

# 11. Lightning introduction to group theory

1. Decide whether the following sets and operations form groups:

- a)  $(\mathbb{R}, +)$
- b)  $([-1, 1], +)$
- c)  $([0, \infty), \cdot)$
- d)  $([1, \infty), \cdot)$
- e)  $(\{ \equiv, \times, \times, \times \}, \cdot)$
- f)  $(\{ \equiv, \equiv, \times, \times \}, \cdot)$

## GROUP AXIOMS:

- Closure: for all  $x, y \in G$   
 $x * y \in G$
- Associativity: for all  $x, y, z \in G$   
 $(x * y) * z = x * (y * z)$
- Identity element: there is  $e \in G$  s.t.  
 $ex = x$  and  $xe = x$  for all  $x \in G$
- Inverses: for all  $x \in G$  there is  $x^{-1} \in G$  s.t.  
 $xx^{-1} = e$  and  $x^{-1}x = e$

2. Let  $C_2 \times C_2$  be the group with set  $\{(0,0), (0,1), (1,0), (1,1)\}$  and operation given by addition modulo 2, so for example

$(1,0) + (1,1) = (2,1) = (0,1)$ . Write down the operation table and prove that  $C_2 \times C_2$  is indeed a group.

3. Recall

with multiplication given by successive application of the maps, for instance

$V * H: \begin{array}{|c|c|} \hline D & C \\ \hline A & B \\ \hline \end{array} \xrightarrow{H} \begin{array}{|c|c|} \hline C & D \\ \hline B & A \\ \hline \end{array} \xrightarrow{V} \begin{array}{|c|c|} \hline A & B \\ \hline D & C \\ \hline \end{array}$  (Notice that we apply the transformations from right to left)

therefore  $V * H = R$

Write down the operation table for  $\text{Sym}(\square)$ . Do you see any similarities with that in 2?

4. Recall that  $C_6 = \{0, 1, 2, 3, 4, 5\}$  with operation addition modulo 6. Compute the order of each element and find two different subgroups

5. (Optional): Prove that the unit element in a group is unique.

(Hint: suppose there are two, say  $e$  and  $f$ , and show that in fact  $e=f$ .)

6. (Challenge) Let  $G$  be a finite group and let  $H \leq G$  be a subgroup. A (left) coset of  $G$  by  $H$  is a set of the form  $gH = \{gh \mid h \in H\}$ . Prove the following statements.

- All cosets have the same number of elements.
- If two cosets have an element in common, then they are equal.
- Every  $g \in G$  lies in some coset.

Deduce that the number of elements of  $H$  divides the number of elements of  $G$ .
