated as their source is separated. Denote F' the functor associated to $W' \to Z \to U$ as in the lemma. In the first paragraph of the proof we showed that F' is representable by an algebraic space étale over U. By Lemma 59.9.1 the map of functors $F' \to F$ is surjective for the étale topology on Sch/U. Moreover, if U' and $\sigma : Z_{U'} \to W_{U'}$ define a point $\xi \in F(U')$, then the fibre product

$$F'' = F' \times_{F,\xi} U'$$

is the functor on Sch/U' associated to the morphisms

$$W'_{U'} \times_{W_{U'},\sigma} Z_{U'} \to Z_{U'} \to U'.$$

Since the first morphism is separated as a base change of a separated morphism, we see that F'' is an algebraic space étale over U' by the result of the first paragraph. It follows that $F' \to F$ is a surjective étale transformation of functors, which is representable by algebraic spaces. Hence F is an algebraic space by Bootstrap, Theorem 54.10.1. Since $F' \to F$ is an étale surjective morphism of algebraic spaces it follows that $F \to U$ is étale because $F' \to U$ is étale. $\square$

59.10. Relative morphisms

Let S be a scheme. Let $Z \to B$ and $X \to B$ be morphisms of algebraic spaces over S. Given a scheme T we can consider pairs (a, b) where $a : T \to B$ is a morphism and

$b : T\times_{a,B} Z \to T\times_{a,B} X$ is a morphism over T. Picture

(59.10.0.1)
$$\begin{tikzcd} T\times_{a,B} Z \arrow[rr, "b"] \arrow[dr] & & T\times_{a,B} X \arrow[dl] & Z \arrow[dr] & & X \arrow[dl] \\ & T \arrow[rrrr, "a"] & & & B & \end{tikzcd}$$

Of course, we can also think of b as a morphism $b : T\times_{a,B} Z \to X$ such that

$$\begin{tikzcd} T\times_{a,B} Z \arrow[r] \arrow[d] \arrow[rr, bend left, "b"] & Z \arrow[dr] & X \arrow[d] \\ T \arrow[rr, "a"] & & B \end{tikzcd}$$

commutes. In this situation we can define a functor

(59.10.0.2) $$Mor_B(Z, X) : (Sch/S)^{opp} \longrightarrow Sets, \quad T \longmapsto \{(a, b) \text{ as above}\}$$

Sometimes we think of this as a functor defined on the category of schemes over B, in which case we drop a from the notation.

Lemma 59.10.1. *Let S be a scheme. Let $Z \to B$ and $X \to B$ be morphisms of algebraic spaces over S. Then*

(1) *$Mor_B(Z, X)$ is a sheaf on $(Sch/S)_{fppf}$.*
(2) *If T is an algebraic space over S, then there is a canonical bijection*

$$Mor_{Sh((Sch/S)_{fppf})}(T, Mor_B(Z, X)) = \{(a, b) \text{ as in } (59.10.0.1)\}$$

Proof. Let T be an algebraic space over S. Let $\{T_i \to T\}$ be an fppf covering of T (as in Topologies on Spaces, Section 44.4). Suppose that $(a_i, b_i) \in Mor_B(Z, X)(T_i)$ such that $(a_i, b_i)|_{T_i\times_T T_j} = (a_j, b_j)|_{T_i\times_T T_j}$ for all i, j. Then by Descent on Spaces, Lemma 45.6.2 there exists a unique morphism $a : T \to B$ such that a_i is the composition of $T_i \to T$ and a. Then $\{T_i \times_{a_i,B} Z \to T\times_{a,B} Z\}$ is an fppf covering too and the same lemma implies there exists a unique morphism $b : T\times_{a,B} Z \to T\times_{a,B} X$ such that b_i is the composition of $T_i \times_{a_i,B} Z \to T\times_{a,B} Z$ and b. Hence $(a, b) \in Mor_B(Z, X)(T)$ restricts to (a_i, b_i) over T_i for all i.

Note that the result of the preceding paragraph in particular implies (1).

Let T be an algebraic space over S. In order to prove (2) we will construct mutually inverse maps between the displayed sets. In the following when we say ``pair'' we mean a pair (a, b) fitting into (59.10.0.1).

Let $v : T \to Mor_B(Z, X)$ be a natural transformation. Choose a scheme U and a surjective étale morphism $p : U \to T$. Then $v(p) \in Mor_B(Z, X)(U)$ corresponds to a pair (a_U, b_U) over U. Let $R = U \times_T U$ with projections $t, s : R \to U$. As v is a transformation of functors we see that the pullbacks of (a_U, b_U) by s and t agree. Hence, since $\{U \to T\}$ is an fppf covering, we may apply the result of the first paragraph that deduce that there exists a unique pair (a, b) over T.

Conversely, let (a, b) be a pair over T. Let $U \to T$, $R = U\times_T U$, and $t, s : R \to U$ be as above. Then the restriction $(a, b)|_U$ gives rise to a tranformation of functors $v : h_U \to Mor_B(Z, X)$ by the Yoneda lemma (Categories, Lemma 4.3.5). As the two pullbacks $s^*(a, b)|_U$ and $t^*(a, b)|_U$ are equal, we see that v coequalizes the two maps $h_t, h_s : h_R \to h_U$. Since

$T = U/R$ is the fppf quotient sheaf by Spaces, Lemma 40.9.1 and since $Mor_B(Z, X)$ is an fppf sheaf by (1) we conclude that v factors through a map $T \to Mor_B(Z, X)$.

We omit the verification that the two constructions above are mutually inverse. □

Lemma 59.10.2. *Let S be a scheme. Let $Z \to B$, $X \to B$, and $B' \to B$ be morphisms of algebraic spaces over S. Set $Z' = B' \times_B Z$ and $X' = B' \times_B X$. Then*

$$Mor_{B'}(Z', X') = B' \times_B Mor_B(Z, X)$$

in $Sh((Sch/S)_{fppf})$.

Proof. The equality as functors follows immediately from the definitions. The equality as sheaves follows from this because both sides are sheaves according to Lemma 59.10.1 and the fact that a fibre product of sheaves is the same as the corresponding fibre product of pre-sheaves (i.e., functors). □

Lemma 59.10.3. *Let S be a scheme. Let $Z \to B$ and $X' \to X \to B$ be morphisms of algebraic spaces over S. Assume*

1. *$X' \to X$ is étale, and*
2. *$Z \to B$ is finite locally free.*

Then $Mor_B(Z, X') \to Mor_B(Z, X)$ is representable by algebraic spaces and étale. If $X' \to X$ is also surjective, then $Mor_B(Z, X') \to Mor_B(Z, X)$ is surjective.

Proof. Let U be a scheme and let $\xi = (a, b)$ be an element of $Mor_B(Z, X)(U)$. We have to prove that the functor

$$h_U \times_{\xi, Mor_B(Z,X)} Mor_B(Z, X')$$

is representable by an algebaic space étale over U. Set $Z_U = U \times_{a,B} Z$ and $W = Z_U \times_{b,X} X'$. Then $W \to Z_U \to U$ is as in Lemma 59.9.2 and the sheaf F defined there is identified with the fibre product displayed above. Hence the first assertion of the lemma. The second assertion follows from this and Lemma 59.9.1 which guarantees that $F \to U$ is surjective in the situation above. □

Lemma 59.10.4. *Let $Z \to B$ and $X \to B$ be morphisms of affine schemes. Assume $\Gamma(Z, \mathcal{O}_Z)$ is a finite free $\Gamma(B, \mathcal{O}_B)$-module. Then $Mor_B(Z, X)$ is representable by an affine scheme over B.*

Proof. Write $B = Spec(R)$. Choose a basis $\{e_1, \ldots, e_m\}$ for $\Gamma(Z, \mathcal{O}_Z)$. Finally, choose a presentation

$$\Gamma(X, \mathcal{O}_X) = R[\{x_i\}_{i\in I}]/(\{f_k\}_{k\in K}).$$

We will denote $\overline{x}_i$ the image of x_i in this quotient. Write

$$P = R[\{a_{ij}\}_{i\in I, 1\leq j\leq m}].$$

Consider the R-algebra map

$$\Psi : R[\{x_i\}_{i\in I}] \longrightarrow P \otimes_R \Gamma(Z, \mathcal{O}_Z), \quad x_i \longmapsto \sum\nolimits_j a_{ij} \otimes e_j.$$

Write $\Psi(f_k) = \sum c_{kj} \otimes e_j$ with $c_{kj} \in P$. Finally, denote $J \subset P$ the ideal generated by the elements c_{kj}, $k \in K$, $1 \leq j \leq m$. We claim that $W = Spec(P/J)$ represents the functor $Mor_B(Z, X)$.

First, note that by construction P/J is an R-algebra, hence a morphism $a_{univ} : W \to B$. Second, by construction the map Ψ factors through $\Gamma(X, \mathcal{O}_X)$, hence we obtain an P/J-algebra homomorphism

$$P/J \otimes_R \Gamma(X, \mathcal{O}_X) \longrightarrow P/J \otimes_R \Gamma(Z, \mathcal{O}_Z)$$

which determines a morphism $b_{univ} : W \times_{a_{univ}, B} Z \to W \times_{a_{univ}, B} X$. By the Yoneda lemma the pair (a_{univ}, b_{univ}) determines a transformation of functors $W \to Mor_B(Z, X)$ which we claim is an isomorphism. To show that it is an isomorphism it suffices to show that it induces a bijection of sets $W(T) \to Mor_B(Z, X)(T)$ over any affine scheme T.

Suppose $T = Spec(R')$ is an affine scheme and $(a, b) \in Mor_B(Z, X)(T)$, then a defines an R-algebra structure on R' and b defines an R'-algebra map

$$b^\sharp : R' \otimes_R \Gamma(X, \mathcal{O}_X) \longrightarrow R' \otimes_R \Gamma(Z, \mathcal{O}_Z).$$

In particular we can write $b^\sharp(1 \otimes \overline{x}_i) = \sum \alpha_{ij} \otimes e_j$ for some $\alpha_{ij} \in R'$. This corresponds to an R-algebra map $P \to R'$ determined by the rule $a_{ij} \mapsto \alpha_{ij}$. This map factors through the quotient P/J by the construction of the ideal J to give a map $P/J \to R'$. This in turn corresponds to a morphism $T \to W$ such that (a, b) is the pullback of (a_{univ}, b_{univ}). Some details omitted. □

Proposition 59.10.5. *Let S be a scheme. Let $Z \to B$ and $X \to B$ be morphisms of algebraic spaces over S. If $Z \to B$ is finite locally free then $Mor_B(Z, X)$ is an algebraic space.*

Proof. Choose a scheme $B' = \coprod B'_i$ which is a disjoint union of affine schemes B'_i and an étale surjective morphism $B' \to B$. We may also assume that $B'_i \times_B Z$ is the spectrum of a ring which is finite free as a $\Gamma(B'_i, \mathcal{O}_{B'_i})$-module. By Lemma 59.10.2 and Spaces, Lemma 40.5.5 the morphism $Mor_{B'}(Z', X') \to Mor_B(Z, X)$ is surjective étale. Hence by Bootstrap, Theorem 54.10.1 it suffices to prove the proposition when $B = B'$ is a disjoint union of affine schemes B'_i so that each $B'_i \times_B Z$ is finite free over B'_i. Then it actually suffices to prove the result for the restriction to each B'_i. Thus we may assume that B is affine and that $\Gamma(Z, \mathcal{O}_Z)$ is a finite free $\Gamma(B, \mathcal{O}_B)$-module.

Choose a scheme X' which is a disjoint union of affine schemes and a surjective étale morphism $X' \to X$. By Lemma 59.10.3 the morphism $Mor_B(Z, X') \to Mor_B(Z, X)$ is representable by algebraic spaces, étale, and surjective. Hence by Bootstrap, Theorem 54.10.1 it suffices to prove the proposition when X is a disjoint union of affine schemes. This reduces us to the case discussed in the next paragraph.

Assume $X = \coprod_{i \in I} X_i$ is a disjoint union of affine schemes, B is affine, and that $\Gamma(Z, \mathcal{O}_Z)$ is a finite free $\Gamma(B, \mathcal{O}_B)$-module. For any finite subset $E \subset I$ set

$$F_E = Mor_B(Z, \coprod\nolimits_{i \in E} X_i).$$

By Lemma 59.10.4 we see that F_E is an algebraic space. Consider the morphism

$$\coprod\nolimits_{E \subset I \text{ finite}} F_E \longrightarrow Mor_B(Z, X)$$

Each of the morphisms $F_E \to Mor_B(Z, X)$ is an open immersion, because it is simply the locus parametrizing pairs (a, b) where b maps into the open subscheme $\coprod_{i \in E} X_i$ of X. Moreover, if T is quasi-compact, then for any pair (a, b) the image of b is contained in $\coprod_{i \in E} X_i$ for some $E \subset I$ finite. Hence the displayed arrow is in fact an open covering and we win[1] by Spaces, Lemma 40.8.4. □

[1] Modulo some set theoretic arguments. Namely, we have to show that $\coprod F_E$ is an algebraic space. This follows because $|I| \leq \text{size}(X)$ and $\text{size}(F_E) \leq \text{size}(X)$ as follows from the explicit description of F_E in the proof of Lemma 59.10.4. Some details omitted.

59.11. Restriction of scalars

Suppose $X \to Z \to B$ are morphisms of algebraic spaces over S. Given a scheme T we can consider pairs (a, b) where $a : T \to B$ is a morphism and $b : T \times_{a,B} Z \to X$ is a morphism over Z. Picture

(59.11.0.1)
$$\begin{tikzcd} & X \arrow[d] \\ T \times_{a,B} Z \arrow[r] \arrow[d] \arrow[ru, "b"] & Z \arrow[d] \\ T \arrow[r, "a"] & B \end{tikzcd}$$

In this situation we can define a functor

(59.11.0.2) $$\mathrm{Res}_{Z/B}(X) : (Sch/S)^{opp} \longrightarrow Sets, \quad T \longmapsto \{(a, b) \text{ as above}\}$$

Sometimes we think of this as a functor defined on the category of schemes over B, in which case we drop a from the notation.

Lemma 59.11.1. *Let S be a scheme. Let $X \to Z \to B$ be morphisms of algebraic spaces over S. Then*

(1) *$Res_{Z/B}(X)$ is a sheaf on $(Sch/S)_{fppf}$.*
(2) *If T is an algebraic space over S, then there is a canonical bijection*

$$Mor_{Sh((Sch/S)_{fppf})}(T, Res_{Z/B}(X)) = \{(a, b) \textit{ as in } (59.11.0.1)\}$$

Proof. Let T be an algebraic space over S. Let $\{T_i \to T\}$ be an fppf covering of T (as in Topologies on Spaces, Section 44.4). Suppose that $(a_i, b_i) \in \mathrm{Res}_{Z/B}(X)(T_i)$ such that $(a_i, b_i)|_{T_i \times_T T_j} = (a_j, b_j)|_{T_i \times_T T_j}$ for all i, j. Then by Descent on Spaces, Lemma 45.6.2 there exists a unique morphism $a : T \to B$ such that a_i is the composition of $T_i \to T$ and a. Then $\{T_i \times_{a_i,B} Z \to T \times_{a,B} Z\}$ is an fppf covering too and the same lemma implies there exists a unique morphism $b : T \times_{a,B} Z \to X$ such that b_i is the composition of $T_i \times_{a_i,B} Z \to T \times_{a,B} Z$ and b. Hence $(a, b) \in \mathrm{Res}_{Z/B}(X)(T)$ restricts to (a_i, b_i) over T_i for all i.

Note that the result of the preceding paragraph in particular implies (1).

Let T be an algebraic space over S. In order to prove (2) we will construct mutually inverse maps between the displayed sets. In the following when we say ``pair'' we mean a pair (a, b) fitting into (59.11.0.1).

Let $v : T \to \mathrm{Res}_{Z/B}(X)$ be a natural transformation. Choose a scheme U and a surjective étale morphism $p : U \to T$. Then $v(p) \in \mathrm{Res}_{Z/B}(X)(U)$ corresponds to a pair (a_U, b_U) over U. Let $R = U \times_T U$ with projections $t, s : R \to U$. As v is a transformation of functors we see that the pullbacks of (a_U, b_U) by s and t agree. Hence, since $\{U \to T\}$ is an fppf covering, we may apply the result of the first paragraph that deduce that there exists a unique pair (a, b) over T.

Conversely, let (a, b) be a pair over T. Let $U \to T$, $R = U \times_T U$, and $t, s : R \to U$ be as above. Then the restriction $(a, b)|_U$ gives rise to a tranformation of functors $v : h_U \to \mathrm{Res}_{Z/B}(X)$ by the Yoneda lemma (Categories, Lemma 4.3.5). As the two pullbacks $s^*(a, b)|_U$ and $t^*(a, b)|_U$ are equal, we see that v coequalizes the two maps $h_t, h_s : h_R \to h_U$. Since $T = U/R$ is the fppf quotient sheaf by Spaces, Lemma 40.9.1 and since $\mathrm{Res}_{Z/B}(X)$ is an fppf sheaf by (1) we conclude that v factors through a map $T \to \mathrm{Res}_{Z/B}(X)$.

We omit the verification that the two constructions above are mutually inverse. □

Of course the sheaf $\text{Res}_{Z/B}(X)$ comes with a natural transformation of functors $\text{Res}_{Z/B}(X) \to B$. We will use this without further mention in the following.

Lemma 59.11.2. *Let S be a scheme. Let $X \to Z \to B$ and $B' \to B$ be morphisms of algebraic spaces over S. Set $Z' = B' \times_B Z$ and $X' = B' \times_B X$. Then*

$$Res_{Z'/B'}(X') = B' \times_B Res_{Z/B}(X)$$

in $Sh((Sch/S)_{fppf})$.

Proof. The equality as functors follows immediately from the definitions. The equality as sheaves follows from this because both sides are sheaves according to Lemma 59.11.1 and the fact that a fibre product of sheaves is the same as the corresponding fibre product of pre-sheaves (i.e., functors). □

Lemma 59.11.3. *Let S be a scheme. Let $X' \to X \to Z \to B$ be morphisms of algebraic spaces over S. Assume*

1. *$X' \to X$ is étale, and*
2. *$Z \to B$ is finite locally free.*

Then $Res_{Z/B}(X') \to Res_{Z/B}(X)$ is representable by algebraic spaces and étale. If $X' \to X$ is also surjective, then $Res_{Z/B}(X') \to Res_{Z/B}(X)$ is surjective.

Proof. Let U be a scheme and let $\xi = (a, b)$ be an element of $\text{Res}_{Z/B}(X)(U)$. We have to prove that the functor

$$h_U \times_{\xi, \text{Res}_{Z/B}(X)} \text{Res}_{Z/B}(X')$$

is representable by an algebaic space étale over U. Set $Z_U = U \times_{a,B} Z$ and $W = Z_U \times_{b,X} X'$. Then $W \to Z_U \to U$ is as in Lemma 59.9.2 and the sheaf F defined there is identified with the fibre product displayed above. Hence the first assertion of the lemma. The second assertion follows from this and Lemma 59.9.1 which guarantees that $F \to U$ is surjective in the situation above. □

At this point we can use the lemmas above to prove that $\text{Res}_{Z/B}(X)$ is an algebraic space whenever $Z \to B$ is finite locally free in almost exactly the same way as in the proof that $Mor_B(Z, X)$ is an algebraic spaces, see Proposition 59.10.5. Instead we will directly deduce this result from the following lemma and the fact that $Mor_B(Z, X)$ is an algebraic space.

Lemma 59.11.4. *Let S be a scheme. Let $X \to Z \to B$ be morphisms of algebraic spaces over S. The following diagram*

$$\begin{tikzcd} Mor_B(Z, X) \arrow[r] & Mor_B(Z, Z) \\ Res_{Z/B}(X) \arrow[r] \arrow[u] & B \arrow[u, "id_Z"'] \end{tikzcd}$$

is a cartesian diagram of sheaves on $(Sch/S)_{fppf}$.

Proof. Omitted. Hint: Exercise in the functorial point of view in algebraic geometry. □

Proposition 59.11.5. *Let S be a scheme. Let $X \to Z \to B$ be morphisms of algebraic spaces over S. If $Z \to B$ is finite locally free then $Res_{Z/B}(X)$ is an algebraic space.*

Proof. By Proposition 59.10.5 the functors $Mor_B(Z, X)$ and $Mor_B(Z, Z)$ are algebraic spaces. Hence this follows from the cartesian diagram of Lemma 59.11.4 and the fact that fibre products of algebraic spaces exist and are given by the fibre product in the underlying category of sheaves of sets (see Spaces, Lemma 40.7.2). $\square$

59.12. Finite Hilbert stacks

In this section we prove some results concerning the finite Hilbert stacks $\mathcal{H}_d(\mathcal{X}/\mathcal{Y})$ introduced in Examples of Stacks, Section 55.17.

Lemma 59.12.1. *Consider a 2-commutative diagram*

$$\begin{tikzcd} \mathcal{X}' \arrow[r, "G"'] \arrow[d, "F'"'] & \mathcal{X} \arrow[d, "F"] \\ \mathcal{Y}' \arrow[r, "H"] & \mathcal{Y} \end{tikzcd}$$

of stacks in groupoids over $(Sch/S)_{fppf}$ with a given 2-isomorphism $\gamma : H \circ F' \to F \circ G$. In this situation we obtain a canonical 1-morphism $\mathcal{H}_d(\mathcal{X}'/\mathcal{Y}') \to \mathcal{H}_d(\mathcal{X}/\mathcal{Y})$. This morphism is compatible with the forgetful 1-morphisms of Examples of Stacks, Equation (55.17.2.1).

Proof. We map the object (U, Z, y', x', α') to the object $(U, Z, H(y'), G(x'), \gamma \star \mathrm{id}_H \star \alpha')$ where $\star$ denotes horizontal composition of 2-morphisms, see Categories, Definition 4.25.1. To a morphism $(f, g, b, a) : (U_1, Z_1, y'_1, x'_1, \alpha'_1) \to (U_2, Z_2, y'_2, x'_2, \alpha'_2)$ we assign $(f, g, H(b), G(a))$. We omit the verification that this defines a functor between categories over $(Sch/S)_{fppf}$. $\square$

Lemma 59.12.2. *In the situation of Lemma 59.12.1 assume that the given square is 2-cartesian. Then the diagram*

$$\begin{tikzcd} \mathcal{H}_d(\mathcal{X}'/\mathcal{Y}') \arrow[r] \arrow[d] & \mathcal{H}_d(\mathcal{X}/\mathcal{Y}) \arrow[d] \\ \mathcal{Y}' \arrow[r] & \mathcal{Y} \end{tikzcd}$$

is 2-cartesian.

Proof. We get a 2-commutative diagram by Lemma 59.12.1 and hence we get a 1-morphism (i.e., a functor)

$$\mathcal{H}_d(\mathcal{X}'/\mathcal{Y}') \longrightarrow \mathcal{Y}' \times_{\mathcal{Y}} \mathcal{H}_d(\mathcal{X}/\mathcal{Y})$$

We indicate why this functor is essentially surjective. Namely, an object of the category on the right hand side is given by a scheme U over S, an object y' of $\mathcal{Y}'_U$, an object (U, Z, y, x, α) of $\mathcal{H}_d(\mathcal{X}/\mathcal{Y})$ over U and an isomorphism $H(y') \to y$ in $\mathcal{Y}_U$. The assumption means exactly that there exists an object x' of $\mathcal{X}'_Z$ such that there exist isomorphisms $G(x') \cong x$ and $\alpha' : y'|_Z \to F'(x')$ compatible with α. Then we see that (U, Z, y', x', α') is an object of $\mathcal{H}_d(\mathcal{X}'/\mathcal{Y}')$ over U. Details omitted. $\square$

Lemma 59.12.3. *In the situation of Lemma 59.12.1 assume*

(1) $\mathcal{Y}' = \mathcal{Y}$ *and* $H = id_{\mathcal{Y}}$,
(2) G *is representable by algebraic spaces and étale.*

Then $\mathcal{H}_d(\mathcal{X}'/\mathcal{Y}) \to \mathcal{H}_d(\mathcal{X}/\mathcal{Y})$ is representable by algebraic spaces and étale. If G is also surjective, then $\mathcal{H}_d(\mathcal{X}'/\mathcal{Y}) \to \mathcal{H}_d(\mathcal{X}/\mathcal{Y})$ is surjective.

Proof. Let U be a scheme and let $\xi = (U, Z, y, x, \alpha)$ be an object of $\mathcal{H}_d(\mathcal{X}/\mathcal{Y})$ over U. We have to prove that the 2-fibre product

$$(Sch/U)_{fppf} \times_{\xi, \mathcal{H}_d(\mathcal{X}/\mathcal{Y})} \mathcal{H}_d(\mathcal{X}'/\mathcal{Y}) \tag{59.12.3.1}$$

is representable by an algebraic space étale over U. An object of this over U' corresponds to an object x' in the fibre category of $\mathcal{X}'$ over $Z_{U'}$ such that $G(x') \cong x|_{Z_{U'}}$. By assumption the 2-fibre product

$$(Sch/Z)_{fppf} \times_{x, \mathcal{X}} \mathcal{X}'$$

is representable by an algebraic space W such that the projection $W \to Z$ is étale. Then (59.12.3.1) is representable by the algebraic space F parametrizing sections of $W \to Z$ over U introduced in Lemma 59.9.2. Since $F \to U$ is étale we conclude that $\mathcal{H}_d(\mathcal{X}'/\mathcal{Y}) \to \mathcal{H}_d(\mathcal{X}/\mathcal{Y})$ is representable by algebraic spaces and étale. Finally, if $\mathcal{X}' \to \mathcal{X}$ is surjective also, then $W \to Z$ is surjective, and hence $F \to U$ is surjective by Lemma 59.9.1. Thus in this case $\mathcal{H}_d(\mathcal{X}'/\mathcal{Y}) \to \mathcal{H}_d(\mathcal{X}/\mathcal{Y})$ is also surjective. □

Lemma 59.12.4. *In the situation of Lemma 59.12.1. Assume that G, H are representable by algebraic spaces and étale. Then $\mathcal{H}_d(\mathcal{X}'/\mathcal{Y}') \to \mathcal{H}_d(\mathcal{X}/\mathcal{Y})$ is representable by algebraic spaces and étale. If also H is surjective and the induced functor $\mathcal{X}' \to \mathcal{Y}' \times_{\mathcal{Y}} \mathcal{X}$ is surjective, then $\mathcal{H}_d(\mathcal{X}'/\mathcal{Y}') \to \mathcal{H}_d(\mathcal{X}/\mathcal{Y})$ is surjective.*

Proof. Set $\mathcal{X}'' = \mathcal{Y}' \times_{\mathcal{Y}} \mathcal{X}$. By Lemma 59.4.1 the 1-morphism $\mathcal{X}' \to \mathcal{X}''$ is representable by algebraic spaces and étale (in particular the condition in the second statement of the lemma that $\mathcal{X}' \to \mathcal{X}''$ be surjective makes sense). We obtain a 2-commutative diagram

$$\begin{tikzcd} \mathcal{X}' \arrow[r] \arrow[d] & \mathcal{X}'' \arrow[r] \arrow[d] & \mathcal{X} \arrow[d] \\ \mathcal{Y}' \arrow[r] & \mathcal{Y}' \arrow[r] & \mathcal{Y} \end{tikzcd}$$

It follows from Lemma 59.12.2 that $\mathcal{H}_d(\mathcal{X}''/\mathcal{Y}')$ is the base change of $\mathcal{H}_d(\mathcal{X}/\mathcal{Y})$ by $\mathcal{Y}' \to \mathcal{Y}$. In particular we see that $\mathcal{H}_d(\mathcal{X}''/\mathcal{Y}') \to \mathcal{H}_d(\mathcal{X}/\mathcal{Y})$ is representable by algebraic spaces and étale, see Algebraic Stacks, Lemma 57.10.6. Moreover, it is also surjective if H is. Hence if we can show that the result holds for the left square in the diagram, then we're done. In this way we reduce to the case where $\mathcal{Y}' = \mathcal{Y}$ which is the content of Lemma 59.12.3. □

Lemma 59.12.5. *Let $F : \mathcal{X} \to \mathcal{Y}$ be a 1-morphism of stacks in groupoids over $(Sch/S)_{fppf}$. Assume that $\Delta : \mathcal{Y} \to \mathcal{Y} \times \mathcal{Y}$ is representable by algebraic spaces. Then*

$$\mathcal{H}_d(\mathcal{X}/\mathcal{Y}) \longrightarrow \mathcal{H}_d(\mathcal{X}) \times \mathcal{Y}$$

see Examples of Stacks, Equation (55.17.2.1) is representably by algebraic spaces.

Proof. Let U be a scheme and let $\xi = (U, Z, p, x, 1)$ be an object of $\mathcal{H}_d(\mathcal{X}) = \mathcal{H}_d(\mathcal{X}/S)$ over U. Here p is just the structure morphism of U. The fifth component 1 exists and is unique since everything is over S. Also, let y be an object of $\mathcal{Y}$ over U. We have to show the 2-fibre product

$$(Sch/U)_{fppf} \times_{\xi \times y, \mathcal{H}_d(\mathcal{X}) \times \mathcal{Y}} \mathcal{H}_d(\mathcal{X}/\mathcal{Y}) \tag{59.12.5.1}$$

is representable by an algebraic space. To explain why this is so we introduce

$$I = Isom_{\mathcal{Y}}(y|_Z, F(x))$$

which is an algebraic space over Z by assumption. Let $a : U' \to U$ be a scheme over U. What does it mean to give an object of the fibre category of (59.12.5.1) over U'? Well, it means that we have an object $\xi' = (U', Z', y', x', \alpha')$ of $\mathcal{H}_d(\mathcal{X}/\mathcal{Y})$ over U' and isomorphisms $(U', Z', p', x', 1) \cong (U, Z, p, x, 1)|_{U'}$ and $y' \cong y|_{U'}$. Thus ξ' is isomorphic to $(U', U' \times_{a,U} Z, a^*y, x|_{U' \times_{a,U} Z}, \alpha)$ for some morphism

$$\alpha : a^*y|_{U' \times_{a,U} Z} \longrightarrow F(x|_{U' \times_{a,U} Z})$$

in the fibre category of $\mathcal{Y}$ over $U' \times_{a,U} Z$. Hence we can view α as a morphism $b : U' \times_{a,U} Z \to I$. In this way we see that (59.12.5.1) is representable by $\mathrm{Res}_{Z/U}(I)$ which is an algebraic space by Proposition 59.11.5. □

The following lemma is a (partial) generalization of Lemma 59.12.3.

Lemma 59.12.6. *Let $F : \mathcal{X} \to \mathcal{Y}$ and $G : \mathcal{X}' \to \mathcal{X}$ be 1-morphisms of stacks in groupoids over $(Sch/S)_{fppf}$. If G is representable by algebraic spaces, then the 1-morphism*

$$\mathcal{H}_d(\mathcal{X}'/\mathcal{Y}) \longrightarrow \mathcal{H}_d(\mathcal{X}/\mathcal{Y})$$

is representable by algebraic spaces.

Proof. Let U be a scheme and let $\xi = (U, Z, y, x, \alpha)$ be an object of $\mathcal{H}_d(\mathcal{X}/\mathcal{Y})$ over U. We have to prove that the 2-fibre product

$$(Sch/U)_{fppf} \times_{\xi, \mathcal{H}_d(\mathcal{X}/\mathcal{Y})} \mathcal{H}_d(\mathcal{X}'/\mathcal{Y}) \tag{59.12.6.1}$$

is representable by an algebraic space étale over U. An object of this over $a : U' \to U$ corresponds to an object x' of $\mathcal{X}'$ over $U' \times_{a,U} Z$ such that $G(x') \cong x|_{U' \times_{a,U} Z}$. By assumption the 2-fibre product

$$(Sch/Z)_{fppf} \times_{x, \mathcal{X}} \mathcal{X}'$$

is representable by an algebraic space X over Z. It follows that (59.12.6.1) is representable by $\mathrm{Res}_{Z/U}(X)$, which is an algebraic space by Proposition 59.11.5. □

Lemma 59.12.7. *Let $F : \mathcal{X} \to \mathcal{Y}$ be a 1-morphism of stacks in groupoids over $(Sch/S)_{fppf}$. Assume F is representable by algebraic spaces and locally of finite presentation. Then*

$$p : \mathcal{H}_d(\mathcal{X}/\mathcal{Y}) \to \mathcal{Y}$$

is limit preserving on objects.

Proof. This means we have to show the following: Given

(1) an affine scheme $U = lim_i U_i$ which is written as the directed limit of affine schemes U_i over S,
(2) an object y_i of $\mathcal{Y}$ over U_i for some i, and
(3) an object $\Xi = (U, Z, y, x, \alpha)$ of $\mathcal{H}_d(\mathcal{X}/\mathcal{Y})$ over U such that $y = y_i|_U$,

then there exists an $i' \geq i$ and an object $\Xi_{i'} = (U_{i'}, Z_{i'}, y_{i'}, x_{i'}, \alpha_{i'})$ of $\mathcal{H}_d(\mathcal{X}/\mathcal{Y})$ over $U_{i'}$ with $\Xi_{i'}|_U = \Xi$ and $y_{i'} = y_i|_{U_{i'}}$. Namely, the last two equalities will take care of the commutativity of (59.5.0.1).

Let $X_{y_i} \to U_i$ be an algebraic space representing the 2-fibre product

$$(Sch/U_i)_{fppf} \times_{y_i, \mathcal{Y}, F} \mathcal{X}.$$

Note that $X_{y_i} \to U_i$ is locally of finite presentation by our assumption on F. Write Ξ. It is clear that $\xi = (Z, Z \to U_i, x, \alpha)$ is an object of the 2-fibre product displayed above, hence ξ gives rise to a morphism $f_\xi : Z \to X_{y_i}$ of algebraic spaces over U_i (since X_{y_i} is the functor of isomorphisms classes of objects of $(Sch/U_i)_{fppf} \times_{y,\mathcal{Y},F} \mathcal{X}$, see Algebraic Stacks, Lemma 57.8.2). By Limits, Lemmas 27.6.1 and 27.6.7 there exists an $i' \geq i$ and a finite locally free morphism $Z_{i'} \to U_{i'}$ of degree d whose base change to U is Z. By More on Morphisms of Spaces, Proposition 46.4.9 we may, after replacing i' by a bigger index, assume there exists a morphism $f_{i'} : Z_{i'} \to X_{y_i}$ such that

$$\begin{tikzcd} Z \arrow[r] \arrow[d] \arrow[rr, bend left, "f_\xi"] & Z_{i'} \arrow[r, "f_{i'}"'] \arrow[d] & X_{y_i} \arrow[d] \\ U \arrow[r] & U_{i'} \arrow[r] & U_i \end{tikzcd}$$

is commutative. We set $\Xi_{i'} = (U_{i'}, Z_{i'}, y_{i'}, x_{i'}, \alpha_{i'})$ where

(1) $y_{i'}$ is the object of $\mathcal{Y}$ over $U_{i'}$ which is the pullback of y_i to $U_{i'}$,
(2) $x_{i'}$ is the object of $\mathcal{X}$ over $Z_{i'}$ corresponding via the 2-Yoneda lemma to the 1-morphism

$$(Sch/Z_{i'})_{fppf} \to \mathcal{S}_{X_{y_i}} \to (Sch/U_i)_{fppf} \times_{y_i,\mathcal{Y},F} \mathcal{X} \to \mathcal{X}$$

where the middle arrow is the equivalence which defines X_{y_i} (notation as in Algebraic Stacks, Sections 57.8 and 57.7).
(3) $\alpha_{i'} : y_{i'}|_{Z_{i'}} \to F(x_{i'})$ is the isomorphism coming from the 2-commutativity of the diagram

$$\begin{tikzcd} (Sch/Z_{i'})_{fppf} \arrow[r] \arrow[dr] & (Sch/U_i)_{fppf} \times_{y_i,\mathcal{Y},F} \mathcal{X} \arrow[r] \arrow[d] & \mathcal{X} \arrow[d, "F"] \\ & (Sch/U_{i'})_{fppf} \arrow[r] & \mathcal{Y} \end{tikzcd}$$

Recall that $f_\xi : Z \to X_{y_i}$ was the morphism corresponding to the object $\xi = (Z, Z \to U_i, x, \alpha)$ of $(Sch/U_i)_{fppf} \times_{y_i,\mathcal{Y},F} \mathcal{X}$ over Z. By construction $f_{i'}$ is the morphism corresponding to the object $\xi_{i'} = (Z_{i'}, Z_{i'} \to U_i, x_{i'}, \alpha_{i'})$. As $f_\xi = f_{i'} \circ (Z \to Z_{i'})$ we see that the object $\xi_{i'} = (Z_{i'}, Z_{i'} \to U_i, x_{i'}, \alpha_{i'})$ pulls back to ξ over Z. Thus $x_{i'}$ pulls back to x and $\alpha_{i'}$ pulls back to α. This means that $\Xi_{i'}$ pulls back to Ξ over U and we win. □

59.13. The finite Hilbert stack of a point

Let $d \geq 1$ be an integer. In Examples of Stacks, Definition 55.17.2 we defined a stack in groupoids $\mathcal{H}_d$. In this section we prove that $\mathcal{H}_d$ is an algebraic stack. We will throughout assume that $S = Spec(\mathbf{Z})$. The general case will follow from this by base change. Recall that the fibre category of $\mathcal{H}_d$ over a scheme T is the category of finite locally free morphisms $\pi : Z \to T$ of degree d. Instead of classifying these directly we first study the quasi-coherent sheaves of algebras $\pi_*\mathcal{O}_Z$.

Let R be a ring. Let us temporarily make the following definition: A *free d-dimensional algebra over R* is given by a commutative R-algebra structure m on $R^{\oplus d}$ such that $e_1 = (1, 0, \ldots, 0)$ is a unit[2]. We think of m as an R-linear map

$$m : R^{\oplus d} \otimes_R R^{\oplus d} \longrightarrow R^{\oplus d}$$

[2]It may be better to think of this as a pair consisting of a multiplication map $m : R^{\oplus d} \otimes_R R^{\oplus d} \to R^{\oplus d}$ and a ring map $\psi : R \to R^{\oplus d}$ satisfying a bunch of axioms.

such that $m(e_1, x) = m(x, e_1) = x$ and such that m defines a commutative and associative ring structure. If we write $m(e_i, e_j) = \sum a_{ij}^k e_k$ then we see this boils down to the conditions

$$\begin{cases} \sum_l a_{ij}^l a_{lk}^m = \sum_l a_{il}^m a_{jk}^l & \forall i, j, k, m \\ a_{ij}^k = a_{ji}^k & \forall i, j, k \\ a_{i1}^j = \delta_{ij} & \forall i, j \end{cases}$$

where δ_{ij} is the Kronecker δ-function. OK, so let's define

$$R_{univ} = \mathbf{Z}[a_{ij}^k]/J$$

where the ideal J is the ideal generated by the relations displayed above. Denote

$$m_{univ} : R_{univ}^{\oplus d} \otimes_{R_{univ}} R_{univ}^{\oplus d} \longrightarrow R_{univ}^{\oplus d}$$

the free d-dimensional algebra m over R_{univ} whose structure constants are the classes of a_{ij}^k modulo J. Then it is clear that given any free d-dimensional algebra m over a ring R there exists a unique $\mathbf{Z}$-algebra homomorphism $\psi : R_{univ} \to R$ such that $\psi_* m_{univ} = m$ (this means that m is what you get by applying the base change functor $- \otimes_{R_{univ}} R$ to m_{univ}). In other words, setting $X = Spec(R_{univ})$ we obtain a canonical identification

$$X(T) = \{\text{free } d\text{-dimensional algebras } m \text{ over } R\}$$

for varying $T = Spec(R)$. By Zariski localization we obtain the following seemingly more general identification

$$X(T) = \{\text{free } d\text{-dimensional algebras } m \text{ over } \Gamma(T, \mathcal{O}_T)\} \tag{59.13.0.1}$$

for any scheme T.

Next we talk a little bit about *isomorphisms of free d-dimensional R-algebras*. Namely, suppose that m, m' are two free d-dimensional algebras over a ring R. An *isomorphism from m to m'* is given by an invertible R-linear map

$$\varphi : R^{\oplus d} \longrightarrow R^{\oplus d}$$

such that $\varphi(e_1) = e_1$ and such that

$$m \circ \varphi \otimes \varphi = \varphi \circ m'.$$

Note that we can compose these so that the collection of free d-dimensional algebras over R becomes a category. In this way we optain a functor

$$FA_d : Sch_{fppf}^{opp} \longrightarrow Groupoids \tag{59.13.0.2}$$

from the category of schemes to groupoids: to a scheme T we associate the set of free d-dimensional algebras over $\Gamma(T, \mathcal{O}_T)$ endowed with the structure of a category using the notion of isomorphisms just defined.

The above suggests we consider the functor G in groups which associates to any scheme T the group

$$G(T) = \{g \in \mathrm{GL}_d(\Gamma(T, \mathcal{O}_T)) \mid g(e_1) = e_1\}$$

It is clear that $G \subset \mathrm{GL}_d$ (see Groupoids, Example 35.5.4) is the closed subgroup scheme cut out by the equations $x_{11} = 1$ and $x_{i1} = 0$ for $i > 1$. Hence G is a smooth affine group scheme over $Spec(\mathbf{Z})$. Consider the action

$$a : G \times_{Spec(\mathbf{Z})} X \longrightarrow X$$

which associates to a T-valued point (g, m) with $T = Spec(R)$ on the left hand side the free d-dimensional algebra over R given by

$$a(g, m) = g^{-1} \circ m \circ g \otimes g.$$

Note that this means that g defines an isomorphism $m \to a(g, m)$ of d-dimensional free R-algebras. We omit the verification that a indeed defines an action of the group scheme G on the scheme X.

Lemma 59.13.1. *The functor in groupoids FA_d defined in (59.13.0.2) is isomorphic (!) to the functor in groupouids which associates to a scheme T the category with*

1. *set of objects is $X(T)$,*
2. *set of morphhisms is $G(T) \times X(T)$,*
3. *$s : G(T) \times X(T) \to X(T)$ is the projection map,*
4. *$t : G(T) \times X(T) \to X(T)$ is $a(T)$, and*
5. *composition $G(T) \times X(T) \times_{s,X(T),t} G(T) \times X(T) \to G(T) \times X(T)$ is given by $((g, m), (g', m')) \mapsto (gg', m')$.*

Proof. We have seen the rule on objects in (59.13.0.1). We have also seen above that $g \in G(T)$ can be viewed as a morphism from m to $a(g, m)$ for any free d-dimensional algebra m. Conversely, any morphism $m \to m'$ is given by an invertible linear map φ which corresponds to an element $g \in G(T)$ such that $m' = a(g, m)$. □

In fact the groupoid $(X, G \times X, s, t, c)$ described in the lemma above is the groupoid associated to the action $a : G \times X \to X$ as defined in Groupoids, Lemma 35.13.1. Since G is smooth over $Spec(\mathbf{Z})$ we see that the two morphisms $s, t : G \times X \to X$ are smooth: by symmetry it suffices to prove that one of them is, and s is the base change of $G \to Spec(\mathbf{Z})$. Hence $(G \times X, X, s, t, c)$ is a smooth groupoid scheme, and the quotient stack $[X/G]$ is an algebraic stack by Algebraic Stacks, Theorem 57.17.3.

Proposition 59.13.2. *The stack $\mathcal{H}_d$ is equivalent to the quotient stack $[X/G]$ described above. In particular $\mathcal{H}_d$ is an algebraic stack.*

Proof. Note that by Groupoids in Spaces, Definition 52.19.1 the quotient stack $[X/G]$ is the stackification of the category fibred in groupoids associated to the ``presheaf in groupoids'' which associates to a scheme T the groupoid

$$(X(T), G(T) \times X(T), s, t, c).$$

Since this ``presheaf in groupoids'' is isomorphic to $FA_d$ by Lemma 59.13.1 it suffices to prove that the $\mathcal{H}_d$ is the stackification of (the category fibred in groupoids associated to the ``presheaf in groupoids'') FA_d. To do this we first define a functor

$$Spec : FA_d \longrightarrow \mathcal{H}_d$$

Recall that the fibre category of $\mathcal{H}_d$ over a scheme T is the category of finite locally free morphisms $Z \to T$ of degree d. Thus given a scheme T and a free d-dimensional $\Gamma(T, \mathcal{O}_T)$-algebra m we may assign to this the object

$$Z = \underline{Spec}_T(\mathcal{A})$$

of $\mathcal{H}_{d,T}$ where $\mathcal{A} = \mathcal{O}_T^{\oplus d}$ endowed with a $\mathcal{O}_T$-algebra structure via m. Moreover, if m' is a second such free d-dimensional $\Gamma(T, \mathcal{O}_T)$-algebra and if $\varphi : m \to m'$ is an isomorphism of these, then the induced $\mathcal{O}_T$-linear map $\varphi : \mathcal{O}_T^{\oplus d} \to \mathcal{O}_T^{\oplus d}$ induces an isomorphism

$$\varphi : \mathcal{A}' \longrightarrow \mathcal{A}$$

of quasi-coherent $\mathcal{O}_T$-algebras. Hence

$$\underline{Spec}_T(\varphi) : \underline{Spec}_T(\mathcal{A}) \longrightarrow \underline{Spec}_T(\mathcal{A}')$$

is a morphism in the fibre category $\mathcal{H}_{d,T}$. We omit the verification that this construction is compatible with base change so we get indeed a functor $Spec : FA_d \to \mathcal{H}_d$ as claimed above.

To show that $Spec : FA_d \to \mathcal{H}_d$ induces an equivalence between the stackification of FA_d and $\mathcal{H}_d$ it suffices to check that

(1) $Isom(m, m') = Isom(Spec(m), Spec(m'))$ for any $m, m' \in FA_d(T)$.
(2) for any scheme T and any object $Z \to T$ of $\mathcal{H}_{d,T}$ there exists a covering $\{T_i \to T\}$ such that $Z|_{T_i}$ is isomorphic to $Spec(m)$ for some $m \in FA_d(T_i)$, and

see Stacks, Lemma 50.9.1. The first statement follows from the observation that any isomorphism

$$\underline{Spec}_T(\mathcal{A}) \longrightarrow \underline{Spec}_T(\mathcal{A}')$$

is necessarily given by a global invertible matrix g when $\mathcal{A} = \mathcal{A}' = \mathcal{O}_T^{\oplus d}$ as modules. To prove the second statement let $\pi : Z \to T$ be a finite locally free morphism of degree d. Then $\mathcal{A}$ is a locally free sheaf $\mathcal{O}_T$-modules of rank d. Consider the element $1 \in \Gamma(T, \mathcal{A})$. This element is nonzero in $\mathcal{A} \otimes_{\mathcal{O}_{T,t}} \kappa(t)$ for every $t \in T$ since the scheme $Z_t = Spec(\mathcal{A} \otimes_{\mathcal{O}_{T,t}} \kappa(t))$ is nonempty being of degree $d > 0$ over $\kappa(t)$. Thus $1 : \mathcal{O}_T \to \mathcal{A}$ can locally be used as the first basis element (for example you can use Algebra, Lemma 7.73.3 parts (1) and (2) to see this). Thus, after localizing on T we may assume that there exists an isomorphism $\varphi : \mathcal{A} \to \mathcal{O}_T^{\oplus d}$ such that $1 \in \Gamma(\mathcal{A})$ corresponds to the first basis element. In this situation the multiplication map $\mathcal{A} \otimes_{\mathcal{O}_T} \mathcal{A} \to \mathcal{A}$ translates via φ into a free d-dimensional algebra m over $\Gamma(T, \mathcal{O}_T)$. This finishes the proof. $\square$

59.14. Finite Hilbert stacks of spaces

The finite Hilbert stack of an algebraic space is an algebraic stack.

Lemma 59.14.1. *Let S be a scheme. Let X be an algebraic space over S. Then $\mathcal{H}_d(X)$ is an algebraic stack.*

Proof. The 1-morphism

$$\mathcal{H}_d(X) \longrightarrow \mathcal{H}_d$$

is representably by algebraic spaces according to Lemma 59.12.6. The stack $\mathcal{H}_d$ is an algebraic stack according to Proposition 59.13.2. Hence $\mathcal{H}_d(X)$ is an algebraic stack by Algebraic Stacks, Lemma 57.15.4. $\square$

This lemma allows us to bootstrap.

Lemma 59.14.2. *Let S be a scheme. Let $F : \mathcal{X} \to \mathcal{Y}$ be a 1-morphism of stacks in groupoids over $(Sch/S)_{fppf}$ such that*

(1) *$\mathcal{X}$ is representable by an algebraic space, and*
(2) *F is representable by algebraic spaces, surjective, flat, and locally of finite presentation.*

Then $\mathcal{H}_d(\mathcal{X}/\mathcal{Y})$ is an algebraic stack.

Proof. Choose a representable stack in groupoids $\mathcal{U}$ over S and a 1-morphism $f : \mathcal{U} \to \mathcal{H}_d(\mathcal{X})$ which is representable by algebraic spaces, smooth, and surjective. This is possible because $\mathcal{H}_d(\mathcal{X})$ is an algebraic stack by Lemma 59.14.1. Consider the 2-fibre product

$$\mathcal{W} = \mathcal{H}_d(\mathcal{X}/\mathcal{Y}) \times_{\mathcal{H}_d(\mathcal{X}), f} \mathcal{U}.$$

Since $\mathcal{U}$ is representable (in particular a stack in setoids) it follows from Examples of Stacks, Lemma 55.17.3 and Stacks, Lemma 50.6.7 that $\mathcal{W}$ is a stack in setoids. The 1-morphism $\mathcal{W} \to \mathcal{H}_d(\mathcal{X}/\mathcal{Y})$ is representable by algebraic spaces, smooth, and surjective as a base change of the morphism f (see Algebraic Stacks, Lemmas 57.9.7 and 57.10.6). Thus, if we can show that $\mathcal{W}$ is representable by an algebraic space, then the lemma follows from Algebraic Stacks, Lemma 57.15.3.

The diagonal of $\mathcal{Y}$ is representable by algebraic spaces according to Lemma 59.4.3. We may apply Lemma 59.12.5 to see that the 1-morphism

$$\mathcal{H}_d(\mathcal{X}/\mathcal{Y}) \longrightarrow \mathcal{H}_d(\mathcal{X}) \times \mathcal{Y}$$

is representable by algebraic spaces. Consider the 2-fibre product

$$\mathcal{V} = \mathcal{H}_d(\mathcal{X}/\mathcal{Y}) \times_{(\mathcal{H}_d(\mathcal{X}) \times \mathcal{Y}), f \times F} (\mathcal{U} \times \mathcal{X}).$$

The projection morphism $\mathcal{V} \to \mathcal{U} \times \mathcal{X}$ is representable by algebraic spaces as a base change of the last displayed morphism. Hence $\mathcal{V}$ is an algebraic space (see Bootstrap, Lemma 54.3.6 or Algebraic Stacks, Lemma 57.9.8). The 1-morphism $\mathcal{V} \to \mathcal{U}$ fits into the following 2-cartesian diagram

$$\begin{tikzcd} \mathcal{V} \arrow[r] \arrow[d] & \mathcal{X} \arrow[d, "F"] \\ \mathcal{W} \arrow[r] & \mathcal{Y} \end{tikzcd}$$

because

$$\mathcal{H}_d(\mathcal{X}/\mathcal{Y}) \times_{(\mathcal{H}_d(\mathcal{X}) \times \mathcal{Y}), f \times F} (\mathcal{U} \times \mathcal{X}) = (\mathcal{H}_d(\mathcal{X}/\mathcal{Y}) \times_{\mathcal{H}_d(\mathcal{X}), f} \mathcal{U}) \times_{\mathcal{Y}, F} \mathcal{X}.$$

Hence $\mathcal{V} \to \mathcal{W}$ is representable by algebraic spaces, surjective, flat, and locally of finite presentation as a base change of F. It follows that the same thing is true for the corresponding sheaves of sets associated to $\mathcal{V}$ and $\mathcal{W}$, see Algebraic Stacks, Lemma 57.10.4. Thus we conclude that the sheaf associated to $\mathcal{W}$ is an algebraic space by Bootstrap, Theorem 54.10.1. $\square$

59.15. LCI locus in the Hilbert stack

Please consult Examples of Stacks, Section 55.17 for notation. Fix a 1-morphism $F : \mathcal{X} \longrightarrow \mathcal{Y}$ of stacks in groupoids over $(Sch/S)_{fppf}$. Assume that F is representable by algebraic spaces. Fix $d \geq 1$. Consider an object (U, Z, y, x, α) of $\mathcal{H}_d$. There is an induced 1-morphism

$$(Sch/Z)_{fppf} \longrightarrow (Sch/U)_{fppf} \times_{y, \mathcal{Y}, F} \mathcal{X}$$

(by the universal property of 2-fibre products) which is representable by a morphism of algebraic spaces over U. Namely, since F is representable by algebraic spaces, we may choose an algebraic space X_y over U which represents the 2-fibre product $(Sch/U)_{fppf} \times_{y, \mathcal{Y}, F} \mathcal{X}$. Since $\alpha : y|_Z \to F(x)$ is an isomorphism we see that $\xi = (Z, Z \to U, x, \alpha)$ is an object of the 2-fibre product $(Sch/U)_{fppf} \times_{y, \mathcal{Y}, F} \mathcal{X}$ over Z. Hence ξ gives rise to a morphism

$x_\alpha : Z \to X_y$ of algebraic spaces over U as X_y is the functor of isomorphisms classes of objects of $(Sch/U)_{fppf} \times_{y,\mathcal{Y},F} \mathcal{X}$, see Algebraic Stacks, Lemma 57.8.2. Here is a picture

$$
\begin{tikzcd}
Z \arrow[r, "x_\alpha"] \arrow[dr] & X_y \arrow[d] \\
& U
\end{tikzcd}
\qquad
\begin{tikzcd}
(Sch/Z)_{fppf} \arrow[r, "{x,\alpha}"] \arrow[dr] & (Sch/U)_{fppf} \times_{y,\mathcal{Y},F} \mathcal{X} \arrow[r] \arrow[d] & \mathcal{X} \arrow[d, "F"] \\
& (Sch/U)_{fppf} \arrow[r, "y"] & \mathcal{Y}
\end{tikzcd}
\tag{59.15.0.1}
$$

We remark that if $(f, g, b, a) : (U, Z, y, x, \alpha) \to (U', Z', y', x', \alpha')$ is a morphism between objects of $\mathcal{H}_d$, then the morphism $x'_{\alpha'} : Z' \to X'_{y'}$ is the base change of the morphism x_α by the morphism $g : U' \to U$ (details omitted).

Now assume moreover that F is flat and locally of finite presentation. In this situation we define a full subcategory

$$\mathcal{H}_{d,lci}(\mathcal{X}/\mathcal{Y}) \subset \mathcal{H}_d(\mathcal{X}/\mathcal{Y})$$

consisting of those objects (U, Z, y, x, α) of $\mathcal{H}_d(\mathcal{X}/\mathcal{Y})$ such that the corresponding morphism $x_\alpha : Z \to X_y$ is unramified and a local complete intersection morphism (see Morphisms of Spaces, Definition 42.34.1 and More on Morphisms of Spaces, Definition 46.24.1 for definitions).

Lemma 59.15.1. *Let S be a scheme. Fix a 1-morphism $F : \mathcal{X} \longrightarrow \mathcal{Y}$ of stacks in groupoids over $(Sch/S)_{fppf}$. Assume F is representable by algebraic spaces, flat, and locally of finite presentation. Then $\mathcal{H}_{d,lci}(\mathcal{X}/\mathcal{Y})$ is a stack in groupoids and the inclusion functor*

$$\mathcal{H}_{d,lci}(\mathcal{X}/\mathcal{Y}) \longrightarrow \mathcal{H}_d(\mathcal{X}/\mathcal{Y})$$

is representable and an open immersion.

Proof. Let $\Xi = (U, Z, y, x, \alpha)$ be an object of $\mathcal{H}_d$. It follows from the remark following (59.15.0.1) that the pullback of Ξ by $U' \to U$ belongs to $\mathcal{H}_{d,lci}(\mathcal{X}/\mathcal{Y})$ if and only if the base change of x_α is unramified and a local complete intersection morphism. Note that $Z \to U$ is finite locally free (hence flat, locally of finite presentation and universally closed) and that $X_y \to U$ is flat and locally of finite presentation by our assumption on F. Then Quot, Lemmas 47.3.1 and 47.3.7 imply exists an open subscheme $W \subset U$ such that a morphism $U' \to U$ factors through W if and only if the base change of x_α via $U' \to U$ is unramified and a local complete intersection morphism. This implies that

$$(Sch/U)_{fppf} \times_{\Xi, \mathcal{H}_d(\mathcal{X}/\mathcal{Y})} \mathcal{H}_{d,lci}(\mathcal{X}/\mathcal{Y})$$

is representable by W. Hence the final statement of the lemma holds. The first statement (that $\mathcal{H}_{d,lci}(\mathcal{X}/\mathcal{Y})$ is a stack in groupoids) follows from this an Algebraic Stacks, Lemma 57.15.5. $\square$

Local complete intersection morphisms are ``locally unobstructed". This holds in much greater generality than the special case that we need in this chapter here.

Lemma 59.15.2. *Let $U \subset U'$ be a first order thickening of affine schemes. Let X' be an algebraic space flat over U'. Set $X = U \times_{U'} X'$. Let $Z \to U$ be finite locally free of degree d. Finally, let $f : Z \to X$ be unramified and a local complete intersection morphism. Then* *there exists a commutative diagram*

$$\begin{tikzcd}
(Z \subset Z') \arrow[rr, "{(f,f')}"'] \arrow[dr] & & (X \subset X') \arrow[dl] \\
& (U \subset U') &
\end{tikzcd}$$

of algebraic spaces over U' such that $Z' \to U'$ is finite locally free of degree d and $Z = U \times_{U'} Z'$.

Proof. By More on Morphisms of Spaces, Lemma 46.24.8 the conormal sheaf $\mathcal{C}_{Z/X}$ of the unramified morphism $Z \to X$ is a finite locally free $\mathcal{O}_Z$-module and by More on Morphisms of Spaces, Lemma 46.24.9 we have an exact sequence

$$0 \to i^*\mathcal{C}_{X/X'} \to \mathcal{C}_{Z/X'} \to \mathcal{C}_{Z/X} \to 0$$

of conormal sheaves. Since Z is affine this sequence is split. Choose a splitting

$$\mathcal{C}_{Z/X'} = i^*\mathcal{C}_{X/X'} \oplus \mathcal{C}_{Z/X}$$

Let $Z \subset Z''$ be the universal first order thickening of of Z over X' (see More on Morphisms of Spaces, Section 46.12). Denote $\mathcal{I} \subset \mathcal{O}_{Z''}$ the quasi-coherent sheaf of ideals corresponding to $Z \subset Z''$. By definition we have $\mathcal{C}_{Z/X'}$ is $\mathcal{I}$ viewed as a sheaf on Z. Hence the splitting above determines a splitting

$$\mathcal{I} = i^*\mathcal{C}_{X/X'} \oplus \mathcal{C}_{Z/X}$$

Let $Z' \subset Z''$ be the closed subscheme cut out by $\mathcal{C}_{Z/X} \subset \mathcal{I}$ viewed as a quasi-coherent sheaf of ideals on Z''. It is clear that Z' is a first order thickening of Z and that we obtain a commutative diagram of first order thickenings as in the statement of the lemma.

Since $X' \to U'$ is flat and since $X = U \times_{U'} X'$ we see that $\mathcal{C}_{X/X'}$ is the pullback of $\mathcal{C}_{U/U'}$ to X, see More on Morphisms of Spaces, Lemma 46.15.1. Note that by construction $\mathcal{C}_{Z/Z'} = i^*\mathcal{C}_{X/X'}$ hence we conclude that $\mathcal{C}_{Z/Z'}$ is isomorphic to the pullback of $\mathcal{C}_{U/U'}$ to Z. Applying More on Morphisms of Spaces, Lemma 46.15.1 once again (or its analogue for schemes, see More on Morphisms, Lemma 33.8.1) we conclude that $Z' \to U'$ is flat and that $Z = U \times_{U'} Z'$. Finally, More on Morphisms, Lemma 33.8.3 shows that $Z' \to U'$ is finite locally free of degree d. □

Lemma 59.15.3. *Let $F : \mathcal{X} \to \mathcal{Y}$ be a 1-morphism of stacks in groupoids over $(Sch/S)_{fppf}$. Assume F is representable by algebraic spaces, flat, and locally of finite presentation. Then*

$$p : \mathcal{H}_{d,lci}(\mathcal{X}/\mathcal{Y}) \to \mathcal{Y}$$

is formally smooth on objects.

Proof. We have to show the following: Given

(1) an object (U, Z, y, x, α) of $\mathcal{H}_{d,lci}(\mathcal{X}/\mathcal{Y})$ over an affine scheme U,
(2) a first order thickening $U \subset U'$, and
(3) an object y' of $\mathcal{Y}$ over U' such that $y'|_U = y$,

then there exists an object $(U', Z', y', x', \alpha')$ of $\mathcal{H}_{d,lci}(\mathcal{X}/\mathcal{Y})$ over U' with $Z = U \times_{U'} Z'$, with $x = x'|_Z$, and with $\alpha = \alpha'|_U$. Namely, the last two equalities will take care of the commutativity of (59.6.0.1).

Consider the morphism $x_\alpha : Z \to X_y$ constructed in Equation (59.15.0.1). Denote similarly $X'_{y'}$ the algebraic space over U' representing the 2-fibre product $(Sch/U')_{fppf} \times_{y',\mathcal{Y},F} \mathcal{X}$.

By assumption the morphism $X'_{y'} \to U'$ is flat (and locally of finite presentation). As $y'|_U = y$ we see that $X_y = U \times_{U'} X'_{y'}$. Hence we may apply Lemma 59.15.2 to find $Z' \to U'$ finite locally free of degree d with $Z = U \times_{U'} Z'$ and with $Z' \to X'_{y'}$ extending x_α. By construction the morphism $Z' \to X'_{y'}$ corresponds to a pair (x', α'). It is clear that $(U', Z', y', x', \alpha')$ is an object of $\mathcal{H}_d(\mathcal{X}/\mathcal{Y})$ over U' with $Z = U \times_{U'} Z'$, with $x = x'|_Z$, and with $\alpha = \alpha'|_U$. As we've seen in Lemma 59.15.1 that $\mathcal{H}_{d,lci}(\mathcal{X}/\mathcal{Y}) \subset \mathcal{H}_d(\mathcal{X}/\mathcal{Y})$ is an ``open substack" it follows that $(U', Z', y', x', \alpha')$ is an object of $\mathcal{H}_{d,lci}(\mathcal{X}/\mathcal{Y})$ as desired. □

Lemma 59.15.4. *Let $F : \mathcal{X} \to \mathcal{Y}$ be a 1-morphism of stacks in groupoids over $(Sch/S)_{fppf}$. Assume F is representable by algebraic spaces, flat, surjective, and locally of finite presentation. Then*

$$\coprod\nolimits_{d \geq 1} \mathcal{H}_{d,lci}(\mathcal{X}/\mathcal{Y}) \longrightarrow \mathcal{Y}$$

is surjective on objects.

Proof. It suffices to prove the following: For any field k and object y of $\mathcal{Y}$ over $Spec(k)$ there exists an integer $d \geq 1$ and an object (U, Z, y, x, α) of $\mathcal{H}_{d,lci}(\mathcal{X}/\mathcal{Y})$ with $U = Spec(k)$. Namely, in this case we see that p is surjective on objects in the strong sense that an extension of the field is not needed.

Denote X_y the algebraic space over $U = Spec(k)$ representing the 2-fibre product $(Sch/U')_{fppf} \times_{y', \mathcal{Y}, F} \mathcal{X}$. By assumption the morphism $X_y \to Spec(k)$ is surjective and locally of finite presentation (and flat). In particular X_y is nonempty. Choose a nonempty affine scheme V and an étale morphism $V \to X_y$. Note that $V \to Spec(k)$ is (flat), surjective, and locally of finite presentation (by Morphisms of Spaces, Definition 42.26.1). Pick a closed point $v \in V$ where $V \to Spec(k)$ is Cohen-Macaulay (i.e., V is Cohen-Macaulay at v), see More on Morphisms, Lemma 33.15.4. Applying More on Morphisms, Lemma 33.16.4 we find a regular immersion $Z \to V$ with $Z = \{v\}$. This implies $Z \to V$ is a closed immersion. Moreover, it follows that $Z \to Spec(k)$ is finite (for example by Algebra, Lemma 7.113.1). Hence $Z \to Spec(k)$ is finite locally free of some degree d. Now $Z \to X_y$ is unramified as the composition of an closed immersion followed by an étale morphism (see Morphisms of Spaces, Lemmas 42.34.3, 42.35.10, and 42.34.8). Finally, $Z \to X_y$ is a local complete intersection morphism as a composition of a regular immersion of schemes and an étale morphism of algebraic spaces (see More on Morphisms, Lemma 33.38.9 and Morphisms of Spaces, Lemmas 42.35.6 and 42.33.8 and More on Morphisms of Spaces, Lemmas 46.24.6 and 46.24.5). The morphism $Z \to X_y$ corresponds to an object x of $\mathcal{X}$ over Z together with an isomorphism $\alpha : y|_Z \to F(x)$. We obtain an object (U, Z, y, x, α) of $\mathcal{H}_d(\mathcal{X}/\mathcal{Y})$. By what was said above about the morphism $Z \to X_y$ we see that it actually is an object of the subcategory $\mathcal{H}_{d,lci}(\mathcal{X}/\mathcal{Y})$ and we win. □

59.16. Bootstrapping algebraic stacks

The following theorem is one of the main results of this chapter.

Theorem 59.16.1. *Let S be a scheme. Let $F : \mathcal{X} \to \mathcal{Y}$ be a 1-morphism of stacks in groupoids over $(Sch/S)_{fppf}$. If*

1. *$\mathcal{X}$ is representable by an algebraic space, and*
2. *F is representable by algebraic spaces, surjective, flat and locally of finite presentation,*

then $\mathcal{Y}$ is an algebraic stack.

Proof. By Lemma 59.4.3 we see that the diagonal of $\mathcal{Y}$ is representable by algebraic spaces. Hence we only need to verify the existence of a 1-morphism $f : \mathcal{V} \to \mathcal{Y}$ of stacks in groupouds over $(Sch/S)_{fppf}$ with $\mathcal{V}$ representable and f surjective and smooth. By Lemma 59.14.2 we know that

$$\coprod\nolimits_{d\geq 1} \mathcal{H}_d(\mathcal{X}/\mathcal{Y})$$

is an algebraic stack. It follows from Lemma 59.15.1 and Algebraic Stacks, Lemma 57.15.5 that

$$\coprod\nolimits_{d\geq 1} \mathcal{H}_{d,lci}(\mathcal{X}/\mathcal{Y})$$

is an algebraic stack as well. Choose a representable stack in groupoids $\mathcal{V}$ over $(Sch/S)_{fppf}$ and a surjective and smooth 1-morphism

$$\mathcal{V} \longrightarrow \coprod\nolimits_{d\geq 1} \mathcal{H}_{d,lci}(\mathcal{X}/\mathcal{Y}).$$

We claim that the composition

$$\mathcal{V} \longrightarrow \coprod\nolimits_{d\geq 1} \mathcal{H}_{d,lci}(\mathcal{X}/\mathcal{Y}) \longrightarrow \mathcal{Y}$$

is smooth and surjective which finishes the proof of the theorem. In fact, the smoothness will be a consequence of Lemmas 59.12.7 and 59.15.3 and the surjectivity a consequence of Lemma 59.15.4. We spell out the details in the following paragraph.

By construction $\mathcal{V} \to \coprod_{d\geq 1} \mathcal{H}_{d,lci}(\mathcal{X}/\mathcal{Y})$ is representable by algebraic spaces, surjective, and smooth (and hence also locally of finite presentation and formally smooth by the general principle Algebraic Stacks, Lemma 57.10.9 and More on Morphisms of Spaces, Lemma 46.16.6). Applying Lemmas 59.5.3, 59.6.3, and 59.7.3 we see that $\mathcal{V} \to \coprod_{d\geq 1} \mathcal{H}_{d,lci}(\mathcal{X}/\mathcal{Y})$ is limit preserving on objects, formally smooth on objects, and surjective on objects. The 1-morphism $\coprod_{d\geq 1} \mathcal{H}_{d,lci}(\mathcal{X}/\mathcal{Y}) \to \mathcal{Y}$ is

(1) limit preserving on objects: this is Lemma 59.12.7 for $\mathcal{H}_d(\mathcal{X}/\mathcal{Y}) \to \mathcal{Y}$ and we combine it with Lemmas 59.15.1, 59.5.4, and 59.5.2 to get it for $\mathcal{H}_{d,lci}(\mathcal{X}/\mathcal{Y}) \to \mathcal{Y}$,
(2) formally smooth on objects by Lemma 59.15.3, and
(3) surjective on objects by Lemma 59.15.4.

Using Lemmas 59.5.2, 59.6.2, and 59.7.2 we conclude that the composition $\mathcal{V} \to \mathcal{Y}$ is limit preserving on objects, formally smooth on objects, and surjective on objects. Using Lemmas 59.5.3, 59.6.3, and 59.7.3 we see that $\mathcal{V} \to \mathcal{Y}$ is locally of finite presentation, formally smooth, and surjective. Finally, using (via the general principle Algebraic Stacks, Lemma 57.10.9) the infinitesimal lifting criterion (More on Morphisms of Spaces, Lemma 46.16.6) we see that $\mathcal{V} \to \mathcal{Y}$ is smooth and we win. □

59.17. Applications

Our first task is to show that the quotient stack $[U/R]$ associated to a ``flat and locally finitely presented groupoid" is an algebraic stack. See Groupoids in Spaces, Definition 52.19.1 for the definition of the quotient stack. The following lemma is preliminary and is the analogue of Algebraic Stacks, Lemma 57.17.2.

Lemma 59.17.1. *Let S be a scheme contained in Sch_{fppf}. Let (U, R, s, t, c) be a groupoid in algebraic spaces over S. Assume s, t are flat and locally of finite presentation. Then the morphism $\mathcal{S}_U \to [U/R]$ is flat, locally of finite presentation, and surjective.*

Proof. Let T be a scheme and let $x : (Sch/T)_{fppf} \to [U/R]$ be a 1-morphism. We have to show that the projection

$$\mathcal{S}_U \times_{[U/R]} (Sch/T)_{fppf} \longrightarrow (Sch/T)_{fppf}$$

is surjective and smooth. We already know that the left hand side is representable by an algebraic space F, see Algebraic Stacks, Lemmas 57.17.1 and 57.10.11. Hence we have to show the corresponding morphism $F \to T$ of algebraic spaces is surjective, locally of finite presentation, and flat. Since we are working with properties of morphisms of algebraic spaces which are local on the target in the fppf topology we may check this fppf locally on T. By construction, there exists an fppf covering $\{T_i \to T\}$ of T such that $x|_{(Sch/T_i)_{fppf}}$ comes from a morphism $x_i : T_i \to U$. (Note that $F \times_T T_i$ represents the 2-fibre product $\mathcal{S}_U \times_{[U/R]} (Sch/T_i)_{fppf}$ so everything is compatible with the base change via $T_i \to T$.) Hence we may assume that x comes from $x : T \to U$. In this case we see that

$$\mathcal{S}_U \times_{[U/R]} (Sch/T)_{fppf} = (\mathcal{S}_U \times_{[U/R]} \mathcal{S}_U) \times_{\mathcal{S}_U} (Sch/T)_{fppf} = \mathcal{S}_R \times_{\mathcal{S}_U} (Sch/T)_{fppf}$$

The first equality by Categories, Lemma 4.28.10 and the second equality by Groupoids in Spaces, Lemma 52.21.2. Clearly the last 2-fibre product is represented by the algebraic space $F = R \times_{s,U,x} T$ and the projection $R \times_{s,U,x} T \to T$ is flat and locally of finite presentation as the base change of the flat locally finitely presented morphism of algebraic spaces $s : R \to U$. It is also surjective as s has a section (namely the identity $e : U \to R$ of the groupoid). This proves the lemma. $\square$

Here is the first main result of this section.

Theorem 59.17.2. *Let S be a scheme contained in Sch_{fppf}. Let (U, R, s, t, c) be a groupoid in algebraic spaces over S. Assume s, t are flat and locally of finite presentation. Then the quotient stack $[U/R]$ is an algebraic stack over S.*

Proof. We check the two conditions of Theorem 59.16.1 for the morphism

$$(Sch/U)_{fppf} \longrightarrow [U/R].$$

The first is trivial (as U is an algebraic space). The second is Lemma 59.17.1. $\square$

59.18. When is a quotient stack algebraic?

In Groupoids in Spaces, Section 52.19 we have defined the quotient stack $[U/R]$ associated to a groupoid (U, R, s, t, c) in algebraic spaces. Note that $[U/R]$ is a stack in groupoids whose diagonal is representable by algebraic spaces (see Bootstrap, Lemma 54.11.3 and Algebraic Stacks, Lemma 57.10.11) and such that there exists an algebraic space U and a 1-morphism $(Sch/U)_{fppf} \to [U/R]$ which is an ``fppf surjection" in the sense that it induces a map on presheaves of isomorphism classes of objects which becomes surjective after sheafification. However, it is not the case that that $[U/R]$ is an algebraic stack in general. This is not a contradiction with Theorem 59.16.1 as the 1-morphism $(Sch/U)_{fppf} \to [U/R]$ is not representable by algebraic spaces in general, and if it is it may not be flat and locally of finite presentation.

The easiest way to make examples of non-algebraic quotient stacks is to look at quotients of the form $[S/G]$ where S is a scheme and G is a group scheme over S acting trivially on S. Namely, we will see below (Lemma 59.18.3) that if $[S/G]$ is algebraic, then $G \to S$ has to be flat and locally of finite presentation. An explicit example can be found in Examples, Section 64.32.

Lemma 59.18.1. *Let S be a scheme and let B be an algebraic space over S. Let (U, R, s, t, c) be a groupoid in algebraic spaces over B. The quotient stack $[U/R]$ is an algebraic stack if and only if there exists a morphism of algebraic spaces $g : U' \to U$ such that*

1. *the composition $U' \times_{g,U,t} R \to R \xrightarrow{s} U$ is a surjection of sheaves, and*
2. *the morphisms $s', t' : R' \to U'$ are flat and locally of finite presentation where (U', R', s', t', c') is the restriction of (U, R, s, t, c) via g.*

Proof. First, assume that $g : U' \to U$ satisfies (1) and (2). Property (1) implies that $[U'/R'] \to [U/R]$ is an equivalence, see Groupoids in Spaces, Lemma 52.24.2. By Theorem 59.17.2 the quotient stack $[U'/R']$ is an algebraic stack. Hence $[U/R]$ is an algebraic stack too, see Algebraic Stacks, Lemma 57.12.4.

Conversely, assume that $[U/R]$ is an algebraic stack. We may choose a scheme W and a surjective smooth 1-morphism

$$f : (Sch/W)_{fppf} \longrightarrow [U/R].$$

By the 2-Yoneda lemma (Algebraic Stacks, Section 57.5) this corresponds to an object ξ of $[U/R]$ over W. By the description of $[U/R]$ in Groupoids in Spaces, Lemma 52.23.1 we can find a surjective, flat, locally finitely presented morphism $b : U' \to W$ of schemes such that $\xi' = b^*\xi$ corresponds to a morphism $g : U' \to U$. Note that the 1-morphism

$$f' : (Sch/U')_{fppf} \longrightarrow [U/R].$$

corresponding to ξ' is surjective, flat, and locally of finite presentation, see Algebraic Stacks, Lemma 57.10.5. Hence $(Sch/U')_{fppf} \times_{[U/R]} (Sch/U')_{fppf}$ which is represented by the algebraic space

$$Isom_{[U/R]}(\text{pr}_0^*\xi', \text{pr}_1^*\xi') = (U' \times_S U') \times_{(g\circ \text{pr}_0, g\circ \text{pr}_1), U\times_S U} R = R'$$

(see Groupoids in Spaces, Lemma 52.21.1 for the first equality; the second is the definition of restriction) is flat and locally of finite presentation over U' via both s' and t' (by base change, see Algebraic Stacks, Lemma 57.10.6). By this description of R' and by Algebraic Stacks, Lemma 57.16.1 we obtain a canonical fully faithful 1-morphism $[U'/R'] \to [U/R]$. This 1-morphism is essentially surjective because f' is flat, locally of finite presentation, and surjective (see Stacks, Lemma 50.4.8); another way to prove this is to use Algebraic Stacks, Remark 57.16.3. Finally, we can use Groupoids in Spaces, Lemma 52.24.2 to conclude that the composition $U' \times_{g,U,t} R \to R \xrightarrow{s} U$ is a surjection of sheaves. □

Lemma 59.18.2. *Let S be a scheme and let B be an algebraic space over S. Let G be a group algebraic space over B. Let X be an algebraic space over B and let $a : G \times_B X \to X$ be an action of G on X over B. The quotient stack $[X/G]$ is an algebraic stack if and only if there exists a morphism of algebraic spaces $\varphi : X' \to X$ such that*

1. *$G \times_B X' \to X$, $(g, x') \mapsto a(g, \varphi(x'))$ is a surjection of sheaves, and*
2. *the two projections $X'' \to X'$ of the algebraic space X'' given by the rule*
$$T \longmapsto \{(x_1', g, x_2') \in (X' \times_B G \times_B X')(T) \mid \varphi(x_1') = a(g, \varphi(x_2'))\}$$
are flat and locally of finite presentation.

Proof. This lemma is a special case of Lemma 59.18.1. Namely, the quotient stack $[X/G]$ is by Groupoids in Spaces, Definition 52.19.1 equal to the quotient stack $[X/G \times_B X]$ of the groupoid in algebraic spaces $(X, G \times_B X, s, t, c)$ associated to the group action in Groupoids in Spaces, Lemma 52.14.1. There is one small observation that is needed to get condition (1). Namely, the morphism $s : G \times_B X \to X$ is the second projection and the morphism

$t : G \times_B X \to X$ is the action morphism a. Hence the morphism $h : U' \times_{g,U,t} R \to R \xrightarrow{s} U$ from Lemma 59.18.1 corresponds to the morphism

$$X' \times_{\varphi,X,a} (G \times_B X) \xrightarrow{\mathrm{pr}_1} X$$

in the current setting. However, because of the symmetry given by the inverse of G this morphism is isomorphic to the morphism

$$(G \times_B X) \times_{\mathrm{pr}_1,X,\varphi} X' \xrightarrow{a} X$$

of the statement of the lemma. Details omitted. □

Lemma 59.18.3. *Let S be a scheme and let B be an algebraic space over S. Let G be a group algebraic space over B. Endow B with the trivial action of G. Then the quotient stack $[B/G]$ is an algebraic stack if and only if G is flat and locally of finite presentation over B.*

Proof. If G is flat and locally of finite presentation over B, then $[B/G]$ is an algebraic stack by Theorem 59.17.2.

Conversely, assume that $[B/G]$ is an algebraic stack. By Lemma 59.18.2 and because the action is trivial, we see there exists an algebraic space B' and a morphism $B' \to B$ such that (1) $B' \to B$ is a surjection of sheaves and (2) the projections

$$B' \times_B G \times_B B' \to B'$$

are flat and locally of finite presentation. Note that the base change $B' \times_B G \times_B B' \to G \times_B B'$ of $B' \to B$ is a surjection of sheaves also. Thus it follows from Descent on Spaces, Lemma 45.7.1 that the projection $G \times_B B' \to B'$ is flat and locally of finite presentation. By (1) we can find an fppf covering $\{B_i \to B\}$ such that $B_i \to B$ factors through $B' \to B$. Hence $G \times_B B_i \to B_i$ is flat and locally of finite presentation by base change. By Descent on Spaces, Lemmas 45.10.11 and 45.10.8 we conclude that $G \to B$ is flat and locally of finite presentation. □

59.19. Algebraic stacks in the étale topology

Let S be a scheme. Instead of working with stacks in groupoids over the big fppf site $(Sch/S)_{fppf}$ we could work with stacks in groupoids over the big étale site $(Sch/S)_{étale}$. All of the material in Algebraic Stacks, Sections 57.4, 57.5, 57.6, 57.7, 57.8, 57.9, 57.10, and 57.11 makes sense for categories fibred in groupouds over $(Sch/S)_{étale}$. Thus we get a second notion of an algebraic stack by working in the étale topology. This notion is (a priori) weaker then the notion introduced in Algebraic Stacks, Definition 57.12.1 since a stack in the fppf topology is certainly a stack in the étale topology. However, the notions are equivalent as is shown by the following lemma.

Lemma 59.19.1. *Denote the common underlying category of Sch_{fppf} and $Sch_{étale}$ by Sch_α (see Sheaves on Stacks, Section 58.4 and Topologies, Remark 30.9.1). Let S be an object of Sch_α. Let*

$$p : \mathcal{X} \to Sch_\alpha/S$$

be a category fibred in groupoids with the following properties:

1. *$\mathcal{X}$ is a stack in groupoids over $(Sch/S)_{étale}$,*
2. *the diagonal $\Delta : \mathcal{X} \to \mathcal{X} \times \mathcal{X}$ is representable by algebraic spaces[3], and*

[3] Here we can either mean sheaves in the étale topology whose diagonal is representable and which have an étale surjective covering by a scheme or algebraic spaces as defined in Algebraic Spaces, Definition 40.6.1. Namely, by Bootstrap, Lemma 54.12.1 there is no difference.

(3) *there exists $U \in Ob(Sch_\alpha/S)$ and a 1-morphism $(Sch/U)_{étale} \to \mathcal{X}$ which is surjective and smooth.*

Then $\mathcal{X}$ is an algebraic stack in the sense of Algebraic Stacks, Definition 57.12.1.

Proof. Note that properties (2) and (3) of the lemma and the corresponding properties (2) and (3) of Algebraic Stacks, Definition 57.12.1 are independent of the topology. This is true because these properties involve only the notion of a 2-fibre product of categories fibred in groupoids, 1- and 2-morphisms of categories fibred in groupoids, the notion of a 1-morphism of categories fibred in groupoids representable by algebraic spaces, and what it means for such a 1-morphism to be surjective and smooth. Thus all we have to prove is that an étale stack in groupoids $\mathcal{X}$ with properties (2) and (3) is also an fppf stack in groupoids.

Using (2) let R be an algebraic space representing

$$(Sch_\alpha/U) \times_{\mathcal{X}} (Sch_\alpha/U)$$

By (3) the projections $s, t : R \to U$ are smooth. Exactly as in the proof of Algebraic Stacks, Lemma 57.16.1 there exists a groupoid in spaces (U, R, s, t, c) and a canonical fully faithful 1-morphism $[U/R]_{étale} \to \mathcal{X}$ where $[U/R]_{étale}$ is the étale stackification of presheaf in groupoids

$$T \longmapsto (U(T), R(T), s(T), t(T), c(T))$$

Claim: If $V \to T$ is a surjective smooth morphism from an algebraic space V to a scheme T, then there exists an étale covering $\{T_i \to T\}$ refining the covering $\{V \to T\}$. This follows from More on Morphisms, Lemma 33.26.7 or the more general Sheaves on Stacks, Lemma 58.18.10. Using the claim and arguing exactly as in Algebraic Stacks, Lemma 57.16.2 it follows that $[U/R]_{étale} \to \mathcal{X}$ is an equivalence.

Next, let $[U/R]$ denote the quotient stack in the fppf topology which is an algebraic stack by Algebraic Stacks, Theorem 57.17.3. Thus we have 1-morphisms

$$U \to [U/R]_{étale} \to [U/R].$$

Both $U \to [U/R]_{étale} \cong \mathcal{X}$ and $U \to [U/R]$ are surjective and smooth (the first by assumption and the second by the theorem) and in both cases the fibre product $U \times_{\mathcal{X}} U$ and $U \times_{[U/R]} U$ is representable by R. Hence the 1-morphism $[U/R]_{étale} \to [U/R]$ is fully faithful (since morphisms in the quotient stacks are given by morphisms into R, see Groupoids in Spaces, Section 52.23).

Finally, for any scheme T and morphism $t : T \to [U/R]$ the fibre product $V = T \times_{U/R} U$ is an algebraic space surjective and smooth over T. By the claim above there exists an étale covering $\{T_i \to T\}_{i \in I}$ and morphisms $T_i \to V$ over T. This proves that the object t of $[U/R]$ over T comes étale locally from U. We conclude that $[U/R]_{étale} \to [U/R]$ is an equivalence of stacks in groupoids over $(Sch/S)_{étale}$ by Stacks, Lemma 50.4.8. This concludes the proof. □

CHAPTER 60

Properties of Algebraic Stacks

60.1. Introduction

Please see Algebraic Stacks, Section 57.1 for a brief introduction to algebraic stacks, and please read some of that chapter for our foundations of algebraic stacks. The intent is that in that chapter we are careful to distinguish between schemes, algebraic spaces, algebraic stacks, and starting with this chapter we employ the customary abuse of language where all of these concepts are used interchangeably.

The goal of this chapter is to introduce some basic notions and properties of algebraic stacks. A fundamental reference for the case of quasi-separated algebraic stacks with representable diagonal is [**LMB00a**].

60.2. Conventions and abuse of language

We choose a big fppf site Sch_{fppf}. All schemes are contained in Sch_{fppf}. And all rings A considered have the property that $Spec(A)$ is (isomorphic) to an object of this big site.

We also fix a base scheme S, by the conventions above an element of Sch_{fppf}. The reader who is only interested in the absolute case can take $S = Spec(\mathbf{Z})$.

Here are our conventions regarding algebraic stacks:

(1) When we say *algebraic stack* we will mean an algebraic stacks over S, i.e., a category fibred in groupoids $p : \mathcal{X} \to (Sch/S)_{fppf}$ which satisfies the conditions of Algebraic Stacks, Definition 57.12.1.
(2) We will say $f : \mathcal{X} \to \mathcal{Y}$ is a *morphism of algebraic stacks* to indicate a 1-morphism of algebraic stacks over S, i.e., a 1-morphism of categories fibred in groupoids over $(Sch/S)_{fppf}$, see Algebraic Stacks, Definition 57.12.3.
(3) A 2-*morphism* $\alpha : f \to g$ will indicate a 2-morphism in the 2-category of algebraic stacks over S, see Algebraic Stacks, Definition 57.12.3.
(4) Given morphisms $\mathcal{X} \to \mathcal{Z}$ and $\mathcal{Y} \to \mathcal{Z}$ of algebraic stacks we abusively call the 2-fibre product $\mathcal{X} \times_{\mathcal{Z}} \mathcal{Y}$ the *fibre product*.
(5) We will write $\mathcal{X} \times_S \mathcal{Y}$ for the product of the algebraic stacks $\mathcal{X}$, $\mathcal{Y}$.
(6) We will often abuse notation and say two algebraic stacks $\mathcal{X}$ and $\mathcal{Y}$ are *isomorphic* if they are equivalent in this 2-category.

Here are our conventions regarding algebraic spaces.

(1) If we say X is an *algebraic space* then we mean that X is an algebraic space over S, i.e., X is a presheaf on $(Sch/S)_{fppf}$ which satisfies the conditions of Spaces, Definition 40.6.1.
(2) A *morphism of algebraic spaces* $f : X \to Y$ is a morphism of algebraic spaces over S as defined in Spaces, Definition 40.6.3.

(3) We will **not** distinguish between an algebraic space X and the algebraic stack $\mathcal{S}_X \to (Sch/S)_{fppf}$ it gives rise to, see Algebraic Stacks, Lemma 57.13.1.
(4) In particular, a *morphism* $f : X \to \mathcal{Y}$ from X to an algebraic stack $\mathcal{Y}$ means a morphism $f : \mathcal{S}_X \to \mathcal{Y}$ of algebraic stacks. Similarly for morphisms $\mathcal{Y} \to X$.
(5) Moreover, given an algebraic stack $\mathcal{X}$ we say $\mathcal{X}$ *is an algebraic space* to indicate that $\mathcal{X}$ is representable by an algebraic space, see Algebraic Stacks, Definition 57.8.1.
(6) We will use the following notational convention: If we indicate an algebraic stack by a roman capital (such as $X, Y, Z, A, B, \ldots$) then it will be the case that its inertia stack is trivial, and hence it is an algebraic space, see Algebraic Stacks, Proposition 57.13.3.

Here are our conventions regarding schemes.

(1) If we say X is a *scheme* then we mean that X is a scheme over S, i.e., X is an object of $(Sch/S)_{fppf}$.
(2) By a *morphism of schemes* we mean a morphism of schemes over S.
(3) We will **not** distinguish between a scheme X and the algebraic stack $\mathcal{S}_X \to (Sch/S)_{fppf}$ it gives rise to, see Algebraic Stacks, Lemma 57.13.1.
(4) In particular, a *morphism* $f : X \to \mathcal{Y}$ from a scheme X to an algebraic stack $\mathcal{Y}$ means a morphism $f : \mathcal{S}_X \to \mathcal{Y}$ of algebraic stacks. Similarly for morphisms $\mathcal{Y} \to X$.
(5) Moreover, given an algebraic stack $\mathcal{X}$ we say $\mathcal{X}$ *is a scheme* to indicate that $\mathcal{X}$ is representable, see Algebraic Stacks, Section 57.4.

Here are our conventions regarding morphism of algebraic stacks:

(1) A morphism $f : \mathcal{X} \to \mathcal{Y}$ of algebraic stacks is *representable*, or *representable by schemes* if for every scheme T and morphism $T \to \mathcal{Y}$ the fibre product $T \times_{\mathcal{Y}} \mathcal{X}$ is a scheme. See Algebraic Stacks, Section 57.6.
(2) A morphism $f : \mathcal{X} \to \mathcal{Y}$ of algebraic stacks is *representable by algebraic spaces* if for every scheme T and morphism $T \to \mathcal{Y}$ the fibre product $T \times_{\mathcal{Y}} \mathcal{X}$ is an algebraic space. See Algebraic Stacks, Definition 57.9.1. In this case $Z \times_{\mathcal{Y}} \mathcal{X}$ is an algebraic space whenever $Z \to \mathcal{Y}$ is a morphism whose source is an algebraic space, see Algebraic Stacks, Lemma 57.9.8.

Note that every morphism $X \to \mathcal{Y}$ from an algebraic space to an algebraic stack is representable by algebraic spaces, see Algebraic Stacks, Lemma 57.10.11. We will use this basic result without further mention.

60.3. Properties of morphisms representable by algebraic spaces

We will study properties of (arbitrary) morphisms of algebraic stacks in its own chapter. For morphisms representable by algebraic spaces we know what it means to be surjective, smooth, or étale, etc. This applies in particular to morphisms $X \to \mathcal{Y}$ from algebraic spaces to algebraic stacks. In this section, we recall how this works, we list the properties to which this applies, and we prove a few easy lemmas.

Our first lemma says a morphism is representable by algebraic spaces if it is so after a base change by a flat, locally finitely presented, surjective morphism.

Lemma 60.3.1. *Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks. Let W be an algebraic space and let $W \to \mathcal{Y}$ be surjective, locally of finite presentation, and flat. The following are equivalent*

(1) *f is representable by algebraic spaces, and*
(2) *$W \times_{\mathcal{Y}} \mathcal{X}$ is an algebraic space.*

Proof. The implication (1) $\Rightarrow$ (2) is Algebraic Stacks, Lemma 57.9.8. Conversely, let $W \to \mathcal{Y}$ be as in (2). To prove (1) it suffices to show that f is faithful on fibre categories, see Algebraic Stacks, Lemma 57.15.2. Assumption (2) implies in particular that $W \times_{\mathcal{Y}} \mathcal{X} \to W$ is faithful. Hence the faithfulness of f follows from Stacks, Lemma 50.6.9. $\square$

Let P be a property of morphisms of algebraic spaces which is fppf local on the target and preserved by arbitrary base change. Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks representable by algebraic spaces. Then we say *f has property P* if and only if for every scheme T and morphism $T \to \mathcal{Y}$ the morphism of algebraic spaces $T \times_{\mathcal{Y}} \mathcal{X} \to T$ has property P, see Algebraic Stacks, Definition 57.10.1.

It turns out that if $f : \mathcal{X} \to \mathcal{Y}$ is representable by algebraic spaces and has property P, then for any morphism of algebraic stacks $\mathcal{Y}' \to \mathcal{Y}$ the base change $\mathcal{Y}' \times_{\mathcal{Y}} \mathcal{X} \to \mathcal{Y}'$ has property P, see Algebraic Stacks, Lemmas 57.9.7 and 57.10.6. If the property P is preserved under compositions, then this holds also in the setting of morphisms of algebraic stacks representable by algebraic spaces, see Algebraic Stacks, Lemmas 57.9.9 and 57.10.5. Moreover, in this case products $\mathcal{X}_1 \times \mathcal{X}_2 \to \mathcal{Y}_1 \times \mathcal{Y}_2$ of morphisms representable by algebraic spaces having property $\mathcal{P}$ have property $\mathcal{P}$, see Algebraic Stacks, Lemma 57.10.8.

Finally, if we have two properties P, P' of morphisms of algebraic spaces which are fppf local on the target and preserved by arbitrary base change and if $P(f) \Rightarrow P'(f)$ for every morphism f, then the same implication holds for the corresponding property of morphisms of algebraic stacks representable by algebraic spaces, see Algebraic Stacks, Lemma 57.10.9. We will use this *without further mention* in the following and in the following chapters.

The discussion above applies to each of the following properties of morphisms of algebraic spaces

(1) quasi-compact, see Morphisms of Spaces, Lemma 42.9.3 and Descent on Spaces, Lemma 45.10.1,
(2) quasi-separated, see Morphisms of Spaces, Lemma 42.5.4 and Descent on Spaces, Lemma 45.10.2,
(3) universally closed, see Morphisms of Spaces, Lemma 42.10.3 and Descent on Spaces, Lemma 45.10.3,
(4) universally open, see Morphisms of Spaces, Lemma 42.7.3 and Descent on Spaces, Lemma 45.10.4,
(5) surjective, see Morphisms of Spaces, Lemma 42.6.5 and Descent on Spaces, Lemma 45.10.5,
(6) universally injective, see Morphisms of Spaces, Lemma 42.18.5 and Descent on Spaces, Lemma 45.10.6,
(7) locally of finite type, see Morphisms of Spaces, Lemma 42.22.3 and Descent on Spaces, Lemma 45.10.7,
(8) locally of finite presentation, see Morphisms of Spaces, Lemma 42.26.3 and Descent on Spaces, Lemma 45.10.8,
(9) finite type, see Morphisms of Spaces, Lemma 42.22.3 and Descent on Spaces, Lemma 45.10.9,
(10) finite presentation, see Morphisms of Spaces, Lemma 42.26.3 and Descent on Spaces, Lemma 45.10.10,

(11) flat, see Morphisms of Spaces, Lemma 42.27.3 and Descent on Spaces, Lemma 45.10.11,

Lemma 60.3.2. *Let P be a property of morphisms of algebraic spaces as above. Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks representable by algebraic spaces. The following are equivalent:*

(1) *f has P,*
(2) *for every algebraic space Z and morphism $Z \to \mathcal{Y}$ the morphism $Z \times_{\mathcal{Y}} \mathcal{X} \to Z$ has P.*

Proof. The implication (2) $\Rightarrow$ (1) is immediate. Assume (1). Let $Z \to \mathcal{Y}$ be as in (2). Choose a scheme U and a surjective étale morphism $U \to Z$. By assumption the morphism

$U \times_{\mathcal{Y}} \mathcal{X} \to U$ has P. But the diagram

$$\begin{tikzcd} U \times_{\mathcal{Y}} \mathcal{X} \arrow[r] \arrow[d] & Z \times_{\mathcal{Y}} \mathcal{X} \arrow[d] \\ U \arrow[r] & Z \end{tikzcd}$$

is cartesian, hence the right vertical arrow has P as $\{U \to Z\}$ is an fppf covering. $\square$

The following lemma tells us it suffices to check P after a base change by a surjective, flat, locally finitely presented morphism.

Lemma 60.3.3. *Let P be a property of morphisms of algebraic spaces as above. Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks representable by algebraic spaces. Let W be an algebraic space and let $W \to \mathcal{Y}$ be surjective, locally of finite presentation, and flat. Set $V = W \times_{\mathcal{Y}} \mathcal{X}$. Then*

$$(f \textit{ has } P) \Leftrightarrow (\textit{the projection } V \to W \textit{ has } P).$$

Proof. The implication from left to right follows from Lemma 60.3.2. Assume $V \to W$ has P. Let T be a scheme, and let $T \to \mathcal{Y}$ be a morphism. Consider the commutative diagram

$$\begin{tikzcd} T \times_{\mathcal{Y}} \mathcal{X} \arrow[d] & T \times_{\mathcal{Y}} W \arrow[l] \arrow[r] \arrow[d] & W \arrow[d] \\ T & T \times_{\mathcal{Y}} V \arrow[l] \arrow[r] & V \end{tikzcd}$$

of algebraic spaces. The squares are cartesian. The bottom left morphism is a surjective, flat morphism which is locally of finite presentation, hence $\{T \times_{\mathcal{Y}} V \to T\}$ is an fppf covering. Hence the fact that the right vertical arrow has property P implies that the left vertical arrow has property P. $\square$

Lemma 60.3.4. *Let P be a property of morphisms of algebraic spaces as above. Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks representable by algebraic spaces. Let $\mathcal{Z} \to \mathcal{Y}$ be a morphism of algebraic stacks which is representable by algebraic spaces, surjective, flat, and locally of finite presentation. Set $\mathcal{W} = \mathcal{Z} \times_{\mathcal{Y}} \mathcal{X}$. Then*

$$(f \textit{ has } P) \Leftrightarrow (\textit{the projection } \mathcal{W} \to \mathcal{Z} \textit{ has } P).$$

Proof. Choose an algebraic space W and a morphism $W \to \mathcal{Z}$ which is surjective, flat, and locally of finite presentation. By the discussion above the composition $W \to \mathcal{Y}$ is also surjective, flat, and locally of finite presentation. Denote $V = W \times_{\mathcal{Z}} \mathcal{W} = V \times_{\mathcal{Y}} \mathcal{X}$. By Lemma 60.3.3 we see that f has $\mathcal{P}$ if and only if $V \to W$ does and that $\mathcal{W} \to \mathcal{Z}$ has $\mathcal{P}$ if and only if $V \to W$ does. The lemma follows. $\square$

Lemma 60.3.5. *Let P be a property of morphisms of algebraic spaces as above. Let $\mathcal{X} \to \mathcal{Y}$ and $\mathcal{Y} \to \mathcal{Z}$ be morphisms of algebraic stacks representable by algebraic spaces. Assume*

1. *$\mathcal{X} \to \mathcal{Y}$ is surjective, flat, and locally of finite presentation,*
2. *the composition has P, and*
3. *P is local on the source in the fppf topology.*

Then $\mathcal{Y} \to \mathcal{Z}$ has property P.

Proof. Let Z be a scheme and let $Z \to \mathcal{Z}$ be a morphism. Set $X = \mathcal{X} \times_{\mathcal{Z}} Z$, $Y = \mathcal{Y} \times_{\mathcal{Z}} Z$. By (1) $\{X \to Y\}$ is an fppf covering of algebraic spaces and by (2) $X \to Z$ has property P. By (3) this implies that $Y \to Z$ has property P and we win. $\square$

Lemma 60.3.6. *Let $g : \mathcal{X}' \to \mathcal{X}$ be a morphism of algebraic stacks which is representable by algebraic spaces. Let $[U/R] \to \mathcal{X}$ be a presentation. Set $U' = U \times_{\mathcal{X}} \mathcal{X}'$, and $R' = R \times_{\mathcal{X}} \mathcal{X}'$. Then there exists a groupoid in algebraic spaces of the form (U', R', s', t', c'), a presentation $[U'/R'] \to \mathcal{X}'$, and the diagram*

$$\begin{tikzcd} {[U'/R']} \arrow[r] \arrow[d, "{[pr]}"'] & \mathcal{X}' \arrow[d, "g"] \\ {[U/R]} \arrow[r] & \mathcal{X} \end{tikzcd}$$

is 2-commutative where the morphism $[pr]$ comes from a morphism of groupoids $pr : (U', R', s', t', c') \to (U, R, s, t, c)$.

Proof. Since $U \to \mathcal{Y}$ is surjective and smooth, see Algebraic Stacks, Lemma 57.17.2 the base change $U' \to \mathcal{X}'$ is also surjective and smooth. Hence, by Algebraic Stacks, Lemma 57.16.2 it suffices to show that $R' = U' \times_{\mathcal{X}'} U'$ in order to get a smooth groupoid (U', R', s', t', c') and a presentation $[U'/R'] \to \mathcal{X}'$. Using that $R = V \times_{\mathcal{Y}} V$ (see Groupoids in Spaces, Lemma 52.21.2) this follows from

$$R' = U \times_{\mathcal{X}} U \times_{\mathcal{X}} \mathcal{X}' = (U \times_{\mathcal{X}} \mathcal{X}') \times_{\mathcal{X}'} (U \times_{\mathcal{X}} \mathcal{X}')$$

see Categories, Lemmas 4.28.8 and 4.28.10. Clearly the projection morphisms $U' \to U$ and $R' \to R$ give the desired morphism of groupoids $\text{pr} : (U', R', s', t', c') \to (U, R, s, t, c)$. Hence the morphism [pr] of quotient stacks by Groupoids in Spaces, Lemma 52.20.1.

We still have to show that the diagram 2-commutes. It is clear that the diagram

$$\begin{tikzcd} U' \arrow[r, "f'"'] \arrow[d, "\text{pr}_U"'] & \mathcal{X}' \arrow[d, "g"] \\ U \arrow[r, "f"] & \mathcal{X} \end{tikzcd}$$

2-commutes where $\text{pr}_U : U' \to U$ is the projection. There is a canonical 2-arrow $\tau : f \circ t \to f \circ s$ in $Mor(R, \mathcal{X})$ coming from $R = U \times_{\mathcal{X}} U$, $t = \text{pr}_0$, and $s = \text{pr}_1$. Using the isomorphism $R' \to U' \times_{\mathcal{X}'} U'$ we get similarly an isomorphism $\tau' : f' \circ t' \to f' \circ s'$. Note that $g \circ f' \circ t' = f \circ t \circ \text{pr}_R$ and $g \circ f' \circ s' = f \circ s \circ \text{pr}_R$, where $\text{pr}_R : R' \to R$ is the projection. Thus it makes sense to ask if

$$\tau \star \text{id}_{\text{pr}_R} = \text{id}_g \star \tau'. \qquad (60.3.6.1)$$

Now we make two claims: (1) if Equation (60.3.6.1) holds, then the diagram 2-commutes, and (2) Equation (60.3.6.1) holds. We omit the proof of both claims. Hints: part (1) follows from the construction of $f = f_{can}$ and $f' = f'_{can}$ in Algebraic Stacks, Lemma 57.16.1. Part (2) follows by carefully working through the definitions. □

Remark 60.3.7. Let $\mathcal{Y}$ be an algebraic stack. Consider the following 2-category:

(1) An object is a morphism $f : \mathcal{X} \to \mathcal{Y}$ which is representable by algebraic spaces,
(2) a 1-morphism $(g, \beta) : (f_1 : \mathcal{X}_1 \to \mathcal{Y}) \to (f_2 : \mathcal{X}_2 \to \mathcal{Y})$ consists of a morphism $g : \mathcal{X}_1 \to \mathcal{X}_2$ and a 2-morphism $\beta : f_1 \to f_2 \circ g$, and
(3) a 2-morphism between $(g, \beta), (g', \beta') : (f_1 : \mathcal{X}_1 \to \mathcal{Y}) \to (f_2 : \mathcal{X}_2 \to \mathcal{Y})$ is a 2-morphism $\alpha : g \to g'$ such that $(\text{id}_{f_2} \star \alpha) \circ \beta = \beta'$.

Let us denote this 2-category $Spaces/\mathcal{Y}$ by analogy with the notation of Topologies on Spaces, Section 44.2. Now we claim that in this 2-category the morphism categories

$$Mor_{Spaces/\mathcal{Y}}((f_1 : \mathcal{X}_1 \to \mathcal{Y}), (f_2 : \mathcal{X}_2 \to \mathcal{Y}))$$

are all setoids. Namely, a 2-morphism α is a rule which to each object x_1 of $\mathcal{X}_1$ assigns an isomorphism $\alpha_{x_1} : g(x_1) \longrightarrow g'(x_1)$ in the relevant fibre category of $\mathcal{X}_2$ such that the diagram

$$\begin{tikzcd} & f_2(x_1) \arrow[dl, "\beta_{x_1}"'] \arrow[dr, "\beta'_{x_1}"] & \\ f_2(g(x_1)) \arrow[rr, "f_2(\alpha_{x_1})"] & & f_2(g'(x_1)) \end{tikzcd}$$

commutes. But since f_2 is faithful (see Algebraic Stacks, Lemma 57.15.2) this means that if α_{x_1} exists, then it is unique! In other words the 2-category $Spaces/\mathcal{Y}$ is very close to being a category. Namely, if we replace 1-morphisms by isomorphism classes of 1-morphisms we obtain a category. We will often perform this replacement without further mention.

60.4. Points of algebraic stacks

Let $\mathcal{X}$ be an algebraic stack. Let K, L be two fields and let $p : Spec(K) \to \mathcal{X}$ and $q : Spec(L) \to \mathcal{X}$ be morphisms. We say that p and q are *equivalent* if there exists a field Ω and a 2-commutative diagram

$$\begin{tikzcd} Spec(\Omega) \arrow[r] \arrow[d] & Spec(L) \arrow[d, "q"] \\ Spec(K) \arrow[r, "p"] & \mathcal{X}. \end{tikzcd}$$

Lemma 60.4.1. *The notion above does indeed define an equivalence relation on morphisms from spectra of fields into the algebraic stack $\mathcal{X}$.*

Proof. It is clear that the relation is reflexive and symmetric. Hence we have to prove that it is transitive. This comes down to the following: Given a diagram

$$\begin{tikzcd} Spec(\Omega) \arrow[r, "b"'] \arrow[d, "a"'] & Spec(L) \arrow[d, "q"] & Spec(\Omega') \arrow[l, "b'"] \arrow[d, "a'"] \\ Spec(K) \arrow[r, "p"] & \mathcal{X} & Spec(K') \arrow[l, "p'"'] \end{tikzcd}$$

with both squares 2-commutative we have to show that p is equivalent to p'. By the 2-Yoneda lemma (see Algebraic Stacks, Section 57.5) the morphisms p, p', and q are given by objects x, x', and y in the fibre categories of $\mathcal{X}$ over $Spec(K)$, $Spec(K')$, and $Spec(L)$. The 2-commutativity of the squares means that there are isomorphisms $\alpha : a^*x \to b^*y$ and $\alpha' : (a')^*x' \to (b')^*y$ in the fibre categories of $\mathcal{X}$ over $Spec(\Omega)$ and $Spec(\Omega')$. Choose any field Ω'' and embeddings $\Omega \to \Omega''$ and $\Omega' \to \Omega''$ agreeing on L. Then we can extend the diagram above to

$$\begin{tikzcd} & Spec(\Omega'') \arrow[dl, "c"'] \arrow[d, "q'"] \arrow[dr, "c'"] & \\ Spec(\Omega) \arrow[r, "b"'] \arrow[d, "a"'] & Spec(L) \arrow[d, "q"] & Spec(\Omega') \arrow[l, "b'"] \arrow[d, "a'"] \\ Spec(K) \arrow[r, "p"] & \mathcal{X} & Spec(K') \arrow[l, "p'"'] \end{tikzcd}$$

with commutative triangles and

$$(q')^*(\alpha')^{-1} \circ (q')^*\alpha : (a \circ c)^*x \longrightarrow (a' \circ c')^*x'$$

is an isomorphism in the fibre category over $Spec(\Omega'')$. Hence p is equivalent to p' as desired. $\square$

Definition 60.4.2. Let $\mathcal{X}$ be an algebraic stack. A *point* of $\mathcal{X}$ is an equivalence class of morphisms from spectra of fields into $\mathcal{X}$. The set of points of $\mathcal{X}$ is denoted $|\mathcal{X}|$.

This agrees with our definition of points of algebraic spaces, see Properties of Spaces, Definition 41.4.1. Moreover, for a scheme we recover the usual notion of points, see Properties of Spaces, Lemma 41.4.2. If $f : \mathcal{X} \to \mathcal{Y}$ is a morphism of algebraic stacks then there is an induced map $|f| : |\mathcal{X}| \to |\mathcal{Y}|$ which maps a representative $x : Spec(K) \to \mathcal{X}$ to the representative $f \circ x : Spec(K) \to \mathcal{Y}$. This is well defined: namely 2-isomorphic 1-morphisms remain 2-isomorphic after pre- or post-composing by a 1-morphism because you can horizontally pre- or post-compose by the identity of the given 1-morphism. This holds in any (strict) $(2, 1)$-category. If

$$\begin{tikzcd}
\mathcal{X} \arrow[r] \arrow[d] & \mathcal{Y} \arrow[d] \\
\mathcal{W} \arrow[r] & \mathcal{Z}
\end{tikzcd}$$

is a 2-commutative diagram of algebraic stacks, then the diagram of sets

$$\begin{tikzcd}
|\mathcal{X}| \arrow[r] \arrow[d] & |\mathcal{Y}| \arrow[d] \\
|\mathcal{W}| \arrow[r] & |\mathcal{Z}|
\end{tikzcd}$$

is commutative. In particular, if $\mathcal{X} \to \mathcal{Y}$ is an equivalence then $|\mathcal{X}| \to |\mathcal{Y}|$ is a bijection.

Lemma 60.4.3. *Let*

$$\begin{tikzcd}
\mathcal{Z} \times_{\mathcal{Y}} \mathcal{X} \arrow[r] \arrow[d] & \mathcal{X} \arrow[d] \\
\mathcal{Z} \arrow[r] & \mathcal{Y}
\end{tikzcd}$$

be a fibre product of algebraic stacks. Then the map of sets of points

$$|\mathcal{Z} \times_{\mathcal{Y}} \mathcal{X}| \longrightarrow |\mathcal{Z}| \times_{|\mathcal{Y}|} |\mathcal{X}|$$

is surjective.

Proof. Namely, suppose given fields K, L and morphisms $Spec(K) \to \mathcal{X}$, $Spec(L) \to \mathcal{Z}$, then the assumption that they agree as elements of $|\mathcal{Y}|$ means that there is a common extension $K \subset M$ and $L \subset M$ such that $Spec(M) \to Spec(K) \to \mathcal{X} \to \mathcal{Y}$ and $Spec(M) \to Spec(L) \to \mathcal{Z} \to \mathcal{Y}$ are 2-isomorphic. And this is exactly the condition which says you get a morphism $Spec(M) \to \mathcal{Z} \times_{\mathcal{Y}} \mathcal{X}$. $\square$

Lemma 60.4.4. *Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks which is representable by algebraic spaces. The following are equivalent:*

(1) $|f| : |\mathcal{X}| \to |\mathcal{Y}|$ *is surjective, and*
(2) f *is surjective.*

Proof. Assume (1). Let $T \to \mathcal{Y}$ be a morphism whose source is a scheme. To prove (2) we have to show that the morphism of algebraic spaces $T \times_{\mathcal{Y}} \mathcal{X} \to T$ is surjective. By Morphisms of Spaces, Definition 42.6.2 this means we have to show that $|T \times_{\mathcal{Y}} \mathcal{X}| \to |T|$ is surjective. Applying Lemma 60.4.3 we see that this follows from (1).

Conversely, assume (2). Let $y : Spec(K) \to \mathcal{Y}$ be a morphism from the spectrum of a field into $\mathcal{Y}$. By assumption the morphism $Spec(K) \times_{y,\mathcal{Y}} \mathcal{X} \to Spec(K)$ of algebraic spaces is surjective. By Morphisms of Spaces, Definition 42.6.2 this means there exists a field extension $K \subset K'$ and a morphism $Spec(K') \to Spec(K) \times_{y,\mathcal{Y}} \mathcal{X}$ such that the left square of the diagram

$$\begin{tikzcd} Spec(K') \arrow[r] \arrow[d] & Spec(K) \times_{y,\mathcal{Y}} \mathcal{X} \arrow[r] \arrow[d] & \mathcal{X} \arrow[d] \\ Spec(K) \arrow[r, equal] & Spec(K) \arrow[r, "y"] & \mathcal{Y} \end{tikzcd}$$

is commutative. This shows that $|X| \to |\mathcal{Y}|$ is surjective. □

Here is a lemma explaining how to compute the set of points in terms of a presentation.

Lemma 60.4.5. *Let $\mathcal{X}$ be an algebraic stack. Let $\mathcal{X} = [U/R]$ be a presentation of $\mathcal{X}$, see Algebraic Stacks, Definition 57.16.5. Then the image of $|R| \to |U| \times |U|$ is an equivalence relation and $|\mathcal{X}|$ is the quotient of $|U|$ by this equivalence relation.*

Proof. The assumption means that we have a smooth groupoid (U, R, s, t, c) in algebraic spaces, and an equivalence $f : [U/R] \to \mathcal{X}$. We may assume $\mathcal{X} = [U/R]$. The induced morphism $p : U \to \mathcal{X}$ is smooth and surjective, see Algebraic Stacks, Lemma 57.17.2. Hence $|U| \to |\mathcal{X}|$ is surjective by Lemma 60.4.4. Note that $R = U \times_{\mathcal{X}} U$, see Groupoids in Spaces, Lemma 52.21.2. Hence Lemma 60.4.3 implies the map

$$|R| \longrightarrow |U| \times_{|\mathcal{X}|} |U|$$

is surjective. Hence the image of $|R| \to |U| \times |U|$ is exactly the set of pairs $(u_1, u_2) \in |U| \times |U|$ such that u_1 and u_2 have the same image in $|\mathcal{X}|$. Combining these two statements we get the result of the lemma. □

Remark 60.4.6. The result of Lemma 60.4.5 can be generalized as follows. Let $\mathcal{X}$ be an algebraic stack. Let U be an algebraic space and let $f : U \to \mathcal{X}$ be a surjective morphism (which makes sense by Section 60.3). Let $R = U \times_{\mathcal{X}} U$, let (U, R, s, t, c) be the groupoid in algebraic spaces, and let $f_{can} : [U/R] \to \mathcal{X}$ be the canonical morphism as constructed in Algebraic Stacks, Lemma 57.16.1. Then the image of $|R| \to |U| \times |U|$ is an equivalence relation and $|\mathcal{X}| = |U|/|R|$. The proof of Lemma 60.4.5 works without change. (Of course in general $[U/R]$ is not an algebraic stack, and in general f_{can} is not an isomorphism.)

Lemma 60.4.7. *There exists a unique topology on the sets of points of algebraic stacks with the following properties:*

1. *for every morphism of algebraic stacks $\mathcal{X} \to \mathcal{Y}$ the map $|\mathcal{X}| \to |\mathcal{Y}|$ is continuous, and*
2. *for every morphism $U \to \mathcal{X}$ which is flat and locally of finite presentation with U an algebraic space the map of topological spaces $|U| \to |\mathcal{X}|$ is continuous and open.*

Proof. Choose a morphism $p : U \to \mathcal{X}$ which is surjective, flat, and locally of finite presentation with U an algebraic space. Such exist by the definition of an algebraic stack, as a smooth morphism is flat and locally of finite presentation (see Morphisms of Spaces, Lemmas 42.33.5 and 42.33.7). We define a topology on $|\mathcal{X}|$ by the rule: $W \subset |\mathcal{X}|$ is open if and only if $|p|^{-1}(W)$ is open in $|U|$. To show that this is independent of the choice of p, let $p' : U' \to \mathcal{X}$ be another morphism which is surjective, flat, locally of finite presentation from an algebraic space to $\mathcal{X}$. Set $U'' = U \times_{\mathcal{X}} U'$ so that we have a 2-commutative diagram

$$\begin{tikzcd} U'' \arrow[r] \arrow[d] & U' \arrow[d] \\ U \arrow[r] & \mathcal{X} \end{tikzcd}$$

As $U \to \mathcal{X}$ and $U' \to \mathcal{X}$ are surjective, flat, locally of finite presentation we see that $U'' \to U'$ and $U'' \to U$ are surjective, flat and locally of finite presentation, see Lemma 60.3.2. Hence the maps $|U''| \to |U'|$ and $|U''| \to |U|$ are continuous, open and surjective, see Morphisms of Spaces, Definition 42.6.2 and Lemma 42.27.5. This clearly implies that our definition is independent of the choice of $p : U \to \mathcal{X}$.

Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks. By Algebraic Stacks, Lemma 57.15.1 we can find a 2-commutative diagram

$$\begin{tikzcd} U \arrow[r, "a"'] \arrow[d, "x"'] & V \arrow[d, "y"] \\ \mathcal{X} \arrow[r, "f"] & \mathcal{Y} \end{tikzcd}$$

with surjective smooth vertical arrows. Consider the associated commutative diagram

$$\begin{tikzcd} {|U|} \arrow[r, "|a|"'] \arrow[d, "|x|"'] & {|V|} \arrow[d, "|y|"] \\ {|\mathcal{X}|} \arrow[r, "|f|"] & {|\mathcal{Y}|} \end{tikzcd}$$

of sets. If $W \subset |\mathcal{Y}|$ is open, then by the definition above this means exactly that $|y|^{-1}(W)$ is open in $|V|$. Since $|a|$ is continuous we conclude that $|a|^{-1}|y|^{-1}(W) = |x|^{-1}|f|^{-1}(W)$ is open in $|W|$ which means by definition that $|f|^{-1}(W)$ is open in $|\mathcal{X}|$. Thus $|f|$ is continuous.

Finally, we have to show that if U is an algebraic space, and $U \to \mathcal{X}$ is flat and locally of finite presentation, then $|U| \to |\mathcal{X}|$ is open. Let $V \to \mathcal{X}$ be surjective, flat, and locally of finite presentation with V an algebraic space. Consider the commutative diagram

$$\begin{tikzcd} {|U \times_{\mathcal{X}} V|} \arrow[r, "e"'] \arrow[dr, "f"'] & {|U| \times_{|\mathcal{X}|} |V|} \arrow[r, "d"'] \arrow[d, "c"'] & {|V|} \arrow[d, "b"] \\ & {|U|} \arrow[r, "a"] & {|\mathcal{X}|} \end{tikzcd}$$

Now the morphism $U \times_{\mathcal{X}} V \to U$ is surjective, i.e, $f : |U \times_{\mathcal{X}} V| \to |U|$ is surjective. The left top horizontal arrow is surjective, see Lemma 60.4.3. The morphism $U \times_{\mathcal{X}} V \to V$ is flat and locally of finite presentation, hence $d \circ e : |U \times_{\mathcal{X}} V| \to |V|$ is open, see Morphisms of Spaces, Lemma 42.27.5. Pick $W \subset |U|$ open. The properties above imply that $b^{-1}(a(W)) = (d \circ e)(f^{-1}(W))$ is open, which by construction means that $a(W)$ is open as desired. $\square$

Definition 60.4.8. Let $\mathcal{X}$ be an algebraic stack. The underlying *topological space* of $\mathcal{X}$ is the set of points $|\mathcal{X}|$ endowed with the topology constructed in Lemma 60.4.7.

This definition does not conflict with the already existing topology on $|\mathcal{X}|$ if $\mathcal{X}$ is an algebraic space.

Lemma 60.4.9. *Let $\mathcal{X}$ be an algebraic stack. Every point of $|\mathcal{X}|$ has a fundamental system of quasi-compact open neighbourhoods. In particular $|\mathcal{X}|$ is locally quasi-compact in the sense of Topology, Definition 5.18.1.*

Proof. This follows formally from the fact that there exists a scheme U and a surjective, open, continuous map $U \to |\mathcal{X}|$ of topological spaces. Namely, if $U \to \mathcal{X}$ is surjective and smooth, then Lemma 60.4.7 garantees that $|U| \to |\mathcal{X}|$ is continuous, surjective, and open. $\square$

60.5. Surjective morphisms

Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks which is representable by algebraic spaces. In Section 60.3 we have already defined what it means for f to be surjective. In Lemma 60.4.4 we have seen that this is equivalent to requiring $|f| : |\mathcal{X}| \to |\mathcal{Y}|$ to be surjective. This clears the way for the following definition.

Definition 60.5.1. Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks. We say f is *surjective* if the map $|f| : |\mathcal{X}| \to |\mathcal{Y}|$ of associated topological spaces is surjective.

Here are some lemmas.

Lemma 60.5.2. *The composition of surjective morphisms is surjective.*

Proof. Omitted. $\square$

Lemma 60.5.3. *The base change of a surjective morphism is surjective.*

Proof. Omitted. Hint: Use Lemma 60.4.3. $\square$

Lemma 60.5.4. *Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks. Let $\mathcal{Y}' \to \mathcal{Y}$ be a surjective morphism of algebraic stacks. If the base change $f' : \mathcal{Y}' \times_{\mathcal{Y}} \mathcal{X} \to \mathcal{Y}'$ of f is surjective, then f is surjective.*

Proof. Immediate from Lemma 60.4.3. $\square$

Lemma 60.5.5. *Let $\mathcal{X} \to \mathcal{Y} \to \mathcal{Z}$ be morphisms of algebraic stacks. If $\mathcal{X} \to \mathcal{Z}$ is surjective so is $\mathcal{Y} \to \mathcal{Z}$.*

Proof. Immediate. $\square$

60.6. Quasi-compact algebraic stacks

The following definition is equivalent with the definition for algebraic spaces by Properties of Spaces, Lemma 41.5.2.

Definition 60.6.1. Let $\mathcal{X}$ be an algebraic stack. We say $\mathcal{X}$ is *quasi-compact* if and only if $|\mathcal{X}|$ is quasi-compact.

Lemma 60.6.2. *Let $\mathcal{X}$ be an algebraic stack. The following are equivalent:*

(1) *$\mathcal{X}$ is quasi-compact,*
(2) *there exists a surjective smooth morphism $U \to \mathcal{X}$ with U a quasi-compact scheme,*
(3) *there exists a surjective smooth morphism $U \to \mathcal{X}$ with U a quasi-compact algebraic space, and*

(4) *there exists a surjective morphism $\mathcal{U} \to \mathcal{X}$ of algebraic stacks such that $\mathcal{U}$ is quasi-compact.*

Proof. We will use Lemma 60.4.4. Suppose $\mathcal{U}$ and $\mathcal{U} \to \mathcal{X}$ are as in (4). Then since $|\mathcal{U}| \to |\mathcal{X}|$ is surjective and continuous we conclude that $|\mathcal{X}|$ is quasi-compact. Thus (4) implies (1). The implications (2) $\Rightarrow$ (3) $\Rightarrow$ (4) are immediate. Assume (1), i.e., $\mathcal{X}$ is quasi-compact, i.e., that $|\mathcal{X}|$ is quasi-compact. Choose a scheme U and a surjective smooth morphism $U \to \mathcal{X}$. Then since $|U| \to |\mathcal{X}|$ is open we see that there exists a quasi-compact open $U' \subset U$ such that $|U'| \to |X|$ is surjective (and still smooth). Hence (2) holds. $\square$

Lemma 60.6.3. *A finite disjoint union of quasi-compact algebraic stacks is a quasi-compact algebraic stack.*

Proof. This is clear from the corresponding topological fact. $\square$

60.7. Properties of algebraic stacks defined by properties of schemes

Any smooth local property of schemes gives rise to a corresponding property of algebraic stacks via the following lemma. Note that a property of schemes which is smooth local is also étale local as any étale covering is also a smooth covering. Hence for a smooth local property P of schemes we know what it means to say that an algebraic space has P, see Properties of Spaces, Section 60.7.

Lemma 60.7.1. *Let $\mathcal{P}$ be a property of schemes which is local in the smooth topology, see Descent, Definition 31.11.1. Let $\mathcal{X}$ be an algebraic stack. The following are equivalent*

(1) *for some scheme U and some surjective smooth morphism $U \to \mathcal{X}$ the scheme U has property $\mathcal{P}$,*
(2) *for every scheme U and every smooth morphism $U \to \mathcal{X}$ the scheme U has property $\mathcal{P}$,*
(3) *for some algebraic space U and some surjective smooth morphism $U \to \mathcal{X}$ the algebraic space U has property $\mathcal{P}$, and*
(4) *for every algebraic space U and every smooth morphism $U \to \mathcal{X}$ the algebraic space U has property $\mathcal{P}$.*

If $\mathcal{X}$ is a scheme this is equivalent to $\mathcal{P}(U)$. If $\mathcal{X}$ is an algebraic space this is equivalent to X having property $\mathcal{P}$.

Proof. Let $U \to \mathcal{X}$ surjective and smooth with U an algebraic space. Let $V \to \mathcal{X}$ be a smooth morphism with V an algebraic space. Choose schemes U' and V' and surjective étale morphisms $U' \to U$ and $V' \to V$. Finally, choose a scheme W and a surjective étale morphism $W \to V' \times_{\mathcal{X}} U'$. Then $W \to V'$ and $W \to U'$ are smooth morphisms of schemes as compositions of étale and smooth morphisms of algebraic spaces, see Morphisms of Spaces, Lemmas 42.35.6 and 42.33.2. Moreover, $W \to V'$ is surjective as $U' \to \mathcal{X}$ is surjective. Hence, we have

$$\mathcal{P}(U) \Leftrightarrow \mathcal{P}(U') \Rightarrow \mathcal{P}(W) \Rightarrow \mathcal{P}(V') \Leftrightarrow \mathcal{P}(V)$$

where the equivalences are by definition of property $\mathcal{P}$ for algebraic spaces, and the two implications come from Descent, Definition 31.11.1. This proves (3) $\Rightarrow$ (4).

The implications (2) $\Rightarrow$ (1), (1) $\Rightarrow$ (3), and (4) $\Rightarrow$ (2) are immediate. $\square$

Definition 60.7.2. Let $\mathcal{X}$ be an algebraic stack. Let $\mathcal{P}$ be a property of schemes which is local in the smooth topology. We say $\mathcal{X}$ *has property $\mathcal{P}$* if any of the equivalent conditions of Lemma 60.7.1 hold.

Remark 60.7.3. Here is a list of properties which are local for the smooth topology (keep in mind that the fpqc, fppf, and syntomic topologies are stronger than the smooth topology):

(1) locally Noetherian, see Descent, Lemma 31.12.1,
(2) Jacobson, see Descent, Lemma 31.12.2,
(3) locally Noetherian and (S_k), see Descent, Lemma 31.13.1,
(4) Cohen-Macaulay, see Descent, Lemma 31.13.2,
(5) reduced, see Descent, Lemma 31.14.1,
(6) normal, see Descent, Lemma 31.14.2,
(7) locally Noetherian and (R_k), see Descent, Lemma 31.14.3,
(8) regular, see Descent, Lemma 31.14.4,
(9) Nagata, see Descent, Lemma 31.14.5.

Any smooth local property of germs of schemes gives rise to a corresponding property of algebraic stacks. Note that a property of germs which is smooth local is also étale local. Hence for a smooth local property of germs of schemes P we know what it means to say that an algebraic space X has property P at $x \in |X|$, see Properties of Spaces, Section 60.7.

Lemma 60.7.4. *Let $\mathcal{X}$ be an algebraic stack. Let $x \in |\mathcal{X}|$ be a point of $\mathcal{X}$. Let $\mathcal{P}$ be a property of germs of schemes which is smooth local, see Descent, Definition 31.17.1. The following are equivalent*

(1) *for any smooth morphism $U \to \mathcal{X}$ with U a scheme and $u \in U$ with $a(u) = x$ we have $\mathcal{P}(U, u)$,*
(2) *for some smooth morphism $U \to \mathcal{X}$ with U a scheme and some $u \in U$ with $a(u) = x$ we have $\mathcal{P}(U, u)$,*
(3) *for any smooth morphism $U \to \mathcal{X}$ with U an algebraic space and $u \in |U|$ with $a(u) = x$ the algebraic space U has property $\mathcal{P}$ at u, and*
(4) *for some smooth morphism $U \to \mathcal{X}$ with U a an algebraic space and some $u \in |U|$ with $a(u) = x$ the algebraic space U has property $\mathcal{P}$ at u.*

If $\mathcal{X}$ is representable, then this is equivalent to $\mathcal{P}(\mathcal{X}, x)$. If $\mathcal{X}$ is an algebraic space then this is equivalent to $\mathcal{X}$ having property $\mathcal{P}$ at x.

Proof. Let $a : U \to \mathcal{X}$ and $u \in |U|$ as in (3). Let $b : V \to \mathcal{X}$ be another smooth morphism with V an algebraic space and $v \in |V|$ with $b(v) = x$ also. Choose a scheme U', an étale morphism $U' \to U$ and $u' \in U'$ mapping to u. Choose a scheme V', an étale morphism $V' \to V$ and $v' \in V'$ mapping to v. By Lemma 60.4.3 there exists a point $\overline{w} \in |V' \times_{\mathcal{X}} U'|$ mapping to u' and v'. Choose a scheme W and a surjective étale morphism $W \to V' \times_{\mathcal{X}} U'$. We may choose a $w \in |W|$ mapping to $\overline{w}$ (see Properties of Spaces, Lemma 41.4.4). Then $W \to V'$ and $W \to U'$ are smooth morphisms of schemes as compositions of étale and smooth morphisms of algebraic spaces, see Morphisms of Spaces, Lemmas 42.35.6 and 42.33.2. Hence

$$\mathcal{P}(U, u) \Leftrightarrow \mathcal{P}(U', u') \Leftrightarrow \mathcal{P}(W, w) \Leftrightarrow \mathcal{P}(V', v') \Leftrightarrow \mathcal{P}(V, v)$$

The outer two equivalences by Properties of Spaces, Definition 41.7.5 and the other two by what it means to be a smooth local property of germs of schemes. This proves (4) ⇒ (3).

The implications (1) ⇒ (2), (2) ⇒ (4), and (3) ⇒ (1) are immediate. □

Definition 60.7.5. Let $\mathcal{P}$ be a property of germs of schemes which is smooth local. Let $\mathcal{X}$ be an algebraic stack. Let $x \in |\mathcal{X}|$. We say $\mathcal{X}$ *has property $\mathcal{P}$ at x* if any of the equivalent conditions of Lemma 60.7.4 holds.

60.8. Monomorphisms of algebraic stacks

We define a monomorphism of algebraic stacks in the following way. We will see in Lemma 60.8.4 that this is compatible with the corresponding 2-category theoretic notion.

Definition 60.8.1. Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks. We say f is a *monomorphism* if it is representable by algebraic spaces and a monomorphism in the sense of Section 60.3.

First some basic lemmas.

Lemma 60.8.2. *Let $\mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks. Let $\mathcal{Z} \to \mathcal{Y}$ be a monomorphism. Then $\mathcal{Z} \times_{\mathcal{Y}} \mathcal{X} \to \mathcal{X}$ is a monomorphism.*

Proof. This follows from the general discussion in Section 60.3. □

Lemma 60.8.3. *Compositions of monomorphisms of algebraic stacks are monomorphisms.*

Proof. This follows from the general discussion in Section 60.3 and Morphisms of Spaces, Lemma 42.14.4. □

Lemma 60.8.4. *Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks. The following are equivalent:*

1. *f is a monomorphism,*
2. *f is fully faithful,*
3. *the diagonal $\Delta_f : \mathcal{X} \to \mathcal{X} \times_{\mathcal{Y}} \mathcal{X}$ is an equivalence, and*
4. *there exists an algebraic space W and a surjective, flat morphism $W \to \mathcal{Y}$ which is locally of finite presentation such that $V = \mathcal{X} \times_{\mathcal{Y}} W$ is an algebraic space, and the morphism $V \to W$ is a monomorphism of algebraic spaces.*

Proof. The equivalence of (1) and (4) follows from the general discussion in Section 60.3 and in particular Lemmas 60.3.1 and 60.3.3.

The equivalence of (2) and (3) is Categories, Lemma 4.32.9.

Assume the equivalent conditions (2) and (3). Then f is representable by algebraic spaces according to Algebraic Stacks, Lemma 57.15.2. Moreover, the 2-Yoneda lemma combined with the fully faithfullness implies that for every scheme T the functor

$$Mor(T, \mathcal{X}) \longrightarrow Mor(T, \mathcal{Y})$$

is fully faithful. Hence given a morphism $y : T \to \mathcal{Y}$ there exists up to unique 2-isomorphism at most one morphism $x : T \to \mathcal{X}$ such that $y \cong f \circ x$. In particular, given a morphism of schemes $h : T' \to T$ there exists at most one lift $\tilde{h} : T' \to T \times_{\mathcal{Y}} \mathcal{X}$ of h. Thus $T \times_{\mathcal{Y}} \mathcal{X} \to T$ is a monomorphism of algebraic spaces, which proves that (1) holds.

Finally, assume that (1) holds. Then for any scheme T and morphism $y : T \to \mathcal{Y}$ the fibre product $T \times_{\mathcal{Y}} \mathcal{X}$ is an algebraic space, and $T \times_{\mathcal{Y}} \mathcal{X} \to T$ is a monomorphism. Hence there exists up to unique isomorphism exactly one pair (x, α) where $x : T \to \mathcal{X}$ is a morphism and $\alpha : f \circ x \to y$ is a 2-morphism. Applying the 2-Yoneda lemma this says exactly that f is fully faithful, i.e., that (2) holds. □

Lemma 60.8.5. *A monomorphism of algebraic stacks induces an injective map of sets of points.*

Proof. Let $f : \mathcal{X} \to \mathcal{Y}$ be a monomorphism of algebraic stacks. Suppose that $x_i : Spec(K_i) \to \mathcal{X}$ be morphisms such that $f \circ x_1$ and $f \circ x_2$ define the same element of $|\mathcal{Y}|$. Applying the definition we find a common extension Ω with corresponding morphisms $c_i : Spec(\Omega) \to Spec(K_i)$ and a 2-isomorphism $\beta : f \circ x_1 \circ c_1 \to f \circ x_1 \circ c_2$. As f is fully faithful, see Lemma 60.8.4, we can lift β to an isomorphism $\alpha : f \circ x_1 \circ c_1 \to f \circ x_1 \circ c_2$. Hence x_1 and x_2 define the same point of $|\mathcal{X}|$ as desired. □

60.9. Immersions of algebraic stacks

Immersions of algebraic stacks are defined as follows.

Definition 60.9.1. Immersions.

(1) A morphism of algebraic stacks is called an *open immersion* if it is representable, and an open immersion in the sense of Section 60.3.
(2) A morphism of algebraic stacks is called a *closed immersion* if it is representable, and a closed immersion in the sense of Section 60.3.
(3) A morphism of algebraic stacks is called an *immersion* if it is representable, and an immersion in the sense of Section 60.3.

This is not the most convenient way to think about immersions for us. For us it is a little bit more convenient to think of an immersion as a morphism of algebraic stacks which is representable by algebraic spaces and is an immersion in the sense of Section 60.3. Similarly for closed and open immersions. Since this is clearly equivalent to the notion just defined we shall use this characterization without further mention. We prove a few simple lemmas about this notion.

Lemma 60.9.2. *Let $\mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks. Let $\mathcal{Z} \to \mathcal{Y}$ be a (closed, resp. open) immersion. Then $\mathcal{Z} \times_{\mathcal{Y}} \mathcal{X} \to \mathcal{X}$ is a (closed, resp. open) immersion.*

Proof. This follows from the general discussion in Section 60.3. □

Lemma 60.9.3. *Compositions of immersions of algebraic stacks are immersions. Similarly for closed immersions and open immersions.*

Proof. This follows from the general discussion in Section 60.3 and Spaces, Lemma 40.12.2. □

Lemma 60.9.4. *Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks. let W be an algebraic space and let $W \to \mathcal{Y}$ be a surjective, flat morphism which is locally of finite presentation. The following are equivalent:*

(1) *f is an (open, resp. closed) immersion, and*
(2) *$V = W \times_{\mathcal{Y}} \mathcal{X}$ is an algebraic space, and $V \to W$ is an (open, resp. closed) immersion.*

Proof. This follows from the general discussion in Section 60.3 and in particular Lemmas 60.3.1 and 60.3.3. □

Lemma 60.9.5. *An immersion is a monomorphism.*

Proof. See Morphisms of Spaces, Lemma 42.14.7. □

The following two lemmas explain how to think about immersions in terms of presentations.

Lemma 60.9.6. *Let (U, R, s, t, c) be a smooth groupoid in algebraic spaces. Let $i : \mathcal{Z} \to [U/R]$ be an immersion. Then there exists an R-invariant locally closed subspace $Z \subset U$ and a presentation $[Z/R_Z] \to \mathcal{Z}$ where R_Z is the restriction of R to Z such that*

$$\begin{tikzcd} {[Z/R_Z]} \arrow[rr] \arrow[dr] & & \mathcal{Z} \arrow[dl, "i"] \\ & {[U/R]} & \end{tikzcd}$$

is 2-commutative. If i is a closed (resp. open) immersion then Z is a closed (resp. open) subspace of U.

Proof. By Lemma 60.3.6 we get a commutative diagram

$$\begin{tikzcd} {[U'/R']} \arrow[rr] \arrow[dr] & & \mathcal{Z} \arrow[dl] \\ & {[U/R]} & \end{tikzcd}$$

where $U' = \mathcal{Z} \times_{[U/R]} U$ and $R' = \mathcal{Z} \times_{[U/R]} R$. Since $\mathcal{Z} \to [U/R]$ is an immersion we see that $U' \to U$ is an immersion of algebraic spaces. Let $Z \subset U$ be the locally closed subspace such that $U' \to U$ factors through Z and induces an isomorphism $U' \to Z$. It is clear from the construction of R' that $R' = U' \times_{U,t} R = R \times_{s,U} U'$. This implies that $Z \cong U'$ is R-invariant and that the image of $R' \to R$ identifies R' with the restriction $R_Z = s^{-1}(Z) = t^{-1}(Z)$ of R to Z. Hence the lemma holds. $\square$

Lemma 60.9.7. *Let (U, R, s, t, c) be a smooth groupoid in algebraic spaces. Let $\mathcal{X} = [U/R]$ be the associated algebraic stack, see Algebraic Stacks, Theorem 57.17.3. Let $Z \subset U$ be an R-invariant locally closed subspace. Then*

$$[Z/R_Z] \longrightarrow [U/R]$$

is an immersion of algebraic stacks, where R_Z is the restriction of R to Z. If $Z \subset U$ is open (resp. closed) then the morphism is an open (resp. closed) immersion of algebraic stacks.

Proof. Recall that by Groupoids in Spaces, Definition 52.17.1 (see also discussion following the definition) we have $R_Z = s^{-1}(Z) = t^{-1}(Z)$ as locally closed subspaces of R. Hence the two morphisms $R_Z \to Z$ are smooth as base changes of s and t. Hence $(Z, R_Z, s|_{R_Z}, t|_{R_Z}, c|_{R_Z \times_{s,Z,t} R_Z})$ is a smooth groupoid in algebraic spaces, and we see that $[Z/R_Z]$ is an algebraic stack, see Algebraic Stacks, Theorem 57.17.3. The assumptions of Groupoids in Spaces, Lemma 52.24.3 are all satisfied and it follows that we have a 2-fibre square

$$\begin{tikzcd} Z \arrow[r] \arrow[d] & {[Z/R_Z]} \arrow[d] \\ U \arrow[r] & {[U/R]} \end{tikzcd}$$

It follows from this and Lemma 60.3.1 that $[Z/R_Z] \to [U/R]$ is representable by algebraic spaces, whereupon it follows from Lemma 60.3.3 that the right vertical arrow is an immersion (resp. closed immersion, resp. open immersion) if and only if the left vertical arrow is. $\square$

We can define open, closed, and locally closed substacks as follows.

Definition 60.9.8. Let $\mathcal{X}$ be an algebraic stack.

(1) An *open substack* of $\mathcal{X}$ is a strictly full subcategory $\mathcal{X}' \subset \mathcal{X}$ such that $\mathcal{X}'$ is an algebraic stack and $\mathcal{X}' \to \mathcal{X}$ is an open immersion.
(2) A *closed substack* of $\mathcal{X}$ is a strictly full subcategory $\mathcal{X}' \subset \mathcal{X}$ such that $\mathcal{X}'$ is an algebraic stack and $\mathcal{X}' \to \mathcal{X}$ is a closed immersion.
(3) A *locally closed substack* of $\mathcal{X}$ is a strictly full subcategory $\mathcal{X}' \subset \mathcal{X}$ such that $\mathcal{X}'$ is an algebraic stack and $\mathcal{X}' \to \mathcal{X}$ is an immersion.

This definition should be used with caution. Namely, if $f : \mathcal{X} \to \mathcal{Y}$ is an equivalence of algebraic stacks and $\mathcal{X}' \subset \mathcal{X}$ is an open substack, then it is not necessarily the case that the subcategory $f(\mathcal{X}')$ is an open substack of $\mathcal{Y}$. The problem is that it may not be a *strictly* full subcategory; but this is also the only problem. Here is a formal statement.

Lemma 60.9.9. *For any immersion $i : \mathcal{Z} \to \mathcal{X}$ there exists a unique locally closed substack $\mathcal{X}' \subset \mathcal{X}$ such that i factors as the composition of an equivalence $i' : \mathcal{Z} \to \mathcal{X}'$ followed by the inclusion morphism $\mathcal{X}' \to \mathcal{X}$. If i is a closed (resp. open) immersion, then $\mathcal{X}'$ is a closed (resp. open) substack of $\mathcal{X}$.*

Proof. Omitted. □

Lemma 60.9.10. *Let $[U/R] \to \mathcal{X}$ be a presentation of an algebraic stack. There is a canonical bijection*

$$R\text{-invariant locally closed subspaces } Z \text{ of } U \leftrightarrow \text{locally closed substacks } \mathcal{Z} \text{ of } \mathcal{X}$$

where if Z corresponds to $\mathcal{Z}$, then $[Z/R_Z] \to \mathcal{Z}$ is a presentation fitting into a 2-commutative diagram with the given presentation of $\mathcal{X}$. Similarly for closed substacks and open substacks.

Proof. Omitted. Hints: Use Lemma 60.9.6 to go from right to left and Lemma 60.9.7 from left to right. □

Lemma 60.9.11. *Let $\mathcal{X}$ be an algebraic stack. The rule $\mathcal{U} \mapsto |\mathcal{U}|$ defines an inclusion preserving bijection between open substacks of $\mathcal{X}$ and open subsets of $|\mathcal{X}|$.*

Proof. Choose a presentation $[U/R] \to \mathcal{X}$, see Algebraic Stacks, Lemma 57.16.2. By Lemma 60.9.10 we see that open substacks correspond to R-invariant open subschemes of U. On the other hand Lemmas 60.4.5 and 60.4.7 guarantee these correspond bijectively to open subsets of $|\mathcal{X}|$. □

Lemma 60.9.12. *Let $\mathcal{X}$ be an algebraic stack. Let U be an algebraic space and $U \to \mathcal{X}$ a surjective smooth morphism. For an open immersion $V \hookrightarrow U$, there exists an algebraic stack $\mathcal{Y}$, an open immersion $\mathcal{Y} \to \mathcal{X}$, and a surjective smooth morphism $V \to \mathcal{Y}$.*

Proof. We define a category fibred in groupoids $\mathcal{Y}$ by letting the fiber category $\mathcal{Y}_T$ over an object T of $(Sch/S)_{fppf}$ be the full subcategory of $\mathcal{X}_T$ consisting of all $y \in Ob(\mathcal{X}_T)$ such that the projection morphism $V \times_{\mathcal{X},y} T \to T$ surjective. Now for any morphism $x : T \to \mathcal{X}$, the 2-fibred product $T \times_{x,\mathcal{X}} \mathcal{Y}$ has fiber category over T' consisting of triples $(f : T' \to T, y \in \mathcal{X}_{T'}, f^*x \simeq y)$ such that $V \times_{\mathcal{X},y} T' \to T'$ is surjective. Note that $T \times_{x,\mathcal{X}} \mathcal{Y}$ is fibered in setoids since $\mathcal{Y} \to \mathcal{X}$ is faithful (see Stacks, Lemma 50.6.7). Now the isomorphism

$f^*x \simeq y$ gives the diagram

$$\begin{tikzcd} V\times_{\mathcal{X},y} T' \arrow[r] \arrow[d] & V\times_{\mathcal{X},x} T \arrow[r] \arrow[d] & V \arrow[d] \\ T' \arrow[r, "f"] & T \arrow[r, "x"] & \mathcal{X} \end{tikzcd}$$

where both squares are cartesian. The morphism $V\times_{\mathcal{X},x} T \to T$ is smooth by base change, and hence open. Let $T_0 \subset T$ be its image. From the cartesian squares we deduce that $V\times_{\mathcal{X},y} T' \to T'$ is surjective if and only if f lands in T_0. Therefore $T\times_{x,\mathcal{X}} \mathcal{Y}$ is representable by T_0, so the inclusion $\mathcal{Y} \to \mathcal{X}$ is an open immersion. By Algebraic Stacks, Lemma 57.15.5 we conclude that $\mathcal{Y}$ is an algebraic stack. Lastly if we denote the morphism $V \to \mathcal{X}$ by g, we have $V\times_{\mathcal{X}} V \to V$ is surjective (the diagonal gives a section). Hence g is in the image of $\mathcal{Y}_V \to \mathcal{X}_V$, i.e., we obtain a morphism $g' : V \to \mathcal{Y}$ fitting into the commutative diagram

$$\begin{tikzcd} V \arrow[r] \arrow[d, "g'"] & U \arrow[d] \\ \mathcal{Y} \arrow[r] & \mathcal{X} \end{tikzcd}$$

Since $V\times_{g,\mathcal{X}} \mathcal{Y} \to V$ is a monomorphism, it is in fact an isomorphism since $(1, g')$ defines a section. Therefore $g' : V \to \mathcal{Y}$ is a smooth morphism, as it is the base change of the smooth morphism $g : V \to \mathcal{X}$. It is surjective by our construction of $\mathcal{Y}$ which finishes the proof of the lemma. □

Lemma 60.9.13. *Let $\mathcal{X}$ be an algebraic stack and $\mathcal{X}_i \subset \mathcal{X}$ a collection of open substacks indexed by $i \in I$. Then there exists an open substack, which we denote $\bigcup_{i\in I} \mathcal{X}_i \subset \mathcal{X}$, such that the $\mathcal{X}_i$ are open substacks covering it.*

Proof. We define a fibred subcategory $\mathcal{X}' = \bigcup_{i\in I} \mathcal{X}_i$ by letting the fiber category over an object T of $(Sch/S)_{fppf}$ be the full subcategory of $\mathcal{X}_T$ consisting of all $x \in Ob(\mathcal{X}_T)$ such that the morphism $\coprod_{i\in I}(\mathcal{X}_i \times_{\mathcal{X}} T) \to T$ is surjective. Let $x_i \in Ob((\mathcal{X}_i)_T)$. Then $(x_i, 1)$ gives a section of $\mathcal{X}_i \times_{\mathcal{X}} T \to T$, so we have an isomorphism. Thus $\mathcal{X}_i \subset \mathcal{X}'$ is a full subcategory. Now let $x \in Ob(\mathcal{X}_T)$. Then $\mathcal{X}_i \times_{\mathcal{X}} T$ is representable by an open subscheme $T_i \subset T$. The 2-fibred product $\mathcal{X}' \times_{\mathcal{X}} T$ has fiber over T' consisting of $(y \in \mathcal{X}_{T'}, f : T' \to T, f^*x \simeq y)$ such that $\coprod(\mathcal{X}_i \times_{\mathcal{X},y} T') \to T'$ is surjective. The isomorphism $f^*x \simeq y$ induces an isomorphism $\mathcal{X}_i \times_{\mathcal{X},y} T' \simeq T_i \times_T T'$. Then the $T_i \times_T T'$ cover T' if and only if f lands in $\bigcup T_i$. Therefore we have a diagram

$$\begin{tikzcd} T_i \arrow[r] \arrow[d] & \bigcup T_i \arrow[r] \arrow[d] & T \arrow[d] \\ \mathcal{X}_i \arrow[r] & \mathcal{X}' \arrow[r] & \mathcal{X} \end{tikzcd}$$

with both squares cartesian. By Algebraic Stacks, Lemma 57.15.5 we conclude that $\mathcal{X}' \subset \mathcal{X}$ is algebraic and an open substack. It is also clear from the cartesian squares above that the morphism $\coprod_{i\in I} \mathcal{X}_i \to \mathcal{X}'$ which finishes the proof of the lemma. □

Lemma 60.9.14. *Let $\mathcal{X}$ be an algebraic stack and $\mathcal{X}' \subset \mathcal{X}$ a quasi-compact open substack. Suppose that we have a collection of open substacks $\mathcal{X}_i \subset \mathcal{X}$ indexed by $i \in I$ such that $\mathcal{X}' \subset \bigcup_{i\in I} \mathcal{X}_i$, where we define the union as in Lemma 60.9.13. Then there exists a finite subset $I' \subset I$ such that $\mathcal{X}' \subset \bigcup_{i\in I'} \mathcal{X}_i$.*

Proof. Since $\mathcal{X}$ is algebraic, there exists a scheme U with a surjective smooth morphism $U \to \mathcal{X}$. Let $U_i \subset U$ be the open subscheme representing $\mathcal{X}_i \times_{\mathcal{X}} U$ and $U' \subset U$ the open subscheme representing $\mathcal{X}' \times_{\mathcal{X}} U$. By hypothesis, $U' \subset \bigcup_{i \in I} U_i$. From the proof of Lemma 60.6.2, there is a quasi-compact open $V \subset U'$ such that $V \to \mathcal{X}'$ is a surjective smooth morphism. Therefore there exists a finite subset $I' \subset I$ such that $V \subset \bigcup_{i \in I'} U_i$. We claim that $\mathcal{X}' \subset \bigcup_{i \in I'} \mathcal{X}_i$. Take $x \in Ob(\mathcal{X}'_T)$ for $T \in Ob((Sch/S)_{fppf})$. Since $\mathcal{X}' \to \mathcal{X}$ is a monomorphism, we have cartesian squares

$$\begin{tikzcd} V \times_{\mathcal{X}} T \arrow[r] \arrow[d] & T \arrow[r, equal] \arrow[d, "x"] & T \arrow[d, "x"] \\ V \arrow[r] & \mathcal{X}' \arrow[r] & \mathcal{X} \end{tikzcd}$$

By base change, $V \times_{\mathcal{X}} T \to T$ is surjective. Therefore $\bigcup_{i \in I'} U_i \times_{\mathcal{X}} T \to T$ is also surjective. Let $T_i \subset T$ be the open subscheme representing $\mathcal{X}_i \times_{\mathcal{X}} T$. By a formal argument, we have a Cartesian square

$$\begin{tikzcd} U_i \times_{\mathcal{X}_i} T_i \arrow[r] \arrow[d] & U \times_{\mathcal{X}} T \arrow[d] \\ T_i \arrow[r] & T \end{tikzcd}$$

where the vertical arrows are surjective by base change. Since $U_i \times_{\mathcal{X}_i} T_i \simeq U_i \times_{\mathcal{X}} T$, we find that $\bigcup_{i \in I'} T_i = T$. Hence x is an object of $(\bigcup_{i \in I'} \mathcal{X}_i)_T$ by definition of the union. Observe that the inclusion $\mathcal{X}' \subset \bigcup_{i \in I'} \mathcal{X}_i$ is automatically an open substack. □

Lemma 60.9.15. *Let $\mathcal{X}$ be an algebraic stack. Let $\mathcal{X}_i$, $i \in I$ be a set of open substacks of $\mathcal{X}$. Assume*

1. *$\mathcal{X} = \bigcup_{i \in I} \mathcal{X}_i$, and*
2. *each $\mathcal{X}_i$ is an algebraic space.*

Then $\mathcal{X}$ is an algebraic space.

Proof. Apply Stacks, Lemma 50.6.10 to the morphism $\coprod_{i \in I} \mathcal{X}_i \to \mathcal{X}$ and the morphism $\text{id} : \mathcal{X} \to \mathcal{X}$ to see that $\mathcal{X}$ is a stack in setoids. Hence $\mathcal{X}$ is an algebraic space, see Algebraic Stacks, Proposition 57.13.3. □

Lemma 60.9.16. *Let $\mathcal{X}$ be an algebraic stack. Let $\mathcal{X}_i$, $i \in I$ be a set of open substacks of $\mathcal{X}$. Assume*

1. *$\mathcal{X} = \bigcup_{i \in I} \mathcal{X}_i$, and*
2. *each $\mathcal{X}_i$ is a scheme*

Then $\mathcal{X}$ is a scheme.

Proof. By Lemma 60.9.15 we see that $\mathcal{X}$ is an algebraic space. Since any algebraic space has a largest open subspace which is a scheme, see Properties of Spaces, Lemma 41.10.1 we see that $\mathcal{X}$ is a scheme. □

The following lemma is the analogue of More on Groupoids, Lemma 36.5.1.

Lemma 60.9.17. *Let $\mathcal{P}, \mathcal{Q}, \mathcal{R}$ be properties of morphisms of algebraic spaces. Assume*

1. *$\mathcal{P}, \mathcal{Q}, \mathcal{R}$ are fppf local on the target and stable under arbitrary base change,*
2. *smooth $\Rightarrow \mathcal{R}$,*
3. *for any morphism $f : X \to Y$ which has $\mathcal{Q}$ there exists a largest open subspace $W(\mathcal{P}, f) \subset X$ such that $f|_{W(\mathcal{P}, f)}$ has $\mathcal{P}$, and*

(4) *for any morphism $f : X \to Y$ which has $\mathcal{Q}$, and any morphism $Y' \to Y$ which has $\mathcal{R}$ we have $Y' \times_Y W(\mathcal{P}, f) = W(\mathcal{P}, f')$, where $f' : X_{Y'} \to Y'$ is the base change of f.*

Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphisms of algebraic stacks representable by algebraic spaces. Assume f has $\mathcal{Q}$. Then

(A) *there exists a largest open substack $\mathcal{X}' \subset \mathcal{X}$ such that $f|_{\mathcal{X}'}$ has $\mathcal{P}$, and*
(B) *if $\mathcal{Z} \to \mathcal{Y}$ is a morphism of algebraic stacks representable by algebraic spaces which has $\mathcal{R}$ then $\mathcal{Z} \times_\mathcal{Y} \mathcal{X}'$ is the largest open substack of $\mathcal{Z} \times_\mathcal{Y} \mathcal{X}$ over which the base change $\mathrm{id}_\mathcal{Z} \times f$ has property $\mathcal{P}$.*

Proof. Choose a scheme V and a surjective smooth morphism $V \to \mathcal{Y}$. Set $U = V \times_\mathcal{Y} \mathcal{X}$ and let $f' : U \to V$ be the base change of f. The morphism of algebraic spaces $f' : U \to V$ has property $\mathcal{Q}$. Thus we obtain the open $W(\mathcal{P}, f') \subset U$ by assumption (3). Note that $U \times_\mathcal{X} U = (V \times_\mathcal{Y} V) \times_\mathcal{Y} \mathcal{X}$ hence the morphism $f'' : U \times_\mathcal{X} U \to V \times_\mathcal{Y} V$ is the base change of f via either projection $V \times_\mathcal{Y} V \to V$. By our choice of V these projections are smooth, hence have property $\mathcal{R}$ by (2). Thus by (4) we see that the inverse images of $W(\mathcal{P}, f')$ under the two projections $\mathrm{pr}_i : U \times_\mathcal{X} U \to U$ agree. In other words, $W(\mathcal{P}, f')$ is an R-invariant subspace of U (where $R = U \times_\mathcal{X} U$). Let $\mathcal{X}'$ be the open substack of $\mathcal{X}$ corresponding to $W(\mathcal{P}, f)$ via Lemma 60.9.6. By construction $W(\mathcal{P}, f') = \mathcal{X}' \times_\mathcal{Y} V$ hence $f|_{\mathcal{X}'}$ has property $\mathcal{P}$ by Lemma 60.3.3. Also, $\mathcal{X}'$ is the largest open substack such that $f|_{\mathcal{X}'}$ has $\mathcal{P}$ as the same maximality holds for $W(\mathcal{P}, f)$. This proves (A).

Finally, if $\mathcal{Z} \to \mathcal{Y}$ is a morphism of algebraic stacks representable by algebraic spaces which has $\mathcal{R}$ then we set $T = V \times_\mathcal{Y} \mathcal{Z}$ and we see that $T \to V$ is a morphism of algebraic spaces having property $\mathcal{R}$. Set $f'_T : T \times_V U \to T$ the base change of f'. By (4) again we see that $W(\mathcal{P}, f'_T)$ is the inverse image of $W(\mathcal{P}, f)$ in $T \times_V U$. This implies (B); some details omitted. □

Remark 60.9.18. Warning: Lemma 60.9.17 should be used with care. For example, it applies to $\mathcal{P}$=``flat'', $\mathcal{Q}$ =``empty'', and $\mathcal{R}$ =``flat and locally of finite presentation''. But given a morphism of algebraic spaces $f : X \to Y$ the largest open subspace $W \subset X$ such that $f|_W$ is flat is *not* the set of points where f is flat!

Remark 60.9.19. Notwithstanding the warning in Remark 60.9.18 there are some cases where Lemma 60.9.17 can be used without causing ambiguity. We give a list. In each case we omit the verification of assumptions (1) and (2) and we give references which imply (3) and (4). Here is the list:

(1) $\mathcal{Q}$ =``locally of finite type'', $\mathcal{R} = \emptyset$, and $\mathcal{P}$ =``relative dimension $\leq d$''. See Morphisms of Spaces, Definition 42.30.2 and Morphisms of Spaces, Lemmas 42.31.4 and 42.31.3.
(2) $\mathcal{Q}$ =``locally of finite type'', $\mathcal{R} = \emptyset$, and $\mathcal{P}$ =``locally quasi-finite''. This is the case $d = 0$ of the previous item, see Morphisms of Spaces, Lemma 42.31.6. On the other hand, properties (3) and (4) are spelled out in Morphisms of Spaces, Lemma 42.31.7.
(3) $\mathcal{Q}$ =``locally of finite type'', $\mathcal{R} = \emptyset$, and $\mathcal{P}$ =``unramified''. This is Morphisms of Spaces, Lemma 42.34.10.
(4) $\mathcal{Q}$ =``locally of finite presentation'', $\mathcal{R}$ =``flat and locally of finite presentation'', and $\mathcal{P}$=``flat''. See More on Morphisms of Spaces, Theorem 46.17.1 and Lemma 46.17.2. Note that here $W(\mathcal{P}, f)$ is always exactly the set of points where the morphism f is flat because we only consider this open when f has $\mathcal{Q}$ (see loc.cit.).

(5) $\mathcal{Q}$ =``locally of finite presentation'', $\mathcal{R}$ =``flat and locally of finite presentation'', and $\mathcal{P}$ =``étale''. This follows on combining (3) and (4) because an unramified morphism which is flat and locally of finite presentation is étale, see Morphisms of Spaces, Lemma 42.35.12.
(6) Add more here as needed (compare with the longer list at More on Groupoids, Remark 36.5.3).

60.10. Reduced algebraic stacks

We have already defined reduced algebraic stacks in Section 60.7.

Lemma 60.10.1. *Let $\mathcal{X}$ be an algebraic stack. Let $T \subset |\mathcal{X}|$ be a closed subset. There exists a unique closed substack $\mathcal{Z} \subset \mathcal{X}$ with the following properties: (a) we have $|\mathcal{Z}| = T$, and (b) $\mathcal{Z}$ is reduced.*

Proof. Let $U \to \mathcal{X}$ be a surjective smooth morphism, where U is an algebraic space. Set $R = U \times_{\mathcal{X}} U$, so that there is a presentation $[U/R] \to \mathcal{X}$, see Algebraic Stacks, Lemma 57.16.2. As usual we denote $s, t : R \to U$ the two smooth projection morphisms. By Lemma 60.4.5 we see that T corresponds to a closed subset $T' \subset |U|$ such that $|s|^{-1}(T') = |t|^{-1}(T')$. Let $Z \subset U$ be the reduced induced algebraic space structure on T', see Properties of Spaces, Definition 41.9.3. The fibre products $Z \times_{U,t} R$ and $R \times_{s,U} Z$ are closed subspaces of R (Spaces, Lemma 40.12.3). The projections $Z \times_{U,t} R \to Z$ and $R \times_{s,U} Z \to Z$ are smooth by Morphisms of Spaces, Lemma 42.33.3. Thus as Z is reduced, it follows that $Z \times_{U,t} R$ and $R \times_{s,U} Z$ are reduced, see Remark 60.7.3. Since

$$|Z \times_{U,t} R| = |t|^{-1}(T') = |s|^{-1}(T') = R \times_{s,U} Z$$

we conclude from the uniqueness in Properties of Spaces, Lemma 41.9.1 that $Z \times_{U,t} R = R \times_{s,U} Z$. Hence Z is an R-invariant closed subspace of U. By the corresondence of Lemma 60.9.10 (and its proof) we obtain a closed substack $\mathcal{Z} \subset \mathcal{Z}$ with a presentation $[Z/R_Z] \to \mathcal{Z}$. Then $|\mathcal{Z}| = |Z|/|R_Z| = |T'|/\sim$ is the given closed subset T. We omit the proof of unicity. □

Lemma 60.10.2. *Let $\mathcal{X}$ be an algebraic stack. If $\mathcal{X}' \subset \mathcal{X}$ is a closed substack, $\mathcal{X}$ is reduced and $|\mathcal{X}'| = |\mathcal{X}|$, then $\mathcal{X}' = \mathcal{X}$.*

Proof. Choose a presentation $[U/R] \to \mathcal{X}$ with U a scheme. As $\mathcal{X}$ is reduced, we see that U is reduced (by definition of reduced algebraic stacks). By Lemma 60.9.10 $\mathcal{X}'$ corresponds to an R-invariant closed subscheme $Z \subset U$. But now $|Z| \subset |U|$ is the inverse image of $|\mathcal{X}'|$, and hence $|Z| = |U|$. Hence Z is a closed subscheme of U whose underlying sets of points agree. By Schemes, Lemma 21.12.6 the map $\mathrm{id}_U : U \to U$ factors through $Z \to U$, and hence $Z = U$, i.e., $\mathcal{X}' = \mathcal{X}$. □

Lemma 60.10.3. *Let $\mathcal{X}$, $\mathcal{Y}$ be algebraic stacks. Let $\mathcal{Z} \subset \mathcal{X}$ be a closed substack Assume $\mathcal{Y}$ is reduced. A morphism $f : \mathcal{Y} \to \mathcal{X}$ factors through $\mathcal{Z}$ if and only if $f(|\mathcal{Y}|) \subset |\mathcal{Z}|$.*

Proof. Assume $f(|\mathcal{Y}|) \subset |\mathcal{Z}|$. Consider $\mathcal{Y} \times_{\mathcal{X}} \mathcal{Z} \to \mathcal{Y}$. There is an equivalence $\mathcal{Y} \times_{\mathcal{X}} \mathcal{Z} \to \mathcal{Y}'$ where $\mathcal{Y}'$ is a closed substack of $\mathcal{Y}$, see Lemmas 60.9.2 and 60.9.9. Using Lemmas 60.4.3, 60.8.5, and 60.9.5 we see that $|\mathcal{Y}'| = |\mathcal{Y}|$. Hence we have reduced the lemma to Lemma 60.10.2. □

Definition 60.10.4. Let $\mathcal{X}$ be an algebraic stack. Let $Z \subset |\mathcal{X}|$ be a closed subset. An *algebraic stack structure on Z* is given by a closed substack $\mathcal{Z}$ of $\mathcal{X}$ with $|\mathcal{Z}|$ equal to

Z. The *reduced induced algebraic stack structure* on Z is the one constructed in Lemma 60.10.1. The *reduction* $\mathcal{X}_{red}$ *of* $\mathcal{X}$ is the reduced induced algebraic stack structure on $|\mathcal{X}|$.

In fact we can use this to define the reduced induced algebraic stack structure on a locally closed subset.

Remark 60.10.5. Let X be an algebraic stack. Let $T \subset |\mathcal{X}|$ be a locally closed subset. Let ∂T be the boundary of T in the topological space $|\mathcal{X}|$. In a formula

$$\partial T = \overline{T} \setminus T.$$

Let $\mathcal{U} \subset \mathcal{X}$ be the open substack of X with $|\mathcal{U}| = |\mathcal{X}| \setminus \partial T$, see Lemma 60.9.11. Let $\mathcal{Z}$ be the reduced closed substack of $\mathcal{U}$ with $|\mathcal{Z}| = T$ obtained by taking the reduced induced closed subspace structure, see Definition 60.10.4. By construction $\mathcal{Z} \to \mathcal{U}$ is a closed immersion of algebraic stacks and $\mathcal{U} \to \mathcal{X}$ is an open immersion, hence $\mathcal{Z} \to \mathcal{X}$ is an immersion of algebraic stacks by Lemma 60.9.3. Note that $\mathcal{Z}$ is a reduced algebraic stack and that $|\mathcal{Z}| = T$ as subsets of $|X|$. We sometimes say $\mathcal{Z}$ is the *reduced induced substack structure* on T.

60.11. Residual gerbes

In the stacks project we would like to define the *residual gerbe* of an algebraic stack $\mathcal{X}$ at a point $x \in |\mathcal{X}|$ to be a monomorphism of algebraic stacks $m_x : \mathcal{Z}_x \to \mathcal{X}$ where $\mathcal{Z}_x$ is a reduced algebraic stack having a unique point which is mapped by m_x to x. It turns out that there are many issues with this notion; existence is not clear in general and neither is uniqueness. We resolve the uniqueness issue by imposing a slightly stronger condition on the algebraic stacks $\mathcal{Z}_x$. We discuss this in more detail by working through a few simple lemmas regarding reduced algebraic stacks having a unique point.

Lemma 60.11.1. *Let $\mathcal{Z}$ be an algebraic stack. Let k be a field and let $Spec(k) \to \mathcal{Z}$ be surjective and flat. Then any morphism $Spec(k') \to \mathcal{Z}$ where k' is a field is surjective and flat.*

Proof. Consider the fibre square

$$\begin{tikzcd} T \arrow[r] \arrow[d] & Spec(k) \arrow[d] \\ Spec(k') \arrow[r] & \mathcal{Z} \end{tikzcd}$$

Note that $T \to Spec(k')$ is flat and surjective hence T is not empty. On the other hand $T \to Spec(k)$ is flat as k is a field. Hence $T \to \mathcal{Z}$ is flat and surjective. It follows from Morphisms of Spaces, Lemma 42.28.5 (via the discussion in Section 60.3) that $Spec(k') \to \mathcal{Z}$ is flat. It is clear that it is surjective as by assumption $|\mathcal{Z}|$ is a singleton. $\square$

Lemma 60.11.2. *Let $\mathcal{Z}$ be an algebraic stack. The following are equivalent*

(1) *$\mathcal{Z}$ is reduced and $|\mathcal{Z}|$ is a singleton,*
(2) *there exists a surjective flat morphism $Spec(k) \to \mathcal{Z}$ where k is a field, and*
(3) *there exists a locally of finite type, surjective, flat morphism $Spec(k) \to \mathcal{Z}$ where k is a field.*

Proof. Assume (1). Let W be a scheme and let $W \to \mathcal{Z}$ be a surjective smooth morphism. Then W is a reduced scheme. Let $\eta \in W$ be a generic point of an irreducible component of W. Since W is reduced we have $\mathcal{O}_{W,\eta} = \kappa(\eta)$. It follows that the canonical morphism

$\eta = Spec(\kappa(\eta)) \to W$ is flat. We see that the composition $\eta \to \mathcal{X}$ is flat (see Morphisms of Spaces, Lemma 42.27.2). It is also surjective as $|\mathcal{X}|$ is a singleton. In other words (2) holds.

Assume (2). Let W be a scheme and let $W \to \mathcal{X}$ be a surjective smooth morphism. Choose a field k and a surjective flat morphism $Spec(k) \to \mathcal{X}$. Then $W \times_{\mathcal{X}} Spec(k)$ is an algebraic space smooth over k, hence regular (see Spaces over Fields, Lemma 48.5.1) and in particular reduced. Since $W \times_{\mathcal{X}} Spec(k) \to W$ is surjective and flat we conclude that W is reduced (Descent on Spaces, Lemma 45.8.2). In other words (1) holds.

It is clear that (3) implies (2). Finally, assume (2). Pick a nonempty affine scheme W and a smooth morphism $W \to \mathcal{X}$. Pick a closed point $w \in W$ and set $k = \kappa(w)$. The composition

$$Spec(k) \xrightarrow{w} W \longrightarrow \mathcal{X}$$

is locally of finite type by Morphisms of Spaces, Lemmas 42.22.2 and 42.33.6. It is also flat and surjective by Lemma 60.11.1. Hence (3) holds. $\square$

The following lemma singles out a slightly better class of singleton algebraic stacks than the preceding lemma.

Lemma 60.11.3. *Let $\mathcal{X}$ be an algebraic stack. The following are equivalent*

1. *$\mathcal{X}$ is reduced, locally Noetherian, and $|\mathcal{X}|$ is a singleton, and*
2. *there exists a locally finitely presented, surjective, flat morphism $Spec(k) \to \mathcal{X}$ where k is a field.*

Proof. Assume (2) holds. By Lemma 60.11.2 we see that $\mathcal{X}$ is reduced and $|\mathcal{X}|$ is a singleton. Let W be a scheme and let $W \to \mathcal{X}$ be a surjective smooth morphism. Choose a field k and a locally finitely presented, surjective, flat morphism $Spec(k) \to \mathcal{X}$. Then $W \times_{\mathcal{X}} Spec(k)$ is an algebraic space smooth over k, hence locally Noetherian (see Morphisms of Spaces, Lemma 42.22.5). Since $W \times_{\mathcal{X}} Spec(k) \to W$ is flat, surjective, and locally of finite presentation, we see that $\{W \times_{\mathcal{X}} Spec(k) \to W\}$ is an fppf covering and we conclude that W is locally Noetherian (Descent on Spaces, Lemma 45.8.3). In other words (1) holds.

Assume (1). Pick a nonempty affine scheme W and a smooth morphism $W \to \mathcal{X}$. Pick a closed point $w \in W$ and set $k = \kappa(w)$. Because W is locally Noetherian the morphism $w : Spec(k) \to W$ is of finite presentation, see Morphisms, Lemma 24.20.7. Hence the composition

$$Spec(k) \xrightarrow{w} W \longrightarrow \mathcal{X}$$

is locally of finite presentation by Morphisms of Spaces, Lemmas 42.26.2 and 42.33.5. It is also flat and surjective by Lemma 60.11.1. Hence (2) holds. $\square$

Lemma 60.11.4. *Let $\mathcal{X}' \to \mathcal{X}$ be a monomorphism of algebraic stacks. Assume there exists a field k and a locally finitely presented, surjective, flat morphism $Spec(k) \to \mathcal{X}$. Then either $\mathcal{X}'$ is empty or $\mathcal{X}' \to \mathcal{X}$ is an equivalence.*

Proof. We may assume that $\mathcal{X}'$ is nonempty. In this case the fibre product $T = \mathcal{X}' \times_{\mathcal{X}} Spec(k)$ is nonempty, see Lemma 60.4.3. Now T is an algebraic space and the projection $T \to Spec(k)$ is a monomorphism. Hence $T = Spec(k)$, see Morphisms of Spaces, Lemma 42.14.8. We conclude that $Spec(k) \to \mathcal{X}$ factors through $\mathcal{X}'$. Suppose the morphism $z : Spec(k) \to \mathcal{X}$ is given by the object ξ over $Spec(k)$. We have just seen that ξ is isomorphic to an object ξ' of $\mathcal{X}'$ over $Spec(k)$. Since z is is surjective, flat, and locally of finite presentation we see that every object of $\mathcal{X}$ over any scheme is fppf locally isomorphic to a pullback of ξ, hence also to a pullback of ξ'. By descent of objects for stacks in groupoids this implies that $\mathcal{Z}' \to \mathcal{Z}$ is essentially surjective (as well as fully faithful, see Lemma 60.8.4). Hence we win. $\square$

Lemma 60.11.5. *Let $\mathcal{Z}$ be an algebraic stack. Assume $\mathcal{Z}$ satisfies the equivalent conditions of Lemma 60.11.2. Then there exists a unique strictly full subcategory $\mathcal{Z}' \subset \mathcal{Z}$ such that $\mathcal{Z}'$ is an algebraic stack which satisfies the equivalent conditions of Lemma 60.11.3. The inclusion morphism $\mathcal{Z}' \to \mathcal{Z}$ is a monomorphism of algebraic stacks.*

Proof. The last part is immediate from the first part and Lemma 60.8.4. Pick a field k and a morphism $Spec(k) \to \mathcal{Z}$ which is surjective, flat, and locally of finite type. Set $U = Spec(k)$ and $R = U \times_{\mathcal{Z}} U$. The projections $s, t : R \to U$ are locally of finite type. Since U is the spectrum of a field, it follows that s, t are flat and locally of finite presentation (by Morphisms of Spaces, Lemma 42.26.7). We see that $\mathcal{Z}' = [U/R]$ is an algebraic stack by Criteria for Representability, Theorem 59.17.2. By Algebraic Stacks, Lemma 57.16.1 we obtain a canonical morphism

$$f : \mathcal{Z}' \longrightarrow \mathcal{Z}$$

which is fully faithful. Hence this morphism is representable by algebraic spaces, see Algebraic Stacks, Lemma 57.15.2 and a monomorphism, see Lemma 60.8.4. By Criteria for Representability, Lemma 59.17.1 the morphism $U \to \mathcal{Z}'$ is surjective, flat, and locally of finite presentation. Hence $\mathcal{Z}'$ is an algebraic stack which satisfies the equivalent conditions of Lemma 60.11.3. By Algebraic Stacks, Lemma 57.12.4 we may replace $\mathcal{Z}'$ by its essential image in $\mathcal{Z}$. Hence we have proved all the assertions of the lemma except for the uniqueness of $\mathcal{Z}' \subset \mathcal{Z}$. Suppose that $\mathcal{Z}'' \subset \mathcal{Z}$ is a second such algebraic stack. Then the projections

$$\mathcal{Z}' \longleftarrow \mathcal{Z}' \times_{\mathcal{Z}} \mathcal{Z}'' \longrightarrow \mathcal{Z}''$$

are monomorphisms. The algebraic stack in the middle is nonempty by Lemma 60.4.3. Hence the two projections are isomorphisms by Lemma 60.11.4 and we win. $\square$

Example 60.11.6. Here is an example where the morphism constructed in Lemma 60.11.5 isn't an isomorphism. This example shows that imposing that residual gerbes are locally Noetherian is necessary in Definition 60.11.8. In fact, the example is even an algebraic space! Let $\text{Gal}(\overline{\mathbf{Q}}/\mathbf{Q})$ be the absolute Galois group of $\mathbf{Q}$ with the pro-finite topology. Let

$$U = Spec(\overline{\mathbf{Q}}) \times_{Spec(\mathbf{Q})} Spec(\overline{\mathbf{Q}}) = \text{Gal}(\overline{\mathbf{Q}}/\mathbf{Q}) \times Spec(\overline{\mathbf{Q}})$$

(we omit a precise explanation of the meaning of the last equal sign). Let G denote the absolute Galois group $\text{Gal}(\overline{\mathbf{Q}}/\mathbf{Q})$ with the discrete topology viewed as a constant group scheme over $Spec(\overline{\mathbf{Q}})$, see Groupoids, Example 35.5.6. Then G acts freely and transitively on U. Let $X = U/G$, see Spaces, Definition 40.14.4. Then X is a non-noetherian reduced algebraic space with exactly one point. Furthermore, X has a (locally) finite type point:

$$x : Spec(\overline{\mathbf{Q}}) \longrightarrow U \longrightarrow X$$

Indeed, every point of U is actually closed! As X is an algebraic space over $\overline{\mathbf{Q}}$ it follows that x is a monomorphism. So x is the morphism constructed in Lemma 60.11.5 but x is not an isomorphism. In fact $Spec(\overline{\mathbf{Q}}) \to X$ is the residual gerbe of X at x.

It will turn out later that under mild assumptions on the algebraic stack $\mathcal{X}$ the equivalent conditions of the following lemma are satisfied for every point $x \in |\mathcal{X}|$ (insert future reference here).

Lemma 60.11.7. *Let $\mathcal{X}$ be an algebraic stack. Let $x \in |\mathcal{X}|$ be a point. The following are equivalent*

(1) *there exists an algebraic stack $\mathcal{Z}$ and a monomorphism $\mathcal{Z} \to \mathcal{X}$ such that $|\mathcal{Z}|$ is a singleton and such that the image of $|\mathcal{Z}|$ in $|\mathcal{X}|$ is x,*
(2) *there exists a reduced algebraic stack $\mathcal{Z}$ and a monomorphism $\mathcal{Z} \to \mathcal{X}$ such that $|\mathcal{Z}|$ is a singleton and such that the image of $|\mathcal{Z}|$ in $|\mathcal{X}|$ is x,*
(3) *there exists an algebraic stack $\mathcal{Z}$, a monomorphism $f : \mathcal{Z} \to \mathcal{X}$, and a surjective flat morphism $z : Spec(k) \to \mathcal{X}$ where k is a field such that $x = f(z)$.*

Moreover, if these conditions hold, then there exists a unique strictly full subcategory $\mathcal{Z}_x \subset \mathcal{X}$ such that $\mathcal{Z}_x$ is a reduced, locally Noetherian algebraic stack and $|\mathcal{Z}_x|$ is a singleton which maps to x via the map $|\mathcal{Z}_x| \to |\mathcal{X}|$.

Proof. If $\mathcal{Z} \to \mathcal{X}$ is as in (1), then $\mathcal{Z}_{red} \to \mathcal{X}$ is as in (2). (See Section 60.10 for the notion of the reduction of an algebraic stack.) Hence (1) implies (2). It is immediate that (2) implies (1). The equivalence of (2) and (3) is immediate from Lemma 60.11.2.

At this point we've seen the equivalence of (1) -- (3). Pick a monomorphism $f : \mathcal{Z} \to \mathcal{X}$ as in (2). Note that this implies that f is fully faithful, see Lemma 60.8.4. Denote $\mathcal{Z}' \subset \mathcal{X}$ the essential image of the functor f. Then $f : \mathcal{Z} \to \mathcal{Z}'$ is an equivalence and hence $\mathcal{Z}'$ is an algebraic stack, see Algebraic Stacks, Lemma 57.12.4. Apply Lemma 60.11.5 to get a strictly full subcategory $\mathcal{Z}_x \subset \mathcal{Z}'$ as in the statement of the lemma. This proves all the statements of the lemma except for uniqueness.

In order to prove the uniqueness suppose that $\mathcal{Z}_x \subset \mathcal{X}$ and $\mathcal{Z}'_x \subset \mathcal{X}$ are two stricly full subcategories as in the statement of the lemma. Then the projections

$$\mathcal{Z}'_x \longleftarrow \mathcal{Z}'_x \times_{\mathcal{X}} \mathcal{Z}_x \longrightarrow \mathcal{Z}_x$$

are monomorphisms. The algebraic stack in the middle is nonempty by Lemma 60.4.3. Hence the two projections are isomorphisms by Lemma 60.11.4 and we win. □

Having explained the above we can now make the following definition.

Definition 60.11.8. Let $\mathcal{X}$ be an algebraic stack. Let $x \in |\mathcal{X}|$.

(1) We say the *residual gerbe of $\mathcal{X}$ at x exists* if the equivalent conditions (1), (2), and (3) of Lemma 60.11.7 hold.
(2) If the residual gerbe of $\mathcal{X}$ at x exists, then the *residual gerbe of $\mathcal{X}$ at x*[1] is the strictly full subcategory $\mathcal{Z}_x \subset \mathcal{X}$ constructed in Lemma 60.11.7.

In particular we know that $\mathcal{Z}_x$ (if it exists) is a locally Noetherian, reduced algebraic stack and that there exists a field and a surjective, flat, locally finitely presented morphism

$$Spec(k) \longrightarrow \mathcal{Z}_x.$$

We will see in Morphisms of Stacks, Lemma 61.19.10 that $\mathcal{Z}_x$ is a gerbe. It turns out that $\mathcal{Z}_x$ is a regular algebraic stack as follows from the following lemma.

Lemma 60.11.9. *A reduced, locally Noetherian algebraic stack $\mathcal{Z}$ such that $|\mathcal{Z}|$ is a singleton is regular.*

[1]This clashes with [**LMB00a**] in spirit, but not in fact. Namely, in Chapter 11 they associate to any point on any quasi-separated algebraic stack a gerbe (not necessarily algebraic) which they call the residual gerbe. We will see in Morphisms of Stacks, Lemma 61.21.1 that on a quasi-separated algebraic stack every point has a residual gerbe in our sense which is then equivalent to theirs. For more information on this topic see [**Ryd10**, Appendix B].

Proof. Let $W \to \mathcal{Z}$ be a surjective smooth morphism where W is a scheme. Let k be a field and let $Spec(k) \to \mathcal{Z}$ be surjective, flat, and locally of finite presentation (see Lemma 60.11.3). The algebraic space $T = W \times_{\mathcal{Z}} Spec(k)$ is smooth over k in particular regular, see Spaces over Fields, Lemma 48.5.1. Since $T \to W$ is locally of finite presentation, flat, and surjective it follows that W is regular, see Descent on Spaces, Lemma 45.8.4. By definition this means that $\mathcal{Z}$ is regular. □

Lemma 60.11.10. *Let $\mathcal{X}$ be an algebraic stack. Let $x \in |\mathcal{X}|$. Assume that the residual gerbe $\mathcal{Z}_x$ of $\mathcal{X}$ exists. Let $f : Spec(K) \to \mathcal{X}$ be a morphism where K is a field in the equivalence class of x. Then f factors through the inclusion morphism $\mathcal{Z}_x \to \mathcal{X}$.*

Proof. Choose a field k and a surjective flat locally finite presentation morphism $Spec(k) \to \mathcal{Z}_x$. Set $T = Spec(K) \times_{\mathcal{X}} \mathcal{Z}_x$. By Lemma 60.4.3 we see that T is nonempty. As $\mathcal{Z}_x \to \mathcal{X}$ is a monomorphism we see that $T \to Spec(K)$ is a monomorphism. Hence by Morphisms of Spaces, Lemma 42.14.8 we see that $T = Spec(K)$ which proves the lemma. □

Lemma 60.11.11. *Let $\mathcal{X}$ be an algebraic stack. Let $x \in |\mathcal{X}|$. Let $\mathcal{Z}$ be an algebraic stack satisfying the equivalent conditions of Lemma 60.11.3 and let $\mathcal{Z} \to \mathcal{X}$ be a monomorphism such that the image of $|\mathcal{Z}| \to |\mathcal{X}|$ is x. Then the residual gerbe $\mathcal{Z}_x$ of $\mathcal{X}$ at x exists and $\mathcal{Z} \to \mathcal{X}$ factors as $\mathcal{Z} \to \mathcal{Z}_x \to \mathcal{X}$ where the first arrow is an equivalence.*

Proof. Let $\mathcal{Z}_x \subset \mathcal{X}$ be the full subcategory corresponding to the essential image of the functor $\mathcal{Z} \to \mathcal{X}$. Then $\mathcal{Z} \to \mathcal{Z}_x$ is an equivalence, hence $\mathcal{Z}_x$ is an algebraic stack, see Algebraic Stacks, Lemma 57.12.4. Since $\mathcal{Z}_x$ inherits all the properties of $\mathcal{Z}$ from this equivalence it is clear from the uniqueness in Lemma 60.11.7 that $\mathcal{Z}_x$ is the residual gerbe of $\mathcal{X}$ at x. □

CHAPTER 61

Morphisms of Algebraic Stacks

61.1. Introduction

In this chapter we introduce some types of morphisms of algebraic stacks. A reference in the case of quasi-separated algebraic stacks with representable diagonal is [**LMB00a**].

The goal is to extend the definition of each of the types of morphisms of algebraic spaces to morphisms of algebraic stacks. Each case is slightly different and it seems best to treat them all separately.

For morphisms of algebraic stacks which are representable by algebraic spaces we have already defined a large number of types of morphisms, see Properties of Stacks, Section 60.3. For each corresponding case in this chapter we have to make sure the definition in the general case is compatible with the definition given there.

61.2. Conventions and abuse of language

We continue to use the conventions and the abuse of language introduced in Properties of Stacks, Section 60.2.

61.3. Properties of diagonals

The diagonal of an algebraic stack is closely related to the $Isom$-sheaves, see Algebraic Stacks, Lemma 57.10.11. By the second defining property of an algebraic stack these $Isom$-sheaves are always algebraic spaces.

Lemma 61.3.1. *Let $\mathcal{X}$ be an algebraic stack. Let T be a scheme and let x, y be objects of the fibre category of $\mathcal{X}$ over T. Then the morphism $Isom_{\mathcal{X}}(x, y) \to T$ is locally of finite type.*

Proof. By Algebraic Stacks, Lemma 57.16.2 we may assume that $\mathcal{X} = [U/R]$ for some smooth groupoid in algebraic spaces. By Descent on Spaces, Lemma 45.10.7 it suffices to check the property fppf locally on T. Thus we may assume that x, y come from morphisms $x', y' : T \to U$. By Groupoids in Spaces, Lemma 52.21.1 we see that in this case $Isom_{\mathcal{X}}(x, y) = T \times_{(y',x'),U\times_S U} R$. Hence it suffices to prove that $R \to U \times_S U$ is locally of finite type. This follows from the fact that the composition $s : R \to U \times_S U \to U$ is smooth (hence locally of finite type, see Morphisms of Spaces, Lemmas 42.33.5 and 42.26.5) and Morphisms of Spaces, Lemma 42.22.6. $\square$

Lemma 61.3.2. *Let $\mathcal{X}$ be an algebraic stack. Let T be a scheme and let x, y be objects of the fibre category of $\mathcal{X}$ over T. Then*

1. *$Isom_{\mathcal{X}}(y, y)$ is a group algebraic space over T, and*
2. *$Isom_{\mathcal{X}}(x, y)$ is a pseudo torsor for $Isom_{\mathcal{X}}(y, y)$ over T.*

Proof. See Groupoids in Spaces, Definitions 52.5.1 and 52.9.1. The lemma follows immediately from the fact that $\mathcal{X}$ is a stack in groupoids. $\square$

Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks. The *diagonal of f* is the morphism

$$\Delta_f : \mathcal{X} \longrightarrow \mathcal{X} \times_{\mathcal{Y}} \mathcal{X}$$

Here are two properties that every diagonal morphism has.

Lemma 61.3.3. *Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks. Then*

(1) *Δ_f is representable by algebraic spaces, and*
(2) *Δ_f is locally of finite type.*

Proof. Let T be a scheme and let $a : T \to \mathcal{X} \times_{\mathcal{Y}} \mathcal{X}$ be a morphism. By definition of the fibre product and the 2-Yoneda lemma the morphism a is given by a triple $a = (x, x', \alpha)$ where x, x' are objects of $\mathcal{X}$ over T, and $\alpha : f(x) \to f(x')$ is a morphism in the fibre category of $\mathcal{Y}$ over T. By definition of an algebraic stack the sheaves $Isom_{\mathcal{X}}(x, x')$ and $Isom_{\mathcal{Y}}(f(x), f(x'))$ are algebraic spaces over T. In this language α defines a section of the morphism $Isom_{\mathcal{X}}(x, x') \to T$. A T'-valued point of $\mathcal{X} \times_{\mathcal{X} \times_{\mathcal{Y}} \mathcal{X}, a} T$ for $T' \to T$ a scheme over T is the same thing as an isomorphism $x|_{T'} \to x'|_{T'}$ whose image under f is $\alpha|_{T'}$. Thus we see that

(61.3.3.1)
$$\begin{tikzcd} \mathcal{X} \times_{\mathcal{X} \times_{\mathcal{Y}} \mathcal{X}, a} T \arrow[r] \arrow[d] & Isom_{\mathcal{X}}(x, x') \arrow[d] \\ T \arrow[r, "\alpha"] & Isom_{\mathcal{Y}}(f(x), f(x')) \end{tikzcd}$$

is a fibre square of sheaves over T. In particular we see that $\mathcal{X} \times_{\mathcal{X} \times_{\mathcal{Y}} \mathcal{X}, a} T$ is an algebraic space which proves part (1) of the lemma.

To prove the second statement we have to show that the left vertical arrow of Diagram (61.3.3.1) is locally of finite type. By Lemma 61.3.1 the algebraic space $Isom_{\mathcal{X}}(x, x')$ and is locally of finite type over T. Hence the right vertical arrow of Diagram (61.3.3.1) is locally of finite type, see Morphisms of Spaces, Lemma 42.22.6. We conclude by Morphisms of Spaces, Lemma 42.22.3. □

Lemma 61.3.4. *Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks which is representable by algebraic spaces. Then*

(1) *Δ_f is representable (by schemes),*
(2) *Δ_f is locally of finite type,*
(3) *Δ_f is a monomorphism,*
(4) *Δ_f is separated, and*
(5) *Δ_f is locally quasi-finite.*

Proof. We have already seen in Lemma 61.3.3 that Δ_f is representable by algebraic spaces. Hence the statements (2) -- (5) make sense, see Properties of Stacks, Section 60.3. Also Lemma 61.3.3 garantees (2) holds. Let $T \to \mathcal{X} \times_{\mathcal{Y}} \mathcal{X}$ be a morphism and contemplate Diagram (61.3.3.1). By Algebraic Stacks, Lemma 57.9.2 the right vertical arrow is injective as a map of sheaves, i.e., a monomorphism of algebraic spaces. Hence also the morphism $T \times_{\mathcal{X} \times_{\mathcal{Y}} \mathcal{X}} \mathcal{X} \to T$ is a monomorphism. Thus (3) holds. We already know that $T \times_{\mathcal{X} \times_{\mathcal{Y}} \mathcal{X}} \mathcal{X} \to T$ is locally of finite type. Thus Morphisms of Spaces, Lemma 42.25.8 allows us to conclude that $T \times_{\mathcal{X} \times_{\mathcal{Y}} \mathcal{X}} \mathcal{X} \to T$ is locally quasi-finite and separated. This proves (4) and (5). Finally, Morphisms of Spaces, Proposition 42.39.2 implies that $T \times_{\mathcal{X} \times_{\mathcal{Y}} \mathcal{X}} \mathcal{X}$ is a scheme which proves (1). □

Lemma 61.3.5. *Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks representable by algebraic spaces. Then the following are equivalent*

(1) *f is separated,*
(2) *Δ_f is a closed immersion,*
(3) *Δ_f is proper, or*
(4) *Δ_f is universally closed.*

Proof. The statements ``$f$ is separated", ``Δ_f is a closed immersion", ``$\Delta_f$ is universally closed", and ``Δ_f is proper" refer to the notions defined in Properties of Stacks, Section 60.3. Choose a scheme V and a surjective smooth morphism $V \to \mathcal{Y}$. Set $U = \mathcal{X} \times_{\mathcal{Y}} V$ which is an algebraic space by assumption, and the morphism $U \to \mathcal{X}$ is surjective and smooth. By Categories, Lemma 4.28.14 and Properties of Stacks, Lemma 60.3.3 we see that for any property P (as in that lemma) we have: Δ_f has P if and only if $\Delta_{U/V} : U \to U \times_V U$ has P. Hence the equivalence of (2), (3) and (4) follows from Morphisms of Spaces, Lemma 42.36.6 applied to $U \to V$. Moreover, if (1) holds, then $U \to V$ is separated and we see that $\Delta_{U/V}$ is a closed immersion, i.e., (2) holds. Finally, assume (2) holds. Let T be a scheme, and $a : T \to \mathcal{Y}$ a morphism. Set $T' = \mathcal{X} \times_{\mathcal{Y}} T$. To prove (1) we have to show that the morphism of algebraic spaces $T' \to T$ is separated. Using Categories, Lemma 4.28.14 once more we see that $\Delta_{T'/T}$ is the base change of Δ_f. Hence our assumption (2) implies that $\Delta_{T'/T}$ is a closed immersion, hence $T' \to T$ is separated as desired. $\square$

Lemma 61.3.6. *Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks representable by algebraic spaces. Then the following are equivalent*

(1) *f is quasi-separated,*
(2) *Δ_f is quasi-compact, or*
(3) *Δ_f is finite type.*

Proof. The statements ``$f$ is quasi-separated", ``Δ_f is quasi-compact", and ``Δ_f is finite type" refer to the notions defined in Properties of Stacks, Section 60.3. Note that (2) and (3) are equivalent in view of the fact that Δ_f is locally of finite type by Lemma 61.3.4 (and Algebraic Stacks, Lemma 57.10.9). Choose a scheme V and a surjective smooth morphism $V \to \mathcal{Y}$. Set $U = \mathcal{X} \times_{\mathcal{Y}} V$ which is an algebraic space by assumption, and the morphism $U \to \mathcal{X}$ is surjective and smooth. By Categories, Lemma 4.28.14 and Properties of Stacks, Lemma 60.3.3 we see that we have: Δ_f is quasi-compact if and only if $\Delta_{U/V} : U \to U \times_V U$ is quasi-compact. If (1) holds, then $U \to V$ is quasi-separated and we see that $\Delta_{U/V}$ is quasi-compact, i.e., (2) holds. Assume (2) holds. Let T be a scheme, and $a : T \to \mathcal{Y}$ a morphism. Set $T' = \mathcal{X} \times_{\mathcal{Y}} T$. To prove (1) we have to show that the morphism of algebraic spaces $T' \to T$ is quasi-separated. Using Categories, Lemma 4.28.14 once more we see that $\Delta_{T'/T}$ is the base change of Δ_f. Hence our assumption (2) implies that $\Delta_{T'/T}$ is quasi-compact, hence $T' \to T$ is quasi-separated as desired. $\square$

Lemma 61.3.7. *Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks representable by algebraic spaces. Then the following are equivalent*

(1) *f is locally separated, and*
(2) *Δ_f is an immersion.*

Proof. The statements ``$f$ is quasi-separated", and ``Δ_f is an immersion" refer to the notions defined in Properties of Stacks, Section 60.3. Proof omitted. Hint: Argue as in the proofs of Lemmas 61.3.5 and 61.3.6. $\square$

61.4. Separation axioms

Let $\mathcal{X} = [U/R]$ be a presentation of an algebraic stack. Then the properties of the diagonal of $\mathcal{X}$ over S, are the properties of the morphism $j : R \to U \times_S U$. For example, if $\mathcal{X} = [S/G]$ for some smooth group G in algebraic spaces over S then j is the structure morphism $G \to U$. Hence the diagonal is not automatically separated itself (contrary to what happens in the case of schemes and algebraic spaces). To say that $[S/G]$ is quasi-separated over S should certainly imply that $G \to S$ is quasi-compact, but we hesitate to say that $[S/G]$ is quasi-separated over S without also requiring the morphism $G \to S$ to be quasi-separated. In other words, requiring the diagonal morphism to be quasi-compact does not really agree with our intuition for a ``quasi-separated algebraic stack'', and we should also require the diagonal itself to be quasi-separated.

What about ``separated algebraic stacks''? We have seen in Morphisms of Spaces, Lemma 42.36.6 that an algebraic space is separated if and only if the diagonal is proper. This is the condition that is usually used to define separated algebraic stacks too. In the example $[S/G] \to S$ above this means that $G \to S$ is a proper group scheme. This means algebraic stacks of the form $[Spec(k)/E]$ are proper over k where E is an elliptic curve over k (insert future reference here). In certain situations it may be more natural to assume the diagonal is finite.

Definition 61.4.1. Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks.

(1) We say f is *DM* if Δ_f is unramified[1].
(2) We say f is *quasi-DM* if Δ_f is locally quasi-finite[2].
(3) We say f is *separated* if Δ_f is proper.
(4) We say f is *quasi-separated* if Δ_f is quasi-compact and quasi-separated.

In this definition we are using that Δ_f is representable by algebraic spaces and we are using Properties of Stacks, Section 60.3 to make sense out of imposing conditions on Δ_f. We note that these definitions do not conflict with the already existing notions if f is representable by algebraic spaces, see Lemmas 61.3.6 and 61.3.5. There is an interesting way to characterize these conditions by looking at higher diagonals, see Lemma 61.6.3.

Definition 61.4.2. Let $\mathcal{X}$ be an algebraic stack over the base scheme S. Denote $p : \mathcal{X} \to S$ the structure morphism.

(1) We say $\mathcal{X}$ is *DM over S* if $p : \mathcal{X} \to S$ is DM.
(2) We say $\mathcal{X}$ is *quasi-DM over S* if $p : \mathcal{X} \to S$ is quasi-DM.
(3) We say $\mathcal{X}$ is *separated over S* if $p : \mathcal{X} \to S$ is separated.
(4) We say $\mathcal{X}$ is *quasi-separated over S* if $p : \mathcal{X} \to S$ is quasi-separated.
(5) We say $\mathcal{X}$ is *DM* if $\mathcal{X}$ is DM[3] over $Spec(\mathbf{Z})$.
(6) We say $\mathcal{X}$ is *quasi-DM* if $\mathcal{X}$ is quasi-DM over $Spec(\mathbf{Z})$.
(7) We say $\mathcal{X}$ is *separated* if $\mathcal{X}$ is separated over $Spec(\mathbf{Z})$.

[1]The letters DM stand for Deligne-Mumford. If f is DM then given any scheme T and any morphism $T \to \mathcal{Y}$ the fibre product $\mathcal{X}_T = \mathcal{X} \times_{\mathcal{Y}} T$ is an algebraic stack over T whose diagonal is unramified, i.e., $\mathcal{X}_T$ is DM. This implies $\mathcal{X}_T$ is a Deligne-Mumford stack, see Theorem 61.15.6. In other words a DM morphism is one whose ``fibres'' are Deligne-Mumford stacks. This hopefully at least motivates the terminology.

[2]If f is quasi-DM, then the ``fibres'' $\mathcal{X}_T$ of $\mathcal{X} \to \mathcal{Y}$ are quasi-DM. An algebraic stack $\mathcal{X}$ is quasi-DM exactly if there exists a scheme U and a surjective flat morphism $U \to \mathcal{X}$ of finite presentation which is locally quasi-finite, see Theorem 61.15.3. Note the similarity to being Deligne-Mumford, which is defined in terms of having an étale covering by a scheme.

[3]Theorem 61.15.6 shows that this is equivalent to $\mathcal{X}$ being a Deligne-Mumford stack.

(8) We say $\mathcal{X}$ is *quasi-separated* if $\mathcal{X}$ is quasi-separated over $Spec(\mathbf{Z})$.

In the last 4 definitions we view $\mathcal{X}$ as an algebraic stack over $Spec(\mathbf{Z})$ via Algebraic Stacks, Definition 57.19.2.

Thus in each case we have an absolute notion and a notion relative to our given base scheme (mention of which is usually surpressed by our abuse of notation introduced in Properties of Stacks, Section 60.2). We will see that (1) $\Leftrightarrow$ (5) and (2) $\Leftrightarrow$ (6) in Lemma 61.4.13. We spend some time proving some standard results on these notions.

Lemma 61.4.3. *Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks.*

(1) *If f is separated, then f is quasi-separated.*
(2) *If f is DM, then f is quasi-DM.*
(3) *If f is representable by algebraic spaces, then f is DM.*

Proof. To see (1) note that a proper morphism of algebraic spaces is quasi-compact and quasi-separated, see Morphisms of Spaces, Definition 42.36.1. To see (2) note that an unramified morphism of algebraic spaces is locally quasi-finite, see Morphisms of Spaces, Lemma 42.34.7. Finally (3) follows from Lemma 61.3.4. □

Lemma 61.4.4. *All of the separation axioms listed in Definition 61.4.1 are stable under base change.*

Proof. Let $f : \mathcal{X} \to \mathcal{Y}$ and $\mathcal{Y}' \to \mathcal{Y}$ be morphisms of algebraic stacks. Let $f' : \mathcal{Y}' \times_{\mathcal{Y}} \mathcal{X} \to \mathcal{Y}'$ be the base change of f by $\mathcal{Y}' \to \mathcal{Y}$. Then $\Delta_{f'}$ is the base change of Δ_f by the morphism $\mathcal{X}' \times_{\mathcal{Y}'} \mathcal{X}' \to \mathcal{X} \times_{\mathcal{Y}} \mathcal{X}$, see Categories, Lemma 4.28.14. By the results of Properties of Stacks, Section 60.3 each of the properties of the diagonal used in Definition 61.4.1 is stable under base change. Hence the lemma is true. □

Lemma 61.4.5. *Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks. Let $W \to \mathcal{Y}$ be a surjective, flat, and locally of finite presentation where W is an algebraic space. If the base change $W \times_{\mathcal{Y}} \mathcal{X} \to W$ has one of the separation properties of Definition 61.4.1 then so does f.*

Proof. Denote $g : W \times_{\mathcal{Y}} \mathcal{X} \to W$ the base change. Then Δ_g is the base change of Δ_f by the morphism $q : W \times_{\mathcal{Y}} (\mathcal{X} \times_{\mathcal{Y}} \mathcal{X}) \to \mathcal{X} \times_{\mathcal{Y}} \mathcal{X}$. Since q is the base change of $W \to \mathcal{Y}$ we see that q is representable by algebraic spaces, surjective, flat, and locally of finite presentation. Hence the result follows from Properties of Stacks, Lemma 60.3.4. □

Lemma 61.4.6. *Let S be a scheme. The property of being quasi-DM over S, quasi-separated over S, or separated over S (see Definition 61.4.2) is stable under change of base scheme, see Algebraic Stacks, Definition 57.19.3.*

Proof. Follows immediately from Lemma 61.4.4. □

Lemma 61.4.7. *Let $f : \mathcal{X} \to \mathcal{Z}$, $g : \mathcal{Y} \to \mathcal{Z}$ and $\mathcal{Z} \to \mathcal{T}$ be morphisms of algebraic stacks. Consider the induced morphism $i : \mathcal{X} \times_{\mathcal{Z}} \mathcal{Y} \to \mathcal{X} \times_{\mathcal{T}} \mathcal{Y}$. Then*

(1) *i is representable by algebraic spaces and locally of finite type,*
(2) *if $\Delta_{\mathcal{Z}/\mathcal{T}}$ is quasi-separated, then i is quasi-separated,*
(3) *if $\Delta_{\mathcal{Z}/\mathcal{T}}$ is separated, then i is separated,*
(4) *if $\mathcal{Z} \to \mathcal{T}$ is DM, then i is unramified,*
(5) *if $\mathcal{Z} \to \mathcal{T}$ is quasi-DM, then i is locally quasi-finite,*
(6) *if $\mathcal{Z} \to \mathcal{T}$ is separated, then i is proper, and*
(7) *if $\mathcal{Z} \to \mathcal{T}$ is quasi-separated, then i is quasi-compact and quasi-separated.*

Proof. The following diagram

$$\begin{tikzcd}
\mathcal{X} \times_{\mathcal{Z}} \mathcal{Y} \arrow[r, "i"'] \arrow[d] & \mathcal{X} \times_{\mathcal{T}} \mathcal{Y} \arrow[d] \\
\mathcal{Z} \arrow[r, "\Delta_{\mathcal{Z}/\mathcal{T}}"] & \mathcal{Z} \times_{\mathcal{T}} \mathcal{Z}
\end{tikzcd}$$

is a 2-fibre product diagram, see Categories, Lemma 4.28.13. Hence i is the base change of the diagonal morphism $\Delta_{\mathcal{Z}/\mathcal{T}}$. Thus the lemma follows from Lemma 61.3.3, and the material in Properties of Stacks, Section 60.3. □

Lemma 61.4.8. *Let $\mathcal{T}$ be an algebraic stack. Let $g : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks over $\mathcal{T}$. Consider the graph $i : \mathcal{X} \to \mathcal{X} \times_{\mathcal{T}} \mathcal{Y}$ of g. Then*

(1) *i is representable by algebraic spaces and locally of finite type,*
(2) *if $\mathcal{Y} \to \mathcal{T}$ is DM, then i is unramified,*
(3) *if $\mathcal{Y} \to \mathcal{T}$ is quasi-DM, then i is locally quasi-finite,*
(4) *if $\mathcal{Y} \to \mathcal{T}$ is separated, then i is proper, and*
(5) *if $\mathcal{Y} \to \mathcal{T}$ is quasi-separated, then i is quasi-compact and quasi-separated.*

Proof. This is a special case of Lemma 61.4.7 applied to the morphism $\mathcal{X} = \mathcal{X} \times_{\mathcal{Y}} \mathcal{Y} \to \mathcal{X} \times_{\mathcal{T}} \mathcal{Y}$. □

Lemma 61.4.9. *Let $f : \mathcal{X} \to \mathcal{T}$ be a morphism of algebraic stacks. Let $s : \mathcal{T} \to \mathcal{X}$ be a morphism such that $f \circ s$ is 2-isomorphic to $id_{\mathcal{T}}$. Then*

(1) *s is representable by algebraic spaces and locally of finite type,*
(2) *if f is DM, then s is unramified,*
(3) *if f is quasi-DM, then s is locally quasi-finite,*
(4) *if f is separated, then s is proper, and*
(5) *if f is quasi-separated, then s is quasi-compact and quasi-separated.*

Proof. This is a special case of Lemma 61.4.8 applied to $g = s$ and $\mathcal{Y} = \mathcal{T}$ in which case $i : \mathcal{T} \to \mathcal{T} \times_{\mathcal{T}} \mathcal{X}$ is 2-isomorphic to s. □

Lemma 61.4.10. *All of the separation axioms listed in Definition 61.4.1 are stable under composition of morphisms.*

Proof. Let $f : \mathcal{X} \to \mathcal{Y}$ and $g : \mathcal{Y} \to \mathcal{Z}$ be morphisms of algebraic stacks to which the axiom in question applies. The diagonal $\Delta_{\mathcal{X}/\mathcal{Z}}$ is the composition

$$\mathcal{X} \longrightarrow \mathcal{X} \times_{\mathcal{Y}} \mathcal{X} \longrightarrow \mathcal{X} \times_{\mathcal{Z}} \mathcal{X}.$$

Our separation axiom is defined by requiring the diagonal to have some property $\mathcal{P}$. By Lemma 61.4.7 above we see that the second arrow also has this property. Hence the lemma follows since the composition of morphisms which are representable by algebraic spaces with property $\mathcal{P}$ also is a morphism with property $\mathcal{P}$, see our general discussion in Properties of Stacks, Section 60.3 and Morphisms of Spaces, Lemmas 42.34.3, 42.25.2, 42.36.3, 42.9.4, and 42.5.8. □

Lemma 61.4.11. *Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks over the base scheme S.*

(1) *If $\mathcal{Y}$ is DM over S and f is DM, then $\mathcal{X}$ is DM over S.*
(2) *If $\mathcal{Y}$ is quasi-DM over S and f is quasi-DM, then $\mathcal{X}$ is quasi-DM over S.*
(3) *If $\mathcal{Y}$ is separated over S and f is separated, then $\mathcal{X}$ is separated over S.*

(4) *If $\mathcal{Y}$ is quasi-separated over S and f is quasi-separated, then $\mathcal{X}$ is quasi-separated over S.*
(5) *If $\mathcal{Y}$ is DM and f is DM, then $\mathcal{X}$ is DM.*
(6) *If $\mathcal{Y}$ is quasi-DM and f is quasi-DM, then $\mathcal{X}$ is quasi-DM.*
(7) *If $\mathcal{Y}$ is separated and f is separated, then $\mathcal{X}$ is separated.*
(8) *If $\mathcal{Y}$ is quasi-separated and f is quasi-separated, then $\mathcal{X}$ is quasi-separated.*

Proof. Parts (1), (2), (3), and (4) follow immediately from Lemma 61.4.10 and Definition 61.4.2. For (5), (6), (7), and (8) think of $\mathcal{X}$ and $\mathcal{Y}$ as algebraic stacks over $Spec(\mathbf{Z})$ and apply Lemma 61.4.10. Details omitted. □

The following lemma is a bit different to the analogue for algebraic spaces. To compare take a look at Morphisms of Spaces, Lemma 42.5.10.

Lemma 61.4.12. *Let $f : \mathcal{X} \to \mathcal{Y}$ and $g : \mathcal{Y} \to \mathcal{Z}$ be morphisms of algebraic stacks.*
(1) *If $g \circ f$ is DM then so is f.*
(2) *If $g \circ f$ is quasi-DM then so is f.*
(3) *If $g \circ f$ is separated and Δ_g is separated, then f is separated.*
(4) *If $g \circ f$ is quasi-separated and Δ_g is quasi-separated, then f is quasi-separated.*

Proof. Consider the factorization

$$\mathcal{X} \to \mathcal{X} \times_{\mathcal{Y}} \mathcal{X} \to \mathcal{X} \times_{\mathcal{Z}} \mathcal{X}$$

of the diagonal morphism of $g \circ f$. Both morphisms are representable by algebraic spaces, see Lemmas 61.3.3 and 61.4.7. Hence for any scheme T and morphism $T \to \mathcal{X} \times_{\mathcal{Y}} \mathcal{X}$ we get morphisms of algebraic spaces

$$A = \mathcal{X} \times_{(\mathcal{X} \times_{\mathcal{Z}} \mathcal{X})} T \longrightarrow B = (\mathcal{X} \times_{\mathcal{Y}} \mathcal{X}) \times_{(\mathcal{X} \times_{\mathcal{Z}} \mathcal{X})} T \longrightarrow T.$$

If $g \circ f$ is DM (resp. quasi-DM), then the composition $A \to T$ is unramified (resp. locally quasi-finite). Hence (1) (resp. (2)) follows on applying Morphisms of Spaces, Lemma 42.34.11 (resp. Morphisms of Spaces, Lemma 42.25.7). This proves (1) and (2).

Proof of (3). Assume $g \circ f$ is quasi-separated and Δ_g is quasi-separated. Consider the factorization

$$\mathcal{X} \to \mathcal{X} \times_{\mathcal{Y}} \mathcal{X} \to \mathcal{X} \times_{\mathcal{Z}} \mathcal{X}$$

of the diagonal morphism of $g \circ f$. Both morphisms are representable by algebraic spaces and the second one is quasi-separated, see Lemmas 61.3.3 and 61.4.7. Hence for any scheme T and morphism $T \to \mathcal{X} \times_{\mathcal{Y}} \mathcal{X}$ we get morphisms of algebraic spaces

$$A = \mathcal{X} \times_{(\mathcal{X} \times_{\mathcal{Z}} \mathcal{X})} T \longrightarrow B = (\mathcal{X} \times_{\mathcal{Y}} \mathcal{X}) \times_{(\mathcal{X} \times_{\mathcal{Z}} \mathcal{X})} T \longrightarrow T$$

such that $B \to T$ is quasi-separated. The composition $A \to T$ is quasi-compact and quasi-separated as we have assumed that $g \circ f$ is quasi-separated. Hence $A \to B$ is quasi-separated by Morphisms of Spaces, Lemma 42.5.10. And $A \to B$ is quasi-compact by Morphisms of Spaces, Lemma 42.9.8. Thus f is quasi-separated.

Proof of (4). Assume $g \circ f$ is separated and Δ_g is separated. Consider the factorization

$$\mathcal{X} \to \mathcal{X} \times_{\mathcal{Y}} \mathcal{X} \to \mathcal{X} \times_{\mathcal{Z}} \mathcal{X}$$

of the diagonal morphism of $g \circ f$. Both morphisms are representable by algebraic spaces and the second one is separated, see Lemmas 61.3.3 and 61.4.7. Hence for any scheme T and morphism $T \to \mathcal{X} \times_{\mathcal{Y}} \mathcal{X}$ we get morphisms of algebraic spaces

$$A = \mathcal{X} \times_{(\mathcal{X} \times_{\mathcal{Z}} \mathcal{X})} T \longrightarrow B = (\mathcal{X} \times_{\mathcal{Y}} \mathcal{X}) \times_{(\mathcal{X} \times_{\mathcal{Z}} \mathcal{X})} T \longrightarrow T$$

such that $B \to T$ is separated. The composition $A \to T$ is proper as we have assumed that $g \circ f$ is quasi-separated. Hence $A \to B$ is proper by Morphisms of Spaces, Lemma 42.36.5 which means that f is separated. □

Lemma 61.4.13. *Let $\mathcal{X}$ be an algebraic stack over the base scheme S.*

1. *$\mathcal{X}$ is DM $\Leftrightarrow$ $\mathcal{X}$ is DM over S.*
2. *$\mathcal{X}$ is quasi-DM $\Leftrightarrow$ $\mathcal{X}$ is quasi-DM over S.*
3. *If $\mathcal{X}$ is separated, then $\mathcal{X}$ is separated over S.*
4. *If $\mathcal{X}$ is quasi-separated, then $\mathcal{X}$ is quasi-separated over S.*

Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks over the base scheme S.

5. *If $\mathcal{X}$ is DM over S, then f is DM.*
6. *If $\mathcal{X}$ is quasi-DM over S, then f is quasi-DM.*
7. *If $\mathcal{X}$ is separated over S and $\Delta_{\mathcal{Y}/S}$ is separated, then f is separated.*
8. *If $\mathcal{X}$ is quasi-separated over S and $\Delta_{\mathcal{Y}/S}$ is quasi-separated, then f is quasi-separated.*

Proof. Parts (5), (6), (7), and (8) follow immediately from Lemma 61.4.12 and Spaces, Definition 40.13.2. To prove (3) and (4) think of X and Y as algebraic stacks over $Spec(\mathbf{Z})$ and apply Lemma 61.4.12. Similarly, to prove (1) and (2), think of $\mathcal{X}$ as an algebraic stack over $Spec(\mathbf{Z})$ consider the morphisms

$$\mathcal{X} \longrightarrow \mathcal{X} \times_S \mathcal{X} \longrightarrow \mathcal{X} \times_{Spec(\mathbf{Z})} \mathcal{X}$$

Both arrows are representable by algebraic spaces. The second arrow is unramified and locally quasi-finite as the base change of the immersion $\Delta_{S/\mathbf{Z}}$. Hence the composition is unramified (resp. locally quasi-finite) if and only if the first arrow is unramified (resp. locally quasi-finite), see Morphisms of Spaces, Lemmas 42.34.3 and 42.34.11 (resp. Morphisms of Spaces, Lemmas 42.25.2 and 42.25.7). □

Lemma 61.4.14. *Let $\mathcal{X}$ be an algebraic stack. Let W be an algebraic space, and let $f : W \to \mathcal{X}$ be a surjective, flat, locally finitely presented morphism.*

1. *If f is unramified (i.e., étale, i.e., $\mathcal{X}$ is Deligne-Mumford), then $\mathcal{X}$ is DM.*
2. *If f is locally quasi-finite, then $\mathcal{X}$ is quasi-DM.*

Proof. Note that if f is unramified, then it is étale by Morphisms of Spaces, Lemma 42.35.12. This explains the parenthetical remark in (1). Assume f is unramified (resp. locally quasi-finite). We have to show that $\Delta_{\mathcal{X}} : \mathcal{X} \to \mathcal{X} \times \mathcal{X}$ is unramified (resp. locally quasi-finite). Note that $W \times W \to \mathcal{X} \times \mathcal{X}$ is also surjective, flat, and locally of finite presentation. Hence it suffices to show that

$$W \times_{\mathcal{X} \times \mathcal{X}, \Delta_{\mathcal{X}}} \mathcal{X} = W \times_{\mathcal{X}} W \longrightarrow W \times W$$

is unramified (resp. locally quasi-finite), see Properties of Stacks, Lemma 60.3.3. By assumption the morphism $\text{pr}_i : W \times_{\mathcal{X}} W \to W$ is unramified (resp. locally quasi-finite). Hence the displayed arrow is unramified (resp. locally quasi-finite) by Morphisms of Spaces, Lemma 42.34.11 (resp. Morphisms of Spaces, Lemma 42.25.7). □

Lemma 61.4.15. *A monomorphism of algebraic stacks is separated and DM. The same is true for immersions of algebraic stacks.*

Proof. If $f : \mathcal{X} \to \mathcal{Y}$ is a monomorphism of algebraic stacks, then Δ_f is an isomorphism, see Properties of Stacks, Lemma 60.8.4. Since an isomorphism of algebraic spaces is proper and unramified we see that f is separated and DM. The second assertion follows from the first as an immersion is a monomorphism, see Properties of Stacks, Lemma 60.9.5. □

Lemma 61.4.16. *Let $\mathcal{X}$ be an algebraic stack. Let $x \in |\mathcal{X}|$. Assume the residual gerbe $\mathcal{Z}_x$ of $\mathcal{X}$ at x exists. If $\mathcal{X}$ is DM, resp. quasi-DM, resp. separated, resp. quasi-separated, then so is $\mathcal{Z}_x$.*

Proof. This is true because $\mathcal{Z}_x \to \mathcal{X}$ is a monomorphism hence DM and separated by Lemma 61.4.15. Apply Lemma 61.4.11 to conclude. □

61.5. Inertia stacks

The (relative) inertia stack of a stack in groupoids is defined in Stacks, Section 50.7. The actual construction, in the setting of fibred categories, and some of its properties is in Categories, Section 4.31.

Lemma 61.5.1. *Let $\mathcal{X}$ be an algebraic stack. Then the inertia stack $\mathcal{I}_\mathcal{X}$ is an algebraic stack as well. The morphism*

$$\mathcal{I}_\mathcal{X} \longrightarrow \mathcal{X}$$

is representable by algebraic spaces and locally of finite type. More generally, let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks. Then the morphism

$$\mathcal{I}_{\mathcal{X}/\mathcal{Y}} \longrightarrow \mathcal{X}$$

is representable by algebraic spaces and locally of finite type.

Proof. By Categories, Lemma 4.31.1 there are equivalences

$$\mathcal{I}_\mathcal{X} \to \mathcal{X} \times_{\Delta, \mathcal{X} \times_S \mathcal{X}, \Delta} \mathcal{X} \quad \text{and} \quad \mathcal{I}_{\mathcal{X}/\mathcal{Y}} \to \mathcal{X} \times_{\Delta, \mathcal{X} \times_\mathcal{Y} \mathcal{X}, \Delta} \mathcal{X}$$

which shows that the inertia stacks are algebraic stacks. Let $T \to \mathcal{X}$ be a morphism given by the object x of the fibre category of $\mathcal{X}$ over T. Then we get a 2-fibre product square

$$\begin{tikzcd} Isom_\mathcal{X}(x, x) \arrow[r] \arrow[d] & \mathcal{I}_\mathcal{X} \arrow[d] \\ T \arrow[r, "x"] & \mathcal{X} \end{tikzcd}$$

This follows immediately from the definition of $\mathcal{I}_\mathcal{X}$. Since $Isom_\mathcal{X}(x, x)$ is always an algebraic space locally of finite type over T (see Lemma 61.3.1) we conclude that $\mathcal{I}_\mathcal{X} \to \mathcal{X}$ is representable by algebraic spaces and locally of finite type. Finally, for the relative inertia we get

$$\begin{tikzcd} Isom_\mathcal{X}(x, x) \arrow[d] & K \arrow[l] \arrow[r] \arrow[d] & \mathcal{I}_{\mathcal{X}/\mathcal{Y}} \arrow[d] \\ Isom_\mathcal{Y}(f(x), f(x)) & T \arrow[l, "e"'] \arrow[r, "x"] & \mathcal{X} \end{tikzcd}$$

with both squares 2-fibre products. This follows from Categories, Lemma 4.31.3. The left vertical arrow is a morphism of algebraic spaces locally of finite type over T, and hence is locally of finite type, see Morphisms of Spaces, Lemma 42.22.6. Thus K is an algebraic space and $K \to T$ is locally of finite type. This proves the assertion on the relative inertia. □

Remark 61.5.2. Let $\mathcal{X}$ be an algebraic stack. In Properties of Stacks, Remark 60.3.7 we have seen that the 2-category of morphisms $\mathcal{X}' \to \mathcal{X}$ representable by algebraic spaces with target $\mathcal{X}$ forms a category. In this category the inertia stack of $\mathcal{X}$ is a *group object*. Recall that an object of $\mathcal{I}_\mathcal{X}$ is just a pair (x, α) where x is an object of $\mathcal{X}$ and α is an automorphism of x in the fibre category of $\mathcal{X}$ that x lives in. The composition

$$c : \mathcal{I}_\mathcal{X} \times_\mathcal{X} \mathcal{I}_\mathcal{X} \longrightarrow \mathcal{I}_\mathcal{X}$$

is given by the rule on objects

$$((x, \alpha), (x', \alpha'), \beta) \mapsto (x, \alpha \circ \beta^{-1} \circ \alpha' \circ \beta)$$

which makes sense as $\beta : x \to x'$ is an isomorphism in the fibre category by our definition of fibre products. The neutral element $e : \mathcal{X} \to \mathcal{I}_\mathcal{X}$ is given by the functor $x \mapsto (x, \mathrm{id}_x)$. We omit the proof that the axioms of a group object hold. There is a variant of this remark for relative inertia stacks.

Let $\mathcal{X}$ be an algebraic stack and let $\mathcal{I}_\mathcal{X}$ be its inertia stack. We have seen in the proof of Lemma 61.5.1 that for any scheme T and object x of $\mathcal{X}$ over T there is a canonical cartesian square

$$\begin{tikzcd} Isom_\mathcal{X}(x, x) \arrow[r] \arrow[d] & \mathcal{I}_\mathcal{X} \arrow[d] \\ T \arrow[r, "x"] & \mathcal{X} \end{tikzcd}$$

The group structure on $\mathcal{I}_\mathcal{X}$ discussed in Remark 61.5.2 induces the group structure on $Isom_\mathcal{X}(x, x)$ of Lemma 61.3.2. This allows us to define the sheaf $Isom_\mathcal{X}$ also for morphisms from algebraic spaces to $\mathcal{X}$. We formalize this in the following definition.

Definition 61.5.3. Let $\mathcal{X}$ be an algebraic stack and let X be an algebraic space. Let $x : X \to \mathcal{X}$ be a morphism. We set

$$Isom_\mathcal{X}(x, x) = X \times_{x, \mathcal{X}} \mathcal{I}_\mathcal{X}$$

We endow it with the structure of a group algebraic space over X by pulling back the composition law discussed in Remark 61.5.2. We will sometimes refer to $Isom_\mathcal{X}(x, x)$ as the *sheaf of automorphisms of x*.

As a variant we may occasionally use the notation $Isom_\mathcal{X}(x, y)$ when given two morphisms $x, y : X \to \mathcal{X}$. This will mean simply the algebraic space

$$(X \times_{x, \mathcal{X}, y} X) \times_{X \times X, \Delta_X} X.$$

Then it is true, as in Lemma 61.3.2, that $Isom_\mathcal{X}(x, y)$ is a pseudo torsor for $Isom_\mathcal{X}(x, x)$ over X. We omit the verification.

Lemma 61.5.4. *Let $\pi : \mathcal{X} \to X$ be a morphism from an algebraic stack to an algebaic space. Let $f : X' \to X$ be a morphism of algebraic spaces. Set $\mathcal{X}' = X' \times_X \mathcal{X}$. Then both squares in the diagram*

$$\begin{tikzcd} \mathcal{I}_{\mathcal{X}'} \arrow[r] \arrow[d, "\textit{Categories, Equation } (4.31.2.1)"'] & \mathcal{X}' \arrow[r] \arrow[d] & X' \arrow[d] \\ \mathcal{I}_\mathcal{X} \arrow[r] & \mathcal{X} \arrow[r] & X \end{tikzcd}$$

are fibre product squares.

Proof. The inertia stack $\mathcal{I}_{\mathcal{X}'}$ is the defined as the category of pairs (x', α') where x' is an object of $\mathcal{X}'$ and α' is an automorphism of x' in its fibre category over $(Sch/S)_{fppf}$, see Categories, Section 4.31. Suppose that x' lies over the scheme U and maps to the object x

of $\mathcal{X}$. By the construction of the 2-fibre product in Categories, Lemma 4.29.3 we see that $x' = (U, a', x, 1)$ where $a' : U \to X'$ is a morphism and 1 indicates that $f \circ a' = \pi \circ x$ as morphisms $U \to X$. Moreover we have $Isom_{\mathcal{X}'}(x', x') = Isom_{\mathcal{X}}(x, x)$ as sheaves on U (by the very construction of the 2-fibre product). This implies that the left square is a fibre product square (details omitted). □

Lemma 61.5.5. *Let $f : \mathcal{X} \to \mathcal{Y}$ be a monomorphism of algebraic stacks. Then the diagram*

$$\begin{tikzcd} \mathcal{I}_\mathcal{X} \arrow[r] \arrow[d] & \mathcal{X} \arrow[d] \\ \mathcal{I}_\mathcal{Y} \arrow[r] & \mathcal{Y} \end{tikzcd}$$

is a fibre product square.

Proof. This follows immediately from the fact that f is fully faithful (see Properties of Stacks, Lemma 60.8.4) and the definition of the inertia in Categories, Section 4.31. Namely, an object of $\mathcal{I}_\mathcal{X}$ over a scheme T is the same thing as a pair (x, α) consisting of an object x of $\mathcal{X}$ over T and a morphism $\alpha : x \to x$ in the fibre category of $\mathcal{X}$ over T. As f is fully faithful we see that α is the same thing as a morphism $\beta : f(x) \to f(x)$ in the fibre category of $\mathcal{Y}$ over T. Hence we can think of objects of $\mathcal{I}_\mathcal{X}$ over T as triples $((y, \beta), x, \gamma)$ where y is an object of $\mathcal{Y}$ over T, $\beta : y \to y$ in $\mathcal{Y}_T$ and $\gamma : y \to f(x)$ is an isomorhism over T, i.e., an object of $\mathcal{I}_\mathcal{Y} \times_\mathcal{Y} \mathcal{X}$ over T. □

Lemma 61.5.6. *Let $\mathcal{X}$ be an algebraic stack. Let $[U/R] \to \mathcal{X}$ be a presentation. Let G/U be the stabilizer group algebraic space associated to the groupoid (U, R, s, t, c). Then*

$$\begin{tikzcd} G \arrow[r] \arrow[d] & U \arrow[d] \\ \mathcal{I}_\mathcal{X} \arrow[r] & \mathcal{X} \end{tikzcd}$$

is a fibre product diagram.

Proof. Immediate from Groupoids in Spaces, Lemma 52.25.2. □

61.6. Higher diagonals

Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks. In this situation it makes sense to consider not only the diagonal

$$\Delta_f : \mathcal{X} \to \mathcal{X} \times_\mathcal{Y} \mathcal{X}$$

but also the diagonal of the diagonal, i.e., the morphism

$$\Delta_{\Delta_f} : \mathcal{X} \longrightarrow \mathcal{X} \times_{(\mathcal{X} \times_\mathcal{Y} \mathcal{X})} \mathcal{X}$$

Because of this we sometimes use the following terminology. We denote $\Delta_{f,0} = f$ the *zeroth diagonal*, we denote $\Delta_{f,1} = \Delta_f$ the *first diagonal*, and we denote $\Delta_{f,2} = \Delta_{\Delta_f}$ the *second diagonal*. Note that $\Delta_{f,1}$ is representable by algebraic spaces and locally of finite type, see Lemma 61.3.3. Hence $\Delta_{f,2}$ is representable, a monomorphism, locally of finite type, separated, and locally quasi-finite, see Lemma 61.3.4.

We can describe the second diagonal using the relative inertia stack. Namely, the fibre product $\mathcal{X} \times_{(\mathcal{X} \times_{\mathcal{Y}} \mathcal{X})} \mathcal{X}$ is equivalent to the relative inertia stack $\mathcal{I}_{\mathcal{X}/\mathcal{Y}}$ by Categories, Lemma 4.31.1. Moreover, via this identification the second diagonal becomes the *neutral section*

$$e : \mathcal{X} \to \mathcal{I}_{\mathcal{X}/\mathcal{Y}}$$

of the relative inertia stack. Moreover, recall from the proof of Lemma 61.5.1 that given a morphism $x : T \to \mathcal{X}$ the fibre product $T \times_{x,\mathcal{X}} \mathcal{I}_{\mathcal{X}/\mathcal{Y}}$ is given as the *kernel* K of the homomorphism of group algebraic spaces

$$Isom_{\mathcal{X}}(x, x) \longrightarrow Isom_{\mathcal{Y}}(f(x), f(x))$$

over T. The morphism e corresponds to the neutral section $e : T \to K$ in this situation.

Lemma 61.6.1. *Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks. Then f is representable by algebraic spaces if and only if the second diagonal is an isomorphism.*

Proof. Namely, f is representable by algebraic spaces if and only if f is faithful, see Algebraic Stacks, Lemma 57.15.2. On the other hand, f is faithful if and only if for every object x of $\mathcal{X}$ over a scheme T the functor f induces an injection $Isom_{\mathcal{X}}(x, x) \to Isom_{\mathcal{Y}}(f(x), f(x))$, which happens if and only if the kernel K is trivial, which happens if and only if $e : T \to K$ is an isomorphism for every $x : T \to \mathcal{X}$. Since $K = T \times_{x,\mathcal{X}} \mathcal{I}_{\mathcal{X}/\mathcal{Y}}$ as discussed above, this proves the lemma. □

Lemma 61.6.2. *Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks. Then*

1. *$\Delta_{f,1}$ separated $\Leftrightarrow$ $\Delta_{f,2}$ closed immersion $\Leftrightarrow$ $\Delta_{f,2}$ proper $\Leftrightarrow$ $\Delta_{f,2}$ universally closed,*
2. *$\Delta_{f,1}$ quasi-separated $\Leftrightarrow$ $\Delta_{f,2}$ finite type $\Leftrightarrow$ $\Delta_{f,2}$ quasi-compact, and*
3. *$\Delta_{f,1}$ locally separated $\Leftrightarrow$ $\Delta_{f,2}$ immersion.*

Proof. Follows from Lemmas 61.3.5, 61.3.6, and 61.3.7 applied to $\Delta_{f,1}$. □

The following lemma is kind of cute and it may suggest a generalization of these conditions to higher algebraic stacks.

Lemma 61.6.3. *Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks. Then*

1. *f is separated if and only if $\Delta_{f,1}$ and $\Delta_{f,2}$ are universally closed, and*
2. *f is quasi-separated if and only if $\Delta_{f,1}$ and $\Delta_{f,2}$ are quasi-compact.*
3. *f is quasi-DM if and only if $\Delta_{f,1}$ and $\Delta_{f,2}$ are locally quasi-finite.*
4. *f is DM if and only if $\Delta_{f,1}$ and $\Delta_{f,2}$ are unramified.*

Proof. Proof of (1). Assume that $\Delta_{f,2}$ and $\Delta_{f,1}$ are universally closed. Then $\Delta_{f,1}$ is separated and universally closed by Lemma 61.6.2. By Morphisms of Spaces, Lemma 42.10.7 and Algebraic Stacks, Lemma 57.10.9 we see that $\Delta_{f,1}$ is quasi-compact. Hence it is quasi-compact, separated, universally closed and locally of finite type (by Lemma 61.3.3) so proper. This proves "$\Leftarrow$" of (1). The proof of the implication in the other direction is omitted.

Proof of (2). This follows immediately from Lemma 61.6.2.

Proof of (3). This follows from the fact that $\Delta_{f,2}$ is always locally quasi-finite by Lemma 61.3.4 applied to $\Delta_f = \Delta_{f,1}$.

Proof of (4). This follows from the fact that $\Delta_{f,2}$ is always unramified as Lemma 61.3.4 applied to $\Delta_f = \Delta_{f,1}$ shows that $\Delta_{f,2}$ is locally of finite type and a monomorphism. See More on Morphisms of Spaces, Lemma 46.11.8. □

61.7. Quasi-compact morphisms

Let f be a morphism of algebraic stacks which is representable by algebraic spaces. In Properties of Stacks, Section 60.3 we have defined what it means for f to be quasi-compact. Here is another characterization.

Lemma 61.7.1. *Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks which is representable by algebraic spaces. The following are equivalent:*

(1) *f is quasi-compact, and*
(2) *for every quasi-compact algebraic stack $\mathcal{Z}$ and any morphism $\mathcal{Z} \to \mathcal{Y}$ the algebraic stack $\mathcal{Z} \times_{\mathcal{Y}} \mathcal{X}$ is quasi-compact.*

Proof. Assume (1), and let $\mathcal{Z} \to \mathcal{Y}$ be a morphism of algebraic stacks with $\mathcal{Z}$ quasi-compact. By Properties of Stacks, Lemma 60.6.2 there exists a quasi-compact scheme U and a surjective smooth morphism $U \to \mathcal{Z}$. Since f is representable by algebraic spaces and quasi-compact we see by definition that $U \times_{\mathcal{Y}} \mathcal{X}$ is an algebraic space, and that $U \times_{\mathcal{Y}} \mathcal{X} \to U$ is quasi-compact. Hence $U \times_Y X$ is a quasi-compact algebraic space. The morphism $U \times_{\mathcal{Y}} \mathcal{X} \to \mathcal{Z} \times_{\mathcal{Y}} \mathcal{X}$ is smooth and surjective (as the base change of the smooth and surjective morphism $U \to \mathcal{Z}$). Hence $\mathcal{Z} \times_{\mathcal{Y}} \mathcal{X}$ is quasi-compact by another application of Properties of Stacks, Lemma 60.6.2

Assume (2). Let $Z \to \mathcal{Y}$ be a morphism, where Z is a scheme. We have to show that the morphism of algebraic spaces $p : Z \times_{\mathcal{Y}} \mathcal{X} \to Z$ is quasi-compact. Let $U \subset Z$ be affine open. Then $p^{-1}(U) = U \times_{\mathcal{Y}} \mathcal{Z}$ and the algebraic space $U \times_{\mathcal{Y}} \mathcal{Z}$ is quasi-compact by assumption (2). Hence p is quasi-compact, see Morphisms of Spaces, Lemma 42.9.7. □

This motivates the following definition.

Definition 61.7.2. Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks. We say f is *quasi-compact* if for every quasi-compact algebraic stack $\mathcal{Z}$ and morphism $\mathcal{Z} \to \mathcal{Y}$ the fibre product $\mathcal{Z} \times_{\mathcal{Y}} \mathcal{X}$ is quasi-compact.

By Lemma 61.7.1 above this agrees with the already existing notion for morphisms of algebraic stacks representable by algebraic spaces. In particular this notion agrees with the notions already defined for morphisms between algebraic stacks and schemes.

Lemma 61.7.3. *The base change of a quasi-compact morphism of algebraic stacks by any morphism of algebraic stacks is quasi-compact.*

Proof. Omitted. □

Lemma 61.7.4. *The composition of a pair of quasi-compact morphisms of algebraic stacks is quasi-compact.*

Proof. Omitted. □

Lemma 61.7.5. *Let*

$$\begin{tikzcd} \mathcal{X} \arrow[rr, "f"] \arrow[dr, "p"'] & & \mathcal{Y} \arrow[dl, "q"] \\ & \mathcal{Z} & \end{tikzcd}$$

be a 2-commutative diagram of morphisms of algebraic stacks. If f is surjective and p is quasi-compact, then q is quasi-compact.

Proof. Let $\mathcal{T}$ be a quasi-compact algebraic stack, and let $\mathcal{T} \to \mathcal{Z}$ be a morphism. By Properties of Stacks, Lemma 60.5.3 the morphism $\mathcal{T} \times_{\mathcal{Z}} \mathcal{X} \to \mathcal{T} \times_{\mathcal{Z}} \mathcal{Y}$ is surjective and by assumption $\mathcal{T} \times_{\mathcal{Z}} \mathcal{X}$ is quasi-compact. Hence $\mathcal{T} \times_{\mathcal{Z}} \mathcal{Y}$ is quasi-compact by Properties of Stacks, Lemma 60.6.2. □

Lemma 61.7.6. *Let $f : \mathcal{X} \to \mathcal{Y}$ and $g : \mathcal{Y} \to \mathcal{Z}$ be morphisms of algebraic stacks. If $g \circ f$ is quasi-compact and g is quasi-separated then f is quasi-compact.*

Proof. This is true because f equals the composition $(1, f) : \mathcal{X} \to \mathcal{X} \times_{\mathcal{Z}} \mathcal{Y} \to \mathcal{Y}$. The first map is quasi-compact by Lemma 61.4.9 because it is a section of the quasi-separated morphism $\mathcal{X} \times_{\mathcal{Z}} \mathcal{Y} \to \mathcal{X}$ (a base change of g, see Lemma 61.4.4). The second map is quasi-compact as it is the base change of f, see Lemma 61.7.3. And compositions of quasi-compact morphisms are quasi-compact, see Lemma 61.7.4. □

Lemma 61.7.7. *Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks.*

1. *If $\mathcal{X}$ is quasi-compact and $\mathcal{Y}$ is quasi-separated, then f is quasi-compact.*
2. *If $\mathcal{X}$ is quasi-compact and quasi-separated and $\mathcal{Y}$ is quasi-separated, then f is quasi-compact and quasi-separated.*
3. *A fibre product of quasi-compact and quasi-separated algebraic stacks is quasi-compact and quasi-separated.*

Proof. Part (1) follows from Lemma 61.7.6. Part (2) follows from (1) and Lemma 61.4.12. For (3) let $\mathcal{X} \to \mathcal{Y}$ and $\mathcal{Z} \to \mathcal{Y}$ be morphisms of quasi-compact and quasi-separated algebraic stacks. Then $\mathcal{X} \times_{\mathcal{Y}} \mathcal{Z} \to \mathcal{Z}$ is quasi-compact and quasi-separated as a base change of $\mathcal{X} \to \mathcal{Y}$ using (2) and Lemmas 61.7.3 and 61.4.4. Hence $\mathcal{X} \times_{\mathcal{Y}} \mathcal{Z}$ is quasi-compact and quasi-separated as an algebraic stack quasi-compact and quasi-separated over $\mathcal{Z}$, see Lemmas 61.4.11 and 61.7.4. □

61.8. Noetherian algebraic stacks

We have already defined locally Noetherian algebraic stacks in Properties of Stacks, Section 60.7.

Definition 61.8.1. Let $\mathcal{X}$ be an algebraic stack. We say $\mathcal{X}$ is *Noetherian* if $\mathcal{X}$ is quasi-compact, quasi-separated and locally Noetherian.

Note that a Noetherian algebraic stack $\mathcal{X}$ is not just quasi-compact and locally Noetherian, but also quasi-separated. In the language of Section 61.6 if we denote $p : \mathcal{X} \to Spec(\mathbf{Z})$ the ``absolute'' structure morphism (i.e., the structure morphism of $\mathcal{X}$ viewed as an algebraic stack over $\mathbf{Z}$), then

$$\mathcal{X} \text{ Noetherian} \Leftrightarrow \mathcal{X} \text{ locally Noetherian and } \Delta_{p,0}, \Delta_{p,1}, \Delta_{p,2} \text{ quasi-compact.}$$

This will later mean that an algebraic stack of finite type over a Noetherian algebraic stack is not automatically Noetherian.

61.9. Open morphisms

Let f be a morphism of algebraic stacks which is representable by algebraic spaces. In Properties of Stacks, Section 60.3 we have defined what it means for f to be universally open. Here is another characterization.

Lemma 61.9.1. *Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks which is representable by algebraic spaces. The following are equivalent*

1. *f is universally open, and*

(2) *for every morphism of algebraic stacks $\mathcal{Z} \to \mathcal{Y}$ the morphism of topological spaces $|\mathcal{Z} \times_{\mathcal{Y}} \mathcal{X}| \to |\mathcal{Z}|$ is open.*

Proof. Assume (1), and let $\mathcal{Z} \to \mathcal{Y}$ be as in (2). Choose a scheme V and a surjective smooth morphism $V \to \mathcal{Z}$. By assumption the morphism $V \times_{\mathcal{Y}} \mathcal{X} \to V$ of algebraic spaces is universally open, in particular the map $|V \times_{\mathcal{Y}} \mathcal{X}| \to |V|$ is open. By Properties of Stacks, Section 60.4 in the commutative diagram

$$\begin{tikzcd} |V \times_{\mathcal{Y}} \mathcal{X}| \arrow[r] \arrow[d] & |\mathcal{Z} \times_{\mathcal{Y}} \mathcal{X}| \arrow[d] \\ |V| \arrow[r] & |\mathcal{Z}| \end{tikzcd}$$

the horizontal arrows are open and surjective, and moreover

$$|V \times_{\mathcal{Y}} \mathcal{X}| \longrightarrow |V| \times_{|\mathcal{Z}|} |\mathcal{Z} \times_{\mathcal{Y}} \mathcal{X}|$$

is surjective. Hence as the left vertical arrow is open it follows that the right vertical arrow is open. This proves (2). The implication (2) $\Rightarrow$ (1) follows from the definitions. □

Thus we may use the following natural definition.

Definition 61.9.2. Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks.

(1) We say f is *open* if the map of topological spaces $|\mathcal{X}| \to |\mathcal{Y}|$ is open.
(2) We say f is *universally open* if for every morphism of algebraic stacks $\mathcal{Z} \to \mathcal{Y}$ the morphism of topological spaces

$$|\mathcal{Z} \times_{\mathcal{Y}} \mathcal{X}| \to |\mathcal{Z}|$$

is open, i.e., the base change $\mathcal{Z} \times_{\mathcal{Y}} \mathcal{X} \to \mathcal{Z}$ is open.

Lemma 61.9.3. *The base change of a universally open morphism of algebraic stacks by any morphism of algebraic stacks is universally open.*

Proof. This is immediate from the definition. □

Lemma 61.9.4. *The composition of a pair of (universally) open morphisms of algebraic stacks is (universally) open.*

Proof. Omitted. □

61.10. Submersive morphisms

Definition 61.10.1. Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks.

(1) We say f is *submersive*[4] if the continuous map $|\mathcal{X}| \to |\mathcal{Y}|$ is submersive, see Topology, Definition 5.15.1.
(2) We say f is *universally submersive* if for every morphism of algebraic stacks $\mathcal{Y}' \to \mathcal{Y}$ the base change $\mathcal{Y}' \times_{\mathcal{Y}} \mathcal{X} \to \mathcal{Y}'$ is submersive.

We note that a submersive morphism is in particular surjective.

[4]This is very different from the notion of a submersion of differential manifolds.

61.11. Universally closed morphisms

Let f be a morphism of algebraic stacks which is representable by algebraic spaces. In Properties of Stacks, Section 60.3 we have defined what it means for f to be universally closed. Here is another characterization.

Lemma 61.11.1. *Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks which is representable by algebraic spaces. The following are equivalent*

1. *f is universally closed, and*
2. *for every morphism of algebraic stacks $\mathcal{Z} \to \mathcal{Y}$ the morphism of topological spaces $|\mathcal{Z} \times_{\mathcal{Y}} \mathcal{X}| \to |\mathcal{Z}|$ is closed.*

Proof. Assume (1), and let $\mathcal{Z} \to \mathcal{Y}$ be as in (2). Choose a scheme V and a surjective smooth morphism $V \to \mathcal{Z}$. By assumption the morphism $V \times_{\mathcal{Y}} \mathcal{X} \to V$ of algebraic spaces is universally closed, in particular the map $|V \times_{\mathcal{Y}} \mathcal{X}| \to |V|$ is closed. By Properties of Stacks, Section 60.4 in the commutative diagram

$$\begin{tikzcd} |V \times_{\mathcal{Y}} \mathcal{X}| \arrow[r] \arrow[d] & |\mathcal{Z} \times_{\mathcal{Y}} \mathcal{X}| \arrow[d] \\ |V| \arrow[r] & |\mathcal{Z}| \end{tikzcd}$$

the horizontal arrows are open and surjective, and moreover

$$|V \times_{\mathcal{Y}} \mathcal{X}| \longrightarrow |V| \times_{|\mathcal{Z}|} |\mathcal{Z} \times_{\mathcal{Y}} \mathcal{X}|$$

is surjective. Hence as the left vertical arrow is closed it follows that the right vertical arrow is closed. This proves (2). The implication (2) ⇒ (1) follows from the definitions. ☐

Thus we may use the following natural definition.

Definition 61.11.2. Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks.

1. We say f is *closed* if the map of topological spaces $|\mathcal{X}| \to |\mathcal{Y}|$ is closed.
2. We say f is *universally closed* if for every morphism of algebraic stacks $\mathcal{Z} \to \mathcal{Y}$ the morphism of topological spaces
$$|\mathcal{Z} \times_{\mathcal{Y}} \mathcal{X}| \to |\mathcal{Z}|$$
is closed, i.e., the base change $\mathcal{Z} \times_{\mathcal{Y}} \mathcal{X} \to \mathcal{Z}$ is closed.

Lemma 61.11.3. *The base change of a universally closed morphism of algebraic stacks by any morphism of algebraic stacks is universally closed.*

Proof. This is immediate from the definition. ☐

Lemma 61.11.4. *The composition of a pair of (universally) closed morphisms of algebraic stacks is (universally) closed.*

Proof. Omitted. ☐

61.12. Types of morphisms smooth local on source-and-target

Given a property of morphisms of algebraic spaces which is *smooth local on the source-and-target*, see Descent on Spaces, Definition 45.18.1 we may use it to define a corresponding property of morphisms of algebraic stacks, namely by imposing either of the equivalent conditions of the lemma below.

Lemma 61.12.1. *Let $\mathcal{P}$ be a property of morphisms of algebraic spaces which is smooth local on the source-and-target. Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks. Consider commutative diagrams*

$$\begin{tikzcd} U \arrow[r, "h"] \arrow[d, "a"'] & V \arrow[d, "b"] \\ \mathcal{X} \arrow[r, "f"] & \mathcal{Y} \end{tikzcd}$$

where U and V are algebraic spaces and the vertical arrows are smooth. The following are equivalent

(1) *for any diagram as above such that in addition $U \to \mathcal{X} \times_{\mathcal{Y}} V$ is smooth the morphism h has property $\mathcal{P}$, and*
(2) *for some diagram as above with $a : U \to \mathcal{X}$ surjective the morphism h has property $\mathcal{P}$.*

If $\mathcal{X}$ and $\mathcal{Y}$ are representable by algebraic spaces, then this is also equivalent to f (as a morphism of algebraic spaces) having property $\mathcal{P}$. If $\mathcal{P}$ is also preserved under any base change, and fppf local on the base, then for morphisms f which are representable by algebraic spaces this is also equivalent to f having property $\mathcal{P}$ in the sense of Properties of Stacks, Section 60.3.

Proof. Let us prove the implication (1) ⇒ (2). Pick an algebraic space V and a surjective and smooth morphism $V \to \mathcal{Y}$. Pick an algebraic space U and a surjective and smooth morphism $U \to \mathcal{X} \times_{\mathcal{Y}} V$. Note that $U \to \mathcal{X}$ is surjective and smooth as well, as a composition of the base change $\mathcal{X} \times_{\mathcal{Y}} V \to \mathcal{X}$ and the chosen map $U \to \mathcal{X} \times_{\mathcal{Y}} V$. Hence we obtain a diagram as in (1). Thus if (1) holds, then $h : U \to V$ has property $\mathcal{P}$, which means that (2) holds as $U \to \mathcal{X}$ is surjective.

Conversely, assume (2) holds and let U, V, a, b, h be as in (2). Next, let U', V', a', b', h' be any diagram as in (1). Picture

$$\begin{tikzcd} U \arrow[r, "h"] \arrow[d] & V \arrow[d] \\ \mathcal{X} \arrow[r, "f"] & \mathcal{Y} \end{tikzcd} \qquad \begin{tikzcd} U' \arrow[r, "h'"] \arrow[d] & V' \arrow[d] \\ \mathcal{X} \arrow[r, "f"] & \mathcal{Y} \end{tikzcd}$$

To show that (2) implies (1) we have to prove that h' has $\mathcal{P}$. To do this consider the commutative diagram

$$\begin{tikzcd} U \arrow[dd, "h"] & U \times_{\mathcal{X}} U' \arrow[l] \arrow[r] \arrow[d] \arrow[dd, bend left, "(h,h')"] & U' \arrow[dd, "h'"] \\ & U \times_{\mathcal{Y}} V' \arrow[ul] \arrow[d] & \\ V & V \times_{\mathcal{Y}} V' \arrow[l] \arrow[r] & V' \end{tikzcd}$$

of algebraic spaces. Note that the horizontal arrows are smooth as base changes of the smooth morphisms $V \to \mathcal{Y}$, $V' \to \mathcal{Y}$, $U \to \mathcal{X}$, and $U' \to \mathcal{X}$. Note that

$$\begin{tikzcd} U \times_{\mathcal{X}} U' \arrow[r] \arrow[d] & U' \arrow[d] \\ U \times_{\mathcal{Y}} V' \arrow[r] & \mathcal{X} \times_{\mathcal{Y}} V' \end{tikzcd}$$

is cartesian, hence the left vertical arrow is smooth as U', V', a', b', h' is as in (1). Since $\mathcal{P}$ is local on the target we see that the base change $U \times_{\mathcal{Y}} V' \to V \times_{\mathcal{Y}} V'$ has $\mathcal{P}$ and hence after precomposing by the smooth morphism $U \times_{\mathcal{X}} U' \to U \times_{\mathcal{Y}} V'$ the morphism we conclude (h, h') has $\mathcal{P}$. Finally, since $U \times_X U' \to U'$ is surjective this implies that h' has $\mathcal{P}$ as $\mathcal{P}$ is local on the source-and-target. This finishes the proof of the equivalence of (1) and (2).

If $\mathcal{X}$ and $\mathcal{Y}$ are representable, then Descent on Spaces, Lemma 45.18.3 applies which shows that (1) and (2) are equivalent to f having $\mathcal{P}$.

Finally, suppose f is representable, and U, V, a, b, h are as in part (2) of the lemma, and that $\mathcal{P}$ is preserved under arbitrary base change. We have to show that for any scheme Z and morphism $Z \to \mathcal{X}$ the base change $Z \times_{\mathcal{Y}} \mathcal{X} \to Z$ has property $\mathcal{P}$. Consider the diagram

$$\begin{tikzcd} Z \times_{\mathcal{Y}} U \arrow[r] \arrow[d] & Z \times_{\mathcal{Y}} V \arrow[d] \\ Z \times_{\mathcal{Y}} \mathcal{X} \arrow[r] & Z \end{tikzcd}$$

Note that the top horizontal arrow is a base change of h and hence has property $\mathcal{P}$. The left vertical arrow is smooth and surjective and the right vertical arrow is smooth. Thus Descent on Spaces, Lemma 45.18.3 kicks in and shows that $Z \times_{\mathcal{Y}} \mathcal{X} \to Z$ has property $\mathcal{P}$. $\square$

Definition 61.12.2. Let $\mathcal{P}$ be a property of morphisms of algebraic spaces which is smooth local on the source-and-target. We say a morphism $f : \mathcal{X} \to \mathcal{Y}$ of algebraic stacks *has property* $\mathcal{P}$ if the equivalent conditions of Lemma 61.12.1 hold.

Remark 61.12.3. Let $\mathcal{P}$ be a property of morphisms of algebraic spaces which is smooth local on the source-and-target and stable under composition. Then the property of morphisms of algebraic stacks defined in Definition 61.12.2 is stable under composition. Namely, let $f : \mathcal{X} \to \mathcal{Y}$ and $g : \mathcal{Y} \to \mathcal{Z}$ be morphisms of algebraic stacks having propery $\mathcal{P}$. Choose an algebraic space W and a surjective smooth morphism $W \to \mathcal{Z}$. Choose an algebraic space V and a surjective smooth morphism $V \to \mathcal{Y} \times_{\mathcal{Z}} W$. Finally, choose an algebraic space U and a surjective and smooth morphism $U \to \mathcal{X} \times_{\mathcal{Y}} V$. Then the morphisms $V \to W$ and $U \to V$ have property $\mathcal{P}$ by definition. Whence $U \to W$ has property $\mathcal{P}$ as we assumed that $\mathcal{P}$ is stable under composition. Thus, by definition again, we see that $g \circ f : \mathcal{X} \to \mathcal{Z}$ has property $\mathcal{P}$.

Remark 61.12.4. Let $\mathcal{P}$ be a property of morphisms of algebraic spaces which is smooth local on the source-and-target and stable under base change. Then the property of morphisms of algebraic stacks defined in Definition 61.12.2 is stable under base change. Namely, let $f : \mathcal{X} \to \mathcal{Y}$ and $g : \mathcal{Y}' \to \mathcal{Y}$ be morphisms of algebraic stacks and assume f has propery $\mathcal{P}$. Choose an algebraic space V and a surjective smooth morphism $V \to \mathcal{Y}$. Choose an algebraic space U and a surjective smooth morphism $U \to \mathcal{X} \times_{\mathcal{Y}} V$. Finally, choose an algebraic space V' and a surjective and smooth morphism $V' \to \mathcal{Y}' \times_{\mathcal{Y}} V$. Then the morphism

$U \to V$ has property $\mathcal{P}$ by definition. Whence $V' \times_V U \to V'$ has property $\mathcal{P}$ as we assumed that $\mathcal{P}$ is stable under base change. Considering the diagram

$$\begin{tikzcd} V' \times_V U \arrow[r] \arrow[d] & \mathcal{Y}' \times_{\mathcal{Y}} \mathcal{X} \arrow[r] \arrow[d] & \mathcal{X} \arrow[d] \\ V' \arrow[r] & \mathcal{Y}' \arrow[r] & \mathcal{Y} \end{tikzcd}$$

we see that the left top horizontal arrow is smooth and surjective, whence by definition we see that the projection $\mathcal{Y}' \times_{\mathcal{Y}} \mathcal{X} \to \mathcal{Y}'$ has property $\mathcal{P}$.

Remark 61.12.5. Let $\mathcal{P}, \mathcal{P}'$ be properties of morphisms of algebraic spaces which are smooth local on the source-and-target and stable under base change. Suppose that we have $\mathcal{P} \Rightarrow \mathcal{P}'$ for morphisms of algebraic spaces. Then we also have $\mathcal{P} \Rightarrow \mathcal{P}'$ for the properties of morphisms of algebraic stacks defined in Definition 61.12.2 using $\mathcal{P}$ and $\mathcal{P}'$. This is clear from the definition.

61.13. Morphisms of finite type

The property ``locally of finite type" of morphisms of algebraic spaces is smooth local on the source-and-target, see Descent on Spaces, Remark 45.18.5. It is also stable under base change and fpqc local on the target, see Morphisms of Spaces, Lemma 42.22.3 and Descent on Spaces, Lemma 45.10.7. Hence, by Lemma 61.12.1 above, we may define what it means for a morphism of algebraic spaces to be locally of finite type as follows and it agrees with the already existing notion defined in Properties of Stacks, Section 60.3 when the morphism is representable by algebraic spaces.

Definition 61.13.1. Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks.

(1) We say f *locally of finite type* if the equivalent conditions of Lemma 61.12.1 hold with $\mathcal{P}=$ locally of finite type.
(2) We say f is *of finite type* if it is locally of finite type and quasi-compact.

Lemma 61.13.2. *The composition of finite type morphisms is of finite type. The same holds for locally of finite type.*

Proof. Combine Remark 61.12.3 with Morphisms of Spaces, Lemma 42.22.2. □

Lemma 61.13.3. *A base change of a finite type morphism is finite type. The same holds for locally of finite type.*

Proof. Combine Remark 61.12.4 with Morphisms of Spaces, Lemma 42.22.3. □

Lemma 61.13.4. *An immersion is locally of finite type.*

Proof. Follows from Morphisms of Spaces, Lemma 42.22.7. □

Lemma 61.13.5. *Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks. If f is locally of finite type and $\mathcal{Y}$ is locally Noetherian, then $\mathcal{X}$ is locally Noetherian.*

Proof. Let

$$\begin{tikzcd} U \arrow[r] \arrow[d] & V \arrow[d] \\ \mathcal{X} \arrow[r] & \mathcal{Y} \end{tikzcd}$$

be a commutative diagram where U, V are schemes, $V \to \mathcal{Y}$ is surjective and smooth, and $U \to V \times_{\mathcal{Y}} \mathcal{X}$ is surjective and smooth. Then $U \to V$ is locally of finite type. If $\mathcal{Y}$ is locally Noetherian, then V is locally Noetherian. By Morphisms, Lemma 24.14.6 we see that U is locally Noetherian, which means that $\mathcal{X}$ is locally Noetherian. $\square$

The following two lemmas will be improved on later (after we have discussed morphisms of algebraic stacks which are locally of finite presentation).

Lemma 61.13.6. *Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks. Let $W \to \mathcal{Y}$ be a surjective, flat, and locally of finite presentation where W is an algebraic space. If the base change $W \times_{\mathcal{Y}} \mathcal{X} \to W$ is locally of finite type, then f is locally of finite type.*

Proof. Choose an algebraic space V and a surjective smooth morphism $V \to \mathcal{Y}$. Choose an algebraic space U and a surjective smooth morphism $U \to V \times_{\mathcal{Y}} \mathcal{X}$. We have to show that $U \to V$ is locally of finite presentation. Now we base change everything by $W \to \mathcal{Y}$: Set $U' = W \times_{\mathcal{Y}} U$, $V' = W \times_{\mathcal{Y}} V$, $\mathcal{X}' = W \times_{\mathcal{Y}} \mathcal{X}$, and $\mathcal{Y}' = W \times_{\mathcal{Y}} \mathcal{Y} = W$. Then it is still true that $U' \to V' \times_{\mathcal{Y}'} \mathcal{X}'$ is smooth by base change. Hence by our definition of locally finite type morphisms of algebraic stacks and the assumption that $\mathcal{X}' \to \mathcal{Y}'$ is locally of finite type, we see that $U' \to V'$ is locally of finite type. Then, since $V' \to V$ is surjective, flat, and locally of finite presentation as a base change of $W \to \mathcal{Y}$ we see that $U \to V$ is locally of finite type by Descent on Spaces, Lemma 45.10.7 and we win. $\square$

Lemma 61.13.7. *Let $\mathcal{X} \to \mathcal{Y} \to \mathcal{Z}$ be morphisms of algebraic stacks. Assume $\mathcal{X} \to \mathcal{Z}$ is locally of finite type and that $\mathcal{X} \to \mathcal{Y}$ is representable by algebraic spaces, surjective, flat, and locally of finite presentation. Then $\mathcal{Y} \to \mathcal{Z}$ is locally of finite type.*

Proof. Choose an algebraic space W and a surjective smooth morphism $W \to \mathcal{Z}$. Choose an algebraic space V and a surjective smooth morphism $V \to W \times_{\mathcal{Z}} \mathcal{Y}$. Set $U = V \times_{\mathcal{Y}} \mathcal{X}$ which is an algebraic space. We know that $U \to V$ is surjective, flat, and locally of finite presentation and that $U \to W$ is locally of finite type. Hence the lemma reduces to the case of morphisms of algebraic spaces. The case of morphisms of algebraic spaces is Descent on Spaces, Lemma 45.14.2. $\square$

Lemma 61.13.8. *Let $f : \mathcal{X} \to \mathcal{Y}$, $g : \mathcal{Y} \to \mathcal{Z}$ be morphisms of algebraic stacks. If $g \circ f : \mathcal{X} \to \mathcal{Z}$ is locally of finite type, then $f : \mathcal{X} \to \mathcal{Y}$ is locally of finite type.*

Proof. We can find a diagram

$$\begin{tikzcd} U \arrow[r] \arrow[d] & V \arrow[r] \arrow[d] & W \arrow[d] \\ \mathcal{X} \arrow[r] & \mathcal{Y} \arrow[r] & \mathcal{Z} \end{tikzcd}$$

where U, V, W are schemes, the vertical arrow $W \to \mathcal{Z}$ is surjective and smooth, the arrow $V \to \mathcal{Y} \times_{\mathcal{Z}} W$ is surjective and smooth, and the arrow $U \to \mathcal{X} \times_{\mathcal{Y}} V$ is surjective and smooth. Then also $U \to \mathcal{X} \times_{\mathcal{Z}} V$ is surjective and smooth (as a composition of a surjective and smooth morphism with a base change of such). By definition we see that $U \to W$ is locally of finite type. Hence $U \to V$ is locally of finite type by Morphisms, Lemma 24.14.8 which in turn means (by definition) that $\mathcal{X} \to \mathcal{Y}$ is locally of finite type. $\square$

61.14. Points of finite type

Let $\mathcal{X}$ be an algebraic stack. A finite type point $x \in |\mathcal{X}|$ is a point which can be represented by a morphism $Spec(k) \to \mathcal{X}$ which is locally of finite type. Finite type points are a suitable replacement of closed points for algebraic spaces and algebraic stacks. There are always ``enough of them'' for example.

Lemma 61.14.1. *Let $\mathcal{X}$ be an algebraic stack. Let $x \in |\mathcal{X}|$. The following are equivalent:*

(1) *There exists a morphism $Spec(k) \to \mathcal{X}$ which is locally of finite type and represents x.*
(2) *There exists a scheme U, a closed point $u \in U$, and a smooth morphism $\varphi : U \to \mathcal{X}$ such that $\varphi(u) = x$.*

Proof. Let $u \in U$ and $U \to \mathcal{X}$ be as in (2). Then $Spec(\kappa(u)) \to U$ is of finite type, and $U \to \mathcal{X}$ is representable and locally of finite type (by Morphisms of Spaces, Lemmas 42.35.8 and 42.26.5). Hence we see (1) holds by Lemma 61.13.2.

Conversely, assume $Spec(k) \to \mathcal{X}$ is locally of finite type and represents x. Let $U \to \mathcal{X}$ be a surjective smooth morphism where U is a scheme. By assumption $U \times_{\mathcal{X}} Spec(k) \to U$ is a morphism of algebraic spaces which is locally of finite type. Pick a finite type point v of $U \times_{\mathcal{X}} Spec(k)$ (there exists at least one, see Morphisms of Spaces, Lemma 42.24.3). By Morphisms of Spaces, Lemma 42.24.4 the image $u \in U$ of v is a finite type point of U. Hence by Morphisms, Lemma 24.15.4 after shrinking U we may assume that u is a closed point of U, i.e., (2) holds. □

Definition 61.14.2. Let $\mathcal{X}$ be an algebraic stack. We say a point $x \in |\mathcal{X}|$ is a *finite type point*[5] if the equivalent conditions of Lemma 61.14.1 are satisfied. We denote $\mathcal{X}_{\text{ft-pts}}$ the set of finite type points of $\mathcal{X}$.

We can describe the set of finite type points as follows.

Lemma 61.14.3. *Let $\mathcal{X}$ be an algebraic stack. We have*

$$\mathcal{X}_{ft\text{-}pts} = \bigcup\nolimits_{\varphi : U \to X \ smooth} |\varphi|(U_0)$$

where U_0 is the set of closed points of U. Here we may let U range over all schemes smooth over $\mathcal{X}$ or over all affine schemes smooth over $\mathcal{X}$.

Proof. Immediate from Lemma 61.14.1. □

Lemma 61.14.4. *Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks. If f is locally of finite type, then $f(\mathcal{X}_{ft\text{-}pts}) \subset \mathcal{Y}_{ft\text{-}pts}$.*

Proof. Take $x \in \mathcal{X}_{\text{ft-pts}}$. Represent x by a locally finite type morphism $x : Spec(k) \to \mathcal{X}$. Then $f \circ x$ is locally of finite type by Lemma 61.13.2. Hence $f(x) \in \mathcal{Y}_{\text{ft-pts}}$. □

Lemma 61.14.5. *Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks. If f is locally of finite type and surjective, then $f(\mathcal{X}_{ft\text{-}pts}) = \mathcal{Y}_{ft\text{-}pts}$.*

Proof. We have $f(\mathcal{X}_{\text{ft-pts}}) \subset \mathcal{Y}_{\text{ft-pts}}$ by Lemma 61.14.4. Let $y \in |\mathcal{Y}|$ be a finite type point. Represent y by a morphism $Spec(k) \to \mathcal{Y}$ which is locally of finite type. As f is surjective the algebraic stack $\mathcal{X}_k = Spec(k) \times_{\mathcal{Y}} \mathcal{X}$ is nonempty, therefore has a finite type point $x \in |\mathcal{X}_k|$ by Lemma 61.14.3. Now $\mathcal{X}_k \to \mathcal{X}$ is a morphism which is locally of finite type as a base change of $Spec(k) \to \mathcal{Y}$ (Lemma 61.13.3). Hence the image of x in $\mathcal{X}$ is a finite type point by Lemma 61.14.4 which maps to y by construction. □

[5] This is a slight abuse of language as it would perhaps be more correct to say ``locally finite type point''.

Lemma 61.14.6. *Let $\mathcal{X}$ be an algebraic stack. For any locally closed subset $T \subset |\mathcal{X}|$ we have*

$$T \neq \emptyset \Rightarrow T \cap \mathcal{X}_{ft\text{-}pts} \neq \emptyset.$$

In particular, for any closed subset $T \subset |\mathcal{X}|$ we see that $T \cap \mathcal{X}_{ft\text{-}pts}$ is dense in T.

Proof. Let $i : \mathcal{Z} \to \mathcal{X}$ be the reduced induced substack structure on T, see Properties of Stacks, Remark 60.10.5. An immersion is locally of finite type, see Lemma 61.13.4. Hence by Lemma 61.14.4 we see $\mathcal{Z}_{\text{ft-pts}} \subset \mathcal{X}_{\text{ft-pts}} \cap T$. Finally, any nonempty affine scheme U with a smooth morphism towards $\mathcal{Z}$ has at least one closed point, hence $\mathcal{Z}$ has at least one finite type point by Lemma 61.14.3. The lemma follows. □

Here is another, more technical, characterization of a finite type point on an algebraic stack. It tells us in particular that the residual gerbe of $\mathcal{X}$ at x exists whenever x is a finite type point!

Lemma 61.14.7. *Let $\mathcal{X}$ be an algebraic stack. Let $x \in |\mathcal{X}|$. The following are equivalent:*

(1) *x is a finite type point,*
(2) *there exists an algebraic stack $\mathcal{Z}$ whose underlying topological space $|\mathcal{Z}|$ is a singleton, and a morphism $f : \mathcal{Z} \to \mathcal{X}$ which is locally of finite type such that $\{x\} = |f|(|\mathcal{Z}|)$, and*
(3) *the residual gerbe $\mathcal{Z}_x$ of $\mathcal{X}$ at x exists and the inclusion morphism $\mathcal{Z}_x \to \mathcal{X}$ is locally of finite type.*

Proof. (All of the morphisms occuring in this paragraph are representable by algebraic spaces, hence the conventions and results of Properties of Stacks, Section 60.3 are applicable.) Assume x is a finite type point. Choose an affine scheme U, a closed point $u \in U$, and a smooth morphism $\varphi : U \to \mathcal{X}$ with $\varphi(u) = x$, see Lemma 61.14.3. Set $u = Spec(\kappa(u))$ as usual. Set $R = u \times_{\mathcal{X}} u$ so that we obtain a groupoid in algebraic spaces (u, R, s, t, c), see Algebraic Stacks, Lemma 57.16.1. The projection morphisms $R \to u$ are the compositions

$$R = u \times_{\mathcal{X}} u \to u \times_{\mathcal{X}} U \to u \times_{\mathcal{X}} X = u$$

where the first arrow is of finite type (a base change of the closed immersion of schemes $u \to U$) and the second arrow is smooth (a base change of the smooth morphism $U \to \mathcal{X}$). Hence $s, t : R \to u$ are locally of finite type (as compositions, see Morphisms of Spaces, Lemma 42.22.2). Since u is the spectrum of a field, it follows that s, t are flat and locally of finite presentation (by Morphisms of Spaces, Lemma 42.26.7). We see that $\mathcal{Z} = [u/R]$ is an algebraic stack by Criteria for Representability, Theorem 59.17.2. By Algebraic Stacks, Lemma 57.16.1 we obtain a canonical morphism

$$f : \mathcal{Z} \longrightarrow \mathcal{X}$$

which is fully faithful. Hence this morphism is representable by algebraic spaces, see Algebraic Stacks, Lemma 57.15.2 and a monomorphism, see Properties of Stacks, Lemma 60.8.4. It follows that the residual gerbe $\mathcal{Z}_x \subset \mathcal{X}$ of $\mathcal{X}$ at x exists and that f factors through an equivalence $\mathcal{Z} \to \mathcal{Z}_x$, see Properties of Stacks, Lemma 60.11.11. By construction the diagram

$$\begin{tikzcd} u \arrow[r] \arrow[d] & U \arrow[d] \\ \mathcal{Z} \arrow[r, "f"] & \mathcal{X} \end{tikzcd}$$

is commutative. By Criteria for Representability, Lemma 59.17.1 the left vertical arrow is surjective, flat, and locally of finite presentation. Consider

$$\begin{tikzcd} u \times_{\mathcal{X}} U \arrow[r] \arrow[d] & \mathcal{Z} \times_{\mathcal{X}} U \arrow[r] \arrow[d] & U \arrow[d] \\ u \arrow[r] & \mathcal{Z} \arrow[r, "f"] & \mathcal{X} \end{tikzcd}$$

As $u \to \mathcal{X}$ is locally of finite type, we see that the base change $u \times_{\mathcal{X}} U \to U$ is locally of finite type. Moreover, $u \times_{\mathcal{X}} U \to \mathcal{Z} \times_{\mathcal{X}} U$ is surjective, flat, and locally of finite presentation as a base change of $u \to \mathcal{Z}$. Thus $\{u \times_{\mathcal{X}} U \to \mathcal{Z} \times_{\mathcal{X}} U\}$ is an fppf covering of algebraic spaces, and we conclude that $\mathcal{Z} \times_{\mathcal{X}} U \to U$ is locally of finite type by Descent on Spaces, Lemma 45.14.1. By definition this means that f is locally of finite type (because the vertical arrow $\mathcal{Z} \times_{\mathcal{X}} U \to \mathcal{Z}$ is smooth as a base change of $U \to \mathcal{X}$ and surjective as $\mathcal{Z}$ has only one point). Since $\mathcal{Z} = \mathcal{Z}_x$ we see that (3) holds.

It is clear that (3) implies (2). If (2) holds then x is a finite type point of $\mathcal{X}$ by Lemma 61.14.4 and Lemma 61.14.6 to see that $\mathcal{Z}_{\text{ft-pts}}$ is nonempty, i.e., the unique point of $\mathcal{Z}$ is a finite type point of $\mathcal{Z}$. $\square$

61.15. Special presentations of algebraic stacks

The following lemma gives a criterion for when a ``slice'' of a presentation is still flat over the algebraic stack.

Lemma 61.15.1. *Let $\mathcal{X}$ be an algebraic stack. Consider a cartesian diagram*

$$\begin{tikzcd} U \arrow[d] & F \arrow[l, "p"'] \arrow[d] \\ \mathcal{X} & Spec(k) \arrow[l] \end{tikzcd}$$

where U is an algebraic space, k is a field, and $U \to \mathcal{X}$ is flat and locally of finite presentation. Let $f_1, \ldots, f_r \in \Gamma(U, \mathcal{O}_U)$ and $z \in |F|$ such that $f_1, \ldots, f_r$ map to a regular sequence in the local ring $\mathcal{O}_{F,\overline{z}}$. Then, after replacing U by an open subspace containing $p(z)$, the morphism

$$V(f_1, \ldots, f_r) \longrightarrow \mathcal{X}$$

is flat and locally of finite presentation.

Proof. Choose a scheme W and a surjective smooth morphism $W \to \mathcal{X}$. Choose an extension of fields $k \subset k'$ and a morphism $w : Spec(k') \to W$ such that $Spec(k') \to W \to \mathcal{X}$ is 2-isomorphic to $Spec(k') \to Spec(k) \to \mathcal{X}$. This is possible as $W \to \mathcal{X}$ is surjective. Consider the commutative diagram

$$\begin{tikzcd} U \arrow[d] & U \times_{\mathcal{X}} W \arrow[l, "\text{pr}_0"'] \arrow[d] & F' \arrow[l, "p'"'] \arrow[d] \\ \mathcal{X} & W \arrow[l] & Spec(k') \arrow[l] \end{tikzcd}$$

both of whose squares are cartesian. By our choice of w we see that $F' = F \times_{Spec(k)} Spec(k')$. Thus $F' \to F$ is surjective and we can choose a point $z' \in |F'|$ mapping to z. Since $F' \to F$ is flat we see that $\mathcal{O}_{F,\overline{z}} \to \mathcal{O}_{F',\overline{z}'}$ is flat, see Morphisms of Spaces, Lemma 42.27.7. Hence $f_1, \ldots, f_r$ map to a regular sequence in $\mathcal{O}_{F',\overline{z}'}$, see Algebra, Lemma 7.65.7. Note that $U \times_{\mathcal{X}} W \to W$ is a morphism of algebraic spaces which is flat and locally of finite presentation. Hence by More on Morphisms of Spaces, Lemma 46.19.1 we see that there exists an open subspace U' of $U \times_{\mathcal{X}} W$ containing $p(z')$ such that the intersection $U' \cap (V(f_1, \ldots, f_r) \times_{\mathcal{X}} W)$ is flat and locally of finite presentation over W. Note that $\text{pr}_0(U')$ is an open subspace of U containing $p(z)$ as pr_0 is smooth hence open. Now we see that $U' \cap (V(f_1, \ldots, f_r) \times_{\mathcal{X}} W) \to \mathcal{X}$ is flat and locally of finite presentation as the composition

$$U' \cap (V(f_1, \ldots, f_r) \times_{\mathcal{X}} W) \to W \to \mathcal{X}.$$

Hence Properties of Stacks, Lemma 60.3.5 implies $\text{pr}_0(U') \cap V(f_1, \ldots, f_r) \to \mathcal{X}$ is flat and locally of finite presentation as desired. $\square$

Lemma 61.15.2. *Let $\mathcal{X}$ be an algebraic stack. Consider a cartesian diagram*

$$\begin{tikzcd} U \arrow[d] & F \arrow[l, "p"'] \arrow[d] \\ \mathcal{X} & Spec(k) \arrow[l] \end{tikzcd}$$

where U is an algebraic space, k is a field, and $U \to \mathcal{X}$ is locally of finite type. Let $z \in |F|$ be such that $\dim_z(F) = 0$. Then, after replacing U by an open subspace containing $p(z)$, the morphism

$$U \longrightarrow \mathcal{X}$$

is locally quasi-finite.

Proof. Since $f : U \to \mathcal{X}$ is locally of finite type there exists a maximal open $W(f) \subset U$ such that the restriction $f|_{W(f)} : W(f) \to \mathcal{X}$ is locally quasi-finite, see Properties of Stacks, Remark 60.9.19 (2). Hence all we need to do is prove that $p(z)$ is a point of $W(f)$. Moreover, the remark referenced above also shows the formation of $W(f)$ commutes with arbitrary base change by a morphism which is representable by algebraic spaces. Hence it suffices to show that the morphism $F \to Spec(k)$ is locally quasi-finite at z. This follows immediately from Morphisms of Spaces, Lemma 42.31.6. $\square$

A quasi-DM stack has a locally quasi-finite ``covering'' by a scheme.

Theorem 61.15.3. *Let $\mathcal{X}$ be an algebraic stack. The following are equivalent*

1. *$\mathcal{X}$ is quasi-DM, and*
2. *there exists a scheme W and a surjective, flat, locally finitely presented, locally quasi-finite morphism $W \to \mathcal{X}$.*

Proof. The implication (2) ⇒ (1) is Lemma 61.4.14. Assume (1). Let $x \in |\mathcal{X}|$ be a finite type point. We will produce a scheme over $\mathcal{X}$ which ``works'' in a neighbourhood of x. At the end of the proof we will take the disjoint union of all of these to conclude.

Let U be an affine scheme, $U \to \mathcal{X}$ a smooth morphism, and $u \in U$ a closed point which maps to x, see Lemma 61.14.1. Denote $u = Spec(\kappa(u))$ as usual. Consider the following commutative diagram

$$\begin{tikzcd} u \arrow[d] & R \arrow[l] \arrow[d] \\ U \arrow[d] & F \arrow[l, "p"'] \arrow[d] \\ \mathcal{X} & u \arrow[l] \end{tikzcd}$$

with both squares fibre product squares, in particular $R = u \times_{\mathcal{X}} u$. In the proof of Lemma 61.14.7 we have seen that (u, R, s, t, c) is a groupoid in algebraic spaces with s, t locally of finite type. Let $G \to u$ be the stabilizer group algebraic space (see Groupoids in Spaces, Definition 52.15.2). Note that

$$G = R \times_{(u \times u)} u = (u \times_{\mathcal{X}} u) \times_{(u \times u)} u = \mathcal{X} \times_{\mathcal{X} \times \mathcal{X}} u.$$

As $\mathcal{X}$ is quasi-DM we see that G is locally quasi-finite over u. By More on Groupoids in Spaces, Lemma 53.7.10 we have $\dim(R) = 0$.

Let $e : u \to R$ be the identity of the groupoid. Thus both compositions $u \to R \to u$ are equal to the identity morphism of u. Note that $R \subset F$ is a closed subspace as $u \subset U$ is a closed subscheme. Hence we can also think of e as a point of F. Consider the maps of étale local rings

$$\mathcal{O}_{U,u} \xrightarrow{p^\sharp} \mathcal{O}_{F,\overline{e}} \longrightarrow \mathcal{O}_{R,\overline{e}}$$

Note that $\mathcal{O}_{R,\overline{e}}$ has dimension 0 by the result of the first paragraph. On the other hand, the kernel of the second arrow is $p^\sharp(\mathfrak{m}_u)\mathcal{O}_{F,\overline{e}}$ as R is cut out in F by $\mathfrak{m}_u$. Thus we see that

$$\mathfrak{m}_{\overline{z}} = \sqrt{p^\sharp(\mathfrak{m}_u)\mathcal{O}_{F,\overline{e}}}$$

On the other hand, as the morphism $U \to \mathcal{X}$ is smooth we see that $F \to u$ is a smooth morphism of algebraic spaces. This means that F is a regular algebraic space (Spaces over Fields, Lemma 48.5.1). Hence $\mathcal{O}_{F,\overline{e}}$ is a regular local ring (Properties of Spaces, Lemma 41.22.1). Note that a regular local ring is Cohen-Macaulay (Algebra, Lemma 7.98.3). Let $d = \dim(\mathcal{O}_{F,\overline{e}})$. By Algebra, Lemma 7.96.11 we can find $f_1, \ldots, f_d \in \mathcal{O}_{U,u}$ whose images $\varphi(f_1), \ldots, \varphi(f_d)$ form a regular sequence in $\mathcal{O}_{F,\overline{z}}$. By Lemma 61.15.1 after shrinking U we may assume that $Z = V(f_1, \ldots, f_d) \to \mathcal{X}$ is flat and locally of finite presentation. Note that by construction $F_Z = Z \times_{\mathcal{X}} u$ is a closed subspace of $F = U \times_{\mathcal{X}} u$, that e is a point of this closed subspace, and that

$$\dim(\mathcal{O}_{F_Z,\overline{e}}) = 0.$$

By Morphisms of Spaces, Lemma 42.31.1 it follows that $\dim_e(F_Z) = 0$ because the transcendece degree of e relative to u is zero. Hence it follows from Lemma 61.15.2 that after possibly shrinking U the morphism $Z \to \mathcal{X}$ is locally quasi-finite.

We conclude that for every finite type point x of $\mathcal{X}$ there exists a locally quasi-finite, flat, locally finitely presented morphism $f_x : Z_x \to \mathcal{X}$ with x in the image of $|f_x|$. Set $W = \coprod_x Z_x$ and $f = \coprod f_x$. Then f is flat, locally of finite presentation, and locally quasi-finite. In particular the image of $|f|$ is open, see Properties of Stacks, Lemma 60.4.7. By construction the image contains all finite type points of $\mathcal{X}$, hence f is surjective by Lemma 61.14.6 (and Properties of Stacks, Lemma 60.4.4). □

Lemma 61.15.4. *Let $\mathcal{Z}$ be a DM, locally Noetherian, reduced algebraic stack with $|\mathcal{Z}|$ a singleton. Then there exists a field k and a surjective étale morphism $Spec(k) \to \mathcal{Z}$.*

Proof. By Properties of Stacks, Lemma 60.11.3 there exists a field k and a surjective, flat, locally finitely presented morphism $Spec(k) \to \mathcal{Z}$. Set $U = Spec(k)$ and $R = U \times_{\mathcal{Z}} U$ so we obtain a groupoid in algebraic spaces (U, R, s, t, c), see Algebraic Stacks, Lemma 57.9.2. Note that by Algebraic Stacks, Remark 57.16.3 we have an equivalence

$$f_{can} : [U/R] \longrightarrow \mathcal{Z}$$

The projections $s, t : R \to U$ are locally of finite presentation. As $\mathcal{X}$ is DM we see that the stabilizer group algebraic space

$$G = U \times_{U \times U} R = U \times_{U \times U} (U \times_{\mathcal{X}} U) = U \times_{\mathcal{X} \times \mathcal{X}, \Delta_{\mathcal{X}}} \mathcal{X}$$

is unramified over U. In particular $\dim(G) = 0$ and by More on Groupoids in Spaces, Lemma 53.7.10 we have $\dim(R) = 0$. This implies that R is a scheme, see Spaces over Fields, Lemma 48.4.1. By Varieties, Lemma 28.13.2 we see that R (and also G) is the disjoint union of spectra of Artinian local rings finite over k via either s or t. Let $P = Spec(A) \subset R$ be the open and closed subscheme whose underlying point is the identity e of the groupoid scheme (U, R, s, t, c). As $s \circ e = t \circ e = \mathrm{id}_{Spec(k)}$ we see that A is an Artinian local ring whose residue field is identified with k via either $s^\sharp : k \to A$ or $t^\sharp : k \to A$. Note that $s, t : Spec(A) \to Spec(k)$ are finite (by the lemma referenced above). Since $G \to Spec(k)$ is unramified we see that

$$G \cap P = P \times_{U \times U} U = Spec(A \otimes_{k \otimes k} k)$$

is unramified over k. On the other hand $A \otimes_{k \otimes k} k$ is local as a quotient of A and surjects onto k. We conclude that $A \otimes_{k \otimes k} k = k$. It follows that $P \to U \times U$ is universally injective (as P has only one point with residue field k, unramified (by the computation of the fibre over the unique image point above), and of finite type (because s, t are) hence a monomorphism (see Étale Morphisms, Lemma 37.7.1). Thus $s|_P, t|_P : P \to U$ define a finite flat equivalence relation. Thus we may apply Groupoids, Proposition 35.19.8 to conclude that U/P exists and is a scheme $\overline{U}$. Moreover, $U \to \overline{U}$ is finite locally free and $P = U \times_{\overline{U}} U$. In fact $\overline{U} = Spec(k_0)$ where $k_0 \subset k$ is the ring of R-invariant functions. As k is a field it follows from the definition Groupoids, Equation (35.19.0.1) that k_0 is a field.

We claim that

$$Spec(k_0) = \overline{U} = U/P \to [U/R] = \mathcal{X} \tag{61.15.4.1}$$

is the desired surjective étale morphism. It follows from Properties of Stacks, Lemma 60.11.1 that this morphism is surjective. Thus it suffices to show that (61.15.4.1) is étale[6]. Instead of proving the étaleness directly we first apply Bootstrap, Lemma 54.9.1 to see that there exists a groupoid scheme $(\overline{U}, \overline{R}, \overline{s}, \overline{t}, \overline{c})$ such that (U, R, s, t, c) is the restriction of $(\overline{U}, \overline{R}, \overline{s}, \overline{t}, \overline{c})$ via the quotient morphism $U \to \overline{U}$. (We verified all the hypothesis of the lemma above except for the assertion that $j : R \to U \times U$ is separated and locally quasi-finite which follows from the fact that R is a separated scheme locally quasi-finite over k.) Since $U \to \overline{U}$ is finite locally free we see that $[U/R] \to [\overline{U}/\overline{R}]$ is an equivalence, see Groupoids in Spaces, Lemma 52.24.2.

Note that s, t are the base changes of the morphsms $\overline{s}, \overline{t}$ by $U \to \overline{U}$. As $\{U \to \overline{U}\}$ is an fppf covering we conclude $\overline{s}, \overline{t}$ are flat, locally of finite presentation, and locally quasi-finite, see Descent, Lemmas 31.19.13, 31.19.9, and 31.19.22. Consider the commutative diagram

$$\begin{tikzcd}
U \times_{\overline{U}} U \arrow[r, equal] \arrow[dr] & P \arrow[r] \arrow[d] & R \arrow[d] \\
 & \overline{U} \arrow[r, "\overline{e}"] & \overline{R}
\end{tikzcd}$$

[6] We urge the reader to find his/her own proof of this fact. In fact the argument has a lot in common with the final argument of the proof of Bootstrap, Theorem 54.10.1 hence probably should be isolated into its own lemma somewhere.

It is a general fact about restrictions that the outer four corners form a cartesian diagram. By the equality we see the inner square is cartesian. Since P is open in R we conclude that $\overline{e}$ is an open immersion by Descent, Lemma 31.19.14.

But of course, if $\overline{e}$ is an open immersion and $\overline{s}, \overline{t}$ are flat and locally of finite presentation then the morphisms $\overline{t}, \overline{s}$ are étale. For example you can see this by applying More on Groupoids, Lemma 36.4.1 which shows that $\Omega_{\overline{R}/\overline{U}} = 0$ implies that $\overline{s}, \overline{t} : \overline{R} \to \overline{U}$ is unramified (see Morphisms, Lemma 24.34.2), which in turn implies that $\overline{s}, \overline{t}$ are étale (see Morphisms, Lemma 24.35.16). Hence $\mathcal{Z} = [\overline{U}/\overline{R}]$ is an étale presentation of the algebraic stack $\mathcal{Z}$ and we conlude that $\overline{U} \to \mathcal{Z}$ is étale by Properties of Stacks, Lemma 60.3.3. $\square$

Lemma 61.15.5. *Let $\mathcal{X}$ be an algebraic stack. Consider a cartesian diagram*

$$\begin{tikzcd} U \arrow[d] & F \arrow[l, "p"'] \arrow[d] \\ \mathcal{X} & Spec(k) \arrow[l] \end{tikzcd}$$

where U is an algebraic space, k is a field, and $U \to \mathcal{X}$ is flat and locally of finite presentation. Let $z \in |F|$ be such that $F \to Spec(k)$ is unramified at z. Then, after replacing U by an open subspace containing $p(z)$, the morphism

$$U \longrightarrow \mathcal{X}$$

is étale.

Proof. Since $f : U \to \mathcal{X}$ is flat and locally of finite presentation there exists a maximal open $W(f) \subset U$ such that the restriction $f|_{W(f)} : W(f) \to \mathcal{X}$ is étale, see Properties of Stacks, Remark 60.9.19 (5). Hence all we need to do is prove that $p(z)$ is a point of $W(f)$. Moreover, the remark referenced above also shows the formation of $W(f)$ commutes with arbitrary base change by a morphism which is representable by algebraic spaces. Hence it suffices to show that the morphism $F \to Spec(k)$ is étale at z. Since it is flat and locally of finite presentation as a base change of $U \to \mathcal{X}$ and since $F \to Spec(k)$ is unramified at z by assumption, this follows from Morphisms of Spaces, Lemma 42.35.12. $\square$

A DM stack is a Deligne-Mumford stack.

Theorem 61.15.6. *Let $\mathcal{X}$ be an algebraic stack. The following are equivalent*

(1) *$\mathcal{X}$ is DM,*
(2) *$\mathcal{X}$ is Deligne-Mumford, and*
(3) *there exists a scheme W and a surjective étale morphism $W \to \mathcal{X}$.*

Proof. Recall that (3) is the definition of (2), see Algebraic Stacks, Definition 57.12.2. The implication (3) $\Rightarrow$ (1) is Lemma 61.4.14. Assume (1). Let $x \in |\mathcal{X}|$ be a finite type point. We will produce a scheme over $\mathcal{X}$ which ``works'' in a neighbourhood of x. At the end of the proof we will take the disjoint union of all of these to conclude.

By Lemma 61.14.7 the residual gerbe $\mathcal{Z}_x$ of $\mathcal{X}$ at x exists and $\mathcal{Z}_x \to \mathcal{X}$ is locally of finite type. By Lemma 61.4.16 the algebraic stack $\mathcal{Z}_x$ is DM. By Lemma 61.15.4 there exists a field k and a surjective étale morphism $z : Spec(k) \to \mathcal{Z}_x$. In particular the composition $x : Spec(k) \to \mathcal{X}$ is locally of finite type (by Morphisms of Spaces, Lemmas 42.22.2 and 42.35.9).

Pick a scheme U and a smooth morphism $U \to \mathcal{X}$ such that x is in the image of $|U| \to |\mathcal{X}|$. Consider the following fibre square

$$\begin{tikzcd} U \arrow[d] & F \arrow[l] \arrow[d] \\ \mathcal{X} & Spec(k) \arrow[l, "x"'] \end{tikzcd}$$

in other words $F = U \times_{\mathcal{X},x} Spec(k)$. By Properties of Stacks, Lemma 60.4.3 we see that F is nonempty. As $\mathcal{Z}_x \to \mathcal{X}$ is a monomorphism we have

$$Spec(k) \times_{z,\mathcal{Z}_x,z} Spec(k) = Spec(k) \times_{x,\mathcal{X},x} Spec(k)$$

with étale projection maps to $Spec(k)$ by construction of z. Since

$$F \times_U F = (Spec(k) \times_{\mathcal{X}} Spec(k)) \times_{Spec(k)} F$$

we see that the projections maps $F \times_U F \to F$ are étale as well. It follows that $\Delta_{F/U} : F \to F \times_U F$ is étale (see Morphisms of Spaces, Lemma 42.35.11). By Morphisms of Spaces, Lemma 42.40.2 this implies that $\Delta_{F/U}$ is an open immersion, which finally implies by Morphisms of Spaces, Lemma 42.34.9 that $F \to U$ is unramified.

Pick a nonempty affine scheme V and an étale morphism $V \to F$. (This could be avoided by working directly with F, but it seems easier to explain what's going on by doing so.) Picture

$$\begin{tikzcd} U \arrow[d] & F \arrow[l] \arrow[d] & V \arrow[l] \arrow[dl] \\ \mathcal{X} & Spec(k) \arrow[l, "x"'] & \end{tikzcd}$$

Then $V \to Spec(k)$ is a smooth morphism of schemes and $V \to U$ is an unramified morphism of schemes (see Morphisms of Spaces, Lemmas 42.33.2 and 42.34.3). Pick a closed point $v \in V$ with $k \subset \kappa(v)$ finite separable, see Varieties, Lemma 28.15.6. Let $u \in U$ be the image point. The local ring $\mathcal{O}_{V,v}$ is regular (see Varieties, Lemma 28.15.3) and the local ring homomorphism

$$\varphi : \mathcal{O}_{U,u} \longrightarrow \mathcal{O}_{V,v}$$

coming from the morphism $V \to U$ is such that $\varphi(\mathfrak{m}_u)\mathcal{O}_{V,v} = \mathfrak{m}_v$, see Morphisms, Lemma 24.34.14. Hence we can find $f_1, \ldots, f_d \in \mathcal{O}_{U,u}$ such that the images $\varphi(f_1), \ldots, \varphi(f_d)$ form a basis for $\mathfrak{m}_v/\mathfrak{m}_v^2$ over $\kappa(v)$. Since $\mathcal{O}_{V,v}$ is a regular local ring this implies that $\varphi(f_1), \ldots, \varphi(f_d)$ form a regular sequence in $\mathcal{O}_{V,v}$ (see Algebra, Lemma 7.98.3). After replacing U by an open neighbourhood of u we may assume $f_1, \ldots, f_d \in \Gamma(U, \mathcal{O}_U)$. After replacing U by a possibly even smaller open neighbourhood of u we may assume that $V(f_1, \ldots, f_d) \to \mathcal{X}$ is flat and locally of finite presentation, see Lemma 61.15.1. By construction

$$V(f_1, \ldots, f_d) \times_{\mathcal{X}} Spec(k) \longleftarrow V(f_1, \ldots, f_d) \times_{\mathcal{X}} V$$

is étale and $V(f_1, \ldots, f_d) \times_{\mathcal{X}} V$ is the closed subscheme $T \subset V$ cut out by $f_1|_V, \ldots, f_d|_V$. Hence by construction $v \in T$ and

$$\mathcal{O}_{T,v} = \mathcal{O}_{V,v}/(\varphi(f_1), \ldots, \varphi(f_d)) = \kappa(v)$$

a finite separable extension of k. It follows that $T \to Spec(k)$ is unramified at v, see Morphisms, Lemma 24.34.14. By definition of an unramified morphism of algebraic spaces this means that $V(f_1, \ldots, f_d) \times_{\mathcal{X}} Spec(k) \to Spec(k)$ is unramified at the image of v in

$V(f_1, \ldots, f_d) \times_{\mathcal{X}} Spec(k)$. Applying Lemma 61.15.5 we see that on shrinking U to yet another open neighbourhood of u the morphism $V(f_1, \ldots, f_d) \to \mathcal{X}$ is étale.

We conclude that for every finite type point x of $\mathcal{X}$ there exists an étale morphism $f_x : W_x \to \mathcal{X}$ with x in the image of $|f_x|$. Set $W = \coprod_x W_x$ and $f = \coprod f_x$. Then f is étale. In particular the image of $|f|$ is open, see Properties of Stacks, Lemma 60.4.7. By construction the image contains all finite type points of $\mathcal{X}$, hence f is surjective by Lemma 61.14.6 (and Properties of Stacks, Lemma 60.4.4). □

61.16. Quasi-finite morphisms

The property ``locally quasi-finite" of morphisms of algebraic spaces is not smooth local on the source-and-target so we cannot use the material in Section 61.12 to define locally quasi-finite morphisms of algebraic stacks. We do already know what it means for a morphism of algebraic stacks representable by algebraic spaces to be locally quasi-finite, see Properties of Stacks, Section 60.3. To find a condition suitable for general morphisms we make the following observation.

Lemma 61.16.1. *Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks. Assume f is representable by algebraic spaces. The following are equivalent*

(1) *f is locally quasi-finite, and*
(2) *f is locally of finite type and for every morphism $Spec(k) \to \mathcal{Y}$ where k is a field the space $|Spec(k) \times_{\mathcal{Y}} \mathcal{X}|$ is discrete.*

Proof. Assume (1). In this case the morphism of algebraic spaces $\mathcal{X}_k \to Spec(k)$ is locally quasi-finite as a base change of f. Hence $|\mathcal{X}_k|$ is discrete by Morphisms of Spaces, Lemma 42.25.4. Conversely, assume (2). Pick a surjective smooth morphism $V \to \mathcal{Y}$ where V is a scheme. It suffices to show that the morphism of algebraic spaces $V \times_{\mathcal{Y}} \mathcal{X} \to V$ is locally quasi-finite, see Properties of Stacks, Lemma 60.3.3. The morphism $V \times_{\mathcal{Y}} \mathcal{X} \to V$ is locally of finite type by assumption. For any morphism $Spec(k) \to V$ where k is a field

$$Spec(k) \times_V (V \times_{\mathcal{Y}} \mathcal{X}) = Spec(k) \times_{\mathcal{Y}} \mathcal{X}$$

has a discrete space of points by assumption. Hence we conclude that $V \times_{\mathcal{Y}} \mathcal{X} \to V$ is locally quasi-finite by Morphisms of Spaces, Lemma 42.25.4. □

A morphism of algebraic stacks which is representable by algebraic spaces is quasi-DM, see Lemma 61.4.3. Combined with the lemma above we see that the following definition does not conflict with all of the already existing notion in the case of morphisms representable by algebraic spaces.

Definition 61.16.2. Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks. We say f is *locally quasi-finite* if f is quasi-DM, locally of finite type, and for every morphism $Spec(k) \to \mathcal{Y}$ where k is a field the space $|\mathcal{X}_k|$ is discrete.

The condition that f be quasi-DM is natural. For example, let k be a field and consider the morphism $\pi : [Spec(k)/\mathbf{G}_m] \to Spec(k)$ which has singleton fibres and is locally of finite type. As we will see later this morphism is smooth of relative dimension -1, and we'd like our locally quasi-finite morphisms to have relative dimension 0. Also, note that the section $Spec(k) \to [Spec(k)/\mathbf{G}_m]$ does not have discrete fibres, hence is not locally quasi-finite, and we'd like to have the following permanence property for locally quasi-finite morphisms: If $f : \mathcal{X} \to \mathcal{X}'$ is a morphism of algebraic stacks locally quasi-finite over the algebraic stack $\mathcal{Y}$, then f is locally quasi-finite (in fact something a bit stronger holds, see Lemma 61.16.8).

Another justification for the definition above is Lemma 61.16.7 below which characterizes being locally quasi-finite in terms of the existence of suitable ``presentations'' or ``coverings'' of $\mathcal{X}$ and $\mathcal{Y}$.

Lemma 61.16.3. *A base change of a locally quasi-finite morphism is locally quasi-finite.*

Proof. We have seen this for quasi-DM morphisms in Lemma 61.4.4 and for locally finite type morphisms in Lemma 61.13.3. It is immediate that the condition on fibres is inherited by a base change. $\square$

Lemma 61.16.4. *Let $\mathcal{X} \to Spec(k)$ be a locally quasi-finite morphism where $\mathcal{X}$ is an algebraic stack and k is a field. Let $f : V \to \mathcal{X}$ be a locally quasi-finite morphism where V is a scheme. Then $V \to Spec(k)$ is locally quasi-finite.*

Proof. By Lemma 61.13.2 we see that $V \to Spec(k)$ is locally of finite type. Assume, to get a contradiction, that $V \to Spec(k)$ is not locally quasi-finite. Then there exists a nontrivial specialization $v \leadsto v'$ of points of V, see Morphisms, Lemma 24.19.6. In particular $\text{trdeg}_k(\kappa(v)) > \text{trdeg}_k(\kappa(v'))$, see Morphisms, Lemma 24.27.6. Because $|\mathcal{X}|$ is discrete we see that $|f|(v) = |f|(v')$. Consider $R = V \times_{\mathcal{X}} V$. Then R is an algebraic space and the projections $s, t : R \to V$ are locally quasi-finite as base changes of $V \to \mathcal{X}$ (which is representable by algebraic spaces so this follows from the discussion in Properties of Stacks, Section 60.3). By Properties of Stacks, Lemma 60.4.3 we see that there exists an $r \in |R|$ such that $s(r) = v$ and $t(r) = v'$. By Morphisms of Spaces, Lemma 42.30.3 we see that the transcendence degree of v/k is equal to the transcendence degree of r/k is equal to the transcendence degree of v'/k. This contradiction proves the lemma. $\square$

Lemma 61.16.5. *A composition of a locally quasi-finite morphisms is locally quasi-finite.*

Proof. We have seen this for quasi-DM morphisms in Lemma 61.4.10 and for locally finite type morphisms in Lemma 61.13.2. Let $\mathcal{X} \to \mathcal{Y}$ and $\mathcal{Y} \to \mathcal{Z}$ be locally quasi-finite. Let k be a field and let $Spec(k) \to \mathcal{Z}$ be a morphism. It suffices to show that $|\mathcal{X}_k|$ is discrete. By Lemma 61.16.3 the morphisms $\mathcal{X}_k \to \mathcal{Y}_k$ and $\mathcal{Y}_k \to Spec(k)$ are locally quasi-finite. In particular we see that $\mathcal{Y}_k$ is a quasi-DM algebraic stack, see Lemma 61.4.13. By Theorem 61.15.3 we can find a scheme V and a surjective, flat, locally finitely presented, locally quasi-finite morphism $V \to \mathcal{Y}_k$. By Lemma 61.16.4 we see that V is locally quasi-finite over k, in particular $|V|$ is discrete. The morphism $V \times_{\mathcal{Y}_k} \mathcal{X}_k \to \mathcal{X}_k$ is surjective, flat, and locally of finite presentation hence $|V \times_{\mathcal{Y}_k} \mathcal{X}_k| \to |\mathcal{X}_k|$ is surjective and open. Thus it suffices to show that $|V \times_{\mathcal{Y}_k} \mathcal{X}_k|$ is discrete. Note that V is a disjoint union of spectra of Artinian local k-algebras A_i with residue fields k_i, see Varieties, Lemma 28.13.2. Thus it suffices to show that each

$$|\, Spec(A_i) \times_{\mathcal{Y}_k} \mathcal{X}_k| = |\, Spec(k_i) \times_{\mathcal{Y}_k} \mathcal{X}_k| = |\, Spec(k_i) \times_{\mathcal{Y}} \mathcal{X}|$$

is discrete, which follows from the assumption that $\mathcal{X} \to \mathcal{Y}$ is locally quasi-finite. $\square$

Before we characterize locally quasi-finite morphisms in terms of coverings we do it for quasi-DM morphisms.

Lemma 61.16.6. *Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks. The following are equivalent*

(1) *f is quasi-DM,*
(2) *for any morphism $V \to \mathcal{Y}$ with V an algebraic space there exists a surjective, flat, locally finitely presented, locally quasi-finite morphism $U \to \mathcal{X} \times_{\mathcal{Y}} V$ where U is an algebraic space, and*

(3) *there exist algebraic spaces U, V and a morphism $V \to \mathcal{Y}$ which is surjective, flat, and locally of finite presentation, and a morphism $U \to \mathcal{X} \times_{\mathcal{Y}} V$ which is surjective, flat, locally of finite presentation, and locally quasi-finite.*

Proof. The implication (2) $\Rightarrow$ (3) is immediate.

Assume (1) and let $V \to \mathcal{Y}$ be as in (2). Then $\mathcal{X} \times_{\mathcal{Y}} V \to V$ is quasi-DM, see Lemma 61.4.4. By Lemma 61.4.3 the algebraic space V is DM, hence quasi-DM. Thus $\mathcal{X} \times_{\mathcal{Y}} V$ is quasi-DM by Lemma 61.4.11. Hence we may apply Theorem 61.15.3 to get the morphism $U \to \mathcal{X} \times_{\mathcal{Y}} V$ as in (2).

Assume (3). Let $V \to \mathcal{Y}$ and $U \to \mathcal{X} \times_{\mathcal{Y}} V$ be as in (3). To prove that f is quasi-DM it suffices to show that $\mathcal{X} \times_{\mathcal{Y}} V \to V$ is quasi-DM, see Lemma 61.4.5. By Lemma 61.4.14 we see that $\mathcal{X} \times_{\mathcal{Y}} V$ is quasi-DM. Hence $\mathcal{X} \times_{\mathcal{Y}} V \to V$ is quasi-DM by Lemma 61.4.13 and (1) holds. This finishes the proof of the lemma. $\square$

Lemma 61.16.7. *Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks. The following are equivalent*

(1) *f is locally quasi-finite,*
(2) *f is quasi-DM and for any morphism $V \to \mathcal{Y}$ with V an algebraic space and any locally quasi-finite morphism $U \to \mathcal{X} \times_{\mathcal{Y}} V$ where U is an algebraic space the morphism $U \to V$ is locally quasi-finite,*
(3) *for any morphism $V \to \mathcal{Y}$ from an algebraic space V there exists a surjective, flat, locally finitely presented, and locally quasi-finite morphism $U \to \mathcal{X} \times_{\mathcal{Y}} V$ where U is an algebraic space such that $U \to V$ is locally quasi-finite,*
(4) *there exists algebraic spaces U, V, a surjective, flat, and locally of finitely presented morphism $V \to \mathcal{Y}$, and a morphism $U \to \mathcal{X} \times_{\mathcal{Y}} V$ which is surjective, flat, locally of finite presentation, and locally quasi-finite such that $U \to V$ is locally quasi-finite.*

Proof. Assume (1). Then f is quasi-DM by assumption. Let $V \to \mathcal{Y}$ and $U \to \mathcal{X} \times_{\mathcal{Y}} V$ be as in (2). By Lemma 61.16.5 the composition $U \to \mathcal{X} \times_{\mathcal{Y}} V \to V$ is locally quasi-finite. Thus (1) implies (2).

Assume (2). Let $V \to \mathcal{Y}$ be as in (3). By Lemma 61.16.6 we can find an algebraic space U and a surjective, flat, locally finitely presented, locally quasi-finite morphism $U \to \mathcal{X} \times_{\mathcal{Y}} V$. By (2) the composition $U \to V$ is locally quasi-finite. Thus (2) implies (3).

It is immediate that (3) implies (4).

Assume (4). We will prove (1) holds, which finishes the proof. By Lemma 61.16.6 we see that f is quasi-DM. To prove that f is locally of finite type it suffices to prove that $g : \mathcal{X} \times_{\mathcal{Y}} V \to V$ is locally of finite type, see Lemma 61.13.6. Then it suffices to check that g precomposed with $h : U \to \mathcal{X} \times_{\mathcal{Y}} V$ is locally of finite type, see Lemma 61.13.7. Since $g \circ h : U \to V$ was assumed to be locally quasi-finite this holds, hence f is locally of finite type. Finally, let k be a field and let $Spec(k) \to \mathcal{Y}$ be a morphism. Then $V \times_{\mathcal{Y}} Spec(k)$ is a nonempty algebraic space which is locally of finite presentation over k. Hence we can find a finite extension $k \subset k'$ and a morphism $Spec(k') \to V$ such that

$$\begin{tikzcd} Spec(k') \arrow[r] \arrow[d] & V \arrow[d] \\ Spec(k) \arrow[r] & \mathcal{Y} \end{tikzcd}$$

commutes (details omitted). Then $\mathcal{X}_{k'} \to \mathcal{X}_k$ is representable (by schemes), surjective, and finite locally free. In particular $|\mathcal{X}_{k'}| \to |\mathcal{X}_k|$ is surjective and open. Thus it suffices to prove that $|\mathcal{X}_{k'}|$ is discrete. Since

$$U \times_V Spec(k') = U \times_{\mathcal{X} \times_{\mathcal{Y}} V} \mathcal{X}_{k'}$$

we see that $U \times_V Spec(k') \to \mathcal{X}_{k'}$ is surjective, flat, and locally of finite presentation (as a base change of $U \to \mathcal{X} \times_{\mathcal{Y}} V$). Hence $|U \times_V Spec(k')| \to |\mathcal{X}_{k'}|$ is surjective and open. Thus it suffices to show that $|U \times_V Spec(k')|$ is discrete. This follows from the fact that $U \to V$ is locally quasi-finite (either by our definition above or from the original definition for morphisms of algebraic spaces, via Morphisms of Spaces, Lemma 42.25.4). □

Lemma 61.16.8. *Let $\mathcal{X} \to \mathcal{Y} \to \mathcal{Z}$ be morphisms of algebraic stacks. Assume that $\mathcal{X} \to \mathcal{Z}$ is locally quasi-finite and $\mathcal{Y} \to \mathcal{Z}$ is quasi-DM. Then $\mathcal{X} \to \mathcal{Y}$ is locally quasi-finite.*

Proof. Write $\mathcal{X} \to \mathcal{Y}$ as the composition

$$\mathcal{X} \longrightarrow \mathcal{X} \times_{\mathcal{Z}} \mathcal{Y} \longrightarrow \mathcal{Y}$$

The second arrow is locally quasi-finite as a base change of $\mathcal{X} \to \mathcal{Z}$, see Lemma 61.16.3. The first arrow is locally quasi-finite by Lemma 61.4.8 as $\mathcal{Y} \to \mathcal{Z}$ is quasi-DM. Hence $\mathcal{X} \to \mathcal{Y}$ is locally quasi-finite by Lemma 61.16.5. □

61.17. Flat morphisms

The property ``being flat'' of morphisms of algebraic spaces is smooth local on the source-and-target, see Descent on Spaces, Remark 45.18.5. It is also stable under base change and fpqc local on the target, see Morphisms of Spaces, Lemma 42.27.3 and Descent on Spaces, Lemma 45.10.11. Hence, by Lemma 61.12.1 above, we may define what it means for a morphism of algebraic spaces to be flat as follows and it agrees with the already existing notion defined in Properties of Stacks, Section 60.3 when the morphism is representable by algebraic spaces.

Definition 61.17.1. Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks. We say f is *flat* if the equivalent conditions of Lemma 61.12.1 hold with $\mathcal{P}=$ flat.

Lemma 61.17.2. *The composition of flat morphisms is flat.*

Proof. Combine Remark 61.12.3 with Morphisms of Spaces, Lemma 42.27.2. □

Lemma 61.17.3. *A base change of a flat morphism is flat.*

Proof. Combine Remark 61.12.4 with Morphisms of Spaces, Lemma 42.27.3. □

Lemma 61.17.4. *Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks. Let $\mathcal{Z} \to \mathcal{Y}$ be a surjective flat morphism of algebraic stacks. If the base change $\mathcal{Z} \times_{\mathcal{Y}} \mathcal{X} \to \mathcal{Z}$ is flat, then f is flat.*

Proof. Choose an algebraic space W and a surjective smooth morphism $W \to \mathcal{Z}$. Then $W \to \mathcal{Z}$ is surjective and flat (Morphisms of Spaces, Lemma 42.33.7) hence $W \to \mathcal{Y}$ is surjective and flat (by Properties of Stacks, Lemma 60.5.2 and Lemma 61.17.2). Since the base change of $\mathcal{Z} \times_{\mathcal{Y}} \mathcal{X} \to \mathcal{Z}$ by $W \to \mathcal{Z}$ is a flat morphism (Lemma 61.17.3) we may replace $\mathcal{Z}$ by W.

Choose an algebraic space V and a surjective smooth morphism $V \to \mathcal{Y}$. Choose an algebraic space U and a surjective smooth morphism $U \to V \times_{\mathcal{Y}} \mathcal{X}$. We have to show that $U \to V$ is flat. Now we base change everything by $W \to \mathcal{Y}$: Set $U' = W \times_{\mathcal{Y}} U$, $V' = W \times_{\mathcal{Y}} V$,

$\mathcal{X}' = W \times_{\mathcal{Y}} \mathcal{X}$, and $\mathcal{Y}' = W \times_{\mathcal{Y}} \mathcal{Y} = W$. Then it is still true that $U' \to V' \times_{\mathcal{Y}'} \mathcal{X}'$ is smooth by base change. Hence by our definition of flat morphisms of algebraic stacks and the assumption that $\mathcal{X}' \to \mathcal{Y}'$ is flat, we see that $U' \to V'$ is flat. Then, since $V' \to V$ is surjective as a base change of $W \to \mathcal{Y}$ we see that $U \to V$ is flat by Morphisms of Spaces, Lemma 42.28.3 (2) and we win. □

Lemma 61.17.5. *Let $\mathcal{X} \to \mathcal{Y} \to \mathcal{Z}$ be morphisms of algebraic stacks. If $\mathcal{X} \to \mathcal{Z}$ is flat and $\mathcal{X} \to \mathcal{Y}$ is surjective and flat, then $\mathcal{Y} \to \mathcal{Z}$ is flat.*

Proof. Choose an algebraic space W and a surjective smooth morphism $W \to \mathcal{Z}$. Choose an algebraic space V and a surjective smooth morphism $V \to W \times_{\mathcal{Z}} \mathcal{Y}$. Choose an algebraic space U and a surjective smooth morphism $U \to V \times_{\mathcal{Y}} \mathcal{X}$. We know that $U \to V$ is flat and that $U \to W$ is flat. Also, as $\mathcal{X} \to \mathcal{Y}$ is surjective we see that $U \to V$ is surjective (as a composition of surjective morphisms). Hence the lemma reduces to the case of morphisms of algebraic spaces. The case of morphisms of algebraic spaces is Morphisms of Spaces, Lemma 42.28.5. □

61.18. Morphisms of finite presentation

The property ``locally of finite presentation'' of morphisms of algebraic spaces is smooth local on the source-and-target, see Descent on Spaces, Remark 45.18.5. It is also stable under base change and fpqc local on the target, see Morphisms of Spaces, Lemma 42.26.3 and Descent on Spaces, Lemma 45.10.8. Hence, by Lemma 61.12.1 above, we may define what it means for a morphism of algebraic spaces to be locally of finite presentation as follows and it agrees with the already existing notion defined in Properties of Stacks, Section 60.3 when the morphism is representable by algebraic spaces.

Definition 61.18.1. Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks.

(1) We say f *locally of finite presentation* if the equivalent conditions of Lemma 61.12.1 hold with $\mathcal{P}$= locally of finite presentation.
(2) We say f is *of finite presentation* if it is locally of finite presentation, quasi-compact, and quasi-separated.

Note that a morphism of finite presentation is **not** just a quasi-compact morphism which is locally of finite presentation.

Lemma 61.18.2. *The composition of finitely presented morphisms is of finite presentation. The same holds for morphisms which are locally of finite presentation.*

Proof. Combine Remark 61.12.3 with Morphisms of Spaces, Lemma 42.26.2. □

Lemma 61.18.3. *A base change of a finitely presented morphism is of finite presentation. The same holds for morphisms which are locally of finite presentation.*

Proof. Combine Remark 61.12.4 with Morphisms of Spaces, Lemma 42.26.3. □

Lemma 61.18.4. *A morphism which is locally of finite presentation is locally of finite type. A morphism of finite presentation is of finite type.*

Proof. Combine Remark 61.12.5 with Morphisms of Spaces, Lemma 42.26.5. □

Lemma 61.18.5. *Let $f : \mathcal{X} \to \mathcal{Y}$ and $g : \mathcal{Y} \to \mathcal{Z}$ be morphisms of algebraic stacks If $g \circ f$ is locally of finite presentation and g is locally of finite type, then f is locally of finite presentation.*

Proof. Choose an algebraic space W and a surjective smooth morphism $W \to \mathcal{Z}$. Choose an algebraic space V and a surjective smooth morphism $V \to \mathcal{Y} \times_{\mathcal{Z}} W$. Choose an algebraic space U and a surjective smooth morphism $U \to \mathcal{X} \times_{\mathcal{Y}} V$. The lemma follows upon applying Morphisms of Spaces, Lemma 42.26.9 to the morphisms $U \to V \to W$. □

Lemma 61.18.6. *An open immersion is locally of finite presentation.*

Proof. Follows from Morphisms of Spaces, Lemma 42.26.10. □

Lemma 61.18.7. *Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks. Let $\mathcal{Z} \to \mathcal{Y}$ be a surjective, flat, locally finitely presented morphism of algebraic stacks. If the base change $\mathcal{Z} \times_{\mathcal{Y}} \mathcal{X} \to \mathcal{Z}$ is locally of finite presentation, then f is locally of finite presentation.*

Proof. Choose an algebraic space W and a surjective smooth morphism $W \to \mathcal{Z}$. Then $W \to \mathcal{Z}$ is surjective, flat, and locally of finite presentation (Morphisms of Spaces, Lemmas 42.33.7 and 42.33.5) hence $W \to \mathcal{Y}$ is surjective, flat, and locally of finite presentation (by Properties of Stacks, Lemma 60.5.2 and Lemmas 61.17.2 and 61.18.2). Since the base change of $\mathcal{Z} \times_{\mathcal{Y}} \mathcal{X} \to \mathcal{Z}$ by $W \to \mathcal{Z}$ is locally of finite presentation (Lemma 61.17.3) we may replace $\mathcal{Z}$ by W.

Choose an algebraic space V and a surjective smooth morphism $V \to \mathcal{Y}$. Choose an algebraic space U and a surjective smooth morphism $U \to V \times_{\mathcal{Y}} \mathcal{X}$. We have to show that $U \to V$ is locally of finite presentation. Now we base change everything by $W \to \mathcal{Y}$: Set $U' = W \times_{\mathcal{Y}} U$, $V' = W \times_{\mathcal{Y}} V$, $\mathcal{X}' = W \times_{\mathcal{Y}} \mathcal{X}$, and $\mathcal{Y}' = W \times_{\mathcal{Y}} \mathcal{Y} = W$. Then it is still true that $U' \to V' \times_{\mathcal{Y}'} \mathcal{X}'$ is smooth by base change. Hence by our definition of locally finitely presented morphisms of algebraic stacks and the assumption that $\mathcal{X}' \to \mathcal{Y}'$ is locally of finite presentation, we see that $U' \to V'$ is locally of finite presentation. Then, since $V' \to V$ is surjective, flat, and locally of finite presentation as a base change of $W \to \mathcal{Y}$ we see that $U \to V$ is locally of finite presentation by Descent on Spaces, Lemma 45.10.8 and we win. □

Lemma 61.18.8. *Let $\mathcal{X} \to \mathcal{Y} \to \mathcal{Z}$ be morphisms of algebraic stacks. If $\mathcal{X} \to \mathcal{Z}$ is locally of finite presentation and $\mathcal{X} \to \mathcal{Y}$ is surjective, flat, and locally of finite presentation, then $\mathcal{Y} \to \mathcal{Z}$ is locally of finite presentation.*

Proof. Choose an algebraic space W and a surjective smooth morphism $W \to \mathcal{Z}$. Choose an algebraic space V and a surjective smooth morphism $V \to W \times_{\mathcal{Z}} \mathcal{Y}$. Choose an algebraic space U and a surjective smooth morphism $U \to V \times_{\mathcal{Y}} \mathcal{X}$. We know that $U \to V$ is flat and locally of finite presentation and that $U \to W$ is locally of finite presentation. Also, as $\mathcal{X} \to \mathcal{Y}$ is surjective we see that $U \to V$ is surjective (as a composition of surjective morphisms). Hence the lemma reduces to the case of morphisms of algebraic spaces. The case of morphisms of algebraic spaces is Descent on Spaces, Lemma 45.14.1. □

Lemma 61.18.9. *Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks which is surjective, flat, and locally of finite presentation. Then for every scheme U and object y of $\mathcal{Y}$ over U there exists an fppf covering $\{U_i \to U\}$ and objects x_i of $\mathcal{X}$ over U_i such that $f(x_i) \cong y|_{U_i}$ in $\mathcal{Y}_{U_i}$.*

Proof. We may think of y as a morphism $U \to \mathcal{Y}$. By Properties of Stacks, Lemma 60.5.3 and Lemmas 61.18.3 and 61.17.3 we see that $\mathcal{X} \times_{\mathcal{Y}} U \to U$ is surjective, flat, and locally of finite presentation. Let V be a scheme and let $V \to \mathcal{X} \times_{\mathcal{Y}} U$ smooth and surjective. Then $V \to \mathcal{X} \times_{\mathcal{Y}} U$ is also surjective, flat, and locally of finite presentation (see Morphisms of Spaces, Lemmas 42.33.7 and 42.33.5). Hence also $V \to U$ is surjective, flat, and locally of finite presentation, see Properties of Stacks, Lemma 60.5.2 and Lemmas 61.18.2, and 61.17.2. Hence $\{V \to U\}$ is the desired fppf covering and $x : V \to \mathcal{X}$ is the desired object. $\square$

Lemma 61.18.10. *Let $f_j : \mathcal{X}_j \to \mathcal{X}$, $j \in J$ be a family of morphisms of algebraic stacks which are each flat and locally of finite presentation and which are jointly surjective, i.e., $|\mathcal{X}| = \bigcup |\mathcal{X}_i|$. Then for every scheme U and object x of $\mathcal{X}$ over U there exists an fppf covering $\{U_i \to U\}_{i\in I}$, a map $a : I \to J$, and objects x_i of $\mathcal{X}_{a(i)}$ over U_i such that $f_{a(i)}(x_i) \cong y|_{U_i}$ in $\mathcal{X}_{U_i}$.*

Proof. Apply Lemma 61.18.9 to the morphism $\coprod_{j\in J} \mathcal{X}_j \to \mathcal{X}$. (There is a slight set theoretic issue here -- due to our setup of things -- which we ignore.) To finish, note that a morphism $x_i : U_i \to \coprod_{j\in J} \mathcal{X}_j$ is given by a disjoint union decomposition $U_i = \coprod U_{i,j}$ and morphisms $U_{i,j} \to \mathcal{X}_j$. Then the fppf covering $\{U_{i,j} \to U\}$ and the morphisms $U_{i,j} \to \mathcal{X}_j$ do the job. $\square$

Lemma 61.18.11. *Let $f : \mathcal{X} \to \mathcal{Y}$ be flat and locally of finite presentation. Then $|f| : |\mathcal{X}| \to |\mathcal{Y}|$ is open.*

Proof. Choose a scheme V and a smooth surjective morphism $V \to \mathcal{Y}$. Choose a scheme U and a smooth surjective morphism $U \to V \times_{\mathcal{Y}} \mathcal{X}$. By assumption the morphism of schemes $U \to V$ is flat and locally of finite presentation. Hence $U \to V$ is open by Morphisms, Lemma 24.24.9. By construction of the topology on $|\mathcal{Y}|$ the map $|V| \to |\mathcal{Y}|$ is open. The map $|U| \to |\mathcal{X}|$ is surjective. The result follows from these facts by elementary topology. $\square$

61.19. Gerbes

An important type of algebraic stack are the stacks of the form $[B/G]$ where B is an algebraic space and G is a flat and locally finitely presented group algebraic space over B (acting trivially on B), see Criteria for Representability, Lemma 59.18.3. It turns out that an algebraic stack is a gerbe when it locally in the fppf topology is of this form, see Lemma 61.19.8. In this section we briefly discuss this notion and the corresponding relative notion.

Definition 61.19.1. Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks. We say $\mathcal{X}$ is a *gerbe over $\mathcal{Y}$* if $\mathcal{X}$ is a gerbe over $\mathcal{Y}$ as stacks in groupoids over $(Sch/S)_{fppf}$, see Stacks, Definition 50.11.4. We say an algebraic stack $\mathcal{X}$ is a *gerbe* if there exists a morphism $\mathcal{X} \to X$ where X is an algebraic space which turns $\mathcal{X}$ into a gerbe over X.

The condition that $\mathcal{X}$ be a gerbe over $\mathcal{Y}$ is defined purely in terms of the topology and category theory underlying the given algebraic stacks; but as we will see later this condition has geometric consequences. For example it implies that $\mathcal{X} \to \mathcal{Y}$ is surjective, flat, and locally of finite presentation, see Lemma 61.19.7. The absolute notion is trickier to parse, because it may not be at first clear that X is well determined. Actually, it is.

Lemma 61.19.2. *Let $\mathcal{X}$ be an algebraic stack. If $\mathcal{X}$ is a gerbe, then the sheafification of the presheaf*

$$(Sch/S)_{fppf}^{opp} \to Sets, \quad U \mapsto Ob(\mathcal{X}_U)/\cong$$

is an algebraic space and $\mathcal{X}$ is a gerbe over it.

Proof. (In this proof the abuse of language introduced in Section 61.2 really pays off.) Choose a morphism $\pi : \mathcal{X} \to X$ where X is an algebraic space which turns $\mathcal{X}$ into a gerbe over X. It suffices to prove that X is the sheafification of the presheaf $\mathcal{F}$ displayed in the lemma. It is clear that there is a map $c : \mathcal{F} \to X$. We will use Stacks, Lemma 50.11.3 properties (2)(a) and (2)(b) to see that the map $c^\# : \mathcal{F}^\# \to X$ is surjective and injective, hence an isomorphism, see Sites, Lemma 9.11.2. Surjective: Let T be a scheme and let $f : T \to X$. By property (2)(a) there exists an fppf covering $\{h_i : T_i \to T\}$ and morphisms $x_i : T_i \to \mathcal{X}$ such that $f \circ h_i$ corresponds to $\pi \circ x_i$. Hence we see that $f|_{T_i}$ is in the image of c. Injective: Let T be a scheme and let $x, y : T \to \mathcal{X}$ be morphisms such that $c \circ x = c \circ y$. By (2)(b) we can find a covering $\{T_i \to T\}$ and morphisms $x|_{T_i} \to y|_{T_i}$ in the fibre category $\mathcal{X}_{T_i}$. Hence the restrictions $x|_{T_i}, y|_{T_i}$ are equal in $\mathcal{F}(T_i)$. This proves that x, y give the same section of $\mathcal{F}^\#$ over T as desired. □

Lemma 61.19.3. *Let*

$$\begin{tikzcd} \mathcal{X}' \arrow[r] \arrow[d] & \mathcal{X} \arrow[d] \\ \mathcal{Y}' \arrow[r] & \mathcal{Y} \end{tikzcd}$$

be a fibre product of algebraic stacks. If $\mathcal{X}$ is a gerbe over $\mathcal{Y}$, then $\mathcal{X}'$ is a gerbe over $\mathcal{Y}'$.

Proof. Immediate from the definitions and Stacks, Lemma 50.11.5. □

Lemma 61.19.4. *Let $\mathcal{X} \to \mathcal{Y}$ and $\mathcal{Y} \to \mathcal{Z}$ be morphisms of algebraic stacks. If $\mathcal{X}$ is a gerbe over $\mathcal{Y}$ and $\mathcal{Y}$ is a gerbe over $\mathcal{Z}$, then $\mathcal{X}$ is a gerbe over $\mathcal{Z}$.*

Proof. Immediate from Stacks, Lemma 50.11.6. □

Lemma 61.19.5. *Let*

$$\begin{tikzcd} \mathcal{X}' \arrow[r] \arrow[d] & \mathcal{X} \arrow[d] \\ \mathcal{Y}' \arrow[r] & \mathcal{Y} \end{tikzcd}$$

be a fibre product of algebraic stacks. If $\mathcal{Y}' \to \mathcal{Y}$ is surjective, flat, and locally of finite presentation and $\mathcal{X}'$ is a gerbe over $\mathcal{Y}'$, then $\mathcal{X}$ is a gerbe over $\mathcal{Y}$.

Proof. Follows immediately from Lemma 61.18.9 and Stacks, Lemma 50.11.7. □

Lemma 61.19.6. *Let $\pi : \mathcal{X} \to U$ be a morphism from an algebraic stack to an algebraic space and let $x : U \to \mathcal{X}$ be a section of π. Set $G = Isom_{\mathcal{X}}(x, x)$, see Definition 61.5.3. If $\mathcal{X}$ is a gerbe over U, then*

(1) *there is a canonical equivalence of stacks in groupoids*

$$x_{can} : [U/G] \longrightarrow \mathcal{X}.$$

where $[U/G]$ is the quotient stack for the trivial action of G on U,

(2) *$G \to U$ is flat and locally of finite presentation, and*

(3) *$U \to \mathcal{X}$ is surjective, flat, and locally of finite presentation.*

Proof. Set $R = U \times_{x,\mathcal{X},x} U$. The morphism $R \to U \times U$ factors through the diagonal $\Delta_U : U \to U \times U$ as it factors through $U \times_U U = U$. Hence $R = G$ because

$$
\begin{aligned}
G &= Isom_{\mathcal{X}}(x, x) \\
&= U \times_{x,\mathcal{X}} \mathcal{I}_{\mathcal{X}} \\
&= U \times_{x,\mathcal{X}} (\mathcal{X} \times_{\Delta,\mathcal{X}\times_S\mathcal{X},\Delta} \mathcal{X}) \\
&= (U \times_{x,\mathcal{X},x} U) \times_{U\times U,\Delta_U} U \\
&= R \times_{U\times U,\Delta_U} U \\
&= R
\end{aligned}
$$

for the fourth equality use Categories, Lemma 4.28.12. Let $t, s : R \to U$ be the projections. The composition law $c : R \times_{s,U,t} R \to R$ constructed on R in Algebraic Stacks, Lemma 57.16.1 agrees with the group law on G (proof omitted). Thus Algebraic Stacks, Lemma 57.16.1 shows we obtain a canonical fully faithful 1-morphism

$$x_{can} : [U/G] \longrightarrow \mathcal{X}$$

of stacks in groupoids over $(Sch/S)_{fppf}$. To see that it is an equivalence it suffices to show that it is essentially surjective. To do this it suffices to show that any object of $\mathcal{X}$ over a scheme T comes fppf locally from x via a morphism $T \to U$, see Stacks, Lemma 50.4.8. However, this follows the condition that π turns $\mathcal{X}$ into a gerbe over X, see property (2)(a) of Stacks, Lemma 50.11.3.

By Criteria for Representability, Lemma 59.18.3 we conclude that $G \to U$ is flat and locally of finite presentation. Finally, $U \to \mathcal{X}$ is surjective, flat, and locally of finite presentation by Criteria for Representability, Lemma 59.17.1. □

Lemma 61.19.7. *Let $\pi : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks. The following are equivalent*

(1) *$\mathcal{X}$ is a gerbe over $\mathcal{Y}$, and*
(2) *there exists an algebraic space U, a group algebraic space G flat and locally of finite presentation over U, and a surjective, flat, and locally finitely presented morphism $U \to \mathcal{Y}$ such that $\mathcal{X} \times_{\mathcal{Y}} U \cong [U/G]$ over U.*

Proof. Assume (2). By Lemma 61.19.5 to prove (1) it suffices to show that $[U/G]$ is a gerbe over U. This is immediate from Groupoids in Spaces, Lemma 52.26.2.

Assume (1). Any base change of π is a gerbe, see Lemma 61.19.3. As a first step we choose a scheme V and a surjective smooth morphism $V \to \mathcal{Y}$. Thus we may assume that $\pi : \mathcal{X} \to V$ is a gerbe over a scheme. This means that there exists an fppf covering $\{V_i \to V\}$ such that the fibre category $\mathcal{X}_{V_i}$ is nonempty, see Stacks, Lemma 50.11.3 (2)(a). Note that $U = \coprod V_i \to U$ is surjective, flat, and locally of finite presentation. Hence we may replace V by U and assume that $\pi : \mathcal{X} \to U$ is a gerbe over a scheme U and that there exists an object x of $\mathcal{X}$ over U. By Lemma 61.19.6 we see that $\mathcal{X} = [U/G]$ over U for some flat and locally finitely presented group algebraic space G over U. □

Lemma 61.19.8. *Let $\pi : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks. If $\mathcal{X}$ is a gerbe over $\mathcal{Y}$, then π is surjective, flat, and locally of finite presentation.*

Proof. By Properties of Stacks, Lemma 60.5.4 and Lemmas 61.17.4 and 61.18.7 it suffices to prove to the lemma after replacing π by a base change with a surjective, flat, locally finitely presented morphism $\mathcal{Y}' \to \mathcal{Y}$. By Lemma 61.19.7 we may assume $\mathcal{Y} = U$ is an algebraic space and $\mathcal{X} = [U/G]$ over U. Then $U \to [U/G]$ is surjective, flat, and locally of finite presentation, see Lemma 61.19.6. This implies that π is surjective, flat, and locally of finite presentation by Properties of Stacks, Lemma 60.5.5 and Lemmas 61.17.5 and 61.18.8. ☐

Proposition 61.19.9. *Let $\mathcal{X}$ be an algebraic stack. The following are equivalent*

(1) *$\mathcal{X}$ is a gerbe, and*
(2) *$\mathcal{I}_\mathcal{X} \to \mathcal{X}$ is flat and locally of finite presentation.*

Proof. Assume (1). Choose a morphism $\mathcal{X} \to X$ into an algebraic space X which turns $\mathcal{X}$ into a gerbe over X. Let $X' \to X$ is a surjective, flat, locally finitely presented morphism and set $\mathcal{X}' = X' \times_X \mathcal{X}$. Note that $\mathcal{X}'$ is a gerbe over X' by Lemma 61.19.3. Then both squares in

$$\begin{tikzcd} \mathcal{I}_{\mathcal{X}'} \arrow[r] \arrow[d] & \mathcal{X}' \arrow[r] \arrow[d] & X' \arrow[d] \\ \mathcal{I}_\mathcal{X} \arrow[r] & \mathcal{X} \arrow[r] & X \end{tikzcd}$$

are fibre product squares, see Lemma 61.5.4. Hence to prove $\mathcal{I}_\mathcal{X} \to \mathcal{X}$ is flat and locally of finite presentation it suffices to do so after such a base change by Lemmas 61.17.4 and 61.18.7. Thus we can apply Lemma 61.19.7 to assume that $\mathcal{X} = [U/G]$. By Lemma 61.19.6 we see G is flat and locally of finite presentation over U and that $x : U \to [U/G]$ is surjective, flat, and locally of finite presentation. Moreover, the pullback of $\mathcal{I}_\mathcal{X}$ by x is G and we conclude that (2) holds by descent again, i.e., by Lemmas 61.17.4 and 61.18.7.

Conversely, assume (2). Choose a smooth presentation $\mathcal{X} = [U/R]$, see Algebraic Stacks, Section 57.16. Denote $G \to U$ the stabilizer group algebraic space of the groupoid (U, R, s, t, c, e, i), see Groupoids in Spaces, Definition 52.15.2. By Lemma 61.5.6 we see that $G \to U$ is flat and locally of finite presentation as a base change of $\mathcal{I}_\mathcal{X} \to \mathcal{X}$, see Lemmas 61.17.3 and 61.18.3. Consider the following action

$$a : G \times_{U,t} R \to R, \quad (g, r) \mapsto c(g, r)$$

of G on R. This action is free on T-valued points for any scheme T as R is a groupoid. Hence $R' = R/G$ is an algebraic space and the quotient morphism $\pi : R \to R'$ is surjective, flat, and locally of finite presentation by Bootstrap, Lemma 54.11.5. The projections $s, t : R \to U$ are G-invariant, hence we obtain morphisms $s', t' : R' \to U$ such that $s = s' \circ \pi$ and $t = t' \circ \pi$. Since $s, t : R \to U$ are flat and locally of finite presentation we conclude that s', t' are flat and locally of finite presentation, see Morphisms of Spaces, Lemmas 42.28.5 and Descent on Spaces, Lemma 45.14.1. Consider the morphism

$$j' = (t', s') : R' \longrightarrow U \times U.$$

We claim this is a monomorphism. Namely, suppose that T is a scheme and that $a, b : T \to R'$ are morphisms which have the same image in $U \times U$. By definition of the quotient $R' = R/G$ there exists an fppf covering $\{h_j : T_j \to T\}$ such that $a \circ h_j = \pi \circ a_j$ and $b \circ h_j = \pi \circ b_j$ for some morphisms $a_j, b_j : T_j \to R$. Since a_j, b_j have the same image in $U \times U$ we see that $g_j = c(a_j, i(b_j))$ is a T_j-valued point of G such that $c(g_j, b_j) = a_j$. In other words, a_j and b_j have the same image in R' and the claim is proved. Since $j : R \to U \times U$ is a pre-equivalence relation (see Groupoids in Spaces, Lemma 52.11.2) and $R \to R'$ is surjective (as a map of sheaves) we see that $j' : R' \to U \times U$ is an equivalence relation. Hence Bootstrap, Theorem 54.10.1 shows that $X = U/R'$ is an algebraic space. Finally, we claim that the morphism

$$\mathcal{X} = [U/R] \longrightarrow X = U/R'$$

turns $\mathcal{X}$ into a gerbe over X. This follows from Groupoids in Spaces, Lemma 52.26.1 as $R \to R'$ is surjective, flat, and locally of finite presentation (if needed use Bootstrap, Lemma 54.4.5 to see this implies the required hypothesis). $\square$

At this point we have developed enough machinery to prove that residual gerbes (when they exist) are gerbes.

Lemma 61.19.10. *Let $\mathcal{Z}$ be a reduced, locally Noetherian algebraic stack such that $|\mathcal{Z}|$ is a singleton. Then $\mathcal{Z}$ is a gerbe over a reduced, locally Noetherian algebraic space Z with $|Z|$ a singleton.*

Proof. By Properties of Stacks, Lemma 60.11.3 there exists a surjective, flat, locally finitely presented morphism $Spec(k) \to \mathcal{Z}$ where k is a field. Then $\mathcal{I}_Z \times_{\mathcal{Z}} Spec(k) \to Spec(k)$ is representable by algebraic spaces and locally of finite type (as a base change of $\mathcal{I}_{\mathcal{Z}} \to \mathcal{Z}$, see Lemmas 61.5.1 and 61.13.3). Therefore it is locally of finite presentation, see Morphisms of Spaces, Lemma 42.26.7. Of course it is also flat as k is a field. Hence we may apply Lemmas 61.17.4 and 61.18.7 to see that $\mathcal{I}_{\mathcal{Z}} \to \mathcal{Z}$ is flat and locally of finite presentation. We conclude that $\mathcal{Z}$ is a gerbe by Proposition 61.19.9. Let $\pi : \mathcal{Z} \to Z$ be a morphism to an algebraic space such that $\mathcal{Z}$ is a gerbe over Z. Then π is surjective, flat, and locally of finite presentation by Lemma 61.19.8. Hence $Spec(k) \to Z$ is surjective, flat, and locally of finite presentation as a composition, see Properties of Stacks, Lemma 60.5.2 and Lemmas 61.17.2 and 61.18.2. Hence by Properties of Stacks, Lemma 60.11.3 we see that $|Z|$ is a singleton and that Z is locally Noetherian and reduced. $\square$

Lemma 61.19.11. *Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks. If $\mathcal{X}$ is a gerbe over $\mathcal{Y}$ then the map $|\mathcal{X}| \to |\mathcal{Y}|$ is a homeomorphism of topological spaces.*

Proof. Let k be a field and let y be an object of $\mathcal{Y}$ over $Spec(k)$. By Stacks, Lemma 50.11.3 property (2)(a) there exists an fppf covering $\{T_i \to Spec(k)\}$ and objects x_i of $\mathcal{X}$ over T_i with $f(x_i) \cong y|_{T_i}$. Choose an i such that $T_i \neq \emptyset$. Choose a morphism $Spec(K) \to T_i$ for some field K. Then $k \subset K$ and $x_i|_K$ is an object of $\mathcal{X}$ lying over $y|_K$. Thus we see that $|\mathcal{Y}| \to |\mathcal{X}|$. is surjective. The map $|\mathcal{Y}| \to |\mathcal{X}|$ is also injective. Namely, if x, x' are objects of $\mathcal{X}$ over $Spec(k)$ whose images $f(x), f(x')$ become isomorphic (over an extension) in $\mathcal{Y}$, then Stacks, Lemma 50.11.3 property (2)(b) garantees the existence of an extension of k over which x and x' become isomorphic (details omitted). Hence $|\mathcal{X}| \to |\mathcal{Y}|$ is continuous and bijective and it suffices to show that it is also open. This follows from Lemmas 61.19.8 and 61.18.11. $\square$

The following lemma tells us that residual gerbes exist for all points on any algebraic stack which is a gerbe.

Lemma 61.19.12. *Let $\mathcal{X}$ be an algebraic stack. If $\mathcal{X}$ is a gerbe then for every $x \in |\mathcal{X}|$ the residual gerbe of $\mathcal{X}$ at x exists.*

Proof. Let $\pi : \mathcal{X} \to X$ be a morphism from $\mathcal{X}$ into an algebraic space X which turns $\mathcal{X}$ into a gerbe over X. Let $Z_x \to X$ be the residual space of X at x, see Decent Spaces, Definition 43.10.6. Let $\mathcal{Z} = \mathcal{X} \times_X Z_x$. By Lemma 61.19.3 the algebraic stack $\mathcal{Z}$ is a gerbe over Z_x. Hence $|\mathcal{Z}| = |Z_x|$ (Lemma 61.19.11) is a singleton. Since $\mathcal{Z} \to Z_x$ is locally of finite presentation as a base change of π (see Lemmas 61.19.8 and 61.18.3) we see that $\mathcal{Z}$ is locally Noetherian, see Lemma 61.13.5. Thus the residual gerbe $\mathcal{Z}_x$ of $\mathcal{X}$ at x exists and is equal to $\mathcal{Z}_x = \mathcal{Z}_{red}$ the reduction of the algebraic stack $\mathcal{Z}$. Namely, we have seen above that $|\mathcal{Z}_{red}|$ is a singleton mapping to $x \in |\mathcal{X}|$, it is reduced by construction, and it is locally

Noetherian (as the reduction of a locally Noetherian algebraic stack is locally Noetherian, details omitted). ☐

61.20. Stratification by gerbes

The goal of this section is to show that many algebraic stacks $\mathcal{X}$ have a ``stratification'' by locally closed substacks $\mathcal{X}_i \subset \mathcal{X}$ such that each $\mathcal{X}_i$ is a gerbe. This shows that in some sense gerbes are the building blocks out of which any algebraic stack is constructed. Note that by stratification we only mean that

$$|\mathcal{X}| = \bigcup\nolimits_i |\mathcal{X}_i|$$

and nothing more (in general). Hence it is harmless to replace $\mathcal{X}$ by its reduction (see Properties of Stacks, Section 60.10) in order to study this stratification.

The following proposition tells us there is (almost always) a dense open substack of the reduction of $\mathcal{X}$

Proposition 61.20.1. *Let $\mathcal{X}$ be a reduced algebraic stack such that $\mathcal{I}_\mathcal{X} \to \mathcal{X}$ is quasi-compact. Then there exists a dense open substack $\mathcal{U} \subset \mathcal{X}$ which is a gerbe.*

Proof. According to Proposition 61.19.9 it is enough to find a dense open substack $\mathcal{U}$ such that $\mathcal{I}_\mathcal{U} \to \mathcal{U}$ is flat and locally of finite presentation. Note that $\mathcal{I}_\mathcal{U} = \mathcal{I}_\mathcal{X} \times_\mathcal{X} \mathcal{U}$, see Lemma 61.5.4.

Choose a presentation $\mathcal{X} = [U/R]$. Let $G \to U$ be the stabilizer group algebraic space of the groupoid R. By Lemma 61.5.6 we see that $G \to U$ is the base change of $\mathcal{I}_\mathcal{X} \to \mathcal{X}$ hence quasi-compact (by assumption) and locally of finite type (by Lemma 61.5.1). Let $W \subset U$ be the largest open (possibly empty) subscheme such that the restriction $G_W \to W$ is flat and locally of finite presentation (we omit the proof that W exists; hint: use that the properties are local). By Morphisms of Spaces, Proposition 42.29.1 we see that $W \subset U$ is dense. Note that $W \subset U$ is R-invariant by More on Groupoids in Spaces, Lemma 53.4.2. Hence W corresponds to an open substack $\mathcal{U} \subset \mathcal{X}$ by Properties of Stacks, Lemma 60.9.10. Since $|U| \to |\mathcal{X}|$ is open and $|W| \subset |U|$ is dense we conclude that $\mathcal{U}$ is dense in $\mathcal{X}$. Finally, the morphism $\mathcal{I}_\mathcal{U} \to \mathcal{U}$ is flat and locally of finite presentation because the base change by the surjective smooth morphism $W \to \mathcal{U}$ is the morphism $G_W \to W$ which is flat and locally of finite presentation by construction. See Lemmas 61.17.4 and 61.18.7. ☐

The above proposition immediately implies that any point has a residual gerbe on an algebraic stack with quasi-compact inertia, as we will show in Lemma 61.21.1. It turns out that there doesn't always exist a finite stratification by gerbes. Here is an example.

Example 61.20.2. Let k be a field. Take $U = Spec(k[x_0, x_1, x_2, \ldots])$ and let $\mathbf{G}_m$ act by $t(x_0, x_1, x_2, \ldots) = (tx_0, t^p x_1, t^{p^2} x_2, \ldots)$ where p is a prime number. Let $\mathcal{X} = [U/\mathbf{G}_m]$. This is an algebraic stack. There is a stratification of $\mathcal{X}$ by strata

1. $\mathcal{X}_0$ is where x_0 is not zero,
2. $\mathcal{X}_1$ is where x_0 is zero but x_1 is not zero,
3. $\mathcal{X}_2$ is where x_0, x_1 are zero, but x_2 is not zero,
4. and so on, and
5. $\mathcal{X}_\infty$ is where all the x_i are zero.

Each stratum is a gerbe over a scheme with group μ_{p^i} for $\mathcal{X}_i$ and $\mathbf{G}_m$ for $\mathcal{X}_\infty$. The strata are reduced locally closed substacks. There is no coarser stratification with the same properties.

Nonetheless, using transfinite induction we can use Proposition 61.20.1 find possibly infinite stratifications by gerbes...!

Lemma 61.20.3. *Let $\mathcal{X}$ be an algebraic stack such that $\mathcal{I}_\mathcal{X} \to \mathcal{X}$ is quasi-compact. Then there exists a well ordered index set I and for every $i \in I$ a reduced locally closed substack $\mathcal{U}_i \subset \mathcal{X}$ such that*

1. *each $\mathcal{U}_i$ is a gerbe,*
2. *we have $|\mathcal{X}| = \bigcup_{i \in I} |\mathcal{U}_i|$,*
3. *$T_i = |\mathcal{X}| \setminus \bigcup_{i' < i} |\mathcal{U}_{i'}|$ is closed in $|\mathcal{X}|$ for all $i \in I$, and*
4. *$|\mathcal{U}_i|$ is open in T_i.*

We can moreover arrange it so that either (a) $|\mathcal{U}_i| \subset T_i$ is dense, or (b) $\mathcal{U}_i$ is quasi-compact. In case (a), if we choose $\mathcal{U}_i$ as large as possible (see proof for details), then the stratification is canonical.

Proof. Let $T \subset |\mathcal{X}|$ be a nonempty closed subset. We are going to find (resp. choose) for every such T a reduced locally closed substack $\mathcal{U}(T) \subset \mathcal{X}$ with $|\mathcal{U}(T)| \subset T$ open dense (resp. nonempty quasi-compact). Namely, by Properties of Stacks, Lemma 60.10.1 there exists a unique reduced closed substack $\mathcal{X}' \subset \mathcal{X}$ such that $T = |\mathcal{X}'|$. Note that $\mathcal{I}_{\mathcal{X}'} = \mathcal{I}_\mathcal{X} \times_\mathcal{X} \mathcal{X}'$ by Lemma 61.5.5. Hence $\mathcal{I}_{\mathcal{X}'} \to \mathcal{X}'$ is quasi-compact as a base change, see Lemma 61.7.3. Therefore Proposition 61.20.1 implies there exists a dense maximal (see proof proposition) open substack $\mathcal{U} \subset \mathcal{X}'$ which is a gerbe. In case (a) we set $\mathcal{U}(T) = \mathcal{U}$ (this is canonical) and in case (b) we simply choose a nonempty quasi-compact open $\mathcal{U}(T) \subset \mathcal{U}$, see Properties of Stacks, Lemma 60.4.9 (we can do this for all T simultaneously by the axiom of choice).

By transfinite induction we construct for every ordinal α a closed subset $T_\alpha \subset |\mathcal{X}|$. For $\alpha = 0$ we set $T_0 = |\mathcal{X}|$. Given T_α set

$$T_{\alpha+1} = T_\alpha \setminus |\mathcal{U}(T_\alpha)|.$$

If β is a limit ordinal we set

$$T_\beta = \bigcap\nolimits_{\alpha < \beta} T_\alpha.$$

We claim that $T_\alpha = \emptyset$ for all α large enough. Namely, assume that $T_\alpha \neq \emptyset$ for all α. Then we obtain an injective map from the class of ordinals into the set of subsets of $|\mathcal{X}|$ which is a contradiction.

The claim implies the lemma. Namely, let

$$I = \{\alpha \mid \mathcal{U}_\alpha \neq \emptyset\}.$$

This is a well ordered set by the claim. For $i = \alpha \in I$ we set $\mathcal{U}_i = \mathcal{U}_\alpha$. So $\mathcal{U}_i$ is a reduced locally closed substack and a gerbe, i.e., (1) holds. By construction $T_i = T\alpha$ if $i = \alpha \in I$, hence (3) holds. Also, (4) and (a) or (b) hold by our choice of $\mathcal{U}(T)$ as well. Finally, to see (2) let $x \in |\mathcal{X}|$. There exists a smallest ordinal β with $x \notin T_\beta$ (because the ordinals are well-ordered). In this case β has to be a successor ordinal by the definition of T_β for limit ordinals. Hence $\beta = \alpha + 1$ and $x \in |\mathcal{U}(T_\alpha)|$ and we win. $\square$

Remark 61.20.4. We can wonder about the order type of the canonical stratifications which occur as output of the stratifications of type (a) constructed in Lemma 61.20.3. A natural guess is that the well ordered set I has *cardinality* at most $\aleph_0$. We have no idea if this is true or false. If you do please email stacks.project@gmail.com.

61.21. Existence of residual gerbes

In this section we prove that residual gerbes (as defined in Properties of Stacks, Definition 60.11.8) exist on many algebraic stacks. First, here is the promised application of Proposition 61.20.1.

Lemma 61.21.1. *Let $\mathcal{X}$ be an algebraic stack such that $\mathcal{I}_\mathcal{X} \to \mathcal{X}$ is quasi-compact. Then the residual gerbe of $\mathcal{X}$ at x exists for every $x \in |\mathcal{X}|$.*

Proof. Let $T = \overline{\{x\}} \subset |\mathcal{X}|$ be the closure of x. By Properties of Stacks, Lemma 60.10.1 there exists a reduced closed substack $\mathcal{X}' \subset \mathcal{X}$ such that $T = |\mathcal{X}'|$. Note that $\mathcal{I}_{\mathcal{X}'} = \mathcal{I}_\mathcal{X} \times_\mathcal{X} \mathcal{X}'$ by Lemma 61.5.5. Hence $\mathcal{I}_{\mathcal{X}'} \to \mathcal{X}'$ is quasi-compact as a base change, see Lemma 61.7.3. Therefore Proposition 61.20.1 implies there exists a dense open substack $\mathcal{U} \subset \mathcal{X}'$ which is a gerbe. Note that $x \in |\mathcal{U}|$ because $\{x\} \subset T$ is a dense subset too. Hence a residual gerbe $\mathcal{Z}_x \subset \mathcal{U}$ of $\mathcal{U}$ at x exists by Lemma 61.19.12. It is immediate from the definitions that $\mathcal{Z}_x \to \mathcal{X}$ is a residual gerbe of $\mathcal{X}$ at x. $\square$

If the stack is quasi-DM then residual gerbes exist too. In particular, residual gerbes always exist for Delinge-Mumford stacks.

Lemma 61.21.2. *Let $\mathcal{X}$ be a quasi-DM algebraic stack. Then the residual gerbe of $\mathcal{X}$ at x exists for every $x \in |\mathcal{X}|$.*

Proof. Choose a scheme U and a surjective, flat, locally finite presented, and locally quasi-finite morphism $U \to \mathcal{X}$, see Theorem 61.15.3. Set $R = U \times_\mathcal{X} U$. The projections $s, t : R \to U$ are surjective, flat, locally of finite presentation, and locally quasi-finite as base changes of the morphism $U \to \mathcal{X}$. There is a canonical morphism $[U/R] \to \mathcal{X}$ (see Algebraic Stacks, Lemma 57.16.1) which is an equivalence because $U \to \mathcal{X}$ is surjective, flat, and locally of finite presentation, see Algebraic Stacks, Remark 57.16.3. Thus we may assume that $\mathcal{X} = [U/R]$ where (U, R, s, t, c) is a groupoid in algebraic spaces such that $s, t : R \to U$ are surjective, flat, locally of finite presentation, and locally quasi-finite. Set

$$U' = \coprod\nolimits_{u \in U \text{ lying over } x} Spec(\kappa(u)).$$

The canonical morphism $U' \to U$ is a monomorphism. Let

$$R' = U' \times_\mathcal{X} U' = R \times_{(U \times U)} (U' \times U')$$

Because $U' \to U$ is a monomorphism we see that both projections $s', t' : R' \to U'$ factor as a monomorphism followed by a locally quasi-finite morphism. Hence, as U' is a disjoint union of spectra of fields, using Spaces over Fields, Lemma 48.4.3 we conclude that the morphisms $s', t' : R' \to U'$ are locally quasi-finite. Again since U' is a disjoint union of spectra of fields, the morphisms s', t' are also flat. Finally, s', t' locally quasi-finite implies s', t' locally of finite type, hence s', t' locally of finite presentation (because U' is a disjoint union of spectra of fields in particular locally Noetherian, so that Morphisms of Spaces, Lemma 42.26.7 applies). Hence $\mathcal{Z} = [U'/R']$ is an algebraic stack by Criteria for Representability, Theorem 59.17.2. As R' is the restriction of R by $U' \to U$ we see $\mathcal{Z} \to \mathcal{X}$ is a monomorphism by Groupoids in Spaces, Lemma 52.24.1 and Properties of Stacks, Lemma 60.8.4. Since $\mathcal{Z} \to \mathcal{X}$ is a monomorphism we see that $|\mathcal{Z}| \to |\mathcal{X}|$ is injective, see Properties of Stacks, Lemma 60.8.5. By Properties of Stacks, Lemma 60.4.3 we see that

$$|U'| = |\mathcal{Z} \times_\mathcal{X} U'| \longrightarrow |\mathcal{Z}| \times_{|\mathcal{X}|} |U'|$$

is surjective which implies (by our choice of U') that $|\mathcal{Z}| \to |\mathcal{X}|$ has image $\{x\}$. We conclude that $|\mathcal{Z}|$ is a singleton. Finally, by construction U' is locally Noetherian and reduced, i.e., $\mathcal{Z}$ is reduced and locally Noetherian. This means that the essential image of $\mathcal{Z} \to \mathcal{X}$ is the residual gerbe of $\mathcal{X}$ at x, see Properties of Stacks, Lemma 60.11.11. □

61.22. Smooth morphisms

The property ``being smooth'' of morphisms of algebraic spaces is smooth local on the source-and-target, see Descent on Spaces, Remark 45.18.5. It is also stable under base change and fpqc local on the target, see Morphisms of Spaces, Lemma 42.33.3 and Descent on Spaces, Lemma 45.10.24. Hence, by Lemma 61.12.1 above, we may define what it means for a morphism of algebraic spaces to be smooth as follows and it agrees with the already existing notion defined in Properties of Stacks, Section 60.3 when the morphism is representable by algebraic spaces.

Definition 61.22.1. Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks. We say f is *smooth* if the equivalent conditions of Lemma 61.12.1 hold with $\mathcal{P}$= smooth.

Lemma 61.22.2. *The composition of smooth morphisms is smooth.*

Proof. Combine Remark 61.12.3 with Morphisms of Spaces, Lemma 42.33.2. □

Lemma 61.22.3. *A base change of a smooth morphism is smooth.*

Proof. Combine Remark 61.12.4 with Morphisms of Spaces, Lemma 42.33.3. □

CHAPTER 62

Cohomology of Algebraic Stacks

62.1. Introduction

In this chapter we write about cohomology of algebraic stacks. This mean in particular cohomology of quasi-coherent sheaves, i.e., we prove analogues of the results in the chapter entitled ``Coherent Cohomology''. The results in this chapter are different from those in [**LMB00a**] mainly because we consistently use the ``big sites''. Before reading this chapter please take a quick look at the chapter ``Sheaves on Algebraic Stacks'' in order to become familiar with the terminology introduced there, see Sheaves on Stacks, Section 58.1.

62.2. Conventions and abuse of language

We continue to use the conventions and the abuse of language introduced in Properties of Stacks, Section 60.2.

62.3. Notation

Different topologies. If we indicate an algebraic stack by a calligraphic letter, such as $\mathcal{X}, \mathcal{Y}, \mathcal{Z}$, then the notation $\mathcal{X}_{Zar}, \mathcal{X}_{étale}, \mathcal{X}_{smooth}, \mathcal{X}_{syntomic}, \mathcal{X}_{fppf}$ indicates the site introduced in Sheaves on Stacks, Definition 58.4.1. (Think ``big site''.) Correspondingly the structure sheaf of $\mathcal{X}$ is a sheaf on $\mathcal{X}_{fppf}$. On the other hand, algebraic spaces and schemes are usually indicated by roman capitals, such as X, Y, Z, and in this case $X_{étale}$ indicates the small étale site of X (as defined in Topologies, Definition 30.4.8 or Properties of Spaces, Definition 41.15.1). It seems that the distinction should be clear enough.

The default topology is the fppf topology. Hence we will sometimes say ``sheaf on $\mathcal{X}$'' or ``sheaf of $\mathcal{O}_\mathcal{X}$'' modules when we mean sheaf on $\mathcal{X}_{fppf}$ or object of $Mod(\mathcal{X}_{fppf}, \mathcal{O}_\mathcal{X})$.

If $f : \mathcal{X} \to \mathcal{Y}$ is a morphism of algebraic stacks, then the functors f_* and f^{-1} defined on presheaves preserves sheaves for any of the topologies mentioned above. In particular when we discuss the pushforward or pullback of a sheaf we don't have to mention which topology we are working with. The same isn't true when we compute cohomology groups and/or higher direct images. In this case we will always mention which topology we are working with.

Suppose that $f : X \to \mathcal{Y}$ is a morphism from an algebraic space X to an algebraic stack $\mathcal{Y}$. Let $\mathcal{G}$ be a sheaf on $\mathcal{Y}_\tau$ for some topology τ. In this case $f^{-1}\mathcal{G}$ is a sheaf for the τ topology on $\mathcal{S}_X$ (the algebraic stack associated to X) because (by our conventions) f really is a 1-morphism $f : \mathcal{S}_X \to \mathcal{Y}$. If $\tau = étale$ or stronger, then we write $f^{-1}\mathcal{G}|_{X_{étale}}$ to denote the restriction to the étale site of X, see Sheaves on Stacks, Section 58.21. If $\mathcal{G}$ is an $\mathcal{O}_\mathcal{X}$-module we sometimes write $f^*\mathcal{G}$ and $f^*\mathcal{G}|_{X_{étale}}$ instead.

62.4. Pullback of quasi-coherent modules

Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks. It is a very general fact that quasi-coherent modules on ringed topoi are compatible with pullbacks. In particular the pullback f^* preserves quasi-coherent modules and we obtain a functor

$$f^* : QCoh(\mathcal{O}_\mathcal{Y}) \longrightarrow QCoh(\mathcal{O}_\mathcal{X}),$$

see Sheaves on Stacks, Lemma 58.11.2. In general this functor isn't exact, but if f is flat then it is.

Lemma 62.4.1. *If $f : \mathcal{X} \to \mathcal{Y}$ is a flat morphism of algebraic stacks then $f^* : QCoh(\mathcal{O}_\mathcal{Y}) \to QCoh(\mathcal{O}_\mathcal{X})$ is an exact functor.*

Proof. Choose a scheme V and a surjective smooth morphism $V \to \mathcal{Y}$. Choose a scheme U and a surjective smooth morphism $U \to V \times_\mathcal{Y} \mathcal{X}$. Then $U \to \mathcal{X}$ is still smooth and surjective as a composition of two such morphisms. From the commutative diagram

$$\begin{tikzcd} U \arrow[r, "f'"'] \arrow[d] & V \arrow[d] \\ \mathcal{X} \arrow[r, "f"] & \mathcal{Y} \end{tikzcd}$$

we obtain a commutative diagram

$$\begin{tikzcd} QCoh(\mathcal{O}_U) & QCoh(\mathcal{O}_V) \arrow[l] \\ QCoh(\mathcal{O}_\mathcal{X}) \arrow[u] & QCoh(\mathcal{O}_\mathcal{Y}) \arrow[l] \arrow[u] \end{tikzcd}$$

of abelian categories. Our proof that the bottom two categories in this diagram are abelian showed that the vertical functors are faithful exact functors (see proof of Sheaves on Stacks, Lemma 58.14.1). Since f' is a flat morphism of schemes (by our definition of flat morphisms of algebraic stacks) we see that $(f')^*$ is an exact functor on quasi-coherent sheaves on V. Thus we win. $\square$

62.5. The key lemma

The following lemma is the basis for our understanding of higher direct images of certain types of sheaves of modules. There are two verions: one for the étale topology and one for the fppf topology.

Lemma 62.5.1. *Let $\mathcal{M}$ be a rule which associates to every algebraic stack $\mathcal{X}$ a subcategory $\mathcal{M}_\mathcal{X}$ of $Mod(\mathcal{X}_{étale}, \mathcal{O}_\mathcal{X})$ such that*

1. *$\mathcal{M}_\mathcal{X}$ is a weak Serre subcategory of $Mod(\mathcal{X}_{étale}, \mathcal{O}_\mathcal{X})$ (see Homology, Definition 10.7.1) for all algebraic stacks $\mathcal{X}$,*
2. *for a smooth morphism of algebraic stacks $f : \mathcal{Y} \to \mathcal{X}$ the functor f^* maps $\mathcal{M}_\mathcal{X}$ into $\mathcal{M}_\mathcal{Y}$,*
3. *if $f_i : \mathcal{X}_i \to \mathcal{X}$ is a family of smooth morphisms of algebraic stacks with $|\mathcal{X}| = \bigcup |f_i|(|\mathcal{X}_i|)$, then an object $\mathcal{F}$ of $Mod(\mathcal{X}_{étale}, \mathcal{O}_\mathcal{X})$ is in $\mathcal{M}_\mathcal{X}$ if and only if $f_i^*\mathcal{F}$ is in $\mathcal{M}_{\mathcal{X}_i}$ for all i, and*
4. *if $f : \mathcal{Y} \to \mathcal{X}$ is a morphism of algebraic stacks such that $\mathcal{X}$ and $\mathcal{Y}$ are representable by affine schemes, then $R^i f_*$ maps $\mathcal{M}_\mathcal{Y}$ into $\mathcal{M}_\mathcal{X}$.*

Then for any quasi-compact and quasi-separated morphism $f : \mathcal{Y} \to \mathcal{X}$ of algebraic stacks $R^i f_*$ maps $\mathcal{M}_\mathcal{Y}$ into $\mathcal{M}_\mathcal{X}$. (Higher direct images computed in étale topology.)

Proof. Let $f : \mathcal{Y} \to \mathcal{X}$ be a quasi-compact and quasi-separated morphism of algebraic stacks and let $\mathcal{F}$ be an object of $\mathcal{M}_\mathcal{Y}$. Choose a surjective smooth morphism $\mathcal{U} \to \mathcal{X}$ where $\mathcal{U}$ is representable by a scheme. By Sheaves on Stacks, Lemma 58.20.3 taking higher direct images commutes with base change. Assumption (2) shows that the pullback of $\mathcal{F}$ to $\mathcal{U} \times_\mathcal{X} \mathcal{Y}$ is in $\mathcal{M}_{\mathcal{U} \times_\mathcal{X} \mathcal{Y}}$ because the projection $\mathcal{U} \times_\mathcal{X} \mathcal{Y} \to \mathcal{Y}$ is smooth as a base change of a smooth morphism. Hence (3) shows we may replace $\mathcal{Y} \to \mathcal{X}$ by the projection $\mathcal{U} \times_\mathcal{X} \mathcal{Y} \to \mathcal{U}$. In other words, we may assume that $\mathcal{X}$ is representable by a scheme. Using (3) once more, we see that the question is Zariski local on $\mathcal{X}$, hence we may assume that $\mathcal{X}$ is representable by an affine scheme. Since f is quasi-compact this implies that also $\mathcal{Y}$ is quasi-compact. Thus we may choose a surjective smooth morphism $g : \mathcal{V} \to \mathcal{Y}$ where $\mathcal{V}$ is representable by an affine scheme.

In this situation we have the spectral sequence

$$E_2^{p,q} = R^q(f \circ g_p)_* g_p^* \mathcal{F} \Rightarrow R^{p+q} f_* \mathcal{F}$$

of Sheaves on Stacks, Proposition 58.20.1. Recall that this is the spectral sequence associated to a double complex. By assumption (1) we may use Homology, Remark 10.19.7. Note that the morphisms

$$g_p : \mathcal{V}_p = \mathcal{V} \times_\mathcal{Y} \ldots \times_\mathcal{Y} \mathcal{V} \longrightarrow \mathcal{Y}$$

are smooth as compositions of base changes of the smooth morphism g. Thus the sheaves $g_p^*\mathcal{F}$ are in $\mathcal{M}_{\mathcal{V}_p}$ by (2). Hence it suffices to prove that the higher direct images of objects of $\mathcal{M}_{\mathcal{V}_p}$ under the morphisms

$$\mathcal{V}_p = \mathcal{V} \times_\mathcal{Y} \ldots \times_\mathcal{Y} \mathcal{V} \longrightarrow \mathcal{X}$$

are in $\mathcal{M}_\mathcal{X}$. The algebraic stacks $\mathcal{V}_p$ are quasi-compact and quasi-separated by Morphisms of Stacks, Lemma 61.7.7. Of course each $\mathcal{V}_p$ is representable by an algebraic space (the diagonal of the algebraic stack $\mathcal{Y}$ is representable by algebraic spaces). This reduces us to the case where $\mathcal{Y}$ is representable by an algebraic space and $\mathcal{X}$ is representable by an affine scheme.

In the situation where $\mathcal{Y}$ is representable by an algebraic space and $\mathcal{X}$ is representable by an affine scheme, we choose anew a surjective smooth morphism $\mathcal{V} \to \mathcal{Y}$ where $\mathcal{V}$ is representable by an affine scheme. Going through the argument above once again we once again reduce to the morphisms $\mathcal{V}_p \to \mathcal{X}$. But in the current situation the algebraic stacks $\mathcal{V}_p$ are representable by quasi-compact and quasi-separated schemes (becase the diagonal of an algebraic space is representable by schemes).

Thus we may assume $\mathcal{Y}$ is representable by a scheme and $\mathcal{X}$ is representable by an affine scheme. Choose (again) a surjective smooth morphism $\mathcal{V} \to \mathcal{Y}$ where $\mathcal{V}$ is representable by an affine scheme. In this case all the algebraic stacks $\mathcal{V}_p$ are representable by separated schemes (because the diagonal of a scheme is separated).

Thus we may assume $\mathcal{Y}$ is representable by a separated scheme and $\mathcal{X}$ is representable by an affine scheme. Choose (yet again) a surjective smooth morphism $\mathcal{V} \to \mathcal{Y}$ where $\mathcal{V}$ is representable by an affine scheme. In this case all the algebraic stacks $\mathcal{V}_p$ are representable by affine schemes (because the diagonal of a separated scheme is a closed immersion hence affine) and this case is handled by assumption (4). This finishes the proof. $\square$

Here is the version for the fppf topology.

Lemma 62.5.2. *Let $\mathcal{M}$ be a rule which associates to every algebraic stack $\mathcal{X}$ a subcategory $\mathcal{M}_\mathcal{X}$ of $Mod(\mathcal{O}_\mathcal{X})$ such that*

1. *$\mathcal{M}_\mathcal{X}$ is a weak Serre subcategory of $Mod(\mathcal{O}_\mathcal{X})$ for all algebraic stacks $\mathcal{X}$,*
2. *for a smooth morphism of algebraic stacks $f : \mathcal{Y} \to \mathcal{X}$ the functor f^* maps $\mathcal{M}_\mathcal{X}$ into $\mathcal{M}_\mathcal{Y}$,*
3. *if $f_i : \mathcal{X}_i \to \mathcal{X}$ is a family of smooth morphisms of algebraic stacks with $|\mathcal{X}| = \bigcup |f_i|(|\mathcal{X}_i|)$, then an object $\mathcal{F}$ of $Mod(\mathcal{O}_\mathcal{X})$ is in $\mathcal{M}_\mathcal{X}$ if and only if $f_i^*\mathcal{F}$ is in $\mathcal{M}_{\mathcal{X}_i}$ for all i, and*
4. *if $f : \mathcal{Y} \to \mathcal{X}$ is a morphism of algebraic stacks and $\mathcal{X}$ and $\mathcal{Y}$ are representable by affine schemes, then R^if_* maps $\mathcal{M}_\mathcal{Y}$ into $\mathcal{M}_\mathcal{X}$.*

Then for any quasi-compact and quasi-separated morphism $f : \mathcal{Y} \to \mathcal{X}$ of algebraic stacks R^if_* maps $\mathcal{M}_\mathcal{Y}$ into $\mathcal{M}_\mathcal{X}$. (Higher direct images computed in fppf topology.)

Proof. Identical to the proof of Lemma 62.5.1. □

62.6. Locally quasi-coherent modules

Let $\mathcal{X}$ be an algebraic stack. Let $\mathcal{F}$ be a presheaf of $\mathcal{O}_\mathcal{X}$-modules. We can ask whether $\mathcal{F}$ is *locally quasi-coherent*, see Sheaves on Stacks, Definition 58.11.4. Briefly, this means $\mathcal{F}$ is an $\mathcal{O}_\mathcal{X}$-module for the étale topology such that for any morphism $f : U \to \mathcal{X}$ the restriction $f^*\mathcal{F}|_{U_{étale}}$ is quasi-coherent on $U_{étale}$. (The actual definition is slightly different, but equivalent.) A useful fact is that

$$LQCoh(\mathcal{O}_\mathcal{X}) \subset Mod(\mathcal{X}_{étale}, \mathcal{O}_\mathcal{X})$$

is a weak Serre subcategory, see Sheaves on Stacks, Lemma 58.11.7.

Lemma 62.6.1. *Let $\mathcal{X}$ be an algebraic stack. Let $f_j : \mathcal{X}_j \to \mathcal{X}$ be a family of smooth morphisms of algebraic stacks with $|\mathcal{X}| = \bigcup |f_j|(|\mathcal{X}_j|)$. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_\mathcal{X}$-modules on $\mathcal{X}_{étale}$. If each $f_j^{-1}\mathcal{F}$ is locally quasi-coherent, then so is $\mathcal{F}$.*

Proof. We may replace each of the algebraic stacks $\mathcal{X}_j$ by a scheme U_j (using that any algebraic stack has a smooth covering by a scheme and that compositions of smooth morphisms are smooth, see Morphisms of Stacks, Lemma 61.22.2). The pullback of $\mathcal{F}$ to $(Sch/U_j)_{étale}$ is still locally quasi-coherent, see Sheaves on Stacks, Lemma 58.11.6. Then $f = \coprod f_j : U = \coprod U_j \to \mathcal{X}$ is a surjective smooth morphism. Let x be an object of $\mathcal{X}$. By Sheaves on Stacks, Lemma 58.18.10 there exists an étale covering $\{x_i \to x\}_{i\in I}$ such that each x_i lifts to an object u_i of $(Sch/U)_{étale}$. This just means that x, x_i live over schemes V, V_i, that $\{V_i \to V\}$ is an étale covering, and that x_i comes from a morphism $u_i : V_i \to U$. The restriction $x_i^*\mathcal{F}|_{V_{i,étale}}$ is equal to the restriction of $f^*\mathcal{F}$ to $V_{i,étale}$, see Sheaves on Stacks, Lemma 58.9.3. Hence $x^*\mathcal{F}|_{V_{étale}}$ is a sheaf on the small étale site of V which is quasi-coherent when restricted to $V_{i,étale}$ for each i. This implies that it is quasi-coherent (as desired), for example by Properties of Spaces, Lemma 41.26.6. □

Lemma 62.6.2. *Let $f : \mathcal{X} \to \mathcal{Y}$ be a quasi-compact and quasi-separated morphism of algebraic stacks. Let $\mathcal{F}$ be a locally quasi-coherent $\mathcal{O}_\mathcal{X}$-module on $\mathcal{X}_{étale}$. Then $R^if_*\mathcal{F}$ (computed in the étale topology) is a locally quasi-coherent on $\mathcal{Y}_{étale}$.*

Proof. We will use Lemma 62.5.1 to prove this. We will check its assumptions (1) -- (4). Parts (1) and (2) follows from Sheaves on Stacks, Lemma 58.11.7. Part (3) follows from Lemma 62.6.1. Thus it suffices to show (4).

Suppose $f : \mathcal{X} \to \mathcal{Y}$ is a morphism of algebraic stacs such that $\mathcal{X}$ and $\mathcal{Y}$ are representable by affine schemes X and Y. Choose any object y of $\mathcal{Y}$ lying over a scheme V. For clarity, denote $\mathcal{V} = (Sch/V)_{fppf}$ the algebraic stack corresponding to V. Consider the cartesian diagram

$$\begin{tikzcd} \mathcal{Z} \arrow[r, "g"'] \arrow[d, "f'"'] & \mathcal{X} \arrow[d, "f"] \\ \mathcal{V} \arrow[r, "y"] & \mathcal{Y} \end{tikzcd}$$

Thus $\mathcal{Z}$ is representable by the scheme $Z = V \times_Y X$ and f' is quasi-compact and separated (even affine). By Sheaves on Stacks, Lemma 58.21.3 we have

$$R^i f_* \mathcal{F}|_{V_{\acute{e}tale}} = R^i f'_{small,*}\big(g^*\mathcal{F}|_{Z_{\acute{e}tale}}\big)$$

The right hand side is a quasi-coherent sheaf on $V_{\acute{e}tale}$ by Cohomology of Spaces, Lemma 49.4.1. This implies the left hand side is quasi-coherent which is what we had to prove. $\square$

Lemma 62.6.3. *Let $\mathcal{X}$ be an algebraic stack. Let $f_j : \mathcal{X}_j \to \mathcal{X}$ be a family of flat and locally finitely presented morphisms of algebraic stacks with $|\mathcal{X}| = \bigcup |f_j|(|\mathcal{X}_j|)$. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_\mathcal{X}$-modules on $\mathcal{X}_{fppf}$. If each $f_j^{-1}\mathcal{F}$ is locally quasi-coherent, then so is $\mathcal{F}$.*

Proof. First, suppose there is a morphism $a : \mathcal{U} \to \mathcal{X}$ which is surjective, flat, locally of finite presentation, quasi-compact, and quasi-separated such that $a^*\mathcal{F}$ is locally quasi-coherent. Then there is an exact sequence

$$0 \to \mathcal{F} \to a_*a^*\mathcal{F} \to b_*b^*\mathcal{F}$$

where b is the morphism $b : \mathcal{U} \times_\mathcal{X} \mathcal{U} \to \mathcal{X}$, see Sheaves on Stacks, Proposition 58.18.7 and Lemma 58.18.10. Moreover, the pullback $b^*\mathcal{F}$ is the pullback of $a^*\mathcal{F}$ via one of the projection morphisms, hence is locally quasi-coherent (Sheaves on Stacks, Lemma 58.11.6). The modules $a_*a^*\mathcal{F}$ and $b_*b^*\mathcal{F}$ are locally quasi-coherent by Lemma 62.6.2. (Note that a_* and b_* don't care about which topology is used to calculate them.) We conclude that $\mathcal{F}$ is locally quasi-coherent, see Sheaves on Stacks, Lemma 58.11.7.

We are going to reduce the proof of the general case the the situation in the first paragraph. Let x be an object of $\mathcal{X}$ lying over the scheme U. We have to show that $\mathcal{F}|_{U_{\acute{e}tale}}$ is a quasi-coherent $\mathcal{O}_U$-module. It suffices to do this (Zariski) locally on U, hence we may assume that U is affine. By Morphisms of Stacks, Lemma 61.18.10 there exists an fppf covering $\{a_i : U_i \to U\}$ such that each $x \circ a_i$ factors through some f_j. Hence $a_i^*\mathcal{F}$ is locally quasi-coherent on $(Sch/U_i)_{fppf}$. After refining the covering we may assume $\{U_i \to U\}_{i=1,\ldots,n}$ is a standard fppf covering. Then $x^*\mathcal{F}$ is an fppf module on $(Sch/U)_{fppf}$ whose pullback by the morphism $a : U_1 \amalg \ldots \amalg U_n \to U$ is locally quasi-coherent. Hence by the first paragraph we see that $x^*\mathcal{F}$ is locally quasi-coherent, which certainly implies that $\mathcal{F}|_{U_{\acute{e}tale}}$ is quasi-coherent. $\square$

62.7. Flat comparison maps

Let $\mathcal{X}$ be an algebraic stack and let $\mathcal{F}$ be an object of $Mod(\mathcal{X}_{\acute{e}tale}, \mathcal{O}_\mathcal{X})$. Given an object x of $\mathcal{X}$ lying over the scheme U the restriction $\mathcal{F}|_{U_{\acute{e}tale}}$ is the restriction of $x^{-1}\mathcal{F}$ to the small étale site of U, see Sheaves on Stacks, Definition 58.9.2. Next, let $\varphi : x \to x'$ be a morphism of

$\mathcal{X}$ lying over a morphism of schemes $f : U \to U'$. Thus a 2-commutative diagram

$$\begin{tikzcd} U \arrow[rr, "f"] \arrow[dr, "x"'] & & U' \arrow[dl, "x'"] \\ & \mathcal{X} & \end{tikzcd}$$

Associated to φ we obtain a comparison map between restrictions

$$c_\varphi : f_{small}^*(\mathcal{F}|_{U'_{\acute{e}tale}}) \longrightarrow \mathcal{F}|_{U_{\acute{e}tale}} \quad (62.7.0.1)$$

see Sheaves on Stacks, Equation (58.9.4.1). In this situation we can consider the following property of $\mathcal{F}$.

Definition 62.7.1. Let $\mathcal{X}$ be an algebraic stack and let $\mathcal{F}$ in $Mod(\mathcal{X}_{\acute{e}tale}, \mathcal{O}_\mathcal{X})$. We say $\mathcal{F}$ has the *flat base change property*[1] if and only if c_φ is an isomorphism whenever f is flat.

Here is a lemma with some properties of this notion.

Lemma 62.7.2. *Let $\mathcal{X}$ be an algebraic stack. Let $\mathcal{F}$ be an $\mathcal{O}_\mathcal{X}$-module on $\mathcal{X}_{\acute{e}tale}$.*

(1) *If $\mathcal{F}$ has the flat base change property then for any morphism $g : \mathcal{Y} \to \mathcal{X}$ of algebraic stacks, the pullback $g^*\mathcal{F}$ does too.*
(2) *The full subcategory of $Mod(\mathcal{X}_{\acute{e}tale}, \mathcal{O}_\mathcal{X})$ consisting of modules with the flat base change property is a weak Serre subcategory.*
(3) *Let $f_i : \mathcal{X}_i \to \mathcal{X}$ be a family of smooth morphisms of algebraic stacks such that $|\mathcal{X}| = \bigcup_i |f_i|(|\mathcal{X}_i|)$. If each $f_i^*\mathcal{F}$ has the flat base change property then so does $\mathcal{F}$.*
(4) *The category of $\mathcal{O}_\mathcal{X}$-modules on $\mathcal{X}_{\acute{e}tale}$ with the flat base change property has colimits and they agree with colimits in $Mod(\mathcal{X}_{\acute{e}tale}, \mathcal{O}_\mathcal{X})$.*

Proof. Let $g : \mathcal{Y} \to \mathcal{X}$ be as in (1). Let y be an object of $\mathcal{Y}$ lying over a scheme V. By Sheaves on Stacks, Lemma 58.9.3 we have $(g^*\mathcal{F})|_{V_{\acute{e}tale}} = \mathcal{F}|_{V_{\acute{e}tale}}$. Moreover a comparison mapping for the sheaf $g^*\mathcal{F}$ on $\mathcal{Y}$ is a special case of a comparison map for the sheaf $\mathcal{F}$ on $\mathcal{X}$, see Sheaves on Stacks, Lemma 58.9.3. In this way (1) is clear.

Proof of (2). We use the characterization of weak Serre subcategories of Homology, Lemma 10.7.3. Kernels and cokernels of maps between sheaves having the flat base change property also have the flat base change property. This is clear because f_{small}^* is exact for a flat morphism of schemes and since the restriction functors $(-)|_{U_{\acute{e}tale}}$ are exact (because we are working in the étale topology). Finally, if $0 \to \mathcal{F}_1 \to \mathcal{F}_2 \to \mathcal{F}_3 \to 0$ is a short exact sequence of $Mod(\mathcal{X}_{\acute{e}tale}, \mathcal{O}_\mathcal{X})$ and the outer two sheaves have the flat base change property then the middle one does as well, again because of the exactness of f_{small}^* and the restriction functors (and the 5 lemma).

Proof of (3). Let $f_i : \mathcal{X}_i \to \mathcal{X}$ be a jointly surjective family of smooth morphisms of algebraic stacks and assume each $f_i^*\mathcal{F}$ has the flat base change property. By part (1), the definition of an algebraic stack, and the fact that compositions of smooth morphisms are smooth (see Morphisms of Stacks, Lemma 61.22.2) we may assume that each $\mathcal{X}_i$ is representable by a scheme. Let $\varphi : x \to x'$ be a morphism of $\mathcal{X}$ lying over a flat morphism $a : U \to U'$ of schemes. By Sheaves on Stacks, Lemma 58.18.10 there exists a jointly

[1] This may be nonstandard notation.

surjective family of étale morphisms $U'_i \to U'$ such that $U' \to U' \to \mathcal{X}$ factors through $\mathcal{X}_i$. Thus we obtain commutative diagrams

$$\begin{tikzcd} U_i = U \times_{U'} U'_i \arrow[r, "a_i"] \arrow[d] & U'_i \arrow[r, "x'_i"] \arrow[d] & \mathcal{X}_i \arrow[d, "f_i"] \\ U \arrow[r, "a"] & U' \arrow[r, "x'"] & \mathcal{X} \end{tikzcd}$$

Note that each a_i is a flat morphism of schemes as a base change of a. Denote $\psi_i : x_i \to x'_i$ the morphism of $\mathcal{X}_i$ lying over a_i with target x'_i. By assumption the comparison maps $c_{\psi_i} : (a_i)^*_{small}\big(f_i^*\mathcal{F}|_{(U'_i)_{étale}}\big) \to f_i^*\mathcal{F}|_{(U_i)_{étale}}$ is an isomorphism. Because the vertical arrows $U'_i \to U'$ and $U_i \to U$ are étale, the sheaves $f_i^*\mathcal{F}|_{(U'_i)_{étale}}$ and $f_i^*\mathcal{F}|_{(U_i)_{étale}}$ are the restrictions of $\mathcal{F}|_{U'_{étale}}$ and $\mathcal{F}|_{U_{étale}}$ and the map c_{ψ_i} is the restriction of c_φ to $(U_i)_{étale}$, see Sheaves on Stacks, Lemma 58.9.3. Since $\{U_i \to U\}$ is an étale covering, this implies that the comparison map c_φ is an isomorphism which is what we wanted to prove.

Proof of (4). Let $\mathcal{I} \to Mod(\mathcal{X}_{étale}, \mathcal{O}_\mathcal{X})$, $i \mapsto \mathcal{F}_i$ be a diagram and assume each $\mathcal{F}_i$ has the flat base change property. Recall that $colim_i\, \mathcal{F}_i$ is the sheafification of the presheaf colimit. As we are using the étale topology, it is clear that

$$(colim_i\, \mathcal{F}_i)|_{U_{étale}} = colim_i\, \mathcal{F}_i|_{U_{étale}}$$

As f^*_{small} commutes with colimits (as a left adjoint) we see that (4) holds. ☐

Lemma 62.7.3. *Let $f : \mathcal{X} \to \mathcal{Y}$ be a quasi-compact and quasi-separated morphism of algebraic stacks. Let $\mathcal{F}$ be an object of $Mod(\mathcal{X}_{étale}, \mathcal{O}_\mathcal{X})$ which is locally quasi-coherent and has the flat base change property. Then each $R^ig_*\mathcal{F}$ (computed in the étale topology) has the flat base change property.*

Proof. We will use Lemma 62.5.1 to prove this. For every algebraic stack $\mathcal{X}$ let $\mathcal{M}_\mathcal{X}$ denote the full subcategory of $Mod(\mathcal{X}_{étale}, \mathcal{O}_\mathcal{X})$ consisting of locally quasi-coherent sheaves with the flat base change property. Once we verify conditions (1) -- (4) of Lemma 62.5.1 the lemma will follow. Properties (1), (2), and (3) follow from Sheaves on Stacks, Lemmas 58.11.6 and 58.11.7 and Lemmas 62.6.1 and 62.7.2. Thus it suffices to show part (4).

Suppose $f : \mathcal{X} \to \mathcal{Y}$ is a morphism of algebraic stacs such that $\mathcal{X}$ and $\mathcal{Y}$ are representable by affine schemes X and Y. In this case, suppose that $\psi : y \to y'$ is a morphism of $\mathcal{Y}$ lying over a flat morphism $b : V \to V'$ of schemes. For clarity denote $\mathcal{V} = (Sch/V)_{fppf}$ and $\mathcal{V}' = (Sch/V')_{fppf}$ the corresponding algebraic stacks. Consider the diagram of algebraic stacks

$$\begin{tikzcd} \mathcal{Z} \arrow[r, "a"] \arrow[d, "f''"'] & \mathcal{Z}' \arrow[r, "x'"] \arrow[d, "f'"'] & \mathcal{X} \arrow[d, "f"] \\ \mathcal{V} \arrow[r, "b"] & \mathcal{V}' \arrow[r, "y'"] & \mathcal{Y} \end{tikzcd}$$

with both squares cartesian. As f is representable by schemes (and quasi-compact and separated -- even affine) we see that $\mathcal{Z}$ and $\mathcal{Z}'$ are representable by schemes Z and Z' and in fact $Z = V \times_{V'} Z'$. Since $\mathcal{F}$ has the flat base change property we see that

$$a^*_{small}\big(\mathcal{F}|_{Z'_{étale}}\big) \longrightarrow \mathcal{F}|_{Z_{étale}}$$

is an isomorphism. Moreover,

$$R^if_*\mathcal{F}|_{V'_{étale}} = R^i(f')_{small,*}\big(\mathcal{F}|_{Z'_{étale}}\big)$$

and

$$R^i f_*\mathcal{F}|_{V_{\acute{e}tale}} = R^i(f'')_{small,*}(\mathcal{F}|_{Z_{\acute{e}tale}})$$

by Sheaves on Stacks, Lemma 58.21.3. Hence we see that the comparision map

$$c_\psi : b^*_{small}(R^i f_*\mathcal{F}|_{V'_{\acute{e}tale}}) \longrightarrow R^i f_*\mathcal{F}|_{V_{\acute{e}tale}}$$

is an isomorphism by Cohomology of Spaces, Lemma 49.9.1. Thus $R^i f_*\mathcal{F}$ has the flat base change property. Since $R^i f_*\mathcal{F}$ is locally quasi-coherent by Lemma 62.6.2 we win. □

Proposition 62.7.4. *Summary of results on locally quasi-coherent modules having the flat base change property.*

(1) *Let $\mathcal{X}$ be an algebraic stack. If $\mathcal{F}$ is an object of $Mod(\mathcal{X}_{\acute{e}tale}, \mathcal{O}_\mathcal{X})$ which is locally quasi-coherent and has the flat base change property, then $\mathcal{F}$ is a sheaf for the fppf topology, i.e., it is an object of $Mod(\mathcal{O}_\mathcal{X})$.*
(2) *The category of modules which are locally quasi-coherent and have the flat base change property is a weak Serre subcategory $\mathcal{M}_\mathcal{X}$ of both $Mod(\mathcal{O}_\mathcal{X})$ and $Mod(\mathcal{X}_{\acute{e}tale}, \mathcal{O}_\mathcal{X})$.*
(3) *Pullback f^* along any morphism of algebraic stacks $f : \mathcal{X} \to \mathcal{Y}$ induces a functor $f^* : \mathcal{M}_\mathcal{Y} \to \mathcal{M}_\mathcal{X}$.*
(4) *If $f : \mathcal{X} \to \mathcal{Y}$ is a quasi-compact and quasi-separated morphism of algebraic stacks and $\mathcal{F}$ is an object of $\mathcal{M}_\mathcal{X}$, then*
   (a) *the derived direct image $Rf_*\mathcal{F}$ and the higher direct images $R^i f_*\mathcal{F}$ can be computed in either the étale or the fppf topology with the same result, and*
   (b) *each $R^i f_*\mathcal{F}$ is an object of $\mathcal{M}_\mathcal{Y}$.*
(5) *The category $\mathcal{M}_\mathcal{X}$ has colimits and they agree with colimits in $Mod(\mathcal{X}_{\acute{e}tale}, \mathcal{O}_\mathcal{X})$ as well as in $Mod(\mathcal{O}_\mathcal{X})$.*

Proof. Part (1) is Sheaves on Stacks, Lemma 58.22.1.

Part (2) for the embedding $\mathcal{M}_\mathcal{X} \subset Mod(\mathcal{X}_{\acute{e}tale}, \mathcal{O}_\mathcal{X})$ we have seen in the proof of Lemma 62.7.3. Let us prove (2) for the embedding $\mathcal{M}_\mathcal{X} \subset Mod(\mathcal{O}_\mathcal{X})$. Let $\varphi : \mathcal{F} \to \mathcal{G}$ be a morphism between objects of $\mathcal{M}_\mathcal{X}$. Since $\mathrm{Ker}(\varphi)$ is the same whether computed in the étale or the fppf topology, we see that $\mathrm{Ker}(\varphi)$ is in $\mathcal{M}_\mathcal{X}$ by the étale case. On the other hand, the cokernel computed in the fppf topology is the fppf sheafification of the cokernel computed in the étale topology. However, this étale cokernel is in $\mathcal{M}_\mathcal{X}$ hence an fppf sheaf by (1) and we see that the cokernel is in $\mathcal{M}_\mathcal{X}$. Finally, suppose that

$$0 \to \mathcal{F}_1 \to \mathcal{F}_2 \to \mathcal{F}_3 \to 0$$

is an exact sequence in $Mod(\mathcal{O}_\mathcal{X})$ (i.e., using the fppf topology) with $\mathcal{F}_1$, $\mathcal{F}_2$ in $\mathcal{M}_\mathcal{X}$. In order to show that $\mathcal{F}_2$ is an object of $\mathcal{M}_\mathcal{X}$ it suffices to show that the sequence is also exact in the étale topology. To do this it suffices to show that any element of $H^1_{fppf}(x, \mathcal{F}_1)$ becomes zero on the members of an étale covering of x (for any object x of $\mathcal{X}$). This is true because $H^1_{fppf}(x, \mathcal{F}_1) = H^1_{\acute{e}tale}(x, \mathcal{F}_1)$ by Sheaves on Stacks, Lemma 58.22.2 and because of locality of cohohomology, see Cohomology on Sites, Lemma 19.8.3. This proves (2).

Part (3) follows from Lemma 62.7.2 and Sheaves on Stacks, Lemma 58.11.6.

Part (4)(b) for $R^i f_*\mathcal{F}$ computed in the étale cohomology follows from Lemma 62.7.3. Whereupon part (4)(a) follows from Sheaves on Stacks, Lemma 58.22.2 combined with (1) above.

Part (5) for the étale topology follows from Sheaves on Stacks, Lemma 58.11.7 and Lemma 62.7.2. The fppf version then follows as the colimit in the étale topology is already an fppf sheaf by part (1). □

Lemma 62.7.5. *Let $\mathcal{X}$ be an algebraic stack. With $\mathcal{M}_\mathcal{X}$ the category of locally quasi-coherent modules with the flat base change property.*

(1) *Let $f_j : \mathcal{X}_j \to \mathcal{X}$ be a family of smooth morphisms of algebraic stacks with $|\mathcal{X}| = \bigcup |f_j|(|\mathcal{X}_j|)$. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_\mathcal{X}$-modules on $\mathcal{X}_{étale}$. If each $f_j^{-1}\mathcal{F}$ is in $\mathcal{M}_{\mathcal{X}_i}$, then $\mathcal{F}$ is in $\mathcal{M}_\mathcal{X}$.*
(2) *Let $f_j : \mathcal{X}_j \to \mathcal{X}$ be a family of flat and locally finitely presented morphisms of algebraic stacks with $|\mathcal{X}| = \bigcup |f_j|(|\mathcal{X}_j|)$. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_\mathcal{X}$-modules on $\mathcal{X}_{fppf}$. If each $f_j^{-1}\mathcal{F}$ is in $\mathcal{M}_{\mathcal{X}_i}$, then $\mathcal{F}$ is in $\mathcal{M}_\mathcal{X}$.*

Proof. Part (1) follows from a combination of Lemmas 62.6.1 and 62.7.2. The proof of (2) is analogous to the proof of Lemma 62.6.3. Let $\mathcal{F}$ of a sheaf of $\mathcal{O}_\mathcal{X}$-modules on $\mathcal{X}_{fppf}$.

First, suppose there is a morphism $a : \mathcal{U} \to \mathcal{X}$ which is surjective, flat, locally of finite presentation, quasi-compact, and quasi-separated such that $a^*\mathcal{F}$ is locally quasi-coherent and has the flat base change property. Then there is an exact sequence

$$0 \to \mathcal{F} \to a_*a^*\mathcal{F} \to b_*b^*\mathcal{F}$$

where b is the morphism $b : \mathcal{U} \times_\mathcal{X} \mathcal{U} \to \mathcal{X}$, see Sheaves on Stacks, Proposition 58.18.7 and Lemma 58.18.10. Moreover, the pullback $b^*\mathcal{F}$ is the pullback of $a^*\mathcal{F}$ via one of the projection morphisms, hence is locally quasi-coherent and has the flat base change property, see Proposition 62.7.4. The modules $a_*a^*\mathcal{F}$ and $b_*b^*\mathcal{F}$ are locally quasi-coherent and have the flat base change property by Proposition 62.7.4. We conclude that $\mathcal{F}$ is locally quasi-coherent and has the flat base change property by Proposition 62.7.4.

Choose a scheme U and a surjective smooth morphism $x : U \to \mathcal{X}$. By part (1) it suffices to show that $x^*\mathcal{F}$ is locally quasi-coherent and has the flat base change property. Again by part (1) it suffices to do this (Zariski) locally on U, hence we may assume that U is affine. By Morphisms of Stacks, Lemma 61.18.10 there exists an fppf covering $\{a_i : U_i \to U\}$ such that each $x \circ a_i$ factors through some f_j. Hence the module $a_i^*\mathcal{F}$ on $(Sch/U_i)_{fppf}$ is locally quasi-coherent and has the flat base change property. After refining the covering we may assume $\{U_i \to U\}_{i=1,\ldots,n}$ is a standard fppf covering. Then $x^*\mathcal{F}$ is an fppf module on $(Sch/U)_{fppf}$ whose pullback by the morphism $a : U_1 \amalg \ldots \amalg U_n \to U$ is locally quasi-coherent and has the flat base change property. Hence by the previous paragraph we see that $x^*\mathcal{F}$ is locally quasi-coherent and has the flat base change property as desired. □

62.8. Parasitic modules

The following definition is compatible with Descent, Definition 31.7.1.

Definition 62.8.1. Let $\mathcal{X}$ be an algebraic stack. A presheaf of $\mathcal{O}_\mathcal{X}$-modules $\mathcal{F}$ is *parasitic* if we have $\mathcal{F}(x) = 0$ for any object x of $\mathcal{X}$ which lies over a scheme U such that the corresponding morphism $x : U \to \mathcal{X}$ is flat.

Here is a lemma with some properties of this notion.

Lemma 62.8.2. *Let $\mathcal{X}$ be an algebraic stack. Let $\mathcal{F}$ be a presheaf of $\mathcal{O}_\mathcal{X}$-modules.*

(1) *If $\mathcal{F}$ is parasitic and $g : \mathcal{Y} \to \mathcal{X}$ is a flat morphism of algebraic stacks, then $g^*\mathcal{F}$ is parasitic.*
(2) *For $\tau \in \{Zariski, étale, smooth, syntomic, fppf\}$ we have*
    (a) *the τ sheafification of a parasitic presheaf of modules is parasitic, and*
    (b) *the full subcategory of $Mod(\mathcal{X}_\tau, \mathcal{O}_\mathcal{X})$ consisting of parasitic modules is a Serre subcategory.*

(3) *Suppose $\mathcal{F}$ is a sheaf for the étale topology. Let $f_i : \mathcal{X}_i \to \mathcal{X}$ be a family of smooth morphisms of algebraic stacks such that $|\mathcal{X}| = \bigcup_i |f_i|(|\mathcal{X}_i|)$. If each $f_i^*\mathcal{F}$ is parasitic then so is $\mathcal{F}$.*

(4) *Suppose $\mathcal{F}$ is a sheaf for the fppf topology. Let $f_i : \mathcal{X}_i \to \mathcal{X}$ be a family of flat and locally finitely presented morphisms of algebraic stacks such that $|\mathcal{X}| = \bigcup_i |f_i|(|\mathcal{X}_i|)$. If each $f_i^*\mathcal{F}$ is parasitic then so is $\mathcal{F}$.*

Proof. To see part (1) let y be an object of $\mathcal{Y}$ which lies over a scheme V such that the corresponding morphism $y : V \to \mathcal{Y}$ is flat. Then $g(y) : V \to \mathcal{Y} \to \mathcal{X}$ is flat as a composition of flat morphisms (see Morphisms of Stacks, Lemma 61.17.2) hence $\mathcal{F}(g(y))$ is zero by assumption. Since $g^*\mathcal{F} = g^{-1}\mathcal{F}(y) = \mathcal{F}(g(y))$ we conclude $g^*\mathcal{F}$ is parasitic.

To see part (2)(a) note that if $\{x_i \to x\}$ is a τ-covering of $\mathcal{X}$, then each of the morphisms $x_i \to x$ lies over a flat morphism of schemes. Hence if x lies over a scheme U such that $x : U \to \mathcal{X}$ is flat, so do all of the objects x_i. Hence the presheaf $\mathcal{F}^+$ (see Sites, Section 9.10) is parasitic if the presheaf $\mathcal{F}$ is parasitic. This proves (2)(a) as the sheafification of $\mathcal{F}$ is $(\mathcal{F}^+)^+$.

Let $\mathcal{F}$ be a parasitic τ-module. It is immediate from the definitions that any submodule of $\mathcal{F}$ is parasitic. On the other hand, if $\mathcal{F}' \subset \mathcal{F}$ is a submodule, then it is equally clear that the presheaf $x \mapsto \mathcal{F}(x)/\mathcal{F}'(x)$ is parasitic. Hence the quotient $\mathcal{F}/\mathcal{F}'$ is a parasitic module by (2)(a). Finally, we have to show that given a short exact sequence $0 \to \mathcal{F}_1 \to \mathcal{F}_2 \to \mathcal{F}_3 \to 0$ with $\mathcal{F}_1$ and $\mathcal{F}_3$ parasitic, then $\mathcal{F}_2$ is parasitic. This follows immediately on evaluating on x lying over a scheme flat over $\mathcal{X}$. This proves (2)(b), see Homology, Lemma 10.7.2.

Let $f_i : \mathcal{X}_i \to \mathcal{X}$ be a jointly surjective family of smooth morphisms of algebraic stacks and assume each $f_i^*\mathcal{F}$ is parasitic. Let x be an object of $\mathcal{X}$ which lies over a scheme U such that $x : U \to \mathcal{X}$ is flat. Consider a surjective smooth covering $W_i \to U \times_{x,\mathcal{X}} \mathcal{X}_i$. Denote $y_i : W_i \to \mathcal{X}_i$ the projection. It follows that $\{f_i(y_i) \to x\}$ is a covering for the smooth topology on $\mathcal{X}$. Since a composition of flat morphisms is flat we see that $f_i^*\mathcal{F}(y_i) = 0$. On the other hand, as we saw in the proof of (1), we have $f_i^*\mathcal{F}(y_i) = \mathcal{F}(f_i(y_i))$. Hence we see that for some smooth covering $\{x_i \to x\}_{i \in I}$ in $\mathcal{X}$ we have $\mathcal{F}(x_i) = 0$. This implies $\mathcal{F}(x) = 0$ because the smooth topology is the same as as the étale topology, see More on Morphisms, Lemma 33.26.7. Namely, $\{x_i \to x\}_{i \in I}$ lies over a smooth covering $\{U_i \to U\}_{i \in I}$ of schemes. By the lemma just referenced there exists an étale covering $\{V_j \to U\}_{j \in J}$ which refines $\{U_i \to U\}_{i \in I}$. Denote $x'_j = x|_{V_j}$. Then $\{x'_j \to x\}$ is an étale covering in $\mathcal{X}$ refining $\{x_i \to x\}_{i \in I}$. This means the map $\mathcal{F}(x) \to \prod_{j \in J} \mathcal{F}(x'_j)$, which is injective as $\mathcal{F}$ is a sheaf in the étale topology, factors through $\mathcal{F}(x) \to \prod_{i \in I} \mathcal{F}(x_i)$ which is zero. Hence $\mathcal{F}(x) = 0$ as desired.

Proof of (4): omitted. Hint: similar, but simpler, than the proof of (3). □

Parasitic modules are preserved under absolutely any pushforward.

Lemma 62.8.3. *Let $\tau \in \{étale, fppf\}$. Let $\mathcal{X}$ be an algebraic stack. Let $\mathcal{F}$ be a parasitic object of $Mod(\mathcal{X}_\tau, \mathcal{O}_\mathcal{X})$.*

(1) *$H^i_\tau(\mathcal{X}, \mathcal{F}) = 0$ for all i.*

(2) *Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks. Then $R^i f_*\mathcal{F}$ (computed in τ-topology) is a parasitic object of $Mod(\mathcal{Y}_\tau, \mathcal{O}_\mathcal{Y})$.*

Proof. We first reduce (2) to (1). By Sheaves on Stacks, Lemma 58.20.2 we see that $R^i f_*\mathcal{F}$ is the sheaf associated to the presheaf

$$y \longmapsto H^i_\tau\Big(V \times_{y,\mathcal{Y}} \mathcal{X},\ \mathrm{pr}^{-1}\mathcal{F}\Big)$$

Here y is a typical object of $\mathcal{Y}$ lying over the scheme V. By Lemma 62.8.2 it suffices to show that these cohomology groups are zero when $y : V \to \mathcal{Y}$ is flat. Note that $\mathrm{pr} : V \times_{y,\mathcal{Y}} \mathcal{X} \to \mathcal{X}$ is flat as a base change of y. Hence by Lemma 62.8.2 we see that $\mathrm{pr}^{-1}\mathcal{F}$ is parasitic. Thus it suffices to prove (1).

To see (1) we can use the spectral sequence of Sheaves on Stacks, Proposition 58.19.1 to reduce this to the the case where $\mathcal{X}$ is an algebraic stack representable by an algebraic space. Note that in the spectral sequence each $f_p^{-1}\mathcal{F} = f_p^*\mathcal{F}$ is a parasitic module by Lemma 62.8.2 because the morphisms $f_p : \mathcal{U}_p = \mathcal{U} \times_{\mathcal{X}} \ldots \times_{\mathcal{X}} \mathcal{U} \to \mathcal{X}$ are flat. Reusing this spectral sequence one more time (as in the proof of the key Lemma 62.5.1) we reduce to the case where the algebraic stack $\mathcal{X}$ is representable by a scheme X. Then $H^i_\tau(\mathcal{X}, \mathcal{F}) = H^i((Sch/X)_\tau, \mathcal{F})$. In this case the vanishing follows easily from an argument with Čech coverings, see Descent, Lemma 31.7.2. □

The following lemma is one of the major reasons we care about parasitic modules. To understand the statement, recall that the functors $QCoh(\mathcal{O}_\mathcal{X}) \to Mod(\mathcal{X}_{étale}, \mathcal{O}_\mathcal{X})$ and $QCoh(\mathcal{O}_\mathcal{X}) \to Mod(\mathcal{O}_\mathcal{X})$ aren't exact in general.

Lemma 62.8.4. *Let $\mathcal{X}$ be an algebraic stack. Let $\mathcal{F}^\bullet$ be an exact complex in $QCoh(\mathcal{O}_\mathcal{X})$. Then the cohomology sheaves of $\mathcal{F}^\bullet$ in either the étale or the fppf topology are parasitic $\mathcal{O}_\mathcal{X}$-modules.*

Proof. Let $x : U \to \mathcal{X}$ be a flat morphism where U is a scheme. Then $x^*\mathcal{F}^\bullet$ is exact by Lemma 62.4.1. Hence the restriction $x^*\mathcal{F}^\bullet|_{U_{étale}}$ is exact which is what we had to prove. □

62.9. Quasi-coherent modules, I

We have seen that the category of quasi-coherent modules on an algebraic stack is equivalent to the category of quasi-coherent modules on a presentation, see Sheaves on Stacks, Section 58.14. This fact is the basis for the following.

Lemma 62.9.1. *Let $\mathcal{X}$ be an algebraic stack. Let $\mathcal{M}_\mathcal{X}$ be the category of locally quasi-coherent modules with the flat base change property, see Proposition 62.7.4. The inclusion functor $i : QCoh(\mathcal{O}_\mathcal{X}) \to \mathcal{M}_\mathcal{X}$ has a right adjoint*

$$Q : \mathcal{M}_\mathcal{X} \to QCoh(\mathcal{O}_\mathcal{X})$$

such that $Q \circ i$ is the identity functor.

Proof. Choose a scheme U and a surjective smooth morphism $f : U \to \mathcal{X}$. Set $R = U \times_\mathcal{X} U$ so that we obtain a smooth groupoid (U, R, s, t, c) in algebraic spaces with the property that $\mathcal{X} = [U/R]$, see Algebraic Stacks, Lemma 57.16.2. We may and do replace $\mathcal{X}$ by $[U/R]$. In the proof of Sheaves on Stacks, Proposition 58.13.1 we constructed a functor

$$q_1 : QCoh(U, R, s, t, c) \longrightarrow QCoh(\mathcal{O}_\mathcal{X}).$$

The construction of the inverse functor in the proof of Sheaves on Stacks, Proposition 58.13.1 works for objects of $\mathcal{M}_\mathcal{X}$ and induces a functor

$$q_2 : \mathcal{M}_\mathcal{X} \longrightarrow QCoh(U, R, s, t, c).$$

Namely, if $\mathcal{F}$ is an object of $\mathcal{M}_\mathcal{X}$ the we set

$$q_2(\mathcal{F}) = (f^*\mathcal{F}|_{U_{\acute{e}tale}}, \alpha)$$

where α is the isomorphism

$$t_{small}^*(f^*\mathcal{F}|_{U_{\acute{e}tale}}) \to t^*f^*\mathcal{F}|_{R_{\acute{e}tale}} \to s^*f^*\mathcal{F}|_{R_{\acute{e}tale}} \to s_{small}^*(f^*\mathcal{F}|_{U_{\acute{e}tale}})$$

where the outer two morphisms are the comparison maps. Note that $q_2(\mathcal{F})$ is quasi-coherent precisely because $\mathcal{F}$ is locally quasi-coherent (and we used the flat base change property in the construction of the descent datum α). We omit the verification that the cocycle condition (see Groupoids in Spaces, Definition 52.12.1) holds. We define $Q = q_1 \circ q_2$. Let $\mathcal{F}$ be an object of $\mathcal{M}_\mathcal{X}$ and let $\mathcal{G}$ be an object of $QCoh(\mathcal{O}_\mathcal{X})$. We have

$$\begin{aligned} Mor_{\mathcal{M}_\mathcal{X}}(i(\mathcal{G}), \mathcal{F}) &= Mor_{QCoh(U,R,s,t,c)}(q_2(\mathcal{G}), q_2(\mathcal{F})) \\ &= Mor_{QCoh(\mathcal{O}_\mathcal{X})}(\mathcal{G}, Q(\mathcal{F})) \end{aligned}$$

where the first equality is Sheaves on Stacks, Lemma 58.13.2 and the second equality holds because q_1 and q_2 are inverse equivalences of categories. The assertion $Q \circ i \cong \text{id}$ is a formal consequence of the fact that i is fully faithful. $\square$

Lemma 62.9.2. *Let $\mathcal{X}$ be an algebraic stack. Let $Q : \mathcal{M}_\mathcal{X} \to QCoh(\mathcal{O}_\mathcal{X})$ be the functor constructed in Lemma 62.9.1.*

(1) *The kernel of Q is exactly the collection of parasitic objects of $\mathcal{M}_\mathcal{X}$.*
(2) *For any object $\mathcal{F}$ of $\mathcal{M}_\mathcal{X}$ both the kernel and the cokernel of the adjunction map $Q(\mathcal{F}) \to \mathcal{F}$ are parasitic.*
(3) *The functor Q is exact.*

Proof. Write $\mathcal{X} = [U/R]$ as in the proof of Lemma 62.9.1. Let $\mathcal{F}$ be an object of $\mathcal{M}_\mathcal{X}$. It is clear from the proof of Lemma 62.9.1 that $\mathcal{F}$ is in the kernel of Q if and only if $\mathcal{F}|_{U_{\acute{e}tale}} = 0$. In particular, if $\mathcal{F}$ is parasitic then $\mathcal{F}$ is in the kernel. Next, let $x : V \to \mathcal{X}$ be a flat morphism, where V is a scheme. Set $W = V \times_\mathcal{X} U$ and consider the diagram

$$\begin{tikzcd} W \arrow[r, "q"] \arrow[d, "p"] & V \arrow[d] \\ U \arrow[r] & \mathcal{X} \end{tikzcd}$$

Note that the projection $p : W \to U$ is flat and the projection $q : W \to V$ is smooth and surjective. This implies that q_{small}^* is a faithful functor on quasi-coherent modules. By assumption $\mathcal{F}$ has the flat base change property so that we obtain $p_{small}^*\mathcal{F}|_{U_{\acute{e}tale}} \cong q_{small}^*\mathcal{F}|_{V_{\acute{e}tale}}$. Thus if $\mathcal{F}$ is in the kernel of Q, then $\mathcal{F}|_{V_{\acute{e}tale}} = 0$ which completes the proof of (1).

Part (2) follows from the discussion above and the fact that the map $Q(\mathcal{F}) \to \mathcal{F}$ becomes an isomorphism after restricting to $U_{\acute{e}tale}$.

To see part (3) note that Q is left exact as a right adjoint. Suppose that $0 \to \mathcal{F} \to \mathcal{G} \to \mathcal{H} \to 0$ is a short exact sequence in $\mathcal{M}_\mathcal{X}$. Let $\mathcal{E} = \text{Coker}(Q(\mathcal{G}) \to Q(\mathcal{H}))$ in $QCoh(\mathcal{O}_\mathcal{X})$. Since $QCoh(\mathcal{O}_\mathcal{X}) \to \mathcal{M}_\mathcal{X}$ is a left adjoint it is right exact. Hence we see that $Q(\mathcal{G}) \to Q(\mathcal{H}) \to \mathcal{E} \to 0$ is exact in $\mathcal{M}_\mathcal{X}$. Using Lemma 62.8.4 we find that the top row of the following commutative diagram has parasitic cohomology sheaves at $Q(\mathcal{F})$ and $Q(\mathcal{G})$:

$$\begin{tikzcd} 0 \arrow[r] & Q(\mathcal{F}) \arrow[r] \arrow[d, "a"] & Q(\mathcal{G}) \arrow[r] \arrow[d, "b"] & Q(\mathcal{H}) \arrow[r] \arrow[d, "c"] & \mathcal{E} \arrow[r] \arrow[d] & 0 \\ 0 \arrow[r] & \mathcal{F} \arrow[r] & \mathcal{G} \arrow[r] & \mathcal{H} \arrow[r] & 0 & \end{tikzcd}$$

The bottom row is exact and the vertical arrows a, b, c have parasitic kernel and cokernels by part (2). It follows that $\mathcal{E}$ is parasitic: in the quotient category of $Mod(\mathcal{O}_\mathcal{X})$/Parasitic (see Homology, Lemma 10.7.6 and Lemma 62.8.2) we see that a, b, c are isomorphisms and that the top row becomes exact. As it is also quasi-coherent, we conclude that $\mathcal{E}$ is zero because $\mathcal{E} = Q(\mathcal{E}) = 0$ by part (1). $\square$

62.10. Pushforward of quasi-coherent modules

Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks. Consider the pushforward

$$f_* : Mod(\mathcal{O}_\mathcal{X}) \longrightarrow Mod(\mathcal{O}_\mathcal{Y})$$

It turns out that this functor almost never preserves the subcategories of quasi-coherent sheaves. For example, consider the morphism of schemes

$$j : X = \mathbf{A}^2_k \setminus \{0\} \longrightarrow \mathbf{A}^2_k = Y.$$

Associated to this we have the corresponding morphism of algebraic stacks

$$f = j_{big} : \mathcal{X} = (Sch/X)_{fppf} \to (Sch/Y)_{fppf} = \mathcal{Y}$$

The pushforward $f_*\mathcal{O}_\mathcal{X}$ of the structure sheaf has global sections $k[x, y]$. Hence if $f_*\mathcal{O}_\mathcal{X}$ is quasi-coherent on $\mathcal{Y}$ then we would have $f_*\mathcal{O}_\mathcal{X} = \mathcal{O}_\mathcal{Y}$. However, consider $T = Spec(k) \to \mathbf{A}^2_k = Y$ mapping to 0. Then $\Gamma(T, f_*\mathcal{O}_\mathcal{X}) = 0$ because $X \times_Y T = \emptyset$ whereas $\Gamma(T, \mathcal{O}_\mathcal{Y}) = k$. On the positive side, we know from Coherent, Lemma 25.6.2 that for any flat morphism $T \to Y$ we have the equality $\Gamma(T, f_*\mathcal{O}_\mathcal{X}) = \Gamma(T, \mathcal{O}_\mathcal{Y})$ (this uses that j is quasi-compact and quasi-separated).

Let $f : \mathcal{X} \to \mathcal{Y}$ be a quasi-compact and quasi-separated morphism of algebraic stacks. We work around the problem mentioned above using the following three observations:

(1) f_* does preserve locally quasi-coherent modules (Lemma 62.6.2),
(2) f_* transforms a quasi-coherent sheaf into a locally quasi-coherent sheaf whose flat comparison maps are isomorphisms (Lemma 62.7.3), and
(3) locally quasi-coherent $\mathcal{O}_\mathcal{Y}$-modules with the flat base change property give rise to quasi-coherent modules on a presentation of $\mathcal{Y}$ and hence quasi-coherent modules on $\mathcal{Y}$, see Sheaves on Stacks, Section 58.14.

Thus we obtain a functor

$$f_{QCoh,*} : QCoh(\mathcal{O}_\mathcal{X}) \longrightarrow QCoh(\mathcal{O}_\mathcal{Y})$$

which is a right adjoint to $f^* : QCoh(\mathcal{O}_\mathcal{Y}) \to QCoh(\mathcal{O}_\mathcal{X})$ such that moreover

$$\Gamma(y, f_*\mathcal{F}) = \Gamma(y, f_{QCoh,*}\mathcal{F})$$

for any $y \in Ob(\mathcal{Y})$ such that the associated 1-morphism $y : V \to \mathcal{Y}$ is flat, see (insert future reference here). Moreover, a similar construction will produce functors $R^i f_{QCoh,*}$. However, these results will not be sufficient to produce a total direct image functor (of complexes with quasi-coherent cohomology sheaves).

Proposition 62.10.1. *Let $f : \mathcal{X} \to \mathcal{Y}$ be a quasi-compact and quasi-separated morphism of algebraic stacks. The functor $f^* : QCoh(\mathcal{O}_\mathcal{Y}) \to QCoh(\mathcal{O}_\mathcal{X})$ has a right adjoint*

$$f_{QCoh,*} : QCoh(\mathcal{O}_\mathcal{X}) \longrightarrow QCoh(\mathcal{O}_\mathcal{Y})$$

which can be defined as the composition

$$QCoh(\mathcal{O}_\mathcal{X}) \to \mathcal{M}_\mathcal{X} \xrightarrow{f_*} \mathcal{M}_\mathcal{Y} \xrightarrow{Q} QCoh(\mathcal{O}_\mathcal{Y})$$

where the functors f_* and Q are as in Proposition 62.7.4 and Lemma 62.9.1. Moreover, if we define $R^i f_{QCoh,*}$ as the composition

$$QCoh(\mathcal{O}_\mathcal{X}) \to \mathcal{M}_\mathcal{X} \xrightarrow{R^i f_*} \mathcal{M}_\mathcal{Y} \xrightarrow{Q} QCoh(\mathcal{O}_\mathcal{Y})$$

then the sequence of functors $\{R^i f_{QCoh,*}\}_{i \geq 0}$ forms a cohomological δ-functor.

Proof. This is a combination of the results mentioned in the statement. The adjointness can be shown as follows: Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_\mathcal{X}$-module and let $\mathcal{G}$ be a quasi-coherent $\mathcal{O}_\mathcal{Y}$-module. Then we have

$$\begin{aligned} Mor_{QCoh(\mathcal{O}_\mathcal{X})}(f^*\mathcal{G}, \mathcal{F}) &= Mor_{\mathcal{M}_\mathcal{Y}}(\mathcal{G}, f_*\mathcal{F}) \\ &= Mor_{QCoh(\mathcal{O}_\mathcal{Y})}(\mathcal{G}, Q(f_*\mathcal{F})) \\ &= Mor_{QCoh(\mathcal{O}_\mathcal{Y})}(\mathcal{G}, f_{QCoh,*}\mathcal{F}) \end{aligned}$$

the first equality by adjointness of f_* and f^* (for arbitrary sheaves of modules). By Proposition 62.7.4 we see that $f_*\mathcal{F}$ is an object of $\mathcal{M}_\mathcal{Y}$ (and can be computed in either the fppf or étale topology) and we obtain the second equality by Lemma 62.9.1. The third equality is the definition of $f_{QCoh,*}$.

To see that $\{R^i f_{QCoh,*}\}_{i \geq 0}$ is a cohomological δ-functor as defined in Homology, Definition 10.9.1 let

$$0 \to \mathcal{F}_1 \to \mathcal{F}_2 \to \mathcal{F}_3 \to 0$$

be a short exact sequence of $QCoh(\mathcal{O}_\mathcal{X})$. This sequence may not be an exact sequence in $Mod(\mathcal{O}_\mathcal{X})$ but we know that it is up to parasitic modules, see Lemma 62.8.4. Thus we may break up the sequence into short exact sequences

$$\begin{aligned} 0 \to \mathcal{P}_1 \to \mathcal{F}_1 \to \mathcal{I}_2 \to 0 \\ 0 \to \mathcal{I}_2 \to \mathcal{F}_2 \to \mathcal{Q}_2 \to 0 \\ 0 \to \mathcal{P}_2 \to \mathcal{Q}_2 \to \mathcal{I}_3 \to 0 \\ 0 \to \mathcal{I}_3 \to \mathcal{F}_3 \to \mathcal{P}_3 \to 0 \end{aligned}$$

of $Mod(\mathcal{O}_\mathcal{X})$ with $\mathcal{P}_i$ parasitic. Note that each of the sheaves $\mathcal{P}_j$, $\mathcal{I}_j$, $\mathcal{Q}_j$ is an object of $\mathcal{M}_\mathcal{X}$, see Proposition 62.7.4. Applying $R^i f_*$ we obtain long exact sequences

$$\begin{aligned} 0 \to f_*\mathcal{P}_1 \to f_*\mathcal{F}_1 \to f_*\mathcal{I}_2 \to R^1 f_*\mathcal{P}_1 \to \ldots \\ 0 \to f_*\mathcal{I}_2 \to f_*\mathcal{F}_2 \to f_*\mathcal{Q}_2 \to R^1 f_*\mathcal{I}_2 \to \ldots \\ 0 \to f_*\mathcal{P}_2 \to f_*\mathcal{Q}_2 \to f_*\mathcal{I}_3 \to R^1 f_*\mathcal{P}_2 \to \ldots \\ 0 \to f_*\mathcal{I}_3 \to f_*\mathcal{F}_3 \to f_*\mathcal{P}_3 \to R^1 f_*\mathcal{I}_3 \to \ldots \end{aligned}$$

where are the terms are objects of $\mathcal{M}_\mathcal{Y}$ by Proposition 62.7.4. By Lemma 62.8.3 the sheaves $R^i f_*\mathcal{P}_j$ are parasitic, hence vanish on applying the functor Q, see Lemma 62.9.2. Since Q is exact the maps

$$Q(R^i f_*\mathcal{F}_3) \cong Q(R^i f_*\mathcal{I}_3) \cong Q(R^i f_*\mathcal{Q}_2) \to Q(R^{i+1} f_*\mathcal{I}_2) \cong Q(R^{i+1} f_*\mathcal{F}_1)$$

can serve as the connecting map which turns the family of functors $\{R^i f_{QCoh,*}\}_{i \geq 0}$ into a cohomological δ-functor. $\square$

Lemma 62.10.2. *Let $f : \mathcal{X} \to \mathcal{Y}$ be a quasi-compact and quasi-separated morphism of algebraic stacks. Let $\mathcal{F}$ be a quasi-coherent sheaf on $\mathcal{X}$. Then there exists a spectral sequence with E_2-page*

$$E_2^{p,q} = H^p(\mathcal{Y}, R^q f_{QCoh,*}\mathcal{F})$$

converging to $H^{p+q}(\mathcal{X}, \mathcal{F})$.

Proof. By Cohomology on Sites, Lemma 19.14.4 the Leray spectral sequence with

$$E_2^{p,q} = H^p(\mathcal{Y}, R^q f_*\mathcal{F})$$

converges to $H^{p+q}(\mathcal{X}, \mathcal{F})$. The kernel and cokernel of the adjunction map

$$R^q f_{QCoh,*}\mathcal{F} \longrightarrow R^q f_*\mathcal{F}$$

are parasitic modules on $\mathcal{Y}$ (Lemma 62.9.2) hence have vanishing cohomology (Lemma 62.8.3). It follows formally that $H^p(\mathcal{Y}, R^q f_{QCoh,*}\mathcal{F}) = H^p(\mathcal{Y}, R^q f_*\mathcal{F})$ and we win. $\square$

Lemma 62.10.3. *Let $f : \mathcal{X} \to \mathcal{Y}$ and $g : \mathcal{Y} \to \mathcal{Z}$ be quasi-compact and quasi-separated morphisms of algebraic stacks. Let $\mathcal{F}$ be a quasi-coherent sheaf on $\mathcal{X}$. Then there exists a spectral sequence with E_2-page*

$$E_2^{p,q} = R^p g_{QCoh,*}(R^q f_{QCoh,*}\mathcal{F})$$

converging to $R^{p+q}(g \circ f)_{QCoh,*}\mathcal{F}$.

Proof. By Cohomology on Sites, Lemma 19.14.6 the Leray spectral sequence with

$$E_2^{p,q} = R^p g_*(R^q f_*\mathcal{F})$$

converges to $R^{p+q}(g \circ f)_*\mathcal{F}$. By the results of Proposition 62.7.4 all the terms of this spectral sequence are objects of $\mathcal{M}_\mathcal{Z}$. Applying the exact functor $Q_\mathcal{Z} : \mathcal{M}_\mathcal{Z} \to QCoh(\mathcal{O}_\mathcal{Z})$ we obtain a spectral sequence in $QCoh(\mathcal{O}_\mathcal{Z})$ convering to $R^{p+q}(g \circ f)_{QCoh,*}\mathcal{F}$. Hence the result follows if we can show that

$$Q_\mathcal{Z}(R^p g_*(R^q f_*\mathcal{F})) = Q_\mathcal{Z}(R^p g_*(Q_\mathcal{X}(R^q f_*\mathcal{F}))$$

This follows from the fact that the kernel and cokernel of the map

$$Q_\mathcal{X}(R^q f_*\mathcal{F}) \longrightarrow R^q f_*\mathcal{F}$$

are parasitic (Lemma 62.9.2) and that $R^p g_*$ transforms parasitic modules into parasitic modules (Lemma 62.8.3). $\square$

To end this section we make explicit the spectral sequences associated to a smooth covering by a scheme. Please compare with Sheaves on Stacks, Sections 58.19 and 58.20.

Proposition 62.10.4. *Let $f : \mathcal{U} \to \mathcal{X}$ be a morphism of algebraic stacks. Assume f is representable by algebraic spaces, surjective, flat, and locally of finite presentation. Let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_\mathcal{X}$-module. Then there is a spectral sequence*

$$E_2^{p,q} = H^q(\mathcal{U}_p, f_p^*\mathcal{F}) \Rightarrow H^{p+q}(\mathcal{X}, \mathcal{F})$$

where f_p is the morphism $\mathcal{U} \times_\mathcal{X} \ldots \times_\mathcal{X} \mathcal{U} \to \mathcal{X}$ ($p + 1$ factors).

Proof. This is a special case of Sheaves on Stacks, Proposition 58.19.1. $\square$

Proposition 62.10.5. *Let $f : \mathcal{U} \to \mathcal{X}$ and $g : \mathcal{X} \to \mathcal{Y}$ be composable morphisms of algebraic stacks. Assume that*

1. *f is representable by algebraic spaces, surjective, flat, locally of finite presentation, quasi-compact, and quasi-separated, and*
2. *g is quasi-compact and quasi-separated.*

If $\mathcal{F}$ is in $QCoh(\mathcal{O}_\mathcal{X})$ then there is a spectral sequence

$$E_2^{p,q} = R^q(g \circ f_p)_{QCoh,*} f_p^*\mathcal{F} \Rightarrow R^{p+q} g_{QCoh,*}\mathcal{F}$$

in $QCoh(\mathcal{O}_\mathcal{Y})$.

Proof. Note that each of the morphisms $f_p : \mathcal{U} \times_{\mathcal{X}} \ldots \times_{\mathcal{X}} \mathcal{U} \to \mathcal{X}$ is quasi-compact and quasi-separated, hence $g \circ f_p$ is quasi-compact and quasi-separated, hence the assertion makes sense (i.e., the functors $R^q(g \circ f_p)_{QCoh,*}$ are defined). There is a spectral sequence

$$E_2^{p,q} = R^q(g \circ f_p)_* f_p^{-1}\mathcal{F} \Rightarrow R^{p+q}g_*\mathcal{F}$$

by Sheaves on Stacks, Proposition 58.20.1. Applying the exact functor $Q_{\mathcal{Y}} : \mathcal{M}_{\mathcal{Y}} \to QCoh(\mathcal{O}_{\mathcal{Y}})$ gives the desired spectral sequence in $QCoh(\mathcal{O}_{\mathcal{Y}})$. □

62.11. The lisse-étale and the flat-fppf sites

In the book [**LMB00a**] many of the results above are proved using the lisse-étale site of an algebraic stack. We define this site here. In Examples, Section 64.37 we show that the lisse-étale site isn't functorial. We also define its analogue, the flat-fppf site, which is better suited to the development of algebraic stacks as given in the stacks project (because we use the fppf topology as our base topology). Of course the flat-fppf site isn't functorial either.

Definition 62.11.1. Let $\mathcal{X}$ be an algebraic stack.

1. The *lisse-étale site* of $\mathcal{X}$ is the full subcategory $\mathcal{X}_{lisse,étale}$[2] of $\mathcal{X}$ whose objects are those $x \in Ob(\mathcal{X})$ lying over a scheme U such that $x : U \to \mathcal{X}$ is smooth. A covering of $\mathcal{X}_{lisse,étale}$ is a family of morphisms $\{x_i \to x\}_{i\in I}$ of $\mathcal{X}_{lisse,étale}$ which forms a covering of $\mathcal{X}_{étale}$.
2. The *flat-fppf site* of $\mathcal{X}$ is the full subcategory $\mathcal{X}_{flat,fppf}$ of $\mathcal{X}$ whose objects are those $x \in Ob(\mathcal{X})$ lying over a scheme U such that $x : U \to \mathcal{X}$ is flat. A covering of $\mathcal{X}_{flat,fppf}$ is a family of morphisms $\{x_i \to x\}_{i\in I}$ of $\mathcal{X}_{flat,fppf}$ which forms a covering of $\mathcal{X}_{fppf}$.

We denote $\mathcal{O}_{\mathcal{X}_{lisse,étale}}$ the restriction of $\mathcal{O}_{\mathcal{X}}$ to the lisse-étale site and similarly for $\mathcal{O}_{\mathcal{X}_{flat,fppf}}$. The relationship between the lisse-étale site and the étale site is as follows (we mainly stick to ``topological'' properties in this lemma).

Lemma 62.11.2. *Let $\mathcal{X}$ be an algebraic stack.*

1. *The inclusion functor $\mathcal{X}_{lisse,étale} \to \mathcal{X}_{étale}$ is fully faithful, continuous and cocontinuous. It follows that*
   (a) *there is a morphism of topoi*
   $$g : Sh(\mathcal{X}_{lisse,étale}) \longrightarrow Sh(\mathcal{X}_{étale})$$
   with g^{-1} given by restriction,
   (b) *the functor g^{-1} has a left adjoint $g_!^{Sh}$ on sheaves of sets,*
   (c) *the adjunction maps $g^{-1}g_* \to id$ and $id \to g^{-1}g_!^{Sh}$ are isomorphisms,*
   (d) *the functor g^{-1} has a left adjoint $g_!$ on abelian sheaves,*
   (e) *the adjunction map $id \to g^{-1}g_!$ is an isomorphism, and*
   (f) *we have $g^{-1}\mathcal{O}_{\mathcal{X}} = \mathcal{O}_{\mathcal{X}_{lisse,étale}}$ hence g induces a flat morphism of ringed topoi such that $g^{-1} = g^*$.*
2. *The inclusion functor $\mathcal{X}_{flat,fppf} \to \mathcal{X}_{fppf}$ is fully faithful, continuous and cocontinuous. It follows that*

[2] In the literature the site is denoted Lis-ét($\mathcal{X}$) or Lis-Et($\mathcal{X}$) and the associated topos is denoted $\mathcal{X}_{\text{lis-ét}}$ or $\mathcal{X}_{\text{lis-et}}$. In the stacks project our convention is to name the site and denote the corresponding topos by $Sh(\mathcal{C})$.

(a) *there is a morphism of topoi*
$$g : Sh(\mathcal{X}_{flat,fppf}) \longrightarrow Sh(\mathcal{X}_{fppf})$$
with g^{-1} given by restriction,
(b) *the functor g^{-1} has a left adjoint $g_!^{Sh}$ on sheaves of sets,*
(c) *the adjunction maps $g^{-1}g_* \to id$ and $id \to g^{-1}g_!^{Sh}$ are isomorphisms,*
(d) *the functor g^{-1} has a left adjoint $g_!$ on abelian sheaves,*
(e) *the adjunction map $id \to g^{-1}g_!$ is an isomorphism, and*
(f) *we have $g^{-1}\mathcal{O}_\mathcal{X} = \mathcal{O}_{\mathcal{X}_{flat,fppf}}$ hence g induces a flat morphism of ringed topoi such that $g^{-1} = g^*$.*

Proof. In both cases it is immediate that the functor is fully faithful, continuous, and cocontinuous (see Sites, Definitions 9.13.1 and 9.18.1). Hence properties (a), (b), (c) follow from Sites, Lemmas 9.19.5 and 9.19.7. Parts (d), (e) follow from Modules on Sites, Lemmas 16.16.2 and 16.16.4. Part (f) is immediate. ☐

Lemma 62.11.3. *Let $\mathcal{X}$ be an algebraic stack. Notation as in Lemma 62.11.2.*

(1) *There exists a functor*
$$g_! : Mod(\mathcal{X}_{lisse,étale}, \mathcal{O}_{\mathcal{X}_{lisse,étale}}) \longrightarrow Mod(\mathcal{X}_{étale}, \mathcal{O}_\mathcal{X})$$
which is left adjoint to g^*. Moreover it agrees with the functor $g_!$ on abelian sheaves and $g^*g_! = id$.
(2) *There exists a functor*
$$g_! : Mod(\mathcal{X}_{flat,fppf}, \mathcal{O}_{\mathcal{X}_{flat,fppf}}) \longrightarrow Mod(\mathcal{X}_{fppf}, \mathcal{O}_\mathcal{X})$$
which is left adjoint to g^*. Moreover it agrees with the functor $g_!$ on abelian sheaves and $g^*g_! = id$.

Proof. In both cases, the existence of the functor $g_!$ follows from Modules on Sites, Lemma 16.35.1. To see that $g_!$ agrees with the functor on abelian sheaves we will show the maps (16.35.2.1) of Modules on Sites, Remark 16.35.2 are isomorphisms.

Lisse-étale case. Let $x \in Ob(\mathcal{X}_{lisse,étale})$ lying over a scheme U with $x : U \to \mathcal{X}$ smooth. Consider the induced fully faithful functor
$$g' : \mathcal{X}_{lisse,étale}/x \longrightarrow \mathcal{X}_{étale}/x$$
The right hand side is identified with $(Sch/U)_{étale}$ and the left hand side with the full subcategory of schemes U'/U such that the composition $U' \to U \to \mathcal{X}$ is smooth. Thus Étale Cohomology, Lemma 38.49.2 applies.

Flat-fppf case. Let $x \in Ob(\mathcal{X}_{flat,fppf})$ lying over a scheme U with $x : U \to \mathcal{X}$ flat. Consider the induced fully faithful functor
$$g' : \mathcal{X}_{flat,fppf}/x \longrightarrow \mathcal{X}_{fppf}/x$$
The right hand side is identified with $(Sch/U)_{fppf}$ and the left hand side with the full subcategory of schemes U'/U such that the composition $U' \to U \to \mathcal{X}$ is flat. Thus Étale Cohomology, Lemma 38.49.2 applies.

In both cases the equality $g^*g_! = \text{id}$ follows from $g^* = g^{-1}$ and the equality for abelian sheaves in Lemma 62.11.2. ☐

Lemma 62.11.4. *Let $\mathcal{X}$ be an algebraic stack. Notation as in Lemmas 62.11.2 and 62.11.3.*

(1) *We have* $g_!\mathcal{O}_{\mathcal{X}_{lisse,étale}} = \mathcal{O}_\mathcal{X}$.
(2) *We have* $g_!\mathcal{O}_{\mathcal{X}_{flat,fppf}} = \mathcal{O}_\mathcal{X}$.

Proof. In this proof we write $\mathcal{C} = \mathcal{X}_{étale}$ (resp. $\mathcal{C} = \mathcal{X}_{fppf}$) and we denote $\mathcal{C}' = \mathcal{X}_{lisse,étale}$ (resp. $\mathcal{C}' = \mathcal{X}_{flat,fppf}$). Then $\mathcal{C}'$ is a full subcategory of $\mathcal{C}$. In this proof we will think of objects V of $\mathcal{C}$ as schemes over $\mathcal{X}$ and objects U of $\mathcal{C}'$ as schemes smooth (resp. flat) over $\mathcal{X}$. Finally, we write $\mathcal{O} = \mathcal{O}_\mathcal{X}$ and $\mathcal{O}' = \mathcal{O}_{\mathcal{X}_{lisse,étale}}$ (resp. $\mathcal{O}' = \mathcal{O}_{\mathcal{X}_{flat,fppf}}$). In the notation above we have $\mathcal{O}(V) = \Gamma(V, \mathcal{O}_V)$ and $\mathcal{O}'(U) = \Gamma(U, \mathcal{O}_U)$. Consider the $\mathcal{O}$-module homomorphism $g_!\mathcal{O}' \to \mathcal{O}$ adjoint to the identification $\mathcal{O}' = g^{-1}\mathcal{O}$.

To see that $g_!\mathcal{O}' \to \mathcal{O}$ is surjective it suffices to show that $1 \in \Gamma(\mathcal{C}, \mathcal{O})$ is locally in the image. Choose an object U of $\mathcal{C}'$ corresponding to a surjective smooth morphism $U \to \mathcal{X}$. Then viewing U both as an object of $\mathcal{C}'$ and $\mathcal{C}$ we have $g_!\mathcal{O}'(U) = \mathcal{O}'(U) = \mathcal{O}(U)$ whence $1 \in \mathcal{O}(U)$ is in the image. Since U surjects onto the final object of $Sh(\mathcal{C})$ we conclude $g_!\mathcal{O}' \to \mathcal{O}$ is surjective.

Suppose that $s \in g_!\mathcal{O}'(V)$ is a section mapping to zero in $\mathcal{O}(V)$. To finish the proof we have to show that s is zero. After replacing V by the members of a covering we may assume s is an element of the colimit

$$colim_{V\to U}\,\mathcal{O}'(U)$$

Say $s = \sum(\varphi_i, s_i)$ is a finite sum with $\varphi_i : V \to U_i$, U_i smooth (resp. flat) over $\mathcal{X}$, and $s_i \in \Gamma(U_i, \mathcal{O}_{U_i})$. Choose a scheme W surjective étale over the algebraic space $U = U_1 \times_\mathcal{X} \ldots \times_\mathcal{X} U_n$. Note that W is still smooth (resp. flat) over $\mathcal{X}$, i.e., defines an object of $\mathcal{C}'$. The fibre product

$$V' = V \times_{(\varphi_1,\ldots,\varphi_n),U} W$$

is surjective étale over V, hence it suffices to show that s maps to zero in $g_!\mathcal{O}'(V')$. Note that the restriction $\sum(\varphi_i, s_i)|_{V'}$ corresponds to the sum of the pullbacks of the functions s_i to W. In other words, we have reduced to the case of (φ, s) where $\varphi : V \to U$ is a morphism with U in $\mathcal{C}'$ and $s \in \mathcal{O}'(U)$ restricts to zero in $\mathcal{O}(V)$. By the commutative diagram

$$\begin{tikzcd} V \arrow[r, "(\varphi,0)"'] \arrow[dr, "\varphi"'] & U \times \mathbf{A}^1 \\ & U \arrow[u, "(\mathrm{id},0)"'] \end{tikzcd}$$

we see that $((\varphi, 0) : V \to U \times \mathbf{A}^1, \mathrm{pr}_2^*x)$ represents zero in the colimit above. Hence we may replace U by $U \times \mathbf{A}^1$, φ by $(\varphi, 0)$ and s by $\mathrm{pr}_1^*s + \mathrm{pr}_2^*x$. Thus we may assume that the vanishing locus $Z : s = 0$ in U of s is smooth (resp. flat) over $\mathcal{X}$. Then we see that $(V \to Z, 0)$ and (φ, s) have the same value in the colimit, i.e., we see that the element s is zero as desired. $\square$

The lisse-étale and the flat-fppf sites can be used to characterize parasitic modules as follows.

Lemma 62.11.5. *Let $\mathcal{X}$ be an algebraic stack.*

(1) *Let $\mathcal{F}$ be an $\mathcal{O}_\mathcal{X}$-module with the flat base change property on $\mathcal{X}_{étale}$. The following are equivalent*
   (a) *$\mathcal{F}$ is parasitic, and*
   (b) *$g^*\mathcal{F} = 0$ where $g : Sh(\mathcal{X}_{lisse,étale}) \to Sh(\mathcal{X}_{étale})$ is as in Lemma 62.11.2.*
(2) *Let $\mathcal{F}$ be an $\mathcal{O}_\mathcal{X}$-module on $\mathcal{X}_{fppf}$. The following are equivalent*
   (a) *$\mathcal{F}$ is parasitic, and*

(b) $g^*\mathcal{F} = 0$ *where* $g : Sh(\mathcal{X}_{flat,fppf}) \to Sh(\mathcal{X}_{fppf})$ *is as in Lemma 62.11.2.*

Proof. Part (2) is immediate from the definitions (this is one of the advantages of the flat-fppf site over the lisse-étale site). The implication (1)(a) ⇒ (1)(b) is immediate as well. To see (1)(b) ⇒ (1)(a) let U be a scheme and let $x : U \to \mathcal{X}$ be a surjective smooth morphism. Then x is an object of the lisse-étale site of $\mathcal{X}$. Hence we see that (1)(b) implies that $\mathcal{F}|_{U_{\acute{e}tale}} = 0$. Let $V \to \mathcal{X}$ be an flat morphism where V is a scheme. Set $W = U \times_{\mathcal{X}} V$ and consider the diagram

$$\begin{tikzcd} W \arrow[r, "q"] \arrow[d, "p"] & V \arrow[d] \\ U \arrow[r] & \mathcal{X} \end{tikzcd}$$

Note that the projection $p : W \to U$ is flat and the projection $q : W \to V$ is smooth and surjective. This implies that q_{small}^* is a faithful functor on quasi-coherent modules. By assumption $\mathcal{F}$ has the flat base change property so that we obtain $p_{small}^*\mathcal{F}|_{U_{\acute{e}tale}} \cong q_{small}^*\mathcal{F}|_{V_{\acute{e}tale}}$. Thus if $\mathcal{F}$ is in the kernel of g^*, then $\mathcal{F}|_{V_{\acute{e}tale}} = 0$ as desired. □

Lemma 62.11.6. *Let $\mathcal{X}$ be an algebraic stack. Notation as in Lemmas 62.11.2 and 62.11.3.*

(1) *The functor $g_! : Ab(\mathcal{X}_{lisse,\acute{e}tale}) \to Ab(\mathcal{X}_{\acute{e}tale})$ has a left derived functor*

$$Lg_! : D(\mathcal{X}_{lisse,\acute{e}tale}) \longrightarrow D(\mathcal{X}_{\acute{e}tale})$$

which is left adjoint to g^{-1} and such that $g^{-1}Lg_! = id$.

(2) *The functor $g_! : Mod(\mathcal{X}_{lisse,\acute{e}tale}, \mathcal{O}_{\mathcal{X}_{lisse,\acute{e}tale}}) \to Mod(\mathcal{X}_{\acute{e}tale}, \mathcal{O}_{\mathcal{X}})$ has a left derived functor*

$$Lg_! : D(\mathcal{O}_{\mathcal{X}_{lisse,\acute{e}tale}}) \longrightarrow D(\mathcal{X}_{\acute{e}tale}, \mathcal{O}_{\mathcal{X}})$$

which is left adjoint to g^* and such that $g^*Lg_! = id$.

(3) *The functor $g_! : Ab(\mathcal{X}_{flat,fppf}) \to Ab(\mathcal{X}_{fppf})$ has a left derived functor*

$$Lg_! : D(\mathcal{X}_{flat,fppf}) \longrightarrow D(\mathcal{X}_{fppf})$$

which is left adjoint to g^{-1} and such that $g^{-1}Lg_! = id$.

(4) *The functor $g_! : Mod(\mathcal{X}_{flat,fppf}, \mathcal{O}_{\mathcal{X}_{flat,fppf}}) \to Mod(\mathcal{X}_{fppf}, \mathcal{O}_{\mathcal{X}})$ has a left derived functor*

$$Lg_! : D(\mathcal{O}_{\mathcal{X}_{flat,fppf}}) \longrightarrow D(\mathcal{O}_{\mathcal{X}})$$

which is left adjoint to g^* and such that $g^*Lg_! = id$.

Warning: It is not clear (a priori) that $Lg_!$ on modules agrees with $Lg_!$ on abelian sheaves, see Cohomology on Sites, Remark 19.22.2.

Proof. The existence of the functor $Lg_!$ and adjointess to g^* is Cohomology on Sites, Lemma 19.22.1. (For the case of abelian sheaves use the constant sheaf $\mathbf{Z}$ as the structure sheaves.) Moreover, it is computed on a complex $\mathcal{H}^\bullet$ by taking a suitable left resolution $\mathcal{K}^\bullet \to \mathcal{H}^\bullet$ and applying the functor $g_!$ to $\mathcal{K}^\bullet$. Since $g^{-1}g_!\mathcal{K}^\bullet = \mathcal{K}^\bullet$ by Lemmas 62.11.3 and 62.11.2 we see that the final assertion holds in each case. □

The lisse-étale site is functorial for smooth morphisms of algebraic stacks and the flat-fppf site is functorial for flat morphisms of algebraic stacks.

Lemma 62.11.7. *Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks.*

(1) *If f is smooth, then f restricts to a continuous and cocontinuous functor $\mathcal{X}_{lisse,étale} \to \mathcal{Y}_{lisse,étale}$ which gives a morphism of ringed topoi fitting into the following commutative diagram*

$$\begin{tikzcd} Sh(\mathcal{X}_{lisse,étale}) \arrow[r, "g'"'] \arrow[d, "f'"'] & Sh(\mathcal{X}_{étale}) \arrow[d, "f"] \\ Sh(\mathcal{Y}_{lisse,étale}) \arrow[r, "g"] & Sh(\mathcal{Y}_{étale}) \end{tikzcd}$$

We have $f'_*(g')^{-1} = g^{-1}f_*$ and $g'_!(f')^{-1} = f^{-1}g_!$.

(2) *If f is flat, then f restricts to a continuous and cocontinuous functor $\mathcal{X}_{flat,fppf} \to \mathcal{Y}_{flat,fppf}$ which gives a morphism of ringed topoi fitting into the following commutative diagram*

$$\begin{tikzcd} Sh(\mathcal{X}_{flat,fppf}) \arrow[r, "g'"'] \arrow[d, "f'"'] & Sh(\mathcal{X}_{fppf}) \arrow[d, "f"] \\ Sh(\mathcal{Y}_{flat,fppf}) \arrow[r, "g"] & Sh(\mathcal{Y}_{fppf}) \end{tikzcd}$$

We have $f'_*(g')^{-1} = g^{-1}f_*$ and $g'_!(f')^{-1} = f^{-1}g_!$.

Proof. The initial statement comes from the fact that if $x \in Ob(\mathcal{X})$ lies over a scheme U such that $x : U \to \mathcal{X}$ is smooth (resp. flat) and if f is smooth (resp. flat) then $f(x) : U \to \mathcal{Y}$ is smooth (resp. flat), see Morphisms of Stacks, Lemmas 61.22.2 and 61.17.2. The induced functor $\mathcal{X}_{lisse,étale} \to \mathcal{Y}_{lisse,étale}$ (resp. $\mathcal{X}_{flat,fppf} \to \mathcal{Y}_{flat,fppf}$) is continuous and cocontinuous by our definition of coverings in these categories. Finally, the commutativity of the diagram is a consequence of the fact that the horizontal morphisms are given by the inclusion functors (see Lemma 62.11.2) and Sites, Lemma 9.19.2.

To show that $f'_*(g')^{-1} = g^{-1}f_*$ let $\mathcal{F}$ be a sheaf on $\mathcal{X}_{étale}$ (resp. $\mathcal{X}_{fppf}$). There is a canonical pullback map

$$g^{-1}f_*\mathcal{F} \longrightarrow f'_*(g')^{-1}\mathcal{F}$$

see Sites, Section 9.39. We claim this map is an isomorphism. To prove this pick an object y of $\mathcal{Y}_{lisse,étale}$ (resp. $\mathcal{Y}_{flat,fppf}$). Say y lies over the scheme V such that $y : V \to \mathcal{Y}$ is smooth (resp. flat). Since g^{-1} is the restriction we find that

$$\left(g^{-1}f_*\mathcal{F}\right)(y) = \Gamma(V \times_{y,\mathcal{Y}} \mathcal{X}, \ \mathrm{pr}^{-1}\mathcal{F})$$

by Sheaves on Stacks, Equation (58.5.0.1). Let $(V \times_{y,\mathcal{Y}} \mathcal{X})' \subset V \times_{y,\mathcal{Y}} \mathcal{X}$ be the full subcategory consisting of objects $z : W \to V \times_{y,\mathcal{Y}} \mathcal{X}$ such that the induced morphism $W \to \mathcal{X}$ is smooth (resp. flat). Denote

$$\mathrm{pr}' : (V \times_{y,\mathcal{Y}} \mathcal{X})' \longrightarrow \mathcal{X}_{lisse,étale} \text{ (resp. } \mathcal{X}_{flat,fppf})$$

the restriction of the functor pr used in the formula above. Exactly the same argument that proves Sheaves on Stacks, Equation (58.5.0.1) shows that for any sheaf $\mathcal{H}$ on $\mathcal{X}_{lisse,étale}$ (resp. $\mathcal{X}_{flat,fppf}$) we have

$$f'_*\mathcal{H}(y) = \Gamma((V \times_{y,\mathcal{Y}} \mathcal{X})', \ (\mathrm{pr}')^{-1}\mathcal{H}) \tag{62.11.7.1}$$

Since $(g')^{-1}$ is restriction we see that

$$\left(f'_*(g')^{-1}\mathcal{F}\right)(y) = \Gamma((V \times_{y,\mathcal{Y}} \mathcal{X})', \ \mathrm{pr}^{-1}\mathcal{F}|_{(V \times_{y,\mathcal{Y}} \mathcal{X})'})$$

By Sheaves on Stacks, Lemma 58.22.3 we see that

$$\Gamma((V \times_{y, \mathcal{Y}} \mathcal{X})', \ \mathrm{pr}^{-1}\mathcal{F}|_{(V \times_{y, \mathcal{Y}} \mathcal{X})'}) = \Gamma(V \times_{y, \mathcal{Y}} \mathcal{X}, \ \mathrm{pr}^{-1}\mathcal{F})$$

are equal as desired; although we omit the verification of the assumptions of the lemma we note that the fact that $V \to \mathcal{Y}$ is smooth (resp. flat) is used to verify the second condition.

Finally, the equality $g'_!(f')^{-1} = f^{-1}g_!$ follows formally from the equality $f'_*(g')^{-1} = g^{-1}f_*$ by the adjointness of f^{-1} and f_*, the adjointness of $g_!$ and g^{-1}, and their ``primed'' versions. □

Lemma 62.11.8. *With assumptions and notation as in Lemma 62.11.7. We have*

$$g^{-1} \circ Rf_* = Rf'_* \circ (g')^{-1} \quad \textit{and} \quad L(g')_! \circ (f')^{-1} = f^{-1} \circ Lg_!$$

on unbounded derived categories (both for the case of modules and for the case of abelian sheaves).

Proof. Let $\mathcal{F}$ be an abelian sheaf on $\mathcal{X}_{\acute{e}tale}$ (resp. $\mathcal{X}_{fppf}$). We first show that the canonical (base change) map

$$g^{-1}Rf_*\mathcal{F} \longrightarrow Rf'_*(g')^{-1}\mathcal{F}$$

is an isomorphism. To do this let y be an object of $\mathcal{Y}_{lisse,\acute{e}tale}$ (resp. $\mathcal{Y}_{flat,fppf}$). Say y lies over the scheme V such that $y : V \to \mathcal{Y}$ is smooth (resp. flat). Since g^{-1} is the restriction we find that

$$\left(g^{-1}R^pf_*\mathcal{F}\right)(y) = H^p_\tau(V \times_{y, \mathcal{Y}} \mathcal{X}, \ \mathrm{pr}^{-1}\mathcal{F})$$

where $\tau = \acute{e}tale$ (resp. $\tau = fppf$), see Sheaves on Stacks, Lemma 58.20.2. By (62.11.7.1) for any sheaf $\mathcal{H}$ on $\mathcal{X}_{lisse,\acute{e}tale}$ (resp. $\mathcal{X}_{flat,fppf}$)

$$f'_*\mathcal{H}(y) = \Gamma((V \times_{y, \mathcal{Y}} \mathcal{X})', \ (\mathrm{pr}')^{-1}\mathcal{H})$$

An object of $(V \times_{y, \mathcal{Y}} \mathcal{X})'$ can be seen as a pair (x, φ) where x is an object of $\mathcal{X}_{lisse,\acute{e}tale}$ (resp. $\mathcal{X}_{flat,fppf}$) and $\varphi : f(x) \to y$ is a morphism in $\mathcal{Y}$. We can also think of φ as a section of $(f')^{-1}h_y$ over x. Thus $(V \times_{\mathcal{Y}} \mathcal{X})'$ is the localization of the site $\mathcal{X}_{lisse,\acute{e}tale}$ (resp. $\mathcal{X}_{flat,fppf}$) at the sheaf of sets $(f')^{-1}h_y$, see Sites, Lemma 9.26.3. The morphism

$$\mathrm{pr}' : (V \times_{y, \mathcal{Y}} \mathcal{X})' \to \mathcal{X}_{lisse,\acute{e}tale} \text{ (resp. } \mathrm{pr}' : (V \times_{y, \mathcal{Y}} \mathcal{X})' \to \mathcal{X}_{flat,fppf})$$

is the localization morphism. In particular, the pullback $(\mathrm{pr}')^{-1}$ preserves injective abelian sheaves, see Cohomology on Sites, Lemma 19.13.3. At this point exactly the same argument as in Sheaves on Stacks, Lemma 58.20.2 shows that

$$R^pf'_*\mathcal{H}(y) = H^p_\tau((V \times_{y, \mathcal{Y}} \mathcal{X})', \ (\mathrm{pr}')^{-1}\mathcal{H}) \tag{62.11.8.1}$$

where $\tau = \acute{e}tale$ (resp. $\tau = fppf$). Since $(g')^{-1}$ is given by restriction we conclude that

$$\left(R^pf'_*(g')^*\mathcal{F}\right)(y) = H^p_\tau((V \times_{y, \mathcal{Y}} \mathcal{X})', \ \mathrm{pr}^{-1}\mathcal{F}|_{(V \times_{y, \mathcal{Y}} \mathcal{X})'})$$

Finally, we can apply Sheaves on Stacks, Lemma 58.22.3 to see that

$$H^p_\tau((V \times_{y, \mathcal{Y}} \mathcal{X})', \ \mathrm{pr}^{-1}\mathcal{F}|_{(V \times_{y, \mathcal{Y}} \mathcal{X})'}) = H^p_\tau(V \times_{y, \mathcal{Y}} \mathcal{X}, \ \mathrm{pr}^{-1}\mathcal{F})$$

are equal as desired; although we omit the verification of the assumptions of the lemma we note that the fact that $V \to \mathcal{Y}$ is smooth (resp. flat) is used to verify the second condition.

The rest of the proof is formal. Since cohomology of abelian groups and sheaves of modules agree we also conclude that $g^{-1}Rf_*\mathcal{F} = Rf'_*(g')^{-1}\mathcal{F}$ when $\mathcal{F}$ is a sheaf of modules on $\mathcal{X}_{\acute{e}tale}$ (resp. $\mathcal{X}_{fppf}$).

Next we show that for $\mathcal{G}$ (either sheaf of modules or abelian groups) on $\mathcal{Y}_{lisse,étale}$ (resp. $\mathcal{Y}_{flat,fppf}$) the canonical map

$$L(g')_!(f')^{-1}\mathcal{G} \to f^{-1}Lg_!\mathcal{G}$$

is an isomorphism. To see this it is enough to prove for any injective sheaf $\mathcal{I}$ on $\mathcal{X}_{étale}$ (resp. $\mathcal{X}_{fppf}$) that the induced map

$$Hom(L(g')_!(f')^{-1}\mathcal{G}, \mathcal{I}[n]) \leftarrow Hom(f^{-1}Lg_!\mathcal{G}, \mathcal{I}[n])$$

is an isomorphism for all $n \in \mathbf{Z}$. (Hom's taken in suitable derived categories.) By the adjointness of f^{-1} and Rf_*, the adjointness of $Lg_!$ and g^{-1}, and their ``primed'' versions this follows from the isomorphism $g^{-1}Rf_*\mathcal{I} \to Rf'_*(g')^{-1}\mathcal{I}$ proved above.

In the case of a bounded complex $\mathcal{G}^\bullet$ (of modules or abelian groups) on $\mathcal{Y}_{lisse,étale}$ (resp. $\mathcal{Y}_{fppf}$) the canonical map

$$L(g')_!(f')^{-1}\mathcal{G}^\bullet \to f^{-1}Lg_!\mathcal{G}^\bullet \tag{62.11.8.2}$$

is an isomorphism as follows from the case of a sheaf by the usual arguments involving truncations and the fact that the functors $L(g')_!(f')^{-1}$ and $f^{-1}Lg_!$ are exact functors of triangulated categories.

Suppose that $\mathcal{G}^\bullet$ is a bounded above complex (of modules or abelian groups) on $\mathcal{Y}_{lisse,étale}$ (resp. $\mathcal{Y}_{fppf}$). The canonical map (62.11.8.2) is an isomorphism because we can use the stupid truncations $\sigma_{\geq -n}$ (see Homology, Section 10.11) to write $\mathcal{G}^\bullet$ as a colimit $\mathcal{G}^\bullet = colim\, \mathcal{G}^\bullet_n$ of bounded complexes. This gives a distinguished triangle

$$\bigoplus\nolimits_{n\geq 1} \mathcal{G}^\bullet_n \to \bigoplus\nolimits_{n\geq 1} \mathcal{G}^\bullet_n \to \mathcal{G}^\bullet \to \ldots$$

and each of the functors $L(g')_!$, $(f')^{-1}$, f^{-1}, $Lg_!$ commutes with direct sums (of complexes).

If $\mathcal{G}^\bullet$ is an arbitrary complex (of modules or abelian groups) on $\mathcal{Y}_{lisse,étale}$ (resp. $\mathcal{Y}_{fppf}$) then we use the canonical truncations $\tau_{\leq n}$ (see Homology, Section 10.11) to write $\mathcal{G}^\bullet$ as a colimit of bounded above complexes and we repeat the argument of the paragraph above.

Finally, by the adjointness of f^{-1} and Rf_*, the adjointness of $Lg_!$ and g^{-1}, and their ``primed'' versions we conclude that the first identity of the lemma follows from the second in full generality. □

62.12. Quasi-coherent modules, II

In this section we explain how to think of quasi-coherent modules on an algebraic stack in terms of its lisse-étale or flat-fppf site.

Lemma 62.12.1. *Let $\mathcal{X}$ be an algebraic stack.*

(1) *Let $f_j : \mathcal{X}_j \to \mathcal{X}$ be a family of smooth morphisms of algebraic stacks with $|\mathcal{X}| = \bigcup |f_j|(|\mathcal{X}_j|)$. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_\mathcal{X}$-modules on $\mathcal{X}_{étale}$. If each $f_j^{-1}\mathcal{F}$ is quasi-coherent, then so is $\mathcal{F}$.*
(2) *Let $f_j : \mathcal{X}_j \to \mathcal{X}$ be a family of flat and locally finitely presented morphisms of algebraic stacks with $|\mathcal{X}| = \bigcup |f_j|(|\mathcal{X}_j|)$. Let $\mathcal{F}$ be a sheaf of $\mathcal{O}_\mathcal{X}$-modules on $\mathcal{X}_{fppf}$. If each $f_j^{-1}\mathcal{F}$ is quasi-coherent, then so is $\mathcal{F}$.*

Proof. Proof of (1). We may replace each of the algebraic stacks $\mathcal{X}_j$ by a scheme U_j (using that any algebraic stack has a smooth covering by a scheme and that compositions of smooth morphisms are smooth, see Morphisms of Stacks, Lemma 61.22.2). The pullback of $\mathcal{F}$ to $(Sch/U_j)_{étale}$ is still locally quasi-coherent, see Sheaves on Stacks, Lemma 58.11.2. Then $f = \coprod f_j : U = \coprod U_j \to \mathcal{X}$ is a smooth surjective morphism. Let $x : V \to \mathcal{X}$ be an object of $\mathcal{X}$. By Sheaves on Stacks, Lemma 58.18.10 there exists an étale covering $\{x_i \to x\}_{i \in I}$ such that each x_i lifts to an object u_i of $(Sch/U)_{étale}$. This just means that x_i lives over a scheme V_i, that $\{V_i \to V\}$ is an étale covering, and that x_i comes from a morphism $u_i : V_i \to U$. Then $x_i^*\mathcal{F} = u_i^* f^*\mathcal{F}$ is quasi-coherent. This implies that $x^*\mathcal{F}$ on $(Sch/V)_{étale}$ is quasi-coherent, for example by Modules on Sites, Lemma 16.23.3. By Sheaves on Stacks, Lemma 58.11.3 we see that $\mathcal{F}$ is quasi-coherent.

Proof of (2). This is proved using exactly the same argument, which we fully write out here. We may replace each of the algebraic stacks $\mathcal{X}_j$ by a scheme U_j (using that any algebraic stack has a smooth covering by a scheme and that flat and locally finite presented morphisms are preserved by composition, see Morphisms of Stacks, Lemmas 61.17.2 and 61.18.2). The pullback of $\mathcal{F}$ to $(Sch/U_j)_{étale}$ is still locally quasi-coherent, see Sheaves on Stacks, Lemma 58.11.2. Then $f = \coprod f_j : U = \coprod U_j \to \mathcal{X}$ is a surjective, flat, and locally finitely presented morphism. Let $x : V \to \mathcal{X}$ be an object of $\mathcal{X}$. By Sheaves on Stacks, Lemma 58.18.10 there exists an fppf covering $\{x_i \to x\}_{i \in I}$ such that each x_i lifts to an object u_i of $(Sch/U)_{étale}$. This just means that x_i lives over a scheme V_i, that $\{V_i \to V\}$ is an fppf covering, and that x_i comes from a morphism $u_i : V_i \to U$. Then $x_i^*\mathcal{F} = u_i^* f^*\mathcal{F}$ is quasi-coherent. This implies that $x^*\mathcal{F}$ on $(Sch/V)_{étale}$ is quasi-coherent, for example by Modules on Sites, Lemma 16.23.3. By Sheaves on Stacks, Lemma 58.11.3 we see that $\mathcal{F}$ is quasi-coherent. □

We recall that we have defined the notion of a quasi-coherent module on any ringed topos in Modules on Sites, Section 16.23.

Lemma 62.12.2. *Let $\mathcal{X}$ be an algebraic stack. Notation as in Lemma 62.11.2.*

1. *Let $\mathcal{H}$ be a quasi-coherent $\mathcal{O}_{\mathcal{X}_{lisse,étale}}$-module on the lisse-étale site of $\mathcal{X}$. Then $g_!\mathcal{H}$ is a quasi-coherent module on $\mathcal{X}$.*
2. *Let $\mathcal{H}$ be a quasi-coherent $\mathcal{O}_{\mathcal{X}_{flat,fppf}}$-module on the flat-fppf site of $\mathcal{X}$. Then $g_!\mathcal{H}$ is a quasi-coherent module on $\mathcal{X}$.*

Proof. Pick a scheme U and a surjective smooth morphism $x : U \to \mathcal{X}$. By Modules on Sites, Definition 16.23.1 there exists an étale (resp. fppf) covering $\{U_i \to U\}_{i \in I}$ such that each pullback $f_i^{-1}\mathcal{H}$ has a global presentation (see Modules on Sites, Definition 16.17.1). Here $f_i : U_i \to \mathcal{X}$ is the composition $U_i \to U \to \mathcal{X}$ which is a morphism of algebraic stacks. (Recall that the pullback ``is'' the restriction to $\mathcal{X}/f_i$, see Sheaves on Stacks, Definition 58.9.2 and the discussion following.) Since each f_i is smooth (resp. flat) by Lemma 62.11.7 we see that $f_i^{-1}g_!\mathcal{H} = g_{i,!}(f_i')^{-1}\mathcal{H}$. Using Lemma 62.12.1 we reduce the statement of the lemma to the case where $\mathcal{H}$ has a global presentation. Say we have

$$\bigoplus\nolimits_{j \in J} \mathcal{O} \longrightarrow \bigoplus\nolimits_{i \in I} \mathcal{O} \longrightarrow \mathcal{H} \longrightarrow 0$$

of $\mathcal{O}$-modules where $\mathcal{O} = \mathcal{O}_{\mathcal{X}_{lisse,étale}}$ (resp. $\mathcal{O} = \mathcal{O}_{\mathcal{X}_{flat,fppf}}$). Since $g_!$ commutes with arbitrary colimits (as a left adjoint functor, see Lemma 62.11.3 and Categories, Lemma 4.22.2) we conclude that there exists an exact sequence

$$\bigoplus\nolimits_{j \in J} g_!\mathcal{O} \longrightarrow \bigoplus\nolimits_{i \in I} g_!\mathcal{O} \longrightarrow g_!\mathcal{H} \longrightarrow 0$$

Finally, Lemma 62.11.4 shows that $g_!\mathcal{O} = \mathcal{O}_\mathcal{X}$ and we win. □

Lemma 62.12.3. *Let $\mathcal{X}$ be an algebraic stack. Let $\mathcal{M}_\mathcal{X}$ be the category of locally quasi-coherent $\mathcal{O}_\mathcal{X}$-modules with the flat base change property.*

(1) *With g as in Lemma 62.11.2 for the lisse-étale site we have*
   (a) *the functors g^{-1} and $g_!$ define mutually inverse functors*

$$QCoh(\mathcal{O}_\mathcal{X}) \underset{g_!}{\overset{g^{-1}}{\rightleftarrows}} QCoh(\mathcal{X}_{lisse,étale}, \mathcal{O}_{\mathcal{X}_{lisse,étale}})$$

   (b) *if $\mathcal{F}$ is in $\mathcal{M}_\mathcal{X}$ then $g^{-1}\mathcal{F}$ is in $QCoh(\mathcal{X}_{lisse,étale}, \mathcal{O}_{\mathcal{X}_{lisse,étale}})$ and*
   (c) *$Q(\mathcal{F}) = g_!g^{-1}\mathcal{F}$ where Q is as in Lemma 62.9.1.*

(2) *With g as in Lemma 62.11.2 for the flat-fppf site we have*
   (a) *the functors g^{-1} and $g_!$ define mutually inverse functors*

$$QCoh(\mathcal{O}_\mathcal{X}) \underset{g_!}{\overset{g^{-1}}{\rightleftarrows}} QCoh(\mathcal{X}_{flat,fppf}, \mathcal{O}_{\mathcal{X}_{flat,fppf}})$$

   (b) *if $\mathcal{F}$ is in $\mathcal{M}_\mathcal{X}$ then $g^{-1}\mathcal{F}$ is in $QCoh(\mathcal{X}_{flat,fppf}, \mathcal{O}_{\mathcal{X}_{flat,fppf}})$ and*
   (c) *$Q(\mathcal{F}) = g_!g^{-1}\mathcal{F}$ where Q is as in Lemma 62.9.1.*

Proof. Pullback by any morphism of ringed topoi preserves categories of quasi-coherent modules, see Modules on Sites, Lemma 16.23.4. Hence g^{-1} preserves the categories of quasi-coherent modules. The same is true for $g_!$ by Lemma 62.12.2. We know that $\mathcal{H} \to g^{-1}g_!\mathcal{H}$ is an isomorphism by Lemma 62.11.2. Conversely, if $\mathcal{F}$ is in $QCoh(\mathcal{O}_\mathcal{X})$ then the map $g_!g^{-1}\mathcal{F} \to \mathcal{F}$ is a map of quasi-coherent modules on $\mathcal{X}$ whose restriction to any scheme smooth over $\mathcal{X}$ is an isomorphism. Then the discussion in Sheaves on Stacks, Sections 58.13 and 58.14 (comparing with quasi-coherent modules on presentations) shows it is an isomorphism. This proves (1)(a) and (2)(a).

Let $\mathcal{F}$ be an object of $\mathcal{M}_\mathcal{X}$. By Lemma 62.9.2 the kernel and cokernel of the map $Q(\mathcal{F}) \to \mathcal{F}$ are parasitic. Hence by Lemma 62.11.5 and since $g^* = g^{-1}$ is exact, we conclude $g^*Q(\mathcal{F}) \to g^*\mathcal{F}$ is an isomorphism. Thus $g^*\mathcal{F}$ is quasi-coherent. This proves (1)(b) and (2)(b). Finally, (1)(c) and (2)(c) follow because $g_!g^*Q(\mathcal{F}) \to Q(\mathcal{F})$ is an isomorphism by our arguments above. □

Remark 62.12.4. Let $\mathcal{X}$ be an algebraic stack. The results of Lemmas 62.9.1 and 62.9.2 imply that

$$QCoh(\mathcal{O}_\mathcal{X}) = \mathcal{M}_\mathcal{X}/\text{Parasitic} \cap \mathcal{M}_\mathcal{X}$$

in words: the category of quasi-coherent modules is the category of locally quasi-coherent modules with the flat base change property divided out by the Serre subcategory consisting of parasitic objects. See Homology, Lemma 10.7.6. The existence of the inclusion functor $i : QCoh(\mathcal{O}_\mathcal{X}) \to \mathcal{M}_\mathcal{X}$ which is left adjoint to the quotient functor means that $\mathcal{M}_\mathcal{X} \to QCoh(\mathcal{O}_\mathcal{X})$ is a *Bousfield colocalization* or a *right Bousfield localization* (insert future reference here). Our next goal is to show a similar result holds on the level of derived categories.

Lemma 62.12.5. *Let $\mathcal{X}$ be an algebraic stack. Notation as in Lemma 62.11.2.*

(1) *Let $\mathcal{H}$ be a quasi-coherent $\mathcal{O}_{\mathcal{X}_{lisse,étale}}$-module on the lisse-étale site of $\mathcal{X}$. For all $p \in \mathbf{Z}$ the sheaf $H^p(Lg_!\mathcal{H})$ is a locally quasi-coherent module with the flat base change property on $\mathcal{X}$.*
(2) *Let $\mathcal{H}$ be a quasi-coherent $\mathcal{O}_{\mathcal{X}_{flat,fppf}}$-module on the flat-fppf site of $\mathcal{X}$. For all $p \in \mathbf{Z}$ the sheaf $H^p(Lg_!\mathcal{H})$ is a locally quasi-coherent module with the flat base change property on $\mathcal{X}$.*

Proof. Pick a scheme U and a surjective smooth morphism $x : U \to \mathcal{X}$. By Modules on Sites, Definition 16.23.1 there exists an étale (resp. fppf) covering $\{U_i \to U\}_{i\in I}$ such that each pullback $f_i^{-1}\mathcal{H}$ has a global presentation (see Modules on Sites, Definition 16.17.1). Here $f_i : U_i \to \mathcal{X}$ is the composition $U_i \to U \to \mathcal{X}$ which is a morphism of algebraic stacks. (Recall that the pullback ``is" the restriction to $\mathcal{X}/f_i$, see Sheaves on Stacks, Definition 58.9.2 and the discussion following.) After refining the covering we may assume each U_i is an affine scheme. Since each f_i is smooth (resp. flat) by Lemma 62.11.8 we see that $f_i^{-1}Lg_!\mathcal{H} = Lg_{i,!}(f_i')^{-1}\mathcal{H}$. Using Lemma 62.7.5 we reduce the statement of the lemma to the case where $\mathcal{H}$ has a global presentation and where $\mathcal{X} = (Sch/X)_{fppf}$ for some affine scheme $X = Spec(A)$.

Say our presentation looks like

$$\bigoplus\nolimits_{j\in J}\mathcal{O} \longrightarrow \bigoplus\nolimits_{i\in I}\mathcal{O} \longrightarrow \mathcal{H} \longrightarrow 0$$

where $\mathcal{O} = \mathcal{O}_{\mathcal{X}_{lisse,étale}}$ (resp. $\mathcal{O} = \mathcal{O}_{\mathcal{X}_{flat,fppf}}$). Note that the site $\mathcal{X}_{lisse,étale}$ (resp. $\mathcal{X}_{flat,fppf}$) has a final object, namely X/X which is quasi-compact (see Cohomology on Sites, Section 19.16). Hence we have

$$\Gamma(\bigoplus\nolimits_{i\in I}\mathcal{O}) = \bigoplus\nolimits_{i\in I} A$$

by Cohomology on Sites, Lemma 19.16.1. Hence the map in the presentation corresponds to a similar presentation

$$\bigoplus\nolimits_{j\in J} A \longrightarrow \bigoplus\nolimits_{i\in I} A \longrightarrow M \longrightarrow 0$$

of an A-module M. Moreover, $\mathcal{H}$ is equal to the restriction to the lisse-étale (resp. flat-fppf) site of the quasi-coherent sheaf M^a associated to M. Choose a resolution

$$\ldots \to F_2 \to F_1 \to F_0 \to M \to 0$$

by free A-modules. The complex

$$\ldots \mathcal{O} \otimes_A F_2 \to \mathcal{O} \otimes_A F_1 \to \mathcal{O} \otimes_A F_0 \to \mathcal{H} \to 0$$

is a resolution of $\mathcal{H}$ by free $\mathcal{O}$-modules because for each object U/X of $\mathcal{X}_{lisse,étale}$ (resp. $\mathcal{X}_{flat,fppf}$) the structure morphism $U \to X$ is flat. Hence by construction the value of $Lg_!\mathcal{H}$ is

$$\ldots \to \mathcal{O}_{\mathcal{X}} \otimes_A F_2 \to \mathcal{O}_{\mathcal{X}} \otimes_A F_1 \to \mathcal{O}_{\mathcal{X}} \otimes_A F_0 \to 0 \to \ldots$$

Since this is a complex of quasi-coherent modules on $\mathcal{X}_{étale}$ (resp. $\mathcal{X}_{fppf}$) it follows from Proposition 62.7.4 that $H^p(Lg_!\mathcal{H})$ is quasi-coherent. $\square$

Lemma 62.12.6. *Let $\mathcal{X}$ be an algebraic stack.*

(1) *$QCoh(\mathcal{O}_{\mathcal{X}_{lisse,étale}})$ is a weak Serre subcategory of $Mod(\mathcal{O}_{\mathcal{X}_{lisse,étale}})$.*
(2) *$QCoh(\mathcal{O}_{\mathcal{X}_{flat,fppf}})$ is a weak Serre subcategory of $Mod(\mathcal{O}_{\mathcal{X}_{flat,fppf}})$.*

Proof. We will verify conditions (1), (2), (3), (4) of Homology, Lemma 10.7.3. Since 0 is a quasi-coherent module on any ringed site we see that (1) holds. By definition $QCoh(\mathcal{O})$ is a strictly full subcategory $Mod(\mathcal{O})$, so (2) holds. Let $\varphi : \mathcal{G} \to \mathcal{F}$ be a morphism of quasi-coherent modules on $\mathcal{X}_{lisse,étale}$ or $\mathcal{X}_{flat,fppf}$. We have $g^*g_!\mathcal{F} = \mathcal{F}$ and similarly for $\mathcal{G}$ and φ, see Lemma 62.11.3. By Lemma 62.12.2 we see that $g_!\mathcal{F}$ and $g_!\mathcal{G}$ are quasi-coherent $\mathcal{O}_\mathcal{X}$-modules. Hence we see that $\text{Ker}(g_!\varphi)$ and $\text{Coker}(g_!\varphi)$ are quasi-coherent modules on $\mathcal{X}$. Since g^* is exact (see Lemma 62.11.2) we see that $g^*\text{Ker}(g_!\varphi) = \text{Ker}(g^*g_!\varphi) = \text{Ker}(\varphi)$ and $g^*\text{Coker}(g_!\varphi) = \text{Coker}(g^*g_!\varphi) = \text{Coker}(\varphi)$ are quasi-coherent too (see Lemma 62.12.3). This proves (3). Finally, suppose that

$$0 \to \mathcal{F} \to \mathcal{E} \to \mathcal{G} \to 0$$

is an extension of $\mathcal{O}_{\mathcal{X}_{lisse,étale}}$-modules (resp. $\mathcal{O}_{\mathcal{X}_{flat,fppf}}$-modules) with $\mathcal{F}$ and $\mathcal{G}$ quasi-coherent. Then

$$H^{-1}(Lg_!\mathcal{G}) \to g_!\mathcal{F} \to g_!\mathcal{E} \to g_!\mathcal{G} \to 0$$

is an exact sequence with $g_!\mathcal{F}$, $g_!\mathcal{G}$, and $H^{-1}(Lg_!\mathcal{G})$ locally quasi-coherent with the flat base change property, see Lemma 62.12.5. By Proposition 62.7.4 it follows that $g_!\mathcal{E}$ is locally quasi-coherent with the flat base change property. Finally, Lemma 62.12.3 implies that $\mathcal{E} = g^{-1}g_!\mathcal{E}$ is quasi-coherent as desired. □

62.13. Derived categories of quasi-coherent modules

Let $\mathcal{X}$ be an algebraic stack. As the inclusion functor $QCoh(\mathcal{O}_\mathcal{X}) \to Mod(\mathcal{O}_\mathcal{X})$ isn't exact, we cannot define $D_{QCoh}(\mathcal{O}_\mathcal{X})$ as the full subcategory of $D(\mathcal{O}_\mathcal{X})$ consisting of complexes with quasi-coherent cohomology sheaves. In stead we define the category as follows.

Definition 62.13.1. Let $\mathcal{X}$ be an algebraic stack. Let $\mathcal{M}_\mathcal{X} \subset Mod(\mathcal{O}_\mathcal{X})$ denote the category of locally quasi-coherent $\mathcal{O}_\mathcal{X}$-modules with the flat base change property. Let $\mathcal{P}_\mathcal{X} \subset \mathcal{M}_\mathcal{X}$ be the full subcategory consisting of parasitic objects. We define the *derived category of $\mathcal{O}_\mathcal{X}$-modules with quasi-coherent cohomology sheaves* as the Verdier quotient[3]

$$D_{QCoh}(\mathcal{O}_\mathcal{X}) = D_{\mathcal{M}_\mathcal{X}}(\mathcal{O}_\mathcal{X})/D_{\mathcal{P}_\mathcal{X}}(\mathcal{O}_\mathcal{X})$$

This definition makes sense: By Proposition 62.7.4 we see that $\mathcal{M}_\mathcal{X}$ is a weak Serre subcategory of $Mod(\mathcal{O}_\mathcal{X})$ hence $D_{\mathcal{M}_\mathcal{X}}(\mathcal{O}_\mathcal{X})$ is a strictly full, saturated triangulated subcategory of $D(\mathcal{O}_\mathcal{X})$, see Derived Categories, Lemma 11.12.1. Since parasitic modules form a Serre subcategory of $Mod(\mathcal{O}_\mathcal{X})$ (by Lemma 62.8.2) we see that $\mathcal{P}_\mathcal{X} = \text{Parasitic} \cap \mathcal{M}_\mathcal{X}$ is a weak Serre subcategory of $Mod(\mathcal{O}_\mathcal{X})$ and hence $D_{\mathcal{P}_\mathcal{X}}(\mathcal{O}_\mathcal{X})$ is a strictly full, saturated triangulated subcategory of $D(\mathcal{O}_\mathcal{X})$. Since clearly

$$D_{\mathcal{P}_\mathcal{X}}(\mathcal{O}_\mathcal{X}) \subset D_{\mathcal{M}_\mathcal{X}}(\mathcal{O}_\mathcal{X})$$

we conclude that the first is a strictly full, saturated triangulated subcategory of the second. Hence the Verdier quotient exists. A morphism $a : E \to E'$ of $D_{\mathcal{M}_\mathcal{X}}(\mathcal{O}_\mathcal{X})$ becomes an isomorphism in $D_{QCoh}(\mathcal{O}_\mathcal{X})$ if and only if the cone $C(a)$ has parasitic cohomology sheaves, see Derived Categories, Section 11.6 and especially Lemma 11.6.10.

Consider the functors

$$D_{\mathcal{M}_\mathcal{X}}(\mathcal{O}_\mathcal{X}) \xrightarrow{H^i} \mathcal{M}_\mathcal{X} \xrightarrow{Q} QCoh(\mathcal{O}_\mathcal{X})$$

[3] This definition is different from the one in the literature, see [**Ols07b**, 6.3], but it agrees with that definition by Lemma 62.13.3.

Note that Q annihilates the subcategory $\mathcal{P}_\mathcal{X}$, see Lemma 62.9.2. By Derived Categories, Lemma 11.6.8 we obtain a cohomological functor

$$H^i : D_{QCoh}(\mathcal{O}_\mathcal{X}) \longrightarrow QCoh(\mathcal{O}_\mathcal{X}) \tag{62.13.1.1}$$

Moreover, note that $E \in D_{QCoh}(\mathcal{O}_\mathcal{X})$ is zero if and only if $H^i(E) = 0$ for all $i \in \mathbf{Z}$.

Note that the categories $\mathcal{P}_\mathcal{X}$ and $\mathcal{M}_\mathcal{X}$ are also weak Serre subcategories of the abelian category $Mod(\mathcal{X}_{étale}, \mathcal{O}_\mathcal{X})$ of modules in the étale topology, see Proposition 62.7.4 and Lemma 62.8.2. Hence the statement of the following lemma makes sense.

Lemma 62.13.2. *Let $\mathcal{X}$ be an algebraic stack. The comparision morphism $\epsilon : \mathcal{X}_{fppf} \to \mathcal{X}_{étale}$ induces a commutative diagram*

$$\begin{tikzcd} D_{\mathcal{P}_\mathcal{X}}(\mathcal{O}_\mathcal{X}) \arrow[r] & D_{\mathcal{M}_\mathcal{X}}(\mathcal{O}_\mathcal{X}) \arrow[r] & D(\mathcal{O}_\mathcal{X}) \\ D_{\mathcal{P}_\mathcal{X}}(\mathcal{X}_{étale}, \mathcal{O}_\mathcal{X}) \arrow[r] \arrow[u, "\epsilon^*"] & D_{\mathcal{M}_\mathcal{X}}(\mathcal{X}_{étale}, \mathcal{O}_\mathcal{X}) \arrow[r] \arrow[u, "\epsilon^*"] & D(\mathcal{X}_{étale}, \mathcal{O}_\mathcal{X}) \arrow[u, "\epsilon^*"] \end{tikzcd}$$

Moreover, the left two vertical arrows are equivalences of triangulated categories, hence we also obtain an equivalence

$$D_{\mathcal{M}_\mathcal{X}}(\mathcal{X}_{étale}, \mathcal{O}_\mathcal{X})/D_{\mathcal{P}_\mathcal{X}}(\mathcal{X}_{étale}, \mathcal{O}_\mathcal{X}) \longrightarrow D_{QCoh}(\mathcal{O}_\mathcal{X})$$

Proof. Since ϵ^* is exact it is clear that we obtain a diagram as in the statement of the lemma. We will show the middle vertical arrow is an equivalence by applying Cohomology on Sites, Lemma 19.20.2 to the following situation: $\mathcal{C} = \mathcal{X}$, $\tau = fppf$, $\tau' = étale$, $\mathcal{O} = \mathcal{O}_\mathcal{X}$, $\mathcal{A} = \mathcal{M}_\mathcal{X}$, and $\mathcal{B}$ is the set of objects of $\mathcal{X}$ lying over affine schemes. To see the lemma applies we have to check conditions (1), (2), (3), (4). Conditions (1) and (2) are clear from the discussion above (explicitly this follows from Proposition 62.7.4). Condition (3) holds because every scheme has a Zariski open covering by affines. Condition (4) follows from Descent, Lemma 31.7.4.

We omit the verification that the equivalence of categories $\epsilon^* : D_{\mathcal{M}_\mathcal{X}}(\mathcal{X}_{étale}, \mathcal{O}_\mathcal{X}) \to D_{\mathcal{M}_\mathcal{X}}(\mathcal{O}_\mathcal{X})$ induces an equivalence of the subcategories of complexes with parasitic cohomology sheaves. $\square$

It turns out that $D_{QCoh}(\mathcal{O}_\mathcal{X})$ is the same as the derived category of complexes of modules with quasi-coherent cohomology sheaves on the lisse-étale or flat-fppf site.

Lemma 62.13.3. *Let $\mathcal{X}$ be an algebraic stack. Let $\mathcal{F}^\bullet$ be an object of $D_{\mathcal{M}_\mathcal{X}}(\mathcal{O}_\mathcal{X})$.*

1. *With g as in Lemma 62.11.2 for the lisse-étale site we have*
   - (a) *$g^{-1}\mathcal{F}^\bullet$ is in $D_{QCoh}(\mathcal{O}_{\mathcal{X}_{lisse,étale}})$,*
   - (b) *$g^{-1}\mathcal{F}^\bullet = 0$ if and only if $\mathcal{F}^\bullet$ is in $D_{\mathcal{P}_\mathcal{X}}(\mathcal{O}_\mathcal{X})$,*
   - (c) *$Lg_!\mathcal{H}^\bullet$ is in $D_{\mathcal{M}_\mathcal{X}}(\mathcal{X}_{étale}, \mathcal{O}_\mathcal{X})$ for $\mathcal{H}^\bullet$ in $D_{QCoh}(\mathcal{O}_{\mathcal{X}_{lisse,étale}})$, and*
   - (d) *the functors g^{-1} and $Lg_!$ define mutually inverse functors*

$$\begin{tikzcd} D_{QCoh}(\mathcal{O}_\mathcal{X}) \arrow[r, shift left, "g^{-1}"] & D_{QCoh}(\mathcal{O}_{\mathcal{X}_{lisse,étale}}) \arrow[l, shift left, "Lg_!"] \end{tikzcd}$$

2. *With g as in Lemma 62.11.2 for the flat-fppf site we have*
   - (a) *$g^{-1}\mathcal{F}^\bullet$ is in $D_{QCoh}(\mathcal{O}_{\mathcal{X}_{lisse,étale}})$,*
   - (b) *$g^{-1}\mathcal{F}^\bullet = 0$ if and only if $\mathcal{F}^\bullet$ is in $D_{\mathcal{P}_\mathcal{X}}(\mathcal{O}_\mathcal{X})$,*

(c) *$Lg_!\mathcal{H}^\bullet$ is in $D_{\mathcal{M}_\mathcal{X}}(\mathcal{O}_\mathcal{X})$ for $\mathcal{H}^\bullet$ in $D_{QCoh}(\mathcal{O}_{\mathcal{X}_{flat,fppf}})$, and*

(d) *the functors g^{-1} and $Lg_!$ define mutually inverse functors*

$$D_{QCoh}(\mathcal{O}_\mathcal{X}) \underset{Lg_!}{\overset{g^{-1}}{\rightleftarrows}} D_{QCoh}(\mathcal{O}_{\mathcal{X}_{flat,fppf}})$$

Proof. The functor g^{-1} is exact, hence (a) and (b) follow from Lemmas 62.12.3 and 62.11.5.

The construction of $Lg_!$ in Lemma 62.11.6 (via Cohomology on Sites, Lemma 19.22.1 which in turn uses Derived Categories, Proposition 11.27.2) shows that $Lg_!$ on any object $\mathcal{H}^\bullet$ of $D(\mathcal{O}_{\mathcal{X}_{lisse,étale}})$ is computed as

$$Lg_!\mathcal{H}^\bullet = colim\, g_!\mathcal{K}_n^\bullet = g_!\, colim\, \mathcal{K}_n^\bullet$$

(termwise colimits) where the quasi-isomorphism $colim\, \mathcal{K}_n^\bullet \to \mathcal{H}^\bullet$ induces quasi-isomorphisms $\mathcal{K}_n^\bullet \to \tau_{\leq n}\mathcal{H}^\bullet$. Since $\mathcal{M}_\mathcal{X} \subset Mod(\mathcal{X}_{étale}, \mathcal{O}_\mathcal{X})$ (resp. $\mathcal{M}_\mathcal{X} \subset Mod(\mathcal{O}_\mathcal{X})$) is preserved under colimits we see that it suffices to prove (c) on bounded above complexes $\mathcal{H}^\bullet$ in $D_{QCoh}(\mathcal{O}_{\mathcal{X}_{lisse,étale}})$ (resp. $D_{QCoh}(\mathcal{O}_{\mathcal{X}_{flat,fppf}})$). In this case to show that $H^n(Lg_!\mathcal{H}^\bullet)$ is in $\mathcal{M}_\mathcal{X}$ we can argue by induction on the integer m such that $\mathcal{H}^i = 0$ for $i > m$. If $m < n$, then $H^n(Lg_!\mathcal{H}^\bullet) = 0$ and the result holds. In general consider the distinguished triangle

$$\tau_{\leq m-1}\mathcal{H}^\bullet \to \mathcal{H}^\bullet \to H^m(\mathcal{H}^\bullet)[-m] \to \ldots$$

and apply the functor $Lg_!$. Since $\mathcal{M}_\mathcal{X}$ is a weak Serre subcategory of the module category it suffices to prove (c) for two out of three. We have the result for $Lg_!\tau_{\leq m-1}\mathcal{H}^\bullet$ by induction and we have the result for $Lg_!H^m(\mathcal{H}^\bullet)[-m]$ by Lemma 62.12.5. Whence (c) holds.

Let us prove (2)(d). By (a) and (b) the functor $g^{-1} = g^*$ induces a functor

$$c : D_{QCoh}(\mathcal{O}_\mathcal{X}) \longrightarrow D_{QCoh}(\mathcal{O}_{\mathcal{X}_{flat,fppf}})$$

see Derived Categories, Lemma 11.6.8. Thus we have the following diagram of triangulated categories

$$\begin{tikzcd} D_{\mathcal{M}_\mathcal{X}}(\mathcal{O}_\mathcal{X}) \arrow[rr, "q"] \arrow[dr, shift left, "g^{-1}"] & & D_{QCoh}(\mathcal{O}_\mathcal{X}) \arrow[dl, "c"] \\ & D_{QCoh}(\mathcal{O}_{\mathcal{X}_{flat,fppf}}) \arrow[ul, shift left, "Lg_!"] & \end{tikzcd}$$

where q is the quotient functor, the inner triangle is commutative, and $g^{-1}Lg_! = \text{id}$. For any object of E of $D_{\mathcal{M}_\mathcal{X}}(\mathcal{O}_\mathcal{X})$ the map $a : Lg_!g^{-1}E \to E$ maps to a quasi-isomorphism in $D(\mathcal{O}_{\mathcal{X}_{flat,fppf}})$. Hence the cone on a maps to zero under g^{-1} and by (b) we see that $q(a)$ is an isomorphism. Thus $q \circ Lg_!$ is a quasi-inverse to c.

In the case of the lisse-étale site exactly the same argument as above proves that

$$D_{\mathcal{M}_\mathcal{X}}(\mathcal{X}_{étale}, \mathcal{O}_\mathcal{X})/D_{\mathcal{P}_\mathcal{X}}(\mathcal{X}_{étale}, \mathcal{O}_\mathcal{X})$$

is equivalent to $D_{QCoh}(\mathcal{O}_{\mathcal{X}_{lisse,étale}})$. Applying the last equivalence of Lemma 62.13.2 finishes the proof. □

The following lemma tells us that the quotient functor $D_{\mathcal{M}_\mathcal{X}}(\mathcal{O}_\mathcal{X}) \to D_{QCoh}(\mathcal{O}_\mathcal{X})$ is a Bousfield colocalization (insert future reference here).

Lemma 62.13.4. *Let $\mathcal{X}$ be an algebraic stack. Let E be an object of $D_{\mathcal{M}_\mathcal{X}}(\mathcal{O}_\mathcal{X})$. There exists a canonical distinguished triangle*

$$E' \to E \to P \to E'[1]$$

in $D_{\mathcal{M}_\mathcal{X}}(\mathcal{O}_\mathcal{X})$ such that P is in $D_{\mathcal{P}_\mathcal{X}}(\mathcal{O}_\mathcal{X})$ and

$$Hom_{D(\mathcal{O}_\mathcal{X})}(E', P') = 0$$

for all P' in $D_{\mathcal{P}_\mathcal{X}}(\mathcal{O}_\mathcal{X})$.

Proof. Consider the morphism of ringed topoi $g : Sh(\mathcal{X}_{flat,fppf}) \longrightarrow Sh(\mathcal{X}_{fppf})$. Set $E' = Lg_!g^{-1}E$ and let P be the cone on the adjunction map $E' \to E$. Since $g^{-1}E' \to g^{-1}E$ is an isomorphism we see that P is an object of $D_{\mathcal{P}_\mathcal{X}}(\mathcal{O}_\mathcal{X})$ by Lemma 62.13.3 (2)(b). Finally, $Hom(E', P') = Hom(Lg_!g^{-1}E, P') = Hom(g^{-1}E, g^{-1}P') = 0$ as $g^{-1}P' = 0$.

Uniqueness. Suppose that $E'' \to E \to P'$ is a second distinguished triangle as in the statement of the lemma. Since $Hom(E', P') = 0$ the morphism $E' \to E$ factors as $E' \to E'' \to E$, see Derived Categories, Lemma 11.4.2. Similarly, the morphism $E'' \to E$ factors as $E'' \to E' \to E$. Consider the composition $\varphi : E' \to E'$ of the maps $E' \to E''$ and $E'' \to E'$. Note that $\varphi - 1 : E' \to E'$ fits into the commutative diagram

$$\begin{tikzcd} E' \arrow[r] \arrow[d, "\varphi-1"] & E \arrow[d, "0"] \\ E' \arrow[r] & E \end{tikzcd}$$

hence factors through $P[-1] \to E$. Since $Hom(E', P[-1]) = 0$ we see that $\varphi = 1$. Whence the maps $E' \to E''$ and $E'' \to E'$ are inverse to each other. □

62.14. Derived pushforward of quasi-coherent modules

Here is a first application of the material above.

Proposition 62.14.1. *Let $f : \mathcal{X} \to \mathcal{Y}$ be a quasi-compact and quasi-separated morphism of algebraic stacks. The functor Rf_* induces a commutative diagram*

$$\begin{tikzcd} D^+_{\mathcal{P}_\mathcal{X}}(\mathcal{O}_\mathcal{X}) \arrow[r] \arrow[d, "Rf_*"] & D^+_{\mathcal{M}_\mathcal{X}}(\mathcal{O}_\mathcal{X}) \arrow[r] \arrow[d, "Rf_*"] & D(\mathcal{O}_\mathcal{X}) \arrow[d, "Rf_*"] \\ D^+_{\mathcal{P}_\mathcal{Y}}(\mathcal{O}_\mathcal{Y}) \arrow[r] & D^+_{\mathcal{M}_\mathcal{Y}}(\mathcal{O}_\mathcal{Y}) \arrow[r] & D(\mathcal{O}_\mathcal{Y}) \end{tikzcd}$$

and hence induces a functor

$$Rf_{QCoh,*} : D^+_{QCoh}(\mathcal{X}) \longrightarrow D^+_{QCoh}(\mathcal{Y})$$

on quotient categories. Moreover, the functor R^if_{QCoh} of Proposition 62.10.1 are equal to $H^i \circ Rf_{QCoh,*}$ with H^i as in (62.13.1.1).

Proof. We have to show that Rf_*E is an object of $D^+_{\mathcal{M}_\mathcal{Y}}(\mathcal{O}_\mathcal{Y})$ for E in $D^+_{\mathcal{M}_\mathcal{X}}(\mathcal{O}_\mathcal{X})$. This follows from Proposition 62.7.4 and the spectral sequence $R^if_*H^j(E) \Rightarrow R^{i+j}f_*E$. The case of parasitic modules works the same way using Lemma 62.8.3. The final statement is clear from the definition of H^i in (62.13.1.1). □

62.15. Derived pullback of quasi-coherent modules

Derived pullback of complexes with quasi-coherent cohomology sheaves exists in general.

Proposition 62.15.1. *Let $f : \mathcal{X} \to \mathcal{Y}$ be a morphism of algebraic stacks. The exact functor f^* induces a commutative diagram*

$$\begin{tikzcd} D_{\mathcal{M}_\mathcal{X}}(\mathcal{O}_\mathcal{X}) \arrow[r] & D(\mathcal{O}_\mathcal{X}) \\ D_{\mathcal{M}_\mathcal{Y}}(\mathcal{O}_\mathcal{Y}) \arrow[r] \arrow[u, "f^*"] & D(\mathcal{O}_\mathcal{Y}) \arrow[u, "f^*"'] \end{tikzcd}$$

The composition

$$D_{\mathcal{M}_\mathcal{Y}}(\mathcal{O}_\mathcal{Y}) \xrightarrow{f^*} D_{\mathcal{M}_\mathcal{X}}(\mathcal{O}_\mathcal{X}) \xrightarrow{q_\mathcal{X}} D_{QCoh}(\mathcal{O}_\mathcal{X})$$

is left deriveable with respect to the localization $D_{\mathcal{M}_\mathcal{Y}}(\mathcal{O}_\mathcal{Y}) \to D_{QCoh}(\mathcal{O}_\mathcal{X})$ and we may define Lf^*_{QCoh} as its left derived functor

$$Lf^*_{QCoh} : D_{QCoh}(\mathcal{O}_\mathcal{Y}) \longrightarrow D_{QCoh}(\mathcal{O}_\mathcal{X})$$

(see Derived Categories, Definitions 11.14.2 and 11.14.9). If f is quasi-compact and quasi-separated, then Lf^*_{QCoh} and $Rf_{QCoh,*}$ satisfy the following adjointness:

$$Hom_{D_{QCoh}(\mathcal{O}_\mathcal{X})}(Lf^*_{QCoh}A, B) = Hom_{D_{QCoh}(\mathcal{O}_\mathcal{Y})}(A, Rf_{QCoh,*}B)$$

for $A \in D_{QCoh}(\mathcal{O}_\mathcal{Y})$ and $B \in D^+_{QCoh}(\mathcal{O}_\mathcal{X})$.

Proof. We have to show that f^*E is an object of $D_{\mathcal{M}_\mathcal{X}}(\mathcal{O}_\mathcal{X})$ for E in $D_{\mathcal{M}_\mathcal{Y}}(\mathcal{O}_\mathcal{Y})$. Since $f^* = f^{-1}$ is exact this follows immediately from the fact that f^* maps $\mathcal{M}_\mathcal{Y}$ into $\mathcal{M}_\mathcal{X}$.

Set $\mathcal{D} = D_{\mathcal{M}_\mathcal{Y}}(\mathcal{O}_\mathcal{Y})$. Let S be the collection of morphisms in $\mathcal{D}$ whose cone is an object of $D_{\mathcal{P}_\mathcal{Y}}(\mathcal{O}_\mathcal{Y})$. Set $\mathcal{D}' = D_{QCoh}(\mathcal{O}_\mathcal{X})$. Set $F = q \circ f^* : \mathcal{D} \to \mathcal{D}'$. Then $\mathcal{D}, S, \mathcal{D}', F$ are as in Derived Categories, Situation 11.14.1 and Definition 11.14.2. Let us prove that $LF(E)$ is defined for any object E of $\mathcal{D}$. Namely, consider the triangle

$$E' \to E \to P \to E'[1]$$

constructed in Lemma 62.13.4. Note that $s : E' \to E$ is an element of S. We claim that E' computes LF. Namely, suppose that $s' : E'' \to E$ is another element of S, i.e., fits into a triangle $E'' \to E \to P' \to E''[1]$ with P' in $D_{\mathcal{P}_\mathcal{Y}}(\mathcal{O}_\mathcal{Y})$. By Lemma 62.13.4 (and its proof) we see that $E' \to E$ factors through $E'' \to E$. Thus we see that $E' \to E$ is cofinal in the system S/E. Hence it is clear that E' computes LF.

To see the final statement, write $B = q_\mathcal{X}(H)$ and $A = q_\mathcal{Y}(E)$. Choose $E' \to E$ as above. We will use on the one hand that $Rf_{QCoh,*}(B) = q_\mathcal{Y}(Rf_*H)$ and on the other that $Lf^*_{QCoh}(A) = q_\mathcal{X}(f^*E')$.

$$\begin{aligned} Hom_{D_{QCoh}(\mathcal{O}_\mathcal{X})}(Lf^*_{QCoh}A, B) &= Hom_{D_{QCoh}(\mathcal{O}_\mathcal{X})}(q_\mathcal{X}(f^*E'), q_\mathcal{X}(H)) \\ &= colim_{H \to H'} Hom_{D(\mathcal{O}_\mathcal{X})}(f^*E', H') \\ &= colim_{H \to H'} Hom_{D(\mathcal{O}_\mathcal{Y})}(E', Rf_*H') \\ &= Hom_{D(\mathcal{O}_\mathcal{Y})}(E', Rf_*H) \\ &= Hom_{D_{QCoh}(\mathcal{O}_\mathcal{Y})}(A, Rf_{QCoh,*}B) \end{aligned}$$

Here the colimit is over morphisms $s : H \to H'$ in $D^+_{\mathcal{M}_\mathcal{X}}(\mathcal{O}_\mathcal{X})$ whose cone $P(s)$ is an object of $D^+_{\mathcal{P}_\mathcal{X}}(\mathcal{O}_\mathcal{X})$. The first equality holds by construction. The second equality holds by construction of the Verdier quotient. The third equality holds by Cohomology on Sites, Lemma 19.19.1. Since $Rf_*P(s)$ is an object of $D^+_{\mathcal{P}_\mathcal{Y}}(\mathcal{O}_\mathcal{Y})$ by Proposition 62.14.1 we see that $Hom_{D(\mathcal{O}_\mathcal{Y})}(E', Rf_*P(s)) = 0$. Thus the fourth equality holds. The final equality holds by construction of E'. $\square$

CHAPTER 63

Introducing Algebraic Stacks

63.1. Why read this?

We give a very informal introduction to algebraic stacks aimed at graduate students and advanced undergraduates. The goal is to quickly introduce a simple language which you can use to think about local and global properties of your favorite moduli problem. Having done this it should be possible to ask yourself well-posed questions about moduli problems and to start solving them, whilst assuming a general theory exists. If you end up with an interesting result, you can go back to the general theory in the other parts of the stacks project and fill in the gaps as needed.

The point of view we take here is very close to the point of view taken in [**KM85**] and [**Mum65**].

63.2. Preliminary

Let S be a scheme. An *elliptic curve* over S is a triple $(E, f, 0)$ where E is a scheme and $f : E \to S$ and $0 : S \to E$ are morphisms of schemes such that

1. (1) $f : E \to S$ is proper, smooth of relative dimension 1,
2. (2) for every $s \in S$ the fibre E_s is a connected curve of genus 1, i.e., $H^0(E_s, \mathcal{O})$ and $H^1(E_s, \mathcal{O})$ both are 1-dimensional $\kappa(s)$-vector spaces, and
3. (3) 0 is a section of f.

Given elliptic curves $(E, f, 0)/S$ and $(E', f', 0')/S'$ a *morphism of elliptic curves over* $a : S \to S'$ is a morphism $\alpha : E \to E'$ such that the diagram

$$\begin{tikzcd}
E \arrow[r, "\alpha"] \arrow[d, "f"] & E' \arrow[d, "f'"'] \\
S \arrow[r, "a"] \arrow[u, bend left=60, "0"] & S' \arrow[u, bend right=60, "0'"']
\end{tikzcd}$$

is commutative. We are going to define the stack of elliptic curves $\mathcal{M}_{1,1}$. In the rest of the stacks project we work out the method introduced in Deligne and Mumford's paper [**DM69a**] which consists in presenting $\mathcal{M}_{1,1}$ as a category endowed with a functor

$$p : \mathcal{M}_{1,1} \longrightarrow Sch, \quad (E, f, 0)/S \longmapsto S$$

This means you work with fibred categories over the categories of schemes, topologies, stacks fibred in groupoids, coverings, etc, etc. In this chapter we throw all of that out of the window and we think about it a bit differently -- probably closer to how the initiators of the theory started thinking about it themselves.

63.3. The moduli stack of elliptic curves

Here is what we are going to do:

(1) Start with your favorite category of schemes *Sch*.
(2) Add a new symbol $\mathcal{M}_{1,1}$.
(3) A morphism $S \to \mathcal{M}_{1,1}$ **is** an elliptic curve $(E, f, 0)$ over S.
(4) A diagram

$$\begin{tikzcd} S \arrow[rr, "a"'] \arrow[dr, "{(E,f,0)}"'] & & S' \arrow[dl, "{(E',F',0')}"] \\ & \mathcal{M}_{1,1} & \end{tikzcd}$$

is commutative if and only if there exists a morphism $\alpha : E \to E'$ of elliptic curves over $a : S \to S'$. We say α *witnesses* the commutativity of the diagram.
(5) Note that commutative diagrams glue as follows

$$\begin{tikzcd} S \arrow[r, "a"'] \arrow[dr, "{(E,f,0)}"'] & S' \arrow[r, "a'"'] \arrow[d, "{(E',F',0')}"'] & S'' \arrow[dl, "{(E'',F'',0'')}"] \\ & \mathcal{M}_{1,1} & \end{tikzcd}$$

because $\alpha' \circ \alpha$ witnesses the commutativity of the outer triangle if α and α' witness the commutativity of the left and right triangles.
(6) The composition

$$S' \xrightarrow{a} S' \xrightarrow{(E',f',0')} \mathcal{M}_{1,1}$$

is given by $(E' \times_{S'} S, f' \times_{S'} S, 0' \times_{S'} S)$.

At the end of this procedure we have enlarged the category *Sch* of schemes with exactly one object...

Except that we haven't defined what a morphism from $\mathcal{M}_{1,1}$ to a scheme T is. The answer is that it is the weakest possible notion such that compositions make sense. Thus a morphism $F : \mathcal{M}_{1,1} \to T$ is a rule which to every elliptic curve $(E, f, 0)/S$ associates a morphism $F(E, f, 0) : S \to T$ such that given any commutative diagram

$$\begin{tikzcd} S \arrow[rr, "a"'] \arrow[dr, "{(E,f,0)}"'] & & S' \arrow[dl, "{(E',F',0')}"] \\ & \mathcal{M}_{1,1} & \end{tikzcd}$$

the diagram

$$\begin{tikzcd} S \arrow[rr, "a"'] \arrow[dr, "{F(E,f,0)}"'] & & S' \arrow[dl, "{F(E',F',0')}"] \\ & T & \end{tikzcd}$$

is commutative also. An example is the j-invariant

$$j : \mathcal{M}_{1,1} \longrightarrow \mathbf{A}^1_{\mathbf{Z}}$$

which you may have heard of. Aha, so now we're done...

Except, no we're not! We still have to define a notion of morphisms $\mathcal{M}_{1,1} \to \mathcal{M}_{1,1}$. This we do in exactly the same way as before, i.e., a morphism $F : \mathcal{M}_{1,1} \to \mathcal{M}_{1,1}$ is a rule which to every elliptic curve $(E, f, 0)/S$ associates another elliptic curve $F(E, f, 0)$ preserving commutativity of diagrams as above. However, since I don't know of a nontrivial example of such a functor, I'll just define the set of morphisms from $\mathcal{M}_{1,1}$ to itself to consist of the identity for now.

I hope you see how to add other objects to this enlarged category. Somehow it seems intuitively clear that given any ``well-behaved'' moduli problem we can perform the construction above and add an object to our category. In fact, much of modern day algebraic geometry takes place in such a universe where *Sch* is enlarged with countably many (explicitly constructed) moduli stacks.

You may object that the category we obtain isn't a category because there is a ``vagueness'' about when diagrams commute and which combinations of diagrams continue to commute as we have to produce a witness to the commutativity. However, it turns out that this, the idea of having witnesses to commutativity, is a valid approach to 2-categories! Thus we stick with it.

63.4. Fibre products

The question we pose here is what should be the fibre product

$$\begin{tikzcd} & ? \arrow[dl, dotted] \arrow[dr, dotted] & \\ S \arrow[dr, "{(E,f,0)}"'] & & S' \arrow[dl, "{(E',f',0')}"] \\ & \mathcal{M}_{1,1} & \end{tikzcd}$$

The answer: A morphism from a scheme T into ? should be a triple (a, a', α) where $a : T \to S$, $a' : T \to S'$ are morphisms of schemes and where $\alpha : E \times_{S,a} T \to E' \times_{S',a'} T$ is a morphism of elliptic curves over id_T. This makes sense because of our definition of composition and commutative diagrams earlier in the discussion.

Lemma 63.4.1 (Key fact)**.** *The functor $Sch^{opp} \to Sets$, $T \mapsto \{(a, a', \alpha)$ as above$\}$ is representable by a scheme $S \times_{\mathcal{M}_{1,1}} S'$.*

Proof. Idea of proof. Relate this functor to

$$Isom_{S\times S'}(E \times S', S \times E')$$

and use Grothendieck's theory of Hilbert schemes. $\square$

Remark 63.4.2. We have the formula $S \times_{\mathcal{M}_{1,1}} S' = (S \times S') \times_{\mathcal{M}_{1,1}\times\mathcal{M}_{1,1}} \mathcal{M}_{1,1}$. Hence the key fact is a property of the diagonal $\Delta_{\mathcal{M}_{1,1}}$ of $\mathcal{M}_{1,1}$.

In any case the key fact allows us to make the following definition.

Definition 63.4.3. We say a morphism $S \to \mathcal{M}_{1,1}$ is *smooth* if for every morphism $S' \to \mathcal{M}_{1,1}$ the projection morphism

$$S \times_{\mathcal{M}_{1,1}} S' \longrightarrow S'$$

is smooth.

Note that this is compatible with the notion of a smooth morphism of schemes as the base change of a smooth morphism is smooth. Moreover, it is clear how to extend this definition to other properties of morphisms into $\mathcal{M}_{1,1}$ (or your own favorite moduli stack). In particular we will use it below for *surjective* morphisms.

63.5. The definition

We'll formulate it as a definition and not as a result since we expect the reader to try out other cases (not just the stack $\mathcal{M}_{1,1}$ and not just Sch the category of all schemes).

Definition 63.5.1. We say $\mathcal{M}_{1,1}$ is an *algebraic stack* if and only if

(1) We have descent for objects for the étale topology on Sch.
(2) The key fact holds.
(3) there exists a surjective and smooth morphism $S \to \mathcal{M}_{1,1}$.

The first condition is a ``sheaf property''. We're going to spell it out since there is a technical point we should make. Suppose given a scheme S and an étale covering $\{S_i \to S\}$ and morphisms $e_i : S_i \to \mathcal{M}_{1,1}$ such that the diagrams

$$\begin{tikzcd} S_i \times_S S_j \arrow[rr, "\mathrm{id}"'] \arrow[dr, "e_i \circ \mathrm{pr}_1"'] & & S_i \times_S S_j \arrow[dl, "e_j \circ \mathrm{pr}_2"] \\ & \mathcal{M}_{1,1} & \end{tikzcd}$$

commute. The sheaf condition does *not* guarantee the existence of a morphism $e : S \to \mathcal{M}_{1,1}$ in this situation. Namely, we need to pick witnesses α_{ij} for the diagrams above and require that

$$\mathrm{pr}_{02}^*\alpha_{ik} = \mathrm{pr}_{12}\alpha_{jk} \circ \mathrm{pr}_{01}^*\alpha_{ij}$$

as witnesses over $S_i \times_S S_j \times_S S_k$. I think it is clear what this means... If not, then I'm afraid you'll have to read some of the material on categories fibred in groupoids, etc. In any case, the displayed equation is often called the *cocycle condition*. A more precise statement of the ``sheaf property'' is: given $\{S_i \to S\}$, $e_i : S_i \to \mathcal{M}_{1,1}$ and witnesses α_{ij} satisfying the cocycle condition, there exists a unique (up to unique isomorphism) $e : S \to \mathcal{M}_{1,1}$ with $e_i \cong e|_{S_i}$ recovering the α_{ij}.

As you can see even formulating a precise statement takes a bit of work. The proof of this ``sheaf property'' relies on a fundamental technique in algebraic geometry, namely descent theory. My suggestion is to initially simply accept the ``sheaf property'' holds, and see what it implies in practice. In fact, a certain amount of mental agility is required to boil the ``sheaf property'' down to a manageable statement that you can fit on a napkin. Perhaps the simplest variant which is already a bit interesting is the following: Suppose we have a Galois extension $K \subset L$ of fields with Galois group $G = \mathrm{Gal}(L/K)$. Set $T = Spec(L)$ and $S = Spec(K)$. Then $\{T \to S\}$ is an étale covering. Let $(E, f, 0)$ be an elliptic curve over L. (Yes, this just means that $E \subset \mathbf{P}^2_L$ is given by a Weierstrass equation and 0 is the usual point at infinity.) Denote $E_\sigma = E \times_{T, Spec(\sigma)} T$ the base change. (Yes, this corresponds to applying σ to the coefficients of the Weierstrass equation, or is it σ^{-1}?) Now, suppose moreover that for every $\sigma \in G$ we are given an isomorphism

$$\alpha_\sigma : E \longrightarrow E_\sigma$$

over T. The cocycle condition above means in this situation that

$$(\alpha_\tau)^\sigma \circ \alpha_\sigma = \alpha_{\tau\sigma}$$

for $\sigma, \tau \in G$. If you've ever done any group cohomology then this should be familiar. Anyway, the ``glueing'' condition on $\mathcal{M}_{1,1}$ says that if you have a solution to this set of equations, then there exists an elliptic curve E' over S such that $E \cong E \times_S T$ (it says a little bit more because it also tells you how to recover the α_σ).

Challenge: Can you prove this entirely using only elliptic curves defined in terms of Weierstrass equations?

63.6. A smooth cover

The last thing we have to do is find a smooth cover of $\mathcal{M}_{1,1}$. In fact, in some sense the existence of a smooth cover *implies*[1] the key fact! In the case of elliptic curves we use the Weierstrass equation to construct one.

Set

$$W = Spec(\mathbf{Z}[a_1, a_2, a_3, a_4, a_6, 1/\Delta])$$

where $\Delta \in \mathbf{Z}[a_1, a_2, a_3, a_4, a_6]$ is a certain polynomial (see below). Set

$$\mathbf{P}^2_W \supset E_W : zy^2 + a_1xyz + a_3yz^2 = x^3 + a_2x^2z + a_4xz^3 + a_6z^3.$$

Denote $f_W : E_W \to W$ the projection. Finally, denote $0_W : W \to E_W$ the section of f_W given by $(0 : 1 : 0)$. It turns out that there is a degree 12 homogeneous polynomial Δ in a_i where $\deg(a_i) = i$ such that $E_W \to W$ is smooth. You can find it explicitly by computing partials of the Weierstrass equation -- of course you can also look it up. You can also use pari/gp to compute it for you. Here it is

$$\begin{aligned}\Delta = &-a_6a_1^6 + a_4a_3a_1^5 + ((-a_3^2 - 12a_6)a_2 + a_4^2)a_1^4 + \\ &(8a_4a_3a_2 + (a_3^3 + 36a_6a_3))a_1^3 + \\ &((-8a_3^2 - 48a_6)a_2^2 + 8a_4^2a_2 + (-30a_4a_3^2 + 72a_6a_4))a_1^2 + \\ &(16a_4a_3a_2^2 + (36a_3^3 + 144a_6a_3)a_2 - 96a_4^2a_3)a_1 + \\ &(-16a_3^2 - 64a_6)a_2^3 + 16a_4^2a_2^2 + (72a_4a_3^2 + 288a_6a_4)a_2 + \\ &- 27a_3^4 - 216a_6a_3^2 - 64a_4^3 - 432a_6^2\end{aligned}$$

You may recognize the last two terms from the case $y^2 = x^3 + Ax + B$ having discriminant $-64A^3 - 432B^2 = -16(4A^3 + 27B^2)$.

Lemma 63.6.1. *The morphism* $W \xrightarrow{(E_W, f_W, 0_W)} \mathcal{M}_{1,1}$ *is smooth and surjective.*

Proof. Surjectivity follows from the fact that every elliptic curve over a field has a Weierstrass equation. We give a very rough sketch of one way to prove smoothness. Consider the sub group scheme

$$H = \left\{ \begin{pmatrix} u^2 & s & 0 \\ 0 & u^3 & 0 \\ r & t & 1 \end{pmatrix} \middle| \begin{matrix} u \text{ unit} \\ s, r, t \text{ arbitrary} \end{matrix} \right\} \subset \mathrm{GL}_{3,\mathbf{Z}}$$

There is an action $H \times W \to W$ of H on the Weierstrass scheme W. To find the equations for this action write out what a coordinate change given by a matrix in H does to the general Weierstrass equation. Then it turns out the following statements hold

(1) any elliptic curve $(E, f, 0)/S$ has Zariski locally on S a Weierstrass equation,
(2) any two Weierstrass equations for $(E, f, 0)$ differ (Zariski locally) by an element of H.

[1]This is a bit of a cheat because in checking the smoothness you have to prove something very close to the key fact -- after all smoothness is defined in terms of fibre products. The advantage is that you only have to prove the existence of these fibre products in the case that on one side you have the morphism that you are trying to show provides the smooth cover.

Considering the fibre product $S \times_{\mathcal{M}_{1,1}} W = Isom_{S\times W}(E \times W, S \times E_W)$ we conclude that this means that the morphism $W \to \mathcal{M}_{1,1}$ is an H-torsor. Since $H \to \mathrm{Spec}(\mathbf{Z})$ is smooth, and since torsors over smooth group schemes are smooth we win. □

Remark 63.6.2. The argument sketched above actually shows that $\mathcal{M}_{1,1} = [W/H]$ is a global quotient stack. It is true about 50% of the time that an argument proving a moduli stack is algebraic will show that it is a global quotient stack.

63.7. Properties of algebraic stacks

Ok, so now we know that $\mathcal{M}_{1,1}$ is an algebraic stack. What can we do with this? Well, it isn't so much the fact that it is an algebraic stack that helps us here, but more the point of view that properties of $\mathcal{M}_{1,1}$ should be encoded in the properties of morphisms $S \to \mathcal{M}_{1,1}$, i.e., in families of elliptic curves. We list some examples

Local properties:

$$\mathcal{M}_{1,1} \to \mathrm{Spec}(\mathbf{Z}) \text{ is smooth} \Leftrightarrow W \to \mathrm{Spec}(\mathbf{Z}) \text{ is smooth}$$

Idea. Local properties of an algebraic stack are encoded in the local properties of its smooth cover.

Global properties:

$$\mathcal{M}_{1,1} \text{ is quasi-compact} \Leftarrow W \text{ is quasi-compact}$$
$$\mathcal{M}_{1,1} \text{ is irreducible} \Leftarrow W \text{ is irreducible}$$

Idea. Some global properties of an algebraic stack can be read off from the corresponding property of a *suitable*[2] smooth cover.

Quasi-coherent sheaves:

$$QCoh(\mathcal{M}_{1,1}) = H\text{-equivariant quasi-coherent modules on } W$$

Idea. On the one hand a quasi-coherent module on $\mathcal{M}_{1,1}$ should correspond to a quasi-coherent sheaf $\mathcal{F}_{S,e}$ on S for each morphism $e : S \to \mathcal{M}_{1,1}$. In particular for the morphism $(E_W, f_W, 0_W) : W \to \mathcal{M}_{1,1}$. Since this morphism is H-equivariant we see the quasi-coherent module $\mathcal{F}_W$ we obtain is H-equivariant. Conversely, given an H-equivariant module we can recover the sheaves $\mathcal{F}_{S,e}$ by descent theory starting with the observation that $S \times_{e,\mathcal{M}_{1,1}} W$ is an H-torsor.

Picard group:

$$\mathrm{Pic}(\mathcal{M}_{1,1}) = \mathrm{Pic}_H(W) = \mathbf{Z}/12\mathbf{Z}$$

Idea. We have seen the first equality above. Note that $\mathrm{Pic}(W) = 0$ because the ring $\mathbf{Z}[a_1, a_2, a_3, a_4, a_6, 1/\Delta]$ has trivial class group. There is an exact sequence

$$\mathbf{Z}\Delta \to \mathrm{Pic}_H(\mathbf{A}^5_{\mathbf{Z}}) \to \mathrm{Pic}_H(W) \to 0$$

The middle group equals $Hom(H, \mathbf{G}_m) = \mathbf{Z}$. The image Δ is 12 because Δ has degree 12. This argument is roughly correct, see [**FO10**].

Étale cohomology: Let Λ be a ring. There is a first quadrant spectral sequence converging to $H^{p+q}_{étale}(\mathcal{M}_{1,1}, \Lambda)$ with E_2-page

$$E_2^{p,q} = H^q_{étale}(W \times H \times \ldots \times H, \Lambda) \quad (p \text{ factors } H)$$

[2] I suppose that it is possible an irreducible algebraic stack exists which doesn't have an irreducible smooth cover -- but if so it is going to be quite nasty!

Idea. Note that

$$W \times_{\mathcal{M}_{1,1}} W \times_{\mathcal{M}_{1,1}} \ldots \times_{\mathcal{M}_{1,1}} W = W \times H \times \ldots \times H$$

because $W \to \mathcal{M}_{1,1}$ is a H-torsor. The spectral sequence is the Čech-to-cohomology spectral sequence for the smooth cover $\{W \to \mathcal{M}_{1,1}\}$. For example we see that $H^0_{\acute{e}tale}(\mathcal{M}_{1,1}, \Lambda) = \Lambda$ because W is connected, and $H^1_{\acute{e}tale}(\mathcal{M}_{1,1}, \Lambda) = 0$ because $H^1_{\acute{e}tale}(W, \Lambda) = 0$ (of course this requires a proof). Of course, the smooth covering $W \to \mathcal{M}_{1,1}$ may not be ``optimal'' for the computation of étale cohomology.

CHAPTER 64

Examples

64.1. Introduction

This chapters will contain examples which illuminate the theory.

64.2. Noncomplete completion

Let R be a ring and let $\mathfrak{m}$ be a maximal ideal. Consider the completion

$$R^\wedge = lim\, R/\mathfrak{m}^n.$$

Note that $R^\wedge$ is a local ring with maximal ideal $\mathfrak{m}' = \text{Ker}(R^\wedge \to R/\mathfrak{m})$. Namely, if $x = (x_n) \in R^\wedge$ is not in $\mathfrak{m}'$, then $y = (x_n^{-1}) \in R^\wedge$ satisfies $xy = 1$, whence $R^\wedge$ is local by Algebra, Lemma 7.17.2. Now it is always true that $R^\wedge$ complete in its limit topology (see the discussion in More on Algebra, Section 12.27). But beyond that, we have the following questions:

(1) Is it true that $\mathfrak{m}R^\wedge = \mathfrak{m}'$?
(2) Is $R^\wedge$ viewed as an $R^\wedge$-module $\mathfrak{m}'$-adically complete?
(3) Is $R^\wedge$ viewed as an R-module $\mathfrak{m}$-adically complete?

It turns out that of these questions all have a negative answer. The example below was taken from an upublished note of Bart de Smit and Hendrik Lenstra. It also is discussed in [**Bou61**, Exercise III.2.12] over a finite field. It is further discussed in [**Yek11**, Example 1.8]

Let k be a field, $R = k[x_1, x_2, x_3, \ldots]$, and $\mathfrak{m} = (x_1, x_2, x_3, \ldots)$. We will think of an element f of $R^\wedge$ as a (possibly) infinite sum

$$f = \sum a_I x^I$$

(using multi-index notation) such that for each $d \geq 0$ there are only finitely many nonzero a_I for $|I| = d$. The maximal ideal $\mathfrak{m}' \subset R^\wedge$ is the collection of f with zero constant term. In particular, the element

$$f = x_1 + x_2^2 + x_3^3 + \ldots$$

is in $\mathfrak{m}'$ but not in $\mathfrak{m}R^\wedge$ which shows that (1) is false in this example. Note that we do have $\mathfrak{m}R^\wedge \subset \mathfrak{m}'$. Hence, $R^\wedge$ is not $\mathfrak{m}$-adically complete as an R-module, then it is also not $\mathfrak{m}'$-adically complete. To show that $R^\wedge$ is not $\mathfrak{m}$-adically complete (as an R-module) it suffices to show that $K_2 = \text{Ker}(R^\wedge \to R/\mathfrak{m}^2)$ is not equal to $\mathfrak{m}^2 R^\wedge$, see Algebra, Lemma 7.90.6. Note that an element of $\mathfrak{m}^2 R^\wedge \subset (\mathfrak{m}')^2$ can be written as a finite sum

$$\sum\nolimits_{i=1,\ldots,t} f_i g_i \qquad (64.2.0.1)$$

with $f_i, g_i \in R^\wedge$ having vanishing constant terms. To get an example we are going to choose an $z \in K_2$ of the form

$$z = z_1 + z_2 + z_3 + \ldots$$

with the following properties

(1) there exist sequences $1 < d_1 < d_2 < d_3 < \ldots$ and $0 < n_1 < n_2 < n_3 < \ldots$ such that $z_i \in k[x_{n_i}, x_{n_i+1}, \ldots, x_{n_{i+1}-1}]$ homogeneous of degree d_i, and
(2) in the ring $k[[x_{n_i}, x_{n_i+1}, \ldots, x_{n_{i+1}-1}]]$ the element z_i cannot be written as a sum (64.2.0.1) with $t \leq i$.

Clearly this implies that z is not in $(\mathfrak{m}')^2$ because the image of the relation (64.2.0.1) in the ring $k[[x_{n_i}, x_{n_i+1}, \ldots, x_{n_{i+1}-1}]]$ for i large enough would produce a contradiction. Hence it suffices to prove that for all $t > 0$ there exists a $d \gg 0$ and an integer n such that we can find an homogeneous element $z \in k[x_1, \ldots, x_n]$ of degree d which cannot be written as a sum (64.2.0.1) for the given t in $k[[x_1, \ldots, x_n]]$. Take $n > 2t$ and any $d > 1$ prime to the characteristic of p and set $z = \sum_{i=1,\ldots,n} x_i^d$. Then the vanishing locus of the ideal

$$(\frac{\partial z}{\partial x_1}, \ldots, \frac{\partial z}{\partial x_n}) = (dx_1^{d-1}, \ldots, dx_n^{d-1})$$

consists of one point. On the other hand,

$$\frac{\partial(\sum_{i=1,\ldots,t} f_i g_i)}{\partial x_j} \in (f_1, \ldots, f_t, g_1, \ldots, g_t)$$

by the Leibniz rule and hence the vanishing locus of these derivatives contains at least

$$V(f_1, \ldots, f_t, g_1, \ldots, g_t) \subset Spec(k[[x_1, \ldots, x_n]]).$$

Hence this is a contradition as the dimension of $V(f_1, \ldots, f_t, g_1, \ldots, g_t)$ is at least $n - 2t \geq 1$.

Lemma 64.2.1. *There exists a local ring R and a maximal ideal $\mathfrak{m}$ such that the completion $R^\wedge$ of R with respect to $\mathfrak{m}$ has the following properties*

(1) *$R^\wedge$ is local, but its maximal ideal is not equal to $\mathfrak{m}R^\wedge$,*
(2) *$R^\wedge$ is not a complete local ring, and*
(3) *$R^\wedge$ is not $\mathfrak{m}$-adically complete as an R-module.*

Proof. This follows from the discussion above as (with $R = k[x_1, x_2, x_3, \ldots]$) the completion of the localization $R_\mathfrak{m}$ is equal to the completion of R. □

64.3. Noncomplete quotient

Let k be a field. Let

$$R = k[t, z_1, z_2, z_3, \ldots, w_1, w_2, w_3, \ldots, x]/(z_i t - x^i w_i, z_i w_j)$$

Note that in particular $z_i z_j t = 0$ in this ring. Any element f of R can be uniquely written as a finite sum

$$f = \sum\nolimits_{i=0,\ldots,d} f_i x^i$$

where each $f_i \in k[t, z_i, w_j]$ has no terms involving the products $z_i t$ or $z_i w_j$. Moreover, if f is written in this way, then $f \in (x^n)$ if and only if $f_i = 0$ for $i < n$. So x is a nonzero divisor and $\bigcap (x^n) = 0$. Let $R^\wedge$ be the completion of R with respect to the ideal (x). Note that $R^\wedge$ is (x)-adically complete, see Algebra, Lemma 7.90.7. By the above we see that an element of $R^\wedge$ can be uniquely written as an infinite sum

$$f = \sum\nolimits_{i=0}^{\infty} f_i x^i$$

where each $f_i \in k[t, z_i, w_j]$ has no terms involving the products $z_i t$ or $z_i w_j$. Consider the element

$$f = \sum\nolimits_{i=1}^{\infty} x^{i-1} w_i = x w_1 + x^2 w_2 + x^3 w_3 + \ldots$$

i.e., we have $f_n = w_n$. Note that $f \in (t, x^n)$ for every n because $x^m w_m \in (t)$ for all m. We claim that $f \not\in (t)$. To prove this assume that $tg = f$ where $g = \sum g_l x^l$ in canonical form as above. Since $tz_iz_j = 0$ we may as well assume that none of the g_l have terms involving the products z_iz_j. Examining the process to get tg in canonical form we see the following: Given any term cm of g_l where $c \in k$ and m is a monomial in t, z_i, w_j and we make the following replacement

(1) if the monomial m does not involve any z_i, then ctm is a term of f_l, and
(2) if the monomial m does involve a z_i then it is eqal to $m = z_i$ and we see that cw_i is term of f_{l+i}.

Since g_0 is a polynomial only finitely many of the variables z_i occur in it. Pick n such that z_n does not occur in g_0. Then the rules above show that w_n does not occur in f_n which is a contradiction. It follows that $R^\wedge/(t)$ is not complete, see Algebra, Lemma 7.90.13.

Lemma 64.3.1. *There exists a ring R complete with respect to a principal ideal I and a principal ideal J such that R/J is not I-adically complete.*

Proof. See discussion above. □

64.4. Completion is not exact

A quick example is the following. Suppose that $R = k[t]$. Let $P = K = \bigoplus_{n \in \mathbf{N}} R$ and $M = \bigoplus_{n \in \mathbf{N}} R/(t^n)$. Then there is a short exact sequence $0 \to K \to P \to M \to 0$ where the first map is given by multiplication by t^n on the nth summand. We claim that $0 \to K^\wedge \to P^\wedge \to M^\wedge \to 0$ is not exact in the middle. Namely, $\xi = (t^2, t^3, t^4, \ldots) \in P^\wedge$ maps to zero in $M^\wedge$ but is not in the image of $K^\wedge \to P^\wedge$, because it would be the image of $(t, t, t, \ldots)$ which is not an element of $K^\wedge$.

A ``smaller'' example is the following. In the situation of Lemma 64.3.1 the short exact sequence $0 \to J \to R \to R/J \to 0$ does not remain exact after completion. Namely, if $f \in J$ is a generator, then $f : R \to J$ is surjective, hence $R \to J^\wedge$ is surjective, hence the image of $J^\wedge \to R$ is $(f) = J$ but the fact that R/J is noncomplete means that the kernel of the surjection $R \to (R/J)^\wedge$ is strictly bigger than J, see Algebra, Lemmas 7.90.1 and 7.90.13. By the same token the sequence $R \to R \to R/(f) \to 0$ does not remain exact on completion.

Lemma 64.4.1. *Completion is not an exact functor in general; it is not even right exact in general. This holds even when I is finitely generated on the category of finitely presented modules.*

Proof. See discussion above. □

64.5. The category of complete modules is not abelian

Let R be a ring and let $I \subset R$ be a finitely generated ideal. Consider the category $\mathcal{A}$ of I-adically complete R-modules, see Algebra, Definition 7.90.5. Let $\varphi : M \to N$ be a morphism of $\mathcal{A}$. The cokernel of φ in $\mathcal{A}$ is the completion $(\text{Coker}(\varphi))^\wedge$ of the usual cokernel (as I is finitely generated this completion is complete, see Algebra, Lemma 7.90.7). Let $K = \text{Ker}(\varphi)$. We claim that K is complete and hence is the kernel of φ in $\mathcal{A}$. Namely, let $K^\wedge$ be the completion. As M is complete we obtain a factorization

$$K \to K^\wedge \to M \xrightarrow{\varphi} N$$

Since φ is continuous for the I-adic topology, $K \to K^\wedge$ has dense image, and $K = \mathrm{Ker}(\varphi)$ we conclude that $K^\wedge$ maps into K. Thus $K^\wedge = K \oplus C$ and K is a direct sum of a complete module, hence complete.

We will give an example that shows that Im≠Coim in general. We take $R = \mathbf{Z}_p = lim_n \mathbf{Z}/p^n\mathbf{Z}$ to be the ring of p-adic integers and we take $I = (p)$. Consider the map

$$\mathrm{diag}(1, p, p^2, \ldots) : \left(\bigoplus\nolimits_{n\geq 1} \mathbf{Z}_p\right)^\wedge \longrightarrow \prod\nolimits_{n \geq 1} \mathbf{Z}_p$$

where the left hand side is the p-adic completion of the direct sum. Hence an element of the left hand side is a vector $(x_1, x_2, x_3, \ldots)$ with $x_i \in \mathbf{Z}_p$ with p-adic valuation $v_p(x_i) \to \infty$ as $i \to \infty$. This maps to $(x_1, px_2, p^2x_3, \ldots)$. Hence we see that $(1, p, p^2, \ldots)$ is in the closure of the image but not in the image. By our description of kernels and cokernels above it is clear that Im≠Coim for this map.

Lemma 64.5.1. *Let R be a ring and let $I \subset R$ be a finitely generated ideal. The category of I-adically complete R-modules has kernels and cokernels but is not abelian in general.*

Proof. See above. $\square$

64.6. Regular sequences and base change

We are going to construct a ring R with a regular sequence (x, y, z) such that there exists a nonzero element $\delta \in R/zR$ with $x\delta = y\delta = 0$.

To construct our example we first construct a peculiar module E over the ring $k[x, y, z]$ where k is any field. Namely, E will be a push-out as in the following diagram

$$\begin{tikzcd}
\frac{xk[x,y,z,y^{-1}]}{xyk[x,y,z]} \arrow[r] \arrow[d, "z/x"] & \frac{k[x,y,z,x^{-1},y^{-1}]}{yk[x,y,z,x^{-1}]} \arrow[r] \arrow[d] & \frac{k[x,y,z,x^{-1},y^{-1}]}{yk[x,y,z,x^{-1}]+xk[x,y,z,y^{-1}]} \arrow[d] \\
\frac{k[x,y,z,y^{-1}]}{yzk[x,y,z]} \arrow[r] & E \arrow[r] & \frac{k[x,y,z,x^{-1},y^{-1}]}{yk[x,y,z,x^{-1}]+xk[x,y,z,y^{-1}]}
\end{tikzcd}$$

where the rows are short exact sequences (we dropped the outer zeros due to typesetting problems). Another way to describe E is as

$$E = \{(f, g) \mid f \in k[x, y, z, x^{-1}, y^{-1}], g \in k[x, y, z, y^{-1}]\}/\sim$$

where $(f, g) \sim (f', g')$ if and only if there exists a $h \in k[x, y, z, y^{-1}]$ such that

$$f = f' + xh \bmod yk[x, y, z, x^{-1}], \quad g = g' - zh \bmod yzk[x, y, z]$$

We claim: (a) $x : E \to E$ is injective, (b) $y : E/xE \to E/xE$ is injective, (c) $E/(x, y)E = 0$, (d) there exists a nonzero element $\delta \in E/zE$ such that $x\delta = y\delta = 0$.

To prove (a) suppose that (f, g) is a pair that gives rise to an element of E and that $(xf, xg) \sim 0$. Then there exists a $h \in k[x, y, z, y^{-1}]$ such that $xf + xh \in yk[x, y, z, x^{-1}]$ and $xg - zh \in yzk[x, y, z]$. We may assume that $h = \sum a_{i,j,k}x^iy^jz^k$ is a sum of monomials where only $j \leq 0$ occurs. Then $xg - zh \in yzk[x, y, z]$ implies that only $i > 0$ occurs, i.e., $h = xh'$ for some $h' \in k[x, y, z, y^{-1}]$. Then $(f, g) \sim (f + xh', g - zh')$ and we see that we may assume that $g = 0$ and $h = 0$. In this case $xf \in yk[x, y, z, x^{-1}]$ implies $f \in yk[x, y, z, x^{-1}]$ and we see that $(f, g) \sim 0$. Thus $x : E \to E$ is injective.

Since multiplication by x is an isomorphism on $\frac{k[x,y,z,x^{-1},y^{-1}]}{yk[x,y,z,x^{-1}]}$ we see that E/xE is isomorphic to

$$\frac{k[x,y,z,y^{-1}]}{yzk[x,y,z] + xk[x,y,z,y^{-1}] + zk[x,y,z,y^{-1}]} = \frac{k[x,y,z,y^{-1}]}{xk[x,y,z,y^{-1}] + zk[x,y,z,y^{-1}]}$$

and hence multiplication by y is an isomorphism on E/xE. This clearly implies (b) and (c).

Let $e \in E$ be the equivalence class of $(1,0)$. Suppose that $e \in zE$. Then there exist $f \in k[x,y,z,x^{-1},y^{-1}]$, $g \in k[x,y,z,y^{-1}]$, and $h \in k[x,y,z,y^{-1}]$ such that

$$1 + zf + xh \in yk[x,y,z,x^{-1}], \quad 0 + zg - zh \in yzk[x,y,z].$$

This is impossible: the monomial 1 cannot occur in zf, nor in xh. On the other hand, we have $ye = 0$ and $xe = (x,0) \sim (0,-z) = z(0,-1)$. Hence settting δ equal to the congruence class of e in E/zE we obtain (d).

Lemma 64.6.1. *There exists a local ring R and a regular sequence x, y, z (in the maximal ideal) such that there exists a nonzero element $\delta \in R/zR$ with $x\delta = y\delta = 0$.*

Proof. Let $R = k[x,y,z] \oplus E$ where E is the module above considered as a square zero ideal. Then it is clear that x, y, z is a regular sequence in R, and that the element $\delta \in E/zE \subset R/zR$ gives an element with the desired properties. To get a local example we may localize R at the maximal ideal $\mathfrak{m} = (x,y,z,E)$. The sequence x, y, z remains a regular sequence (as localization is exact), and the element δ remains nonzero as it is supported at $\mathfrak{m}$. □

Lemma 64.6.2. *There exists a local homomorphism of local rings $A \to B$ and a regular sequence x, y in the maximal ideal of B such that $B/(x,y)$ is flat over A, but such that the images $\overline{x}, \overline{y}$ of x, y in $B/\mathfrak{m}_A B$ do not form a regular sequence, nor even a Koszul-regular sequence.*

Proof. Set $A = k[z]_{(z)}$ and let $B = (k[x,y,z] \oplus E)_{(x,y,z,E)}$. Since x, y, z is a regular sequence in B, see proof of Lemma 64.6.1, we see that x, y is a regular sequence in B and that $B/(x,y)$ is a torsion free A-module, hence flat. On the other hand, there exists a nonzero element $\delta \in B/\mathfrak{m}_A B = B/zB$ which is annihilated by $\overline{x}, \overline{y}$. Hence $H_2(K_\bullet(B/\mathfrak{m}_A B, \overline{x}, \overline{y})) \neq 0$. Thus $\overline{x}, \overline{y}$ is not Koszul-regular, in particular it is not a regular sequence, see More on Algebra, Lemma 12.22.2. □

64.7. A Noetherian ring of infinite dimension

A Noetherian local ring has finite dimension as we saw in Algebra, Proposition 7.57.8. But there exist Noetherian rings of infinite dimension. See [**Nag62**, Appendix, Example 1].

Namely, let k be a field, and consider the ring

$$R = k[x_1, x_2, x_3, \ldots].$$

Let $\mathfrak{p}_i = (x_{2^{i-1}}, x_{2^{i-1}+1}, \ldots, x_{2^i-1})$ for $i = 1, 2, \ldots$ which are prime ideals of R. Let S be the multiplicative subset

$$S = \bigcap\nolimits_{i \geq 1} (R \setminus \mathfrak{p}_i).$$

Consider the ring $A = S^{-1}R$. We claim that

(1) The maximal ideals of the ring A are the ideals $\mathfrak{m}_i = \mathfrak{p}_i A$.
(2) We have $A_{\mathfrak{m}_i} = R_{\mathfrak{p}_i}$ which is a Noetherian local ring of dimension 2^i.
(3) The ring A is Noetherian.

Hence it is clear that this is the example we are looking for. Details omitted.

64.8. Local rings with nonreduced completion

In Algebra, Example 7.110.4 we gave an example of a characteristic p Noetherian local domain R of dimension 1 whose completion is nonreduced. In this section we present the example of [**FR70**, Proposition 3.1] which gives a similar ring in characteristic zero.

Let $\mathbf{C}\{x\}$ be the ring of convergent power series over the field $\mathbf{C}$ of complex numbers. The ring of all power series $\mathbf{C}[[x]]$ is its completion. Let $K = \mathbf{C}\{x\}[1/x] = f.f.(B)$ be the field of convergent Laurent series. The K-module $\Omega_{K/\mathbf{C}}$ of algebraic differentials of K over $\mathbf{C}$ is an infinite dimensional K-vector space (proof omitted). We may choose $f_n \in x\mathbf{C}\{x\}$, $n \geq 1$ such that $\mathrm{d}x, \mathrm{d}f_1, \mathrm{d}f_2, \ldots$ are part of a basis of $\Omega_{K/\mathbf{C}}$. Thus we can find a $\mathbf{C}$-derivation

$$D : \mathbf{C}\{x\} \longrightarrow \mathbf{C}((x))$$

such that $D(x) = 0$ and $D(f_i) = x^{-n}$. Let

$$A = \{f \in \mathbf{C}\{x\} \mid D(f) \in \mathbf{C}[[x]]\}$$

We claim that

(1) $\mathbf{C}\{x\}$ is integral over A,
(2) A is a local domain,
(3) $\dim(A) = 1$,
(4) the maximal ideal of A is generated by x and xf_1,
(5) A is Noetherian, and
(6) the completion of A is equal to the ring of dual numbers over $\mathbf{C}[[x]]$.

Since the dual numbers are nonreduced the ring A gives the example.

Note that if $0 \neq f \in x\mathbf{C}\{x\}$ then we may write $D(f) = h/f^n$ for some $n \geq 0$ and $h \in \mathbf{C}[[x]]$. Hence $D(f^{n+1}/(n+1)) \in \mathbf{C}[[x]]$ and $D(f^{n+2}/(n+2)) \in \mathbf{C}[[x]]$. Thus we see $f^{n+1}, f^{n+2} \in A$! In particular we see (1) holds. We also conclude that the fraction field of A is equal to the fraction field of $\mathbf{C}\{x\}$. It also follows immediately that $A \cap x\mathbf{C}\{x\}$ is the set of nonunits of A, hence A is a local domain of dimension 1. If we can show (4) then it will follow that A is Noetherian (proof omitted). Suppose that $f \in A \cap x\mathbf{C}\{x\}$. Write $D(f) = h$, $h \in \mathbf{C}[[x]]$. Write $h = c + xh'$ with $c \in \mathbf{C}$, $h' \in \mathbf{C}[[x]]$. Then $D(f - cxf_1) = c + xh' - c = xh'$. On the other hand $f - cxf_1 = xg$ with $g \in \mathbf{C}\{x\}$, but by the computation above we have $D(g) = h' \in \mathbf{C}[[x]]$ and hence $g \in A$. Thus $f = cxf_1 + xg \in (x, xf_1)$ as desired.

Finally, why is the completion of A nonreduced? Denote $\hat{A}$ the completion of A. Of course this maps surjectively to the completion $\mathbf{C}[[x]]$ of $\mathbf{C}\{x\}$ because $x \in A$. Denote this map $\psi : \hat{A} \to \mathbf{C}[[x]]$. Above we saw that $\mathfrak{m}_A = (x, xf_1)$ and hence $D(\mathfrak{m}_A^n) \subset (x^{n-1})$ by an easy computation. Thus $D : A \to \mathbf{C}[[x]]$ is continuous and gives rise to a continuous derivation $\hat{D} : \hat{A} \to \mathbf{C}[[x]]$ over ψ. Hence we get a ring map

$$\psi + \epsilon\hat{D} : \hat{A} \longrightarrow \mathbf{C}[[x]][\epsilon].$$

Since $\hat{A}$ is a one dimensional Noetherian complete local ring, if we can show this arrow is surjective then it will follow that $\hat{A}$ is nonreduced. Actually the map is an isomorphism but we omit the verification of this. The subring $\mathbf{C}[x]_{(x)} \subset A$ gives rise to a map $i : \mathbf{C}[[x]] \to \hat{A}$ on completions such that $i \circ \psi = \mathrm{id}$ and such that $D \circ i = 0$ (as $D(x) = 0$ by construction). Consider the elements $x^n f_n \in A$. We have

$$(\psi + \epsilon D)(x^n f_n) = x^n f_n + \epsilon$$

for all $n \geq 1$. Surjectivity easily follows from these remarks.

64.9. A non catenary Noetherian local ring

Even though there is a succesful dimension theory of Noetherian local rings there are non-catenary Noetherian local rings. An example may be found in [**Nag62**, Appendix, Example 2]. In fact, we will present this example in the simplest case. Namely, we will construct a local Noetherian domain A of dimension 2 which is not universally catenary. (Note that A is automatically catenary, see Exercises, Exercise 65.12.2.) The existence of a Noetherian local ring which is not universally catenary implies the existence of a Noetherian local ring which is not catenary -- and we spell this out at the end of this section in the particular example at hand.

Let k be a field, and consider the formal power series ring $k[[x]]$ in one variable over k. Let

$$z = \sum\nolimits_{i=1}^{\infty} a_i x^i$$

be a formal power series. We assume z as an element of the Laurent series field $k((x)) = f.f.(k[[x]])$ is transcendental over $k(x)$. Put

$$z_j = x^{-j}(z - \sum\nolimits_{i=1,\ldots,j-1} a_i x^i) = \sum\nolimits_{i=j}^{\infty} a_i x^{i-j} \in k[[x]].$$

Note that $Z = z_1$. Let R be the subring of $k[[x]]$ generated by x, z and all of the z_j, in other words

$$R = k[x, z_1, z_2, z_3, \ldots] \subset k[[x]].$$

Consider the ideals $\mathfrak m = (x)$ and $\mathfrak n = (x - 1, z_1, z_2, \ldots)$ of R.

We have $x(z_{j+1} + a_j) = z_j$. Hence $R/\mathfrak m = k$ and $\mathfrak m$ is a maximal ideal. Moreover, any element of R not in $\mathfrak m$ maps to a unit in $k[[x]]$ and hence $R_{\mathfrak m} \subset k[[x]]$. In fact it is easy to deduce that $R_{\mathfrak m}$ is a discrete valuation ring and residue field k.

We claim that

$$R/(x - 1) = k[x, z_1, z_2, z_3, \ldots]/(x - 1) \cong k[z].$$

Namely, the relation above implies that $(x-1)(z_{j+1} + a_j) = -z_{j+1} - a_j + z_j$, and hence we may express the class of z_{j+1} in terms of z_j in the quotient $R/(x-1)$. Since the fraction field of R has transcendence degree 2 over k by construction we see that z is transcendental over k in $R/(x - 1)$, whence the desired isomorphism. Hence $\mathfrak n = (x - 1, z)$ and is a maximal ideal. In fact the map

$$k[x, x^{-1}, z]_{(x-1,z)} \longrightarrow R_{\mathfrak n}$$

is an isomorphism (since x^{-1} is invertible in $R_{\mathfrak n}$ and since $z_{j+1} = x^{-1}z_j - a_j = \ldots = f_j(x, x^{-1}, z)$). This shows that $R_{\mathfrak n}$ is a regular local ring of dimension 2 and residue field k.

Let S be the multiplicative subset

$$S = (R \setminus \mathfrak m) \cap (R \setminus \mathfrak n) = R \setminus (\mathfrak m \cup \mathfrak n)$$

and set $B = S^{-1}R$. We claim that

(1) The ring B is a k-algebra.
(2) The maximal ideals of the ring B are the two ideals $\mathfrak m B$ and $\mathfrak n B$.
(3) The residue fields at these maximal ideals is k.
(4) We have $B_{\mathfrak m B} = R_{\mathfrak m}$ and $B_{\mathfrak n B} = R_{\mathfrak n}$ which are Noetherian regular local rings of dimensions 1 and 2.
(5) The ring B is Noetherian.

We omit the details of the verifications.

Whenever given a k-algebra B with the properties listed above we get an example as follows. Take $A = k + \text{rad}(B) \subset B$, in our case $\text{rad}(B) = \mathfrak{m}B + \mathfrak{n}B$. It is easy to see that B is finite over A and hence A is Noetherian by Eakin's theorem (see [**Eak68**], or [**Nag62**, Appendix A1], or insert future reference here). Also A is a local domain with the same fraction field as B and residue field k. Since the dimension of B is 2 we see that A has dimension 2 as well, by Algebra, Lemma 7.103.4.

If A were universally catenary then the dimension formula, Algebra, Lemma 7.104.1 would give $\dim(B_{\mathfrak{m}B}) = 2$ contradiction.

Note that B is generated by one element over A. Hence $B = A[x]/\mathfrak{p}$ for some prime $\mathfrak{p}$ of $A[x]$. Let $\mathfrak{m}' \subset A[x]$ be the maximal ideal corresponding to $\mathfrak{m}B$. Then on the one hand $\dim(A[x]_{\mathfrak{m}'}) = 3$ and on the other hand

$$(0) \subset \mathfrak{p}A[x]_{\mathfrak{m}'} \subset \mathfrak{m}'A[x]_{\mathfrak{m}'}$$

is a maximal chain of primes. Hence $A[x]_{\mathfrak{m}'}$ is an example of a non catenary Noetherian local ring.

64.10. Non-quasi-affine variety with quasi-affine normalization

The existence of an example of this kind is mentioned in [**DG67**, II Remark 6.6.13]. They refer to the fifth volume of EGA for such an example, but the fifth volume did not appear.

Let k be a field. Let $Y = \mathbf{A}^2_k \setminus \{(0,0)\}$. We are going to construct a finite surjective birational morphism $\pi : Y \longrightarrow X$ with X a variety over k such that X is not quasi-affine. Namely, consider the following curves in Y:

$$\begin{array}{lcl} C_1 & : & x = 0 \\ C_2 & : & y = 0 \end{array}$$

Note that $C_1 \cap C_2 = \emptyset$. We choose the isomorphism $\varphi : C_1 \to C_2$, $(0, y) \mapsto (y^{-1}, 0)$. We claim there is a unique morphism $\pi : Y \to X$ as above such that

$$\begin{tikzcd} C_1 \arrow[r, shift left, "\mathrm{id}"] \arrow[r, shift right, "\varphi"'] & Y \arrow[r, "\pi"] & X \end{tikzcd}$$

is a coequalizer diagram in the category of varieties (and even in the category of schemes). Accepting this for the moment let us show that such an X cannot be quasi-affine. Namely, it is clear that we would get

$$\Gamma(X, \mathcal{O}_X) = \{f \in k[x, y] \mid f(0, y) = f(y^{-1}, 0)\} = k \oplus (xy) \subset k[x, y].$$

In particular these functions do not separate the points $(1, 0)$ and $(-1, 0)$ whose images in X (we will see below) are distinct (if the characteristic of k is not 2).

To show that X exists consider the Zariski open $D(x + y) \subset Y$ of Y. This is the spectrum of the ring $k[x, y, 1/(x + y)]$ and the curves C_1, C_2 are completely contained in $D(x + y)$. Moreover the morphism

$$C_1 \coprod C_2 \longrightarrow D(x + y) \cap Y = Spec(k[x, y, 1/(x + y)])$$

is a closed immersion. It follows from Algebra, Lemma 7.47.10 that the ring

$$A = \{f \in k[x, y, 1/(x + y)] \mid f(0, y) = f(y^{-1}, 0)\}$$

is of finite type over k. On the other hand we have the open $D(xy) \subset Y$ of Y which is disjoint from the curves C_1 and C_2. It is the spectrum of the ring

$$B = k[x, y, 1/xy].$$

Note that we have $A_{xy} \cong B_{x+y}$ (since A clearly contains the elements $xyP(x, y)$ any polynomial P and the element $xy/(x+y)$). The scheme X is obtained by glueing the affine schemes $Spec(A)$ and $Spec(B)$ using the isomorphism $A_{xy} \cong B_{x+y}$ and hence is clearly of finite type over k. To see that it is separated one has to show that the ring map $A \otimes_k B \to B_{x+y}$ is surjective. To see this use that $A \otimes_k B$ contains the element $xy/(x + y) \otimes 1/xy$ which maps to $1/(x + y)$. The morphism $X \to Y$ is given by the natural maps $D(x + y) \to Spec(A)$ and $D(xy) \to Spec(B)$. Since these are both finite we deduce that $X \to Y$ is finite as desired. We omit the verification that X is indeed the coequalizer of the displayed diagram above, however, see (insert future reference for push outs in the category of schemes here). Note that the morphism $\pi : Y \to X$ does map the points $(1, 0)$ and $(-1, 0)$ to distinct points in X because the function $(x + y^3)/(x + y)^2 \in A$ has value $1/1$, resp. $-1/(-1)^2 = -1$ which are always distinct (unless the characteristic is 2 -- please find your own points for characteristic 2). We summarize this discussion in the form of a lemma.

Lemma 64.10.1. *Let k be a field. There exists a variety X whose normalization is quasi-affine but which is itself not quasi-affine.*

Proof. See discussion above and (insert future reference on normalization here). □

64.11. A locally closed subscheme which is not open in closed

This is a copy of Morphisms, Example 24.2.10. Here is an example of an immersion which is not a composition of an open immersion followed by a closed immersion. Let k be a field. Let $X = Spec(k[x_1, x_2, x_3, \ldots])$. Let $U = \bigcup_{n=1}^{\infty} D(x_n)$. Then $U \to X$ is an open immersion. Consider the ideals

$$I_n = (x_1^n, x_2^n, \ldots, x_{n-1}^n, x_n - 1, x_{n+1}, x_{n+2}, \ldots) \subset k[x_1, x_2, x_3, \ldots][1/x_n].$$

Note that $I_n k[x_1, x_2, x_3, \ldots][1/x_n x_m] = (1)$ for any $m \neq n$. Hence the quasi-coherent ideals $\tilde{I}_n$ on $D(x_n)$ agree on $D(x_n x_m)$, namely $\tilde{I}_n|_{D(x_n x_m)} = \mathcal{O}_{D(x_n x_m)}$ if $n \neq m$. Hence these ideals glue to a quasi-coherent sheaf of ideals $\mathcal{I} \subset \mathcal{O}_U$. Let $Z \subset U$ be the closed subscheme corresponding to $\mathcal{I}$. Thus $Z \to X$ is an immersion.

We claim that we cannot factor $Z \to X$ as $Z \to \overline{Z} \to X$, where $\overline{Z} \to X$ is closed and $Z \to \overline{Z}$ is open. Namely, $\overline{Z}$ would have to be defined by an ideal $I \subset k[x_1, x_2, x_3, \ldots]$ such that $I_n = Ik[x_1, x_2, x_3, \ldots][1/x_n]$. But the only element $f \in k[x_1, x_2, x_3, \ldots]$ which ends up in all I_n is 0! Hence I does not exist.

64.12. Pushforward of quasi-coherent modules

In Schemes, Lemma 21.24.1 we proved that f_* transformes quasi-coherent modules into quasi-coherent modules when f is quasi-compact and quasi-separated. Here are some examples to show that these conditions are both necessary.

Suppose that $Y = \mathrm{Spec}(A)$ is an affine scheme and that $X = \coprod_{n \in \mathbf{N}} Y$. We claim that $f_*\mathcal{O}_X$ is not quasi-coherent where $f : X \to Y$ is the obvious morphism. Namely, for $a \in A$ we have

$$f_*\mathcal{O}_X(D(a)) = \prod\nolimits_{n \in \mathbf{N}} A_a$$

Hence, in order for $f_*\mathcal{O}_X$ to be quasi-coherent we would need

$$\prod\nolimits_{n\in\mathbf{N}} A_a = \left(\prod\nolimits_{n\in\mathbf{N}} A\right)_a$$

for all $a \in A$. This isn't true in general, for example if $A = \mathbf{Z}$ and $a = 2$, then $(1, 1/2, 1/4, 1/8, \ldots)$ is an element of the left hand side which is not in the right hand side. Note that f is a non-quasi-compact separated morphism.

Let k be a field. Set

$$A = k[t, z, x_1, x_2, x_3, \ldots]/(tx_1z, t^2x_2^2z, t^3x_3^3z, \ldots)$$

Let $Y = Spec(A)$. Let $V \subset Y$ be the open subscheme $V = D(x_1) \cup D(x_2) \cup \ldots$. Let X be two copies of Y glued along V. Let $f : X \to Y$ be the obvious morphism. Then we have an exact sequence

$$0 \to f_*\mathcal{O}_X \to \mathcal{O}_Y \oplus \mathcal{O}_Y \xrightarrow{(1,-1)} j_*\mathcal{O}_V$$

where $j : V \to Y$ is the inclusion morphism. Since

$$A \longrightarrow \prod A_{x_n}$$

is injective (details omitted) we see that $\Gamma(Y, f_*\mathcal{O}_X) = A$. On the other hand, the kernel of the map

$$A_t \longrightarrow \prod A_{tx_n}$$

is nonzero because it contains the element z. Hence $\Gamma(D(t), f_*\mathcal{O}_X)$ is strictly bigger than A_t because it contains $(z, 0)$. Thus we see that $f_*\mathcal{O}_X$ is not quasi-coherent. Note that f is quasi-compact but non-quasi-separated.

Lemma 64.12.1. *Schemes, Lemma 21.24.1 is sharp in the sense that one can neither drop the assumption of quasi-compactness nor the assumption of quasi-separatedness.*

Proof. See discussion above. □

64.13. A nonfinite module with finite free rank 1 stalks

Let $R = \mathbf{Q}[x]$. Set $M = \sum_{n\in\mathbf{N}} \frac{1}{x-n} R$ as a submodule of the fraction field of R. Then M is not finitely generated, but for every prime $\mathfrak{p}$ of R we have $M_\mathfrak{p} \cong R_\mathfrak{p}$ as an $R_\mathfrak{p}$-module.

64.14. A finite flat module which is not projective

This is a copy of Algebra, Remark 7.72.3. It is not true that a finite R-module which is R-flat is automatically projective. A counter example is where $R = \mathcal{C}^\infty(\mathbf{R})$ is the ring of infinitely differentiable functions on $\mathbf{R}$, and $M = R_\mathfrak{m} = R/I$ where $\mathfrak{m} = \{f \in R \mid f(0) = 0\}$ and $I = \{f \in R \mid \exists\epsilon, \epsilon > 0 : f(x) = 0\ \forall x, |x| < \epsilon\}$.

The morphism $Spec(R/I) \to Spec(R)$ is also an example of a flat closed immersion which is not open.

Lemma 64.14.1. *Strange flat modules.*

1. *There exists a ring R and a finite flat R-module M which is not projective.*
2. *There exists a closed immersion which is flat but not open.*

Proof. See discussion above. □

64.15. A projective module which is not locally free

We give two examples. One where the rank is between 0 and 1 and one where the rank is $\aleph_0$.

Lemma 64.15.1. *Let R be a ring. Let $I \subset R$ be an ideal generated by a countable collection of idempotents. Then I is projective as an R-module.*

Proof. Say $I = (e_1, e_2, e_3, \ldots)$ with e_n an idempotent of R. After inductively replacing e_{n+1} by $e_n + (1 - e_n)e_{n+1}$ we may assume that $(e_1) \subset (e_2) \subset (e_3) \subset \ldots$ and hence $I = \bigcup_{n\geq 1}(e_n) = colim_n\, e_nR$. In this case

$$Hom_R(I, M) = Hom_R(colim_n\, e_nR, M) = lim_n\, Hom_R(e_nR, M) = lim_n\, e_nM$$

Note that the transition maps $e_{n+1}M \to e_nM$ are given by multiplication by e_n are are surjective. Hence by Algebra, Lemma 7.80.4 the functor $Hom_R(I, M)$ is exact, i.e., I is a projective R-module. □

Lemma 64.15.2. *Let R be a ring. Let $n \geq 1$. Let M be an R-module generated by $< n$ elements. Then any R-module map $f : R^{\oplus n} \to M$ has a nonzero kernel.*

Proof. Choose a surjection $R^{\oplus n-1} \to M$. We may lift the map f to a map $f' : R^{\oplus n} \to R^{\oplus n-1}$. It suffices to prove f' has a nonzero kernel. The map $f' : R^{\oplus n} \to R^{\oplus n-1}$ is given by a matrix $A = (a_{ij})$. If one of the a_{ij} is not nilpotent, say $a = a_{ij}$ is not, then we can replace A by the localization A_a and we may assume a_{ij} is a unit. Since if we find a nonzero kernel after localization then there was a nonzero kernel to start with as localization is exact, see Algebra, Proposition 7.9.12. In this case we can do a base change on both $R^{\oplus n}$ and $R^{\oplus n-1}$ and reduce to the case where

$$A = \begin{pmatrix} 1 & 0 & 0\ldots & \\ 0 & a_{22} & a_{23} & \ldots \\ 0 & a_{32} & \ldots & \\ \ldots & \ldots & & \end{pmatrix}$$

Hence in this case we win by induction on n. If not then each a_{ij} is nilpotent. Set $I = (a_{ij}) \subset R$. Note that $I^{m+1} = 0$ for some $m \geq 0$. Let m be the largest integer such that $I^m \neq 0$. Then we see that $(I^m)^{\oplus n}$ is contained in the kernel of the map and we win. □

Suppose that $P \subset Q$ is an inclusion of R-modules with Q a finite R-module and P locally free, see Algebra, Definition 7.72.1. Suppose that Q can be generated by N elements as an R-module. Then it follows from Lemma 64.15.2 that P is finite locally free (with the free parts having rank at most N). And in this case P is a finite R-module, see Algebra, Lemma 7.72.2.

Combining this with the above we see that a non-finitely-generated ideal which is generated by a countable collection of idempotents is projective but not locally free. An explicit example is $R = \prod_{n\in\mathbf{N}} \mathbf{F}_2$ and I the ideal generated by the idempotents

$$e_n = (1, 1, \ldots, 1, 0, \ldots)$$

where the sequence of 1's has length n.

Lemma 64.15.3. *There exists a ring R and an ideal I such that I is projective as an R-module but not locally free as an R-module.*

Proof. See above. □

Lemma 64.15.4. *Let K be a field. Let C_i, $i = 1, \ldots, n$ be smooth, projective, geometrically irreducible curves over K. Let $P_i \in C_i(K)$ be a rational point and let $Q_i \in C_i$ be a point such that $[\kappa(Q_i) : K] = 2$. Then $[P_1 \times \ldots \times P_n]$ is nonzero in $A_0(U_1 \times_K \ldots \times_K U_n)$ where $U_i = C_i \setminus \{Q_i\}$.*

Proof. There is a degree map $\deg : A_0(C_1 \times_K \ldots \times_K C_n) \to \mathbf{Z}$ Because each Q_i has degree 2 over K we see that any zero cycle supported on the ``boundary"

$$C_1 \times_K \ldots \times_K C_n \setminus U_1 \times_K \ldots \times_K U_n$$

has degree divisible by 2. □

We can construct another example of a projective but not locally free module using the lemma above as follows. Let C_n, $n = 1, 2, 3, \ldots$ be smooth, projective, geometrically irreducible curves over $\mathbf{Q}$ each with a pair of points $P_n, Q_n \in C_n$ such that $\kappa(P_n) = \mathbf{Q}$ and $\kappa(Q_n)$ is a quadratic extension of $\mathbf{Q}$. Set $U_n = C_n \setminus \{Q_n\}$; this is an affine curve. Let $\mathcal{L}_n$ be the inverse of the ideal sheaf of P_n on U_n. Note that $c_1(\mathcal{L}_n) = [P_n]$ in the group of zero cycles $A_0(U_n)$. Set $A_n = \Gamma(U_n, \mathcal{O}_{U_n})$. Let $L_n = \Gamma(U_n, \mathcal{L}_n)$ which is a locally free module of rank 1 over A_n. Set

$$B_n = A_1 \otimes_{\mathbf{Q}} A_2 \otimes_{\mathbf{Q}} \ldots \otimes_{\mathbf{Q}} A_n$$

so that $Spec(B_n) = U_1 \times \ldots \times U_n$ all products over $Spec(\mathbf{Q})$. For $i \leq n$ we set

$$L_{n,i} = A_1 \otimes_{\mathbf{Q}} \ldots \otimes_{\mathbf{Q}} M_i \otimes_{\mathbf{Q}} \ldots \otimes_{\mathbf{Q}} A_n$$

which is a locally free B_n-module of rank 1. Note that this is also the global sections of $\text{pr}_i^*\mathcal{L}_n$. Set

$$B_\infty = colim_n B_n \quad \text{and} \quad L_{\infty,i} = colim_n L_{n,i}$$

Finally, set

$$M = \bigoplus\nolimits_{i \geq 1} L_{\infty,i}.$$

This is a direct sum of finite locally free modules, hence projective. We claim that M is not locally free. Namely, suppose that $f \in B_\infty$ is a nonzero function such that M_f is free over $(B_\infty)_f$. Let $e_1, e_2, \ldots$ be a basis. Choose $n \geq 1$ such that $f \in B_n$. Choose $m \geq n + 1$ such that $e_1, \ldots, e_{n+1}$ are in

$$\bigoplus\nolimits_{1 \leq i \leq m} L_{m,i}.$$

Because the elements $e_1, \ldots, e_{n+1}$ are part of a basis after a faithfully flat base change we conclude that the chern classes

$$c_i(\text{pr}_1^*\mathcal{L}_1 \oplus \ldots \oplus \text{pr}_m^*\mathcal{L}_m), \quad i = m, m-1, \ldots, m-n$$

are zero in the chow group of

$$D(f) \subset U_1 \times \ldots \times U_m$$

Since f is the pullback of a function on $U_1 \times \ldots \times U_n$ this implies in particular that

$$c_{m-n}(\mathcal{O}_W^{\oplus n} \oplus \text{pr}_1^*\mathcal{L}_{n+1} \oplus \ldots \oplus \text{pr}_{m-n}^*\mathcal{L}_m) = 0.$$

on the variety

$$W = (C_{n+1} \times \ldots \times C_m)_K$$

over the field $K = \mathbf{Q}(C_1 \times \ldots \times C_n)$. In other words the cycle

$$[(P_{n+1} \times \ldots \times P_m)_K]$$

is zero in the chow group of zero cycles on W. This contradicts Lemma 64.15.4 above because the points Q_i, $n + 1 \leq i \leq m$ induce corresponding points Q_i' on $(C_n)_K$ and as $K/\mathbf{Q}$ is geometrically irreducible we have $[\kappa(Q_i') : K] = 2$.

Lemma 64.15.5. *There exists a countable ring R and a projective module M which is a direct sum of countably many locally free rank 1 modules such that M is not locally free.*

Proof. See above. $\square$

64.16. Zero dimensional local ring with nonzero flat ideal

In [**Laz67**] there is an example of a zero dimensional local ring with a nonzero flat ideal. Here is the construction. Let k be a field. Let X_i, Y_i, $i \geq 1$ be variables. Take $R = k[X_i, Y_i]/(X_i - Y_iX_{i+1}, Y_i^2)$. Denote x_i, resp. y_i the image of X_i, resp. Y_i in this ring. Note that

$$x_i = y_ix_{i+1} = y_iy_{i+1}x_{i+2} = y_iy_{i+1}y_{i+2}x_{i+3} = \ldots$$

in this ring. The ring R has only one prime ideal, namely $\mathfrak{m} = (x_i, y_i)$. We claim that the ideal $I = (x_i)$ is flat as an R-module.

Note that the annihilator of x_i in R is the ideal $(x_1, x_2, x_3, \ldots, y_i, y_{i+1}, y_{i+2}, \ldots)$. Consider the R-module M generated by elements e_i, $i \geq 1$ and relations $e_i = y_ie_{i+1}$. Then M is flat as it is the colimit $colim_i\ R$ of copies of R with transition maps

$$R \xrightarrow{y_1} R \xrightarrow{y_2} R \xrightarrow{y_3} \ldots$$

Note that the annilator of e_i in M is the ideal $(x_1, x_2, x_3, \ldots, y_i, y_{i+1}, y_{i+2}, \ldots)$. Since every element of M, resp. I can be written as fe_i, resp. hx_i for some $f, h \in R$ we see that the map $M \to I$, $e_i \to x_i$ is an isomorphism and I is flat.

Lemma 64.16.1. *There exists a local ring R with a unique prime ideal and a nonzero ideal $I \subset R$ which is a flat R-module*

Proof. See discussion above. $\square$

64.17. An epimorphism of zero-dimensional rings which is not surjective

In [**Laz69**] one can find the following example. Let k be a field. Consider the ring homomorphism

$$k[x_1, x_2, \ldots, z_1, z_2, \ldots]/(x_i^{4^i}, z_i^{4^i}) \longrightarrow k[x_1, x_2, \ldots, y_1, y_2, \ldots]/(x_i^{4^i}, y_i - x_{i+1}y_{i+1}^2)$$

which maps x_i to x_i and z_i to x_iy_i. Note that $y_i^{4^{i+1}}$ is zero in the right hand side but that y_1 is not zero (details omitted). This map is not surjective: we can think of the above as a map of $\mathbf{Z}$-graded algebras by setting $\deg(x_i) = -1$, $\deg(z_i) = 0$, and $\deg(y_i) = 1$ and then it is clear that y_1 is not in the image. Finally, the map is an epimorphism because

$$y_{i-1} \otimes 1 = x_iy_i^2 \otimes 1 = y_i \otimes x_iy_i = x_iy_i \otimes y_i = 1 \otimes x_iy_i^2.$$

hence the tensor product of the target over the source is isomorphic to the target.

Lemma 64.17.1. *There exists an epimorphism of local rings of dimension 0 which is not a surjection.*

Proof. See discussion above. $\square$

64.18. Finite type, not finitely presented, flat at prime

Let k be a field. Consider the local ring $A_0 = k[x,y]_{(x,y)}$. Denote $\mathfrak{p}_{0,n} = (y + x^n + x^{n+1})$. This is a prime ideal. Set

$$A = A_0[z_1, z_2, z_3, \ldots]/(z_n z_m, z_n(y + x^n + x^{2n+1}))$$

Note that $A \to A_0$ is a surjection whose kernel is an ideal of square zero. Hence A is also a local ring and the prime ideals of A are in one-to-one correspondence with the prime ideals of A_0. Denote $\mathfrak{p}_n$ the prime ideal of A corresponding to $\mathfrak{p}_{0,n}$. Observe that $\mathfrak{p}_n$ is the annihilator of z_n in A. Let

$$C = A[z]/(xz^2 + z + y)[\frac{1}{2zx + 1}].$$

Note that $A \to C$ is an étale ring map, see Algebra, Example 7.126.8. Let $\mathfrak{q} \subset C$ be the maximal ideal generated by x, y, z and all z_n. As $A \to C$ is flat we see that the annihilator of z_n in C is $\mathfrak{p}_n C$. We compute

$$\begin{aligned} C/\mathfrak{p}_n C &= A_0/(y + x^n + x^{2n+1}) \\ &= k[x]_{(x)}[z]/(xz^2 + z - x^n - x^{2n+1}) \\ &= k[x]_{(x)}[z]/(z - x^n) \times k[x]_{(x)}[z]/(xz + x^{n+1} + 1) \\ &= k[x]_{(x)} \times k(x) \end{aligned}$$

because $(z - x^n)(xz + x^{n+1} + 1) = xz^2 + z - x^n - x^{2n+1}$. Hence we see that $\mathfrak{p}_n C = \mathfrak{r}_n \cap \mathfrak{q}_n$ with $\mathfrak{r}_n = \mathfrak{p}_n C + (z - x^n)C$ and $\mathfrak{q}_n = \mathfrak{p}_n C + (xz + x^{n+1} + 1)C$. Since $\mathfrak{q}_n + \mathfrak{r}_n = C$ we also get $\mathfrak{p}_n C = \mathfrak{r}_n \mathfrak{q}_n$, It follows that $\mathfrak{q}_n$ is the annihilator of $\xi_n = (z - x^n)z_n$. Observe that on the one hand $\mathfrak{r}_n \subset \mathfrak{q}$, and on the other hand $\mathfrak{q}_n + \mathfrak{q} = C$. This follows for example because $\mathfrak{q}_n$ is a maximal ideal of C distinct from $\mathfrak{q}$. Similarly we have $\mathfrak{q}_n + \mathfrak{q}_m = C$. At this point we let

$$B = \operatorname{Im}(C \longrightarrow C_{\mathfrak{q}})$$

We observe that the elements ξ_n map to zero in B as $xz + x^{n+1} + 1$ is not in $\mathfrak{q}$. Denote $\mathfrak{q}' \subset B$ the image of $\mathfrak{q}$. By construction B is a finite type A-algebra, with $B_{\mathfrak{q}'} \cong C_{\mathfrak{q}}$. In particular we see that $B_{\mathfrak{q}'}$ is flat over A.

We claim there does not exist an element $g' \in B$, $g' \notin \mathfrak{q}'$ such that $B_{g'}$ is of finite presentation over A. We sketch a proof of this claim. Choose an element $g \in C$ which maps to $g' \in B$. Consider the map $C_g \to B_{g'}$. By Algebra, Lemma 7.6.3 we see that B_g is finitely presented over A if and only if the kernel of $C_g \to B_{g'}$ is finitely generated. But the element $g \in C$ is not contained in $\mathfrak{q}$, hence maps to a nonzero element of $A_0[z]/(xz^2 + z + y)$. Hence g can only be contained in finitely many of the prime ideals $\mathfrak{q}_n$, because the primes $(y + x^n + x^{2n+1}, xz + x^{n+1} + 1)$ are an infinite collection of codimension 1 points of the 2-dimensional irreducible Noetherian space $Spec(k[x,y,z]/(xz^2 + z + y))$. The map

$$\bigoplus\nolimits_{g \notin \mathfrak{q}_n} C/\mathfrak{q}_n \longrightarrow C_g, \quad (c_n) \longrightarrow \sum c_n \xi_n$$

is injective and its image is the kernel of $C_g \to B_{g'}$. We omit the proof of this statement. (Hint: Write $A = A_0 \oplus I$ as an A_0-module where I is the kernel of $A \to A_0$. Similarly, write $C = C_0 \oplus IC$. Write $IC = \bigoplus Cz_n \cong \bigoplus (C/\mathfrak{r}_n \oplus C/\mathfrak{q}_n)$ and study the effect of multiplication by g on the summands.) This concludes the sketch of the proof of the claim. This also proves that $B_{g'}$ is not flat over A for any g' as above. Namely, if it were flat, then the annihilator of the image of z_n in $B_{g'}$ would be $\mathfrak{p}_n B_{g'}$, and would not contain $z - x^n$.

As a consequence we can answer (negatively) a question posed in [**GR71**, Part I, Remarques (3.4.7) (v)]. Here is a precise statement.

Lemma 64.18.1. *There exists a local ring A, a finite type ring map $A \to B$ and a prime $\mathfrak{q}$ lying over $\mathfrak{m}_A$ such that $B_\mathfrak{q}$ is flat over A, and for any element $g \in B$, $g \notin \mathfrak{q}$ the ring B_g is neither finitely presented over A nor flat over A.*

Proof. See discussion above. □

64.19. Finite type, flat and not of finite presentation

In this section we give some examples of ring maps and morphisms which are of finite type and flat but not of finite presentation.

Let R be a ring which has an ideal I such that R/I is a finite flat module but not projective, see Section 64.14 for an explicit example. Note that this means that I is not finitely generated, see Algebra, Lemma 7.100.5. Note that $I = I^2$, see Algebra, Lemma 7.100.2. The base ring in our examples will be R and correspondingly the base scheme $S = Spec(R)$.

Consider the ring map $R \to R \oplus R/I\epsilon$ where $\epsilon^2 = 0$ by convention. This is a finite, flat ring map which is not of finite presentation. All the fibre rings are complete intersections and geometrically irreducible.

Let $A = R[x, y]/(xy, ay; a \in I)$. Note that as an R-module we have $A = \bigoplus_{i \geq 0} Ry^i \oplus \bigoplus_{j>0} R/Ix^j$. Hence $R \to A$ is a flat finite type ring map which is not of finite presentation. Each fibre ring is isomorphic to either $\kappa(\mathfrak{p})[x, y]/(xy)$ or $\kappa(\mathfrak{p})[x]$.

We can turn the previous example into a projective morphism by taking $B = R[X_0, X_1, X_2]/(X_1X_2, aX_2; a \in I)$. In this case $X = \text{Proj}(B) \to S$ is a proper flat morphism which is not of finite presentation such that for each $s \in S$ the fibre X_s is isomorphic either to $\mathbf{P}^1_s$ or to the closed subscheme of $\mathbf{P}^2_s$ defined by the vanishing of X_1X_2 (this is a projective nodal curve of arithmetic genus 0).

Let $M = R \oplus R \oplus R/I$. Set $B = \text{Sym}_R(M)$ the symmetric algebra on M. Set $X = \text{Proj}(B)$. Then $X \to S$ is a proper flat morphism, not of finite presentation such that for $s \in S$ the geometric fibre is isomorphic to either $\mathbf{P}^1_s$ or $\mathbf{P}^2_s$. In particular these fibres are smooth and geometrically irreducible.

Lemma 64.19.1. *There exist examples of*

1. *a flat finite type ring map with geometrically irreducible complete intersection fibre rings which is not of finite presentation,*
2. *a flat finite type ring map with geometrically connected, geometrically reduced, dimension 1, complete intersection fibre rings which is not of finite presentation,*
3. *a proper flat morphism of schemes $X \to S$ each of whose fibres is isomorphic to either $\mathbf{P}^1_s$ or to the vanishing locus of X_1X_2 in $\mathbf{P}^2_s$ which is not of finite presentation, and*
4. *a proper flat morphism of schemes $X \to S$ each of whose fibres is isomorphic to either $\mathbf{P}^1_s$ or $\mathbf{P}^2_s$ which is not of finite presentation.*

Proof. See discussion above. □

64.20. Topology of a finite type ring map

Let $A \to B$ be a local map of local domains. If A is Noetherian, $A \to B$ is essentially of finite type, and $A/\mathfrak{m}_A \subset B/\mathfrak{m}_B$ is finite then there exists a prime $\mathfrak{q} \subset B$, $\mathfrak{q}\neq\mathfrak{m}_B$ such that $A \to B/\mathfrak{q}$ is the localization of a quasi-finite ring map. See More on Morphisms, Lemma 33.33.6.

In this section we give an example that shows this result is false A is no longer Noetherian. Namely, let k be a field and set

$$A = \{a_0 + a_1x + a_2x^2 + \ldots \mid a_0 \in k, a_i \in k((y)) \text{ for } i \geq 1\}$$

and

$$C = \{a_0 + a_1x + a_2x^2 + \ldots \mid a_0 \in k[y], a_i \in k((y)) \text{ for } i \geq 1\}.$$

The inclusion $A \to C$ is of finite type as C is generated by y over A. We claim that A is a local ring with maximal ideal $\mathfrak{m} = \{a_1x + a_2x^2 + \ldots \in A\}$ and no prime ideals besides (0) and $\mathfrak{m}$. Namely, an element $f = a_0 + a_1x + a_2x^2 + \ldots$ of A is invertible as soon as $a_0\neq 0$. If $\mathfrak{q} \subset A$ is a nonzero prime ideal, and $f = a_ix^i + \ldots \in \mathfrak{q}$, then using properties of power series one sees that for any $g \in k((y))$ the element $g^{i+1}x^{i+1} \in \mathfrak{q}$, i.e., $gx \in \mathfrak{q}$. This proves that $\mathfrak{q} = \mathfrak{m}$.

As to the spectrum of the ring C, arguing in the same way as above we see that any nonzero prime ideal contains the prime $\mathfrak{p} = \{a_1x + a_2x^2 + \ldots \in C\}$ which lies over $\mathfrak{m}$. Thus the only prime of C which lies over (0) is (0). Set $\mathfrak{m}_C = yC + \mathfrak{p}$ and $B = C_{\mathfrak{m}_C}$. Then $A \to B$ is the desired example.

Lemma 64.20.1. *There exists a local homomorphism $A \to B$ of local domains which is essentially of finite type and such that $A/\mathfrak{m}_A \to B/\mathfrak{m}_B$ is finite such that for every prime $\mathfrak{q}\neq\mathfrak{m}_B$ of B the ring map $A \to B/\mathfrak{q}$ is not the localization of a quasi-finite ring map.*

Proof. See the discussion above. □

64.21. Pure not universally pure

Let k be a field. Let

$$R = k[[x, xy, xy^2, \ldots]] \subset k[[x, y]].$$

In other words, a power series $f \in k[[x, y]]$ is in R if and only if $f(0, y)$ is a constant. In particular $R[1/x] = k[[x, y]][1/x]$ and R/xR is a local ring with a maximal ideal whose square is zero. Denote $R[y] \subset k[[x, y]]$ the set of power series $f \in k[[x, y]]$ such that $f(0, y)$ is a polynomial in y. Then $R \to R[y]$ is a finite type but not finitely presented ring map which induces an isomorphism after inverting x. Also there is a surjection $R[y]/xR[y] \to k[y]$ whose kernel has square zero. Consider the finitely presented ring map $R \to S = R[t]/(xt-xy)$. Again $R[1/x] \to S[1/x]$ is an isomorphism and in this case $S/xS \cong (R/xR)[t]/(xy)$ maps onto $k[t]$ with nilpotent kernel. There is a surjection $S \to R[y]$, $t \longmapsto y$ which induces an isomorphism on inverting x and a surjection with nilpotent kernel modulo x. Hence the kernel of $S \to R[y]$ is locally nilpotent. In particular $S \to R[y]$ is a universal homeomorphism.

First we claim that S is an S-module which is relatively pure over R. Since on inverting x we obtain an isomorphism we only need to check this at the maximal ideal $\mathfrak{m} \subset R$. Since R is complete with respect to its maximal ideal it is henselian hence we need only check that every prime $\mathfrak{p} \subset R$, $\mathfrak{p}\neq\mathfrak{m}$, the unique prime $\mathfrak{q}$ of S lying over $\mathfrak{p}$ satisfies $\mathfrak{m}S + \mathfrak{q}\neq S$. Since $\mathfrak{p}\neq\mathfrak{m}$ it corresponds to a unique prime ideal of $k[[x, y]][1/x]$. Hence either $\mathfrak{p} = (0)$

or $\mathfrak{p} = (f)$ for some irreducible element $f \in k[[x, y]]$ which is not associated to x (here we use that $k[[x, y]]$ is a UFD -- insert future reference here). In the first case $\mathfrak{q} = (0)$ and the result is clear. In the second case we may multiply f by a unit so that $f \in R[y]$ (Weierstrass preparation; details omitted). Then it is easy to see that $R[y]/fR[y] \cong k[[x, y]]/(f)$ hence f defines a prime ideal of $R[y]$ and $\mathfrak{m}R[y] + fR[y] \neq R[y]$. Since $S \to R[y]$ is a universal homeomorphism we deduce the desired result for S also.

Second we claim that S is not universally relatively pure over R. Namely, to see this it sufffices to find a valuation ring $\mathcal{O}$ and a local ring map $R \to \mathcal{O}$ such that $Spec(R[y] \otimes_R \mathcal{O}) \to Spec(\mathcal{O})$ does not hit the closed point of $Spec(\mathcal{O})$. Equivalently, we have to find $\varphi : R \to \mathcal{O}$ such that $\varphi(x) \neq 0$ and $v(\varphi(x)) > v(\varphi(xy))$ where v is the valuation of $\mathcal{O}$. (Because this means that the valuation of y is negative.) To do this consider the ring map

$$R \longrightarrow \{a_0 + a_1x + a_2x^2 + \ldots \mid a_0 \in k[y^{-1}], a_i \in k((y))\}$$

defined in the obvious way. We can find a valuation ring $\mathcal{O}$ dominating the localization of the right hand side at the maximal ideal (y^{-1}, x) and we win.

Lemma 64.21.1. *There exists a morphism of affine schemes of finite presentation $X \to S$ and an $\mathcal{O}_X$-module $\mathcal{F}$ of finite presentation such that $\mathcal{F}$ is pure relative to S, but not universally pure relative to S.*

Proof. See discussion above. □

64.22. A formally smooth non-flat ring map

Let k be a field. Consider the k-algebra $k[\mathbf{Q}]$. This is the k-algebra with basis x_α, $\alpha \in \mathbf{Q}$ and multiplication determined by $x_\alpha x_\beta = x_{\alpha+\beta}$. (In particular $x_0 = 1$.) Consider the k-algebra homomorphism

$$k[\mathbf{Q}] \longrightarrow k, \quad x_\alpha \longmapsto 1.$$

It is surjective with kernel J generated by the elements $x_\alpha - 1$. Let us compute J/J^2. Note that multiplication by x_α on J/J^2 is the identity map. Denote z_α the class of $x_\alpha - 1$ modulo J^2. These classes generate J/J^2. Since

$$(x_\alpha - 1)(x_\beta - 1) = x_{\alpha+\beta} - x_\alpha - x_\beta + 1 = (x_{\alpha+\beta} - 1) - (x_\alpha - 1) - (x_\beta - 1)$$

we see that $z_{\alpha+\beta} = z_\alpha + z_\beta$ in J/J^2. A general element of J/J^2 is of the form $\sum \lambda_\alpha z_\alpha$ with $\lambda_\alpha \in k$ (only finitely many nonzero). Note that if the characteristic of k is $p > 0$ then

$$0 = pz_{\alpha/p} = z_{\alpha/p} + \ldots + z_{\alpha/p} = z_\alpha$$

and we see that $J/J^2 = 0$. If the characteristic of k is zero, then

$$J/J^2 = \mathbf{Q} \otimes_{\mathbf{Z}} k \cong k$$

(details omitted) is not zero.

We claim that $k[\mathbf{Q}] \to k$ is a formally smooth ring map if the characteristic of k is positive. Namely, suppose given a solid commutative diagram

$$\begin{tikzcd}
k \arrow[r] \arrow[rd, dotted] & A \\
k[\mathbf{Q}] \arrow[u] \arrow[r, "\varphi"] & A' \arrow[u]
\end{tikzcd}$$

with $A' \to A$ a surjection whose kernel I has square zero. To show that $k[\mathbf{Q}] \to k$ is formally smooth we have to prove that φ factors through k. Since $\varphi(x_\alpha - 1)$ maps to zero in A we see that φ induces a map $\overline{\varphi} : J/J^2 \to I$ whose vanishing is the obstruction to the desired factorization. Since $J/J^2 = 0$ if the characteristic is $p > 0$ we get the result we want, i.e., $k[\mathbf{Q}] \to k$ is formally smooth in this case. Finally, this ring map is not flat, for example as the nonzero divisor $x_2 - 1$ is mapped to zero.

Lemma 64.22.1. *There exists a formally smooth ring map which is not flat.*

Proof. See discussion above. □

64.23. A formally étale non-flat ring map

In this section we give a counterexample to the final sentence in [**DG67**, 0_{IV}, Example 19.10.3(i)] (this was not one of the items caught in their later errata lists). Consider $A \to A/J$ for a local ring A and a nonzero proper ideal J such that $J^2 = J$ (so J isn't finitely generated); the valuation ring of an algebraically closed non-archimedean field with J its maximal ideal is a source of such (A, J). These non-flat quotient maps are formally étale. Namely, suppose given a commutative diagram

$$\begin{tikzcd} A/J \arrow[r] & R/I \\ A \arrow[u] \arrow[r, "\varphi"] & R \arrow[u] \end{tikzcd}$$

where I is an ideal of the ring R with $I^2 = 0$. Then $A \to R$ factors uniquely through A/J because

$$\varphi(J) = \varphi(J^2) \subset (\varphi(J)A)^2 \subset I^2 = 0.$$

Hence this also provides a counterexample to the formally étale case of the ``structure theorem'' for locally finite type and formally étale morphisms in [**DG67**, IV, Theorem 18.4.6(i)] (but not a counterexample to part (ii), which is what people actually use in practice). The error in the proof of the latter is that the very last step of the proof is to invoke the incorrect [**DG67**, 0_{IV}, Example 19.3.10(i)], which is how the counterexample just mentioned creeps in.

Lemma 64.23.1. *There exist formally étale nonflat ring maps.*

Proof. See discussion above. □

64.24. A formally étale ring map with nontrivial cotangent complex

Let k be a field. Consider the ring

$$R = k[\{x_n\}_{n\geq 1}, \{y_n\}_{n\geq 1}]/(x_1y_1, x_{nm}^m - x_n, y_{nm}^m - y_n)$$

Let A be the localization at the maximal ideal generated by all x_n, y_n and denote $J \subset A$ the maximal ideal. Set $B = A/J$. By construction $J^2 = J$ and hence $A \to B$ is formally étale (see Section 64.23). We claim that the element $x_1 \otimes y_1$ is a nonzero element in the kernel of

$$J \otimes_A J \longrightarrow J.$$

Namely, (A, J) is the colimit of the localizations (A_n, J_n) of the rings

$$R_n = k[x_n, y_n]/(x_n^n y_n^n)$$

at their corresponding maximal ideals. Then $x_1 \otimes y_1$ corresponds to the element $x_n^n \otimes y_n^n \in J_n \otimes_{A_n} J_n$ and is nonzero (by an explicit computation which we omit). Since $\otimes$ commutes with colimits we conclude. By [**Ill72**, III Section 3.3] we see that J is not weakly regular.

Hence by [**Ill72**, III Proposition 3.3.3] we see that the cotangent complex $L_{B/A}$ is not zero. In fact, we can be more precise. We have $H_0(L_{B/A}) = \Omega_{B/A}$ and $H_1(L_{B/A}) = 0$ because $J/J^2 = 0$. But from the five-term exact sequence of Quillen's fundamental spectral sequence [**Rei**, Corollary 8.2.6] and the nonvanishing of $\text{Tor}_2^A(B, B) = \text{Ker}(J \otimes_A J \to J)$ we conclude that $H_2(L_{B/A})$ is nonzero.

Lemma 64.24.1. *There exists a formally étale surjective ring map $A \to B$ with $L_{B/A}$ not equal to zero.*

Proof. See discussion above. □

64.25. Ideals generated by sets of idempotents and localization

Let R be a ring. Consider the ring

$$B(R) = R[x_n; n \in \mathbf{Z}]/(x_n(x_n - 1), x_n x_m; n \neq m)$$

It is easy to show that every prime $\mathfrak{q} \subset B(R)$ is either of the form

$$\mathfrak{q} = \mathfrak{p}B(R) + (x_n; n \in \mathbf{Z})$$

or of the form

$$\mathfrak{q} = \mathfrak{p}B(R) + (x_n - 1) + (x_m; n \neq m, m \in \mathbf{Z}).$$

Hence we see that

$$Spec(B(R)) = Spec(R) \amalg \coprod\nolimits_{n \in \mathbf{Z}} Spec(R)$$

where the topology is not just the disjoint union topology. It has the following properties: Each of the copies indexed by $n \in \mathbf{Z}$ is an open subscheme, namely it is the standard open $D(x_n)$. The "central" copy of $Spec(R)$ is in the closure of the union of any infinitely many of the other copies of $Spec(R)$. Note that this last copy of $Spec(R)$ is cut out by the ideal $(x_n, n \in \mathbf{Z})$ which is generated by the idempotents x_n. Hence we see that if $Spec(R)$ is connected, then the decomposition above is exactly the decomposition of $Spec(B(R))$ into connected components.

Next, let $A = \mathbf{C}[x, y]/((y - x^2 + 1)(y + x^2 - 1))$. The spectrum of A consists of two irreducible components $C_1 = Spec(A_1)$, $C_2 = Spec(A_2)$ with $A_1 = \mathbf{C}[x, y]/(y - x^2 + 1)$ and $A_2 = \mathbf{C}[x, y]/(y + x^2 - 1)$. Note that these are parametrized by $(x, y) = (t, t^2 - 1)$ and $(x, y) = (t, -t^2 + 1)$ which meet in $P = (-1, 0)$ and $Q = (1, 0)$. We can make a twisted version of $B(A)$ where we glue $B(A_1)$ to $B(A_2)$ in the following way: Above P we let $x_n \in B(A_1) \otimes \kappa(P)$ correspond to $x_n \in B(A_2) \otimes \kappa(P)$, but above Q we let $x_n \in B(A_1) \otimes \kappa(P)$ correspond to $x_{n+1} \in B(A_2) \otimes \kappa(P)$. Let $B^{twist}(A)$ denote the resulting A-algebra. Details omitted. By construction $B^{twist}(A)$ is Zariski locally over A isomorphic to the untwisted version. Namely, this happens over both the principal open $Spec(A) \setminus \{P\}$ and the principal open $Spec(A) \setminus \{Q\}$. However, our choice of glueing produces enough "monodromy" such that $Spec(B^{twist}(A))$ is connected (details omitted). Finally, there is a central copy of $Spec(A) \to Spec(B^{twist}(A))$ which gives a closed subscheme whose ideal is Zariski locally on $B^{twist}(A)$ cut out by ideals generated by idempotents, but not globally (as $B^{twist}(A)$ has no nontrivial idempotents).

Lemma 64.25.1. *There exists an affine scheme $X = Spec(A)$ and a closed subscheme $T \subset X$ such that T is Zariski locally on X cut out by ideals generated by idempotents, but T is not cut out by an ideal generated by idempotents.*

Proof. See above. □

64.26. Non flasque quasi-coherent sheaf associated to injective module

For more examples of this type see [**BGI71**, Exposé II, Appendix I] where Illusie explains some examples due to Verdier.

Consider the affine scheme $X = Spec(A)$ where

$$A = k[f, g, x, y, \{a_n, b_n\}_{n\geq 1}]/(fy - gx, \{a_n f^n + b_n g^n\}_{n\geq 1})$$

is the ring from Properties, Example 23.22.2. Set $I = (f, g) \subset A$. Consider the quasi-compact open $U = D(f) \cup D(g)$ of X. We have seen in loc. cit. that there is a section $s \in \mathcal{O}_X(U)$ which does not come from an A-module map $I^n \to A$ for any $n \geq 0$.

Let $\alpha : A \to J$ be the embedding of A into an injective A-module. Let $Q = J/\alpha(A)$ and denote $\beta : J \to Q$ the quotient map. We claim that the map

$$\Gamma(X, \tilde{J}) \longrightarrow \Gamma(U, \tilde{J})$$

is not surjective. Namely, we claim that $\alpha(s)$ is not in the image. To see this, we argue by contradiction. So assume that $x \in J$ is an element which restricts to $\alpha(s)$ over U. Then $\beta(x) \in Q$ is an element which restricts to 0 over U. Hence we know that $I^n\beta(x) = 0$ for some n, see Properties, Lemma 23.22.1. This implies that we get a morphism $\varphi : I^n \to A$, $h \mapsto \alpha^{-1}(hx)$. It is easy to see that this morphism φ gives rise to the section s via the map of Properties, Lemma 23.22.1 which is a contradiction.

Lemma 64.26.1. *There exists an affine scheme $X = Spec(A)$ and an injective A-module J such that $\tilde{J}$ is not a flasque sheaf on X. Even the restriction $\Gamma(X, \tilde{J}) \to \Gamma(U, \tilde{J})$ with U quasi-compact open need not be surjective.*

Proof. See above. □

64.27. A non-separated flat group scheme

Every group scheme over a field is separated, see Groupoids, Lemma 35.7.2. This is not true for group schemes over a base.

Let k be a field. Let $S = Spec(k[x]) = \mathbf{A}^1_k$. Let G be the affine line with 0 doubled (see Schemes, Example 21.14.3) seen as a scheme over S. Thus a fibre of $G \to S$ is either a singleton or a set with two elements (one in U and one in V). Thus we can endow these fibres with the structure of a group (by letting the element in U be the zero of the group structure). More precisely, G has two opens U, V which map isomorphically to S such that $U \cap V$ is mapped isomorphically to $S \setminus \{0\}$. Then

$$G \times_S G = U \times_S U \cup V \times_S U \cup U \times_S V \cup V \times_S V$$

where each piece is isomorphic to S. Hence we can define a multiplication $m : G \times_S G \to G$ as the unique S-morphism which maps the first and the last piece into U and the two middle pieces into V. This matches the pointwise description given above. We omit the verification that this defines a group scheme structure.

Lemma 64.27.1. *There exists a flat group scheme of finite type over the affine line which is not separated.*

Proof. See discussion above. □

64.28. A non-flat group scheme with flat identity component

Let $X \to S$ be a monomorphism of schemes. Let $G = S \amalg X$. Let $m : G \times_S G \to G$ be the S-morphism

$$G \times_S G = X \times_S X \amalg X \amalg X \amalg S \longrightarrow G = X \amalg S$$

which maps the summands $X \times_S X$ and S into S and maps the summands X into X by the identity morphism. This defines a group law. To see this we have to show that $m \circ (m \times \text{id}_G) = m \circ (\text{id}_G \times m)$ as maps $G \times_S G \times_S G \to G$. Decomposing $G \times_S G \times_S G$ into components as above, we see that we need to verify this for the restriction to each of the 8-pieces. Each piece is isomorphic to either S, X, $X \times_S X$, or $X \times_S X \times_S X$. Moreover, both maps map these pieces to S, X, S, X respectively. Having said this, the fact that $X \to S$ is a monomorphism implies that $X \times_S X \cong X$ and $X \times_S X \times_S X \cong X$ and that there is in each case exactly one S-morphism $S \to S$ or $X \to X$. Thus we see that $m \circ (m \times \text{id}_G) = m \circ (\text{id}_G \times m)$. Thus taking $X \to S$ to be any nonflat monomorphism of schemes (e.g., a closed immersion) we get an example of a group scheme over a base S whose identity component is S (hence flat) but which is not flat.

Lemma 64.28.1. *There exists a group scheme G over a base S whose identity component is flat over S but which is not flat over S.*

Proof. See discussion above. $\square$

64.29. A non-separated group algebraic space over a field

Every group scheme over a field is separated, see Groupoids, Lemma 35.7.2. This is not true for group algebraic spaces over a field.

Let k be a field of characteristic zero. Consider the algebraic space $G = \mathbf{A}^1_k/\mathbf{Z}$ from Spaces, Example 40.14.8. By construction G is the fppf sheaf associated to the presheaf

$$T \longmapsto \Gamma(T, \mathcal{O}_T)/\mathbf{Z}$$

on the category of schemes over k. The obvious addition rule on the presheaf induces an addtion $m : G \times G \to G$ which turns G into a group algebraic space over $Spec(k)$. Note that G is not separated (and not even quasi-separated or locally separated). On the other hand $G \to Spec(k)$ is of finite type!

Lemma 64.29.1. *There exists a group algebraic space of finite type over a field which is not separated (and not even quasi-separated or locally separated).*

Proof. See discussion above. $\square$

64.30. Specializations between points in fibre étale morphism

If $f : X \to Y$ is an étale, or more generally a locally quasi-finite morphism of schemes, then there are no specializations between points of fibres, see Morphisms, Lemma 24.19.8. However, for morphisms of algebraic spaces this doesn't hold in general.

To give an example, let k be a field. Set

$$P = k[u, u^{-1}, y, \{x_n\}_{n \in \mathbf{Z}}].$$

Consider the action of $\mathbf{Z}$ on P by k-algebra maps generated by the automorphism τ given by the rules $\tau(u) = u$, $\tau(y) = uy$, and $\tau(x_n) = x_{n+1}$. For $d \geq 1$ set $I_d = ((1-u^d)y, x_n - x_{n+d}, n \in \mathbf{Z})$. Then $V(I_d) \subset Spec(P)$ is the fix point locus of τ^d. Let $S \subset P$ be the multiplicative subset generated by y and all $1 - u^d$, $d \in \mathbf{N}$. Then we see that $\mathbf{Z}$ acts freely on $U = Spec(S^{-1}P)$. Let $X = U/\mathbf{Z}$ be the quotient algebraic space, see Spaces, Definition 40.14.4.

Consider the prime ideals $\mathfrak{p}_n = (x_n, x_{n+1}, \ldots)$ in $S^{-1}P$. Note that $\tau(\mathfrak{p}_n) = \mathfrak{p}_{n+1}$. Hence each of these define point $\xi_n \in U$ whose image in X is the same point x of X. Moreover we have the specializations

$$\ldots \rightsquigarrow \xi_n \rightsquigarrow \xi_{n-1} \rightsquigarrow \ldots$$

We conclude that $U \to X$ is an example of the promised type.

Lemma 64.30.1. *There exists an étale morphism of algebraic spaces $f : X \to Y$ and a nontrivial specialization of points $x \rightsquigarrow x'$ in $|X|$ with $f(x) = f(x')$ in $|Y|$.*

Proof. See discussion above. $\square$

64.31. A torsor which is not an fppf torsor

In Groupoids, Remark 35.9.5 we raise the question whether any G-torsor is a G-torsor for the fppf topology. In this section we show that this is not always the case.

Let k be a field. All schemes and stacks are over k in what follows. Let $G \to Spec(k)$ be the group scheme

$$G = (\mu_{2,k})^\infty = \mu_{2,k} \times_k \mu_{2,k} \times_k \mu_{2,k} \times_k \ldots = lim_n (\mu_{2,k})^n$$

where $\mu_{2,k}$ is the group scheme of second roots of unity over $Spec(k)$, see Groupoids, Example 35.5.2. As an inverse limit of affine schemes we see that G is an affine group scheme. In fact it is the spectrum of the ring $k[t_1, t_2, t_3, \ldots]/(t_i^2 - 1)$. The multiplication map $m : G \times_k G \to G$ is on the algebra level given by $t_i \mapsto t_i \otimes t_i$.

We claim that any G-torsor over k is of the form

$$P = Spec(k[x_1, x_2, x_3, \ldots]/(x_i^2 - a_i))$$

for certain $a_i \in k^*$ and with G-action $G \times_k P \to P$ given by $x_i \to t_i \otimes x_i$ on the algebra level. We omit the proof. Actually for the example we only need that P is a G-torsor which is clear since over $k' = k(\sqrt{a_1}, \sqrt{a_2}, \ldots)$ the scheme P becomes isomorphic to G in a G-equivariant manner. Note that P is trivial if and only if $k' = k$ since if P has a k-rational point then all of the a_i are squares.

We claim that P is an fppf torsor if and only if the field extension $k \subset k' = k(\sqrt{a_1}, \sqrt{a_2}, \ldots)$ is finite. If k' is finite over k, then $\{Spec(k') \to Spec(k)\}$ is an fppf covering which trivializes P and we see that P is indeed an fppf torsor. Conversely, suppose that P is a G-torsor for the fppf topology. This means that there exists an fppf covering $\{S_i \to Spec(k)\}$ such that each P_{S_i} is trivial. Pick an i such that S_i is not empty. Let $s \in S_i$ be a closed point. By Varieties, Lemma 28.12.1 the field extension $k \subset \kappa(s)$ is finite, and by construction $P_{\kappa(s)}$ has a $\kappa(s)$-rational point. Thus we see that $k \subset k' \subset \kappa(s)$ and k' is finite over k.

To get an explicit example take $k = \mathbf{Q}$ and $a_i = i$ for example (or a_i is the ith prime if you like).

Lemma 64.31.1. *Let S be a scheme. Let G be a group scheme over S. The stack G-Principal classifying principal homogeneous G-spaces (see Examples of Stacks, Subsection 55.13.5) and the stack G-Torsors classifying fppf G-torsors (see Examples of Stacks, Subsection 55.13.8) are not equivalent in general.*

Proof. The discussion above shows that the functor *G-Torsors* → *G-Principal* isn't essentially surjective in general. □

64.32. Stack with quasi-compact flat covering which is not algebraic

In this section we briefly describe an example due to Brian Conrad. You can find the example online at this location. Our example is slightly different.

Let k be an algebraically closed field. All schemes and stacks are over k in what follows. Let $G \to Spec(k)$ be an affine group scheme. In Examples of Stacks, Proposition 55.14.4 we have seen that $\mathcal{X} = [Spec(k)/G]$ is a stack in groupoids over $(Sch/Spec(k))_{fppf}$ which can be described as follows. A 1-morphism $T \to \mathcal{X}$ corresponds by definition to an fppf G_T-torsor P over T. The diagonal 1-morphism

$$\Delta : \mathcal{X} \longrightarrow \mathcal{X} \times_{Spec(k)} \mathcal{X}$$

is representable and affine. The reason for this is that given any pair of G_T-torsors P_1, P_2 in the fppf topology over a scheme S/k the scheme $Isom(P_1, P_2)$ is affine over T. The trivial G-torsor over $Spec(k)$ defines a 1-morphism

$$f : Spec(k) \longrightarrow \mathcal{X}.$$

We claim that this is a surjective 1-morphism. The reason is simply that by definition for any 1-morphism $T \to \mathcal{X}$ there exists a fppf covering $\{T_i \to T\}$ such that P_{T_i} is isomorphic to the trivial G_{T_i}-torsor. Hence the compositions $T_i \to T \to \mathcal{X}$ factor through f. Thus it is clear that the projection $T \times_{\mathcal{X}} Spec(k) \to \mathcal{X}$ is surjective (which is how we define the property that f is surjective, see Algebraic Stacks, Definition 57.10.1). In a similar way you show that f is quasi-compact and flat (details omitted). We also record here the observation that

$$Spec(k) \times_{\mathcal{X}} Spec(k) \cong G$$

as schemes over k.

Suppose there exists a surjective smooth morphism $p : U \to \mathcal{X}$ where U is a scheme. Consider the fibre product

$$\begin{tikzcd} W \arrow[r] \arrow[d] & U \arrow[d] \\ Spec(k) \arrow[r] & \mathcal{X} \end{tikzcd}$$

Then we see that W is a nonempty smooth scheme over k which hence has a k-point. This means that we can factor f through U. Hence we obtain

$$G \cong Spec(k) \times_{\mathcal{X}} Spec(k) \cong (Spec(k) \times_k Spec(k)) \times_{(U \times_k U)} (U \times_{\mathcal{X}} U)$$

and since the projections $U \times_{\mathcal{X}} U \to U$ were assumed smooth we conclude that $U \times_{\mathcal{X}} U \to U \times_k U$ is locally of finite type, see Morphisms, Lemma 24.14.8. It follows that in this case G is locally of finite type over k. Alltogether we have proved the following lemma (which can be significantly generalized).

Lemma 64.32.1. *Let k be a field. Let G be an affine group scheme over k. If the stack $[Spec(k)/G]$ has a smooth covering by a scheme, then G is of finite type over k.*

Proof. See discussion above. □

To get an explicit example as in the title of this section, take for example $G = (\mu_{2,k})^\infty$ the group scheme of Section 64.31, which is not locally of finite type over k. By the discussion above we see that $\mathcal{X} = [Spec(k)/G]$ has properties (1) and (2) of Algebraic Stacks, Definition 57.12.1, but not property (3). Hence $\mathcal{X}$ is not an algebraic stack. On the other hand, there does exists a scheme U an a surjective, flat, quasi-compact morphism $U \to \mathcal{X}$, namely the morphism $f : Spec(k) \to \mathcal{X}$ we studied above.

64.33. A non-algebraic classifying stack

Let $S = \mathrm{Spec}(\mathbf{F}_p)$ and let μ_p denote the group scheme of pth roots of unity over S. In Groupoids in Spaces, Section 52.19 we have introduced the quotient stack $[S/\mu_p]$ and in Examples of Stacks, Section 55.14 we have shown $[S/\mu_p]$ is the classifying stack for fppf μ_p-torsors: Given a scheme T over S the category $Mor_S(T, [S/\mu_p])$ is canonically equivalent to the category of fppf μ_p-torsors over T. Finally, in Criteria for Representability, Theorem 59.17.2 we have seen that $[S/\mu_p]$ is an algebraic stack.

Now we can ask the question: ``How about the category fibred in groupoids $\mathcal{S}$ classifying étale μ_p-torsors?'' (In other words $\mathcal{S}$ is a category over Sch/S whose fibre category over a scheme T is the category of étale μ_p-torsors over T.)

The first objection is that this isn't a stack for the fppf topology, because descent for objects isn't going to hold. For example the μ_p-torsor $\mathrm{Spec}(\mathbf{F}_p(t)[x]/(x^p - t))$ over $T = \mathrm{Spec}(\mathbf{F}_p(T))$ is fppf locally trivial, but not étale locally trivial.

A fix for this first problem is to work with the étale topology and in this case descent for objects does work. Indeed it is true that $\mathcal{S}$ is a stack in groupoids over $(Sch/S)_{étale}$. Moreover, it is also the case that the diagonal $\Delta : \mathcal{S} \to \mathcal{S} \times \mathcal{S}$ is representable (by schemes). This is true because given two μ_p-torsors (whether they be étale locally trivial or not) the sheaf of isomorphisms between them is representable by a scheme.

Thus we can finally ask if there exists a scheme U and a smooth and surjective 1-morphism $U \to \mathcal{S}$. We will show in two ways that this is impossible: by a direct argument (which we advise the reader to skip) and by an argument using a general result.

Direct argument (sketch): Note that the 1-morphism $\mathcal{S} \to \mathrm{Spec}(\mathbf{F}_p)$ satisfies the infinitesimal lifting criterion for formal smoothness. This is true because given a first order infinitesimal thickening of schemes $T \to T'$ the kernel of $\mu_p(T') \to \mu_p(T)$ is isomorphic to the sections of the ideal sheaf of T in T', and hence $H^1_{étale}(T, \mu_p) = H^1_{étale}(T', \mu_p)$. Moreover, $\mathcal{S}$ is a limit preserving stack. Hence if $U \to \mathcal{S}$ is smooth, then $U \to \mathrm{Spec}(\mathbf{F}_p)$ is limit preserving and satisfies the infinitesimal lifting criterion for formal smoothness. This implies that U is smooth over $\mathbf{F}_p$. In particular U is reduced, hence $H^1_{étale}(U, \mu_p) = 0$. Thus $U \to \mathcal{S}$ factors as $U \to \mathrm{Spec}(\mathbf{F}_p) \to \mathcal{S}$ and the first arrow is smooth. By descent of smoothness, we see that $U \to \mathcal{S}$ being smooth would imply $\mathrm{Spec}(\mathbf{F}_p) \to \mathcal{S}$ is smooth. However, this is not the case as $\mathrm{Spec}(\mathbf{F}_p) \times_{\mathcal{S}} \mathrm{Spec}(\mathbf{F}_p)$ is μ_p which is not smooth over $\mathrm{Spec}(\mathbf{F}_p)$.

Structural argument: In Criteria for Representability, Section 59.19 we have seen that we can think of algebraic stacks as those stacks in groupoids for the étale topology with diagonal representable by algebraic spaces having a smooth covering. Hence if a smooth surjective $U \to \mathcal{S}$ exists then $\mathcal{S}$ is an algebraic stack, and in particular satisfies descent in the fppf topology. But we've seen above that $\mathcal{S}$ does not satisfies descent in the fppf topology.

Loosely speaking the arguments above show that the classifying stack in the étale topology for étale locally trivial torsors for a group scheme G over a base B is algebraic if and only if G is smooth over B. One of the advantages of working with the fppf topology is that it suffices to assume that $G \to B$ is flat and locally of finite presentation. In fact the quotient stack (for the fppf topology) $[B/G]$ is algebraic if and only if $G \to B$ is flat and locally of finite presentation, see Criteria for Representability, Lemma 59.18.3.

64.34. Sheaf with quasi-compact flat covering which is not algebraic

Consider the functor $F = (\mathbf{P}^1)^\infty$, i.e., for a scheme T the value $F(T)$ is the set of $f = (f_1, f_2, f_3, \ldots)$ where each $f_i : T \to \mathbf{P}^1$ is a morphism of schemes. Note that $\mathbf{P}^1$ satisfies the sheaf property for fpqc coverings, see Descent, Lemma 31.9.3. A product of sheaves is a sheaf, so F also satisfies the sheaf property for the fpqc toplogy. The diagonal of F is representable: if $f : T \to F$ and $g : S \to F$ are morphisms, then $T \times_F S$ is the scheme theoretic intersection of the closed subschemes $T \times_{f_i, \mathbf{P}^1, g_i} S$ inside the scheme $T \times S$. Consider the group scheme SL_2 which comes with a surjective smooth affine morphism $\mathrm{SL}_2 \to \mathbf{P}^1$. Next, consider $U = (\mathrm{SL}_2)^\infty$ with its canonical (product) morphism $U \to F$. Note that U is an affine scheme. We claim the morphism $U \to F$ is flat, surjective, and universally open. Namely, suppose $f : T \to F$ is a morphism. Then $Z = T \times_F U$ is the infinite fibre product of the schemes $Z_i = T \times_{f_i, \mathbf{P}^1} \mathrm{SL}_2$ over T. Each of the morphisms $Z_i \to T$ is surjective smooth and affine which implies that

$$Z = Z_1 \times_T Z_2 \times_T Z_3 \times_T \ldots$$

is a scheme flat and affine over Z. A simple limit argument shows that $Z \to T$ is open as well.

On the other hand, we claim that F isn't an algebraic space. Namely, if F where an algebraic space it would be a quasi-compact and separated (by our description of fibre products over F) algebraic space. Hence cohomology of quasi-coherent sheaves would vanish above a certain cutoff (see Cohomology of Spaces, Proposition 49.7.2 and remarks preceding it). But clearly by taking the pullback of $\mathcal{O}(-2, -2, \ldots, -2)$ under the projection

$$(\mathbf{P}^1)^\infty \longrightarrow (\mathbf{P}^1)^n$$

(which has a section) we can obtain a quasi-coherent sheaf whose cohomology is nonzero in degree n. Altogether we obtain an answer to a question asked by Anton Geraschenko on mathoverflow.

Lemma 64.34.1. *There exists a functor $F : Sch^{opp} \to Sets$ which satisfies the sheaf condition for the fpqc topology, has representable diagonal $\Delta : F \to F \times F$, and such that there exists a surjective, flat, universally open, quasi-compact morphism $U \to F$ where U is a scheme, but such that F is not an algebraic space.*

Proof. See discussion above. □

64.35. Sheaves and specializations

In the following we fix a big étale site $Sch_{étale}$ as constructed in Topologies, Definition 30.4.6. Moreover, a scheme will be an object of this site. Recall that if x, x' are points of a scheme X we say x is a *specialization* of x' or we write $x' \leadsto x$ if $x \in \overline{\{x'\}}$. This is true in particular if $x = x'$.

Consider the functor $F : Sch_{étale} \to Ab$ defined by the following rules:

$$F(X) = \prod\nolimits_{x \in X} \prod\nolimits_{x' \in X, x' \leadsto x, x' \neq x} \mathbf{Z}/2\mathbf{Z}$$

Given a scheme X we denote $|X|$ the underlying set of points. An element $a \in F(X)$ will be viewed as a map of sets $|X| \times |X| \to \mathbf{Z}/2\mathbf{Z}$, $(x, x') \mapsto a(x, x')$ which is zero if $x = x'$ or if x is not a specialization of x'. Given a morphism of schemes $f : X \to Y$ we define

$$F(f) : F(Y) \longrightarrow F(X)$$

by the rule that for $b \in F(Y)$ we set

$$F(f)(b)(x, x') = \begin{cases} 0 & \text{if } x \text{ is not a specialization of } x' \\ b(f(x), f(x')) & \text{else.} \end{cases}$$

Note that this really does define an element of $F(X)$. We claim that if $f : X \to Y$ and $g : Y \to Z$ are composable morphisms then $F(f) \circ F(g) = F(g \circ f)$. Namely, let $c \in F(Z)$ and let $x' \rightsquigarrow x$ be a specialization of points in X, then

$$F(g \circ f)(x, x') = c(g(f(x)), g(f(x'))) = F(g)(F(f)(c))(x, x')$$

because $f(x') \rightsquigarrow f(x)$. (This also works if $f(x) = f(x')$.)

Let G be the sheafification of F in the étale topology.

I claim that if X is a scheme and $x' \rightsquigarrow x$ is a specialization and $x' \neq x$, then $G(X) \neq 0$. Namely, let $a \in F(X)$ be an element such that when we think of a as a function $|X| \times |X| \to \mathbf{Z}/2\mathbf{Z}$ it is nonzero at (x, x'). Let $\{f_i : U_i \to X\}$ be an étale covering of X. Then we can pick an i and a point $u_i \in U_i$ with $f_i(u_i) = x$. Since generalizations lift along flat morphisms (see Morphisms, Lemma 24.24.8) we can find a specialization $u_i' \rightsquigarrow u_i$ with $f_i(u_i') = x'$. By our construction above we see that $F(f_i)(a) \neq 0$. Hence a determines a nonzero element of $G(X)$.

Note that if $X = Spec(k)$ where k is a field (or more generally a ring all of whose prime ideals are maximal), then $F(X) = 0$ and for every étale morphism $U \to X$ we have $F(U) = 0$ because there are no specializations between distinct points in fibres of an étale morphism. Hence $G(X) = 0$.

Suppose that $X \subset X'$ is a thickening, see More on Morphisms, Definition 33.2.1. Then the category of schemes étale over X' is equivalent to the category of schemes étale over X by the base change functor $U' \mapsto U = U' \times_{X'} X$, see Étale Cohomology, Theorem 38.45.1. Since it is always the case that $F(U) = F(U')$ in this situation we see that also $G(X) = G(X')$.

As a variant we can consider the presheaf F_n which associates to a scheme X the collection of maps $a : |X|^{n+1} \to \mathbf{Z}/2\mathbf{Z}$ where $a(x_0, \ldots, x_n)$ is nonzero only if $x_n \rightsquigarrow \ldots \rightsquigarrow x_0$ is a sequence of specializations and $x_n \neq x_{n-1} \neq \ldots \neq x_0$. Let G_n be the sheaf associated to F_n. In exactly the same way as above one shows that G_n is nonzero if $\dim(X) \geq n$ and is zero if $\dim(X) < n$.

Lemma 64.35.1. *There exists a sheaf of abelian groups G on $Sch_{étale}$ with the following properties*

(1) $G(X) = 0$ *whenever* $\dim(X) < n$,
(2) $G(X)$ *is not zero if* $\dim(X) \geq n$, *and*
(3) *if $X \subset X'$ is a thickening, then $G(X) = G(X')$.*

Proof. See the discussion above. $\square$

Remark 64.35.2. Here are some remarks:

(1) The presheaves F and F_n are separated presheaves.
(2) It turns out that F, F_n are not sheaves.

(3) One can show that G, G_n is actually a sheaf for the fppf topology.

We will prove these results if we need them.

64.36. Sheaves and constructible functions

In the following we fix a big étale site $Sch_{étale}$ as constructed in Topologies, Definition 30.4.6. Moreover, a scheme will be an object of this site. A *constructible stratification* of a scheme X is a locally finite disjoint union decomposition $X = \coprod_{i \in I} X_i$ such that each $X_i \subset X$ is a locally constructible subset of X. Locally finite means that for any quasi-compact open $U \subset X$ there are only finitely many $i \in I$ such that $X_i \cap U$ is not empty. Note that if $f : X \to Y$ is a morphism of schemes and $Y = \coprod Y_j$ is a constructible stratification, then $X = \coprod f^{-1}(Y_j)$ is a constructible stratification of X. Given a set S and a scheme X a *constructible function* $f : |X| \to S$ is a map such that $X = \coprod_{s \in S} f^{-1}(s)$ is a constructible stratification of X. If G is an (abstract group) and $a, b : |X| \to G$ are constructible functions, then $ab : |X| \to G, x \mapsto a(x)b(x)$ is a constructible function too. The reason is that given any two constructible stratifications there is a third one refining both.

Let A be any abelian group. For any scheme X we define

$$F(X) = \frac{\{a : |X| \to A \mid a \text{ is a constructible function}\}}{\text{locally constant functions } |X| \to A}$$

We think of an element a of $F(X)$ simply as a function well defined up to adding a locally constant one. Given a morphism of schemes $f : X \to Y$ and an element $b \in F(Y)$, then we define $F(f)(b) = b \circ f$. Thus F is a presheaf on $Sch_{étale}$.

Note that if $\{f_i : U_i \to X\}$ is an fppf covering, and $a \in F(X)$ is such that $F(f_i)(a) = 0$ in $F(U_i)$, then $a \circ f_i$ is a locally constant function for each i. This means in turn that a is a locally constant function as the morphisms f_i are open. Hence $a = 0$ in $F(X)$. Thus we see that F is a separated presheaf (in the fppf topology hence a fortiori in the étale topology).

Let G be the sheafification of F in the étale topology. Since F is separated, and since $F(X) \neq 0$ for example when X is the spectrum of a discrete valuation ring, we see that G is not zero.

Let $X = Spec(k)$ where k is a field. Then any étale covering of X can be dominated by a covering $\{Spec(k') \to Spec(k)\}$ with $k \subset k'$ a finite separable extension of fields. Since $F(Spec(k')) = 0$ we see that $G(X) = 0$.

Suppose that $X \subset X'$ is a thickening, see More on Morphisms, Definition 33.2.1. Then the category of schemes étale over X' is equivalent to the category of schemes étale over X by the base change functor $U' \mapsto U = U' \times_{X'} X$, see Étale Cohomology, Theorem 38.45.1. Since $F(U) = F(U')$ in this situation we see that also $G(X) = G(X')$.

The sheaf G is limit preserving, see More on Morphisms of Spaces, Definition 46.4.1. Namely, let R be a ring which is written as a directed colimit $R = colim_i R_i$ of rings. Set $X = Spec(R)$ and $X_i = Spec(R_i)$, so that $X = lim_i X_i$. Then $G(X) = colim_i G(X_i)$. To prove this one first proves that a constructible stratification of $Spec(R)$ comes from a constructible stratifications of some $Spec(R_i)$. Hence the result for F. To get the result for the sheafification, use that any étale ring map $R \to R'$ comes from an étale ring map $R_i \to R_i'$ for some i. Details omitted.

Lemma 64.36.1. *There exists a sheaf of abelian groups G on $Sch_{étale}$ with the following properties*

(1) *$G(Spec(k)) = 0$ whenever k is a field,*
(2) *G is limit preserving,*
(3) *if $X \subset X'$ is a thickening, then $G(X) = G(X')$, and*
(4) *G is not zero.*

Proof. See discussion above. □

64.37. The lisse-étale site is not functorial

The *lisse-étale* site $X_{lisse,étale}$ of X is the category of schemes smooth over X endowed with (usual) étale coverings, see Cohomology of Stacks, Section 62.11. Let $f : X \to Y$ be a morphism of schemes. There is a functor

$$u : Y_{lisse,étale} \longrightarrow X_{lisse,étale}, \quad V/Y \longmapsto V \times_Y X$$

which is continuous. Hence we obtain an adjoint pair of functors

$$u^s : Sh(X_{lisse,étale}) \longrightarrow Sh(Y_{lisse,étale}), \quad u_s : Sh(Y_{lisse,étale}) \longrightarrow Sh(X_{lisse,étale}),$$

see Sites, Section 9.13. We claim that, in general, u does **not** define a morphism of sites, see Sites, Definition 9.14.1. In other words, we claim that u_s is not left exact in general. Note that representable presheaves are sheaves on lisse-étale sites. Hence, by Sites, Lemma 9.13.5 we see that $u_s h_V = h_{V \times_Y X}$. Now consider two morphisms

$$\begin{tikzcd} V_1 \arrow[r, shift left, "a"] \arrow[r, shift right, "b"'] \arrow[dr] & V_2 \arrow[d] \\ & Y \end{tikzcd}$$

of schemes V_1, V_2 smooth over Y. Now if u_s is left exact, then we would have

$$u_s\text{Equalizer}(h_a, h_b : h_{V_1} \to h_{V_2}) = \text{Equalizer}(h_{a\times 1}, h_{b\times 1} : h_{V_1\times_Y X} \to h_{V_2\times_Y X})$$

We will take the morphisms $a, b : V_1 \to V_2$ such that there exists no morphism from a scheme smooth over Y into $(a = b) \subset V_1$, i.e., such that the left hand side is the empty sheaf, but such that after base change to X the equalizer is nonempty and smooth over X. A silly example is to take $X = Spec(\mathbf{F}_p)$, $Y = Spec(\mathbf{Z})$ and $V_1 = V_2 = \mathbf{A}^1_{\mathbf{Z}}$ with morphisms $a(x) = x$ and $b(x) = x + p$. Note that the equalizer of a and b is the fibre of $\mathbf{A}^1_{\mathbf{Z}}$ over (p).

Lemma 64.37.1. *The lisse-étale site is not functorial, even for morphisms of schemes.*

Proof. See discussion above. □

64.38. Derived pushforward of quasi-coherent modules

Let k be a field of characteristic $p > 0$. Let $S = Spec(k[x])$. Let $G = \mathbf{Z}/p\mathbf{Z}$ viewed either as an abstract group or as a constant group scheme over S. Consider the algebraic stack $\mathcal{X} = [S/G]$ where G acts trivially on S, see Examples of Stacks, Remark 55.14.3 and Criteria for Representability, Lemma 59.18.3. Consider the structure morphism

$$f : \mathcal{X} \longrightarrow S$$

This morphism is quasi-compact and quasi-separated. Hence we get a functor

$$Rf_{QCoh,*} : D^+_{QCoh}(\mathcal{O}_{\mathcal{X}}) \longrightarrow D^+_{QCoh}(\mathcal{O}_S),$$

see Cohomology of Stacks, Proposition 62.14.1. Let's compute $Rf_{QCoh,*}\mathcal{O}_{\mathcal{X}}$. Since $D_{QCoh}(\mathcal{O}_S)$ is equivalent to the derived category of $k[x]$-modules (see Coherent, Lemma 25.4.1) this is equivalent to computing $R\Gamma(\mathcal{X}, \mathcal{O}_\mathcal{X})$. For this we can use the covering $S \to \mathcal{X}$ and the spectral sequence

$$H^q(S \times_\mathcal{X} \ldots \times_\mathcal{X} S, O) \Rightarrow H^{p+q}(\mathcal{X}, \mathcal{O}_\mathcal{X})$$

see Cohomology of Stacks, Proposition 62.10.4. Note that

$$S \times_\mathcal{X} \ldots \times_\mathcal{X} S = S \times G^p$$

which is affine. Thus the complex

$$k[x] \to \mathrm{Map}(G, k[x]) \to \mathrm{Map}(G^2, k[x]) \to \ldots$$

computes $R\Gamma(\mathcal{X}, \mathcal{O}_\mathcal{X})$. Here for $\varphi \in \mathrm{Map}(G^{p-1}, k[x])$ its differential is the map which sends $(g_1, \ldots, g_p)$ to

$$\varphi(g_2, \ldots, g_p) + \sum\nolimits_{i=1}^{p-1} (-1)^i \varphi(g_1, \ldots, g_i + g_{i+1}, \ldots, g_p) + (-1)^p \varphi(g_1, \ldots, g_{p-1}).$$

This is just the complex computing the group cohomology of G acting trivially on $k[x]$ (insert future reference here). The cohomology of the cyclic group G on $k[x]$ is exactly one copy of $k[x]$ in each cohomological degree ≥ 0 (insert future reference here). We conclude that

$$Rf_*\mathcal{O}_\mathcal{X} = \bigoplus\nolimits_{n \geq 0} \mathcal{O}_S[-n]$$

Now, consider the complex

$$E = \bigoplus\nolimits_{m \geq 0} \mathcal{O}_\mathcal{X}[m]$$

This is an object of $D_{QCoh}(\mathcal{X})$. Note that in the derived category we have

$$E = \prod\nolimits_{m \geq 0} \mathcal{O}_\mathcal{X}[m]$$

because this is true on affine objects over $\mathcal{X}$ by Injectives, Remark 17.17.5 (details omitted). Since cohomology commutes with limits we see that

$$Rf_*E = \prod\nolimits_{m \geq 0} \left(\bigoplus\nolimits_{n \geq 0} \mathcal{O}_S[m-n] \right)$$

Note that this complex is not an object of $D_{QCoh}(\mathcal{O}_S)$.

Lemma 64.38.1. *A quasi-compact and quasi-separated morphism $f : \mathcal{X} \to \mathcal{Y}$ of algebraic stacks need not induce a functor $Rf_* : D_{QCoh}(\mathcal{O}_\mathcal{X}) \to D_{QCoh}(\mathcal{O}_\mathcal{Y})$.*

Proof. See discussion above. □

64.39. A big abelian category

The purpose of this section is to give an example of a ``big'' abelian category $\mathcal{A}$ and objects M, N such that the collection of isomorphism classes of extensions $\mathrm{Ext}_\mathcal{A}(M, N)$ is not a set. The example is due to Freyd, see [**Fre64**, page 131, Exercise A].

We define $\mathcal{A}$ as follows. An object of $\mathcal{A}$ consists of a triple (M, α, f) where M is an abelian group and α is an ordinal and $f : \alpha \to \mathrm{End}(M)$ is a map. A morphism $(M, \alpha, f) \to (M', \alpha', f')$ is given by a homomorphism of abelian groups $\varphi : M \to M'$ such that for *any* ordinal β we have

$$\varphi \circ f(\beta) = f'(\beta) \circ \varphi$$

Here the rule is that we set $f(\beta) = 0$ if β is not in α and similarly we set $f'(\beta)$ equal to zero if β is not an element of α'. We omit the verification that the category so defined is abelian.

Consider the object $Z = (\mathbf{Z}, \emptyset, f)$, i.e., all the operators are zero. The observation is that computed in $\mathcal{A}$ the group $\mathrm{Ext}^1_\mathcal{A}(Z, Z)$ is a proper class and not a set. Namely, for each ordinal α we can find an extension $(M, \alpha + 1, f)$ of Z by Z whose underlying group is $M = \mathbf{Z} \oplus \mathbf{Z}$ and where the value of f is always zero except for

$$f(\alpha) = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix}.$$

This clearly produces a proper class of isomorphism classes of extensions. In particular, the derived category of $\mathcal{A}$ has proper classes for its collections of morphism, see Derived Categories, Lemma 11.26.6. This means that some care has to be exercised when defining Verdier quotients of triangulated categories.

Lemma 64.39.1. *There exists a ``big'' abelian category $\mathcal{A}$ whose Ext-groups are proper classes.*

Proof. See discussion above. $\square$

CHAPTER 65

Exercises

65.1. Algebra

This first section just contains some assorted questions.

Exercise 65.1.1. Let A be a ring, and $\mathfrak{m}$ a maximal ideal. In $A[X]$ let $\tilde{\mathfrak{m}}_1 = (\mathfrak{m}, X)$ and $\tilde{\mathfrak{m}}_2 = (\mathfrak{m}, X-1)$. Show that

$$A[X]_{\tilde{\mathfrak{m}}_1} \cong A[X]_{\tilde{\mathfrak{m}}_2}.$$

Exercise 65.1.2. Find an example of a non Noetherian ring R such that every finitely generated ideal of R is finitely presented as an R-module. (A ring is said to be *coherent* if the last property holds.)

Exercise 65.1.3. Suppose that $(A, \mathfrak{m}, k)$ is a Noetherian local ring. For any finite A-module M define $r(M)$ to be the minimum number of generators of M as an A-module. This number equals $\dim_k M/\mathfrak{m}M = \dim_k M \otimes_A k$ by NAK.

(1) Show that $r(M \otimes_A N) = r(M)r(N)$.
(2) Let $I \subset A$ be an ideal with $r(I) > 1$. Show that $r(I^2) < r(I)^2$.
(3) Conclude that if every ideal in A is a flat module, then A is a PID (or a field).

Exercise 65.1.4. Let k be a field. Show that the following pairs of k-algebras are not isomorphic:

(1) $k[x_1, \ldots, x_n]$ and $k[x_1, \ldots, x_{n+1}]$ for any $n \geq 1$.
(2) $k[a, b, c, d, e, f]/(ab + cd + ef)$ and $k[x_1, \ldots, x_n]$ for $n = 5$.
(3) $k[a, b, c, d, e, f]/(ab + cd + ef)$ and $k[x_1, \ldots, x_n]$ for $n = 6$.

Remark 65.1.5. Of course the idea of this exercise is to find a simple argument in each case rather than applying a ``big'' theorem. Nonetheless it is good to be guided by general principles.

Exercise 65.1.6. Algebra. (Silly and should be easy.)

(1) Give an example of a ring A and a nonsplit short exact sequence of A-modules
$$0 \to M_1 \to M_2 \to M_3 \to 0.$$
(2) Give an example of a nonsplit sequence of A-modules as above and a faithfully flat $A \to B$ such that
$$0 \to M_1 \otimes_A B \to M_2 \otimes_A B \to M_3 \otimes_A B \to 0.$$
is split as a sequence of B-modules.

Exercise 65.1.7. Suppose that k is a field having a primitive nth root of unity ζ. This means that $\zeta^n = 1$, but $\zeta^m \neq 1$ for $0 < m < n$.

(1) Show that the characteristic of k is prime to n.

(2) Suppose that $a \in k$ is an element of k which is not an dth power in k for any divisor d of n, $in \geq d > 1$. Show that $k[x]/(x^n - a)$ is a field. (Hint: Consider a splitting field for $x^n - a$ and use Galois theory.)

Exercise 65.1.8. Let $\nu : k[x] \setminus \{0\} \to \mathbf{Z}$ be a map with the following properties: $\nu(fg) = \nu(f) + \nu(g)$ whenever f, g not zero, and $\nu(f + g) \geq min(\nu(f), \nu(g))$ whenever f, g, $f + g$ are not zero, and $\nu(c) = 0$ for all $c \in k^*$.

(1) Show that if f, g, and $f + g$ are nonzero and $\nu(f) \neq \nu(g)$ then we have equality $\nu(f + g) = min(\nu(f), \nu(g))$.
(2) Show that if $f = \sum a_i x^i$, $f \neq 0$, then $\nu(f) \geq min(\{i\nu(x)\}_{a_i \neq 0})$. When does equality hold?
(3) Show that if ν attains a negative value then $\nu(f) = -n\deg(f)$ for some $n \in \mathbf{N}$.
(4) Suppose $\nu(x) \geq 0$. Show that $\{f \mid f = 0,\ or\ \nu(f) > 0\}$ is a prime ideal of $k[x]$.
(5) Describe all possible ν.

Let A be a ring. An *idempotent* is an element $e \in A$ such that $e^2 = e$. The elements 1 and 0 are always idempotent. A *nontrivial idempotent* is an idempotent which is not equal to zero. Two idempotents $e, e' \in A$ are called *orthogonal* if $ee' = 0$.

Exercise 65.1.9. Let A be a ring. Show that A is a product of two nonzero rings if and only if A has a nontrivial idempotent.

Exercise 65.1.10. Let A be a ring and let $I \subset A$ be a locally nilpotent ideal. Show that the map $A \to A/I$ induces a bijection on idempotents. (Hint: It may be easier to prove this when I is nilpotent. Do this first. Then use ``absolute Noetherian reduction'' to reduce to the nilpotent case.)

65.2. Colimits

Definition 65.2.1. A *directed partially ordered set* is a nonempty set I endowed with a partial ordering $\leq$ such that given any pair $i, j \in I$ there exists a $k \in I$ such that $i \leq k$ and $j \leq k$. A *system of rings* over I is given by a ring A_i for each $i \in I$ and a map of rings $\varphi_{ij} : A_i \to A_j$ whenever $i \leq j$ such that the composition $A_i \to A_j \to A_k$ is equal to $A_i \to A_k$ whenever $i \leq j \leq k$.

One similarly defines systems of groups, modules over a fixed ring, vector spaces over a field, etc.

Exercise 65.2.2. Let I be a directed partially ordered set and let (A_i, φ_{ij}) be a system of rings over I. Show that there exists a ring A and maps $\varphi_i : A_i \to A$ such that $\varphi_j \circ \varphi_{ij} = \varphi_i$ for all $i \leq j$ with the following universal property: Given any ring B and maps $\psi_i : A_i \to B$ such that $\psi_j \circ \varphi_{ij} = \psi_i$ for all $i \leq j$, then there exists a unique ring map $\psi : A \to B$ such that $\psi_i = \psi \circ \varphi_i$.

Definition 65.2.3. The ring A constructed in Exercise 65.2.2 is called the *colimit* of the system. Notation $colim\, A_i$.

Exercise 65.2.4. Let $(I, \geq)$ be a directed partially ordered set and let (A_i, φ_{ij}) be a system of rings over I with colimit A. Prove that there is a bijection

$$\mathrm{Spec}(A) = \{(\mathfrak{p}_i)_{i \in I} \mid \ \mathfrak{p}_i \subset A_i \text{ and } \mathfrak{p}_i = \varphi_{ij}^{-1}(\mathfrak{p}_j)\ \forall i \leq j\} \subset \prod\nolimits_{i \in I} Spec(A_i)$$

The set on the right hand side is the limit of the sets $Spec(A_i)$. Notation $lim\, Spec(A_i)$.

Exercise 65.2.5. Let $(I, \geq)$ be a directed partially ordered set and let (A_i, φ_{ij}) be a system of rings over I with colimit A. Suppose that $\mathrm{Spec}(A_j) \to \mathrm{Spec}(A_i)$ is surjective for all $i \leq j$. Show that $\mathrm{Spec}(A) \to \mathrm{Spec}(A_i)$ is surjective for all i. (Hint: You can try to use Tychonoff, but there is also a basically trivial direct algebraic proof based on Algebra, Lemma 7.16.9.)

Exercise 65.2.6. Let $A \subset B$ be an integral ring extension. Prove that $\mathrm{Spec}(B) \to \mathrm{Spec}(A)$ is surjective. Use the exercises above, the fact that this holds for a finite ring extension (proved in the lectures), and by proving that $B = colim\, B_i$ is a directed colimit of finite extensions $A \subset B_i$.

Exercise 65.2.7. Let $(I, \geq)$ be a partially ordered set which is directed. Let A be a ring and let $(N_i, \varphi_{i,i'})$ be a directed system of A-modules indexed by I. Suppose that M is another A-module. Prove that

$$colim_{i\in I}\, M \otimes_A N_i \cong M \otimes_A \Big(colim_{i\in I}\, N_i \Big).$$

Definition 65.2.8. A module M over R is said to be of *finite presentation* over R if it is isomorphic to the cokernel of a map of finite free modules $R^{\oplus n} \to R^{\oplus m}$.

Exercise 65.2.9. Prove that any module over any ring is

(1) the colimit of its finitely generated submodules, and
(2) in some way a colimit of finitely presented modules.

65.3. Additive and abelian categories

Exercise 65.3.1. Let k be a field. Let $\mathscr{C}$ be the category of filtered vector spaces over k, see Homology, Definition 10.13.1 for the definition of a filtered object of any category.

(1) Show that this is an additive category (explain carefully what the direct sum of two objects is).
(2) Let $f : (V, F) \to (W, F)$ be a morphism of $\mathscr{C}$. Show that f has a kernel and cokernel (explain precisely what the kernel and cokernel of f are).
(3) Give an example of a map of $\mathscr{C}$ such that the canonical map $\mathrm{Coim}(f) \to \mathrm{Im}(f)$ is not an isomorphism.

Exercise 65.3.2. Let R be a Noetherian domain. Let $\mathscr{C}$ be the category of finitely generated torsion free R-modules.

(1) Show that this is an additive category.
(2) Let $f : N \to M$ be a morphism of $\mathscr{C}$. Show that f has a kernel and cokernel (make sure you define precisely what the kernel and cokernel of f are).
(3) Give an example of a Noetherian domain R and a map of $\mathscr{C}$ such that the canonical map $\mathrm{Coim}(f) \to \mathrm{Im}(f)$ is not an isomorphism.

Exercise 65.3.3. Give an example of a category which is additive and has kernels and cokernels but which is not as in Exercises 65.3.1 and 65.3.2.

65.4. Flat ring maps

Exercise 65.4.1. Let S be a multiplicative subset of the ring A.

(1) For an A-module M show that $S^{-1}M = S^{-1}A \otimes_A M$.
(2) Show that $S^{-1}A$ is flat over A.

Exercise 65.4.2. Find an injection $M_1 \to M_2$ of A-modules such that $M_1 \otimes N \to M_2 \otimes N$ is not injective in the following cases:

(1) $A = k[x, y]$ and $N = (x, y) \subset A$. (Here and below k is a field.)
(2) $A = k[x, y]$ and $N = A/(x, y)$.

Exercise 65.4.3. Give an example of a ring A and a finite A-module M which is a flat but not a projective A-module.

Remark 65.4.4. If M is of finite presentation and flat over A, then M is projective over A. Thus your example will have to involve a ring A which is not Noetherian. I know of an example where A is the ring of $\mathcal{C}^\infty$-functions on $\mathbf{R}$.

Exercise 65.4.5. Find a flat but not free module over $\mathbf{Z}_{(2)}$.

Exercise 65.4.6. Flat deformations.

(1) Suppose that k is a field and $k[\epsilon]$ is the ring of dual numbers $k[\epsilon] = k[x]/(x^2)$ and $\epsilon = \bar{x}$. Show that for any k-algebra A there is a flat $k[\epsilon]$-algebra B such that A is isomorphic to $B/\epsilon B$.
(2) Suppose that $k = \mathbf{F}_p = \mathbf{Z}/p\mathbf{Z}$ and
$$A = k[x_1, x_2, x_3, x_4, x_5, x_6]/(x_1^p, x_2^p, x_3^p, x_4^p, x_5^p, x_6^p).$$
Show that there exists a flat $\mathbf{Z}/p^2\mathbf{Z}$-algebra B such that B/pB is isomorphic to A. (So here p plays the role of ϵ.)
(3) Now let $p = 2$ and consider the same question for $k = \mathbf{F}_2 = \mathbf{Z}/2\mathbf{Z}$ and
$$A = k[x_1, x_2, x_3, x_4, x_5, x_6]/(x_1^2, x_2^2, x_3^2, x_4^2, x_5^2, x_6^2, x_1x_2 + x_3x_4 + x_5x_6).$$
However, in this case show that there does *not* exist a flat $\mathbf{Z}/4\mathbf{Z}$-algebra B such that $B/2B$ is isomorphic to A. (Find the trick! The same example works in arbitrary characteristic $p > 0$, except that the computation is more difficult.)

Exercise 65.4.7. Let $(A, \mathfrak{m}, k)$ be a local ring and let $k \subset k'$ be a finite field extension. Show there exists a flat, local map of local rings $A \to B$ such that $\mathfrak{m}_B = \mathfrak{m}B$ and $B/\mathfrak{m}B$ is isomorphic to k' as k-algebra. (Hint: first do the case where $k \subset k'$ is generated by a single element.)

Remark 65.4.8. The same result holds for arbitrary field extensions $k \subset K$.

65.5. The Spectrum of a ring

Exercise 65.5.1. Compute $Spec(\mathbf{Z})$ as a set and describe its topology.

Exercise 65.5.2. Let A be any ring. For $f \in A$ we define $D(f) := \{\mathfrak{p} \subset A \mid f \not\in \mathfrak{p}\}$. Prove that the open subsets $D(f)$ form a basis of the topology of $Spec(A)$.

Exercise 65.5.3. Prove that the map $I \mapsto V(I)$ defines a natural bijection
$$\{I \subset A \text{ with } I = \sqrt{I}\} \longrightarrow \{T \subset Spec(A) \text{ closed}\}$$

Definition 65.5.4. A topological space X is called *quasi-compact* if for any open covering $X = \bigcup_{i \in I} U_i$ there is a finite subset $\{i_1, \ldots, i_n\} \subset I$ such that $X = U_{i_1} \cup \ldots U_{i_n}$.

Exercise 65.5.5. Prove that $Spec(A)$ is quasi-compact for any ring A.

Definition 65.5.6. A topological space X is said to verify the separation axiom T_0 if for any pair of points $x, y \in X$, $x \neq y$ there is an open subset of X containing one but not the other. We say that X is *Hausdorff* if for any pair $x, y \in X$, $x \neq y$ there are disjoint open subsets U, V such that $x \in U$ and $y \in V$.

Exercise 65.5.7. Show that $Spec(A)$ is **not** Hausdorff in general. Prove that $Spec(A)$ is T_0. Give an example of a topological space X that is not T_0.

Remark 65.5.8. Usually the word compact is reserved for quasi-compact and Hausdorff spaces.

Definition 65.5.9. A topological space X is called *irreducible* if X is not empty and if $X = Z_1 \cup Z_2$ with $Z_1, Z_2 \subset X$ closed, then either $Z_1 = X$ or $Z_2 = X$. A subset $T \subset X$ of a topological space is called *irreducible* if it is an irreducible topological space with the topology induced from X. This definition implies T is irreducible if and only if the closure $\bar{T}$ of T in X is irreducible.

Exercise 65.5.10. Prove that $Spec(A)$ is irreducible if and only if $Nil(A)$ is a prime ideal and that in this case it is the unique minimal prime ideal of A.

Exercise 65.5.11. Prove that a closed subset $T \subset Spec(A)$ is irreducible if and only if it is of the form $T = V(\mathfrak{p})$ for some prime ideal $\mathfrak{p} \subset A$.

Definition 65.5.12. A point x of an irreducible topological space X is called a *generic point* of X if X is equal to the closure of the subset $\{x\}$.

Exercise 65.5.13. Show that in a T_0 space X every irreducible closed subset has at most one generic point.

Exercise 65.5.14. Prove that in $Spec(A)$ every irreducible closed subset *does* have a generic point. In fact show that the map $\mathfrak{p} \mapsto \overline{\{\mathfrak{p}\}}$ is a bijection of $Spec(A)$ with the set of irreducible closed subsets of X.

Exercise 65.5.15. Give an example to show that an irreducible subset of $Spec(\mathbf{Z})$ does not neccesarily have a generic point.

Definition 65.5.16. A topological space X is called *Noetherian* if any decreasing sequence $Z_1 \supset Z_2 \supset Z_3 \supset \ldots$ of closed subsets of X stabilizes. (It is called *Artinian* if any increasing sequence of closed subsets stabilizes.)

Exercise 65.5.17. Show that if the ring A is Noetherian then the topological space $Spec(A)$ is Noetherian. Give an example to show that the converse is false. (The same for Artinian if you like.)

Definition 65.5.18. A maximal irreducible subset $T \subset X$ is called an *irreducible component* of the space X. Such an irreducible component of X is automatically a closed subset of X.

Exercise 65.5.19. Prove that any irreducible subset of X is contained in an irreducible component of X.

Exercise 65.5.20. Prove that a Noetherian topological space X has only finitely many irreducible components, say $X_1, \ldots, X_n$, and that $X = X_1 \cup X_2 \cup \ldots \cup X_n$. (Note that any X is always the union of its irreducible components, but that if $X = \mathbf{R}$ with its usual topology for instance then the irreducible components of X are the one point subsets. This is not terribly interesting.)

Exercise 65.5.21. Show that irreducible components of $Spec(A)$ correspond to minimal primes of A.

Definition 65.5.22. A point $x \in X$ is called *closed* if $\overline{\{x\}} = \{x\}$. Let x, y be points of X. We say that x is a *specialization* of y, or that y is a *generalization* of x if $x \in \overline{\{y\}}$.

Exercise 65.5.23. Show that closed points of $Spec(A)$ correspond to maximal ideals of A.

Exercise 65.5.24. Show that $\mathfrak{p}$ is a generalization of $\mathfrak{q}$ in $Spec(A)$ if and only if $\mathfrak{p} \subset \mathfrak{q}$. Characterize closed points, maximal ideals, generic points and minimal prime ideals in terms of generalization and specialization. (Here we use the terminology that a point of a possibly reducible topological space X is called a generic point if it is a generic points of one of the irreducible components of X.)

Exercise 65.5.25. Let I and J be ideals of A. What is the condition for $V(I)$ and $V(J)$ to be disjoint?

Definition 65.5.26. A topological space X is called *connected* if it is not the union of two nonempty disjoint open subsets. A *connected component* of X is a (nonempty) maximal connected subset. Any point of X is contained in a connected component of X and any connected component of X is closed in X. (But in general a connected component need not be open in X.)

Exercise 65.5.27. Show that $Spec(A)$ is disconnected iff $A \cong B \times C$ for certain nonzero rings B, C.

Exercise 65.5.28. Let T be a connected component of $Spec(A)$. Prove that T is stable under generalization. Prove that T is an open subset of $Spec(A)$ if A is Noetherian. (Remark: This is wrong when A is an infinite product of copies of $\mathbf{F}_2$ for example. The spectrum of this ring consists of infinitely many closed points.)

Exercise 65.5.29. Compute $Spec(k[x])$, i.e., describe the prime ideals in this ring, describe the possible specializations, and describe the topology. (Work this out when k is algebraically closed but also when k is not.)

Exercise 65.5.30. Compute $Spec(k[x, y])$, where k is algebraically closed. [Hint: use the morphism $\varphi : Spec(k[x, y]) \to Spec(k[x])$; if $\varphi(\mathfrak{p}) = (0)$ then localize with respect to $S = \{f \in k[x] \mid f \neq 0\}$ and use result of lecture on localization and $Spec$.] (Why do you think algebraic geometers call this affine 2-space?)

Exercise 65.5.31. Compute $Spec(\mathbf{Z}[y])$. [Hint: as above.] (Affine 1-space over $\mathbf{Z}$.)

65.6. Localization

Exercise 65.6.1. Let A be a ring. Let $S \subset A$ be a multiplicative subset. Let M be an A-module. Let $N \subset S^{-1}M$ be an $S^{-1}A$-submodule. Show that there exists an A-submodule $N' \subset M$ such that $N = S^{-1}N'$. (This useful result applies in particular to ideals of $S^{-1}A$.)

Exercise 65.6.2. Let A be a ring. Let M be an A-module. Let $m \in M$.

(1) Show that $I = \{a \in A \mid am = 0\}$ is an ideal of A.
(2) For a prime $\mathfrak{p}$ of A show that the image of m in $M_{\mathfrak{p}}$ is zero if and only if $I \not\subset \mathfrak{p}$.
(3) Show that m is zero if and only if the image of m is zero in $M_{\mathfrak{p}}$ for all primes $\mathfrak{p}$ of A.
(4) Show that m is zero if and only if the image of m is zero in $M_{\mathfrak{m}}$ for all maximal ideals $\mathfrak{m}$ of A.
(5) Show that $M = 0$ if and only if $M_{\mathfrak{m}}$ is zero for all maximal ideals $\mathfrak{m}$.

Exercise 65.6.3. Find a pair (A, f) where A is a domain with three or more pairwise distinct primes and $f \in A$ is an element such that the principal localization $A_f = \{1, f, f^2, \ldots\}^{-1}A$ is a field.

Exercise 65.6.4. Let A be a ring. Let M be a finite A-module. Let $S \subset A$ be a multiplicative set. Assume that $S^{-1}M = 0$. Show that there exists an $f \in S$ such that the principal localization $M_f = \{1, f, f^2, \ldots\}^{-1}M$ is zero.

Exercise 65.6.5. Give an example of a triple (A, I, S) where A is a ring, $0 \neq I \neq A$ is a proper nonzero ideal, and $S \subset A$ is a multiplicative subset such that $A/I \cong S^{-1}A$ as A-algebras.

65.7. Nakayama's Lemma

Exercise 65.7.1. Let A be a ring. Let I be an ideal of A. Let M be an A-module. Let $x_1, \ldots, x_n \in M$. Assume that

(1) M/IM is generated by $x_1, \ldots, x_n$,
(2) M is a finite A-module,
(3) I is contained in every maximal ideal of A.

Show that $x_1, \ldots, x_n$ generate M. (Suggested solution: Reduce to a localization at a maximal ideal of A using Exercise 65.6.2 and exactness of localization. Then reduce to the statement of Nakayama's lemma in the lectures by looking at the quotient of M by the submodule generated by $x_1, \ldots, x_n$.)

65.8. Length

Definition 65.8.1. Let A be a ring. Let M be an A-module. The *length* of M as an R-module is

$$\text{length}_A(M) = \sup\{n \mid \exists\, 0 = M_0 \subset M_1 \subset \ldots \subset M_n = M,\ M_i \neq M_{i+1}\}.$$

In other words, the supremum of the lengths of chains of submodules.

Exercise 65.8.2. Show that a module M over a ring A has length 1 if and only if it is isomorphic to $A/\mathfrak{m}$ for some maximal ideal $\mathfrak{m}$ in A.

Exercise 65.8.3. Compute the length of the following modules over the following rings. Briefly(!) explain your answer. (Please feel free to use additivity of the length function in short exact sequences, see Algebra, Lemma 7.48.3).

(1) The length of $\mathbf{Z}/120\mathbf{Z}$ over $\mathbf{Z}$.
(2) The length of $\mathbf{C}[x]/(x^{100} + x + 1)$ over $\mathbf{C}[x]$.
(3) The length of $\mathbf{R}[x]/(x^4 + 2x^2 + 1)$ over $\mathbf{R}[x]$.

Exercise 65.8.4. Let $A = k[x, y]_{(x,y)}$ be the local ring of the affine plane at the origin. Make any assumption you like about the field k. Suppose that $f = x^3 + x^2y^2 + y^{100}$ and $g = y^3 - x^{999}$. What is the length of $A/(f, g)$ as an A-module? (Possible way to proceed: think about the ideal that f and g generate in quotients of the form $A/\mathfrak{m}_A^n = k[x, y]/(x, y)^n$ for varying n. Try to find n such that $A/(f, g) + \mathfrak{m}_A^n \cong A/(f, g) + \mathfrak{m}_A^{n+1}$ and use NAK.)

65.9. Singularities

Exercise 65.9.1. Let k be any field. Suppose that $A = k[[x, y]]/(f)$ and $B = k[[u, v]]/(g)$, where $f = xy$ and $g = uv + \delta$ with $\delta \in (u, v)^3$. Show that A and B are isomorphic rings.

Remark 65.9.2. A singularity on a curve over a field k is called an ordinary double point if the complete local ring of the curve at the point is of the form $k'[[x, y]]/(f)$, where (a) k' is a finite separable extension of k, (b) the initial term of f has degree two, i.e., it looks like $q = ax^2 + bxy + cy^2$ for some $a, b, c \in k'$ not all zero, and (c) q is a nondegenerate quadratic form over k' (in char 2 this means that b is not zero). In general there is one isomorphism class of such rings for each isomophism class of pairs (k', q).

65.10. Hilbert Nullstellensatz

Exercise 65.10.1. *A silly argument using the complex numbers!* Let $\mathbf{C}$ be the complex number field. Let V be a vector space over $\mathbf{C}$. The spectrum of a linear operator $T : V \to V$ is the set of complex numbers $\lambda \in \mathbf{C}$ such that the operator $T - \lambda \mathrm{id}_V$ is not invertible.

(1) Show that $\mathbf{C}(X) = f.f.(\mathbf{C}[X])$ has uncountable dimension over $\mathbf{C}$.
(2) Show that any linear operator on V has a nonempty spectrum if the dimension of V is finite or countable.
(3) Show that if a finitely generated $\mathbf{C}$-algebra R is a field, then the map $\mathbf{C} \to R$ is an isomorphism.
(4) Show that any maximal ideal $\mathfrak{m}$ of $\mathbf{C}[x_1, \ldots, x_n]$ is of the form $(x_1 - \alpha_1, \ldots, x_n - \alpha_n)$ for some $\alpha_i \in \mathbf{C}$.

Remark 65.10.2. Let k be a field. Then for every integer $n \in \mathbf{N}$ and every maximal ideal $\mathfrak{m} \subset k[x_1, \ldots, x_n]$ the quotient $k[x_1, \ldots, x_n]/\mathfrak{m}$ is a finite field extension of k. This will be shown later in the course. Of course (please check this) it implies a similar statement for maximal ideals of finitely generated k-algebras. The exercise above proves it in the case $k = \mathbf{C}$.

Exercise 65.10.3. Let k be a field. Please use Remark 65.10.2.

(1) Let R be a k-algebra. Suppose that $\dim_k R < \infty$ and that R is a domain. Show that R is a field.
(2) Suppose that R is a finitely generated k-algebra, and $f \in R$ not nilpotent. Show that there exists a maximal ideal $\mathfrak{m} \subset R$ with $f \not\in \mathfrak{m}$.
(3) Show by an example that this statement fails when R is not of finite type over a field.
(4) Show that any radical ideal $I \subset \mathbf{C}[x_1, \ldots, x_n]$ is the intersection of the maximal ideals containing it.

Remark 65.10.4. This is the Hilbert Nullstellensatz. Namely it says that the closed subsets of $Spec(k[x_1, \ldots, x_n])$ (which correspond to radical ideals by a previous exercise) are determined by the closed points contained in them.

Exercise 65.10.5. Let $A = \mathbf{C}[x_{11}, x_{12}, x_{21}, x_{22}, y_{11}, y_{12}, y_{21}, y_{22}]$. Let I be the ideal of A generated by the entries of the matrix XY, with

$$X = \begin{pmatrix} x_{11} & x_{12} \\ x_{21} & x_{22} \end{pmatrix} \quad \text{and} \quad Y = \begin{pmatrix} y_{11} & y_{12} \\ y_{21} & y_{22} \end{pmatrix}.$$

Find the irreducible components of the closed subset $V(I)$ of $Spec(A)$. (I mean describe them and give equations for each of them. You do not have to prove that the equations you write down define prime ideals.) Hints:

(1) You may use the Hilbert Nullstellensatz, and it suffices to find irreducible locally closed subsets which cover the set of closed points of $V(I)$.
(2) There are two easy components.
(3) An image of an irreducible set under a continuous map is irreducible.

65.11. Dimension

Exercise 65.11.1. Construct a ring A with finitely many prime ideals having dimension > 1.

Exercise 65.11.2. Let $f \in \mathbf{C}[x, y]$ be a nonconstant polynomial. Show that $\mathbf{C}[x, y]/(f)$ has dimension 1.

Exercise 65.11.3. Let $(R, \mathfrak{m})$ be a Noetherian local ring. Let $n \geq 1$. Let $\mathfrak{m}' = (\mathfrak{m}, x_1, \ldots, x_n)$ in the polynomial ring $R[x_1, \ldots, x_n]$. Show that

$$\dim(R[x_1, \ldots, x_n]_{\mathfrak{m}'}) = \dim(R) + n.$$

65.12. Catenary rings

Definition 65.12.1. A Noetherian ring A is said to be *catenary* if for any triple of prime ideals $\mathfrak{p}_1 \subset \mathfrak{p}_2 \subset \mathfrak{p}_3$ we have

$$ht(\mathfrak{p}_3/\mathfrak{p}_1) = ht(\mathfrak{p}_3/\mathfrak{p}_2) + ht(\mathfrak{p}_2/\mathfrak{p}_1).$$

Here $ht(\mathfrak{p}/\mathfrak{q})$ means the height of $\mathfrak{p}/\mathfrak{q}$ in the ring $A/\mathfrak{q}$.

Exercise 65.12.2. Show that a Noetherian local domain of dimension 2 is catenary.

Exercise 65.12.3. Let k be a field. Show that a finite type k-algebra is catenary.

65.13. Fraction fields

Exercise 65.13.1. Consider the domain

$$\mathbf{Q}[r, s, t]/(s^2 - (r - 1)(r - 2)(r - 3), t^2 - (r + 1)(r + 2)(r + 3)).$$

Find a domain of the form $\mathbf{Q}[x, y]/(f)$ with isomorphic field of fractions.

65.14. Transcendence degree

Exercise 65.14.1. Let $k \subset K \subset K'$ be field extensions with K' algebraic over K. Prove that $\text{trdeg}_k(K) = \text{trdeg}_k(K')$. (Hint: Show that if $x_1, \ldots, x_d \in K$ are algebraically independent over k and $d < \text{trdeg}_k(K')$ then $k(x_1, \ldots, x_d) \subset K$ cannot be algebraic.)

65.15. Finite locally free modules

Definition 65.15.1. Let A be a ring. Recall that a *finite locally free* A-module M is a module such that for every $\mathfrak{p} \in Spec(A)$ there exists an $f \in A$, $f \not\in \mathfrak{p}$ such that M_f is a finite free A_f-module. We say M is an *invertible module* if M is finite locally free of rank 1, i.e., for every $\mathfrak{p} \in Spec(A)$ there exists an $f \in A$, $f \not\in \mathfrak{p}$ such that $M_f \cong A_f$ as an A_f-module.

Exercise 65.15.2. Prove that the tensor product of finite locally free modules is finite locally free. Prove that the tensor product of two invertible modules is invertible.

Definition 65.15.3. Let A be a ring. The *class group of* A, sometimes called the *Picard group of* A is the set $\text{Pic}(A)$ of isomomorphism classes of invertible A-modules endowed with a group operation defined by tensor product (see Exercise 65.15.2).

Note that the class group of A is trivial exactly when every invertible module is isomorphic to a free module of rank 1.

Exercise 65.15.4. Show that the class groups of the following rings are trivial

(1) a polynomial ring $A = k[x]$ where k is a field,

(2) the integers $A = \mathbf{Z}$,
(3) a polynomial ring $A = k[x, y]$ where k is a field, and
(4) the quotient $k[x, y]/(xy)$ where k is a field.

Exercise 65.15.5. Show that the class group of the the ring $A = k[x, y]/(y^2 - f(x))$ where k is a field of characteristic not 2 and where $f(x) = (x - t_1) \ldots (x - t_n)$ with $t_1, \ldots, t_n \in k$ distinct and $n \geq 3$ an odd integer is not trivial. (Hint: Show that the ideal $(y, x - t_1)$ defines a nontrivial element of $\text{Pic}(A)$.)

Exercise 65.15.6. Let A be a ring.

(1) Suppose that M is a finite locally free A-module, and suppose that $\varphi : M \to M$ is an endomorphism. Define/construct the *trace* and *determinant* of φ and prove that your construction is ``functorial in the triple (A, M, φ)".
(2) Show that if M, N are finite locally free A-modules, and if $\varphi : M \to N$ and $\psi : N \to M$ then $Trace(\varphi \circ \psi) = Trace(\psi \circ \varphi)$ and $Det(\varphi \circ \psi) = Det(\psi \circ \varphi)$.
(3) In case M is finite locally free show that Det defines a multiplicative map $End_A(M) \to A$.

Exercise 65.15.7. Now suppose that B is an A-algebra which is finite locally free as an A-module, in other words B is a finite locally free A-algebra.

(1) Define $Trace_{B/A}$ and $Norm_{B/A}$ using $Trace$ and Det as defined above.
(2) Let $b \in B$ and let $\pi : Spec(B) \to Spec(A)$ be the induced morphism. Show that $\pi(V(b)) = V(Norm_{B/A}(b))$. (Recall that $V(f) = \{\mathfrak{p} \mid f \in \mathfrak{p}\}$.)
(3) (Base change.) Suppose that $i : A \to A'$ is a ring map. Set $B' = B \otimes_A A'$. Indicate why $i(Norm_{B/A}(b))$ equals $Norm_{B'/A'}(b \otimes 1)$.
(4) Compute $Norm_{B/A}(b)$ when $B = A \times A \times A \times \ldots \times A$ and $b = (a_1, \ldots, a_n)$.
(5) Compute the norm of $y - y^3$ under the finite flat map $\mathbf{Q}[x] \to \mathbf{Q}[y]$, $x \to y^n$. (Hint: use the ``base change" $A = \mathbf{Q}[x] \subset A' = \mathbf{Q}(\zeta_n)(x^{1/n})$.)

65.16. Glueing

Exercise 65.16.1. Suppose that A is a ring and M is an A-module. Let f_i, $i \in I$ be a collection of elements of A such that

$$Spec(A) = \bigcup D(f_i).$$

(1) Show that if M_{f_i} is a finite A_{f_i}-module, then M is a finite A-module.
(2) Show that if M_{f_i} is a flat A_{f_i}-module, then M is a flat A-module. (This is kind of silly if you think about it right.)

Remark 65.16.2. In algebraic geometric language this means that the property of ``being finitely generated" or ``being flat" is local for the Zariski topology (in a suitable sense). You can also show this for the property ``being of finite presentation".

Exercise 65.16.3. Suppose that $A \to B$ is a ring map. Let $f_i \in A$, $i \in I$ and $g_j \in B$, $j \in J$ be collections of elements such that

$$Spec(A) = \bigcup D(f_i) \quad \text{and} \quad Spec(B) = \bigcup D(g_j).$$

Show that if $A_{f_i} \to B_{f_i g_j}$ is of finite type for all i, j then $A \to B$ is of finite type.

65.17. Going up and going down

Definition 65.17.1. Let $\phi : A \to B$ be a homomorphism of rings. We say that the *going-up theorem* holds for ϕ if the following condition is satisfied:

(GU) for any $\mathfrak{p}, \mathfrak{p}' \in Spec(A)$ such that $\mathfrak{p} \subset \mathfrak{p}'$, and for any $P \in Spec(B)$ lying over $\mathfrak{p}$, there exists $P' \in Spec(B)$ lying over $\mathfrak{p}'$ such that $P \subset P'$.

Similarly, we say that the *going-down theorem* holds for ϕ if the following condition is satisfied:

(GD) for any $\mathfrak{p}, \mathfrak{p}' \in Spec(A)$ such that $\mathfrak{p} \subset \mathfrak{p}'$, and for any $P' \in Spec(B)$ lying over $\mathfrak{p}'$, there exists $P \in Spec(B)$ lying over $\mathfrak{p}$ such that $P \subset P'$.

Exercise 65.17.2. In each of the following cases determine whether (GU), (GD) holds, and explain why. (Use any Prop/Thm/Lemma you can find, but check the hypotheses in each case.)

(1) k is a field, $A = k$, $B = k[x]$.
(2) k is a field, $A = k[x]$, $B = k[x, y]$.
(3) $A = \mathbf{Z}$, $B = \mathbf{Z}[1/11]$.
(4) k is an algebraically closed field, $A = k[x, y]$, $B = k[x, y, z]/(x^2 - y, z^2 - x)$.
(5) $A = \mathbf{Z}$, $B = \mathbf{Z}[i, 1/(2 + i)]$.
(6) $A = \mathbf{Z}$, $B = \mathbf{Z}[i, 1/(14 + 7i)]$.
(7) k is an algebraically closed field, $A = k[x]$, $B = k[x, y, 1/(xy - 1)]/(y^2 - y)$.

Exercise 65.17.3. Let k be an algebraically closed field. Compute the image in $Spec(k[x, y])$ of the following maps:

(1) $Spec(k[x, yx^{-1}]) \to Spec(k[x, y])$, where $k[x, y] \subset k[x, yx^{-1}] \subset k[x, y, x^{-1}]$. (Hint: To avoid confusion, give the element yx^{-1} another name.)
(2) $Spec(k[x, y, a, b]/(ax - by - 1)) \to Spec(k[x, y])$.
(3) $Spec(k[t, 1/(t - 1)]) \to Spec(k[x, y])$, induced by $x \mapsto t^2$, and $y \mapsto t^3$.
(4) $k = \mathbf{C}$ (complex numbers), $Spec(k[s, t]/(s^3 + t^3 - 1)) \to Spec(k[x, y])$, where $x \mapsto s^2$, $y \mapsto t^2$.

Remark 65.17.4. Finding the image as above usually is done by using elimination theory.

65.18. Fitting ideals

Exercise 65.18.1. Let R be a ring and let M be a finite R-module. Choose a presentation

$$\bigoplus\nolimits_{j\in J} R \longrightarrow R^{\oplus n} \longrightarrow M \longrightarrow 0.$$

of M. Note that the map $R^{\oplus n} \to M$ is given by a sequence of elements $x_1, \ldots, x_n$ of M. The elements x_i are *generators* of M. The map $\bigoplus_{j\in J} R \to R^{\oplus n}$ is given by a $n \times J$ matrix A with coefficients in R. In other words, $A = (a_{ij})_{i=1,\ldots,n, j\in J}$. The columns $(a_{1j}, \ldots, a_{nj})$, $j \in J$ of A are said to be the *relations*. Any vector $(r_i) \in R^{\oplus n}$ such that $\sum r_i x_i = 0$ is a linear combination of the columns of A. Of course any finite R-module has a lot of different presentations.

(1) Show that the ideal generated by the $(n - k) \times (n - k)$ minors of A is independent of the choice of the presentation. This ideal is the *kth fitting ideal of M*. Notation $Fit_k(M)$.
(2) Show that $Fit_0(M) \subset Fit_1(M) \subset Fit_2(M) \subset \ldots$. (Hint: Use that a determinant can be computed by expanding along a column.)
(3) Show that the following are equivalent:

(a) $Fit_{r-1}(M) = (0)$ and $Fit_r(M) = R$, and
(b) M is locally free of rank r.

65.19. Hilbert functions

Definition 65.19.1. A *numerical polynomial* is a polynomial $f(x) \in \mathbf{Q}[x]$ such that $f(n) \in \mathbf{Z}$ for every integer n.

Definition 65.19.2. A *graded module* M over a ring A is an A-module M endowed with a direct sum decomposition $\bigoplus_{n \in \mathbf{Z}} M_n$ into A-submodules. We will say that M is *locally finite* if all of the M_n are finite A-modules. Suppose that A is a Noetherian ring and that φ is a *Euler-Poincaré function* on finite A-modules. This means that for every finitely generated A-module M we are given an integer $\varphi(M) \in \mathbf{Z}$ and for every short exact sequence

$$0 \longrightarrow M' \longrightarrow M \longrightarrow M'' \longrightarrow 0$$

we have $\varphi(M) = \varphi(M') + \varphi(M')$. The *Hilbert function* of a locally finite graded module M (with respect to φ) is the function $\chi_\varphi(M, n) = \varphi(M_n)$. We say that M has a *Hilbert polynomial* if there is some numerical polynomial P_φ such that $\chi_\varphi(M, n) = P_\varphi(n)$ for all sufficiently large integers n.

Definition 65.19.3. A *graded A-algebra* is a graded A-module $B = \bigoplus_{n \geq 0} B_n$ together with an A-bilinear map

$$B \times B \longrightarrow B, \ (b, b') \longmapsto bb'$$

that turns B into an A-algebra so that $B_n \cdot B_m \subset B_{n+m}$. Finally, a *graded module M over a graded A-algebra B* is given by a graded A-module M together with a (compatible) B-module structure such that $B_n \cdot M_d \subset M_{n+d}$. Now you can define *homomorphisms of graded modules/rings*, *graded submodules*, *graded ideals*, *exact sequences of graded modules*, etc, etc.

Exercise 65.19.4. Let $A = k$ a field. What are all possible Euler-Poincaré functions on finite A-modules in this case?

Exercise 65.19.5. Let $A = \mathbf{Z}$. What are all possible Euler-Poincaré functions on finite A-modules in this case?

Exercise 65.19.6. Let $A = k[x, y]/(xy)$ with k algebraically closed. What are all possible Euler-Poincaré functions on finite A-modules in this case?

Exercise 65.19.7. Suppose that A is Noetherian. Show that the kernel of a map of locally finite graded A-modules is locally finite.

Exercise 65.19.8. Let k be a field and let $A = k$ and $B = k[x, y]$ with grading determined by $\deg(x) = 2$ and $\deg(y) = 3$. Let $\varphi(M) = \dim_k(M)$. Compute the Hilbert function of B as a graded k-module. Is there a Hilbert polynomial in this case?

Exercise 65.19.9. Let k be a field and let $A = k$ and $B = k[x, y]/(x^2, xy)$ with grading determined by $\deg(x) = 2$ and $\deg(y) = 3$. Let $\varphi(M) = \dim_k(M)$. Compute the Hilbert function of B as a graded k-module. Is there a Hilbert polynomial in this case?

Exercise 65.19.10. Let k be a field and let $A = k$. Let $\varphi(M) = \dim_k(M)$. Fix $d \in \mathbf{N}$. Consider the graded A-algebra $B = k[x, y, z]/(x^d + y^d + z^d)$, where x, y, z each have degree 1. Compute the Hilbert function of B. Is there a Hilbert polynomial in this case?

65.20. Proj of a ring

Definition 65.20.1. Let R be a graded ring. A *homogeneous* ideal is simply an ideal $I \subset R$ which is also a graded submodule of R. Equivalently, it is an ideal generated by homogeneous elements. Equivalently, if $f \in I$ and

$$f = f_0 + f_1 + \ldots + f_n$$

is the decomposition of f into homogenous pieces in R then $f_i \in I$ for each i.

Definition 65.20.2. We define the *homogeneous spectrum Proj*(R) of the graded ring R to be the set of homogenous, prime ideals $\mathfrak{p}$ of R such that $R_+ \not\subset \mathfrak{p}$. Note that Proj($R$) is a subset of *Spec*($R$) and hence has a natural induced topology.

Definition 65.20.3. Let $R = \bigoplus_{d \geq 0} R_d$ be a graded ring, let $f \in R_d$ and assume that $d \geq 1$. We define $R_{(f)}$ to be the subring of R_f consisting of elements of the form r/f^n with r homogenous and $\deg(r) = nd$. Furthermore, we define

$$D_+(f) = \{\mathfrak{p} \in \text{Proj}(R) | f \notin \mathfrak{p}\}.$$

Finally, for a homogenous ideal $I \subset R$ we define $V_+(I) = V(I) \cap \text{Proj}(R)$.

Exercise 65.20.4. On the topology on Proj(R). With definitions and notation as above prove the following statements.

1. Show that $D_+(f)$ is open in Proj(R).
2. Show that $D_+(ff') = D_+(f) \cap D_+(f')$.
3. Let $g = g_0 + \ldots + g_m$ be an element of R with $g_i \in R_i$. Express $D(g) \cap \text{Proj}(R)$ in terms of $D_+(g_i)$, $i \geq 1$ and $D(g_0) \cap \text{Proj}(R)$. No proof necessary.
4. Let $g \in R_0$ be a homogenous element of degree 0. Express $D(g) \cap \text{Proj}(R)$ in terms of $D_+(f_\alpha)$ for a suitable family $f_\alpha \in R$ of homogenous elements of positive degree.
5. Show that the collection $\{D_+(f)\}$ of opens forms a basis for the topology of Proj(R).
6. Show that there is a canonical bijection $D_+(f) \to Spec(R_{(f)})$. (Hint: Imitate the proof for *Spec* but at some point thrown in the radical of an ideal.)
7. Show that the map from (6) is a homeomorphism.
8. Give an example of an R such that Proj(R) is not quasi-compact. No proof necessary.
9. Show that any closed subset $T \subset \text{Proj}(R)$ is of the form $V_+(I)$ for some homogenous ideal $I \subset R$.

Remark 65.20.5. There is a continuous map $\text{Proj}(R) \longrightarrow Spec(R_0)$.

Exercise 65.20.6. If $R = A[X]$ with $\deg(X) = 1$, show that the natural map $\text{Proj}(R) \to Spec(A)$ is a bijection and in fact a homeomorphism.

Exercise 65.20.7. Blowing up: part I. In this exercise $R = Bl_I(A) = A \oplus I \oplus I^2 \oplus \ldots$. Consider the natural map $b : \text{Proj}(R) \to Spec(A)$. Set $U = Spec(A) - V(I)$. Show that

$$b : b^{-1}(U) \longrightarrow U$$

is a homeomorphism. Thus we may think of U as an open subset of Proj(R). Let $Z \subset Spec(A)$ be an irreducible closed subscheme with generic point $\xi \in Z$. Assume that $\xi \notin V(I)$, in other words $Z \not\subset V(I)$, in other words $\xi \in U$, in other words $Z \cap U \neq \emptyset$. We define the *strict transform* Z' of Z to be the closure of the unique point ξ' lying above ξ. Another way to say this is that Z' is the closure in Proj(R) of the locally closed subset $Z \cap U \subset U \subset \text{Proj}(R)$.

Exercise 65.20.8. Blowing up: Part II. Let $A = k[x, y]$ where k is a field, and let $I = (x, y)$. Let R be the blow up algebra for A and I.

(1) Show that the strict transforms of $Z_1 = V(\{x\})$ and $Z_2 = V(\{y\})$ are disjoint.
(2) Show that the strict transforms of $Z_1 = V(\{x\})$ and $Z_2 = V(\{x - y^2\})$ are not disjoint.
(3) Find an ideal $J \subset A$ such that $V(J) = V(I)$ and such that the strict transforms of $Z_1 = V(\{x\})$ and $Z_2 = V(\{x - y^2\})$ are disjoint.

Exercise 65.20.9. Let R be a graded ring.

(1) Show that Proj(R) is empty if $R_n = (0)$ for all $n >> 0$.
(2) Show that Proj(R) is an irreducible topological space if R is a domain and R_+ is not zero. (Recall that the empty topological space is not irreducible.)

Exercise 65.20.10. Blowing up: Part III. Consider A, I and U, Z as in the definition of strict transform. Let $Z = V(\mathfrak{p})$ for some prime ideal $\mathfrak{p}$. Let $\bar{A} = A/\mathfrak{p}$ and let $\bar{I}$ be the image of I in $\bar{A}$.

(1) Show that there exists a surjective ring map $R := Bl_I(A) \to \bar{R} := Bl_{\bar{I}}(\bar{A})$.
(2) Show that the ring map above induces a bijective map from Proj($\bar{R}$) onto the strict transform Z' of Z. (This is not so easy. Hint: Use 5(b) above.)
(3) Conclude that the strict transform $Z' = V_+(P)$ where $P \subset R$ is the homogenous ideal defined by $P_d = I^d \cap \mathfrak{p}$.
(4) Suppose that $Z_1 = V(\mathfrak{p})$ and $Z_2 = V(\mathfrak{q})$ are irreducible closed subsets defined by prime ideals such that $Z_1 \not\subset Z_2$, and $Z_2 \not\subset Z_1$. Show that blowing up the ideal $I = \mathfrak{p} + \mathfrak{q}$ separates the strict transforms of Z_1 and Z_2, i.e., $Z_1' \cap Z_2' = \emptyset$. (Hint: Consider the homogenous ideal P and Q from part (c) and consider $V(P + Q)$.)

65.21. Cohen-Macaulay rings of dimension 1

Definition 65.21.1. A Noetherian local ring A is said to be *Cohen-Macaulay* of dimension d if it has dimension d and there exists a system of parameters $x_1, \ldots, x_d$ for A such that x_i is a nonzero divisor in $A/(x_1, \ldots, x_{i-1})$ for $i = 1, \ldots, d$.

Exercise 65.21.2. Cohen-Macaulay rings of dimension 1. Part I: Theory.

(1) Let $(A, \mathfrak{m})$ be a local Noetherian with $\dim A = 1$. Show that if $x \in \mathfrak{m}$ is not a zero divisor then
   (a) $\dim A/xA = 0$, in other words A/xA is Artinian, in other words $\{x\}$ is a system of parameters for A.
   (b) A is has no embedded prime.
(2) Conversely, let $(A, \mathfrak{m})$ be a local Noetherian ring of dimension 1. Show that if A has no embedded prime then there exists a nonzero divisor in $\mathfrak{m}$.

Exercise 65.21.3. Cohen-Macaulay rings of dimension 1. Part II: Examples.

(1) Let A be the local ring at (x, y) of $k[x, y]/(x^2, xy)$.
   (a) Show that A has dimension 1.
   (b) Prove that every element of $\mathfrak{m} \subset A$ is a zero divisor.
   (c) Find $z \in \mathfrak{m}$ such that $\dim A/zA = 0$ (no proof required).
(2) Let A be the local ring at (x, y) of $k[x, y]/(x^2)$. Find a nonzero divisor in $\mathfrak{m}$ (no proof required).

Exercise 65.21.4. Local rings of embedding dimension 1. Suppose that $(A, \mathfrak{m}, k)$ is a Noetherian local ring of embedding dimension 1, i.e.,

$$\dim_k \mathfrak{m}/\mathfrak{m}^2 = 1.$$

Show that the function $f(n) = \dim_k \mathfrak{m}^n/\mathfrak{m}^{n+1}$ is either constant with value 1, or its values are

$$1, 1, \ldots, 1, 0, 0, 0, 0, 0, \ldots$$

Exercise 65.21.5. Regular local rings of dimension 1. Suppose that $(A, \mathfrak{m}, k)$ is a regular Noetherian local ring of dimension 1. Recall that this means that A has dimension 1 and embedding dimension 1, i.e.,

$$\dim_k \mathfrak{m}/\mathfrak{m}^2 = 1.$$

Let $x \in \mathfrak{m}$ be any element whose class in $\mathfrak{m}/\mathfrak{m}^2$ is not zero.

(1) Show that for every element y of $\mathfrak{m}$ there exists an integer n such that y can be written as $y = ux^n$ with $u \in A^*$ a unit.
(2) Show that x is a nonzero divisor in A.
(3) Conclude that A is a domain.

Exercise 65.21.6. Let $(A, \mathfrak{m}, k)$ be a Noetherian local ring with associated graded $Gr_{\mathfrak{m}}(A)$.

(1) Suppose that $x \in \mathfrak{m}^d$ maps to a nonzero divisor $\bar{x} \in \mathfrak{m}^d/\mathfrak{m}^{d+1}$ in degree d of $Gr_{\mathfrak{m}}(A)$. Show that x is a nonzero divisor.
(2) Suppose the depth of A is at least 1. Namely, suppose that there exists a nonzero divisor $y \in \mathfrak{m}$. In this case we can do better: assume just that $x \in \mathfrak{m}^d$ maps to the element $\bar{x} \in \mathfrak{m}^d/\mathfrak{m}^{d+1}$ in degree d of $Gr_{\mathfrak{m}}(A)$ which is a nonzero divisor on sufficiently high degrees: $\exists N$ such that for all $n \geq N$ the map of multiplication by $\bar{x}$
$$\mathfrak{m}^n/\mathfrak{m}^{n+1} \longrightarrow \mathfrak{m}^{n+d}/\mathfrak{m}^{n+d+1}$$
is injective. Then show that x is a nonzero divisor.

Exercise 65.21.7. Suppose that $(A, \mathfrak{m}, k)$ is a Noetherian local ring of dimension 1. Assume also that the embedding dimension of A is 2, i.e., assume that

$$\dim_k \mathfrak{m}/\mathfrak{m}^2 = 2.$$

Notation: $f(n) = \dim_k \mathfrak{m}^n/\mathfrak{m}^{n+1}$. Pick generators $x, y \in \mathfrak{m}$ and write $Gr_{\mathfrak{m}}(A) = k[\bar{x}, \bar{y}]/I$ for some homogenous ideal I.

(1) Show that there exists a homogenous element $F \in k[\bar{x}, \bar{y}]$ such that $I \subset (F)$ with equality in all sufficiently high degrees.
(2) Show that $f(n) \leq n + 1$.
(3) Show that if $f(n) < n + 1$ then $n \geq \deg(F)$.
(4) Show that if $f(n) < n + 1$, then $f(n + 1) \leq f(n)$.
(5) Show that $f(n) = \deg(F)$ for all $n >> 0$.

Exercise 65.21.8. Cohen-Macaulay rings of dimension 1 and embedding dimension 2. Suppose that $(A, \mathfrak{m}, k)$ is a Noetherian local ring which is Cohen-Macaulay of dimension 1. Assume also that the embedding dimension of A is 2, i.e., assume that

$$\dim_k \mathfrak{m}/\mathfrak{m}^2 = 2.$$

Notations: f, F, $x, y \in \mathfrak{m}$, I as in Ex. 6 above. Please use any results from the problems above.

(1) Suppose that $z \in \mathfrak{m}$ is an element whose class in $\mathfrak{m}/\mathfrak{m}^2$ is a linear form $\alpha\bar{x}+\beta\bar{y} \in k[\bar{x}, \bar{y}]$ which is coprime with f.
   (a) Show that z is a nonzero divisor on A.
   (b) Let $d = \deg(F)$. Show that $\mathfrak{m}^n = z^{n+1-d}\mathfrak{m}^{d-1}$ for all sufficiently large n. (Hint: First show $z^{n+1-d}\mathfrak{m}^{d-1} \to \mathfrak{m}^n/\mathfrak{m}^{n+1}$ is surjective by what you know about $Gr_{\mathfrak{m}}(A)$. Then use NAK.)

(2) What condition on k garantees the existence of such a z? (No proof required; it's too easy.)
Now we are going to assume there exists a z as above. This turns out to be a harmless assumption (in the sense that you can reduce to the situation where it holds in order to obtain the results in parts (d) and (e) below).

(3) Now show that $\mathfrak{m}^\ell = z^{\ell-d+1}\mathfrak{m}^{d-1}$ for all $\ell \geq d$.

(4) Conclude that $I = (F)$.

(5) Conclude that the function f has values

$$2, 3, 4, \ldots, d-1, d, d, d, d, d, d, d, \ldots$$

Remark 65.21.9. This suggests that a local Noetherian Cohen-Macaulay ring of dimension 1 and embedding dimension 2 is of the form B/FB, where B is a 2-dimensional regular local ring. This is more or less true (under suitable ``niceness" properties of the ring).

65.22. Infinitely many primes

A section with a collection of strange questions on rings where infinitely many primes are not invertible.

Exercise 65.22.1. Give an example of a finite type $\mathbf{Z}$-algebra R with the following two properties:
(a) There is no ring map $R \to \mathbf{Q}$.
(b) For every prime p there exists a maximal ideal $\mathfrak{m} \subset R$ such that $R/\mathfrak{m} \cong \mathbf{F}_p$.

Exercise 65.22.2. For $f \in \mathbf{Z}[x, u]$ we define $f_p(x) = f(x, x^p) \bmod p \in \mathbf{F}_p[x]$. Give an example of an $f \in \mathbf{Z}[x, u]$ such that the following two properties hold:
(a) There exist infinitely many p such that f_p does not have a zero in $\mathbf{F}_p$.
(b) For all $p >> 0$ the polynomial f_p either has a linear or a quadratic factor.

Exercise 65.22.3. For $f \in \mathbf{Z}[x, y, u, v]$ we define $f_p(x, y) = f(x, y, x^p, y^p) \bmod p \in \mathbf{F}_p[x, y]$. Give an ``interesting" example of an $f$ such that $f_p$ is reducible for all $p >> 0$. For example, $f = xv - yu$ with $f_p = xy^p - x^p y = xy(x^{p-1} - y^{p-1})$ is ``uninteresting"; any f depeding only on x, u is ``uninteresting", etc.

Remark 65.22.4. Let $h \in \mathbf{Z}[y]$ be a monic polynomial of degree d. Then:

(1) The map $A = \mathbf{Z}[x] \to B = \mathbf{Z}[y]$, $x \mapsto h$ is finite locally free of rank d.
(2) For all primes p the map $A_p = \mathbf{F}_p[x] \to B_p = \mathbf{F}_p[y]$, $y \mapsto h(y) \bmod p$ is finite locally free of rank d.

Exercise 65.22.5. Let h, A, B, A_p, B_p be as in the remark. For $f \in \mathbf{Z}[x, u]$ we define $f_p(x) = f(x, x^p) \bmod p \in \mathbf{F}_p[x]$. For $g \in \mathbf{Z}[y, v]$ we define $g_p(y) = g(y, y^p) \bmod p \in \mathbf{F}_p[y]$.

(1) Give an example of a h and g such that there does not exist a f with the property

$$f_p = Norm_{B_p/A_p}(g_p).$$

(2) Show that for any choice of h and g as above there exists a nonzero f such that for all p we have
$$Norm_{B_p/A_p}(g_p) \text{ divides } f_p.$$
If you want you can restrict to the case $h = y^n$, even with $n = 2$, but it is true in general.

(3) Discuss the relevance of this to Exercises 6 & 7 of the previous set.

Exercise 65.22.6. Unsolved problems. They may be really hard or they may be easy. I don't know.

(1) Is there any $f \in \mathbf{Z}[x, u]$ such that f_p is irreducible for an infinite number of p? (Hint: Yes, this happens for $f(x, u) = u - x - 1$ and also for $f(x, u) = u^2 - x^2 + 1$.)
(2) Let $f \in \mathbf{Z}[x, u]$ nonzero, and suppose $\deg_x(f_p) = dp + d'$ for all large p. (In other words $\deg_u(f) = d$ and the coefficient c of u^d in f has $\deg_x(c) = d'$.) Suppose we can write $d = d_1 + d_2$ and $d' = d'_1 + d'_2$ with $d_1, d_2 > 0$ and $d'_1, d'_2 \geq 0$ such that for all sufficiently large p there exists a factorization
$$f_p = f_{1,p} f_{2,p}$$
with $\deg_x(f_{1,p}) = d_1 p + d'_1$. Is it true that f comes about via a norm construction as in Exercise 4? (More precisely, are there a h and g such that $Norm_{B_p/A_p}(g_p)$ divides f_p for all $p >> 0$.)
(3) Analogous question to the one in (b) but now with $f \in \mathbf{Z}[x_1, x_2, u_1, u_2]$ irreducible and just assuming that $f_p(x_1, x_2) = f(x_1, x_2, x_1^p, x_2^p) \bmod p$ factors for all $p >> 0$.

65.23. Filtered derived category

In order to do the exercises in this section, please read the material in Homology, Section 10.13. We will say A is a filtered object of $\mathcal{A}$, to mean that A comes endowed with a filtration F which we omit from the notation.

Exercise 65.23.1. Let $\mathcal{A}$ be an abelian category. Let I be a filtered object of $\mathcal{A}$. Assume that the filtration on I is finite and that each $\text{gr}^p(I)$ is an injective object of $\mathcal{A}$. Show that there exists an isomorphism $I \cong \bigoplus \text{gr}^p(I)$ with filtration $F^p(I)$ corresponding to $\bigoplus_{p' \geq p} \text{gr}^p(I)$.

Exercise 65.23.2. Let $\mathcal{A}$ be an abelian category. Let I be a filtered object of $\mathcal{A}$. Assume that the filtration on I is finite. Show the following are equivalent:

(1) For any solid diagram
$$\begin{tikzcd} A \arrow[r, "\alpha"] \arrow[d] & B \arrow[dl, dashed] \\ I & \end{tikzcd}$$
of filtered objects with (i) the filtrations on A and B are finite, and (ii) $\text{gr}(\alpha)$ injective the dotted arrow exists making the diagram commute.
(2) Each $\text{gr}^p I$ is injective.

Note that given a morphism $\alpha : A \to B$ of filtered objects with finite filtrations to say that $\text{gr}(\alpha)$ injective is the same thing as saying that α is a *strict monomorphism* in the category $\text{Fil}(\mathcal{A})$. Namely, being a monomorphism means $\text{Ker}(\alpha) = 0$ and strict means that this also implies $\text{Ker}(\text{gr}(\alpha)) = 0$. See Homology, Lemma 10.13.15. (We only use the term ``injective'' for a morphism in an abelian category, allthough it makes sense in any additive category having kernels.) The exercises above justifies the following definition.

Definition 65.23.3. Let $\mathcal{A}$ be an abelian category. Let I be a filtered object of $\mathcal{A}$. Assume the filtration on I is finite. We say I is *filtered injective* if each $\mathrm{gr}^p(I)$ is an injective object of $\mathcal{A}$.

We make the following definition to avoid having to keep saying ``with a finite filtration'' everywhere.

Definition 65.23.4. Let $\mathcal{A}$ be an abelian category. We denote $\mathit{Fil}^f(\mathcal{A})$ the full subcategory of $\mathrm{Fil}(\mathcal{A})$ whose objects consist of those $A \in \mathit{Ob}(\mathrm{Fil}(\mathcal{A}))$ whose filtration is finite.

Exercise 65.23.5. Let $\mathcal{A}$ be an abelian category. Assume $\mathcal{A}$ has enough injectives. Let A be an object of $\mathrm{Fil}^f(\mathcal{A})$. Show that there exists a strict monomorphism $\alpha : A \to I$ of A into a filtered injective object I of $\mathrm{Fil}^f(\mathcal{A})$.

Definition 65.23.6. Let $\mathcal{A}$ be an abelian category. Let $\alpha : K^\bullet \to L^\bullet$ be a morphism of complexes of $\mathrm{Fil}(\mathcal{A})$. We say that α is a *filtered quasi-isomorphism* if for each $p \in \mathbf{Z}$ the morphism $\mathrm{gr}^p(K^\bullet) \to \mathrm{gr}^p(L^\bullet)$ is a quasi-isomorphism.

Definition 65.23.7. Let $\mathcal{A}$ be an abelian category. Let $K^\bullet$ be a complex of $\mathrm{Fil}^f(\mathcal{A})$. We say that $K^\bullet$ is *filtered acyclic* if for each $p \in \mathbf{Z}$ the complex $\mathrm{gr}^p(K^\bullet)$ is acyclic.

Exercise 65.23.8. Let $\mathcal{A}$ be an abelian category. Let $\alpha : K^\bullet \to L^\bullet$ be a morphism of bounded below complexes of $\mathrm{Fil}^f(\mathcal{A})$. (Note the superscript f.) Show that the following are equivalent:

(1) α is a filtered quasi-isomorphism,
(2) for each $p \in \mathbf{Z}$ the map $\alpha : F^pK^\bullet \to F^pL^\bullet$ is a quasi-isomorphism,
(3) for each $p \in \mathbf{Z}$ the map $\alpha : K^\bullet/F^pK^\bullet \to L^\bullet/F^pL^\bullet$ is a quasi-isomorphism, and
(4) the cone of α (see Derived Categories, Definition 11.8.1) is a filtered acyclic complex.

Moreover, show that if α is a filtered quasi-isomorphism then α is also a usual quasi-isomorphism.

Exercise 65.23.9. Let $\mathcal{A}$ be an abelian category. Assume $\mathcal{A}$ has enough injectives. Let A be an object of $\mathrm{Fil}^f(\mathcal{A})$. Show there exists a complex $I^\bullet$ of $\mathrm{Fil}^f(\mathcal{A})$, and a morphism $A[0] \to I^\bullet$ such that

(1) each I^p is filtered injective,
(2) $I^p = 0$ for $p < 0$, and
(3) $A[0] \to I^\bullet$ is a filtered quasi-isomorphism.

Exercise 65.23.10. Let $\mathcal{A}$ be an abelian category. Assume $\mathcal{A}$ has enough injectives. Let $K^\bullet$ be a bounded below complex of objects of $\mathrm{Fil}^f(\mathcal{A})$. Show there exists a filtered quasi-isomorphism $\alpha : K^\bullet \to I^\bullet$ with $I^\bullet$ a complex of $\mathrm{Fil}^f(\mathcal{A})$ having filtered injective terms I^n, and bounded below. In fact, we may choose α such that each α^n is a strict monomorphism.

Exercise 65.23.11. Let $\mathcal{A}$ be an abelian category. Consider a solid diagram

$$\begin{tikzcd} K^\bullet \arrow[r, "\alpha"] \arrow[d, "\gamma"'] & L^\bullet \arrow[dl, dashed, "\beta"] \\ I^\bullet & \end{tikzcd}$$

of complexes of $\mathrm{Fil}^f(\mathcal{A})$. Assume $K^\bullet$, $L^\bullet$ and $I^\bullet$ are bounded below and assume each I^n is a filtered injective object. Also assume that α is a filtered quasi-isomorphism.

(1) There exists a map of complexes β making the diagram commute up to homotopy.
(2) If α is a strict monomorphism in every degree then we can find a β which makes the diagram commute.

Exercise 65.23.12. Let $\mathcal{A}$ be an abelian category. Let $K^\bullet$, $K^\bullet$ be complexes of $\mathrm{Fil}^f(\mathcal{A})$. Assume

(1) $K^\bullet$ bounded below and filtered acyclic, and
(2) $I^\bullet$ bounded below and consisting of filtered injective objects.

Then any morphism $K^\bullet \to I^\bullet$ is homotopic to zero.

Exercise 65.23.13. Let $\mathcal{A}$ be an abelian category. Consider a solid diagram

$$\begin{tikzcd} K^\bullet \arrow[r, "\alpha"] \arrow[d, "\gamma"'] & L^\bullet \arrow[dl, dashed, "\beta_i"] \\ I^\bullet & \end{tikzcd}$$

of complexes of $\mathrm{Fil}^f(\mathcal{A})$. Assume $K^\bullet$, $L^\bullet$ and $I^\bullet$ bounded below and each I^n a filtered injective object. Aslo assume α a filtered quasi-isomorphism. Any two morphisms β_1, β_2 making the diagram commute up to homotopy are homotopic.

65.24. Regular functions

Exercise 65.24.1. In this exercise we try to see what happens with regular functions over non-algebraically closed fields. Let k be a field. Let $Z \subset k^n$ be a Zariski locally closed subset, i.e., there exist ideals $I \subset J \subset k[x_1, \ldots, x_n]$ such that

$$Z = \{a \in k^n \mid f(a) = 0 \ \forall f \in I, \ \exists g \in J, \ g(a) \neq 0\}.$$

A function $\varphi : Z \to k$ is said to be *regular* if for every $z \in Z$ there exists a Zariski open neighbourhood $z \in U \subset Z$ and polynomials $f, g \in k[x_1, \ldots, x_n]$ such that $g(u) \neq 0$ for all $u \in U$ and such that $\varphi(u) = f(u)/g(u)$ for all $u \in U$.

(1) If $k = \bar{k}$ and $Z = k^n$ show that regular functions are given by polynomials. (Only do this if you haven't seen this argument before.)
(2) If k is finite show that (a) every function φ is regular, (b) the ring of regular functions is finite dimensional over k. (If you like you can take $Z = k^n$ and even $n = 1$.)
(3) If $k = \mathbf{R}$ give an example of a regular function on $Z = \mathbf{R}$ which is not given by a polynomial.
(4) If $k = \mathbf{Q}_p$ give an example of a regular function on $Z = \mathbf{Q}_p$ which is not given by a polynomial.

65.25. Sheaves

A morphism $f : X \to Y$ of a category $\mathcal{C}$ is an *monomorphism* if for every pair of morphisms $a, b : W \to X$ we have $f \circ a = f \circ b \Rightarrow a = b$. A monomorphism in the category of sets is an injective map of sets.

Exercise 65.25.1. Carefully prove that a map of sheaves of sets is an monomorphism (in the category of sheaves of sets) if and only if the induced maps on all the stalks are injective.

A morphism $f : X \to Y$ of a category $\mathcal{C}$ is an *isomorphism* if there exists a morphsm $g : Y \to X$ such that $f \circ g = \mathrm{id}_Y$ and $g \circ f = \mathrm{id}_X$. An isomorphism in the category of sets is a bijective map of sets.

Exercise 65.25.2. Carefully prove that a map of sheaves of sets is an isomorphism (in the category of sheaves of sets) if and only if the induced maps on all the stalks are bijective.

A morphism $f : X \to Y$ of a category $\mathcal{C}$ is an *epimorphism* if for every pair of morphisms $a, b : Y \to Z$ we have $a \circ f = b \circ f \Rightarrow a = b$. An epimorphism in the category of sets is a surjective map of sets.

Exercise 65.25.3. Carefully prove that a map of sheaves of sets is an epimorphism (in the category of sheaves of sets) if and only if the induced maps on all the stalks are surjective.

Exercise 65.25.4. Let $f : X \to Y$ be a map of topological spaces. Prove pushforward f_* and pullback f^{-1} for sheaves of **sets** form an adjoint pair of functors.

Exercise 65.25.5. Let $j : U \to X$ be an open immersion. Show that j^{-1} has a left adjoint $j_!$ on the category of sheaves of sets. Characterize the stalks of $j_!(\mathcal{G})$. (Hint: $j_!$ is called extension by zero when you do this for abelian sheaves...)

Exercise 65.25.6. Let $X = \mathbf{R}$ with the usual topology. Let $\mathcal{O}_X = \underline{\mathbf{Z}/2\mathbf{Z}}_X$. Let $i : Z = \{0\} \to X$ be the inclusion and let $\mathcal{O}_Z = \underline{\mathbf{Z}/2\mathbf{Z}}_Z$. Prove the following (the first three follow from the definitions but if you are not clear on the definitions you should elucidate them):

(1) $i_*\mathcal{O}_Z$ is a skyscraper sheaf.
(2) There is a canonical surjective map from $\underline{\mathbf{Z}/2\mathbf{Z}}_X \to i_*\underline{\mathbf{Z}/2\mathbf{Z}}_Z$. Denote the kernel $\mathcal{I} \subset \mathcal{O}_X$.
(3) $\mathcal{I}$ is an ideal sheaf of $\mathcal{O}_X$.
(4) The sheaf $\mathcal{I}$ on X cannot be locally generated by sections (as in Modules, Definition 15.8.1.)

Exercise 65.25.7. Let X be a topological space. Let $\mathcal{F}$ be an abelian sheaf on X. Show that $\mathcal{F}$ is the quotient of a (possibly very large) direct sum of sheaves all of whose terms are of the form

$$j_!(\underline{\mathbf{Z}}_U)$$

where $U \subset X$ is open and $\underline{\mathbf{Z}}_U$ denotes the constant sheaf with value $\mathbf{Z}$ on U.

Remark 65.25.8. Let X be a topological space. In the category of abelian sheaves the direct sum of a family of sheaves $\{\mathcal{F}_i\}_{i \in I}$ is the sheaf associated to the presheaf $U \mapsto \bigoplus \mathcal{F}_i(U)$. Consequently the stalk of the direct sum at a point x is the direct sum of the stalks of the $\mathcal{F}_i$ at x.

Exercise 65.25.9. Let X be a topological space. Suppose we are given a collection of abelian groups A_x indexed by $x \in X$. Show that the rule $U \mapsto \prod_{x \in U} A_x$ with obvious restriction mappings defines a sheaf $\mathcal{G}$ of abelian groups. Show, by an example, that usually it is not the case that $\mathcal{G}_x = A_x$ for $x \in X$.

Exercise 65.25.10. Let X, A_x, $\mathcal{G}$ be as in Exercise 65.25.9. Let $\mathcal{B}$ be a basis for the topology of X, see Topology, Definition 5.3.1. For $U \in \mathcal{B}$ let A_U be a subgroup $A_U \subset \mathcal{G}(U) = \prod_{x \in U} A_x$. Assume that for $U \subset V$ with $U, V \in \mathcal{B}$ the restriction maps A_V into A_U. For $U \subset X$ open set

$$\mathcal{F}(U) = \left\{ (s_x)_{x \in U} \;\middle|\; \begin{array}{l} \text{for every } x \text{ in } U \text{ there exists } V \in \mathcal{B} \\ x \in V \subset U \text{ such that } (s_y)_{y \in V} \in A_V \end{array} \right\}$$

Show that $\mathcal{F}$ defines a sheaf of abelian groups on X. Show, by an example, that it is usually not the case that $\mathcal{F}(U) = A_U$ for $U \in \mathcal{B}$.

65.26. Schemes

Let LRS be the category of locally ringed spaces. An affine scheme is an object in LRS isomorphic in LRS to a pair of the form $(Spec(A), \mathcal{O}_{Spec(A)})$. A scheme is an object $(X, \mathcal{O}_X)$ of LRS such that every point $x \in X$ has an open neighbourhood $U \subset X$ such that the pair $(U, \mathcal{O}_X|_U)$ is an affine scheme.

Exercise 65.26.1. Find a 1-point locally ringed space which is not a scheme.

Exercise 65.26.2. Suppose that X is a scheme whose underlying topological space has 2 points. Show that X is an affine scheme.

Exercise 65.26.3. Suppose that X is a scheme whose underlying topological space is a finite discrete set. Show that X is an affine scheme.

Exercise 65.26.4. Show that there exists a non-affine scheme having three points.

Exercise 65.26.5. Suppose that X is a quasi-compact scheme. Show that X has a closed point.

Remark 65.26.6. When $(X, \mathcal{O}_X)$ is a ringed space and $U \subset X$ is an open subset then $(U, \mathcal{O}_X|_U)$ is a ringed space. Notation: $\mathcal{O}_U = \mathcal{O}_X|_U$. There is a canonical morphisms of ringed spaces

$$j : (U, \mathcal{O}_U) \longrightarrow (X, \mathcal{O}_X).$$

If $(X, \mathcal{O}_X)$ is a locally ringed space, so is $(U, \mathcal{O}_U)$ and j is a morphism of locally ringed spaces. If $(X, \mathcal{O}_X)$ is a scheme so is $(U, \mathcal{O}_U)$ and j is a morphism of schemes. We say that $(U, \mathcal{O}_U)$ is an *open subscheme* of $(X, \mathcal{O}_X)$ and that j is an *open immersion*. More generally, any morphism $j' : (V, \mathcal{O}_V) \to (X, \mathcal{O}_X)$ that is *isomorphic* to a morphism $j : (U, \mathcal{O}_U) \to (X, \mathcal{O}_X)$ as above is called an open immersion.

Exercise 65.26.7. Give an example of an affine scheme $(X, \mathcal{O}_X)$ and an open $U \subset X$ such that $(U, \mathcal{O}_X|U)$ is not an affine scheme.

Exercise 65.26.8. Given an example of a pair of affine schemes $(X, \mathcal{O}_X)$, $(Y, \mathcal{O}_Y)$, an open subscheme $(U, \mathcal{O}_X|_U)$ of X and a morphism of schemes $(U, \mathcal{O}_X|_U) \to (Y, \mathcal{O}_Y)$ that does not extend to a morphism of schemes $(X, \mathcal{O}_X) \to (Y, \mathcal{O}_Y)$.

Exercise 65.26.9. (This is pretty hard.) Given an example of a scheme X, and open subscheme $U \subset X$ and a closed subscheme $Z \subset U$ such that Z does not extend to a closed subscheme of X.

Exercise 65.26.10. Give an example of a scheme X, a field K, and a morphism of ringed spaces $Spec(K) \to X$ which is NOT a morphism of schemes.

Exercise 65.26.11. Do all the exercises in Hartshorne, [**Har77**, Chapter II], Sections 1 and 2... Just kidding!

Definition 65.26.12. A scheme X is called *integral* if for every nonempty affine open $U \subset X$ the ring $\Gamma(U, \mathcal{O}_X) = \mathcal{O}_X(U)$ is a domain.

Exercise 65.26.13. Give an example of a morphism of *integral* schemes $f : X \to Y$ such that the induced maps $\mathcal{O}_{Y,f(x)} \to \mathcal{O}_{X,x}$ are surjective for all $x \in X$, but f is not a closed immersion.

Exercise 65.26.14. Give an example of a fibre product $X \times_S Y$ such that X and Y are affine but $X \times_S Y$ is not.

Remark 65.26.15. It turns out this cannot happen with S separated. Do you know why?

Exercise 65.26.16. Give an example of a scheme V which is integral 1-dimensional scheme of finite type over $\mathbf{Q}$ such that $Spec(\mathbf{C}) \times_{Spec(\mathbf{Q})} V$ is not integral.

Exercise 65.26.17. Give an example of a scheme V which is integral 1-dimensional scheme of finite type over a field k such that $Spec(k') \times_{Spec(k)} V$ is not reduced for some finite field extension $k \subset k'$.

Remark 65.26.18. If your scheme is affine then dimension is the same as the Krull dimension of the underlying ring. So you can use last semesters results to compute dimension.

65.27. Morphisms

An important question is, given a morphism $\pi : X \to S$, whether the morphism has a section or a rational section. Here are some example exercises.

Exercise 65.27.1. Consider the morphism of schemes

$$\pi : X = Spec(\mathbf{C}[x, t, 1/xt]) \longrightarrow S = Spec(\mathbf{C}[t]).$$

(1) Show there does not exist a morphism $\sigma : S \to X$ such that $\pi \circ \sigma = \mathrm{id}_U$.
(2) Show there does exist a nonempty open $U \subset S$ and a morphism $\sigma : U \to X$ such that $\pi \circ \sigma = \mathrm{id}_U$.

Exercise 65.27.2. Consider the morphism of schemes

$$\pi : X = Spec(\mathbf{C}[x, t]/(x^2 + t)) \longrightarrow S = Spec(\mathbf{C}[t]).$$

Show there does not exist a nonempty open $U \subset S$ and a morphism $\sigma : U \to X$ such that $\pi \circ \sigma = \mathrm{id}_U$.

Exercise 65.27.3. Let $A, B, C \in \mathbf{C}[t]$ be nonzero polynomials. Consider the morphism of schemes

$$\pi : X = Spec(\mathbf{C}[x, y, t]/(A + Bx^2 + Cy^2)) \longrightarrow S = Spec(\mathbf{C}[t]).$$

Show there does exist a nonempty open $U \subset S$ and a morphism $\sigma : U \to X$ such that $\pi \circ \sigma = \mathrm{id}_U$. (Hint: Symbolically, write $x = X/Z$, $y = Y/Z$ for some $X, Y, Z \in \mathbf{C}[t]$ of degree $\leq d$ for some d, and work out the condition that this solves the equation. Then show, using dimension theory, that if $d >> 0$ you can find nonzero X, Y, Z solving the equation.)

Remark 65.27.4. Exercise 65.27.3 is a special case of ``Tsen's theorem''. Exercise 65.27.5 shows that the method is limited to low degree equations (conics when the base and fibre have dimension 1).

Exercise 65.27.5. Consider the morphism of schemes

$$\pi : X = Spec(\mathbf{C}[x, y, t]/(1 + tx^3 + t^2y^3)) \longrightarrow S = Spec(\mathbf{C}[t])$$

Show there does not exist a nonempty open $U \subset S$ and a morphism $\sigma : U \to X$ such that $\pi \circ \sigma = \mathrm{id}_U$.

Exercise 65.27.6. Consider the schemes

$$X = Spec(\mathbf{C}[\{x_i\}_{i=1}^8, s, t]/(1 + sx_1^3 + s^2x_2^3 + tx_3^3 + stx_4^3 + s^2tx_5^3 + t^2x_6^3 + st^2x_7^3 + s^2t^2x_8^3))$$

and

$$S = Spec(\mathbf{C}[s, t])$$

and the morphism of schemes

$$\pi : X \longrightarrow S$$

Show there does not exist a nonempty open $U \subset S$ and a morphism $\sigma : U \to X$ such that $\pi \circ \sigma = \mathrm{id}_U$.

Exercise 65.27.7. (For the number theorists.) Give an example of a closed subscheme

$$Z \subset Spec\left(\mathbf{Z}[x, \frac{1}{x(x-1)(2x-1)}]\right)$$

such that the morphism $Z \to Spec(\mathbf{Z})$ is finite and surjective.

Exercise 65.27.8. If you do not like number theory, you can try the variant where you look at

$$Spec\left(\mathbf{F}_p[t, x, \frac{1}{x(x-t)(tx-1)}]\right) \longrightarrow Spec(\mathbf{F}_p[t])$$

and you try to find a closed subscheme of the top scheme which maps finite surjectively to the bottom one. (There is a theoretical reason for having a finite ground field here; allthough it may not be necessary in this particular case.)

Remark 65.27.9. The interpretation of the results of Exercise 65.27.7 and 65.27.8 is that given the morphism $X \to S$ all of whose fibres are nonempty, there exists a finite surjective morphism $S' \to S$ such that the base change $X_{S'} \to S'$ does have a section. This is not a general fact, but it holds if the base is the spectrum of a dedekind ring with finite residue fields at closed points, and the morphism $X \to S$ is flat with geometrically irreducible generic fibre. See Exercise 65.27.10 below for an example where it doesn't work.

Exercise 65.27.10. Prove there exist a $f \in \mathbf{C}[x, t]$ which is not divisible by $t - \alpha$ for any $\alpha \in \mathbf{C}$ such that there does not exist any $Z \subset Spec(\mathbf{C}[x, t, 1/f])$ which maps finite surjectively to $Spec(\mathbf{C}[t])$. (I think that $f(x, t) = (xt - 2)(x - t + 3)$ works. To show any candidate has the required property is not so easy I think.)

65.28. Tangent Spaces

Definition 65.28.1. For any ring R we denote $R[\epsilon]$ the ring of *dual numbers*. As an R-module it is free with basis $1, \epsilon$. The ring structure comes from setting $\epsilon^2 = 0$.

Exercise 65.28.2. Let $f : X \to S$ be a morphism of schemes. Let $x \in X$ be a point, let $s = f(x)$. Consider the solid commutative diagram

$$\begin{tikzcd}
Spec(\kappa(x)) \arrow[r] \arrow[rr, bend left] \arrow[dr] & Spec(\kappa(x)[\epsilon]) \arrow[r, dotted] \arrow[d] & X \arrow[d] \\
 & Spec(\kappa(s)) \arrow[r] & S
\end{tikzcd}$$

with the curved arrow being the canonical morphism of $Spec(\kappa(x))$ into X. If $\kappa(x) = \kappa(s)$ show that the set of dotted arrows which make the diagram commute are in one to one correspondence with the set of linear maps

$$Hom_{\kappa(x)}(\frac{\mathfrak{m}_x}{\mathfrak{m}_x^2 + \mathfrak{m}_s \mathcal{O}_{X,x}}, \kappa(x))$$

In other words: describe such a bijection. (This works more generally if $\kappa(x) \supset \kappa(s)$ is a separable algebraic extension.)

Definition 65.28.3. Let $f : X \to S$ be a morphism of schemes. Let $x \in X$. We dub the set of dotted arrows of Exercise 65.28.2 the *tangent space of X over S* and we denote it $T_{X/S,x}$. An element of this space is called a *tangent vector* of X/S at x.

Exercise 65.28.4. For any field K prove that the diagram

$$\begin{tikzcd} Spec(K) \arrow[r] \arrow[d] & Spec(K[\epsilon_1]) \arrow[d] \\ Spec(K[\epsilon_2]) \arrow[r] & Spec(K[\epsilon_1, \epsilon_2]/(\epsilon_1\epsilon_2)) \end{tikzcd}$$

is a push out diagram in the category of schemes. (Here $\epsilon_i^2 = 0$ as before.)

Exercise 65.28.5. Let $f : X \to S$ be a morphism of schemes. Let $x \in X$. Define addition of tangent vectors, using Exercise 65.28.4 and a suitable morphism

$$Spec(K[\epsilon]) \longrightarrow Spec(K[\epsilon_1, \epsilon_2]/(\epsilon_1\epsilon_2)).$$

Similarly, define scalar multiplication of tangent vectors (this is easier). Show that $T_{X/S,x}$ becomes a $\kappa(x)$-vector space with your constructions.

Exercise 65.28.6. Let k be a field. Consider the structure morphism $f : X = \mathbf{A}^1_k \to Spec(k) = S$.

(1) Let $x \in X$ be a closed point. What is the dimension of $T_{X/S,x}$?
(2) Let $\eta \in X$ be the generic point. What is the dimension of $T_{X/S,\eta}$?
(3) Consider now X as a scheme over $Spec(\mathbf{Z})$. What are the dimensions of $T_{X/\mathbf{Z},x}$ and $T_{X/\mathbf{Z},\eta}$?

Remark 65.28.7. Exercise 65.28.6 explains why it is necessary to consider the tangent space of X over S to get a good notion.

Exercise 65.28.8. Consider the morphism of schemes

$$f : X = Spec(\mathbf{F}_p(t)) \longrightarrow Spec(\mathbf{F}_p(t^p)) = S$$

Compute the tangent space of X/S at the unique point of X. Isn't that weird? What do you think happens if you take the morphism of schemes corresponding to $\mathbf{F}_p[t^p] \to \mathbf{F}_p[t]$?

Exercise 65.28.9. Let k be a field. Compute the tangent space of X/k at the point $x = (0, 0)$ where $X = Spec(k[x, y]/(x^2 - y^3))$.

Exercise 65.28.10. Let $f : X \to Y$ be a morphism of schemes over S. Let $x \in X$ be a point. Set $y = f(x)$. Assume that the natural map $\kappa(y) \to \kappa(x)$ is bijective. Show, using the definition, that f induces a natural linear map

$$\mathrm{d}f : T_{X/S,x} \longrightarrow T_{Y/S,y}.$$

Match it with what happens on local rings via Exercise 65.28.2 in case $\kappa(x) = \kappa(s)$.

Exercise 65.28.11. Let k be an algebraically closed field. Let

$$\begin{array}{rcl} f : \mathbf{A}^n_k & \longrightarrow & \mathbf{A}^m_k \\ (x_1, \ldots, x_n) & \longmapsto & (f_1(x_i), \ldots, f_m(x_i)) \end{array}$$

be a morphism of schemes over k. This is given by m polynomials $f_1, \ldots, f_m$ in n variables. Consider the matrix

$$A = \left(\frac{\partial f_j}{\partial x_i}\right)$$

Let $x \in \mathbf{A}^n_k$ be a closed point. Set $y = f(x)$. Show that the map on tangent spaces $T_{\mathbf{A}^n_k/k,x} \to T_{\mathbf{A}^m_k/k,y}$ is given by the value of the matrix A at the point x.

65.29. Quasi-coherent Sheaves

Definition 65.29.1. Let X be a scheme. A sheaf $\mathcal{F}$ of $\mathcal{O}_X$-modules is *quasi-coherent* if for every affine open $Spec(R) = U \subset X$ the restriction $\mathcal{F}|_U$ is of the form $\widetilde{M}$ for some R-module M.

It is enough to check this conditions on the members of an affine open covering of X. See Schemes, Section 21.24 for more results.

Definition 65.29.2. Let X be a topological space. Let $x, x' \in X$. We say x is a *specialization* of x' if and only if $x \in \overline{\{x'\}}$.

Exercise 65.29.3. Let X be a scheme. Let $x, x' \in X$. Let $\mathcal{F}$ be a quasi-coherent sheaf of $\mathcal{O}_X$-modules. Suppose that (a) x is a specialization of x' and (b) $\mathcal{F}_{x'} \neq 0$. Show that $\mathcal{F}_x \neq 0$.

Exercise 65.29.4. Find an example of a scheme X, points $x, x' \in X$, a sheaf of $\mathcal{O}_X$-modules $\mathcal{F}$ such that (a) x is a specialization of x' and (b) $\mathcal{F}_{x'} \neq 0$ and $\mathcal{F}_x = 0$.

Definition 65.29.5. A scheme X is called *locally Noetherian* if and only if for every point $x \in X$ there exists an affine open $Spec(R) = U \subset X$ such that R is Noetherian. A scheme is *Noetherian* if it is locally Noetherian and quasi-compact.

If X is locally Noetherian then any affine open of X is the spectrum of a Noetherian ring, see Properties, Lemma 23.5.2.

Definition 65.29.6. Let X be a locally Noetherian scheme. Let $\mathcal{F}$ be a quasi-coherent sheaf of $\mathcal{O}_X$-modules. We say $\mathcal{F}$ is *coherent* if for every point $x \in X$ there exists an affine open $Spec(R) = U \subset X$ such that $\mathcal{F}|_U$ is isomorphic to $\widetilde{M}$ for some finite R-module M.

Exercise 65.29.7. Let $X = Spec(R)$ be an affine scheme.

(1) Let $f \in R$. Let $\mathcal{G}$ be a quasi-coherent sheaf of $\mathcal{O}_{D(f)}$-modules on the open subscheme $D(f)$. Show that $\mathcal{G} = \mathcal{F}|_U$ for some quasi-coherent sheaf of $\mathcal{O}_X$-modules $\mathcal{F}$.
(2) Let $I \subset R$ be an ideal. Let $i : Z \to X$ be the closed subscheme of X corresponding to I. Let $\mathcal{G}$ be a quasi-coherent sheaf of $\mathcal{O}_Z$-modules on the closed subscheme Z. Show that $\mathcal{G} = i^*\mathcal{F}$ for some quasi-coherent sheaf of $\mathcal{O}_X$-modules $\mathcal{F}$. (Why is this silly?)
(3) Assume that R is Noetherian. Let $f \in R$. Let $\mathcal{G}$ be a coherent sheaf of $\mathcal{O}_{D(f)}$-modules on the open subscheme $D(f)$. Show that $\mathcal{G} = \mathcal{F}|_U$ for some coherent sheaf of $\mathcal{O}_X$-modules $\mathcal{F}$.

Remark 65.29.8. If $U \to X$ is a quasi-compact immersion then any quasi-coherent sheaf on U is the restriction of a quasi-coherent sheaf on X. If X is a Noetherian scheme, and $U \subset X$ is open, then any coherent sheaf on U is the restriction of a coherent sheaf on X. Of course the exercise above is easier, and shouldn't use these general facts.

65.30. Proj and projective schemes

Exercise 65.30.1. Give examples of graded rings S such that

(1) $\text{Proj}(S)$ is affine and nonempty, and
(2) $\text{Proj}(S)$ is integral, nonempty but not isomorphic to $\mathbf{P}^n_A$ for any $n \geq 0$, any ring A.

Exercise 65.30.2. Give an example of a nonconstant morphism of schemes $\mathbf{P}^1_{\mathbf{C}} \to \mathbf{P}^5_{\mathbf{C}}$ over $Spec(\mathbf{C})$.

Exercise 65.30.3. Give an example of an isomorphism of schemes

$$\mathbf{P}^1_{\mathbf{C}} \to \text{Proj}(\mathbf{C}[X_0, X_1, X_2]/(X_0^2 + X_1^2 + X_2^2))$$

Exercise 65.30.4. Give an example of a morphism of schemes $f : X \to \mathbf{A}^1_{\mathbf{C}} = Spec(\mathbf{C}[T])$ such that the (scheme theoretic) fibre X_t of f over $t \in \mathbf{A}^1_{\mathbf{C}}$ is (a) isomorphic to $\mathbf{P}^1_{\mathbf{C}}$ when t is a closed point not equal to 0, and (b) not isomorphic to $\mathbf{P}^1_{\mathbf{C}}$ when $t = 0$. We will call X_0 the *special fibre* of the morphism. This can be done in many, many ways. Try to give examples that satisfy (each of) the following additional restraints (unless it isn't possible):

(1) Can you do it with special fibre projective?
(2) Can you do it with special fibre irreducible and projective?
(3) Can you do it with special fibre integral and projective?
(4) Can you do it with special fibre smooth and projective?
(5) Can you do it with f a flat morphism? This just means that for every affine open $Spec(A) \subset X$ the induced ring map $\mathbf{C}[t] \to A$ is flat, which in this case means that any nonzero polynomial in t is a nonzero divisor on A.
(6) Can you do it with f a flat and projective morphism?
(7) Can you do it with f flat, projective and special fibre reduced?
(8) Can you do it with f flat, projective and special fibre irreducible?
(9) Can you do it with f flat, projective and special fibre integral?

What do you think happens when you replace $\mathbf{P}^1_{\mathbf{C}}$ with another variety over $\mathbf{C}$? (This can get very hard depending on which of the variants above you ask for.)

Exercise 65.30.5. Let $n \geq 1$ be any positive integer. Give an example of a surjective morphism $X \to \mathbf{P}^n_{\mathbf{C}}$ with X affine.

Exercise 65.30.6. Maps of Proj. Let R and S be graded rings. Suppose we have a ring map

$$\psi : R \to S$$

and an integer $e \geq 1$ such that $\psi(R_d) \subset S_{de}$ for all $d \geq 0$. (By our conventions this is not a homomorphism of graded rings, unless $e = 1$.)

(1) For which elements $\mathfrak{p} \in \text{Proj}(S)$ is there a well-defined corresponding point in $\text{Proj}(R)$? In other words, find a suitable open $U \subset \text{Proj}(S)$ such that ψ defines a continuous map $r_\psi : U \to \text{Proj}(R)$.
(2) Give an example where $U \neq \text{Proj}(S)$.
(3) Give an example where $U = \text{Proj}(S)$.

(4) (Do not write this down.) Convince yourself that the continuous map $U \to \mathrm{Proj}(R)$ comes canonically with a map on sheaves so that r_ψ is a morphism of schemes:
$$\mathrm{Proj}(S) \supset U \longrightarrow \mathrm{Proj}(R).$$
(5) What can you say about this map if $R = \bigoplus_{d \geq 0} S_{de}$ (as a graded ring with S_e, S_{2e}, etc in degree 1, 2, etc) and ψ is the inclusion mapping?

Notation. Let R be a graded ring as above and let $n \geq 0$ be an integer. Let $X = \mathrm{Proj}(R)$. Then there is a unique quasi-coherent $\mathcal{O}_X$-module $\mathcal{O}_X(n)$ on X such that for every homogeneous element $f \in R$ of positive degree we have $\mathcal{O}_X|_{D_+(f)}$ is the quasi-coherent sheaf associated to the $R_{(f)} = (R_f)_0$-module $(R_f)_n$ (=elements homogenous of degree n in $R_f = R[1/f]$). See Hartshorne, page 116+. Note that there are natural maps
$$\mathcal{O}_X(n_1) \otimes_{\mathcal{O}_X} \mathcal{O}_X(n_2) \longrightarrow \mathcal{O}_X(n_1 + n_2)$$

Exercise 65.30.7. Pathologies in Proj. Give examples of R as above such that
(1) $\mathcal{O}_X(1)$ is not an invertible $\mathcal{O}_X$-module.
(2) $\mathcal{O}_X(1)$ is invertible, but the natural map $\mathcal{O}_X(1) \otimes_{\mathcal{O}_X} \mathcal{O}_X(1) \to \mathcal{O}_X(2)$ is NOT an isomorphism.

Exercise 65.30.8. Let S be a graded ring. Let $X = \mathrm{Proj}(S)$. Show that any finite set of points of X is contained in a standard affine open.

Exercise 65.30.9. Let S be a graded ring. Let $X = \mathrm{Proj}(S)$. Let $Z, Z' \subset X$ be two closed subschemes. Let $\varphi : Z \to Z'$ be an isomorphism. Assume $Z \cap Z' = \emptyset$. Show that for any $z \in Z$ there exists an affine open $U \subset X$ such that $z \in U$, $\varphi(z) \in U$ and $\varphi(Z \cap U) = Z' \cap U$. (Hint: Use Exercise 65.30.8 and something akin to Schemes, Lemma 21.11.5.)

65.31. Morphisms from surfaces to curves

Exercise 65.31.1. Let R be a ring. Let $R \to k$ be a map from R to a field. Let $n \geq 0$. Show that
$$Mor_{Spec(R)}(Spec(k), \mathbf{P}^n_R) = (k^{n+1} \setminus \{0\})/k^*$$
where k^* acts via scalar multiplication on k^{n+1}. From now on we denote $(x_0 : \ldots : x_n)$ the morphism $Spec(k) \to \mathbf{P}^n_k$ corresponding to the equivalence class of the element $(x_0, \ldots, x_n) \in k^{n+1} \setminus \{0\}$.

Exercise 65.31.2. Let k be a field. Let $Z \subset \mathbf{P}^2_k$ be a irreducible closed subscheme. Show that either (a) Z is a closed point, or (b) there exists an homogeneous irreducible $F \in k[X_0, X_1, X_2]$ of degree > 0 such that $Z = V_+(F)$, or (c) $Z = \mathbf{P}^2_k$. (Hint: Look on a standard affine open.)

Exercise 65.31.3. Let k be a field. Let $Z_1, Z_2 \subset \mathbf{P}^2_k$ be irreducible closed subschemes of the form $V_+(F)$ for some homogeneous irreducible $F_i \in k[X_0, X_1, X_2]$ of degree > 0. Show that $Z_1 \cap Z_2$ is not empty. (Hint: Use dimension theory to estimate the dimension of the local ring of $k[X_0, X_1, X_2]/(F_1, F_2)$ at 0.)

Exercise 65.31.4. Show there does not exist a nonconstant morphism of schemes $\mathbf{P}^2_{\mathbf{C}} \to \mathbf{P}^1_{\mathbf{C}}$ over $Spec(\mathbf{C})$. Here a *constant morphism* is one whose image is a single point. (Hint: If the morphism is not constant consider the fibres over 0 and ∞ and argue that they have to meet to get a contradiction.)

Exercise 65.31.5. Let k be a field. Suppose that $X \subset \mathbf{P}^3_k$ is a closed subscheme given by a single homogeneous equation $F \in k[X_0, X_1, X_2, X_3]$. In other words,

$$X = \mathrm{Proj}(k[X_0, X_1, X_2, X_3]/(F)) \subset \mathbf{P}^3_k$$

as explained in the course. Assume that

$$F = X_0 G + X_1 H$$

for some homogeneous polynomials $G, H \in k[X_0, X_1, X_2, X_3]$ of positive degree. Show that if X_0, X_1, G, H have no common zeros then there exists a nonconstant morphism

$$X \longrightarrow \mathbf{P}^1_k$$

of schemes over $Spec(k)$ which on field points (see Exercise 65.31.1) looks like $(x_0 : x_1 : x_2 : x_3) \mapsto (x_0 : x_1)$ whenever x_0 or x_1 is not zero.

65.32. Invertible sheaves

Definition 65.32.1. Let X be a locally ringed space. An *invertible $\mathcal{O}_X$-module* on X is a sheaf of $\mathcal{O}_X$-modules $\mathcal{L}$ such that every point has an open neighbourhood $U \subset X$ such that $\mathcal{L}|_U$ is isomorphic to $\mathcal{O}_U$ as $\mathcal{O}_U$-module. We say that $\mathcal{L}$ is trivial if it is isomorphic to $\mathcal{O}_X$ as a $\mathcal{O}_X$-module.

Exercise 65.32.2. General facts.

(1) Show that an invertible $\mathcal{O}_X$-module on a scheme X is quasi-coherent.
(2) Suppose $X \to Y$ is a morphism of ringed spaces, and $\mathcal{L}$ an invertible $\mathcal{O}_Y$-module. Show that $f^*\mathcal{L}$ is an invertible $\mathcal{O}_X$ module.

Exercise 65.32.3. Algebra.

(1) Show that an invertible $\mathcal{O}_X$-module on an affine scheme $Spec(A)$ corresponds to an A-module M which is (i) finite, (ii) projective, (iii) locally free of rank 1, and hence (iv) flat, and (v) finitely presented. (Feel free to quote things from last semesters course; or from algebra books.)
(2) Suppose that A is a domain and that M is a module as in (a). Show that M is isomorphic as an A-module to an ideal $I \subset A$ such that $IA_{\mathfrak{p}}$ is principal for every prime $\mathfrak{p}$.

Definition 65.32.4. Let R be a ring. An *invertible module* M is an R-module M such that $\widetilde{M}$ is an invertible sheaf on the spectrum of R. We say M is *trivial* if $M \cong R$ as an R-module.

In other words, M is invertible if and only if it satisfies all of the following conditions: it is flat, of finite presentation, projective, and locally free of rank 1. (Of course it suffices for it to be locally free of rank 1).

Exercise 65.32.5. Simple examples.

(1) Let k be a field. Let $A = k[x]$. Show that $X = Spec(A)$ has only trivial invertible $\mathcal{O}_X$-modules. In other words, show that every invertible A-module is free of rank 1.
(2) Let A be the ring

$$A = \{f \in k[x] \mid f(0) = f(1)\}.$$

Show there exists a nontrivial invertible A-module, unless $k = \mathbf{F}_2$. (Hint: Think about $Spec(A)$ as identifying 0 and 1 in $\mathbf{A}^1_k = Spec(k[x])$.)

(3) Same question as in (2) for the ring $A = k[x^2, x^3] \subset k[x]$ (except now $k = \mathbf{F}_2$ works as well).

Exercise 65.32.6. Higher dimensions.

(1) Prove that every invertible sheaf on two dimensional affine space is trivial. More precisely, let $\mathbf{A}^2_k = Spec(k[x, y])$ where k is a field. Show that every invertible sheaf on $\mathbf{A}^2_k$ is trivial. (Hint: One way to do this is to consider the corresponding module M, to look at $M \otimes_{k[x,y]} k(x)[y]$, and then use Exercise 65.32.5 (1) to find a generator for this; then you still have to think. Another way to is to use Exercise 65.32.3 and use what we know about ideals of the polynomial ring: primes of height one are generated by an irreducible polynomial; then you still have to think.)
(2) Prove that every invertible sheaf on any open subscheme of two dimensional affine space is trivial. More precisely, let $U \subset \mathbf{A}^2_k$ be an open subscheme where k is a field. Show that every invertible sheaf on U is trivial. Hint: Show that every invertible sheaf on U extends to one on $\mathbf{A}^2_k$. Not easy; but you can find it in Hartshorne.
(3) Find an example of a nontrivial invertible sheaf on a punctured cone over a field. More precisely, let k be a field and let $C = Spec(k[x, y, z]/(xy - z^2))$. Let $U = C \setminus \{(x, y, z)\}$. Find a nontrivial invertible sheaf on U. Hint: It may be easier to compute the group of isomorphism classes of invertible sheaves on U than to just find one. Note that U is covered by the opens $Spec(k[x, y, z, 1/x]/(xy - z^2))$ and $Spec(k[x, y, z, 1/y]/(xy - z^2))$ which are ``easy'' to deal with.

Definition 65.32.7. Let X be a locally ringed space. The *Picard group of X* is the set $\text{Pic}(X)$ of isomorphism classes of invertible $\mathcal{O}_X$-modules with addition given by tensor product. See Modules, Definition 15.21.6. For a ring R we set $\text{Pic}(R) = \text{Pic}(Spec(R))$.

Exercise 65.32.8. Let R be a ring.

(1) Show that if R is a Noetherian normal domain, then $\text{Pic}(R) = \text{Pic}(R[t])$. [Hint: There is a map $R[t] \to R$, $t \mapsto 0$ which is a left inverse to the map $R \to R[t]$. Hence it suffices to show that any invertible $R[t]$-module M such that $M/tM \cong R$ is free of rank 1. Let $K = f.f.(R)$. Pick a trivialization $K[t] \to M \otimes_{R[t]} K[t]$ which is possible by Exercise 65.32.5 (1). Adjust it so it agrees with the trivialization of M/tM above. Show that it is in fact a trivialization of M over $R[t]$ (this is where normality comes in).]
(2) Let k be a field. Show that $\text{Pic}(k[x^2, x^3, t]) \neq \text{Pic}(k[x^2, x^3])$.

65.33. Čech Cohomology

Exercise 65.33.1. Čech cohomology. Here k is a field.

(1) Let X be a scheme with an open covering $\mathcal{U} : X = U_1 \cup U_2$, with $U_1 = Spec(k[x])$, $U_2 = Spec(k[y])$ with $U_1 \cap U_2 = Spec(k[z, 1/z])$ and with open immersions $U_1 \cap U_2 \to U_1$ resp. $U_1 \cap U_2 \to U_2$ determined by $x \mapsto z$ resp. $y \mapsto z$ (and I really mean this). (We've seen in the lectures that such an X exists; it is the affine line zith zero doubled.) Compute $H^1(\mathcal{U}, \mathcal{O})$; eg. give a basis for it as a k-vectorspace.
(2) For each element in $H^1(\mathcal{U}, \mathcal{O})$ construct an exact sequence of sheaves of $\mathcal{O}_X$-modules

$$0 \to \mathcal{O}_X \to E \to \mathcal{O}_X \to 0$$

such that the boundary $\delta(1) \in H^1(\mathcal{U}, \mathcal{O})$ equals the given element. (Part of the problem is to make sense of this. See also below. It is also OK to show abstractly such a thing has to exist.)

Definition 65.33.2. (Definition of delta.) Suppose that

$$0 \to \mathcal{F}_1 \to \mathcal{F}_2 \to \mathcal{F}_3 \to 0$$

is a short exact sequence of abelian sheaves on any topological space X. The boundary map $\delta : H^0(X, \mathcal{F}_3) \to H^1(X, \mathcal{F}_1)$ is defined as follows. Take an element $\tau \in H^0(X, \mathcal{F}_3)$. Choose an open covering $\mathcal{U} : X = \bigcup_{i \in I} U_i$ such that for each i there exists a section $\tilde{\tau}_i \in \mathcal{F}_2$ lifting the restriction of τ to U_i. Then consider the assignment

$$(i_0, i_1) \longmapsto \tilde{\tau}_{i_0}|_{U_{i_0 i_1}} - \tilde{\tau}_{i_1}|_{U_{i_0 i_1}}.$$

This is clearly a 1-coboundary in the Čech complex $C^*(\mathcal{U}, \mathcal{F}_2)$. But we observe that (thinking of $\mathcal{F}_1$ as a subsheaf of $\mathcal{F}_2$) the RHS always is a section of $\mathcal{F}_1$ over $U_{i_0 i_1}$. Hence we see that the assignment defines a 1-cochain in the complex $C^*(\mathcal{U}, \mathcal{F}_2)$. The cohomology class of this 1-cochain is by definition $\delta(\tau)$.

65.34. Divisors

We collect all relevant definitions here in one spot for convenience.

Definition 65.34.1. Throughout, let S be any scheme and let X be a Noetherian, integral scheme.

(1) A *Weil divisor* on X is a formal linear combination $\Sigma n_i[Z_i]$ of prime divisors Z_i with integer coefficients.
(2) A *prime divisor* is a closed subscheme $Z \subset X$, which is integral with generic point $\xi \in Z$ such that $\mathcal{O}_{X,\xi}$ has dimension 1. We will use the notation $\mathcal{O}_{X,Z} = \mathcal{O}_{X,\xi}$ when $\xi \in Z \subset X$ is as above. Note that $\mathcal{O}_{X,Z} \subset K(X)$ is a subring of the function field of X.
(3) The *Weil divisor associated to a rational function* $f \in K(X)^*$ is the sum $\Sigma v_Z(f)[Z]$. Here $v_Z(f)$ is defined as follows
   (a) If $f \in \mathcal{O}_{X,Z}^*$ then $v_Z(f) = 0$.
   (b) If $f \in \mathcal{O}_{X,Z}$ then
   $$v_Z(f) = \text{length}_{\mathcal{O}_{X,Z}}(\mathcal{O}_{X,Z}/(f)).$$
   (c) If $f = \frac{a}{b}$ with $a, b \in \mathcal{O}_{X,Z}$ then
   $$v_Z(f) = \text{length}_{\mathcal{O}_{X,Z}}(\mathcal{O}_{X,Z}/(a)) - \text{length}_{\mathcal{O}_{X,Z}}(\mathcal{O}_{X,Z}/(b)).$$
(4) An *effective Cartier divisor* on a scheme S is a closed subscheme $D \subset S$ such that every point $d \in D$ has an affine open neighbourhood $Spec(A) = U \subset S$ in S so that $D \cap U = Spec(A/(f))$ with $f \in A$ a nonzero divisor.
(5) The *Weil divisor* $[D]$ *associated to an effective Cartier divisor* $D \subset X$ of our Noetherian integral scheme X is defined as the sum $\Sigma v_Z(D)[Z]$ where $v_Z(D)$ is defined as follows
   (a) If the generic point ξ of Z is not in D then $v_Z(D) = 0$.
   (b) If the generic point ξ of Z is in D then
   $$v_Z(D) = \text{length}_{\mathcal{O}_{X,Z}}(\mathcal{O}_{X,Z}/(f))$$
   where $f \in \mathcal{O}_{X,Z} = \mathcal{O}_{X,\xi}$ is the nonzero divisor which defines D in an affine neighbourhood of ξ (as in (4) above).

(6) Let S be a scheme. The *sheaf of total quotient rings* $\mathcal{K}_S$ is the sheaf of $\mathcal{O}_S$-algebras which is the sheafification of the pre-sheaf $\mathcal{K}'$ defined as follows. For $U \subset S$ open we set $\mathcal{K}'(U) = S_U^{-1}\mathcal{O}_S(U)$ where $S_U \subset \mathcal{O}_S(U)$ is the multiplicative subset consisting of sections $f \in \mathcal{O}_S(U)$ such that the germ of f in $\mathcal{O}_{S,u}$ is a nonzero divisor for every $u \in U$. In particular the elements of S_U are all nonzero divisors. Thus $\mathcal{O}_S$ is a subsheaf of $\mathcal{K}_S$, and we get a short exact sequence

$$0 \to \mathcal{O}_S^* \to \mathcal{K}_S^* \to \mathcal{K}_S^*/\mathcal{O}_S^* \to 0.$$

(7) A *Cartier divisor* on a scheme S is a global section of the quotient sheaf $\mathcal{K}_S^*/\mathcal{O}_S^*$.

(8) The *Weil divisor associated to a Cartier divisor* $\tau \in \Gamma(X, \mathcal{K}_X^*/\mathcal{O}_X^*)$ over our Noetherian integral scheme X is the sum $\Sigma v_Z(\tau)[Z]$ where $v_Z(\tau)$ is defined as by the following recipe
   (a) If the germ of τ at the generic point ξ of Z is zero -- in other words the image of τ in the stalk $(\mathcal{K}^*/\mathcal{O}^*)_\xi$ is ``zero'' -- then $v_Z(\tau) = 0$.
   (b) Find an affine open neighbourhood $Spec(A) = U \subset X$ so that $\tau|_U$ is the image of a section $f \in \mathcal{K}(U)$ and moreover $f = a/b$ with $a, b \in A$. Then we set

$$v_Z(f) = \text{length}_{\mathcal{O}_{X,Z}}(\mathcal{O}_{X,Z}/(a)) - \text{length}_{\mathcal{O}_{X,Z}}(\mathcal{O}_{X,Z}/(b)).$$

Remarks 65.34.2. Here are some trivial remarks.

(1) On a Noetherian integral scheme X the sheaf $\mathcal{K}_X$ is constant with value the function field $K(X)$.
(2) To make sense out of the definitions above one needs to show that

$$\text{length}_{\mathcal{O}}(\mathcal{O}/(ab)) = \text{length}_{\mathcal{O}}(\mathcal{O}/(a)) + \text{length}_{\mathcal{O}}(\mathcal{O}/(b))$$

for any pair (a, b) of nonzero elements of a Noetherian 1-dimensional local domain $\mathcal{O}$. This will be done in the lectures.

Exercise 65.34.3. (On any scheme.) Describe how to assign a Cartier divisor to an effective Cartier divisor.

Exercise 65.34.4. (On an integral scheme.) Describe how to assign a Cartier divisor D to a rational function f such that the Weil divisor associated to D and to f agree. (This is silly.)

Exercise 65.34.5. Give an example of a Weil divisor on a variety which is not the Weil divisor associated to any Cartier divisor.

Exercise 65.34.6. Give an example of a Weil divisor D on a variety which is not the Weil divisor associated to any Cartier divisor but such that nD is the Weil divisor associated to a Cartier divisor for some $n > 1$.

Exercise 65.34.7. Give an example of a Weil divisor D on a variety which is not the Weil divisor associated to any Cartier divisor and such that nD is NOT the Weil divisor associated to a Cartier divisor for any $n > 1$. (Hint: Consider a cone, for example $X : xy - zw = 0$ in $\mathbf{A}_k^4$. Try to show that $D = [x = 0, z = 0]$ works.)

Exercise 65.34.8. On a separated scheme X of finite type over a field: Give an example of a Cartier divisor which is not the difference of two effective Cartier divisors. Hint: Find some X which does not have any nonempty effective Cartier Cartier divisors for example the scheme constructed in Harthorne, III Exercise 5.9. There is even an example with X a variety -- namely the variety of Exercise 65.34.9.

Exercise 65.34.9. Example of a nonprojective proper variety. Let k be a field. Let $L \subset \mathbf{P}^3_k$ be a line and let $C \subset \mathbf{P}^3_k$ be a nonsingular conic. Assume that $C \cap L = \emptyset$. Choose an isomorphism $\varphi : L \to C$. Let X be the k-variety obtained by glueing C to L via φ. In other words there is a surjective proper birational morphism

$$\pi : \mathbf{P}^3_k \longrightarrow X$$

and an open $U \subset X$ such that $\pi : \pi^{-1}(U) \to U$ is an isomorphism, $\pi^{-1}(U) = \mathbf{P}^3_k \setminus (L \cup C)$ and such that $\pi|_L = \pi|_C \circ \varphi$. (These conditions do not yet uniquely define X. In order to do this you need to specify the structure sheaf of X along points of $Z = X \setminus U$.) Show X exists, is a proper variety, but is not projective. (Hint: For existence use the result of Exercise 65.30.9. For non-projectivity use that $\text{Pic}(\mathbf{P}^3_k) = \mathbf{Z}$ to show that X cannot have an ample invertible sheaf.)

65.35. Differentials

Definitions and results. Kähler differentials.

(1) Let $R \to A$ be a ring map. The *module of Kähler differentials of A over R* is
$$\Omega_{A/R} = \bigoplus\nolimits_{a \in A} A \cdot da \Big/ \langle d(a_1a_2) - a_1da_2 - a_2da_1, dr\rangle.$$
The canonical universal R-derivation $d : A \to \Omega_{A/R}$ maps $a \mapsto da$.

(2) Consider the short exact sequence
$$0 \to I \to A \otimes_R A \to A \to 0$$
which defines the ideal I. There is a canonical derivation $d : A \to I/I^2$ which maps a to the class of $a \otimes 1 - 1 \otimes a$. This is another presentation of the module of derivations of A over R, in other words
$$(I/I^2, d) \cong (\Omega_{A/R}, d).$$

(3) For multiplicative subsets $S_R \subset R$ and $S_A \subset A$ such that S_R maps into S_A we have
$$\Omega_{S_A^{-1}A/S_R^{-1}R} = S_A^{-1}\Omega_{A/R}.$$

(4) If A is a finitely presented R-algebra then $\Omega_{A/R}$ is a finitely presented A-module. Hence in this case the *fitting* ideals of $\Omega_{A/R}$ are defined. (See exercise set 6 of last semester.)

(5) Let $f : X \to S$ be a morphism of schemes. There is a quasi-coherent sheaf of $\mathcal{O}_X$-modules $\Omega_{X/S}$ and a $\mathcal{O}_S$-linear derivation
$$d : \mathcal{O}_X \longrightarrow \Omega_{X/S}$$
such that for any affine opens $Spec(A) = U \subset X$, $Spec(R) = V \subset S$ with $f(U) \subset V$ we have
$$\Gamma(Spec(A), \Omega_{X/S}) = \Omega_{A/R}$$
compatibly with d.

Exercise 65.35.1. Let $k[\epsilon]$ be the ring of dual numbers over the field k, i.e., $\epsilon^2 = 0$.

(1) Consider the ring map
$$R = k[\epsilon] \to A = k[x, \epsilon]/(\epsilon x)$$
Show that the fitting ideals of $\Omega_{A/R}$ are (starting with the zeroth fitting ideal)
$$(\epsilon), A, A, \ldots$$

(2) Consider the map $R = k[t] \to A = k[x, y, t]/(x(y-t)(y-1), x(x-t))$. Show that the fitting ideals of of $\Omega_{A/R}$ in A are (assume characteristic k is zero for simplicity)

$$x(2x - t)(2y - t - 1)A,\ (x, y, t) \cap (x, y - 1, t),\ A,\ A, \ldots$$

So the 0-the fitting ideal is cut out by a single element of A, the 1st fitting ideal defines two closed points of $Spec(A)$, and the others are all trivial.

(3) Consider the map $R = k[t] \to A = k[x, y, t]/(xy-t^n)$. Compute the fitting ideals of $\Omega_{A/R}$.

Remark 65.35.2. The kth fitting ideal of $\Omega_{X/S}$ is commonly used to define the singular scheme of the morphism $X \to S$ when X has relative dimension k over S. But as part (a) shows, you have to be careful doing this when your family does not have ``constant'' fibre dimension, e.g., when it is not flat. As part (b) shows, flatness doesn't garantee it works either (and yes this is a flat family). In ``good cases'' -- such as in (c) -- for families of curves you expect the 0-th fitting ideal to be zero and the 1st fitting ideal to define (scheme-theoretically) the singular locus.

Exercise 65.35.3. Suppose that R is a ring and

$$A = k[x_1, \ldots , x_n]/(f_1, \ldots , f_n).$$

Note that we are assuming that A is presented by the same number of equations as variables. Thus the matrix of partial derivatives

$$(\partial f_i/\partial x_j)$$

is $n \times n$, i.e., a square matrix. Assume that its determinant is invertible as an element in A. Note that this is exactly the condition that says that $\Omega_{A/R} = (0)$ in this case of n-generators and n relations. Let $\pi : B' \to B$ be a surjection of R-algebras whose kernel J has square zero (as an ideal in B'). Let $\varphi : A \to B$ be a homomorphism of R-algebras. Show there exists a unique homomorphism of R-algebras $\varphi' : A \to B'$ such that $\varphi = \pi \circ \varphi'$.

Exercise 65.35.4. Find a generalization of the result of the previous exercise to the case where $A = R[x, y]/(f)$.

65.36. Schemes, Final Exam, Fall 2007

These were the questions in the final exam of a course on Schemes, in the Spring of 2007 at Columbia University.

Exercise 65.36.1. Definitions. Provide definitions of the following concepts.

(1) X is a *scheme*
(2) the morphism of schemes $f : X \to Y$ is *finite*
(3) the morphisms of schemes $f : X \to Y$ is *of finite type*
(4) the scheme X is *Noetherian*
(5) the $\mathcal{O}_X$-module $\mathcal{L}$ on the scheme X is *invertible*
(6) the *genus* of a nonsingular projective curve over an algebraically closed field

Exercise 65.36.2. Let $X = Spec(\mathbf{Z}[x, y])$, and let $\mathcal{F}$ be a quasi-coherent $\mathcal{O}_X$-module. Suppose that $\mathcal{F}$ is zero when restricted to the standard affine open $D(x)$.

(1) Show that every global section s of $\mathcal{F}$ is killed by some power of x, i.e., $x^n s = 0$ for some $n \in \mathbf{N}$.
(2) Do you think the same is true if we do not assume that $\mathcal{F}$ is quasi-coherent?

Exercise 65.36.3. Suppose that $X \to Spec(R)$ is a proper morphism and that R is a discrete valuation ring with residue field k. Suppose that $X \times_{Spec(R)} Spec(k)$ is the empty scheme. Show that X is the empty scheme.

Exercise 65.36.4. Consider the projective[1] variety

$$\mathbf{P}^1 \times \mathbf{P}^1 = \mathbf{P}^1_{\mathbf{C}} \times_{Spec(\mathbf{C})} \mathbf{P}^1_{\mathbf{C}}$$

over the field of complex numbers $\mathbf{C}$. It is covered by four affine pieces, corresponding to pairs of standard affine pieces of $\mathbf{P}^1_{\mathbf{C}}$. For example, suppose we use homogenous coordinates X_0, X_1 on the first factor and Y_0, Y_1 on the second. Set $x = X_1/X_0$, and $y = Y_1/Y_0$. Then the 4 affine open pieces are the spectra of the rings

$$\mathbf{C}[x, y], \quad \mathbf{C}[x^{-1}, y], \quad \mathbf{C}[x, y^{-1}], \quad \mathbf{C}[x^{-1}, y^{-1}].$$

Let $X \subset \mathbf{P}^1 \times \mathbf{P}^1$ be the closed subscheme which is the closure of the closed subset of the first affine piece given by the equation

$$y^3(x^4 + 1) = x^4 - 1.$$

(1) Show that X is contained in the union of the first and the last of the 4 affine open pieces.
(2) Show that X is a nonsingular projective curve.
(3) Consider the morphism $pr_2 : X \to \mathbf{P}^1$ (projection onto the first factor). On the first affine piece it is the map $(x, y) \mapsto x$. Briefly explain why it has degree 3.
(4) Compute the ramification points and ramification indices for the map $pr_2 : X \to \mathbf{P}^1$.
(5) Compute the genus of X.

Exercise 65.36.5. Let $X \to Spec(\mathbf{Z})$ be a morphism of finite type. Suppose that there is an infinite number of primes p such that $X \times_{Spec(\mathbf{Z})} Spec(\mathbf{F}_p)$ is not empty.

(1) Show that $X \times_{Spec(\mathbf{Z})} Spec(\mathbf{Q})$ is not empty.
(2) Do you think the same is true if we replace the condition ``finite type" by the condition ``locally of finite type"?

65.37. Schemes, Final Exam, Spring 2009

These were the questions in the final exam of a course on Schemes, in the Spring of 2009 at Columbia University.

Exercise 65.37.1. Let X be a Noetherian scheme. Let $\mathcal{F}$ be a coherent sheaf on X. Let $x \in X$ be a point. Assume that $\text{Supp}(\mathcal{F}) = \{x\}$.

(1) Show that x is a closed point of X.
(2) Show that $H^0(X, \mathcal{F})$ is not zero.
(3) Show that $\mathcal{F}$ is generated by global sections.
(4) Show that $H^p(X, \mathcal{F}) = 0$ for $p > 0$.

Remark 65.37.2. Let k be a field. Let $\mathbf{P}^2_k = \text{Proj}(k[X_0, X_1, X_2])$. Any invertible sheaf on $\mathbf{P}^2_k$ is isomorphic to $\mathcal{O}_{\mathbf{P}^2_k}(n)$ for some $n \in \mathbf{Z}$. Recall that

$$\Gamma(\mathbf{P}^2_k, \mathcal{O}_{\mathbf{P}^2_k}(n)) = k[X_0, X_1, X_2]_n$$

[1]The projective embedding is $((X_0, X_1), (Y_0, Y_1)) \mapsto (X_0Y_0, X_0Y_1, X_1Y_0, X_1Y_1)$ in other words $(x, y) \mapsto (1, y, x, xy)$.

is the degree n part of the polynomial ring. For a quasi-coherent sheaf $\mathcal{F}$ on $\mathbf{P}^2_k$ set $\mathcal{F}(n) = \mathcal{F} \otimes_{\mathcal{O}_{\mathbf{P}^2_k}} \mathcal{O}_{\mathbf{P}^2_k}(n)$ as usual.

Exercise 65.37.3. Let k be a field. Let $\mathcal{E}$ be a vector bundle on $\mathbf{P}^2_k$, i.e., a finite locally free $\mathcal{O}_{\mathbf{P}^2_k}$-module. We say $\mathcal{E}$ is *split* if $\mathcal{E}$ is isomorphic to a direct sum invertible $\mathcal{O}_{\mathbf{P}^2_k}$-modules.

(1) Show that $\mathcal{E}$ is split if and only if $\mathcal{E}(n)$ is split.
(2) Show that if $\mathcal{E}$ is split then $H^1(\mathbf{P}^2_k, \mathcal{E}(n)) = 0$ for all $n \in \mathbf{Z}$.
(3) Let
$$\varphi : \mathcal{O}_{\mathbf{P}^2_k} \longrightarrow \mathcal{O}_{\mathbf{P}^2_k}(1) \oplus \mathcal{O}_{\mathbf{P}^2_k}(1) \oplus \mathcal{O}_{\mathbf{P}^2_k}(1)$$
be given by linear forms $L_0, L_1, L_2 \in \Gamma(\mathbf{P}^2_k, \mathcal{O}_{\mathbf{P}^2_k}(1))$. Assume $L_i \neq 0$ for some i. What is the condition on L_0, L_1, L_2 such that the cokernel of φ is a vector bundle? Why?
(4) Given an example of such a φ.
(5) Show that $\text{Coker}(\varphi)$ is not split (if it is a vector bundle).

Remark 65.37.4. Freely use the following facts on dimension theory (and add more if you need more).

(1) The dimension of a scheme is the supremum of the length of chains of irreducible closed subsets.
(2) The dimension of a finite type scheme over a field is the maximum of the dimensions of its affine opens.
(3) The dimension of a Noetherian scheme is the maximum of the dimensions of its irreducible components.
(4) The dimension of an affine scheme coincides with the dimension of the corresponding ring.
(5) Let k be a field and let A be a finite type k-algebra. If A is a domain, and $x \neq 0$, then $\dim(A) = \dim(A/xA) + 1$.

Exercise 65.37.5. Let k be a field. Let X be a projective, reduced scheme over k. Let $f : X \to \mathbf{P}^1_k$ be a morphism of schemes over k. Assume there exists an integer $d \geq 0$ such that for every point $t \in \mathbf{P}^1_k$ the fibre $X_t = f^{-1}(t)$ is irreducible of dimension d. (Recall that an irreducible space is not empty.)

(1) Show that $\dim(X) = d + 1$.
(2) Let $X_0 \subset X$ be an irreducible component of X of dimension $d+1$. Prove that for every $t \in \mathbf{P}^1_k$ the fibre $X_{0,t}$ has dimension d.
(3) What can you conclude about X_t and $X_{0,t}$ from the above?
(4) Show that X is irreducible.

Remark 65.37.6. Given a projective scheme X over a field k and a coherent sheaf $\mathcal{F}$ on X we set
$$\chi(X, \mathcal{F}) = \sum\nolimits_{i \geq 0} (-1)^i \dim_k H^i(X, \mathcal{F}).$$

Exercise 65.37.7. Let k be a field. Write $\mathbf{P}^3_k = \text{Proj}(k[X_0, X_1, X_2, X_3])$. Let $C \subset \mathbf{P}^3_k$ be a *type* (5, 6) *complete intersection curve*. This means that there exist $F \in k[X_0, X_1, X_2, X_3]_5$ and $G \in k[X_0, X_1, X_2, X_3]_6$ such that
$$C = \text{Proj}(k[X_0, X_1, X_2, X_3]/(F, G))$$
is a variety of dimension 1. (Variety implies reduced and irreducible, but feel free to assume C is nonsingular if you like.) Let $i : C \to \mathbf{P}^3_k$ be the corresponding closed immersion. Being

a complete intersection also implies that

$$0 \longrightarrow \mathcal{O}_{\mathbf{P}^3_k}(-11) \xrightarrow{\begin{pmatrix} -G \\ F \end{pmatrix}} \mathcal{O}_{\mathbf{P}^3_k}(-5) \oplus \mathcal{O}_{\mathbf{P}^3_k}(-6) \xrightarrow{(F,G)} \mathcal{O}_{\mathbf{P}^3_k} \longrightarrow i_*\mathcal{O}_C \longrightarrow 0$$

is an exact sequence of sheaves. Please use these facts to:

(1) compute $\chi(C, i^*\mathcal{O}_{\mathbf{P}^3_k}(n))$ for any $n \in \mathbf{Z}$, and
(2) compute the dimension of $H^1(C, \mathcal{O}_C)$.

Exercise 65.37.8. Let k be a field. Consider the rings

$$A = k[x, y]/(xy)$$
$$B = k[u, v]/(uv)$$
$$C = k[t, t^{-1}] \times k[s, s^{-1}]$$

and the k-algebra maps

$$\begin{array}{llll} A \longrightarrow C, & x \mapsto (t, 0), & y \mapsto (0, s) \\ B \longrightarrow C, & u \mapsto (t^{-1}, 0), & v \mapsto (0, s^{-1}) \end{array}$$

It is a true fact that these maps induce isomorphisms $A_{x+y} \to C$ and $B_{u+v} \to C$. Hence the maps $A \to C$ and $B \to C$ identify $Spec(C)$ with open subsets of $Spec(A)$ and $Spec(B)$. Let X be the scheme obtained by glueing $Spec(A)$ and $Spec(B)$ along $Spec(C)$:

$$X = Spec(A) \coprod\nolimits_{Spec(C)} Spec(B).$$

As we saw in the course such a scheme exists and there are affine opens $Spec(A) \subset X$ and $Spec(B) \subset X$ whose overlap is exactly $Spec(C)$ identified with an open of each of these using the maps above.

(1) Why is X separated?
(2) Why is X of finite type over k?
(3) Compute $H^1(X, \mathcal{O}_X)$, or what is its dimension?
(4) What is a more geometric way to describe X?

65.38. Schemes, Final Exam, Fall 2010

These were the questions in the final exam of a course on Schemes, in the Fall of 2010 at Columbia University.

Exercise 65.38.1. Definitions. Provide definitions of the following concepts.

(1) a separated scheme,
(2) a quasi-compact morphism of schemes,
(3) an affine morphism of schemes,
(4) a multiplicative subset of a ring,
(5) a Noetherian scheme,
(6) a variety.

Exercise 65.38.2. Prime avoidance.

(1) Let A be a ring. Let $I \subset A$ be an ideal and let $\mathfrak{q}_1$, $\mathfrak{q}_2$ be prime ideals such that $I \not\subset \mathfrak{q}_i$. Show that $I \not\subset \mathfrak{q}_1 \cup \mathfrak{q}_2$.
(2) What is a geometric interpretation of (1)?
(3) Let $X = \text{Proj}(S)$ for some graded ring S. Let $x_1, x_2 \in X$. Show that there exists a standard open $D_+(F)$ which contains both x_1 and x_2.

Exercise 65.38.3. Why is a composition of affine morphisms affine?

Exercise 65.38.4. Examples. Give examples of the following:

(1) A reducible projective scheme over a field k.
(2) A scheme with 100 points.
(3) A non-affine morphism of schemes.

Exercise 65.38.5. Chevalley's theorem and the Hilbert Nullstellensatz.

(1) Let $\mathfrak{p} \subset \mathbf{Z}[x_1, \ldots , x_n]$ be a maximal ideal. What does Chevalley's theorem imply about $\mathfrak{p} \cap \mathbf{Z}$?
(2) In turn, what does the Hilbert Nullstellensatz imply about $\kappa(\mathfrak{p})$?

Exercise 65.38.6. Let A be a ring. Let $S = A[X]$ as a graded A-algebra where X has degree 1. Show that $\text{Proj}(S) \cong Spec(A)$ as schemes over A.

Exercise 65.38.7. Let $A \to B$ be a finite ring map. Show that $Spec(B)$ is a H-projective scheme over $Spec(A)$.

Exercise 65.38.8. Give an example of a scheme X over a field k such that X is irreducible and such that for some finite extension $k \subset k$ the base change $X_{k'} = X \times_{Spec(k)} Spec(k')$ is connected but reducible.

65.39. Schemes, Final Exam, Spring 2011

These were the questions in the final exam of a course on Schemes, in the Spring of 2011 at Columbia University.

Exercise 65.39.1. Definitions. Provide definitions of the italicized concepts.

(1) a *separated* scheme,
(2) a *universally closed* morphism of schemes,
(3) *A dominates B* for local rings A, B contained in a common field,
(4) the *dimension* of a scheme X,
(5) the *codimension* of an irreducible closed subscheme Y of a scheme X,

Exercise 65.39.2. Results. State something formally equivalent to the fact discussed in the course.

(1) The valuative criterion of properness for a morphism $X \to Y$ of varieties for example.
(2) The relationship between $\dim(X)$ and the function field $k(X)$ of X for a variety X over a field k.
(3) Fill in the blank: The category of nonsingular projective curves over k and non-constant morphisms is anti-equivalent to … … ….
(4) Noether normalization.
(5) Jacobian criterion.

Exercise 65.39.3. Let k be a field. Let $F \in k[X_0, X_1, X_2]$ be a homogeneous form of degree d. Assume that $C = V_+(F) \subset \mathbf{P}^2_k$ is a smooth curve over k. Denote $i : C \to \mathbf{P}^2_k$ the corresponding closed immersion.

(1) Show that there is a short exact sequence

$$0 \to \mathcal{O}_{\mathbf{P}^2_k}(-d) \to \mathcal{O}_{\mathbf{P}^2_k} \to i_*\mathcal{O}_C \to 0$$

of coherent sheaves on $\mathbf{P}^2_k$: tell me what the maps are and briefly why it is exact.

(2) Conclude that $H^0(C, \mathcal{O}_C) = k$.
(3) Compute the genus of C.
(4) Assume now that $P = (0 : 0 : 1)$ is not on C. Prove that $\pi : C \to \mathbf{P}^1_k$ given by $(a_0 : a_1 : a_2) \mapsto (a_0 : a_1)$ has degree d.
(5) Assume k is algebraically closed, assume all ramification indices (the ``e_i") are 1 or 2, and assume the characteristic of k is not equal to 2. How many ramification points does $\pi : C \to \mathbf{P}^1_k$ have?
(6) In terms of F, what do you think is a set of equations of the set of ramification points of π?
(7) Can you guess K_C?

Exercise 65.39.4. Let k be a field. Let X be a ``triangle" over k, i.e., you get X by glueing three copies of $\mathbf{A}^1_k$ to each other by identifying 0 on the first copy to 1 on the second copy, 0 on the second copy to 1 on the first copy, and 0 on the third copy to 1 on the first copy. It turns out that X is isomorphic to $Spec(k[x, y]/(xy(x+y+1)))$; feel free to use this. Compute the Picard group of X.

Exercise 65.39.5. Let k be a field. Let $\pi : X \to Y$ be a finite birational morphism of curves with X a projective nonsingular curve over k. It follows from the material in the course that Y is a proper curve and that π is the normalization morphism of Y. We have also seen in the course that there exists a dense open $V \subset Y$ such that $U = \pi^{-1}(V)$ is a dense open in X and $\pi : U \to V$ is an isomorphism.

(1) Show that there exists an effective Cartier divisor $D \subset X$ such that $D \subset U$ and such that $\mathcal{O}_X(D)$ is ample on X.
(2) Let D be as in (1). Show that $E = \pi(D)$ is an effective Cartier divisor on Y.
(3) Briefly indicate why
    (a) the map $\mathcal{O}_Y \to \pi_*\mathcal{O}_X$ has a coherent cokernel Q which is supported in $Y \setminus V$, and
    (b) for every n there is a corresponding map $\mathcal{O}_Y(nE) \to \pi_*\mathcal{O}_X(nD)$ whose cokernel is isomorphic to Q.
(4) Show that $\dim_k H^0(X, \mathcal{O}_X(nD)) - \dim_k H^0(Y, \mathcal{O}_Y(nE))$ is bounded (by what?) and conclude that the invertible sheaf $\mathcal{O}_Y(nE)$ has lots of sections for large n (why?).

65.40. Schemes, Final Exam, Fall 2011

These were the questions in the final exam of a course on Commutative Algebra, in the Fall of 2011 at Columbia University.

Exercise 65.40.1. Definitions. Provide definitions of the italicized concepts.

(1) a *Noetherian* ring,
(2) a *Noetherian* scheme,
(3) a *finite* ring homomorphism,
(4) a *finite* morphism of schemes,
(5) the *dimension* of a ring.

Exercise 65.40.2. Results. State something formally equivalent to the fact discussed in the course.

(1) Zariski's Main Theorem.
(2) Noether normalization.
(3) Chinese remainder theorem.
(4) Going up for finite ring maps.

Exercise 65.40.3. Let $(A, \mathfrak{m}, \kappa)$ be a Noetherian local ring whose residue field has characteristic not 2. Suppose that $\mathfrak{m}$ is generated by three elements x, y, z and that $x^2 + y^2 + z^2 = 0$ in A.

(1) What are the possible values of $\dim(A)$?
(2) Give an example to show that each value is possible.
(3) Show that A is a domain if $\dim(A) = 2$. (Hint: look at $\bigoplus_{n \geq 0} \mathfrak{m}^n/\mathfrak{m}^{n+1}$.)

Exercise 65.40.4. Let A be a ring. Let $S \subset T \subset A$ be multiplicative subsets. Assume that

$$\{\mathfrak{q} \mid \mathfrak{q} \cap S = \emptyset\} = \{\mathfrak{q} \mid \mathfrak{q} \cap T = \emptyset\}.$$

Show that $S^{-1}A \to T^{-1}A$ is an isomorphism.

Exercise 65.40.5. Let k be an algebraically closed field. Let

$$V_0 = \{A \in \text{Mat}(3 \times 3, k) \mid \text{rank}(A) = 1\} \subset \text{Mat}(3 \times 3, k) = k^9.$$

(1) Show that V_0 is the set of closed points of a (Zariski) locally closed subset $V \subset \mathbf{A}^9_k$.
(2) Is V irreducible?
(3) What is $\dim(V)$?

Exercise 65.40.6. Prove that the ideal (x^2, xy, y^2) in $\mathbf{C}[x, y]$ cannot be generated by 2 elements.

Exercise 65.40.7. Let $f \in \mathbf{C}[x, y]$ be a nonconstant polynomial. Show that for some $\alpha, \beta \in \mathbf{C}$ the $\mathbf{C}$-algebra map

$$\mathbf{C}[t] \longrightarrow \mathbf{C}[x, y]/(f), \quad t \longmapsto \alpha x + \beta y$$

is finite.

Exercise 65.40.8. Show that given finitely many points $p_1, \ldots, p_n \in \mathbf{C}^2$ the scheme $\mathbf{A}^2_{\mathbf{C}} \setminus \{p_1, \ldots, p_n\}$ is a union of two affine opens.

Exercise 65.40.9. Show that there exists a surjective morphism of schemes $\mathbf{A}^1_{\mathbf{C}} \to \mathbf{P}^1_{\mathbf{C}}$. (Surjective just means surjective on underlying sets of points.)

Exercise 65.40.10. Let k be an algebraically closed field. Let $A \subset B$ be an extension of domains which are both finite type k-algebras. Prove that the image of $\text{Spec}(B) \to \text{Spec}(A)$ contains a nonempty open subset of $\text{Spec}(A)$ using the following steps:

(1) Prove it if $A \to B$ is also finite.
(2) Prove it in case the fraction field of B is a finite extension of the fraction field of A.
(3) Reduce the statement to the previous case.

CHAPTER 66

A Guide to the Literature

66.1. Short introductory articles

- Barbara Fantechi: *Stacks for Everybody* [**Fan01**]
- Dan Edidin: *What is a stack?* [**Edi03**]
- Dan Edidin: *Notes on the construction of the moduli space of curves* [**Edi00**]
- Angelo Vistoli: *Intersection theory on algebraic stacks and on their moduli spaces*, and especially the appendix. [**Vis89**]

66.2. Classic references

- Mumford: *Picard groups of moduli problems* [**Mum65**]
  Mumford never uses the term ``stack'' here but the concept is implicit in the paper; he computes the picard group of the moduli stack of elliptic curves.
- Deligne, Mumford: *The irreducibility of the space of curves of given genus* [**DM69b**]
  This influential paper introduces ``algebraic stacks'' in the sense which are now universally called Deligne-Mumford stacks (stacks with representable diagonal which admit étale presentations by schemes). There are many foundational results *without proof*. The paper uses stacks to give two proofs of the irreducibility of the moduli space of curves of genus g.
- Artin: *Versal deformations and algebraic stacks* [**Art74b**]
  This paper introduces ``algebraic stacks'' which generalize Deligne-Mumford stacks and are now commonly referred to as *Artin stacks*, stacks with representable diagonal which admit smooth presentations by schemes. This paper gives deformation-theoretic criterion known as Artin's criterion which allows one to prove that a given moduli stack is an Artin stack without explicitly exhibiting a presentation.

66.3. Books and online notes

- Laumon, Moret-Bailly: *Champs Algébriques* [**LMB00b**]
  This book is currently the most exhaustive reference on stacks containing many foundational results. It assumes the reader is familiar with algebraic spaces and frequently references Knutson's book [**Knu71b**]. There is an error in chapter 12 concerning the functoriality of the lisse-étale site of an algebraic stack. One doesn't need to worry about this as the error has been patched by Martin Olsson (see [**Ols07b**]) and the results in the remaining chapters (after perhaps slight modification) are correct.
- The Stacks Project Authors: *Stacks Project* [**Aut**].
  You are reading it!
- Anton Geraschenko: *Lecture notes for Martin Olsson's class on stacks* [**Ols07a**]

This course systematically develops the theory of algebraic spaces before introducing algebraic stacks (first defined in Lecture 27!). In addition to basic properties, the course covers the equivalence between being Deligne-Mumford and having unramified diagonal, the lisse-étale site on an Artin stack, the theory of quasi-coherent sheaves, the Keel-Mori theorem, cohomological descent, and gerbes (and their relation to the Brauer group). There are also some exercises.

- Behrend, Conrad, Edidin, Fantechi, Fulton, Göttsche, and Kresch: *Algebraic stacks*, online notes for a book being currently written [**BCE$^+$**]
  The aim of this book is to give a friendly introduction to stacks without assuming a sophisticated background with a focus on examples and applications. Unlike [**LMB00b**], it is not assumed that the reader has digested the theory of algebraic spaces. Instead, Deligne-Mumford stacks are introduced with algebraic spaces being a special case with part of the goal being to develop enough theory to prove the assertions in [**DM69b**]. The general theory of Artin stacks is to be developed in the second part. Only a fraction of the book is now available on Kresch's website.

66.4. Related references on foundations of stacks

- Vistoli: *Notes on Grothendieck topologies, fibered categories and descent theory* [**Vis05**]
  Contains useful facts on fibered categories, stacks and descent theory in the fpqc topology as well as rigorous proofs.
- Knutson: *Algebraic Spaces* [**Knu71b**]
  This book, which evolved from his PhD thesis under Michael Artin, contains the foundations of the theory of algebraic spaces. The book [**LMB00b**] frequently references this text. See also Artin's papers on algebraic spaces: [**Art69b**], [**Art69d**], [**Art69f**], [**Art70b**], [**Art71d**], [**Art71b**], [**Art73b**], and [**Art74b**]
- Grothendieck et al, *Théorie des Topos et Cohomologie Étale des Schémas I, II, III* also known as SGA4 [**MA71**]
  Volume 1 contains many general facts on universes, sites and fibered categories. The word ``champ'' (French for ``stack'') appears in Deligne's Exposé XVIII.
- Jean Giraud: *Cohomologie non abélienne* [**Gir65**]
  The book discusses fibered categories, stacks, torsors and gerbes over general sites but does not discuss algebraic stacks. For instance, if G is a sheaf of abelian groups on X, then in the same way $H^1(X, G)$ can be identified with G-torsors, $H^2(X, G)$ can be identified with an appropriately defined set of G-gerbes. When G is not abelian, then $H^2(X, G)$ is defined as the set of G-gerbes.
- Kelly and Street: *Review of the elements of 2-categories* [**KS74**]
  The category of stacks form a 2-category although a simple type of 2-category where are 2-morphisms are invertible. This is a reference on general 2-categories. I have never used this so I cannot say how useful it is. Also note that [**Aut**] contains some basics on 2-categories.

66.5. Papers in the literature

Below is a list of research papers which contain fundamental results on stacks and algebraic spaces. The intention of the summaries is to indicate only the results of the paper which contribute toward stack theory; in many cases these results are subsidiary to the main goals of the paper. We divide the papers into categories with some papers falling into multiple categories.

66.5.1. Deformation theory and algebraic stacks. The first three papers by Artin do not contain anything on stacks but they contain powerful results with the first two papers being essential for [**Art74b**].

- Artin: *Algebraic approximation of structures over complete local rings* [**Art69b**]
  It is proved that under mild hypotheses any effective formal deformation can be approximated: if $F : (Sch/S) \to (Sets)$ is a contravariant functor locally of finite presentation with S finite type over a field or excellent DVR, $s \in S$, and $\hat{\xi} \in F(\hat{\mathcal{O}}_{S,s})$ is an effective formal deformation, then for any $n > 0$, there exists an residually trivial étale neighborhood $(S', s') \to (S, s)$ and $\xi' \in F(S')$ such that ξ' and $\hat{\xi}$ agree up to order n (ie. have the same restriction in $F(\mathcal{O}_{S,s}/\mathfrak{m}^n)$).
- Artin: *Algebraization of formal moduli I* [**Art69d**]
  It is proved that under mild hypotheses any effective formal versal deformation is algebraizable. Let $F : (Sch/S) \to (Sets)$ be a contravariant functor locally of finite presentation with S finite type over a field or excellent DVR, $s \in S$ be a locally closed point , $\hat{A}$ be a complete noetherian local $\mathcal{O}_S$-algebra with residue field k' a finite extension of $k(s)$, and $\hat{\xi} \in F(\hat{A})$ be an effective formal versal deformation of an element $\xi_0 \in F(k')$. Then there is a scheme X finite type over S and a closed point $x \in X$ with residue field $k(x) = k'$ and an element $\xi \in F(X)$ such that there is an isomorphism $\hat{\mathcal{O}}_{X,x} \cong \hat{A}$ identifying the restrictions of ξ and $\hat{\xi}$ in each $F(\hat{A}/\mathfrak{m}^n)$. The algebraization is unique if $\hat{\xi}$ is a universal deformation. Applications are given to the representability of the Hilbert and Picard schemes.
- Artin: *Algebraization of formal moduli. II* [**Art70b**]
  Vaguely, it is shown that if one can contract a closed subset $Y' \subseteq X'$ formally locally around Y', then exists a global morphism $X' \to X$ contracting Y with X an algebraic space.
- Artin: *Versal deformations and algebraic stacks* [**Art74b**]
  This momentous paper builds on his work in [**Art69b**] and [**Art69d**]. This paper introduces Artin's criterion which allows one to prove algebraicity of a stack by verifying deformation-theoretic properties. More precisely (but not very precisely), Artin constructs a presentation of a limit preserving stack $\mathcal{X}$ locally around a point $x \in \mathcal{X}(k)$ as follows: assuming the stack $\mathcal{X}$ satisfies Schlessinger's criterion([**Sch68**]), there exists a formal versal deformation $\hat{\xi} \in lim\, \mathcal{X}(\hat{A}/\mathfrak{m}^n)$ of x. Assuming that formal deformations are effective (i.e., $\mathcal{X}(\hat{A}) \to lim\, \mathcal{X}(\hat{A}/\mathfrak{m}^n)$ is bijective), then one obtains an effective formal versal deformation $\xi \in \mathcal{X}(\hat{A})$. Using results in [**Art69d**], one produces a finite type scheme U and an element $\xi_U : U \to \mathcal{X}$ which is formally versal at a point $u \in U$ over x. Then if we assume $\mathcal{X}$ admits a deformation and obstruction theory satisfying certain conditions (ie. compatibility with étale localization and completion as well as constructibility condition), then it is shown in section 4 that formal versality is an open condition so that after shrinking U, $U \to \mathcal{X}$ is smooth. Artin also presents a proof that any stack admitting an fppf presentation by a scheme admits a smooth presentation by a scheme so that in particular one can form quotient stacks by flat, separated, finitely presented group schemes.
- Conrad, de Jong: *Approximation of Versal Deformations* [**CdJ02b**]

This paper offers an approach to Artin's algebraization result by applying Popescu's powerful result: if A is a noetherian ring and B a noetherian A-algebra, then the map $A \to B$ is a regular morphism if and only if B is a direct limit of smooth A-algebras. It is not hard to see that Popescu's result implies Artin's approximation over an arbitrary excellent scheme (the excellence hypothesis implies that for a local ring A, the map $A^{\mathrm{h}} \to \hat{A}$ from the henselization to the completion is regular). The paper uses Popescu's result to give a ``groupoid'' generalization of the main theorem in [**Art69d**] which is valid over arbitrary excellent base schemes and for arbitrary points $s \in S$. In particular, the results in [**Art74b**] hold under an arbitrary excellent base. They discuss the étale-local uniqueness of the algebraization and whether the automorphism group of the object acts naturally on the henselization of the algebraization.

- Jason Starr: *Artin's axioms, composition, and moduli spaces* [**Sta06**]
  The paper establishes that Artin's axioms for algebraization are compatible with the composition of 1-morphisms.
- Martin Olsson: *Deformation theory of representable morphism of algebraic stacks* [**Ols06a**]
  This generalizes standard deformation theory results for morphisms of schemes to representable morphisms of algebraic stacks in terms of the cotangent complex. These results cannot be viewed as consequences of Illusie's general theory as the cotangent complex of a representable morphism $X \to \mathcal{X}$ is not defined in terms of cotangent complex of a morphism of ringed topoi (because the lisse-étale site is not functorial).

66.5.2. Coarse moduli spaces.

- Keel, Mori: *Quotients in Groupoids* [**KM97b**]
  It had apparently long been ``folklore'' that separated Deligne-Mumford stacks admitted coarse moduli spaces. A rigorous (although terse) proof of the following theorem is presented here: if $\mathcal{X}$ is an Artin stack locally of finite type over a noetherian base scheme such that the inertia stack $I_{\mathcal{X}} \to \mathcal{X}$ is finite, then there exists a coarse moduli space $\phi : \mathcal{X} \to Y$ with ϕ separated and Y an algebraic space locally of finite type over S. The hypothesis that the inertia is finite is precisely the right condition: there exists a coarse moduli space $\phi : \mathcal{X} \to Y$ with ϕ separated if and only if the inertia is finite.
- Conrad: *The Keel-Mori Theorem via Stacks* [**Con05**]
  Keel and Mori's paper [**KM97b**] is written in the groupoid language and some find it challenging to grasp. Brian Conrad presents a stack-theoretic version of the proof which is quite transparent although it uses the sophisticated language of stacks. Conrad also removes the noetherian hypothesis.
- Rydh: *Existence of quotients by finite groups and coarse moduli spaces* [**Ryd07a**]
  Rydh removes the hypothesis from [**KM97b**] and [**Con05**] that $\mathcal{X}$ be finitely presented over some base.
- Abramovich, Olsson, Vistoli: *Tame stacks in positive characteristic* [**AOV08**]
  They define a *tame Artin stack* as an Artin stack with finite inertia such that if $\phi : \mathcal{X} \to Y$ is the coarse moduli space, ϕ_* is exact on quasi-coherent sheaves. They prove that for an Artin stack with finite inertia, the following are equivalent: $\mathcal{X}$ is tame $\iff$ the stabilizers of $\mathcal{X}$ are linearly reductive $\iff$ $\mathcal{X}$ is étale locally on the coarse moduli space a quotient of an affine scheme by a linearly reductive group scheme. For a tame Artin stack, the coarse moduli space is particularly

nice. For instance, the coarse moduli space commutes with arbitrary base change while a general coarse moduli space for an Artin stack with finite inertia will only commute with flat base change.

- Alper: *Good moduli spaces for Artin stacks* [**Alp08**]
  For general Artin stacks with infinite affine stabilizer groups (which are necessarily non-separated), coarse moduli spaces often do not exist. The simplest example is $[\mathbf{A}^1/\mathbf{G}_m]$. It is defined here that a quasi-compact morphism $\phi : \mathcal{X} \to Y$ is a *good moduli space* if $\mathcal{O}_Y \to \phi_*\mathcal{O}_\mathcal{X}$ is an isomorphism and ϕ_* is exact on quasi-coherent sheaves. This notion generalizes a tame Artin stack in [**AOV08**] as well as encapsulates Mumford's geometric invariant theory: if G is a reductive group acting linearly on $X \subseteq \mathbf{P}^n$, then the morphism from the quotient stack of the semi-stable locus to the GIT quotient $[X^{ss}/G] \to X//G$ is a good moduli space. The notion of a good moduli space has many nice geometric properties: (1) ϕ is surjective, universally closed, and universally submersive, (2) ϕ identifies points in Y with points in $\mathcal{X}$ up to closure equivalence, (3) ϕ is universal for maps to algebraic spaces, (4) good moduli spaces are stable under arbitrary base change, and (5) a vector bundle on an Artin stack descends to the good moduli space if and only if the representations are trivial at closed points.

66.5.3. Intersection theory.

- Vistoli: *Intersection theory on algebraic stacks and on their moduli spaces* [**Vis89**]
  This paper develops the foundations for intersection theory with rational coefficients for Deligne-Mumford stacks. If $\mathcal{X}$ is a separated Deligne-Mumford stack, the chow group $A_*(\mathcal{X})$ with rational coefficients is defined as the free abelian group of integral closed substacks of dimension k up to rational equivalence. There is a flat pullback, a proper push-forward and a generalized Gysin homomorphism for regular local embeddings. If $\phi : \mathcal{X} \to Y$ is a moduli space (ie. a proper morphism with is bijective on geometric points), there is an induced push-forward $A_*(\mathcal{X}) \to A_k(Y)$ which is an isomorphism.
- Edidin, Graham: *Equivariant Intersection Theory* [**EG98**]
  The purpose of this article is to develop intersection theory with integral coefficients for a quotient stack $[X/G]$ of an action of an algebraic group G on an algebraic space X or, in other words, to develop a G-equivariant intersection theory of X. Equivariant chow groups defined using only invariant cycles does not produce a theory with nice properties. Instead, generalizing Totaro's definition in the case of BG and motivated by the fact that if $V \to X$ is a vector bundle then $A_i(X) \cong A_i(V)$ naturally, the authors define $A_i^G(X)$ as follows: Let $\dim(X) = n$ and $\dim(G) = g$. For each i, choose a l-dimensional G-representation V where G acts freely on an open subset $U \subseteq V$ whose complement as codimension $d > n - i$. So $X_G = [X \times U/G]$ is an algebraic space (it can even be chosen to be a scheme). Then they define $A_i^G(X) = A_{i+l-g}(X_G)$. For the quotient stack, one defines $A_i([X/G]) := A_{i+g}^G(X) = A_{i+l}(X_G)$. In particular, $A_i([X/G]) = 0$ for $i > \dim[X/G] = n - g$ but can be non-zero for $i << 0$ (eg. $A_i(B\mathbf{G}_m) = \mathbf{Z}$ for $i \leq 0$). They establish that these equivariant Chow groups enjoy the same functorial properties as ordinary Chow groups. Furthermore, they establish that if $[X/G] \cong [Y/H]$ that $A_i([X/G]) = A_i([Y/H])$ so that the definition is independent on how the stack is presented as a quotient stack.
- Kresch: *Cycle Groups for Artin Stacks* [**Kre99**]

Kresch defines Chow groups for arbitrary Artin stacks agreeing with Edidin and Graham's definition in [**EG98**] in the case of quotient stack. For algebraic stacks with affine stabilizer groups, the theory satisfies the usual properties.

- Behrend and Fantechi: *The intrinsic normal cone* [**BF97**]
  Generalizing a construction due to Li and Tian, Behrend and Fantechi construct a virtual fundamental class for a Deligne-Mumford stack.

66.5.4. Quotient stacks. Quotient stacks[1] form a very important subclass of Artin stacks which include almost all moduli stacks studied by algebraic geometers. The geometry of a quotient stack $[X/G]$ is the G-equivariant geometry of X. It is often easier to show properties are true for quotient stacks and some results are only known to be true for quotient stacks. The following papers address: When is an algebraic stack a global quotient stack? Is an algebraic stack ``locally'' a quotient stack?

- Laumon, Moret-Bailly: [**LMB00b**, Chapter 6]
  Chapter 6 contains several facts about the local and global structure of algebraic stacks. It is proved that an algebraic stack $\mathcal{X}$ over S is a quotient stack $[Y/G]$ with Y an algebraic space (resp. scheme, resp. affine scheme) and G a finite group if and only if there exists an algebraic space (resp. scheme, resp. affine scheme) Y' and an finite étale morphism $Y' \to \mathcal{X}$. It is shown that any Deligne-Mumford stack over S and $x : Spec(K) \to \mathcal{X}$ admits an representable, étale and separated morphism $\phi : [X/G] \to \mathcal{X}$ where G is a finite group acting on an affine scheme over S such that $Spec(K) = [X/G] \times_{\mathcal{X}} Spec(K)$. The existence of presentations with geometrically connected fibers is also discussed in detail.
- Edidin, Hassett, Kresch, Vistoli: *Brauer Groups and Quotient stacks* [**EHKV01**]
  First, they establish some fundamental (although not very difficult) facts concerning when a given algebraic stack (always assumed finite type over a noetherian scheme in this paper) is a quotient stack. For an algebraic stack $\mathcal{X}$: $\mathcal{X}$ is a quotient stack $\iff$ there exists a vector bundle $V \to \mathcal{X}$ such that for every geometric point, the stabilizer acts faithfully on the fiber $\iff$ there exists a vector bundle $V \to \mathcal{X}$ and a locally closed substack $V^0 \subseteq V$ such that V^0 is representable and surjects onto F. They establish that an algebraic stack is a quotient stack if there exists finite flat cover by an algebraic space. Any smooth Deligne-Mumford stack with generically trivial stabilizer is a quotient stack. They show that a $\mathbf{G}_m$-gerbe over a noetherian scheme X corresponding to $\beta \in H^2(X, \mathbf{G}_m)$ is a quotient stack if and only if β is in the image of the Brauer map $\mathrm{Br}(X) \to \mathrm{Br}'(X)$. They use this to produce a non-separated Deligne-Mumford stack that is not a quotient stack.
- Totaro: *The resolution property for schemes and stacks* [**Tot04**]
  A stack has the resolution property if every coherent sheaf is the quotient of a vector bundle. The first main theorem is that if $\mathcal{X}$ is a normal noetherian algebraic stack with affine stabilizer groups at closed points, then the following are equivalent: (1) $\mathcal{X}$ has the resolution property and (2) $\mathcal{X} = [Y/\mathrm{GL}_n]$ with Y quasi-affine. In the case $\mathcal{X}$ is finite type over a field, then (1) and (2) are equivalent to: (3) $\mathcal{X} = [Spec(A)/G]$ with G an affine group scheme finite type over k. The implication that quotient stacks have the resolution property was proven by Thomason. The second main theorem is that if $\mathcal{X}$ is a smooth Deligne-Mumford stack over a

[1] In the literature, *quotient stack* often means a stack of the form $[X/G]$ with X an algebraic space and G a subgroup scheme of GL_n rather than an arbitrary flat group scheme.

field which has a finite and generically trivial stabilizer group $I_{\mathcal{X}} \to \mathcal{X}$ and whose coarse moduli space is a scheme with affine diagonal, then $\mathcal{X}$ has the resolution property. Another cool result states that if $\mathcal{X}$ is a noetherian algebraic stack satisfying the resolution property, then $\mathcal{X}$ has affine diagonal if and only if the closed points have affine stabilizer.

- Kresch: *On the Geometry of Deligne-Mumford Stacks* [**Kre09**]
  This article summarizes general structure results of Deligne-Mumford stacks (of finite type over a field) and contains some interesting results concerning quotient stacks. It is shown that any smooth, separated, generically tame Deligne-Mumford stack with quasi-projective coarse moduli space is a quotient stack $[Y/G]$ with Y quasi-projective and G an algebraic group. If $\mathcal{X}$ is a Deligne-Mumford stack whose coarse moduli space is a scheme, then $\mathcal{X}$ is Zariski-locally a quotient stack if and only if it admits a Zariski-open covering by stack quotients of schemes by finite groups. If $\mathcal{X}$ is a Deligne-Mumford stack proper over a field of characteristic 0 with coarse moduli space Y, then: Y is projective and $\mathcal{X}$ is a quotient stack $\iff$ Y is projective and $\mathcal{X}$ possesses a generating sheaf $\iff$ $\mathcal{X}$ admits a closed embedding into a smooth proper DM stack with projective coarse moduli space. This motivates a definition that a Deligne-Mumford stack is *projective* if there exists a closed embedding into a smooth, proper Deligne-Mumford stack with projective coarse moduli space.
- Kresch, Vistoli *On coverings of Deligne-Mumford stacks and surjectivity of the Brauer map* [**KV04**]
  It is shown that in characteristic 0 and for a fixed n, the following two statements are equivalent: (1) every smooth Deligne-Mumford stack of dimension n is a quotient stack and (2) the Azumaya Brauer group coincides with the cohomological Brauer group for smooth schemes of dimension n.
- Kresch: *Cycle Groups for Artin Stacks* [**Kre99**]
  It is shown that a reduced Artin stack finite type over a field with affine stabilizer groups admits a stratification by quotient stacks.
- Abramovich-Vistoli: *Compactifying the space of stable maps* [**AV02**]
  Lemma 2.2.3 establishes that for any separated Deligne-Mumford stack is étale-locally on the coarse moduli space a quotient stack $[U/G]$ where U affine and G a finite group. [**Ols06b**, Theorem 2.12] shows in this argument G is even the stabilizer group.
- Abramovich, Olsson, Vistoli: *Tame stacks in positive characteristic* [**AOV08**]
  This paper shows that a tame Artin stack is étale locally on the coarse moduli space a quotient stack of an affine by the stabilizer group.
- Alper: *On the local quotient structure of Artin stacks* [**Alp09**]
  It is conjectured that for an Artin stack $\mathcal{X}$ and a closed point $x \in \mathcal{X}$ with linearly reductive stabilizer, then there is an étale morphism $[V/G_x] \to \mathcal{X}$ with V an algebraic space. Some evidence for this conjecture is given. A simple deformation theory argument (based on ideas in [**AOV08**]) shows that it is true formally locally. A stack-theoretic proof of Luna's étale slice theorem is presented proving that for stacks $\mathcal{X} = [Spec(A)/G]$ with G linearly reductive, then étale locally on the GIT quotient $Spec(A^G)$, $\mathcal{X}$ is a quotient stack by the stabilizer.

66.5.5. Cohomology.

- Olsson: *Sheaves on Artin stacks* [**Ols07b**]

This paper develops the theory of quasi-coherent and constructible sheaves proving basic cohomological properties. This paper corrects a mistake in [**LMB00b**] in the functorirality of the lisse-étale site. The cotangent complex is constructed. In addition, the following theorems are proved: Grothendieck's Fundamental Theorem for proper morphisms, Grothendieck's Existence Theorem, Zariski's Connectness Theorem and finiteness theorem for proper pushoforwards of coherent and constructible sheaves.

- Behrend: *Derived l-adic categories for algebraic stacks* [**Beh03**]
  Proves the Lefschetz trace formula for algebraic stacks.
- Behrend: *Cohomology of stacks* [**Beh04**]
  Defines the de Rham cohomology for differentiable stacks and singular cohomology for topological stacks.
- Faltings: *Finiteness of coherent cohomology for proper fppf stacks* [**Fal03**]
  Proves coherence for direct images of coherent sheaves for proper morphisms.
- Abramovich, Corti, Vistoli: *Twisted bundles and admissible covers* [**ACV03**]
  The appendix contains the proper base change theorem for étale cohomology for tame Deligne-Mumford stacks.

66.5.6. Existence of finite covers by schemes. The existence of finite covers of Deligne-Mumford stacks by schemes is an important result. In intersection theory on Deligne-Mumford stacks, it is an essential ingredient in defining proper push-forward for non-representable morphisms. There are several results about $\overline{\mathscr{M}}_g$ relying on the existence of a finite cover by a *smooth* scheme which was proven by Looijenga. Perhaps the first result in this direction is [**Ses72**, Theorem 6.1] which treats the equivariant setting.

- Vistoli: *Intersection theory on algebraic stacks and on their moduli spaces* [**Vis89**]
  If $\mathcal{X}$ is a Deligne-Mumford stack with a moduli space (ie. a proper morphism which is bijective on geometric points), then there exists a finite morphism $X \to \mathcal{X}$ from a scheme X.
- Laumon, Moret-Bailly: [**LMB00b**, Chapter 16]
  As an application of Zariski's main theorem, Theorem 16.6 establishes: if $\mathcal{X}$ is a Deligne-Mumford stack finite type over a noetherian scheme, then there exists a finite, surjective, generically étale morphism $Z \to \mathcal{X}$ with Z a scheme. It is also shown in Corollary 16.6.2 that any noetherian normal algebraic space is isomorphic to the algebraic space quotient X'/G for a finite group G acting a normal scheme X.
- Edidin, Hassett, Kresch, Vistoli: *Brauer Groups and Quotient stacks* [**EHKV01**]
  Theorem 2.7 states: if $\mathcal{X}$ is an algebraic stack of finite type over a noetherian ground scheme S, then the diagonal $\mathcal{X} \to \mathcal{X} \times_S \mathcal{X}$ is quasi-finite if and only if there exists a finite surjective morphism $X \to F$ from a scheme X.
- Kresch, Vistoli: *On coverings of Deligne-Mumford stacks and surjectivity of the Brauer map* [**KV04**]
  It is proved here that any smooth, separated Deligne-Mumford stack finite type over a field with quasi-projective coarse moduli space admits a finite, flat cover by a smooth quasi-projective scheme.
- Olsson: *On proper coverings of Artin stacks* [**Ols05**]
  Proves that if $\mathcal{X}$ is an Artin stack separated and finite type over S, then there exists a proper surjective morphism $X \to \mathcal{X}$ from a scheme X quasi-projective over S.

As an application, Olsson proves coherence and constructibility of direct image sheaves under proper morphisms. As an application, he proves Grothendieck's existence theorem for proper Artin stacks.

66.5.7. Rigidification. Rigidification is a process for removing a flat subgroup from the inertia. For example, if X is a projective variety, the morphism from the Picard stack to the Picard scheme is a rigidification of the group of automorphism $\mathbf{G}_m$.

- Abramovich, Corti, Vistoli: *Twisted bundles and admissible covers* [**ACV03**]
  Let $\mathcal{X}$ be an algebraic stack over S and H be a flat, finitely presented separated group scheme over S. Assume that for every object $\xi \in \mathcal{X}(T)$ there is an embedding $H(S) \hookrightarrow \mathrm{Aut}_{\mathcal{X}(T)}(\xi)$ which is compatible under pullbacks in the sense that for every arrow $\phi : \xi \to \xi'$ over $f : T \to T'$ and $g \in H(T)$, $g \circ \phi = \phi \circ f^* g$. Then there exists an algebraic stack $\mathcal{X}/H$ and a morphism $\rho : \mathcal{X} \to \mathcal{X}/H$ which is an fppf gerbe such that for every $\xi \in \mathcal{X}(T)$, the morphism $\mathrm{Aut}_{\mathcal{X}(T)}(\xi) \to \mathrm{Aut}_{\mathcal{X}/H(T)}(\xi)$ is surjective with kernel $H(T)$.
- Romagny: *Group actions on stacks and applications* [**Rom05**]
  Discusses how group actions behave with respect to rigidifications.
- Abramovich, Graber, Visolit: *Gromov-Witten theory for Deligne-Mumford stacks* [**AGV08**]
  The appendix gives a summary of rigidification as in [**ACV03**] with two alternative interpretations. This paper also contains constructions for gluing algebraic stacks along closed substacks and for taking roots of line bundles.
- Abramovich, Olsson, Vistoli: *Tame stacks in positive characteristic* ([**AOV08**])
  The appendix handles the more complicated situation where the flat subgroup stack of the inertia $H \subseteq I_{\mathcal{X}}$ is normal but not necessarily central.

66.5.8. Stacky curves.

- Abramovich, Vistoli: *Compactifying the space of stable maps* [**AV02**]
  This paper introduces *twisted curves*. If one defines the moduli space of stable maps into a stacks using stable curves, the result is not compact. By using maps from twisted curves, the authors define a proper moduli stack.
- Behrend, Noohi: *Uniformization of Deligne-Mumford curves* [**BN06**]
  Proves a uniformization theorem of Deligne-Mumford analytic curves.

66.5.9. Hilbert, Quot, Hom and branchvariety stacks.

- Vistoli: *The Hilbert stack and the theory of moduli of families* [**Vis91**]
  If $\mathcal{X}$ is a algebraic stack separated and locally of finite type over a locally noetherian and locally separated algebraic space S, Vistoli defines the Hilbert stack $\mathscr{H}\mathrm{ilb}(\mathscr{F}/S)$ parameterizing finite and unramifed morphisms from proper schemes. It is claimed without proof that $\mathscr{H}\mathrm{ilb}(\mathscr{F}/S)$ is an algebraic stack. As a consequence, it is proved that with $\mathcal{X}$ as above, the Hom stack $\mathscr{H}\mathrm{om}_S(T, \mathcal{X})$ is an algebraic stack if T is proper and flat over S.
- Olsson, Starr: *Quot functors for Deligne-Mumford stacks* [**OS03b**]
  If $\mathcal{X}$ is a Deligne-Mumford stack separated and locally of finite presentation over an algebraic space S and $\mathscr{F}$ is a locally finitely-presented $\mathcal{O}_{\mathcal{X}}$-module, the quot functor $\mathrm{Quot}(\mathscr{F}/\mathcal{X}/S)$ is represented by an algebraic space separated and locally of finite presentation over S. This paper also defines generating sheaves and proves existence of a generating sheaf for tame, separated Deligne-Mumford stacks which are global quotient stacks of a scheme by a finite group.

- Olsson: *Hom-stacks and Restrictions of Scalars* [**Ols06b**]
  Suppose $\mathcal{X}$ and $\mathcal{Y}$ are Artin stacks locally of finite presentation over an algebraic space S with finite diagonal with $\mathcal{X}$ proper and flat over S such that fppf-locally on S, $\mathcal{X}$ admits a finite finitely presented flat cover by an algebraic space (eg. $\mathcal{X}$ is Deligne-Mumford or a tame Artin stack). Then $Hom_S(\mathcal{X}, \mathcal{Y})$ is an Artin stack locally of finite presentation over S.
- Alexeev and Knutson: *Complete moduli spaces of branchvarieties* ([**AK06**])
  They define a branchvariety of $\mathbf{P}^n$ as a finite morphism $X \to \mathbf{P}^n$ from a *reduced* scheme X. They prove that the moduli stack of branchvarieties with fixed Hilbert polynomial and total degrees of i-dimensional components is a proper Artin stack with finite stabilizer. They compare the stack of branchvarieties with the Hilbert scheme, Chow scheme and moduli space of stable maps.
- Lieblich: *Remarks on the stack of coherent algebras* [**Lie06**]
  This paper constructs a generalization of Alexeev and Knutson's stack of branchvarieties over a scheme Y by building the stack as a stack of algebras over the structure sheaf of Y. Existence proofs of Quot and *Hom* spaces are given.
- Starr: *Artin's axioms, composition, and moduli spaces* [**Sta06**]
  As an application of the main result, a common generalization of Vistoli's Hilbert stack [**Vis91**] and Alexeev and Knutson's stack of branchvarieties [**AK06**] is provided. If $\mathcal{X}$ is an algebraic stack locally of finite type over an an excellent scheme S with finite diagonal, then the stack $\mathcal{H}$ parameterizing morphisms $g : T \to \mathcal{X}$ from a proper algebraic space T with a G-ample line bundle L is an Artin stack locally of finite type over S.
- Lundkvist and Skjelnes: *Non-effective deformations of Grothendieck's Hilbert functor* [**LS08**]
  Shows that the Hilbert functor of a non-separated scheme is not represented since there are non-effective deformations.

66.5.10. Toric stacks. Toric stacks provide a great class of examples and a natural testing ground for conjectures due to the dictionary between the geometry of a toric stack and the combinatorics of its stacky fan in a similar way that toric varieties provide examples and counterexamples in scheme theory.

- Borisov, Chen and Smith: *The orbifold Chow ring of toric Deligne-Mumford stacks* [**BCS05**]
  Inspired by Cox's construction for toric varieties, this paper defines smooth toric DM stacks as explicit quotient stacks associated to a combinatorial object called a *stacky fan*.
- Iwanari: *The category of toric stacks* [**Iwa09**]
  This paper defines a *toric triple* as a smooth Deligne-Mumford stack $\mathcal{X}$ with an open immersion $\mathbf{G}_m \hookrightarrow \mathcal{X}$ with dense image (and therefore $\mathcal{X}$ is an orbifold) and an action $\mathcal{X} \times \mathbf{G}_m \to \mathcal{X}$. It is shown that there is an equivalence between the 2-category of toric triples and the 1-category of stacky fans. The relationship between toric triples and the definition of smooth toric DM stacks in [**BCS05**] is discussed.
- Iwanari: *Integral Chow rings for toric stacks* [**Iwa07**]
  Generalizes Cox's Δ-collections for toric varieties to toric orbifolds.
- Perroni: *A note on toric Deligne-Mumford stacks* [**Per08**]
  Generalizes Cox's Δ-collections and Iwanari's paper [**Iwa07**] to general smooth toric DM stacks.

- Fantechi, Mann, and Nironi: *Smooth toric DM stacks* [**BF07**]
  This paper defines a smooth toric DM stack as a smooth DM stack $\mathcal{X}$ with the action of a DM torus $\mathcal{T}$ (ie. a Picard stack isomorphic to $T \times BG$ with G finite) having an open dense orbit isomorphic to $\mathcal{T}$. They give a ``bottom-up description" and prove an equivalence between smooth toric DM stacks and stacky fans.

66.5.11. Theorem on formal functions and Grothendieck's Existence Theorem. These papers give generalizations of the theorem on formal functions [**DG67**, III.4.1.5] (sometimes referred to Grothendieck's Fundamental Theorem for proper morphisms) and Grothendieck's Existence Theorem [**DG67**, III.5.1.4].

- Knutson: *Algebraic spaces* [**Knu71b**, Chapter V]
  Generalizes these theorems to algebraic spaces.
- Abramovich-Vistoli: *Compactifying the space of stable maps* [**AV02**, A.1.1]
  Generalizes these theorems to tame Deligne-Mumford stacks
- Olsson and Starr: *Quot functors for Deligne-Mumford stacks* [**OS03b**]
  Generalizes these theorems to separated Deligne-Mumford stacks.
- Olsson: *On proper coverings of Artin stacks* [**Ols05**]
  Provides a generalization to proper Artin stacks.
- Conrad: *Formal GAGA on Artin stacks* [**Con**]
  Provides a generalization to proper Artin stacks and proves a formal GAGA theorem.
- Olsson: *Sheaves on Artin stacks* [**Ols07b**]
  Provides another proof for the generalization to proper Artin stacks.

66.5.12. Group actions on stacks. Actions of groups on algebraic stacks naturally appear. For instance, symmetric group S_n acts on $\overline{\mathcal{M}}_{g,n}$ and for an action of a group G on a scheme X, the normalizer of G in $\text{Aut}(X)$ acts on $[X/G]$. Furthermore, torus actions on stacks often appear in Gromov-Witten theory.

- Romagny: *Group actions on stacks and applications* [**Rom05**]
  This paper makes precise what it means for a group to act on an algebraic stack and proves existence of fixed points as well as existence of quotients for actions of group schemes on algebraic stacks. See also Romagny's earlier note [**Rom03**].

66.5.13. Taking roots of line bundles. This useful construction was discovered independently by Cadman and by Abramovich, Graber and Vistoli. Given a scheme X with an effective Cartier divisor D, the rth root stack is an Artin stack branched over X at D with a μ_r stabilizer over D and scheme-like away from D.

- Charles Cadman *Using Stacks to Impose Tangency Conditions on Curves* [**Cad07**]
- Abramovich, Graber, Vistoli: *Gromov-Witten theory for Deligne-Mumford stacks* [**AGV08**]

66.5.14. Other papers.

- Lieblich: *Moduli of twisted sheaves* [**Lie07**]
  This paper contains a summary of gerbes and twisted sheaves. If $\mathcal{X} \to X$ is a μ_n-gerbe with X a projective relative surface with smooth connected geometric fibers, it is shown that the stack of semistable $\mathcal{X}$-twisted sheaves is an Artin stack locally of finite presentation over S. This paper also develops the theory of associated points and purity of sheaves on Artin stacks.
- Lieblich, Osserman: *Functorial reconstruction theorem for stacks* [**LO08**]

Proves some surprising and interesting results on when an algebraic stack can be reconstructed from its associated functor.

- David Rydh: *Noetherian approximation of algebraic spaces and stacks* [**Ryd08**]
  This paper shows that every quasi-compact algebraic stack with quasi-finite diagonal can be approximated by a noetherian stack. There are applications to removing the noetherian hypothesis in results of Chevalley, Serre, Zariski and Chow.

66.6. Stacks in other fields

- Behrend and Noohi: *Uniformization of Deligne-Mumford curves* [**BN06**]
  Gives an overview and comparison of topological, analytic and algebraic stacks.
- Behrang Noohi: *Foundations of topological stacks I* [**Noo05**]

CHAPTER 67

Desirables

67.1. Introduction

This is basically just a list of things that we want to put in the stacks project. As we add material to the project continuously this is always somewhat behind the current state of the project.

67.2. Conventions

We should have a chapter with a short list of conventions used in the document. This chapter already exists, see Conventions, Section 2.1, but a lot more could be added there. Especially useful would be to find ``hidden'' conventions and tacit assumptions and put those there.

67.3. Sites and Topoi

We have a chapter on sites and sheaves, see Sites, Section 9.1. We have a chapter on ringed sites (and topoi) and modules on them, see Modules on Sites, Section 16.1. We have a chapter on cohomology in this setting, see Cohomology on Sites, Section 19.1. But a lot more could be added, especially in the chapter on cohomology.

67.4. Stacks

We have a chapter on (abstract) stacks, see Stacks, Section 50.1. It would be nice if

(1) improve the discussion on ``stackyfication'',
(2) give examples of stackyfication,
(3) more examples in general,
(4) a discussion of gerbes is missing sofar.

Example result: Given a sheaf of abelian groups $\mathcal{F}$ over $\mathcal{C}$ the set of equivalence classes of gerbes with ``group'' $\mathcal{F}$ is bijective to $H^2(\mathcal{C}, \mathcal{F})$.

67.5. Simplicial methods

We have a chapter on simplicial methods, see Simplicial, Section 14.1. This has to be reviewed and improved. Moreover, there should be a chapter on ``simplicial algebraic geometry'', where we discuss simplicial schemes, and how to think of their geometry, cohomology, etc. Then this should be tied into the chapter on hypercoverings to ``explain'' the results of this chapter in the new language.

67.6. Cohomology of schemes

There is already a chapter on cohomology of quasi-coherent sheaves, see Coherent, Section 25.1. What is missing are chapters on étale cohomology and flat cohomology of schemes, the relation with Galois cohomology etc.

67.7. Deformation theory a la Schlessinger

What is needed is a discussion of Schlessinger's paper first and foremost. It would be nice to discuss this a tiny bit more generally than in Schlessinger's paper, but it is easy to fix this up later also. For example we could discuss what happens if you have automorphisms (e.g., functor in groupoids). After all this is usually why you have hulls and not actual prorepresentability.

67.8. Definition of algebraic stacks

An algebraic stack is a stack that has a diagonal representable by algebraic spaces, that is the target of a surjective smooth morphism from a scheme.

The notion ``Deligne-Mumford stack'' will be reserved for a stack as in [**DM69a**]. We will reserve the term ``Artin stack'' for a stack such as in the papers by Artin [**Art69c**], and [**Art74a**]. (See also [**CdJ02a**].) In other words, and Artin stack will be an algebraic stack with some reasonable finiteness and separatedness conditions.

67.9. Examples of schemes, algebraic spaces, algebraic stacks

It really is not that hard to show that $\mathcal{M}_g$ is an algebraic stack for $g \geq 2$. We should have $[X/G]$ here. We should really have a long list of moduli problems here and prove they are all algebraic stacks. (Some of them we can postpone the proof until after Artin approximation.) For example the Kontsevich moduli space in characteristic $p > 0$.

Here are some items for the list of moduli problems mentioned above.

(1) $\mathcal{M}_g$, i.e., moduli of smooth projective curves of genus g,
(2) $\overline{\mathcal{M}}_g$, i.e., moduli of stable genus g curves,
(3) $\mathcal{A}_g$, i.e., principally polarised abelian schemes of genus g,
(4) $\mathcal{M}_{1,1}$, i.e., 1-pointed smooth projective genus 1 curves,
(5) $\mathcal{M}_{g,n}$, i.e., smooth projective genus g-curves with n pairwise distinct labeled points,
(6) $\overline{\mathcal{M}}_{g,n}$, i.e., stable n-pointed nodal projective genus g-curves,
(7) $\mathcal{H}om_S(\mathcal{X}, \mathcal{Y})$, moduli of morphisms (with suitable conditions on the stacks $\mathcal{X}$, $\mathcal{Y}$ and the base scheme S),
(8) $Bun_G(X) = \mathcal{H}om_S(X, BG)$, the stack of G-bundles of the geometric Langlands programme (with suitable conditions on the scheme X, the group scheme G, and the base scheme S),
(9) $Pic_{\mathcal{X}/S}$, i.e., the Picard stack associated to an algebraic stack over a base scheme (or space).

How about the algebraic space you get from the deformation theory of a general surface in $\mathbf{P}^3$ with a node? (I mean where you deform it to a general smooth surface in $\mathbf{P}^3$.)

Perhaps we can talk about some small dimensional examples here too. For example the stack where you have $\mathbf{A}^1$ with a $B(\mathbf{Z}/2)$ sitting at 0. Bugeyed covers. You name it.

67.10. Properties of algebraic stacks

Such as the various ways of defining what a proper algebraic stack is. Of course these things are really properties of morphisms of stacks.

We can define singularities (up to smooth factors) etc. Prove that a connected normal stack is irreducible, etc.

67.11. Lisse étale site of an algebraic stack

This has to be explained and introduced. Explain it is not functorial with respect to 1-morphisms of algebraic stacks. Define étale cohomology of an algebraic stack with coefficients in a sheaf on the lisse-étale site. Prove a Leray spectral sequence exists (always?). Explain about cohomology of quasi-coherent sheaves.

67.12. Things you always wanted to know but were afraid to ask

There are going to be lots of lemmas that you use over and over again that are useful but aren't really mentioned specifically in the literature, or it isn't easy to find references for. Bag of tricks.

Example: Given two groupoids in schemes $R \Rightarrow U$ and $R' \Rightarrow U'$ what does it mean to have a 1-morphism $[U/R] \to [U'/R']$ purely in terms of groupoids in schemes. (This is bad because surely this is in the lit somewhere.) More anybody?

67.13. Quasi-coherent sheaves on stacks

Define them and explain how you get them. You can define them as living on the lisse-étale site or on all of the stack and show the two notions are equivalent. Cohomology of quasi-coherent sheaves.

67.14. Flat and smooth

Artin's theorem that having a flat surjection from a scheme is a replacement for the smooth surjective condition.

67.15. Artin's representability theorem

Title is clear enough. Perhaps we can reformulate the condition of having a deformation theory a little to adapt it more to the examples we know about, especially those where there is a perfect obstruction theory (discussions with Jason)?

67.16. DM stacks are finitely covered by schemes

This all begins with Gabber's lemma I think. Somewhere in Asterisque about Faltings proof of Mordell?

67.17. Martin Olson's paper on properness

This proves two notions of proper are the same. We can also discuss Faltings result that it suffices to use DVR's in certain cases.

67.18. Proper pushforward of coherent sheaves

No comments yet.

67.19. Keel and Mori

See [**KM97a**]. The steps in this article also give a good way of looking at what an algebraic stack locally looks like.

CHAPTER 68

Coding Style

68.1. List of style comments

These will be changed over time, but having some here now will hopefully encourage a consistent LaTeX style. We will call ``code[1]'' the contents of the source files.

(1) Keep all lines in all tex files to at most 80 characters.
(2) Do not use indentation in the tex file. Use syntax highlighting in your editor, instead of indentation, to visualize environments, etc.
(3) Use

```
\medskip\noindent
```

to start a new paragraph, and use

```
\noindent
```

to start a new paragraph just after an environment.
(4) Do not break the code for mathematical formulas across lines if possible. If the complete code complete with enclosing dollar signs does not fit on the line, then start with the first dollar sign on the first character of the next line. If it still does not fit, find a mathematically reasonable spot to break the code.
(5) Displayed math equations should be coded as follows

```
$$
...
...
$$
```

In other words, start with a double dollar sign on a line by itself and end similarly.
(6) *Do not use any macros*. Rationale: This makes it easier to read the tex file, and start editing an arbitrary part without having to learn inumerable macros. And it doesn't make it harder or more timeconsuming to write. Of course the disadvantage is that the same mathematical object may be TeXed differently in different places in the text, but this should be easy to spot.
(7) The theorem environments we use are: ``theorem'', ``proposition'', ``lemma'' (plain), ``definition'', ``example'', ``exercise'', ``situation'' (definition), ``remark'', ``remarks'' (remark). Of course there is also a ``proof'' environment.
(8) An environment ``foo'' should be coded as follows

```
\begin{foo}
...
...
\end{foo}
```

similarly to the way displayed equations are coded.

[1] It is all Knuth's fault. See [**Knu79**].

(9) Instead of a ``corollary", just use ``lemma" environment since likely the result will be used to prove the next bigger theorem anyway.
(10) Directly following each lemma, proposition, or theorem is the proof of said lemma, proposition, or theorem. No nested proofs please.
(11) The files preamble.tex, chapters.tex and fdl.tex are special tex files. Apart from these, each tex file has the following structure

```
\input{preamble}
\begin{document}
\title{Title}
\maketitle
\tableofcontents
...
...
\input{chapters}
\bibliography{my}
\bibliographystyle{amsalpha}
\end{document}
```

(12) Try to add labels to lemmas, propositions, theorems, and even remarks, exercise, and other environments. If labelling a lemma use something like

```
\begin{lemma}
\label{lemma-bar}
...
\end{lemma}
```

Similarly for all other environments. In other words, the label of a environment named ``foo" starts with ``foo-". In addition to this please make all labels consist only of lower case letters, digits, and the symbol ``-".
(13) Never refer to ``the lemma above" (or proposition, etc). Instead use:

```
Lemma \ref{lemma-bar} above
```

This means that later moving lemmas around is basically harmless.
(14) Cross-file referencing. To reference a lemma labeled ``lemma-bar" in the file foo.tex which has title ``Foo", please use the following code

```
Foo, Lemma \ref{foo-lemma-bar}
```

If this does not work, then take a look at the file preamble.tex to find the correct expression to use. This will produce the ``Foo, Lemma <link>" in the output file so it will be clear that the link points out of the file.
(15) If at all possible avoid forward references in proof environments. (It should be possible to write an automated test for this.)
(16) Do not start any sentence with a mathematical symbol.
(17) Do not have a sentence of the type ``This follows from the following" just before a lemma, proposition, or theorem. Every sentence ends with a period.
(18) State all hypotheses in each lemma, proposition, theorem. This makes it easier for readers to see if a given lemma, proposition, or theorem applies to their particular problem.
(19) Keep proofs short; less than 1 page in pdf or dvi. You can always achieve this by splitting out the proof in lemmas etc.
(20) In a defining property foobar use

```
{\it foobar}
```

in the code inside the definition evironment. Similarly if the definition occurs in the text of the document. This will make it easier for the reader to see what it is that is being defined.

(21) Put any definition that will be used outside the section it is in, in its own definition evironment. Temporary definitions may be made in the text. A tricky case is that of mathematical constructions (which are often definitions involving interrelated lemmas). Maybe a good solution is to have them in their own short section so users can refer to the section instead of a definition.

(22) Do not number equations unless they are actually being referenced somewhere in the text. We can always add labels later.

(23) In statements of lemmas, propositions and theorems and in proofs keep the sentences short. For example, instead of ``Let $R$ be a ring and let $M$ be an $R$-module." write ``Let R be a ring. Let M be an R-module.". Rationale: This makes it easier to parse the trickier parts of proofs and statements.

(24) Use the

```
\section
```

command to make sections, but try to avoid using subsections and subsubsections.

(25) Avoid using complicated latex constructions.

CHAPTER 69

Obsolete

69.1. Introduction

In this chapter we put some lemmas that have become ``obsolete'' (see [**Mil17**]).

69.2. Lemmas related to ZMT

The lemmas in this section were originally used in the proof of the (algebraic version of) Zariski's Main Theorem, Algebra, Theorem 7.114.13.

Lemma 69.2.1. *Let $\varphi : R \to S$ be a ring map. Suppose $t \in S$ satisfies the relation $\varphi(a_0) + \varphi(a_1)t + \ldots + \varphi(a_n)t^n = 0$. Set $u_n = \varphi(a_n)$, $u_{n-1} = u_n t + \varphi(a_{n-1})$, and so on till $u_1 = u_2 t + \varphi(a_1)$. Then all of $u_n, u_{n-1}, \ldots, u_1$ and $u_n t, u_{n-1} t, \ldots, u_1 t$ are integral over R, and the ideals $(\varphi(a_0), \ldots, \varphi(a_n))$ and $(u_n, \ldots, u_1)$ of S are equal.*

Proof. We prove this by induction on n. As $u_n = \varphi(a_n)$ we conclude from Algebra, Lemma 7.114.1 that $u_n t$ is integral over R. Of course $u_n = \varphi(a_n)$ is integral over R. Then $u_{n-1} = u_n t + \varphi(a_{n-1})$ is integral over R (see Algebra, Lemma 7.32.7) and we have

$$\varphi(a_0) + \varphi(a_1)t + \ldots + \varphi(a_{n-1})t^{n-1} + u_{n-1}t^{n-1} = 0.$$

Hence by the induction hypothesis applied to the map $S' \to S$ where S' is the integral closure of R in S and the displayed equation we see that $u_{n-1}, \ldots, u_1$ and $u_{n-1}t, \ldots, u_1 t$ are all in S' too. The statement on the ideals is immediate from the shape of the elements and the fact that $u_1 t + \varphi(a_0) = 0$. ☐

Lemma 69.2.2. *Let $\varphi : R \to S$ be a ring map. Suppose $t \in S$ satisfies the relation $\varphi(a_0) + \varphi(a_1)t + \ldots + \varphi(a_n)t^n = 0$. Let $J \subset S$ be an ideal such that for at least one i we have $\varphi(a_i) \notin J$. Then there exists a $u \in S$, $u \notin J$ such that both u and ut are integral over R.*

Proof. This is immediate from Lemma 69.2.1 since one of the elements u_i will not be in J. ☐

The following two lemmas are a way of describing closed subschemes of $\mathbf{P}^1_R$ cut out by one (nondegenerate) equation.

Lemma 69.2.3. *Let R be a ring. Let $F(X, Y) \in R[X, Y]$ be homogenous of degree d. Assume that for every prime $\mathfrak{p}$ of R at least one coefficient of F is not in $\mathfrak{p}$. Let $S = R[X, Y]/(F)$ as a graded ring. Then for all $n \geq d$ the R-module S_n is finite locally free of rank d.*

Proof. The R-module S_n has a presentation

$$R[X, Y]_{n-d} \to R[X, Y]_n \to S_n \to 0.$$

Thus by Algebra, Lemma 7.73.3 it is enough to show that multiplication by F induces an injective map $\kappa(\mathfrak{p})[X, Y] \to \kappa(\mathfrak{p})[X, Y]$ for all primes $\mathfrak{p}$. This is clear from the assumption that F does not map to the zero polynomial mod $\mathfrak{p}$. The assertion on ranks is clear from this as well. $\square$

Lemma 69.2.4. *Let k be a field. Let $F, G \in k[X, Y]$ be homogeneous of degrees d, e. Assume F, G relatively prime. Then multiplication by G is injective on $S = k[X, Y]/(F)$.*

Proof. This is one way to define ``relatively prime''. If you have another definition, then you can show it is equivalent to this one. $\square$

Lemma 69.2.5. *Let R be a ring. Let $F(X, Y) \in R[X, Y]$ be homogenous of degree d. Let $S = R[X, Y]/(F)$ as a graded ring. Let $\mathfrak{p} \subset R$ be a prime such that some coefficient of F is not in $\mathfrak{p}$. There exists an $f \in R$ $f \notin \mathfrak{p}$, an integer e, and a $G \in R[X, Y]_e$ such that multiplication by G induces isomorphisms $(S_n)_f \to (S_{n+e})_f$ for all $n \geq d$.*

Proof. During the course of the proof we may replace R by R_f for $f \in R$, $f \notin \mathfrak{p}$ (finitely often). As a first step we do such a replacement such that some coefficient of F is invertible in R. In particular the modules S_n are now locally free of rank d for $n \geq d$ by Lemma 69.2.3. Pick any $G \in R[X, Y]_e$ such that the image of G in $\kappa(\mathfrak{p})[X, Y]$ is relatively prime to the image of $F(X, Y)$ (this is possible for some e). Apply Algebra, Lemma 7.73.3 to the map induced by multiplication by G from $S_d \to S_{d+e}$. By our choice of G and Lemma 69.2.4 we see $S_d \otimes \kappa(\mathfrak{p}) \to S_{d+e} \otimes \kappa(\mathfrak{p})$ is bijective. Thus, after replacing R by R_f for a suitable f we may assume that $G : S_d \to S_{d+e}$ is bijective. This in turn implies that the image of G in $\kappa(\mathfrak{p}')[X, Y]$ is relatively prime to the image of F for all primes $\mathfrak{p}'$ of R. And then by Algebra, Lemma 7.73.3 again we see that all the maps $G : S_d \to S_{d+e}$, $n \geq d$ are isomorphisms. $\square$

Remark 69.2.6. Let R be a ring. Suppose that we have $F \in R[X, Y]_d$ and $G \in R[X, Y]_e$ such that, setting $S = R[X, Y]/(F)$ we have (1) S_n is finite locally free of rank d for all $n \geq d$, and (2) multiplication by G defines ismorphisms $S_n \to S_{n+e}$ for all $n \geq d$. In this case we may define a finite, locally free R-algebra A as follows:

(1) as an R-module $A = S_{ed}$, and
(2) multiplication $A \times A \to A$ is given by the rule that $H_1 H_2 = H_3$ if and only if $G^d H_3 = H_1 H_2$ in S_{2ed}.

This makes sense because multiplication by G^d induces a bijective map $S_{de} \to S_{2de}$. It is easy to see that this defines a ring structure. Note the confusing fact that the element G^d defines the unit element of the ring A.

Lemma 69.2.7. *Let R be a ring, let $f \in R$. Suppose we have S, S' and the solid arrows forming the following commutative diagram of rings*

$$\begin{tikzcd}
 & S'' \arrow[rd, dashed] \arrow[dd, dashed] & \\
R \arrow[ru, dashed] \arrow[rr] \arrow[d] & & S \arrow[d] \\
R_f \arrow[r] & S' \arrow[r] & S_f
\end{tikzcd}$$

Assume that $R_f \to S'$ is finite. Then we can find a finite ring map $R \to S''$ and dotted arrows as in the diagram such that $S' = (S'')_f$.

Proof. Namely, suppose that S' is generated by x_i over R_f, $i = 1, \ldots, w$. Let $P_i(t) \in R_f[t]$ be a monic polynomial such that $P_i(x_i) = 0$. Say P_i has degree $d_i > 0$. Write $P_i(t) = t^{d_i} + \sum_{j<d_i}(a_{ij}/f^n)t^j$ for some uniform n. Also write the image of x_i in S_f as g_i/f^n for suitable $g_i \in S$. Then we know that the element $\xi_i = f^{nd_i}g_i^{d_i} + \sum_{j<d_i} f^{n(d_i-j)}a_{ij}g_i^j$ of S is killed by a power of f. Hence upon increasing n to n', which replaces g_i by $f^{n'-n}g_i$ we may assume $\xi_i = 0$. Then S' is generated by the elements $f^n x_i$, each of which is a zero of the monic polynomial $Q_i(t) = t^{d_i} + \sum_{j<d_i} f^{n(d_i-j)}a_{ij}t^j$ with coefficients in R. Also, by construction $Q_i(f^n g_i) = 0$ in S. Thus we get a finite R-algebra $S'' = R[z_1, \ldots, z_w]/(Q_1(z_1), \ldots, Q_w(z_w))$ which fits into a commutative diagram as above. The map $\alpha : S'' \to S$ maps z_i to $f^n g_i$ and the map $\beta : S'' \to S'$ maps z_i to $f^n x_i$. It may not yet be the case that β induces an isomorphism $(S'')_f \cong S'$. For the moment we only know that this map is surjective. The problem is that there could be elements $h/f^n \in (S'')_f$ which map to zero in S' but are not zero. In this case $\beta(h)$ is an element of S such that $f^N\beta(h) = 0$ for some N. Thus $f^N h$ is an element ot the ideal $J = \{h \in S'' \mid \alpha(h) = 0 \text{ and } \beta(h) = 0\}$ of S''. OK, and it is easy to see that S''/J does the job. $\square$

69.3. Formally smooth ring maps

Lemma 69.3.1. *Let R be a ring. Let S be a R-algebra. If S is of finite presentation and formally smooth over R then S is smooth over R.*

Proof. See Algebra, Proposition 7.127.13. $\square$

CHAPTER 70

GNU Free Documentation License

Preamble

The purpose of this License is to make a manual, textbook, or other functional and useful document "free" in the sense of freedom: to assure everyone the effective freedom to copy and redistribute it, with or without modifying it, either commercially or noncommercially. Secondarily, this License preserves for the author and publisher a way to get credit for their work, while not being considered responsible for modifications made by others.

This License is a kind of "copyleft", which means that derivative works of the document must themselves be free in the same sense. It complements the GNU General Public License, which is a copyleft license designed for free software.

We have designed this License in order to use it for manuals for free software, because free software needs free documentation: a free program should come with manuals providing the same freedoms that the software does. But this License is not limited to software manuals; it can be used for any textual work, regardless of subject matter or whether it is published as a printed book. We recommend this License principally for works whose purpose is instruction or reference.

70.1. APPLICABILITY AND DEFINITIONS

This License applies to any manual or other work, in any medium, that contains a notice placed by the copyright holder saying it can be distributed under the terms of this License. Such a notice grants a world-wide, royalty-free license, unlimited in duration, to use that work under the conditions stated herein. The **"Document"**, below, refers to any such manual or work. Any member of the public is a licensee, and is addressed as **"you"**. You accept the license if you copy, modify or distribute the work in a way requiring permission under copyright law.

A **"Modified Version"** of the Document means any work containing the Document or a portion of it, either copied verbatim, or with modifications and/or translated into another language.

A **"Secondary Section"** is a named appendix or a front-matter section of the Document that deals exclusively with the relationship of the publishers or authors of the Document to the Document's overall subject (or to related matters) and contains nothing that could fall directly within that overall subject. (Thus, if the Document is in part a textbook of mathematics, a Secondary Section may not explain any mathematics.) The relationship could be a matter of historical connection with the subject or with related matters, or of legal, commercial, philosophical, ethical or political position regarding them.

The **"Invariant Sections"** are certain Secondary Sections whose titles are designated, as being those of Invariant Sections, in the notice that says that the Document is released under this License. If a section does not fit the above definition of Secondary then it is not allowed to be designated as Invariant. The Document may contain zero Invariant Sections. If the Document does not identify any Invariant Sections then there are none.

The **"Cover Texts"** are certain short passages of text that are listed, as Front-Cover Texts or Back-Cover Texts, in the notice that says that the Document is released under this License. A Front-Cover Text may be at most 5 words, and a Back-Cover Text may be at most 25 words.

A **"Transparent"** copy of the Document means a machine-readable copy, represented in a format whose specification is available to the general public, that is suitable for revising the document straightforwardly with generic text editors or (for images composed of pixels) generic paint programs or (for drawings) some widely available drawing editor, and that is suitable for input to text formatters or for automatic translation to a variety of formats suitable for input to text formatters. A copy made in an otherwise Transparent file format whose markup, or absence of markup, has been arranged to thwart or discourage subsequent modification by readers is not Transparent. An image format is not Transparent if used for any substantial amount of text. A copy that is not "Transparent" is called **"Opaque"**.

Examples of suitable formats for Transparent copies include plain ASCII without markup, Texinfo input format, LaTeX input format, SGML or XML using a publicly available DTD, and standard-conforming simple HTML, PostScript or PDF designed for human modification. Examples of transparent image formats include PNG, XCF and JPG. Opaque formats include proprietary formats that can be read and edited only by proprietary word processors, SGML or XML for which the DTD and/or processing tools are not generally available, and the machine-generated HTML, PostScript or PDF produced by some word processors for output purposes only.

The **"Title Page"** means, for a printed book, the title page itself, plus such following pages as are needed to hold, legibly, the material this License requires to appear in the title page. For works in formats which do not have any title page as such, "Title Page" means the text near the most prominent appearance of the work's title, preceding the beginning of the body of the text.

A section **"Entitled XYZ"** means a named subunit of the Document whose title either is precisely XYZ or contains XYZ in parentheses following text that translates XYZ in another language. (Here XYZ stands for a specific section name mentioned below, such as **"Acknowledgements"**, **"Dedications"**, **"Endorsements"**, or **"History"**.) To **"Preserve the Title"** of such a section when you modify the Document means that it remains a section "Entitled XYZ" according to this definition.

The Document may include Warranty Disclaimers next to the notice which states that this License applies to the Document. These Warranty Disclaimers are considered to be included by reference in this License, but only as regards disclaiming warranties: any other implication that these Warranty Disclaimers may have is void and has no effect on the meaning of this License.

70.2. VERBATIM COPYING

You may copy and distribute the Document in any medium, either commercially or noncommercially, provided that this License, the copyright notices, and the license notice saying this License applies to the Document are reproduced in all copies, and that you add no other conditions whatsoever to those of this License. You may not use technical measures to obstruct or control the reading or further copying of the copies you make or distribute. However, you may accept compensation in exchange for copies. If you distribute a large enough number of copies you must also follow the conditions in section 3.

You may also lend copies, under the same conditions stated above, and you may publicly display copies.

70.3. COPYING IN QUANTITY

If you publish printed copies (or copies in media that commonly have printed covers) of the Document, numbering more than 100, and the Document's license notice requires Cover Texts, you must enclose the copies in covers that carry, clearly and legibly, all these Cover Texts: Front-Cover Texts on the front cover, and Back-Cover Texts on the back cover. Both covers must also clearly and legibly identify you as the publisher of these copies. The front cover must present the full title with all words of the title equally prominent and visible. You may add other material on the covers in addition. Copying with changes limited to the covers, as long as they preserve the title of the Document and satisfy these conditions, can be treated as verbatim copying in other respects.

If the required texts for either cover are too voluminous to fit legibly, you should put the first ones listed (as many as fit reasonably) on the actual cover, and continue the rest onto adjacent pages.

If you publish or distribute Opaque copies of the Document numbering more than 100, you must either include a machine-readable Transparent copy along with each Opaque copy, or state in or with each Opaque copy a computer-network location from which the general network-using public has access to download using public-standard network protocols a complete Transparent copy of the Document, free of added material. If you use the latter option, you must take reasonably prudent steps, when you begin distribution of Opaque copies in quantity, to ensure that this Transparent copy will remain thus accessible at the stated location until at least one year after the last time you distribute an Opaque copy (directly or through your agents or retailers) of that edition to the public.

It is requested, but not required, that you contact the authors of the Document well before redistributing any large number of copies, to give them a chance to provide you with an updated version of the Document.

70.4. MODIFICATIONS

You may copy and distribute a Modified Version of the Document under the conditions of sections 2 and 3 above, provided that you release the Modified Version under precisely this License, with the Modified Version filling the role of the Document, thus licensing distribution and modification of the Modified Version to whoever possesses a copy of it. In addition, you must do these things in the Modified Version:

A. Use in the Title Page (and on the covers, if any) a title distinct from that of the Document, and from those of previous versions (which should, if there were any, be listed in the History section of the Document). You may use the same title as a previous version if the original publisher of that version gives permission.
B. List on the Title Page, as authors, one or more persons or entities responsible for authorship of the modifications in the Modified Version, together with at least five of the principal authors of the Document (all of its principal authors, if it has fewer than five), unless they release you from this requirement.

C. State on the Title page the name of the publisher of the Modified Version, as the publisher.
D. Preserve all the copyright notices of the Document.
E. Add an appropriate copyright notice for your modifications adjacent to the other copyright notices.
F. Include, immediately after the copyright notices, a license notice giving the public permission to use the Modified Version under the terms of this License, in the form shown in the Addendum below.
G. Preserve in that license notice the full lists of Invariant Sections and required Cover Texts given in the Document's license notice.
H. Include an unaltered copy of this License.
I. Preserve the section Entitled "History", Preserve its Title, and add to it an item stating at least the title, year, new authors, and publisher of the Modified Version as given on the Title Page. If there is no section Entitled "History" in the Document, create one stating the title, year, authors, and publisher of the Document as given on its Title Page, then add an item describing the Modified Version as stated in the previous sentence.
J. Preserve the network location, if any, given in the Document for public access to a Transparent copy of the Document, and likewise the network locations given in the Document for previous versions it was based on. These may be placed in the "History" section. You may omit a network location for a work that was published at least four years before the Document itself, or if the original publisher of the version it refers to gives permission.
K. For any section Entitled "Acknowledgements" or "Dedications", Preserve the Title of the section, and preserve in the section all the substance and tone of each of the contributor acknowledgements and/or dedications given therein.
L. Preserve all the Invariant Sections of the Document, unaltered in their text and in their titles. Section numbers or the equivalent are not considered part of the section titles.
M. Delete any section Entitled "Endorsements". Such a section may not be included in the Modified Version.
N. Do not retitle any existing section to be Entitled "Endorsements" or to conflict in title with any Invariant Section.
O. Preserve any Warranty Disclaimers.

If the Modified Version includes new front-matter sections or appendices that qualify as Secondary Sections and contain no material copied from the Document, you may at your option designate some or all of these sections as invariant. To do this, add their titles to the list of Invariant Sections in the Modified Version's license notice. These titles must be distinct from any other section titles.

You may add a section Entitled "Endorsements", provided it contains nothing but endorsements of your Modified Version by various parties--for example, statements of peer review or that the text has been approved by an organization as the authoritative definition of a standard.

You may add a passage of up to five words as a Front-Cover Text, and a passage of up to 25 words as a Back-Cover Text, to the end of the list of Cover Texts in the Modified Version. Only one passage of Front-Cover Text and one of Back-Cover Text may be added by (or through arrangements made by) any one entity. If the Document already includes a cover text for the same cover, previously added by you or by arrangement made by the same entity you are acting on behalf of, you may not add another; but you may replace the old one, on explicit permission from the previous publisher that added the old one.

The author(s) and publisher(s) of the Document do not by this License give permission to use their names for publicity for or to assert or imply endorsement of any Modified Version.

70.5. COMBINING DOCUMENTS

You may combine the Document with other documents released under this License, under the terms defined in section 4 above for modified versions, provided that you include in the combination all of the Invariant Sections of all of the original documents, unmodified, and list them all as Invariant Sections of your combined work in its license notice, and that you preserve all their Warranty Disclaimers.

The combined work need only contain one copy of this License, and multiple identical Invariant Sections may be replaced with a single copy. If there are multiple Invariant Sections with the same name but different contents, make the title of each such section unique by adding at the end of it, in parentheses, the name of the original author or publisher of that section if known, or else a unique number. Make the same adjustment to the section titles in the list of Invariant Sections in the license notice of the combined work.

In the combination, you must combine any sections Entitled "History" in the various original documents, forming one section Entitled "History"; likewise combine any sections Entitled "Acknowledgements", and any sections Entitled "Dedications". You must delete all sections Entitled "Endorsements".

70.6. COLLECTIONS OF DOCUMENTS

You may make a collection consisting of the Document and other documents released under this License, and replace the individual copies of this License in the various documents with a single copy that is included in the collection, provided that you follow the rules of this License for verbatim copying of each of the documents in all other respects.

You may extract a single document from such a collection, and distribute it individually under this License, provided you insert a copy of this License into the extracted document, and follow this License in all other respects regarding verbatim copying of that document.

70.7. AGGREGATION WITH INDEPENDENT WORKS

A compilation of the Document or its derivatives with other separate and independent documents or works, in or on a volume of a storage or distribution medium, is called an "aggregate" if the copyright resulting from the compilation is not used to limit the legal rights of the compilation's users beyond what the individual works permit. When the Document is included in an aggregate, this License does not apply to the other works in the aggregate which are not themselves derivative works of the Document.

If the Cover Text requirement of section 3 is applicable to these copies of the Document, then if the Document is less than one half of the entire aggregate, the Document's Cover Texts may be placed on covers that bracket the Document within the aggregate, or the electronic equivalent of covers if the Document is in electronic form. Otherwise they must appear on printed covers that bracket the whole aggregate.

70.8. TRANSLATION

Translation is considered a kind of modification, so you may distribute translations of the Document under the terms of section 4. Replacing Invariant Sections with translations requires special permission from their copyright holders, but you may include translations of some or all Invariant Sections in addition to the original versions of these Invariant Sections. You may include a translation of this License, and all the license notices in the Document, and any Warranty Disclaimers, provided that you also include the original English version of this License and the original versions of those notices and disclaimers. In case of a disagreement between the translation and the original version of this License or a notice or disclaimer, the original version will prevail.

If a section in the Document is Entitled "Acknowledgements", "Dedications", or "History", the requirement (section 4) to Preserve its Title (section 1) will typically require changing the actual title.

70.9. TERMINATION

You may not copy, modify, sublicense, or distribute the Document except as expressly provided for under this License. Any other attempt to copy, modify, sublicense or distribute the Document is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.

70.10. FUTURE REVISIONS OF THIS LICENSE

The Free Software Foundation may publish new, revised versions of the GNU Free Documentation License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns. See http://www.gnu.org/copyleft/.

Each version of the License is given a distinguishing version number. If the Document specifies that a particular numbered version of this License "or any later version" applies to it, you have the option of following the terms and conditions either of that specified version or of any later version that has been published (not as a draft) by the Free Software Foundation. If the Document does not specify a version number of this License, you may choose any version ever published (not as a draft) by the Free Software Foundation.

70.11. ADDENDUM: How to use this License for your documents

To use this License in a document you have written, include a copy of the License in the document and put the following copyright and license notices just after the title page:

> Copyright ©YEAR YOUR NAME. Permission is granted to copy, distribute and/or modify this document under the terms of the GNU Free Documentation License, Version 1.2 or any later version published by the Free Software Foundation; with no Invariant Sections, no Front-Cover Texts, and no Back-Cover Texts. A copy of the license is included in the section entitled "GNU Free Documentation License".

If you have Invariant Sections, Front-Cover Texts and Back-Cover Texts, replace the "with...Texts." line with this:

with the Invariant Sections being LIST THEIR TITLES, with the Front-Cover Texts being LIST, and with the Back-Cover Texts being LIST.

If you have Invariant Sections without Cover Texts, or some other combination of the three, merge those two alternatives to suit the situation.

If your document contains nontrivial examples of program code, we recommend releasing these examples in parallel under your choice of free software license, such as the GNU General Public License, to permit their use in free software.

big affine fppf site of S in 30.7.8
big affine smooth site of S in 30.5.8
big affine syntomic site of S in 30.6.8
big affine Zariski site of S in 30.3.7
big crystalline site in 39.12.4
big fppf site of S in 30.7.8
big fppf site in 30.7.6
big smooth site of S in 30.5.8
big smooth site in 30.5.6
big syntomic site of S in 30.6.8
big syntomic site in 30.6.6
big Zariski site of S in 30.3.7
big Zariski site in 30.3.5
big in 38.27.3
birational in 24.7.1
blowing up of X along Z in 22.21.1
blowing up of X in the ideal sheaf $\mathcal{I}$ in 22.21.1
blowup algebra in 7.54.1
bounded above in 11.7.1
bounded below in 11.7.1
bounded derived category in 11.10.3
bounded filtered derived category in 11.13.7
bounded in 11.7.1
bounds the degrees of the fibres of f in 24.48.1
Brauer group in 8.5.2
Brauer group in 38.59.4
canonical descent datum in 31.2.3
canonical descent datum in 31.30.10
canonical descent datum in 31.30.11
canonical descent datum in 45.3.3
canonical descent datum in 50.3.5
canonical scheme structure on T in 24.25.2
canonical topology in 9.40.12
Cartan-Eilenberg resolution in 11.20.1
cartesian in 31.36.1
Cartier divisor in 65.34.1
categorical quotient in $\mathcal{C}$ in 56.4.1
categorical quotient in schemes in 56.4.1
categorical quotient in the category of schemes in 56.4.1
categorical quotient in 56.4.1
category $\widehat{\mathcal{F}}$ of formal objects of $\mathcal{F}$ in 51.7.1
category cofibered in groupoids over $\mathcal{C}$ in 51.5.1
category fibred in discrete categories in 4.35.2
category fibred in setoids in 4.36.2
category fibred in sets in 4.35.2
category of (cochain) complexes in 11.7.1
category of cosimplicial objects of $\mathcal{C}$ in 14.5.1
category of finite filtered objects of $\mathcal{A}$ in 11.13.1
category of groupoids in functors on $\mathcal{C}$ in 51.19.1
category of sheaves of sets in 38.11.4
category of simplicial objects of $\mathcal{C}$ in 14.3.1
category in 4.2.1
catenary in 5.8.1
catenary in 7.97.1
catenary in 23.11.1
catenary in 65.12.1
Cech cohomology groups in 19.9.1
Cech complex in 19.9.1
centered in 7.46.1

central in 8.2.4
chain of irreducible closed subsets in 5.7.1
change of base of $\mathcal{X}'$ in 57.19.3
chern classes of $\mathcal{E}$ on X in 29.34.1
choice of pullbacks in 4.30.5
Chow group of k-cycles module rational equivalence on X in 29.19.1
Chow group of k-cycles on X in 29.19.1
class group of A in 65.15.3
classical case in 51.3.1
closed immersion of ringed spaces in 15.13.1
closed immersion in 21.4.1
closed immersion in 21.10.2
closed immersion in 40.12.1
closed immersion in 60.9.1
closed subgroup scheme in 35.4.3
closed subscheme in 21.10.2
closed subspace of X associated to the sheaf of ideals $\mathcal{I}$ in 21.4.4
closed subspace in 40.12.1
closed substack in 60.9.8
closed in 5.12.2
closed in 42.10.2
closed in 61.11.2
closed in 65.5.22
coarse quotient in schemes in 56.6.1
coarse quotient in 56.6.1
cocontinuous in 9.18.1
cocycle condition in 31.2.1
cocycle condition in 31.3.1
cocycle condition in 31.30.1
cocycle condition in 45.3.1
cocycle condition in 50.3.1
codimension in 5.8.3
codirected in 4.18.1
codirected in 4.18.1
coefficient ring in 7.143.4
coequalizer in 4.11.1
cofiltered in 4.18.1
cofiltered in 4.18.1
Cohen ring in 7.143.5
Cohen-Macaulay at x in 33.15.1
Cohen-Macaulay morphism in 33.15.1
Cohen-Macaulay in 7.95.1
Cohen-Macaulay in 7.96.1
Cohen-Macaulay in 7.96.6
Cohen-Macaulay in 23.8.1
Cohen-Macaulay in 25.13.2
Cohen-Macaulay in 65.21.1
coherent $\mathcal{O}_X$-module in 15.12.1
coherent module in 7.84.1
coherent ring in 7.84.1
coherent in 16.23.1
coherent in 65.29.6
cohomological δ-functor in 10.9.1
cohomological in 11.3.5
cohomology modules in 29.3.1
cohomology modules in 29.3.1
coimage of f in 10.3.9
cokernel in 10.3.9
colimit in 4.13.2
colimit in 65.2.3
collapses at E_r in 10.14.2
combinatorially equivalent in 9.8.2
commutative in 10.25.3
compact object in 12.43.2
compatible with the triangulated structure in 11.5.1
complete dévissage of $\mathcal{F}/X/S$ at x in 34.6.2
complete dévissage of $\mathcal{F}/X/S$ over s in 34.6.1
complete dévissage of $N/S/R$ at $\mathfrak{q}$ in 34.7.4
complete dévissage of $N/S/R$ over $\mathfrak{r}$ in 34.7.2
complete intersection (over k) in 7.124.5
complete local ring in 7.143.1
completely normal in 7.33.3
completion $(U, R, s, t, c)^\wedge$ of (U, R, s, t, c) in 51.20.2
completion of $\mathcal{F}$ in 51.7.3
complex in 10.3.18
composition $f \circ g$ in 9.15.1
composition of φ and ψ in 6.21.9
composition of morphisms of germs in 31.16.1
composition of morphisms of ringed sites in 16.6.1
composition of morphisms of ringed spaces in 6.25.3
composition of morphisms of ringed topoi in 16.7.1
composition in 4.26.1
composition in 9.14.4
computes in 11.14.10
computes in 11.14.10

condition (RS) in 51.15.1
conditions (S1) and (S2) in 51.9.1
cone $\pi : C \to S$ *over* S in 22.7.2
cone associated to $\mathcal{A}$ in 22.7.1
cone in 11.8.1
connected component in 5.4.1
connected component in 65.5.26
connected in 4.15.1
connected in 5.4.1
connected in 65.5.26
conormal algebra $\mathcal{C}_{Z/X,*}$ *of* Z *in* X in 26.11.1
conormal algebra of f in 26.11.1
conormal module in 7.136.2
conormal sheaf $\mathcal{C}_{Z/X}$ *of* Z *in* X in 24.31.1
conormal sheaf $\mathcal{C}_{Z/X}$ *of* Z *in* X in 46.5.1
conormal sheaf of i in 24.31.1
conormal sheaf of i in 46.5.1
conormal sheaf of Z *over* X in 33.5.2
conormal sheaf of Z *over* X in 46.12.5
conservative in 9.34.1
constant presheaf with value A in 6.3.2
constant sheaf with value A in 6.7.4
constant sheaf in 38.23.1
constructible in 5.10.1
constructible in 38.62.3
continuous group cohomology groups in 38.57.3
continuous in 9.13.1
contravariant in 4.3.2
converges to in 10.17.6
converges in 10.17.6
converges in 10.18.7
converges in 10.19.4
converges in 10.19.4
coproduct in 4.5.1
coproduct in 4.13.6
cosimplicial abelian group in 14.5.1
cosimplicial object U *of* $\mathcal{C}$ in 14.5.1
cosimplicial set in 14.5.1
coverings of $\mathcal{C}$ in 9.6.2
coverings in 38.10.2
covering in 20.2.4
covers F in 21.15.3
crystal in $\mathcal{O}_{X/S}$*-modules* in 39.15.1
crystal in finite locally free modules in 39.15.3
crystal in quasi-coherent modules in 39.15.3
crystalline site in 39.13.1
curve in 38.59.13
cycle on X in 29.8.1
decent in 43.6.1
decent in 43.13.1
decreasing filtration in 10.13.1
Dedekind domain in 7.111.8
deformation category in 51.15.8
degeneracy of x in 14.11.1
degenerates at E_r in 10.14.2
degenerate in 14.11.1
degree d finite Hilbert stack of $\mathcal{X}$ *over* $\mathcal{Y}$ in 55.17.2
degree of X *over* Y in 24.45.5
degree of inseparability in 7.38.3
degree in 24.44.1
degree in 42.38.2
Deligne-Mumford stack in 57.12.2
depth k at a point in 25.13.1
depth k at a point in 25.13.1
depth in 7.65.4
derivation in 7.122.1
derivation in 24.32.1
derived category of $\mathcal{A}$ in 11.10.3
derived category of $\mathcal{O}_{\mathcal{X}}$*-modules with quasi-coherent cohomology sheaves* in 62.13.1
derived category of $\mathcal{O}_X$*-modules with quasi-coherent cohomology sheaves* in 49.3.1
derived tensor product in 12.3.12
derived tensor product in 18.20.13
derived tensor product in 19.17.11
descent datum $(\mathcal{F}_i, \varphi_{ij})$ *for quasi-coherent sheaves* in 31.2.1
descent datum $(\mathcal{F}_i, \varphi_{ij})$ *for quasi-coherent sheaves* in 45.3.1
descent datum (N, φ) *for modules with respect to* $R \to A$ in 31.3.1
descent datum (V_i, φ_{ij}) *relative to the family* $\{X_i \to S\}$ in 31.30.3
descent datum (X_i, φ_{ij}) *in* $\mathcal{S}$ *relative to the family* $\{f_i : U_i \to U\}$ in 50.3.1
descent datum for $V/X/S$ in 31.30.1
descent datum relative to $X \to S$ in 31.30.1
descent datum in 38.16.1
descent datum in 38.16.5
determinant of (M, φ, ψ) in 29.3.4
determinant of the finite length R*-module* in 29.2.1

differential $d\varphi : T\mathcal{F} \to T\mathcal{G}$ of φ in 51.11.3
differential graded algebra in 10.25.1
differential object in 10.16.1
dimension function in 5.16.1
dimension of X at x in 23.10.1
dimension of X at x in 41.8.1
dimension of the local ring of X at x in 41.20.2
dimension of the local ring of the fibre of f at x in 42.30.1
dimension in 5.7.1
dimension in 23.10.1
dimension in 41.8.2
direct image functor in 9.21.1
direct image functor in 16.19.1
direct image in 38.35.1
direct image in 38.35.3
direct sum dévissage in 7.78.1
direct sum in 10.3.5
directed inverse system in 4.19.2
directed partially ordered set in 65.2.1
directed set in 7.8.1
directed system in 4.19.2
directed system in 7.8.2
directed in 4.17.1
directed in 4.17.1
directed in 4.19.2
discrete G-module in 38.57.1
discrete G-set in 38.55.1
discrete valuation ring in 7.46.8
discrete in 4.35.1
distance between M and M' in 7.112.5
distinguished triangle of $K(\mathcal{A})$ in 11.9.1
distinguished triangles in 11.3.2
divided power A-derivation in 39.10.1
divided power envelope of J in B relative to (A, I, γ) in 39.6.2
divided power ring in 39.3.1
divided power scheme in 39.11.2
divided power structure γ in 39.11.1
divided power structure in 39.2.1
divided power thickening of X relative to $(S, \mathcal{I}, \gamma)$ in 39.12.1
divided power thickening in 39.9.2
divided power thickening in 39.11.3
DM over S in 61.4.2
DM in 61.4.1
DM in 61.4.2
dominant in 24.6.1
dominates in 7.46.1
dominates in 7.82.2
double complex in 10.19.1
dual numbers in 65.28.1
effective Cartier divisor in 26.9.1
effective Cartier divisor in 65.34.1
effective epimorphism in 9.12.1
effective in 31.2.3
effective in 31.3.4
effective in 31.30.10
effective in 31.30.11
effective in 38.16.1
effective in 38.16.6
effective in 45.3.3
effective in 50.3.5
Eilenberg-Maclane object $K(A, k)$ in 14.20.3
elementary étale localization of the ring map $R \to S$ at $\mathfrak{q}$ in 34.7.1
elementary étale neighbourhood in 33.25.1
elementary standard in A over R in 13.3.3
embedded associated point in 26.4.1
embedded associated primes in 7.64.1
embedded component in 26.4.1
embedded point in 26.4.1
embedded primes of R in 7.64.1
enough injectives in 10.20.4
enough projectives in 10.21.4
epimorphism in 4.23.1
equalizer in 4.10.1
equidimensional in 5.7.4
equivalence of categories in 4.2.17
equivalence relation on U over B in 52.4.1
equivalence relation on U over S in 35.3.1
equivalent in 4.26.4
equivalent in 11.26.4
equivalent in 24.8.1
equivalent in 38.59.3
equivariant quasi-coherent $\mathcal{O}_X$-module in 35.10.1
equivariant quasi-coherent $\mathcal{O}_X$-module in 52.10.1
equivariant in 35.8.1
equivariant in 52.8.1
essential surjection in 51.3.9
essentially constant inverse system in 4.20.2
essentially constant system in 4.20.2

essentially constant in 4.20.1
essentially of finite presentation in 7.50.1
essentially of finite type in 7.50.1
essentially surjective in 4.2.9
Euler-Poincaré function in 65.19.2
everywhere defined in 11.14.9
everywhere defined in 11.14.9
exact at y in 10.3.18
exact couple in 10.15.1
exact functor in 11.3.3
exact sequences of graded modules in 65.19.3
exact in 4.21.1
exact in 10.3.18
exact in 29.3.1
excellent in 12.39.1
exhaustive in 10.13.1
extends in 39.4.1
extension E of B by A in 10.4.1
extension $j_!\mathcal{F}$ of $\mathcal{F}$ by 0 in 6.31.5
extension $j_!\mathcal{F}$ of $\mathcal{F}$ by e in 6.31.5
extension $j_{p!}\mathcal{F}$ of $\mathcal{F}$ by 0 in 6.31.5
extension $j_{p!}\mathcal{F}$ of $\mathcal{F}$ by e in 6.31.5
extension by 0 in 6.31.5
extension by 0 in 6.31.5
extension by zero in 16.19.1
extension by zero in 38.63.1
extension of $\mathcal{F}$ by the empty set $j_!\mathcal{F}$ in 6.31.3
extension of $\mathcal{F}$ by the empty set $j_{p!}\mathcal{F}$ in 6.31.3
extension of $\mathcal{G}$ by the empty set in 9.21.1
face of x in 14.11.1
faithfully flat in 7.35.1
faithfully flat in 7.35.1
faithfully flat in 37.9.1
faithfully flat in 37.9.3
faithful in 4.2.9
family of morphisms with fixed target in 9.6.1
family of morphisms with fixed target in 38.10.1
fibre category in 4.29.2
fibre of f over s in 21.18.4
fibre product of V and W over U in 14.7.1
fibre product of V and W over U in 14.10.1
fibre product in 4.6.1
fibre product in 21.17.1
fibred category over $\mathcal{C}$ in 4.30.4
fibred in groupoids in 4.32.1
fibres of f are universally bounded in 24.48.1
fibres of f are universally bounded in 43.3.1
field of rational functions in 24.8.5
filtered acyclic in 11.13.2
filtered acyclic in 65.23.7
filtered complex $K^\bullet$ of $\mathcal{A}$ in 10.18.1
filtered derived category of $\mathcal{A}$ in 11.13.5
filtered derived functor in 38.71.1
filtered differential object in 10.17.1
filtered injective in 11.25.1
filtered injective in 38.70.1
filtered injective in 65.23.3
filtered object of $\mathcal{A}$ in 10.13.1
filtered quasi-isomorphism in 11.13.2
filtered quasi-isomorphism in 38.70.1
filtered quasi-isomorphism in 65.23.6
filtered in 4.17.1
filtered in 4.17.1
final object in 4.28.1
final in 4.12.1
finer in 9.40.8
finite Tor-dimension in 38.75.1
finite R-module in 7.5.1
finite free in 16.17.1
finite global dimension in 7.101.6
finite locally constant in 38.62.1
finite locally free in 7.72.1
finite locally free in 15.14.1
finite locally free in 16.23.1
finite locally free in 24.44.1
finite locally free in 42.38.2
finite locally free in 65.15.1
finite presentation at $x \in X$ in 24.20.1
finite presentation at x in 42.26.1
finite presentation in 7.6.1
finite presentation in 15.11.1
finite presentation in 24.20.1
finite presentation in 65.2.8
finite projective dimension in 7.101.2
finite tor dimension in 12.41.1
finite tor dimension in 12.41.1
finite type at $x \in X$ in 24.14.1
finite type at x in 42.22.1
finite type point in 24.15.3
finite type point in 42.24.2
finite type point in 61.14.2

finite type in 7.6.1
finite type in 15.9.1
finite type in 24.14.1
finitely generated R-module in 7.5.1
finitely presented R-module in 7.5.1
finite in 7.7.1
finite in 8.2.1
finite in 10.13.1
finite in 24.42.1
finite in 42.37.2
first order infinitesimal neighbourhood in 33.3.1
first order infinitesimal neighbourhood in 46.9.1
first order thickening in 33.2.1
first order thickening in 46.8.1
flat (resp. faithfully flat) in 37.9.1
flat at $x \in X$ in 37.9.3
flat at x over Y in 42.28.2
flat at x in 15.16.3
flat at x in 15.17.1
flat at x in 42.27.1
flat at a point $x \in X$ in 24.24.1
flat base change property in 62.7.1
flat group scheme in 35.4.4
flat local complete intersection over R in 7.125.1
flat over S at a point $x \in X$ in 24.24.1
flat over S in 24.24.1
flat over Y at $x \in X$ in 37.9.3
flat over Y in 42.28.2
flat pullback of α by f in 29.14.1
flat pullback in 56.3.4
flat-fppf site in 62.11.1
flattening stratification in 34.21.2
flattening stratification in 34.21.2

flat in 42.27.1
flat in 61.17.1
formal object $\xi = (R, \xi_n, f_n)$ of $\mathcal{F}$ in 51.7.1
formally étale over R in 7.137.1
formally étale in 33.6.1
formally étale in 46.10.1
formally étale in 46.13.1
formally principally homogeneous under G in 35.9.1
formally principally homogeneous under G in 52.9.1
formally smooth for the $\mathfrak{n}$-adic topology in 12.28.3
formally smooth over R in 7.127.1
formally smooth over R in 12.28.1
formally smooth in 33.9.1
formally smooth in 46.10.1
formally smooth in 46.16.1
formally unramified over R in 7.135.1
formally unramified in 33.4.1
formally unramified in 46.10.1
formally unramified in 46.11.1
fppf covering of T in 30.7.1
fppf covering of X in 44.4.1
fppf sheaf in 58.4.3
fpqc covering of T in 30.8.1
fpqc covering of X in 44.3.1
fpqc covering in 38.15.1
free $\mathcal{O}$-module in 16.17.1
free abelian presheaf on $\mathcal{G}$ in 38.18.4
free abelian presheaf in 16.4.1
free abelian sheaf in 16.5.1
free module in 17.3.1
free in 52.8.2
full subcategory in 4.2.10
fully faithful in 4.2.9
function field in 24.8.5
functorial injective embeddings in 10.20.5
functorial projective surjections in 10.21.5
functor in 4.2.8
functor in 4.26.5
G-ring in 12.38.1
G-unramified at $\mathfrak{q}$ in 7.138.1
G-unramified at $x \in X$ in 24.34.1
G-unramified at x in 42.34.1
G-unramified in 7.138.1
G-unramified in 24.34.1

G-unramified in 42.34.1
Galois cohomology groups of K with coefficients in M in 38.57.3
Galois cohomology groups in 38.57.3
Galois in 7.38.1
generalizations lift along f in 5.14.3
generalization in 5.14.1
generalization in 65.5.22
generalizing in 5.14.3
generated by finitely many global sections in 16.17.1
generated by global sections in 15.4.1
generated by global sections in 16.17.1
generate in 15.4.1
generator in 17.14.1
generic point in 5.5.4
generic point in 65.5.12
geometric frobenius in 38.66.5
geometric frobenius in 38.66.11
geometric point lying over x in 41.16.1
geometric point in 38.29.1
geometric point in 41.16.1
geometric quotient in 56.10.1
geometrically connected over k in 7.44.3
geometrically connected in 28.5.1
geometrically integral over k in 7.45.1
geometrically integral in 28.7.1
geometrically irreducible over k in 7.43.6
geometrically irreducible in 28.6.1
geometrically normal at x in 28.8.1
geometrically normal in 7.147.2
geometrically normal in 28.8.1
geometrically pointwise integral at x in 28.7.1
geometrically pointwise integral in 28.7.1
geometrically reduced at x in 28.4.1
geometrically reduced over k in 7.40.1
geometrically reduced in 28.4.1
geometrically regular at x in 28.10.1
geometrically regular over k in 28.10.1
geometrically regular in 7.148.2
geometrically unibranch at x in 41.21.2
geometrically unibranch in 41.21.2
gerbe over in 50.11.4
gerbe over in 61.19.1
gerbe in 50.11.1
gerbe in 61.19.1
germ of X at x in 31.16.1
global complete intersection over k in 7.124.1
global dimension in 7.101.6
global finite presentation in 16.17.1
global Lefschetz number in 38.76.1
global presentation in 16.17.1
global sections in 9.39.1
going down in 7.36.1
going up in 7.36.1
going-down theorem in 65.17.1
going-up theorem in 65.17.1
good quotient in 56.9.1
graded A-algebra in 65.19.3
graded ideals in 65.19.3
graded module M over a graded A-algebra B in 65.19.3
graded module in 65.19.2
graded object of $\mathscr{A}$ in 10.13.12
graded submodules in 65.19.3
Grothendieck abelian category in 17.14.1
group algebraic space over B in 52.5.1
group cohomology groups in 38.57.3
group of infinitesimal automorphisms of x' over x in 51.18.1
group of infinitesimal automorphisms of x_0 in 51.18.2
group scheme over S in 35.4.1
groupoid in algebraic spaces over B in 52.11.1
groupoid in functors on $\mathscr{C}$ in 51.19.1
groupoid over S in 35.11.1
groupoid scheme over S in 35.11.1
groupoid in 4.2.5
Gysin homomorphism in 29.28.1
H-projective in 24.41.1
H-quasi-projective in 24.39.1
has coproducts of pairs of objects in 4.5.2
has enough points in 9.34.1
has fibre products in 4.6.2
has products of pairs of objects in 4.4.2
has property (β) in 43.13.1
has property (β) in 43.13.1
has property $\mathscr{P}$at x in 41.7.5
has property $\mathscr{P}$at x in 60.7.5
*has property $\mathscr{P}$*in 41.7.2
*has property $\mathscr{P}$*in 42.21.2
*has property $\mathscr{P}$*in 60.7.2
*has property $\mathscr{P}$*in 61.12.2

has property $\mathcal{Q}$ at x in 42.21.4
Hausdorff in 65.5.6
height in 7.57.2
henselian in 7.139.1
henselian in 38.32.2
henselization of $\mathcal{O}_{S,s}$ in 38.33.2
henselization of S at s in 38.33.2
henselization in 7.139.14
Herbrand quotient in 29.3.2
higher direct images in 38.35.4
Hilbert function in 65.19.2
Hilbert polynomial in 65.19.2
homogeneous spectrum $Proj(R)$ in 65.20.2
homogeneous spectrum of $\mathcal{A}$ over S in 22.16.7
homogeneous spectrum in 7.53.1
homogeneous spectrum in 22.8.3
homogeneous in 65.20.1
homological in 11.3.5
homology of K in 20.3.1
homology in 10.16.3
homomorphism of differential graded algebras in 10.25.2
homomorphism of divided power rings in 39.3.1
homomorphism of divided power thickenings in 39.9.2
homomorphism of systems in 7.8.7
homomorphism of topological modules in 12.27.1
homomorphism of topological rings in 12.27.1
homomorphisms of graded modules/rings in 65.19.3
homotopic in 14.24.1
homotopic in 14.26.1
homotopy connecting a and b in 14.24.1
homotopy connecting a and b in 14.26.1
homotopy equivalence in 10.10.2
homotopy equivalence in 10.10.8
homotopy equivalence in 14.24.5
homotopy equivalent in 10.10.2
homotopy equivalent in 10.10.8
homotopy equivalent in 14.24.5
horizontal in 4.25.1
horizontal in 4.26.1
hypercovering in 20.2.6
ideal of definition in 12.27.1
ideal sheaf of denominators of s in 26.15.14
image of φ in 9.3.5
image of f in 10.3.9
image of the short exact sequence under the given δ-functor in 11.3.6
immediate specialization in 5.16.1
immersion in 21.10.2
immersion in 40.12.1
immersion in 60.9.1
impurity of $\mathcal{F}$ above s in 34.15.2
induced filtration in 10.13.1
induced filtration in 10.17.4
induced filtration in 10.18.5
inductive system over I in $\mathcal{C}$ in 4.19.1
inertia fibred category $\mathcal{I}_{\mathcal{S}}$ of $\mathcal{S}$ in 4.31.2
initial in 4.12.1
injective resolution of A in 11.17.1
injective resolution of $K^\bullet$ in 11.17.1
injective in 6.16.2
injective in 6.16.2
injective in 9.3.1
injective in 9.11.1
injective in 10.3.14
injective in 10.20.1
inseparable degree in 7.38.3
integral closure of $\mathcal{O}_X$ in $\mathcal{A}$ in 24.46.2
integral closure in 7.32.8
integral over I in 7.34.1
integral over R in 7.32.1
integrally closed in 7.32.8
integral in 7.32.1
integral in 23.3.1
integral in 24.42.1
integral in 42.37.2
integral in 65.26.12
interior in 5.17.1
intersection with the jth chern class of $\mathcal{E}$ in 29.35.1
intersection with the first chern class of $\mathcal{L}$ in 29.25.1
inverse image $f^{-1}(Z)$ of the closed subscheme Z in 21.17.7
inverse image in 38.36.1
inverse system over I in $\mathcal{C}$ in 4.19.1
invertible $\mathcal{O}$-module in 16.28.1
invertible $\mathcal{O}_X$-module in 15.21.1
invertible $\mathcal{O}_X$-module in 65.32.1
invertible module M in 65.32.4

invertible module in 65.15.1
invertible sheaf $\mathcal{O}_S(D)$ *associated to* D in 26.9.11
irreducible component in 5.5.1
irreducible component in 65.5.18
irreducible in 5.5.1
irreducible in 7.111.1
irreducible in 65.5.9
irreducible in 65.5.9
is essentially constant in 4.20.1
isolated point in 5.18.3
isomorphism in 4.2.4
J-0 in 12.35.1
J-1 in 12.35.1
J-2 in 12.35.1
J-2 in 24.18.1
Jacobson ring in 7.31.1
Jacobson in 5.13.1
Jacobson in 23.6.1
Japanese in 7.144.1
Japanese in 23.13.1
K-flat in 12.3.3
K-flat in 18.20.2
K-flat in 19.17.2
K-injective in 11.28.1
Kaplansky dévissage in 7.78.1
kernel of F in 11.6.5
kernel of H in 11.6.5
kernel of the functor F in 10.7.5
kernel in 10.3.9
Kolmogorov in 5.5.4
Koszul at x in 33.38.2
Koszul at x in 46.24.1
Koszul complex on $f_1, \ldots, f_r$ in 12.21.2
Koszul complex on $f_1, \ldots, f_r$ in 15.20.2
Koszul complex in 12.21.1
Koszul complex in 15.20.1
Koszul morphism in 33.38.2
Koszul morphism in 46.24.1
Koszul-regular ideal in 12.23.1
Koszul-regular immersion in 26.13.1
Koszul-regular immersion in 46.21.2
Koszul-regular in 12.22.1
Koszul-regular in 26.12.2
Krull dimension of X *at* x in 5.7.1
Krull dimension in 5.7.1
Krull dimension in 7.57.1
lattice in V in 7.112.3
left acyclic for F in 11.15.3
left adjoint in 4.22.1
left deriveable in 11.14.9
left derived functor LF *is defined at* in 11.14.2
left derived functors of F in 11.15.3
left exact in 4.21.1
left multiplicative system in 4.24.1
Leibniz rule in 7.122.1
Leibniz rule in 16.29.1
Leibniz rule in 24.32.1
length in 5.7.1
length in 7.48.1
length in 65.8.1
lies over in 38.29.1
lift of x *along* f in 51.16.1
lift in 4.29.2
lift in 4.29.2
limit preserving in 46.4.1
limit in 4.13.1
limit in 10.14.2
limp in 19.13.4
linearly adequate in 32.3.2
linearly topologized in 12.27.1
linearly topologized in 12.27.1
lisse-étale site in 62.11.1
lisse in 38.80.1
local complete intersection morphism in 33.38.2
local complete intersection morphism in 46.24.1
local complete intersection over k in 7.124.1
local complete intersection over k in 24.30.1
local complete intersection in 12.24.2
local homomorphism of local rings in 7.17.1
local in the τ*-topology* in 31.11.1
local Lefschetz number in 38.76.2
local on the base for the τ*-topology* in 31.18.1
local on the base for the τ*-topology* in 45.9.1
local on the source for the τ*-topology* in 31.22.1
local on the source for the τ*-topology* in 45.12.1
local ring map $\varphi : R \to S$ in 7.17.1
local ring of X *at* x in 21.2.1
local ring of the fibre at $\mathfrak{q}$ in 7.103.5
local ring in 7.17.1

localization morphism in 9.21.1
localization morphism in 9.26.4
localization morphism in 16.19.1
localization morphism in 16.21.2
localization of A with respect to S in 7.9.2
localization of the ringed site $(\mathcal{C}, \mathcal{O})$ at the object U in 16.19.1
localization of the ringed topos $(Sh(\mathcal{C}), \mathcal{O})$ at $\mathcal{F}$ in 16.21.2
localization of the site $\mathcal{C}$ at the object U in 9.21.1
localization of the topos $Sh(\mathcal{C})$ at $\mathcal{F}$ in 9.26.4
localization in 7.9.6
locally P in 23.4.2
locally algebraic k-scheme in 28.13.1
locally closed immersion in 21.10.2
locally closed subspace in 40.12.1
locally closed substack in 60.9.8
locally connected in 5.4.7
locally construcible in 5.10.1
locally finite in 18.18.1
locally finite in 29.8.1
locally finite in 65.19.2
locally free in 7.72.1
locally free in 15.14.1
locally free in 16.23.1
locally generated by sections in 15.8.1
locally generated by sections in 16.23.1
locally nilpotent in 7.47.2
locally Noetherian in 5.6.1
locally Noetherian in 23.5.1
locally Noetherian in 65.29.5
locally of finite presentation over S in 46.4.1
locally of finite presentation in 24.20.1
locally of finite presentation in 42.26.1
locally of finite presentation in 46.4.1
locally of finite presentation in 46.4.1
locally of finite presentation in 61.18.1
locally of finite type in 24.14.1
locally of finite type in 42.22.1
locally of finite type in 61.13.1
locally of type P in 24.13.2
locally principal closed subscheme in 26.9.1
locally projective in 23.19.1
locally projective in 24.41.1
locally projective in 41.28.2
locally quasi-coherent in 39.15.1
locally quasi-coherent in 58.11.4
locally quasi-compact in 5.18.1
locally quasi-finite in 24.19.1
locally quasi-finite in 42.25.1
locally quasi-finite in 61.16.2
locally quasi-projective in 24.39.1
locally ringed site in 16.34.4
locally ringed space $(X, \mathcal{O}_X)$ in 21.2.1
locally ringed in 16.34.6
locally separated over S in 40.13.2
locally separated in 41.3.1
locally separated in 41.3.1
locally separated in 42.5.2
locally trivial in 35.9.3
locally trivial in 52.9.3
local in 23.4.1
local in 24.13.1
maximal Cohen-Macaulay in 7.96.9
meromorphic function in 26.15.1
meromorphic section of $\mathcal{F}$ in 26.15.5
minimal in 51.13.4
minimal in 51.25.1
miniversal in 51.13.4
Mittag-Leffler condition in 10.23.2
Mittag-Leffler directed system of modules in 7.82.1
Mittag-Leffler inverse system in 7.80.1
Mittag-Leffler in 7.82.6
ML in 10.23.2
module of differentials in 7.122.2
module of differentials in 16.29.3
module of Kähler diffentials in 7.122.2
module-valued functor in 32.3.1
monomorphism in 4.23.1
monomorphism in 21.23.1
monomorphism in 42.14.1
monomorphism in 60.8.1
morphism $(A, F) \to (B, F)$ of filtered objects in 10.13.1
morphism $(A, k) \to (B, k)$ of graded objects in 10.13.12
morphism $(N, \varphi) \to (N', \varphi')$ of descent data in 31.3.1
morphism $(U, R, s, t, c) \to (U', R', s', t', c')$ of groupoids in functors on $\mathcal{C}$ in 51.19.1
morphism $\psi : (\mathcal{F}_i, \varphi_{ij}) \to (\mathcal{F}'_i, \varphi'_{ij})$ of descent data in 31.2.1
morphism $\psi : (\mathcal{F}_i, \varphi_{ij}) \to (\mathcal{F}'_i, \varphi'_{ij})$ of descent data in 45.3.1

morphism $\psi : (G, m) \to (G', m')$ of group algebraic spaces over B in 52.5.1
morphism $\psi : (G, m) \to (G', m')$ of group schemes over S in 35.4.1
morphism $\psi : (V_i, \varphi_{ij}) \to (V'_i, \varphi'_{ij})$ of descent data in 31.30.3
morphism $\psi : (X_i, \varphi_{ij}) \to (X'_i, \varphi'_{ij})$ of descent data in 50.3.1
morphism $\varphi : \mathcal{F} \to \mathcal{G}$ of presheaves of $\mathcal{O}$-modules on $\mathcal{B}$ in 6.30.11
morphism $\varphi : \mathcal{F} \to \mathcal{G}$ of presheaves of $\mathcal{O}$-modules in 6.6.1
morphism $\varphi : \mathcal{F} \to \mathcal{G}$ of presheaves of $\mathcal{O}$-modules in 16.9.1
morphism $\varphi : \mathcal{F} \to \mathcal{G}$ of presheaves of sets on $\mathcal{B}$ in 6.30.1
morphism $\varphi : \mathcal{F} \to \mathcal{G}$ of presheaves of sets on X in 6.3.1
morphism $\varphi : \mathcal{F} \to \mathcal{G}$ of presheaves with value in $\mathcal{C}$ in 6.5.1
morphism $\varphi : \mathcal{F} \to \mathcal{G}$ of presheaves with values in $\mathcal{C}$ on $\mathcal{B}$ in 6.30.8
morphism $a : \xi \to \eta$ of formal objects in 51.7.1
morphism $f : (U, R, s, t, c) \to (U', R', s', t', c')$ of groupoid schemes over S in 35.11.1
morphism $f : (U, R, s, t, c) \to (U', R', s', t', c')$ of groupoids in algebraic spaces over B in 52.11.1
morphism $f : (V/X, \varphi) \to (V'/X, \varphi')$ of descent data relative to $X \to S$ in 31.30.1
morphism $f : F \to F'$ of algebraic spaces over S in 40.6.3
morphism $f : p \to p'$ in 9.33.2
morphism $f : X \to Y$ of schemes over S in 21.18.1
morphism from $\mathcal{U}$ to $\mathcal{V}$ in 9.8.1
morphism of δ-functors from F to G in 10.9.2
morphism of $\mathcal{G}$-torsors in 18.5.1
morphism of G-modules in 38.57.1
morphism of G-sets in 38.55.1
morphism of G-torsors in 19.5.1
morphism of n-truncated simplicial objects in 14.17.1
morphism of étale neighborhoods in 38.29.1
morphism of étale neighborhoods in 41.16.2
morphism of étale neighbourhoods in 33.25.1
morphism of abelian presheaves over X in 6.4.4
morphism of affine schemes in 21.5.5
morphism of cones in 22.7.2
morphism of cosimplicial objects $U \to U'$ in 14.5.1
morphism of differential objects in 10.16.1
morphism of divided power schemes in 39.11.2
morphism of divided power thickenings of X relative to $(S, \mathcal{I}, \gamma)$ in 39.12.1
morphism of exact couples in 10.15.1
morphism of families of maps with fixed target of $\mathcal{C}$ from $\mathcal{U}$ to $\mathcal{V}$ in 9.8.1
morphism of functors in 4.2.15
morphism of germs in 31.16.1
morphism of lifts in 51.16.1
morphism of locally ringed sites in 16.34.8
morphism of locally ringed spaces in 21.2.1
morphism of locally ringed topoi in 16.34.8
morphism of module-valued functors in 32.3.1
morphism of predeformation categories in 51.6.2
morphism of presheaves on $\mathcal{X}$ in 58.3.1
morphism of pseudo $\mathcal{G}$-torsors in 19.5.1
morphism of ringed sites in 16.6.1
morphism of ringed spaces in 6.25.1
morphism of ringed topoi in 16.7.1
morphism of schemes in 21.9.1
morphism of sheaves of $\mathcal{O}$-modules in 6.10.1
morphism of sheaves of $\mathcal{O}$-modules in 16.10.1
morphism of sheaves of sets on $\mathcal{B}$ in 6.30.2
morphism of sheaves of sets in 6.7.1
morphism of simplicial objects $U \to U'$ in 14.3.1
morphism of sites in 9.14.1
morphism of spectral sequences in 10.14.1
morphism of thickenings in 33.2.1
morphism of thickenings in 46.8.1
morphism of topoi in 9.15.1
morphism of triangles in 11.3.1
morphism of vector bundles over S in 22.6.2
Morphisms of presheaves in 9.2.1
morphisms of thickenings over B in 46.8.1

morphisms of thickenings over S in 33.2.1
morphisms of type $\mathcal{P}$ satisfy descent for τ-coverings in 31.32.1
morphism in 9.2.2
morphism in 38.80.1
multiplicative subset of R in 7.9.1
multiplicative system in 4.24.1
multiplicity of Z' in $\mathcal{F}$ in 29.10.2
multiplicity of Z' in Z in 29.9.2
multiplicity in 29.3.2
N-1 in 7.144.1
N-2 in 7.144.1
Nagata ring in 7.144.15
Nagata in 23.13.1
naive cotangent complex in 7.123.1
natural transformation in 4.2.15
nilpotent in 7.47.2
Noetherian in 5.6.1
Noetherian in 23.5.1
Noetherian in 41.12.1
Noetherian in 61.8.1
Noetherian in 65.5.16
Noetherian in 65.29.5
nondegenerate in 39.31.2
nonsingular in 23.9.1
nontrivial solution in 38.59.8
normal at x in 33.13.1
normal bundle in 26.11.5
normal cone $C_Z X$ in 26.11.5
normal morphism in 33.13.1
normalization of X in Y in 24.46.3
normalization in 24.46.12
normalized in 51.25.1
normal in 7.33.1
normal in 7.33.10
normal in 7.38.1
normal in 23.7.1
nowhere dense in 5.17.1
numerical polynomial in 7.55.2
numerical polynomial in 65.19.1
of finite presentation in 16.23.1
of finite presentation in 42.26.1
of finite presentation in 61.18.1
of finite type in 16.23.1
of finite type in 42.22.1
of finite type in 61.13.1
Oka family in 7.25.2
one step dévissage of $\mathcal{F}/X/S$ at x in 34.5.2
one step dévissage of $\mathcal{F}/X/S$ over s in 34.5.1
open immersion in 21.3.1
open immersion in 21.10.2
open immersion in 40.12.1
open immersion in 60.9.1
open subgroup scheme in 35.4.3
open subscheme in 21.10.2
open subspace of $(X, \mathcal{O})$ associated to U in 6.31.2
open subspace of X associated to U in 21.3.3
open subspace in 40.12.1
open substack in 60.9.8
open in 24.22.1
open in 38.89.1
open in 42.7.2
open in 61.9.2
opposite algebra in 8.2.5
opposite category in 4.3.1
orbit space for R in 56.5.18
orbit in 56.5.1
orbit in 56.5.4
order of vanishing along R in 7.112.2
order of vanishing of f along Z in 29.16.1
order of vanishing of s along Z in 29.23.1
ordered Čech complex in 18.17.2
p-basis of K over k in 12.34.1
p-independent over k in 12.34.1
parasitic for the τ-topology in 31.7.1
parasitic in 31.7.1
parasitic in 62.8.1
partially ordered set in 7.8.1
perfect at x in 46.23.1
perfect closure in 7.42.5
perfect complexes in 38.75.4

Picard group of A in 65.15.3
Picard group of X in 65.32.7
Picard group in 15.21.6
Picard group in 16.28.4
PID in 7.111.6
point p of the site $\mathcal{C}$ in 9.28.2
point p in 9.45.1

point of the topos Sh($\mathcal{C}$) in 9.28.1
point in 41.4.1
point in 60.4.2
polynomial relation among the chern classes in 29.36.1
pre-adic in 12.27.1
pre-admissible in 12.27.1
pre-equivalence relation in 35.3.1
pre-equivalence relation in 52.4.1
pre-relation in 35.3.1
pre-relation in 52.4.1
pre-triangulated category in 11.3.2
pre-triangulated subcategory in 11.3.4
preadditive in 10.3.1
predeformation category in 51.6.2
presentation of $\mathcal{F}$ by (U, R, s, t, c) in 51.23.1
presentation in 40.9.3
presentation in 57.16.5
preserved under arbitrary base change in 21.18.3
preserved under arbitrary base change in 21.18.3
preserved under base change in 21.18.3
preserved under base change in 21.18.3
presheaf $\mathcal{F}$ of sets on $\mathcal{B}$ in 6.30.1
presheaf $\mathcal{F}$ of sets on X in 6.3.1
presheaf $\mathcal{F}$ on X with values in $\mathcal{C}$ in 6.5.1
presheaf $\mathcal{F}$ with values in $\mathcal{C}$ on $\mathcal{B}$ in 6.30.8
presheaf of $\mathcal{O}$-modules $\mathcal{F}$ on $\mathcal{B}$ in 6.30.11
presheaf of $\mathcal{O}$-modules in 6.6.1
presheaf of $\mathcal{O}$-modules in 16.9.1
presheaf of abelian groups on X in 6.4.4
presheaf of isomorphisms from x to y in 50.2.2
presheaf of modules on $\mathcal{X}$ in 58.7.1
presheaf of morphisms from x to y in 50.2.2
presheaf of sets on $\mathcal{C}$ in 4.3.3
presheaf of sets in 9.2.1
presheaf of sets in 38.9.1
presheaf on $\mathcal{X}$ in 58.3.1
presheaf in 4.3.3
presheaf in 9.2.2
prime divisor in 65.34.1
prime in 7.111.1
principal divisor associated to f in 29.17.1
principal homogeneous G-space over B in 52.9.3
principal homogeneous space in 35.9.3
principal homogeneous space in 52.9.3
principal ideal domain in 7.111.6
product $U \times V$ exists in 14.12.1
product $U \times V$ of U and V in 14.12.1
product category in 4.2.20
product of U and V in 14.6.1
product of U and V in 14.9.1
product in 4.4.1
product in 4.13.5
projective n-space over $\mathbf{Z}$ in 22.13.2
projective n-space over R in 22.13.2
projective n-space over S in 22.13.2
projective bundle associated to $\mathcal{E}$ in 22.20.1
projective dimension in 7.101.2
projective resolution of A in 11.18.1
projective resolution of $K^\bullet$ in 11.18.1
projective system over I in $\mathcal{C}$ in 4.19.1
projective variety in 28.16.1
projective in 7.71.1
projective in 10.21.1
projective in 24.41.1
projective in 38.70.1
proper variety in 28.16.1
property $\mathcal{P}$ in 40.5.1
property $\mathcal{P}$ in 54.4.1
property $\mathcal{P}$ in 57.10.1
proper in 5.12.2
proper in 24.40.1
proper in 42.36.1
prorepresentable in 51.6.1
prorepresentable in 51.20.1
pseudo $\mathcal{G}$-torsor in 19.5.1
pseudo G-torsor in 35.9.1
pseudo G-torsor in 52.9.1
pseudo functor in 4.26.5
pseudo torsor in 19.5.1
pseudo-coherent at x in 46.22.1
pseudo-coherent relative to R in 12.45.4
pseudo-coherent relative to R in 12.45.4
pseudo-coherent ring map in 12.46.1
pseudo-coherent in 12.40.1
pseudo-coherent in 12.40.1
pseudo-coherent in 33.36.2
pseudo-coherent in 46.22.1
pulbacks of meromorphic functions are defined for f in 26.15.3
pullback $x^{-1}\mathcal{F}$ of $\mathcal{F}$ in 58.9.2
pullback functor in 4.30.5

pullback functor in 31.30.7
pullback functor in 31.30.9
pullback functor in 50.3.4
pullback of $\mathcal{S}$ along f in 50.12.9
pullback of D by f is defined in 26.9.8
pullback of S by f in 9.40.4
pullback of the effective Cartier divisor in 26.9.8
pullback in 6.26.1
pullback in 16.13.1
pullback in 35.3.3
pullback in 38.36.1
pullback in 52.4.3
pullback in 56.3.4
pure along X_s in 34.16.1
pure along X_s in 34.16.1
pure extension module in 32.8.8
pure injective resolution in 32.8.5
pure injective in 32.8.1
pure projective resolution in 32.8.5
pure projective in 32.8.1
pure relative to S in 34.16.1
pure relative to S in 34.16.1
purely inseparable in 7.38.1
purely transcendental extension in 7.37.1
pure in 7.100.1
push out of V and W over U in 14.8.1
push out in 4.9.1
pushforward of $\mathcal{S}$ along f in 50.12.4
pushforward in 6.26.1
pushforward in 9.38.1
pushforward in 16.13.1
pushforward in 29.12.1
pushforward in 38.35.1
pushforward in 38.35.3
quasi-affine in 23.15.1
quasi-affine in 24.12.1
quasi-affine in 42.20.2
quasi-coherent $\mathcal{O}_{\mathcal{X}}$-module in 58.11.1
quasi-coherent module on (U, R, s, t, c) in 35.12.1
quasi-coherent module on (U, R, s, t, c) in 52.12.1
quasi-coherent module on $\mathcal{X}$ in 58.11.1
quasi-coherent sheaf of $\mathcal{O}_X$-modules in 15.10.1
quasi-coherent in 16.23.1
quasi-coherent in 38.17.2
quasi-coherent in 39.15.1
quasi-coherent in 41.26.1
quasi-coherent in 65.29.1
quasi-compact in 5.9.1
quasi-compact in 5.9.1
quasi-compact in 21.19.1
quasi-compact in 41.5.1
quasi-compact in 42.9.2
quasi-compact in 60.6.1
quasi-compact in 61.7.2
quasi-compact in 65.5.4
quasi-DM over S in 61.4.2
quasi-DM in 61.4.1
quasi-DM in 61.4.2
quasi-excellent in 12.39.1
quasi-finite at $\mathfrak{q}$ in 7.113.3
quasi-finite at x in 42.25.1
quasi-finite at a point $x \in X$ in 24.19.1
quasi-finite in 7.113.3
quasi-finite in 24.19.1
quasi-finite in 42.25.1
quasi-inverse in 4.2.17
quasi-isomorphism in 10.10.4
quasi-isomorphism in 10.10.10
quasi-isotrivial in 35.9.3
quasi-isotrivial in 52.9.3
quasi-projective variety in 28.16.1
quasi-projective in 24.39.1
quasi-proper in 5.12.2
quasi-regular ideal in 12.23.1
quasi-regular immersion in 26.13.1
quasi-regular immersion in 46.21.2
quasi-regular sequence in 7.66.1
quasi-regular in 26.12.2
quasi-separated over S in 40.13.2
quasi-separated over S in 61.4.2
quasi-separated in 21.21.3
quasi-separated in 21.21.3
quasi-separated in 41.3.1
quasi-separated in 41.3.1
quasi-separated in 42.5.2
quasi-separated in 61.4.1
quasi-separated in 61.4.2
quasi-split over u in 53.11.1
quasi-splitting of R over u in 53.11.1
quotient category $\mathcal{D}/\mathcal{B}$ in 11.6.7
quotient category cofibered in groupoids $[U/R] \to \mathcal{C}$ in 51.19.9

quotient filtration in 10.13.1
quotient functor in 11.6.7
quotient morphism $U \to [U/R]$ in 51.19.9
quotient of U by G in 40.14.4
quotient representable by an algebraic space in 52.18.3
quotient representable by an algebraic space in 52.18.3
quotient sheaf U/R in 35.17.1
quotient sheaf U/R in 52.18.1
quotient stack in 52.19.1
quotient stack in 52.19.1
quotient in 10.3.14
radicial in 24.10.1
radicial in 46.3.1
rank r in 16.28.1
rank in 7.94.4
rank in 24.44.1
rank in 42.38.2
rational function on X in 24.8.2
rational map from X to Y in 24.8.1
rationally equivalent to zero in 29.19.1
rationally equivalent in 29.19.1
reasonable in 43.6.1
reasonable in 43.13.1
reduced induced algebraic space structure in 41.9.3
reduced induced algebraic stack structure in 60.10.4
reduced induced scheme structure in 21.12.5
reduced in 21.12.1
reduction $\mathcal{X}_{red}$ of $\mathcal{X}$ in 60.10.4
reduction X_{red} of X in 21.12.5
reduction X_{red} of X in 41.9.3
Rees algebra in 7.54.1
refinement in 9.8.1
regular at x in 33.14.1
regular ideal in 12.23.1
regular immersion in 26.13.1
regular in codimension $\leq k$ in 7.140.1
regular in codimension k in 23.12.1
regular local ring in 7.57.9
regular locus in 23.14.1
regular morphism in 33.14.1
regular section in 26.9.13
regular sequence in 7.65.1
regular system of parameters in 7.57.9
regular in 7.102.6
regular in 12.31.1
regular in 23.9.1
regular in 26.12.2
regular in 26.15.10
relation in 7.8.12
relation in 35.3.1
relation in 52.4.1
relative H_1-regular immersion in 26.14.2
relative assassin of $\mathcal{F}$ in X over S in 26.7.1
relative assassin of N over S/R in 7.62.2
relative cotangent space in 51.3.6
relative dimension $\leq d$ at x in 24.28.1
relative dimension $\leq d$ in 24.28.1
relative dimension $\leq d$ in 42.30.2
relative dimension d in 24.28.1
relative dimension d in 42.30.2
relative dimension of S/R at $\mathfrak{q}$ in 7.116.1
relative dimension of in 7.116.1
relative effective Cartier divisor in 26.10.2
relative global complete intersection in 7.125.5
relative homogeneous spectrum of $\mathcal{A}$ over S in 22.16.7
relative inertia of $\mathcal{S}$ over $\mathcal{S}'$ in 4.31.2
relative Proj of $\mathcal{A}$ over S in 22.16.7
relative quasi-regular immersion in 26.14.2
relative spectrum of $\mathcal{A}$ over S in 22.4.5
relative weak assassin of $\mathcal{F}$ in X over S in 26.8.1
relatively ample in 24.36.1
relatively limit preserving in 46.4.1
relatively very ample in 24.37.1
representable by a scheme in 21.15.1
representable by algebraic spaces in 54.3.1
representable by algebraic spaces in 57.9.1
representable by an algebraic space over S in 57.8.1
representable by open immersions in 21.15.3
representable quotient in 35.17.2
representable quotient in 35.17.2
representable quotient in 52.18.3
representable quotient in 52.18.3
representable sheaf in 9.12.3
representable in 4.3.6
representable in 4.6.3
representable in 4.8.2
representable in 4.37.1

representable in 4.38.5
representable in 21.15.1
representable in 51.19.4
residual gerbe of $\mathcal{X}$ at x exists in 60.11.8
residual gerbe of $\mathcal{X}$ at x in 60.11.8
residual space of X at x in 43.10.6
residue field of X at x in 21.2.1
resolution functor in 11.22.2
resolution of M by finite free R-modules in 7.67.2
resolution of M by free R-modules in 7.67.2
resolution in 7.67.2
restriction $(U, R, s, t, c)|_{\mathcal{C}'}$ of (U, R, s, t, c) to $\mathcal{C}'$ in 51.19.7
restriction of (U, R, s, t, c) to U' in 35.15.2
restriction of (U, R, s, t, c) to U' in 52.16.2
restriction of $\mathcal{F}$ to $\mathcal{C}/U$ in 9.21.1
restriction of $\mathcal{F}$ to $\mathcal{C}/U$ in 16.19.1
restriction of $\mathcal{F}$ to $U_{étale}$ in 58.9.2
restriction of $\mathcal{G}$ to U in 6.31.2
restriction of $\mathcal{G}$ to U in 6.31.2
restriction of $\mathcal{G}$ to U in 6.31.2
restriction to the small étale site in 30.4.14
restriction to the small Zariski site in 30.3.14
restriction in 35.3.3
restriction in 38.64.3
restriction in 52.4.3
retrocompact in 5.9.1
right acyclic for F in 11.15.3
right adjoint in 4.22.1
right deriveable in 11.14.9
right derived functor RF is defined at in 11.14.2
right derived functors of F in 11.15.3
right exact in 4.21.1
right multiplicative system in 4.24.1
ring of rational functions on X in 24.8.3
ringed site in 16.6.1
ringed site in 38.17.2
ringed space in 6.25.1
ringed topos in 16.7.1
satisfies the existence part of the valuative criterion in 21.20.3
satisfies the existence part of the valuative criterion in 42.11.1
satisfies the sheaf property for the fpqc topology in 30.8.12
satisfies the sheaf property for the fpqc topology in 38.15.5
satisfies the sheaf property for the given family in 30.8.12
satisfies the sheaf property for the Zariski topology in 21.15.3
satisfies the uniqueness part of the valuative criterion in 21.20.3
satisfies the uniqueness part of the valuative criterion in 42.11.1
satisfies the valuative criterion in 42.11.1
saturated in 4.24.17
saturated in 11.6.1
scheme over R in 21.18.1
scheme over S in 21.18.1
scheme structure on Z in 21.12.5
scheme theoretic closure of U in X in 24.5.1
scheme theoretic fibre X_s of f over s in 21.18.4
scheme theoretic image in 24.4.2
scheme theoretic support of $\mathcal{F}$ in 25.10.5
scheme theoretically dense in X in 24.5.1
scheme in 21.9.1
semi-representable objects in 20.2.1
separable degree in 7.38.3
separable over k in 7.39.1
separable in 7.38.1
separably generated over k in 7.39.1
separated group scheme in 35.4.4
separated over S in 40.13.2
separated over S in 61.4.2
separated presheaf in 38.11.1
separated in 6.11.2
separated in 9.10.9
separated in 9.42.2
separated in 10.13.1
separated in 21.21.3
separated in 21.21.3
separated in 41.3.1
separated in 41.3.1
separated in 42.5.2
separated in 61.4.1
separated in 61.4.2
separates R-orbits in 56.5.8
separates orbits in 56.5.8
Serre subcategory in 10.7.1
set-theoretic equivalence relation in 56.5.13

set-theoretic pre-equivalence relation in 56.5.13
set-theoretically R-invariant in 56.5.8
setoid in 4.36.1
sheaf $\mathcal{F}$ of $\mathcal{O}$-modules on $\mathcal{B}$ in 6.30.11
sheaf $\mathcal{F}$ of sets on $\mathcal{B}$ in 6.30.2
sheaf $\mathcal{F}$ of sets on X in 6.7.1
sheaf $\mathcal{F}$ with values in $\mathcal{C}$ on $\mathcal{B}$ in 6.30.8
sheaf associated to $\mathcal{F}$ in 9.10.11
sheaf associated to $\mathcal{F}$ in 9.42.4
sheaf associated to the module M and the ring map α in 15.10.6
sheaf associated to the module M in 15.10.6
sheaf for the étale topology in 58.4.3
sheaf for the fppf topology in 58.4.3
sheaf for the smooth topology in 58.4.3
sheaf for the syntomic topology in 58.4.3
sheaf for the Zariski topology in 58.4.3
sheaf of $\mathcal{O}$-modules associated to $\mathcal{F}$ in 31.6.2
sheaf of $\mathcal{O}$-modules associated to $\mathcal{F}$ in 31.6.2
sheaf of $\mathcal{O}$-modules in 6.10.1
sheaf of $\mathcal{O}$-modules in 16.10.1
sheaf of $\mathcal{O}_{\mathcal{X}}$-modules in 58.7.1
sheaf of R-invariant functions on X in 56.8.1
sheaf of abelian groups on X in 6.8.1
sheaf of automorphisms of x in 61.5.3
sheaf of differentials $\Omega_{X/S}$ of X over S in 24.32.4
sheaf of differentials $\Omega_{X/Y}$ of X over Y in 16.29.6
sheaf of differentials $\Omega_{X/Y}$ of X over Y in 46.6.2
sheaf of meromorphic functions on X in 26.15.1
sheaf of total quotient rings $\mathcal{K}_S$ in 65.34.1
sheaf theoretically empty in 9.37.1
sheaf in 6.9.1
sheaf in 9.7.1
sheaf in 9.7.6
sheaf in 9.40.10
sheaf in 38.11.1
sheaf in 58.4.3
short exact sequence in 10.3.18
sieve on U generated by the morphisms f_i in 9.40.3
sieve S on U in 9.40.1
similar in 38.59.3
simple in 7.48.9
simple in 8.2.3
simple in 8.2.3
simplicial abelian group in 14.3.1
simplicial object U of $\mathcal{C}$ in 14.3.1
simplicial scheme associated to f in 31.36.2
simplicial set in 14.3.1
singular ideal of A over R in 13.3.1
singular locus in 23.14.1
site in 9.6.2
site in 38.10.2
size in 17.15.1
skew field in 8.2.2
skyscraper sheaf at x with value A in 6.27.1
skyscraper sheaf in 6.27.1
skyscraper sheaf in 6.27.1
skyscraper sheaf in 6.27.1
skyscraper sheaf in 6.27.1
skyscraper sheaf in 9.28.6
small τ-site of S in 38.20.4
small étale site $X_{étale}$ in 41.15.1
small étale site of S in 30.4.8
small étale site over S in 38.27.3
small étale topos in 38.21.1
small étale topos in 41.15.6
small extension in 7.130.1
small extension in 51.3.2
small Zariski site F_{Zar} in 40.12.6
small Zariski site of S in 30.3.7
small Zariski sites in 38.27.3
small Zariski topos in 38.21.1
smooth at $\mathfrak{q}$ in 7.126.11
smooth at $x \in X$ in 24.33.1
smooth at x in 42.33.1
smooth covering of T in 30.5.1
smooth covering of X in 44.6.1
smooth group scheme in 35.4.4
smooth groupoid in 57.16.4
smooth local on source-and-target in 45.18.1
smooth local in 31.17.1
smooth of relative dimension d in 24.33.13
smooth sheaf in 58.4.3
smooth in 7.126.1
smooth in 24.33.1
smooth in 31.16.2
smooth in 42.33.1
smooth in 51.8.1

smooth in 51.21.1
smooth in 61.22.1
smooth in 63.4.3
sober in 5.5.4
special cocontinuous functor u from $\mathcal{C}$ to $\mathcal{D}$ in 9.25.2
specializations lift along f in 5.14.3
specialization in 5.14.1
specialization in 65.5.22
specialization in 65.29.2
specializing in 5.14.3
spectral sequence associated to (A, d, α) in 10.16.5
spectral sequence associated to the exact couple in 10.15.3
spectral sequence in $\mathcal{A}$ in 10.14.1
spectrum of $\mathcal{A}$ over S in 22.4.5
spectrum in 7.16.1
spectrum in 21.5.3
split category fibred in groupoids in 4.34.2
split fibred category in 4.33.2
split over u in 53.11.1
splits in 8.8.1
splitting field in 8.8.1
splitting of R over u in 53.11.1
split in 10.3.20
split in 14.16.1
stabilizer of the groupoid in algebraic spaces (U, R, s, t, c) in 52.15.2
stabilizer of the groupoid scheme (U, R, s, t, c) in 35.14.2
stable under base change in 24.13.1
stable under composition in 24.13.1
stable under generalization in 5.14.1
stable under specialization in 5.14.1
stack in discrete categories in 50.6.1
stack in groupoids in 50.5.1
stack in setoids in 50.6.1
stack in sets in 50.6.1
stack in 50.4.1
stalk in 38.29.6
stalk in 38.80.6
stalk in 41.16.6
standard τ-covering in 38.20.2
standard étale covering in 30.4.5
standard étale in 7.132.13
standard étale in 24.35.1
standard étale in 38.26.3
standard fppf covering in 30.7.5
standard fpqc covering in 30.8.9
standard open covering in 21.5.2
standard open covering in 21.5.2
standard open covering in 22.8.2
standard opens in 7.16.3
standard shrinking in 34.5.6
standard shrinking in 34.6.5
standard smooth algebra over R in 7.126.6
standard smooth covering in 30.5.5
standard smooth in 24.33.1
standard syntomic covering in 30.6.5
standard syntomic in 24.30.1
standard Zariski covering in 30.3.4
strict henselization of $\mathcal{O}_{S,s}$ in 38.33.2
strict henselization of R with respect to $\kappa \subset \kappa^{sep}$ in 7.139.14
strict henselization of S at $\overline{s}$ in 38.33.2
strict henselization of X at $\overline{x}$ in 41.19.2
strict henselization in 7.139.14
strict transform of M along $R \to R'$ in 12.19.1
strictly commutative in 10.25.3
strictly full in 4.2.10
strictly henselian in 7.139.1
strictly henselian in 38.32.6
strictly standard in A over R in 13.3.3
strict in 10.13.3
strongly $\mathcal{C}$-cartesian morphism in 4.30.1
strongly cartesian morphism in 4.30.1
strongly transcendental over R in 7.114.8
structure morphism in 21.18.1
structure of site on $\mathcal{S}$ inherited from $\mathcal{C}$ in 50.10.2
structure sheaf $\mathcal{O}_{Spec(R)}$ of the spectrum of R in 21.5.3
structure sheaf $\mathcal{O}_{Proj(S)}$ of the homogeneous spectrum of S in 22.8.3
structure sheaf of $\mathcal{X}$ in 58.6.1
structure sheaf of the big site $(Sch/S)_\tau$ in 31.6.2
structure sheaf in 16.6.1
structure sheaf in 16.7.1
structure sheaf in 38.23.3
structure sheaf in 41.18.2
sub 2-category in 4.26.2
subcanonical in 9.12.2
subcategory in 4.2.10

subfunctor $H \subset F$ in 21.15.3
submersive in 5.15.1
submersive in 24.23.1
submersive in 42.8.1
submersive in 61.10.1
subobject in 10.3.14
subpresheaf in 6.16.2
subpresheaf in 9.3.3
subsheaf generated by the s_i in 15.4.5
subsheaf of sections annihilated by $\mathcal{I}$ in 23.22.4
subsheaf in 6.16.2
sum of the effective Cartier divisors D_1 and D_2 in 26.9.4
sum of the effective Cartier divisors in 29.27.5
support of $\mathcal{F}$ in 15.5.1
support of $\mathcal{F}$ in 38.31.3
support of $\mathcal{F}$ in 41.17.3
support of σ in 38.31.3
support of σ in 41.17.3
support of M in 7.59.2
support of s in 15.5.1
surjective in 6.16.2
surjective in 6.16.2
surjective in 9.3.1
surjective in 9.11.1
surjective in 10.3.14
surjective in 24.9.1
surjective in 42.6.2
surjective in 60.5.1
symbol associated to M, a, b in 29.4.3
symbolic power in 7.61.1
symbol in 29.2.1
syntomic at $x \in X$ in 24.30.1
syntomic at x in 42.32.1
syntomic covering of T in 30.6.1
syntomic covering of X in 44.5.1
syntomic of relative dimension d in 24.30.15
syntomic sheaf in 58.4.3
syntomic in 7.125.1
syntomic in 24.30.1
syntomic in 42.32.1
system (M_i, μ_{ij}) of R-modules over I in 7.8.2
system of parameters of R in 7.57.9
system of rings in 65.2.1
system over I in $\mathcal{C}$ in 4.19.1
tame symbol in 29.4.5
tangent space $T\mathcal{F}$ of $\mathcal{F}$ in 51.11.1
tangent space TF of F in 51.10.9
tangent space of X over S in 65.28.3
tangent vector in 65.28.3
tautologically equivalent in 9.8.2
tensor power of $\mathcal{L}$ in 15.21.3
tensor product differential graded algebra in 10.25.4
termwise split injection $\alpha : A^\bullet \to B^\bullet$ in 11.8.3
termwise split sequence of complexes of $\mathcal{A}$ in 11.8.8
termwise split surjection $\beta : B^\bullet \to C^\bullet$ in 11.8.3
the fibre of X over z is flat at x over the fibre of Y over z in 46.18.2
the fibre of X over z is flat over the fibre of Y over z in 46.18.2
the functions on X are the R-invariant functions on U in 56.8.1
the restriction of $\mathcal{F}$ to its fibre over z is flat at x over the fibre of Y over z in 46.18.2
thickenings over B in 46.8.1
thickenings over S in 33.2.1
thickening in 33.2.1
thickening in 46.8.1
topological module in 12.27.1
topological ring in 12.27.1
topological space in 41.4.7
topological space in 60.4.8
topology associated to $\mathcal{C}$ in 9.41.2
topology on $\mathcal{C}$ in 9.40.6
topos in 9.15.1
tor dimension $\leq d$ in 12.41.1
Tor independent over R in 12.5.1
tor-amplitude in $[a, b]$ in 12.41.1
torsion free in 12.17.1
torsion in 12.17.1
torsion in 38.80.6
torsor in 18.5.1
torsor in 19.5.1
total chern class of $\mathcal{E}$ on X in 29.34.1
total right derived functor of F in 38.69.4
total right derived functor of G in 38.69.4
totally disconnected in 5.4.6
trace in 38.64.3
trace in 38.67.1

transcendence basis in 7.37.1
transcendence degree of $x/f(x)$ in 42.30.1
transcendence degree in 7.37.3
transition maps in 4.19.1
triangle associated to the termwise split sequence of complexes in 11.8.8
triangle in 11.3.1
triangulated category in 11.3.2
triangulated functor in 11.3.3
triangulated subcategory in 11.3.4
trivial $\mathcal{G}$-torsor in 18.5.1
trivial $\mathcal{G}$-torsor in 19.5.1
trivial descent datum in 31.2.3
trivial descent datum in 31.30.10
trivial descent datum in 45.3.3
trivial descent datum in 50.3.5
trivial in 15.21.1
trivial in 35.9.1
trivial in 52.9.1
trivial in 65.32.4
twist of the structure sheaf of $Proj(S)$ in 22.10.1
twist of the structure sheaf in 22.20.1
type of algebraic structure in 6.15.1
UFD in 7.111.4
underlying presheaf of sets of $\mathcal{F}$ in 6.5.2
uniform categorical quotient in 56.4.4
uniformly in 56.7.1
unique factorization domain in 7.111.4
universal δ-functor in 10.9.3
universal φ-derivation in 16.29.3
universal S-derivation in 24.32.4
universal Y-derivation in 16.29.6
universal Y-derivation in 46.6.2
universal categorical quotient in 56.4.4
universal effective epimorphism in 9.12.1
universal first order thickening in 7.136.2
universal first order thickening in 33.5.2
universal first order thickening in 46.12.5
universal flattening of $\mathcal{F}$ exists in 34.21.1
universal flattening of X exists in 34.21.1
universal homeomorphism in 24.43.1
universal homeomorphism in 42.41.2
universally S-pure in 34.16.1
universally catenary in 7.97.5
universally catenary in 24.16.1
universally closed in 5.12.2
universally closed in 21.20.1
universally closed in 42.10.2
universally closed in 61.11.2
universally exact in 7.76.1
universally injective in 7.76.1
universally injective in 24.10.1
universally injective in 42.18.3
universally Japanese in 7.144.15
universally Japanese in 23.13.1
universally open in 24.22.1
universally open in 42.7.2
universally open in 61.9.2
universally pure along X_s in 34.16.1
universally pure relative to S in 34.16.1
universally submersive in 24.23.1
universally submersive in 42.8.1
universally submersive in 61.10.1
universally in 56.7.1
unramified at $\mathfrak{q}$ in 7.138.1
unramified at $x \in X$ in 24.34.1
unramified at x in 37.3.5
unramified at x in 42.34.1
unramified cusp form on $GL_2(\mathbf{A})$ with values in Λ in 38.93.1
unramified homomorphism of local rings in 37.3.1
unramified in 7.138.1
unramified in 24.34.1
unramified in 37.3.5
unramified in 42.34.1
valuation ring in 7.46.1
valuation in 7.46.8
value group in 7.46.8
value of LF at X in 11.14.2
value of RF at X in 11.14.2
value in 4.20.1
value in 4.20.1
variety in 28.3.1
variety in 38.59.13
vector bundle $\pi : V \to S$ over S in 22.6.2
vector bundle associated to $\mathcal{E}$ in 22.6.1
versal in 51.8.13
vertical in 4.26.1
very ample on X/S in 24.37.1
very reasonable in 43.6.1
very reasonable in 43.13.1
viewed as an algebraic space over S' in 40.16.2

viewed as an algebraic stack over S' in 57.19.2
weak R-orbit in 56.5.4
weak functor in 4.26.5
weak orbit in 56.5.4
weak Serre subcategory in 10.7.1
weaker than the canonical topology in 9.12.2
weakly R-equivalent in 56.5.4
weakly associated points of X in 26.5.1
weakly associated in 7.63.1
weakly associated in 26.5.1
Weil divisor $[D]$ associated to an effective Cartier divisor $D \subset X$ in 65.34.1
Weil divisor associated to $\mathscr{L}$ in 29.24.1
Weil divisor associated to s in 29.24.1
Weil divisor associated to a Cartier divisor in 65.34.1
Weil divisor associated to a rational function $f \in K(X)^*$ in 65.34.1
Weil divisor in 65.34.1
which associates a sheaf to a semi-representable object in 20.2.2
Yoneda extension in 11.26.4
Zariski covering of T in 30.3.1
Zariski covering of X in 44.8.1
Zariski covering in 40.12.5
Zariski locally quasi-separated over S in 40.13.2
Zariski locally quasi-separated in 41.3.1
Zariski locally quasi-separated in 41.3.1
Zariski sheaf in 58.4.3
Zariski topos in 38.21.1
Zariski, étale, smooth, syntomic, or fppf covering in 39.12.4
Zariski in 7.16.3
zero object in 10.3.3
zero scheme in 26.9.15
zeroth K-group of $\mathscr{A}$ in 10.8.1
zeroth Cech cohomology group in 38.13.1
Čech cohomology groups in 18.9.1
Čech complex in 18.9.1

Set Theory

Categories

In 4.2.1: *category*
In 4.2.4: *isomorphism*
In 4.2.5: *groupoid*
In 4.2.8: *functor*
In 4.2.9: *faithful*, *fully faithful*, *essentially surjective*
In 4.2.10: *subcategory*, *full subcategory*, *strictly full*
In 4.2.15: *natural transformation*, *morphism of functors*
In 4.2.17: *equivalence of categories*, *quasi-inverse*
In 4.2.20: *product category*
In 4.3.1: *opposite category*
In 4.3.2: *contravariant*
In 4.3.3: *presheaf of sets on $\mathscr{C}$*, *presheaf*
In 4.3.6: *representable*
In 4.4.1: *product*
In 4.4.2: *has products of pairs of objects*
In 4.5.1: *coproduct*, *amalgamated sum*
In 4.5.2: *has coproducts of pairs of objects*
In 4.6.1: *fibre product*
In 4.6.2: *has fibre products*
In 4.6.3: *representable*
In 4.8.2: *representable*, *F is relatively representable over G*
In 4.9.1: *push out*
In 4.10.1: *equalizer*
In 4.11.1: *coequalizer*
In 4.12.1: *initial*, *final*
In 4.13.1: *limit*
In 4.13.2: *colimit*
In 4.13.5: *product*
In 4.13.6: *coproduct*
In 4.15.1: *connected*
In 4.17.1: *directed*, *filtered*, *directed*, *filtered*
In 4.17.5: *$\mathscr{I}$ is cofinal in $\mathscr{J}$*
In 4.18.1: *codirected*, *cofiltered*, *codirected*, *cofiltered*
In 4.19.1: *system over I in $\mathscr{C}$*, *inductive system over I in $\mathscr{C}$*, *inverse system over I in*

$\mathscr{C}$, *projective system over* I *in* $\mathscr{C}$, *transition maps*
In 4.19.2: *directed system*, *directed inverse system*, *directed*
In 4.20.1: *is essentially constant*, *value*, *essentially constant*, *value*
In 4.20.2: *essentially constant system*, *essentially constant inverse system*
In 4.21.1: *left exact*, *right exact*, *exact*
In 4.22.1: *left adjoint*, *right adjoint*
In 4.23.1: *monomorphism*, *epimorphism*
In 4.24.1: *left multiplicative system*, *right multiplicative system*, *multiplicative system*
In 4.24.17: *saturated*
In 4.25.1: *horizontal*
In 4.26.1: 2-*category*, 1-*morphisms*, 2-*morphisms*, *vertical*, *composition*, *horizontal*
In 4.26.2: *sub* 2-*category*
In 4.26.4: *equivalent*
In 4.26.5: *functor*, *weak functor*, *pseudo functor*
In 4.27.1: $(2,1)$-*category*
In 4.28.1: *final object*
In 4.28.2: *2-fibre product of* f *and* g
In 4.29.1: 2-*category of categories over* $\mathscr{C}$
In 4.29.2: *fibre category*, *lift*, x *lies over* U, *lift*, ϕ *lies over* f
In 4.30.1: *strongly cartesian morphism*, *strongly* $\mathscr{C}$*-cartesian morphism*
In 4.30.4: *fibred category over* $\mathscr{C}$
In 4.30.5: *choice of pullbacks*, *pullback functor*
In 4.30.8: 2-*category of fibred categories over* $\mathscr{C}$
In 4.31.2: *relative inertia of* $\mathscr{S}$ *over* $\mathscr{S}'$, *inertia fibred category* $\mathscr{I}_{\mathscr{S}}$ *of* $\mathscr{S}$
In 4.32.1: *fibred in groupoids*
In 4.32.6: 2-*category of categories fibred in groupoids over* $\mathscr{C}$
In 4.33.2: *split fibred category*, $\mathscr{S}_F$
In 4.34.2: *split category fibred in groupoids*, $\mathscr{S}_F$
In 4.35.1: *discrete*
In 4.35.2: *category fibred in sets*, *category fibred in discrete categories*
In 4.35.3: 2-*category of categories fibred in sets over* $\mathscr{C}$
In 4.36.1: *setoid*
In 4.36.2: *category fibred in setoids*
In 4.36.3: 2-*category of categories fibred in setoids over* $\mathscr{C}$
In 4.37.1: *representable*
In 4.38.5: *representable*, $\mathscr{X}$ *is relatively representable over* $\mathscr{Y}$

Topology

In 5.3.1: *base for the topology on* X, *basis for the topology on* X
In 5.4.1: *connected*, *connected component*
In 5.4.6: *totally disconnected*
In 5.4.7: *locally connected*
In 5.5.1: *irreducible*, *irreducible component*
In 5.5.4: *generic point*, *Kolmogorov*, *sober*
In 5.6.1: *Noetherian*, *locally Noetherian*
In 5.7.1: *chain of irreducible closed subsets*, *length*, *dimension*, *Krull dimension*, *Krull dimension of* X *at* x
In 5.7.4: *equidimensional*
In 5.8.1: *catenary*
In 5.8.3: *codimension*
In 5.9.1: *quasi-compact*, *quasi-compact*, *retrocompact*
In 5.10.1: *constructible*, *locally construcible*
In 5.12.2: *closed*, *proper*, *quasi-proper*, *universally closed*
In 5.13.1: *Jacobson*
In 5.14.1: *specialization*, *generalization*, *stable under specialization*, *stable under generalization*
In 5.14.3: *specializations lift along* f, *specializing*, *generalizations lift along* f, *generalizing*
In 5.15.1: *submersive*
In 5.16.1: *immediate specialization*, *dimension function*
In 5.17.1: *interior*, *nowhere dense*
In 5.18.1: *locally quasi-compact*
In 5.18.3: *isolated point*

Sheaves on Spaces

In 6.3.1: *presheaf* $\mathscr{F}$ *of sets on* X, *morphism* $\varphi : \mathscr{F} \to \mathscr{G}$ *of presheaves of sets on* X
In 6.3.2: *constant presheaf with value* A
In 6.4.4: *presheaf of abelian groups on* X, *abelian presheaf over* X, *morphism of abelian presheaves over* X

In 6.5.1: *presheaf $\mathcal{F}$ on X with values in $\mathcal{C}$*, *morphism $\varphi : \mathcal{F} \to \mathcal{G}$ of presheaves with value in $\mathcal{C}$*
In 6.5.2: *underlying presheaf of sets of $\mathcal{F}$*
In 6.6.1: *presheaf of $\mathcal{O}$-modules*, *morphism $\varphi : \mathcal{F} \to \mathcal{G}$ of presheaves of $\mathcal{O}$-modules*
In 6.7.1: *sheaf $\mathcal{F}$ of sets on X*, *morphism of sheaves of sets*
In 6.7.4: *constant sheaf with value A*
In 6.8.1: *abelian sheaf on X*, *sheaf of abelian groups on X*
In 6.9.1: *sheaf*
In 6.10.1: *sheaf of $\mathcal{O}$-modules*, *morphism of sheaves of $\mathcal{O}$-modules*
In 6.11.2: *separated*
In 6.15.1: *type of algebraic structure*
In 6.16.2: *subpresheaf*, *subsheaf*, *injective*, *surjective*, *injective*, *surjective*
In 6.21.7: *f-map $\xi : \mathcal{G} \to \mathcal{F}$*
In 6.21.9: *composition of φ and ψ*
In 6.25.1: *ringed space*, *morphism of ringed spaces*
In 6.25.3: *composition of morphisms of ringed spaces*
In 6.26.1: *pushforward*, *pullback*
In 6.27.1: *skyscraper sheaf at x with value A*, *skyscraper sheaf*, *skyscraper sheaf*, *skyscraper sheaf*, *skyscraper sheaf*
In 6.30.1: *presheaf $\mathcal{F}$ of sets on $\mathcal{B}$*, *morphism $\varphi : \mathcal{F} \to \mathcal{G}$ of presheaves of sets on $\mathcal{B}$*
In 6.30.2: *sheaf $\mathcal{F}$ of sets on $\mathcal{B}$*, *morphism of sheaves of sets on $\mathcal{B}$*
In 6.30.8: *presheaf $\mathcal{F}$ with values in $\mathcal{C}$ on $\mathcal{B}$*, *morphism $\varphi : \mathcal{F} \to \mathcal{G}$ of presheaves with values in $\mathcal{C}$ on $\mathcal{B}$*, *sheaf $\mathcal{F}$ with values in $\mathcal{C}$ on $\mathcal{B}$*
In 6.30.11: *presheaf of $\mathcal{O}$-modules $\mathcal{F}$ on $\mathcal{B}$*, *morphism $\varphi : \mathcal{F} \to \mathcal{G}$ of presheaves of $\mathcal{O}$-modules on $\mathcal{B}$*, *sheaf $\mathcal{F}$ of $\mathcal{O}$-modules on $\mathcal{B}$*
In 6.31.2: *restriction of $\mathcal{G}$ to U*, *restriction of $\mathcal{G}$ to U*, *open subspace of $(X, \mathcal{O})$ associated to U*, *restriction of $\mathcal{G}$ to U*
In 6.31.3: *extension of $\mathcal{F}$ by the empty set $j_{p!}\mathcal{F}$*, *extension of $\mathcal{F}$ by the empty set $j_!\mathcal{F}$*
In 6.31.5: *extension $j_{p!}\mathcal{F}$ of $\mathcal{F}$ by 0*, *extension $j_!\mathcal{F}$ of $\mathcal{F}$ by 0*, *extension $j_{p!}\mathcal{F}$ of $\mathcal{F}$ by e*, *extension $j_!\mathcal{F}$ of $\mathcal{F}$ by e*, *extension by 0*, *extension by 0*

Commutative Algebra

In 7.5.1: *finite R-module*, *finitely generated R-module*, *finitely presented R-module*, *R-module of finite presentation*
In 7.6.1: *finite type*, *S is a finite type R-algebra*, *finite presentation*
In 7.7.1: *finite*
In 7.8.1: *partially ordered set*, *directed set*
In 7.8.2: *system (M_i, μ_{ij}) of R-modules over I*, *directed system*
In 7.8.7: *homomorphism of systems*
In 7.8.12: *relation*
In 7.9.1: *multiplicative subset of R*
In 7.9.2: *localization of A with respect to S*
In 7.9.6: *localization*
In 7.11.1: *R-bilinear*
In 7.11.6: *(A, B)-bimodule*
In 7.13.1: *base change*, *base change*
In 7.16.1: *spectrum*
In 7.16.3: *Zariski*, *standard opens*
In 7.17.1: *local ring*, *local homomorphism of local rings*, *local ring map $\varphi : R \to S$*
In 7.25.2: *Oka family*
In 7.31.1: *Jacobson ring*
In 7.32.1: *integral over R*, *integral*
In 7.32.8: *integral closure*, *integrally closed*
In 7.33.1: *normal*
In 7.33.3: *almost integral over R*, *completely normal*
In 7.33.10: *normal*
In 7.34.1: *integral over I*
In 7.35.1: *flat*, *faithfully flat*, *flat*, *faithfully flat*
In 7.36.1: *going up*, *going down*
In 7.37.1: *algebraically independent*, *purely transcendental extension*, *transcendence basis*
In 7.37.3: *transcendence degree*
In 7.38.1: *algebraic*, *separable*, *purely inseparable*, *normal*, *Galois*
In 7.38.3: *separable degree*, *inseparable degree*, *degree of inseparability*
In 7.38.6: *algebraic closure of k in K*, *algebraically closed in K*
In 7.39.1: *separably generated over k*, *separable over k*

In 7.40.1: *geometrically reduced over k*
In 7.42.1: *perfect*
In 7.42.5: *perfect closure*
In 7.43.6: *geometrically irreducible over k*
In 7.44.3: *geometrically connected over k*
In 7.45.1: *geometrically integral over k*
In 7.46.1: *dominates*, *valuation ring*, *centered*
In 7.46.8: *value group*, *valuation*, *discrete valuation ring*
In 7.47.2: *locally nilpotent*, *nilpotent*
In 7.48.1: *length*
In 7.48.9: *simple*
In 7.49.1: *Artinian*
In 7.50.1: *essentially of finite type*, *essentially of finite presentation*
In 7.53.1: *homogeneous spectrum*
In 7.54.1: *blowup algebra*, *Rees algebra*, *affine blowup algebra*
In 7.55.2: *numerical polynomial*
In 7.56.1: *an ideal of definition of R*
In 7.56.7: $d(M)$
In 7.57.1: *Krull dimension*
In 7.57.2: *height*
In 7.57.9: *system of parameters of R*, *regular local ring*, *regular system of parameters*
In 7.59.2: *support of M*
In 7.60.1: *associated*
In 7.61.1: *symbolic power*
In 7.62.2: *relative assassin of N over S/R*
In 7.63.1: *weakly associated*
In 7.64.1: *embedded associated primes*, *embedded primes of R*
In 7.65.1: *M-regular*, *M-regular sequence in I*, *regular sequence*
In 7.65.4: *I-depth*, *depth*
In 7.66.1: *M-quasi-regular*, *quasi-regular sequence*
In 7.67.2: *resolution*, *resolution of M by free R-modules*, *resolution of M by finite free R-modules*
In 7.71.1: *projective*
In 7.72.1: *locally free*, *finite locally free*
In 7.76.1: *universally injective*, *universally exact*
In 7.78.1: *direct sum dévissage*, *Kaplansky dévissage*
In 7.80.1: *Mittag-Leffler inverse system*
In 7.82.1: *Mittag-Leffler directed system of modules*
In 7.82.2: *dominates*
In 7.82.6: *Mittag-Leffler*
In 7.84.1: *coherent module*, *coherent ring*
In 7.90.5: *I-adically complete*, *I-adically complete*
In 7.94.4: *rank*
In 7.95.1: *Cohen-Macaulay*
In 7.96.1: *Cohen-Macaulay*
In 7.96.6: *Cohen-Macaulay*
In 7.96.9: *maximal Cohen-Macaulay*
In 7.97.1: *catenary*
In 7.97.5: *universally catenary*
In 7.100.1: *pure*
In 7.101.2: *finite projective dimension*, *projective dimension*
In 7.101.6: *finite global dimension*, *global dimension*
In 7.102.6: *regular*
In 7.103.5: *local ring of the fibre at $\mathfrak{q}$*
In 7.111.1: *associates*, *irreducible*, *prime*
In 7.111.4: *unique factorization domain*, *UFD*
In 7.111.6: *principal ideal domain*, *PID*
In 7.111.8: *Dedekind domain*
In 7.112.2: *order of vanishing along R*
In 7.112.3: *lattice in V*
In 7.112.5: *distance between M and M'*
In 7.113.3: *quasi-finite at $\mathfrak{q}$*, *quasi-finite*
In 7.114.8: *strongly transcendental over R*
In 7.116.1: *relative dimension of S/R at $\mathfrak{q}$*, *relative dimension of*
In 7.122.1: *derivation*, *R-derivation*, *Leibniz rule*
In 7.122.2: *module of Kähler diffentials*, *module of differentials*
In 7.123.1: *naive cotangent complex*
In 7.124.1: *global complete intersection over k*, *local complete intersection over k*
In 7.124.5: *complete intersection (over k)*
In 7.125.1: *syntomic*, *flat local complete intersection over R*
In 7.125.5: *relative global complete intersection*
In 7.126.1: *smooth*
In 7.126.6: *standard smooth algebra over R*
In 7.126.11: *smooth at $\mathfrak{q}$*

In 7.127.1: *formally smooth over R*
In 7.130.1: *small extension*
In 7.132.1: *étale*, *étale at $\mathfrak{q}$*
In 7.132.13: *standard étale*
In 7.135.1: *formally unramified over R*
In 7.136.2: *universal first order thickening*, *conormal module*, $C_{S/R}$
In 7.137.1: *formally étale over R*
In 7.138.1: *unramified*, *G-unramified*, *unramified at $\mathfrak{q}$*, *G-unramified at $\mathfrak{q}$*
In 7.139.1: *henselian*, *strictly henselian*
In 7.139.14: *henselization*, *strict henselization of R with respect to $\kappa \subset \kappa^{sep}$*, *strict henselization*
In 7.140.1: (R_k), *regular in codimension $\leq k$*, (S_k)
In 7.143.1: *complete local ring*
In 7.143.4: *coefficient ring*
In 7.143.5: *Cohen ring*
In 7.144.1: *N-1*, *N-2*, *Japanese*
In 7.144.15: *universally Japanese*, *Nagata ring*
In 7.144.23: *analytically unramified*, *analytically unramified*
In 7.147.2: *geometrically normal*
In 7.148.2: *geometrically regular*

Brauer groups

In 8.2.1: *finite*
In 8.2.2: *skew field*
In 8.2.3: *simple*, *simple*
In 8.2.4: *central*
In 8.2.5: *opposite algebra*
In 8.5.2: *Brauer group*
In 8.8.1: *splits*, *splitting field*

Sites and Sheaves

In 9.2.1: *presheaf of sets*, *Morphisms of presheaves*
In 9.2.2: *presheaf*, *morphism*
In 9.3.1: *injective*, *surjective*
In 9.3.3: *subpresheaf*
In 9.3.5: *image of φ*
In 9.6.1: *family of morphisms with fixed target*
In 9.6.2: *site*, *coverings of $\mathcal{C}$*
In 9.7.1: *sheaf*
In 9.7.5: *$Sh(\mathcal{C})$*
In 9.7.6: *sheaf*
In 9.8.1: *morphism of families of maps with fixed target of $\mathcal{C}$ from $\mathcal{U}$ to $\mathcal{V}$*, *morphism from $\mathcal{U}$ to $\mathcal{V}$*, *refinement*
In 9.8.2: *combinatorially equivalent*, *tautologically equivalent*
In 9.10.9: *separated*
In 9.10.11: *sheaf associated to $\mathcal{F}$*
In 9.11.1: *injective*, *surjective*
In 9.12.1: *effective epimorphism*, *universal effective epimorphism*
In 9.12.2: *weaker than the canonical topology*, *subcanonical*
In 9.12.3: $\underline{U} = h_U$, U, *representable sheaf*
In 9.13.1: *continuous*
In 9.14.1: *morphism of sites*
In 9.14.4: *composition*
In 9.15.1: *topos*, *morphism of topoi*, *composition $f \circ g$*
In 9.18.1: *cocontinuous*
In 9.21.1: *localization of the site $\mathcal{C}$ at the object U*, *localization morphism*, *direct image functor*, *restriction of $\mathcal{F}$ to $\mathcal{C}/U$*, *extension of $\mathcal{G}$ by the empty set*
In 9.25.2: *special cocontinuous functor u from $\mathcal{C}$ to $\mathcal{D}$*
In 9.26.4: *localization of the topos $Sh(\mathcal{C})$ at $\mathcal{F}$*, *localization morphism*
In 9.28.1: *point of the topos $Sh(\mathcal{C})$*
In 9.28.2: *point p of the site $\mathcal{C}$*
In 9.28.6: *skyscraper sheaf*
In 9.32.1: *2-morphism from f to g*
In 9.33.2: *morphism $f : p \to p'$*
In 9.34.1: *conservative*, *has enough points*
In 9.37.1: *sheaf theoretically empty*
In 9.37.3: *almost cocontinuous*
In 9.38.1: *pushforward*
In 9.39.1: *global sections*
In 9.40.1: *sieve S on U*
In 9.40.3: *sieve on U generated by the morphisms f_i*
In 9.40.4: *pullback of S by f*
In 9.40.6: *topology on $\mathcal{C}$*
In 9.40.8: *finer*
In 9.40.10: *sheaf*
In 9.40.12: *canonical topology*
In 9.41.2: *topology associated to $\mathcal{C}$*
In 9.42.2: *separated*
In 9.42.4: *sheaf associated to $\mathcal{F}$*

In 9.45.1: *point p*

Homological Algebra

In 10.3.1: *preadditive*, *additive*
In 10.3.3: *zero object*
In 10.3.5: *direct sum*
In 10.3.8: *additive*
In 10.3.9: *kernel*, *cokernel*, *coimage of f*, *image of f*
In 10.3.12: *abelian*
In 10.3.14: *injective*, *surjective*, *subobject*, *quotient*
In 10.3.18: *complex*, *exact at y*, *exact*, *short exact sequence*
In 10.3.20: *split*
In 10.4.1: *extension E of B by A*
In 10.4.2: *Ext-group*
In 10.7.1: *Serre subcategory*, *weak Serre subcategory*
In 10.7.5: *kernel of the functor F*
In 10.8.1: *zeroth K-group of $\mathcal{A}$*
In 10.9.1: *cohomological δ-functor*, *δ-functor*
In 10.9.2: *morphism of δ-functors from F to G*
In 10.9.3: *universal δ-functor*
In 10.10.2: *homotopy equivalence*, *homotopy equivalent*
In 10.10.4: *quasi-isomorphism*, *acyclic*
In 10.10.8: *homotopy equivalence*, *homotopy equivalent*
In 10.10.10: *quasi-isomorphism*, *acyclic*
In 10.12.1: *k-shifted chain complex $A[k]_\bullet$*
In 10.12.2: $H_{i+k}(A_\bullet) \to H_i(A[k]_\bullet)$
In 10.12.7: *k-shifted cochain complex $A[k]^\bullet$*
In 10.12.8: $H^{i+k}(A^\bullet) \longrightarrow H^i(A[k]^\bullet)$
In 10.13.1: *decreasing filtration*, *filtered object of $\mathcal{A}$*, *morphism $(A, F) \to (B, F)$ of filtered objects*, *induced filtration*, *quotient filtration*, *finite*, *separated*, *exhaustive*
In 10.13.3: *strict*
In 10.13.12: *graded object of $\mathcal{A}$*, *morphism $(A, k) \to (B, k)$ of graded objects*
In 10.14.1: *spectral sequence in $\mathcal{A}$*, *morphism of spectral sequences*
In 10.14.2: *limit*, *collapses at E_r*, *degenerates at E_r*
In 10.15.1: *exact couple*, *morphism of exact couples*
In 10.15.3: *spectral sequence associated to the exact couple*
In 10.16.1: *differential object*, *morphism of differential objects*
In 10.16.3: *homology*
In 10.16.5: *spectral sequence associated to (A, d, α)*
In 10.17.1: *filtered differential object*
In 10.17.4: *induced filtration*
In 10.17.6: *converges*, *abuts to*, *converges to*
In 10.18.1: *filtered complex $K^\bullet$ of $\mathcal{A}$*
In 10.18.5: *induced filtration*
In 10.18.7: *converges*
In 10.19.1: *double complex*
In 10.19.2: *associated simple complex $sA^\bullet$*, *associated total complex*
In 10.19.4: *converges*, *converges*
In 10.20.1: *injective*
In 10.20.4: *enough injectives*
In 10.20.5: *functorial injective embeddings*
In 10.21.1: *projective*
In 10.21.4: *enough projectives*
In 10.21.5: *functorial projective surjections*
In 10.23.2: *Mittag-Leffler condition*, *ML*
In 10.25.1: *differential graded algebra*
In 10.25.2: *homomorphism of differential graded algebras*
In 10.25.3: *commutative*, *strictly commutative*
In 10.25.4: *tensor product differential graded algebra*

Derived Categories

In 11.3.1: *triangle*, *morphism of triangles*
In 11.3.2: *triangulated category*, *distinguished triangles*, *pre-triangulated category*
In 11.3.3: *exact functor*, *triangulated functor*
In 11.3.4: *pre-triangulated subcategory*, *triangulated subcategory*
In 11.3.5: *homological*, *cohomological*
In 11.3.6: *δ-functor from $\mathcal{A}$ to $\mathcal{D}$*, *image of the short exact sequence under the given δ-functor*
In 11.5.1: *compatible with the triangulated structure*
In 11.6.1: *saturated*
In 11.6.5: *kernel of F*, *kernel of H*

In 11.6.7: *quotient category $\mathcal{D}/\mathcal{B}$*, *quotient functor*
In 11.7.1: *category of (cochain) complexes*, *bounded below*, *bounded above*, *bounded*
In 11.8.1: *cone*
In 11.8.3: *termwise split injection $\alpha : A^\bullet \to B^\bullet$*, *termwise split surjection $\beta : B^\bullet \to C^\bullet$*
In 11.8.8: *termwise split sequence of complexes of $\mathcal{A}$*, *triangle associated to the termwise split sequence of complexes*
In 11.9.1: *distinguished triangle of $K(\mathcal{A})$*
In 11.10.3: *derived category of $\mathcal{A}$*, *bounded derived category*
In 11.13.1: *category of finite filtered objects of $\mathcal{A}$*
In 11.13.2: *filtered quasi-isomorphism*, *filtered acyclic*
In 11.13.5: *filtered derived category of $\mathcal{A}$*
In 11.13.7: *bounded filtered derived category*
In 11.14.2: *right derived functor RF is defined at*, *value of RF at X*, *left derived functor LF is defined at*, *value of LF at X*
In 11.14.9: *right deriveable*, *everywhere defined*, *left deriveable*, *everywhere defined*
In 11.14.10: *computes*, *computes*
In 11.15.3: *right derived functors of F*, *left derived functors of F*, *right acyclic for F*, *acyclic for RF*, *left acyclic for F*, *acyclic for LF*
In 11.16.2: *ith right derived functor R^iF of F*
In 11.17.1: *injective resolution of A*, *injective resolution of $K^\bullet$*
In 11.18.1: *projective resolution of A*, *projective resolution of $K^\bullet$*
In 11.20.1: *Cartan-Eilenberg resolution*
In 11.22.2: *resolution functor*
In 11.25.1: *filtered injective*
In 11.26.1: *ith extension group*
In 11.26.4: *Yoneda extension*, *equivalent*
In 11.28.1: *K-injective*

More on Algebra

In 12.3.3: *K-flat*
In 12.3.12: *derived tensor product*
In 12.5.1: *Tor independent over R*
In 12.8.1: *I-power torsion module*, *an f-power torsion module*
In 12.10.1: *auto-associated*
In 12.17.1: *torsion*, *torsion free*
In 12.19.1: *strict transform of M along $R \to R'$*
In 12.21.1: *Koszul complex*
In 12.21.2: *Koszul complex on $f_1, \ldots, f_r$*
In 12.22.1: *Koszul-regular*, *H_1-regular*
In 12.23.1: *regular ideal*, *Koszul-regular ideal*, *H_1-regular ideal*, *quasi-regular ideal*
In 12.24.2: *local complete intersection*
In 12.27.1: *topological ring*, *topological module*, *homomorphism of topological modules*, *homomorphism of topological rings*, *linearly topologized*, *linearly topologized*, *ideal of definition*, *pre-admissible*, *admissible*, *pre-adic*, *adic*
In 12.28.1: *formally smooth over R*
In 12.28.3: *formally smooth for the $\mathfrak{n}$-adic topology*
In 12.31.1: *regular*
In 12.34.1: *p-independent over k*, *p-basis of K over k*
In 12.35.1: *J-0*, *J-1*, *J-2*
In 12.38.1: *G-ring*
In 12.39.1: *quasi-excellent*, *excellent*
In 12.40.1: *m-pseudo-coherent*, *pseudo-coherent*, *m-pseudo-coherent*, *pseudo-coherent*
In 12.41.1: *tor-amplitude in $[a, b]$*, *finite tor dimension*, *tor dimension $\leq d$*, *finite tor dimension*
In 12.42.1: *perfect*, *perfect*
In 12.43.2: *compact object*
In 12.44.2: *an A-module finitely presented relative to R*
In 12.45.4: *m-pseudo-coherent relative to R*, *pseudo-coherent relative to R*, *m-pseudo-coherent relative to R*, *pseudo-coherent relative to R*
In 12.46.1: *pseudo-coherent ring map*, *perfect ring map*

Smoothing Ring Maps

In 13.3.1: *singular ideal of A over R*
In 13.3.3: *elementary standard in A over R*, *strictly standard in A over R*

Simplicial Methods

In 14.2.1: $\delta^n_j : [n-1] \to [n]$, $\sigma^n_j : [n+1] \to [n]$
In 14.3.1: *simplicial object U of $\mathcal{C}$*, *simplicial set*, *simplicial abelian group*, *morphism of simplicial objects $U \to U'$*, *category of simplicial objects of $\mathcal{C}$*
In 14.5.1: *cosimplicial object U of $\mathcal{C}$*, *cosimplicial set*, *cosimplicial abelian group*, *morphism of cosimplicial objects $U \to U'$*, *category of cosimplicial objects of $\mathcal{C}$*
In 14.6.1: *product of U and V*
In 14.7.1: *fibre product of V and W over U*
In 14.8.1: *push out of V and W over U*
In 14.9.1: *product of U and V*
In 14.10.1: *fibre product of V and W over U*
In 14.11.1: *n-simplex of U*, *face of x*, *degeneracy of x*, *degenerate*
In 14.12.1: *product $U \times V$ of U and V*, *product $U \times V$ exists*
In 14.13.1: $\mathit{Hom}(U, V)$
In 14.15.1: $\mathit{Hom}(U, V)$
In 14.16.1: *split*
In 14.17.1: *n-truncated simplicial object of $\mathcal{C}$*, *morphism of n-truncated simplicial objects*
In 14.18.1: *augmentation $\epsilon : U \to X$ of U towards an object X of $\mathcal{C}$*
In 14.20.3: *Eilenberg-Maclane object $K(A, k)$*
In 14.24.1: *homotopic*, *homotopy connecting a and b*
In 14.24.5: *homotopy equivalence*, *homotopy equivalent*
In 14.26.1: *homotopic*, *homotopy connecting a and b*

Sheaves of Modules

In 15.4.1: *generated by global sections*, *generate*
In 15.4.5: *subsheaf generated by the s_i*
In 15.5.1: *support of $\mathcal{F}$*, *support of s*
In 15.8.1: *locally generated by sections*
In 15.9.1: *finite type*
In 15.10.1: *quasi-coherent sheaf of $\mathcal{O}_X$-modules*
In 15.10.6: *sheaf associated to the module M and the ring map α*, *sheaf associated to the module M*
In 15.11.1: *finite presentation*
In 15.12.1: *coherent $\mathcal{O}_X$-module*
In 15.13.1: *closed immersion of ringed spaces*
In 15.14.1: *locally free*, *finite locally free*
In 15.16.1: *flat*
In 15.16.3: *flat at x*
In 15.17.1: *flat at x*, *flat*
In 15.20.1: *Koszul complex*
In 15.20.2: *Koszul complex on $f_1, \ldots, f_r$*
In 15.21.1: *invertible $\mathcal{O}_X$-module*, *trivial*
In 15.21.3: *tensor power of $\mathcal{L}$*
In 15.21.4: *associated graded ring*
In 15.21.6: *Picard group*

Modules on Sites

In 16.4.1: *free abelian presheaf*
In 16.5.1: *free abelian sheaf*
In 16.6.1: *ringed site*, *structure sheaf*, *morphism of ringed sites*, *composition of morphisms of ringed sites*
In 16.7.1: *ringed topos*, *structure sheaf*, *morphism of ringed topoi*, *composition of morphisms of ringed topoi*
In 16.8.1: *2-morphism from f to g*
In 16.9.1: *presheaf of $\mathcal{O}$-modules*, *morphism $\varphi : \mathcal{F} \to \mathcal{G}$ of presheaves of $\mathcal{O}$-modules*
In 16.10.1: *sheaf of $\mathcal{O}$-modules*, *morphism of sheaves of $\mathcal{O}$-modules*
In 16.13.1: *pushforward*, *pullback*
In 16.16.1: $g_{p!}\mathcal{F}$, $g_!\mathcal{F} = (g_{p!}\mathcal{F})^\#$
In 16.17.1: *free $\mathcal{O}$-module*, *finite free*, *generated by global sections*, *generated by finitely many global sections*, *global presentation*, *global finite presentation*
In 16.19.1: *localization of the ringed site $(\mathcal{C}, \mathcal{O})$ at the object U*, *localization morphism*, *direct image functor*, *restriction of $\mathcal{F}$ to $\mathcal{C}/U$*, *extension by zero*
In 16.21.2: *localization of the ringed topos $(Sh(\mathcal{C}), \mathcal{O})$ at $\mathcal{F}$*, *localization morphism*
In 16.23.1: *locally free*, *finite locally free*, *locally generated by sections*, *of finite type*, *quasi-coherent*, *of finite presentation*, *coherent*
In 16.26.1: *flat*, *flat*, *flat*, *flat*
In 16.27.1: *flat*, *flat*
In 16.28.1: *rank r*, *invertible $\mathcal{O}$-module*, $\mathcal{O}^*$
In 16.28.4: *Picard group*

In 16.29.1: *$\mathcal{O}_1$-derivation*, *φ-derivation*, *Leibniz rule*
In 16.29.3: *module of differentials*, *universal φ-derivation*
In 16.29.6: *Y-derivation*, *sheaf of differentials $\Omega_{X/Y}$ of X over Y*, *universal Y-derivation*
In 16.34.4: *locally ringed site*
In 16.34.6: *locally ringed*
In 16.34.8: *morphism of locally ringed topoi*, *morphism of locally ringed sites*

Injectives

In 17.3.1: *$M \mapsto M^\vee$*, *free module*
In 17.6.4: *α-small with respect to I*
In 17.14.1: *generator*, *Grothendieck abelian category*
In 17.15.1: *size*

Cohomology of Sheaves

In 18.5.1: *torsor*, *$\mathcal{G}$-torsor*, *morphism of $\mathcal{G}$-torsors*, *trivial $\mathcal{G}$-torsor*
In 18.9.1: *Čech complex*, *Čech cohomology groups*
In 18.17.1: *alternating Čech complex*
In 18.17.2: *ordered Čech complex*
In 18.18.1: *locally finite*
In 18.20.2: *K-flat*
In 18.20.13: *derived tensor product*

Cohomology on Sites

In 19.5.1: *pseudo torsor*, *pseudo $\mathcal{G}$-torsor*, *morphism of pseudo $\mathcal{G}$-torsors*, *torsor*, *$\mathcal{G}$-torsor*, *morphism of G-torsors*, *trivial $\mathcal{G}$-torsor*
In 19.9.1: *Cech complex*, *Cech cohomology groups*
In 19.13.4: *limp*
In 19.17.2: *K-flat*
In 19.17.11: *derived tensor product*

Hypercoverings

In 20.2.1: *semi-representable objects*
In 20.2.2: *which associates a sheaf to a semi-representable object*
In 20.2.4: *covering*
In 20.2.6: *hypercovering*
In 20.3.1: *homology of K*

Schemes

In 21.2.1: *locally ringed space $(X, \mathcal{O}_X)$*, *local ring of X at x*, *residue field of X at x*, *morphism of locally ringed spaces*
In 21.3.1: *open immersion*
In 21.3.3: *open subspace of X associated to U*
In 21.4.1: *closed immersion*
In 21.4.4: *closed subspace of X associated to the sheaf of ideals $\mathcal{I}$*
In 21.5.2: *standard open covering*, *standard open covering*
In 21.5.3: *structure sheaf $\mathcal{O}_{Spec(R)}$ of the spectrum of R*, *spectrum*
In 21.5.5: *affine scheme*, *morphism of affine schemes*
In 21.9.1: *scheme*, *morphism of schemes*
In 21.10.2: *open immersion*, *open subscheme*, *closed immersion*, *closed subscheme*, *immersion*, *locally closed immersion*
In 21.12.1: *reduced*
In 21.12.5: *scheme structure on Z*, *reduced induced scheme structure*, *reduction X_{red} of X*
In 21.15.1: *representable by a scheme*, *representable*
In 21.15.3: *satisfies the sheaf property for the Zariski topology*, *subfunctor $H \subset F$*, *representable by open immersions*, *covers F*
In 21.17.1: *fibre product*
In 21.17.7: *inverse image $f^{-1}(Z)$ of the closed subscheme Z*
In 21.18.1: *scheme over S*, *structure morphism*, *scheme over R*, *morphism $f : X \to Y$ of schemes over S*, *base change*, *base change*, *base change*
In 21.18.3: *preserved under arbitrary base change*, *preserved under base change*, *preserved under arbitrary base change*, *preserved under base change*
In 21.18.4: *scheme theoretic fibre X_s of f over s*, *fibre of f over s*
In 21.19.1: *quasi-compact*
In 21.20.1: *universally closed*
In 21.20.3: *satisfies the existence part of the valuative criterion*, *satisfies the uniqueness part of the valuative criterion*

In 21.21.3: *separated*, *quasi-separated*, *separated*, *quasi-separated*
In 21.23.1: *monomorphism*

Constructions of Schemes

In 22.4.5: *relative spectrum of $\mathcal{A}$ over S*, *spectrum of $\mathcal{A}$ over S*
In 22.5.1: *affine n-space over S*, *affine n-space over R*
In 22.6.1: *vector bundle associated to $\mathcal{E}$*
In 22.6.2: *vector bundle $\pi : V \to S$ over S*, *morphism of vector bundles over S*
In 22.7.1: *cone associated to $\mathcal{A}$*, *affine cone associated to $\mathcal{A}$*
In 22.7.2: *cone $\pi : C \to S$ over S*, *morphism of cones*
In 22.8.2: *standard open covering*
In 22.8.3: *structure sheaf $\mathcal{O}_{Proj(S)}$ of the homogeneous spectrum of S*, *homogeneous spectrum*
In 22.10.1: *twist of the structure sheaf of $Proj(S)$*
In 22.13.2: *projective n-space over $\mathbf{Z}$*, *projective n-space over S*, *projective n-space over R*
In 22.16.7: *relative homogeneous spectrum of $\mathcal{A}$ over S*, *homogeneous spectrum of $\mathcal{A}$ over S*, *relative Proj of $\mathcal{A}$ over S*
In 22.20.1: *projective bundle associated to $\mathcal{E}$*, *twist of the structure sheaf*
In 22.21.1: *blowing up of X along Z*, *blowing up of X in the ideal sheaf $\mathcal{I}$*

Properties of Schemes

In 23.3.1: *integral*
In 23.4.1: *local*
In 23.4.2: *locally P*
In 23.5.1: *locally Noetherian*, *Noetherian*
In 23.6.1: *Jacobson*
In 23.7.1: *normal*
In 23.8.1: *Cohen-Macaulay*
In 23.9.1: *regular*, *nonsingular*
In 23.10.1: *dimension*, *dimension of X at x*
In 23.11.1: *catenary*
In 23.12.1: *regular in codimension k*, (R_k), (S_k)
In 23.13.1: *Japanese*, *universally Japanese*, *Nagata*
In 23.14.1: *regular locus*, *singular locus*
In 23.15.1: *quasi-affine*
In 23.19.1: *locally projective*
In 23.21.1: *κ-generated*
In 23.22.4: *subsheaf of sections annihilated by $\mathcal{I}$*
In 23.23.1: *ample*

Morphisms of Schemes

In 24.4.2: *scheme theoretic image*
In 24.5.1: *scheme theoretic closure of U in X*, *scheme theoretically dense in X*
In 24.6.1: *dominant*
In 24.7.1: *birational*
In 24.8.1: *equivalent*, *rational map from X to Y*, *S-rational map from X to Y*
In 24.8.2: *rational function on X*
In 24.8.3: *ring of rational functions on X*
In 24.8.5: *function field*, *field of rational functions*
In 24.9.1: *surjective*
In 24.10.1: *universally injective*, *radicial*
In 24.11.1: *affine*
In 24.12.1: *quasi-affine*
In 24.13.1: *local*, *stable under base change*, *stable under composition*
In 24.13.2: *locally of type P*
In 24.14.1: *finite type at $x \in X$*, *locally of finite type*, *finite type*
In 24.15.3: *finite type point*
In 24.16.1: *universally catenary*
In 24.18.1: *J-2*
In 24.19.1: *quasi-finite at a point $x \in X$*, *locally quasi-finite*, *quasi-finite*
In 24.20.1: *finite presentation at $x \in X$*, *locally of finite presentation*, *finite presentation*
In 24.22.1: *open*, *universally open*
In 24.23.1: *submersive*, *universally submersive*
In 24.24.1: *flat at a point $x \in X$*, *flat over S at a point $x \in X$*, *flat*, *flat over S*
In 24.25.2: *canonical scheme structure on T*
In 24.28.1: *relative dimension $\leq d$ at x*, *relative dimension $\leq d$*, *relative dimension d*
In 24.30.1: *syntomic at $x \in X$*, *syntomic*, *local complete intersection over k*, *standard syntomic*
In 24.30.15: *syntomic of relative dimension d*

In 24.31.1: *conormal sheaf* $\mathcal{C}_{Z/X}$ *of* Z *in* X, *conormal sheaf of* i
In 24.32.1: *derivation*, S*-derivation*, *Leibniz rule*
In 24.32.4: *sheaf of differentials* $\Omega_{X/S}$ *of* X *over* S, *universal* S*-derivation*
In 24.33.1: *smooth at* $x \in X$, *smooth*, *standard smooth*
In 24.33.13: *smooth of relative dimension* d
In 24.34.1: *unramified at* $x \in X$, G*-unramified at* $x \in X$, *unramified*, G*-unramified*
In 24.35.1: *étale at* $x \in X$, *étale*, *standard étale*
In 24.36.1: *relatively ample*, f*-relatively ample*, *ample on* X/S, f*-ample*
In 24.37.1: *relatively very ample*, f*-relatively very ample*, *very ample on* X/S, f*-very ample*
In 24.39.1: *quasi-projective*, *H-quasi-projective*, *locally quasi-projective*
In 24.40.1: *proper*
In 24.41.1: *projective*, *H-projective*, *locally projective*
In 24.42.1: *integral*, *finite*
In 24.43.1: *universal homeomorphism*
In 24.44.1: *finite locally free*, *rank*, *degree*
In 24.45.5: *degree of* X *over* Y
In 24.46.2: *integral closure of* $\mathcal{O}_X$ *in* $\mathcal{A}$
In 24.46.3: *normalization of* X *in* Y
In 24.46.12: *normalization*
In 24.48.1: *bounds the degrees of the fibres of* f, *fibres of* f *are universally bounded*

Coherent Cohomology

In 25.10.5: *scheme theoretic support of* $\mathcal{F}$
In 25.13.1: *depth* k *at a point*, *depth* k *at a point*, (S_k), (S_k)
In 25.13.2: *Cohen-Macaulay*

Divisors

In 26.2.1: *associated*, *associated points of* X
In 26.4.1: *embedded associated point*, *embedded point*, *embedded component*
In 26.5.1: *weakly associated*, *weakly associated points of* X
In 26.7.1: *relative assassin of* $\mathcal{F}$ *in* X *over* S
In 26.8.1: *relative weak assassin of* $\mathcal{F}$ *in* X *over* S
In 26.9.1: *locally principal closed subscheme*, *effective Cartier divisor*
In 26.9.4: *sum of the effective Cartier divisors* D_1 *and* D_2
In 26.9.8: *pullback of* D *by* f *is defined*, *pullback of the effective Cartier divisor*
In 26.9.11: *invertible sheaf* $\mathcal{O}_S(D)$ *associated to* D
In 26.9.13: *regular section*
In 26.9.15: *zero scheme*
In 26.10.2: *relative effective Cartier divisor*
In 26.11.1: *conormal algebra* $\mathcal{C}_{Z/X,*}$ *of* Z *in* X, *conormal algebra of* f
In 26.11.5: *normal cone* C_ZX, *normal bundle*
In 26.12.2: *regular*, *Koszul-regular*, H_1*-regular*, *quasi-regular*
In 26.13.1: *regular immersion*, *Koszul-regular immersion*, H_1*-regular immersion*, *quasi-regular immersion*
In 26.14.2: *relative quasi-regular immersion*, *relative* H_1*-regular immersion*
In 26.15.1: *sheaf of meromorphic functions on* X, $\mathcal{K}_X$, *meromorphic function*
In 26.15.3: *pulbacks of meromorphic functions are defined for* f
In 26.15.5: *meromorphic section of* $\mathcal{F}$
In 26.15.10: *regular*
In 26.15.14: *ideal sheaf of denominators of* s

Limits of Schemes

Varieties

In 28.3.1: *variety*
In 28.4.1: *geometrically reduced at* x, *geometrically reduced*
In 28.5.1: *geometrically connected*
In 28.6.1: *geometrically irreducible*
In 28.7.1: *geometrically pointwise integral at* x, *geometrically pointwise integral*, *geometrically integral*
In 28.8.1: *geometrically normal at* x, *geometrically normal*
In 28.10.1: *geometrically regular at* x, *geometrically regular over* k
In 28.13.1: *algebraic* k*-scheme*, *locally algebraic* k*-scheme*

In 28.16.1: *affine variety*, *projective variety*, *quasi-projective variety*, *proper variety*

Chow Homology and Chern Classes

In 29.2.1: *admissible*, *symbol*, *admissible relation*, *determinant of the finite length R-module*
In 29.3.1: 2-*periodic complex*, *cohomology modules*, *exact*, (2, 1)-*periodic complex*, *cohomology modules*
In 29.3.2: *multiplicity*, *Herbrand quotient*
In 29.3.4: *determinant of* (M, φ, ψ)
In 29.4.3: *symbol associated to* M, a, b
In 29.4.5: *tame symbol*
In 29.7.5: *δ-dimension of Z*
In 29.8.1: *locally finite*, *cycle on X*, *k-cycle*
In 29.9.2: *multiplicity of Z' in Z*, *k-cycle associated to Z*
In 29.10.2: *multiplicity of Z' in $\mathcal{F}$*, *k-cycle associated to $\mathcal{F}$*
In 29.12.1: *pushforward*
In 29.14.1: *flat pullback of α by f*
In 29.16.1: *order of vanishing of f along Z*
In 29.17.1: *principal divisor associated to f*
In 29.19.1: *rationally equivalent to zero*, *rationally equivalent*, *Chow group of k-cycles on X*, *Chow group of k-cycles module rational equivalence on X*
In 29.23.1: *order of vanishing of s along Z*
In 29.24.1: *Weil divisor associated to s*, *Weil divisor associated to $\mathcal{L}$*
In 29.25.1: *intersection with the first chern class of $\mathcal{L}$*
In 29.27.3: *ϵ-invariant*
In 29.27.5: *sum of the effective Cartier divisors*
In 29.28.1: *Gysin homomorphism*
In 29.34.1: *chern classes of $\mathcal{E}$ on X*, *total chern class of $\mathcal{E}$ on X*
In 29.35.1: *intersection with the jth chern class of $\mathcal{E}$*
In 29.36.1: *polynomial relation among the chern classes*

Topologies on Schemes

In 30.3.1: *Zariski covering of T*
In 30.3.4: *standard Zariski covering*
In 30.3.5: *big Zariski site*
In 30.3.7: *big Zariski site of S*, *small Zariski site of S*, *big affine Zariski site of S*
In 30.3.14: *restriction to the small Zariski site*
In 30.4.1: *étale covering of T*
In 30.4.5: *standard étale covering*
In 30.4.6: *big étale site*
In 30.4.8: *big étale site of S*, *small étale site of S*, *big affine étale site of S*
In 30.4.14: *restriction to the small étale site*
In 30.5.1: *smooth covering of T*
In 30.5.5: *standard smooth covering*
In 30.5.6: *big smooth site*
In 30.5.8: *big smooth site of S*, *big affine smooth site of S*
In 30.6.1: *syntomic covering of T*
In 30.6.5: *standard syntomic covering*
In 30.6.6: *big syntomic site*
In 30.6.8: *big syntomic site of S*, *big affine syntomic site of S*
In 30.7.1: *fppf covering of T*
In 30.7.5: *standard fppf covering*
In 30.7.6: *big fppf site*
In 30.7.8: *big fppf site of S*, *big affine fppf site of S*
In 30.8.1: *fpqc covering of T*
In 30.8.9: *standard fpqc covering*
In 30.8.12: *satisfies the sheaf property for the given family*, *satisfies the sheaf property for the fpqc topology*

Descent

In 31.2.1: *descent datum $(\mathcal{F}_i, \varphi_{ij})$ for quasi-coherent sheaves*, *cocycle condition*, *morphism $\psi : (\mathcal{F}_i, \varphi_{ij}) \to (\mathcal{F}'_i, \varphi'_{ij})$ of descent data*
In 31.2.3: *trivial descent datum*, *canonical descent datum*, *effective*
In 31.3.1: *descent datum (N, φ) for modules with respect to $R \to A$*, *cocycle condition*, *morphism $(N, \varphi) \to (N', \varphi')$ of descent data*
In 31.3.4: *effective*
In 31.6.2: *structure sheaf of the big site $(Sch/S)_\tau$*, *sheaf of $\mathcal{O}$-modules associated to $\mathcal{F}$*, *sheaf of $\mathcal{O}$-modules associated to $\mathcal{F}$*
In 31.7.1: *parasitic*, *parasitic for the τ-topology*
In 31.11.1: *local in the τ-topology*

In 31.16.1: *germ of X at x*, *morphism of germs*, *composition of morphisms of germs*
In 31.16.2: *étale*, *smooth*
In 31.17.1: *étale local*, *smooth local*
In 31.18.1: *τ local on the base*, *τ local on the target*, *local on the base for the τ-topology*
In 31.22.1: *τ local on the source*, *local on the source for the τ-topology*
In 31.28.3: *étale local on source-and-target*
In 31.29.1: *étale local on the source-and-target*
In 31.30.1: *descent datum for $V/X/S$*, *cocycle condition*, *descent datum relative to $X \to S$*, *morphism $f : (V/X, \varphi) \to (V'/X, \varphi')$ of descent data relative to $X \to S$*
In 31.30.3: *descent datum (V_i, φ_{ij}) relative to the family $\{X_i \to S\}$*, *morphism $\psi : (V_i, \varphi_{ij}) \to (V'_i, \varphi'_{ij})$ of descent data*
In 31.30.7: *pullback functor*
In 31.30.9: *pullback functor*
In 31.30.10: *trivial descent datum*, *canonical descent datum*, *effective*
In 31.30.11: *canonical descent datum*, *effective*
In 31.32.1: *morphisms of type $\mathcal{P}$ satisfy descent for τ-coverings*
In 31.36.1: *cartesian*, *$V_\bullet$ is cartesian over $X_\bullet$*
In 31.36.2: *simplicial scheme associated to f*

Adequate Modules

In 32.3.1: *module-valued functor*, *morphism of module-valued functors*
In 32.3.2: *adequate*, *linearly adequate*
In 32.5.1: *adequate*
In 32.5.7: *$Adeq(\mathcal{O})$*, *$Adeq((Sch/S)_\tau, \mathcal{O})$*, *$Adeq(S)$*
In 32.8.1: *pure projective*, *pure injective*
In 32.8.5: *pure projective resolution*, *pure injective resolution*
In 32.8.8: *pure extension module*

More on Morphisms

In 33.2.1: *thickening*, *first order thickening*, *morphism of thickenings*, *thickenings over S*, *morphisms of thickenings over S*
In 33.3.1: *first order infinitesimal neighbourhood*
In 33.4.1: *formally unramified*
In 33.5.2: *universal first order thickening*, *conormal sheaf of Z over X*
In 33.6.1: *formally étale*
In 33.9.1: *formally smooth*
In 33.13.1: *normal at x*, *normal morphism*
In 33.14.1: *regular at x*, *regular morphism*
In 33.15.1: *Cohen-Macaulay at x*, *Cohen-Macaulay morphism*
In 33.25.1: *étale neighbourhood of (S, s)*, *morphism of étale neighbourhoods*, *elementary étale neighbourhood*
In 33.36.2: *pseudo-coherent*
In 33.37.2: *perfect*
In 33.38.2: *Koszul at x*, *Koszul morphism*, *local complete intersection morphism*

More on flatness

In 34.2.1: *$\mathcal{F}$ is locally finitely presented relative to S*
In 34.5.1: *one step dévissage of $\mathcal{F}/X/S$ over s*
In 34.5.2: *one step dévissage of $\mathcal{F}/X/S$ at x*
In 34.5.6: *standard shrinking*
In 34.6.1: *complete dévissage of $\mathcal{F}/X/S$ over s*
In 34.6.2: *complete dévissage of $\mathcal{F}/X/S$ at x*
In 34.6.5: *standard shrinking*
In 34.7.1: *elementary étale localization of the ring map $R \to S$ at $\mathfrak{q}$*
In 34.7.2: *complete dévissage of $N/S/R$ over $\mathfrak{r}$*
In 34.7.4: *complete dévissage of $N/S/R$ at $\mathfrak{q}$*
In 34.15.2: *impurity of $\mathcal{F}$ above s*
In 34.16.1: *pure along X_s*, *universally pure along X_s*, *pure along X_s*, *universally S-pure*, *universally pure relative to S*, *S-pure*, *pure relative to S*, *S-pure*, *pure relative to S*
In 34.21.1: *universal flattening of $\mathcal{F}$ exists*, *universal flattening of X exists*
In 34.21.2: *flattening stratification*, *flattening stratification*

Groupoid Schemes

In 35.3.1: *pre-relation*, *relation*, *pre-equivalence relation*, *equivalence relation on U over S*
In 35.3.3: *restriction*, *pullback*

In 35.4.1: *group scheme over S*, *morphism $\psi : (G, m) \to (G', m')$ of group schemes over S*
In 35.4.3: *closed subgroup scheme*, *open subgroup scheme*
In 35.4.4: *smooth group scheme*, *flat group scheme*, *separated group scheme*
In 35.8.1: *action of G on the scheme X/S*, *equivariant*, *G-equivariant*
In 35.9.1: *pseudo G-torsor*, *formally principally homogeneous under G*, *trivial*
In 35.9.3: *principal homogeneous space*, *G-torsor*, *G-torsor in the τ topology*, *τ G-torsor*, *τ torsor*, *quasi-isotrivial*, *locally trivial*
In 35.10.1: *G-equivariant quasi-coherent $\mathcal{O}_X$-module*, *equivariant quasi-coherent $\mathcal{O}_X$-module*
In 35.11.1: *groupoid scheme over S*, *groupoid over S*, *morphism $f : (U, R, s, t, c) \to (U', R', s', t', c')$ of groupoid schemes over S*
In 35.12.1: *quasi-coherent module on (U, R, s, t, c)*
In 35.14.2: *stabilizer of the groupoid scheme (U, R, s, t, c)*
In 35.15.2: *restriction of (U, R, s, t, c) to U'*
In 35.16.1: *R-invariant*, *R-invariant*, *R-invariant*
In 35.17.1: *quotient sheaf U/R*
In 35.17.2: *representable quotient*, *representable quotient*

More on Groupoid Schemes

Étale Morphisms of Schemes

In 37.3.1: *unramified homomorphism of local rings*
In 37.3.5: *unramified at x*, *unramified*
In 37.9.1: *flat*, *faithfully flat*, *flat (resp. faithfully flat)*
In 37.9.3: *flat over Y at $x \in X$*, *flat at $x \in X$*, *flat*, *faithfully flat*
In 37.11.1: *étale homomorphism of local rings*
In 37.11.4: *étale at $x \in X$*, *étale*

Étale Cohomology

In 38.4.1: *étale covering*
In 38.9.1: *presheaf of sets*, *abelian presheaf*
In 38.10.1: *family of morphisms with fixed target*
In 38.10.2: *site*, *coverings*
In 38.11.1: *separated presheaf*, *sheaf*
In 38.11.4: *category of sheaves of sets*, *abelian sheaves*
In 38.13.1: *zeroth Cech cohomology group*
In 38.15.1: *fpqc covering*
In 38.15.5: *satisfies the sheaf property for the fpqc topology*
In 38.16.1: *descent datum*, *effective*
In 38.16.5: *descent datum*
In 38.16.6: *effective*
In 38.17.2: *ringed site*, *quasi-coherent*
In 38.18.1: *Cech complex*, *Cech cohomology groups*
In 38.18.4: *free abelian presheaf on $\mathcal{G}$*
In 38.20.1: *τ-covering*
In 38.20.2: *standard τ-covering*
In 38.20.4: *big τ-site of S*, *small τ-site of S*
In 38.21.1: *étale topos*, *small étale topos*, *Zariski topos*, *small Zariski topos*, *big τ-topos*
In 38.23.1: *constant sheaf*
In 38.23.3: *structure sheaf*
In 38.26.1: *étale*
In 38.26.3: *standard étale*
In 38.27.1: *étale covering*
In 38.27.3: *big étale site over S*, *small étale site over S*, *big*, *small Zariski sites*
In 38.29.1: *geometric point*, *lies over*, *étale neighborhood*, *morphism of étale neighborhoods*
In 38.29.6: *stalk*
In 38.31.3: *support of $\mathcal{F}$*, *support of σ*
In 38.32.2: *henselian*
In 38.32.6: *strictly henselian*
In 38.33.2: *étale local ring of S at $\overline{s}$*, *strict henselization of $\mathcal{O}_{S,s}$*, *henselization of $\mathcal{O}_{S,s}$*, *strict henselization of S at $\overline{s}$*, *henselization of S at s*
In 38.35.1: *direct image*, *pushforward*
In 38.35.3: *direct image*, *pushforward*
In 38.35.4: *higher direct images*
In 38.36.1: *inverse image*, *pullback*
In 38.55.1: *G-set*, *discrete G-set*, *morphism of G-sets*, *G-Sets*

In 38.56.1: *absolute Galois group*, *algebraic*
In 38.57.1: *G-module*, *discrete G-module*, *morphism of G-modules*, *Mod_G*
In 38.57.3: *continuous group cohomology groups*, *group cohomology groups*, *Galois cohomology groups*, *Galois cohomology groups of K with coefficients in M*
In 38.59.3: *similar*, *equivalent*
In 38.59.4: *Brauer group*
In 38.59.8: *C_r*, *nontrivial solution*
In 38.59.13: *variety*, *curve*
In 38.61.1: *abelian variety*
In 38.62.1: *finite locally constant*
In 38.62.3: *constructible*
In 38.63.1: *extension by zero*
In 38.64.3: *restriction*, *trace*
In 38.66.1: *absolute frobenius*
In 38.66.5: *geometric frobenius*
In 38.66.9: *arithmetic frobenius*
In 38.66.11: *geometric frobenius*
In 38.67.1: *trace*
In 38.69.4: *total right derived functor of F*, *total right derived functor of G*
In 38.70.1: *filtered injective*, *projective*, *filtered quasi-isomorphism*
In 38.71.1: *filtered derived functor*
In 38.73.1: *perfect*
In 38.75.1: *finite Tor-dimension*
In 38.75.4: *perfect complexes*
In 38.76.1: *global Lefschetz number*
In 38.76.2: *local Lefschetz number*
In 38.77.2: *G-trace of f on P*
In 38.80.1: *$\mathbf{Z}_\ell$-sheaf*, *lisse*, *morphism*
In 38.80.6: *torsion*, *stalk*
In 38.80.8: *ℓ-adic cohomology*
In 38.81.1: *L-function of $\mathcal{F}$*
In 38.81.3: *L-function of $\mathcal{F}$*
In 38.89.1: *open*
In 38.93.1: *unramified cusp form on $GL_2(\mathbf{A})$ with values in Λ*

Crystalline Cohomology

In 39.2.1: *divided power structure*
In 39.3.1: *divided power ring*, *homomorphism of divided power rings*
In 39.4.1: *extends*
In 39.6.2: *divided power envelope of J in B relative to (A, I, γ)*
In 39.8.1: *δ is compatible with γ*
In 39.9.2: *divided power thickening*, *homomorphism of divided power thickenings*
In 39.10.1: *divided power A-derivation*
In 39.11.1: *divided power structure γ*
In 39.11.2: *divided power scheme*, *morphism of divided power schemes*
In 39.11.3: *divided power thickening*
In 39.12.1: *divided power thickening of X relative to $(S, \mathcal{I}, \gamma)$*, *morphism of divided power thickenings of X relative to $(S, \mathcal{I}, \gamma)$*
In 39.12.4: *Zariski, étale, smooth, syntomic, or fppf covering*, *big crystalline site*
In 39.13.1: *crystalline site*
In 39.15.1: *locally quasi-coherent*, *quasi-coherent*, *crystal in $\mathcal{O}_{X/S}$-modules*
In 39.15.3: *crystal in quasi-coherent modules*, *crystal in finite locally free modules*
In 39.16.1: *S-derivation $D : \mathcal{O}_{X/S} \to \mathcal{F}$*
In 39.31.2: *F-crystal on X/S (relative to σ)*, *nondegenerate*

Algebraic Spaces

In 40.5.1: *property $\mathcal{P}$*
In 40.6.1: *algebraic space over S*
In 40.6.3: *morphism $f : F \to F'$ of algebraic spaces over S*
In 40.9.2: *étale equivalence relation*
In 40.9.3: *presentation*
In 40.12.1: *open immersion*, *open subspace*, *closed immersion*, *closed subspace*, *immersion*, *locally closed subspace*
In 40.12.5: *Zariski covering*
In 40.12.6: *small Zariski site F_{Zar}*
In 40.13.2: *separated over S*, *locally separated over S*, *quasi-separated over S*, *Zariski locally quasi-separated over S*
In 40.14.4: *acts freely*, *quotient of U by G*
In 40.16.2: *base change of F' to S*, *viewed as an algebraic space over S'*

Properties of Algebraic Spaces

In 41.3.1: *separated*, *locally separated*, *quasi-separated*, *Zariski locally quasi-separated*, *separated*, *locally separated*, *quasi-separated*, *Zariski locally quasi-separated*
In 41.4.1: *point*
In 41.4.7: *topological space*
In 41.5.1: *quasi-compact*

In 41.7.2: *has property* $\mathcal{P}$
In 41.7.5: *has property* $\mathcal{P}$ *at* x
In 41.8.1: *dimension of* X *at* x
In 41.8.2: *dimension*
In 41.9.3: *algebraic space structure on* Z, *reduced induced algebraic space structure*, *reduction* X_{red} *of* X
In 41.12.1: *Noetherian*
In 41.13.2: *étale*
In 41.15.1: *small étale site* $X_{étale}$
In 41.15.2: $X_{spaces,étale}$
In 41.15.6: *étale topos*, *small étale topos*
In 41.15.8: f*-map* $\varphi : \mathcal{G} \to \mathcal{F}$
In 41.16.1: *geometric point*, *geometric point lying over* x
In 41.16.2: *étale neighborhood*, *morphism of étale neighborhoods*
In 41.16.6: *stalk*
In 41.17.3: *support of* $\mathcal{F}$, *support of* σ
In 41.18.2: *structure sheaf*
In 41.19.2: *étale local ring of* X *at* $\overline{x}$, *strict henselization of* X *at* $\overline{x}$
In 41.20.2: *dimension of the local ring of* X *at* x
In 41.21.2: *geometrically unibranch at* x, *geometrically unibranch*
In 41.26.1: *quasi-coherent*
In 41.28.2: *locally projective*

Morphisms of Algebraic Spaces

In 42.5.2: *separated*, *locally separated*, *quasi-separated*
In 42.6.2: *surjective*
In 42.7.2: *open*, *universally open*
In 42.8.1: *submersive*, *universally submersive*
In 42.9.2: *quasi-compact*
In 42.10.2: *closed*, *universally closed*
In 42.11.1: *satisfies the uniqueness part of the valuative criterion*, *satisfies the existence part of the valuative criterion*, *satisfies the valuative criterion*
In 42.14.1: *monomorphism*
In 42.18.3: *universally injective*
In 42.19.2: *affine*
In 42.20.2: *quasi-affine*
In 42.21.2: *has property* $\mathcal{P}$
In 42.21.4: *has property* $\mathcal{Q}$ *at* x
In 42.22.1: *locally of finite type*, *finite type at* x, *of finite type*
In 42.24.2: *finite type point*
In 42.25.1: *locally quasi-finite*, *quasi-finite at* x, *quasi-finite*
In 42.26.1: *locally of finite presentation*, *finite presentation at* x, *of finite presentation*
In 42.27.1: *flat*, *flat at* x
In 42.28.2: *flat at* x *over* Y, *flat over* Y
In 42.30.1: *dimension of the local ring of the fibre of* f *at* x, *transcendence degree of* $x/f(x)$, f *has relative dimension* d *at* x
In 42.30.2: *relative dimension* $\leq d$, *relative dimension* d
In 42.32.1: *syntomic*, *syntomic at* x
In 42.33.1: *smooth*, *smooth at* x
In 42.34.1: *unramified*, *unramified at* x, *G-unramified*, *G-unramified at* x
In 42.35.1: *étale at* x
In 42.36.1: *proper*
In 42.37.2: *integral*, *finite*
In 42.38.2: *finite locally free*, *rank*, *degree*
In 42.41.2: *universal homeomorphism*

Decent Algebraic Spaces

In 43.3.1: *fibres of* f *are universally bounded*
In 43.6.1: *decent*, *reasonable*, *very reasonable*
In 43.10.6: *residual space of* X *at* x
In 43.13.1: *has property* (β), *has property* (β), *decent*, *reasonable*, *very reasonable*

Topologies on Algebraic Spaces

In 44.3.1: *fpqc covering of* X
In 44.4.1: *fppf covering of* X
In 44.5.1: *syntomic covering of* X
In 44.6.1: *smooth covering of* X
In 44.7.1: *étale covering of* X
In 44.8.1: *Zariski covering of* X

Descent and Algebraic Spaces

In 45.3.1: *descent datum* $(\mathcal{F}_i, \varphi_{ij})$ *for quasi-coherent sheaves*, *cocycle condition*, *morphism* $\psi : (\mathcal{F}_i, \varphi_{ij}) \to (\mathcal{F}'_i, \varphi'_{ij})$ *of descent data*
In 45.3.3: *trivial descent datum*, *canonical descent datum*, *effective*
In 45.9.1: τ *local on the base*, τ *local on the target*, *local on the base for the* τ*-topology*

In 45.12.1: *τ local on the source*, *local on the source for the τ-topology*
In 45.18.1: *smooth local on source-and-target*

More on Morphisms of Spaces

In 46.3.1: *radicial*
In 46.4.1: *locally of finite presentation*, *limit preserving*, *locally of finite presentation over S*, *locally of finite presentation*, *relatively limit preserving*
In 46.5.1: *conormal sheaf $\mathcal{C}_{Z/X}$ of Z in X*, *conormal sheaf of i*
In 46.6.2: *sheaf of differentials $\Omega_{X/Y}$ of X over Y*, *universal Y-derivation*
In 46.8.1: *thickening*, *first order thickening*, *morphism of thickenings*, *thickenings over B*, *morphisms of thickenings over B*
In 46.9.1: *first order infinitesimal neighbourhood*
In 46.10.1: *formally smooth*, *formally étale*, *formally unramified*
In 46.11.1: *formally unramified*
In 46.12.5: *universal first order thickening*, *conormal sheaf of Z over X*
In 46.13.1: *formally étale*
In 46.16.1: *formally smooth*
In 46.18.2: *the restriction of $\mathcal{F}$ to its fibre over z is flat at x over the fibre of Y over z*, *the fibre of X over z is flat at x over the fibre of Y over z*, *the fibre of X over z is flat over the fibre of Y over z*
In 46.21.2: *Koszul-regular immersion*, *H_1-regular immersion*, *quasi-regular immersion*
In 46.22.1: *pseudo-coherent*, *pseudo-coherent at x*
In 46.23.1: *perfect*, *perfect at x*
In 46.24.1: *Koszul morphism*, *local complete intersection morphism*, *Koszul at x*

Quot and Hilbert Spaces

Algebraic Spaces over Fields

Cohomology of Algebraic Spaces

In 49.3.1: *derived category of $\mathcal{O}_X$-modules with quasi-coherent cohomology sheaves*
In 49.6.2: *alternating Čech complex*

Stacks

In 50.2.2: *presheaf of morphisms from x to y*, *presheaf of isomorphisms from x to y*
In 50.3.1: *descent datum (X_i, φ_{ij}) in $\mathcal{S}$ relative to the family $\{f_i : U_i \to U\}$*, *cocycle condition*, *morphism $\psi : (X_i, \varphi_{ij}) \to (X'_i, \varphi'_{ij})$ of descent data*
In 50.3.4: *pullback functor*
In 50.3.5: *trivial descent datum*, *canonical descent datum*, *effective*
In 50.4.1: *stack*
In 50.4.5: *2-category of stacks over $\mathcal{C}$*
In 50.5.1: *stack in groupoids*
In 50.5.5: *2-category of stacks in groupoids over $\mathcal{C}$*
In 50.6.1: *stack in setoids*, *stack in sets*, *stack in discrete categories*
In 50.6.5: *2-category of stacks in setoids over $\mathcal{C}$*
In 50.10.2: *structure of site on $\mathcal{S}$ inherited from $\mathcal{C}$*, *$\mathcal{S}$ is endowed with the topology inherited from $\mathcal{C}$*
In 50.11.1: *gerbe*
In 50.11.4: *gerbe over*
In 50.12.4: *$f_*\mathcal{S}$*, *pushforward of $\mathcal{S}$ along f*
In 50.12.9: *$f^{-1}\mathcal{S}$*, *pullback of $\mathcal{S}$ along f*

Formal Deformation Theory

In 51.3.1: *$\mathcal{C}_\Lambda$*, *classical case*
In 51.3.2: *small extension*
In 51.3.6: *relative cotangent space*
In 51.3.9: *essential surjection*
In 51.4.1: *$\widehat{\mathcal{C}}_\Lambda$*
In 51.5.1: *category cofibered in groupoids over $\mathcal{C}$*
In 51.6.1: *prorepresentable*
In 51.6.2: *predeformation category*, *morphism of predeformation categories*
In 51.7.1: *category $\widehat{\mathcal{F}}$ of formal objects of $\mathcal{F}$*, *formal object $\xi = (R, \xi_n, f_n)$ of $\mathcal{F}$*, *morphism $a : \xi \to \eta$ of formal objects*
In 51.7.3: *completion of $\mathcal{F}$*
In 51.8.1: *smooth*
In 51.8.13: *versal*
In 51.9.1: *conditions (S1) and (S2)*
In 51.10.1: *R-linear*
In 51.10.9: *tangent space TF of F*
In 51.11.1: *tangent space $T\mathcal{F}$ of $\mathcal{F}$*

In 51.11.3: *differential* $d\varphi : T\mathcal{F} \to T\mathcal{G}$ *of* φ
In 51.13.4: *minimal*, *miniversal*
In 51.15.1: *condition (RS)*
In 51.15.8: *deformation category*
In 51.16.1: *lift of* x *along* f, *morphism of lifts*
In 51.18.1: *group of infinitesimal automorphisms of* x' *over* x
In 51.18.2: *group of infinitesimal automorphisms of* x_0
In 51.18.5: *automorphism functor of* x
In 51.19.1: *category of groupoids in functors on* $\mathcal{C}$, *groupoid in functors on* $\mathcal{C}$, *morphism* $(U, R, s, t, c) \to (U', R', s', t', c')$ *of groupoids in functors on* $\mathcal{C}$
In 51.19.4: *representable*
In 51.19.7: *restriction* $(U, R, s, t, c)|_{\mathcal{C}'}$ *of* (U, R, s, t, c) *to* $\mathcal{C}'$
In 51.19.9: *quotient category cofibered in groupoids* $[U/R] \to \mathcal{C}$, *quotient morphism* $U \to [U/R]$
In 51.20.1: *prorepresentable*
In 51.20.2: *completion* $(U, R, s, t, c)^\wedge$ *of* (U, R, s, t, c)
In 51.21.1: *smooth*
In 51.23.1: *presentation of* $\mathcal{F}$ *by* (U, R, s, t, c)
In 51.25.1: *normalized*, *minimal*

Groupoids in Algebraic Spaces

In 52.4.1: *pre-relation*, *relation*, *pre-equivalence relation*, *equivalence relation on* U *over* B
In 52.4.3: *restriction*, *pullback*
In 52.5.1: *group algebraic space over* B, *morphism* $\psi : (G, m) \to (G', m')$ *of group algebraic spaces over* B
In 52.8.1: *action of* G *on the algebraic space* X/B, *equivariant*, G*-equivariant*
In 52.8.2: *free*
In 52.9.1: *pseudo* G*-torsor*, *formally principally homogeneous under* G, *trivial*
In 52.9.3: *principal homogeneous space*, *principal homogeneous* G*-space over* B, G*-torsor in the* τ *topology*, τ G*-torsor*, τ *torsor*, *quasi-isotrivial*, *locally trivial*
In 52.10.1: G*-equivariant quasi-coherent* $\mathcal{O}_X$*-module*, *equivariant quasi-coherent* $\mathcal{O}_X$*-module*
In 52.11.1: *groupoid in algebraic spaces over* B, *morphism* $f : (U, R, s, t, c) \to (U', R', s', t', c')$ *of groupoids in algebraic spaces over* B
In 52.12.1: *quasi-coherent module on* (U, R, s, t, c)
In 52.15.2: *stabilizer of the groupoid in algebraic spaces* (U, R, s, t, c)
In 52.16.2: *restriction of* (U, R, s, t, c) *to* U'
In 52.17.1: R*-invariant*, R*-invariant*, R*-invariant*
In 52.18.1: *quotient sheaf* U/R
In 52.18.3: *quotient representable by an algebraic space*, *representable quotient*, *representable quotient*, *quotient representable by an algebraic space*
In 52.19.1: *quotient stack*, *quotient stack*

More on Groupoids in Spaces

In 53.11.1: *split over* u, *splitting of* R *over* u, *quasi-split over* u, *quasi-splitting of* R *over* u

Bootstrap

In 54.3.1: *representable by algebraic spaces*
In 54.4.1: *property* $\mathcal{P}$

Examples of Stacks

In 55.17.2: *degree* d *finite Hilbert stack of* $\mathcal{X}$ *over* $\mathcal{Y}$

Quotients of Groupoids

In 56.3.1: R*-invariant*, G*-invariant*
In 56.3.4: *pullback*, *flat pullback*
In 56.4.1: *categorical quotient*, *categorical quotient in* $\mathcal{C}$, *categorical quotient in the category of schemes*, *categorical quotient in schemes*
In 56.4.4: *universal categorical quotient*, *uniform categorical quotient*
In 56.5.1: *orbit*, R*-orbit*
In 56.5.4: *weakly* R*-equivalent*, R*-equivalent*, *weak orbit*, *weak* R*-orbit*, *orbit*, R*-orbit*
In 56.5.8: *set-theoretically* R*-invariant*, *separates orbits*, *separates* R*-orbits*
In 56.5.13: *set-theoretic pre-equivalence relation*, *set-theoretic equivalence relation*
In 56.5.18: *orbit space for* R

In 56.6.1: *coarse quotient*, *coarse quotient in schemes*
In 56.7.1: *uniformly*, *universally*
In 56.8.1: *sheaf of R-invariant functions on X*, *the functions on X are the R-invariant functions on U*
In 56.9.1: *good quotient*
In 56.10.1: *geometric quotient*

Algebraic Stacks

In 57.8.1: *representable by an algebraic space over S*
In 57.9.1: *representable by algebraic spaces*
In 57.10.1: *property $\mathcal{P}$*
In 57.12.1: *algebraic stack over S*
In 57.12.2: *Deligne-Mumford stack*
In 57.12.3: *2-category of algebraic stacks over S*
In 57.16.4: *smooth groupoid*
In 57.16.5: *presentation*
In 57.19.2: *viewed as an algebraic stack over S'*
In 57.19.3: *change of base of $\mathcal{X}'$*

Sheaves on Algebraic Stacks

In 58.3.1: *presheaf on $\mathcal{X}$*, *morphism of presheaves on $\mathcal{X}$*
In 58.4.1: *associated Zariski site*, *associated étale site*, *associated smooth site*, *associated syntomic site*, *associated fppf site*
In 58.4.3: *Zariski sheaf*, *sheaf for the Zariski topology*, *étale sheaf*, *sheaf for the étale topology*, *smooth sheaf*, *sheaf for the smooth topology*, *syntomic sheaf*, *sheaf for the syntomic topology*, *fppf sheaf*, *sheaf*, *sheaf for the fppf topology*
In 58.4.5: *associated morphism of fppf topoi*
In 58.6.1: *structure sheaf of $\mathcal{X}$*
In 58.7.1: *presheaf of modules on $\mathcal{X}$*, *$\mathcal{O}_\mathcal{X}$-module*, *sheaf of $\mathcal{O}_\mathcal{X}$-modules*
In 58.9.2: *pullback $x^{-1}\mathcal{F}$ of $\mathcal{F}$*, *restriction of $\mathcal{F}$ to $U_{étale}$*
In 58.11.1: *quasi-coherent module on $\mathcal{X}$*, *quasi-coherent $\mathcal{O}_\mathcal{X}$-module*
In 58.11.4: *locally quasi-coherent*

Criteria for Representability

In 59.8.1: *algebraic*

Properties of Algebraic Stacks

In 60.4.2: *point*
In 60.4.8: *topological space*
In 60.5.1: *surjective*
In 60.6.1: *quasi-compact*
In 60.7.2: *has property $\mathcal{P}$*
In 60.7.5: *has property $\mathcal{P}$ at x*
In 60.8.1: *monomorphism*
In 60.9.1: *open immersion*, *closed immersion*, *immersion*
In 60.9.8: *open substack*, *closed substack*, *locally closed substack*
In 60.10.4: *algebraic stack structure on Z*, *reduced induced algebraic stack structure*, *reduction $\mathcal{X}_{red}$ of $\mathcal{X}$*
In 60.11.8: *residual gerbe of $\mathcal{X}$ at x exists*, *residual gerbe of $\mathcal{X}$ at x*

Morphisms of Algebraic Stacks

In 61.4.1: *DM*, *quasi-DM*, *separated*, *quasi-separated*
In 61.4.2: *DM over S*, *quasi-DM over S*, *separated over S*, *quasi-separated over S*, *DM*, *quasi-DM*, *separated*, *quasi-separated*
In 61.5.3: *sheaf of automorphisms of x*
In 61.7.2: *quasi-compact*
In 61.8.1: *Noetherian*
In 61.9.2: *open*, *universally open*
In 61.10.1: *submersive*, *universally submersive*
In 61.11.2: *closed*, *universally closed*
In 61.12.2: *has property $\mathcal{P}$*
In 61.13.1: *locally of finite type*, *of finite type*
In 61.14.2: *finite type point*
In 61.16.2: *locally quasi-finite*
In 61.17.1: *flat*
In 61.18.1: *locally of finite presentation*, *of finite presentation*
In 61.19.1: *gerbe over*, *gerbe*
In 61.22.1: *smooth*

Cohomology of Algebraic Stacks

In 62.7.1: *flat base change property*
In 62.8.1: *parasitic*
In 62.11.1: *lisse-étale site*, *flat-fppf site*
In 62.13.1: *derived category of $\mathcal{O}_\mathcal{X}$-modules with quasi-coherent cohomology sheaves*

Introducing Algebraic Stacks

In 63.4.3: *smooth*

In 63.5.1: *algebraic stack*

Examples

Exercises

In 65.2.1: *directed partially ordered set*, *system of rings*
In 65.2.3: *colimit*
In 65.2.8: *finite presentation*
In 65.5.4: *quasi-compact*
In 65.5.6: *Hausdorff*
In 65.5.9: *irreducible*, *irreducible*
In 65.5.12: *generic point*
In 65.5.16: *Noetherian*, *Artinian*
In 65.5.18: *irreducible component*
In 65.5.22: *closed*, *specialization*, *generalization*
In 65.5.26: *connected*, *connected component*
In 65.8.1: *length*
In 65.12.1: *catenary*
In 65.15.1: *finite locally free*, *invertible module*
In 65.15.3: *class group of A*, *Picard group of A*
In 65.17.1: *going-up theorem*, *going-down theorem*
In 65.19.1: *numerical polynomial*
In 65.19.2: *graded module*, *locally finite*, *Euler-Poincaré function*, *Hilbert function*, *Hilbert polynomial*
In 65.19.3: *graded A-algebra*, *graded module M over a graded A-algebra B*, *homomorphisms of graded modules/rings*, *graded submodules*, *graded ideals*, *exact sequences of graded modules*
In 65.20.1: *homogeneous*
In 65.20.2: *homogeneous spectrum $Proj(R)$*
In 65.20.3: $R_{(f)}$
In 65.21.1: *Cohen-Macaulay*
In 65.23.3: *filtered injective*
In 65.23.4: $Fil^f(\mathcal{A})$
In 65.23.6: *filtered quasi-isomorphism*
In 65.23.7: *filtered acyclic*
In 65.26.12: *integral*
In 65.28.1: *dual numbers*
In 65.28.3: *tangent space of X over S*, *tangent vector*
In 65.29.1: *quasi-coherent*
In 65.29.2: *specialization*
In 65.29.5: *locally Noetherian*, *Noetherian*
In 65.29.6: *coherent*
In 65.32.1: *invertible $\mathcal{O}_X$-module*
In 65.32.4: *invertible module M*, *trivial*
In 65.32.7: *Picard group of X*
In 65.33.2: $\delta(\tau)$
In 65.34.1: *Weil divisor*, *prime divisor*, *Weil divisor associated to a rational function $f \in K(X)^*$*, *effective Cartier divisor*, *Weil divisor $[D]$ associated to an effective Cartier divisor $D \subset X$*, *sheaf of total quotient rings $\mathcal{K}_S$*, *Cartier divisor*, *Weil divisor associated to a Cartier divisor*
